Select Subsystem Execution

Introduced before R2006a

Synchronous Subsystem

Represent subsystem that has synchronous reset and enable behavior

Library

HDL Coder / HDL Subsystems

Description

A Synchronous Subsystem is a subsystem that uses the `Synchronous` mode of the State Control block. If an **S** symbol appears in the subsystem, then it is synchronous.

To create a Synchronous Subsystem, add the block to your Simulink model from the HDL Subsystems block library. You can also add a State Control block with **State control** set to `Synchronous` inside a subsystem. For more information about the State Control block, see State Control.

Data Type Support

See Inport for information on the data types accepted by a subsystem's input ports. See Outport for information on the data types output by a subsystem's output ports.

For more information, see "Data Types Supported by Simulink" in the Simulink documentation.

Parameters

Show port labels

Cause Simulink software to display labels for the subsystem's ports on the subsystem's icon.

Default: `FromPortIcon`

`none`

Does not display port labels on the subsystem block.

`FromPortIcon`

If the corresponding port icon displays a signal name, display the signal name on the subsystem block. Otherwise, display the port block's name.

`FromPortBlockName`

Display the name of the corresponding port block on the subsystem block.

`SignalName`

If a name exists, display the name of the signal connected to the port on the subsystem block; otherwise, the name of the corresponding port block.

See "Block-Specific Parameters" on page 6-130 for the command-line information.

Read/Write permissions

Control user access to the contents of the subsystem.

Default: `ReadWrite`

`ReadWrite`

Enables opening and modification of subsystem contents.

`ReadOnly`

Enables opening but not modification of the subsystem. If the subsystem resides in a block library, you can create and open links to the subsystem and can make and

modify local copies of the subsystem but cannot change the permissions or modify the contents of the original library instance.

`NoReadOrWrite`

Disables opening or modification of subsystem. If the subsystem resides in a library, you can create links to the subsystem in a model but cannot open, modify, change permissions, or create local copies of the subsystem.

See "Block-Specific Parameters" on page 6-130 for the command-line information.

Name of error callback function

Enter name of a function to be called if an error occurs while Simulink software is executing the subsystem.

Default: ` `

Simulink software passes two arguments to the function: the handle of the subsystem and a character vector that specifies the error type. If no function is specified, Simulink software displays a generic error message if executing the subsystem causes an error.

See "Block-Specific Parameters" on page 6-130 for the command-line information.

Permit hierarchical resolution

Specify whether to resolve names of workspace variables referenced by this subsystem.

Default: `All`

`All`

Resolve all names of workspace variables used by this subsystem, including those used to specify block parameter values and Simulink data objects (for example, `Simulink.Signal` objects).

`ExplicitOnly`

Resolve only names of workspace variables used to specify block parameter values, data store memory (where no block exists), signals, and states marked as "must resolve".

None

Do not resolve any workspace variable names.

See "Block-Specific Parameters" on page 6-130 for the command-line information.

Treat as atomic unit

Causes Simulink software to treat the subsystem as a unit when determining the execution order of block methods.

Default: Off

☑ On

Cause Simulink software to treat the subsystem as a unit when determining the execution order of block methods. For example, when it needs to compute the output of the subsystem, Simulink software invokes the output methods of all the blocks in the subsystem before invoking the output methods of other blocks at the same level as the subsystem block.

☐ Off

Cause Simulink software to treat all blocks in the subsystem as being at the same level in the model hierarchy as the subsystem when determining block method execution order. This can cause execution of methods of blocks in the subsystem to be interleaved with execution of methods of blocks outside the subsystem.

This parameter enables:

- "Minimize algebraic loop occurrences" on page 1-0 .
- "Sample time" on page 1-0
- "Function packaging" on page 1-0 (requires a Simulink Coder license)

See "Block-Specific Parameters" on page 6-130 for the command-line information.

Treat as grouped when propagating variant conditions

Causes Simulink software to treat the subsystem as a unit when propagating variant conditions from Variant Source blocks or to Variant Sink blocks.

Default: On

☑ On

> Simulink treats the subsystem as a unit when propagating variant conditions from Variant Source blocks or to Variant Sink blocks. For example, when Simulink computes the variant condition of the subsystem, it propagates that condition to all the blocks in the subsystem.

☐ Off

> Simulink treats all blocks in the subsystem as being at the same level in the model hierarchy as the subsystem itself when determining their variant condition.

"Treat as grouped when propagating variant conditions" on page 1-0   enables this parameter.

See "Block-Specific Parameters" on page 6-130 for the command-line information.

Function packaging

Specify the code format to be generated for an atomic (nonvirtual) subsystem.

Default: `Auto`

`Auto`

> Simulink Coder software chooses the optimal format for you based on the type and number of instances of the subsystem that exist in the model.

`Inline`

> Simulink Coder software inlines the subsystem unconditionally.

`Nonreusable function`

> Simulink Coder software explicitly generates a separate function in a separate file. Subsystems with this setting generate functions that might have arguments

depending on the "Function interface" on page 1-0   parameter setting. You can name the generated function and file using parameters "Function name" on page 1-0   and "File name (no extension)" on page 1-0   . These functions are not reentrant.

`Reusable function`

Simulink Coder software generates a function with arguments that allows reuse of subsystem code when a model includes multiple instances of the subsystem.

This option also generates a function with arguments that allows subsystem code to be reused in the generated code of a model reference hierarchy that includes multiple instances of a subsystem across referenced models. In this case, the subsystem must be in a library.

See "Block-Specific Parameters" on page 6-130 for the command-line information.

Characteristics

Data Types	Double | Single | Boolean | Base Integer | Fixed-Point | Enumerated | Bus
Multidimensional Signals	Yes
Variable-Size Signals	Yes

Tapped Delay

Delay scalar signal multiple sample periods and output all delayed versions
Library

Discrete

Description

The Tapped Delay block delays an input by the specified number of sample periods and outputs all the delayed versions. Use this block to discretize a signal in time or resample a signal at a different rate.

The block accepts one scalar input and generates an output vector that contains each delay. Specify the order of the delays in the output vector with the **Order output vector starting with** parameter:

- Oldest orders the output vector starting with the oldest delay version and ending with the newest delay version.
- Newest orders the output vector starting with the newest delay version and ending with the oldest delay version.

Specify the output vector for the first sampling period with the **Initial condition** parameter. Careful selection of this parameter can minimize unwanted output behavior.

Specify the time between samples with the **Sample time** parameter. Specify the number of delays with the **Number of delays** parameter. A value of -1 instructs the block to inherit the number of delays by back propagation. Each delay is equivalent to the z^{-1} discrete-time operator, which the Unit Delay block represents.

Data Type Support

The Tapped Delay block accepts signals of the following data types:

- Floating point
- Built-in integer
- Fixed point
- Boolean

For more information, see "Data Types Supported by Simulink" in the Simulink documentation.

Parameters

Initial condition

Specify the initial output of the simulation. The **Initial condition** parameter is converted from a double to the input data type offline using round-to-nearest and saturation. Simulink software does not allow you to set the initial condition of this block to inf or NaN.

Sample time

Specify the time interval between samples. To inherit the sample time, set this parameter to -1. See "Specify Sample Time" in the online Simulink documentation for more information.

Number of delays

Specify the number of discrete-time operators.

Order output vector starting with

Specify whether to output the oldest delay version first, or the newest delay version first.

Include current input in output vector

Select to include the current input in the output vector.

Characteristics

Data Types	Double	Single	Boolean	Base Integer	Fixed-Point
Sample Time	Specified in the **Sample time** parameter
Direct Feedthrough	Yes, when **Include current input in output vector** check box is selected. No, otherwise.
Multidimensional Signals	No
Variable-Size Signals	No
Code Generation	Yes

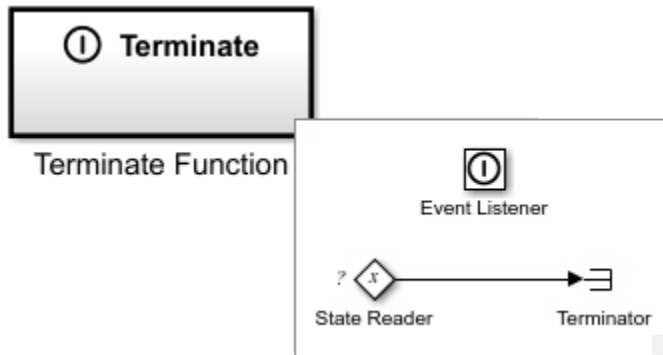
Terminate Function

Execute contents on a model terminate event
Library: User-Defined Functions
Description

The Terminate Function block is a pre-configured subsystem block that executes on a model terminate event. By default, the Terminate Function block includes an Event Listener block with **Event** set to `Terminate`, a Terminator block, and a State Reader block.


Replace the Terminator block with blocks to save the state value from the State Reader block.

For a list of unsupported blocks and features, see "Initialize, Reset, and Terminate Function Limitations".

The input and output ports of a component containing Initialize Function and Terminate Function blocks must connect to input and output port blocks.

The code generated from this block is part of the `model_terminate` function that is called once at the end of model execution.

Terminator

Terminate unconnected output port
Library: Simulink / Commonly Used Blocks
                 Simulink / Sinks

Description

Use the Terminator block to cap blocks whose output ports do not connect to other blocks. If you run a simulation with blocks having unconnected output ports, Simulink issues warning messages. Using Terminator blocks to cap those blocks helps prevent warning messages.

Ports

Input

Port_1 — Input signal
scalar | vector | matrix | n-D array | bus

Use this port to direct signals from output ports that are otherwise unconnected during a simulation. The port accepts real or complex signals of all data types.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Block Characteristics

Data Types	`double` | `single` | `Boolean` | `base integer` | `fixed point` | `enumerated` | `bus`
Multidimensional Signals	Yes

Variable-Size Signals	No

Extended Capabilities

C/C++ Code Generation
Generate C and C++ code using Simulink® Coder™.

HDL Code Generation
Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

When you use this block in your model, HDL Coder does not generate code for it.

PLC Code Generation
Generate Structured Text code using Simulink® PLC Coder™.

Fixed-Point Conversion
Convert floating-point algorithms to fixed point using Fixed-Point Designer™.

Timed-Based Linearization

Generate linear models in base workspace at specific times

Library

Model-Wide Utilities

Description

This block calls `linmod` or `dlinmod` to create a linear model for the system when the simulation clock reaches the time specified by the **Linearization time** parameter. No trimming is performed. The linear model is stored in the base workspace as a structure, along with information about the operating point at which the snapshot was taken. Multiple snapshots are appended to form an array of structures.

The block sets the following model parameters to the indicated values:

- `BufferReuse = 'off'`
- `RTWInlineParameters = 'on'`
- `BlockReductionOpt = 'off'`

The name of the structure used to save the snapshots is the name of the model appended by `_Timed_Based_Linearization`, for example, `vdp_Timed_Based_Linearization`. The structure has the following fields:

Field	Description
a	The A matrix of the linearization
b	The B matrix of the linearization

Field	Description
c	The C matrix of the linearization
d	The D matrix of the linearization
StateName	Names of the model's states
OutputName	Names of the model's output ports
InputName	Names of the model's input ports
OperPoint	A structure that specifies the operating point of the linearization. The structure specifies the operating point time (OperPoint.t). The states (OperPoint.x) and inputs (OperPoint.u) fields are not used.
Ts	The sample time of the linearization for a discrete linearization

Use the Trigger-Based Linearization block if you need to generate linear models conditionally.

You can use state and simulation time logging to extract the model states and inputs at operating points. For example, suppose that you want to get the states of the f14 example model at linearization times of 2 seconds and 5 seconds.

1. Open the model and drag an instance of this block from the Model-Wide Utilities library and drop the instance into the model.

2. Open the block's parameter dialog box and set the **Linearization time** to 2 and 5.

3. Open the model's **Model Configuration Parameters** dialog box.

4. Select the **Data Import/Export** pane.

5. Check **States** and **Time** on the **Save to Workspace** control panel

6. Select OK to confirm the selections and close the dialog box.

7. Simulate the model.

   At the end of the simulation, the following variables appear in the MATLAB workspace: f14_Timed_Based_Linearization, tout, and xout.

8. Get the indices to the operating point times by entering the following at the MATLAB command line:

```
ind1 = find(f14_Timed_Based_Linearization(1).OperPoint.t==tout);
ind2 = find(f14_Timed_Based_Linearization(1).OperPoint.t==tout);
```

9. Get the state vectors at the operating points.

```
x1 = xout(ind1,:);
x2 = xout(ind2,:);
```

Data Type Support

Not applicable.

Parameters

Linearization time

Time at which you want the block to generate a linear model. Enter a vector of times if you want the block to generate linear models at more than one time step.

Sample time (of linearized model)

Specify a sample time to create discrete-time linearizations of the model (see "Discrete-Time System Linearization" on page 2-48).

Characteristics

Data Types	Not applicable
Sample Time	Specified in the **Sample time** parameter
Multidimensional Signals	No
Variable-Size Signals	No
Code Generation	No

Trigger-Based Linearization

Introduced in R2010a

To File

Write data to file
Library

Sinks

Description

The To File block inputs a signal and writes the signal data into a MAT-file. Use the To File block to log signal data.

The To File block icon shows the name of the output file.

The block writes to the output file incrementally, with minimal memory overhead during simulation. If the output file exists when the simulation starts, the block overwrites the file. The file automatically closes when simulation is complete or paused. If simulation terminates abnormally, the To File block saves the data it has logged up until the point of the abnormal termination.

Tip If MATLAB encounters memory issues when you log a large number of signals in a long simulation that has many time steps, consider logging to persistent storage. When you log to persistent storage, the `Dataset` format logging data is stored in a MAT-file. Compared to logging to persistent storage, connecting a To File block to signals:

- Is a per-signal approach that can clutter a model with several To File blocks attached to individual signals.
- Creates a separate MAT-file for each To File block, compared to the one MAT-file that logging to persistent storage uses.

For details, see "Log Data to Persistent Storage".

Specifying the Format for Writing Data

Use the **Save format** parameter to specify the format for writing data:

- `Timeseries` (default)
- `Array`

Use the `Array` format only for vector, double, noncomplex signals. To save bus data, use the `Timeseries` format.

For the `Timeseries` format, the To File block:

- Writes data in a MATLAB `timeseries` object
- Supports writing multidimensional, real or complex output values
- Supports writing output values that have any built-in data type, including `Boolean`, enumerated (`enum`), and fixed-point data with a word length of up to 32 bits
- For bus input signals, creates a MATLAB structure that matches the bus hierarchy. Each leaf of the structure is a MATLAB `timeseries` object.

For the `Array` format, the To File block:

- Writes data into a matrix containing two or more rows. The matrix has the following form:

$$\begin{bmatrix} t_1 & t_2 & \dots & t_{final} \\ u1_1 & u1_2 & \dots & u1_{final} \\ \dots & & & \\ un_1 & un_2 & \dots & un_{final} \end{bmatrix}$$

  Simulink writes one column to the matrix for each data sample. The first element of the column contains the time stamp. The remainder of the column contains data for the corresponding output values.

- Supports writing data that is one-dimensional, double, and noncomplex.

The following table shows how simulation mode support depends on the **Save format** value.

Simulation Mode	Timeseries	Array
Normal	Supported.	Supported.
Accelerator	Supported.	Supported.
Rapid Accelerator	Supported.	Supported.
Software-in-the-Loop (SIL)	Not supported.	Supported if MAT-file logging is enabled.
Processor-in-the-Loop (PIL)	Not supported.	Supported if MAT-file logging is available and enabled.
External	Not supported.	Supported if MAT-file logging is enabled.
RSim target	Supported.	Supported if MAT-file logging is enabled.

Controlling When Data Is Written to the File

The To File block **Decimation** and **Sample Time** parameters control when data is written to the file.

The To File block does not log data outside of the intervals specified by the **Model Configuration Parameters** > **Data Import/Export** > **Logging intervals** parameter. The block stores the logged data in the file associated with the block instead of storing the data in the variable that you specify for the **Single simulation output** parameter.

Saving Data for Use by a From File Block

The From File block can use data written by a To File block in any format (`Timeseries` or `Array`) without any modifications to the data or other special provisions.

Saving Data for Use by a From Workspace Block

The From Workspace block can read data that is in the `Array` format and is the transposition of the data written by the To File block. To provide the required format, use MATLAB commands to load and transpose the data from the MAT-file.

Simulation Stepper Interaction with To File Block

If you pause using the Simulation Stepper, the To File block captures the simulation data up to the point of the pause. When you step back, the To File data file no longer contains any simulation data past the new reduced time of the last output.

Limitations of To File blocks in a Referenced Model

When a To File block is in a referenced model, that model must be a single-instance model. Only one instance of such a model can exist in a model hierarchy. See "Specify Reusability of Referenced Models" for more information.

Compressing MAT-File Data

To avoid the overhead of compressing data in real time, the To File block writes an uncompressed Version 7.3 MAT-file. To compress the data within the MAT-file, load and save the file in MATLAB. The resaved file is smaller than the original MAT-file that the To File block created, because the **Save** command compresses the data in the MAT-file.

Saving Bus Data

The To File block supports virtual and nonvirtual bus input.

To save bus data, set the **Save format** parameter to `Timeseries`.

If the input signal is a bus, then the To File block creates a MATLAB structure that matches the bus hierarchy. Each leaf of the structure is a MATLAB `timeseries` object.

Pausing a Simulation

After pausing a simulation, do not alter any file that a To File block logs into. For example, do not save such a file with the MATLAB `save` command. Altering the file can cause an error when you resume the simulation. If you want to alter the file after pausing, copy the file and work with the copy of the file.

Generating Code

To generate code for a To File block, on the **Code Generation > Interface** pane, you must select the configuration parameter "MAT-file logging" (Simulink Coder).

Data Type Support

The To File block accepts real or complex signal data of any data type that Simulink supports, with the exception that the word length for fixed-point data must be 32 bits or less.

The To File block accepts bus data.

Parameters

File name

The path or file name of the MAT-file in which to store the output. On UNIX systems, the pathname can start with a tilde (~) character signifying your home folder. The default file name is `untitled.mat`. If you specify a file name without path information, Simulink stores the file in the MATLAB working folder. (To determine the working folder, type `pwd` at the MATLAB command line.) If the file already exists, Simulink overwrites it.

Variable name

The name of the matrix contained in the named file. The default name is `ans`.

Save format

The data format that the To File block uses for writing data:

- `Timeseries` (default)
- `Array`

Decimation

The decimation factor, `n`, where `n` specifies writing data at every `n`th time that the block executes. The default decimation is `1`, which writes data at every time step.

Sample time

Specifies the sample period and offset at which to collect points. This parameter is useful when you are using a variable-step solver where the interval between time steps might

not be constant. The default is -1, which inherits the sample time from the driving block. See "Specify Sample Time" for more information.

Characteristics

Data Types	Double | Single | Boolean | Base Integer | Fixed-Point | Enumerated | Bus
Sample Time	Specified in the **Sample time** parameter
Multidimensional Signals	Yes
Variable-Size Signals	No
Code Generation	Yes

See Also

"Save Runtime Data from Simulation", "Convert Logged Data to Dataset Format", From File, From Workspace, To Workspace

Introduced before R2006a

To Workspace

Write data to workspace
Library

Sinks

Description

The To Workspace block inputs a signal and writes the signal data to a workspace. During the simulation, the block writes data to an internal buffer. When the simulation is completed or paused, that data is written to the workspace. Data is not available until the simulation is stopped or paused.

- For menu-based simulation, data is written in the MATLAB base workspace.
- A `sim` command in a MATLAB function sends data logged with the To Workspace block to the workspace of the calling function, not to the MATLAB (base) workspace. To send the logged data to the base workspace, use an `assignin` command in the function. For example:

```
function myfunc
    a = sim('mTest','SimulationMode','normal');
    b = a.get('simout')
    assignin('base','b',b);
end
```

The block icon shows the name of the variable to which the data is written. To specify the name of the workspace variable to which the To Workspace block writes the data, use the **Variable name** parameter.

To specify the data format of the variable, use the **Save format** parameter. You can specify to save the data in one of the following formats:

- A MATLAB `timeseries` object (or structure of MATLAB `timeseries` objects for bus data)
- An array
- Structure
- Structure with time

From one of these formats, you can convert the data to `Dataset` format. Converting to `Dataset` format makes it easier to post-process with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see "Convert Logged Data to Dataset Format". You can also use signal logging with a variable-size signal exception.

Saving Data for Use by a From Workspace Block

To use a From Workspace block to read into Simulink the sample-based data that was saved by a To Workspace block in a previous simulation, in the To Workspace block, specify time information using the `Timeseries` or `Structure with time` format.

Controlling the Amount of Data Saved

If you specify intervals with the **Model Configuration Parameters** > **Data Import/ Export** > **Logging intervals** parameter, the block does not log data outside of the intervals. For example, the block logs no data if the intervals are empty (`[]`).

For variable-step solvers, to control the amount of data available to the To Workspace block, use the **Model Configuration Parameters** > **Data Import/Export** > **Additional parameters** > **Output options** parameter. For example, to have Simulink write data at identical time points over multiple simulations, select the `Produce specified output only` option.

Then use To Workspace block parameters to control when and how much of this data the block writes:

- Use the **Limit data points to last** parameter to specify how many sample points to save. If the simulation generates more data points than the specified maximum, the simulation saves only the most recently generated samples. To capture all the data, set this value to `inf`.

- Use the **Decimation** parameter to have the To Workspace block write data at every nth sample, where n is the decimation factor. The default decimation, 1, writes data at every time hit.

- Use the **Sample time** parameter to specify a sampling interval at which to collect points. This parameter is useful when you are using a variable-step solver where the interval between time hits might not be the same. The default value of -1 causes the block to inherit the sample time from the driving block when determining the points to write. See "Specify Sample Time" in the online documentation for more information.

For example, suppose you have a simulation where the start time is 0, the **Limit data points to last** is 100, the **Decimation** is 1, and the **Sample time** is 0.5. The To Workspace block collects a maximum of 100 points, at time values of 0, 0.5, 1.0, 1.5, ..., seconds. Specifying a **Decimation** value of 1 directs the block to write data at each step.

In a similar example, the **Limit data points to last** is 100 and the **Sample time** is 0.5, but the **Decimation** is 5. In this example, the block collects up to 100 points, at time values of 0, 2.5, 5.0, 7.5, ..., seconds. Specifying a **Decimation** value of 5 directs the block to write data at every fifth sample. The sample time ensures that data is written at these points.

In another example, all parameters are as defined in the first example except that the **Limit data points to last** is 3. In this case, only the last three sample points collected are written to the workspace. If the simulation stop time is 100, data corresponds to times 99.0, 99.5, and 100.0 seconds (three points).

MAT-File Logging

When you enable the **MAT-file logging** parameter in **Configuration Parameters**, To Workspace logs its data to a MAT-file. For information about this parameter, in the Simulink Coder documentation, see "MAT-file logging" (Simulink Coder).

Frame-Based Signals

By default, the To Workspace block treats input signals as sample-based.

To have the To Workspace block treat input signals as frame-based, set:

1 **Save format** to either `Array` or `Structure`

2 **Save 2-D signals as** to `2-D array (concatenate along first dimension)`

Data Type Support

The To Workspace block can save to the MATLAB workspace real or complex inputs of any data type that Simulink supports, including fixed-point and enumerated data types, as well as bus objects.

For more information, see "Data Types Supported by Simulink".

Parameters

Variable name

Specify the name of the variable for the saved the data.

Limit data points to last

Specify the maximum number of input samples to save. The default is `inf`.

Decimation

Specify the decimation factor. The default is `1`.

Save format

Specify one of these formats for saving simulation output to the workspace:

- `Timeseries` (Default)

  Save non-bus signals as a MATLAB `timeseries` object and bus signals as a structure of MATLAB `timeseries` objects.

- `Array`

  Save the input as an N-dimensional array where N is one more than the number of dimensions of the input signal. For example, if the input signal is a vector, the resulting workspace array is two-dimensional. If the input signal is a matrix, then the array is three-dimensional.

1-1821

How Simulink stores samples in the array depends on whether the input signal is a scalar, vector, or matrix. If the input is a scalar or a vector, each input sample is output as a row of the array. For example, suppose that the name of the output array is `simout`. Then, `simout(1,:)` corresponds to the first sample, `simout(2,:)` corresponds to the second sample, and so on. If the input signal is a matrix, time corresponds to the third dimension. For example, suppose again that `simout` is the name of the resulting workspace array. Then, `simout(:,:,1)` is the value of the input signal at the first sample point; `simout(:,:,2)` is the value of the input signal at the second sample point; and so on.

If you select `Array`, the **Save 2-D signals** as parameter appears.

To treat input signals as frame-based, set **Save format** to either `Array` or `Structure` and set the **Save 2-D signals** parameter to `2-D array (concatenate along first dimension)`.

- `Structure`

  This format consists of a structure with three fields:

  - `time` — This field is empty for this format.
  - `signals` — A structure with three fields: `values`, `dimensions`, and `label`. The `values` field contains the array of signal values. The `dimensions` field specifies the dimensions of the corresponding signals. The `label` field contains the label of the input line.
  - `blockName` — Name of the To Workspace block

  If you select `Structure`, the **Save 2-D signals** as parameter appears.

  To treat input signals as frame-based, set **Save format** to either `Structure` or `Array` and set the **Save 2-D signals** parameter to `2-D array (concatenate along first dimension)`.

- `Structure With Time`

  This format is the same as `Structure`, except that the time field contains a vector of simulation time hits.

  To read To Workspace block output directly with a From Workspace block, use either the `Timeseries` or `Structure with Time` format. For details, see "Comparison of Signal Loading Techniques".

`Structure with Time` format does not support frame-based signals. Use `Array` or `Structure` format instead.

The following table shows how simulation mode support depends on the **Save format** value.

Simulation Mode	Timeseries	Array, Structure, or Structure With Time
Normal	Supported.	Supported.
Accelerator	Supported.	Supported only in top model, not referenced models.
Rapid Accelerator	Not supported.	Supported only in top model, not referenced models.
Software-in-the-Loop (SIL)	Not supported.	If MAT-file logging is enabled, supported only in top model, not referenced models.
Processor-in-the-Loop (PIL)	Not supported.	If MAT-file logging is available and enabled, supported only in top model, not referenced models.
External	Not supported.	Supported only in top model, not referenced models.
Simulink Coder Targets	Not supported.	If MAT-file logging is enabled, supported only in top model, not referenced models.

Save 2-D signal as

If you set **Save format** to `Array` or `Structure`, the **Save 2-D signals as** parameter appears.

Specify one of these formats for saving 2-D signals to the workspace:

- `3-D array (concatenate along third dimension)` (Default)

  This setting is well-suited for sample-based signals. Data is concatenated along the third dimension. For example, 2-by-4 matrix input for 10 samples is stored as a 2x4x10 array.

- 2-D array (concatenate along first dimension)

  This setting is well-suited for frame-based signals. The data is concatenated along the first dimension. For example, 2-by-4 matrix input for 10 samples is stored as a 20x4 array

- Inherit from input (this choice will be removed — see release notes)

  This setting is for backward compatibility. To configure this block to treat input signals as frame-based in future releases, set this parameter to 2-D array (concatenate along first dimension). To configure this block to treat input signals as sample-based in future releases, set this parameter to 3-D array (concatenate along third dimension).

When the **Save format** is set to Array or Structure, the dimensions of the output depend on the input dimensions and the setting of the **Save 2-D signals as** parameter. The following table summarizes the output dimensions under various conditions. In the table, K represents the value of the **Limit data points to last** parameter.

Input Signal Dimensions	Save 2-D Signals as ...	Signal To Workspace Output Dimension
M-by-N matrix	2-D array (concatenate along first dimension)	K-by-N matrix. If you set the **Limit data points to last** parameter to inf, K represents the total number of samples acquired in each column by the end of simulation. This is equivalent to multiplying the input frame size (M) by the total number of M-by-N inputs acquired by the block.

Input Signal Dimensions	Save 2-D Signals as ...	Signal To Workspace Output Dimension
M-by-*N* matrix	`3-D array (concatenate along third dimension)`	*M*-by-*N*-by-*K* array. If you set the **Limit data points to last** parameter to `inf`, *K* represents the total number of *M*-by-*N* inputs acquired by the end of the simulation.
Length-*N* unoriented vector	Any setting	*K*-by-*N* matrix
N-dimensional array where *N* > 2	Any setting	Array with *N+1* dimensions, where the size of the last dimension is equal to *K*. If you set the **Limit data points to last** parameter to `inf`, *K* represents the total number of *M*-by-*N* inputs acquired by the end of simulation

Log fixed-point data as a fi object

By default, the To Workspace block logs fixed-point data to the MATLAB workspace as a Fixed-Point Designer `fi` object. If you clear this parameter, fixed-point data is logged to the workspace as `double`.

Sample time

Specify the sample period and offset at which to collect data. This parameter is useful when you are using a variable-step solver where the interval between time hits might not be constant. The default is `-1`, which inherits the sample time from the driving block. See "Specify Sample Time" for more information.

Examples

The `sldemo_varsize_basic` example shows how to use the To Workspace block.

Characteristics

Data Types	Double | Single | Boolean | Base Integer | Fixed-Point | Enumerated | Bus
Sample Time	Specified in the **Sample time** parameter
Multidimensional Signals	Yes
Variable-Size Signals	Yes
Code Generation	No

Introduced before R2006a

Toggle Switch

Toggle parameter between two values
Library: Simulink / Dashboard

Description

The Toggle Switch block toggles the value of the connected block parameter between two values during simulation. For example, you can connect the Toggle Switch block to a Switch block in your model and change its state during simulation. Use the Toggle Switch block with other Dashboard blocks to create an interactive dashboard for your model.

Double-clicking the Toggle Switch block does not open its dialog box during simulation and when the block is selected. To edit the block's parameters, you can use the **Property Inspector**, or you can right-click the block and select **Block Parameters** from the context menu.

Note Dashboard blocks cannot connect to variables until you update your model diagram. To connect Dashboard blocks to variables or modify variable values between opening your model and running a simulation, update your model diagram with **Ctrl+D**.

Connection

Dashboard block controls connect to variables and block parameters. To connect a Dashboard block to a variable or parameter, use the connection table in the block parameters. To see variables in the **Connection** table, update the model diagram with **Ctrl+D**.

1   Double-click the block.

2   Populate the **Connection** table by selecting blocks of interest in your model.

3   Mark the button next to the parameter or variable you want to adjust during simulation.

4   Click **Apply**.

Parameter Logging

Tunable parameters connected to Dashboard blocks are logged to the Simulation Data Inspector, where you can view parameter values along with logged signal data. You can access logged parameter data in the MATLAB workspace by exporting the parameter data from the Simulation Data Inspector UI or by using the `Simulink.sdi.exportRun` function. For more information about exporting data with the Simulation Data Inspector UI, see "Export Data from the Simulation Data Inspector". The parameter data is stored in a `Simulink.SimulationData.Parameter` object, accessible as an element in the exported `Simulink.SimulationData.Dataset`.

Limitations

- You cannot save the block connections or properties in model files that use the `MDL` format.

  To save connections and properties, save the model file in the `SLX` format.

- Dashboard blocks can only connect to real scalar signals.

- Dashboard blocks cannot connect to blocks that are commented out.

- Dashboard blocks cannot connect to signals inside reference models.

- Parameters specified by indexing a variable array do not appear in the **Connection** table. For example, a block parameter defined using the variable `engine(1)` does not appear in the table.

  To access the parameter in the **Connection** table, assign the indexed value to a scalar variable, such as `engine_1`. Then, use the scalar variable to define the block parameter.

Parameters

`Connection` — Select a block parameter to connect
signal connection options

Select the block parameter to control using the **Connection** table. To open the dialog box, double-click the block. Then, populate the **Connection** table by selecting a block in your model. Select the variable or parameter you want to control, and click **Apply**.

Note To see workspace variables in the connection table, update the model diagram using **Ctrl+D**.

States

`Label (Top)` — Label for top switch position
'On' (default) | character vector

Labels the top switch position. You can use the **Label** to display the value the connected parameter takes when the switch is positioned at the top, or you can enter a text label.

Example: `Gain = 2`

`Value (Top)` — Value for top switch position
1 (default) | scalar

The value assigned to the connected parameter when the switch is positioned at the top.

`Label (Bottom)` — Label for bottom switch position
'Off' (default) | character vector

Labels the bottom switch position. You can use the **Label** to display the value the connected parameter takes when the switch is positioned at the bottom, or you can enter a text label.

Example: `Gain = 1`

`Value (Bottom)` — Value for bottom switch position
0 (default) | scalar

The value assigned to the connected parameter when the switch is positioned at the bottom.

Label — Block label position

'Top' (default) | 'Bottom' | 'Hide'

Position of the block label. When the block is connected to a signal, the label is the name of the connected signal. When the block is not connected, the label is the instructional text.

To String

Convert input signal to string signal
Library: Simulink / String
Description

The To String block creates a string signal from an input signal. For example, consider using this signal to convert a logical value `1` or `0` to its string equivalent `"false"` or `"true"`.

Ports

Input

Port_1 — Input signal
scalar

Input signal, specified as a scalar.

Output

Port_1 — Output string
scalar

Output string, specified as a scalar. This block returns the output as a string, surrounded by double quotes.

- If the input is a Boolean, the output is a logical value (`1` or `0`) and the block returns its textual equivalent (`true` or `false`).

- If the input is a numeric data type, such as an integer, single, double, or fixed point, the block returns the number as a string. For example, an input of `1` converts to `"1"` and an input of `0` converts to `"0"`.

Data Types: `string`

Block Characteristics

Data Types	`double` | `single` | `Boolean` | `base integer` | `fixed point` | `enumerated`
Multidimensional Signals	No
Variable-Size Signals	No

Transfer Fcn

Model linear system by transfer function
Library: Simulink / Continuous

$$\boxed{\dfrac{1}{s+1}}$$
Description

The Transfer Fcn block models a linear system by a transfer function of the Laplace-domain variable s. The block can model single-input single-output (SISO) and single-input multiple-output (SIMO) systems.

Conditions for Using This Block

The Transfer Fcn block assumes the following conditions:

- The transfer function has the form

$$H(s) = \frac{y(s)}{u(s)} = \frac{num(s)}{den(s)} = \frac{num(1)s^{nn-1} + num(2)s^{nn-2} + \ldots + num(nn)}{den(1)s^{nd-1} + den(2)s^{nd-2} + \ldots + den(nd)},$$

  where u and y are the system input and outputs, respectively, nn and nd are the number of numerator and denominator coefficients, respectively. $num(s)$ and $den(s)$ contain the coefficients of the numerator and denominator in descending powers of s.

- The order of the denominator must be greater than or equal to the order of the numerator.

- For a multiple-output system, all transfer functions have the same denominator and all numerators have the same order.

Modeling a Single-Output System

For a single-output system, the input and output of the block are scalar time-domain signals. To model this system:

1 Enter a vector for the numerator coefficients of the transfer function in the **Numerator coefficients** field.

2 Enter a vector for the denominator coefficients of the transfer function in the **Denominator coefficients** field.

Modeling a Multiple-Output System

For a multiple-output system, the block input is a scalar and the output is a vector, where each element is an output of the system. To model this system:

1 Enter a matrix in the **Numerator coefficients** field.

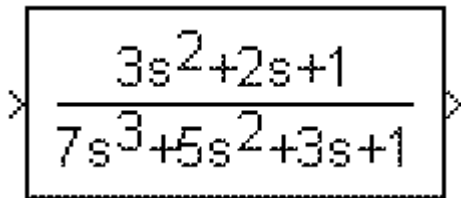
   Each *row* of this matrix contains the numerator coefficients of a transfer function that determines one of the block outputs.

2 Enter a vector of the denominator coefficients common to all transfer functions of the system in the **Denominator coefficients** field.

Specifying Initial Conditions

A transfer function describes the relationship between input and output in Laplace (frequency) domain. Specifically, it is defined as the Laplace transform of the response (output) of a system with zero initial conditions to an impulse input.

Operations like multiplication and division of transfer functions rely on zero initial state. For example, you can decompose a single complicated transfer function into a series of simpler transfer functions. Apply them sequentially to get a response equivalent to that of the original transfer function. This will not be correct if one of the transfer functions assumes a non-zero initial state. Furthermore, a transfer function has infinitely many time domain realizations, most of whose states do not have any physical meaning.

For these reasons, Simulink presets the initial conditions of the Transfer Fcn block to zero. To specify initial conditions for a given transfer function, convert the transfer function to its controllable, canonical state-space realization using `tf2ss`. Then, use the State-Space block. The `tf2ss` utility provides the A, B, C, and D matrices for the system.


For more information, type `help tf2ss` or see the Control System Toolbox™ documentation.

Transfer Function Display on the Block

The Transfer Fcn block displays the transfer function depending on how you specify the numerator and denominator parameters.

- If you specify each parameter as an expression or a vector, the block shows the transfer function with the specified coefficients and powers of *s*. If you specify a variable in parentheses, the block evaluates the variable.
  For example, if you specify **Numerator coefficients** as [3,2,1] and **Denominator coefficients** as (den), where den is [7,5,3,1], the block looks like this:

$$\frac{3s^2+2s+1}{7s^3+5s^2+3s+1}$$

- If you specify each parameter as a variable, the block shows the variable name followed by (s).

  For example, if you specify **Numerator coefficients** as num and **Denominator coefficients** as den, the block looks like this:

$$\frac{num(s)}{den(s)}$$

Ports

Input

Port_1 — Input signal
scalar

Input signal, specified as a scalar with data type `double`.

Data Types: `double`

Output

Port_1 — Output signal
scalar | vector

Output signal, provided as a scalar or vector with data type `double`.

- For a single-output system, the input and output of the block are scalar time-domain signals.
- For a multiple-output system, the input is a scalar, and the output is a vector, where each element is an output of the system.

Data Types: `double`

Parameters

Numerator coefficients — Vector or matrix of numerator coefficients
[1] (default) | vector | matrix

Define the numerator coefficients of the transfer function.

- For a single-output system, enter a vector for the numerator coefficients of the transfer function.
- For a multiple-output system, enter a matrix. Each row of this matrix contains the numerator coefficients of a transfer function that determines one of the block outputs.

Programmatic Use
Block Parameter: `Numerator`
Type: character vector
Value: vector | matrix
Default: `'[1]'`

Denominator coefficients — Row vector of denominator coefficients
[1 1] (default) | vector

Define the row vector of denominator coefficients.

- For a single-output system, enter a vector for the denominator coefficients of the transfer function.

- For a multiple-output system, enter a vector containing the denominator coefficients common to all transfer functions of the system.

Programmatic Use
Block Parameter: Denominator
Type: character vector
Value: vector
Default: '[1 1]'

Absolute tolerance — Absolute tolerance for computing block states
auto (default) | scalar | vector

Absolute tolerance for computing block states, specified as a positive, real-valued, scalar or vector. To inherit the absolute tolerance from the Configuration Parameters, specify auto or -1.

- If you enter a real scalar, then that value overrides the absolute tolerance in the Configuration Parameters dialog box for computing all block states.

- If you enter a real vector, then the dimension of that vector must match the dimension of the continuous states in the block. These values override the absolute tolerance in the Configuration Parameters dialog box.

- If you enter auto or –1, then Simulink uses the absolute tolerance value in the Configuration Parameters dialog box (see "Solver Pane") to compute block states.

Programmatic Use
Block Parameter: AbsoluteTolerance
Type: character vector
Values: 'auto' | '-1' | any positive real-valued scalar or vector
Default: 'auto'

State Name (e.g., 'position') — Assign unique name to each state
' ' (default) | 'position' | {'a', 'b', 'c'} | a | …

Assign a unique name to each state. If this field is blank (' '), no name assignment occurs.

- To assign a name to a single state, enter the name between quotes, for example, 'position'.

- To assign names to multiple states, enter a comma-delimited list surrounded by braces, for example, `{'a', 'b', 'c'}`. Each name must be unique.
- To assign state names with a variable in the MATLAB workspace, enter the variable without quotes. A variable can be a character vector, cell array, or structure.

Limitations

- The state names apply only to the selected block.
- The number of states must divide evenly among the number of state names.
- You can specify fewer names than states, but you cannot specify more names than states.

  For example, you can specify two names in a system with four states. The first name applies to the first two states and the second name to the last two states.

Programmatic Use
Block Parameter: `ContinuousStateAttributes`
Type: character vector
Values: `' '` | user-defined
Default: `' '`

Block Characteristics

Data Types	`double`
Multidimensional Signals	No
Variable-Size Signals	No

Extended Capabilities

C/C++ Code Generation
Generate C and C++ code using Simulink® Coder™.

Not recommended for production-quality code. Relates to resource limits and restrictions on speed and memory often found in embedded systems. The code generated can contain dynamic allocation and freeing of memory, recursion, additional memory overhead, and widely-varying execution times. While the code is functionally valid and generally acceptable in resource-rich environments, smaller embedded targets often cannot support such code.

In general, consider using the Simulink Model Discretizer to map continuous blocks into discrete equivalents that support production code generation. To start the Model Discretizer, select **Analysis > Control Design > Model Discretizer**. One exception is the Second-Order Integrator block because, for this block, the Model Discretizer produces an approximate discretization.

Transfer Fcn Direct Form II

Implement Direct Form II realization of transfer function

Library

Additional Math & Discrete / Additional Discrete

Description

The Transfer Fcn Direct Form II block implements a Direct Form II realization of the transfer function that the **Numerator coefficients** and **Denominator coefficients excluding lead** parameters specify. The block supports only single input-single output (SISO) transfer functions.

The block automatically selects the data types and scalings of the output, the coefficients, and any temporary variables.

Data Type Support

The Transfer Fcn Direct Form II block accepts signals of the following data types:

- Floating point
- Built-in integer
- Fixed point

For more information, see "Data Types Supported by Simulink" in the Simulink documentation.

Parameters

Numerator coefficients

Specify the numerator coefficients.

Denominator coefficients excluding lead

Specify the denominator coefficients, excluding the leading coefficient, which must be 1.0.

Initial condition

Set the initial condition.

Integer rounding mode

Specify the rounding mode for fixed-point operations. For more information, see "Rounding" (Fixed-Point Designer).

Saturate to max or min when overflows occur

Select to have overflows saturate to the maximum or minimum value that the data type can represent. Otherwise, overflows wrap.

When you select this check box, saturation applies to every internal operation on the block, not just the output or result. In general, the code generation process can detect when overflow is not possible. In this case, the code generator does not produce saturation code.

Characteristics

Data Types	Double | Single | Base Integer | Fixed-Point
Direct Feedthrough	Yes
Multidimensional Signals	No
Variable-Size Signals	No
Zero-Crossing Detection	No
Code Generation	Yes

See Also

Transfer Fcn Direct Form II Time Varying

Introduced before R2006a

Transfer Fcn Direct Form II Time Varying

Implement time varying Direct Form II realization of transfer function
Library

Additional Math & Discrete / Additional Discrete

Description

The Transfer Fcn Direct Form II Time Varying block implements a Direct Form II realization of the specified transfer function. The block supports only single input-single output (SISO) transfer functions.

The input signal labeled `Den No Lead` contains the denominator coefficients of the transfer function. The full denominator has a leading coefficient of one, but it is excluded from the input signal. For example, a denominator of [1 -1.7 0.72] is represented by a signal with the value [-1.7 0.72]. The input signal labeled `Num` contains the numerator coefficients. The data types of the numerator and denominator coefficients can be different, but the length of the numerator vector and the full denominator vector must be the same. Pad the numerator vector with zeros, if needed.

The block automatically selects the data types and scalings of the output, the coefficients, and any temporary variables.

Data Type Support

The Transfer Fcn Direct Form II Time Varying block accepts signals of the following data types:

- Floating point
- Built-in integer
- Fixed point

For more information, see "Data Types Supported by Simulink" in the Simulink documentation.

Parameters

Initial condition

Set the initial condition.

Integer rounding mode

Specify the rounding mode for fixed-point operations. For more information, see "Rounding" (Fixed-Point Designer).

Saturate to max or min when overflows occur

Select to have overflows saturate to the maximum or minimum value that the data type can represent. Otherwise, overflows wrap.

When you select this check box, saturation applies to every internal operation on the block, not just the output or result. In general, the code generation process can detect when overflow is not possible. In this case, the code generator does not produce saturation code.

Characteristics

Data Types	Double	Single	Boolean	Base Integer	Fixed-Point
Direct Feedthrough	Yes
Multidimensional Signals	No
Variable-Size Signals	No

Transfer Fcn First Order

Implement discrete-time first order transfer function
Library: Simulink / Discrete

$$\frac{0.05z}{z-0.95}$$
Description

The Transfer Fcn First Order block implements a discrete-time first order transfer function of the input. The transfer function has a unity DC gain.

Ports

Input

Port_1 — Input signal
scalar | vector

Input signal to the first order transfer function algorithm.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point`

Output

Port_1 — Transfer function output signal
scalar | vector

Output signal that is the discrete-time first order transfer function of the input with a unity DC gain.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point`

Parameters

Pole (in Z plane) — Pole
0.95 (default) | scalar

Specify the pole.

Programmatic Use
Block Parameter: PoleZ
Type: character vector
Value: real scalar
Default: '0.95'

Initial condition for previous output — Initial condition for previous output
0.0 (default) | scalar

Specify the initial condition for the previous output.

Programmatic Use
Block Parameter: ICPrevOutput
Type: character vector
Value: real scalar
Default: '0.0'

Integer rounding mode — Rounding mode for fixed-point operations
Floor (default) | Ceiling | Convergent | Nearest | Round | Simplest | Zero

For more information, see "Rounding" (Fixed-Point Designer).

Block parameters always round to the nearest representable value. To control the rounding of a block parameter, enter an expression using a MATLAB rounding function into the mask field.

Programmatic Use
Block Parameter: RndMeth
Type: character vector
Values: 'Ceiling' | 'Convergent' | 'Floor' | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
Default: 'Floor'

Saturate to max or min when overflows occur — Method of overflow action
off (default) | on

When you select this check box, overflows saturate to the maximum or minimum value that the data type can represent. Otherwise, overflows wrap.

When you select this check box, saturation applies to every internal operation on the block, not just the output or result. In general, the code generation process can detect when overflow is not possible. In this case, the code generator does not produce saturation code.

Programmatic Use
Block Parameter: `DoSatur`
Type: character vector
Values: `'off'` | `'on'`
Default: `'off'`

Block Characteristics

Data Types	`double` | `single` | `base integer` | `fixed point`
Multidimensional Signals	No
Variable-Size Signals	Yes

Extended Capabilities

C/C++ Code Generation
Generate C and C++ code using Simulink® Coder™.

PLC Code Generation
Generate Structured Text code using Simulink® PLC Coder™.

Fixed-Point Conversion
Convert floating-point algorithms to fixed point using Fixed-Point Designer™.

Transfer Fcn | Transfer Fcn Lead or Lag

Introduced before R2006a

Transfer Fcn Lead or Lag

Implement discrete-time lead or lag compensator
Library: Simulink / Discrete
Description

The Transfer Fcn Lead or Lag block implements a discrete-time lead or lag compensator of the input. The instantaneous gain of the compensator is 1, and the DC gain is equal to `(1-z)/(1-p)`, where `z` is the zero and `p` is the pole of the compensator.

The block implements a lead compensator when `0<z<p<1`, and implements a lag compensator when `0<p<z<1`.

Ports

Input

Port_1 — Input signal
scalar | vector

Input signal that the block applies the discrete-time lead or lag compensation to.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fixed point`

Output

Port_1 — Output signal
scalar | vector

Output signal that is discrete-time lead or lag compensation of the input sign.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fixed point`

Parameters

Pole of compensator (in Z plane) — Pole
`0.95` (default) | scalar

Specify the pole of the compensator.

Programmatic Use
Block Parameter: `PoleZ`
Type: character vector
Value: real scalar
Default: `'0.95'`

Zero of compensator (in Z plane) — Zero of compensator
`0.75` (default) | scalar

Specify the zero of compensator in the Z plane.

Programmatic Use
Block Parameter: `ZeroZ`
Type: character vector
Value: real scalar
Default: `'0.75'`

Initial condition for previous output — Initial condition for previous output
`0.0` (default) | scalar

Specify the initial condition for the previous output.

Programmatic Use
Block Parameter: `ICPrevOutput`
Type: character vector
Value: real scalar
Default: `'0.0'`

Initial condition for previous input — Initial condition for previous input
`0.0` (default) | scalar

Specify the initial condition for the previous input.

Programmatic Use
Block Parameter: `ICPrevInput`
Type: character vector
Value: real scalar
Default: `'0.0'`

Initial condition for previous output — Initial condition for previous output
`0.0` (default) | scalar

Specify the initial condition for the previous output.

Programmatic Use
Block Parameter: `ICPrevOutput`
Type: character vector
Value: real scalar
Default: `'0.0'`

Integer rounding mode — Rounding mode for fixed-point operations
`Floor` (default) | `Ceiling` | `Convergent` | `Nearest` | `Round` | `Simplest` | `Zero`

For more information, see "Rounding" (Fixed-Point Designer).

Block parameters always round to the nearest representable value. To control the rounding of a block parameter, enter an expression using a MATLAB rounding function into the mask field.

Programmatic Use
Block Parameter: `RndMeth`
Type: character vector
Values: `'Ceiling'` | `'Convergent'` | `'Floor'` | `'Nearest'` | `'Round'` | `'Simplest'` | `'Zero'`
Default: `'Floor'`

Saturate to max or min when overflows occur — Method of overflow action
`off` (default) | `on`

When you select this check box, overflows saturate to the maximum or minimum value that the data type can represent. Otherwise, overflows wrap.

When you select this check box, saturation applies to every internal operation on the block, not just the output or result. In general, the code generation process can detect

when overflow is not possible. In this case, the code generator does not produce saturation code.

Programmatic Use
Block Parameter: `DoSatur`
Type: character vector
Values: `'off'` | `'on'`
Default: `'off'`

Block Characteristics

Data Types	double | single | Boolean[a] | base integer | fixed point
Multidimensional Signals	No
Variable-Size Signals	Yes

a. This block is not recommended for use with Boolean signals.

Transfer Fcn | Transfer Fcn First Order

Introduced before R2006a

Transfer Fcn Real Zero

Implement discrete-time transfer function that has real zero and no pole
Library: Simulink / Discrete
Description

The Transfer Fcn Real Zero block implements a discrete-time transfer function that has a real zero and effectively no pole.

Ports

Input

Port_1 — Input signal
scalar | vector

Input signal to the discrete-time transfer function algorithm.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fixed point`

Output

Port_1 — Output signal
scalar | vector

Output signal that is the discrete-time transfer function wih a real zero and effectively no pole of the input signal.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fixed point`

1-1855

Parameters

Zero (in Z plane) — Zero
`0.75` (default) | scalar

Specify the zero in the Z plane.

Programmatic Use
Block Parameter: `ZeroZ`
Type: character vector
Value: real scalar
Default: `'0.75'`

Initial condition for previous input — Initial condition for previous input
`0.0` (default) | scalar

Specify the initial condition for the previous input.

Programmatic Use
Block Parameter: `ICPrevInput`
Type: character vector
Value: real scalar
Default: `'0.0'`

Input processing — Specify sample- or frame-based processing
`Elements as channels (sample based)` (default) | `Columns as channels
(frame based)` | `Inherited`

Specify whether the block performs sample- or frame-based processing:

- `Columns as channels (frame based)` — Treat each column of the input as a separate channel (frame-based processing).

  Note Frame-based processing requires a DSP System Toolbox license.

  For more information, see "Sample- and Frame-Based Concepts" (DSP System Toolbox).

- `Elements as channels (sample based)` — Treat each element of the input as a separate channel (sample-based processing).

- `Inherited` — Inherit the processing mode from the input signal and delay the input accordingly. You can identify whether the input signal is sample or frame based by

looking at the signal line. Simulink represents sample-based signals with a single line and frame-based signals with a double line.

Note When you choose the `Inherited` option for the **Input processing** parameter, and the input signal is frame based, Simulink generates a warning or error in future releases.

Use **Input processing** to specify whether the block performs sample- or frame-based processing. The block accepts frame-based signals for the input u. All other input signals must be sample based.

Input Signal u	Input Processing Mode	Block Works?
Sample based	Sample based	Yes
Frame based		No, produces an error
Sample based	Frame based	Yes
Frame based		Yes
Sample based	Inherited	Yes
Frame based		Yes

For more information about these two processing modes, see "Sample- and Frame-Based Concepts" (DSP System Toolbox).

Programmatic Use
Block Parameter: InputProcessing
Type: character vector
Values: 'Columns as channels (frame based)'|'Elements as channels (sample based)'|'Inherited'
Default: 'Elements as channels (sample based)'

Integer rounding mode — Rounding mode for fixed-point operations
Floor (default) | Ceiling | Convergent | Nearest | Round | Simplest | Zero

For more information, see "Rounding" (Fixed-Point Designer).

Block parameters always round to the nearest representable value. To control the rounding of a block parameter, enter an expression using a MATLAB rounding function into the mask field.

Programmatic Use
Block Parameter: RndMeth
Type: character vector
Values: 'Ceiling' | 'Convergent' | 'Floor' | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
Default: 'Floor'

Saturate to max or min when overflows occur — Method of overflow action
off (default) | on

When you select this check box, overflows saturate to the maximum or minimum value that the data type can represent. Otherwise, overflows wrap.

When you select this check box, saturation applies to every internal operation on the block, not just the output or result. In general, the code generation process can detect when overflow is not possible. In this case, the code generator does not produce saturation code.

Programmatic Use
Block Parameter: DoSatur
Type: character vector
Values: 'off' | 'on'
Default: 'off'

Block Characteristics

Data Types	double	single	Boolean[a]	base integer	fixed point
Multidimensional Signals	No
Variable-Size Signals	Yes

a.   This block is not recommended for use with Boolean signals.

Extended Capabilities

C/C++ Code Generation
Generate C and C++ code using Simulink® Coder™.

PLC Code Generation
Generate Structured Text code using Simulink® PLC Coder™.

Fixed-Point Conversion
Convert floating-point algorithms to fixed point using Fixed-Point Designer™.

Transport Delay

Delay input by given amount of time

Library

Continuous

Description

The Transport Delay block delays the input by a specified amount of time. You can use this block to simulate a time delay. The input to this block should be a continuous signal.

At the start of simulation, the block outputs the **Initial output** parameter until the simulation time exceeds the **Time delay** parameter. Then, the block begins generating the delayed input. During simulation, the block stores input points and simulation times in a buffer. You specify this size with the **Initial buffer size** parameter.

When you want output at a time that does not correspond to times of the stored input values, the block interpolates linearly between points. When the delay is smaller than the step size, the block extrapolates from the last output point, which can produce inaccurate results. Because the block does not have direct feedthrough, it cannot use the current input to calculate an output value. For example, consider a fixed-step simulation with a step size of 1 and the current time at t = 5. If the delay is 0.5, the block must generate a point at t = 4.5. Because the most recent stored time value is at t = 4, the block performs forward extrapolation.

The Transport Delay block does not interpolate discrete signals. Instead, the block returns the discrete value at the required time.

This block differs from the Unit Delay block, which delays and holds the output on sample hits only.

> **Tip** Avoid using `linmod` to linearize a model that contains a Transport Delay block. For more information, see "Linearizing Models" in the Simulink documentation.

Data Type Support

The Transport Delay block accepts and outputs real signals of type `double`.

For more information, see "Data Types Supported by Simulink" in the Simulink documentation.

Parameters

Time delay

Specify the amount of simulation time to delay the input signal before propagation to the output.

Default: 1

This value must be nonnegative.

Parameter: `DelayTime`
Type: scalar or vector
Value: `'1'`
Default: `'1'`

Initial output

Specify the output that the block generates until the simulation time first exceeds the time delay input.

Default: `Run-to-run tunable parameter`

A `Run-to-run tunable parameter` cannot be changed during a simulation's run time. However, changing it before a simulation begins will not cause Accelerator or Rapid Accelerator to regenerate code.

1-1861

Also, the initial output of this block cannot be `inf` or `NaN`.

Parameter: `InitialOutput`
Type: scalar or vector
Value: `'0'`
Default: `'0'`

Initial buffer size

Define the initial memory allocation for the number of input points to store.

Default: `1024`

- If the number of input points exceeds the initial buffer size, the block allocates additional memory.
- After simulation ends, a message shows the total buffer size needed.

- Because allocating memory slows down simulation, choose this value carefully if simulation speed is an issue.
- For long time delays, this block can use a large amount of memory, particularly for dimensionalized input.

Parameter: `BufferSize`
Type: scalar
Value: `'1024'`
Default: `'1024'`

Use fixed buffer size

Specify use of a fixed-size buffer to save input data from previous time steps.

Default: Off

☑ On

  The block uses a fixed-size buffer.

☐ Off

> The block does not use a fixed-size buffer.

The **Initial buffer size** parameter specifies the size of the buffer. If the buffer is full, new data replaces data already in the buffer. Simulink software uses linear extrapolation to estimate output values that are not in the buffer.

Note If you have a Simulink Coder license, ERT or GRT code generation uses a fixed-size buffer even if you do not select this check box.

- If the input data is linear, selecting this check box can save memory.
- If the input data is nonlinear, do not select this check box. Doing so can yield inaccurate results.

Parameter: `FixedBuffer`
Type: character vector
Value: `'off'` | `'on'`
Default: `'off'`

Direct feedthrough of input during linearization

Cause the block to output its input during linearization and trim, which sets the block mode to direct feedthrough.

Default: Off

☑ On

> Enables direct feedthrough of input.

☐ Off

> Disables direct feedthrough of input.

- Selecting this check box can cause a change in the ordering of states in the model when you use the functions `linmod`, `dlinmod`, or `trim`. To extract this new state ordering:

1. Compile the model using the following command, where `model` is the name of the Simulink model.

   ```
   [sizes, x0, x_str] = model([],[],[],'lincompile');
   ```

2. Terminate the compilation with the following command.

   ```
   model([],[],[],'term');
   ```

- The output argument `x_str`, which is a cell array of the states in the Simulink model, contains the new state ordering. When you pass a vector of states as input to the `linmod`, `dlinmod`, or `trim` functions, the state vector must use this new state ordering.

Parameter: `TransDelayFeedthrough`
Type: character vector
Value: `'off'` | `'on'`
Default: `'off'`

Pade order (for linearization)

Set the order of the Pade approximation for linearization routines.

Default: `0`

- The default value is 0, which results in a unity gain with no dynamic states.
- Setting the order to a positive integer `n` adds `n` states to your model, but results in a more accurate linear model of the transport delay.

Parameter: `PadeOrder`
Type: character vector
Value: `'0'`
Default: `'0'`

Characteristics

Data Types	Double
Sample Time	Continuous
Direct Feedthrough	No

Multidimensional Signals	No
Variable-Size Signals	No
Zero-Crossing Detection	No
Code Generation	Yes

Variable Time Delay

Introduced before R2006a

Trigger

Add trigger port to subsystem or model
Library: Ports & Subsystems

Description

The Trigger block allows an external signal to control the execution of a subsystem or a model. To enable this functionality, add this block to a Subsystem block or at the root level of a model that is referenced in a Model block.

Then, configure the Trigger block to execute a subsystem or model:

- Once at each time step, when the value of the trigger signal changes in a way that you specify.
- Multiple times during a time step, when the trigger signal is a function-call from a Stateflow chart, Function-Call Generator block, or S-Function block.

Ports

Output

`Trigger signal` — External trigger signal for a subsystem or model
scalar

Trigger signal attached externally to the outside of an Subsystem block or a Model block that is passed to the inside of the block. To enable this port, select **Show output port**.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `expression`

Parameters

Main

`Trigger type` — Select the type of event
`rising` (default) | `falling` | `either` | `function-call`

Select the type of event that triggers execution of the subsystem or model.

`rising`

Trigger execution of subsystem or model when the trigger signal rises from a negative or zero value to a positive value. If the initial value is negative, a rising signal to zero triggers execution.

`falling`

Trigger execution of subsystem or model when the trigger signal falls from a positive or a zero value to a negative value. If the initial value is positive, a falling signal to zero triggers execution.

`either`

Trigger execution of subsystem or model when the trigger signal is either rising or falling.

`function-call`

Trigger execution of subsystem or model when the trigger signal is a function-call event from a Stateflow chart, Function-Call Generator block, or an S-function block.

Programmatic Use
Block parameter: `TriggerType`
Type: character vector
Value: `'rising'` | `'falling'` | `'either'` | `'function-call'`
Default: `'rising'`

`Treat as Simulink function` — Create Simulink Function block
off (default) | on

Create a Simulink Function block by configuring a Subsystem block that is callable with arguments from a function caller.

☐ off

Remove configuration.

1-1867

☑ on

> Configure a Subsystem block as a Simulink Function block. The Trigger block must reside within the subsystem.
>
> You can edit the function prototype that displays on the block face to specify input and output arguments for the block.

Dependency

To display and enable this parameter, select `function-call` from the **Trigger type** list.

Programmatic Use
Block parameter: `IsSimulinkFunction`
Type: character vector
Value: `'off'` | `'on'`
Default: `'off'`

Function name — Specify function name for Simulink Function block
f (default) | function name

Specify the function name for a Simulink Function block. Alternatively, you can specify the name by editing the function prototype on the face of the block.

f

> Default name for a Simulink Function block.

function name

> Function name that displays on the face of a Simulink Function block.

Dependency

To display and enable this parameter, select `function-call` from the **Trigger type** list and select the **Treat as a Simulink Function** check box.

Programmatic Use
Block parameter: `FunctionName`
Type: character vector
Value: `'f'` | `'<function name>'`
Default: `'f'`

Enable variant condition — Controls activating the variant control (condition)
on (default) | off

Control activating the variant control (condition) defined with the **Variant Control** parameter.

☐ off

Deactivate variant control of subsystem.

☑ on

Activate variant control of subsystem. Selecting this parameter:

- Enables the **Variant control** parameter.
- Displays a variant badge ⬜ on the face of the block indicating variant conditions are enabled.

Dependency

To display and enable this parameter, select `function-call` from the **Trigger type** list and select the **Treat as a Simulink Function** check box..

Programmatic Use
Block parameter: `Variant`
Type: character vector
Value: `'off'` | `'on'`
Default: `'off'`

Variant control — Specify variant control (condition) expression
`(inherit)` `(default)` | `<logical expression>`

Specify variant control (condition) expression that executes a variant Simulink Function block when the expression evaluates to `true`.

`(inherit)`

Default value for variant control. Inherits the variant condition from the corresponding Function Caller blocks in the model. When **Variant Control** is set as `(inherit)` the value for **Generate preprocessor conditionals** is inherited automatically from the Function Caller block in the model.

logical expression

A logical (Boolean) expression or a `Simulink.Variant` object representing a logical expression.

The function is activated when the expression evaluates to `true`.

If you want to generate code for your model, define the variables in the expression as `Simulink.Parameter` objects.

Dependency

To display and enable this parameter, select `function-call` from the **Trigger type** list, select the **Treat as a Simulink Function** check box and then select the **Enable variant condition** check box.

Programmatic Use
Block parameter: `VariantControl`
Type: character vector
Value: `'(inherit)'`|`<logical expression>`|`Simulink.Variant object`
Default: `'(inherit)'`

Generate preprocessor conditionals — Control enclosing variant choices
off (default) | on

Control enclosing variant choices within C preprocessor conditional statements.

☐ off

Do not enclose variant choices within C preprocessor conditional statements.

☑ on

When generating code for an ERT target, enclose variant choices within C preprocessor conditional statements (#if).

Dependency

To display and enable this parameter, select the **Enable variant condition** check box.

Programmatic Use
Block parameter: `GeneratePreprocessorConditionals`
Type: character vector
Value: `'off'` | `'on'`
Default: `'off'`

Function visibility — Select scope visibility of function
scoped (default) | global

Select scope of Simulink Function block within subsystem or model.

scoped

>   Limit accessibility of function to:

>   • Hierarchic level containing the Simulink Function block and levels below.

>   • One hierarchical level above with qualification.

global

>   Function accessible from any part of the model hierarchy.

Dependency

To display and enable this parameter, select `function-call` from the **Trigger type** list and then select the **Treat as a Simulink Function** check box..

Programmatic Use
Block parameter: FunctionVisibility
Type: character vector
Value: `'scoped'` | `'global'`
Default: `'scoped'`

States when enabling — Select how to set block state values
held (default) | reset | inherit

Select how to set block state values when the subsystem or model is disabled.

held

>   Leave the block states at their current values.

reset

>   Reset the block state values.

inherit

>   Use the `held` or `reset` setting from the parent subsystem initiating the function-call. If the parent of the initiator is the model root, the inherited setting is `held`. If the trigger has multiple initiators, set the parents of all initiators to either `held` or `reset`.

Dependencies

To enable this parameter, select `function-call` from the **Trigger Type** list.

This parameter setting applies only if the model explicitly enables and disables the function-call subsystem. For example:

- The function-call subsystem resides in an enabled subsystem. In this case, the model enables and disables the function-call subsystem along with the parent subsystem.

- The function-call initiator that controls the function-call subsystem resides in an enabled subsystem. In this case, the model enables and disables the function-call subsystem along with the enabled subsystem containing the function-call initiator.

- The function-call initiator is a Stateflow event bound to a particular state. See "Control Function-Call Subsystems Using Bind Actions" (Stateflow).

- The function-call initiator is an S-function that explicitly enables and disables the function-call subsystem. See `ssEnableSystemWithTid` for an example.

Programmatic Use
Block parameter: `StatesWhenEnabling`
Type: character vector
Value: `'held'` | `'reset'` | `'inherit'`
Default: `'held'`

Propagate sizes of variable-size signals — Select when to propagate variable-size signals
`During execution` (default) | `Only when enabling`

Select when to propagate variable-size signals.

`During execution`

Propagate variable-size signals at each time step.

`Only when enabling`

Propagate variable-size signals when executing a Subsystem block or Model block containing an Enable port, Trigger port with **Trigger type** set to `function- call`, or Action Port block. When you select this option, sample time must be periodic.

Dependencies

To display and enable this parameter for a Trigger port block, select `Function-call` from the **Trigger type** list.

Programmatic Use
Block parameter: `PropagateVarSize`
Type: character vector
Value: `'During execution'` | `'Only when enabling'`
Default: `'During execution'`

Show output port — Control display of output port
off (default) | on

Control display of an output port for a signal that identifies the trigger signal.

☐ off

> Remove the output port.

☑ on

> Display the output port and determine which signal caused the trigger. The width of
> the output port signal is the width of the triggering signal. The signal value is:

- 1 for a signal that causes a rising trigger
- -1 for a signal that causes a falling trigger
- 2 for a function-call trigger
- 0 in all other cases

Programmatic Use
Block parameter: ShowOutputPort
Type: character vector
Value: 'off' | 'on'
Default: 'off'

Output data type — Select output port data type
auto (default) | double | int8

Select output port data type for the signal that identifies the trigger signal.

auto

> Data type is the same as the port connected to the output.

double

> Double value.

int8

> Integer value

Dependency

To enable this parameter, select the **Show output port** check box.

The Trigger block ignores the **Data type override** setting for the Fixed-Point Tool.

Programmatic Use
Block parameter: OutputDataType
Type: character vector
Value: 'auto' | 'double' | 'int8'
Default: 'auto'

Sample time type — Select calling rate
triggered (default) | periodic

Select the calling rate for a subsystem or model.

triggered

   Apply to applications that do not have a periodic calling frequency.

periodic

   Apply if the caller of the parent function-call subsystem calls the subsystem once per time step when the subsystem is active (enabled). A Stateflow chart is an example of a caller.

Dependency

To enable this parameter, select Function-call from the **Trigger type** list.

Programmatic Use
Block parameter: SampleTimeType
Type: character vector
Value: 'triggered' | 'periodic'
Default: 'triggered'

Sample time — Specify time interval
-1 (default) | Ts | [Ts, To]

Specify the time interval between function calls to a subsystem or model containing this Trigger port block. If the actual calling rate for the subsystem or model differs from the time interval this parameter specifies, Simulink displays an error.

-1

   Inherit time interval from the trigger signal.

Ts

   Scalar where Ts is the time interval.

```
[Ts, To]
```

Vector where Ts is the time interval and To is the initial time offset.

Dependencies

To enable this parameter, select `function-call` from the **Trigger type** list and `periodic` from the **Sample time type** list.

Programmatic Use
Block parameter: SampleTime
Type: character vector
Value: '-1' | 'Ts' | '[Ts, To]'
Default: '-1'

Enable zero-crossing detection — Control zero-crossing detection
on (default) | off

Control .

☑ on

Detect zero crossings.

☐ off

Do not detect zero crossings.

Dependencies

To enable this parameter, select `rising`, `falling`, or `either` from the **Trigger type** list.

Programmatic Use
Block parameter: ZeroCross
Type: character vector
Value: 'on' | 'off'
Default: 'on'

Initial trigger signal state — Select the initial state of the trigger signal
compatibility (no trigger on first evaluation) (default) | zero | positive | negative

Select the initial state of the trigger signal.

`compatibility (no trigger on first evaluation)`

No trigger at the first evaluation of trigger signal. If you choose this option and the Trigger block is in a subsystem where the states are reset, the block does not reset.

`zero`

Zero. Helps to evaluate a rising or falling trigger signal at the first time step.

`positive`

Positive value. Helps to evaluate a falling trigger signal at the first time step.

`negative`

Negative value. Helps to evaluate a rising trigger signal at the first time step.

Dependency

To display and activate this parameter, select `rising`, `falling`, or `either` from the **Trigger type** list.

Programmatic Use
Block parameter: `InitialTriggerSignalState`
Type: character vector
Value: `'compatibility (no trigger on first evaluation)'`|`'zero'`| `'positive'`|`'negative'`
Default: `'compatibility (no trigger on first evaluation)'`

Signal Attribute

Port dimensions — Specify dimensions for the trigger signal
1 (default) | [n] | [m n]

Specify dimensions for the trigger signal attached externally to the Model block and passed to the inside of the block.

`1`

Scalar signal.

`[n]`

Vector signal of width `n`.

`[m n]`

Matrix signal having `m` rows and `n` columns.

Dependency

To display and enable this parameter for a Trigger port block at the root-level of a model, select `rising`, `falling`, or `either` from the **Trigger type** list.

Programmatic Use
Block parameter: `PortDimensions`
Type: character vector
Value: `'1'` | `'[n]'` | `'[m n]'`
Default: `'1'`

Trigger signal sample time — Specify time interval
-1 (default) | Ts | [Ts, To]

Specify time interval between block method executions for the block driving the trigger signal.

-1

    Inherit time interval.

Ts

    Scalar where Ts is the time interval.

[Ts, To]

    Vector where Ts is the time interval and To is the initial time offset.

Dependency

To display and enable this parameter for a Trigger port block at the root-level of a model, select `rising`, `falling`, or `either` from the **Trigger type** list.

Programmatic Use
Block parameter: `TriggerSignalSampleTime`
Type: character vector
Value: `'-1'` | `'Ts'` | `'[Ts, To]'`
Default: `'-1'`

Minimum — Specify minimum output value for the trigger signal
[] (default) | real scalar

Specify minimum value for the trigger signal attached externally to a Model block and passed to the inside of the block.

Simulink uses this value to perform:

- Simulation range checking. See "Signal Ranges".
- Automatic scaling of fixed-point data types.
- Optimization of generated code. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. See "Optimize using the specified minimum and maximum values" (Simulink Coder).

`[]`

> Unspecified minimum value.

real scalar

> Real scalar value.

Dependency

To display and enable this parameter for a Trigger port block at the root-level of a model, select `rising`, `falling`, or `either` from the **Trigger type** list.

Programmatic Use
Block parameter: OutMin
Type: character vector
Value: `'[]'` | `'<real scalar>'`
Default: `'[]'`

Maximum — Specify maximum output value for the trigger signal
[] (default) | real scalar

Specify maximum value for the trigger signal attached externally to a Model block and passed to the inside of the block.

Simulink uses this value to perform:

- Simulation range checking. See "Signal Ranges".
- Automatic scaling of fixed-point data types.
- Optimization of generated code. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. See "Optimize using the specified minimum and maximum values" (Simulink Coder).

`[]`

> Unspecified maximum value.

real scalar

> Real scalar value.

Dependency

To display and enable this parameter for a Trigger port block at the root-level of a model, select `rising`, `falling`, or `either` from the **Trigger type** list.

Programmatic Use
Block parameter: OutMax
Type: character vector
Value: `'[]'` | `'<real scalar>'`
Default: `'[]'`

Data type — Select output data type for the trigger signal
double (default) | single | int8 | uint8 | int16 | uint16 | int32 | uint32 | boolean | fixdt(1,16) | fixdt(1,16,0) | fixdt(1,16,2^,0) | <data type expression>

Select data type for the trigger signal attached externally to a Model block and passed to the inside of the block.

double

    Double-precision floating point.

single

    Single-precision floating point.

int8

    Signed 8-bit integer.

uint8

    Unsigned 8-bit integer.

int16

    Signed 16-bit integer.

uint16

    Unsigned 16-bit integer.

int32

    Signed 32-bit integer.

uint32

    Unsigned 32-bit integer.

boolean

    Boolean with a value of `true` or `false`.

`fixdt(1,16)`

> Signed 16-bit fixed point number with binary point undefined.

`fixdt(1,16,0)`

> Signed 16-bit fixed point number with binary point set to zero.

`fixdt(1,16,2^,0)`

> Signed 16-bit fixed point number with slope set to `2^0` and bias set to `0`.

`<data type expression>`

> Data type object, for example `Simulink.NumericType`. Do not specify a bus object as the expression.

Dependency

To display and enable this parameter for a Trigger port block at the root-level of a model, select `rising`, `falling`, or `either` from the **Trigger type** list.

Programmatic Use
Block parameter: `OutDataTypeStr`
Type: character vector
Value: `'double'` | `'single'` | `'int8'` | `'uint8'` | `'int16'` | `'uint16'` | `'int32'` | `'uint32'` | `'boolean'` | `'fixdt(1,16)'` | `'fixdt(1,16,0)'` | `'fixdt(1,16,2^0,0)'` | `'<data type expression>'`
Default: `'double'`

Mode — Select data type category
`Build in` (default) | `Fixed point` | `Expression`

Select data type category and display drop-down lists to help you define the data type.

`Build in`

> Display drop-down lists for data type and **Data type override**.

`Fixed point`

> Display drop-down lists for **Signedness**, **Scaling**, and **Data type override**.

`Expression`

> Display text box for entering an expression.

Dependency

To enable this parameter, select the Show data type assistant button ⟦ `>>` ⟧.

Programmatic Use

No equivalent command-line parameter.

`Interpolate data` — Control how missing workspace data is estimated
on (default) | off

Control how missing workspace data is estimated when loading data from the MATLAB workspace.

☑ on

> Linearly interpolate output at time steps for which no corresponding workspace data exists.

☐ off

> Do not interpolate output at time steps. The current output equals the output at the most recent time step for which data exists.

Dependency

To display and enable this parameter for a Trigger port block at the root-level of a model, select `rising`, `falling`, or `either` from the **Trigger type** list.

Programmatic Use
Block parameter: `Interpolate`
Type: character vector
Value: `'on'` | `'off'`
Default: `'on'`

Trigger-Based Linearization

Generate linear models in base workspace when triggered

Library

Model-Wide Utilities

Description

When triggered, this block calls `linmod` or `dlinmod` to create a linear model for the system at the current operating point. No trimming is performed. The linear model is stored in the base workspace as a structure, along with information about the operating point at which the snapshot was taken. Multiple snapshots are appended to form an array of structures.

The block sets the following model parameters to the indicated values:

- `BufferReuse = 'off'`
- `RTWInlineParameters = 'on'`
- `BlockReductionOpt = 'off'`

The name of the structure used to save the snapshots is the name of the model appended by `_Trigger_Based_Linearization`, for example, `vdp_Trigger_Based_Linearization`. The structure has the following fields:

Field	Description
a	The A matrix of the linearization
b	The B matrix of the linearization

Field	Description
c	The C matrix of the linearization
d	The D matrix of the linearization
StateName	Names of the model's states
OutputName	Names of the model's output ports
InputName	Names of the model's input ports
OperPoint	A structure that specifies the operating point of the linearization. The structure specifies the value of the model's states (OperPoint.x) and inputs (OperPoint.u) at the operating point time (OperPoint.t).
Ts	The sample time of the linearization for a discrete linearization

Use the Timed-Based Linearization block to generate linear models at predetermined times.

You can use state and simulation time logging to extract the model states at operating points. For example, suppose that you want to get the states of the vdp example model when the signal x1 triggers the Trigger-Based Linearization block on a rising edge.

1 Open the model and drag an instance of this block from the Model-Wide Utilities library and drop the instance into the model.

2 Connect the block's trigger port to the signal labeled x1.

3 Open the model's **Model Configuration Parameters** dialog box.

4 Select the **Data Import/Export** pane.

5 Check **States** and **Time** on the **Save to Workspace** control panel

6 Select OK to confirm the selections and close the dialog box.

7 Simulate the model.

   At the end of the simulation, the following variables appear in the MATLAB workspace: vdp_Trigger_Based_Linearization, tout, and xout.

8 Get the index to the first operating point time by entering the following at the MATLAB command line:

   ```
   ind1 = find(vdp_Trigger_Based_Linearization(1).OperPoint.t==tout);
   ```

9 Get the state vector at this operating point.

   ```
   x1 = xout(ind1,:);
   ```

Data Type Support

The trigger port accepts signals of any numeric data type that Simulink supports.

For more information, see "Data Types Supported by Simulink" in the Simulink documentation.

Parameters

Trigger type

Type of event on the trigger input signal that triggers generation of a linear model. See the **Trigger type** parameter of the Trigger block for an explanation of the various trigger types that you can select.

Sample time (of linearized model)

Specify a sample time to create a discrete-time linearization of the model (see "Discrete-Time System Linearization" on page 2-48).

Characteristics

Data Types	Double | Single | Boolean | Base Integer | Fixed-Point
Sample Time	Specified in the **Sample time** parameter
Multidimensional Signals	No
Variable-Size Signals	No
Code Generation	No

Triggered Subsystem

Subsystem whose execution is triggered by external input
Library: Ports & Subsystems
Description

The Triggered Subsystem block is a Subsystem block preconfigured as a starting point for creating a subsystem that executes each time the control signal has a trigger event.
Use Trigger Subsystem blocks to model:

- A task that runs with the detection of an event.
- An interrupt from I/O hardware.
- A processor request to handle an exception or error.

Ports

Input

In — Signal input to a subsystem block
scalar | vector | matrix

Placing an Inport block in a subsystem block adds an external input port to the block. The port label matches the name of the Inport block.

Use Inport blocks to get signals from the local environment.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Trigger — Control signal input to a subsystem block
scalar

Placing a Trigger block in a subsystem block adds an external input port to the block.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | fixed point

Output

Out — Signal output from a subsystem
scalar | vector | matrix

Placing an Outport block in a subsystem block adds an output port from the block. The port label on the subsystem block is the name of the Outport block.

Use Outport blocks to send signals to the local environment.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Trigonometric Function

Specified trigonometric function on input
Library: Simulink / Math Operations

Description

The Trigonometric Function block performs common trigonometric functions and outputs the result in rad.

Supported Functions

You can select one of these functions from the **Function** parameter list.

Function	Description	Mathematical Expression	MATLAB Equivalent
sin	Sine of the input	$\sin(u)$	sin
cos	Cosine of the input	$\cos(u)$	cos
tan	Tangent of the input	$\tan(u)$	tan
asin	Inverse sine of the input	$\mathrm{asin}(u)$	asin
acos	Inverse cosine of the input	$\mathrm{acos}(u)$	acos
atan	Inverse tangent of the input	$\mathrm{atan}(u)$	atan
atan2	Four-quadrant inverse tangent of the input	$\mathrm{atan2}(u)$	atan2

Function	Description	Mathematical Expression	MATLAB Equivalent
sinh	Hyperbolic sine of the input	$\text{sinh}(u)$	sinh
cosh	Hyperbolic cosine of the input	$\text{cosh}(u)$	cosh
tanh	Hyperbolic tangent of the input	$\text{tanh}(u)$	tanh
asinh	Inverse hyperbolic sine of the input	$\text{asinh}(u)$	asinh
acosh	Inverse hyperbolic cosine of the input	$\text{acosh}(u)$	acosh
atanh	Inverse hyperbolic tangent of the input	$\text{atanh}(u)$	atanh
sincos	Sine of the input; cosine of the input	—	—
cos + jsin	Complex exponential of the input	—	—

CORDIC Approximation Method

If you use the CORDIC approximation method (see "Definitions" on page 1-1900), the block input has some further requirements.

When you set **Function** to sin, cos, sincos, or cos + jsin, and set the **Approximation method** to CORDIC, the block has these limitations:

- When you use signed fixed-point types, the input angle must fall within the range [–2π, 2π) rad.

- When you use unsigned fixed-point types, the input angle must fall within the range [0, 2π) rad.

When you set **Function** to atan2 and the **Approximation method** to CORDIC, the block has these limitations:

- Inputs must be the same size, or at least one value must be a scalar value.

- Both inputs must have the same data type.
- When you use signed fixed-point types, the word length must be 126 or less.
- When you use unsigned fixed-point types, the word length must be 125 or less.

This table summarizes what happens for an invalid input.

Block Usage	Effect of Invalid Input
Simulation	An error appears.
Generated code	Undefined behavior occurs. Avoid relying on undefined behavior for generated code or accelerator modes.
Accelerator modes	

Ports

Input

Port_1 — Input signal
scalar | vector | matrix

Input specified as a scalar, vector, or matrix. The block accepts input signals of the following data types:

Functions	Input Data Types
• `sin` • `cos` • `sincos` • `cos + jsin` • `atan2`	• Floating point • Fixed point (only when **Approximation method** is CORDIC)

Functions	Input Data Types
• `tan` • `asin` • `acos` • `atan` • `sinh` • `cosh` • `tanh` • `asinh` • `acosh` • `atanh`	• Floating point

Dependencies

- When you set **Function** to `atan2`, the block shows two input ports. The first input (**Port_1**) is the *y*-axis or imaginary part of the function argument. The second input (**Port_2**) is the *x*-axis or real part of the function argument.

- You can use floating-point input signals when you set **Approximation method** to `None` or `CORDIC`. However, the block output data type depends on which of these approximation method options you choose.

Input Data Type	Approximation Method	Output Data Type
Floating point	None	Depends on your selection for **Output signal type**. Options are `auto` (same data type as input), `real`, or `complex`.
Floating point	CORDIC	Same as input. **Output signal type** is not available when you use the CORDIC approximation method to compute the block output.

For CORDIC approximations:

- Input must be real for the `sin`, `cos`, `sincos`, `cos + jsin`, and `atan2` functions.

- Output is real for the `sin`, `cos`, `sincos`, and `atan2` functions.
- Output is complex for the `cos + jsin` function.

Limitations

Complex input signals are supported for all functions in this block, except `atan2`.

You can use fixed-point input signals only when **Approximation method** is set to `CORDIC`. The CORDIC approximation is available for the `sin`, `cos`, `sincos`, `cos + jsin`, and `atan2` functions. For the `atan2` function, the relationship between input and output data types depends also on whether the fixed-point input is signed or unsigned.

Input Data Type	Function	Output Data Type
Fixed point, signed or unsigned	`sin`, `cos`, `sincos`, and `cos + jsin`	`fixdt(1, WL, WL - 2)` where *WL* is the input word length This fixed-point type provides the best precision for the CORDIC algorithm.
Fixed point, signed	`atan2`	`fixdt(1, WL, WL − 3)`
Fixed point, unsigned	`atan2`	`fixdt(1, WL, WL − 2)`

When you set **Function** to `sin`, `cos`, `sincos`, or `cos + jsin`, and set the **Approximation method** to `CORDIC`, the block has these limitations:

- When you use signed fixed-point types, the input angle must fall within the range [–2π, 2π) rad.
- When you use unsigned fixed-point types, the input angle must fall within the range [0, 2π) rad.

When you set **Function** to `atan2` and the **Approximation method** to `CORDIC`, the block has these limitations:

- Inputs must be the same size, or at least one value must be a scalar value.
- Both inputs must have the same data type.
- When you use signed fixed-point types, the word length must be 126 or less.
- When you use unsigned fixed-point types, the word length must be 125 or less.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fixed point`

Port_2 — *x*-axis or real part of the function argument for atan2
scalar | vector | matrix

Input the *x*-axis or real part of the function argument for `atan2`. When you set **Function** to `atan2`, the block shows two input ports. The first input (**Port_1**) is the *y*-axis or imaginary part of the function argument. The second input (**Port_2**) is the *x*-axis or real part of the function argument. (See "Port Location After Rotating or Flipping" for a description of the port order for various block orientations.)

Dependencies

To enable this port, set **Function** to `atan2`.

Limitations

- Fixed-point input signals are supported only when you set **Approximation method** to `CORDIC`.

- When you set **Function** to `atan2` and **Approximation method** to `CORDIC`:

  - Inputs must be the same size, or at least one value must be a scalar value.

  - Both inputs must have the same data type.

  - When you use signed fixed-point types, the word length must be `126` or less.

  - When you use unsigned fixed-point types, the word length must be `125` or less.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fixed point`

Output

Port_1 — Specified trigonometric function of input
scalar | vector | matrix

Result of applying the specified trigonometric function to one or more inputs in rad. Each function supports:

- Scalar operations
- Element-wise vector and matrix operations

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fixed point`

sin — Sine of input signal
scalar | vector | matrix

Sine of the input signal, in rad.

Dependencies

To enable this port, set **Function** to `sincos`.

Limitations

Fixed-point input signals are supported only when you set **Approximation method** to `CORDIC`.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fixed point`

cos — Cosine of input signal
scalar | vector | matrix

Cosine of the input signal, in rad.

Dependencies

To enable this port, set **Function** to `sincos`.

Limitations

Fixed-point input signals are supported only when you set **Approximation method** to `CORDIC`.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fixed point`

Parameters

Function — Trigonometric function
sin (default) | cos | tan | asin | acos | atan | atan2 | sinh | cosh | tanh | asinh | acosh | atanh | sincos | cos + jsin

Specify the trigonometric function. The name of the function on the block icon changes to match your selection.

Limitations

When you set **Function** to `sin`, `cos`, `sincos`, or `cos + jsin`, and set the **Approximation method** to `CORDIC`, the block has these limitations:

- When you use signed fixed-point types, the input angle must fall within the range [–2π, 2π) rad.

- When you use unsigned fixed-point types, the input angle must fall within the range [0, 2π) rad.

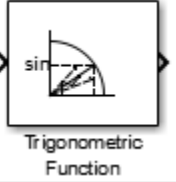
When you set **Function** to `atan2` and the **Approximation method** to `CORDIC`, the block has these limitations:

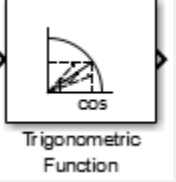
- Inputs must be the same size, or at least one value must be a scalar value.

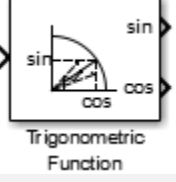
- Both inputs must have the same data type.

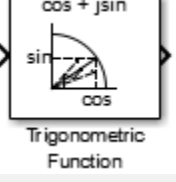
- When you use signed fixed-point types, the word length must be `126` or less.

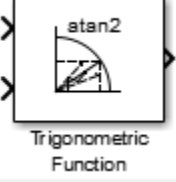
- When you use unsigned fixed-point types, the word length must be `125` or less.

Programmatic Use
Block Parameter: `Operator`
Type: character vector
Values: `'sin'` | `'cos'` | `'tan'` | `'asin'` | `'acos'` | `'atan'` | `'atan2'` | `'sinh'` | `'cosh'` | `'tanh'` | `'asinh'` | `'acosh'` | `'atanh'` | `'sincos'` | `'cos + jsin'`
Default: `'sin'`










Approximation method — CORDIC or none
None (default) | CORDIC

Specify the type of approximation for computing output.

Approximation Method	Data Types Supported	When to Use This Method
None (default)	Floating point	You want to use the default Taylor series algorithm.
CORDIC	Floating point and fixed point	You want a fast, approximate calculation.

If you select `CORDIC` and enlarge the block from the default size, the block icon changes:

Function	Block Icon
sin	
cos	
sincos	
cos + jsin	
atan2	

Dependencies

To enable this parameter, set **Function** to sin, cos, sincos, cos + jsin, or atan2.

To use fixed-point input signals, you must set **Approximation method** to CORDIC.

Limitations

When you set **Function** to `sin`, `cos`, `sincos`, or `cos + jsin`, and set the **Approximation method** to `CORDIC`, the block has these limitations:

- When you use signed fixed-point types, the input angle must fall within the range [–2π, 2π) rad.
- When you use unsigned fixed-point types, the input angle must fall within the range [0, 2π) rad.

When you set **Function** to `atan2` and the **Approximation method** to `CORDIC`, the block has these limitations:

- Inputs must be the same size, or at least one value must be a scalar value.
- Both inputs must have the same data type.
- When you use signed fixed-point types, the word length must be 126 or less.
- When you use unsigned fixed-point types, the word length must be 125 or less.

Programmatic Use
Block Parameter: `ApproximationMethod`
Type: character vector
Values: `'None'` | `'CORDIC'`
Default: `'None'`

Number of iterations — Number of iterations for CORDIC algorithm
11 (default) | positive integer, less than or equal to word length of fixed-point input

Specify the number of iterations to perform the CORDIC algorithm. The default value is 11.

- When the block input uses a floating-point data type, the number of iterations can be a positive integer.
- When the block input is a fixed-point data type, the number of iterations cannot exceed the word length.

  For example, if the block input is `fixdt(1,16,15)`, the word length is 16. In this case, the number of iterations cannot exceed 16.

Dependencies

To enable this parameter, you must set the **Function** and **Approximation method** parameters as follows:

- Set **Function** to sin, cos, sincos, cos + jsin, or atan2.

- Set **Approximation method** to CORDIC.

Programmatic Use
Block Parameter: NumberOfIterations
Type: character vector
Values: positive integer, less than or equal to word length of fixed-point input
Default: '11'

Output signal type — complexity of output signal
auto (default) | real | complex

Specify the output signal type of the Trigonometric Function block as auto, real, or complex.

Function	Input Signal Type	Output Signal Type		
		Auto	**Real**	**Complex**
Any selection for the **Function** parameter	real	real	real	complex
	complex	complex	error	complex

Dependencies

Setting **Approximation method** to CORDIC disables this parameter.

Note When **Function** is atan2, complex input signals are not supported for simulation or code generation.

Programmatic Use
Block Parameter: OutputSignalType
Type: character vector
Values: 'auto' | 'real' | 'complex'
Default: 'auto'

Sample time — Specify sample time as a value other than -1
-1 (default) | scalar

Specify the sample time as a value other than -1. For more information, see "Specify Sample Time".

Dependencies

This parameter is not visible unless it is explicitly set to a value other than -1. To learn more, see "Blocks for Which Sample Time Is Not Recommended".

Programmatic Use
Block Parameter: SampleTime
Type: character vector
Values: scalar
Default: '-1'

Block Characteristics

Data Types	double | single
Multidimensional Signals	Yes
Variable-Size Signals	Yes

Definitions

CORDIC

CORDIC is an acronym for COordinate Rotation DIgital Computer. The Givens rotation-based CORDIC algorithm is one of the most hardware-efficient algorithms available because it requires only iterative shift-add operations (see References). The CORDIC algorithm eliminates the need for explicit multipliers. Using CORDIC, you can calculate various functions, such as sine, cosine, arc sine, arc cosine, arc tangent, and vector magnitude. You can also use this algorithm for divide, square root, hyperbolic, and logarithmic functions.

Increasing the number of CORDIC iterations can produce more accurate results, but doing so also increases the expense of the computation and adds latency.

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Not all compilers support the `asinh`, `acosh`, and `atanh` functions. If you use a compiler that does not support those functions, a warning appears and the generated code fails to link.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

For more information about HDL code generation, see Trigonometric Function.

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

Fixed-Point Conversion

Convert floating-point algorithms to fixed point using Fixed-Point Designer™.

This block supports fixed-point and base integer data types when you set the **Function** to sin, cos, sincos, cos + jsin, or atan2, and set the **Approximation method** to CORDIC.

Unary Minus

Negate input
Library: Simulink / Math Operations

Description

The Unary Minus block negates the input.

Ports

Input

Port_1 — Signal to negate
scalar | vector | matrix | N-D array

Input signal, specified as a scalar, vector, matrix, or N-D array.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `fixed point`

Output

Port_1 — Negation of input signal
scalar | vector | matrix | N-D array

Negation of the input signal. The output has the same data type and dimensions as the input.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `fixed point`

Parameters

`Saturate on integer overflow` — Method of overflow action
`off` (default) | `on`

Select to have integer overflows saturate. Otherwise, overflows wrap.

When you select this check box, saturation applies to every internal operation on the block, not just the output, or result. In general, the code generation process can detect when overflow is not possible. In this case, the code generator does not produce saturation code.

For signed-integer data types, the unary minus of the most negative value is not representable by the data type. In this case, the **Saturate on integer overflow** check box controls the behavior of the block:

Parameter Setting	Block Behavior	Examples
Saturate on integer overflow = `on`	Values saturate to the most positive value of the integer data type	• For 8-bit signed integers, -128 maps to 127. • For 16-bit signed integers, -32768 maps to 32767. • For 32-bit signed integers, -2147483648 maps to 2147483647.
Saturate on integer overflow = `off`	Values wrap to the most negative value of the integer data type	• For 8-bit signed integers, -128 remains -128. • For 16-bit signed integers, -32768 remains -32768. • For 32-bit signed integers, -2147483648 remains -2147483648.

Programmatic Use
Block Parameter: `SaturateOnIntegerOverflow`
Type: character vector
Values: `'off'` | `'on'`
Default: `'off'`

`Sample time` — Specify sample time as a value other than -1
`-1` (default) | scalar

Specify the sample time as a value other than -1. For more information, see "Specify Sample Time".

Dependencies

This parameter is not visible unless it is explicitly set to a value other than -1. To learn more, see "Blocks for Which Sample Time Is Not Recommended".

Programmatic Use
Block Parameter: SampleTime
Type: character vector
Values: scalar
Default: '-1'

Block Characteristics

Data Types	double	single	base integer[a]	fixed point[a]
Multidimensional Signals	Yes
Variable-Size Signals	No

a. This block only supports signed fixed-point data types.

Extended Capabilities

C/C++ Code Generation
Generate C and C++ code using Simulink® Coder™.

HDL Code Generation
Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

For more information about HDL code generation, see Unary Minus.

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

Uniform Random Number

Generate uniformly distributed random numbers
Library: Simulink / Sources
Description

The Uniform Random Number block generates uniformly distributed random numbers over an interval that you specify. To generate normally distributed random numbers, use the Random Number block.

You can generate a repeatable sequence using any Uniform Random Number block with the same nonnegative seed and parameters. The seed resets to the specified value each time a simulation starts.

Avoid integrating a random signal, because solvers must integrate relatively smooth signals. Instead, use the Band-Limited White Noise block.

The numeric parameters of this block must have the same dimensions after scalar expansion. If you select the **Interpret vector parameters as 1-D** check box and the numeric parameters are row or column vectors after scalar expansion, the block outputs a 1-D signal. If you clear the **Interpret vector parameters as 1-D** check box, the block outputs a signal of the same dimensionality as the parameters.

Ports

Output

Port_1 — Random number output signal
scalar | vector

Output signal of generated uniformly distributed random numbers over the interval you specify.

Data Types: `double`

Parameters

`Minimum` — Minimum interval
`-1` (default) | scalar | vector

Specify the minimum of the interval.

Programmatic Use
Block Parameter: `Minimum`
Type: character vector
Values: scalar
Default: `'-1'`

`Maximum` — Maximum interval
`1` (default) | scalar | vector

Specify the maximum of the interval.

Programmatic Use
Block Parameter: `Maximum`
Type: character vector
Values: scalar
Default: `'1'`

`Seed` — Random number seed
`0` (default) | scalar

Specify the starting seed for the random number generator.

The seed must be 0 or a positive integer. Output is repeatable for a given seed.

Programmatic Use
Block Parameter: `See`
Type: character vector
Values: scalar
Default: `'0'`

`Sample time` — Sample time
`0.1` (default) | scalar

Specify the time interval between samples. See "Specify Sample Time" in the Simulink documentation for more information.

Programmatic Use
Block Parameter: SampleTime
Type: character vector
Values: scalar
Default: '0.1'

Interpret vector parameters as 1-D — Treat vectors as 1-D
on (default) | off

Select this check box to output a vector of length N if the **Constant value** parameter evaluates to an N-element row or column vector.

- When you select this check box, the block outputs a vector of length N if the **Constant value** parameter evaluates to an N-element row or column vector. For example, the block outputs a matrix of dimension 1-by-N or N-by-1.

- When you clear this check box, the block does not output a vector of length N if the **Constant value** parameter evaluates to an N-element row or column vector.

Programmatic Use
Block Parameter: VectorParams1D
Type: character vector
Values: 'on' | 'off'
Default: 'on'

Block Characteristics

Data Types	double
Multidimensional Signals	Yes
Variable-Size Signals	No

Extended Capabilities

C/C++ Code Generation
Generate C and C++ code using Simulink® Coder™.

Unit System Configuration

Configure units

Library

Ports & Subsystems

Description

The Unit System Configuration block specifies allowed and disallowed unit systems for the component. It restricts units systems for a subsystem or top model and all its children, unless you override it with another Unit System Configuration block in a child.

This block supports normal, accelerator, and rapid accelerator modes and fast restart.

Parameters

Disallowed unit systems

Displays disallowed unit system.

To designate a unit system as disallowed, select it in the **Allowed unit systems** column and click **<<Disallow**.

Default: None

See "Block-Specific Parameters" on page 6-130 for the command-line information.

Allowed unit systems

Displays allowed unit system.

To designate a unit system as allowed, select it in the **Disallowed unit systems** column and click **Allow>>**.

Default: SI, English, SI (extended), CGS

See "Block-Specific Parameters" on page 6-130 for the command-line information.

Allow all unit systems

Allow or restrict unit systems.

Default: On

☑ On

Allow all unit systems.

☐ Off

Restrict unit systems to those in **Allowed unit systems**.

Selecting the **Allow all unit systems** check box disables the **Disallowed unit systems** and **Allowed unit systems** parameters.

See "Block-Specific Parameters" on page 6-130 for the command-line information.

Introduced in R2016a

Unit Conversion

Convert units
Library

Signal Attributes

Description

The Unit Conversion block converts the unit of the input signal to the output signal. The block can convert if the units are separated by a scaling factor or offset, or are inverse units, for example:

- $y=a*U$
- $y=a*U+b$, where a is the scale and b is the offset
- $y=a/U$

This block supports normal, accelerator, and rapid accelerator modes and fast restart.

Data Type Support

The Unit Conversion block accepts and outputs real or complex values of the following data types:

- Floating point
- Built-in integer
- Fixed point

For more information, see "Data Types Supported by Simulink".

Parameters

Output data type

Specify the output data type.

Default: `Inherit: Inherit via internal rule`

`Inherit: Inherit via internal rule`

Simulink chooses intermediate and output data types to balance numerical accuracy, performance, and generated code size, while taking into account the properties of the embedded target hardware. If you change the embedded target settings, the data type selected by the internal rule might change.

`Inherit: Inherit via back propagation`

Output data type is inherited via back propagation. Internal rules determine the intermediate data types and Simulink casts the final results to the output data type.

See "Block-Specific Parameters" on page 6-130 for the command-line information.

See "Converting Units" for more information.

Characteristics

Data Types	Double | Single | Base Integer | Fixed-Point
Sample Time	Inherited from driving block
Multidimensional Signals	Yes
Variable-Size Signals	Yes
Zero-Crossing Detection	No
Code Generation	Yes

Unit Delay

Delay signal one sample period
Library: Simulink / Discrete
Description

The Unit Delay block holds and delays its input by the sample period you specify. When placed in an iterator subsystem, it holds and delays its input by one iteration. This block is equivalent to the z^{-1} discrete-time operator. The block accepts one input and generates one output. Each signal can be scalar or vector. If the input is a vector, the block holds and delays all elements of the vector by the same sample period.

You specify the block output for the first sampling period with the **Initial conditions** parameter. Careful selection of this parameter can minimize unwanted output behavior. You specify the time between samples with the **Sample time** parameter. A setting of -1 means the block inherits the **Sample time**.

Note The Unit Delay block errors out if you use it to create a transition between blocks operating at different sample rates. Use the Rate Transition block instead.

Comparison with Similar Blocks

The Memory, Unit Delay, and Zero-Order Hold blocks provide similar functionality but have different capabilities. Also, the purpose of each block is different.

This table shows recommended usage for each block.

Block	Purpose of the Block	Reference Examples
Unit Delay	Implement a delay using a discrete sample time that you specify. The block accepts and outputs signals with a discrete sample time.	• `sldemo_enginewc` (Compression subsystem)
Memory on page 1-1056	Implement a delay by one major integration time step. Ideally, the block accepts continuous (or fixed in minor time step) signals and outputs a signal that is fixed in minor time step.	• `sldemo_bounce` • `sldemo_clutch` (Friction Mode Logic/Lockup FSM subsystem)
Zero-Order Hold	Convert an input signal with a continuous sample time to an output signal with a discrete sample time.	• `sldemo_radar_eml` • `aero_dap3dof`

Each block has the following capabilities.

Capability	Memory	Unit Delay	Zero-Order Hold
Specification of initial condition	Yes	Yes	No, because the block output at time t = 0 must match the input value.
Specification of sample time	No, because the block can only inherit sample time from the driving block or the solver used for the entire model.	Yes	Yes
Support for frame-based signals	No	Yes	Yes
Support for state logging	No	Yes	No

Ports

Input

Port_1 — Input signal
scalar | vector

Input signal that the block delays by one sample period.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Output

Port_1 — Output signal
scalar | vector

Output signal that is the input delayed by one sample period.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Parameters

Main

Initial condition — First sample period output
0 (default) | scalar | vector

Specify the output of the simulation for the first sampling period, during which the output of the Unit Delay block is otherwise undefined.

Programmatic Use
Block Parameter: `InitialCondition`
Type: character vector
Value: scalar | vector
Default: `'0'`

Input processing — Specify sample- or frame-based processing
Elements as channels (sample based) (default) | Columns as channels
(frame based) | Inherited

Specify whether the block performs sample- or frame-based processing:

- Columns as channels (frame based) — Treat each column of the input as a separate channel (frame-based processing).

  Note Frame-based processing requires a DSP System Toolbox license.

  For more information, see "Sample- and Frame-Based Concepts" (DSP System Toolbox).

- Elements as channels (sample based) — Treat each element of the input as a separate channel (sample-based processing).

- Inherited — Inherit the processing mode from the input signal and delay the input accordingly. You can identify whether the input signal is sample or frame based by looking at the signal line. Simulink represents sample-based signals with a single line and frame-based signals with a double line.

  Note When you choose the Inherited option for the **Input processing** parameter, and the input signal is frame based, Simulink generates a warning or error in future releases.

Use **Input processing** to specify whether the block performs sample- or frame-based processing. The block accepts frame-based signals for the input u. All other input signals must be sample based.

Input Signal u	Input Processing Mode	Block Works?
Sample based	Sample based	Yes
Frame based		No, produces an error
Sample based	Frame based	Yes
Frame based		Yes
Sample based	Inherited	Yes
Frame based		Yes

For more information about these two processing modes, see "Sample- and Frame-Based Concepts" (DSP System Toolbox).

Programmatic Use
Block Parameter: InputProcessing
Type: character vector
Values: 'Columns as channels (frame based)'|'Elements as channels (sample based)'|'Inherited'
Default: 'Elements as channels (sample based)'

Sample time (-1 for inherited) — Discrete interval between sample time hits
-1 (default) | scalar

Enter the discrete interval between sample time hits or specify -1 to inherit the sample time.

See also "Specify Sample Time".

Programmatic Use
Block Parameter: SampleTime
Type: character vector
Value: real scalar
Default: '-1'

State Attributes

State name — Unique name for block state
'' (default) | alphanumeric string

Use this parameter to assign a unique name to the block state. The default is ' '. When this field is blank, no name is assigned. When using this parameter, remember these considerations:

- A valid identifier starts with an alphabetic or underscore character, followed by alphanumeric or underscore characters.
- The state name applies only to the selected block.

This parameter enables **State name must resolve to Simulink signal object** when you click **Apply**.

For more information, see "Apply Storage Classes to Individual Signal, State, and Parameter Data Elements" (Simulink Coder).

Programmatic Use
Block Parameter: `StateName`
Type: character vector
Values: unique name
Default: `''`

State name must resolve to Simulink signal object — Require state names resolve to signal object

`Off` (default) | Boolean

Specify if requiring that state name resolve to Simulink signal objects or not. If selected, the software generates an error at run time if you specify a state name that does not match the name of a Simulink signal object.

Dependency

Enabled when you give the parameter **State name** a value and set the model configuration parameter **Signal resolution** to a value other than `None`.

Selecting this check box disables **Code generation storage class**.

Programmatic Use
Block Parameter: `StateMustResolveToSignalObject`
Type: character vector
Values: `'off'` | `'on'`
Default: `'off'`

Signal object class — Custom storage class package name

`Simulink.Signal` (default)

Choose a custom storage class package by selecting a signal object class that the target package defines. For example, to apply custom storage classes from the built-in package `mpt`, select `mpt.Signal`. Unless you use an ERT-based code generation target with Embedded Coder, custom storage classes do not affect the generated code.

If the class that you want does not appear in the list, select `Customize class lists`. For instructions, see "Target Class Does Not Appear in List of Signal Object Classes" (Embedded Coder).

For information about storage classes, see "Apply Storage Classes to Individual Signal, State, and Parameter Data Elements" (Simulink Coder). For information about custom

storage classes, see "Apply Custom Storage Classes to Individual Signal, State, and Parameter Data Elements" (Embedded Coder).

Programmatic Use
Block Parameter: `StateSignalObject`
Type: character vector
Values: `'Simulink.Signal'` | `'<StorageClass.PackageName>'`
Default: `'Simulink.Signal'`

Code generation storage class — Storage class for code generation
Auto (default) | Model default | ExportedGlobal | ImportedExtern | ImportedExternPointer | Bitfield (Custom) | Volatile (Custom) | ExportToFile (Custom) | ImportFromFile (Custom) | FileScope (Custom) | Struct (Custom) | GetSet (Custom) | Reusable (Custom)

Select state storage class for code generation. If you do not need to interface to external code, select `Auto`.

For more information, see "Apply Storage Classes to Individual Signal, State, and Parameter Data Elements" (Simulink Coder) and "Apply Custom Storage Classes to Individual Signal, State, and Parameter Data Elements" (Embedded Coder).

Programmatic Use
Block Parameter: `StateStorageClass`
Type: character vector
Values: `'Auto'` | `'Model default'` | `'ExportedGlobal'` | `'ImportedExtern'` | `'ImportedExternPointer'` | `'Custom'`
Default: `'Auto'`

Block Characteristics

Data Types	double | single | Boolean | base integer | fixed point | enumerated | bus
Multidimensional Signals	Yes
Variable-Size Signals	Yes

Introduced before R2006a

Unit Delay Enabled Resettable Synchronous

Delay input signal by one sample period when external Enable signal is true and external Reset signal is false

Library: HDL Coder / Discrete / Unit Delay Enabled Resettable Synchronous

Unit Delay Enabled Resettable Synchronous
Description

The Unit Delay Enabled Resettable Synchronous block combines the functionality of the Unit Delay Enabled Synchronous block and the Unit Delay Resettable Synchronous block.

The Unit Delay Enabled Resettable Synchronous block delays the input signal u by one sample period when the external Enable signal is true and when the external Reset signal is false. When the Enable signal is false, the state and output signal hold the previous value. When the Reset signal is true, the state and output signal take the value of the **Initial condition** parameter. The Enable and Reset signals are true when E and R are nonzero and false when E and R equal zero.

The Unit Delay Enabled Synchronous block implementation consists of a Synchronous Subsystem that contains an Enabled Delay block with a **Delay length** of one and a State Control block in `Synchronous` mode. When you use this block in your model and have HDL Coder installed, your model generates cleaner HDL code and uses fewer hardware resources due to the `Synchronous` behavior of the State Control block.

Limitations

- The block does not support vector inputs on the Reset and Enable ports.
- You cannot use the block inside Enabled Subsystem, Triggered Subsystem, or Resettable Subsystem blocks that use `Classic` semantics. The Subsystem must use `Synchronous` semantics.

Ports

Input

u — Input signal
Scalar | Vector | Matrix | Array | Bus

The Unit Delay Enabled Resettable Synchronous block accepts the input signal of the data types listed below. For more information, see "Data Types Supported by Simulink".

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Input

E — Enable signal
Scalar

The Unit Delay Enabled Synchronous block accepts the Enable signal of the data types listed below. For more information, see "Data Types Supported by Simulink".

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point

R — Reset signal
Scalar

The Unit Delay Resettable Synchronous block accepts the Reset signal of the data types listed below. For more information, see "Data Types Supported by Simulink".

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point

Output

y — Output signal
Scalar | Vector | Matrix | Array | Bus

Output data type always matches input.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Parameters

Initial condition — Initial output of simulation
0.0 (default) | Scalar | Vector | Matrix | Array | Bus

The **Initial condition** can take a scalar input or use the same data type as the input signal. You cannot run the simulation with NaN or Inf as the **Initial condition**.

Programmatic Use
Block parameter: InitialCondition
Type: character vector
Value: '0' | '[n]' | '[m n]'
Default: '0'

Sample time — Time interval between samples
-1 (default) | Scalar | Vector

The **Sample time** must be a real double scalar that specifies the period or a real double vector of length two that specifies the period and offset. The period and offset must be finite and non-negative with offset less than the period.

Programmatic Use
Block parameter: SampleTime
Type: character vector
Value: '-1' | '[n]' | '[m n]'
Default: '-1'

Block Characteristics

Data Types	double | single | base integer | fixed point | bus
Sample Time	Inherit
Direct Feedthrough	Yes
Multidimensional Signals	Scalar
Variable-Size Signals	Yes

Zero-Crossing Detection	No

Extended Capabilities

C/C++ Code Generation
Generate C and C++ code using Simulink® Coder™.

HDL Code Generation
Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

Fixed-Point Conversion
Convert floating-point algorithms to fixed point using Fixed-Point Designer™.

Unit Delay Enabled Synchronous

Delay input signal by one sample period when external Enable signal is true
Library: HDL Coder / Discrete / Unit Delay Enabled
Synchronous
Description

The Unit Delay Enabled Synchronous block delays the input signal u by one sample period when the external Enable signal is true. When the Enable signal is false, the state and output signal hold the previous value. The Enable signal is true when E is not zero and false when E is zero.

The Unit Delay Enabled Synchronous block implementation consists of a Synchronous Subsystem that contains an Enabled Delay block with a **Delay length** of one and a State Control block in `Synchronous` mode. When you use this block in your model and have HDL Coder installed, your model generates cleaner HDL code and uses fewer hardware resources due to the `Synchronous` behavior of the State Control block.

Limitations

- The block does not support vector inputs on the Enable port.
- You cannot use the block inside Enabled Subsystem, Triggered Subsystem, or Resettable Subsystem blocks that use `Classic` semantics. The Subsystem must use `Synchronous` semantics.

Ports

Input

u — Input signal
Scalar | Vector | Matrix | Array | Bus

The Unit Delay Enabled Synchronous block accepts the input signal of the data types listed below. For more information, see "Data Types Supported by Simulink".

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Input

E — Enable signal
Scalar

The Unit Delay Enabled Synchronous block accepts the Enable signal of the data types listed below. For more information, see "Data Types Supported by Simulink".

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point

Output

y — Output signal
Scalar | Vector | Matrix | Array | Bus

Output data type always matches input.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Parameters

Initial condition — Initial output of simulation
0.0 (default) | Scalar | Vector | Matrix | Array | Bus

The **Initial condition** can take a scalar input or use the same data type as the input signal. You cannot run the simulation with `NaN` or `Inf` as the **Initial condition**.

Programmatic Use
Block parameter: `InitialCondition`
Type: character vector
Value: `'0'` | `'[n]'` | `'[m n]'`
Default: `'0'`

`Sample time` **— Time interval between samples**
-1 (default) | `Scalar` | `Vector`

The **Sample time** must be a real double scalar that specifies the period or a real double vector of length two that specifies the period and offset. The period and offset must be finite and non-negative with offset less than the period.

Programmatic Use
Block parameter: `SampleTime`
Type: character vector
Value: `'-1'` | `'[n]'` | `'[m n]'`
Default: `'-1'`

Block Characteristics

Data Types	`double` | `single` | `base integer` | `fixed point` | `bus`
Sample Time	`Inherit`
Direct Feedthrough	`Yes`
Multidimensional Signals	`Scalar`
Variable-Size Signals	`Yes`
Zero-Crossing Detection	`No`

Extended Capabilities

C/C++ Code Generation
Generate C and C++ code using Simulink® Coder™.

HDL Code Generation
Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

Fixed-Point Conversion
Convert floating-point algorithms to fixed point using Fixed-Point Designer™.

State Control | Unit Delay | Unit Delay Resettable Synchronous | Unit Delay Enabled Resettable Synchronous

Introduced in R2017b

Unit Delay Resettable Synchronous

Delay input signal by one sample period when external Reset signal is false
Library: HDL Coder / Discrete / Unit Delay Resettable
Synchronous

Unit Delay Resettable
Synchronous
Description

The Unit Delay Resettable Synchronous block delays the input signal u by one sample period when the external Reset signal is false. When the Reset signal is true, the state and output signal take the value of the **Initial condition** parameter. The Reset signal is true when R is not zero and false when R is zero.

The Unit Delay Resettable Synchronous block implementation consists of a Synchronous Subsystem that contains a Resettable Delay block with a **Delay length** of one and a State Control block in `Synchronous` mode. When you use this block in your model and have HDL Coder installed, your model generates cleaner HDL code and uses fewer hardware resources due to the `Synchronous` behavior of the State Control block.

Limitations

- The block does not support vector inputs on the Reset port.
- You cannot use the block inside Enabled Subsystem, Triggered Subsystem, or Resettable Subsystem blocks that use `Classic` semantics. The Subsystem must use `Synchronous` semantics.

Ports

Input

u — Input signal
Scalar | Vector | Matrix | Array | Bus

The Unit Delay Resettable Synchronous block accepts the input signal of the data types listed below. For more information, see "Data Types Supported by Simulink".

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Input

R — Reset signal
Scalar

The Unit Delay Resettable Synchronous block accepts the Reset signal of the data types listed below. For more information, see "Data Types Supported by Simulink".

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point

Output

y — Output signal
Scalar | Vector | Matrix | Array | Bus

Output data type always matches input.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Parameters

Initial condition — Initial output of simulation
0.0 (default) | Scalar | Vector | Matrix | Array | Bus

The **Initial condition** can take a scalar input or use the same data type as the input signal. You cannot run the simulation with NaN or Inf as the **Initial condition**.

Programmatic Use
Block parameter: InitialCondition
Type: character vector
Value: '0' | '[n]' | '[m n]'
Default: '0'

Sample time — Time interval between samples
-1 (default) | Scalar | Vector

The **Sample time** must be a real double scalar that specifies the period or a real double vector of length two that specifies the period and offset. The period and offset must be finite and non-negative with offset less than the period.

Programmatic Use
Block parameter: SampleTime
Type: character vector
Value: '-1' | '[n]' | '[m n]'
Default: '-1'

Block Characteristics

Data Types	double | single | base integer | fixed point | bus
Sample Time	Inherit
Direct Feedthrough	Yes
Multidimensional Signals	Scalar
Variable-Size Signals	Yes
Zero-Crossing Detection	No

Extended Capabilities

Introduced in R2017b

Variable Integer Delay

Delay input signal by variable sample period
Library: Simulink / Discrete
Description

The Variable Integer Delay block is a variant of the Delay block that has the source of the delay length set to `Input port`, by default.

Ports

Input

u — Data input signal
scalar | vector

Input data signal delayed according to parameters settings.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

d — Delay length
scalar

Delay length specified as inherited from an input port. Enabled when you select the **Delay length: Source** parameter as `Input port`.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fixed point`

Enable — External enable signal
scalar

Enable signal that enables or disables execution of the block. To create this port, select the **Show enable port** parameter.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point`

External reset — External reset signal
scalar

External signal that resets execution of the block to the initial condition. To create this port, select the **External reset** parameter.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point`

x0 — Initial condition
scalar | vector

Initial condition specified as inherited from an input port. Enabled when you select the **Initial Condition: Source** parameter as `Input port`.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fixed point`

Output

Port_1 — Output signal
scalar | vector

Output signal that is the input signal delayed by the length of time specified by the parameter **Delay length**. The initial value of the output signal depends on several conditions. See "Initial Block Output" on page 1-296.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Parameters

Main

Delay length — Delay length
Dialog (default) | Input port

Specify whether to enter the delay length directly on the dialog box (fixed delay) or to inherit the delay from an input port (variable delay).

- If you set **Source** to `Dialog`, enter the delay length in the edit field under **Value**.

- If you set **Source** to `Input port`, verify that an upstream signal supplies a delay length for the d input port. You can also specify its maximum value by specifying the parameter **Upper limit**.

Specify the scalar delay length as a real, non-negative integer. An out-of-range or non-integer value in the dialog box (fixed delay) returns an error. An out-of-range value from an input port (variable delay) casts it into the range. A non-integer value from an input port (variable delay) truncates it to the integer.

Programmatic Use
Block Parameter: DelayLengthSource
Type: character vector
Values: 'Dialog' | 'Input port' |
Default: 'Dialog'
Block Parameter: DelayLength
Type: character vector
Values: scalar
Default: '2'
Block Parameter: DelayLengthUpperLimit
Type: character vector
Values: scalar
Default: '100'

Initial condition — Initial condition
Dialog (default) | Input port

Specify whether to enter the initial condition directly on the dialog box or to inherit the initial condition from an input port.

- If you set **Source** to Dialog, enter the initial condition in the edit field under **Value**.

- If you set **Source** to Input port, verify that an upstream signal supplies an initial condition for the x0 input port.

Simulink converts offline the data type of **Initial condition** to the data type of the input signal u using a round-to-nearest operation and saturation.

Note When **State name must resolve to Simulink signal object** is selected on the **State Attributes** pane, the block copies the initial value of the signal object to the **Initial condition** parameter. However, when the source for **Initial condition** is Input port, the block ignores the initial value of the signal object.

Programmatic Use
Block Parameter: InitialConditionSource
Type: character vector
Values: 'Dialog' | 'Input port' |
Default: 'Dialog'
Block Parameter: InitialCondition
Type: character vector

Values: scalar
Default: `'0.0'`

Input processing — Specify sample- or frame-based processing
`Elements as channels (sample based)` (default) | `Columns as channels (frame based)` | `Inherited`

Specify whether the block performs sample- or frame-based processing:

- `Columns as channels (frame based)` — Treat each column of the input as a separate channel (frame-based processing).

   Note Frame-based processing requires a DSP System Toolbox license.

   For more information, see "Sample- and Frame-Based Concepts" (DSP System Toolbox).

- `Elements as channels (sample based)` — Treat each element of the input as a separate channel (sample-based processing).

- `Inherited` — Inherit the processing mode from the input signal and delay the input accordingly. You can identify whether the input signal is sample or frame based by looking at the signal line. Simulink represents sample-based signals with a single line and frame-based signals with a double line.

   Note When you choose the `Inherited` option for the **Input processing** parameter, and the input signal is frame based, Simulink generates a warning or error in future releases.

Use **Input processing** to specify whether the block performs sample- or frame-based processing. The block accepts frame-based signals for the input u. All other input signals must be sample based.

Input Signal u	Input Processing Mode	Block Works?
Sample based	Sample based	Yes
Frame based		No, produces an error
Sample based	Frame based	Yes
Frame based		Yes

Input Signal u	Input Processing Mode	Block Works?
Sample based	Inherited	Yes
Frame based		Yes

For more information about these two processing modes, see "Sample- and Frame-Based Concepts" (DSP System Toolbox).

Programmatic Use
Block Parameter: InputProcessing
Type: character vector
Values: 'Columns as channels (frame based)'|'Elements as channels (sample based)'|'Inherited'
Default: 'Elements as channels (sample based)'

Use circular buffer for state — Circular buffer for storing state
off (default) | on

Select to use a circular buffer for storing the state in simulation and code generation. Otherwise, an array buffer stores the state.

Using a circular buffer can improve execution speed when the delay length is large. For an array buffer, the number of copy operations increases as the delay length goes up. For a circular buffer, the number of copy operations is constant for increasing delay length.

If one of the following conditions is true, an array buffer always stores the state because a circular buffer does not improve execution speed:

- For sample-based signals, the delay length is 1.
- For frame-based signals, the delay length is no larger than the frame size.

Programmatic Use
Block Parameter: UseCircularBuffer
Type: character vector
Values: 'off' | 'on'
Default: 'off'

Prevent direct feedthrough — Prevent direct feedthrough
off (default) | on

Select to increase the delay length from zero to the lower limit for the **Input processing** mode:

- For sample-based signals, increase the minimum delay length to 1.
- For frame-based signals, increase the minimum delay length to the frame length.

Selecting this check box prevents direct feedthrough from the input port, u, to the output port. However, this check box cannot prevent direct feedthrough from the initial condition port, x0, to the output port.

Dependency

To enable this parameter, set **Delay length: Source** to Input port.

Programmatic Use
Block Parameter: PreventDirectFeedthrough
Type: character vector
Values: 'off' | 'on'
Default: 'off'

Remove delay length check in generated code — Remove delay length out-of-range check
off (default) | on

Select to remove code that checks for out-of-range delay length.

Check Box	Result	When to Use
Selected	Generated code does not include conditional statements to check for out-of-range delay length.	For code efficiency
Cleared	Generated code includes conditional statements to check for out-of-range delay length.	For safety-critical applications

Dependency

To enable this parameter, set **Delay length: Source** to Input port.

Programmatic Use
Block Parameter: RemoveDelayLengthCheckInGeneratedCode
Type: character vector
Values: 'off' | 'on'

Default: `'off'`

`Diagnostic for delay length` — Diagnostic checks for delay length
`None (default)` | `Warning` | `Error`

Specify whether to produce a warning or error when the input d is less than the lower limit or greater than the **Delay length: Upper limit**. The lower limit depends on the setting for **Prevent direct feedthrough**.

- If the check box is cleared, the lower limit is zero.
- If the check box is selected, the lower limit is 1 for sample-based signals and frame length for frame-based signals.

Options for the diagnostic include:

- `None` — Simulink software takes no action.
- `Warning` — Simulink software displays a warning and continues the simulation.
- `Error` — Simulink software terminates the simulation and displays an error.

Dependency

To enable this parameter, set **Delay length: Source** to `Input port`.

Programmatic Use
Block Parameter: `DiagnosticForDelayLength`
Type: character vector
Values: `'None'` | `'Warning'` | `'Error'`
Default: `'None'`

`Show enable port` — Create enable port
`off` (default) | `on`

Select to control execution of this block with an enable port. The block is considered enabled when the input to this port is nonzero, and is disabled when the input is 0. The value of the input is checked at the same time step as the block execution.

`External reset` — External state reset
`None (default)` | `Rising` | `Falling` | `Either` | `Level` | `Level hold`

Specify the trigger event to use to reset the states to the initial conditions.

Reset Mode	Behavior
None	No reset.
Rising	Reset on a rising edge.
Falling	Reset on a falling edge.
Either	Reset on either a rising or falling edge.
Level	Reset in either of these cases: • when the reset signal is nonzero at the current time step • when the reset signal value changes from nonzero at the previous time step to zero at the current time step
Level hold	Reset when the reset signal is nonzero at the current time step

Programmatic Use
Block Parameter: ExternalReset
Type: character vector
Values: 'None' | 'Rising' | 'Falling' | 'Either' | 'Level' | 'Level hold'
Default: 'None'

Sample time (-1 for inherited) — Discrete interval between sample time hits
-1 (default) | scalar

Specify the time interval between samples. To inherit the sample time, set this parameter to -1. This block supports discrete sample time, but not continuous sample time.

Programmatic Use
Block Parameter: SampleTime
Type: character vector
Value: real scalar
Default: '-1'

State Attributes

State name — Unique name for block state
'' (default) | alphanumeric string

Use this parameter to assign a unique name to the block state. The default is ' '. When this field is blank, no name is assigned. When using this parameter, remember these considerations:

- A valid identifier starts with an alphabetic or underscore character, followed by alphanumeric or underscore characters.
- The state name applies only to the selected block.

This parameter enables **State name must resolve to Simulink signal object** when you click **Apply**.

For more information, see "Apply Storage Classes to Individual Signal, State, and Parameter Data Elements" (Simulink Coder).

Programmatic Use
Block Parameter: StateName
Type: character vector
Values: unique name
Default: ''

State name must resolve to Simulink signal object — Require state name resolve to a signal object
off (default) | on

Select this check box to require that the state name resolves to a Simulink signal object.

Dependencies

To enable this parameter, specify a value for **State name**. This parameter appears only if you set the model configuration parameter **Signal resolution** to a value other than None.

Selecting this check box disables **Code generation storage class**.

Programmatic Use
Block Parameter: StateMustResolveToSignalObject
Type: character vector
Values: 'off' | 'on'
Default: 'off'

Signal object class — Custom storage class package name
Simulink.Signal (default) | <StorageClass.PackageName>

Choose a custom storage class package by selecting a signal object class that the target package defines. For example, to apply custom storage classes from the built-in package

`mpt`, select `mpt.Signal`. Unless you use an ERT-based code generation target with Embedded Coder, custom storage classes do not affect the generated code.

If the class that you want does not appear in the list, select `Customize class lists`. For instructions, see "Target Class Does Not Appear in List of Signal Object Classes" (Embedded Coder).

For information about storage classes, see "Apply Storage Classes to Individual Signal, State, and Parameter Data Elements" (Simulink Coder). For information about custom storage classes, see "Apply Custom Storage Classes to Individual Signal, State, and Parameter Data Elements" (Embedded Coder).

Programmatic Use
Block Parameter: `StateSignalObject`
Type: character vector
Values: `'Simulink.Signal'` | `'<StorageClass.PackageName>'`
Default: `'Simulink.Signal'`

Code generation storage class — State storage class for code generation
`Auto` (default) | `Model default` | `ExportedGlobal` | `ImportedExtern` | `ImportedExternPointer` | `BitField (Custom)` | `Model default` | `ExportToFile (Custom)` | `ImportFromFile (Custom)` | `FileScope (Custom)` | `AutoScope (Custom)` | `Struct (Custom)` | `GetSet (Custom)` | `Reusable (Custom)`

Select state storage class for code generation.

- `Auto` is the appropriate storage class for states that you do not need to interface to external code.

- *StorageClass* applies the storage class or custom storage class that you select from the list. For information about storage classes, see "Apply Storage Classes to Individual Signal, State, and Parameter Data Elements" (Simulink Coder). For information about custom storage classes, see "Apply Custom Storage Classes to Individual Signal, State, and Parameter Data Elements" (Embedded Coder).

Use **Signal object class** to select custom storage classes from a package other than `Simulink`.

Dependencies

To enable this parameter, specify a value for **State name**.

Programmatic Use
Block Parameter: StateStorageClass
Type: character vector
Values: 'Auto' | 'SimulinkGlobal' | 'ExportedGlobal' |
'ImportedExtern' | 'ImportedExternPointer' | 'Custom' | ...
Default: 'Auto'

Block Characteristics

Data Types	double | single | Boolean | base integer | fixed point | enumerated | bus
Multidimensional Signals	Yes
Variable-Size Signals	Yes

Extended Capabilities

C/C++ Code Generation
Generate C and C++ code using Simulink® Coder™.

Consider using the Model Discretizer to map these continuous blocks into discrete equivalents that support code generation. From a model, select **Analysis** > **Control Design** > **Model Discretizer**.

Not reommended for production code.

HDL Code Generation
Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

Delay input by variable amount of time

Library

Continuous

Description

The Variable Transport Delay and Variable Time Delay appear as two blocks in the Simulink block library. However, they are the same Simulink block with different settings of a **Select delay type** parameter. Use this parameter to specify the mode in which the block operates.

Variable Time Delay

In this mode, the block has a data input, a time delay input, and a data output. (See "Port Location After Rotating or Flipping" in the Simulink documentation for a description of the port order for various block orientations.) The output at the current time step equals the value of its data input at a previous time step. This time step is the current simulation time minus a delay time specified by the time delay input.

$$y(t) = u(t - t_0) = u(t - \tau(t))$$
During the simulation, the block stores time and input value pairs in an internal buffer. At the start of simulation, the block outputs the value of the **Initial output** parameter until the simulation time exceeds the time delay input. Then, at each simulation step, the block outputs the signal at the time that corresponds to the current simulation time minus the delay time.

If you want the output at a time between input storing times and the solver is a continuous solver, the block interpolates linearly between points. If the time delay is smaller than the step size, the block extrapolates an output point from a previous point. For example, consider a fixed-step simulation with a step size of 1 and the current time at t = 5. If the delay is 0.5, the block needs to generate a point at t = 4.5, but the most recent stored time value is at t = 4. Thus, the block extrapolates the input at 4.5 from the input at 4 and uses the extrapolated value as its output at t = 5.

Extrapolating forward from the previous time step can produce a less accurate result than extrapolating back from the current time step. However, the block cannot use the current input to calculate its output value because the input port does not have direct feedthrough.

If the model specifies a discrete solver, the block does not interpolate between time steps. Instead, it returns the nearest stored value that precedes the required value.

Variable Transport Delay

In this mode, the block output at the current time step is equal to the value of its data (top, or left) input at an earlier time step equal to the current time minus a transportation delay.

$$y(t) = u(t - t_d(t))$$

Simulink software finds the transportation delay, $t_d(t)$, by solving the following equation:

$$\int_{t-t_d(t)}^{t} \frac{1}{t_i(\tau)} d\tau = 1$$

This equation involves an instantaneous time delay, $t_i(t)$, given by the time delay (bottom, or right) input.

1-1951
Suppose you want to use this block to model the fluid flow through a pipe where the fluid speed varies with time. In this case, the time delay input to the block is

$$t_i(t) = \frac{L}{v_i(t)}$$

where L is the length of the pipe and $v_i(t)$ is the speed of the fluid.

Data Type Support

The Variable Time Delay and Variable Transport Delay blocks accept and output real signals of type `double`.

For more information, see "Data Types Supported by Simulink" in the Simulink documentation.

Parameters

Select delay type

Specify the mode in which the block operates.

Default: The Variable Time Delay block has a default value of `Variable time delay`. The Variable Transport Delay block has a default value of `Variable transport delay`.

`Variable time delay`
    Specifies a Variable Time Delay block.

```
Variable transport delay
```
    Specifies a Variable Transport Delay block.

Setting this parameter to `Variable time delay` enables the **Handle zero delay** parameter.

Setting this parameter to `Variable transport delay` enables the **Absolute tolerance** and **State Name** parameters.

Parameter: `VariableDelayType`
Type: character vector
Value: `'Variable transport delay'` | `'Variable time delay'`
Default: `'Variable time delay'`

Maximum delay

Set the maximum value of the time delay input.

Default: `10`

- This value defines the largest time delay input that this block allows. The block clips any delay that exceeds this value.
- This value cannot be negative. If the time delay becomes negative, the block clips it to zero and issues a warning message.

Parameter: `MaximumDelay`
Type: scalar or vector
Value: `'10'`
Default: `'10'`

Initial output

Specify the output that the block generates until the simulation time first exceeds the time delay input.

Default:`Run-to-run tunable parameter`

A `Run-to-run tunable parameter` cannot be changed during simulation run time. However, changing it before a simulation begins will not cause Accelerator or Rapid

Accelerator to regenerate code. Also, the initial output of this block cannot be `inf` or `NaN`.

Parameter: `InitialOutput`
Type: scalar or vector
Value: `'0'`
Default: `'0'`

Initial buffer size

Define the initial memory allocation for the number of input points to store. The input points define the history of the input signal up to the current simulation time.

Default: 1024

- If the number of input points exceeds the initial buffer size, the block allocates additional memory.

- After simulation ends, a message displays if the buffer is not sufficient and more memory needs to be allocated.

- Because allocating memory slows down simulation, choose this value carefully if simulation speed is an issue.

- For long time delays, this block might use a large amount of memory, particularly for dimensionalized input.

Parameter: `MaximumPoints`
Type: scalar
Value: `'1024'`
Default: `'1024'`

Use fixed buffer size

Specify use of a fixed-size buffer to save input data from previous time steps.

Default: Off

☑ On

> The block uses a fixed-size buffer.

☐ Off

> The block does not use a fixed-size buffer.

The **Initial buffer size** parameter specifies the buffer size. If the buffer is full, new data replaces data already in the buffer. Simulink software uses linear extrapolation to estimate output values that are not in the buffer.

Note ERT or GRT code generation uses a fixed-size buffer even if you do not select this check box.

- If the input data is linear, selecting this check box can save memory.
- If the input data is nonlinear, do not select this check box. Doing so might yield inaccurate results.

Parameter: `FixedBuffer`
Type: character vector
Value: `'off'` | `'on'`
Default: `'off'`

Handle zero delay

Convert this block to a direct feedthrough block.

Default: Off

☑ On

> The block uses direct feedthrough.

☐ Off

> The block does not use direct feedthrough.

Setting **Select delay type** to `Variable time delay` enables this parameter.

Parameter: ZeroDelay
Type: character vector
Value: 'off' | 'on'
Default: 'off'

Direct feedthrough of input during linearization

Cause the block to output its input during linearization and trim, which sets the block mode to direct feedthrough.

Default: Off

☑ On

  Enables direct feedthrough of input.

☐ Off

  Disables direct feedthrough of input.

- Selecting this check box can cause a change in the ordering of states in the model when you use the functions linmod, dlinmod, or trim. To extract this new state ordering:

    1 Compile the model using the following command, where model is the name of the Simulink model.

        [sizes, x0, x_str] = model([],[],[],'lincompile');

    2 Terminate the compilation with the following command.

        model([],[],[],'term');

- The output argument x_str, which is a cell array of the states in the Simulink model, contains the new state ordering. When you pass a vector of states as input to the linmod, dlinmod, or trim functions, the state vector must use this new state ordering.

Parameter: TransDelayFeedthrough
Type: character vector
Value: 'off' | 'on'
Default: 'off'

Pade order (for linearization)

Set the order of the Pade approximation for linearization routines.

Default: 0

- The default value is 0, which results in a unity gain with no dynamic states.
- Setting the order to a positive integer n adds n states to your model, but results in a more accurate linear model of the transport delay.

Parameter: PadeOrder
Type: character vector
Value: '0'
Default: '0'

Absolute tolerance

Specify the absolute tolerance for computing the block state.

Default: auto

- You can enter auto, -1, or a positive real scalar or vector.
- If you enter auto, or -1, then Simulink uses the absolute tolerance value in the Configuration Parameters dialog box (see "Solver Pane") to compute the block states.
- If you enter a real scalar, then that value overrides the absolute tolerance in the Configuration Parameters dialog box for computing all block states.
- If you enter a real vector, then the dimension of that vector must match the dimension of the continuous states in the block. These values override the absolute tolerance in the Configuration Parameters dialog box.

Setting **Select delay type** to Variable transport delay enables this parameter.

Parameter: AbsoluteTolerance
Type: character vector, scalar, or vector
Value: 'auto' | '-1' | any positive real scalar or vector
Default: 'auto'

State Name (e.g., 'position')

Assign a unique name to each state.

Default: ' '

If this field is blank, no name assignment occurs.

- To assign a name to a single state, enter the name between quotes, for example, `'velocity'`.
- To assign names to multiple states, enter a comma-delimited list surrounded by braces, for example, `{'a', 'b', 'c'}`. Each name must be unique.
- The state names apply only to the selected block.
- The number of states must divide evenly among the number of state names.
- You can specify fewer names than states, but you cannot specify more names than states.

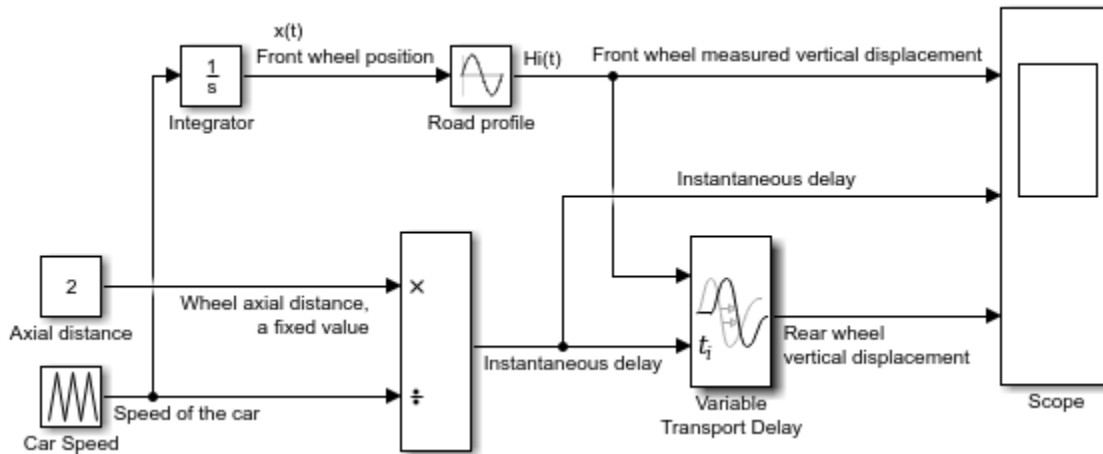
   For example, you can specify two names in a system with four states. The first name applies to the first two states and the second name to the last two states.
- To assign state names with a variable in the MATLAB workspace, enter the variable without quotes. A variable can be a character vector, cell array, or structure.

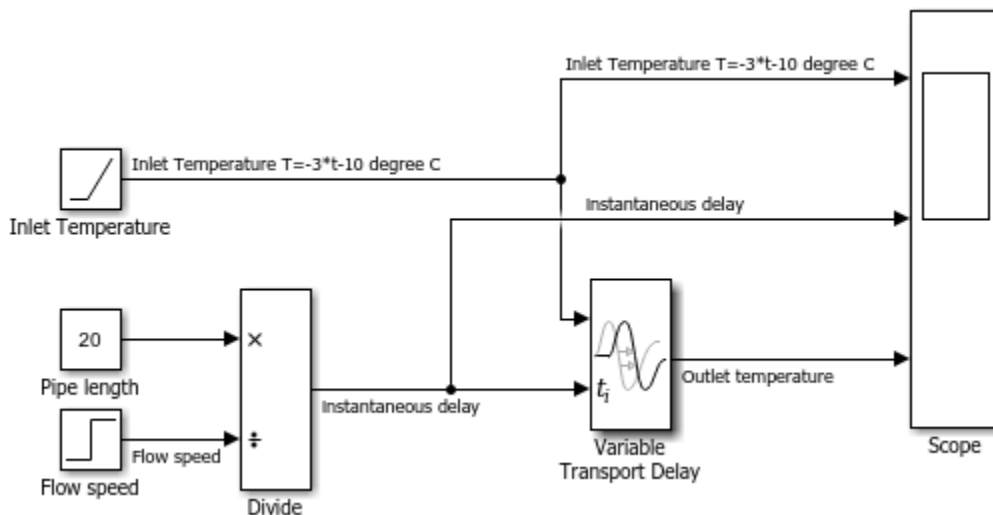
Setting **Select delay type** to `Variable transport delay` enables this parameter.

Parameter: `ContinuousStateAttributes`
Type: character vector
Value: ' ' | user-defined
Default: ' '

Examples

The `sldemo_VariableTransportDelay` and `sldemo_VariableTransportDelay_pipe` models show how you can use the Variable Transport Delay block.

The `sldemo_VariableTransportDelay` model shows how to model vertical wheel displacement on a one-dimensional car. The Variable Transport Delay block models the delay in vertical displacement of the rear wheel when the road profile changes:


The `sldemo_VariableTransportDelay_pipe` model shows how to model incompressible flow through a fixed-length pipe. The Variable Transport Delay block models the delay in temperature change at the outlet when fluid flow occurs:


Characteristics

Data Types	Double
Sample Time	Continuous
Direct Feedthrough	Yes, of the time delay (second) input
Multidimensional Signals	No
Variable-Size Signals	No
Zero-Crossing Detection	No
Code Generation	Yes

Variant Sink

Route amongst multiple outputs using variants
Library: Simulink / Signal Routing
Description

The Variant Sink block has one input port and one or more output ports. You can define variant choices as blocks that are connected to the output port so that, at most, one choice is active.

Each output port is associated with a variant control. The variant control that evaluates to `true`, determines which output port is active.

During simulation, Simulink connects the active choice directly to the input port of the Variant Sink block and ignores the inactive choices.

Ports

Input

Port_1 — Input signal
scalar | vector | matrix

Input signal, specified as a scalar, vector, or matrix, to be connected to the active output port.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus` | `struct`

Output

Port_1 — Output from first variant
scalar | vector | matrix

Output signal from the first variant. The variant control that evaluates to `true`, determines which output port is active.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Port_N — Output from Nth variant
scalar | vector | matrix

Output signal from the Nth variant. The variant control that evaluates to `true`, determines which output port is active.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Parameters

Port — Number of connected input port
no default

Number of the input port that is connected to one variant choice upstream of the Variant Sink block. This value is read-only.

Click ![add icon] to add a port or ![delete icon] to delete an existing one.

Variant Control — Variant controls available in the base workspace
`'Variant'` (default)

Displays the variant controls available in the base workspace. The variant control can be a Boolean condition expression or a `Simulink.Variant` object representing a Boolean condition expression. If you want to generate code for your model, you must define the control variables as `Simulink.Parameter` objects.

To enter a variant name, double-click a **Variant control** cell in a new row and type in the variant control expression. Click **Apply** after you edit a variant control name. If you add

or delete a variant control without applying the changes, the previous edits on the variant control name are lost.

Programmatic Use
Block Parameter: `VariantControls`
Type: cell array of character vectors
Value: Variant control that is associated with the variant choice.
Default: `'Variant'`

Condition (read-only) — Condition for variant controls
no default

Displays the **Condition** for the variant controls that are `Simulink.Variant` objects. Create or change a variant condition in the `Simulink.Variant` parameter dialog box or in the base workspace.

For more information, see "Create Variant Controls Programmatically" and `Simulink.Variant`.

Override variant conditions and use the following variant — Ignore variant control value while determining the active variant
off (default) | on

When you select this check box,the block ignores the variant control value while determining the active variant and uses the overridden variant control as the active variant. The overriding variant control must be defined in the variant block dialog box.

If you do not select this option, Simulink determines the active variant choice based on the variant control that evaluates to `true` in the global workspace.

When you select this option, the variant badge indicates the change.

Dependencies

Selecting this check box enables the **Variant** parameter.

For more information, see "Working with Variant Choices".

Programmatic Use
Block Parameter: `OverrideUsingVariant`
Type: character vector
Value: `''` if no overriding variant is specified.
Default: `''`

Variant — Overriding variant control
Variant_1 (default) | name of variant control

Select the variant control that Simulink uses if you select **Override variant conditions and use the following variant**.

The **Variant** drop-down list displays all variant controls that are currently defined in the base workspace or a data dictionary. Use valid MATLAB identifiers to specify variant controls.

See Simulink.Variant for more information.

Dependencies

To enable this parameter, select the **Override variant conditions and use the following variant** check box.

Programmatic Use
Block Parameter: OverrideUsingVariant
Type: character vector
Value: Specified by the variant control expression.
Default: Variant_1

Allow zero active variant controls — Simulate model without active variant choice
off (default) | on

To simulate a model (containing a variant block) without an active variant choice, select the **Allow zero active variant controls** option. When this option is selected and there is no active variant choice, Simulink disables all the blocks connected to the input and output stream of Variant Sink block. The removed blocks are ignored from update diagram or simulation.

If you do not select this option, Simulink generates an error when there is no active variant choice.

When you select this option, the variant badge indicates the change.

Dependencies

To enable this parameter, clear the **Override variant conditions and use the following variant** check box.

Programmatic Use
Block Parameter: AllowZeroVariantControls
Type: character vector
Value: 'off' | 'on'
Default: 'off'

Show variant condition on block — Annotate block ports
off (default) | on

When you select this option, Simulink annotates each variant control (condition expression) on the Variant Sink block ports.

Programmatic Use
Block Parameter: ShowConditionOnBlock
Type: character vector
Value: 'off' | 'on'
Default: 'off'

Analyze all choices during update diagram and generate preprocessor conditionals — Analyze all variant choices during update diagram or simulation
off (default) | on

When you select this option, Simulink analyzes all variant choices during an update diagram or simulation. This analysis helps Simulink to maintain consistency of all variant branches during simulation and code generation. Simulink routes the output of the active and inactive regions to an internal VariantMerge block.

When you select this option, the preprocessor conditionals (#if) are generated in the code with ERT-based targets.

When you select this option, the variant badge indicates the change.

For more information, see "Represent Variant Source and Sink Blocks in Generated Code" (Embedded Coder)

Dependencies

- To enable this parameter, clear the **Override variant conditions and use the following variant** check box ('off')
- The check box is available for generating ERT targets only.

Programmatic Use
Block Parameter: GeneratePreprocessorConditionals
Type: character vector
Value: 'off' | 'on'
Default: 'off'

Block Characteristics

Data Types	double	single	Boolean	base integer	fixed point	enumerated	bus
Multidimensional Signals	No
Variable-Size Signals	No

Extended Capabilities

C/C++ Code Generation
Generate C and C++ code using Simulink® Coder™.

Fixed-Point Conversion
Convert floating-point algorithms to fixed point using Fixed-Point Designer™.

Variant Source

Route amongst multiple inputs using variants
Library: Simulink / Signal Routing
Description

The Variant Source block has one or more input ports and one output port. You can define variant choices as blocks that are connected to the input port so that, at most, one choice is active.

Each input port is associated with a variant control. The variant control that evaluates to `true`, determines which input port is active.

When the **Analyze all choices during update diagram and generate preprocessor conditionals** option in the block dialog box is cleared, then during simulation Simulink connects the active choice directly to the output port of the Variant Source block and ignores the inactive choices.

Ports

Input

`Port_1` — Input port associated with first variant control
scalar | vector | matrix

Input port associated with the first variant control. The variant control that evaluates to `true`, determines which input port is active.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus` | `struct`

Port_N — Input port associated with Nth variant control
scalar | vector | matrix

Input port associated with the Nth variant control. The variant control that evaluates to `true`, determines which input port is active.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Output

Port_1 — Output of active variant
scalar | vector | matrix

Output signal from the active variant.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Parameters

Port — Number of connected input port
no default

Number of the input port that is connected to one variant choice upstream of the Variant Source block. This value is read-only.

Click 🞡 to add a port or ❎ to delete an existing one.

Variant control — Variant controls available in the base workspace
`'Variant'` (default)

Displays the variant controls available in the base workspace. The variant control can be a Boolean condition expression or a `Simulink.Variant` object representing a Boolean condition expression. If you want to generate code for your model, you must define the control variables as `Simulink.Parameter` objects.

To edit a variant name, double-click a **Variant control** cell and type in the variant control expression. Click **Apply** after you edit a variant control name. If you add or delete a variant control without applying the changes, the previous edits on the variant control name are lost.

The **Variant control** that evaluates to `true` determines which input port must be active.

Programmatic Use
Block Parameter: `VariantControls`
Type: cell array of character vectors
Value: Variant control that is associated with the variant choice.
Default: `'Variant'`

Condition (read-only) — Condition for variant controls
no default

Displays the **Condition** for the variant controls that are `Simulink.Variant` objects. Create or change a variant condition in the `Simulink.Variant` parameter dialog box or in the base workspace.

For more information, see "Create Variant Controls Programmatically" and `Simulink.Variant`.

Override variant conditions and use the following variant — Ignore variant control value while determining the active variant
off (default) | on

When you select this check box, the block ignores the variant control value while determining the active variant and uses the overridden variant control as the active variant. The overriding variant control must be defined in the variant block dialog box.

If you do not select this option, Simulink determines the active variant choice based on the variant control that evaluates to `true` in the global workspace.

When you select this option, the variant badge indicates the change.

For more information, see "Working with Variant Choices".

Dependencies

Selecting this check box enables the **Variant** parameter.

Programmatic Use
Block Parameter: `OverrideUsingVariant`
Type: character vector
Value: `''` if no overriding variant is specified.
Default: `''`

Variant — Overriding variant control
`Variant_1` (default) | name of variant control

Select the variant control that Simulink uses if you select **Override variant conditions and use the following variant**.

The **Variant** drop-down list displays all variant controls that are currently defined in the base workspace or a data dictionary. Use valid MATLAB identifiers to specify variant controls. For more information, see `Simulink.Variant`.

Dependencies

To enable this parameter, select the **Override variant conditions and use the following variant** check box.

Programmatic Use
Block Parameter: `OverrideUsingVariant`
Type: character vector
Value: Specified by the variant control expression.
Default: `Variant_1`

Allow zero active variant controls — Simulate model without active variant choice
`off` (default) | `on`

To simulate a model (containing a variant block) without an active variant choice, select the **Allow zero active variant controls** option. When this option is selected and there is no active variant choice, Simulink disables all the blocks connected to the input and output stream of Variant Source block. The removed blocks are ignored from update diagram or simulation.

If you do not select this option, Simulink generates an error when there is no active variant choice.

When you select this option, the variant badge indicates the change.

Dependencies

To enable this parameter, clear the **Override variant conditions and use the following variant** check box.

Programmatic Use
Block Parameter: `AllowZeroVariantControls`
Type: character vector
Values: `'off'` | `'on'`
Default: `'off'`

Show variant condition on block — Annotate block ports
off (default) | on

When you select this option, Simulink annotates each variant control (condition expression) on the Variant Source block ports.

Programmatic Use
Block Parameter: `ShowConditionOnBlock`
Type: character vector
Value: `'off'` | `'on'`
Default: `'off'`

Analyze all choices during update diagram and generate preprocessor conditionals — Analyze all variant choices during update diagram or simulation
off (default) | on

When you select this option, Simulink analyzes all variant choices during an update diagram or simulation. This analysis helps Simulink to maintain consistency of all variant branches during simulation and code generation. Simulink routes the output of the active and inactive regions to an internal `VariantMerge` block.

When this option is selected, the preprocessor conditionals (`#if`) are generated in the code with ERT-based targets.

If this option is selected during code generation, the data type and the semantics at all input ports of the Variant Source block must be same to avoid failure.

When you select this option, the variant badge indicates the change.

For more information, see "Represent Variant Source and Sink Blocks in Generated Code" (Embedded Coder)

Dependencies

- To enable this parameter, clear the **Override variant conditions and use the following variant** check box.
- The check box is available for generating ERT targets only.

Programmatic Use
Block Parameter: GeneratePreprocessorConditionals
Type: character vector
Value: 'off' | 'on'
Default: 'off'

Block Characteristics

Data Types	double | single | Boolean | base integer | fixed point | enumerated | bus
Multidimensional Signals	No
Variable-Size Signals	No

Extended Capabilities

C/C++ Code Generation
Generate C and C++ code using Simulink® Coder™.

Fixed-Point Conversion
Convert floating-point algorithms to fixed point using Fixed-Point Designer™.

Introduced in R2016a

Variant Subsystem

Template subsystem containing Subsystem blocks as variant choices
Library: Simulink / Ports & Subsystems

Description

The Variant Subsystem block can have one active choice for simulation. The Variant Subsystem block is a template preconfigured to contain two Subsystem blocks to use as variant systems. The Variant Subsystem block (variant system container blocks) can contain a mixture of Subsystem and Model blocks as variant systems. The variant system container blocks can also include Inport, Outport, and Connection Port blocks. There are no drawn connections inside the variant system container blocks.

Each variant system is associated with a variant control that is created in the base workspace. The variant control determines which variant system is active. The variant control can be a condition expression, a `Simulink.Variant` object specifying a condition expression, or a default variant. The variant control that evaluates to `true` determines the active variant.

When you select the **Specify output when source is unconnected** option in the Outport block that is in a variant subsystem container block, you can specify a nonground value as its output. Specify the data type in the **Signal Attributes** section of the Outport block dialog box.

Ports

During simulation, Simulink disables the inactive ports in a variant subsystem container block.

1-1975

Input

Input_Port_1 — Input port corresponding to root-level Inport blocks contained in variant subsystem
same data types accepted by Inport blocks

Each Subsystem or Model block contained within a variant subsystem represents one variant system. If the inport names on a variant system are a subset of the inport names used by the variant subsystem container block, then variant system blocks can have different numbers of inports than the variant subsystem container block has.

Output

Output_Port_1 — Output port corresponding to root-level Outport blocks contained in variant subsystem
same data types accepted by Outport blocks

Each Subsystem or Model block contained within a variant subsystem represents one variant system. If the outport names on a variant system are a subset of the outport names used by the variant subsystem container block, then variant system blocks can have different numbers of outports than the variant subsystem container block has.

Parameters

Variant choices (table of variant systems) — Table of variant choices, variant controls, and conditions
empty table (default)

The table has a row for each variant system contained in the variant subsystem. If there are no variant systems, the table is empty.

You can use buttons to the left of the **Variant choices** table to modify the elements in the table.

To...	Click...
Create and add a new subsystem choice: Place a new subsystem variant choice in the table and create a Subsystem block in the variant subsystem container block diagram.	

To...	Click...
Create and add a new model variant choice: Place a new model variant choice in the table and create a Model block in the variant subsystem container block.	
Create/Edit selected variant object: Create a `Simulink.Variant` object in the base workspace and open the `Simulink.Variant` object parameter dialog box to specify the variant **Condition**.	
Open selected variant choice block: Open the subsystem block diagram for the selected row in the **Variant choices** table.	
Refresh dialog information from Variant Subsystem contents: Update the **Variant choices** table according to the variant system and values of the variant control in the base workspace.	

Name (read-only) — Variant system name
'' (default) | name of Subsystem or Model block contained in the variant subsystem

This read-only field is based on the variant system name. To add a subsystem variant choice, click . To add a model variant choice, click .

Variant Control — Variant control in base workspace
Variant (default) | boolean condition expression | a Simulink.Variant object representing a boolean condition expression | a Simulink.Parameter object (required for code generation)

To enter a variant name, double-click a **Variant control** cell in a new row and type in the variant control expression.

Programmatic Use
Structure field: Represented by the read-only `variant.Name` field in the `Variant` parameter structure
Type: character vector
Value: Variant control that is associated with the variant choice
Default: ''

Condition (read-only) — Condition for variant controls
'' (default)

This read-only field is based on the condition for the associated variant control in the base workspace. Create or change a variant condition in the `Simulink.Variant` parameter dialog box or in the base workspace.

`Override variant conditions and use the following variant` — Override variant conditions and use specified variant
off (default) | on

To choose the active variant based on the evaluation of the variant conditions, use the default (off) . To choose the active variant based on the value specified in the **Variant** parameter, select the **Override variant conditions and use following variant** parameter.

For **Override variant conditions and use following variant** option, the variant control need not be a Boolean condition expression or a `Simulink.Variant` object. Variant controls that start with a % symbol are ignored.

When you select this option, the variant badge indicates the change.
Programmatic Use
Parameter: `OverrideUsingVariant`
Type: character vector
Value: `''` if no overriding variant is specified
Default: `''`

`Variant` — Name of variant to use if overriding variant conditions
`''` (default) | character vector

If you select **Override variant conditions and use following variant**, specify the name of the variant to use. The variant name must be valid MATLAB identifier.

For **Override variant conditions and use following variant** option, the variant control need not be a boolean condition expression, or a `Simulink.Variant` object. Variant controls that start with a % symbol are ignored.

Tip You can use the **Variant** drop-down list to see a list of variant controls that are specified in the variant choice section.

Dependencies

To enable this parameter, select the **Override variant conditions and use the following variant** parameter.

Programmatic Use
Parameter: `ActiveVariant`
Type: character vector
Value: `''` if no variant is active, the value is either empty or the name of the active variant.
Default: `''`

Allow zero active variant controls — Simulate model without using active variant
off (default) | on

To simulate a model (containing a variant system) without an active variant choice, select the **Allow zero active variant controls** option. When you select this option and there is no active variant choice, Simulink disables all the blocks connected to the input and output stream of variant subsystem container block. The disabled blocks are ignored from update diagram or simulation.

If you do not select this option, Simulink generates an error when there is no active variant choice.

Dependencies

- No (default) option of variant is selected

- **Override variant conditions and use following variant** is cleared (`'off'`)

Programmatic Use
Parameter: `AllowZeroVariantControls`
Type: character vector
Value: `'off'` `'on'`
Default: `'off'`

Analyze all choices during update diagram and generate preprocessor conditionals — Generate preprocessor conditionals
off (default) | on

When generating code for an ERT target, this parameter determines whether variant choices are enclosed within C preprocessor conditional statements (`#if`).

When you select this option, Simulink analyzes all variant choices during an update diagram or simulation. This analysis provides early validation of the code generation readiness of all variant choices.

When you select this option, the variant badge indicates the change.

Dependencies

- The check box is available for generating only ERT targets.
- **Override variant conditions and use following variant** is cleared (`'off'`).

Programmatic Use
Parameter: `GeneratePreprocessorConditionals`
Type: character vector
Value: `'off'` `'on'`
Default: `'off'`

Propagate conditions outside of Variant Subsystem — Propagate variant conditions outside of variant subsystem container block
off (default) | on

When you select this option, Simulink propagates the variant conditions outside of the variant subsystem container block to determine which components of the model are active during simulation.

When you select this option, the variant badge indicates the change.

Programmatic Use
Parameter: `PropagateVariantConditions`
Type: character vector
Value: `'off'` `'on'`
Default: `'off'`

Block Characteristics

Data Types	double[a] | single[a] | Boolean[a] | base integer[a] | fixed point[a] | enumerated[a] | bus[a]

Vector Concatenate, Matrix Concatenate

Concatenate input signals of same data type to create contiguous output signal

Library: Simulink / Commonly Used Blocks
Simulink / Math Operations
Simulink / Signal Routing
Description

The Concatenate block concatenates the input signals to create an output signal whose elements reside in contiguous locations in memory.

Tip The Concatenate block is useful for creating an output signal that is nonvirtual. However, to create a vector of function calls, use a Mux block instead.

You use a Concatenate block to define an array of buses. For details about defining an array of buses, see "Combine Buses into an Array of Buses".

The Concatenate block operates in either vector or multidimensional array concatenation mode, depending on the setting of its **Mode** parameter. In either case, the block concatenates the inputs from the top to bottom, or left to right, input ports.

Vector Mode

In vector mode, all input signals must be either vectors or row vectors (1-by-M matrices) or column vectors (M-by-1 matrices) or a combination of vectors and either row or column vectors. When all inputs are vectors, the output is a vector.

If any of the inputs are row or column vectors, the output is a row or column vector, respectively.

Multidimensional Array Mode

Multidimensional array mode accepts vectors and arrays of any size. It assumes that the trailing dimensions are all ones for input signals with lower dimensionality. For example, if the output is 4-D and the input is [2x3] (2-D), this block treats the input as [2x3x1x1]. The output is always an array. The **Concatenate dimension** parameter allows you to specify the output dimension along which the block concatenates its input arrays.

If you set the **Concatenate dimension** parameter to 2 and inputs are 2-D matrices, the block performs horizontal matrix concatenation and places the input matrices side-by-side to create the output matrix. For example, see the ex_concatenate_horizontal model:
If you set the **Concatenate dimension** parameter to 1 and inputs are 2-D matrices, the block performs vertical matrix concatenation and stacks the input matrices on top of each other to create the output matrix. For example, see the ex_concatenate_vertical model:
For horizontal concatenation, the input matrices must have the same column dimension. For vertical concatenation, the input matrices must have the same row dimension. All input signals must have the same dimension for all dimensions other than the concatenation dimensions.

If you set the **Mode** parameter to `Multidimensional array`, the **Concatenate dimension** parameter to 3, and the inputs are 2-D matrices, the block performs multidimensional matrix concatenation. For example, see the ex_concatenate_multidims model:
Ports

Input

Port_1 — First input to concatenate
scalar | vector | matrix | N-D array

First input to concatenate, specified as a scalar, vector, matrix, or N-D array.

Dependencies

- Inputs must be of the same data type.
- Matrix and N-D array inputs are supported only when you set **Mode** to `Multidimensional array`.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Port_N — Nth input to concatenate
scalar | vector | matrix | N-D array

Nth input to concatenate, specified as a scalar, vector, matrix, or N-D array.

1-1985

Dependencies

- To enable this port, set **Number of inputs** to an integer greater than or equal to 2.
- Inputs must be of the same data type.
- Matrix and N-D array inputs are supported only when you set **Mode** to `Multidimensional array`.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Output

Port_1 — Concatenation of input signals
scalar | vector | matrix | N-D array

Concatenation of input signals, along specified dimension. Outputs have the same data type as the input.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated`

Parameters

Number of inputs — Number of input ports
2 (default) | positive integer

Specify the number of inputs for the block as a real-valued, positive integer, less than or equal to 65536.

Programmatic Use
Block Parameter: `NumInputs`
Type: character vector
Values: positive integer
Default: `'2'`

Mode — Type of concatenation
`Vector` | `Multidimensional array`

Select the type of concatenation that this block performs. The default **Mode** of the Vector Concatenate block is `Vector`. The default **Mode** of the Matrix Concatenate block is `Multidimensional array`.

- When you select `Vector` the block performs vector concatenation (see "Vector Mode" on page 1-1983 for details).
- When you select `Multidimensional array`, the block performs matrix concatenation (see "Multidimensional Array Mode" on page 1-1984 for details).

Programmatic Use
Block Parameter: `Mode`
Type: character vector
Values: `'Vector'` | `'Multidimensional array'`
Default: `'Vector'`

`Concatenate dimension` — Output dimension along which to concatenate input arrays
1 (default) | scalar integer

Specify the output dimension along which to concatenate the input arrays.

- To concatenate input arrays vertically, enter 1.
- To concatenate input arrays horizontally, enter 2.
- To perform multidimensional concatenation on the inputs, specify an integer greater than 2.

Dependencies

To enable this parameter, set **Mode** to `Multidimensional array`.

Programmatic Use
Block Parameter: `ConcatenateDimension`
Type: character vector
Values: scalar integer
Default: `'1'`

Block Characteristics

Data Types	double | single | Boolean | base integer | fixed point | enumerated
Multidimensional Signals	No

Variable-Size Signals	Yes

Extended Capabilities

C/C++ Code Generation
Generate C and C++ code using Simulink® Coder™.

HDL Code Generation
Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

For more information about HDL code generation, see Vector Concatenate.

PLC Code Generation
Generate Structured Text code using Simulink® PLC Coder™.

Fixed-Point Conversion
Convert floating-point algorithms to fixed point using Fixed-Point Designer™.

Introduced in R2009b

Weighted Sample Time

Support calculations involving sample time
Library

Signal Attributes

Description

The Weighted Sample Time block is an implementation of the Weighted Sample Time Math block. See Weighted Sample Time Math for more information.

Characteristics

Data Types	Double	Single	Boolean	Base Integer	Fixed-Point
Multidimensional Signals	No
Variable-Size Signals	No
Code Generation	Yes

Introduced before R2006a

Waveform Generator

Output waveforms using signal notations

Description

The Waveform Generator block outputs waveforms based on signal notations that you enter in the **Waveform Definition** table.

This block supports these syntaxes for the signal notations:

- Function syntax — Specify all arguments in the specific order for the signal syntax (see "Algorithms" on page 1-1999).
- Name-value syntax — Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (`'  '`). You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`. For more information, see "Algorithms" on page 1-1999.

This block supports normal, accelerator, and rapid accelerator modes and fast restart.

Supported Operators

Operation	Operator
Absolute value	`abs()`
Addition	+
Division	/
Multiplication	*
Parentheses	()
Subtraction	-
Unary minus	-

The Waveform block observes the following rules of operator precedence:

1 ( )

2 + - (unary)

3 * /

4 + -

Supported Operations

The Waveform Generator block outputs one signal at a time. You can change this output signal. Express frequency and phase offset parameters in radians. You can also:

- Nest signal notations, for example:

  ```
  sin('Amplitude',sin('Amplitude',1,'Frequency',1,'Phase',0),'Frequency',1,'Phase',1)
  ```
- Reference real scalar variables in the base or model workspace, for example:

  sin('Amplitude',x,'Frequency',y,'Phase',z)

  x, *y*, and *z* exist in the base workspace.

For more information on waveforms, see the Algorithms section.

To quickly determine the response of a system to different types of inputs, you can vary the output signal of the Waveform Generator block while a simulation is in progress.

Limitations

- You cannot tune the parameters of a waveform, such as frequency or amplitude, during execution of the code that you generate by using Simulink Coder. Instead, you can generate code that enables you to switch between waveform variants that you specify. For more information, see "Switch Between Output Waveforms During Code Execution for Waveform Generator Block" (Simulink Coder).

Ports

Output

`Port_1` — **Generated output signal**
scalar | vector

Output signal specified by an entry in the **Waveform Definition** table.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | bus

Parameters

Main

`Output Signal` — **Waveform for output signal**
1 (default) | integer

Select waveform definition to specify the output signal. The number corresponds to the line item in the **Waveform Definition** table. You can change this parameter while a simulation is running.

Programmatic Use
Block Parameter: `SelectedSignal`
Type: character vector
Values: scalar
Default: `'1'`
Waveform Definition — Waveform signal notations
`constant | gaussian(mean,variance,seed) |`
`pulse(amplitude,trigger_time,duration) |`
`sawtooth(amplitude,frequence,phase_offset) |`
`sin(amplitude,frequence,phase_offset) |`
`square(amplitude,frequence,phase_offset) |`
`step(step_time,initial_value,final_value)`

Enter signal notations in the **Waveform Definition** table, one waveform definition per line. For syntax details, see Algorithms.

Signal Attributes

Click the **Show data type assistant** button `>>` to display the **Data Type Assistant**, which helps you set the data type attributes. See "Specify Data Types Using Data Type Assistant" in the *Simulink User's Guide* for more information.

Output minimum — Minimum output value for range checking
[] (default) | scalar

Lower value of the output range that Simulink checks.

Simulink uses the minimum to perform:

- Parameter range checking (see "Specify Minimum and Maximum Values for Block Parameters") for some blocks.
- Simulation range checking (see "Signal Ranges" and "Enable Simulation Range Checking").
- Automatic scaling of fixed-point data types.

- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see "Optimize using the specified minimum and maximum values" (Simulink Coder).

Note Output minimum does not saturate or clip the actual output signal. Use the Saturation block instead.

Programmatic Use
Block Parameter: OutMin
Type: character vector
Values: '[ ]'| scalar
Default: '[ ]'

Output maximum — Maximum output value for range checking
[] (default) | scalar

Upper value of the output range that Simulink checks.

Simulink uses the maximum value to perform:

- Parameter range checking (see "Specify Minimum and Maximum Values for Block Parameters") for some blocks.
- Simulation range checking (see "Signal Ranges" and "Enable Simulation Range Checking").
- Automatic scaling of fixed-point data types.
- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see "Optimize using the specified minimum and maximum values" (Simulink Coder).

Note Output maximum does not saturate or clip the actual output signal. Use the Saturation block instead.

Programmatic Use
Block Parameter: OutMax
Type: character vector

Values: `'[ ]'` | scalar
Default: `'[ ]'`

Output data type — Specify the output data type
double (default) | Inherit: Inherit via back propagation | single | int8 |
int32 | uint32 | fixdt(1,16,2^0,0) | <data type expression> | …

Choose the data type for the output. The type can be inherited, specified directly, or expressed as a data type object such as `Simulink.NumericType`.

Programmatic Use
Block Parameter: OutDataTypeStr
Type: character vector
Values: , `'Inherit: Inherit via back propagation'`, `'single'`, `'int8'`,
`'uint8'`, int16, `'uint16'`, `'int32'`, `'uint32'`, fixdt(1,16,0),
fixdt(1,16,2^0,0), fixdt(1,16,2^0,0). `'<data type expression>'`
Default: `'Double'`

Lock output data type setting against changes by the fixed-point tools — Prevent fixed-point tools from overriding data types
off (default) | on

Select to lock the output data type setting of this block against changes by the Fixed-Point Tool and the Fixed-Point Advisor. For more information, see "Use Lock Output Data Type Setting" (Fixed-Point Designer).

Programmatic Use
Block Parameter: LockScale
Type: character vector
Values: `'off'` | `'on'`
Default: `'off'`

Lock data type settings against changes by the fixed-point tools —
off (default) | on

Select to lock data type settings of this block against changes by the Fixed-Point Tool and the Fixed-Point Advisor.

Programmatic Use
Block Parameter: LockScale
Values: `'off'` | `'on'`
Default: `'off'`

See Also

For more information, see "Lock the Output Data Type Setting" (Fixed-Point Designer).

Integer rounding mode — Specify the rounding mode for fixed-point operations
Floor (default) | Ceiling | Convergent | Nearest | Round | Simplest | Zero

Choose one of these rounding modes.

Ceiling

> Rounds both positive and negative numbers toward positive infinity. Equivalent to the MATLAB `ceil` function.

Convergent

> Rounds number to the nearest representable value. If a tie occurs, rounds to the nearest even integer. Equivalent to the Fixed-Point Designer `convergent` function.

Floor

> Rounds both positive and negative numbers toward negative infinity. Equivalent to the MATLAB `floor` function.

Nearest

> Rounds number to the nearest representable value. If a tie occurs, rounds toward positive infinity. Equivalent to the Fixed-Point Designer `nearest` function.

Round

> Rounds number to the nearest representable value. If a tie occurs, rounds positive numbers toward positive infinity and rounds negative numbers toward negative infinity. Equivalent to the Fixed-Point Designer `round` function.

Simplest

> Automatically chooses between round toward floor and round toward zero to generate rounding code that is as efficient as possible.

Zero

> Rounds number toward zero. Equivalent to the MATLAB `fix` function.

Programmatic Use
Block Parameter: RndMeth
Type: character vector
Values: 'Ceiling' | 'Convergent' | 'Floor' | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
Default: 'Floor'

See Also

For more information, see "Rounding" (Fixed-Point Designer).

Saturate on integer overflow — Method of overflow action
off (default) | on

Specify whether overflows saturate or wrap.

Action	Rationale	Impact on Overflows	Example
Select this check box (on).	Your model has possible overflow, and you want explicit saturation protection in the generated code.	Overflows saturate to either the minimum or maximum value that the data type can represent.	The maximum value that the int8 (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box selected, the block output saturates at 127. Similarly, the block output saturates at a minimum output value of -128.

Action	Rationale	Impact on Overflows	Example
Do not select this check box (off).	You want to optimize efficiency of your generated code. You want to avoid overspecifying how a block handles out-of-range signals. For more information, see "Check for Signal Range Errors".	Overflows wrap to the appropriate value that is representable by the data type.	The maximum value that the int8 (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box cleared, the software interprets the overflow-causing value as int8, which can produce an unintended result. For example, a block result of 130 (binary 1000 0010) expressed as int8, is -126.

When you select this check box, saturation applies to every internal operation on the block, not just the output, or result. Usually, the code generation process can detect when overflow is not possible. In this case, the code generator does not produce saturation code.

Programmatic Use
Block Parameter: SaturateOnIntegerOverflow
Type: character vector
Values: 'off' | 'on'
Default: 'off'

Sample time — Time interval between samples
0.1 (default) | scalar

Specify the time interval between samples. To inherit the sample time, set this parameter to -1. See "Specify Sample Time" for more information.

Programmatic Use
Block Parameter: SampleTime
Type: character vector
Values: scalar

Default: `'0.1'`

Algorithms

Enter signal notations in the **Waveform Definition** table, one waveform definition per line. To add a waveform definition, click **Add**. The new waveform appears as an empty character vector. The block interprets empty character vectors or white space character vectors as ground.

To remove a waveform definition, click **Remove**. You can select multiple waveforms using **Ctrl+**click or **Shift+**click.

Constant

Constant values can be:

- Numbers
- Workspace variables

  - Scalar, real variables only

- Built-in MATLAB constant, `pi`

- `1`
- `1.1`
- `x`
- `pi`

Gaussian Noise

`gaussian(mean,variance,seed)`

`gaussian('Mean',mean,'Variance',variance,'Seed',seed)`

- `mean` — Mean value of the random variable output.

- Default: 0
- `variance` — Standard deviation squared of the random variable output.

    - Default: 1
    - Value: Positive constant or positive real scalar variable
- `seed` — Initial seed value for the random number generator.

    - Default: 0
    - Value: Constant or real scalar variable

```
gaussian('Mean',0,'Variance',10,'Seed',1)
```

Pulse

```
pulse(amplitude,trigger_time,duration)
```

```
pulse('Amplitude',amplitude,'TriggerTime',trigger_time,'Duration',duration)
```

- `amplitude` — Value of signal when pulse is high.

- Default: 1
- `trigger_time` — Elapsed simulation time when signal changes to amplitude, in seconds.

  - Default: 1
  - Value: Constant or real scalar variable
- `duration` — How long the signal remains at the given amplitude before returning to ground, in seconds.

  - Default: 1
  - Value: Positive constant or positive real scalar variable

```
pulse('Amplitude',1,'TriggerTime',1,'Duration',1)
```

Sawtooth

```
sawtooth(amplitude,frequency,phase_offset)
```

```
sawtooth('Amplitude',amplitude,'Frequency',frequency,'Phase',phase_offset)
```

- `amplitude` — Sawtooth peak value.

  - Default: 1

- `frequency` — Waveform frequency, in rad/s.

  - Default: 1

- `phase_offset` — Horizontal signal shift, based on elapsed simulation time, in seconds.

  - Default: 0

`sawtooth('Amplitude',1,'Frequency',1,'Phase',0)`
Sine Wave

```
sin(amplitude,frequency,phase_offset)
```

```
sin('Amplitude',amplitude,'Frequency',frequency,'Phase',phase_offset)
```

- `amplitude` — Amplitude of sine wave.

  - Default: 1
- `frequency` — Waveform frequency, in rad/s.

  - Default: 1
- `phase_offset` — Phase offset, in rads.

  - Default: 0

```
sin('Amplitude',1,'Frequency',1,'Phase',0)
```

To get the cosine waveform:

```
sin('Amplitude',1,'Frequency',1,'Phase',pi/2)
```
Square

```
square(amplitude,frequency,phase_delay,duty_cycle)
```

```
square('Amplitude',amplitude,'Frequency',frequency,'Phase',phase_delay,...
'DutyCycle',duty_cycle)
```

- amplitude — Amplitude of signal.

  - Default: 1
- frequency — Waveform frequency in rad/s.

  - Default: 1
- phase_delay — Horizontal signal shift based on elapsed simulation time, in seconds.

  - Default: 0
- duty_cycle — Percentage of high signal per period (0–100%). The block clips the minimum signal to 0% and the maximum signal to 100%.

  - Default: 50

```
square('Amplitude',1,'Frequency',1,'Phase',0,'DutyCycle',50)
```

Step

```
step(step_time,initial_value,final_value)
```

```
step('StepTime',step_time,'InitialValue',initial_value,'FinalValue',final_value)
```

- step_time — Elapsed simulation time when signal changes from initial value to final value, in seconds.

  - Default: 1
  - Value: Constant or positive real scalar variable.

- initial_value — Value of signal when elapsed simulation time is less than step_time, in seconds.

  - Default: 0

- final_value — Value of signal when elapsed simulation time is greater than or equal to step time, in seconds.

1-2005

- Default: 1

```
step('StepTime',1,'InitialValue',0,'FinalValue',1)
```

Weighted Sample Time Math

Support calculations involving sample time
Library:　　　　Simulink / Math Operations

Description

The Weighted Sample Time Math block adds, subtracts, multiplies, or divides its input signal, u, by a weighted sample time, Ts. If the input signal is continuous, Ts is the sample time of the Simulink model. Otherwise, Ts is the sample time of the discrete input signal. If the input signal is constant, Simulink assigns a finite sample time to the block based on its connectivity and context.

You specify the math operation with the **Operation** parameter. The block can output just a weighted sample time (Ts Only) or a weighted sample rate (1/Ts Only).

Enter the weighting factor in the **Weight value** parameter. If the weight, w, is 1, that value does not appear in the equation on the block icon.

Tip You can use the Weighted Sample Time and Weighted Sample Time Math blocks to extract the sample time from a Simulink signal. To do so, set the **Operation** parameter to Ts and the **Weight value** to 1.0. In this configuration, the block outputs the sample time of the input signal.

The block computes its output using the precedence rules for MATLAB operators (see "Operator Precedence" (MATLAB) in the MATLAB documentation). For example, if the **Operation** parameter specifies +, the block calculates output using this equation:

u + (Ts * w)

However, if the **Operation** parameter specifies /, the block calculates output using this equation:

(u / Ts) / w

1-2007

Ports

Input

Port_1 — Input signal
scalar | vector | matrix

Specify the input signal, u to add, subtract, multiply, or divide by the weighted sample time, Ts.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `bus`

Output

Port_1 — Input signal, adjusted by weighted sample time
scalar | vector | matrix

Output the input signal, adjusted by the weighted sample time, Ts. If the input signal is continuous, Ts is the sample time of the Simulink model. Otherwise, Ts is the sample time of the discrete input signal. When the input signal is constant, Simulink assigns a finite sample time to the block based on its connectivity and context.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `bus`

Parameters

Main

Operation — Math operation
+ (default) | - | * | / | Ts Only | 1/Ts Only

Specify the operation to use for adjusting the input signal. You can select: +, -, *, /, Ts Only, or 1/Ts Only.

Programmatic Use
Block Parameter: TsamMathOp

Type: character vector
Values: '+' | '-' | '*' | '/' | 'Ts Only' | '1/Ts Only'
Default: '+'

Weight value — Weight of sample time
1.0 (default) | real-valued scalar

Enter the weight of the sample time as a real-valued scalar.

Programmatic Use
Block Parameter: weightValue
Type: character vector
Values: real-valued scalar
Default: '1.0'

Implement using — Method for adjusting sample time
Online Calculations (default) | Offline Scaling Adjustment

Select one of two modes: online calculations or offline scaling adjustment.

Result of (Ts * w)	Output Data Type of Two Modes	Block Execution
A power of 2, or an integer value	The same, when **Output data type** is Inherit: Inherit via internal rule	Equally efficient in both modes
Not power of 2 and not an integer value	Different	More efficient for the offline scaling mode

Note When the **Implement using** parameter is not visible, operations default to online calculations.

Dependencies

To enable this parameter, set **Operation** to * or /.

Programmatic Use
Block Parameter: TsampMathImp
Type: character vector

Values: `'Online Calculations'` | `'Offline Scaling Adjustment'`
Default: `'Online Calculations'`

Signal Attributes

`Output data type` — Data type of output signal
`Inherit: Inherit via internal rule` (default) | `Inherit: Inherit via back propagation` | `<data type expression>`

Specify the data type for the output.

Programmatic Use
Block Parameter: `OutDataTypeStr`
Type: character vector
Values: `'Inherit: Inherit via internal rule` | `'Inherit: Inherit via back propagation'` | `'<data type expression>'`
Default: `'Inherit: Inherit via internal rule'`

`Integer rounding mode` — Rounding mode for fixed-point operations
`Floor` (default) | `Ceiling` | `Convergent` | `Nearest` | `Round` | `Simplest` | `Zero`

For more information, see "Rounding" (Fixed-Point Designer).

Block parameters always round to the nearest representable value. To control the rounding of a block parameter, enter an expression using a MATLAB rounding function into the mask field.

Programmatic Use
Block Parameter: `RndMeth`
Type: character vector
Values: `'Ceiling'` | `'Convergent'` | `'Floor'` | `'Nearest'` | `'Round'` | `'Simplest'` | `'Zero'`
Default: `'Floor'`

`Saturate on integer overflow` — Method of overflow action
`off` (default) | `on`

Specify whether overflows saturate or wrap.

Action	Rationale	Impact on Overflows	Example
Select this check box (on).	Your model has possible overflow, and you want explicit saturation protection in the generated code.	Overflows saturate to either the minimum or maximum value that the data type can represent.	The maximum value that the int8 (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box selected, the block output saturates at 127. Similarly, the block output saturates at a minimum output value of -128.
Do not select this check box (off).	You want to optimize efficiency of your generated code. You want to avoid overspecifying how a block handles out-of-range signals. For more information, see "Check for Signal Range Errors".	Overflows wrap to the appropriate value that is representable by the data type.	The maximum value that the int8 (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box cleared, the software interprets the overflow-causing value as int8, which can produce an unintended result. For example, a block result of 130 (binary 1000 0010) expressed as int8, is -126.

When you select this check box, saturation applies to every internal operation on the block, not just the output, or result. Usually, the code generation process can detect when overflow is not possible. In this case, the code generator does not produce saturation code.

Programmatic Use
Block Parameter: SaturateOnIntegerOverflow
Type: character vector
Values: 'off' | 'on'
Default: 'off'

Block Characteristics

Data Types	double | single | Boolean | base integer | fixed point
Multidimensional Signals	No
Variable-Size Signals	No

Extended Capabilities

C/C++ Code Generation
Generate C and C++ code using Simulink® Coder™.

Fixed-Point Conversion
Convert floating-point algorithms to fixed point using Fixed-Point Designer™.

While Iterator

Repeat execution of a subsystem while a logical expression is true
Library: Ports & Subsystems
Description

The While Iterator block, when placed in a Subsystem block, repeatedly executes the contents of the subsystem during the current time step while the value of the input condition is true or `1`. Use this block to implement the block diagram equivalent of a `while` loop in a programming language.

The While Iterator Subsystem block is preconfigured with a While Iterator block. Placing a While Iterator block in a Subsystem block makes it an atomic subsystem.

Ports

Input

cond — Logical condition signal
scalar

Signal with the result from evaluating a logical condition. Because the subsystem is not externally triggered during a time step, evaluating a condition as true (`1`) or false (`0`) must reside within the subsystem.

The data type and values of the signal can be:

*   Logical (Boolean) — true (`1`) or false (`0`) .
*   Numerical — true (any positive or negative number) or false (`0`).

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point`

`IC` — Initial logical condition
scalar

Signal with the initial logical condition. At the beginning of each time step:

- If `IC` is false (`0`), the subsystem does not execute during the time step.
- If `IC` is true (value not equal to `0`), the subsystem starts executing and continues to repeat execution as long as the `cond` signal is true.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point`

Output Arguments

`Iteration number` — Signal with the number of iterations
scalar

Signal with the number of While Iterator Subsystem block executions during each time step.

Data Types: `double` | `int8` | `int16` | `int32`

Parameters

`Maximum number of iterations` — Specify maximum number of iterations
-1 (default) | integer

Specify maximum number of iterations allowed during a time step.

-1

  Any number of iterations as long as the `cond` signal is true (value not equal to `0`) . If you specify -1 and the `cond` signal never becomes false (`0`), the simulation runs in an infinite loop. In this case, the only way to stop the simulation is to terminate MATLAB.

integer

  Maximum number of iterations during a time step.

Programmatic Use
Block Parameter: `MaxIters`
Type: character vector
Values: `'5'` | `'-1'` | `'<integer>'`
Default: `'5'`

`While loop type — Select type of block`
`while` (default) | `do-while`

Select type of block.

`while`

    The While Iterator block has two inputs, a `cond` (logical condition) input and an `IC` (initial logical condition) input. The source of the `IC` signal must be external to the While Iterator Subsystem block.

    At the beginning of each time step:

- If the `IC` input is true (value not equal to `0`), the blocks in the subsystem repeat execution while the `cond` input is true. This process continues during a time step as long as the `cond` input is true and the number of iterations is less than or equal to the **Maximum number of iterations**.

- If the `IC` input is false, the While Iterator block does not execute the contents of the subsystem.

`do-while`

    The While Iterator block has one input, the `cond` (while condition) input.

    At each time step, the blocks in the subsystem repeat execution while the `cond` input is true (value not equal to `0`). This process continues as long as the `cond` input is true and the number of iterations is less than or equal to the **Maximum number of iterations**.

Programmatic Use
Block pParameter: `WhileBlockType`
Type: character vector
Values: `'while'` | `'do-while'`
Default: `'while'`

`States when starting — Select block states between time steps`
`held` (default) | `reset`

Select how to handle block states between time steps.

`held`

> Hold block states between time steps. Block state values persist across time steps.

`reset`

> Reset block states to their initial values at the beginning of each time step and before the first iteration loop.

Programmatic Use
Block Parameter: `ResetStates`
Type: character vector
Values: `'held'` | `'reset'`
Default: `'held'`

`Show iteration number port` — Control display of output port
clear | select

Control display of output port for signal with number of block executions. The value of the signal from this port starts at 1and is incremented by 1 for each succeeding iteration.

☐ off

> Remove output port.

☑ on

> Display output port for signal with iteration number.

Dependencies

Selecting this parameter enables the **Output data type** parameter.

Programmatic Use
Block Parameter: `ShowIterationPort`
Type: character vector
Values: `'off'` | `'on'`
Default: `'off'`

`Output data type` — Select output data type for current iteration number
int32 (default) | int16 | int8 | double

Select output data type for iteration number signal. The value of this signal is the number of iterations during a time step and the total number of iterations at the end of a time step.

int32

Signed 32-bit integer.

int16

Signed 16-bit integer.

int8

Signed 8-bit integer.

double

Double-precision floating point.

Dependencies

Select the **Show iteration number port** check box to enable this parameter.

Programmatic Use
Block parameter: OutputDataType
Type: character vector
Value: 'int32' | 'int16' | 'int8' | 'double'
Default: 'int32'

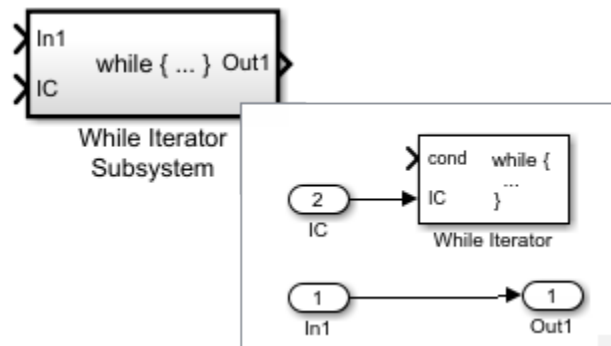
While Iterator Subsystem

Subsystem that repeats execution during a simulation time step
Library: Simulink / Ports & Subsystems
Description

The While Iterator Subsystem block is a Subsystem block preconfigured as a starting point for creating a subsystem that repeats execution during a simulation time step while a logical condition is `true`.


Use While Iterator Subsystem blocks to model:

- Block diagram equivalent of a program `while` or `do-while` loop.
- An iterative algorithm that converges on a more accurate solution after multiple iterations.

When using simplified initialization mode, if you place a block that needs elapsed time (such as a Discrete-Time Integrator block) in a While Iterator Subsystem block, Simulink displays an error.

If the output signal from a While Iterator Subsystem block is a function-call signal, Simulink displays an error when you simulate the model or update the diagram.

Ports

Input

In1 — Signal input to a subsystem block
scalar | vector | matrix

Placing an Inport block in a subsystem block adds an external input port to the block. The port label matches the name of the Inport block.

Use Inport blocks to get signals from the local environment.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

IC (initial logical condition) — Control initial execution of a subsystem block
scalar

Placing a While Iterator block connected to an Input block in a Subsystem block adds this external input port to the block.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point`

Output

Out — Signal output from a subsystem
scalar | vector | matrix

Placing an Outport block in a subsystem block adds an output port from the block. The port label on the subsystem block is the name of the Outport block.

Use Outport blocks to send signals to the local environment.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Block Characteristics

Data Types	double[a] | single[a] | Boolean[a] | base integer[a] | fixed point[a] | enumerated[a] | bus[a]
Multidimensional Signals	Yes[a]
Variable-Size Signals	Yes[a]

a.   Actual data type or capability support depends on block implementation.

Extended Capabilities

C/C++ Code Generation
Generate C and C++ code using Simulink® Coder™.

Actual data type or capability support depends on block implementation.

Introduced before R2006a

Width

Output width of input vector

Library

Signal Attributes

Description

The Width block generates as output the width of its input vector.

You can use an array of buses as an input signal to a Width block. For details about defining and using an array of buses, see "Combine Buses into an Array of Buses".

Data Type Support

The Width block accepts real or complex signals of the following data types:

*   Floating point
*   Built-in integer
*   Fixed point
*   Boolean
*   Enumerated

The Width block also supports mixed-type signal vectors.

When the **Output data type mode** is not `Choose intrinsic data type`, the block supports only built-in numeric types. For more information, see "Data Types Supported by Simulink" in the Simulink documentation.

Parameters

Note The Width block ignores the **Data type override** setting of the Fixed-Point Tool.

Output data type mode

Specify the output data type to be the same as the input, or inherit the data type by back propagation. You can also choose to specify a built-in data type from the drop-down list in the **Output data type** parameter.

Output data type

This parameter is visible when you select `Choose intrinsic data type` for **Output data type mode**. Select a built-in data type from the drop-down list.

Characteristics

Data Types	Double | Single | Boolean | Base Integer | Fixed-Point | Enumerated | Bus
Sample Time	Constant
Multidimensional Signals	Yes
Variable-Size Signals	Yes
Zero-Crossing Detection	No
Code Generation	Yes

Introduced before R2006a

Wrap To Zero

Set output to zero if input is above threshold
Library: Simulink / Discontinuities

Description

The Wrap To Zero block sets the output to zero when the input is above the **Threshold** value. When the input is less than or equal to the **Threshold**, then the output is equal to the input.

Ports

Input

Port_1 — Input signal
scalar | vector

Example:

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point`

Output

Port_1 — Output signal
scalar | vector

Output signal set to the input signal value or zero. The data type of the output is the same data type as the input.

Tip If the input data type cannot represent zero, parameter overflow occurs. To detect this overflow, go to the **Diagnostics > Data Validity** pane of the Configuration Parameters dialog box and set **Parameters > Detect overflow** to `warning` or `error`.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point`

Parameters

To edit the parameters for the Wrap to Zero block, double-click the block icon.

Threshold — Threshold for outputting zero
255 (default) | scalar

Threshold value for setting the output value to zero.

Programmatic Use
Block Parameter: `Threshold`
Type: character vector
Values: `scalar`
Default: `'255'`

Block Characteristics

Data Types	double	single	Boolean	base integer	fixed point
Multidimensional Signals	Yes
Variable-Size Signals	No

Extended Capabilities

C/C++ Code Generation
Generate C and C++ code using Simulink® Coder™.

HDL Code Generation
Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

For more information on HDL code generation, see Wrap To Zero.

PLC Code Generation
Generate Structured Text code using Simulink® PLC Coder™.

Fixed-Point Conversion
Convert floating-point algorithms to fixed point using Fixed-Point Designer™.

XY Graph

Display X-Y plot of signals using MATLAB figure window
Library: Simulink / Sinks

Description

The XY Graph block displays an X-Y plot of its inputs in a MATLAB figure window.
The block has two scalar inputs. The block plots data from the first input (the *x* direction) against data from the second input (the *y* direction). (See "Port Location After Rotating or Flipping" for a description of the port order for various block orientations.) This block is

1-2027

useful for examining limit cycles and other two-state data. Data outside the specified range does not appear.

A figure window appears for each XY Graph block in the model at the start of simulation.

Note The XY Graph block does not support stepping back in a simulation.

Ports

Input

`Port1` — **X-axis values**
scalar

Plot input as x values on an X-Y plot. See "Port Location After Rotating or Flipping" for a description of the port order for various block orientations.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point`

`Port2` — **Y-axis values**
scalar

Plot input as y values on an X-Y plot. See "Port Location After Rotating or Flipping" for a description of the port order for various block orientations.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point`

Parameters

`X-min` — **Minimum x**
`-1` (default) | real number

Specify the minimum x-axis value. Data below the minimum x is ignored.

`X-max` — **Maximum x**
`1` (default) | real number

Specify the maximum *x*-axis value. Data above the maximum *x* is ignored.

Y-min — Minimum y
-1 (default) | real number

Specify the minimum *y*-axis value. Data below the minimum *y* is ignored.

Y-max — Maximum y
1 (default) | real number

Specify the maximum *y*-axis value. Data above the maximum *y* is ignored.

Sample time — Sample time
-1 (default) | positive number

Specify the time interval between samples. To inherit the sample time, set this parameter to -1. For more information, see "Specify Sample Time".

Introduced before R2006a

Zero-Order Hold

Implement zero-order hold sample period
Library: Simulink / Discrete

Description

The Zero-Order Hold block holds its input for the sample period you specify. If the input is a vector, the block holds all elements of the vector for the same sample period.

You specify the time between samples with the **Sample time** parameter. A setting of -1 means the block inherits the **Sample time**.

Tip Do not use the Zero-Order Hold block to create a fast-to-slow transition between blocks operating at different sample rates. Instead, use the Rate Transition block.

Bus Support

The Zero-Order Hold block is a bus-capable block. The input can be a virtual or nonvirtual bus signal. No block-specific restrictions exist. All signals in a nonvirtual bus input to a Zero-Order Hold block must have the same sample time, even if the elements of the associated bus object specify inherited sample times. You can use a Rate Transition block to change the sample time of an individual signal, or of all signals in a bus. See "Specify Bus Signal Sample Times" and "Bus-Capable Blocks" for more information.

You can use an array of buses as an input signal to a Zero-Order Hold block. For details about defining and using an array of buses, see "Combine Buses into an Array of Buses".

Comparison with Similar Blocks

The Memory, Unit Delay, and Zero-Order Hold blocks provide similar functionality but have different capabilities. Also, the purpose of each block is different.

This table shows recommended usage for each block.

Block	Purpose of the Block	Reference Examples
Unit Delay	Implement a delay using a discrete sample time that you specify. The block accepts and outputs signals with a discrete sample time.	• `sldemo_enginewc` (Compression subsystem)
Memory on page 1-1056	Implement a delay by one major integration time step. Ideally, the block accepts continuous (or fixed in minor time step) signals and outputs a signal that is fixed in minor time step.	• `sldemo_bounce` • `sldemo_clutch` (Friction Mode Logic/Lockup FSM subsystem)
Zero-Order Hold	Convert an input signal with a continuous sample time to an output signal with a discrete sample time.	• `sldemo_radar_eml` • `aero_dap3dof`

Each block has the following capabilities.

Capability	Memory	Unit Delay	Zero-Order Hold
Specification of initial condition	Yes	Yes	No, because the block output at time t = 0 must match the input value.
Specification of sample time	No, because the block can only inherit sample time from the driving block or the solver used for the entire model.	Yes	Yes
Support for frame-based signals	No	Yes	Yes
Support for state logging	No	Yes	No

Ports

Input

Port_1 — Input signal
scalar | vector

Input signal that the block holds by one sample period.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Output

Port_1 — Output signal
scalar | vector

Output signal that is the input held by one sample period.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Parameters

Sample time (-1 for inherited) — Discrete interval between sample time hits
`-1` (default) | `scalar`

Specify the time interval between samples. To inherit the sample time, set this parameter to `-1`. See "Specify Sample Time" in the online documentation for more information.

Do not specify a continuous sample time, either `0` or `[0,0]`. This block supports only discrete sample times. When this parameter is `-1`, the inherited sample time must be discrete and not continuous.

Block Characteristics

Data Types	double | single | Boolean | base integer | fixed point | enumerated | bus
Multidimensional Signals	No
Variable-Size Signals	No

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Generated code relies on `memcpy` or `memset` functions (`strong.h`) under certain conditions.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

For information about HDL code generation, see Zero-Order Hold.

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

Fixed-Point Conversion

Convert floating-point algorithms to fixed point using Fixed-Point Designer™.

Introduced before R2006a

Zero-Pole

Model system by zero-pole-gain transfer function
Library: Simulink / Continuous

$$\frac{(s-1)}{s(s+1)}$$
Description

The Zero-Pole block models a system that you define with the zeros, poles, and gain of a Laplace-domain transfer function. This block can model single-input single output (SISO) and single-input multiple-output (SIMO) systems.

Conditions for Using This Block

The Zero-Pole block assumes the following conditions:

- The transfer function has the form

$$H(s) = K\frac{Z(s)}{P(s)} = K\frac{(s-Z(1))(s-Z(2))\dots(s-Z(m))}{(s-P(1))(s-P(2))\dots(s-P(n))},$$

  where Z represents the zeros, P the poles, and K the gain of the transfer function.

- The number of poles must be greater than or equal to the number of zeros.

- If the poles and zeros are complex, they must be complex-conjugate pairs.

- For a multiple-output system, all transfer functions must have the same poles. The zeros can differ in value, but the number of zeros for each transfer function must be the same.

Note You cannot use a Zero-Pole block to model a multiple-output system when the transfer functions have a differing number of zeros or a single zero each. Use multiple Zero-Pole blocks to model such systems.

Modeling a Single-Output System

For a single-output system, the input and the output of the block are scalar time-domain signals. To model this system:

1 Enter a vector for the zeros of the transfer function in the **Zeros** field.

2 Enter a vector for the poles of the transfer function in the **Poles** field.

3 Enter a 1-by-1 vector for the gain of the transfer function in the **Gain** field.

Modeling a Multiple-Output System

For a multiple-output system, the block input is a scalar and the output is a vector, where each element is an output of the system. To model this system:

1 Enter a matrix of zeros in the **Zeros** field.

Each *column* of this matrix contains the zeros of a transfer function that relates the system input to one of the outputs.

2 Enter a vector for the poles common to all transfer functions of the system in the **Poles** field.

3 Enter a vector of gains in the **Gain** field.

Each element is the gain of the corresponding transfer function in **Zeros**.

Each element of the output vector corresponds to a column in **Zeros**.

Transfer Function Display on the Block

The Zero-Pole block displays the transfer function depending on how you specify the zero, pole, and gain parameters.

- If you specify each parameter as an expression or a vector, the block shows the transfer function with the specified zeros, poles, and gain. If you specify a variable in parentheses, the block evaluates the variable.

  For example, if you specify **Zeros** as `[3,2,1]`, **Poles** as `(poles)`, where `poles` is `[7,5,3,1]`, and **Gain** as `gain`, the block looks like this:

- If you specify each parameter as a variable, the block shows the variable name followed by (s) if appropriate.

  For example, if you specify **Zeros** as `zeros`, **Poles** as `poles`, and **Gain** as `gain`, the block looks like this:
$$\frac{gain^*zeros(s)}{poles(s)}$$

Ports

Input

Port_1 — Input signal
scalar

Input signal, specified as a scalar with data type `double`.

Data Types: `double`

Output

Port_1 — Output signal
scalar | vector

System modeled by a zero-pole gain transfer function, provided as a scalar or vector signal with data type `double`.

- When modeling a single-output system, the block outputs a scalar time-domain signal. For more information, see "Modeling a Single-Output System" on page 1-2036.

- When modeling a multiple-output system, the block outputs a vector, where each element is an output of the system. For more information, see "Modeling a Multiple-Output System" on page 1-2036.

Data Types: `double`

Parameters

Zeros — Matrix of zeros
[1] (default) | vector | matrix

Define the matrix of zeros.

- For a single-output system, enter a vector for the zeros of the transfer function.
- For a multiple-output system, enter a matrix. Each *column* of this matrix contains the zeros of a transfer function that relates the system input to one of the outputs.

Programmatic Use
Block Parameter: Zeros
Type: character vector
Value: vector | matrix
Default: '[1]'

Poles — Vector of poles
[0 -1] (default) | vector

Define the vector of poles.

- For a single-output system, enter a vector for the poles of the transfer function.
- For a multiple-output system, enter a vector for the poles common to all transfer functions of the system.

Programmatic Use
Block Parameter: Poles
Type: character vector
Value: vector
Default: '[0 -1]'

Gain — Vector of gains
[1] (default) | vector

Define the vector of gains.

- For a single-output system, enter a 1-by-1 vector for the gain of the transfer function.
- For a multiple-output system, enter a vector of gains. Each element is the gain of the corresponding transfer function in **Zeros**.

Programmatic Use
Block Parameter: `Gain`
Type: character vector
Value: vector
Default: `'[1]'`

Absolute tolerance — Absolute tolerance for computing block states
`auto` (default) | scalar | vector

Absolute tolerance for computing block states, specified as a positive, real-valued, scalar or vector. To inherit the absolute tolerance from the Configuration Parameters, specify `auto` or `-1`.

- If you enter a real scalar, then that value overrides the absolute tolerance in the Configuration Parameters dialog box for computing all block states.

- If you enter a real vector, then the dimension of that vector must match the dimension of the continuous states in the block. These values override the absolute tolerance in the Configuration Parameters dialog box.

- If you enter `auto` or –1, then Simulink uses the absolute tolerance value in the Configuration Parameters dialog box (see "Solver Pane") to compute block states.

Programmatic Use
Block Parameter: `AbsoluteTolerance`
Type: character vector
Values: `'auto'` | `'-1'` | any positive real-valued scalar or vector
Default: `'auto'`

State Name (e.g., 'position') — Assign unique name to each state
`' '` (default) | `'position'` | `{'a', 'b', 'c'}` | a | …

Assign a unique name to each state. If this field is blank (`' '`), no name assignment occurs.

- To assign a name to a single state, enter the name between quotes, for example, `'position'`.

- To assign names to multiple states, enter a comma-delimited list surrounded by braces, for example, `{'a', 'b', 'c'}`. Each name must be unique.

- To assign state names with a variable in the MATLAB workspace, enter the variable without quotes. A variable can be a character vector, cell array, or structure.

Limitations

- The state names apply only to the selected block.

- The number of states must divide evenly among the number of state names.

- You can specify fewer names than states, but you cannot specify more names than states.

  For example, you can specify two names in a system with four states. The first name applies to the first two states and the second name to the last two states.

Programmatic Use
Block Parameter: `ContinuousStateAttributes`
Type: character vector
Values: ' ' | user-defined
Default: ' '

Block Characteristics

Data Types	`double`
Multidimensional Signals	No
Variable-Size Signals	No

Extended Capabilities

C/C++ Code Generation
Generate C and C++ code using Simulink® Coder™.

Not recommended for production-quality code. Relates to resource limits and restrictions on speed and memory often found in embedded systems. The code generated can contain dynamic allocation and freeing of memory, recursion, additional memory overhead, and widely-varying execution times. While the code is functionally valid and generally

acceptable in resource-rich environments, smaller embedded targets often cannot support such code.

In general, consider using the Simulink Model Discretizer to map continuous blocks into discrete equivalents that support production code generation. To start the Model Discretizer, select **Analysis > Control Design > Model Discretizer**. One exception is the Second-Order Integrator block because, for this block, the Model Discretizer produces an approximate discretization.

Introduced before R2006a

Functions — Alphabetical List

add_block

Add block to model

Syntax

```
h = add_block(source,dest)
h = add_block(source,dest,'MakeNameUnique','on')
h = add_block(sourceIn,destIn,'CopyOption','duplicate')
h = ( ___ ,Name,Value)
```

Description

`h = add_block(source,dest)` adds a copy of the block `source` from a library or model to the specified destination model and block name. This syntax creates the block at the same location as it appears in the model or the library model.

If you are copying between models or from a library, load the destination model first.

`h = add_block(source,dest,'MakeNameUnique','on')` ensures that the destination block name is unique in the model. This syntax adds a number to the destination block name if a block with that name exists, incrementing to ensure a unique name.

`h = add_block(sourceIn,destIn,'CopyOption','duplicate')` duplicates an inport block in a subsystem, giving the destination block the same port number as the source block. Duplicate an inport to branch a signal from an input port without creating a port or adding lines. For more information, see "Creating Duplicate Inports" on page 1-800.

`h = ( ___ ,Name,Value)` uses optional `Name,Value` arguments.

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (`' '`). You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

With the `add_block` function, you can use block parameter and value pairs. For a list of all the block parameters, see "Common Block Properties" on page 6-111 and "Block-Specific Parameters" on page 6-130.

Examples

Add Block to Model from a Library

Add the block from the Simulink library to the model `f14`.

Load or open the destination model.

```
open_system('f14');
```

Add the Scope block from the Simulink Sinks library to `f14`, naming the new block `MyScope`.

```
add_block('simulink/Sinks/Scope','f14/MyScope');
```

Add a Block from Another Model

Add a copy of a block from the model `f14` to `vdp`.

Load or open the destination model.

```
open_system('vdp');
```

Add the Actuator Model block from `f14` to `vdp`.

```
add_block('f14/Actuator Model','vdp/Actuator Model');
```

Add a Block Using a Unique Name

Add the block from the Simulink library to the model `vdp`. Because there is already a block named Scope in `vdp`, use the `MakeNameUnique` option to ensure that the new block name is unique.

Load or open the destination model.

```
open_system('vdp');
```

Add the Scope block from the Simulink Sinks library to `vdp`, ensuring that the name is unique.

```
add_block('simulink/Sinks/Scope','vdp/Scope','MakeNameUnique','on')
```

Duplicate an Inport Block in a Subsystem

Add an inport block in the `f14/Controller` subsystem that uses the same port number as another inport in that subsystem.

Duplicate the Stick Input (in) block in the Controller subsystem, naming the copy Stick Input (in)2. The resulting block uses the same port number as Stick Input (in) but does not add an inport on the parent subsystem. The signal that enters that port branches to both inports.

```
add_block('f14/Controller/Stick Input (in)',...
'f14/Controller/Stick Input (in)2','CopyOption','duplicate')
```

Add a Block and Set Parameters

Add a block from a library to a model and set parameters using a `Name,Value` pair.

Load or open the destination model.

```
open_system('vdp');
```

Add a Gain block from the library to `vdp`, and set the `Gain` value to 5.

```
add_block('simulink/Math Operations/Gain','vdp/Five','Gain','5')
```

Input Arguments

source — Block to copy to model
block path name | library block path name

Block to copy to model, specified as:

- The full block path name if you are copying the block from another model, for example, `'vdp/Mu'`. This usage copies the block and its settings.

- The library block path name if you want to add a block from a library, for example, `'simulink/Math Operations/Gain'`.

  To get the library block path name, you can hover over the block in the Library Browser. Alternatively, you can open the library model, select the block, and enter `gcb` at the command line. To open the library model, in the Library Browser, right-click the library name in the library list and select **Open** *library_name* **library**.

You can also use the syntax `'built-in/`*blocktype*`'` as the source block path name, where *blocktype* is the programmatic block name—the value of the `BlockType` parameter (see "Common Block Properties" on page 6-111). However, blocks added using `'built-in/`*blocktype*`'` sometimes have different default parameter values from library blocks.

For subsystems and masked blocks, use the library block path name. Using the `BlockType` value (`SubSystem`) creates an empty subsystem.

Example: `'vdp/Mu'`, `'simulink/Sinks/Scope'`

dest — Name and location of new block
block path name

Name and location of the new block in the model, specified as the block path name.

Example: `'f14/Controller/MyNewBlock'`

sourceIn — Inport block whose port number to copy
block path name

Inport block whose port number to copy, specified as the block path name.

Example: `'f14/Controller/Stick Input (in)'`, `'myModel/mySubsystem/In1'`

destIn — Inport block to create
block path name

Inport block with duplicate port number to create, specified as the block path name. Create the destination block in the same system as the source block.

Example: `'myModel/mySubsystem/DupPortIn'`

Output Arguments

h — New block
handle

New block, returned as a handle.

"Create Annotations Programmatically"

Introduced before R2006a

add_exec_event_listener

Register listener for block method execution event

Syntax

```
h = add_exec_event_listener(blk,event,listener);
```

Description

`h = add_exec_event_listener(blk,event,listener)` registers a listener for a block method execution event where the listener is a MATLAB program that performs some task, such as logging runtime data for a block, when the event occurs (see "Listen for Method Execution Events"). Simulink software invokes the registered listener whenever the specified event occurs during simulation of the model. You cannot register a listener for virtual blocks.

Note Simulink software can register a listener only while a simulation is running. Invoking this function when no simulation is running results in an error message. To ensure that a listener catches all relevant events triggered by a model's simulation, you should register the listener in the model's `StartFcn` callback function (see "Callbacks for Customized Model Behavior").

Input Arguments

`blk`

Specifies the block whose method execution event the listener is intended to handle. May be one of the following:

- Full pathname of a block
- A block handle
- A block runtime object (see "Access Block Data During Simulation".)

event

Specifies the type of event for which the listener listens. It may be any of the following:

Event	Occurs...
`'PreDerivatives'`	Before a block's Derivatives method executes
`'PostDerivatives'`	After a block's Derivatives method executes
`'PreOutputs'`	Before a block's Outputs method executes.
`'PostOutputs'`	After a block's Outputs method executes
`'PreUpdate'`	Before a block's Update method executes
`'PostUpdate'`	After a block's Update method executes

listener

Specifies the listener to be registered. It may be either a character vector specifying a MATLAB expression, e.g., `'disp(''here'')'` or a handle to a MATLAB function that accepts two arguments. The first argument is the block runtime object of the block that triggered the event. The second argument is an instance of `EventData` class that specifies the runtime object and the name of the event that just occurred.

Output Arguments

`add_exec_event_listener` returns a handle to the listener that it registered. To stop listening for an event, use the MATLAB `clear` command to clear the listener handle from the workspace in which the listener was registered.

Introduced before R2006a

add_line

Add line to Simulink model

Syntax

```
h = add_line(sys,out,in)
h = add_line(sys,out,in,'autorouting',autoOption)
h = add_line(sys,points)
```

Description

`h = add_line(sys,out,in)` adds a line in the model or subsystem `sys` that connects one block's output port `out` to another block's input port `in`. This syntax draws the most direct route from port to port, for example, diagonal lines or lines that go through other blocks.

You can connect ports when:

- The input port does not already have a connection.
- The blocks are compatible for connecting.

`h = add_line(sys,out,in,'autorouting',autoOption)` connects blocks, specifying whether to route the lines around other blocks.

`h = add_line(sys,points)` adds a line drawn by (x,y) coordinate `points` relative to the upper-left corner of the Simulink Editor canvas before any canvas resizing. If either end of the line is within five pixels of a corresponding port, the function connects the line to it. The line can have multiple segments.

Examples

Connect Blocks Using Port Numbers

Use the block port numbers to add a line to connect blocks.

Create a model and open it.

```
open_system(new_system('connect_model'));
```

Add and position a Constant block and a Gain block.

```
add_block('simulink/Commonly Used Blocks/Constant','connect_model/Constant');
set_param('connect_model/Constant','position',[140,80,180,120]);
add_block('simulink/Commonly Used Blocks/Gain','connect_model/Gain');
set_param('connect_model/Gain','position',[220,80,260,120]);
```

Connect the blocks. Each block has one port, so specify port 1.

```
add_line('connect_model','Constant/1','Gain/1');
```

Connect Blocks Using Port Handles

Get the port handles and connect the ports using `add_line`.

Open the model `vdp`.

```
open_system('vdp');
```

Delete the line that connects the Mu gain block to the Sum block.

```
delete_line('vdp','Mu/1','Sum/2');
```

Get the port handles from the Mu block and the Sum block.

```
h = get_param('vdp/Mu','PortHandles');
h1 = get_param('vdp/Sum','PortHandles');
```

Look at the h1 structure. Notice the two handles for the Inport property.

```
h1

h1 =

  struct with fields:

     Inport: [47.0002 54.0002]
    Outport: 39.0002
     Enable: []
    Trigger: []
      State: []
```

```
      LConn: []
      RConn: []
    Ifaction: []
      Reset: []
```

Index into the Outport and Inport properties on the port handles to get the handles you want and connect them. Connect to the second inport.

```
add_line('vdp',h.Outport(1),h1.Inport(2));
```

Add a Branched Line

You can branch a line by adding a connection programmatically. You can use the `points` syntax to draw the segment, or you can draw the line by specifying the ports to connect. When using the port, use automatic line routing to improve the look of the branched line.

Add a scope to the `vdp` model above the outport.

```
vdp
add_block('simulink/Commonly Used Blocks/Scope','vdp/Scope1');
set_param('vdp/Scope1','position',[470,70,500,110]);
```

Connect the Integrator block x1 to Scope1. This code branches the existing line from the x1 output and connects it to the scope. With autorouting on, the resulting line is segmented.

```
add_line('vdp','x1/1','Scope1/1','autorouting','on')
```

Connect Blocks Using Points

You can use points on the canvas as the start and end of each segment. Get the port locations using `get_param` with the `'PortConnectivity'` option.

Open the model `vdp` and delete the line that connects the Mu and Sum blocks.

```
vdp
delete_line('vdp','Mu/1','Sum/2')
```

Get the port locations for Mu. Mu has two ports. The first is the input port, and the second is the output port.

```
mu = get_param('vdp/Mu','PortConnectivity');
mu.Position
```

```
ans =

   190   150
```

```
ans =

   225   150
```

Get the port locations for Sum, which has three ports. The second position is the lower input port.

```
s = get_param('vdp/Sum','PortConnectivity');
s.Position
```

```
ans =

   250   135
```

```
ans =

   250   150
```

```
ans =

   285   145
```

Connect the ports using the output and input points.

```
add_line('vdp',[225 150; 250 150])
```

Connect Blocks Using Autorouting Options

This example shows the effect of adding lines with and without autorouting options.

Create a model route. Display default block names.

```
open_system(new_system('route'));
set_param('route','HideAutomaticNames','off')
```

Add blocks as shown. Add an inport and outport to each subsystem.

Add lines to connect the outputs from Subsystem to the inputs of Subsystem1.

```
add_line('route',{'Subsystem/1','Subsystem/2'},...
    {'Subsystem1/1','Subsystem1/2'})
```

Because you did not use the autorouting options, the function draws straight lines, which pass through the Gain block.
Delete the lines. Add lines again, this time using the autorouting option set to `'on'`.

```
add_line('route',{'Subsystem/1','Subsystem/2'},...
    {'Subsystem1/1','Subsystem1/2'},'autorouting','on')
```

The lines route around the Gain block.
Delete the lines. Add lines again, using the `smart` autorouting option. When you use an array to connect two sets of inports and outports, `'smart'` autorouting routes them together if doing so makes better use of the space.

```
add_line('route',{'Subsystem/1','Subsystem/2'},...
    {'Subsystem1/1','Subsystem1/2'},'autorouting','smart')
```

Input Arguments

`sys` — Model or subsystem to add line to
character vector

Model or subsystem to add the line to, specified as character vector.

Example: `'vdp'` , `'f14/Controller'`

`out` — Block output port to connect line from
block/port name or number character vector | port handle | array of port designators

Block output port to connect line from, specified as:

- The block name, a slash, and the port name or number. Most block ports are numbered from top to bottom or from left to right. For a state port, use the port name State instead of a port number.

- The port handle that you want to connect from.

- An array of either of these port designators.

Use `'PortHandles'` with `get_param` to get the handles.

Example: `'Mu/1'`, `'Subsystem/2'`, `h.Outport(1){'Subsystem/1','Subsystem/2'}`

in — Block input port to connect line to
block/port name or number character vector | port handle | array of port designators

Block input port to connect line to, specified as:

- The block name, a slash, and the port name or number. The port name on:

  - An enabled subsystem is Enable.
  - A triggered subsystem is Trigger.
  - If Action and Switch Case Action subsystems is Action.
- The port handle that you want to add the line to.
- An array of either of these port designators.

Use the `'PortHandles'` option with `get_param` to get handles.

Example: `'Mu/1'`, `'Subsystem/2'`, `h.Inport(1)`, `{'Subsystem/1','Subsystem/2'}`

autoOption — Type of automatic line routing
`'off'` (default) | `'on'` | `'smart'`

Type of automatic line routing around other blocks, specified as:

- `'off'` for no automatic line routing
- `'on'` for automatic line routing
- `'smart'` for automatic line routing that takes the best advantage of the blank spaces on the canvas and avoids overlapping other lines and labels

points — Points of the line to draw
matrix

Points of the line to draw, specified as at least a 2-by-2 matrix. Add a row for every segment you want to draw. Specify points as (x,y) coordinates from the upper-left corner of the Editor before any canvas resizing.

Example: `[100 300; 200 300; 200 300; 200 500]`

Output Arguments

h — Line
handle

Line created by `add_line`, returned as a handle.

"Create a Triggered Subsystem"

Introduced before R2006a

add_param

Add parameter to Simulink system

Syntax

```
add_param('sys','parameter1',value1,'parameter2',value2,...)
```

Description

The `add_param` command adds the specified parameters to the specified system and initializes the parameters to the specified values. Case is ignored for parameter names. Value character vectors are case sensitive. The value of the parameter must be a character vector. Once the parameter is added to a system, `set_param` and `get_param` can be used on the new parameters as if they were standard Simulink parameters. Simulink software saves these new parameters with the model file.

Note If you attempt to add a parameter that has the same name as an existing parameter of the system, Simulink software displays an error.

Examples

This command

```
add_param('vdp','DemoName','VanDerPolEquation','EquationOrder','2')
```

adds the parameters `DemoName` and `EquationOrder` with `'VanDerPolEquation'` and `'2'` to the `vdp` system. Afterward, you can use the following command to retrieve the value of the `DemoName` parameter.

```
get_param('vdp','DemoName')
```

Introduced before R2006a

addFile

Add file to Simulink Project

Syntax

addFile(proj,fileorfolder)

Description

addFile(proj,fileorfolder) adds a file to the project `proj`.

Examples

Add Files to a Project

Open the airframe project and create a project object.

```
sldemo_slproject_airframe
proj = simulinkproject;
```

Remove a file.

```
removeFile(proj,'models/AnalogControl.mdl')
```

Add the file back to the project.

```
addFile(proj,'models/AnalogControl.mdl');
```

Create and save a new model.

```
new_system('mymodel');
save_system('mymodel');
```

Add the new file to the project and return a project file object.

```
newPrjFile = addFile(proj,'mymodel.slx');
```

Use the project file object to manipulate the file, for example, adding a label.

```
addLabel(newPrjFile, 'Classification', 'Design')
```

Input Arguments

`proj` — Project
project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

`fileorfolder` — Path of file or folder
character vector | cell array of character vectors | string array

Path of the file or folder to add relative to the project root folder, specified as a character vector, string, or array. Files must include the file extension. The file or folder must be within the root folder.

Example: 'models/myModelName.slx'

Functions
addFolderIncludingChildFiles | removeFile | simulinkproject

Introduced in R2013a

addFolderIncludingChildFiles

Add folder and child files to Simulink Project

Syntax

```
addFolderIncludingChildFiles(proj,folder)
```

Description

addFolderIncludingChildFiles(proj,folder) adds a folder and all child files to the project proj.

Examples

Add Folders to a Project

Open the airframe project and create a project object.

```
sldemo_slproject_airframe
proj = simulinkproject;
```

Create a new folder in the project folder.

```
new_folder_path = fullfile(proj.RootFolder, 'new_folder')
mkdir(new_folder_path);
```

Create a new folder in the previous folder.

```
new_sub_folder_path = fullfile(new_folder_path, 'new_sub_folder')
mkdir(new_sub_folder_path);
```

Create a new file in the folder.

```
filepath = fullfile(new_sub_folder_path, 'new_model_in_subfolder.slx')
new_system('new_model_in_subfolder');
save_system('new_model_in_subfolder', filepath)
```

Add this new folder and child files to the project.

```
projectFile = addFolderIncludingChildFiles(proj, new_folder_path)
```

Input Arguments

`proj` — Project
project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

`folder` — Path of folder
character vector | string

Path of the folder to add relative to the project root folder, specified as a character vector or string. The folder must be within the root folder.

Example: 'models'

attachComponent

Attach a component to a configuration set

Syntax

```
attachComponent(cs,component)
```

Description

`attachComponent(cs,component)` attaches a component to a `Simulink.ConfigSet` object.

Examples

Replace Solver Component for Active Configuration Set

Replace the solver component of the active configuration set of one model with the solver component of another model.

Get the active configuration set for `modelB`.

```
hCs = getActiveConfigSet('modelB');
```

Get the 'Solver' component for this configuration set.

```
hSolverConfig = getComponent(hCs,'Solver');
```

Create a copy of the component.

```
hSolverConfig = copy(hSolverConfig);
```

Get the active configuration set for `modelA`.

```
hCs = getActiveConfigSet('modelA');
```

Attach the copy of the 'Solver' component from `modelB` to `modelA`.

```
attachComponent(hCs,hSolverConfig);
```

Input Arguments

cs — Configuration set object
ConfigSet object

A configuration set object that you can attach a component to.

component — Component object
SimulinkConfigComponent object

A component that you can attach to configuration set.

See Also
Simulink.ConfigSet

Topics

Introduced before R2006a

attachConfigSet

Associate configuration set or configuration reference with model

Syntax

```
attachConfigSet(model, configObj)
```

```
attachConfigSet(model, configObj, allowRename)
```

Arguments

model

> The name of an open model, or `gcs` to specify the current model

configObj

> A configuration set (`Simulink.ConfigSet`) or configuration reference
> (`Simulink.ConfigSetRef`)

allowRename

> Boolean that determines how Simulink software handles a name conflict

Description

`attachConfigSet` associates the configuration set or configuration reference
(configuration object) specified by `configObj` with `model`.

You cannot attach a configuration object to a model if the configuration object is already
attached to another model, or has the same name as another configuration object
attached to the same model. The optional Boolean argument `allowRename` determines
how Simulink software handles a name conflict between configuration objects. If
`allowRename` is `false` and the configuration object specified by `configObj` has the
same name as a configuration object already attached to `model`, Simulink software
generates an error. If `allowRename` is `true` and a name conflict occurs, Simulink
software provides a unique name for `configObj` before associating `configObj` with
`model`.

Examples

The following example creates a copy of the current model's active configuration object and attaches it to the model, changing its name if necessary to be unique. The code is the same whether the object is a configuration set or configuration reference.

```
myConfigObj = getActiveConfigSet(gcs);
copiedConfig = myConfigObj.copy;
copiedConfig.Name = 'DevConfig';
attachConfigSet(gcs, copiedConfig, true);
```

See Also

attachConfigSetCopy | closeDialog | detachConfigSet | getActiveConfigSet | getConfigSet | getConfigSets | openDialog | setActiveConfigSet

Topics
"Manage a Configuration Set"
"Manage a Configuration Reference"

Introduced before R2006a

attachConfigSetCopy

Copy configuration set or configuration reference and associate it with model

Syntax

```
myConfigObj = attachConfigSetCopy(model, configObj)
```

```
myConfigObj = attachConfigSetCopy(model, configObj, allowRename)
```

Arguments

`model`

> The name of an open model, or `gcs` to specify the current model

`configObj`

> A configuration set (`Simulink.ConfigSet`) or configuration reference
> (`Simulink.ConfigSetRef`)

`allowRename`

> Boolean that specifies how Simulink software handles a name conflict

Description

`attachConfigSetCopy` copies the configuration set or configuration reference
(configuration object) specified by `configObj` and associates the copy with `model`.
Simulink software returns the copied configuration object as `newConfigObj`.

You cannot attach a configuration object to a model if the configuration object has the
same name as another configuration object attached to the same model. The optional
Boolean argument `allowRename` determines how Simulink software handles a name
conflict between configuration objects. If `allowRename` is `false` and the configuration
object specified by `configObj` has the same name as a configuration object already
attached to `model`, Simulink software generates an error. If `allowRename` is `true` and a
name conflict occurs, Simulink software provides a unique name for the copy of
`configObj` before associating it with `model`.

Examples

The following example creates a copy of ModelA's active configuration object and attaches it to ModelB, changing the name if necessary to be unique. The code is the same whether the object is a configuration set or configuration reference.

```
myConfigObj = getActiveConfigSet('ModelA');
newConfigObj = attachConfigSetCopy('ModelB', myConfigObj, true);
```

addLabel

Attach label to Simulink Project file

Syntax

```
addLabel(file,categoryName,labelName)
addLabel(file,categoryName,labelName,labelData)
```

Description

addLabel(file,categoryName,labelName) attaches the specified label labelName in the category categoryName to the file.

addLabel(file,categoryName,labelName,labelData) attaches the label with data labelData.

Examples

Attach a Label to a Project File

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Get a particular file by name.

```
myfile = findFile(proj,'models/AnalogControl.mdl')

myfile =

  ProjectFile with properties:

      Path: 'C:\Work\temp\slexamples\airframe\models\AnalogControl.mdl'
    Labels: [1x1 slproject.Label]
```

```
   Revision: '2'
SourceControlStatus: Unmodified
```

Get the `Labels` property of the file.

`myfile.Labels`

```
ans =

  Label with properties:

            File: 'C:\Work\temp\slexamples\airframe\models\AnalogControl.mdl'
            Data: []
        DataType: 'none'
            Name: 'Design'
    CategoryName: 'Classification'
```

Attach the label `'Artifact'` to the file.

`addLabel(myfile,'Classification','Artifact')`

```
ans =

  Label with properties:

            File: 'C:\Work\temp\slexamples\airframe\models\AnalogControl.mdl'
            Data: []
        DataType: 'none'
            Name: 'Artifact'
    CategoryName: 'Classification'
```

Index into the Labels property to get the label attached to this file.

`reviewlabel = myfile.Labels(1)`

```
reviewlabel =

  Label with properties:

            File: 'C:\Work\temp\slexamples\airframe\models\AnalogControl.mdl'
            Data: []
        DataType: 'none'
            Name: 'Artifact'
    CategoryName: 'Classification'
```

Detach the new label from the file.

```
removeLabel(myfile,reviewlabel)
```

Attach a Label to a Subset of Files

Attach the `'Classification'` category label `'Utility'` to all files in the project that have the `.m` file extension.

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Get the list of files.

```
files = proj.Files;
```

Loop through each file. If a file has the extension `.m`, attach the label `'Utility'`.

```
for fileIndex = 1:numel(files)
    file = files(fileIndex);
    [~, ~, fileExtension] = fileparts(file.Path);
    if strcmp(fileExtension,'.m')
        addLabel(file,'Classification','Utility');
    end
end
```

In the Simulink Project **Files** view, the **Classification** column displays the label `Utility` for each `.m` file in the `utilities` folder.

Attach a Label and Label Data to a File

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Create a new category `'Review'`.

```
createCategory(proj,'Review','char');
```

For the new category, create a label `'To Review'`.

```
reviewCategory = findCategory(proj,'Review');
createLabel(reviewCategory,'To Review');
```

Get a particular file by name.

```
myfile = findFile(proj,'models/AnalogControl.mdl')
```

```
myfile =

  ProjectFile with properties:

      Path: 'C:\Work\temp\slexamples\airframe\models\AnalogControl.mdl'
    Labels: [1x1 slproject.Label]
 Revision: '2'
SourceControlStatus: Unmodified
```

Attach the label `'To Review'` and a character vector of label data to the file.

```
addLabel(myfile,'Review','To Review','Whole team design review')
```

Index into the Labels property to get the second label attached to this particular file, and see the label data.

```
myfile.Labels(2)
```

```
ans =

  Label with properties:

            File: 'C:\Work\temp\slexamples\airframe\models\AnalogControl.mdl'
            Data: 'Whole team design review'
        DataType: 'char'
            Name: 'To Review'
    CategoryName: 'Review'
```

In the Simulink Project **Files** view, for the `AnalogControl.mdl` file, the **Review** column displays the `To Review` label with label data.

Alternatively, you can set or change label data using the data property.

```
mylabel = myfile.Labels(2);
mylabel.Data = 'Final review';
```

Input Arguments

file — File to attach label to
file object

File to attach the label to, specified as a file object. You can get the file object by examining the project's Files property (`proj.Files`), or use `findFile` to find a file by name. The file must be in the project.

categoryName — Name of category for label
character vector

Name of the category for the label, specified as a character vector.

labelName — Name of label
character vector | label definition object

Name of the label to attach, specified as a character vector or a label definition object returned by the `file.Label` property or `findLabel`. You can specify a new label name that does not already exist in the project.

labelData — Data to attach to label
character vector | numeric

Data to attach to the label, specified as a character vector or numeric. Data type depends on the label definition. Get a label to examine its `DataType` property using `file.Label` or `findLabel`.

bdclose

Close any or all Simulink system windows unconditionally

Syntax

```
bdclose
bdclose('sys')

bdclose('all')
```

Description

`bdclose` with no arguments closes the current system window unconditionally and without confirmation. Any changes made to the system since it was last saved are lost.

`bdclose('sys')` closes the specified system window.

`bdclose('all')` closes all system windows.

Examples

This command closes the `vdp` system.

```
bdclose('vdp')
```

Introduced before R2006a

bdIsDirty

Whether block diagram has unsaved changes

Syntax

```
isDirty = bdIsDirty(bdname)
```

Description

`isDirty = bdIsDirty(bdname)` returns whether or not the loaded block diagram `bdname` has unsaved changes.

Examples

Check Models for Unsaved Changes

Check if models contain unsaved changes using `bdIsDirty`.

Check if a single model is dirty.

```
vdp
bdIsDirty('vdp')

ans =

  logical

   0
```

Check if a cell array of models are dirty.

```
vdp
sf_car
bdIsDirty({'sf_car','vdp'})
```

```
ans =

  1×2 logical array

   0   0
```

* "Manage Shadowed and Dirty Models and Other Project Files"

Input Arguments

bdname — Loaded block diagram name
character vector | cell array of character vectors | double array

Loaded block diagram name, specified as a character vector, a cell array of character vectors, or a double array. All character vectors must be the names of loaded block diagrams. All doubles must be the handles of loaded block diagrams. It is an error to supply an invalid handle, a handle to anything other than a block diagram, a path to a block or subsystem, or a block diagram that is not loaded.

Data Types: `double` | `char` | `cell`

Output Arguments

isDirty — Whether block diagram has unsaved changes
logical scalar | logical array

Whether block diagram has unsaved changes, returned as a logical array with one entry for each block diagram. The logical value is true if the block diagram has been modified in memory since it was loaded or last saved, and false if there are no unsaved changes.

See Also
`bdIsLoaded`

Topics
"Manage Shadowed and Dirty Models and Other Project Files"

Introduced in R2017a

bdIsLibrary

Whether block diagram is a library

Syntax

```
isLibrary = bdIsLibrary(bdnames)
```

Description

`isLibrary = bdIsLibrary(bdnames)` returns whether the loaded block diagrams specified by `bdnames` are libraries.

Examples

Check Whether Block Diagrams Are Libraries

Load some block diagrams and get a handle to one of them.

```
load_system({'sf_car','hydlib','vdp'})
h = get_param('hydlib','Handle');
```

Check whether `sf_car` is a library. The returned value 0 indicates that it is not.

```
bdIsLibrary('sf_car')

ans =
    0
```

Check whether `hydlib` and `vdp` are libraries. The returned value shows that `hydlib` is a library and `vdp` is not.

```
bdIsLibrary({'hydlib','vdp'})

ans =
1    0
```

Using the handle to `hydlib`, check whether `hdlib` is a library. The value returned shows that it is.

```
bdIsLibrary(h)

ans =
1
```

Input Arguments

`bdnames` — Names or handles of loaded block diagrams
character vector | cell array of character vectors | double | array of doubles

Names or handles of loaded block diagrams, specified as a character vector, a cell array of character vectors, a double, or a double array. All character vectors are names of loaded block diagrams. All doubles are handles of loaded block diagrams.

Data Types: `char` | `cell` | `double`

Output Arguments

`isLibrary` — Logical array showing whether block diagrams are libraries
logical scalar | logical array

Logical array showing whether block diagrams are libraries, returned as a logical scalar or array (`1` for a library, `0` otherwise).

See Also
`bdIsLoaded` | `bdroot` | `find_system`

Introduced in R2015a

bdIsLoaded

Whether block diagram is in memory

Syntax

```
isLoaded = bdIsLoaded(bdnames)
```

Description

isLoaded = bdIsLoaded(*bdnames*) returns whether or not a block diagram is in memory. bdnames can be a character vector or a cell array of character vectors. All character vectors must be valid block diagram names. It is an error to supply a path to a block or subsystem.

isLoaded is a logical array with one entry for each block diagram name.

Examples

```
bdIsLoaded('sf_car')
```

returns a logical scalar.

```
bdIsLoaded({'sf_car','vdp'})
```

returns a 1-by-2 logical array.

bdIsDirty | bdIsLibrary | find_system

Introduced in R2008a

bdroot

Top-level model of current system

Syntax

```
model = bdroot
model = bdroot(elements)
```

Description

`model = bdroot` returns the top-level model of the current system. The current system is the currently active Simulink Editor window or the system in which a block is selected.

`model = bdroot(elements)` returns the top-level model of the specified model elements. Before using `bdroot`, make sure the top-level model of each element in `elements` is loaded.

Examples

Get Top-Level Model of Current System

Open the system Controller in the model `f14`.

```
load_system('f14')
open_system('f14/Controller')
```

Get the top-level model of the current system.

```
bdroot

ans =

    'f14'
```

Get Top-Level Model of a System

Open the system Controller in the model `f14`.

```
load_system('f14')
open_system('f14/Controller')
```

Get the top-level model of the current system.

```
bdroot(gcs)

ans =

    'f14'
```

Input Arguments

`elements` — Model elements whose top-level models to return
model name | block path name | handle | cell array of character vectors | string array | numeric array

Model elements whose top-level model to return, specified as the model name, block or system path name, handle, cell array of character vectors or string array of system names, or numeric array of handles.

Tip Use `bdroot` with `gcs`, `gcb`, and `gcbh` to get the top-level model of the current system or block.

Output Arguments

`model` — Top-level model
character vector | cell array | string array

Top-level model, returned as a character vector of the model name. If the input was an array, `model` is returned as an array of the same type as the input.

Introduced before R2006a

dlinmod

Extract discrete-time linear state-space model around operating point

Syntax

argout = dlinmod('*sys*', *Ts*)

argout = dlinmod('*sys*', *Ts*, *x*, *u*)

argout = dlinmod('*sys*', *Ts*, *x*, *u*, *para*, 'v5')

argout = dlinmod('s*ys*', *Ts*, *x*, *u*, *para*, *xpert*, *upert*, 'v5')

Arguments

sys	Name of the Simulink system from which the linear model is extracted.
x, *u*	State (*x*) and the input (*u*) vectors. If specified, they set the operating point at which the linear model is extracted. When a model has model references using the Model block, you must use the Simulink structure format to specify x. To extract the x structure from the model, use the following command: `x = Simulink.BlockDiagram.getInitialState('`*sys*`');` You can then change the operating point values within this structure by editing `x.signals.values`. If the state contains different data types (for example, `'double'` and `'uint8'`), then you cannot use a vector to specify this state. You must use a structure instead. In addition, you can only specify the state as a vector if the state data type is `'double'`.
Ts	Sample time of the discrete-time linearized model

`'v5'`	An optional argument that invokes the perturbation algorithm created prior to MATLAB 5.3. Invoking this optional argument is equivalent to calling `linmodv5`.
para	A three-element vector of optional arguments:

- `para(1)` — Perturbation value of delta, the value used to perform the perturbation of the states and the inputs of the model. This is valid for linearizations using the `'v5'` flag. The default value is 1e-05.

- `para(2)` — Linearization time. For blocks that are functions of time, you can set this parameter with a nonnegative value that gives the time (`t`) at which Simulink evaluates the blocks when linearizing a model. The default value is 0.

- `para(3)` — Set `para(3)=1` to remove extra states associated with blocks that have no path from input to output. The default value is 0.

xpert, *upert*	The perturbation values used to perform the perturbation of all the states and inputs of the model. The default values are

```
xpert = para(1) + 1e-3*para(1)*abs(x)
upert = para(1) + 1e-3*para(1)*abs(u)
```

When a model has model references using the Model block, you must use the Simulink structure format to specify `xpert`. To extract the `xpert` structure, use the following command:

```
xpert = Simulink.BlockDiagram.getInitialState('sys');
```

You can then change the perturbation values within this structure by editing `xpert.signals.values`.

The perturbation input arguments are only available when invoking the perturbation algorithm created prior to MATLAB 5.3, either by calling `linmodv5` or specifying the `'v5'` input argument to `linmod`.

argout	linmod, dlinmod, and linmod2 return state-space representations if you specify the output (left-hand) side of the equation as follows:

- [*A*,*B*,*C*,*D*] = linmod('*sys*', *x*, *u*) obtains the linearized model of *sys* around an operating point with the specified state variables *x* and the input *u*. If you omit *x* and *u*, the default values are zero.

linmod and dlinmod both also return a transfer function and MATLAB data structure representations of the linearized system, depending on how you specify the output (left-hand) side of the equation. Using linmod as an example:

- [num, den] = linmod('*sys*', *x*, *u*) returns the linearized model in transfer function form.
- sys_struc = linmod('*sys*', *x*, *u*) returns a structure that contains the linearized model, including state names, input and output names, and information about the operating point.

Description

dlinmod compute a linear state-space model for a discrete-time system by linearizing each block in a model individually.

linmod obtains linear models from systems of ordinary differential equations described as Simulink models. Inputs and outputs are denoted in Simulink block diagrams using Inport and Outport blocks.

The default algorithm uses preprogrammed analytic block Jacobians for most blocks which should result in more accurate linearization than numerical perturbation of block inputs and states. A list of blocks that have preprogrammed analytic Jacobians is available in the Simulink Control Design documentation along with a discussion of the block-by-block analytic algorithm for linearization.

The default algorithm also allows for special treatment of problematic blocks such as the Transport Delay and the Quantizer. See the mask dialog of these blocks for more information and options.

Discrete-Time System Linearization

The function `dlinmod` can linearize discrete, multirate, and hybrid continuous and discrete systems at any given sampling time. Use the same calling syntax for `dlinmod` as for `linmod`, but insert the sample time at which to perform the linearization as the second argument. For example,

```
[Ad,Bd,Cd,Dd] = dlinmod('sys', Ts, x, u);
```

produces a discrete state-space model at the sampling time `Ts` and the operating point given by the state vector `x` and input vector `u`. To obtain a continuous model approximation of a discrete system, set `Ts` to `0`.

For systems composed of linear, multirate, discrete, and continuous blocks, `dlinmod` produces linear models having identical frequency and time responses (for constant inputs) at the converted sampling time `Ts`, provided that

- `Ts` is an integer multiple of all the sampling times in the system.
- The system is stable.

For systems that do not meet the first condition, in general the linearization is a time-varying system, which cannot be represented with the [*A*,*B*,*C*,*D*] state-space model that `dlinmod` returns.

Computing the eigenvalues of the linearized matrix `Ad` provides an indication of the stability of the system. The system is stable if `Ts>0` and the eigenvalues are within the unit circle, as determined by this statement:

```
all(abs(eig(Ad))) < 1
```

Likewise, the system is stable if `Ts = 0` and the eigenvalues are in the left half plane, as determined by this statement:

```
all(real(eig(Ad))) < 0
```

When the system is unstable and the sample time is not an integer multiple of the other sampling times, `dlinmod` produces `Ad` and `Bd` matrices, which can be complex. The eigenvalues of the `Ad` matrix in this case still, however, provide a good indication of stability.

You can use `dlinmod` to convert the sample times of a system to other values or to convert a linear discrete system to a continuous system or vice versa.

You can find the frequency response of a continuous or discrete system by using the `bode` command.

Notes

By default, the system time is set to zero. For systems that are dependent on time, you can set the variable `para` to a two-element vector, where the second element is used to set the value of `t` at which to obtain the linear model.

The ordering of the states from the nonlinear model to the linear model is maintained. For Simulink systems, a character vector variable that contains the block name associated with each state can be obtained using

```
[sizes,x0,xstring] = sys
```

where `xstring` is a vector of strings whose *i*th row is the block name associated with the `ith` state. Inputs and outputs are numbered sequentially on the diagram.

For single-input multi-output systems, you can convert to transfer function form using the routine `ss2tf` or to zero-pole form using `ss2zp`. You can also convert the linearized models to LTI objects using `ss`. This function produces an LTI object in state-space form that can be further converted to transfer function or zero-pole-gain form using `tf` or `zpk`.

The default algorithms in `linmod` and `dlinmod` handle Transport Delay blocks by replacing the linearization of the blocks with a Pade approximation. For the `'v5'` algorithm, linearization of a model that contains Derivative or Transport Delay blocks can be troublesome. For more information, see "Linearizing Models".

Introduced in R2007a

close_system

Close Simulink system window or block dialog box

Syntax

```
close_system

close_system('sys')

close_system('sys', saveflag)

close_system('sys', 'newname')

close_system('sys', 'newname','ErrorIfShadowed', true)
```

Description

`close_system` with no arguments closes the current system or subsystem window. If the current system is the top-level system and it has been modified, `close_system` returns an error. The current system is defined in the description of the `gcs` command.

`close_system('sys')` closes the specified system, subsystem, or block window.

`close_system('sys')` unloads a model after specifying

• `load_system('sys')`.

`'sys'` can be a character vector (which can be a system, a subsystem, or a full block pathname), a cell array of character vectors, a numeric handle, or an array of numeric handles. This command displays an error if `'sys'` is a MATLAB keyword, `'simulink'`, or more than 63 characters long.

`close_system('sys', saveflag)`, if `saveflag` is 1, saves the specified top-level system to a file with its current name, then closes the specified top-level system window and removes it from memory. If `saveflag` is 0, the system is closed without saving. A single `saveflag` can be supplied, in which case it is applied to all block diagrams. Alternatively, separate `saveflag`s can be supplied for each block diagram, as a numeric array.

close_system('*sys*', '*newname*') saves the specified top-level system to a file with the specified new name, then closes the system.

Additional arguments can be supplied when saving a block diagram. These are exactly the same as for save_system:

- ErrorIfShadowed: true or false (default: false)
- BreakAllLinks: true or false (default: false)
- SaveAsVersion: MATLAB version name (default: current)
- OverwriteIfChangedOnDisk: true or false (default: false)
- SaveModelWorkspace: true or false (default: false)

If you try to specify additional options when you are doing something other than saving a block diagram, they are ignored. You see a warning if you try to save when closing something other than a block diagram (e.g., a subsystem or a Block Properties dialog).

Examples

This command closes the current system.

```
close_system
```

This command closes the vdp system, unless it has been modified, in which case it returns an error.

```
close_system('vdp')
```

This command saves the engine system with its current name, then closes it.

```
close_system('engine', 1)
```

This command saves the mymdl12 system under the new name testsys, then closes it.

```
close_system('mymdl12', 'testsys')
```

This command tries to save the vdp system to a file with the name 'max', but returns an error because 'max' is the name of an existing MATLAB function.

```
close_system('vdp','max','ErrorIfShadowed', true)
```

All three of the following commands save and close mymodel (saved with the same name), and replace links to library blocks with copies of the library blocks in the saved file:

```
close_system('mymodel',1,'BreakAllLinks',true)
close_system('mymodel','mymodel','BreakAllLinks',true)
close_system('mymodel',[],'BreakAllLinks',true)
```

This command closes the dialog box of the Unit Delay block in the Combustion subsystem of the engine system.

```
close_system('engine/Combustion/Unit Delay')
```

Note The close_system command cannot be used in a block or menu callback to close the root-level model. Attempting to close the root-level model in a block or menu callback results in an error and discontinues the callback's execution.

Introduced before R2006a

closeDialog

Close configuration parameters dialog

Syntax

closeDialog(*configObj*)

Arguments

configObj

A configuration set (Simulink.ConfigSet) or configuration reference
(Simulink.ConfigSetRef)

Description

closeDialog closes an open configuration parameters dialog box. If *configObj* is a
configuration set, the function closes the dialog box that displays the configuration set. If
configObj is a configuration reference, the function closes the dialog box that displays
the referenced configuration set, or generates an error if the reference does not specify a
valid configuration set. If the dialog box is already closed, the function does nothing.

Examples

The following example closes a configuration parameters dialog box that shows the
current parameters for the current model. The parameter values derive from the active
configuration set or configuration reference (configuration object). The code is the same
in either case; the only difference is which type of configuration object is currently active.

```
myConfigObj = getActiveConfigSet(gcs);
closeDialog(myConfigObj);
```

Introduced in R2006b

close

Close Simulink Project

Syntax

```
close(proj)
```

Description

`close(proj)` closes the project `proj`.

Examples

Open and Close a Simulink Project

Open a specified project and get a project object to manipulate the project at the command line. For example,

```
proj = simulinkproject('C:/projects/project1/myproject.prj')
```

Close the project.

```
close(proj)
```

Input Arguments

`proj` — Project
project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

See Also

Functions
simulinkproject

Introduced in R2013a

coder.allowpcode

Package: coder

Control code generation from protected MATLAB files

Syntax

```
coder.allowpcode('plain')
```

Description

`coder.allowpcode('plain')` allows you to generate protected MATLAB code (P-code) that you can then compile into optimized MEX functions or embeddable C/C++ code. This function does not obfuscate the generated MEX functions or embeddable C/C++ code.

With this capability, you can distribute algorithms as protected P-files that provide code generation optimizations, providing intellectual property protection for your source MATLAB code.

Call this function in the top-level function before control-flow statements, such as `if`, `while`, `switch`, and function calls.

MATLAB functions can call P-code. When the `.m` and `.p` versions of a file exist in the same folder, the P-file takes precedence.

`coder.allowpcode` is ignored outside of code generation.

Examples

Generate optimized embeddable code from protected MATLAB code:

1   Write an function `p_abs` that returns the absolute value of its input:

```
function out = p_abs(in)   %#codegen
% The directive %#codegen indicates that the function
```

```
% is intended for code generation
coder.allowpcode('plain');
out = abs(in);
```

2 Generate protected P-code. At the MATLAB prompt, enter:

```
pcode p_abs
```

The P-file, `p_abs.p`, appears in the current folder.

3 Generate a MEX function for `p_abs.p`, using the `-args` option to specify the size, class, and complexity of the input parameter (requires a MATLAB Coder license). At the MATLAB prompt, enter:

```
codegen p_abs -args { int32(0) }
```

`codegen` generates a MEX function in the current folder.

4 Generate embeddable C code for `p_abs.p` (requires a MATLAB Coder license). At the MATLAB prompt, enter:

```
codegen p_abs -config:lib -args { int32(0) };
```

`codegen` generates C library code in the `codegen\lib\p_abs` folder.

See Also

codegen | pcode

Introduced in R2011a

coder.ceval

Call external C/C++ function

Syntax

```
coder.ceval(cfun_name)
coder.ceval(cfun_name,cfun_arguments)

coder.ceval('-global',cfun_name)
coder.ceval('-global',cfun_name,cfun_arguments)

cfun_return = coder.ceval( ___ )
```

Description

`coder.ceval(cfun_name)` executes the external C/C++ function specified by `cfun_name`. Define `cfun_name` in an external C/C++ source file or library. Provide the external source, library, and header files to the code generator.

`coder.ceval(cfun_name,cfun_arguments)` executes `cfun_name` with arguments `cfun_arguments`. `cfun_arguments` is a comma-separated list of input arguments in the order that `cfun_name` requires.

By default, `coder.ceval` passes arguments by value to the C/C++ function whenever C/C++ supports passing arguments by value. To make `coder.ceval` pass arguments by reference, use the constructs `coder.ref`, `coder.rref`, and `coder.wref`. If C/C++ does not support passing arguments by value, for example, if the argument is an array, `coder.ceval` passes arguments by reference. If you do not use `coder.ref`, `coder.rref` or `coder.wref`, a copy of the argument can appear in the generated code to enforce MATLAB semantics for arrays.

`coder.ceval('-global',cfun_name)` executes `cfun_name` and indicates that `cfun_name` uses one or more MATLAB global variables. The code generator can then produce code that is consistent with this global variable usage.

`coder.ceval('-global',cfun_name,cfun_arguments)` executes `cfun_name` with arguments `cfun_arguments` and indicates that `cfun_name` uses one or more MATLAB global variables.

`cfun_return = coder.ceval( ___ )` executes `cfun_name` and returns a single scalar value, `cfun_return`, corresponding to the value that the C/C++ function returns in the `return` statement. To be consistent with C/C++, `coder.ceval` can return only a scalar value. It cannot return an array. Use this option with any of the input argument combinations in the previous syntaxes.

Examples

Call External C Function

Call a C function `foo(u)` from a MATLAB function from which you intend to generate C code.

Create a C header file `foo.h` for a function `foo` that takes two input parameters of type `double` and returns a value of type `double`.

```
double foo(double in1, double in2);
```

Write the C function `foo.c`.

```
#include <stdio.h>
#include <stdlib.h>
#include "foo.h"

double foo(double in1, double in2)
{
  return in1 + in2;
}
```

Write a function `callfoo` that calls `foo` by using `coder.ceval`. Provide the source and header files to the code generator in the function.

```
function y = callfoo  %#codegen
y = 0.0;
if coder.target('MATLAB')
    % Executing in MATLAB, call MATLAB equivalent of
    % C function foo
```

```
    y = 10 + 20;
else
    % Executing in generated code, call C function foo
    coder.updateBuildInfo('addSourceFiles','foo.c');
    coder.cinclude('foo.h');
    y = coder.ceval('foo', 10, 20);
end
end
```

Generate C library code for function `callfoo`. The `codegen` function generates C code in the `\codegen\lib\callfoo` subfolder.

```
codegen -config:lib callfoo -report
```

Call a C Library Function

Call a C library function from MATLAB code.

Write a MATLAB function `myabsval`.

```
function y = myabsval(u)
%#codegen
y = abs(u);
```

Generate a C static library for `myabsval`, using the `-args` option to specify the size, type, and complexity of the input parameter.

```
codegen -config:lib myabsval -args {0.0}
```

The `codegen` function creates the library file `myabsval.lib` and header file `myabsval.h` in the folder `\codegen\lib\myabsval`. (The library file extension can change depending on your platform.) It generates the functions `myabsval_initialize` and `myabsval_terminate` in the same folder.

Write a MATLAB function to call the generated C library function using `coder.ceval`.

```
function y = callmyabsval(y)
%#codegen
% Check the target. Do not use coder.ceval if callmyabsval is
% executing in MATLAB
if coder.target('MATLAB')
  % Executing in MATLAB, call function myabsval
  y = myabsval(y);
```

```matlab
else
  % add the required include statements to generated function code
  coder.updateBuildInfo('addIncludePaths','$(START_DIR)/codegen/lib/myabsval');
  coder.cinclude('myabsval_initialize.h');
  coder.cinclude('myabsval.h');
  coder.cinclude('myabsval_terminate.h');

  % Executing in the generated code.
  % Call the initialize function before calling the
  % C function for the first time
  coder.ceval('myabsval_initialize');

  % Call the generated C library function myabsval
  y = coder.ceval('myabsval',y);

  % Call the terminate function after
  % calling the C function for the last time
  coder.ceval('myabsval_terminate');
end
```

Generate the MEX function `callmyabsval_mex`. Provide the generated library file at the command line.

```matlab
codegen -config:mex callmyabsval codegen\lib\myabsval\myabsval.lib -args {-2.75}
```

Rather than providing the library at the command line, you can use `coder.updateBuildInfo` to specify the library within the function. Use this option to preconfigure the build. Add this line to the `else` block:

```matlab
coder.updateBuildInfo('addLinkObjects','myabsval.lib','$(START_DIR)\codegen\lib\myabsva
```

Run the MEX function `callmyabsval_mex` which calls the library function `myabsval`.

```matlab
callmyabsval_mex(-2.75)

ans =

    2.7500
```

Call the MATLAB function `callmyabsval`.

```matlab
callmyabsval(-2.75)

ans =

    2.7500
```

The `callmyabsval` function exhibits the desired behavior for execution in MATLAB and in code generation.

Call C Function That Uses Global Variable

Use the `'-global'` flag when you call a C function that modifies a global variable.

Write a MATLAB function `useGlobal` that calls a C function `addGlobal`. Use the `'-global'` flag to indicate to the code generator that the C function uses a global variable.

```
function y = useGlobal()
global g;
t = g;
% compare execution with/without '-global' flag
coder.ceval('-global','addGlobal');
y = t;
end
```

Create a C header file `addGlobal.h` for the function `addGlobal`.

```
void addGlobal(void);
```

Write the C function `addGlobal` in the file `addGlobal.c`. This function includes the header file `useGlobal_data.h` that the code generator creates when you generate code for the function `useGlobal`. This header file contains the global variable declaration for `g`.

```
#include "addGlobal.h"
#include "useGlobal_data.h"
void addGlobal(void) {
    g++;
}
```

Generate the MEX function for `useGlobal`. To define the input to the code generator, declare the global variable in the workspace.

```
global g;
g = 1;
codegen useGlobal -report addGlobal.h addGlobal.c
y = useGlobal_mex();
```

With the `'-global'` flag, the MEX function produces the result `y = 1`. The `'-global'` flag indicates to the code generator that the C function possibly modifies the global variable. For `useGlobal`, the code generator produces this code:

```
real_T useGlobal(const emlrtStack *sp)
{
  real_T y;
  (void)sp;
  y = g;
  addGlobal();
  return y;
}
```

Without the `'-global'` flag, the MEX function produces `y = 2`. Because there is no indication that the C function modifies `g`, the code generator assumes that `y` and `g` are identical. This C code is generated:

```
real_T useGlobal(const emlrtStack *sp)
{
  (void)sp;
  addGlobal();
  return g;
}
```

Input Arguments

`cfun_name` — C/C++ function name
character vector | string scalar

Name of external C/C++ function to call.

Example: `coder.ceval('foo')`

Data Types: `char` | `string`

`cfun_arguments` — C/C++ function arguments
scalar variable | array | element of an array | structure | structure field | object property

Comma-separated list of input arguments in the order that `cfun_name` requires.

Example: `coder.ceval('foo', 10, 20);`

Example: `coder.ceval('myFunction', coder.ref(x));`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical` | `char` | `struct`
Complex Number Support: Yes

Limitations

- You cannot use `coder.ceval` on functions that you declare extrinsic with `coder.extrinsic`.

- When the LCC compiler creates a library, it adds a leading underscore to the library function names. If the compiler for the library was LCC and your code generation compiler is not LCC, you must add the leading underscore to the function name, for example, `coder.ceval('_mylibfun')`. If the compiler for a library was not LCC, you cannot use LCC to generate code from MATLAB code that calls functions from that library. Those library function names do not have the leading underscore that the LCC compiler requires.

- If a property has a get method, a set method, or validators, or is a System object property with certain attributes, then you cannot pass the property by reference to an external function. See "Passing By Reference Not Supported for Some Properties".

Tips

- For code generation, before calling `coder.ceval`, you must specify the type, size, and complexity data type of return values and output arguments.

- Use `coder.ceval` only in MATLAB for code generation. `coder.ceval` generates an error in uncompiled MATLAB code. To determine if a MATLAB function is executing in MATLAB, use `coder.target`. If the function is executing in MATLAB, call the MATLAB version of the C/C++ function.

Introduced in R2011a

coder.cinclude

Include header file in generated code

Syntax

```
coder.cinclude(headerfile)
coder.cinclude(headerfile,'InAllSourceFiles',allfiles)
```

Description

`coder.cinclude(headerfile)` includes a header file in generated C/C++ source code.

MATLAB Coder generates the include statement in the C/C++ source files that are generated from the MATLAB code that contains the `coder.cinclude` call.

In a Simulink model, when a `coder.cinclude` call appears in a MATLAB Function block, the code generator puts the include statement in the model header file.

`coder.cinclude(headerfile,'InAllSourceFiles',allfiles)` uses the `allfiles` option to determine whether to include the header file in almost all C/C++ source files.

If `allfiles` is `true`, MATLAB Coder generates the include statement in almost all C/C++ source files, except for some utility files. This behavior is the `coder.cinclude` behavior from R2016a and earlier releases. The presence of the include statement in these additional files can increase compile time and make the generated code less readable. Use this option only if your code depends on the legacy behavior. If `allfiles` is `false`, the behavior is the same as the behavior of `coder.cinclude(headerfile)`.

In a MATLAB Function block, `coder.cinclude(headerfile,'InAllSourceFiles', allfiles)` is the same as `coder.cinclude(headerfile)`.

Examples

Include Header File in C/C++ Code Generated by Using the MATLAB Coder codegen Command

Generate code from a MATLAB function that calls an external C function. Use `coder.cinclude` to include the required header file in the generated C code.

In a writable folder, create a subfolder `mycfiles`.

Write a C function `myMult2.c` that doubles its input. Save it in `mycfiles`.

```
#include "myMult2.h"
double myMult2(double u)
{
    return 2 * u;
}
```

Write the header file `myMult2.h`. Save it in `mycfiles`.

```
#if !defined(MYMULT2)
#define MYMULT2
extern double myMult2(double);
#endif
```

Write a MATLAB function, `myfunc`, that includes `myMult2.h` and calls `myMult2` for code generation only.

```
function y = myfunc
%#codegen
y = 21;
if ~coder.target('MATLAB')
    % Running in generated code
    coder.cinclude('myMult2.h');
    y = coder.ceval('myMult2', y);
else
    % Running in MATLAB
    y = y * 2;
end
end
```

Create a code configuration object for a static library. Specify the locations of `myMult2.h` and `myMult2.c`

```
cfg = coder.config('lib');
cfg.CustomInclude = fullfile(pwd,'mycfiles');
cfg.CustomSource = fullfile(pwd,'mycfiles','myMult2.c');
```

Generate the code.

```
codegen -config cfg myfunc -report
```

The file `myfunc.c` contains this statement:

```
#include "myMult2.h"
```

The include statement does not appear in any other file.

Include Header File in C/C++ Code Generated from a MATLAB Function Block in a Simulink Model

Generate code from a MATLAB Function block that calls an external C function. Use `coder.cinclude` to include the required header file in the generated C code.

In a writable folder, create a subfolder `mycfiles`.

Write a C function `myMult2.c` that doubles its input. Save it in `mycfiles`.

```
#include "myMult2.h"
double myMult2(double u)
{
    return 2 * u;
}
```

Write the header file `myMult2.h`. Save it in `mycfiles`.

```
#if !defined(MYMULT2)
#define MYMULT2
extern double myMult2(double);
#endif
```

Create a Simulink model that contains a MATLAB Function block connected to an Outport block.

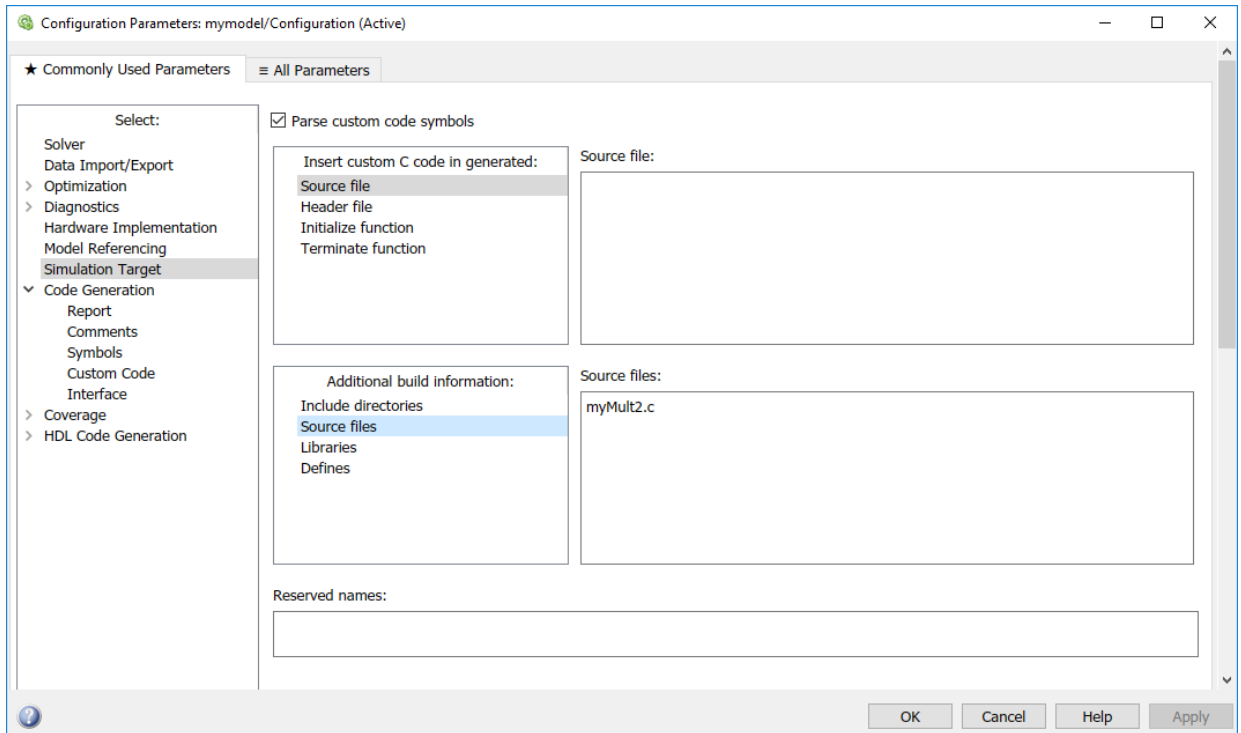
In the MATLAB Function block, add the function `myfunc` that includes `myMult2.h` and calls `myMult2`.

```
function y = myfunc
%#codegen
y = 21;
coder.cinclude('myMult2.h');
y = coder.ceval('myMult2', y);
end
```

Open the Configuration Parameters dialog box.

On the **Solver** pane, select a fixed-step solver.

Specify the locations of `myMult2.h` and `myMult2.c` for simulation and code generation.

- On the **Simulation Target** pane, under **Additional build information**, for **Include directories**, enter `mycfiles`.
- For **Source files**, enter `myMult2.c`.


- On the **Code Generation > Custom Code** pane, select the **Use the same custom code settings as Simulation Target** check box.

Save the model as `mymodel`.

Build the model.

The file `mymodel.h` contains this statement:

```
#include "myMult2.h"
```

Input Arguments

headerfile — Name of header file
character vector | string scalar

Name of a header file specified as a character vector or string scalar. `headerfile` must be a compile-time constant.

Enclose a system header file name in angle brackets `< >`. The generated `#include` statement for a system header file has the format `#include <sysheader>`. A system header file must be in a standard location or on the include path. Specify the include path by using code generation custom code parameters.

Example: `coder.cinclude('<sysheader.h>')`

For a header file that is not a system header file, omit the angle brackets. The generated `#include` statement for a header file that is not a system header file has the format `#include "myHeader"`. The header file must be in the current folder or on the include path. Specify the include path by using code generation custom code parameters.

Example: `coder.cinclude('myheader.h')`

Data Types: `char`

allfiles — All source files option
true | false

Option to include header file in all generated C/C++ source files. If `allfiles` is `true`, MATLAB Coder generates the include statement in almost all of the C/C++ source files, except for some utility files. If `allfiles` is `false`, the behavior is the same as the behavior of `coder.cinclude(headerfile)`.

In a MATLAB Function block, the code generator ignores the all source files option.

Data Types: `logical`

Limitations

- Do not call `coder.cinclude` inside run-time conditional constructs such as `if` statements, `switch` statements, `while`-loops, and `for`-loops. You can call `coder.cinclude` inside compile-time conditional statements, such as `coder.target`. For example:

```
...
 if ~coder.target('MATLAB')
   coder.cinclude('foo.h');
   coder.ceval('foo');
```

```
end
...
```

Tips

- Before a `coder.ceval` call, call `coder.cinclude` to include the header file required by the external function that `coder.ceval` calls.

- Extraneous include statements in generated C/C++ code can increase compile time and reduce code readability. To avoid extraneous include statements in code generated by MATLAB Coder, follow these best practices:

  - Place a `coder.cinclude` call as close as possible to the `coder.ceval` call that requires the header file.
  - Do not set `allfiles` to `true`.

  For the MATLAB Function block, the code generator generates the include statement in the model header file.

- In R2016a and earlier releases, for any `coder.cinclude` call, MATLAB Coder included the header file in almost all generated C/C++ source files, except for some utility files. If you have code that depends on this legacy behavior, you can preserve the legacy behavior by using this syntax:

  ```
  coder.cinclude(headerfile,'InAllSourceFiles',true)
  ```

"Model Configuration Parameters: Code Generation Custom Code" (Simulink Coder)

Introduced in R2013a

coder.const

Fold expressions into constants in generated code

Syntax

```
out = coder.const(expression)
[out1,...,outN] = coder.const(handle,arg1,...,argN)
```

Description

`out = coder.const(expression)` evaluates `expression` and replaces `out` with the result of the evaluation in generated code.

`[out1,...,outN] = coder.const(handle,arg1,...,argN)` evaluates the multi-output function having handle `handle`. It then replaces `out1,...,outN` with the results of the evaluation in the generated code.

Examples

Specify Constants in Generated Code

This example shows how to specify constants in generated code using `coder.const`.

Write a function `AddShift` that takes an input `Shift` and adds it to the elements of a vector. The vector consists of the square of the first 10 natural numbers. `AddShift` generates this vector.

```
function y = AddShift(Shift) %#codegen
y = (1:10).^2+Shift;
```

Generate code for `AddShift` using the `codegen` command. Open the Code Generation Report.

```
codegen -config:lib -launchreport AddShift -args 0
```

The code generator produces code for creating the vector. It adds `Shift` to each element of the vector during vector creation. The definition of `AddShift` in generated code looks as follows:

```
void AddShift(double Shift, double y[10])
{
  int k;
  for (k = 0; k < 10; k++) {
    y[k] = (double)((1 + k) * (1 + k)) + Shift;
  }
}
```

Replace the statement

```
y = (1:10).^2+Shift;
```

with

```
y = coder.const((1:10).^2)+Shift;
```

Generate code for `AddShift` using the `codegen` command. Open the Code Generation Report.

```
codegen -config:lib -launchreport AddShift -args 0
```

The code generator creates the vector containing the squares of the first 10 natural numbers. In the generated code, it adds `Shift` to each element of this vector. The definition of `AddShift` in generated code looks as follows:

```
void AddShift(double Shift, double y[10])
{
  int i0;
  static const signed char iv0[10] = { 1, 4, 9, 16, 25, 36,
                                  49, 64, 81, 100 };

  for (i0 = 0; i0 < 10; i0++) {
    y[i0] = (double)iv0[i0] + Shift;
  }
}
```

Create Lookup Table in Generated Code

This example shows how to fold a user-written function into a constant in generated code.

Write a function `getsine` that takes an input `index` and returns the element referred to by `index` from a lookup table of sines. The function `getsine` creates the lookup table using another function `gettable`.

```matlab
function y = getsine(index) %#codegen
  assert(isa(index, 'int32'));
  persistent tbl;
  if isempty(tbl)
          tbl = gettable(1024);
  end
  y = tbl(index);

function y = gettable(n)
      y = zeros(1,n);
      for i = 1:n
         y(i) = sin((i-1)/(2*pi*n));
      end
```

Generate code for `getsine` using an argument of type `int32`. Open the Code Generation Report.

```matlab
codegen -config:lib -launchreport getsine -args int32(0)
```

The generated code contains instructions for creating the lookup table.

Replace the statement:

```matlab
tbl = gettable(1024);
```

with:

```matlab
tbl = coder.const(gettable(1024));
```

Generate code for `getsine` using an argument of type `int32`. Open the Code Generation Report.

The generated code contains the lookup table itself. `coder.const` forces the expression `gettable(1024)` to be evaluated during code generation. The generated code does not contain instructions for the evaluation. The generated code contains the result of the evaluation itself.

Specify Constants in Generated Code Using Multi-Output Function

This example shows how to specify constants in generated code using a multi-output function in a `coder.const` statement.

Write a function `MultiplyConst` that takes an input `factor` and multiplies every element of two vectors `vec1` and `vec2` with `factor`. The function generates `vec1` and `vec2` using another function `EvalConsts`.

```matlab
function [y1,y2] = MultiplyConst(factor) %#codegen
  [vec1,vec2]=EvalConsts(pi.*(1./2.^(1:10)),2);
  y1=vec1.*factor;
  y2=vec2.*factor;

function [f1,f2]=EvalConsts(z,n)
  f1=z.^(2*n)/factorial(2*n);
  f2=z.^(2*n+1)/factorial(2*n+1);
```

Generate code for `MultiplyConst` using the `codegen` command. Open the Code Generation Report.

```matlab
codegen -config:lib -launchreport MultiplyConst -args 0
```

The code generator produces code for creating the vectors.

Replace the statement

```matlab
[vec1,vec2]=EvalConsts(pi.*(1./2.^(1:10)),2);
```

with

```matlab
[vec1,vec2]=coder.const(@EvalConsts,pi.*(1./2.^(1:10)),2);
```

Generate code for `MultiplyConst` using the `codegen` command. Open the Code Generation Report.

```matlab
codegen -config:lib -launchreport MultiplyConst -args 0
```

The code generator does not generate code for creating the vectors. Instead, it calculates the vectors and specifies the calculated vectors in generated code.

Read Constants by Processing XML File

This example shows how to call an extrinsic function using `coder.const`.

Write an XML file `MyParams.xml` containing the following statements:

```
<params>
    <param name="hello" value="17"/>
    <param name="world" value="42"/>
</params>
```

Save `MyParams.xml` in the current folder.

Write a MATLAB function `xml2struct` that reads an XML file. The function identifies the XML tag `param` inside another tag `params`.

After identifying `param`, the function assigns the value of its attribute `name` to the field name of a structure `s`. The function also assigns the value of attribute `value` to the value of the field.

```matlab
function s = xml2struct(file)

s = struct();
doc = xmlread(file);
els = doc.getElementsByTagName('params');
for i = 0:els.getLength-1
    it = els.item(i);
    ps = it.getElementsByTagName('param');
    for j = 0:ps.getLength-1
        param = ps.item(j);
        paramName = char(param.getAttribute('name'));
        paramValue = char(param.getAttribute('value'));
        paramValue = evalin('base', paramValue);
        s.(paramName) = paramValue;
    end
end
```

Save `xml2struct` in the current folder.

Write a MATLAB function `MyFunc` that reads the XML file `MyParams.xml` into a structure `s` using the function `xml2struct`. Declare `xml2struct` as extrinsic using `coder.extrinsic` and call it in a `coder.const` statement.

```matlab
function y = MyFunc(u) %#codegen
  assert(isa(u, 'double'));
```

```
coder.extrinsic('xml2struct');
s = coder.const(xml2struct('MyParams.xml'));
y = s.hello + s.world + u;
```

Generate code for `MyFunc` using the `codegen` command. Open the Code Generation Report.

```
codegen -config:dll -launchreport MyFunc -args 0
```

The code generator executes the call to `xml2struct` during code generation. It replaces the structure fields `s.hello` and `s.world` with the values 17 and 42 in generated code.

Input Arguments

expression — MATLAB expression or user-written function
expression with constants | single-output function with constant arguments

MATLAB expression or user-defined single-output function.

The expression must have compile-time constants only. The function must take constant arguments only. For instance, the following code leads to a code generation error, because `x` is not a compile-time constant.

```
function y=func(x)
   y=coder.const(log10(x));
```

To fix the error, assign `x` to a constant in the MATLAB code. Alternatively, during code generation, you can use `coder.Constant` to define input type as follows:

```
codegen -config:lib func -args coder.Constant(10)
```

Example: `2*pi`, `factorial(10)`

handle — Function handle
function handle

Handle to built-in or user-written function.

Example: `@log`, `@sin`

Data Types: `function_handle`

`arg1,...,argN` — Arguments to the function with handle `handle`
function arguments that are constants

Arguments to the function with handle `handle`.

The arguments must be compile-time constants. For instance, the following code leads to a code generation error, because x and y are not compile-time constants.

```
function y=func(x,y)
    y=coder.const(@nchoosek,x,y);
```

To fix the error, assign x and y to constants in the MATLAB code. Alternatively, during code generation, you can use `coder.Constant` to define input type as follows:

```
codegen -config:lib func -args {coder.Constant(10),coder.Constant(2)}
```

Output Arguments

`out` — Value of expression
value of the evaluated expression

Value of `expression`. In the generated code, MATLAB Coder replaces occurrences of `out` with the value of `expression`.

`out1,...,outN` — Outputs of the function with handle `handle`
values of the outputs of the function with handle `handle`

Outputs of the function with handle `handle`.MATLAB Coder evaluates the function and replaces occurrences of `out1,...,outN` with constants in the generated code.

Tips

- When possible, the code generator constant-folds expressions automatically. Typically, automatic constant-folding occurs for expressions with scalars only. Use `coder.const` when the code generator does not constant-fold expressions on its own.

- When constant-folding computationally intensive function calls, to reduce code generation time, make the function call extrinsic. The extrinsic function call causes evaluation of the function call by MATLAB instead of by the code generator. For example:

```
function j = fcn(z)
zTable = coder.const(0:0.01:100);
jTable = coder.const(feval('besselj',3,zTable));
j = interp1(zTable,jTable,z);
end
```

See "Use coder.const with Extrinsic Function Calls" (MATLAB Coder).

- If `coder.const` is unable to constant-fold a function call, try to force constant-folding by making the function call extrinsic. The extrinsic function call causes evaluation of the function call by MATLAB instead of by the code generator. For example:

```
function yi = fcn(xi)
y = coder.const(feval('rand',1,100));
yi = interp1(y,xi);
end
```

See "Use coder.const with Extrinsic Function Calls" (MATLAB Coder).

Introduced in R2013b

coder.cstructname

Package: coder

Name C structure type in generated code

`coder.cstructname` names the generated or externally defined C structure type to use for MATLAB variables that are represented as structures in generated code.

Syntax

```
coder.cstructname(var,structName)
coder.cstructname(var,structName,'extern','HeaderFile',headerfile)
coder.cstructname(var,structName,'extern','HeaderFile',
headerfile,'Alignment',alignment)

outtype = coder.cstructname(intype,structName)
outtype = coder.cstructname(intype,structName,'extern','HeaderFile',
headerfile)
outtype = coder.cstructname(inptype,
structName,'extern','HeaderFile',headerfile,'Alignment',alignment)
```

Description

`coder.cstructname(var,structName)` names the C structure type generated for the MATLAB variable `var`. The input `var` can be a structure or a cell array. Use this syntax in a function from which you generate code. Place `coder.cstructname` after the definition of `var` and before the first use of `var`. If `var` is an entry-point (top-level) function input argument, place `coder.cstructname` at the beginning of the function, before any control flow statements.

`coder.cstructname(var,structName,'extern','HeaderFile',headerfile)` specifies that the C structure type to use for `var` has the name `structName` and is defined in the external file, `headerfileName`.

It is possible to use the `'extern'` option without specifying the header file. However, it is a best practice to specify the header file so that the code generator produces the `#include` statement in the correct location.

`coder.cstructname(var,structName,'extern','HeaderFile',` `headerfile,'Alignment',alignment)` also specifies the run-time memory alignment for the externally defined structure type `structName`. If you have Embedded Coder and use custom Code Replacement Libraries (CRLs), specify the alignment so that the code generator can match CRL functions that require alignment for structures. See "Data Alignment for Code Replacement" (Embedded Coder).

`outtype = coder.cstructname(intype,structName)` returns a structure or cell array type object `outtype` that specifies the name of the C structure type to generate. `coder.cstructname` creates `outtype` with the properties of the input type `intype`. Then, it sets the `TypeName` property to `structName`. Use this syntax to create a type object that you use with the `codegen -args` option. You cannot use this syntax in a function from which you generate code.

You cannot use this syntax in a MATLAB Function block.

`outtype = coder.cstructname(intype,structName,'extern','HeaderFile',` `headerfile)` returns a type object `outtype` that specifies the name and location of an externally defined C structure type. The code generator uses the externally defined structure type for variables with type `outtype`.

You cannot use this syntax in a MATLAB Function block.

`outtype = coder.cstructname(inptype,` `structName,'extern','HeaderFile',headerfile,'Alignment',alignment)` creates a type object `outtype` that also specifies the C structure type alignment.

You cannot use this syntax in a MATLAB Function block.

Examples

Name the C Structure Type for a Variable in a Function

In a MATLAB function, `myfun`, assign the name `MyStruct` to the generated C structure type for the variable `v`.

```matlab
function y = myfun()
%#codegen
v = struct('a',1,'b',2);
coder.cstructname(v, 'myStruct');
y = v;
end
```

Generate standalone C code. For example, generate a static library.

```
codegen -config:lib myfun -report
```

To see the generated structure type, open `codegen/lib/myfun/myfun_types.h` or view `myfun_types.h` in the code generation report. The generated C structure type is:

```c
typedef struct {
  double a;
  double b;
} myStruct;
```

Name the C Structure Type Generated for a Substructure

In a MATLAB function, `myfun1`, assign the name `MyStruct` to the generated C structure type for the structure `v`. Assign the name `mysubStruct` to the structure type generated for the substructure `v.b`.

```matlab
function y = myfun()
%#codegen
v = struct('a',1,'b',struct('f',3));
coder.cstructname(v, 'myStruct');
coder.cstructname(v.b, 'mysubStruct');
y = v;
end
```

The generated C structure type `mysubStruct` is:

```c
typedef struct {
  double f;
} mysubStruct;
```

The generated C structure type `myStruct` is:

```c
typedef struct {
  double a;
```

```
    mysubStruct b;
} myStruct;
```

Name the Structure Type Generated for a Cell Array

In a MATLAB function, `myfun2`, assign the name `myStruct` to the generated C structure type for the cell array `c`.

```
function z = myfun2()
c = {1 2 3};
coder.cstructname(c,'myStruct')
z = c;
```

The generated C structure type for `c` is:

```
typedef struct {
  double f1;
  double f2;
  double f3;
} myStruct;
```

Name an Externally Defined C Structure Type

Specify that a structure passed to a C function has a structure type defined in a C header file.

Create a C header file `mycadd.h` for the function `mycadd` that takes a parameter of type `mycstruct`. Define the type `mycstruct` in the header file.

```
#ifndef MYCADD_H
#define MYCADD_H

typedef struct {
    double f1;
    double f2;
} mycstruct;

double mycadd(mycstruct *s);
#endif
```

Write the C function `mycadd.c`.

```
#include <stdio.h>
#include <stdlib.h>

#include "mycadd.h"

double mycadd(mycstruct *s)
{
  return  s->f1 + s->f2;
}
```

Write a MATLAB function `mymAdd` that passes a structure by reference to `mycadd`. Use `coder.cstructname` to specify that in the generated code, the structure has the C type `mycstruct`, which is defined in `mycadd.h`.

```matlab
function y = mymAdd
%#codegen
s = struct('f1', 1, 'f2', 2);
coder.cstructname(s, 'mycstruct', 'extern', 'HeaderFile', 'mycadd.h');
y = 0;
y = coder.ceval('mycadd', coder.ref(s));
```

Generate a C static library for function `mymAdd`.

```
codegen -config:lib mymAdd mycadd.c
```

The generated header file `mymadd_types.h` does not contain a definition of the structure `mycstruct` because `mycstruct` is an external type.

Create a Structure Type Object That Names the Generated C Structure Type

Suppose that the entry-point function `myFunction` takes a structure argument. To specify the type of the input argument at the command line:

1   Define an example structure `S`.

2   Create a type `T` from `S` by using `coder.typeof`.

3   Use `coder.cstructname` to create a type `T1` that:

   • Has the properties of `T`.

   • Names the generated C structure type `myStruct`.

4   Pass the type to `codegen` by using the `-args` option.

For example:

```
S = struct('a',double(0),'b',single(0));
T = coder.typeof(S);
T1 = coder.cstructname(T,'myStruct');
codegen -config:lib myFunction -args T1
```

Alternatively, you can create the structure type directly from the example structure.

```
S = struct('a',double(0),'b',single(0));
T1 = coder.cstructname(S,'myStruct');
codegen -config:lib myFunction -args T1
```

Input Arguments

`var` — MATLAB structure or cell array variable
structure | cell array

MATLAB structure or cell array variable that is represented as a structure in the generated code.

`structName` — Name of C structure type
character vector | string scalar

Name of generated or externally defined C structure type, specified as a character vector or string scalar.

`headerfile` — Header file that contains the C structure type definition
character vector | string scalar

Header file that contains the C structure type definition, specified as a character vector or string scalar.

To specify the path to the file:

- Use the `codegen -I` option or the **Additional include directories** parameter on the MATLAB Coder app settings **Custom Code** tab.
- For a MATLAB Function block, on the **Simulation Target** and the **Code Generation > Custom Code** panes, under **Additional build information**, set the **Include directories** parameter.

Alternatively, use `coder.updateBuildInfo` with the `'addIncludePaths'` option.

Example: `'mystruct.h'`

`alignment` — Run-time memory alignment for structure
-1 (default) | power of 2 not greater than 128

Run-time memory alignment for generated or externally defined structure.

`intype` — Type object or variable for creation of new type object
coder.StructType | coder.CellType | structure | cell array

Structure type object, cell array type object, structure variable, or cell array variable from which to create a type object.

Limitations

- You cannot apply `coder.cstructname` directly to a global variable. To name the structure type to use with a global variable, use `coder.cstructname` to create a type object that names the structure type. Then, when you run `codegen`, specify that the global variable has that type. See "Name the C Structure Type to Use With a Global Structure Variable" (MATLAB Coder).

- For cell array inputs, the field names of externally defined structures must be `f1`, `f2`, and so on.

Tips

- For information about how the code generator determines the C/C++ types of structure fields, see "Mapping MATLAB Types to Types in Generated Code" (MATLAB Coder).

- Using `coder.cstructname` on a structure array sets the name of the structure type of the base element, not the name of the array. Therefore, you cannot apply `coder.cstructname` to a structure array element, and then apply it to the array with a different C structure type name. For example, the following code is not allowed. The second `coder.cstructname` attempts to set the name of the base type to `myStructArrayName`, which conflicts with the previously specified name, `myStructName`.

```
% Define scalar structure with field a
myStruct = struct('a', 0);
```

```
coder.cstructname(myStruct,'myStructName');
% Define array of structure with field a
myStructArray = repmat(myStruct,k,n);
coder.cstructname(myStructArray,'myStructArrayName');
```

- Applying `coder.cstructname` to an element of a structure array produces the same result as applying `coder.cstructname` to the entire structure array. If you apply `coder.cstructname` to an element of a structure array, you must refer to the element by using a single subscript. For example, you can use `var(1)`, but not `var(1,1)`. Applying `coder.cstructname` to `var(:)` produces the same result as applying `coder.cstructname` to `var` or `var(n)`.

- Heterogeneous cell arrays are represented as structures in the generated code. Here are considerations for using `coder.cstructname` with cell arrays:

  - In a function from which you generate code, using `coder.cstructname` with a cell array variable makes the cell array heterogeneous. Therefore, if a cell array is an entry-point function input and its type is permanently homogeneous, then you cannot use `coder.cstructname` with the cell array.

  - Using `coder.cstructname` with a homogeneous `coder.CellType` object `intype` makes the returned object heterogeneous. Therefore, you cannot use `coder.cstructname` with a permanently homogeneous `coder.CellType` object. For information about when a cell array is permanently homogeneous, see "Specify Cell Array Inputs at the Command Line" (MATLAB Coder).

  - When used with a `coder.CellType` object, `coder.cstructname` creates a `coder.CellType` object that is permanently heterogeneous.

- These tips apply only to MATLAB Function blocks:

  - MATLAB Function block input and output structures are associated with bus signals. The generated name for the structure type comes from the bus signal name. Do not use `coder.cstructname` to name the structure type for input or output signals. See "Create Structures in MATLAB Function Blocks".

  - The code generator produces structure type names according to identifier naming rules, even if you name the structure type with `coder.cstructname`. If you have Embedded Coder, you can customize the naming rules. See "Construction of Generated Identifiers" (Embedded Coder).

"Code Generation for Cell Arrays"

Introduced in R2011a

coder.extrinsic

Package: coder

Declare extrinsic function or functions

Syntax

```
coder.extrinsic('function_name');

coder.extrinsic('function_name_1', ... , 'function_name_n');

coder.extrinsic('-sync:on', 'function_name');

coder.extrinsic('-sync:on', 'function_name_1', ... ,
'function_name_n');

coder.extrinsic('-sync:off','function_name');

coder.extrinsic('-sync:off', 'function_name_1', ... ,
'function_name_n');
```

Arguments

function_name
function_name_1, ... , *function_name_n*

Declares *function_name* or *function_name_1* through *function_name_n* as extrinsic functions.

–sync:on

function_name or *function_name_1* through *function_name_n*.

Enables synchronization of global data between MATLAB and MEX functions before and after calls to the extrinsic functions, *function_name* or *function_name_1* through *function_name_n*. If only a few extrinsic calls modify global data, turn off synchronization before and after all extrinsic function calls by setting the global synchronization mode to `At MEX-function entry and exit`. Use the *–sync:on*

option to turn on synchronization for only the extrinsic calls that *do* modify global data.

–sync:off

Disables synchronization of global data between MATLAB and MEX functions before and after calls to the extrinsic functions, *function_name* or *function_name_1* through *function_name_n*. If most extrinsic calls modify global data, but a few do not, you can use the *–sync:off* option to turn off synchronization for the extrinsic calls that *do not* modify global data.

Description

`coder.extrinsic` declares extrinsic functions. During simulation, the code generator produces code for the call to an extrinsic function, but does not produce the function's internal code. Therefore, simulation can run only on platforms where MATLAB software is installed. During standalone code generation, MATLAB attempts to determine whether the extrinsic function affects the output of the function in which it is called — for example by returning `mxArrays` to an output variable. Provided that there is no change to the output, MATLAB proceeds with code generation, but excludes the extrinsic function from the generated code. Otherwise, compilation errors occur.

You cannot use `coder.ceval` on functions that you declare extrinsic by using `coder.extrinsic`.

`coder.extrinsic` is ignored outside of code generation.

Limitations

- Extrinsic function calls have some overhead that can affect performance. Input data that is passed in an extrinsic function call must be provided to MATLAB, which requires making a copy of the data. If the function has any output data, this data must be transferred back into the MEX function environment, which also requires a copy.

Tips

- The code generator detects calls to many common visualization functions, such as `plot`, `disp`, and `figure`. The software treats these functions like extrinsic functions, but you do not have to declare them extrinsic using the `coder.extrinsic` function.

- Use the `coder.screener` function to detect which functions you must declare extrinsic. This function opens the code generations readiness tool that detects code generation issues in your MATLAB code.

Examples

The following code declares the MATLAB function `patch` as extrinsic in the MATLAB local function `create_plot`.

```
function c = pythagoras(a,b,color) %#codegen
% Calculates the hypotenuse of a right triangle
%  and displays the triangle as a patch object.

c = sqrt(a^2 + b^2);

create_plot(a, b, color);

function create_plot(a, b, color)

%Declare patch as extrinsic
coder.extrinsic('patch');

x = [0;a;a];
y = [0;0;b];
patch(x, y, color);
axis('equal');
```

By declaring `patch` as extrinsic, you instruct the code generator not to compile or produce code for `patch`. Instead, the code generator dispatches `patch` to MATLAB for execution.

coder.ignoreConst

Prevent use of constant value of expression for function specializations

Syntax

```
coder.ignoreConst(expression)
```

Description

coder.ignoreConst(expression) prevents the code generator from using the constant value of expression to create function specializations on page 2-97. coder.ignoreConst(expression) returns the value of expression.

Examples

Prevent Function Specializations Based on Constant Input Values

Use coder.ignoreConst to prevent function specializations for a function that is called with constant values.

Write the function call_myfn, which calls myfcn.

```
function [x, y] = call_myfcn(n)
%#codegen
x = myfcn(n, 'mode1');
y = myfcn(n, 'mode2');
end

function y = myfcn(n,mode)
coder.inline('never');
if strcmp(mode,'mode1')
    y = n;
else
    y = -n;
```

```
    end
end
```

Generate standalone C code. For example, generate a static library. Enable the code generation report.

```
codegen -config:lib call_myfcn -args {1} -report
```

In the code generation report, you see two function specializations for `call_myfcn`.
The code generator creates `call_myfcn>myfcn>1` for `mode` with a value of `'mode1'`. It creates `call_myfcn>myfcn>2` for `mode` with a value of `'mode2'`.

In the generated C code, you see the specializations `my_fcn` and `b_my_fcn`.

```
static double b_myfcn(double n)
{
  return -n;
}

static double myfcn(double n)
{
  return n;
}
```

To prevent the function specializations, instruct the code generator to ignore that values of the `mode` argument are constant.

```
function [x, y] = call_myfcn(n)
%#codegen
x = myfcn(n, coder.ignoreConst('mode1'));
y = myfcn(n, coder.ignoreConst('mode2'));
end

function y = myfcn(n,mode)
coder.inline('never');
if strcmp(mode,'mode1')
```

```
    y = n;
else
    y = -n;
end
end
```

Generate the C code.

```
codegen -config:lib call_myfcn -args {1} -report
```

In the code generation report, you do not see multiple function specializations.
In the generated C code, you see one function for `my_fcn`.

Input Arguments

expression — Expression whose value is to be treated as a nonconstant
MATLAB expression

Definitions

Function Specialization

Version of a function in which an input type, size, complexity, or value is customized for a particular invocation of the function.

Function specialization produces efficient C code at the expense of code duplication. The code generation report shows all MATLAB function specializations that the code generator creates. However, the specializations might not appear in the generated C/C++ code due to later transformations or optimizations.

Tips

- For some recursive function calls, you can use `coder.ignoreConst` to force run-time recursion. See "Force Code Generator to Use Run-Time Recursion".

- `coder.ignoreConst(expression)` prevents the code generator from using the constant value of `expression` to create function specializations. It does not prevent other uses of the constant value during code generation.

Introduced in R2017a

coder.inline

Package: coder

Control inlining in generated code

Syntax

```
coder.inline('always')
coder.inline('never')
coder.inline('default')
```

Description

coder.inline('always') forces inlining on page 2-100 of the current function in the generated code. Place the coder.inline directive inside the function to which it applies. The code generator does not inline entry-point functions, inline functions into parfor loops, or inline functions called from parfor loops.

coder.inline('never') prevents inlining of the current function in the generated code. Prevent inlining when you want to simplify the mapping between the MATLAB source code and the generated code.

coder.inline('default') uses internal heuristics to determine whether to inline the current function. Usually, the heuristics produce highly optimized code. Use coder.inline only when you need to fine-tune these optimizations.

Examples

- "Prevent Function Inlining" on page 2-99
- "Use coder.inline in Control Flow Statements" on page 2-100

Prevent Function Inlining

In this example, function foo is not inlined in the generated code:

```
function y = foo(x)
  coder.inline('never');
  y = x;
end
```

Use coder.inline in Control Flow Statements

You can use `coder.inline` in control flow code. If the software detects contradictory `coder.inline` directives, the generated code uses the default inlining heuristic and issues a warning.

Suppose that you want to generate code for a division function used by a system with limited memory. To optimize memory use in the generated code, the `inline_division` function manually controls inlining based on whether it performs scalar division or vector division:

```
function y = inline_division(dividend, divisor)

% For scalar division, inlining produces smaller code
% than the function call itself.
if isscalar(dividend) && isscalar(divisor)
    coder.inline('always');
else
% Vector division produces a for-loop.
% Prohibit inlining to reduce code size.
    coder.inline('never');
end

if any(divisor == 0)
    error('Cannot divide by 0');
end

y = dividend / divisor;
```

Definitions

Inlining

Technique that replaces a function call with the contents (body) of that function. Inlining eliminates the overhead of a function call, but can produce larger C/C++ code. Inlining can create opportunities for further optimization of the generated C/C++ code.

Introduced in R2011a

coder.load

Load compile-time constants from MAT-file or ASCII file into caller workspace

Syntax

```
S = coder.load(filename)
S = coder.load(filename,var1,...,varN)
S = coder.load(filename,'-regexp',expr1,...,exprN)
S = coder.load(filename,'-ascii')
S = coder.load(filename,'-mat')
S = coder.load(filename,'-mat',var1,...,varN)
S = coder.load(filename,'-mat','-regexp', expr1,...,exprN)
```

Description

`S = coder.load(filename)` loads compile-time constants from `filename`.

- If `filename` is a MAT-file, then `coder.load` loads variables from the MAT-file into a structure array.
- If `filename` is an ASCII file, then `coder.load` loads data into a double-precision array.

`S = coder.load(filename,var1,...,varN)` loads only the specified variables from the MAT-file `filename`.

`S = coder.load(filename,'-regexp',expr1,...,exprN)` loads only the variables that match the specified regular expressions.

`S = coder.load(filename,'-ascii')` treats `filename` as an ASCII file, regardless of the file extension.

`S = coder.load(filename,'-mat')` treats `filename` as a MAT-file, regardless of the file extension.

`S = coder.load(filename,'-mat',var1,...,varN)` treats `filename` as a MAT-file and loads only the specified variables from the file.

S = coder.load(filename,'-mat','-regexp', expr1,...,exprN) treats
`filename` as a MAT-file and loads only the variables that match the specified regular
expressions.

Examples

Load compile-time constants from MAT-file

Generate code for a function `edgeDetect1` which given a normalized image, returns an
image where the edges are detected with respect to the threshold value. `edgeDetect1`
uses `coder.load` to load the edge detection kernel from a MAT-file at compile time.

Save the Sobel edge-detection kernel in a MAT-file.

```
k = [1 2 1; 0 0 0; -1 -2 -1];
```

```
save sobel.mat k
```

Write the function `edgeDetect1`.

```
function edgeImage = edgeDetect1(originalImage, threshold) %#codegen
assert(all(size(originalImage) <= [1024 1024]));
assert(isa(originalImage, 'double'));
assert(isa(threshold, 'double'));

S = coder.load('sobel.mat','k');
H = conv2(double(originalImage),S.k, 'same');
V = conv2(double(originalImage),S.k','same');
E = sqrt(H.*H + V.*V);
edgeImage = uint8((E > threshold) * 255);
```

Create a code generation configuration object for a static library.

```
cfg = coder.config('lib');
```

Generate a static library for `edgeDetect1`.

```
codegen -report -config cfg edgeDetect1
```

`codegen` generates C code in the `codegen\lib\edgeDetect1` folder.

Load compile-time constants from ASCII file

Generate code for a function `edgeDetect2` which given a normalized image, returns an image where the edges are detected with respect to the threshold value. `edgeDetect2` uses `coder.load` to load the edge detection kernel from an ASCII file at compile time.

Save the Sobel edge-detection kernel in an ASCII file.

```
k = [1 2 1; 0 0 0; -1 -2 -1];
save sobel.dat k -ascii
```

Write the function `edgeDetect2`.

```
function edgeImage = edgeDetect2(originalImage, threshold) %#codegen
assert(all(size(originalImage) <= [1024 1024]));
assert(isa(originalImage, 'double'));
assert(isa(threshold, 'double'));

k = coder.load('sobel.dat');
H = conv2(double(originalImage),k, 'same');
V = conv2(double(originalImage),k','same');
E = sqrt(H.*H + V.*V);
edgeImage = uint8((E > threshold) * 255);
```

Create a code generation configuration object for a static library.

```
cfg = coder.config('lib');
```

Generate a static library for `edgeDetect2`.

```
codegen -report -config cfg edgeDetect2
```

`codegen` generates C code in the `codegen\lib\edgeDetect2` folder.

Input Arguments

`filename` — Name of file
character vector | string scalar

Name of file. `filename` must be a compile-time constant.

`filename` can include a file extension and a full or partial path. If `filename` has no extension, `load` looks for a file named `filename.mat`. If `filename` has an extension other than `.mat`, `load` treats the file as ASCII data.

ASCII files must contain a rectangular table of numbers, with an equal number of elements in each row. The file delimiter (the character between elements in each row) can be a blank, comma, semicolon, or tab character. The file can contain MATLAB comments (lines that begin with a percent sign, `%`).

Example: `'myFile.mat'`

var1,...,varN — Names of variables to load
character vector | string scalar

Names of variables, specified as one or more character vectors or string scalars. Each variable name must be a compile-time constant. Use the * wildcard to match patterns.

Example: `coder.load('myFile.mat','A*')` loads all variables in the file whose names start with A.

expr1,...,exprN — Regular expressions indicating which variables to load
character vector | string scalar

Regular expressions indicating which variables to load specified as one or more character vectors or string scalars. Each regular expression must be a compile-time constant.

Example: `coder.load('myFile.mat', '-regexp', '^A')` loads only variables whose names begin with A.

Output Arguments

S — Loaded variables or data
structure array | m-by-n array

If `filename` is a MAT-file, `S` is a structure array.

If `filename` is an ASCII file, `S` is an m-by-n array of type `double`. m is the number of lines in the file and n is the number of values on a line.

Limitations

- `coder.load` does not support loading objects.
- Arguments to `coder.load` must be compile-time constants.
- The output `S` must be the name of a structure or array without any subscripting. For example, `S(i) = coder.load('myFile.mat')` is not allowed.
- You cannot use `save` to save workspace data to a file inside a function intended for code generation. The code generator does not support the `save` function. Furthermore, you cannot use `coder.extrinsic` with `save`. Prior to generating code, you can use `save` to save workspace data to a file.

Tips

- `coder.load` loads data at compile time, not at run time. If you are generating MEX code or code for Simulink simulation, you can use the MATLAB function `load` to load run-time values.
- If the MAT-file contains unsupported constructs, use `coder.load(filename,var1,...,varN)` to load only the supported constructs.
- If you generate code in a MATLAB Coder project, the code generator practices incremental code generation for the `coder.load` function. When the MAT-file or ASCII file used by `coder.load` changes, the software rebuilds the code.

`matfile` | `regexp` | `save`

Topics

"Regular Expressions" (MATLAB)

Introduced in R2013a

coder.nullcopy

Package: coder

Declare uninitialized variables

Syntax

X = `coder.nullcopy(`*A*`)`

Description

X = `coder.nullcopy(`*A*`)` copies type, size, and complexity of *A* to *X*, but does not copy element values. Preallocates memory for *X* without incurring the overhead of initializing memory.

Use With Caution

Use this function with caution. See "How to Eliminate Redundant Copies by Defining Uninitialized Variables".

Examples

The following example shows how to declare variable *X* as a 1-by-5 vector of real doubles without performing an unnecessary initialization:

```
function X = foo

N = 5;
X = coder.nullcopy(zeros(1,N));
for i = 1:N
   if mod(i,2) == 0
      X(i) = i;
   else
      X(i) = 0;
```

```
    end
end
```

Using `coder.nullcopy` with `zeros` lets you specify the size of vector *X* without initializing each element to zero.

Limitations

- `coder.nullcopy` does not support MATLAB classes as inputs.
- You cannot use `coder.nullcopy` on sparse matrices, or on structures, cell arrays, or classes that contain sparse matrices.

See Also

Topics
"Eliminate Redundant Copies of Variables in Generated Code"

Introduced in R2011a

coder.opaque

Declare variable in generated code

Syntax

```
y = coder.opaque(type)
y = coder.opaque(type,value)
y = coder.opaque( ___ ,'Size',Size)
y = coder.opaque( ___ ,'HeaderFile',HeaderFile)
```

Description

`y = coder.opaque(type)` declares a variable y with the specified type and no initial value in the generated code.

- y can be a variable or a structure field.
- MATLAB code cannot set or access y, but external C functions can accept y as an argument.
- y can be an:
    - Argument to `coder.rref`, `coder.wref`, or `coder.ref`
    - Input or output argument to `coder.ceval`
    - Input or output argument to a user-written MATLAB function
    - Input to a subset of MATLAB toolbox functions supported for code generation
- Assignment from y declares another variable with the same type in the generated code. For example:

    ```
    y = coder.opaque('int');
    z = y;
    ```

    declares a variable z of type `int` in the generated code.
- You can assign y from another variable declared using either `coder.opaque` or assignment from a variable declared using `coder.opaque`. The variables must have identical types.

- You can compare y to another variable declared using either `coder.opaque` or assignment from a variable declared using `coder.opaque`. The variables must have identical types.

`y = coder.opaque(type,value)` specifies the type and initial value of y.

`y = coder.opaque( ___ ,'Size',Size)` specifies the size, in bytes, of y. You can specify the size with any of the previous syntaxes.

`y = coder.opaque( ___ ,'HeaderFile',HeaderFile)` specifies the header file that contains the type definition. The code generator produces the `#include` statement for the header file where the statement is required in the generated code. You can specify the header file with any of the previous syntaxes.

Examples

Declare Variable Specifying Initial Value

Generate code for a function `valtest` which returns `1` if the call to `myfun` is successful. This function uses `coder.opaque` to declare a variable `x1` with type `int` and initial value `0`. The assignment `x2 = x1` declares `x2` to be a variable with the type and initial value of `x1`.

Write a function `valtest`.

```
function y = valtest
%codegen
%declare x1 to be an integer with initial value '0'
x1 = coder.opaque('int','0');
%Declare x2 to have same type and initial value as x1
x2 = x1;
x2 = coder.ceval('myfun');
%test the result of call to 'myfun' by comparing to value of x1
if x2 == x1
  y = 0;
else
  y = 1;
```

```
end
end
```

Declare Variable Specifying Initial Value and Header File

Generate code for a MATLAB function `filetest` which returns its own source code using `fopen/fread/fclose`. This function uses `coder.opaque` to declare the variable that stores the file pointer used by `fopen/fread/fclose`. The call to `coder.opaque` declares the variable f with type `FILE *`, initial value `NULL`, and header file `<stdio.h>`.

Write a MATLAB function `filetest`.

```matlab
function buffer = filetest
%#codegen

% Declare 'f' as an opaque type 'FILE *' with initial value 'NULL"
%Specify the header file that contains the type definition of 'FILE *';

f = coder.opaque('FILE *', 'NULL','HeaderFile','<stdio.h>');
% Open file in binary mode
f = coder.ceval('fopen', cstring('filetest.m'), cstring('rb'));

% Read from file until end of file is reached and put
% contents into buffer
n = int32(1);
i = int32(1);
buffer = char(zeros(1,8192));
while n > 0
    % By default, MATLAB converts constant values
    % to doubles in generated code
    % so explicit type conversion to int32 is inserted.
    n = coder.ceval('fread', coder.ref(buffer(i)), int32(1), ...
        int32(numel(buffer)), f);
    i = i + n;
end
coder.ceval('fclose',f);

buffer = strip_cr(buffer);

% Put a C termination character '\0' at the end of MATLAB character vector
function y = cstring(x)
    y = [x char(0)];

% Remove all character 13 (CR) but keep character 10 (LF)
function buffer = strip_cr(buffer)
j = 1;
for i = 1:numel(buffer)
    if buffer(i) ~= char(13)
        buffer(j) = buffer(i);
        j = j + 1;
    end
```

```
end
buffer(i) = 0;
```

Compare Variables Declared Using `coder.opaque`

Compare variables declared using `coder.opaque` to test for successfully opening a file.

Use `coder.opaque` to declare a variable `null` with type `FILE *` and initial value `NULL`.

```
null = coder.opaque('FILE *', 'NULL', 'HeaderFile', '<stdio.h>');
```

Use assignment to declare another variable `ftmp` with the same type and value as `null`.

```
ftmp = null;
ftmp = coder.ceval('fopen', ['testfile.txt', char(0)], ['r', char(0)]);
```

Compare the variables.

```
if ftmp == null
        %error condition
end
```

Cast to and from Types of Variables Declared Using `coder.opaque`

This example shows how to cast to and from types of variables that are declared using `coder.opaque`. The function `castopaque` calls the C run-time function `strncmp` to compare at most `n` characters of the strings `s1` and `s2`. `n` is the number of characters in the shorter of the strings. To generate the correct C type for the `strncmp` input `nsizet`, the function casts `n` to the C type `size_t` and assigns the result to `nsizet`. The function uses `coder.opaque` to declare `nsizet`. Before using the output `retval` from `strncmp`, the function casts `retval` to the MATLAB type `int32` and stores the results in `y`.

Write this MATLAB function:

```
function y = castopaque(s1,s2)

%  <0 - the first character that does not match has a lower value in s1 than in s2
%   0 - the contents of both strings are equal
%  >0 - the first character that does not match has a greater value in s1 than in s2
%
%#codegen
```

```
coder.cinclude('<string.h>');
n = min(numel(s1), numel(s2));

% Convert the number of characters to compare to a size_t

nsizet = cast(n,'like',coder.opaque('size_t','0'));

% The return value is an int
retval = coder.opaque('int');
retval = coder.ceval('strncmp', cstr(s1), cstr(s2), nsizet);

% Convert the opaque return value to a MATLAB value
y = cast(retval, 'int32');

%--------------
function sc = cstr(s)
% NULL terminate a MATLAB character vector for C
sc = [s, char(0)];
```

Generate the MEX function.

```
codegen castopaque -args {blanks(3), blanks(3)} -report
```

Call the MEX function with inputs 'abc' and 'abc'.

```
castopaque_mex('abc','abc')

ans =

         0
```

The output is 0 because the strings are equal.

Call the MEX function with inputs 'abc' and 'abd'.

```
castopaque_mex('abc','abd')

ans =

        -1
```

The output is -1 because the third character d in the second string is greater than the third character c in the first string.

Call the MEX function with inputs 'abd' and 'abc'.

```
castopaque_mex('abd','abc')

ans =

            1
```

The output is `1` because the third character `d` in the first string is greater than the third character `c` in the second string.

In the MATLAB workspace, you can see that the type of `y` is `int32`.

Declare Variable Specifying Initial Value and Size

Declare `y` to be a 4-byte integer with initial value 0.

```
y = coder.opaque('int','0', 'Size', 4);
```

Input Arguments

type — Type of variable
character vector | string scalar

Type of variable in generated code. `type` must be a compile-time constant. The type must be a:

- Built-in C data type or a type defined in a header file
- C type that supports copy by assignment
- Legal prefix in a C declaration

Example: `'FILE *'`

value — Initial value of variable
character vector | string scalar

Initial value of variable in generated code. `value` must be a compile-time constant. Specify a C expression not dependent on MATLAB variables or functions.

If you do not provide the initial value in `value`, initialize the value of the variable before using it. To initialize a variable declared using `coder.opaque`:

- Assign a value from another variable with the same type declared using either `coder.opaque` or assignment from a variable declared using `coder.opaque`.
- Assign a value from an external C function.
- Pass the address of the variable to an external function using `coder.wref`.

Specify a `value` that has the type that `type` specifies. Otherwise, the generated code can produce unexpected results.

Example: `'NULL'`

Size — Size of variable
integer

Number of bytes for the variable in the generated code, specified as an integer. If you do not specify the size, the size of the variable is 8 bytes.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64`

HeaderFile — Name of header file
character vector | string scalar

Name of header file that contains the definition of `type`. `HeaderFile` must be a compile-time constant.

For a system header file, use angle brackets.

Example: `'<stdio.h>'` generates `#include <stdio.h>`

For an application header file, use double quotes.

Example: `'"foo.h"'` generates `#include "foo.h"`

If you omit the angle brackets or double quotes, the code generator produces double quotes.

Example: `'foo.h'` generates `#include "foo.h"`

Specify the include path in the build configuration parameters.

Example: `cfg.CustomInclude = 'c:\myincludes'`

Tips

- Specify a `value` that has the type that `type` specifies. Otherwise, the generated code can produce unexpected results. For example, the following `coder.opaque` declaration can produce unexpected results.

  ```
  y = coder.opaque('int', '0.2')
  ```

- `coder.opaque` declares the type of a variable. It does not instantiate the variable. You can instantiate a variable by using it later in the MATLAB code. In the following example, assignment of `fp1` from `coder.ceval` instantiates `fp1`.

  ```
  % Declare fp1 of type FILE *
  fp1 = coder.opaque('FILE *');
  %Create the variable fp1
  fp1 = coder.ceval('fopen', ['testfile.txt', char(0)], ['r', char(0)]);
  ```

- In the MATLAB environment, `coder.opaque` returns the value specified in `value`. If `value` is not provided, it returns an empty character vector.

- You can compare variables declared using either `coder.opaque` or assignment from a variable declared using `coder.opaque`. The variables must have identical types. The following example demonstrates how to compare these variables. "Compare Variables Declared Using coder.opaque" on page 2-112

- To avoid multiple inclusions of the same header file in generated code, enclose the header file in the conditional preprocessor statements `#ifndef` and `#endif`. For example:

  ```
  #ifndef MyHeader_h
  #define MyHeader_h
  <body of header file>
  #endif
  ```

- You can use the MATLAB `cast` function to cast a variable to or from a variable that is declared using `coder.opaque`. Use `cast` with `coder.opaque` only for numeric types.

  To cast a variable declared by `coder.opaque` to a MATLAB type, you can use the `B = cast(A,type)` syntax. For example:

  ```
  x = coder.opaque('size_t','0');
  x1 = cast(x, 'int32');
  ```

  You can also use the `B = cast(A,'like',p)` syntax. For example:

```
x = coder.opaque('size_t','0');
x1 = cast(x, 'like', int32(0));
```

To cast a MATLAB variable to the type of a variable declared by `coder.opaque`, you must use the `B = cast(A,'like',p)` syntax. For example:

```
x = int32(12);
x1 = coder.opaque('size_t', '0');
x2 = cast(x, 'like', x1));
```

Use `cast` with `coder.opaque` to generate the correct data types for:

- Inputs to C/C++ functions that you call using `coder.ceval`.
- Variables that you assign to outputs from C/C++ functions that you call using `coder.ceval`.

Without this casting, it is possible to receive compiler warnings during code generation.

`coder.ceval` | `coder.ref` | `coder.rref` | `coder.wref`

Introduced in R2011a

coder.ref

Indicate data to pass by reference

Syntax

```
coder.ref(arg)
```

Description

`coder.ref(arg)` indicates that `arg` is an expression or variable to pass by reference to an external C/C++ function. Use `coder.ref` inside a `coder.ceval` call only. The C/C++ function can read from or write to the variable passed by reference. Use a separate `coder.ref` construct for each argument that you pass by reference to the function.

Examples

Pass Scalar Variable by Reference

Consider the C function `addone` that returns the value of an input plus one:

```
double addone(double* p) {
  return *p + 1;
}
```

The C function defines the input variable `p` as a pointer to a double.

Pass the input by reference to `addone`:

```
...
y = 0;
u = 42;
```

```
y = coder.ceval('addone', coder.ref(u));
...
```

Pass Multiple Arguments by Reference

```
...
u = 1;
v = 2;
y = coder.ceval('my_fcn', coder.ref(u), coder.ref(v));
...
```

Pass Class Property by Reference

```
...
x = myClass;
x.prop = 1;
coder.ceval('foo', coder.ref(x.prop));
...
```

Pass a Structure by Reference

To indicate that the structure type is defined in a C header file, use
coder.cstructname.

Suppose that you have the C function incr_struct. This function reads from and writes
to the input argument.

```
#include "MyStruct.h"

void incr_struct(struct MyStruct *my_struct)
{
  my_struct->f1 =  my_struct->f1 + 1;
  my_struct->f2 =  my_struct->f2 + 1;
}
```

The C header file, MyStruct.h, defines a structure type named MyStruct:

```
#ifndef MYSTRUCT
#define MYSTRUCT

typedef struct MyStruct
{
```

```
    double f1;
    double f2;
} MyStruct;

void incr_struct(struct MyStruct *my_struct);

#endif
```

In your MATLAB function, pass a structure by reference to `incr_struct`. To indicate that the structure type for `s` has the name `MyStruct` that is defined in the C header file `MyStruct.h`, use `coder.cstructname`.

```
function y = foo
%#codegen
y = 0;
coder.updateBuildInfo('addSourceFiles','incr_struct.c');

s = struct('f1',1,'f2',2);
coder.cstructname(s,'MyStruct','extern','HeaderFile','MyStruct.h');
coder.ceval('incr_struct', coder.ref(s));
```

To generate standalone library code, enter:

```
codegen -config:lib foo -report
```

Pass Structure Field by Reference

```
...
s = struct('s1', struct('a', [0 1]));
coder.ceval('foo', coder.ref(s.s1.a));
...
```

You can also pass an element of an array of structures:

```
...
c = repmat(struct('u',magic(2)),1,10);
b = repmat(struct('c',c),3,6);
a = struct('b',b);
coder.ceval('foo', coder.ref(a.b(3,4).c(2).u));
...
```

Input Arguments

`arg` — Argument to pass by reference
scalar variable | array | element of an array | structure | structure field | object property

Argument to pass by reference to an external C/C++ function. The argument cannot be a class, a System object, a cell array, or an index into a cell array.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical` | `char` | `struct`
Complex Number Support: Yes

Limitations

- You cannot pass these data types by reference:

  - Class or System object
  - Cell array or index into a cell array

- If a property has a get method, a set method, or validators, or is a System object property with certain attributes, then you cannot pass the property by reference to an external function. See "Passing By Reference Not Supported for Some Properties".

Tips

- If `arg` is an array, then `coder.ref(arg)` provides the address of the first element of the array. The `coder.ref(arg)` function does not contain information about the size of the array. If the C function must know the number of elements of your data, pass that information as a separate argument. For example:

  ```
  coder.ceval('myFun',coder.ref(arg),int32(numel(arg)));
  ```
- When you pass a structure by reference to an external C/C++ function, use `coder.cstructname` to provide the name of a C structure type that is defined in a C header file.

- In MATLAB, `coder.ref` results in an error. To parameterize your MATLAB code so that it can run in MATLAB and in generated code, use `coder.target`.

- You can use `coder.opaque` to declare variables that you pass to and from an external C/C++ function.

Topics

"Integrate C Code Using the MATLAB Function Block"

Introduced in R2011a

coder.rref

Indicate read-only data to pass by reference

Syntax

```
coder.rref(arg)
```

Description

`coder.rref(arg)` indicates that `arg` is a read-only expression or variable to pass by reference to an external C/C++ function. Use `coder.rref` only inside a `coder.ceval` call. Use a separate `coder.rref` construct for each argument that you pass by reference to the function.

The `coder.rref` function can enable the code generator to optimize the generated code. For example, the code generator can perform expression folding on assignments to `arg` that occur before and after the `coder.ceval` call. Expression folding is the combining of multiple operations into one statement to avoid the use of temporary variables and improve code performance.

Note The code generator assumes that the memory that you pass with `coder.rref(arg)` is read-only. To avoid unpredictable results, the C/C++ function must not write to this variable.

Examples

Pass Scalar Variable as a Read-Only Reference

Consider the C function `addone` that returns the value of a constant input plus one:

```
double addone(const double* p) {
  return *p + 1;
}
```

The C function defines the input variable `p` as a pointer to a constant double.

Pass the input by reference to `addone`:

```
...
y = 0;
u = 42;
y = coder.ceval('addone', coder.rref(u));
...
```

Pass Multiple Arguments as a Read-Only Reference

```
...
u = 1;
v = 2;
y = coder.ceval('my_fcn', coder.rref(u), coder.rref(v));
...
```

Pass Class Property as a Read-Only Reference

```
...
x = myClass;
x.prop = 1;
y = coder.ceval('foo', coder.rref(x.prop));
...
```

Pass Structure as a Read-Only Reference

To indicate that the structure type is defined in a C header file, use `coder.cstructname`.

Suppose that you have the C function `use_struct`. This function reads from the input argument but does not write to it.

```
#include "MyStruct.h"

double use_struct(const struct MyStruct *my_struct)
{
  return my_struct->f1 + my_struct->f2;
}
```

The C header file, `MyStruct.h`, defines a structure type named `MyStruct`:

```
#ifndef MYSTRUCT
#define MYSTRUCT

typedef struct MyStruct
{
    double f1;
    double f2;
} MyStruct;

double use_struct(const struct MyStruct *my_struct);

#endif
```

In your MATLAB function, pass a structure as a read-only reference to `use_struct`. To indicate that the structure type for `s` has the name `MyStruct` that is defined in the C header file `MyStruct.h`, use `coder.cstructname`.

```matlab
function y = foo
%#codegen
y = 0;
coder.updateBuildInfo('addSourceFiles','use_struct.c');

s = struct('f1',1,'f2',2);
coder.cstructname(s,'MyStruct','extern','HeaderFile','MyStruct.h');
y = coder.ceval('use_struct', coder.rref(s));
```

To generate standalone library code, enter:

```matlab
codegen -config:lib foo -report
```

Pass Structure Field as a Read-Only Reference

```matlab
...
s = struct('s1', struct('a', [0 1]));
y = coder.ceval('foo', coder.rref(s.s1.a));
...
```

You can also pass an element of an array of structures:

```matlab
...
c = repmat(struct('u',magic(2)),1,10);
b = repmat(struct('c',c),3,6);
a = struct('b',b);
coder.ceval('foo', coder.rref(a.b(3,4).c(2).u));
...
```

2-125

Input Arguments

`arg` — Argument to pass by reference
scalar variable | array | element of an array | structure | structure field | object property

Argument to pass by reference to an external C/C++ function. The argument cannot be a class, a System object, a cell array, or an index into a cell array.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical` | `char` | `struct`
Complex Number Support: Yes

Limitations

- You cannot pass these data types by reference:

  - Class or System object
  - Cell array or index into a cell array

- If a property has a get method, a set method, or validators, or is a System object property with certain attributes, then you cannot pass the property by reference to an external function. See "Passing By Reference Not Supported for Some Properties".

Tips

- If `arg` is an array, then `coder.rref(arg)` provides the address of the first element of the array. The `coder.rref(arg)` function does not contain information about the size of the array. If the C function must know the number of elements of your data, pass that information as a separate argument. For example:

  `coder.ceval('myFun',coder.rref(arg),int32(numel(arg)));`

- When you pass a structure by reference to an external C/C++ function, use `coder.cstructname` to provide the name of a C structure type that is defined in a C header file.

- In MATLAB, `coder.rref` results in an error. To parametrize your MATLAB code so that it can run in MATLAB and in generated code, use `coder.target`.

- You can use `coder.opaque` to declare variables that you pass to and from an external C/C++ function.

Topics

"Integrate C Code Using the MATLAB Function Block"

Introduced in R2011a

coder.screener

Determine if function is suitable for code generation

Syntax

```
coder.screener(fcn)
coder.screener(fcn_1,...,fcn_n )
```

Description

`coder.screener(fcn)` analyzes the entry-point MATLAB function, `fcn`. It identifies unsupported functions and language features as code generation compliance issues. It displays the code generation compliance issues in a report. If `fcn` calls other functions directly or indirectly that are not MathWorks® functions, `coder.screener` analyzes these functions. It does not analyze MathWorks functions. It is possible that `coder.screener` does not detect all code generation issues. Under certain circumstances, it is possible that `coder.screener` reports false errors.

`coder.screener(fcn_1,...,fcn_n )` analyzes entry-point functions (`fcn_1,...,fcn_n`).

Input Arguments

fcn

Name of entry-point MATLAB function that you want to analyze. Specify as a character vector or a string scalar.

fcn_1,...,fcn_n

Comma-separated list of names of entry-point MATLAB functions that you want to analyze. Specify as character vectors or string scalars.

Examples

Identify Unsupported Functions

The `coder.screener` function identifies calls to functions that are not supported for code generation. It checks both the entry-point function, `foo1`, and the function `foo2` that `foo1` calls.

Write the function `foo2` and save it in the file `foo2.m`.

```
function out = foo2(in)
  out = eval(in);
end
```

Write the function `foo1` that calls `foo2`. Save `foo1` in the file `foo1.m`.

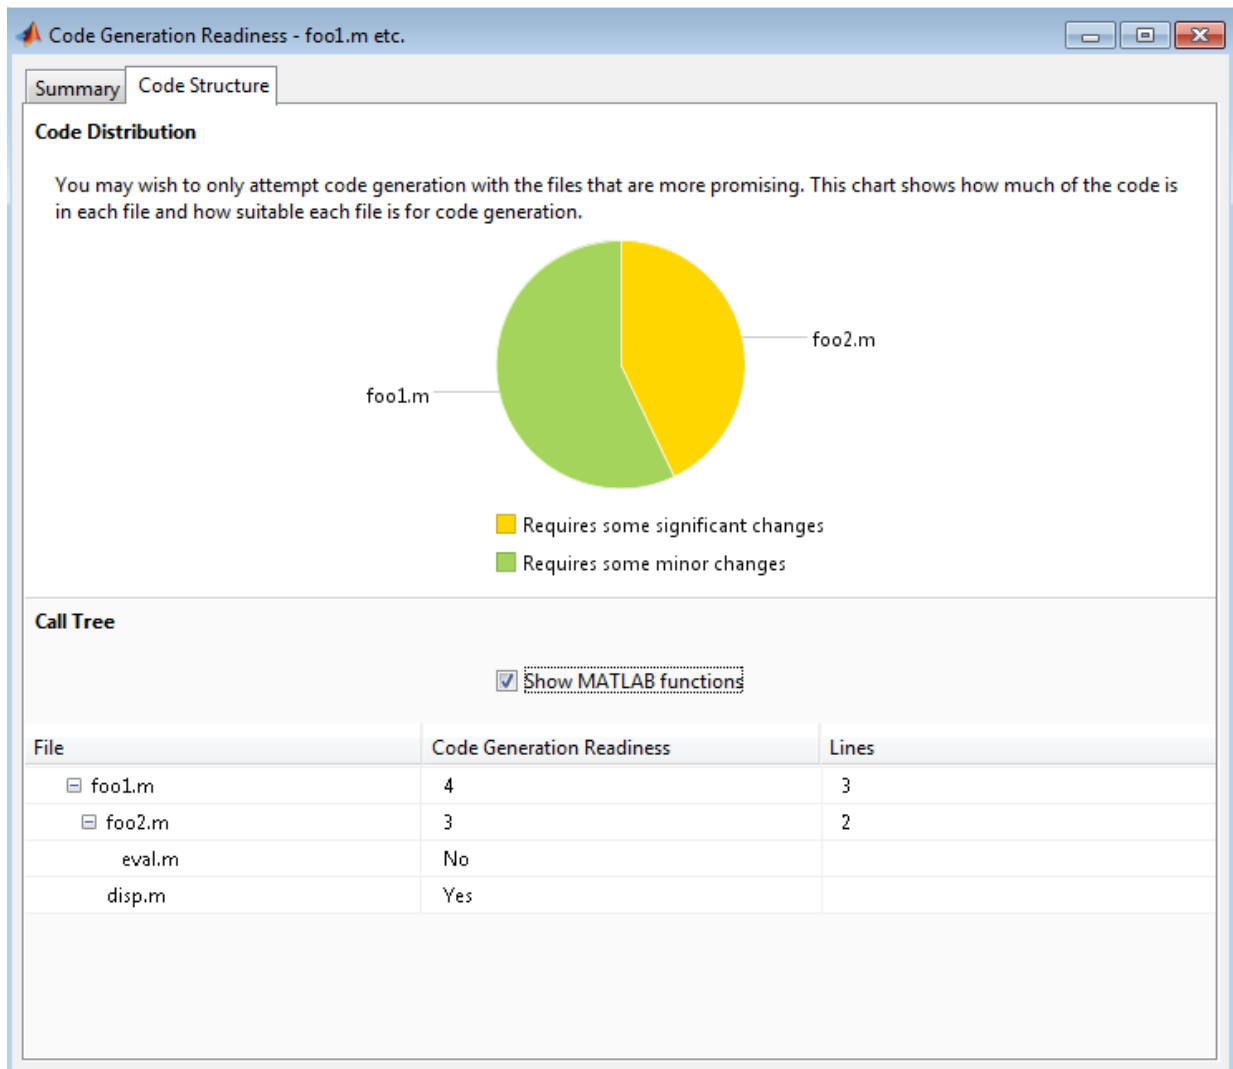
```
function out = foo1(in)
  out = foo2(in);
  disp(out);
end
```

Analyze `foo1`.

```
coder.screener('foo1')
```

The code generation readiness report displays a summary of the unsupported MATLAB function calls. The function `foo2` calls one unsupported MATLAB function.
In the report, click the **Code Structure** tab and select the **Show MATLAB functions** check box.

This tab displays a pie chart showing the relative size of each file and how suitable each file is for code generation. In this case, the report:

- Colors `foo1.m` green to indicate that it is suitable for code generation.
- Colors `foo2.m` yellow to indicate that it requires significant changes.
- Assigns `foo1.m` a code generation readiness score of 4 and `foo2.m` a score of 3. The score is based on a scale of 1–5. 1 indicates that significant changes are required; 5 indicates that the code generation readiness tool does not detect issues.
- Displays a call tree.


The report **Summary** tab indicates that `foo2.m` contains one call to the `eval` function, which code generation does not support. To generate a MEX function for `foo2.m`, modify the code to make the call to `eval` extrinsic.

```
function out = foo2(in)
  coder.extrinsic('eval');
```

```
  out = eval(in);
end
```

Rerun the code generation readiness tool.

```
coder.screener('foo1')
```

The report no longer flags that code generation does not support the `eval` function. When you generate a MEX function for `foo1`, the code generator dispatches `eval` to MATLAB for execution. For standalone code generation, the code generator does not generate code for `eval`.

Identify Unsupported Data Types

The `coder.screener` function identifies MATLAB data types that code generation does not support.

Write the function `myfun` that contains a MATLAB table.

```
function outTable = myfun1(A)
outTable = table(A);
end
```

Analyze `myfun`.

```
coder.screener('myfun1');
```

The code generation readiness report indicates that table data types are not supported for code generation.
The report assigns `myfun1` a code readiness score of 3. Before generating code, you must fix the reported issues.

Tips

- Before using `coder.screener`, fix issues that the Code Analyzer identifies.
- Before generating code, use `coder.screener` to check that a function is suitable for code generation. Fix all the issues that it detects.

Alternatives

- "Run the Code Generation Readiness Tool From the Current Folder Browser"

"Code Generation Readiness Tool"

Introduced in R2012b

coder.target

Determine if code generation target is specified target

Syntax

```
tf = coder.target(target)
```

Description

`tf = coder.target(target)` returns true (1) if the code generation target is `target`. Otherwise, it returns false (0).

If you generate code for MATLAB classes, MATLAB computes class initial values at class loading time before code generation. If you use `coder.target` in MATLAB class property initialization, `coder.target('MATLAB')` returns true.

Examples

Use coder.target to Parametrize a MATLAB Function

Parametrize a MATLAB function so that it works in MATLAB or in generated code. When the function runs in MATLAB, it calls the MATLAB function `myabsval`. The generated code, however, calls a C library function `myabsval`.

Write a MATLAB function `myabsval`.

```
function y = myabsval(u)
%#codegen
y = abs(u);
```

Generate a C static library for `myabsval`, using the `-args` option to specify the size, type, and complexity of the input parameter.

```
codegen -config:lib myabsval -args {0.0}
```

The codegen function creates the library file myabsval.lib and header file myabsval.h in the folder \codegen\lib\myabsval. (The library file extension can change depending on your platform.) It generates the functions myabsval_initialize and myabsval_terminate in the same folder.

Write a MATLAB function to call the generated C library function using coder.ceval.

```matlab
function y = callmyabsval(y)
%#codegen
% Check the target. Do not use coder.ceval if callmyabsval is
% executing in MATLAB
if coder.target('MATLAB')
  % Executing in MATLAB, call function myabsval
  y = myabsval(y);
else
  % add the required include statements to generated function code
  coder.updateBuildInfo('addIncludePaths','$(START_DIR)/codegen/lib/myabsval');
  coder.cinclude('myabsval_initialize.h');
  coder.cinclude('myabsval.h');
  coder.cinclude('myabsval_terminate.h');

  % Executing in the generated code.
  % Call the initialize function before calling the
  % C function for the first time
  coder.ceval('myabsval_initialize');

  % Call the generated C library function myabsval
  y = coder.ceval('myabsval',y);

  % Call the terminate function after
  % calling the C function for the last time
  coder.ceval('myabsval_terminate');
end
```

Generate the MEX function callmyabsval_mex. Provide the generated library file at the command line.

```matlab
codegen -config:mex callmyabsval codegen\lib\myabsval\myabsval.lib -args {-2.75}
```

Rather than providing the library at the command line, you can use coder.updateBuildInfo to specify the library within the function. Use this option to preconfigure the build. Add this line to the else block:

```matlab
coder.updateBuildInfo('addLinkObjects','myabsval.lib','$(START_DIR)\codegen\lib\myabsva
```

Run the MEX function `callmyabsval_mex` which calls the library function `myabsval`.

```
callmyabsval_mex(-2.75)

ans =

    2.7500
```

Call the MATLAB function `callmyabsval`.

```
callmyabsval(-2.75)

ans =

    2.7500
```

The `callmyabsval` function exhibits the desired behavior for execution in MATLAB and in code generation.

Input Arguments

`target` — code generation target
`'MATLAB'` | `'MEX'` | `'Sfun'` | `'Rtw'` | `'HDL '` | `'Custom'`

Code generation target, specified as a character vector or a string scalar. Specify one of these targets.

`'MATLAB'`	Running in MATLAB (not generating code)
`'MEX'`	Generating a MEX function
`'Sfun'`	Simulating a Simulink model
`'Rtw'`	Generating a LIB, DLL, or EXE target
`'HDL'`	Generating an HDL target
`'Custom'`	Generating a custom target

Example: `tf = coder.target('MATLAB')`

Example: `tf = coder.target("MATLAB")`

Introduced in R2011a

coder.unroll

Unroll `for`-loop by making a copy of the loop body for each loop iteration

Syntax

```
coder.unroll()
coder.unroll(flag)
for i = coder.unroll(range)
for i = coder.unroll(range, flag)
```

Description

`coder.unroll()` unrolls a `for`-loop. The `coder.unroll` call must be on a line by itself immediately preceding the `for`-loop that it unrolls.

Instead of producing a `for`-loop in the generated code, loop unrolling produces a copy of the `for`-loop body for each loop iteration. In each iteration, the loop index becomes constant. To unroll a loop, the code generator must be able to determine the bounds of the `for`-loop.

For small, tight loops, unrolling can improve performance. However, for large loops, unrolling can increase code generation time significantly and generate inefficient code.

`coder.unroll` is ignored outside of code generation.

`coder.unroll(flag)` unrolls a `for`-loop if `flag` is `true`. `flag` is evaluated at code generation time. The `coder.unroll` call must be on a line by itself immediately preceding the `for`-loop that it unrolls.

`for i = coder.unroll(range)` is a legacy syntax that generates the same code as `coder.unroll()`.

`for i = coder.unroll(range, flag)` is a legacy syntax that generates the same code as `coder.unroll(flag)`.

Examples

Unroll a `for`-loop

To produce copies of a `for`-loop body in the generated code, use `coder.unroll`.

In one file, write the entry-point function `call_getrand` and a local function `getrand`. `getrand` unrolls a `for`-loop that assigns random numbers to an n-by-1 array. `call_getrand` calls `getrand` with the value 3.

```
function z = call_getrand
%#codegen
z = getrand(3);
end

function y = getrand(n)
coder.inline('never');
y = zeros(n, 1);
coder.unroll();
for i = 1:n
    y(i) = rand();
end
end
```

Generate a static library.

```
codegen -config:lib call_getrand -report
```

In the generated code, the code generator produces a copy of the `for`-loop body for each of the three loop iterations.

```
static void getrand(double y[3])
{
  y[0] = b_rand();
  y[1] = b_rand();
  y[2] = b_rand();
}
```

Control `for`-loop Unrolling with Flag

Control loop unrolling by using `coder.unroll` with the `flag` argument.

In one file, write the entry-point function `call_getrand_unrollflag` and a local function `getrand_unrollflag`. When the number of loop iterations is less than 10, `getrand_unrollflag` unrolls the `for`-loop. `call_getrand` calls `getrand` with the value 50.

```
function z = call_getrand_unrollflag
%#codegen
z = getrand_unrollflag(50);
end

function y = getrand_unrollflag(n)
coder.inline('never');
unrollflag = n < 10;
y = zeros(n, 1);
coder.unroll(unrollflag)
for i = 1:n
    y(i) = rand();
end
end
```

Generate a static library.

```
codegen -config:lib call_getrand_unrollflag -report
```

The number of iterations is not less than 10. Therefore, the code generator does not unroll the `for`-loop. It produces a `for`-loop in the generated code.

```
static void getrand_unrollflag(double y[50])
{
  int i;
  for (i = 0; i < 50; i++) {
    y[i] = b_rand();
  }
}
```

Use Legacy Syntax to Unroll `for`-Loop

```
function z = call_getrand
%#codegen
z = getrand(3);
end

function y = getrand(n)
coder.inline('never');
```

```
y = zeros(n, 1);
for i = coder.unroll(1:n)
    y(i) = rand();
end
end
```

Use Legacy Syntax to Control for-Loop Unrolling

```
function z = call_getrand_unrollflag
%#codegen
z = getrand_unrollflag(50);
end

function y = getrand_unrollflag(n)
coder.inline('never');
unrollflag = n < 10;
y = zeros(n, 1);
for i = coder.unroll(1:n, unrollflag)
    y(i) = rand();
end
end
```

Input Arguments

flag — Indicates whether to unroll the for-loop
true (default) | false

When `flag` is `true`, the code generator unrolls the for-loop. When `flag` is `false`, the code generator produces a for-loop in the generated code. `flag` is evaluated at code generation time.

Tips

Sometimes, the code generator unrolls a for-loop even though you do not use `coder.unroll`. For example, if a for-loop indexes into a heterogeneous cell array or into `varargin` or `varargout`, the code generator unrolls the loop. By unrolling the loop, the code generator can determine the value of the index for each loop iteration. The code generator uses heuristics to determine when to unroll a for-loop. If the heuristics fail to identify that unrolling is warranted, or if the number of loop iterations exceeds a limit,

code generation fails. In these cases, you can force loop unrolling by using `coder.unroll`. See "Nonconstant Index into varargin or varargout in a for-Loop".

Introduced in R2011a

coder.updateBuildInfo

Update build information object `RTW.BuildInfo`

Syntax

```
coder.updateBuildInfo('addCompileFlags',options)
coder.updateBuildInfo('addLinkFlags',options)
coder.updateBuildInfo('addDefines',options)
coder.updateBuildInfo( ___ ,group)

coder.updateBuildInfo('addLinkObjects',filename,path)
coder.updateBuildInfo('addLinkObjects',filename,path,priority,
precompiled)
coder.updateBuildInfo('addLinkObjects',filename,path,priority,
precompiled,linkonly)
coder.updateBuildInfo( ___ ,group)

coder.updateBuildInfo('addNonBuildFiles',filename)
coder.updateBuildInfo('addSourceFiles',filename)
coder.updateBuildInfo('addIncludeFiles',filename)
coder.updateBuildInfo( ___ ,path)
coder.updateBuildInfo( ___ ,path,group)

coder.updateBuildInfo('addSourcePaths',path)
coder.updateBuildInfo('addIncludePaths',path)
coder.updateBuildInfo( ___ ,group)
```

Description

coder.updateBuildInfo('addCompileFlags',options) adds compiler options to the build information object.

coder.updateBuildInfo('addLinkFlags',options) adds link options to the build information object.

`coder.updateBuildInfo('addDefines',options)` adds preprocessor macro definitions to the build information object.

`coder.updateBuildInfo( ___ ,group)` assigns a group name to `options` for later reference.

`coder.updateBuildInfo('addLinkObjects',filename,path)` adds a link object from a file to the build information object.

`coder.updateBuildInfo('addLinkObjects',filename,path,priority, precompiled)` specifies if the link object is precompiled.

`coder.updateBuildInfo('addLinkObjects',filename,path,priority, precompiled,linkonly)` specifies if the object is to be built before being linked or used for linking alone. If the object is to be built, it specifies if the object is precompiled.

`coder.updateBuildInfo( ___ ,group)` assigns a group name to the link object for later reference.

`coder.updateBuildInfo('addNonBuildFiles',filename)` adds a nonbuild-related file to the build information object.

`coder.updateBuildInfo('addSourceFiles',filename)` adds a source file to the build information object.

`coder.updateBuildInfo('addIncludeFiles',filename)` adds an include file to the build information object.

`coder.updateBuildInfo( ___ ,path)` adds the file from specified path.

`coder.updateBuildInfo( ___ ,path,group)` assigns a group name to the file for later reference.

`coder.updateBuildInfo('addSourcePaths',path)` adds a source file path to the build information object.

`coder.updateBuildInfo('addIncludePaths',path)` adds an include file path to the build information object.

`coder.updateBuildInfo( ___ ,group)` assigns a group name to the path for later reference.

Examples

Add Multiple Compiler Options

Add the compiler options `-Zi` and `-Wall` during code generation for function, `func`.

Anywhere in the MATLAB code for `func`, add the following line:

```
coder.updateBuildInfo('addCompileFlags','-Zi -Wall');
```

Generate code for `func` using the `codegen` command. Open the Code Generation Report.

```
codegen -config:lib -launchreport func
```

Add Source File Name

Add a source file to the project build information while generating code for a function, `calc_factorial`.

1   Write a header file `fact.h` that declares a C function `factorial`.

```
 double factorial(double x);
```

`fact.h` will be included as a header file in generated code. This inclusion ensures that the function is declared before it is called.

Save the file in the current folder.

2   Write a C file `fact.c` that contains the definition of `factorial`. `factorial` calculates the factorial of its input.

```
#include "fact.h"

    double factorial(double x)
    {
        int i;
        double fact = 1.0;
        if (x == 0 || x == 1) {
            return 1.0;
        } else {
            for (i = 1; i <= x; i++) {
```

2-147

```
                    fact *= (double)i;
            }
            return fact;
        }
    }
```

`fact.c` is used as a source file during code generation.

Save the file in the current folder.

3   Write a MATLAB function `calc_factorial` that uses `coder.ceval` to call the external C function `factorial`.

Use `coder.updateBuildInfo` with option `'addSourceFiles'` to add the source file `fact.c` to the build information. Use `coder.cinclude` to include the header file `fact.h` in the generated code.

```matlab
function y = calc_factorial(x) %#codegen

  coder.cinclude('fact.h');
  coder.updateBuildInfo('addSourceFiles', 'fact.c');

  y = 0;
  y = coder.ceval('factorial', x);
```

4   Generate code for `calc_factorial` using the `codegen` command.

```
codegen -config:dll -launchreport calc_factorial -args 0
```

Add Link Object

Add a link object `LinkObj.lib` to the build information while generating code for a function `func`. For this example, you must have a link object `LinkObj.lib` saved in a local folder, for example, `c:\Link_Objects`.

Anywhere in the MATLAB code for `func`, add the following lines:

```matlab
libPriority = '';
libPreCompiled = true;
libLinkOnly = true;
libName = 'LinkObj.lib';
libPath = 'c:\Link_Objects';
```

```
coder.updateBuildInfo('addLinkObjects', libName, libPath, ...
     libPriority, libPreCompiled, libLinkOnly);
```

Generate a MEX function for `func` using the `codegen` command. Open the Code Generation Report.

```
codegen -launchreport func
```

Add Include Paths

Add an include path to the build information while generating code for a function, `adder`. Include a header file, `adder.h`, existing on the path.

When header files do not reside in the current folder, to include them, use this method:

1   Write a header file `mysum.h` that contains the declaration for a C function `mysum`.

```
double mysum(double, double);
```

Save it in a local folder, for example `c:\coder\myheaders`.

2   Write a C file `mysum.c` that contains the definition of the function `mysum`.

```
#include "mysum.h"

double mysum(double x, double y)
 {
  return(x+y);
 }
```

Save it in the current folder.

3   Write a MATLAB function `adder` that adds the path `c:\coder\myheaders` to the build information.

Use `coder.cinclude` to include the header file `mysum.h` in the generated code.

```
function y = adder(x1, x2) %#codegen
   coder.updateBuildInfo('addIncludePaths','c:\coder\myheaders');
   coder.updateBuildInfo('addSourceFiles','mysum.c');
     %Include the source file containing C function definition
   coder.cinclude('mysum.h');
   y = 0;
```

```matlab
    if coder.target('MATLAB')
        % This line ensures that the function works in MATLAB
        y = x1 + x2;
    else
        y = coder.ceval('mysum', x1, x2);
    end
end
```

4 Generate code for `adder` using the `codegen` command.

```matlab
codegen -config:lib -launchreport adder -args {0,0}
```

Input Arguments

`options` — Build options
character vector | string scalar

Build options, specified as a character vector or string scalar. The value must be a compile-time constant.

Depending on the leading argument, `options` specifies the relevant build options to be added to the project's build information.

Leading Argument	Values in options
`'addCompileFlags'`	Compiler options
`'addLinkFlags'`	Link options
`'addDefines'`	Preprocessor macro definitions

The function adds the options to the end of an option vector.

Example: `coder.updateBuildInfo('addCompileFlags','-Zi -Wall')`

`group` — Group name
character vector | string scalar

Name of user-defined group, specified as a character vector or string scalar. The value must be a compile-time constant.

The `group` option assigns a group name to the parameters in the second argument.

Leading Argument	Second Argument	Parameters Named by group
'addCompileFlags'	options	Compiler options
'addLinkFlags'	options	Link options
'addLinkObjects'	filename	Name of file containing linkable objects
'addNonBuildFiles'	filename	Name of nonbuild-related file
'addSourceFiles'	filename	Name of source file
'addSourcePaths'	path	Name of source file path

You can use group to:

- Document the use of specific parameters.
- Retrieve or apply multiple parameters together as one group.

filename — File name
character vector | string scalar

File name, specified as a character vector or string scalar. The value must be a compile-time constant.

Depending on the leading argument, filename specifies the relevant file to be added to the project's build information.

Leading Argument	File Specified by filename
'addLinkObjects'	File containing linkable objects
'addNonBuildFiles'	Nonbuild-related file
'addSourceFiles'	Source file

The function adds the file name to the end of a file name vector.

Example: coder.updateBuildInfo('addSourceFiles', 'fact.c')

path — Path name
character vector | string scalar

Relative path name, specified as a character vector or string scalar. The value must be a compile-time constant.

Depending on the leading argument, `path` specifies the relevant path name to be added to the project's build information. The function adds the path to the end of a path name vector.

Leading Argument	Path Specified by `path`
`'addLinkObjects'`	Path to linkable objects
`'addNonBuildFiles'`	Path to nonbuild-related files
`'addSourceFiles'`, `'addSourcePaths'`	Path to source files

The relative path starts from the *build folder*. If you have a function `foo` contained in the folder `C:\myCode`, and you generate MEX code by using:

```
codegen foo -report
```

then the build folder is `C:\myCode\codegen\mex\foo`. You can write the path from the build folder or write the path from the current working folder in which you generate code. Reference the current working folder by using the `START_DIR` macro. For example, suppose that your source file is contained in `C:\myCode\mySrcDir`, and you generate code from `C:\myCode`. Write the path as in these examples:

Example: `coder.updateBuildInfo('addSourceFiles','fact.c','..\..\..\mySrcDir')`

Example: `coder.updateBuildInfo('addSourceFiles','fact.c','$(START_DIR)\mySrcDir')`

priority — Relative priority of link object
''

Priority of link objects.

This feature applies only when several link objects are added. Currently, only a single link object file can be added for every `coder.updateBuildInfo` statement. Therefore, this feature is not available for use.

To use the succeeding arguments, include `''` as a placeholder argument.

precompiled — Variable indicating if link objects are precompiled
logical value

Variable indicating if the link objects are precompiled, specified as a logical value. The value must be a compile-time constant.

If the link object has been prebuilt for faster compiling and linking and exists in a specified location, specify `true`. Otherwise, the MATLAB Coder build process creates the link object in the build folder.

If `linkonly` is set to `true`, this argument is ignored.

Data Types: `logical`

`linkonly` — Variable indicating if objects must be used for linking only
logical value

Variable indicating if objects must be used for linking only, specified as a logical value. The value must be a compile-time constant.

If you want that the MATLAB Coder build process must not build or generate rules in the makefile for building the specified link object, specify `true`. Instead, when linking the final executable, the process should just include the object. Otherwise, rules for building the link object are added to the makefile.

You can use this argument to incorporate link objects for which source files are not available.

If `linkonly` is set to `true`, the value of `precompiled` is ignored.

Data Types: `logical`

Introduced in R2013b

coder.varsize

Package: coder

Declare variable-size array

Syntax

```
coder.varsize('var₁', 'var₂', ...)
coder.varsize('var₁', 'var₂', ..., ubound)
coder.varsize('var₁', 'var₂', ..., ubound, dims)
coder.varsize('var₁', 'var₂', ..., [], dims)
```

Description

`coder.varsize('var₁', 'var₂', ...)` declares one or more variables as variable-size data, allowing subsequent assignments to extend their size. Each 'var_n' is the name of a variable or structure field enclosed in quotes. If the structure field belongs to an array of structures, use colon (`:`) as the index expression to make the field variable-size for all elements of the array. For example, the expression `coder.varsize('data(:).A')` declares that the field A inside each element of `data` is variable sized.

`coder.varsize('var₁', 'var₂', ..., ubound)` declares one or more variables as variable-size data with an explicit upper bound specified in *ubound*. The argument *ubound* must be a constant, integer-valued vector of upper bound sizes for every dimension of each 'var_n'. If you specify more than one 'var_n', each variable must have the same number of dimensions.

`coder.varsize('var₁', 'var₂', ..., ubound, dims)` declares one or more variables as variable size with an explicit upper bound and a mix of fixed and varying dimensions specified in *dims*. The argument *dims* is a logical vector, or double vector containing only zeros and ones. Dimensions that correspond to zeros or `false` in *dims* have fixed size; dimensions that correspond to ones or `true` vary in size. If you specify more than one variable, each fixed dimension must have the same value across all 'var_n'.

coder.varsize('*var₁*', '*var₂*', ..., [], *dims*) declares one or more variables as variable size with a mix of fixed and varying dimensions. The empty vector [] means that you do not specify an explicit upper bound.

When you do *not* specify *ubound*, the upper bound is computed for each '*var_n*' in generated code.

When you do *not* specify *dims*, dimensions are assumed to be variable except the singleton ones. A singleton dimension is a dimension for which size(A,dim) = 1.

You must add the coder.varsize declaration before each '*var_n*' is used (read). You can add the declaration before the first assignment to each '*var_n*'. However, for a cell array element, the coder.varsize declaration must follow the first assignment to the element. For example:

```
...
x = cell(3, 3);
x{1} = [1 2];
coder.varsize('x{1}');
...
```

You cannot use coder.varsize outside the MATLAB code intended for code generation. For example, the following code does not declare the variable, var, as variable-size data:

```
coder.varsize('var',10);
codegen -config:lib MyFile -args var
```

Instead, include the coder.varsize statement inside MyFile to declare var as variable-size data.

Examples

Develop a Simple Stack That Varies in Size up to 32 Elements as You Push and Pop Data at Run Time.

Write primary function test_stack to issue commands for pushing data on and popping data from a stack.

```
function test_stack %#codegen
    % The directive %#codegen indicates that the function
    % is intended for code generation
```

```
    stack('init', 32);
    for i = 1 : 20
        stack('push', i);
    end
    for i = 1 : 10
        value = stack('pop');
        % Display popped value
        value
    end
end
```

Write local function `stack` to execute the push and pop commands.

```
function y = stack(command, varargin)
    persistent data;
    if isempty(data)
        data = ones(1,0);
    end
    y = 0;
    switch (command)
    case {'init'}
        coder.varsize('data', [1, varargin{1}], [0 1]);
        data = ones(1,0);
    case {'pop'}
        y = data(1);
        data = data(2:size(data, 2));
    case {'push'}
        data = [varargin{1}, data];
    otherwise
        assert(false, ['Wrong command: ', command]);
    end
end
```

The variable `data` is the stack. The statement `coder.varsize('data', [1, varargin{1}], [0 1])` declares that:

- `data` is a row vector
- Its first dimension has a fixed size
- Its second dimension can grow to an upper bound of 32

Generate a MEX function for `test_stack`:

```
codegen -config:mex test_stack
```

`codegen` generates a MEX function in the current folder.

Run `test_stack_mex` to get these results:

```
value =
    20

value =
    19

value =
    18

value =
    17

value =
    16

value =
    15

value =
    14

value =
    13

value =
    12

value =
    11
```

At run time, the number of items in the stack grows from zero to 20, and then shrinks to 10.

Declare a Variable-Size Structure Field.

Write a function `struct_example` that declares an array `data`, where each element is a structure that contains a variable-size field:

```matlab
function y=struct_example() %#codegen

  d = struct('values', zeros(1,0), 'color', 0);
  data = repmat(d, [3 3]);
  coder.varsize('data(:).values');

  for i = 1:numel(data)
      data(i).color = rand-0.5;
      data(i).values = 1:i;
  end

  y = 0;
  for i = 1:numel(data)
      if data(i).color > 0
          y = y + sum(data(i).values);
      end;
  end
```

The statement `coder.varsize('data(:).values')` marks as variable-size the field `values` inside each element of the matrix `data`.

Generate a MEX function for `struct_example`:

```
codegen -config:mex struct_example
```

Run `struct_example`.

Each time you run `struct_example` you get a different answer because the function loads the array with random numbers.

Make a Cell Array Variable-Size

Write the function `make_varsz_cell` that defines a local cell array variable `c` whose elements have the same class, but different sizes. Use `coder.varsize` to indicate that `c` has variable-size.

```matlab
function y =  make_varsz_cell()
c = {1 [2 3]};
coder.varsize('c', [1 3], [0 1]);
y = c;
end
```

Generate a C static library.

```
codegen -config:lib make_varsz_cell -report
```

In the report, view the MATLAB variables.

`c` is a 1x:3 homogeneous cell array whose elements are 1x:2 double.

Make the Elements of a Cell Array Variable-Size

Write the function `mycell` that defines a local cell array variable `c`. Use `coder.varsize` to make the elements of `c` variable-size.

```
function y =  mycell()
c = {1 2 3};
coder.varsize('c{:}', [1 5], [0 1]);
y = c;
end
```

Generate a C static library.

```
codegen -config:lib mycell -report
```

In the report, view the MATLAB variables.

The elements of `c` are 1-by-:5 arrays of doubles.

Limitations

- If you use the cell function to create a `cell` array, you cannot use `coder.varsize` with that cell array.
- If you use `coder.varsize` with a cell array element, the `coder.varsize` declaration must follow the first assignment to the element. For example:

  ```
  ...
  x = cell(3, 3);
  x{1} = [1 2];
  coder.varsize('x{1}');
  ...
  ```
- You cannot use `coder.varsize` with global variables.
- You cannot use `coder.varsize` with MATLAB class properties.

- You cannot use `coder.varsize` with string scalars.

Tips

- `coder.varsize` fixes the size of a singleton dimension unless the `dims` argument explicitly specifies that the singleton dimension has a variable size.

  For example, the following code specifies that `v` has size 1-by-:10. The first dimension (the singleton dimension) has a fixed size. The second dimension has a variable size.

  ```
  coder.varsize('v', [1 10])
  ```

  By contrast, the following code specifies that `v` has size :1-by-:10. Both dimensions have a variable size.

  ```
  coder.varsize('v',[1,10],[1,1])
  ```

  Note For a MATLAB Function block, singleton dimensions of input or output signals cannot have a variable size.

- If you use input variables (or result of a computation using input variables) to specify the size of an array, it is declared as variable-size in the generated code. Do not use `coder.varsize` on the array again, unless you also want to specify an upper bound for its size.

- Using `coder.varsize` on an array without explicit upper bounds causes dynamic memory allocation of the array. This dynamic memory allocation can reduce the speed of generated code. To avoid dynamic memory allocation, use the syntax `coder.varsize('var_1', 'var_2', ..., ubound)` to specify an upper bound for the array size (if you know it in advance).

- A cell array can be variable size only if it is homogeneous. When you use `coder.varsize` with a cell array, the code generator tries to make the cell array homogeneous. It tries to find a class and size that apply to all elements of the cell array. For example, if the first element is double and the second element is 1x2 double, all elements can be represented as 1x:2 double. If the code generator cannot find a common class and size, code generation fails. For example, suppose that the first element of a cell array is char and the second element is double. The code generator cannot find a class that can represent both elements.

Introduced in R2011a

coder.wref

Indicate write-only data to pass by reference

Syntax

```
coder.wref(arg)
```

Description

`coder.wref(arg)` indicates that `arg` is a write-only expression or variable to pass by reference to an external C/C++ function. Use `coder.wref` only inside a `coder.ceval` call. Using `coder.wref(arg)` can allow the code generator to optimize the generated code by ignoring prior assignments to `arg`. Use a separate `coder.wref` construct for each argument that you pass by reference to the function.

Note The memory referenced by `coder.wref(arg)` is write-only. For your generated code to avoid reading uninitialized memory, the C/C++ function must fully initialize the memory in `arg` before reading from it. Initialize the memory by assigning values to every element of `arg` in your C/C++ function. Otherwise, undefined run-time behavior can result.

Examples

Pass Array by Reference as Write-Only

Suppose that you have a C function `init_array`.

```
void init_array(double* array, int numel) {
  for(int i = 0; i < numel; i++) {
    array[i] = 42;
  }
}
```

The C function defines the input variable `array` as a pointer to a double.

Call the C function `init_array` to initialize all elements of y to 42:

```
...
Y = zeros(5, 10);
coder.ceval('init_array', coder.wref(Y), int32(numel(Y)));
...
```

Pass Multiple Arguments as a Write-Only Reference

```
...
U = zeros(5, 10);
V = zeros(5, 10);
coder.ceval('my_fcn', coder.wref(U), int32(numel(U)), coder.wref(V), int32(numel(V)));
...
```

Pass Class Property as a Write-Only Reference

```
...
x = myClass;
x.prop = 1;
coder.ceval('foo', coder.wref(x.prop));
...
```

Pass Structure as a Write-Only Reference

To indicate that the structure type is defined in a C header file, use `coder.cstructname`.

Suppose that you have the C function `init_struct`. This function writes to the input argument but does not read from it.

```
#include "MyStruct.h"

void init_struct(struct MyStruct *my_struct)
{
    my_struct->f1 = 1;
    my_struct->f2 = 2;
}
```

The C header file, `MyStruct.h`, defines a structure type named `MyStruct`:

```
#ifndef MYSTRUCT
#define MYSTRUCT
```

```
typedef struct MyStruct
{
    double f1;
    double f2;
} MyStruct;

void init_struct(struct MyStruct *my_struct);

#endif
```

In your MATLAB function, pass a structure as a write-only reference to `init_struct`. To indicate that the structure type for `s` has the name `MyStruct` that is defined in the C header file `MyStruct.h`, use `coder.cstructname`.

```
function y = foo
%#codegen
y = 0;
coder.updateBuildInfo('addSourceFiles','init_struct.c');

s = struct('f1',1,'f2',2);
coder.cstructname(s,'MyStruct','extern','HeaderFile','MyStruct.h');
coder.ceval('init_struct', coder.wref(s));
```

To generate standalone library code, enter:

```
codegen -config:lib foo -report
```

Pass Structure Field as a Write-Only Reference

```
...
s = struct('s1', struct('a', [0 1]));
coder.ceval('foo', coder.wref(s.s1.a));
...
```

You can also pass an element of an array of structures:

```
...
c = repmat(struct('u',magic(2)),1,10);
b = repmat(struct('c',c),3,6);
a = struct('b',b);
coder.ceval('foo', coder.wref(a.b(3,4).c(2).u));
...
```

Input Arguments

`arg` — Argument to pass by reference
scalar variable | array | element of an array | structure | structure field | object property

Argument to pass by reference to an external C/C++ function. The argument cannot be a class, a System object, a cell array, or an index into a cell array.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical` | `char` | `struct`
Complex Number Support: Yes

Limitations

- You cannot pass these data types by reference:

  - Class or System object

  - Cell array or index into a cell array

- If a property has a get method, a set method, or validators, or is a System object property with certain attributes, then you cannot pass the property by reference to an external function. See "Passing By Reference Not Supported for Some Properties".

Tips

- If `arg` is an array, then `coder.wref(arg)` provides the address of the first element of the array. The `coder.wref(arg)` function does not contain information about the size of the array. If the C function must know the number of elements of your data, pass that information as a separate argument. For example:

  ```
  coder.ceval('myFun',coder.wref(arg),int32(numel(arg)));
  ```

- When you pass a structure by reference to an external C/C++ function, use `coder.cstructname` to provide the name of a C structure type that is defined in a C header file.

- In MATLAB, `coder.wref` results in an error. To parametrize your MATLAB code so that it can run in MATLAB and in generated code, use `coder.target`.

- You can use `coder.opaque` to declare variables that you pass to and from an external C/C++ function.

Introduced in R2011a

createInputDataset

Generate dataset object for root-level Inport blocks in model

Syntax

```
[inports_dataset] = createInputDataset(model)
```

Description

`[inports_dataset] = createInputDataset(model)` generates a `Simulink.SimulationData.Dataset` object from the root-level Inport blocks in a model. Signals in the generated dataset have the properties of the root inports and the corresponding ground values at model start and stop times. You can create `timetable` or `timeseries` objects for the time and values for signals for which you want to load data for simulation. The other signals use ground values.

Examples

Generate and Populate Dataset for Root-Level Inport Blocks

Create a dataset with elements for the four root-level Inport blocks in a model. Use that dataset as a basis for creating a dataset to load signal data into the model.

Open the model. The `In1` block outputs a double, `In2` and `In3` each output a nonvirtual bus, and `In4` outputs an `int16`.

```
mdl = 'ex_dataset_for_inports';
open_system(mdl)
```
Create a `Dataset` object for the root-level Inport blocks.

```
ds = createInputDataset(mdl)
```

```
Simulink.SimulationData.Dataset '' with 4 elements

                             Name  BlockPath
                             ____  _____

    1  [1x1 timeseries]      In1   ''
    2  [1x1 struct    ]      In2   ''
    3  [1x1 struct    ]      In3   ''
    4  [1x1 timeseries]      In4   ''

  - Use braces { } to access, modify, or add elements using index.
```

Replace the placeholder value for the first signal in the `Dataset` with actual signal values that you want to load into the model.

```
ds{1} = ds{1}.delsample('Index',[1,2]);
ds{1} = ds{1}.addsample('time',[1 3 3 10]','data',[1 1 5 5]');
```

Examine the `In2` signal.

```
ds{2}
```

```
ans =

  struct with fields:

    a: [1×1 timeseries]
    b: [1×1 timeseries]
```

For `In2`, create data for bus elements `a` and `b`.

```
ds{2}.a = ds{2}.a.delsample('Index',[1,2]);
ds{2}.a = addsample(ds{2}.a,'time',[1:10]','data',[1:10]');
ds{2}.b = timeseries((1:10)',0.1:.1:1,'Name','sig2_b');
```

For `In3`, specify data for element `a` of the bus, and use ground values for element `b`.

```
ds{3}.a = timeseries((1:10)',0.1:.1:1,'Name','sig3_a');
```

Plot `ds`. For more information, see the `Simulink.SimulationData.Dataset.plot` documentation.

```
plot(ds)
```

Set the **Input** configuration parameter to `ds`.

```
set_param(mdl,'LoadExternalInput','on');
set_param(mdl,'ExternalInput','ds');
```

Tip Alternatively, you can use the Root Inport Mapper tool to set the **Input** parameter. For details, see "Map Root Inport Signal Data".

Run the simulation. The Inport blocks use the signal data specified in `ds` or ground values for elements that do not have specified signal data.

```
sim(mdl)
```

Input Arguments

`model` — Model for which to generate dataset for root-level Inport blocks
character vector | model handle

Model for which to generate a dataset with an element for each root-level Inport block, specified as a character vector or model handle.

Output Arguments

inports_dataset — Dataset with an element for each root-level Inport block
a `Simulink.SimulationData.Dataset` object

Dataset with an element for each root-level Inport block, returned as a `Simulink.SimulationData.Dataset` object.

Introduced in R2017a

getHardwareImplementation

Class: coder.BuildConfig
Package: coder

Get handle of copy of hardware implementation object

Syntax

```
hw = bldcfg.getHardwareImplementation()
```

Description

`hw = bldcfg.getHardwareImplementation()` returns the handle of a copy of the hardware implementation object.

Input Arguments

bldcfg

`coder.BuildConfig` object.

Output Arguments

hw

Handle of copy of hardware implementation object.

See Also

getStdLibInfo

Class: coder.BuildConfig
Package: coder

Get standard library information

Syntax

```
[linkLibPath,linkLibExt,execLibExt,libPrefix]=
bldcfg.getStdLibInfo()
```

Description

`[linkLibPath,linkLibExt,execLibExt,libPrefix]=`
`bldcfg.getStdLibInfo()` returns character vectors representing the:

- Standard MATLAB architecture-specific library path
- Platform-specific library file extension for use at link time
- Platform-specific library file extension for use at run time
- Standard architecture-specific library name prefix

Input Arguments

bldcfg

`coder.BuildConfig` object.

Output Arguments

linkLibPath

Standard MATLAB architecture-specific library path specified as a character vector. The character vector can be empty.

linkLibExt

Platform-specific library file extension for use at link time, specified as a character vector. The value is one of `'.lib'`, `'.dylib'`, `'.so'`, `''`.

execLibExt

Platform-specific library file extension for use at run time, specified as a character vector. The value is one of `'.dll'`, `'.dylib'`, `'.so'`, `''`.

linkPrefix

Standard architecture-specific library name prefix, specified as a character vector. The character vector can be empty.

getTargetLang

Class: coder.BuildConfig
Package: coder

Get target code generation language

Syntax

```
lang = bldcfg.getTargetLang()
```

Description

`lang = bldcfg.getTargetLang()` returns a character vector containing the target code generation language.

Input Arguments

`bldcfg`

`coder.BuildConfig` object.

Output Arguments

`lang`

A character vector containing the target code generation language. The value is `'C'` or `'C++'`.

getToolchainInfo

Class: coder.BuildConfig
Package: coder

Returns handle of copy of toolchain information object

Syntax

```
tc = bldcfg.getToolchainInfo()
```

Description

`tc = bldcfg.getToolchainInfo()` returns a handle of a copy of the toolchain information object.

Input Arguments

bldcfg

`coder.BuildConfig` object.

Output Arguments

tc

Handle of copy of toolchain information object.

See Also

isCodeGenTarget

Class: coder.BuildConfig
Package: coder

Determine if build configuration represents specified target

Syntax

```
tf = bldcfg.isCodeGenTarget(target)
```

Description

`tf = bldcfg.isCodeGenTarget(target)` returns true (1) if the code generation target of the current build configuration represents the code generation target specified by `target`. Otherwise, it returns false (0).

Input Arguments

bldcfg

`coder.BuildConfig` object.

target

Code generation target specified as a character vector or cell array of character vectors.

Specify	For code generation target
`'rtw'`	C/C++ dynamic Library, C/C++ static library, or C/C++ executable
`'sfun'`	S-function (Simulation)
`'mex'`	MEX-function

Specify `target` as a cell array of character vectors to test if the code generation target of the build configuration represents one of the targets specified in the cell array.

For example:

```
...
mytarget = {'sfun','mex'};
tf = bldcfg.isCodeGenTarget(mytarget);
...
```

tests whether the build context represents an S-function target or a MEX-function target.

Output Arguments

tf

The value is true (1) if the code generation target of the build configuration represents the code generation target specified by `target`. Otherwise, the value is false (0).

See Also
coder.target

isMatlabHostTarget

Class: coder.BuildConfig
Package: coder

Determine if hardware implementation object target is MATLAB host computer

Syntax

```
tf = bldcfg.isMatlabHostTarget()
```

Description

`tf = bldcfg.isMatlabHostTarget()` returns true (1) if the current hardware implementation object targets the MATLAB host computer. Otherwise, it returns false (0).

Input Arguments

bldcfg

`coder.BuildConfig` object.

Output Arguments

tf

Value is true (1) if the current hardware implementation object targets the MATLAB host computer. Otherwise, the value is false (0).

See Also

coder.ExternalDependency.getDescriptiveName

Class: coder.ExternalDependency
Package: coder

Return descriptive name for external dependency

Syntax

extname = coder.ExternalDependency.getDescriptiveName(bldcfg)

Description

extname = coder.ExternalDependency.getDescriptiveName(bldcfg) returns
the name that you want to associate with an "external dependency" on page 2-180. The
code generator uses the external dependency name for error messages.

Input Arguments

bldcfg

coder.BuildConfig object. Use coder.BuildConfig methods to get information
about the "build context" on page 2-180

You can use this information when you want to return different names based on the build
context.

Output Arguments

extname

External dependency name returned as a character vector.

Examples

Return external dependency name

Define a method that always returns the same name.

```matlab
function myextname = getDescriptiveName(~)
   myextname = 'MyLibrary'
end
```

Return external library name based on the code generation target

Define a method that uses the build context to determine the name.

```matlab
function myextname = getDescriptiveName(context)
    if context.isMatlabHostTarget()
        myextname = 'MyLibary_MatlabHost';
    else
        myextname = 'MyLibrary_Local';
    end
end
```

Definitions

external dependency

External code interface represented by a class derived from a `coder.ExternalDependency` class. The external code can be a library, object files, or C/C++ source.

build context

Information used by the build process including:

- Target language
- Code generation target

- Target hardware
- Build toolchain

See Also

`coder.BuildConfig` | `coder.ExternalDependency` | `coder.ceval` | `coder.updateBuildInfo`

Topics

"Develop Interface for External C/C++ Code" (MATLAB Coder)

"Integrate External/Custom Code" (MATLAB Coder)

coder.ExternalDependency.isSupportedContext

Class: coder.ExternalDependency
Package: coder

Determine if build context supports external dependency

Syntax

```
tf = coder.ExternalDependency.isSupportedContext(bldcfg)
```

Description

`tf = coder.ExternalDependency.isSupportedContext(bldcfg)` returns true (1) if you can use the "external dependency" on page 2-183 in the current "build context" on page 2-183 . You must provide this method in the class definition for a class that derives from `coder.ExternalDependency`.

If you cannot use the "external dependency" on page 2-183 in the current "build context" on page 2-183, display an error message and stop code generation. The error message must describe why you cannot use the external dependency in this build context. If the method returns false (0), the code generator uses a default error message. The default error message uses the name returned by the `getDescriptiveName` method of the `coder.ExternalDependency` class.

Use `coder.BuildConfig` methods to determine if you can use the external dependency in the current build context.

Input Arguments

bldcfg

`coder.BuildConfig` object. Use `coder.BuildConfig` methods to get information about the "build context" on page 2-183.

Output Arguments

`tf`

Value is true (1) if the build context supports the external dependency.

Examples

Report error when build context does not support external library

This method returns true(1) if the code generation target is a MATLAB host target. Otherwise, the method reports an error and stops code generation.

Write `isSupportedContext` method.

```
function tf = isSupportedContext(ctx)
    if  ctx.isMatlabHostTarget()
        tf = true;
    else
        error('adder library not available for this target');
    end
end
```

Definitions

external dependency

External code interface represented by a class derived from `coder.ExternalDependency` class. The external code can be a library, object file, or C/C++ source.

build context

Information used by the build process including:

- Target language

- Code generation target
- Target hardware
- Build toolchain

See Also

`coder.BuildConfig` | `coder.ExternalDependency` | `coder.ceval` | `coder.updateBuildInfo`

Topics

"Integrate External/Custom Code" (MATLAB Coder)

coder.ExternalDependency.updateBuildInfo

Class: coder.ExternalDependency
Package: coder

Update build information

Syntax

```
coder.ExternalDependency.updateBuildInfo(buildInfo, bldcfg)
```

Description

`coder.ExternalDependency.updateBuildInfo(buildInfo, bldcfg)` updates the build information object whose handle is `buildInfo`. After code generation, the build information object has standard information. Use this method to provide additional information required to link to external code. Use `coder.BuildConfig` methods to get information about the "build context" on page 2-186.

You must implement this method in a subclass of `coder.ExternalDependency`.

Input Arguments

buildInfo

Handle of build information object.

bldcfg

`coder.BuildConfig` object. Use `coder.BuildConfig` methods to get information about the "build context" on page 2-186.

Limitations

- The build information method `AddIncludeFiles` has no effect in a `coder.ExternalDependency` `updateBuildInfo` method.

Definitions

build context

Information used by the build process including:

- Target language
- Code generation target
- Target hardware
- Build toolchain

convertToSLDataset

Convert contents of MAT-file to `Simulink.SimulationData.Dataset` object

Syntax

```
success=convertToSLDataset(source,destination)
success=convertToSLDataset(source,destination,datasetname)
```

Description

`success=convertToSLDataset(source,destination)` converts the contents of a MAT-file (`source`) to a destination MAT-file (`destination`).

`success=convertToSLDataset(source,destination,datasetname)` names the dataset `datasetname`.

When converting structure signal data, the function names the signal using the value contained in the label field of the structure signal field, such as: `mySignal.signal(1).label`.

This function ignores time expressions in source.

Examples

Save Signals to Dataset in file2.mat

Save signals from `file1.mat` to a dataset named `file1` in `file2.mat`.

```
success=convertToSLDataset('file1.mat','file2.mat')
```

Save Signals to Dataset Named myDataset in file2.mat

Save signals from `file1.mat` to a dataset named `myDataset` in `file2.mat`.

```
success=convertToSLDataset('file1.mat','file2.mat','myDataset')
```

Input Arguments

source — MAT-file
character vector

MAT–file that contains Simulink inputs.

destination — MAT-file
character vector

MAT–file to contain `Simulink.SimulationData.Dataset` converted from contents of `source`.

datasetname — Data set name
character vector

Data set name for new `Simulink.SimulationData.Dataset` object.

Output Arguments

success — Outcome of conversion
binary

Outcome of conversion, specified as binary:

- 1

   Conversion is successful.

- 0

   Conversion is not successful.

See Also

Introduced in R2016a

copy

Copy a configuration set

Syntax

copyCs = copy(cs)

Description

copyCs = copy(cs) returns a copy of a configuration set.

Examples

Attach New Configuration Set to a Model

Create a copy of a configuration set and attach it to a model.

Get the active configuration set for your model.

activeConfig = getActiveConfigSet ('vdp');

Copy the active configuration set.

develConfig = copy(activeConfig);

Give the copied configuration set a name.

develConfig.Name = 'develConfig';

Attach the new configuration set to the model.

```
attachConfigSet('vdp',develConfig);
```

Input Arguments

cs — Configuration set
ConfigSet object

Configuration set object to copy, specified as a `ConfigSet` object.

Output Arguments

copyCs — Copy of configuration set
ConfigSet object

A copy of the configuration set, specified as a `ConfigSet` object.

Topics
"About Configuration Sets"
"Manage a Configuration Set"

Introduced before R2006a

createCategory

Create category of Simulink Project labels

Syntax

```
createCategory(proj,categoryName)
createCategory(proj,categoryName,dataType)
createCategory(proj,categoryName,dataType, single-valued)
```

Description

`createCategory(proj,categoryName)` creates a new category of labels `categoryName` in the project `proj`.

`createCategory(proj,categoryName,dataType)` specifies the class of data to store in labels of the new category.

`createCategory(proj,categoryName,dataType, single-valued)` specifies a single-valued category, where you can attach only one label from the category to a file. If you do not specify single-valued, then you can attach multiple labels from the category to a file.

Examples

Create a New Category of Labels for File Ownership

Create a new category of labels for file ownership, and attach a new label and label data to a file.

Open the airframe project and create a project object.

```
sldemo_slproject_airframe
proj = simulinkproject;
```

Create a new category of labels, called `Engineers`, to denote file ownership in a project. These labels have the char `datatype` for attaching character vector data.

```
createCategory(proj,'Engineers','char');
```

Use `findCategory` to get the new category.

```
engineersCategory = findCategory(proj,'Engineers');
```

Create labels in the new category.

```
createLabel(engineersCategory,'Tom');
createLabel(engineersCategory,'Dick')
createLabel(engineersCategory,'Harry')
```

Attach one of the new labels to a file in the project.

```
myfile = findFile(proj,'models/AnalogControl.mdl')
addLabel(myfile,'Engineers','Tom');
```

Get the label and add data.

```
label = findLabel(file,'Engineers','Tom');
label.Data = 'Maintenance responsibility';
disp(label)

Label with properties:

            File: [1x80 char]
            Data: 'Maintenance responsibility'
        DataType: 'char'
            Name: 'Tom'
    CategoryName: 'Engineers'
```

Create a New Category of Labels with Datatype Double

Open the airframe project and create a project object.

```
sldemo_slproject_airframe
proj = simulinkproject;
```

Create a new category of labels.

```
createCategory(proj,'Coverage','double')
```

2-192

```
category =

  Category with properties:

               Name: 'Coverage'
           DataType: 'double'
    LabelDefinitions: []
```

Find out what you can do with the new category.

```
category = findCategory(proj, 'Coverage');
methods(category)

Methods for class slproject.Category:

findLabel   removeLabel   createLabel
```

Create a Single-Valued Category

Open the airframe project and create a project object.

```
sldemo_slproject_airframe
proj = simulinkproject;
```

Create a category of labels for file ownership, and specify single-valued to restrict only one label in the category per file.

```
createCategory(proj,'Engineers','char', 'single-valued');
```

Input Arguments

proj — Project
project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

categoryName — Name of category
character vector

Name of the category of labels to create, specified as a character vector.

dataType — Class of data to store in labels
character vector

The class of data to store in labels in the new category, specified as a character vector.

single-valued — Single-valued category
character vector

Single-valued category, specified as a character vector. Single-valued means you can attach only one label from the category to a file. If you do not specify single-valued, then you can attach multiple labels from the category to a file.

Tips

After you create a new category, you can create labels in the new category. See `createLabel`.

See Also

Functions
`createLabel` | `simulinkproject`

Introduced in R2013a

createLabel

Define Simulink Project label

Syntax

```
createLabel(category,newLabelName)
```

Description

createLabel(category,newLabelName) creates a new label, newLabelName, in a category. Use this syntax if you previously got a category by accessing a Categories property, e.g., using a command like proj.Categories(1).

Use addLabel instead to create and attach a new label in an existing category using a single step.

Use createCategory first if you want to make a new category of labels.

Examples

Create a New Label

Open the airframe project and create a project object.

```
sldemo_slproject_airframe
proj = simulinkproject;
```

Examine the first existing category.

```
cat = proj.Categories(1)

cat =

  Category with properties:
```

```
              Name: 'Classification'
          DataType: 'none'
  LabelDefinitions: [1x8 slproject.LabelDefinition]
```

Define a new label in the category.

```
createLabel(cat,'Future');
```

Create a New Category of Labels for File Ownership

Open the airframe project and create a project object.

```
sldemo_slproject_airframe
proj = simulinkproject;
```

Create creates a new category of labels called `Engineers` which can be used to denote file ownership in a project. These labels have the char `datatype` for attaching character vector data.

```
createCategory(proj,'Engineers','char');
```

Use `findCategory` to get the new category.

```
engineersCategory = findCategory(proj,'Engineers');
```

Create labels in the new category.

```
createLabel(engineersCategory,'Tom');
createLabel(engineersCategory,'Dick');
createLabel(engineersCategory,'Harry');
```

Attach one of the new labels to a file in the project.

```
myfile = findFile(proj,'models/AnalogControl.mdl')
addLabel(myfile,'Engineers', 'Tom');
```

Get the label and add data.

```
label = findLabel(myfile,'Engineers','Tom');
label.Data = 'Maintenance responsibility';
disp(label)

Label with properties:
```

```
      File: [1x80 char]
      Data: 'Maintenance responsibility'
  DataType: 'char'
      Name: 'Tom'
CategoryName: 'Engineers'
```

Input Arguments

category — Category
category object

Category for the new label, specified as a category object. Get the category by accessing a `Categories` property, e.g. with a command like `proj.Categories(1)`, or use `findCategory`. To create a new category, use `createCategory`.

newLabelName — The name of the new label to define
character vector

The name of the new label to define, specified as a character vector.

See Also

Functions
addLabel | createCategory

Introduced in R2013a

addStartupFile

Add startup file to project

Syntax

```
addStartupFile(proj, file)
```

Description

`addStartupFile(proj, file)` adds a startup file to the project `proj`. Startup files automatically run (`.m` and `.p` files), load (.mat files), or open (Simulink models) when you open the project.

Examples

Add a Startup File

Open the airframe project and create a project object.

```
sldemo_slproject_airframe
proj = simulinkproject;
```

Create a new file.

```
filepath = fullfile(proj.RootFolder, 'new_model.slx')
    new_system('new_model');
    save_system('new_model', filepath)
```

Add the new model to the project.

```
 projectFile = addFile(proj, filepath)
```

Automatically open the model when the project opens, by making it a startup file.

```
addStartupFile(proj, filepath);
```

Input Arguments

proj — Project
project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

file — Path of file
character vector

Path of the file to add relative to the project root folder, including the file extension, specified as a character vector. The file must be within the root folder.

Example: 'models/myModelName.slx'

See Also
`simulinkproject`

Introduced in R2017b

addShutdownFile

Add shutdown file to project

Syntax

```
addShutdownFile(proj, file)
```

Description

addShutdownFile(proj, file) adds a shutdown file to the project proj. When you close the project, it runs the shutdown file automatically. Use the shutdown list to specify executable MATLAB code to run as the project shuts down.

Examples

Add a Shutdown File

Open the airframe project and create a project object.

```
sldemo_slproject_airframe
proj = simulinkproject;
```

Specify executable MATLAB code to run as the project shuts down.

```
    filepath = fullfile('utilities', 'rebuild_s_functions.m');
```

Automatically run the file when the project closes, by making it a shutdown file.

```
addShutdownFile(project, filepath);
```

Input Arguments

proj — Project
project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

file — Path of file
character vector

Path of the MATLAB file to add relative to the project root folder, including the file extension, specified as a character vector. The file must be within the root folder.

Example: 'utilities/myscript.m'

See Also
`simulinkproject`

Introduced in R2017b

removeStartupFile

Remove startup file from project startup list

Syntax

```
removeStartupFile(proj, file)
```

Description

removeStartupFile(proj, file) removes the startup file from the startup list in the project proj.

Examples

Remove a Startup File

Open the airframe project and create a project object.

```
sldemo_slproject_airframe
proj = simulinkproject;
```

Create a new file.

```
filepath = fullfile(proj.RootFolder, 'new_model.slx')
    new_system('new_model');
    save_system('new_model', filepath)
```

Add the new model to the project.

```
 projectFile = addFile(proj, filepath)
```

Automatically open the model when the project opens, by making it a startup file.

```
addStartupFile(proj, filepath);
```

Remove the startup file.

```
removeStartupFile(proj, filepath);
```

Input Arguments

proj — Project
project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

file — Path of file
character vector

Path of the file to add relative to the project root folder, including the file extension, specified as a character vector. The file must be within the root folder.

Example: 'models/myModelName.slx'

See Also
`simulinkproject`

Introduced in R2017b

removeShutdownFile

Remove shutdown file from project shutdown list

Syntax

```
removeShutdownFile(proj, file)
```

Description

removeShutdownFile(proj, file) removes the shutdown file from the shutdown list in the project proj.

Examples

Remove a Shutdown File

Open the airframe project and create a project object.

```
sldemo_slproject_airframe
proj = simulinkproject;
```

Specify executable MATLAB code to run as the project shuts down.

```
    filepath = fullfile('utilities', 'rebuild_s_functions.m');
```

Automatically run the file when the project closes, by making it a shutdown file.

```
addShutdownFile(project, filepath);
```

Remove the shutdown file.

```
removeShutdownFile(project, filepath);
```

Input Arguments

`proj` — Project
project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

`file` — Path of file
character vector

Path of the MATLAB file to add relative to the project root folder, including the file extension, specified as a character vector. The file must be within the root folder.

Example: 'utilities/myscript.m'

See Also
`simulinkproject`

Introduced in R2017b

delete_block

Delete blocks from Simulink system

Syntax

```
delete_block(blockArg)
```

Description

`delete_block(blockArg)` deletes the specified blocks from a system. Open the system before you delete blocks.

Examples

Delete Block Using Full Path Name

Delete the block Mu from the `vdp` system.

```
open_system('vdp')
delete_block('vdp/Mu')
```

Delete Block Using Block Handle

Delete the block Out2 from the `vdp` system using the block handle.

Open the `vdp` system.

```
open_system('vdp')
```

Interactively select the block Out1. Get the block's handle and assign it to the variable `Out1_handle`. Delete the block using the handle.

```
Out1_handle = get_param(gcb,'Handle');
delete_block(Out1_handle)
```

Delete Blocks Using Vector of Handles

Delete three blocks from the vdp system.

Open the vdp system. Add three blocks and assign their handles to variables.

```
open_system('vdp')
Constant_handle = add_block('built-in/Constant','vdp/MyConstant');
Gain_handle = add_block('built-in/Gain','vdp/MyGain');
Outport_handle = add_block('built-in/Outport','vdp/MyOutport');
```

Delete the blocks you added using a vector of handles.

```
delete_block([Constant_handle Gain_handle Outport_handle])
```

Input Arguments

blockArg — Blocks to delete
full path name | handle | vector of handles | 1-D cell array of handles or block path names

Blocks to delete, specified as the full block path name, a handle, a vector of handles, or a 1-D cell array of handles or block path names.

Example: 'vdp/Mu'

Example: [handle1 handle2]

Example: {'vdp/Mu' 'vdp/Out1' 'vdp/Out2'}

See Also
add_block

Introduced before R2006a

delete_line

Delete line from Simulink model

Syntax

```
delete_line(sys,out,in)
delete_line(sys,point)
delete_line(lineHandle)
```

Description

`delete_line(sys,out,in)` deletes the line from the model or subsystem `sys` that connects the output port `out` to the input port `in`.

`delete_line(sys,point)` deletes the line that includes the point `point`.

`delete_line(lineHandle)` deletes the line using the line handle.

Examples

Remove Line Using Block Port Names

For the model `vdp`, remove the line connecting the Product block with the Gain block.

```
load_system('vdp');
delete_line('vdp','Product/1','Mu/1');
```

Remove Line Using Line Handle

For the model `vdp`, remove a line using the line handle. You can get the line handle using different techniques.

```
load_system('vdp');
h = get_param('vdp/Mu','LineHandles');
delete_line(h.Outport(1));
```

Get a line handle when you create the line. Delete the line using that handle.

```
a = add_line('vdp','Mu/1','Sum/2');
delete_line(a)
```

Delete a Line Using a Point

You can use a point on the line to delete the whole line.

Find the port coordinates for the block Mu in the model vdp.

```
open_system('vdp');
mu = get_param('vdp/Mu','PortConnectivity');
mu.Position
```

ans = *1×2*

   190   150

ans = *1×2*

   225   150

The line that connects the Mu block to the Sum block starts at the output port, which is at (225,150). You can use any point to the right of that point along the same *x*-axis to delete the line.

```
delete_line('vdp',[230,150]);
```

Delete Segments of Branched Lines

Use delete_line with branched lines to remove the segment for any connection.

Open the model vdp.

```
open_system('vdp');
```

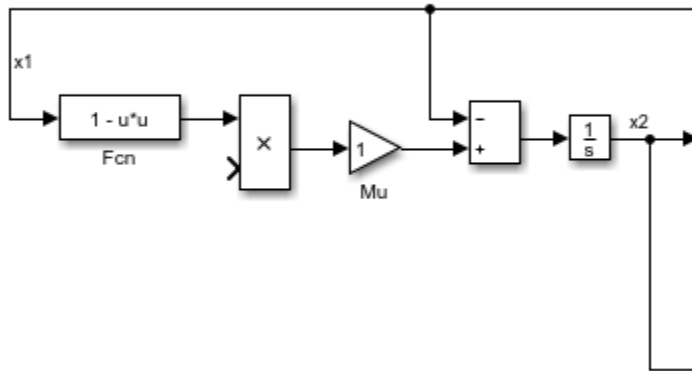
Delete the line from x1 to the Out1 block. This command deletes only the segment of the line that connects the branch to the specified block.

```
delete_line('vdp','x1/1','Out1/1')
```

Delete the line segment from x2 to the Mux.

```
delete_line('vdp','x2/1','Mux/2')
```

Delete the line segment from x2 to the Product block.

```
delete_line('vdp','x2/1','Product/2')
```


Input Arguments

sys — Model or subsystem to delete line from
character vector

Model or subsystem to delete the line from, specified as a character vector.

Example: `'vdp'` , `'f14/Controller'`

out — Block output port to delete line from
block/port name or number character vector | port handle

Block output port to delete line from, specified as either:

- The block name, a slash, and the port name or number. Most block ports are numbered from top to bottom or from left to right. For a state port, use the port name State instead of a port number.
- The port handle that you want to delete the line from.

Use `'PortHandles'` with `get_param` to get the handles.

Example: `'Mu/1', 'Subsystem/2'`

in — Block input port to delete line from
block/port name or number character vector | port handle

Block input port to delete line from, specified as either:

- The block name, a slash, and the port name or number. The port name on:
  - An enabled subsystem is Enable.
  - A triggered subsystem is Trigger.
  - If Action and Switch Case Action subsystems is Action.
- The port handle that you want to delete the line from.

Use `'PortHandles'` with `get_param` to get handles.

Example: `'Mu/1', 'Subsystem/2'`

`point` — Point on the line you want to delete
1-by-2 matrix

Point that falls on the line you want to delete, specified as a 1-by-2 matrix.

Example: `[150 200]`

`lineHandle` — Handle of the line you want to delete
handle

Handle of the line you want to delete. You can get the line handle by using `get_param` with the `'LineHandles'` option or by assigning the line to a handle when you create it programmatically.

See Also
`add_line` | `get_param`

Introduced before R2006a

delete_param

Delete system parameter added via `add_param` command

Syntax

```
delete_param('sys','parameter1','parameter2',...)
```

Description

This command deletes parameters that were added to the system using the `add_param` command. The command displays an error message if a specified parameter was not added with the `add_param` command.

Examples

The following example

```
add_param('vdp','DemoName','VanDerPolEquation','EquationOrder','2')
delete_param('vdp','DemoName')
```

adds the parameters `DemoName` and `EquationOrder` to the `vdp` system, then deletes `DemoName` from the system.

See Also

`add_param`

Introduced before R2006a

dependencies.fileDependencyAnalysis

Find model file dependencies

Syntax

```
files = dependencies.fileDependencyAnalysis('modelname')
[files, missing] = dependencies.fileDependencyAnalysis('modelname')
[files, missing, depfile] = dependencies.fileDependencyAnalysis('
modelname')
[files, missing, depfile, manifestfile] =
dependencies.fileDependencyAnalysis('modelname', 'manifestfile')
```

Description

`files = dependencies.fileDependencyAnalysis('modelname')` returns `files`, a cell array of character vectors containing the full paths of all existing files referenced by the model `modelname`.

`[files, missing] = dependencies.fileDependencyAnalysis('modelname')` returns `files`, all existing files referenced by the model `modelname`, and any referenced files that cannot be found in *missing*.

`[files, missing, depfile] = dependencies.fileDependencyAnalysis('modelname')` also returns `depfile`, the full path of the user dependencies (`.smd`) file, if it exists, that stores the names of any files you manually added or excluded.

`[files, missing, depfile, manifestfile] = dependencies.fileDependencyAnalysis('modelname', 'manifestfile')` also creates a manifest file with the name and path specified in `manifestfile`.

Input Arguments

modelname

Character vector specifying the name of the model to analyze for dependencies.

manifestfile

(Optional) Character vector to specify the name of the manifest file to create. You can specify a full path or just a file name (in which case the file is created in the current folder). The function adds the suffix `.smf` to the user-specified name.

Output Arguments

files

A cell array of character vectors containing the full-paths of all existing files referenced by the model `modelname`. If there is only one dependency, the return is a character vector. If there are no dependencies, the return is empty.

Default: [ ]

missing

A cell array of character vectors containing the names of any files that are referenced by the model `modelname`, but cannot be found.

Default: [ ]

depfile

Character vector containing the full path of a user dependencies (`.smd`) file, if it exists, that stores the names of any files you manually added or excluded. Simulink uses the `.smd` file to remember your changes the next time you generate a manifest. See "Edit Manifests".

Default: [ ]

manifestfile

Character vector containing the name and path of the new manifest file.

Default: [ ]

Examples

The following code analyses the model *mymodel* for file dependencies:

```
files = dependencies.fileDependencyAnalysis('mymodel')
```

If you try dependency analysis on an example model, it returns an empty list of required files because the standard MathWorks installation includes all the files required for the example models.

Tip

If you try dependency analysis on an example model, it returns an empty list of required files because the standard MathWorks installation includes all the files required for the example models.

Alternatives

If your file is in a Simulinkproject, use `listRequiredFiles` instead.

You can interactively run dependency analysis in Simulink Project. See "Run Dependency Analysis".

To create a report to identify where dependencies arise, find required toolboxes, and for more control over dependency analysis options, you can interactively generate a manifest and report. See "Analyze Model Dependencies".

To programmatically check which *toolboxes* are required, see `dependencies.toolboxDependencyAnalysis`.

See Also
`dependencies.toolboxDependencyAnalysis` | `listRequiredFiles`

Topics
"What Are Model Dependencies?"

Introduced in R2012a

dependencies.toolboxDependencyAnalysis

Find toolbox dependencies

Syntax

```
names = dependencies.toolboxDependencyAnalysis(files_in)
[names, folders] = dependencies.toolboxDependencyAnalysis(files_in)
```

Description

`names = dependencies.toolboxDependencyAnalysis(files_in)` returns `names`, a cell array of toolbox names required by the files in `files_in`.

`[names, folders] = dependencies.toolboxDependencyAnalysis(files_in)` returns toolbox names and also a cell array of the toolbox folders.

Tip In a Simulink project, you can interactively run dependency analysis. You can find the required toolboxes for the whole project or for selected files. You can see which products a new team member requires to use the project, or find which file is introducing a product dependency. See "Find Required Toolboxes".

Input Arguments

files_in

Cell array of character vectors containing `.m`, `.mdl`, or `.slx` files on the MATLAB path. Simulink model names (without file extension) are also allowed.

Default: [ ]

Output Arguments

names

Cell array of toolbox names required by the files in `files_in`.

folders

(Optional) Cell-array of the required toolbox folders.

Examples

The following code reports the detectable required toolboxes for the model `vdp`:

```
files_in={'vdp'};
names = dependencies.toolboxDependencyAnalysis(files_in)

names =

    'MATLAB'    'Simulink'    'Simulink Coder'
```

To find all detectable toolbox dependencies of your model *and* the files it depends on:

1 Call `fileDependencyAnalysis` on your model.

For example:

```
files = dependencies.fileDependencyAnalysis('mymodel')

files =
    'C:\Work\foo.m'
    'C:\Work\mymodel.mdl'
```

2 Call `toolboxDependencyAnalysis` on the `files` output of step 1.

For example:

```
tbxes = dependencies.toolboxDependencyAnalysis(files)

tbxes =
[1x24 char]    'MATLAB'    'Simulink Coder'    'Simulink'
```

To view long product names examine the `tbxes` cell array as follows:

```
tbxes{:}

ans =
Image Processing Toolbox

ans =
MATLAB

ans =
Simulink Coder

ans =

Simulink
```

Tips

The function `dependencies.toolboxDependencyAnalysis` looks for toolbox dependencies of the files in `files_in` but does *not* analyze any subsequent dependencies. See "Examples" on page 2-219.

For command-line dependency analysis, the analysis uses the default settings for analysis scope to determine required toolboxes. For example, if you have code generation products, then the check **Find files required for code generation** is on by default and Simulink Coder is always reported as required. See "Required Toolboxes" in the manifest documentation for more examples of how your installed products and analysis scope settings can affect reported toolbox requirements.

Alternatives

In a Simulink project, you can interactively run dependency analysis and find the required toolboxes for the whole project or for selected files. See "Find Required Toolboxes".

For a model that is not in a project, you can interactively generate a manifest and report. You can create a report to identify where dependencies arise, and control dependency analysis options. See "Analyze Model Dependencies".

To programmatically check which *files* are required, see `dependencies.fileDependencyAnalysis`.

Introduced in R2012a

detachConfigSet

Dissociate configuration set or configuration reference from model

Syntax

```
detachConfigSet(model, configObjName)
```

Arguments

`model`

> The name of an open model, or `gcs` to specify the current model

`configObjName`

> The name of a configuration set (`Simulink.ConfigSet`) or configuration reference (`Simulink.ConfigSetRef`)

Description

`detachConfigSet` detaches the configuration set or configuration reference (configuration object) specified by `configObjName` from `model`. If no such configuration object is attached to the model, an error occurs.

Examples

The following example detaches the configuration object named `DevConfig` from the current model. The code is the same whether `DevConfig` is a configuration set or configuration reference.

```
detachConfigSet(gcs, 'DevConfig');
```

See Also

removeLabel(was detachLabelFromFile)

REMOVE — RENAMED TO REMOVELABEL — consolidate with existing removeLabel page. was: Detach label from Simulink Project file

Syntax

```
removeLabel(file,labelDefinition)
```

Description

removeLabel(file,labelDefinition) detaches the specified label labelDefinition from the file. Before you can detach the label, you need to get the label from the file.Label property or by using findLabel.

Examples

Detach a Label from a File

Remove a label from a particular project file.

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Get a particular file by name.

```
myfile = findFile(proj,'models/AnalogControl.mdl')

myfile =

  ProjectFile with properties:

      Path: [1x86 char]
    Labels: [1x1 slproject.Label]
```

Get the `Labels` property of the file.

```
myfile.Labels

ans =

  Label with properties:

            File: 'C:\work\airframe\models\AnalogControl.mdl'
            Data: []
        DataType: 'none'
            Name: 'Design'
    CategoryName: 'Classification'
```

Attach the label `'To Review'` to the file.

```
addLabel(myfile,'Review','To Review')
```

Get the label you want to remove. Index into the Labels property to get the second label attached to the file.

```
 labeltoremove = myfile.Labels(2)

labeltoremove =

  Label with properties:

            File: [1x86 char]
            Data: []
        DataType: 'char'
            Name: 'To Review'
    CategoryName: 'Review'
```

Remove the label from the file.

```
removeLabel(myfile,labeltoremove)
myfile.Labels

ans =

  Label with properties:

            File: [1x86 char]
            Data: []
        DataType: 'none'
```

```
          Name: 'Design'
  CategoryName: 'Classification'
```

Input Arguments

`file` — File to detach label from
file object

File to detach the label from, specified as a file object. You can get the file object by examining the project's Files property (`proj.Files`), or use `findFile` to find a file by name. The file must be within the root folder.

`labelDefinition` — Label to detach
label definition object

Name of the label to detach, specified as a label definition object returned by the `file.Label` property or `findLabel`.

Functions
addLabel | createLabel | findFile | findLabel | simulinkproject

disableimplicitsignalresolution

Convert model to use only explicit signal resolution

Syntax

retVal = disableimplicitsignalresolution('*model*')
retVal = disableimplicitsignalresolution('*model*', *displayOnly*)

Description

retVal = disableimplicitsignalresolution('*model*') inputs a model, reports all signals and states that implicitly resolve to signal objects, and converts the model to resolve only signals and states that explicitly require it. The report and any changes are limited to the model itself; they do not include blocks that are library links.

Before executing this function, ensure that all relevant Simulink data objects are defined in the base workspace or a data dictionary to which the model is linked. The function ignores any data objects that are defined elsewhere.

The function scans *model*, returns a structure of handles to signals and states that resolve implicitly to signal objects, and performs the following operations on *model*:

- Search the model for all output ports and block states that resolve to Simulink signal objects.
- Modify these ports and blocks to enforce signal object resolution in the future.
- Set the model's SignalResolutionControl parameter to 'UseLocalSettings' (GUI: **Explicit Only**).

  If SignalResolutionControl is already set to 'UseLocalSettings' or to 'None', the function takes no action and returns a warning.

- If any Stateflow output data resolves to a Simulink signal object:

  - Turn off hierarchical scoping of signal objects from within the Stateflow chart.
  - Explicitly label the output signal of the Stateflow chart.

- Enforce signal object resolution for this signal in the future.

Any changes made by `disableimplicitsignalresolution` permanently change the model. Be sure to back up the model before calling the function with *displayOnly* defaulted to or specified as `false`.

retVal = disableimplicitsignalresolution('*model*', *displayOnly*) is equivalent to `disableimplicitsignalresolution`(*model*) if *displayOnly* is `false`.

If *displayOnly* is `true`, the function returns a structure of handles to signals and states that resolve implicitly to signal objects, but leaves the model unchanged.

Input Arguments

displayOnly

Boolean specifying whether to change the model (`false`) or just generate a report (`true`)

Default: `false`

model

Model name or handle

Output Arguments

retVal

A MATLAB structure containing:

`Signals`	Handles to ports with signal names that resolve to signal objects
`States`	Handles to blocks with states that resolve to signal objects

See Also
`Simulink.Signal`

Topics
"Data Validity Diagnostics Overview"
"Symbol Resolution"

Introduced in R2007a

docblock

Get or set editor invoked by Simulink DocBlock

Syntax

docblock(setEditorType,command)

editCommand = docblock(getEditorType)

Description

docblock(setEditorType,command) uses the specified command to set the editor opened by double-clicking a DocBlock block.

By default, a DocBlock block opens Microsoft Word to edit HTML or RTF files. If Word is not available on your system, the block opens these file types using the text editor specified on the **Editor/Debugger Preferences** pane of the MATLAB Preferences dialog box. For text files, the default editor is the text editor specified in the MATLAB preferences.

editCommand = docblock(getEditorType) returns the current command to open the specified editor from a DocBlock block.

Input Arguments

setEditorType — File type whose editor command to set
'setEditorHTML' | 'setEditorDOC' | 'setEditorTXT'

File type whose editor command you want to set, specified as 'setEditorHTML', 'setEditorDOC', or 'setEditorTXT'.

command — Command to open file in editor
character vector | ''

Command to open the specified file type in an editor from the MATLAB command prompt, specified as a character vector. Use `''` to reset to the default editor for that file type.

In the command, use the `"%<FileName>"` token to represent the full pathname to the document.

`getEditorType` — File type of the editor command to return
`'getEditorHTML'` | `'getEditorDOC'` | `'getEditorTXT'`

File type of the editor command to return, specified as `'getEditorHTML'`, `'getEditorDOC'`, or `'getEditorTXT'`.

Output Arguments

`editCommand` — Command to open the editor
character vector

Command to open the editor, returned as a character vector.

Examples

Set DocBlock Text Editor

Specify Notepad as the DocBlock editor for text files.

```
docblock('setEditorTXT','system(''notepad "%<FileName>"'');')
```

Set and Get Current HTML Editor

You can use the `docblock` command to get the current editor.

Set your HTML editor for the DocBlock block to Mozilla Composer. The ampersand executes the command in the background.

```
docblock('setEditorHTML',...
    'system(''/usr/local/bin/mozilla -edit "%<FileName>" &'');')
```

Get the current HTML editor.

```
htmlEd = docblock('getEditorHTML')

htmlEd =

    'system('/usr/local/bin/mozilla -edit "%<FileName>" &');'
```

Reset Text Editor to Default

Specify Notepad as the DocBlock editor for text files.

```
docblock('setEditorTXT','system(''notepad "%<FileName>"'');')
```

Get the current text editor.

```
txtEd = docblock('getEditorTXT')

txtEd =

    'system('notepad "%<FileName>"');'
```

Reset the editor to the default editor.

```
docblock('setEditorTXT','')
```

Introduced in R2007a

export

Export Simulink Project to zip

Syntax

```
export(proj,zipFileName)
export(proj,zipFileName,definitionType)
```

Description

export(proj,zipFileName) exports the project proj to a zip file specified by zipFileName. The zip archive preserves the project files, structure, labels, and shortcuts, and does not include any source control information. You can use the zip archive to send the project to customers, suppliers, or colleagues who do not have access to your source control repository. Recipients can create a new project from the zip archive by clicking **New** in the Simulink Project Tool, and then in the start page, clicking **Archive**.

export(proj,zipFileName,definitionType) exports the project using the specified definitionType for the project definition files, single or multiple. If you do not specify definitionType, the project's current setting is used. Use the definitionType export option if you want to change project definition file management from the type selected when the project was created. You can control project definition file management in the preferences.

Examples

Export a Project to a Zip File

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Export the project to a zip file.

```
export(proj,'airframeproj.zip')
```

• "Archive Projects in Zip Files"

Input Arguments

proj — Project
project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

zipFileName — Zip file name or path
character vector

Zip file name or path, specified as a character vector ending in the file extension `.zip`. If `zipFileName` is a filename, Simulink exports the file to the current folder. You can also specify a fully qualified path name.

Example: `'project.zip'`

Data Types: `char`

definitionType — Definition file type
slproject.DefinitionFiles.SingleFile | slproject.DefinitionFiles.MultiFile

Definition file type, specified as `slproject.DefinitionFiles.SingleFile`, `slproject.DefinitionFiles.MultiFile`, or `slproject.DefinitionFiles.FixedPathMultiFile` . Use the `definitionType` export option if you want to change project definition file management from the type selected when the project was created. `MultiFile` is better for avoiding merging issues on shared projects. `SingleFile` is faster but is likely to cause merge issues when two users submit changes in the same project to a source control tool. If you need to work with long file paths, use `FixedPathMultiFile`.

Example: `export(proj,'proj.zip',slproject.DefinitionFiles.SingleFile)`

See Also

Topics
"Archive Projects in Zip Files"

Introduced in R2013a

findCategory

Get Simulink Project category of labels

Syntax

```
category = findCategory(proj,categoryName)
```

Description

`category = findCategory(proj,categoryName)` returns the project category specified by `categoryName`. You need to get a category before you can use `createLabel` or `removeLabel`.

Examples

Get a Category of Project Labels

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Use `findCategory` to get a category of labels by name.

```
category = findCategory(proj,'Classification')

category =

  Category with properties:

                 Name: 'Classification'
             DataType: 'none'
    LabelDefinitions: [1x8 slproject.LabelDefinition]]
```

Alternatively, you can examine categories by index. Get the first category.

```
proj.Categories(1)

ans =

  Category with properties:

                Name: 'Classification'
            DataType: 'none'
    LabelDefinitions: [1x8 slproject.LabelDefinition]
```

Find out what you can do with the category.

```
methods(category)

Methods for class slproject.Category:

createLabel          findLabel   removeLabel
```

Input Arguments

proj — Project
project

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

categoryName — Name of category
character vector

Name of the category to get, specified as a character vector.

Output Arguments

category — Category of labels
category object

Category of labels, returned as a category object that you can query or modify. If the specified category is not found, the function returns an empty array.

See Also

Functions
createLabel | removeLabel | simulinkproject

Introduced in R2013a

findFile

Get Simulink Project file by name

Syntax

```
file = findFile(proj,fileorfolder)
```

Description

`file = findFile(proj,fileorfolder)` returns a specific project file by name. You need to get a file before you can query labels, or use `addLabel` or `removeLabel`.

Examples

Find a File By Name

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Use `findFile` to get a file by name. You need to know the path if it is inside subfolders under the project root.

```
myfile = findFile(proj,'models/AnalogControl.mdl')

myfile =

  ProjectFile with properties:

      Path: [1x86 char]
    Labels: [1x1 slproject.Label]
  Revision: '2'
SourceControlStatus: Unmodified
```

Alternatively, you can examine files by index. Get the first file.

```
file = proj.Files(1);
```

Find out what you can do with the file.

```
methods(file)

Methods for class slproject.ProjectFile:

addLabel     removeLabel   findLabel
```

Input Arguments

`proj` — **Project**
project

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

`fileorfolder` — **Path of file or folder**
character vector | cell array of character vectors | string array

Path of the file or folder to find relative to the project root folder, specified as a character vector, string, or array. Files must include any subfolders under the project root and the file extension. The file or folder must be within the root folder.

Example: 'models/myModelName.slx'

Output Arguments

`file` — **Project file**
file object

Project file, returned as a file object that you can query or modify.

See Also

Functions
addLabel | findCategory | findLabel | removeLabel | simulinkproject

Introduced in R2013a

findLabel

Get Simulink Project file label

Syntax

```
label = findLabel(file,categoryName,labelName)
label = findLabel(file,labelDefinition)
label = findLabel(category,labelName)
```

Description

`label = findLabel(file,categoryName,labelName)` returns the label and its attached data for the label `labelName` in the category `categoryName` that is attached to the specified `file` or files. Use this syntax when you know the label name and category.

`label = findLabel(file,labelDefinition)` returns the file label and its attached data for the label name and category specified by `labelDefinition`. Use this syntax if you previously got a `labelDefinition` by accessing a `Labels` property, e.g., using a command like `myfile.Labels(1)`.

`label = findLabel(category,labelName)` returns the label definition of the label in this category specified by `labelName`. Returns an empty array if the label is not found.

Examples

Find Files with the Label `Utilility`

Find all project files with a particular label.

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Get the list of project files.

```
files = proj.Files;
```

Loop through each file. If the file has the extension .m, attach the label Utility.

```
for fileIndex = 1:numel(files)
   file = files(fileIndex);
   [~, ~, fileExtension] = fileparts(file.Path);
   if strcmp(fileExtension,'.m')
      addLabel(file,'Classification','Utility');
   end
end
```

Find all the files with the label Utility and add them to a list returned in utility_files_to_review.

```
utility_files_to_review = {};
for jj=1:numel(files)
   this_file = files(jj);

   label = findLabel(this_file,'Classification','Utility');

   if ( ~isempty(label))
      % This is a file labeled 'Utility'. Add to the
      % list of utility files.
      utility_files_to_review = [utility_files_to_review; this_file];
   end
end
```

Find a Label by Name or Definition

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Get a particular file by name.

```
myfile = findFile(proj,'models/AnalogControl.mdl');
```

Get a label by name.

```
label = findLabel(myfile,'Classification','Design');
```

2-243

Alternatively, examine the `Labels` property of the file to get an array of Label objects, one for each label attached to the file.

```
labels = myfile.Labels
```

Index into the Labels property to get the label attached to the particular file.

```
labeldefinition = myfile.Labels(1)
```

After you get the label definition from the Labels property, you can use it with `findLabel`.

```
label = findLabel(myfile,labeldefinition);
```

Find Labels by Name or Definition

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Get a category.

```
category = proj.Categories(1)

category =

  Category with properties:

                Name: 'Classification'
            DataType: 'none'
    LabelDefinitions: [1x8 slproject.LabelDefinition]
```

Get a label definition.

```
ld = findLabel(category,'Design')

ld =

  LabelDefinition with properties:
```

```
          Name: 'Design'
  CategoryName: 'Classification'
```

Input Arguments

file — File to search labels of
file object

File to search the labels of, specified as a file object or an array of file objects. You can get the file object by examining the project's Files property (`proj.Files`), or use `findFile` to get a file by name. The file must be in the project.

categoryName — Name of category
character vector

Name of the parent category for the label, specified as a character vector.

labelName — Name of label
character vector

Name of the label to get, specified as a character vector.

labelDefinition — Name of label
label definition object

Name of the label to get, specified as a label definition object returned by the `file.Label` property.

category — Category of labels
category object

Category of labels, specified as a category object. Get a category object from the `proj.Categories` property or by using `findCategory`.

Output Arguments

label — Label
label object

Label, returned as a label object.

Functions
addLabel | createLabel | findFile | simulinkproject

Introduced in R2013a

findLabelDefinition(renamed to findLabel)

Get Simulink Project label definition

Syntax

```
labelDefinition = findLabelDefinition(category,labelName)
```

Description

`labelDefinition = findLabelDefinition(category,labelName)` returns the label definition of the label in this category specified by `labelName`. Returns an empty array if the label is not found.

Examples

Find Labels by Name or Definition

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Get a category.

```
category = proj.Categories(1)

category =

  Category with properties:

                Name: 'Review'
            DataType: 'char'
    LabelDefinitions: [1x4 slproject.LabelDefinition]
```

Get a label definition.

```
ld = findLabelDefinition(category,'To Review')

ld =

  LabelDefinition with properties:

            Name: 'To Review'
    CategoryName: 'Review'
```

Alternatively, get a file and examine the `Labels` property to get an array of Label objects, one for each label attached to the file.

```
myfile = findFile(proj,'models/AnalogControl.mdl');
labels = myfile.Labels
```

Index into the Labels property to get the second label attached to the particular file.

```
labeldefinition = myfile.Labels(1)
```

After you get the label definition from the Labels property, you can use it with `findLabel`.

```
label = findLabel(myfile,labeldefinition);
```

Alternatively, get a particular file by name, and then get one of its labels by name.

```
myfile = findFile(proj,'models/AnalogControl.mdl');
label = findLabel(myfile,'Review','To Review');
```

Input Arguments

labelName — Name of label
character vector

Name of the label to get, specified as a character vector.

category — Category of labels
category object

Category of labels, specified as a category object. Get a category object from the `proj.Categories` property or by using `findCategory`.

Output Arguments

`labelDefinition` — Label definition
label definition object

Label definition, returned as a label definition object. Query the label definition properties to find the label data type.

Functions
addLabel | createLabel | findCategory | simulinkproject

Introduced in R2013a

find_mdlrefs

Find Model blocks and referenced models at all levels or at top level only

Syntax

```
[refMdls,mdlBlks] = find_mdlrefs(system)
[refMdls,mdlBlks] = find_mdlrefs(system,Name,Value)
[refMdls,mdlBlks] = find_mdlrefs(system,allLevels)
```

Description

`[refMdls,mdlBlks] = find_mdlrefs(system)` finds all referenced models and Model blocks contained by the subsystem or model reference hierarchy that `system` is the top level of.

`[refMdls,mdlBlks] = find_mdlrefs(system,Name,Value)` finds referenced models and Model blocks with additional options specified by one or more `Name,Value` pair arguments.

`[refMdls,mdlBlks] = find_mdlrefs(system,allLevels)` specifies the levels of the system to search.

Tip The `find_mdlrefs` function provides two different ways to specify the levels of the system to search. Both techniques give the same results, but only the name and value technique allows you to control inclusion of protected and variant models in `refMdls`.

Examples

Find Referenced Models in Model Reference Hierarchy

Find referenced models and Model blocks for all models referenced by the specified model. Include all model reference variants.

```
load_system('sldemo_mdlref_variants_enum');
[myModels,myModelBlks] = find_mdlrefs('sldemo_mdlref_variants_enum',...
'AllLevels',true,'Variants','AllVariants')

myModels = 9x1 cell array
    {'sldemo_mrv_linear_controller'     }
    {'sldemo_mrv_nonlinear_controller'  }
    {'sldemo_mrv_sig_filter1_production'}
    {'sldemo_mrv_sig_filter1_prototype' }
    {'sldemo_mrv_sig_filter2_production'}
    {'sldemo_mrv_sig_filter2_prototype' }
    {'sldemo_mrv_sig_filter3_production'}
    {'sldemo_mrv_sig_filter3_prototype' }
    {'sldemo_mdlref_variants_enum'      }

myModelBlks = 8x1 cell array
    {'sldemo_mdlref_variants_enum/Controller/Linear'    }
    {'sldemo_mdlref_variants_enum/Controller/Nonlinear'}
    {'sldemo_mdlref_variants_enum/Filter1/Production'   }
    {'sldemo_mdlref_variants_enum/Filter1/Prototype'    }
    {'sldemo_mdlref_variants_enum/Filter2/Production'   }
    {'sldemo_mdlref_variants_enum/Filter2/Prototype'    }
    {'sldemo_mdlref_variants_enum/Filter3/Production'   }
    {'sldemo_mdlref_variants_enum/Filter3/Prototype'    }
```

- "Set up Model Variants Using a Model Block"
- "Simulate Protected Models from Third Parties"

Input Arguments

system — System to search
character vector | handle

System to search, specified as a character vector or a handle.

- The character vector can be the path to a Model block, subsystem, or a model in a model reference hierarchy.
- The handle can be for a Model block, subsystem, or model in a model reference hierarchy.

allLevels — Levels to search
true (default) | false

Levels to search, specified as true or false.

- true — Search all Model blocks in the model reference hierarchy for which the system is the top model.
- false — Search only the top-level system.

Data Types: logical

Name-Value Pair Arguments

Specify optional comma-separated pairs of Name,Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as Name1,Value1,...,NameN,ValueN.

Example: refModels = find_mdlrefs(top_model,'Variants',true)

AllLevels — Levels to search
true (default) | false

Levels to search, specified as a true or false.

- true — Search all Model blocks in the model reference hierarchy for which the system is the top model.
- false — Search only the top-level system.

Data Types: logical

IncludeProtectedModels — Include protected models in search results
false (default) | true

Include protected models in search, specified as true or false. This setting does not affect the list of Model blocks returned.

Data Types: logical

Variants — Include variants in search
'ActivePlusCodeVariants' (default) | 'ActiveVariants' | 'AllVariants'

Include variants in search, specified as `'ActivePlusCodeVariants'`, `'ActiveVariants'`, or `'AllVariants'`.

- `'ActivePlusCodeVariants'` — Include all variants for Model Variants blocks for which you select the **Generate preprocessor conditionals** option.
- `'ActiveVariants'` — Include the active variant for Model Variants blocks.
- `'AllVariants'` — Include all variants for Model Variants blocks.

IncludeCommented — Include commented blocks in search
false (default) | true

Include commented blocks in search, specified as `false` or `true`.

Data Types: logical

KeepModelsLoaded — Keep loaded models that function loads
false (default) | true

The `find_mdlrefs` function loads the models in the model reference hierarchy of the model that you specify. By default, the function closes those models, except for models that were already loaded before execution of the function. To keep all the models loaded that the function loads, set this argument to `true`.

Data Types: logical

Output Arguments

refMdls — Names of referenced models
cell array of character vectors

Names of referenced models, returned as a cell array of character vectors. The last element is the system you specified in the `system` input argument or the parent model of that system.

mdlBlks — Names of Model blocks
cell array of character vectors

Names of Model blocks, returned as a cell array of character vectors.

Model | `find_system`

Topics

"Set up Model Variants Using a Model Block"
"Simulate Protected Models from Third Parties"
"Model Referencing"

Introduced before R2006a

find_system

Find systems, blocks, lines, ports, and annotations

Syntax

```
Objects = find_system
Objects = find_system(System)
Objects = find_system(Name,Value)
Objects = find_system(System,Name,Value)
```

Description

`Objects = find_system` returns loaded systems and their blocks, including subsystems.

`Objects = find_system(System)` returns the specified system and its blocks.

`Objects = find_system(Name,Value)` returns loaded systems and the objects in those systems that meet the criteria specified by one or more `Name,Value` pair arguments. You can use this syntax to specify search constraints and to search for specific parameter values. Specify the search constraints before the parameter and value pairs.

`Objects = find_system(System,Name,Value)` returns the objects in the specified system that meet the specified criteria.

Input Arguments

System — System to search
path name | cell array of path names | handle | vector of handles

System to search, specified as the full system path name, a cell array of system path names, a handle, or a vector of handles.

Example: `'MyModel/Subsystem1'`

Example: `{'vdp','fuelsys'}`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

When you use the `find_system` function, `Name,Value` pair arguments can include search constraints and parameter name and value pairs. You can specify search constraints in any order, but they must precede the parameter name and value pairs.

See "Model Parameters" on page 6-2 and "Block-Specific Parameters" on page 6-130 for the lists of model and block parameters.

Example: `'SearchDepth','0','LookUnderMasks','none','BlockType','Goto'` searches in loaded systems, excluding masked subsystems, for Goto blocks.

The table lists the possible search constraint pairs. Braces indicate default values.

Name	Value Type	Description
`'BlockDialogParams'`	character vector	Search block dialog box parameters for the specified value. This pair, like parameter and value pairs, must follow the other search constraint pairs.
`'CaseSensitive'`	`{'on'}` | `'off'`	If `'on'`, search considers case when matching.
`'FindAll'`	`'on'` | `{'off'}`	If `'on'`, search includes lines, ports, and annotations within systems. `find_system` returns a vector of handles when this option is set to `'on'`, regardless of how you specify `System`.
`'FirstResultOnly'`	`'on'` | `{'off'}`	Return only the first result found and stop the search.

Name	Value Type	Description
'FollowLinks'	'on' | {'off'}	If 'on', search follows links into library blocks. If you do not specify a system to search, find_system includes loaded libraries in the results, whether you set 'FollowLinks' to 'on' or 'off'. You can use 'FollowLinks' with 'LookUnderMasks' to update library links in subsystems. See "Update Library Links in a Subsystem" on page 2-263.
'IncludeCommented'	'on' | {'off'}	Specify whether to include commented blocks in the search.
'LoadFullyIfNeeded'	{'on'} | 'off'	If 'on', attempts to load any partially loaded models. If 'off', disables model loading. Use this pair, for example, to prevent load warnings.
'LookUnderMasks'	{'graphical'}	Search includes masked subsystems that have no workspaces and no dialogs.
	'none'	Search skips masked subsystems.
	'functional'	Search includes masked subsystems that do not have dialogs.
	'all'	Search includes all masked subsystems.
	'on' | 'off'	If 'on', search includes all masked subsystems. If 'off', search skips masked subsystem.
'RegExp'	'on' | {'off'}	If 'on', search treats search expressions as regular expressions. To learn more about MATLAB regular expressions, see "Regular Expressions" (MATLAB).

Name	Value Type	Description
`'SearchDepth'`	positive integer character vector	Restricts the search depth to the specified level (`'0'` for loaded systems only, `'1'` for blocks and subsystems of the top-level system, `'2'` for the top-level system and its children, etc.). The default is all levels.
`'Variants'` This search constraint applies only to variant subsystems and model variants.	`{'ActiveVariants'}`	Search in only the active variant subsystems.
	`'AllVariants'`	Search in all variants.
	`'ActivePlusCodeVariants'`	Search all variants if any generate preprocessor conditionals. Otherwise, search only the active variant.

Output Arguments

`Objects` — Matching objects
cell array of path names | vector of handles

Matching objects found, returned as:

- A cell array of path names if you specified `System` as a path name or cell array of path names, or if you did not specify a system
- A vector of handles if you specified `System` as a handle or vector of handles

Examples

Find Loaded Systems and Their Blocks

Return the names of all loaded systems and their blocks.

```
load_system('vdp')
find_system

ans = 13x1 cell array
    {'vdp'                    }
```

```
{'vdp/Fcn'                }
{'vdp/More Info'          }
{'vdp/More Info/Model Info'}
{'vdp/Mu'                 }
{'vdp/Mux'                }
{'vdp/Product'            }
{'vdp/Scope'              }
{'vdp/Sum'                }
{'vdp/x1'                 }
{'vdp/x2'                 }
{'vdp/Out1'               }
{'vdp/Out2'               }
```

Returns loaded systems and libraries, including vdp.

Find Specific System and Its Blocks

Return vdp system and its blocks.

```
load_system({'vdp','fuelsys'})
find_system('vdp')

ans = 13x1 cell array
    {'vdp'                    }
    {'vdp/Fcn'                }
    {'vdp/More Info'          }
    {'vdp/More Info/Model Info'}
    {'vdp/Mu'                 }
    {'vdp/Mux'                }
    {'vdp/Product'            }
    {'vdp/Scope'              }
    {'vdp/Sum'                }
    {'vdp/x1'                 }
    {'vdp/x2'                 }
    {'vdp/Out1'               }
    {'vdp/Out2'               }
```

Return Names of Loaded Models

Return the names of only the loaded models, i.e., block diagrams. This command returns library names as well, because libraries are treated as models.

```
load_system('vdp');
open_bd = find_system('type','block_diagram')

open_bd = 1x1 cell array
    {'vdp'}
```

Search Children of Subsystem

Return the names of all Goto blocks that are children of the Unlocked subsystem in the `sldemo_clutch` system.

```
load_system('sldemo_clutch');
find_system('sldemo_clutch/Unlocked','SearchDepth',1,'BlockType','Goto')

ans = 2x1 cell array
    {'sldemo_clutch/Unlocked/Goto' }
    {'sldemo_clutch/Unlocked/Goto1'}
```

Search Using Multiple Criteria

Search in the `vdp` system and return the names of all Gain blocks whose **Gain** value is set to 1.

```
load_system('vdp');
find_system('vdp','BlockType','Gain','Gain','1')

ans = 1x1 cell array
    {'vdp/Mu'}
```

Return Lines and Annotations as Handles

Get the handles of all lines and annotations in the vdp system. With `'FindAll'`, the function returns handles regardless of how you specify the system to search.

```
load_system('vdp');
L = find_system('vdp','FindAll','on','type','line')
```

L = *17×1*

```
   33.0012
   32.0013
   31.0012
   30.0012
   29.0012
   28.0012
   27.0012
   26.0012
   25.0012
   24.0012
      ⋮
```

```
A = find_system('vdp','FindAll','on','type','annotation')
```

A = *2×1*

```
   35.0012
   34.0012
```

Search for Specific Block Parameter Value

Find any block dialog box parameters with a value of 0 in the vdp and fuelsys systems.

```
load_system({'vdp','fuelsys'})
find_system({'vdp','fuelsys'},'BlockDialogParams','0')
```

ans =

```
    'vdp/x2'
    'vdp/Out1'
    'vdp/Out2'
```

```
             'fuelsys/Constant2'
             'fuelsys/Constant4'
             'fuelsys/Constant5'
             'fuelsys/engine …'
             'fuelsys/engine …'
             'fuelsys/engine …'
             'fuelsys/engine …'
                        .
                        .
                        .
```

Search Using Regular Expressions

Find all blocks in the top level of the currently loaded systems with a block dialog
parameter value that starts with 3.

```
load_system({'fuelsys','vdp'});
find_system('SearchDepth','1','regexp','on','BlockDialogParams','^3')

ans = 3x1 cell array
    {'vdp/Scope'         }
    {'vdp/Scope'         }
    {'fuelsys/Nominal...'}
```

Regular Expression Search for Partial Match

When you search using regular expressions, you can specify a part of the character vector
you want to match to return all objects that contain that character vector. Find all the
inport and outport blocks in the sldemo_clutch model.

```
load_system('sldemo_clutch');
find_system('sldemo_clutch','regexp','on','blocktype','port')

ans = 39x1 cell array
    {'sldemo_clutch/Friction...'                      }
    {'sldemo_clutch/Friction...'                      }
    {'sldemo_clutch/Friction...'                      }
    {'sldemo_clutch/Friction Mode Logic/Tin'          }
    {'sldemo_clutch/Friction Mode Logic/Tfmaxs'       }
```

```
{'sldemo_clutch/Friction Mode Logic/Break Apart...'          }
{'sldemo_clutch/Friction Mode Logic/Break Apart...'          }
{'sldemo_clutch/Friction Mode Logic/Break Apart...'          }
{'sldemo_clutch/Friction Mode Logic/Lockup...'               }
{'sldemo_clutch/Friction Mode Logic/Lockup...'               }
{'sldemo_clutch/Friction Mode Logic/Lockup...'               }
{'sldemo_clutch/Friction Mode Logic/Lockup...'               }
{'sldemo_clutch/Friction Mode Logic/Lockup...'               }
{'sldemo_clutch/Friction Mode Logic/Lockup...'               }
{'sldemo_clutch/Friction Mode Logic/Lockup...'               }
{'sldemo_clutch/Friction Mode Logic/Lockup FSM/lock'         }
{'sldemo_clutch/Friction Mode Logic/Lockup FSM/unlock'       }
{'sldemo_clutch/Friction Mode Logic/Lockup FSM/locked'       }
{'sldemo_clutch/Friction Mode Logic/Requisite Friction/Tin'}
{'sldemo_clutch/Friction Mode Logic/Requisite Friction/Tf' }
{'sldemo_clutch/Friction Mode Logic/locked'                  }
{'sldemo_clutch/Friction Mode Logic/lock'                    }
{'sldemo_clutch/Friction Mode Logic/unlock'                  }
{'sldemo_clutch/Friction Mode Logic/Tf'                      }
{'sldemo_clutch/Locked/Tin'                                  }
{'sldemo_clutch/Locked/w'                                    }
{'sldemo_clutch/Unlocked/Tfmaxk'                             }
{'sldemo_clutch/Unlocked/Tin'                                }
{'sldemo_clutch/Unlocked/we'                                 }
{'sldemo_clutch/Unlocked/wv'                                 }
{'sldemo_clutch/we'                                          }
{'sldemo_clutch/wv'                                          }
{'sldemo_clutch/w'                                           }
{'sldemo_clutch/Locked Flag'                                 }
{'sldemo_clutch/Lockup Flag'                                 }
{'sldemo_clutch/Break-Apart Flag'                            }
{'sldemo_clutch/FrictionTorque...'                           }
{'sldemo_clutch/Max Static...'                               }
```

Update Library Links in a Subsystem

In this example, myModel contains a single subsystem, which is a library link. After the model was last opened, a Gain block was added to the corresponding subsystem in the library.

Open the model. Use `find_system` with `'FollowLinks'` set to `'off'`. The command does not follow the library links into the subsystem and returns only the subsystem at the top level.

```
open_system('myModel')
find_system(bdroot,'LookUnderMasks','on','FollowLinks', 'off')

ans =

    'myModel'
    'myModel/Subsystem'
```

Use `find_system` with `'FollowLinks'` set to `'on'`. `find_system` updates the library links and returns the block in the subsystem.

```
find_system(bdroot,'LookUnderMasks','on','FollowLinks','on')

Updating Link: myModel/Subsystem/Gain
Updating Link: myModel/Subsystem/Gain

ans =

    'myModel'
    'myModel/Subsystem'
    'myModel/Subsystem/Gain'
```

Return Values as Handles

Provide the system to `find_system` as a handle. Search for block dialog box parameters with a value of `0`. If you make multiple calls to `get_param` for the same block, then using the block handle is more efficient than specifying the full block path as a character vector.

```
load_system('vdp');
sys = get_param('vdp','Handle');
find_system(sys,'BlockDialogParams','0')

ans = 6×1

    11.0029
    14.0029
    15.0028
    15.0028
    16.0028
```

```
16.0028

Introduced before R2006a

fixdt

Create `Simulink.NumericType` object describing fixed-point or floating-point data type

Syntax

```
a = fixdt(Signed, WordLength)
a = fixdt(Signed, WordLength, FractionLength)
a = fixdt(Signed, WordLength, TotalSlope, Bias)
a = fixdt(Signed, WordLength, SlopeAdjustmentFactor, FixedExponent,
Bias)
a = fixdt(DataTypeNameString)
a = fixdt(..., 'DataTypeOverride', 'Off')
[DataType,IsScaledDouble] = fixdt(DataTypeNameString)
[DataType,IsScaledDouble] = fixdt(DataTypeNameString,
'DataTypeOverride', 'Off')
```

Description

`a = fixdt(Signed, WordLength)` returns a `Simulink.NumericType` object describing a fixed-point data type with unspecified scaling. The scaling would typically be determined by another block parameter. `Signed` can be `0` (false) for unsigned or `1` (true) for signed.

`a = fixdt(Signed, WordLength, FractionLength)` returns a `Simulink.NumericType` object describing a fixed-point data type with binary point scaling. `FractionLength` can be greater than `WordLength`. For more information, see "Binary Point Interpretation" (Fixed-Point Designer).

`a = fixdt(Signed, WordLength, TotalSlope, Bias)` or `a = fixdt(Signed, WordLength, SlopeAdjustmentFactor, FixedExponent, Bias)` returns a `Simulink.NumericType` object describing a fixed-point data type with slope and bias scaling.

`a = fixdt(DataTypeNameString)` returns a `Simulink.NumericType` object describing an integer, fixed-point, or floating-point data type specified by a data type

name. The data type name can be either the name of a built-in Simulink data type or the name of a fixed-point data type that conforms to the naming convention for fixed-point names established by the Fixed-Point Designer product. For more information, see "Fixed-Point Data Type and Scaling Notation" (Fixed-Point Designer).

`a = fixdt(..., 'DataTypeOverride', 'Off')` returns a `Simulink.NumericType` object with its `DataTypeOverride` parameter set to `Off`. The default value for this property is `Inherit`. You can specify the `DataTypeOverride` parameter after any combination of other input parameters.

`[DataType,IsScaledDouble] = fixdt(DataTypeNameString)` returns a `Simulink.NumericType` object describing an integer, fixed-point, or floating-point data type specified by a data type name and a flag that indicates whether the specified data type name was the name of a scaled double data type.

`[DataType,IsScaledDouble] = fixdt(DataTypeNameString, 'DataTypeOverride', 'Off')` returns:

- A `Simulink.NumericType` object describing an integer, fixed-point, or floating-point data type specified by a data type name. The `DataTypeOverride` parameter of the `Simulink.NumericType` object is set to `Off`.

- A flag that indicates whether the specified data type name was the name of a scaled double data type.

Examples

Return a `Simulink.NumericType` object describing a fixed-point data type with unspecified scaling:

```
a = fixdt(1,16)

a =

Simulink.NumericType
    DataTypeMode: 'Fixed-point: unspecified scaling'
      Signedness: 'Signed'
      WordLength: 16
         IsAlias: false
      HeaderFile: ''
     Description: ''
```

Return a `Simulink.NumericType` object describing a fixed-point data type with binary point scaling :

```
a = fixdt(1,16,2)

a =

Simulink.NumericType
    DataTypeMode: 'Fixed-point: binary point scaling'
      Signedness: 'Signed'
      WordLength: 16
  FractionLength: 2
          IsAlias: false
       HeaderFile: ''
      Description: ''
```

Return a `Simulink.NumericType` object describing a fixed-point data type with slope and bias scaling:

```
a = fixdt(1, 16, 2^-2, 4)

a =

Simulink.NumericType
    DataTypeMode: 'Fixed-point: slope and bias scaling'
      Signedness: 'Signed'
      WordLength: 16
            Slope: 0.25
             Bias: 4
          IsAlias: false
       HeaderFile: ''
      Description: ''
```

Return a `Simulink.NumericType` object describing an integer, fixed-point, or floating-point data type specified by a data type name:

```
[DataType,IsScaledDouble] = fixdt('ufix8')

DataType =

Simulink.NumericType
    DataTypeMode: 'Fixed-point: binary point scaling'
      Signedness: 'Unsigned'
      WordLength: 8
  FractionLength: 0
```

```
      IsAlias: false
    HeaderFile: ''
   Description: ''
IsScaledDouble =

     0
```

Return a `Simulink.NumericType` object with its `DataTypeOverride` property set to `Off`:

```
 a = fixdt(0, 8, 2, 'DataTypeOverride', 'Off')

a =

Simulink.NumericType
    DataTypeMode: 'Fixed-point: binary point scaling'
     Signedness: 'Unsigned'
     WordLength: 8
  FractionLength: 2
DataTypeOverride: Off
        IsAlias: false
     HeaderFile: ''
    Description: ''
```

fixpt_evenspace_cleanup

Modify breakpoints of lookup table to have even spacing

Syntax

xdata_modified = fixpt_evenspace_cleanup(*xdata*,*xdt*,*xscale*)

Description

xdata_modified = fixpt_evenspace_cleanup(*xdata*,*xdt*,*xscale*) modifies breakpoints of a lookup table to have even spacing after quantization. By adjusting breakpoints to have even spacing after quantization, Simulink Coder generated code can exclude breakpoints from memory.

xdata is the breakpoint vector of a lookup table to make evenly spaced, such as 0:0.005:1. *xdt* is the data type of the breakpoints, such as sfix(16). *xscale* is the scaling of the breakpoints, such as 2^-12. Using these three inputs, fixpt_evenspace_cleanup returns the modified breakpoints in *xdata_modified*.

This function works only with nontunable data and considers data to have even spacing relative to the scaling slope. For example, the breakpoint vector [0 2 5], which has spacing value 2 and 3, appears to have uneven spacing. However, the difference between the maximum spacing 3 and the minimum spacing 2 equals 1. If the scaling slope is 1 or greater, a spacing variation of 1 represents a 1-bit change or less. In this case, the fixpt_evenspace_cleanup function considers a spacing variation of 1 bit or less to be even.

Modifications to breakpoints can change the numerical behavior of a lookup table. To check for changes, test the model using simulation, rapid prototyping, or other appropriate methods.

Examples

Modify breakpoints of a lookup table to have even spacing after quantization:

```
xdata = 0:0.005:1;
xdt = sfix(16);
xscale = 2^-12;
xdata_modified = fixpt_evenspace_cleanup(xdata,xdt,xscale)
```

fixpt_interp1

Implement 1-D lookup table

Syntax

y = fixpt_interp1(*xdata*,*ydata*,*x*,*xdt*,*xscale*,*ydt*,*yscale*,*rndmeth*)

Description

y = fixpt_interp1(*xdata*,*ydata*,*x*,*xdt*,*xscale*,*ydt*,*yscale*,*rndmeth*) implements a one-dimensional lookup table to find output *y* for input *x*. If *x* falls between two *xdata* values (breakpoints), *y* is the result of interpolating between the corresponding *ydata* values. If *x* is greater than the maximum value in *xdata*, *y* is the maximum *ydata* value. If *x* is less than the minimum value in *xdata*, *y* is the minimum *ydata* value.

If the input data type *xdt* or the output data type *ydt* is floating point, fixpt_interp1 performs the interpolation using floating-point calculations. Otherwise, fixpt_interp1 uses integer-only calculations. These calculations handle the input scaling *xscale* and the output scaling *yscale* and obey the rounding method *rndmeth*.

Input Arguments

xdata

Vector of breakpoints for the lookup table, such as linspace(0,8,33).

ydata

Vector of table data that correspond to the breakpoints for the lookup table, such as sin(xdata).

x

Vector of input values for the lookup table to process, such as linspace(-1,9,201).

xdt

Data type of input x, such as `sfix(8)`.

xscale

Scaling for input x, such as `2^-3`.

ydt

Data type of output y, such as `sfix(16)`.

yscale

Scaling for output y, such as `2^-14`.

rndmeth

Rounding mode supported by fixed-point Simulink blocks:

`'Ceiling'`	Round to the nearest representable number in the direction of positive infinity.
`'Floor'` (default)	Round to the nearest representable number in the direction of negative infinity.
`'Nearest'`	Round to the nearest representable number.
`'Toward Zero'`	Round to the nearest representable number in the direction of zero.

Examples

Interpolate outputs for x using a 1-D lookup table that approximates the sine function:

```
xdata = linspace(0,8,33).';
ydata = sin(xdata);
% Define input x as a vector of 201 evenly
% spaced points between -1 and 9 (includes
% values both lower and higher than the range
% of breakpoints in xdata)
x = linspace(-1,9,201).';
% Interpolate output values for x
```

```
y = fixpt_interp1(xdata,ydata,x,sfix(8),2^-3,sfix(16),...
 2^-14,'Floor')
```

fixpt_look1_func_approx

Optimize fixed-point approximation of nonlinear function by interpolating lookup table data points

Syntax

[*xdata*,*ydata*,*errworst*] = fixpt_look1_func_approx('*func*',...
xmin,*xmax*,*xdt*,*xscale*,*ydt*,*yscale*,*rndmeth*,*errmax*,*nptsmax*)
[*xdata*,*ydata*,*errworst*] = fixpt_look1_func_approx('*func*',...
xmin,*xmax*,*xdt*,*xscale*,*ydt*,*yscale*,*rndmeth*,*errmax*,[])
[*xdata*,*ydata*,*errworst*] = fixpt_look1_func_approx('*func*',...
xmin,*xmax*,*xdt*,*xscale*,*ydt*,*yscale*,*rndmeth*,[],*nptsmax*)
[*xdata*,*ydata*,*errworst*] = fixpt_look1_func_approx('*func*',...
xmin,*xmax*,*xdt*,*xscale*,*ydtydt*,*yscale*,*rndmeth*,*errmax*,*nptsmax*,*spacing*)

Description

[*xdata*,*ydata*,*errworst*] = fixpt_look1_func_approx('*func*',...
xmin,*xmax*,*xdt*,*xscale*,*ydt*,*yscale*,*rndmeth*,*errmax*,*nptsmax*) returns the optimal breakpoints of a lookup table, an ideal function applied to the breakpoints, and the worst-case approximation error. The lookup table satisfies the maximum acceptable error and maximum number of points that you specify.

[*xdata*,*ydata*,*errworst*] = fixpt_look1_func_approx('*func*',...
xmin,*xmax*,*xdt*,*xscale*,*ydt*,*yscale*,*rndmeth*,*errmax*,[]) returns the optimal breakpoints of a lookup table, an ideal function applied to the breakpoints, and the worst-case approximation error. The lookup table satisfies the maximum acceptable error that you specify.

[*xdata*,*ydata*,*errworst*] = fixpt_look1_func_approx('*func*',...
xmin,*xmax*,*xdt*,*xscale*,*ydt*,*yscale*,*rndmeth*,[],*nptsmax*) returns the optimal breakpoints of a lookup table, an ideal function applied to the breakpoints, and the worst-case approximation error. The lookup table satisfies the maximum number of points that you specify.

[*xdata*,*ydata*,*errworst*] = fixpt_look1_func_approx('*func*',...

xmin,*xmax*,*xdt*,*xscale*,*ydtydt*,*yscale*,*rndmeth*,*errmax*,*nptsmax*,*spacing*)
returns the optimal breakpoints of a lookup table, an ideal function applied to the
breakpoints, and the worst-case approximation error. The lookup table satisfies the
maximum acceptable error, maximum number of points, and breakpoint spacing that you
specify.

In each case, `fixpt_look1_func_approx` interpolates between lookup table data points
to optimize the fixed-point approximation. The inputs *xmin* and *xmax* specify the range
over which to approximate the breakpoints. The inputs *xdt*, *xscale*, *ydt*, *yscale*, and
rndmeth follow conventions used by fixed-point Simulink blocks.

The inputs *errmax*, *nptsmax*, and *spacing* are optional. Of these inputs, you must
specify at least *errmax* or *nptsmax*. If you omit one of those two inputs, you must use
brackets, [], in place of the omitted input. `fixpt_look1_func_approx` ignores that
requirement for the lookup table.

If you do not specify spacing, and more than one spacing satisfies *errmax* and *nptsmax*,
`fixpt_look1_func_approx` chooses in this order: power-of-2 spacing, even spacing,
uneven spacing. This behavior applies when you specify both *errmax* and *nptsmax*, but
not when you specify just one of the two.

Input Arguments

func

Function of x for which to approximate breakpoints. Enclose this expression in single
quotes, for example, `'sin(2*pi*x)'`.

xmin

Minimum value of x.

xmax

Maximum value of x.

xdt

Data type of x.

xscale

Scaling for the x values.

ydt

Data type of y.

yscale

Scaling for the y values.

rndmeth

Rounding mode supported by fixed-point Simulink blocks:

`'Ceiling'`	Round to the nearest representable number in the direction of positive infinity.
`'Floor'` (default)	Round to the nearest representable number in the direction of negative infinity.
`'Nearest'`	Round to the nearest representable number.
`'Toward Zero'`	Round to the nearest representable number in the direction of zero.

errmax

Maximum acceptable error between the ideal function and the approximation given by the lookup table.

nptsmax

Maximum number of points for the lookup table.

spacing

Spacing of breakpoints for the lookup table:

`'even'`	Even spacing
`'pow2'`	Even, power-of-2 spacing
`'unrestricted'` (default)	Uneven spacing

If you specify...	The breakpoints of the lookup table...
errmax and *nptsmax*	Meet both criteria, if possible. The *errmax* requirement has higher priority than *nptsmax*. If the breakpoints cannot meet both criteria with the specified spacing, *nptsmax* does not apply.
errmax only	Meet the error criteria, and `fixpt_look1_func_approx` returns the fewest number of points.
nptsmax only	Meet the points criteria, and `fixpt_look1_func_approx` returns the smallest worst-case error.

Output Arguments

xdata

Vector of breakpoints for the lookup table.

ydata

Vector of values from applying the ideal function to the breakpoints.

errworst

Worst-case error, which is the maximum absolute error between the ideal function and the approximation given by the lookup table.

Examples

Approximate a fixed-point sine function using a lookup table:

```
func = 'sin(2*pi*x)';
% Define the range over which to optimize breakpoints
xmin = 0;
xmax = 0.25;
% Define the data type and scaling for the inputs
```

```
xdt = ufix(16);
xscale = 2^-16;
% Define the data type and scaling for the outputs
ydt = sfix(16);
yscale = 2^-14;
% Specify the rounding method
rndmeth = 'Floor';
% Define the maximum acceptable error
errmax = 2^-10;
% Choose even, power-of-2 spacing for breakpoints
spacing = 'pow2';
% Create the lookup table
[xdata,ydata,errworst] = fixpt_look1_func_approx(func,...
 xmin,xmax,xdt,xscale,ydt,yscale,rndmeth,errmax,[],spacing);
```

fixpt_look1_func_plot

Plot fixed-point approximation function for lookup table

Syntax

```
fixpt_look1_func_plot(xdata,ydata,'func',...
xmin,xmax,xdt,xscale,ydt,yscale,rndmeth)
errworst = fixpt_look1_func_plot(xdata,ydata,'func',...
xmin,xmax,xdt,xscale,ydt,yscale,rndmeth)
```

Description

`fixpt_look1_func_plot(xdata,ydata,'func',...`
`xmin,xmax,xdt,xscale,ydt,yscale,rndmeth)` plots a lookup table approximation function and the error from the ideal function.

`errworst = fixpt_look1_func_plot(xdata,ydata,'func',...`
`xmin,xmax,xdt,xscale,ydt,yscale,rndmeth)` plots a lookup table approximation function and the error from the ideal function. The output `errworst` is the maximum absolute error.

You can use `fixpt_look1_func_approx` to generate `xdata` and `ydata`, the breakpoints and table data for the lookup table, respectively.
`fixpt_look1_func_approx` applies the ideal function to the breakpoints in `xdata` to produce `ydata`. While this method is the easiest way to generate `ydata`, you can choose other values for `ydata` as input for `fixpt_look1_func_plot`. Choosing different values for `ydata` can, in some cases, produce a lookup table with a smaller maximum absolute error.

Input Arguments

xdata

Vector of breakpoints for the lookup table.

ydata

Vector of values from applying the ideal function to the breakpoints.

func

Function of x for which to approximate breakpoints. Enclose this expression in single quotes, for example, `'sin(2*pi*x)'`.

xmin

Minimum value of x.

xmax

Maximum value of x.

xdt

Data type of x.

xscale

Scaling for the x values.

ydt

Data type of y.

yscale

Scaling for the y values.

rndmeth

Rounding mode supported by fixed-point Simulink blocks:

`'Ceiling'`	Round to the nearest representable number in the direction of positive infinity.
`'Floor'` (default)	Round to the nearest representable number in the direction of negative infinity.
`'Nearest'`	Round to the nearest representable number.

'Toward Zero'	Round to the nearest representable number in the direction of zero.

Examples

Plot a fixed-point approximation of the sine function using data points generated by `fixpt_look1_func_approx`:

```
func = 'sin(2*pi*x)';
% Define the range over which to optimize breakpoints
xmin = 0;
xmax = 0.25;
% Define the data type and scaling for the inputs
xdt = ufix(16);
xscale = 2^-16;
% Define the data type and scaling for the outputs
ydt = sfix(16);
yscale = 2^-14;
% Specify the rounding method
rndmeth = 'Floor';
% Define the maximum acceptable error
errmax = 2^-10;
% Choose even, power-of-2 spacing for breakpoints
spacing = 'pow2';
% Generate data points for the lookup table
[xdata,ydata,errworst]=fixpt_look1_func_approx(func,...
 xmin,xmax,xdt,xscale,ydt,yscale,rndmeth,errmax,[],spacing);
% Plot the sine function (ideal and fixed-point) & errors
fixpt_look1_func_plot(xdata,ydata,func,xmin,xmax,...
 xdt,xscale,ydt,yscale,rndmeth);
```

`fixpt_look1_func_plot` plots the fixed-point sine function, using generated data points, and plots the error between the ideal function and the fixed-point function. The maximum absolute error and the number of points required appear on the plot. The error drops to zero at a breakpoint, but increases between breakpoints due to curvature differences between the ideal function and the line drawn between breakpoints.
The lookup table requires 33 points to achieve a maximum absolute error of 2^-11.3922.

"Producing Lookup Table Data" (Fixed-Point Designer)
"Use Lookup Table Approximation Functions" (Fixed-Point Designer)

Introduced before R2006a

fixpt_set_all

Set property for each fixed-point block in subsystem

Syntax

fixpt_set_all(*SystemName*,*fixptPropertyName*,*fixptPropertyValue*)

Description

fixpt_set_all(*SystemName*,*fixptPropertyName*,*fixptPropertyValue*) sets the property fixptPropertyName of every applicable block in the model or subsystem *SystemName* to the value *fixptPropertyValue*

Examples

Set each fixed-point block in a model Filter_1 to round towards the floor and saturate upon overflow:

```
% Round towards the floor
fixpt_set_all('Filter_1','RndMeth','Floor')

% Saturate upon overflow
fixpt_set_all('Filter_1','DoSatur','on')
```

Introduced before R2006a

fixptbestexp

Exponent that gives best precision for fixed-point representation of value

Syntax

out = fixptbestexp(*RealWorldValue*, *TotalBits*, *IsSigned*)
out = fixptbestexp(*RealWorldValue*, *FixPtDataType*)

Description

out = fixptbestexp(*RealWorldValue*, *TotalBits*, *IsSigned*) returns the exponent that gives the best precision for the fixed-point representation of *RealWorldValue*. *TotalBits* specifies the number of bits for the fixed-point number. *IsSigned* specifies whether the fixed-point number is signed: 1 indicates the number is signed and 0 indicates the number is not signed.

out = fixptbestexp(*RealWorldValue*, *FixPtDataType*) returns the exponent that gives the best precision based on the data type *FixPtDataType*.

Examples

Get the exponent that gives the best precision for the real-world value 4/3 using a signed, 16-bit number:

```
out = fixptbestexp(4/3,16,1)

out =
   -14
```

Alternatively, specify the fixed-point data type:

```
out = fixptbestexp(4/3,sfix(16))

out =
   -14
```

This shows that the maximum precision representation of 4/3 is obtained by placing 14 bits to the right of the binary point:

`01.01010101010101`

You can specify the precision of this representation in fixed-point blocks by setting the scaling to `2^-14` or `2^fixptbestexp(4/3,16,1)`.

See Also

`fixptbestprec`

Introduced before R2006a

fixptbestprec

Determine maximum precision available for fixed-point representation of value

Syntax

```
out = fixptbestprec(RealWorldValue,TotalBits,IsSigned)
out = fixptbestprec(RealWorldValue,FixPtDataType)
```

Description

`out = fixptbestprec(RealWorldValue,TotalBits,IsSigned)` determines the maximum precision for the fixed-point representation of the real-world value specified by `RealWorldValue`. You specify the number of bits for the fixed- point number with `TotalBits`, and you specify whether the fixed-point number is signed with `IsSigned`. If `IsSigned` is 1, the number is signed. If `IsSigned` is 0, the number is not signed. The maximum precision is returned to `out`.

`out = fixptbestprec(RealWorldValue,FixPtDataType)` determines the maximum precision based on the data type specified by `FixPtDataType`.

Examples

Example 1

The following command returns the maximum precision available for the real-world value 4/3 using a signed, 8-bit number:

```
out = fixptbestprec(4/3,8,1)

out =
    0.015625
```

Alternatively, you can specify the fixed-point data type:

```
out = fixptbestprec(4/3,sfix(8))
```

```
out =
    0.015625
```

This value means that the maximum precision available for 4/3 is obtained by placing six bits to the right of the binary point since 2^{-6} equals 0.015625:

```
01.010101
```

Example 2

You can use the maximum precision as the scaling in fixed-point blocks. This enables you to use `fixptbestprec` to perform a type of autoscaling if you would like to designate a known range of your simulation. For example, if your known range is -13 to 22, and you are using a safety margin of 30%:

```
knownMax = 22;
knownMin = -13;
localSafetyMargin = 30;
slope = max( fixptbestprec( (1+localSafetyMargin/100)* ...
 [knownMax,knownMin], sfix(16) ) );
```

The variable `slope` can then be used in the expression that you specify for the **Output data type** parameter in a block mask. Be sure to select the **Lock output data type setting against changes by the fixed-point tools** check box in the same block to prevent the Fixed-Point Tool from overriding the scaling. If you know the range, you can use this technique in place of relying on a model simulation to provide the range to the autoscaling tool, as described in `autofixexp` in the Fixed-Point Designer documentation.

fixptbestexp

Introduced before R2006a

float

Create `Simulink.NumericType` object describing floating-point data type

Syntax

```
a = float('single')
a = float('double')
```

Description

`a = float('single')` returns a `Simulink.NumericType` object that describes the data type of an IEEE single (32 total bits, 8 exponent bits).

`a = float('double')` returns a `Simulink.NumericType` object that describes the data type of an IEEE double (64 total bits, 11 exponent bits).

Note `float` is a legacy function. In new code, use `fixdt` instead. In existing code, replace `float('single')` with `fixdt('single')` and `float('double')` with `fixdt('double')`.

Examples

Define an IEEE single data type.

```
>> a = float('single')

a =

  NumericType with properties:

    DataTypeMode: 'Single'
         IsAlias: 0
       DataScope: 'Auto'
      HeaderFile: ''
     Description: ''
```

Introduced before R2006a

frameedit

Edit print frames for Simulink and Stateflow block diagrams

Syntax

```
frameedit
frameedit filename
```

Description

`frameedit` starts the PrintFrame Editor, a graphical user interface you use to create borders for Simulink and Stateflow block diagrams. With no argument, `frameedit` opens the **PrintFrame Editor** window with a new file.

`frameedit filename` opens the **PrintFrame Editor** window with the specified filename, where `filename` is a figure file (`.fig`) previously created and saved using `frameedit`.

Tips

This illustrates the main features of the PrintFrame Editor.
Closing the PrintFrame Editor

To close the **PrintFrame Editor** window, click the close box in the upper right corner, or select **Close** from the **File** menu.

Printing Simulink Block Diagrams with Print Frames

Select **Print** from the Simulink **File** menu. Check the **Frame** box and supply the filename for the print frame you want to use. Click **OK** in the **Print** dialog box.

Getting Help for the PrintFrame Editor

For further instructions on using the PrintFrame Editor, select **PrintFrame Editor Help** from the **Help** menu in the PrintFrame Editor.

Introduced in R2008b

fxptdlg

Start Fixed-Point Tool

Syntax

```
fxptdlg('modelname')
```

Description

`fxptdlg('modelname')` starts the Fixed-Point Tool for the Simulink model specified by `modelname`. You can also access this tool by the following methods:

- From the Simulink **Analysis** menu, select **Data Type Design** > **Fixed-Point Tool**.
- From a subsystem context (right-click) menu, select **Fixed-Point Tool**.

In conjunction with Fixed-Point Designer software, the Fixed-Point Tool provides convenient access to:

- Model and subsystem parameters that control the signal logging, fixed-point instrumentation mode, and data type override. (see "Model Parameters" on page 6-2)
- Plotting capabilities that enable you to plot data that resides in the MATLAB workspace, namely, simulation results associated with Scope, To Workspace, and root-level Outport blocks, in addition to logged signal data (see "Signal Logging" in the *Simulink User's Guide*)
- An interactive automatic data typing feature that proposes fixed-point data types for appropriately configured objects in your model, and then allows you to selectively accept and apply the data type proposals

You can launch the Fixed-Point Tool for any system or subsystem, and the tool controls the object selected in its **System under design** pane. If Fixed-Point Designer software is installed, the Fixed-Point Tool displays the name, data type, design minimum and maximum values, minimum and maximum simulation values, and scaling of each model object that logs fixed-point data. Additionally, if a signal saturates or overflows, the tool displays the number of times saturation or overflow occurred.

2-295

Note The Fixed-Point Tool works only for models that simulate in Normal mode. The tool does not work when you simulate your model in Accelerator or Rapid Accelerator mode.

Overriding Fixed-Point Specifications

Most of the functionality in the Fixed-Point Tool is for use with the Fixed-Point Designer software. However, even if you do not have Fixed-Point Designer software, you can configure data type override settings to simulate a model that specifies fixed-point data types. In this mode, the Simulink software temporarily overrides fixed-point data types with floating-point data types when simulating the model.

Note If you use fi objects or embedded numeric data types in your model or workspace, you might introduce fixed-point data types into your model. You can set fipref to prevent the checkout of a Fixed-Point Designer license.

To simulate a model without using Fixed-Point Designer:

1   Enter the following at the command line.

```
set_param(gcs, 'DataTypeOverride', 'Double',...
 'DataTypeOverrideAppliesTo','AllNumericTypes',...
 'MinMaxOverflowLogging','ForceOff')
```

2   If you use fi objects or embedded numeric data types in your model, set the fipref DataTypeOverride property to TrueDoubles or TrueSingles (to be consistent with the model-wide data type override setting) and the DataTypeOverrideAppliesTo property to All numeric types.

For example, at the MATLAB command line, enter:

```
 p = fipref('DataTypeOverride', 'TrueDoubles', ...
        'DataTypeOverrideAppliesTo', 'AllNumericTypes');
```

Introduced before R2006a

gcb

Get path name of current block

Syntax

```
bl = gcb
bl = gcb(sys)
```

Description

`bl = gcb` returns the full block path name of the current block in the current system. The current block is:

- The most recently clicked block
- The S-Function block currently executing its corresponding MATLAB function
- The block whose callback routine is being executed
- The block whose mask is being evaluated as part of the `MaskInitialization` parameter evaluation
- The last block loaded after opening a model

`bl = gcb(sys)` returns the full block path name of the current block in the specified system. Load the system first.

Input Arguments

sys — System that contains the block
character vector

System that contains the block, specified as a character vector.

Example: `'vdp'` `'sldemo_fuelsys/fuel_rate_control'`

Examples

Get Path Name of Most Recently Selected Block

Open a model.

```
vdp
```

In the model, select a block. For example, select the Gain block. Then, enter `gcb` at the command prompt.

```
gcb

ans =

vdp/Mu
```

Get Parameters of Current Block

Open a model.

```
vdp
```

Select the Gain block.

Use the value of `gcb` with `get_param` to get the value of the `Gain` parameter.

```
x = get_param(gcb,'Gain')

x =

1
```

Get Current Block in Specified System

Load the model.

```
load_system('sldemo_fuelsys');
```

Get the current block in the `fuel_rate_control` subsystem.

```
bl = gcb('sldemo_fuelsys/fuel_rate_control')

bl =

sldemo_fuelsys/fuel_rate_control/validate_sample_time
```

See Also
gcbh | gcs | get_param

Topics
"Mask Callback Code"

Introduced before R2006a

gcbh

Get handle of current block

Syntax

gcbh

Description

gcbh returns the handle of the current block in the current system.

You can use this command to identify or address blocks that have no parent system. The command should be most useful to blockset authors.

Examples

This command returns the handle of the most recently selected block.

gcbh

ans =

   281.0001

See Also

gcb | getSimulinkBlockHandle

Introduced before R2006a

gcs

Get path name of current system

Syntax

`gcs`

Description

`gcs` returns the path name of the current system. The current system is one of these:

- During editing, the system or subsystem most recently clicked or that contains the block most recently clicked
- During simulation of a system that contains an S-Function block, the system or subsystem containing the S-Function block currently being evaluated
- During callbacks, the system containing any block whose callback routine is being executed
- During evaluation of `MaskInitialization`, the system containing the block whose mask is being evaluated
- The system most recently loaded into memory with `load_system`; only the first use of `load_system` makes the model the current system

The current system is the current model or a subsystem of the current model. Use `bdroot` to get the current model.

If you close the model that contains the current system, another open or loaded system becomes the current one. Use `gcs` to find out the new current system.

To explicitly set the current system, you can either:

- Use `set_param` with the `'CurrentSystem'` parameter on the root Simulink model, for example:

  `set_param(0,'CurrentSystem','mymodel')`

- Open the model by using `open_system` or the model name at the MATLAB command prompt.

Examples

Get Current System That Contains a Block

Return the path of the system that contains the most recently selected block.

Open the model `sldemo_fuelsys`. Open the subsystem To Controller.

```
sldemo_fuelsys
open_system('sldemo_fuelsys/To Controller')
```

Click the Rate Transition block. Get the current system.

```
gcs
```

```
ans =

    'sldemo_fuelsys/To Controller'
```

Get Current System After Loading a Model

Open the model `f14` and get the current system.

```
f14
gcs
```

```
ans =

    'f14'
```

Load the model `vdp` using `load_system`. Then get the current system.

```
load_system('vdp');
gcs
```

```
ans =

    'vdp'
```

To remove vdp from memory, close it. In this example, the current system becomes the open model, f14.

```
close_system('vdp');
gcs

ans =

    'f14'
```

See Also

bdroot | gcb

Introduced before R2006a

get_param

Get parameter names and values

Syntax

```
ParamValue = get_param(Object,Parameter)
```

Description

`ParamValue = get_param(Object,Parameter)` returns the name or value of the specified parameter for the specified model or block object. Open or load the Simulink model first.

Tip If you make multiple calls to `get_param` for the same block, then specifying the block using a numeric handle is more efficient than using the full block path. Use `getSimulinkBlockHandle` to get a block handle.

For parameter names, see:

- "Model Parameters" on page 6-2
- "Block-Specific Parameters" on page 6-130
- "Common Block Properties" on page 6-111

Examples

Get a Block Parameter Value and a Model Parameter Value

Load the vdp model.

```
load_system('vdp');
```

Get the value for the `Expression` block parameter.

```
BlockParameterValue = get_param('vdp/Fcn','Expression')
```

```
BlockParameterValue =
    1 - u*u
```

Get the value for the SolverType model parameter.

```
SolverType = get_param('vdp','SolverType')
```

```
SolverType =
   Variable-step
```

Get Root Parameter Names and Values

Get a list of global parameter names by finding the difference between the Simulink root parameter names and the model parameter names.

```
RootParameterNames = fieldnames(get_param(0,'ObjectParameters'));
load_system('vdp')
ModelParameterNames = fieldnames(get_param('vdp','ObjectParameters'));
GlobalParameterNames = setdiff(RootParameterNames,ModelParameterNames)
```

```
GlobalParameterNames =
          'AutoSaveOptions'
          'CacheFolder'
          'CallbackTracing'
          'CharacterEncoding'
                 . . .
          'CurrentSystem'
```

Get the value of a global parameter.

```
GlobalParameterValue = get_param(0,'CurrentSystem')
```

```
GlobalParameterValue =
          vdp
```

Get Model Parameter Names and Values

Get a list of model parameters for the vdp model .

```
load_system('vdp')
ModelParameterNames = get_param('vdp','ObjectParameters')

ModelParameterNames =
               Name: [1x1 struct]
                Tag: [1x1 struct]
        Description: [1x1 struct]
               Type: [1x1 struct]
             Parent: [1x1 struct]
             Handle: [1x1 struct]
                    . . .
            Version: [1x1 struct]
```

Get the current value of the `ModelVersion` model parameter for the `vdp` model.

```
ModelParameterValue = get_param('vdp','ModelVersion')

ModelParameterValue =
           1.6
```

Get All Blocks and a Parameter Value

Get a list of block paths and names for the `vdp` model.

```
load_system('vdp')
BlockPaths = find_system('vdp','Type','Block')

BlockPaths =
    'vdp/Fcn'
    'vdp/More Info'
    'vdp/More Info/Model Info'
    'vdp/Mu'
    'vdp/Mux'
    'vdp/Product'
    'vdp/Scope'
    'vdp/Sum'
    'vdp/x1'
    'vdp/x2'
    'vdp/Out1'
    'vdp/Out2'
```

Get a list of block dialog parameters for the `Fcn` block.

```
BlockDialogParameters = get_param('vdp/Fcn','DialogParameters')
```

```
BlockDialogParameters =
              Expr: [1x1 struct]
        SampleTime: [1x1 struct]
```

Get the value for the Expr block parameter.

```
BlockParameterValue = get_param('vdp/Fcn','Expr')

BlockParameterValue =
    1 - u*u
```

Get a Block Parameter Value Using a Block Handle

If you make multiple calls to get_param for the same block, then using the block handle is more efficient than specifying the full block path as a character vector, e.g., 'vdp/Fcn'.

You can use the block handle in subsequent calls to get_param or set_param. If you examine the handle, you can see that it contains a double. Do not try to use the number of a handle alone (e.g., 5.007) because you usually need to specify many more digits than MATLAB displays. Instead, assign the handle to a variable and use that variable name to specify a block.

Use getSimulinkBlockHandle to load the vdp model if necessary (by specifying true), and get a handle to the FCN block.

```
fcnblockhandle = getSimulinkBlockHandle('vdp/Fcn',true);
```

Use the block handle with get_param and get the value for the Expr block parameter.

```
BlockParameterValue = get_param(fcnblockhandle,'Expression')

BlockParameterValue =
    1 - u*u
```

Display Block Types for all Blocks in a Model

Get a list of block paths and names for the vdp model.

```
load_system('vdp')
BlockPaths = find_system('vdp','Type','Block')
```

```
BlockPaths =
    'vdp/Fcn'
    'vdp/More Info'
    'vdp/More Info/Model Info'
    'vdp/Mu'
    'vdp/Mux'
    'vdp/Product'
    'vdp/Scope'
    'vdp/Sum'
    'vdp/x1'
    'vdp/x2'
    'vdp/Out1'
    'vdp/Out2'
```

Get the value for the `BlockType` parameter for each of the blocks in the `vdp` model.

```
BlockTypes = get_param(BlockPaths,'BlockType')

BlockTypes =
    'Fcn'
    'SubSystem'
    'SubSystem'
    'Gain'
    'Mux'
    'Product'
    'Scope'
    'Sum'
    'Integrator'
    'Integrator'
    'Outport'
    'Outport'
```

- "Associating User Data with Blocks"
- "Use MATLAB Commands to Change Workspace Data"

Input Arguments

`Object` — Name or handle of a model or block, or root
handle | character vector | cell array of character vectors | 0

Handle or name of a model or block, or root, specified as a numeric handle or a character vector, a cell array of character vectors for multiple blocks, or `0` for root. A numeric

handle must be a scalar. You can also get parameters of lines and ports, but you must use numeric handles to specify them.

Tip If you make multiple calls to `get_param` for the same block, then specifying a block using a numeric handle is more efficient than using the full block path. Use `getSimulinkBlockHandle` to get a block handle. Do not try to use the number of a handle alone (e.g., `5.007`) because you usually need to specify many more digits than MATLAB displays. Assign the handle to a variable and use that variable name to specify a block.

Specify `0` to get root parameter names, including global parameters and model parameters for the current Simulink session.

- Global parameters include Editor preferences and Simulink Coder parameters.
- Model parameters include configuration parameters, Simulink Coder parameters, and Simulink Code Inspector™ parameters.

Example: `'vdp/Fcn'`

`Parameter` — Parameter of model or block, or root
character vector

Parameter of model or block, or root, specified as a character vector or `0` for root. The table shows special cases.

Specified Parameter	Result
`'ObjectParameters'`	Returns a structure array with the parameter names of the specified object (model, block, or root) as separate fields in the structure.
`'DialogParameters'`	Returns a structure array with the block dialog box parameter names as separate fields in the structure. If the block has a mask, the function instead returns the mask parameters.

Specified Parameter	Result
Parameter name, e.g., `'BlockType'`. Specify any model or block parameter, or block dialog box parameter.	Returns the value of the specified model or block parameter. If you specified multiple blocks as a cell array, returns a cell array with the values of the specified parameter common to all blocks. All of the specified blocks in the cell array must contain the parameter, otherwise the function returns an error.

Example: `'ObjectParameters'`

Data Types: `char`

Output Arguments

`ParamValue` — The name or value of the specified parameter for the specified model or block, or root
any data type, depending on the parameter

The name or value of the specified parameter for the specified model or block, or root. If you specify multiple objects, the output is a cell array of objects. The table shows special cases.

Specified Parameter	ParamValue Returned
`'ObjectParameters'`	A structure array with the parameter names of the specified object (model, block, or root) as separate fields in the structure.
`'DialogParameters'`	A structure array with the block dialog box parameter names as separate fields in the structure. If the block has a mask, the function instead returns the mask parameters.

Specified Parameter	ParamValue Returned
Parameter name, e.g., `'BlockType'`	The value of the specified model or block parameter. If multiple blocks are specified as a cell array, returns a cell array with the values of the specified parameter common to all blocks.

If you get the root parameters by specifying `get_param(0,'ObjectParameters')`, then the output `ParamValue` is a structure array with the root parameter names as separate fields in the structure. Each parameter field is a structure containing these fields:

- Type — Parameter type values are: `'boolean'`, `'string'`, `'int'`, `'real'`, `'point'`, `'rectangle'`, `'matrix'`, `'enum'`, `'ports'`, or `'list'`
- Enum — Cell array of enumeration character vector values that applies only to `'enum'` parameter types
- Attributes — Cell array of character vectors defining the attributes of the parameter. Values are: `'read-write'`, `'read-only'`, `'read-only-if-compiled'`, `'write-only'`, `'dont-eval'`, `'always-save'`, `'never-save'`, `'nondirty'`, or `'simulation'`

Introduced before R2006a

getActiveConfigSet

Get model's active configuration set or configuration reference

Syntax

```
myConfigObj = getActiveConfigSet(model)
```

Arguments

`model`

The name of an open model, or `gcs` to specify the current model

Description

`getActiveConfigSet` returns the configuration set or configuration reference (configuration object) that is the active configuration object of `model`.

Examples

The following example returns the active configuration object of the current model. The code is the same whether the object is a configuration set or configuration reference.

```
myConfigObj = getActiveConfigSet(gcs);
```

See Also

Introduced before R2006a

getCallbackAnnotation

Get annotation executing callback

Syntax

```
ann = getCallbackAnnotation
```

Description

`ann = getCallbackAnnotation` gets the annotation from which a callback was invoked. Invoke a callback from an annotation click function. After you get the annotation, you can, for example, get text or parameters from the annotation to use someplace else in your model.

For information on click functions, see "Associate a Click Function with an Annotation".

Examples

Click Annotation to Change Parameter Value

Invoke a callback by way of an annotation click function. This example shows how to change a parameter value on a block to the value shown on an annotation.

Open `vdp`. Add and position two annotations. Each annotation displays a different value.

```
open_system('vdp');
an1 = Simulink.Annotation('vdp/1');
an1.position = [100,300];
an2 = Simulink.Annotation('vdp/3');
an2.position = [150,300];
```

Assign a click function to each annotation. The click function uses `getAnnotationCallback` to get the annotation instance. Get the text from each annotation and use it to set the parameter on the Gain block (Mu).

```
an1.ClickFcn = 'ann = getCallbackAnnotation; v = ann.Text; set_param(''vdp/Mu'',''Gain
an2.ClickFcn = 'ann = getCallbackAnnotation; v = ann.Text; set_param(''vdp/Mu'',''Gain
```

Click each annotation. When you click, the gain value on the Mu block changes to the number shown on the annotation.

Output Arguments

ann — Annotation
Simulink.Annotation instance

Annotation, returned as a Simulink.Annotation instance.

See Also
Simulink.Annotation

Topics
"Associate a Click Function with an Annotation"

Introduced before R2006a

getComponent

Get a configuration set component

Syntax

```
component = getComponent(cs,componentName)
```

Description

`component = getComponent(cs,componentName)` returns the specified component from a configuration set. With no component name specified, returns a list of the components contained in the configuration set.

Examples

Get a Component for a Configuration Set

Get the solver component for the active configuration set.

Get the active configuration set of the currently selected model.

```
hCs = getActiveConfigSet(gcs);
```

Get the solver component of the active configuration set.

```
hSolverConfig = getComponent(hCs, 'Solver);
```

Get List of Components for an Active Configuration Set

Get a list of the components contained in the active configuration set.

Get the active configuration set of the currently selected model.

```
hCs = getActiveConfigSet(gcs);
```

Get the list of components contained in the configuration set.

```
getComponent(hCs)
```

The code displays the names of the components at the MATLAB command line.

Input Arguments

cs — Configuration set object
ConfigSet object

Configuration set, specified as a ConfigSet object

componentName — Component name
character vector

Name of a component object, specified as a character vector. If a component name is not specified, the function displays a list of the components contained in the configuration set at the MATLABcommand line.

Example: 'Solver'

Output Arguments

component — Component
Simulink.ConfigComponent object

A component in the configuration set, returned as an instance of a Simulink.ConfigComponent object

See Also

Topics
"About Configuration Sets"
"Manage a Configuration Set"

Introduced before R2006a

getConfigSet

Get one of model's configuration sets or configuration references

Syntax

```
myConfigObj = getConfigSet(model, configObjName)
```

Arguments

`model`

>The name of an open model, or `gcs` to specify the current model

`configObjName`

>The name of a configuration set (`Simulink.ConfigSet`) or configuration reference (`Simulink.ConfigSetRef`)

Description

`getConfigSet` returns the configuration set or configuration reference (configuration object) that is attached to `model` and is named `configObjName`. If no such object exists, an error occurs.

Examples

The following example returns the configuration object that is named `DevConfig` and attached to the current model. The code is the same whether `DevConfig` is a configuration set or configuration reference.

```
 myConfigObj = getConfigSet(gcs, 'DevConfig');
```

See Also

Topics
"Manage a Configuration Set"
"Manage a Configuration Reference"

Introduced before R2006a

getConfigSets

Get names of all of model's configuration sets or configuration references

Syntax

myConfigObjNames = getConfigSets(model)

Arguments

model

>   The name of an open model, or `gcs` to specify the current model

Description

getConfigSets returns a cell array of character vectors specifying the names of all configuration sets and configuration references (configuration objects) attached to model.

Examples

The following example obtains the names of the configuration objects attached to the current model.

```
myConfigObjNames = getConfigSets(gcs)
```

Introduced before R2006a

getfullname

Get pathname of block or line

Syntax

`path=getfullname(handle)`

Description

`path=getfullname(handle)` returns the full pathname of the block or line specified by `handle`.

Examples

`getfullname(gcb)` returns the pathname of the block currently selected in the model editor's window.

The following code returns the pathname of the line currently selected in the model editor's window.

```
line = find_system(gcs, 'SearchDepth', 1, 'FindAll', 'on', ...
     'Type', 'line', 'Selected', 'on');
path = getfullname(line);
```

See Also

`find_system` | `gcb`

Introduced in R2007a

getInputString

Create comma-separated list of variables to map

Syntax

```
externalInputString = getInputString(inputmap,'base')

externalInputString = getInputString(inputmap,filename)

externalInputString = getInputString(inputmap)
```

Description

`externalInputString = getInputString(inputmap,'base')` creates an input character vector using the supplied mapping `inputmap` and the variables loaded in the base workspace (`'base'`).

This function generates a comma-separated list of variables (input character vector) to be mapped. You can then use this list:

- As input to the `sim` command. Load the variables in the base workspace first.
- As input for the **Configuration Parameters** > **Data Import/Export** > **Input** parameter. Copy the contents of the input character vector into the text field.

This function is most useful if you have created a custom mapping.

`externalInputString = getInputString(inputmap,filename)` creates an input character vector using the supplied mapping `inputmap` and the variables defined in `filename`.

`externalInputString = getInputString(inputmap)` creates an input character vector using the signals from the most recently created mapping.

Examples

Create an input character vector from the base workspace

Create an input character vector from the base workspace and simulate a model.

Open the model

```
slexAutotransRootInportsExample;
```

Create signal variables in the base workspace

```
Throttle = timeseries(ones(10,1)*10);
Brake    = timeseries(zeros(10,1));
```

Create a mapping (`inputMap`) for the model.

```
inputMap = getRootInportMap('model',...
'slexAutotransRootInportsExample',...
'signalName',{'Throttle','Brake'},...
'blockName',{'Throttle','Brake'});
```

Call `getInputString` with `inputMap` and `'base'` as inputs.

```
externalInputString = getInputString(inputMap,'base')

externalInputString =

Throttle,Brake
```

Simulate the model with the input character vector.

```
sim('slexAutotransRootInportsExample','ExternalInput',...
externalInputString);
```

Create an external input character vector from variables in a MAT-file

Create an external input character vector from variables in a MAT-file named `input.mat`.

In a writable folder, create a MAT-file with input variables.

```
Throttle = timeseries(ones(10,1)*10);
Brake    = timeseries(zeros(10,1));
save('input.mat','Throttle','Brake');
```

Open the model.

2-325

```
slexAutotransRootInportsExample;
```

Create map object.

```
inputMap = getRootInportMap('model',...
'slexAutotransRootInportsExample',...
'signalName',{'Throttle','Brake'},...
'blockName',{'Throttle','Brake'});
```

Get the resulting input character vector.

```
externalInputString = getInputString(inputMap,'input.mat')
```

```
externalInputString =
```

```
Throttle,Brake
```

Load variables from the base workspace for the simulation.

```
load('input.mat');
```

Simulate the model.

```
sim('slexAutotransRootInportsExample','ExternalInput',...
externalInputString);
```

Create an external input character vector from only an input map

Create an input character vector from only an input map vector and simulate the model.

Open the model.

```
slexAutotransRootInportsExample;
```

Create signal variables in the base workspace

```
Throttle = timeseries(ones(10,1)*10);
Brake    = timeseries(zeros(10,1));
```

Create a mapping vector for the model.

```
inputMap = getSlRootInportMap('model', 'slexAutotransRootInportsExample',...
'MappingMode','BlockName',...
```

```
'signalName',{'Throttle', 'Brake'},...
'signalValue',{Throttle, Brake});
```

Get the resulting input character vector.

```
externalInputString = getInputString(inputMap)
```

Simulate the model with the input character vector.

```
sim('slexAutotransRootInportsExample','ExternalInput',...
externalInputString);
```

Alternatively, if you want to input the list of variables through the Configuration Parameters dialog, copy the contents of externalInputString (Throttle,Brake) into the **Data Import/Export** > **Input** parameter. Apply the changes, and then simulate the model.

Input Arguments

inputmap — Map object
character vector

Map object, as returned from the getRootInportMap or getSlRootInportMap functions.

filename — Input variables
MAT-file name as character vector

Input variables, contained in a MAT-file. The file contains variables to map.

Example: 'data.mat'

Data Types: char

Output Arguments

externalInputString — External input
comma-separated character vector

External input, returned as a comma-separated character vector. The character vector contains root inport information that you can specify to the `sim` command or the **Configuration Parameters** > **Data Import/Export** > **Input** parameter.

See Also

getRootInportMap | getSlRootInportMap

Topics

"Map Root Inport Signal Data"

Introduced in R2013a

getRootInportMap

Create custom object to map signals to root-level inports

Syntax

```
map = getRootInportMap('Empty');
map = getRootInportMap(model,mdl,Name,Value);
map = getRootInportMap(inputmap,map,Name,Value);
```

Description

`map = getRootInportMap('Empty');` creates an empty map object, *map*. Use this map object to set up an empty custom mapping object. Load the model before using this function. If you do not load the model first, the function loads the model to make the mapping and then closes the model afterwards.

`map = getRootInportMap(model,mdl,Name,Value);` creates a map object for `model`, `mdl`, with block names and signal names specified. Load the model before using this function. If you do not load the model first, the function loads the model to make the mapping and then closes the model afterwards. To create a comma-separated list of variables to map from this object, use the `getInputString` function.

`map = getRootInportMap(inputmap,map,Name,Value);` overrides the mapping object with the specified property. You can override only the properties `model`, `blockName`, and `signalName`. Load the model before using this function. If you do not load the model first, the function loads the model to make the mapping and then closes the model afterwards. To create a comma-separated list of variables to map from this object, use the `getInputString` function.

Use the `getRootInportMap` function when creating a custom mapping mode to map data to root-level inports. See the example file `BlockNameIgnorePrefixMap.m`, located in *matlabroot*/help/toolbox/simulink/examples, for an example of a custom mapping algorithm.

Input Arguments

`Empty`

Create an empty map object.

Default: none

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (`' '`). You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

`model`

Name of model to associate with the root inport map.

Default: None

`blockName`

Block names of root-level input ports. The tool assigns data to ports according to the name of the root-inport block. If the tool finds a data element whose name matches the name of a root-inport block, it maps the data to the corresponding port.

The value for this argument can be:
Block name of root-level input ports.
Cell array containing multiple block names of root-level input ports.

Default: None

`signalName`

Signal names to be mapped. The tool assigns data to ports according to the name of the signal on the port. If the tool finds a data element whose name matches the name of a signal at a port, it maps the data to the corresponding port.

The value for this argument can be:
Signal name to be mapped.

Cell array containing multiple signal names of signals to be mapped.

Default: None

inputmap

Name of mapping object to override.

Default: None

Output Arguments

map

Custom object that you can use to map data to root-level input port. To create a comma-separated list of variables to map from this object, use the `getInputString` function.

Examples

Empty Mapping Object

Create an empty custom mapping object.

```
map = getRootInportMap('Empty')

map =

  1x0 InputMap array with properties:

    Type
    DataSourceName
    Destination
```

Simple Mapping Object

Create a simple mapping object using a MATLAB time series object.

Create a time series object, `signalIn1`.

```
signalIn1 = timeseries((1:10)')

Common Properties:
            Name: 'unnamed'
            Time: [10x1 double]
        TimeInfo: [1x1 tsdata.timemetadata]
            Data: [10x1 double]
        DataInfo: [1x1 tsdata.datametadata]
```

Create a mapping object for the time series object for the model, ex_minportsOnlyModel.

```
modelFile = fullfile(matlabroot,'help','toolbox','simulink',...
'examples','ex_minportsOnlyModel');
load_system(modelFile);
map = getRootInportMap('model','ex_minportsOnlyModel',...
'blockName','In1','signalname','signalIn1')

map =

  InputMap with properties:

               Type: 'Inport'
     DataSourceName: 'signalIn1'
        Destination: [1x1 Simulink.iospecification.Destination]
```

Mapping Object with Vectors

Create a mapping object using vectors of block names and signal names for the model ex_minportsOnlyModel.

Create a mapping object of vectors.

```
modelFile = fullfile(matlabroot,'help','toolbox','simulink',...
'examples','ex_minportsOnlyModel');
load_system(modelFile);
map = getRootInportMap('model','ex_minportsOnlyModel',...
'blockName',{'In1' 'In2'}, ...
'signalname',{'signalIn1' 'signalIn2'})

map =

  1x2 InputMap array with properties:
```

```
Type
DataSourceName
Destination
```

Overriding Maps

Create a mapping object that contains the signal *var2,* then override *var2* with *var1*.

Create a mapping object of vectors.

```
% Load the model and define variables
modelFile = fullfile(matlabroot,'help','toolbox','simulink',...
'examples','ex_minportsOnlyModel');
load_system(modelFile);
modelValue = 'ex_minportsOnlyModel';
blockNameValue = 'In1';
signalNameValue = 'var2';
portType = 'Inport';

% Define var1 and override var2 with var1
signalNameToOverload = 'var1';
mapToOverload = getRootInportMap('model',modelValue,...
'blockName',blockNameValue,...
 'signalName',signalNameToOverload)

mapToOverload =

  InputMap with properties:

             Type: 'Inport'
    DataSourceName: 'var1'
       Destination: [1x1 Simulink.iospecification.Destination]
```

- "Create Custom Mapping File Function"

Tips

- Load the model before running this function.
- If your custom mapping mode similar to an existing Simulink mapping mode, consider using the `getSlRootInportMap` function instead.

"Create Custom Mapping File Function"

Introduced in R2012b

getSimulinkBlockHandle

Get block handle from block path

Syntax

```
handle = getSimulinkBlockHandle(path)
handle = getSimulinkBlockHandle(path,true)
```

Description

`handle = getSimulinkBlockHandle(path)` returns the numeric handle of the block specified by `path`, if it exists in a loaded model or library. Returns `-1` if the block is not found. Library links are resolved where necessary.

Use the numeric handle returned by `getSimulinkBlockHandle` to manipulate the block in subsequent calls to `get_param` or `set_param`. This approach is more efficient than making multiple calls to these functions using the full block path. Do not try to use the number of a handle alone (e.g., `5.007`) because you usually need to specify many more digits than MATLAB displays. Assign the handle to a variable and use that variable name to specify a block. The handle applies only to the current MATLAB session.

Use `getSimulinkBlockHandle` to check whether a block path is valid. This approach is more efficient than calling `get_param` inside a `try` statement.

`handle = getSimulinkBlockHandle(path,true)` attempts to load the model or library containing the specified block `path`, and then checks if the block exists. No error is returned if the model or library is not found. Any models or libraries loaded this way remain in memory even if the function does not find a block with the specified path.

Examples

Get the Handle of a Block

Get the handle of the `Pilot` block.

```
load_system('f14')
handle = getSimulinkBlockHandle('f14/Pilot')

handle =

  562.0004
```

You can use the handle in subsequent calls to `get_param` or `set_param`.

Load the Model and Get the Block Handle

Load the model `f14` if necessary (by specifying `true`), and get the handle of the `Pilot` block.

```
handle = getSimulinkBlockHandle('f14/Pilot',true)

handle =

  562.0004
```

You can use the handle in subsequent calls to `get_param` or `set_param`.

Check If a Model Contains a Specific Block

Check whether the model `f14` is loaded and contains a block named `Pilot`. Valid handles are always greater than zero. If the function does not find the block, it returns `-1`.

```
valid_block_path = getSimulinkBlockHandle('f14/Pilot') > 0

valid_block_path =

     0
```

The model contains the block but the model is not loaded, so this command returns `0` because it cannot find the block.

Using `getSimulinkBlockHandle` to check whether a block path is valid is more efficient than calling `get_param` inside a `try` statement.

Input Arguments

path — Block path name
character vector | cell array of character vectors

Block path name, specified as a character vector or a cell array of character vectors.

Example: `'f14/Pilot'`

Data Types: `char`

Output Arguments

handle — Numeric handle of a block
double | array of doubles

Numeric handle of a block, returned as a double or an array of doubles. Valid handles are always greater than zero. If the function does not find the block, it returns `-1`. If the `path` input is a cell array of character vectors, then the output is a numeric array of handles.

Data Types: `double`

`get_param` | `set_param`

Introduced in R2015a

getSlRootInportMap

Create custom object to map signals to root-level inports using Simulink mapping mode

Syntax

```
inputMap = getSlRootInportMap('model',modelname,'MappingMode',
mappingmode,'SignalName',signalname,'SignalValue',signalvalue)
[inputMap, hasASignal] = getSlRootInportMap('model',
modelname,'MappingMode',mappingmode,'SignalName',
signalname,'SignalValue',signalvalue)
```

```
inputMap = getSlRootInportMap('model',
modelname,'MappingMode','Custom','CustomFunction',
customfunction,'SignalName',signalname,'SignalValue',signalvalue)
[inputMap,hasASignal] = getSlRootInportMap('model',
modelname,'MappingMode','Custom','CustomFunction',
customfunction,'SignalName',signalname,'SignalValue',signalvalue)
```

Description

`inputMap = getSlRootInportMap('model',modelname,'MappingMode',
mappingmode,'SignalName',signalname,'SignalValue',signalvalue)` creates
a root inport map using one of the Simulink mapping modes. Load the model before using
this function. If you do not load the model first, the function loads the model to make the
mapping and then closes the model afterwards. To create a comma-separated list of
variables to map from this object, use the `getInputString` function.

`[inputMap, hasASignal] = getSlRootInportMap('model',
modelname,'MappingMode',mappingmode,'SignalName',
signalname,'SignalValue',signalvalue)` returns a vector of logical values
specifying whether or not the root inport map has a signal associated with it. To create a
comma-separated list of variables to map from this object, use the `getInputString`
function.

`inputMap = getSlRootInportMap('model',
modelname,'MappingMode','Custom','CustomFunction',`

customfunction,'SignalName',signalname,'SignalValue',signalvalue)
creates a root inport map using a custom mapping mode specified in `customfunction`.
Load the model before using this function. If you do not load the model first, the function
loads the model to make the mapping and then closes the model afterwards. To create a
comma-separated list of variables to map from this object, use the `getInputString`
function.

[inputMap,hasASignal] = getSlRootInportMap('model',
modelname,'MappingMode','Custom','CustomFunction',
customfunction,'SignalName',signalname,'SignalValue',signalvalue)
returns a vector of logical values specifying whether or not the root inport map has a
signal associated with it. To create a comma-separated list of variables to map from this
object, use the `getInputString` function.

To map signals to root-level inports using custom mapping modes, you can use
`getSlRootInport` with the Root Inport Mapper dialog box custom mapping capability.

Examples

Create inport map using Simulink mapping mode

Create a vector of inport maps using a built-in mapping mode.

```
Throttle = timeseries(ones(10,1)*10);
Brake    = timeseries(zeros(10,1));
inputMap = getSlRootInportMap('model','slexAutotransRootInportsExample',...
           'MappingMode','BlockName', ...
           'SignalName',{'Throttle' 'Brake'},...
           'SignalValue',{Throttle Brake});
```

Create inport map using custom function

Create a vector of inport maps using a custom function

```
port1    = timeseries(ones(10,1)*10);
port2    = timeseries(zeros(10,1));
inputMap = getSlRootInportMap('model','slexAutotransRootInportsExample',...
           'MappingMode','Custom', ...
           'CustomFunction','slexCustomMappingMyCustomMap',...
```

```
'SignalName',{'port1' 'port2'},...
'SignalValue',{port1 port2});
```

Input Arguments

modelname — Model name
character vector

Specify the model to associate with the root inport map.

Data Types: `char`

mappingmode — Simulink mapping mode
character vector

Specify the mapping mode to use with model name and data source. Possible values are:

`'Index'`	Assign sequential index numbers, starting at 1, to the data in the MAT-file, and map this data to the corresponding inport.
`'BlockName'`	Assign data to ports according to the name of the root-inport block. If the block name of a data element matches the name of a root-inport block, map the data to the corresponding port.
`'SignalName'`	Assign data to ports according to the name of the signal on the port. If the signal name of a data element matches the name of a signal at a port, map the data to the corresponding port.
`'BlockPath'`	Assign data to ports according to the block path of the root-inport block. If the block path of a data element matches the block path of a root-inport block, map the data to the corresponding port.
`'Custom'`	Apply mappings according to the definitions in a custom file.

Data Types: `char`

customfunction — Custom function file name
character vector

Specify name of file that implements a custom method to map signals to root-level ports. This function must be on the MATLAB path.

Data Types: `char`

signalname — signal name
scalar | cell array of character vectors

Specify the signal name(s) of the signal to associate with the root inport map.

Data Types: `char` | `cell`

signalvalue — signal value
scalar | cell arrays

Specify the values of the signals to map to the root inport map. For the list of supported data types for the values, see "Choose a Base Workspace and MAT-File Format".

Output Arguments

inputMap — input map
scalar | vector

Mapping object that defines the mapping of input signals to root-level ports. To create a comma-separated list of variables to map from this object, use the `getInputString` function.

hasASignal — signal presence indicator
scalar | vector

A vector of logical values with the same length as `inputMap`. If the value is true the inputMap has a signal associated with it. If the value is false the inputMap does not have a signal associated with it and will use a ground value as an input

Data Types: `logical`

Tips

- Load the model before running this function.

- If your custom mapping mode is not similar to an existing Simulink mapping mode, consider using the `getRootInportMap` function instead.

Topics

"Map Root Inport Signal Data"

Introduced in R2013b

hdllib

Display blocks that are compatible with HDL code generation

Syntax

```
hdllib
hdllib('off')
hdllib('html')
hdllib('librarymodel')
```

Description

`hdllib` displays the blocks that are supported for HDL code generation, and for which you have a license, in the Library Browser. To build models that are compatible with the HDL Coder software, use blocks from this Library Browser view.

If you close and reopen the Library Browser in the same MATLAB session, the Library Browser continues to show only the blocks supported for HDL code generation. To show all blocks, regardless of HDL code generation compatibility, at the command prompt, enter `hdllib('off')`.

`hdllib('off')` displays all the blocks for which you have a license in the Library Browser, regardless of HDL code generation compatibility.

`hdllib('html')` creates a library of blocks that are compatible with HDL code generation. It generates two additional HTML reports: a categorized list of blocks (`hdlblklist.html`) and a table of blocks and their HDL code generation parameters (`hdlsupported.html`).

To run `hdllib('html')`, you must have an HDL Coder license.

`hdllib('librarymodel')` displays blocks that are compatible with HDL code generation in the Library Browser. To build models that are compatible with the HDL Coder software, use blocks from this library.

The default library name is `hdlsupported`. After you generate the library, you can save it to a folder of your choice.

To keep the library current, you must regenerate it each time that you install a new software release.

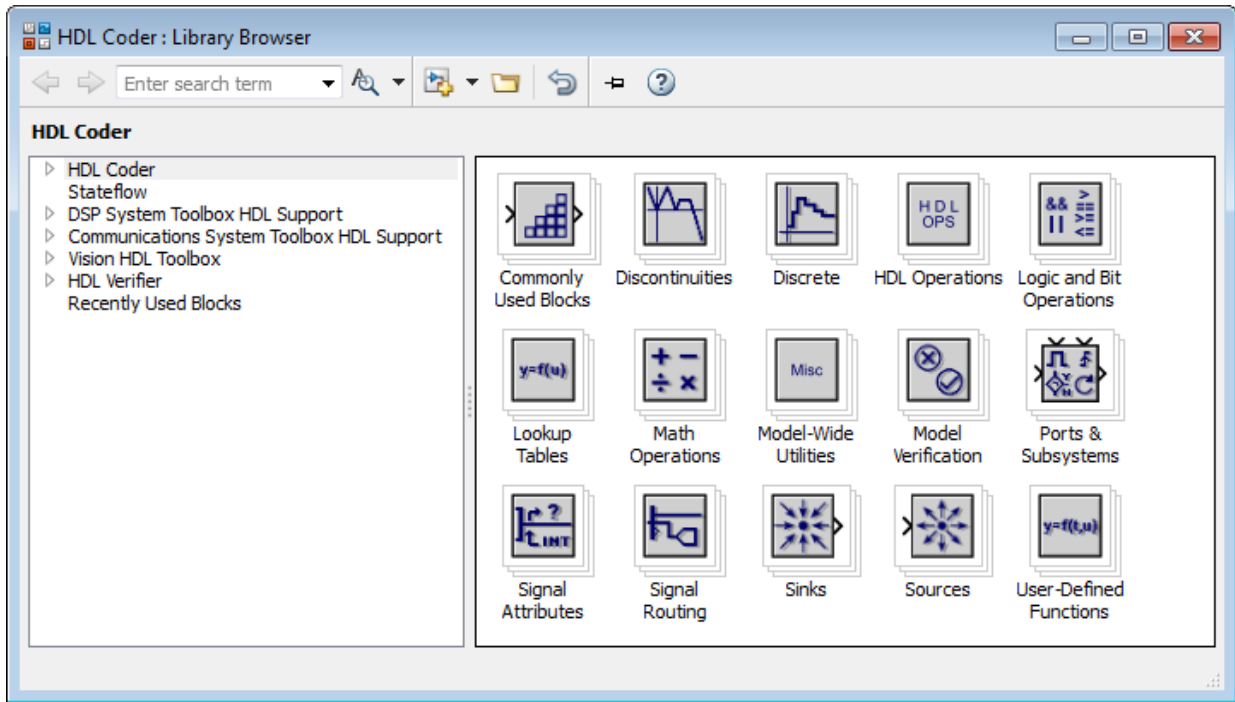
To run `hdllib('librarymodel')`, you must have an HDL Coder license.

Examples

Display Supported Blocks in the Library Browser

To display blocks that are compatible with HDL code generation in the Library Browser:

```
hdllib
```

```
### Generating view of HDL Coder compatible blocks in Library Browser.
### To restore the Library Browser to the default Simulink view, enter "hdllib off".
```


Display All Blocks in the Library Browser

To display all blocks in the Library Browser, regardless of HDL code generation compatibility:

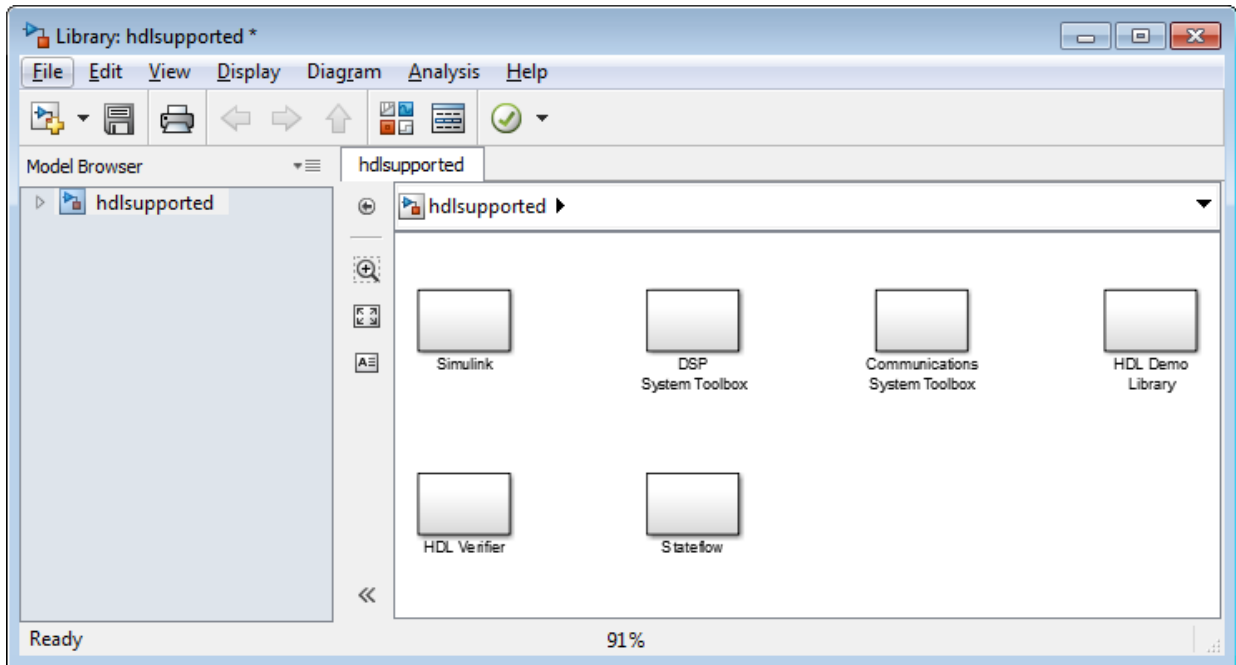
```
hdllib('off')
```

```
### Restoring Library Browser to default view; removing the HDL Coder compatibility fil
```
Create a Supported Blocks Library and HTML Reports

To create a library and HTML reports showing the blocks that are compatible with HDL code generation:

```
hdllib('html')

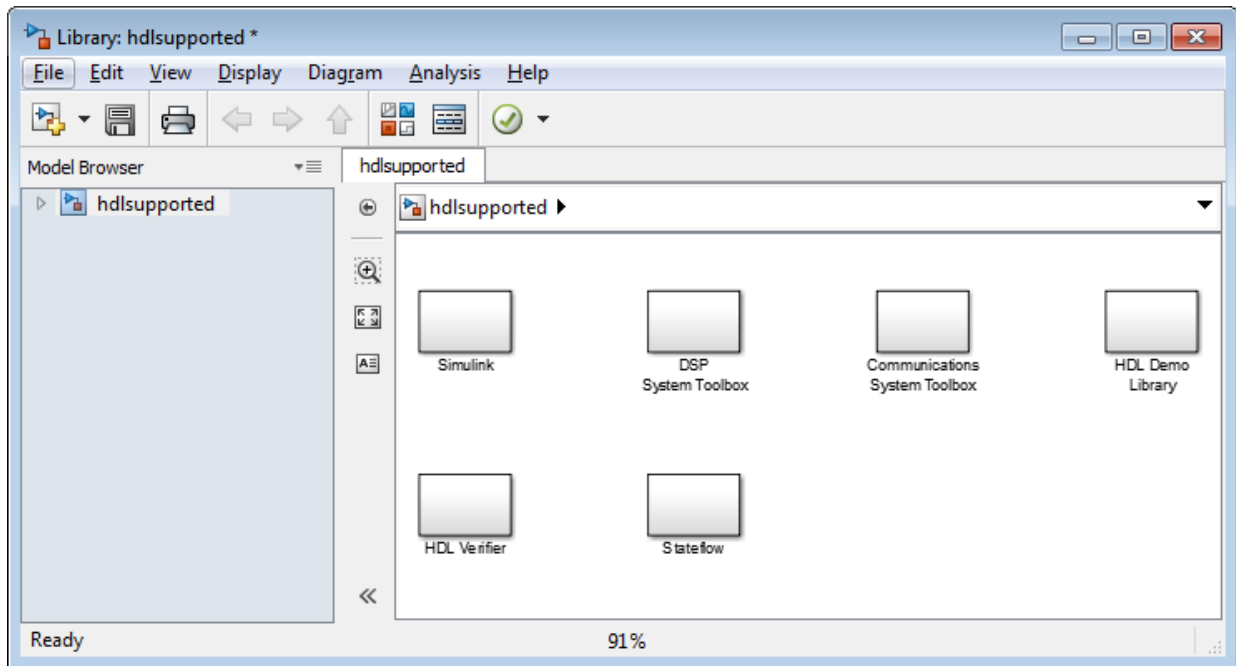
### HDL supported block list hdlblklist.html
### HDL implementation list hdlsupported.html
```

The `hdlsupported` library opens. To view the reports, click the `hdlblklist.html` and `hdlsupported.html` links.


Create a Supported Blocks Library

To create a library that contains blocks that are compatible with HDL code generation:

hdllib('librarymodel')

The hdlsupported block library opens.


- "Show Blocks Supported for HDL Code Generation" (HDL Coder)
- "View HDL-Specific Block Documentation" (HDL Coder)
- "Prepare Simulink Model For HDL Code Generation" (HDL Coder)

Introduced in R2006b

hilite_system

Highlight block, signal line, port, or annotation

Syntax

```
hilite_system(obj)
hilite_system(obj,style)
```

Description

`hilite_system(obj)` highlights a block, line, port, or annotation in an open model using the default highlight style. Use `hilite_system` with a port to highlight the signal line attached to the port. Each use of `hilite_system` adds to the highlighting. Highlighting is not saved with the model.

`hilite_system(obj,style)` uses the specified highlighting style.

Input Arguments

obj — Block, port, line, or annotation to highlight
block path name | numeric handle | Simulink identifier | traceability tag

Block, port, line, or annotation to highlight, specified as:

- The full block path name
- A numeric handle for lines, ports, or annotations
- Simulink identifier
- A traceability tag from the comments of Simulink Coder generated code.

  Using a traceability tag requires a Simulink Coder license.

The format for a traceability tag is `<system>/block`, where `system` is either:

- Root

- A unique system number assigned by Simulink during code generation

Example: `'vdp/Mu'`, `'sldemo_fuelsys/fuel_rate_control/airflow_calc'`, `'vdp:3'`, `'<Root>/Mu'`

style — Highlighting style
`'default'` (default) | character vector

Highlighting style, specified as one of these values. You can customize the appearance of any of the styles. See "Customize a Highlighting Style" on page 2-352.

- `'default'` — Default color scheme: red outline, yellow fill.

- `'none'` — Clears the highlight.

  To clear all highlighting, in the Simulink Editor, select **Display > Remove Highlighting**.

- `'debug'` — Uses default color scheme.

- `'different'` — Applies red outline, white fill.

- `'error'` — Uses default color scheme.

- `'fade'` — Applies gray outline, white fill.

- `'find'` — Applies dark blue outline, blue fill.

- `'lineTrace'` — Applies red outline, blue fill.

- `'unique'` — Dark blue outline, white fill.

- `'user1'`, `'user2'`, `'user3'`, `'user4'`, `'user5'` — Applies custom highlight: black outline, white fill by default (i.e., no highlight).

In addition, you can use these color schemes. The first word is the outline and the second is the fill color.

- `'orangeWhite'`

- `'blackWhite'`

- `'redWhite'`

- `'blueWhite'`

- `'greenWhite'`

Examples

Highlight Block Using Default Highlight Style

Open the model `slexAircraftExample`.

`slexAircraftExample`

Highlight the Controller block. When you use the default highlight style, the block appears highlighted with a red outline and yellow fill.

`hilite_system('slexAircraftExample/Controller')`

Highlight a Block Using a Highlight Style

Open the model `vdp`.

`vdp`

Highlight the Mu block using the style `'fade'`.

`hilite_system('vdp/Mu','fade')`

Use Block Highlighting to Trace Generated Code

If you have a Simulink Coder license, you can trace generated code to the corresponding source block in a model.

Open the model `f14`.

`f14`

In the model configuration parameters, in the **Solver** pane, set **Type** to `Fixed-step`.

Generate code for the model using **Code > C/C++ Code > Build Model**.

In an editor or in the code generation report, open a generated source or header file. As you review lines of code, note traceability tags that correspond to code of interest.

Highlight a block using a traceability tag.

```
hilite_system('<Root>/Stick Input')
```

Highlight a block in a subsystem.

```
hilite_system('<S3>/W-gust model')
```

Customize a Highlighting Style

You can customize a highlighting style by setting the `'HiliteAncestorsData'` parameter on the root-level model using `set_param` in this form:

```
set_param(0,'HiliteAncestorsData',hiliteData)
```

Specify `hiliteData` as a structure array that has these fields:

- `'HiliteType'` — Highlighting style to customize, such as `'user1'`, `'debug'`, or `'error'`.
- `'ForegroundColor'` — Color for block fill.
- `'BackgroundColor'` — Color for block outline.

The supported values for `'ForegroundColor'` and `'BackgroundColor'` are:

- `'black'`
- `'white'`
- `'gray'`
- `'red'`
- `'orange'`
- `'yellow'`
- `'green'`
- `'darkGreen'`
- `'blue'`
- `'lightBlue'`
- `'cyan'`
- `'magenta'`

Define a highlight style for `'user1'`, and customize the style for `'debug'`.

```
set_param(0,'HiliteAncestorsData',...
              struct('HiliteType','user1',...
                     'ForegroundColor','darkGreen',...
                     'BackgroundColor','lightBlue'));
set_param(0,'HiliteAncestorsData',...
              struct('HiliteType','debug',...
                     'ForegroundColor','red',...
                     'BackgroundColor','black'));
```

Use the defined style to highlight a block.

```
f14
hilite_system('f14/Controller/Alpha-sensor Low-pass Filter','user1')
```

find_system | rtwtrace

Introduced before R2006a

isLoaded

Determine if Simulink Project is loaded

Syntax

```
loaded = isLoaded(proj)
```

Description

loaded = isLoaded(proj) returns whether the project referenced by the project object proj is loaded.

Examples

Find Out if Project Is Loaded

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Find out if the project is still loaded.

```
loaded = isLoaded(proj)

loaded =

     1
```

Input Arguments

proj — Project
project

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

Output Arguments

`loaded` — Loaded status
1 | 0

Project loaded status, returned as true (1) if the project is loaded.

Data Types: `logical`

Functions
`reload` | `simulinkproject`

Introduced in R2013a

legacy_code

Use Legacy Code Tool

Syntax

```
legacy_code('help')
specs = legacy_code('initialize')
legacy_code('sfcn_cmex_generate', specs)
legacy_code('compile', specs, compilerOptions)
legacy_code('generate_for_sim', specs, modelname)
legacy_code('slblock_generate', specs, modelname)
legacy_code('sfcn_tlc_generate', specs)
legacy_code('sfcn_makecfg_generate', specs)
legacy_code('rtwmakecfg_generate', specs)
legacy_code('backward_compatibility')
```

Description

The `legacy_code` function creates a MATLAB structure for registering the specification for existing C or C++ code and the S-function being generated. In addition, the function can generate, compile and link, and create a masked block for the specified S-function. Other options include generating

- A TLC file for simulation in Accelerator mode or code generation
- An `rtwmakecfg.m` file that you can customize to specify dependent source and header files that reside in a different directory than that of the generated S-function

`legacy_code('help')` displays instructions for using Legacy Code Tool.

`specs = legacy_code('initialize')` initializes the Legacy Code Tool data structure, `specs`, which registers characteristics of existing C or C++ code and properties of the S-function that the Legacy Code Tool generates.

`legacy_code('sfcn_cmex_generate', specs)` generates an S-function source file as specified by the Legacy Code Tool data structure, `specs`.

`legacy_code('compile',` *specs*`,` *compilerOptions*`)` compiles and links the S-function generated by the Legacy Code Tool based on the data structure, *specs*, and compiler options that you might specify. The compiler options must be supported by the mex (MATLAB) function.

`legacy_code('generate_for_sim',` *specs*`,` *modelname*`)` generates, compiles, and links the S-function in a single step. If the `Options.useTlcWithAccel` field of the Legacy Code Tool data structure is set to logical 1 (`true`), the function also generates a TLC file for accelerated simulations.

`legacy_code('slblock_generate',` *specs*`,` *modelname*`)` generates a masked S-Function block for the S-function generated by the Legacy Code Tool based on the data structure, *specs*. The block appears in the Simulink model specified by `modelname`. If you omit `modelname`, the block appears in an empty model editor window.

`legacy_code('sfcn_tlc_generate',` *specs*`)` generates a TLC file for the S-function generated by the Legacy Code Tool based on the data structure, *specs*. This option is relevant if you want to:

- Force Accelerator mode in Simulink software to use the TLC inlining code of the generated S-function. See the description of the `ssSetOptions` SimStruct function and `SS_OPTION_USE_TLC_WITH_ACCELERATOR` S-function option for more information.
- Use Simulink Coder software to generate code from your Simulink model. For more information, see "Import Calls to External Code into Generated Code with Legacy Code Tool" (Simulink Coder).

`legacy_code('sfcn_makecfg_generate',` *specs*`)` generates an *sFunction*`_makecfg.m` file for the S-function generated by the Legacy Code Tool based on the data structure, *specs*. This option is relevant only if you use Simulink Coder software to generate code from your Simulink model. For more information, see "Use makecfg to Customize Generated Makefiles for S-Functions" (Simulink Coder) and "Import Calls to External Code into Generated Code with Legacy Code Tool" (Simulink Coder).

`legacy_code('rtwmakecfg_generate',` *specs*`)` generates an `rtwmakecfg.m` file for the S-function generated by the Legacy Code Tool based on the data structure, *specs*. This option is relevant only if you use Simulink Coder software to generate code from your Simulink model. For more information, see "Use rtwmakecfg.m API to Customize Generated Makefiles" (Simulink Coder) and "Import Calls to External Code into Generated Code with Legacy Code Tool" (Simulink Coder).

legacy_code('backward_compatibility') automatically updates syntax for using Legacy Code Tool to the supported syntax described in this reference page and in "Integrate C Functions Using Legacy Code Tool".

Input Arguments

specs

A structure with the following fields:

Name the S-function

SFunctionName (Required) — A character vector specifying a name for the S-function to be generated by the Legacy Code Tool.

Define Legacy Code Tool Function Specifications

- InitializeConditionsFcnSpec — A nonempty character vector specifying a reentrant function that the S-function calls to initialize and reset states. You must declare this function by using tokens that Simulink software can interpret as explained in "Declaring Legacy Code Tool Function Specifications".

- OutputFcnSpec — A nonempty character vector specifying the function that the S-function calls at each time step. You must declare this function by using tokens that Simulink software can interpret as explained in "Declaring Legacy Code Tool Function Specifications".

- StartFcnSpec — A character vector specifying the function that the S-function calls when it begins execution. This function can access S-function parameter arguments only. You must declare this function by using tokens that Simulink software can interpret as explained in "Declaring Legacy Code Tool Function Specifications".

- TerminateFcnSpec — A character vector specifying the function that the S-function calls when it terminates execution. This function can access S-function parameter arguments only. You must declare this function by using tokens that Simulink software can interpret as explained in "Declaring Legacy Code Tool Function Specifications".

Define Compilation Resources

- HeaderFiles — A cell array of character vectors specifying the file names of header files required for compilation.

- `SourceFiles` — A cell array of character vectors specifying source files required for compilation. You can specify the source files using absolute or relative path names.
- `HostLibFiles` — A cell array of character vectors specifying library files required for host compilation. You can specify the library files using absolute or relative path names.
- `TargetLibFiles` — A cell array of character vectors specifying library files required for target (that is, standalone) compilation. You can specify the library files using absolute or relative path names.
- `IncPaths` — A cell array of character vectors specifying directories containing header files. You can specify the directories using absolute or relative path names.
- `SrcPaths` — A cell array of character vectors specifying directories containing source files. You can specify the directories using absolute or relative path names.
- `LibPaths` — A cell array of character vectors specifying directories containing host and target library files. You can specify the directories using absolute or relative path names.

Specify a Sample Time

`SampleTime` — One of the following:

- `'inherited'` (default) — Sample time is inherited from the source block.
- `'parameterized'` — Sample time is represented as a tunable parameter. Generated code can access the parameter by calling MEX API functions, such as `mxGetPr` or `mxGetData`.
- Fixed — Sample time that you explicitly specify. For information on how to specify sample time, see "Specify Sample Time".

If you specify this field, you must specify it last.

Define S-Function Options

`Options` — A structure that controls S-function options. The structure's fields include:

- `isMacro` — A logical value specifying whether the legacy code is a C macro. By default, the value is false (`0`).
- `isVolatile` — A logical value specifying the setting of the S-function `SS_OPTION_NONVOLATILE` option. By default, the value is true (`1`).

- `canBeCalledConditionally` — A logical value specifying the setting of the S-function `SS_OPTION_CAN_BE_CALLED_CONDITIONALLY` option. By default, the value is true (`1`).
- `useTlcWithAccel` — A logical value specifying the setting of the S-function `SS_OPTION_USE_TLC_WITH_ACCELERATOR` option. By default, the value is true (`1`).
- `language` — A character vector specifying either `'C'` or `'C++'` as the target language of the S-function that Legacy Code Tool will produce. By default, the value is `'C'`.

Note The Legacy Code Tool can interface with C++ functions, but not C++ objects. For a work around, see "Legacy Code Tool Limitations" in the Simulink documentation.

- `singleCPPMexFile` — A logical value that, if `true`, specifies that generated code:

  - Requires you to generate and manage an inlined S-function as only one file (`.cpp`) instead of two (`.c` and `.tlc`).
  - Maintains model code style (level of parentheses usage and preservation of operand order in expressions and condition expressions in if statements) as specified by model configuration parameters.

  By default, the value is `false`.

Limitations You cannot set the `singleCPPMexFile` field to `true` if

- `Options.language='C++'`
- You use one of the following Simulink objects with the `IsAlias` property set to `true`:

  - `Simulink.Bus`
  - `Simulink.AliasType`
  - `Simulink.NumericType`
- The Legacy Code Tool function specification includes a `void*` or `void**` to represent scalar work data for a state argument
- `HeaderFiles` field of the Legacy Code Tool structure specifies multiple header files

---

- `supportsMultipleExecInstances`— A logical value specifying whether to include a call to the `ssSupportsMultipleExecInstances` function. By default, the value is `false` (`0`).

- `convertNDMatrixToRowMajor`— A logical value specifying the automatic conversion of a matrix between a column-major format and a row-major format. The column-major format is used by MATLAB, Simulink, and the generated code. The row-major format is used by C. By default, the value is `false` (`0`). If you currently specify the previous version of the option, `convert2DMatrixToRowMajor`, the function automatically specifies the new `convertNDMatrixToRowMajor` option.

  Note This option does not support a 2–D matrix of complex data.

- `supportCoverage`— A logical value specifying whether the generated S-function must be compatible with Model Coverage. By default, the value is `false` (`0`).

- `supportCoverageAndDesignVerifier`— A logical value specifying whether the generated S-function must be compatible with Model Coverage and Simulink Design Verifier™. By default, the value is `false` (`0`).

- `outputsConditionallyWritten`— A logical value specifying whether the legacy code conditionally writes the output ports. If `true`, the generated S-function specifies that the memory associated with each output port cannot be overwritten and is global (SS_NOT_REUSABLE_AND_GLOBAL). If `false`, the memory associated with each output port is reusable and is local (SS_REUSABLE_AND_LOCAL). By default, the value is `false` (`0`). For more information, see `ssSetOutputPortOptimOpts`.

modelname

The name of a Simulink model into which Legacy Code Tool is to insert the masked S-function block generated when you specify `legacy_code` with the action character vector `'slblock_generate'`. If you omit this argument, the block appears in an empty model editor window.

Introduced in R2006b

libinfo

Get information about library blocks referenced by model

Syntax

libdata = libinfo('*system*')
libdata = libinfo('*system*', *constraint1*, *value1*, ...)

Description

libdata = libinfo('*system*') returns information about library blocks referenced by *system* and all the systems underneath it.

libdata = libinfo('*system*', *constraint1*, *value1*, ...) restricts the search as indicated by the search constraint(s) *c1*, *v1*, ...

Input Arguments

system

The system to search recursively for library blocks.

constraint1, value1, ...

One or more pairs, each consisting of a search constraint followed by a constraint value. You can specify any of the search constraints that you can use with find_system.

Output Arguments

libdata

An array of structures that describes each library block referenced by *system*. Each structure has the following fields:

`Block`	Path of the link to the library block
`Library`	Name of the library containing the referenced block
`ReferenceBlock`	Path of the library block
`LinkStatus`	Value of the `LinkStatus` parameter for the link to the library block

Introduced before R2006a

linmod

Extract continuous-time linear state-space model around operating point

Syntax

```
argout = linmod('sys');
argout = linmod('sys', x, u);
argout = linmod('sys', x, u, para);
argout = linmod('sys', x, u, 'v5');
argout = linmod('sys', x, u, para, 'v5');
argout = linmod('sys', x, u, para, xpert, upert, 'v5');
```

Arguments

sys	Name of the Simulink system from which the linear model is extracted.
x and u	State (x) and the input (u) vectors. If specified, they set the operating point at which the linear model is extracted. When a model has model references using the Model block, you must use the Simulink structure format to specify x. To extract the x structure from the model, use the following command:
	`x = Simulink.BlockDiagram.getInitialState('sys');`
	You can then change the operating point values within this structure by editing `x.signals.values`.
	If the state contains different data types (for example, `'double'` and `'uint8'`), then you cannot use a vector to specify this state. You must use a structure instead. In addition, you can only specify the state as a vector if the state data type is `'double'`.
Ts	Sample time of the discrete-time linearized model
'v5'	An optional argument that invokes the perturbation algorithm created prior to MATLAB 5.3. Invoking this optional argument is equivalent to calling `linmodv5`.

para	A three-element vector of optional arguments:
	• para(1) — Perturbation value of delta, the value used to perform the perturbation of the states and the inputs of the model. This is valid for linearizations using the 'v5' flag. The default value is 1e-05.
	• para(2) — Linearization time. For blocks that are functions of time, you can set this parameter with a nonnegative value that gives the time (t) at which Simulink evaluates the blocks when linearizing a model. The default value is 0.
	• para(3) — Set para(3)=1 to remove extra states associated with blocks that have no path from input to output. The default value is 0.
xpert and upert	The perturbation values used to perform the perturbation of all the states and inputs of the model. The default values are

```
xpert = para(1) + 1e-3*para(1)*abs(x)
upert = para(1) + 1e-3*para(1)*abs(u)
```

When a model has model references using the Model block, you must use the Simulink structure format to specify xpert. To extract the xpert structure, use the following command:

```
xpert = Simulink.BlockDiagram.getInitialState('sys');
```

You can then change the perturbation values within this structure by editing xpert.signals.values.

The perturbation input arguments are only available when invoking the perturbation algorithm created prior to MATLAB 5.3, either by calling linmodv5 or specifying the 'v5' input argument to linmod.

argout	linmod, dlinmod, and linmod2 return state-space representations if you specify the output (left-hand) side of the equation as follows:

- [*A*,*B*,*C*,*D*] = linmod('*sys*', *x*, *u*) obtains the linearized model of *sys* around an operating point with the specified state variables *x* and the input *u*. If you omit *x* and *u*, the default values are zero.

linmod and dlinmod both also return a transfer function and MATLAB data structure representations of the linearized system, depending on how you specify the output (left-hand) side of the equation. Using linmod as an example:

- [num, den] = linmod('*sys*', *x*, *u*) returns the linearized model in transfer function form.
- sys_struc = linmod('*sys*', *x*, *u*) returns a structure that contains the linearized model, including state names, input and output names, and information about the operating point.

Description

linmod compute a linear state-space model by linearizing each block in a model individually.

linmod obtains linear models from systems of ordinary differential equations described as Simulink models. Inputs and outputs are denoted in Simulink block diagrams using Inport and Outport blocks.

The default algorithm uses preprogrammed analytic block Jacobians for most blocks which should result in more accurate linearization than numerical perturbation of block inputs and states. A list of blocks that have preprogrammed analytic Jacobians is available in the Simulink Control Design documentation along with a discussion of the block-by-block analytic algorithm for linearization.

The default algorithm also allows for special treatment of problematic blocks such as the Transport Delay and the Quantizer. See the mask dialog of these blocks for more information and options.

Notes

By default, the system time is set to zero. For systems that are dependent on time, you can set the variable `para` to a two-element vector, where the second element is used to set the value of `t` at which to obtain the linear model.

The ordering of the states from the nonlinear model to the linear model is maintained. For Simulink systems, a character vector variable that contains the block name associated with each state can be obtained using

```
[sizes,x0,xstring] = sys
```

where `xstring` is a vector of strings whose *i*th row is the block name associated with the `i`th state. Inputs and outputs are numbered sequentially on the diagram.

For single-input multi-output systems, you can convert to transfer function form using the routine `ss2tf` or to zero-pole form using `ss2zp`. You can also convert the linearized models to LTI objects using `ss`. This function produces an LTI object in state-space form that can be further converted to transfer function or zero-pole-gain form using `tf` or `zpk`.

The default algorithms in `linmod` handle Transport Delay blocks by replacing the linearization of the blocks with a Pade approximation. For the `'v5'` algorithm, linearization of a model that contains Derivative or Transport Delay blocks can be troublesome. For more information, see "Linearizing Models".

Introduced in R2007a

linmod2

Extract continuous-time linear state-space model around operating point

Syntax

```
argout = linmod2('sys', x, u);
argout = linmod2('sys', x, u, para);
```

Arguments

sys	Name of the Simulink system from which the linear model is extracted.
x, *u*	State (*x*) and the input (*u*) vectors. If specified, they set the operating point at which the linear model is extracted. When a model has model references using the Model block, you must use the Simulink structure format to specify x. To extract the x structure from the model, use the following command:

```
x = Simulink.BlockDiagram.getInitialState('sys');
```

You can then change the operating point values within this structure by editing x.signals.values.

If the state contains different data types (for example, 'double' and 'uint8'), then you cannot use a vector to specify this state. You must use a structure instead. In addition, you can only specify the state as a vector if the state data type is 'double'.

para	A three-element vector of optional arguments:
	• para(1) — Perturbation value of delta, the value used to perform the perturbation of the states and the inputs of the model. This is valid for linearizations using the 'v5' flag. The default value is 1e-05.
	• para(2) — Linearization time. For blocks that are functions of time, you can set this parameter with a nonnegative value that gives the time (t) at which Simulink evaluates the blocks when linearizing a model. The default value is 0.
	• para(3) — Set para(3)=1 to remove extra states associated with blocks that have no path from input to output. The default value is 0.
argout	linmod, dlinmod, and linmod2 return state-space representations if you specify the output (left-hand) side of the equation as follows:
	• [*A*,*B*,*C*,*D*] = linmod('*sys*', *x*, *u*) obtains the linearized model of *sys* around an operating point with the specified state variables *x* and the input *u*. If you omit *x* and *u*, the default values are zero.
	linmod and dlinmod both also return a transfer function and MATLAB data structure representations of the linearized system, depending on how you specify the output (left-hand) side of the equation. Using linmod as an example:
	• [num, den] = linmod('*sys*', *x*, *u*) returns the linearized model in transfer function form.
	• sys_struc = linmod('*sys*', *x*, *u*) returns a structure that contains the linearized model, including state names, input and output names, and information about the operating point.

Description

linmod2 computes a linear state-space model by perturbing the model inputs and model states, and uses an advanced algorithm to reduce truncation error.

`linmod2` obtains linear models from systems of ordinary differential equations described as Simulink models. Inputs and outputs are denoted in Simulink block diagrams using Inport and Outport blocks.

Notes

By default, the system time is set to zero. For systems that are dependent on time, you can set the variable `para` to a two-element vector, where the second element is used to set the value of `t` at which to obtain the linear model.

The ordering of the states from the nonlinear model to the linear model is maintained. For Simulink systems, a character vector variable that contains the block name associated with each state can be obtained using

`[sizes,x0,xstring] = ` *sys*

where `xstring` is a vector of strings whose *i*th row is the block name associated with the *i*th state. Inputs and outputs are numbered sequentially on the diagram.

For single-input multi-output systems, you can convert to transfer function form using the routine `ss2tf` or to zero-pole form using `ss2zp`. You can also convert the linearized models to LTI objects using `ss`. This function produces an LTI object in state-space form that can be further converted to transfer function or zero-pole-gain form using `tf` or `zpk`.

The default algorithms in `linmod` and `dlinmod` handle Transport Delay blocks by replacing the linearization of the blocks with a Pade approximation. For more information, see "Linearizing Models".

Introduced in R2007a

linmodv5

Extract continuous-time linear state-space model around operating point

Syntax

```
argout = linmodv5('sys');
argout = linmodv5('sys',x,u);
argout = linmodv5('sys', x, u, para);
argout = linmodv5('sys', x, u, para, xpert, upert);
```

Arguments

sys	Name of the Simulink system from which the linear model is extracted.
x, *u*	State (*x*) and the input (*u*) vectors. If specified, they set the operating point at which the linear model is extracted. When a model has model references using the Model block, you must use the Simulink structure format to specify x. To extract the x structure from the model, use the following command:

```
x = Simulink.BlockDiagram.getInitialState('sys');
```

You can then change the operating point values within this structure by editing `x.signals.values`.

If the state contains different data types (for example, `'double'` and `'uint8'`), then you cannot use a vector to specify this state. You must use a structure instead. In addition, you can only specify the state as a vector if the state data type is `'double'`.

para	A three-element vector of optional arguments:
	• `para(1)` — Perturbation value of delta, the value used to perform the perturbation of the states and the inputs of the model. This is valid for linearizations using the `'v5'` flag. The default value is 1e-05.
	• `para(2)` — Linearization time. For blocks that are functions of time, you can set this parameter with a nonnegative value that gives the time (`t`) at which Simulink evaluates the blocks when linearizing a model. The default value is 0.
	• `para(3)` — Set `para(3)=1` to remove extra states associated with blocks that have no path from input to output. The default value is 0.
xpert, *upert*	The perturbation values used to perform the perturbation of all the states and inputs of the model. The default values are

```
xpert = para(1) + 1e-3*para(1)*abs(x)
upert = para(1) + 1e-3*para(1)*abs(u)
```

When a model has model references using the Model block, you must use the Simulink structure format to specify `xpert`. To extract the `xpert` structure, use the following command:

```
xpert = Simulink.BlockDiagram.getInitialState('sys');
```

You can then change the perturbation values within this structure by editing `xpert.signals.values`.

The perturbation input arguments are only available when invoking the perturbation algorithm created prior to MATLAB 5.3, either by calling `linmodv5` or specifying the `'v5'` input argument to `linmod`.

argout	linmod, dlinmod, and linmod2 return state-space representations if you specify the output (left-hand) side of the equation as follows:

- [*A*,*B*,*C*,*D*] = linmod('*sys*', *x*, *u*) obtains the linearized model of *sys* around an operating point with the specified state variables *x* and the input *u*. If you omit *x* and *u*, the default values are zero.

linmod and dlinmod both also return a transfer function and MATLAB data structure representations of the linearized system, depending on how you specify the output (left-hand) side of the equation. Using linmod as an example:

- [num, den] = linmod('*sys*', *x*, *u*) returns the linearized model in transfer function form.
- sys_struc = linmod('*sys*', *x*, *u*) returns a structure that contains the linearized model, including state names, input and output names, and information about the operating point.

Description

linmodv5 computes a linear state space model using the full model perturbation algorithm created prior to MATLAB 5.3.

linmodv5 obtains linear models from systems of ordinary differential equations described as Simulink models. Inputs and outputs are denoted in Simulink block diagrams using Inport and Outport blocks.

Notes

By default, the system time is set to zero. For systems that are dependent on time, you can set the variable para to a two-element vector, where the second element is used to set the value of t at which to obtain the linear model.

The ordering of the states from the nonlinear model to the linear model is maintained. For Simulink systems, a character vector variable that contains the block name associated with each state can be obtained using

```
[sizes,x0,xstring] = sys
```

where `xstring` is a vector of strings whose *i*th row is the block name associated with the `ith` state. Inputs and outputs are numbered sequentially on the diagram.

For single-input multi-output systems, you can convert to transfer function form using the routine `ss2tf` or to zero-pole form using `ss2zp`. You can also convert the linearized models to LTI objects using `ss`. This function produces an LTI object in state-space form that can be further converted to transfer function or zero-pole-gain form using `tf` or `zpk`.

The default algorithms in `linmod` and `dlinmod` handle Transport Delay blocks by replacing the linearization of the blocks with a Pade approximation. For the `'v5'` algorithm, linearization of a model that contains Derivative or Transport Delay blocks can be troublesome. For more information, see "Linearizing Models".

dlinmod | linmod | linmod2

Introduced in R2011b

load_system

Load Simulink model into memory

Syntax

```
handle = load_system(sys)
```

Description

`handle = load_system(sys)` loads the model `sys` into memory without opening the model in the Simulink Editor. After you load a model into memory, you can work with it using Simulink API commands. Save changes to the model using `save_system`.

Examples

Load Model into Memory

Load the model `vdp` into memory and return the model handle.

```
h = load_system("vdp")

h =

   172.0004
```

Input Arguments

sys — Model to load into memory
character vector | string scalar

Model to load into memory, specified as a character vector or string scalar.

Example: `"vdp"`

Output Arguments

handle — Handle of loaded model
handle

Handle of loaded model.

See Also

close_system | open_system | save_system

Introduced before R2006a

loadIntoMemory

Load logged data into memory

Syntax

```
logs = loadIntoMemory(logs)
```

Description

`logs = loadIntoMemory(logs)` loads the data in `logs` into memory. Data is logged to a repository and brought into memory on an as-needed basis. When you want to work with all elements of a large set of logged data, use `loadIntoMemory` to bring all of the elements into memory at once. Loading all the data at once, rather than element by element, is much faster.

Examples

Load Logged Data into Memory

This example shows how to load a set of logged data into memory all at once, rather than element by element.

```
% Simulate model to generate logged data
sim('sldemo_fuelsys')
```

The simulation logs all of the instrumented signals in the model to the `Simulink.SimulationData.Dataset` object `sldemo_fuelsys_output`. At the end of simulation, the signal data remains in the repository until used in the MATLAB workspace. When you work with small sets of data or only postprocess a subset, leaving signals in the repository improves performance. But when you have a large set of data and need to postprocess all of the signals, you should bring them all into memory at once.

```
% Load all logged signals into memory
loadIntoMemory(sldemo_fuelsys_output);
```

All of the data in `sldemo_fuelsys_output` is now available for efficient postprocessing.

Input Arguments

`logs` — Data to load into memory
`'Simulink.SimulationData.Dataset'` | `'Simulink.SimulationOutput'`

Data to load into memory. The `loadIntoMemory` function can load
`Simulink.SimulationData.Dataset` and `Simulink.SimulationOutput` data.

Example: `logsout`

Output Arguments

`logs` — Data
`'Simulink.SimulationData.Dataset'` | `'Simulink.SimulationOutput'`

Data loaded into memory.

See Also
`Simulink.SimulationData.Dataset` | `Simulink.SimulationOutput`

Introduced in R2017b

model

Execute particular phase of simulation of model

Syntax

```
[sys,x0,str,ts] = model([],[],[],'sizes');
[sys,x0,str,ts] = model([],[],[],'compile');
outputs = model(t,x,u,'outputs');
derivs = model(t,x,u,'derivs');
dstates = model(t,x,u,'update');
model([],[],[],'term');
```

Description

The `model` command executes a specific phase of the simulation of a Simulink model whose name is `model`. The command's last argument (`flag`) specifies the phase of the simulation to be executed. See "Simulation Phases in Dynamic Systems" for a description of the steps that Simulink software uses to simulate a model.

This command ignores the effects of state transitions and conditional execution. Therefore, it is not suitable for models which have such logic. Use this command for models which can be represented as simple dynamic systems. Such systems should meet these requirements.

- All states in the model must be built-in non-bus data types. For a discussion on built-in data types, see "About Data Types in Simulink".

- If you are using vector format to specify the state, this command can access only non-complex states of `double` data type.

- There is minimal amount of state logic (Stateflow, conditionally executed subsystems etc.)

- The models are not mixed-domain models. That is, most blocks in the model are built-in Simulink blocks and do not include user-written S-functions or blocks from other Sim* products.

For models which do not comply with these requirements, using this command can cause Simulink to produce results which can only be interpreted by further analyzing and simplifying the model.

Note The state variable x can be represented in structure as well as vector formats. The variable follows the limitations of the format in which it is specified.

This command is also not intended to be used to run a model step-by-step, for example, to debug a model. Use the Simulink debugger if you need to examine intermediate results to debug a model.

Arguments

sys	Vector of model size data: - sys(1) = number of continuous states - sys(2) = number of discrete states - sys(3) = number of outputs - sys(4) = number of inputs - sys(5) = reserved - sys(6) = direct-feedthrough flag (1 = yes, 0 = no) - sys(7) = number of sample times (= number of rows in ts)
x0	Vector containing the initial conditions of the system's states
str	Vector of names of the blocks associated with the model's states. The state names and initial conditions appear in the same order in str and x0, respectively.
ts	An *m*-by-2 matrix containing the sample time (period, offset) information
outputs	Outputs of the model at time step t.
derivs	Derivatives of the continuous states of the model at time t.

dstates	States of the model at time t returned as either a structure or an array. Simulink returns a structure when the model has states and x is either empty ([]) or in structure format. Otherwise, Simulink returns an array. • If the return type is a vector or array, Simulink returns real double discrete states only. • If the return type is a structure, Simulink returns a structure that contains both continuous and discrete states of built-in types only. Non-built-in types are omitted.
t	Time step, specified as real double in scalar format.
x	State vector, specified as real double in structure or vector format.
u	Inputs, specified as real double in vector format.
flag	Specification of the simulation phase to be executed: • 'sizes' executes the size computation phase of the simulation. This phase determines the sizes of the model's inputs, outputs, state vector, etc. • 'compile' executes the compilation phase of the simulation. The compilation phase propagates signal and sample time attributes. • 'update' computes the next values of the model's discrete states. • 'outputs' computes the outputs of the model's blocks at time t. • 'derivs' computes the derivatives of the model's continuous states at time step t. • 'term' causes Simulink software to terminate simulation of the model. **Note** The output, update, and derivs flags are valid only for single-tasking models. For more information on single-tasking and multi-tasking, see "Tasking Modes" (Simulink Coder).

Examples

The following command executes the compilation phase of the vdp model that comes with Simulink software.

```
vdp([], [], [], 'compile')
```

The following command terminates the simulation initiated in the previous example.

```
vdp([], [], [], 'term')
```

Note Simulink does not let you close a model while it is compiling or simulating. For all phases except the `'sizes'` phase, before closing the model, you must invoke the model command with the `'term'` argument.

sim

Introduced in R2007a

modeladvisor

Open Model Advisor

Syntax

```
modeladvisor(model)
```

Description

modeladvisor(model) opens the Model Advisor for the model or subsystem specified by model. If the specified model or subsystem is not open, this command opens it.

Examples

Open Model Advisor for model

Open the Model Advisor for vdp example model:

```
modeladvisor('vdp')
```

Open Model Advisor for subsystem

Open the Model Advisor for the Aircraft Dynamics Model subsystem of the f14 example model:

```
modeladvisor('f14/Aircraft Dynamics Model')
```

Open Model Advisor for currently selected model

Open the Model Advisor on the currently selected model:

```
modeladvisor(bdroot)
```

Open Model Advisor for currently selected subsystem

Open the Model Advisor on the currently selected subsystem:

```
modeladvisor(gcs)
```

Input Arguments

model — Model or subsystem name
character vector

Model or subsystem name or handle, specified as a character vector.

Data Types: `char`

See Also
"Run Model Checks"

Introduced before R2006a

new_system

Create Simulink model or library in memory

Syntax

```
h = new_system

h = new_system(name)
h = new_system(name,'FromTemplate',template)
h = new_system(name,'FromFile',file)
h = new_system( ___ ,'ErrorIfShadowed')

h = new_system(name,'Model')
h = new_system(name,'Model',subsys)
h = new_system(name,'Library')
h = new_system( ___ ,'ErrorIfShadowed')
```

Description

`h = new_system` creates a model named `untitled` (and then `untitled1`, `untitled2`, and so on) based on your default model template and returns the new model's numeric handle. Select your default model template on the Simulink start page or by using the `Simulink.defaultModelTemplate` function.

The `new_system` function does not open the new model. This function creates the model in memory. To save the model, use `save_system`, or open the model with `open_system` and then save it using the Simulink Editor.

`h = new_system(name)` creates a model based on your default model template and gives the new model the specified name. This function returns the new model's numeric handle. Select your default model template on the Simulink start page or by using the `Simulink.defaultModelTemplate` function.

If `name` is empty, the function creates a model named `untitled`, `untitled1`, `untitled2`, and so on.

The `new_system` function does not open the new model. This function creates the model in memory. To save the model, use `save_system`, or open the model with `open_system` and then save it using the Simulink Editor.

`h = new_system(name,'FromTemplate',template)` creates the model based on the specified template.

`h = new_system(name,'FromFile',file)` creates the model based on the specified model or template.

`h = new_system( ___ ,'ErrorIfShadowed')` creates the model or returns an error if another model, MATLAB file, or variable with the same name is on the MATLAB path or in the workspace. It uses any of the input arguments in the previous syntaxes.

`h = new_system(name,'Model')` creates an empty model based on the Simulink default model and returns the new model's numeric handle. The Simulink default model is also known as the root block diagram and has the numeric handle `0`. If `name` is empty, the function creates a model or library named `untitled`, `untitled1`, `untitled2`, and so on.

The `new_system` function does not open the new model. This function creates the model in memory. To save the model, use `save_system`, or open the model with `open_system` and then save it using the Simulink Editor.

`h = new_system(name,'Model',subsys)` creates a model based on the subsystem `subsys` in a currently loaded model.

`h = new_system(name,'Library')` creates an empty library that has the specified name and returns a numeric handle.

`h = new_system( ___ ,'ErrorIfShadowed')` returns an error if another model, MATLAB file, or variable with the same name is on the MATLAB path or in the workspace. This syntax uses any of the input arguments in the previous syntaxes.

Examples

Create a Model Based on Default Template

Create a model in memory called `untitled`.

```
h = new_system;
```

You can use `get_param` to get the name.

```
get_param(h,'Name')
open_system(h)
open_system('untitled')
open_system(get_param(h,'Name'))

ans =

untitled
```

Use the name, the handle, or `get_param` command as input to `open_system`. You can use any of these commands:

Create a Model Based on Named Template

Before you use this syntax, create a template. In the Simulink Editor, create the model you want to use as the template. Then select **File** > **Export Model to** > **Template**. For this example, name the template `mytemplate`.

By default, the template is on the MATLAB path, so if you change location, add the folder to the MATLAB path.

Create a model named `templateModel` based on the template `mytemplate`.

```
h = new_system('templateModel','FromTemplate','mytemplate');

Invoking template \\myuserdir\Documents\MATLAB\mytemplate.sltx
```

Create a Model Based on Another Model

Create a model named `mynewmodel` based on `myoldmodel`, which is in the current folder.

```
h = new_system('mynewmodel','FromFile','myoldmodel.slx');
```

Create Model from Subsystem

Load the model `f14`. Create a model based on the Controller subsystem.

```
load_system('f14');
new_system('mycontroller','Model','f14/Controller');
open_system('mycontroller');
```

Create a Library

Create a library in memory and then open it.

```
new_system('mylib','Library')
open_system('mylib')
```

Ensure Model Name Is Unique

Create a variable with the name `myvar`.

```
myvar = 17
```

Try to create a model that uses the same name as the variable. When you use the `'ErrorIfShadowed'` option, the `new_system` function returns an error.

```
new_system('myvar2','Model','ErrorIfShadowed')
```

```
The model 'myvar2' cannot be created because this name is shadowing another name on the
path or in the workspace.  Choose another name, or do not use the option 'ErrorIfShadow
```

Input Arguments

name — Name of new model or library
character vector

Name of new model or library, specified as a character vector that:

- Has 63 or fewer characters
- Is not a MATLAB keyword
- Is not `'simulink'`
- Is unique among model names, variables, and MATLAB files on the MATLAB path and in the workspace

Example: `'mymodel', 'mylibrary'`

subsys — Subsystem to base new model on
subsystem block path name

Subsystem to base the new model on, specified as the subsystem block path name in a currently open model.

Example: `'f14/Controller'`

template — Name of template to base new model on
character vector

Name of the template to base the new model on, specified as a character vector of the name of a template on the MATLAB path. Create a template in the Simulink Editor using **File > Export Model to > Template**.

Example: `'mytemplate'`, `'mytemplate.sltx'`

file — Path name of model or template to base new model on
character vector

Path name of the model or template to base the new model on, specified as a character vector. You can use an `.mdl`, `.slx`, or `..sltx` file. Include the extension and use a full or relative path.

Example: `'Models/mymodel.slx'`, `'mytemplate.sltx'`, `'model.mdl'`

Introduced before R2006a

num2fixpt

Convert number to nearest value representable by specified fixed-point data type

Syntax

```
outValue = num2fixpt(OrigValue, FixPtDataType, FixPtScaling,
    RndMeth, DoSatur)
```

Description

num2fixpt(OrigValue, FixPtDataType, FixPtScaling, RndMeth, DoSatur) returns the result of converting OrigValue to the nearest value representable by the fixed-point data type FixPtDataType. Both OrigValue and outValue are of data type double. As illustrated in the example that follows, you can use num2fixpt to investigate quantization error that might result from converting a number to a fixed-point data type. The arguments of num2fixpt include:

OrigValue	Value to be converted to a fixed-point representation. Must be specified using a double data type.
FixPtDataType	The fixed-point data type used to convert OrigValue.
FixPtScaling	Scaling of the output in either Slope or [Slope Bias] format. If FixPtDataType does not specify a generalized fixed-point data type using the sfix or ufix command, FixPtScaling is ignored.
RndMeth	Rounding technique used if the fixed-point data type lacks the precision to represent OrigValue. If FixPtDataType specifies a floating-point data type using the float command, RndMeth is ignored. Valid values are Zero, Nearest, Ceiling, or Floor (the default).

DoSatur	Indicates whether the output should be saturated to the minimum or maximum representable value upon underflow or overflow. If FixPtDataType specifies a floating-point data type using the float command, DoSatur is ignored. Valid values are on or off (the default).

Examples

Suppose you wish to investigate the quantization effect associated with representing the real-world value 9.875 as a signed, 8-bit fixed-point number. The command

```
num2fixpt(9.875, sfix(8), 2^-1)
```

```
ans =

    9.50000000000000
```

reveals that a slope of 2^-1 results in a quantization error of 0.375. The command

```
num2fixpt(9.875, sfix(8), 2^-2)
```

```
ans =

    9.75000000000000
```

demonstrates that a slope of 2^-2 reduces the quantization error to 0.125. But a slope of 2^-3, as used in the command

```
num2fixpt(9.875, sfix(8), 2^-3)
```

```
ans =

    9.87500000000000
```

eliminates the quantization error entirely.

Introduced before R2006a

open_system

Open Simulink model, library, subsystem, or block dialog box

Syntax

```
open_system(obj)

open_system(sys,'loadonly')

open_system(sbsys,'window')
open_system(sbsys,'tab')

open_system(blk,'mask')
open_system(blk,'force')
open_system(blk,'parameter')
open_system(blk,'OpenFcn')
```

Description

`open_system(obj)` opens the specified model, library, subsystem, or block. This is equivalent to double-clicking the model or library in the Current Folder Browser, or the subsystem or block in the Simulink Editor.

A model or library opens in a new window. For a subsystem or block within a model, the behavior depends on the type of block and its properties.

- Any OpenFcn callback parameter is evaluated.
- If there is no OpenFcn callback, and a mask is defined, the mask parameter dialog box opens.
- Without an OpenFcn callback or a mask parameter, Simulink opens the object.

  - A referenced model opens in a new window.
  - A subsystem opens in a new tab in the same window.
  - For blocks, the parameters dialog box for the block opens.

To open a specific subsystem or block, you must load the model or library containing it. Otherwise Simulink returns an error.

You can override the default behavior by supplying a second input argument.

`open_system(sys,'loadonly')` loads the specified model or library without opening the Simulink Editor. This is equivalent to using `load_system`.

`open_system(sbsys,'window')` opens the subsystem `sbsys` in a new Simulink Editor window. Before opening a specific subsystem or block, load the model or library containing it. Otherwise Simulink returns an error.

`open_system(sbsys,'tab')` opens the subsystem in a new Simulink Editor tab in the same window. Before opening a specific subsystem or block, load the model or library containing it. Otherwise Simulink returns an error.

`open_system(blk,'mask')` opens the mask dialog box of the block or subsystem specified by `blk`. Load the model or library containing `blk` before opening it.

`open_system(blk,'force')` looks under the mask of a masked block or subsystem. It opens the dialog box of the block under the mask or opens a masked subsystems in a new Simulink Editor tab. This is equivalent to the **Look Under Mask** menu item. Before opening a specific subsystem or block, load the model or library containing it. Otherwise Simulink returns an error.

`open_system(blk,'parameter')` opens the block parameter dialog box.

`open_system(blk,'OpenFcn')` runs the block callback `OpenFcn`.

Examples

Open a Model

Open the `f14` model.

```
open_system('f14')
```

Load a Model Without Opening it

Load the f14 model.

```
open_system('f14','loadonly')
```

Open a Subsystem

Open the Controller subsystem of the f14 model.

```
load_system('f14')
open_system('f14/Controller')
```

Open a Subsystem in New Tab in Existing Window

Open the f14 model and open the Controller subsystem in a new tab.

```
f14
open_system('f14/Controller','tab')
```

Open a Subsystem in a Separate Window

Open a subsystem in its own Simulink Editor window.

```
open_system('f14')
open_system('f14/Controller','window')
```

Open a Referenced Model

Open the model sldemo_mdlref_counter, which is referenced by the CounterA model block in sldemo_mdlref_basic.

```
open_system('sldemo_mdlref_basic')
open_system('sldemo_mdlref_basic/CounterA')
```

The referenced model opens in its own Simulink Editor window.

Open Block Dialog Box

Open the block parameters dialog box for the first Gain block in the `Controller` subsystem.

```
load_system('f14')
open_system('f14/Controller/Gain')
```

Run Block Open Callback Function

Define an `OpenFcn` callback for a block and execute the block callback.

```
f14
set_param('f14/Pilot','OpenFcn','disp(''Hello World!'')')
open_system('f14/Pilot','OpenFcn')
```

The words `Hello World` appear on the MATLAB Command Prompt.

Open Masked Subsystem

Open the contents of the masked subsystem Vehicle in the model `sf_car`.

```
open_system('sf_car')
open_system('sf_car/Vehicle', 'force')
```

Open Multiple Systems with One Command

Create a cell array of two model names, `f14` and `vdp`. Open both models using `open_system` with the cell array name.

```
models = {'f14','vdp'}
open_system(models)
```

Input Arguments

obj — Model, referenced model, library, subsystem, or block path
character vector

Model, referenced model, library, subsystem, or block path, specified as a character vector. If the model is not on the MATLAB path, specify the full path to the model file. Specify the block or subsystem using its full name, e.g., `f14/Controller/Gain`, on an opened or loaded model. On UNIX systems, the fully qualified path name of a model can start with a tilde (~), signifying your home directory.

Data Types: `char`

sys — Model or library path
character vector

The full name or path of a model or library, specified as a character vector.

Data Types: `char`

sbsys — Subsystem path
character vector

The full name or path of a subsystem in an open or loaded model, specified as a character vector.

Data Types: `char`

blk — Block or subsystem path
character vector

The full name or path of a block or subsystem in an open or loaded model, specified as a character vector.

Data Types: `char`

Introduced before R2006a

openDialog

Open configuration parameters dialog

Syntax

openDialog(*configObj*)

Arguments

configObj

> A configuration set (`Simulink.ConfigSet`) or configuration reference
> (`Simulink.ConfigSetRef`)

Description

`openDialog` opens a configuration parameters dialog box. If *configObj* is a
configuration set, the dialog box displays the configuration set. If *configObj* is a
configuration reference, the dialog box displays the referenced configuration set, or
generates an error if the reference does not specify a valid configuration set. If the dialog
box is already open, its window becomes selected.

Examples

The following example opens a configuration parameters dialog box that shows the
current parameters for the current model. The parameter values derive from the active
configuration set or configuration reference (configuration object). The code is the same
in either case; the only difference is which type of configuration object is currently active.

```
myConfigObj = getActiveConfigSet(gcs);
openDialog(myConfigObj);
```

parsim

Simulate dynamic system in parallel or serial

Syntax

```
simOut = parsim(in)
simOut = parsim(in,'ShowSimulationManager','on')
simOut = parsim(in,Name,Value,...NameN,ValueN)
```

Description

`simOut = parsim(in)` simulates a model using the inputs specified in the `SimulationInput` object, in. The `parsim` command uses an array of `SimulationInput` objects to run multiple simulations.

`simOut = parsim(in,'ShowSimulationManager','on')` simulates a model in parallel using the inputs specified in the `SimulationInput` object and opens the Simulation Manager UI. For more information, see `Simulation Manager`.

`simOut = parsim(in,Name,Value,...NameN,ValueN)` simulates a model in parallel using the inputs specified in the `SimulationInput` object and the options specified as the `Name,Value` pair.

The `parsim` command uses the Parallel Computing Toolbox™ license to run the simulations in parallel. `parsim` runs the simulations in serial if a parallel pool cannot be created and in the absence of Parallel Computing Toolbox .

Examples

Simulate Model in Parallel with parsim

Simulate the model, CSTR, in parallel by sweeping over a variable. An array of SimulationInput objects is used to perform the sweep.

Specify sweep values.

```
FeedTempSweep = 250:10:300;
```

Create an array of SimulationInput objects.

```
for i = length(FeedTempSweep):-1:1;
in(i) = Simulink.SimulationInput('CSTR');
in(i) = in(i).setVariable('FeedTemp0',FeedTempSweep(i));
end
```

Simulate the model in parallel.

```
out = parsim(in, 'ShowProgress', 'on')
```

```
[08-Jan-2018 14:10:43] Checking for availability of parallel pool...

out =

1x6 Simulink.SimulationOutput array
```

Parsim with Rapid Accelerator

Simulate the model, vdp, in rapid accelerator mode.

Load the model.

```
model = 'vdp';
load_system(model)
```

This step builds the Rapid Accelerator target

```
Simulink.BlockDiagram.buildRapidAcceleratorTarget(model);
```

Create a `SimulationInput` object and use `setModelParameter` method to set
`RapidAcceleratorUpToDateCheck` off.

```
in = in.setModelParameter('SimulationMode', 'rapid-accelerator');
in = in.setModelParameter('RapidAcceleratorUpToDateCheck', 'off');
```

Simulate the model.

```
out = parsim(in)
```

Input Arguments

`in` — Simulink.SimulationInput object used to simulate the model
object, array

A `Simulink.SimulationInput` object or an array of `Simulink.SimulationInput`
objects that is used to specify changes to the model for a simulation.

Example: `in = Simulink.SimulationInput('vdp')`

Name-Value Pair Arguments

Note All parameters passed to `parsim` command are unrelated to the parameters that
are used with the sim command. Use the list of following input arguments to pass to the
`parsim` command.

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the
argument name and `Value` is the corresponding value. `Name` and `Value` must appear
inside single quotes (`'  '`). You can specify several name and value pair arguments in any
order as `Name1,Value1,...,NameN,ValueN`.

Example: `'ShowProgress', 'on'`

ShowProgress — Show the progress of the simulations
'on'(default) | 'off'

When ShowProgress is set to `'on'`, you can see the progress of the simulations in the
command window. The progress is hidden when set to `'off'`.

Note When the progress is shown, a message 'Cleaning up parallel workers..' may be displayed before the completion of the last few simulations. This message does not depend on the completion of the simulations. Simulations "complete" when the outputs are fetched from the future.

RunInBackground — Run simulations in background
'off' (default) | 'on'

When 'RunInBackground' is set to 'on', the simulations run asynchronously, keeping the MATLAB command prompt available for use.

SetupFcn — Function handle to run once per worker
function handle

You can specify a function handle to 'SetupFcn' to run once per worker before the start of the simulations .

Example: 'SetupFcn',@()simulinkproject('OCRAex/OCRA_example.prj')

Note When buildRapidAcceleratorTarget is used in the SetupFcn and the model has external inputs specified, either set 'LoadExternalInput' to 'off' or ensure that the specified external input is available on the workers to prevent compilation error.

CleanupFcn — Function handle to run once per worker after running simulations
function handle

You can specify a function handle to 'CleanupFcn' to run once per worker after the simulations are completed.

ManageDependencies — Manage model dependecies
'on' (default) | 'off'

When ManageDependencies is set to on, model dependencies are automatically sent to the parallel workers if required. If off, explicitly attache model dependecies to the parallel pool.

UseFastRestart — Use fast restart
false (default) | true

When UseFastRestart is set to true, simulations run on the workers using fast restart.

Note When using `parsim`, use the `UseFastRestart` option and NOT the `FastRestart` option. See "Factors Affecting Fast Restart" for more information.

`TransferBaseWorkspaceVariables` — Transfer variables to the parallel workers
false (default) | true

When `TransferBaseWorkspaceVariables` is set to `true`, variables used in the model and defined in the base workspace are transferred to the parallel workers.

Note Use of `TransferBaseWorkspaceVariables` requires model compilation.

`ShowSimulationManager` — Starts the Simulation Manager App
'off' (default) | 'on'

When `'ShowSimulationManager'` is set to `'on'`, you can use the Simulation Manager App to monitor simulations.

Output Arguments

`simOut` — Simulation object containing logged simulation results
object

`Simulink.SimulationOutput` is an array of `Simulink.SimulationOutput` objects that contains all of the logged simulation results. The size of the array is equal to the size of the array of `Simulink.SimulationInput` objects.

All simulation outputs (logged time, states, and signals) are returned in a single `Simulink.SimulationOutput` object. You define the model time, states, and output that is logged using the **Data Import/Export** pane of the **Model Configuration Parameters** dialog box. You can log signals using blocks such as the To Workspace and Scope blocks. The **Signal & Scope Manager** can directly log signals.

Introduced in R2017a

performanceadvisor

Open Performance Advisor

Syntax

```
performanceadvisor(model)
```

Description

`performanceadvisor(model)` opens the Performance Advisor on the model or subsystem specified by model. If the specified model or subsystem is not open, this command opens it.

Input Arguments

model

A character vector specifying the name or handle to the model or subsystem.

Examples

Open Performance Advisor

Open Performance Advisor on the vdp example model.

```
performanceadvisor('vdp')
```

Performance Advisor opens the vdp model and opens Performance Advisor on the model.

- "Improve Simulation Performance Using Performance Advisor"
- "Perform a Quick Scan Diagnosis"

- "Improve vdp Model Performance"

Alternatives

In the Simulink Editor, select **Analysis** > **Performance Tools** > **Performance Advisor**.

"Performance Advisor Window"

Introduced in R2013a

reload

Reload Simulink Project

Syntax

```
reload(proj)
```

Description

`reload(proj)` reloads the project. Use `reload` when you want to run the project startup shortcuts.

Examples

Reload Project

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

When you want to run the startup shortcuts again, reload the project.

```
reload(proj)
```

Input Arguments

`proj` — Project
project object

Project, specified as a project object already created with `simulinkproject` to manipulate a Simulink Project at the command line.

See Also

Functions
isLoaded | simulinkproject

Introduced in R2013a

removeCategory

Remove Simulink Project category of labels

Syntax

```
removeCategory(proj,categoryName)
```

Description

removeCategory(proj,categoryName) removes a category of labels, categoryName, from the Simulink Project specified by proj.

Examples

Remove Category

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Create a new category of labels.

```
createCategory(proj,'Engineers','char');
```

Remove the new category of labels.

```
removeCategory(proj,'Engineers');
```

A message appears warning you that you cannot undo the operation. Click **Continue**. You can configure warnings in the Preferences in the Simulink Project Tool.

Input Arguments

`proj` — Project
project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

`categoryName` — Name of category
character vector

Name of the category to remove, which exists in the project, specified as a character vector.

See Also

Functions
createCategory | findCategory | simulinkproject

Introduced in R2013a

removeFile

Remove file from Simulink Project

Syntax

```
removeFile(proj,file)
```

Description

removeFile(proj,file) removes a file from the project proj.

Examples

Remove File from Project

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Remove a file.

```
removeFile(proj,'models/AnalogControl.mdl')
```

Add the file back to the project.

```
addFile(proj,'models/AnalogControl.mdl')
```

Input Arguments

proj — Project
project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

`file` — Path of file
character vector | file object

Path of the file to remove relative to the project root folder, including the file extension, specified as a character vector or a file object returned by `findFile`. The file must be in the project.

Example: `'models/myModelName.slx'`

See Also

Functions
addFile | findFile | simulinkproject

Introduced in R2013a

removeLabel

Remove label from Simulink Project

Syntax

```
removeLabel(category,labelName)
removeLabel(file,categoryName,labelName)
removeLabel(file,labelDefinition)
```

Description

`removeLabel(category,labelName)` removes the label from the specified category of labels in the currently loaded project.

`removeLabel(file,categoryName,labelName)` removes the specified label in the category `categoryName` from the file. Use this syntax to specify category and label by name.

`removeLabel(file,labelDefinition)` removes the specified label `labelDefinition` from the file. Before you can remove the label, you need to get the label from the `file.Label` property or by using `findLabel`.

Examples

Remove a Label

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Examine the first existing category.

```
cat = proj.Categories(1)
```

```
cat =

  Category with properties:

               Name: 'Classification'
           DataType: 'none'
   LabelDefinitions: [1x8 slproject.LabelDefinition]
```

Define a new label in the category.

```
createLabel(cat,'Future');
```

Remove the new label.

```
removeLabel(cat,'Future');
```

Input Arguments

`category` — Category of labels
category object

Category of labels, specified as a category object. Get a category object from the `proj.Categories` property or by using `findCategory`.

`labelName` — Name of label
character vector

Name of the label to remove, specified as a character vector.

`file` — File to detach label from
file object

File to detach the label from, specified as a file object. You can get the file object by examining the project's Files property (`proj.Files`), or use `findFile` to find a file by name. The file must be within the root folder.

`categoryName` — Name of category that contains label
character vector

Name of the category that contains the label to remove, specified as a character vector.

labelDefinition — Label to detach
label definition object

Name of the label to detach, specified as a label definition object returned by the
`file.Label` property or `findLabel`.

Functions
addLabel | createLabel | findCategory | findLabel | simulinkproject

Introduced in R2013a

replace_block

Replace blocks in Simulink model

Syntax

```
replBlks = replace_block(sys,current,new)
replBlks = replace_block(sys,Name,Value,new)
replBlks = replace_block( ___ ,'noprompt')
```

Description

`replBlks = replace_block(sys,current,new)` replaces the blocks `current` in the model `sys` with blocks of type `new`. You can use a block from a Simulink library or from another model as the replacement block.

Load the model `sys` before using this function. The function prompts you to select the blocks you want to replace from a list of blocks that match the `current` argument.

Tip Save the model before using this command.

`replBlks = replace_block(sys,Name,Value,new)` replaces the blocks that match the block parameters specified by the `Name,Value` pair arguments. You can also use `find_system Name,Value` pairs to qualify the search for blocks to replace.

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

With the `replace_block` function, you can use block parameter and value pairs. For a list of all the block parameters, see "Common Block Properties" on page 6-111 and "Block-Specific Parameters" on page 6-130.

To specify additional information about the search for blocks to replace, you use `find_system Name,Value` pairs before the block parameters. For example, you can use

'CaseSensitive','off' to make the search for blocks case insensitive or 'FollowLinks','on' to follow links into library links. See find_system for that list of Name,Value pairs.

replBlks = replace_block(___ ,'noprompt') replaces the blocks without prompting you to select them from a dialog box.

Examples

Replace Blocks in a Model

Replace blocks in the 'vdp' model.

Load the model 'vdp'.

```
load_system('vdp');
```

Replace Gain blocks with Integrator blocks.

```
RepNames = replace_block('vdp','Gain','Integrator');
```

A dialog box prompts you to select the blocks you want to replace.

With vdp/Mu selected in the dialog box, click **OK**.

Replace Scope blocks with To Workspace blocks.

```
RepNames = replace_block('vdp','Scope','simulink/Sinks/To Workspace');
```

A dialog box prompts you to select the blocks you want to replace.

With vdp/Scope selected in the dialog box, click **OK**.

Replace Blocks in a Subsystem Using Parameter Values

Replace blocks in the Unlocked subsystem of the sldemo_clutch model. Replace blocks whose Gain parameter is set to bv.

Load the model sldemo_clutch.

```
load_system('sldemo_clutch');
```

In the `'Unlocked'` subsystem, replace blocks whose `Gain` value is `bv` with Integrator blocks.

```
replace_block('sldemo_clutch/Unlocked','Gain','bv','Integrator');
```

A dialog box prompts you to select the blocks to replace.

With `sldemo_clutch/Unlocked/VehicleDamping` selected in the dialog box, click **OK**.

Replace Blocks Without Dialog Box

Load the model `f14`.

```
load_system('f14')
```

Replace Gain blocks with Integrator blocks. The command returns the blocks it found to replace and replaces the blocks.

```
repl = replace_block('f14','Gain','Integrator','noprompt')
```

```
repl = 13x1 cell array
    {'f14/Aircraft...'     }
    {'f14/Aircraft...'     }
    {'f14/Aircraft...'     }
    {'f14/Aircraft...'     }
    {'f14/Controller/Gain' }
    {'f14/Controller/Gain2'}
    {'f14/Controller/Gain3'}
    {'f14/Gain'            }
    {'f14/Gain1'           }
    {'f14/Gain2'           }
    {'f14/Gain5'           }
    {'f14/Nz pilot...'     }
    {'f14/Nz pilot...'     }
```

Use find_system Pairs with replace_block

Select a block that is a library link. Follow the library links and replace Gain blocks with Integrator blocks within them.

```
replace_block(gcb, 'FollowLinks', 'on', 'BlockType', 'Gain', 'Integrator', 'noprompt')
```

Input Arguments

sys — Model or subsystem whose blocks to replace
character vector

Name of model whose blocks to replace, specified as a character vector. If you specify a model, the command replaces all blocks that match in the model. If you specify a subsystem, the command replaces blocks in that subsystem and below.

Example: `'vdp'`, `'sldemo_fuelsys/fuel_rate_control'`

current — Type of block to replace
`BlockType` value | `MaskType` value

Type of block to replace, specified as a `BlockType` or `MaskType` value. To find out the block type, select the block and, at the command prompt, enter:

```
get_param(gcb,'BlockType')
```

For masked blocks, to find out the mask type, select the block and enter:

```
get_param(gcb,'MaskType')
```

new — Block to replace current blocks
`BlockType` value | `MaskType` value | library path | block path name from a model

Block to replace the current block, specified in one of these forms:

- `BlockType` value of the replacement block. Specifying this value uses a library block as the replacement block.
- `MaskType` value of the replacement block. Specifying this value uses a library block as the replacement block.
- Library path of the replacement block, for example, `'simulink/Sinks/To Workspace'`. Hover over the block in the library to see the library path.

2-423

- Block path name of a block from a different model, for example, `'vdp/Mu'`. Use this value to reuse an instance of a block from another model in your model.

Output Arguments

`replBlks` — Blocks returned by the `current` argument
cell array of character vectors

Blocks returned by the `current` argument, returned as a cell array of character vectors. The function returns the values regardless of whether you complete the replacement.

Introduced before R2006a

save_system

Save Simulink model

Syntax

```
filename = save_system
filename = save_system(sys)
filename = save_system(sys,newsys)
filename = save_system(sys,newsys,Name,Value)
```

Description

`filename = save_system` saves the current top-level model. If the model was not previously saved, `save_system` creates a file in the current folder.

To save a subsystem, instead use `Simulink.SubSystem.copyContentsToBlockDiagram` to copy the subsystem contents to a new model. You can then save that model using `save_system`. See `Simulink.SubSystem.copyContentsToBlockDiagram`.

If you set the model `UpdateHistory` property to `UpdateHistoryWhenSave`, no dialog box prompt appears when you use `save_system` to save the model. If you want to update the comment, use the `'ModifiedComment'` parameter with `set_param` before saving, for example:

```
set_param('mymodel','ModifiedComment','Here is my ccomment.')
```

`filename = save_system(sys)` saves the model `sys`. The model must be open or loaded.

`filename = save_system(sys,newsys)` saves the model to a new file `newsys`. If you do not specify an extension, then `save_system` uses the file format specified in your Simulink preferences.

`filename = save_system(sys,newsys,Name,Value)` saves the system with additional options specified by one or more `Name,Value` pair arguments. To use `Name,Value` pairs without saving to a new file, use `[]` for `newsys`.

2-425

Input Arguments

sys — Name of model to save
character vector | cell array of character vectors | string array | handle | array of handles

Name of model to save, specified as a character, cell array of character vectors, string array, handle, or array of handles. Do not use a file extension.

newsys — File to save to
character vector | cell array of character vectors | string array | [ ]

File to save to, specified as a character vector, cell array of character vectors, string array, or, to use `Name,Value` pairs without changing the file name, `[]`. You can specify a model name in the current folder or the full path name, with or without an extension.

With no an extension, `save_system` saves to the file format specified in your Simulink preferences. Possible model extensions are `.slx` and `.mdl`. With the `'ExportToXML'` option, use the extension `.xml`.

For information on rules for naming models, see "Model Names".

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example:
`save_system('mymodel','newmodel','SaveModelWorkspace',true,'BreakUserLinks',true,'OverwriteIfChangedOnDisk',true)`

AllowPrompt — Allow dialog box prompts
false (default) | true | 'on' | 'off'

Option to allow dialog box prompts, specified as `true`, `false`, `'on'`, or `'off'`. By default, warnings and error messages appear at the command line.

BreakAllLinks — Replace links to library blocks
false (default) | true | 'on' | 'off'

Option to, in the saved file, replace links to library blocks with copies of the library blocks, specified as `true`, `false`, `'on'`, or `'off'`. This option affects user-defined blocks and Simulink library blocks.

Caution The `'BreakAllLinks'` option can result in compatibility issues when upgrading to newer versions of Simulink. For example:

- Any masks on top of library links to Simulink S-functions do not upgrade to the new version of the S-function.
- Any library links to masked subsystems in a Simulink library do not upgrade to the new subsystem behavior.
- Any broken links prevent the library forwarding mechanism from upgrading the link.

If you saved a model with broken links to built-in libraries, use the Upgrade Advisor to scan the model for out-of-date blocks. Then upgrade the Simulink blocks to their current versions.

BreakUserLinks — Replace links to user-defined blocks
`false` (default) | `true` | `'on'` | `'off'`

Option to, in the saved file, replace links to user-defined library blocks with copies of the library blocks, specified as `true`, `false`, `'on'`, or `'off'`.

BreakToolboxLinks — Replace links to built-in library block
`false` (default) | `true` | `'on'` | `'off'`

Option to, in the saved file, replace links to built-in library blocks with copies of the library blocks, specified as `true`, `false`, `'on'`, or `'off'`. This option affects Simulink library blocks and blocks from libraries supplied with MathWorks toolboxes or blocksets.

ErrorIfShadowed — Return an error if name exists
`false` (default) | `true` | `'on'` | `'off'`

Option to return an error if the new name exists on the MATLAB path or workspace, specified as `true`, `false`, `'on'`, or `'off'`.

ExportToXML — Export model to XML format
`false` (default) | `true` | `'on'` | `'off'`

Option to export the model to a file in a simple XML format, specified as `true`, `false`, `'on'`, or `'off'`. Specify the full name of the file, including the `.xml` extension. The block

diagram in memory does not change and no callbacks execute. Use this option without any other `Name,Value` pair arguments. This option warns and will be removed in a future release.

Example: `save_system('mymodel','exportfile.xml','ExportToXML',true)`

ExportToVersion — MATLAB release name to export to
character vector | `string scalar`

MATLAB release name to export to, specified in either of these forms (not case sensitive). You can export to seven years of previous releases.

- Release name, for example, `'R2012A'`, `'R2016B'`
- Release name, followed by an underscore and then the extension, for example, `'R2016A_SLX'`, `'R2014A_MDL'`. For releases before R2012a, you can specify only to `.mdl` files. If you do not specify an extension, you export to the file format specified in your Simulink preferences.

`save_system` exports the system such that the specified Simulink version can load it. If the system contains functionality not supported by the specified Simulink version, the command removes the functionality in the exported file. It also replaces unsupported blocks with empty masked subsystem blocks colored yellow. As a result, the exported system might generate different results.

Alternatively, use `Simulink.exportToVersion` or, interactively, the Export to Previous Version dialog box.

OverwriteIfChangedOnDisk — Overwrite file
false (default) | `true` | `'on'` | `'off'`

Option to overwrite the file on disk even if it has been modified since the system was loaded, specified as `true`, `false`, `'on'`, or `'off'`. By default, if the file changed on disk since the model was loaded, `save_system` displays an error to prevent the changes on disk from being overwritten.

You can control whether `save_system` displays an error if the file has changed on disk using a Simulink preference. In the **Model File** pane of the Simulink Preferences dialog box, under **Change Notification**, select **Saving the model**. This preference is on by default.

SaveDirtyReferencedModels — Save referenced models with unsaved changes
false (default) | `true` | `'on'` | `'off'`

Option to save referenced models that contain unsaved changes while also saving the model, specified as `true`, `false`, `'on'`, or `'off'`. By default, attempting to save a model that contains unsaved referenced models return an error.

SaveModelWorkspace — Save model workspace
`false` (default) | `true` | `'on'` | `'off'`

Option to save the contents of the model workspace, specified as `true`, `false`, `'on'`, or `'off'`. The model workspace `DataSource` must be a MAT-file. If the data source is not a MAT-file, `save_system` does not save the workspace. See "Specify Source for Data in Model Workspace".

Output Arguments

`filename` — Name of saved file
character vector | cell array of character vectors

Full name of saved file, returned as a character vector or a cell array of character vectors.

Examples

Save Named Model

Create a model.

```
new_system('newmodel')
```

Save the model.

```
save_system('newmodel')
```

Save Model with Another Name

Open the model `vdp`. Save it to a model named `myvdp` in the current folder. Without a file extension, the function saves the model using the format specified in your Simulink preferences.

```
open_system('vdp')
save_system('vdp','myvdp')
```

After you save the model by another name, the model is no longer open under its original name. Open vdp again and save it as an .mdl file in the current folder.

```
open_system('vdp')
save_system('vdp','mynewvdp.mdl')
```

Return Error If Name Exists

Save a model with a new name and return an error if something with this name exists on the MATLAB path. In this case, save_system displays an error because max is the name of a MATLAB function. The model is not saved.

```
open_system('vdp')
save_system('vdp','max','ErrorIfShadowed',true)
```

```
Error using save_system (line 38)
The model 'vdp' cannot be saved with the new name 'max', because this name is
shadowing another name on the MATLAB path or in the workspace.  Choose another
name, or do not use the option 'ErrorIfShadowed'
```

Save Model with Options

Suppose that you have a model named mymodel. Open the model and save it to a model named newmodel. Also save the model workspace, break links to user-defined library blocks, and overwrite if the file has changed on disk,

```
open_system('mymodel')
save_system('mymodel','mynewmodel','SaveModelWorkspace',
true,'BreakUserLinks',true,'OverwriteIfChangedOnDisk',true)
```

Save Model to Same Name and Use Options

Save the model mymodel, breaking links to user-defined library blocks in the model.

```
save_system('mymodel',[],'BreakUserLinks',true)
```

"Save a Model"

Introduced before R2006a

set_param

Set system and block parameter values

Syntax

```
set_param(Object,ParameterName,Value,...ParameterNameN,ValueN)
```

Description

`set_param(Object,ParameterName,Value,...ParameterNameN,ValueN)` sets the parameter to the specified value on the specified model or block object.

When you set multiple parameters on the same model or block, use a single `set_param` command with multiple pairs of `ParameterName`, `Value` arguments, rather than multiple `set_param` commands. This technique is efficient because using a single call requires evaluating parameters only once. If any parameter names or values are invalid, then the function doesn't set any parameters.

Tips:

- If you make multiple calls to `set_param` for the same block, then specifying the block using a numeric handle is more efficient than using the full block path. Use `getSimulinkBlockHandle` to get a block handle.

- If you use `matlab -nodisplay` to start a session, you cannot use `set_param` to run your simulation. The `-nodisplay` mode does not support simulation using `set_param`. Use the `sim` command instead.

- After you set parameters in the MATLAB workspace, to see the changes in a model, update the diagram.

  ```
  set_param(model,'SimulationCommand','Update')
  ```

For parameter names, see:

- "Common Block Properties" on page 6-111

Examples

Set Model Configuration Parameters for a Model

Open vdp and set the Solver and StopTime parameters.

```
vdp
set_param('vdp','Solver','ode15s','StopTime','3000')
```

Set Model Configuration Parameters for Current Model

Open a model and set the Solver and StopTime parameters. Use bdroot to get the current top-level model.

```
vdp
set_param(bdroot,'Solver','ode15s','StopTime','3000')
```

Set a Gain Block Parameter Value

Open vdp and set a Gain parameter value in the Mu block.

```
vdp
set_param('vdp/Mu','Gain','10')
```

Set Position of Block

Open vdp and set the position of the Fcn block.

```
vdp
set_param('vdp/Fcn','Position',[50 100 110 120])
```

Set Position of Block Using a Handle

Set the position of the `Fcn` block in the `vdp` model.

Use `getSimulinkBlockHandle` to load the `vdp` model if necessary (by specifying `true`), and get a handle to the `Fcn` block. If you make multiple calls to `set_param` for the same block, then using the block handle is more efficient than specifying the full block path as a character vector.

```
fcnblockhandle = getSimulinkBlockHandle('vdp/Fcn',true);
```

You can use the block handle in subsequent calls to `get_param` or `set_param`. If you examine the handle, you can see that it contains a double. Do not try to use the number of a handle alone (e.g., `5.007`) because you usually need to specify many more digits than MATLAB displays. Instead, assign the handle to a variable and use that variable name to specify a block.

Use the block handle with `set_param` to set the position.

```
set_param(fcnblockhandle,'Position',[50 100 110 120])
```

- "Associating User Data with Blocks"
- "Use MATLAB Commands to Change Workspace Data"
- "Control Simulations Programmatically"

Input Arguments

`Object` — Name or handle of a model or block
character vector | handle

Handle or name of a model or block, specified as a numeric handle or a character vector. A numeric handle must be a scalar. You can also set parameters of lines and ports, but you must use numeric handles to specify them.

Tip If you make multiple calls to `set_param` for the same block, then specifying a block using a numeric handle is more efficient than using the full block path with `set_param`. Use `getSimulinkBlockHandle` to get a block handle. Do not try to use the number of a handle alone (e.g., `5.007`) because you usually need to specify many more digits than MATLAB displays. Assign the handle to a variable and use that variable name to specify a block.

Example: `'vdp/Fcn'`

`ParameterName` — Model or block parameter name
character vector

Model or block parameter name, specified as the comma-separated pair consisting of the parameter name, specified as a character vector, and the value, specified in the format determined by the parameter type. Parameter names and values are case sensitive. Values are often character vectors, but they can also be numeric, arrays, and other types. Many block parameter values are specified as character vectors, but two exceptions are these parameters: `Position`, specified as a vector, and `UserData`, which can be any data type.

Example: `'Solver','ode15s','StopTime','3000'`

Example: `'SimulationCommand', 'start'`

Example: `'Position',[50 100 110 120]`

Data Types: `char`

setActiveConfigSet

Specify model's active configuration set or configuration reference

Syntax

```
setActiveConfigSet(model, configObjName)
```

Arguments

`model`

> The name of an open model, or `gcs` to specify the current model

`configObjName`

> The name of a configuration set (`Simulink.ConfigSet`) or configuration reference (`Simulink.ConfigSetRef`)

Description

`setActiveConfigSet` specifies the active configuration set or configuration reference (configuration object) of `model` to be the configuration object specified by `configObjName`. If no such configuration object is attached to the model, an error occurs. The previously active configuration object becomes inactive.

Examples

The following example makes `DevConfig` the active configuration object of the current model. The code is the same whether `DevConfig` is a configuration set or configuration reference.

```
setActiveConfigSet(gcs, 'DevConfig');
```

Introduced before R2006a

sfix

Create `Simulink.NumericType` object describing signed fixed-point data type

Syntax

```
a = sfix(WordLength)
```

Description

`sfix(WordLength)` returns a `Simulink.NumericType` object that describes a signed fixed-point number with the specified word length and unspecified scaling.

Note `sfix` is a legacy function. In new code, use `fixdt` instead. In existing code, replace `sfix(WordLength)` with `fixdt(1,WordLength)`.

Examples

Define a 16-bit signed fixed-point data type.

```
a = sfix(16)

a =

  NumericType with properties:

    DataTypeMode: 'Fixed-point: unspecified scaling'
      Signedness: 'Signed'
      WordLength: 16
         IsAlias: 0
       DataScope: 'Auto'
      HeaderFile: ''
     Description: ''
```

See Also

Simulink.NumericType | fixdt | float | sfrac | sint | ufix | ufrac | uint

Introduced before R2006a

sfrac

Create `Simulink.NumericType` object describing signed fractional data type

Syntax

```
a = sfrac(WordLength)
a = sfrac(WordLength, GuardBits)
```

Description

`sfrac(WordLength)` returns a `Simulink.NumericType` object that describes the data type of a signed fractional data type with a word size given by `WordLength`.

`sfrac(WordLength, GuardBits)` returns a `Simulink.NumericType` object that describes the data type of a signed fractional number. The total word size is given by `WordLength` with `GuardBits` bits located to the left of the binary point.

The most significant (leftmost) bit is the sign bit. The default binary point for this data type is assumed to lie immediately to the right of the sign bit. If guard bits are specified, they lie to the left of the binary point and to right of the sign bit. For example, the structure for an 8-bit signed fractional data type with 4 guard bits is:
> **Note** `sfrac` is a legacy function. In new code, use `fixdt` instead. In existing code, replace `sfrac(WordLength,GuardBits)` with `fixdt(1,WordLength, (WordLength-1-GuardBits))` and `sfrac(WordLength)` with `fixdt(1,WordLength,(WordLength-1))`.

Examples

Define an 8-bit signed fractional data type with 4 guard bits. Note that the range of this data type is $-2^4 = -16$ to $(1 - 2^{(1 - 8)}).2^4 = 15.875$.

```
a = sfrac(8,4)

a =

  NumericType with properties:

      DataTypeMode: 'Fixed-point: binary point scaling'
        Signedness: 'Signed'
        WordLength: 8
    FractionLength: 3
            IsAlias: 0
         DataScope: 'Auto'
        HeaderFile: ''
       Description: ''
```

signalbuilder

Create and access Signal Builder blocks

Syntax

```
[time, data] = signalbuilder(block)
[time, data, signames] = signalbuilder(block)
[time, data, signames, groupnames] = signalbuilder(block)
block = signalbuilder([], 'create', time, data, signames,
groupnames)
block = signalbuilder(path, 'create', time, data, signames,
groupnames)
block = signalbuilder(path,'create', time, data, signames,
groupnames, vis)
block = signalbuilder(path,'create', time, data, signames,
groupnames, vis, pos)
block = signalbuilder(path,'create', time, data, signames,
groupnames, vis, pos,{openui openmodel})
block = signalbuilder(block, 'append', time, data, signames,
groupnames)
block = signalbuilder(block, 'appendgroup', time, data, signames,
groupnames)
signalbuilder(block,'append',ds)
signalbuilder(block,'appendgroup',ds)
signalbuilder(block,'append',[ds ds2])
signalbuilder(block,'appendgroup',[ds ds2])
signalbuilder(block,'appendsignal', time, data, signames)
signalbuilder(block, 'showsignal', signal, group)
signalbuilder(block, 'hidesignal', signal, group)
[time, data] = signalbuilder(block, 'get', signal, group)
ds=signalbuilder(block,'get',group)
[ds1 ds2] =signalbuilder(block,'get',group)
signalbuilder(block, 'set', signal, group, time, data)
signalbuilder(block,'set',groupid,ds)
signalbuilder(block,'set',groupid,[ds1 ds2])
index = signalbuilder(block, 'activegroup')
```

```
[index, activeGroupLabel]= signalbuilder(block, 'activegroup')
signalbuilder(block, 'activegroup', index)
signalbuilder(block, 'annotategroup', onoff)
signalbuilder(block, 'print', [])
signalbuilder(block, 'print', config, printArgs)
figh = signalbuilder(block, 'print', config, 'figure')
```

Description

Use the `signalbuilder` command to interact programmatically with Signal Builder blocks.

- "Creating and Accessing Signal Builder Blocks" on page 2-443
- "Adding New Groups" on page 2-445
- "Working with Signals" on page 2-446
- "Using Get/Set Methods for Specific Signals and Groups" on page 2-447
- "Querying, Labelling, and Setting the Active Group" on page 2-448
- "Enabling Current Group Display" on page 2-448
- "Printing Signal Groups" on page 2-448
- "Interpolating Missing Data Values" on page 2-449

Note When you use the `signalbuilder` command to interact with a Signal Builder block, the **Undo last edit** and **Redo last edit** buttons on the block dialog box are grayed out. You cannot undo the results of using the `signalbuilder` command.

Creating and Accessing Signal Builder Blocks

`[time, data] = signalbuilder(block)` returns the time (*x*-coordinate) and amplitude (*y*-coordinate) data of the Signal Builder block, *block*.

The output arguments, `time` and `data`, take different formats depending on the block configuration:

Configuration	Time/Data Format
1 signal, 1 group	Row vector of break points.
>1 signal, 1 group	Column cell vector where each element corresponds to a separate signal and contains a row vector of points.
1 signal, >1 group	Row cell vector where each element corresponds to a separate group and contains a row vector of points.
>1 signal, >1 group	Cell matrix where each element (i, j) corresponds to signal i and group j.

`[time, data, signames] = signalbuilder(`*block*`)` returns the signal names, `signames`, in a character vector or a cell array of character vectors.

`[time, data, signames, groupnames] = signalbuilder(`*block*`)` returns the group names, `groupnames`, in a character vector or a cell array of character vectors.

`block = signalbuilder([], 'create', `*time*`, `*data*`, `*signames*`, `*groupnames*`)` creates a Signal Builder block in a new Simulink model using the specified values. The preceding table describes the allowable formats of *time* and *data*. If *data* is a cell array and *time* is a vector, the *time* values are duplicated for each element of *data*. Each vector in *time* and *data* must be the same length and have at least two elements. If *time* is a cell array, all elements in a column must have the same initial and final value. Signal names, *signames*, and group names, *groupnames*, can be omitted to use default values. The function returns the path to the new block, `block`. Always provide `time` and `data` when using the `create` command. These two parameters are always required.

`block = signalbuilder(`*path*`, 'create', `*time*`, `*data*`, `*signames*`, `*groupnames*`)` creates a new Signal Builder block at *path* using the specified values. If *path* is empty, the function creates a block in a new model, which has a default name. If *data* is a cell array and *time* is a vector, the *time* values are duplicated for each element of *data*. Each vector within *time* and *data* must be the same length and have at least two elements. If *time* is a cell array, all elements in a column must have the same initial and final value. Signal names, *signames*, and group names, *groupnames*, can be omitted to use default values. The function returns the path to the new block, *block*. Always provide `time` and `data` when using the `create` command. These two parameters are always required.

block = signalbuilder(*path*,'create', *time*, *data*, *signames*, *groupnames*, *vis*) creates a new Signal Builder block and sets the visible signals in each group based on the values of the matrix `vis`. This matrix must be the same size as the cell array, *data*. Always provide `time` and `data` when using the `create` command. These two parameters are always required. You cannot create Signal Builder blocks in which all signals are invisible. For example, if you set the *vis* parameter for all signals to 0, the first signal is still visible.

block = signalbuilder(*path*,'create', *time*, *data*, *signames*, *groupnames*, *vis*, *pos*) creates a new Signal Builder block and sets the block position to *pos*. Always provide `time` and `data` when using the `create` command. These two parameters are always required. You cannot create Signal Builder blocks in which all signals are invisible. For example, if you set the *vis* parameter for all signals to 0, the first signal is still visible.

If you create signals that are smaller than the display range or do not start from 0, the Signal Builder block extrapolates the undefined signal data. It does so by holding the final value.

block = signalbuilder(*path*,'create', *time*, *data*, *signames*, *groupnames*, *vis*, *pos*,{*openui openmodel*}) creates a new Signal Builder block and opens or invisibly loads the model and Signal Builder block window.

- Set *openui* to 1 to open the Signal Builder block window when you create the Signal Builder block. Set *openui* to 0 keep this window closed upon block creation.
- Set *openmodel* to 1 to open the model when you create the Signal Builder block. Set *openmodel* to 0 to invisibly load the model upon block creation.

Adding New Groups

block = signalbuilder(*block*, 'append', *time*, *data*, *signames*, *groupnames*) or block = signalbuilder(*block*, 'appendgroup', *time*, *data*, *signames*, *groupnames*) appends new groups to the Signal Builder block, *block*. The *time* and *data* arguments must have the same number of signals as the existing block.

signalbuilder(block,'append',ds) or
signalbuilder(block,'appendgroup',ds) appends one data set.

signalbuilder(block,'append',[ds ds2]) or
signalbuilder(block,'appendgroup',[ds ds2]) appends *N* data sets.

Data sets must have the same number of elements as the signals in a signal group. Data set format limitations for the `set`, `append`, and `appendgroup` functions include:

- Elements must be MATLAB timeseries data.
- Timeseries data and/or time must not be empty.
- Timeseries data must be of type double.
- Timeseries data must be 1-D (scalar value at each time).

Note

- If you specify a value of ' ' or {} for *signames*, the function uses existing signal names for the new groups.
- If you do not specify a value for *groupnames*, the function creates the new signal groups with the default group name pattern, GROUP *#n*.

Working with Signals

`signalbuilder(`*block*`,'appendsignal',` *time*, *data*, *signames*`)` appends new signals to all signal groups in the Signal Builder block, *block*. You can append either the same signals to all groups, or append different signals to different groups. Regardless of which signals you append, append the same number of signals to all the groups. Append signals to all the groups in the block; you cannot append signals to a subset of the groups. Correspondingly, provide *time* and *data* arguments for either one group (append the same information to all groups) or different *time* and *data* arguments for different groups. To use default signal names, omit the signal names argument, *signames*.

`signalbuilder(`*block*`, 'showsignal',` *signal*, *group*`)` makes *signals* that are hidden from the Signal Builder block visible. By default, signals in the current active group are visible when created. You control the visibility of a signal at creation with the *vis* parameter. *signal* can be a unique signal name, a signal scalar index, or an array of signal indices. `group` is the list of one or more signal groups that contains the affected signals. *group* can be a unique group name, a scalar index, or an array of indices.

`signalbuilder(`*block*`, 'hidesignal',` *signal*, *group*`)` makes signals, *signal*, hidden from the Signal Builder block. By default, all signals are visible when created. *signal* can be a unique signal name, a signal scalar index, or an array of signal indices. `group` is the list of one or more signal groups that contains the affected signals. *group* can be a unique group name, a scalar index, or an array of indices.

Note For the `showsignal` and `hidesignal` methods, if you do not specify a value for the `group` argument, `signalbuilder` applies the operation to all the signals and groups.

Using Get/Set Methods for Specific Signals and Groups

`[time, data] = signalbuilder(`*block*`, 'get', `*signal*`, `*group*`)` gets the time and data values for the specified signal(s) and group(s). The signal argument can be the name of a signal, a scalar index of a signal, or an array of signal indices. The group argument can be a group name, a scalar index, or an array of indices.

`ds=signalbuilder(block,'get',`*group*`)` gets one data set for one requested signal Builder group.

`[ds1 ds2] =signalbuilder(block,'get',`*group*`)` gets *N* data sets for *N* requested Signal Builder groups.

`signalbuilder(`*block*`, 'set', `*signal*`, `*group*`, `*time*`, `*data*`)` sets the time and data values for the specified signal(s) and group(s). Use empty values of *time* and *data* to remove groups and signals. To remove a signal group, you must also remove all the signals in that group in the same command.

`signalbuilder(block,'set',groupid,ds)` sets one data set for the requested Signal Builder group. Specifying an empty data set deletes the groups specified in *groupid*.

`signalbuilder(block,'set',groupid,[ds1 ds2])` sets *N* data sets for *N* requested groups.

Data sets must have the same number of elements as the signals in a signal group. Data set format limitations for the `set`, `append`, and `appendgroup` functions include:

- Elements must be MATLAB timeseries data.
- Timeseries data and/or time must not be empty.
- Timeseries data must be of type double.
- Timeseries data must be 1-D (scalar value at each time).

Note For the `set` method, if you do not specify a value for the `group` argument, `signalbuilder` applies the operation to all signals and groups.

When removing signals, you remove all signals from all groups. You cannot select a subset of groups from which to remove signals, unless you are also going to also remove that group.

Note The `signalbuilder` function does not allow you to alter and delete data in the same invocation. It also does not allow you to delete all the signals and groups from the application.

If you set signals that are smaller than the display range or do not start from 0, the Signal Builder block extrapolates the undefined signal data by holding the final value.

Querying, Labelling, and Setting the Active Group

`index = signalbuilder(`*`block`*`, 'activegroup')` gets the index of the active group.

`[index, activeGroupLabel]= signalbuilder(`*`block`*`, 'activegroup')` gets the label value of the active group.

`signalbuilder(`*`block`*`, 'activegroup', `*`index`*`)` sets the active group index to *`index`*.

Enabling Current Group Display

`signalbuilder(`*`block`*`, 'annotategroup', `*`onoff`*`)` controls the display of the current group name on the mask of the Signal Builder block.

onoff Value	Description
`'on'`	Default. Displays the current group name on the block mask.
`'off'`	Does not display the current group name on the block mask.

Printing Signal Groups

`signalbuilder(`*`block`*`, 'print', [])` prints the currently active signal group.

`signalbuilder(`*`block`*`, 'print', `*`config`*`, `*`printArgs`*`)` prints the currently active signal group or the signal group that *`config`* specifies. The argument *`config`* is a

structure that allows you to customize the printed appearance of a signal group. The *config* structure may contain any of the following fields:

Field	Description	Example Value
`groupIndex`	Scalar specifying index of signal group to print	`2`
`timeRange`	Two-element vector specifying the time range to print (must not exceed the block's time range)	`[3 6]`
`visibleSignals`	Vector specifying index of signals to print	`[1 2]`
`yLimits`	Cell array specifying limits for each signal's *y*-axis	`{[-1 1],` `[0 1]}`
`extent`	Two-element vector of the form: `[width, height]` specifying the dimensions (in pixels) of the area in which to print the signals	`[500 300]`
`showTitle`	Logical value specifying whether to print a title; `true` (1) prints the title	`false`

Set up the structure with one or more of these fields before you print. For example, if you want to print just group 2 using a configuration structure, `configstruct`, set up the structure as follows. You do not need to specify any other fields.

`configstruct.groupIndex=2`

The optional argument *printArgs* allows you to configure print options (see `print` in the MATLAB Function Reference).

`figh = signalbuilder(`*block*`, 'print', `*config*`, 'figure')` prints the currently active signal group or the signal group that *config* specifies to a new hidden figure handle, `figh`.

Interpolating Missing Data Values

When specifying a periodic signal such as a Sine Wave, the `signalbuilder` function uses linear Lagrangian interpolation to compute data values for time steps that occur between time steps for which the `signalbuilder` function supplies data. When

2-449

specifying periodic signals, specify them as a time vector that is defined as multiples of sample time, for example:

```
t = 0.2*[0:49]';
```

Examples

Example 1

Create a Signal Builder block in a new model editor window:

```
block = signalbuilder([], 'create', [0 5], {[2 2];[0 2]});
```

Get signal builder data from this block.

```
[time, data, signames, groupnames] = signalbuilder('untitled/Signal Builder')

time =

    [1x2 double]
    [1x2 double]

data =

    [1x2 double]
    [1x2 double]

signames =

    'Signal 1'    'Signal 2'

groupnames =

    'Group 1'
```

The Signal Builder block contains two signals in one group. Alter the second signal in the group:

```
signalbuilder(block, 'set', 2, 1, [0 5], [2 0])
```

To make this same change using the signal name and group name:

```
signalbuilder(block, 'set', 'Signal 2', 'Group 1', [0 5], [2 0])
```

Delete the first signal from the group:

```
signalbuilder(block, 'set', 1, 1, [], [])
```

Append the group with a new signal:

```
signalbuilder(block, 'append', [0 2.5 5], [0 2 0], 'Signal 2', 'Group 2');
```

Append another group with a new signal using appendgroup:

```
signalbuilder(block, 'appendgroup', [0 2.5 5], [0 2 0], 'Signal 2', 'Group 3');
```

Example 2

Create a Signal Builder block in a new model editor window:

```
block = signalbuilder([], 'create', [0 2], {[0 1],[1 0]});
```

The Signal Builder block has two groups, each of which contains a signal. To delete the second group, also delete its signal:

```
signalbuilder(block, 'set', 1, 2, [], [])
```

Example 3

Create a Signal Builder block in a new model editor window:

```
block = signalbuilder([], 'create', [0 1], ...
        {[0 0],[1 1];[1 0],[0 1];[1 1],[0 0]});
```

The Signal Builder block has two groups, each of which contains three signals.

Example 4

Create a Signal Builder block in a new model editor window:

```
block = signalbuilder([],'create',{[0 10],[0 20]},{[6 -6],...
[2 5]});
```

The Signal Builder block has two groups. Each group contains one signal.

Append a new signal group to the existing block.

```
block = signalbuilder(block,'append',[0 30],[10 -10]);
```

Append a new signal, sig3, to all groups.

```
signalbuilder(block,'appendsignal',[0 30],[0 10],'sig3');
```

Example 5

Create a Signal Builder block in a new model editor window:

```
time = [0 1];
data = {[0 0],[1 1];[1 0],[0 1];[1 1],[0 0]};
block = signalbuilder([], 'create', time, data);
```

The Signal Builder block has two groups. Each group contains three signals.

Delete the second group. To delete a signal group, also delete all the signals in the group.

```
signalbuilder(block, 'set',[1,2,3],'Group 2',[]);
```

Example 6

Create a Signal Builder block in a new model editor window:

```
block = signalbuilder([], 'create', [0 5], {[2 2];[0 2]});
```

The Signal Builder block has one group that contains two signals.

Hide the signal, Signal 1.

```
signalbuilder(block,'hidesignal','Signal 1', 'Group 1')
```

Signal 1 is no longer visible in the Signal Builder block.

Make Signal 1 visible again.

```
signalbuilder(block,'showsignal','Signal 1', 'Group 1')
```

Example 7

Create a Signal Builder block in a new model editor window:

```
block = signalbuilder([], 'create', [0 5], {[2 2] [0 2]});
```

The Signal Builder block has two groups, each with one signal.

Create a structure, `configstruct`, to customize the Signal Builder block that you want to print.

```
configstruct.groupIndex = 2;
configstruct.timeRange = [0 2];
configstruct.visibleSignals = 1;
configstruct.yLimits = {[0 1]};
configstruct.extent = [500 300];
configstruct.showTitle = true;
```

This sequence fills all the fields of the `configstruct` structure.

Print a view of the Signal Builder block to the default printer. The `configstruct` structure defines the view to print.

```
signalbuilder(block,'print',configstruct)
```

Print with print options, for example `-dps`.

```
signalbuilder(block,'print',configstruct,'-dps')
```

Print a view of the Signal Builder block as defined by the `configstruct` structure to a new hidden figure handle, `figH`.

```
figH = signalbuilder(block,'print',configstruct,'figure')
figure(figH)
```

Example 8

Create two Signal Builder blocks in new model editor windows:

```
block = signalbuilder([], 'create', [0 5], {[2 2];[0 2]});
block1 = signalbuilder('untitled/Signal Builder1', 'create', [1 2], {[1 2];[0 10]});
```

Get a data set for group 1 of *block*.

```
ds=signalbuilder(block,'get',1);
```

Get a data set for group 1 of *block1*.

```
ds1=signalbuilder(block1,'get',1);
```

Set the data set for group 1 of *block* to *ds1*.

2-453

```
signalbuilder(block,'set',1,ds1);
```

Append the original data set for group 1 of *block* (*ds*) to *block*.

```
signalbuilder(block,'append',ds);
```

To create a third group in *block,* append *ds1* to the end of the groups in *block*.

```
signalbuilder(block,'appendgroup',ds1);
```

Introduced in R2007a

signalEditor

Start Signal Editor

Syntax

```
signalEditor
signalEditor(Name,Value)
```

Description

`signalEditor` starts Signal Editor without an associated model.

`signalEditor(Name,Value)` starts signal Editor using additional options specified by one or more name-value pair arguments.

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (`' '`). You can specify the name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

- Model - Model name, specified as a character array, for which Signal Editor is to start. You can specify one model per call to the `signalEditor` function.

  Note Load the model before starting Signal Editor for it.

- DataSource - Data set name, specified as a character array, to be edited. You can specify one data set file per call to the `signalEditor` function.

  Note You can start multiple sessions of Signal Editor for the same model. However, you can associate a data set file with only one Signal Editor at a time. A data set file cannot have multiple Signal Editor sessions associated with it.

Examples

Start Signal Editor for a Model

Start the Signal Editor for the model, slexAutotransRootInportsExample.

Load the slexAutotransRootInportsExample model, then start Signal Editor for it.

```
open_system('slexAutotransRootInportsExample')
signalEditor('Model', 'slexAutotransRootInportsExample');
```

Start Signal Editor to Edit a Data Set File

Start Signal Editor to edit `myFile.mat`.

```
signalEditor('DataSource','myFile.mat');
```

Start Signal Editor and Data Set File for a Model

Load the slexAutotransRootInportsExample model, then start Signal Editor for the model, and edit `myFile.mat`.

```
open_system('slexAutotransRootInportsExample')
signalEditor('Model','slexAutotransRootInportsExample','DataSource','myFile.mat');
```

sim

Simulate dynamic system

Syntax

```
simOut = sim(model,Name,Value)
simOut = sim(model,ParameterStruct)
simOut = sim(model,ConfigSet)
simOut = sim(model)
simOut = sim(model,'ReturnWorkspaceOutputs','on')
simOut = sim(simIn)
simOut = sim(simIn,'ShowProgress',true)
```

Description

`simOut = sim(model,Name,Value)` simulates the specified model using parameter name-value pairs.

`simOut = sim(model,ParameterStruct)` simulates the specified model using the parameter values specified in the structure `ParameterStruct`.

`simOut = sim(model,ConfigSet)` simulates the specified model using the configuration settings specified in the model configuration set `ConfigSet`.

`simOut = sim(model)` simulates the specified model using existing model configuration parameters, and returns the result as either a `Simulink.SimulationOutput` object (single-output format) or as a time vector compatible with Simulink version R2009a or earlier.

To return simulation results using the single-output format (simulation object), select **Single simulation output** on the Data Import/Export pane of the Configuration Parameters dialog box. This selection overrides the `Dataset` format used for signal logging.

To return simulation results using the backward-compatible format (time vector), see "Backward-Compatible Syntax" on page 2-465.

`simOut = sim(model,'ReturnWorkspaceOutputs','on')` simulates the specified model using existing model configuration parameters, and returns the result as a `Simulink.SimulationOutput` object (single-output format).

`simOut = sim(simIn)` simulates a model using the inputs specified in the SimulationInput object, `simIn`. The sim command is also used with an array of SimulationInput objects to run multiple simulations in a series.

`simOut = sim(simIn,'ShowProgress',true)` simulates a model in a series using an array of SimulationInput objects and shows the progress of these simulations at the command line.

Examples

Simulate Model with `sim` Command-Line Options

Simulate the model, `vdp`, in Rapid Accelerator mode for an absolute tolerance of `1e-5` and save the states in `xoutNew` and the output in `youtNew`.

Specify parameters as name-value pairs to the `sim` command:

```
simOut = sim('vdp','SimulationMode','rapid','AbsTol','1e-5',...
            'StopTime', '30', ...
            'ZeroCross','on', ...
            'SaveTime','on','TimeSaveName','tout', ...
            'SaveState','on','StateSaveName','xoutNew',...
            'SaveOutput','on','OutputSaveName','youtNew',...
            'SignalLogging','on','SignalLoggingName','logsout')

### Building the rapid accelerator target for model: vdp
### Successfully built the rapid accelerator target for model: vdp

simOut =
  Simulink.SimulationOutput:

                    tout: [86x1 double]
                 xoutNew: [86x2 double]
                 youtNew: [86x2 double]

       SimulationMetadata: [1x1 Simulink.SimulationMetadata]
             ErrorMessage: [0x0 char]
```

Simulate Model with `sim` Command-Line Options in Structure

Simulate the model, vdp, in Rapid Accelerator mode for an absolute tolerance of `1e-5` and save the states in xoutNew and the output in youtNew.

Specify parameters using a name-value pairs structure `paramNameValStruct` for the `sim` command:

```
paramNameValStruct.SimulationMode = 'rapid';
paramNameValStruct.AbsTol         = '1e-5';
paramNameValStruct.SaveState      = 'on';
paramNameValStruct.StateSaveName  = 'xoutNew';
paramNameValStruct.SaveOutput     = 'on';
paramNameValStruct.OutputSaveName = 'youtNew';
simOut = sim('vdp',paramNameValStruct)
```

```
### Building the rapid accelerator target for model: vdp
### Successfully built the rapid accelerator target for model: vdp

simOut =
  Simulink.SimulationOutput:

                xoutNew: [65x2 double]
                youtNew: [65x2 double]

    SimulationMetadata: [1x1 Simulink.SimulationMetadata]
          ErrorMessage: [0x0 char]
```

Simulate Model with `sim` Command-Line Options in Configuration Set

Simulate the model, vdp, in Rapid Accelerator mode for an absolute tolerance of `1e-5` and save the states in xoutNew and the output in youtNew.

Specify parameters as name-value pairs in configuration set mdl_cs for the `sim` command:

```
mdl = 'vdp';
load_system(mdl)
simMode = get_param(mdl, 'SimulationMode');
```

```
set_param(mdl, 'SimulationMode', 'rapid')
cs = getActiveConfigSet(mdl);
mdl_cs = cs.copy;
set_param(mdl_cs,'AbsTol','1e-5',...
        'SaveState','on','StateSaveName','xoutNew',...
        'SaveOutput','on','OutputSaveName','youtNew')
simOut = sim(mdl, mdl_cs);

### Building the rapid accelerator target for model: vdp
### Successfully built the rapid accelerator target for model: vdp

set_param(mdl, 'SimulationMode', simMode)
```

Simulate Model with Default Parameter Settings

Simulate the model vdp using default model configuration parameters.

```
simOut = sim('vdp','ReturnWorkspaceOutputs','on')
```

Input Arguments

`model` — Model to simulate
character vector

Name of model to simulate, specified as a character vector.

Example: `simOut = sim('vdp')`

`ParameterStruct` — Structure containing parameter settings
structure

Structure with fields that are the names of the configuration parameters for the simulation. The corresponding values are the parameter values.

Example: `simOut = sim('vdp',paramNameValStruct)`

`ConfigSet` — Configuration set
object

The set of configuration parameters for a model.

Example: `simOut = sim('vdp',mdl_cs)`

`simIn` — SimulationInput object for a model
object

SimulationInput object created by specifying the model name. For more information, see
`Simulink.SimulationInput`

Example: `simIn = Simulink.SimulationInput('CSTR')`

Use the SimulationInput object to specify Block Parameters, Model Parameters, Variables
and External Inputs to a model to be simulated.

Example: `simIn.setBlockParameter('CSTR/Feed Temperature', 'Value', '300'); simIn.setModelParameter('StartTime', '1'); simIn.setVariable('FeedTemp0', 320)`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the
argument name and `Value` is the corresponding value. `Name` must appear inside single
quotes (`' '`). You can specify several name and value pair arguments in any order as
`Name1,Value1,...,NameN,ValueN`.

Example: `'Solver','ode15s','TimeOut',30` specifies that the model is simulated
using the ode15s solver with a maximum simulation time of 30 seconds.

The `sim` command accepts all simulation parameters as name-value pair arguments. See
"Model Parameters" on page 6-2 for a list of all simulation parameters.

In addition, the `sim` command accepts the following parameters.

`CaptureErrors` — Save errors to `SimulationMetadata` object
off (default) | on

By default, if an error occurs during simulation, the `sim` command stops and reports the
error in the MATLAB Command Window. If you specify `'CaptureErrors','on'`, the
`sim` command does not stop, but instead saves any errors to the `ErrorDiagnostic`
structure within the `SimulationMetadata` object. The error message is saved in the
`ErrorMessage` property of the `SimulationOutput` object.

This option is useful when running multiple simulations in a loop, so that one simulation
error will not stop a script or function from continuing.

If you specify an array of input objects, the `sim` commands runs with `CaptureErrors`
enabled. If an error occurs, the error messages are included in the

2-461

`Simulink.SimulationMetadata` object for the simulation, as well as simulation data up to the point of the failure.

This option is not available for simulation in SIL and PIL modes.

Example: `'CaptureErrors','on'`

ConcurrencyResolvingToFileSuffix — Append suffix to model name
character vector

(Rapid Accelerator mode only) Appends this suffix character vector to the filename of a model (before the file extension) if:

- The model contains a To File block.

- You call the `sim` command from `parfor`.

Example: `'ConcurrencyResolvingToFileSuffix','model'`

Debug — Run simulation in debug mode
off (default) | on | cmds

Starts the simulation in debug mode (see "Debugger Graphical User Interface" for more information). The value of this option can be a cell array of commands to be sent to the debugger after it starts.

Example: `'Debug','on'`

LoggingFileName — Specify name of MAT-file to log data
out.mat (default) | character vector

Use when you enable the `LoggingToFile` name-value pair for logging to persistent storage. Specify the destination MAT-file for data logging.

Tip Do not use a file name from one locale in a different locale.

Example: `'LoggingFileName','out.mat'`

LoggingToFile — Log simulation data to MAT-file
off (default) | on

Store logged data that uses `Dataset` format to persistent storage (MAT-file).

Use this feature when logging large amounts of data that can cause memory issues. For details, see "Log Data to Persistent Storage".

Tip To avoid running out of memory when accessing stored data, you can use a reference to access the object stored in the MAT-file. Use a `Simulink.SimlationData.DatasetRef` object to access stored data by reference. Using this object loads signal logging and states data into the model workspace incrementally (signal by signal). Accessing data for other kinds of logging loads all of the data at once.

Example: `'LoggingToFile','on'`

RapidAcceleratorParameterSets — Pass run-time parameters directly to Rapid Accelerator simulations
structure

(Rapid Accelerator mode only) Returns structure that contains run-time parameters for running Rapid Accelerator simulations in `parfor`.

Example: `'RapidAcceleratorParameterSets',parameterSet(idx)`

RapidAcceleratorUpToDateCheck — Perform up-to-date check before simulation
on (default) | off

(Rapid Accelerator mode only) Enables/disables up-to-date check. If you set this value to `'off'`, Simulink does not perform an up-to-date check. It skips the start/stop callbacks in blocks. If you call the `sim` command from `parfor`, set this value to `'off'`.

When you set this option to `'off'`, changes that you make to block parameter values in the model (for example, by using block dialog boxes, by using the `set_param` function, or by changing the values of MATLAB variables) do not affect the simulation. Instead, use `RapidAcceleratorParameterSets` to pass new parameter values directly to the simulation.

Example: `'RapidAcceleratorUpToDateCheck','off'`

SrcWorkspace — Workspace in which to evaluate MATLAB expressions
base (default) | current | parent

Specifies the workspace in which to evaluate MATLAB expressions defined in the model. Setting `SrcWorkspace` has no effect on a referenced model that executes in Accelerator

mode. Setting `SrcWorkspace` to `current` within a `parfor` loop causes a transparency violation.

Example: `'SrcWorkspace','current'`

`TimeOut` — Maximum simulation run time
positive scalar

Specify the time, in seconds, to allow the simulation to run. If you run your model for a period longer than the value of `TimeOut`, the software issues a warning and stops the simulation. `TimeOut` refers to the time spent for a simulation.

Example: `'TimeOut',60`

`Trace` — Enables simulation tracing facilities
minstep | siminfo | compile

Enables simulation tracing facilities (specify one or more as a comma-separated list):

- `'minstep'` specifies that simulation stops when the solution changes so abruptly that the variable-step solvers cannot take a step and satisfy the error tolerances.
- `'siminfo'` provides a short summary of the simulation parameters in effect at the start of simulation.
- `'compile'` displays the compilation phases of a block diagram model.

By default, Simulink issues a warning message and continues the simulation.

Example: `'Trace','minstep','Trace','siminfo','Trace','compile'`

Output Arguments

`simOut` — Simulation object containing logged simulation results
object

`Simulink.SimulationOutput` object that contains all of the logged simulation results.

All simulation outputs (logged time, states, and signals) are returned in a single `Simulink.SimulationOutput` object. You define the model time, states, and output that is logged using the **Data Import/Export** pane of the **Model Configuration Parameters** dialog box. You can log signals using blocks such as the To Workspace and Scope blocks. The **Signal & Scope Manager** can directly log signals.

Note The output of the `sim` command always returns to `SimOut`, the single simulation output object. The simulation output object in turn, is returned to the workspace.

Definitions

Backward-Compatible Syntax

Starting with R2009b, the `sim` command was enhanced to provide greater compatibility with parallel computing. The improved single-output format saves all simulation results to a single object, simplifying the management of output variables.

For backward compatibility with R2009a or earlier releases, use the backward-compatible syntax:

```
[T,X,Y] = sim('model',Timespan, Options, UT)
[T,X,Y1,...,Yn] = sim('model',Timespan, Options, UT)
```

If you specify only the `model` argument, Simulink automatically saves the time, state, and output to the specified output arguments.

If you do not specify any output arguments, Simulink determines what data to log based on the settings for the **Configuration Parameters > Data Import/Export** pane. Simulink stores the simulation output either in the current workspace or in the variable *ans*, based on the setting for **Save simulation output as a single object** parameter.

Argument	Description
T	The time vector returned.
X	The state returned in matrix or structure format. The state matrix contains continuous states followed by discrete states.
Y	The output returned in matrix or structure format. For block diagram models, this variable contains all root-level blocks.
Y1,...,Yn	The outports, which can only be specified for diagram models. Here, *n* must be the number of root-level blocks. Each outport will be returned in the *Y1,...,Yn* variables.
'model'	The name of the model to simulate.

Argument	Description
Timespan	The timespan can be `TFinal`, `[TStart TFinal]`, or `[TStart OutputTimes TFinal]`. Output times are time points returned in *T*, but in general, *T* includes additional time points.
Options	Optional simulation parameters created in a structure by the `simset` command using name-value pairs.
UT	Optional external inputs. For supported expressions, see "Load Data to Root-Level Input Ports".

Simulink requires only the `model` argument. Simulink takes all defaults from the block diagram, including unspecified options. If you specify any optional arguments, your specified settings override the settings in the block diagram.

Specifying an input argument of `sim` as the empty matrix, `[ ]`, causes Simulink to use the default for that argument.

This command simulates the Van der Pol equations, using the `vdp` model. The command uses all default parameters.

```
[t,x,y] = sim('vdp')
```

This command simulates the Van der Pol equations, using the parameter values associated with the `vdp` model, but defines a value for the `Refine` parameter.

```
[t,x,y] = sim('vdp', [], simset('Refine',2));
```

This command simulates the Van der Pol equations for 1,000 seconds, saving the last 100 rows of the return variables. The simulation outputs values for `t` and `y` only, but saves the final state vector in a variable called `xFinal`.

```
[t,x,y] = sim('vdp', 1000, simset('MaxRows', 100,
          'OutputVariables', 'ty', 'FinalStateName', 'xFinal'));
```

Tips

- Parameters specified using the `sim` command override the values defined in the **Model Configuration Parameters** dialog box. The software restores the original configuration values at the end of simulation.

- In the case of a model with a model reference block, the parameter specifications are applied to the top model.
- When simulating a model with infinite stop time, to stop the simulation, you must press **Ctrl+C**. Note that **Ctrl+C** breaks the simulation and the simulation results are not saved in workspace.
- To specify the time span for a simulation, you must specify the `StartTime` and `StopTime` parameters.
- To log the model time, states, or outputs, use the **Data Import/Export** pane of the Model Configuration Parameters dialog box.
- To log signals, either use a block such as the To Workspace block or the Scope block, or use the Signal and Scope Manager to log results directly.
- To get a list of simulation parameters for the model `vdp`, in the MATLAB Command Window, enter:

  ```
  configSet = getActiveConfigSet('vdp')
  configSetNames = get_param(configSet, 'ObjectParameters')
  ```

  This command lists several object parameters, including simulation parameters such as `'StopTime'`, `'SaveTime'`, `'SaveState'`, `'SaveOutput'`, and `'SignalLogging'`.

Introduced before R2006a

simplot

Redirects to the Simulation Data Inspector

Note `simplot` will be removed in a future release. Use the Simulation Data Inspector instead.

Syntax

```
simplot
```

Description

`simplot` redirects to the Simulation Data Inspector and returns empty handles. This function is no longer supported and has been replaced by the Simulation Data Inspector. Use the **Simulation Data Inspector** button in the Simulink Editor to capture simulation output in the Simulation Data Inspector. Programmatically, use the function `Simulink.sdi.view` instead.

See Also

`Simulink.sdi.view`

Simulation Manager

Monitor multiple simulations in one window

Description

Simulation Manager allows you to monitor the status of multiple simulations. Using this app, you can:

- View the progress of the simulations in a high-level grid view or a detailed list view.
- Find the simulations that error out.
- Abort simulations.
- Select a simulation run and open the model in Simulink, with all of the simulation's settings applied to the model.
- View simulation results in the **Simulation Data Inspector**.

Open the Simulation Manager App

- `sim` command – Set the argument `ShowSimulationManager` to `on`.
- `parsim` command – Set the argument `ShowSimulationManager` to `on` with Parallel Computing Toolbox. `parsim` command uses a SimulationInput object to run simulations. For more information, see `Simulink.SimulationInput`.

  ```
  out = parsim(in, 'ShowSimulationManager', 'on')
  ```
- To reopen the Simulation Manager, use the command `openSimulationManager('modelName')`. This command lets you reopen the last running session.

  Note You can use this command to reopen the Simulation Manager, if you close the window unintentionally.

Examples

Open Simulation Manager

Open the model `sldemo_suspn_3dof` and create a set of sweep values.

```
mdl = 'sldemo_suspn_3dof';
open_system(mdl);
Cf_sweep = Cf*(0.05:0.1:0.95);
numSims = length(Cf_sweep);
```

Create an array of `Simulink.SimulationInput` objects to modify the block parameter **Road-Suspension Interaction** with the sweep values.

```
for i = numSims:-1:1
 in(i) = Simulink.SimulationInput(mdl);
 in(i) = setBlockParameter(in(i), [mdl '/Road-Suspension Interaction'], 'Cf', num2str(Cf_sweep(i)));
end
```

Run multiple simulations and open the Simulation Manager to monitor them.

```
out = parsim(in, 'ShowSimulationManager', 'on')
```

In the absence of Parallel Computing Toolbox, the simulations run in serial.

Using Simulation Manager

Once you run the `parsim` command, the Simulation Manager UI opens up as follows:

The progress bar on top right is color coded based on the status of the simulations.

You can view all the multiple simulations in a detailed list view. This view gives you an option to add or delete columns. Use the button, ⊕, to choose which columns to display. You can also sort the colums based on your preference.

You can view more information about a particular run by clicking on it. When you click on a run, simulation details appear at the bottom of the window.

To hide the details of the selected run, click the **Simulation Details** button, .

Open Selected button, , allows you to open the model with the specifications of the selected run.

You can view the results of one or more runs in the Simulation Data Inspector by clicking the Show Results button, . Clicking on Show Results creates a Simulation Data Inspector run from the `Simulin.SimulationOutput` object and is displayed in Simulink Data Inspector. You can also return your results in the `Simulin.SimulationOutput` object.

To stop the job at the beginning of your simulations, you can use the **Stop Job** button, .

simulink

Open Simulink Start Page

Syntax

```
simulink
```

Description

`simulink` opens the Simulink Start Page. Choose a model or project template, or browse the examples. See "Create and Open Models".

The behavior of the `simulink` function changed in R2016a. Formerly it opened the Simulink Library Browser and loaded the Simulink block library. If you wish to preserve that behavior, use `slLibraryBrowser` instead to open the Library Browser, or `load_system simulink` to load the Simulink block library.

If you want to start Simulink without opening the Library Browser or Start Page, use the faster `start_simulink` instead.

See Also
`slLibraryBrowser` | `start_simulink`

"Modeling"

Introduced before R2006a

simulinkproject

Open Simulink Project and get project object

Syntax

```
simulinkproject
simulinkproject(projectPath)

proj = simulinkproject
proj = simulinkproject(projectPath)
```

Description

`simulinkproject` opens Simulink Project or brings focus to the tool if it is already open. After you open the tool, you can create new projects or access recent projects using the **Simulink Project** tab.

`simulinkproject(projectPath)` opens the Simulink project specified by any file or folder under the project root in `projectPath` and gives focus to Simulink Project.

`proj = simulinkproject` returns a project object `proj` you can use to manipulate the project at the command line. You need to get a project object before you can use any of the other project functions.

If you want to avoid giving focus to Simulink Project in your startup script, specify an output argument.

To avoid your startup script opening windows that take focus away from the MATLAB Desktop, use `start_simulink` instead of the `simulink` function, and use `simulinkproject` with an output argument instead of `uiopen`.

`proj = simulinkproject(projectPath)` opens the Simulink project specified by `projectPath` and returns a project object.

Examples

Open Simulink Project Tool

Open the Simulink Project Tool.

```
simulinkproject
```

Open a Simulink Project

Specify either the `.prj` file path or the folder that contains your `.SimulinkProject` folder and `.prj` file. The project opens and brings focus to Simulink Project.

```
simulinkproject('C:/projects/project1/')
```

Open a Simulink Project and Get a Project Object

Open a specified project and get a project object to manipulate the project at the command line. To avoid your startup script opening windows that take focus away from the MATLAB Desktop, use `start_simulink` instead of the `simulink` function, and use `simulinkproject` with an output argument instead of `uiopen`. If you use `uiopen(myproject.prj)` this calls `simulinkproject` with no output argument and gives focus to Simulink Project.

```
start_simulink
proj = simulinkproject('C:/projects/project1/myproject.prj')
```

Get Airframe Example Project

Open the Airframe project and create a project object to manipulate and explore the project at the command line.

```
sldemo_slproject_airframe
proj = simulinkproject

proj =
```

```
  ProjectManager with properties:

              Name: 'Simulink Project Airframe Example'
       Information: [1x1 slproject.Information]
      Dependencies: [1x1 slproject.Dependencies]
        Categories: [1×1 slproject.Category]
             Files: [1×31 slproject.ProjectFile]
         Shortcuts: [1×7 slproject.Shortcut]
       ProjectPath: [1×7 slproject.PathFolder]
 ProjectReferences: [1×0 slproject.ProjectReference]
      StartupFiles: [1×0 slproject.StartupFile]
     ShutdownFiles: [1×0 slproject.ShutdownFile]
        RootFolder: 'C:\slexamples\airframe11'
```

Find Project Commands

Find out what you can do with your project.

```
methods(proj)
```

```
Methods for class slproject.ProjectManager:

addFile
addFolderIncludingChildFiles
addPath
addReference
addShortcut
addShutdownFile
addStartupFile
close
createCategory
export
findCategory
findFile
isLoaded
listModifiedFiles
listRequiredFiles
refreshSourceControl
reload
removeCategory
removeFile
removePath
```

2-479

```
removeReference
removeShortcut
removeShutdownFile
RemoveStartupFile
```

Examine Project Properties Programmatically

After you get a project object using the `simulinkproject` function, you can examine project properties.

Examine the project files.

```
files = proj.Files
```

```
files =

  1x31 ProjectFile array with properties:

    Path
    Labels
    Revision
    SourceControlStatus
```

Use indexing to access files in this list. The following command gets file number 14. Each file has properties describing its path, attached labels, and source control information.

```
proj.Files(15)
```

```
ans =

  ProjectFile with properties:

             Path: 'C:\slexamples\airframe24\models\DigitalControl.slx'
           Labels: [1x1 slproject.Label]
         Revision: '2'
SourceControlStatus: Unmodified
```

Examine the labels of the file.

```
proj.Files(15).Labels
```

```
ans =
```

```
  Label with properties:

File: 'C:\slexamples\airframe24\models\DigitalControl.slx'
        DataType: 'none'
            Data: []
            Name: 'Design'
    CategoryName: 'Classification'
```

Get a particular file by name.

```
myfile = findFile(proj,'models/AnalogControl.mdl')

myfile =

  ProjectFile with properties:

  Path: 'C:\slexamples\airframe24\models\AnalogControl.mdl'
                Labels: [1×1 slproject.Label]
              Revision: '2'
    SourceControlStatus: Unmodified
```

Find out what you can do with the file.

```
methods(myfile)

Methods for class slproject.ProjectFile:

addLabel     findLabel     removeLabel
```

Update the file dependencies.

```
update(proj.Dependencies)
```

The project runs a dependency analysis to update the known dependencies between project files.

For more information on working with project files, including modified files and dependencies, see "Automate Simulink Project Tasks Using Scripts".

- "Automate Simulink Project Tasks Using Scripts"
- "Create a New Project From a Folder"
- "Open Recent Projects"
- "Retrieve a Working Copy of a Project from Source Control"

Input Arguments

`projectPath` — Full path to project file or folder
character vector

Full path to project `.prj` file, or the path to the project root folder, or any subfolder or file under your project root, specified as a character vector.

Example: `'C:/projects/project1/myProject.prj'`

Example: `'C:/projects/project1/'`

Output Arguments

`proj` — Project
project object

Project, returned as a project object. Use the project object to manipulate the currently open Simulink project at the command line.

Properties of `proj` output argument.

Project Property	Description
Categories	Categories of project labels
Dependencies	Dependencies between project files in a MATLAB digraph object
Files	Paths and names of project files
Information	Information about the project such as the description, source control integration, repository location, and whether it is a top-level project
Name	Project name
ProjectPath	Folders that the project puts on the MATLAB path
ProjectReferences	Folders that contain referenced projects. Contains read-only project objects for referenced projects.

Project Property	Description
RootFolder	Full path to project root folder
Shortcuts	An array of the shortcuts in this project
ShutdownFiles	An array of the shutdown files in this project
StartupFiles	An array of the startup files in this project

Tips

Alternatively, you can use `slproject.loadProject` to load a project, and `slproject.getCurrentProjects` to get a project object. Use `simulinkproject` to open projects and explore projects interactively. Use `slproject.getCurrentProjects` and `slproject.loadProject` for project automation scripts.

Simulink.allBlockDiagrams

Find loaded Simulink models and libraries

Syntax

```
bd = Simulink.allBlockDiagrams()
bd = Simulink.allBlockDiagrams(type)
```

Description

`bd = Simulink.allBlockDiagrams()` returns all loaded block diagrams, including models and libraries.

`bd = Simulink.allBlockDiagrams(type)` returns either models or libraries.

Examples

Find Loaded Models

Find all loaded models in the current Simulink session, excluding libraries. The example shows a result from a typical session.

```
Simulink.allBlockDiagrams('model')

ans =

  237.0001
   56.0001
    2.0001
```

Get Names of Loaded Block Diagrams

Find all loaded models in the current Simulink session and return results as names. Use `Simulink.allBlockDiagrams` with `get_param` to get the names. The example shows a result from a typical session and includes loaded libraries and models.

```
get_param(Simulink.allBlockDiagrams(),'Name')

ans =

  5×1 cell array

    {'simulink_extras'}
    {'simulink'        }
    {'sldemo_fuelsys'  }
    {'f14'             }
    {'vdp'             }
```

Get Loaded Block Diagrams Based on Parameter

Find all loaded models in the current Simulink session whose `'Dirty'` parameter is `'on'`.

```
bds = Simulink.allBlockDiagrams();
dirtyBds = bds(strcmp(get_param(bds,'Dirty'),'on'));
```

Input Arguments

type — Type of block diagram whose blocks to return
`'model'` | `'library'`

Type of block diagram whose blocks to return, specified as `'model'` or `'library'`.

Output Arguments

bd — Loaded block diagrams
array of handles

Loaded block diagrams, returned as an array of handles.

Simulink.FindOptions | Simulink.findBlocks | Simulink.findBlocksOfType

Introduced in R2018a

Simulink.architecture.add

Add tasks or triggers to selected architecture of model

Syntax

```
Simulink.architecture.add(Type,Object)
```

Description

Simulink.architecture.add(Type,Object) adds the new task or trigger Object of the specified Type to a model.

Examples

Add periodic trigger

Add a task, MyTask1, to the software node MulticoreProcessor of the selected architecture of the slexMulticoreExample model.

```
slexMulticoreExample;
Simulink.architecture.add('Task','slexMulticoreExample/MulticoreProcessor/Core2/MyTask1');
```

Input Arguments

Type — Object type
'PeriodicTrigger' | 'AperiodicTrigger' | 'Task'

Object type that identifies the kind of trigger or task to add, , specified as a 'PeriodicTrigger', 'AperiodicTrigger', or 'Task'.

- 'PeriodicTrigger'

  Adds a periodic trigger to the architecture. Set the properties of the trigger with the Simulink.architecture.set_param function.

- `'AperiodicTrigger'`

  Adds an aperiodic trigger to the architecture. Set the properties of the trigger with the `Simulink.architecture.set_param` function.

- `'Task'`

  Adds a task to the architecture. Set the properties of the task with the `Simulink.architecture.set_param` function.

Object — Trigger or task object identifier
character vector

Trigger or task object identifier to add to architecture, specified as a character vector.

Example: `'slexMulticoreExample/MulticoreProcessor/Core2/MyTask1'`

Data Types: `char`

See Also

Introduced in R2014a

Simulink.architecture.config

Create or convert configuration for concurrent execution

Syntax

```
Simulink.architecture.config(model,'Convert')
Simulink.architecture.config(model,'Add')
Simulink.architecture.config(model,'OpenDialog')
```

Description

`Simulink.architecture.config(model,'Convert')` converts the active configuration set in the specified model to one for concurrent execution.

`Simulink.architecture.config(model,'Add')` adds and activates a new configuration set for concurrent execution.

`Simulink.architecture.config(model,'OpenDialog')` opens the Concurrent Execution dialog box for a model configuration.

Examples

Convert existing configuration set

Convert existing configuration set for concurrent execution in the model vdp.

```
vdp;
Simulink.architecture.config('vdp','Convert');
```

Add new configuration set

Add a new configuration set (copied from the existing configuration set) for concurrent execution in the model vdp.

```
vdp;
Simulink.architecture.config('vdp','Add');
```

Open Concurrent Execution dialog box

Open the Concurrent Execution dialog box in the model slexMulticoreExample.

```
slexMulticoreExample;
Simulink.architecture.config('slexMulticoreExample','OpenDialog');
```

Input Arguments

model — Model name
character vector

Model name whose configuration set you want to convert or add to, specified as a character vector.

Example:

Data Types: char

See Also
Simulink.architecture.add | Simulink.architecture.profile | Simulink.architecture.set_param

Introduced in R2014a

signalBuilderToSignalEditor

Import signal data and properties from Signal Builder block to Signal Editor block

Syntax

```
signal_editor = signalBuilderToSignalEditor(signal_builder,Name,
Value)
[signal_editor,sorted_group_index,sorted_group_names] =
signalBuilderToSignalEditor(signal_builder,Name,Value)
```

Description

`signal_editor = signalBuilderToSignalEditor(signal_builder,Name,
Value)` imports signal data and properties from Signal Builder block to the Signal Editor block. This function adds a Signal Editor block to the current model using the signal data and properties from the Signal Builder block.

During the port, the `signalBuilderToSignalEditor` function:

- Orders signal groups alphabetically.
- Removes spaces from group names.
- Creates unique group names from existing names following MATLAB conventions.

The `signalBuilderToSignalEditor` function does not support models that contain test case parameters. You can successfully port data from the Signal Builder block, but you cannot initialize parameters with the Signal Editor block in test harnesses generated by Simulink Design Verifier.

`[signal_editor,sorted_group_index,sorted_group_names] =
signalBuilderToSignalEditor(signal_builder,Name,Value)` outputs vectors containing the signal groups and group names.

Examples

Replace Signal Builder block with Signal Editor block

Replace existing Signal Builder block with Signal Editor block. To store signals from Signal Builder, use `RoadProfiles.mat`.

```
model = 'sldemo_suspn_3dof';
open_system(model);
sbBlockH = [model '/Road Profiles'];
seBlockH = signalBuilderToSignalEditor(sbBlockH,...
'Replace',true,'FileName','RoadProfiles.mat');
```

Replace Signal Builder block with Signal Editor block and return signal groups and names

Replace existing Signal Builder block with Signal Editor block and return ordered list of signal group indices and names. To store signals from Signal Builder, use `RoadProfiles.mat`.

```
model = 'sldemo_suspn_3dof';
open_system(model);
sbBlockH = [model '/Road Profiles'];
[seBlockH, sorted_group, sorted_group_names] = signalBuilderToSignalEditor(sbBlockH,..
'Replace',true,'FileName','RoadProfiles.mat');
>> test1
```

Input Arguments

signal_builder — Signal Builder block to replace
current model (default) | scalar

Signal Builder block to replace, specified as a scalar.

Data Types: `char` | `string`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single

quotes (' '). You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: 'FileName','RoadProfiles.mat'

FileName — MAT-file that stores signals
`'dataset.mat'` (default) | scalar

MAT-file that stores signals and properties, specified as a scalar. Do not use a file name from one locale in a different locale. When using the block on multiple platforms, consider specifying just the MAT-file name and having the MAT-file be on the MATLAB path.

Data Types: `char` | `string`

Replace — Replace Signal Builder block with Signal Editor block
`false` (default) | `true`

Replace Signal Builder block with Signal Editor block, specified as `true` or `false`.

Data Types: `logical`

Output Arguments

signal_editor — Signal Editor block handle
scalar

Signal Editor block handle, specified as a scalar.

sorted_group_index — List of Signal Builder group indices
vector

List of Signal Builder group indices, specified as a vector and ordered as they will appear in the Signal Editor.

sorted_group_names — List of Signal Builder group names
cell array

Signal Editor group names, specified as a cell array of vectors, in alphabetical order.

The names are unique valid MATLAB variable names generated from the Signal Builder group names.

.

See Also

Signal Editor | Signal Builder | `signalEditor` | `signalbuilder`

Introduced in R2018a

Simulink.architecture.delete

Delete triggers and tasks from selected architecture of model

Syntax

```
Simulink.architecture.delete(Object)
```

Description

`Simulink.architecture.delete(Object)` deletes the specified object trigger or task.

Examples

Delete task Plant

Delete the task Task3 from the Core2 periodic trigger of the MulticoreProcessor software node of the selected architecture of the `slexMulticoreExample` model.

```
slexMulticoreExample
Simulink.architecture.delete('slexMulticoreExample/MulticoreProcessor/Core2/Task3')
```

Input Arguments

`Object` — Object to delete, specified as a character vector
character vector

Object to be deleted. Possible objects are:

• Periodic trigger

> **Note** You cannot delete the last periodic trigger. The software node must contain at least one periodic trigger.

- Aperiodic trigger
- Task

Example: `[bdroot '/MulticoreProcessor/Core2/Task3']`

Data Types: `char`

See Also
`Simulink.architecture.add` | `Simulink.architecture.find_system` | `Simulink.architecture.get_param` | `Simulink.architecture.importAndSelect` | `Simulink.architecture.profile` | `Simulink.architecture.register`

Introduced in R2014a

Simulink.architecture.find_system

Find objects under architecture object

Syntax

```
object = Simulink.architecture.find_system(RootObject)
```

```
object = Simulink.architecture.find_system(RootObject,ParamName,
ParamValue)
```

Description

`object = Simulink.architecture.find_system(RootObject)` looks for all objects under `RootObject`.

`object = Simulink.architecture.find_system(RootObject,ParamName, ParamValue)` returns the object in `RootObject` whose parameter `ParamName` has the value `ParamValue`. Parameter name and value character vectors are case-sensitive.

Examples

Look for all objects

To find all the objects in `slexMulticoreExample`:

```
slexMulticoreExample
t = Simulink.architecture.find_system('slexMulticoreExample')

t =

    'slexMulticoreExample'
    'slexMulticoreExample/MulticoreProcessor'
    'slexMulticoreExample/MulticoreProcessor/Core1'
    'slexMulticoreExample/MulticoreProcessor/Core1/Task1'
    'slexMulticoreExample/MulticoreProcessor/Core1/Task2'
```

```
    'slexMulticoreExample/MulticoreProcessor/Core2'
    'slexMulticoreExample/MulticoreProcessor/Core2/Task3'
    'slexMulticoreExample/MulticoreProcessor/Core2/Task4'
```

Look for all tasks

To find all the tasks in `slexMulticoreExample`:

```
slexMulticoreExample
t = Simulink.architecture.find_system('slexMulticoreExample','Type','Task')

t =

    'slexMulticoreExample/MulticoreProcessor/Core1/Task1'
    'slexMulticoreExample/MulticoreProcessor/Core1/Task2'
    'slexMulticoreExample/MulticoreProcessor/Core2/Task3'
    'slexMulticoreExample/MulticoreProcessor/Core2/Task4'
```

Input Arguments

`RootObject` — Object to search
character vector

Object to search for parameter value, specified as a character vector giving the object full path name. Possible objects are:

- Model
- Software node
- Hardware node
- Periodic trigger
- Aperiodic trigger
- Task

Example: `'slexMulticoreExample'`

`ParamName` — Name of parameter to find
character vector | scalar | vector

Name of the parameter to find. Possible values are:

- `'Name'`
- `'Type'`
- `'ClockFrequency'`
- `'Color'`
- `'Period'`
- `'EventHandlerType'`
- `'SignalNumber'`
- `'EventName'`

Example: `'EventName'`

ParamValue — Parameter value to find
character vector | scalar | vector

Parameter value to find, specified as a character vector, a scalar, or a vector.

Example: `'ERTDefaultEvent'`

See Also

Simulink.architecture.add | Simulink.architecture.delete | Simulink.architecture.importAndSelect | Simulink.architecture.profile | Simulink.architecture.register | Simulink.architecture.set_param

Introduced in R2014a

Simulink.architecture.get_param

Get configuration parameters of architecture objects

Syntax

```
ParamValue = Simulink.architecture.get_param(Object,ParamName)
```

Description

`ParamValue = Simulink.architecture.get_param(Object,ParamName)` returns the value of the specified parameter for the object, `Object`. `ParamName` is case-sensitive.

Examples

Get period

Get the period of task Task3 of trigger Core2 of software node MulticoreProcessor of the selected architecture for the model `slexMulticoreExample`.

```
slexMulticoreExample;
p = Simulink.architecture.get_param('slexMulticoreExample/MulticoreProcessor/Core2/Task3','Period')

p =

0.2
```

Input Arguments

Object — Object whose parameter value to return
character vector

Object whose parameter value to return, specified as a character vector giving the object full path name. Possible objects are:

- Software node
- Hardware node
- Periodic trigger
- Aperiodic trigger
- Task

ParamName — Parameter whose value to return
character vector

Name of a parameter for which `Simulink.architecture.get_param` returns a value.

The following are the possible `ParamName` values:

For a model:

- `'ArchitectureName'`
- `'Type'`

For a software node:

- `'Name'`
- `'Type'`

For a hardware node

- `'Name'`
- `'ClockFrequency'`
- `'Color'`
- `'Type'`

For a periodic trigger:

- `'Name'`
- `'Period'`
- `'Color'`
- `'Type'`

For an aperiodic trigger:

- `'Name'`
- `'Color'`
- `'EventHandlerType'`
- `'SignalNumber'`
- `'EventName'`
- `'Type'`

For a task:

- `'Name'`
- `'Period'`
- `'Color'`
- `'Type'`

Introduced in R2014a

Simulink.architecture.importAndSelect

Import and select target architecture for concurrent execution environment for model

Syntax

```
Simulink.architecture.importAndSelect(model,Architecture)
```

```
Simulink.architecture.importAndSelect(model,
CustomArchitectureDescriptionFile)
```

Description

`Simulink.architecture.importAndSelect(model,Architecture)` imports and selects the built-in target architecture for the concurrent execution environment for the model.

Importing and selecting target architectures requires that the associated support packages or hardware is installed on your computer.

`Simulink.architecture.importAndSelect(model, CustomArchitectureDescriptionFile)` imports and selects the architecture from an XML-based architecture description file.

Importing and selecting target architectures requires that the associated support packages or hardware is installed on your computer.

Examples

Import and select a different architecture

Import and select the sample architecture to the model `slexMulticoreExample`.

```
slexMulticoreExample
Simulink.architecture.importAndSelect('slexMulticoreExample','Sample Architecture')
```

Import and select a custom architecture

Import and select the custom architecture defined in the XML file `custom_arch.xml`.
This example requires you to create a `custom_arch.xml` file first.

```
slexMulticoreExample
Simulink.architecture.importAndSelect('slexMulticoreExample','custom_arch.xml')
```

Input Arguments

`model` — Model
character vector

Model to import architecture to, specified as a character vector.

Data Types: `char`

`Architecture` — Target architecture name
character vector

Target architecture name to import into the concurrent execution environment for the
model. Possible target names are:

Property	Description
`'Multicore'`	Single CPU with multiple cores
`'Sample Architecture'`	Example architecture consisting of single CPU with multiple cores and two FPGAs. You can use this architecture to model for concurrent execution.
`'Simulink Real-Time'`	Simulink Real-Time™ target
`'Xilinx Zynq ZC702 evaluation kit'`	Xilinx® Zynq® ZC702 evaluation kit target
`'Xilinx Zynq ZC706 evaluation kit'`	Xilinx Zynq ZC706 evaluation kit target

Property	Description
`'Xilinx Zynq Zedboard'`	Xilinx Zynq ZedBoard™ target

Data Types: `char`

CustomArchitectureDescriptionFile — Custom target architecture file
XML file

Custom target architecture file name, in XML format, that describes a custom target for the concurrent execution environment for the model, specified as a character vector giving the XML file name.

Example: `custom_arch.xml`

Introduced in R2014a

Simulink.architecture.profile

Generate profile report for model configured for concurrent execution

Syntax

```
Simulink.architecture.profile(model)
Simulink.architecture.profile(model,numSamples)
```

Description

`Simulink.architecture.profile(model)` generates a profile report for a model configured for concurrent execution. Subsequent calls to the command for the same model name overwrite the existing profile report.

`Simulink.architecture.profile(model,numSamples)` specifies the number of samples to generate a profile report.

Examples

Generate profile report

Generate profile report for the model `slexMulticoreExample`.

```
slexMulticoreExample;
Simulink.architecture.profile('slexMulticoreExample');
```

The command creates the file `slexMulticoreExample_ProfileReport.html` in the current folder and opens it.

Generate profile report for 120 time steps

Generate profile report for the model `slexMulticoreExample` with data for 120 time steps.

```
slexMulticoreExample;
Simulink.architecture.profile('slexMulticoreExample',120);
```

The command creates the file `slexMulticoreExample_ProfileReport.html` in the current folder.

Input Arguments

`model` — Model to profile
character vector

Model to profile, specified as a character vector. Specify a model that is configured for concurrent execution.

Data Types: `char`

`numSamples` — Number of time steps
100 (default) | real, positive integer

Number of time steps, specified as a real, positive integer. This value determines the number of steps to collect data for in the profiled model.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64`

Introduced in R2014a

Simulink.architecture.register

Add custom target architecture to concurrent execution target architecture selector

Syntax

Simulink.architecture.register(CustomArchFile)

Description

Simulink.architecture.register(CustomArchFile) adds an XML-format custom target architecture file CustomArchFile to the concurrent execution target architecture selector. To access this selector, click the **Select** button on the Concurrent Execution pane of the Concurrent Execution dialog box.

Examples

Add custom target architecture

Add custom target architecture defined in the XML file custom_arch.xml to the concurrent execution target architecture selector. This example requires you to create a custom_arch.xml first.

```
slexMulticoreExample
Simulink.architecture.register('custom_arch.xml')
```

Input Arguments

CustomArchFile — Custom target architecture file
XML file

Custom target architecture file that describes a custom target for concurrent execution, specified as an XML file.

Simulink.architecture.set_param

Introduced in R2014a

Simulink.architecture.set_param

Set architecture object properties

Syntax

```
Simulink.architecture.set_param(Object,ParamName,ParamValue)
```

Description

`Simulink.architecture.set_param(Object,ParamName,ParamValue)` sets the specified parameter of `Object` to the specified value. Parameter name and value character vectors are case sensitive.

Examples

Set software node name

Set the software node name from `MulticoreProcessor` to `MyCPUNewName`.

```
slexMulticoreExample
Simulink.architecture.set_param([bdroot '/MulticoreProcessor'],'Name','MyCPUNewName');
```

Change Periodic

Set Core2 trigger period to .01.

```
slexMulticoreExample
Simulink.architecture.set_param([bdroot '/MyCPUNewName/Core2'],'Period','.01')
```

Input Arguments

Object — Object whose parameter value to set
character vector

Object whose parameter value to set, specified as a character vector giving the object full path name. Possible objects are:

- Software node
- Hardware node
- Periodic trigger
- Aperiodic trigger
- Task

ParamName — Name of the parameter to set
character vector

Name of parameter whose value to set.

These are the possible parameters whose values you can set for each of the object types:

For software node:

- `'Name'` — Name of the software node.

For hardware node:

- `'Name'` — Name of the hardware node.
- `'ClockFrequency'` — Frequency of the hardware node clock.
- `'Color'` — Color of the trigger icon, specified as an RGB triplet (vector).

For a periodic trigger:

- `'Name'` — Name of the trigger.
- `'Period'` — Period of the trigger.
- `'Color'` — Color of the trigger icon, specified as an RGB triplet (vector).

For an aperiodic trigger:

- `'Name'` — Name of the trigger.
- `'Color'` — Color of the trigger icon, specified as an RGB triplet (vector).
- `'EventHandlerType'` — Trigger source for the interrupt-driven task. Possible values:

- `'Event (Windows)'`
- `'Posix Signal (Linux/VxWorks 6.x)'`

- `'SignalNumber'` — Signal number for the trigger. You can set this value only if `EventHandlerType` is set to `Event (Windows)`.

- `'EventName'` — Event name for the trigger. You can set this value only if `EventHandlerType` is set to `Posix Signal (Linux/VxWorks 6.x)`.

For task:

- `'Name'` — Name of the task.
- `'Period'` — Period of the task.
- `'Color'` — Color of the task icon, specified as an RGB triplet (vector).

Data Types: `char`

ParamValue — Value to set the parameter to
character vector | vector

Value to set the parameter to, specified as a character vector, scalar, or vector. The possible values depend on the parameter.

Example: `'MyCPUNewName'`

Simulink.Block.getSampleTimes

Return sample time information for a block

Syntax

```
ts = Simulink.Block.getSampleTimes(block)
```

Input Arguments

block

Full name or handle of a Simulink block

Output Arguments

ts

The command returns `ts` which is a `1xn` array of Simulink.SampleTime objects associated with the model passed to Simulink.Block.getSampleTimes. Here `n` is the number of sample times associated with the block. The format of the returns is:

```
1xn Simulink.SampleTime
Package: Simulink
value: [1x2 double]
Description: [char string]
ColorRGBValue: [1x3 double]
Annotation: [char string]
OwnerBlock: [char string]
ComponentSampleTimes: [1x2 struct]
Methods
```

- `value` — A two-element array of doubles that contains the sample time period and offset

- `Description` — A character vector that describes the sample time type

- `ColorRGBValue` — A 1x3 array of doubles that contains the red, green and blue (RGB) values of the sample time color

- `Annotation` — A character vector that represents the annotation of a specific sample time (e.g., 'D1')
- `OwnerBlock` — For asynchronous and variable sample times, a character vector containing the full path to the block that controls the sample time. For all other types of sample times, an empty character vector.
- `ComponentSampleTimes` — A structure array of elements of the same type as `Simulink.BlockDiagram.getSampleTimes` if the sample time is an async union or if the sample time is hybrid and the component sample times are available.

Description

`ts = Simulink.Block.getSampleTimes(`*`block`*`)` performs an update diagram and then returns the sample times of the block connected to the input argument *mdl/signal*. This method performs an update diagram to ensure that the sample time information returned is up-to-date. If the model is already in the compiled state via a call to the model API, then an update diagram is not necessary.

Using this method allows you to access all information in the Sample Time Legend programmatically.

`Simulink.BlockDiagram.getSampleTimes`

Introduced in R2009a

Simulink.BlockDiagram.addBusToVector

Convert virtual bus signals into vector signals by adding Bus to Vector blocks

Syntax

```
[destBlocks,busToVectorBlocks,ignoredBlocks] =
Simulink.BlockDiagram.addBusToVector(model)
[destBlocks,busToVectorBlocks,ignoredBlocks] =
Simulink.BlockDiagram.addBusToVector(model,includeLibs)
[destBlocks,busToVectorBlocks,ignoredBlocks] =
Simulink.BlockDiagram.addBusToVector(model,includeLibs,reportOnly)
[destBlocks,busToVectorBlocks,ignoredBlocks] =
Simulink.BlockDiagram.addBusToVector(model,includeLibs,reportOnly,
strictOnly)
```

Description

`[destBlocks,busToVectorBlocks,ignoredBlocks] =
Simulink.BlockDiagram.addBusToVector(model)` searches a model, excluding any
library blocks, for bus signals used implicitly as vectors, and returns the results of the
search.

`[destBlocks,busToVectorBlocks,ignoredBlocks] =
Simulink.BlockDiagram.addBusToVector(model,includeLibs)` searches a
model, and if `includeLibs` is `true`, includes in the search library blocks for bus signals
used implicitly as vectors.

`[destBlocks,busToVectorBlocks,ignoredBlocks] =
Simulink.BlockDiagram.addBusToVector(model,includeLibs,reportOnly)`
searches a model, and if `reportOnly` is set to `false`, then the function inserts a Bus to
Vector block into each bus that is used as a vector in any block that it searches. The
insertion replaces the implicit use of a bus as a vector with an explicit conversion of the
bus to a vector. The source and destination blocks of the signal do not change.

If `Simulink.BlockDiagram.addBusToVector` adds Bus to Vector blocks to the model
or any library, the function changes the saved copy of the diagram.

2-515

If `Simulink.BlockDiagram.addBusToVector` changes a library block, the change affects every instance of that block in every model that uses the library.

`[destBlocks,busToVectorBlocks,ignoredBlocks] = Simulink.BlockDiagram.addBusToVector(model,includeLibs,reportOnly, strictOnly)` searches a model, and if `strictOnly` is `true`, the function checks for input bus signals used implicitly as vectors that are fed into one of these blocks. These blocks cannot take virtual bus signals, but they can accept nonvirtual bus signals.

- Delay
- Selector
- Assignment
- Vector Concatenate
- Reshape
- Permute Dimensions

Examples

Insert Bus to Vector Block to Handle Bus Used as Vector

The `ex_bus_to_mux_ng` model simulates correctly, but the input to the Gain block is a bus, while the output is a vector. Therefore, the Gain block uses a bus signal as a vector.

Open the model.

```
open_system(fullfile(matlabroot,'examples','simulink',...
'ex_bus_to_mux_ng'))
```
Insert a Bus to Vector block to convert the bus input signal for the Gain block to a vector signal because the Gain block can accept only non-bus signals.

```
[blocks,busToVectors] = Simulink.BlockDiagram.addBusToVector(...
'ex_bus_to_mux_ng',true,false)
```

```
### Processing block diagram 'ex_bus_to_mux_ng'
### Number of blocks left that are connected to a bus being used as a vector: 1
### Successfully inserted Bus to Vector Blocks in model. Preparing to save model and/or libraries
### To eliminate modeling errors in the future, please enable strict bus modeling by setting the 'Bus signal
### Done processing block diagram 'ex_bus_to_mux_ng'

blocks =

  struct with fields:

    BlockPath: 'ex_bus_to_mux_ng/Gain'
    InputPort: 1
      LibPath: ''

busToVectors =

  cell

    'ex_bus_to_mux_ng/Bus to Vector'
```

The Gain block no longer implicitly converts the bus to a vector. The inserted Bus to Vector block performs the conversion explicitly. The results of simulation are the same for both models. The Bus to Vector block is virtual and does not affect simulation results, code generation, or performance.
Input Arguments

`model` — Model name or handle
character vector

Model name or handle, specified as a character vector.

`includeLibs` — Search library blocks
false (default) | true

Search library blocks, specified as `false` or `true`.

- `false` — Search only the blocks in the model.
- `true` — Search library blocks for bus signals used implicitly as vectors.

Specify as the second argument.

Data Types: `logical`

`reportOnly` — Report results without changing model
true (default) | false

Choice to report results without changing the model, specified as `false` or `true`.

- `false` — Update the model by inserting Bus to Vector blocks for bus signals that are implicitly used as vectors.
- `true` — Report search results, but do not change the model.

Specify as the third argument. You must also specify the `model` and `includeLibs` arguments.

Data Types: `logical`

`strictOnly` — Check input bus signals used implicitly as vectors that feed blocks that can accept nonvirtual, but not virtual, bus signals
`false` (default) | `true`

Check input bus signals used implicitly as vectors that feed blocks that can accept nonvirtual, but not virtual, bus signals, specified as `false` or `true`. If `strictOnly` is `true`, the function checks for input bus signals used implicitly as vectors that are fed into one of these blocks. These blocks cannot take virtual bus signals, but they can accept nonvirtual bus signals.

- Delay
- Selector
- Assignment
- Vector Concatenate
- Reshape
- Permute Dimensions

Specify as the fourth argument. You must also specify the `model`, `includeLibs`, and `reportOnly` arguments.

Data Types: `logical`

Output Arguments

`destBlocks` — Blocks connected to buses but that treat buses as vectors
array of structures

Blocks connected to buses that treat buses as vectors, returned as an array of structures. Each structure in the array contains these fields:

- `BlockPath` — Character vector specifying the path to the block to which the bus connects.
- `InputPort` — Integer specifying the input port to which the bus connects.

- LibPath — If the block is a library block instance, and `includeLibs` is `true`, the field value is the path to the source library block. Otherwise, `LibPath` is empty (`[]`).

busToVectorBlocks — Bus to Vector blocks added by function
cell array

Bus to Vector blocks added by the function, specified as a cell array. If `reportOnly` is set to `false`, the cell array contains the paths to each Bus to Vector block that the function added to replace buses used as vectors. Otherwise, `busToVectorBlocks` is empty (`[]`).

ignoredBlocks — Cases where function cannot insert Bus to Vector block
array of structures

Cases where function cannot insert Bus to Vector block, specified as an array of structures. Each structure in the array contains these fields:

- `BlockPath` — Character vector specifying the path to the block to which the bus connects.
- `InputPort` — Integer specifying the input port to which the bus connects.

These cases occur when a Bus to Vector cannot be inserted because the input virtual bus signal consists of elements with mixed attributes.

Tips

- Before you execute this function:

  1 Ensure that the model compiles without error.
  2 Save the model.
- Back up the model and any libraries before calling the function with `reportOnly` set to `false`.
- To preview the effects of the change on blocks in all models, call `Simulink.BlockDiagram.addBusToVector` with `includeLibs` set to `true` and `reportOnly` set to `true`. Then, examine the information returned in the `destBlocks` output argument.

See Also

Bus to Vector

Introduced in R2007a

Simulink.BlockDiagram.buildRapidAcceleratorTarget

Build Rapid Accelerator target for model and return run-time parameter set

Syntax

```
rtp = Simulink.BlockDiagram.buildRapidAcceleratorTarget(mdl)
```

Description

`rtp = Simulink.BlockDiagram.buildRapidAcceleratorTarget(mdl)` builds a Rapid Accelerator target for model, `mdl`, and returns run-time parameter set, `rtp`.

Input Arguments

mdl

Name or handle of a Simulink model

Output Arguments

rtp

Run-time parameter set that contains two elements:

Element	Description
modelChecksum	1x4 vector that encodes the structure of the model.
parameters	A structure of the tunable parameters in the model. This structure contains the following fields.
	Field	Description

Element	Description		
	dataTypeName	The data type name, for example, `double`.	
	dataTypeId	Internal data type identifier for use by Simulink Coder.	
	complex	Complex type or real type specification. Value is `0` if real, `1` if complex.	
	dtTransIdx	Internal data type identifier for use by Simulink Coder.	
	values	All values associated with this entry in the `parameters` substructure.	
	map	Mapping structure information that correlates the values to the model tunable parameters. This structure contains the following fields.	
		Field	Description
		`Identifier`	Tunable parameter name.
		`ValueIndices`	Start and end indices into the values field, `[startIdx, endIdx]`.
		`Dimensions`	Dimension of this tunable parameter (matrices are generally stored in column-major format).

Examples

Build Rapid Accelerator Target for Model

In the MATLAB Command Window, type:

```
rtp = Simulink.BlockDiagram.buildRapidAcceleratorTarget('f14')

### Building the rapid accelerator target for model: f14
### Successfully built the rapid accelerator target for model: f14

rtp =
```

```
    modelChecksum: [2.6812e+09 2.7198e+09 589261472 4.0180e+09]
       parameters: [1x1 struct]
```

Introduced in R2012b

Simulink.BlockDiagram.copyContentsToSubsystem

Copy contents of block diagram to empty subsystem

Syntax

Simulink.BlockDiagram.copyContentsToSubsystem(*bdiag*, *subsys*)

Description

Simulink.BlockDiagram.copyContentsToSubsystem(*bdiag*, *subsys*) copies the contents of the block diagram *bdiag* to the subsystem *subsys*. The block diagram and subsystem must have already been loaded. The subsystem cannot be part of the block diagram.

The function affects only blocks, lines, and annotations; it does not affect nongraphical information such as configuration sets. You can use this function to convert a referenced model derived from an atomic subsystem into an atomic subsystem that is equivalent to the original subsystem.

This function cannot be used if the destination subsystem contains any blocks or signals. Other types of information can exist in the destination subsystem and are not affected by the function. Use Simulink.SubSystem.deleteContents if necessary to empty the subsystem before using Simulink.BlockDiagram.copyContentsToSubsystem.

Input Arguments

bdiag

Block diagram name or handle

subsys

Subsystem name or handle

Examples

Copy the contents of vdp to an empty subsystem named vdp_subsystem that is in the model named new_model_with_vdp:

```
open_system('vdp');
new_system('new_model_with_vdp')
open_system('new_model_with_vdp');
add_block('built-in/Subsystem', 'new_model_with_vdp/vdp_subsystem')
Simulink.BlockDiagram.copyContentsToSubsystem...
('vdp', 'new_model_with_vdp/vdp_subsystem')
```

Introduced in R2007a

Simulink.BlockDiagram.createSubsystem

Create subsystem containing specified set of blocks

Syntax

```
Simulink.BlockDiagram.createSubsystem(blocks)
Simulink.BlockDiagram.createSubsystem()
```

Description

`Simulink.BlockDiagram.createSubsystem(blocks)` creates a new subsystem and moves the specified blocks into the subsystem. All of the specified blocks must originally reside at the top level of the model or in the same existing subsystem within the model.

If any of the blocks have unconnected input ports, the command creates input port blocks for each unconnected input port in the subsystem and connects the input port block to the unconnected input port. The command similarly creates and connects output port blocks for unconnected output ports on the specified blocks. If any of the specified blocks is an input port, the command creates an input port block in the parent system and connects it to the corresponding input port of the newly created subsystem. The command similarly creates and connects output port blocks for each of the specified blocks that is an output port block.

`Simulink.BlockDiagram.createSubsystem()` creates a new subsystem in the currently selected model and moves the currently selected blocks in the current model to the new subsystem.

Input Arguments

blocks

An array of block handles

Default: [ ]

Examples

This function converts the contents of a model or subsystem into a subsystem.

```
function convert2subsys(sys)
  blocks = find_system(sys, 'SearchDepth', 1);
  bh = [];
  for i = 2:length(blocks)
    bh = [bh get_param(blocks{i}, 'handle')];
  end
  Simulink.BlockDiagram.createSubsystem(bh);
end
```

For example, suppose you create this model and save it as `initial_model.slx`.
Execute this code to convert the model to create a subsystem:

```
convert2subsys('initial_model');
```

"Create a Subsystem"

Introduced in R2009a

Simulink.BlockDiagram.deleteContents

Delete contents of block diagram

Syntax

```
Simulink.BlockDiagram.deleteContents(bdiag)
```

Description

`Simulink.BlockDiagram.deleteContents(`*bdiag*`)` deletes the contents of the block diagram *bdiag*. The function affects only blocks, lines, and annotations. The block diagram must have already been loaded.

Input Arguments

bdiag

Block diagram name or handle

Examples

Delete the graphical content of an open block diagram named `f14`, including all subsystems:

```
Simulink.BlockDiagram.deleteContents('f14');
```

See Also

"Create a Subsystem"

Introduced in R2007a

Simulink.BlockDiagram.expandSubsystem

Expand subsystem contents to containing model level

Syntax

```
Simulink.BlockDiagram.expandSubsystem(block)
```

Description

`Simulink.BlockDiagram.expandSubsystem(block)` expands the contents of the subsystem for the specified Subsystem block. Subsystem expansion involves moving the contents of a virtual subsystem into the system that contains that subsystem.

You can expand virtual subsystems that are not masked, linked, or commented. For details, see "Subsystems That You Can Expand".

Input Arguments

block

A character vector that specifies one of the following:

- The path to a subsystem block in a loaded model.
- The block handle of a subsystem block in a loaded model.
- `gcb` (the currently selected block)

Examples

The following function expands the Combustion subsystem.

```
open_system('sldemo_enginewc')
Simulink.BlockDiagram.expandSubsystem('sldemo_enginewc/Combustion')
```

The blocks and signals that were in the Combustion subsystem become part of the top-level model that contained the Combustion subsystem, replacing that Subsystem block.

Simulink.BlockDiagram.getChecksum

Return checksum of model

Syntax

[*checksum*,*details*] = Simulink.BlockDiagram.getChecksum('*model*')

Description

[*checksum*,*details*] = Simulink.BlockDiagram.getChecksum('*model*') returns the checksum of the specified model. Simulink software computes the checksum based on attributes of the model and the blocks the model contains.

One use of this command is to determine why the Accelerator mode in Simulink software regenerates code. For an example, see slAccelDemoWhyRebuild.

Note Simulink.BlockDiagram.getChecksum compiles the specified model, if the model is not already in a compiled state.

This command accepts the argument *model*, which is the full name or handle of the model for which you are returning checksum data.

This command returns the following output:

- *checksum* — Array of four 32-bit integers that represents the model's 128-bit checksum.
- *details* — Structure of the form

  ```
  ContentsChecksum: [1x1 struct]
  InterfaceChecksum: [1x1 struct]
  ContentsChecksumItems: [nx1 struct]
  InterfaceChecksumItems: [mx1 struct]
  ```

  - ContentsChecksum — Structure of the following form that represents a checksum that provides information about all blocks in the model.

```
Value: [4x1 uint32]
MarkedUnique: [bool]
```

- `Value` — Array of four 32-bit integers that represents the model's 128-bit checksum.

- `MarkedUnique` — True if any blocks in the model have a property that prevents code reuse.

- `InterfaceChecksum` — Structure of the following form that represents a checksum that provides information about the model.

```
Value: [4x1 uint32]
MarkedUnique: [bool]
```

- `Value` — Array of four 32-bit integers that represents the model's 128-bit checksum.

- `MarkedUnique` — Always true. Present for consistency with `ContentsChecksum` structure.

- `ContentsChecksumItems` and `InterfaceChecksumItems` — Structure arrays of the following form that contain information that Simulink software uses to compute the checksum for `ContentsChecksum` and `InterfaceChecksum`, respectively:

```
Handle: [char array]
Identifier: [char array]
Value: [type]
```

- `Handle` — Object for which Simulink software added an item to the checksum. For a block, the handle is a full block path. For a block port, the handle is the full block path and a character vector that identifies the port.

- `Identifier` — Descriptor of the item Simulink software added to the checksum. If the item is a documented parameter, the identifier is the parameter name.

- `Value` — Value of the item Simulink software added to the checksum. If the item is a parameter, `Value` is the value returned by

  ```
  get_param(handle, identifier)
  ```

`Simulink.BlockDiagram.getChecksum` returns a checksum that depends on why and how you compiled the model. This function also compiles the model if it is not in a compiled state. The model compiles for:

- Simulation— if the simulation mode is Accelerator or you have not installed Simulink Coder
- Code generation— in all other cases

To compile the model before calling `Simulink.BlockDiagram.getChecksum`, use this command:

```
modelName([],[],[],'compile')
```

Note The checksum that `Simulink.BlockDiagram.getChecksum` returns can vary from the checksum returned if you first compile the model at the command line (using the `model` command) before running `Simulink.BlockDiagram.getChecksum`.

Tip

The structural checksum reflects changes to the model that can affect the simulation results, including:

- Changing the solver type, for example from `Variable-step` to `Fixed-step`
- Adding or deleting blocks or connections between blocks
- Changing the values of nontunable block parameters, for example, the **Seed** parameter of the Random Number block
- Changing the number of inputs or outputs of blocks, even if the connectivity is vectorized
- Changing the number of states or the initial states in the model
- Selecting a different function in the Trigonometric Function block
- Changing signs used in a Sum block
- Adding a Target Language Compiler (TLC) file to inline an S-function

Examples of model changes that do not affect the structural checksum include:

- Changing the position of a block
- Changing the position of a line
- Resizing a block
- Adding, removing, or changing a model annotation

Introduced in R2006b

Simulink.BlockDiagram.getInitialState

Return initial state data of block diagram

Syntax

```
x0 = Simulink.BlockDiagram.getInitialState('model')
```

Description

`x0 = Simulink.BlockDiagram.getInitialState('model')` returns the initial state data of the block diagram specified by the input argument *model*. You can use this initial state data as the initial state for simulating a model or to provide an initial state condition to the linearization commands. To specify the initial state for a simulation, use the `LoadInitialState` model argument or the **Data Import/Export > Initial state** configuration parameter.

To specify the format for the initial state data, use the `SaveFormat` model argument. The default format is `'Dataset'`. Other formats `'Array'`, `'Structure'`, and `'StructureWithTime'`. Alternatively, you can set the initial state format using the **Data Import/Export > Format** configuration parameter.

- If format is `'Dataset'`, then the `Simulink.BlockDiagram.getInitialState` function returns a `Simulink.SimulationData.Dataset` object.
- For other format settings, the function returns a structure of the form:

  ```
  time: 0
  signals: [1xn struct]
  ```

  where `n` is the number of states contained in the model, including any models referenced by Model blocks. The `signals` field is a structure of the form:

  ```
  values: [1xm double]
  dimensions: [1x1 double]
  label: [char array]
  blockName: [char array]
  inReferencedModel: [bool]
  sampleTime: [1x2 double]
  ```

- `values` — Numeric array of length `m`, where `m` is the number of states in the signal
- `dimensions` — Length of the `values` vector
- `label` — Indication of whether the state is continuous (`CSTATE`) or discrete. If the state is discrete:

  The name of the discrete state is shown for S-function blocks.

  The name of the discrete state is shown for those built-in blocks that assign their own names to discrete states.

  `DSTATE` is used in all other cases.

- `blockName` — Full path to block associated with this state
- `inReferencedModel` — Indication of whether the state originates in a model referenced by a Model block (`1`) or in the top model (`0`)
- `sampleTime` — Array containing the sample time and offset of the block that owns the state

Using this function to return the initial state data simplifies specifying initial state values for models with multiple states. Each state is associated with the full path to its parent block.

Introduced in R2006b

Simulink.BlockDiagram.getSampleTimes

Return all sample times associated with model

Syntax

`ts = Simulink.BlockDiagram.getSampleTimes('`*`model`*`')`

Description

`ts = Simulink.BlockDiagram.getSampleTimes('`*`model`*`')` performs an update diagram and then returns the sample times associated with the block diagram *model*. The update diagram ensures that the sample time information returned is up to date. If the model is already in the compiled state via a call to the model API, then an update diagram is not necessary.

Using this method allows you to access all information in the Sample Time Legend programmatically.

Input Arguments

model

Name or handle of a Simulink model

Output Arguments

`ts`

The command returns a `1xn` array of `Simulink.SampleTime` objects associated with the model passed to `Simulink.BlockDiagram.getSampleTimes`. Here `n` is the number of sample times associated with the block diagram. The format of the returns is as follows:

`1xn Simulink.SampleTime`
`Package: Simulink`

```
value: [1x2 double]
Description: [char string]
ColorRGBValue: [1x3 double]
Annotation: [char string]
OwnerBlock: [char string]
ComponentSampleTimes: [1x2 struct]
Methods
```

- `value` — A two-element array of doubles that contains the sample time period and offset.

- `Description` — A character vector that describes the sample time type.

- `ColorRGBValue` — A `1x3` array of doubles that contains the red, green, and blue (RGB) values of the sample time color.

- `Annotation` — A character vector that represents the annotation of a specific sample time (e.g., `'D1'`).

- `OwnerBlock` — For asynchronous and variable sample times, a character vector containing the full path to the block that controls the sample time. For all other types of sample times, an empty character vector.

- `ComponentSampleTimes` — A structure array of elements of the same type as `Simulink.BlockDiagram.getSampleTimes` if the sample time is an async union or if the sample time is hybrid and the component sample times are available.

`Simulink.Block.getSampleTimes`

Introduced in R2009a

Simulink.BlockDiagram.loadActiveConfigSet

Package: Simulink.BlockDiagram

Load, associate, and activate configuration set with model

Syntax

```
Simulink.BlockDiagram.loadActiveConfigSet(model, filename)
```

Description

`Simulink.BlockDiagram.loadActiveConfigSet(model, filename)` loads a configuration set, associates it with a model, and makes it the active configuration set. `model` is the name or handle of a model. `filename` is the name of the file (`.m` or `.mat`) that creates or contains a configuration set object to load. If you do not provide a file extension, it defaults to `.m`. If the file name is the same as a model name on the MATLAB path, the software cannot determine which file contains the configuration set object and displays an error message.

Examples

Save the configuration set from the `sldemo_counters` model to `my_config_set.m`.

```
% Open the sldemo_counters model
sldemo_counters
% Save the active configuration set to my_config_set.m
Simulink.BlockDiagram.saveActiveConfigSet('sldemo_counters', 'my_config_set.m')
```

Load the configuration set from `my_config_set.m`, associate it with the `vdp` model, and make it the active configuration set.

```
% Open the vdp model
vdp
% Load the configuration set from my_config_set.m, making it the active
% configuration set for vdp.
Simulink.BlockDiagram.loadActiveConfigSet('vdp', 'my_config_set.m')
```

Tips

- If you load a configuration set with the same name as the active configuration set, the software overwrites the active configuration set.
- If you load a configuration set with the same name as an inactive configuration set associated with the model, the software detaches the inactive configuration from the model.
- If you load a configuration set object that contains an invalid custom target, the software sets the **"System target file" (Simulink Coder)** parameter to `ert.tlc`.

Simulink.BlockDiagram.propagateConfigSet

Propagate top model configuration reference to referenced models

Syntax

```
[isPropagated, convertedModels] =
Simulink.BlockDiagram.propagateConfigSet(model)
[isPropagated, convertedModels] =
Simulink.BlockDiagram.propagateConfigSet(model, 'include',
refModels)
[isPropagated, convertedModels] =
Simulink.BlockDiagram.propagateConfigSet(model, 'exclude',
refModels)
handle = Simulink.BlockDiagram.propagateConfigSet(model, 'gui')
```

Description

`[isPropagated, convertedModels] = Simulink.BlockDiagram.propagateConfigSet(model)` propagates the configuration reference for `model` to all referenced models. Execute the function from a writable folder.

`[isPropagated, convertedModels] = Simulink.BlockDiagram.propagateConfigSet(model, 'include', refModels)` propagates the configuration reference for `model` to the models in the `refModels` list. Execute the function from a writable folder.

`[isPropagated, convertedModels] = Simulink.BlockDiagram.propagateConfigSet(model, 'exclude', refModels)` propagates the configuration reference for `model` to all referenced models in the hierarchy except for the models in the `refModels` list. Execute the function from a writable folder.

`handle = Simulink.BlockDiagram.propagateConfigSet(model, 'gui')` opens the **Configuration Reference Propagation to Referenced Models** dialog box.

Examples

Propagate a Configuration Reference to All Referenced Models

```
[isPropagated,convertedModels] = ...
Simulink.BlockDiagram.propagateConfigSet('sldemo_mdlref_depgraph')
```

Propagate a Configuration Reference to Listed Referenced Models

```
[isPropagated,convertedModels] = ...
Simulink.BlockDiagram.propagateConfigSet(...
'sldemo_mdlref_depgraph','include',...
{'sldemo_mdlref_heater','sldemo_mdlref_house'})
```

Propagate a Configuration Reference to Referenced Models with Exclusions

```
[isPropagated,convertedModels] = ...
Simulink.BlockDiagram.propagateConfigSet(...
'sldemo_mdlref_depgraph','exclude',...
{'sldemo_mdlref_heater','sldemo_mdlref_house'})
```

Open the Configuration Reference Propagation to Referenced Models Dialog Box for a Model

```
Simulink.BlockDiagram.propagateConfigSet(...
'sldemo_mdlref_depgraph','gui')
```

- "Share a Configuration Across Referenced Models"
- "Manage a Configuration Reference"

Input Arguments

model — Top model
character vector

Top model with configuration reference to propagate, specified as a character vector.

Example: 'mdl'

`refModels` — Referenced models
cell array of character vectors

List of referenced models to be included or excluded in propagation, specified as a cell array of character vectors.

Example: {'mdl1','mdl2','mdl3'}

Output Arguments

`isPropagated` — Success of propagation
false (default) | true

Indication of whether configuration reference propagation is successful, specified as a Boolean.

`convertedModels` — Converted models
cell array of character vectors

List of converted model names, specified as a cell array of character vectors.

`handle` — Handle to dialog box
handle

Handle to the **Configuration Reference Propagation to Referenced Models** dialog box. Returned when you specify the 'gui' argument to the function.

See Also

Introduced in R2012b

Simulink.BlockDiagram.restoreConfigSet

Restore model configuration for converted models

Syntax

```
[isRestored, restoredModels] =
Simulink.BlockDiagram.restoreConfigSet(model)
```

Description

`[isRestored, restoredModels] = Simulink.BlockDiagram.restoreConfigSet(model)` restores the model configuration for all converted models after propagating a configuration reference from a top model to the referenced models. Execute the function from a writable folder.

Examples

Restore the Model Configuration for Converted Models

```
[isRestored,restoredModels] = ...
Simulink.BlockDiagram.restoreConfigSet('sldemo_mdlref_depgraph');
```

- "Share a Configuration Across Referenced Models"
- "Manage a Configuration Reference"

Input Arguments

model — Top model
character vector

Name of top model, specified as a character vector.

Example: 'mdl'

Output Arguments

`isRestored` — Success of restoration
false (default) | true

Indication of whether configuration reference propagation is successful, specified as a Boolean.

`restoredModels` — Restored models
cell array of character vectors

List of restored model names, specified as a cell array of character vectors.

Simulink.BlockDiagram.saveActiveConfigSet

Package: Simulink.BlockDiagram

Save active configuration set of model

Syntax

```
Simulink.BlockDiagram.saveActiveConfigSet(model, filename)
```

Description

`Simulink.BlockDiagram.saveActiveConfigSet(model, filename)` saves the active configuration set of a model to a `.m` or `.mat` file. `model` is the name or handle of the model. `filename` is the name of the file to save the model configuration set. If you specify a `.m` extension, the file contains a function that creates a configuration set object. If you specify a `.mat` extension, the file contains a configuration set object. If you do not provide a file extension, the active configuration set is saved to a file with a `.m` extension. Do not specify `filename` to be the same as a model name; otherwise the software cannot determine which file contains the configuration set object when loading the file.

Note If you specify a `.mat` extension when you save the active configuration set, all of the parameters are preserved. If you specify a `.m` extension, the `.m` file does not include hidden or disabled parameters.

Examples

Save the configuration set from the `sldemo_counters` model to `my_config_set.m`.

```
% Open the sldemo_counters model
sldemo_counters
% Save the active configuration set to my_config_set.m
Simulink.BlockDiagram.saveActiveConfigSet('sldemo_counters', 'my_config_set.m')
```

"Save a Configuration Set"

Introduced in R2010b

Simulink.Bus.cellToObject

Convert cell array containing bus information to bus objects

Syntax

```
Simulink.Bus.cellToObject(busCells)
```

Description

`Simulink.Bus.cellToObject(busCells)` creates a set of bus objects in the MATLAB base workspace from a cell array of bus information.

Examples

Create Bus Objects from Cell Array of Bus Information

Create a cell array of cell arrays of bus information, and use that cell array to generate a bus object in the base workspace.

Create a cell array of bus information.

```
busCell = { ...
        { ...
            'myBusObj', ...
            'MyHeader.h', ...
            'My description', ...
            'Exported', ...
            '-1', ...
            {{'a',1,'double', [0.2 0],'real','Frame'}; ...
            {'b',1,'double', [0.2 0],'real','Sample'}},...
            }, ...
        };
```

Generate a bus object in the base workspace from the cell array.

```
Simulink.Bus.cellToObject(busCell)
```

- "When to Use Bus Objects"
- "Create Bus Objects Programmatically"
- "Create Bus Objects with the Bus Editor"
- "Save and Import Bus Objects"

Input Arguments

busCells — Bus object information
cell array of cell arrays

Bus object information, specified as a cell array of cell arrays. Each subordinate cell array contains bus object information, using these data fields:

- Bus name
- Header file
- Description
- Data scope
- Alignment
- Elements

The elements field is an array containing this data for each element:

- Element name
- Dimensions
- Data type
- Sample time
- Complexity
- Sample mode
- Dimensions mode
- Minimum
- Maximum

- Units
- Description

Tips

The inverse function is `Simulink.Bus.objectToCell`.

Introduced before R2006a

Simulink.Bus.createMATLABStruct

Create MATLAB structures using same hierarchy and attributes as bus signals

Syntax

```
structFromBus = Simulink.Bus.createMATLABStruct(busSource)
structFromBus = Simulink.Bus.createMATLABStruct(busSource,
partialValues)
structFromBus = Simulink.Bus.createMATLABStruct(busSource,
partialValues,dims)

structsForBuses = Simulink.Bus.createMATLABStruct(portHandles)
structsForBuses = Simulink.Bus.createMATLABStruct(portHandles,
partialStructures)
structsForBuses = Simulink.Bus.createMATLABStruct(busObjectNames)
```

Description

`structFromBus = Simulink.Bus.createMATLABStruct(busSource)` creates a MATLAB structure that has the same hierarchy and attributes (such as type and dimension) as the bus specified in `busSource`. The resulting structure uses the ground values of the bus signal.

`structFromBus = Simulink.Bus.createMATLABStruct(busSource, partialValues)` creates a structure that uses specified values of `partialValues` instead of the corresponding ground values of the bus signal.

`structFromBus = Simulink.Bus.createMATLABStruct(busSource, partialValues,dims)` creates a structure that has the specified dimensions. To create a structure for an array of buses, use `dims`.

`structsForBuses = Simulink.Bus.createMATLABStruct(portHandles)` creates a cell array of structures for bus signal ports, specified with port handles. The resulting cell array of structures uses ground values. Use this syntax to create initialization structures for multiple bus ports. This syntax improves performance compared to using separate `Simulink.Bus.createMATLABStruct` calls to create the structures.

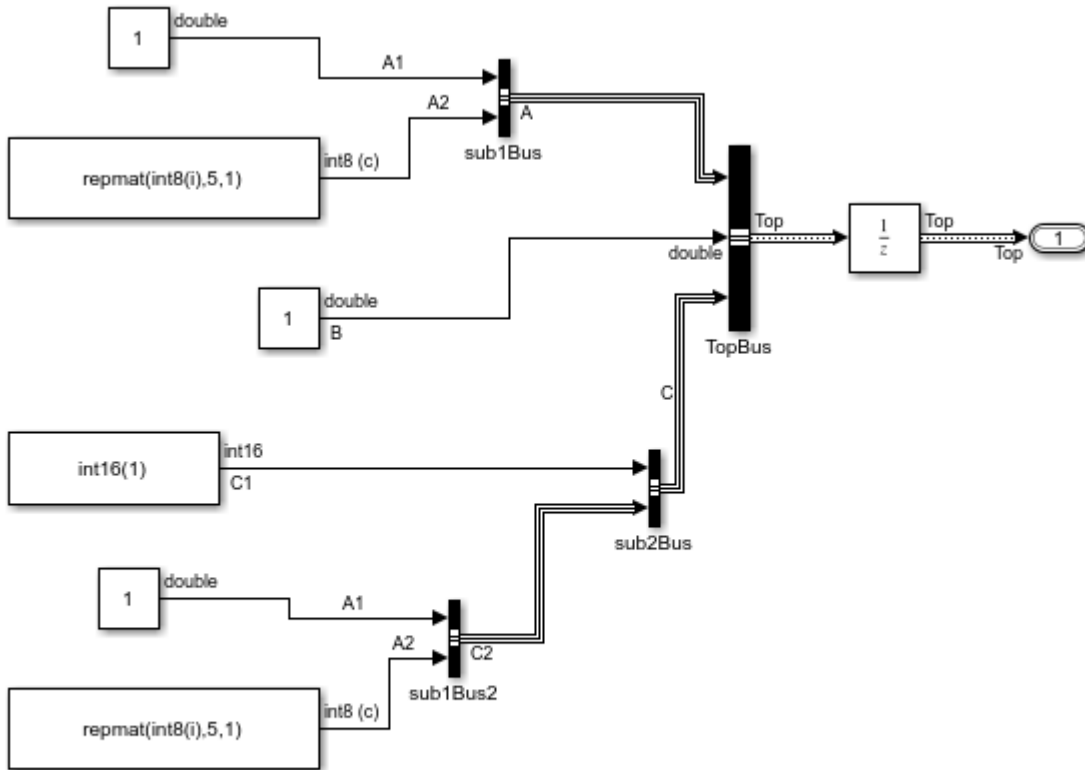
structsForBuses = Simulink.Bus.createMATLABStruct(portHandles, partialStructures) creates a cell array of structures that uses the specified values of partialStructures instead of the ground values.

structsForBuses = Simulink.Bus.createMATLABStruct(busObjectNames) creates a cell array of structures based on the specified bus objects.

Examples

MATLAB Structure from Bus Object

Open a Simulink® model and simulate it.

```
model = fullfile(matlabroot,'examples','simulink','busic_example');
open_system(model);
sim('busic_example')
```


Copyright 2004-2010 The MathWorks, Inc.

Create a MATLAB® structure using the bus object `Top`, which the `busic_example` model loads.

```
mStruct = Simulink.Bus.createMATLABStruct('Top')

mStruct =

  struct with fields:

    A: [1x1 struct]
    B: 0
```

```
    C: [1x1 struct]
```

Set a value for the field of the `mStruct` structure that corresponds to bus element `A1` of bus `A`.

```
mStruct.A.A1 = 3;
mStruct.A

ans =

  struct with fields:

    A1: 3
    A2: [5x1 int8]
```

Simulink sets the other fields in the structure to the ground values of the corresponding bus elements.

You can use `mStruct` as the initial condition structure for the Unit Delay block.

Initialize Signal Elements That Use a Data Type Other than double

Create a MATLAB® structure for a bus whose signal elements use a data type other than `double`. Use a partial structure to specify initialization values for a subset of the elements. When you create the partial structure, match the data types of the fields with the data types of the corresponding elements.

Open a Simulink® model.

```
model = fullfile(matlabroot,'examples','simulink','busic_example');
open_system(model);
sim('busic_example')
```
Copyright 2004-2010 The MathWorks, Inc.

The `C1` signal element that the Constant5 block produces uses the data type `int16`.

Find the port handle for the Bus Creator block port that produces the `Top` bus signal.

```
ph = get_param('busic_example/TopBus','PortHandles');
```

Create a partial structure that specifies values for a subset of the elements in the bus signal created by the TopBus block. To set the value of the `C.C1` field, use a typed expression. Match the data type in the expression with the data type of the signal element in the model (`int16`).

```
PartialstructForK = struct('B',3,'C',struct('C1',int16(5)));
```

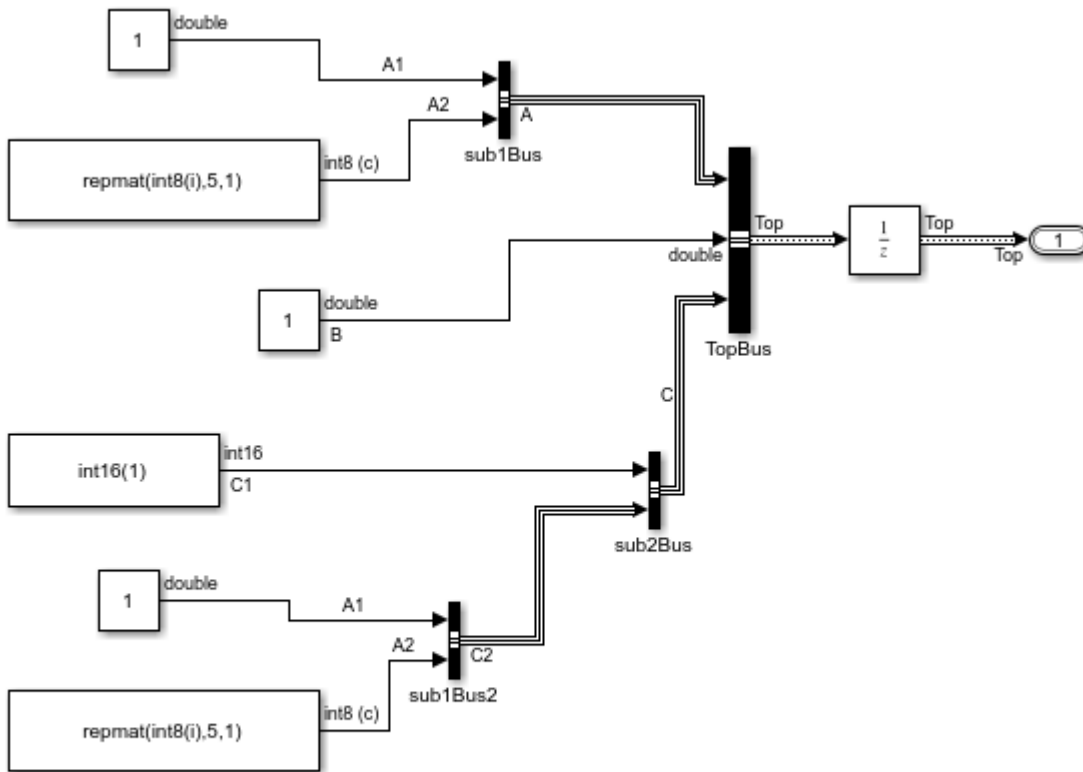
Create a full structure by using the port handle (`ph`) for the `TopBus` block. Override the ground values for the `C.C1` and `B` elements.

```
outPort = ph.Outport;
mStruct = Simulink.Bus.createMATLABStruct(outPort,PartialstructForK);
```

The field `C.C1` in the output structure continues to use the data type `int16`.

MATLAB Structure with Specified Dimensions

Open a Simulink® model and simulate it.

```
model = fullfile(matlabroot,'examples','simulink','busic_example');
open_system(model);
sim('busic_example')
```


Copyright 2004-2010 The MathWorks, Inc.

Create a partial structure, which is a MATLAB® structure that specifies values for a subset of bus elements for the bus signal created by the TopBus block.

```
PartialStructForK = struct('A',struct('A1',4),'B',3)

PartialStructForK =

  struct with fields:

    A: [1x1 struct]
```

```
    B: 3
```

Create a MATLAB structure using the bus object `Top` (which the `busic_example` model loads), a partial structure, and dimensions for the resulting structure.

```
structFromBus = Simulink.Bus.createMATLABStruct...
    ('Top',PartialStructForK,[2 3])

structFromBus =

  2x3 struct array with fields:

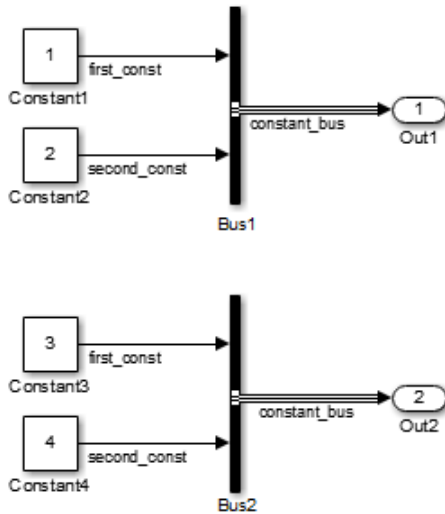
    A
    B
    C
```

Close the system.

```
close_system('busic_example')
```

Cell Array of MATLAB Structures

Open a Simulink model and simulate it.

```
open_system(docpath(fullfile(docroot,'toolbox','simulink',...
'examples','ex_two_outports_create_struct')))
sim('ex_two_outports_create_struct')
```


Find the port handles for the Bus Creator blocks Bus1 and Bus2.

```
ph_1 = get_param...
    ('ex_two_outports_create_struct/Bus Creator','PortHandles')
ph_2 = get_param...
    ('ex_two_outports_create_struct/Bus Creator1','PortHandles')
```

Create a MATLAB structure using an array of port handles.

```
mStruct = Simulink.Bus.createMATLABStruct...
    ([ph_1.Outport ph_2.Outport])

mStruct =

    [1x1 struct]
    [1x1 struct]
```

Close the system.

```
close_system('ex_two_outports_create_struct')
```

MATLAB Structure from Bus Port and Partial Structure

Create a MATLAB structure based on a port that connects to a bus signal. Use a partial structure to specify values for a subset of bus elements of the bus signal that connects to the port.

Open a Simulink model.

```
run([docroot '/toolbox/simulink/ug/examples/signals/busic_example.mdl']);
sim('busic_example')
```

Find the port handle for the Bus Creator block port that produces the Top bus signal. The Outport handle is the handle that you need.

```
ph = get_param('busic_example/TopBus','PortHandles')

ph =
```

```
     Inport: [143.0013 144.0013 145.0013]
    Outport: 34.0013
     Enable: []
    Trigger: []
      State: []
      LConn: []
      RConn: []
    Ifaction: []
```

Create a partial structure, which is a MATLAB structure that specifies values for a subset of bus elements for the bus signal created by the TopBus block.

```
PartialstructForK = struct('A',struct('A1',4),'B',3)

PartialstructForK =

    A: [1x1 struct]
    B: 3
```

Bus elements represented by structure fields `Top.B` and `Top.A` are at the same nesting level in the bus. You can use this partial structure to override the ground values for the `B` and `A` bus signal elements.

When you create a structure from a bus object or from a bus port, you can use a partial structure as an optional argument.

Create a MATLAB structure by using the port handle (`ph`) for the `TopBus` block. Override the ground values for the `A.A1` and `B` bus elements.

```
outPort = ph.Outport;
mStruct = Simulink.Bus.createMATLABStruct(outPort,PartialstructForK)

mStruct =

    A: [1x1 struct]
    B: 3
    C: [1x1 struct]
```

Input Arguments

busSource — Source representing a bus signal
a Simulink.Bus object | port handle

Source representing a bus signal to use for creating a MATLAB structure, specified as the name of a bus object or port handle.

- If you use the `dims` argument, then for `busSource`, use a bus object.
- For an array of buses signal, you cannot use a port handle.
- If you use a bus object name, then the bus object must be in the MATLAB base workspace. The data type for the bus object name is `char`.
- If you use a port handle, then the model must compile successfully before you use the `createMATLABStruct` method. The data type for the port handle is a `double`.

Example:

```
structFromBus = Simulink.Bus.createMATLABStruct('myBusObject');
structForPortHandle = Simulink.Bus.createMATLABStruct(port_handle_1);
```

partialValues — Values for a subset of leaf nodes of the resulting structure
partial structure | [ ]

Values for a subset of leaf nodes of the resulting structure, specified as a partial structure or empty array. Each field that you specify in a partial structure must match the data attributes of the corresponding bus element exactly. For details, see "Create Partial Structures for Initialization".

Use an empty matrix `[]` when you use the `dims` argument and want to use ground values for all of the nodes in the resulting structure.

Data Types: `struct`

dims — Dimensions of the resulting structure
vector

Dimensions of the resulting structure, specified as a vector.

Each dimension element must be an integer that is greater than or equal to 1. If you specify `partialValues`, then each dimension element in `dims` must be greater than or equal to its corresponding dimension element in the partial structure.

To use ground values, use an empty matrix (`[]`) for `partialValues` .

Data Types: `double`

portHandles — Handles of bus signal ports
array

Handles of bus signal ports, specified as an array. If you use the `partialStructures` argument, then the number of port handles that you specify in `portHandles` must be the same as the number of partial structures.

Data Types: `double`

partialStructures — Partial structures
cell array

Partial structures specified as a cell array. The number of port handles that you specify in `portHandles` must be the same as the number of partial structures.

Data Types: `cell`

busObjectNames — Bus object names
cell array

Bus object names, specified as a cell array.

Data Types: `cell`

Output Arguments

structFromBus — Bus signal hierarchy and attributes
MATLAB structure

Bus signal hierarchy and attributes, returned as a MATLAB structure.

The dimensions of `structFromBus` depend on the input arguments:

- If you specify only `busSource`, then the dimension is 1.
- If you also specify `partialValues`, then the dimensions match the dimensions of `partialValues`.
- If you specify the `dims` argument, then the dimensions match the dimensions of `dims`.

structsForBuses — Structures having the same hierarchy and attributes as bus signals
cell array

Structures having the same hierarchy and attributes as bus signals, returned as a cell array of structures of data with same hierarchy and attributes as a bus signals that you

specify with an array of port handles. The cell array of structures uses ground values of the bus signals.

The dimensions of `StructsForBuses` depend on the input arguments:

- If you specify only `portHandles`, then the dimension is 1.
- If you also specify `partialStructures`, then the dimensions match the dimensions of `partialStructures`.

Tips

- If you use the `Simulink.Bus.createMATLABStruct` function repeatedly for the same model (for example, in a loop in a script), you can improve performance by avoiding multiple model compilations. For improved speed, put the model in compile before using the function multiple times. For example, to put the `vdp` model in compile, use this command:

  ```
  [sys,x0,str,ts] = vdp([],[],[],'compile')
  ```

  After you create the MATLAB structure, terminate the compile. For example:

  ```
  vdp([],[],[],'term')
  ```

- You can use the Bus Editor to invoke the `Simulink.Bus.createMATLABStruct` function. Use one of these approaches:

  - Select the **File > Create a MATLAB structure** menu item.
  - Select the bus object for which you want to create a full MATLAB structure. Then, in the toolbar, click the **Create a MATLAB structure** button ().

  You can then edit the MATLAB structure in the MATLAB Editor and evaluate the code to create or update the values in this structure.

- You can use the `Simulink.Bus.createMATLABStruct` function to specify the initial value of the output of a referenced model. For details, see the "Referenced Model: Setting Initial Value for Bus Output" section of the Detailed Workflow for Managing Data with Model Reference example.

Introduced in R2010a

Simulink.Bus.createObject

Create bus objects from blocks or MATLAB structures

Syntax

```
busInfo = Simulink.Bus.createObject(model,blocks)
busInfo = Simulink.Bus.createObject(struct)
busInfo = Simulink.Bus.createObject( ___ ,file)
busInfo = Simulink.Bus.createObject( ___ ,format)
```

Description

`busInfo = Simulink.Bus.createObject(model,blocks)` creates bus objects (instances of `Simulink.Bus` class in the MATLAB base workspace) for specified blocks, and returns information about the objects that it created.

`busInfo = Simulink.Bus.createObject(struct)` creates bus objects in the MATLAB workspace from a MATLAB structure of `timeseries` objects or a numeric MATLAB structure.

`busInfo = Simulink.Bus.createObject( ___ ,file)` saves the bus objects in a MATLAB file that contains a cell array of cell arrays. Each subordinate cell array represents a bus object and contains this data:

- Bus name
- Header file
- Description
- Data scope
- Alignment
- Elements

The elements field is an array containing this data for each element:

- Element name

- Dimensions
- Data type
- Sample time
- Complexity
- Dimensions mode
- Minimum
- Maximum
- Units
- Description

`busInfo = Simulink.Bus.createObject( ___ ,format)` saves the bus objects in a file that contains either a cell array of bus information, or the bus objects themselves.

Examples

Use Bus Creator Blocks to Create a Bus Object

Create a bus object from the Bus Creator block called `Bus Creator2`.

```
open_system('busdemo')
bus2Info = Simulink.Bus.createObject...
('busdemo','busdemo/Bus Creator2')
close_system('busdemo')
```

Create a bus object from two Bus Creator blocks, using block handles to specify the blocks. Assign the block handles to variables and use the variables in a vector to specify the blocks used for creating the bus object.

Open the model.

```
clear;
open_system('busdemo')
```

In the Simulink Editor, select the `Bus Creator2` block. In MATLAB, assign the block handle to a variable.

```
bc2 = gcbh;
```

In the Simulink Editor, select the `Bus Creator` block. In MATLAB, assign the block handle to a variable.

```
bc1 = gcbh;
```

Use the block handle variables in a vector to create a bus object.

```
bus3Info = Simulink.Bus.createObject...
('busdemo', [bc2 bc1], 'busdemo_busobject')
close_system('busdemo')
```

Create Bus Objects from Cell Array of Bus Information

Create a cell array of cell arrays of bus information, and use that cell array to generate a bus object in the base workspace.

Create a cell array of bus information.

```
busCell = { ...
        { ...
            'myBusObj', ...
            'MyHeader.h', ...
            'My description', ...
            'Exported', ...
            '-1', ...
            {{'a',1,'double', [0.2 0],'real','Frame'}; ...
            {'b',1,'double', [0.2 0],'real','Sample'}},...
            }, ...
        };
```

Generate a bus object in the base workspace from the cell array.

```
Simulink.Bus.cellToObject(busCell)
```

Input Arguments

`model` — Model name or handle
character vector

Model name or handle, specified as a character vector.

blocks — Blocks to create bus objects for
character vector | cell array of block pathnames | vector of block names

Blocks to create bus object for, specified as a character vector, cell array of block pathnames, or vector of block names.

- For just one block, specify the full path name of the block.
- For multiple blocks, specify either a cell array of block pathnames or a vector of block names.
- If you specify a Bus Creator block that is at the highest level of a bus hierarchy, the function creates bus objects for all buses in the hierarchy.

struct — Structure used to create bus objects
structure of MATLAB `timeseries` objects | numeric structure

Structure used to create bus objects, specified as a structure of MATLAB `timeseries` objects or a numeric structure.

file — File to save bus objects in
character vector

File to save bus objects in, specified as a character vector. The file name must be unique. If you omit this argument, the function saves the created bus objects in a cell array, not in a file.

format — Format for storing bus objects in file
`'cell'` (default) | `'object'`

Format for storing bus objects in file, specified as either `'cell'` or `'object'`. The cell format is more compact, but the cell format is easier to read.

Output Arguments

busInfo — Bus information for specified blocks
structure array

Bus information for specified blocks, returned as a structure array. Each element of the structure array corresponds to one block and contains these fields:

- `block` – Handle of the block

- `busName` – Name of the bus object associated with the block

Tips

If you specify a model name, the model must compile successfully before you use the `Simulink.Bus.createObject` command.

Introduced before R2006a

Simulink.Bus.objectToCell

Use bus objects to create cell array containing bus information

Syntax

```
busCells = Simulink.Bus.objectToCell(busNames)
```

Description

`busCells = Simulink.Bus.objectToCell(busNames)` inputs a cell array of names of bus objects that are in the MATLAB base workspace. The function returns a cell array of cell arrays in which each subordinate cell array contains the bus information defined by one of the bus objects. The order of the elements in the output cell array corresponds to the order of the names in the input cell array.

Examples

Create Cell Array Containing Bus Object Information

Use the `Simulink.Bus.objectToCell` function to create a cell array of information about bus objects in the base workspace.

Open a model that has two bus objects defined, `CONTROL` and `MAIN`.

```
open_system(fullfile(matlabroot,'examples','simulink',...
    'ex_bus_object_tutorial_using_objects'))
```
Create cell array of information about the `CONTROL` bus object.

```
busCells = Simulink.Bus.objectToCell({'CONTROL'});
busCells{1}
```

```
ans =

  1x6 cell array

    {'CONTROL'}    {0x0 char}    {0x0 char}    {'Auto'}    {'-1'}    {2x1 cell}
```

- "Create Bus Objects Programmatically"
- "When to Use Bus Objects"
- "Create Bus Objects with the Bus Editor"

- "Modify Bus Objects"
- "Save and Import Bus Objects"

Input Arguments

busNames — Bus objects in base workspace for which to create cell arrays of bus object information
cell array of names of bus objects, specified as character vectors

Bus objects in the base workspace for which to create cell arrays of bus object information, specified as a cell array of names of bus objects. Specify the bus object names as character vectors. If `busNames` is empty, the function converts all bus objects in the base workspace.

Output Arguments

busCells — Bus object information
cell array of cell arrays

Bus object information, specified as a cell array of cell arrays. Each subordinate cell array contains bus object information, using these data fields:

- Bus name
- Header file
- Description
- Data scope
- Alignment
- Elements

The elements field is an array containing this data for each element:

- Element name
- Dimensions
- Data type
- Sample time

- Complexity
- Dimensions mode
- Minimum
- Maximum
- Units
- Description

Tips

The inverse function is `Simulink.Bus.cellToObject`.

Introduced in R2007a

Simulink.Bus.save

Save bus objects in MATLAB file

Syntax

```
Simulink.Bus.save(fileName)
Simulink.Bus.save(fileName,format)
Simulink.Bus.save(fileName,format,busNames)
```

Description

`Simulink.Bus.save(fileName)` saves all bus objects (instances of `Simulink.Bus` class) that are in the MATLAB base workspace in a MATLAB file that contains a cell array of cell arrays. Each subordinate cell array represents a bus object and contains this data:

- Bus name
- Header file
- Description
- Data scope
- Alignment
- Elements

The elements field is an array containing this data for each element:

- Element name
- Dimensions
- Data type
- Sample time
- Complexity
- Dimensions mode
- Minimum

- Maximum
- Units
- Description

`Simulink.Bus.save(fileName,format)` saves the bus objects in a MATLAB file that contains either a cell array of bus information or the bus objects themselves.

`Simulink.Bus.save(fileName,format,busNames)` saves only those bus objects whose names appear in `busNames`.

Examples

Save a Bus Object

Use the `Simulink.Bus.save` function to save a bus object.

Define a cell array of bus object information.

```
busCell = { ...
      { ...
          'myBusObj', ...
          'MyHeader.h', ...
          'My description', ...
          'Exported', ...
          '-1', ...
          {{'a',1,'double',[0.2 0],'real','Frame'}; ...
          {'b',1,'double',[0.2 0],'real','Sample'}},...
          }, ...
      };
```

Create `myBusObj` bus object from the cell array.

```
Simulink.Bus.cellToObject(busCell);
```

Save the bus object in the `BusCellFile1` file, in cell format.

```
fileName = 'BusCellFile1';
Simulink.Bus.save(fileName);
```

Save the bus object in bus format.

```
Simulink.Bus.save('BusObjFile','object');
```

Save myBusObj in cell format in BusCellFile2.m.

```
Simulink.Bus.save('BusCellFile2','cell',{'myBusObj'});
```

- "When to Use Bus Objects"
- "Create Bus Objects Programmatically"
- "Create Bus Objects with the Bus Editor"
- "Save and Import Bus Objects"

Input Arguments

fileName — File in which to store bus objects
character vector

File in which to store bus objects, specified as a character vector.

format — Format for storing bus objects in file
'cell' (default) | 'object'

Format for storing bus objects in file, specified as either 'cell' or 'object'. The cell format is more compact, but the object format is easier to read.

busNames — Bus objects to save
cell array of bus objects

Bus objects to save, specified as a cell array of bus objects. Only the specified bus objects in the base workspace are saved.

Tips

Executing a MATLAB file created by Simulink.Bus.save in cell array format calls Simulink.Bus.cellToObject to recreate the bus objects and returns the new bus objects in the cell array. To suppress the creation of bus objects, specify the optional argument 'false' when you execute the MATLAB file.

Simulink.createFromTemplate

Create model or project from template

Syntax

```
Simulink.createFromTemplate(templatename)
h = Simulink.createFromTemplate(templatename)
h = Simulink.createFromTemplate(templatename,Name,Value)
```

Description

`Simulink.createFromTemplate(templatename)` creates a model or a project from the template file specified by `templatename`.

`h = Simulink.createFromTemplate(templatename)` creates a model or a project from the template file and returns h, either a numeric model handle or a `simulinkproject` object.

`h = Simulink.createFromTemplate(templatename,Name,Value)` specifies additional options as one or more Name, Value pair arguments.

Examples

Create a Model From a Template

```
Simulink.createFromTemplate('simple_simulation.sltx')
```

Create a Project From a Template and Get the Handle

Create a project from a template, specify the name and root folder, and return the handle to the new project (a `simulinkproject` object) for manipulating it programmatically.

2-583

```
proj = Simulink.createFromTemplate('code_generation_example.sltx','Name','myProject','I
```

- "Create and Open Models"
- "Create a Template from a Model"
- "Using Templates to Create Standard Project Settings"

Input Arguments

templatename — Template file name
character vector

Template file name, specified as a character vector. If the template is not on the MATLAB path, specify the fully-qualified path to the template file and `*.sltx` extension.

Example:

Data Types: char

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (`' '`). You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example:

Folder — Project root folder
character vector

Project root folder, if creating a new project, specified as a character vector.

Data Types: char

Name — New model or project name
character vector

New model or project name, specified as a character vector.

Data Types: char

Output Arguments

h — Handle
numeric handle | `simulinkproject`

Handle to the new model project, returned either as a numeric model handle or a `simulinkproject` object.

Simulink.data.assigninGlobal

Modify variable values in context of Simulink model

Syntax

```
Simulink.data.assigninGlobal(modelName,varName,varValue)
```

Description

`Simulink.data.assigninGlobal(modelName,varName,varValue)` assigns the value `varValue` to the variable or data dictionary entry `varName` in the context of the Simulink model `modelName`. `assigninGlobal` creates the variable or data dictionary entry if it does not already exist. The function operates in the Design Data section of the data dictionary that is linked to the target model or in the MATLAB base workspace if the target model is not linked to any data dictionary.

If the target model is linked to a data dictionary that references other dictionaries, `assigninGlobal` searches for `varName` in the entire dictionary hierarchy. If `assigninGlobal` does not find a matching entry, the function creates an entry in the dictionary that is linked to the target model.

Examples

Modify Variable in Model With or Without Data Dictionary

Create a variable `myNewVariable` with value 237 in the context of the Simulink model `vdp.slx`, which is not linked to any data dictionary. `myNewVariable` appears as a variable in the MATLAB base workspace.

```
Simulink.data.assigninGlobal('vdp','myNewVariable',237)
```

Create a variable `myNewEntry` with value `true` in the context of the Simulink model `sldemo_fuelsys_dd_controller.slx`, which is linked to the data dictionary

`sldemo_fuelsys_dd_controller.sldd`. The entry `myNewEntry` appears in the Design Data section of the dictionary.

```
Simulink.data.assigninGlobal('sldemo_fuelsys_dd_controller',...
'myNewEntry',true)
```

Confirm the addition of `myNewEntry` to the data dictionary `sldemo_fuelsys_dd_controller.sldd` by viewing the dictionary in Model Explorer.

```
myDictionaryObj = Simulink.data.dictionary.open(...
'sldemo_fuelsys_dd_controller.sldd');
show(myDictionaryObj)
```

• "Store Data in Dictionary Programmatically"

Input Arguments

modelName — Name of target Simulink model
character vector

Name of target Simulink model, specified as a character vector.

Example: `'myTestModel'`

Data Types: `char`

varName — Name of target variable or data dictionary entry
character vector

Name of target variable or data dictionary entry, specified as a character vector.

Example: `'myTargetVariable'`

Data Types: `char`

varValue — Value to assign to variable or data dictionary entry
MATLAB expression

Value to assign to variable or data dictionary entry, specified as a MATLAB expression that returns any valid data type or data dictionary content.

Example: `27.5`

Example: `myBaseWorkspaceVariable`

Example: `Simulink.Parameter`

Tips

- `assigninGlobal` helps you transition Simulink models to using data dictionaries. You can use the function to assign values to model variables before and after linking a model to a data dictionary.

Introduced in R2015a

Simulink.data.dictionary.cleanupWorkerCache

Restore defaults after parallel simulation with data dictionary

Syntax

`Simulink.data.dictionary.cleanupWorkerCache`

Description

`Simulink.data.dictionary.cleanupWorkerCache` restores default settings after you have finished parallel simulation of a model that is linked to a data dictionary. Use this function in a `spmd` block, after you finish parallel simulation using `parfor` blocks, to restore default settings that were altered by the `Simulink.data.dictionary.setupWorkerCache` function.

During parallel simulation of a model that is linked to a data dictionary, you can allow each worker to access and modify the data in the dictionary independently of other workers. The function `Simulink.data.dictionary.setupWorkerCache` grants each worker a unique dictionary cache to allow independent access to the data, and the function `Simulink.data.dictionary.cleanupWorkerCache` restores cache settings to their default values.

You must have a Parallel Computing Toolbox license to perform parallel simulation using a `parfor` block.

Examples

Sweep Variant Control Using Parallel Simulation

To use parallel simulation to sweep a variant control (a `Simulink.Parameter` object whose value influences the variant condition of a `Simulink.Variant` object) that you

2-589

store in a data dictionary, use this code as a template. Change the names and values of the model, data dictionary, and variant control to match your application.

To sweep block parameter values or the values of workspace variables that you use to set block parameters, use `Simulink.SimulationInput` objects instead of the programmatic interface to the data dictionary. See "Optimize, Estimate, and Sweep Block Parameter Values".

You must have a Parallel Computing Toolbox license to perform parallel simulation.

```matlab
% For convenience, define names of model and data dictionary
model = 'mySweepMdl';
dd = 'mySweepDD.sldd';

% Define the sweeping values for the variant control
CtrlValues = [1 2 3 4];

% Grant each worker in the parallel pool an independent data dictionary
% so they can use the data without interference
spmd
    Simulink.data.dictionary.setupWorkerCache
end

% Determine the number of times to simulate
numberOfSims = length(CtrlValues);

% Prepare a nondistributed array to contain simulation output
simOut = cell(1,numberOfSims);

parfor index = 1:numberOfSims
    % Create objects to interact with dictionary data
    % You must create these objects for every iteration of the parfor-loop
    dictObj = Simulink.data.dictionary.open(dd);
    sectObj = getSection(dictObj,'Design Data');
    entryObj = getEntry(sectObj,'MODE');
    % Suppose MODE is a Simulink.Parameter object stored in the data dictionary

    % Modify the value of MODE
    temp = getValue(entryObj);
    temp.Value = CtrlValues(index);
    setValue(entryObj,temp);

    % Simulate and store simulation output in the nondistributed array
    simOut{index} = sim(model);
```

```
    % Each worker must discard all changes to the data dictionary and
    % close the dictionary when finished with an interation of the parfor-loop
    discardChanges(dictObj);
    close(dictObj);
end

% Restore default settings that were changed by the function
% Simulink.data.dictionary.setupWorkerCache
% Prior to calling cleanupWorkerCache, close the model

spmd
    bdclose(model)
    Simulink.data.dictionary.cleanupWorkerCache
end
```

Note If data dictionaries are open, you cannot use the command `Simulink.data.dictionary.cleanupWorkerCache`. To identify open data dictionaries, use `Simulink.data.dictionary.getOpenDictionaryPaths`.

See Also

`Simulink.data.dictionary.closeAll` | `Simulink.data.dictionary.getOpenDictionaryPaths` | `Simulink.data.dictionary.setupWorkerCache` | `parfor` | `spmd`

Topics

"Store Data in Dictionary Programmatically"
"What Is a Data Dictionary?"
"Run Code on Parallel Pools" (Parallel Computing Toolbox)

Introduced in R2015a

Simulink.data.dictionary.closeAll

Close all connections to all open data dictionaries

Syntax

```
Simulink.data.dictionary.closeAll
Simulink.data.dictionary.closeAll(dictFileName)
Simulink.data.dictionary.closeAll( ___ ,unsavedAction)
```

Description

`Simulink.data.dictionary.closeAll` attempts to close all connections to all data dictionaries that are open. For example, if you create objects, such as `Simulink.data.Dictionary`, that refer to a dictionary, that dictionary is open.

Some commands and functions, such as `Simulink.data.dictionary.cleanupWorkerCache`, cannot operate when dictionaries are open. It is a best practice to close each connection individually by using functions and methods such as the `close` method of a `Simulink.data.Dictionary` object. To find dictionaries that are open, use `Simulink.data.dictionary.getOpenDictionaryPaths`. However, you can use this function to close all connections to all dictionaries.

You can also use this function to close dictionaries in a shutdown script that is part of a Simulink Project.

`Simulink.data.dictionary.closeAll(dictFileName)` closes all connections to the dictionary named `dictFileName`. If you open multiple dictionaries that use this file name (for example, if the dictionaries have different file paths), the function closes all connections to all of the dictionaries.

You cannot specify `dictFileName` as a full file path such as `'C:\temp\myDict.sldd'`.

`Simulink.data.dictionary.closeAll( ___ ,unsavedAction)` closes all connections to the target dictionaries by discarding or saving unsaved changes. You can choose whether to save or discard all changes to all of the target dictionaries.

Examples

Close All Connections to All Open Dictionaries

Discard any unsaved changes. All of the entries in the dictionaries revert to the last saved state.

```
Simulink.data.dictionary.closeAll('-discard')
```

Close All Connections to Single Data Dictionary

Open multiple connections to a data dictionary, make a change, and close all of the connections by discarding the unsaved change.

At the command prompt, open a data dictionary by creating a `Simulink.data.Dictionary` object that refers to the dictionary.

```
dictObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd.sldd');
```

Display the dictionary in the Model Explorer

```
show(dictObj)
```

You now have two connections to this dictionary: The `Simulink.data.Dictionary` object and the Model Explorer.

Make a change to the dictionary by adding an entry.

```
dDataSectObj = getSection(dictObj,'Design Data');
addEntry(dDataSectObj,'myEntry',5.2);
```

The `Simulink.data.dictionary.Section` object `dDataSectObj` is a third connection to the dictionary.

Close the connections to the dictionary. Discard the unsaved change.

```
Simulink.data.dictionary.closeAll('sldemo_fuelsys_dd.sldd','-discard')
```

The dictionary no longer appears as a node in the **Model Hierarchy** pane of the Model Explorer. The `Simulink.data.Dictionary` object `dictObj` is disconnected from the

dictionary. You cannot interact with the dictionary by using the `Simulink.data.dictionary.Section` object `dDataSectObj`.

Clear the objects that referred to the dictionary.

```
clear dictObj dDataSectObj
```

• "Store Data in Dictionary Programmatically"

Input Arguments

`dictFileName` — File name of target data dictionary or dictionaries
character vector

File name of target data dictionary or dictionaries, specified as a character vector. Use the file extension `sldd`.

Example: `'myDict.sldd'`

Data Types: `char`

`unsavedAction` — Action for unsaved changes
`'-discard'` | `'-save'`

Action for unsaved changes, specified as `'-discard'` (to discard changes) or `'-save'` (to save changes).

Tips

A data dictionary is open if any of these conditions are true:

• The dictionary appears as a node in the **Model Hierarchy** pane of the Model Explorer. To close this connection to the dictionary, right-click the node in Model Explorer and select **Close**. Alternatively, use the `hide` method of a `Simulink.data.Dictionary` object.

• You created an object of any of these classes that refer to the dictionary:

  • `Simulink.data.Dictionary`
  • `Simulink.data.dictionary.Section`

- `Simulink.data.dictionary.Entry`

  To close these connections to the dictionary, use the `close` method of the `Simulink.data.Dictionary` object or clear the object. Clear the `Simulink.data.dictionary.Section` and `Simulink.data.dictionary.Entry` objects.

- A model that is linked to the dictionary is open. To close this connection to the dictionary, close the model.

`Simulink.data.Dictionary` | `Simulink.data.dictionary.cleanupWorkerCache` | `Simulink.data.dictionary.getOpenDictionaryPaths` | `Simulink.data.dictionary.setupWorkerCache`

Topics
"Store Data in Dictionary Programmatically"

Introduced in R2016a

2-595

Simulink.data.dictionary.create

Create new data dictionary and create `Simulink.data.Dictionary` object

Syntax

```
dictionaryObj = Simulink.data.dictionary.create(dictionaryFile)
```

Description

`dictionaryObj = Simulink.data.dictionary.create(dictionaryFile)`
creates a data dictionary file in your current working folder or in a file path you can
specify in `dictionaryFile`. The function returns a `Simulink.data.Dictionary`
object representing the new data dictionary.

Examples

Create New Data Dictionary and Data Dictionary Object

Create a data dictionary `myNewDictionary.sldd` in your current working folder and a
`Simulink.data.Dictionary` object representing the new data dictionary. Assign the
object to the variable `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.create('myNewDictionary.sldd')

myDictionaryObj =

  data dictionary with properties:

         DataSources: {0x1 cell}
    HasUnsavedChanges: 0
       NumberOfEntries: 0
```

• "Store Data in Dictionary Programmatically"

Input Arguments

dictionaryFile — Name of new data dictionary
character vector

Name of new data dictionary, specified as a character vector containing the file name and, optionally, path of the dictionary to create. If you do not specify a path, `Simulink.data.dictionary.create` creates the new data dictionary file in your working MATLAB folder. `Simulink.data.dictionary.create` also supports file paths specified relative to your working folder.

Example: `'myDictionary.sldd'`

Example: `'C:\Users\jsmith\myDictionary.sldd'`

Example: `'..\myOtherDictionary.sldd'`

Data Types: `char`

Output Arguments

dictionaryObj — Newly created data dictionary
`Simulink.data.Dictionary` object

Newly created data dictionary, returned as a `Simulink.data.Dictionary` object.

Alternatives

You can use the Simulink Editor to create a data dictionary and link it to a model. See "Migrate Single Model to Use Dictionary" for more information.

See Also

`Simulink.data.Dictionary` | `Simulink.data.dictionary.open`

Topics

"Store Data in Dictionary Programmatically"
"What Is a Data Dictionary?"

Introduced in R2015a

Simulink.data.dictionary.getOpenDictionaryPaths

Return file names and paths of open data dictionaries

Syntax

```
openDDs = Simulink.data.dictionary.getOpenDictionaryPaths
openDDs = Simulink.data.dictionary.getOpenDictionaryPaths(
dictFileName)
```

Description

`openDDs = Simulink.data.dictionary.getOpenDictionaryPaths` returns the
file names and paths of all data dictionaries that are open. For example, a data dictionary
is open if you create objects, such as `Simulink.data.Dictionary`, that refer to the
dictionary. If you open two or more dictionaries that have the same file name but different
file paths, this function returns multiple file paths.

Before executing commands and functions that cannot operate when dictionaries are
open, use this function to identify open dictionaries so that you can close them. For
example, when you run parallel simulations as described in "Sweep Variant Control Using
Parallel Simulation", this function helps you identify open dictionaries before executing
the command `Simulink.data.dictionary.cleanupWorkerCache`.

`openDDs = Simulink.data.dictionary.getOpenDictionaryPaths(
dictFileName)` returns the file paths of data dictionaries that have the file name
`dictFileName`. If you open two or more dictionaries that have the same file name but
different file paths, you can use this syntax to return all of the file paths.

Examples

Identify and Close All Open Data Dictionaries

Open, identify, and close a data dictionary. After you close the connections to the dictionary, you can use commands and functions, such as `Simulink.data.dictionary.cleanupWorkerCache`, that cannot operate when dictionaries are open.

At the command prompt, open a data dictionary by creating a `Simulink.data.Dictionary` object that refers to the dictionary.

```
dictObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd.sldd');
```

Display the dictionary in the Model Explorer

```
show(dictObj)
```

Identify all of the dictionaries that are open.

```
openDDs = Simulink.data.dictionary.getOpenDictionaryPaths;
```

The file path of the dictionary that you opened, `sldemo_fuelsys_dd.sldd`, appears in the cell array of character vectors `openDDs`.

Close the connection from the Model Explorer to the dictionary.

```
hide(dictObj)
```

The dictionary no longer appears as a node in the **Model Hierarchy** pane of the Model Explorer.

Close the connection from the `Simulink.data.Dictionary` object to the dictionary.

```
close(dictObj)
clear dictObj
```

- "Store Data in Dictionary Programmatically"

Input Arguments

dictFileName — File name of target data dictionary or dictionaries
character vector

File name of target data dictionary or dictionaries, specified as a character vector. Use the file extension `sldd`.

Example: `'myDict.sldd'`

Data Types: `char`

Output Arguments

openDDs — File names and paths of open data dictionaries
cell array of character vectors

File names and paths of open data dictionaries, returned as a cell array of character vectors.

Tips

A data dictionary is open if any of these conditions are true:

- The dictionary appears as a node in the **Model Hierarchy** pane of the Model Explorer. To close this connection to the dictionary, right-click the node in Model Explorer and select **Close**. Alternatively, use the `hide` method of a `Simulink.data.Dictionary` object.

- You created an object of any of these classes that refer to the dictionary:

  - `Simulink.data.Dictionary`
  - `Simulink.data.dictionary.Section`
  - `Simulink.data.dictionary.Entry`

  To close these connections to the dictionary, use the `close` method of the `Simulink.data.Dictionary` object or clear the object. Clear the `Simulink.data.dictionary.Section` and `Simulink.data.dictionary.Entry` objects.

- A model that is linked to the dictionary is open. To close this connection to the dictionary, close the model.

Topics

"Store Data in Dictionary Programmatically"

Introduced in R2016a

Simulink.data.dictionary.open

Open data dictionary for editing

Syntax

```
dictionaryObj = Simulink.data.dictionary.open(dictionaryFile)
```

Description

`dictionaryObj = Simulink.data.dictionary.open(dictionaryFile)` opens the specified data dictionary and returns a `Simulink.data.Dictionary` object representing an existing data dictionary identified by its file name and, optionally, file path with `dictionaryFile`.

Make sure any dictionaries referenced by the target dictionary are on the MATLAB path.

Examples

Open Existing Data Dictionary

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd')

myDictionaryObj =

  Dictionary with properties:

          DataSources: {'myRefDictionary_ex_API.sldd'}
    HasUnsavedChanges: 0
       NumberOfEntries: 4
```

• "Store Data in Dictionary Programmatically"

Input Arguments

`dictionaryFile` — Target data dictionary
character vector

Target data dictionary, specified as a character vector containing the file name and, optionally, path of the dictionary. If you do not specify a path, `Simulink.data.dictionary.open` searches the MATLAB path for the specified file. `Simulink.data.dictionary.open` also supports paths specified relative to the MATLAB working folder.

Example: `'myDictionary_ex_API.sldd'`

Example: `'C:\Users\jsmith\myDictionary_ex_API.sldd'`

Example: `'..\myOtherDictionary.sldd'`

Data Types: `char`

"Store Data in Dictionary Programmatically"

Introduced in R2015a

Simulink.data.dictionary.setupWorkerCache

Enable parallel simulation with data dictionary

Syntax

`Simulink.data.dictionary.setupWorkerCache`

Description

`Simulink.data.dictionary.setupWorkerCache` prepares the workers in a parallel pool for simulating a model that is linked to a data dictionary. Use this function in a `spmd` block, prior to starting a `parfor` block, to provide the workers in a parallel pool a way to safely interact with a single data dictionary.

During parallel simulation of a model that is linked to a data dictionary, you can allow each worker to access and modify the data in the dictionary independently of other workers. `Simulink.data.dictionary.setupWorkerCache` temporarily provides each worker in the pool with its own data dictionary cache, allowing the workers to use the data in the dictionary without permanently changing it.

You must have a Parallel Computing Toolbox license to perform parallel simulation using a `parfor` block.

Examples

Sweep Variant Control Using Parallel Simulation

To use parallel simulation to sweep a variant control (a `Simulink.Parameter` object whose value influences the variant condition of a `Simulink.Variant` object) that you store in a data dictionary, use this code as a template. Change the names and values of the model, data dictionary, and variant control to match your application.

To sweep block parameter values or the values of workspace variables that you use to set block parameters, use `Simulink.SimulationInput` objects instead of the

programmatic interface to the data dictionary. See "Optimize, Estimate, and Sweep Block Parameter Values".

You must have a Parallel Computing Toolbox license to perform parallel simulation.

```matlab
% For convenience, define names of model and data dictionary
model = 'mySweepMdl';
dd = 'mySweepDD.sldd';

% Define the sweeping values for the variant control
CtrlValues = [1 2 3 4];

% Grant each worker in the parallel pool an independent data dictionary
% so they can use the data without interference
spmd
    Simulink.data.dictionary.setupWorkerCache
end

% Determine the number of times to simulate
numberOfSims = length(CtrlValues);

% Prepare a nondistributed array to contain simulation output
simOut = cell(1,numberOfSims);

parfor index = 1:numberOfSims
    % Create objects to interact with dictionary data
    % You must create these objects for every iteration of the parfor-loop
    dictObj = Simulink.data.dictionary.open(dd);
    sectObj = getSection(dictObj,'Design Data');
    entryObj = getEntry(sectObj,'MODE');
    % Suppose MODE is a Simulink.Parameter object stored in the data dictionary

    % Modify the value of MODE
    temp = getValue(entryObj);
    temp.Value = CtrlValues(index);
    setValue(entryObj,temp);

    % Simulate and store simulation output in the nondistributed array
    simOut{index} = sim(model);

    % Each worker must discard all changes to the data dictionary and
    % close the dictionary when finished with an interation of the parfor-loop
    discardChanges(dictObj);
    close(dictObj);
```

```
end

% Restore default settings that were changed by the function
% Simulink.data.dictionary.setupWorkerCache
% Prior to calling cleanupWorkerCache, close the model

spmd
    bdclose(model)
    Simulink.data.dictionary.cleanupWorkerCache
end
```

Note If data dictionaries are open, you cannot use the command `Simulink.data.dictionary.cleanupWorkerCache`. To identify open data dictionaries, use `Simulink.data.dictionary.getOpenDictionaryPaths`.

Introduced in R2015a

Simulink.data.evalinGlobal

Evaluate MATLAB expression in context of Simulink model

Syntax

```
returnValue = Simulink.data.evalinGlobal(modelName,expression)
```

Description

`returnValue = Simulink.data.evalinGlobal(modelName,expression)`
evaluates the MATLAB expression `expression` in the context of the Simulink model
`modelName` and returns the values returned by `expression`. `evalinGlobal` evaluates
`expression` in the Design Data section of the data dictionary that is linked to the target
model or in the MATLAB base workspace if the target model is not linked to any data
dictionary.

Examples

Evaluate MATLAB Expression in Model With or Without Data Dictionary

Evaluate the MATLAB expression `myNewVariable = 237;` in the context of the model
`vdp`, which is not linked to any data dictionary. `myNewVariable` appears as a variable in
the MATLAB base workspace.

```
Simulink.data.evalinGlobal('vdp','myNewVariable = 237;')
```

Evaluate the MATLAB expression `myNewEntry = true;` in the context of the model
`sldemo_fuelsys_dd_controller`, which is linked to the data dictionary
`sldemo_fuelsys_dd_controller.sldd`. `myNewEntry` appears as an entry in the
Design Data section of the dictionary.

```
Simulink.data.evalinGlobal('sldemo_fuelsys_dd_controller',...
'myNewEntry = true;')
```

Confirm the creation of the entry `myNewEntry` in the data dictionary `sldemo_fuelsys_dd_controller.sldd` by viewing the dictionary in Model Explorer.

```
myDictionaryObj = Simulink.data.dictionary.open(...
'sldemo_fuelsys_dd_controller.sldd');
show(myDictionaryObj)
```

- "Store Data in Dictionary Programmatically"

Input Arguments

modelName — Name of target Simulink model
character vector

Name of target Simulink model, specified as a character vector.

Example: `'myTestModel'`

Data Types: `char`

expression — MATLAB expression to evaluate
character vector

MATLAB expression to evaluate, specified as a character vector.

Example: `'a = 5.3'`

Example: `'whos'`

Example: `'CurrentSpeed.Value = 290.73'`

Data Types: `char`

Output Arguments

returnValue — Value returned by specified expression
valid entry or variable value

Value returned by the specified MATLAB expression.

Tips

- `evalinGlobal` helps you transition Simulink models to the use of data dictionaries. You can use the function to manipulate model variables before and after linking a model to a data dictionary.

See Also

`Simulink.data.assigninGlobal` | `Simulink.data.existsInGlobal` | `evalin`

Topics

"Store Data in Dictionary Programmatically"

Introduced in R2015a

Simulink.data.existsInGlobal

Check existence of variable in context of Simulink model

Syntax

```
varExists = Simulink.data.existsInGlobal(modelName,varName)
```

Description

`varExists = Simulink.data.existsInGlobal(modelName,varName)` returns an indication of the existence of a variable or data dictionary entry `varName` in the context of the Simulink model `modelName`. `Simulink.data.existsInGlobal` searches the Design Data section of the data dictionary that is linked to the target model or the MATLAB base workspace if the target model is not linked to any data dictionary.

Examples

Determine Existence of Variable in Model With or Without Data Dictionary

Determine the existence of a variable `PressVect` in the context of the Simulink model `vdp.slx`, which is not linked to any data dictionary.

```
Simulink.data.existsInGlobal('vdp','PressVect')
```

```
ans =

    0
```

Because `vdp.slx` is not linked to any data dictionary, `existsInGlobal` searches only in the MATLAB base workspace for `PressVect`.

Determine the existence of a variable `PressVect` in the context of the Simulink model `sldemo_fuelsys_dd_controller.slx`, which is linked to the data dictionary `sldemo_fuelsys_dd_controller.sldd`.

```
Simulink.data.existsInGlobal('sldemo_fuelsys_dd_controller','PressVect')

ans =

     1
```

Because `sldemo_fuelsys_dd_controller.slx` is linked to the data dictionary `sldemo_fuelsys_dd_controller.sldd`, `existsInGlobal` searches for `PressVect` only in the Design Data section of the dictionary.

• "Store Data in Dictionary Programmatically"

Input Arguments

`modelName` — Name of target Simulink model
character vector

Name of target Simulink model, specified as a character vector.

Example: `'myTestModel'`

Data Types: `char`

`varName` — Name of target variable or data dictionary entry
character vector

Name of target variable or data dictionary entry, specified as a character vector.

Example: `'myTargetVariable'`

Data Types: `char`

Output Arguments

`varExists` — Indication of existence of target variable or data dictionary entry
1 | 0

Indication of existence of target variable or data dictionary entry, returned as 1 to indicate existence or 0 to indicate absence.

Tips

*   `existsInGlobal` helps you transition Simulink models to the use of data dictionaries. You can use the function to find model variables before and after linking a model to a data dictionary.

Alternatives

You can use Model Explorer to search a data dictionary or any workspace for entries or variables.

Topics

"Store Data in Dictionary Programmatically"

Introduced in R2015a

Simulink.data.getEnumTypeInfo

Get information about enumerated data type

Syntax

```
information = Simulink.data.getEnumTypeInfo(enumTypeName,
infoRequest)
```

Description

`information = Simulink.data.getEnumTypeInfo(enumTypeName, infoRequest)` returns information about an enumerated data type `enumTypeName`.

Use this function only to return information about an enumerated data type. To customize an enumerated data type, for example, by specifying a default enumeration member or by controlling the scope of the type definition in generated code, see "Customize Simulink Enumeration".

Examples

Return Default Value of Enumerated Data Type

Get the default enumeration member of an enumerated data type `LEDcolor`. Suppose `LEDcolor` defines two enumeration members, `GREEN` and `RED`, and uses `GREEN` as the default member.

```
Simulink.data.getEnumTypeInfo('LEDcolor','DefaultValue')

ans =

    GREEN
```

Get Scope of Enumerated Data Type Definition in Generated Code

For an enumerated data type `LEDcolor`, find out if generated code exports or imports the definition of the type to or from a header file.

```
Simulink.data.getEnumTypeInfo('LEDcolor','DataScope')
Simulink.data.getEnumTypeInfo('LEDcolor','HeaderFile')
```

```
ans =

Auto

ans =

    ''
```

Because `DataScope` is `'Auto'` and `HeaderFile` is empty, generated code defines the enumerated data type `LEDcolor` in the header file *model*`_types.h` where *model* is the name of the model used to generate code.

• "Customize Simulink Enumeration"

Input Arguments

enumTypeName — Name of target enumerated data type
character vector

Name of the target enumerated data type, specified as a character vector.

Example: `'myFirstEnumType'`

Data Types: `char`

infoRequest — Information to return
valid character vector

Information to return, specified as one of the character vector options in the table.

Specified value	Information returned	Example return value
`'DefaultValue'`	The default enumeration member, returned as an instance of the enumerated data type.	`enumMember1`
`'Description'`	The custom description of this data type, returned as a character vector. Returns an empty character vector if a description was not specified for the type.	`'My first enum type.'`
`'HeaderFile'`	The name of the custom header file that defines the data type in generated code, returned as a character vector. Returns an empty character vector if a header file was not specified for the type.	`'myEnumType.h'`
`'DataScope'`	Indication whether generated code imports or exports the definition of the data type. A return value of `'Auto'` indicates generated code defines the type in the header file *model*_types.h or imports the definition from the header file identified by `HeaderFile`. A return value of `'Exported'` or `'Imported'` indicates generated code exports or imports the definition to or from the header file identified by `HeaderFile`.	`'Exported'`
`'StorageType'`	The integer data type used by generated code to store the numeric values of the enumeration members, returned as a character vector. Returns `'int'` if you did not specify a storage type for the enumerated type, in which case generated code uses the native integer type of the hardware target.	`'int32'`
`'AddClassNameToEnumNames'`	Indication whether generated code prefixes the names of enumeration members with the name of the data type. Returned as `true` or `false`.	`true`

See Also

`Simulink.defineIntEnumType`

Topics

"Customize Simulink Enumeration"
"Simulink Enumerations"

Introduced in R2014b

Simulink.defineIntEnumType

Define enumerated data type

Syntax

```
Simulink.defineIntEnumType(ClassName, CellOfEnums, IntValues)
Simulink.defineIntEnumType(ClassName, CellOfEnums, IntValues,
'Description', ClassDesc)
Simulink.defineIntEnumType(ClassName, CellOfEnums, IntValues,
'DefaultValue', DefValue)
Simulink.defineIntEnumType(ClassName, CellOfEnums, IntValues,
'DataScope', ScopeSelection)
Simulink.defineIntEnumType(ClassName, CellOfEnums, IntValues,
'HeaderFile', FileName)
Simulink.defineIntEnumType(ClassName, CellOfEnums, IntValues,
'AddClassNameToEnumNames', Flag)
Simulink.defineIntEnumType(ClassName, CellOfEnums, IntValues,
'StorageType', DataType)
```

Description

Simulink.defineIntEnumType(*ClassName*, *CellOfEnums*, *IntValues*) defines an enumeration named *ClassName* with enumeration values specified with *CellOfEnums* and underlying numeric values specified by *IntValues*.

Simulink.defineIntEnumType(*ClassName*, *CellOfEnums*, *IntValues*, 'Description', *ClassDesc*) defines the enumeration with a description (character vector).

Simulink.defineIntEnumType(*ClassName*, *CellOfEnums*, *IntValues*, 'DefaultValue', *DefValue*) defines a default value for the enumeration, which is one of the character vectors you specify for *CellOfEnums*.

Simulink.defineIntEnumType(*ClassName*, *CellOfEnums*, *IntValues*, 'DataScope', *ScopeSelection*) specifies whether the data type definition should be imported from, or exported to, a header file during code generation.

`Simulink.defineIntEnumType`(*ClassName*, *CellOfEnums*, *IntValues*, `'HeaderFile'`, *FileName*) specifies the name of a header file containing the enumeration class definition for use in code generated from a model.

`Simulink.defineIntEnumType`(*ClassName*, *CellOfEnums*, *IntValues*, `'AddClassNameToEnumNames'`, *Flag*) specifies whether the code generator applies the class name as a prefix to the enumeration values that you specify for *CellOfEnums*. For *Flag*, specify `true` or `false`. For example, if you specify `true`, the code generator would use `BasicColors.Red` instead of `Red` to represent an enumerated value.

`Simulink.defineIntEnumType`(*ClassName*, *CellOfEnums*, *IntValues*, `'StorageType'`, *DataType*) specifies the data type used to store the enumerations' underlying integer values in code generated from a model.

Input Arguments

ClassName

The name of the enumerated data type.

CellOfEnums

A cell array of character vectors that defines the enumerations for the data type.

IntValues

An array of numeric values that correspond to enumerations of the data type.

'Description', ClassDesc

Specifies a character vector that describes the enumeration data type.

'DefaultValue', DefValue

Specifies the default enumeration value.

'HeaderFile', FileName

Specifies a character vector naming the header file that is to contain the data type definition.

By default, the generated `#include` directive uses the preprocessor delimiter `"` instead of `<` and `>`. To generate the directive `#include <myTypes.h>`, specify `FileName` as `'<myTypes.h>'`.

`'DataScope', 'Auto' | 'Exported' | 'Imported'`

Specifies whether the data type definition should be imported from, or exported to, a header file during code generation.

Value	Action
`Auto` (default)	If no value is specified for `Headerfile`, export the type definition to *model*`_types.h`, where *model* is the model name.
	If a value is specified for `Headerfile`, import the data type definition from the specified header file.
`Exported`	Export the data type definition to a header file.
	If no value is specified for `Headerfile`, the header file name defaults to *type*`.h`, where *type* is the data type name.
`Imported`	Import the data type definition from a header file.
	If no value is specified for `Headerfile`, the header file name defaults to *type*`.h`, where *type* is the data type name.

`'AddClassNameToEnumNames', Flag`

A logical flag that specifies whether code generator applies the class name as a prefix to the enumerations.

`'StorageType', DataType`

Specifies a character vector that identifies the data type used to store the enumerations' underlying integer values in generated code. The following data types are supported: `'int8'`, `'int16'`, `'int32'`, `'uint8'`, or `'uint16'`.

Examples

Assume an external data dictionary includes the following enumeration:

```
BasicColors.Red(0), BasicColors.Yellow(1), BasicColors.Blue(2)
```

Import the enumeration class definition into the MATLAB workspace while specifying `int16` as the underlying integer data type for generated code:

```
Simulink.defineIntEnumType('BasicColors', ...
    {'Red', 'Yellow', 'Blue'}, ...
    [0;1;2], ...
    'Description', 'Basic colors', ...
    'DefaultValue', 'Blue', ...
    'HeaderFile', 'mybasiccolors.h', ...
    'DataScope', 'Exported', ...
    'AddClassNameToEnumNames', true, ...
    'StorageType', 'int16');
```

Introduced in R2010b

Simulink.defaultModelTemplate

Set or get default model template

Syntax

```
Simulink.defaultModelTemplate(templatename)
templatepath = Simulink.defaultModelTemplate
```

Description

`Simulink.defaultModelTemplate(templatename)` sets the template file specified by `templatename` as the default model template to use for new models. This setting is persistent between Simulink sessions.

`templatepath = Simulink.defaultModelTemplate` gets the full path to the current default model template.

Examples

Set the default model template

```
Simulink.defaultModelTemplate('simple_simulation.sltx')
```

Get the default model template

```
mydefaulttemplate = Simulink.defaultModelTemplate
```

Clear and restore the default model template

Use `set_param` to set a root block diagram parameter. This clears the default template so that new models will inherit this property of the root block diagram, and warns.

```
set_param(0,'StopTime','99');
```

Restore the default template.

```
Simulink.defaultModelTemplate('$restore');
```

- "Create and Open Models"
- "Create a Template from a Model"
- "Using Templates to Create Standard Project Settings"

Input Arguments

templatename — Template file name
character vector

Template file name, specified as a character vector. If the template is not on the MATLAB path, specify the fully-qualified path to the template file and `*.sltx` extension.

Example: \\Home\username\Documents\MATLAB\template.sltx

Data Types: `char`

Output Arguments

templatepath — Template path
character vector

Template path, specified as a character vector, showing the full path to the current default model template.

See Also
`Simulink.createFromTemplate` | `Simulink.exportToTemplate` | `Simulink.findTemplates` | `new_system`

Topics
"Create and Open Models"
"Create a Template from a Model"

"Using Templates to Create Standard Project Settings"

Introduced in R2016b

Simulink.exportToTemplate

Create template from model or project

Syntax

```
templatefile = Simulink.exportToTemplate(obj,templatename)
templatefile = Simulink.exportToTemplate(obj,templatename,
Name,Value)
```

Description

`templatefile = Simulink.exportToTemplate(obj,templatename)` creates a
template file (*templatename*`.sltx`) from a model or project specified by `obj`.

If you have project templates created in R2014a or earlier (`.zip` files), use
`Simulink.exportToTemplate` to upgrade them to `.sltx` files, then you can use them
in the start page.

`templatefile = Simulink.exportToTemplate(obj,templatename,
Name,Value)` specifies additional template options as one or more Name, Value pair
arguments.

Examples

Create a Template From a Model

Open the `vdp` model and create a template from it.

```
vdp
myvdptemplate = Simulink.exportToTemplate(bdroot,'vdptemplate')
```

Create a Template From a Model and Specify Description

Open the `vdp` model and create a template from it, specifying a description.

```
vdp
myvdptemplate = Simulink.exportToTemplate(bdroot,'vdptemplate','Description','Use this
```

- • "Create and Open Models"
- • "Create a Template from a Model"
- • "Using Templates to Create Standard Project Settings"

Input Arguments

`obj` — Model, library, or project
character vector | numeric handle | `slproject.ProjectManager`

Model, library, or project, specified by name or numeric handle, or a `slproject.ProjectManager` object returned by the `simulinkproject` function.

Data Types: `double` | `char`

`templatename` — Template file name
character vector

Template file name, specified as a character vector that can optionally include the fully-qualified path to a template file and `*.sltx` extension.

Data Types: `char`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (`' '`). You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: `Title,'My Project Template'`

`Group` — Group of template
character vector

Group of template, specified as a character vector. On the Start Page, templates are shown under group headings.

Example: `'Simscape'`

Data Types: `char`

Author — Author of template
character vector

Author of template, specified as a character vector.

Data Types: `char`

Description — Description of template
character vector

Description of template, specified as a character vector.

Data Types: `char`

ThumbnailFile — Thumbnail image file name
character vector

Thumbnail image file name, specified as a character vector.

Data Types: `char`

Title — Title of model or project template
character vector

Title of template, specified as a character vector. On the Start Page, the templates titles are shown on the tiles. The title can be different from the file name, and you can use any characters in the title. The default value is the name of the model or project.

Example: `'My Project Template'`

Data Types: `char`

Output Arguments

templatefile — Template file
character vector

Template file, returned as *templatename*`.sltx` file.

Introduced in R2016a

Simulink.exportToVersion

Export model or library for use in previous version of Simulink

Syntax

```
exported_file = Simulink.exportToVersion(modelname,target_filename,
version)
exported_file = Simulink.exportToVersion(modelname,target_filename,
version,Name,Value)
```

Description

`exported_file = Simulink.exportToVersion(modelname,target_filename, version)` exports the model or library `modelname` to a file named `target_filename` in a format that the specified previous Simulink `version` can load.

If the system contains functionality not supported by the specified Simulink software version, the command removes the functionality and replaces any unsupported blocks with empty masked subsystem blocks colored yellow. As a result, the converted system may generate different results.

The `save_system ExportToVersion` option is a legacy option for this functionality that is also supported.

`exported_file = Simulink.exportToVersion(modelname,target_filename, version,Name,Value)` specifies additional options as one or more Name, Value pair arguments.

Examples

Export a Model to a Previous Version

Get the current top-level system and export it.

```
Simulink.exportToVersion(bdroot,'mymodel.slx','R2014b');
```

Export a Model to a Previous Version and Break Links

Get the current top-level system and export it, replacing links to library blocks with copies of the library blocks in the saved file.

```
Simulink.exportToVersion(bdroot,'mymodel.slx','R2014b','BreakUserLinks',true);
```

• "Save a Model"

Input Arguments

modelname — Model to export
character vector

Model to export, specified as a character vector, without any file extension. The model must be loaded and unmodified. The target file must not be the same as the model file.

Data Types: char

target_filename — Exported file name
character vector

Exported file name, specified as a character vector. The target file must not be the same as the model file.

Example: 'mymodel.slx'

Data Types: char

version — MATLAB release name
'R2012A' | 'R2014A_MDL' | 'R2016B_SLX' | ...

MATLAB release name, specified as a character vector, which specifies a previous Simulink version. Simulink.exportToVersion exports the system to a format that the specified previous Simulink version can load. You cannot export to your current version. These version names are not case sensitive.

To export to Release 2012a and later, you can specify model file format as SLX or MDL using the suffix _MDL or _SLX. If you do not specify a format, you export your default model file format.

If you use the Export to Previous Version dialog box instead of `Simulink.exportToVersion`, then the **Save as type** list supports 7 years of previous releases.

Example: `'R2015B'`

Data Types: `char`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (`'  '`). You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example:

AllowPrompt — Allow prompt or message dialog box
`false` (default) | `true` | `'on'` | `'off'`

Allow prompt or message dialog box, specified by a logical value that indicates whether to display any output prompt or message in a dialog box or only messages at the command line. For example, prompts to make files writable, or messages about exported versions. If you want to allow prompts, then set to `true`. or `on`.

BreakUserLinks — Break user-defined links
`false` (default) | `true` | `'on'` | `'off'`

Break user-defined links, specified by a logical value that indicates whether the function replaces links to user-defined library blocks with copies of the library blocks in the saved file.

BreakToolboxLinks — Break all toolbox links
`false` (default) | `true` | `'on'` | `'off'`

Break all toolbox links, specified by a logical value that indicates whether the function replaces links to built-in MathWorks library blocks with copies of the library blocks in the saved file. The `'BreakToolboxLinks'` option affects Simulink library blocks and blocks from any other libraries supplied with MathWorks toolboxes or blocksets.

Note The `'BreakToolboxLinks'` option can result in compatibility issues when upgrading to newer versions of Simulink software. For example:

- Any masks on top of library links to Simulink S-functions will not upgrade to the new version of the S-function.
- Any library links to masked subsystems in a Simulink library will not upgrade to the new subsystem behavior.
- Any broken links prevent the automatic library forwarding mechanism from upgrading the link.

  If you have saved a model with broken links to built-in libraries, use the Upgrade Advisor to scan the model for out-of-date blocks and upgrade the Simulink blocks to their current versions.

Output Arguments

exported_file — Exported file
character vector

Exported file, returned in the format that the specified previous Simulink version can load.

Introduced in R2016a

Simulink.findBlocks

Find blocks in Simulink models

Syntax

```
bl = Simulink.findBlocks(sys)
bl = Simulink.findBlocks(sys,options)
bl = Simulink.findBlocks(sys,Param1,Value1,...,ParamN,ValueN)
bl = Simulink.findBlocks(sys,Param1,Value1,...,ParamN,ValueN,
options)
```

Description

`bl = Simulink.findBlocks(sys)` returns handles to all blocks in the model or subsystem `sys`.

`bl = Simulink.findBlocks(sys,options)` finds blocks that match the criteria specified by a `Simulink.FindOptions` object.

`bl = Simulink.findBlocks(sys,Param1,Value1,...,ParamN,ValueN)` finds blocks whose block parameters have the specified values.

`bl = Simulink.findBlocks(sys,Param1,Value1,...,ParamN,ValueN, options)` finds blocks whose parameters have the specified values and that match the criteria specified by a `FindOptions` object.

Examples

Find Blocks in a Model

Return handles for all blocks in the model `vdp`.

```
load_system(vdp);
bl = Simulink.findBlocks('vdp')
```

```
bl =

    5.0001
   83.0001
   86.0001
    6.0001
    7.0001
    8.0001
    9.0001
   10.0001
   11.0001
   12.0001
   13.0001
   14.0001
   15.0001
   16.0001
```

Return block names.

```
bl = getfullname(Simulink.findBlocks('vdp'))
```

```
bl =

  12×1 cell array

    {'vdp/Fcn'               }
    {'vdp/More Info'         }
    {'vdp/More Info/Model Info'}
    {'vdp/Mu'                }
    {'vdp/Mux'               }
    {'vdp/Product'           }
    {'vdp/Scope'             }
    {'vdp/Sum'               }
    {'vdp/x1'                }
    {'vdp/x2'                }
    {'vdp/Out1'              }
    {'vdp/Out2'              }
```

Return block handles for the block whose name is Mu.

```
Simulink.findBlocks('vdp','Name','Mu')
```

```
ans =

    8.0001
```

Input Arguments

sys — Model or subsystem to find blocks in
character vector | string array

Model or subsystem to find blocks in, specified as a character vector or string array.

Example: `'vdp'` `"f14/Aircraft Dynamics Model"`

options — Search constraints
`simulink.FindOptions` object

Search constraints, specified as a `Simulink.FindOptions` object.

Example: `'vdp'` `"f14/Aircraft Dynamics Model"`

Output Arguments

bl — Search results
array of handles

Search results, returned as an array of handles.

Introduced in R2018a

Simulink.findBlocksOfType

Find specified type of block in Simulink models

Syntax

```
bl = Simulink.findBlocksOfType(sys,type)
bl = Simulink.findBlocksOfType(sys,type,options)
bl = Simulink.findBlocksOfType(sys,
type,Param1,Value1,...,ParamN,ValueN)
bl = Simulink.findBlocksofType(sys,
type,Param1,Value1,...,ParamN,ValueN,options)
```

Description

`bl = Simulink.findBlocksOfType(sys,type)` returns handles to all blocks of the specified type in the model or subsystem `sys`.

`bl = Simulink.findBlocksOfType(sys,type,options)` matches the criteria specified by a `FindOptions` object.

`bl = Simulink.findBlocksOfType(sys, type,Param1,Value1,...,ParamN,ValueN)` finds blocks whose parameters have the specified values.

`bl = Simulink.findBlocksofType(sys, type,Param1,Value1,...,ParamN,ValueN,options)` finds blocks whose parameters have the specified values and that match the criteria specified by a `FindOptions` object.

Examples

Find Blocks of a Type in Model

Find all blocks of type Gain in the model `vdp`.

```
load_system('vdp');
Simulink.findBlocksOfType('vdp','Gain')
```

```
ans =

    7.0001
```

To return block names instead of handles, use `getfullname`.

```
getfullname(Simulink.findBlocksOfType('vdp','Gain'))
```

```
ans =

    'vdp/Mu'
```

Find Blocks of a Type Using Search Options

Load the model `sldemo_clutch`. Then, create a `FindOptions` object and use it to constrain the search of GoTo blocks in the model to the Unlocked system.

```
load_system('sldemo_clutch');
f = Simulink.FindOptions('SearchDepth',1);
bl = Simulink.findBlocksOfType('sldemo_clutch/Unlocked','Goto',f)
```

```
bl =

  166.0001
  167.0001
```

Input Arguments

sys — Model or subsystem to find blocks in
character vector | string array

Model or subsystem to find blocks in, specified as a character vector or string array.

Example: `'vdp'` `"f14/Aircraft Dynamics Model"`

type — Block type
character vector | string array

Block type, specified as a character vector or string array. Use `get_param` with the `'BlockType'` parameter to get the block type.

options — Search constraints
`simulink.FindOptions` object

Search constraints, specified as a `Simulink.FindOptions` object.

Example: `Simulink.FindOptions('SearchDepth',1)`

Output Arguments

bl — Search results
array of handles

Search results, returned as an array of handles.

Introduced in R2018a

Simulink.findTemplates

Find model or project templates with specified properties

Syntax

```
filename = Simulink.findTemplates(templatename)
filename = Simulink.findTemplates(templatename,Name,Value)
[filename,info] = Simulink.findTemplates(templatename)
```

Description

`filename = Simulink.findTemplates(templatename)` returns the names and `TemplateInfo` objects for all matching templates that include `templatename`.

`filename = Simulink.findTemplates(templatename,Name,Value)` also specifies additional template properties as one or more Name, Value pair arguments.

`[filename,info] = Simulink.findTemplates(templatename)` returns the names and `TemplateInfo` objects for all matching templates.

Examples

Find a Particular Template

Get the full path to the default model template.

```
filename = Simulink.findTemplates('factory_default_model');
```

Find All Templates With Specified Folders or Authors

Get all templates inside folders called `work`.

```
filename = Simulink.findTemplates('work/')
```

Get all templates for which the `Author` property includes the character vector `Smith`.

```
filename = Simulink.findTemplates('*','Author','Smith')
```

Find All DSP Templates and Get TemplateInfo Objects

Get the paths to all DSP model templates, and `sltemplate.TemplateInfo` objects for each of them.

```
[filename,info] = Simulink.findTemplates('dsp*','Type','Model');
```

- "Create and Open Models"
- "Create a Template from a Model"
- "Using Templates to Create Standard Project Settings"

Input Arguments

`templatename` — Template name
character vector

Template name, specified as a character vector containing a portion of a file name, which can contain the wildcard asterisk character "*".

Example:

Data Types: `char`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

You can specify regular expressions for any of the Value character vectors, e.g., including the wildcard asterisk character "*".

Example: `'Author','*son'`

Type — Model, library, or project
`'Model'` | `'Library'` | `'Project'`

Model, library, or project template type, specified as a character vector for model, library, or project.

Example: `'Simscape'`

Data Types: `char`

Title — Title of template
character vector

Title of template, specified as a character vector.

Example: `'Simscape'`

Data Types: `char`

Group — Group of template
character vector

Group of template, specified as a character vector. On the Start Page, templates are shown under group headings.

Example: `'Simscape'`

Data Types: `char`

Author — Author of template
character vector

Author of template, specified as a character vector.

Data Types: `char`

Description — Description of template
character vector

Description of template, specified as a character vector.

Data Types: `char`

Output Arguments

`filename` — Template name
character vector | cell array of character vectors

Template names of matching templates, returned as character vectors.

`info` — Template information
template info objects | array of template info objects

Template information of matching templates, returned as `sltemplate.TemplateInfo` objects.

Simulink.findVars

Analyze relationship between variables and blocks in models

Syntax

```
[variables] = Simulink.findVars(context)
[variables] = Simulink.findVars(context,variablefilter)
[variables] = Simulink.findVars( ___ ,Name,Value)
```

Description

`[variables] = Simulink.findVars(context)` finds and returns variables that are used in the blocks and models specified by `context`, including subsystems and referenced models. The function returns an empty vector if `context` does not use any variables.

`[variables] = Simulink.findVars(context,variablefilter)` finds only the variables or enumerated types that are specified by `variablefilter`. For example, use this syntax to determine where a variable is used in a model.

`[variables] = Simulink.findVars( ___ ,Name,Value)` finds variables with additional options specified by one or more `Name,Value` pair arguments. For example, you can search for unused variables. You can also search for enumerated data types that are used in `context`, in addition to variables.

Examples

Variables in Use in a Model

Find variables used by `MyModel`.

```
variables = Simulink.findVars('MyModel');
```

Specific Variable in Use in a Model

Find all uses of the base workspace variable k by MyModel. Use the cached results to avoid compiling MyModel.

```
variables = Simulink.findVars('MyModel','Name','k',
'SearchMethod','cached','SourceType','base workspace');
```

Regular Expression Matching

Find all uses of a variable whose name matches the regular expression ^trans.

```
variables = Simulink.findVars('MyModel','Regexp','on',
'Name','^trans');
```

Variables Common to Two Models

Given two models, find the variables used by the first model, the second, and both

```
model1Vars = Simulink.findVars('model1');
model2Vars = Simulink.findVars('model2');
commonVars = intersect(model1vars,model2Vars);
```

Variables Not Used in a Model

Find the variables that are defined in the model workspace of MyModel but that are not used by the model.

```
unusedVars = Simulink.findVars('MyModel','FindUsedVars','off',
'SourceType','model workspace');
```

Specific Variable Not Used in a Model

Determine if the base workspace variable k is not used by MyModel.

```
varObj = Simulink.VariableUsage('k','base workspace');
unusedVar = Simulink.findVars('MyModel',varObj,
'FindUsedVars','off');
```

Variables Used by a Block

Find the variables that are used by the block Gain1 in MyModel.

```
variables = Simulink.findVars('MyModel',
'Users','MyModel/Gain1');
```

Variables Used in a Model Reference Hierarchy

Find the variables that are used in a model reference hierarchy. Begin the search with the model MyNestedModel, and search the entire hierarchy below MyNestedModel.

```
variables = Simulink.findVars('MyNestedModel','SearchReferencedModels','on');
```

Variables and Enumerated Types Used in a Model

Find variables and enumerated types that are used in MyModel.

```
varsAndEnumTypes = Simulink.findVars('MyModel','IncludeEnumTypes','on');
```

• "Search Using Model Explorer"

Input Arguments

context — Models and blocks to search
character vector | cell array of character vectors

Models and blocks to search, specified as a character vector or a cell array of character vectors. You can specify context in one of the following ways:

• The name of a model. For example, ('vdp') specifies the model vdp.slx.
• The name or path of a block or masked block. For example, ('vdp/Gain1') specifies a block named Gain1 at the root level of the model vdp.slx.

- A cell array of model or block names.

Data Types: `char` | `cell`

variablefilter — Specific variables to find
array of `Simulink.VariableUsage` objects

Specific variables to find, specified as an array of `Simulink.VariableUsage` objects. Each `Simulink.VariableUsage` object identifies a variable to find.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (`' '`). You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: `'FindUsedVars','off'`

FindUsedVars — Find variables that are used or not used
`'on'` (default) | `'off`

Flag to find variables that are explicitly used or not used, specified as the comma-separated pair consisting of `'FindUsedVars'` and `'on'` or `'off`. If you specify `FindUsedVars` as `'off'`, the function finds variables that are not used in `context` but that are defined in the workspace specified by `SourceType`.

Example: `'FindUsedVars','off'`

IncludeEnumTypes — Find enumerated types that are used
`'off'` (default) | `'on'`

Flag to find enumerated data types that are used, specified as the comma-separated pair consisting of `'IncludeEnumTypes'` and `'on'` or `'off'`. The function finds enumerated types that are used explicitly in `context` as well as types that define variables that are used in `context`.

If you specify `SourceType` as `'base workspace'`, `'model workspace'`, or `'mask workspace'`, the function does not report enumerated types because those sources cannot define enumerated types.

You cannot find unused enumerated types by specifying `FindUsedVars` as `'off'`.

Example: `'IncludeEnumTypes','on'`

RegExp — Enable regular expression matching
`'off'` (default) | `'on'`

Flag to enable regular expression matching for input arguments, specified as the comma-separated pair consisting of `'RegExp'` and `'on'`. You can match only input arguments that have character vector values.

Example: `'RegExp','on'`

SearchMethod — Compile status
`'compiled'` (default) | `'cached'`

Compile status, specified as the comma-separated pair consisting of `'SearchMethod'` and one of these values:

- `'compiled'` — Return up-to-date results by compiling every model in the search context before search.
- `'cached'` — Return quicker results by using results cached during the previous compile.

Example: `'SearchMethod','compiled'`

SearchReferencedModels — Enable search in referenced models
`'off'` (default) | `'on'`

Flag to enable search in referenced models, specified as the comma-separated pair consisting of `'SearchReferencedModels'` and `'on'`.

Example: `'SearchReferencedModels','on'`

Name — Name of a variable or enumerated type to search for
character vector

Name of a variable or enumerated data type to search for, specified as the comma-separated pair consisting of `'Name'` and a character vector.

Example: `'Name','trans'`

Data Types: `char`

SourceType — Workspace or source defining the variables or enumerated types
character vector

Workspace or source defining the variables, specified as the comma-separated pair of `'SourceType'` and one of these options:

- `'base workspace'`
- `'model workspace'`
- `'mask workspace'`
- `'data dictionary'`

The function filters results for variables that are defined in the specified source.

Example: `'SourceType','base workspace'`

If you search for enumerated data types by specifying `'IncludeEnumTypes'` as `'on'`, `'SourceType'` represents the way an enumerated type is defined. You can specify one of these options:

- `'MATLAB file'`
- `'dynamic class'`
- `'data dictionary'`

The function filters results for enumerated types that are defined in the specified source.

Example: `'SourceType','MATLAB file'`

If you do not specify `SourceType`, the function does not filter results by source.

Users — Name of block to search for variables
character vector

Name of specific block to search for variables, specified as the comma-separated pair consisting of `'Users'` and a character vector.

To search a set of specific blocks, enable regular expression matching by specifying `RegExp` as `'on'` and use regular expressions in the character vector. For example, you can specify `'Users','MyModel/Gain*` to search all blocks in `MyModel` whose names begin with `Gain`.

Example: `'Users','MyModel/Gain1'`

Example: `'Users','MyModel/mySubsystem/Gain2'`

Example: `'Users','MyModel/Gain*`

Limitations

`Simulink.findVars` does not work with these constructs:

- MATLAB code in scripts and initialization and callback functions
- Libraries and blocks in libraries
- Variables in MATLAB Function blocks, except for input arguments

  However, `Simulink.findVars` can find enumerated types anywhere they are used in MATLAB Function blocks.
- Calls directly to MATLAB from the Stateflow action language
- S-functions that use data type variables registered using `ssRegisterDataType`

  To make the variables searchable, use `ssRegisterTypeFromNamedObject` instead.
- Variables referenced by machine-parented data in Stateflow

`Simulink.findVars` discovers variable usage in inactive subsystem variants only if you select **Analyze all choices during update diagram and generate preprocessor conditionals** in the Variant Subsystem block dialog box. If you do not select this check box, the function does not discover variable usage in inactive variants.

Simulink.getFileChecksum

Checksum of file

Syntax

```
checksum = Simulink.getFileChecksum(filename)
```

Description

`checksum = Simulink.getFileChecksum(filename)` returns the checksum of the specified file, using the MD5 checksum algorithm. Use the checksum to see if the file has changed compared to a previous checksum. You can use checksums as part of an audit trail.

Use `Simulink.getFileChecksum` to get a checksum for any file. If the file contents do not change from one checksum to the next, the checksum from `Simulink.getFileChecksum` stays the same. Otherwise, the checksum is different with each change to the file contents.

For functional information on a model, use `Simulink.BlockDiagram.getChecksum` instead. `Simulink.BlockDiagram.getChecksum` looks at the functional aspect of the model. If the functional aspect doesn't change, then `Simulink.BlockDiagram.getChecksum` returns the same checksum.

For example, if you moved a block, the file contents are different (measured by `Simulink.getFileChecksum`) but the function of the model is unchanged (measured by `Simulink.BlockDiagram.getChecksum`).

Examples

Get Checksum of a File

Use `fullfile` to specify a full path to a file and get the checksum.

```
filechecksum = Simulink.getFileChecksum(fullfile(matlabroot,'toolbox',...
'matlab','demos','gatlin.mat'));
```

Input Arguments

`filename` — File name to get checksum for
file of any type

File name to get checksum for, with file extension and optional full path. Use `fullfile` to specify a full path to a file, or use the form `'C:\Work\filename.mat'`.

Example: `'lengthofline.m'`

Data Types: `char`

Output Arguments

`checksum` — Checksum value
character vector

Checksum value in a 32-character vector.

`Simulink.BlockDiagram.getChecksum` | `Simulink.SubSystem.getChecksum`

Introduced in R2014b

Simulink.getSuppressedDiagnostics

Return `Simulink.SuppressedDiagnostic` objects associated with a block, subsystem, or model

Syntax

```
suppressed_diagnostics = Simulink.getSuppressedDiagnostics(source)
```

Description

`suppressed_diagnostics = Simulink.getSuppressedDiagnostics(source)` returns an array of `Simulink.SuppressedDiagnostic` objects that are associated with the specified source.

Examples

Get All `Simulink.SuppressedDiagnostic` Objects on a Specific Block

Using the model from "Suppress Diagnostic Messages Programmatically", get all suppressed diagnostics associated with a specified block.

Use the `Simulink.suppressDiagnostic` function to suppress the parameter precision loss warning thrown by the Constant block, `one`.

```
Simulink.suppressDiagnostic('Suppressor_CLI_Demo/one',...
 'SimulinkFixedPoint:util:fxpParameterPrecisionLoss');
```

Get the `Simulink.SuppressedDiagnostic` objects associated with the block.

```
suppressed_diagnostic = Simulink.getSuppressedDiagnostics('Suppressor_CLI_Demo/one')

suppressed_diagnostic =

  SuppressedDiagnostic with properties:
```

```
        Source: 'Suppressor_CLI_Demo/one'
            Id: 'SimulinkFixedPoint:util:fxpParameterPrecis…'
  LastModifiedBy: ''
       Comments: ''
    LastModified: '2016-Jul-04 14:12:24'
```

- "Suppress Diagnostic Messages Programmatically"

Input Arguments

source — System, block, or model object throwing warning
model | subsystem | block path | block handle

The source of the diagnostic, specified as a model, subsystem, block path, block handle, cell array of block paths, or cell array of block handles.

To get the block path, use the `gcb` function.

To get the block handle, use the `getSimulinkBlockHandle` function.

Data Types: `char` | `cell`

Output Arguments

suppressed_diagnostics — Suppressed diagnostics
array

Suppressed diagnostics, returned as an array of `Simulink.SuppressedDiagnostic` objects.

See Also
`Simulink.SuppressedDiagnostic` | `Simulink.SuppressedDiagnostic.restore` | `Simulink.getSuppressedDiagnostics` | `Simulink.restoreDiagnostic` | `Simulink.suppressDiagnostic`

Simulink.importExternalCTypes

Generate Simulink representations of custom data types defined by C or C++ code

Syntax

```
importInfo = Simulink.importExternalCTypes(headerFiles)
importInfo = Simulink.importExternalCTypes(modelName)
importInfo = Simulink.importExternalCTypes( ___ ,Name,Value)
```

Description

`importInfo = Simulink.importExternalCTypes(headerFiles)` parses the C or C++ header files (`.h` or `.hpp`) identified by `headerFiles` for `typedef`, `struct`, and `enum` type definitions, and generates Simulink representations of the types. The output, `importInfo`, identifies the successfully and unsuccessfully imported types.

You can use the Simulink representations to:

- Reuse your existing algorithmic C code and, through simulation, test its interaction with your Simulink control algorithm. For an example that shows how to use the Legacy Code Tool, see "Integrate C Function Whose Arguments Are Pointers to Structures".

- Generate code (Simulink Coder) that reuses the types and data that your existing code defines. You can then integrate and compile the generated and existing code into a single application. For an example, see "Exchange Structured and Enumerated Data Between Generated and External Code" (Embedded Coder).

- Create and organize data (signals, parameters, and states) in a model by using standard data types that your organization defines in C code.

  - To create structures of signals in Simulink, use nonvirtual buses. See "Getting Started with Buses".

  - To create structures of parameters, use MATLAB structures and `Simulink.Parameter` objects. See "Organize Related Block Parameter Definitions in Structures".

- To create enumerated data, see "Use Enumerated Data in Simulink Models".
- To match a primitive `typedef` statement, use a `Simulink.AliasType` object to set parameter and signal data types in a model.

By default, the function:

- Imports an enumerated type by generating a script file that derives an enumeration class from `Simulink.IntEnumType`, as described in "Define Simulink Enumerations". If necessary, you can then edit the class definition to customize it (for example, by implementing the `addClassNameToEnumNames` method).
- Imports a structure type by generating a `Simulink.Bus` object in the base workspace.
- Imports a primitive `typedef` statement by generating a `Simulink.AliasType` object in the base workspace.
- Interprets generic C data types, such as `int` or `short`, according to the word lengths of your host computer. For example, for most modern machines, `int` has a 32-bit word length, so the function represents an `int` structure field as a bus element that uses the Simulink data type `int32`.

  To override this default behavior, identify your target hardware board by using the `HardwareImplementation` pair argument.

For additional information about default behavior, see "Tips" on page 2-675.

`importInfo = Simulink.importExternalCTypes(modelName)` generates Simulink representations of custom C data types by analyzing a model that you identify with `modelName`. When you use the **Simulation Target** configuration parameters in a model to identify header files for inclusion during simulation, use this syntax to import types for the purpose of simulating the model on your host computer. The function interprets generic C data types according to the word lengths of your host computer.

When you use this syntax, do not use pair arguments, such as `HardwareImplementation`, that can conflict with the configuration parameters of the target model. When you use such pair arguments with this syntax, the function generates a warning.

`importInfo = Simulink.importExternalCTypes( ___ ,Name,Value)` specifies additional options using one or more name-value pair arguments. You can use this syntax to:

- Specify the names of types to import by using the `Names` pair argument.
- Control the way that Simulink stores the imported types, for example, by generating the types in a Simulink data dictionary. Use the `MATFile` and `DataDictionary` pair arguments.
- Control the way that the function interprets generic C data types. Use the `HardwareImplementation` pair argument.
- Maintain synchrony between the C-code definitions and the Simulink representations by attempting to import the updated C-code definitions again. You can choose whether to overwrite the existing Simulink representations. Use the `Overwrite` and `Verbose` pair arguments.

Examples

Import Simple Structure and Enumerated Types

This example shows how to generate Simulink representations of a C structure type (`struct`) and an enumerated (`enum`) data type from a header file.

1   In your current folder, create the file `ex_cc_simpleTypes.h`.

```
typedef enum {
  PWR_LOSS = 0,                 /* Default value */
  OVERSPD,
  PRESS_LOW,
} fault_T;

typedef struct {
    double coeff;
    double init;
} params_T;
```

2   Generate Simulink representations of the types by calling `Simulink.importExternalCTypes`.

```
Simulink.importExternalCTypes('ex_cc_simpleTypes.h');
```

The function creates a `Simulink.Bus` object, `params_T`, in the base workspace.

3   To inspect the properties of the object, open the Bus Editor.

```
buseditor
```

Each bus element uses a name and a data type (`double`) that match the corresponding structure field in `ex_cc_simpleTypes.h`.

4 In your current folder, inspect the generated file, `fault_T.m`, which defines the enumerated type `fault_T` as an enumeration class.

You can use the bus object and the eumeration class to set signal and parameter data types in Simulink models.

Import Structure Type Whose Fields Use Custom Data Types

This example shows how to generate a Simulink representation of a structure type whose fields use custom data types (`typedef`).

Create the file `ex_integer_aliases.h` in your current folder.

```
typedef int sint_32;

typedef unsigned short uint_16;
```

Create the file `ex_cc_struct_alias.h` in your current folder.

```
#include "ex_integer_aliases.h"

typedef struct {
    sint_32 accum;
    uint_16 index;
} my_ints_T;
```

Import the structure type into Simulink as a `Simulink.Bus` object in the base workspace. Import the `typedef` statements as `Simulink.AliasType` objects.

```
Simulink.importExternalCTypes('ex_cc_struct_alias.h');
```

Inspect the data types of the bus elements in the bus object. For example, inspect the `DataType` property of the first bus element, which corresponds to the structure field `accum`.

```
my_ints_T.Elements(1)
```

```
ans =
```

```
BusElement with properties:

            Name: 'accum'
      Complexity: 'real'
      Dimensions: 1
        DataType: 'sint_32'
             Min: []
             Max: []
  DimensionsMode: 'Fixed'
      SampleTime: -1
            Unit: ''
     Description: ''
```

The `Simulink.importExternalCTypes` function uses the generated `Simulink.AliasType` objects to set the data types of the bus elements.

Inspect the `Simulink.AliasType` objects in the base workspace. For example, the object named `sint_32` corresponds to one of the `typedef` statements in `ex_integer_aliases.h`.

sint_32

```
sint_32 =

  AliasType with properties:

    Description: ''
      DataScope: 'Imported'
     HeaderFile: 'ex_integer_aliases.h'
        BaseType: 'int32'
```

For most host computers (which the function targets by default), the word length of `int` is 32 bits and the word length of `unsigned short` is 16 bits. The function maps `int` and `unsigned short` to the Simulink types `int32` and `uint16`.

If you have Embedded Coder, the code that you generate from the model can use `sint_32` and `uint_16` instead of the standard data type names, `int32_T` and `uint16_T`.

Store Imported Types in Data Dictionary

This example shows how to store the imported data types in a Simulink data dictionary. A data dictionary stores data specifications (such as for signals and block parameter values), data types, and other design data for one or more Simulink models.

In your current folder, create the file ex_cc_simpleTypes.h.

```
typedef enum {
  PWR_LOSS = 0,              /* Default value */
  OVERSPD,
  PRESS_LOW,
} fault_T;

typedef struct {
    double coeff;
    double init;
} params_T;
```

Create a subfolder called myDictionaries.

```
mkdir('myDictionaries')
```

Generate Simulink representations of the types by calling Simulink.importExternalCTypes. Permanently store the type definitions by creating a new data dictionary, ex_cc_myTypes.sldd, in the new subfolder.

```
Simulink.importExternalCTypes('ex_cc_simpleTypes.h',...
    'DataDictionary','ex_cc_myTypes.sldd',...
    'OutputDir','myDictionaries');
```

To inspect the contents of the dictionary, set your current folder to myDictionaries and double-click the dictionary file.

To use the Simulink representations in the dictionary, you must link a model or models to the dictionary. See "Migrate Models to Use Simulink Data Dictionary".

Import Only Specified Types

This example shows how to generate Simulink representations only for enumerated and structure data types that you identify by name.

In your current folder, create the file `ex_cc_manySimpleTypes.h`. The file defines three structure types: `params_T`, `signals_T`, and `states_T`.

```
typedef struct {
    double coeff;
    double init;
} params_T;

typedef struct {
    double flow_rate;
    double steam_press;
} signals_T;

typedef struct {
    double accum;
    double error;
} states_T;
```

Generate Simulink representations only for `params_T` and `signals_T`.

```
Simulink.importExternalCTypes('ex_cc_manySimpleTypes.h',...
    'Names',{'params_T','signals_T'});
```

The `Simulink.Bus` objects, `params_T` and `signals_T`, appear in the base workspace.

Import Types for 16-Bit Hardware

By default, `Simulink.importExternalCTypes` represents an enumerated data type by creating an enumeration class that derives from the built-in class `Simulink.IntEnumType`. When you simulate or generate code from a model that uses the generated class, configuration parameters that you select for the model (for example, on the **Hardware Implementation** pane) determine the specific integer length that `Simulink.IntEnumType` and the enumeration class employ.

By default, the function interprets generic, primitive C data types, such as `short` and `int`, according to the word lengths of your host computer. For example, to represent an `int` structure field, the function typically applies the 32-bit data type `int32` to the corresponding bus element. When you want to simulate and generate code for hardware other than your host computer, use the `HardwareImplementation` pair argument to identify the target hardware and, by extension, the word lengths of the hardware.

This example shows how to import data types from code that you intend to use on 16-bit hardware. For this board, `int` has a 16-bit length, and each item of enumerated data (`enum`) consumes 16 bits.

In your current folder, create the file `ex_cc_intTypes.h`.

```
typedef enum {
  PWR_LOSS = 0,              /* Default value */
  OVERSPD,
  PRESS_LOW,
} fault_T;

typedef struct {
    int coeff;
    int init;
} params_T;
```

The code defines an enumerated data type and a structure type whose fields use the generic C data type `int`.

To generate an accurate Simulink representation of the structure type, first open an existing model or create a new model. For this example, create a new model named `ex_hdwImpl_16bit`.

In the new model, set **Configuration Parameters > Hardware Implementation > Device vendor** to `Atmel`. Set **Device type** to AVR.

Alternatively, at the command prompt, use these commands to create and configure the model:

```
new_system('ex_hdwImpl_16bit','Model');
set_param('ex_hdwImpl_16bit','ProdHWDeviceType','Atmel->AVR')
```

Generate Simulink representations of the types. To specify the word lengths of the target 16-bit hardware, extract the model configuration parameters (which include the **Hardware Implementation** settings) as a `Simulink.ConfigSet` object.

```
configSet = getActiveConfigSet('ex_hdwImpl_16bit');
Simulink.importExternalCTypes('ex_cc_intTypes.h','HardwareImplementation',configSet);
```

The `Simulink.Bus` object `params_T` appears in the base workspace. The bus elements, such as `coeff`, use the Simulink data type `int16`.

```
params_T.Elements(1)
```

```
ans =

  BusElement with properties:

                Name: 'coeff'
          Complexity: 'real'
          Dimensions: 1
            DataType: 'int16'
                 Min: []
                 Max: []
      DimensionsMode: 'Fixed'
          SampleTime: -1
                Unit: ''
         Description: ''
```

In your current folder, the file `fault_T.m` defines the enumeration class `fault_T`. The class derives from `Simulink.IntEnumType`, so you must use model configuration parameters to identify the target hardware and, by extension, the correct native integer length.

```
type('fault_T.m')
```

```
classdef fault_T < Simulink.IntEnumType
    % MATLAB enumeration class definition generated from template

    enumeration
        PWR_LOSS(0),
        OVERSPD(1),
        PRESS_LOW(2)
    end

    methods (Static)

        function defaultValue = getDefaultValue()
            % GETDEFAULTVALUE   Returns the default enumerated value.
            %   If this method is not defined, the first enumeration is used.
            defaultValue = fault_T.PWR_LOSS;
        end

        function dScope = getDataScope()
```

```
            % GETDATASCOPE  Specifies whether the data type definition should be impor
            %               or exported to, a header file during code generation.
            dScope = 'Imported';
        end

        function desc = getDescription()
            % GETDESCRIPTION  Returns a description of the enumeration.
            desc = '';
        end

        function headerFile = getHeaderFile()
            % GETHEADERFILE  Specifies the name of a header file.
            headerFile = 'ex_cc_intTypes.h';
        end

        function flag = addClassNameToEnumNames()
            % ADDCLASSNAMETOENUMNAMES  Indicate whether code generator applies the clas
            %                          to the enumeration.
            flag = false;
        end

    end

end
```

Import Structure Type Whose Fields Use 16-Bit Fixed-Point Data Types

Create the file ex_cc_fixpt_struct.h in your current folder.

```
typedef struct {

    int coeff;   /* Word length 16,
        binary fraction length 7 */

    int init;   /* Word length 16,
        binary fraction length 3 */

} params_T;
```

The file defines a structure type whose fields use fixed-point data types. For example, the structure stores the field coeff in a signed, 16-bit integer data type. A binary fraction length of 7 relates the stored integer value to the real-world value.

Suppose that this code operates on 16-bit hardware (such that the generic C data type `int` has a 16-bit word length). To generate a Simulink representation of the type, first create a `coder.HardwareImplementation` object that identifies the hardware.

```
hdw = coder.HardwareImplementation;
hdw.ProdHWDeviceType = 'Atmel->AVR';
```

Generate a Simulink representation of the structure type.

```
Simulink.importExternalCTypes('ex_cc_fixpt_struct.h',...
    'HardwareImplementation',hdw);
```

The `Simulink.Bus` object, `params_T`, appears in the base workspace. Each bus element, such as `coeff`, uses the data type `int16`.

```
params_T.Elements(1)
```

```
ans =

  BusElement with properties:

             Name: 'coeff'
       Complexity: 'real'
       Dimensions: 1
         DataType: 'int16'
              Min: []
              Max: []
    DimensionsMode: 'Fixed'
       SampleTime: -1
             Unit: ''
      Description: ''
```

`Simulink.importExternalCTypes` cannot infer the fixed-point scaling (binary fraction length) from the C code. You must manually specify the data types of the bus elements. To specify the data types at the command prompt, use the `fixdt` function.

```
params_T.Elements(1).DataType = 'fixdt(1,16,7)';
params_T.Elements(2).DataType = 'fixdt(1,16,3)';
```

To specify the data types interactively (by using the Data Type Assistant), use the Bus Editor.

```
buseditor
```

Manually Synchronize Simulink Representations with C-Code Definitions

This example shows how to maintain the Simulink representations of C data types whose definitions you modify during the life of a modeling project.

Import Custom C Types

Create the file ex_cc_myTypes_rec.h in your current folder. The file defines a custom structure type.

```
typedef struct {
    double flow;
    double pres;
    double tqe;
} sigStructType;
```

Generate a Simulink.Bus object that represents the type.

```
Simulink.importExternalCTypes('ex_cc_myTypes_rec.h');
```

Modify Type Definition in C Code

In ex_cc_myTypes_rec.h, add a field named spd to sigStructType.

In the same file, create a new structure type, stateStructType.

```
typedef struct {
    double flow;
    double pres;
    double tqe;
    double spd;
} sigStructType;

typedef struct {
    double err;
    double read;
    double write;
} stateStructType;
```

Attempt to Import Types Again

Attempt to generate bus objects that represent the types.

```
importInfo = Simulink.importExternalCTypes('ex_cc_myTypes_rec.h');
```

The function generates warnings at the command prompt. Instead of relying on the warnings, you can inspect the output, `importInfo`, to determine whether the function failed to import any types.

```
importInfo.failedToImport.Bus
```

```
ans =

  1×1 cell array

    {'sigStructType'}
```

The function did not import `sigStructType`. The corresponding bus object in the base workspace still has only three bus elements. To determine the reason that the function did not import `sigStructType`, inspect the `report` field of `importInfo`.

Import `sigStructType` again. This time, overwrite the existing bus object.

```
importInfo = Simulink.importExternalCTypes('ex_cc_myTypes_rec.h',...
    'Names',importInfo.failedToImport.Bus,'Overwrite','on');
```

When you overwrite existing Simulink representations, any customizations that you made to the Simulink representations (such as the application of fixed-point data types to bus elements) are overwritten.

Input Arguments

headerFiles — Names and paths of header files to parse
character vector | cell array of character vectors | string scalar | string array

Names and paths of header files to parse, specified as a character vector, cell array of character vectors, string, or string array. Include the `.h` or `.hpp` file extension.

If you use a hierarchy of included (`#include`) header files to define your types, when you specify `HeaderFiles`, you need to identify only the entry-point files. The function parses the included files as well as the identified entry-point files. If the included files are not in the same folder as the corresponding entry-point file, use the `IncludeDirs` pair argument to identify the additional folders.

Example: `'myHeader.h'`

Example: `{'thisHeader.hpp','thatHeader.hpp'}`

Data Types: `char` | `cell` | `string`

modelName — Name of loaded Simulink model for which to import types
character vector | string scalar

Name of a loaded Simulink model for which to import types, specified as a character vector or string scalar. A model is loaded if, for example, you open the model or use the `load_system` function. When you use this argument, the function:

- Searches the model configuration parameters for custom header files and parses those header files for data types to import. Only the configuration parameters on the **Simulation Target** pane affect this search.

  For example, if in the model you set **Configuration Parameters > Simulation Target > Insert custom C code in generated > Header file** to `#include "myTypes.h"`, the function parses `myTypes.h` for types to import.

- Interprets generic C data types such as `int` or `short` according to the word lengths of your host computer. Do not use the `HardwareImplementation` pair argument to override this interpretation.

Example: `'myModel'`

Data Types: `char` | `string`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (`' '`). You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example:
`Simulink.importExternalCTypes('myHdr.h','DataDictionary','myDictionary.sldd')`

MATFile — Name and path of MAT-file to create for storing generated objects
`''` (empty) (default) | character vector | string scalar

Name and, optionally, path of the MAT-file to create for storing generated `Simulink.Bus` and `Simulink.AliasType` objects, specified as a character vector or string. If you do not use `MATFile`, by default, the function generates the objects in the base workspace.

The function does not generate enumeration definitions in MAT-files.

If you import some `struct` types and primitive `typedef` statements by using `MATFile` and later import some of the same types again by using `MATFile`, the function entirely replaces the old MAT-file with a new one. The function discards any changes that you made to the contents of the old MAT-file.

You cannot use the `MATFile` and `DataDictionary` pair arguments simultaneously.

Example: `'myMat.mat'`

Example: `'myMat'`

Example: `fullfile('subfolder','myMat')`

Data Types: `char` | `string`

DataDictionary — Name and path of Simulink data dictionary to use or create for storing types
`''` (default) | character vector | string scalar

Name and, optionally, path of the Simulink data dictionary to use or create for storing generated enumerations and objects, specified as a character vector or string. When you use this pair argument, the function imports enumerated types as `Simulink.data.dictionary.EnumTypeDefinition` objects, and stores those objects

(as well as `Simulink.Bus` objects and `Simulink.AliasType` objects) in the target dictionary.

For information about data dictionaries, see "What Is a Data Dictionary?".

You can optionally specify a `.sldd` extension.

You cannot use the `DataDictionary` and `MATFile` pair arguments simultaneously.

Example: `'myDict.sldd'`

Example: `'myDict'`

Example: `fullfile('subfolder','myDict.sldd')`

Data Types: `char` | `string`

Names — Names of types to import
`''` (default) | character vector | cell array of character vectors | string scalar | string array

Names of types to import, specified as a character vector, cell array of character vectors, string, or string array. By default, if you do not use `Names`, the function attempts to import all of the custom types that the identified header files define.

To match multiple type names with a single character vector, use an asterisk (*).

Example: `'myEnumType'`

Example: `{'myEnumType','myStructType'}`

Example: `'my*Type'`

Data Types: `char` | `cell` | `string`

Defines — Compiler options to define macros that influence type definitions
`''` (default) | character vector | string scalar

Compiler options to define macros that influence C type definitions, specified as a character vector, or string scalar. For example, a macro influences a type definition if you enclose the definition in an `#ifdef` block that checks whether the macro is defined.

Use `Defines` to specify macro definitions that you otherwise define through compiler options such as `-D`.

Example: `'SIGSTRUCT=1'`

Example: `'SIGSTRUCT=1 ENUM=1'`

Data Types: `char` | `string`

`UnDefines` — Compiler options to delete macros that influence type definitions
`''` (default) | character vector | string scalar

Compiler options to delete macros that influence C type definitions, specified as a character vector or string scalar. For example, a macro influences a type definition if you enclose the definition in an `#ifdef` block that checks whether the macro is defined.

Use `UnDefines` to specify macro deletions that you otherwise define through compiler options such as `-U`.

Example: `'SIGSTRUCT'`

Example: `'SIGSTRUCT ENUM'`

Data Types: `char` | `string`

`IncludeDirs` — Folders that contain subordinate, included header files
`''` (default) | character vector | cell array of character vectors | string scalar | string array

Folders that contain subordinate, included (`#include`) header files, specified as a character vector, cell array of character vectors, string, or string array. Use this pair argument to enable the function to locate and parse additional header files on which the primary header files (which you specify with the `headerFiles` argument) depend.

If you use the `modelName` syntax instead of the `headerFiles` syntax, in the target model, you can use the **Simulation Target** configuration parameters to specify include paths. In that case, you do not need to use the `IncludeDirs` pair argument.

Example: `'myHeaders'`

Example: `fullfile('myProject','myHeaders')`

Example:
`{fullfile('myProject','myHeaders'),fullfile('myProject','myOtherHeaders')}`

Data Types: `char` | `cell` | `string`

`OutputDir` — Folder for storing generated files
`''` (default) | character vector | string scalar

Folder for storing generated files, specified as a character vector or string. The function places generated files, such as `classdef` script files and data dictionary files, in this folder.

The folder that you specify must exist before you use the function.

Example: `'myDictionaries'`

Example: `fullfile('myProject','myDictionaries')`

Data Types: `char` | `string`

HardwareImplementation — Word lengths for interpreting generic, primitive C data types
`''` (default) | `Simulink.ConfigSet` object | `coder.HardwareImplementation` object

Word lengths for interpreting generic, primitive C data types, specified as a `Simulink.ConfigSet` or `coder.HardwareImplementation` object.

- To use a `Simulink.ConfigSet` object, you can extract a configuration set from a model by using functions such as `getConfigSet` and `getActiveConfigSet`. This technique enables you to use the Configuration Parameters dialog box to identify your target hardware (through the **Hardware Implementation** configuration parameters).

- To use a `coder.HardwareImplementation` object (which you create and configure programmatically), specify properties of the object, such as `ProdHWDeviceType`, to identify your target hardware. The object then sets other properties, such as `ProdBitPerInt`, that reflect the native integer size of the hardware.

The function inspects the object to determine which Simulink integer data types to employ when interpreting generic C data types such as `int`. For example, if you create a `coder.HardwareImplementation` object to identify 16-bit hardware and then use the function to import a structure type whose fields use the C data type `int`, the function generates a bus object whose bus elements use the Simulink data type `int16`. The function uses the production hardware settings, not the test hardware settings.

For more information about hardware implementation settings for Simulink models, see "Configure Run-Time Environment Options" (Simulink Coder).

Overwrite — Specification to overwrite existing Simulink representations
`'off'` (default) | `'on'`

Specification to overwrite existing Simulink representations, specified as `'on'` or `'off'`. If an imported type already has a representation in Simulink:

- If you specify `'off'` or if you do not specify `Overwrite`, the function does not import the type. In the output argument, `importInfo`, the `failedToImport` field identifies the type.
- If you specify `'on'`, the function overwrites the existing Simulink representation.

If you use the function to import some types into the base workspace or a data dictionary and later customize the generated Simulink representations, when you use the function again and set `Overwrite` to `'on'`, the function does not preserve your customizations. These customizations can include:

- In an enumeration class definition, implementing extra methods or modifying the generated methods such as `getDataScope` (see "Customize Simulink Enumeration").
- Modifying the properties of a generated `Simulink.Bus` or `Simulink.AliasType` object (for example, manually setting the data types of bus elements to a fixed-point data type).

Verbose — Specification to generate messages for successful import operations
`'off'` (default) | `'on'`

Specification to generate messages for successful import operations, specified as `'on'` or `'off'`.

- If you specify `'off'` or if you do not specify `Verbose`, the function imports types silently. Messages do not appear in the Command Window unless the function cannot import a type.
- If you specify `'on'`, the function generates a message in the Command Window for each operation during the import process.

Output Arguments

importInfo — Information about types that were imported and not imported
structure

Information about types that were imported and not imported, returned as a structure with these fields.

report — Descriptions of types that were imported and not imported
character vector

Descriptions of types that were imported and not imported, returned as a character vector. Inspect the value of this field to determine the reason that the function could not import a type.

failedToImport — Types that were not imported
structure

Types that were not imported, returned as a structure with these fields.

Field Name	Field Value	Purpose
Bus	Cell array of character vectors	Names of structure (struct) types that were not imported.
Enum	Cell array of character vectors	Names of enumerated types (enum) that were not imported.
AliasType	Cell array of character vectors	Names of primitive typedef statements that were not imported.

importedTypes — Types that were successfully imported
structure

Types that were successfully imported, returned as a structure with these fields.

Field Name	Field Value	Purpose
Bus	Cell array of character vectors	Names of structure (struct) types that were imported. The generated Simulink.Bus objects use these names.
Enum	Cell array of character vectors	Names of enumerated types (enum) that were imported. The generated enumeration classes or Simulink.data.dictionary.EnumTypeDefinition objects use these names.

Field Name	Field Value	Purpose
AliasType	Cell array of character vectors	Names of primitive typedef statements that were imported. The generated Simulink.AliasType objects use these names.

Limitations

- The function does not support:

  - C data types that do not correspond to a type that Simulink supports. For example, Simulink does not recognize an equivalent for long double. For information about data types that Simulink supports, see "Data Types Supported by Simulink".

  - Pointer types, such as a structure that defines a field whose value is a pointer or a typedef statement whose base type is a pointer type.

  - Structures that define a field whose value has more than one dimension.

    If a field value is a 1-D array, the function creates a bus element that represents a vector, not a matrix.

  - Unions.

- If a structure field represents fixed-point data, or if a typedef statement maps to a fixed-point base type, the function sets the data type of the corresponding bus element or Simulink.AliasType object to the relevant Simulink integer type (such as int16). The importer cannot determine the fixed-point scaling by parsing the C code. After using the function, you must manually specify the data type of the bus element or the base type of the Simulink.AliasType object by using the fixdt function.

Tips

- If a MATLAB Function block or Stateflow chart in your model uses an imported enumeration or structure type, configure the model configuration parameters to include (#include) the type definition from your external header file. See "Control Imported Bus and Enumeration Type Definitions" (for a MATLAB Function block) and

"Integrate Custom C/C++ Code for Simulation" (Stateflow) and "Integrate Custom Structures in Stateflow Charts" (Stateflow) (for a chart).

- By default:

  - For an imported enumeration, because the Simulink enumeration class derives from `Simulink.IntEnumType`, when you simulate or generate code from a model, the enumeration uses the integer size that is native to your target hardware. You specify the characteristics of your target hardware by using model configuration parameters such as **Production device vendor and type** and **Native word size in production hardware**.

  - For an imported structure type:

    - The function imports a structure field as numerically complex only if the field uses one of the corresponding Simulink Coder structure types as the data type. For example, if a structure field in your external code uses the data type `cint8_T`, the function imports the field as a bus element (`Simulink.BusElement` object) whose data type is `int8` and whose `Complexity` property is set to `'complex'`.

    - For nested structures, the function generates a bus object for each unique structure type.

  - For an imported structure type or enumeration, if your external code uses a `typedef` statement to name the type, the name of the generated bus object or Simulink enumeration class matches the `typedef` name. If your code does not use a `typedef` statement, the name of the object or class is `struct_`*`type`* or `enum_`*`type`* where *`type`* is the tag name of the type. If you do not specify a tag name or apply a `typedef` name, Simulink generates an arbitrary name for the object or class.

  - The function configures the generated Simulink representations as imported for the purposes of simulation and code generation. For example, for bus objects, the function sets the `DataScope` property to `'Imported'` and the `HeaderFile` property to the name of your external header file. To simulate or generate code from a model that uses one of these Simulink representations, you must make your header file available to the model.

- When you specify files for `Simulink.importExternalCTypes` to use or generate, for example, by using the `DataDictionary` pair argument:

  - If the existing files to use are in your current folder or on the MATLAB path, you do not need to specify a file path. You can specify the file name by itself.

- To control the folder location of generated files, you can specify paths as well as file names. You can also use the `OutputDir` pair argument.

Introduced in R2017a

Simulink.ModelDataLogs.convertToDataset

Convert logging data from `Simulink.ModelDataLogs` format to
`Simulink.SimulationData.Dataset` format

Syntax

convertedDataset =
sourceModelDataLogsObject.convertToDataset(*convertedDatasetName*)

Description

> **Note** The `ModelDataLogs` class is supported for backwards compatibility. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format. In R2016a or later, when you open a model from an earlier release that had used `ModelDataLogs` format, the model simulated in use `Dataset` format.
>
> You can convert signal logging data from `ModelDataLogs` to `Dataset` format. Converting to `Dataset` format makes it easier to post-process with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see "Convert Logged Data to Dataset Format".
>
> If you have legacy code that uses the `ModelDataLogs` API, you can encounter situations that require updates to your code or model. See "Migrate Scripts That Use Legacy ModelDataLogs API".

convertedDataset =
sourceModelDataLogsObject.convertToDataset(*convertedDatasetName*)
converts the *sourceModelDataLogsObject* to a
`Simulink.SimulationData.Dataset` object. The name of the converted object is
based on *convertedDatasetName*.

The resulting `Simulink.SimulationData.Dataset` object is a flat list. This list has
one element for each `Simulink.Timeseries` or `Simulink.TsArray` object in the
`Simulink.ModelDataLogs` object.

Limitations

Source of Simulink.ModelDataLogs Logged Data	Conversion Limitation
Referenced model	Loads all ancestors of the referenced model not previously loaded. If any ancestor model does not appear on the MATLAB path, the conversion fails. If the model has changed, or the model ancestors have changed, after Simulink logged the data, the conversion can fail. For example, adding, deleting, or renaming a block after logging can cause conversion failure.
Variant model or subsystem	The current active variant must be the same one that was active when Simulink logged the data. Otherwise, the conversion fails.
Frame signal	The conversion fails.
Mux block	The conversion produces a different `Simulink.SimulationData.Dataset` object as the dataset than Simulink creates when you simulate the model using the `Dataset` format for the logged data.
Stateflow chart	Not supported.

Input Arguments

sourceModelDataLogsObject

A `Simulink.ModelDataLogs` object that you want to convert to a `Simulink.SimulationData.Dataset` object.

convertedDatasetName

Name of the dataset that the conversion process creates.

Output Arguments

`convertedDataset`

The `Simulink.SimulationDataset` object that the `Simulink.ModelDataLogs.convertToDataset` function creates.

For details about the converted dataset, see `Simulink.SimulationData.Dataset`.

Example

In releases before R2016a, you could log signals using `ModelDataLogs` format. If you have a MAT-file with signal logging data that uses the `ModelDataLogs` format, here is how you can convert that data to `Dataset` format. This example assumes that the model that generated the logging data had the **Configuration Parameters** > **Data Import/ Export** > **Signal logging** name set to `logsout`.

1 Load the MAT-file.

2 Convert `logsout` to a dataset called `myModel_dataset`. (The elements information will be different for your data.)

```
dataset = logsout.convertToDataset('myModel_Dataset')

dataset =
  Simulink.SimulationData.Dataset
  Package: Simulink.SimulationData

  Characteristics:
              Name: 'myModel_Dataset'
    Total Elements: 2

  Elements:
    1: 'x1'
    2: 'x2'

  -Use get or getElement to access elements by index or name.
  -Use addElement or setElement to add or modify elements.

  Methods, Superclasses
```

Simulink.restoreDiagnostic

Restore diagnostic warnings to a specific block, subsystem, or model

Syntax

```
Simulink.restoreDiagnostic(source)
Simulink.restoreDiagnostic(source, message_id)
Simulink.restoreDiagnostic(diagnostic)
Simulink.restoreDiagnostic(system, 'FindAll', 'on')
```

Description

`Simulink.restoreDiagnostic(source)` restores all suppressed diagnostics associated with the blocks specified by `source`.

`Simulink.restoreDiagnostic(source, message_id)` restores all instances of `message_id` on the blocks specified by `source`.

`Simulink.restoreDiagnostic(diagnostic)` restores the suppressed diagnostics associated with `MSLDiagnostic` object `diagnostic`.

`Simulink.restoreDiagnostic(system, 'FindAll', 'on')` restores all suppressed diagnostics associated with the system specified by `system`.

Examples

Restore All Diagnostics for a Specified Block

Using the model from "Suppress Diagnostic Messages Programmatically", restore all suppressed diagnostics on a specified block.

Create a cell array of message identifiers. Use the `Simulink.suppressDiagnostic` function to suppress these multiple diagnostics from the Constant block, `one`.

```
diags = {'SimulinkFixedPoint:util:fxpParameterPrecisionLoss',...
 'SimulinkFixedPoint:util:fxpParameterUnderflow'};
Simulink.suppressDiagnostic('Suppressor_CLI_Demo/one', diags);
```

Remove all suppressions and restore diagnostics to the block.

```
Simulink.restoreDiagnostic('Suppressor_CLI_Demo/one');
```

Restore a Diagnostic for a Specified Block

Using the model from "Suppress Diagnostic Messages Programmatically", restore a suppressed diagnostic on a specified block.

Use the `Simulink.suppressDiagnostic` function to suppress the parameter precision loss warning thrown by the Constant block, `one`.

```
Simulink.suppressDiagnostic('Suppressor_CLI_Demo/one',...
 'SimulinkFixedPoint:util:fxpParameterPrecisionLoss');
```

Remove the suppression and restore diagnostics to the block.

```
Simulink.restoreDiagnostic('Suppressor_CLI_Demo/one',...
 'SimulinkFixedPoint:util:fxpParameterPrecisionLoss');
```

Restore All Diagnostics for a Specified System

Using the model from "Suppress Diagnostic Messages Programmatically", restore all suppressed diagnostics on the specified subsystem.

To restore all diagnostics from a system, use `'FindAll'`, `'on'` to search within the system hierarchy. Specify the system or system handle within which to search.

```
Simulink.restoreDiagnostic('Suppressor_CLI_Demo/Convert',...
 'FindAll', 'On');
```

- "Suppress Diagnostic Messages Programmatically"

Input Arguments

source — Block or model object throwing diagnostic
block path | block handle

The source of the diagnostic, specified as a block path, block handle, cell array of block paths, or cell array of block handles.

To get the block path, use the `gcb` function.

To get the block handle, use the `getSimulinkBlockHandle` function.

Data Types: `char` | `cell`

message_id — message identifier of diagnostic
message identifier | cell array of message identifiers

Message identifier of the diagnostic, specified as a character vector or a cell array of character vectors. You can find the message identifier of warnings and errors thrown during simulation by accessing the `ExecutionInfo` property of the `Simulink.SimulationMetadata` object associated with a simulation. You can also use the `lastwarn` function.

Data Types: `char` | `cell`

system — Name of subsystem
character vector

The subsystem name, or handle, specified as a character vector.

Data Types: `char`

diagnostic — Diagnostic object
`MSLDiagnostic` object

Diagnostic specified as an `MSLDiagnostic` object. Access the `MSLDiagnostic` object through the `ExecutionInfo` property of the `Simulink.SimulationMetadata` object.

Data Types: `struct`

Introduced in R2016b

getBlockSimState

Class: Simulink.SimState.ModelSimState
Package: Simulink.SimState

Access SimState of individual Stateflow Chart, MATLAB Function, or S-function block

Syntax

blockSimState = getBlockSimState(*x*, '*blockpath*')

Description

blockSimState = getBlockSimState(*x*, '*blockpath*') returns the SimState of the block specified as *blockpath*. *blockpath* must be either a Stateflow Chart, MATLAB Function, or S-function block. For other types of blocks, see the `loggedStates` property of the Simulink.SimState.ModelSimState class.

Input Arguments

x

The x argument is a `Simulink.SimState.ModelSimState` object.

blockpath

The path to the block for which you are requesting the SimState values.

Output Arguments

blockSimState

The SimState of the block specified.

Examples

```
chartState = getBlockSimState(x, 'mymodel/chart')
```

To get the SimState of a block that is in a referenced model, specify the full path of the block relative to the root model.

```
rootModel = 'sldemo_fuelsys_dd';
opt = struct('SaveFinalState','on','SaveCompleteFinalSimState','on','StopTime','1');
simOut = sim(rootModel,opt);
x = simOut.xFinal;
blockPath = 'sldemo_fuelsys_dd/Fuel Rate Controller|sldemo_fuelsys_dd_controller/contro
chartState = getBlockSimState(x,blockPath)
```

See Also
Simulink.SimState.ModelState.setBlockSimState

setBlockSimState

Class: Simulink.SimState.ModelSimState
Package: Simulink.SimState

Set SimState of individual Stateflow Chart, MATLAB Function, or S-function block

Syntax

setBlockSimState(*x*,'*blockpath*', *blockSimState*)

Description

setBlockSimState(*x*,'*blockpath*', *blockSimState*) sets the SimState of the block specified as *blockpath*. *blockpath* must be either a Stateflow Chart, MATLAB Function, or S-function block. For other types of blocks, see the loggedStates property of the Simulink.SimState.ModelSimState class.

Input Arguments

x

The argument *x* is a Simulink.SimState.ModelSimState object.

blockpath

The path to the block for which you are setting the SimState values

blockSimState

The SimState of the block specified.

Examples

newObj = setBlockSimState(obj, 'mymodel/chart', newChartState);

See Also

Simulink.SimState.ModelState.getBlockSimState

Simulink.saveVars

Save workspace variables and their values in MATLAB code format

Syntax

Note `Simulink.saveVars` is not recommended. Use `matlab.io.saveVariablesToScript` instead.

```
Simulink.saveVars(filename)
Simulink.saveVars(filename, VarNames)
Simulink.saveVars(filename, '-regexp', RegExps)
Simulink.saveVars(filename, Specifications, UpdateOption)
Simulink.saveVars(filename, Specifications, Configuration)
Simulink.saveVars(filename, Specifications, MatlabVer)
[r1, r2] = Simulink.saveVars(filename, Specifications)
```

Description

`Simulink.saveVars(filename)` saves all variables in the current workspace for which MATLAB code can be generated to a MATLAB file named `filename`.m. If MATLAB code cannot be generated for a variable, the variable is saved into a companion MAT-file named `filename`.mat, and a warning is generated. If either file already exists, it is overwritten. The `filename` cannot match the name of any variable in the current workspace, and can optionally include the suffix `.m`. Using `Simulink.saveVars` has no effect on the contents of any workspace.

Executing the MATLAB file restores the variables saved in the file to the current workspace. If a companion MAT-file exists, code in the MATLAB file loads the MAT-file, restoring its variables also. When both a MATLAB file and a MAT-file exist, do not load the MATLAB file unless the MAT file is available, or an error will occur. Do not load a MAT-file directly, or incomplete data restoration will result. No warning occurs if loading a file overwrites any existing variables.

You can edit a MATLAB file that `Simulink.saveVars` creates. You can insert comments between or within the MATLAB code sections for saved variables. However, if you later use `Simulink.saveVars` to update or append to the file, only comments between MATLAB code sections will be preserved. Internal comments should therefore be used only in files that you do not expect to change any further.

You must not edit the header section in the MATLAB file, which comprises the first five comment lines. Simulink does not check that a manually edited MATLAB file is syntactically correct. MathWorks recommends not editing any MATLAB code in the file. You cannot edit a MAT-file and should never attempt to do so.

`Simulink.saveVars(`*filename*`, `*VarNames*`)` saves only the variables specified in *VarNames*, which is a comma-separated list of variable names. You can use the wildcard character * to save all variables that match a pattern. The * matches one or more characters, including non-alphanumeric characters.

`Simulink.saveVars(`*filename*`, '-regexp', `*RegExps*`)` saves only variables whose names match one of the regular expressions in *RegExps*, which is a comma-separated list of expressions. See "Regular Expressions" (MATLAB) for more information. A call to the function can specify both *VarNames* and `-regexps` *RegExps*, in that order and comma-separated.

`Simulink.saveVars(`*filename*`, `*Specifications*`, `*UpdateOption*`)` saves the variables described by *Specifications* (which represents the variable specifications in any of the above syntaxes) as directed by *UpdateOption*, which can be any one of the following:

- `'-create'` — Create a new MATLAB file (and MAT-file if needed) as directed by the *Specifications*. If either file already exists, it is overwritten. This is the default behavior.

- `'-update'` — Update the existing MATLAB file (and MAT-file if needed) specified by *filename* by changing only variables that match the *Specifications* and already exist in any files. The order of the variables in files is preserved. Comments within MATLAB code sections are not preserved.

- `'-append'` — Update the existing MATLAB file (and MAT-file if needed) specified by *filename* by:

  - Updating variables that match the *Specifications* and already exist in the file or files, preserving the existing order in the file or files. Comments within MATLAB code sections are not preserved.

- Appending variables that match the *Specifications* and do not exist in the file or files by appending the variables to the file or files. These new sections initially have no comments.

`Simulink.saveVars(`*filename*`, `*Specifications*`, `*Configuration*`)` saves the variables described by *Specifications* (which represents the variable specifications in any of the above syntaxes) according to the specified *Configuration*. The *Configuration* can contain any or all of the following options, in any order, separated by commas if more than one appears:

- `'-maxnumel'` *MaxNum* — Limits the number of elements saved for an array to *MaxNum*, which must be an integer between 1 and 10000. For a character array, the upper limit is set to twice the value that you specify with *MaxNum*. If an array is larger than *MaxNum*, the whole array appears in the MAT-file rather than the MATLAB file, generating a warning. Default: 1000

- `'-maxlevels'` *MaxLevels* limits the number of levels of hierarchy saved for a structure or cell array to *MaxLevels*, which must be an integer between 1 and 200. If a structure or cell array is deeper than *MaxLevels*, the whole entity appears in the MAT-file rather than the MATLAB file, generating a warning. Default: 20

- `'-textwidth'` *TextWidth* sets the text wrap width in the MATLAB file to *TextWidth*, which must be an integer between 32 and 256. Default: 76

- `'-2dslice'` — Sets two dimensions for 2-D slices that represent n-D (where n is greater than 2) char, logic, or numeric array data. `Simulink.saveVars` uses the first two dimensions of the n-D array to specify the size of the 2-D slice, unless you supply two positive integer arguments after the `-2dslice` option. If you specify two integer arguments:

  - The two integers must be positive.
  - The two integers must be less than or equal to the number of dimensions of the n-D array.
  - The second integer must be greater than the first.

`Simulink.saveVars(`*filename*`, `*Specifications*`, `*MatlabVer*`)` acts as described by *Specifications* (which represents the specifications after *filename* in any of the above syntaxes) saving any MAT-file that it creates in the format required by the MATLAB version specified by *MatlabVer*. Possible values:

- `'-v7.3'` — 7.3 or later
- `'-v7.0'` — 7.0 or later

- `'-v6'` — Version 6 or later
- `'-v4'` — Any MATLAB version

[*r1*, *r2*] = Simulink.saveVars(*filename*, *Specifications*) acts as described by *Specifications* (which represents the specifications after *filename* in any of the above syntaxes) and reports what variables it has saved:

- *r1* — A cell array of character vectors. The character vectors name all variables (if any) that were saved to a MATLAB file.
- *r2* — A cell array of character vectors. The character vectors name all variables (if any) that were saved to a MAT-file.

Input Arguments

filename

The name of the file or names of the files that the function creates or updates. The *filename* cannot match the name of any variable in the current workspace. The *filename* can have the suffix .m, but the function ignores it.

VarNames

A variable or sequence of comma-separated variables. The function saves only the specified variables to the output file. You can use the wildcard character * to save all variables that match a pattern. The * matches one or more characters, including non-alphanumeric characters.

'-regexp', RegExps

After the keyword, a regular expression or sequence of comma-separated regular expressions. The function saves to the output file only those variables whose names match one of the expressions. See "Regular Expressions" (MATLAB) for more information A call to the function can specify both *VarNames* and -regexps *RegExps*, in that order and comma-separated.

UpdateOption

Any of three keywords that control the action of the function. The possible values are:

- `'-create'` — Create a new MATLAB file (and MAT-file if needed) as directed by the *Specifications*.

- `'-update'` — Update the existing MATLAB file (and MAT-file if needed) specified by *filename* by changing only variables that match the *Specifications* and already exist in the file or files. The order of the variables in the file or files is preserved.

- `'-append'` — Update the existing MATLAB file (and MAT-file if needed) specified by *filename* by:

  - Updating variables that match the *Specifications* and already exist in the file or files, preserving the existing order in the file or files.

  - Appending variables that match the *Specifications* and do not exist in the file or files by appending the variables that match the *Specifications* to the file or files.

Default: `'-create'`

Configuration

Any or all of the following options, in any order, separated by commas if more than one appears:

- `'-maxnumel'` *MaxNum* — Limits the number of elements saved for an array to *MaxNum*, which must be an integer between 0 and 10000. If an array is larger than that, the whole array appears in the MAT-file rather than the MATLAB script file, generating a warning. Default: 1000

- `'-maxlevels'` *MaxLevels* — Limits the number of levels saved for a structure or cell array to *MaxLevels*, which must be an integer between 0 and 200. If a structure or cell array is deeper than that, the whole entity appears in the MAT-file rather than the MATLAB script file, generating a warning. Default: 20

- `'-textwidth'` *TextWidth* — Sets the text wrap width in the MATLAB script file to *TextWidth*, which must be an integer between 32 and 256. Default: 76

- `'-2dslice'` — Sets two dimensions for 2-D slices that represent n-D (where n is greater than 2) arrays of char, logic, or numeric data. Using the `'-2dslice'` option produces more readable generated code that is consistent with how MATLAB displays n-D array data.

  `Simulink.saveVars` uses the first two dimensions of the n-D array to specify the size of the 2-D slice, unless you supply two positive integer arguments after the `-2dslice` option. If you specify two integer arguments:

  - The two integers must be positive.

- The two integers must be less than or equal to the number of dimensions of the n-D array.
- The second integer must be greater than the first.

Note You can use the MATLAB Preferences to change the defaults for the `-maxnumel`, `-maxlevels`, `'-2dslice'`, and `-textwidth` configuration options. In the **Workspace** pane, use the options in the **Saving variables as MATLAB script files** group.

MatlabVer

Specifies the MATLAB version whose syntax will be used by any MAT-file saved by the function.

- `'-v7.3'` — 7.3 or later
- `'-v7.0'` — 7.0 or later
- `'-v6'` — Version 6 or later
- `'-v4'` — Any MATLAB version

Default: `'-v7.3'`

Output Arguments

r1

A list of the names of all variables (if any) that were saved to a MATLAB file.

r2

A list of the names of all variables (if any) that were saved to a MAT-file.

Examples

Define some base workspace variables, then save them all to a new MATLAB file named `MyVars.m` using the default values for all input arguments except the *filename*.

```
a = 1;
b = 2.5;
```

```
c = 'A string';
d = {a, b, c};
Simulink.saveVars('MyVars');
```

Define additional base workspace variables, then append them to the existing file `MyVars.m` without changing the values previously saved in the file:

```
K = Simulink.Parameter;
MyType = fixdt (1,16,3);
Simulink.saveVars('MyVars', '-append', 'K', 'MyType');
```

Update the variables `V1` and `V2` with their values in a MATLAB file, or for any whose value cannot be converted to MATLAB code, in a MAT-file. The file must already exist. Any array with more than 10 elements will be saved to a MAT-file that can be loaded on any version of MATLAB. The return argument `r1` lists the names of any variables saved to a MATLAB file; `r2` lists any saved to a MAT-file.

```
[r1, r2] = Simulink.saveVars('MyFile', 'V1', 'V2', '-update',
'-maxnumel', 10, '-v4');
```

Specify a 2-D slice for the output of the `my3Dtable` 3-D array. Specify that the 2-D slice expands along the first and third dimensions:

```
my3DTable = zeros(3, 4, 2, 'single');
Simulink.saveVars('mfile.m', 'my3DTable', '-2dslice', 1, 3);
```

The generated MATLAB code is:

```
my3DTable = zeros(3, 4, 2, 'single');
my3DTable (:,1,:) = single ( ...
  [1 13;
   5 17;
   9 21]);
my3DTable (:,2,:) = single( ...
  [2 14;
   6 18;
   10 22]);
my3DTable (:,3,:) = single( ...
  [3 15;
   7 19;
   11 23]);
my3DTable (:,4,:) = single( ...
  [4 16;
   8 20;
   12 24]);
```

Limitations

The `Simulink.saveVars` function:

- Does not preserve shared references.
- Ignores dynamic properties of objects.
- Saves the following to the MAT-file although they could appear in the MATLAB file:

    - `Simulink.ConfigSet` objects with custom target components.
      (Use the `Simulink.ConfigSet` method `saveAs` instead.)
    - `Simulink.Timeseries` and `Simulink.ModelDataLogs` objects.

If you save many variables, the generated MATLAB file can contain many lines of code and take a long time to execute. To avoid the long execution time, consider these alternatives:

- Permanently store variables in a data dictionary instead of using `Simulink.saveVars`. A data dictionary also provides more tools for managing variables. See "Determine Where to Store Variables and Objects for Simulink Models".
- Save variables in a MAT-file by using the `save` function.

Tips

- If you do not need to save variables in an easily-understood form, see the `save` function.
- If you need to save only bus objects, use the `Simulink.Bus.save` function.
- If you need to save only a configuration set, use the `Simulink.ConfigSet.saveAs` method.

`Simulink.Bus.save` | `Simulink.Bus.save` | `Simulink.ConfigSet` | `matlab.io.saveVariablesToScript` | `save`

Introduced in R2010a

Simulink.sdi.addToRun

Package: Simulink.sdi

Add one or more signals to existing run

Syntax

```
sigIDs = Simulink.sdi.addToRun(runID,'vars',var,var2,...,varn)
sigIDs = Simulink.sdi.addToRun(runID,'namevalue',sourceNames,
dataValues)
```

Description

`sigIDs = Simulink.sdi.addToRun(runID,'vars',var,var2,...,varn)` adds the data in the variables `var,var2,...,varn` to the run corresponding to the `runID` and returns the signal IDs for the signals added to the run.

`sigIDs = Simulink.sdi.addToRun(runID,'namevalue',sourceNames, dataValues)` adds the data in the cell array `dataValues` to the run corresponding to the `runID` and returns the signal IDs for the signals added to the run. The `sourceNames` argument specifies names to use for the source of the data in `dataValues` in the signal metadata.

Examples

Add Workspace Data to Run

This example shows how to use `Simulink.sdi.addToRun` to add workspace data to a run in the Simulation Data Inspector.

Generate Workspace Data

Generate workspace data to add to a simulation run in place of measured data, input data, or any other data that you want to associate with the simulation.

```
time = linspace(0, 60, 201);
cos_vals = 2*cos(2*pi/6.8*time);
cos_ts = timeseries(cos_vals, time);
cos_ts.Name = 'cosine';
```

Simulate Model

Simulate the `slexAircraftExample` model to create a run containing the simulation outputs.

```
load_system('slexAircraftExample');
sim('slexAircraftExample','SaveFormat','Dataset');
```

Add Workspace Data to Simulation Run

Add the workspace data to the run. Then, view the results in the Simulation Data Inspector.

```
% Get run ID
count = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(count);

% Add data to run
sigIDs = Simulink.sdi.addToRun(runID,'vars',cos_ts);

Simulink.sdi.view
```

Add States Data to a Run

The model `slexAircraftExample` is configured to log outputs, states, and time data. The output data automatically logs to the Simulation Data Inspector as well as the base workspace, but the states data does not. To bring the states data into the Simulation Data Inspector, you can record the data, or you can add it to the run created by simulating the model. This example shows how to add logged states data to a Simulation Data Inspector run programmatically.

Simulate the Model and Get States Data

Simulate the model using the `sim` function with `'ReturnWorkspaceOutputs'` set to `'on'`. Select the states data, `xout`, from the simulation outputs.

```
load_system('slexAircraftExample')
```

```
simOut = sim('slexAircraftExample','ReturnWorkspaceOutputs','on',...
    'SaveFormat','Dataset');

% Get states data from simulation output
states = simOut.xout;
```

Get the Run ID

Because the outputs data automatically logs to the Simulation Data Inspector, a run is created upon simulating `slexAircraftExample`. Get the run ID for the run using the Simulation Data Inspector programmatic interface.

```
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

Add States Data to the Run

Add the states data to the run with the output data.

```
sigIDs = Simulink.sdi.addToRun(runID,'namevalue',{'States'},{states});
```

Input Arguments

runID — Run ID to add data to
scalar

Run ID for the signal you want to add data to. The Simulation Data Inspector assigns a unique run ID when it creates a run. You can get the run ID for your run using `Simulink.sdi.getAllRunIDs` and `Simulink.sdi.getRunIDByIndex`.

var — Data to add to run
variable

Workspace data to add to the run. `Simulink.sdi.addToRun` supports all loading and logging data formats, including `timeseries` and `Simulink.SimulationData.Dataset`. Provide one or more `var` inputs when you specify `'vars'` as the second argument.

Example: `myData`

sourceNames — Cell array of names for signal metadata
cell array of character vectors

Names to use as the source of the data in the metadata for the added signals. Provide a `sourceNames` input when you specify `'namevalue'` as the second argument.

Example: `{'speed','position'}`

dataValues — Cell array of data to add to run
cell array

Cell array of data to add to the run. Provide a `dataValues` input when you specify `'namevalue'` as the second argument.

Example: `{sig1,sig2}`

Output Arguments

sigIDs — Matrix containing signal IDs for added signals
matrix

Matrix of signal IDs for signals added to the run.

"Inspect and Compare Data Programmatically"

Introduced in R2011b

Simulink.sdi.cleanupWorkerResources

Clean up worker repositories

Syntax

Simulink.sdi.cleanupWorkerResources

Description

Simulink.sdi.cleanupWorkerResources removes redundant data from each parallel worker repository file used by the Simulation Data Inspector. Call this function while worker pools are running. The Simulation Data Inspector automatically cleans up repository files when you close the worker pool.

Examples

Access Data from a Parallel Simulation

This example executes parallel simulations of the model slexAircraftExample with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport('local')

% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];
```

Initialize Parallel Workers

Use gcp to create a pool of local workers to run parallel simulations if you don't already have one. In an `spmd` code block, load the `slexAircraftExample` model and select signals to log. To avoid data concurrency issues using `sim` in `parfor`, create a temporary directory for each worker to use during simulations.

```
p = gcp;
spmd

    % Load system and select signals to log
    load_system('slexAircraftExample')
    Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
    Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',

    % Create temporary directory on each worker
    workDir = pwd;
    addpath(workDir)
    tempDir = tempname;
    mkdir(tempDir)
    cd(tempDir)

end
```

Run Parallel Simulations

Use `parfor` to run the seven simulations in parallel. Select the value for `Ts` for each simulation, and modify the value of `Ts` in the model workspace. Then, run the simulation and build an array of `Simulink.sdi.WorkerRun` objects to access the data with the Simulation Data Inspector. After the `parfor` loop, use another `spmd` segment to remove the temporary directories from the workers.

```
parfor index = 1:7

    % Select value for Ts
    Ts_val = Ts_vals(index);

    % Change the filter time constant and simulate
    modelWorkspace = get_param('slexAircraftExample','modelworkspace');
    modelWorkspace.assignin('Ts',Ts_val)
    sim('slexAircraftExample')

    % Create a worker run for each simulation
    workerRun(index) = Simulink.sdi.WorkerRun.getLatest
```

```
    end

    spmd

        % Remove temporary directories
        cd(workDir)
        rmdir(tempDir, 's')
        rmpath(workDir)

    end
```

Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

```
ds(7) = Simulink.SimulationData.Dataset;

for a = 1:7
    ds(a) = workerRun(a).getDataset;
end
ds(1)

ans =
Simulink.SimulationData.Dataset '' with 2 elements

                          Name        BlockPath
                          _____  _____
    1  [1x1 Signal]       alpha, rad  ...rcraftExample/Aircraft Dynamics Model
    2  [1x1 Signal]       Stick       slexAircraftExample/Pilot

  - Use braces { } to access, modify, or add elements using index.
```

Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```
for b = 1:7
    datasetRef(b) = workerRun(b).getDatasetRef;
end

datasetRef(1)
```

```
ans =
  DatasetRef with properties:

          Name: 'Run 5: slexAircraftExample'
           Run: [1×1 Simulink.sdi.Run]
    numElements: 2
```

Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local Run objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```
for c = 1:7

    Runs(c) = workerRun(c).getLocalRun;
    Ts_val_str = num2str(Ts_vals(c));
    desc = strcat('Ts = ', Ts_val_str);
    Runs(c).Description = desc;
    Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);

end
```

Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

```
Simulink.sdi.cleanupWorkerResources
```

"Inspect and Compare Data Programmatically"

Introduced in R2017b

Simulink.sdi.clear

Package: Simulink.sdi

Clear all data from the Simulation Data Inspector

Syntax

```
Simulink.sdi.clear
```

Description

`Simulink.sdi.clear` clears all data from the Simulation Data Inspector. `Simulink.sdi.clear` does not affect preferences or settings you have configured in the Simulation Data Inspector. Use `Simulink.sdi.clearPreferences` to reset the Simulation Data Inspector preferences to their default values.

Examples

Save a Simulation Data Inspector Session

This example shows how to create, save, and load a Simulation Data Inspector session. The example uses data logging to populate the Simulation Data Inspector with data and then uses the Simulation Data Inspector's programmatic interface to create plots to visualize the data. After saving the data and visualization settings in a session, the Simulation Data Inspector repository is emptied in order to demonstrate how to load the session.

Create Simulation Data

This example logs the `Stick`, `alpha, rad`, and `q, rad/sec` signals to generate simulation data using the model `slexAircraftExample` and creates two runs. The first uses a sine input, and the second has a square wave input.

```
% Ensure you start with an empty Simulation Data Inspector repository
Simulink.sdi.clear
```

```
% Load system
load_system('slexAircraftExample')

% Configure signals to log
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot',1,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',3,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on')

% Change Pilot signal to sine
set_param('slexAircraftExample/Pilot','WaveForm','sine')

% Simulate model
sim('slexAircraftExample')

% Change Pilot signal to square
set_param('slexAircraftExample/Pilot','WaveForm','square')

% Simulate model
sim('slexAircraftExample')
```

Access Simulation Data

Use the Simulation Data Inspector programmatic interface to access the simulation data
so you can create plots to visualize the signals.

```
% Get run objects
runIDs = Simulink.sdi.getAllRunIDs;
sineRunID = runIDs(end-1);
squareRunID = runIDs(end);

sineRun = Simulink.sdi.getRun(sineRunID);
squareRun = Simulink.sdi.getRun(squareRunID);

% Get signal objects
sineOut = sineRun.getSignalByIndex(1);
sineIn = sineRun.getSignalByIndex(3);

squareOut = squareRun.getSignalByIndex(1);
squareIn = squareRun.getSignalByIndex(3);
```

Create Plots in the Simulation Data Inspector

Use the programmatic interface to visualize the signal data from the two simulation runs.
You can set the plot layout and plot signals on specific subplots.

2-707

```
% Set subplot layout
Simulink.sdi.setSubPlotLayout(2,1)

% Plot sine data on top plot
sineIn.plotOnSubPlot(1,1,true)
sineOut.plotOnSubPlot(1,1,true)

% Plot square wave data on bottom plot
squareIn.plotOnSubPlot(2,1,true)
squareOut.plotOnSubPlot(2,1,true)
```

Save a Simulation Data Inspector Session

First, view the plots you just created. Then, save the Simulation Data Inspector session as an MLDATX-file to recover your data along with your preference selections and plots.

```
% View the visualized data in the Simulation Data Inspector
Simulink.sdi.view

% Save the Simulation Data Inspector session
Simulink.sdi.save('myData.mldatx')
```

Load a Simulation Data Inspector Session

First, clear the Simulation Data Inspector repository with `Simulink.sdi.clear` and reset visualization settings with `Simulink.sdi.clearPreferences`. Then, you can load the session to see how the data and settings are preserved.

```
% Clear Simulation Data Inspector repository and preferences
Simulink.sdi.clear
Simulink.sdi.clearPreferences

% Load session file to view data
Simulink.sdi.load('myData.mldatx');
```

"Inspect and Compare Data Programmatically"

Introduced in R2011b

Simulink.sdi.clearPreferences

Clear Simulation Data Inspector preference changes

Syntax

`Simulink.sdi.clearPreferences`

Description

`Simulink.sdi.clearPreferences` reverts all Simulation Data Inspector preferences to their default values.

Examples

Restore All Simulation Data Inspector Preferences to Default Values

You can restore default values to all Simulation Data Inspector preferences programmatically with `Simulink.sdi.clearPreferences`.

`Simulink.sdi.clearPreferences`

Modify Run Naming Rule Then Restore Default

This example shows how to use the Simulation Data Inspector API to modify the Simulation Data Inspector run naming rule, check a run's name, restore default preferences, and check the run naming rule.

```
% Load model
load_system('sldemo_fuelsys')

% Modify run naming rule
Simulink.sdi.setRunNamingRule('<model_name> Run <run_index>')
```

```matlab
% Simulate system
sim('sldemo_fuelsys')

% Check run name
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
run = Simulink.sdi.getRun(runID);
run.name

ans =
'sldemo_fuelsys Run 15'

% Clear preferences to reset the run naming rule
Simulink.sdi.clearPreferences

% Check run naming rule
Simulink.sdi.getRunNamingRule

ans =
'Run <run_index>: <model_name>'
```

Introduced in R2017a

Simulink.sdi.close

Package: Simulink.sdi

Close the Simulation Data Inspector

Syntax

```
Simulink.sdi.close
Simulink.sdi.close('filename')
```

Description

`Simulink.sdi.close` closes the Simulation Data Inspector.

`Simulink.sdi.close('filename')` closes the Simulation Data Inspector and saves the data in the file, `filename`.

Examples

Close the Simulation Data Inspector from the Command Line

You can close the Simulation Data Inspector from the MATLAB command line when you have finished inspecting and analyzing your data.

```
Simulink.sdi.close
```

Create a Run and View the Data

This example shows how to create a run, add data to it, and then view the data in the Simulation Data Inspector.

Create Data for the Run

This example creates `timeseries` objects for a sine and a cosine. To visualize your data, the Simulation Data Inspector requires at least a time vector that corresponds with your data.

```
% Generate timeseries data
time = linspace(0, 20, 100);

sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals, time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals, time);
cos_ts.Name = 'Cosine, T=8';
```

Create a Simulation Data Inspector Run and Add Your Data

To give the Simulation Data Inspector access to your data, use the `create` method and create a run. This example modifies some of the run's properties to help identify the data. You can easily view run and signal properties with the Simulation Data Inspector.

```
% Create a run
run = Simulink.sdi.Run.create;
run.Name = 'Sinusoids';
run.Description = 'Sine and cosine signals with different frequencies';

% Add timeseries data to run
run.add('vars', sine_ts, cos_ts);
```

Plot Your Data Using the `Simulink.sdi.Signal` Object

The `getSignalByIndex` method returns a `Simulink.sdi.Signal` object that can be used to plot the signal in the Simulation Data Inspector. You can also programmatically control aspects of the plot's appearance, such as the color and style of the line representing the signal. This example customizes the subplot layout and signal characteristics.

```
% Get signal, modify its properties, and change Checked property to true
sine_sig = run.getSignalByIndex(1);
sine_sig.LineColor = [0 0 1];
sine_sig.LineDashed = '-.';
sine_sig.Checked = true;
```

2-713

```
% Add another subplot for the cosine signal
Simulink.sdi.setSubPlotLayout(2, 1);

% Plot the cosine signal and customize its appearance
cos_sig = run.getSignalByIndex(2);
cos_sig.LineColor = [0 1 0];
cos_sig.plotOnSubPlot(2, 1, true);

% View the signal in the Simulation Data Inspector
Simulink.sdi.view
```

Close the Simulation Data Inspector and Save Your Data

```
Simulink.sdi.close('sinusoids.mat')
```

Simulink.sdi.compareRuns

Package: Simulink.sdi

Compare the data in two simulation runs

Syntax

```
diffResult = Simulink.sdi.compareRuns(runID1,runID2)
diffResult = Simulink.sdi.compareRuns(runID1,runID2,Name,Value)
```

Description

`diffResult = Simulink.sdi.compareRuns(runID1,runID2)` compares the data in the runs corresponding to `runID1` and `runID2`, returning the result in the `Simulink.sdi.DiffRunResult` object, `diffResult`.

`diffResult = Simulink.sdi.compareRuns(runID1,runID2,Name,Value)` compares the simulation runs corresponding to `runID1` and `runID2` using the options specified by one or more `Name,Value` pair arguments and returns the comparison result in the `Simulink.sdi.DiffRunResult` object, `diffResult`. For more information about how the Simulation Data Inspector aligns signals for comparison, see "How the Simulation Data Inspector Compares Data".

Examples

Compare Simulation Data Inspector Runs Programmatically

This example shows how to compare runs of simulation data and analyze the comparison results with the Simulation Data Inspector programmatic interface.

Generate Runs of Simulation Data

Simulate the model with different `Desired relative slip` values to create runs of simulation data to analyze with the Simulation Data Inspector programmatic interface.

```
% Open model
load_system('ex_sldemo_absbrake')

% Set the desired slip ratio to 0.24 and simulate
set_param('ex_sldemo_absbrake/Desired relative slip','Value','0.24')
sim('ex_sldemo_absbrake');

% Change the desired slip ratio to 0.25 and simulate
set_param('ex_sldemo_absbrake/Desired relative slip','Value','0.25')
sim('ex_sldemo_absbrake');
```

Compare Runs with a Global Tolerance

Get the run IDs for the runs you just created with the `Simulink.sdi.getAllRunIDs` function. Then, compare the runs using a global relative tolerance and a global time tolerance to analyze whether your data meets specifications.

```
% Get run IDs for last two runs
runIDs = Simulink.sdi.getAllRunIDs;
runID1 = runIDs(end - 1);
runID2 = runIDs(end);

% Compare runs
runResult = Simulink.sdi.compareRuns(runID1,runID2,'reltol',0.2,'timetol',0.5);
```

Create a Plot of a Comparison Result

Use the `Simulink.sdi.DiffRunResult` object you created in the previous step with `Simulink.sdi.compareRuns` to access the data for the Ww signal result to plot it in a figure.

```
% Plot the |Ww| signal difference
signalResult_Ww = runResult.getResultByIndex(1);
figure(1)
plot(signalResult_Ww.Diff)
```

Analyze Simulation Data with Signal Tolerances

You can change tolerance values on a signal-by-signal basis to evaluate the effect of a model parameter change. This example uses the `slexAircraftExample` model and the Simulation Data Inspector to evaluate the effect of changing the time constant for the low-pass filter following the control input.

Setup

Load the model, and mark the `q, rad/sec` and `alpha, rad` signals for logging. Then, simulate the model to create the baseline run.

```
% Load example model
load_system('slexAircraftExample')

% Mark the q, rad/sec and alpha, rad signals for logging
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',3,'or
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'or

% Simulate system
sim('slexAircraftExample')
```

Modify Model Parameter

Modify the model parameter Ts in the model workspace to change the time constant of the input low-pass filter.

```
% Change input filter time constant
modelWorkspace = get_param('slexAircraftExample','modelworkspace');
modelWorkspace.assignin('Ts',1)

% Simulate again
sim('slexAircraftExample')
```

Compare Runs and Inspect Results

Use the Simulink.sdi.compareRuns function to compare the data from the simulations. Then, inspect the match property of the signal result to see whether the signals fell within the default tolerance of 0.

```
% Get run data
runIDs = Simulink.sdi.getAllRunIDs;
runID1 = runIDs(end - 1);
runID2 = runIDs(end);

% Compare runs
diffRun1 = Simulink.sdi.compareRuns(runID1,runID2);

% Get signal result
sig1Result1 = diffRun1.getResultByIndex(1);
sig2Result1 = diffRun1.getResultByIndex(2);

% Check whether signals matched
sig1Result1.Match
```

```
ans = logical
   0
```

```
sig2Result1.Match
```

```
ans = logical
   0
```

Compare Runs with Signal Tolerances

The signals did not match within the default tolerance of 0. To further analyze the effect of the time constant change, add signal tolerances to the comparison with the baseline signal properties to determine the tolerance required for a pass. This example uses a combination of time and absolute tolerances.

```
% Get signal object for sigID1
run1 = Simulink.sdi.getRun(runID1);
sigID1 = run1.getSignalIDByIndex(1);
sigID2 = run1.getSignalIDByIndex(2);

sig1 = Simulink.sdi.getSignal(sigID1);
sig2 = Simulink.sdi.getSignal(sigID2);

% Set tolerances for q, rad/sec
sig1.AbsTol = 0.1;
sig1.TimeTol = 0.6;

% Set tolerances for alpha, rad
sig2.AbsTol = 0.2;
sig2.TimeTol = 0.8;

% Run the comparison again
diffRun2 = Simulink.sdi.compareRuns(runID1,runID2);
sig1Result2 = diffRun2.getResultByIndex(1);
sig2Result2 = diffRun2.getResultByIndex(2);

% Check the result
sig1Result2.Match
```

```
ans = logical
   1
```

```
sig2Result2.Match
```

2-719

```
ans = logical
   1
```

Compare Runs with Alignment Criteria

This example shows how to compare runs using your desired criteria for aligning signals between runs.

Generate Runs to Compare

This example simulates the `slexAircraftExample` model with two different values of `Ts` to generate two simulation runs for comparison.

```
% Configure model "slexAircraftExample" for logging and simulate
simOut = sim('slexAircraftExample', 'SaveOutput', 'on', 'SaveFormat', ...
                'Dataset', 'ReturnWorkspaceOutputs', 'on');

% Create a run from the simulation output
runID1 = Simulink.sdi.createRun('My Run', 'namevalue', {'simOut'}, ...
                                {simOut});

% Get workspace and change workspace variable Ts
modelWorkspace = get_param('slexAircraftExample', 'modelworkspace');
modelWorkspace.assignin('Ts', 0.2);

% Simulate again
simOut = sim('slexAircraftExample', 'SaveOutput', 'on', 'SaveFormat', ...
                'Dataset', 'ReturnWorkspaceOutputs', 'on');

% Create another run and get signal IDs
runID2 = Simulink.sdi.createRun('New Run', 'namevalue', {'simOut'}, ...
                                {simOut});
```

Define Alignment Criteria for the Comparison

Before running the comparison, define how you want the Simulation Data Inspector to align the signals between the runs. This example aligns signals by their name, then by their block path, and then by their Simulink identifier.

```
% Define the alignment criteria for the comparison to align signals by
% name, then by block path, then by SID
alignMethods = [Simulink.sdi.AlignType.SignalName
```

```
                      Simulink.sdi.AlignType.BlockPath
                      Simulink.sdi.AlignType.SID];
```

Compare the Runs with the Specified Alignment Criteria

Compare the simulation data in your two runs, with the alignment criteria you specified.

```
% Compare the runs
diffResults = Simulink.sdi.compareRuns(runID1 ,runID2, alignMethods);
```

Check the Comparison Results for the Aligned Signals

You can use the getResultByIndex method to access the aligned signals and the results of the comparison for each signal in the runs you compared.

```
% Check the number of comparisons in the result
numComparisons = diffResults.count;

% Iterate through each element and display results in command window
for k = 1:numComparisons

    resultAtIdx = diffResults.getResultByIndex(k);

    % Get signal IDs for each comparison result
    sigID1 = resultAtIdx.signalID1;
    sigID2 = resultAtIdx.signalID2;

    sig1 = Simulink.sdi.getSignal(sigID1);
    sig2 = Simulink.sdi.getSignal(sigID2);

    % Display whether signals match
    displayStr = 'Signals with IDs %s and %s %s \n';
    if resultAtIdx.match
       fprintf(displayStr, sig1.Name, sig2.Name, 'match');
    else
       fprintf(displayStr, sig1.Name, sig2.Name, 'do not match');
    end

end

Signals with IDs Actuator Model and Actuator Model do not match
Signals with IDs Integrate qdot and Integrate qdot do not match
Signals with IDs Integrate and Integrate do not match
Signals with IDs Alpha-sensor Low-pass Filter and Alpha-sensor Low-pass Filter do not
Signals with IDs Pitch Rate Lead Filter and Pitch Rate Lead Filter do not match
```

2-721

```
Signals with IDs Proportional plus integral compensator and Proportional plus integral
Signals with IDs Stick Prefilter and Stick Prefilter do not match
Signals with IDs Q-gust model and Q-gust model do not match
Signals with IDs W-gust model(1) and W-gust model(1) do not match
Signals with IDs W-gust model(2) and W-gust model(2) do not match
Signals with IDs alpha, rad and alpha, rad do not match
```

- "Inspect and Compare Data Programmatically"
- "Compare Simulation Data"
- "How the Simulation Data Inspector Compares Data"

Input Arguments

`runID1` — Baseline run identifier
integer

Numerical identification for the **Baseline** run in the comparison.

`runID2` — Compare to run identifier
integer

Numerical identification for the **Compare to** run in the comparison.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (`'  '`). You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: `'abstol',x,'align',alignOpts`

`align` — Signal alignment options
array

Array specifying alignment algorithms to use for pairing signals from the runs for comparison. The Simulation Data Inspector aligns signals first by the first element in the array, then by the second element in the array, and so on.

Value	Aligns By
`Simulink.sdi.AlignType.BlockPath`	Path to the signal's source block
`Simulink.sdi.AlignType.SID`	Simulink identifier "Locate Diagram Components Using Simulink Identifiers"
`Simulink.sdi.AlignType.SignalName`	Signal name
`Simulink.sdi.AlignType.DataSource`	Path of the variable in the MATLAB workspace

Example:
`[Simulink.sdi.AlignType.SignalName,Simulink.sdi.AlignType.SID]`
specifies signal alignment by name and then by SID.

`abstol` — Absolute tolerance for comparison
0 (default) | scalar

Positive-valued global absolute tolerance used for all signals in the run comparison. For more information about tolerances in the Simulation Data Inspector, see "How the Simulation Data Inspector Compares Data".

Example: `0.5`

Data Types: `double`

`reltol` — Relative tolerance for comparison
0 (default) | scalar

Positive-valued global relative tolerance used for all signals in the run comparison. The relative tolerance is expressed as a fractional multiplier. For example, `0.1` specifies a 10 percent tolerance. For more information about how the relative tolerance is applied in the Simulation Data Inspector, see "How the Simulation Data Inspector Compares Data".

Example: `0.1`

Data Types: `double`

`timetol` — Time tolerance for comparison
0 (default) | scalar

Positive-valued global time tolerance used for all signals in the run comparison. Specify the time tolerance with units of seconds. For more information about tolerances in the Simulation Data Inspector, see "How the Simulation Data Inspector Compares Data".

Example: `0.2`

Data Types: `double`

Output Arguments

`diffResult` — Comparison results
'Simulink.sdi.diffRunResult'

`Simulink.sdi.DiffRunResult` object that provides access to comparison results.

"Compare Simulation Data"
"How the Simulation Data Inspector Compares Data"

Introduced in R2011b

Simulink.sdi.compareSignals

Package: Simulink.sdi

Compare data from two signals

Syntax

```
diff = Simulink.sdi.compareSignals(sigID1,sigID2)
```

Description

`diff = Simulink.sdi.compareSignals(sigID1,sigID2)` compares the signals corresponding to the signal IDs `sigID1` and `sigID2` and returns the results in a `Simulink.sdi.DiffSignalResult` object. For more information on how the comparison results are computed, see "How the Simulation Data Inspector Compares Data".

Examples

Compare Signals Within a Simulation Run

This example uses the `slexAircraftExample` model to demonstrate the comparison of the input and output signals for a control system. The example marks the signals for streaming then gets the run object for a simulation run. Signal IDs from the run object specify the signals to be compared.

```
% Load model slexAircraftExample and mark signals for streaming
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot',1,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on

% Simulate model slexAircraftExample
sim('slexAircraftExample')
```

```matlab
% Get run IDs for most recent run
allIDs = Simulink.sdi.getAllRunIDs;
runID = allIDs(end);

% Get Run object
run = Simulink.sdi.getRun(runID);

% Get signal IDs
signalID1 = run.getSignalIDByIndex(1);
signalID2 = run.getSignalIDByIndex(2);

if (run.isValidSignalID(signalID1))
    % Change signal tolerance
    signal1 = Simulink.sdi.getSignal(signalID1);
    signal1.AbsTol = 0.1;
end

if (run.isValidSignalID(signalID1) && run.isValidSignalID(signalID2))
    % Compare signals
    diff = Simulink.sdi.compareSignals(signalID1,signalID2);

    % Check whether signals match within tolerance
    match = diff.match
end

match = logical
    0
```

Compare Signals from Different Runs

This example shows how to compare signals from different simulation runs using the Simulation Data Inspector's `Simulink.sdi.compareSignals` function. When you only have one signal of interest to compare, using a signal comparison returns the `Simulink.sdi.diffSignalResult` object with the comparison data directly.

Generate Simulation Data

Use the `slexAircraftExample` model to generate simulation runs. Between the runs, change the time constant of the input filter.

```matlab
% Load example model
load_system('slexAircraftExample')
```

```
% Mark the alpha, rad signal for streaming
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'o

% Simulate system
sim('slexAircraftExample')

% Change input filter time constant
modelWorkspace = get_param('slexAircraftExample','modelworkspace');
modelWorkspace.assignin('Ts',0.2)

% Simulate again
sim('slexAircraftExample')
```

Get Signal IDs for the Signal Comparison

Create run objects using the run IDs, and then use `getSignalIDByIndex` to get the signal IDs to pass to `Simulink.sdi.compareSignals`.

```
% Get run data
runIDs = Simulink.sdi.getAllRunIDs;

runID1 = runIDs(end-1);
runID2 = runIDs(end);

run1 = Simulink.sdi.getRun(runID1);
run2 = Simulink.sdi.getRun(runID2);

sigID1 = run1.getSignalIDByIndex(1);
sigID2 = run2.getSignalIDByIndex(1);
```

Compare Signals

Compare the signals, and open the Simulation Data Inspector to view the results.

```
diffResult = Simulink.sdi.compareSignals(sigID1,sigID2);

Simulink.sdi.view
```

Input Arguments

sigID1 — Signal ID of Baseline signal
scalar

Signal ID for the **Baseline** signal. The Simulation Data Inspector assigns signal and run IDs when you create a run for your data. You can access the signal ID from a `Simulink.sdi.Run` object with the `getSignalIDByIndex` method.

`sigID2` — Signal ID of Compare to signal
scalar

Signal ID for the **Compare to** signal. The Simulation Data Inspector assigns signal and run IDs when you create a run for your data. You can access the signal ID from a `Simulink.sdi.Run` object with the `getSignalIDByIndex` method.

Output Arguments

`diff` — Comparison results
'Simulink.sdi.diffSignalResult'

`Simulink.sdi.DiffSignalResult` object containing the results of the signal comparison.

Introduced in R2011b

Simulink.sdi.copyRun

Copy a Simulation Data Inspector run

Syntax

```
newRunID = Simulink.sdi.copyRun(runID)
[newRunID,runIndex] = Simulink.sdi.copyRun(runID)
[newRunID,runIndex,signalIDs] = Simulink.sdi.copyRun(runID)
```

Description

`newRunID = Simulink.sdi.copyRun(runID)` copies the run corresponding to `runID` and returns the run ID for the new run. The new run includes all the simulation data and metadata from the original run. You can modify the copy of the run by adding or deleting signals and metadata while still retaining the original run.

`[newRunID,runIndex] = Simulink.sdi.copyRun(runID)` copies the run corresponding to `runID` and returns the run ID and index in the Simulation Data Inspector repository for the new run. The new run includes all the simulation data and metadata from the original run.

`[newRunID,runIndex,signalIDs] = Simulink.sdi.copyRun(runID)` copies the run corresponding to `runID` and returns the signal IDs for the signals in the new run along with its run ID and index in the Simulation Data Inspector repository. The new run includes all the simulation data and metadata from the original run.

Examples

Compare a Subset of Signals

This example shows how to use `Simulink.sdi.copyRun` and `Simulink.sdi.deleteSignal` to create a copy of a run that contains a subset of the signals from the original run. You can use the copy to analyze and run comparisons on a

subset of signals while still holding onto the original run that has all of the signals. For example, the model `sldemo_fuelsys` is configured to log ten signals. To compare the system's responses to different types of failures, you don't need to run the comparison on all of the logged signals. Deleting signals that do not represent the system's response before running the comparison saves processing time and simplifies the view of the results.

Create Runs

Load the model `sldemo_fuelsys` and run simulations to create runs in the Simulation Data Inspector. The first run simulates a failure of the throttle angle sensor, and the second run simulates a failure of the exhaust gas oxygen sensor.

```
load_system('sldemo_fuelsys')
modelWorkspace = get_param('sldemo_fuelsys','modelworkspace');
modelWorkspace.assignin('throttle_sw',0)
modelWorkspace.assignin('ego_sw',1)
sim('sldemo_fuelsys')

modelWorkspace.assignin('throttle_sw',1)
modelWorkspace.assignin('ego_sw',0)
sim('sldemo_fuelsys')
```

Copy the Run

Use the Simulation Data Inspector's programmatic interface to get `Simulink.sdi.Run` objects for the simulations, and then create copies of the runs.

```
% Get runs
runIDs = Simulink.sdi.getAllRunIDs;

runID1 = runIDs(end-1);
runID2 = runIDs(end);

run1 = Simulink.sdi.getRun(runID1);
run2 = Simulink.sdi.getRun(runID2);

% Create a copy of each run, truncRun
[truncRun1,runIndex1,signalIDs1] = Simulink.sdi.copyRun(runID1);
[truncRun2,runIndex2,signalIDs2] = Simulink.sdi.copyRun(runID2);
```

Delete Signals in Run Copy

The `sldemo_fuelsys` model is configured to log the values of the fault switches along with several signals representing the system's response. When you compare the system's

response when a throttle angle sensor fails to its response when an exhaust gas oxygen sensor fails, comparing the fault switch states does not provide new information. Therefore, delete the switch signals before running the comparison to eliminate unnecessary computations.

```
Simulink.sdi.deleteSignal(signalIDs1(1))
Simulink.sdi.deleteSignal(signalIDs1(3))
Simulink.sdi.deleteSignal(signalIDs1(5))
Simulink.sdi.deleteSignal(signalIDs1(8))

Simulink.sdi.deleteSignal(signalIDs2(1))
Simulink.sdi.deleteSignal(signalIDs2(3))
Simulink.sdi.deleteSignal(signalIDs2(5))
Simulink.sdi.deleteSignal(signalIDs2(8))
```

Compare Truncated Runs

You can use the truncated runs you created with `Simulink.sdi.copyRun` and `Simulink.sdi.deleteSignal` to perform a comparison of the system's response to different types of failures. Then, open the Simulation Data Inspector to view the comparison results.

```
diff = Simulink.sdi.compareRuns(truncRun1,truncRun2);

Simulink.sdi.view
```

Input Arguments

runID — Numeric run identifier
scalar

Run ID for the run you want to copy. The Simulation Data Inspector assigns run IDs when it creates runs. You can get the run ID for your run using `Simulink.sdi.getAllRunIDs` or `Simulink.sdi.getRunIDByIndex`.

Output Arguments

newRunID — Run ID for the copy
scalar

Run ID for the copy of the run.

`runIndex` — Run index for the copy
scalar

Index of the copy in the Simulation Data Inspector repository.

`signalIDs` — Numeric identifiers for the signals in the copy
matrix

Matrix containing the signal IDs for the copies of signals created in the copy of the run.

"Inspect and Compare Data Programmatically"

Introduced in R2011b

Simulink.sdi.copyRunViewSettings

Copy line style and color for signals from one run to another

Syntax

```
sigIDs = Simulink.sdi.copyRunViewSettings(run1,run2,plot)
```

Description

`sigIDs = Simulink.sdi.copyRunViewSettings(run1,run2,plot)` copies the line style and color specifications from `runID1` to `runID2` for matched signals. You can specify `run1` and `run2` with their run ID or as a `Simulink.sdi.Run` object. If `plot` is specified as `true`, `Simulink.sdi.copyRunViewSettings` also changes signal parameters in both runs so that aligned signals that are plotted come from the `run2`. The function returns an array of signal identifiers for the signals that the Simulation Data Inspector aligned between the two runs. To learn more about how the Simulation Data Inspector aligns signals between runs, see "How the Simulation Data Inspector Compares Data".

Examples

Copy View Settings to a Run

This example shows how to copy the view settings for aligned signals from one run to another.

Simulate Your Model and get Run Object

Simulate the `vdp` model to create a run of data to visualize.

```
load_system('vdp')
set_param('vdp','SaveFormat','Dataset','SaveOutput','on')
sim('vdp')
```

```
runIndex = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(runIndex);
run = Simulink.sdi.getRun(runID);
```

Modify View Settings for Signals

Use the `Simulink.sdi.Run` object to access the signals in the run. Then, modify the signals' view settings, and plot them in the Simulation Data Inspector. Open the Simulation Data Inspector and use `Simulink.sdi.snapshot` to view the results.

```
sig1 = run.getSignalByIndex(1);
sig2 = run.getSignalByIndex(2);

sig1.LineColor = [0 0 1];
sig1.LineDashed = '-.';

sig2.LineColor = [1 0 0];
sig2.LineDashed = ':';
```

Capture a Snapshot from the Simulation Data Inspector

Create a `Simulink.sdi.CustomSnapshot` object and use the `Simulink.sdi.snapshot` function to programmatically capture a snapshot of the contents of the Simulation Data Inspector.

```
snap = Simulink.sdi.CustomSnapshot;

snap.Rows = 2;
snap.YRange = {[-2.25 2.25],[-3 3]};
snap.plotOnSubPlot(1,1,sig1,true)
snap.plotOnSubPlot(2,1,sig2,true)

fig = Simulink.sdi.snapshot("from","custom","to","figure","settings",snap);
```

Copy the View Settings to a New Simulation Run

Simulate the model again, with a different Mu value. Then, visualize the new run by copying the view settings from the first run. Specify the plot input as true to plot the signals from the new run.

```
set_param('vdp/Mu','Gain','5')
sim('vdp')

runIndex2 = Simulink.sdi.getRunCount;
runID2 = Simulink.sdi.getRunIDByIndex(runIndex2);
run2 = Simulink.sdi.getRun(runID2);

sigIDs = Simulink.sdi.copyRunViewSettings(runID,runID2,true);
```

2-735

Capture a Snapshot of the New Simulation Run

Use the `Simulink.sdi.CustomSnapshot` object to capture a snapshot of the new simulation run. First, clear the signals from the subplots. Then, plot the signals from the new run and capture another snapshot.

```
snap.clearSignals
snap.YRange = {[-2.25 2.25],[-8 8]};
snap.plotOnSubPlot(1,1,sigIDs(2),true)
snap.plotOnSubPlot(2,1,sigIDs(1),true)

fig = snap.snapshot("to","figure");
```

Input Arguments

run1 — Simulation Data Inspector run ID for source run
scalar | `'Simulink.sdi.Run'` object

Run with the view settings you want to copy specified with its run ID or
`Simulink.sdi.Run` object. The Simulation Data Inspector assigns run IDs when it
creates runs. You can get the run ID for your run using `Simulink.sdi.getAllRunIDs`
or `Simulink.sdi.getRunIDByIndex`.

run2 — Simulation Data Inspector run ID for destination run
scalar | `'Simulink.sdi.Run'` object

Run you want to copy the view settings to, specified with its run ID or `Simulink.sdi.Run` object. The Simulation Data Inspector assigns run IDs when it creates runs. You can get the run ID for your run using `Simulink.sdi.getAllRunIDs` or `Simulink.sdi.getRunIDByIndex`.

`plot` — Specify whether to update plotted signals
`true` | `false`

Specifies whether the Simulation Data Inspector changes the plot settings in the runs corresponding to `run1` and `run2`.

- When `plot` is `true`, the Simulation Data Inspector modifies the signal parameters so that the aligned signals that are plotted come from `run2`.

- When `plot` is `false`, the Simulation Data Inspector does not change which signals are plotted.

Data Types: `logical`

Output Arguments

`sigIDs` — Signal IDs for aligned signals
matrix

Matrix containing the signal IDs for signals in `run2` that aligned with signals in `run1` and had view settings modified.

Topics

"Inspect and Compare Data Programmatically"
"Create Plots Using the Simulation Data Inspector"

Introduced in R2016a

Simulink.sdi.createRun

Package: Simulink.sdi

Create a run in the Simulation Data Inspector

Syntax

```
runID = Simulink.sdi.createRun
runID = Simulink.sdi.createRun(runName)
runID = Simulink.sdi.createRun(var)

runID = Simulink.sdi.createRun(runName,'vars',var,var2,...,varn)
runID = Simulink.sdi.createRun(runName,'namevalue',sourceNames,
sigValues)
runID = Simulink.sdi.createRun(runName,'file',filename)

[runID,runIndex] = Simulink.sdi.createRun( ___ )
[runID,runIndex,signalIDs] = Simulink.sdi.createRun( ___ )
```

Description

`runID = Simulink.sdi.createRun` creates an empty, unnamed run in the Simulation Data Inspector repository and returns the run ID. You can use `Simulink.sdi.getRun` to get a `Simulink.sdi.Run` object for the run, which allows you to add metadata and signals to the run.

`runID = Simulink.sdi.createRun(runName)` creates an empty run named `runName`.

`runID = Simulink.sdi.createRun(var)` creates a run named `var` containing the data in the workspace variable `var`.

`runID = Simulink.sdi.createRun(runName,'vars',var,var2,...,varn)` creates a run named `runName` containing data from one or more variables in the base workspace. The signals in the run take their names from the variable names.

runID = Simulink.sdi.createRun(runName,'namevalue',sourceNames, sigValues) creates a run named runName with the data in the cell array sigValues. The cell array of sourceNames specifies names to use as the source for the sigValues data.

runID = Simulink.sdi.createRun(runName,'file',filename) creates a run with data from the file specified by filename.

[runID,runIndex] = Simulink.sdi.createRun(___) returns the run ID and run index for the run created in the Simulation Data Inspector repository.

[runID,runIndex,signalIDs] = Simulink.sdi.createRun(___) returns the run ID, run index within the Simulation Data Inspector, and the signal IDs for the signals in the run.

Examples

Create a Run in the Simulation Data Inspector

This example shows several ways to create a run in the Simulation Data Inspector for your data. You can create a run from simulation outputs, workspace data, and from a file.

Create Data

You can create Simulation Data Inspector runs from workspace data or from a file. The namevalue syntax for Simulink.sdi.createRun can be useful for hierarchical data. Create example data to use in each scenario.

```
% Create timeseries workspace data
time = linspace(0, 20, 101);

sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals,time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals,time);
cos_ts.Name = 'Cosine, T=8';

% Create Dataset workspace data
```

```
sinusoids_ds = Simulink.SimulationData.Dataset;
sinusoids_ds = sinusoids_ds.add(cos_ts);
sinusoids_ds = sinusoids_ds.add(sine_ts);

doubSine = 2*sine_ts;
doubCos = 2*cos_ts;

doubSinusoids_ds = Simulink.SimulationData.Dataset;
doubSinusoids_ds = doubSinusoids_ds.add(doubSine);
doubSinusoids_ds = doubSinusoids_ds.add(doubCos);

% Save workspace data to a MAT-file
save sinusoids.mat sine_ts cos_ts
```

Create a Run with a Run Object

You can create a run object using the `Simulink.sdi.Run` object's `create` method and then add data to the run using the `add` method. The `add` method supports all loading and logging data formats.

```
% Create a run
run = Simulink.sdi.Run.create;
run.Name = 'Sinusoids';
run.Description = 'Sine and cosine signals of different frequencies';

% Add timeseries data to run
run.add('vars', sine_ts, cos_ts);
```

Create a Run for a Variable

When you have only one signal of interest that you want to inspect and compare in the Simulation Data Inspector you can use a simple syntax to create the run. The run takes the same name as the variable.

```
runID = Simulink.sdi.createRun(sine_ts);
```

Create a Named Empty Run

With this syntax, you can create an empty run and specify its name. Then, you can use the returned runID to add data to the run.

```
runID = Simulink.sdi.createRun('My Waves');
signalID = Simulink.sdi.addToRun(runID,'vars',cos_ts);
```

Create a Run from Multiple Workspace Variables

When your signals of interest are in multiple variables in your workspace, use the `'vars'` syntax. You can also use this syntax to provide a custom name for a run created from a single variable.

```
runID = Simulink.sdi.createRun(' My Sinusoids','vars',sine_ts,cos_ts);
```

Create a Run and Specify the Source for the Data

Providing a name for the source of the run data can be helpful, particularly with hierarchical data. Use the `'namevalue'` syntax to specify data source names.

```
runID = Simulink.sdi.createRun('Waves','namevalue',{'Sinusoids',...
    'BigSinusoids'},{sinusoids_ds,doubSinusoids_ds});
```

Create a Run from Data in a File

You can create a run in the Simulation Data Inspector directly from a file of data using the `'file'` syntax.

```
runID = Simulink.sdi.createRun('Wave Data','file','sinusoids.mat');
```

View Runs in the Simulation Data Inspector

Look at the runs in the Inspect pane to see the results from each run creation method. You can select a run or a signal to view its metadata.

```
Simulink.sdi.view
```

Create a Simulation Data Inspector Run and Access Signal Data

This example shows how to access signal data when you create a run in the Simulation Data Inspector.

Generate Data for Run

For this example, create timeseries data for sine and cosine signals.

```
% Create timeseries workspace data
time = linspace(0, 20, 101);

sine_vals = sin(2*pi/5*time);
```

```
sine_ts = timeseries(sine_vals,time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals,time);
cos_ts.Name = 'Cosine, T=8';
```

Create a Run and Return Signal IDs

You can use the `Simulink.sdi.createRun` syntax with multiple return arguments to get the signal IDs more directly instead of accessing the signal IDs through a `Simulink.sdi.Run` object.

```
[runID,runIndex,sigIDs] = Simulink.sdi.createRun('Sinusoids','vars',...
    sine_ts,cos_ts);

cosID = sigIDs(2);
cosSig = Simulink.sdi.getSignal(cosID);
```

Modify Signal Properties and View in the Simulation Data Inspector

You can use the `Simulink.sdi.Signal` object to view and modify signal properties and to plot signals in the Simulation Data Inspector.

```
cosSig.Checked = true;
cosSig.AbsTol = 0.05;
Simulink.sdi.view
cosSig.Name

ans =

    'Cosine, T=8'
```

Input Arguments

runName — Name for the run
character vector

Name for the run in the Simulation Data Inspector.

Example: `'Baseline Simulation'`

var — Variable name
variable

Variable in the base workspace containing the data you want to create a run for in the Simulation Data Inspector. The Simulation Data Inspector requires an associated time vector for your data. `Simulink.sdi.createRun` supports all loading and logging data formats, including `timeseries` and `Simulink.SimulationData.Dataset`.

Provide one `var` argument when `var` is the only argument and one or more `var` arguments when you specify `'vars'` for the second argument.

Example: `myData`

sourceNames — Cell array of signal names
cell array

Cell array of character vectors in which each element is the name of the source for data in the run. Provide a `sigNames` input when you specify `'namevalue'` for the second argument.

Example: `{'sig1','sig2'}`

sigValues — Signal data
cell array

Cell array of variables containing signal data for the run. Provide a `sigValues` input when you specify `'namevalue'` for the second argument.

Example: `{var1,var2}`

filename — Name of file containing data for run
character vector

File name of the file containing your run data. Provide a `filename` input when you specify `'file'` for the second argument.

Example: `'simulation.mat'`

Output Arguments

runID — Run identifier
scalar

Run identifier for the new run.

`runIndex` — Run index
scalar

Index of the new run in the Simulation Data Inspector repository.

`signalIDs` — Signal IDs for signals in run
vector

Vector containing the signal IDs for the signals in the run.

See Also

`Simulink.sdi.Run` | `Simulink.sdi.addToRun` | `Simulink.sdi.copyRun` | `Simulink.sdi.createRunOrAddToStreamedRun` | `Simulink.sdi.deleteRun` | `Simulink.sdi.getRun`

Introduced in R2011b

Simulink.sdi.createRunOrAddToStreamedRun

Package: Simulink.sdi

Create a single run for all simulation outputs

Syntax

```
runID = Simulink.sdi.createRunOrAddToStreamedRun(mdl,runName,
varSources,varValues)
```

Description

`runID = Simulink.sdi.createRunOrAddToStreamedRun(mdl,runName, varSources,varValues)` creates a run with the data `varValues` if no run exists in the Simulation Data Inspector repository for the model `mdl`. If one or more runs for the model `mdl` exist in the Simulation Data Inspector repository, the function adds `varValues` to the most recent run associated with `mdl`. The run is named according to `runName`, and the sources for the data in `varValues` are named according to `varSources`.

Examples

Add Signals to a Run

This example shows how to use `Simulink.sdi.createRunOrAddToStreamedRun` to add data to an existing run for a model. In this example, you add logged states data to the run created through simulation.

Simulate the Model

Simulate the model to generate data. The model `slexAircraftExample` is configured to log outputs, so the Simulation Data Inspector automatically creates a run with the logged outport data. Using this simulation syntax, `out` contains the outport data (`yout`) and the states data (`xout`).

```
load_system('slexAircraftExample')
out = sim('slexAircraftExample','ReturnWorkspaceOutputs','on',...
          'SaveFormat','Dataset');
```

Add Logged States Data to Run

The Simulation Data Inspector automatically created a run for the logged outport data. Add the logged state data to the existing run using Simulink.sdi.createRunOrAddToStreamedRun.

```
Simulink.sdi.createRunOrAddToStreamedRun('slexAircraftExample','Run 1',...
          {'out'},{out});
```

Open the Simulation Data Inspector to View Results

Using Simulink.sdi.createRunOrAddToStreamedRun avoids redundancy in the data shown in the Simulation Data Inspector. Using Simulink.sdi.createRun to bring the states data into the Simulation Data Inspector creates a second run. Simulink.sdi.addToRun creates a duplicate signal from the outport data. Using Simulink.sdi.createRunOrAddToStreamedRun, you can include all simulation data in a single run without duplicating any signals.

```
Simulink.sdi.view
```

Input Arguments

mdl — Name of model that created simulation data
character vector

Name of the model the simulation data is from, specified as a character vector.

Example: 'sldemo_absbrake'

runName — Name for the run
character vector

Name for the new or augmented run. If Simulink.sdi.createRunOrAddToStreamedRun adds data to an existing run, the run is renamed according to runName.

Example: 'Run 1'

varSources — Names to use for the sources of data
cell array of character vectors

Names for the sources of the data in `varValues`.

Example: `{'sig1','sig2'}`

varValues — Data to add to run
cell array

Cell array of data to incorporate into the run.
`Simulink.sdi.createRunOrAddToStreamedRun` supports data in all logging and loading formats, including `timeseries` and `Simulink.SimulationData.Dataset`.

Example: `{sig1,sig2}`

Output Arguments

runID — Run identifier
scalar

Run identifier for the new or augmented run.

Introduced in R2017a

Simulink.sdi.deleteRun

Package: Simulink.sdi

Delete a run from the Simulation Data Inspector repository

Syntax

```
Simulink.sdi.deleteRun(runID)
```

Description

`Simulink.sdi.deleteRun(runID)` deletes the run corresponding to `runID`. When you delete a run, the indices of all runs following the deleted run change to account for the change in the run count. Deleting a run does not change any run IDs.

Examples

Delete a Run

You can delete a run from the Simulation Data Inspector repository to free up memory space or to declutter your workspace from data you do not need.

```
% Load and simulate sldemo_fuelsys model
load_system('sldemo_fuelsys')
sim('sldemo_fuelsys')

% Get the run ID for the run
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

```
% Delete the run
Simulink.sdi.deleteRun(runID)
```

Input Arguments

runID — Run identifier
scalar

Run ID for the run you want to delete. You can get the run ID for a run using
`Simulink.sdi.getAllRunIDs` or `Simulink.sdi.getRunIDByIndex`.

See Also
`Simulink.sdi.clear` | `Simulink.sdi.copyRun` | `Simulink.sdi.deleteSignal` |
`Simulink.sdi.getAllRunIDs` | `Simulink.sdi.getRunIDByIndex` |
`Simulink.sdi.setRunOverwrite`

Topics
"Inspect and Compare Data Programmatically"

Introduced in R2011b

Simulink.sdi.deleteSignal

Package: Simulink.sdi

Delete a signal from the Simulation Data Inspector repository

Syntax

```
Simulink.sdi.deleteSignal(sigID)
```

Description

`Simulink.sdi.deleteSignal(sigID)` deletes the signal corresponding to `sigID` from the Simulation Data Inspector repository.

Examples

Compare a Subset of Signals

This example shows how to use `Simulink.sdi.copyRun` and `Simulink.sdi.deleteSignal` to create a copy of a run that contains a subset of the signals from the original run. You can use the copy to analyze and run comparisons on a subset of signals while still holding onto the original run that has all of the signals. For example, the model `sldemo_fuelsys` is configured to log ten signals. To compare the system's responses to different types of failures, you don't need to run the comparison on all of the logged signals. Deleting signals that do not represent the system's response before running the comparison saves processing time and simplifies the view of the results.

Create Runs

Load the model `sldemo_fuelsys` and run simulations to create runs in the Simulation Data Inspector. The first run simulates a failure of the throttle angle sensor, and the second run simulates a failure of the exhaust gas oxygen sensor.

```
load_system('sldemo_fuelsys')
modelWorkspace = get_param('sldemo_fuelsys','modelworkspace');
modelWorkspace.assignin('throttle_sw',0)
modelWorkspace.assignin('ego_sw',1)
sim('sldemo_fuelsys')

modelWorkspace.assignin('throttle_sw',1)
modelWorkspace.assignin('ego_sw',0)
sim('sldemo_fuelsys')
```

Copy the Run

Use the Simulation Data Inspector's programmatic interface to get `Simulink.sdi.Run` objects for the simulations, and then create copies of the runs.

```
% Get runs
runIDs = Simulink.sdi.getAllRunIDs;

runID1 = runIDs(end-1);
runID2 = runIDs(end);

run1 = Simulink.sdi.getRun(runID1);
run2 = Simulink.sdi.getRun(runID2);

% Create a copy of each run, truncRun
[truncRun1,runIndex1,signalIDs1] = Simulink.sdi.copyRun(runID1);
[truncRun2,runIndex2,signalIDs2] = Simulink.sdi.copyRun(runID2);
```

Delete Signals in Run Copy

The `sldemo_fuelsys` model is configured to log the values of the fault switches along with several signals representing the system's response. When you compare the system's response when a throttle angle sensor fails to its response when an exhaust gas oxygen sensor fails, comparing the fault switch states does not provide new information. Therefore, delete the switch signals before running the comparison to eliminate unnecessary computations.

```
Simulink.sdi.deleteSignal(signalIDs1(1))
Simulink.sdi.deleteSignal(signalIDs1(3))
Simulink.sdi.deleteSignal(signalIDs1(5))
Simulink.sdi.deleteSignal(signalIDs1(8))

Simulink.sdi.deleteSignal(signalIDs2(1))
Simulink.sdi.deleteSignal(signalIDs2(3))
```

```
Simulink.sdi.deleteSignal(signalIDs2(5))
Simulink.sdi.deleteSignal(signalIDs2(8))
```

Compare Truncated Runs

You can use the truncated runs you created with `Simulink.sdi.copyRun` and `Simulink.sdi.deleteSignal` to perform a comparison of the system's response to different types of failures. Then, open the Simulation Data Inspector to view the comparison results.

```
diff = Simulink.sdi.compareRuns(truncRun1,truncRun2);
```

```
Simulink.sdi.view
```

Input Arguments

sigID — Signal ID
scalar

Unique number identifying the signal within the Simulation Data Inspector repository. You can get the signal ID for a signal as a return from `Simulink.sdi.createRun` or using the `Simulink.sdi.Run` object's methods.

See Also

`Simulink.sdi.Run` | `Simulink.sdi.Signal` | `Simulink.sdi.copyRun` | `Simulink.sdi.createRun`

Topics
"Inspect and Compare Data Programmatically"

Introduced in R2016a

Simulink.sdi.enablePCTSupport

Control how the Simulation Data Inspector works with the Parallel Computing Toolbox

Syntax

```
Simulink.sdi.enablePCTSupport(mode)
```

Description

`Simulink.sdi.enablePCTSupport(mode)` enables support for automatic data import from parallel workers into the Simulation Data Inspector, according to the mode specified by `mode`. You can configure the Simulation Data Inspector to import no worker data, only data from local workers, or data from all workers — local and remote. You can also configure the parallel worker support as manual, where you manually select runs to import to the Simulation Data Inspector using the `Simulink.sdi.sendWorkerRunToClient` function. By default, the Simulation Data Inspector automatically imports runs from local workers.

Examples

Enable Parallel Support for All Workers

Configure Simulation Data Inspector parallel worker support to import the output automatically from both local and remote workers.

```
Simulink.sdi.enablePCTSupport('all')
```

Disable Support for Parallel Workers

To prevent the output from any Parallel Computing Toolbox workers from automatically importing to the Simulation Data Inspector, disable Parallel Computing Toolbox support.

```
Simulink.sdi.enablePCTSupport('none')
```

Manually Send Runs from Parallel Workers to the Simulation Data Inspector

This example shows how to use `Simulink.sdi.sendWorkerRunToClient` to send runs created using parallel workers manually to the Simulation Data Inspector.

Setup

This example runs several simulations of the `vdp` model, varying the value of the gain, `Mu`. To set up for the parallel simulation, define a vector of `Mu` values and configure the Simulation Data Inspector for manual Parallel Computing Toolbox support.

```
% Enable manual Parallel Computing Toolbox support
Simulink.sdi.enablePCTSupport('manual');

% Choose several Mu values
MuVals = [1 2 3 4];
```

Initialize Parallel Workers

Use `parpool` to start a pool of four parallel workers. This example calls `parpool` inside an if statement so you only create a parallel pool if you don't already have one. You can use `spmd` to run initialization code common to all workers. For example, load the `vdp` model and select signals to log to runs that we can send to the Simulation Data Inspector on the client MATLAB. To avoid data concurrency issues when simulating with `sim` in `parfor`, create a temporary directory on each worker. After the simulations complete, another spmd block deletes the temporary directories.

```
p = gcp('nocreate');

if isempty(p)

    parpool(4);

end
```

```
Starting parallel pool (parpool) using the 'local' profile ...
connected to 4 workers.
```

```
spmd
```

```
% Load system and select signals to log
load_system('vdp')
Simulink.sdi.markSignalForStreaming('vdp/x1',1,'on')
Simulink.sdi.markSignalForStreaming('vdp/x2',1,'on')

% Create temporary directory for simulation on worker
workDir = pwd;
addpath(workDir)
tempDir = tempname;
mkdir(tempDir)
cd(tempDir)

end
```

Run Parallel Simulations with `parfor`

To stream data from parallel workers to the Simulation Data Inspector, you have to run parallel simulations using `parfor`. Each worker runs a `vdp` simulation with a different value of `Mu`. Simulink cannot access the contents of the `parfor` loop, so the variable `MuVal` is defined in the worker's workspace, where the `vdp` model can see it, using `assignin`.

```
parfor (index = 1:4)

    % Set value of Mu in the worker's base workspace
    assignin('base','MuVal',MuVals(index));

    % Modify the value of Mu in the model and simulate
    set_param('vdp/Mu','Gain','MuVal')
    sim('vdp')
```

Access Data and Send Run to Client MATLAB

You can use the Simulation Data Inspector programmatic interface on the worker the same way you would in the client MATLAB. This example creates a `Simulink.sdi.Run` object and attaches the value of `Mu` used in the simulation with the `Tag` property.

```
% Attach metadata to the run
IDs = Simulink.sdi.getAllRunIDs;
lastIndex = length(IDs);
runID = Simulink.sdi.getRunIDByIndex(lastIndex);
run = Simulink.sdi.getRun(runID);
```

```
    run.Tag = strcat('Mu = ',num2str(MuVals(index)));

    % Send the run to the Simulation Data Inspector on the client MATLAB
    Simulink.sdi.sendWorkerRunToClient
```

end

Close Temporary Directories and View Runs in the Simulation Data Inspector

Use another `spmd` section to delete the temporary directories created on the workers once the simulations complete. In each simulation, `Simulink.sdi.sendWorkerRunToClient` imported runs from all the workers into the Simulation Data Inspector. You can view the data and check the run properties to see the value of `Mu` used during simulation.

spmd

```
    % Remove temporary directories
    cd(workDir)
    rmdir(tempDir, 's')
    rmpath(workDir)
```

end

```
Simulink.sdi.view
```

Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport('local')
```

```
% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];
```

Initialize Parallel Workers

Use gcp to create a pool of local workers to run parallel simulations if you don't already have one. In an `spmd` code block, load the `slexAircraftExample` model and select signals to log. To avoid data concurrency issues using `sim` in `parfor`, create a temporary directory for each worker to use during simulations.

```
p = gcp;
spmd

    % Load system and select signals to log
    load_system('slexAircraftExample')
    Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
    Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',

    % Create temporary directory on each worker
    workDir = pwd;
    addpath(workDir)
    tempDir = tempname;
    mkdir(tempDir)
    cd(tempDir)

end
```

Run Parallel Simulations

Use `parfor` to run the seven simulations in parallel. Select the value for `Ts` for each simulation, and modify the value of `Ts` in the model workspace. Then, run the simulation and build an array of `Simulink.sdi.WorkerRun` objects to access the data with the Simulation Data Inspector. After the `parfor` loop, use another `spmd` segment to remove the temporary directories from the workers.

```
parfor index = 1:7

    % Select value for Ts
    Ts_val = Ts_vals(index);

    % Change the filter time constant and simulate
    modelWorkspace = get_param('slexAircraftExample','modelworkspace');
    modelWorkspace.assignin('Ts',Ts_val)
```

```
    sim('slexAircraftExample')

    % Create a worker run for each simulation
    workerRun(index) = Simulink.sdi.WorkerRun.getLatest

end

spmd

    % Remove temporary directories
    cd(workDir)
    rmdir(tempDir, 's')
    rmpath(workDir)

end
```

Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

```
ds(7) = Simulink.SimulationData.Dataset;

for a = 1:7
    ds(a) = workerRun(a).getDataset;
end
ds(1)

ans =
Simulink.SimulationData.Dataset '' with 2 elements

                        Name        BlockPath
                        _____  _____
    1  [1x1 Signal]     alpha, rad  ...rcraftExample/Aircraft Dynamics Model
    2  [1x1 Signal]     Stick       slexAircraftExample/Pilot

  - Use braces { } to access, modify, or add elements using index.
```

Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```
for b = 1:7
    datasetRef(b) = workerRun(b).getDatasetRef;
```

```
end

datasetRef(1)

ans =
  DatasetRef with properties:

          Name: 'Run 5: slexAircraftExample'
           Run: [1×1 Simulink.sdi.Run]
    numElements: 2
```

Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local Run objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```
for c = 1:7

    Runs(c) = workerRun(c).getLocalRun;
    Ts_val_str = num2str(Ts_vals(c));
    desc = strcat('Ts = ', Ts_val_str);
    Runs(c).Description = desc;
    Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);

end
```

Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

```
Simulink.sdi.cleanupWorkerResources
```

Input Arguments

mode — Prallel worker support mode
`'local'` (default) | `'none'` | `'all'` | `'manual'`

Mode of Simulation Data Inspector support for importing runs from parallel workers.

- `'local'` — The default behavior configures automatic import for runs generated on local workers.
- `'none'` — Disables parallel worker support. No runs from local or remote workers import to the Simulation Data Inspector.
- `'all'` — Enables automatic import for runs created from local and remote workers.
- `'manual'` — Configures support for manual import of runs created by parallel workers using the `Simulink.sdi.sendWorkerRunToClient` function.

Data Types: `char` | `string`

Introduced in R2017b

Simulink.sdi.exportRun

Export run data to a Simulink.SimulationData.Dataset object

Syntax

```
dataset = Simulink.sdi.exportRun(runID)
```

Description

`dataset = Simulink.sdi.exportRun(runID)` creates a
`Simulink.SimulationData.Dataset` object in the base workspace with the data in
the Simulation Data Inspector run identified by `runID`.

Examples

Export Run Data

This example shows how to export data from a run in the Simulation Data Inspector to a
`Simulink.SimulationData.Dataset` object in the base workspace you can use to
further process your data. The method you choose to export your run depends on the
processing you do in your script. If you have a run object for the run, you can use the
`export` method to create a `Simulink.SimulationData.Dataset` object with the run's
data in the base workspace. If you do not have a run object, use the
`Simulink.sdi.exportRun` function to export the run to the workspace.

Export Run Using `Simulink.sdi.exportRun`

Use the `Simulink.sdi.export` function when your workflow does not include creating
a run object.

```
% Load vdp model
load_system('vdp')

% Get handles for signal lines in model
```

```matlab
SignalHandles = get_param('vdp', 'Lines');

% Mark signals for streaming
Simulink.sdi.markSignalForStreaming(SignalHandles(5).Handle, 'on')
Simulink.sdi.markSignalForStreaming(SignalHandles(6).Handle, 'on')

% Simulate vdp model
sim('vdp')

% Get run ID for simulation run
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Export run
simDataset = Simulink.sdi.exportRun(runID);
```

Export Run Using export Method

When you already have a `Simulink.sdi.Run` object for your run, you can use the `export` method to create a `Simulink.SimulationData.Dataset` object in the base workspace for further processing of the data.

```matlab
% Load vdp model
load_system('vdp')

% Get handles for signal lines in model
SignalHandles = get_param('vdp', 'Lines');

% Mark signals for streaming
Simulink.sdi.markSignalForStreaming(SignalHandles(5).Handle, 'on')
Simulink.sdi.markSignalForStreaming(SignalHandles(6).Handle, 'on')

% Simulate model vdp and get run object
sim('vdp')

% Get run object for simulation run
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
run = Simulink.sdi.getRun(runID);

% Get signal ids for signals
sigID1 = run.getSignalIDByIndex(1);
sigID2 = run.getSignalIDByIndex(2);

% Compare signals
```

2-763

```
diffResult = Simulink.sdi.compareSignals(sigID1,sigID2);
diffResult.match
```

```
ans = logical
   0
```

```
% Export run
simDataset = run.export;
```

Input Arguments

runID — Run identifier
scalar

Run identifier for the run you want to export to a
`Simulink.SimulationData.Dataset`. The Simulation Data Inspector assigns a unique
run ID when it creates a run. You can get the run ID for your run using
`Simulink.sdi.getAllRunIDs` and `Simulink.sdi.getRunIDByIndex`.

Output Arguments

dataset — Dataset containing run data
`Simulink.SimulationData.Dataset`

`Simulink.SimulationData.Dataset` object containing the data from the run
identified by `runID`.

Introduced in R2017a

Simulink.sdi.getAllRunIDs

Package: Simulink.sdi

Get all Simulation Data Inspector run identifiers

Syntax

```
runIDs = Simulink.sdi.getAllRunIDs
```

Description

`runIDs = Simulink.sdi.getAllRunIDs` returns a matrix of the run identifiers for all runs in the Simulation Data Inspector repository.

Examples

Get Run ID for a Simulation

Many workflows that use the Simulation Data Inspector programmatic interface start with obtaining the ID for a simulation run. This example shows two different methods to use the programmatic interface to get the run ID for a run. You can use the run ID to create a `Simulink.sdi.Run` object to access run data and metadata, or you can use the run ID for a comparison.

Simulate a Model to Create a Run

The model `sldemo_fuelsys` is already configured for logging. When you simulate the model, the Simulation Data Inspector automatically creates a run and assigns it a run ID.

```
% Load and simulate system
load_system('sldemo_fuelsys')
sim('sldemo_fuelsys')
```

Get Run ID Using `Simulink.sdi.getAllRunIDs`

`Simulink.sdi.getAllRunIDs` returns an array of all run IDs for runs in the Simulation Data Inspector repository in order, with the most recently created run at the end.

```
% Get runID for most recent run
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

Get Run ID Using `Simulink.sdi.getRunIDByIndex`

You can also use `Simulink.sdi.getRunCount` and `Simulink.sdi.getRunIDByIndex` to get the run ID for a run. This method is useful if you also want to use `count` as a counting variable to index through the runs in the Simulation Data Inspector repository.

```
count = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(count);
```

Analyze Simulation Data with Signal Tolerances

You can change tolerance values on a signal-by-signal basis to evaluate the effect of a model parameter change. This example uses the `slexAircraftExample` model and the Simulation Data Inspector to evaluate the effect of changing the time constant for the low-pass filter following the control input.

Setup

Load the model, and mark the `q, rad/sec` and `alpha, rad` signals for logging. Then, simulate the model to create the baseline run.

```
% Load example model
load_system('slexAircraftExample')

% Mark the q, rad/sec and alpha, rad signals for logging
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',3,'o
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'o

% Simulate system
sim('slexAircraftExample')
```

Modify Model Parameter

Modify the model parameter `Ts` in the model workspace to change the time constant of the input low-pass filter.

```
% Change input filter time constant
modelWorkspace = get_param('slexAircraftExample','modelworkspace');
modelWorkspace.assignin('Ts',1)

% Simulate again
sim('slexAircraftExample')
```

Compare Runs and Inspect Results

Use the `Simulink.sdi.compareRuns` function to compare the data from the simulations. Then, inspect the `match` property of the signal result to see whether the signals fell within the default tolerance of 0.

```
% Get run data
runIDs = Simulink.sdi.getAllRunIDs;
runID1 = runIDs(end - 1);
runID2 = runIDs(end);

% Compare runs
diffRun1 = Simulink.sdi.compareRuns(runID1,runID2);

% Get signal result
sig1Result1 = diffRun1.getResultByIndex(1);
sig2Result1 = diffRun1.getResultByIndex(2);

% Check whether signals matched
sig1Result1.Match

ans = logical
   0

sig2Result1.Match

ans = logical
   0
```

Compare Runs with Signal Tolerances

The signals did not match within the default tolerance of 0. To further analyze the effect of the time constant change, add signal tolerances to the comparison with the baseline signal properties to determine the tolerance required for a pass. This example uses a combination of time and absolute tolerances.

```
% Get signal object for sigID1
run1 = Simulink.sdi.getRun(runID1);
sigID1 = run1.getSignalIDByIndex(1);
sigID2 = run1.getSignalIDByIndex(2);

sig1 = Simulink.sdi.getSignal(sigID1);
sig2 = Simulink.sdi.getSignal(sigID2);

% Set tolerances for q, rad/sec
sig1.AbsTol = 0.1;
sig1.TimeTol = 0.6;

% Set tolerances for alpha, rad
sig2.AbsTol = 0.2;
sig2.TimeTol = 0.8;

% Run the comparison again
diffRun2 = Simulink.sdi.compareRuns(runID1,runID2);
sig1Result2 = diffRun2.getResultByIndex(1);
sig2Result2 = diffRun2.getResultByIndex(2);

% Check the result
sig1Result2.Match

ans = logical
   1

sig2Result2.Match

ans = logical
   1
```

Output Arguments

runIDs — Matrix of Simulation Data Inspector run IDs
matrix

Matrix of run IDs in the Simulation Data Inspector repository.

Simulink.sdi.getMarkersOn

Package: Simulink.sdi

Return logical indication of marker property

Syntax

```
res = Simulink.sdi.getMarkersOn
```

Description

`res = Simulink.sdi.getMarkersOn` returns the logical value `res` indicating whether data markers are displayed on plots in the Simulation Data Inspector.

Examples

Save Marker State

You can use the `Simulink.sdi.getMarkersOn` property to save or query part of a Simulation Data Inspector configuration.

```
markerState = Simulink.sdi.getMarkersOn
```

Output Arguments

res — Logical indication of marker state
true | false

Logical indication of whether markers are displayed on plots in the Simulation Data Inspector.

- `true` indicates that markers are displayed.

- `false` indicates that markers are not displayed.

Introduced in R2017b

Simulink.sdi.getRun

Package: Simulink.sdi

Get a `Simulink.sdi.Run` object to access data

Syntax

```
run = Simulink.sdi.getRun(runID)
```

Description

`run = Simulink.sdi.getRun(runID)` returns a `Simulink.sdi.Run` object that provides access to the data in the run corresponding to the `runID`. The Simulation Data Inspector assigns run IDs when it creates a run. You can get the run ID for your run using `Simulink.sdi.getAllRunIDs` or `Simulink.sdi.getRunIDByIndex`.

Examples

Get a Run Object for Simulation Data

Many workflows using the Simulation Data Inspector programmatic interface start with acquiring a `Simulink.sdi.Run` object for your simulation data.

```
% Load and simulate system
load_system('sldemo_fuelsys')
sim('sldemo_fuelsys')

% Get runID for most recent run
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get run object
run = Simulink.sdi.getRun(runID);
```

You can use the `Simulink.sdi.Run` object to access signal data, add data, and inspect run metadata.

Plot Signals from a Simulation Run

This example demonstrates how to access the `Simulink.sdi.Run` object for a run created by logging signals to the Simulation Data Inspector. From the `Simulink.sdi.Run` object you can get `Simulink.sdi.Signal` objects that you can use to view data.

```
% Simulate model sldemo_absbrake to create a run
sim('sldemo_fuelsys')

% Get runID for the run
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get run object for the run
run = Simulink.sdi.getRun(runID);

% Check signal count of the run
run.signalCount

ans = int32
    15

% Get signal objects for the signals in the run
signal1 = run.getSignalByIndex(4);
signal2 = run.getSignalByIndex(9);
signal3 = run.getSignalByIndex(10);

% Create subplot layout to display signals
Simulink.sdi.setSubPlotLayout(3, 1)

% Plot signals
signal1.checked = true;
signal2.plotOnSubPlot(2, 1, true);
signal3.plotOnSubPlot(3, 1, true);

% View plots in the Simulation Data Inspector
Simulink.sdi.view
```

Input Arguments

runID — Numeric run identifier
scalar

Run ID for the run you want a `Simulink.sdi.Run` object for. The Simulation Data Inspector assigns run IDs when it creates runs. You can get the run ID for a run using `Simulink.sdi.getAllRunIDs` or `Simulink.sdi.getRunIDByIndex`.

Output Arguments

run — Simulink.sdi.Run object
'Simulink.sdi.Run'

`Simulink.sdi.Run` object for the run corresponding to the run ID.

Introduced in R2011b

Simulink.sdi.getRunCount

Package: Simulink.sdi

Get number of runs in Simulation Data Inspector repository

Syntax

```
count = Simulink.sdi.getRunCount
```

Description

`count = Simulink.sdi.getRunCount` returns the number of runs in the Simulation Data Inspector repository. You can use the run count to loop over all runs in the Simulation Data Inspector repository to modify run or signal properties. For example, you could add an absolute tolerance to a signal in every run.

Examples

Modify Parameter for Several Runs

This example shows how to modify a parameter for all the runs in the Simulation Data Inspector programmatically.

Generate Runs

Load the `vdp` model and mark the `x1` and `x2` signals for logging. Then, run several simulations.

```
% Clear all data from the Simulation Data Inspector repository
Simulink.sdi.clear

% Load the model and mark signals of interest for streaming
load_system('vdp')
Simulink.sdi.markSignalForStreaming('vdp/x1',1,'on')
```

```
Simulink.sdi.markSignalForStreaming('vdp/x2',1,'on')

% Simulate the model with several Mu values
for gain = 1:5
    gainVal = num2str(gain);
    set_param('vdp/Mu','Gain',gainVal)
    sim('vdp')
end
```

Use `Simulink.sdi.getRunCount` to Assign Tolerance to x1 Signals

```
count = Simulink.sdi.getRunCount;

for a = 1:count
    runID = Simulink.sdi.getRunIDByIndex(a);
    run = Simulink.sdi.getRun(runID);
    sig = run.getSignalByIndex(1);
    sig.AbsTol = 0.1;
end

% Open the Simulation Data Inspector to view your data
Simulink.sdi.view
```

Output Arguments

count — Number of runs
scalar

Number of runs in the Simulation Data Inspector repository.

"Inspect and Compare Data Programmatically"

Introduced in R2011b

Simulink.sdi.getRunIDByIndex

Package: Simulink.sdi

Use Simulation Data Inspector run index to get run ID

Syntax

```
runID = Simulink.sdi.getRunIDByIndex(index)
```

Description

`runID = Simulink.sdi.getRunIDByIndex(index)` returns the run ID for the run with the specified `index` in the Simulation Data Inspector repository.

Examples

Get Run ID for a Simulation

Many workflows that use the Simulation Data Inspector programmatic interface start with obtaining the ID for a simulation run. This example shows two different methods to use the programmatic interface to get the run ID for a run. You can use the run ID to create a `Simulink.sdi.Run` object to access run data and metadata, or you can use the run ID for a comparison.

Simulate a Model to Create a Run

The model `sldemo_fuelsys` is already configured for logging. When you simulate the model, the Simulation Data Inspector automatically creates a run and assigns it a run ID.

```
% Load and simulate system
load_system('sldemo_fuelsys')
sim('sldemo_fuelsys')
```

Get Run ID Using `Simulink.sdi.getAllRunIDs`

`Simulink.sdi.getAllRunIDs` returns an array of all run IDs for runs in the Simulation Data Inspector repository in order, with the most recently created run at the end.

```
% Get runID for most recent run
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

Get Run ID Using `Simulink.sdi.getRunIDByIndex`

You can also use `Simulink.sdi.getRunCount` and `Simulink.sdi.getRunIDByIndex` to get the run ID for a run. This method is useful if you also want to use `count` as a counting variable to index through the runs in the Simulation Data Inspector repository.

```
count = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(count);
```

Input Arguments

`index` — Run index in Simulation Data Inspector
integer

Positive, whole number index of the run in the Simulation Data Inspector repository.

Example: 3

Output Arguments

`runID` — Numeric run identifier
scalar

Numeric run identification assigned by the Simulation Data Inspector.

Introduced in R2011b

Simulink.sdi.getRunNamingRule

Package: Simulink.sdi

Get the Simulation Data Inspector rule for naming runs

Syntax

```
namingRule = Simulink.sdi.getRunNamingRule
```

Description

`namingRule = Simulink.sdi.getRunNamingRule` returns the run naming rule as a character vector. The run naming rule can contain one or more tokens that update for each run, for example, `<run_index>`. The run naming rule applies to runs automatically created through simulating a model in Simulink.

Examples

Modify Run Naming Rule Then Restore Default

This example shows how to use the Simulation Data Inspector API to modify the Simulation Data Inspector run naming rule, check a run's name, restore default preferences, and check the run naming rule.

```
% Load model
load_system('sldemo_fuelsys')

% Modify run naming rule
Simulink.sdi.setRunNamingRule('<model_name> Run <run_index>')

% Simulate system
sim('sldemo_fuelsys')

% Check run name
```

```
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
run = Simulink.sdi.getRun(runID);
run.name

ans =
'sldemo_fuelsys Run 15'

% Clear preferences to reset the run naming rule
Simulink.sdi.clearPreferences

% Check run naming rule
Simulink.sdi.getRunNamingRule

ans =
'Run <run_index>: <model_name>'
```

Output Arguments

`namingRule` — Naming rule for Simulation Data Inspector runs
character vector

Character vector that specifies the naming rule the Simulation Data Inspector uses to name the runs automatically created through simulating a Simulink model. The run naming rule can contain any of the following tokens that represent information pulled for each run:

- `<run_index>` – Run's index in the Simulation Data Inspector repository.
- `<model_name>` – Name of the model simulated to create the run.
- `<time_stamp>` – Start time for the simulation that created the run.
- `<sim_mode>` – Simulation mode used for the simulation that created the run.

Alternatives

You can view the run naming rule using the Simulation Data Inspector UI. You can find the **New Run** options under the Simulation Data Inspector **Preferences** menu.

Introduced in R2015a

Simulink.sdi.getSignal

Package: Simulink.sdi

Get Simulink.sdi.Signal object for a signal

Syntax

```
signalObj = Simulink.sdi.getSignal(sigID)
```

Description

`signalObj = Simulink.sdi.getSignal(sigID)` returns a `Simulink.sdi.Signal` object for the signal in the Simulation Data Inspector repository that corresponds to the signal ID, `sigID`. The `Simulink.sdi.Signal` object manages signal data and metadata and allows you to view and modify signal properties.

Examples

Create a Simulation Data Inspector Run and Access Signal Data

This example shows how to access signal data when you create a run in the Simulation Data Inspector.

Generate Data for Run

For this example, create timeseries data for sine and cosine signals.

```
% Create timeseries workspace data
time = linspace(0, 20, 101);

sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals,time);
sine_ts.Name = 'Sine, T=5';
```

```
cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals,time);
cos_ts.Name = 'Cosine, T=8';
```

Create a Run and Return Signal IDs

You can use the `Simulink.sdi.createRun` syntax with multiple return arguments to get the signal IDs more directly instead of accessing the signal IDs through a `Simulink.sdi.Run` object.

```
[runID,runIndex,sigIDs] = Simulink.sdi.createRun('Sinusoids','vars',...
    sine_ts,cos_ts);

cosID = sigIDs(2);
cosSig = Simulink.sdi.getSignal(cosID);
```

Modify Signal Properties and View in the Simulation Data Inspector

You can use the `Simulink.sdi.Signal` object to view and modify signal properties and to plot signals in the Simulation Data Inspector.

```
cosSig.Checked = true;
cosSig.AbsTol = 0.05;
Simulink.sdi.view
cosSig.Name

ans =

    'Cosine, T=8'
```

Input Arguments

sigID — Signal ID
scalar

Signal identifier. The Simulation Data Inspector assigns signal IDs to signals when a run is created. You can get the signal ID for a signal as a return from `Simulink.sdi.createRun` or using the `Simulink.sdi.Run` object's methods.

Output Arguments

signalObj — Simlink.sdi.Signal object
'Simulink.sdi.Signal' object

Simulink.sdi.Signal object for the signal corresponding to `sigID`.

Simulink.sdi.isPCTSupportEnabled

Determine status and mode for Parallel Computing Toolbox support

Syntax

`[enabled,mode] = Simulink.sdi.isPCTSupportEnabled`

Description

`[enabled,mode] = Simulink.sdi.isPCTSupportEnabled` returns `enabled`, a logical indication of whether support for the Parallel Computing Toolbox is enabled, and `mode`, the mode of support enabled.

Examples

Check Status of Parallel Worker Support

Before running code that depends on whether automatic import of runs created by parallel workers is enabled, you can use the `Simulink.sdi.isPCTSupportEnabled` function to check the support status. The default behavior for the Simulation Data Inspector enables parallel worker support in `local` mode. In `local` mode, only runs created on local workers automatically import into the Simulation Data Inspector.

```
[enabled, mode] = Simulink.sdi.isPCTSupportEnabled

enabled =

  logical

   1

mode =
```

```
'local'
```

Output Arguments

enabled — Logical indicator of parallel worker support
logical

Logical indication of parallel worker support.

- **1** indicates that support for parallel workers is enabled.

- **0** indicates that support for parallel workers is not enabled.

mode — Parallel worker support mode
local (default)

Mode of Parallel Computing Toolbox support.

- `'local'` — Runs generated on local workers automatically import to the Simulation Data Inspector.

- `'none'` — Parallel worker support is disabled.

- `'all'` — Runs created from local and remote workers automatically import to the Simulation Data Inspector.

- `'manual'` — Support for manual import of runs created by parallel workers using the `Simulink.sdi.sendWorkerRunToClient` function.

Topics

"Inspect and Compare Data Programmatically"

Introduced in R2017b

Simulink.sdi.isValidRunID

Package: Simulink.sdi

Determine whether a run ID is valid

Syntax

```
valid = Simulink.sdi.isValidRunID(runID)
```

Description

`valid = Simulink.sdi.isValidRunID(runID)` returns `true` if `runID` corresponds to a run in the Simulation Data Inspector repository.

Examples

Check Run ID Validity

This example shows how to check whether a run ID is valid. You can use `Simulink.sdi.isValidRunID` to ensure you have valid data throughout your script.

Create a Simulation Run

Simulate the model `sldemo_fuelsys` to create a run in the Simulation Data Inspector, and use `Simulink.sdi.getAllRunIDs` to get its run ID.

```
% Simulate model
load_system('sldemo_fuelsys')
sim('sldemo_fuelsys')

% Get run ID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

Check Run ID Validity

Check to verify that the Simulation Data Inspector has a run corresponding to the run ID.

```
Simulink.sdi.isValidRunID(runID)
```

```
ans = logical
   1
```

Delete the Run and Check Validity

You can delete runs to clear out memory space or clean up the Simulation Data Inspector UI. When you delete a run, the run ID for that run becomes invalid.

```
Simulink.sdi.deleteRun(runID)
```

```
Simulink.sdi.isValidRunID(runID)
```

```
ans = logical
   0
```

Input Arguments

runID — Simulation Data Inspector run identifier
scalar

Unique numeric identification for the run. The Simulation Data Inspector assigns run IDs when it creates runs. You can get the run ID for your run using `Simulink.sdi.getAllRunIDs` or `Simulink.sdi.getRunIDByIndex`.

Output Arguments

valid — Run validity indicator
logical

Run validity indicator. When `valid` is `true`, the `runID` is valid. When `valid` is `false`, the `runID` is invalid.

See Also

Topics

"Inspect and Compare Data Programmatically"

Introduced in R2011b

Simulink.sdi.load

Package: Simulink.sdi

Load a Simulation Data Inspector session or view

Syntax

```
valid = Simulink.sdi.load(fileName)
```

Description

`valid = Simulink.sdi.load(fileName)` loads the data in the MLDATX-file or MAT-file specified by `fileName` and returns `1` when `fileName` is a valid file. A return value of `0` indicates that the file specified by `fileName` is invalid and cannot be loaded into the Simulation Data Inspector. You can use `Simulink.sdi.load` to load Simulation Data Inspector sessions and views. A view includes preferences and visualization options but does not save data. A session saves data along with preference selections and plot configurations.

Examples

Save a Simulation Data Inspector Session

This example shows how to create, save, and load a Simulation Data Inspector session. The example uses data logging to populate the Simulation Data Inspector with data and then uses the Simulation Data Inspector's programmatic interface to create plots to visualize the data. After saving the data and visualization settings in a session, the Simulation Data Inspector repository is emptied in order to demonstrate how to load the session.

Create Simulation Data

This example logs the Stick, alpha, rad, and q, rad/sec signals to generate simulation data using the model slexAircraftExample and creates two runs. The first uses a sine input, and the second has a square wave input.

```matlab
% Ensure you start with an empty Simulation Data Inspector repository
Simulink.sdi.clear

% Load system
load_system('slexAircraftExample')

% Configure signals to log
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot',1,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',3,'on
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on

% Change Pilot signal to sine
set_param('slexAircraftExample/Pilot','WaveForm','sine')

% Simulate model
sim('slexAircraftExample')

% Change Pilot signal to square
set_param('slexAircraftExample/Pilot','WaveForm','square')

% Simulate model
sim('slexAircraftExample')
```

Access Simulation Data

Use the Simulation Data Inspector programmatic interface to access the simulation data so you can create plots to visualize the signals.

```matlab
% Get run objects
runIDs = Simulink.sdi.getAllRunIDs;
sineRunID = runIDs(end-1);
squareRunID = runIDs(end);

sineRun = Simulink.sdi.getRun(sineRunID);
squareRun = Simulink.sdi.getRun(squareRunID);

% Get signal objects
sineOut = sineRun.getSignalByIndex(1);
sineIn = sineRun.getSignalByIndex(3);
```

```
squareOut = squareRun.getSignalByIndex(1);
squareIn = squareRun.getSignalByIndex(3);
```

Create Plots in the Simulation Data Inspector

Use the programmatic interface to visualize the signal data from the two simulation runs.
You can set the plot layout and plot signals on specific subplots.

```
% Set subplot layout
Simulink.sdi.setSubPlotLayout(2,1)

% Plot sine data on top plot
sineIn.plotOnSubPlot(1,1,true)
sineOut.plotOnSubPlot(1,1,true)

% Plot square wave data on bottom plot
squareIn.plotOnSubPlot(2,1,true)
squareOut.plotOnSubPlot(2,1,true)
```

Save a Simulation Data Inspector Session

First, view the plots you just created. Then, save the Simulation Data Inspector session as
an MLDATX-file to recover your data along with your preference selections and plots.

```
% View the visualized data in the Simulation Data Inspector
Simulink.sdi.view

% Save the Simulation Data Inspector session
Simulink.sdi.save('myData.mldatx')
```

Load a Simulation Data Inspector Session

First, clear the Simulation Data Inspector repository with `Simulink.sdi.clear` and
reset visualization settings with `Simulink.sdi.clearPreferences`. Then, you can
load the session to see how the data and settings are preserved.

```
% Clear Simulation Data Inspector repository and preferences
Simulink.sdi.clear
Simulink.sdi.clearPreferences
```

```
% Load session file to view data
Simulink.sdi.load('myData.mldatx');
```

Input Arguments

`fileName` — Name of file to load
character vector

Name of the file to load with the session or view data.

Example: `'myData.mldatx'`

Example: `'myData.mat'`

Output Arguments

`valid` — File validity indicator
logical

Validity indicator for the file. When the file specified by `fileName` is valid, `valid` is `1`. A `valid` value of `0` indicates an invalid file.

Introduced in R2011b

Simulink.sdi.markSignalForStreaming

Package: Simulink.sdi

Turn logging on or off for a signal

Syntax

```
Simulink.sdi.markSignalForStreaming(block,portIndex,log)
Simulink.sdi.markSignalForStreaming(portHandle,log)
Simulink.sdi.markSignalForStreaming(lineHandle,log)
```

Description

`Simulink.sdi.markSignalForStreaming(block,portIndex,log)` marks the signal on the specified `portIndex` of the specified `block` for logging when you specify `log` as `'on'`. To stop logging a signal, specify `log` as `'off'`.

`Simulink.sdi.markSignalForStreaming(portHandle,log)` marks the signal on the port specified by `portHandle` for logging when you specify `log` as `'on'`. To stop logging a signal, specify `log` as `'off'`.

`Simulink.sdi.markSignalForStreaming(lineHandle,log)` marks the signal with the specified `lineHandle` for logging when you specify `log` as `'on'`. To stop logging a signal, specify `log` as `'off'`.

Examples

Compare Signals Within a Simulation Run

This example uses the `slexAircraftExample` model to demonstrate the comparison of the input and output signals for a control system. The example marks the signals for streaming then gets the run object for a simulation run. Signal IDs from the run object specify the signals to be compared.

```
% Load model slexAircraftExample and mark signals for streaming
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot',1,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on')

% Simulate model slexAircraftExample
sim('slexAircraftExample')

% Get run IDs for most recent run
allIDs = Simulink.sdi.getAllRunIDs;
runID = allIDs(end);

% Get Run object
run = Simulink.sdi.getRun(runID);

% Get signal IDs
signalID1 = run.getSignalIDByIndex(1);
signalID2 = run.getSignalIDByIndex(2);

if (run.isValidSignalID(signalID1))
    % Change signal tolerance
    signal1 = Simulink.sdi.getSignal(signalID1);
    signal1.AbsTol = 0.1;
end

if (run.isValidSignalID(signalID1) && run.isValidSignalID(signalID2))
    % Compare signals
    diff = Simulink.sdi.compareSignals(signalID1,signalID2);

    % Check whether signals match within tolerance
    match = diff.match
end
match = logical
   0
```

Mark Signals for Logging with Port Handles

This example shows how to mark signals for logging using port handles.

Load Model and Mark Signals for Streaming

User `get_param` to get the port handles for the blocks with your signals of interest. Then, use the handle to mark the desired signals for logging.

```
load_system('vdp')

% Get port handles
x1_handles = get_param('vdp/x1','PortHandles');
x1 = x1_handles.Outport(1);
x2_handles = get_param('vdp/x2','PortHandles');
x2 = x2_handles.Outport(1);

% Mark signals for streaming
Simulink.sdi.markSignalForStreaming(x1,'on');
Simulink.sdi.markSignalForStreaming(x2,'on');
```

Simulate Model and View Signals in the Simulation Data Inspector

Simulate the model and then open the Simulation Data Inspector to view the logged signals.

```
sim('vdp')
```

```
Simulink.sdi.view
```

Mark Signals for Logging with Line Handles

This example shows how to mark signals for logging using their line handles.

Load System and Mark Signals for Logging

Load a model and use `get_param` to get handles for the signals in the model. Then, use the line handles to mark signals of interest for logging.

```
load_system('slexAircraftExample')

lines = get_param('slexAircraftExample','Lines');

sig1handle = lines(1).Handle;
sig2handle = lines(2).Handle;
```

```
Simulink.sdi.markSignalForStreaming(sig1handle,'on')
Simulink.sdi.markSignalForStreaming(sig2handle,'on')
```

Simulate Model and View Signals

Simulate the model and view the signals marked for logging in the Simulation Data Inspector.

```
sim('slexAircraftExample')
```

```
Simulink.sdi.view
```

Input Arguments

block — Source block path or handle
character vector

Block path for the block with the desired signal connected to one of its outports.

Example: `'slexAircraftExample/Pilot'`

portIndex — Source block output port index
integer

Index of the port connected to the signal you want to mark for streaming.

Example: `'slexAircraftExample/Pilot'`

log — Logging state
'on' | 'off'

Logging state desired for signal.

- `'on'` -- Turn logging on for a signal.
- `'off'` -- Turn logging off for a signal.

portHandle — Source block output port handle
handle

Port handle for the source block's output port that connects to the signal.

Example: `x1_handles.Outport(1)`

lineHandle — Signal line handle
handle

Line handle for the signal.

Example: `lines(1).Handle`

"View Data with the Simulation Data Inspector"

Introduced in R2015b

Simulink.sdi.report

Package: Simulink.sdi

Generate a Simulation Data Inspector report

Syntax

```
Simulink.sdi.report
Simulink.sdi.report(Name,Value)
```

Description

`Simulink.sdi.report` creates a Simulation Data Inspector report of the plotted data in the **Inspect** pane of the Simulation Data Inspector.

`Simulink.sdi.report(Name,Value)` uses additional options specified by one or more `Name,Value` pair arguments to generate a report of the specified view in the Simulation Data Inspector.

Examples

Generate a Simulation Data Inspector Report Programmatically

This example shows how to create reports using the Simulation Data Inspector programmatic interface. You can create a report for plotted signals in the Inspect pane or for comparison data in the Compare pane. This example first generates data by simulating a model, then shows how to create an `Inspect Signals` report. To run the example exactly as shown, ensure that the Simulation Data Inspector repository starts empty with the `Simulink.sdi.clear` function.

Generate Data

This example generates data using model `ex_sldemo_absbrake` with two different desired slip ratios.

```matlab
% Ensure Simulation Data Inspector is empty
Simulink.sdi.clear

% Open model
load_system('ex_sldemo_absbrake')

% Set slip ratio and simulate model
set_param('ex_sldemo_absbrake/Desired relative slip','Value','0.24')
sim('ex_sldemo_absbrake')

% Set new slip ratio and simulate model again
set_param('ex_sldemo_absbrake/Desired relative slip','Value','0.25')
sim('ex_sldemo_absbrake')
```

Plot Signals in the Inspect Pane

The `Inspect Signals` report includes all signals plotted in the graphical viewing area of the Inspect pane and all displayed metadata for the plotted signals.

```matlab
% Get Simulink.sdi.Run objects
runIDs = Simulink.sdi.getAllRunIDs;
runID1 = runIDs(end-1);
runID2 = runIDs(end);

run1 = Simulink.sdi.getRun(runID1);
run2 = Simulink.sdi.getRun(runID2);

% Get Simulink.sdi.Signal objects for slp signal
run1_slp = run1.getSignalByIndex(4);
run2_slp = run2.getSignalByIndex(4);

% Plot slp signals
run1_slp.plotOnSubPlot(1, 1, true)
run2_slp.plotOnSubPlot(1, 1, true)
```

Create a Report of Signals Plotted in Inspect Pane

You can include more data in the report by adding more columns using the Simulation Data Inspector UI, or you can specify the information you want in the report programmatically with Name-Value pairs and the enumeration class `Simulink.sdi.SignalMetaData`. This example shows how to specify the data in the report programmatically.

```matlab
% Specify report parameters
reportType = 'Inspect Signals';
```

```
reportName = 'Data_Report.html';

signalMetadata = [Simulink.sdi.SignalMetaData.Run, ...
    Simulink.sdi.SignalMetaData.Line, ...
    Simulink.sdi.SignalMetaData.BlockName, ...
    Simulink.sdi.SignalMetaData.SignalName];

Simulink.sdi.report('ReportToCreate', reportType, 'ReportOutputFile', ...
    reportName, 'ColumnsToReport', signalMetadata);
```

Input Arguments

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (`'  '`). You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: `'ReportToCreate','Compare Runs','ShortenBlockPath',true`

ReportToCreate — Information to include in the report
`'Inspect Signals'` (default) | `'Compare Runs'`

Simulation Data Inspector pane to capture in the report.

- `'Inspect Signals'` –– Create a report of the information on the **Inspect** pane.
- `'Compare Runs'` –– Create a report of the information on the **Compare** pane.

Example: `'ReportToCreate','Inspect Signals'`

Example: `'ReportToCreate','Compare Runs'`

ReportOutputFolder — Folder where report is saved
`<current working folder>/slprj/sdi` (default) | path

Folder where the report is saved. Specify the path to the folder where you want to save the report as a character vector.

Example: `'ReportOutputFolder','C:\Users\user1\Desktop'`

ReportOutputFile — Report file name
'SDI_report.html' (default) | character vector

File name for report.

Example: 'ReportOutputFile','MyReport.html'

PreventOverwritingFile — Report overwrite prevention
true (default) | false

File overwrite protection for the report. File overwrite protection prevents the Simulation Data Inspector from overwriting an existing file by appending the file name with a number that increments for subsequent reports. When you disable file overwrite protection, the Simulation Data Inspector overwrites the existing report file unless you specify a unique file name.

- true enables file overwrite protection.
- false disables file overwrite protection.

Example: 'PreventOverwritingFile',true

Example: 'PreventOverwritingFile',false

ColumnsToReport — Signal metadata to include in report
array

Signal metadata to include in report. By default, the Inspect Signals report includes the block path, name, line style and color, and data source parameters for each plotted signal. The Compare Runs report includes the signal name, absolute tolerance, relative tolerance, and maximum difference metadata by default.

Specify metadata to include as an array, using the enumeration class Simulink.sdi.SignalMetaData. For example, to include the name of the simulation run and signal name, create an array like signal_metadata:

```
signal_metadata = [Simulink.sdi.SignalMetaData.Run,...
                   Simulink.sdi.SignalMetaData.SignalName];
```

Then, specify ColumnsToReport as signal_metadata in the name-value pair:

```
Simulink.sdi.report('ColumnsToReport',signal_metadata)
```

The table summarizes the metadata available for Inspect Signals report.

Column Value	Description
SignalName (default)	Signal name
Line (default)	Signal line style and color
SID	Simulink identifier For more information about SIDs, see "Locate Diagram Components Using Simulink Identifiers"
Units	Signal measurement units
SigDataType	Signal data type
SigSampleTime	Method used to sample the signal
Model	Name of the model that generated the signal
BlockName	Name of the source block for the signal
BlockPath	Path to the source block for the signal
Port	Index of the signal on the output port of its block
Dimensions	Dimensions of the matrix containing the signal
Channel	Index of signal within matrix
Run	Name of the simulation run containing the signal
AbsTol	Absolute tolerance for the signal
RelTol	Relative tolerance for the signal
OverrideGlobalTol	Property that specifies whether signal tolerances take priority over global tolerances
TimeTol	Time tolerance for the signal
InterpMethod	Interpolation method
SyncMethod	Synchronization method used to coordinate signals for comparison

Column Value	Description
`TimeSeriesRoot`	Name of the variable associated with the signal for signals imported from the MATLAB workspace
`TimeSource`	Name of the array containing the time data for signals imported from the MATLAB workspace
`DataSource`	Name of the array containing the signal data for signals imported from the MATLAB workspace

The table provides a summary of the metadata available for the `Compare Runs` report.

Column Value	Description
`Result` (default)	Pass/fail result of the signal comparison between the **Baseline** and **Compare To** runs
`Line1`	Line style and color for the **Baseline** signal
`Line2`	Line style and color for the **Compare To** signal
`AbsTol` (default)	Absolute tolerance for the **Baseline** signal
`RelTol` (default)	Relative tolerance for the **Baseline** signal
`MaxDifference`	The maximum difference between the **Baseline** and **Compare To** signals
`OverrideGlobalTol`	Property that specifies whether the **Baseline** signal tolerances take priority over global tolerances
`TimeTol`	Time tolerance for the **Baseline** signal
`SignalName1`	Signal name from the **Baseline** run
`SignalName2`	Signal name from the **Compare To** run
`Units1`	Measurement units for the signal in the **Baseline** run
`Units2`	Measurement units for the signal in the **Compare To** run

Column Value	Description
SigDataType1	The data type for the signal in the **Baseline** run
SigDataType2	The data type for the signal in the **Compare To** run
SigSampleTime1	Method used to sample the signal in the **Baseline** run
SigSampleTime2	Method used to sample the signal in the **Compare To** run
Run1	Name of the **Baseline** run
Run2	Name of the **Compare To** run
AlignedBy (default)	Signal alignment method used to correlate **Baseline** and **Compare To** signals
Model1	Name of the model that generated the **Baseline** signals
Model2	Name of the model that generated the **Compare To** signals
BlockName1	Name of the source block for the **Baseline** signal
BlockName2	Name of the source block for the **Compare To** signal
BlockPath1	Path to the source block for the **Baseline** signal
BlockPath2	Path to the source block for the **Compare To** signal
Port1	Index of the **Baseline** signal on the output port of its block
Port2	Index of the **Compare To** signal on the output port of its block
Dimensions1	Dimensions of the matrix containing the **Baseline** signal
Dimensions2	Dimensions of the matrix containing the **Compare To** signal

Column Value	Description
Channel1	Index of the **Baseline** within its matrix
Channel2	Index of the **Compare To** within its matrix
InterpMethod	Interpolation method for the **Baseline** signal
SyncMethod	Synchronization method for the **Baseline** signal
TimeSeriesRoot1	Name of the variable associated with the **Baseline** signal for signals imported from the MATLAB workspace
TimeSeriesRoot2	Name of the variable associated with the **Compare To** signal for signals imported from the MATLAB workspace
TimeSource1	Name of the array containing the **Baseline** time data for signals imported from the MATLAB workspace
TimeSource2	Name of the array containing the **Compare To** time data for signals imported from the MATLAB workspace
DataSource1	Name of the array containing the **Baseline** signal data for signals imported from the MATLAB workspace
DataSource2	Name of the array containing the **Compare To** signal data for signals imported from the MATLAB workspace
LinkToPlot (default)	Link to a plot of each comparison result

Example: 'ColumnsToReport',metadata

ShortenBlockPath — Block path length
true (default) | false

Block path length.

- true -- Report shortened block path length.
- false -- Include the full block path in the report.

Example: `'ShortenBlockPath',false`

LaunchReport — Open report when created
`true` (default) | `false`

Open report when created.

- `true` –– Open the report when it is created.
- `false` –– Do not open the report upon creation.

Example: `'LaunchReport',false`

SignalsToReport — Signals to include in a Compare Runs report
`'ReportOnlyMismatchedSignals'` (default) | `'ReportAllSignals'`

Signals to include in a `Compare Runs` report.

- `ReportOnlyMismatchedSignals` –– Include only signals that fall out of tolerance.
- `ReportAllSignals` –– Include all signals.

Example: `'SignalsToReport','ReportAllSignals'`

Simulink.sdi.resetRunNamingRule

Package: Simulink.sdi

Revert the Simulation Data Inspector run naming rule to default

Syntax

```
Simulink.sdi.resetRunNamingRule
```

Description

`Simulink.sdi.resetRunNamingRule` resets the run naming rule the Simulation Data Inspector uses to assign a name to runs created through simulating a Simulink model to its default `'Run <run_index>: <model_name>'`.

Examples

Modify then Reset Run Naming Rule

This example shows how to use the Simulation Data Inspector API to modify the Simulation Data Inspector run naming rule, check a run's name, reset the run naming rule to its default, and check the run naming rule.

```
% Load model
load_system('sldemo_fuelsys')

% Modify run naming rule
Simulink.sdi.setRunNamingRule('<model_name> Run <run_index>')

% Simulate system
sim('sldemo_fuelsys')

% Check run name
runIDs = Simulink.sdi.getAllRunIDs;
```

```
runID = runIDs(end);
run = Simulink.sdi.getRun(runID);
run.name

ans =
'sldemo_fuelsys Run 4'

% Reset the run naming rule
Simulink.sdi.resetRunNamingRule

% Check run naming rule
Simulink.sdi.getRunNamingRule

ans =
'Run <run_index>: <model_name>'
```

Alternatives

You can reset the run naming rule to its default using the Simulation Data Inspector UI. Use the **Restore Defaults** button on the **New Run** tab under Simulation Data Inspector **Preferences**.

`Simulink.sdi.clearPreferences` restores the run naming rule, along with all other Simulation Data Inspector preferences.

"Inspect and Compare Data Programmatically"
"Organize Your Simulation Data Inspector Workspace"

Introduced in R2015a

Simulink.sdi.save

Package: Simulink.sdi

Save Simulation Data Inspector session

Syntax

```
Simulink.sdi.save(fileName)
```

Description

`Simulink.sdi.save(fileName)` saves all runs, signals, and plot settings as a Simulation Data Inspector session in the file `fileName`.

Examples

Save a Simulation Data Inspector Session

This example shows how to create, save, and load a Simulation Data Inspector session. The example uses data logging to populate the Simulation Data Inspector with data and then uses the Simulation Data Inspector's programmatic interface to create plots to visualize the data. After saving the data and visualization settings in a session, the Simulation Data Inspector repository is emptied in order to demonstrate how to load the session.

Create Simulation Data

This example logs the `Stick`, `alpha, rad`, and `q, rad/sec` signals to generate simulation data using the model `slexAircraftExample` and creates two runs. The first uses a sine input, and the second has a square wave input.

```
% Ensure you start with an empty Simulation Data Inspector repository
Simulink.sdi.clear
```

```
% Load system
load_system('slexAircraftExample')

% Configure signals to log
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot',1,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',3,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on')

% Change Pilot signal to sine
set_param('slexAircraftExample/Pilot','WaveForm','sine')

% Simulate model
sim('slexAircraftExample')

% Change Pilot signal to square
set_param('slexAircraftExample/Pilot','WaveForm','square')

% Simulate model
sim('slexAircraftExample')
```

Access Simulation Data

Use the Simulation Data Inspector programmatic interface to access the simulation data
so you can create plots to visualize the signals.

```
% Get run objects
runIDs = Simulink.sdi.getAllRunIDs;
sineRunID = runIDs(end-1);
squareRunID = runIDs(end);

sineRun = Simulink.sdi.getRun(sineRunID);
squareRun = Simulink.sdi.getRun(squareRunID);

% Get signal objects
sineOut = sineRun.getSignalByIndex(1);
sineIn = sineRun.getSignalByIndex(3);

squareOut = squareRun.getSignalByIndex(1);
squareIn = squareRun.getSignalByIndex(3);
```

Create Plots in the Simulation Data Inspector

Use the programmatic interface to visualize the signal data from the two simulation runs.
You can set the plot layout and plot signals on specific subplots.

```
% Set subplot layout
Simulink.sdi.setSubPlotLayout(2,1)

% Plot sine data on top plot
sineIn.plotOnSubPlot(1,1,true)
sineOut.plotOnSubPlot(1,1,true)

% Plot square wave data on bottom plot
squareIn.plotOnSubPlot(2,1,true)
squareOut.plotOnSubPlot(2,1,true)
```

Save a Simulation Data Inspector Session

First, view the plots you just created. Then, save the Simulation Data Inspector session as an MLDATX-file to recover your data along with your preference selections and plots.

```
% View the visualized data in the Simulation Data Inspector
Simulink.sdi.view

% Save the Simulation Data Inspector session
Simulink.sdi.save('myData.mldatx')
```

Load a Simulation Data Inspector Session

First, clear the Simulation Data Inspector repository with `Simulink.sdi.clear` and reset visualization settings with `Simulink.sdi.clearPreferences`. Then, you can load the session to see how the data and settings are preserved.

```
% Clear Simulation Data Inspector repository and preferences
Simulink.sdi.clear
Simulink.sdi.clearPreferences

% Load session file to view data
Simulink.sdi.load('myData.mldatx');
```

Input Arguments

`fileName` — File name
character vector

Name for the session file.

Example: `'myData.mldatx'`

Introduced in R2011b

Simulink.sdi.sendWorkerRunToClient

Package: Simulink.sdi

Send run created on parallel workers to the Simulation Data Inspector

Syntax

```
Simulink.sdi.sendWorkerRunToClient
Simulink.sdi.sendWorkerRunToClient(run)
```

Description

`Simulink.sdi.sendWorkerRunToClient` sends the run most recently generated by the worker to the client MATLAB and imports the run to the Simulation Data Inspector.

`Simulink.sdi.sendWorkerRunToClient(run)` sends the run corresponding to `run` to the client MATLAB and imports the run to the Simulation Data Inspector.

Examples

Manually Send Runs from Parallel Workers to the Simulation Data Inspector

This example shows how to use `Simulink.sdi.sendWorkerRunToClient` to send runs created using parallel workers manually to the Simulation Data Inspector.

Setup

This example runs several simulations of the `vdp` model, varying the value of the gain, `Mu`. To set up for the parallel simulation, define a vector of `Mu` values and configure the Simulation Data Inspector for manual Parallel Computing Toolbox support.

```
% Enable manual Parallel Computing Toolbox support
Simulink.sdi.enablePCTSupport('manual');
```

```
% Choose several Mu values
MuVals = [1 2 3 4];
```

Initialize Parallel Workers

Use `parpool` to start a pool of four parallel workers. This example calls `parpool` inside an if statement so you only create a parallel pool if you don't already have one. You can use `spmd` to run initialization code common to all workers. For example, load the `vdp` model and select signals to log to runs that we can send to the Simulation Data Inspector on the client MATLAB. To avoid data concurrency issues when simulating with `sim` in `parfor`, create a temporary directory on each worker. After the simulations complete, another spmd block deletes the temporary directories.

```
p = gcp('nocreate');

if isempty(p)

    parpool(4);

end
```

```
Starting parallel pool (parpool) using the 'local' profile ...
connected to 4 workers.
```

```
spmd

    % Load system and select signals to log
    load_system('vdp')
    Simulink.sdi.markSignalForStreaming('vdp/x1',1,'on')
    Simulink.sdi.markSignalForStreaming('vdp/x2',1,'on')

    % Create temporary directory for simulation on worker
    workDir = pwd;
    addpath(workDir)
    tempDir = tempname;
    mkdir(tempDir)
    cd(tempDir)

end
```

Run Parallel Simulations with `parfor`

To stream data from parallel workers to the Simulation Data Inspector, you have to run parallel simulations using `parfor`. Each worker runs a `vdp` simulation with a different

value of `Mu`. Simulink cannot access the contents of the `parfor` loop, so the variable `MuVal` is defined in the worker's workspace, where the `vdp` model can see it, using `assignin`.

```
parfor (index = 1:4)

    % Set value of Mu in the worker's base workspace
    assignin('base','MuVal',MuVals(index));

    % Modify the value of Mu in the model and simulate
    set_param('vdp/Mu','Gain','MuVal')
    sim('vdp')
```

Access Data and Send Run to Client MATLAB

You can use the Simulation Data Inspector programmatic interface on the worker the same way you would in the client MATLAB. This example creates a `Simulink.sdi.Run` object and attaches the value of `Mu` used in the simulation with the `Tag` property.

```
    % Attach metadata to the run
    IDs = Simulink.sdi.getAllRunIDs;
    lastIndex = length(IDs);
    runID = Simulink.sdi.getRunIDByIndex(lastIndex);
    run = Simulink.sdi.getRun(runID);
    run.Tag = strcat('Mu = ',num2str(MuVals(index)));

    % Send the run to the Simulation Data Inspector on the client MATLAB
    Simulink.sdi.sendWorkerRunToClient
```

```
end
```

Close Temporary Directories and View Runs in the Simulation Data Inspector

Use another `spmd` section to delete the temporary directories created on the workers once the simulations complete. In each simulation, `Simulink.sdi.sendWorkerRunToClient` imported runs from all the workers into the Simulation Data Inspector. You can view the data and check the run properties to see the value of `Mu` used during simulation.

```
spmd

    % Remove temporary directories
```

```
    cd(workDir)
    rmdir(tempDir, 's')
    rmpath(workDir)

end

Simulink.sdi.view
```

Input Arguments

run — Run ID or `Simulink.sdi.Run` object
runID | `Simulink.sdi.Run` object

Run ID or `Simulink.sdi.Run` object corresponding to the run you want to import into the Simulation Data Inspector.

Simulink.sdi.setMarkersOn

Package: Simulink.sdi

Control whether markers are shown

Syntax

```
Simulink.sdi.setMarkersOn(value)
```

Description

`Simulink.sdi.setMarkersOn(value)` sets the show markers parameter in the Simulation Data Inspector according to `value`.

Examples

Display Markers in the Simulation Data Inspector

```
Simulink.sdi.setMarkersOn(true);
```

Input Arguments

value — Logical input
'true' | 'false'

Logical indication of whether markers are shown on plots in the Simulation Data Inspector.

- `True` shows markers on plots in the Simulation Data Inspector.
- `False` does not show markers on plots in the Simulation Data Inspector.

Data Types: `logical`

Simulink.sdi.setRunNamingRule

Package: Simulink.sdi

Specify the Simulation Data Inspector run naming rule

Syntax

```
Simulink.sdi.setRunNamingRule('rule')
```

Description

`Simulink.sdi.setRunNamingRule('rule')` sets the Simulation Data Inspector rule for naming runs created by simulating a Simulink model.

Examples

Modify Run Naming Rule Then Restore Default

This example shows how to use the Simulation Data Inspector API to modify the Simulation Data Inspector run naming rule, check a run's name, restore default preferences, and check the run naming rule.

```
% Load model
load_system('sldemo_fuelsys')

% Modify run naming rule
Simulink.sdi.setRunNamingRule('<model_name> Run <run_index>')

% Simulate system
sim('sldemo_fuelsys')

% Check run name
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

```
run = Simulink.sdi.getRun(runID);
run.name

ans =
'sldemo_fuelsys Run 15'

% Clear preferences to reset the run naming rule
Simulink.sdi.clearPreferences

% Check run naming rule
Simulink.sdi.getRunNamingRule

ans =
'Run <run_index>: <model_name>'
```

Input Arguments

'rule' — Simulation Data Inspector run naming rule
'Run <run_index>: <model_name> (default) | character vector

Simulation Data Inspector run naming rule for runs created by simulating a Simulink model. The character vector specifying the run naming rule can include plain text and any of the following tokens that represent data pulled from each run:

- <run_index> – Run's index in the Simulation Data Inspector repository.
- <model_name> – Name of the model simulated to create the run.
- <time_stamp> – Start time for the simulation that created the run.
- <sim_mode> – Simulation mode used for the simulation that created the run.

Example: '<time_stamp> Simulation <run_index>: <model_name>'

Example: '<model_name> - <run_index>'

Alternatives

You can modify the run naming rule using the Simulation Data Inspector UI in the **Preferences** menu. You can rename a run by modifying the Name property of its Simulink.sdi.Run object.

`Simulink.sdi.getRunNamingRule` | `Simulink.sdi.resetRunNamingRule` |
`Simulink.sdi.setRunOverwrite`

Topics

"Inspect and Compare Data Programmatically"
"Organize Your Simulation Data Inspector Workspace"

Introduced in R2011b

Simulink.sdi.setRunOverwrite

Package: Simulink.sdi

Enable and disable run overwrite mode for a Simulation Data Inspector run

Syntax

```
Simulink.sdi.setRunOverwrite(runID,overwrite)
```

Description

`Simulink.sdi.setRunOverwrite(runID,overwrite)` configures run overwrite mode for the run corresponding to `runID`, according to the value specified for `overwrite`.

Examples

Enable and Disable Run Overwrite for a Run

This example shows how to enable and disable run overwrite mode for a run in the Simulation Data Inspector. Run overwrite mode can help you avoid creating a large amount of intermediate data in an iterative design workflow.

Simulate a Model to Create a Run

Load the `sldemo_fuelsys` model, and then run a simulation to create a run in the Simulation Data Inspector. Use the Simulation Data Inspector's programmatic interface to access the run ID for the run.

```
load_system('sldemo_fuelsys')
sim('sldemo_fuelsys')

runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

2-825

Enable Run Overwrite

Enable run overwrite for the run you created to start your iterative design process. When run overwrite is enabled for a run, the Simulation Data Inspector replaces that run's data with new simulation data for every subsequent simulation until you disable run overwrite mode for that run.

```
Simulink.sdi.setRunOverwrite(runID,true)
```

Disable Run Overwrite

When you get to a stopping point or a meaningful intermediate stage and you want to retain the data for a run, you can disable run overwrite mode for the run.

```
Simulink.sdi.setRunOverwrite(runID,false)
```

Input Arguments

runID — Numeric run identifier
scalar

Run ID for the run you want to set run overwrite for. The Simulation Data Inspector assigns run IDs when it creates runs. You can get the run ID for a run using `Simulink.sdi.getAllRunIDs` or `Simulink.sdi.getRunIDByIndex`.

overwrite — Run overwrite enable/disable
true | false

Logical value for run overwrite mode. Specify `overwrite` as `true` to enable run overwrite mode for a run, and set `overwrite` to `false` to disable run overwrite mode for a run.

Alternatives

You can configure run overwrite mode for a run using the Simulation Data Inspector UI. See "Iterate Model Design with the Simulation Data Inspector" for more information.

You can also use `Simulink.sdi.deleteRun` to help programmatically manage your data in the Simulation Data Inspector.

See Also

Simulink.sdi.Run | Simulink.sdi.clearPreferences | Simulink.sdi.deleteRun | Simulink.sdi.exportRun | Simulink.sdi.getAllRunIDs | Simulink.sdi.getRunIDByIndex

"Iterate Model Design with the Simulation Data Inspector"

Introduced in R2011b

Simulink.sdi.setSubPlotLayout

Package: Simulink.sdi

Set subplot layout in the Simulation Data Inspector

Syntax

```
Simulink.sdi.setSubPlotLayout(r,c)
```

Description

`Simulink.sdi.setSubPlotLayout(r,c)` sets the grid layout of plots in the Simulation Data Inspector using the specified number of rows, `r`, and columns, `c`.

Examples

Change Subplot Layout

```
% Change subplot layout to 4 rows and 2 columns
Simulink.sdi.setSubPlotLayout(4,2);
```

Create a Run and View the Data

This example shows how to create a run, add data to it, and then view the data in the Simulation Data Inspector.

Create Data for the Run

This example creates `timeseries` objects for a sine and a cosine. To visualize your data, the Simulation Data Inspector requires at least a time vector that corresponds with your data.

```
% Generate timeseries data
time = linspace(0, 20, 100);
```

```
sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals, time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals, time);
cos_ts.Name = 'Cosine, T=8';
```

Create a Simulation Data Inspector Run and Add Your Data

To give the Simulation Data Inspector access to your data, use the `create` method and create a run. This example modifies some of the run's properties to help identify the data. You can easily view run and signal properties with the Simulation Data Inspector.

```
% Create a run
run = Simulink.sdi.Run.create;
run.Name = 'Sinusoids';
run.Description = 'Sine and cosine signals with different frequencies';

% Add timeseries data to run
run.add('vars', sine_ts, cos_ts);
```

Plot Your Data Using the `Simulink.sdi.Signal` Object

The `getSignalByIndex` method returns a `Simulink.sdi.Signal` object that can be used to plot the signal in the Simulation Data Inspector. You can also programmatically control aspects of the plot's appearance, such as the color and style of the line representing the signal. This example customizes the subplot layout and signal characteristics.

```
% Get signal, modify its properties, and change Checked property to true
sine_sig = run.getSignalByIndex(1);
sine_sig.LineColor = [0 0 1];
sine_sig.LineDashed = '-.';
sine_sig.Checked = true;

% Add another subplot for the cosine signal
Simulink.sdi.setSubPlotLayout(2, 1);

% Plot the cosine signal and customize its appearance
cos_sig = run.getSignalByIndex(2);
cos_sig.LineColor = [0 1 0];
cos_sig.plotOnSubPlot(2, 1, true);
```

```
% View the signal in the Simulation Data Inspector
Simulink.sdi.view
```

Close the Simulation Data Inspector and Save Your Data

```
Simulink.sdi.close('sinusoids.mat')
```

- "Inspect and Compare Data Programmatically"
- "Create Plots Using the Simulation Data Inspector"

Input Arguments

r — Number of rows
integer

Number of rows in the subplot grid layout, specified as a whole number between 1 and 8, inclusive.

Example: 2

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `char`

c — Number of columns
integer

Number of columns in the subplot grid layout, specified as a whole number between 1 and 8, inclusive.

Example: 2

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `char`

See Also

Introduced in R2016a

Simulink.sdi.setTableGrouping

Package: Simulink.sdi

Change signal grouping hierarchy in Inspect pane

Syntax

```
Simulink.sdi.setTableGrouping
Simulink.sdi.setTableGrouping('group1')
Simulink.sdi.setTableGrouping('group1', 'group2')
Simulink.sdi.setTableGrouping('group1', 'group2', 'group3')
```

Description

`Simulink.sdi.setTableGrouping` groups signals in the **Inspect** pane of the Simulation Data Inspector as a flat list.

`Simulink.sdi.setTableGrouping('group1')` groups signals in the **Inspect** pane by the parameter specified by `group1`.

`Simulink.sdi.setTableGrouping('group1', 'group2')` groups signals in the **Inspect** pane first by the parameter specified by `group1` and then by the parameter specified by `group2`.

`Simulink.sdi.setTableGrouping('group1', 'group2', 'group3')` groups signals in the **Inspect** pane first by the parameter specified by `group1`, then by the parameter specified by `group2`, and finally by the parameter specified by `group3`. If you have a Simscape license, you have three options for table grouping.

Examples

Group Data by Model and Then Data Hierarchy

You can group your data in the navigation pane to visualize subsystem and data hierarchy relationships among signals clearly.

```
Simulink.sdi.setTableGrouping('Subsystems','DataHierarchy');
```

*   "Inspect and Compare Data Programmatically"
*   "Organize Your Simulation Data Inspector Workspace"

Input Arguments

`'group1'` — Signal grouping parameter
character vector

Parameter used to group signals in the **Inspect** pane of the Simulation Data Inspector. You can specify two grouping parameters, or three if you have a Simscape license.

*   `DataHierarchy` groups signals according to any data hierarchy in the model, for example grouping signals in a bus together.
*   `SubSystems` groups signals according to the model's subsystem hierarchy.
*   `PhysmodHierarchy` groups signals according to the Simscape block structure. This parameter is only available with a Simscape license.

Example: `'SubSystems'`

Example: `'DataHierarchy'`

Data Types: `char`

Introduced in R2016a

Simulink.sdi.snapshot

Package: Simulink.sdi

Capture contents of Simulation Data Inspector plots

Syntax

```
fig = Simulink.sdi.snapshot
[fig,image] = Simulink.sdi.snapshot
Simulink.sdi.snapshot(Name,Value)
Simulink.sdi.snapshot(Name,Value)
Simulink.sdi.snapshot(Name,Value)
```

Description

`fig = Simulink.sdi.snapshot` creates a figure of the plotting area in the open Simulation Data Inspector session with the figure handle `fig`.

`[fig,image] = Simulink.sdi.snapshot` creates a figure of the plotting area in the open Simulation Data Inspector session with the figure handle `fig` and returns the image data in the array, `image`.

`Simulink.sdi.snapshot(Name,Value)` captures an image of the Simulation Data Inspector plots according to the options specified by name-value pairs.

`fig = Simulink.sdi.snapshot(Name,Value)` captures an image of the Simulation Data Inspector plots according to the options specified by name-value pairs. This syntax returns the figure handle, `fig`, if a figure is created.

`[fig, image] = Simulink.sdi.snapshot(Name,Value)` captures an image of the Simulation Data Inspector plots according to the options specified by name-value pairs. This syntax returns the figure handle, `fig`, and an array of image data, `image`, when appropriate for the specified options.

Examples

Copy View Settings to a Run

This example shows how to copy the view settings for aligned signals from one run to another.

Simulate Your Model and get Run Object

Simulate the vdp model to create a run of data to visualize.

```
load_system('vdp')
set_param('vdp','SaveFormat','Dataset','SaveOutput','on')
sim('vdp')

runIndex = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(runIndex);
run = Simulink.sdi.getRun(runID);
```

Modify View Settings for Signals

Use the Simulink.sdi.Run object to access the signals in the run. Then, modify the signals' view settings, and plot them in the Simulation Data Inspector. Open the Simulation Data Inspector and use Simulink.sdi.snapshot to view the results.

```
sig1 = run.getSignalByIndex(1);
sig2 = run.getSignalByIndex(2);

sig1.LineColor = [0 0 1];
sig1.LineDashed = '-.';

sig2.LineColor = [1 0 0];
sig2.LineDashed = ':';
```

Capture a Snapshot from the Simulation Data Inspector

Create a Simulink.sdi.CustomSnapshot object and use the Simulink.sdi.snapshot function to programmatically capture a snapshot of the contents of the Simulation Data Inspector.

```
snap = Simulink.sdi.CustomSnapshot;

snap.Rows = 2;
```

```
snap.YRange = {[-2.25 2.25],[-3 3]};
snap.plotOnSubPlot(1,1,sig1,true)
snap.plotOnSubPlot(2,1,sig2,true)

fig = Simulink.sdi.snapshot("from","custom","to","figure","settings",snap);
```

Copy the View Settings to a New Simulation Run

Simulate the model again, with a different Mu value. Then, visualize the new run by copying the view settings from the first run. Specify the plot input as true to plot the signals from the new run.

```
set_param('vdp/Mu','Gain','5')
sim('vdp')
```

```
runIndex2 = Simulink.sdi.getRunCount;
runID2 = Simulink.sdi.getRunIDByIndex(runIndex2);
run2 = Simulink.sdi.getRun(runID2);

sigIDs = Simulink.sdi.copyRunViewSettings(runID,runID2,true);
```

Capture a Snapshot of the New Simulation Run

Use the `Simulink.sdi.CustomSnapshot` object to capture a snapshot of the new simulation run. First, clear the signals from the subplots. Then, plot the signals from the new run and capture another snapshot.

```
snap.clearSignals
snap.YRange = {[-2.25 2.25],[-8 8]};
snap.plotOnSubPlot(1,1,sigIDs(2),true)
snap.plotOnSubPlot(2,1,sigIDs(1),true)

fig = snap.snapshot("to","figure");
```

Input Arguments

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (`' '`). You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: `'to','figure','props',{'Name','My Data'}`

`from` — Content to include in the snapshot
'opened' (default) | 'active' | 'comparison' | 'custom'

Content to include in the snapshot.

- 'opened' — Include all subplots in the graphical viewing area of the open Simulation Data Inspector session.
- 'active' — Include only the active (selected) subplot in the open Simulation Data Inspector session.
- 'comparison' — Include the comparison plots for the selected comparison run or signal in the open Simulation Data Inspector session.
- 'custom' — Include contents specified by the settings name-value pair Simulink.sdi.CustomSnapshot object. You can use the 'from','custom' option to create a snapshot without opening the Simulation Data Inspector or affecting your open Simulation Data Inspector session. Include a settings name-value pair when you specify 'from','custom'.

Example: 'from','comparison'

Data Types: char | string

`to` — Type of snapshot to create
'image' (default) | 'figure' | 'file' | 'clipboard'

Type of snapshot to create.

- 'image' — Create a figure and return the figure handle and an array of image data. When you specify 'to','image', the fig and image outputs both have value.
- 'figure' — Create a figure and return the figure handle. When you specify 'to','figure' the fig output has value, and the image output is empty.
- 'file' — Save to a PNG file with the name specified by the filename name-value pair. If you do not specify a filename name-value pair, the file is named plots.png. When you specify 'to','file', the fig and image outputs are both empty.
- 'clipboard' — Copy the plots to your system clipboard. From the clipboard, you can paste the image into another program such as Microsoft Word. When you specify 'to','clipboard', the fig and image outputs are both empty.

Example: 'to','file'

Data Types: char | string

`filename` — Name for image file
`'plots.png'` (default) | character array | string

Name of the image file to store the snapshot when you specify `'to','file'`.

Example: `'filename','MyImage.png'`

Data Types: `char` | `string`

`props` — Properties to customize the figure
cell array

Figure properties, specified as a cell array. You can include settings for the figure properties described in Figure Properties.

Example: `'props',{'Name','MyData','NumberTitle','off'}`

Data Types: `char` | `string`

`settings` — Custom snapshot settings
`Simulink.sdi.CustomSnapshot`

`Simulink.sdi.CustomSnapshot` object specifying custom snapshot settings. You can use the `settings` name-value pair to specify the dimensions of the image in pixels, subplot layout, and limits for the *x*- and *y*-axes.

Example: `'settings',customSnap`

Data Types: `char` | `string`

Output Arguments

`fig` — Figure handle
figure handle

Handle for the figure. When a figure is not created with your specified options, the `fig` output is empty.

`image` — Image data
array

Array of image data. The `image` output has value when you use `Simulink.sdi.snapshot` without any input arguments or without a `to` name-value pair and when you specify `'to','image'`.

Topics
"Inspect and Compare Data Programmatically"
"Create Plots Using the Simulation Data Inspector"

Introduced in R2018a

Simulink.sdi.view

Package: Simulink.sdi

Open the Simulation Data Inspector

Syntax

```
Simulink.sdi.view
```

Description

`Simulink.sdi.view` opens the Simulation Data Inspector. You can write a script to plot your data and customize the Simulation Data Inspector properties and then use `Simulink.sdi.view` to see the results.

Examples

Open the Simulation Data Inspector from the Command Line

You can open the Simulation Data Inspector from the MATLAB command line to visualize, inspect, and analyze your data.

```
Simulink.sdi.view
```

Create a Run and View the Data

This example shows how to create a run, add data to it, and then view the data in the Simulation Data Inspector.

Create Data for the Run

This example creates `timeseries` objects for a sine and a cosine. To visualize your data, the Simulation Data Inspector requires at least a time vector that corresponds with your data.

```
% Generate timeseries data
time = linspace(0, 20, 100);

sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals, time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals, time);
cos_ts.Name = 'Cosine, T=8';
```

Create a Simulation Data Inspector Run and Add Your Data

To give the Simulation Data Inspector access to your data, use the `create` method and create a run. This example modifies some of the run's properties to help identify the data. You can easily view run and signal properties with the Simulation Data Inspector.

```
% Create a run
run = Simulink.sdi.Run.create;
run.Name = 'Sinusoids';
run.Description = 'Sine and cosine signals with different frequencies';

% Add timeseries data to run
run.add('vars', sine_ts, cos_ts);
```

Plot Your Data Using the `Simulink.sdi.Signal` Object

The `getSignalByIndex` method returns a `Simulink.sdi.Signal` object that can be used to plot the signal in the Simulation Data Inspector. You can also programmatically control aspects of the plot's appearance, such as the color and style of the line representing the signal. This example customizes the subplot layout and signal characteristics.

```
% Get signal, modify its properties, and change Checked property to true
sine_sig = run.getSignalByIndex(1);
sine_sig.LineColor = [0 0 1];
sine_sig.LineDashed = '-.';
sine_sig.Checked = true;
```

```
% Add another subplot for the cosine signal
Simulink.sdi.setSubPlotLayout(2, 1);

% Plot the cosine signal and customize its appearance
cos_sig = run.getSignalByIndex(2);
cos_sig.LineColor = [0 1 0];
cos_sig.plotOnSubPlot(2, 1, true);

% View the signal in the Simulation Data Inspector
Simulink.sdi.view
```

Close the Simulation Data Inspector and Save Your Data

```
Simulink.sdi.close('sinusoids.mat')
```

- "Inspect and Compare Data Programmatically"
- "View Data with the Simulation Data Inspector"

Alternatives

You can open the Simulation Data Inspector from the Simulink Editor toolbar with the

Simulation Data Inspector button .

Introduced in R2011b

Simulink.SimulationData.createStructOfTimeseries

Create a structure with MATLAB `timeseries` object leaf nodes

Syntax

```
struct_of_ts = Simulink.SimulationData.createStructOfTimeseries(
tsArrayObject)
```

```
struct_of_ts = Simulink.SimulationData.createStructOfTimeseries(
busObj,structOfTimeseries)
```

```
struct_of_ts = Simulink.SimulationData.createStructOfTimeseries(
busObj,cellOfTimeseries)
struct_of_ts = Simulink.SimulationData.createStructOfTimeseries(
busObj,cellOfTimeseries,dims)
```

Description

`struct_of_ts = Simulink.SimulationData.createStructOfTimeseries(
tsArrayObject)` creates a structure of MATLAB `timeseries` objects from a
`Simulink.TsArray` object. Use this syntax for signal logging data for a model simulated
in a release earlier than R2016a that used `ModelDataLogs` signal logging format.

`struct_of_ts = Simulink.SimulationData.createStructOfTimeseries(
busObj,structOfTimeseries)` creates a structure that matches the attributes of the
bus object `busObj` and sets the values of structure leaf nodes using a structure of
MATLAB `timeseries` objects `structOfTimeseries`. Use this syntax when using a
partial structure as the basis for creating a full structure to load into a model.

`struct_of_ts = Simulink.SimulationData.createStructOfTimeseries(
busObj,cellOfTimeseries)` creates a structure that matches the attributes of the bus
object `busObj` and sets the values of structure leaf nodes using a cell array of MATLAB
`timeseries` objects `cellOfTimeseries`.

struct_of_ts = Simulink.SimulationData.createStructOfTimeseries(
busObj,cellOfTimeseries,dims) creates a structure with the dimensions dims. Use
this syntax to create a structure to load into an array of buses.

Examples

Structure Based on `Simulink.TsArray`

Suppose you had signal logging data from simulating a model in a release earlier than
R2016a, using the ModelDataLogs format. The logged output is logsout.
View the logged data.

```
logsout
```

```
logsout =

Simulink.ModelDataLogs (log_modeldatalogs):
  Name                    Elements   Simulink Class

  bus1                       2         TsArray
```

Convert the logged data to a structure of MATLAB timeseries objects.

```
struct_of_ts = ...
Simulink.SimulationData.createStructOfTimeseries(logsout.bus1)

struct_of_ts =
```

```
        const1-sig: [1x1 timeseries]
        const2_sig: [1x1 timeseries]
```

Structure Based on Bus Object and a Partial Structure of Timeseries Data

Create a structure of MATLAB `timeseries` objects based on a `Simulink.Bus` object and a partial structure of MATLAB `timeseries` objects. Use this structure to load into another model. Open a model and simulate it, producing signal logging data.

Open a model and simulate it, producing signal logging data.

```
open_system(docpath(fullfile(docroot,'toolbox','simulink',...
'examples','ex_log_structTimeSeries')))
sim('ex_log_structTimeSeries')
```

View the logged signal data.

```
ex_log_structTimeSeries_logsout
```

```
Simulink.SimulationData.Dataset 'ex_log_structTimeSeries_logsout' with 2 elements

                    Name  BlockPath
```

```
   1  [1x1 Signal]       bus1  ex_log_structTimeSeries/Bus Creator
   2  [1x1 Signal]       bus2  ex_log_structTimeSeries/Bus Creator1

 - Use braces { } to access, modify, or add elements using index.
```

Open the model to load the logged signal data into.

```
open_system(docpath(fullfile(docroot,'toolbox','simulink',...
'examples','ex_load_structTimeSeries_Bus')))
```

The ex_load_structTimeSeries_Bus model **Configuration Parameters > Data Import/Export > Input** parameter lists the ex_load_structTimeSeries_inputBus variable. However, you have not yet defined that variable in the MATLAB workspace. Use Simulink.SimulationData.createStructOfTimeseries to define that variable.

```
ex_load_structTimeSeries_inputBus = ...
Simulink.SimulationData.createStructOfTimeseries...
('bus', ex_log_structTimeSeries_logsout.get(2).Values)

ex_load_structTimeSeries_inputBus =

    a: [1x1 timeseries]
    b: [1x1 timeseries]
```

Structure to Use with an Array of Buses

Create a structure of MATLAB timeseries objects to load into an array of buses. Specify the dimensions of the created structure and a cell array of MATLAB timeseries objects.

Open a model and simulate it, producing signal logging data.

```
open_system(docpath(fullfile(docroot,'toolbox','simulink',...
'examples','ex_log_structTimeSeries')))
sim('ex_log_structTimeSeries')
```

The simulated ex_log_structTimeseries model looks like this:
View the logged signal data.

ex_log_structTimeSeries_logsout

```
Simulink.SimulationData.Dataset 'ex_log_structTimeSeries_logsout' with 2 elements

                        Name  BlockPath
                        ____  _____
    1  [1x1 Signal]     bus1  ex_log_structTimeSeries/Bus Creator
    2  [1x1 Signal]     bus2  ex_log_structTimeSeries/Bus Creator1

  - Use braces { } to access, modify, or add elements using index.
```

Open the model to load the logged signal data into.

```
open_system(docpath(fullfile(docroot,'toolbox','simulink',...
'examples','ex_load_structTimeSeries_AoB')))
```
The `ex_load_structTimeSeries_AoB` model's **Configuration Parameters** > **Data Import/Export** > **Input** parameter lists the `ex_load_structTimeSeries_inputAoB` variable. However, you have not yet defined that variable in the MATLAB workspace. Use `Simulink.SimulationData.createStructOfTimeseries` to define that variable.

```
ex_load_structTimeSeries_inputAoB = ...
Simulink.SimulationData.createStructOfTimeseries...
('bus',{ex_log_structTimeSeries_logsout.get(1).Values.a,...
ex_log_structTimeSeries_logsout.get(1).Values.b,...
ex_log_structTimeSeries_logsout.get(2).Values.c,...
ex_log_structTimeSeries_logsout.get(2).Values.d},[2, 1])

ex_load_structTimeSeries_inputAoB =

2x1 struct array with fields:
    a
    b
```

Input Arguments

tsArrayObject — Simulink.TsArray object to convert
Simulink.TsArray object

`Simulink.TsArray` object to convert to a structure of MATLAB `timeseries` objects

In releases earlier than R2016a, when you log signals using the `ModelDataLogs` format, the logged data is a collection of `Simulink.TsArray` objects.

busObj — Bus object for creating a structure of MATLAB `timeseries` objects
`Simulink.Bus` object

Bus object for creating a structure of MATLAB `timeseries` objects, specified as the name of a `Simulink.Bus` object.

Data Types: `char`

structOfTimeseries — Structure object for values to override ground values, specified as a structure of MATLAB `timeseries` objects.
structure of MATLAB `timeseries` objects

Structure object for values to override ground values, specified as a structure of MATLAB `timeseries` objects. The structure must have the same hierarchy as the bus object. However, the names of the fields in the structure do not have to match the names of the corresponding bus object nodes.

Data Types: `struct`

cellOfTimeseries — Cell array objects for values to override ground values, specified as a cell array of MATLAB `timeseries` objects.
cell array of MATLAB `timeseries` objects

Cell array object for values to override ground values, specified as a cell array of MATLAB `timeseries` objects. If you specify a cell array of MATLAB `timeseries` objects and you specify a `dims` argument, then the length of the cell array must be equal to the result of `Simulink.BusObject.getNumLeafBusElements` times the product of the specified dimensions.

Data Types: `cell`

dims — Dimensions of the structure that this function creates.
vector

Dimensions of the structure that this function creates, specified as a vector. The length of the cell array is equal to the result of `Simulink.BusObject.getNumLeafBusElements` times the product of the specified dimensions.

If you specify a dimension in the form `[n]`, then Simulink interprets the dimension to be `1xn`.

Data Types: `double`

Output Arguments

struct_of_ts — Structure of MATLAB `timeseries` objects.
MATLAB structure

MATLAB `timeseries` objects, returned as a structure. The structure has the same hierarchy and attributes as the `Simulink.TsArray` object or `Simulink.Bus` object that you specify.

The dimensions of `structOfTimeseries` depend on the input arguments:

- If you specify `tsArrayObject`, then the dimension is 1.
- If you specify the `busObj` and a structure of MATLAB `timeseries`, then the dimension matches the dimensions of the specified structure.
- If you specify only the `busObj` and a cell array of MATLAB `timeseries`, then the dimension is 1.
- If you specify the `busObj` argument, a cell array of MATLAB `timeseries`, and the `dims` argument, then the dimensions match the dimensions of `dims`.

getAsDatastore

Class: Simulink.SimulationData.DatasetRef
Package: Simulink.SimulationData

Get matlab.io.datastore.SimulationDatastore representation of element from referenced Dataset object

Syntax

```
element =
Simulink.SimulationData.DatasetRef.getAsDatastore(datasetref_element
s)
```

Description

`element =`
`Simulink.SimulationData.DatasetRef.getAsDatastore(datasetref_element`
`s)` returns a `matlab.io.datastore.SimulationDatastore` representation of an element or collection of elements from the referenced dataset, based on index, name, or block path of the element.

You can represent a `Dataset` element as a
`matlab.io.datastore.SimulationDatastore` object if the element was placed into the MAT-file using either of these approaches:

- Log `Dataset` format data to persistent storage (MAT-file).

- Place the element into a `Simulink.SimulationData.Dataset` object and saved the `Dataset` object to a v7.3 MAT-file.

The `SimulationDatastore` representation for a `Dataset` element creates a SimulationDatastore object for the Values field of that element. The `SimulationDatastore` representation supports streaming of the data for the `Values` property of the element into other simulations or into MATLAB.

Note You cannot use create a `SimulationDatastore` for `Dataset` elements that contain these types of data:

- Array

You can use `SimulationDatastore` objects to:

- Refer to logged simulation data that is stored on disk in a MAT-file.
- Specify signals to stream incrementally from disk to a simulation.
- Provide a basis for big data analysis using MATLAB functions.

Input Arguments

datasetref_element — Element of referenced dataset in MAT-file
index of the element

Element of a referenced dataset in a MAT-file, specified as an index, name (as a character vector), or block path (as a character vector.

Output Arguments

element — Element accessed using SimulationDatastore object
matlab.io.datastore.SimulationDatastore object |
Simulink.SimulationData.Signal, Simulink.SimulationData.State or similar object, whose Values data uses a matlab.io.datastore.SimulationDatastore object

Element accessed using `SimulationDatastore` object, returned as either a `matlab.io.datastore.SimulationDatastore` object or a `Simulink.Signal`, `Simulink.State`, or similar object, whose `Values` data uses a `matlab.io.datastore.SimulationDatastore` object.

Examples

Use a SimulationDatastore to Reference a Signal's Data in a DatasetRef

Log signal data to persistent storage (select the **Log Dataset data to file** configuration parameter) and simulate a model.

Create a `DatasetRef` for the signal logging `Dataset` data (`logsout`) in the `out.mat` MAT-file.

```
sigLogRef = Simulink.SimulationData.DatasetRef('out.mat','logsout');
firstSig = sigLogRef.getAsDatastore(1)

firstSig =

  Simulink.SimulationData.Signal
  Package: Simulink.SimulationData

  Properties:
              Name: 'x1'
    PropagatedName: ''
         BlockPath: [1x1 Simulink.SimulationData.BlockPath]
          PortType: 'outport'
         PortIndex: 1
            Values: [1×1 matlab.io.datastore.SimulationDatastore]
```

Load the data into another model. This approach streams the values of the signal `x1` for another simulation.

```
ds = Simulink.SimulationData.Dataset;
ds{1} = sigLogRef{1};
sim('other_model','ExternalInput','ds');
```

• "Load Big Data for Simulations"

Alternative

To streamline the use of indexing, you can use curly braces (`{}`) syntax to obtain a `SimulationDatastore` object for `DatasetRef` object signal values. The requirements and results are the same as using `getAsDatastore`. For example, if you log signal data to persistent storage (select the **Log Dataset data to file** configuration parameter) and simulate a model.

```
sigLogRef = Simulink.SimulationData.DatasetRef('out.mat','logsout');
firstSig = sigLogRef{1}
```

```
ans =

  Simulink.SimulationData.Signal
  Package: Simulink.SimulationData

  Properties:
              Name: 'x1'
    PropagatedName: ''
         BlockPath: [1x1 Simulink.SimulationData.BlockPath]
          PortType: 'outport'
         PortIndex: 1
            Values: [1×1 matlab.io.datastore.SimulationDatastore]
```

See Also

Topics

"Load Big Data for Simulations"

Introduced in R2017a

Simulink.SimulationData.DatasetRef.-getDatasetVariableNames

List names of `Dataset` variables in MAT-file

Syntax

```
varNames =
Simulink.SimulationData.DatasetRef.getDatasetVariableNames(matFile)
```

Description

```
varNames =
Simulink.SimulationData.DatasetRef.getDatasetVariableNames(matFile)
```
lists the names of variables for `Dataset` data in a MAT-file.

Examples

List Variable Names in MAT-File

Suppose that you simulate a model using the default variable names for signal logging data and states data. You enable the **Configuration Parameters > Data Import/Export > Log Dataset data to file** and use the default MAT-file name of `out.mat`.

List the variable names in the MAT-file.

```
varNames = Simulink.SimulationData.DatasetRef.getDatasetVariableNames('out.mat')
```

```
varNames =

    'xout'   'logsout'
```

- "Log Data to Persistent Storage"
- "Load Big Data for Simulations"

Tips

To get the names of `Dataset` variables in the MAT-file, using the
`Simulink.SimulationData.DatasetRef.getDatasetVariableNames` function
processes faster than using the `who`, or `whos` functions.

Input Arguments

matFile — MAT-file that contains Dataset variables
character vector

MAT-file that contains `Dataset` variables, specified as a character vector. The character
vector specifies the path to the MAT-file.

Output Arguments

varNames — Names of Dataset variables in MAT-file
cell array

Names of `Dataset` variables in MAT-file, returned as a cell array.

Simulink.SimulationData.forEachTimeseries

Call function on each `timeseries` object

Syntax

```
dataResults = Simulink.SimulationData.forEachTimeseries(
functionHandle,inputData)
```

Description

`dataResults = Simulink.SimulationData.forEachTimeseries(
functionHandle,inputData)` runs the specified function handle on all MATLAB
`timeseries` objects contained in `inputData`.

Examples

Find Minimum for Logged Bus Signal Data

This example shows how to use the `forEachTimeseries` function to run the `min`
function on each `timeseries` object in the logged data for the `COUNTERBUS` signal.

Open the model and simulate it.

```
open_system('sldemo_mdlref_bus')
sim('sldemo_mdlref_bus');
```

Interface Specification Using Bus Objects and Array of Buses
Access the signal logging data. For this model, that data is stored in the `topOut` variable.

```
topOut
```

```
Simulink.SimulationData.Dataset 'topOut' with 4 elements
```

```
                     Name          BlockPath
                     _____   _____
  1  [1x1 Signal]    COUNTERBUS     sldemo_mdlref_bus/Concatenate
  2  [1x1 Signal]    OUTERDATA      sldemo_mdlref_bus/CounterA
  3  [1x1 Signal]    INCREMENTBUS   sldemo_mdlref_bus/IncrementBusCreator
  4  [1x1 Signal]    INNERDATA      ...erA|sldemo_mdlref_counter_bus/COUNTER
```

```
  - Use braces { } to access, modify, or add elements using index.
```

Find the values for the `COUNTERBUS` element.

```
counterbusData = topOut{1}.Values
```

```
counterbusData =
```

```
  2×1 struct array with fields:
```

```
    data
    limits
```

Run the `min` function on the `counterbus` data.

```
ret = Simulink.SimulationData.forEachTimeseries(@min,counterbusData)

ret =

2x1 struct array with fields:
  data
limits
```

Explore the returned data.

```
ret(1)

ans =

    data: 0
  limits: [1x1 struct]
```

```
ret(2).limits

ans =

  upper_saturation_limit: 40
  lower_saturation_limit: 0
```

Input Arguments

`functionHandle` — Function to run on MATLAB `timeseries` objects
function handle

Function to run on `timeseries` objects, specified as a function handle. For information about specifying function handles, see "Pass Function to Another Function" (MATLAB).

The function that you use with `forEachTimeseries`:

- Can be either a built-in function or a user-specified function
- Must return a scalar

If the function that you use with `forEachTimeseries` takes:

- One argument, specify the function handle and the input data. For example:

  ```
  ret = Simulink.SimulationData.forEachTimeseries(@min,data);
  ```

- More than one argument, specify the function handle as `@(x)` and then specify the function, using `x` as the first argument. For remaining arguments, specify values. For example, this command runs the `resample` function on MATLAB `timeseries` objects in data, for the time vector `[2.5 3]`.

  ```
  ret = Simulink.SimulationData.forEachTimeseries(@(x)...
   (resample(x,[2.5 3]),data);
  ```

inputData — Data to run specified function on
MATLAB `timeseries` object | array of `timeseries` | structure with `timeseries` at leaf nodes | array of structures with `timeseries` at leaf nodes

Data to run specified function on, specified as `timeseries` data.

Output Arguments

dataResults — Data resulting from running specified function
MATLAB `timeseries` object | array of `timeseries` | structure with `timeseries` at leaf nodes | array of structures with `timeseries` at leaf nodes

Data resulting from running specified function, returned using the format and hierarchy of the input data.

Introduced in R2016b

Simulink.SimulationData.signalLoggingSelector

Open Signal Logging Selector

Syntax

Simulink.SimulationData.signalLoggingSelector(modelName)

Description

Simulink.SimulationData.signalLoggingSelector(modelName) opens the Signal Logging Selector dialog box for the model that you specify with modelName.

Input Arguments

modelName

Character vector that specifies the name of the model for which you want to open the Signal Logging Selector dialog box.

Example

Open the Signal Logging Selector dialog box for the sldemo_mdlref_bus.mdl.

Simulink.SimulationData.signalLoggingSelector('sldemo_mdlref_bus')

Introduced in R2011a

setName

Class: Simulink.SimulationData.Unit
Package: Simulink.SimulationData

Specify name of logging data units

Syntax

```
unitObject = setName(unitObj,unitName)
```

Description

`unitObject = setName(unitObj,unitName)` sets the name for the `Simulink.SimulationData.Unit` object to the name specified in `unitName`.

Input Arguments

unitObj — Logging data unit object to name
Simulink.SimulationData.Unit object

Logging data unit object to name, specified as a `Simulink.SimulationData.Unit` object.

unitName — Name of logging data unit
character vector

Name of logging data unit, specified as a character vector.

Output Arguments

name — Name of logging data units
character vector

Name of logging data units, returned as a character vector.

Examples

Name a Logging Data Unit Object

```
inchesUnit = Simulink.SimulationData.Unit('in');
inchesUnit = setName(inchesUnit,'inches')

inchesUnit =

  Units with properties:

    Name: 'inches'
```

Simulink.SimulationData.updateDatasetFormatLogging

Convert model and its referenced models to use `Dataset` format for signal logging

Syntax

```
Simulink.SimulationData.updateDatasetFormatLogging(top_model)
Simulink.SimulationData.updateDatasetFormatLogging(top_model,
variants)
```

Description

Note The `ModelDataLogs` class is supported for backwards compatibility. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format. In R2016a or later, when you open a model from an earlier release that had used `ModelDataLogs` format, the model simulated in use `Dataset` format. You do not need to use this command to update the signal logging format for a model that uses model referencing. Opening the model in R2016a or later uses `Dataset` format for all signal logging.

You can convert signal logging data from `ModelDataLogs` to `Dataset` format. Converting to `Dataset` format makes it easier to post-process with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see "Convert Logged Data to Dataset Format".

If you have legacy code that uses the `ModelDataLogs` API, you can encounter situations that require updates to your code or model. See "Migrate Scripts That Use Legacy ModelDataLogs API".

`Simulink.SimulationData.updateDatasetFormatLogging(top_model)` converts the top-level model and all of its referenced models to use the `Dataset` format for signal logging instead of the `ModelDataLogs` format. You can convert signal logging data from `ModelDataLogs` to `Dataset` format. Converting to `Dataset` format makes it easier to

post-process with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see "Convert Logged Data to Dataset Format".

If a Model block has the **Generate preprocessor conditionals** option selected, the function converts all the variants; otherwise, the function converts only the active variant.

`Simulink.SimulationData.updateDatasetFormatLogging(top_model, variants)` specifies which variant models to convert to use the `Dataset` signal logging format. For details about the `variants` argument, see "Input Arguments" on page 2-869

Input Arguments

top_model

Character vector that specifies the name of the top-level model.

variants

Character vector that specifies which variant models to update:

- `'ActivePlusCodeVariants'` — (Default) Search all variants if any generate preprocessor conditionals. Otherwise, search only the active variant.
- `'ActiveVariants'` — Convert only the active variant.
- `'AllVariants'` — Convert all variants.

Definitions

Dataset

The *Dataset* format causes Simulink to use a `Simulink.SimulationData.Dataset` object to store the logged signal data. The `Dataset` format use MATLAB `timeseries` objects to formatting the data.

ModelDataLogs

The *ModelDataLogs* format causes Simulink to use a `Simulink.ModelDataLogs` object to store the logged signal data.`Simulink.Timeseries` and `Simulink.TsArray` objects provide the format for the data.

Tips

- The conversion function sets the `SignalLoggingSaveFormat` parameter value to `Dataset` for all the updated models.

- If you want to save the format updates that the conversion function makes, then ensure that the top-level model, referenced models, and variant models are accessible and writable.

- If a model has no other unsaved changes, the conversion function saves the format updates to the model. If the model has unsaved changes, the function updates the format, but does not save those changes.

- If you use this function for a model that does not include any referenced models, the function converts the top-level model use the `Dataset` format.

Topics

"Migrate Scripts That Use Legacy ModelDataLogs API"

Introduced in R2011a

find

Class: Simulink.SimulationOutput
Package: Simulink

Access and display values of simulation results

Syntax

output = simOut.find('*VarName*')

Description

output = simOut.find('*VarName*') accepts one variable name. Specify *VarName* inside single quotes.

Input Arguments

VarName

Name of logged variable for which you seek values.

Default:

Output Arguments

Value

Value of the logged variable name specified in input.

Examples

Simulate vdp and store the values of the variable *youtNew* in *yout*.

```
simOut = sim('vdp','SimulationMode','rapid','AbsTol','1e-5',...
        'SaveState','on','StateSaveName','xoutNew',...
        'SaveOutput','on','OutputSaveName','youtNew');
yout = simOut.find('youtNew')
```

Alternatives

A simpler alternative to use dot notation. For example, to access data for the xoutNew output variable, you can use this command:

```
simOut.xoutNew
```

Another alternative is to use Simulink.SimulationOutput.who and then Simulink.SimulationOutput.get.

See Also
Simulink.SimulationOutput.get | Simulink.SimulationOutput.who

get

Class: Simulink.SimulationOutput
Package: Simulink

Access and display values of simulation results

Syntax

output = simOut.get('*VarName*')

Description

output = simOut.get('*VarName*') accepts one variable name. Specify *VarName* inside single quotes.

Tip A simpler alternative to using the get function is to use dot notation. For example, to access data for the xout output variable, you can use this command:

simOut.xout

Input Arguments

VarName

Name of logged variable for which you seek values.

Default:

Output Arguments

`Value`

Value of the logged variable name specified in input.

Examples

Simulate `vdp` and store the values of the variable *youtNew* in *yout*.

```
simOut = sim('vdp','SimulationMode','rapid','AbsTol','1e-5',...
        'SaveState','on','StateSaveName','xoutNew',...
        'SaveOutput','on','OutputSaveName','youtNew');
yout = simOut.get('youtNew')
```

Alternatives

A simpler alternative to use dot notation. For example, to access data for the `xout` output variable, you can use this command:

```
simOut.xout
```

Another alternative is to use `Simulink.SimulationOutput.who` and then `Simulink.SimulationOutput.find`.

See Also
`Simulink.SimulationOutput.find` | `Simulink.SimulationOutput.who`

getSimulationMetadata

Class: Simulink.SimulationOutput
Package: Simulink

Return `SimulationMetadata` object for simulation

Syntax

```
mData = simout.getSimulationMetadata()
```

Description

`mData = simout.getSimulationMetadata()` retrieves metadata information in a `SimulationMetadata` object from the `simout` `SimulationOutput` object.

Input Arguments

simout — Simulation object to get metadata from
object

Simulation object to get metadata from, specified as a `SimulationOutput` object.

Output Arguments

mData — SimulationMetadata object stored in the simout SimulationOutput object
object

`SimulationMetadata` object stored in the `simout` `SimulationOutput` object, returned as an object.

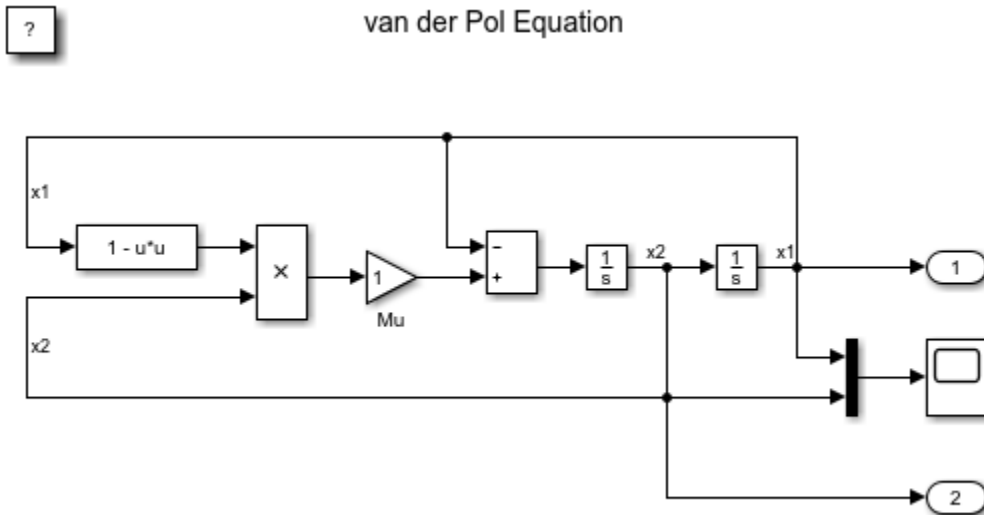
Examples

Retrieve Metadata From vdp Simulation

Simulate the `vdp` model and retrieve metadata information from the simulation.

Simulate the `vdp` model. Save the results of the `Simulink.SimulationOutput` object in `simout`

```
open_system('vdp')
simout = sim(bdroot,'ReturnWorkspaceOutputs','on');
```



Copyright 2004-2013 The MathWorks, Inc.
Retrieve metadata information about this simulation using mData.

```
mData=simout.getSimulationMetadata()
```

```
mData =

  SimulationMetadata with properties:

        ModelInfo: [1x1 struct]
       TimingInfo: [1x1 struct]
    ExecutionInfo: [1x1 struct]
       UserString: ''
```

```
        UserData: []
```

Alternatives

A simpler alternative to use dot notation with the `SimulationMetadata` property. For example:

```
simOut.SimulationMetadata.ModelInfo
```

Another alternative is to display simulation metadata in the Variable Editor using one of these approaches:

- Select the **Show Simulation Metadata** check box (which displays the data in a tree structure).
- Double-click the **SimulationMetadata** row.
- View the `SimulationMetadata` object.

See Also

`Simulink.SimulationMetadata` | `Simulink.SimulationOutput.setUserData` | `Simulink.SimulationOutput.setUserString`

setUserData

Class: Simulink.SimulationOutput
Package: Simulink

Store custom data in `SimulationMetadata` object that `SimulationOutput` object contains

Syntax

```
simoutNew = simout.setUserData(CustomData)
```

Description

`simoutNew = simout.setUserData(CustomData)` assigns a copy of the `simout` `SimulationOutput` object to `simoutNew`. The copy contains `CustomData` in its `SimulationMetadata` object.

Input Arguments

`simout` — Simulation object to get metadata from
object

Simulation object to get metadata from, specified as a `SimulationOutput` object.

`CustomData` — Data to store in a metadata object
data

Any custom data you want to store in the metadata object.

Output Arguments

`simoutNew` — Simulation object that stores metadata object with custom data
object

A copy of the `simout` `SimulationOutput` object that contains `CustomData` in its `SimulationMetadata` object, returned as an object.

Examples

Store Data in SimulationMetadata Object of vdp Simulation

Simulate the `vdp` model. Store custom data in the `SimulationMetadata` object that the `SimulationOutput` object contains.

Simulate the `vdp` model. Save the results of the `Simulink.SimulationOutput` object in `simout`.

```
open_system('vdp')
simout=sim(bdroot,'ReturnWorkspaceOutputs','on');
```

van der Pol Equation
Copyright 2004-2013 The MathWorks, Inc.
Store custom data about the simulation in the `SimulationMetadata` object that `simout` contains.

```
simout=simout.setUserData(struct('param1','value1','param2','value2','param3','value3')
```

Use `SimulationOutput.getSimulationMetadata` to retrieve the information you stored.

```
mData=simout.getSimulationMetadata();
disp(mData.UserData)

    param1: 'value1'
    param2: 'value2'
```

```
param3: 'value3'
```

See Also

```
Simulink.SimulationMetadata |
Simulink.SimulationOutput.getSimulationMetadata |
Simulink.SimulationOutput.setUserString
```

setUserString

Class: Simulink.SimulationOutput
Package: Simulink

Store custom character vector in `SimulationMetadata` object that `SimulationOutput` object contains

Syntax

```
simoutNew = simout.setUserString(CustomString)
```

Description

`simoutNew = simout.setUserString(CustomString)` assigns a copy of the `simout` `SimulationOutput` object to `simoutNew`. The copy contains `CustomString` in its `SimulationMetadata` object.

Input Arguments

`simout` — Simulation object to get metadata from
object

Simulation object to get metadata from, specified as a `SimulationOutput` object.

`CustomString` — Character vector to store in a metadata object
character vector

Any custom character vector you want to store in the metadata object.

Output Arguments

`simoutNew` — Simulation object that stores metadata object with custom character vector
object

A copy of the `simout SimulationOutput` object that contains `CustomString` in its `SimulationMetadata` object, returned as an object.

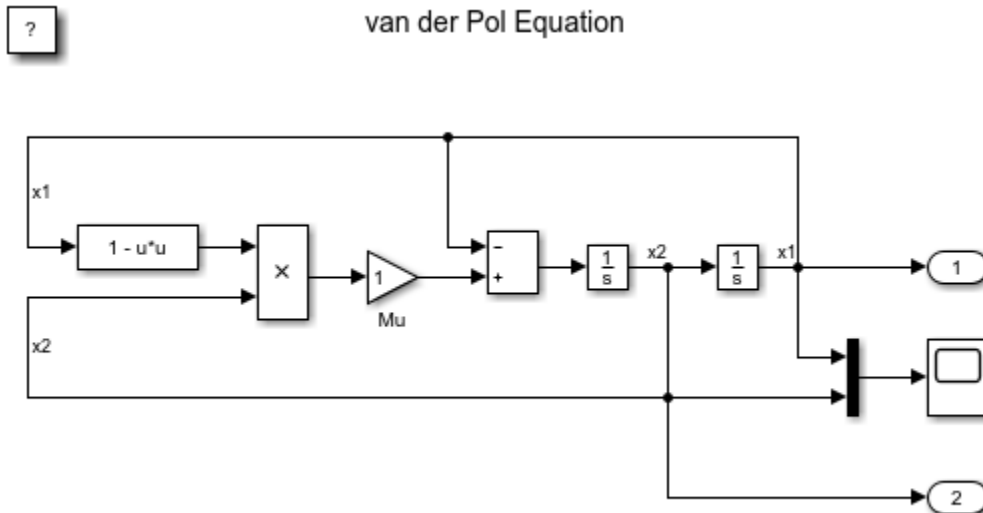
Examples

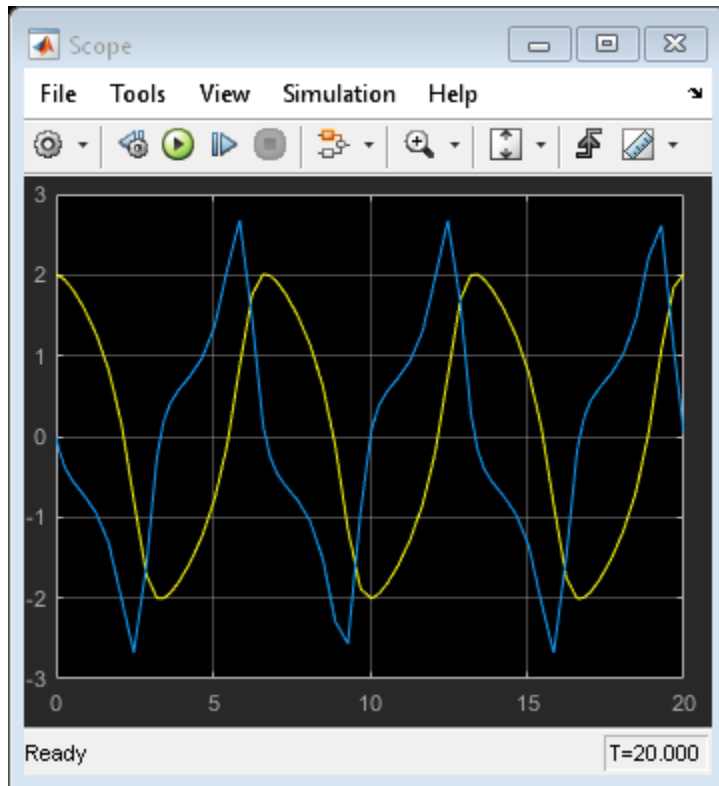
Store a Character Vector in SimulationMetadata Object of vdp Simulation

Simulate the `vdp` model. Store a custom character vector in the `SimulationMetadata` object that the `SimulationOutput` object contains.

Simulate the `vdp` model. Save the results of the `Simulink.SimulationOutput` object in `simout`.

```
open_system('vdp')
simout=sim(bdroot,'ReturnWorkspaceOutputs','on');
```

van der Pol Equation


Copyright 2004-2013 The MathWorks, Inc.


Store a character vector to describe the simulation.

```
simout=simout.setUserString('First Simulation');
```

Use `SimulationOutput.getSimulationMetadata` to retrieve the information you stored.

```
mData=simout.getSimulationMetadata();
disp(mData.UserString)
```

First Simulation

Simulink.SimulationMetadata |
Simulink.SimulationOutput.getSimulationMetadata |
Simulink.SimulationOutput.setUserData

who

Class: Simulink.SimulationOutput
Package: Simulink

Access and display output variable names of simulation

Syntax

simOutVar = simOut.who

Description

simOutVar = simOut.who returns the names of all simulation output variables, including workspace variables.

Output Arguments

simOutVar

Character vector array of output variable names of simulation.

Examples

Simulate vdp and store the character vector values of the output variable names.

```
simOut = sim('vdp','SimulationMode','rapid','AbsTol','1e-5',...
        'SaveState','on','StateSaveName','xoutNew',...
        'SaveOutput','on','OutputSaveName','youtNew');
simOutVar = simOut.who
```

Alternatives

A simpler alternative to use dot notation. For example, to access data for the `xoutNew` output variable, you can use this command:

```
simOut.xoutNew
```

See Also

`Simulink.SimulationOutput.find` | `Simulink.SimulationOutput.get`

Simulink.SubSystem.convertToModelReference

Convert subsystem to model reference

Syntax

```
Simulink.SubSystem.convertToModelReference(gcb,'UseConversionAdvisor
',true)

[success,mdlRefBlkHs] = Simulink.SubSystem.convertToModelReference(
subsys,mdlRefs)
[success,mdlRefBlkHs] = Simulink.SubSystem.convertToModelReference(
subsys,mdlRefs,Name,Value)
```

Description

`Simulink.SubSystem.convertToModelReference(gcb,'UseConversionAdvisor',true)` opens the Model Reference Conversion Advisor for the currently selected subsystem block.

`[success,mdlRefBlkHs] = Simulink.SubSystem.convertToModelReference(subsys,mdlRefs)` converts the specified subsystems to referenced models using the `mdlRefs` value.

For each subsystem that the function converts, it:

- Creates a model
- Copies the contents of the subsystem into the new model
- Updates any root-level Input, Outport, Trigger, and Enable blocks and the configuration parameters of the model to match the compiled attributes of the original subsystem
- Copies the contents of the model workspace of the original model to the new model

Before you use the function, load the model containing the subsystem.

[success,mdlRefBlkHs] = Simulink.SubSystem.convertToModelReference(
subsys,mdlRefs,Name,Value) uses additional options specified by one or more
Name,Value pair arguments.

Examples

Open the Model Reference Conversion Advisor

Open the f14 model.

```
open_system('f14');
```

In the f14 model, select the Controller subsystem output signal, click the **Simulation Data Inspector** button arrow ⌷, and select **Log Selected Signals**.

In the Simulink Editor, select the Controller subsystem. Then open the Model Reference Conversion Advisor from the command line.

```
Simulink.SubSystem.convertToModelReference(gcb,'UseConversionAdvisor',true);
```

Perform the conversion using the advisor.

Convert Subsystem to Referenced Model

Convert the Bus Counter subsystem to a referenced model named bus_counter_ref_model.

```
open_system('sldemo_mdlref_conversion');
Simulink.SubSystem.convertToModelReference(...
   'sldemo_mdlref_conversion/Bus Counter', ...
   'bus_counter_ref_model', ...
   'AutoFix',true,...
   'ReplaceSubsystem',true,...
   'CheckSimulationResults',true);

### Successfully converted Subsystem to Model reference block
```

Conversion to Model Reference Example

Copyright 1990-2014 The MathWorks, Inc.

Convert Multiple Subsystems to Referenced Models

Convert the two subsystems with one command.

```
open_system('f14');
set_param(gcs,'SaveOutput','on','SaveFormat','Dataset');
set_param(gcs,'SignalResolutionControl','UseLocalSettings');
Simulink.SubSystem.convertToModelReference(...
{'f14/Controller','f14/Aircraft Dynamics Model'},...
{'controller_ref_model','aircraft_dynamics_ref_model'},...
'ReplaceSubsystem',true,...
```

```
'AutoFix',true,...
'CheckSimulationResults',true)
```

- sldemo_mdlref_conversion
- "Convert a Subsystem to a Referenced Model"
- "Model Referencing"

Input Arguments

subsys — Subsystems to convert
character vector | subsystem handle | cell array of character vectors | array of subsystem handles

Subsystems to convert, specified as a character vector, subsystem handle, or cell array of strings or array of subsystem handles.

For information about which subsystems you can convert, see "Limitations on Subsystems That You Can Convert".

Note You cannot convert a parent subsystem a child of that subsystem at the same time.

Data Types: `double`

mdlRefs — Referenced model names
character vector | cell array of character vectors

Referenced model names, specified as a character vector or cell array of character vectors. Each model name must be 59 characters or less.

If you specify a cell array of subsystems to convert, specify a cell array of referenced model names. Each model name corresponds to the specified subsystem, in the same order.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single

quotes (' '). You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: `Simulink.SubSystem.convertToModelReference...`
`(engineSubsys,engineModelRef,'ReplaceSubsystem',true)`

AutoFix — Fix all conversion issues that can be fixed automatically
`false` (default) | `true`

If you set `AutoFix` to `true`, the function fixes all conversion issues that it can fix.

For issues that the function cannot fix, the conversion process generates error messages that you address by modifying the model.

Note If you set `'Force'` to `true`, then the function does not automatically fix conversion issues.

Data Types: `logical`

Force — Complete conversion even with errors
`false` (default) | `true`

If you set `'Force'` to `true`, the function returns conversion errors as warnings and continues with the conversion without fixing the errors. This option allows you to use the function to do the initial steps of conversion and then complete the conversion process yourself.

If you set `Force` to `true`, then the function does not fix conversion issues, even if you set `'AutoFix'` to `true`. However, the `success` output argument is `true`, regardless of whether any conversion errors occurred.

CheckSimulationResults — Compare simulation results before and after conversion
`false` (default) | `true`

Compare simulation results before and after conversion, specified as `true` or `false`.

Before performing the conversion, enable signal logging for the subsystem output signals of interest in the model.

For the `Simulink.SubSystem.convertToModelReference` command, set:

- `'CheckSimulationResults'` to `true`
- `'AbsoluteTolerance'`
- `'RelativeTolerance'`
- `'SimulationModes'` to the same as the simulation mode as in the original model

If the difference between simulation results exceeds the tolerance level, the function displays a message.

AbsoluteTolerance — Absolute signal tolerance for comparison
`'1e-06'` (default) | double

Absolute signal tolerance for comparison, specified as a double. Use the option only if you set `CheckSimulationResults` to `true`.

Data Types: `double`

RelativeTolerance — Relative signal tolerance for comparison
`'1e-06'` (default) | double

Relative signal tolerance for comparison, specified as a double. Use the option only if you set `CheckSimulationResults` to `true`.

Data Types: `double`

DataFileName — Name of file for storing conversion data
character vector

Name of file for storing conversion data, specified as a character vector. You can specify an absolute or relative path.

You can save the conversion data in a MAT-file (default) or a MATLAB file. If you use a `.m` file extension, the function serializes all variables to a MATLAB file.

By default, the function uses a file name consisting of the model name plus `_conversion_data.mat`.

ReplaceSubsystem — Replace content of each subsystem with Model blocks
false (default) | `true`

Replace subsystem blocks with Model blocks, specified as `true` or `false`. The Model block references the referenced model.

By default, the function displays the referenced models in separate Simulink Editor windows.

If you set the value to `true`, consider making a backup of the original model before you convert the subsystems. If you want to undo the conversion, having a backup makes it easier to restore the model.

If you set `ReplaceSubsystem` to `true`, the conversion action depends on whether you use the automatic fix options.

- If you use the automatic fixes, then the conversion replaces the Subsystem block with a Model block unless the automatic fixes change the input or output ports. If the ports change, then the conversion includes the contents of the subsystem in a Model block that is inserted in the Subsystem block.
- If you do not use the automatic fixes, then the conversion replaces the Subsystem block with a Model block.

Data Types: `logical`

CreateWrapperSubsystem — Insert wrapper subsystem to preserve model layout
`false` (default) | `true`

Insert wrapper subsystem to preserve model layout, specified as `true` or `false`. When you convert a subsystem to a referenced model, you can have the conversion process insert a wrapper subsystem to preserve the layout of a model. The subsystem wrapper contains the Model block from the conversion.

The conversion creates a wrapper subsystem automatically if the conversion modifies the Model block interface by adding ports.

Data Types: `logical`

SimulationModes — Simulation mode for Model blocks
`'Normal'` (default) | `'Accelerator'`

Simulation mode for Model blocks, specified as a `'Normal'` or `'Accelerator'`. The simulation mode setting applies to the Model blocks that reference the models that the conversion creates.

BuildTarget — Model reference targets to generate
`'Sim'` | `'RTW'`

Model reference targets to generate.

- `'Sim'` — Model reference simulation target
- `'RTW'` — Code generation target

Output Arguments

`success` — Conversion status
1 | 0

Conversion status. A value of 1 indicates a successful conversion.

If you set `'Force'` to `true`, the function returns a value of 1 if the conversion completes. However, the simulation results can differ from the simulation results for the model before conversion.

`mdlRefBlkHs` — Handles of created Model blocks
handle of Model block | array of handles of Model blocks

Handles of created Model blocks, returned as a double or cell array.

Data Types: `double`

Tips

- You cannot convert a parent subsystem a child of that subsystem at the same time.
- Specifying multiple subsystems to convert with one command can save time, compared to converting each subsystem separately. The multiple-subsystem conversion process compiles the model one time.
- If you specify multiple subsystems to convert, the conversion process attempts to convert each subsystem. Successfully converted subsystems produce referenced models, even if the conversions of other subsystems fail.
- If you specify multiple subsystems, consider:
  - Specifying these `'Autofix'`, `'ReplaceSubsystem'`, `'CheckSimulationResults'` name and value pairs, set to `true`.
  - In the model, setting a short simulation time.
- Simulink uses the data dictionary to save the bus objects that it creates as part of the conversion processing when both these conditions exist:

- The top model uses a data dictionary.
- All changes to the top model are saved.

- After you complete the conversion, update the model as necessary to meet your modeling requirements. For details, see "Integrate the Referenced Model into the Parent Model".

- Converting a masked subsystem can require you to perform additional tasks to maintain the same general behavior that the masked subsystem provided.

  If the subsystem that you convert contains a masked block, consider masking the Model block in your new referenced model (see "Block Masks"). Configure the referenced model to support the functionality of the masked subsystem.

  Note A referenced model does not support the functionality that you can achieve with mask initialization code to create masked parameters.

  For mask parameters, replace the mask parameters with model arguments (see "Parameterize Instances of a Reusable Referenced Model"):

  1 In the model workspace of the referenced model, create a variable for each mask parameter.

  2 In the Model Explorer, select the `Model Workspace` node. In the **Contents** pane, select the **Argument** check box to identify the variables as model arguments.

  3 In the new Model block, on the **Arguments** tab, in the **Model arguments** table, specify the values for the model arguments.

  For masked callbacks, icons, ports, and documentation:

  1 In the backup copy, open the Mask Editor on the masked subsystem and copy the content you want into the masked Model block.

  2 In the Mask Editor for the new Model block, paste the masked subsystem content.

Simulink.SubSystem.copyContentsToBlockDiagram

Copy contents of subsystem to empty block diagram

Syntax

Simulink.SubSystem.copyContentsToBlockDiagram(*subsys*, *bdiag*)

Description

Simulink.SubSystem.copyContentsToBlockDiagram(*subsys*, *bdiag*) copies the contents of the subsystem *subsys* to the block diagram *bdiag*. The subsystem and block diagram must have already been loaded. The subsystem cannot be part of the block diagram. The function affects only blocks, lines, and annotations; it does not affect nongraphical information such as configuration sets.

This function cannot be used if the destination block diagram contains any blocks or signals. Other types of information can exist in the destination block diagram and are unaffected by the function. Use Simulink.BlockDiagram.deleteContents if necessary to empty the block diagram before using Simulink.SubSystem.copyContentsToBlockDiagram.

Tip To flatten a model hierarchy by expanding the contents of a subsystem to the system that contains that subsystem, do not use the Simulink.SubSystem.copyContentsToBlockDiagram function. Instead, expand the subsystem, as described in "Expand Subsystem Contents".

Input Arguments

subsys

Subsystem name or handle

bdiag

Block diagram name or handle

Examples

Copy the graphical contents of `f14/Controller`, including all nested subsystems, to a new block diagram:

```
% open f14
open_system('f14');

% create a new model
newbd = new_system;
open_system(newbd);

% copy the subsystem
Simulink.SubSystem.copyContentsToBlockDiagram('f14/Controller', newbd);

% close f14 and the new model
close_system('f14', 0);
close_system(newbd, 0);
```

Simulink.SubSystem.deleteContents

Delete contents of subsystem

Syntax

Simulink.SubSystem.deleteContents(*subsys*)

Description

Simulink.SubSystem.deleteContents(*subsys*) deletes the contents of the subsystem *subsys*. The function affects only blocks, lines, and annotations. The subsystem must have already been loaded.

Note This function does not delete library blocks in a subsystem.

Input Arguments

subsys

Subsystem name or handle

Examples

Delete the graphical contents of `Controller`, including all nested subsystems:

Simulink.SubSystem.deleteContents('f14/Controller');

Simulink.SubSystem.getChecksum

Return checksum of nonvirtual subsystem

Syntax

```
[checksum,details] = Simulink.SubSystem.getChecksum(subsys)
```

Description

`[checksum,details] = Simulink.SubSystem.getChecksum(subsys)` returns the checksum of the specified nonvirtual subsystem. Simulink computes the checksum based on the subsystem parameter settings and the blocks the subsystem contains. Virtual subsystems do not have checksums.

One use of this command is to determine why code generated for a subsystem is not being reused.

Note `Simulink.SubSystem.getChecksum` compiles the model that contains the specified subsystem, if the model is not already in a compiled state. If you need to get the checksum for multiple subsystems and want to avoid multiple compiles, use the command `,model([], [], [], 'compile')` to place the model in a compiled state before using `Simulink.SubSystem.getChecksum`.

This command accepts the argument `subsys`, which is the full name or handle of the nonvirtual subsystem block for which you are returning checksum data.

Examples

Run getChecksum on Model

Run the function `Simulink.SubSystem.getChecksum` on the model `rtwdemo_ssreuse`. In the MATLAB editor window, both output structures are displayed. In the workspace pane, double-click on either of the structures to view its contents.

Load the model `rtwdemo_ssreuse`.

`rtwdemo_ssreuse`

Select subsystem `SS1` and execute the follow line of code in the MATLAB editor to get the full name and path to the subsystem SS1:

`path_ss1 = gcb`

Run the function `getChecksum` on the subsystem with the following command:

`[chksum1, chksum1_details] = Simulink.SubSystem.getChecksum(path_ss1)`

The output structures `chksum1` and `chksum1_details` will store the output of the `getChecksum` function call.

```
chksum1 =

  struct with fields:

          Value: [4×1 uint32]
    MarkedUnique: 0

chksum1_details =

  struct with fields:

          ContentsChecksum: [1×1 struct]
         InterfaceChecksum: [1×1 struct]
     ContentsChecksumItems: [359×1 struct]
    InterfaceChecksumItems: [60×1 struct]
```

Input Arguments

subsys — Name or handle of nonvirtual subsystem
character vector

Input the full name of the nonvirtual subsystem for which you want to calculate the checksum.

Data Types: `char`

Output Arguments

`checksum` — A structure that stores the value of the checksum and indicates whether `subsys` contains unique block or subsystem properties which prevent generated code reuse
structure

Checksum information, returned as a structure with the fields:

`Value` — Array of four 32-bit integers that represents the subsystem's 128-bit checksum
4x1 uint32

`MarkedUnique` — True if the subsystem or the blocks it contains have properties that would prevent the code generated for the subsystem from being reused; otherwise, false
bool

`details` — A structure that stores checksum data on model contents and the interface
structure

Checksum information, returned as a structure with the fields:

`ContentsChecksum` — A structure of the same form as `checksum`, representing a checksum that provides information about all blocks in the system
structure

`InterfaceChecksum` — A structure of the same form as`checksum`, representing a checksum that provides information about the subsystem's block parameters and connections
structure

`ContentsChecksumItems` — Structure array that Simulink uses to compute the checksum for `ContentsChecksum`
structure

Structure array returned with the following fields:

Handle — Object for which Simulink added an item to the checksum. For a block, the handle is a full block path. For a block port, the handle is the full block path and a character vector that identifies the port
char array

Identifier — Descriptor of the item Simulink added to the checksum. If the item is a documented parameter, the identifier is the parameter name
char array

Value — Value of the item Simulink added to the checksum. If the item is a parameter, Value is the value returned by get_param(handle, identifier)
type

InterfaceChecksumItems — Structure array that Simulink uses to compute the checksum for InterfaceChecksum
structure

Structure array returned with the following fields:

Handle — Object for which Simulink added an item to the checksum. For a block, the handle is a full block path. For a block port, the handle is the full block path and a character vector that identifies the port
char array

Identifier — Descriptor of the item Simulink added to the checksum. If the item is a documented parameter, the identifier is the parameter name
char array

Value — Value of the item Simulink added to the checksum. If the item is a parameter, Value is the value returned by get_param(handle, identifier)
type

Introduced in R2006b

Simulink.suppressDiagnostic

Suppress a diagnostic from a specific block

Syntax

```
Simulink.suppressDiagnostic(source, message_id)
Simulink.suppressDiagnostic(diagnostic)
```

Description

`Simulink.suppressDiagnostic(source, message_id)` suppresses all instances of diagnostics represented by `message_id` thrown by the blocks specified by `source`.

`Simulink.suppressDiagnostic(diagnostic)` suppresses the diagnostics associated with `MSLDiagnostic` object `diagnostic`.

Examples

Suppress a Warning Thrown By a Block

Using the model from "Suppress Diagnostic Messages Programmatically", use the `Simulink.suppressDiagnostic` function to suppress the parameter precision loss warning thrown by the Constant block, `one`.

```
Simulink.suppressDiagnostic('Suppressor_CLI_Demo/one',...
 'SimulinkFixedPoint:util:fxpParameterPrecisionLoss');
```

• "Suppress Diagnostic Messages Programmatically"

Input Arguments

source — Block or model object throwing the diagnostic
block path | block handle

The source of the diagnostic, specified as a block path, block handle, cell array of block paths, or cell array of block handles.

To get the block path, use the `gcb` function.

To get the block handle, use the `getSimulinkBlockHandle` function.

Data Types: `char` | `cell`

message_id — message identifier of diagnostic
message identifier | cell array of message identifiers

Message identifier of the diagnostic, specified as a character vector or a cell array of character vectors. You can find the message identifier of diagnostics thrown during simulation by accessing the `ExecutionInfo` property of the `Simulink.SimulationMetadata` object associated with a simulation. You can also use the `lastwarn` function.

Data Types: `char` | `cell`

diagnostic — Diagnostic object
MSLDiagnostic object

Diagnostic specified as an `MSLDiagnostic` object. Access the `MSLDiagnostic` object through the `ExecutionInfo` property of the `Simulink.SimulationMetadata` object.

Data Types: `struct`

See Also

Topics
"Suppress Diagnostic Messages Programmatically"

sint

Create `Simulink.NumericType` object describing signed integer data type

Syntax

```
a = sint(WordLength)
```

Description

`sint(WordLength)` returns a `Simulink.NumericType` object that describes the data type of a signed integer with a word size given by `WordLength`.

Note `sint` is a legacy function. In new code, use `fixdt` instead. In existing code, replace `sint(WordLength)` with `fixdt(1,WordLength,0)`.

Examples

Define a 16-bit signed integer data type.

```
a = sint(16)

a =

  NumericType with properties:

      DataTypeMode: 'Fixed-point: binary point scaling'
       Signedness: 'Signed'
       WordLength: 16
    FractionLength: 0
          IsAlias: 0
        DataScope: 'Auto'
       HeaderFile: ''
      Description: ''
```

See Also

Simulink.NumericType | fixdt | float | sfix | sfrac | ufix | ufrac | uint

Introduced before R2006a

slbuild

Build standalone executable or model reference target for model; except where noted, this function requires a Simulink Coder license

Syntax

```
slbuild(model,buildSpec,varArgIn)
```

Description

slbuild(model,buildSpec,varArgIn) builds a standalone Simulink Coder binary executable file from the *model*, using the current model configuration settings. If the *model* has not been loaded, slbuild loads it before initiating the build process. The *buildSpec* and *varArgIn* arguments are optional.

Do not use rtwbuild, rtwrebuild, or slbuild commands with parallel language features (Parallel Computing Toolbox) (for example, within a parfor or spmd loop). For information about parallel builds of referenced models, see "Reduce Build Time for Referenced Models" (Simulink Coder).

You cannot use slbuild to build subsystems.

Examples

Generate Code and Build Executable Image for Model

Generate C code for model rtwdemo_rtwintro.

```
slbuild('rtwdemo_rtwintro')
% same operation as ...
% slbuild('rtwdemo_rtwintro','StandaloneRTWTarget')
```

For the GRT target, the coder generates the following code files and places them in folders rtwdemo_rtwintro_grt_rtw and slprj/grt/_sharedutils.

Model Files	Shared Files	Interface Files	Other Files
rtwdemo_rtwintro.c	rtwtypes.h	rtmodel.h	none
rtwdemo_rtwintro.h	multiword_types.h		
rtwdemo_rtwintro_private.h	builtin_typeid_types.h		
rtwdemo_rtwintrotypes.h			

If the following model configuration parameters settings apply, the coder generates additional results.

Parameter Setting	Results
Code Generation > Generate code only pane is cleared	Executable image rtwdemo_rtwintro.exe
Code Generation > Report > Create code generation report is selected	Report appears, providing information and links to generated code files, subsystem and code interface reports, entry-point functions, inports, outports, interface parameters, and data stores

Force Top Model Build

Generate code and build an executable image for rtwdemo_mdlreftop, which refers to model rtwdemo_mdlrefbot, regardless of model checksums and parameter settings.

```
slbuild('rtwdemo_mdlreftop','StandaloneRTWTarget', ...
    'ForceTopModelBuild',true)
```

Clean Top Model Build

Clean the model build area enough to trigger regeneration of the top model code at the next build.

```
slbuild('rtwdemo_rtwintro','CleanTopModel')
```

Input Arguments

model — Specifies model for the build process
handle | character vector

Model for which to build a standalone executable or model reference target, specified as a handle or a character vector representing the model name.

Example: gcs

buildSpec — Specifies the code generation action for the build process
'StandaloneRTWTarget' (default) | 'ModelReferenceSimTarget' | 'ModelReferenceRTWTarget' | 'ModelReferenceRTWTargetOnly' | 'CleanTopModel'

The *buildSpec* directs the code generator to perform the selected build action for the *model* and the build process:

- Honors the setting of the **Rebuild** parameter on the **Model Referencing** pane of the Configuration Parameters dialog box.
- Requires a Simulink Coder license only if you build a model reference Simulink Coder target, not if you build only a model reference simulation target.

The *buildSpec* argument must be one of the following:

buildSpec	Build Action
'StandaloneRTWTarget'	Builds a standalone Simulink Coder binary executable file from the *model*, using the current model configuration settings. If the *model* has not been loaded, slbuild loads it before initiating the build process.
'ModelReferenceSimTarget'	Builds a model reference simulation target (does not require a Simulink Coder license)
'ModelReferenceRTWTarget'	Builds a model reference Simulink Coder target and the corresponding model reference simulation target
'ModelReferenceRTWTargetOnly'	Builds only a model reference Simulink Coder target

buildSpec	Build Action
`'CleanTopModel'`	Cleans the model build area enough to trigger regeneration of the top model code at the next build

Example: `'ModelReferenceSimTarget'`

varArgIn — Name-value pair parameters that provide added arguments for the build process
name-value pairs

`slbuild(myModel,'StandaloneRTWTarget','ForceTopModelBuild',true)`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (`'  '`). You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: `'UpdateThisModelReferenceTarget','Force'`

UpdateThisModelReferenceTarget — Specifies a conditional rebuild option for the model reference build
`'Force'` | `'IfOutOfDateOrStructuralChange'` | `'IfOutOfDate'`

The `'UpdateThisModelReferenceTarget'` option only applies when the *buildSpec* selection is `'ModelReferenceSimTarget'`, `'ModelReferenceRTWTarget'`, or `'ModelReferenceRTWTargetOnly'`.

The `'UpdateThisModelReferenceTarget'` value specifies a conditional rebuild option for the model reference target build when the **Rebuild** parameter on the **Model Referencing** pane of the Configuration Parameters dialog box is set to `Never`.

The `'UpdateThisModelReferenceTarget'` value applies only to *model*, not to any models referenced by *model*.

The `'UpdateThisModelReferenceTarget'` value must be one of the following:

UpdateThisModelReferenceTarget	Conditional Rebuild Action
`'Force'`	Unconditionally rebuilds the model. This option is equivalent to the `Always` rebuild option on the **Model Referencing** pane of the Configuration Parameters dialog box.
`'IfOutOfDateOrStructuralChange'`	Rebuilds the model if the build process detects any changes. This option is equivalent to the `If any changes detected` rebuild option on the **Model Referencing** pane of the Configuration Parameters dialog box.
`'IfOutOfDate'`	Rebuilds the model if the build process detects any changes in known dependencies of this model. This option is equivalent to the `If any changes in known dependencies detected` rebuild option on the **Model Referencing** pane of the Configuration Parameters dialog box.

Example: `'UpdateThisModelReferenceTarget','Force'`

ForceTopModelBuild — Directs the code generator to generate code and build an executable image for the top model of the referenced model hierarchy, regardless of model checksums and parameter settings
false (default) | true

Use `'ForceTopModelBuild'` value `true` to force the top model build.

Example: `'ForceTopModelBuild',true`

OpenBuildStatusAutomatically — Display build information in the Build Process Status Window
false (default) | true

Display build information in the **Build Process Status** window, specified as `true` or `false`. For more information about using the status window, see "View Build Process Status" (Simulink Coder).

The **Build Process Status** window support parallel builds of referenced model hierarchies. Do not use the **Build Process Status** window for sequential (non-parallel) builds.

Action	Specify
Display build information in the Build Process Status Window	true
No action	false

Introduced before R2006a

slCharacterEncoding

Change MATLAB character set encoding

Syntax

```
currentCharacterEncoding = slCharacterEncoding()
slCharacterEncoding(encoding)
```

Description

This command allows you to change the current MATLAB character set encoding to be compatible with the character encoding of a model that you want to open.

`currentCharacterEncoding = slCharacterEncoding()` returns the current MATLAB character set encoding.

`slCharacterEncoding(encoding)` changes the MATLAB character set encoding to the specified `encoding`. You should only specify these values:

- `'US-ASCII'`
- `'Windows-1252'`
- `'ISO-8859-1'`
- `'Shift_JIS'`
- `'UTF-8'`

If you want to use a different character encoding, you need to start MATLAB with the appropriate locale settings for your operating system. Consult your operating system manual to change the locale setting. Simulink can support any character encoding that uses single-byte or double-byte characters.

If you open a model that uses a particular character set encoding in a MATLAB session that uses a different encoding, a warning appears. For example, suppose that you create a model in a MATLAB session configured for `Shift_JIS` and open it in a session configured for `US_ASCII`. The warning message shows the encoding of the current session and the encoding used to create the model. If you encounter any problems with

corrupted characters, for example when using MATLAB files associated with the model, then try using the `slCharacterEncoding` function to change the character encoding

1   Close all open models.
2   Use `slCharacterEncoding` to change the character encoding of the current MATLAB session to match the model character encoding.
3   Reopen the model.

Note You must close all open models or libraries before changing the MATLAB character set encoding except when changing from `'US-ASCII'` to another encoding.

Topics
"Open a Model with Different Character Encoding"
"Save Models with Different Character Encodings"

Introduced before R2006a

sldebug

Start simulation in debug mode

Syntax

```
sldebug('sys')
```

Description

`sldebug('sys')` starts a simulation in debug mode. See "Debugger Command-Line Interface" for information about using the debugger.

Examples

The following command:

```
sldebug('vdp')
```

loads the Simulink example model `vdp` into memory and starts the simulation in debug mode. Alternatively, you can achieve the same result by using the `sim` command:

```
sim('vdp', 'debug', 'on')
```

See Also

```
sim
```

Introduced in R2006a

sldiagnostics

Display diagnostic information about Simulink system

Syntax

```
sldiagnostics('sys')
[txtRpt, sRpt] = sldiagnostics('sys')
[txtRpt, sRpt] = sldiagnostics('sys', options)
[txtRpt, sRpt] = sldiagnostics('sys', 'CompileStats')
[txtRpt, sRpt] = sldiagnostics('sys', 'RTWBuildStats')
```

Description

`sldiagnostics('sys')` displays the following diagnostic information associated with the model or subsystem specified by `sys`:

- Number of each type of block
- Number of each type of Stateflow object
- Number of states, outputs, inputs, and sample times of the root model.
- Names of libraries referenced and instances of the referenced blocks
- Time and additional memory used for each compilation phase of the root model

If the model specified by `sys` is not loaded, then `sldiagnostics` loads the model before performing the analysis.

The command `sldiagnostics('sys', options)` displays only the diagnostic information associated with the specific operations listed as `options` character vectors. The table below summarizes the options available and their corresponding valid input and output.

With `sldiagnostics`, you can input the name of a model or the path to a subsystem. For some analysis options, `sldiagnostics` can analyze only a root model. If you provide an incompatible input for one of these analyses, then `sldiagnostics` issues a warning. Finally, if you input a Simulink Library, then `sldiagnostics` cannot perform options that

require a model compilation (**Update Diagram**). Instead, `sldiagnostics` issues a warning.

During the analysis, `sldiagnostics` will follow library links but will not follow or analyze Model References. See `find_mdlrefs` for more information on finding all Model blocks and referenced models in a specified model.

Option	Valid Inputs	Output
CountBlocks	root model, library, or subsystem	Lists all unique blocks in the system and the number of occurrences of each. This includes blocks that are nested in masked subsystems or hidden blocks.
CountSF	root model, library, or subsystem	Lists all unique Stateflow objects in the system and the number of occurrences of each.
Sizes	root model	Lists the number of states, outputs, inputs, and sample times, as well as a flag indicating direct feedthrough, used in the root model.
Libs	root model, library, or subsystem	Lists all unique libraries referenced in the root model, as well as the names and numbers of the library blocks.
CompileStats	root model	Lists the time and additional memory used for each compilation phase of the root model. This information helps users troubleshoot model compilation speed and memory issues.
RTWBuildStats	root model	Lists the same information as the `CompileStats` diagnostic. When issued with the second output argument `sRpt`, it captures the same statistics included in `CompileStats` and also the Simulink Coder build statistics. You must explicitly specify this option, because it is not part of the default analysis.

Option	Valid Inputs	Output
All	not applicable	Performs all diagnostics.

Note Running the `CompileStats` diagnostic before simulating a model for the first time will show greater memory usage. However, subsequent runs of the `CompileStats` diagnostic on the model will require less memory usage.

`[txtRpt, sRpt] = sldiagnostics('sys')` returns the diagnostic information as a textual report `txtRpt` and a structure array `sRpt`, which contains the following fields that correspond to the diagnostic options:

- `blocks`
- `stateflow`
- `sizes`
- `links`
- `compilestats`

`[txtRpt, sRpt] = sldiagnostics('sys', `*`options`*`)` returns only the specified options. If your chosen options specify just one type of analysis, then `sRpt` contains the results of only that analysis.

`[txtRpt, sRpt] = sldiagnostics('sys', 'CompileStats')` returns information on time and memory usage in `txtRpt` and `sRpt`.

`[txtRpt, sRpt] = sldiagnostics('sys', 'RTWBuildStats')` includes Simulink Coder build statistics in addition to the information reported for `CompileStats` in the `sRpt` output.

- `txtRpt` contains the formatted textual output of time spent in each of the phases in Simulink and Simulink Coder (if you specified `RTWBuildStats`), for example:

```
Compile Statistics For: rtwdemo_counter
    Cstat1: 0.00 seconds Model compilation pre-start
    Cstat2: 0.00 seconds Stateflow compile pre-start notification
    Cstat3: 0.10 seconds Post pre-comp-start engine event
    Cstat4: 10.00 seconds Stateflow compile start notification
    Cstat5: 0.00 seconds Model compilation startup completed
```
- `sRpt` is a MATLAB structure containing time and memory usage for each of the phases, for example:

```
sRpt =
Model:      'myModel1'
Statistics:    [1x134 struct]
```

The size of the `sRpt.Statistics` array indicates the number of compile and build phases executed during the operation. Examine the Statistics fields:

```
sRpt.Statistics(1) =
Description:    'Phase1'
CPUTime:    7.2490
WallClockTime    4.0092
ProcessMemUsage:    26.2148
ProcessMemUsagePeak:    28.6680
ProcessVMSize:    15.9531
```

`CPUTime` and `WallClockTime` show the elapsed time for the phase in seconds. `ProcessMemUsage`, `ProcessMemUsagePeak` and `ProcessVMSize` show the memory consumption during execution of the phase in MB.

Examine these key metrics to understand the performance:

- `WallClockTime`—The real-time elapsed in each phase in seconds. Sum the `WallClockTime` in each phase to get the total time taken to perform the operation:

  `ElapsedTime = sum([statRpt.Statistics(:).WallClockTime]);`

- `ProcessMemUsage`—The amount of memory consumed in each phase. Sum the `ProcessMemUsage` across all the phases to get the memory consumption during the entire operation:

  `TotalMemory = sum([statRpt.Statistics(:).ProcessMemUsage]);`

- `ProcessMemUsagePeak`—The maximum amount of allocated memory in each phase. Get the maximum of this metric across all the phases to find the peak memory allocation during the operation:

  `PeakMemory = max([statRpt.Statistics(:).ProcessMemUsagePeak]);`

Note Memory statistics are available only on the Microsoft Windows platform.

2-923

Examples

The following command counts and lists each type of block used in the `sldemo_bounce` model that comes with Simulink software.

```
sldiagnostics('sldemo_bounce', 'CountBlocks')
```

The following command counts and lists both the unique blocks and Stateflow objects used in the `sf_boiler` model that comes with Stateflow software; the textual report returned is captured as `myReport`.

```
myReport = sldiagnostics('sf_boiler', 'CountBlocks', 'CountSF')
```

The following commands open the `f14` model that comes with Simulink software, and counts the number of blocks used in the `Controller` subsystem.

```
sldiagnostics('f14/Controller', 'CountBlocks')
```

The following command runs the `Sizes` and `CompileStats` diagnostics on the `f14` model, capturing the results as both a textual report and structure array.

```
[txtRpt, sRpt] = sldiagnostics('f14', 'Sizes', 'CompileStats')
```

See Also

find_system | get_param

Introduced in R2006a

sldiagviewer.diary

Log simulation warnings and errors and build information to file

Syntax

```
sldiagviewer.diary
sldiagviewer.diary(filename)
sldiagviewer.diary(toggle)
sldiagviewer.diary(filename,'UTF-8')
```

Description

`sldiagviewer.diary` intercepts build information, warnings, and errors transmitted to the Command Window or the Diagnostic Viewer and logs them to a text file `diary.txt` in the current folder.

`sldiagviewer.diary(filename)` toggles the logging state of the text file specified by `filename`.

`sldiagviewer.diary(toggle)` turns logging to the log file on or off. The setting applies to the last file name you specified for logging or to `diary.txt` if you did not specify a file name.

`sldiagviewer.diary(filename,'UTF-8')` specifies the character encoding for the log file `filename`.

Examples

Log Build Information and Simulation Warnings and Errors

Start logging build information and simulation warnings and errors to `diary.txt`.

```
sldiagviewer.diary
open_system('vdp')
rtwbuild('vdp')
```

Open `diary.txt` to view logs.

```
### Starting build procedure for model: vdp
### Build procedure for model: 'vdp' aborted due to an error.
...
```

Log to Specific File

Set up logging to a file.

```
sldiagviewer.diary('C:\MyLogs\log1.txt')
```

Toggle File Logging State

Switch the logging state of a file.

```
sldiagviewer.diary('C:\MyLogs\log1.txt') % Start logging
open_system('vdp')
rtwbuild('vdp')

sldiagviewer.diary('off') % Switch off logging
open_system('sldemo_fuelsys')
rtwbuild('sldemo_fuelsys')

sldiagviewer.diary('on') % Resume logging
```

Specify Log File Name and Character Encoding

Set the file name to log to and the character encoding to use.

```
sldiagviewer.diary('C:\MyLogs\log1.txt','UTF-8')
```

- "View Diagnostics"
- "Customize Diagnostic Messages"

Input Arguments

`toggle` — Logging state
`'off'` | `'on'`

Logging state, specified as `'on'` or `'off'`.

Example: `sldiagviewer.diary('on')`

`filename` — Name of file to log data to
character vector

Name of file to log data to, specified as a character vector.

Example: `sldiagviewer.diary('C:\Simulations\mySimulationDiary.txt')`

Introduced in R2014a

sldiscmdl

Discretize model that contains continuous blocks

Syntax

```
sldiscmdl('model_name',sample_time)
sldiscmdl('model_name',sample_time,method)
sldiscmdl('model_name',sample_time,options)
sldiscmdl('model_name',sample_time,method,freq)
sldiscmdl('model_name',sample_time,method,options)
sldiscmdl('model_name',sample_time,method,freq,options)
[old_blks,new_blks] =
sldiscmdl('model_name',sample_time,method,freq,options)
```

Description

sldiscmdl('*model_name*',*sample_time*) discretizes the model named '*model_name*' using the specified *sample_time*. The model does not need to be open, and the units for *sample_time* are simulation seconds.

sldiscmdl('*model_name*',*sample_time*,*method*) discretizes the model using *sample_time* and the transform method specified by *method*.

sldiscmdl('*model_name*',*sample_time*,*options*) discretizes the model using *sample_time* and criteria specified by the *options* cell array. This array consists of four elements: {*target*, *replace_with*, *put_into*, *prompt*}.

sldiscmdl('*model_name*',*sample_time*,*method*,*freq*) discretizes the model using *sample_time*, *method*, and the critical frequency specified by *freq*. The units for *freq* are Hz. When you specify *freq*, *method* must be 'prewarp'.

sldiscmdl('*model_name*',*sample_time*,*method*,*options*) discretizes the model using *sample_time*, *method*, and *options*.

sldiscmdl('*model_name*',*sample_time*,*method*,*freq*,*options*) discretizes the model using *sample_time*, *method*, *freq*, and *options*. When you specify *freq*, *method* must be 'prewarp'.

[*old_blks*,*new_blks*] = sldiscmdl('*model_name*',*sample_time*,*method*,*freq*,*options*) discretizes the model using *sample_time*, *method*, *freq*, and *options*. When you specify *freq*, *method* must be 'prewarp'. The function also returns two cell arrays that contain full path names of the original, continuous blocks and the new, discretized blocks.

Input Arguments

model_name

Name of the model to discretize.

sample_time

Sample-time specification for the model:

Scalar value	Sample time with zero offset, such as 1
Two-element vector	Sample time with nonzero offset, such as [1 0.1]

method

Method of converting blocks from continuous to discrete mode:

'zoh' (default)	Zero-order hold on the inputs
'foh'	First-order hold on the inputs
'tustin'	Bilinear (Tustin) approximation
'prewarp'	Tustin approximation with frequency prewarping
'matched'	Matched pole-zero method
	For single-input, single-output (SISO) systems only

freq

Critical frequency in Hz. This input applies only when the *method* input is `'prewarp'`.

options

Cell array {*target*, *replace_with*, *put_into*, *prompt*}, where each element can take the following values:

target	`'all'` (default)	Discretize all continuous blocks
	`'selected'`	Discretize only selected blocks in the model
	`'full_blk_path'`	Discretize specified block
replace_with	`'parammask'` (default)	Create discrete blocks whose parameters derive from the corresponding continuous blocks
	`'hardcoded'`	Create discrete blocks with hard-coded parameters placed directly into each block dialog box
put_into	`'copy'` (default)	Create discretization in a copy of the original model
	`'configurable'`	Create discretization candidate in a configurable subsystem
	`'current'`	Apply discretization to the current model
	`'untitled'`	Create discretization in a new untitled window
prompt	`'on'` (default)	Show discretization information at the command prompt
	`'off'`	Do not show discretization information at the command prompt

Examples

Discretize all continuous blocks in the `slexAircraftExample` model using a 1-second sample time:

```
sldiscmdl('slexAircraftExample',1);
```

Discretize the `Aircraft Dynamics Model` subsystem in the `slexAircraftExample` model using a 1-second sample time, a 0.1-second offset, and a first-order hold transform method:

```
sldiscmdl('slexAircraftExample',[1 0.1],'foh',...
{'slexAircraftExample/Aircraft Dynamics Model',...
'parammask','copy','on'});
```

Discretize the `Aircraft Dynamics Model` subsystem in the `slexAircraftExample` model and retrieve the full path name of the second discretized block:

```
[old_blks,new_blks] = sldiscmdl('slexAircraftExample',[1 0.1],...
'foh',{'slexAircraftExample/Aircraft Dynamics Model','parammask',...
'copy','on'});
% Get full path name of the second discretized block
new_blks{2}
```

See Also
slmdldiscui

Topics
"Discretize a Model with the sldiscmdl Function"

Introduced before R2006a

slexpr

Generate expression to use in value of parameter object

Syntax

```
expressionOut = slexpr(expressionIn)
```

Description

`expressionOut = slexpr(expressionIn)` converts the MATLAB-syntax expression `expressionIn` to an object, `expressionOut`, that you can use to set the `Value` property of a parameter object (such as `Simulink.Parameter`). When you use multiple parameter objects to set block parameter values, you can use the expression to model mathematical relationships between the objects. For more information, see "Set Variable Value by Using a Mathematical Expression".

Examples

Model Relationship Between Mass, Length, and Moment of Inertia of Metronome

In the base workspace, create three `Simulink.Parameter` objects that represent the mass, length, and moment of inertia of a pointlike metronome.

```
m = Simulink.Parameter;
r = Simulink.Parameter;
J = Simulink.Parameter;
```

Set the mass to 0.1 kg and the length to 1.0 m.

```
m.Value = 0.1;
r.Value = 1.0;
```

Set the value of the moment of inertia to the mass times the square of the length.

```
J.Value = slexpr('m*r^2');
```

Simulink preserves the expression, `m*r^2`. If you change the value of the mass or the length, Simulink recalculates the value of the moment of inertia.

- "Share and Reuse Block Parameter Values by Creating Variables"
- "Create Tunable Calibration Parameter in the Generated Code" (Simulink Coder)

Input Arguments

expressionIn — Target expression
string | character vector

Target expression, specified as a string or character vector.

Example: `"myParam + myOtherParam"`

Data Types: `char` | `string`

Output Arguments

expressionOut — Simulink representation of expression
`Simulink.data.Expression` object

Simulink representation of the target expression, returned as a `Simulink.data.Expression` object. A `Simulink.data.Expression` object has no use outside the `Value` property of a parameter object.

See Also
`Simulink.Parameter`

Topics
"Share and Reuse Block Parameter Values by Creating Variables"
"Create Tunable Calibration Parameter in the Generated Code" (Simulink Coder)

Introduced in R2018a

slIsFileChangedOnDisk

Determine whether model has changed since it was loaded

Syntax

```
Changed = slIsFileChangedOnDisk('sys')
```

Description

`Changed = slIsFileChangedOnDisk('sys')` Returns true if the file which contains block diagram *sys* was changed on disk since the block diagram was loaded.

Examples

To ensure that code is not generated for a model whose file has changed on disk since it was loaded, include the following in the `'entry'` section of the *STF*_make_rtw_hook.m file:

```
if (slIsFileChangedOnDisk(sys))
    error('File has changed on disk since it was loaded. Aborting code generation.');
end
```

Introduced in R2007b

slLibraryBrowser

Open Simulink Library Browser

Syntax

```
slLibraryBrowser
slLibraryBrowser('open')
slLibraryBrowser('noshow')
libraryhandle = slLibraryBrowser
slLibraryBrowser('close')
```

Description

slLibraryBrowser opens the Simulink Library Browser.

If you want to load the Simulink block library, use load_system simulink instead.

If you want to start Simulink without opening any windows, use the faster start_simulink instead.

slLibraryBrowser('open') opens the Library Browser.

slLibraryBrowser('noshow') loads the Library Browser in memory without making it visible. Use this to make future calls to slLibraryBrowser('open') faster.

libraryhandle = slLibraryBrowser returns the handle of the Library Browser object.

slLibraryBrowser('close') closes the Library Browser.

Examples

Open and Close the Library Browser

```
slLibraryBrowser
slLibraryBrowser('close')
```

Load the Library Browser and Get a Handle

```
libraryhandle = slLibraryBrowser('noshow')
```

Introduced in R2016a

slmdldiscui

Open Model Discretizer GUI

Syntax

```
slmdldiscui
slmdldiscui('model')
```

Description

`slmdldiscui` opens the Model Discretizer. A model does not need to be open.

`slmdldiscui('model')` opens the Model Discretizer for the model or library called `'name'`.

To use the Model Discretizer, you must have a Control System Toolbox license, version 5.2 or later.

Examples

Open the Model Discretizer for the `slexAircraftExample` model:

```
slmdldiscui('slexAircraftExample')
```

Open the Model Discretizer for the `discretizing` library:

```
slmdldiscui('discretizing')
```

See Also
`sldiscmdl`

Topics
"Discretize a Model with the Model Discretizer"

Introduced before R2006a

slprofreport

Regenerate profiler report from data, `ProfileData`, saved from previous run

Syntax

slprofreport(*model_name*ProfileData)

Description

When you run a model with the profiler enabled, the simulation generates the data and saves it in the variable, *model_name*ProfileData. slprofreport(*model_name* ProfileData) generates a profiler report based on the data in *model_name*ProfileData, saved from the model run.

Input Arguments

ProfileData

Variable that contains profiler data from a model run. The variable name consists of the model name and `ProfileData`, for example, `vdpProfileData`.

Default: None

Examples

Regenerate Simulink Profiler Results

Regenerate the Profiler report for model `vdp`

In the MATLAB Command Window, start the `vdp` model.

In the Simulink editor window, run `vdp` model with Simulink Profiler enabled.

Simulink stores the data to the variable `vdpProfileData`.

To review the report, in the MATLAB Command Window

`slprofreport(vdpProfileData)`

The Simulink Profiler Report window is displayed.

Introduced in R2012a

slproject.create

Create blank Simulink project

Syntax

```
proj = slproject.create
proj = slproject.create(path)
proj = slproject.create(name)
```

Description

`proj = slproject.create` creates and opens a Simulink project using the blank project template from the start page, and returns a project object. Use the project object to manipulate the currently open Simulink project at the command line. The new project is created in the default project folder. To change the default folder for new Simulink projects, on the Simulink Project tab, click **Preferences**, and then set the **Default folder**.

`proj = slproject.create(path)` creates the project at the location specified by path.

`proj = slproject.create(name)` creates the project in the default folder, with the name specified by `name`.

Examples

Create a Blank Project in the Default Folder

```
slproject.create
```

You can control the default folder for new projects using the project preferences.

Create a Blank Project in a Specified Folder

```
proj = slproject.create('C:\work\myprojectname');
```

Create a Named Blank Project in the Default Folder

```
proj = slproject.create('myprojectname');
```

* "Creating Simulink Projects Programmatically"
* "Automate Simulink Project Tasks Using Scripts"

Input Arguments

`path` — Path for the new project location
character vector

Path for the new project location, specified as a character vector. If you do not specify the path, `slproject.create` creates the project in the default location. You can change the default location in the project preferences.

Example: `C:\work\projectname`

Data Types: `char`

`name` — Name for the new project
character vector

Name for the new project, specified as a character vector.

Example: `myproject`

Data Types: `char`

Output Arguments

`proj` — Project
project object

Project, returned as a project object. Use the project object to manipulate the currently open Simulink project at the command line.

Properties of `proj` output argument.

Project Property	Description
Name	Project name
Information	Information about the project such as the description, source control integration, repository location, and whether it is a top-level project.
Dependencies	Dependencies between project files in a MATLAB digraph object.
Shortcuts	Shortcut files in the project.
ProjectPath	Folders that the project puts on the MATLAB path.
ProjectReferences	Folders that contain referenced projects. Contains read-only project objects for referenced projects.
Categories	Categories of project labels.
Files	Paths and names of project files.
RootFolder	Full path to project root folder.

Introduced in R2017a

addPath

Add folder to path of Simulink project

Syntax

```
folderpath = addPath(project, folder)
```

Description

`folderpath = addPath(project, folder)` adds a folder in a Simulink project to the current project path. The folder must be in the project. The project puts the folders on the MATLAB search path when it loads and removes them from the path when it closes. To learn more, see "Specify Project Path".

Examples

Add a Folder to the Project Path

```
sldemo_slproject_airframe;
project = simulinkproject;
```

Create a new folder.

```
 folderpath = fullfile(project.RootFolder,'folder');
 mkdir(filepath);
```

Add this new folder to the project.

```
 projectFile = addFile(project,folderpath);
```

Add this new folder to the project path.

```
folderpath = addPath(project,folderpath);
```

• "Specify Project Path"

Input Arguments

`project` — Project
project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink project at the command line.

`folder` — Path of folder
character vector | string

Path of the folder to add relative to the project root folder, specified as a character vector or string. The folder must be within the root folder.

Example: models/myfolder

Output Arguments

`folderpath` — Path folder
path folder object

Path folder object containing the specified folder path. The project puts the folders on the MATLAB search path when it loads and removes them from the path when it closes.

`addFile` | `addFolderIncludingChildFiles` | `removePath` | `simulinkproject`

Topics
"Specify Project Path"

Introduced in R2017a

removePath

Remove folder from Simulink project path

Syntax

```
removePath(project, folder)
```

Description

removePath(`project, folder`) removes a folder in a Simulink project from the current project path. The folder must be in the project.

Examples

Remove a Folder from the Project Path

```
sldemo_slproject_airframe;
project = simulinkproject;
```

Create a new folder.

```
 folderpath = fullfile(project.RootFolder,'folder');
 mkdir(filepath);
```

Add this new folder to the project.

```
 projectFile = addFile(project,folderpath);
```

Add the new folder to the project path.

```
folderpath = addPath(project,folderpath);
```

Remove the new folder from the project path.

```
removePath(project,folderpath)
```

Input Arguments

`project` — Project
project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink project at the command line.

`folder` — Path of folder
character vector

Path of the folder to remove relative to the project root folder, specified as a character vector. The folder must be within the root folder.

Example: models/myfolder

See Also

addPath | simulinkproject

Introduced in R2017a

addReference

Add referenced project to Simulink project

Syntax

```
projreference = addReference(project,folder)
projreference = addReference(project,folder,type)
```

Description

`projreference = addReference(project,folder)` adds a reference to the Simulink project specified by `folder`. The reference is added to the current project, `project`.

`projreference = addReference(project,folder,type)` specifies the type of reference to create. Specify relative or absolute reference.

Examples

Add a Referenced Project

Create a project and get a project object.

```
sldemo_slproject_airframe;
project = simulinkproject;
```

Create a new blank project.

```
projectToReference = slproject.create();
```

Reload the first project and add a reference to the new blank project.

```
reload(project);
addReference(project, projectToReference, 'absolute');
```

Find out if a project is a top-level project. 1 indicates a top-level project.

```
project.Information.TopLevel
```

```
ans =

  logical

   1
```

Input Arguments

`project` — Project
project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink project at the command line.

`folder` — Path of folder
character vector

Path of the folder to add the reference, relative to the project root folder, specified as a character vector. The folder must be within the root folder.

Example: models/myfolder

`type` — Type of reference
relative | absolute

Type of reference, relative to the project root folder, specified as a character vector.

Output Arguments

`projreference` — Project reference
project reference object

Project reference object containing information about the referenced project.

See Also

removeReference | simulinkproject

Introduced in R2017a

removeReference

Add folder to Simulink project path

Syntax

```
removeReference(project,folder)
```

Description

removeReference(project,folder) removes the reference to the Simulink project project from the current project.

Examples

Remove a Referenced Project

Create a project and get a project object.

```
sldemo_slproject_airframe;
project = simulinkproject;
```

Create a new blank project.

```
projectToReference = slproject.create();
```

Reload the first project and add a reference to the new blank project.

```
 project.reload();
addReference(project, projectToReference, 'absolute');
```

Remove the reference to the blank project.

```
removeReference(project, projectToReference);
```

Input Arguments

`project` — Project
project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink project at the command line.

`folder` — Path of folder
character vector

Path of the folder to the reference to be removed, relative to the project root folder, specified as a character vector. The folder must be within the root folder.

Example: models/myfolder

See Also
addReference | simulinkproject

Introduced in R2017a

addShortcut

Add shortcut to Simulink project

Syntax

```
shortcut = addShortcut(project,file)
```

Description

`shortcut = addShortcut(project,file)` adds a shortcut to the specified file in the Simulink project.

To set the shortcut to run at startup or shutdown, use Simulink Project. See "Automate Startup Tasks".

Examples

Add a Shortcut

Create a project and get a project object.

```
sldemo_slproject_airframe;
project = simulinkproject;
```

Create a new file.

```
filepath = fullfile(project.RootFolder, 'new_model.slx')
    new_system('new_model');
    save_system('new_model',filepath)
```

Add this new model to the project.

```
projectFile = addFile(project,filepath)
```

Add a new shortcut to the new model.

```
shortcut = addShortcut(project,filepath);
```

- "Automate Startup Tasks"

Input Arguments

project — Project
project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink project at the command line.

file — Path of file
character vector

Path of the file to add a shortcut to, relative to the project root folder, including the file extension, specified as a character vector. The file must be within the root folder.

Example: 'models/myModelName.slx'

Output Arguments

shortcut — Shortcut
shortcut object

Shortcut object containing information about the shortcut.

See Also
removeShortcut | simulinkproject

Topics
"Automate Startup Tasks"

Introduced in R2017a

removeShortcut

Remove shortcut from Simulink project

Syntax

```
removeShortcut(project,file)
```

Description

removeShortcut(`project,file`) removes the shortcut to the specified file in the Simulink project.

Examples

Remove a Shortcut

Create a project and get a project object.

```
sldemo_slproject_airframe;
project = simulinkproject;
```

Create a new file.

```
filepath = fullfile(project.RootFolder, 'new_model.slx')
    new_system('new_model');
    save_system('new_model', filepath)
```

Add this new model to the project.

```
projectFile = addFile(project, filepath)
```

Add a new shortcut to the new model.

```
shortcut = addShortcut(project, filepath);
```

Remove the shortcut.

```
removeShortcut(project, shortcut);
```

Input Arguments

`project` — Project
project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink project at the command line.

`file` — Path of file
character vector

Path of the shortcut file, relative to the project root folder, including the file extension, specified as a character vector. The file must be within the root folder.

Example: 'models/myModelName.slx'

See Also

`addShortcut` | `simulinkproject`

Introduced in R2017a

slproject.getCurrentProject

Manipulate current Simulink Project at command line

Syntax

```
proj = slproject.getCurrentProject
```

Description

`proj = slproject.getCurrentProject` gets the current project open in the Simulink Project Tool and returns a project object `proj` that you can use to manipulate the project programmatically. If no project is open, then you see an error.

Note `slproject.getCurrentProject` will be removed in a future release. Use `slproject.getCurrentProjects` instead.

Examples

Get Airframe Example Project

Open the Airframe project and use `slproject.getCurrentProject` to get a project object to manipulate the project at the command line.

```
sldemo_slproject_airframe
proj = slproject.getCurrentProject

proj =

  ProjectManager with properties:

          Name: 'Simulink Project Airframe Example'
     Categories: [1x1 slproject.Category]
       Shortcuts: [1x8 slproject.Shortcut]
     ProjectPath: [1x7 slproject.PathFolder]
```

```
    ProjectReferences: [1x0 slproject.ProjectReference]
                Files: [1x30 slproject.ProjectFile]
           RootFolder: 'C:\Work\Simulink\Projects\slexamples\airframe'
```

Output Arguments

`proj` — Project
project object

Project, returned as a project object. Use the project object to manipulate the currently open Simulink Project at the command line.

See Also

Functions
`simulinkproject` | `slproject.getCurrentProjects` | `slproject.loadProject`

Introduced in R2013a

slproject.getCurrentProjects

List all top-level Simulink projects

Syntax

```
projects = slproject.getCurrentProjects
```

Description

`projects = slproject.getCurrentProjects` returns a list of all top-level projects open in Simulink Project. Currently only one or zero top-level projects can be loaded. Returns an object array of 1 or 0 `ProjectManager` objects `projects` that you can use to manipulate the project programmatically. Use `slproject.getCurrentProjects` for project automation scripts.

If you execute `slproject.getCurrentProjects` inside a project shortcut, it returns only the project that the shortcut belongs to. If the shortcut belongs to a referenced project, it returns the referenced project.

Examples

Get Airframe Example Project

Open the Airframe project and use `slproject.getCurrentProjects` to get a project object to manipulate the project at the command line.

```
sldemo_slproject_airframe
proj = slproject.getCurrentProjects

proj =

  ProjectManager with properties:

        Name: 'Simulink Project Airframe Example'
```

```
         Categories: [1x1 slproject.Category]
          Shortcuts: [1x8 slproject.Shortcut]
        ProjectPath: [1x7 slproject.PathFolder]
  ProjectReferences: [1x0 slproject.ProjectReference]
              Files: [1x30 slproject.ProjectFile]
         RootFolder: 'C:\Work\Simulink\Projects\airframe'
```

Find Project Commands

Open the airframe project and create a project object.

```
sldemo_slproject_airframe
proj = slproject.getCurrentProject

proj =

  ProjectManager with properties:

               Name: 'Simulink Project Airframe Example'
         Categories: [1x1 slproject.Category]
          Shortcuts: [1x8 slproject.Shortcut]
        ProjectPath: [1x7 slproject.PathFolder]
  ProjectReferences: [1x0 slproject.ProjectReference]
              Files: [1x30 slproject.ProjectFile]
         RootFolder: 'C:\Work\Simulink\Projects\airframe'
```

Find out what you can do with your project.

```
methods(proj)

Methods for class slproject.ProjectManager:

addFile                     findCategory
addFolderIncludingChildFiles  findFile
close                       isLoaded
createCategory              listModifiedFiles
export                      refreshSourceControl

reload
removeCategory
removeFile
```

Examine Project Properties

After you get a project object, you can examine project properties.

Open the airframe project and create a project object.

```
sldemo_slproject_airframe
proj = slproject.getCurrentProjects;
```

Examine the project files.

```
files = proj.Files

files =

  1x30 ProjectFile array with properties:

    Path
    Labels
    Revision
    SourceControlStatus
```

Examine the labels of the eighth file.

```
proj.Files(8).Labels

ans =

  Label with properties:

File: 'C:\Work\airframe\data\system_model.sldd'
          Data: []
      DataType: 'none'
          Name: 'Design'
    CategoryName: 'Classification'
```

Get a particular file.

```
myfile = findFile(proj, 'models/AnalogControl.mdl')

myfile =

  ProjectFile with properties:

    Path:   'C:\Temp\airframe\models\AnalogControl.mdl'
    Labels: [1x1 slproject.Label]
```

```
  Revision: '2'
SourceControlStatus: Unmodified
```

Find out what you can do with the file.

```
methods(myfile)

Methods for class slproject.ProjectFile:

addLabel
removeLabel
findLabel
```

Output Arguments

`projects` — Projects
object array of 1 or 0 `ProjectManager` objects

Projects, returned as an object array of 1 or 0 `ProjectManager` objects. Use the project object to manipulate the currently open Simulink Project at the command line.

Properties of `ProjectManager` objects in output argument.

Project Property	Description
Name	Project name
Categories	Categories of project labels
Shortcuts	Shortcut files in project
ProjectPath	Folders that the project puts on the MATLAB path
ProjectReferences	Folders that contain referenced projects
Files	Paths and names of project files
RootFolder	Full path to project root folder

Tips

Alternatively, you can use `simulinkproject` to get a project object, but `simulinkproject` also opens and gives focus to the Simulink Project Tool. Use

`simulinkproject` to open projects and explore projects interactively. Use
`slproject.getCurrentProjects` for project automation scripts.

See Also

Functions
`simulinkproject` | `slproject.getCurrentProject` | `slproject.loadProject`

Introduced in R2016a

slproject.loadProject

Load Simulink project

Syntax

```
slproject.loadProject(projectPath);
proj = slproject.loadProject(projectPath)
```

Description

`slproject.loadProject(projectPath);` loads the project specified by the `.prj` file or folder `projectPath` in the Simulink Project Tool, and closes any currently open project.

`proj = slproject.loadProject(projectPath)` loads the project and returns a project object `proj` for manipulating the project. Use `slproject.loadProject` for project automation scripts.

Examples

Load Project

Load a project from a folder called `'C:/projects/project1/'`. Replace this path with the location of your project.

```
proj = slproject.loadProject('C:/projects/project1/')
```

Get Airframe Example Project

Open the Airframe project and use `slproject.getCurrentProjects` to get a project object to manipulate the project at the command line.

```
sldemo_slproject_airframe
proj = slproject.getCurrentProjects

proj =

  ProjectManager with properties:

            Name: 'Simulink Project Airframe Example'
        Categories: [1x1 slproject.Category]
          Shortcuts: [1x8 slproject.Shortcut]
        ProjectPath: [1x7 slproject.PathFolder]
    ProjectReferences: [1x0 slproject.ProjectReference]
              Files: [1x30 slproject.ProjectFile]
          RootFolder: 'C:\Work\Simulink\Projects\airframe'
```

Find Project Commands

Get the Airframe project.

```
sldemo_slproject_airframe
proj = slproject.getCurrentProjects;
```

Find project commands.

```
methods(proj)

Methods for class slproject.ProjectManager:

addFile                   findCategory
addFolderIncludingChildFiles  findFile
close                     isLoaded
createCategory            listModifiedFiles
export                    refreshSourceControl

reload
removeCategory
removeFile
```

Examine Project Properties

After you get a project object, you can examine project properties.

Get the airframe project.

```
sldemo_slproject_airframe
proj = slproject.getCurrentProjects;
```

Examine the project files.

```
files = proj.Files

files =

  1x30 ProjectFile array with properties:

    Path
    Labels
    Revision
    SourceControlStatus
```

Examine the labels of the 13th file.

```
proj.Files(13).Labels

ans =

  Label with properties:

File:  'C:\Temp\airframe\models\AnalogControl.mdl'
         Data: []
     DataType: 'none'
         Name: 'Design'
 CategoryName: 'Classification'
```

Get a particular file by name.

```
myfile = findFile(proj, 'models/AnalogControl.mdl')

myfile =

  ProjectFile with properties:

       Path:  'C:\Temp\airframe\models\AnalogControl.mdl'
     Labels: [1x1 slproject.Label]
   Revision: '2'
SourceControlStatus: Unmodified
```

Find out what you can do with the file.

```
methods(myfile)

Methods for class slproject.ProjectFile:

addLabel
removeLabel
findLabel
```

Input Arguments

projectPath — Full path to project file or folder
character vector

Full path to project `.prj` file or the path to the project root folder, specified as a character vector.

Example: `'C:/projects/project1/myProject.prj'`

Example: `'C:/projects/project1/'`

Output Arguments

proj — Project
project object

Project, returned as a project object. Use the project object to manipulate and explore the Simulink Project at the command line.

Properties of `proj` output argument.

Project Property	Description
Name	Project name
Categories	Categories of project labels
Shortcuts	Shortcut files in project
ProjectPath	Folders that the project puts on the MATLAB path
ProjectReferences	Folders that contain referenced projects

Project Property	Description
Files	Paths and names of project files
RootFolder	Full path to project root folder

See Also

Functions
simulinkproject | slproject.getCurrentProjects

Topics
"What Are Simulink Projects?"

Introduced in R2013a

listModifiedFiles

List modified files in Simulink project

Syntax

```
modifiedfiles = listModifiedFiles(proj)
```

Description

`modifiedfiles = listModifiedFiles(proj)` returns the list of modified project files in the project object `proj`. `listModifiedFiles` refreshes the source control statuses in the project and then returns an array of the project files which are listed in the Modified Files view of the Simulink Project.

Examples

Get a List of Modified Files in the Project

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Modify a project model file by adding an arbitrary block.

```
open_system('AnalogControl')
add_block('built-in/SubSystem', 'AnalogControl/test')
save_system('AnalogControl')
```

Get all the modified files in the project.

```
modifiedfiles = listModifiedFiles(proj)

modifiedfiles =
```

```
   1x2 ProjectFile array with properties:

     Path
     Labels
     Revision
     SourceControlStatus
```

Observe two modified files. Compare with the Modified Files view in Simulink Project, where you can see a modified model file, and the corresponding `.SimulinkProject` definition file.

Get the second modified file.

```
modifiedfiles(2)
```

```
ans =

  ProjectFile with properties:

Path: 'C:\Work\temp\slexamples\airframe2\models\AnalogControl.mdl'
              Labels: [1x1 slproject.Label]
             Revision: '2'
   SourceControlStatus: Modified
```

Observe the file `SourceControlStatus` property is `Modified`. Similarly, `listModifiedFiles` returns any files that are added, conflicted, deleted, etc., that show up in the Modified Files view in Simulink Project.

Get all the project files with a particular source control status. For example, get the files that are `Unmodified`.

```
proj.Files(ismember([proj.Files.SourceControlStatus], matlab.sourcecontrol.Status.Unmod
```

```
ans =

  1x29 ProjectFile array with properties:

     Path
     Labels
```

```
Revision
SourceControlStatus
```

Input Arguments

proj — Project
project

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

Output Arguments

modifiedfiles — Modified files
file object | array

Modified files, returned as an array of file objects.

See Also

Functions
refreshSourceControl | simulinkproject

Introduced in R2016a

listRequiredFiles

Get project file dependencies

Syntax

```
files = listRequiredFiles(proj,file)
```

Description

`files = listRequiredFiles(proj,file)` returns the files that the specified file requires to run.

Examples

Get Required Files

Open the airframe project, create a project object and get a file.

```
sldemo_slproject_airframe;
proj = simulinkproject;
file = 'models/slproject_f14.slx'
```

Get the files required by the specified file.

```
files = listRequiredFiles(project, file);
```

•   "Perform Impact Analysis"

Input Arguments

proj — Project
project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

file — Path of file
character vector | project file object

Path of the file relative to the project root folder, including the file extension, specified as a character vector, an absolute file path or an instance of a project file object. The file must be within the root folder.

Example: 'models/myModelName.slx'

Output Arguments

file — Project file
cell array of character vectors

Required files, returned as a cell array of character vectors.

See Also
`simulinkproject`

Topics
"Perform Impact Analysis"

Introduced in R2017a

refreshSourceControl

Update source control status of Simulink project files

Syntax

```
refreshSourceControl(proj)
```

Description

refreshSourceControl(proj) updates the source control status for all files in the Simulink project proj. Use this to get the latest source control information before querying the SourceControlStatus property on individual files.

If you use listModifiedFiles to find all modified files in the project, you do not need to call refreshSourceControl first.

Examples

Refresh Source Control Information on Files in the Project

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Refresh source control status before querying individual files.

```
refreshSourceControl(proj)
```

Input Arguments

proj — Project
project

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

See Also

Functions
`listModifiedFiles` | `simulinkproject`

Introduced in R2016a

solverprofiler.profileModel

Examine model for performance analysis

Syntax

```
res = solverprofiler.profileModel(model)
res = solverprofiler.profileModel(model, Name,Value)
```

Description

`res = solverprofiler.profileModel(model)` runs the Solver Profiler on the specified `model` and stores the results in `res`

`res = solverprofiler.profileModel(model, Name,Value)` specifies the Solver Profiler parameters using one or more `Name, Value` pair arguments.

Examples

Examine a Model with Default Settings

Examine the model `f14` using the default commandline settings.

```
model = 'f14';
res = solverprofiler.profileModel(model);
```

You can see a summary of the results by calling `res.summary`.

```
res.summary

 struct with fields:

         solver: 'ode45'
         tStart: 0
          tStop: 60
         absTol: 1.0000e-06
```

```
        relTol: 1.0000e-04
          hMax: 0.1000
      hAverage: 0.0444
         steps: 1352
   profileTime: 0.9974
      zcNumber: 0
   resetNumber: 600
 jacobianNumber: 0
 exceptionNumber: 195
```

Open the results in the Solver Profiler dialog to visualize them. This step is equivalent to enabling `OpenSP` when calling the function.

```
solverprofiler.exploreResult(res)
```

Configure Solver Profiler and Examine a Model

Examine the model `ssc_actuator_custom_pneumatic` with a fully specified configuration.

```
model = 'ssc_actuator_custom_pneumatic';
res = solverprofiler.profileModel(model, ...
    'SaveStates' , 'on', ...
    'SaveSimscapeStates' , 'On', ...
    'SaveJacobian' , 'On', ...
    'StartTime' , 5, ...
    'StopTime' , 50, ...
    'BufferSize',  10000,...
    'TimeOut', 5,...
    'OpenSP', 'On',...
    'DataFullFile', fullfile(pwd, 'ssc_profiling_result.mat'));
```

Input Arguments

`model` — Model to examine
character vector (default)

Name of model to be profiled, specified as a character vector.

Example: `h = solverprofiler.profileModel('vdp')`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (`' '`). You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: `'StartTime',0,'StopTime',10,'SaveStates','On'`

`SaveStates` — Save model states to file
off (default) | on

By default, the profiler does not save the states of the model. Enabling this parameter configures the profiler to save the states to a MAT-file.

Example: `'SaveStates','On'`

`SaveSimscapeStates` — Save Simscape states to file
off (default) | on

Enable this parameter to save Simscape states to a MAT-file.

Example: `'SaveSimscapeStates', 'On'`

`SaveJacobian` — Save model Jacobian
off (default) | on

Option to log the solver Jacobian matrices to memory. This option is useful for simulations that use implicit solvers. For a comparison of solvers, see "Compare Solvers".

Example: `'SaveJacobian', 'On'`

`StartTime` — Profiler start time
model start time (default) | scalar

Time, in seconds, of the simulation that the profiler starts analyzing the model. This is not the same as the start time of the simulation.

Example: `'StartTime',5`

`StopTime` — Profiler stop time
model stop time (default) | scalar

Time, in seconds, of the simulation to which the profiler should profile the model. By default, the analysis continues until the end of the simulation. Changing this parameter

does not change the stop time of the model which you specify in the Model Configuration Parameters.

A value less than the configured stop time of the model stops the profiling and simulation at `StopTime`.

Example: `'StopTime',30`

BufferSize — Memory impact of logging
50000 (default) | positive scalar

Maximum number of events that are logged. If the number of logged events reaches this value and memory is available, increase `BufferSize`. If memory is limited, consider lowering the value.

Example: `'BufferSize',60000`

TimeOut — Maximum time to wait for solver to resume
positive scalar

Time, in seconds, to wait before the profiler stops running. This option is useful in situations where the simulation is unable to proceed. The profiler waits for the specified time and quits if no progress has been made.

Example: `'TimeOut', 10`

OpenSP — Open the Solver Profiler dialog box
off (default) | on

Option to open the Solver Profiler dialog box after profiling has completed.

Example: `'OpenSP','On'`

DataFullFile — Path and name of saved results
character vector of full file path

By default, the profiling results are saved in a MAT-file named `model_@_dd_Month_yyyy_hh_mm_ss.mat` in the current working folder. You can specify a different file name by which to save the results in the current working folder. To save the file in a different location, specify the full path of the file, including the file name.

Example: `'DataFullFile','C:\Users\myusername\Documents\profiled \vdp_results.mat'`

Output Arguments

`res` — High-level summary of profiling results
structure

Profiling results, returned as a structure with the fields:

`file` — Full path and name of saved results
character vector

Path and name of the MAT-file where the results of the profiling operation are stored as MAT file. By default, they are stored in the current working folder with a file name having the pattern: `model_@_dd_Month_yyyy_hh_mm_ss.mat`. To store them in a different location or by a different name, specify `DataFullFile` when calling `solverprofiler.profileModel`.

`summary` — Summary of profiling results
structure

A high-level summary of the results of the profiling operation, returned as a structure. The summary provides an overview of the performance of the simulation and health of the model.

The `summary` structure contains these fields.

Field	Purpose	Values	Description
`solver`	Solver used by simulation	any of the solvers supported by Solver Profiler	Solver used by the simulation as configured in the Configuration Parameters for the model. For a list of all the solvers, see "Solver". The Solver Profiler does not support models without any continuous states.
`tStart`	Start time of simulation	scalar	Start time, in seconds, for the simulation of the model during the profiling operation.

Field	Purpose	Values	Description
tStop	Stop time of simulation	scalar	Stop time, in seconds, of the simulation during the profiling operation. If `StopTime` is set to be earlier than the configured Stop Time of the model, the simulation stops at `StopTime`.
absTol	Absolute tolerance of the solver	positive scalar	Absolute tolerance of the solver as specified in the configuration settings for the model. For more information, see "Absolute tolerance"
relTol	Relative tolerance of the solver	positive scalar	Relative tolerance of the solver as specified in the configuration settings of the model. For more information, see "Relative tolerance"
hMax	Maximum step size	positive scalar	Largest time step that the solver can take. See "Max step size".
hAverage	Average step size	positive scalar	Average size of the time step taken by the solver.
steps	Total steps taken	positive scalar	Total number of time steps taken by the solver.
profileTime	Time to profile	positive scalar	Time, in seconds, taken by the Solver Profiler to examine the model.
zcNumber	Total number of zero crossings	nonnegative scalar	Number of times zero crossings occur during the simulation of the model. The detection of these zero crossings incurs computational cost and can slow down the simulation. For information on zero-crossing detection, see "Zero-Crossing Detection".
resetNumber	Number of solver resets	nonnegative scalar	Number of times the solver has to reset its parameters.

Field	Purpose	Values	Description
`jacobianNumber`	Number of Jacobian updates	nonnegative scalar	Number of times the solver Jacobian matrix is updated during a simulation. For more information, see "Explicit Versus Implicit Continuous Solvers".
`exceptionNumber`	Number of solver exceptions	nonnegative scalar	Total number of solver exceptions encountered during a simulation. These exceptions are events where the solver is unable to solve the model states to the specified accuracy. As a result, the solver runs adjusted trials which increase computational cost.

Data Types: `struct`

Introduced in R2017b

start_simulink

Start Simulink without opening any windows

Syntax

```
start_simulink
```

Description

start_simulink starts Simulink without opening any models, the Start Page, or the Simulink Library Browser. Use this in startup scripts to start Simulink without any other window taking the focus away from the MATLAB Desktop. For example, use start_simulink in the MATLAB startup.m file, when starting MATLAB with the -r command line option, or in Simulink project startup scripts. Opening a model for the first time in a MATLAB session is much quicker after running start_simulink.

If you want to open the Simulink Start Page to create or open models, use the simulink function instead.

If you want to open the Library Browser, use slLibraryBrowser.

Examples

Start Simulink When Starting MATLAB

Use the -r command line option to start Simulink when starting MATLAB, without opening any windows.

On Windows, create a desktop shortcut with the following target:

matlabroot\bin\win64\matlab.exe -r start_simulink

On Linux® and Mac, enter:

```
matlab -r start_simulink
```

- "Automate Startup Tasks"

simulink | simulinkproject | slLibraryBrowser

Topics

"Automate Startup Tasks"

Introduced in R2015b

slupdate

Replace blocks from previous releases with latest versions

Note `slupdate` will be removed in a future release. The `slupdate` command can only upgrade some parts of your model. Use the Upgrade Advisor instead. See "Model Upgrades".

Syntax

```
slupdate('sys')
slupdate('sys', prompt)
AnalysisResult = slupdate('sys', 'OperatingMode', 'Analyze')
```

Description

`slupdate('sys')` replaces blocks in model *sys* from a previous release of Simulink software with the latest versions. The `slupdate` function alone cannot perform all upgrade checks on your model. Use the Upgrade Advisor to access the `slupdate` checks and also advice and fixes for all other upgrade checks. See "Model Upgrades".

Note Best practice is to first open the model, and press CTRL+D to update the model, before you call `slupdate`.

`slupdate('sys', prompt)` specifies whether to prompt you before replacing a block. If *prompt* equals 1, the command prompts you before replacing the block. The prompt asks whether you want to replace the block. Valid responses are

- y

  Replace the block (the default).

- n

Do not replace the block.

- `a`

  Replace this and all subsequent obsolete blocks without further prompting.

If *prompt* equals `0`, the command replaces all obsolete blocks without prompting you.

In addition to replacing obsolete blocks, `slupdate`

- Reconnects broken links to masked blocks in libraries provided by MathWorks to ensure that the model reflects changes made to the blocks in this release. This will overwrite any custom changes you made to the masks of these blocks.
- Updates obsolete configuration settings for the model.

`AnalysisResult = slupdate('`*sys*`', 'OperatingMode', 'Analyze')` performs only the analysis portion without updating or changing the model. This command analyzes referenced models, linked libraries, and S-functions, and then returns a data structure with the following fields:

- `Message` — character vector containing a message summarizing the results
- `blockList` — cell array listing blocks that need to be updated
- `blockReasons` — cell array listing reasons for updating the corresponding blocks
- `modelList` — cell array listing referenced models and the parent model
- `libraryList` — cell array listing non-MathWorks libraries referenced
- `configSetList` — for internal use
- `sfunList` — cell array listing S-functions referenced
- `sfunOK` — logical array representing S-function status, where `false` indicates that an S-function needs updating and `true` indicates otherwise
- `sfunType` — cell array listing apparent S-function type (e.g., `.mex`)

stringtype

Create string data type

Syntax

```
string = stringtype(maximum_length)
stringtype(maximum_length)
```

Description

`string = stringtype(maximum_length)` creates a Simulink string data type with a maximum length. Alternatively, you can also create string data types using the String Constant, String Concatenate, and Compose String blocks.

`stringtype(maximum_length)` creates a Simulink string data type with a maximum length that you can type directly on the MATLAB command line or in the **Output data type** parameter of the String Constant, String Concatenate, or Compose String block.

Examples

Create a String Data Type of Maximum Length 10

Create a string data type of maximum length 10.

```
h=stringtype(10)

h =

  StringType with properties:

    MaximumLength: 10
      Description: ''
```

```
   DataScope: 'Auto'
   HeaderFile: ''
```

Input Arguments

`maximum_length` — Maximum length
scalar

Maximum length of string data type, specified as a scalar, from 1 to 32766. This value can be an integer, MATLAB variable, or MATLAB expression.

Data Types: `double`

Output Arguments

`string` — String data type object
scalar

String object, specified as a scalar.

trim

Find trim point of dynamic system

Syntax

```
[x,u,y,dx] = trim('sys')
[x,u,y,dx] = trim('sys',x0,u0,y0)
[x,u,y,dx] = trim('sys',x0,u0,y0,ix,iu,iy)
[x,u,y,dx] = trim('sys',x0,u0,y0,ix,iu,iy,dx0,idx)
[x,u,y,dx,options] = trim('sys',x0,u0,y0,ix,iu,iy,dx0,idx,options)
[x,u,y,dx,options] = trim('sys',x0,u0,y0,ix,iu,iy,dx0,idx,options,t)
```

Description

A trim point, also known as an equilibrium point, is a point in the parameter space of a dynamic system at which the system is in a steady state. For example, a trim point of an aircraft is a setting of its controls that causes the aircraft to fly straight and level. Mathematically, a trim point is a point where the system's state derivatives equal zero. `trim` starts from an initial point and searches, using a sequential quadratic programming algorithm, until it finds the nearest trim point. You must supply the initial point implicitly or explicitly. If `trim` cannot find a trim point, it returns the point encountered in its search where the state derivatives are closest to zero in a min-max sense; that is, it returns the point that minimizes the maximum deviation from zero of the derivatives. `trim` can find trim points that meet specific input, output, or state conditions, and it can find points where a system is changing in a specified manner, that is, points where the system's state derivatives equal specific nonzero values.

`[x,u,y,dx] = trim('sys')` finds the equilibrium point of the model `'sys'`, nearest to the system's initial state, `x0`. Specifically, `trim` finds the equilibrium point that minimizes the maximum absolute value of `[x-x0,u,y]`. If `trim` cannot find an equilibrium point near the system's initial state, it returns the point at which the system is nearest to equilibrium. Specifically, it returns the point that minimizes `abs(dx)` where `dx` represents the derivative of the system. You can obtain `x0` using this command.

```
[sizes,x0,xstr] = sys([],[],[],0)
```

`[x,u,y,dx] = trim('sys',x0,u0,y0)` finds the trim point nearest to `x0`, `u0`, `y0`, that is, the point that minimizes the maximum value of

`abs([x-x0; u-u0; y-y0])`

`[x,u,y,dx] = trim('sys',x0,u0,y0,ix,iu,iy)` finds the trim point closest to `x0`, `u0`, `y0` that satisfies a specified set of state, input, and/or output conditions. The integer vectors `ix`, `iu`, and `iy` select the values in `x0`, `u0`, and `y0` that must be satisfied. If `trim` cannot find an equilibrium point that satisfies the specified set of conditions exactly, it returns the nearest point that satisfies the conditions, namely,

`abs([x(ix)-x0(ix); u(iu)-u0(iu); y(iy)-y0(iy)])`

`[x,u,y,dx] = trim('sys',x0,u0,y0,ix,iu,iy,dx0,idx)` finds specific nonequilibrium points, that is, points at which the system's state derivatives have some specified nonzero value. Here, `dx0` specifies the state derivative values at the search's starting point and `idx` selects the values in `dx0` that the search must satisfy exactly.

`[x,u,y,dx,options] = trim('sys',x0,u0,y0,ix,iu,iy,dx0,idx,options)` specifies an array of optimization parameters that `trim` passes to the optimization function that it uses to find trim points. The optimization function, in turn, uses this array to control the optimization process and to return information about the process. `trim` returns the `options` array at the end of the search process. By exposing the underlying optimization process in this way, `trim` allows you to monitor and fine-tune the search for trim points.

The following table describes how each element affects the search for a trim point. Array elements 1, 2, 3, 4, and 10 are particularly useful for finding trim points.

No.	Default	Description
1	0	Specifies display options. 0 specifies no display; 1 specifies tabular output; -1 suppresses warning messages.
2	10^{-4}	Precision the computed trim point must attain to terminate the search.
3	10^{-4}	Precision the trim search goal function must attain to terminate the search.
4	10^{-6}	Precision the state derivatives must attain to terminate the search.
5	N/A	Not used.

No.	Default	Description
6	N/A	Not used.
7	N/A	Used internally.
8	N/A	Returns the value of the trim search goal function (λ in goal attainment).
9	N/A	Not used.
10	N/A	Returns the number of iterations used to find a trim point.
11	N/A	Returns the number of function gradient evaluations.
12	0	Not used.
13	0	Number of equality constraints.
14	100*(Number of variables)	Maximum number of function evaluations to use to find a trim point.
15	N/A	Not used.
16	10^{-8}	Used internally.
17	0.1	Used internally.
18	N/A	Returns the step length.

`[x,u,y,dx,options] = trim('`*`sys`*`',x0,u0,y0,ix,iu,iy,dx0,idx,options,t)` sets the time to `t` if the system is dependent on time.

Note If you fix any of the state, input or output values, `trim` uses the unspecified free variables to derive the solution that satisfies these constraints.

Examples

Consider a linear state-space system modeled using a State-Space block

$$\dot{x} = Ax + Bu$$
$$y = Cx + Du$$

The *A*, *B*, *C*, and *D* matrices to enter at the command line or in the block parameters dialog are:.

```
A = [-0.09 -0.01;  1   0];
B = [ 0    -7;     0  -2];
C = [ 0     2;     1  -5];
D = [-3     0;     1   0];
```

Example 1

To find an equilibrium point in this model called sys, use:

```
[x,u,y,dx,options] = trim('sys')
x =
    0
    0
u =
    0
    0
y =
    0
    0
dx =
    0
    0
```

The number of iterations taken is:

```
options(10)
ans =
     7
```

Example 2

To find an equilibrium point near x = [1;1], u = [1;1], enter

```
x0 = [1;1];
u0 = [1;1];
[x,u,y,dx,options] = trim('sys', x0, u0);
x =
   1.0e-13 *
  -0.5160
  -0.5169
u =
   0.3333
   0.0000
```

```
y =
    -1.0000
     0.3333
dx =
    1.0e-12 *
     0.1979
     0.0035
```

The number of iterations taken is

```
options(10)
ans =
      25
```

Example 3

To find an equilibrium point with the outputs fixed to 1, use:

```
y = [1;1];
iy = [1;2];
[x,u,y,dx] = trim('sys', [], [], y, [], [], iy)
x =
     0.0009
    -0.3075
u =
    -0.5383
     0.0004
y =
     1.0000
     1.0000
dx =
    1.0e-15 *
    -0.0170
     0.1483
```

Example 4

To find an equilibrium point with the outputs fixed to 1 and the derivatives set to 0 and 1, use

```
y = [1;1];
iy = [1;2];
dx = [0;1];
```

```
idx = [1;2];
[x,u,y,dx,options] = trim('sys',[],[],y,[],[],iy,dx,idx)
x =
     0.9752
    -0.0827
u =
    -0.3884
    -0.0124
y =
     1.0000
     1.0000
dx =
     0.0000
     1.0000
```

The number of iterations taken is

```
options(10)
ans =
      13
```

Limitations

The trim point found by `trim` starting from any given initial point is only a local value. Other, more suitable trim points may exist. Thus, if you want to find the most suitable trim point for a particular application, it is important to try a number of initial guesses for x, u, and y.

Algorithms

`trim` uses a sequential quadratic programming algorithm to find trim points. See "Sequential Quadratic Programming (SQP)" (Optimization Toolbox) for a description of this algorithm.

Introduced before R2006a

tunablevars2parameterobjects

Create Simulink parameter objects from tunable parameters

Syntax

```
tunablevars2parameterobjects ('modelName')
tunablevars2parameterobjects ('modelName', class)
```

Description

tunablevars2parameterobjects ('*modelName*') creates `Simulink.Parameter` objects in the base workspace for the variables listed in the specified model's Tunable Parameters dialog, then deletes the source information from the dialog. To preserve the information, save the resulting Simulink parameter objects into a MAT-file.

If a tunable variable is already defined as a numeric variable in the base workspace, the variable will be replaced by a parameter object and the original variable will be copied to the object's Value property.

If a tunable variable is already defined as a Simulink parameter object, the object will not be modified but the information for the variable will still be deleted from the Tunable Parameters dialog.

If a tunable variable is defined as any other class of variable, the variable will not be modified and the information for the variable will not be deleted from the Tunable Parameters dialog.

tunablevars2parameterobjects ('*modelName*', *class*) creates objects of the specified class rather than `Simulink.Parameter` objects.

Input Arguments

modelName

Model name or handle

class

Parameter class to use for creating objects

Default: `Simulink.Parameter`

See Also
`Simulink.Parameter`

Topics
"Tunable Parameters"

Introduced in R2007b

ufix

Create `Simulink.NumericType` object describing unsigned fixed-point data type

Syntax

```
a = ufix(WordLength)
```

Description

`ufix(WordLength)` returns a `Simulink.NumericType` object that describes an unsigned fixed-point data type with the specified word length and unspecified scaling.

Note `ufix` is a legacy function. In new code, use `fixdt` instead. In existing code, replace `ufix(WordLength)` with `fixdt(0,WordLength)`.

Examples

Define a 16-bit unsigned fixed-point data type.

```
a = ufix(16)

a =

  NumericType with properties:

    DataTypeMode: 'Fixed-point: unspecified scaling'
      Signedness: 'Unsigned'
      WordLength: 16
         IsAlias: 0
       DataScope: 'Auto'
      HeaderFile: ''
     Description: ''
```

See Also

Simulink.NumericType | fixdt | float | sfix | sfrac | sint | ufrac | uint

Introduced before R2006a

ufrac

Create `Simulink.NumericType` object describing unsigned fractional data type

Syntax

```
a = ufrac(WordLength)
a = ufrac(WordLength, GuardBits)
```

Description

`ufrac(WordLength)` returns a `Simulink.NumericType` object that describes the data type of an unsigned fractional data type with a word size given by `WordLength`.

`ufrac(WordLength, GuardBits)` returns a `Simulink.NumericType` object that describes the data type of an unsigned fractional data type. The total word size is given by `WordLength` with `GuardBits` bits located to the left of the binary point.

Note `ufrac` is a legacy function. In new coder, use `fixdt` instead. In existing code, replace `ufrac(WordLength)` with `fixdt(0,WordLength,WordLength)` and `ufrac(WordLength,GuardBits)` with `fixdt(0,WordLength,(WordLength-GuardBits))`.

Examples

Define an 8-bit unsigned fractional data type with 4 guard bits. Note that the range of this data type is from 0 to $(1 - 2^{-8}).2^4 = 15.9375$.

```
a = ufrac(8,4)

a =

  NumericType with properties:

      DataTypeMode: 'Fixed-point: binary point scaling'
        Signedness: 'Unsigned'
```

```
      WordLength: 8
  FractionLength: 4
         IsAlias: 0
       DataScope: 'Auto'
      HeaderFile: ''
     Description: ''
```

See Also

Simulink.NumericType | fixdt | float | sfix | sfrac | sint | ufix | uint

Introduced before R2006a

uint

Create `Simulink.NumericType` object describing unsigned integer data type

Syntax

```
a = uint(WordLength)
```

Description

`uint(WordLength)` returns a `Simulink.NumericType` object that describes the data type of an unsigned integer with a word size given by `WordLength`.

Note `uint` is a legacy function. In new code, use `fixdt` instead. In existing code, replace `uint(WordLength)` with `fixdt(0,WordLength,0)`.

Examples

Define a 16-bit unsigned integer.

```
a = uint(16)

a =

  NumericType with properties:

      DataTypeMode: 'Fixed-point: binary point scaling'
       Signedness: 'Unsigned'
       WordLength: 16
    FractionLength: 0
          IsAlias: 0
         DataScope: 'Auto'
        HeaderFile: ''
       Description: ''
```

See Also

Introduced before R2006a

unpack

Extract signal logging objects from signal logs and write them into MATLAB workspace

Syntax

```
log.unpack
tsarray.unpack
log.unpack('systems')
log.unpack('all')
```

Description

Note The `ModelDataLogs` class is supported for backwards compatibility. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format. In R2016a or later, when you open a model from an earlier release that had used `ModelDataLogs` format, the model simulated in use `Dataset` format.

You can convert signal logging data from `ModelDataLogs` to `Dataset` format. Converting to `Dataset` format makes it easier to post-process with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see "Convert Logged Data to Dataset Format".

If you have legacy code that uses the `ModelDataLogs` API, you can encounter situations that require updates to your code or model. See "Migrate Scripts That Use Legacy ModelDataLogs API".

`log.unpack` or `unpack(log)` extracts the top level elements of the `Simulink.ModelDataLogs` or `Simulink.SubsysDataLogs` object named **log** (e.g., `logsout`).

`log.unpack('systems')` or `unpack(log, 'systems')` extracts `Simulink.Timeseries` and `Simulink.TsArray` objects from the `Simulink.ModelDataLogs` or `Simulink.SubsysDataLogs` object named `log` . This command does not extract `Simulink.Timeseries` objects from `Simulink.TsArray`

objects nor does it write intermediate `Simulink.ModelDataLogs` or `Simulink.SubsysDataLogs` objects to the MATLAB workspace.

`log.unpack('all')` or `unpack(`*log*`, 'all')` extracts all the `Simulink.Timeseries` objects contained by the `Simulink.ModelDataLogs`, `Simulink.TsArray`, or `Simulink.SubsysDataLogs` object named `log`.

`tsarray.unpack` extracts the time-series objects of class `Simulink.Timeseries` from the `Simulink.TsArray` object named `tsarray`.

Topics

"Export Signal Data Using Signal Logging"

Introduced before R2006a

upgradeadvisor

Open Upgrade Advisor

Syntax

```
upgradeadvisor('modelname')
upgrader = upgradeadvisor('modelname')
```

Description

`upgradeadvisor('modelname')` opens the Upgrade Advisor for the model specified by `modelname`. This command loads the model if necessary, but does not open it in the Simulink Editor. Use the Upgrade Advisor to help you upgrade and improve models with the current release.

`upgrader = upgradeadvisor('modelname')` returns an object that you can use to analyze and upgrade a hierarchy of models programmatically. If you specify an output, then the Upgrade Advisor does not open. You can use the methods `analyze` and `upgrade` with the `upgrader` object output of the `upgradeadvisor` function.

- To programmatically analyze a model for recommended upgrades, create an `upgrader` object and use the method `analyze`.

- To programmatically analyze and upgrade a model, create an `upgrader` object and use the method `upgrade`.

- To configure options before running analyze or upgrade, see "Examples" on page 2-1007.

Tip For an example showing how to programmatically upgrade a whole project, see "Upgrade Simulink Models Using a Simulink Project".

Input Arguments

modelname

Name or handle to the model, specified as a character vector.

Output Arguments

upgrader

Object for analyzing and upgrading the hierarchy of models programmatically.

Examples

Open Upgrade Advisor on a Model

To open the Upgrade Advisor on the vdp example model:

```
upgradeadvisor('vdp')
```

To open the Upgrade Advisor on the currently selected model:

```
upgradeadvisor(bdroot)
```

Programmatically Analyze and Upgrade a Model

1   Get an upgrader object. This example uses a writable copy of the vdp model.

```
load_system('vdp'); save_system('vdp',fullfile(tempdir, 'myvdp'))
upgrader = upgradeadvisor('myvdp')

upgrader =

  Upgrader with properties:

     ChecksToSkip: {}
    SkipLibraries: 0
    SkipBlocksets: 1
     OneLevelOnly: 0
```

```
ShowReport: 1
 RootModel: 'myvdp'
ReportFile: ''
```

2 To analyze the model for recommended upgrades, following library links and model references, run:

```
analyze(upgrader);
```

You see a report of issues found.

3 To analyze the model and automatically fix all issues (where automated fixes are available), run:

```
upgrade(upgrader);
```

This command follows library links and model references, and saves any fixes to the model files.

You see a report of issues found and actions taken.

4 To find the location of the report:

```
reportLocation = upgrader.ReportFile
```

5 You can configure options before running analyze or upgrade.

- Specify checks to skip before running analyze or upgrade. Find the ID for a check in the Upgrade Advisor by right-clicking the check and selecting **Send Check ID to Workspace**. Then set the `advisor.ChecksToSkip` property. For example:

```
advisor.ChecksToSkip = {'mathworks.design.CSStoVSSConvert'};
upgrade(upgrader);
```

- Specify running the Upgrade Advisor on only the current model without following library links or model references:

```
upgrader.OneLevelOnly = true; % default false
```

- Specify running the Upgrade Advisor on the current model, following model references but not library links:

```
upgrader.SkipLibraries = true; % default false
```

- Specify running the Upgrade Advisor on the current model, including upgrading files in blocksets or toolboxes:

```
upgrader.SkipBlocksets = false; % default true
```

By default, the Upgrade Advisor does not upgrade files in blocksets or toolboxes. The Upgrade Advisor detects blocksets from the output of `ver` and the existence of a `Contents.m` file.

- To turn off showing the report after analyze or upgrade, set:

```
upgrader.ShowReport = false; % default true
```

Tip For an example showing how to programmatically upgrade a whole project, see "Upgrade Simulink Models Using a Simulink Project".

Tips

- The Upgrade Advisor can identify cases where you can benefit by changing your model to use new features and settings in Simulink. The Advisor provides advice for transitioning to new technologies, and upgrading a model hierarchy.

  The Upgrade Advisor can also identify cases where a model will not work because changes and improvements in Simulink require changes to a model.

  The Upgrade Advisor offers options to perform recommended actions automatically or instructions for manual fixes.

Alternatives

You can also open the Upgrade Advisor from the Simulink Editor, by selecting **Analysis > Model Advisor > Upgrade Advisor**.

Alternatively, you can open the Upgrade Advisor from the Model Advisor. In the Model Advisor, under `By Task` checks, expand the folder `Upgrading to the Current Simulink Version` and select the check `Open the Upgrade Advisor`.

Introduced in R2012b

view_mdlrefs

Display graph of model reference dependencies

Syntax

```
view_mdlrefs('modelName')
```

Description

`view_mdlrefs('modelName')` launches the Model Dependency Viewer, which displays a graph of model reference dependencies for the model specified by *modelName*. The nodes in the graph represent Simulink models. The directed lines indicate model dependencies.

The default display omits library blocks. You could see this same display by opening *modelName* and choosing **Analysis > Model Dependencies > Model Dependency Viewer > Models Only** from the model menu. Use **Analysis > Model Dependencies > Model Dependency Viewer**to see other dependency displays.

The Model Dependency Viewer is the same tool, and provides the same options, whether you launch it by typing `view_mdlrefs('modelName')` or by using the Simulink GUI. To see an example of using the Model Dependency Viewer, type `sldemo_mdlref_depgraph` in the MATLAB Command Window.

Introduced before R2006a

who

List names of top-level data logging objects in Simulink `ModelDataLogs` data log

Syntax

```
log.who
```

```
tsarray.who
```

```
log.who('systems')
```

```
log.who('all')
```

Description

Note To list names of top-level data logging objects in `Dataset` format, use `Simulink.SimulationData.Dataset.find`.

The `ModelDataLogs` class is supported for backwards compatibility. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format. In R2016a or later, when you open a model from an earlier release that had used `ModelDataLogs` format, the model simulated in use `Dataset` format.

You can convert signal logging data from `ModelDataLogs` to `Dataset` format. Converting to `Dataset` format makes it easier to post-process with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see "Convert Logged Data to Dataset Format".

If you have legacy code that uses the `ModelDataLogs` API, you can encounter situations that require updates to your code or model. See "Migrate Scripts That Use Legacy ModelDataLogs API".

`log.who` or `who(log)` lists the names of the top-level signal logging objects contained by `log`, where `log` is the handle of a `Simulink.ModelDataLogs` object name.

tsarray.who or who(tsarray) lists the names of Simulink.TimeSeries objects contained by the Simulink.TsArray object named tsarray.

log.who('systems') or who(log, 'systems') lists the names of all signal logging objects contained by log except for Simulink.Timeseries objects stored in Simulink.TsArray objects contained by log.

log.who('all') or who(log, 'all') lists the names of all the Simulink.Timeseries objects contained by the Simulink.ModelDataLogs, Simulink.TsArray, or Simulink.SubsysDataLogs object named log.

For information about other uses of who, execute help who in the MATLAB Command Window.

Tip To get the names of Dataset variables in the MAT-file, using the Simulink.SimulationData.DatasetRef.getDatasetVariableNames function processes faster than using the who or whos functions.

Introduced before R2006a

whos

List names and types of top-level data logging objects in Simulink `ModelDataLogs` data log

Syntax

```
log.whos

tsarray.whos

log.whos('systems')

log.whos('all')
```

Description

Note To list names of top-level data logging objects in `Dataset` format, use `Simulink.SimulationData.Dataset.find`.

The `ModelDataLogs` class is supported for backwards compatibility. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format. In R2016a or later, when you open a model from an earlier release that had used `ModelDataLogs` format, the model simulated in use `Dataset` format.

You can convert signal logging data from `ModelDataLogs` to `Dataset` format. Converting to `Dataset` format makes it easier to post-process with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see "Convert Logged Data to Dataset Format".

If you have legacy code that uses the `ModelDataLogs` API, you can encounter situations that require updates to your code or model. See "Migrate Scripts That Use Legacy ModelDataLogs API".

`log.whos` or `whos(log)` lists the names and types of the top-level signal logging objects contained by `log`, where `log` is the handle of a `Simulink.ModelDataLogs` object name.

`tsarray.whos` or `whos(tsarray)` lists the names and types of `Simulink.TimeSeries` objects contained by the `Simulink.TsArray` object named `tsarray`.

`log.whos('systems')` or `whos(log, 'systems')` lists the names and types of all signal logging objects contained by `log` except for `Simulink.Timeseries` objects stored in `Simulink.TsArray` objects contained by `log`.

`log.whos('all')` or `whos(log, 'all')` lists the names and types of all the `Simulink.Timeseries` objects contained by the `Simulink.ModelDataLogs`, `Simulink.TsArray` or `Simulink.SubsysDataLogs` object named `log`.

For information about other uses of `whos`, execute help whos in the MATLAB Command Window.

Tip To get the names of `Dataset` variables in the MAT-file, using the `Simulink.SimulationData.DatasetRef.getDatasetVariableNames` function processes faster than using the `who` or `whos` functions.

Mask Icon Drawing Commands

color	Change drawing color of subsequent mask icon drawing commands
disp	Display text on masked subsystem icon
dpoly	Display transfer function on masked subsystem icon
droots	Display transfer function on masked subsystem icon
fprintf	Display variable text centered on masked subsystem icon
image	Display RGB image on masked subsystem icon
patch	Draw color patch of specified shape on masked subsystem icon
plot	Draw graph connecting series of points on masked subsystem icon
port_label	Draw port label on masked subsystem icon
text	Display text at specific location on masked subsystem icon
	Promote a block icon image to the masked Subsystem

color

Change drawing color of subsequent mask icon drawing commands

Syntax

```
color(colorstr)
```

Here, *colorostr* must be a character vector.

Description

color(*colorstr*) sets the drawing color of all subsequent mask drawing commands to the color specified by the string *colorstr*.

colorstr must be one of the following supported color strings.

```
blue
green
red
cyan
magenta
yellow
black
```

Entering any other string or specifying the color using RGB values results in a warning at the MATLAB command prompt; Simulink ignores the color change. The specified drawing color does not influence the color used by the patch or image drawing commands.

Examples

The following commands

```
color('cyan');
droots([-1], [-2 -3], 4)
color('magenta')
```

```
port_label('input',1,'in')
port_label('output',1,'out')
```

draw the following mask icon.
See Also
droots | port_label

Introduced in R2006b

disp

Display text on masked subsystem icon

Syntax

```
disp(text)
disp(text, 'texmode', 'on')
```

Description

disp(*text*) displays *text* centered on the block icon. *text* is any MATLAB expression that evaluates to a string.

disp(text, 'texmode', 'on') allows you to use TeX formatting commands in *text*. The TeX formatting commands in turn allow you to include symbols and Greek letters in icon text. See "Interpreter" (MATLAB) for information on the TeX formatting commands supported by Simulink software.

Examples

The following command

```
disp('{\itEquation:}  \alpha^2 + \beta^2 \rightarrow \gamma^2,
\chi, \phi_3 = {\bfcool}', 'texmode','on')
```

draws the equation that appears on this masked block icon.

Equation
See Also

fprintf | port_label | text

Introduced in R2007a

dpoly

Display transfer function on masked subsystem icon

Syntax

dpoly(*num*, *den*)

dpoly(*num*, *den*, '*character*')

Description

dpoly(*num*, *den*) displays the transfer function whose numerator is *num* and denominator is *den*.

dpoly(*num*, *den*, '*character*') specifies the name of the transfer function independent variable. The default is *s*.

When Simulink draws the block icon, the initialization commands execute and the resulting equation appears on the block icon, as in the following examples:

- To display a continuous transfer function in descending powers of *s*, enter

  dpoly(num, den)
  For example, for num = [0 0 1]; and den = [1 2 1] the icon looks like:
- To display a discrete transfer function in descending powers of *z*, enter
  dpoly(num, den, 'z')

  For example, for num = [0 0 1]; and den = [1 2 1]; the icon looks like:

- To display a discrete transfer function in ascending powers of *1/z*, enter

  dpoly(num, den, 'z-')

  For example, for *num* and *den* as defined previously, the icon looks like:

If the parameters are not defined or have no values when you create the icon, Simulink software displays three question marks (? ? ?) in the icon. When you define parameter values in the Mask Settings dialog box, Simulink software evaluates the transfer function and displays the resulting equation in the icon.

See Also
disp | droots | port_label | text

droots

Display transfer function on masked subsystem icon

Syntax

```
droots(zero, pole, gain)
droots(zero, pole, gain,'z')
droots(zero, pole, gain,'z-')
```

Description

`droots(zero, pole, gain)` displays the transfer function whose zero is *zero*, pole is *pole*, and gain is *gain*.

`droots(zero, pole, gain,'z')` and `droots(zero, pole, gain,'z-')` expresses the transfer function in terms of *z* or *1/z*.

When Simulink draws the block icon, the initialization commands execute and the resulting equation appears on the block icon, as in the following examples:

- To display a zero-pole gain transfer function, enter

  ```
  droots(z, p, k)
  ```

  For example, the preceding command creates this icon for these values:

  ```
  z = []; p = [-1 -1]; k = 1;
  ```

If the parameters are not defined or have no values when you create the icon, Simulink software displays three question marks (? ? ?) in the icon. When you define parameter values in the Mask Settings dialog box, Simulink software evaluates the transfer function and displays the resulting equation in the icon.

See Also

disp | dpoly | port_label | text

Introduced in R2007a

fprintf

Display variable text centered on masked subsystem icon

Syntax

```
fprintf(text)
fprintf(formatSpec, var)
```

Description

The `fprintf` command displays formatted text centered on the icon and can display *formatSpec* along with the contents of *var*.

Note While this `fprintf` function is identical in name to its corresponding MATLAB function, it provides only the functionality described on this page.

`formatSpec` can be a character vector in single quotes, or a string scalar.

Formatting Operator

A formatting operator starts with a percent sign, %, and ends with a conversion character. The conversion character is required. Optionally, you can specify identifier, flags, field width, precision, and subtype operators between % and the conversion character. (Spaces are invalid between operators and are shown here only for readability).

```
              % 3$ 0– 12 .5 b u

Identifier ——————┘  │                ┌—— Conversion character
Flags ——————————————┘                └—— Subtype
Field width ——————————————————┘      ┌—— Precision
```

Conversion Character

This table shows conversion characters to format numeric and character data as text.

Value Type	Conversion	Details
Integer, signed	%d or %i	Base 10
Integer, unsigned	%u	Base 10
	%o	Base 8 (octal)
	%x	Base 16 (hexadecimal), lowercase letters a–f
	%X	Same as %x, uppercase letters A–F
Floating-point number	%f	Fixed-point notation (Use a precision operator to specify the number of digits after the decimal point.)
	%e	Exponential notation, such as 3.141593e+00 (Use a precision operator to specify the number of digits after the decimal point.)
	%E	Same as %e, but uppercase, such as 3.141593E+00 (Use a precision operator to specify the number of digits after the decimal point.)
	%g	The more compact of %e or %f, with no trailing zeros (Use a precision operator to specify the number of significant digits.)
	%G	The more compact of %E or %f, with no trailing zeros (Use a precision operator to specify the number of significant digits.)
Characters or strings	%c	Single character
	%s	Character vector or string array. The type of the output text is the same as the type of formatSpec.

Examples

The command

```
fprintf('Hello');
```

displays the text `'Hello'` on the icon.

The command

```
fprintf('Hello = %d',17);
```

uses the decimal notation format (`%d`) to display the variable 17.

See Also

disp | port_label | text

Introduced before R2006a

image

Display RGB image on masked subsystem icon

Syntax

```
image(a)
image(a, position)
image(a, position, rotation)
```

Description

image(*a*) displays the image *a*, where *a* is an *m*-by-*n*-by-3 array of RGB values. If necessary, use the MATLAB commands imread and ind2rgb to read and convert bitmap files (such as GIF) to the necessary matrix format.

image(*a*, *position*) creates the image at the specified position as follows.

Position	Description
[*x*, *y*, *w*, *h*]	Position (*x*, *y*) and size (*w*, *h*) of the image where the position is relative to the lower-left corner of the mask. The image scales to fit the specified size.
'center'	Center of the mask
'top-left'	Top left corner of the mask, unscaled
'bottom-left'	Bottom left corner of the mask, unscaled
'top-right'	Top right corner of the mask, unscaled
'bottom-right'	Bottom right corner of the mask, unscaled

image(*a*, *position*, *rotation*) allows you to specify whether the image rotates ('on') or remains stationary ('off') as the icon rotates. The default is 'off'.

Note Images in formats .cur, .hdf4, .ico, .pcx, .ras, .xwd, .svg (full version) cannot be used as block mask images.

Examples

You can use different commands depending on your requirement to add an image. These commands can be added in the **Icon & Ports** pane of the Mask Editor dialog box.

Syntax	Description
`image('icon.jpg')`	Reads the icon image from a JPEG file named `icon.jpg` in the MATLAB path.
`[data, map]=image('label.gif');` `pic=ind2rgb(data,map);`	Reads and converts a GIF file, `label.gif`, to the appropriate matrix format.
`image(pic)`	Reads the converted label image.

See Also

`patch` | `plot`

Introduced before R2006a

patch

Draw color patch of specified shape on masked subsystem icon

Syntax

```
patch(x, y)
patch(x, y, [r g b])
```

Description

patch(*x*, *y*) creates a solid patch having the shape specified by the coordinate vectors x and y. The patch's color is the current foreground color.

patch(*x*, *y*, [*r g b*]) creates a solid patch of the color specified by the vector [r g b], where r is the red component, g the green, and b the blue. For example,

```
patch([0 .5 1], [0 1 0], [1 0 0])
```

creates a red triangle on the mask's icon.

Examples

The command

```
patch([0 .5 1], [0 1 0], [1 0 0])
```

creates a red triangle on the mask's icon.
Pyramid

See Also

`image` | `plot`

Introduced before R2006a

plot

Draw graph connecting series of points on masked subsystem icon

Syntax

```
plot(Y)
plot(X1,Y1,X2,Y2,...)
```

Description

`plot(Y)` plots, for a vector *Y*, each element against its index. If *Y* is a matrix, it plots each column of the matrix as though it were a vector.

`plot(X1,Y1,X2,Y2,...)` plots the vectors *Y1* against *X1*, *Y2* against *X2*, and so on. Vector pairs must be the same length and the list must consist of an even number of vectors.

Plot commands can include `NaN` and `inf` values. When Simulink software encounters `NaN`s or `inf`s, it stops drawing, and then begins redrawing at the next numbers that are not `NaN` or `inf`. The appearance of the plot on the icon depends on the units defined by the **Icon units** option in the Mask Editor.

Simulink software displays three question marks (? ? ?) in the block icon and issues warnings in these situations:

- When you have not defined values for the parameters used in the drawing commands (for example, when you first create the mask, but have not yet entered values in the Mask Settings dialog box)
- When you enter a masked block parameter or drawing command incorrectly

Examples

The command

```
plot([0 1 5], [0 0 4])
```

generates the plot that appears on the icon for the Ramp block, in the Sources library.
See Also

`image`

Introduced before R2006a

port_label

Draw port label on masked subsystem icon

Syntax

```
port_label('port_type', port_number, 'label')
port_label('port_type', port_number, 'label', 'texmode', 'on')
```

Description

port_label('*port_type*', *port_number*, '*label*') draws a label on a port. Valid values for *port_type* include the following.

Value	Description
input	Simulink input port
output	Simulink output port
lconn	Physical Modeling connection port on the left side of a masked subsystem
rconn	Physical Modeling connection port on the right side of a masked subsystem
Enable	Label for the enable port in a masked Triggered or Enabled and Triggered subsystem.
trigger	Label for the trigger port in a masked Triggered or Enabled and Triggered subsystem.
action	Label for the action port in a masked Switch Case Action Subsystem.

The input argument *port_number* is an integer, and *label* is text specifying the port's label.

> **Note** Physical Modeling port labels are assigned based on the nominal port location. If the masked subsystem has been rotated or flipped, for example, a port labeled using `'lconn'` as the `port_type` may not appear on the left side of the block.

`port_label('port_type', port_number, 'label', 'texmode', 'on')` lets you use TeX formatting commands in `label`. The TeX formatting commands allow you to include symbols and Greek letters in the port label. See "Interpreter" (MATLAB) for information on the TeX formatting commands that the Simulink software supports.

Examples

The command

`port_label('input', 1, 'a')`

defines `a` as the label of input port 1.

The command

`port_label('Enable','En')`

defines `En` as the label of Enable port.

The command

`port_label('trigger','Tr')`

defines `Tr` as the label of trigger port.

The command

`port_label('action','Switch():')`

defines `Switch():` as the label of action port.

The command

`port_label('trigger','$\sqrt m$','interpreter','tex')`

defines the label of trigger port with LaTeX interpretation.

The commands

```
disp('Card\nSwapper');
port_label('input',1,'\spadesuit','texmode','on');
port_label('output',1,'\heartsuit','texmode','on');
```

draw playing card symbols as the labels of the ports on a masked subsystem.
See Also
disp | fprintf | text

Introduced before R2006a

3-21

text

Display text at specific location on masked subsystem icon

Syntax

```
text(x, y, 'text')
text(x, y, 'text', 'horizontalAlignment', 'halign',
  'verticalAlignment', 'valign')
text(x, y, 'text', 'texmode', 'on')
```

Description

The `text` command places a character vector at a location specified by the point `(x,y)` whose units are defined by the **Icon units** option in the Mask Editor.

`text(x,y, text, 'texmode', 'on')` allows you to use TeX formatting commands in `text`. The TeX formatting commands in turn allow you to include symbols and Greek letters in icon text. See "Interpreter" (MATLAB) for information on the TeX formatting commands supported by Simulink software.

You can optionally specify the horizontal and/or vertical alignment of the text relative to the point (x, y) in the `text` command.

The `text` command offers the following horizontal alignment options.

Option	Aligns
`'left'`	The left end of the text at the specified point
`'right'`	The right end of the text at the specified point
`'center'`	The center of the text at the specified point

The `text` command offers the following vertical alignment options.

Option	Aligns
`'base'`	The baseline of the text at the specified point

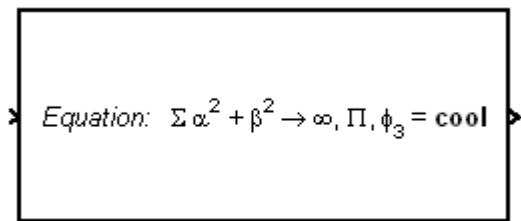
Option	Aligns
`'bottom'`	The bottom line of the text at the specified point
`'middle'`	The midline of the text at the specified point
`'cap'`	The capitals line of the text at the specified point
`'top'`	The top of the text at the specified point

Note While this `text` function is identical in name to its corresponding MATLAB function, it provides only the functionality described on this page.

Examples

Text Alignment

Center the mask icon text `foobar`.

```
text(0.5, 0.5, 'foobar', 'horizontalAlignment', 'center')
```


Equation in Mask Icon

Draw a left-aligned equation as the mask icon.

In the Icons & Ports dialog of the Mask Editor, set **Icon units** to `Normalized`.

In the **Icon drawing commands** text box, enter the following command.

```
text(.05,.5,'{\itEquation:}  \Sigma \alpha^2 +
\beta^2 \rightarrow \infty, \Pi, \phi_3 = {\bfcool}',
'hor','left','texmode','on')
```

Equation

See Also

disp | fprintf | port_label

Introduced before R2006a

block_icon

Promote a block icon image to the masked Subsystem

Syntax

```
block_icon(BlockName)
```

Description

`block_icon(BlockName)` displays the underneath block icon image on the masked Subsystem icon. For more information, see slexblockicon.

Input Arguments

BlockName — Name of the underneath block
String

The name of the underneath block whose icon image you want to display on the Subsystem block that encapsulates the specified block. For more information, see slexblockicon

Data Types: `string`

See Also
`Simulink.Mask` | slexblockicon

Introduced in R2006b

Simulink Debugger Commands

ashow	Show algebraic loop
atrace	Set algebraic loop trace level
bafter	Insert breakpoint after specified method
break	Insert breakpoint before specified method
bshow	Show specified block
clear	Clear breakpoints from model
continue	Continue simulation
disp	Display block's I/O when simulation stops
ebreak	Enable (or disable) breakpoint on solver errors
elist	List simulation methods in order in which they are executed during simulation
emode	Toggle model execution between accelerated and normal mode
etrace	Enable or disable method tracing
help	Display help for debugger commands
nanbreak	Set or clear nonfinite value break mode
next	Advance simulation to start of next method at current level in model's execution list
probe	I/O and state data for blocks
quit	Stop simulation debugger
rbreak	Break simulation before solver reset
run	Run simulation to completion
slist	Sorted list of model blocks
states	Current state values
status	Debugging options in effect
step	Advance simulation by one or more methods
stimes	Model sample times
stop	Stop simulation
strace	Set solver trace level
systems	List nonvirtual systems of model
tbreak	Set or clear time breakpoint
trace	Display block's I/O each time block executes
undisp	Remove block from debugger's list of display points
untrace	Remove block from debugger's list of trace points
where	Display current location of simulation in simulation loop
xbreak	Break when debugger encounters step-size-limiting state
zcbreak	Toggle breaking at nonsampled zero-crossing events

ashow

Show algebraic loop

Syntax

```
ashow <gcb | s:b | s#n | clear>
as <gcb | s:b | s#n | clear>
```

Arguments

gcb	Current block.
s:b	The block whose system index is s and block index is b.
s#n	The algebraic loop numbered n in system s.
clear	Switch that clears loop coloring.

Description

ashow without any arguments lists all of a model's algebraic loops in the MATLAB Command Window. ashow gcb or ashow s:b highlights the algebraic loop that contains the specified block. ashow s#n highlights the nth algebraic loop in system s. The ashow **clear** command removes algebraic loop highlights from the model diagram.

See Also
atrace|slist

Introduced before R2006a

atrace

Set algebraic loop trace level

Syntax

```
atrace level
```

```
at level
```

Arguments

level   Trace level (0 = none, 4 = everything).

Description

The `atrace` command sets the algebraic loop trace level for a simulation.

Command	Displays for Each Algebraic Loop
atrace 0	No information
atrace 1	The loop variable solution, the number of iterations required to solve the loop, and the estimated solution error
atrace 2	Same as level 1
atrace 3	Level 2 plus Jacobian matrix used to solve loop
atrace 4	Level 3 plus intermediate solutions of the loop variable

Introduced before R2006a

bafter

Insert breakpoint after specified method

Syntax

bafter

ba

bafter **m:***mid*

bafter <*sysIdx*:*blkIdx* | **gcb**> [*mth*] [**tid:***TID*]

bafter <**s:***sysIdx* | **gcs**> [*mth*] [**tid:***TID*]

bafter **model** [*mth*] [**tid:***TID*]

Arguments

mid	Method ID
sysIdx:*blkIdx*	Block ID
gcb	Currently selected block
sysIdx	System ID
gcs	Currently selected system
model	Currently selected model
mth	A method name, e.g., `Outputs.Major`
TID	Task ID

Description

`bafter` inserts a breakpoint after the current method.

Instead of `bafter`, you can use the short form of `ba` with any of the syntaxes.

`bafter` **m:***mid* inserts a breakpoint after the method specified by *mid* (see "Method ID").

`bafter` *sysIdx:blkIdx* inserts a breakpoint after each invocation of the method of the block specified by *sysIdx:blkIdx* (see "Block ID") in major time steps. `bafter gcb` inserts a breakpoint after each invocation of a method of the currently selected block (see gcb) in major times steps.

`bafter` **s:***sysIdx* inserts a breakpoint after each method of the root system or nonvirtual subsystem specified by the system ID: *sysIdx*.

Note The systems command displays the system IDs for all nonvirtual systems in the currently selected model.

`bafter` **gcs** inserts a breakpoint after each method of the currently selected nonvirtual system.

`bafter` **model** inserts a breakpoint after each method of the currently selected model.

The optional *mth* parameter allow you to set a breakpoint after a particular block, system, or model method and task. For example, `bafter` **gcb** `Outputs` sets a breakpoint after the Outputs method of the currently selected block.

The optional TID parameter allows you to set a breakpoint after invocation of a method by a particular task. For example, suppose that the currently selected nonvirtual subsystem operates on task 2 and 3. Then `bafter` **gcs** `Outputs` **tid:**2 sets a breakpoint after the invocation of the subsystem's Outputs method that occurs when task 2 is active.

See Also
break | clear | ebreak | nanbreak | rbreak | slist | systems | tbreak | where | xbreak | zcbreak

Introduced before R2006a

break

Insert breakpoint before specified method

Syntax

```
break

b

break m:mid
break <sysIdx:blkIdx | gcb> [mth] [tid:TID]

break <s:sysIdx | gcs> [mth] [tid:TID]

break model [mth] [tid:TID]
```

Arguments

mid	Method ID
sysIdx:*blkIdx*	Block ID
gcb	Currently selected block
sysIdx	System ID
gcs	Currently selected system
model	Currently selected model
mth	A method name, e.g., `Outputs.Major`
TID	task ID

Description

`break` inserts a breakpoint before the current method.

Instead of `break`, you can use the short form of `b` with any of the syntaxes.

break **m:**_mid_ inserts a breakpoint before the method specified by _mid_ (see "Method ID").

break _sysIdx_:_blkIdx_ inserts a breakpoint before each invocation of the method of the block specified by _sysIdx_:_blkIdx_ (see "Block ID") in major time steps. break gcb inserts a breakpoint before each invocation of a method of the currently selected block (see gcb) in major times steps.

break **s:**_sysIdx_ inserts a breakpoint at each method of the root system or nonvirtual subsystem specified by the system ID: _sysIdx_.

Note The systems command displays the system IDs for all nonvirtual systems in the currently selected model.

---

break gcs inserts a breakpoint at each method of the currently selected nonvirtual system.

break model inserts a breakpoint at each method of the currently selected model.

The optional _mth_ parameter allow you to set a breakpoint at a particular block, system, or model method. For example, break gcb Outputs sets a breakpoint at the Outputs method of the currently selected block.

The optional TID parameter allows you to set a breakpoint at the invocation of a method by a particular task. For example, suppose that the currently selected nonvirtual subsystem operates on task 2 and 3. Then break gcs Outputs tid:2 sets a breakpoint at the invocation of the subsystem's Outputs method that occurs when task 2 is active.

Introduced before R2006a

bshow

Show specified block

Syntax

```
bshow s:b
bs s:b
```

Arguments

s:b   The block whose system index is s and block index is b.

Description

The bshow command opens the model window containing the specified block and selects the block.

See Also
slist

Introduced before R2006a

clear

Clear breakpoints from model

Syntax

```
clear
cl
clear m:mid
clear id
clear <sysIdx:blkIdx | gcb>
```

Arguments

mid	Method ID
id	Breakpoint ID
sysIdx:*blk Idx*	Block ID
gcb	Currently selected block

Description

`clear` clears a breakpoint from the current method.

Instead of `clear`, you can use the short form of `cl` with any of the syntaxes.

`clear` **m:***mid* clears a breakpoint from the method specified by *mid*.

`clear` *id* clears the breakpoint specified by the breakpoint ID *id*.

`clear` *sysIdx*:*blkIdx* clears any breakpoints set on the methods of the block specified by *sysIdx:blkIdx*.

`clear` **gcb** clears any breakpoints set on the methods of the currently selected block.

See Also
bafter | break | slist

Introduced before R2006a

continue

Continue simulation

Syntax

```
continue
```

```
c
```

Description

The `continue` command continues the simulation from the current breakpoint. If animation mode is not enabled, the simulation continues until it reaches another breakpoint or its final time step. If animation mode is enabled, the simulation continues in animation mode to the first method of the next major time step, ignoring breakpoints.

See Also

quit | run | stop

Introduced before R2006a

disp

Display block's I/O when simulation stops

Syntax

disp

d

disp gcb

disp s:b

Arguments

s:b   The block whose system index is s and block index is b.

gcb   Current block.

Description

The `disp` command registers a block as a display point. The debugger displays the inputs and outputs of all display points in the MATLAB Command Window whenever the simulation halts. Invoking `disp` without arguments shows a list of display points. Use `undisp` to unregister a block.

Instead of `disp`, you can use the short form of `d` with any of the syntaxes.

See Also
probe | slist | trace | undisp

Introduced before R2006a

ebreak

Enable (or disable) breakpoint on solver errors

Syntax

ebreak

eb

Description

This command causes the simulation to stop if the solver detects a recoverable error in the model. If you do not set or disable this breakpoint, the solver recovers from the error and proceeds with the simulation without notifying you.

See Also

bafter | break | clear | nanbreak | rbreak | slist | systems | tbreak | where | xbreak | zcbreak

Introduced before R2006a

elist

List simulation methods in order in which they are executed during simulation

Syntax

```
elist
el
elist m:mid [tid:TID]
elist <gcs | s:sysIdx> [mth] [tid:TID]
elist <gcb | sysIdx:blkIdx> [mth] [tid:TID]
```

Description

Instead of `elist`, you can use the short form of `el` with any of the syntaxes.

`elist m:mid` lists the methods invoked by the system or nonvirtual subsystem method corresponding to the method id *mid* (see the `where` command for information on method IDs), e.g.,

The method list specifies the calling method followed by the methods that it calls in the order in which they are invoked. The entry for the calling method includes

- The name of the method

  The name of the method is prefixed by the type of system that defines the method, e.g., RootSystem.
- The name of the model or subsystem instance on which the method is invoked
- The ID of the task that invokes the method

The entry for each called method includes

- The ID (*sysIdx:blkIdx*) of the block instance on which the method is invoked

  The block ID is prefixed by a number specifying the system that contains the block (the *sysIdx*). This allows Simulink software to assign the same block ID to blocks residing in different subsystems.
- The name of the method

  The method name is prefixed with the type of block that defines the method, e.g., Integrator.
- The name of the block instance on which the method is invoked
- The task that invokes the method

The optional task ID parameter (**tid:***TID*) allows you to restrict the displayed lists to methods invoked for a specified task. You can specify this option only for system or atomic subsystem methods that invoke Outputs or Update methods.

elist <**gcs** | **s:**sysIdx> lists the methods executed for the currently selected system (specified by the gcs command) or the system or nonvirtual subsystem specified by the system ID *sysIdx*, e.g.,

```
(sldebug @19): elist gcs

RootSystem.Start 'vdp':
  0:0  Integrator.Start 'vdp/x1'
  0:2  Integrator.Start 'vdp/x2'
  0:4  Scope.Start 'vdp/Scope'
  0:5  Fcn.Start 'vdp/Fcn'
  0:6  Product.Start 'vdp/Product'
  0:7  Gain.Start 'vdp/Mu'
  0:8  Sum.Start 'vdp/Sum'

RootSystem.Initialize 'vdp':
  0:0  Integrator.Initialize 'vdp/x1'
            ...
```

The system ID of a model's root system is 0. You can use the debugger's `systems` command to determine the system IDs of a model's subsystems.

Note The `elist` and `where` commands use block IDs to identify subsystems in their output. The block ID for a subsystem is not the same as the system ID displayed by the `systems` command. Use the `elist` *sysIdx:blkIdx* form of the `elist` command to display the methods of a subsystem whose block ID appears in the output of a previous invocation of the `elist` or `where` command.

---

elist <**gcs** | **s:**sysIdx> *mth* lists methods of type *mth* to be executed for the system specified by the `gcs` command or the system ID *sysIdx*, e.g.,

```
(sldebug @19): elist gcs Start

RootSystem.Start 'vdp':
  0:0  Integrator.Start 'vdp/x1'
  0:2  Integrator.Start 'vdp/x2'
  0:4  Scope.Start 'vdp/Scope'
  0:5  Fcn.Start 'vdp/Fcn'
  0:6  Product.Start 'vdp/Product'
  0:7  Gain.Start 'vdp/Mu'
  0:8  Sum.Start 'vdp/Sum'
              ...
```

Use elist **gcb** to list the methods invoked by the nonvirtual subsystem currently selected in the model.

See Also

slist | systems | where

Introduced before R2006a

emode

Toggle model execution between accelerated and normal mode

Syntax

emode

em

Description

Toggles the simulation between accelerated and normal mode when using the Accelerator mode in Simulink software. For more information, see "Run Accelerator Mode with the Simulink Debugger".

Introduced before R2006a

etrace

Enable or disable method tracing

Syntax

etrace **level** level-number

et **level** level-number

Description

This command enables or disables method tracing, depending on the value of `level`:

Level	Description
0	Turn tracing off.
1	Trace model methods.
2	Trace model and system methods.
3	Trace model, system, and block methods.

When method tracing is on, the debugger prints a message at the command line every time a method of the specified level is entered or exited. The message specifies the current simulation time, whether the simulation is entering or exiting the method, the method id and name, and the name of the model, system, or block to which the method belongs.

elist | trace | where

Introduced before R2006a

help

Display help for debugger commands

Syntax

```
help
?
h
```

Description

The `help` command displays a list of debugger commands in the command window. The list includes the syntax and a brief description of each command.

Introduced before R2006a

nanbreak

Set or clear nonfinite value break mode

Syntax

nanbreak

na

Description

The nanbreak command causes the debugger to break whenever the simulation encounters a nonfinite (NaN or Inf) value. If nonfinite break mode is set, nanbreak clears it.

next

Advance simulation to start of next method at current level in model's execution list

Syntax

```
next
```

```
n
```

Description

The `next` command advances the simulation to the start of the next method at the current level in the model's method execution list.

Note The next command has the same effect as the `step over` command. See `step` for more information.

See Also

```
step
```

Introduced before R2006a

probe

I/O and state data for blocks

Syntax

```
probe
probe s:b
probe gcb
probe level level-type
p
```

Description

`probe` sets the Simulink debugger to interactive probe mode. In this mode, the debugger displays the I/O of a selected block. To exit interactive probe mode, enter a debugger command or press the **Enter** key.

`probe s:b` displays the I/O of the block whose system index is *s* and block index is *b*.

`probe gcb` displays the I/O of the currently selected block.

`probe level level-type` sets the verbosity level for `probe`, `trace`, and `dis`. If *level-type* is `io`, the debugger displays block I/O. If *level-type* is `all` (default), the debugger displays all information for the current state of a block, including inputs and outputs, states, and zero crossings.

`p` is the short form of the command.

Examples

Display I/O for the currently selected block `Out2` in the model `vdp` using the Simulink debugger.

1   In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt >> changes to the Simulink debugger prompt
(sldebug @0): >>.

2 Enter:

```
probe gcb
```

The MATLAB Command Window displays:

```
probe: Data of 0:3 Outport block 'vdp/Out2':
U1      = [0]
```

See Also

disp | trace

Introduced in R2007a

quit

Stop simulation debugger

Syntax

```
quit
q
```

Description

`quit` stops the Simulink debugger and returns to the MATLAB command prompt.

`q` is the short form of the command.

Examples

Start the Simulink debugger for the model `vdp` and then stop it.

1. In the MATLAB Command Window, enter:

   ```
   sldebug 'vdp'
   ```

   The MATLAB command prompt >> changes to the Simulink debugger prompt (sldebug @0): >>.

2. Enter:

   ```
   quit
   ```

See Also

`stop`

Introduced before R2006a

rbreak

Break simulation before solver reset

Syntax

```
rbreak
rb
```

Description

rbreak enables (or disables) a solver reset breakpoint if the breakpoint is disabled (or enabled). The breakpoint causes the debugger to halt the simulation whenever an event requires a solver reset. The halt occurs before the solver resets.

rb is the short form of the command.

Examples

Start Simulink debugger for the model vdp and a set breakpoint before a solver reset.

1   In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt >> is replaced with the Simulink debugger prompt (sldebug @0): >>.

2   Enter:

```
rbreak
```

The MATLAB Command Window displays:

```
Break on solver reset request              : enabled
```

See Also

bafter | break | ebreak | nanbreak | tbreak | xbreak | zcbreak

Introduced before R2006a

run

Run simulation to completion

Syntax

```
run
r
```

Description

`run` starts the simulation from the current breakpoint to its final time step. It ignores breakpoints and display points.

`r` is the short form of the command

Examples

Continue the simulation for the model `vdp` using the Simulink debugger.

1 In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt >> changes to the Simulink debugger prompt (sldebug @0): >>.

2 Enter:

```
run
```

See Also

continue | quit | stop

4-29

Introduced before R2006a

slist

Sorted list of model blocks

Syntax

```
slist
sli
```

Description

`slist` displays a list of blocks for the root system and each nonvirtual subsystem sorted according to data dependencies and other criteria.

For each system (root or nonvirtual), `slist` displays:

- Title line specifying the name of the system, the number of nonvirtual blocks that the system contains, and the number of blocks in the system that have direct feedthrough ports.

- Entry for each block in the order in which the blocks appear in the sorted list.

For each block entry, `slist` displays the block ID and the name and type of the block. The block ID consists of a system index and a block index separated by a colon (`sysIdx:blkIdx`).

- Block index is the position of the block in the sorted list.
- System index is the order in which the Simulink software generated the system sorted list. The system index has no special significance. It simply allows blocks that appear in the same position in different sorted lists to have unique identifiers.

Simulink software uses sorted lists to create block method execution lists (see `elist`) for root system and nonvirtual subsystem methods. In general, root system and nonvirtual subsystem methods invoke the block methods in the same order as the blocks appear in the sorted list.

Exceptions occur in the execution order of block methods. For example, execution lists for multicast models group together all blocks operating at the same rate and in the same

task. Slower groups appear later than faster groups. The grouping of methods by task can result in a block method execution order that is different from the block sorted order. However, within groups, methods execute in the same order as the corresponding blocks appear in the sorted list.

`sli` is the short form of the command.

Examples

Display a sorted list of the root system in the `vdp` model using the Simulink debugger.

1 In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt >> changes to the Simulink debugger prompt (sldebug @0): >>.

2 Enter:

```
slist
```

The MATLAB Command Window displays:

```
---- Sorted list for 'vdp' [9 nonvirtual blocks, directFeed=0]
  0:0    'vdp/x1' (Integrator)
  0:1    'vdp/Out1' (Outport)
  0:2    'vdp/x2' (Integrator)
  0:3    'vdp/Out2' (Outport)
  0:4    'vdp/Scope' (Scope)
  0:5    'vdp/Fcn' (Fcn)
  0:6    'vdp/Product' (Product)
  0:7    'vdp/Mu' (Gain)
  0:8    'vdp/Sum' (Sum)
```

See Also
`elist` | `systems`

Introduced before R2006a

states

Current state values

Syntax

```
states
```

Description

`states` displays a list of the current states of the model. The list includes the index, current value, system:block:element ID, state vector name, and block name for each state.

Examples

Display information about the states for the `vdp` model.

1   In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt >> changes to the Simulink debugger prompt (sldebug @0): >>.

2   Enter:

```
states
```

The MATLAB Command Window displays:

```
Continuous States:
Idx  Value                (system:block:element  Name   'BlockName')
  0  0                    (0:0:0  CSTATE  'vdp/x1')
  1  0                    (0:2:0  CSTATE  'vdp/x2')
```

Introduced before R2006a

status

Debugging options in effect

Syntax

Description

Display a list of the debugging options in effect.

Examples

View Debugger Status for vdp

Start the debugger with `vdp`. The command prompt changes to the Simulink debugger prompt (`sldebug @0): >>`.

sldebug `'vdp'`

Display the debugging status.

status

```

Introduced before R2006a

step

Advance simulation by one or more methods

Syntax

```
step
step in
step over
step out
step top
step blockmth
s
```

Description

`step` or `step in` advances the simulation to the next method in the current time step.

`step over` advances the simulation over the next method.

`step out` advances the simulation the end of the current simulation point hierarchy.

`step top` advances the simulation to the first method executed in the next time step.

`step blockmth` advances the simulation to the next method that operates on a block.

`s` is the short form of the command.

If `step` advances the simulation to the start of a block method, the debugger points at the block on which the method operates.

.

Examples

The following diagram illustrates the effect of various forms of the `step` command for the model `vdp`.

```
 0 >> vdp.Simulate
 1       vdp.Start
...
15       vdp.Outputs.InvariantConstants
17    >> vdp.SimulationLoop
18       >> vdp.Outputs.Major
19            RootSystem.Outputs 'vdp'
20                0:0 Integrator.Outputs 'x1'
21                0:1 Outport.Outputs 'Out1'
...
28                0:8 Sum.Outputs 'Sum'
29            vdp.Update
33            vdp.Solver
```

Introduced in R2007a

stimes

Model sample times

Syntax

```
stimes
sti
```

Description

`stimes` displays information about the model sample times, including the sample time period, offset, and task ID.

`sti` is the short form of the command.

Examples

Display sample times for the model `vdp` using the Simulink debugger.

1   In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt >> changes to the Simulink debugger prompt (sldebug @0): >>.

2   Enter:

```
stimes
```

The MATLAB Command Window displays:

```
--- Sample times  for 'vdp' [Number of sample times = 1]
  1. [0    , 0    ]  tid=0 (continuous sample time)
```

Introduced before R2006a

stop

Stop simulation

Syntax

```
stop
```

Description

`stop` stops the simulation of the model you are debugging.

Examples

Start and stop a simulation for the model `vdp` using the Simulink debugger.

1 Start a debugger session. In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt >> changes to the Simulink debugger prompt (sldebug @0): >>.

2 Start a simulation of the model. Enter:

```
run
```

3 Stop the simulation. Enter:

```
stop
```

See Also

continue | quit | run

Introduced before R2006a

strace

Set solver trace level

Syntax

```
strace level
i
```

Description

strace *level* causes the solver to display diagnostic information in the MATLAB Command Window, depending on the value of level. Values are 0 (no information) or 1 (maximum information about time steps, integration steps, zero crossings, and solver resets).

i is the short form of the command.

Examples

Display maximum information about a simulation for the model vdp using the Simulink debugger.

1   In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt >> changes to the Simulink debugger prompt (sldebug @0): >>.

2   Get information about the notation . Enter:

```
help time
```

The MATLAB Command Window displays:

```
Time is displayed as:
 TM = <time while in MajorTimeStep>
```

```
Tm = <time while in MinorTImeStep>
Tr = <time while in solver reset>
Tz = <time at or just after zero crossing>
TzL = <time while in major step just before (at left post of) zero crossing>
TzR = <time while in major step at or just after (at right post of) zero crossing>
Ts = <time of successful integration step>
Tf = <time of failed integration step>
Tn = <time while in Newton iteration> (when using implicit solvers)
Tj = <time during Jacobian evaluation> (when using implicit solvers)

Step size is displayed as:
 Hm = <step size at the start of solver phase>
 Hs = <successful  integration step size>
 Hf = <failed integration step size>
 Hn = <step size during Newton iteration> (when using implicit solvers)
 Hz = <value of 'TM - TzL' during zero crossing search>
 Iz= <value of 'Tz - TzL' during zero crossing search>
```

3 Set trace to display all information. Enter:

```
strace 1
```

When diagnostic tracing is on, the debugger displays the sizes of major and minor time steps.

```
[TM = 13.21072088374186 ] Start of Major Time Step
[Tm = 13.21072088374186 ] Start of Minor Time Step
```

The debugger displays integration information. This information includes the time step of the integration method, step size of the integration method, outcome of the integration step, normalized error, and index of the state.

```
[Tm = 13.21072088374186 ] [H  = 0.2751116230148764 ] Begin Integration Step
[Tf = 13.48583250675674 ] [Hf = 0.2751116230148764 ] Fail  [Er = 1.0404e+000]
    [Ix = 1]
[Tm = 13.21072088374186 ] [H  = 0.2183536061326544 ] Retry
[Ts = 13.42907448987452 ] [Hs = 0.2183536061326539 ] Pass  [Er = 2.8856e-001]
    [Ix = 1]
```

For zero crossings, the debugger displays information about the iterative search algorithm when the zero crossing occurred. This information includes the time step of the zero crossing, step size of the zero crossing detection algorithm, length of the time interval bracketing the zero crossing, and a flag denoting the rising or falling direction of the zero crossing.

```
[Tz = 3.615333333333301 ] Detected 1 Zero Crossing Event 0[F]
                       Begin iterative search to bracket zero crossing event
[Tz = 3.621111157580072 ] [Hz = 0.005777824246771424 ] [Iz = 4.2222e-003] 0[F]
[Tz = 3.621116982080098 ] [Hz = 0.005783648746797265 ] [Iz = 4.2164e-003] 0[F]
[Tz = 3.621116987943544 ] [Hz = 0.005783654610242994 ] [Iz = 4.2163e-003] 0[F]
[Tz = 3.621116987943544 ] [Hz = 0.005783654610242994 ] [Iz = 1.1804e-011] 0[F]
[Tz = 3.621116987949452 ] [Hz = 0.005783654616151157 ] [Iz = 5.8962e-012] 0[F]
[Tz = 3.621116987949452 ] [Hz = 0.005783654616151157 ] [Iz = 5.1514e-014] 0[F]
                       End iterative search to bracket zero crossing event
```

When a solver resets occur, the debugger displays the time at which the solver was reset.

```
[Tr = 6.246905153573676 ] Process Solver Reset
[Tr = 6.246905153573676 ] Reset Zero Crossing Cache
[Tr = 6.246905153573676 ] Reset Derivative Cache
```

systems

List nonvirtual systems of model

Syntax

```
systems
sys
```

Description

`systems` displays the nonvirtual subsystems for a model in the MATLAB Command Window.

`sys` is the short form of the command.

Examples

Display the nonvirtual systems for the model `sldemo_enginewc` using the Simulink debugger.

1   In the MATLAB Command Window, enter:

```
sldebug 'sldemo_enginewc'
```

The MATLAB command prompt >> changes to the Simulink debugger prompt (sldebug @0): >>.

2   Enter:

```
systems
```

The MATLAB Command Window displays the nonvirtual subsystems.

```
0    'sldemo_enginewc'
2    'sldemo_enginewc/Compression'
3    'sldemo_enginewc/Controller'
4    'sldemo_enginewc/Throttle & Manifold/Throttle/TmpAtomicSubsysAtSwitchInport1'
5    'sldemo_enginewc/valve timing/positive edge to dual edge conversion'
```

tbreak

Set or clear time breakpoint

Syntax

tbreak

tb

tbreak t

Description

The tbreak command sets a breakpoint at the specified time step. If a breakpoint already exists at the specified time, tbreak clears the breakpoint. If you do not specify a time, tbreak toggles a breakpoint at the current time step.

Instead of tbreak, you can use the short form of tb, with or without t.

trace

Display block's I/O each time block executes

Syntax

```
trace gcb
trace s:b

tr gcb
trace s:b
```

Arguments

s:b   The block whose system index is s and block index is b.

gcb   Current block.

Description

The `trace` command registers a block as a trace point. The debugger displays the I/O of each registered block each time the block executes.

undisp

Remove block from debugger's list of display points

Syntax

```
undisp gcb

und gcb

undisp s:b

und s:b
```

Arguments

`s:b`	The block whose system index is `s` and block index is `b`.
`gcb`	Current block.

Description

The `undisp` command removes the specified block from the debugger's list of display points.

See Also

```
disp | slist

untrace

Remove block from debugger's list of trace points

Syntax

```
untrace gcb

unt gcb

untrace s:b

unt s:b
```

Arguments

`s:b`	The block whose system index is `s` and block index is `b`.
`gcb`	Current block.

Description

The `untrace` command removes the specified block from the debugger's list of trace points.

See Also
`slist` | `trace`

where

Display current location of simulation in simulation loop

Syntax

```
where [detail]

w [detail]
```

Description

The `where` command displays the current location of the simulation in the simulation loop, for example,

The display consists of a list of simulation nodes with the last entry being the node that is about to be entered or exited. Each entry contains the following information:

- Method ID

  The method ID identifies a specific invocation of a method.

- A symbol specifying its state:

  - `>>` (active)
  - `>|`(about to be entered)
  - `<|`(about to be exited)

- Name of the method invoked (e.g., RootSystem.Start)
- Name of the block or system on which the method is invoked (e.g., Sum)
- System and block ID (`sysIdx:blkIdx`) of the block on which the method is invoked

  For example, `0:8` indicates that the specified method operates on block `8` of system `0`.

`where detail`, where `detail` is any nonnegative integer, includes inactive nodes in the display.

```
0 >> vdp.Simulate
    1       >> vdp.Start
    2          >> RootSystem.Start 'vdp'
    3             0:4 Scope.Start 'Scope'
    4               0:5 Fcn.Start 'Fcn'
    5               0:6 Product.Start
'Product'
    6               0:7 Gain.Start 'Mu'

Simulink Classes

matlab.io.datastore.sdidatastore class

Package: matlab.io.datastore

Datastore for Simulation Data Inspector signals

Description

A `matlab.io.datastore.sdidatastore` object enables the Simulation Data Inspector to interact with large sets of data that are too large to fit in memory. An `sdidatastore` object references the data for one signal.

Construction

`ds_element = dsrObj.getAsDatastore(arg)` creates the `sdidatastore`, `ds_element`, for the signal in the `Simulink.sdi.Datasetref` object selected by the search criterion `arg`.

`ds_element = matlab.io.datastore.sdidatastore(signalID)` creates the `sdidatastore`, `ds_element` for the signal specified by `signalID`.

Input Arguments

`arg` — Element selection criterion
character vector | integer

Search criterion used to retrieve the element from the `Simulink.sdi.DatasetRef`object. For name based searches, specify `arg` as a character vector. For index based searches, `arg` is an integer, representing the index of the desired element.

Example: `'MySignal'`

Example: 3

`signalID` — Numeric signal identifier
integer

Unique number identifying a signal.

Properties

Name — Signal name
character vector

Name of the signal specified as a character vector.

Example: `'My Signal'`

Signal — Simulink.sdi.Signal object
Simulink.sdi.Signal object

`Simulink.sdi.Signal` object associated with the `sdidatastore`.

Methods

Inherited Methods

hasdata	Determine if data is available to read
preview	Return subset of data from datastore
progress	Return percentage of data that you have read from a datastore
read	Read data in datastore
readall	Read all data in datastore
reset	Reset datastore to initial state

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Create an sdidatastore Object for a Signal

This example shows how to create a `sdidatastore` object for a signal in a
`Simulink.sdi.DatasetRef` object.

```
% Simulate model sldemo_fuelsys to create a run of logged signals
sim('sldemo_fuelsys')

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
run = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = run.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames
```

```
names =

  15x1 cell array

    {'EGO Fault Switch:1'          }
    {'air_fuel_ratio'              }
    {'Engine Speed Fault Switch:1' }
    {'speed'                       }
    {'MAP Fault Switch:1'          }
    {'map'                         }
    {'ego'                         }
    {'Throttle Angle Fault Switch:1'}
    {'throttle'                    }
    {'fuel'                        }
    {'ego_sw'                      }
    {'engine_speed'                }
    {'speed_sw'                    }
    {'map_sw'                      }
    {'throttle_sw'                 }
```

```
% Get sdidatastore object for fuel signal
fuel_ds = run_DSRef.getAsDatastore(10);
```

"Inspect and Compare Data Programmatically"

Introduced in R2017b

matlab.io.datastore.SimulationDatastore class

Package: matlab.io.datastore

Datastore for inputs and outputs of Simulink models

Description

A `matlab.io.datastore.SimulationDatastore` object enables a Simulink model to interact with big data. You can load big data as simulation input and log big output data from a simulation. To simulate models with big data, you store the data in a MAT-file and refer to the data through a `SimulationDatastore` object. See "Work with Big Data for Simulations".

A `SimulationDatastore` object refers to big simulation data (which a MAT-file stores) for one signal. If the MAT-file stores simulation data for a bus signal, a `SimulationDatastore` object refers to the data for one leaf signal element in the bus. You can use the datastore object to inspect and access the data and, through a parent object such as `Simulink.SimulationData.Signal`, simulate a Simulink model with the data.

To analyze the datastore data, you can use the methods and properties of the `SimulationDatastore` object as well as MATLAB tools such as the `tall` function. For more information about the MATLAB tools, see "Getting Started with Datastore" (MATLAB).

Construction

After you store big simulation data in a `Simulink.SimulationData.Dataset` object in a MAT-file, a signal element in the `Dataset` object points to the big data. To create a `matlab.io.datastore.SimulationDatastore` object that refers to the big data:

1 At the command prompt or in a script, create a `Simulink.SimulationData.DatasetRef` object that refers to the `Dataset` object in the MAT-file.

2 Use one of these techniques:

- Use one-based, curly-brace indexing (for example, `{1}`) to return an object that represents the target signal element, such as `Simulink.SimulationData.Signal` or `Simulink.SimulationData.State`. For example, for a `DatasetRef` object named `logsout_ref`, to create a `Signal` object that refers to the second signal element, use this code:

  ```
  myLoggedSig = logsout_ref{2}
  ```
- Use the `getAsDatastore` method of the `DatasetRef` object to return an object that represents the target signal element. For more information, see `Simulink.SimulationData.DatasetRef.getAsDatastore`.

The `SimulationDatastore` object resides in the `Values` property of the returned object.

Properties

FileName — Name and path of file that contains big data
character vector

Name and path of the file that contains the big data, returned as a character vector. This property is read-only.

Data Types: `char`

NumSamples — Total number of samples (time steps) in the datastore
integer

Total number of samples (time steps) in the datastore, returned as an integer. The `readall` method extracts this many samples from the big data. This property is read-only.

Data Types: `uint64`

ReadSize — Amount of data to read at a time
`100` (default) | scalar double

Amount of data to read at a time, in number of samples (time steps), specified as a scalar double. The `read` method extracts this many samples from the big data.

Data Types: `double`

Methods

hasdata	Determine if data is available to read
preview	Return subset of data from datastore
progress	Return percentage of data that you have read from a datastore
read	Read data in datastore
readall	Read all data in datastore
reset	Reset datastore to initial state

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Limitations

- `SimulationDatastore` does not support using a parallel pool with Parallel Computing Toolbox installed. To analyze data using tall arrays or run MapReduce algorithms, set the global execution environment to be the local MATLAB session using `mapreducer`. Enter this code:

  ```
  mapreducer(0)
  ```

  For information about controlling parallel resources, see "Run mapreduce on a Parallel Pool" (Parallel Computing Toolbox).

- You cannot use a MATLAB tall variable as simulation input data.

Examples

Inspect and Analyze Data in Simulation Datastore

This example shows how to log big data from a simulation and inspect and analyze portions of that data by interacting with a `matlab.io.datastore.SimulationDatastore` object.

Log Big Data from Model

Open the example model `sldemo_fuelsys`.

`open_system(`'sldemo_fuelsys'`)`

Fault-Tolerant Fuel Control System

Open the Dashboard subsystem to simulate any combination of sensor failures. Copyright 1990-2017 The MathWorks, Inc.

Select **Configuration Parameters > Data Import/Export > Log Dataset data to file**.

`set_param(`'sldemo_fuelsys'`,`'LoggingToFile'`,`'on'`)`

Simulate the model.

`sim(`'sldemo_fuelsys'`)`

The MAT-file `out.mat` appears in your current folder. The file contains data for logged signals such as `fuel` (which is at the root level of the model).

At the command prompt, create a `DatasetRef` object that refers to the logging variable by name, `sldemo_fuelsys_output`.

```
DSRef = Simulink.SimulationData.DatasetRef('out.mat','sldemo_fuelsys_output');
```

Preview Big Data

Use curly braces ({ and }) to extract the signal element `fuel`, which is the tenth element in `DSRef`, as a `Simulink.SimulationData.Signal` object that contains a `SimulationDatastore` object.

```
SimDataSig = DSRef{10};
```

To more easily interact with the `SimulationDatastore` object that resides in the `Values` property of the `Signal` object, store a handle in a variable named `DStore`.

```
DStore = SimDataSig.Values;
```

Use the `preview` method to inspect the first five samples of logged data for the `fuel` signal.

```
preview(DStore)

ans =

  10x1 timetable

        Time            Data

    _____    _____

    0 sec                1.209
    0.00056199 sec       1.209
    0.0033719 sec        1.209
    0.01 sec            1.1729
    0.02 sec            1.1409
    0.03 sec            1.1124
    0.04 sec            1.0873
    0.05 sec            1.0652
    0.055328 sec        1.0652
    0.055328 sec        1.0652
```

Inspect Specific Sample

Inspect the 603rd sample of logged `fuel` data.

Set the `ReadSize` property of `DStore` to a number that, considering memory resources, your computer can tolerate. For example, set `ReadSize` to `200`.

```
DStore.ReadSize = 200;
```

Read from the datastore three times. Each read operation advances the reading position by 200 samples.

```
read(DStore);
read(DStore);
read(DStore);
```

Now that you are very close to the 603rd sample, set `ReadSize` to a smaller number. For example, set `ReadSize` to `5`.

```
DStore.ReadSize = 5;
```

Read from the datastore again.

```
read(DStore)
```

```
ans =

  5x1 timetable

    Time        Data
    _____    _____

    5.79 sec    1.6097
    5.8 sec     1.6136
    5.81 sec    1.6003
    5.82 sec    1.5904
    5.83 sec    1.5832
```

The third sample of read data is the 603rd sample in the datastore.

Inspect Earlier Sample

Inspect the 403rd sample of logged `fuel` data. Due to previous read operations, the datastore now reads starting from the 606th sample, so you must reset the datastore. Then, you can read from the first sample up to the 403rd sample.

Use the `reset` method to reset `DStore`.

```
reset(DStore);
```

Set ReadSize to 200 again.

```
DStore.ReadSize = 200;
```

Read from the datastore twice to advance the read position to the 401st sample.

```
read(DStore);
read(DStore);
```

Set ReadSize to 5 again.

```
DStore.ReadSize = 5;
```

Read from the datastore.

```
read(DStore)
```

```
ans =

  5x1 timetable

     Time        Data
    _____    _____

    3.85 sec      0.999
    3.86 sec    0.99219
    3.87 sec    0.98538
    3.88 sec    0.97858
    3.89 sec    0.97179
```

Extract Multiple Samples

Extract samples 1001 through 1020 (a total of 20 samples).

Reset the datastore.

```
reset(DStore)
```

Advance to sample 1001.

```
DStore.ReadSize = 200;
```

```
for i = 1:5
    read(DStore);
end
```

Prepare to extract 20 samples from the datastore.

```
DStore.ReadSize = 20;
```

Extract samples 1001 through 1020. Store the extracted data in a variable named `targetSamples`.

```
targetSamples = read(DStore)
```

```
targetSamples =

  20x1 timetable

     Time        Data
    _____    _____

    9.7 sec     1.5828
    9.71 sec    1.5733
    9.72 sec    1.5664
    9.73 sec    1.5614
    9.74 sec    1.5579
    9.75 sec    1.5553
    9.76 sec    1.5703
    9.77 sec     1.582
    9.78 sec    1.5913
    9.79 sec    1.5988
    9.8 sec      1.605
    9.81 sec    1.6101
    9.82 sec    1.6145
    9.83 sec    1.6184
    9.84 sec    1.6049
    9.85 sec     1.595
    9.86 sec    1.5877
    9.87 sec    1.5824
    9.88 sec    1.5785
    9.89 sec    1.5757
```

Find Maximum Value of Data in Datastore

Reset the datastore.

```
reset(DStore)
```

Write a `while` loop, using the `hasdata` method, to incrementally analyze the data in chunks of 200 samples.

```
DStore.ReadSize = 200;
runningMax = [];
while hasdata(DStore)
    tt = read(DStore);
    rawChunk = tt.Data;
    runningMax = max([rawChunk; runningMax]);
end
```

Now, the variable `runningMax` stores the maximum value in the entire datastore.

```
runningMax
```

```
runningMax =

    1.6423
```

hasdata

Class: matlab.io.datastore.SimulationDatastore
Package: matlab.io.datastore

Determine if data is available to read

Syntax

```
tf = hasdata(dst)
```

Description

`tf = hasdata(dst)` returns logical `1` (`true`) if there is data available to read from the datastore (`matlab.io.datastore.SimulationDatastore` object) specified by `dst`. Otherwise, it returns logical `0` (`false`).

Input Arguments

dst — Input datastore
matlab.io.datastore.SimulationDatastore object

Input datastore, specified as a `matlab.io.datastore.SimulationDatastore` object. To create a `SimulationDatastore` object, see `matlab.io.datastore.SimulationDatastore`.

Examples

Inspect and Analyze Data in Simulation Datastore

This example shows how to log big data from a simulation and inspect and analyze portions of that data by interacting with a `matlab.io.datastore.SimulationDatastore` object.

Log Big Data from Model

Open the example model `sldemo_fuelsys`.

`open_system('sldemo_fuelsys')`

Fault-Tolerant Fuel Control System

Open the Dashboard subsystem to simulate any combination of sensor failures.   Copyright 1990-2017 The MathWorks, Inc.

Select **Configuration Parameters > Data Import/Export > Log Dataset data to file**.

`set_param('sldemo_fuelsys','LoggingToFile','on')`

Simulate the model.

`sim('sldemo_fuelsys')`

The MAT-file `out.mat` appears in your current folder. The file contains data for logged signals such as `fuel` (which is at the root level of the model).

At the command prompt, create a `DatasetRef` object that refers to the logging variable by name, `sldemo_fuelsys_output`.

```
DSRef = Simulink.SimulationData.DatasetRef('out.mat','sldemo_fuelsys_output');
```

Preview Big Data

Use curly braces ({ and }) to extract the signal element `fuel`, which is the tenth element in `DSRef`, as a `Simulink.SimulationData.Signal` object that contains a `SimulationDatastore` object.

```
SimDataSig = DSRef{10};
```

To more easily interact with the `SimulationDatastore` object that resides in the `Values` property of the `Signal` object, store a handle in a variable named `DStore`.

```
DStore = SimDataSig.Values;
```

Use the `preview` method to inspect the first five samples of logged data for the `fuel` signal.

```
preview(DStore)
```

```

    5.8 sec     1.6136
    5.81 sec    1.6003
    5.82 sec    1.5904
    5.83 sec    1.5832
```

The third sample of read data is the 603rd sample in the datastore.

Inspect Earlier Sample

Inspect the 403rd sample of logged `fuel` data. Due to previous read operations, the datastore now reads starting from the 606th sample, so you must reset the datastore. Then, you can read from the first sample up to the 403rd sample.

Use the `reset` method to reset `DStore`.

```
reset(DStore);
```

Set `ReadSize` to 200 again.

```
DStore.ReadSize = 200;
```

Read from the datastore twice to advance the read position to the 401st sample.

```
read(DStore);
read(DStore);
```

Set `ReadSize` to 5 again.

```
DStore.ReadSize = 5;
```

Read from the datastore.

```
read(DStore)
```

```
ans =

  5x1 timetable

    3.89 sec    0.97179
```

Extract Multiple Samples

Extract samples 1001 through 1020 (a total of 20 samples).

Reset the datastore.

```
reset(DStore)
```

Advance to sample 1001.

```
DStore.ReadSize = 200;
```

```
for i = 1:5
    read(DStore);
end
```

Prepare to extract 20 samples from the datastore.

```
DStore.ReadSize = 20;
```

Extract samples 1001 through 1020. Store the extracted data in a variable named
targetSamples.

```
targetSamples = read(DStore)
```

```
targetSamples =

  20x1 timetable

     Time        Data
    _____     _____

    9.89 sec     1.5757
```

Find Maximum Value of Data in Datastore

Reset the datastore.

```
reset(DStore)
```

Write a `while` loop, using the `hasdata` method, to incrementally analyze the data in chunks of 200 samples.

```
DStore.ReadSize = 200;
runningMax = [];
while hasdata(DStore)
    tt = read(DStore);
    rawChunk = tt.Data;
    runningMax = max([rawChunk; runningMax]);
end
```

Now, the variable `runningMax` stores the maximum value in the entire datastore.

```
runningMax
```

```
runningMax =

    1.6423
```

"Work with Big Data for Simulations"

Introduced in R2017a

preview

Class: matlab.io.datastore.SimulationDatastore
Package: matlab.io.datastore

Return subset of data from datastore

Syntax

```
data = preview(dst)
```

Description

`data = preview(dst)` returns a subset of data from datastore
(`matlab.io.datastore.SimulationDatastore` object) `dst` without changing its
current read position. `preview` returns only the first ten samples (time steps) of data in
the datastore. Use this method to quickly inspect and verify that the data appears as you
expect.

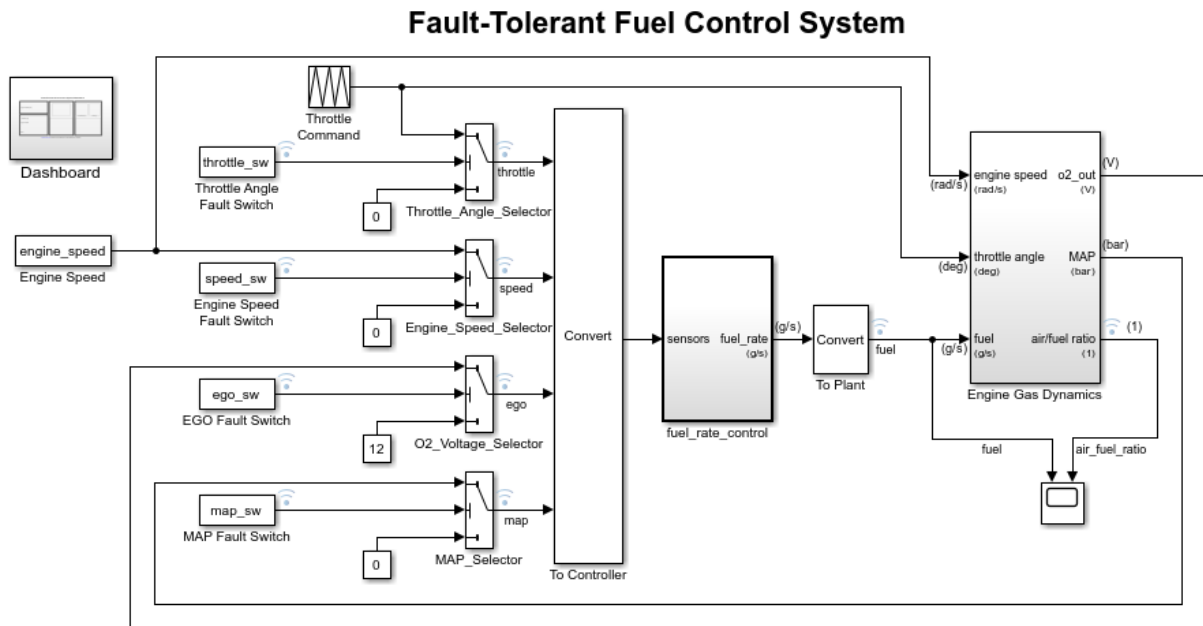
Input Arguments

dst — Input datastore
`matlab.io.datastore.SimulationDatastore` object

Input datastore, specified as a `matlab.io.datastore.SimulationDatastore` object.
To create a `SimulationDatastore` object, see
`matlab.io.datastore.SimulationDatastore`.

Output Arguments

data — Subset of data
`timetable` object

Subset of data, returned as a `timetable` object. For information about `timetable`, see "Timetables" (MATLAB).


Examples

Inspect and Analyze Data in Simulation Datastore

This example shows how to log big data from a simulation and inspect and analyze portions of that data by interacting with a `matlab.io.datastore.SimulationDatastore` object.

Log Big Data from Model

Open the example model `sldemo_fuelsys`.

```
open_system('sldemo_fuelsys')
```

Fault-Tolerant Fuel Control System

Open the Dashboard subsystem to simulate any combination of sensor failures.   Copyright 1990-2017 The MathWorks, Inc.

Select **Configuration Parameters > Data Import/Export > Log Dataset data to file**.

```
set_param('sldemo_fuelsys','LoggingToFile','on')
```

Simulate the model.

```
sim('sldemo_fuelsys')
```

The MAT-file `out.mat` appears in your current folder. The file contains data for logged signals such as `fuel` (which is at the root level of the model).

At the command prompt, create a `DatasetRef` object that refers to the logging variable by name, `sldemo_fuelsys_output`.

```
DSRef = Simulink.SimulationData.DatasetRef('out.mat','sldemo_fuelsys_output');
```

Preview Big Data

Use curly braces (`{` and `}`) to extract the signal element `fuel`, which is the tenth element in `DSRef`, as a `Simulink.SimulationData.Signal` object that contains a `SimulationDatastore` object.

```
SimDataSig = DSRef{10};
```

To more easily interact with the `SimulationDatastore` object that resides in the `Values` property of the `Signal` object, store a handle in a variable named `DStore`.

```
DStore = SimDataSig.Values;
```

Use the `preview` method to inspect the first five samples of logged data for the `fuel` signal.

```
preview(DStore)

ans =

  10x1 timetable

        Time           Data
    _____    _____

    0 sec             1.209
    0.00056199 sec    1.209
    0.0033719 sec     1.209
```

```
0.01 sec          1.1729
0.02 sec          1.1409
0.03 sec          1.1124
0.04 sec          1.0873

0.055328 sec      1.0652
0.055328 sec      1.0652
```

Inspect Specific Sample

Inspect the 603rd sample of logged `fuel` data.

Set the `ReadSize` property of `DStore` to a number that, considering memory resources, your computer can tolerate. For example, set `ReadSize` to `200`.

```
DStore.ReadSize = 200;
```

Read from the datastore three times. Each read operation advances the reading position by 200 samples.

```
read(DStore);
read(DStore);
read(DStore);
```

Now that you are very close to the 603rd sample, set `ReadSize` to a smaller number. For example, set `ReadSize` to `5`.

```
DStore.ReadSize = 5;
```

Read from the datastore again.

```
read(DStore)
```

```
ans =

  5x1 timetable

progress

Class: matlab.io.datastore.SimulationDatastore
Package: matlab.io.datastore

Return percentage of data that you have read from a datastore

Syntax

```
p = progress(dst)
```

Description

`p = progress(dst)` returns the percentage, as a number between 0 and 1, of the data that you have read from a datastore (`matlab.io.datastore.SimulationDatastore` object). For example, a return value of `0.55` means you have read 55% of the data. Use the `progress` method and the `NumSamples` property to determine the current read position.

You read data from a `SimulationDatastore` object by using the `read` method.

Input Arguments

dst — Input datastore
matlab.io.datastore.SimulationDatastore object

Input datastore, specified as a `matlab.io.datastore.SimulationDatastore` object. To create a `SimulationDatastore` object, see
`matlab.io.datastore.SimulationDatastore`.

Output Arguments

p — Percentage of data that you have read from the datastore
scalar double

Percentage of data that you have read from the datastore, returned as a scalar double.

Data Types: `double`

Introduced in R2017a

read

Class: matlab.io.datastore.SimulationDatastore
Package: matlab.io.datastore

Read data in datastore

Syntax

```
data = read(dst)
[data,info] = read(dst)
```

Description

`data = read(dst)` returns data from a datastore
(`matlab.io.datastore.SimulationDatastore` object). Subsequent calls to the `read`
function continue reading from the endpoint of the previous call. Use the `ReadSize`
property of the `SimulationDatastore` object to specify the amount of data, in samples
(time steps), to read at a time. Use the `progress` method and the `NumSamples` property
to determine the current read position.

`[data,info] = read(dst)` also returns information about the extracted data in `info`.

Input Arguments

dst — Input datastore
matlab.io.datastore.SimulationDatastore object

Input datastore, specified as a `matlab.io.datastore.SimulationDatastore` object.
To create a `SimulationDatastore` object, see
`matlab.io.datastore.SimulationDatastore`.

Output Arguments

`data` — Output data
`timetable` object

Output data, returned as a `timetable` object. For information about `timetable`, see "Timetables" (MATLAB).

`info` — Information about read data
structure array

Information about read data, returned as a structure. The structure has one field, `FileName`, which is a fully resolved path containing the path string, the name of the file, and the file extension.

Examples

Inspect and Analyze Data in Simulation Datastore

This example shows how to log big data from a simulation and inspect and analyze portions of that data by interacting with a `matlab.io.datastore.SimulationDatastore` object.

Log Big Data from Model

Open the example model `sldemo_fuelsys`.

Introduced in R2017a

readall

Class: matlab.io.datastore.SimulationDatastore
Package: matlab.io.datastore

Read all data in datastore

Syntax

```
data = readall(dst)
```

Description

`data = readall(dst)` returns all the data in the datastore
(`matlab.io.datastore.SimulationDatastore` object) specified by `dst`.

If all the data in the datastore does not fit in memory, `readall` returns an error. To
determine how many samples (time steps) a datastore holds, inspect the `NumSamples`
property of the `SimulationDatastore` object.

Input Arguments

dst — Input datastore
matlab.io.datastore.SimulationDatastore object

Input datastore, specified as a `matlab.io.datastore.SimulationDatastore` object.
To create a `SimulationDatastore` object, see
`matlab.io.datastore.SimulationDatastore`.

Output Arguments

data — All data in the datastore
timetable object

All data in the datastore, returned as a `timetable` object. For information about `timetable`, see "Timetables" (MATLAB).

reset

Class: matlab.io.datastore.SimulationDatastore
Package: matlab.io.datastore

Reset datastore to initial state

Syntax

```
reset(dst)
```

Description

reset(dst) sets the read position of the datastore
(matlab.io.datastore.SimulationDatastore object) specified by dst to the first
sample in the datastore. Use reset to reread data from a datastore. You read from a
datastore by using the read method.

Input Arguments

dst — Input datastore
matlab.io.datastore.SimulationDatastore object

Input datastore, specified as a matlab.io.datastore.SimulationDatastore object.
To create a SimulationDatastore object, see
matlab.io.datastore.SimulationDatastore.

Examples

Inspect and Analyze Data in Simulation Datastore

    _____     _____

    0 sec                1.209
    0.00056199 sec       1.209
    0.0033719 sec        1.209
    0.01 sec            1.1729
    0.02 sec            1.1409
    0.03 sec            1.1124
    0.04 sec            1.0873
    0.05 sec            1.0652
    0.055328 sec        1.0652
    0.055328 sec        1.0652
```

Inspect Specific Sample

Inspect the 603rd sample of logged `fuel` data.

Set the `ReadSize` property of `DStore` to a number that, considering memory resources, your computer can tolerate. For example, set `ReadSize` to `200`.

```
DStore.ReadSize = 200;
```

Read from the datastore three times. Each read operation advances the reading position by 200 samples.

```
read(DStore);
read(DStore);
read(DStore);
```

Now that you are very close to the 603rd sample, set `ReadSize` to a smaller number. For example, set `ReadSize` to `5`.

```
DStore.ReadSize = 5;
```

Read from the datastore again.

```
read(DStore)
```

```
ans =

  5x1 timetable

     Time        Data
    _____     _____

    5.79 sec     1.6097
    5.8 sec      1.6136
    5.81 sec     1.6003
    5.82 sec     1.5904
    5.83 sec     1.5832
```

The third sample of read data is the 603rd sample in the datastore.

Inspect Earlier Sample

Inspect the 403rd sample of logged `fuel` data. Due to previous read operations, the datastore now reads starting from the 606th sample, so you must reset the datastore. Then, you can read from the first sample up to the 403rd sample.

Use the `reset` method to reset `DStore`.

```
reset(DStore);
```

Set `ReadSize` to 200 again.

```
DStore.ReadSize = 200;
```

Read from the datastore twice to advance the read position to the 401st sample.

```
read(DStore);
read(DStore);
```

Set `ReadSize` to 5 again.

```
DStore.ReadSize = 5;
```

Read from the datastore.

```
read(DStore)
```

```
ans =

  5x1 timetable

    Time         Data
    _____    _____

    3.85 sec      0.999
    3.86 sec    0.99219
    3.87 sec    0.98538
    3.88 sec    0.97858
    3.89 sec    0.97179
```

Extract Multiple Samples

Extract samples 1001 through 1020 (a total of 20 samples).

Reset the datastore.

```
reset(DStore)
```

Advance to sample 1001.

```
DStore.ReadSize = 200;

for i = 1:5
    read(DStore);
end
```

Prepare to extract 20 samples from the datastore.

```
DStore.ReadSize = 20;
```

Extract samples 1001 through 1020. Store the extracted data in a variable named targetSamples.

```
targetSamples = read(DStore)
```

```
targetSamples =

  20x1 timetable

     Time        Data
    _____     _____

    9.7 sec     1.5828
    9.71 sec    1.5733
    9.72 sec    1.5664
    9.73 sec    1.5614
    9.74 sec    1.5579
    9.75 sec    1.5553
    9.76 sec    1.5703
    9.77 sec     1.582
    9.78 sec    1.5913
    9.79 sec    1.5988
    9.8 sec      1.605
    9.81 sec    1.6101
    9.82 sec    1.6145
    9.83 sec    1.6184
    9.84 sec    1.6049
    9.85 sec     1.595
```

```
9.86 sec     1.5877
9.87 sec     1.5824
9.88 sec     1.5785
9.89 sec     1.5757
```

Find Maximum Value of Data in Datastore

Reset the datastore.

```
reset(DStore)
```

Write a `while` loop, using the `hasdata` method, to incrementally analyze the data in chunks of 200 samples.

```
DStore.ReadSize = 200;
runningMax = [];
while hasdata(DStore)
    tt = read(DStore);
    rawChunk = tt.Data;
    runningMax = max([rawChunk; runningMax]);
end
```

Now, the variable `runningMax` stores the maximum value in the entire datastore.

```
runningMax
```

```
runningMax =

    1.6423
```

eventData

Provide information about block method execution events

Description

Simulink software creates an instance of this class when a block method execution event occurs during simulation and passes it to any listeners registered for the event (see `add_exec_event_listener`). The instance specifies the type of event that occurred and the block whose method execution triggered the event. See "Access Block Data During Simulation" for more information.

Parent

None

Children

None

Property Summary

Name	Description
"Type" on page 5-51	Type of method execution event that occurred.
"Source" on page 5-51	Block that triggered the event.

Properties

Type

Type of method execution event that occurred. Possible values are:

event	Occurs...
'PreOutputs'	Before a block's Outputs method executes.
'PostOutputs'	After a block's Outputs method executes.
'PreUpdate'	Before a block's Update method executes.
'PostUpdate'	After a block's Update method executes.
'PreDerivatives'	Before a block's Derivatives method executes.
'PostDerivatives'	After a block's Derivatives method executes.

character vector

Simulink.RunTimeBlock

RO

Introduced in R2009b

LibraryBrowser.LibraryBrowser2 class

Package: LibraryBrowser

Simulink Library Browser

Description

Programmatically display, hide, size, and position the Simulink Library Browser.

Construction

```
lb = LibraryBrowser.LibraryBrowser2
```

Properties

IsOnTop — Always put library window on top
0 (default) | 1

Always put library window on top of other Simulink Editor windows, specified as 1 for always on top.

Example: `lb.IsOnTop = 1`

Methods

Method	Meaning	Example
refresh	Update the library browser display with changes that affect the library browser. Examples include adding a library to the library browser, removing a library from the library browser, and changes to your custom libraries, `slblocks` function, or `sl_customization.m` file. In general, refresh the library browser when you have made any changes that affect libraries on your MATLAB path that are registered in the library browser. .	`lb = LibraryBrowser.LibraryBrowser2;` `refresh(lb)`
show	Display the library browser.	`lb = LibraryBrowser.LibraryBrowser2;` `show(lb)`
hide	Hide the library browser.	`lb = LibraryBrowser.LibraryBrowser2;` `hide(lb)`

getPosition	Get the position of the library browser. Returned as four integers, in pixels: upper-left x coordinate, upper-left y coordinate, width, and depth.	`lb = LibraryBrowser.LibraryBrowser2;`
		`getPosition(lb)`
		
		`ans =`
		
		`   50   279   600   600`

setPosition	Set the position of the library browser. Use an array of integers, in pixels: upper-left x coordinate, upper-left y coordinate, width, and depth.	`lb = LibraryBrowser.LibraryBrowser2;` `setPosition(lb,[70 250 500 500])`

Introduced in R2016b

allowModelReferenceDiscreteSampleTimeInheritanceImpl

Model reference sample time inheritance status for discrete sample times

Syntax

```
flag = allowModelReferenceDiscreteSampleTimeInheritanceImpl(obj)
```

Description

`flag = allowModelReferenceDiscreteSampleTimeInheritanceImpl(obj)` specifies whether a System object in a reference model is allowed to inherit the sample time of the parent model. Use this method only for System objects that use discrete sample time and are intended for inclusion in Simulink via the MATLAB System block.

During model compilation, Simulink sets the model reference sample time inheritance before the System object `setupImpl` method is called.

Note You must set `Access = protected` for this method.

Input Arguments

obj

System object handle

Output Arguments

flag

Flag indicating whether model reference discrete sample time inheritance is allowed for the MATLAB System block containing the System object, returned as a logical value.

The default value for this argument depends on the number of inputs to the System object. To use the default value, you do not need to include this method in your System object class definition file.

Number of System object Inputs	Default Value and Override Effects
No inputs	**Default:** `false` — Model reference discrete sample time inheritance is not allowed. If your System object uses discrete sample time in its algorithm, override the default by returning `true` from `allowModelReferenceDiscreteSampleTimeInheritanceImpl`.
One or more inputs	**Default:** `true` — If no other Simulink constraint prevents it, model reference sample time inheritance is allowed. If your System object does not use sample time in its algorithm, override the default by returning `false` from `allowModelReferenceDiscreteSampleTimeInheritanceImpl`.

Examples

Set Sample Time Inheritance for System Object

For a System object that has one or more inputs, to disallow model reference discrete sample time inheritance for that object, set the sample time inheritance to `false`. Include this code in your class definition file for the object.

```
methods (Access = protected)
    function flag = allowModelReferenceDiscreteSampleTimeInheritanceImpl(~)
        flag = false;
    end
end
```

getInputNamesImpl

Names of MATLAB System block input ports

Syntax

```
[name1,name2,...] = getInputNamesImpl(obj)
```

Description

`[name1,name2,...] = getInputNamesImpl(obj)` specifies the names of the input ports of the System object on a MATLAB System block. The number of returned input names matches the number of inputs returned by the `getNumInputs` method. If you change a property value that changes the number of inputs, the names of those inputs also change.

`getInputNamesImpl` is called by the `getInputNames` method by the MATLAB System block.

Note You must set `Access = protected` for this method.

Input Arguments

obj

System object

Output Arguments

name1,name2,...

Names of the inputs for the specified object, returned as character vectors

Default: empty character vector

Examples

Specify Input Port Name

Specify in your class definition file the names of two input ports as `'upper'` and `'lower'`.

```
methods (Access = protected)
    function varargout = getInputNamesImpl(obj)
        numInputs = getNumInputs(obj);
        varargout = cell(1,numInputs);
        varargout{1} = 'upper';
        if numInputs > 1
            varargout{2} = 'lower';
        end
    end
end
```

getNumInputsImpl | getOutputNamesImpl

Topics

"Specify Input and Output Names"

getOutputNamesImpl

Names of MATLAB System block output ports

Syntax

```
[name1,name2,...] = getOutputNamesImpl(obj)
```

Description

`[name1,name2,...] = getOutputNamesImpl(obj)` returns the names of the output ports from System object, `obj` implemented in a MATLAB System block. The number of returned output names matches the number of outputs returned by the `getNumOutputs` method. If you change a property value that affects the number of outputs, the names of those outputs also change.

`getOutputNamesImpl` is called by the MATLAB System block.

Note You must set `Access = protected` for this method.

Input Arguments

obj

System object

Output Arguments

name1,name2,...

Names of the outputs for the specified object, returned as character vectors.

Default: empty character vector

Examples

Specify Output Port Name

Specify the name of an output port as `'count'`.

```
methods (Access = protected)
    function outputName = getOutputNamesImpl(~)
        outputName = 'count';
    end
end
```

- "Specify Input and Output Names"

See Also

getInputNamesImpl | getNumOutputsImpl

Topics

"Specify Input and Output Names"

getPropertyGroupsImpl

Property groups for System object display

Syntax

```
group = getPropertyGroupsImpl
```

Description

`group = getPropertyGroupsImpl` specifies how to group properties for display. You specify property sections (`matlab.system.display.Section`) and section groups (`matlab.system.display.SectionGroup`) within this method. Sections arrange properties into groups. Section groups arrange sections and properties into groups. If a System object, included through the MATLAB System block, has a section, but that section is not in a section group, its properties appear above the block dialog tab panels.

If you do not include a `getPropertyGroupsImpl` method in your code, all public properties are included in the dialog box by default. If you include a `getPropertyGroupsImpl` method but do not list a property, that property does not appear in the dialog box.

When the System object is displayed at the MATLAB command line, the properties are grouped as defined in `getPropertyGroupsImpl`. If your `getPropertyGroupsImpl` defines multiple section groups, only properties from the first section group are displayed at the command line. To display properties in other sections, a link is provided at the end of a System object property display. Group titles are also displayed at the command line. To omit the "Main" title for the first group of properties, set `TitleSource` to `'Auto'` in `matlab.system.display.SectionGroup`.

`getPropertyGroupsImpl` is called by the MATLAB System block and when displaying the object at the command line.

Note You must set `Access = protected` and `Static` for this method.

Output Arguments

group

Property group or groups

Examples

Define Block Dialog Tabs

Define two block dialog tabs, each containing specific properties. For this example, you use the `getPropertyGroupsImpl`, `matlab.system.display.SectionGroup`, and `matlab.system.display.Section` methods in your class definition file.

```matlab
methods (Static, Access = protected)
    function groups = getPropertyGroupsImpl
        valueGroup = matlab.system.display.Section(...
            'Title','Value parameters',...
            'PropertyList',{'StartValue','EndValue'});

        thresholdGroup = matlab.system.display.Section(...
            'Title','Threshold parameters',...
            'PropertyList',{'Threshold','UseThreshold'});

        mainGroup = matlab.system.display.SectionGroup(...
            'Title','Main', ...
            'Sections',[valueGroup,thresholdGroup]);

        initGroup = matlab.system.display.SectionGroup(...
            'Title','Initial conditions', ...
            'PropertyList',{'IC1','IC2','IC3'});

        groups = [mainGroup,initGroup];
    end
end
```

The resulting dialog box appears as follows.

- "Add Property Groups to System Object and MATLAB System Block"

Topics

"Add Property Groups to System Object and MATLAB System Block"

getSimulateUsingImpl

Specify value for Simulate using parameter

Syntax

```
simmode = getSimulateUsingImpl
```

Description

`simmode = getSimulateUsingImpl` specifies the simulation mode of the System object implemented in a MATLAB System block. The simulation mode restricts your System object to simulation using either code generation or interpreted execution. The associated `showSimulateUsingImpl` method controls whether the **Simulate using** option is displayed on the dialog box.

`getSimulateUsingImpl` is called by the MATLAB System block.

Note You must set `Access = protected` and `Static` for this method.

Output Arguments

simmode

Simulation mode, returned as the character vector `'Code generation'` or `'Interpreted execution'`. If you do not include the `getSimulateUsingImpl` method in your class definition file, the simulation mode is unrestricted. Depending on the value returned by the associated `showSimulateUsingImpl` method, the simulation mode is displayed as either a dropdown list on the dialog box or not at all.

Examples

Specify the Simulation Mode

In the class definition file of your System object, define the simulation mode to display in the MATLAB System block. To prevent **Simulate using** from displaying, see showSimulateUsingImpl.

```matlab
methods (Static, Access = protected)
    function simMode = getSimulateUsingImpl
        simMode = "Interpreted execution";
    end
end
```

- "Control Simulation Type in MATLAB System Block"

See Also

showSimulateUsingImpl

Topics

"Control Simulation Type in MATLAB System Block"

showFiSettingsImpl

Fixed point data type tab visibility for System objects

Syntax

```
flag = showFiSettingsImpl
```

Description

`flag = showFiSettingsImpl` specifies whether the Data Types tab appears on the MATLAB System block dialog box. The Data Types tab includes parameters to control processing of fixed point data the MATLAB System block. You cannot specify which parameters appear on the tab. If you implement `showFiSettingsImpl`, the simulation mode is set code generation.

`showFiSettingsImpl` is called by the MATLAB System block.

The parameters that appear on the Data Types tab, which cannot be customized, are

- **Saturate on integer overflow** is a check box to control the action to take on integer overflow for built-in integer types. The default is that the box is checked, which indicates to saturate. This is also the default for when **Same as MATLAB** is selected as the **MATLAB System fimath** option.

- **Treat these inherited Simulink signal types as fi objects** is a pull down that indicates which inherited data types to treat as fi data types. Valid options are `Fixed point` and `Fixed point & integer`. The default value is `Fixed point`.

- **MATLAB System fimath** has two radio button options: **Same as MATLAB** and **Specify Other**. The default, **Same as MATLAB**, uses the current MATLAB fixed-point math settings. **Specify Other** enables the edit box for specifying the desired fixed-point math settings. For information on setting fixed-point math, see `fimath`, in the Fixed-Point Designer documentation.

Note If you do not want to display the tab, you do not need to implement this method in your class definition file.

You must set `Access = protected` and `Static` for this method.

Output Arguments

flag

Flag indicating whether to display the Data Types tab on the MATLAB System block mask, returned as a logical scalar value. Returning a `true` value displays the tab. A `false` value does not display the tab.

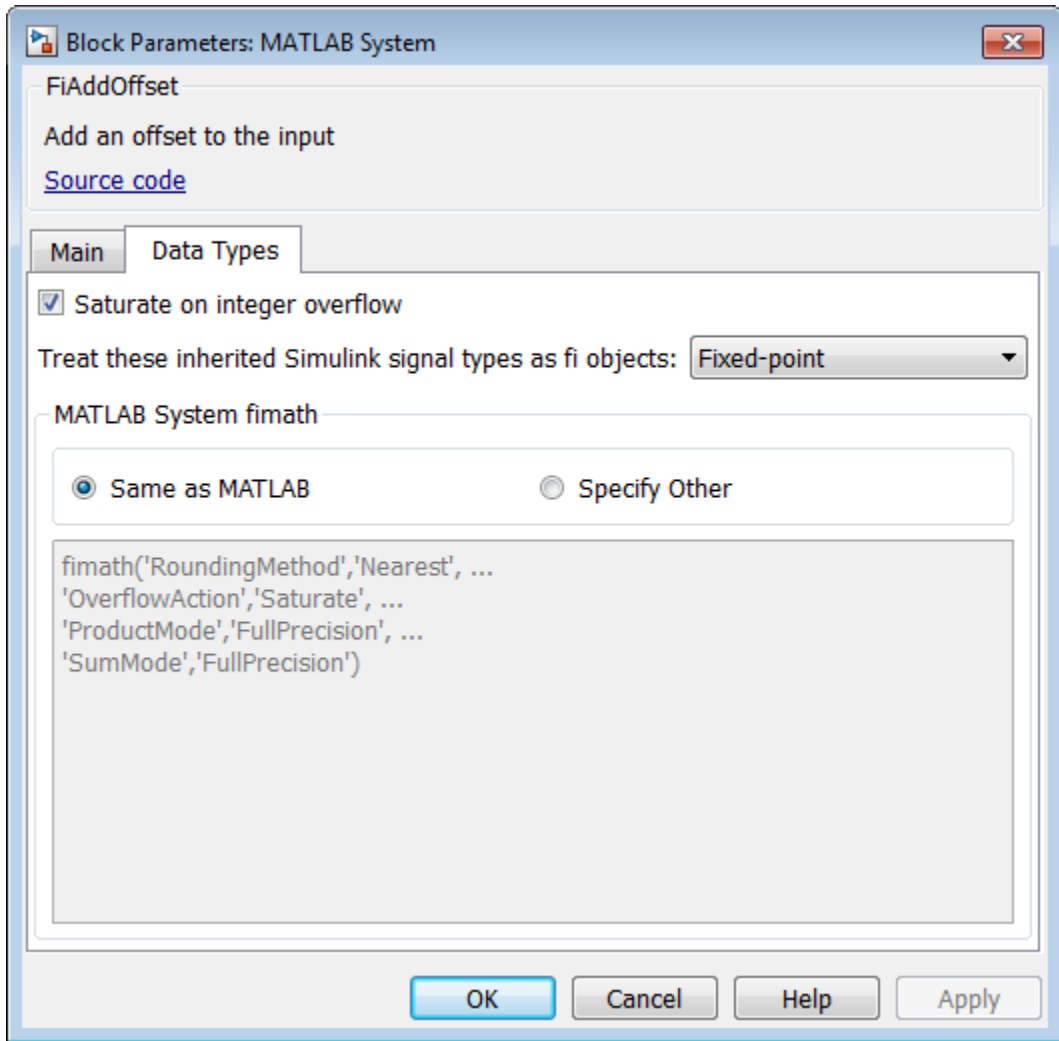
Default: `false`

Examples

Show the Data Types Tab

Show the Data Types tab on the MATLAB System block dialog box.

```
methods (Static, Access = protected)
    function isVisible = showFiSettingsImpl
        isVisible = true;
    end
end
```

If you set the flag, `isVisible`, to `true`, the tab appears as follows when you add the object to Simulink with the MATLAB System block.


- "Add Data Types Tab to MATLAB System Block"

See Also

Topics
"Add Data Types Tab to MATLAB System Block"

showSimulateUsingImpl

Visibility of `Simulate using` parameter

Syntax

```
flag = showSimulateUsingImpl
```

Description

`flag = showSimulateUsingImpl` specifies whether **Simulation mode** appears on the MATLAB System block dialog box.

`showSimulateUsingImpl` is called by the MATLAB System block.

Note You must set `Access = protected` and `Static` for this method.

Output Arguments

`flag`

Flag indicating whether to display the **Simulate using** parameter and dropdown list on the MATLAB System block mask, returned as a logical scalar value. A `true` value displays the parameter and dropdown list. A `false` value hides the parameter and dropdown list.

Default: `true`

Examples

Hide the Simulate using Parameter

Hide the **Simulate using** parameter on the MATLAB System block dialog box.

```
methods (Static, Access = protected)
  function flag = showSimulateUsingImpl
    flag = false;
  end
end
```

If you set the flag to `true` or omit the `showSimulateUsingImpl` method, which defaults to `true`, the dialog appears as follows when you add the object to Simulink with the MATLAB System block.
If you also specify a single value for `getSimulateUsingImpl`, the dialog appears as follows when you add the object to Simulink with the MATLAB System block.

See Also

getSimulateUsingImpl

Topics

"Control Simulation Type in MATLAB System Block"

getGlobalNamesImpl

Global variable names for MATLAB System block

Syntax

name = getGlobalNamesImpl(obj)

Description

name = getGlobalNamesImpl(obj) specifies the names of global variables that are declared in a System object for use in a Simulink P-code file. For P-code files, in addition to declaring your global variables in stepImpl, outputImpl, or updateImpl, you must include the getGlobalNamesImpl method. You declare global variables in a cell array in the getGlobalNamesImpl method. System objects that contain these global variables are included in Simulink using a MATLAB System block. To enable a global variable in Simulink, your model also must include a Data Store Memory block with a **Data Store Name** that matches the global variable name.

getGlobalNamesImpl is called by the MATLAB System block.

Note You must set Access = protected for this method.

Input Arguments

obj

System object

Output Arguments

name

Name of the cell array containing the global variable names. The elements of the cell array are character vectors.

Examples

Specify Global Names

Specify two global names in your class definition file.

```
methods(Access = protected)
    function glnames = getGlobalNamesImpl(obj)
      glnames = {"FEE","OTHERFEE"};
    end

    function y = stepImpl(obj,u)
      global FEE
      global OTHERFEE
      y = u - FEE * obj.lastData + OTHERFEE;
      obj.lastData = u;
    end
end
```

outputImpl | stepImpl | updateImpl

Topics
"System Object Global Variables in Simulink"

Introduced in R2016b

getHeaderImpl

Header for System object display

Syntax

```
header = getHeaderImpl
```

Description

`header = getHeaderImpl` specifies the dialog header to display on the MATLAB System block dialog box. If you do not specify the `getHeaderImpl` method, no title or text appears for the header in the block dialog box.

`getHeaderImpl` is called by the MATLAB System block.

Note You must set `Access = protected` and `Static` for this method.

Output Arguments

header

Header text

Examples

Define Header for System Block Dialog Box

Define a header in your class definition file for the `EnhancedCounter` System object.

```
methods (Static, Access = protected)
   function header = getHeaderImpl
      header = matlab.system.display.Header('EnhancedCounter',...
```

```
            'Title','Enhanced Counter');
        end
    end
```

- "Add Header to MATLAB System Block"

See Also

getPropertyGroupsImpl

Topics
"Add Header to MATLAB System Block"

getDiscreteStateImpl

Discrete state property values

Syntax

```
s = getDiscreteStateImpl(obj)
```

Description

`s = getDiscreteStateImpl(obj)` returns a struct `s` of internal state value properties, which have the `DiscreteState` attribute. The field names of the struct are the object's `DiscreteState` property names. To restrict or change the values returned by `getDiscreteState` method, you can override this `getDiscreteStateImpl` method.

`getDiscreteStatesImpl` is called by the `getDiscreteState` method, which is called by the `setup` method.

Note You must set `Access = protected` for this method.

You cannot modify any properties in this method.

Input Arguments

obj

System object handle

Output Arguments

s

State values, returned as a struct

5-79

Examples

Get Discrete State Values

Use the `getDiscreteStateImpl` method in your class definition file to get the discrete states of the object.

```
methods (Access = protected)
    function s = getDiscreteStateImpl(obj)
    end
end
```

See Also
setupImpl

Topics
"Define Property Attributes" (MATLAB)

supportsMultipleInstanceImpl

Support System object in Simulink For Each subsystem

Syntax

```
flag = supportsMultipleInstanceImpl(obj)
```

Description

`flag = supportsMultipleInstanceImpl(obj)` specifies whether the System object can be used in a Simulink For Each subsystem via the MATLAB System block. To enable For Each support, you must include the `supportsMultipleInstanceImpl` in your class definition file and have it return `true`. Do not enable For Each support if your System object allocates exclusive resources that may conflict with other System objects, such as allocating file handles, memory by address, or hardware resources.

During Simulink model compilation and propagation, the MATLAB System block calls the `supportMultipleInstance` method, which then calls the `supportsMultipleInstanceImpl` method to determine For Each support.

Note You must set `Access = protected` for this method.

You cannot modify any properties in this method.

Input Arguments

obj

System object handle

5-81

Output Arguments

flag

Boolean value indicating whether the System object can be used in a For Each subsystem. The default value, if you do not include the `supportMultipleInstance` method, is `false`.

Examples

Enable For-Each Support for System Object

Specify in your class definition file that the System object can be used in a Simulink For Each subsystem.

```
methods (Access = protected)
    function flag = supportsMultipleInstanceImpl(obj)
        flag = true;
    end
end
```

• "Enable For Each Subsystem Support"

See Also
`matlab.System`

Topics
"Enable For Each Subsystem Support"

processTunedPropertiesImpl

Action when tunable properties change

Syntax

processTunedPropertiesImpl(obj)

Description

processTunedPropertiesImpl(obj) specifies the algorithm to perform when one or more tunable property values change. This method is called as part of the next call to the System object after a tunable property value changes. A property is tunable only if its Nontunable attribute is false, which is the default.

processTunedPropertiesImpl is called when you run the System object.

Note You must set Access = protected for this method.

You cannot modify any tunable properties in this method if its System object will be used in the Simulink MATLAB System block.

Input Arguments

obj

System object

Examples

Specify Action When Tunable Property Changes

Use `processTunedPropertiesImpl` to recalculate the lookup table if the value of either the `NumNotes` or `MiddleC` property changes before the next call to the System object. `propChange` indicates if either property has changed.

```matlab
methods (Access = protected)
    function processTunedPropertiesImpl(obj)
        propChange = isChangedProperty(obj,'NumNotes') ||...
            isChangedProperty(obj,'MiddleC')
        if propChange
            obj.pLookupTable = obj.MiddleC * (1+log(1:obj.NumNotes)/log(12));
        end
    end
end
```

- "Validate Property and Input Values" (MATLAB)
- "Define Property Attributes" (MATLAB)

Tips

Use this method when a tunable property affects the value of a different property.

To check if a property has changed since `stepImpl` was last called, use `isChangedProperty` within `processTunedPropertiesImpl`. See "Specify Action When Tunable Property Changes" on page 5-83 for an example.

In MATLAB when multiple tunable properties are changed before running the System object, `processTunedPropertiesImpl` is called only once for all the changes. `isChangedProperty` returns `true` for all the changed properties.

In Simulink, when a parameter is changed in a MATLAB System block dialog, the next simulation step calls `processTunedPropertiesImpl` before calling `stepImpl`. All tunable parameters are considered changed and `processTunedPropertiesImpl` method is called for each of them. `isChangedProperty` returns `true` for all the dialog properties.

matlab.system.mixin.CustomIcon class

Package: matlab.system.mixin

Custom icon mixin class

Description

`matlab.system.mixin.CustomIcon` is a class that specifies the `getIcon` method. This method customizes the name of the icon used for the System object implemented through a MATLAB System block.

To use this method, you must subclass from this class in addition to the `matlab.System` base class. Type the following syntax as the first line of your class definition file, where `ObjectName` is the name of your object:

```
classdef ObjectName < matlab.system &...
    matlab.system.mixin.CustomIcon
```

Methods

getIconImpl   Name to display as block icon

See Also
`matlab.System` | `matlab.system.display.Icon`

Topics
"Add Text to Block Icon"

getIconImpl

Class: matlab.system.mixin.CustomIcon
Package: matlab.system.mixin

Name to display as block icon

Syntax

```
icon = getIconImpl(obj)
```

Description

`icon = getIconImpl(obj)` specifies the text or image to display on the block icon of the MATLAB System block. If you do not specify the `getIconImpl` method, the block displays the class name of the System object as the block icon. For example, if you specify `pkg.MyObject` in the MATLAB System block, the default icon is labeled `MyObject`

`getIconImpl` is called by the MATLAB System block during Simulink model compilation.

Note You must set `Access = protected` for this method.

Input Arguments

obj

System object handle

Output Arguments

icon

The text or image to display as the block icon. Each cell is displayed as a separate line.

Examples

Add System Block Icon Name

Specify in your class definition file the name of the block icon as `'Enhanced Counter'` using two lines.

```
methods (Access = protected)
   function icon = getIconImpl(~)
      icon = {'Enhanced','Counter'};
   end
end
```

Add Image to MATLAB System Block

Define an image in your class definition file.

```
methods(Access = protected)
    function icon = getIconImpl(~)
        % Define icon for System block
        icon = matlab.system.display.Icon('my_icon.png');
    end
end
```

The image now appears on the System block icon.

matlab.system.display.Header class

Package: matlab.system.display

Header for System objects properties

Syntax

```
matlab.system.display.Header(N1,V1,...Nn,Vn)
matlab.system.display.Header(Obj,...)
```

Description

`matlab.system.display.Header(N1,V1,...Nn,Vn)` specifies a header for the System object, with the header properties defined in Name-Value (N,V) pairs. You use `matlab.system.display.Header` within the `getHeaderImpl` method. The available header properties are

- `Title` — Header title. The default value is an empty character vector.
- `Text` — Header description. The default value is an empty character vector.
- `ShowSourceLink` — Show link to source code for the object.

`matlab.system.display.Header(Obj,...)` creates a header for the specified System object (`Obj`) and sets the following property values:

- `Title` — Set to the `Obj` class name.
- `Text` — Set to help summary for `Obj`.
- `ShowSourceLink` — Set to `true` if `Obj` is MATLAB code. In this case, the **Source Code** link is displayed. If `Obj` is P-coded and the source code is not available, set this property to `false`.

You can use `mfilename('class')` from within this method to get the name of the System object. If you set any Name-Value pairs, those property values override the default settings.

Examples

Define System Block Header

Define a header in your class definition file.

```
methods (Static, Access = protected)
    function header = getHeaderImpl
        header = matlab.system.display.Header(mfilename('class'), ...
            'Title','AlternativeTitle',...
            'Text','An alternative class description');
    end
end
```

The resulting output appears as follows. In this case, **Source code** appears because the ShowSourceLink property was set to true.

matlab.system.display.Section class

Package: matlab.system.display

Property group section for System objects

Syntax

```
matlab.system.display.Section(N1,V1,...Nn,Vn)
matlab.system.display.Section(Obj,...)
```

Description

matlab.system.display.Section(N1,V1,...Nn,Vn) creates a property group section for displaying System object properties, which you define using property Name-Value pairs (N,V). You use matlab.system.display.Section to define property groups using the getPropertyGroupsImpl method. The available Section properties are

- Title — Section title. The default value is an empty character vector.

- TitleSource — Source of section title. Valid values are 'Property' and 'Auto'. The default value is 'Property', which uses the character vector from the Title property. If the Obj name is given, the default value is Auto, which uses the Obj name.

- Description — Section description. The default value is an empty character vector.

- PropertyList — Section property list as a cell array of property names. The default value is an empty array. If the Obj name is given, the default value is all eligible display properties.

Note Certain properties are not eligible for display either in a dialog box or in the System object summary on the command-line. Property types that cannot be displayed are: hidden, abstract, private or protected access, discrete state, and continuous state. Dependent properties do not display in a dialog box, but do display in the command-line summary.

`matlab.system.display.Section(Obj,...)` creates a property group section for the specified System object (`Obj`) and sets the following property values:

- `TitleSource` — Set to `'Auto'`, which uses the `Obj` name.
- `PropertyList` — Set to all publicly-available properties in the `Obj`.

You can use `mfilename('class')` from within this method to get the name of the System object. If you set any Name-Value pairs, those property values override the default settings.

Methods

Examples

Define Property Groups

Define two property groups in your class definition file by specifying their titles and property lists.

```
methods (Static, Access = protected)
    function groups = getPropertyGroupsImpl
        valueGroup = matlab.system.display.Section(...
            'Title','Value parameters',...
            'PropertyList',{'StartValue','EndValue'});

        thresholdGroup = matlab.system.display.Section(...
            'Title','Threshold parameters',...
            'PropertyList',{'Threshold','UseThreshold'});
        groups = [valueGroup,thresholdGroup];
    end
end
```

When you specify the System object in the MATLAB System block, the resulting dialog box appears as follows.
- "Add Property Groups to System Object and MATLAB System Block"

Topics

"Add Property Groups to System Object and MATLAB System Block"

matlab.system.display.Action class

Package: matlab.system.display

Custom button

Syntax

```
matlab.system.display.Action(action)
matlab.system.display.Action(action,Name,Value)
```

Description

`matlab.system.display.Action(action)` specifies a button to display on the MATLAB System block. This button executes a function by launching a System object method or invoking any MATLAB function or code.

A typical button function launches a figure. The launched figure is decoupled from the block dialog box. Changes to the block are not synced to the displayed figure.

You define `matlab.system.display.Action` within the `getPropertyGroupsImpl` method in your class definition file. You can define multiple buttons using separate instances of `matlab.system.display.Action` in your class definition file.

`matlab.system.display.Action(action,Name,Value)` includes `Name,Value` pair arguments, which you can use to specify any properties.

Input Arguments

`action`

Action taken when the user presses the specified button on the MATLAB System block dialog. The action is defined as a function handle or as a MATLAB command. If you define the action as a function handle, the function definition must define two inputs. These inputs are a `matlab.system.display.ActionData` object and a System object instance, which can be used to invoke a method.

A `matlab.system.display.ActionData` object is the callback object for a display action. You use the `UserData` property of `matlab.system.display.ActionData` to store persistent data, such as a figure handle.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (`'  '`). You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Properties

You specify these properties as part of the input using `Name,Value` pair arguments. Optionally, you can define them using `object.property` syntax.

- `ActionCalledFcn` — Action to take when the button is pressed. You cannot specify this property using a Name-Value pair argument.
- `Label` — Text to display on the button. The default value is an empty character vector.
- `Description` — Text for the button tooltip. The default value is an empty character vector.
- `Placement` — Character vector indicating where on a separate row in the property group to place the button. Valid values are `'first'`, `'last'`, or a property name. If you specify a property name, the button is placed above that property. The default value is `'last'`.
- `Alignment` — Character vector indicating how to align the button. Valid values are `'left'` and `'right'`. The default value is `'left'`.

Examples

Define Button on MATLAB System Block

Define a **Visualize** button and its associated function to open a figure that plots a ramp using the parameter values in the block dialog.

```
methods(Static,Access = protected)
  function group = getPropertyGroupsImpl
```

```matlab
      group = matlab.system.display.Section(mfilename('class'));
      group.Actions = matlab.system.display.Action(@(~,obj)...
          visualize(obj),'Label','Visualize');
    end
end

methods
  function obj = PlotRamp(varargin)
    setProperties(obj,nargin,varargin{:});
  end

  function visualize(obj)
    figure;
    d = 1:obj.RampLimit;
    plot(d);
  end
end
end
```

When you specify the System object in the MATLAB System block, the resulting block dialog box appears as follows.
To open the same figure, rather than multiple figures, when the button is pressed more than once, use this code instead.

```matlab
methods(Static,Access = protected)
  function group = getPropertyGroupsImpl
    group = matlab.system.display.Section(mfilename('class'));
    group.Actions = matlab.system.display.Action(@(actionData,obj)...
        visualize(obj,actionData),'Label','Visualize');
  end
end

methods
  function obj = ActionDemo(varargin)
    setProperties(obj,nargin,varargin{:});
  end

  function visualize(obj,actionData)
    f = actionData.UserData;
    if isempty(f) || ~ishandle(f)
      f = figure;
      actionData.UserData = f;
    else
        figure(f); % Make figure current
    end

    d = 1:obj.RampLimit;
    plot(d);
  end
end
```

"Add Button to MATLAB System Block"

matlab.system.display.SectionGroup class

Package: matlab.system.display

Section group for System objects

Syntax

```
matlab.system.display.SectionGroup(N1,V1,...Nn,Vn)
matlab.system.display.SectionGroup(Obj,...)
```

Description

`matlab.system.display.SectionGroup(N1,V1,...Nn,Vn)` creates a group for displaying System object properties and display sections created with `matlab.system.display.Section`. You define such sections or properties using property Name-Value pairs (N,V). A section group can contain both properties and sections. You use `matlab.system.display.SectionGroup` to define section groups using the `getPropertyGroupsImpl` method. Section groups display as separate tabs in the MATLAB System block. The available Section properties are

- `Title` — Group title. The default value is an empty character vector.

- `TitleSource` — Source of group title. Valid values are `'Property'` and `'Auto'`. The default value is `'Property'`, which uses the character vector from the `Title` property. If the `Obj` name is given, the default value is `Auto`, which uses the `Obj` name. In the System object property display at the MATLAB command line, you can omit the default "Main" title for the first group of properties by setting `TitleSource` to `'Auto'`.

- `Description` — Group or tab description that appears above any properties or panels. The default value is an empty character vector.

- `PropertyList` — Group or tab property list as a cell array of property names. The default value is an empty array. If the `Obj` name is given, the default value is all eligible display properties.

- `Sections` — Group sections as an array of section objects. If the `Obj` name is given, the default value is the default section for the `Obj`.

5-101

matlab.system.display.SectionGroup(Obj,...) creates a section group for the specified System object (Obj) and sets the following property values:

- TitleSource — Set to 'Auto'.
- Sections — Set to matlab.system.display.Section object for Obj.

You can use mfilename('class') from within this method to get the name of the System object. If you set any Name-Value pairs, those property values override the default settings.

Examples

Define Block Dialog Tabs

Define in your class definition file two tabs, each containing specific properties. For this example, you use the matlab.system.display.SectionGroup, matlab.system.display.Section, and getPropertyGroupsImpl methods.

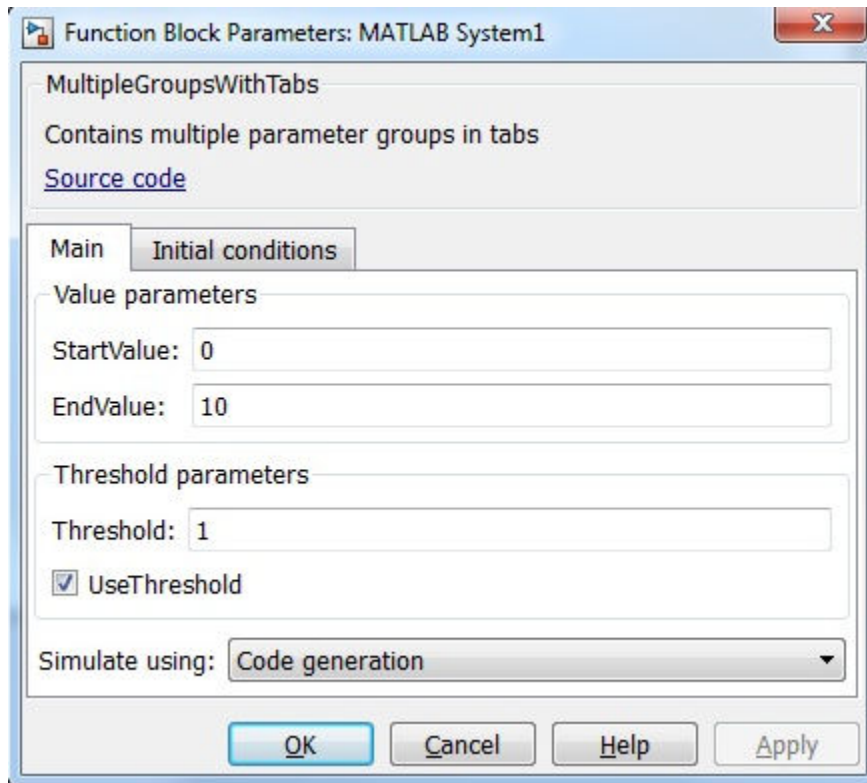
```
methods (Static, Access = protected)
    function groups = getPropertyGroupsImpl
        valueGroup = matlab.system.display.Section(...
            'Title','Value parameters',...
            'PropertyList',{'StartValue','EndValue'});

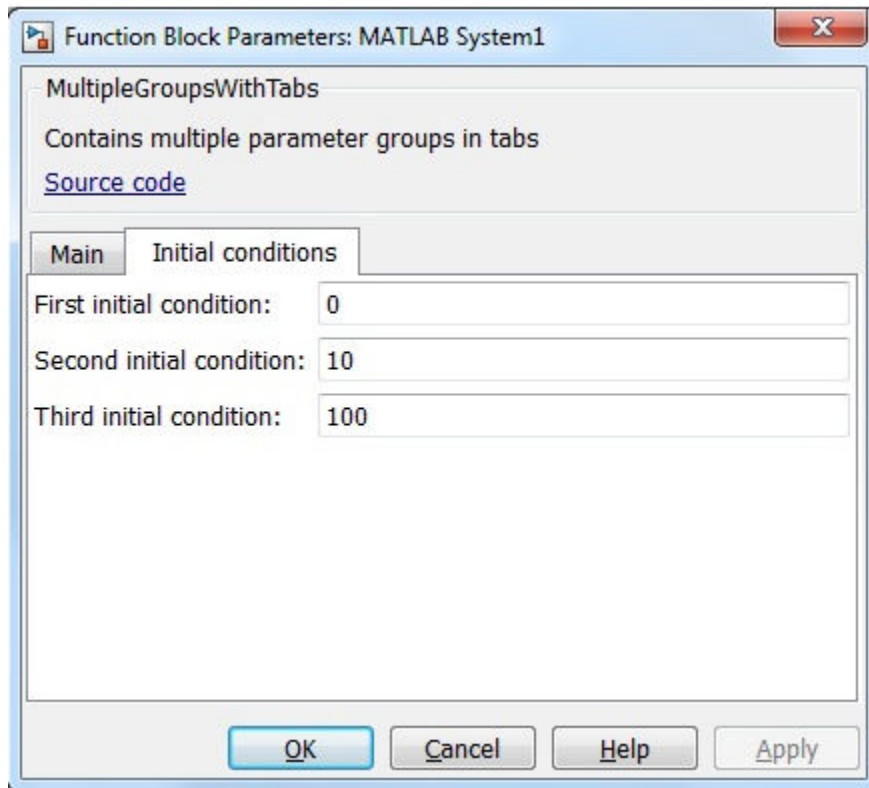
        thresholdGroup = matlab.system.display.Section(...
            'Title','Threshold parameters',...
            'PropertyList',{'Threshold','UseThreshold'});

        mainGroup = matlab.system.display.SectionGroup(...
            'Title','Main', ...
            'Sections',[valueGroup,thresholdGroup]);

        initGroup = matlab.system.display.SectionGroup(...
            'Title','Initial conditions', ...
            'PropertyList',{'IC1','IC2','IC3'});

        groups = [mainGroup,initGroup];
    end
end
```

The resulting dialog appears as follows when you add the object to Simulink with the MATLAB System block.




- "Add Property Groups to System Object and MATLAB System Block"

"Add Property Groups to System Object and MATLAB System Block"

matlab.system.display.Icon class

Package: matlab.system.display

Custom icon image

Syntax

```
icon = matlab.system.display.Icon(imageFile)
```

Description

`icon = matlab.system.display.Icon(imageFile)` sets the `imageFile` image as the MATLAB System block icon. To set the icon image, use the `icon` output argument from `getIconImpl`.

Input Arguments

`imageFile` — Image file
character array

Image file to display on the block icon, specified as a character array. If the image is not on the path, use the full path to your image file.

The image file must be in a file format supported for block masks. See "Draw Static Icon".

Example: `"image.png"`

Examples

Add Image to MATLAB System Block

Define an image in your class definition file.

```
methods(Access = protected)
    function icon = getIconImpl(~)
        % Define icon for MATLAB System block
        icon = matlab.system.display.Icon("my_icon.png");
    end
end
```

The image now appears on the MATLAB System block icon.

Introduced in R2017a

matlab.system.mixin.Propagates class

Package: matlab.system.mixin

Signal characteristics propagation mixin class

Description

`matlab.system.mixin.Propagates` specifies the output size, data type, and complexity of a System object. Use this mixin class and its methods when you will include your System object in Simulink via the MATLAB System block. This mixin is called by the MATLAB System block during Simulink model compilation.

Implement the methods of this class when Simulink cannot infer the output specifications directly from the inputs or when you want bus support. If you do not include this mixin, Simulink cannot propagate the output or bus data type, an error occurs.

To use this mixin, subclass from this `matlab.system.mixin.Propagates` in addition to subclassing from the `matlab.System` base class. Type the following syntax as the first line of your class definition file. `ObjectName` is the name of your System object.

```
classdef ObjectName < matlab.System &...
    matlab.system.mixin.Propagates
```

Methods

getDiscreteStateSpecificationImpl

	Discrete state size, data type, and complexity
getOutputDataTypeImpl	Data types of output ports
getOutputSizeImpl	Sizes of output ports
isOutputComplexImpl	Complexity of output ports
isOutputFixedSizeImpl	Fixed- or variable-size output ports
propagatedInputComplexity	Complexity of input during Simulink propagation
propagatedInputDataType	Data type of input during Simulink propagation
propagatedInputFixedSize	Fixed-size status of input during Simulink propagation
propagatedInputSize	Size of input during Simulink propagation

Note If your System object has exactly one input and one output and no discrete property states, or if you do not need bus support, you do not have to implement any of these methods. The `matlab.system.mixin.Propagates` provides default values in these cases.

getDiscreteStateSpecificationImpl

Class: matlab.system.mixin.Propagates
Package: matlab.system.mixin

Discrete state size, data type, and complexity

Syntax

```
[sz,dt,cp] = getDiscreteStateSpecificationImpl(obj,propertyname)
```

Description

`[sz,dt,cp] = getDiscreteStateSpecificationImpl(obj,propertyname)` returns the size, data type, and complexity of the discrete state property. This property must be a discrete state property. You must define this method if your System object has discrete state properties and is used in the MATLAB System block.

You always set the `getDiscreteStateSpecificationImpl` method access to `protected` because it is an internal method that users do not directly call or run.

`getDiscreteStateSpecificationImpl` is called by the MATLAB System block during Simulink model compilation.

Note You must set `Access = protected` for this method.

You cannot modify any properties in this method.

Input Arguments

obj

System object handle

propertyname

Name of discrete state property of the System object

Output Arguments

sz

Vector containing the length of each dimension of the property.

Default: [1 1]

dt

Data type of the property. For built-in data types, dt is a character vector. For fixed-point data types, dt is a numerictype object.

Default: double

cp

Complexity of the property as a scalar, logical value:

- true = complex
- false = real

Default: false

Examples

Specify Discrete State Property Size, Data Type, and Complexity

Specify in your class definition file the size, data type, and complexity of a discrete state property.

```
methods (Access = protected)
   function [sz,dt,cp] = getDiscreteStateSpecificationImpl(~,name)
      sz = [1 1];
      dt = "double";
```

```
      cp = false;
   end
end
```

• "Set Discrete State Output Specification"

See Also

`matlab.system.mixin.Propagates`

Topics

"Set Discrete State Output Specification"

getOutputDataTypeImpl

Class: matlab.system.mixin.Propagates
Package: matlab.system.mixin

Data types of output ports

Syntax

```
[dt_1,dt_2,...,dt_n] = getOutputDataTypeImpl(obj)
```

Description

`[dt_1,dt_2,...,dt_n] = getOutputDataTypeImpl(obj)` returns the data type of each output port as a character vector for built-in data types or as a numeric object for fixed-point data types. The number of outputs must match the value returned from the `getNumOutputs` method or the number of output arguments listed in the `stepImpl` method.

For System objects with one input and one output and where you want the input and output data types to be the same, you do not need to implement this method. In this case, `getOutputDataTypeImpl` assumes the input and output data types are the same and returns the data type of the input.

If your System object has more than one input or output, and you subclass from `matlab.system.mixin.Propagates`, you must set the output data types in the `getOutputDataTypeImpl` method. For Simulink, if the input and output data types are different, you might have to cast the output value to the data type of the appropriate `dt_n` output argument. You specify this casting in the `stepImpl` method. For bus output, you must specify the name of the output bus in `getOutputDataTypeImpl`.

If needed to determine the output data type, you can use `propagatedInputDataType` within the `getOutputDataTypeImpl` method to obtain the input type.

Note You must set `Access = protected` for this method.

You cannot modify any properties in this method.

If you are debugging your code and examine the data types before Simulink completes propagation, you might see outputs with empty, [ ], data types. This occurs because Simulink has not completed setting the output data types.

Input Arguments

obj

System object

Output Arguments

dt_1,dt_2,...

Data type of the property. For built-in data types, dt is a character vector. For fixed-point data types, dt is a numerictype object.

Examples

Specify Output Data Type

Specify, in your class definition file how to control the output data type from a MATLAB System block. This example shows how to use the getOutputDataTypeImpl method to change the output data type from single to double, or propagate the input as a double. It also shows how to cast the data type to change the output data type in the stepImpl method.

```
classdef DataTypeChange < matlab.System & ...
  matlab.system.mixin.Propagates

  properties(Nontunable)
    Quantize = false
  end

  methods(Access = protected)
    function y = stepImpl(obj,u)
      if obj.Quantize == true
```

```matlab
            % Cast for output data type to differ from input.
            y = single(u);
        else
            % Propagate output data type.
            y = u;
        end
    end

    function out = getOutputDataTypeImpl(obj)
        if obj.Quantize == true
            out = "single";
        else
            out = propagatedInputDataType(obj,1);
        end
    end
    end
end
```

Specify Bus Output

Specify, in your class definition file, that the System object data type is a bus. You must also include a property to specify the bus name.

```matlab
properties(Nontunable)
    OutputBusName = "myBus";
end

methods (Access = protected)
    function out = getOutputDataTypeImpl(obj)
        out = obj.OutputBusName;
    end
end
```

- "Set Output Data Type"

See Also

`matlab.system.mixin.Propagates` | `propagatedInputDataType`

Topics
"Set Output Data Type"

getOutputSizeImpl

Class: matlab.system.mixin.Propagates
Package: matlab.system.mixin

Sizes of output ports

Syntax

```
[sz_1,sz_2,...,sz_n] = getOutputSizeImpl(obj)
```

Description

`[sz_1,sz_2,...,sz_n] = getOutputSizeImpl(obj)` returns the size of each output port. The number of outputs must match the value returned from the `getNumOutputs` method or the number of output arguments listed in the `stepImpl` method.

If your System object has only one input and one output and you want the input and output sizes to be the same, you do not need to implement this method. In this case `getOutputSizeImpl` assumes that the input and output sizes are the same and returns the size of the input. For variable-size inputs in MATLAB, the size varies each time you run your object. For variable-size inputs in Simulink, the output size is the maximum input size.

You must implement the `getOutputSizeImpl` method to define the output size, if:

- Your System object has more than one input or output
- You need the output and input sizes to be different.

  If the output size differs from the input size, you must also use the `propagatedInputSize` method

During Simulink model compilation and propagation, the MATLAB System block calls the `getOutputSizeImpl` method to determine the output size.

All inputs default to variable-size inputs For these inputs, the output size is the maximum input size.

Note You must set `Access = protected` for this method.

In this method, you cannot modify any properties.

Input Arguments

obj

System object handle

Output Arguments

sz_1,sz_2,...

Vector containing the size of each output port.

Examples

Specify Output Size

Specify in your class definition file the size of a System object output.

```
methods (Access = protected)
   function sz_1 = getOutputSizeImpl(obj)
      sz_1 = [1 1];
   end
end
```

Specify Multiple Output Ports

Specify in your class definition file the sizes of multiple System object outputs.

```
methods (Access = protected)
   function [sz_1,sz_2] = getOutputSizeImpl(obj)
      sz_1 = propagatedInputSize(obj,1);
      sz_2 = [1 1];
   end
end
```

Specify Output When Using Propagated Input Size

Specify in your class definition file the size of System object output when it depends on the propagated input size.

```
methods (Access = protected)
   function varargout = getOutputSizeImpl(obj)
      varargout{1} = propagatedInputSize(obj,1);
      if obj.HasSecondOutput
         varargout{2} = [1 1];
      end
   end
end
```

- "Set Output Size"

See Also
matlab.system.mixin.Propagates | propagatedInputSize

Topics
"Set Output Size"

isOutputComplexImpl

Class: matlab.system.mixin.Propagates
Package: matlab.system.mixin

Complexity of output ports

Syntax

```
[cp_1,cp_2,...,cp_n] = isOutputComplexImpl(obj)
```

Description

`[cp_1,cp_2,...,cp_n] = isOutputComplexImpl(obj)` returns whether each output port has complex data. The number of outputs must match the value returned from the `getNumOutputs` method or the number of output arguments listed in the `stepImpl` method.

For System objects with one input and one output and where you want the input and output complexities to be the same, you do not need to implement this method. In this case `isOutputComplexImpl` assumes the input and output complexities are the same and returns the complexity of the input.

If your System object has more than one input or output or you need the output and input complexities to be different, you must implement the `isOutputComplexImpl` method to define the output complexity. You also must use the `propagatedInputComplexity` method if the output complexity differs from the input complexity.

During Simulink model compilation and propagation, the MATLAB System block calls the `isOutputComplex` method, which then calls the `isOutputComplexImpl` method to determine the output complexity.

Note You must set `Access = protected` for this method.

You cannot modify any properties in this method.

Input Arguments

obj

System object handle

Output Arguments

cp_1,cp_2,...

Logical, scalar value indicating whether the specific output port is complex (`true`) or real (`false`).

Examples

Specify Output as Real-Valued

Specify in your class definition file that the output from a System object is a real value.

```
methods (Access = protected)
   function c1 = isOutputComplexImpl(obj)
       c1 = false;
   end
end
```

Class: matlab.system.mixin.Propagates
Package: matlab.system.mixin

Fixed- or variable-size output ports

Syntax

```
[flag_1,flag_2,...flag_n] = isOutputFixedSizeImpl(obj)
```

Description

`[flag_1,flag_2,...flag_n] = isOutputFixedSizeImpl(obj)` returns whether each output port is fixed size. The number of outputs must match the value returned from the `getNumOutputs` method, which is the number of output arguments listed in the `stepImpl` method.

For System objects with one input and one output and where you want the input and output fixed sizes to be the same, you do not need to implement this method. In this case `isOutputFixedSizeImpl` assumes the input and output fixed sizes are the same and returns the fixed size of the input.

If your System object has more than one input or output or you need the output and input fixed sizes to be different, you must implement the `isOutputFixedSizeImpl` method to define the output fixed size. You also must use the `propagatedInputFixedSize` method if the output fixed size status differs from the input fixed size status.

During Simulink model compilation and propagation, the MATLAB System block calls the `isOutputFixedSize` method, which then calls the `isOutputFixedSizeImpl` method to determine the output fixed size.

All inputs default to variable-size inputs For these inputs, the output size is the maximum input size.

Note You must set `Access = protected` for this method.

You cannot modify any properties in this method.

Input Arguments

obj

System object handle

Output Arguments

flag_1,flag2,...

Logical, scalar value indicating whether the specific output port is fixed size (`true`) or variable size (`false`).

Examples

Specify Output as Fixed Size

Specify in your class definition file that the output from a System object is of fixed size.

```
methods (Access = protected)
   function c1 = isOutputFixedSizeImpl(obj)
      c1 = true;
   end
end
```

propagatedInputComplexity

Class: matlab.system.mixin.Propagates
Package: matlab.system.mixin

Complexity of input during Simulink propagation

Syntax

```
flag = propagatedInputComplexity(obj,index)
```

Description

`flag = propagatedInputComplexity(obj,index)` returns `true` or `false` to indicate whether the input argument for the indicated System object is complex. `index` specifies the input for which to return the complexity flag.

You can use `propagatedInputComplexity` only from within the `isOutputComplexImpl` method in your class definition file. Use `isOutputComplexImpl` when:

- Your System object has more than one input or output.
- The input complexity determines the output complexity.
- The output complexity must differ from the input complexity.

Input Arguments

obj

System object

index

Index of the specified input. Do not count the `obj` in the `index`. The first input is always `obj`.

5-123

Output Arguments

flag

Complexity of the specified input, returned as `true` or `false`

Examples

Match Input and Output Complexity

Get the complexity of the second input when you run the object and set the output to match it. Assume that the first input has no impact on the output complexity.

```
methods (Access = protected)
   function outcomplx = isOutputComplexImpl(obj)
      outcomplx = propagatedInputComplexity(obj,2);
   end
end
```

"Set Output Complexity"

propagatedInputDataType

Class: matlab.system.mixin.Propagates
Package: matlab.system.mixin

Data type of input during Simulink propagation

Syntax

```
dt = propagatedInputDataType(obj,index)
```

Description

`dt = propagatedInputDataType(obj,index)` returns the data type of an input argument for a System object. `index` specifies the input for which to return the data type.

You can use `propagatedInputDataType` only from within `getOutputDataTypeImpl`. Use `getOutputDataTypeImpl` when:

- Your System object has more than one input or output.
- The input data type status determines the output data type.
- The output data type must differ from the input data type.

Input Arguments

obj

System object

index

Index of the specified input. Do not count the `obj` in the `index`. The first input is always `obj`.

Output Arguments

dt

Data type of the specified input, returned as a character vector for floating-point input or as a numerictype for fixed-point input.

Examples

Match Input and Output Data Type

Get the data type of the second input. If the second input data type is `double`, then the output data type is `int32`. For all other cases, the output data type matches the second input data type. Assume that the first input has no impact on the output.

```
methods (Access = protected)
    function dt = getOutputDataTypeImpl(obj)
        if strcmpi(propagatedInputDataType(obj,2),'double')
            dt = 'int32';
        else
            dt = propagatedInputDataType(obj,2);
        end
    end
end
```

propagatedInputFixedSize

Class: matlab.system.mixin.Propagates
Package: matlab.system.mixin

Fixed-size status of input during Simulink propagation

Syntax

```
flag = propagatedInputFixedSize(obj,index)
```

Description

`flag = propagatedInputFixedSize(obj,index)` returns `true` or `false` to indicate whether an input argument of a System object is fixed size. `index` specifies the input for which to return the fixed-size flag.

You can use `propagatedInputFixedSize` only from within `isOutputFixedSizeImpl`. Use `isOutputFixedSizeImpl` when:

- Your System object has more than one input or output.
- The input fixed-size status determines the output fixed-size status.
- The output fixed-size status must differ from the input fixed-size status.

Input Arguments

obj

System object

index

Index of the specified input. Do not count the `obj` in the `index`. The first input is always `obj`.

5-127

Output Arguments

flag

Fixed-size status of the specified input, returned as `true` or `false`.

Examples

Match Fixed-Size Status of Input and Output

Get the fixed-size status of the third input and set the output to match it. Assume that the first and second inputs have no impact on the output.

```
methods (Access = protected)
   function outtype = isOutputFixedSizeImpl(obj)
      outtype = propagatedInputFixedSize(obj,3)
   end
end
```

• "Set Fixed- or Variable-Size Output"

See Also
`isOutputFixedSizeImpl` | `matlab.system.mixin.Propagates`

Topics
"Set Fixed- or Variable-Size Output"

propagatedInputSize

Class: matlab.system.mixin.Propagates
Package: matlab.system.mixin

Size of input during Simulink propagation

Syntax

```
sz = propagatedInputSize(obj,index)
```

Description

`sz = propagatedInputSize(obj,index)` returns, as a vector, the input size of the specified System object. The`index` specifies the input for which to return the size information. (Do not count the `obj` in the `index`. The first input is always `obj`.)

You can use `propagatedInputSize` only from within the `getOutputSizeImpl` method in your class definition file. Use `getOutputSizeImpl` when:

- Your System object has more than one input or output.
- The input size determines the output size.
- The output size must differ from the input size.

Note For variable-size inputs, the propagated input size from `propagatedInputSize` differs depending on the environment.

- MATLAB — `propagatedInputSize` returns the size of the inputs used when you run the object for the first time.
- Simulink — `propagatedInputSize` returns the upper bound of the input sizes.

Input Arguments

`obj`

System object

`index`

Index of the specified input

Output Arguments

`sz`

Size of the specified input, returned as a vector

Examples

Match Size of Input and Output

Get the size of the second input. If the first dimension of the second input has a size greater than 1, then set the output size to a 1 x 2 vector. For all other cases, the output is a 2 x 1 matrix. Assume that the first input has no impact on the output size.

```
methods (Access = protected)
    function outsz = getOutputSizeImpl(obj)
        sz = propagatedInputSize(obj,2);
        if sz(1) == 1
            outsz = [1,2];
        else
            outsz = [2,1];
        end
    end
end
```

matlab.system.mixin.Nondirect class

Package: matlab.system.mixin

Nondirect feedthrough mixin class

Description

`matlab.system.mixin.Nondirect` is a class that uses the `output` and `update` methods to process nondirect feedthrough data through a System object.

For System objects that use direct feedthrough, the object's input is needed to generate the output at that time. For these direct feedthrough objects, running the System object calculates the output and updates the state values. For nondirect feedthrough, however, the object's output depends only on the internal states at that time. The inputs are used to update the object states. For these objects, calculating the output with `outputImpl` is separated from updating the state values with `updateImpl`. If you use the `matlab.system.mixin.Nondirect` mixin and include the `stepImpl` method in your class definition file, an error occurs. In this case, you must include the `updateImpl` and `outputImpl` methods instead.

The following cases describe when System objects in Simulink use direct or nondirect feedthrough.

- System object supports code generation and does not inherit from the `Propagates` mixin — Simulink automatically infers the direct feedthrough settings from the System object code.

- System object supports code generation and inherits from the `Propagates` mixin — Simulink does not automatically infer the direct feedthrough settings. Instead, it uses the value returned by the `isInputDirectFeedthroughImpl` method.

- System object does not support code generation — Default `isInputDirectFeedthroughImpl` method returns false, indicating that direct feedthrough is not enabled. To override the default behavior, implement the `isInputDirectFeedthroughImpl` method in your class definition file.

Use the `Nondirect` mixin to allow a System object to be used in a Simulink feedback loop. A delay object is an example of a nondirect feedthrough object.

To use this mixin, you must subclass from this class in addition to subclassing from the `matlab.System` base class. Type the following syntax as the first line of your class definition file, where `ObjectName` is the name of your object:

```
classdef ObjectName < matlab.system & matlab.system.mixin.Nondirect
```

Methods

isInputDirectFeedthroughImpl	Direct feedthrough status of input
outputImpl	Output calculation from input or internal state of System object
updateImpl	Update object states based on inputs

See Also

`matlab.System`

Topics

"Use Update and Output for Nondirect Feedthrough"

isInputDirectFeedthroughImpl

Class: matlab.system.mixin.Nondirect
Package: matlab.system.mixin

Direct feedthrough status of input

Syntax

```
[flag1,...,flagN] = isInputDirectFeedthroughImpl(obj,u1,u2,...,uN)
```

Description

`[flag1,...,flagN] = isInputDirectFeedthroughImpl(obj,u1,u2,...,uN)` specifies whether each input is a direct feedthrough input. If direct feedthrough is `true`, the output depends on the input at each time instant.

Note You must set `Access = protected` for this method.

You cannot modify any properties or implement or access tunable properties in this method.

If you do not include the `isInputDirectFeedthroughImpl` method in your System object class definition file, all inputs are assumed to be direct feedthrough.

The following cases describe when System objects in Simulink code generation use direct or nondirect feedthrough.

• System object supports code generation and does not inherit from the `Propagates` mixin — Simulink automatically infers the direct feedthrough settings from the System object code.

• System object supports code generation and inherits from the `Propagates` mixin — Simulink does not automatically infer the direct feedthrough settings. Instead, it uses the value returned by the `isInputDirectFeedthroughImpl` method.

- System object does not support code generation — Default `isInputDirectFeedthroughImpl` method returns false, indicating that direct feedthrough is not enabled. To override the default behavior, implement the `isInputDirectFeedthroughImpl` method in your class definition file.

`isInputDirectFeedthroughImpl` is called by the MATLAB System block.

Input Arguments

obj

System object handle

u1,u2,...,uN

Specifications of the inputs to the algorithm.

Output Arguments

flag1,...,flagN

Logical value or either `true` or `false`. This value indicates whether the corresponding input is direct feedthrough or not, respectively. The number of outputs must match the number of outputs returned by the `getNumOutputs` method.

Examples

Specify Input as Nondirect Feedthrough

Use `isInputDirectFeedthroughImpl` in your class definition file to mark the inputs as nondirect feedthrough.

```
methods (Access = protected)
   function flag = isInputDirectFeedthroughImpl(obj,input1)
      flag = false;
```

```
    end
end
```

`matlab.system.mixin.Nondirect`

Topics

"Use Update and Output for Nondirect Feedthrough"

outputImpl

Class: matlab.system.mixin.Nondirect
Package: matlab.system.mixin

Output calculation from input or internal state of System object

Syntax

```
[y1,y2,...,yN] = outputImpl(obj,u1,u2,...,uN)
```

Description

`[y1,y2,...,yN] = outputImpl(obj,u1,u2,...,uN)` specifies the algorithm to output the System object states. . The output values are calculated from the states and property values. Any inputs that you set to nondirect feedthrough are ignored during output calculation.

`outputImpl` is called by the `output` method. It is also called before the `updateImpl` method. For sink objects, calling `updateImpl` before `outputImpl` locks the object. For all other types of objects, calling `updateImpl` before `outputImpl` causes an error.

Note You must set `Access = protected` for this method.

You cannot modify any tunable properties in this method if its System object will be used in the Simulink MATLAB System block.

Input Arguments

obj

System object handle

u1,u2,...uN

Inputs from the algorithm. The number of inputs must match the number of inputs returned by the `getNumInputs` method. Nondirect feedthrough inputs are ignored during normal execution of the System object. However, for code generation, you must provide these inputs even if they are empty.

Output Arguments

y1,y2,...yN

Outputs calculated from the specified algorithm. The number of outputs must match the number of outputs returned by the `getNumOutputs` method.

Examples

Set Up Output that Does Not Depend on Input

Specify in your class definition file that the output does not directly depend on the current input with the `outputImpl` method. `PreviousInput` is a property of the `obj`.

```
methods (Access = protected)
   function [y] = outputImpl(obj, ~)
      y = obj.PreviousInput(end);
   end
end
```

• "Use Update and Output for Nondirect Feedthrough"

See Also
matlab.system.mixin.Nondirect | matlab.system.mixin.Propagates

Topics
"Use Update and Output for Nondirect Feedthrough"

updateImpl

Class: matlab.system.mixin.Nondirect
Package: matlab.system.mixin

Update object states based on inputs

Syntax

```
updateImpl(obj,u1,u2,...,uN)
```

Description

updateImpl(obj,u1,u2,...,uN) specifies the algorithm to update the System object states. You use this method when your algorithm outputs depend only on the object's internal state and internal properties. Do not use this method to update the outputs from the inputs.

updateImpl is called by the update method and after the outputImpl method. For sink objects, calling updateImpl before outputImpl locks the object. For all other types of objects, calling updateImpl before outputImpl causes an error.

Note You must set Access = protected for this method.

You cannot modify any tunable properties in this method if its System object will be used in the Simulink MATLAB System block.

Input Arguments

obj

System object handle

u1,u2,...uN

Inputs to the algorithm. The number of inputs must match the number of inputs returned by the getNumInputs method.

Examples

Set Up Output that Does Not Depend on Current Input

Update the object with previous inputs. Use updateImpl in your class definition file. This example saves the u input and shifts the previous inputs.

```
methods (Access = protected)
   function updateImpl(obj,u)
      obj.PreviousInput = [u obj.PreviousInput(1:end-1)];
   end
end
```

matlab.system.mixin.SampleTime class

Control sample time for System objects in Simulink

Description

`matlab.system.mixin.SampleTime` specifies the sample time specifications for a System object when it is included in a MATLAB System block. Inherit from this mixin class and its methods to control the sample time of your System object in Simulink, via the MATLAB System block.

With this mixin, you can:

- Specify the sample time type
- Specify the sample time
- Customize the sample time with offsets and tick times
- Get the current simulation time

System objects that inherit from this mixin class must also inherit from `matlab.System`. For example:

`classdef *MySystemObject* < matlab.System & matlab.system.mixin.SampleTime`

Methods

getSampleTimeImpl	Specify sample time type, offset time, and sample time
getSampleTime	Query sample time
getCurrentTime	Current simulation time in MATLAB System block
createSampleTime	Create sample time specification object
setNumTicksUntilNextHit	Set the number of ticks in Simulink sample time

Blocks
MATLAB System

Topics
"Specify Sample Time for MATLAB System Block System Objects"

Introduced in R2017b

getSampleTimeImpl

Class: matlab.system.mixin.SampleTime

Specify sample time type, offset time, and sample time

Syntax

```
sts = getSampleTimeImpl(obj)
```

Description

`sts = getSampleTimeImpl(obj)` returns the sample time specification created within the method body, `sts`, for the System object `obj`. Specify the sample time specification within the body of `getSampleTimeImpl` by calling `createSampleTime`. The sample time specification affects the simulation time when the System object is included in a MATLAB System block.

This method is called during setup by `setupImpl`.

Input Arguments

obj — System object
system object

System object for which you want to specify the sample time.

Output Arguments

sts — Sample time specification object
sample time specification object

An object defining the sample time specification values. You create this object with the `createSampleTime` function.

Examples

Specify Inherited Sample Time

Specify that the MATLAB System block should inherit the sample from upstream blocks.

```
function sts = getSampleTimeImpl(obj)
    sts = createSampleTime(obj,'Type','Inherited');
end
```

Specify Discrete Sample Time

Specify a discrete sample time for the MATLAB System block.

```
function sts = getSampleTimeImpl(obj)
    sts = createSampleTime(obj,'Type','Discrete',...
      'SampleTime',10.2,'OffsetTime',0.5);
end
```

"Specify Sample Time for MATLAB System Block System Objects"

Introduced in R2017b

getSampleTime

Class: matlab.system.mixin.SampleTime

Query sample time

Syntax

```
sts = getSampleTime(obj)
```

Description

`sts = getSampleTime(obj)` returns the sample time specification for theSystem object `obj` when the System object is included in a MATLAB System block. You can call `getSampleTime` in the `stepImpl` method to change the algorithm based on the sample time.

Before sample time has propagated throughout the MATLAB System block model, `getSampleTime` returns the `getSampleTimeImpl` sample time specification. If your system object does not override `getSampleTimeImpl`, the default `Inherited` sample time specification is returned.

After sample time has propagated, `getSampleTime` returns the sample time specification populated with the actual MATLAB System block sample time type, sample time, and offset time.

Input Arguments

obj — System object
system object

System object included in a MATLAB System block that you want to query.

Output Arguments

sts — Sample time specification object
sample time specification object

The sample time specification for the System object. For more details about sample time specification objects, see `createSampleTime`.

Examples

Return Sample Time

This example of `stepImpl` returns a count value `y`, the current simulation time `ct`, and the sample time `st`. The sample time is obtained by calling `getSampleTime`.

```
function [y,ct,st] = stepImpl(obj,u)
    y = obj.Count + u;
    obj.Count = y;
    ct = getCurrentTime(obj);
    sts = getSampleTime(obj);
    st = sts.SampleTime;
end
```

For a complete class definition, see "Specify Sample Time for MATLAB System Block System Objects".

Topics

"Specify Sample Time for MATLAB System Block System Objects"

Introduced in R2017b

getCurrentTime

Class: matlab.system.mixin.SampleTime

Current simulation time in MATLAB System block

Syntax

```
t = getCurrentTime(obj)
```

Description

`t = getCurrentTime(obj)` returns the current simulation time in the MATLAB System block. Call this method in the `stepImpl` method of your System object.

Input Arguments

obj — System object
system object

System object included in a MATLAB System block that you want to query.

Output Arguments

t — Current simulation time
double

The current simulation time of the MATLAB System block that contains the System object.

Examples

Return Current Simulation Time

This example of `stepImpl` returns a count value y and the current simulation time ct. The simulation time is obtained by calling `getCurrentTime`.

```
function [y,ct] = stepImpl(obj,u)
  y = obj.Count + u;
  obj.Count = y;
  ct = getCurrentTime(obj);
end
```

For a complete class definition, see "Specify Sample Time for MATLAB System Block System Objects".

• "Specify Sample Time for MATLAB System Block System Objects"

See Also

createSampleTime | getSampleTime | getSampleTimeImpl | matlab.system.mixin.SampleTime

Topics

"Specify Sample Time for MATLAB System Block System Objects"

Introduced in R2017b

createSampleTime

Class: matlab.system.mixin.SampleTime

Create sample time specification object

Syntax

```
sts = createSampleTime(obj)
sts = createSampleTime(obj,'Type',Type)
sts = createSampleTime(obj,'Type',Type,Name,Value)
```

Description

`sts = createSampleTime(obj)` creates a sample time specification object for inherited sample time for the System object `obj`. Use this sample time specification object in the `getSampleTimeImpl` method of your System object. The sample time specification affects the simulation time when the System object is included in a MATLAB System block.

`sts = createSampleTime(obj,'Type',Type)` creates a sample time specification object with the specified sample time type.

`sts = createSampleTime(obj,'Type',Type,Name,Value)` creates a sample time specification object with additional options specified by one or more `Name,Value` pair arguments. `Name` is a property name and `Value` is the corresponding value. `Name` must appear inside single quotes (`''`). You can specify several name-value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Input Arguments

obj — System object
system object

System object that you want to specify the sample time.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (`' '`). You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: `'Type','Fixed In Minor Step'`

Type — Sample time type
`'Inherited'` (default) | `'Controllable'` | `'Discrete'` | `'Fixed In Minor Step'`

Type of sample time you want the System object to use in Simulink. For descriptions of the different types of sample times, see:

- `'Inherited'` - "Inherited Sample Time"
- `'Controllable'` - "Controllable Sample Time"
- `'Discrete'` - "Discrete Sample Time"
- `'Fixed In Minor Step'` - "Fixed-in-Minor-Step"

Example: `createSampleTime('Type','Fixed In Minor Step')`

Disallow — Disallow controllable sample time
`'Controllable'`

Optional for `Inherited` sample time only.

When the sample time type is set to `Inherited`, this option disallows inherited controllable sample time. Use this option if your System object depends on having constant time between each sample-time hit.

If controllable sample time is propagated to the System object, discrete sample time is used instead with the same tick time as the propagated controllable sample time.

Example:
`createSampleTime('Type','Inherited','Disallow','Controllable')`

SampleTime — Time between samples
1 (default) | positive number

For `Discrete` sample time only.

Specify the time between sample hits in Simulink.

Data Types: `single` | `double`

Example: `createSampleTime('Type','Discrete','SampleTime',1)`

`OffsetTime` — Offset from sample time
`0` (default) | nonnegative number less than `SampleTime`

For `Discrete` sample time only.

Specify the offset time for the sample hit. The offset is a time interval indicating an update delay. The block is updated later in the sample interval than other blocks operating at the same sample rate.

The offset time must be nonnegative and less than `SampleTime`.

Data Types: `single` | `double`

Example: `createSampleTime('Type','Discrete','SampleTime', 2,'OffsetTime',1)`

`TickTime` — Time between sample time hits
-1 (default) | positive scalar

Required for `Controllable` sample time only.

Specify the time between controllable sample time hits. The tick time must be a positive scalar.

Data Types: `single` | `double`

Example:
`createSampleTime('Type','Controllable','TickTime',obj.TickTime)`

Output Arguments

`sts` — Sample time specification object
sample time specification object

The sample time specification object. This object has the following properties:

- Type — Type of sample time

- SampleTime — Time between samples
- OffsetTime — Offset from sample time

Use this object as the return value of `getSampleTimeImpl`.

Examples

Create Inherited Sample Time Specification Objects

Specify that the MATLAB System block inherits the sample from upstream blocks. Inherited sample time is the default, so no additional arguments are needed.

```
function sts = getSampleTimeImpl(obj)
    sts = createSampleTime(obj);
end
```

Create Discrete Sample Time Object

Specify a discrete sample time specification for the MATLAB System block, including offset time and the sample time.

```
function sts = getSampleTimeImpl(obj)
    sts = createSampleTime(obj,'Type','Discrete',...
       'SampleTime',10.2,'OffsetTime',0.5);
end
```

Topics
"Specify Sample Time for MATLAB System Block System Objects"

Introduced in R2017b

setNumTicksUntilNextHit

Class: matlab.system.mixin.SampleTime

Set the number of ticks in Simulink sample time

Syntax

setNumTicksUntilNextHit(obj,ticks)

Description

setNumTicksUntilNextHit(obj,ticks) sets the number of ticks in Simulink sample time to wait until the next call to stepImpl, or outputImpl/updateImpl. To use this method, set your System object to controllable sample time with createSampleTime('Type','Controllable'). Otherwise, your System object gives a compilation error.

You can only call this method from stepImpl, outputImpl, updateImpl, or resetImpl.

Input Arguments

obj — System object
system object

System object that you want to specify the sample time.

ticks — Number of ticks in Simulink sample time
positive integer scalar

Number of ticks in Simulink sample time to wait until the next call to stepImpl or outputImpl/updateImpl. Specify this number as a positive integer scalar less than intmax('uint64').

The number of sample time ticks to wait until the next hit is persistent. If you don't update this number, Simulink uses the previously set value of number of ticks to wait.

ModelAdvisor.Preferences class

Package: ModelAdvisor

Set Model Advisor window preferences by specifying which folders and tabs to display

Description

Use instances of this class to set Model Advisor preferences.

Construction

The constructor `ModelAdvisor.Preferences` creates an instance of this class with default property values.

Create an instance `modelPreferences` of the `ModelAdvisor.Preferences` class.

```
modelPreferences = ModelAdvisor.Preferences;
```

Properties

`DeselectByProduct` — Deselect the By Product folder
(default) | `true`

Selection of the **By Product** folder in the Model Advisor window. The default value is `true`.

Example: `true`

Data Types: `logical`

`ShowAccordion` — Display advisors
(default) | `true`

Display of the **Code Generation Advisor**, **Upgrade Advisor**, and **Performance Advisor** in the Model Advisor window. You can use these advisors to help configure your model for code generation, upgrade your model for the current release, or improve performance.

Example: `true`

Data Types: `logical`

ShowByProduct — Display the By Product folder
(default) | `true`

Display of the **By Product** folder in the Model Advisor window. The default value is `true`.

Example: `true`

Data Types: `logical`

ShowByTask — Display the By Task folder
(default) | `true`

Display of the **By Task** folder in the Model Advisor window. The default value is `true`.

Example: `true`

Data Types: `logical`

ShowExclusionsInRpt — Include exclusions in report
(default) | `true`

Include exclusions in the Model Advisor report. The default value is `true`.

Example: `true`

Data Types: `logical`

ShowExclusionTab — Display the Exclusions tab
(default) | `false`

Display of the **Exclusions** tab in the Model Advisor window. The default value is `false`. When you click the **Exclusions** tab, the Model Advisor window displays checks that are excluded form the Model Advisor analysis.

Example: `true`

Data Types: `logical`

ShowSourceTab — Display the Source tab
(default) | `false`

Display of the **Source** tab in the Model Advisor window. The default value is `false`. When you click the **Source** tab, the Model Advisor window displays the check Title, TitleID, and location of the MATLAB source code for the check.

Example: `true`

Data Types: `logical`

Examples

Turn Off Display Of By Product Folder

This example shows how to not display the **By Product** folder in the Model Advisor window:

```
mp = ModelAdvisor.Preferences;
mp.load;
mp.ShowByProduct = false;
mp.save
```

Alternatives

You can set the Model Advisor preferences by using the Model Advisor Preferences dialog box:

- On the Model Advisor menu, select **Settings** > **Preferences**.
- From the Model Editor, select **Analysis** > **Model Advisor** > **Preferences**.

"Run Model Checks"

Introduced in R2014b

Simulink.AliasType

Create alias for signal and parameter data type

Description

Use a `Simulink.AliasType` to create an alias of a built-in data type such as `int8`.

The name of the object is the alias. The data type to which an alias refers, such as `int8`, is the base type.

You create the object in the base workspace or a data dictionary. To use the alias, you use the name of the object to set data types for signals, states, and parameters in a model.

Using aliases to specify signal and parameter data types can greatly simplify global changes to the data types that a model specifies. In particular, changing the data type of all signals, states, and parameters whose data type is specified by an alias requires changing only the base type of the alias. By contrast, changing the data types of signals, states, and parameters whose data types are specified by an actual type name requires respecifying the data type of each signal and parameter individually.

You can use objects of this class to create an alias for Simulink built-in data types, fixed-point data types, enumerated data types, `Simulink.NumericType` objects, and other `Simulink.AliasType` objects. The code that you generate from a model (Simulink Coder) uses the alias only if you use an ERT-based system target file (Embedded Coder).

Alternatively, to define and name a numeric data type, you can use an object of the class `Simulink.NumericType`.

Creation

You can use either the Model Explorer or MATLAB commands to create a data type alias.

To use the Model Explorer to create an alias:

1   On the Model Explorer **Model Hierarchy** pane, select `Base Workspace`.

You must create data type aliases in the MATLAB workspace or in a data dictionary. If you attempt to create an alias in a model workspace, Simulink software displays an error.

2   From the Model Explorer **Add** menu, select **Simulink.AliasType**.

Simulink software creates an instance of a `Simulink.AliasType` object and assigns it to a variable named `Alias` in the MATLAB workspace.

3   Rename the variable to a more appropriate name, for example, a name that reflects its intended usage.

To change the name, edit the name displayed in the **Name** field on the Model Explorer **Contents** pane.

4   On the Model Explorer **Dialog** pane, in the **Base type** field, enter the name of the data type that this alias represents.

You can specify the name of any existing standard or user-defined data type in this field. Skip this step if the base type is `double` (the default).

To generate `Simulink.AliasType` objects that correspond to `typedef` statements in your external C code, consider using the `Simulink.importExternalCTypes` function.

To create a data type alias programmatically, use the `Simulink.AliasType` function described below.

Syntax

```
aliasObj = Simulink.AliasType
aliasObj = Simulink.AliasType(baseType)
```

Description

`aliasObj = Simulink.AliasType` returns a `Simulink.AliasType` object with default property values.

`aliasObj = Simulink.AliasType(baseType)` returns a `Simulink.AliasType` object and initializes the value of the `BaseType` property by using `baseType`.

Properties

For information about properties in the property dialog box of a `Simulink.AliasType` object, see "Simulink.AliasType Property Dialog Box".

BaseType — Name of base data type
`'double'` (default) | character vector

Name of the base data type that this alias renames, specified as a character vector. You can specify the name of a stanard data type, such as `int8`, or the name of a custom data type, such as the name of another `Simulink.AliasType` object or the name of an enumeration.

To specify a fixed-point data type, you can use a call to the `fixdt` function, such as `'fixdt(0,16,7)'`.

You can, with one exception, specify a nonstandard data type, e.g., a data type defined by a `Simulink.NumericType` object, by specifying the data type name. The exception is a `Simulink.NumericType` whose `DataTypeMode` is `Fixed-point: unspecified scaling`.

Note `Fixed-point: unspecified scaling` is a partially specified type whose definition is completed by the block that uses the `Simulink.NumericType`. Forbidding its use in alias types avoids creating aliases that have different base types depending on where they are used.

Corresponds to **Base type** in the property dialog box.

Example: `'int8'`

Example: `'myOtherAlias'`

Data Types: `char`

DataScope — Specification to generate or import type definition in the generated code
`'Auto'` (default) | `'Exported'` | `'Imported'`

Specification to generate or import the type definition (`typedef`) in the generated code (Simulink Coder), specified as `'Auto'`, `'Exported`, or `'Imported'`.

The table shows the effect of each option.

Value	Action
`'Auto'` (default)	If no value is specified for `HeaderFile`, export the type definition to *model*_types.h, where *model* is the model name. If you have an Embedded Coder license, and you have specified a data type replacement, then export the type definition to `rtwtypes.h`. If a value is specified for `HeaderFile`, import the data type definition from the specified header file.
`'Exported'`	Export the data type definition to a header file, which can be specified in the `HeaderFile` property. If no value is specified for `HeaderFile`, the header file name defaults to *type*.h. *type* is the data type name.
`'Imported'`	Import the data type definition from a header file, which can be specified in the `HeaderFile` property. If no value is specified for `HeaderFile`, the header file name defaults to *type*.h. *type* is the data type name.

For more information, see "Control File Placement of Custom Data Types" (Embedded Coder).

Corresponds to **Data scope** in the property dialog box.

Description — Custom description of data type alias
`''` (empty character vector) (default) | character vector

Custom description of the data type alias, specified as a character vector.

Corresponds to **Description** in the property dialog box.

Example: `'This type alias corresponds to a floating-point implementation.'`

Data Types: `char`

HeaderFile — Name of header file that contains type definition in the generated code
`''` (empty character vector) (default) | character vector

Name of the header file that contains the type definition (`typedef`) in the generated code, specified as a character vector.

If this property is specified, the specified name is used during code generation for importing or exporting. If this property is empty, the value defaults to *type*.h if `DataScope` equals `'Imported'` or `'Exported'`, or defaults to *model*_types.h if `DataScope` equals `'Auto'`.

By default, the generated `#include` directive uses the preprocessor delimiter `"` instead of `<` and `>`. To generate the directive `#include <myTypes.h>`, specify `HeaderFile` as `'<myTypes.h>'`.

For more information, see "Control File Placement of Custom Data Types" (Embedded Coder).

Corresponds to **Header file** in the property dialog box.

Example: `'myHdr.h'`

Example: `'myHdr'`

Example: `'myHdr.hpp'`

Data Types: `char`

Examples

Create Alias for Enumerated Data Type

To create an alias for an enumerated type called `SlDemoSign`:

```
myEnumAlias = Simulink.AliasType('Enum: SlDemoSign');
```

Create Alias for Fixed-Point Data Type

To create an alias for a fixed-point data type by using a `Simulink.AliasType` object, set the `BaseType` property of the object by using a call to the `fixdt` function. Because the value of `BaseType` must be a character vector, wrap the function call in a character vector.

For example, this code creates an alias for an unsigned fixed-point data type with word length 16 and fraction length 7.

```
myFixptAlias = Simulink.AliasType;
myFixptAlias.BaseType = 'fixdt(0,16,7)';
```

Simulink.Annotation

Specify properties of model annotation

Description

Instances of this class specify the properties of annotations. You can use `getCallbackAnnotation` in an annotation callback function to get the `Simulink.Annotation` instance for the annotation associated with the callback function. You can use `find_system` and `get_param` to get the `Simulink.Annotation` instance associated with any annotation in a model. For example, this code gets the annotation object for the first annotation in the currently selected model and turns on its drop shadow

```
ah = find_system(gcs,'FindAll','on','type','annotation');
ao = get_param(ah(1),'Object');
ao.DropShadow = 'on';
```

Children

None.

Property Summary

Property	Description	Values
AnnotationType	Type of annotation—text (note), area, or image. This property is read only.	note_annotation | area_annotation | image_annotation

Property	Description	Values
BackgroundColor	Background color of this annotation.	RGB value array | [r,g,b,a] where r, g, b, and a are the red, green, blue, and alpha values of the color normalized to the range 0.0 to 1.0, delineated with commas. The alpha value is optional and ignored. Annotation background color can also be 'black', 'white', 'red', 'green', 'blue', 'cyan', 'magenta', 'yellow', 'gray', 'lightBlue', 'orange', 'darkGreen'.
ClickFcn	Specifies MATLAB code to execute when you click this annotation. See "Associate a Click Function with an Annotation" for more information.	character vector
DeleteFcn	MATLAB code to execute before deleting this annotation. See "Annotation Callback Functions".	character vector
Description	Description of this annotation.	character vector
DropShadow	Turn drop shadow display on or off.	'on' | {'off'}
FixedHeight	Specify whether the bottom border of the annotation resizes as you add content	'on' | {'off'}, where 'off' means that the bottom border resizes as you add content
FixedWidth	Specify whether to use word wrap or to have the width of the annotation expand to accommodate text	'on' | {'off'}, where 'off' means to use word wrap

Property	Description	Values
FontAngle	Angle of the annotation font. The default value, `'auto'`, uses of the default font angle specified for lines in the Font Styles dialog box.	`'normal'` | `'italic'` | `'oblique'` | `{'auto'}`
FontName	Name of annotation font. The default value, `'auto'`, uses the default font specified for lines in the Font Styles dialog box.	character vector
FontSize	Size of annotation font in points. The default value, `-1`, uses the default text size for lines specified in the Font Styles dialog box.	decimal number | `{'-1'}`
FontWeight	Weight of the annotation font. The default value, `'auto'`, use of the default weight for lines specified in the Font Styles dialog box.	`'light'` | `'normal'` | `'demi'` | `'bold'` | `{'auto'}`
ForegroundColor	Foreground color of this annotation.	RGB value array | `[r,g,b,a]` where r, g, b, and a are the red, green, blue, and alpha values of the color normalized to the range 0.0 to 1.0, delineated with commas. The alpha value is optional and ignored. Annotation background color can also be `'black'`, `'white'`, `'red'`, `'green'`, `'blue'`, `'cyan'`, `'magenta'`, `'yellow'`, `'gray'`, `'lightBlue'`, `'orange'`, `'darkGreen'`.
Handle	Annotation handle.	real
HiliteAncestors	For internal use.	
Horizontal-Alignment	Horizontal alignment of this annotation.	`'center'` | `{'left'}`|`'right'`

Property	Description	Values
`Interpreter`	Specifies whether the annotation is interpreted as rich or contains LaTex commands	`'rich' | 'tex' | {'off'}`
`IsImage`	Specifies whether the annotation is an image-only annotation.	`'on' | {'off'}`
`InternalMargins`	Space from the bounding box of text to the borders of the annotation.	1x4 array `[left top right bottom]`. The default is `[1 1 1 1]`. The maximum value for a coordinate is 32767.
`LoadFcn`	MATLAB code to execute when the model containing this annotation is loaded. See "Annotation Callback Functions".	character vector
`Name`	Text of annotation. Same as `Text`.	character vector
`Parent`	Parent name of annotation object.	character vector
`Path`	Path to the annotation.	character vector
`PlainText`	Read-only display of the text in the annotation, without formatting	vector
`Position`	Location of the annotation	1x4 array `[left top right bottom]`. The maximum value for a coordinate is 32767.
`RequirementInfo`	For internal use.	character vector
`Selected`	Specifies whether this annotation is currently selected.	`'on' | 'off'`
`Tag`	Text to assign to the annotation `Tag` parameter and save with the annotation.	character vector
`TeXMode`	Specifies whether to render TeX markup.	`'on' | {'off'}`

Property	Description	Values
`Text`	Text of annotation. Same as `Name`.	character vector
`Type`	Annotation type. This is always `'annotation'`.	`'annotation'`
`UseDisplayText-AsClickCallback`	Specifies whether to use the contents of the `Text` property as the click function for this annotation. If set to `'on'`, the text of the annotation is interpreted as a valid MATLAB expression and run. If set to `'off'`, clicking the annotation runs the click function, if there is one. If there is no click function, clicking the annotation has no effect. See "Associate a Click Function with an Annotation" for more information.	`'on'` | `{'off'}`
`UserData`	Any data that you want to associate with this annotation.	vector
`VerticalAlignment`	Vertical alignment of this annotation.	`'middle'` | `{'top'}`|`'cap'`|`'baseline'`|`'bottom'`

Method Summary

Method	Description
`delete`	Delete this annotation from the Simulink model.
`dialog`	Display the Annotation properties dialog box.
`disp`	Display the property names and their settings for this Annotation object.
`fitToView`	Zoom in on this annotation and highlight it in the model.

Method	Description
get	Return the specified property settings for this annotation.
help	Display a list of properties for this Annotation object with short descriptions.
methods	Display all nonglobal methods of this Annotation object.
set	Set the specified property of this Annotation object with the specified value.
setImage	Set the annotation contents to the specified image file. The resulting annotation is an image-only annotation.
struct	Return and display a MATLAB structure containing the property settings of this Annotation object.
view	Display this annotation in the Simulink Editor with this annotation highlighted.

Introduced before R2006a

Simulink.BlockCompDworkData

Provide postcompilation information about block's DWork vector

Description

Simulink software returns an instance of this class when a MATLAB program, e.g., a Level-2 MATLAB S-function, invokes the "Dwork" on page 5-410 method of a block's run-time object after the model containing the block has been compiled.

Parent

`Simulink.BlockData`

Children

None

Property Summary

Name	Description
"Usage" on page 5-171	Usage type of this DWork vector.
"UsedAsDiscState" on page 5-171	True if this DWork vector is being used to store the values of a block's discrete states.

Properties

Usage

Returns a character vector indicating how this DWork vector is used. Permissible values are:

• DWork
• DState
• Scratch
• Mode

character vector

`RW` for MATLAB S-function blocks, `RO` for other blocks.

UsedAsDiscState

True if this DWork vector is being used to store the values of a block's discrete states.

Boolean

`RW` for MATLAB S-Function blocks, `RO` for other blocks.

Introduced before R2006a

Simulink.BlockCompInputPortData

Provide postcompilation information about block input port

Description

Simulink software returns an instance of this class when a MATLAB program, e.g., a Level-2 MATLAB S-function, invokes the "InputPort" on page 5-411 method of a block's run-time object after the model containing the block has been compiled.

Parent

`Simulink.BlockPortData`

Children

None

Property Summary

Name	Description
"DirectFeedthrough" on page 5-172	True if this port has direct feedthrough.
"Overwritable" on page 5-173	True if this port is overwritable.

Properties

DirectFeedthrough

True if this input port has direct feedthrough.

Boolean

RW for MATLAB S functions, RO for other blocks.

Overwritable

True if this input port is overwritable.

Boolean

RW for MATLAB S functions, RO for other blocks.

Introduced before R2006a

Simulink.BlockCompOutputPortData

Provide postcompilation information about block output port

Description

Simulink software returns an instance of this class when a MATLAB program, e.g., a Level-2 MATLAB S-function, invokes the "OutputPort" on page 5-412 method of a block's run-time object after the model containing the block has been compiled.

Parent

`Simulink.BlockPortData`

Children

None

Property Summary

Name	Description
"Reusable" on page 5-195	Specifies whether an output port's memory is reusable.

Properties

Reusable

Specifies whether an output port's memory is reusable. Options are: `NotReusableAndGlobal` and `ReusableAndLocal`.

character vector

`RW` for MATLAB S functions, `RO` for other blocks.

Introduced before R2006a

Simulink.BlockData

Provide run-time information about block-related data, such as block parameters

Description

This class defines properties that are common to objects that provide run-time information about a block's ports and work vectors.

Parent

None

Children

Simulink.BlockPortData, Simulink.BlockCompDworkData

Property Summary

Name	Description
"AliasedThroughDataType" on page 5-177	Fundamental base data type.
"AliasedThroughDataTypeID" on page 5-178	Fundamental base data type ID.
"Complexity" on page 5-178	Numeric type (real or complex) of the block data.
"Data" on page 5-178	The block data.
"DataAsDouble" on page 5-178	The block data in double form.
"Datatype" on page 5-179	Data type of the block data.
"DatatypeID" on page 5-179	Index of the data type of the block data.

Name	Description
"Dimensions" on page 5-180	Dimensions of the block data.
"Name" on page 5-180	Name of the block data.
"Type" on page 5-180	Type of block data (e.g., a parameter).

Properties

AliasedThroughDataType

Data type aliases allow a data type (B) to be recursively aliased to another alias type or `BaseType` (A). If alias type A is aliased to another alias type that is aliased to another alias type and so forth, this property allows the alias type to be iteratively searched (aliased through) until the type is no longer an alias type and that final result is the value of the property returned. For example, assume that you have created the Simulink Alias types A and B as follows:

```
A=Simulink.AliasType('double')

A =
Simulink.AliasType
    Description: ''
     HeaderFile: ''
        BaseType: 'double'
B=Simulink.AliasType('A')

B =
Simulink.AliasType
    Description: ''
     HeaderFile: ''
        BaseType: 'A'
```

If the data type of an item of block data is B, this property returns the base type A instead of B.

character vector

RO

AliasedThroughDataTypeID

Index of the data type alias returned by the `AliasedThroughDataType` property.

integer

RO

Complexity

Numeric type (real or complex) of the block data.

character vector

RW for MATLAB S functions, RO for other blocks.

Data

The block data.

The data type specified by the "Datatype" on page 5-179 or "DatatypeID" on page 5-179 properties of this object.

RW

DataAsDouble

The block data's in `double` form.

double

RO

Datatype

Data type of the values of the block-related object.

character vector

RO

DatatypeID

Index of the data type of the values of the block-related object. enter the numeric value for the desired data type, as follows:

Data Type	Value
`'inherited'`	-1
`'double'`	0
`'single'`	1
`'int8'`	2
`'uint8'`	3
`'int16'`	4
`'uint16'`	5
`'int32'`	6
`'uint32'`	7
`'boolean'` or fixed-point data types	8

integer

RW for MATLAB S functions, RO for other blocks

Dimensions

Dimensions of the block-related object, e.g., parameter or DWork vector.

array

RW for MATLAB S functions, RO for other blocks

Name

Name of block-related object, e.g., a block parameter or DWork vector.

character vector

RW for MATLAB S functions, RO for other blocks

Type

Type of block data. Possible values are:

Type	Description
`'BlockPreCompInputPortData'`	This object contains data for an input port before the model is compiled.
`'BlockPreCompOutputPortData'`	This object contains data for an output port before the model is compiled.
`'BlockCompInputPortData'`	This object contains data for an input port after the model is compiled.
`'BlockCompOutputPortData'`	This object contains data for an output port after the model is compiled.
`'BlockPreCompDworkData'`	This object contains data for a DWork vector before the model is compiled.

Type	Description
`'BlockCompDworkData'`	This object contains data for a DWork vector after the model is compiled.
`'BlockDialogPrmData'`	This object describes a dialog box parameter of a Level-2 MATLAB S-function.
`'BlockRuntimePrmData'`	This object describes a run-time parameter of a Level-2 MATLAB S-function.
`'BlockCompContStatesData'`	This object describes the continuous states of the block at the current time step.
`'BlockDerivativesData'`	This object describes the derivatives of the block's continuous states at the current time step.

character vector

RO

Introduced before R2006a

Simulink.BlockPath

Fully specified Simulink block path

Description

A `Simulink.BlockPath` object represents a fully specified block path that uniquely identifies a block within a model hierarchy, including model reference hierarchies that involve multiple instances of a referenced model. Simulink uses block path objects in a variety of contexts. For example, when you specify normal mode visibility, Simulink uses block path objects to identify the models with Normal mode visibility. For details, see "Normal Mode Visibility".

The `Simulink.BlockPath` class is very similar to the `Simulink.SimulationData.BlockPath` class.

You must have Simulink installed to use the `Simulink.BlockPath` class. However, you do not have to have Simulink installed to use the `Simulink.SimulationData.BlockPath` class. If you have Simulink installed, consider using `Simulink.BlockPath` instead of `Simulink.SimulationData.BlockPath`, because the `Simulink.BlockPath` class includes a method for checking the validity of block path objects without you having to update the model diagram.

Property Summary

Name	Description
`SubPath` on page 5-183	Individual component within the block specified by the block path

Method Summary

Name	Description
`BlockPath` on page 5-183	Create a block path.

Name	Description
convertToCell on page 5-186	Convert a block path to a cell array of character vectors.
getBlock on page 5-187	Get a single block path in the model reference hierarchy.
getLength on page 5-188	Get the length of the block path.
validate on page 5-188	Determine whether the block path represents a valid block hierarchy.

Properties

SubPath

Represents an individual component within the block specified by the block path.

For example, if the block path refers to a Stateflow chart, you can use SubPath to indicate the chart signals. For example:

```
Block Path:
      'sf_car/shift_logic'

    SubPath:
      'gear_state.first'
```

character vector

RW

Methods

BlockPath

Create block path

```
blockpath_object = Simulink.BlockPath()
blockpath_object = Simulink.BlockPath(blockpath)
blockpath_object = Simulink.BlockPath(paths)
blockpath_object = Simulink.BlockPath(paths, subpath)
```

`blockpath`

Block path object that you want to copy.

`paths`

A character vector or cell array of character vectors that Simulink uses to build the block path.

Specify each character vector in order, from the top model to the specific block for which you are creating a block path.

Each character vector must be a path to a block within the Simulink model. The block must be:

- A block in a single model
- A Model block (except for the last character vector, which may be a block other than a Model block)
- A block that is in a model that is referenced by a Model block that is specified in the previous character vector

When you create a block path for specifying Normal mode visibility:

- The first character vector must represent a block that is in the top model in the model reference hierarchy.
- Character vectors must represent Model blocks that are in Normal mode.
- Character vectors that represent variant models or variant subsystems must refer to an active variant.

You can use `gcb` in the cell array to specify the currently selected block.

`subpath`

Character vector that represents an individual component within a block.

`blockpath_object`

Block path that you create.

`blockpath_object = Simulink.BlockPath()` creates an empty block path.

`blockpath_object = Simulink.BlockPath(blockpath)` creates a copy of the block path of the block path object that you specify with the `source_blockpath` argument.

`blockpath = Simulink.BlockPath(paths)` creates a block path from the cell array of character vectors that you specify with the `paths` argument. Each character vector represents a path at a level of model hierarchy. Simulink builds the full block path based on the character vectors.

`blockpath = Simulink.BlockPath(paths, subpath)` creates a block path from the character vector or cell array of character vectors that you specify with the `paths` argument and creates a path for the individual component (for example, a signal) of the block.

Create a block path object called `bp1`, using `gcb` to get the current block.

```
sldemo_mdlref_depgraph
bp1 = Simulink.BlockPath(gcb)
```

The resulting block path is the top-level Model block called `thermostat` (the top-left Model block.

```
bp1 =

  Simulink.BlockPath
  Package: Simulink

  Block Path:
    'sldemo_mdlref_depgraph/thermostat'
```

Create a block path object called `bp2`, using a cell array of character vectors representing elements of the block path.

```
sldemo_mdlref_depgraph
bp2 = Simulink.BlockPath({'sldemo_mdlref_depgraph/thermostat', ...
'sldemo_mdlref_heater/Fahrenheit to Celsius', ...
'sldemo_mdlref_F2C/Gain1'})
```

The resulting block path reflects the model reference hierarchy for the block path

```
bp2 =

  Simulink.BlockPath
  Package: Simulink

  Block Path:
    'sldemo_mdlref_depgraph/thermostat'
      'sldemo_mdlref_heater/Fahrenheit to Celsius'
        'sldemo_mdlref_F2C/Gain1'
```

convertToCell

Convert block path to cell array of character vectors

```
cellarray = Simulink.BlockPath.convertToCell()
```

`cellarray`

Cell array of character vectors representing elements of block path.

`cellarray = Simulink.BlockPath.convertToCell()` converts a block path to a cell array of character vectors.

```
sldemo_mdlref_depgraph
bp2 = Simulink.BlockPath({'sldemo_mdlref_depgraph/thermostat', ...
'sldemo_mdlref_heater/Fahrenheit to Celsius', ...
'sldemo_mdlref_F2C/Gain1'})
cellarray_for_bp2 = bp2.convertToCell()
```

The result is a cell array representing the elements of the block path.

```
cellarray_for_bp2 =

    'sldemo_mdlref_depgraph/thermostat'
    'sldemo_mdlref_heater/Fahrenheit to Celsius'
    'sldemo_mdlref_F2C/Gain1'
```

getBlock

Get block path in model reference hierarchy

```
block = Simulink.BlockPath.getBlock(index)
```

index

 The index of the block for which you want to get the block path. The index reflects the level in the model reference hierarchy. An index of 1 represents a block in the top-level model, an index of 2 represents a block in a model referenced by the block of index 1, and an index of n represents a block that the block with index n-1 references.

block

 The block representing the level in the model reference hierarchy specified by the index argument.

blockpath = Simulink.BlockPath.getBlock(index) returns the block path of the block specified by the index argument.

Get the block for the second level in the model reference hierarchy.

```
sldemo_mdlref_depgraph
bp2 = Simulink.BlockPath({'sldemo_mdlref_depgraph/thermostat', ...
'sldemo_mdlref_heater/Fahrenheit to Celsius', ...
'sldemo_mdlref_F2C/Gain1'})
blockpath = bp2.getBlock(2)
```

The result is the thermostat block, which is at the second level in the block path hierarchy.

```
blockpath =

sldemo_mdlref_heater/Fahrenheit to Celsius
```

getLength

Get length of block path

```
length = Simulink.BlockPath.getLength()
```

```
length
```

> The length of the block path. The length is the number of levels in the model reference hierarchy.

`length = Simulink.BlockPath.getLength()` returns a numeric value that corresponds to the number of levels in the model reference hierarchy for the block path.

Get the length of block path `bp2`.

```
sldemo_mdlref_depgraph
bp2 = Simulink.BlockPath({'sldemo_mdlref_depgraph/thermostat', ...
'sldemo_mdlref_heater/Fahrenheit to Celsius', ...
'sldemo_mdlref_F2C/Gain1'})
length_bp2 = bp2.getLength()
```

The result reflects that the block path has three elements.

```
length_bp2 =

     3
```

validate

Determine whether block path represents valid block hierarchy

```
Simulink.BlockPath.validate()
Simulink.BlockPath.validate(AllowInactiveVariant)
```

`Simulink.BlockPath.validate()` determines whether the block path represents a valid block hierarchy. If there are any validity issues, messages appear in the MATLAB command window. The method checks that:

- All elements in the block path represent valid blocks.
- Each element except for the last element:
    - Is a valid Model block
    - References the model of the next element

Simulink.BlockPortData

Describe block input or output port

Description

This class defines properties that are common to objects that provide run-time information about a block's ports.

Parent

`Simulink.BlockData`

Children

`Simulink.BlockPreCompInputPortData`, `Simulink.BlockPreCompOutputPortData`, `Simulink.BlockCompInputPortData`, `Simulink.BlockCompOutputPortData`

Property Summary

Name	Description
"IsBus" on page 5-191	True if this port is connected to a bus.
"IsSampleHit" on page 5-191	True if this port produces output or accepts input at the current simulation time step.
"SampleTime" on page 5-191	Sample time of this port.
"SampleTimeIndex" on page 5-191	Sample time index of this port.

Properties

IsBus

True if this port is connected to a bus.

Boolean

RO

IsSampleHit

True if this port produces output or accepts input at the current simulation time step.

Boolean

RO

SampleTime

Sample time of this port.

`[period offset]` where `period` and `offset` are values of type `double`. See "Specify Sample Time" for more information.

`RW` for MATLAB S functions, `RO` for other blocks

SampleTimeIndex

Sample time index of this port.

integer

R0

Introduced before R2006a

Simulink.BlockPreCompInputPortData

Provide precompilation information about block input port

Description

Simulink software returns an instance of this class when a MATLAB program, e.g., a Level-2 MATLAB S-function, invokes the "InputPort" on page 5-411 method of a block's run-time object before the model containing the block has been compiled.

Parent

`Simulink.BlockPortData`

Children

None

Property Summary

Name	Description
"DirectFeedthrough" on page 5-194	True if this port has direct feedthrough.
"Overwritable" on page 5-194	True if this port is overwritable.

Properties

DirectFeedthrough

True if this input port has direct feedthrough.

Boolean

RW for MATLAB S functions, RO for other blocks

Overwritable

True if this input port is overwritable.

Boolean

RW for MATLAB S functions, RO for other blocks

Introduced before R2006a

Simulink.BlockPreCompOutputPortData

Provide precompilation information about block output port

Description

Simulink software returns an instance of this class when a MATLAB program, e.g., a Level-2 MATLAB S-function, invokes the "OutputPort" on page 5-412 method of a block's run-time object before the model containing the block has been compiled.

Parent

Simulink.BlockPortData

Children

Property Summary

Name	Description
"Reusable" on page 5-195	Specifies whether an output port's memory is reusable.

Properties

Reusable

Specifies whether an output port's memory is reusable. Options are: NotReusableAndGlobal and ReusableAndLocal.

character vector

`RW` for MATLAB S functions, `RO` for other blocks

Introduced before R2006a

Simulink.Breakpoint class

Package: Simulink

Store and share data for a breakpoint set, configure the data for ASAP2 and AUTOSAR code generation

Description

An object of the `Simulink.Breakpoint` class stores breakpoint set data for a lookup table. You can use that data in one or more Prelookup blocks. With the object, you can specify a data type and code generation settings for the breakpoint set and share the set between multiple lookup tables. Use `Simulink.Breakpoint` objects and `Simulink.LookupTable` objects to configure COM_AXIS code generation for calibration.

The code generated for a `Simulink.Breakpoint` object is an array or a structure with two fields. If you configure the object to appear as a structure, one field stores the specified breakpoint set data and one scalar field stores the number of elements in the breakpoint set data. You can configure the structure type name, the field name, and other characteristics by using the properties of the object.

To package lookup table and breakpoint set data into a single structure in the generated code, for example, for STD_AXIS code generation, use a `Simulink.LookupTable` object to store all of the data. See "Package Shared Breakpoint and Table Data for Lookup Tables".

Construction

`BpSet = Simulink.Breakpoint` returns a `Simulink.Breakpoint` object named `BpSet` with default property values.

To create a `Simulink.Breakpoint` object by using the Model Explorer, use the button

 on the toolbar. The default name for the object is `Object`.

Property Dialog Box

Breakpoints

The breakpoint set information. You can configure these characteristics:

Support tunable size

Specification to enable tuning the effective size of the table in the generated code. If you select this option, in the generated code, the `Simulink.Breakpoint` object appears as a structure variable. The structure has one field to store the breakpoint vector data and one field to store the number of elements in the breakpoint vector. You can change the value of the second field to adjust the effective size of the table.

If you clear this option, the `Simulink.Breakpoint` object appears in the generated code as a separate array variable instead of a structure.

Value

Breakpoint set data. Specify a vector with at least two elements.

You can also use an expression with mathematical operators such as `sin(1:0.5:30)` as long as the expression returns a numeric vector. When you click **Apply** or **OK**, the object executes the expression and uses the result to set the value of this property.

When you set **Data type** to `auto`, to set **Value**, use a typed expression such as `single([1 2 3])` or use the `fi` constructor to embed an `fi` object.

You can edit this data by using a more intuitive interface in a lookup table block. See "Import Lookup Table Data from MATLAB".

Data type

Data type of the breakpoint set. The default setting is `auto`, which means that the breakpoint set acquires a data type from the value that you specify in **Value**. If you use an untyped expression such as `[1 2 3]` to set **Value**, the breakpoint data use the data type `double`. If you specify a typed expression such as `single([1 2 3])` or an `fi` object, the breakpoint data use the data type specified by the expression or object. Enumerated data types are also supported.

You can explicitly specify an integer data type, a floating-point data type, a fixed-point data type, or a data type expression such as the name of a `Simulink.AliasType` object.

For more information about data types in Simulink, see "Data Types Supported by Simulink". To decide how to control the data types of table and breakpoint data in `Simulink.LookupTable` and `Simulink.Breakpoint` objects, see "Control Data Types of Lookup Table Objects" (Simulink Coder).

Dimensions

Dimension lengths of the breakpoint set.

To use symbolic dimensions, specify a character vector. See "Implement Dimension Variants for Array Sizes in Generated Code" (Embedded Coder).

Min

Minimum value of the elements in the breakpoint set. The default value is empty, `[]`. You can specify a numeric, real value.

For more information about how Simulink uses this property, see "Specify Minimum and Maximum Values for Block Parameters".

Max

Maximum value of the elements in the breakpoint set. The default value is empty, `[]`. You can specify a numeric, real value.

For more information about how Simulink uses this property, see "Specify Minimum and Maximum Values for Block Parameters".

5-199

Unit

Physical unit of the elements in the breakpoint set. You can specify text such as `degC`. See "Unit Specification in Simulink Models".

Field name

Name of a structure field in the generated code. This field stores the breakpoint set data. The default value is `BP`. To change the field name, specify text.

This column appears only if you select **Support tunable size**.

Tunable size name

Name of a structure field in the generated code. This scalar field stores the length of the breakpoint set (the number of elements), which the generated code algorithm uses to determine the size of the table. To tune the effective size of the table during code execution, change the value of this structure field in memory. The default name is `N`. To change the field name, specify text.

This column appears only if you select **Support tunable size**.

Description

Description of the breakpoint set. You can specify text such as `This breakpoint set represents the pressure input`.

Data definition: Storage class

Storage class of the structure variable (if you select **Support tunable size**) or array variable in the generated code. The variable stores the breakpoint set data. The default setting is `Auto`.

For more information about storage classes, see "Apply Storage Classes to Individual Signal, State, and Parameter Data Elements" (Simulink Coder).

If you have Embedded Coder, you can choose a custom storage class. For information about custom storage classes, see "Apply Custom Storage Classes to Individual Signal, State, and Parameter Data Elements" (Embedded Coder).

Data definition: Alias

Alternative name for the variable in the generated code. The default value is empty, in which case the generated code uses the name of the `Simulink.Breakpoint` object as the name of the variable. To set the alias, specify text.

To enable this property, set **Data definition: Storage class** to a setting other than `Auto`.

Data definition: Alignment

Data alignment boundary in the generated code. The starting memory address for the data allocated for the structure or array variable is a multiple of the value that you specify. The default value is -1, which allows the code generator to determine an optimal alignment based on usage.

Specify a positive integer that is a power of 2, not exceeding 128. For more information about using data alignment for code replacement, see "Data Alignment for Code Replacement" (Embedded Coder).

Struct Type definition: Name

Name of the structure type that the structure variable uses in the generated code. The default value is empty. Specify text.

This property appears only if you select **Support tunable size**.

Struct Type definition: Data scope

Scope of the structure type definition (imported from your handwritten code or exported from the generated code). The default value is Auto. When you select Auto:

- If you do not specify a value in the **Struct Type definition: Header file** box, the generated code exports the structure type definition to the file *model*_types.h. *model* is the name of the model.

- If you specify a value in the **Struct Type definition: Header file** box, such as myHdr.h, the generated code imports the structure type definition from myHdr.h.

To explicitly specify the data scope:

- To import the structure type definition into the generated code from your custom code, select Imported.

- To export the structure type definition from the generated code, select Exported.

If you do not specify a value in the **Struct Type definition: Header file** box, the generated code imports or exports the type definition from or to *StructName*.h. *StructName* is the name that you specify with the property **Struct Type definition: Name**.

This property appears only if you select **Support tunable size**.

Struct Type definition: Header file

Name of the header file that contains the structure type definition. You can import the definition from a header file that you create, or export the definition into a generated

header file. To control the scope of the structure type, adjust the setting for the **Struct Type definition: Data scope** property.

This property appears only if you select **Support tunable size**.

Properties

Breakpoints — Breakpoint set data
`Simulink.lookuptable.Breakpoint` object

Breakpoint set data, specified as a `Simulink.lookuptable.Breakpoint` object. Use this embedded object to configure the structure field names and characteristics of the breakpoint set data such as breakpoint values, data type, and dimensions.

CoderInfo — Code generation settings for variable
`Simulink.CoderInfo` object

Code generation settings for the structure variable (if you set `SupportTunableSize` to `true`) or array variable (`false`) that stores the breakpoint set data, specified as a `Simulink.CoderInfo` object. You can specify a storage class or custom storage class by using this embedded object. For more information, see `Simulink.CoderInfo`.

StructTypeInfo — Settings for structure type in the generated code
`Simulink.lookuptable.StructTypeInfo` object

Settings for the structure type that the structure variable uses in the generated code, specified as a `Simulink.lookuptable.StructTypeInfo` object.

If you set `SupportTunableSize` to `false`, the `Simulink.Breakpoint` object does not appear in the generated code as a structure. The code generator ignores this property.

SupportTunableSize — Option to generate code that enables tunability of table size
`false` (default) | `true`

Option to generate code that enables tunability of the effective size of the table, specified as `true` or `false`. See the **Support Tunable Size** parameter.

Data Types: `logical`

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Share Breakpoint Data Between One-Dimensional Lookup Tables

1 Create a `Simulink.Breakpoint` object named `myBpSet`.

```
myBpSet = Simulink.Breakpoint
```

2 Specify the breakpoint data.

```
myBpSet.Breakpoints.Value = [-2 -1 0 1 2];
```

3 Create a `Simulink.LookupTable` object named `FirstLUTObj`.

```
FirstLUTObj = Simulink.LookupTable;
```

4 Specify the table data.

```
FirstLUTObj.Table.Value = [1.1 2.2 3.3 4.4 5.5];
```

5 Configure the lookup table object to refer to the breakpoint set object.

```
FirstLUTObj.Breakpoints = {'myBpSet'};
```

6 Create another `Simulink.LookupTable` object to store a different set of table data. Configure the lookup table object to refer to the same breakpoint set object.

```
SecondLUTObj = Simulink.LookupTable;
SecondLUTObj.Table.Value = [1.2 2.3 3.4 4.5 5.6];
SecondLUTObj.Breakpoints = {'myBpSet'};
```

You can use `FirstLUTObj` and `SecondLUTObj` to specify the table data in two different Interpolation Using Prelookup blocks. Use `myBpSet` to specify the breakpoint set data in one or two Prelookup blocks that provide the inputs for the Interpolation Using Prelookup blocks.

Limitations

- You cannot subclass `Simulink.Breakpoint` or `Simulink.LookupTable`. For this reason, you cannot apply custom storage classes other than those in the built-in `Simulink` package.

- You cannot use `Simulink.Breakpoint` objects or `Simulink.LookupTable` objects that refer to `Simulink.Breakpoint` objects as instance-specific parameter data for reusable components. For example, you cannot use one of these objects as:

  - A model argument in a model workspace or a model argument value in a Model block.

  - The value of a mask parameter on a CodeReuse Subsystem block.

  - The value of a mask parameter on a subsystem that you reuse by creating a custom library.

  However, you can use standalone `Simulink.LookupTable` objects, which do not refer to `Simulink.Breakpoint` objects, in these ways.

- You cannot generate code according to the FIX_AXIS style.

- When blocks in a subsystem use `Simulink.LookupTable` or `Simulink.Breakpoint` objects, you cannot set data type override (see "Control Fixed-Point Instrumentation and Data Type Override") only on the subsystem. Instead, set data type override on the entire model.

Simulink.Bus class

Package: Simulink

Specify properties of bus signal

Description

Objects of the `Simulink.Bus` class, used with objects of the `Simulink.BusElement` class, specify the properties of a bus signal. Bus objects validate the properties of bus signals. When you simulate a model or update diagram, Simulink checks whether the buses connected to the blocks have the properties specified by the bus objects. If not, Simulink halts and displays an error message. For a complete list of blocks that support using a bus object as a data type, see "When to Use Bus Objects".

You can use the Simulink Bus editor or MATLAB commands to create and modify bus objects in the base MATLAB workspace. You cannot store a bus object in a model workspace.

When you use the Bus Editor, you create `Simulink.Bus` and `Simulink.BusElement` objects in the base workspace or the associated Simulink data dictionary.

Also, you can use a bus object to specify the attributes of a signal (for example, at the root level of a model or in a Data Store Memory block).

Construction

`busObj = Simulink.Bus` returns a bus object with these property values:

```
Description: ''
  DataScope: 'Auto'
 HeaderFile: ''
  Alignment: -1
    Elements: [0×0 Simulink.BusElement]
```

The name of the bus object is the name of the MATLAB variable to which you assign the bus object. You can set individual properties after you construct the bus object.

Output Arguments

`busObject` — Bus object
Simulink.Bus object

Bus object, returned as a `Simulink.Bus` object.

Properties

`Description` — Bus object description
character vector

Bus object description, specified as a character vector. Use the description to document information about the bus object, such as the kind of signal it applies to or where the bus object is used. This information does not affect Simulink processing.

`Elements` — Bus elements
array of Simulink.BusElement objects

Bus elements, specified as an array of `Simulink.BusElement` objects. Each bus element object defines the name, data type, dimensions, and other properties of the signal within a bus.

`DataScope` — Data type definition mode in generated code
'Auto' (default) | 'Exported' | 'Imported'

Data type definition mode in generated code, specified as `'Auto'`, `'Exported'`, or `'Imported'`. This property specifies whether during code generation the data type definition is imported from, or exported to, the header file specified with the `HeaderFile` property.

Value	Action
`'Auto'` (default)	Import the data type definition from the specified header file. If you do not specify the header file, export the data type definition to the default header file.
`'Exported'`	Export the data type definition to the specified header file or to the default header file.

Value	Action
`'Imported'`	Import the data type definition from the specified header file specified or from the default header file.

HeaderFile — C header file used with data type definition
character vector

C header file used with data type definition, specified as a character vector. The header file is the file to import the data type definition from or export the data type definition to (based on the value of the `DataScope` property. The Simulink Coder software uses this property for code generation. Simulink software ignores this property.

By default, the generated `#include` directive uses the preprocessor delimiter " instead of < and >. To generate the directive `#include <myTypes.h>`, specify `HeaderFile` as `<myTypes.h>`.

Alignment — Data alignment boundary
-1 (default) | integer

Data alignment boundary, specified as an integer, in number of bytes. The Simulink Coder software uses this property for code generation. Simulink software ignores this property.

The starting memory address for the data allocated for the bus is a multiple of the `Alignment` setting. If the object occurs in a context that requires alignment, you must specify an `Alignment` value with a positive integer that is a power of 2, not exceeding 128.

Methods

Method	Purpose
`Simulink.Bus.cellToObject`	Convert cell array containing bus information to bus objects
`Simulink.Bus.createMATLABStruct`	Create MATLAB structures using same hierarchy and attributes as bus signals
`Simulink.Bus.createObject`	Create bus objects from blocks or MATLAB structures
`Simulink.Bus.objectToCell`	Use bus objects to create cell array containing bus information

Method	Purpose
`Simulink.Bus.save`	Save bus objects in MATLAB file

Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects (MATLAB).

Examples

Create Bus Objects and Bus Elements

Create the `CONTROL` bus object and its bus elements. The bus objects are stored in the base workspace.

```
clear elems;
elems(1) = Simulink.BusElement;
elems(1).Name = 'VALVE1';
elems(1).Dimensions = 1;
elems(1).DimensionsMode = 'Fixed';
elems(1).DataType = 'double';
elems(1).SampleTime = -1;
elems(1).Complexity = 'real';

elems(2) = Simulink.BusElement;
elems(2).Name = 'VALVE2';
elems(2).Dimensions = 1;
elems(2).DimensionsMode = 'Fixed';
elems(2).DataType = 'double';
elems(2).SampleTime = -1;
elems(2).Complexity = 'real';

CONTROL = Simulink.Bus;
CONTROL.Elements = elems;
```

This script is similar to the file that you get by saving a bus object to a MATLAB file and choosing the `Object` format.

- "Create Bus Objects Programmatically"

- "Organize Data into Structures in Generated Code" (Simulink Coder)
- "Data Alignment for Code Replacement" (Embedded Coder)
- "Create Bus Objects with the Bus Editor"
- "Save and Import Bus Objects"
- "When to Use Bus Objects"

Alternatives

You can use the Bus Editor to create interactively a bus object and its bus elements. For details, see "Create Bus Objects with the Bus Editor".

Programmatically, you can create bus objects from:

- Blocks in a model
- MATLAB data
- External C code. See `Simulink.importExternalCTypes`.

Simulink.BusElement class

Package: Simulink

Describe element of bus signal

Description

An object of this class specifies the properties of a signal in a bus. Bus element objects validate of the properties of signals in a bus. A `Simulink.Bus` object contains bus elements. A bus element exists only within a bus object. You can specify a bus object, but not a bus element, as a block parameter value. When you simulate a model or update diagram, Simulink checks whether the signals in a bus connected to blocks have the properties specified by the bus elements. If not, Simulink halts and displays an error message.

You can use the Simulink Bus editor (see "Create Bus Objects with the Bus Editor"), or MATLAB commands (see "Create Bus Objects Programmatically") to create and modify bus objects and bus elements in the base MATLAB workspace.

Construction

`busElementName = Simulink.BusElement` returns a bus element with these property values:

```
           Name: 'a'
     Complexity: 'real'
     Dimensions: 1
       DataType: 'double'
            Min: []
            Max: []
 DimensionsMode: 'Fixed'
     SampleTime: -1
           Unit: ''
    Description: ''
```

Output Arguments

busElement — Bus element
Simulink.BusElement object

Bus element, returned as a Simulink.BusElement object.

Properties

Name — Name of bus element
character vector

Name of bus element, specified as a character vector.

Complexity — Numeric type of bus element
'real' (default) | 'complex'

Numeric type of the bus element, specified as 'real' or 'complex'.

Dimensions — Dimensions of bus element
array

Dimensions of bus element, specified as an array.

DataType — Data type of bus element
built-in Simulink data type | a Simulink.NumericType object | a Simulink.Bus object

Data type of bus element, specified as a built-in Simulink data type or
Simulink.NumericType object. Examples of built-in data types include double and
uint8. You can specify a Simulink.NumericType object whose DataTypeMode
property is set to a value other than 'Fixed-point: unspecified scaling'.
Specifying a bus object allows you to create bus objects that specify hierarchical buses
(that is, buses that contain other buses).

Min — Minimum value of bus element
double | []

Minimum value of the bus element, specified as a double. This value must be a finite real
double scalar or, if the element is a bus, the value must be empty, [].

Max — Maximum value of bus element
double | [ ]

Maximum value of the bus element, specified as a double. This value must be a finite real double scalar or, if the element is a bus, the value must be empty, `[]`.

DimensionsMode — How to handle size of bus element
`'Fixed'` (default) | `'Variable'`

How to handle size of bus element, specified as `'Fixed'` or `'Variable'`.

SampleTime — Sample time of bus element
-1 (default) | double

Sample time of bus element, specified as a double. The sample time is the size of the interval between times when this signal value must be recomputed. If these conditions apply, use the default value of -1:

• The bus element is a bus.
• The bus that includes this element passes through a block that changes the bus sample time, such as a Rate Transition block.

Unit — Physical unit for expressing bus element
character vector

Physical unit for expressing bus element, specified as a character vector (for example, `'inches'`).

Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects (MATLAB).

Examples

Create Bus Objects and Bus Elements

Create the `CONTROL` bus object and its bus elements. The bus objects are stored in the base workspace.

```
clear elems;
elems(1) = Simulink.BusElement;
elems(1).Name = 'VALVE1';
elems(1).Dimensions = 1;
elems(1).DimensionsMode = 'Fixed';
elems(1).DataType = 'double';
elems(1).SampleTime = -1;
elems(1).Complexity = 'real';

elems(2) = Simulink.BusElement;
elems(2).Name = 'VALVE2';
elems(2).Dimensions = 1;
elems(2).DimensionsMode = 'Fixed';
elems(2).DataType = 'double';
elems(2).SampleTime = -1;
elems(2).Complexity = 'real';

CONTROL = Simulink.Bus;
CONTROL.Elements = elems;
```

This script is similar to the file that you get by saving a bus object to a MATLAB file and choosing the `Object` format. For information about saving bus objects, see "Save and Import Bus Objects".

- "Create Bus Objects Programmatically"
- "Save and Import Bus Objects"
- "Signal Names and Labels"
- "Specify Sample Time"

Simulink.CoderInfo

Specify information needed to generate code for signal, state, or parameter data

Description

Use a `Simulink.CoderInfo` object to specify code generation settings for signal, state, and parameter data in a model.

Simulink creates a `Simulink.CoderInfo` object for each data object that you create. Data objects represent signal, state, or parameter data. The `Simulink.CoderInfo` object exists in the `CoderInfo` property of each data object.

Data objects include objects of these classes:

- `Simulink.Parameter`
- `Simulink.Signal`
- `Simulink.LookupTable`
- `Simulink.Breakpoint`
- `Simulink.DualScaledParameter`

Use the properties of the `Simulink.CoderInfo` object to configure the representation of the parent data object in the generated code.

You can set the properties of a `Simulink.CoderInfo` object through the `CoderInfo` property or the property dialog box of the parent data object. For example, the following MATLAB expression sets the `StorageClass` property of a `Simulink.CoderInfo` object used by a signal object named `mysignal`.

```
mysignal.CoderInfo.StorageClass = 'ExportedGlobal';
```

Creation

When you create a data object, Simulink sets the value of the `CoderInfo` property by creating a `Simulink.CoderInfo` object. You do not need to create a `Simulink.CoderInfo` object explicitly.

Properties

Alias — Alternative name for code generation
'' (empty character vector) (default) | character vector

Alternative name for the data in the generated code, specified as a character vector.

Example: 'myOtherName'

Data Types: char

Alignment — Data alignment boundary
-1 (default) | positive integer

Data alignment boundary for this data, specified as a positive integer that is a power of 2, not exceeding 128. Specify an integer number of double data type. See "Data Alignment for Code Replacement" (Embedded Coder) for more information.

Example: 8

Data Types: double
Complex Number Support: Yes

CustomAttributes — Custom storage class attributes of this data
SimulinkCSC.AttribClass_Simulink_Default object (default) | custom attributes object

Custom storage class attributes of this data, returned as a custom attributes object. You must set the property StorageClass to 'Custom' to enable this property.

Depending on the custom storage class that you apply by using the CustomStorageClass property of the Simulink.CoderInfo object, Simulink sets the value of this property by creating a custom attributes object. Then, you can set the values of the properties of the custom attributes object. See "Apply Custom Storage Classes to Individual Signal, State, and Parameter Data Elements" (Embedded Coder) for more information.

CustomStorageClass — Custom storage class of this data
'Default' (default) | character vector

Custom storage class of this data, specified as a character vector. You must set the property StorageClass to 'Custom' to enable this property.

For a list of valid custom storage classes (Embedded Coder) when you create the data object from the `Simulink` package, see "Choose a Storage Class for Controlling Data Representation in the Generated Code" (Embedded Coder).

Example: `'ExportToFile'`

Data Types: `char`

StorageClass — Storage class of this data
`'Auto'` (default) | character vector

Storage class of this data, specified as a character vector. For more information, see "Apply Storage Classes to Individual Signal, State, and Parameter Data Elements" (Simulink Coder).

Example: `'ExportedGlobal'`

Data Types: `char`

Examples

Configure Code Generation Settings Programmatically

For examples that show how to configure code generation settings for a data item programmatically, see "Apply Storage Classes to Individual Signal, State, and Parameter Data Elements" (Simulink Coder) and "Apply Custom Storage Classes to Individual Signal, State, and Parameter Data Elements" (Embedded Coder).

*   "Apply Storage Classes to Individual Signal, State, and Parameter Data Elements" (Simulink Coder)

ConfigSet

Model configuration set

Description

Use the `ConfigSet` object to access a model configuration set. Get information about your configuration set, manage configuration parameters, and manage components.

Creation

Use the getActiveConfigSet function to get the active configuration set for a model. Use the getConfigSet function to get a model configuration set by name.

Properties

`Components` — Components of the configuration set
cell array of `Simulink.ConfigComponent` objects

Components of the configuration set, specified by a cell array of `Simulink.ConfigComponent` objects.

`Description` — Description of the configuration set
character vector

Description of the configuration set, specified as a character vector. Use the description to provide additional information about a configuration set, such as its purpose.

`Name` — Name of the configuration set
character vector

Name of the configuration set, specified by a character vector. This name represents the configuration set in the Model Explorer.

Object Functions

attachComponent	Attach a component to a configuration set
copy	Copy a configuration set
getComponent	Get a configuration set component
getFullName	
getModel	
get_param	Get parameter names and values
isActive	
isValidParam	
saveAs	
setPropEnabled	
set_param	Set system and block parameter values

Examples

Get the Active Configuration Set for a Model

This example gets the active configuration set of the currently selected model.

```
hCs - getActiveConfigSet(gcs);
```

Introduced in R2006a

Simulink.ConfigSetRef

Link model to configuration set stored independently of any model

Description

Instances of this handle class allow a model to reference configuration sets that exist outside any model. See "Manage a Configuration Set", "Overview", and "Manage a Configuration Reference" for more information.

Property Summary

Name	Description
"Description" on page 5-222	Description of the configuration reference.
"Name" on page 5-222	Name of the configuration reference.
"SourceName" on page 5-223	Name of the variable in the workspace or the data dictionary that contains the referenced configuration set.

Note You can use the **Configuration Reference** dialog box to set the `Name`, `Description`, and `SourceName` properties of a configuration reference. See "Create and Attach a Configuration Reference" for details.

Method Summary

Name	Description
"copy" on page 5-223	Create a copy of a configuration reference.
"getFullName" on page 5-223	Get the full pathname of a configuration reference.
"getModel" on page 5-224	Get the handle of the model that owns a configuration reference.

Name	Description
"get_param" on page 5-224	Get the value of a configuration set parameter indirectly through a configuration reference.
"getRefConfigSet" on page 5-225	Get the configuration set specified by a configuration reference.
"isActive" on page 5-225	Determine whether a configuration reference is the active configuration object of the model.
"refresh" on page 5-225	Update configuration reference after any change to properties or configuration set availability.

Properties

Description

Description of the configuration reference. You can use this property to provide additional information about a configuration reference, such as its purpose. This field can remain blank.

```
character vector
```

```
RW
```

Name

Name of the configuration reference. This name represents the configuration reference in the GUI.

```
character vector
```

```
RW
```

SourceName

Name of the variable in the workspace or the data dictionary that contains the referenced configuration set.

`character vector`

RW

Methods

copy

Create a copy of this configuration reference.

`copy`

This method creates a copy of this configuration set.

Note You must use this method to create copies of configuration references. This is because `Simulink.ConfigSetRef` is a handle class. See "Handle Versus Value Classes" for more information.

---

getFullName

Get the full pathname of a configuration reference.

`getFullName`

This method returns a character vector specifying the full pathname of a configuration reference, e.g., `'vdp/Configuration'`.

getModel

Get the model that owns this configuration reference.

getModel

Returns a handle to the model that owns this configuration reference.

The following command opens the block diagram of the model that owns the configuration set referenced by the MATLAB workspace variable hCr.

open_system(hCr.getModel);

get_param

Get the value of a configuration set parameter indirectly through a configuration reference.

get_param(*paramName*)

paramName
    Character vector specifying the name of the parameter whose value is to be returned.

This method returns the value of the specified parameter from the configuration set to which the configuration reference points. To obtain this value, the method uses the value of SourceName to retrieve the configuration set, then retrieves the value of *paramName* from that configuration set. Specifying *paramName* as 'ObjectParameters' returns the names of all valid parameters in the configuration set. If a valid configuration set is not attached to the configuration reference, the method returns unreliable values.

The inverse method, set_param, is not defined for configuration references. To obtain a parameter value through a configuration reference, you must first use the getRefConfigSet method to retrieve the configuration set from the reference, then use set_param directly on the configuration set itself.

You can also use the `get_param` model construction command to get the values of parameters of a model's active configuration set, e.g., `get_param(bdroot, 'SolverName')` gets the solver name of the currently selected model.

The following command gets the name of the solver used by the selected model's active configuration.

```
hAcs = getActiveConfigSet(bdroot);
hAcs.get_param('SolverName');
```

getRefConfigSet

Get the configuration set specified by a configuration reference

```
getRefConfigSet
```

Returns a handle to the configuration set specified by the `SourceName` property of a configuration reference.

isActive

Determine whether this configuration set is its model's active configuration set.

```
isActive
```

Returns `true` if this configuration set is the active configuration set of the model that owns this configuration set.

refresh

Update configuration reference after any change to properties or configuration set availability

refresh

Updates a configuration reference after using the API to change any property of the reference, or after providing a configuration set that did not exist at the time the set was originally specified in `SourceName`. If you omit executing `refresh` after any such change, the configuration reference handle will be stale, and using it will give incorrect results.

Introduced in R2007a

Simulink.FindOptions class

Package: Simulink

Options for finding blocks in models and subsystems

Description

Create an options object to use with `Simulink.findBlocks` and
`Simulink.findBlocksOfType` to constrain the search.

Construction

`f = Simulink.FindOptions` creates a `FindOptions` object that uses the default
search options.

`f = Simulink.FindOptions(Option1,Value1,...OptionN,ValueN)` creates the
object using the specified search options.

Input Arguments

`'CaseSensitive'` — Option to specify whether to match case when searching
`true` (default) | `false`

Option to specify whether to match case when searching, specified as `true` for case-
sensitive search or `false` for case-insensitive search.

`'FollowLinks'` — Option to follow library links
`false` (default) | `true`

Option to follow library links, specified as `true` or `false`. If `true`, search follows links
into library blocks.

`'IncludeCommented'` — Option for the search to include commented blocks
`true` (default) | `false`

Option for the search to include commented blocks, specified as `true` or `false`.

5-227

'LookUnderMasks' — Options to search masked blocks
'all' (default) | 'none' | 'functional' | 'graphical'

Options to search masked blocks, specified as:

- 'all' — Search in all masked blocks.
- 'none' — Prevent searching in masked systems.
- 'functional' — Include masked subsystems that do not have dialogs.
- 'graphical' — Include masked subsystems that do not have workspaces or dialogs.

'Variants' — Options to search Variant subsystems
'AllVariants' (default) | 'ActiveVariants' | 'ActivePlusCodeVariants'

Options to search Variant subsystems, specified as:

- 'AllVariants' — Search all variant choices.
- 'ActiveVariants' — Search only active variant choices.
- 'ActivePlusCodeVariants' — Search all variant choices with 'Generate preprocessor conditionals' active. Otherwise, search only the active variant choices.

The 'Variants' search constraint applies only to variant subsystems and model variants.

'RegExp' — Option to treat the search text as a regular expression
false (default) | true

Option to treat the search text as a regular expression, specified as true or false. To learn more about MATLAB regular expressions, see "Regular Expressions" (MATLAB).

'SearchDepth' — Levels in the model to search
positive integer

Levels in the model to search, specified as a positive integer. The default is to search all levels. Specify:

- 1 — Search in the top-level system.
- 2 — Search the top-level system and its children, 3 to search an additional level, and so on.

Examples

Specify Search Options to Use with `Simulink.findBlocks`

Search for all blocks in the Unlocked subsystem but not in any of its children.

```
f = Simulink.FindOptions('SearchDepth',1);
load_system('sldemo_clutch');
bl = Simulink.findBlocks('sldemo_clutch/Unlocked',f)

bl =

   1.0e+03 *

   1.1140
   1.1150
   1.1160
   1.1170
   1.1180
   1.1190
   1.1200
   1.1210
   1.1220
   1.1230
   1.1240
   1.1250
   1.1260
   1.1270
   1.1280
   1.1290
   1.1300
   1.1310
   1.1320
   1.1330
```

To get the block name and path instead of the handle, use `getfullname`.

```
bl = getfullname (Simulink.findBlocks('sldemo_clutch/Unlocked',f))

bl =

  20×1 cell array

    {'sldemo_clutch/Unlocked/Tfmaxk'                         }
```

```
{'sldemo_clutch/Unlocked/Tin'                          }
{'sldemo_clutch/Unlocked/Enable'                       }
{'sldemo_clutch/Unlocked/E_Sum'                        }
{'sldemo_clutch/Unlocked/Engine↵Damping'               }
{'sldemo_clutch/Unlocked/Engine↵Inertia'               }
{'sldemo_clutch/Unlocked/Engine↵Integrator'            }
{'sldemo_clutch/Unlocked/Goto'                         }
{'sldemo_clutch/Unlocked/Goto1'                        }
{'sldemo_clutch/Unlocked/Max↵Dynamic↵Friction↵Torque'}
{'sldemo_clutch/Unlocked/V_Sum'                        }
{'sldemo_clutch/Unlocked/Vehicle↵Damping'              }
{'sldemo_clutch/Unlocked/Vehicle↵Inertia'              }
{'sldemo_clutch/Unlocked/Vehicle↵Integrator'           }
{'sldemo_clutch/Unlocked/W_Slip'                       }
{'sldemo_clutch/Unlocked/slip direction'               }
{'sldemo_clutch/Unlocked/w0'                           }
{'sldemo_clutch/Unlocked/w0 '                          }
{'sldemo_clutch/Unlocked/we'                           }
{'sldemo_clutch/Unlocked/wv'                           }
```

Simulink.GlobalDataTransfer class

Package: Simulink

Configure concurrent execution data transfers

Description

The `Simulink.GlobalDataTransfer` object contains the data transfer information for the concurrent execution of a model. To access the properties of this class, use the `get_param` function to get the handle for this class, and then use dot notation to access the properties. For example:

```
dt=get_param(gcs,'DataTransfer');
dt.DefaultTransitionBetweenContTasks

ans =

Ensure deterministic transfer (minimum delay)
```

Properties

DefaultTransitionBetweenSyncTasks

Global setting for data transfer handling option when the source and destination of a signal are in two different and periodic tasks.

Data Type: Enumeration. Can be one of:

- `'Ensure data integrity only'`
- `'Ensure deterministic transfer (maximum delay)'`
- `'Ensure deterministic transfer (minimum delay)'`

Access: Read/write

DefaultTransitionBetweenContTasks

Global setting for the data transfer handling option for signals that have a continuous sample time.

Data Type: Enumeration. Can be one of:

- `'Ensure data integrity only'`
- `'Ensure deterministic transfer (maximum delay)'`
- `'Ensure deterministic transfer (minimum delay)'`

Access: Read/write

DefaultExtrapolationMethodBetweenContTasks

Global setting for the data transfer extrapolation method for signals that have a continuous sample time.

Data Type: Enumeration. Can be one of:

- `'None'`
- `'Zero Order Hold'`
- `'Linear'`
- `'Quadratic'`

Access: Read/write

AutoInsertRateTranBlk

Setting for whether or not Simulink software automatically inserts hidden Rate Transition blocks between blocks that have different sample rates to ensure the integrity of data transfers between tasks; and optional determinism of data transfers for periodic tasks.

Data Type: Boolean. Can be one of:

- `0`
- `1`

Access: Read/write

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Access the properties of this class.

```
dt=get_param(gcs,'DataTransfer');
dt.DefaultTransitionBetweenContTasks

ans =

Ensure deterministic transfer (minimum delay)
```

Simulink.HMI.InstrumentedSignals class

Package: Simulink.HMI

Access logged signals in model

Description

`Simulink.HMI.InstrumentedSignals` objects contain a list of all logged signals in a model, including signals from all subsystems, library instances, and Stateflow charts. The list does not include signals inside reference models. You can access the list of logged signals in a reference model by creating a `Simulink.HMI.InstrumentedSignals` object for the reference model.

The `Simulink.HMI.InstrumentedSignals` object provides access to `Simulink.HMI.SignalSpecification` objects using the `get` method.

Construction

`instSigs = get_param(model, 'InstrumentedSignals')` returns `instSigs`, a `Simulink.HMI.InstrumentedSignals` object containing a list of all of the logged signals in the model, `model`.

Input Arguments

`model` — Model name
character vector

Model name or full path to model.

Example: `'sldemo_fuelsys'`

Example: `fullpath(matlabroot, 'examples', 'simulink', 'ex_sldemo_absbrake.slx')`

`'InstrumentedSignals'` — Parameter selection
'InstrumentedSignals'

Desired return from `get_param`, specified as a character vector. Using a value of `'InstrumentedSignals'`, `get_param` returns a `Simulink.HMI.InstrumentedSignals` object with a list of all the logged signals.

Example: `'InstrumentedSignals'`

Properties

Model — Model name
character vector

Name of the model the aggregation of logged signals corresponds to.

Example: `'sldemo_fuelsys'`

Count — Number of logged signals
integer

Number of logged signals in the model.

Example: `10`

Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects (MATLAB).

Examples

Evaluate and Modify Logged Signals in Model

This example shows how to obtain the block paths for logged signals and remove the logging badge for a signal using `Simulink.HMI.InstrumentedSignals` and `Simulink.HMI.SignalSpecification` objects.

Get InstrumentedSignals Object

```
% Load the model sldemo_absbrake
load_system('sldemo_absbrake')
```

```
% Get logged signals with Simulink.HMI.InstrumentedSignals object
instSigs = get_param('sldemo_absbrake', 'InstrumentedSignals');

% Check logged signals count
instSigs.Count

ans = uint32
    2
```

Inspect Block Paths with SignalSpecifications Objects

Use the `get` method to get the `Simulink.HMI.SignalSpecification` objects for each of the signals in the `Simulink.HMI.InstrumentedSignals` object

```
% Get Simulink.HMI.SignalSpecification objects
sig1 = instSigs.get(1);
sig2 = instSigs.get(2);

% Inspect block paths for signals
blockPath1 = sig1.BlockPath

blockPath1 =
  Simulink.BlockPath
  Package: Simulink

  Block Path:
    sldemo_absbrake/Bus Creator

  Use the getBlock method to access block path strings from this object.

  Methods

blockPath2 = sig2.BlockPath

blockPath2 =
  Simulink.BlockPath
  Package: Simulink

  Block Path:
    sldemo_absbrake/Relative Slip

  Use the getBlock method to access block path strings from this object.

  Methods
```

Remove Logging Badge for Bus Signal

Remove the logging badge for the signal from the Bus Creator block.

```
% Get block path string and port index for the Bus Creator signal
blockPath_str = blockPath1.getBlock(1);
portIndex = sig1.OutputPortIndex;

% Clear the logging badge for the Bus Creator signal
Simulink.sdi.markSignalForStreaming(blockPath_str, portIndex, 'off')
```

Save and Restore a Set of Logged Signals

This example shows the capability of using the `Simulink.HMI.InstrumentedSignals` object to save a set of logged signals to restore after running a simulation with a different set of signals.

Load Model and Save Initial Configuration

Load the `sldemo_fuelsys` model, and save the initial set of logged signals.

```
% Load model
load_system sldemo_fuelsys

% Get Simulink.HMI.InstrumentedSignals object
initSigs = get_param('sldemo_fuelsys', 'InstrumentedSignals');

% Save logging configuration to file for future use
save initial_instSigs.mat initSigs
```

Remove All Logging Badges

Return to a baseline of no logged signals so you can easily select a different configuration of signals to log.

```
% Clear all logging signals
set_param('sldemo_fuelsys', 'InstrumentedSignals', [])
```

Restore Saved Logging Configuration

After working with a different set of logged signals, you can easily restore a saved configuration with the `Simulink.HMI.InstrumentedSignals` object.

```
% Load the saved configuration
load initial_instSigs.mat
```

5-237

```
% Restore logging configuration
set_param('sldemo_fuelsys', 'InstrumentedSignals', initSigs)
```

Topics
"View Data with the Simulation Data Inspector"
"Tune and Visualize Your Model with Dashboard Blocks"

Introduced in R2015b

Simulink.HMI.SignalSpecification class

Package: Simulink.HMI

Information for logging a signal

Description

The `Simulink.HMI.SignalSpecification` object contains the block path and port index required by `Simulink.sdi.markSignalForStreaming` to turn logging on or off for a signal.

Construction

`sigSpec = instSigs.get(index)` returns the `Simulink.HMI.SignalSpecification` object `sigSpec` for the signal at the specified index in the `Simulink.HMI.InstrumentedSignals` object `instSigs`.

Input Arguments

`index` — Index of signal
integer

Numeric index of the signal within the `Simulink.HMI.InstrumentedSignals` object.

Example: 1

Properties

`BlockPath` — Block path for signal
Simulink.BlockPath object

`Simulink.BlockPath` object with the block path for the signal.

`OutputPortIndex` — Signal index on block port
integer

Index of the signal on the output port of its block. For Stateflow signals, the OutputPortIndex is set to 1.

Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects (MATLAB).

Examples

Evaluate and Modify Logged Signals in Model

This example shows how to obtain the block paths for logged signals and remove the logging badge for a signal using Simulink.HMI.InstrumentedSignals and Simulink.HMI.SignalSpecification objects.

Get InstrumentedSignals Object

```
% Load the model sldemo_absbrake
load_system('sldemo_absbrake')

% Get logged signals with Simulink.HMI.InstrumentedSignals object
instSigs = get_param('sldemo_absbrake', 'InstrumentedSignals');

% Check logged signals count
instSigs.Count

ans = uint32
    2
```

Inspect Block Paths with SignalSpecifications Objects

Use the get method to get the Simulink.HMI.SignalSpecification objects for each of the signals in the Simulink.HMI.InstrumentedSignals object

```
% Get Simulink.HMI.SignalSpecification objects
sig1 = instSigs.get(1);
sig2 = instSigs.get(2);

% Inspect block paths for signals
blockPath1 = sig1.BlockPath
```

```
blockPath1 =
  Simulink.BlockPath
  Package: Simulink

  Block Path:
    sldemo_absbrake/Bus Creator

  Use the getBlock method to access block path strings from this object.

  Methods
```

blockPath2 = sig2.BlockPath

```
blockPath2 =
  Simulink.BlockPath
  Package: Simulink

  Block Path:
    sldemo_absbrake/Relative Slip

  Use the getBlock method to access block path strings from this object.

  Methods
```

Remove Logging Badge for Bus Signal

Remove the logging badge for the signal from the Bus Creator block.

```
% Get block path string and port index for the Bus Creator signal
blockPath_str = blockPath1.getBlock(1);
portIndex = sig1.OutputPortIndex;

% Clear the logging badge for the Bus Creator signal
Simulink.sdi.markSignalForStreaming(blockPath_str, portIndex, 'off')
```

Simulink.LookupTable class

Package: Simulink

Store and share lookup table and breakpoint data, configure the data for ASAP2 and AUTOSAR code generation

Description

An object of the `Simulink.LookupTable` class stores lookup table and breakpoint data. You can use that data in a lookup table block such as the n-D Lookup Table block. With the object, you can specify data types and code generation settings for the table and the breakpoint sets.

When you store all of the table and breakpoint set data in a single `Simulink.LookupTable` object, all of the data appears in a single structure in the generated code. To configure STD_AXIS code generation for calibration, use this technique.

To share a breakpoint set between multiple lookup tables, for example for COM_AXIS code generation, use a `Simulink.Breakpoint` object in one or more Prelookup blocks. Use `Simulink.LookupTable` objects in Interpolation Using Prelookup blocks. Then, configure the lookup table objects to refer to the breakpoint object. For more information, see "Package Shared Breakpoint and Table Data for Lookup Tables".

Construction

`LUTObj = Simulink.LookupTable` returns a `Simulink.LookupTable` object `LUTObj` with default property values.

To create a `Simulink.LookupTable` object by using the Model Explorer, use the button

on the toolbar. The default name for the object is `Object`.

Property Dialog Box

Number of table dimensions

Number of dimensions of the lookup table. Specify an integer value up to 30 (inclusive). For example, to represent a three-dimensional lookup table, specify the integer 3.

Table

Information for the table data. You can configure these characteristics:

Value

Table data. Specify a numeric vector or multidimensional array with at least two elements.

You can also use an expression with mathematical operators such as `sin(1:0.5:30)` as long as the expression returns a numeric vector or multidimensional array. When you click **Apply** or **OK**, the object executes the expression and uses the result to set the value of this property.

When you set **Data type** to `auto`, to set **Value**, use a typed expression such as `single([1 2 3])` or use the `fi` constructor to embed an `fi` object.

When you specify table data with three or more dimensions, **Value** displays the data as an expression that contains a call to the `reshape` function. To edit the values in the data, modify the first argument of the `reshape` call, which contains all of the values in a serialized vector. When you add or remove elements along a dimension, you must also correct the argument that represents the length of the modified dimension.

You can edit this data by using a more intuitive interface in a lookup table block. See "Import Lookup Table Data from MATLAB".

Data type

Data type of the table data. The default setting is `auto`, which means that the table data acquire a data type from the value that you specify in **Value**. If you use an untyped expression such as `[1 2 3]` to set **Value**, the table data use the data type `double`. If you specify a typed expression such as `single([1 2 3])` or an `fi` object, the table data use the data type specified by the expression or object. Enumerated data types are also supported.

You can explicitly specify an integer data type, a floating-point data type, a fixed-point data type, or a data type expression such as the name of a `Simulink.AliasType` object.

For more information about data types in Simulink, see "Data Types Supported by Simulink". To decide how to control the data types of table and breakpoint data in `Simulink.LookupTable` and `Simulink.Breakpoint` objects, see "Control Data Types of Lookup Table Objects" (Simulink Coder).

Dimensions

Dimension lengths of the lookup table data.

To use symbolic dimensions, specify a character vector. See "Implement Dimension Variants for Array Sizes in Generated Code" (Embedded Coder).

Min

Minimum value of the elements in the table data. The default value is empty, [].
You can specify a numeric, real value.

For more information about how Simulink uses this property, see "Specify
Minimum and Maximum Values for Block Parameters".

Max

Maximum value of the elements in the table data. The default value is empty, [].
You can specify a numeric, real value.

For more information about how Simulink uses this property, see "Specify
Minimum and Maximum Values for Block Parameters".

Unit

Physical units of the elements in the lookup table. You can specify text such as
`degC`. See "Unit Specification in Simulink Models".

Field name

Name of a structure field in the generated code. This field stores the table data if
you configure the `Simulink.LookupTable` object to appear in the generated
code as a structure. The default value is `Table`. To change the field name, specify
text.

Description

Description of the lookup table. You can specify text such as `This lookup
table describes the action of a pump`.

Breakpoints

Breakpoint set information. Each row is one breakpoint set. To configure additional
breakpoint sets, specify an integer value in the **Number of table dimensions** box.

For the breakpoint sets, you can configure these characteristics:

Specification

Source for the information of the breakpoint sets, specified as `Explicit values`
(default), `Reference`, or `Even spacing`.

- To store all of the table and breakpoint set data in the
  `Simulink.LookupTable` object, set **Specification** to `Explicit values`.

  The `Simulink.LookupTable` object appears in the generated code as a
  single structure variable.

- To store the table data in the `Simulink.LookupTable` object and store the breakpoint set data in `Simulink.Breakpoint` objects, set **Specification** to `Reference`.

  The `Simulink.LookupTable` object appears in the generated code as a separate array variable that contains the table data. Each `Simulink.Breakpoint` object appears as a separate array or structure variable that contains the breakpoint set data.

- To store the table data and evenly spaced breakpoints in the `Simulink.LookupTable` object, set **Specification** to `Even spacing`. Use the **First point** and **Spacing** parameters to generate a set of evenly spaced breakpoints.

Note When **Specification** is set to `Explicit values` or `Even spacing`, you can change the order of the tunable size, breakpoint, and table entries in a lookup table object-generated structure.

Support tunable size

Specification to enable tuning the effective size of the table in the generated code. In the code, the structure that corresponds to the object has an extra field for each breakpoint vector. Each extra field stores the length of the corresponding breakpoint vector. You can change the value of each field to adjust the effective size of the table.

This property appears only if you set **Specification** to `Explicit values` or `Even spacing`.

Note If you store breakpoint data in `Simulink.Breakpoint` objects by setting **Specification** to `Reference`, to enable tuning of the table size in the generated code, use the **Support tunable size** property of each `Simulink.Breakpoint` object.

Value

Data for the breakpoint set. Specify a numeric vector with at least two elements.

You can also use an expression with mathematical operators such as `sin(1:0.5:30)` as long as the expression returns a numeric vector. When you

click **Apply** or **OK**, the object executes the expression and uses the result to set the value of this property.

When you set **Data type** to `auto`, to set **Value**, use a typed expression such as `single([1 2 3])` or use the `fi` constructor to embed an `fi` object.

You can edit this data by using a more intuitive interface in a lookup table block. See "Import Lookup Table Data from MATLAB".

Data type

Data type of the breakpoint set. The default setting is `auto`, which means that the breakpoint set acquires a data type from the value that you specify in **Value**. If you use an untyped expression such as `[1 2 3]` to set **Value**, the breakpoint data use the data type `double`. If you specify a typed expression such as `single([1 2 3])` or an `fi` object, the breakpoint data use the data type specified by the expression or object.

You can explicitly specify an integer data type, a floating-point data type, a fixed-point data type, or a data type expression such as the name of a `Simulink.AliasType` object.

For more information about data types in Simulink, see "Data Types Supported by Simulink". To decide how to control the data types of table and breakpoint data in `Simulink.LookupTable` and `Simulink.Breakpoint` objects, see "Control Data Types of Lookup Table Objects" (Simulink Coder).

Dimensions

Dimension lengths of the breakpoint set.

To use symbolic dimensions, specify a character vector. See "Implement Dimension Variants for Array Sizes in Generated Code" (Embedded Coder).

Min

Minimum value of the elements in the breakpoint set. The default value is empty, `[]`. You can specify a numeric, real value.

For more information about how Simulink uses this property, see "Specify Minimum and Maximum Values for Block Parameters".

Max

Maximum value of the elements in the breakpoint set. The default value is empty, `[]`. You can specify a numeric, real value.

For more information about how Simulink uses this property, see "Specify Minimum and Maximum Values for Block Parameters".

Unit

Physical unit of the elements in the breakpoint set. You can specify text such as `degF`. See "Unit Specification in Simulink Models".

Field name

Name of a structure field in the generated code. This field stores the breakpoint set data. The default value is `BP1` for the first breakpoint set and `BP2` for the second set. To change the field name, specify text.

Tunable size name

Name of a structure field in the generated code. This field stores the length (number of elements) of the breakpoint set, which the generated code algorithm uses to determine the size of the table. To tune the effective size of the table during code execution, change the value of this structure field in memory. The default name is `N1` for the first breakpoint set and `N2` for the second set. To change the field name, specify text.

This column appears only if you select **Support tunable size**.

Description

Description of the breakpoint set. You can specify text such as `This breakpoint set represents the pressure input`.

First point

First point in evenly spaced breakpoint data. This parameter is available when **Specification** is set to `Even spacing`.

Spacing

Spacing between points in evenly spaced breakpoint data. This parameter is available when **Specification** is set to `Even spacing`.

Name

Name of the `Simulink.Breakpoint` object that stores the information for this breakpoint set.

This column appears only if you set **Specification** to `Reference`.

First point name

Name of the `Simulink.Breakpoint` object that stores the information for the first point. This parameter is available when **Specification** is set to `Even spacing`.

Spacing name

> Name of the `Simulink.Breakpoint` object that stores the information for the spacing. This parameter is available when **Specification** is set to `Even spacing`.

Data definition: Storage class

Storage class of the structure variable (if you set **Specification** to `Explicit values` or `Even spacing`) or array variable (`Reference`) in the generated code. The variable stores the table data and, if the variable is a structure, the breakpoint set data. The default setting is `Auto`.

For more information about storage classes, see "Apply Storage Classes to Individual Signal, State, and Parameter Data Elements" (Simulink Coder).

If you have Embedded Coder, you can choose a custom storage class. For information about custom storage classes, see "Apply Custom Storage Classes to Individual Signal, State, and Parameter Data Elements" (Embedded Coder).

Data definition: Alias

Alternative name for the structure variable (if you set **Specification** to `Explicit values` or `Even spacing`) or array variable (`Reference`) in the generated code. The default value is empty, in which case the generated code uses the name of the `Simulink.LookupTable` object as the name of the structure or array variable. To set the alias, specify text.

To enable this property, set **Data definition: Storage class** to a setting other than `Auto`.

Data definition: Alignment

Data alignment boundary in the generated code. The starting memory address for the data allocated for the structure or array variable is a multiple of the value that you specify. The default value is `-1`, which allows the code generator to determine an optimal alignment based on usage.

Specify a positive integer that is a power of 2, not exceeding 128. For more information about using data alignment for code replacement, see "Data Alignment for Code Replacement" (Embedded Coder).

Struct Type definition: Name

Name of the structure type that the structure variable uses in the generated code. The default value is empty. Specify text.

This property appears only if you set **Specification** to `Explicit values` or `Even spacing`.

Struct Type definition: Data scope

Scope of the structure type definition (imported from your custom code or exported from the generated code). The default value is `Auto`. When you select `Auto`:

- If you do not specify a value in the **Struct Type definition: Header file** box, the generated code exports the structure type definition to the file *model*`_types.h`. *model* is the name of the model.

- If you specify a value in the **Struct Type definition: Header file** box, such as `myHdr.h`, the generated code imports the structure type definition from `myHdr.h`.

To explicitly specify the data scope:

- To import the structure type definition into the generated code from your custom code, select `Imported`.

- To export the structure type definition from the generated code, select `Exported`.

If you do not specify a value in the **Struct Type definition: Header file** box, the generated code imports or exports the type definition from or to *StructName*`.h`. *StructName* is the name that you specify by using the property **Struct Type definition: Name**.

This property appears only if you set **Specification** to `Explicit values` or `Even spacing`.

Struct Type definition: Header file

Name of the header file that contains the structure type definition. You can import the definition from a header file that you create, or export the definition into a generated header file. To control the scope of the structure type, adjust the setting for the **Struct Type definition: Data scope** property.

This property appears only if you set **Specification** to `Explicit values` or `Even spacing`.

Properties

Breakpoints — Breakpoint set information
vector of `Simulink.lookuptable.Breakpoint` objects | cell array of character vectors

Breakpoint set information, specified as a vector of
`Simulink.lookuptable.Breakpoint` objects, a cell array of character vectors, or a
vector of `Simulink.lookuptable.Evenspacing` objects.

If you use a vector of `Simulink.lookuptable.Breakpoint` objects, each object
represents a breakpoint set. Using a vector of `Simulink.lookuptable.Breakpoint`
objects sets the property `BreakpointsSpecification` to `'Explicit values'`.

If you use a cell array of character vectors, each character vector represents the name of
a `Simulink.Breakpoint` object. Using a cell array of character vectors sets the
property `BreakpointsSpecification` to `'Reference'`.

If you use a vector of `Simulink.lookuptable.Evenspacing` objects, each object
represents a breakpoint set. Using a vector of `Simulink.lookuptable.Evenspacing`
objects sets the property `BreakpointsSpecification` to `'Even Spacing'`.

BreakpointsSpecification — Source of breakpoint set information
`'Explicit values'` (default) | `'Reference'` | `'Even spacing'`

Source of the breakpoint set information, specified as `'Explicit values'` (default),
`'Even spacing'`, or `'Reference'`. See the **Breakpoints > Specification** parameter.

Data Types: `char`

CoderInfo — Code generation settings for structure or array variable
`Simulink.CoderInfo` object

Code generation settings for the structure variable (if you set
`BreakpointsSpecification` to `'Explicit values'` or `'Even spacing'`) or array
variable (`'Reference'`) that stores the lookup table and breakpoint sets, specified as a
`Simulink.CoderInfo` object. You can specify a storage class or custom storage class by
using this embedded object. See `Simulink.CoderInfo`.

StructTypeInfo — Settings for structure type in the generated code
`Simulink.lookuptable.StructTypeInfo` object

Settings for the structure type that the structure variable uses in the generated code,
specified as a `Simulink.lookuptable.StructTypeInfo` object.

If you set `BreakpointsSpecification` to `'Reference'`, the
`Simulink.LookupTable` object does not appear in the generated code as a structure.
The code generator ignores this property.

SupportTunableSize — Option to generate code that enables tunability of table size
`false` (default) | `true`

Option to generate code that enables tunability of the effective size of the table, specified as `true` or `false`. See the **Support Tunable Size** parameter.

Data Types: `logical`

Table — Information for table data
`Simulink.lookuptable.Table` object

Information for the table data, specified as a `Simulink.lookuptable.Table` object.

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Represent a One-Dimensional Lookup Table

1   Create a `Simulink.LookupTable` object named `LUTObj`.

    LUTObj = Simulink.LookupTable;

2   Specify the table data.

    LUTObj.Table.Value = [1.1 2.2 3.3 4.4 5.5];

3   Specify the breakpoint set data.

    LUTObj.Breakpoints(1).Value = [-2 -1 0 1 2];

4   Specify a name for the structure type in the generated code.

    LUTObj.StructTypeInfo.Name = 'myLUTStruct';

You can use `LUTObj` in a 1-D Lookup Table block dialog box. In the block, set **Data specification** to `Lookup table object` and **Name** to `LUTObj`.

Represent a Two-Dimensional Lookup Table

1   Create a `Simulink.LookupTable` object named `LUTObj`.

```
LUTObj = Simulink.LookupTable;
```

2   Specify the table data.

```
LUTObj.Table.Value = [1.1 2.2 3.3 4.4 5.5; ...
                      6.6 7.7 8.8 9.9 10.1];
```

3   Specify the breakpoint set data. In the `Breakpoints` property, use the vector index 2 to set the values in the second breakpoint set.

```
LUTObj.Breakpoints(1).Value = [-1 1];

LUTObj.Breakpoints(2).Value = [-2 -1 0 1 2];
```

`LUTObj` creates a `Simulink.lookuptable.Breakpoint` object as the second vector element in the value of the `Breakpoints` property. Except for the `Value` property, the new object has default property values.

4   Specify a name for the structure type in the generated code.

```
LUTObj.StructTypeInfo.Name = 'myLUTStruct';
```

You can use `LUTObj` in a 2-D Lookup Table block dialog box.

Evenly Space Every Second Value Starting from 1

To evenly space every second value starting from 1, use the Breakpoint object.

1   Create a `Simulink.LookupTable` object named `LUTObj`.

```
LUTObj=Simulink.LookupTable

LUTObj =

  LookupTable with properties:

                        Table: [1×1 Simulink.lookuptable.Table]
     BreakpointsSpecification: 'Explicit values'
                  Breakpoints: [1×1 Simulink.lookuptable.Breakpoint]
            SupportTunableSize: 0
```

```
                            CoderInfo: [1×1 Simulink.CoderInfo]
                       StructTypeInfo: [1×1 Simulink.lookuptable.StructTypeInfo]
```

2   Set up the breakpoint property to even spacing.

```
LUTObj.BreakpointsSpecification='Even spacing'
```

```
LUTObj =

  LookupTable with properties:

                        Table: [1×1 Simulink.lookuptable.Table]
    BreakpointsSpecification: 'Even spacing'
                  Breakpoints: [1×1 Simulink.lookuptable.Evenspacing]
           SupportTunableSize: 0
                    CoderInfo: [1×1 Simulink.CoderInfo]
               StructTypeInfo: [1×1 Simulink.lookuptable.StructTypeInfo]
```

3   Get the properties of the breakpoint.

```
LUTObj.Breakpoints(1)
```

```
ans =

  Evenspacing with properties:

          FirstPoint: 0
             Spacing: 1
            DataType: 'auto'
                 Min: []
                 Max: []
                Unit: ''
       FirstPointName: 'BPFirstPoint1'
          SpacingName: 'BPSpacing1'
      TunableSizeName: 'N1'
          Description: ''
```

4   To set the first point property, use the Breakpoint object `FirstPoint` property.

```
LUTObj.Breakpoints(1).FirstPoint=1
```

5   To set the spacing property, use the Breakpoint object.

```
LUTObj.Breakpoints(1).Spacing=2
```

6   Get the properties of the breakpoint.

5-255

```
LUTObj.Breakpoints(1)

ans =

  Evenspacing with properties:

          FirstPoint: 1
             Spacing: 2
            DataType: 'auto'
                 Min: []
                 Max: []
                Unit: ''
       FirstPointName: 'BPFirstPoint1'
         SpacingName: 'BPSpacing1'
     TunableSizeName: 'N1'
         Description: ''
```

Control Code Generation for Lookup Table and Breakpoint Sets

Create a `Simulink.LookupTable` object named `LUTObj`.

```
LUTObj = Simulink.LookupTable;
```

Specify the table data.

```
LUTObj.Table.Value = [1.00 2.25 3.50 4.75 6.00; ...
                      7.25 8.50 9.75 11.00 12.25];
```

Specify the breakpoint set data. In the `Breakpoints` property, use the array index 2 to create an additional `Simulink.lookuptable.BreakpointInfo` object, which represents the second breakpoint set.

```
LUTObj.Breakpoints(1).Value = [-1 1];
```

```
LUTObj.Breakpoints(2).Value = [-2 -1 0 1 2];
```

Specify data types for the lookup table and each breakpoint set.

```
LUTObj.Table.DataType = 'fixdt(1,16,2)';
```

```
LUTObj.Breakpoints(1).DataType = 'int16';
```

```
LUTObj.Breakpoints(2).DataType = 'int16';
```

Specify unique names for the structure fields that store the table data and breakpoint sets in the generated code.

```
LUTObj.Table.FieldName = 'myTable';
```

```
LUTObj.Breakpoints(1).FieldName = 'myBPSet1';
```

```
LUTObj.Breakpoints(2).FieldName = 'myBPSet2';
```

Export the structure variable definition from the generated code by using the storage class `ExportedGlobal`.

```
LUTObj.CoderInfo.StorageClass = 'ExportedGlobal';
```

Name the structure type in the generated code `LUTStructType`. Export the structure type definition to a generated header file named `myLUTHdr.h`.

```
LUTObj.StructTypeInfo.Name = 'LUTStructType';
LUTObj.StructTypeInfo.DataScope = 'Exported';
LUTObj.StructTypeInfo.HeaderFileName = 'myLUTHdr.h';
```

In an n-D Lookup Table block in a model, set **Data specification** to `Lookup table object` and **Name** to `LUTObj`.

```
load_system('myModel_LUTObj')
set_param('myModel_LUTObj/Lookup Table','DataSpecification','Lookup table object',...
    'LookupTableObject','LUTObj')
```

Generate code from the model.

```
rtwbuild('myModel_LUTObj')
```

```
### Starting build procedure for model: myModel_LUTObj
### Successful completion of code generation for model: myModel_LUTObj
```

The generated code defines the structure type `LUTStructType` in the generated header file `myLUTHdr.h`.

```
file = fullfile('myModel_LUTObj_ert_rtw','myLUTHdr.h');
rtwdemodbtype(file,'typedef struct {','} LUTStructType;',1,1)
```

```
typedef struct {
  int16_T myBPSet1[2];
```

```
    int16_T myBPSet2[5];
    int16_T myTable[10];
} LUTStructType;
```

The code uses the global structure variable `LUTObj` to store the table and breakpoint set data. The table data is scaled based on the specified fixed-point data type.

```
file = fullfile('myModel_LUTObj_ert_rtw','myModel_LUTObj.c');
rtwdemodbtype(file,'LUTStructType LUTObj = {','/* Variable: LUTObj',1,1)

LUTStructType LUTObj = {
  { -1, 1 },

  { -2, -1, 0, 1, 2 },

  { 4, 29, 9, 34, 14, 39, 19, 44, 24, 49 }
} ;                                      /* Variable: LUTObj
```

Generate Code That Uses Conditionally Compiled Dimension Lengths

Suppose your handwritten code conditionally allocates memory and initializes a lookup table based on dimension lengths that you specify as `#define` macros. This example shows how to generate code that uses your external table and breakpoint data.

Symbolic dimensions require that you use an ERT-based system target file, which requires Embedded Coder®.

Explore External Code

In your current folder, copy these macro definitions into a header file named `ex_myHdr_LUT.h`.

```
#include "rtwtypes.h"

#ifndef _HEADER_MYHDR_H_
#define _HEADER_MYHDR_H_

#define bp1Len 2
#define bp2Len 2
```

```
typedef struct {
  real_T BP1[bp1Len];
  real_T BP2[bp2Len];
  real_T Table[bp1Len * bp2Len];
} LUTObj_Type;

extern LUTObj_Type LUTObj;

#endif
```

Copy this static initialization code into a source file named ex_mySrc_LUT.c.

```
#include "ex_myHdr_LUT.h"

#if bp1Len == 2 && bp1Len == 2
LUTObj_Type LUTObj = {
  { 1.0, 2.0 },

  { 3.0, 4.0 },

  { 3.0, 2.0, 4.0, 1.0 }
} ;
#endif

#if bp1Len == 3 && bp1Len == 3
LUTObj_Type LUTObj = {
  { 1.0, 2.0, 3.0 },

  { 4.0, 5.0, 6.0 },

  { 1.0, 6.0, 2.0, 3.0, 8.0, 9.0, 5.0, 4.0, 7.0 }
} ;
#endif
```

To generate code that imports this data, create bp1Len and bp2Len as Simulink.Parameter objects in MATLAB. Create LUTObj as a Simulink.LookupTable object. Use the parameter objects to specify the dimension lengths for the table and breakpoint set data in the Simulink.LookupTable object.

Create Example Model

Create the example model ex_LUTObj by using an n-D Lookup Table block. In the Lookup Table block dialog box, on the **Table and Breakpoints** tab, set **Number of table dimensions** to 2.

5-259

```
open_system('ex_LUTObj')
```

Create `Simulink.LookupTable` Object

In the Model Explorer **Model Hierarchy** pane, select **Base Workspace**.

On the toolbar, click the **Add Simulink LookupTable** button. A `Simulink.LookupTable` object named `Object` appears in the base workspace.

In the **Contents** pane (the middle pane), rename the object as `LUTObj`.

Alternatively, create the object at the command prompt:

```
LUTObj = Simulink.LookupTable;
```

Configure `Simulink.LookupTable` Object

In the **Contents** pane, select the new object `LUTObj`. The property dialog box appears in the **Dialog** pane (the right pane).

Set **Number of table dimensions** to 2.

Under **Table**, set **Value** to [3 4; 2 1].

In the first row under **Breakpoints**, set **Value** to [1 2].

In the second row under **Breakpoints**, set **Value** to [3 4]. Click **Apply**.

Under **Struct Type definition**, set **Data scope** to `Imported`. Set **Header file** to `ex_myHdr_LUT.h`. Set **Name** to `LUTObj_Type`.

In the Lookup Table block dialog box, set **Data specification** to `Lookup table object`. Set **Name** to `LUTObj`. Click **Apply**.

Alternatively, to configure the object and the blocks, use these commands:

```
LUTObj.Breakpoints(1).Value = [1 2];
LUTObj.Breakpoints(2).Value = [3 4];
LUTObj.Table.Value = [3 4; 2 1];
LUTObj.StructTypeInfo.DataScope = 'Imported';
LUTObj.StructTypeInfo.HeaderFileName = 'ex_myHdr_LUT.h';
LUTObj.StructTypeInfo.Name = 'LUTObj_Type';
set_param('ex_LUTObj/Lookup Table','LookupTableObject','LUTObj')
set_param('ex_LUTObj/Lookup Table',...
    'DataSpecification','Lookup table object')
```

Enable the code generator to use Simulink.Parameter objects as macros that specify dimension lengths. Select the configuration parameter **Allow symbolic dimension specification**.

```
set_param('ex_LUTObj','AllowSymbolicDim','on')
```

Create the Simulink.Parameter objects that represent the macros bp1Len and bp2Len. To generate code that imports the macros from your header file ex_myHdr_LUT.h, apply the custom storage class ImportedDefine.

```
bp1Len = Simulink.Parameter(2);
bp1Len.Min = 2;
bp1Len.Max = 3;
bp1Len.DataType = 'int32';
bp1Len.CoderInfo.StorageClass = 'Custom';
bp1Len.CoderInfo.CustomStorageClass = 'ImportedDefine';
bp1Len.CoderInfo.CustomAttributes.HeaderFile = 'ex_myHdr_LUT.h';

bp2Len = Simulink.Parameter(2);
bp2Len.Min = 2;
bp2Len.Max = 3;
bp2Len.DataType = 'int32';
bp2Len.CoderInfo.StorageClass = 'Custom';
bp2Len.CoderInfo.CustomStorageClass = 'ImportedDefine';
bp2Len.CoderInfo.CustomAttributes.HeaderFile = 'ex_myHdr_LUT.h';
```

Configure the existing Simulink.LookupTable object LUTObj to use the Simulink.Parameter objects. Set the dimension lengths of the breakpoint set data and the table data by using the names of the parameter objects.

```
LUTObj.Breakpoints(1).Dimensions = '[1 bp1Len]';
LUTObj.Breakpoints(2).Dimensions = '[1 bp2Len]';
LUTObj.Table.Dimensions = '[bp1Len bp2Len]';
```

5-261

Configure `LUTObj` as imported data by applying the custom storage class `ImportFromFile`. To import your definition of `LUTObj`, add the name of the file `ex_mySrc_LUT.c` to the model configuration parameter **Configuration Parameters > Code Generation > Custom Code > Additional Build Information > Source files**.

```
LUTObj.CoderInfo.StorageClass = 'Custom';
LUTObj.CoderInfo.CustomStorageClass = 'ImportFromFile';
LUTObj.CoderInfo.CustomAttributes.HeaderFile = 'ex_myHdr_LUT.h';

set_param('ex_LUTObj','CustomSource','ex_mySrc_LUT.c')
```

Generate and Inspect Code

Configure the model to compile an executable from the generated code.

```
set_param('ex_LUTObj','GenCodeOnly','off')
```

Generate code from the model.

```
rtwbuild('ex_LUTObj')
```

```
### Starting build procedure for model: ex_LUTObj
### Successful completion of build procedure for model: ex_LUTObj
```

In the code generation report, view the generated file `ex_LUTObj.h`. The file imports the macro definitions and the structure type definition by including your header file `ex_myHdr_LUT.h`.

```
file = fullfile('ex_LUTObj_ert_rtw','ex_LUTObj.h');
rtwdemodbtype(file,'#include "ex_myHdr_LUT.h"','#include "ex_myHdr_LUT.h"',1,1)
```

```
#include "ex_myHdr_LUT.h"
```

In the source file `ex_LUTObj.c`, the code algorithm in the model `step` function passes the breakpoint and table data to the function that performs the table lookup. The algorithm also passes `bp1Len` so the lookup function can traverse the rows and columns of the table data, which appear in the generated code as a serialized 1-D array.

```
file = fullfile('ex_LUTObj_ert_rtw','ex_LUTObj.c');
rtwdemodbtype(file,'/* Model step function */','/* Model initialize function */',1,0)
```

```
/* Model step function */
void ex_LUTObj_step(void)
```

```
{
  /* Outport: '<Root>/Out1' incorporates:
   *  Inport: '<Root>/In1'
   *  Inport: '<Root>/In2'
   *  Lookup_n-D: '<Root>/Lookup Table'
   */
  ex_LUTObj_Y.Out1 = look2_binlcapw(ex_LUTObj_U.In1, ex_LUTObj_U.In2,
    (&(LUTObj.BP1[0])), (&(LUTObj.BP2[0])), (&(LUTObj.Table[0])),
    ex_LUTObj_ConstP.LookupTable_maxIndex, (uint32_T)bp1Len);
}
```

Limitations

- You cannot subclass `Simulink.Breakpoint` or `Simulink.LookupTable`. For this reason, you cannot apply custom storage classes other than those in the built-in `Simulink` package.

- You cannot use `Simulink.Breakpoint` objects or `Simulink.LookupTable` objects that refer to `Simulink.Breakpoint` objects as instance-specific parameter data for reusable components. For example, you cannot use one of these objects as:

  - A model argument in a model workspace or a model argument value in a Model block.

  - The value of a mask parameter on a CodeReuse Subsystem block.

  - The value of a mask parameter on a subsystem that you reuse by creating a custom library.

  However, you can use standalone `Simulink.LookupTable` objects, which do not refer to `Simulink.Breakpoint` objects, in these ways.

- When blocks in a subsystem use `Simulink.LookupTable` or `Simulink.Breakpoint` objects, you cannot set data type override only on the subsystem. Instead, set data type override on the entire model.

Simulink.lookuptable.Breakpoint class

Package: Simulink.lookuptable

Configure breakpoint set data for lookup table object

Description

An object of the `Simulink.lookuptable.Breakpoint` class stores breakpoint set information for a lookup table. The object resides in the `Breakpoints` property of a `Simulink.LookupTable` object or `Simulink.Breakpoint` object.

You can use `Simulink.LookupTable` and `Simulink.Breakpoint` objects to store and configure a lookup table for ASAP2 and AUTOSAR code generation.

To represent multiple breakpoint sets for a multidimensional lookup table, store a vector of `Simulink.lookuptable.Breakpoint` objects in the `Breakpoints` property of a `Simulink.LookupTable` object.

To share a breakpoint set between multiple lookup tables, use a `Simulink.Breakpoint` object to store and configure the breakpoint set information. Use the object in a Prelookup block and create `Simulink.LookupTable` objects to use in Interpolation Using Prelookup blocks.

Construction

When you create a `Simulink.LookupTable` object or `Simulink.Breakpoint` object, a `Simulink.lookuptable.Breakpoint` object appears as the value of the `Breakpoints` property.

To create more `Simulink.lookuptable.Breakpoint` objects for a `Simulink.LookupTable` object, use this technique:

Access the `Breakpoints` property by specifying a vector index.

To create a `Simulink.lookuptable.Breakpoint` object, you can set the value of any of the object properties. The `Simulink.LookupTable` object creates the

`Simulink.lookuptable.Breakpoint` object with default property values, and sets the property that you specified.

The value of the `Breakpoints` property is an array of `Simulink.lookuptable.Breakpoint` objects. Each embedded object represents one breakpoint set.

For example, suppose that you create a `Simulink.LookupTable` object named `LUTObj`. To create more breakpoint sets, access the `Breakpoints` property by specifying vector indices:

```
LUTObj.Breakpoints(1).Value = [-1 1];
LUTObj.Breakpoints(2).Value = [-2 -1 0 1 2];
LUTObj.Breakpoints(3).Value = [-5 -3 0 3 5];
```

The object `LUTObj` creates additional `Simulink.lookuptable.Breakpoint` objects and sets the `Value` property of each object. `LUTObj` now stores information for three breakpoint sets.

Properties

DataType — Data type of breakpoint set elements
`'auto'` (default) | character vector

Data type of breakpoint set elements, specified as a character vector. You can explicitly specify an integer, a floating-point, a fixed-point data type, or a data type expression such as the name of a `Simulink.AliasType` object.

The default value, `'auto'`, means that the breakpoint set acquires a data type from the value that you specify in the `Value` property. If you use an untyped expression such as `[1 2 3]` to set `Value`, the breakpoint data use the data type `double`. If you specify a typed expression such as `single([1 2 3])` or an `fi` object, the breakpoint data use the data type specified by the expression or object.

For more information about data types in Simulink, see "Data Types Supported by Simulink". To decide how to control the data types of table and breakpoint data in `Simulink.LookupTable` and `Simulink.Breakpoint` objects, see "Control Data Types of Lookup Table Objects" (Simulink Coder).

Example: `'int16'`

Example: `'myTypeAlias'`

Data Types: `char`

Description — Description of breakpoint set
'' (default) | character vector

Description of the breakpoint set, specified as a character vector.

Example: `'This breakpoint set represents the pressure input.'`

Data Types: `char`

Dimensions — Dimension lengths of breakpoint set
[0 0] (default) | numeric vector

Dimension lengths of the breakpoint set, returned as a numeric vector or specified as a character vector.

To use symbolic dimensions, specify a character vector.

FieldName — Name of structure field that stores breakpoint set data
'BP' (default) | character vector

Name of a structure field in the generated code, specified as a character vector. This field stores the breakpoint set data.

The code generator uses this property only under these circumstances, which cause the breakpoint data to appear in the generated code as a structure field:

- The `Simulink.lookuptable.Breakpoint` object exists in a `Simulink.LookupTable` object and in the `Simulink.LookupTable` object you set `BreakpointsSpecification` to `'Explicit values'`.
- The `Simulink.lookuptable.Breakpoint` object exists in a `Simulink.Breakpoint` object and in the `Simulink.Breakpoint` object you set `SupportTunableSize` to `true`.

Example: `'MyBkptSet1'`

Data Types: `char`

Max — Maximum value of breakpoint set elements
[] (default) | numeric `double` value

Maximum value of the elements of the breakpoint set, specified as a numeric, real value of the data type `double`.

Example: `17.23`

Data Types: `double`

`Min` — Minimum value of breakpoint set elements
`[]` (default) | numeric `double` value

Minimum value of the elements of the breakpoint set, specified as a numeric, real value of the data type `double`.

Example: `-52.6`

Data Types: `double`

`TunableSizeName` — Name of structure field that stores length of breakpoint set
`'N'` (default) | character vector

Name of a structure field in the generated code, specified as a character vector. This field stores the length of the breakpoint set, which the generated code algorithm uses to determine the size of the table. To tune the effective size of the table during code execution, change the value of this structure field in memory.

The code generator uses this property only under these circumstances, which enable a tunable table size in the generated code:

- The `Simulink.lookuptable.Breakpoint` object exists in a `Simulink.LookupTable` object and in the `Simulink.LookupTable` object you set:

  - `BreakpointsSpecification` to `'Explicit values'`.
  - `SupportTunableSize` to `true`.

- The `Simulink.lookuptable.Breakpoint` object exists in a `Simulink.Breakpoint` object and in the `Simulink.Breakpoint` object you set `SupportTunableSize` to `true`.

Example: `'LengthForDim1'`

Data Types: `char`

`Unit` — Physical unit of breakpoint set
`''` (default) | character vector

Physical unit of the elements of the breakpoint set, specified as a character vector.

Example: `'inches'`

Data Types: `char`

Value — Breakpoint set data
[ ] (default) | numeric vector

The breakpoint set data, specified as a numeric vector with at least two elements. To control the data type of the breakpoint set, use the `DataType` property of the `Simulink.lookuptable.Breakpoint` object.

When you set `DataType` to `'auto'`, to set the `Value` property, use a typed expression such as `single([1 2 3])` or use the `fi` constructor to embed an `fi` object.

Example: [10 20 30]

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fi`

`Simulink.Breakpoint` | `Simulink.LookupTable`

Introduced in R2016b

Simulink.lookuptable.Evenspacing class

Package: Simulink.lookuptable

Configure even spacing set data for lookup table object

Description

An object of the `Simulink.lookuptable.Evenspacing` class stores event spacing set information for a lookup table. The object resides in the `Evenspacing` property of a `Simulink.LookupTable` object.

You can use `Simulink.LookupTable` objects to store and configure a lookup table for ASAP2 and AUTOSAR code generation.

To represent multiple breakpoint sets for a multidimensional lookup table, store a vector of `Simulink.lookuptable.Evenspacing` objects in the `Evenspacing` property of a `Simulink.LookupTable` object.

Construction

When you create a `Simulink.LookupTable` object and set `BreakpointSpecification` to `'Even spacing'`, a `Simulink.lookuptable.Evenspacing` object appears as the value of the `Breakpoints` property.

To create more `Simulink.lookuptable.Evenspacing` objects for a `Simulink.LookupTable` object, use this technique:

Access the `Breakpoints` property by specifying a vector index.

To create a `Simulink.lookuptable.Evenspacing` object, you can set the value of any of the object properties. The `Simulink.LookupTable` object creates the `Simulink.lookuptable.Evenspacing` object with default property values, and sets the property that you specified.

The value of the `Breakpoints` property is an array of `Simulink.lookuptable.Evenspacing` objects. Each embedded object represents one breakpoint set.

For example, suppose that you create a `Simulink.LookupTable` object named `myLUTObj`. To create more breakpoint sets, access the `Breakpoints` property by specifying scalar indices for `FirstPoint` and `Spacing` properties. To create more even spacing breakpoint sets, update the object with this pair of properties:

```
LUTObj.Breakpoints(1).FirstPoint=-1;
LUTObj.Breakpoints(1).Spacing=2;
LUTObj.Breakpoints(1).FirstPoint=-2;
LUTObj.Breakpoints(1).Spacing=1;
LUTObj.Breakpoints(1).FirstPoint=-5;
LUTObj.Breakpoints(1).Spacing=2;
```

The object `myLUTObj` creates additional `Simulink.lookuptable.Evenspacing` objects and sets the `FirstPoint` and `Spacing` properties of each object. `LUTObj` now stores information for three breakpoint sets.

Properties

`FirstPoint` — First point in evenly spaced breakpoint data
`[]` (default) | numeric scalar

First point in evenly spaced breakpoint data, specified as a numeric scalar. To control the data type of the breakpoint set, use the `DataType` property of the `Simulink.lookuptable.Evenspacing` object.

When you set `DataType` to `'auto'`, to set the `FirstPoint` property, use a typed expression such as `single(1)` or use the `fi` constructor to embed a `fi` object.

Example: `-1`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fi`

`Spacing` — Spacing between points in evenly spaced breakpoint data
`[]` (default) | numeric, positive, monotonically increasing scalar

Spacing between points in evenly spaced breakpoint data, specified as a numeric scalar. To control the data type of the breakpoint set, use the `DataType` property of the `Simulink.lookuptable.Evenspacing` object.

When you set `DataType` to `'auto'`, to set the `Spacing` property, use a typed expression such as `single(1)` or use the `fi` constructor to embed an `fi` object.

Example: `-1`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fi`

DataType — Data type of breakpoint set elements
`'auto'` (default) | character vector

Data type of breakpoint set elements, specified as a character vector. You can explicitly specify an integer, a floating-point, a fixed-point data type, or a data type expression such as the name of a `Simulink.AliasType` object.

The default value, `'auto'`, means that the breakpoint set acquires a data type from the value that you specify in the `Value` property. If you use an untyped expression such as `[1 2 3]` to set `Value`, the breakpoint data use the data type `double`. If you specify a typed expression such as `single([1 2 3])` or an `fi` object, the breakpoint data use the data type specified by the expression or object.

For more information about data types in Simulink, see "Data Types Supported by Simulink". To decide how to control the data types of table and breakpoint data in `Simulink.LookupTable` and `Simulink.Breakpoint` objects, see "Control Data Types of Lookup Table Objects" (Simulink Coder).

Example: `'int16'`

Example: `'myTypeAlias'`

Data Types: `char`

Min — Minimum value of breakpoint set elements
`[]` (default) | numeric `double` value

Minimum value of the elements of the breakpoint set, specified as a numeric, real value of the data type `double`.

Example: `-52.6`

Data Types: `double`

Max — Maximum value of breakpoint set elements
`[]` (default) | numeric `double` value

Maximum value of the elements of the breakpoint set, specified as a numeric, real value of the data type `double`.

Example: `17.23`

Data Types: `double`

Unit — Physical unit of breakpoint set
`''` (default) | character vector

Physical unit of the elements of the breakpoint set, specified as a character vector.

Example: `'inches'`

Data Types: `char`

FirstPointName — Name of the `Simulink.lookuptable.Evenspacing` object that stores the information for the first point
`'BPFirstPoint1'` (default) | character vector

Name of the `Simulink.Breakpoint` object that stores the information for the first point, specified as a character vector. Generated code uses this name to display the first point.

Example: `'myFirstPointName'`

Data Types: `char`

SpacingName — Name of the `Simulink.lookuptable.Evenspacing` object that stores the information for the spacing
`'auto'` (default) | character vector

Name of the `Simulink.Breakpoint` object that stores the information for the spacing, specified as a character vector. Generated code uses this name to display the spacing.

Example: `'mySpacing'`

Data Types: `char`

TunableSizeName — Name of structure field that stores length of breakpoint set
`'N'` (default) | character vector

Name of a structure field in the generated code, specified as a character vector. This field stores the length of the breakpoint set, which the generated code algorithm uses to determine the size of the table. To tune the effective size of the table during code execution, change the value of this structure field in memory.

The code generator uses the property only under these circumstances, which enable a tunable table size in the generated code:

- The `Simulink.lookuptable.Evenspacing` object exists in a `Simulink.LookupTable` object, in which you set `BreakpointsSpecification` to `'Even spacing'` and `SupportTunableSize` to `true`.

Example: `'LengthForDim1'`

Data Types: `char`

Description — Description of breakpoint set
`''` (default) | character vector

Description of the breakpoint set, specified as a character vector.

Example: `'This breakpoint set represents the pressure input.'`

Data Types: `char`

Introduced in R2017b

Simulink.lookuptable.StructTypeInfo class

Package: Simulink.lookuptable

Configure settings for structure type that lookup table object uses in the generated code

Description

An object of the `Simulink.lookuptable.StructTypeInfo` class controls the structure type that the generated code creates to store data for lookup table objects. The `Simulink.lookuptable.StructTypeInfo` object resides in the `StructTypeInfo` property of a `Simulink.LookupTable` object or `Simulink.Breakpoint` object. Use these parent objects to store and configure a lookup table for ASAP2 and AUTOSAR code generation.

A `Simulink.LookupTable` object appears as a structure in the generated code when you set the `Specification` property to `'Explicit values'`. A `Simulink.Breakpoint` object appears as a structure in the generated code when you set the `SupportTunableSize` property to `true`.

Construction

When you create a `Simulink.LookupTable` or `Simulink.Breakpoint` object, a `Simulink.lookuptable.StructTypeInfo` object appears as the value of the `StructTypeInfo` property.

Properties

DataScope — Scope of structure type definition
`'Auto'` (default) | `'Exported'` | `'Imported'`

Scope of structure type definition, specified as a character vector.

Data Types: `char`

5-275

HeaderFileName — Name of header file that contains structure type definition
'' (default) | character vector

Name of the header file that contains the structure type definition, specified as a character vector.

Example: 'myHdr.h'

Data Types: char

Name — Name of structure type
'' (default) | character vector

Name of the structure type, specified as a character vector.

Data Types: char

Simulink.lookuptable.Table class

Package: Simulink.lookuptable

Configure table data for lookup table object

Description

An object of the `Simulink.lookuptable.Table` class stores table information for a lookup table. The object resides in the `Table` property of a `Simulink.LookupTable` object. You can use the `Simulink.LookupTable` object to store and configure a lookup table for ASAP2 and AUTOSAR code generation.

Construction

When you create a `Simulink.LookupTable` object, a `Simulink.lookuptable.Table` object appears as the value of the `Table` property.

Properties

DataType — Data type of table data elements
`'auto'` (default) | character vector

Data type of the table data elements, specified as a character vector. You can explicitly specify an integer data type, a floating-point data type, a fixed-point data type, or a data type expression such as the name of a `Simulink.AliasType` object.

The default value, `'auto'`, means that the table data acquire a data type from the value that you specify in the `Value` property. If you use an untyped expression such as `[1 2 3]` to set `Value`, the table data use the data type `double`. If you specify a typed expression such as `single([1 2 3])` or an `fi` object, the table data use the data type specified by the expression or object.

For more information about data types in Simulink, see "Data Types Supported by Simulink". To decide how to control the data types of table and breakpoint data in

`Simulink.LookupTable` and `Simulink.Breakpoint` objects, see "Control Data Types of Lookup Table Objects" (Simulink Coder).

Example: `'int16'`

Example: `'myTypeAlias'`

Data Types: `char`

Description — Description of table data
`''` (default) | character vector

Description of the table data, specified as a character vector.

Example: `'This lookup table describes the action of a pump.'`

Data Types: `char`

Dimensions — Dimension lengths of table data
`[0 0]` (default) | numeric vector

Dimension lengths of the table data, returned as a numeric vector or specified as a character vector.

To use symbolic dimensions, specify a character vector.

FieldName — Name of a structure field in the generated code
`'Table'` (default) | character vector

Name of a structure field in the generated code, specified as a character vector. This field stores the table data if you configure the `Simulink.LookupTable` object to appear in the generated code as a structure.

Example: `'MyPumpTable'`

Data Types: `char`

Max — Maximum value of table data elements
`[]` (default) | numeric `double` value

Maximum value of the elements of the table data, specified as a numeric, real value of the data type `double`.

Example: `17.23`

Data Types: `double`

Min — Minimum value of table data elements
[] (default) | numeric `double` value

Minimum value of the elements of the table data, specified as a numeric, real value of the data type `double`.

Example: `-52.6`

Data Types: `double`

Unit — Physical unit of table elements
`''` (default) | character vector

Physical unit of the elements of the table data, specified as a character vector.

Example: `'degC'`

Data Types: `char`

Value — Table data
[] (default) | numeric vector or multidimensional array

The table data, specified as a numeric vector or multidimensional array with at least two elements. To control the data type of the table data, use the `DataType` property of the `Simulink.lookuptable.Table` object.

When you set `DataType` to `'auto'`, to set the `Value` property, use a typed expression such as `single([1 2 3])` or use the `fi` constructor to embed an `fi` object.

Example: `[10 20 30; 40 50 60]`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fi`

Copy Semantics

`Simulink.Breakpoint` | `Simulink.LookupTable`

Introduced in R2016b

Simulink.MDLInfo class

Package: Simulink

Extract model file information without loading block diagram into memory

Description

The class Simulink.MDLInfo extracts information from a model file without loading the block diagram into memory.

You can create an `MdlInfo` object containing all the model information properties, or you can use the static methods for convenient access to individual properties without creating the class first. For example, to get the description only:

```
description = Simulink.MDLInfo.getDescription('mymodel')
```

To get the metadata only:

```
metadata = Simulink.MDLInfo.getMetadata('mymodel')
```

All model information properties are read only.

Construction

`info = Simulink.MDLInfo('`*mymodel*`')` creates an instance of the `MdlInfo` class `info` and populates the properties with the information from the model file `'`*mymodel*`'`.

mymodel can be:

- A block diagram name (for example, `vdp`)
- The file name for a file on the MATLAB path (for example, `mymodel.slx`)
- A file name relative to the current folder (for example, `mydir/mymodel.slx`)
- A fully qualified file name (for example, `C:\mydir\mymodel.slx`)

`Simulink.MDLInfo` resolves the supplied name by looking at files on the MATLAB path, and ignores any block diagrams in memory. This may cause unexpected results if you

supply the name of a loaded model, but its file is shadowed by another file on the MATLAB path. If a file is shadowed, you see a warning in the command window. To avoid any confusion, supply a fully-qualified file name to `Simulink.MDLInfo`.

Properties

BlockDiagramName

Name of block diagram.

Description

Description of model.

FileName

Name of model file.

Interface

Names and attributes of the block diagram's root inports, outports, model references, etc., describing the graphical interface if you created a Model Reference block from this model.

Structure.

IsLibrary

Whether the block diagram is a library.

LastSavedArchitecture

Platform architecture when saved, for example, `'glnxa64'`.

Metadata

Names and attributes of arbitrary data associated with the model.

Structure. The structure fields can be character vectors, numeric matrices of type "double", or more structures. Use the method `getMetadata` to extract this metadata structure without loading the model.

ModelVersion

Model version number.

ReleaseName

Name of release, for example, `'R2016a'`.

SavedCharacterEncoding

Character encoding when saved, for example, `'UTF-8'`.

SimulinkVersion

Version number of Simulink software that was used to save the model file.

Methods

getDescription	Extract model file description without loading block diagram into memory
getMetadata	Extract model file metadata without loading block diagram into memory

Copy Semantics

Handle. To learn how this affects your use of the class, see Copying Objects (MATLAB) in the MATLAB Programming Fundamentals documentation.

Examples

Construct and view a model information object:

```
info = Simulink.MDLInfo('mymodel')
% Get the Version when the model was saved
simulink_version = info.SimulinkVersion;
% Get model metadata
metadata = info.metadata
```

To add metadata to a model, create a metadata structure containing the information you require and use `set_param` to attach it to the model. For example:

```
metadata.TestStatus = 'untested';
metadata.ExpectedCompletionDate
    = '01/01/2011';
load_system(mymodelname);
set_param(mymodelname,'Metadata',...
metadata)  % must be a struct
save_system(mymodelname);
close_system(mymodelname);
```

Construct a model information object for a model named `mpowertrain`, in order to find the names of referenced models without loading the model into memory:

```
info = Simulink.MDLInfo('mpowertrain')
% Get the Interface property
info.Interface
```

Output:

```
ans =

                   Inports: [0x1 struct]
                  Outports: [0x1 struct]
                  Trigports: [0x1 struct]
                  Connports: [0x1 struct]
              ModelVersion: '1.122'
          ModelReferences: {2x1 cell}
    ParameterArgumentNames: ''
        TestPointedSignals: [0x1 struct]
```

Get the referenced models:

```
 info.Interface.ModelReferences
```

Output is in the form *model name / block path | referenced model name*:

```
ans =
    'mpowertrain/Model Variants|manual_transmission'
    'mpowertrain/engine model|menginemodel'
```

See Also

`Simulink.MDLInfo.getDescription`; `Simulink.MDLInfo.getMetadata`

Simulink.MDLInfo.getDescription

Class: Simulink.MDLInfo
Package: Simulink

Extract model file description without loading block diagram into memory

Syntax

```
description = Simulink.MDLInfo.getDescription('mymodel')
description = info.getDescription
```

Description

`description = Simulink.MDLInfo.getDescription('mymodel')` returns the
`description` associated with the file *mymodel*, without loading the model.

mymodel can be:

- A block diagram name (for example, `vdp`)
- The file name for a file on the MATLAB path (for example, `mymodel.slx`)
- A file name relative to the current folder (for example, `mydir/mymodel.slx`)
- A fully qualified file name (for example, `C:\mydir\mymodel.slx`)

`description = info.getDescription` returns the `description` property of the
`Simulink.MDLInfo` object `info`.

Examples

Get the description without loading the model or creating a `Simulink.MDLInfo` object:

```
description = Simulink.MDLInfo.getDescription('mymodel')
```

Create a `Simulink.MDLInfo` object containing all the model information properties, and
get the description property:

5-285

```
info = Simulink.MDLInfo('mymodel')
description = info.getDescription
```

See Also

Simulink.MDLInfo; Simulink.MDLInfo.getMetadata

Simulink.MDLInfo.getMetadata

Class: Simulink.MDLInfo
Package: Simulink

Extract model file metadata without loading block diagram into memory

Syntax

```
metadata = Simulink.MDLInfo.getMetadata('mymodel')
metadata = info.getMetadata
```

Description

`metadata = Simulink.MDLInfo.getMetadata('mymodel')` extracts the structure `metadata` associated with the file *mymodel*, without loading the model.

mymodel can be:

- A block diagram name (for example, `vdp`)
- The file name for a file on the MATLAB path (for example, `mymodel.slx`)
- A file name relative to the current folder (for example, `mydir/mymodel.slx`)
- A fully qualified file name (for example, `C:\mydir\mymodel.slx`)

`metadata = info.getMetadata` returns the `metadata` property of the `Simulink.MDLInfo` object `info`.

`metadata` is a structure containing the names and attributes of arbitrary data associated with the model. The structure fields can be character vectors, numeric matrices of type "double", or more structures.

To add metadata to a model, create a metadata structure containing the information you require and use `set_param` to attach it to the model. If it is important to extract the information without loading the model, use metadata instead of adding custom user data with `add_param`.

Examples

Create a metadata structure and use `set_param` to attach it to the model:

```
metadata.TestStatus = 'untested';
metadata.ExpectedCompletionDate = '01/01/2011';
load_system('mymodel');
set_param('mymodel','Metadata',metadata) % must be a struct
save_system('mymodel');
close_system('mymodel');
```

Get the metadata without loading the model or creating a `Simulink.MDLInfo` object:

```
metadata = Simulink.MDLInfo.getMetadata('mymodel')
```

Create a `Simulink.MDLInfo` object containing all the model information properties, and get the metadata property:

```
info = Simulink.MDLInfo('mymodel')
metadata = info.getMetadata
```

`Simulink.MDLInfo`; `Simulink.MDLInfo.getDescription`

Simulink.ModelAdvisor

Run Model Advisor from MATLAB file

Description

Use instances of this class in MATLAB programs to run the Model Advisor, for example, to perform a standard set of checks. MATLAB software creates an instance of this object for each model that you open in the current MATLAB session. To get a handle to a model's Model Advisor object, execute the following command

```
ma = Simulink.ModelAdvisor.getModelAdvisor(model);
```

where *model* is the name of the model or subsystem that you want to check. Your program can then use the Model Advisor object's methods to initialize and run the Model Advisor's checks.

About IDs

Many `Simulink.ModelAdvisor` object methods require or return IDs. An *ID* is a unique identifier for a Model Advisor check, task, or group. ID must remain constant. A `Simulink.ModelAdvisor` object includes methods that enable you to retrieve the ID or IDs for all checks, tasks, and groups, checks belonging to groups and tasks, the active check, and selected checks, tasks and groups.

You find check IDs in the Model Advisor, using check context menus.

To Find	Do This
Check Title, ID, or location of the MATLAB source code	1 On the model window toolbar, select **Settings > Preferences**.
	2 In the Model Advisor Preferences dialog box, select **Show Source Tab**.
	3 In the right pane of the Model Advisor window, click the **Source** tab. The Model Advisor window displays the check Title, TitleId, and location of the MATLAB source code for the check.

To Find	Do This
Check ID	**1** In the left pane of the Model Advisor, select the check. **2** Right-click the check name and select **Send Check ID to Workspace**. The ID is displayed in the Command Window and sent to the base workspace.
Check IDs for selected checks in a folder	**1** In the left pane of the Model Advisor, select the checks for which you want IDs. Clear the other checks in the folder. **2** Right-click the folder and select **Send Check ID to Workspace**. An array of the selected check IDs are sent to the base workspace.

Syntax

ma = Simulink.ModelAdvisor

Arguments

ma

   A variable representing the Simulink.ModelAdvisor object you create.

Properties

EmitInputParametersToReport

The EmitInputParametersToReport property specifies the display of check input parameters in the Model Advisor report.

Value	Description
'true' (default)	Display check input parameters in the Model Advisor report.
'false'	Do not display check input parameters in the Model Advisor report.

Method Summary

Name	Description
"closeReport" on page 5-293	Close Model Advisor report.
"deselectCheck" on page 5-293	Clear checks.
"deselectCheckAll" on page 5-294	Clear all checks.
"deselectCheckForGroup" on page 5-294	Clear a group of checks.
"deselectCheckForTask" on page 5-295	Clear checks that belong to a specified task or set of tasks.
"deselectTask" on page 5-295	Clear tasks.
"deselectTaskAll" on page 5-296	Clear all tasks.
"displayReport" on page 5-296	Display Model Advisor report.
"exportReport" on page 5-297	Copy report to a specified location.
"filterResultWithExclusion" on page 5-297	Filter objects that have been excluded by user-defined exclusions.
"getBaselineMode" on page 5-298	Get baseline mode setting for the Model Advisor.
"getCheckAll" on page 5-299	Get the IDs of the checks performed by the Model Advisor.
"getCheckForGroup" on page 5-299	Get checks belonging to a check group.
"getCheckForTask" on page 5-300	Get checks belonging to a task.
"getCheckResult" on page 5-300	Get check results.
"getCheckResultData" on page 5-301	Get check result data.
"getCheckResultStatus" on page 5-301	Get pass/fail status of a check or set of checks.
"getGroupAll" on page 5-302	Get the IDs of the groups of tasks performed by the Model Advisor.
"getInputParameters" on page 5-302	Get input parameters of a check.
"getListViewParameters" on page 5-303	Get list view parameters of a check.

Name	Description
"getModelAdvisor" on page 5-304	Get the Model Advisor for a model or subsystem.
"getSelectedCheck" on page 5-304	Get selected checks.
"getSelectedSystem" on page 5-305	Get path of system currently targeted by the Model Advisor.
"getSelectedTask" on page 5-305	Get selected tasks.
"getTaskAll" on page 5-306	Get the IDs of the tasks performed by the Model Advisor.
"Simulink.ModelAdvisor.openConfigUI" on page 5-306	Start the Model Advisor Configuration editor.
"Simulink.ModelAdvisor.reportExists" on page 5-307	Determine whether a report exists for a system or subsystem.
"runCheck" on page 5-307	Run selected checks.
"runTask" on page 5-308	Run checks for selected tasks.
"selectCheck" on page 5-308	Select checks.
"selectCheckAll" on page 5-309	Select all checks.
"selectCheckForGroup" on page 5-309	Select a group of checks.
"selectCheckForTask" on page 5-310	Select checks that belong to a specified task.
"selectTask" on page 5-310	Select tasks.
"selectTaskAll" on page 5-311	Select all tasks.
"setActionEnable" on page 5-311	Set enable/disable status for a check action.
"setBaselineMode" on page 5-312	Set baseline mode for the Model Advisor.
"setCheckErrorSeverity" on page 5-313	Set severity of a check failure.
"setCheckResult" on page 5-313	Set result for the currently running check.
"setCheckResultData" on page 5-314	Set result data for the currently running check.

Name	Description
"setCheckResultStatus" on page 5-315	Set pass/fail status for the currently running check.
"setListViewParameters" on page 5-315	Set list view parameters for a check.
"verifyCheckRan" on page 5-316	Verify that checks have run.
"verifyCheckResult" on page 5-317	Generate a baseline set of check results or compare the current set of results to the baseline results.
"verifyCheckResultStatus" on page 5-318	Verify that a model has passed or failed a set of checks.
"verifyHTML" on page 5-319	Generate a baseline report or compare the current report to a baseline report.

Methods

closeReport

Close Model Advisor report

```
closeReport
```

Closes the report associated with this Model Advisor object, which closes the Model Advisor window.

"displayReport" on page 5-296

deselectCheck

Clear check

```
success = deselectCheck(ID)
```

ID
    Character vector or cell array that specifies the IDs of the checks to be cleared.
success
    True (1) if the check is cleared.

This method clears the checks specified by ID.

Note This method cannot clear disabled checks.

"getCheckAll" on page 5-299, "deselectCheckForGroup" on page 5-294, "selectCheck" on page 5-308

deselectCheckAll

Clear all checks

```
success = deselectCheckAll
```

success
    True (1) if all checks are cleared.

Clears all checks that are not disabled.

"selectCheckAll" on page 5-309

deselectCheckForGroup

Clear group of checks

```
success = deselectCheckForGroup(groupName)
```

groupName
    Character vector or cell array that specifies the names of the groups to be cleared.

success
    True (1) if the method succeeds in clearing the specified group.

Clears a specified group of checks.

"selectCheckForGroup" on page 5-309

deselectCheckForTask

Clear checks that belong to specified task or set of tasks

```
success = deselectCheckForTask(ID)
```

ID
    Character vector or cell array of character vectors that specify the IDs of tasks whose checks are to be cleared.

success
    True (1) if the specified tasks are cleared.

Clears checks belonging to the tasks specified by the *ID* argument.

"getTaskAll" on page 5-306, "selectCheckForTask" on page 5-310

deselectTask

Clear task

```
success = deselectTask(ID)
```

ID

    Character vector or cell array that specifies the ID of tasks to be cleared

`success`

    True (1) if the method succeeded in clearing the specified tasks.

Clears the tasks specified by *ID*.

"selectTask" on page 5-310, "getTaskAll" on page 5-306

deselectTaskAll

Clears all tasks

```
success = deselectTaskAll
```

`success`

    True (1) if this method succeeds in clearing all tasks.

Clears all tasks.

"selectTaskAll" on page 5-311

displayReport

Display report in Model Advisor window

```
displayReport
```

Displays the report associated with this Model Advisor object in the Model Advisor window. The report includes the most recent results of running checks on the system associated with this Model Advisor object and the current selection status of checks, groups, and tasks for the system.

"Simulink.ModelAdvisor.reportExists" on page 5-307

exportReport

Create copy of report generated by Model Advisor

```
[success message] = exportReport(destination)
```

destination

 Path name of copy to be made of the report file.

success

 True (1) if this method succeeded in creating a copy of the report at the specified location.

message

 Empty if the copy was successful; otherwise, the reason the copy did not succeed.

This method creates a copy of the last report generated by the Model Advisor and stores the copy at the specified location.

"Simulink.ModelAdvisor.reportExists" on page 5-307

filterResultWithExclusion

Filter objects that have been excluded by user-defined exclusions.

```
filteredResultHandles = obj.filterResultWithExclusion(ResultHandles)
```

`filteredResultHandles`

An array of objects causing exclusion enabled checks to warn or fail.

obj

A variable representing the `Simulink.ModelAdvisor.getModelAdvisor` object.

ResultHandles

An array of objects causing a check warning or failure.

This method filters objects that cause a check warning or failure with checks that have exclusions enabled.

Note This method is intended for excluding objects from custom checks created with the Model Advisor's customization API, a feature available with Simulink Check™.

---

getBaselineMode

Determine whether Model Advisor is in baseline data generation mode

`mode = getBaselineMode`

`mode`

Boolean value indicating baseline mode.

The `mode` output variable returns true if the Model Advisor is in baseline data mode. Baseline data mode causes the verification methods of the Model Advisor, for example, "verifyHTML" on page 5-319, to generate baseline data.

getCheckAll

Get IDs of all checks

```
IDs = getCheckAll
```

IDs

Cell array of character vectors specifying the IDs of all checks performed by the Model Advisor.

Returns a cell array of character vectors specifying the IDs of all checks performed by the Model Advisor.

"getTaskAll" on page 5-306, "getGroupAll" on page 5-302

getCheckForGroup

Get checks that belong to check group

```
IDs = getCheckForGroup(groupName)
```

groupName

Character vector specifying the name of a group.

IDs

Cell array of IDs.

Returns a cell array of IDs of the tasks and checks belonging to the group specified by *groupName*.

"getCheckForTask" on page 5-300

getCheckForTask

Get checks that belong to task

```
checkIDs = getCheckForTask(taskID)
```

taskID
    ID of a task.
checkIDs
    Cell array of IDs of checks belonging to the specified task.

Returns a cell array of IDs of the checks belonging to the task specified by *taskID*.

"getCheckForGroup" on page 5-299

getCheckResult

Get results of running check or set of checks

```
result = getCheckResult(ID)
```

ID
    ID of a check or cell array of check IDs.
result
    A check result or cell array of check results.

Gets results for the specified checks. The format of the results depends on the checks that generated the data.

> **Note** This method is intended for accessing results generated by custom checks created with the Model Advisor's customization API, an optional feature available with Simulink Check software. For more information, see "Define Custom Checks" (Simulink Check).

getCheckResultData

Get data resulting from running check or set of checks

```
result = getCheckResultData(ID)
```

ID
    Check ID or cell array of check IDs.

result
    Data from a check result or cell array of data from check results.

Gets the check result data for the specified checks. The format of the data depends on the checks that generated the data.

> **Note** This method is intended for accessing check result data generated by custom checks created with the Model Advisor's customization API, an optional feature available with Simulink Check software. For more information, see "Define Custom Checks" (Simulink Check).

getCheckResultStatus

Get status of check or set of checks

```
result = getCheckResultStatus(ID)
```

ID
    Check ID or cell array of check IDs.
result
    Boolean or a cell array of Boolean values indication the pass or fail status of a check
    or set of checks.

Invoke this method after running a set of checks to determine whether the checks passed
or failed.

"getCheckResult" on page 5-300, "getCheckResultData" on page 5-301

getGroupAll

Get all groups of checks run by Model Advisor

```
IDs = getGroupAll
```

IDs
    Cell array of IDs of all groups of checks run by the Model Advisor.

Returns a cell array of IDs of all groups of checks run by the Model Advisor.

"getCheckAll" on page 5-299, "getTaskAll" on page 5-306

getInputParameters

Get input parameters of check

```
params = obj.getInputParameters(check_ID)
```

params
    A cell array of `ModelAdvisor.InputParameter` objects.

obj
    A variable representing the `Simulink.ModelAdvisor` object.

check_ID
    A character vector that uniquely identifies the check.

    You can omit the *check_ID* if you use the method inside a check callback function.

Returns the input parameters associated with a check.

Note This method is intended for accessing custom checks created with the Model Advisor's customization API, an optional feature available with Simulink Check software. For more information, see "Define Custom Checks" (Simulink Check).

`ModelAdvisor.InputParameter`

getListViewParameters

Get list view parameters of check

params = *obj*.getListViewParameters(*check_ID*)

params
    A cell array of `ModelAdvisor.ListViewParameter` objects.
obj
    A variable representing the `Simulink.ModelAdvisor` object.
check_ID
    A character vector that uniquely identifies the check.

    You can omit the *check_ID* if you use the method inside a check callback function.

Returns the list view parameters associated with a check.

Note This method is intended for accessing custom checks created with the Model Advisor's customization API, an optional feature available with Simulink Check software. For more information, see "Define Custom Checks" (Simulink Check).

"setListViewParameters" on page 5-315, `ModelAdvisor.ListViewParameter`

getModelAdvisor

Get Model Advisor object for system or subsystem

```
obj = Simulink.ModelAdvisor.getModelAdvisor(system)
obj = Simulink.ModelAdvisor.getModelAdvisor(system, 'new')
```

system

    Name of model or subsystem.

`'new'`

    Required when changing Model Advisor working scope from one system to another without closing the previous session. Alternatively, you can close the previous session before invoking `getModelAdvisor`, in which case `'new'` can be omitted.

`obj`

    Model Advisor object.

This static method (see "Static Methods") creates and returns an instance of `Simulink.ModelAdvisor` class for the model or subsystem specified by `system`.

getSelectedCheck

Get currently selected checks

```
IDs = getSelectedCheck
```

`IDs`
    Cell array of IDs of currently selected checks.

Returns the IDs of the currently selected checks in the Model Advisor.

"getSelectedTask" on page 5-305

getSelectedSystem

Get system currently targeted by Model Advisor

```
path = getSelectedSystem
```

`path`
    Path of the selected system.

Gets the path of the system currently targeted by the Model Advisor. That is, the system or subsystem most recently selected for checking either interactively by the user or programmatically via `Simulink.ModelAdisor.getModelAdvisor`.

"getModelAdvisor" on page 5-304

getSelectedTask

Get selected tasks

```
IDs = getSelectedTask
```

IDs

    Cell array of IDs of currently selected tasks.

Returns the IDs of the currently selected tasks in the Model Advisor.

"getSelectedCheck" on page 5-304

getTaskAll

Get tasks run by Model Advisor

```
IDs = getTaskAll
```

IDs

    Cell array of IDs of tasks run by the Model Advisor.

Returns a cell array of IDs of tasks run by the Model Advisor.

"getCheckAll" on page 5-299, "getGroupAll" on page 5-302

Simulink.ModelAdvisor.openConfigUI

Starts Model Advisor Configuration editor

```
Simulink.ModelAdvisor.openConfigUI
```

This static method starts the Model Advisor Configuration editor. Use the Model Advisor Configuration editor to create customized configurations for the Model Advisor.

Note The Model Advisor Configuration editor is an optional feature available with Simulink Check software (see "Organize Checks and Folders Using the Model Advisor Configuration Editor" (Simulink Check) for more information).

- Before starting the Model Advisor Configuration editor, ensure that the current folder is writable. If the folder is not writable, you see an error message when you start the Model Advisor Configuration editor.
- The Model Advisor Configuration editor uses the `slprj` folder in the code generation folder to store reports and other information. If the `slprj` folder does not exist in the code generation folder, the Model Advisor Configuration editor creates it. For more information, see "Model Reference Simulation Targets".

Simulink.ModelAdvisor.reportExists

Determine whether report exists for model or subsystem

```
exists = reportexists('system')
```

system

    Character vector specifying path of a system or subsystem.

exists

    True (1) if a report exists for *system*.

This method returns true (1) if a report file exists for the model (system) or subsystem specified by *system* in the `slprj/modeladvisor` subfolder of the MATLAB working folder.

"exportReport" on page 5-297

runCheck

Run currently selected checks

```
success = runCheck(ID)
```

ID

    ID or cell array of IDs of checks to run.

success

    True (1) if the checks were run.

Runs the checks currently selected in the Model Advisor. Invoking this method is equivalent to selecting the **Run Selected Checks** button on the Model Advisor window.

"selectCheck" on page 5-308

runTask

Run currently selected tasks

```
success = runTask
```

success

    True (1) if the tasks were run.

Runs the tasks currently selected in the Model Advisor. Invoking this method is equivalent to selecting the **Run Selected Checks** button on the Model Advisor window.

"selectTask" on page 5-310

selectCheck

Select check

```
success = selectCheck(ID)
```

ID

    ID or cell array of IDs of checks to be selected.

success

    True (1) if this method succeeded in selecting the specified checks.

Select the check specified by *ID*. This method cannot select a check that is disabled.

"selectCheckAll" on page 5-309, "selectCheckForGroup" on page 5-309, "deselectCheck" on page 5-293

selectCheckAll

Select all checks

```
success = selectCheckAll
```

success

    True (1) if this method succeeded in selecting all checks.

Selects all checks that are not disabled.

"selectCheck" on page 5-308, "selectCheckForGroup" on page 5-309, "deselectCheck" on page 5-293

selectCheckForGroup

Select group of checks

```
success = selectCheckForGroup(ID)
```

ID

　　ID or cell array of group IDs.

success

　　True (1) if this method succeeded in selecting the specified groups

Selects the groups specified by *ID*.

"deselectCheckForGroup" on page 5-294

selectCheckForTask

Select checks that belong to specified task or set of tasks

```
success = selectCheckForTask(ID)
```

ID

　　ID or cell array of IDs of tasks whose checks are to be selected.

success

　　True (1) if this method succeeded in selecting the checks for the specified tasks

Selects checks belonging to the tasks specified by the *ID* argument.

"deselectCheckForTask" on page 5-295

selectTask

Select task

```
success = selectTask(ID)
```

ID

    ID or cell array of IDs of the task to be selected.

`success`

    True (1) if this method succeeds in selecting the specified tasks.

Selects a task.

"deselectTask" on page 5-295

selectTaskAll

Select all tasks

`success = selectTaskAll`

`success`

    True (1) if this method succeeds in selecting all tasks.

Selects all tasks.

"deselectTaskAll" on page 5-296

setActionEnable

Set status for check action

obj`.setActionEnable(`*value*`)`

obj

    A variable representing the `Simulink.ModelAdvisor` object.

value

> Boolean value indicating whether the Action box is enabled or disabled.
>
> - `true` — enable the Action box.
> - `false` — Disable the Action box.

The `setActionEnable` method specifies the enables or disables the Action box. Only a check callback function can invoke this method.

Note This method is intended for accessing custom checks created with the Model Advisor's customization API, an optional feature available with Simulink Check software. For more information, see "Define Custom Checks" (Simulink Check).

`ModelAdvisor.Action`

setBaselineMode

Set baseline data generation mode for Model Advisor

`setBaselineMode(`*mode*`)`

mode

> Boolean value indicating setting of Model Advisor's baseline mode, either on (`true`) or off (`false`).

Sets the Model Advisor's baseline mode to *mode*. Baseline mode causes the Model Advisor's verify methods to generate baseline comparison data for verifying the results of a Model Advisor run.

"getBaselineMode" on page 5-298, "verifyCheckResult" on page 5-317, "verifyHTML" on page 5-319

setCheckErrorSeverity

Set severity of check failure

obj.setCheckErrorSeverity(*value*)

obj

    A variable representing the Simulink.ModelAdvisor object.

value

    Integer indicating severity of failure.

- 0 — Check Result = Warning
- 1 — Check Result = Failed

Sets result status for a currently running check that fails to *value*. Only a check callback function can invoke this method.

Note This method is intended for accessing custom checks created with the Model Advisor's customization API, an optional feature available with Simulink Check software. For more information, see "Define Custom Checks" (Simulink Check).

---

setCheckResult

Set result for currently running check

success = setCheckResult(*result*)

result

    Character vector or cell array that specifies the result of the currently running task.

success

  True (1) if this method succeeds in setting the check result.

Sets the check result for the currently running check. Only the callback function of a check can invoke this method.

Note This method is intended for use with custom checks created with the Model Advisor's customization API, an optional feature available with Simulink Check software. For more information, see "Define Custom Checks" (Simulink Check).

"getCheckResult" on page 5-300, "setCheckResultData" on page 5-314, "setCheckResultStatus" on page 5-315

setCheckResultData

Set result data for currently running check

```
success = setCheckResultData(data)
```

data

  Result data to be set.

success

  True (1) if this method succeeds in setting the result data for the current check

Sets the check result data for the currently running check. Only the callback function of a check can invoke this method.

Note This method is intended for use with custom checks created with the Model Advisor's customization API, an optional feature available with Simulink Check software. For more information, see "Define Custom Checks" (Simulink Check).

---

setCheckResultStatus

Set status for currently running check

```
success = setCheckResultStatus(status)
```

status

Boolean value that indicates the status of the check that just ran, either pass (`true`) or fail (`false`)

success

True (1) if the status was set.

Sets the pass or fail status for the currently running check to `status`. Only the callback function of the check can invoke this method.

Note This method is intended for use with custom checks created with the Model Advisor's customization API, an optional feature available with Simulink Check software. For more information, see "Define Custom Checks" (Simulink Check).

setListViewParameters

Specify list view parameters for check

```
obj.setListViewParameters(check_ID, params)
```

obj

A variable representing the `Simulink.ModelAdvisor` object.

check_ID

A character vector that uniquely identifies the check.

You can omit the *check_ID* if you use the method inside a check callback function.

params

A cell array of `ModelAdvisor.ListViewParameter` objects.

Set the list view parameters for the check.

Note This method is intended for accessing custom checks created with the Model Advisor's customization API, an optional feature available with Simulink Check software. For more information, see "Define Custom Checks" (Simulink Check).

"getListViewParameters" on page 5-303, `ModelAdvisor.ListViewParameter`

verifyCheckRan

Verify that Model Advisor has run set of checks

```
[success, missingChecks, additionalChecks] = verifyCheckRan(IDs)
```

IDs

Cell array of IDs of checks to verify.

`success`

Boolean value specifying whether the checks ran.

`missingChecks`

Cell array of IDs for specified checks that did not run.

`additionalChecks`

Cell array of IDs for unspecified checks that ran.

The output variable `success` returns `true` if both:

- All the checks specified by *IDs* ran.
- Only the checks specified by *IDs* ran.

The `missingChecks` argument provides the specified checks that did not run. The `additionalChecks` argument lists unspecified checks that ran.

verifyCheckResult

Generate baseline Model Advisor check results file or compare current check results to baseline check results

`[success message] = verifyCheckResult(`*baseline*`, `*checkIDs*`)`

baseline

    Path of the baseline check results MAT-file.

checkIDs

    Cell array of check IDs.

`success`

    Boolean value specifying whether the method succeeded.

`message`

    Character vector specifying an error message.

If the Model Advisor is in baseline mode (see "setBaselineMode" on page 5-312), this method stores the most recent results of running the checks specified by `checkIDs` in a MAT-file at the location specified by `baseline`. If the method is unable to store the check results at the specified location, it returns `false` in the output variable `success` and the reason for the failure in the output variable `message`. If the Model Advisor is not in baseline mode, this method compares the most recent results of running the checks specified by `checkIDs` with the report specified by `baseline`. If the current results

match the baseline results, this method returns`true` as the value of the `success` output variable.

Note You must run the checks specified by `checkIDs` (see "runCheck" on page 5-307) before invoking `verifyCheckResult`.

This method enables you to compare the most recent check results generated by the Model Advisor with a baseline set of check results. You can use the method to generate the baseline report as well as perform current-to-baseline result comparisons. To generate a baseline report, put the Model Advisor in baseline mode, using "setBaselineMode" on page 5-312. Then invoke this method with the baseline argument set to the location where you want to store the baseline results. To perform a current-to-baseline report comparison, first ensure that the Model Advisor is not in baseline mode (see "getBaselineMode" on page 5-298). Then invoke this method with the path of the baseline report as the value of the `baseline` input argument.

"setBaselineMode" on page 5-312, "getBaselineMode" on page 5-298, "runCheck" on page 5-307, "verifyCheckResultStatus" on page 5-318

verifyCheckResultStatus

Verify that model has passed or failed set of checks

```
[success message] = verifyCheckResultStatus(baseline, checkIDs)
```

baseline
    Array of Boolean variables.
checkIDs
    Cell array of check IDs.
`success`
    Boolean value specifying whether the method succeeded.
`message`
    Character vector specifying an error message.

This method compares the passor fail (`true` or `false`) statuses from the most recent running of the checks specified by *checkIDs* with the Boolean values specified by *baseline*. If the statuses match the baseline, this method returns `true` as the value of the `success` output variable.

Note You must run the checks specified by *checkIDs* (see "runCheck" on page 5-307) before invoking `verifyCheckResultStatus`.

---

verifyHTML

Generate baseline Model Advisor report or compare current report to baseline report

```
[success message] = verifyHTML(baseline)
```

baseline

    Path of a Model Advisor report.

success

    Boolean value specifying whether the method succeeded.

message

    Character vector specifying an error message.

If the Model Advisor is in baseline mode (see "setBaselineMode" on page 5-312), this method stores the report most recently generated by the Model Advisor at the location specified by *baseline*. If the method is unable to store a copy of the report at the specified location, it returns `false` in the output variable `success` and the reason for the failure in the output variable `message`. If the Model Advisor is not in baseline mode, this method compares the report most recently generated by the Model Advisor with the report specified by *baseline*. If the current report has exactly the same content as the baseline report, this method returns `true` as the value of the `success` output variable.

This method enables you to compare a report generated by the Model Advisor with a baseline report to determine if they differ. You can use the method to generate the baseline report as well as perform current-to-baseline report comparisons. To generate a baseline report, put the Model Advisor in baseline mode. Then invoke this method with the baseline argument set to the location where you want to store the baseline report. To perform a current-to-baseline report comparison, first ensure that the Model Advisor is not in baseline mode (see "getBaselineMode" on page 5-298). The invoke this method with the path of the baseline report as the value of the *baseline* input argument.

"setBaselineMode" on page 5-312, "getBaselineMode" on page 5-298, "verifyCheckResult" on page 5-317

Introduced in R2006a

Simulink.ModelDataLogs

Container for signal data logs of a model

Description

Note The `ModelDataLogs` class is supported for backwards compatibility. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format. In R2016a or later, when you open a model from an earlier release that had used `ModelDataLogs` format, the model simulated in use `Dataset` format.

You can convert signal logging data from `ModelDataLogs` to `Dataset` format. Converting to `Dataset` format makes it easier to post-process with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see "Convert Logged Data to Dataset Format".

If you have legacy code that uses the `ModelDataLogs` API, you can encounter situations that require updates to your code or model. See "Migrate Scripts That Use Legacy ModelDataLogs API".

In releases before R2016a, if you set **Configuration Parameters** > **Data Import/Export** > **Signal logging format** to `ModelDataLogs`, Simulink software created instances of the `Simulink.ModelDataLogs` class to contain signal logs while simulating a model. Logging created an instance of this class for a top model and for each model referenced by the top model that contains signals to be logged. Logging assigned the `ModelDataLogs` object for the top model to a variable in the base workspace. The name of the variable is the name specified in the **Configuration Parameters** > **Data Import/ export** > **Signal logging name** parameter. The default value is `logsout`.

A `ModelDataLogs` object has a variable number of properties. The first property, named `Name`, specifies the name of the model whose signal data the object contains or, if the model is a referenced model, the name of the Model block that references the model. The remaining properties reference objects that contain signal data logged during simulation of the model. The objects may be instances of any of the following types of objects:

- `Simulink.ModelDataLogs`

Container for the data logs of a model

- `Simulink.SubsysDataLogs`

  Container for the data logs of a subsystem

- `Simulink.Timeseries`

  Data log for any signal except a mux or bus signal

- `Simulink.TsArray`

  Data log for a mux or bus signal

The names of the properties identify the data being logged as follows:

- For signal data logs, the name of the signal
- For a subsystem or model log container, the name of the subsystem or model, respectively

Consider, for example, the following model.
As indicated by the testpoint icons, this model specifies that Simulink software should log the signals named `step` and `scope` in the root system and the signal named `clk` in the subsystem named Delayed Out. After you simulate this model in a release earlier than R2016a, the MATLAB workspace contains the following variable:

```
Simulink.ModelDataLogs (siglgex):
  Name                    elements   Simulink Class

  scope                      2       TsArray
  step                       1       Timeseries
  ('Delayed Out')            2       SubsysDataLogs
```

You can use fully qualified object names or the Simulink `unpack` command to access the signal data. For example, to access the amplitudes of the `clk` signal in the Delayed Out subsystem in a `logsout` object, enter

```
data = logsout.('Delayed Out').clk.Data;
```

or

```
>> logsout.unpack('all');
>> data = clk.Data;
```

Access Logged Signal Data Saved in `ModelDataLogs` Format

The `Simulink.ModelDataLogs` object contains signal data objects to capture signal logging information for specific model elements.

Model Element	Signal Data Object
Top-level or referenced model	`Simulink.ModelDataLogs`
Subsystem in a model	`Simulink.SubsysDataLogs`
Signal other than a bus or Mux signal	`Simulink.Timeseries`
Bus signal or Mux signal	`Simulink.TsArray`

Handling Spaces and Newlines in Logged Names

Signal names in data logs can have spaces or newlines in their names when the signal:

• Is named and the name includes a space or newline character.

- Is unnamed and originates in a block whose name includes a space or newline character.
- Exists in a subsystem or referenced model, and the name of the subsystem, Model block, or of any superior block includes a space or newline character.

The following model shows a signal whose name contains a space, a signal whose name contains a newline, and an unnamed signal that originates in a block whose name contains a newline:
The following example shows how to handle spaces or new lines in logged names, if a model uses `ModelDataLogs` for the signal logging format.

```
logsout
```

```
logsout =

Simulink.ModelDataLogs (model_name):
  Name                          Elements   Simulink Class

  ('x y')                          1          Timeseries
  ('a
b')                      1        Timeseries
  ('SL_Sine
Wave1')          1      Timeseries
```

You cannot access any of the `Simulink.Timeseries` objects in this log using TAB name completion or by typing the name to MATLAB. This syntax is not recognized because the

space or newline in each name appears to the MATLAB parser as a separator between identifiers. For example:

```
logsout.x y

??? logsout.x y
            |
Error: Unexpected MATLAB expression.
```

To reference a `Simulink.Timeseries` object whose name contains a space, enclose the element containing the space in single quotes:

```
logsout.('x y')

      Name: 'x y'
  BlockPath: 'model_name/Sine'
  PortIndex: 1
 SignalName: 'x y'
 ParentName: 'x y'
   TimeInfo: [1x1 Simulink.TimeInfo]
       Time: [51x1 double]
       Data: [51x1 double]
```

To reference a `Simulink.Timeseries` object whose name contains a newline, concatenate to construct the element containing the newline:

```
cr=sprintf('\n')
logsout.(['a' cr 'b'])
```

The same techniques work when a space or newline in a data log derives from the name of:

- An unnamed logged signal's originating block
- A subsystem or Model block that contains any logged signal
- Any block that is superior to such a block in the model hierarchy

This code can reference logged data for the signal:

```
logsout.(['SL_Sine' cr 'Wave1'])
```

For names with multiple spaces, newlines, or both, repeat and combine the two techniques as needed to specify the intended name to MATLAB.

Bus Signals

`ModelDataLogs` format stores each logged bus signal data in a separate `Simulink.TsArray` object.

The hierarchy of a bus signal is preserved in the logged signal data. The logged name of a signal in a virtual bus derives from the name of the source signal. The logged name of a signal in a nonvirtual bus derives from the applicable bus object, and can differ from the name of the source signal. See "Composite Signals" for information about those capabilities.

Introduced before R2006a

Simulink.SimState.ModelSimState class

Package: Simulink.SimState

Access SimState snapshot data

Description

The `Simulink.SimState.ModelSimState` class contains all of the information associated with a "snapshot" of a simulation, including the logged states, the time of the snapshot, and the start time of the simulation. To access these data for a block, use the `getBlockSimState` method or the `loggedStates` property.

Properties

description

Specify a description. By default, Simulink generates a character vector based on your model name.

loggedStates

The logged states are the continuous and discrete states of the blocks in a model. These states represent a subset of the complete simulation state (SimState) of the model.

If `loggedStates` is in `Dataset` format, you cannot assign a structure or a `Simulink.SimulationData.Dataset` object with a different number of elements than that of the `Dataset` object used for `loggedStates`.

If the `loggedStates` is in `Structure` format, you cannot assign a `Dataset` object.

Attributes:

dependent	`loggedStates` is obtained from the saved states of the block. `loggedStates` depends on the full state being saved in the SimState object, unlike, properties like `description`, which are independent of the save states.

snapshotTime

Time at which Simulink takes a "snapshot" of the complete simulation states. This data is read only.

startTime

Time at which the simulation starts. This data is read only.

Methods

getBlockSimState	Access SimState of individual Stateflow Chart, MATLAB Function, or S-function block
setBlockSimState	Set SimState of individual Stateflow Chart, MATLAB Function, or S-function block

Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects (MATLAB) in the MATLAB Programming Fundamentals documentation.

Simulink.ModelWorkspace

Interact with the model workspace of a model programmatically

Description

Use a `Simulink.ModelWorkspace` object to interact with a model workspace. For example, you can add and remove variables, set the data source of the workspace, and save changes to the workspace.

For more information, see "Model Workspaces".

Creation

To create a `Simulink.ModelWorkspace`, use the `get_param` function to query the value of the model parameter `ModelWorkspace`. For example, to create an object named `mdlWks` that represents the model workspace of a model named `myModel.slx`:

```
mdlWks = get_param('myModel','ModelWorkspace')
```

Properties

DataSource — Source for initializing variables in model workspace
`'Model File'` (default) | `'MAT-File'` | `'MATLAB Code'` | `'MATLAB File'`

Source for initializing the variables in the model workspace, specified as one of these character vectors:

- `'Model File'` — The variables are stored in the model file. When you save the model, you also save the variables.
- `'MATLAB Code'` — The variables are created by MATLAB code that you write and store in the model file.
- `'MAT-File'` — The variables are stored in a MAT-file, which you can manage and manipulate separately from the model file.

5-329

- `'MATLAB File'` — The variables are created by MATLAB code in a script file, which you can manage and manipulate separately from the model file.

Data Types: `char`

FileName — Name of external file that stores or creates variables
`''` (empty character vector) (default) | character vector

Name of the external file that stores or creates variables, specified as a character vector. To enable this property, set `DataSource` to `'MAT-File'` or `'MATLAB File'`.

Example: `'myFile.mat'`

Example: `'myFile.m'`

Data Types: `char`

MATLABCode — MATLAB code for initializing variables
`''` (empty character vector) (default) | character vector

MATLAB code for initializing variables, specified as a character vector. To enable this property, set `DataSource` to `'MATLAB Code'`.

Example: `sprintf('%% Create variables that this model uses.\n\nK = 0.00983;\n\nP = Simulink.Parameter(5);')`

Data Types: `char`

Object Functions

getVariable	Return value of variable in the model workspace of a model
hasVariable	Determine whether variable exists in the model workspace of a model
whos	Return list of variables in the model workspace of a model
saveToSource	Save model workspace changes to the external data source of the model workspace
save	Save contents of model workspace to a MAT-file
reload	Reinitialize variables from the data source of a model workspace
evalin	Evaluate expression in the model workspace of a model
clear	Clear variables from the model workspace of a model
assignin	Assign value to variable in the model workspace of a model

Examples

Interact With Model Workspace Programmatically

Create a variable in the model workspace of a model. Then, modify the variable and query the variable value to confirm the modification.

Open the example model vdp.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object `mdlWks` that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp','ModelWorkspace');
```

Create a variable named `myVar` with value `5.12` in the model workspace.

```
assignin(mdlWks,'myVar',5.12)
```

Apply a new value, `7.22`. To do so, first create a temporary copy of the variable by using the `getVariable` function. Then, modify the copy and use it to overwrite the original variable in the model workspace.

```
temp = getVariable(mdlWks,'myVar');
temp = 7.22;
assignin(mdlWks,'myVar',temp)
```

Confirm the new value by querying the value of the variable.

```
getVariable(mdlWks,'myVar')
```

```
ans =

    7.2200
```

Introduced before R2006a

assignin

Package: Simulink

Assign value to variable in the model workspace of a model

Syntax

```
assignin(mdlWks,varName,varValue)
```

Description

assignin(mdlWks,varName,varValue) assigns the value varValue to the MATLAB variable varName in the model workspace represented by the Simulink.ModelWorkspace object mdlWks. If the variable does not exist, assignin creates it.

Examples

Assign Value to Variable in Model Workspace

Open the example model vdp.

```
open_system('vdp')
```

Create a Simulink.ModelWorkspace object that represents the model workspace of vdp.

```
mdlWks = get_param('vdp','ModelWorkspace');
```

Create a variable named myVar with value 5.12 in the model workspace.

```
assignin(mdlWks,'myVar',5.12)
```

Input Arguments

mdlWks — Target model workspace
Simulink.ModelWorkspace object

Target model workspace, specified as a Simulink.ModelWorkspace object.

varName — Name of target variable
character vector

Name of the target variable, specified as a character vector.

Example: 'myVar'

Data Types: char

varValue — Value to assign to target variable
valid value

Value to assign to the target value, specified as a valid value. For example, you can specify a literal number, a structure, or an expression that evaluates to a valid value.

If you specify the name of a handle object, such as a Simulink.Parameter object, use the copy function to create a separate copy of the object.

Example: 5.12

Example: struct('a',5.12,'b',7.22)

Example: Simulink.Parameter(5.12)

Example: copy(myExistingParameterObject)

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | logical | char | string | struct | table | cell | categorical | datetime | duration | calendarDuration | fi
Complex Number Support: Yes

See Also
Simulink.ModelWorkspace

Introduced before R2006a

clear

Package: Simulink

Clear variables from the model workspace of a model

Syntax

```
clear(mdlWks)
```

Description

`clear(mdlWks)` removes all variables from the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`.

Examples

Clear Variables From Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp','ModelWorkspace');
```

Create a variable named `myVar` with value `5.12` in the model workspace.

```
assignin(mdlWks,'myVar',5.12)
```

Clear all variables from the model workspace, including `myVar`.

```
clear(mdlWks)
```

Input Arguments

mdlWks — Target model workspace
Simulink.ModelWorkspace object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

See Also

Simulink.ModelWorkspace

Introduced before R2006a

evalin

Package: Simulink

Evaluate expression in the model workspace of a model

Syntax

```
result = evalin(mdlWks,expression)
```

Description

`result = evalin(mdlWks,expression)` evaluates the expression `expression` in the model workspace represented by the `Simulink.ModelWorkspace` object represented by `mdlWks`. The function returns the result of the expression in `result`.

Examples

Evaluate Expression in Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp','ModelWorkspace');
```

Create some variables in the model workspace.

```
assignin(mdlWks,'myVar',5.12)
assignin(mdlWks,'myOtherVar',7.22)
```

Evaluate the expression `myLastVar = myVar + myOtherVar` in the model workspace. The expression creates another variable, `myLastVar`, whose value is the sum of the first two variables.

```
evalin(mdlWks,'myLastVar = myVar + myOtherVar');
```

Input Arguments

`mdlWks` — Target model workspace
`Simulink.ModelWorkspace` object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

`expression` — Expression to evaluate
character vector

Expression to evaluate, specified as a character vector.

Example: `'myLastVar = myVar + myOtherVar'`

Data Types: `char`

Output Arguments

`result` — Result of expression
number, structure, or other MATLAB value

Result of the evaluated expression, returned as a number, structure, or other MATLAB value.

See Also
`Simulink.ModelWorkspace`

Introduced before R2006a

reload

Package: Simulink

Reinitialize variables from the data source of a model workspace

Syntax

```
reload(mdlWks)
```

Description

`reload(mdlWks)` reinitializes the variables in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`. When you set the `DataSource` property of the model workspace to `'MAT-File'`, `'MATLAB File'`, or `'MATLAB Code'`, `reload` overwrites variables that exist in the model workspace by loading the associated MAT-file or by running the associated MATLAB code.

Examples

Reinitialize Variables in a Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp','ModelWorkspace');
```

Configure the model workspace to use some MATLAB code as a data source.

```
mdlWks.DataSource = 'MATLAB Code';
mdlWks.MATLABCode = sprintf('myVar = 5.12;\nmyOtherVar = 7.22;');
```

Create variables in the model workspace by executing the MATLAB code.

```
reload(mdlWks)
```

Assign new values to the variables in the model workspace.

```
assignin(mdlWks,'myVar',5.22)
assignin(mdlWks,'myOtherVar',7.33)
```

Overwrite the new values with the values specified by the MATLAB code.

```
reload(mdlWks)
```

Confirm that the variables have the values specified by the MATLAB code.

```
myVarValue = getVariable(mdlWks,'myVar')
myOtherVarValue = getVariable(mdlWks,'myOtherVar')

myVarValue =

    5.1200

myOtherVarValue =

    7.2200
```

Input Arguments

mdlWks — Target model workspace
Simulink.ModelWorkspace object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

See Also
Simulink.ModelWorkspace

Introduced before R2006a

save

Package: Simulink

Save contents of model workspace to a MAT-file

Syntax

```
save(mdlWks,fileName)
```

Description

`save(mdlWks,fileName)` saves the variables in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks` to the MAT-file specified by `fileName`.

When you set the `DataSource` property of the model workspace to `'MAT-File'` or `'MATLAB File'`, to save to the file that acts as the external data source of the model, use `saveToSource` instead of `save`.

Examples

Save Contents of Model Workspace to MAT-File

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp','ModelWorkspace');
```

Create some variables in the model workspace.

```
assignin(mdlWks,'myVar',5.12)
assignin(mdlWks,'myOtherVar',7.22)
```

Save the variables to a new MAT-file named `myVars.mat`.

```
save(mdlWks,'myVars.mat')
```

The MAT-file appears in your current folder.

Input Arguments

`mdlWks` — Target model workspace
`Simulink.ModelWorkspace` object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

`fileName` — Name of target MAT-file
character vector

Name of the target MAT-file, specified as a character vector.

Example: `'myFile.mat'`

Data Types: `char`

See Also
`Simulink.ModelWorkspace`

Introduced before R2006a

saveToSource

Package: Simulink

Save model workspace changes to the external data source of the model workspace

Syntax

```
saveToSource(mdlWks)
```

Description

`saveToSource(mdlWks)` saves the variables in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks` to the MAT-file or script file specified by the `FileName` property of the model workspace.

When you set the `DataSource` property of the model workspace to `'MAT-File'` or `'MATLAB File'`, the `FileName` property specifies the name of the file that acts as the external data source of the workspace. As you make changes to the variables in the model workspace, use `saveToSource` to permanently save the changes in the external data source.

Examples

Save Variables to External Data Source of Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp','ModelWorkspace');
```

Create some variables in the model workspace.

```
assignin(mdlWks,'myVar',5.12)
assignin(mdlWks,'myOtherVar',7.22)
```

Configure the model workspace to use a MAT-file named `myVars.mat` as the data source.

```
mdlWks.DataSource = 'MAT-File';
mdlWks.FileName = 'myVars.mat';
```

Save the variables to the external data source (the MAT-file).

```
saveToSource(mdlWks)
```

The file appears in your current folder.

Input Arguments

mdlWks — Target model workspace
Simulink.ModelWorkspace object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

See Also
Simulink.ModelWorkspace

Introduced before R2006a

whos

Package: Simulink

Return list of variables in the model workspace of a model

Syntax

```
varList = whos(mdlWks)
```

Description

`varList = whos(mdlWks)` returns a list of the variables in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`.

Examples

Return List of Variables in Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp','ModelWorkspace');
```

Create some variables in the model workspace.

```
assignin(mdlWks,'myVar',5.12)
assignin(mdlWks,'myOtherVar',7.22)
```

Display a list of the variables in the model workspace.

```
whos(mdlWks)
```

```
Name            Size              Bytes  Class     Attributes

myOtherVar      1x1                   8  double
myVar           1x1                   8  double
```

Input Arguments

mdlWks — Target model workspace
Simulink.ModelWorkspace object

Target model workspace, specified as a Simulink.ModelWorkspace object.

Output Arguments

varList — List of variables
nested structure array

List of variables, returned as a nested structure array. For details about the information in the list, see whos.

See Also

Simulink.ModelWorkspace

Introduced before R2006a

getVariable

Package: Simulink

Return value of variable in the model workspace of a model

Syntax

```
varValue = getVariable(mdlWks,varName)
```

Description

`varValue = getVariable(mdlWks,varName)` returns the value of the variable whose name is `varName` that exists in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`.

If the value of the target variable is a handle to a handle object (such as `Simulink.Parameter`), `getVariable` returns a copy of the handle. Changes you make to the variable in the model workspace or to the returned variable (`variableValue`) affect both variables.

To return a deep copy of the handle object, use the `copy` method of the object. To modify a handle object that you store in a model workspace, it is a best practice to use both the `getVariable` and `assignin` methods (see "Modify Property Value of Handle Object" on page 5-349).

Examples

Return Value of Variable in Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp','ModelWorkspace');
```

Create a variable named `myVar` in the model workspace.

```
assignin(mdlWks,'myVar',5.12)
```

Return the value of the new variable. Store the value in another variable named `varValue`.

```
varValue = getVariable(mdlWks,'myVar');
```

Modify Property Value of Handle Object

Modify a property of the `Simulink.Parameter` object K, which is defined in model `mdl.slx`. When you call `getVariable`, use the `copy` method because `Simulink.Parameter` is a handle class.

```
wksp = get_param(mdl,'ModelWorkspace');
value = copy(getVariable(wksp,'K'));
value.DataType = 'single';
assignin(wksp,'K',value);
```

Input Arguments

mdlWks — Target model workspace
Simulink.ModelWorkspace object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

varName — Name of target variable
character vector

Name of the target variable, specified as a character vector.

Example: `'myVariable'`

Data Types: `char`

Output Arguments

`varValue` — Value of target variable
number, structure, or other MATLAB value

Value of the target variable, returned as a number, structure, or other MATLAB value.

See Also

`Simulink.ModelWorkspace` | `get_param`

Introduced in R2012a

hasVariable

Package: Simulink

Determine whether variable exists in the model workspace of a model

Syntax

```
varExists = hasVariable(mdlWks,varName)
```

Description

varExists = hasVariable(mdlWks,varName) returns 1 if a variable whose name is varName exists in the model workspace represented by the Simulink.ModelWorkspace object mdlWks.

Examples

Determine Existence of Variable in Model Workspace

Open the example model vdp.

```
open_system('vdp')
```

Create a Simulink.ModelWorkspace object that represents the model workspace of vdp.

```
mdlWks = get_param('vdp','ModelWorkspace');
```

Create a variable named myVar in the model workspace.

```
assignin(mdlWks,'myVar',5.12)
```

Determine whether a variable named myVar exists in the model workspace.

```
exists = hasVariable(mdlWks,'myVar')
```

```
exists =
     1
```

Input Arguments

mdlWks — Target model workspace
Simulink.ModelWorkspace object

Target model workspace, specified as a Simulink.ModelWorkspace object.

varName — Name of target variable
character vector

Name of the target variable, specified as a character vector.

Example: 'myVariable'

Data Types: char

Output Arguments

varExists — Indication of existence
1 | 0

Indication of variable existence, returned as 1 (true) or 0.

Simulink.ModelWorkspace | get_param

Introduced in R2012a

Simulink.MSFcnRunTimeBlock

Get run-time information about Level-2 MATLAB S-function block

Description

This class allows a Level-2 MATLAB S-function or other MATLAB program to obtain information from Simulink software and provide information to Simulink software about a Level-2 MATLAB S-Function block. Simulink software creates an instance of this class for each Level-2 MATLAB S-Function block in a model. Simulink software passes the object to the callback methods of Level-2 MATLAB S-functions when it updates or simulates a model, allowing the callback methods to get and provide block-related information to Simulink software. See "Write Level-2 MATLAB S-Functions" for more information.

You can also use instances of this class in MATLAB programs to obtain information about Level-2 MATLAB S-Function blocks during a simulation. See "Access Block Data During Simulation" for more information.

The Level-2 MATLAB S-function template *matlabroot*/toolbox/simulink/blocks/ msfuntmpl.m shows how to use a number of the following methods.

Parent Class

Simulink.RunTimeBlock

Derived Classes

None

Property Summary

Name	Description
"AllowSignalsWithMoreThan2D" on page 5-356	enable Level-2 MATLAB S-function to use multidimensional signals.
"DialogPrmsTunable" on page 5-356	Specifies which of the S-function's dialog parameters are tunable.
"NextTimeHit" on page 5-356	Time of the next sample hit for variable sample time S-functions.

Method Summary

Name	Description
"AutoRegRuntimePrms" on page 5-357	Register this block's dialog parameters as run-time parameters.
"AutoUpdateRuntimePrms" on page 5-357	Update this block's run-time parameters.
"IsDoingConstantOutput" on page 5-357	Determine whether the current simulation stage is the constant sample time stage.
"IsMajorTimeStep" on page 5-358	Determine whether the current simulation time step is a major time step.
"IsSampleHit" on page 5-358	Determine whether the current simulation time is one at which a task handled by this block is active.
"IsSpecialSampleHit" on page 5-359	Determine whether the current simulation time is one at which multiple tasks handled by this block are active.
"RegBlockMethod" on page 5-360	Register a callback method for this block.

Name	Description
"RegisterDataTypeFxpBinaryPoint" on page 5-360	Register fixed-point data type with binary point-only scaling.
"RegisterDataTypeFxpFSlopeFixexpBias" on page 5-361	Register fixed-point data type with [Slope Bias] scaling specified in terms of fractional slope, fixed exponent, and bias.
"RegisterDataTypeFxpSlopeBias" on page 5-362	Register data type with [Slope Bias] scaling.
"SetAccelRunOnTLC" on page 5-364	Specify whether to use this block's TLC file to generate the simulation target for the model that uses it.
"SetPreCompInpPortInfoToDynamic" on page 5-364	Set precompiled attributes of this block's input ports to be inherited.
"SetPreCompOutPortInfoToDynamic" on page 5-365	Set precompiled attributes of this block's output ports to be inherited.
"SetPreCompPortInfoToDefaults" on page 5-365	Set precompiled attributes of this block's ports to the default values.
"SetSimViewingDevice" on page 5-365	Specify whether block is a viewer.
"SupportsMultipleExecInstances" on page 5-366	
"WriteRTWParam" on page 5-366	Write custom parameter information to Simulink Coder file.

Properties

AllowSignalsWithMoreThan2D

Allow Level-2 MATLAB S-functions to use multidimensional signals. You must set the `AllowSignalsWithMoreThan2D` property in the `setup` method.

Boolean

RW

DialogPrmsTunable

Specifies whether a dialog parameter of the S-function is tunable. Tunable parameters are registered as run-time parameters when you call the "AutoRegRuntimePrms" on page 5-357 method. Note that `SimOnlyTunable` parameters are not registered as run-time parameters. For example, the following lines initializes three dialog parameters where the first is tunable, the second in not tunable, and the third is tunable only during simulation.

```
block.NumDialogPrms     = 3;
block.DialogPrmsTunable = {'Tunable','Nontunable','SimOnlyTunable'};
```

array

RW

NextTimeHit

Time of the next sample hit for variable sample-time S-functions.

double

RW

Methods

AutoRegRuntimePrms

Register a block's tunable dialog parameters as run-time parameters.

```
AutoRegRuntimePrms;
```

Use in the `PostPropagationSetup` method to register this block's tunable dialog parameters as run-time parameters.

AutoUpdateRuntimePrms

Update a block's run-time parameters.

```
AutoUpdateRuntimePrms;
```

Automatically update the values of the run-time parameters during a call to `ProcessParameters`.

See the S-function *matlabroot*/toolbox/simulink/simdemos/simfeatures/ adapt_lms.m in the Simulink model sldemo_msfcn_lms for an example.

IsDoingConstantOutput

Determine whether this is in the constant sample time stage of a simulation.

```
bVal = IsDoingConstantOutput;
```

Returns true if this is the constant sample time stage of a simulation, i.e., the stage at the beginning of a simulation where Simulink software computes the values of block outputs that cannot change during the simulation (see "Constant Sample Time"). Use this method

in the `Outputs` method of an S-function with port-based sample times to avoid unnecessarily computing the outputs of ports that have constant sample time, i.e., `[inf, 0]`.

```
function Outputs(block)
.
.
  if block.IsDoingConstantOutput
    ts = block.OutputPort(1).SampleTime;
    if ts(1) == Inf
    %% Compute port's output.
    end
  end
.
.
%% end of Outputs
```

See "Specifying Port-Based Sample Times" for more information.

IsMajorTimeStep

Determine whether current time step is a major or a minor time step.

```
bVal = IsMajorTimeStep;
```

Returns true if the current time step is a major time step; false, if it is a minor time step. This method can be called only from the `Outputs` or `Update` methods.

IsSampleHit

Determine whether the current simulation time is one at which a task handled by this block is active.

```
bVal = IsSampleHit(stIdx);
```

stIdx
    Global index of the sample time to be queried.

Use in `Outputs` or `Update` block methods when the MATLAB S-function has multiple sample times to determine whether a sample hit has occurred at `stIdx`. The sample time index `stIdx` is a global index for the Simulink model. For example, consider a model that contains three sample rates of 0.1, 0.2, and 0.5, and a MATLAB S-function block that contains two rates of 0.2 and 0.5. In the MATLAB S-function, `block.IsSampleHit(0)` returns true for the rate 0.1, not the rate 0.2.

This block method is similar to `ssIsSampleHit` for C-MeX S-functions, however `ssIsSampleHit` returns values based on only the sample times contained in the S-function. For example, if the model described above contained a C-MeX S-function with sample rates of 0.2 and 0.5, `ssIsSampleHit(S,0,tid)` returns `true` for the rate of 0.2.

Use port-based sample times to avoid using the global sample time index for multi-rate systems (see `Simulink.BlockPortData`).

IsSpecialSampleHit

Determine whether the current simulation time is one at which multiple tasks implemented by this block are active.

```
bVal = IsSpecialSampleHit(stIdx1,stIdx1);
```

`stIdx1`

   Index of sample time of first task to be queried.

`stIdx2`

   Index of sample time of second task to be queried.

Use in `Outputs` or `Update` block methods to ensure the validity of data shared by multiple tasks running at different rates. Returns true if a sample hit has occurred at `stIdx1` and a sample hit has also occurred at `stIdx2` in the same time step (similar to `ssIsSpecialSampleHit` for C-Mex S-functions).

When using the `IsSpecialSampleHit` macro, the slower sample time must be an integer multiple of the faster sample time.

RegBlockMethod

Register a block callback method.

```
RegBlockMethod(methName, methHandle);
```

methName
    Name of method to be registered.
methHandle
    MATLAB function handle of the callback method to be registered.

Registers the block callback method specified by `methName` and `methHandle`. Use this method in the `setup` function of a Level-2 MATLAB S-function to specify the block callback methods that the S-function implements.

RegisterDataTypeFxpBinaryPoint

Register fixed-point data type with binary point-only scaling.

```
dtID = RegisterDataTypeFxpBinaryPoint(isSigned, wordLength,
fractionalLength, obeyDataTypeOverride);
```

isSigned
    `true` if the data type is signed.

    `false` if the data type is unsigned.
wordLength
    Total number of bits in the data type, including any sign bit.
fractionalLength
    Number of bits in the data type to the right of the binary point.
obeyDataTypeOverride
    `true` indicates that the **Data Type Override** setting for the subsystem is to be obeyed. Depending on the value of **Data Type Override**, the resulting data type could

be `Double`, `Single`, `ScaledDouble`, or the fixed-point data type specified by the other arguments of the function.

`false` indicates that the **Data Type Override** setting is to be ignored.

This method registers a fixed-point data type with Simulink software and returns a data type ID. The data type ID can be used to specify the data types of input and output ports, run-time parameters, and DWork states. It can also be used with all the standard data type access methods defined for instances of this class, such as "DatatypeSize" on page 5-409.

Use this function if you want to register a fixed-point data type with binary point-only scaling. Alternatively, you can use one of the other fixed-point registration functions:

- Use "RegisterDataTypeFxpFSlopeFixexpBias" on page 5-361 to register a data type with [Slope Bias] scaling by specifying the word length, fractional slope, fixed exponent, and bias.
- Use "RegisterDataTypeFxpSlopeBias" on page 5-362 to register a data type with [Slope Bias] scaling.

If the registered data type is not one of the Simulink built-in data types, a Fixed-Point Designer license is checked out.

RegisterDataTypeFxpFSlopeFixexpBias

Register fixed-point data type with [Slope Bias] scaling specified in terms of fractional slope, fixed exponent, and bias

```
dtID = RegisterDataTypeFxpFSlopeFixexpBias(isSigned, wordLength,
fractionalSlope, fixedexponent, bias, obeyDataTypeOverride);
```

`isSigned`

　　`true` if the data type is signed.

　　`false` if the data type is unsigned.

`wordLength`

　　Total number of bits in the data type, including any sign bit.

`fractionalSlope`

Fractional slope of the data type.

`fixedexponent`

exponent of the slope of the data type.

`bias`

Bias of the scaling of the data type.

`obeyDataTypeOverride`

`true` indicates that the **Data Type Override** setting for the subsystem is to be obeyed. Depending on the value of **Data Type Override**, the resulting data type could be `True Doubles`, `True Singles`, `ScaledDouble`, or the fixed-point data type specified by the other arguments of the function.

`false` indicates that the **Data Type Override** setting is to be ignored.

This method registers a fixed-point data type with Simulink software and returns a data type ID. The data type ID can be used to specify the data types of input and output ports, run-time parameters, and DWork states. It can also be used with all the standard data type access methods defined for instances of this class, such as "DatatypeSize" on page 5-409.

Use this function if you want to register a fixed-point data type by specifying the word length, fractional slope, fixed exponent, and bias. Alternatively, you can use one of the other fixed-point registration functions:

- Use "RegisterDataTypeFxpBinaryPoint" on page 5-360 to register a data type with binary point-only scaling.
- Use "RegisterDataTypeFxpSlopeBias" on page 5-362 to register a data type with [Slope Bias] scaling.

If the registered data type is not one of the Simulink built-in data types, a Fixed-Point Designer license is checked out.

RegisterDataTypeFxpSlopeBias

Register data type with [Slope Bias] scaling.

```
dtID = RegisterDataTypeFxpSlopeBias(isSigned, wordLength,
totalSlope, bias, obeyDataTypeOverride);
```

`isSigned`

> `true` if the data type is signed.
>
> `false` if the data type is unsigned.

`wordLength`

> Total number of bits in the data type, including any sign bit.

`totalSlope`

> Total slope of the scaling of the data type.

`bias`

> Bias of the scaling of the data type.

`obeyDataTypeOverride`

> `true` indicates that the **Data Type Override** setting for the subsystem is to be obeyed. Depending on the value of **Data Type Override**, the resulting data type could be `True Doubles`, `True Singles`, `ScaledDouble`, or the fixed-point data type specified by the other arguments of the function.
>
> `false` indicates that the **Data Type Override** setting is to be ignored.

This method registers a fixed-point data type with Simulink software and returns a data type ID. The data type ID can be used to specify the data types of input and output ports, run-time parameters, and DWork states. It can also be used with all the standard data type access methods defined for instances of this class, such as "DatatypeSize" on page 5-409.

Use this function if you want to register a fixed-point data type with [Slope Bias] scaling. Alternatively, you can use one of the other fixed-point registration functions:

- Use "RegisterDataTypeFxpBinaryPoint" on page 5-360 to register a data type with binary point-only scaling.
- Use "RegisterDataTypeFxpFSlopeFixexpBias" on page 5-361 to register a data type by specifying the word length, fractional slope, fixed exponent, and bias

If the registered data type is not one of the Simulink built-in data types, a Fixed-Point Designer license is checked out.

SetAccelRunOnTLC

Specify whether to use block's TLC file to generate code for the Accelerator mode of Simulink software.

```
SetAccelRunOnTLC(bVal);
```

bVal

    May be `'true'` (use TLC file) or `'false'` (run block in interpreted mode).

Specify if the block should use its TLC file to generate code that runs with the accelerator. If this option is `'false'`, the block runs in interpreted mode. See the S-function `msfcn_times_two.m` in the Simulink model `msfcndemo_timestwo` for an example.

Note The default JIT Accelerator mode does not support inlining of user-written TLC S-Functions. Please see "How Acceleration Modes Work" and "Control S-Function Execution" for more information.

SetPreCompInpPortInfoToDynamic

Set precompiled attributes of this block's input ports to be inherited.

```
SetPreCompInpPortInfoToDynamic;
```

Initialize the compiled information (dimensions, data type, complexity, and sampling mode) of this block's input ports to be inherited. See the S-function *matlabroot*/`toolbox/simulink/simdemos/simfeatures/adapt_lms.m` in the Simulink model `sldemo_msfcn_lms` for an example.

SetPreCompOutPortInfoToDynamic

Set precompiled attributes of this block's output ports to be inherited.

```
SetPreCompOutPortInfoToDynamic;
```

Initialize the compiled information (dimensions, data type, complexity, and sampling mode) of the block's output ports to be inherited. See the S-function *matlabroot*/ `toolbox/simulink/simdemos/simfeatures/adapt_lms.m` in the Simulink model `sldemo_msfcn_lms` for an example.

SetPreCompPortInfoToDefaults

Set precompiled attributes of this block's ports to the default values.

```
SetPreCompPortInfoToDefaults;
```

Initialize the compiled information (dimensions, data type, complexity, and sampling mode) of the block's ports to the default values. By default, a port accepts a real scalar sampled signal with a data type of `double`.

SetSimViewingDevice

Specify whether this block is a viewer.

```
SetSimViewingDevice(bVal);
```

bVal
    May be `'true'` (is a viewer) or `'false'` (is not a viewer).

Specify if the block is a viewer/scope. If this flag is specified, the block will be used only during simulation and automatically stubbed out in generated code.

SupportsMultipleExecInstances

Specify whether or not a For Each Subsystem supports an S-function inside of it.

```
SupportsMultipleExecInstances(bVal);
```

bVal

    May be `'true'` (S-function is supported) or `'false'` (S-function is not supported).

Specify if an S-function can operate within a For Each Subsystem.

WriteRTWParam

Write a custom parameter to the Simulink Coder information file used for code generation.

```
WriteRTWParam(pType, pName, pVal)
```

pType

    Type of the parameter to be written. Valid values are `'string'` and `'matrix'`.

pName

    Name of the parameter to be written.

pVal

    Value of the parameter to be written.

Use in the `WriteRTW` method of the MATLAB S-function to write out custom parameters. These parameters are generally settings used to determine how code should be generated in the TLC file for the S-function. See the S-function *matlabroot*/toolbox/simulink/simdemos/simfeatures/adapt_lms.m in the Simulink model sldemo_msfcn_lms for an example.

Introduced before R2006a

Simulink.NumericType

Specify floating-point, integer, or fixed-point data type

Description

Use a `Simulink.NumericType` object to set and share numeric data types for signal, state, and parameter data in a model.

1. Create an instance of this class in the MATLAB base workspace, a model workspace, or a data dictionary. To create a numeric type in a model workspace, you must clear the **Is alias** property.
2. Set the properties of the object to create a custom floating point, integer, or fixed point data type.
3. Assign the data type to all signals and parameters of your model that you want to conform to the data type.

Assigning a data type in this way allows you to change the data types of the signals and parameters in your model by changing the properties of the object that describe them. You do not have to change the model itself.

To rename a data type in a model and in the code that you generate from a model (by generating a `typedef` statement), you can use an object of the class `Simulink.AliasType`.

Creation

To create a `Simulink.NumericType` object interactively, use the Model Explorer:

1. On the Model Explorer **Model Hierarchy** pane, select a workspace, such as the base workspace, or a data dictionary.
2. From the Model Explorer **Add** menu, select **Simulink.NumericType**.

   The Model Explorer creates an instance of a `Simulink.NumericType` object and assigns it to a variable named `Numeric` in the target workspace.

3 Rename the variable to a more appropriate name, for example, a name that reflects its intended usage.

To change the name, edit the name displayed in the **Name** field on the Model Explorer **Contents** pane.

4 On the Model Explorer **Dialog** pane, use the **Data type mode** property to select a data type that the object represents.

To create a `Simulink.NumericType` object programmatically, use the `Simulink.NumericType` function described below.

Syntax

```
typeObj = Simulink.NumericType
```

Description

`typeObj = Simulink.NumericType` returns a `Simulink.NumericType` object with default property values.

Properties

`Bias` — Bias for slope and bias scaling
0 (default) | real number

Bias for slope and bias scaling of a fixed-point data type (Fixed-Point Designer), specified as a real number.

If you use a number with a data type other than `double` to set the value, Simulink converts the value to `double`.

Corresponds to **Bias** in the property dialog box.

Example: 3

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical`

DataScope — Specification to generate or import type definition in the generated code
'Auto' (default) | 'Exported' | 'Imported'

Specification to generate or import the type definition (typedef) in the generated code (Simulink Coder), specified as 'Auto', 'Exported, or 'Imported'.

The table shows the effect of each option.

Value	Action
'Auto' (default)	If no value is specified for HeaderFile, export the type definition to *model*_types.h. *model* is the model name. If a value is specified for HeaderFile, import the data type definition from the specified header file.
'Exported'	Export the data type definition to a header file, which can be specified in the HeaderFile property. If no value is specified for HeaderFile, the header file name defaults to *type*.h. *type* is the data type name.
'Imported'	Import the data type definition from a header file, which can be specified in the HeaderFile property. If no value is specified for HeaderFile, the header file name defaults to *type*.h. *type* is the data type name.

For more information, see "Control File Placement of Custom Data Types" (Embedded Coder).

Corresponds to **Data scope** in the property dialog box.

DataTypeMode — Mode of numeric data type
'Double' (default) | 'Single' | 'Boolean' | 'Fixed-point: unspecified scaling' | 'Fixed-point: binary point scaling' | 'Fixed-point: slope and bias scaling'

Mode of the numeric data type, specified as one of these character vectors:

- 'Double' — Same as the MATLAB double type.
- 'Single' — Same as the MATLAB single type.
- 'Boolean' — Same as the MATLAB boolean type.
- 'Fixed-point: unspecified scaling' — A fixed-point data type with unspecified scaling.

- `'Fixed-point: binary point scaling'` — A fixed-point data type with binary-point scaling.
- `'Fixed-point: slope and bias scaling'` — A fixed-point data type with slope and bias scaling.

Selecting a fixed-point data type mode can, depending on the other dialog box options that you select, cause the model to run only on systems that have a Fixed-Point Designer option installed.

Corresponds to **Data type mode** in the property dialog box.

Data Types: `char`

`DataTypeOverride` — Data type override mode
`'Inherit'` (default) | `'Off'`

Data type override mode, specified as `'Inherit'` or `'Off'`.

- If you specify `'Inherit'`, the data type override setting for the context in which this numeric type is used (block, signal, Stateflow chart in Simulink) applies to this numeric type.
- If you specify `'Off'`, data type override does not apply to this numeric type.

For more information about data type override, see "Control Data Type Override".

Corresponds to **Data type override** in the property dialog box.

Data Types: `char`

`Description` — Custom description of data type
`''` (empty character vector) (default) | character vector

Custom description of the data type, specified as a character vector.

Corresponds to **Description** in the property dialog box.

Example: `'This is a floating-point data type.'`

Data Types: `char`

`FixedExponent` — Exponent for binary point scaling
`0` (default) | real number

Exponent for binary point scaling, specified as a real number. Setting this property causes Simulink software to set the `FractionLength` and `Slope` properties accordingly, and

vice versa. This property applies only if the `DataTypeMode` is `Fixed-point: binary point scaling` or `Fixed-point: slope and bias scaling`.

If you use a number with a data type other than `double` to set the value, Simulink converts the value to `double`.

This property does not appear in the property dialog box.

Example: `-8`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical`

`FractionLength` — Bit length of the fractional portion of a fixed-point number
`0` (default) | real integer

Bit length of the fractional portion of a fixed-point number (Fixed-Point Designer), specified as a real integer. This property equals `-FixedExponent`. Setting this property causes Simulink software to set the `FixedExponent` property accordingly, and vice versa.

If you use a number with a data type other than `double` to set the value, Simulink converts the value to `double`.

Corresponds to **Fraction length** in the property dialog box.

Example: `8`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical`

`HeaderFile` — Name of header file that contains type definition in the generated code
`''` (empty character vector) (default) | character vector

Name of the header file that contains the type definition (`typedef`) in the generated code, specified as a character vector.

If this property is specified, the specified name is used during code generation for importing or exporting. If this property is empty, the value defaults to *type*`.h` if `DataScope` equals `'Imported'` or `'Exported'`, or defaults to *model*`_types.h` if `DataScope` equals `'Auto'`.

By default, the generated `#include` directive uses the preprocessor delimiter `"` instead of `<` and `>`. To generate the directive `#include <myTypes.h>`, specify `HeaderFile` as `'<myTypes.h>'`.

For more information, see "Control File Placement of Custom Data Types" (Embedded Coder).

Corresponds to **Header file** in the property dialog box.

Example: `'myHdr.h'`

Example: `'myHdr'`

Example: `'myHdr.hpp'`

Data Types: `char`

IsAlias — Specification to create data type alias using object name
`false` (default) | `true`

Specification to create a data type alias by using the name of the object, specified as `true` (yes) or `false` (no).

If you specify `true`, the object acts as a data type alias in a similar manner to a `Simulink.AliasType` object. For more information, see "Control Data Type Names in Generated Code" (Embedded Coder).

Corresponds to **Is alias** in the property dialog box.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical`

Signedness — Signedness of fixed-point data type
`'Signed` (default) | `'Unsigned'` | `'Auto'`

Signedness of a fixed-point data type (Fixed-Point Designer), specified as `'Signed'` (signed), `'Unsigned'` (unsigned), or `'Auto'` (inherit signedness).

Corresponds to **Signedness** in the property dialog box.

Data Types: `char`

Slope — Slope for slope and bias scaling of fixed-point data type
`2^0` (default) | real number

Slope for slope and bias scaling of a fixed-point data type (Fixed-Point Designer), specified as a real number.

This property equals `SlopeAdjustmentFactor * 2^FixedExponent`. If `SlopeAdjustmentFactor` is 1.0, Simulink software displays the value of this field as `2^SlopeAdjustmentFactor`. Otherwise, it displays it as a numeric value. Setting this property causes Simulink software to set the `FixedExponent` and `SlopeAdjustmentFactor` properties accordingly, and vice versa.

If you use a number with a data type other than `double` to set the value, Simulink converts the value to `double`.

This property appears only if `DataTypeMode` is `Fixed-point: slope and bias scaling`.

Corresponds to **Slope** in the property dialog box.

Example: `5.2`

Example: `2^9`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical`

SlopeAdjustmentFactor — Slope for slope and bias scaling of fixed-point data type
1 (default) | real number

Slope for slope and bias scaling of a fixed-point data type (Fixed-Point Designer), specified as a real number in the range [1, 2).

Setting this property causes Simulink software to adjust the `Slope` property accordingly, and vice versa. This property applies only if `DataTypeMode` is `Fixed-point: slope and bias scaling`.

If you use a number with a data type other than `double` to set the value, Simulink converts the value to `double`.

This property does not appear in the property dialog box.

Example: `1.7`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical`

WordLength — Word size of fixed-point or integer data type
16 (default) | integer

Word size of a fixed-point (Fixed-Point Designer) or integer data type, specified as an integer number of bits.

This property appears only if `DataTypeMode` is `Fixed-point`.

If you use a number with a data type other than `double` to set the value, Simulink converts the value to `double`.

Corresponds to **Word length** in the property dialog box.

Example: 8

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical`

Object Functions

isboolean	Determine whether numeric type represents the Boolean data type boolean
isdouble	Determine whether numeric type represents the double-precision, floating-point data type double
isfixed	Determine whether numeric type represents a fixed-point data type
isfloat	Determine whether numeric type represents a floating-point data type
isscalingbinarypoint	Determine whether fixed-point numeric type has binary-point scaling
isscalingslopebias	Determine whether numeric type represents a fixed-point data type with slope-and-bias scaling
isscalingunspecified	Determine whether numeric type represents a data type with unspecified scaling
issingle	Determine whether numeric type represents the single-precision, floating-point data type single

Examples

Share a Data Type Between Separate Algorithms, Data Paths, Models, and Bus Elements

Introduced before R2006a

isboolean

Package: Simulink

Determine whether numeric type represents the Boolean data type `boolean`

Syntax

```
indication = isboolean(numericType)
```

Description

`indication = isboolean(numericType)` returns `1` (`true`) if the `Simulink.NumericType` object `numericType` represents the Boolean data type `boolean` and `0` (`false`) otherwise.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

Input Arguments

numericType — Target numeric type
`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

Output Arguments

indication — Indication of whether target object represents boolean
`1` | `0`

Indication of whether the target object represents `boolean`, returned as `1` (`true`) or `0` (false).

See Also

`Simulink.NumericType`

"Control Data Type Names in Generated Code" (Embedded Coder)

Introduced in R2010b

isdouble

Package: Simulink

Determine whether numeric type represents the double-precision, floating-point data type `double`

Syntax

```
indication = isdouble(numericType)
```

Description

`indication = isdouble(numericType)` returns `1` (`true`) if the `Simulink.NumericType` object `numericType` represents the double-precision, floating-point data type `double` and `0` (`false`) otherwise.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

Input Arguments

numericType — Target numeric type
Simulink.NumericType object

Target numeric type, specified as a `Simulink.NumericType` object.

Output Arguments

indication — Indication of whether target object represents double
1 | 0

Indication of whether the target object represents `double`, returned as `1` (`true`) or `0` (`false`).

isfixed

Package: Simulink

Determine whether numeric type represents a fixed-point data type

Syntax

```
indication = isfixed(numericType)
```

Description

`indication = isfixed(numericType)` returns `1` (`true`) if the `Simulink.NumericType` object `numericType` represents a fixed-point data type and `0` (`false`) otherwise.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

Input Arguments

numericType — Target numeric type
`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

Output Arguments

indication — Indication of whether target object represents a fixed-point type
`1` | `0`

Indication of whether the target object represents a fixed-point type, returned as `1` (`true`) or `0` (`false`).

Introduced in R2010b

isfloat

Package: Simulink

Determine whether numeric type represents a floating-point data type

Syntax

```
indication = isfloat(numericType)
```

Description

`indication = isfloat(numericType)` returns `1` (`true`) if the `Simulink.NumericType` object `numericType` represents a floating-point data type such as `double` or `single`, and `0` (`false`) otherwise.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

Input Arguments

numericType — Target numeric type
`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

Output Arguments

indication — Indication of whether target object represents a floating-point type
`1 | 0`

Indication of whether the target object represents a floating-point type, returned as `1` (`true`) or `0` (`false`).

Introduced in R2010b

isscalingbinarypoint

Package: Simulink

Determine whether fixed-point numeric type has binary-point scaling

Syntax

```
indication = isscalingbinarypoint(numericType)
```

Description

`indication = isscalingbinarypoint(numericType)` returns `1` (`true`) if the `Simulink.NumericType` object `numericType` represents a fixed-point data type with binary-point scaling and `0` (`false`) otherwise. A numeric type object can use binary-point scaling if you explicitly specify it or if you specify trivial slope-and-bias scaling (the slope is an integer power of two and the bias is zero).

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

Input Arguments

numericType — Target numeric type
Simulink.NumericType object

Target numeric type, specified as a `Simulink.NumericType` object.

Output Arguments

indication — Indication of whether target object represents fixed-point type with binary-point scaling
1 | 0

Indication of whether the target object represents a fixed-point type with binary-point scaling, returned as `1` (`true`) or `0` (`false`).

Introduced in R2010b

isscalingslopebias

Package: Simulink

Determine whether numeric type represents a fixed-point data type with slope-and-bias scaling

Syntax

```
indication = isscalingslopebias(numericType)
```

Description

`indication = isscalingslopebias(numericType)` returns `1` (`true`) if the `Simulink.NumericType` object `numericType` represents a fixed-point data type with nontrivial slope-and-bias scaling and `0` (`false`) otherwise. A slope-and-bias fixed-point type has trivial scaling if the slope is an integer power of two and the bias is zero.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

Input Arguments

numericType — Target numeric type
Simulink.NumericType object

Target numeric type, specified as a `Simulink.NumericType` object.

Output Arguments

indication — Indication of whether target object represents fixed-point type with slope-and-bias scaling
1 | 0

Indication of whether the target object represents a fixed-point type with nontrivial slope-and-bias scaling, returned as 1 (`true`) or 0 (`false`).

Introduced in R2010b

isscalingunspecified

Package: Simulink

Determine whether numeric type represents a data type with unspecified scaling

Syntax

```
indication = isscalingunspecified(numericType)
```

Description

`indication = isscalingunspecified(numericType)` returns `1` (`true`) if the `Simulink.NumericType` object `numericType` represents a fixed-point or scaled double data type with unspecified scaling and `0` (`false`) otherwise.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

Input Arguments

numericType — Target numeric type
`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

Output Arguments

indication — Indication of whether target object represents a type with unspecified scaling
`1` | `0`

Indication of whether the target object represents a type with unspecified scaling, returned as `1` (`true`) or `0` (`false`).

Introduced in R2010b

issingle

Package: Simulink

Determine whether numeric type represents the single-precision, floating-point data type
`single`

Syntax

```
indication = issingle(numericType)
```

Description

`indication = issingle(numericType)` returns `1` (`true`) if the
`Simulink.NumericType` object `numericType` represents the single-precision, floating-
point data type `single` and `0` (`false`) otherwise.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share
between different data items in a model. For more information, see
`Simulink.NumericType`.

Input Arguments

numericType — Target numeric type
Simulink.NumericType object

Target numeric type, specified as a `Simulink.NumericType` object.

Output Arguments

indication — Indication of whether target object represents `single`
1 | 0

Indication of whether the target object represents `single`, returned as `1` (`true`) or `0`
(`false`).

Simulink.Parameter

Store, share, and configure block parameter values

Description

Create a `Simulink.Parameter` object to set the value of one or more block parameters in a model, such as the **Gain** parameter of a Gain block. You create the object in a workspace or in a data dictionary. Set the parameter value in the object, not in the block.

Use a `Simulink.Parameter` object to:

- Share a value among multiple block parameters.
- Represent an engineering constant or a tunable calibration parameter.
- Separate a parameter value from its data type.
- Configure parameter data for code generation.

The `Value` property of the object stores the parameter value. To use the object in a model, set the value of a block parameter to an expression that involves the name of the object. Omit the `Value` property from the expression. For more information, see "Use Parameter Objects".

For more information about block parameters, see "Set Block Parameter Values" and "How Generated Code Stores Internal Signal, State, and Parameter Data" (Simulink Coder).

Creation

Create a `Simulink.Parameter` object:

- Directly from a block dialog box or the Property Inspector. See "Create, Edit, and Manage Workspace Variables".
- By using the Model Data Editor. Inspect the **Parameters** tab.
- By using the Model Explorer. See "Create Data Objects from Built-In Data Class Package Simulink".

- By using the `Simulink.Parameter` function, described below.

Syntax

```
paramObj = Simulink.Parameter
paramObj = Simulink.Parameter(paramValue)
```

Description

`paramObj = Simulink.Parameter` returns a `Simulink.Parameter` object with default property values.

`paramObj = Simulink.Parameter(paramValue)` returns a `Simulink.Parameter` object and initializes the value of the `Value` property by using `paramValue`.

Properties

For information about properties in the property dialog box of a `Simulink.Parameter` object, see "Simulink.Parameter Property Dialog Box".

CoderInfo — Specifications for generating code for parameter object
`Simulink.CoderInfo` object

Specifications for generating code for the parameter object, returned as a `Simulink.CoderInfo` object.

This property is read only. Instead, modify the properties of the `Simulink.CoderInfo` object that this property contains.

For example, the `StorageClass` property of the `Simulink.CoderInfo` object determines how Simulink code generation toolboxes allocate memory for the parameter object in the generated code. For more information, see "Apply Storage Classes to Individual Signal, State, and Parameter Data Elements" (Simulink Coder) and "Choose a Storage Class for Controlling Data Representation in the Generated Code" (Embedded Coder).

Complexity — Numeric complexity of parameter value
`'real'` (default) | `'complex'`

Numeric complexity of the parameter value, returned as `'real'` (if the value is real) or `'complex'` (if the value is complex). Simulink determines the complexity from the parameter value that you specify in the `Value` property. This property is read only.

Data Types: `char`

DataType — Data type of parameter value
`'auto'` (default) | character vector

Data type of the parameter value that you specify in the `Value` property. When you simulate the model or generate code, Simulink casts the value to the specified data type.

If you specify `'auto'`, the default setting, the parameter object uses the same data type as the block parameters that use the object. See "Reduce Maintenance Effort with Data Type Inheritance".

When you set the `Value` property by using something other than a `double` number, the object typically sets the `DataType` property based on the value of the `Value` property. For example, when you set the `Value` property to `int8(5)`, the object sets the value of the `DataType` property to `'int8'`.

To explicitly specify a built-in data type (see "Data Types Supported by Simulink"), specify one of these options:

- `'double'`
- `'single'`
- `'int8'`
- `'uint8'`
- `'int16'`
- `'uint16'`
- `'int32'`
- `'uint32'`
- `'boolean'`

To specify a fixed-point data type, use the `fixdt` function. For example, specify `'fixdt(1,16,5)'`.

If you use a `Simulink.AliasType` or `Simulink.NumericType` object to create and share custom data types in your model, specify the name of the object.

To specify an enumerated data type, use the name of the type preceded by `Enum:`. For example, specify `'Enum: myEnumType'`.

When you store a structure or array of structures in the `Value` property of the object, the object sets the `DataType` property to `'struct'`. To specify a `Simulink.Bus` object as the data type, use the name of the bus object preceded by `Bus:`. For example, specify `'Bus: myBusObject'`.

Example: `'auto'`

Example: `'int8'`

Example: `'fixdt(1,16,5)'`

Example: `'myAliasTypeObject'`

Example: `'Enum: myEnumType'`

Example: `'Bus: myBusObject'`

Data Types: `char`

Description — Custom description of parameter object
`''` (empty character vector) (default) | character vector

Custom description of the parameter object, specified as a character vector. Use this property to document the significance that the parameter object has in your algorithm.

If you have Embedded Coder, you can configure this description to appear in the generated code as a comment. See "Simulink data object descriptions" (Simulink Coder).

Example: `'This parameter represents the maximum rotation speed of the engine.'`

Data Types: `char`

Dimensions — Dimensions of parameter value
`[0 0]` (default) | row vector | character vector

Dimensions of the value stored in the `Value` property, returned as a row vector or specified as a character vector.

When you set the `Value` property of the object, the object sets the value of the `Dimensions` property to a `double` row vector. The vector is the same vector that the `size` function returns.

To use symbolic dimensions, specify a character vector. See "Implement Dimension Variants for Array Sizes in Generated Code" (Embedded Coder).

Example: [1 3]

Example: '[1 myDimParam]'

Data Types: double | char

Max — Maximum value of parameter
[] (empty) (default) | real double scalar

Maximum value that the Value property of the object can store, specified as a real double scalar.

The default value is [] (empty), which means the parameter value does not have a maximum.

If you store a complex number in the Value property, the Max property applies separately to the real and imaginary parts.

If you store a structure in the Value property, the object ignores the Max property. Instead, use a Simulink.Bus object as the data type of the parameter object, and specify a maximum value for each field by using the elements of the bus object. See "Control Field Data Types and Characteristics by Creating Parameter Object".

If the parameter value is greater than the maximum value or if the maximum value is outside the range of the object data type, Simulink generates a warning. When updating the diagram or starting a simulation, Simulink generates an error.

For more information about how Simulink uses this property, see "Specify Minimum and Maximum Values for Block Parameters".

Example: 5.32

Data Types: double

Min — Minimum value of parameter
[] (empty) (default) | real double scalar

Minimum value that the Value property of the object can store, specified as a real double scalar.

The default value is [] (empty), which means the parameter value does not have a minimum.

If you store a complex number in the `Value` property, the `Min` property applies separately to the real and imaginary parts.

If you store a structure in the `Value` property, the object ignores the `Min` property. Instead, use a `Simulink.Bus` object as the data type of the parameter object, and specify a minimum value for each field by using the elements of the bus object. See "Control Field Data Types and Characteristics by Creating Parameter Object".

If the parameter value is less than the minimum value or if the minimum value is outside the range of the object data type, Simulink generates a warning. When updating the diagram or starting a simulation, Simulink generates an error.

For more information about how Simulink uses this property, see "Specify Minimum and Maximum Values for Block Parameters"

Example: `-0.92`

Data Types: `double`

Unit — Physical unit of parameter value
empty (default) | valid unit

Physical unit of parameter value, specified as a character vector. For more information, see "Unit Specification in Simulink Models".

Example: `'degC'`

Data Types: `char`

Value — Value to use in target block parameters
[] (default) | valid value

Value to use in target block parameters, specified as any of these valid values:

- Numeric value
- Boolean value
- Instance of enumerated type
- Structure
- Scalar or array
- Mathematical expression (see "Set Variable Value by Using a Mathematical Expression")

You can use MATLAB syntax to specify the value.

Example Expression	Description
`15.23`	Specifies a scalar value
`[3 4; 9 8]`	Specifies a matrix
`3+2i`	Specifies a complex value
`struct('A',20,'B',5)`	Specifies a structure with two fields, A and B, with double-precision values 20 and 5. Organize block parameters into structures (see "Organize Related Block Parameter Definitions in Structures") or initialize the signal elements in a bus (see "Specify Initial Conditions for Bus Signals").
`slexpr('myVar + myOtherVar')`	Specifies the expression `myVar + myOtherVar` where `myVar` and `myOtherVar` are other MATLAB variables or parameter objects. Simulink preserves this mathematical relationship between the object and the variables.

To use a `Simulink.Parameter` object to store a value of a particular numeric data type, specify the ideal value with the `Value` property, and control the type with the `DataType` property.

If you set the `Value` property by using a typed expression such as `single(32.5)`, the `DataType` property changes to reflect the new type. A best practice is using an expression that is not typed. You can avoid accumulating numerical error through repeated quantizations or data type saturation, especially for fixed-point data types.

Example: `3.15`

Example: `single([3.15 1.23])`

Example: `1.2 + 3.2i`

Example: `true`

Example: `myEnumType.myEnumValue`

Example: `struct('field1',15,'field2',7.32)`

Example: `slexpr('myVar + myOtherVar')`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical` | `struct` | `fi`

Complex Number Support: Yes

Examples

Use Parameter Object to Set Value of Gain Parameter

1   At the command prompt, create a `Simulink.Parameter` object.

```
myParam = Simulink.Parameter;
```

2   Assign a numeric value to the `Value` property.

```
myParam.Value = 15.23;
```

3   Specify other characteristics for the block parameter by adjusting the object properties. For example, to specify the minimum and maximum values the parameter can take, use the `Min` and `Max` properties.

```
myParam.Min = 10.11;
myParam.Max = 25.27;
```

4   In a block dialog box, specify the value of a parameter as `myParam`. For example, in a Gain block dialog box, specify **Gain** as `myParam`.

During simulation, the **Gain** parameter uses the value `15.23`.

Change Value Stored by Parameter Object

1   At the command prompt, create a `Simulink.Parameter` object that stores the value `2.52`.

```
myParam = Simulink.Parameter(2.52);
```

2   Change the value by accessing the `Value` property of the object. This technique preserves the values of the other properties of the object.

```
myParam.Value = 1.13;
```

Create Parameter Object with Specific Numeric Data Type

To reduce model maintenance, you can leave the `DataType` property at its default value, `auto`. The parameter object acquires a data type from the block parameter that uses the object.

To reduce the risk of the data type changing when you make changes to signal data types and other data types in your model, you can explicitly specify a data type for the parameter object. For example, when you generate code that exports parameter data to your custom code, explicitly specify a data type for the object.

1 At the command prompt, create a `Simulink.Parameter` object that stores the value `18.25`.

```
myParam = Simulink.Parameter(18.25);
```

The expression `18.25` returns the number `18.25` with the double-precision, floating-point data type `double`. The `Value` property stores the number `18.25` with double precision.

2 Use the `DataType` property to specify the single-precision data type `single`.

```
myParam.DataType = 'single';
```

When you simulate or generate code, the parameter object casts the value of the `Value` property, `18.25`, to the data type specified by the `DataType` property, `single`.

Set Parameter Value to a Mathematical Expression

This example shows how to set the value of a parameter object, `myParam`, to the sum of two other variables, `myVar` and `myOtherVar`. With this technique, when you change the values of the independent variables, Simulink immediately calculates the new value of the parameter object.

1 Create the two independent variables.

```
myVar = 5.2;
myOtherVar = 9.8;
```

2 Create the parameter object.

```
myParam = Simulink.Parameter;
```

3 Set the value of the parameter object to the expression `myVar + myOtherVar`.

```
myParam.Value = slexpr('myVar + myOtherVar')
```

Simulink.RunTimeBlock

Allow Level-2 MATLAB S-function and other MATLAB programs to get information about block while simulation is running

Description

This class allows a Level-2 MATLAB S-function or other MATLAB program to obtain information about a block. Simulink software creates an instance of this class or a derived class for each block in a model. Simulink software passes the object to the callback methods of Level-2 MATLAB S-functions when it updates or simulates a model, allowing the callback methods to get block-related information from and provide such information to Simulink software. See "Write Level-2 MATLAB S-Functions" in Writing S-Functions for more information. You can also use instances of this class in MATLAB programs to obtain information about blocks during a simulation. See "Access Block Data During Simulation" for more information.

Note `Simulink.RunTimeBlock` objects do not support MATLAB sparse matrices. For example, the following line of code attempts to assign a sparse identity matrix to the run-time object's output port data. This line of code in a Level-2 MATLAB S-function produces an error:

```
block.Outport(1).Data = speye(10);
```

Parent Class

None

Derived Classes

`Simulink.MSFcnRunTimeBlock`

Property Summary

Name	Description
"BlockHandle" on page 5-405	Block's handle.
"CurrentTime" on page 5-405	Current simulation time.
"NumDworks" on page 5-405	Number of discrete work vectors used by the block.
"NumOutputPorts" on page 5-406	Number of block output ports.
"NumContStates" on page 5-406	Number of block's continuous states.
"NumDworkDiscStates" on page 5-406	Number of block's discrete states
"NumDialogPrms" on page 5-406	Number of parameters that can be entered on S-function block's dialog box.
"NumInputPorts" on page 5-407	Number of block's input ports.
"NumRuntimePrms" on page 5-407	Number of run-time parameters used by block.
"SampleTimes" on page 5-407	Sample times at which block produces outputs.

Method Summary

Name	Description
"ContStates" on page 5-408	Get a block's continuous states.
"DataTypeIsFixedPoint" on page 5-408	Determine whether a data type is fixed point.
"DatatypeName" on page 5-408	Get name of a data type supported by this block.
"DatatypeSize" on page 5-409	Get size of a data type supported by this block.
"Derivatives" on page 5-409	Get a block's continuous state derivatives.
"DialogPrm" on page 5-410	Get a parameter entered on an S-function block's dialog box.

Name	Description
"Dwork" on page 5-410	Get one of a block's DWork vectors.
"FixedPointNumericType" on page 5-411	Determine the properties of a fixed-point data type.
"InputPort" on page 5-411	Get one of a block's input ports.
"OutputPort" on page 5-412	Get one of a block's output ports.
"RuntimePrm" on page 5-412	Get one of the run-time parameters used by a block.

Properties

BlockHandle

Block's handle.

RO

CurrentTime

Current simulation time.

RO

NumDworks

Number of data work vectors.

RW

`ssGetNumDWork`

NumOutputPorts

Number of output ports.

RW

ssGetNumOutputPorts

NumContStates

Number of continuous states.

RW

ssGetNumContStates

NumDworkDiscStates

Number of discrete states. In a MATLAB S-function, you need to use DWorks to set up discrete states.

RW

ssGetNumDiscStates

NumDialogPrms

Number of parameters declared on the block's dialog. In the case of the S-function, it returns the number of parameters listed as a comma-separated list in the **S-function parameters** dialog field.

RW

`ssGetNumSFcnParams`

NumInputPorts

Number of input ports.

RW

`ssGetNumInputPorts`

NumRuntimePrms

Number of run-time parameters used by this block. See "Run-Time Parameters" for more information.

RW

`ssGetNumSFcnParams`

SampleTimes

Block's sample times.

RW for MATLAB S-functions, RO for all other blocks.

Methods

ContStates

Get a block's continuous states.

```
states = ContStates();
```

Get vector of continuous states.

```
ssGetContStates
```

DataTypeIsFixedPoint

Determine whether a data type is fixed point.

```
bVal = DataTypeIsFixedPoint(dtID);
```

```
dtID
```
    Integer value specifying the ID of a data type.

Returns `true` if the specified data type is a fixed-point data type.

DatatypeName

Get the name of a data type.

```
name = DatatypeName(dtID);
```

dtID
>   Integer value specifying ID of a data type.

Returns the name of the data type specified by dtID.

"DatatypeSize" on page 5-409

DatatypeSize

Get the size of a data type.

```
size = DatatypeSize(dtID);
```

dtID
>   Integer value specifying the ID of a data type.

Returns the size of the data type specified by dtID.

"DatatypeName" on page 5-408

Derivatives

Get derivatives of a block's continuous states.

```
derivs = Derivatives();
```

Get vector of state derivatives.

ssGetdX

DialogPrm

Get an S-function's dialog parameters.

```
param = DialogPrm(pIdx);
```

pIdx

    Integer value specifying the index of the parameter to be returned.

Get the specified dialog parameter. In the case of the S-function, each `DialogPrm` corresponds to one of the elements in the comma-separated list of parameters in the **S-function parameters** dialog field.

`ssGetSFcnParam`, "RuntimePrm" on page 5-412

Dwork

Get one of a block's DWork vectors.

```
dworkObj = Dwork(dwIdx);
```

dwIdx

    Integer value specifying the index of a work vector.

Get information about the DWork vector specified by `dwIdx` where `dwIdx` is the index number of the work vector. This method returns an object of type `Simulink.BlockCompDworkData`.

`ssGetDWork`

FixedPointNumericType

Get the properties of a fixed-point data type.

```
eno = FixedPointNumericType(dtID);
```

dtID
    Integer value specifying the ID of a fixed-point data type.

Returns an object of `embedded.Numeric` class that contains the attributes of the specified fixed-point data type.

Note `embedded.Numeric` is also the class of the `numerictype` objects created by Fixed-Point Designer software. For information on the properties defined by `embedded.Numeric` class, see "numerictype Object Properties" (Fixed-Point Designer).

InputPort

Get an input port of a block.

```
port = InputPort(pIdx);
```

pIdx
    Integer value specifying the index of an input port.

Get the input port specified by `pIdx`, where `pIdx` is the index number of the input port. For example,

```
port = rto.InputPort(1)
```

returns the first input port of the block represented by the run-time object `rto`.

This method returns an object of type `Simulink.BlockPreCompInputPortData` or `Simulink.BlockCompInputPortData`, depending on whether the model that contains

the port is uncompiled or compiled. You can use this object to get and set the input port's uncompiled or compiled properties, respectively.

ssGetInputPortSignalPtrs, Simulink.BlockPreCompInputPortData, Simulink.BlockCompInputPortData, "OutputPort" on page 5-412

OutputPort

Get an output port of a block.

```
port = OutputPort(pIdx);
```

pIdx

   Integer value specifying the index of an output port.

Get the output port specified by pIdx, where pIdx is the index number of the output port. For example,

```
port = rto.OutputPort(1)
```

returns the first output port of the block represented by the run-time object rto.

This method returns an object of type Simulink.BlockPreCompOutputPortData or Simulink.BlockCompOutputPortData, depending on whether the model that contains the port is uncompiled or compiled, respectively. You can use this object to get and set the output port's uncompiled or compiled properties, respectively.

ssGetInputPortSignalPtrs, Simulink.BlockPreCompOutputPortData, Simulink.BlockCompOutputPortData

RuntimePrm

Get an S-function's run-time parameters.

```
param = RuntimePrm(pIdx);
```

pIdx

   Integer value specifying the index of a run-time parameter.

Get the run-time parameter whose index is pIdx. This run-time parameter is a Simulink.BlockData on page 5-176 object of type Simulink.BlockRunTimePrmData.

ssGetRunTimeParamInfo

Introduced before R2006a

Simulink.SampleTime class

Package: Simulink

Object containing sample time information

Description

The `SampleTime` class represents the sample time information associated with an individual sample time.

Use the methods `Simulink.Block.getSampleTimes` and `Simulink.BlockDiagram.getSampleTimes` to retrieve the values of the `SampleTime` properties for a block and for a block diagram, respectively.

Properties

`Value`

A two-element array of doubles that contains the period and offset of the sample time

`Description`

A 1x*n* character array that describes the sample time type

`ColorRGBValue`

A 1x3 array of doubles that contains the red, green and blue (RGB) values of the sample time color

`Annotation`

A 1x*n* character array that represents the annotation of a specific sample time (for example, 'D1')

OwnerBlock

For asynchronous and variable sample times, `OwnerBlock` is a character vector containing the full path to the block that controls the sample time. For all other types of sample times, it is an empty character vector.

ComponentSampleTimes

If the sample time is an async union or if the sample time is hybrid and the component sample times are available, then the array ComponentSampleTimes contains Simulink.SampleTime objects.

Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects (MATLAB) in the MATLAB Programming Fundamentals documentation.

Examples

Retrieve the sample time information for the 'vdp' model.

```
ts = Simulink.BlockDiagram.getSampleTimes('vdp')
```

Simulink returns:

```
ts =

  1x2 Simulink.SampleTime
  Package: Simulink

  Properties:
    Value
    Description
    ColorRGBValue
    Annotation
    OwnerBlock
    ComponentSampleTimes

  Methods
```

To examine the values of the properties:

```
ts(1), ts(2)

ans =

  Simulink.SampleTime
  Package: Simulink

  Properties:
                 Value: [0 0]
           Description: 'Continuous'
          ColorRGBValue: [0 0 0]
             Annotation: 'Cont'
              OwnerBlock: []
    ComponentSampleTimes: {}

  Methods

ans =

  Simulink.SampleTime
  Package: Simulink

  Properties:
                 Value: [Inf 0]
           Description: 'Constant'
          ColorRGBValue: [1 0.2600 0.8200]
             Annotation: 'Inf'
              OwnerBlock: []
    ComponentSampleTimes: {}

  Methods
```

See Also

Simulink.Block.getSampleTimes | Simulink.BlockDiagram.getSampleTimes

Simulink.sdi.CustomSnapshot class

Package: Simulink.sdi

Specify settings for a snapshot without opening or affecting the Simulation Data Inspector

Description

Use a `Simulink.sdi.CustomSnapshot` object to specify settings for a snapshot you want to create without opening the Simulation Data Inspector or affecting the open session. Creating a snapshot using a `Simulink.sdi.CustomSnapshot` object is the best option for fully scripted workflows. You can specify the snapshot dimensions in pixels, the subplot layout, and limits for the *x*- and *y*- axes. You can use the `clearSignals` and `plotOnSubplot` methods to plot signals you want to include in the snapshot. To capture the snapshot, you can pass the `Simulink.sdi.CustomSnapshot` object as the value for the `settings` name-value pair for the `Simulink.sdi.snapshot` function or use the `snapshot` method.

Construction

`snap = Simulink.sdi.CustomSnapshot` creates a `Simulink.sdi.CustomSnapshot` object.

Properties

Width — Image width
600 (default) | scalar

Image width, in pixels.

Example: 750

Height — Image height
400 (default) | scalar

Image height, in pixels.

Example: 500

Rows — Number of subplot rows
1 (default) | scalar

Number of subplot rows, specified as a scalar between 1 and 8, inclusive. Use Rows and Columns to set your desired subplot layout.

Example: 2

Columns — Number of subplot columns
1 (default) | scalar

Number of subplot rows, specified as a scalar between 1 and 8, inclusive. Use Rows and Columns to set your desired subplot layout.

Example: 3

TimeSpan — X-axis limits
2x1 matrix

Limits for the time axis in the snapshot. The time axis limits are the same for all subplots. By default, the time axis adjusts to accommodate the largest time range of the plotted signals.

Example: [0 20]

YRange — Y-axis limits
cell array

Cell array of 1-by-2 matrices specifying the *y*-axis limits for all subplots in the custom snapshot. By default, YRange is [-3 3] for all subplots.

Example: {[-10 10],[0 100]}

Methods

clearSignals	Clear signals plotted on subplots of a Simulink.sdi.CustomSnapshot object
plotOnSubPlot	Plot signals on Simulink.sdi.CustomSnapshot object subplots
snapshot	Create a custom snapshot

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Copy View Settings to a Run

This example shows how to copy the view settings for aligned signals from one run to another.

Simulate Your Model and get Run Object

Simulate the vdp model to create a run of data to visualize.

```
load_system('vdp')
set_param('vdp','SaveFormat','Dataset','SaveOutput','on')
sim('vdp')

runIndex = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(runIndex);
run = Simulink.sdi.getRun(runID);
```

Modify View Settings for Signals

Use the Simulink.sdi.Run object to access the signals in the run. Then, modify the signals' view settings, and plot them in the Simulation Data Inspector. Open the Simulation Data Inspector and use Simulink.sdi.snapshot to view the results.

```
sig1 = run.getSignalByIndex(1);
sig2 = run.getSignalByIndex(2);

sig1.LineColor = [0 0 1];
sig1.LineDashed = '-.';

sig2.LineColor = [1 0 0];
sig2.LineDashed = ':';
```

Capture a Snapshot from the Simulation Data Inspector

Create a `Simulink.sdi.CustomSnapshot` object and use the
`Simulink.sdi.snapshot` function to programmatically capture a snapshot of the
contents of the Simulation Data Inspector.

```
snap = Simulink.sdi.CustomSnapshot;

snap.Rows = 2;
snap.YRange = {[-2.25 2.25],[-3 3]};
snap.plotOnSubPlot(1,1,sig1,true)
snap.plotOnSubPlot(2,1,sig2,true)

fig = Simulink.sdi.snapshot("from","custom","to","figure","settings",snap);
```

Copy the View Settings to a New Simulation Run

Simulate the model again, with a different Mu value. Then, visualize the new run by copying the view settings from the first run. Specify the plot input as true to plot the signals from the new run.

```
set_param('vdp/Mu','Gain','5')
sim('vdp')

runIndex2 = Simulink.sdi.getRunCount;
runID2 = Simulink.sdi.getRunIDByIndex(runIndex2);
run2 = Simulink.sdi.getRun(runID2);

sigIDs = Simulink.sdi.copyRunViewSettings(runID,runID2,true);
```

Capture a Snapshot of the New Simulation Run

Use the Simulink.sdi.CustomSnapshot object to capture a snapshot of the new simulation run. First, clear the signals from the subplots. Then, plot the signals from the new run and capture another snapshot.

```
snap.clearSignals
snap.YRange = {[-2.25 2.25],[-8 8]};
snap.plotOnSubPlot(1,1,sigIDs(2),true)
snap.plotOnSubPlot(2,1,sigIDs(1),true)

fig = snap.snapshot("to","figure");
```

clearSignals

Class: Simulink.sdi.CustomSnapshot
Package: Simulink.sdi

Clear signals plotted on subplots of a `Simulink.sdi.CustomSnapshot` object

Syntax

```
snap.clearSignals
```

Description

`snap.clearSignals` clears plotted signals from all subplots in the `Simulink.sdi.CustomSnapshot` object, `snap`. Using the `clearSignals` method does not affect any subplots or signals in your open Simulation Data Inspector session.

Examples

Copy View Settings to a Run

This example shows how to copy the view settings for aligned signals from one run to another.

Simulate Your Model and get Run Object

Simulate the `vdp` model to create a run of data to visualize.

```
load_system('vdp')
set_param('vdp','SaveFormat','Dataset','SaveOutput','on')
sim('vdp')

runIndex = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(runIndex);
run = Simulink.sdi.getRun(runID);
```

Modify View Settings for Signals

Use the `Simulink.sdi.Run` object to access the signals in the run. Then, modify the signals' view settings, and plot them in the Simulation Data Inspector. Open the Simulation Data Inspector and use `Simulink.sdi.snapshot` to view the results.

```
sig1 = run.getSignalByIndex(1);
sig2 = run.getSignalByIndex(2);

sig1.LineColor = [0 0 1];
sig1.LineDashed = '-.';

sig2.LineColor = [1 0 0];
sig2.LineDashed = ':';
```
Capture a Snapshot from the Simulation Data Inspector

Create a `Simulink.sdi.CustomSnapshot` object and use the `Simulink.sdi.snapshot` function to programmatically capture a snapshot of the contents of the Simulation Data Inspector.

```
snap = Simulink.sdi.CustomSnapshot;

snap.Rows = 2;
snap.YRange = {[-2.25 2.25],[-3 3]};
snap.plotOnSubPlot(1,1,sig1,true)
snap.plotOnSubPlot(2,1,sig2,true)

fig = Simulink.sdi.snapshot("from","custom","to","figure","settings",snap);
```

Copy the View Settings to a New Simulation Run

Simulate the model again, with a different Mu value. Then, visualize the new run by copying the view settings from the first run. Specify the plot input as true to plot the signals from the new run.

```
set_param('vdp/Mu','Gain','5')
sim('vdp')

runIndex2 = Simulink.sdi.getRunCount;
runID2 = Simulink.sdi.getRunIDByIndex(runIndex2);
run2 = Simulink.sdi.getRun(runID2);

sigIDs = Simulink.sdi.copyRunViewSettings(runID,runID2,true);
```

Capture a Snapshot of the New Simulation Run

Use the `Simulink.sdi.CustomSnapshot` object to capture a snapshot of the new simulation run. First, clear the signals from the subplots. Then, plot the signals from the new run and capture another snapshot.

```
snap.clearSignals
snap.YRange = {[-2.25 2.25],[-8 8]};
snap.plotOnSubPlot(1,1,sigIDs(2),true)
snap.plotOnSubPlot(2,1,sigIDs(1),true)

fig = snap.snapshot("to","figure");
```

plotOnSubPlot

Class: Simulink.sdi.CustomSnapshot
Package: Simulink.sdi

Plot signals on `Simulink.sdi.CustomSnapshot` object subplots

Syntax

```
snap.plotOnSubPlot(row,column,signal,plot)
```

Description

`snap.plotOnSubPlot(row,column,signal,plot)` plots the `signal` on the subplot in the `Simulink.sdi.CustomSnapshot` object, `snap`, specified by `row` and `column` when `plot` is `true`. When `plot` is `false`, `plotOnSubPlot` clears the `signal` from the subplot.

Input Arguments

`row` — Subplot row
scalar

Row for subplot on which you want to plot a signal. Specify `row` as a value from 1 through 8, inclusive.

Example: 2

`column` — Subplot column
scalar

Column for subplot on which you want to plot a signal. Specify `column` as a value from 1 through 8, inclusive.

Example: 3

signal — Signal to plot
Simulink.sdi.Signal | signal ID

Signal ID or `Simulink.sdi.Signal` object corresponding to the signal you want to plot.

Example: `sigID`

plot — Plot indicator
logical

Logical indicator of whether to plot or clear the signal from the subplot.

- `true` – Plot the signal.
- `false` – Clear the signal.

Example: `true`

Data Types: `logical`

Examples

Copy View Settings to a Run

This example shows how to copy the view settings for aligned signals from one run to another.

Simulate Your Model and get Run Object

Simulate the `vdp` model to create a run of data to visualize.

```
load_system('vdp')
set_param('vdp','SaveFormat','Dataset','SaveOutput','on')
sim('vdp')

runIndex = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(runIndex);
run = Simulink.sdi.getRun(runID);
```

Modify View Settings for Signals

Use the `Simulink.sdi.Run` object to access the signals in the run. Then, modify the signals' view settings, and plot them in the Simulation Data Inspector. Open the Simulation Data Inspector and use `Simulink.sdi.snapshot` to view the results.

```
sig1 = run.getSignalByIndex(1);
sig2 = run.getSignalByIndex(2);

sig1.LineColor = [0 0 1];
sig1.LineDashed = '-.';

sig2.LineColor = [1 0 0];
sig2.LineDashed = ':';
```
Capture a Snapshot from the Simulation Data Inspector

Create a `Simulink.sdi.CustomSnapshot` object and use the `Simulink.sdi.snapshot` function to programmatically capture a snapshot of the contents of the Simulation Data Inspector.

```
snap = Simulink.sdi.CustomSnapshot;

snap.Rows = 2;
snap.YRange = {[-2.25 2.25],[-3 3]};
snap.plotOnSubPlot(1,1,sig1,true)
snap.plotOnSubPlot(2,1,sig2,true)

fig = Simulink.sdi.snapshot("from","custom","to","figure","settings",snap);
```

Copy the View Settings to a New Simulation Run

Simulate the model again, with a different Mu value. Then, visualize the new run by copying the view settings from the first run. Specify the plot input as true to plot the signals from the new run.

```
set_param('vdp/Mu','Gain','5')
sim('vdp')

runIndex2 = Simulink.sdi.getRunCount;
runID2 = Simulink.sdi.getRunIDByIndex(runIndex2);
run2 = Simulink.sdi.getRun(runID2);

sigIDs = Simulink.sdi.copyRunViewSettings(runID,runID2,true);
```
5-431

Capture a Snapshot of the New Simulation Run

Use the `Simulink.sdi.CustomSnapshot` object to capture a snapshot of the new simulation run. First, clear the signals from the subplots. Then, plot the signals from the new run and capture another snapshot.

```
snap.clearSignals
snap.YRange = {[-2.25 2.25],[-8 8]};
snap.plotOnSubPlot(1,1,sigIDs(2),true)
snap.plotOnSubPlot(2,1,sigIDs(1),true)

fig = snap.snapshot("to","figure");
```

snapshot

Class: Simulink.sdi.CustomSnapshot
Package: Simulink.sdi

Create a custom snapshot

Syntax

```
fig = snap.snapshot
[fig,image] = snap.snapshot
fig = snap.snapshot(Name,Value)
[fig,image] = snap.snapshot
```

Description

`fig = snap.snapshot` creates a figure according to the properties of the `Simulink.sdi.CustomSnapshot` object, `snap`, and returns the handle for the figure, `fig`.

`[fig,image] = snap.snapshot` creates a figure according to the properties of the `Simulink.sdi.CustomSnapshot` object, `snap`, and returns the handle for the figure, `fig`, and an array of image data, `image`.

`fig = snap.snapshot(Name,Value)` creates a figure according to the properties of the `Simulink.sdi.CustomSnapshot` object, `snap`, with additional options specified by one or more `Name,Value` pair arguments. This syntax returns the figure handle, `fig`.

`[fig,image] = snap.snapshot` creates a figure according to the properties of the `Simulink.sdi.CustomSnapshot` object, `snap`, with additional options specified by one or more `Name,Value` pair arguments. This syntax returns the figure handle, `fig`, and an array of image data, `image`.

Input Arguments

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (`'  '`). You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: `'to','figure','props',{'Name','My Data'}`

to — Type of snapshot to create
`'image'` (default) | `'figure'` | `'file'` | `'clipboard'`

Type of snapshot to create.

- `'image'` — Create a figure and return the figure handle and an array of image data. When you specify `'to','image'`, the `fig` and `image` outputs both have value.
- `'figure'` — Create a figure and return the figure handle. When you specify `'to','figure'` the `fig` output has value, and the `image` output is empty.
- `'file'` — Save to a PNG file with the name specified by the `filename` name-value pair. If you do not specify a `filename` name-value pair, the file is named `plots.png`. When you specify `'to','file'`, the `fig` and `image` outputs are both empty.
- `'clipboard'` — Copy the plots to your system clipboard. From the clipboard, you can paste the image into another program such as Microsoft Word. When you specify `'to','clipboard'`, the `fig` and `image` outputs are both empty.

Example: `'to','file'`

Data Types: `char` | `string`

filename — Name for image file
`'plots.png'` (default) | character array | string

Name of the image file to store the snapshot when you specify `'to','file'`.

Example: `'filename','MyImage.png'`

Data Types: `char` | `string`

props — Properties to customize the figure
cell array

Figure properties, specified as a cell array. You can include settings for the figure properties described in Figure Properties.

Example: `'props',{'Name','MyData','NumberTitle','off'}`

Data Types: `char` | `string`

Output Arguments

`fig` — Figure handle
figure handle

Handle for the figure. When a figure is not created with your specified options, the `fig` output is empty.

`image` — Image data
array

Array of image data. The `image` output has value when you use `Simulink.sdi.snapshot` without any input arguments or without a `to` name-value pair and when you specify `'to','image'`.

Examples

Copy View Settings to a Run

This example shows how to copy the view settings for aligned signals from one run to another.

Simulate Your Model and get Run Object

Simulate the `vdp` model to create a run of data to visualize.

```
load_system('vdp')
set_param('vdp','SaveFormat','Dataset','SaveOutput','on')
sim('vdp')

runIndex = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(runIndex);
run = Simulink.sdi.getRun(runID);
```

Modify View Settings for Signals

Use the `Simulink.sdi.Run` object to access the signals in the run. Then, modify the signals' view settings, and plot them in the Simulation Data Inspector. Open the Simulation Data Inspector and use `Simulink.sdi.snapshot` to view the results.

```
sig1 = run.getSignalByIndex(1);
sig2 = run.getSignalByIndex(2);

sig1.LineColor = [0 0 1];
sig1.LineDashed = '-.';

sig2.LineColor = [1 0 0];
sig2.LineDashed = ':';
```
Capture a Snapshot from the Simulation Data Inspector

Create a `Simulink.sdi.CustomSnapshot` object and use the `Simulink.sdi.snapshot` function to programmatically capture a snapshot of the contents of the Simulation Data Inspector.

```
snap = Simulink.sdi.CustomSnapshot;

snap.Rows = 2;
snap.YRange = {[-2.25 2.25],[-3 3]};
snap.plotOnSubPlot(1,1,sig1,true)
snap.plotOnSubPlot(2,1,sig2,true)

fig = Simulink.sdi.snapshot("from","custom","to","figure","settings",snap);
```

Copy the View Settings to a New Simulation Run

Simulate the model again, with a different Mu value. Then, visualize the new run by copying the view settings from the first run. Specify the plot input as true to plot the signals from the new run.

```
set_param('vdp/Mu','Gain','5')
sim('vdp')

runIndex2 = Simulink.sdi.getRunCount;
runID2 = Simulink.sdi.getRunIDByIndex(runIndex2);
run2 = Simulink.sdi.getRun(runID2);

sigIDs = Simulink.sdi.copyRunViewSettings(runID,runID2,true);
```

Capture a Snapshot of the New Simulation Run

Use the `Simulink.sdi.CustomSnapshot` object to capture a snapshot of the new simulation run. First, clear the signals from the subplots. Then, plot the signals from the new run and capture another snapshot.

```
snap.clearSignals
snap.YRange = {[-2.25 2.25],[-8 8]};
snap.plotOnSubPlot(1,1,sigIDs(2),true)
snap.plotOnSubPlot(2,1,sigIDs(1),true)

fig = snap.snapshot("to","figure");
```

Simulink.sdi.DatasetRef class

Package: Simulink.sdi

Access data in Simulation Data Inspector repository

Description

The `Simulink.sdi.DatasetRef` class provides access to data in the Simulation Data Inspector repository without loading the entire set of data into memory. The class is compatible with the `Simulink.SimulationData.DatasetRef` class.

Construction

`dsr_array = Simulink.sdi.DatasetRef` constructs an array containing a `Simulink.sdi.DatasetRef` object for each run in the Simulation Data Inspector.

`dsr_array = Simulink.sdi.DatasetRef(domain)` creates an array containing a `Simulink.sdi.DatasetRef` object for each run, with the contents of each run limited to the selected `domain`.

`dsr = Simulink.sdi.DatasetRef(runID)` creates a `Simulink.sdi.DatasetRef` object of the run corresponding to the run identifier, `runID`.

`dsr = Simulink.sdi.DatasetRef(runID, domain)` creates a `Simulink.sdi.DatasetRef` object of the run corresponding to `runID` with the contents specified by `domain`.

`dsr = Simulink.sdi.DatasetRef(runID, domain, repositoryPath)` creates a `Simulink.sdi.DatsetRef` object of the run corresponding to `runID` including the contents specified by `domain` from a repository path specified by `repositoryPath`.

Input Arguments

`domain` — Specify contents of Simulink.sdi.DatasetRef objects
'signals' | 'outports' | []

Limits the contents included in the `Simulink.sdi.DatasetRef` object.

- `'signals'` includes only logged signals.
- `'outports'` includes only logged outports.
- `[]` includes all run data.

runID — Run identifier
integer

Specifies the run containing the data for the `Simulink.sdi.DatasetRef` object.

repositoryPath — Path containing the run
string | character vector

Specifies the location of the run containing the data for the `Simulink.sdi.DatasetRef` object.

Properties

Name — Run name
character vector

The name of the run that corresponds with the `Simulink.sdi.DatasetRef` object.

Example: `'Run 1'`

Run — Simulink.sdi.Run object
Simulink.sdi.Run object

`Simulink.sdi.Run` object associated with the `Simulink.sdi.DatasetRef` object.

numElements — Number of top-level elements in run
Simulink.sdi.Run object

Number of top-level elements in the `Simulink.sdi.Run` object associated with the `Simulink.sdi.DatasetRef` object.

Methods

compare	Compare runs with DatasetRef objects
getAsDatastore	Retrieve element as sdidatastore object
getElement	Retrieve DatasetRef element by index
getElementNames	Get character vectors of element names
getSignal	Return Signal object
plot	Open the Simulation Data Inspector to view and compare data

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Compare Runs with the Simulink.sdi.DatasetRef Object

This example shows how to work with the `Simulink.sdi.DatasetRef` object by comparing two runs of the `ex_sldemo_absbrake` system with different desired slip ratios.

```matlab
% Simulate model ex_sldemo_absbrake to create a run of logged signals
load_system('ex_sldemo_absbrake')
sim('ex_sldemo_absbrake')

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
run = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = run.getDatasetRef;
```

```matlab
% Get the names of the elements in the object
names = run_DSRef.getElementNames

names = 2x1 cell array
    {'yout'}
    {'slp' }

% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);

% View signals in outputs
outputs = yout.Values

outputs = struct with fields:
    Ww: [1x1 timeseries]
    Vs: [1x1 timeseries]
    Sd: [1x1 timeseries]

% Get slp signal
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

% Create another run for a different Desired relative slip
set_param('ex_sldemo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_sldemo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));

% Open the Simulation Data Inspector to view signals
run_DSRef.plot
```

"Inspect and Compare Data Programmatically"

Introduced in R2017b

compare

Class: Simulink.sdi.DatasetRef
Package: Simulink.sdi

Compare runs with DatasetRef objects

Syntax

```
[matches, mismatches, results] = dsrObj.compare(other)
```

Description

`[matches, mismatches, results] = dsrObj.compare(other)` returns the number of matches, number of mismatches, and comparison results for a comparison of data in a `Simulink.sdi.DatasetRef` object. The comparison results are returned as a `Simulink.sdi.DiffRunResult` object.

Input Arguments

`other` — Comparison data
MAT-file | variable

Comparison data, which can come from another `Simulink.sdi.DatasetRef` object, a `Dataset` in the workspace, or a MAT-file.

Example: `'data.mat'`

Example: `var`

Output Arguments

`matches` — Number of matching signals
integer

Number of signals that matched within tolerance in the comparison.

mismatches — Number of mismatched signals
integer

Number of signals that did not match within tolerance in the comparison.

results — Simulink.sdi.DiffRunResult object with comparison results
Simulink.sdi.DiffRunResult object

Results of the comparison, returned in a `Simulink.sdi.DiffRunResult` object.

Examples

Compare Runs with the Simulink.sdi.DatasetRef Object

This example shows how to work with the `Simulink.sdi.DatasetRef` object by comparing two runs of the `ex_sldemo_absbrake` system with different desired slip ratios.

```
% Simulate model ex_sldemo_absbrake to create a run of logged signals
load_system('ex_sldemo_absbrake')
sim('ex_sldemo_absbrake')

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
run = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = run.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames

names = 2x1 cell array
    {'yout'}
    {'slp' }

% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);
```

```
% View signals in outputs
outputs = yout.Values

outputs = struct with fields:
    Ww: [1x1 timeseries]
    Vs: [1x1 timeseries]
    Sd: [1x1 timeseries]

% Get slp signal
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

% Create another run for a different Desired relative slip
set_param('ex_sldemo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_sldemo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));

% Open the Simulation Data Inspector to view signals
run_DSRef.plot
```

Alternatives

Using the Simulation Data Inspector API, you could create runs for the data you want to compare and use `Simulink.sdi.compareRuns` for the comparison. You can also view runs created from simulation, import data to runs, and compare runs with the Simulation Data Inspector UI.

getAsDatastore

Class: Simulink.sdi.DatasetRef
Package: Simulink.sdi

Retrieve element as sdidatastore object

Syntax

```
[elementDatastore, name, index] = SDIDatasetRef.getAsDatastore(arg)
```

Description

`[elementDatastore, name, index] = SDIDatasetRef.getAsDatastore(arg)`
returns the requested element as a `matlab.io.datastore.sdidatastore`object,
along with the element name and index.

Input Arguments

`arg` — Element selection criterion
integer | character vector

Search criterion used to retrieve the element from the
`Simulink.sdi.DatasetRef`object. For name-based searches, specify `arg` as a
character vector. For index-based searches, `arg` is an integer, representing the index of
the desired element.

Example: `'MySignal'`

Example: 3

Output Arguments

`elementDatastore` — Element as sdidatastore
sdidatastore object

Element as `matlab.io.datastore.sdidatastore` object.

name — Element name
character vector

The name of the element.

index — Element index in DatasetRef object
integer

The index of the element in the `Simulink.sdi.DatasetRef` object.

Examples

Create an sdidatastore Object for a Signal

This example shows how to create a `sdidatastore` object for a signal in a `Simulink.sdi.DatasetRef` object.

```
% Simulate model sldemo_fuelsys to create a run of logged signals
sim('sldemo_fuelsys')

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
run = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = run.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames
```

```
names =

  15x1 cell array

    {'EGO Fault Switch:1'        }
    {'air_fuel_ratio'            }
```

```
{'Engine Speed Fault Switch:1'  }
{'speed'                        }
{'MAP Fault Switch:1'           }
{'map'                          }
{'ego'                          }
{'Throttle Angle Fault Switch:1'}
{'throttle'                     }
{'fuel'                         }
{'ego_sw'                       }
{'engine_speed'                 }
{'speed_sw'                     }
{'map_sw'                       }
{'throttle_sw'                  }
```

```
% Get sdidatastore object for fuel signal
fuel_ds = run_DSRef.getAsDatastore(10);
```

Alternatives

You can construct a `sdidatastore` object for a specified signal using `matlab.io.datastore.sdidatastore`.

getElement

Class: Simulink.sdi.DatasetRef
Package: Simulink.sdi

Retrieve DatasetRef element by index

Syntax

```
[element, name, index] = SDIdatasetRef.getElement(index)
```

Description

`[element, name, index] = SDIdatasetRef.getElement(index)` returns the element within the Run in the `Simulink.sdi.DatasetRef` object at the specified `index`.

Input Arguments

`index` — Index of element
integer

Location of the element in the `Simulink.sdi.DatasetRef` object.

Output Arguments

`element` — Run element in the DatasetRef object
signal

Element from the run in the `Simulink.sdi.DatasetRef` object.

`name` — Element name
character vector

Name of the element retrieved from the `Simulink.sdi.DatasetRef` object.

index — Location of element
integer

Location of the element within the `Simulink.sdi.DatasetRef` object.

Examples

Compare Runs with the Simulink.sdi.DatasetRef Object

This example shows how to work with the `Simulink.sdi.DatasetRef` object by comparing two runs of the `ex_sldemo_absbrake` system with different desired slip ratios.

```
% Simulate model ex_sldemo_absbrake to create a run of logged signals
load_system('ex_sldemo_absbrake')
sim('ex_sldemo_absbrake')

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
run = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = run.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames

names = 2x1 cell array
    {'yout'}
    {'slp' }

% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);

% View signals in outputs
outputs = yout.Values

outputs = struct with fields:
    Ww: [1x1 timeseries]
```

```
    Vs: [1x1 timeseries]
    Sd: [1x1 timeseries]

% Get slp signal
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

% Create another run for a different Desired relative slip
set_param('ex_sldemo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_sldemo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));

% Open the Simulation Data Inspector to view signals
run_DSRef.plot
```

getElementNames

Class: Simulink.sdi.DatasetRef
Package: Simulink.sdi

Get character vectors of element names

Syntax

```
names = dsrObj.getElementNames
```

Description

`names = dsrObj.getElementNames` returns a cell array of character vectors containing the names of the elements in `dsrObj`.

Output Arguments

names — Element names
cell array

Names of the top level elements in the `Simulink.sdi.DatasetRef` object in a cell array.

Examples

Compare Runs with the Simulink.sdi.DatasetRef Object

This example shows how to work with the `Simulink.sdi.DatasetRef` object by comparing two runs of the `ex_sldemo_absbrake` system with different desired slip ratios.

```
% Simulate model ex_sldemo_absbrake to create a run of logged signals
load_system('ex_sldemo_absbrake')
```

```
sim('ex_sldemo_absbrake')

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
run = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = run.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames

names = 2x1 cell array
    {'yout'}
    {'slp' }

% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);

% View signals in outputs
outputs = yout.Values

outputs = struct with fields:
    Ww: [1x1 timeseries]
    Vs: [1x1 timeseries]
    Sd: [1x1 timeseries]

% Get slp signal
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

% Create another run for a different Desired relative slip
set_param('ex_sldemo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_sldemo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));
```

```
% Open the Simulation Data Inspector to view signals
run_DSRef.plot
```

getSignal

Class: Simulink.sdi.DatasetRef
Package: Simulink.sdi

Return Signal object

Syntax

```
sigObj = SDIDatasetRef.getSignal(searchArg)
```

Description

`sigObj = SDIDatasetRef.getSignal(searchArg)` returns the `Simulink.sdi.Signal` object corresponding to the search argument, `searchArg`.

Input Arguments

searchArg — Search parameter
character vector | integer

The search parameters to select the `Simulink.sdi.Signal` object. The `searchArg` can be a character vector or string targeting a signal name or an integer for an index-based search.

Example: `'throttle'`

Example: 2

Output Arguments

sigObj — Simulink.sdi.Signal object
Simulink.sdi.Signal object

The `Simulink.sdi.Signal` object corresponding to the search query.

Examples

Compare Runs with the Simulink.sdi.DatasetRef Object

This example shows how to work with the `Simulink.sdi.DatasetRef` object by comparing two runs of the `ex_sldemo_absbrake` system with different desired slip ratios.

```
% Simulate model ex_sldemo_absbrake to create a run of logged signals
load_system('ex_sldemo_absbrake')
sim('ex_sldemo_absbrake')

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
run = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = run.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames

names = 2x1 cell array
    {'yout'}
    {'slp' }

% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);

% View signals in outputs
outputs = yout.Values

outputs = struct with fields:
    Ww: [1x1 timeseries]
    Vs: [1x1 timeseries]
    Sd: [1x1 timeseries]

% Get slp signal
```

```
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

% Create another run for a different Desired relative slip
set_param('ex_sldemo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_sldemo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));

% Open the Simulation Data Inspector to view signals
run_DSRef.plot
```

Alternatives

If the signal is a top-level element in the `Simulink.sdi.DatasetRef` object, you can use the `Simulink.sdi.DatasetRef.getElement` method to get the `Simulink.sdi.Signal` object by index.

Simulink.sdi.DiffRunResult class

Package: Simulink.sdi

Access run comparison metadata

Description

The `Simulink.sdi.DiffRunResult` class provides access to the run comparison metadata. You can use the `getSignalByIndex` method to access the data and comparison results for each signal in the run comparison.

Construction

`DiffRunResultObj = Simulink.sdi.compareRuns(runID1, runID2)` returns a `Simulink.sdi.DiffRunResult` object to provide access to the comparison results from comparing the runs corresponding to `runID1` and `runID2`.

Input Arguments

runID1 — Baseline run identifier
integer

Numeric run identifier for the **Baseline** run in the comparison.

runID2 — Compare to run identifier
integer

Numeric identifier for the **Compare to** run in the comparison.

Properties

RunID1 — Baseline signal run ID
integer

Run identifier for the **Baseline** signal of the comparison.

RunID2 — Compare to signal run ID
integer

Run identifier for the **Compare to** signal of the comparison.

MatlabVersion — Version used
character vector

Version of MATLAB used.

DateCreated — Object creation date
datetime

Date and time the `Simulink.sdi.DiffRunResult` object was created.

Data Types: `datetime`

Count — Number of signals compared
integer

Number of signals aligned between the two runs in the comparison. For more information on how signals are aligned for comparisons, see "How the Simulation Data Inspector Compares Data".

Methods

getResultByIndex   Return signal comparison result

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Analyze Simulation Data with Signal Tolerances

You can change tolerance values on a signal-by-signal basis to evaluate the effect of a model parameter change. This example uses the `slexAircraftExample` model and the

Simulation Data Inspector to evaluate the effect of changing the time constant for the low-pass filter following the control input.

Setup

Load the model, and mark the `q, rad/sec` and `alpha, rad` signals for logging. Then, simulate the model to create the baseline run.

```
% Load example model
load_system('slexAircraftExample')

% Mark the q, rad/sec and alpha, rad signals for logging
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',3,'on
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on

% Simulate system
sim('slexAircraftExample')
```

Modify Model Parameter

Modify the model parameter `Ts` in the model workspace to change the time constant of the input low-pass filter.

```
% Change input filter time constant
modelWorkspace = get_param('slexAircraftExample','modelworkspace');
modelWorkspace.assignin('Ts',1)

% Simulate again
sim('slexAircraftExample')
```

Compare Runs and Inspect Results

Use the `Simulink.sdi.compareRuns` function to compare the data from the simulations. Then, inspect the `match` property of the signal result to see whether the signals fell within the default tolerance of 0.

```
% Get run data
runIDs = Simulink.sdi.getAllRunIDs;
runID1 = runIDs(end - 1);
runID2 = runIDs(end);

% Compare runs
diffRun1 = Simulink.sdi.compareRuns(runID1,runID2);

% Get signal result
```

```
sig1Result1 = diffRun1.getResultByIndex(1);
sig2Result1 = diffRun1.getResultByIndex(2);

% Check whether signals matched
sig1Result1.Match

ans = logical
   0

sig2Result1.Match

ans = logical
   0
```

Compare Runs with Signal Tolerances

The signals did not match within the default tolerance of 0. To further analyze the effect of the time constant change, add signal tolerances to the comparison with the baseline signal properties to determine the tolerance required for a pass. This example uses a combination of time and absolute tolerances.

```
% Get signal object for sigID1
run1 = Simulink.sdi.getRun(runID1);
sigID1 = run1.getSignalIDByIndex(1);
sigID2 = run1.getSignalIDByIndex(2);

sig1 = Simulink.sdi.getSignal(sigID1);
sig2 = Simulink.sdi.getSignal(sigID2);

% Set tolerances for q, rad/sec
sig1.AbsTol = 0.1;
sig1.TimeTol = 0.6;

% Set tolerances for alpha, rad
sig2.AbsTol = 0.2;
sig2.TimeTol = 0.8;

% Run the comparison again
diffRun2 = Simulink.sdi.compareRuns(runID1,runID2);
sig1Result2 = diffRun2.getResultByIndex(1);
sig2Result2 = diffRun2.getResultByIndex(2);
```

```
% Check the result
sig1Result2.Match

ans = logical
   1

sig2Result2.Match

ans = logical
   1
```

Alternatives

You can view and inspect comparison results using the Simulation Data Inspector UI. For more information, see "Compare Simulation Data".

getResultByIndex

Class: Simulink.sdi.DiffRunResult
Package: Simulink.sdi

Return signal comparison result

Syntax

```
diffSigObj = diffRunObj.getResultByIndex(index)
```

Description

diffSigObj = diffRunObj.getResultByIndex(index) returns the
Simulink.sdi.DiffSignalResult object diffSigObj corresponding to the index in
the Simulink.sdi.DiffRunResult object, diffRunObj.

Input Arguments

index — Index of signal in run
integer

Index of the signal in the Simulink.sdi.DiffRunResult object.

Output Arguments

diffSigObj — Simulink.sdi.DiffSignalResult object corresponding to the index
Simulink.sdi.DiffSignalResult object

Simulink.sdi.DiffSignalResult object for the signal at the specified index.

Examples

Analyze Simulation Data with Signal Tolerances

You can change tolerance values on a signal-by-signal basis to evaluate the effect of a model parameter change. This example uses the `slexAircraftExample` model and the Simulation Data Inspector to evaluate the effect of changing the time constant for the low-pass filter following the control input.

Setup

Load the model, and mark the `q, rad/sec` and `alpha, rad` signals for logging. Then, simulate the model to create the baseline run.

```
% Load example model
load_system('slexAircraftExample')

% Mark the q, rad/sec and alpha, rad signals for logging
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',3,'on'
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on'

% Simulate system
sim('slexAircraftExample')
```

Modify Model Parameter

Modify the model parameter `Ts` in the model workspace to change the time constant of the input low-pass filter.

```
% Change input filter time constant
modelWorkspace = get_param('slexAircraftExample','modelworkspace');
modelWorkspace.assignin('Ts',1)

% Simulate again
sim('slexAircraftExample')
```

Compare Runs and Inspect Results

Use the `Simulink.sdi.compareRuns` function to compare the data from the simulations. Then, inspect the `match` property of the signal result to see whether the signals fell within the default tolerance of 0.

```
% Get run data
runIDs = Simulink.sdi.getAllRunIDs;
```

```
runID1 = runIDs(end - 1);
runID2 = runIDs(end);

% Compare runs
diffRun1 = Simulink.sdi.compareRuns(runID1,runID2);

% Get signal result
sig1Result1 = diffRun1.getResultByIndex(1);
sig2Result1 = diffRun1.getResultByIndex(2);

% Check whether signals matched
sig1Result1.Match

ans = logical
   0

sig2Result1.Match

ans = logical
   0
```

Compare Runs with Signal Tolerances

The signals did not match within the default tolerance of 0. To further analyze the effect of the time constant change, add signal tolerances to the comparison with the baseline signal properties to determine the tolerance required for a pass. This example uses a combination of time and absolute tolerances.

```
% Get signal object for sigID1
run1 = Simulink.sdi.getRun(runID1);
sigID1 = run1.getSignalIDByIndex(1);
sigID2 = run1.getSignalIDByIndex(2);

sig1 = Simulink.sdi.getSignal(sigID1);
sig2 = Simulink.sdi.getSignal(sigID2);

% Set tolerances for q, rad/sec
sig1.AbsTol = 0.1;
sig1.TimeTol = 0.6;

% Set tolerances for alpha, rad
sig2.AbsTol = 0.2;
sig2.TimeTol = 0.8;
```

```
% Run the comparison again
diffRun2 = Simulink.sdi.compareRuns(runID1,runID2);
sig1Result2 = diffRun2.getResultByIndex(1);
sig2Result2 = diffRun2.getResultByIndex(2);

% Check the result
sig1Result2.Match

ans = logical
   1

sig2Result2.Match

ans = logical
   1
```

Alternatives

You can inspect comparison results using the Simulation Data Inspector UI. For more information, see "Compare Simulation Data".

"Inspect and Compare Data Programmatically"

Introduced in R2012b

Simulink.sdi.DiffSignalResult class

Package: Simulink.sdi

Access signal comparison results

Description

The `Simulink.sdi.DiffSignalResult` object provides access to the data and metadata created by a signal comparison. A `Simulink.sdi.DiffSignalResult` object gives access the difference signal, tolerance data, and the synchronized signal data.

Construction

`DiffSignalObj = Simulink.sdi.compareSignals(signalID1, signalID2)`creates a `Simulink.sdi.DiffSignalResult` object to provide access to the results of the comparison of the signals corresponding to `sigID1` and `sigID2`.

`DiffSignalObj = DiffRunObj.getResultByIndex(index)` returns a `Simulink.sdi.DiffSignalResult` object for the signal comparison corresponding to the `index` within a `Simulink.sdi.DiffRunResult` object.

Input Arguments

`signalID1` — Signal identifier for Baseline signal
integer

Numeric signal identifier for the **Baseline** signal in comparison.

`signalID2` — Signal identifier for Compare to signal
integer

Numeric signal identifier for the **Compare to** signal in comparison

`index` — Index of signal in run
integer

Index of the signal within the run.

Properties

`Diff` — Difference signal
timeseries

Difference signal resulting from the comparison as a `timeseries` object.

`Match` — Logical indicator of signal match
logical

Logical indicator of whether comparison signals match within the tolerances.

- `0` indicates that the difference between the signals is not within tolerance.
- `1` indicates that the difference between the signals is within tolerance.

`UnitsMatch` — Logical indicator of unit match
logical

Logical indicator of whether comparison signals' units match. Comparisons of signals with units that do not match are always marked out of tolerance, and no difference signal is computed.

- `0` indicates that the signals' units do not match.
- `1` indicates that the signals' units match.

`MaxDifference` — Maximum difference
double

Maximum difference between the two comparison signals.

`SignalID1` — Baseline signal identifier
integer

Unique signal identifier for the **Baseline** comparison signal.

`SignalID2` — Compare to signal identifier
integer

Unique signal identifier for the **Compare to** comparison signal.

Sync1 — Synchronized Baseline signal
timeseries

Synchronized **Baseline** signal. For more information about synchronization, see "How the Simulation Data Inspector Compares Data".

Sync2 — Synchronized Compare to signal
timeseries

Synchronized **Compare to** signal. For more information about synchronization, see "How the Simulation Data Inspector Compares Data".

Tol — Tolerance signal
timeseries

Tolerance data for every data point of the comparison. For more information on how the tolerance signal is computed, see "How the Simulation Data Inspector Compares Data".

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Compare Signals Within a Simulation Run

This example uses the `slexAircraftExample` model to demonstrate the comparison of the input and output signals for a control system. The example marks the signals for streaming then gets the run object for a simulation run. Signal IDs from the run object specify the signals to be compared.

```
% Load model slexAircraftExample and mark signals for streaming
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot',1,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on')

% Simulate model slexAircraftExample
sim('slexAircraftExample')
```

```
% Get run IDs for most recent run
allIDs = Simulink.sdi.getAllRunIDs;
runID = allIDs(end);

% Get Run object
run = Simulink.sdi.getRun(runID);

% Get signal IDs
signalID1 = run.getSignalIDByIndex(1);
signalID2 = run.getSignalIDByIndex(2);

if (run.isValidSignalID(signalID1))
    % Change signal tolerance
    signal1 = Simulink.sdi.getSignal(signalID1);
    signal1.AbsTol = 0.1;
end

if (run.isValidSignalID(signalID1) && run.isValidSignalID(signalID2))
    % Compare signals
    diff = Simulink.sdi.compareSignals(signalID1,signalID2);

    % Check whether signals match within tolerance
    match = diff.match
end

match = logical
   0
```

Alternatives

You can view and inspect comparison results using the Simulation Data Inspector UI. For more information, see "Compare Simulation Data".

Simulink.sdi.Run class

Package: Simulink.sdi

Access run signals and metadata

Description

The `Simulink.sdi.Run` object manages a run's metadata and the signals that comprise the run. You can use several methods to retrieve `Simulink.sdi.Signal` objects to access the signal data and metadata.

Construction

`runObj = Simulink.sdi.Run.create` creates an empty `Simulink.sdi.Run` object.

`runObj = Simulink.sdi.getRun(runID)` creates a `Simulink.sdi.Run`object, `runObj`, for the run corresponding to `runID`.

You can also use the `Simulink.sdi.createRun` and `Simulink.sdi.createRunOrAddToStreamedRun` functions to create `Run` objects.

Input Arguments

runID — Run identifier
integer

Unique number identifying the run.

Properties

id — Run identifier
integer

Unique numerical identification for the run.

Name — Run name
[] (default) | character vector

Name of the run. By default, `name` is empty.

Example: `'Run 1'`

Description — Run description
[] (default) | character vector

Description of the run. By default, `Description` is empty.

Example: `'Initial simulation'`

Tag — Information tag
[] (default) | character vector

Tag for additional run information. By default, `Tag` is empty. You can use the `Tag` parameter to categorize your simulation data or attach extra information to simulation runs.

Example: `'Gain = 2'`

DateCreated — Run creation time
datetime object

Date and time the run was created.

Data Types: `datetime`

SignalCount — Number of signals in run
integer

Number of signals contained in the run.

Model — Model that created the run
character vector

Name of the model that created the run.

SimMode — Simulation mode
character vector

Simulation mode used to create the run, for runs created by simulation.

StartTime — Run start time
integer

First time point shared by all signals in the run.

StopTime — Run stop time
integer

Last time point shared by all signals in the run.

SLVersion — Simulink version used to create run
character vector

Version of Simulink used for the simulation that created the run.

ModelVersion — Model version used to create run
character vector

Version of the model simulated to create the run, taken from the **Model Properties**.

UserID — System account
character vector

System account used for the simulation that created the run. UserID only has a value for runs produced with Simulink simulations.

MachineName — Name of machine used for simulation
character vector

Name of the machine used for the simulation that created the run. MachineName only has a value for runs produced with Simulink simulations.

TaskName — Task name
[] (default) | character vector

Name of the simulation task that created the run for runs created with Parallel Computing Toolbox workers.

SolverType — Type of solver used to create run
'Variable-Step' | 'Fixed-Step'

The type of solver used for the simulation that created the run. SolverType only has a value for runs produced with Simulink simulations.

SolverName — Name of solver used to create run
character vector

Name of the solver used for the simulation that created the run. `SolverName` only has a value for runs produced with Simulink simulations.

Example: `ode45`

ModelInitializationTime — Time to initialize model
double

Amount of time to initialize the model for the simulation that created the run. `ModelInitializationTime` only has a value for runs produced with Simulink simulations.

ModelExecutionTime — Time to execute model
double

Execution time of the model simulation that created the run. `ModelExecutionTime` only has a value for runs produced with Simulink simulations.

ModelTerminationTime — Time to terminate simulation
double

Time to terminate the simulation that created the run. `ModelTerminationTime` only has a value for runs produced with Simulink simulations.

ModelTotalElapsedTime — Total simulation time
double

Total time to run model simulation that created the run. `ModelTotalElapsedTime` only has a value for runs produced with Simulink simulations.

Methods

add	Add signals to run
create	Create a Simulink.sdi.Run object
export	Export run to Simulink.SimulationData.Dataset object
getDatasetRef	Create a Simulink.sdi.DatasetRef object for a run
getSignalByIndex	Get `Simulink.sdi.Signal` object by index
getSignalIDByIndex	Return signal ID for signal at index
isValidSignalID	Determine whether signal ID is valid within a run

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Plot Signals from a Simulation Run

This example demonstrates how to access the `Simulink.sdi.Run` object for a run created by logging signals to the Simulation Data Inspector. From the `Simulink.sdi.Run` object you can get `Simulink.sdi.Signal` objects that you can use to view data.

```
% Simulate model sldemo_absbrake to create a run
sim('sldemo_fuelsys')

% Get runID for the run
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get run object for the run
run = Simulink.sdi.getRun(runID);

% Check signal count of the run
run.signalCount
```

```
ans = int32
    15
```

```
% Get signal objects for the signals in the run
signal1 = run.getSignalByIndex(4);
signal2 = run.getSignalByIndex(9);
signal3 = run.getSignalByIndex(10);

% Create subplot layout to display signals
Simulink.sdi.setSubPlotLayout(3, 1)

% Plot signals
signal1.checked = true;
signal2.plotOnSubPlot(2, 1, true);
signal3.plotOnSubPlot(3, 1, true);

% View plots in the Simulation Data Inspector
Simulink.sdi.view
```

Create a Run and View the Data

This example shows how to create a run, add data to it, and then view the data in the Simulation Data Inspector.

Create Data for the Run

This example creates `timeseries` objects for a sine and a cosine. To visualize your data, the Simulation Data Inspector requires at least a time vector that corresponds with your data.

```
% Generate timeseries data
time = linspace(0, 20, 100);

sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals, time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals, time);
cos_ts.Name = 'Cosine, T=8';
```

Create a Simulation Data Inspector Run and Add Your Data

To give the Simulation Data Inspector access to your data, use the `create` method and create a run. This example modifies some of the run's properties to help identify the data. You can easily view run and signal properties with the Simulation Data Inspector.

```matlab
% Create a run
run = Simulink.sdi.Run.create;
run.Name = 'Sinusoids';
run.Description = 'Sine and cosine signals with different frequencies';

% Add timeseries data to run
run.add('vars', sine_ts, cos_ts);
```

Plot Your Data Using the `Simulink.sdi.Signal` Object

The `getSignalByIndex` method returns a `Simulink.sdi.Signal` object that can be used to plot the signal in the Simulation Data Inspector. You can also programmatically control aspects of the plot's appearance, such as the color and style of the line representing the signal. This example customizes the subplot layout and signal characteristics.

```matlab
% Get signal, modify its properties, and change Checked property to true
sine_sig = run.getSignalByIndex(1);
sine_sig.LineColor = [0 0 1];
sine_sig.LineDashed = '-.';
sine_sig.Checked = true;

% Add another subplot for the cosine signal
Simulink.sdi.setSubPlotLayout(2, 1);

% Plot the cosine signal and customize its appearance
cos_sig = run.getSignalByIndex(2);
cos_sig.LineColor = [0 1 0];
cos_sig.plotOnSubPlot(2, 1, true);

% View the signal in the Simulation Data Inspector
Simulink.sdi.view
```

Close the Simulation Data Inspector and Save Your Data

```
Simulink.sdi.close('sinusoids.mat')
```

Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport('local')

% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];
```

Initialize Parallel Workers

Use gcp to create a pool of local workers to run parallel simulations if you don't already have one. In an `spmd` code block, load the `slexAircraftExample` model and select signals to log. To avoid data concurrency issues using `sim` in `parfor`, create a temporary directory for each worker to use during simulations.

```
p = gcp;
spmd

    % Load system and select signals to log
    load_system('slexAircraftExample')
    Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
    Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',

    % Create temporary directory on each worker
    workDir = pwd;
    addpath(workDir)
    tempDir = tempname;
    mkdir(tempDir)
```

```
        cd(tempDir)

end
```

Run Parallel Simulations

Use `parfor` to run the seven simulations in parallel. Select the value for `Ts` for each simulation, and modify the value of `Ts` in the model workspace. Then, run the simulation and build an array of `Simulink.sdi.WorkerRun` objects to access the data with the Simulation Data Inspector. After the `parfor` loop, use another `spmd` segment to remove the temporary directories from the workers.

```
parfor index = 1:7

    % Select value for Ts
    Ts_val = Ts_vals(index);

    % Change the filter time constant and simulate
    modelWorkspace = get_param('slexAircraftExample','modelworkspace');
    modelWorkspace.assignin('Ts',Ts_val)
    sim('slexAircraftExample')

    % Create a worker run for each simulation
    workerRun(index) = Simulink.sdi.WorkerRun.getLatest

end

spmd

    % Remove temporary directories
    cd(workDir)
    rmdir(tempDir, 's')
    rmpath(workDir)

end
```

Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

```
ds(7) = Simulink.SimulationData.Dataset;

for a = 1:7
```

```
    ds(a) = workerRun(a).getDataset;
end
ds(1)

ans =
Simulink.SimulationData.Dataset '' with 2 elements

                          Name        BlockPath
                          _____  _____
    1  [1x1 Signal]       alpha, rad  ...rcraftExample/Aircraft Dynamics Model
    2  [1x1 Signal]       Stick       slexAircraftExample/Pilot

  - Use braces { } to access, modify, or add elements using index.
```

Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```
for b = 1:7
    datasetRef(b) = workerRun(b).getDatasetRef;
end

datasetRef(1)

ans =
  DatasetRef with properties:

            Name: 'Run 5: slexAircraftExample'
             Run: [1×1 Simulink.sdi.Run]
      numElements: 2
```

Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local `Run` objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```
for c = 1:7

    Runs(c) = workerRun(c).getLocalRun;
    Ts_val_str = num2str(Ts_vals(c));
    desc = strcat('Ts = ', Ts_val_str);
```

```
    Runs(c).Description = desc;
    Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);

end
```

Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you
want to run on your worker pool.

```
Simulink.sdi.cleanupWorkerResources
```

Alternatives

You can view runs and their properties in the Simulation Data Inspector UI. You can also
import data to create runs in the Simulation Data Inspector GUI. For more information,
see "View Data with the Simulation Data Inspector".

add

Class: Simulink.sdi.Run
Package: Simulink.sdi

Add signals to run

Syntax

```
run.add(sig)
run.add(source, filename)
run.add(source, ts1, ts2)
```

Description

`run.add(sig)` adds the data `sig` to the `Simulink.sdi.Run` object `run` from the base workspace.

`run.add(source, filename)` adds the data in the file `filename` to the `Simulink.sdi.Run` object, `run`.

`run.add(source, ts1, ts2)` allows you to add multiple signals to the run from the base workspace.

Input Arguments

sig — Data to add

Signals to add to the run. Data types that you can add to a run include:

- `timeseries`
- `Simulink.SimulationData.Dataset`
- `Simulink.SimulationOutput`
- `timetable`

- Data logged with `Structure with time` format
- Simscape variables

`source` — Data source selector
'file' | 'vars'

Source of the data to add to the run, specified as a character vector.

- `'file'` indicates that the data comes from a file.
- `'vars'` indicates that the data comes from one or more variables in the workspace.

`filename` — File containing data
character vector

File with data to add to the run.

Example: `'data.mat'`

`ts1, ts2` — Workspace variables to add to run
timeseries

Data to add to the run in one or more `timeseries` objects.

Examples

Create a Run and View the Data

This example shows how to create a run, add data to it, and then view the data in the Simulation Data Inspector.

Create Data for the Run

This example creates `timeseries` objects for a sine and a cosine. To visualize your data, the Simulation Data Inspector requires at least a time vector that corresponds with your data.

```
% Generate timeseries data
time = linspace(0, 20, 100);

sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals, time);
```

```
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals, time);
cos_ts.Name = 'Cosine, T=8';
```

Create a Simulation Data Inspector Run and Add Your Data

To give the Simulation Data Inspector access to your data, use the `create` method and create a run. This example modifies some of the run's properties to help identify the data. You can easily view run and signal properties with the Simulation Data Inspector.

```
% Create a run
run = Simulink.sdi.Run.create;
run.Name = 'Sinusoids';
run.Description = 'Sine and cosine signals with different frequencies';

% Add timeseries data to run
run.add('vars', sine_ts, cos_ts);
```

Plot Your Data Using the `Simulink.sdi.Signal` Object

The `getSignalByIndex` method returns a `Simulink.sdi.Signal` object that can be used to plot the signal in the Simulation Data Inspector. You can also programmatically control aspects of the plot's appearance, such as the color and style of the line representing the signal. This example customizes the subplot layout and signal characteristics.

```
% Get signal, modify its properties, and change Checked property to true
sine_sig = run.getSignalByIndex(1);
sine_sig.LineColor = [0 0 1];
sine_sig.LineDashed = '-.';
sine_sig.Checked = true;

% Add another subplot for the cosine signal
Simulink.sdi.setSubPlotLayout(2, 1);

% Plot the cosine signal and customize its appearance
cos_sig = run.getSignalByIndex(2);
cos_sig.LineColor = [0 1 0];
cos_sig.plotOnSubPlot(2, 1, true);

% View the signal in the Simulation Data Inspector
Simulink.sdi.view
```

Close the Simulation Data Inspector and Save Your Data

```
Simulink.sdi.close('sinusoids.mat')
```

Simulink.sdi.Run.create

Class: Simulink.sdi.Run
Package: Simulink.sdi

Create a Simulink.sdi.Run object

Syntax

```
runObj = Simulink.sdi.Run.create
```

Description

`runObj = Simulink.sdi.Run.create` creates the empty run object, `runObj`. You can add signals to the `Run` object with the `Simulink.sdi.Run.add` method or the `Simulink.sdi.addToRun` function. For more information on the `Simulink.sdi.Run` object and its properties, see `Simulink.sdi.Run`.

Output Arguments

runObj — Simulink.sdi.Run object
Simulink.sdi.Run object

Empty `Simulink.sdi.Run` object.

Examples

Create a Run and View the Data

This example shows how to create a run, add data to it, and then view the data in the Simulation Data Inspector.

Create Data for the Run

This example creates `timeseries` objects for a sine and a cosine. To visualize your data, the Simulation Data Inspector requires at least a time vector that corresponds with your data.

```matlab
% Generate timeseries data
time = linspace(0, 20, 100);

sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals, time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals, time);
cos_ts.Name = 'Cosine, T=8';
```

Create a Simulation Data Inspector Run and Add Your Data

To give the Simulation Data Inspector access to your data, use the `create` method and create a run. This example modifies some of the run's properties to help identify the data. You can easily view run and signal properties with the Simulation Data Inspector.

```matlab
% Create a run
run = Simulink.sdi.Run.create;
run.Name = 'Sinusoids';
run.Description = 'Sine and cosine signals with different frequencies';

% Add timeseries data to run
run.add('vars', sine_ts, cos_ts);
```

Plot Your Data Using the `Simulink.sdi.Signal` Object

The `getSignalByIndex` method returns a `Simulink.sdi.Signal` object that can be used to plot the signal in the Simulation Data Inspector. You can also programmatically control aspects of the plot's appearance, such as the color and style of the line representing the signal. This example customizes the subplot layout and signal characteristics.

```matlab
% Get signal, modify its properties, and change Checked property to true
sine_sig = run.getSignalByIndex(1);
sine_sig.LineColor = [0 0 1];
sine_sig.LineDashed = '-.';
sine_sig.Checked = true;
```

```
% Add another subplot for the cosine signal
Simulink.sdi.setSubPlotLayout(2, 1);

% Plot the cosine signal and customize its appearance
cos_sig = run.getSignalByIndex(2);
cos_sig.LineColor = [0 1 0];
cos_sig.plotOnSubPlot(2, 1, true);

% View the signal in the Simulation Data Inspector
Simulink.sdi.view
```

Close the Simulation Data Inspector and Save Your Data

```
Simulink.sdi.close('sinusoids.mat')
```

export

Class: Simulink.sdi.Run
Package: Simulink.sdi

Export run to Simulink.SimulationData.Dataset object

Syntax

```
ds = runObj.export
```

Description

`ds = runObj.export` exports the `Simulink.sdi.Run` object `runObj` to the `Simulink.SimulationData.Dataset`, `ds`.

Output Arguments

ds — Simulink.SimulationData.Dataset object containing run data
Simulink.SimulationData.Dataset object

Simulink.SimulationData.Dataset object containing the run data.

Examples

Export Run Data

This example shows how to export data from a run in the Simulation Data Inspector to a `Simulink.SimulationData.Dataset` object in the base workspace you can use to further process your data. The method you choose to export your run depends on the processing you do in your script. If you have a run object for the run, you can use the `export` method to create a `Simulink.SimulationData.Dataset` object with the run's data in the base workspace. If you do not have a run object, use the `Simulink.sdi.exportRun` function to export the run to the workspace.

Export Run Using `Simulink.sdi.exportRun`

Use the `Simulink.sdi.export` function when your workflow does not include creating a run object.

```
% Load vdp model
load_system('vdp')

% Get handles for signal lines in model
SignalHandles = get_param('vdp', 'Lines');

% Mark signals for streaming
Simulink.sdi.markSignalForStreaming(SignalHandles(5).Handle, 'on')
Simulink.sdi.markSignalForStreaming(SignalHandles(6).Handle, 'on')

% Simulate vdp model
sim('vdp')

% Get run ID for simulation run
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Export run
simDataset = Simulink.sdi.exportRun(runID);
```

Export Run Using `export` Method

When you already have a `Simulink.sdi.Run` object for your run, you can use the `export` method to create a `Simulink.SimulationData.Dataset` object in the base workspace for further processing of the data.

```
% Load vdp model
load_system('vdp')

% Get handles for signal lines in model
SignalHandles = get_param('vdp', 'Lines');

% Mark signals for streaming
Simulink.sdi.markSignalForStreaming(SignalHandles(5).Handle, 'on')
Simulink.sdi.markSignalForStreaming(SignalHandles(6).Handle, 'on')

% Simulate model vdp and get run object
sim('vdp')

% Get run object for simulation run
```

```
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
run = Simulink.sdi.getRun(runID);

% Get signal ids for signals
sigID1 = run.getSignalIDByIndex(1);
sigID2 = run.getSignalIDByIndex(2);

% Compare signals
diffResult = Simulink.sdi.compareSignals(sigID1,sigID2);
diffResult.match

ans = logical
   0

% Export run
simDataset = run.export;
```

Alternatives

You can export run data programmatically using the `Simulink.sdi.exportRun` function, or you can use the Simulation Data Inspector UI. For more information, see "Save and Share Simulation Data Inspector Data and Views".

getDatasetRef

Class: Simulink.sdi.Run
Package: Simulink.sdi

Create a Simulink.sdi.DatasetRef object for a run

Syntax

```
DatasetRef = runObj.getDatasetRef
```

Description

DatasetRef = runObj.getDatasetRef creates a `Simulink.sdi.DatasetRef` object with the data in the `Simulink.sdi.Run` object, `runObj`.

Output Arguments

DatasetRef — Simulink.sdi.DatasetRef object
Simulink.sdi.DatasetRef object

`Simulink.sdi.DatasetRef` object that provides access to the run data.

Examples

Compare Runs with the Simulink.sdi.DatasetRef Object

This example shows how to work with the `Simulink.sdi.DatasetRef` object by comparing two runs of the `ex_sldemo_absbrake` system with different desired slip ratios.

```
% Simulate model ex_sldemo_absbrake to create a run of logged signals
load_system('ex_sldemo_absbrake')
sim('ex_sldemo_absbrake')
```

```matlab
% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
run = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = run.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames

names = 2x1 cell array
    {'yout'}
    {'slp' }

% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);

% View signals in outputs
outputs = yout.Values

outputs = struct with fields:
    Ww: [1x1 timeseries]
    Vs: [1x1 timeseries]
    Sd: [1x1 timeseries]

% Get slp signal
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

% Create another run for a different Desired relative slip
set_param('ex_sldemo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_sldemo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));
```

```
% Open the Simulation Data Inspector to view signals
run_DSRef.plot
```

Alternatives

You can also create a `Simulink.sdi.DatasetRef` object using the `Simulink.sdi.DatasetRef` constructor.

`Simulink.sdi.DatasetRef` | `Simulink.sdi.Run`

Topics

"Inspect and Compare Data Programmatically"

Introduced in R2017b

getSignalByIndex

Class: Simulink.sdi.Run
Package: Simulink.sdi

Get `Simulink.sdi.Signal` object by index

Syntax

```
signal = runObj.getSignalByIndex(index)
```

Description

`signal = runObj.getSignalByIndex(index)` returns a signal object for the signal at the specified `index` within the `Simulink.sdi.Run` object, `runObj`.

Input Arguments

`index` — Signal index
integer

Index of the signal within the run.

Output Arguments

`signal` — Simulink.sdi.Signal object
Simulink.sdi.Signal object

`Simulink.sdi.Signal` object for the signal at the specified index in the run.

Examples

Plot Signals from a Simulation Run

This example demonstrates how to access the `Simulink.sdi.Run` object for a run created by logging signals to the Simulation Data Inspector. From the `Simulink.sdi.Run` object you can get `Simulink.sdi.Signal` objects that you can use to view data.

```matlab
% Simulate model sldemo_absbrake to create a run
sim('sldemo_fuelsys')

% Get runID for the run
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get run object for the run
run = Simulink.sdi.getRun(runID);

% Check signal count of the run
run.signalCount

ans = int32
    15

% Get signal objects for the signals in the run
signal1 = run.getSignalByIndex(4);
signal2 = run.getSignalByIndex(9);
signal3 = run.getSignalByIndex(10);

% Create subplot layout to display signals
Simulink.sdi.setSubPlotLayout(3, 1)

% Plot signals
signal1.checked = true;
signal2.plotOnSubPlot(2, 1, true);
signal3.plotOnSubPlot(3, 1, true);

% View plots in the Simulation Data Inspector
Simulink.sdi.view
```

Alternatives

You can access signal properties, view signals, and export data to the workspace using the Simulation Data Inspector UI. For more information, see "Organize Your Simulation Data Inspector Workspace".

getSignalIDByIndex

Class: Simulink.sdi.Run
Package: Simulink.sdi

Return signal ID for signal at index

Syntax

```
signalID = runObj.getSignalIDByIndex(index)
```

Description

`signalID = runObj.getSignalIDByIndex(index)` returns the signal ID for the signal at the specified `index` in the `Simulink.sdi.Run` object. You can use the signal ID to create a `Simulink.sdi.Signal` object or to perform a signal comparison with `Simulink.sdi.compareSignals`.

Input Arguments

`index` — Signal index
integer

Index of the signal within the run.

Output Arguments

`signalID` — Signal identifier
integer

Unique numeric signal identifier.

Examples

Compare Signals Within a Simulation Run

This example uses the `slexAircraftExample` model to demonstrate the comparison of the input and output signals for a control system. The example marks the signals for streaming then gets the run object for a simulation run. Signal IDs from the run object specify the signals to be compared.

```
% Load model slexAircraftExample and mark signals for streaming
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot',1,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on

% Simulate model slexAircraftExample
sim('slexAircraftExample')

% Get run IDs for most recent run
allIDs = Simulink.sdi.getAllRunIDs;
runID = allIDs(end);

% Get Run object
run = Simulink.sdi.getRun(runID);

% Get signal IDs
signalID1 = run.getSignalIDByIndex(1);
signalID2 = run.getSignalIDByIndex(2);

if (run.isValidSignalID(signalID1))
    % Change signal tolerance
    signal1 = Simulink.sdi.getSignal(signalID1);
    signal1.AbsTol = 0.1;
end

if (run.isValidSignalID(signalID1) && run.isValidSignalID(signalID2))
    % Compare signals
    diff = Simulink.sdi.compareSignals(signalID1,signalID2);

    % Check whether signals match within tolerance
    match = diff.match
end
```

```
match = logical
   0
```

Alternatives

You can access signal properties, view signals, and export data to the workspace using the Simulation Data Inspector UI. For more information, see "Organize Your Simulation Data Inspector Workspace".

isValidSignalID

Class: Simulink.sdi.Run
Package: Simulink.sdi

Determine whether signal ID is valid within a run

Syntax

```
isValid = runObj.isValidSignalID(signalID)
```

Description

`isValid = runObj.isValidSignalID(signalID)` returns a logical indication of whether the `signalID` corresponds to a signal in the `Simulink.sdi.Run` object `runObj`.

Input Arguments

`signalID` — Signal identifier
integer

Unique numeric signal identifier.

Output Arguments

`isValid` — Logical indicator
logical

Logical indicator of signal ID validity.

- `true` when the `signalID` corresponds to a signal in the run object.
- `false` when the `signalID` does not correspond to a signal in the run object.

Examples

Compare Signals Within a Simulation Run

This example uses the `slexAircraftExample` model to demonstrate the comparison of the input and output signals for a control system. The example marks the signals for streaming then gets the run object for a simulation run. Signal IDs from the run object specify the signals to be compared.

```
% Load model slexAircraftExample and mark signals for streaming
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot',1,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on

% Simulate model slexAircraftExample
sim('slexAircraftExample')

% Get run IDs for most recent run
allIDs = Simulink.sdi.getAllRunIDs;
runID = allIDs(end);

% Get Run object
run = Simulink.sdi.getRun(runID);

% Get signal IDs
signalID1 = run.getSignalIDByIndex(1);
signalID2 = run.getSignalIDByIndex(2);

if (run.isValidSignalID(signalID1))
    % Change signal tolerance
    signal1 = Simulink.sdi.getSignal(signalID1);
    signal1.AbsTol = 0.1;
end

if (run.isValidSignalID(signalID1) && run.isValidSignalID(signalID2))
    % Compare signals
    diff = Simulink.sdi.compareSignals(signalID1,signalID2);

    % Check whether signals match within tolerance
    match = diff.match
end
```

```
match = logical
   0
```

Simulink.sdi.Signal class

Package: Simulink.sdi

Access signal data and metadata

Description

A `Simulink.sdi.Signal` object provides access to signal data and metadata. The metadata includes properties for visualizing and comparing signals.

Construction

`signal = Simulink.sdi.getSignal(signalID)` returns a `Simulink.sdi.Signal` object corresponding to the `signalID`.

`signal = runObj.getSignal(signalID)` returns a `Simulink.sdi.Signal` object corresponding to the `signalID`.

`signal = runObj.getSignalByIndex(index)` returns a `Simulink.sdi.Signal` object corresponding to the `signalID` at the index specified by `index` in the Run object `runObj`.

Input Arguments

`signalID` — Signal identifier
integer

Numeric signal identifier for the signal generated by the Simulation Data Inspector. You can get the signal ID for a signal using methods of the `Simulink.sdi.Run` object or using the `Simulink.sdi.getSignal` function.

`index` — Signal index within run
integer

Index of the signal within the run.

Example: 1

Properties

Signal Properties (read only)

ID — Signal identifier
integer

Unique number identifying the signal.

Example: 1330

RunID — Run identifier
integer

Run identifier for the run that contains the signal.

Example: 1402

Name — Signal name
character vector

Name of the signal.

Example: `'fuel'`

Units — Signal measurement units
character vector

Signal units of measure.

Example: `'g/s'`

Data Type — Data type for signal data
character vector

Data type of signal data.

Example: `'double'`

Complexity — Complexity of signal data
character vector

Specifies whether signal data is real or complex.

Example: `'real'`

SampleTime — Signal sample time
character vector

Signal sample time. A value of `'Continuous'` indicates a variable-step simulation.

Example: `'Continuous'`

Example: `0.1`

Model — Name of model that produced signal
character vector

Name of the model that produced the signal.

Example: `'sldemo_fuelsys'`

BlockPath — Path of block that defines signal
character vector

The path to the block that produced the signal.

Example: `'sldemo_fuelsys/Engine Gas Dynamics'`

FullBlockPath — Path of the block that defines the signal
character vector

Path to the block that generates the signal including the full model hierarchy. For signals within reference models, `FullBlockPath` is a cell array containing the full path. For other signals, `FullBlockPath` is identical to `BlockPath`.

Example: `'sldemo_fuelsys/Engine Gas Dynamics/Mixing & Combustion/MinMax'`

PortIndex — Block port index
integer

Index of the output port that defines the signal.

Example: 1

Dimensions — Dimensions of matrix containing signal
integer array

Dimensions of the matrix that contains the signal.

Example: [1]

Channel — Index of signal within matrix
integer array

Indices of the signal for signals that are part of a vector or matrix.

Values — Signal values
timeseries

Time and data values for the signal. For buses, `Values` is a struct.

RootSource — High-level logging structure containing signal imported from workspace
character vector

Name of the high-level logging structure containing the signal for signals imported from the MATLAB workspace.

TimeSource — Source of signal time data imported from workspace
character vector

Name of the variable containing the signal time data for signals imported from the MATLAB workspace.

DataSource — Source of data imported from workspace
character vector

Name of the array containing the signal data for signals imported from the MATLAB workspace.

Visualization Properties

ComplexFormat — Display format for complex signals
`"real-imaginary"` | `"magnitude"` | `"magnitude-phase"` | `"phase"`

Complex format specifying how to display complex signal data in the Simulation Data Inspector.

- `"real-imaginary"` — The real and imaginary components of the signal display together when you plot the signal. The imaginary component of the signal is plotted with a different shade of the **Line Color**.

- `"magnitude"` — The magnitude of the signal displays when you plot the signal.
- `"magnitude-phase"` — The magnitude and phase of the signal display together when you plot the signal.
- `"phase"` — The phase of the signal displays when you plot the signal. The phase is plotted with a different shade of the **Line Color**.

Data Types: `char` | `string`

Checked — Plotting indicator
false (default) | true

Logical value indicating whether the signal is plotted on any subplot. Setting `Checked` to `false` clears the signal from all subplots. Setting `Checked` to `true` plots the signal on the active subplot.

Data Types: `logical`

LineColor — Signal line color
`1-by-3` vector

Color of signal in plots, specified as a 1-by-3 RGB vector.

Example: [0 114 189]

Data Types: `double`

LineDashed — Signal line style
'-' | '--' | ':' | '-.'

Signal line style.

- `'-'` specifies a solid line style.
- `'--'` specifies a dashed line style.
- `':'` specifies a dotted line style.
- `'-.'` specifies a dash-dot line style.

InterpMethod — Interpolation method
'linear' (default) | 'zoh'

Interpolation method used in data visualization and synchronization. `'zoh'` specifies zero-order hold, and `'linear'` specifies linear interpolation. For more information about the interpolation options, see "How the Simulation Data Inspector Compares Data".

Comparison Properties

AbsTol — Absolute tolerance
0 (default) | double

Positive-valued absolute tolerance of the signal used for signal comparisons. The Simulation Data Inspector uses tolerances specified in the signal properties of the baseline signal when **Override Global Tol** is set to `yes`. For more information about tolerances in the Simulation Data Inspector, see "How the Simulation Data Inspector Compares Data".

Example: `0.1`

Data Types: `double`

RelTol — Relative tolerance
0 (default) | double

Positive-valued relative tolerance for the signal used for signal comparisons. The Simulation Data Inspector uses tolerances specified in the signal properties of the baseline signal when **Override Global Tol** is set to `yes`. The relative tolerance is expressed as a fractional multiplier. For example, `0.1` specifies a 10 percent tolerance. For more information about tolerances in the Simulation Data Inspector, see "How the Simulation Data Inspector Compares Data".

Example: `0.05`

Data Types: `double`

TimeTol — Time tolerance
0 (default) | double

Positive-valued time tolerance for the signal used in signal comparisons. The Simulation Data Inspector uses tolerances specified in the signal properties of the baseline signal when **Override Global Tol** is set to `yes`. Specify the time tolerance in seconds. For more information about tolerances in the Simulation Data Inspector, see "How the Simulation Data Inspector Compares Data".

Example: `0.1`

Data Types: `double`

SyncMethod — Synchronization method
'union' (default) | 'intersection'

Method used to synchronize signal time data for comparison. For more information about the synchronization options, see "How the Simulation Data Inspector Compares Data".

Methods

convertUnits	Convert signal units
export	Export signal object to MATLAB timeseries
getAsTall	Return tall timetable with time and data values
plotOnSubPlot	Plot signal on specified sub-plot

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Analyze Simulation Data with Signal Tolerances

You can change tolerance values on a signal-by-signal basis to evaluate the effect of a model parameter change. This example uses the `slexAircraftExample` model and the Simulation Data Inspector to evaluate the effect of changing the time constant for the low-pass filter following the control input.

Setup

Load the model, and mark the `q, rad/sec` and `alpha, rad` signals for logging. Then, simulate the model to create the baseline run.

```
% Load example model
load_system('slexAircraftExample')

% Mark the q, rad/sec and alpha, rad signals for logging
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',3,'or
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'or
```

```
% Simulate system
sim('slexAircraftExample')
```

Modify Model Parameter

Modify the model parameter Ts in the model workspace to change the time constant of the input low-pass filter.

```
% Change input filter time constant
modelWorkspace = get_param('slexAircraftExample','modelworkspace');
modelWorkspace.assignin('Ts',1)

% Simulate again
sim('slexAircraftExample')
```

Compare Runs and Inspect Results

Use the Simulink.sdi.compareRuns function to compare the data from the simulations. Then, inspect the match property of the signal result to see whether the signals fell within the default tolerance of 0.

```
% Get run data
runIDs = Simulink.sdi.getAllRunIDs;
runID1 = runIDs(end - 1);
runID2 = runIDs(end);

% Compare runs
diffRun1 = Simulink.sdi.compareRuns(runID1,runID2);

% Get signal result
sig1Result1 = diffRun1.getResultByIndex(1);
sig2Result1 = diffRun1.getResultByIndex(2);

% Check whether signals matched
sig1Result1.Match

ans = logical
   0

sig2Result1.Match

ans = logical
   0
```

Compare Runs with Signal Tolerances

The signals did not match within the default tolerance of 0. To further analyze the effect of the time constant change, add signal tolerances to the comparison with the baseline signal properties to determine the tolerance required for a pass. This example uses a combination of time and absolute tolerances.

```matlab
% Get signal object for sigID1
run1 = Simulink.sdi.getRun(runID1);
sigID1 = run1.getSignalIDByIndex(1);
sigID2 = run1.getSignalIDByIndex(2);

sig1 = Simulink.sdi.getSignal(sigID1);
sig2 = Simulink.sdi.getSignal(sigID2);

% Set tolerances for q, rad/sec
sig1.AbsTol = 0.1;
sig1.TimeTol = 0.6;

% Set tolerances for alpha, rad
sig2.AbsTol = 0.2;
sig2.TimeTol = 0.8;

% Run the comparison again
diffRun2 = Simulink.sdi.compareRuns(runID1,runID2);
sig1Result2 = diffRun2.getResultByIndex(1);
sig2Result2 = diffRun2.getResultByIndex(2);

% Check the result
sig1Result2.Match
```

```
ans = logical
   1
```

```matlab
sig2Result2.Match
```

```
ans = logical
   1
```

Define Comparison and Visualization Properties for a Signal

This example shows how to obtain a `Simulink.sdi.Signal` object and modify its properties using the Simulation Data Inspector programmatic interface.

Acquire a `Simulink.sdi.Signal` Object

First, run a simulation to create a run. This example uses example model `slexAircraftExample`. Then, use the Simulation Data Inspector programmatic interface to get the `Simulink.sdi.Signal` object for your signal of interest.

```matlab
% Configure model "slexAircraftExample" for logging and simulate
simOut = sim('slexAircraftExample','SaveOutput','on',...
                    'SaveFormat','StructureWithTime');

% Use Simulink.sdi.createRun to create a run and return the list of signal IDs for sigr
% contained in the run
[~,~,signalIDs] = Simulink.sdi.createRun('My Run','base',{'simOut'});

% Get the signal object corresponding to the first signal ID
signalObj = Simulink.sdi.getSignal(signalIDs(1));
```

Modify the Signal Properties

The `Simulink.sdi.Signal` object has several comparison and visualization properties that you can modify.

```matlab
% Define comparison and visualization properties for this signal
signalObj.syncMethod = 'intersection';
signalObj.lineColor = [1,0.4,0.6];
signalObj.lineDashed = '-';
signalObj.checked = true;
```

View the Signal Properties

You can view the signal properties in the command window and in the Simulation Data Inspector to verify that the signal has its properties defined how you want them.

```matlab
signalObj

signalObj =
  Signal with properties:

               ID: 129887
            RunID: 129876
             Name: 'Integrate:CSTATE'
            Units: ''
         DataType: 'double'
       Complexity: "real"
    ComplexFormat: "real-imaginary"
```

```
     SampleTime: ''
          Model: 'slexAircraftExample'
      BlockPath: 'slexAircraftExample/Aircraft...'
  FullBlockPath: 'slexAircraftExample/Aircraft Dynamics Model/Vertical Channel/Integr
      PortIndex: 0
     Dimensions: 1
        Channel: [1x0 int32]
        Checked: 1
      LineColor: [1 0.4000 0.6000]
     LineDashed: '-'
   InterpMethod: 'linear'
         AbsTol: 0
         RelTol: 0
        TimeTol: 0
     SyncMethod: 'intersection'
         Values: [1x1 timeseries]
     RootSource: 'simOut.get(''xout'')'
     TimeSource: 'simOut.get(''xout'').time'
     DataSource: 'simOut.get(''xout'').signals(1).values'
```

```
Simulink.sdi.view
```

Compare Signals Within a Simulation Run

This example uses the slexAircraftExample model to demonstrate the comparison of
the input and output signals for a control system. The example marks the signals for
streaming then gets the run object for a simulation run. Signal IDs from the run object
specify the signals to be compared.

```matlab
% Load model slexAircraftExample and mark signals for streaming
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot',1,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on

% Simulate model slexAircraftExample
sim('slexAircraftExample')

% Get run IDs for most recent run
allIDs = Simulink.sdi.getAllRunIDs;
runID = allIDs(end);

% Get Run object
run = Simulink.sdi.getRun(runID);
```

```matlab
% Get signal IDs
signalID1 = run.getSignalIDByIndex(1);
signalID2 = run.getSignalIDByIndex(2);

if (run.isValidSignalID(signalID1))
    % Change signal tolerance
    signal1 = Simulink.sdi.getSignal(signalID1);
    signal1.AbsTol = 0.1;
end

if (run.isValidSignalID(signalID1) && run.isValidSignalID(signalID2))
    % Compare signals
    diff = Simulink.sdi.compareSignals(signalID1,signalID2);

    % Check whether signals match within tolerance
    match = diff.match
end
match = logical
    0
```

Plot Signals from a Simulation Run

This example demonstrates how to access the `Simulink.sdi.Run` object for a run created by logging signals to the Simulation Data Inspector. From the `Simulink.sdi.Run` object you can get `Simulink.sdi.Signal` objects that you can use to view data.

```matlab
% Simulate model sldemo_absbrake to create a run
sim('sldemo_fuelsys')

% Get runID for the run
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get run object for the run
run = Simulink.sdi.getRun(runID);

% Check signal count of the run
run.signalCount

ans = int32
    15
```

5-523

```
% Get signal objects for the signals in the run
signal1 = run.getSignalByIndex(4);
signal2 = run.getSignalByIndex(9);
signal3 = run.getSignalByIndex(10);

% Create subplot layout to display signals
Simulink.sdi.setSubPlotLayout(3, 1)

% Plot signals
signal1.checked = true;
signal2.plotOnSubPlot(2, 1, true);
signal3.plotOnSubPlot(3, 1, true);

% View plots in the Simulation Data Inspector
Simulink.sdi.view
```

Alternatives

Use the Simulation Data Inspector UI to view and modify signals and signal properties.

convertUnits

Class: Simulink.sdi.Signal
Package: Simulink.sdi

Convert signal units

Syntax

```
signal.convertUnits(units)
```

Description

`signal.convertUnits(units)` converts the units of `signal` to the units specified by `units`. For a list of acceptable units, see Allowed Units. You can use `Simulink.sdi.Signal.convertUnits` to convert the units on `Simulink.sdi.Signal` objects with data of all built-in and fixed-point types.

Input Arguments

units — Desired signal units
string | character vector

Desired units for the signal.

Example: `'m'`

Example: `"ft/s"`

Data Types: `char` | `string`

Examples

Programmatically Convert Signal Units

This example shows how to use the `convertUnits` method to convert the units of a `Simulink.sdi.Signal` object, using the model `sldemo_autotrans`.

Generate Simulation Data

Simulate the model to create a run of data. Then, use the Simulation Data Inspector programmatic interface to get the run data.

```
% Simulate the model
sim('sldemo_autotrans')

% Get a Simulink.sdi.Run object for the most recently created run
ids = Simulink.sdi.getAllRunIDs;
id = ids(end);
run = Simulink.sdi.getRun(id);
```

Inspect the Signal Properties

Get a `Simulink.sdi.Signal` object for the `EngineRPM` signal and inspect its properties to determine the units.

```
% Get Simulink.sdi.Signal object
signal = run.getSignalByIndex(1)

signal =
  Signal with properties:

               ID: 150831
            RunID: 150867
             Name: 'EngineRPM'
            Units: 'rpm'
         DataType: 'double'
       Complexity: "real"
    ComplexFormat: "real-imaginary"
       SampleTime: '0.04'
            Model: 'sldemo_autotrans'
        BlockPath: 'sldemo_autotrans/Engine'
    FullBlockPath: 'sldemo_autotrans/Engine'
        PortIndex: 1
       Dimensions: 1
```

```
    Channel: [1x0 int32]
    Checked: 0
   LineColor: [0.3920 0.8310 0.0750]
  LineDashed: '-'
 InterpMethod: 'linear'
      AbsTol: 0
      RelTol: 0
     TimeTol: 0
   SyncMethod: 'union'
      Values: [1x1 timeseries]
   RootSource: ''
   TimeSource: ''
   DataSource: ''
```

Convert Signal Units

Use the `convertUnits` method to convert the `EngineRPM` signal units to rad/s. Then, change the signal name to reflect the new units.

```
% Convert units
signal.convertUnits('rad/s')

signal.Name = 'Engine,rad/s';
```

export

Class: Simulink.sdi.Signal
Package: Simulink.sdi

Export signal object to MATLAB timeseries

Syntax

```
ts = sigObj.export
ts = sigObj.export(startTime, endTime)
```

Description

`ts = sigObj.export` exports the `Simulink.sdi.Signal` object `sigObj` to the timeseries `ts` in the MATLAB workspace.

`ts = sigObj.export(startTime, endTime)` exports the portion of the `Simulink.sdi.Signal` object defined by `startTime` and `endTime` to the timeseries `ts` in the MATLAB workspace.

Input Arguments

`startTime` — Export start time
integer

Start time for the signal portion to export.

Example: `0`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64`

`endTime` — Export end time
integer

End time for the signal portion to export.

Example: 10

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64`

Output Arguments

`ts` — Exported timeseries
timeseries

Timeseries exported from Simulink.sdi.Signal object.

Examples

Export Signal Data to Timeseries

This example shows how to generate a signal and export the signal data to a timeseries.

```
% Simulate model sldemo_fuelsys to create a run of logged signals
sim('sldemo_fuelsys');

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
run = Simulink.sdi.getRun(runID);

% Get a signal
signal = run.getSignalByIndex(2);

% Export signal data to timeseries
ts = signal.export;
```

Alternatives

You can export data to MATLAB or a MAT-file from the Simulation Data Inspector UI. For more information, see "Save and Share Simulation Data Inspector Data and Views".

getAsTall

Class: Simulink.sdi.Signal
Package: Simulink.sdi

Return tall timetable with time and data values

Syntax

```
tt = sigObj.getAsTall
```

Description

`tt = sigObj.getAsTall` returns a tall timetable of the time and data values in the Simulink.sdi.Signal object `sigObj`. For more information on working with tall arrays, see "Tall Arrays" (MATLAB).

Output Arguments

tt — Tall timetable
tall timetable

Tall timetable containing the data from the Simulink.sdi.Signal object.

Examples

Get Tall Timetable of Signal Data

This example shows how to generate a tall timetable from signal data in a `Simulink.sdi.Signal` object.

```
% Simulate the model sldemo_fuelsys to create a run of logged signals
sim('sldemo_fuelsys');
```

```
% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
run = Simulink.sdi.getRun(runID);

% Get a signal
signal = run.getSignalByIndex(2);

% Get tall timetable of signal
tt = signal.getAsTall

tt =

  Mx1 tall timetable

        Time             Data

    _____      _____

    0 sec               0.068493
    0.00056199 sec      0.092452
    0.0033719 sec        0.21101

plotOnSubPlot

Class: Simulink.sdi.Signal
Package: Simulink.sdi

Plot signal on specified sub-plot

Syntax

```
signalObj.plotOnSubplot(r, c, checked)
```

Description

signalObj.plotOnSubplot(r, c, checked) plots or clears the signal corresponding to the Simulink.sdi.Signal object, sigObj, on the sub-plot specified by r and c.

Input Arguments

r — Row index
scalar

Row index for the sub-plot.

Example: 1

c — Column index
scalar

Column index for the sub-plot.

Example: 2

checked — Signal checked parameter state
true | false

Desired state for signal on sub-plot.

- `true` plots the signal on the sub-plot.
- `false` clears the signal from the sub-plot.

Data Types: `logical`

Examples

Plot Signals from a Simulation Run

This example demonstrates how to access the `Simulink.sdi.Run` object for a run created by logging signals to the Simulation Data Inspector. From the `Simulink.sdi.Run` object you can get `Simulink.sdi.Signal` objects that you can use to view data.

```
% Simulate model sldemo_absbrake to create a run
sim('sldemo_fuelsys')

% Get runID for the run
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get run object for the run
run = Simulink.sdi.getRun(runID);

% Check signal count of the run
run.signalCount

ans = int32
    15

% Get signal objects for the signals in the run
signal1 = run.getSignalByIndex(4);
signal2 = run.getSignalByIndex(9);
signal3 = run.getSignalByIndex(10);

% Create subplot layout to display signals
Simulink.sdi.setSubPlotLayout(3, 1)

% Plot signals
signal1.checked = true;
signal2.plotOnSubPlot(2, 1, true);
signal3.plotOnSubPlot(3, 1, true);
```

```
% View plots in the Simulation Data Inspector
Simulink.sdi.view
```

Alternatives

You can use the Simulation Data Inspector GUI to modify your plot layout and where you plot signals. For more information, see "Inspect Simulation Data".

Simulink.sdi.WorkerRun class

Package: Simulink.sdi

Access simulation data from parallel workers

Description

The `Simulink.sdi.WorkerRun` class provides access to run data generated on Parallel Computing Toolbox parallel workers. Create a `Simulink.sdi.WorkerRun` object on the worker, and then use the object to access data in your local MATLAB session.

Construction

`workerRun = Simulink.sdi.WorkerRun(runID)` creates a `Simulink.sdi.WorkerRun` object with the run identifier specified by `runID`.

`workerRun = Simulink.sdi.WorkerRun.getLatest` creates a `Simulink.sdi.WorkerRun` object of the most recent run.

Input Arguments

`runID` — Run identifier
integer

Run identifier

Methods

getDataset	Create Dataset of worker run data
getDatasetRef	Create DatasetRef for worker run
getLatest	Create worker run for latest run
getLocalRun	Create local run from worker run

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport('local')

% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];
```

Initialize Parallel Workers

Use gcp to create a pool of local workers to run parallel simulations if you don't already have one. In an `spmd` code block, load the `slexAircraftExample` model and select signals to log. To avoid data concurrency issues using `sim` in `parfor`, create a temporary directory for each worker to use during simulations.

```
p = gcp;
spmd

    % Load system and select signals to log
    load_system('slexAircraftExample')
    Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
    Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',
```

```matlab
    % Create temporary directory on each worker
    workDir = pwd;
    addpath(workDir)
    tempDir = tempname;
    mkdir(tempDir)
    cd(tempDir)

end
```

Run Parallel Simulations

Use `parfor` to run the seven simulations in parallel. Select the value for `Ts` for each simulation, and modify the value of `Ts` in the model workspace. Then, run the simulation and build an array of `Simulink.sdi.WorkerRun` objects to access the data with the Simulation Data Inspector. After the `parfor` loop, use another `spmd` segment to remove the temporary directories from the workers.

```matlab
parfor index = 1:7

    % Select value for Ts
    Ts_val = Ts_vals(index);

    % Change the filter time constant and simulate
    modelWorkspace = get_param('slexAircraftExample','modelworkspace');
    modelWorkspace.assignin('Ts',Ts_val)
    sim('slexAircraftExample')

    % Create a worker run for each simulation
    workerRun(index) = Simulink.sdi.WorkerRun.getLatest

end

spmd

    % Remove temporary directories
    cd(workDir)
    rmdir(tempDir, 's')
    rmpath(workDir)

end
```

Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

```
ds(7) = Simulink.SimulationData.Dataset;

for a = 1:7
    ds(a) = workerRun(a).getDataset;
end
ds(1)

ans =
Simulink.SimulationData.Dataset '' with 2 elements

                          Name       BlockPath
                          _____  _____
    1  [1x1 Signal]       alpha, rad ...rcraftExample/Aircraft Dynamics Model
    2  [1x1 Signal]       Stick      slexAircraftExample/Pilot

  - Use braces { } to access, modify, or add elements using index.
```

Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```
for b = 1:7
    datasetRef(b) = workerRun(b).getDatasetRef;
end

datasetRef(1)

ans =
  DatasetRef with properties:

          Name: 'Run 5: slexAircraftExample'
           Run: [1×1 Simulink.sdi.Run]
    numElements: 2
```

Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local Run objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```
for c = 1:7

    Runs(c) = workerRun(c).getLocalRun;
    Ts_val_str = num2str(Ts_vals(c));
    desc = strcat('Ts = ', Ts_val_str);
    Runs(c).Description = desc;
    Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);

end
```

Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

```
Simulink.sdi.cleanupWorkerResources
```

Alternatives

You can also access, view, and analyze simulation data from Parallel Computing Toolbox workers using the Simulation Data Inspector UI.

getDataset

Class: Simulink.sdi.WorkerRun
Package: Simulink.sdi

Create Dataset of worker run data

Syntax

```
dataset = workerRun.getDataset
dataset = workerRun.getDataset(domain)
```

Description

`dataset = workerRun.getDataset` returns a
`Simulink.SimulationData.Dataset` object of the data corresponding to the
`Simulink.sdi.WorkerRun` object.

`dataset = workerRun.getDataset(domain)` returns a
`Simulink.SimulationData.Dataset` object of the data corresponding to the
`Simulink.sdi.WorkerRun` object limited to the scope specified by `domain`.

Input Arguments

domain — Scope specifier
'signals' | 'outports'

Scope limiting argument that selects the data to return in the
`Simulink.SimulationData.Dataset` object.

- `'signals'` limits the data returned in the `Dataset` to signals in the `WorkerRun`.

- `'outports'` limits the data returned in the `Dataset` to outport data in the
  `WorkerRun`.

Output Arguments

dataset — Simulink.SimulationData.Dataset object
Simulink.SimulationData.Dataset object

`Simulink.SimulationData.Dataset` object containing the data from the
`Simulink.sdi.WorkerRun` object.

Examples

Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with
different input filter time constants and shows several ways to access the data using the
Simulation Data Inspector programmatic interface.

Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox
support is configured to import runs created on local workers automatically. Then, create
a vector of filter parameter values to use in each simulation.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport('local')

% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];
```

Initialize Parallel Workers

Use gcp to create a pool of local workers to run parallel simulations if you don't already
have one. In an `spmd` code block, load the `slexAircraftExample` model and select
signals to log. To avoid data concurrency issues using `sim` in `parfor`, create a temporary
directory for each worker to use during simulations.

```
p = gcp;
spmd

    % Load system and select signals to log
```

```matlab
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',

% Create temporary directory on each worker
workDir = pwd;
addpath(workDir)
tempDir = tempname;
mkdir(tempDir)
cd(tempDir)
```

```matlab
end
```

Run Parallel Simulations

Use `parfor` to run the seven simulations in parallel. Select the value for `Ts` for each simulation, and modify the value of `Ts` in the model workspace. Then, run the simulation and build an array of `Simulink.sdi.WorkerRun` objects to access the data with the Simulation Data Inspector. After the `parfor` loop, use another `spmd` segment to remove the temporary directories from the workers.

```matlab
parfor index = 1:7

    % Select value for Ts
    Ts_val = Ts_vals(index);

    % Change the filter time constant and simulate
    modelWorkspace = get_param('slexAircraftExample','modelworkspace');
    modelWorkspace.assignin('Ts',Ts_val)
    sim('slexAircraftExample')

    % Create a worker run for each simulation
    workerRun(index) = Simulink.sdi.WorkerRun.getLatest

end

spmd

    % Remove temporary directories
    cd(workDir)
    rmdir(tempDir, 's')
    rmpath(workDir)

end
```

Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

```
ds(7) = Simulink.SimulationData.Dataset;

for a = 1:7
    ds(a) = workerRun(a).getDataset;
end
ds(1)

ans =
Simulink.SimulationData.Dataset '' with 2 elements

                          Name        BlockPath
                          _____  _____
    1  [1x1 Signal]       alpha, rad  ...rcraftExample/Aircraft Dynamics Model
    2  [1x1 Signal]       Stick       slexAircraftExample/Pilot

  - Use braces { } to access, modify, or add elements using index.
```

Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```
for b = 1:7
    datasetRef(b) = workerRun(b).getDatasetRef;
end

datasetRef(1)

ans =
  DatasetRef with properties:

          Name: 'Run 5: slexAircraftExample'
           Run: [1×1 Simulink.sdi.Run]
    numElements: 2
```

Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local Run objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```
for c = 1:7

    Runs(c) = workerRun(c).getLocalRun;
    Ts_val_str = num2str(Ts_vals(c));
    desc = strcat('Ts = ', Ts_val_str);
    Runs(c).Description = desc;
    Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);

end
```

Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

```
Simulink.sdi.cleanupWorkerResources

getDatasetRef

Class: Simulink.sdi.WorkerRun
Package: Simulink.sdi

Create DatasetRef for worker run

Syntax

```
datasetRef = workerRun.getDatasetRef
datasetRef = workerRun.getDatasetRef(domain)
```

Description

`datasetRef = workerRun.getDatasetRef` returns a
`Simulink.SimulationData.DatasetRef` object referencing the data in the
`Simulink.sdi.WorkerRun` object, `workerRun`.

`datasetRef = workerRun.getDatasetRef(domain)` returns a
`Simulink.SimulationData.DatasetRef` object referencing the data in the
`Simulink.sdi.WorkerRun` object, `workerRun`, limited to the scope specified by
`domain`.

Input Arguments

domain — Scope limiting input
'signals' | 'outports'

Scope limiting argument that selects the data to reference in the
`Simulink.SimulationData.DatasetRef` object.

- `'signals'` limits the data referenced in the `DatasetRef` to signals in the
  `WorkerRun`.

- `'outports'` limits the data referenced in the `DatasetRef` to outport data in the
  `WorkerRun`.

Output Arguments

datasetRef — Simulink.SimulationData.DatasetRef object
Simulink.sdi.DatasetRef object

`Simulink.sdi.DatasetRef` object referencing the data in the Parallel Computing Toolbox worker run.

Examples

Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport('local')

% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];
```

Initialize Parallel Workers

Use gcp to create a pool of local workers to run parallel simulations if you don't already have one. In an `spmd` code block, load the `slexAircraftExample` model and select signals to log. To avoid data concurrency issues using `sim` in `parfor`, create a temporary directory for each worker to use during simulations.

```
p = gcp;
spmd

    % Load system and select signals to log
```

```
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',

% Create temporary directory on each worker
workDir = pwd;
addpath(workDir)
tempDir = tempname;
mkdir(tempDir)
cd(tempDir)

end
```

Run Parallel Simulations

Use `parfor` to run the seven simulations in parallel. Select the value for `Ts` for each simulation, and modify the value of `Ts` in the model workspace. Simulink.sdi.WorkerRun.getLatest

Class: Simulink.sdi.WorkerRun
Package: Simulink.sdi

Create worker run for latest run

Syntax

```
runObj = Simulink.sdi.WorkerRun.getLatest
```

Description

`runObj = Simulink.sdi.WorkerRun.getLatest` creates a
`Simulink.sdi.WorkerRun` object for the latest run on a Parallel Computing Toolbox worker.

Output Arguments

runObj — Local Simulink.sdi.Run object
Simulink.sdi.WorkerRun object

`Simulink.sdi.WorkerRun` object to access the data from the latest Parallel Computing Toolbox worker run.

Examples

Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport('local')

% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];
```

Initialize Parallel Workers

Use gcp to create a pool of local workers to run parallel simulations if you don't already have one. In an spmd code block, load the slexAircraftExample model and select signals to log. To avoid data concurrency issues using sim in parfor, create a temporary directory for each worker to use during simulations.

```
p = gcp;
spmd

    % Load system and select signals to log
    load_system('slexAircraftExample')
    Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
    Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',

    % Create temporary directory on each worker
    workDir = pwd;
    addpath(workDir)
    tempDir = tempname;
    mkdir(tempDir)
    cd(tempDir)

end
```

Run Parallel Simulations

Use parfor to run the seven simulations in parallel. Select the value for Ts for each simulation, and modify the value of Ts in the model workspace. Then, run the simulation and build an array of Simulink.sdi.WorkerRun objects to access the data with the

Simulation Data Inspector. After the `parfor` loop, use another `spmd` segment to remove the temporary directories from the workers.

```
parfor index = 1:7

    % Select value for Ts
    Ts_val = Ts_vals(index);

    % Change the filter time constant and simulate
    modelWorkspace = get_param('slexAircraftExample','modelworkspace');
    modelWorkspace.assignin('Ts',Ts_val)
    sim('slexAircraftExample')

    % Create a worker run for each simulation
    workerRun(index) = Simulink.sdi.WorkerRun.getLatest

end

spmd

    % Remove temporary directories
    cd(workDir)
    rmdir(tempDir, 's')
    rmpath(workDir)

end
```

Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

```
ds(7) = Simulink.SimulationData.Dataset;

for a = 1:7
    ds(a) = workerRun(a).getDataset;
end
ds(1)

ans =
Simulink.SimulationData.Dataset '' with 2 elements

                      Name          BlockPath
                      _____     _____
    1   [1x1 Signal]  alpha, rad    ...rcraftExample/Aircraft Dynamics Model
```

```
   2  [1x1 Signal]     Stick        slexAircraftExample/Pilot

  - Use braces { } to access, modify, or add elements using index.
```

Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```
for b = 1:7
    datasetRef(b) = workerRun(b).getDatasetRef;
end

datasetRef(1)

ans =
  DatasetRef with properties:

          Name: 'Run 5: slexAircraftExample'
           Run: [1×1 Simulink.sdi.Run]
    numElements: 2
```

Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local `Run` objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```
for c = 1:7

    Runs(c) = workerRun(c).getLocalRun;
    Ts_val_str = num2str(Ts_vals(c));
    desc = strcat('Ts = ', Ts_val_str);
    Runs(c).Description = desc;
    Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);

end
```

Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

```

getLocalRun

Class: Simulink.sdi.WorkerRun
Package: Simulink.sdi

Create local run from worker run

Syntax

```
runObj = workerRun.getLocalRun
```

Description

`runObj = workerRun.getLocalRun` creates the local `Simulink.sdi.Run` object
`runObj` for the `Simulink.sdi.WorkerRun` object `workerRun`. Use `getLocalRun` in
the client MATLAB to access the `Simulink.sdi.WorkerRun` data.

Output Arguments

runObj — Local Simulink.sdi.Run object
Simulink.sdi.Run object

Local `Simulink.sdi.Run` object.

Examples

Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with
different input filter time constants and shows several ways to access the data using the
Simulation Data Inspector programmatic interface.

Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport('local')

% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];
```

Initialize Parallel Workers

Use gcp to create a pool of local workers to run parallel simulations if you don't already have one. In an spmd code block, load the slexAircraftExample model and select signals to log. To avoid data concurrency issues using sim in parfor, create a temporary directory for each worker to use during simulations.

```
p = gcp;
spmd

    % Load system and select signals to log
    load_system('slexAircraftExample')
    Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
    Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',

    % Create temporary directory on each worker
    workDir = pwd;
    addpath(workDir)
    tempDir = tempname;
    mkdir(tempDir)
    cd(tempDir)

end
```

Run Parallel Simulations

Use parfor to run the seven simulations in parallel. Select the value for Ts for each simulation, and modify the value of Ts in the model workspace. Then, run the simulation and build an array of Simulink.sdi.WorkerRun objects to access the data with the

Simulation Data Inspector. After the `parfor` loop, use another `spmd` segment to remove the temporary directories from the workers.

```
parfor index = 1:7

    % Select value for Ts
    Ts_val = Ts_vals(index);

    % Change the filter time constant and simulate
    modelWorkspace = get_param('slexAircraftExample','modelworkspace');
    modelWorkspace.assignin('Ts',Ts_val)
    sim('slexAircraftExample')

    % Create a worker run for each simulation
    workerRun(index) = Simulink.sdi.WorkerRun.getLatest

end

spmd

    % Remove temporary directories
    cd(workDir)
    rmdir(tempDir, 's')
    rmpath(workDir)

end
```

Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

```
ds(7) = Simulink.SimulationData.Dataset;

for a = 1:7
    ds(a) = workerRun(a).getDataset;
end
ds(1)

ans =
Simulink.SimulationData.Dataset '' with 2 elements

                        Name        BlockPath
                        _____   _____
    1   [1x1 Signal]    alpha, rad  ...rcraftExample/Aircraft Dynamics Model
```

```
    2  [1x1 Signal]      Stick       slexAircraftExample/Pilot

  - Use braces { } to access, modify, or add elements using index.
```

Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```
for b = 1:7
    datasetRef(b) = workerRun(b).getDatasetRef;
end

datasetRef(1)

ans =
  DatasetRef with properties:

          Name: 'Run 5: slexAircraftExample'
           Run: [1×1 Simulink.sdi.Run]
    numElements: 2
```

Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local `Run` objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```
for c = 1:7

    Runs(c) = workerRun(c).getLocalRun;
    Ts_val_str = num2str(Ts_vals(c));
    desc = strcat('Ts = ', Ts_val_str);
    Runs(c).Description = desc;
    Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);

end
```

Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

```
Simulink.sdi.cleanupWorkerResources
```

Simulink.Signal

Specify attributes of signal

Description

This class enables you to create workspace objects that you can use to assign or validate the attributes of a signal or discrete state, such as its data type, numeric type, dimensions, and so on.

You can use a signal object to:

- Assign values to signal attributes that are left unassigned (have a value of -1 or `auto`) by the signal source.
- Validate signal attributes whose values are explicitly assigned by the signal source. Such attributes have values other than -1 or `auto`. Successful validation guarantees that the signal has the attributes that you intended it to have.

You can create a `Simulink.Signal` object in the MATLAB workspace or in a model workspace.

Use signal objects to assign or validate signal or discrete state attributes by giving the signal or discrete state the same name as the workspace variable that references the `Simulink.Signal` object.

For more information about using signal objects, see "Use Simulink.Signal Objects to Specify and Control Signal Attributes" and "Data Objects".

Creation

Create a `Simulink.Signal` object:

- By using the Model Data Editor. See "For Signals".
- By using the Model Explorer. See "Create Data Objects from Built-In Data Class Package Simulink".

- Directly from a signal properties dialog box or the Property Inspector in a model. See "Create Signal Object from Signal Properties Dialog Box".

- By using the `Simulink.Signal` function, described below.

Syntax

`signalObj = Simulink.Signal`

Description

`signalObj = Simulink.Signal` returns a `Simulink.Signal` object with default property values.

Properties

For information about properties in the property dialog box of a `Simulink.Signal` object, see "Property Dialog Box".

CoderInfo — Specifications for generating code for signal
`Simulink.CoderInfo` object

Information used by Simulink Coder for generating code for this signal. The value of this property is an object of `Simulink.CoderInfo` class.

For more information, see "Apply Storage Classes to Individual Signal, State, and Parameter Data Elements" (Simulink Coder) and "Choose a Storage Class for Controlling Data Representation in the Generated Code" (Embedded Coder).

Complexity — Numeric complexity of signal
`'auto'` (default) | `'real'` | `'complex'`

Character vector specifying the numeric type of this signal. Valid values are `'auto'` (determined by Simulink), `'real'`, or `'complex'`.

Data Types: `char`

DataType — Data type of signal
`'auto'` (default) | character vector

Character vector specifying the data type of this signal.

The default value, `'auto'`, specifies that Simulink should determine the data type. You can specify a built-in data type (for example, `'uint8'` or `'single'`) or a custom data type. To specify a custom data type, use a MATLAB expression that specifies the type, (for example, the name of a `Simulink.NumericType` object that you create in the base workspace).

To specify a bus object as the data type for the signal object, use the `'Bus: <object_name>'` syntax. See "Bus Support" for details about what you need to do if you specify a bus object as the data type.

Example: `'auto'`

Example: `'int8'`

Example: `'fixdt(1,16,5)'`

Example: `'myAliasTypeObject'`

Example: `'Enum: myEnumType'`

Example: `'Bus: myBusObject'`

Data Types: `char`

`Description` — Custom description of signal
`''` (empty character vector) (default) | character vector

Description of this signal. This field is intended for use in documenting this signal.

This property is used by the Simulink Report Generator and for code generation.

If you have an Embedded Coder license, you can add the signal description as a comment for the variable declaration in generated code:

- Specify a storage class for the signal object other than `Auto`.
- On the **Code Generation > Comments** pane of the model Configuration Parameters dialog box, select the model configuration parameter **Simulink data object descriptions**. For more information, see "Simulink data object descriptions" (Simulink Coder).

Example: `'This signal represents the rotation speed of the engine.'`

Data Types: `char`

Dimensions — Dimensions of signal
-1 (default) | row vector | character vector

Scalar or vector specifying the dimensions of this signal.

Valid values are -1 (the default) specifying any dimensions, N specifying a vector signal of size N, or [M N] specifying an MxN matrix signal.

To use symbolic dimensions, specify a character vector.

Example: [1 3]

Example: '[1 myDimParam]'

Data Types: double | char

DimensionsMode — Dimension mode of signal
'auto' (default) | 'Fixed' | 'Variable'

Dimensions mode of the signal. Valid values are:

- 'auto'— Allows variable-size and fixed-size signals.
- 'Fixed'—Allows only fixed-size signals. Does not allow variable-size signals.
- 'Variable'—Allows only variable-size signals.

For information about variable-size signals, see "Variable-Size Signal Basics".

Max — Maximum value of signal
[] (empty) (default) | real double scalar

Maximum value that this signal can have.

The default value is [] (unspecified). Specify a finite, real, double, scalar value.

Note If you specify a bus object as the data type for a signal, do not set the maximum value for bus data on the signal property dialog box. Simulink ignores this setting. Instead, set the maximum values for bus elements of the bus object specified as the data type. For information on the Maximum property of a bus element, see Simulink.BusElement.

Simulink uses this value in the following ways:

- When updating the diagram or starting a simulation, Simulink generates an error if the initial value of the signal is greater than the maximum value or if the maximum value is outside the range of the data type of the signal.
- When you enable the **Simulation range checking** diagnostic, Simulink alerts you during simulation if the signal value is greater than the maximum value (see "Simulation range checking").

Example: `5.32`

Data Types: `double`

`Min` — Minimum value of signal
`[]` (empty) (default) | real `double` scalar

Minimum value that this signal can have.

The default value is `[]` (unspecified). Specify a finite, real, double, scalar value.

Note If you specify a bus object as the data type for a signal, do not set the minimum value for bus data on the signal property dialog box. Simulink ignores this setting. Instead, set the minimum values for bus elements of the bus object specified as the data type. For information on the Minimum property of a bus element, see `Simulink.BusElement`.

Simulink uses this value in the following ways:

- When updating the diagram or starting a simulation, Simulink generates an error if the signal's initial value is less than the minimum value or if the minimum value is outside the range for the data type of the signal.
- When you enable the **Simulation range checking** diagnostic, Simulink alerts you during simulation if the signal value is less than the minimum value (see "Simulation range checking").

Example: `-0.92`

Data Types: `double`

`InitialValue` — Initial value of signal or state
`''` (empty character vector) (default) | character vector

Signal or state value before a simulation takes its first time step.

You can specify any MATLAB expression, including the name of a workspace variable, that evaluates to a numeric scalar value or array.

At the command prompt or in a script, even if you use a number, specify the initial value as a character vector.

```
mySigObject.InitialValue='5.3';
```

```
mySigObject.InitialValue = 'myNumericVariable';
```

To specify an initial value for a signal that uses a numeric data type other than `double`, cast the initial value to the signal data type. For example, you can specify `'single(73.3)'` to use `73.3` as the initial value for a signal of data type `single`.

If you use a bus object as the data type for the signal object, set `InitialValue` to a character vector containing either `0` or a MATLAB structure that matches the bus object. See "Bus Support" for details.

If the initial value evaluates to a MATLAB structure, then in the **Configuration Parameters** dialog box, set "Underspecified initialization detection" to `Simplified`.

If necessary, Simulink converts the initial value to ensure type, complexity, and dimension consistency with the corresponding block parameter value. If you specify an invalid value or expression, an error message appears when you update the model. Also, Simulink performs range checking of the initial value. The software alerts you when the initial value of the signal lies outside a range that corresponds to its specified minimum and maximum values and data type.

Classic initialization mode: In this mode, initial value settings for signal objects that represent the following signals and states override the corresponding block parameter initial values if undefined (specified as `[]`):

- Output signals of conditionally executed subsystems and Merge blocks
- Block states

Simplified initialization mode: In this mode, initial values of signal objects associated with the following blocks are ignored. The initial values of the corresponding blocks are used instead.

- Outport blocks of conditionally executed subsystems
- Merge blocks

Example: `'15.23'`

Example: `'myInitParam'`

Data Types: `char`

SampleTime — Sample time of signal
`-1` (default) | `double` scalar or array

Rate at which this signal should be updated.

See "Specify Sample Time" for details.

Example: `0.001`

Example: `2`

Data Types: `double`

Unit — Physical unit of signal value
`''` (default) | valid unit

Physical unit used for expressing this signal value (for example, inches).

For more information, see "Unit Specification in Simulink Models".

Example: `'degC'`

Data Types: `char`

Simulink.SimulationData.BlockPath

Fully specified Simulink block path

Description

Simulink creates block path objects when creating dataset objects for signal logging and data store logging. `Simulink.SimulationData.Signal` and `Simulink.SimulationData.DataStoreMemory` objects include block path objects.

You can create a block path that you can use with the `Simulink.SimulationData.Dataset.getElement` method to access a specific dataset element. If you want to create a dataset in MATLAB to use as a baseline to compare against a signal logging or data store logging dataset, then you need to create the block paths as part of that dataset.

The `Simulink.SimulationData.BlockPath` class is very similar to the `Simulink.BlockPath` class.

You do not have to have Simulink installed to use the `Simulink.SimulationData.BlockPath` class. However, you must have Simulink installed to use the `Simulink.BlockPath` class. If you have Simulink installed, consider using `Simulink.BlockPath` instead of `Simulink.SimulationData.BlockPath`, because the `Simulink.BlockPath` class includes a method for checking the validity of block path objects without you having to update the model diagram.

Property Summary

Name	Description
SubPath on page 5-183	Individual component within the block specified by the block path

Method Summary

Name	Description
BlockPath on page 5-183	Create a block path.
convertToCell on page 5-186	Convert a block path to a cell array of character vectors.
getBlock on page 5-187	Get a single block path in the model reference hierarchy.
getLength on page 5-188	Get the length of the block path.

Properties

SubPath

Represents an individual component within the block specified by the block path.

For example, if the block path refers to a Stateflow chart, you can use SubPath to indicate the chart signals. For example:

```
Block Path:
    'sf_car/shift_logic'

  SubPath:
    'gear_state.first'
```

character vector

RW

Methods

BlockPath

Create block path

```
blockpath_object = Simulink.SimulationData.BlockPath()
blockpath_object = Simulink.SimulationData.BlockPath(blockpath)
blockpath_object = Simulink.SimulationData.BlockPath(paths)
blockpath_object = Simulink.SimulationData.BlockPath(paths, subpath)
```

`blockpath`

    The block path object that you want to copy.

`paths`

    A character vector or cell array of character vectors that Simulink uses to build the block path.

    Specify each character vector in order, from the top model to the specific block for which you are creating a block path.

    Each character vector must be a path to a block within the Simulink model. The block must be:

- A block in a single model
- A Model block (except for the last character vector, which may be a block other than a Model block)
- A block that is in a model that is referenced by a Model block that is specified in the previous character vector

`subpath`

    A character vector that represents an individual component within a block.

`blockpath_object`

    The block path that you create.

`blockpath_object = Simulink.SimulationData.BlockPath()` creates an empty block path.

`blockpath_object = Simulink.SimulationData.BlockPath(blockpath)` creates a copy of the block path of the block path object that you specify with the `source_blockpath` argument.

`blockpath = Simulink.SimulationData.BlockPath(paths)` creates a block path from the character vector or cell array of character vectors that you specify with the `paths` argument. Each character vector represents a path at a level of model hierarchy.

`blockpath = Simulink.SimulationData.BlockPath(paths, subpath)` creates a block path from the character vector or cell array of character vectors that you specify with the `paths` argument and creates a path for the individual component (for example, a signal) of the block.

Create a block path object called `bp1`, using a cell array of character vectors representing elements of the block path.

```
bp1 = Simulink.SimulationData.BlockPath(...
{'sldemo_mdlref_depgraph/thermostat', ...
'sldemo_mdlref_heater/Fahrenheit to Celsius', ...
'sldemo_mdlref_F2C/Gain1'})
```

The resulting block path reflects the model reference hierarchy for the block path.

```
bp1 =

  Simulink.BlockPath
  Package: Simulink

  Block Path:
    'sldemo_mdlref_depgraph/thermostat'
      'sldemo_mdlref_heater/Fahrenheit to Celsius'
        'sldemo_mdlref_F2C/Gain1
```

convertToCell

Convert block path to cell array of character vectors

`cellarray = Simulink.SimulationData.BlockPath.convertToCell()`

`cellarray`
    The cell array of character vectors representing the elements of the block path.

`cellarray = Simulink.SimulationData.BlockPath.convertToCell()` converts a block path to a cell array of character vectors.

```
bp1 = Simulink.SimulationData.BlockPath(...
{'sldemo_mdlref_depgraph/thermostat', ...
'sldemo_mdlref_heater/Fahrenheit to Celsius', ...
'sldemo_mdlref_F2C/Gain1'})
cellarray_for_bp1 = bp1.convertToCell()
```

The result is a cell array representing the elements of the block path.

```
cellarray_for_bp1 =

    'sldemo_mdlref_depgraph/thermostat'
    'sldemo_mdlref_heater/Fahrenheit to Celsius'
    'sldemo_mdlref_F2C/Gain1'
```

getBlock

Get single block path in model reference hierarchy

`block = Simulink.SimulationData.BlockPath.getBlock(index)`

`index`

The index of the block for which you want to get the block path. The index reflects the level in the model reference hierarchy. An index of 1 represents a block in the top-level model, an index of 2 represents a block in a model referenced by the block of index 1, and an index of n represents a block that the block with index n-1 references.

`block`

The block representing the level in the model reference hierarchy specified by the `index` argument.

`blockpath = Simulink.SimulationData.BlockPath.getBlock(index)` returns the block path of the block specified by the `index` argument.

Get the block for the second level in the model reference hierarchy.

```
bp1 = Simulink.SimulationData.BlockPath(...
{'sldemo_mdlref_depgraph/thermostat', ...
'sldemo_mdlref_heater/Fahrenheit to Celsius', ...
'sldemo_mdlref_F2C/Gain1'})
blockpath = bp1.getBlock(2)
```

The result is the `thermostat` block, which is at the second level in the block path hierarchy.

```
blockpath =

sldemo_mdlref_heater/Fahrenheit to Celsius
```

getLength

Get length of block path

```
length = Simulink.SimulationData.BlockPath.getLength()
```

`length`

The length of the block path. The length is the number of levels in the model reference hierarchy.

`length = Simulink.SimulationData.BlockPath.getLength()` returns a numeric value that corresponds to the number of levels in the model reference hierarchy for the block path.

Get the length of block path `bp1`.

```
bp1 = Simulink.SimulationData.BlockPath(...
{'sldemo_mdlref_depgraph/thermostat', ...
'sldemo_mdlref_heater/Fahrenheit to Celsius', ...
 'sldemo_mdlref_F2C/Gain1'})
length_bp1 = bp1.getLength()
```

The result reflects that the block path has three elements.

```
length_bp1 =

     3
```

See Also

`Simulink.BlockPath` | `Simulink.SimulationData.Dataset`

Introduced in R2012b

Simulink.SimulationData.Dataset class

Package: Simulink.SimulationData

Create Simulink.SimulationData.Dataset object

Description

Simulink creates `Simulink.SimulationData.Dataset` objects to store data elements when:

- Performing signal logging, which use the `Dataset` format
- Logging states or outputs, if you use the default format of `Dataset`.
- Logging a data store

Using the `Dataset` format for state and output logging offers several advantages compared to `Array`, `Structure`, or `Structure with time`. For details, see "Format for State Information Saved Without SimState".

To generate a `Simulink.SimulationData.Dataset` object from the root-level Inport blocks in a model, you can use the `createInputDataset` function. Signals in the generated dataset have the properties of the Inport blocks and the corresponding ground values at model start and stop times. You can create `timeseries` and `timetable` objects for the time and values for signals for which you want to load data for simulation. The other signals use ground values.

You can use curly braces (`{}`) to streamline indexing syntax to access, set, and add elements in a dataset, instead of using `get`, `getElement`, `setElement`, or `addElement` methods. To get or set an element using curly braces, the index must be a scalar that is not greater than the number of elements in the dataset variable. To add an element, the index must be a scalar that is greater than the total number of elements in the dataset by one. The `get`, `getElement`, `setElement`, or `addElement` methods support specifying an element by name or block path, as well as by index.

For individual non-bus signal data, you can specify these types of data for `Dataset` elements:

- `timeseries`
- `timetable`
- `matlab.io.datastore.SimulationDatastore`
- `double` vectors or structure of `double` data
- `timeseries`
- a `Simulink.SimulationData.Signal`, `Simulink.SimulationData.State`, or `Simulink.SimulationData.DataStoreMemory` object

For bus signals, use a structure with a data element for each leaf signal, using one of these formats:

- A MATLAB `timeseries` object
- A MATLAB `timetable` object
- A `matlab.io.datastore.SimulationDatastore` object
- An empty matrix
- An array that meets one of these requirements:
    - An array with time in the first column and the remaining columns each corresponding to an input port. See "Loading Data Arrays to Root-Level Inputs".
    - An `nx1` array for a root inport that drives a function-call subsystem.
- Another structure, with data elements for each signal that are consistent with these requirements for a structure for bus data

Variable-size signals are not supported for `Dataset` data values.

Construction

`convertedDataset = Simulink.SimulationData.Dataset( loggedDataToConvert)` converts the `loggedDataToConvert` to a `Simulink.SimulationData.Dataset` object. You can then use the `Simulink.SimulationData.Dataset.concat` method to combine elements of two `Dataset` objects.

`constructedDataset = Simulink.SimulationData.Dataset( variableName,'DatasetName','dsname')` constructs a `Simulink.SimulationData.Dataset` object, adds variable `variableName`, and names the data set `dsname`.

Input Arguments

`loggedDataToConvert` — Data element to convert
character vector

Data element to convert to a data set, specified as a character vector. You can convert elements such as:

*   Array
*   Structure

Note Structure inputs cannot be arrays or matrices.

*   Structure with time
*   MATLAB time series
*   Structure of MATLAB time-series elements
*   `ModelDataLogs`

`variableName` — Variable to add to data set
character vector

Variable to add to data set, specified as a character vector.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: `'DatasetName','dsname'`

`DatasetName` — Data set name
character vector

Data set name, specified as a character vector.

Output Arguments

convertedDataset — Converted data set
`Simulink.SimulationData.Dataset` object

Converted data set, returned as a `Simulink.SimulationData.Dataset` object.

constructedDataset — Constructed data set
`Simulink.SimulationData.Dataset` object

Constructed data set, returned as a `Simulink.SimulationData.Dataset` object.

Properties

Name — Name of the data set
same as the logging variable (default) | character vector

Name of the data set, specified as a character vector or logging variable (for example, `logsout` for signal logging). Specify a name when you want to distinguish easily one data set from another. For example, you could reset the name when comparing multiple simulations. This property is read/write.

```
ds = Simulink.SimulationData.Dataset
ds.Name = 'Dataset1'
```

Total Elements — Total number of elements
double

Total number of elements in data set, specified as a double. This property is read only. To get this value, use the `Simulink.SimulationData.Dataset.numElements` method.

Methods

addElement	Add element to end of data set
concat	Concatenate dataset to another dataset
get	Get element or collection of elements from dataset
getElementNames	Return names of all elements in dataset
find	Get element or collection of elements from dataset
numElements	Get number of elements in data set
plot	Plot dataset elements in Signal Preview window or Simulation Data Inspector
setElement	Change element stored at specified index

Tip To get the names of `Dataset` variables in the MAT-file, using the `Simulink.SimulationData.DatasetRef.getDatasetVariableNames` function processes faster than using the `who` or `whos` functions.

Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects (MATLAB).

Examples

Concatenate Dataset ds1 to Dataset ds

Convert data from two To Workspace blocks, convert to `Dataset` format, and concatenate them. `myvdp` is the `vdp` model with two To Workspace blocks with variables named `simout` and `simout1`. These blocks log data in time-series format.

```
mdl = 'myvdp';
open_system(mdl);
sim(mdl)
ds = Simulink.SimulationData.Dataset(simout);
```

```
ds1 = Simulink.SimulationData.Dataset(simout1);
dsfinal = concat(ds,ds1)
```

Access, Change, and Add Dataset Elements

Use curly brace indexing syntax to work with a `logsout` signal logging dataset that has three elements.

Get the second element of the `logsout` dataset.

```
logsout{2}
```

Change the name of the third element.

```
logsout{3}.Name = 'thirdSignal'
```

Add a fourth element.

```
time = 0.1*(0:100)';
element4 = Simulink.SimulationData.Signal;
element4.Name = 'C';
element4.Values = timeseries(3*sin(time),time);
logsout{4} = element4
```

Introduced in R2011a

Simulink.SimulationData.DatasetRef class

Package: Simulink.SimulationData

Create `Simulink.SimulationData.DatasetRef` object

Description

To use a reference for accessing a `Simulink.SimulationData.Dataset` object stored in a MAT-file, create a `Simulink.SimulationData.DatasetRef` object. You can use this reference to avoid running out of memory, by retrieving data signal by signal, for data that you log to persistent storage. You can stream a `DatasetRef` object into a root-level input port or you can use it to create a `SimulationDatastore` object to use for streaming. For details, see "Load Big Data for Simulations".

For parallel simulations, for which you specify an array of `Simulink.SimulationInput` objects, if you are logging to file, Simulink:

- Creates `Simulink.SimulationData.DatasetRef` objects to access output data in the MAT-file and includes those objects in the `SimulationOutput` object data
- Enables the `CaptureErrors` argument for simulation

Construction

`datasetRefObj = Simulink.SimulationData.DatasetRef(location, identifier)` creates a reference to the contents of a `Simulink.SimulationData.Dataset` variable stored in a MAT-file.

Input Arguments

`location` — MAT-file containing `Simulink.SimulationData.Dataset` object to reference
character vector

MAT-file containing `Simulink.SimulationData.Dataset` object to reference, specified as a character vector. The character vector is a path to the MAT-file. Do not use a file name from one locale in a different locale.

`identifier` — Name of variable in MAT-file
character vector

Name of a `Simulink.SimulationData.Dataset` variable in MAT-file, specified as a character vector. When you log to persistent storage, Simulink uses the variable names specified for each kind of logging.

Suppose that you use the default variable name for signal logging (`logsout`) and default MAT-file name for persistent storage logging (`mat.out`), After you simulate the model, then to create a reference to the `Dataset` object for signal logging, at the MATLAB command line, enter:

```
sigLogRef = Simulink.SimulationData.DatasetRef('out.mat','logsout');
```

Output Arguments

`datasetRefObj` — Reference to Dataset object
`Simulink.SimulationData.DatasetRef` object

Reference to logging dataset, returned as a `Simulink.SimulationData.DatasetRef` object.

Properties

`Location` — MAT-file containing `Simulink.SimulationData.Dataset` object to reference
character vector

MAT-file containing `Simulink.SimulationData.Dataset` object to reference, specified as a character vector. The character vector is a path to the MAT-file. Include the `.mat` extension in the file name. Do not use a file name from one locale in a different locale.

`Identifier` — Name of variable in MAT-file
character vector

Name of a `Simulink.SimulationData.Dataset` variable in MAT-file, specified as a character vector. When you log to persistent storage, Simulink uses the variable names specified for each kind of logging (for example, `'logsout'` for signal logging data).

Methods

Use the `numElements`, `getElement`, and `getElementNames` methods for a `Simulink.SimulationData.DatasetRef` object the same way that you use those methods for a `Simulink.SimulationData.Dataset` object.

Method	Purpose
numElements	Get number of elements from dataset
getElementNames	Return names of all elements in dataset
get The `get` method is an alias for the `getElement` method. **Note** You can use curly braces to streamline indexing syntax to access elements in a dataset reference, instead of using `get` or `getElement` methods. To get an element using curly braces, the index must be a scalar that is not greater than the number of elements in the variable. The `get` and `getElement` methods support specifying an element by name or block path, as well as by index.	Get element from dataset
getAsDatastore	Get `matlab.io.datastore.SimulationDatastore` representation of element from a `DatasetRef` object
getDatasetVariableNames on page 2-858	List names of `Dataset` variables in MAT-file

Method	Purpose
plot	Plot elements from dataset in Signal Preview window

Tip To get the names of `Dataset` variables in the MAT-file, using the `Simulink.SimulationData.DatasetRef.getDatasetVariableNames` function processes faster than using the `who` or `whos` functions.

Copy Semantics

You can copy `DatasetRef` object properties by value. However, copying the `DatasetRef` object produces a handle object. Copying the `DatasetRef` object does not copy the data in the MAT-file that the object references. For details about copy operations, see Copying Objects (MATLAB) in the MATLAB documentation.

Examples

Create References to Persistent Storage Dataset Objects

This example shows how to construct and use `Simulink.SimulationData.DatasetRef` objects to access data for a model that logs to persistent storage. This simple example shows the basic steps for logging to persistent storage. This example does not represent a realistic situation for logging to persistent storage, because it shows a short simulation with small memory requirements.

Open the vdp model.

In the **Configuration Parameters > Data Import/Export** pane, select these parameters:

- **States**
- **Log Dataset data to file**

Set the **Format** parameter to `Dataset`.

Leave the other parameter settings as they are and click **Apply**.

In the model, click a signal and from the action bar, select **Enable Data Logging**.

Simulate the model.

Get a list of `Dataset` variable names in the `out.mat` file.

```
varNames = Simulink.SimulationData.DatasetRef.getDatasetVariableNames('out.mat')

varNames =

  1x2 cell array

  'logsout'    'xout'
```

Create a reference to the logged states data that is stored in `out.mat`. The variable for the logged states data is `xout`.

```
statesLogRef = Simulink.SimulationData.DatasetRef('out.mat','xout')

statesLogRef =

  Simulink.SimulationData.DatasetRef
  Characteristics:
          Location: out.mat (/my_files/out.mat)
        Identifier: xout

  Resolved Dataset: 'xout' with 2 elements

      Name  BlockPath
      ____  _____
    1 ''    vdp/x1
    2 ''    vdp/x2
```

Create a reference to the signal logging data that is stored in `out.mat`. The variable for the signal logging data is `logsout`.

```
sigLogRef = Simulink.SimulationData.DatasetRef('out.mat.','logsout')

sigLogRef =

  Simulink.SimulationData.DatasetRef
  Characteristics:
          Location: out.mat (/my_files/out.mat)
        Identifier: logsout
```

```
   Resolved Dataset: 'logsout' with 1 element

       Name   BlockPath
       ____   _____
    1  x1     vdp/x1
```

Use the `numElements` to access the number of elements in the logged states dataset.

```
statesLogRef.numElements
```

```
ans =

     2
```

Use the `DatasetRef` to access the first element of the signal logging dataset.

```
sigLogRef{1}
```

```
ans =

  Simulink.SimulationData.Signal
  Package: Simulink.SimulationData

  Properties:
              Name: 'x1'
    PropagatedName: ''
         BlockPath: [1x1 Simulink.SimulationData.BlockPath]
          PortType: 'outport'
         PortIndex: 1
            Values: [1x1 timeseries]

  Methods, Superclasses
```

Delete the persistent storage MAT-file and try to use one of the `DatasetRef` objects.

```
delete('out.mat');
statesLogRef.get(1)
```

```
File does not exist.
```

The `statesLogRef` still exists, but it is a reference to a `Dataset` object that is in a file that no longer exists.

Simulink.SimulationData.DataStoreMemory

Container for data store logging information

Description

Simulink uses `Simulink.SimulationData.DataStoreMemory` objects to store logging information from Data Store Memory blocks during simulation. The objects contain information about the blocks that write to the data store.

Property Summary

Name	Description
`BlockPath` on page 5-590	Location of Data Store Memory block for the logged data store
`DSMWriterBlockPaths` on page 5-591	Location of Data Store Write blocks that write to the data store
`DSMWriters` on page 5-591	Data Store Write blocks for each signal value
`Name` on page 5-591	Name of the data store dataset
`Scope` on page 5-592	Scope of the data store: `'local'` or `'global'`
`Values` on page 5-592	Time and data that were logged

Properties

BlockPath

Location of Data Store Memory block for the logged data store.

character vector

RW

DSMWriterBlockPaths

Location of blocks that write to the data store. Each element of the array contains the full block path of one writer block.

Vector of `Simulink.SimulationData.BlockPath` objects

RO

DSMWriters

The number of writes in the data store.

The nth element of `DSMWriters` contains the index of the element in `DSMWriterBLockPaths` that contains the block path of the writer that performed the nth write to `Values`.

Integer vector

RO

Name

Name of the data store dataset

character vector

RO

Scope

Scope of the data store: `'local'` or `'global'`

character vector

RW

Values

Time and data that were logged

MATLAB `timeseries`

RW

Simulink.SimulationData.LoggingInfo

Signal logging override settings

Description

This object specifies a set of signal logging override settings.

Use a `Simulink.SimulationData.LoggingInfo` object to specify the signal logging override settings for a signal. You can use this object for the `LoggingInfo` property of a `Simulink.SimulationData.SignalLoggingInfo` object.

Property Summary

Name	Description
`DataLogging` on page 5-594	Signal logging mode.
`NameMode` on page 5-594	Source of signal logging name.
`LoggingName` on page 5-594	Custom signal logging name.
`DecimateData` on page 5-595	Use subset of sample points.
`Decimation` on page 5-595	Decimation value (n): Simulink logs every nth data point.
`LimitDataPoints` on page 5-595	Limit number of data points to log.
`MaxPoints` on page 5-596	Maximum number of data points to log (`N`). The set of logged data points is the last `N` data points generated by the simulation.

Method Summary

Name	Description
`LoggingInfo` on page 5-596	Create a set of signal logging override settings for a signal.

Properties

DataLogging

Signal logging mode.

Indicates whether logging is enabled for this signal.

logical value — `{true}` | `false`

RW

NameMode

Source of signal logging name.

Indicates whether the signal logging name is a custom name (`'true'`) or whether the signal logging name is the same as the signal name (`'false'`).

logical value — `true` | `{false}`

RW

LoggingName

Custom signal logging name

The custom signal logging name to use for this signal, if the `NameMode` property is `true`.

character vector

RW

DecimateData

Log a subset of sample points, selecting data points at a specified interval. The first sample point is always logged.

logical value — `true` | `{false}`

RW

Decimation

Decimation value (n). If the `DecimateData` property is `true`, then Simulink logs every `n`th data point.

positive integer

RW

LimitDataPoints

Limit the number of data points to log.

logical value — `true` | `{false}`

RW

MaxPoints

Maximum number of data points to log (N). If the `LimitDataPoints` property is `true`, then the set of logged data points includes the last `N` data points generated by the simulation.

positive integer

RW

Methods

LoggingInfo

Create a `Simulink.SimulationData.LoggingInfo` object.

```
logging_info_object = Simulink.SimulationData.LoggingInfo()
logging_info_object = Simulink.SimulationData.LoggingInfo(object)
```

`object`

A signal logging override settings object whose property values the constructor uses for the new `Simulink.SimlationData.LoggingInfo` object. The signal logging override object that you specify must be one of the following types of objects:

- `Simulink.SimulationData.LoggingInfo` object
- `Simulink.LoggingInfo` object

`logging_info_object`

A `Simulink.SimulationData.LoggingInfo` object.

`logging_info_object = Simulink.SimulationData.LoggingInfo()` creates a `Simulink.SimulationData.LoggingInfo` object that has default property values.

logging_info_object = Simulink.SimulationData.LoggingInfo(object)
creates a `Simulink.SimulationData.LoggingInfo` object that copies the property
values from the signal logging override object that you specify with the `object`
argument.

The following example creates a `Simulink.SimulationData.LoggingInfo` object
with default settings, changes the `DecimateData` and `Decimation` properties, and uses
the object for the `LoggingInfo` property of a
`Simulink.SimulationData.SignalLoggingInfo` object `mi`.

```
open_system(docpath(fullfile(docroot, 'toolbox', 'simulink', 'examples', 'ex_mdlref_cou
open_system(docpath(fullfile(docroot, 'toolbox', 'simulink', 'examples', 'ex_bus_loggin
log_info = Simulink.SimulationData.LoggingInfo();
log_info.DecimateData = true;
log_info.Decimation = 2;
mi = Simulink.SimulationData.SignalLoggingInfo('ex_bus_logging');
mi.LoggingInfo = log_info

Simulink.SimulationData.SignalLoggingInfo
  Package: Simulink.SimulationData

  BlockPath:
    'ex_bus_logging'

  OutputPortIndex: 1

  LoggingInfo:
        DataLogging: 1
           NameMode: 0
        LoggingName: ''
       DecimateData: 1
         Decimation: 2
    LimitDataPoints: 0
          MaxPoints: 5000
```

Simulink.SimulationData.ModelLoggingInfo

Signal logging override settings for a model

Description

This class is a collection of `Simulink.SimulationData.SignalLoggingInfo` objects that specify all signal logging override settings for a model.

Use methods and properties of this class to:

- Turn off logging for a signal or a Model block.
- Change logging settings for any signals that are already marked for logging within a model.

You can control whether a top-level model and referenced models use override signal logging settings or use the signal logging settings specified by the model. Use the `LoggingMode` and `LogAsSpecifiedByModels` properties to control which logging settings to apply.

Logging Mode for Models	Property Settings
For top-level model and all referenced models, use logging settings specified in the model.	Set `LoggingMode` to `LogAllAsSpecifiedInModel`.
For top-level model and all referenced models, use override signal logging settings.	Set `LoggingMode` to `OverrideSignals`.
For top-level model and referenced models, use a mix of override signal logging settings and the signal logging settings specified in the model.	Set `LoggingMode` to `OverrideSignals`. In the `LogAsSpecifiedByModels` cell array, include the models that you do not want to use the override signal logging settings.

For more information and examples, see "Override Signal Logging Settings from MATLAB".

Property Summary

Name	Description
`LoggingMode` on page 5-600	Signal logging override status
`LogAsSpecifiedByModels` on page 5-601	Source of signal logging settings for the top-level model or a top-level Model block
`Signals` on page 5-602	All signals that have signal override settings

Method Summary

Name	Description
`findSignal` on page 5-607	Find signals within the `Signals` vector, using block path and output port index.
`verifySignalAndModelPaths` on page 5-610	Verify signal and model paths for the model signal logging override object.
`getLogAsSpecifiedInModel` on page 5-608	Determine whether the model logs signals as specified in the model or uses override settings.
`setLogAsSpecifiedInModel` on page 5-609	Set the logging mode for the top-level model or a top-level Model block.
`createFromModel` on page 5-602	Create and populate a model signal logging override object with all logged signals in the model reference hierarchy.
`ModelLoggingInfo` on page 5-605	Set signals to log or override logging settings.

Properties

LoggingMode

Signal logging override status. Values are:

- `OverrideSignals` — (Default) Uses the logging settings for signals, as specified in the `Signals` property. For models where `getLogAsSpecifiedInModel` is:

- `true` — Logs all signals, as specified in the model.
- `false` — Logs only the signals specified in the `Signals` property.
- `LogAllAsSpecifiedInModel` — Logs signals in the top-level model and all referenced models, as specified in the model. Simulink honors the signal logging indicators (blue antennae) and ignores the `Signals` property.

To change the logging mode for the top-level model or for a given reference model, use the `setLogAsSpecifiedInModel` method.

character array

RW

LogAsSpecifiedByModels

When `LoggingMode` is set to `'OverrideSignals'`, this cell array specifies whether the top-level model or a top-level Model block logs all signals based on the signal logging settings defined in the model.

- For the top-level model and top-level Model blocks that the cell array includes, Simulink ignores the `Signals` property overrides.
- For a model or Model block that the cell array does *not* include, Simulink uses the `Signals` property to determine which signals to log.

When `LoggingMode` is set to `'LogAllAsSpecifiedInModel'`, Simulink ignores the `LogAsSpecifiedByModels` property.

Use the `getLogAsSpecifiedInModel` method to determine whether the top-level model or top-level Model block logs signals as specified in the model (default logging), and use `setLogAsSpecifiedInModel` to turn default logging on and off.

cell array — For the top-level model, specify the model name. For Model blocks, specify the block path.

RW

Signals

Vector of `Simulink.SimulationData.SignalLoggingInfo` objects for all signals with signal logging override settings.

vector of `Simulink.SimulationData.SignalLoggingInfo` objects

RW

Methods

createFromModel

Create a `Simulink.SimulationData.ModelLoggingInfo` object for a top-level model, with override settings for each logged signal in the model.

```
model_logging_info_object = ...
Simulink.SimulationData.ModelLoggingInfo.createFromModel(...
model,options)
```

`model`

    Name of the top-level model for which to create a `Simulink.SimulationData.ModelLoggingInfo` object.

`options`

    You can use any combination of the following option name and value pairs to control the kinds of systems from which to include logged signals.

- `FollowLinks`

    - `on` — (Default) Include logged signals from inside of libraries.
    - `off` — Skip all libraries.

- `LookUnderMasks`

- all — (Default) Include logged signals from all masked subsystems.
- none — Skip all masked subsystems.
- graphical — Include logged signals from masked subsystems that do not have a workspace or dialog box.
- functional — Include logged signals from masked subsystems that do not have a dialog box.

- Variants

  - ActiveVariants — (Default) Include logged signals from only active subsystem and model reference variants.
  - AllVariants — Include logged signals from all subsystem and model reference variants.

- RefModels

  - on — (Default) Include logged signals from referenced models.
  - off — Skip all referenced models.

If you select more than one option, then the created Simulink.SimlationData.ModelLoggingInfo object includes signals that fit the combinations (the "AND") of the specified options. For example, if you set FollowLinks to on and set RefModels to off, then the model signal logging override object does not include signals from library links that exist inside of referenced models.

model_logging_override_object

Simulink.SimulationData.ModelLoggingInfo object for the top-level model.

model_logging_info_object = Simulink.SimulationData.ModelLoggingInfo.createFromModel(model) creates a Simulink.SimulationData.ModelLoggingInfo object for the model that includes logged signals for the following kinds of systems:

- Libraries
- Masked subsystems
- Referenced models

- Active variants

`model_logging_override_object =`
`Simulink.SimulationData.ModelLoggingInfo.createFromModel(model,`
`options)` creates a `Simulink.SimulationData.ModelLoggingInfo` object for the
model. The included logged signals reflect the options settings for the following kinds of
systems:

- Libraries
- Masked subsystems
- Referenced models
- Variants

The following example creates a model logging override object for the
`sldemo_mdlref_bus` model and automatically adds each logged signal in the model to
that object:

```
mi = Simulink.SimulationData.ModelLoggingInfo.createFromModel(...
'sldemo_mdlref_bus')

mi =

  ModelLoggingInfo with properties:

                    Model: 'sldemo_mdlref_bus'
              LoggingMode: 'OverrideSignals'
    LogAsSpecifiedByModels: {}
                  Signals: [1x3 Simulink.SimulationData.SignalLoggingInfo]
```

To apply the model override object settings, use:

```
set_param(sldemo_mdlref_bus,'DataLoggingOverride',mi);
```

The following example explicitly specifies the kinds of systems from which to include
signals, rather than use the default settings for each kind of system. This example
specifies to include signals from all model reference variants (instead of using the default
of including only active variant).

The `sldemo_mdlref_variants` model has two variants:
`sldemo_mrv_nonlinear_controller` and `sldemo_controller`. In this example, in
each variant, you configure a signal for signal logging, and then create a
`Simulink.SimulationData.ModelLoggingInfo` object. The resulting object includes,
in the `Signals` property, two signals (one from each variant).

```
sldemo_mrv_nonlinear_controller;
sldemo_mrv_nonlinear_controller;
ph = get_param('sldemo_mrv_nonlinear_controller/Add','PortHandles');
set_param(ph.Outport(1),'DataLogging','on');
ph1 = get_param('sldemo_mrv_nonlinear_controller/Add','PortHandles');
set_param(ph1.Outport(1),'DataLogging','on');
mi = Simulink.SimulationData.ModelLoggingInfo.createFromModel(...
'sldemo_mdlref_variants', 'Variants', 'AllVariants')

V_NONLINEAR_CONTROLLER =

Simulink.Variant
    Condition: 'CTRL==1'

V_NONLINEAR_CONTROLLER =

Simulink.Variant
    Condition: 'CTRL==2'

CTRL =

     1

mi =

  Simulink.SimulationData.ModelLoggingInfo
  Package: Simulink.SimulationData

  Properties:
                    Model: 'sldemo_mdlref_variants'
              LoggingMode: 'OverrideSignals'
    LogAsSpecifiedByModels: {}
                  Signals: [1x2 Simulink.SimulationData.SignalLoggingInfo]

   Methods
```

ModelLoggingInfo

Specify signals to log or override logging settings.

```
model_logging_override_object = ....
Simulink.SimulationData.ModelLoggingInfo(model)
```

```
model
```
Name of the top-level model for which to create a
`Simulink.SimulationData.ModelLoggingInfo` object

model_logging_override_object

    Simulink.SimulationData.ModelLoggingInfo object created for the specified top-level model.

model_logging_override_object=
Simulink.SimulationData.ModelLoggingInfo(model) creates a
Simulink.SimulationData.ModelLoggingInfo object for the specified top-level model.

If you use the Simulink.SimulationData.ModelLoggingInfo constructor, specify a Simulink.SimulationData.SignalLoggingInfo object for each logged signal for which you want to override logging settings.

To check that you have specified valid signal logging override settings for a model, use the verifySignalAndModelPaths method with the Simulink.SimulationData.ModelLoggingInfo object for the model.

The following example shows how to log all signals as specified in the top-level model and all referenced models.

```
mi = Simulink.SimulationData.ModelLoggingInfo('sldemo_mdlref_bus');
mi.LoggingMode = 'LogAllAsSpecifiedInModel'

mi =

  ModelLoggingInfo with properties:

                    Model: 'sldemo_mdlref_bus'
               LoggingMode: 'LogAllAsSpecifiedInModel'
    LogAsSpecifiedByModels: {}
                   Signals: []
```

To apply the model override object settings, use:

```
set_param(sldemo_mdlref_bus, 'DataLoggingOverride', mi);
```

The following example shows how to log only signals in the top-level model:

```
mi = ...
Simulink.SimulationData.ModelLoggingInfo('sldemo_mdlref_bus');
mi.LoggingMode = 'OverrideSignals';
mi = mi.setLogAsSpecifiedInModel('sldemo_mdlref_bus', true);
set_param('sldemo_mdlref_bus', 'DataLoggingOverride', mi);
```

findSignal

Find signals within the `Signals` vector, using a block path and optionally an output port index.

```
signal_indices = ...
      model_logging_override_object.findSignal(block_path)
signal_indices = ...
      model_logging_override_object.findSignal(...
      block_path, port_index)
```

block_path

    Source block to search. The `block_path` must be one of the following:

- Character vector
- Cell array of character vectors
- `Simulink.BlockPath` object

port_index

    Index of the output port to search. Specify a scalar greater than, or equal to, 1.

signal_indices

    Vector of numeric indices into the signals vector of the `Simulink.SimulationData.ModelLoggingInfo` object.

`signal_indices = model_logging_override_object.findSignal(block_path)` finds the indices of the signals for the block path that you specify.

To find a *single* instance of a signal within a referenced model, use a `Simulink.BlockPath` object or a cell array with a *full path*.

To find *all* instances of a signal within a referenced model, use a character vector with the *relative* path of the signal within the referenced model.

To find a logged chart signal within a Stateflow chart, use a `Simulink.BlockPath` object and set the `SubPath` property to the name of the Stateflow chart signal.

signal_indices = model_logging_override_object.findSignal(
block_path, port_index) finds the indices of the output signal for the port that you
specify, for the block path that you specify.

Do not use the `port_index` argument for Stateflow chart signals.

To find a signal that is *not* in a Stateflow chart and that does *not* appear in multiple
instances of a referenced model:

```
open_system(docpath(fullfile(docroot,'toolbox','simulink','examples','ex_bus_logging')))
% Open the referenced model
ex_mdlref_counter_bus
mi = Simulink.SimulationData.ModelLoggingInfo.createFromModel(...
    'ex_bus_logging');
% Click the COUNTERBUSCreator block that is the source of
% the logged COUNTERBUS signal
signal_index = mi.findSignal(gcb)

signal_index =

     1
```

To find a signal in a specific instance of a referenced model that is not in a Stateflow
chart, use the following approach:

```
signal_index = mi.findSignal({'ex_bus_logging/CounterA', ...
'ex_mdlref_counter_bus/Bus Creator'})

signal_index =

     4
```

For an example that uses the `findSignal` method with a Stateflow chart, see "Override
Logging Properties with the Command-Line API" (Stateflow).

getLogAsSpecifiedInModel

Determine whether the model logs as specified in the model or uses override settings.

```
logging_mode = ...
getLogAsSpecifiedInModel(model_logging_override_object, path)
```

model_logging_override_object

A `Simulink.SimulationData.ModelLoggingInfo` object.

path

The `path` is a character vector that specifies one of the following:

- Name of the top-level model
- Block path of a Model block in the top-level model

logging_mode

The `logging_mode` is:

- `true`, if the model specified by `path` is logged as specified in the model.
- `false`, if the model specified by `path` is logged using the override settings specified in the `Signals` property.

logging_mode =
model_logging_override_object.getLogAsSpecifiedInModel(path) returns:

- `true`, if the model specified by `path` is logged as specified in the model.
- `false`, if the model specified by `path` is logged using the override settings specified in the `Signals` property.

In the following example, the `Simulink.SimulationData.ModelLoggingInfo` object `mi` uses the override settings specified in its `Signals` property.

```
mi = Simulink.SimulationData.ModelLoggingInfo('sldemo_mdlref_bus');
logging_mode = getLogAsSpecifiedInModel(mi, 'sldemo_mdlref_bus')

logging_mode =

     0
```

setLogAsSpecifiedInModel

Set logging mode for top-level model or top-level Model block

```
setLogAsSpecifiedInModel(override_object, path)
```

`override_object`

Simulink.SimulationData.ModelLoggingInfo object.

`path`

Character vector that specifies one of the following:

- Name of the top-level model
- Block path of a Model block in the top-level model

`value`

Logging mode:

- `true`, if the model specified by `path` is logged as specified in the model
- `false`, if the model specified by `path` is logged using the override settings specified in the `Signals` property.

`setLogAsSpecifiedInModel(override_object, path, value)` sets the LoggingMode property for a top-level model or a Model block in the top-level model.

The following example shows how to log only signals in the top-level model, using the logging settings specified in that model:

```
sldemo_mdlref_bus;
mi = Simulink.SimulationData.ModelLoggingInfo('sldemo_mdlref_bus');
mi.LoggingMode = 'OverrideSignals';
mi = setLogAsSpecifiedInModel(mi, 'sldemo_mdlref_bus', true);
set_param('sldemo_mdlref_bus', 'DataLoggingOverride', mi);
```

verifySignalAndModelPaths

Verify paths in `Simulink.SimulationData.ModelLoggingInfo` object.

```
verified_object = verifySignalAndModelPaths...
     (model_logging_override_object, action)
```

model_logging_override_object

> The `Simulink.SimulationData.ModelLoggingInfo` object to verify. This argument is required.

action

> The action that the function performs if verification fails. This argument is optional. Specify one of the following values:
>
> - `error` — (default) Throw an error when verification fails
> - `warnAndRemove` — Issue a warning when verification fails and update the `Simulink.SimulationData.ModelLoggingInfo` object.
> - `remove` — Silently update the `Simulink.SimulationData.ModelLoggingInfo` object.

verified_object

> If the method detects no invalid paths, it returns the validated object. For example:
>
> ```
> verified_object =
>
>   Simulink.SimulationData.ModelLoggingInfo
>   Package: Simulink.SimulationData
>
>   Properties:
>                     Model: 'logging_top'
>               LoggingMode: 'OverrideSignals'
>     LogAsSpecifiedByModels: {}
>                   Signals: [1x11 Simulink.SimulationData.SignalLoggingInfo]
> ```
>
> If the method detects an invalid path, it performs the action specified by the `action` argument. By default, it issues an error message.

verified_object = verifySignalAndModelPaths(
model_logging_override_object, action)

For a `Simulink.SimulationData.ModelLoggingInfo` object, verify that:

- All character vectors in the `LogAsSpecifiedByModels` property are either the name of the top-level model or the block path of a Model block in the top-level model.
- The block paths for signals in the `Signals` property refer to valid blocks within the hierarchy of the top-level model.

- The `OutputPortIndex` property for all signals in the `Signals` property are valid for the given block.
- All signals in the `Signals` property refer to *logged* signals.

The `action` argument specifies what action the method performs. By default, the method returns an error if it detects an invalid path.

If you use the `Simulink.SimulationData.ModelLoggingInfo` constructor and specify a `Simulink.SimulationData.SignalLoggingInfo` object for each signal, then consider using the `verifySignalAndModelPaths` method to verify that your object definitions are valid.

The following example shows how to validate the signal and block paths in a `Simulink.SimulationData.ModelLoggingInfo` object. Because the `action` argument is `warnAndRemove`, if the validation fails, the `verifySignalAndModelPaths` method issues a warning and updates the `Simulink.SimulationData.ModelLoggingInfo` object.

```
mi = Simulink.SimulationData.ModelLoggingInfo('sldemo_mdlref_bus');
verified_object = verifySignalAndModelPaths...
    (mi, 'warnAndRemove')
```

Introduced in R2012b

Simulink.SimulationData.Parameter class

Stores logged parameter data and metadata

Description

The `Simulink.SimulationData.Parameter` object stores data and metadata for logged block parameters. Tunable parameters connected to Dashboard blocks are logged to the Simulation Data Inspector during simulation. To access logged parameter data, you can export the simulation run from the Simulation Data Inspector using the UI or the `Simulink.sdi.exportRun` function. For more information about exporting simulation runs with the Simulation Data Inspector UI, see "Export Data from the Simulation Data Inspector".

Construction

`dataset = Simulink.sdi.exportRun(runID)` returns a `Simulink.SimulationData.Parameter` object as an element in `dataset` when the run corresponding to `runID` contains logged parameter data.

Input Arguments

runID — Run ID for a run with logged parameter data
integer

Run ID for the run containing logged parameter data. Run IDs are assigned by the Simulation Data Inspector. You can get the run ID for a simulation run using the `Simulink.sdi.getAllRunIDs` or `Simulink.sdi.getRunIDByIndex` function.

Output Arguments

dataset — Dataset containing the run data
Simulink.SimulationData.Dataset

`Simulink.SimulationData.Dataset` object containing the run data and metadata. When the run contains logged parameter data, the dataset contains a

`Simulink.SimulationData.Parameter` object as an element for each logged parameter. The `Simulink.SimulationData.Parameter` element takes the name of the logged parameter. You can access a `Simulink.SimulationData.Parameter` object using `get`.

Properties

Name — Parameter name in Dashboard label
character vector

Parameter name as it appears in the label for the Dashboard block.

Example: `'Mu:Gain'`

BlockPath — Path of the block associated with the parameter
`Simulink.SimulationData.BlockPath`

Path to the block the parameter or variable corresponds to, returned as a `Simulink.SimulationData.BlockPath` object.

Example: `vdp/Mu`

ParameterName — Parameter name
character vector

Name of the logged parameter as it appears in the block dialog box. For variables, the `ParameterName` property is empty.

Example: `'Gain'`

VariableName — Variable name
character vector

Name of the logged variable. For parameters, the `VariableName` property is empty.

Example: `'Zw'`

Values — Timeseries of parameter values
timeseries

`timeseries` of parameter values. For logged variables, the `timeseries` name is the variable name. For logged parameters, the `timeseries` name is empty.

Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects (MATLAB).

Examples

Access Logged Parameter Data

This example shows how to access logged parameter data. Parameter data automatically logs to the Simulation Data Inspector when you connect a Dashboard block to a block parameter. Parameter data does not export to the workspace with other simulation data at the end of simulation. You can access the logged parameter data by exporting the run containing it from the Simulation Data Inspector.

Log Parameter Data

Run a simulation of the model `ex_vdp_param`, a modified version of the `vdp` model with an Edit block connected to the gain parameter of the Mu block. The parameter data logs with the signal data for signals marked for logging.

```
sim('ex_vdp_param')
```

Export Run

Use the Simulation Data Inspector programmatic interface to get the run ID for the `ex_vdp_param` simulation, and export the run.

```
index = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(index);

dataset = Simulink.sdi.exportRun(runID);
```

Access Parameter Data

Use the `get` method to access the `Simulink.SimulationData.Parameter` object for the logged parameter data. The `Values` property contains the timeseries data for the parameter.

```
muGain = dataset.get('Mu:Gain')

muGain =
  Simulink.SimulationData.Parameter
```

```
Package: Simulink.SimulationData

Properties:
        Name: 'Mu:Gain'
  BlockPath: [1x1 Simulink.SimulationData.BlockPath]
     Values: [1x1 timeseries]

Methods, Superclasses

Simulink.SimulationData.SignalLoggingInfo

Signal logging override settings for signal

Description

This object contains the signal override signal logging settings for a single logged signal.

Property Summary

Name	Description
BlockPath on page 5-617	Simulink.BlockPath of source block of a signal to log.
OutputPortIndex on page 5-618	Index of an output port to log.
LoggingInfo on page 5-618	Simulink.SimulationData.LoggingInfo object containing all logging override settings for a signal.

Method Summary

Name	Description
SignalLoggingInfo on page 5-619	Create a signal logging override object for a signal.

Properties

BlockPath

Simulink.BlockPath of source block of signal to log. The block path represents the full model reference hierarchy.

To specify a specific instance of a signal, use an absolute path, reflecting the model reference hierarchy, starting at the top model. For example:

```
sig_log_info = Simulink.SimulationData.SignalLoggingInfo(...
{'sldemo_mdlref_bus/CounterA', ...
'sldemo_mdlref_counter_bus/Bus Creator'})
```

Simulink.BlockPath

RW

OutputPortIndex

Index of the output port to log. The index is a 1-based numeric value.

nonzero integer

RW

LoggingInfo

`Simulink.SimulationData.LoggingInfo` object containing logging override settings for a signal. The logging settings specify whether signal logging is overridden for this signal. The logging settings also can specify a logging name, a decimation factor, and a maximum number of data points.

`Simulink.SimulationData.LoggingInfo` object

RW

Methods

SignalLoggingInfo

Construct a `Simulink.SimulationData.SignalLoggingInfo` object.

```
signal_logging_info_object = ...
   Simulink.SimulationData.SignalLoggingInfo()
signal_loggingInfo_object = ...
   Simulink.SimulationData.SignalLoggingInfo(path)
signalLoggingInfo_object = ...
   Simulink.SimulationData.SignalLoggingInfo(path,index)
```

path

    The block path of the source block for which the signal logging override settings apply. If you use this argument without also using the `port` argument, then Simulink sets the output port index to 1.

index

    Output port index to which the signal logging override settings apply.

signal_logging_object

    `Simulink.SimulationData.SignalLoggingInfo` object that represents the override settings of a signal.

`signal_logging_override_object = Simulink.SimulationData.SignalLoggingInfo()` creates a `Simulink.SimulationData.LoggingInfo` object that contains default logging settings for a signal.

`signal_logging_override_object = Simulink.SimulationData.SignalLoggingInfo(path)` creates a `Simulink.SimulationData.LoggingInfo` object, using the specified block path, and sets the output port index to 1.

`signal_logging_override_object = Simulink.SimulationData.SignalLoggingInfo(path, port)` creates a

`Simulink.SimulationData.LoggingInfo` object that contains default logging settings for the specified block path and output port index.

The following example creates a `Simulink.SimulationData.SignalLoggingInfo` object for the first output port of the `Bus Creator` block in the `sldemo_mdlref_bus` model.

```
sldemo_mdlref_bus;
mi = Simulink.SimulationData.ModelLoggingInfo(...
'sldemo_mdlref_bus');
mi.LoggingMode = 'OverrideSignals';
mi.Signals = ...
   Simulink.SimulationData.SignalLoggingInfo(...
   {'sldemo_mdlref_bus/CounterA', ...
'sldemo_mdlref_counter_bus/Bus Creator'}, 1)
```

The output is:

```
mi =

  Data.ModelLoggingInfo with properties:

                    Model: 'sldemo_mdlref_bus'
              LoggingMode: 'OverrideSignals'
    LogAsSpecifiedByModels: {}
                  Signals: [1x1 Simulink.SimulationData.SignalLoggingInfo]

  Methods
```

Simulink.SimulationData.Signal

Container for signal logging information

Description

Simulink uses `Simulink.SimulationData.Signal` objects to store signal logging information during simulation. The objects contain information about the source block for the signal, including the port type and index.

Property Summary

Name	Description
BlockPath on page 5-621	Block path for the source block for the signal
Name on page 5-622	Name of signal element to use for name-based access
PropagatedName on page 5-622	Propagated signal name, if any
PortIndex on page 5-622	Numeric index of port that was logged
PortType on page 5-623	Type of port that was logged: for signal logging, the port type is `'outport'`
Values on page 5-623	Time and data that were logged

Properties

BlockPath

Block path for the source block for the signal

Simulink.SimulationData.BlockPath

RW

Name

Name of signal element to use for name-based access

character vector

RW

PropagatedName

Propagated name of signal element

Signal logging and root Outport block logging data for a signal captures the propagated signal name if the logging format is `Dataset` and:

- For signal logging, you:
    - Mark the signal for signal logging and in the Signal Properties dialog box select **Show Propagated Signals**.
    - Enable **Configuration Parameters** > **Data Import/Export** > **Signal logging**.
- For root Outport block logging, you select **Configuration Parameters** > **Data Import/Export** > **Output**.

The propagated signal name does not include angle brackets (<>).

character vector

RO

PortIndex

Numeric index of port that was logged

scalar real integer

RW

PortType

Type of port that was logged: for signal logging, the port type is `'outport'`

character vector

RW

Values

Time and data that were logged.

For an example of how to use the `Values` property and plot logged signal data, in the `sldemo_mdlref_bus` example, see "Logging Signal Data."

- MATLAB `timeseries` object
- Structure of MATLAB `timeseries` objects (for bus signals)
- Array of structures of MATLAB `timeseries` objects (for array of buses signals)
- Array of MATLAB `timeseries` objects (for nonbus signals in a For Each subsystem)
- MATLAB `timetable` object
- Structure of MATLAB `timetable` objects (for bus signals)
- Array of structures of MATLAB `timetable` objects (for array of buses signals)
- Cell array of MATLAB `timetable` objects (for nonbus signals in a For Each subsystem)

Simulink.SimulationData.State class

Package: Simulink.SimulationData

State logging element

Description

Simulink uses `Simulink.SimulationData.State` objects to store state logging information during simulation. The objects contain state information about which block the state data is coming from and the type of state.

Properties

Name — Name of state element to use for name-based access
character vector

Name of state element to use for name-based access, specified as a character vector. If you do not specify a name, `'CSTATE'` or `'DSTATE'` is used, depending on whether it a continuous or discrete state.

BlockPath — Block path for state source block
a `Simulink.SimulationData.BlockPath` object

Block path for state source block, specified as a `Simulink.SimulationData.BlockPath` object

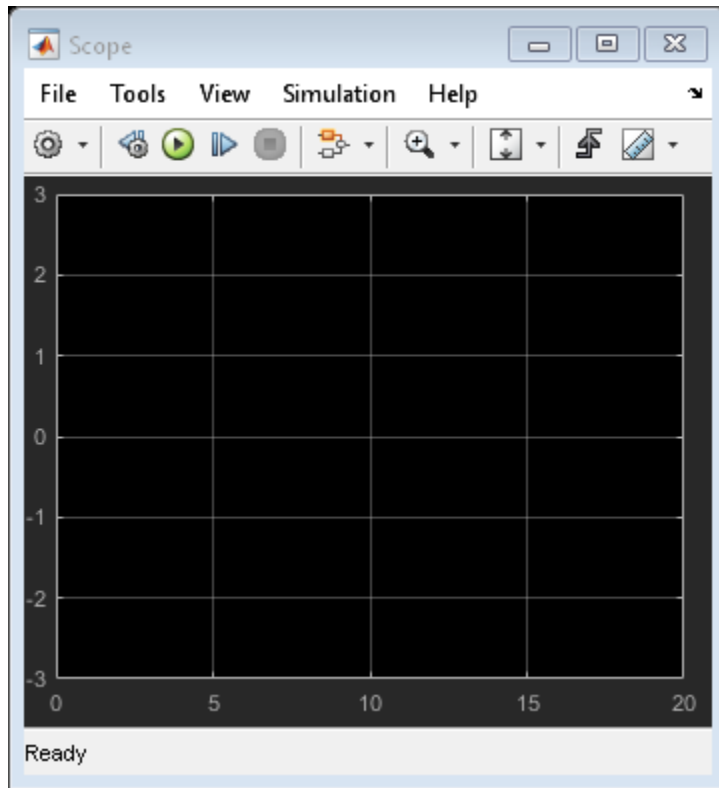
Label — Type of state
`'CSTATE'` | `'DSTATE'`

Type of state, returned as `'CSTATE'` or `'DSTATE'`. Read-only property.

- `'CSTATE'` – Continuous state
- `'DSTATE'` – Discrete state

Values — State element information
single MATLAB `timeseries` object | a structure of MATLAB `timeseries` objects

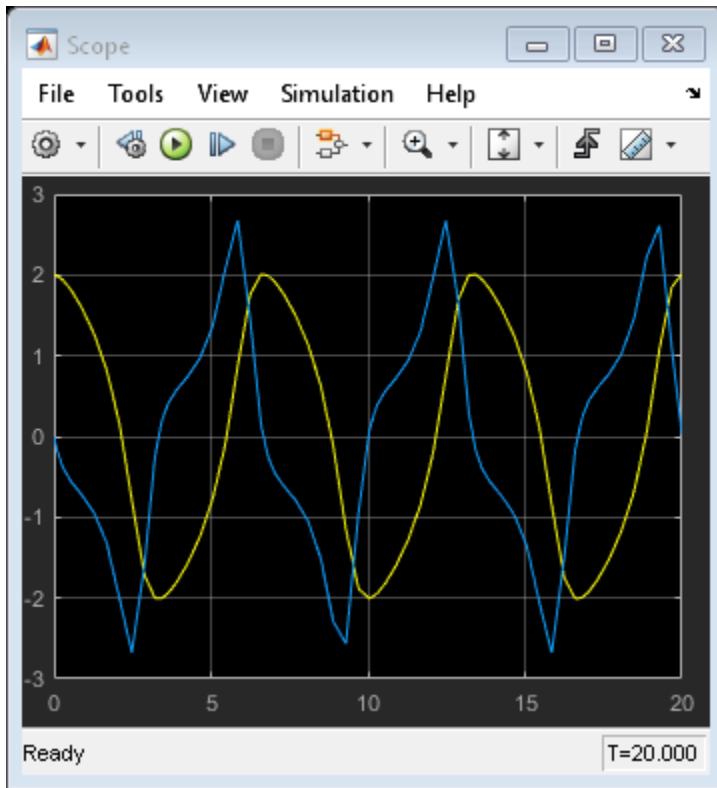
State element information, specified as a single MATLAB `timeseries` object or as a structure of MATLAB `timeseries` objects.
Examples

Final State Information in Structure with Dataset Format


Saved final state information in `Dataset` format and access the state data after simulation.

Open the `vdp` model and specify to log final states in `Dataset` format. Use the default logged state variable, `xFinal`.

```
open_system('vdp');
set_param(gcs,'SaveFinalState','on','SaveFormat','Dataset');
```



Copyright 2004-2013 The MathWorks, Inc.

Simulate the model.

```
sim('vdp');
```

View the state logging information in xFinal.

```
xFinal
```

```
xFinal =

Simulink.SimulationData.Dataset 'xFinal' with 2 elements

                      Name   BlockPath
                      ____   _____
   1  [1x1 State]      ''    vdp/x1
   2  [1x1 State]      ''    vdp/x2

 - Use braces { } to access, modify, or add elements using index.
```

Examine the first element of the state dataset.

```
xFinal.get(1)
```

```
ans =

  Simulink.SimulationData.State
  Package: Simulink.SimulationData

  Properties:
        Name: ''
    BlockPath: [1x1 Simulink.SimulationData.BlockPath]
        Label: CSTATE
       Values: [1x1 timeseries]
```

Simulink.SimulationData.Unit class

Package: Simulink.SimulationData

Store units for simulation data

Description

Simulink creates `Simulink.SimulationData.Unit` objects to store unit information for signals when:

- Performing signal logging, which uses the `Dataset` format
- Logging root Outport blocks, if in **Configurations Parameters** you select the **Output** parameter and set **Format** to `Dataset`
- Logging to a To Workspace block or To File block, if you set the **Save format** block parameter to the default of `Timeseries`

Construction

`unitsObj = Simulink.SimulationData.Unit(unitName)` creates a `Simulink.SimulationData.Unit` object with the unit that you specify.

Input Arguments

`unitName` — Name of logging data units
character vector

Name of logging data units, specified as a character vector.

Output Arguments

`unitObj` — Logging data units
`Simulink.SimulationData.Unit` object

Logging data units, returned as a `Simulink.SimulationData.Unit` object.

Properties

Name — Name of the units
character vector

Name of the units, specified as a character vector.

Methods

Method	Purpose
`Simulink.SimulationData.Unit.setName`	Specify name of logging data unit

Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects (MATLAB).

Examples

Create and Use Inches Logging Units

Create a `Simulink.SimulationData.Unit` object representing inches.

```
inchesUnit = Simulink.SimulationData.Unit('inches');
```

Create a MATLAB `timeseries` object and set its `Units` field to the `Simulink.SimulationData.Unit` object.

```
ts = timeseries(1:10);
ts.DataInfo.Units = inchesUnit;
ts.DataInfo.Units
```

```
ans =

  Units with properties:
```

```
Name: 'inches'
```

Simulink.SimulationInput class

Package: Simulink

Creates `SimulationInput` objects to make changes to a model for multiple or individual simulations

Description

The `Simulink.SimulationInput` object allows you to make changes to a model and run simulations with those changes. These changes are temporarily applied to the model. Through `Simulink.SimulationInput` object, you can change:

- Initial state
- Model parameters
- Block parameters
- External inputs
- Variables

Through the `Simulink.SimulationInput` object, you can also specify MATLAB functions to run at the start and the end of each simulation by using `in.PreSimFcn` and `in.PostSimFcn`, respectively.`Simulink.SimulationInput` does not support the ability to allow model references to have their own data dictionary.

Construction

`in = Simulink.SimulationInput('modelName')` creates a `SimulationInput` object for a model.

Input Arguments

modelName — Name of the model
character vector

Create a `Simulink.SimulationInput` object by passing the name of the model as an argument.

Example: `in = Simulink.SimulationInput('cstr')`

Properties

ModelName — Name of the model
character vector

Name of the model for which the `SimulationInput` object is created.

InitialState — Initial state
`Simulink.SimState.ModelSimState` object

Initial state of the model for a simulation specified as a `Simulink.SimState.ModelSimState` object

ExternalInput — External Input
numerical array, dataset object, timeseries, character array

External inputs added to the model for a simulation.

BlockParameters — Block parameters
array of `Simulink.Simulation.BlockParameter`

Block parameters of the model that are modified.

Variables — Variables
array of `Simulink.Simulation.Variable`

Variables of the model that are modified.

ModelParameters — Model parameters
array of `Simulink.Simulation.ModelParameter`

Model parameters of the model that are modified .

PreSimFcn — Function
MATLAB function

MATLAB function to run before the start of the simulation.

PostSimFcn — Function
MATLAB function

MATLAB function to run after the simulations.

UserString — User string
character array

Brief description of the simulation specified as a character array.

Methods

Method	Purpose
setModelParameter	Set model parameters to be used for a specific simulation through SimulationInput object.
setBlockParameter	Set block parameters to be used for a specific simulation through SimulationInput object.
setInitialState	Set initial state to be used for a specific simulation through SimulationInput object.
setExternalInput	Set external inputs for a simulation through SimulationInput object.
setVariable	Set variables for a simulation through SimulationInput object.
setPreSimFcn	Specify a MATLAB function to run before start of each simulation through SimulationInput object.
setPostSimFcn	Specify a MATLAB function to run after each simulation is complete through SimulationInput object.
applyToModel	Apply changes to the model specified through a SimulationInput object.
validate	Validate the contents of the SimulationInput object.

Examples

Create a Simulink.SimulationInput Object

This example shows you how to create a `SimulationInput` object.

Create a single `SimulationInput` object for a model.

```
model = 'sldemo_househeat';
in = Simulink.SimulationInput(model);
```

Create an Array of Simulink.SimulationInput Objects

This example shows you how to create an array of `SimulationInput` objects.

Create an array of `SimulationInput` objects by using the `for` loop.

```
model = 'vdp';
for i = 10:-1:1
    in(i) = Simulink.SimulationInput(model);
end
```

Set Block Parameters using an Array of Simulink.SimulationInput Objects

This example modifies the block parameters of a model through the `SimulationInput` object.

Open the model

```
mdl = 'sldemo_househeat';
open_system(mdl);
```

Create a `SimulationInput` object for this model.

```
in = Simulink.SimulationInput(mdl);
```

Modify block parameter.

```
in = in.setBlockParameter('sldemo_househeat/Set Point','Value','300');
```

Simulate the model.

```
out = sim(in)
```

Introduced in R2017a

applyToModel

Apply changes to the model specified through a `SimulationInput` object, `in`

Syntax

```
in.applyToModel
```

Description

`in.applyToModel` applies the changes specified through the `SimulationInput` object to the model. You can use it to debug a model or to interactively analyze a simulation.

Examples

Apply Changes Made Through the Simulink.SimulationInput Object to the Model

This example shows how to modify a model through a `SimulationInput` object and save those modifications.

Open the model and create a `SimulationInput` object.

```
open_system('sldemo_househeat');
in = Simulink.SimulationInput('sldemo_househeat');
```

Modify block parameter, model parameters and a variable through `SimulationInput` object.

```
in = in.setBlockParameter('sldemo_househeat/Set Point','Value','75');
in = in.setVariable('cost',50,'Workspace','sldemo_househeat');
in = in.setModelParameter('StartTime','1','StopTime','5');
```

Apply the modifications made in the above step to the model.

`in.applyToModel`

Introduced in R2017a

setExternalInput

Set external inputs for a simulation through `SimulationInput` object, `in`

Syntax

```
in = in.setExternalInput([t, u1,..uN])
in = in.setExternalInput(ds)
in = in.setExternalInput(ts)
```

Description

`in = in.setExternalInput([t, u1,..uN])` allows you to directly specify numerical arrays as inputs to a model if a model has root inports.

`in = in.setExternalInput(ds)` allows you to directly specify dataset objects as external inputs to a model if a model has root inports..

`in = in.setExternalInput(ts)` allows you to directly specify timeseries object as external input if a model has a single root inport.

Examples

Set Numerical Arrays as External Inputs Through a Simulink.SimulationInput Object

This example shows how to set numerical arrays as external inputs.

Open the model

```
open_system('sldemo_mdlref_counter');
```

Create a `SimulationInput` object for this model.

```
in = Simulink.SimulationInput('sldemo_mdlref_counter');
```

Prepare external inputs.

```
t = (0:0.01:10)';
u1 = 5*ones(size(t));
u2 = 10*sin(t);
u3 = -5*ones(size(t));
```

Set external inputs to the model.

```
in.setExternalInput = [t, u1, u2, u3];
```

Simulate the model.

```
out = sim(in);
```

Input Arguments

[t, u1,..uN] — Numerical array
numerical array

Numerical array to be used as an external input.

ds — Dataset object
Simulink.SimulationData.Dataset object

Dataset object to be used as an external input

ts — Time series
time object handle

Time series to be used as an external input

Topics
"Run Multiple Simulations"

"Parallel Simulations Workflow"

Introduced in R2017a

setPostSimFcn

Specify a MATLAB function to run after each simulation is complete through `SimulationInput` object, in

Syntax

```
in = in.setPostSimFcn(@(y) myfunction(arg1, arg2...))
```

Description

`in = in.setPostSimFcn(@(y) myfunction(arg1, arg2...))` runs after each simulation is complete. The `Simulink.SimulationOutput` object is passed as the argument `y` to this function. `myfunction` is any MATLAB function and can be used to do the post processing on the output. To return post processed data, you must return it as values in a struct. These values are then packed into the `Simulink.SimulationOutput` output to replace the usual logged data or add new data to the `Simulink.SimulationOutput` object.

Examples

Specify a MATLAB function for Postprocessing of the Output

This example specifies a MATLAB Function through `SimulationInput` object to run after each simulation is complete.

Create a `PostSimFcn` to get the mean of the output.

```
function newout = postsim(out);
newout.mean = mean(out.yout);
end
```

Create a `SimulationInput` object for a model.

```
in = Simulink.SimulationInput('vdp');
in = in.setPostSimFcn(@(x) postsim(x));
in = in.setModelParameter('SaveOutput','on');
```

Simulate the model.

```
out = sim(in)
```

View your result

```
out.mean
```

It is best practice to avoid using `'ErrorMessage'` and `'SimulationMetadata'` as field names in the function.

Input Arguments

y — Copy of Simulink.SimulationOutput object for postprocessing
`Simulink.SimulationOutput` object

This is a `Simulink.SimulationOutput` object which is an input to `myfunction`.

See Also

Topics
"Run Multiple Simulations"
"Parallel Simulations Workflow"

Introduced in R2017a

setPreSimFcn

Specify a MATLAB function to run before start of each simulation through `SimulationInput` object, in

Syntax

```
in = in.setPreSimFcn(@(x) myfunction(arg1, arg2...))
```

Description

`in = in.setPreSimFcn(@(x) myfunction(arg1, arg2...))` runs before each simulation starts. The `Simulink.SimulationInput` object is passed as an argument `x` to this function. `myfunction` is any MATLAB function and can be used to modify the `Simulink.SimulationInput` object. If you use `myfunction` to modify the `Simulink.SimulationInput` object, you must return `Simulink.SimulationInput` object as the only output argument.

Examples

Specify a MATLAB Function to Run Before Each Simulation

This example shows how to specify a MATLAB function through `SimulationInput` object to run at before start of each simulation.

Create a `PreSimFcn` function.

```
function presim(in)
signalbuilder('sf_car/User Inputs', 'ActiveGroup', in.Variables.Value)
end
```

Open the model.

```
model = 'sf_car';
open_system(model);
```

Create an array of `SimulationInput` objects for this model. Use `in.PreSimFcn` to run `presim` before simulation.

```
 n = 4;
    for idx = n:-1:1
       in(idx) = Simulink.SimulationInput(model);
       in(idx) = in(idx).setVariable('SigIndex', idx);
       in(idx) = in(idx).setPreSimFcn(@(x) presim(x));
    end
```

Simulate the model.

```
out = sim(in)
```

Input Arguments

x — A Simulink.SimulationInput object as input to the myfunction
Simulink.SimulationInput object

This is an input to `myfunction` in which you can modify the `Simulink.SimulationInput` object.

See Also

Topics
"Run Multiple Simulations"
"Parallel Simulations Workflow"

Introduced in R2017a

setBlockParameter

Set block parameters to be used for a specific simulation through `SimulationInput` object, `in`

Syntax

```
in = in.setBlockParameter(BlockPath,ParameterName,Value,...
ParameterNameN,ValueN)
```

Description

`in = in.setBlockParameter(BlockPath,ParameterName,Value,...
ParameterNameN,ValueN)` sets the parameter on the block specified at `BlockPath` with the properties `ParameterName` and `Value`. You can set multiple block parameters in a model using the same `SimulationInput` object. For more information on block parameter, see "Block-Specific Parameters" on page 6-130.

Examples

Modify a Block Parameter for a Simulation

This example modifies the block parameters of a model through the `SimulationInput` object.

Open the model

```
mdl = 'sldemo_househeat';
open_system(mdl);
```

Create a `SimulationInput` object for this model.

```
in = Simulink.SimulationInput(mdl);
```

Modify block parameter.

```
in = in.setBlockParameter('sldemo_househeat/Set Point','Value','300');
```

Simulate the model.

```
out = sim(in)
```

Input Arguments

BlockPath — Path of the block
character vector

BlockPath is the path of the block for which the parameter is changed

Example: `'sldemo_househeat/Set Point'`

ParameterName — Block parameter name
character vector

Specify optional comma-separated pairs of `ParameterName,Value` arguments. `ParameterName` is the parameter name and `Value` is the corresponding value. `ParameterName` must appear inside single quotes (' '). Block parameter values are typically specified as character vectors. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`. `ParameterNameN,ValueN` pairs follow the same syntax as `set_param`.

Example: `'Value', '350'`

Set initial state to be used for a specific simulation through `SimulationInput` object, in

Syntax

`in.setInitialState = xInitial`

Description

`in.setInitialState = xInitial` sets the initial state of a model to `xInitial`, a `Simulink.SimState.ModelSimState` object.

Input Arguments

xInitial — Simulink.SimState.ModelSimState object
Simulink.SimState.ModelSimState

You can change the `Initial State` of a model by assigning it to a `Simulink.SimState.ModelSimState` object.

Introduced in R2017a

setModelParameter

Set model parameters to be used for a specific simulation through `SimulationInput` object, `in`

Syntax

```
in = in.setModelParameter(ParameterName,Value,...ParameterNameN,
ValueN)
```

Description

`in = in.setModelParameter(ParameterName,Value,...ParameterNameN, ValueN)` sets a model parameter `Name` with a `Value`. You can add multiple model parameters to the model using the same `SimulationInput` object. For more information on model parameters, see "Model Parameters" on page 6-2.

Examples

Modify a Model Parameter for a Simulation

This example modifies the model parameters of through the `SimulationInput` object

Open the model.

```
mdl = 'sldemo_househeat';
open_system(mdl);
```

Create a `SimulationInput` object for this model.

```
in = Simulink.SimulationInput(mdl);
```

Modify model parameters.

```
in = in.setModelParameter('StartTime','1','StopTime','4');
```

Simulate the model.

```
out = sim(in)
```

Input Arguments

`ParameterName` — Block parameter name
character vector

Specify optional comma-separated pairs of `ParameterName,Value` arguments. `ParameterName` is the parameter name and `Value` is the corresponding value. `ParameterName` must appear inside single quotes (`' '`). Model parameter values are typically specified as character vectors. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`. `ParameterNameN,ValueN` pairs follow the same syntax as `set_param`.

Example: `'StartTime','1'`

Introduced in R2017a

setVariable

Set variables for a simulation through `SimulationInput` object, `in`

Syntax

```
in = in.setVariable(Name,Value)
in = in.setVariable(Name,Value,'Workspace', 'ModelName')
```

Description

`in = in.setVariable(Name,Value)` assigns a `Value` to variable `Name`. You can add multiple variables to the model using the same `SimulationInput` object.

`in = in.setVariable(Name,Value,'Workspace', 'ModelName')` assigns the `Value` to variable `Name`. Variables that are defined through the `SimulationInput` object are placed in the global workspace scope by default. The term global workspace is specific to the `Simulink.SimulationInput` object and its methods. Variables in the global workspace scope take precedence if a variable with the same name exists in the base workspace or the data dictionary. The variables in the model workspace take precedence over the global workspace scope. To change the value of a model workspace variable, set the scope by specifying the model name when you add the variable to the `SimulationInput` object.

For information on using nonscalar variables, structure variables and parameter objects, see "Sweep Nonscalars, Structures, and Parameter Objects".

Examples

Modify a Variable for a Simulation

This example modifies the model parameters of through the `SimulationInput` object.

Open the model.

```
mdl = 'sldemo_househeat';
open_system(mdl);
```

Create a `SimulationInput` object for this model

```
in = Simulink.SimulationInput(mdl);
```

Set the variable value to 50.

```
in = in.setVariable('cost',50);
```

By default, this variable is placed in the global workspace scope.

Simulate the model.

```
out = sim(in)
```

Modify a Variable for a Simulation in the Model Workspace

This example modifies the model parameters of through the `SimulationInput` object.

Set path and open the model.

```
mdl = 'sldemo_househeat';
open_system(mdl);
```

Create a `SimulationInput` object for this model

```
in = Simulink.SimulationInput(mdl);
```

Set the variable to 50 and set the scope to model workspace.

```
in = in.setVariable('cost',50,'Workspace','sldemo_househeat');
```

Simulate the model.

```
out = sim(in)
```

Input Arguments

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the literal value of the variable. `Name` must appear inside single quotes (`' '`). You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: `'cost','65'`

Workspace — Workspace for the variable
character vector

Set the scope of the defined variable by specifying the model name

Example: `'Workspace', 'sldemo_househeat'`

Topics
"Run Multiple Simulations"
"Parallel Simulations Workflow"

Introduced in R2017a

validate

Validate the contents of the `SimulationInput` object, `in`

Syntax

```
in.validate
```

Description

`in.validate` validates the changes made to the model through the `SimulationInput` object. This method validates all the changes made to the model through the `SimulationInput` object.

Examples

Validate Changes Made Through the SimulationInput Object

This example modifies and validates the variable of the model through the `SimulationInput` object.

Open the model.

```
mdl = 'sldemo_househeat';
open_system(mdl);
```

Create a `SimulationInput` object for this model

```
in = Simulink.SimulationInput(mdl);
```

Modify a model parameter

```
in = in.setModelParameter('InvalidParamName','5');
```

Validate this change

```
in.validate
```

Simulink.SimulationMetadata class

Package: Simulink

Access metadata of simulation runs

Description

The `SimulationMetadata` class contains information about a simulation run including:

- Model information
- Timing information
- Execution and diagnostic information
- Custom character vector to tag the simulation
- Custom data to describe the simulation

`SimulationMetadata` packages this information with the `SimulationOutput` object. To use `SimulationMetadata`, use one of these approaches:

- In **Configuration Parameters > Data Import/Export**, under **Save options**, select **Single simulation output**.
- Use `set_param` to set `ReturnWorkspaceOutputs` to on.

  ```
  set_param(model_name,'ReturnWorkspaceOutputs','on');
  ```

To retrieve the `SimulationMetadata` object, use the `getSimulationMetadata` method on a `SimulationOutput` object.

Properties

`ModelInfo` — Information about the model and simulation operating environment
structure

The `ModelInfo` structure has these fields.

Field Name	Type	Description
ModelName	char	Name of the model
ModelVersion	char	Version of the model
ModelFilePath	char	Absolute location of the .mdl/.slx file
UserID	char	System user ID of the machine used for the simulation
MachineName	char	Hostname of the machine used for the simulation
Platform	char	Operating system of the machine used for the simulation
ModelStructuralChecksum	4–by–1 uint32	Structural checksum of the model calculated after an update diagram
SimulationMode	char	Simulation mode
StartTime	double	Simulation start time
StopTime	double	Time at which the simulation was terminated
SolverInfo	structure	Solver information: • Fixed-step solvers – Solver type, name, and fixed step size • Variable solvers – Solver type, name, and max step size (initial setting)
SimulinkVersion	structure	Version of Simulink
LoggingInfo	structure	Metadata about logging to persistent storage: • LoggingToFile field — Indicates whether logging to persistent storage is enabled ('on' or 'off') • LoggingFileName field — Specifies the resolved file name for the persistent storage MAT-file (if LoggingToFile is 'on').

ExecutionInfo — Structure to store information about a simulation run
structure

Structure to store information about a simulation run, including the reason a simulation stopped and any diagnostics reported during the simulation. The structure has these fields.

Field Name	Type	Description
StopEvent	Nontranslated character vector	Reason the simulation stopped, represented by one of these. • `ReachedStopTime` – Simulation stopped upon reaching stop time and no errors were reported during execution. `StopEvent` has value `ReachedStopTime`, even if errors are reported in the stop callbacks, which are executed after the simulation ends. • `ModelStop` – Simulation stopped by a block or by solver before reaching stop time • `StopCommand` – Simulation stopped manually by clicking the **Stop** button or programmatically using the `set_param` command • `DiagnosticError` – Simulation stopped because an error was reported during simulation • `KeyboardControlC` – Simulation stopped using keystroke `Ctrl+C`. • `PauseCommand` – Simulation paused manually by clicking the **Pause** button or programmatically using the `set_param` command • `ConditionalPause` – Simulation paused using a conditional breakpoint • `PauseTime` – Simulation paused at or after specified pause time • `StepForward` – Simulation paused after clicking step forward • `StepBackward` – Simulation paused after clicking step backward

Field Name	Type	Description
		• `TimeOut` – Simulation stopped because execution time exceeded timeout specified by `TimeOut`
`StopEventSource`	`Simulink.Sim ulationData. BlockPath`	Source of stop event, if it is a valid Simulink object
`StopEventDescription`	Translated character vector	Super set of information stored in `StopEvent` and `StopEventSource`
`ErrorDiagnostic`	struct	Error reported during simulation, represented by these fields. • `Diagnostic` – `MSLDiagnostic` object that includes object paths, ID, message, cause, and stack • `SimulationPhase` – Represented by one of these: `Initialization`, `Execution`, or `Termination` • `SimulationTime` – Simulation time represented as a double, if reported during Execution; else, represented as `[]` By passing the name–value pair `'ReturnErrorsInOutput', 'on'` to the `sim` command, errors generated during simulation are reported in `ExecutionInfo.ErrorDiagnostic`. The `sim` command does not capture generated errors.

Field Name	Type	Description
`WarningDiagnostics`	Array of struct	Array of all warnings reported during the simulation. Each array item is represented by these fields. • `Diagnostic` – `MSLDiagnostic` object that includes object paths, ID, message, cause, and stack • `SimulationPhase` – Represented by one of these: `Initialization`, `Execution`, or `Termination` • `SimulationTime` – Simulation time represented as a double, if reported during `Execution`; else, represented as `[]`

`TimingInfo` — Structure to store profiling information about the simulation
structure

Structure to store profiling information about the simulation, including the time stamps for the start and end of the simulation. The structure has these fields.

Field Name	Type	Description
`WallClockTimestampStart`	character vector	Wall clock time when the simulation started, in `YYYY-MM-DD HH:MI:SS` format with microsecond resolution
`WallClockTimestampStop`	character vector	Wall clock time when the simulation stopped, in `YYYY-MM-DD HH:MI:SS` format with microsecond resolution
`InitializationElapsedWallTime`	double	Time spent before execution, in seconds
`ExecutionElapsedWallTime`	double	Time spent during execution, in seconds
`TerminationElapsedWallTime`	double	Time spent after execution in, seconds

Field Name	Type	Description
TotalElapsedWallTime	double	Total time spent in initialization, execution, and termination, in seconds

The `ExecutionElapsedWallTime` includes the time that Simulink spent to roll back or step back in a simulation. The `ExecutionElapsedWallTime` does not include the time spent between steps. For example, if you use Stepper to step through a simulation, the `ExecutionElapsedWallTime` time does not include the time when the simulation is in a paused state. For more information about using Stepper, see "How Simulation Stepper Helps With Model Analysis".

UserString — Custom character vector to describe the simulation
character vector

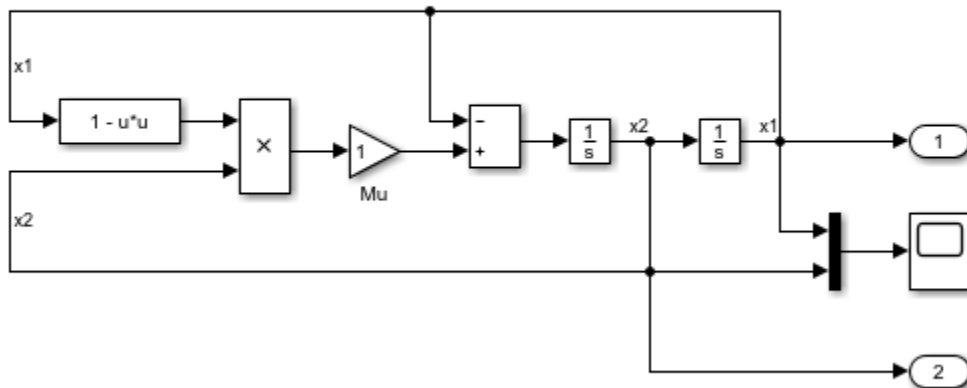
Use `Simulink.SimulationOutput.setUserString` to directly store a character vector in the `SimulationMetadata` object that is contained in the `SimulationOutput` object.

UserData — Custom data to store in `SimulationMetadata` object that is contained in the `SimulationOutput` object
character vector

Use `Simulink.SimulationOutput.setUserData` to store custom data in the `SimulationMetadata` object that is contained in the `SimulationOutput` object.

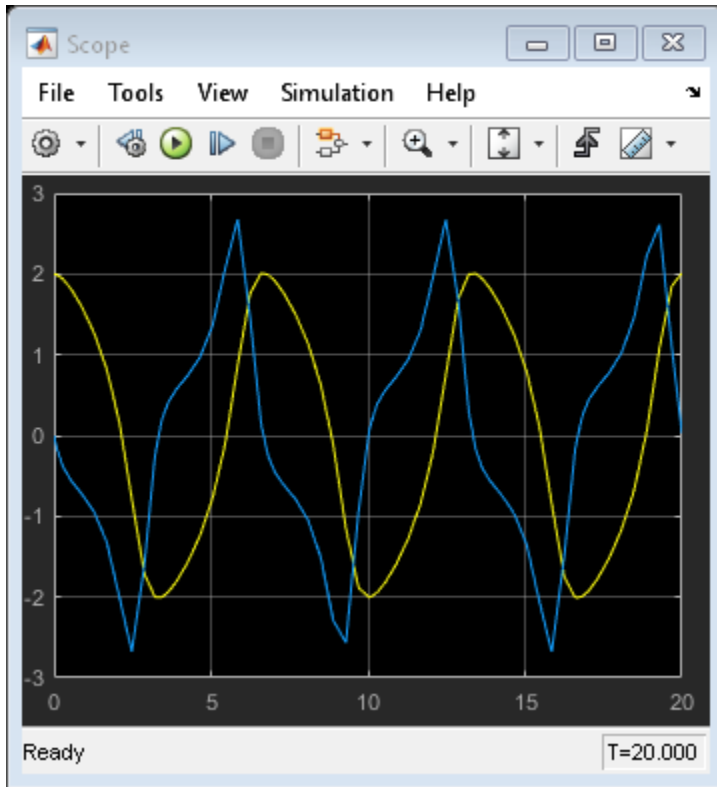
Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects (MATLAB).

Examples


Get a SimulationMetadata Object for vdp Simulation

Simulate the `vdp` model. Retrieve metadata from a `SimulationMetadata` object of the simulation.

Simulate the `vdp` model. Save the results of the `Simulink.SimulationOutput` object in `simout`.


```
open_system('vdp');
simout = sim(bdroot,'ReturnWorkspaceOutputs','on');
```

van der Pol Equation

Copyright 2004-2013 The MathWorks, Inc.

Retrieve metadata information about this simulation using mData. This is the SimulationMetadata object that simout contains.

```
mData=simout.getSimulationMetadata()
```

```
mData =

  SimulationMetadata with properties:

         ModelInfo: [1x1 struct]
        TimingInfo: [1x1 struct]
     ExecutionInfo: [1x1 struct]
        UserString: ''
          UserData: []
```

Store custom data or string in `simout`.

```
simout=simout.setUserData(struct('param1','value1','param2','value2','param3','value3
simout=simout.setUserString('Store first simulation results');
```

Retrieve the custom data you stored from `mData`.

```
mData=simout.getSimulationMetadata()
disp(mData.UserData)
```

```
mData =

  SimulationMetadata with properties:

        ModelInfo: [1x1 struct]
       TimingInfo: [1x1 struct]
    ExecutionInfo: [1x1 struct]
       UserString: 'Store first simulation results'
         UserData: [1x1 struct]

    param1: 'value1'
    param2: 'value2'
    param3: 'value3'
```

Retrieve the custom string you stored from `mData`.

```
mData=simout.getSimulationMetadata()
disp(mData.UserString)
```

```
mData =

  SimulationMetadata with properties:

        ModelInfo: [1x1 struct]
       TimingInfo: [1x1 struct]
    ExecutionInfo: [1x1 struct]
       UserString: 'Store first simulation results'
         UserData: [1x1 struct]
```

```
Store first simulation results
```

Simulink.SimulationOutput.setUserString

Introduced in R2015a

Simulink.SimulationOutput class

Package: Simulink

Access object values of simulation results

Description

The `SimulationOutput` class contains all simulation outputs, including workspace variables.

You can use dot notation to access the data for simulation outputs. For example, to return data for the xout variable for a simOut `SimulationOutput` object, use a `simOut.tout` command.

Alternatively, you can use `Simulink.SimulationOutput.who` and either `Simulink.SimulationOutput.get` or `Simulink.SimulationOutput.find` methods to access the output variable names and their respective values.

Properties

`SimulationMetadata` — Metadata for simulation runs
`Simulink.SimulationMetadata` object

Metadata for simulation runs, returned as a `Simulink.SimulationMetadata` object. Fields other than the `UserData` and `UserString` fields are read only.

`ErrorMessage` — Simulation logging error messages
char vector

Simulation logging error message, returned as a char vector. (read only)

Methods

find	Access and display values of simulation results
get	Access and display values of simulation results
getSimulationMetadata	Return `SimulationMetadata` object for simulation
setUserData	Store custom data in `SimulationMetadata` object that `SimulationOutput` object contains
setUserString	Store custom character vector in `SimulationMetadata` object that `SimulationOutput` object contains
who	Access and display output variable names of simulation

Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects (MATLAB) in the MATLAB Programming Fundamentals documentation.

Examples

View Simulation Output and Metadata

Simulate a model and place the results of the `Simulink.SimulationOutput` object in `simOut` and view the simulation metadata.

Simulate the `vdp` model.

```
simOut = sim('vdp','SimulationMode','normal','AbsTol','1e-5',...
             'SaveState','on','StateSaveName','xoutNew',...
             'SaveOutput','on','OutputSaveName','youtNew')

 Simulink.SimulationOutput:

             xoutNew: [65x2 double]
             youtNew: [65x2 double]

    SimulationMetadata: [1x1 Simulink.SimulationMetadata]
          ErrorMessage: [0x0 char]
```

Get the values of the variable *youtNew*.

```
simOut.youtNew
```

Simulink returns and displays the values.

Get the timing information for the simulation.

```
myMetadata = simOut.SimulationMetadata

myMetadata =

  SimulationMetadata with properties:

        ModelInfo: [1×1 struct]
       TimingInfo: [1×1 struct]
    ExecutionInfo: [1×1 struct]
       UserString: ''
         UserData: []
```

```
myMetadata.TimingInfo

ans =

  struct with fields:

            WallClockTimestampStart: '2016-12-30 08:47:51.739935'
             WallClockTimestampStop: '2016-12-30 08:47:58.185579'
       InitializationElapsedWallTime: 5.9166
           ExecutionElapsedWallTime: 0.1910
         TerminationElapsedWallTime: 0.3380
               TotalElapsedWallTime: 6.4456
```

Simulink.SubsysDataLogs

Container for subsystem signal data logs

Description

Note Before R2016a, the `Simulink.SubsysDataLogs` class was used in conjunction with the `ModelDataLogs` logging data format. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format.

However, you can use data that was logged in a previous release using `ModelDataLogs` format.

In releases before R2016a, Simulink created instances of this class to contain logs for signals in a subsystem models were logged in `ModelDataLogs` format. Objects of this class have a variable number of properties. The first property, named `Name`, is the name of the subsystem whose log data this object contains. The remaining properties are signal log or signal log container objects containing the data logged for the subsystem specified by this object's `Name` property.

For example, suppose you have this logged data from a model run in a release earlier than R2016a:

```
Simulink.SubsysDataLogs (Gain):
  Name                     elements  Simulink Class

  a                             1       Timeseries
  m                             2       TsArray
```

You can use either fully qualified log names or the `unpack` command to access the signal logs contained by a `SubsysDataLogs` object. For example, to access the amplitudes logged for signal `a` in the preceding example, you could enter the following at the MATLAB command line:

```
data = logsout.Gain.a.Data;
```

or

```
>> logsout.unpack('all');
data = a.Data;
```

Introduced before R2006a

Simulink.SuppressedDiagnostic class

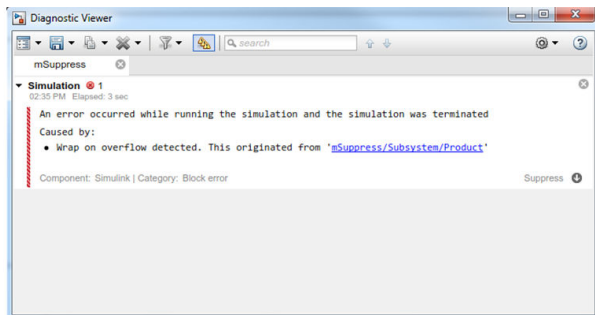
Package: Simulink

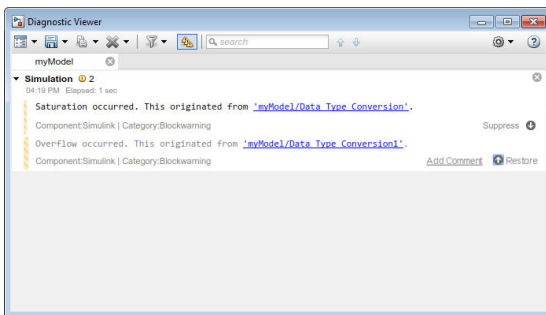
Suppress diagnostic messages from a specified block

Description

A `Simulink.SuppressedDiagnostic` object contains information related to diagnostic warnings or errors that are suppressed from being thrown during simulation.

Construction

The Diagnostic Viewer in Simulink includes an option to suppress certain diagnostics. This feature enables you to suppress warnings or errors for specific objects in your model. Click the **Suppress** button next to the warning in the Diagnostic Viewer to suppress the warning from the specified source. This action creates a `Simulink.SuppressedDiagnostic` object. You can access this object at the MATLAB command line using the `Simulink.getSuppressedDiagnostics` function. You can restore the diagnostic by clicking **Restore**. You can add a comment for the suppressed diagnostics.




`DiagnosticObject = Simulink.SuppressedDiagnostic(source, message_id)` creates a suppressed diagnostic object. The object suppresses all instances of diagnostics represented by `message_id` thrown by the blocks specified by `source`.

Input Arguments

source — System, block, or model object throwing diagnostic
model | subsystem | block path | block handle

The source of the diagnostic, specified as a model, subsystem, block path, block handle, cell array of block paths, or cell array of block handles.

To get the block path, use the `gcb` function.

To get the block handle, use the `getSimulinkBlockHandle` function.

Data Types: `char` | `cell`

message_id — message identifier of diagnostic
message identifier | cell array of message identifiers

The message identifier of the diagnostic, specified as a character vector or a cell array of character vectors. You can find the message identifier of diagnostics thrown during simulation by accessing the `ExecutionInfo` property of the `Simulink.SimulationMetadata` object associated with a simulation. You can also use the `lastwarn` function.

Data Types: `char` | `cell`

Properties

Comments — Comments associated with the suppression object
character vector

Comments associated with the suppression object, specified as a character vector. This property is optional.

Data Types: `char`

ID — Message identifier of the diagnostic that was suppressed
character vector

The message identifier of the diagnostic that was suppressed, specified as a character vector.

Data Types: `char`

`LastModified` — Date the suppression object was last modified
character vector

Date the suppression object was last modified, specified as a character vector. This property is read-only.

Data Types: `char`

`LastModifiedBy` — Name of the user who was last to add or edit the suppression object
character vector

Name of the user who last to add or edit the suppression object, specified as a character vector. This property is optional.

Data Types: `char`

`Source` — block path of the source of the diagnostic
character vector

The block path of the model object that has a suppressed diagnostic, specified as a character vector.

Data Types: `char`

Methods

restore   Remove specified diagnostic suppressions
suppress   Suppress diagnostic specified by `Simulink.SuppressedDiagnostic` object

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Create a Simulink.SuppressedDiagnostic Object

Using the model from"Suppress Diagnostic Messages Programmatically", create and then restore a diagnostic suppression.

Create a `Simulink.SuppressedDiagnostic` object, `suppression` to suppress the parameter precision loss warning thrown by the Constant block, `one`.

```
suppression = Simulink.SuppressedDiagnostic('Suppressor_CLI_Demo/one',...
'SimulinkFixedPoint:util:fxpParameterPrecisionLoss');
```

The parameter precision loss warning is no longer thrown in future simulations of this model.

Add accountability information to the object by editing the `LastModifiedBy` and `Comments` properties of the object.

```
suppression.LastModifiedBy = 'John Doe';
suppression.Comments = 'Reviewed: Joe Schmoe'

suppression =

  SuppressedDiagnostic with properties:

            Source: 'Suppressor_CLI_Demo/one'
                Id: 'SimulinkFixedPoint:util:fxpParameterPrecisionLoss'
     LastModifiedBy: 'John Doe'
          Comments: 'Reviewed: Joe Schmoe'
      LastModified: '2016-Jun-01 17:25:21'
```

You can restore the diagnostic using the `restore` method.

```
restore(suppression);
```

• "Suppress Diagnostic Messages Programmatically"

Topics

"Suppress Diagnostic Messages Programmatically"
Class Attributes (MATLAB)
Property Attributes (MATLAB)

Introduced in R2016b

restore

Class: Simulink.SuppressedDiagnostic
Package: Simulink

Remove specified diagnostic suppressions

Syntax

```
restore(SuppressedDiagnostic)
```

Description

`restore(SuppressedDiagnostic)` removes the specified suppressed diagnostic object.

Input Arguments

SuppressedDiagnostic — Suppressed diagnostic object to restore
`Simulink.SuppressedDiagnostic` object

`Simulink.SuppressedDiagnostic` object

Examples

Restore a Suppressed Diagnostic

Using the model from "Suppress Diagnostic Messages Programmatically", create and then restore a diagnostic suppression.

Create a `Simulink.SuppressedDiagnostic` object, `suppression` to suppress the parameter precision loss warning from the Constant block, `one`.

```
suppression = Simulink.SuppressedDiagnostic('Suppressor_CLI_Demo/one',...
'SimulinkFixedPoint:util:fxpParameterPrecisionLoss');
```

You can restore the diagnostic using the `restore` method.

```
restore(suppression);
```

Restore All Suppressed Diagnostics

Using the model from "Suppress Diagnostic Messages Programmatically", restore all diagnostic suppressions associated with a model.

Use the `Simulink.suppressDiagnostic` function to suppress the parameter precision loss and parameter underflow warnings from the Constant block, `one`.

```
diags = {'SimulinkFixedPoint:util:fxpParameterPrecisionLoss', 'SimulinkFixedPoint:util
Simulink.suppressDiagnostic('Suppressor_CLI_Demo/one',diags);
```

Use the `Simulink.getSuppressedDiagnostics` function to get all suppressions associated with the model, returned as an array of `Simulink.SuppressedDiagnostic` objects.

```
suppressed_diagnostics = Simulink.getSuppressedDiagnostics('Suppressor_CLI_Demo')

suppressed_diagnostics =

  1×2 SuppressedDiagnostic array with properties:

    Source
    Id
    LastModifiedBy
    Comments
    LastModified
```

Restore all diagnostics using the `restore` method and iterating through the `suppressed_diagnostics` array.

```
for iter = 1:numel(suppressed_diagnostics)
    restore(suppressed_diagnostics(iter));
end
```

Simulink.TimeInfo

Provide information about time data in `Simulink.Timeseries` object

Description

Simulink software creates instances of these objects to describe the time data that it includes in `Simulink.Timeseries` objects.

Note The `Simulink.Timeseries` class is supported for backwards compatibility. The `ModelDataLogs` format created `Simulink.Timeseries` objects for signal logging data. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format. In R2016a or later, when you open a model from an earlier release that had used `ModelDataLogs` format, the model simulated in use `Dataset` format.

You can convert signal logging data from `ModelDataLogs` to `Dataset` format. Converting to `Dataset` format makes it easier to post-process with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see "Convert Logged Data to Dataset Format".

If you have legacy code that uses the `ModelDataLogs` API, you can encounter situations that require updates to your code or model. See "Migrate Scripts That Use Legacy ModelDataLogs API".

Properties

Name	Access	Description
`Units`	RW	The units, e.g., `'seconds'`, in which the time series data are expressed in the associated `Simulink.Timeseries` object.

Name	Access	Description
Start	RW	If the associated signal is not in a conditionally executed subsystem, this field contains the simulation time of the first signal value recorded in the associated `Simulink.Timeseries` object. If the signal is in a conditionally executed subsystem, this field contains an array of times when the system became active.
end	RW	If the associated signal is not in a conditionally executed subsystem, this field contains the simulation time of the last signal value recorded in the associated `Simulink.Timeseries` object. If the signal is in a conditionally executed subsystem, this field contains an array of times when the system became inactive.
Increment	RW	The interval between simulation times at which signal data is logged in the associated `Simulink.Timeseries` object. If the signal is aperiodic (continuous signal with variable-step solver), this property has a value of `NaN`. A signal is periodic if it has a discrete sample time (not continuous or constant) or is continuous with a fixed-step solver.
Length	W	The number of signal samples recorded in the associated `Simulink.Timeseries` object, i.e., the length of the arrays referenced by the object's `Time` and `Data` properties.

`Simulink.Timeseries` , `Simulink.SimulationData.Dataset`

Introduced before R2006a

Simulink.Timeseries

Store data for any signal except mux or bus signal

Description

Note The `Simulink.Timeseries` class is supported for backwards compatibility. The `ModelDataLogs` format created `Simulink.Timeseries` objects for signal logging data. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format. In R2016a or later, when you open a model from an earlier release that had used `ModelDataLogs` format, the model simulated in use `Dataset` format.

You can convert signal logging data from `ModelDataLogs` to `Dataset` format. Converting to `Dataset` format makes it easier to post-process with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see "Convert Logged Data to Dataset Format".

If you have legacy code that uses the `ModelDataLogs` API, you can encounter situations that require updates to your code or model. See "Migrate Scripts That Use Legacy ModelDataLogs API".

Simulink software creates instances of this class to store signal data that it logs for any signal except a mux or bus signal, which are stored in a `Simulink.TsArray`. See "Export Signal Data Using Signal Logging" for more information.

Properties

Name	Access	Description
Name	RW	Name of this signal log.
BlockPath	RW	Path of the block that output the signal logged in this signal log.

Name	Access	Description
PortIndex	RW	Index of the output port that emitted the signal logged in this signal log.
SignalName	RW	Name of the signal logged in this signal log.
ParentName	RW	Name of the parent of the signal recorded in this log, if the signal is an element of a mux or a virtual bus; otherwise, the same as SignalName.
TimeInfo	RW	An object of Simulink.TimeInfo class that describes the time data in this log.
Time	RW	An array containing the simulation times at which signal data was logged.
Data	RW	An array containing the signal data.

Introduced before R2006a

Simulink.TsArray

Store data for mux or bus signal

Description

Note Before R2016a, the `Simulink.TsArray` class was used in conjunction with the `ModelDataLogs` logging data format. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format.

However, you can use data that was logged in a previous release using `ModelDataLogs` format.

In releases earlier than R2016a, Simulink software created instances of this class to contain the data that it logs for a mux or bus signal. Other types of signals were stored in a `Simulink.Timeseries`.

Objects of the `Simulink.TsArray` class have a variable number of properties. The first property, called `Name`, specifies the log name of the logged signal. The remaining properties reference logs for the elements of the logged signal: `Simulink.Timeseries` objects for elementary signals and `Simulink.TSArray` objects for mux or bus signals. The name of each property is the log name of the corresponding signal.

For example, suppose you have this logged data from a model run in a release earlier than R2016a that was configured to log in `ModelDataLogs` format.

```
logsout.b2
```

```
Simulink.TsArray (untitled/Bus Creator1):
  Name                    elements    Simulink Class

  x1                          1        Timeseries
  b1                          2        TsArray
```

The `Simulink.ModelDataLogs` object, named `logsout`, contains a `Simulink.TsArray` object, named `b2`, that contains the logs for the elements of b2 (that is, the elementary signal `x1` and the bus signal `b1`). Entering the fully qualified name of

the `Simulink.TsArray` object, (`logsout.b2`) at the MATLAB command line reveals the structure of the signal log for this model.

You can use either fully qualified log names or the `unpack` command to access the signal logs contained by a `Simulink.TsArray` object. For example, to access the amplitudes logged for signal `x1` in the preceding example, you can enter the following at the MATLAB command line:

```
data = logsout.b2.x1.Data;
```

or

```
logsout.unpack('all');
data = x1.Data;
```

Simulink.Variant class

Package: Simulink

Specify conditions that control variant selection

Description

An object of the `Simulink.Variant` class represents a conditional expression called a variant control. The object allows you to specify a Boolean expression that activates a specific variant choice when it evaluates to `true`.

A variant control comprises one or more variant control variables, specified using MATLAB variables or `Simulink.Parameter` objects.

You specify variant controls for each variant choice represented in a Variant Subsystem or Model Variant block. For a given Variant Subsystem or Model Variant block, only one variant control can evaluate to `true` at a time. When a variant control evaluates to `true`, Simulink activates the variant choice that corresponds to that variant control.

Construction

`variantControl = Simulink.Variant(conditionExpression)` creates a variant control.

Properties

conditionExpression — Variant condition expression
`'(default)'` | character vector

Variant condition expression, specified as a character vector containing one or more of these operands and operators.

Operands

- Variable names that resolve to MATLAB variables or `Simulink.Parameter` objects with integer or enumerated data type and scalar literal values
- Variable names that resolve to `Simulink.Variant` objects
- Scalar literal values that represent integer or enumerated values

Operators

- Parentheses for grouping
- Arithmetic, relational, logical, or bit-wise operators

The variant condition expression evaluates to a Boolean value. This property has read and write access.

Example: `'(Fuel==2 || Emission==1) && Ratio==2'`

Examples

Create Variant Controls Using MATLAB Variables

Use MATLAB variables when you want to simulate the model but are not considering code generation.

Create MATLAB variables with scalar literal values.

```
Fuel = 3;
Emission = 1;
Ratio = 3;
```

Develop conditional expressions using the variables.

```
Variant1 = Simulink.Variant('Fuel==1 && Emission==2');
Variant2 = Simulink.Variant('(Fuel==2 || Emission==1) && Ratio==2');
Variant3 = Simulink.Variant('Fuel==3 || Ratio==4');
```

Create Variant Controls Using `Simulink.Parameter` Objects

If you want to generate preprocessor conditionals for code generation, use `Simulink.Parameter` objects instead of MATLAB variables.

Create variant `Simulink.Parameter` objects with scalar literal values.

```
Fuel = Simulink.Parameter(3);
Emission = Simulink.Parameter(1);
Ratio = Simulink.Parameter(3);
```

Specify the custom storage class for these objects as `ImportedDefine` so that the values are specified by an external header file.

Other valid values for the custom storage class are `Define` and `CompilerFlag`.

```
Fuel.CoderInfo.StorageClass = 'Custom';
Fuel.CoderInfo.CustomStorageClass = 'ImportedDefine';

Emission.CoderInfo.StorageClass = 'Custom';
Emission.CoderInfo.CustomStorageClass = 'ImportedDefine';

Ratio.CoderInfo.StorageClass = 'Custom';
Ratio.CoderInfo.CustomStorageClass = 'ImportedDefine';
```

Develop conditional expressions using the variables and create variant controls.

```
Variant1 = Simulink.Variant('Fuel==1 && Emission==2');
Variant2 = Simulink.Variant('(Fuel==2 || Emission==1) && Ratio==2');
Variant3 = Simulink.Variant('Fuel==3 || Ratio==4');
```

Simulink.VariantConfigurationData class

Package: Simulink

Class representing a variant configurations data object

Description

The variant configuration data object, stores a collection of variant configurations, constraints, and the name of the default active configuration. The `Simulink.VariantConfigurationData` class has properties that enable you to add, modify, or remove variant configurations, constraints, and control variables. Use an instance of `Simulink.VariantConfigurationData` class to do the following:

- Define and edit variant configurations.
- Add control variables to variant configurations.
- Add copy of variant configuration.
- Delete existing variant configurations, constraints, and sub model configurations.
- Set a specific configuration as default active.
- Validate model using default or a specific variant configuration.
- Query or create variant configurations data object for a given model.

Properties

VariantConfigurations

Set of variant configurations. The names of the configurations must be unique and valid MATLAB variable names.

Constraints

Set of constraints that must always be satisfied by the model for all variant configurations. The name of the constraints must be unique and valid MATLAB variable names.

DefaultConfigurationName

Name of the variant configuration to be used by default for validation.

Methods

addConfiguration	Add a new variant configuration to the variant configuration data object
addConstraint	Add a constraint to the variant configuration data object
addControlVariables	Add control variables to an existing variant configuration
addCopyOfConfiguration	Add a copy of an existing variant configuration to the variant configuration data object
addSubModelConfigurations	Add to a variant configuration the names of the configurations to be used for submodels
existsFor	Check if variant configuration data object exists for a model
getConfiguration	Returns the variant configuration with a given name from a variant configuration data object
getDefaultConfiguration	Returns default variant configuration, if any, for a variant configuration data object
getFor	Get existing variant configuration data object for a model
getOrCreateFor	Get existing or create a new variant configuration data object for a model
removeConfiguration	Remove a variant configuration with a given name from the variant configuration data object
removeConstraint	Remove a constraint from the variant configuration data object
removeControlVariable	Remove a control variable from a variant configuration
removeSubModelConfiguration	Remove from a variant configuration, the configuration to be used for a sub model.
setDefaultConfigurationName	Set name of the default variant configuration for a variant configuration data object
validateModel	Validate all variant blocks in the model and submodels in the hierarchy during simulation
VariantConfigurationData	Object constructor with optional arguments for variant configurations, constraints, and default configuration name

Examples

```
load_system(model);
% Create variant config and associate it with model
variantConfig = Simulink.VariantConfigurationData;
set_param(model, 'VariantConfigurationObject', 'variantConfig');
```

addConfiguration

Class: Simulink.VariantConfigurationData
Package: Simulink

Add a new variant configuration to the variant configuration data object

Syntax

```
vcdataObj.addConfiguration(name)
vcdataObj.addConfiguration(name,description)
vcdataObj.addConfiguration(name,description,controlVars)
vcdataObj.addConfiguration(name,description,controlVars,
subModelConfigurations)
```

Description

`vcdataObj.addConfiguration(name)` adds a new variant configuration with a given name to the variant configuration data object.

`vcdataObj.addConfiguration(name,description)` adds a new variant configuration with a given name and optional description to the variant configuration data object.

`vcdataObj.addConfiguration(name,description,controlVars)` adds a new variant configuration with a given name, optional description, and control variables to the variant configuration data object.

`vcdataObj.addConfiguration(name,description,controlVars, subModelConfigurations)` adds a new variant configuration with a given name, optional description, control variables, and submodel configurations to the variant configuration data object.

Input Arguments

`name`

Name of variant configuration being added.

`description`

Description text for the variant configuration being added.

`controlVars`

Control variables for the variant configuration being added. This argument must be a vector of structures with required fields: `Name` and `Value`. The values assigned to the `Name` field must be unique and valid MATLAB variable names. The `Value` field can contain either character vectors or `Simulink.Parameter` objects. The values of control variables are checked during validation of the variant configuration.

`subModelConfigurations`

Vector of structures containing fields: `ModelName`, `ConfigurationName`. The names of submodels must be unique and valid MATLAB variable names and configuration names must be valid MATLAB variables.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add a variant configuration LinInterExp
vcdataObj.addConfiguration('LinInterExp')
```

Simulink.VariantConfigurationData.addSubModelConfigurations

addConstraint

Class: Simulink.VariantConfigurationData
Package: Simulink

Add a constraint to the variant configuration data object

Syntax

```
vcdataObj.addConstraint(nameOfConstraint)
vcdataObj.addConstraint(nameOfConstraint,condition)
vcdataObj.addConstraint(nameOfConstraint,condition,description)
```

Description

`vcdataObj.addConstraint(nameOfConstraint)` adds a new constraint with a given name to `vcdataObj`.

`vcdataObj.addConstraint(nameOfConstraint,condition)` adds a new constraint with a given name and condition expression to `vcdataObj`.

`vcdataObj.addConstraint(nameOfConstraint,condition,description)` adds a new constraint with a given name, condition expression, and description to `vcdataObj`.

Input Arguments

nameOfConstraint

Name of constraint being added. Must be unique and valid MATLAB variable name.

condition

Boolean expression that must evaluate to true. When the expression evaluates to true, it means the constraint is satisfied.

description

Text that describes the constraint.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add a constraint named LinNotExtern
vcdataObj.addConstraint('LinNotExtern','((Ctrl~=1)...
   || (PlantLocation ~=1))','Description of the constraint')
```

See Also

Simulink.VariantConfigurationData |
Simulink.VariantConfigurationData.addConfiguration |
Simulink.VariantConfigurationData.removeConfiguration |
Simulink.VariantConfigurationData.removeConstraint
```

addControlVariables

Class: Simulink.VariantConfigurationData
Package: Simulink

Add control variables to an existing variant configuration

Syntax

```
vcdataObj.addControlVariables(nameOfConfiguration,controlVars)
```

Description

`vcdataObj.addControlVariables(nameOfConfiguration,controlVars)`, adds control variables to a variant configuration.

Input Arguments

nameOfConfiguration

Specifies the name of an existing configuration.

controlVars

Control variables being added. This argument must be a vector of structures with required fields: `Name` and `Value`. The values assigned to the `Name` field must be unique and valid MATLAB variable names. The `Value` field can contain either character vectors or `Simulink.Parameter` objects. The values of control variables are checked during validation of the variant configuration.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;
```

```
% Add a variant configuration named LinInterExp
vcdataObj.addConfiguration('LinInterExp',...
'Linear Internal Experimental Plant Controller');

% Add control variables SmartSensor1Mod and PlanLocation
vcdataObj.addControlVariables('LinInterExp',...
  cell2struct({'SmartSensor1Mod', '2';...
               'PlantLocation', '1'},...
              {'Name', 'Value'}, 2))
```

See Also

```
Simulink.VariantConfigurationData |
Simulink.VariantConfigurationData.addSubModelConfigurations |
Simulink.VariantConfigurationData.removeControlVariable |
Simulink.VariantConfigurationData.removeSubModelConfiguration
```

addCopyOfConfiguration

Class: Simulink.VariantConfigurationData
Package: Simulink

Add a copy of an existing variant configuration to the variant configuration data object

Syntax

```
vcdataObj.addCopyOfConfiguration(nameOfExistingConfiguration)
vcdataObj.addCopyOfConfiguration(nameOfExistingConfiguration,
nameOfTobeAddedConfiguration)
```

Description

vcdataObj.addCopyOfConfiguration(nameOfExistingConfiguration), adds a
new configuration with a default name (default name is based on existing configuration
name being copied) as a copy of the existing configuration to the variant configuration
data object.

vcdataObj.addCopyOfConfiguration(nameOfExistingConfiguration,
nameOfTobeAddedConfiguration), adds a new configuration with a specified name, as
a copy of the existing configuration, to the variant configuration data object.

Input Arguments

nameOfExistingConfiguration

Name of existing configuration.

Default:

nameOfTobeAddedConfiguration

Name of new configuration to be added as a copy of the configuration.

Default:

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add the variant configuration LinInterExp
vcdataObj.addConfiguration('LinInterExp',...
  'Linear Internal Experimental Plant Controller');

% Add a copy of variant configuration LinInterExp
% and name the copy as LinExtExp
vcdataObj.addCopyOfConfiguration('LinInterExp','LinExtExp')
```

See Also

```
Simulink.VariantConfigurationData |
Simulink.VariantConfigurationData.addConfiguration |
Simulink.VariantConfigurationData.removeConfiguration |
Simulink.VariantConfigurationData.setDefaultConfiguration
```

addSubModelConfigurations

Class: Simulink.VariantConfigurationData
Package: Simulink

Add to a variant configuration the names of the configurations to be used for submodels

Syntax

```
vcdataObj.addSubModelConfigurations(nameOfConfiguration,
subModelConfigurations)
```

Description

`vcdataObj.addSubModelConfigurations(nameOfConfiguration, subModelConfigurations)`, specifies names of the configurations to be used for submodels.

Input Arguments

nameOfConfiguration

Name for the configuration of submodels that are model references.

subModelConfigurations

Vector of structures containing fields: `ModelName`, `ConfigurationName`. The names of submodels must be unique and valid MATLAB variable names and configuration names must be valid MATLAB variables.

Examples

```
% Add the path to the model file
addpath(fullfile(docroot,'toolbox','simulink','examples'));
```

```
% Load the model
load_system('slexVariantManagementExample');

% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add the variant configuration LinInterExp
vcdataObj.addConfiguration('LinInterExp',...
  'Linear Internal Experimental Plant Controller');

% Add a new submodel configuration to LinInterExp
vcdataObj.addSubModelConfigurations('LinInterExp',...
  [struct('ModelName', 'slexVariantManagementExternalPlantMdlRef',...
          'ConfigurationName', 'LowFid')])
```

existsFor

Class: Simulink.VariantConfigurationData
Package: Simulink

Check if variant configuration data object exists for a model

Syntax

```
Simulink.VariantConfigurationData.existsFor(modelNameOrHandle)
```

Description

`Simulink.VariantConfigurationData.existsFor(modelNameOrHandle)` returns true if the variant configuration data object exists for the model.

Input Arguments

`modelNameOrHandle`

Name or handle to the model.

Examples

```
% Add the path to the model file
addpath(fullfile(docroot,'toolbox','simulink','examples'));

% Load the model
load_system('slexVariantManagementExample');

% Checks whether a variant configuration
% data object exists for model
[exists] = Simulink.VariantConfigurationData.existsFor...
  ('slexVariantManagementExample')
```

See Also

Simulink.VariantConfigurationData |
Simulink.VariantConfigurationData.getFor

getConfiguration

Class: Simulink.VariantConfigurationData
Package: Simulink

Returns the variant configuration with a given name from a variant configuration data object

Syntax

vcdataObj.getConfiguration(nameOfConfiguration)

Description

vcdataObj.getConfiguration(nameOfConfiguration) returns a specific variant configuration that is associated with the variant configuration data object.

Input Arguments

nameOfConfiguration

Name of the variant configuration to be returned.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add the variant configuration LinInterExp
vcdataObj.addConfiguration('LinInterExp',...
  'Linear Internal Experimental Plant Controller');

% Add a control variable SmartSensor1Mod
vcdataObj.addControlVariables('LinInterExp',...
  [struct('Name','SmartSensor1Mod','Value','2')]);
```

```
% Obtain information on the variant configuration..
% LinInterExp from the variant configuration data object
vc = vcdataObj.getConfiguration('LinInterExp')
```

Simulink.VariantConfigurationData.removeConfiguration

getDefaultConfiguration

Class: Simulink.VariantConfigurationData
Package: Simulink

Returns default variant configuration, if any, for a variant configuration data object

Syntax

vcdataObj.getDefaultConfiguration

Description

vcdataObj.getDefaultConfiguration returns the default variant configuration. If no default variant configuration is defined, then [] is returned.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add the variant configuration named LinInterExp
vcdataObj.addConfiguration('LinInterExp',...
  'Linear Internal Experimental Plant Controller');

% Add the variant configuration LinInterStd
vcdataObj.addConfiguration('LinInterStd',...
  'Linear Internal Standard Plant Controller');

% Set LinExtExp as the default variant configuration
vcdataObj.setDefaultConfigurationName('LinExtExp');

% Obtain the default variant configuration
defvc = vcdataObj.getDefaultConfiguration
```

See Also

```

```

getFor

Class: Simulink.VariantConfigurationData
Package: Simulink

Get existing variant configuration data object for a model

Syntax

```
Simulink.VariantConfigurationData.getFor(modelNameOrHandle)
```

Description

`Simulink.VariantConfigurationData.getFor(modelNameOrHandle)`, returns the variant configuration object for the model. If no default variant configuration is defined, then `[]` is returned.

Input Arguments

modelNameOrHandle

Model name or handle.

Examples

```
% Add the path to the model file
addpath(fullfile(docroot,'toolbox','simulink','examples'));

% Load the model
load_system('slexVariantManagementExample');

% Obtain variant configuration data object for the model
% slexVariantManagementExample
vcdataObj = Simulink.VariantConfigurationData.getFor...
  ('slexVariantManagementExample')
```

getOrCreateFor

Class: Simulink.VariantConfigurationData
Package: Simulink

Get existing or create a new variant configuration data object for a model

Syntax

```
Simulink.VariantConfigurationData.getOrCreateFor(modelNameOrHandle)
```

Description

`Simulink.VariantConfigurationData.getOrCreateFor(modelNameOrHandle)`, returns the object if the variant configuration data objects exists otherwise, creates an empty object.

Input Arguments

modelNameOrHandle

Model name or handle to the model.

Examples

```
% Add the path to the model file
addpath(fullfile(docroot,'toolbox','simulink','examples'));

% Load the model
load_system('slexVariantManagementExample');

% Obtain existing or create an empty variant configuration
% data object for the slexVariantManagementExample model
vcdataObj = Simulink.VariantConfigurationData.getOrCreateFor...
  ('slexVariantManagementExample')
```

removeConfiguration

Class: Simulink.VariantConfigurationData
Package: Simulink

Remove a variant configuration with a given name from the variant configuration data object

Syntax

```
vcdataObj.removeConfiguration(nameOfConfiguration)
```

Description

`vcdataObj.removeConfiguration(nameOfConfiguration)` removes the configuration from the variant configuration data object.

Input Arguments

nameOfConfiguration

Name of the configuration to be removed.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add the LinInterExp variant configuration
% to the variant configuration data object
vcdataObj.addConfiguration('LinInterExp',...
  'Linear Internal Experimental Plant Controller');

% Remove the LinInterExp configuration
```

```
% from the variant configuration data object
vcdataObj.removeConfiguration('LinInterExp')
```

See Also

```
Simulink.VariantConfigurationData |

Simulink.VariantConfigurationData.getConfiguration
```

removeConstraint

Class: Simulink.VariantConfigurationData
Package: Simulink

Remove a constraint from the variant configuration data object

Syntax

```
vcdataObj.removeConstraint(nameOfConstraint)
```

Description

`vcdataObj.removeConstraint(nameOfConstraint)`, removes the constraint from the variant configuration data object.

Input Arguments

nameOfConstraint

Name of the constraint to be removed.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add a constraint named LinNotExtern
vcdataObj.addConstraint('LinNotExtern','((Ctrl~=1)...
  || (PlantLocation ~=1))',..
  'Description of the constraint');

% Remove the constraint LinNotExtern
% from the variant configuration
vcdataObj.removeConstraint('LinNotExtern')
```

See Also

Simulink.VariantConfigurationData |
Simulink.VariantConfigurationData.addConstraint

removeControlVariable

Class: Simulink.VariantConfigurationData
Package: Simulink

Remove a control variable from a variant configuration

Syntax

```
vcdataObj.removeControlVariable(nameOfConfiguration,
nameOfControlVariable)
```

Description

`vcdataObj.removeControlVariable(nameOfConfiguration, nameOfControlVariable)` removes a control variable from a variant configuration.

Input Arguments

nameOfConfiguration

Name of the variant configuration.

nameOfControlVariable

Name of the control variable to be deleted.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add a variant configuration named LinInterExp
vcdataObj.addConfiguration('LinInterExp',...
  'Linear Internal Experimental Plant Controller');
```

```
% Add control variables SmartSensor1Mod and PlanLocation
vcdataObj.addControlVariables('LinInterExp',...
  [struct('Name','SmartSensor1Mod','Value','2')]);

% Remove the control variable SmartSensor1Mod
% from the configuration LinInterExp
vcdataObj.removeControlVariable('LinInterExp',...
  'SmartSensor1Mod')
```

See Also

```
Simulink.VariantConfigurationData|
Simulink.VariantConfigurationData.addControlVariables
```

removeSubModelConfiguration

Class: Simulink.VariantConfigurationData
Package: Simulink

Remove from a variant configuration, the configuration to be used for a sub model.

Syntax

```
vcdataObj.removeSubModelConfiguration(nameOfConfiguration,
nameOfSubModel)
```

Description

`vcdataObj.removeSubModelConfiguration(nameOfConfiguration,
nameOfSubModel)`, removes the configuration specified for a submodel.

Input Arguments

nameOfConfiguration

Name of the submodel configuration to be removed.

nameOfSubModel

Name of the submodel from which the configuration must be removed.

Examples

```
% Load the model
load_system('slexVariantManagementExample');

% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;
```

```
% Add the variant configuration named LinInterExp
vcdataObj.addConfiguration('LinInterExp',...
  'Linear Internal Experimental Plant Controller',controlvars);

% Add a new submodel configuration to LinInterExp
vcdataObj.addSubModelConfigurations('LinInterExp',...
  [struct('ModelName','slexVariantManagementExternalPlantMdlRef',...
  'ConfigurationName', 'LowFid')]);

% Remove the submodel configuration LinInterExp
% from the submodel slexVariantManagementExternalPlantMdlRef
vcdataObj.removeSubModelConfiguration('LinInterExp',..
  'slexVariantManagementExternalPlantMdlRef')
```

See Also

Simulink.VariantConfigurationData |
Simulink.VariantConfigurationData.addSubModelConfigurations

setDefaultConfigurationName

Class: Simulink.VariantConfigurationData
Package: Simulink

Set name of the default variant configuration for a variant configuration data object

Syntax

```
vcdataObj.setDefaultConfigurationName(nameOfConfiguration)
```

Description

`vcdataObj.setDefaultConfigurationName(nameOfConfiguration)` sets the default configuration name. A variant configuration must exist with the same name. If an empty value is passed, then the default configuration name is cleared.

Input Arguments

nameOfConfiguration

Name of the configuration to be set as the default.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add the LinInterExp variant configuration
vcdataObj.addConfiguration('LinInterExp',...
  'Linear Internal Experimental Plant Controller');

% Set the configuration LinInterExp as default
vcdataObj.setDefaultConfigurationName('LinInterExp');
```

```
% Obtain the default variant configuration
dconfig = vcdataObj.getDefaultConfiguration
```

See Also

```
Simulink.VariantConfigurationData |
Simulink.VariantConfigurationData.getDefaultConfiguration
```

validateModel

Class: Simulink.VariantConfigurationData
Package: Simulink

Validate all variant blocks in the model and submodels in the hierarchy during simulation

Syntax

```
Simulink.VariantConfigurationData.validateModel(modelName)
Simulink.VariantConfigurationData.validateModel(modelName,
configName)
```

Description

`Simulink.VariantConfigurationData.validateModel(modelName)`, validates the model and referenced models during simulation.

`Simulink.VariantConfigurationData.validateModel(modelName, configName)`, validates the model and referenced models during simulation optionally using a variant configuration.

Input Arguments

modelName

Name of the model

configName

Name of the configuration to be validated

Examples

```
% Add the path to the model file
addpath(fullfile(docroot,'toolbox','simulink','examples'));
```

```
% Load the model
load_system('slexVariantManagementExample');

% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add a variant configuration LinInterExp
vcdataObj.addConfiguration('LinInterExp');

% Add control variables to LinInterExp
vcdataObj.addControlVariables('LinInterExp',...
   cell2struct({'Ctrl', '1';...
                'PlantLocation', '2';...
                'SimType', '2'},...
               {'Name', 'Value'}, 2));

% Associate this object with the model
set_param('slexVariantManagementExample',...
   'VariantConfigurationObject', 'vcdataObj');

% Validate the model slexVariantManagementExample using
% the configuration LinInterExp
[valid, errors] = Simulink.VariantConfigurationData.validateModel...
   ('slexVariantManagementExample','LinInterExp')
```

VariantConfigurationData

Class: Simulink.VariantConfigurationData
Package: Simulink

Object constructor with optional arguments for variant configurations, constraints, and default configuration name

Syntax

```
vardataObj = Simulink.VariantConfigurationData(
variantConfigurations)
```

Description

`vardataObj = Simulink.VariantConfigurationData(variantConfigurations)`, constructor that creates an empty variant configuration data object. Optionally, can also accept constraints and a default configuration name as inputs.

Input Arguments

variantConfigurations

Configurations that are part of the variant configuration data object.

constraints

Constraints to be satisfied by the model.

defaultConfigurationName

Name of the default configuration

Examples

```
% Create an empty variant configuration data object
vcdataObj = Simulink.VariantConfigurationData
```

See Also

Simulink.VariantConfigurationData.addSubModelConfigurations
```

Simulink.VariantManager class

Package: Simulink

Class representing a set of Variant Manager functionality

Description

The variant manager class provides a set of methods to access Variant Manager functionality from the MATLAB command-line. Use an instance of `Simulink.VariantManager` class to:

- Convert the Subsystems or Model block to a Variant Subsystem.
- Find variables used in Variant control expressions.
- Generate a reduced model for specified variant configurations.
- Display or control behavior of a variant condition legend.

Method

variantLegend   Display or control behavior of variant condition legend

reduceModel   Generate reduced model for specified variant configurations

convertToVariant Convert Subsystem, or Model block, or Variant Model block to a Variant Subsystem block

See Also

Topics
"Variant Manager Overview"
Simulink.VariantManager.variantLegend
Simulink.VariantManager.convertToVariant

5-729

variantLegend

Class: Simulink.VariantManager
Package: Simulink

Display or control behavior of variant condition legend

Syntax

```
Simulink.VariantManager.variantLegend(modelName, action)
```

Description

`Simulink.VariantManager.variantLegend(modelName, action)` displays or performs a specified `action` on the variant condition legend.

Input Arguments

`modelName` — Model for which the variant legend is displayed
character vector

Model for which the variant legend is displayed, specified as a character vector.

`action` — Task to be performed on the variant legend
`'open'` | `'print'` | `'showCodeConditions'` | `'close'`

Task to be performed on the variant condition legend for the model. You can specify the task as:

- `'open'` — Displays the variant condition legend for a model. The model must be open. If the legend is opened for the first time, the model is updated.

- `'print'` — Prints the data in the variant condition legend. The legend must be open. There is no preview before printing the legend.

- `'showCodeConditions'` — Displays code generation conditions column in the variant condition legend. The legend must be open. `showCodeConditions` is used as a name-value pair and accepts `'on'` or `'off'` as its values.

- `'close'` — Closes the variant condition legend belonging to the specified model.

Examples

```
model = 'sldemo_variant_subsystems';
       open_system(model);
       % Open the variant condition legend
       Simulink.VariantManager.variantLegend(model,'open');
       % Display the code generation conditions
       Simulink.VariantManager.variantLegend(model,'showCodeConditions','on');
```

"Create a Simple Variant Model"
"What Are Variants and When to Use Them"

Introduced in R2017b

reduceModel

Class: Simulink.VariantManager
Package: Simulink

Generate reduced model for specified variant configurations

Syntax

```
Simulink.VariantManager.reduceModel(Model)
Simulink.VariantManager.reduceModel(Model, Name, Value)
```

Description

`Simulink.VariantManager.reduceModel(Model)` creates a reduced model for the specified configuration. The referenced models and library blocks are also reduced. By default, the name of the reduced model and any reduced child referenced model name is the original model name suffixed with _r.

`Simulink.VariantManager.reduceModel(Model, Name, Value)` specifies the reduction parameters in the Name and Value arguments form.

Input Arguments

Model — Model to be reduced
character vector

Required field. Model to be reduced, specified as a character vector.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' ') and is caseinsensitive whereas, the value string is casesensitive. You can

specify several name and value pair arguments in any order as
`Name1,Value1,...,NameN,ValueN`.

NamedConfigurations — Variant configuration name
{`''`} | character vector | `'cell array'`

Specifies the names of variant configurations. By default, current values of variant control variables are used for reduction.

VariableConfigurations — Variant control variable value
{`''`} | `'cell array'`

Specifies the variant control variable values to be used for reduction. By default, the current values of variant control variables are used.

The specified values must be a cell array with variant control variable names and their corresponding values.

Note `'VariableConfigurations'` and `'NamedConfigurations'` are mutually exclusive.

Consider this example:

```
Simulink.VariantManager.reduceModel('slexVariantReducer',...
              'VariableConfigurations',{'V',1,'W',[1 2]})
```

FullRangeVariables — Variant control variable value
{`''`} | `'cell array'`

Specifies the full-range variant control variable values to be used for reduction. This allows you to reduce a model for all valid values of the specified variant control variable. Provide a reference value for variant control variable that results in a successful model compilation.

Consider this example:

```
Simulink.VariantManager.reduceModel('slexVariantReducer',...
                    'VariableConfigurations',{'V',1},...
                    'FullRangeVariables',{'W',1});
```

You can specify a variant control variable, 'W', as a full-range variant control variable. This allows you to reduce the model for all valid values of variable 'W'. In the example, full-range variant control variable W uses a reference value of 1.

`OutputFolder` — Folder to store the reduced model
character vector

Specifies the folder to place the reduced models and related artifacts. By default, the reduced models are generated in `./reducedModel` subfolder in the original model folder.

`PreserveSignalAttributes` — Preserve the signal attributes in the reduced model
{true} | false

When the value is `true`, the Variant Reducer preserves the compiled signal attributes between the original and reduced models by adding signal specification blocks at appropriate block ports in the reduced model. Compiled signal attributes include signal data types, signal dimensions, compiled sample times, etc.

`Verbose` — Displays step details
true | {false}

When the value is `true`, the Variant Reducer displays details of the steps performed during model reduction.

`ModelSuffix` — Reduced model name suffix
{_r}

Specifies the suffix to append to the reduced models and the related artifacts.

`GenerateSummary` — Generates a summary html file
true | {false}

When the value is `true`, the Variant Reducer generates a html file with details about the reduced model and any modifications that may be required for masks and callbacks.

Note To generate summary, you must have **Simulink Report Generator** license.

Examples

```
% Reduce model based on its variant control variable values in the base workspace.
Simulink.VariantManager.reduceModel('sldemo_variant_subsystems');

% Reduce the model associated with a variant configuration data object and configurations to be retained in
Simulink.VariantManager.reduceModel('slexVariantManagementExample', ...
                                    'NamedConfigurations', {'LinInterStd',
                                    'NonLinExterHighFid'})

% Reduce the model by specifying variant control variable values. Here, two configurations are specified cor
% {V==1, W==1}, and {V==2, W==2} respectively.
Simulink.VariantManager.reduceModel('iv_model', ...
                                    'VariableConfigurations',...
                                    {{'V',1,'W',1},{'V',2,'W',2}});

% Reduce the model by specifying variant control variable values where 'W' is a full-range variant control v
% automatically maps the specification to correspond to the following four explicit configurations: {V==1, W
Simulink.VariantManager.reduceModel('slexVariantReducer',...
                                    'VariableConfigurations',...
                                    {'V',1},...
                                    'FullRangeVariables',{'W',1});
```

"What Are Variants and When to Use Them"
Simulink.VariantManager
Simulink.VariantManager.variantLegend

Introduced in R2016a

convertToVariant

Class: Simulink.VariantManager
Package: Simulink

Convert Subsystem, or Model block, or Variant Model block to a Variant Subsystem block

Syntax

```
variant_subsystem = Simulink.VariantManager.convertToVariant(block)
variant_subsystem = Simulink.VariantManager.convertToVariant(
blockHandle)
```

Description

`variant_subsystem = Simulink.VariantManager.convertToVariant(block)`
or `variant_subsystem = Simulink.VariantManager.convertToVariant(`
`blockHandle)` converts a Subsystem, or Model block, or Variant Model block to a
Variant Subsystem block. A Variant Subsystem can contain Subsystems, Model blocks, or
both as choices.

Consider this model with Subsystem block.

You can convert this Subsystem block to a Variant Subsystem block using the
`convertToVariant` method.
Similarly you can convert a Variant Model block to a Variant Subsystem block.

To convert a Variant Model block to a Variant Subsystem block, you can also use the Upgrade Advisor check, **Identify Variant Model blocks and convert those to Variant Subsystem containing Model block choices**. This check provides a **Fix** button to convert Variant Model blocks to Variant Subsystem blocks. For more information on using Upgrade Advisor check to convert a Variant Model block to a Variant Subsystem block, see "Upgrade Advisor Checks"

If there are inconsistencies in the port name or port number in models referenced by Variant Model block, Simulink corrects these inconsistencies while converting the Variant Model block to Variant Subsystem block.

Consider this model with Variant Model block having different port names.
When you convert this Variant Model block to a Variant Subsystem block, the inconsistencies are corrected automatically.
Note Future releases will no longer support using a Model block to contain model variants. You can use the `convertToVariant` method to convert model variants so that Model blocks are contained in a Variant Subsystem. Use of a Variant Subsystem block provides these advantages:

- Allows you to mix Model and Subsystem blocks as variant choices
- Supports flexible I/O, so that all variants do not need to have the same number of input and output ports

For an example of a model that uses a Variant Subsystem block as a container for variant models, see "Model Reference Variants".

Limitations

You cannot convert a Subsystem block that meets the following condition:

- The Subsystem block is in a Simscape model that has Editing Mode set to **Restricted**.
- The Variant Model block has a mix of control ports or there is a name mismatch in control port types.
- The Variant Model block has control ports with different port numbers and name mapping.

Input Arguments

`block` — Subsystem or Model block to convert
block path | block handle

The path or block handle of the Subsystem or Model block to convert to a Variant Subsystem block. Specify a block path as a character vector and a block handle as a scalar.

Output Arguments

`variant_subsystem` — Handle of Variant Subsystem block
scalar returned by Simulink

If you specify an output argument, the method returns the block handle of the Variant Subsystem block created by the conversion.

Examples

```
open_system('autoMRVar');
    Simulink.VariantManager.convertToVariant('autoMRVar/Engine');
```

Alternative Functionality

Simulink Editor

In the Simulink Editor, right-click the Model block and select **Subsystems & Model Reference** > **Convert to** > **Variant Subsystem**.

"What Are Variants and When to Use Them"

Introduced in R2017b

Simulink.WorkspaceVar

Store information about workspace variables and blocks that use them

> **Note** `Simulink.WorkspaceVar` is not recommended. Use `Simulink.VariableUsage` instead.

Description

A `Simulink.WorkspaceVar` object describes attributes of a workspace variable and lists the blocks that use the variable.

Creation

The `Simulink.findVars` function returns one or more `Simulink.WorkspaceVar` objects that embody the results of searching for variables.

Only the `Simulink.WorkspaceVar` function can set any field value in a `Simulink.WorkspaceVar` object. The fields are otherwise read-only.

Syntax

```
varObj = Simulink.WorkspaceVar(varNames,wkspName)
```

Description

`varObj = Simulink.WorkspaceVar(varNames,wkspName)` creates an array of `Simulink.WorkspaceVar` objects to describe the variables `varNames`. The constructor sets the `Name` property of each object to one of the variable names specified by `varNames`, and sets the `Workspace` property of all the objects to the workspace specified by `wkspName`. You can specify `varNames` with variables that are not used in any loaded models.

Input Arguments

`varNames` — Names of target variables
character vector | cell array of character vectors

Names of target variables, specified as a character vector or a cell array of character vectors. The constructor creates a `Simulink.WorkspaceVar` object for each variable name. You can specify `varNames` with variables that are not used in any loaded models.

Example: `'k'`

Example: `{'k','asdf','fuelFlow'}`

Data Types: `char` | `cell`

`wkspName` — Name of containing workspace
character vector

Name of the workspace that defines the target variables, specified as a character vector. For example, you can specify the MATLAB base workspace. The constructor also determines and sets the `WorkspaceType` property of each of the returned `Simulink.WorkspaceVar` objects.

Example: `'base workspace'`

Example: `'myModel'`

Example: `'myDictionary.sldd'`

Data Types: `char`

Properties

Name — Name of variable
`''` (empty character vector) (default) | character vector

This property is read-only.

Name of the variable described by the object, returned as a character vector.

Workspace — Name of workspace that contains variable
`''` (empty character vector (default) | character vector

This property is read-only.

Name of the workspace that contains the variable, returned as a character vector. For example:

Workspace value	Meaning
'base workspace'	The MATLAB base workspace
'MyModel'	The model workspace for the model MyModel.
'MyModel/Mask1'	The mask workspace for the masked block Mask1 in the model MyModel.

WorkspaceType — Type of workspace containing variable
'unknown' (default) | 'base' | 'model' | 'mask'

This property is read-only.

Type of workspace that contains the variable, returned as a character vector. The possible values are:

- 'base' — The base workspace
- 'model' — A model workspace
- 'mask' — A mask workspace

UsedByBlocks — Users of variable
{} (empty cell array) (default) | cell array of character vectors

This property is read-only.

Users of the variable, returned as a cell array of character vectors. Each character vector identifies a block that uses the variable. The Simulink.findVars function populates this property.

Object Functions

intersect   Return intersection of two arrays of Simulink.VariableUsage objects
setdiff   Return difference between two arrays of Simulink.VariableUsage objects

Examples

Create Object That Represents Variable in Base Workspace

Return a `Simulink.WorkspaceVar` object for a variable k in the base workspace.

```
var = Simulink.WorkspaceVar('k', 'base workspace');
```

Represent All Variables in the Base Workspace

Return an array of `Simulink.WorkspaceVar` objects containing one object for each variable returned by the `whos` command in the base workspace.

```
vars = Simulink.WorkspaceVar(who,WkspName)
```

Represent All Variables in a Model Workspace

Return an array of `Simulink.WorkspaceVar` objects that describes all the variables in a model workspace.

```
hws = get_param('mymodel', 'ModelWorkspace');
vars=Simulink.WorkspaceVar(hws.whos, 'MyModel')
```

Represent All Variables in a Mask Workspace

Return an array of `Simulink.WorkspaceVar` objects that describes all the variables in a mask workspace.

```
maskVars = get_param('mymodel/maskblock', 'MaskWSVariables');
vars = Simulink.WorkspaceVar(maskVars, 'mymodel/maskblock');
```

See Also
`Simulink.findVars` | `intersect` | `setdiff`

Introduced in R2010a

Simulink.VariableUsage

Store information about the relationship between variables and blocks in models

Description

A `Simulink.VariableUsage` object describes where a variable is used in models.

Use this information to:

- Prepare to permanently store the variables in files and workspaces. For more information about storing variables for a model, see "Determine Where to Store Variables and Objects for Simulink Models".
- Reduce the number of variables that you need to store by eliminating unused variables.
- Prepare to partition variables and establish variable ownership when you work in a team.

To analyze variable usage in models, use `Simulink.VariableUsage` objects together with the `Simulink.findVars` function. The function returns and accepts `Simulink.VariableUsage` objects as arguments. For more information, see `Simulink.findVars`.

A `Simulink.VariableUsage` object can also describe the usage of an enumerated data type.

Only a `Simulink.VariableUsage` constructor or the `Simulink.findVars` function can set property values in a `Simulink.VariableUsage` object. The properties are otherwise read only.

Creation

The `Simulink.findVars` function returns `Simulink.VariableUsage` objects.

To create variable usage objects for use as a filter when using `Simulink.findVars`, use the `Simulink.VariableUsage` function described below.

Syntax

```
variableUsageObj = Simulink.VariableUsage(varNames,sourceName)
```

Description

`variableUsageObj = Simulink.VariableUsage(varNames,sourceName)` creates an array of `Simulink.VariableUsage` objects to describe the variables `varNames`. The constructor sets the `Name` property of each object to one of the variable names specified by `varNames`, and sets the `Source` property of all the objects to the source specified by `sourceName`. You can specify `varNames` with variables that are not used in any loaded models.

Input Arguments

varNames — Names of target variables
character vector | cell array of character vectors

Names of target variables, specified as a character vector or a cell array of character vectors. The constructor creates a `Simulink.VariableUsage` object for each variable name.

Example: `'k'`

Example: `{'k','asdf','fuelFlow'}`

Data Types: `char` | `cell`

sourceName — Name of variable source
character vector

Name of the source that defines the target variables, specified as a character vector. For example, you can specify the MATLAB base workspace or a data dictionary as a source. The constructor also determines and sets the `SourceType` property of each of the returned `Simulink.VariableUsage` objects.

Example: `'base workspace'`

Example: `'myModel'`

Example: `'myDictionary.sldd'`

Data Types: `char`

Properties

Name — Name of variable or enumerated type
'' (empty character vector) (default) | character vector

This property is read-only.

The name of the variable or enumerated data type the object describes, returned as a character vector.

Source — Name of defining workspace
'' (empty character vector) (default) | character vector

This property is read-only.

The name of the workspace or data dictionary that defines the described variable, returned as a character vector. The table shows some examples.

Source Value	Meaning
'base workspace'	MATLAB base workspace
'MyModel'	Model workspace for the model MyModel
'MyModel/Mask1'	Mask workspace for the masked block Mask1 in the model MyModel
'sldemo_fuelsys_dd_controller.sldd'	The data dictionary named 'sldemo_fuelsys_dd_controller.sldd'

The table shows some examples if you created the Simulink.VariableUsage object by using the Simulink.findVars function to find enumerated data types.

Source Value	Meaning
'BasicColors.m'	The enumerated type is defined in the MATLAB file 'BasicColors.m'.
''	The enumerated type is defined dynamically and has no source.
'sldemo_fuelsys_dd_controller.sldd'	The enumerated type is defined in the data dictionary named 'sldemo_fuelsys_dd_controller.sldd'.

SourceType — Type of defining workspace
'unknown source' (default) | 'base workspace' | 'model workspace' | 'mask workspace' | 'data dictionary'

This property is read-only.

The type of the workspace that defines the variable, returned as a character vector. The possible values are:

- 'base workspace'
- 'model workspace'
- 'mask workspace'
- 'data dictionary'

If you created the `Simulink.VariableUsage` object by using the `Simulink.findVars` function to find enumerated data types, the possible values are:

- 'MATLAB file'
- 'dynamic class'
- 'data dictionary'

Users — Blocks that use the variable or models that use the enumerated type
{} (empty cell array) (default) | cell array of character vectors

This property is read-only.

Blocks that use the variable or models that use the enumerated type, returned as a cell array of character vectors. Each character vector names a block or model that uses the variable or enumerated type. The `Simulink.findVars` function populates this property.

Object Functions

intersect Return intersection of two arrays of Simulink.VariableUsage objects
setdiff   Return difference between two arrays of Simulink.VariableUsage objects

Examples

Create Object That Represents Variable in Base Workspace

Return a `Simulink.VariableUsage` object for a variable `k` in the base workspace.

```
var = Simulink.VariableUsage('k','base workspace');
```

You can use `var` as a filter for the `Simulink.findVars` function.

Represent All Variables in the Base Workspace

Return an array of `Simulink.VariableUsage` objects containing one object for each variable returned by the `whos` command in the base workspace.

```
vars = Simulink.VariableUsage(whos,'base workspace')
```

Represent All Variables in a Model Workspace

Return an array of `Simulink.VariableUsage` objects that describes all the variables in a model workspace.

```
hws = get_param('mymodel','ModelWorkspace');
vars = Simulink.VariableUsage(hws.whos,'MyModel')
```

Represent All Variables in a Mask Workspace

Return an array of `Simulink.VariableUsage` objects that describes all the variables in a mask workspace.

```
maskVars = get_param('mymodel/maskblock','MaskWSVariables');
vars = Simulink.VariableUsage(maskVars,'mymodel/maskblock');
```

Simulink.data.existsInGlobal | Simulink.findVars

Topics
"Model Exploration"

"Variables"

Introduced in R2012b

intersect

Package: Simulink

Return intersection of two arrays of `Simulink.VariableUsage` objects

Syntax

```
VarsOut = intersect(VarsIn1,VarsIn2)
```

Description

`VarsOut = intersect(VarsIn1,VarsIn2)` returns an array that identifies the variables described in `VarsIn1` and in `VarsIn2`, which are arrays of `Simulink.VariableUsage` objects. If a variable is described by a `Simulink.VariableUsage` object in `VarsIn1` and in `VarsIn2`, the function returns a `Simulink.VariableUsage` object that stores the variable usage information from both objects in the `Users` property.

`intersect` compares the `Name`, `Source`, and `SourceType` properties of the `Simulink.VariableUsage` objects in `VarsIn1` with the same properties of the objects in `VarsIn2`. If `VarsIn1` and `VarsIn2` each contain `Simulink.VariableUsage` objects that have the same values for these three properties, they both describe the same variable.

To create `Simulink.VariableUsage` objects that describe the usage of variables in a model, use the `Simulink.findVars` function.

Examples

Compare Variables Used by Models

Given two models, discover the variables needed by both models.

```
model1Vars = Simulink.findVars('model1');
model2Vars = Simulink.findVars('model2');
commonVars = intersect(model1Vars,model2Vars);
```

Input Arguments

`VarsIn1` — First array of variables for comparison
array of `Simulink.VariableUsage` objects

First array of variables for comparison, specified as an array of
`Simulink.VariableUsage` objects.

`VarsIn2` — Second array of variables for comparison
array of `Simulink.VariableUsage` objects

Second array of variables for comparison, specified as an array of
`Simulink.VariableUsage` objects.

Output Arguments

`VarsOut` — Variables described in both input arrays
array of `Simulink.VariableUsage` objects

Variables that are described in both input arrays, returned as an array of
`Simulink.VariableUsage` objects. The function returns an object for each variable that
is described in `VarsIn1` and in `VarsIn2`.

See Also
`Simulink.VariableUsage` | `Simulink.findVars` | `setdiff`

Topics
"Model Exploration"
"Variables"

Introduced in R2012b

setdiff

Package: Simulink

Return difference between two arrays of `Simulink.VariableUsage` objects

Syntax

```
VarsOut = setdiff(VarsIn1,VarsIn2)
```

Description

`VarsOut = setdiff(VarsIn1,VarsIn2)` returns an array that identifies the variables described in `VarsIn1` but not in `VarsIn2`, which are arrays of `Simulink.VariableUsage` objects. If a variable is described by a `Simulink.VariableUsage` object in `VarsIn1` but not in `VarsIn2`, the function returns a copy of the object.

`setdiff` compares the `Name`, `Source`, and `SourceType` properties of the `Simulink.VariableUsage` objects in `VarsIn1` with the same properties of the objects in `VarsIn2`. If `VarsIn1` and `VarsIn2` each contain a `Simulink.VariableUsage` object with the same values for these three properties, the objects describe the same variable, and `setdiff` does not return an object to describe it.

To create `Simulink.VariableUsage` objects that describe the usage of variables in a model, use the `Simulink.findVars` function.

Examples

Determine Variable Usage Difference Between Models

Given two models, discover the variables that are needed by the first model but not the second model.

```
model1Vars = Simulink.findVars('model1');
model2Vars = Simulink.findVars('model2');
differentVars = setdiff(model1Vars,model2Vars);
```

Find Variables Not Used by Model

Locate all variables in the base workspace that are not used by a loaded model that has been recently compiled.

```
models = find_system('type','block_diagram','LibraryType','None');
base_vars = Simulink.VariableUsage(who,'base workspace');
used_vars = Simulink.findVars(models,'WorkspaceType','base');
unusedVars = setdiff(base_vars,used_vars);
```

Input Arguments

`VarsIn1` — First array of variables for comparison
array of `Simulink.VariableUsage` objects

First array of variables for comparison, specified as an array of `Simulink.VariableUsage` objects.

`VarsIn2` — Second array of variables for comparison
array of `Simulink.VariableUsage` objects

Second array of variables for comparison, specified as an array of `Simulink.VariableUsage` objects.

Output Arguments

`VarsOut` — Variables described in first array but not second array
array of `Simulink.VariableUsage` objects

Variables that are described in the first input array but not in the second input array, returned as an array of `Simulink.VariableUsage` objects. The function returns an object for each variable that is described in `VarsIn1` but not in `VarsIn2`.

Introduced in R2012b

Simulink.data.Dictionary class

Package: Simulink.data

Configure data dictionary

Description

An object of the `Simulink.data.Dictionary` class represents a data dictionary. The object allows you to perform operations on the data dictionary such as save or discard changes, import data from the base workspace, and add other data dictionaries as references.

Construction

The functions `Simulink.data.dictionary.create` and `Simulink.data.dictionary.open` create a `Simulink.data.Dictionary` object.

Properties

DataSources — Referenced data dictionaries
cell array of character vectors

This property is read-only.

Referenced data dictionaries by file name, returned as a cell array of character vectors. This property only lists directly referenced dictionaries whose parent is the `Simulink.data.Dictionary` object.

EnableAccessToBaseWorkspace — Specify whether models can use design data in the base workspace
`false` (default) | `true`

Whether linked models can use design data in the base workspace, specified as `true` or `false`.

To determine whether a dictionary provides access to the base workspace (including through referenced dictionaries), query the `HasAccessToBaseWorkspace` property.

For more information about this property, including restrictions that limit your ability to interact with base workspace data through the dictionary, see "Continue to Use Shared Data in the Base Workspace".

Data Types: `logical`

HasAccessToBaseWorkspace — Query whether models can use design data in the base workspace
0 (default) | 1

This property is read-only.

Query whether models can use design data in the base workspace, returned as 1 (true) or 0 (false). If the dictionary or a referenced dictionary has the `EnableAccessToBaseWorkspace` property set to `true`, this property returns 1.

Use this property to determine whether models that link to the dictionary can use design data in the base workspace. You do not need to query each referenced dictionary to determine whether it has the `EnableAccessToBaseWorkspace` property set to `true`.

Data Types: `logical`

HasUnsavedChanges — Indicator of unsaved changes
0 | 1

This property is read-only.

Indicator of unsaved changes to the data dictionary, returned as 0 or 1. The value is 1 if changes have been made since last data dictionary save and 0 if not.

NumberOfEntries — Total number of entries in data dictionary
integer

This property is read-only.

Total number of entries in data dictionary, including those in referenced dictionaries, returned as an integer.

Methods

addDataSource	Add reference data dictionary to parent data dictionary
close	Close connection between data dictionary and `Simulink.data.Dictionary` object
discardChanges	Discard changes to data dictionary
filepath	Full path and file name of data dictionary
getSection	Return `Simulink.data.dictionary.Section` object to represent data dictionary section
hide	Remove data dictionary from Model Explorer
importEnumTypes	Import enumerated type definitions to data dictionary
importFromBaseWorkspace	Import base workspace variables to data dictionary
listEntry	List data dictionary entries
removeDataSource	Remove reference data dictionary from parent data dictionary
saveChanges	Save changes to data dictionary
show	Show data dictionary in Model Explorer

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Create New Data Dictionary and Data Dictionary Object

Create a data dictionary file `myNewDictionary.sldd` and a `Simulink.data.Dictionary` object representing the new data dictionary. Assign the object to variable `dd1`.

```
dd1 = Simulink.data.dictionary.create('myNewDictionary.sldd')
```

```
dd1 =

  data dictionary with properties:

          DataSources: {0x1 cell}
    HasUnsavedChanges: 0
        NumberOfEntries: 0
```

Open Existing Data Dictionary

Create a `Simulink.data.Dictionary` object representing the existing data dictionary `myDictionary_ex_API.sldd`. Assign the object to variable `dd2`.

```
dd2 = Simulink.data.dictionary.open('myDictionary_ex_API.sldd')

dd2 =

  Dictionary with properties:

          DataSources: {'myRefDictionary_ex_API.sldd'}
    HasUnsavedChanges: 0
        NumberOfEntries: 4
```

Introduced in R2015a

addDataSource

Class: Simulink.data.Dictionary
Package: Simulink.data

Add reference data dictionary to parent data dictionary

Syntax

```
addDataSource(dictionaryObj,refDictionaryFile)
```

Description

addDataSource(dictionaryObj,refDictionaryFile) adds a data dictionary, refDictionaryFile, as a reference dictionary to a parent dictionary dictionaryObj, a Simulink.data.Dictionary object.

The parent dictionary contains all the entries that are defined in the referenced dictionary until the referenced dictionary is removed from the parent dictionary. The DataSource property of an entry indicates the dictionary that defines the entry.

Input Arguments

dictionaryObj — Parent data dictionary
Simulink.data.Dictionary object

Parent data dictionary, specified as a Simulink.data.Dictionary object. Before you use this function, represent the target dictionary with a Simulink.data.Dictionary object by using, for example, the Simulink.data.dictionary.create or Simulink.data.dictionary.open function.

refDictionaryFile — File name of data dictionary to reference
character vector

File name of data dictionary to reference, specified as a character vector that includes the .sldd extension. The data dictionary file must be on your MATLAB path.

Example: `'mySubDictionary_ex_API.sldd'`

Data Types: `char`

Examples

Add a Reference Data Dictionary to a Parent Data Dictionary

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Add the data dictionary `mySubDictionary_ex_API.sldd` as a reference dictionary to `myDictionary_ex_API.sldd`.

```
addDataSource(myDictionaryObj,'mySubDictionary_ex_API.sldd');
```

Confirm the addition by viewing the `DataSources` property of variable `myDictionaryObj`. The property returns the name of the newly referenced dictionary.

```
myDictionaryObj.DataSources
```

```
ans =

    'myRefDictionary_ex_API.sldd'
    'mySubDictionary_ex_API.sldd'
```

• "Store Data in Dictionary Programmatically"

Alternatives

You can use the Model Explorer window to manage reference dictionaries. See "Partition Dictionary Data Using Referenced Dictionaries" for more information.

Topics
"Store Data in Dictionary Programmatically"

Introduced in R2015a

close

Class: Simulink.data.Dictionary
Package: Simulink.data

Close connection between data dictionary and `Simulink.data.Dictionary` object

Syntax

close(dictionaryObj)

Description

close(dictionaryObj) closes the connection between the
`Simulink.data.Dictionary` object `dictionaryObj` and the data dictionary it
represents. `dictionaryObj` remains as a `Simulink.data.Dictionary` object but no
longer represents any data dictionary.

Input Arguments

dictionaryObj — Target `Simulink.data.Dictionary` object
handle to `Simulink.data.Dictionary` object

Target `Simulink.data.Dictionary` object, specified as a handle to the object.

Tips

- Use the `close` function in a custom MATLAB function to disassociate a
  `Simulink.data.Dictionary` object from a data dictionary. Custom MATLAB
  functions can create and store variables and objects in function workspaces but cannot
  delete those variables and objects.
- The `close` function does not affect the content or the state of the represented data
  dictionary. The function does not discard unsaved changes to the represented
  dictionary or entries. You can save or discard them later.

`Simulink.data.Dictionary`

Topics

"Store Data in Dictionary Programmatically"

Introduced in R2015a

discardChanges

Class: Simulink.data.Dictionary
Package: Simulink.data

Discard changes to data dictionary

Syntax

discardChanges(dictionaryObj)

Description

discardChanges(dictionaryObj) discards all changes made to the specified data dictionary since the last time changes to the dictionary were saved using the saveChanges function. discardChanges also discards changes made to referenced data dictionaries. The changes to the target dictionary and its referenced dictionaries are permanently lost.

Input Arguments

dictionaryObj — Target data dictionary
Simulink.data.Dictionary object

Target data dictionary, specified as a Simulink.data.Dictionary object. Before you use this function, represent the target dictionary with a Simulink.data.Dictionary object by using, for example, the Simulink.data.dictionary.create or Simulink.data.dictionary.open function.

Examples

Discard Changes to Data Dictionary

Create a `Simulink.data.Dictionary` object representing the data dictionary `myDictionary_ex_API.sldd` and assign the object to variable `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd')

myDictionaryObj =

  Dictionary with properties:

         DataSources: {'myRefDictionary_ex_API.sldd'}
    HasUnsavedChanges: 0
        NumberOfEntries: 4
```

Make a change to `myDictionary_ex_API.sldd` by adding an entry named `myNewEntry` with value 237. View the `HasUnsavedChanges` property of `myDictionaryObj` to confirm a change was made.

```
addEntry(dDataSectObj,'myNewEntry',237);
myDictionaryObj

myDictionaryObj =

  Dictionary with properties:

         DataSources: {'myRefDictionary_ex_API.sldd'}
    HasUnsavedChanges: 1
        NumberOfEntries: 5
```

Discard all changes to `myDictionary_ex_API.sldd`. The `HasUnsavedChanges` property of `myDictionaryObj` indicates changes were discarded.

```
discardChanges(myDictionaryObj)
myDictionaryObj

myDictionaryObj =

  Dictionary with properties:

         DataSources: {'myRefDictionary_ex_API.sldd'}
    HasUnsavedChanges: 0
        NumberOfEntries: 4
```

• "Store Data in Dictionary Programmatically"

Alternatives

You can use the Model Explorer window to discard changes to data dictionaries. See "View and Revert Changes to Dictionary Entries" for more information.

filepath

Class: Simulink.data.Dictionary
Package: Simulink.data

Full path and file name of data dictionary

Syntax

```
dictionaryFilePath = filepath(dictionaryObj)
```

Description

`dictionaryFilePath = filepath(dictionaryObj)` returns the full path and file name of the data dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object.

Input Arguments

dictionaryObj — Target data dictionary
`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

Examples

Return Path of Data Dictionary File

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Return the full path of `myDictionary_ex_API.sldd` and assign it to variable `myDictionaryFilePath`.

`myDictionaryFilePath = filepath(myDictionaryObj)`

`myDictionaryFilePath =`

`C:\Users\jsmith\myDictionary_ex_API.sldd`

• "Store Data in Dictionary Programmatically"

Topics

"Store Data in Dictionary Programmatically"

Introduced in R2015a

getSection

Class: Simulink.data.Dictionary
Package: Simulink.data

Return `Simulink.data.dictionary.Section` object to represent data dictionary section

Syntax

```
sectionObj = getSection(dictionaryObj,sectionName)
```

Description

`sectionObj = getSection(dictionaryObj,sectionName)` returns a `Simulink.data.dictionary.Section` object representing one section, `sectionName`, of a data dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object.

You cannot use the data dictionary programmatic interface (see "Store Data in Dictionary Programmatically") to access the **Embedded Coder** section of a data dictionary. Instead, see Embedded Coder Dictionary.

Input Arguments

dictionaryObj — Data dictionary containing target section
`Simulink.data.Dictionary` object

Data dictionary containing target section, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

sectionName — Name of target data dictionary section
character vector

Name of target data dictionary section, specified as a character vector.

Example: `'Design Data'`

Example: `'Configurations'`

Data Types: `char`

Examples

Create New Data Dictionary Section Object

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
dDataSectObj = getSection(myDictionaryObj,'Design Data')

dDataSectObj =

  Section with properties:

    Name: 'Design Data'
```

- "Store Data in Dictionary Programmatically"

Topics
"Store Data in Dictionary Programmatically"

Introduced in R2015a

hide

Class: Simulink.data.Dictionary
Package: Simulink.data

Remove data dictionary from Model Explorer

Syntax

```
hide(dictionaryObj)
```

Description

`hide(dictionaryObj)` removes the data dictionary `dictionaryObj` from the **Model Hierarchy** pane of Model Explorer. The target dictionary no longer appears as a node in the model hierarchy tree. Use this function when you are finished working with a data dictionary and want to reduce clutter in the Model Explorer.

Input Arguments

dictionaryObj — Target data dictionary
Simulink.data.Dictionary object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

Examples

Hide Data Dictionary from Model Explorer

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Open Model Explorer and display the new data dictionary as the selected tree node in the **Model Hierarchy** pane.

```
show(myDictionaryObj)
```

With Model Explorer open, at the MATLAB command prompt, call the `hide` function to observe the removal of `myDictionary_ex_API.sldd` from the model hierarchy tree.

```
hide(myDictionaryObj)
```

• "Store Data in Dictionary Programmatically"

Tips

• To add a data dictionary as a node in the model hierarchy tree in Model Explorer, use the `show` function or use the interface to open and view the dictionary in Model Explorer.
• The `hide` function does not affect the content of the target dictionary.

Alternatives

You can remove a data dictionary from the **Model Hierarchy** pane of Model Explorer by right-clicking the dictionary tree node and selecting **Close**.

Topics

"Store Data in Dictionary Programmatically"

Introduced in R2015a

importEnumTypes

Class: Simulink.data.Dictionary
Package: Simulink.data

Import enumerated type definitions to data dictionary

Syntax

```
importedTypes = importEnumTypes(dictionaryObj,targetTypes)
[importedTypes,importFailures] = importEnumTypes(dictionaryObj,
targetTypes)
```

Description

`importedTypes = importEnumTypes(dictionaryObj,targetTypes)` imports to the data dictionary `dictionaryObj` the definitions of one or more enumerated types `targetTypes`. `importEnumTypes` does not import MATLAB variables created using enumerated types but instead, in support of those variables, imports the definitions of the types. The target data dictionary stores the definition of a successfully imported type as an entry. This syntax returns a list of the names of successfully imported types. `importEnumTypes` saves changes made to the target dictionary, so before you use `importEnumTypes`, confirm that unsaved changes are acceptable.

`[importedTypes,importFailures] = importEnumTypes(dictionaryObj, targetTypes)` additionally returns a list of any target types that were not successfully imported. You can inspect the list to determine the reason for each failure.

Input Arguments

dictionaryObj — Target data dictionary
Simulink.data.Dictionary object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary`

object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

`targetTypes` — Enumerated type definitions to import
cell array of character vectors

Enumerated type definitions to import, specified as a cell array of character vectors. If any target types are defined using `classdef` blocks in MATLAB files or P-files, the files must be available on your MATLAB path so that `importEnumTypes` can disable them.

Example: `{'myEnumType'}`

Example: `{'myFirstEnumType','mySecondEnumType','myThirdEnumType'}`

Data Types: `cell`

Output Arguments

`importedTypes` — Target types successfully imported
array of structures

Target enumerated type definitions successfully imported, returned as an array of structures. Each structure in the array represents one imported type. The `className` field of each structure identifies a type by name and the `renamedFiles` field identifies any renamed MATLAB files or P-files.

`importFailures` — Target types not imported
array of structures

Enumerated type definitions targeted but not imported, returned as an array of structures. Each structure in the array represents one type not imported. The `className` field of each structure identifies a type by name and the `reason` field explains the failure.

Examples

Import Enumerated Data to Data Dictionary

Create a data dictionary `myNewDictionary.sldd` in your current working folder and a `Simulink.data.Dictionary` object representing the new data dictionary. Assign the object to the variable `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.create('myNewDictionary.sldd');
```

Run the script in the MATLAB file myDataEnum_ex_API.m. The file defines an enumerated type named InstrumentTypes using the Simulink.defineIntEnumType function and creates three variables based on the new type. Then, import the new variables from the base workspace to myDictionary_ex_API.sldd.

```
myDataEnum_ex_API
importFromBaseWorkspace(myDictionaryObj,'varList',...
{'firstEnumVariable','secondEnumVariable','thirdEnumVariable'});
```

Clear the imported variables from the base workspace. Before you can import an enumerated data type definition to the target data dictionary, you must clear the base workspace of any variables created using the target type.

```
clear firstEnumVariable
clear secondEnumVariable
clear thirdEnumVariable
```

Import the data type definition to myDictionary_ex_API.sldd.

```
importEnumTypes(myDictionaryObj,{'InstrumentTypes'})

ans =

      className: 'InstrumentTypes'
    renamedFiles: {}
```

- "Enumerations in Data Dictionary"
- "Store Data in Dictionary Programmatically"

Tips

- Before you can import an enumerated data type definition to a data dictionary, you must clear the base workspace of any variables created using the target type.
- You can define an enumerated type using a classdef block in a MATLAB file or a P-file. importEnumTypes imports type definitions directly from these files if you specify the names of the types to import using the input argument targetTypes and if the files defining the types are on your MATLAB path.
- To avoid conflicting definitions for imported types, importEnumTypes renders MATLAB files or P-files ineffective by appending .save to their names. The .save

extensions cause variables to rely on the definitions in the target data dictionary and not on the definitions in the files. You can remove the `.save` extensions to restore the files to their original state.

- You can use `importEnumTypes` to import enumerated types defined using the `Simulink.defineIntEnumType` function. Because such types are not defined using MATLAB files or P-files, `importEnumTypes` does not rename any files.

- Use the function `Simulink.findVars` to generate a list of the enumerated types that are used by a model. Then, use the list with `importEnumTypes` to import the definitions of the types to a data dictionary. See "Enumerations in Data Dictionary" for more information.

`Simulink.data.Dictionary` | `importFromBaseWorkspace`

Topics

"Enumerations in Data Dictionary"
"Store Data in Dictionary Programmatically"

Introduced in R2015a

importFromBaseWorkspace

Class: Simulink.data.Dictionary
Package: Simulink.data

Import base workspace variables to data dictionary

Syntax

```
importedVars = importFromBaseWorkspace(dictionaryObj)
importedVars = importFromBaseWorkspace(dictionaryObj,Name,Value)
[importedVars,existingVars] = importFromBaseWorkspace(___)
```

Description

`importedVars = importFromBaseWorkspace(dictionaryObj)` imports all variables from the MATLAB base workspace to the data dictionary `dictionaryObj` without overwriting existing entries in the dictionary. If any base workspace variables are already in the dictionary, the function present a warning and a list.

This syntax returns a list of names of the successfully imported variables. A variable is considered successfully imported only if `importFromBaseWorkspace` assigns the value of the variable to the corresponding entry in the target data dictionary.

`importedVars = importFromBaseWorkspace(dictionaryObj,Name,Value)` imports base workspace variables to a data dictionary, with additional options specified by one or more `Name,Value` pair arguments.

`[importedVars,existingVars] = importFromBaseWorkspace(___)` additionally returns a list of variables that were not overwritten. Use this syntax if `existingVarsAction` is set to `'none'`, the default value, which prevents existing dictionary entries from being overwritten.

5-779

Input Arguments

`dictionaryObj` — Target data dictionary
`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (`'  '`). You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

`clearWorkspaceVars` — Flag to clear base workspace of imported variables
`false` (default) | `true`

Flag to clear the base workspace of any successfully imported variables, specified as the comma-separated pair consisting of `'clearWorkspaceVars'` and `true` or `false`.

Example: `'clearWorkspaceVars',true`

Data Types: `logical`

`existingVarsAction` — Action to take for existing dictionary variables
`'none'` (default) | `'error'` | `'overwrite'`

Action to take for existing dictionary variables, specified as the comma-separated pair consisting of `'existingVarsAction'` and `'none'`, `'error'`, or `'overwrite'`.

If you specify `'none'`, `importFromBaseWorkspace` attempts to import target variables but does not import or make any changes to variables that are already in the data dictionary.

If you specify `'error'`, `importFromBaseWorkspace` returns an error, without importing any variables, if any target variables are already in the data dictionary.

If you specify `'overwrite'`, `importFromBaseWorkspace` imports all target variables and overwrites any variables that are already in the data dictionary.

Example: `'existingVarsAction','error'`

Data Types: `char`

varList — Variables to import
cell array of character vectors

Names of specific base workspace variables to import, specified as the comma-separated pair consisting of `'varList'` and a cell array of character vectors. If you want to import only one variable, specify the name inside a cell array. If you do not specify `'varList'`, `importFromBaseWorkspace` imports all variables from the MATLAB base workspace.

Example: `'varList',{'a','myVariable','fuelFlow'}`

Example: `'varList',{'fuelFlow'}`

Data Types: `cell`

Output Arguments

importedVars — Successfully imported variables
cell array of character vectors

Names of successfully imported variables, returned as a cell array of character vectors. A variable is considered successfully imported only if `importFromBaseWorkspace` assigns the value of the variable to the corresponding entry in the target data dictionary.

existingVars — Variables that were not imported
cell array of character vectors

Names of target variables that were not imported due to their existence in the target data dictionary, returned as a cell array of character vectors. `existingVars` has content only if `'existingVarsAction'` is set to `'none'` which is also the default. In that case `importFromBaseWorkspace` imports only variables that are not already in the target data dictionary.

Examples

Import All Base Workspace Variables to Data Dictionary

In the MATLAB base workspace, create variables to import.

```
a = 'Char Variable';
myVariable = true;
fuelFlow = 324;
```

Open the data dictionary myDictionary_ex_API.sldd and represent it with a
Simulink.data.Dictionary object named myDictionaryObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import all base workspace variables to the data dictionary and return a list of successfully
imported variables. If any base workspace variables are already in
myDictionary_ex_API.sldd, importFromBaseWorkspace presents a warning and a
list of the affected variables.

```
importFromBaseWorkspace(myDictionaryObj);
```

```
Warning: The following variables were not imported because
they already exist in the dictionary:
    fuelFlow
```

Specify Variables to Import to Data Dictionary from Base Workspace

In the MATLAB base workspace, create variables to import.

```
b = 'Char Variable';
mySecondVariable = true;
airFlow = 324;
```

Open the data dictionary myDictionary_ex_API.sldd and represent it with a
Simulink.data.Dictionary object named myDictionaryObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import only the new base workspace variables to the data dictionary.

```
importFromBaseWorkspace(myDictionaryObj,'varList',...
{'b','mySecondVariable','airFlow'});
```

Import Variables from Base Workspace and Overwrite Conflicts

In the MATLAB base workspace, create a variable to import.

```
fuelFlow = 324;
```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`. `myDictionary_ex_API.sldd` already contains an entry called `fuelFlow`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import the variable `fuelFlow` and overwrite the corresponding entry in `myDictionary_ex_API.sldd`.

```
importFromBaseWorkspace(myDictionaryObj,'varList',{'fuelFlow'},...
'existingVarsAction','overwrite');
```

`importFromBaseWorkspace` assigns the value of the base workspace variable `fuelFlow` to the value of the corresponding entry in `myDictionary_ex_API.sldd`.

Return Variables Not Imported to Data Dictionary from Base Workspace

Return a list of variables that are not imported from the MATLAB base workspace because they are already in the target data dictionary.

In the MATLAB base workspace, create variables to import.

```
fuelFlow = 324;
myNewVariable = 'This is a character vector.'
```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`. `myDictionary_ex_API.sldd` already contains an entry called `fuelFlow`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import the variables `fuelFlow` and `myNewVariable` to the data dictionary. Specify names for the output arguments of `importFromBaseWorkspace` to return the names of successfully and unsuccessfully imported variables.

```
[importedVars,existingVars] = importFromBaseWorkspace(myDictionaryObj,...
'varList',{'fuelFlow','myNewVariable'})
```

```
importedVars =

    'myNewVariable'

existingVars =

    'fuelFlow'
```

`importFromBaseWorkspace` does not import the variable `fuelflow` because it is already in the target data dictionary.

- "Store Data in Dictionary Programmatically"

Tips

- `importFromBaseWorkspace` can import MATLAB variables created from enumerated data types but cannot import the definitions of the enumerated types. Use the `importEnumTypes` function to import enumerated data type definitions to a data dictionary. If you import variables of enumerated data types to a data dictionary but do not import the enumerated type definitions, the dictionary is less portable and might not function properly if used by someone else.

Alternatives

- When you use the Simulink Editor to link a model to a data dictionary, you can choose to import model variables from the base workspace. See "Migrate Single Model to Use Dictionary" for more information.
- You can also use the Model Explorer window to drag-and-drop variables from the base workspace into a data dictionary.

`Simulink.data.Dictionary` | `importEnumTypes`

Topics
"Store Data in Dictionary Programmatically"

Introduced in R2015a

listEntry

Class: Simulink.data.Dictionary
Package: Simulink.data

List data dictionary entries

Syntax

```
listEntry(dictionaryObj)
listEntry(dictionaryObj,Name,Value)
```

Description

`listEntry(dictionaryObj)` displays in the MATLAB Command Window a table of information about all the entries in the data dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object. The displayed information includes the name of each entry, the name of the section containing each entry, the status of each entry, the date and time each entry was last modified, the last user name to modify each entry, and the class of the value each entry contains. By default, the function sorts the list of entries alphabetically by entry name.

`listEntry(dictionaryObj,Name,Value)` displays the entries in a data dictionary with additional options specified by one or more `Name,Value` pair arguments.

To return the value of a data dictionary entry at the command prompt, use the `getValue` method of a `Simulink.data.dictionary.Entry` object. See "Store Data in Dictionary Programmatically".

Input Arguments

dictionaryObj — Target data dictionary
Simulink.data.Dictionary object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary`

object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (`' '`). You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

`Ascending` — Sort order of list
`true` (default) | `false`

Sort order of the list of data dictionary entries, specified as the comma-separated pair consisting of `'Ascending'` and `true` or `false`. If you specify `false`, `listEntry` sorts the list in descending order.

Example: `'Ascending',false`

Data Types: `logical`

`Class` — Criteria to filter list by class
character vector

Criteria to filter the list of data dictionary entries by class, specified as the comma-separated pair consisting of `'Class'` and a character vector identifying a valid class. The function lists only entries whose values are of the specified class.

Example: `'Class','Simulink.Parameter'`

Data Types: `char`

`LastModifiedBy` — Criteria to filter list by user name of last modifier
character vector

Criteria to filter the list of data dictionary entries by the user name of the last user to modify each entry, specified as the comma-separated pair consisting of `'LastModifiedBy'` and a character vector identifying the specified user name. The function lists only entries that were last modified by the specified user name.

Example: `'LastModifiedBy','jsmith'`

Data Types: `char`

Limit — Maximum number of entries to list
integer

Maximum number of entries to list, specified as the comma-separated pair consisting of `'Limit'` and an integer. The function lists up to the specified number of entries starting from the top of the sorted and filtered list.

Example: `'Limit',9`

Data Types: `double`

Name — Criteria to filter list by entry name
character vector

Criteria to filter the list of data dictionary entries by entry name, specified as the comma-separated pair consisting of `'Name'` and a character vector defining the filter criteria. You can use an asterisk character, *, as a wildcard to represent any number of characters. The function lists only entries whose names match the filter criteria.

Example: `'Name','fuelFlow'`

Example: `'Name','fuel*'`

Data Types: `char`

Section — Criteria to filter list by data dictionary section
character vector

Criteria to filter the list of data dictionary entries by section, specified as the comma-separated pair consisting of `'Section'` and a character vector identifying the target section. The function lists only entries that are contained in the target section.

Example: `'Section','Design Data'`

SortBy — Flag to sort list by specific property
`'Name'` (default) | `'Section'` | `'LastModified'` | `'LastModifiedBy'`

Flag to sort the list of data dictionary entries by a specific property, specified as the comma-separated pair consisting of `'SortBy'` and a character vector identifying a property in the list of entries. Valid properties include `'Name'`, `'Section'`, `'LastModified'`, and `'LastModifiedBy'`.

Example: `'SortBy','LastModifiedBy'`

Examples

List All Entries in Data Dictionary

Represent the data dictionary `sldemo_fuelsys_dd_controller.sldd` with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd_controller.sldd');
```

List all the entries in the data dictionary.

```
listEntry(myDictionaryObj)
```

Sort List of Data Dictionary Entries in Descending Order

Represent the data dictionary `sldemo_fuelsys_dd_controller.sldd` with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd_controller.sldd');
```

List all the entries in the data dictionary and sort the list in descending order by entry name.

```
listEntry(myDictionaryObj,'Ascending',false)
```

Filter List of Data Dictionary Entries by Name

Represent the data dictionary `sldemo_fuelsys_dd_controller.sldd` with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd_controller.sldd');
```

List only the entries in the data dictionary whose names begin with `max`.

```
listEntry(myDictionaryObj,'Name','max*')
```

Sort List of Data Dictionary Entries by Time of Modification

Represent the data dictionary `sldemo_fuelsys_dd_controller.sldd` with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd_controller.sldd');
```

List all the entries in the dictionary and sort the list by the date and time each entry was last modified.

```
listEntry(myDictionaryObj,'SortBy','LastModified')
```

"Store Data in Dictionary Programmatically"
"What Is a Data Dictionary?"

Introduced in R2015a

removeDataSource

Class: Simulink.data.Dictionary
Package: Simulink.data

Remove reference data dictionary from parent data dictionary

Syntax

removeDataSource(dictionaryObj,refDictionaryFile)

Description

removeDataSource(dictionaryObj,refDictionaryFile) removes a referenced data dictionary, refDictionaryFile, from a parent dictionary dictionaryObj, a Simulink.data.Dictionary object.

The parent dictionary no longer contains the entries that are defined in the referenced dictionary.

Input Arguments

dictionaryObj — Parent data dictionary
Simulink.data.Dictionary object

Parent data dictionary, specified as a Simulink.data.Dictionary object. Before you use this function, represent the target dictionary with a Simulink.data.Dictionary object by using, for example, the Simulink.data.dictionary.create or Simulink.data.dictionary.open function.

refDictionaryFile — File name of referenced data dictionary
character vector

File name of referenced data dictionary, specified as a character vector that includes the .sldd extension. The data dictionary file must be on your MATLAB path.

Example: `'myRefDictionary_ex_API.sldd'`

Data Types: `char`

Examples

Remove Referenced Data Dictionary from Parent Data Dictionary

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`. The `DataSources` property of `myDictionaryObj` indicates `myDictionary_ex_API.sldd` references `myRefDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd')

myDictionaryObj =

  Dictionary with properties:

         DataSources: {'myRefDictionary_ex_API.sldd'}
    HasUnsavedChanges: 0
        NumberOfEntries: 4
```

Remove `myRefDictionary_ex_API.sldd` from `myDictionary_ex_API.sldd`.

```
removeDataSource(myDictionaryObj,'myRefDictionary_ex_API.sldd');
```

View the properties of the `Simulink.data.Dictionary` object `myDictionaryObj`, which represents the parent data dictionary. The `DataSources` property confirms the removal of `myRefDictionary_ex_API.sldd`.

```
myDictionaryObj

myDictionaryObj =

  Dictionary with properties:

         DataSources: {0x1 cell}
    HasUnsavedChanges: 1
        NumberOfEntries: 3
```

- "Store Data in Dictionary Programmatically"

Alternatives

You can use Model Explorer to manage reference dictionaries. See "Partition Dictionary Data Using Referenced Dictionaries" for more information.

`Simulink.data.Dictionary` | `addDataSource`

Topics

"Store Data in Dictionary Programmatically"

Introduced in R2015a

saveChanges

Class: Simulink.data.Dictionary
Package: Simulink.data

Save changes to data dictionary

Syntax

```
saveChanges(dictionaryObj)
```

Description

`saveChanges(dictionaryObj)` saves all changes made to a data dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object. `saveChanges` also saves changes made to referenced data dictionaries. The previous states of the target dictionary and its referenced dictionaries are permanently lost.

Input Arguments

dictionaryObj — Target data dictionary
`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

Examples

Save Changes to Data Dictionary

Create a new data dictionary `myNewDictionary.sldd` and represent the Design Data section with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.create('myNewDictionary.sldd')
dDataSectObj = getSection(myDictionaryObj,'Design Data');

myDictionaryObj =

  data dictionary with properties:

          DataSources: {0x1 cell}
    HasUnsavedChanges: 0
      NumberOfEntries: 0
```

Change `myNewDictionary.sldd` by adding an entry named `myNewEntry` with value 237. View the `HasUnsavedChanges` property of `myDictionaryObj` to confirm a change was made.

```
addEntry(dDataSectObj,'myNewEntry',237);
myDictionaryObj

myDictionaryObj =

  Dictionary with properties:

          DataSources: {0x1 cell}
    HasUnsavedChanges: 1
      NumberOfEntries: 1
```

Save all changes to `myNewDictionary.sldd`. The `HasUnsavedChanges` property of `myDictionaryObj` indicates changes were saved.

```
saveChanges(myDictionaryObj)
myDictionaryObj

myDictionaryObj =

  Dictionary with properties:

          DataSources: {0x1 cell}
```

```
     HasUnsavedChanges: 0
          NumberOfEntries: 1
```

•   "Store Data in Dictionary Programmatically"

Alternatives

You can use Model Explorer to save changes to a data dictionary by right-clicking on the dictionary tree node in the **Model Hierarchy** pane and selecting **Save Changes**.

See Also

`Simulink.data.Dictionary` | `discardChanges`

Topics

"Store Data in Dictionary Programmatically"

Introduced in R2015a

show

Class: Simulink.data.Dictionary
Package: Simulink.data

Show data dictionary in Model Explorer

Syntax

```
show(dictionaryObj)
show(dictionaryObj,openModelExplorer)
```

Description

`show(dictionaryObj)` opens Model Explorer and displays the data dictionary `dictionaryObj` as the selected tree node in the **Model Hierarchy** pane.

`show(dictionaryObj,openModelExplorer)` enables you to add the target dictionary to the **Model Hierarchy** pane without opening Model Explorer.

Input Arguments

dictionaryObj — Target data dictionary
`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

openModelExplorer — Flag to open Model Explorer
`true` (default) | `false`

Flag to open Model Explorer, specified as `true` or `false`.

Data Types: `logical`

Examples

Show Data Dictionary in Model Explorer

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Open Model Explorer and display `myDictionary_ex_API` as the selected node of the model hierarchy tree in the **Model Hierarchy** pane.

```
show(myDictionaryObj)
```

Add Data Dictionary to Model Hierarchy Tree

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Add `myDictionary_ex_API.sldd` to the model hierarchy tree without opening Model Explorer.

```
show(myDictionaryObj,false)
```

You can confirm the addition of `myDictionary_ex_API` to the model hierarchy tree by manually opening Model Explorer.

• "Store Data in Dictionary Programmatically"

Tips

• Use the `hide` function to remove a data dictionary from the tree in the **Model Hierarchy** pane of Model Explorer. The dictionary does not appear in the hierarchy again until you use the `show` function or you open and view the dictionary in the Model Explorer using the interface.

`Simulink.data.Dictionary` | `hide`

Topics

"Store Data in Dictionary Programmatically"

Introduced in R2015a

Simulink.data.dictionary.Entry class

Package: Simulink.data.dictionary

Configure data dictionary entry

Description

An object of the `Simulink.data.dictionary.Entry` class represents one entry of a data dictionary. The object allows you to perform operations such as assign the entry a value or change the name of the entry.

Before you can create a new `Simulink.data.dictionary.Entry` object, you must create a `Simulink.data.dictionary.Section` object representing the data dictionary section that contains the target entry. However, once created, the `Simulink.data.dictionary.Entry` object exists independently of the `Simulink.data.dictionary.Section` object. Use the function `getSection` to create a `Simulink.data.dictionary.Section` object.

Construction

The functions `addEntry`, `getEntry`, and `find` create `Simulink.data.dictionary.Entry` objects.

Properties

DataSource — File name of containing data dictionary
character vector

File name of containing data dictionary, specified as a character vector. Changes you make to this property affect the represented data dictionary entry.

Example: `'myDictionary.sldd'`

Data Types: `char`

`LastModified` — Date and time of last modification
character vector

Date and time of last modification to entry, returned in Coordinated Universal Time (UTC) as a character vector. This property is read only.

`LastModifiedBy` — Name of last user to modify entry
character vector

Name of last user to modify entry, returned as a character vector. This property is read only.

`Name` — Name of entry
character vector

Name of entry, specified as a character vector. Changes you make to this property affect the represented data dictionary entry.

Data Types: `char`

`Status` — State of entry
`'New'` | `'Modified'` | `'Unchanged'` | `'Deleted'`

State of entry, returned as `'New'`, `'Modified'`, `'Unchanged'`, or `'Deleted'`. The state is valid since the last data dictionary save. If the state is `'Deleted'`, the represented entry was deleted from its data dictionary. This property is read only.

Methods

deleteEntry	Delete data dictionary entry
discardChanges	Discard changes to data dictionary entry
find	Search in array of data dictionary entries
getValue	Return value of data dictionary entry
setValue	Set value of data dictionary entry
showChanges	Display changes made to data dictionary entry

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Add Entry to Data Dictionary and Modify its Value

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Add an entry `myEntry` with value 27 to the Design Data section of `myDictionary_ex_API.sldd`. Assign the returned `Simulink.data.dictionary.Entry` object to variable `e`.

```
e = addEntry(dDataSectObj,'myEntry',27)

e =

  Entry with properties:

              Name: 'myEntry'
             Value: 27
        DataSource: 'myDictionary_ex_API.sldd'
      LastModified: '2014-Aug-26 18:42:08.439709'
    LastModifiedBy: 'jsmith'
            Status: 'New'
```

Change the value of `myEntry` from 27 to the character vector `'My New Value'`.

```
setValue(e,'My New Value')
e

e =

  Entry with properties:
```

```
          Name: 'myEntry'
         Value: 'My New Value'
    DataSource: 'myDictionary_ex_API.sldd'
  LastModified: '2014-Aug-26 18:45:58.336598'
LastModifiedBy: 'jsmith'
        Status: 'New'
```

Return Value of Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a
`Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is
defined in the data dictionary `myDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
fuelFlowObj = getEntry(dDataSectObj,'fuelFlow');
```

Return the value of the entry `fuelFlow` and assign the value to the variable
`fuelFlowValue`.

```
fuelFlowValue = getValue(fuelFlowObj)

fuelFlowValue =

   237
```

Move Entry Within Data Dictionary Hierarchy

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd`
with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.
`myDictionary_ex_API.sldd` references the data dictionary
`myRefDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Create a `Simulink.data.dictionary.Entry` object representing the entry `fuelFlow`,
which resides in `myDictionary_ex_API.sldd`. Assign the object to variable `e`.

```
e = getEntry(dDataSectObj,'fuelFlow')
```

```
e =

  Entry with properties:

              Name: 'fuelFlow'
             Value: 237
        DataSource: 'myDictionary_ex_API.sldd'
      LastModified: '2014-Sep-05 13:12:06.099278'
    LastModifiedBy: 'jsmith'
            Status: 'Unchanged'
```

Migrate the entry `fuelFlow` to the reference data dictionary
`myRefDictionary_ex_API.sldd` by modifying the `DataSource` property of `e`.

```
e.DataSource = 'myRefDictionary_ex_API.sldd'

e =

  Entry with properties:

              Name: 'fuelFlow'
             Value: 237
        DataSource: 'myRefDictionary_ex_API.sldd'
      LastModified: '2014-Sep-05 13:12:06.099278'
    LastModifiedBy: 'jsmith'
            Status: 'Modified'
```

Because `myDictionary_ex_API.sldd` references `myRefDictionary_ex_API.sldd`,
both dictionaries belong to the same dictionary hierarchy, allowing you to migrate the
entry `fuelFlow` between them.

"What Is a Data Dictionary?"

Introduced in R2015a

deleteEntry

Class: Simulink.data.dictionary.Entry
Package: Simulink.data.dictionary

Delete data dictionary entry

Syntax

```
deleteEntry(entryObj)
```

Description

`deleteEntry(entryObj)` deletes the data dictionary entry represented by `entryObj`, a `Simulink.data.dictionary.Entry` object. The represented entry no longer exists in the data dictionary that defined it.

The function sets the `Status` properties of any `Simulink.data.dictionary.Entry` objects representing the deleted entry to `'Deleted'`. You can access only the `Status` properties of the objects.

Input Arguments

entryObj — Target data dictionary entry
Simulink.data.dictionary.Entry object

Target data dictionary entry, specified as a `Simulink.data.dictionary.Entry` object. Before you use this function, represent the target entry with a `Simulink.data.dictionary.Entry` object by using, for example, the `getEntry` function.

Examples

Delete Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a
`Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is
defined in the data dictionary `myDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
fuelFlowObj = getEntry(dDataSectObj,'fuelFlow');
```

Delete the entry `fuelFlow` from the data dictionary `myDictionary_ex_API.sldd`.
`myDictionary_ex_API.sldd` no longer contains the `fuelFlow` entry.

```
deleteEntry(fuelFlowObj)
```

• "Store Data in Dictionary Programmatically"

Alternatives

You can use the Model Explorer window to view the contents of a data dictionary and
delete entries.

See Also
`Simulink.data.dictionary.Entry` | `addEntry`

Topics
"Store Data in Dictionary Programmatically"

Introduced in R2015a

discardChanges

Class: Simulink.data.dictionary.Entry
Package: Simulink.data.dictionary

Discard changes to data dictionary entry

Syntax

```
discardChanges(entryObj)
```

Description

discardChanges(entryObj) discards all changes made to the data dictionary entry entryObj, a Simulink.data.dictionary.Entry object, since the last time the containing data dictionary was saved using the saveChanges function. The changes to the entry are permanently lost.

Input Arguments

entryObj — Target data dictionary entry
Simulink.data.dictionary.Entry object

Target data dictionary entry, specified as a Simulink.data.dictionary.Entry object. Before you use this function, represent the target entry with a Simulink.data.dictionary.Entry object by using, for example, the getEntry function.

Examples

Discard Changes to Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a
`Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is
defined in the data dictionary `myDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
fuelFlowObj = getEntry(dDataSectObj,'fuelFlow');
```

Change the entry `fuelFlow` by assigning it the new value 493. Confirm a change was
made by viewing the `Status` property of `fuelFlowObj`.

```
setValue(fuelFlowObj,493);
fuelFlowObj

fuelFlowObj =

  Entry with properties:

             Name: 'fuelFlow'
            Value: 493
       DataSource: 'myDictionary_ex_API.sldd'
     LastModified: '2014-Sep-05 13:14:30.661978'
   LastModifiedBy: 'jsmith'
           Status: 'Modified'
```

Discard all changes to the entry `fuelFlow`. The `Status` property of `fuelFlowObj` shows
that changes were discarded.

```
discardChanges(fuelFlowObj)
fuelFlowObj

fuelFlowObj =

  Entry with properties:

             Name: 'fuelFlow'
            Value: 237
       DataSource: 'myDictionary_ex_API.sldd'
     LastModified: '2014-Sep-05 13:12:06.099278'
```

```
   LastModifiedBy: 'jsmith'
           Status: 'Unchanged'
```

•   "Store Data in Dictionary Programmatically"

Tips

•   You can use the `discardChanges` function or the `saveChanges` function with an entire data dictionary, discarding or saving changes to all entries in the dictionary at once. However, only the `discardChanges` function can additionally operate on individual entries. You cannot use the `saveChanges` function to save changes to individual entries.

Alternatives

You can use Model Explorer and the Comparison Tool to discard changes to data dictionary entries. See "View and Revert Changes to Dictionary Entries" for more information.

`Simulink.data.dictionary.Entry` | `saveChanges`

Topics

"Store Data in Dictionary Programmatically"

Introduced in R2015a

find

Class: Simulink.data.dictionary.Entry
Package: Simulink.data.dictionary

Search in array of data dictionary entries

Syntax

```
foundEntries = find(targetEntries,PName1,PValue1,...,PNameN,PValueN)
foundEntries = find(targetEntries,PName1,PValue1,...,PNameN,PValueN,
options)
```

Description

foundEntries = find(targetEntries,PName1,PValue1,...,PNameN,PValueN)
searches the array of data dictionary entries `targetEntries` using search criteria
`PName1,PValue1,...,PNameN,PValueN`, and returns an array of entries matching the
criteria. This syntax matches the search criteria with the properties of the target entries,
which are `Simulink.data.dictionary.Entry` objects, but not with the properties of
their values. See `Simulink.data.dictionary.Entry` for a list of data dictionary entry
properties.

foundEntries = find(targetEntries,PName1,PValue1,...,PNameN,PValueN,
options) searches for data dictionary entries using additional search options. For
example, you can match the search criteria with the values of the target entries.

Input Arguments

targetEntries — Data dictionary entries to search
array of Simulink.data.dictionary.Entry objects

Data dictionary entries to search, specified as an array
`Simulink.data.dictionary.Entry` objects. Before you use this function, represent
the target entries with `Simulink.data.dictionary.Entry` objects by using, for
example, the `getEntry` function.

Example: `[myEntryObj1,myEntryObj2,myEntryObj3]`

PName1,PValue1,...,PNameN,PValueN — Search criteria
name-value pairs representing properties

Search criteria, specified as one or more name-value pairs representing names and values of properties of the target data dictionary entries. For a list of the properties of a data dictionary entry, see `Simulink.data.dictionary.Entry`. If you specify more than one name-value pair, the returned entries meet all of the criteria.

If you include the `'-value'` option to search in the values of the target entries, the search criteria apply to the values of the entries rather than to the entries themselves.

Example: `'LastModifiedBy','jsmith'`

Example: `'DataSource','myRefDictionary_ex_API.sldd'`

options — Additional search options
supported option codes

Additional search options, specified as one or more of the following supported option codes.

`'-value'`	This option causes `find` to search only in the values of the target data dictionary entries. Specify this option before any other search criteria or `options` arguments.
`'-and'`, `'-or'`, `'-xor'`, or `'-not'` logical operators	These options modify or combine multiple search criteria or other option codes.
`'-property',propertyName`	This name-value pair causes `find` to search for entries or values that have the property `propertyName` regardless of the value of the property. Specify `propertyName` as a character vector.
`'-class',className`	This name-value pair causes `find` to search for entries or values that are objects of the class `className`. Specify `className` as a character vector.

`'-isa',className`	This name-value pair causes `find` to search for entries or values that are objects of the class or of any subclass derived from the class `className`. Specify `className` as a character vector.
`'-regexp'`	This option allows you to use regular expressions in your search criteria. This option affects only search criteria that follow `'-regexp'`.

Example: `'-value'`

Example: `'-value','-property','CoderInfo'`

Example: `'-value','-class','Simulink.Parameter'`

Output Arguments

foundEntries — Data dictionary entries matching search criteria
array of Simulink.data.dictionary.Entry objects

Data dictionary entries matching the specified search criteria, returned as an array of `Simulink.data.dictionary.Entry` objects.

Examples

Search Data Dictionary Entry Values for Specific Class

Search in an array of data dictionary entries `myEntryObjs` for entries whose values are objects of the class `Simulink.Parameter`.

```
foundEntries = find(myEntryObjs,'-value','-class','Simulink.Parameter')
```

Search Data Dictionary Entries for Modifying User

Search in an array of data dictionary entries `myEntryObjs` for entries that were last modified by the user `jsmith`.

```
foundEntries = find(myEntryObjs,'LastModifiedBy','jsmith')
```

Search Data Dictionary Entries Using Multiple Criteria

Search in an array of data dictionary entries `myEntryObjs` for entries that were last modified by the user `jsmith` or whose names begin with `fuel`.

```
foundEntries = find(myEntryObjs,'LastModifiedBy','jsmith','-or',...
'-regexp','Name','fuel*')
```

Search Data Dictionary Entries Using Regular Expressions

Search in an array of data dictionary entries `myEntryObjs` for entries whose names begin with `Press`.

```
foundEntries = find(myEntryObjs,'-regexp','Name','Press*')
```

Search Data Dictionary Entries for Specific Value

Search in an array of data dictionary entries `myEntryObjs` for entries whose values are 273. If you find more than one entry, store the entries in an array called `foundEntries`.

```
foundEntries = [];
for i = 1:length(myEntryObjs)
    if getValue(myEntryObjs(i)) == 237
        foundEntries = [foundEntries myEntryObjs(i)];
    end
end
```

Search Data Dictionary Entry Values for Specific Property

Search in an array of data dictionary entries `myEntryObjs` for entries whose values have a property `DataType`.

```
foundEntries = find(myEntryObjs,'-value','-property','DataType')
```

Introduced in R2015a

getValue

Class: Simulink.data.dictionary.Entry
Package: Simulink.data.dictionary

Return value of data dictionary entry

Syntax

```
entryValue = getValue(entryObj)
```

Description

`entryValue = getValue(entryObj)` returns the value of the data dictionary entry `entryObj`, a `Simulink.data.dictionary.Entry` object.

To programmatically access variables for the purpose of sweeping block parameter values, consider using `Simulink.SimulationInput` objects instead of modifying the variables through the programmatic interface of the data dictionary. See "Optimize, Estimate, and Sweep Block Parameter Values".

Input Arguments

entryObj — Target data dictionary entry
Simulink.data.dictionary.Entry object

Target data dictionary entry, specified as a `Simulink.data.dictionary.Entry` object. Before you use this function, represent the target entry with a `Simulink.data.dictionary.Entry` object by using, for example, the `getEntry` function.

Examples

Return Value of Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a
`Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is
defined in the data dictionary `myDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
fuelFlowObj = getEntry(dDataSectObj,'fuelFlow');
```

Return the value of the entry `fuelFlow` and assign the value to variable
`fuelFlowValue`.

```
fuelFlowValue = getValue(fuelFlowObj)

fuelFlowValue =

    237
```

`Simulink.data.dictionary.Entry` | `setValue`

Topics
"Store Data in Dictionary Programmatically"

Introduced in R2015a

setValue

Class: Simulink.data.dictionary.Entry
Package: Simulink.data.dictionary

Set value of data dictionary entry

Syntax

```
setValue(entryObj,newValue)
```

Description

setValue(entryObj,newValue) assigns the value newValue to the data dictionary entry entryObj, a Simulink.data.dictionary.Entry object.

To programmatically access variables for the purpose of sweeping block parameter values, consider using Simulink.SimulationInput objects instead of modifying the variables through the programmatic interface of the data dictionary. See "Optimize, Estimate, and Sweep Block Parameter Values".

Input Arguments

entryObj — Target data dictionary entry
Simulink.data.dictionary.Entry object

Target data dictionary entry, specified as a Simulink.data.dictionary.Entry object. Before you use this function, represent the target entry with a Simulink.data.dictionary.Entry object by using, for example, the getEntry function.

newValue — Value to assign to data dictionary entry
MATLAB expression

Value to assign to data dictionary entry, specified as a MATLAB expression. The expression must return a value that is supported by the data dictionary section that contains the entry.

Example: 27.5

Example: myBaseWorkspaceVariable

Example: Simulink.Parameter

Examples

Set Value of Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
fuelFlowObj = getEntry(dDataSectObj,'fuelFlow');
```

Set the value of the entry `fuelFlow` to `493`. Then, view the `Value` property of `fuelFlowObj` to observe the change.

```
setValue(fuelFlowObj,493)
fuelFlowObj

fuelFlowObj =

  Entry with properties:

             Name: 'fuelFlow'
            Value: 493
       DataSource: 'myDictionary_ex_API.sldd'
     LastModified: '2014-Sep-05 13:37:22.161124'
   LastModifiedBy: 'jsmith'
           Status: 'Modified'
```

• "Store Data in Dictionary Programmatically"

Alternatives

You can use the Model Explorer window to view and change the values of data dictionary entries.

`Simulink.data.dictionary.Entry` | `getValue`

Topics

"Store Data in Dictionary Programmatically"

Introduced in R2015a

showChanges

Class: Simulink.data.dictionary.Entry
Package: Simulink.data.dictionary

Display changes made to data dictionary entry

Syntax

showChanges(entryObj)

Description

showChanges(entryObj) opens the Comparison Tool to show changes made to the data dictionary entry entryObj, a Simulink.data.dictionary.Entry object. The Comparison Tool displays the properties of entryObj as they were when the data dictionary was last saved and as they were when the showChanges function was called.

Input Arguments

entryObj — Target data dictionary entry
Simulink.data.dictionary.Entry object

Target data dictionary entry, specified as a Simulink.data.dictionary.Entry object. Before you use this function, represent the target entry with a Simulink.data.dictionary.Entry object by using, for example, the getEntry function.

Examples

View Unsaved Changes to Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
fuelFlowObj = getEntry(dDataSectObj,'fuelFlow');
```

Make a change to the entry `fuelFlow` by assigning it the new value `494`.

```
setValue(fuelFlowObj,494);
```

Observe the unsaved change to the entry `fuelFlow`. The Comparison Tool opens and compares side by side the current state of the entry with its most recently saved state.

```
showChanges(fuelFlowObj)
```

- "Store Data in Dictionary Programmatically"

Alternatives

You can use Model Explorer and the Comparison Tool to view changes to data dictionary entries. See "View and Revert Changes to Dictionary Entries" for more information.

Introduced in R2015a

Simulink.data.dictionary.EnumTypeDefinition class

Package: Simulink.data.dictionary

Store enumerated type definition in data dictionary

Description

An object of the `Simulink.data.dictionary.EnumTypeDefinition` class defines an enumerated data type in a data dictionary. You store the object in a data dictionary entry so models linked to the dictionary can use the enumerated type definition.

In the MATLAB base workspace, objects of this class retain information about an enumerated type but do not define the type for use by other variables or by models.

Construction

When you use the function `importEnumTypes` to import the definitions of enumerated types to a data dictionary, Simulink creates a `Simulink.data.dictionary.EnumTypeDefinition` object in the dictionary for each imported definition. The dictionary stores each object in an individual entry.

The constructor `Simulink.data.dictionary.EnumTypeDefinition` creates an instance of this class with default property values and a single enumeration member that has underlying integer value `0`.

Properties

AddClassNameToEnumNames — Flag to control enumeration identifiers in generated code
`false` (default) | `true`

Flag to prefix enumerations with the class name in generated code, specified as `true` or `false`.

If you specify `true`, when you generate code the identifier of each enumeration member begins with the name of the enumeration class. For example, an enumeration class `LEDcolor` with enumeration members `GREEN` and `RED` defines the enumeration members in generated code as `LEDcolor_GREEN` and `LEDcolor_RED`.

Data Types: `logical`

DataScope — Flag to control data type definition in generated code
`'Auto'` (default) | `'Imported'` | `'Exported'`

Flag to control data type definition in generated code, specified as `'Auto'`, `'Imported'`, or `'Exported'`. The table describes the behavior of generated code for each value.

Value	Action
`Auto` (default)	If you do not specify the property `Headerfile`, export the data type definition to *model*`_types.h`, where *model* is the model name. If you specify `Headerfile`, import the data type definition from the specified header file.
`Exported`	Export the data type definition to a separate header file. If you do not specify the property `Headerfile`, the header file name defaults to *type*`.h`, where *type* is the data type name.
`Imported`	Import the data type definition from a separate header file. If you do not specify the property `Headerfile`, the header file name defaults to *type*`.h`, where *type* is the data type name.

DefaultValue — Default enumeration member
`''` (default) | character vector

Default enumeration member, specified as a character vector. Specify `DefaultValue` as the name of an enumeration member you have already defined.

When you create a `Simulink.data.dictionary.EnumTypeDefinition` object, `DefaultValue` is an empty character vector, `''`, and Simulink uses the first enumeration member as the default member.

Example: `'enumMember1'`

Description — Description of enumerated data type in generated code
`''` (default) | character vector

Description of the enumerated data type, specified as a character vector. Use this property to explain the purpose of the type in generated code.

Example: `'Two possible colors of LED indicator: GREEN and RED.'`

Data Types: `char`

HeaderFile — Name of header file defining enumerated data type in generated code
`''` (default) | character vector

Name of the header file that defines the enumerated data type in generated code, specified as a character vector. Use a `.h` extension to specify the file name.

If you do not specify `HeaderFile`, generated code uses a default header file name that depends on the value of the `DataScope` property .

Example: `'myTypeIncludeFile.h'`

Data Types: `char`

StorageType — Data type of underlying integer values
`''` (default) | character vector

Data type of the integer values underlying the enumeration members, specified as a character vector. Generated code stores the underlying integer values using the data type you specify.

You can specify one of these supported integer types:

- `'int8'`
- `'int16'`

- `'int32'`
- `'uint8'`
- `'uint16'`

To store the underlying integer values in generated code using the native integer type of the target hardware, specify `StorageType` as an empty character vector, `''`, which is the default value.

Example: `'int16'`

`''`

Methods

appendEnumeral	Add enumeration member to enumerated data type definition in data dictionary
removeEnumeral	Remove enumeration member from enumerated data type definition in data dictionary

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Programmatically Create Enumerated Type Definition in Data Dictionary

Create an object that can store the definition of an enumerated type. By default, the new type defines a single enumeration member `enum1` with underlying integer value `0`.

```
myColors = Simulink.data.dictionary.EnumTypeDefinition

myColors =
```

```
Simulink.data.dictionary.EnumTypeDefinition
    enum1
```

Add some enumeration members to the definition of the type.

```
appendEnumeral(myColors,'Orange',1,'')
appendEnumeral(myColors,'Black',2,'')
appendEnumeral(myColors,'Cyan',3,'')
myColors

myColors =

    Simulink.data.dictionary.EnumTypeDefinition
        enum1
        Orange
        Black
        Cyan
```

Remove the default enumeration member `enum1`. Since `enum1` is the first enumeration member in the list, identify it with index 1.

```
removeEnumeral(myColors,1)
myColors

myColors =

    Simulink.data.dictionary.EnumTypeDefinition
        Orange
        Black
        Cyan
```

Customize the enumerated type by configuring the properties of the object representing it.

```
myColors.Description = 'These are my favorite colors.';
myColors.DefaultValue = 'Cyan';
myColors.HeaderFile = 'colorsType.h';
```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import the object that defines the enumerated type `myColors` to the dictionary.

```
importFromBaseWorkspace(myDictionaryObj,'varList',{'myColors'});
```

- "Store Data in Dictionary Programmatically"

Alternatives

You can use Model Explorer to add and modify enumerated data types stored in a data dictionary.

"Use Enumerated Data in Simulink Models"

Introduced in R2015a

appendEnumeral

Class: Simulink.data.dictionary.EnumTypeDefinition
Package: Simulink.data.dictionary

Add enumeration member to enumerated data type definition in data dictionary

Syntax

appendEnumeral(typeObj,memberName,memberValue,memberDesc)

Description

appendEnumeral(typeObj,memberName,memberValue,memberDesc) adds an enumeration member to the enumerated type definition stored by typeObj, a Simulink.data.dictionary.EnumTypeDefinition object.

Input Arguments

typeObj — Target enumerated type definition
Simulink.data.dictionary.EnumTypeDefinition object

Target enumerated type definition, specified as a Simulink.data.dictionary.EnumTypeDefinition object.

memberName — Name of new enumeration member
character vector

Name of the new enumeration member, specified as a character vector.

Example: 'myNewEnumMember'

Data Types: char

memberValue — Integer value underlying new enumeration member
integer

Integer value underlying the new enumeration member, specified as an integer.

The definition of the enumeration class determines the integer data type used in generated code to store the underlying values of enumeration members.

Example: 3

Data Types: `single` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `double`

`memberDesc` — Description of new enumeration member
character vector

Description of the new enumeration member, specified as a character vector.

If you do not want to supply a description for the enumeration member, use an empty character vector.

Example: `'Enumeration member number 1.'`

Example: `''`

Data Types: `char`

Examples

Programmatically Create Enumerated Type Definition in Data Dictionary

Create an object that can store the definition of an enumerated type. By default, the new type defines a single enumeration member `enum1` with underlying integer value `0`.

```
myColors = Simulink.data.dictionary.EnumTypeDefinition

myColors =

    Simulink.data.dictionary.EnumTypeDefinition
        enum1
```

Add some enumeration members to the definition of the type.

```
appendEnumeral(myColors,'Orange',1,'')
appendEnumeral(myColors,'Black',2,'')
```

```
appendEnumeral(myColors,'Cyan',3,'')
myColors

myColors =

    Simulink.data.dictionary.EnumTypeDefinition
        enum1
        Orange
        Black
        Cyan
```

Remove the default enumeration member enum1. Since enum1 is the first enumeration member in the list, identify it with index 1.

```
removeEnumeral(myColors,1)
myColors

myColors =

    Simulink.data.dictionary.EnumTypeDefinition
        Orange
        Black
        Cyan
```

Customize the enumerated type by configuring the properties of the object representing it.

```
myColors.Description = 'These are my favorite colors.';
myColors.DefaultValue = 'Cyan';
myColors.HeaderFile = 'colorsType.h';
```

Open the data dictionary myDictionary_ex_API.sldd and represent it with a Simulink.data.Dictionary object named myDictionaryObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import the object that defines the enumerated type myColors to the dictionary.

```
importFromBaseWorkspace(myDictionaryObj,'varList',{'myColors'});
```

• "Store Data in Dictionary Programmatically"

Alternatives

You can use Model Explorer to add enumeration members to the enumerated data type represented by a `Simulink.data.dictionary.EnumTypeDefinition` object.

See Also

`Simulink.data.dictionary.EnumTypeDefinition` |
`Simulink.data.dictionary.EnumTypeDefinition.removeEnumeral`

Topics
"Store Data in Dictionary Programmatically"
"Use Enumerated Data in Simulink Models"

Introduced in R2015a

removeEnumeral

Class: Simulink.data.dictionary.EnumTypeDefinition
Package: Simulink.data.dictionary

Remove enumeration member from enumerated data type definition in data dictionary

Syntax

removeEnumeral(typeObj,memberNum)

Description

removeEnumeral(typeObj,memberNum) removes an enumeration member from the enumerated type definition stored by typeObj, a Simulink.data.dictionary.EnumTypeDefinition object.

Input Arguments

typeObj — Target enumerated type definition
Simulink.data.dictionary.EnumTypeDefinition object

Target enumerated type definition, specified as a Simulink.data.dictionary.EnumTypeDefinition object.

memberNum — Index of target enumeration member
integer

Index of target enumeration member, specified as an integer.

The first enumeration member in an enumerated type definition has index 1. For example, suppose an enumerated type BasicColors has this definition:

myColors =

    Simulink.data.dictionary.EnumTypeDefinition

```
        Orange
        Black
        Cyan
```

To remove the enumeration member `Black`, specify `memberNum` as `2`. To remove the enumeration member `Cyan`, specify `3`.

Do not specify `memberNum` using the integer value underlying an enumeration member. The integer value underlying the member is not equivalent to the index of the member.

Example: 3

Data Types: `single` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `double`

Examples

Programmatically Create Enumerated Type Definition in Data Dictionary

Create an object that can store the definition of an enumerated type. By default, the new type defines a single enumeration member `enum1` with underlying integer value `0`.

```
myColors = Simulink.data.dictionary.EnumTypeDefinition
```

```
myColors =

   Simulink.data.dictionary.EnumTypeDefinition
       enum1
```

Add some enumeration members to the definition of the type.

```
appendEnumeral(myColors,'Orange',1,'')
appendEnumeral(myColors,'Black',2,'')
appendEnumeral(myColors,'Cyan',3,'')
myColors
```

```
myColors =

   Simulink.data.dictionary.EnumTypeDefinition
       enum1
       Orange
       Black
       Cyan
```

Remove the default enumeration member `enum1`. Since `enum1` is the first enumeration member in the list, identify it with index `1`.

```
removeEnumeral(myColors,1)
myColors

myColors =

   Simulink.data.dictionary.EnumTypeDefinition
      Orange
      Black
      Cyan
```

Customize the enumerated type by configuring the properties of the object representing it.

```
myColors.Description = 'These are my favorite colors.';
myColors.DefaultValue = 'Cyan';
myColors.HeaderFile = 'colorsType.h';
```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import the object that defines the enumerated type `myColors` to the dictionary.

```
importFromBaseWorkspace(myDictionaryObj,'varList',{'myColors'});
```

- "Store Data in Dictionary Programmatically"

Alternatives

You can use Model Explorer to remove enumeration members from the enumerated data type represented by a `Simulink.data.dictionary.EnumTypeDefinition` object.

Topics
"Store Data in Dictionary Programmatically"
"Use Enumerated Data in Simulink Models"

Introduced in R2015a

Simulink.data.dictionary.Section class

Package: Simulink.data.dictionary

Configure data dictionary section

Description

An object of the `Simulink.data.dictionary.Section` class represents one section of a data dictionary, such as Design Data or Configurations. The object allows you to perform operations on the section such as add or delete entries and import data from files.

Before you can create a `Simulink.data.dictionary.Section` object, you must create a `Simulink.data.Dictionary` object representing the target data dictionary. Once created, the `Simulink.data.dictionary.Section` object exists independently of the `Simulink.data.Dictionary` object.

You cannot use the data dictionary programmatic interface (see "Store Data in Dictionary Programmatically") to access the **Embedded Coder** section of a data dictionary. Instead, see Embedded Coder Dictionary.

Construction

The function `getSection` creates a `Simulink.data.dictionary.Section` object.

Properties

Name — Name of data dictionary section
character vector

Name of data dictionary section, returned as a character vector. This property is read only.

Methods

addEntry	Add new entry to data dictionary section
assignin	Assign value to data dictionary entry
deleteEntry	Delete data dictionary entry
evalin	Evaluate MATLAB expression in data dictionary section
exist	Check existence of data dictionary entry
exportToFile	Export data dictionary entries from section to MAT-file or MATLAB file
find	Search in data dictionary section
getEntry	Create `Simulink.data.dictionary.Entry` object to represent data dictionary entry
importFromFile	Import variables from MAT-file or MATLAB file to data dictionary section

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Create New Data Dictionary Section Object

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
dDataSectObj = getSection(myDictionaryObj,'Design Data')

dDataSectObj =

  Section with properties:
```

```
Name: 'Design Data'
```

• "Store Data in Dictionary Programmatically"

See Also
`Simulink.data.Dictionary` | `getSection`

Topics
"Store Data in Dictionary Programmatically"
"What Is a Data Dictionary?"

Introduced in R2015a

addEntry

Class: Simulink.data.dictionary.Section
Package: Simulink.data.dictionary

Add new entry to data dictionary section

Syntax

```
addEntry(sectionObj,entryName,entryValue)
entryObj = addEntry(sectionObj,entryName,entryValue)
```

Description

`addEntry(sectionObj,entryName,entryValue)` adds an entry, with name `entryName` and value `entryValue`, to the data dictionary section `sectionObj`, a `Simulink.data.dictionary.Section` object.

`entryObj = addEntry(sectionObj,entryName,entryValue)` returns a `Simulink.data.dictionary.Entry` object representing the newly added data dictionary entry.

Input Arguments

`sectionObj` — Target data dictionary section
Simulink.data.dictionary.Section object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

`entryName` — Name of new data dictionary entry
character vector

Name of new data dictionary entry, specified as a character vector.

Example: `'myNewEntry'`

Data Types: `char`

`entryValue` — Value of new data dictionary entry
MATLAB expression

Value of new data dictionary entry, specified as a MATLAB expression that returns any valid data dictionary content.

Example: `27.5`

Example: `myBaseWorkspaceVariable`

Example: `Simulink.Parameter`

Examples

Add Entry to Design Data Section of Data Dictionary

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Add an entry to the Design Data section of `myDictionary_ex_API.sldd` an entry `myNewEntry` with value 237.

```
addEntry(dDataSectObj,'myNewEntry',237)
```

Add New Simulink.Parameter Object to Data Dictionary

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Add an entry to the Design Data section of `myDictionary_ex_API.sldd`. Name the new entry `myNewParam` and assign a `Simulink.Parameter` object to the value.

```
addEntry(dDataSectObj,'myNewParam',Simulink.Parameter)
```

The expression `Simulink.Parameter` constructs a new `Simulink.Parameter` object, and the `addEntry` function assigns the object to the value of the new data dictionary entry `myNewParam`.

*   "Store Data in Dictionary Programmatically"

Tips

*   `addEntry` returns an error if the entry name you specify with `entryName` is already the name of an entry in the target data dictionary section or in the same section of any referenced dictionaries.

Alternatives

You can use Model Explorer to add entries to a data dictionary in the same way you can use it to add variables to a model workspace or the base workspace.

See Also

`Simulink.data.dictionary.Entry` | `Simulink.data.dictionary.Section` | `assignin`

Topics

"Store Data in Dictionary Programmatically"

Introduced in R2015a

assignin

Class: Simulink.data.dictionary.Section
Package: Simulink.data.dictionary

Assign value to data dictionary entry

Syntax

```
assignin(sectionObj,entryName,entryValue)
```

Description

`assignin(sectionObj,entryName,entryValue)` assigns the value `entryValue` to the data dictionary entry `entryName` in the data dictionary section `sectionObj`, a `Simulink.data.dictionary.Section` object. If an entry with the specified name is not in the target section, `assignin` creates the entry with the specified name and value.

If an entry with the name specified by input argument `entryName` is not defined in the target data dictionary section but is defined in a referenced dictionary, `assignin` does not create a new entry in the target section but operates on the entry in the referenced dictionary.

To programmatically access variables for the purpose of sweeping block parameter values, consider using `Simulink.SimulationInput` objects instead of modifying the variables through the programmatic interface of the data dictionary. See "Optimize, Estimate, and Sweep Block Parameter Values".

Input Arguments

sectionObj — Target data dictionary section
Simulink.data.dictionary.Section object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a

`Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

entryName — Name of target data dictionary entry
character vector

Name of target data dictionary entry, specified as a character vector. If a matching entry does not already exist, the functions creates a new entry using the specified name.

Example: `'myEntry'`

Data Types: `char`

entryValue — Value to assign to data dictionary entry
MATLAB expression

Value to assign to data dictionary entry, specified as a MATLAB expression that returns any valid data dictionary content.

Example: `27.5`

Example: `myBaseWorkspaceVariable`

Example: `Simulink.Parameter`

Examples

Assign Value to Data Dictionary Entry

Assign a value to a data dictionary entry by operating on a `Simulink.data.dictionary.Section` object.

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Assign the value 237 to an entry `myAssignedEntry` in the data dictionary `myDictionary_ex_API.sldd`. If an entry named `myAssignedEntry` is not in `myDictionary_ex_API.sldd`, create it.

```
assignin(dDataSectObj,'myAssignedEntry',237)
```

- "Store Data in Dictionary Programmatically"

Alternatives

You can use the Model Explorer window to view and change the values of data dictionary entries.

See Also

`Simulink.data.dictionary.Section` | `setValue`

Topics

"Store Data in Dictionary Programmatically"

Introduced in R2015a

deleteEntry

Class: Simulink.data.dictionary.Section
Package: Simulink.data.dictionary

Delete data dictionary entry

Syntax

```
deleteEntry(sectionObj,entryName)
deleteEntry(sectionObj,entryName,'DataSource',dictionaryName)
```

Description

deleteEntry(sectionObj,entryName) deletes a data dictionary entry entryName from the data dictionary section sectionObj, a Simulink.data.dictionary.Section object. If there are multiple entries with the specified name in a hierarchy of reference dictionaries, the function deletes all the entries. If you represent a data dictionary entry with one or more Simulink.data.dictionary.Entry objects and later delete the entry using the deleteEntry function, the objects remain with their Status property set to 'Deleted'.

deleteEntry(sectionObj,entryName,'DataSource',dictionaryName) deletes an entry that is defined in the data dictionary DictionaryName. Use this syntax to uniquely identify an entry that is defined more than once in a hierarchy of referenced data dictionaries.

Input Arguments

sectionObj — Target data dictionary section
Simulink.data.dictionary.Section object

Target data dictionary section, specified as a Simulink.data.dictionary.Section object. Before you use this function, represent the target section with a

Simulink.data.dictionary.Section object by using, for example, the getSection function.

entryName — Name of target data dictionary entry
character vector

Name of target data dictionary entry, specified as a character vector.

Example: 'myEntry'

Data Types: char

dictionaryName — Name of data dictionary that defines target entry
character vector

File name of data dictionary that defines the target entry, specified as a character vector including the .sldd extension.

Example: 'mySubDictionary_ex_API.sldd'

Data Types: char

Examples

Delete Entry from Data Dictionary Section

Represent the Design Data section of the data dictionary myDictionary_ex_API.sldd with a Simulink.data.dictionary.Section object named dDataSectObj. The Design Data section of myDictionary_ex_API.sldd already contains an entry named fuelFlow.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Delete the entry fuelFlow from the data dictionary myDictionary_ex_API.sldd. myDictionary_ex_API.sldd no longer contains the fuelFlow entry.

```
deleteEntry(dDataSectObj,'fuelFlow')
```

Delete Entry from Reference Data Dictionary

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Delete the entry `myRefEntry` from the data dictionary `myRefDictionary_ex_API.sldd`. `myDictionary_ex_API.sldd` references `myRefDictionary_ex_API.sldd`, and `myRefDictionary_ex_API.sldd` defines an entry`myRefEntry`.

```
deleteEntry(dDataSectObj,'myRefEntry','DataSource',...
'myRefDictionary_ex_API.sldd')
```

- "Store Data in Dictionary Programmatically"

Alternatives

You can use the Model Explorer window to delete entries from a data dictionary in the same way you can delete variables from a model workspace or the base workspace.

Topics

"Store Data in Dictionary Programmatically"

Introduced in R2015a

evalin

Class: Simulink.data.dictionary.Section
Package: Simulink.data.dictionary

Evaluate MATLAB expression in data dictionary section

Syntax

```
returnValue = evalin(sectionObj,expression)
```

Description

`returnValue = evalin(sectionObj,expression)` evaluates a MATLAB expression in the data dictionary section `sectionObj` and returns the values returned by `expression`.

To programmatically access variables for the purpose of sweeping block parameter values, consider using `Simulink.SimulationInput` objects instead of modifying the variables through the programmatic interface of the data dictionary. See "Optimize, Estimate, and Sweep Block Parameter Values".

Input Arguments

sectionObj — Target data dictionary section
Simulink.data.dictionary.Section object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

expression — MATLAB expression to evaluate
character vector

MATLAB expression to evaluate, specified as a character vector.

Example: `'a = 5.3'`

Example: `'whos'`

Example: `'CurrentSpeed.Value = 290.73'`

Data Types: `char`

Examples

List All Entries in Data Dictionary Section

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Execute the `whos` command in the Design Data section of `myDictionary_ex_API.sldd`.

```
evalin(dDataSectObj,'whos')
```

Name	Size	Bytes	Class	Attributes
fuelFlow	1x1	8	double	
myRefEntry	1x1	1	logical	
parameterGain37	1x1	112	Simulink.Parameter	

*   "Store Data in Dictionary Programmatically"

Tips

*   `evalin` allows you to treat a data dictionary section as a MATLAB workspace. You can think of entries contained in the section as workspace variables you can manipulate with MATLAB expressions.

`Simulink.data.dictionary.Section` | `Simulink.data.evalinGlobal`

Topics
"Store Data in Dictionary Programmatically"

Introduced in R2015a

exist

Class: Simulink.data.dictionary.Section
Package: Simulink.data.dictionary

Check existence of data dictionary entry

Syntax

```
doesExist = exist(sectionObj,entryName)
```

Description

`doesExist = exist(sectionObj,entryName)` determines if the data dictionary section `sectionObj` contains an entry by the name of `entryName` and returns an indication.

Input Arguments

sectionObj — Target data dictionary section
`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

entryName — Name of target entry
character vector

Name of target entry, specified as a character vector.

Example: `'myEntry'`

Data Types: `char`

Output Arguments

doesExist — Indication of entry existence
0 | 1

Indication of entry existence, returned as 0 if false and 1 if true.

Examples

Determine if Data Dictionary Entry Exists

Determine if an entry exists in a data dictionary by searching for the name of the entry

Represent the Design Data section of the data dictionary myDictionary_ex_API.sldd with a Simulink.data.dictionary.Section object named dDataSectObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Determine if an entry fuelFlow exists in the Design Data section of myDictionary_ex_API.sldd.

```
exist(dDataSectObj,'fuelFlow')
```

ans =

     1

Determine if an entry myEntry exists in the Design Data section of myDictionary_ex_API.sldd.

```
exist(dDataSectObj,'myEntry')
```

ans =

     0

- "Store Data in Dictionary Programmatically"

Tips

- `exist` also determines if a matching entry exists in the same section of any referenced data dictionaries. For example, if `sectionObj` represents the Design Data section of a data dictionary `myDictionary_ex_API.sldd`, `exist` searches the Design Data section of `myDictionary_ex_API.sldd` and the Design Data sections of any dictionaries referenced by `myDictionary_ex_API.sldd`.

Alternatives

You can use Model Explorer to search a data dictionary for an entry.

`Simulink.data.dictionary.Section` | `Simulink.data.existsInGlobal` | `find`

Topics

"Store Data in Dictionary Programmatically"

Introduced in R2015a

exportToFile

Class: Simulink.data.dictionary.Section
Package: Simulink.data.dictionary

Export data dictionary entries from section to MAT-file or MATLAB file

Syntax

exportToFile(sectionObj,fileName)

Description

exportToFile(sectionObj,fileName) exports to a MAT or MATLAB file all the values of the entries contained in the data dictionary section sectionObj, a Simulink.data.dictionary.Section object. exportToFile exports the values of all entries, including those defined in referenced dictionaries.

Input Arguments

sectionObj — Target data dictionary section
Simulink.data.dictionary.Section object

Target data dictionary section, specified as a Simulink.data.dictionary.Section object. Before you use this function, represent the target section with a Simulink.data.dictionary.Section object by using, for example, the getSection function.

fileName — Name of MAT or MATLAB file
character vector

Name of target MAT or MATLAB file, specified as a character vector. exportToFile supplies a file extension .mat if you do not specify an extension.

Example: 'myNewFile.mat'

Example: 'myNewFile.m'

Data Types: `char`

Examples

Export Data Dictionary Entries to MAT or MATLAB Files

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`. Represent the Configurations section of `myDictionary_ex_API.sldd` with an object named `configSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
configSectObj = getSection(myDictionaryObj,'Configurations');
```

Export the entries from the Design Data section of `myDictionary_ex_API.sldd` to a MATLAB file in your current working folder.

```
exportToFile(dDataSectObj,'myDictionaryDesignData.m')
```

Export the entries from the Configurations section of `myDictionary_ex_API.sldd` to a MAT-file in your current working folder.

```
exportToFile(configSectObj,'myDictionaryConfigurations.mat')
```

```
Exported 1 entries from scope 'Configurations'
to MAT-file myDictionaryConfigurations.mat.
```

• "Store Data in Dictionary Programmatically"

Limitation

The `exportToFile` method does not export enumerated data types (which are stored as `Simulink.data.dictionary.EnumTypeDefinition` objects). To transfer or copy an enumerated type from one dictionary to another, use the `getEntry` and `addEntry` methods of `Simulink.data.dictionary.Section` objects.

Alternatives

You can use Model Explorer to export data dictionary entries to a file. See "Export Design Data from Dictionary" for more information.

"Store Data in Dictionary Programmatically"

Introduced in R2015a

find

Class: Simulink.data.dictionary.Section
Package: Simulink.data.dictionary

Search in data dictionary section

Syntax

```
foundEntries = find(sectionObj,PName1,PValue1,...,PNameN,PValueN)
foundEntries = find(sectionObj,PName1,PValue1,...,PNameN,PValueN,
options)
```

Description

`foundEntries = find(sectionObj,PName1,PValue1,...,PNameN,PValueN)` searches the data dictionary section `sectionObj` using search criteria `PName1,PValue1,...,PNameN,PValueN`, and returns an array of matching entries that were found in the target section. This syntax matches the search criteria with the properties of the entries in the target section but not with the properties of their values. See `Simulink.data.dictionary.Entry` for a list of data dictionary entry properties.

`foundEntries = find(sectionObj,PName1,PValue1,...,PNameN,PValueN, options)` searches for data dictionary entries using additional search options. For example, you can match the search criteria with the values of the entries in the target section.

Input Arguments

sectionObj — Data dictionary section to search
Simulink.data.dictionary.Section object

Data dictionary section to search, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

PName1,PValue1,...,PNameN,PValueN — Search criteria
name-value pairs representing properties

Search criteria, specified as one or more name-value pairs representing names and values of properties of the entries in the target data dictionary section. For a list of the properties of a data dictionary entry, see `Simulink.data.dictionary.Entry`. If you specify more than one name-value pair, the returned entries meet all of the criteria.

If you include the `'-value'` option to search in the values of the entries, the search criteria apply to the values of the entries rather than to the entries themselves.

Example: `'LastModifiedBy','jsmith'`

Example: `'DataSource','myRefDictionary_ex_API.sldd'`

options — Additional search options
supported option codes

Additional search options, specified as one or more of the following supported option codes.

`'-value'`	This option causes `find` to search only in the values of the entries in the target data dictionary section. Specify this option before any other search criteria or `options` arguments.
`'-and'`, `'-or'`, `'-xor'`, `'-not'` logical operators	These options modify or combine multiple search criteria or other option codes.
`'-property',propertyName`	This name-value pair causes `find` to search for entries or values that have the property `propertyName` regardless of the value of the property. Specify `propertyName` as a character vector.
`'-class',className`	This name-value pair causes `find` to search for entries or values that are objects of the class `className`. Specify `className` as a character vector.
`'-isa',className`	This name-value pair causes `find` to search for entries or values that are objects of the class or of any subclass derived from the class `className`. Specify `className` as a character vector.

`'-regexp'`	This option allows you to use regular expressions in your search criteria. This option affects only search criteria that follow `'-regexp'`.

Example: `'-value'`

Example: `'-value','-property','CoderInfo'`

Example: `'-value','-class','Simulink.Parameter'`

Output Arguments

foundEntries — Data dictionary entries matching search criteria
array of `Simulink.data.dictionary.Entry` objects

Data dictionary entries matching the specified search criteria, returned as an array of `Simulink.data.dictionary.Entry` objects.

Examples

Return Array of All Entries in Data Dictionary Section

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Return all of the entries stored in the Design Data section of the data dictionary `myDictionary_ex_API.sldd`.

```
allEntries = find(dDataSectObj)
```

Search Data Dictionary Section for Specific Class

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Search in the Design Data section of myDictionary_ex_API.sldd for entries whose values are objects of the Simulink.Parameter class.

```
foundEntries = find(dDataSectObj,'-value','-class','Simulink.Parameter')
```

Search Data Dictionary Section for Modifying User

Represent the Design Data section of the data dictionary myDictionary_ex_API.sldd with a Simulink.data.dictionary.Section object named dDataSectObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Search in the Design Data section of myDictionary_ex_API.sldd for entries that were last modified by the user jsmith.

```
foundEntries = find(dDataSectObj,'LastModifiedBy','jsmith')
```

Search Data Dictionary Section Using Multiple Criteria

Represent the Design Data section of the data dictionary myDictionary_ex_API.sldd with a Simulink.data.dictionary.Section object named dDataSectObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Search in the Design Data section of myDictionary_ex_API.sldd for entries that were last modified by the user jsmith or whose names begin with fuel.

```
foundEntries = find(dDataSectObj,'LastModifiedBy','jsmith','-or',...
'-regexp','Name','fuel*')
```

Search Data Dictionary Section Using Regular Expressions

Represent the Design Data section of the data dictionary myDictionary_ex_API.sldd with a Simulink.data.dictionary.Section object named dDataSectObj.

5-861

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Search in the Design Data section of `myDictionary_ex_API.sldd` for entries whose names begin with `fuel`.

```
foundEntries = find(dDataSectObj,'-regexp','Name','fuel*')
```

Search Data Dictionary Section for Specific Value

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Return all of the entries stored in the Design Data section of the data dictionary `myDictionary_ex_API.sldd`.

```
allEntries = find(dDataSectObj);
```

Find the entries with value 237. If you find more than one entry, store the entries in an array called `foundEntries`.

```
foundEntries = [];
for i = 1:length(allEntries)
    if getValue(allEntries(i)) == 237
        foundEntries = [foundEntries allEntries(i)];
    end
end
```

Search Data Dictionary Section for Specific Property

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Search in the Design Data section of `myDictionary_ex_API.sldd` for entries whose values have a property `DataType`.

```
foundEntries = find(dDataSectObj,'-value','-property','DataType')
```

- "Store Data in Dictionary Programmatically"

Alternatives

You can use Model Explorer to search a data dictionary for entries using arbitrary criteria.

Simulink.data.dictionary.Entry | Simulink.data.dictionary.Section | exist | find

Topics

"Store Data in Dictionary Programmatically"

Introduced in R2015a

getEntry

Class: Simulink.data.dictionary.Section
Package: Simulink.data.dictionary

Create `Simulink.data.dictionary.Entry` object to represent data dictionary entry

Syntax

```
entryObj = getEntry(sectionObj,entryName)
entryObj = getEntry(sectionObj,
entryName,'DataSource',dictionaryName)
```

Description

`entryObj = getEntry(sectionObj,entryName)` returns an array of
`Simulink.data.dictionary.Entry` objects representing data dictionary entries
`entryName` found in the data dictionary section `sectionObj`, a
`Simulinkdata.dictionary.Section` object. `getEntry` returns multiple objects if
multiple entries have the specified name in a reference hierarchy of data dictionaries.

`entryObj = getEntry(sectionObj,
entryName,'DataSource',dictionaryName)` returns an object representing a data
dictionary entry that is defined in the data dictionary `dictionaryName`. Use this syntax
to uniquely identify an entry that is defined more than once in a hierarchy of referenced
data dictionaries.

Input Arguments

sectionObj — Target data dictionary section
Simulink.data.dictionary.Section object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section`
object. Before you use this function, represent the target section with a
`Simulink.data.dictionary.Section` object by using, for example, the `getSection`
function.

entryName — Name of target data dictionary entry
character vector

Name of target data dictionary entry, specified as a character vector.

Example: `'myEntry'`

Data Types: `char`

dictionaryName — Name of data dictionary containing target entry
character vector

File name of data dictionary containing the target entry, specified as a character vector including the `.sldd` extension.

Example: `'mySubDictionary_ex_API.sldd'`

Data Types: `char`

Output Arguments

entryObj — Target data dictionary entry
`Simulink.data.dictionary.Entry` object

Target data dictionary entry, returned as one or more `Simulink.data.dictionary.Entry` objects.

Examples

Set Value of Data Dictionary Entry

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```
fuelFlowObj = getEntry(dDataSectObj,'fuelFlow');
```

Set the value of the entry `fuelFlow` to `493`.

```
setValue(fuelFlowObj,493)
```

Set Value of Entry in Reference Dictionary

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Represent the data dictionary entry `myRefEntry` with a `Simulink.data.dictionary.Entry` object named `refEntryObj`. `myDictionary_ex_API.sldd` references `myRefDictionary_ex_API.sldd`, and `myRefDictionary_ex_API.sldd` defines an entry `myRefEntry`.

```
refEntryObj = getEntry(dDataSectObj,'myRefEntry','DataSource',...
'myRefDictionary_ex_API.sldd');
```

Set the value of the entry `myRefEntry` to `493`.

```
setValue(refEntryObj,493)
```

Topics

"Store Data in Dictionary Programmatically"

Introduced in R2015a

importFromFile

Class: Simulink.data.dictionary.Section
Package: Simulink.data.dictionary

Import variables from MAT-file or MATLAB file to data dictionary section

Syntax

```
importedVars = importFromFile(sectionObj,fileName)
importedVars = importFromFile(sectionObj,
fileName,'existingVarsAction',existAction)
[importedVars,existingVars] = importFromFile( ___ )
```

Description

`importedVars = importFromFile(sectionObj,fileName)` imports variables defined in the MAT-file or MATLAB file `fileName` to the data dictionary section `sectionObj` without overwriting any variables that are already in the target section. If any variables are already in the target section, the function displays a warning and a list in the MATLAB Command Window. This syntax returns a list of variables that were successfully imported. A variable is considered successfully imported only if `importFromFile` assigns the value of the variable to the corresponding entry in the target data dictionary.

`importedVars = importFromFile(sectionObj, fileName,'existingVarsAction',existAction)` imports variables that are already in the target section by taking a specified action `existAction`. For example, you can choose to use the variable values in the target file to overwrite the corresponding values in the target section.

`[importedVars,existingVars] = importFromFile( ___ )` returns a list of variables in the target section that were not overwritten. Use this syntax if `existingVarsAction` is set to `'none'`, the default value, which prevents existing dictionary entries from being overwritten.

Input Arguments

sectionObj — Target data dictionary section
Simulink.data.dictionary.Section object

Target data dictionary section, specified as a Simulink.data.dictionary.Section object. Before you use this function, represent the target section with a Simulink.data.dictionary.Section object by using, for example, the getSection function.

fileName — Name of MAT or MATLAB file
character vector

Name of target MAT or MATLAB file, specified as a character vector. importFromFile automatically supplies a file extension .mat if you do not specify an extension.

Example: 'myFile.mat'

Example: 'myFile.m'

Data Types: char

existAction — Action to take for existing dictionary variables
'none' (default) | 'overwrite' | 'error'

Action to take for existing dictionary variables, specified as 'none', 'overwrite', or 'error'.

If you specify 'none', importFromFile attempts to import target variables but does not import or make any changes to variables that are already in the data dictionary section.

If you specify 'overwrite', importFromFile imports all target variables and overwrites any variables that are already in the data dictionary section.

If you specify 'error', importFromFile returns an error, without importing any variables, if any target variables are already in the data dictionary section.

Example: 'overwrite'

Data Types: char

Output Arguments

`importedVars` — Successfully imported variables
cell array of character vectors

Names of successfully imported variables, returned as a cell array of character vectors. A variable is considered successfully imported only if `importFromFile` assigns its value to the corresponding entry in the target data dictionary.

`existingVars` — Variables that were not imported
cell array of character vectors

Names of target variables that were not imported due to their existence in the target data dictionary, returned as a cell array of character vectors. `existingVars` has content only if `existAction` is set to `'none'`, which is also the default. In that case `importFromFile` imports only variables that are not already in the target data dictionary.

Examples

Import to Data Dictionary from File

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Import all variables contained in the file `myData_ex_API.m` to the data dictionary and return a list of successfully imported variables. If any variables are already in `myDictionary_ex_API.sldd`, `importFromFile` returns a warning and a list of the affected variables.

```
importFromFile(dDataSectObj,'myData_ex_API.m')

Warning: The following variables were not imported because
they already exist in the dictionary:
   fuelFlow

ans =
```

```
'myFirstEntry'
'mySecondEntry'
'myThirdEntry'
```

Import Variables from File and Overwrite Conflicts

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Import all variables contained in the file `myData_ex_API.m` to the data dictionary, overwrite any variables that are already in the dictionary, and return a list of successfully imported variables.

```
importFromFile(dDataSectObj,'myData_ex_API.m','existingVarsAction','overwrite')
```

```
ans =

    'fuelFlow'
    'myFirstEntry'
    'mySecondEntry'
    'myThirdEntry'
```

Return Variables Not Imported to Data Dictionary from File

Return a list of variables that are not imported from a file because they are already in the target data dictionary

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Import all variables contained in the file `myData_ex_API.m` to the data dictionary. Specify names for the output arguments of `importFromFile` to return the names of successfully and unsuccessfully imported variables.

```
[importedVars,existingVars] = importFromFile(dDataSectObj,'myData_ex_API.m')

importedVars =

    'myFirstEntry'
    'mySecondEntry'
    'myThirdEntry'

existingVars =

    'fuelFlow'
```

`importFromFile` does not import the variable `fuelflow` because it is already in the target data dictionary.

•   "Store Data in Dictionary Programmatically"

Tips

•   `importFromFile` can import MATLAB variables created from enumerated data types but cannot import the definitions of the enumerated types. Use the `importEnumTypes` function to import enumerated data type definitions to a data dictionary. If you import variables of enumerated data types to a data dictionary but do not import the enumerated type definitions, the dictionary is less portable and might not function properly if used by someone else.

Alternatives

You can use the Model Explorer to import variables to a data dictionary from a file. See "Import Data to Dictionary from File" for more information.

Topics
"Store Data in Dictionary Programmatically"

Introduced in R2015a

Simulink.DualScaledParameter

Specify name, value, units, and other properties of Simulink dual-scaled parameter

Description

Use `Simulink.DualScaledParameter` so that you can define an object that stores two scaled values of the same physical value.

For example, for temperature measurement, you can store a Fahrenheit scale and a Celsius scale with conversion defined by a computation method that you provide. Given one scaled value, the `Simulink.DualScaledParameter` computes the other scaled value using the computation method.

A dual-scaled parameter inherits some properties from the `Simulink.Parameter` class. A dual-scaled parameter has:

- A calibration value. The value that you prefer to use.
- A main value. The real-world value that Simulink uses.
- An internal stored integer value. The value that is used in the embedded code.

You can use `Simulink.DualScaledParameter` objects in your model for both simulation and code generation. The parameter computes the internal value before code generation via the computation method. This offline computation results in leaner generated code.

If you provide the calibration value, the parameter computes the main value using the computation method. This method can be a first-order rational function.

$$y = \frac{ax + b}{cx + d}$$

- `x` is the calibration value.
- `y` is the main value.
- `a` and `b` are the coefficients of the CalToMain compute numerator.
- `c` and `d` are the coefficients of the CalToMain compute denominator.

If you provide the calibration minimum and maximum values, the parameter computes minimum and maximum values of the main value. Simulink performs range checking of parameter values. The software alerts you when the parameter object value lies outside a range that corresponds to its specified minimum and maximum values and data type.

Creation

Create a `Simulink.DualScaledParameter` object:

- By using the Model Data Editor. Instead of creating a `Simulink.Parameter` object, create a `Simulink.DualScaledParameter` object. See "Interact with a Model That Uses Workspace Variables".

- By using the Model Explorer:

  1 In the **Model Hierarchy** pane, select a workspace or data dictionary.

  2 On the toolbar, select **Add > Add Custom**.

  3 In the Model Explorer — Select Object dialog box, set **Object class** to `Simulink.DualScaledParameter`.

- By using the `Simulink.DualScaledParameter` function, described below.

Syntax

```
DSParam = Simulink.DualScaledParameter
```

Description

`DSParam = Simulink.DualScaledParameter` returns a `Simulink.DualScaledParameter` object with default property values.

Properties

For information about properties in the property dialog box of a `Simulink.DualScaledParameter` object, see "Simulink.DualScaledParameter Property Dialog Box".

CalibrationValue — Calibration value of this parameter
[] (default) | finite, real, double number

Calibration value of this parameter, specified as a finite, real, double number. This value represents the value that you prefer to use.

Before specifying `CalibrationValue`, you must specify `CalToMainCompuNumerator` and `CalToMainCompuDenominator` to define the computation method. The parameter uses the computation method and the calibration value to calculate the main value that Simulink uses.

Corresponds to **Calibration value** in the property dialog box.

Example: `5.34`

Data Types: `double`

CalibrationMin — Calibration minimum value of this parameter
[] (default) | finite, real, double, scalar number

Calibration minimum value of this parameter, specified as a finite, real, double, scalar number. The default value, `[]`, means the minimum is unspecified.

Before specifying `CalibrationMin`, you must specify `CalToMainCompuNumerator` and `CalToMainCompuDenominator` to define the computation method. The parameter uses the computation method and the calibration minimum value to calculate the minimum or maximum value that Simulink uses. A first order rational function is strictly monotonic, either increasing or decreasing. If it is increasing, setting the calibration minimum sets the main minimum value. If it is decreasing, setting the calibration minimum sets the main maximum.

If the parameter value is less than the minimum value or if the minimum value is outside the range of the parameter data type, Simulink generates a warning. In these cases, when updating the diagram or starting a simulation, Simulink generates an error.

Corresponds to **Calibration minimum** in the property dialog box.

Example: `10.51`

Data Types: `double`

CalibrationMax — Calibration maximum value of this parameter
[] (default) | finite, real, double, scalar number

Calibration maximum value of this parameter, specified as a finite, real, double, scalar number. The default value, `[]`, means the maximum is unspecified.

Before specifying `CalibrationMax`, you must specify `CalToMainCompuNumerator` and `CalToMainCompuDenominator` to define the computation method. The parameter uses the computation method and the calibration maximum value to calculate the corresponding maximum or minimum value that Simulink uses. A first order rational function is strictly monotonic, either increasing or decreasing. If it is increasing, setting the calibration maximum sets the main maximum value. If it is decreasing, setting the calibration maximum sets the main minimum.

If the parameter value is less than the minimum value or if the minimum value is outside the range of the parameter data type, Simulink generates a warning. In these cases, when updating the diagram or starting a simulation, Simulink generates an error.

Corresponds to **Calibration maximum** in the property dialog box.

Example: `-10.51`

Data Types: `double`

CalToMainCompuNumerator — Numerator coefficients of the computation method
`[]` (default) | finite, real, double scalar | finite, real, double vector

Numerator coefficients of the computation method, specified as a scalar number or vector of values for the numerator coefficients `a` and `b` of the first-order linear equation:

$$y = \frac{ax + b}{cx + d}$$

The default value is `[]` (unspecified). Specify finite, real, double scalar values for `a` and `b`. For example, `[1 1]` or, for reciprocal scaling, `1`.

Once you have applied `CalToMainCompuNumerator`, you cannot change it.

Corresponds to **CalToMain compute numerator** in the property dialog box.

Example: `[1 1]`

Example: `1`

Data Types: `double`

CalToMainCompuDenominator — Denominator coefficients of the computation method
[] (default) | finite, real, double scalar | finite, real, double vector

Denominator coefficients of the computation method, specified as a scalar number or vector of values for the denominator coefficients `c` and `d` of the first-order linear equation:

$$y = \frac{ax + b}{cx + d}$$

The default value is `[]` (unspecified). Specify finite, real, double scalar values for `c` and `d`. For example, `[1 1]`.

Once you have applied `CalToMainCompuDenominator`, you cannot change it.

Corresponds to **CalToMain compute denominator** in the property dialog box.

Example: [1 1]

Data Types: `double`

CalibrationName — Name of the calibration parameter
`''` (empty character vector) (default) | character vector

Name of the calibration parameter, specified as a character vector.

Corresponds to **Calibration name** in the property dialog box.

Example: `'This is a calibration parameter.'`

Data Types: `char`

CalibrationDocUnits — Measurement units for this calibration parameter's value
`''` (empty character vector) (default) | character vector

Measurement units for this calibration parameter's value, specified as a character vector.

Corresponds to **Calibration units** in the property dialog box.

Example: `'Fahrenheit'`

Data Types: `char`

`IsConfigurationValid` — Information about validity of configuration
`true` (default) | `false`

This property is read-only.

Information about the validity of the object configuration, returned as `true` (valid) or `false` (invalid). If Simulink detects an issue with the configuration, it sets this field to `false` and provides information in the `DiagnosticMessage` property.

Corresponds to **Is configuration valid** in the property dialog box.

Data Types: `logical`

`DiagnosticMessage` — Diagnostic information about invalid configuration
`''` (empty character vector) (default) | character vector

This property is read-only.

Diagnostic information about an invalid object configuration, returned as a character vector. If you specify invalid property settings, Simulink displays a message in this field. Use the diagnostic information to help you fix an invalid configuration issue.

Corresponds to **Diagnostic message** in the property dialog box.

Data Types: `char`

Examples

Create and Update a Dual-Scaled Parameter

Create a `Simulink.DualScaledParameter` object that stores a temperature as both Fahrenheit and Celsius.

Create a `Simulink.DualScaledParameter` object.

```
Temp = Simulink.DualScaledParameter;
```

Set the computation method that converts between Fahrenheit and Celsius.

```
Temp.CalToMainCompuNumerator = [1 -32];
Temp.CalToMainCompuDenominator = [1.8];
```

Set the value of the temperature that you want to see in Fahrenheit.

```
Temp.CalibrationValue = 212

Temp =

  DualScaledParameter with properties:

            CalibrationValue: 212
              CalibrationMin: []
              CalibrationMax: []
    CalToMainCompuNumerator: [1 -32]
  CalToMainCompuDenominator: 1.8000
             CalibrationName: ''
         CalibrationDocUnits: ''
        IsConfigurationValid: 1
           DiagnosticMessage: ''
                       Value: 100
                   CoderInfo: [1x1 Simulink.CoderInfo]
                 Description: ''
                    DataType: 'auto'
                         Min: []
                         Max: []
                        Unit: ''
                  Complexity: 'real'
                  Dimensions: [1 1]
```

The `Simulink.DualScaledParameter` calculates `Temp.Value` which is the value that Simulink uses. `Temp.CalibrationValue` is `212` (degrees Fahrenheit), so `Temp.Value` is `100` (degrees Celsius).

Name the value and specify the units.

```
Temp.CalibrationName = 'TempF';
Temp.CalibrationDocUnits = 'Fahrenheit';
```

Set calibration minimum and maximum values.

```
Temp.CalibrationMin = 0;
Temp.CalibrationMax = 300;
```

If you specify a calibration value outside this allowable range, Simulink generates a warning.

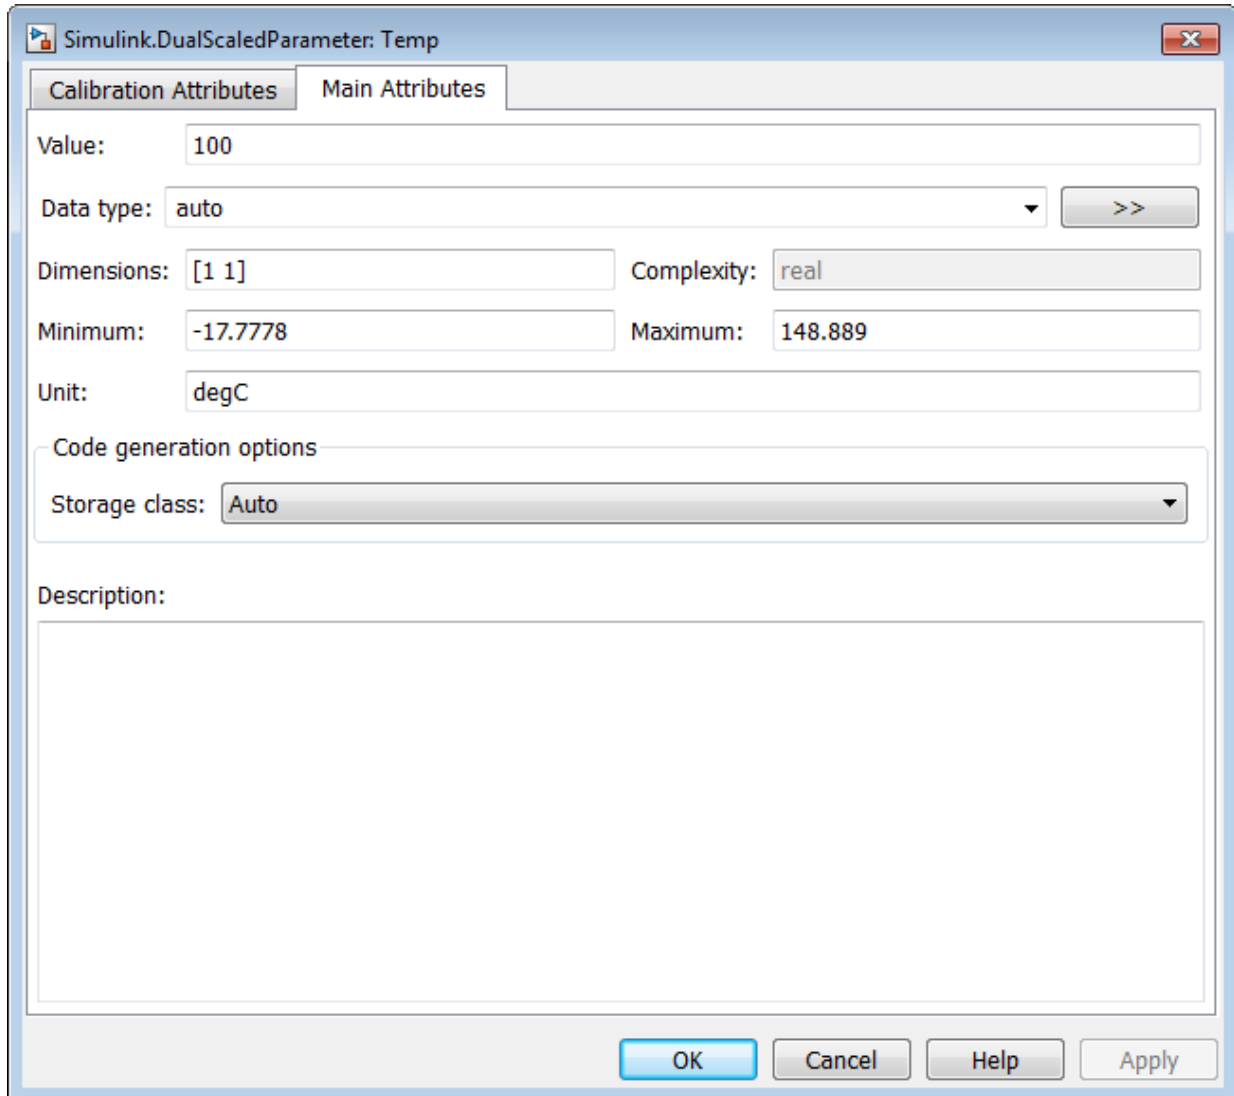
Specify the units that Simulink uses.

```
Temp.Unit = 'degC';
```

Open the Simulink.DualScaledParameter dialog box.

```
open Temp
```

The **Calibration Attributes** tab displays the calibration value and the computation method that you specified.

In the dialog box, click the **Main Attributes** tab.


This tab displays information about the value used by Simulink.

Introduced in R2013b

Simulink.Mask class

Package: Simulink

Control masks programmatically

Description

Use an instance of `Simulink.Mask` class to perform the following operations:

- Create, copy, and delete masks.
- Create, edit, and delete mask parameters.
- Determine the block that owns the mask.
- Obtain workspace variables defined for a mask.

Properties

Type

Specifies the mask type of the associated block.

Type: `character vector | string scalar`

Default: `Empty character vector`

Description

Specifies the block description of the associated block.

Type: `character vector | string scalar`

Default: `Empty character vector`

Help

Specifies the help text that is displayed for the mask.

Type: `character vector | string scalar`

Default: `Empty character vector`

Initialization

Specifies the initialization commands for the associated block.

Type: `character vector | string scalar`

Default: `Empty character vector`

SelfModifiable

Indicates that the block can modify itself and its content.

Type: `boolean`

Values: `'on' | 'off'`

Default: `'off'`

Display

Specifies MATLAB code for drawing the block icon.

Type: `character vector | string scalar`

Default: `Empty character vector`

IconFrame

Sets the visibility of the block frame. (Visible is on, Invisible is off).

Type: `boolean`

Values: `'on' | 'off'`

Default: `'on'`

IconOpaque

Sets the transparency of the icon (Opaque is on, Transparent is off).

Type: boolean

Values: `'on'|'off'`

Default: `'on'`

RunInitForIconRedraw

Specifies whether Simulink must run mask initialization before executing the mask icon commands.

Type: enum

Values: `'auto'|'on'|'off'`

Default: `'auto'`

IconRotate

Sets icon to rotate with the block.

Type: enum

Values: `'none'|'port'`

Default: `'none'`

PortRotate

Specifies the port rotation policy for the masked block.

Type: enum

Values: `'default'|'physical'`

Default: `'default'`

IconUnits

Specifies the units for the drawing commands.

Type: enum

Values: `'pixel'|'autoscale'|'normalized'`

Default: `'autoscale'`

Methods

addParameter	Add a parameter to a mask
copy	Copy a mask from one block to another
create	Create a mask on a Simulink block
delete	Unmask a block and delete the mask from memory
get	Get a block mask as a mask object
addDialogControl	Add dialog control elements to mask dialog box
getDialogControl	Search for a specific dialog control on the mask
getOwner	Determine the block that owns a mask
getParameter	Get a mask parameter using its name
getWorkspaceVariables	Get all the variables defined in the mask workspace for a masked block
numParameters	Determine the number of parameters in a mask
removeDialogControl	Remove dialog control element from mask dialog box
removeParameter	Remove parameter from mask dialog box
removeAllParameters	Remove all existing parameters from a mask
set	Set the properties of an existing mask
addParameterConstraint	Add parameter constraint to a mask
removeParameterConstraint	Delete a mask parameter constraint
removeCrossParameterConstraint	Delete a cross-parameter constraint
removeAllParameterConstraints	Delete all mask parameter constraints
removeAllCrossParameterConstraints	Delete all cross-parameter constraints from a mask
getParameterConstraint	Get mask parameter constraint properties
getCrossParameterConstraint	Get cross-parameter constraint
getAssociatedParametersOfConstraint	Get mask parameters associated with a constraint
addCrossParameterConstraint	Add cross-parameter constraint

addParameter

Class: Simulink.Mask
Package: Simulink

Add a parameter to a mask

Syntax

```
p = Simulink.Mask.get(blockName)
p.addParameter(Name,Value)
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`p.addParameter(Name,Value)` appends a parameter to the mask. If you do not specify name–value pairs as arguments with this command, Simulink generates name for the mask parameter with control type set to `edit`.

Input Arguments

`blockName`

The handle to the block or the path to the block inside the model.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (`' '`). You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Type

Type of control that is used to specify the value of this parameter.

Default: edit

TypeOptions

The options that are displayed within a popup control or in a promoted parameter. This field is a cell array.

Default: empty

Name

The name of the mask parameter. This name is assigned to the mask workspace variable created for this parameter.

Default: generated name

Prompt

Text that identifies the parameter on the Mask Parameters dialog box.

Default: empty

Value

The default value of the mask parameter in the Mask Parameters dialog box.

Default: Type specific; depends on the Type of the parameter

Evaluate

Option to specify whether parameter must be evaluated.

Default: 'on'

Tunable

Option to specify whether parameter is tunable.

Default: 'on'

Enabled

Option to specify whether user can set parameter value.

Default: `'on'`

Visible

Option to set whether mask parameter is hidden or visible to the user.

Default: `'on'`

Callback

Container for MATLAB code that executes when user makes a change in the Mask Parameters dialog box and clicks **Apply**.

Default: empty

Container

Option to specifies a container for the child dialog control. The permitted values are `'panel'`, `'group'`, and `'tab'`.

Examples

1   Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```

2   Add a parameter to the mask without specifying name–value pairs for parameter attributes.

```
p.addParameter;
```

3   Add a mask parameter of type popup that cannot be evaluated.

```
p.addParameter('Type','popup','TypeOptions',...
{'Red' 'Blue' 'Green'},'Evaluate','off');
```

"Block Masks" | `Simulink.Mask`

Simulink.Mask.copy

Class: Simulink.Mask
Package: Simulink

Copy a mask from one block to another

Syntax

```
pSource = Simulink.Mask.get(srcBlockName)
pDest = Simulink.Mask.create(destBlockName)
pDest.copy(pSource)
```

Description

`pSource = Simulink.Mask.get(srcBlockName)` gets the mask on the source block specified by `blockName` as a mask object.

`pDest = Simulink.Mask.create(destBlockName)` creates an empty mask on the destination block specified by `destBlockName`.

`pDest.copy(pSource)` overwrites the destination mask with the source mask.

Input Arguments

srcBlockName

The handle to the source block or the path to the source block inside the model.

Note The source block should be masked.

destBlockName

The handle to the destination block or the path to the destination block inside the model.

Note The destination block should have an empty mask. Otherwise, the copied mask will overwrite the non-empty mask.

Examples

1 Create an empty mask on the destination block using the block's path.

```
pDest = Simulink.Mask.create('myModel/Subsystem');
```

2 Get source mask as an object using the source block's path.

```
pSource = Simulink.Mask.get('myModel/Abs');
```

3 Make the destination mask a copy of the source mask.

```
pDest.copy(pSource);
```

See Also

"Block Masks" | Simulink.Mask

Simulink.Mask.create

Class: Simulink.Mask
Package: Simulink

Create a mask on a Simulink block

Syntax

```
p = Simulink.Mask.create(blockName)
```

Description

`p = Simulink.Mask.create(blockName)` creates an empty mask on the block specified by `blockName`. If the specified block is already masked, an error message appears.

Input Arguments

blockName

The handle to the block or the path to the block inside the model.

Examples

1   Create a mask using a block's handle.

> **Note** In the model, select the block to be masked.

```
p = Simulink.Mask.create(gcbh);
```

2   Create a mask using the block's path.

```
p = Simulink.Mask.create('myModel/Subsystem');
```

See Also

"Block Masks" | Simulink.Mask

delete

Class: Simulink.Mask
Package: Simulink

Unmask a block and delete the mask from memory

Syntax

```
p = Simulink.Mask.get(blockName)
p.delete
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`p.delete` unmasks the block and deletes the mask from memory.

Input Arguments

blockName

The handle to the block or the path to the block inside the model.

Examples

1   Get mask as an object using a masked block's path.

    ```
    p = Simulink.Mask.get('myModel/Subsystem');
    ```

2   Unmask the block using the mask object and delete the mask from memory.

    ```
    p.delete;
    ```

See Also

"Block Masks" | `Simulink.Mask`

Simulink.Mask.get

Class: Simulink.Mask
Package: Simulink

Get a block mask as a mask object

Syntax

```
p = Simulink.Mask.get(blockName)
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object. If the specified block is not masked, a null value returns.

Input Arguments

blockName

The handle to the block or the path to the block inside the model.

Examples

1   Get mask as an object using a masked block's handle.

Note In the model, select the masked block.

```
p = Simulink.Mask.get(gcbh);
```
2   Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```

See Also

"Block Masks" | `Simulink.Mask`

addDialogControl

Class: Simulink.Mask
Package: Simulink

Add dialog control elements to mask dialog box

Syntax

```
successIndicator = maskObj.addDialogControl(controlType,
controlIdentifier)
successIndicator = maskObj.addDialogControl(Name,Value)
```

Description

`successIndicator = maskObj.addDialogControl(controlType, controlIdentifier)` adds dialog control elements like text, hyperlinks, or tabs to mask dialog box. First get the mask object and assign it to the variable `maskObj`

`successIndicator = maskObj.addDialogControl(Name,Value)` specifies the Name and Value arguments for an element on the mask dialog box. You can specify multiple Name-Value pairs.

Input Arguments

`controlType` — Value type of dialog control element
character vector | string scalar

Type of dialog control element, specified

- `'panel'`
- `'group'`
- `'tabcontainer'`
- `'tab'`

- `'collapsiblepanel'`
- `'text'`
- `'image'`
- `'hyperlink'`
- `'pushbutton'`

`controlIdentifer` — Unique identifier for the element
character vector | string scalar

Specifies the programmatic identifier for the element of mask dialog box. Use a name that is unique and does not have space between words. For more information, see "Variable Names" (MATLAB).

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (`'  '`) and is case-sensitive. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Type

Type of control that is used to specify the value of this dialog control element. Type is a required argument. The permitted values are `'panel'`, `'group'`, `'tabcontainer'`, `'tab'`, `'collapsiblepanel'`, `'text'`, `'image'`, `'hyperlink'`, and `'pushbutton'`.

Default: empty

Name

The identifier of the dialog control element. Name is a required argument. This field is available for all dialog control types.

Default: empty

Prompt

Text that is displayed in the dialog control element on the Mask dialog box. This field is available for all except for panel and image dialog control types.

Default: empty

`Tooltip`

Tooltip for the dialog control element.

Default: empty

`Enabled`

Option to specify whether you can set value for the dialog control element. This field is available for all dialog control types.

Default: `'on'`

`Visible`

Option to set whether the dialog control element is hidden or visible to the user. This field is available for all dialog control types.

Default: `'on'`

`Callback`

Container for MATLAB code that executes when you edit the dialog control element and click **Apply**. This field is available only for the hyperlink and pushbutton dialog control types.

Default: empty

`Row`

Option to set whether the dialog control is placed in the new row or the same row. This field is available for all dialog control types.

Default: empty

`Filepath`

Contains the path to an image file. This field is available for image, and pushbutton dialog control types.

Default: empty

Container

Option to specifies a container for the child dialog control. The permitted values are the names of `'panel'`, `'group'`, and `'tab'` dialog controls.

Examples

Add Dialog Control Elements to Mask Dialog Box

Get mask object and add dialog control element to it.

```
% Get mask object on model Engine

maskObj = Simulink.Mask.get('Engine/Gain');

% Add hyperlink to mask dialog box

maskLink = maskObj.addDialogControl('hyperlink','link');
maskLink.Prompt = 'Mathworks Home Page';
maskLink.Callback = 'web(''www.mathworks.com'')'

% Alternative method to add hyperlink

maskLink = maskObj.addDialogControl('hyperlink','link');
maskLink.Prompt = 'www.mathworks.com';

% Add text to mask dialog box

maskText = maskObj.addDialogControl('text','text_tag');
maskText.Prompt = 'Enable range checking';

% Add button to mask dialog box

maskButton = maskObj.addDialogControl('pushbutton','button_tag');
maskButton.Prompt = 'Compute';
```

Add Dialog Control Elements to Mask Dialog Box Tabs

Create tabs on the mask dialog box and add elements to these tabs.

```
% Get mask object on a block named 'GainBlock'

maskObj = Simulink.Mask.get('GainBlock/Gain');

% Create a tab container

maskObj.addDialogControl('tabcontainer','allTabs');
tabs = maskObj.getDialogControl('allTabs');

% Create tabs and name them

maskTab1 = tabs.addDialogControl('tab','First');
maskTab1.Prompt = 'First tab';

maskTab2 = tabs.addDialogControl('tab','Second');
maskTab2.Prompt = 'Second tab';

% Add elements to one of the tabs

firstTab = tabs.getDialogControl('First');
firstTab.addDialogControl('text','textOnFirst');
firstTab.getDialogControl('textOnFirst').Prompt = 'Tab one';
```

Add Dialog Control Element Using Name-Value Pair

Add dialog control element and specify values for it

```
% Get mask object on model Engine

maskObj = Simulink.Mask.get('Engine/Gain');

% Add a dialog box and specify values for it

maskDialog = maskObj.addDialogControl('Type','text',...
'Prompt','hello','Visible','off');
```

See Also

"Block Masks" | Control Masks Programmatically | Simulink.Mask

Introduced in R2014a

getDialogControl

Class: Simulink.Mask
Package: Simulink

Search for a specific dialog control on the mask

Syntax

```
[control, phandle] = handle.getDialogControl(cname)
```

Description

`[control, phandle] = handle.getDialogControl(cname)`, search for a specific child dialog control recursively on the mask dialog.

Input Arguments

cname

Name of the dialog control being searched on the mask dialog.

Default:

Output Arguments

control

Target dialog control being searched on the mask dialog.

phandle

Parent of the dialog control being searched mask dialog.

Examples

Find a dialog control

Find a text dialog control on the mask dialog box. `maskObj` is the handle to the mask object. The `getDialogControl` method returns the handle to the dialog control (`hdlgctrl`) and handle to the parent dialog control (`phandle`).

```
[hdlgctrl, phandle] = maskObj.getDialogControl('txt_var')
```

See Also

"Block Masks" | `Simulink.Mask`

getOwner

Class: Simulink.Mask
Package: Simulink

Determine the block that owns a mask

Syntax

```
p = Simulink.Mask.get(blockName)
p.getOwner
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`p.getOwner` returns the interface to the block that owns the mask.

Input Arguments

blockName

The handle to the block or the path to the block inside the model.

Examples

1 Get mask as an object using a masked block's path.

   ```
   p = Simulink.Mask.get('myModel/Subsystem');
   ```

2 Get the interface to the block that owns the mask.

   ```
   p.getOwner;
   ```

See Also

"Block Masks" | `Simulink.Mask`

getParameter

Class: Simulink.Mask
Package: Simulink

Get a mask parameter using its name

Syntax

```
p = Simulink.Mask.get(blockName)
param = p.getParameter(paramName)
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`param = p.getParameter(paramName)` returns an array of mask parameters.

Input Arguments

blockName

The handle to the block or the path to the block inside the model.

paramName

The name of the parameter you want to get.

Examples

1   Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```

2 Get a mask parameter by using its name.

```
param = p.getParameter('intercept');
```

See Also

"Block Masks" | `Simulink.Mask`

getWorkspaceVariables

Class: Simulink.Mask
Package: Simulink

Get all the variables defined in the mask workspace for a masked block

Syntax

```
p = Simulink.Mask.get(blockName)
vars = p.getWorkspaceVariables
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`vars = p.getWorkspaceVariables` returns as a structure all the variables defined in the mask workspace for the masked block.

Input Arguments

blockName

The handle to the block or the path to the block inside the model.

Examples

1   Get mask as an object using a masked block's path.

    ```
    p = Simulink.Mask.get('myModel/Subsystem');
    ```

2   Get all the variables defined in the mask workspace for the masked block.

    ```
    vars = p.getWorkspaceVariables;
    ```

See Also

"Block Masks" | `Simulink.Mask`

numParameters

Class: Simulink.Mask
Package: Simulink

Determine the number of parameters in a mask

Syntax

```
p = Simulink.Mask.get(blockName)
p.numParameters
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`p.numParameters` returns the number of parameters in the mask.

Input Arguments

blockName

The handle to the block or the path to the block inside the model.

Examples

1   Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```

2   Get the number of parameters in the mask.

```
p.numParameters;
```

See Also

"Block Masks" | `Simulink.Mask`

removeDialogControl

Class: Simulink.Mask
Package: Simulink

Remove dialog control element from mask dialog box

Syntax

```
successIndicator = maskVariable.removeDialogControl(
controlIdentifier)
```

Description

`successIndicator = maskVariable.removeDialogControl(
controlIdentifier)` removes dialog control element, specified by
`controlIndentifier`, like text, hyperlinks, or tabs from a mask dialog box. First get
the mask object and assign it to the variable `maskVariable`.

Successful removal of a dialog control element returns a Boolean value of `1`.

Input Arguments

`controlIdentifer` — Unique identifier for the element
character vector | string scalar

Programmatic identifier for the dialog control element of mask dialog box.

Examples

Remove Dialog Control Element from Mask Dialog Box

```
% Get mask object on the Gain block in the model Engine.
```

```
maskObj = Simulink.Mask.get('Engine/Gain');

% Remove element named AllTab from mask dialog box.

p = maskObj.removeDialogControl('AllTab');
```

See Also

"Block Masks" | Simulink.Mask

Introduced in R2013b

removeParameter

Class: Simulink.Mask
Package: Simulink

Remove parameter from mask dialog box

Syntax

```
successIndicator = maskVariable.removeParameter(controlIdentifier)
```

Description

`successIndicator = maskVariable.removeParameter(controlIdentifier)` removes parameter, specified by `controlIdentifier`, like edit, check box, popup from an existing mask dialog box. First get the mask object and assign it to the variable `maskVariable`.

Successful removal of a parameter returns a Boolean value of 1.

Input Arguments

`controlIdentifer` — Unique identifier for the parameter
character vector | string scalar

Programmatic identifier for the parameter of mask dialog box, specified as a character vector.

Examples

Remove Parameter from Mask Dialog Box

```
% Get mask object on the Gain block in the model Engine.
```

```
maskObj = Simulink.Mask.get('Engine/Gain');

% Remove parameter named checkbox1 from mask dialog box.

p = maskObj.removeParameter('checkbox1');
```

Note You can also use the index number as the controlIdentifier.

See Also
"Block Masks" | Simulink.Mask

Introduced in R2012b

removeAllParameters

Class: Simulink.Mask
Package: Simulink

Remove all existing parameters from a mask

Syntax

```
p = Simulink.Mask.get(blockName)
p.removeAllParameters
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`p.removeAllParameters` deletes all existing parameters from the mask.

Input Arguments

blockName

The handle to the block or the path to the block inside the model.

Examples

1 Get mask as an object using a masked block's path.

   ```
   p = Simulink.Mask.get('myModel/Subsystem');
   ```
2 Delete all existing parameters from the mask.

   ```
   p.removeAllParameters;
   ```

See Also

"Block Masks" | `Simulink.Mask`

set

Class: Simulink.Mask
Package: Simulink

Set the properties of an existing mask

Syntax

```
p = Simulink.Mask.get(blockName)
p.set(Name,Value)
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`p.set(Name,Value)` sets mask properties that you specify using name–value pairs as arguments.

Input Arguments

blockName

The handle to the block or the path to the block inside the model.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (`' '`). You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Type

Text used as title for mask documentation that user sees on clicking **Help** in the Mask Parameters dialog box.

Default: empty

Description

Text used as summary for mask documentation that user sees on clicking **Help** in the Mask Parameters dialog box.

Default: empty

Help

Text used as body text for mask documentation that user sees on clicking **Help** in the Mask Parameters dialog box.

Default: empty

Initialization

MATLAB code that initializes the mask.

Default: empty

SelfModifiable

Option to set whether the mask can modify itself during simulation.

Default: `'off'`

Display

MATLAB code that draws the mask icon.

Default: empty

IconFrame

Option to specify whether the mask icon appears inside a visible block frame.

Default: `'on'`

MaskIconOpaque

Option to set the mask icon as opaque or transparent.

Default: `'opaque'`

RunInitForIconRedraw

Option to specify whether Simulink should run mask initialization before executing the mask icon commands.

Default: `'off'`

IconRotate

Option to specify icon rotation.

Default: `'none'`

PortRotate

Option to specify port rotation.

Default: `'default'`

IconUnits

Option to specify whether mask icon is autoscaled, normalized, or scaled in pixels.

Default: `'autoscale'`

Examples

1 Get mask as an object using a masked block's path.

   ```
   p = Simulink.Mask.get('myModel/Subsystem');
   ```

2 Modify the mask so that its mask icon is transparent and its documentation summarizes what it does.

   ```
   p.set('IconOpaque','off','Type','Random number generator','Description',...
   'This block generates random numbers.');
   ```

"Block Masks" | `Simulink.Mask`

addParameterConstraint

Class: Simulink.Mask
Package: Simulink

Add parameter constraint to a mask

Syntax

```
paramConstraint = maskObj.addParameterConstraint(Name,Value)
```

Description

`paramConstraint = maskObj.addParameterConstraint(Name,Value)` adds a constraint to the specified mask. Constraints can only be associated to the Edit type mask parameters.

Input Arguments

`maskObj` — Block mask handle
mask object

Block mask handle, specified as a mask object. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information, see `Simulink.Mask.get`

Data Types: `char` | `cell`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Name — Mask constraint name
character vector | string

Required field. Must be a valid MATLAB name. Specifies a name for the mask parameter constraint.

`Parameters` — Mask parameter name
cell array of character vector | string

Optional field. Specifies the **Edit** mask parameter name to which you want to associate the constraint.

`Rules` — Rule for mask parameter constraint
DataType | Dimension | Complexity | Sign | Finiteness | Minimum | Maximum | CustomConstraint

Required field. Rules are defined within curly braces. A constraint can have single or multiple rules.

Name-Value Pairs for Rules

Name	Value
`DataType`	`double`, `single`, `numeric`, `integer`, `int8`, `uint8`, `int16`, `uint16`, `int32`, `uint32`, `boolean`, `enum`, `fixdt`
`Dimension`	`scalar`, `rowvectar`, `columnvectar`, `2dmatrix`, `ndmatrix`
`Complexity`	`real`, `complex`
`Sign`	`positive`, `negative`, `zero`
`Finiteness`	`finite`, `inf`, `-inf`, `NaN`
`Minimum`	character vector
`Maximum`	character vector
`CustomConstraint`	Valid MATLAB expression returning logical true or false.

Output Arguments

`paramConstraint` — Mask parameter constraint
character vector | string

Handle to the mask parameter constraint, returned as a character vector. You can associate a constraint to the mask parameter either during or after creating the constraint.

Examples

Create Mask Constraint with Single Rule

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Create mask constraint with single rule.
paramConstraint = maskObj.addParameterConstraint('Name','const2',...
'Parameters',{'Parameter2'}, 'Rules', {'DataType', 'uint8'})

ans =

  Constraints with properties:

             Name: 'const2'
    ConstraintRules: [1×1 Simulink.Mask.ParameterConstraintRules]
```

Create Mask Constraint with Multiple Rules

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Create mask constraint with multiple rules.
paramConstraint = maskObj.addParameterConstraint('Name','const3',...
'Parameters',{'Parameter3'}, 'Rules', {{'DataType', 'uint8'},{'DataType', {'fixdt(1,8,4

ans =

  Constraints with properties:

             Name: 'const3'
    ConstraintRules: [1×2 Simulink.Mask.ParameterConstraintRules]
```

"Block Masks" | `Simulink.Mask`

Introduced in R2018a

removeParameterConstraint

Class: Simulink.Mask
Package: Simulink

Delete a mask parameter constraint

Syntax

```
maskObj.removeParameterConstraint(paramConstraint)
```

Description

`maskObj.removeParameterConstraint(paramConstraint)` deletes the specified mask parameter constraint.

Input Arguments

maskObj — Block mask handle
mask object

Handle to the block mask, specified as mask object. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information, see `Simulink.Mask.get`.

Data Types: `char` | `cell`

paramConstraint — Mask constraint name
character vector | string

Name of the mask parameter constraint to be deleted, specified as character vector.

Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);
```

```
% Remove mask constraint with name 'const1'.
maskObj.removeParameterConstraint('const1')
```

See Also

"Block Masks" | Simulink.Mask

Introduced in R2018a

removeCrossParameterConstraint

Class: Simulink.Mask
Package: Simulink

Delete a cross-parameter constraint

Syntax

```
maskObj.removeCrossParameterConstraint(CrossConstraint)
```

Description

`maskObj.removeCrossParameterConstraint(CrossConstraint)` deletes the specified cross-constraint.

Input Arguments

`maskObj` — Block mask handle
mask object

Handle to the block mask, specified as mask object. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information, see `Simulink.Mask.get`.

Data Types: `char` | `cell`

`CrossConstraint` — Cross constraint name
character vector | string

Name of the cross-constraint to be removed, specified as character vector.

Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);
```

```
% Remove cross-constraint of name 'const1'.
maskObj.removeCrossParameterConstraint('const1')
```

removeAllParameterConstraints

Class: Simulink.Mask
Package: Simulink

Delete all mask parameter constraints

Syntax

```
maskObj.removeAllParameterConstraints()
```

Description

`maskObj.removeAllParameterConstraints()` deletes all the parameter constraints from a mask.

Input Arguments

maskObj — Block mask handle
mask object

Handle to the block mask. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information see, `Simulink.Mask.get`

Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Remove all constraints from the mask.
maskObj.removeAllParameterConstraints()
```

See Also

removeAllCrossParameterConstraints

Class: Simulink.Mask
Package: Simulink

Delete all cross-parameter constraints from a mask

Syntax

```
maskObj.removeAllCrossParameterConstraints()
```

Description

`maskObj.removeAllCrossParameterConstraints()` deletes all cross-constraints from a mask.

Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Remove all cross constraints from the mask.
maskObj.removeAllCrossParameterConstraints()
```

getParameterConstraint

Class: Simulink.Mask
Package: Simulink

Get mask parameter constraint properties

Syntax

```
paramConstraint = maskObj.getParameterConstraint(
paramConstraintName)
```

Description

`paramConstraint = maskObj.getParameterConstraint(
paramConstraintName)` gets the properties of a mask parameter constraint.

Input Arguments

`maskObj` — Block mask handle
mask object

Handle to the block mask, specified as mask object. You can use the
`Simulink.Mask.get` command to get the block mask handle. For more information, see
`Simulink.Mask.get`.

Data Types: `char` | `cell`

`paramConstraintName` — Mask constraint name
character vector | string

Name of the constraint of which you want get the properties, specified as character
vector.

Output Arguments

`paramConstraint` — Mask constraint property
cell array of character vector

Constraint properties, returned as a cell array.

Examples

```matlab
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Find parameters associated with the constraint.
paramConstraint = maskObj.getParameterConstraint('const3')

ans =

  Constraints with properties:

          Name: 'const3'
  ConstraintRules: [1×2 Simulink.Mask.ParameterConstraintRules]
```

See Also

"Block Masks" | Simulink.Mask

Introduced in R2018a

getCrossParameterConstraint

Class: Simulink.Mask
Package: Simulink

Get cross-parameter constraint

Syntax

```
CrossConstraint = maskObj.getCrossParameterConstraint(
CrossConstraintName)
```

Description

`CrossConstraint = maskObj.getCrossParameterConstraint(
CrossConstraintName)` gets the properties of a cross parameter constraint on a mask. Apply a cross-parameter constraint to specify rules between mask parameter values.

Input Arguments

maskObj — Block mask handle
mask object

Handle to the block mask, specified as mask object. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information, see `Simulink.Mask.get`.

Data Types: `char` | `cell`

CrossConstraintName — Cross-constraint name
character vector | string

Name of the cross-parameter constraint for which you get the constraint properties, specified as the mask object.

Output Arguments

`CrossConstraint` — Cross-constraint property
cell array

Cross-parameter constraint properties, returned as a cell array.

Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get cross constraint.
CrossConstraint = maskObj.getCrossParameterConstraint('crossparam1')

ans =

  CrossParameterConstraints with properties:
          Name: 'crossparam1'
          Rule: 'Parameter2 > Parameter3'
    ErrorMessage: ''
```

getAssociatedParametersOfConstraint

Class: Simulink.Mask
Package: Simulink

Get mask parameters associated with a constraint

Syntax

```
maskParam = maskObj.getAssociatedParametersOfConstraint(
paramConstraintName)
```

Description

`maskParam = maskObj.getAssociatedParametersOfConstraint(
paramConstraintName)` gets the parameters that are associated with a mask
constraint.

Input Arguments

maskObj — Block mask handle
mask object

Handle to the block mask, specified as mask object. You can use the
`Simulink.Mask.get` command to get the block mask handle. For more information, see
`Simulink.Mask.get`.

Data Types: `char` | `cell`

paramConstraintName — Mask constraint name
character vector | string

Name of the constraint for which you want to find the associated mask parameters,
specified as character vector.

Output Arguments

maskParam — Mask parameter name
cell array of character vector

Mask parameter, specified as a cell array.

Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Find parameters associated with the constraint.
maskParam = maskObj.getAssociatedParametersOfConstraint('const3')

ans =

  1×1 cell array

    {'Parameter1'}
```

See Also

"Block Masks" | Simulink.Mask

Introduced in R2018a

addCrossParameterConstraint

Class: Simulink.Mask
Package: Simulink

Add cross-parameter constraint

Syntax

```
CrossConstraint = maskObj.addCrossParameterConstraint(Name,Value)
```

Description

`CrossConstraint = maskObj.addCrossParameterConstraint(Name,Value)`
adds a constraint among parameters of a mask.

Input Arguments

`maskObj` — Block mask handle
mask object

Block mask handle, specified as a mask object. You can use the `Simulink.Mask.get`
command to get the block mask handle. For more information, see `Simulink.Mask.get`.

Data Types: `char` | `cell`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the property
name and `Value` is the corresponding value. You can specify several name and value pair
arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Name — Cross-parameter constraint name
character vector | string

Cross-parameter constraint name, specified as a character vector. Must be a valid MATLAB value.

Rule — Cross-parameter constraint rule
MATLAB expression | string

Cross-parameter constraint rule, specified as a valid MATLAB expression that returns logical true or false. You can specify multiple rules by separating them with a logical operators like &&. For example, `parameter1 > parameter2 && parameter2 > parameter3`. Here, `parameter1`, `parameter2` and `parameter3` are parameters of a mask.

ErrorMessage — Error message
character vector | string

Optional field. Specifies the error message to be displayed when the cross parameter constraint rule is not satisfied. You can specify the error message as character vector or as a message catalog ID. If you use the message catalog ID to specify an error, the error message must not have any holes in it. Simulink displays a default error message if no user-defined error message is found.

Output Arguments

CrossConstraint — Cross parameter constraint
cell array

Handle to the cross-parameter constraint, returned as a cell array.

Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Add cross parameter constraint.
CrossConstraint = maskObj.addCrossParameterConstraint('Name','crossconstraint1',...
'Rule','upperbound > lowerbound','ErrorMessage','Incorrect value specified.')

ans =
```

```
CrossParameterConstraints with properties:

        Name: 'crossconstraint1'
        Rule: 'upperbound > lowerbound'
ErrorMessage: 'Incorrect value specified.'
```

"Block Masks" | Simulink.Mask

Introduced in R2018a

Simulink.Mask.Constraints class

Package: Simulink.Mask

Create Mask Constraint

Description

Use an instance of the `Simulink.Mask.Constraint` to add or remove a parameter constraint rule.

Properties

DataType

Specifies the data type associated with the constraint rule.

Type: `double, single, numeric, integer, int8, uint8, int16, uint16, int32, uint32, boolean, enum, fixdt`

Default: `Empty`

Dimension

Specifies the dimension associated with the constraint rule.

Type: `scalar, rowvector, columnvector, 2dmatrix, ndmatrix`

Default: `Empty`

Complexity

Specifies the complexity associated with the constraint rule.

Type: `real, complex`

Default: `Empty`

5-947

Sign

Specifies the sign associated with the constraint rule.

Type: `positive, negative, zero`

Default: `Empty`

Finiteness

Specifies the finiteness associated with the constraint rule.

Type: `finite, inf, -inf, NaN`

Default: `Empty`

Range

Specifies the range associated with the constraint rule.

Type: `Minimum, Maximum`

Default: `Empty`

CustomConstraint

Specifies the error message associated with the constraint rule.

Type: `Valid MATLAB expression`

Default: `Empty`

Methods

addParameterConstraintRule	Add rules to a parameter constraint
removeParameterConstraintRule	Delete a mask parameter constraint rule

See Also

Introduced in R2018a

addParameterConstraintRule

Class: Simulink.Mask.Constraints
Package: Simulink.Mask

Add rules to a parameter constraint

Syntax

```
paramConstRule = paramConstraint.addParameterConstraintRule(
Name,Value)
```

Description

`paramConstRule = paramConstraint.addParameterConstraintRule(`
`Name,Value)` adds rule to a parameter constraint.

Input Arguments

`paramConstraint` — Handle to mask constraint
constraint object

Handle to the mask parameter constraint for which you want to add constraint rules, specified as constraint object.

Data Types: `char` | `cell`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Name-Value Pair for Rules

Name	Value
DataType	double, single, numeric, integer, int8, uint8, int16, uint16, int32, uint32, boolean, enum, fixdt
Dimension	scalar, rowvectar, columnvectar, 2dmatrix, ndmatrix
Complexity	real, complex
Sign	positive, negative, zero
Finiteness	finite, inf, -inf, NaN
Minimum	string
Maximum	string
CustomConstraint	Valid MATLAB expression

Output Arguments

paramConstRule — Mask constraint rule
cell array

Mask constraint rule, specified as as a cell array.

Examples

```
% Get mask constraint handle
paramConstraint = maskObj.getParameterConstraint('const3');

% Add rules to the constraint.
paramConstRule = paramConstraint.addParameterConstraintRule('DataType','int8')

ans =

  ParameterConstraintRules with properties:

        DataType: 'int8'
```

```
        Dimension: {0×1 cell}
       Complexity: {0×1 cell}
             Sign: {0×1 cell}
       Finiteness: {0×1 cell}
          Minimum: ''
          Maximum: ''
 CustomConstraint: ''
```

removeParameterConstraintRule

Class: Simulink.Mask.Constraints
Package: Simulink.Mask

Delete a mask parameter constraint rule

Syntax

paramConstraint.removeParameterConstraintRule(RuleIndex)

Description

paramConstraint.removeParameterConstraintRule(RuleIndex) deletes the
specified constraint rule from a mask parameter constraint.

Input Arguments

paramConstraint — Handle to constraint
constraint object

Handle to mask parameter constraint of which you want to remove constraint rule,
specified as an object.

Data Types: char | cell

RuleIndex — Constraint rule index
integer

Index number of the mask constraint rule, specified as an integer.

Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);
```

```
% Get mask constraint handle.
paramConstraint = maskObj.getParameterConstraint('const3');

% Remove mask constraint rule.
paramConstraint.removeParameterConstraintRule(1)
```

"Block Masks" | Simulink.Mask

Introduced in R2018a

Simulink.MaskParameter class

Package: Simulink

Control mask parameters programmatically

Description

Use an instance of `Simulink.MaskParameter` to set the properties of mask parameters.

Properties

Type

Specifies the mask parameter type.

Type: `character vector`

Values:
`'edit'|'checkbox'|'popup'|'min'|'max'|'promote'|'combobox'|'radiobut
ton'|'unidt'|'slider'|'dial'|'spinbox'`

Default: `'edit'`

TypeOptions

Specifies the option for the parameter if it exists, otherwise, it is empty. Applicable for parameters of type `popup`, `radio`, `Datatypestr`, and `promote` .

Type: `cell array of character vectors`

Default: `{''}`

Name

Specifies the name of the mask parameter. This name is assigned to the mask workspace variable created for the mask parameter. The mask parameter name must not match the built-in parameter name.

Type: `character vector`

Default: `Auto generated`

Prompt

Specifies a character vector that appears as the label associated with the parameter on the mask dialog.

Type: `character vector`

Default: `Empty character vector`

Value

Specifies the value of the mask parameter.

Default: Depends on the type of the parameter.

Evaluate

Indicates if the parameter value is to be evaluated in MATLAB or treated as a character vector when the block is evaluated.

Type: `boolean`

Values: `'on'|'off'`

Default: `'on'`

Tunable

Indicates if the parameter value can be changed during simulation.

Type: `boolean`

Values: `'on'|'off'`

Default: `'on'`

NeverSave

Indicates if the parameter value gets saved in the model file.

Type: `boolean`

Values: `'on'|'off'`

Default: `'off'`

Hidden

Indicates if the parameter should never show on the mask dialog box.

Type: `boolean`

Values: `'on'|'off'`

Default: `'off'`

ReadOnly

Indicates if the parameter on the mask dialog box is editable or is read-only.

Type: `boolean`

Values: `'on'|'off'`

Default: `'off'`

Enabled

Indicates if the parameter is enabled in the mask dialog box.

Type: `boolean`

Values: `'on'|'off'`

Default: `'on'`

Visible

Indicates if the parameter is visible in the mask dialog box.

Type: `boolean`

Values: `'on'|'off'`

Default: `'on'`

ShowTooltip

Indicates if tool tip is enabled for the mask parameter.

Type: `boolean`

Values: `'on'|'off'`

Default: `'on'`

Callback

Specifies the MATLAB code that executes when a user changes the parameter value from the mask dialog box.

Type: `character vector`

Default: `Empty character vector`

TabName

Specifies the tab name of the mask dialog box where the parameter is displayed.

Type: `character vector`

Default: `Empty character vector`

Alias

Specifies the alternate name for mask parameter.

Type: `character vector`

Default: `Empty character vector`

Methods

set   Set properties of mask parameters

See Also

Topics
"Control Masks Programmatically"
"Block Masks"

set

Class: Simulink.MaskParameter
Package: Simulink

Set properties of mask parameters

Syntax

```
Simulink.MaskParameter.set(Name,Value)
```

Description

`Simulink.MaskParameter.set(Name,Value)` sets the properties of a mask parameter.

Input Arguments

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Type

Type of control that is used to specify the value of this parameter.

Default: edit

TypeOptions

The options that are displayed within a popup control or in a promoted parameter. This field is a cell array.

Default: empty

Name

The name of the mask parameter. This name is assigned to the mask workspace variable created for this parameter.

Default: empty

Prompt

Text that identifies the parameter on the Mask Parameters dialog.

Default: empty

Value

The default value of the mask parameter in the Mask Parameters dialog.

Default: Type specific; depends on the Type of the parameter

Evaluate

Option to specify whether parameter must be evaluated.

Default: 'on'

Tunable

Option to specify whether parameter is tunable.

Default: 'on'

Enabled

Option to specify whether user can set parameter value.

Default: 'on'

Visible

Option to set whether mask parameter is hidden or visible to the user.

Default: 'on'

`Callback`

Container for MATLAB code that executes when user makes a change in the Mask Parameters dialog and clicks **Apply**.

Default: empty

Examples

1   Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```

2   Get a mask parameter.

```
a = p.Parameters(1);
```

3   Edit mask parameter so it is of type popup, cannot be evaluated.

```
a.set('Type','popup','TypeOptions',{'Red' 'Blue' 'Green'},...
'Evaluate','off');
```

Simulink.dialog.Control class

Package: Simulink.dialog

Create instances of dialog control

Description

Use an instance of `Simulink.dialog.Control` class to create, delete, or search dialog controls.

Properties

Name

Uniquely identifies the dialog control element and is a required field.

Type: `character vector`

See Also

`Simulink.dialog.Button` | `Simulink.dialog.Hyperlink` | `Simulink.dialog.Image` | `Simulink.dialog.Text` | `Simulink.dialog.parameter.Control` | `Simulink.dialog.Container` | "Block Masks"

Simulink.dialog.Container class

Package: Simulink.dialog

Create instances of a container dialog control

Description

Use an instance of `Simulink.dialog.Container` class to add container type dialog control.

Properties

Name

Uniquely identifies the container dialog control and is a required filed.

Type: `character vector`

Enabled

Indicates whether container is active on the mask dialog box.

Type: `boolean`

Value: `'on'|'off'`

Default: `'on'`

Visible

Indicates whether container is displayed on the mask dialog box.

Type: `boolean`

Value: `'on'|'off'`

Default: `'on'`

AlignPrompts

Allows you to align the parameters vertically on the mask dialog box.

Type: `boolean`

Value: `'on'|'off'`

Default: `'off'`

DialogControls

Specifies the child dialog controls contained in the container.

Type: `Simulink.dialog.Control`

Default: `Empty array`

Methods

addDialogControl	Add dialog control elements to mask dialog box
removeDialogControl	Remove dialog control element from mask dialog box
getDialogControl	Search for a specific dialog control on the mask

See Also

`Simulink.dialog.Group`|`Simulink.dialog.Panel`|`Simulink.dialog.Tab`|
`Simulink.dialog.TabContainer`|`Simulink.dialog.Control`|"Block Masks"

addDialogControl

Class: Simulink.dialog.Container
Package: Simulink.dialog

Add dialog control elements to mask dialog box

Syntax

```
successIndicator = maskObj.addDialogControl(controlType,
controlIdentifier)
successIndicator = maskObj.addDialogControl(Name,Value)
```

Description

`successIndicator = maskObj.addDialogControl(controlType, controlIdentifier)` adds dialog control elements like text, hyperlinks, or tabs to mask dialog box. First get the mask object and assign it to the variable `maskObj`

`successIndicator = maskObj.addDialogControl(Name,Value)` specifies the Name and Value arguments for an element on the mask dialog box. You can specify multiple Name-Value pairs.

Input Arguments

`controlType` — Value type of dialog control element
character vector

Type of dialog control element, specified

- `'panel'`
- `'group'`
- `'tabcontainer'`
- `'tab'`

- 'collapsiblepanel'
- 'text'
- 'image'
- 'hyperlink'
- 'pushbutton'

controlIdentifer — Unique identifier for the element
character vector

Specifies the programmatic identifier for the element of mask dialog box. Use a name that is unique and does not have space between words. For more information, see "Variable Names" (MATLAB).

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (`' '`) and is case-sensitive. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Type

Type of control that is used to specify the value of this dialog control element. Type is a required argument. The permitted values are `'panel'`, `'group'`, `'tabcontainer'`, `'tab'`, `'collapsiblepanel'`, `'text'`, `'image'`, `'hyperlink'`, and `'pushbutton'`. If the parent dialog control type is `'tabcontainer'`, the child dialog control must be `'tab'`.

Name

The identifier of the dialog control element. Name is a required argument. This field is available for all dialog control types.

Prompt

Text that is displayed in the dialog control element on the Mask dialog box. This field is available for all except for panel and image dialog control types.

Default: empty

Enabled

Option to specify whether you can set value for the dialog control element. This field is available for all dialog control types.

Default: `'on'`

Visible

Option to set whether the dialog control element is hidden or visible to the user. This field is available for all dialog control types.

Default: `'on'`

Callback

Container for MATLAB code that executes when you edit the dialog control element and click **Apply**. This field is available only for the hyperlink and pushbutton dialog control types.

Default: empty

Row

Option to set whether the dialog control is placed in the new row or the same row. This field is available for all dialog control types.

Default: empty

FilePath

Contains the path to an image file. This field is available for image, and pushbutton dialog control types.

Default: empty

Container

Option to specifies a container for the child dialog control. The permitted values are the names of `'panel'`, `'group'`, and `'tab'` dialog controls.

Examples

Add Dialog Control Elements to Mask Dialog Box

Get mask object and add dialog control element to it.

```
% Get mask object on model Engine

maskObj = Simulink.Mask.get('Engine/Gain');

% Add hyperlink to mask dialog box

maskLink = maskObj.addDialogControl('hyperlink','link');
maskLink.Prompt = 'Mathworks Home Page';
maskLink.Callback = 'web(''www.mathworks.com'')'

% Alternative method to add hyperlink

maskLink = maskObj.addDialogControl('hyperlink','link');
maskLink.Prompt = 'www.mathworks.com';

% Add text to mask dialog box

maskText = maskObj.addDialogControl('text','text_tag');
maskText.Prompt = 'Enable range checking';

% Add button to mask dialog box

maskButton = maskObj.addDialogControl('pushbutton','button_tag');
maskButton.Prompt = 'Compute';
```

Add Dialog Control Elements to Mask Dialog Box Tabs

Create tabs on the mask dialog box and add elements to these tabs.

```
% Get mask object on a block named 'GainBlock'

maskObj = Simulink.Mask.get('GainBlock/Gain');

% Create a tab container
```

```
maskObj.addDialogControl('tabcontainer','allTabs');
tabs = maskObj.getDialogControl('allTabs');

% Create tabs and name them

maskTab1 = tabs.addDialogControl('tab','First');
maskTab1.Prompt = 'First tab';

maskTab2 = tabs.addDialogControl('tab','Second');
maskTab2.Prompt = 'Second tab';

% Add elements to one of the tabs

firstTab = tabs.getDialogControl('First');
firstTab.addDialogControl('text','textOnFirst');
firstTab.getDialogControl('textOnFirst').Prompt = 'Tab one';
```

Add Dialog Control Element Using Name-Value Pair

Add dialog control element and specify values for it

```
% Get mask object on model Engine

maskObj = Simulink.Mask.get('Engine/Gain');

% Add a dialog box and specify values for it

maskDialog = maskObj.addDialogControl('Type','text',...
'Prompt','hello','Visible','off');
```

See Also
Simulink.dialog.Container | "Block Masks"

Introduced in R2014a

removeDialogControl

Class: Simulink.dialog.Container
Package: Simulink.dialog

Remove dialog control element from mask dialog box

Syntax

```
successIndicator = maskVariable.removeDialogControl(
controlIdentifier)
```

Description

`successIndicator = maskVariable.removeDialogControl(
controlIdentifier)` removes dialog control element, specified by
`controlIndentifier`, like text, hyperlinks, or tabs from a mask dialog box. First get
the mask object and assign it to the variable `maskVariable`.

Successful removal of a dialog control element returns a Boolean value of `1`.

Input Arguments

`controlIdentifer` — Unique identifier for the element
character vector

Programmatic identifier for the dialog control element of mask dialog box, specified as a
character vector.

Examples

Remove Dialog Control Element from Mask Dialog Box

```
% Get mask object on the Gain block in the model Engine.
```

```
maskObj = Simulink.Mask.get('Engine/Gain');

% Remove element named AllTab from mask dialog box.

maskTab = maskObj.removeDialogControl('AllTab');
```

Simulink.dialog.Container | "Block Masks"

Introduced in R2013b

getDialogControl

Class: Simulink.dialog.Container
Package: Simulink.dialog

Search for a specific dialog control on the mask

Syntax

```
[control, phandle] = handle.getDialogControl(controlIdentifier)
```

Description

[control, phandle] = handle.getDialogControl(controlIdentifier),
search for a specific child dialog control recursively on the mask dialog box.

Input Arguments

controlIdentifier

Name of the dialog control being searched on the mask dialog box.

Default:

Output Arguments

control

Target dialog control being searched on the mask dialog box.

phandle

Parent of the dialog control being searched mask dialog box.

Examples

Find a dialog control

Find a text dialog control on the mask dialog box. `maskObj` is the handle to the mask object. The `getDialogControl` method returns the handle to the dialog control (`hdlgctrl`) and handle to the parent dialog control (`phandle`).

```
[hdlgctrl, phandle] = maskObj.getDialogControl('txt_var')
```

Simulink.dialog.Panel class

Package: Simulink.dialog

Create an instance of a panel dialog control

Description

Use an instance of `Simulink.dialog.Panel` class to create an instance of panel dialog control.

Properties

Name

Uniquely identifies the panel dialog control and is a required field.

Type: `character vector`

Row

Specifies whether panel is placed on the current row or on a new row.

Type: `character vector`

Values: `'current'|'new'`

Default: `'new'`

Enabled

Specifies whether panel is active on the mask dialog box.

Type: `boolean`

Values: `'on'|'off'`

Default: `'on'`

Visible

Specifies whether panel is displayed on the mask dialog box.

Type: `boolean`

Values: `'on'|'off'`

Default: `'on'`

DialogControls

Specifies the child dialog controls contained in the panel.

Type: `Simulink.dialog.Control`

Default: `Empty array`

Methods

addDialogControl	Add dialog control elements to mask dialog box
removeDialogControl	Remove dialog control element from mask dialog box
getDialogControl	Search for a specific dialog control on the mask

See Also

Simulink.dialog.Group class

Package: Simulink.dialog

Create an instance of a group dialog control

Description

Use an instance of `Simulink.dialog.Group` class to create an instance of group dialog control.

Properties

Name

Uniquely identifies the group dialog control and is a required field.

Type: `character vector`

Prompt

Specifies the text displayed on the group.

Type: `character vector`

Default: `Empty character vector`

Row

Specifies whether group is placed on the current row or on a new row.

Type: `character vector`

Values: `'current'|'new'`

Default: `'new'`

Enabled

Specifies whether group is active on the mask dialog box.

Type: `boolean`

Values: `'on'|'off'`

Default: `'on'`

Visible

Specifies whether group is displayed on the mask dialog box.

Type: `boolean`

Values: `'on'|'off'`

Default: `'on'`

DialogControls

Specifies the child dialog controls contained in the group.

Type: `Simulink.dialog.Control`

Default: `Empty array`

Methods

addDialogControl	Add dialog control elements to mask dialog box
removeDialogControl	Remove dialog control element from mask dialog box
getDialogControl	Search for a specific dialog control on the mask

Simulink.dialog.Tab class

Package: Simulink.dialog

Create an instance of a tab dialog control

Description

Use an instance of `Simulink.dialog.Tab` class to create an instance of tab dialog control.

Properties

Name

Uniquely identifies the tab dialog control and is a required field.

Type: `character vector`

Prompt

Specifies the text displayed on the tab.

Type: `character vector`

Default: `Empty character vector`

Enabled

Specifies whether tab is active on the mask dialog box.

Type: `boolean`

Values: `'on'|'off'`

Default: `'on'`

`Visible`

Specifies whether tab is displayed on the mask dialog box.

Type: `boolean`

Values: `'on'`|`'off'`

Default: `'on'`

`DialogControls`

Specifies the child dialog controls contained in the tab dialog control.

Type: `Simulink.dialog.Control`

Default: `Empty array`

Methods

addDialogControl	Add dialog control elements to mask dialog box
removeDialogControl	Remove dialog control element from mask dialog box
getDialogControl	Search for a specific dialog control on the mask

See Also

Simulink.dialog.TabContainer class

Package: Simulink.dialog

Create an instance of a tab container dialog control

Description

Use an instance of `Simulink.dialog.TabContainer` class to create an instance of tab container dialog control. Tab container dialog box be used to group the tab dialog controls.

Properties

Name

Uniquely identifies the tab container dialog control and is a required field.

Type: `character vector`

Row

Specifies whether tab container is placed on the current row or on a new row.

Type: `enumerated string`

Values: `'current'|'new'`

Default: `'new'`

Enabled

Specifies whether tab container is active on the mask dialog box.

Type: `boolean`

Values: `'on'|'off'`

Default: `'on'`

`Visible`

Specifies whether tab container is displayed on the mask dialog box.

Type: `boolean`

Values: `'on'`|`'off'`

Default: `'on'`

`DialogControls`

Specifies the child dialog controls contained in the group.
`Simulink.dialog.TabContainer` class can only contain `Simulink.dialog.Tab` dialog control.

Type: `Simulink.dialog.Tab`

Default: `Empty array`

Methods

addDialogControl	Add dialog control elements to mask dialog box
removeDialogControl	Remove dialog control element from mask dialog box
getDialogControl	Search for a specific dialog control on the mask

Simulink.dialog.Button class

Package: Simulink.dialog

Create a button dialog control

Description

Use an instance of `Simulink.dialog.Button` class to add a button dialog control.

Properties

Name

Uniquely identifies the dialog control and is a required field.

Type: `character vector`

Prompt

Specifies the text displayed on the button dialog control.

Type: `character vector`

Default: `empty`

FilePath

Specifies the path to the image file to be shown on the button dialog control.

Type: `character vector`

Default: `empty`

Callback

Specifies the MATLAB command (s) to be executed when the dialog control is invoked.

Type: `character vector`

Default: `empty`

Row

Specifies whether dialog control is placed on the current row or on a new row.

Type: `character vector`

Value: `'current'|'new'`

Default: `'current'`

Enabled

Indicates whether container is active on the mask dialog box.

Type: `boolean`

Value: `'on'|'off'`

Default: `'on'`

Visible

Indicates whether container is displayed on the mask dialog box.

Type: `boolean`

Value: `'on'|'off'`

Default: `'on'`

Simulink.dialog.Hyperlink class

Package: Simulink.dialog

Create a hyperlink dialog control

Description

Use an instance of `Simulink.dialog.Hyperlink` class to add a hyperlink dialog control.

Properties

Name

Uniquely identifies the dialog control and is a required field.

Type: `character vector`

Prompt

Specifies the text displayed on the hyperlink.

Type: `character vector`

Default: `empty`

Callback

Specifies the MATLAB command (s) to be executed when the dialog control is invoked.

Type: `character vector`

Default: `empty`

Row

Specifies whether hyperlink is placed on the current row or on a new row.

Type: `character vector`

Value: `'current'|'new'`

Default: `'new'`

Enabled

Indicates whether hyperlink is active on the mask dialog box.

Type: `boolean`

Value: `'on'|'off'`

Default: `'on'`

Visible

Indicates whether hyperlink is displayed on the mask dialog box.

Type: `boolean`

Value: `'on'|'off'`

Default: `'on'`

Simulink.dialog.Image class

Package: Simulink.dialog

Create an image dialog control

Description

Use an instance of `Simulink.dialog.Image` class to add an image dialog control.

Properties

Name

Uniquely identifies the dialog control and is a required field.

Type: `character vector`

FilePath

Specifies the path to the image file to be displayed on the dialog box.

Type: `character vector`

Default: `empty`

Row

Specifies whether dialog control is placed on the current row or on a new row.

Type: `character vector`

Value: `'current'|'new'`

Default: `'new'`

Enabled

Indicates whether image is active on the mask dialog box.

Type: `boolean`

Value: `'on'|'off'`

Default: `'on'`

`Visible`

Indicates whether image is displayed on the mask dialog box.

Type: `boolean`

Value: `'on'|'off'`

Default: `'on'`

`Simulink.dialog.Control` | "Block Masks"

Simulink.dialog.Text class

Package: Simulink.dialog

Create a text dialog control

Description

Use an instance of `Simulink.dialog.Text` class to add a text dialog control.

Properties

Name

Uniquely identifies the dialog control element and is a required field.

Type: `character vector`

Prompt

Specifies the text displayed on the mask dialog box.

Type: `character vector`

Default: `empty`

WordWrap

Specifies whether to wrap long text to the next line on the mask dialog box.

Type: `boolean`

Value: `'on'|'off'`

Default: `'on'`

Row

Specifies whether dialog control is placed on the current row or on a new row.

Type: character vector

Value: 'current'|'new'

Default: 'new'

Enabled

Indicates whether dialog control is active on the mask dialog box.

Type: boolean

Value: 'on'|'off'

Default: 'on'

Visible

Indicates whether dialog control is displayed on the mask dialog box.

Type: boolean

Value: 'on'|'off'

Default: 'on'

Simulink.dialog.Control | "Block Masks"

Simulink.dialog.parameter.Control class

Package: Simulink.dialog.parameter

Create a parameter dialog control

Description

Use an instance of `Simulink.dialog.parameter.Control` class to add a parameter dialog control.

Properties

Name

Uniquely identifies the dialog control element. This is a required field and has the same value as its underlying parameter name.

Type: `character vector`

Row

Specifies whether the dialog control is placed on the current row or on a new row.

Type: `character vector`

Value: `'current'|'new'`

Default: `'new'`

See Also

`Simulink.dialog.Control` | "Block Masks"

Simulink.sfunction.Analyzer class

Package: Simulink.sfunction

Create a Simulink S-function analyzer object

Description

This class enables you to perform checks on S-functions within a model or a library. These checks include MEX compiler setup check, source code check, MEX-file check, parameter robustness check for S-functions. The check result can be accessed either from a MATLAB structure or an HTML report.

The S-function analyzer checks the source code of the S-functions based on the S-function names. The S-function source code can be automatically included in the analysis if the source file is a single .c or .cpp file in the MATLAB path that has the same name as the S-function. Otherwise, the build information can be specified through the S-function Analyzer APIs. If no source code is available on the specified path, the analysis is skipped.

Construction

sfunAnalyzer = Simulink.sfunction.Analyzer(model) creates a Simulink.sfunction.Analyzer object with the model you specify. In this case, the source code for the S-function can be automatically included in the analysis if the source code file is a single .c or .cpp file in the MATLAB path that has the same name as the S-function. For example, if the specified model contains an S-function called mysfun, and the source file for mysfun is a single file mysfun.c in the MATLAB path, a Simulink.sfunction.analyzer.BuildInfo object is automatically created and included in the analysis.

sfunAnalyzer = Simulink.sfunction.Analyzer(model,'BuildInfo', {bdInfo}) creates a Simulink.sfunction.Analyzer object with the model and a Simulink.sfunction.analyzer.BuildInfo object named bdInfo.

sfunAnalyzer = Simulink.sfunction.Analyzer(model,'Options',{opts}) creates an Simulink.sfunction.Analyzer object with the model and a Simulink.sfunction.analyzer.Options object named opts.

Input Arguments

`model` — Specify a model in the path
character vector

Names of the model in the path, specified as a character vector.

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (`' '`). You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: `'BuildInfo', {buildInfo}`

`BuildInfo` — Specify the buildinfo object
cell array

A cell array of `buildinfo` objects. See `Simulink.sfunction.analyzer.BuildInfo` for more information.

`Options` — Specify the S-function analyzer running options
object

An object to specify S-function analyzer running options. These checks include Polyspace® Code Prover™ and parameter robustness checks. See `Simulink.sfunction.analyzer.Options` for more information.

Methods

run   Perform checks on S-functions
generateReport   Generate an HTML report of S-function checks

run

Class: Simulink.sfunction.Analyzer
Package: Simulink.sfunction

Perform checks on S-functions

Syntax

```
result = run()
```

Description

`result = run()` returns a struct containing the result from the analyzer checks. An example result struct has the following fields:

```
    TimeGenerated: '19-Jul-2017 19:25:32'
         Platform: 'win64'
          Release: '(R2017b)'
   SimulinkVersion: '9.0'
    ExemptedBlocks: {}
   MexConfiguration: [1×1 mex.CompilerConfiguration]
              Data: [4×4 struct]
```

Output Arguments

`result` — Sfunction.Analyzer structure
MATLAB structure

MATLAB structure containing the result of S-function analyzer.

Introduced in R2017b

Simulink.sfunction.analyzer.BuildInfo class

Package: Simulink.sfunction.analyzer

Create an object to represent build information

Description

`Simulink.sfunction.analyzer.BuildInfo` object captures the build information for S-functions, such as source files, header files, and linking libraries, for use with the `Simulink.sfunction.Analyzer` class.

Construction

`bdInfo= Simulink.sfunction.analyzer.BuildInfo(SfcnFile)` creates a `Simulink.sfunction.analyzer.BuildInfo` object.

`bdInfo = Simulink.sfunction.analyzer.BuildInfo(SfcnFile, 'SrcPath', {srcpaths}, 'ExtraSrcFileList', {srcfilelist})` creates a `Simulink.sfunction.analyzer.BuildInfo` object for a C-MEX S-function source file, a list of extra source files located in the specified path.

`bdInfo = Simulink.sfunction.analyzer.BuildInfo(SfcnFile, 'ObjFileList',{objfilelist})` creates a `Simulink.sfunction.analyzer.BuildInfo` object for C-MEX S-function source file and list of extra objective code files.

`bdInfo = Simulink.sfunction.analyzer.BuildInfo(SfcnFile, 'IncPaths', {incpathslist})` creates a `Simulink.sfunction.analyzer.BuildInfo` object for C-MEX S-function source file and paths to the folders including header files.

`bdInfo = Simulink.sfunction.analyzer.BuildInfo(SfcnFile, 'LibFileList',{libfilelist}, 'LibPaths',{libpaths})` creates a `Simulink.sfunction.analyzer.BuildInfo` object for C-MEX S-function source file and library files and library file paths used for building.

`bdInfo = Simulink.sfunction.analyzer.BuildInfo(SfcnFile, 'PreProcDefList',{preprocdir})` creates a

`Simulink.sfunction.analyzer.BuildInfo` object for C-MEX S-function source file and `pre-processor` directives list.

Input Arguments

`SfcnFile` — S-function source file
character vector

S-function source file having the same name as the S-function.

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: `'SrcPath', {srcpath}`

`SrcPath` — Source file path
cell array of character vectors

Search paths to extra S-function source files that are referenced by `SfcnFile`, specified as a cell array.

`ExtraSrcFileList` — Extra source file list
cell array of character vectors

List of extra S-function source files, specified as a cell array.

`ObjFileList` — Extra objective code
cell array

List of objective files used for building, specified as a cell array.

`IncPaths` — Search paths for header files
cell array of character vectors

Specify paths to include folders for header files, specified as a cell array.

`LibFileList` — External libraries list
cell array of character vectors

List of external library files used for building, specified as a cell array.

`LibPaths` — Search paths for external libraries
cell array of character vectors

Search paths for external library files used for building, specified as a cell array.

`PreProcDefList` — Preprocessor directives
cell array of character vectors

List of the preprocessor directives, specified as a cell array.

Output Arguments

`bdInfo` — BuildInfo object
object

Build information for the S-functions supplied to the S-function analyzer. Returns a `simulink.sfunction.analyzer.BuildInfo` object.

Examples

Create a `bdInfo` object for an S-function `mysfun` that includes a source file `mysfun.c`:

Basic Use

```
bdInfo = Simulink.sfunction.analyzer.BuildInfo('mysfun.c');
```

The output `bdInfo` has the following fields:

```
bdInfo =

  BuildInfo with properties:

           SfcnFile: 'mysfun.c'
           SfcnName: 'mysfun'
            SrcType: 'C'
           SrcPaths: {}
     ExtraSrcFileList: {}
         ObjFileList: {}
            IncPaths: {}
         LibFileList: {}
```

```
        LibPaths: {}
   PreProcDefList: {}
```

Advanced Use

Create a `bdInfo` object for an S-function `mysfun` that includes a source file `mysfun.c` and also includes:

- List of extra source files, `extra1.c` and `extra2.c`
- Paths to source file folders, `/path1` and `/path2`.
- List of objective files, `o1.obj` and `o2.obj`.
- List of library files, `l1.lib` and `l2.lib`.
- Library paths, `/libpath1`.
- Pre-processor running directives, `-DDEBUG`.

```
Simulink.sfunction.analyzer.BuildInfo('mysfun.c',...
                                      'ExtraSrcFileList',{extra1.c,extra2.c},... %spec
                                      'SrcPaths',{/path1,/path2},...             %spec
                                      'ObjFileList',{o1.obj,o2.obj},...          %spec
                                      'LibFileList',{l1.lib,l2.lib},...          %spec
                                      'LibPaths',{/libpath1},...                 %spec
                                      'PreProcDefList',{DEBUG});                 %spec
```

Simulink.sfunction.analyzer.Options class

Package: Simulink.sfunction.analyzer

Create an object to specify options for running S-function checks

Description

`Simulink.sfunction.analyzer.Options` object is created through the constructor `Simulink.sfunction.analyzer.Options()`.
`Simulink.sfunction.analyzer.Options` object captures the options for running S-function checks. These checks include whether to enable Polyspace and Parameter Robustness checks, maximum model simulation time and output path for result report.

Construction

`opts= Simulink.sfunction.analyzer.Options()` returns a options object with these property values:

```
    EnablePolyspace: 0
   EnableRobustness: 0
         ReportPath: ''
     ModelSimTimeOut: 10
```

Properties

EnablePolyspace — Polyspace Code Prover check
False (default) | True

Boolean type check to determine whether to include Polyspace Code Prover check.

Note These checks usually take some time to run.

EnableRobustness — Parameter robustness check
`False` (default) | `True`

Boolean type check to indicate whether to include Robutness checks.

Note These checks usually take some time to run.

ReportPath — Generated report directory
character array

Path to the generated report directory.

ModelSimTimeOut — Maximum model simulation time
positive scalar

Maximum model simulation time in seconds.

findSfunctions

Find and return all eligible S-functions in a model

Syntax

```
sfuns = Simulink.sfunction.analyzer.findSfunctions(model)
```

Description

`sfuns = Simulink.sfunction.analyzer.findSfunctions(model)` returns all eligible S-functions in a model for the S-function checks. Rules are applied to filter out all ineligible S-functions.

Input Arguments

`model` — A Simulink model or library in path
Simulink model

A Simulink model or library in path.

Output Arguments

`sfuns` — A list of all eligible S-functions
cell array

Eligible s-functions in the model, specified as a cell array.

addElement

Class: Simulink.SimulationData.Dataset
Package: Simulink.SimulationData

Add element to end of data set

Syntax

```
dataset = addElement(dataset,element)
dataset = addElement(dataset,element,name)
```

Description

`dataset = addElement(dataset,element)` adds an element to the `Simulink.SimulationData.Dataset` dataset.

`dataset = addElement(dataset,element,name)` adds an element to the `Simulink.SimulationData.Dataset` data set and gives the element the name that you specify with the `name` argument. If the object already has a name, the element instead uses the name you specify by using the `name` argument.

Input Arguments

dataset — Data set
`SimulationData.Dataset` object

The data set to which to add the element.

element — Element to add
`Simulink.SimulationData.Signal` object | `Simulink.SimulationData.State` object | `Simulink.SimulationData.DataStoreMemory` object | `timeseries` object | `matlab.io.datastore.SimulationDatastore` object

Element to add to the data set, specified as a `Simulink.SimulationData.Signal`, `Simulink.SimulationData.DataStoreMemory`, or `matlab.io.datastore.SimulationDatastore` object.

name — Name for element
character vector

Name for element, specified as a character vector.

Output Arguments

dataset — Data set
character vector

The data set to which you add the element, returned as a character vector. The new element is added to the end of the data set.

Examples

Create a Data Set

Create a data set and add three elements to it.

```
time = 0.1*(0:100)';
ds = Simulink.SimulationData.Dataset;
element1 = Simulink.SimulationData.Signal;
element1.Name = 'A';
element1.Values = timeseries(sin(time),time);
ds = addElement(ds,element1);
element2 = Simulink.SimulationData.Signal;
element2.Name = 'B';
element2.Values = timeseries(2*sin(time),time);
ds = addElement(ds,element2);
element3 = Simulink.SimulationData.Signal;
element3.Name = 'C';
element3.Values = timeseries(3*sin(time),time);
ds = addElement(ds,element3);
ds
```

```
ds =

Simulink.SimulationData.Dataset '' with 3 elements

                        Name  BlockPath
                        ____  _____
    1  [1x1 Signal]     A     ''
    2  [1x1 Signal]     B     ''
    3  [1x1 Signal]     C     ''

  - Use braces { } to access, modify, or add elements using index.
```

- "Migrate Scripts That Use Legacy ModelDataLogs API"
- "Export Signal Data Using Signal Logging"
- "Log Data Stores"
- "Convert Logged Data to Dataset Format"
- "Migrate Scripts That Use Legacy ModelDataLogs API"

Alternative

To streamline indexing syntax, you can use curly braces ({}) to add an element to a dataset, instead of using addElement. For the index, use a scalar that is greater than the number of elements by one. The new element becomes the last element of the dataset.

```
time = 0.1*(0:100)';
ds = Simulink.SimulationData.Dataset;
element1 = Simulink.SimulationData.Signal;
element1.Name = 'A';
element1.Values = timeseries(sin(time),time);
ds{1} = element1;
element2 = Simulink.SimulationData.Signal;
element2.Name = 'B';
element2.Values = timeseries(2*sin(time),time);
ds{2} = element2;
element3 = Simulink.SimulationData.Signal;
element3.Name = 'C';
element3.Values = timeseries(3*sin(time),time);
ds{3} = element3;
```

concat

Class: Simulink.SimulationData.Dataset
Package: Simulink.SimulationData

Concatenate dataset to another dataset

Syntax

```
dataset1 = concat(dataset1,dataset2)
```

Description

dataset1 = concat(dataset1,dataset2) concatenates the elements of `dataset2` to `dataset1`.

Input Arguments

dataset1 — Dataset to concatenate to
data set

Dataset to concatenate to with `dataset2`, returned as a cell array.

dataset2 — Dataset to concatenate
data set

Data set to concatenate to `dataset1`, specified as a cell array.

Output Arguments

dataset1 — Concatenated dataset
data set

Concatenated dataset from `dataset1` and `dataset2`.

Examples

Concatenate ds1 to ds

Convert output from two To Workspace blocks to `Dataset` format and concatenate them.

```
mdl = 'myvdp';
open_system(mdl);
sim(mdl)
ds = Simulink.SimulationData.Dataset(simout);
ds1 = Simulink.SimulationData.Dataset(simout1);
dsfinal = concat(ds,ds1);
```

get

Class: Simulink.SimulationData.Dataset
Package: Simulink.SimulationData

Get element or collection of elements from dataset

Syntax

```
element = get(dataset,index)
element = get(dataset,name)
element = get(dataset,{name})
```

Description

`element = get(dataset,index)` returns the element corresponding to the `index`. The `getElement` method uses the same syntax and behavior as the `get` method.

`element = get(dataset,name)` returns the element whose name matches `name`. When `name` is in a cell array, return the index of the element whose name matches `name`.

`element = get(dataset,{name})` returns a single element if only one element name matches, a `SimulationData.Dataset` if multiple elements with this name exist.

If you use **Log Dataset data to file** to create the MAT-file, use `getAsDatastore` for fast access to the data.

Input Arguments

dataset — Dataset
`SimulationData.Dataset` object

The data set from which to get the element.

index — Index value of element to get
scalar numeric

Index value of element to get. The index reflects the index value of a data set element.

name — Name for data set element
character array | cell array

Name for a data set element, specified as:

- A character array reflecting the name of the data set element
- A cell array containing one character vector. To return a `SimulationData.Dataset object` that can contain one element, use this format. Consider this form when writing scripts.

Output Arguments

`element` — Element
element | `SimulationData.Dataset` object | empty object

The element that the `get` method finds.

- If `index` is the first argument after the data set, the method returns the element at the `index`.
- If `name` is the first argument after the data set:
  - If the method finds one element, it returns the element.
  - If the method finds more than one element, return a Dataset that contains the elements.
  - If the method does not find an element, it returns an empty object.

Examples

Access Dataset Elements

Access `Simulink.SimulationData.Dataset` elements in the top model of the `ex_bus_logging` model. The signal logging dataset is `topOut`.

```
open_system(docpath(fullfile(docroot,'toolbox','simulink',...
'examples','ex_bus_logging')));
```

```
open_system(docpath(fullfile(docroot,'toolbox','simulink',...
'examples','ex_mdlref_counter_bus')));
sim('ex_bus_logging')
topOut

topOut =

  Simulink.SimulationData.Dataset
  Package: Simulink.SimulationData

  Characteristics:
              Name: 'topOut'
    Total Elements: 4

  Elements:
    1: 'COUNTERBUS'
    2: 'OUTPUTBUS'
    3: 'INCREMENTBUS'
    4: 'inner_bus'

  -Use get or getElement to access elements by index, name or
   block path.
  -Use addElement or setElement to add or modify elements.

  Methods, Superclasses
```

Access Dataset Elements with Index

Access the element at index if the first argument is a numeric value.

```
el = logsout.get(1);
```

Access Dataset Elements with Characters

Access the element whose name matches name.

```
el = logsout.get('name');
```

Access Dataset Elements with Cell Array

Return a dataset if the first argument is a cell array with a character vector as the first element.

```
ds = logsout.get({'my_name'});
```

- "Migrate Scripts That Use Legacy ModelDataLogs API"
- "Export Signal Data Using Signal Logging"
- "Log Data Stores"
- "Convert Logged Data to Dataset Format"
- "Migrate Scripts That Use Legacy ModelDataLogs API"

Alternatives

You can use curly braces to streamline indexing syntax to get an element in a dataset, instead of using `get` or `getElement`. The index must be a scalar that is not greater than the number of elements in the variable. For example, get the second element of the `logsout` dataset.

```
logsout{2}
```

Also, you can use the `find` method to get an element or collection of elements from a dataset.

getElementNames

Class: Simulink.SimulationData.Dataset
Package: Simulink.SimulationData

Return names of all elements in dataset

Syntax

element_list = getElementNames(dataset)

Description

element_list = getElementNames(dataset) returns the names of all of the elements in the Simulink.SimulationData.Dataset object.

Input Arguments

dataset — Data set
SimulationData.Dataset object

The data set from which to the element name.

Output Arguments

element_list — Data set
cell array

Data set, returned as a cell array of the character vectors containing names of all of the elements of the dataset.

Examples

Return Names of Elements

Return the names of the elements for the `topOut` data set (the signal logging data).

```
open_system(docpath(fullfile(docroot,'toolbox','simulink',...
'examples','ex_bus_logging')));
open_system(docpath(fullfile(docroot,'toolbox','simulink',...
'examples','ex_mdlref_counter_bus')));
sim('ex_bus_logging')
el_names = topOut.getElementNames

el_names =

    'COUNTERBUS'
    'OUTPUTBUS'
    'INCREMENTBUS'
    'inner_bus'
```

find

Class: Simulink.SimulationData.Dataset
Package: Simulink.SimulationData

Get element or collection of elements from dataset

Syntax

```
[datasetOut,retIndex]=find(datasetIn,Name,Value,…)
```

```
[datasetOut,retIndex]=find(datasetIn,Name,Value,'-logicaloperator',…
Name,Value,…)
```

```
[datasetOut,retIndex]=find(datasetIn,'-regexp',Name,Value,…)
```

Description

`[datasetOut,retIndex]=find(datasetIn,Name,Value,…)` returns a
`Simulink.SimulationData.Dataset` object and indices of the elements whose
property values match the specified property names and values. Specify optional comma-
separated pairs of `Name,Value` properties. `Name` is the property name and `Value` is the
corresponding value. `Name` must appear inside single quotes (`' '`). You can specify
several name-value pair properties in any order as `Name1,Value1,...,NameN,ValueN`.

`[datasetOut,retIndex]=find(datasetIn,Name,Value,'-logicaloperator',…
Name,Value,…)` applies the logical operator to the matching property value. You can
combine multiple logical operators. Logical operator can be one of:

- `-or`
- `-and`

If you do not specify an operation, the method assumes `-and`.

`[datasetOut,retIndex]=find(datasetIn,'-regexp',Name,Value,…)` matches
elements using regular expressions as if the value of the property is passed to the `regexp`
function as:

```
regexp(element.Name,Value)
```

The method applies regular expression matching to the name-value pairs that appear after `-regexp`. If there is no `-regexp`, the method matches elements as if the value of the property is passed as:

```
isequal(element.Name,Value)
```

For more information on `-regexp`, see "-regexp With Multiple Block Paths" on page 5-1022.

`-regexp` With Multiple Block Paths

`-regexp` works with properties of type char. To specify multiple block paths, you can use `Simulink.SimulationData.BlockPath` and `Simulink.BlockPath`. For example, when a signal is logged in a referenced model, you can use `Simulink.SimulationData.BlockPath` to specify multiple block paths.

The method returns elements that contain a **BlockPath** property where one or more of the individual block paths match the specified `Value` path when you use:

- `-regexp` with the **BlockPath** `Name` property.
- `Value` as a character vector or scalar object of type `Simulink.SimulationData.BlockPath` with one block path

Input Arguments

`datasetIn` — `SimulationData.Dataset`
`SimulationData.Dataset` object

`SimulationData.Dataset` object in which to search for matching elements.

`Name` — Name of property
character vector

Name of property to find in the element.

`Value` — Value of property
character vector | double | `Simulink.SimulationData.BlockPath`

Value of property to find in the element.

Output Arguments

datasetOut — SimulationData.Dataset data set
SimulationData.Dataset

SimulationData.Dataset object that contains the elements that match the specified criteria. If there is no matching SimulationData.Dataset object, the returned SimulationData.Dataset object contains no elements.

retIndex — Indices
vector

Indices of the elements datasetIn that match the specified criteria.

Examples

Find Block Path

Find a specific block path (specified by character vector) and port index.

```
dsOut = find(dsIn, 'BlockPath', 'vdp/x1', 'PortIndex', 1)
```

Find Elements

Find elements that have either name or propagated name as InValve.

```
dsOut = find(dsIn, 'Name', 'InValve', '-or', 'PropagatedName', 'InValve')
dsOut = find(dsIn, '-regex','Name', 'In*', '-or', …
                   '-regex','PropagatedName', 'In*')
```

Find and Change Element

Find and replace all elements containing specified_name with a new_name.

```
[dsOut,idxInDs] = find(ds, 'specified_name');
for idx=1: length(idxInDs)
  % process each element
```

```
    elm = get(dsOut, idx);
    elm.Name= 'New_Name'
    dsIn = setElement(dsIn, idxInDs(idx), elm);
end
```

Find Signals in subSys Using -regexp

Find all signals logged in a subSys using -regexp.

```
dsOut = find(dsIn, '-regexp', 'BlockPath', 'mdl/subSys/.*')
```

Find Signals in Referenced Model

Find all signals logged in the Model block.

```
dsOut = find(dsIn, '-regexp', 'BlockPath', 'refmdl/ModelBlk')
```

- "Log Data Stores"
- "Convert Logged Data to Dataset Format"
- "Migrate Scripts That Use Legacy ModelDataLogs API"
- "Load Big Data for Simulations"

Alternative

You can use curly braces to streamline indexing syntax to get an element in a dataset, instead of using find. The index must be a scalar that is not greater than the number of elements in the variable. For example, get the second element of the logsout dataset.

```
logsout{2}
```

Also, you can use the get method to get an element or collection of elements from a dataset.

numElements

Class: Simulink.SimulationData.Dataset
Package: Simulink.SimulationData

Get number of elements in data set

Syntax

```
length = numElements(dataset)
```

Description

`length = numElements(dataset)` gets the number of elements in the top-level dataset. To get the number of elements of a nested data set, use `numElements` with the nested data set.

Input Arguments

dataset — Data set
`SimulationData.Dataset` object

The data set from which to get the number of elements.

Output Arguments

length — Number of elements
double

Number of elements, returned as a double.

Examples

Get Number of Elements

Get the number of elements in the signal logging data set for the `ex_bus_logging`.

```
length = topOut.numElements()
```

plot

Class: Simulink.SimulationData.Dataset
Package: Simulink.SimulationData

Plot dataset elements in Signal Preview window or Simulation Data Inspector

Syntax

```
plot(ds)
plot(ds,viewer)
```

Description

`plot(ds)` plots the `Simulink.SimulationData.Dataset` elements against time and interpolates values between samples by using either zero-order-hold or linear interpolation. The plot displays as a read-only plot in the Signal Preview window.

`plot(ds,viewer)` displays the plot in the Signal Preview window or Simulation Data Inspector, depending on the `viewer` value.

Input Arguments

`ds` — Data set
`SimulationData.Dataset` object

The data set that contains the elements to plot.

`viewer` — Viewer to display plot
preview (default) | sdi

Viewer to display the plot, specified as `preview` (Signal Preview window) or `sdi` (Simulation Data Inspector).

Examples

Plot a Data Set

Create a timeseries object `ts` and add elements to plot in Simulation Data Inspector.

```
% Create a timeseries object
ts = timeseries([0;20],[0;10]);
% Create a SimulationData.Dataset
ds = Simulink.SimulationData.Dataset();
% Place timeseries object in dataset
ds = ds.addElement(ts,'ts');
% Plot the element
plot(ds,'sdi');

setElement

Class: Simulink.SimulationData.Dataset
Package: Simulink.SimulationData

Change element stored at specified index

Syntax

```
dataset = setElement(dataset,index,... element)
dataset = setElement(index,element, name)
```

Description

`dataset = setElement(dataset,index,... element)` changes the element stored at the specified index, for an existing index. If `index` is one greater than the number of elements in the data set, the function adds the element at the end of the data set.

`dataset = setElement(index,element, name)` changes the element stored at the specified index and gives it the name that you specify. You can use `name` to identify an element that does not have a name. If the signal already has a name, the element instead uses the name you specify by using the `name` argument.

Input Arguments

dataset — Data set
SimulationData.Dataset object

The data set for which to set the element.

index — Index
scalar

Index for the added element, specified as a scalar numeric value. The value must be between 1 and the number of elements plus 1.

`element` — Element to replace existing element
`Simulink.SimulationData.Signal` object |
`Simulink.SimulationData.DataStoreMemory` object

Element to replace existing element or to add to the data set, specified as a
`Simulink.SimulationData.Signal` object or
`Simulink.SimulationData.DataStoreMemory` object.

`name` — Element name
character vector

Element name, returned as a character vector.

Output Arguments

`dataset` — Data set
character vector

Data set in which you change or add an element, specified as a character vector.

Examples

Set Element Name

Set element name.

```
ds = Simulink.SimulationData.Dataset
element1 = Simulink.SimulationData.Signal
element1.Name = 'A'
ds = ds.addElement(element1)
element2 = Simulink.SimulationData.Signal
element2.Name = 'B'
elementNew = Simulink.SimulationData.Signal
ds = ds.setElement(2,elementNew,'B1')
ds

ds =

  Simulink.SimulationData.Dataset
```

```
Package: Simulink.SimulationData

Characteristics:
            Name: 'topOut'
  Total Elements: 2

Elements:
  1: 'A'
  2: 'B1'

Use getElement to access elements by index, name or
block path.

Methods, Superclasses
```

- "Migrate Scripts That Use Legacy ModelDataLogs API"
- "Export Signal Data Using Signal Logging"
- "Log Data Stores"
- "Migrate Scripts That Use Legacy ModelDataLogs API"

Alternative

You can use curly braces to streamline indexing syntax to change an element in a dataset, instead of using `setElement`. The index must be a scalar that is not greater than the number of elements in the variable. For example, change the name of second element of the `logsout` dataset.

```
logsout{2}.Name = 'secondSignal'
```

Introduced in R2011a

coder.BuildConfig class

Package: coder

Build context during code generation

Description

The code generator creates an object of this class to facilitate access to the build context. The build context encapsulates the settings used by the code generator including:

- Target language
- Code generation target
- Target hardware
- Build toolchain

Use `coder.BuildConfig` methods in the methods that you write for the `coder.ExternalDependency` class.

Construction

The code generator creates objects of this class.

Methods

getHardwareImplementation	Get handle of copy of hardware implementation object
getStdLibInfo	Get standard library information
getTargetLang	Get target code generation language
getToolchainInfo	Returns handle of copy of toolchain information object
isCodeGenTarget	Determine if build configuration represents specified target
isMatlabHostTarget	Determine if hardware implementation object target is MATLAB host computer

Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects (MATLAB).

Examples

Use `coder.BuildConfig` methods to access the build context in `coder.ExternalDependency` methods

This example shows how to use `coder.BuildConfig` methods to access the build context in `coder.ExternalDependency` methods. In this example, you use:

- `coder.BuildConfig.isMatlabHostTarget` to verify that the code generation target is the MATLAB host. If the host is not MATLAB report an error.
- `coder.BuildConfig.getStdLibInfo` to get the link-time and run-time library file extensions. Use this information to update the build information.

Write a class definition file for an external library that contains the function `adder`.

```
%=================================================================
% This class abstracts the API to an external Adder library.
% It implements static methods for updating the build information
% at compile time and build time.
%=================================================================
```

```matlab
classdef AdderAPI < coder.ExternalDependency
    %#codegen

    methods (Static)

        function bName = getDescriptiveName(~)
            bName = 'AdderAPI';
        end

        function tf = isSupportedContext(buildContext)
            if   buildContext.isMatlabHostTarget()
                tf = true;
            else
                error('adder library not available for this target');
            end
        end

        function updateBuildInfo(buildInfo, buildContext)
            % Get file extensions for the current platform
            [~, linkLibExt, execLibExt, ~] = buildContext.getStdLibInfo();

            % Add file paths
            hdrFilePath = fullfile(pwd, 'codegen', 'dll', 'adder');
            buildInfo.addIncludePaths(hdrFilePath);

            % Link files
            linkFiles = strcat('adder', linkLibExt);
            linkPath = hdrFilePath;
            linkPriority = '';
            linkPrecompiled = true;
            linkLinkOnly = true;
            group = '';
            buildInfo.addLinkObjects(linkFiles, linkPath, ...
                linkPriority, linkPrecompiled, linkLinkOnly, group);

            % Non-build files for packaging
            nbFiles = 'adder';
            nbFiles = strcat(nbFiles, execLibExt);
            buildInfo.addNonBuildFiles(nbFiles,'','');
        end

        %API for library function 'adder'
        function c = adder(a, b)
```

```matlab
            if coder.target('MATLAB')
                % running in MATLAB, use built-in addition
                c = a + b;
            else
                % Add the required include statements to the generated function code
                coder.cinclude('adder.h');
                coder.cinclude('adder_initialize.h');
                coder.cinclude('adder_terminate.h');
                c = 0;

                % Because MATLAB Coder generated adder, use the
                % housekeeping functions before and after calling
                % adder with coder.ceval.

                coder.ceval('adder_initialize');
                c = coder.ceval('adder', a, b);
                coder.ceval('adder_terminate');
            end
        end
    end
end
```

"Develop Interface for External C/C++ Code" (MATLAB Coder)
"Customize the Post-Code-Generation Build Process" (MATLAB Coder)

Introduced in R2013b

coder.ExternalDependency class

Package: coder

Interface to external code

Description

`coder.ExternalDependency` is an abstract class for developing an interface between external code and MATLAB code intended for code generation. You can define classes that derive from `coder.ExternalDependency` to encapsulate the interface to external libraries, object files, and C/C++ source code. This encapsulation allows you to separate the details of the interface from your MATLAB code.

To define a class derived from `coder.ExternalDependency`, create a subclass. For example:

```
classdef myClass < coder.ExternalDependency
```

You must define all of the methods listed in "Methods" on page 5-1040. These methods are static and are not compiled. The code generator invokes these methods in MATLAB after code generation is complete to configure the build for the generated code. The `RTW.BuildInfo` and `coder.BuildConfig` objects that describe the build information and build context are automatically created during the build process. The `updateBuildInfo` method provides access to these objects. For more information on build information customization, see "Customize the Post-Code-Generation Build Process" (MATLAB Coder).

You also define methods that call the external code. These methods are compiled. For each external function that you want to call, write a method to define the programming interface to the function. In the method, use `coder.ceval` to call the external function.

Methods

getDescriptiveName	Return descriptive name for external dependency
isSupportedContext	Determine if build context supports external dependency
updateBuildInfo	Update build information

Examples

Encapsulate the Interface to an External C Dynamic Library

This example shows how to encapsulate the interface to an external C dynamic linked library using `coder.ExternalDependency`.

Write a function `adder` that returns the sum of its inputs.

```
function c = adder(a,b)
%#codegen
c = a + b;
end
```

Generate a library that contains `adder`.

```
codegen('adder','-args',{-2,5},'-config:dll','-report')
```

Write the class definition file `AdderAPI.m` to encapsulate the library interface.

```
%================================================================
% This class abstracts the API to an external Adder library.
% It implements static methods for updating the build information
% at compile time and build time.
%================================================================

classdef AdderAPI < coder.ExternalDependency
    %#codegen

    methods (Static)

        function bName = getDescriptiveName(~)
            bName = 'AdderAPI';
        end
```

```matlab
function tf = isSupportedContext(buildContext)
    if  buildContext.isMatlabHostTarget()
        tf = true;
    else
        error('adder library not available for this target');
    end
end

function updateBuildInfo(buildInfo, buildContext)
    % Get file extensions for the current platform
    [~, linkLibExt, execLibExt, ~] = buildContext.getStdLibInfo();

    % Add file paths
    hdrFilePath = fullfile(pwd, 'codegen', 'dll', 'adder');
    buildInfo.addIncludePaths(hdrFilePath);

    % Link files
    linkFiles = strcat('adder', linkLibExt);
    linkPath = hdrFilePath;
    linkPriority = '';
    linkPrecompiled = true;
    linkLinkOnly = true;
    group = '';
    buildInfo.addLinkObjects(linkFiles, linkPath, ...
        linkPriority, linkPrecompiled, linkLinkOnly, group);

    % Non-build files for packaging
    nbFiles = 'adder';
    nbFiles = strcat(nbFiles, execLibExt);
    buildInfo.addNonBuildFiles(nbFiles,'','');
end

%API for library function 'adder'
function c = adder(a, b)
    if coder.target('MATLAB')
        % running in MATLAB, use built-in addition
        c = a + b;
    else
        % Add the required include statements to the generated function code
        coder.cinclude('adder.h');
        coder.cinclude('adder_initialize.h');
        coder.cinclude('adder_terminate.h');
        c = 0;
```

```
                % Because MATLAB Coder generated adder, use the
                % housekeeping functions before and after calling
                % adder with coder.ceval.

                coder.ceval('adder_initialize');
                c = coder.ceval('adder', a, b);
                coder.ceval('adder_terminate');
            end
        end
    end
end
```

Write a function `adder_main` that calls the external library function `adder`.

```
function y = adder_main(x1, x2)
    %#codegen
    y = AdderAPI.adder(x1, x2);
end
```

Generate a MEX function for `adder_main`. The MEX Function exercises the `coder.ExternalDependency` methods.

```
codegen('adder_main', '-args', {7,9}, '-report')
```

Copy the library to the current folder using the file extension for your platform.

For Windows, use:

```
copyfile(fullfile(pwd, 'codegen', 'dll', 'adder', 'adder.dll'));
```

For Linux, use:

```
copyfile(fullfile(pwd, 'codegen', 'dll', 'adder', 'adder.so'));
```

Run the MEX function and verify the result.

```
adder_main_mex(2,3)
```

Introduced in R2013b

TimeScopeConfiguration

Control Scope block appearance and behavior

Description

Scope configuration properties control the appearance and behavior of a scope block. Create a scope configuration object with `get_param`, and then change property values using the object with dot notation.

Creation

`myScopeConfiguration = get_param(gcbh,'ScopeConfiguration')` creates a scope configuration object for the selected scope block.

Properties

Name — Title on a scope window
block name (default) | character vector

Title on a scope window, specified as a character vector.

NumInputPorts — Number of input ports
'1' (default) | character vector

Number of input ports on a scope block, specified as a character vector. The maximum number of input ports is 96.

UI Use

Select **File > Number of Input Ports**.

ActiveDisplay — Display for setting display-specific properties
'1' (default) | character vector

Display for setting display-specific properties, specified as a character vector. The number of a display corresponds to its column-wise placement index. For multi-column layouts, the displays are numbered down and then across.

Dependency

Setting this property selects the display for setting the properties `ShowGrid`, `ShowLegend`, `Title`, `PlotAsMagnitudePhase`, `YLabel`, and `YLimits`.

UI Use

Open the **Configuration Properties**. On the **Display** tab, set **Active display**.

AxesScaling — How to scale y-axes
`'Manual'` (default) | `'Auto'` | `'Updates'`

How to scale *y*-axes, specified as one of these values:

- `'Manual'` — Manually scale *y*-axes with the **Scale Y-axis Limits** button.
- `'Auto'` — Scale *y*-axes during and after simulation.
- `'Updates'` — Scale *y*-axes after specified number of block updates (time intervals).

Dependency

If this property is set to `'Updates'`, also specify the property `AxesScalingNumUpdates`

UI Use

Open the **Configuration Properties**. On the **Main** tab, set **Axes scaling**.

AxesScalingNumUpdates — Number of updates before scaling y-axes
`'10'` (default) | character vector

Number of updates before scaling *y*-axes, specified as a character vector.

Dependency

Activate this property by setting AxesScaling to `'Updates'`.

UI Use

Open the **Configuration Properties**. On the **Main** tab, set **Number of updates**.

DataLogging — Save scope data
`false` (default) | `true`

Set this property to `true` to save scope data to a variable in the MATLAB workspace.

This property does not apply to floating scopes and scope viewers.

Dependency

If this property is set to `true`, you must also specify the properties `DataLoggingVariableName` and `DataLoggingSaveFormat`.

UI Use

Open the **Configuration Properties**. On the **Logging** tab, set **Log data to workspace**.

DataLoggingVariableName — Variable name for saving scope data
`'ScopeData'` (default) | character vector

Variable name for saving scope data in the MATLAB workspace, specified as a character vector. This property does not apply to floating scopes and scope viewers.

Dependency

Activate this property by setting `DataLogging` to `true`.

UI Use

Open the **Configuration Properties**. On the **Logging** tab, set **Variable name**.

DataLoggingSaveFormat — Variable format for saving scope data
`'Dataset'` (default) | `'Structure With Time'` | `'Structure'` | `'Array'`

Variable format for saving scope data to the MATLAB workspace, specified as one of these values:

- `'Dataset'` — Save data as a dataset object. This format does not support variable-size data, MAT-file logging, or external mode archiving. See `Simulink.SimulationData.Dataset`.
- `'StructureWithTime'` — Save data as a structure with associated time information. This format does not support single- or multiport frame-based data, or multirate data.
- `'Structure'` — Save data as a structure. This format does not support multirate data.
- `'Array'` — Save data as an array with associated time information. This format does not support multiport sample-based data, single- or multiport frame-based data, variable-size data, or multirate data.

This property does not apply to floating scopes and scope viewers.

Dependency

Activate this property by setting `DataLogging` to `true`.

UI Use

Open the **Configuration Properties**. On the **Logging** tab, set **Save format**.

DataLoggingLimitDataPoints — Limit buffered data
false (default) | true

Set to `true` to limit buffered data before plotting and saving data.

For simulations with **Stop time** set to `inf`, always set this parameter to `true`.

Dependency

If this property is set to `true`, also specify the number of data values to plot and save with the property `DataLoggingMaxPoints`.

UI Use

Open the **Configuration Properties**. On the **Logging** tab, set **Limit data points to last**.

DataLoggingMaxPoints — Maximum number of data values
'5000' (default) | character vector

Maximum number of data values to plot and save, specified as a character vector. The data values that are plotted and saved are from the end of a simulation. For example, setting this property to 100 saves the last 100 data points.

Dependency

Activate this property by setting `DataLoggingLimitDataPoints` to `true`. Specifying this property limits the data values a scope plots and the data values saved in the MATLAB variable specified in `DataLoggingVariableName`.

UI Use

Open the **Configuration Properties**. On the **Display** tab, set the text box to the right of **Limit data points to last**.

DataLoggingDecimateData — Reduce scope data
false (default) | true

Set this property to true to reduce scope data before plotting and saving.

Dependency

If this property is set to true, you must also specify the DataLoggingDecimation property.

UI Use

Open the **Configuration Properties**. On the **Logging** tab, set **Decimation**.

DataLoggingDecimation — Decimation factor
'1' (default) | character vector

Decimation factor applied to the signal data before plotting and saving, specified as a character vector. The scope buffers every N^{th} data point, where N is the decimation factor you specify. A value of 1 buffers all data values.

Dependency

Activate this property by setting DataLoggingDecimateData to true.

UI Use

Open the **Configuration Properties**. On the **Logging** tab, set the text box to the right of **Decimation**.

FrameBasedProcessing — Frame-based processing of signals
false (default for Time Scope block) | true (default for Scope block)

Set this property to true to process signals as frame-based.

- false — Process signal values in a channel at each time interval (sample based).
- true — Process signal values in a channel as a group of values from multiple time intervals (frame based). Frame-based processing is available only with discrete input signals.

UI Use

Open the **Configuration Properties**. On the **Main** tab, set **Input processing**.

LayoutDimensions — Number of display rows and columns
[1 1] (default) | [numberOfRows numberOfColumns]

Number of display rows and columns, specified with as a two-element vector. The maximum layout dimension is four rows by four columns.

- If the number of displays is equal to the number of ports, signals from each port appear on separate displays.
- If the number of displays is less than the number of ports, signals from additional ports appear on the last *y*-axis.

UI Use

Open the **Configuration Properties**. On the **Main** tab, select the **Layout** button.

MaximizeAxes — Maximize size of signal plots
'Auto' (default) | 'On' | 'Off'

Specify whether or not to maximize the size of signal plots:

- 'Auto' — If Title and YLabel are not specified, maximize all plots.
- 'On' — Maximize all plots. Values in Title and YLabel are hidden.
- 'Off' — Do not maximize plots.

Each of the plots expands to fit the full display. Maximizing the size of signal plots removes the background area around the plots.

UI Use

Open the **Configuration Properties**. On the **Main** tab, set **Maximize axes**.

MinimizeControls — Hide menu and toolbar
false (default) | true

Set this property to true to hide the menu and toolbar.

If you dock the scope, this property is inactive.

OpenAtSimulationStart — Open scope when starting simulation
true (default for Time Scope) | false (default for Scope)

Set this property to true to open the scope when the simulation starts.

UI Use

Select **File > Open at Start of Simulation**

PlotAsMagnitudePhase — Magnitude and phase plots
false (default) | true

Specify whether or not to display the magnitude and phase plots:

- false — Display signal plot.

  If the signal is complex, plot the real and imaginary parts on the same *y*-axis (display).
- true — Display magnitude and phase plots.

  If the signal is real, plot the absolute value of the signal for the magnitude. The phase is 0 degrees for positive values and 180 degrees for negative values.

Dependency

Set the ActiveDisplay property before setting this property.

UI Use

Open the **Configuration Properties**. On the **Display** tab, set **Plot signals as magnitude and phase**.

Position — Size and location of the scope
[left bottom width height]

Size and location of scope window, specified as a four-element vector consisting of the left, bottom, width, and height positions, in pixels.

By default, a scope window appears in the center of your screen with a width of 560 pixels and height of 420 pixels.

ShowGrid — Vertical and horizontal grid lines
true (default) | false

Set this property to true to display vertical and horizontal grid lines.

Dependency

Set the ActiveDisplay property before setting this property.

UI Use

Open the **Configuration Properties**. On the **Display** tab, set **Show grid**.

SampleTime — Time interval
`'-1'` (default) | character vector

Time interval between Scope block updates during a simulation, specified as a character vector. This property does not apply to floating scopes and scope viewers.

UI Use

Open the **Configuration Properties**. On the **Main** tab, set **Sample Time**.

ShowLegend — Signal legend
`false` (default) | `true`

Set this property to `true` to display the legend.

Names listed in the legend are the signal names from the model. For signals with multiple channels, a channel index is appended after the signal name. See the Scope block reference for an example.

Dependency

Set the `ActiveDisplay` property before setting this property.

UI Use

Open the **Configuration Properties**. On the **Display** tab, set **Show legend**.

ShowTimeAxisLabel — Display or hide x-axis labels
`true` (default for Time Scope block) | `false` (default for Scope block)

Set this property to `true` to display the *x*-axis labels.

Dependency

Set the `ActiveDisplay` property before setting this property.

If this property is set to `true`, also set `TimeAxisLabels`. If `TimeAxisLabels` is set to `'None'`, this property is inactive.

UI Use

Open the **Configuration Properties**. On the **Time** tab, set **Show time-axis label**.

5-1051

TimeAxisLabels — How x-axis labels display
'All' (default for Time Scope block) | 'Bottom' (default for Scope block) | 'None'

How *x*-axis labels display, specified as one of these values:

- 'All' — Display *x*-axis labels on all displays.
- 'Bottom' — Display *x*-axis labels only on the bottom display.
- 'None' — Do not display labels and deactivate ShowTimeAxisLabel property.

Dependency

Set the ActiveDisplay property before specifying this property.

Set ShowTimeAxisLabel to true and set Maximize axes to 'Off'.

UI Use

Open the **Configuration Properties**. On the **Time** tab, set **Time-axis labels**.

TimeDisplayOffset — x-axis range offset
'0' (default) | character vector

x-axis range offset number, specified as a character vector. For input signals with multiple channels, enter a scalar or vector of offsets.

- Scalar — Offset all channels of an input signal by the same value.
- Vector — Independently offset the channels.

UI Use

Open the **Configuration Properties**. On the **Time** tab, set **Time display offset**.

TimeSpan — Length of x-axis range to display
'0' (default) | character vector | 'Auto'

Length of *x*-axis range to display, specified as one of these values:

- Positive real number — Any value less than the total simulation time specified as a character vector.
- 'Auto' — Difference between the simulation start and stop times.

The block calculates the beginning and end times of the *x*-axis range using the `TimeDisplayOffset` and `TimeSpan` properties. For example, if you set `TimeDisplay` to `10` and the `TimeSpan` to `20`, the scope sets the *x*-axis range from `10` to `30`.

UI Use

Open the **Configuration Properties**. On the **Time** tab, set **Time span**.

TimeSpanOverrunAction — How to display data
`'Wrap'` (default) | `'Scroll'`

How to display data beyond the visible *x*-axis range, specified as one of these values:

- `'Wrap'` — Draw a full screen of data from left to right, clear the screen, and then restart drawing of data.
- `'Scroll'` — Move data to the left as new data is drawn on the right. This mode is graphically intensive and can affect run-time performance.

You can see the effects of this option only when plotting is slow with large models or small step sizes.

UI Use

Open the **Configuration Properties**. On the **Time** tab, set **Time span overrun action**.

TimeUnits — Units to display on the x-axis
`'Metric'` (default for Time Scope block) | `'None'` (default for Scope block) | `'Seconds'`

Units to display on the *x*-axis, specified as one of these values:

- `'Metric'` — Display time units based on the length of the `TimeSpan` property.
- `'None'` — Display `Time` on the *x*-axis.
- `'Seconds'` — Display `Time (seconds)` on the *x*-axis.

UI Use

Open the **Configuration Properties**. On the **Time** tab, set **Time units**.

Title — Title for display
`'%<SignalLabel>'` (default) | character vector

Title for a display, specified as a character vector. The default value `%<SignalLabel>` uses the input signal name for the title.

Dependency

Set the `ActiveDisplay` property before setting this property.

UI Use

Open the **Configuration Properties**. On the **Display** tab, set **Title**.

Visible — Visibility of scope window
true (default) | false

Set this property to true to make the scope window visible.

YLabel — Y-axis label
'' (default) | character vector

y-axis label for active display, specified as a character vector.

Dependency

Set the `ActiveDisplay` property before setting this property.

If `PlotAsMagnitudePhase` is `true`, the value of `YLabel` is hidden and plots are labeled `Magnitude` and `Phase`.

UI Use

Open the **Configuration Properties**. On the **Display** tab, set **Y-label**.

YLimits — Minimum and maximum values of y-axis
[-10 10] (default) | [ymin ymax]

Minimum and maximum values of *y*-axis, specified as a two-element numeric vector.

Dependency

Set the `ActiveDisplay` property before setting this property.

When `PlotAsMagnitudePhase` is `true`, this property specifies the *y*-axis limits for the magnitude plot. The *y*-axis limits of the phase plot are always [-180 180].

UI Use

Open the **Configuration Properties**. On the **Display** tab, set **Y-limits (Minimum)** and **Y-limits (Maximum)**.

Examples

Create Scope Configuration Object

This example creates a scope configuration object using the `'vdp'` model which models the van der Pol equation.

```
open_system('vdp')
myScopeConfiguration = get_param('vdp/Scope','ScopeConfiguration');
myScopeConfiguration.NumInputPorts = '2';
```

Model and Block Parameters

Model Parameters

In this section...
"About Model Parameters" on page 6-2
"Examples of Setting Model Parameters" on page 6-109

About Model Parameters

You can query and/or modify the properties (parameters) of a Simulink model from the command line. Parameters that describe a model are model parameters, and parameters that describe a Simulink block are block parameters. Block parameters that are common to Simulink blocks are called common block parameters. There are also block-specific parameters. Masks also have parameters, that is, parameters that describe a masked block.

The model and block properties can also include callbacks, which are commands that execute when certain model or block events occur. These events include opening a model, simulating a model, copying a block, opening a block, and so on.

This table lists, in alphabetical order, parameters that describe a model. You can set these parameters using the set_param command. The **Description** column indicates where you can set the value on a dialog box.

For examples, see "Examples of Setting Model Parameters" on page 6-109. The **Values** column shows the type of value required, the possible values (separated with a vertical line), and the default value enclosed in braces.

The table also includes model callback parameters (see "Callbacks for Customized Model Behavior"). Do not use model parameters in a PreLoadFcn callback. Instead, use them in a PostLoadFcn callback.

Model Parameters in Alphabetical Order

Parameter	Description	Values
AbsTol	Specify the largest acceptable solver error, as the value of the measured state approaches zero. Set by **Absolute tolerance** on the **Solver** pane of the Configuration Parameters dialog box.	{'auto'}
AccelVerboseBuild	Controls the verbosity level during code generation for Simulink Accelerator mode, model reference Accelerator mode, and Rapid Accelerator mode. Set by **Verbose accelerator builds** on the Configuration Parameters dialog box.	{'off'} | 'on'
AlgebraicLoopMsg	Specifies diagnostic action to take when there is an algebraic loop. Set by **Algebraic loop** on the **Solver** section of the **Diagnostics** pane of the Configuration Parameters dialog box.	'none' | {'warning'} | 'error'

Parameter	Description	Values
`ArrayBoundsChecking`	Select the diagnostic action to take when blocks write data to locations outside the memory allocated to them. Set by **Array bounds exceeded** on the Configuration Parameters dialog box.	`{'none'}` | `'warning'` | `'error'`
`ArtificialAlgebraic-` `LoopMsg`	Specifies diagnostic action to take if algebraic loop minimization cannot be performed for a subsystem because an input port of that subsystem has direct feedthrough. Set by **Minimize algebraic loop** on the **Solver** section of the **Diagnostics** pane in the Configuration Parameters dialog box.	`'none'` | `{'warning'}` | `'error'`
`AssertControl`	Enable model verification blocks in the current model either globally or locally. Set by **Model Verification block enabling** on the Configuration Parameters dialog box.	`{'UseLocalSettings'}` | `'EnableAll'` | `'DisableAll'`

Parameter	Description	Values
`AutoInsertRateTranBlk`	Specify whether Simulink software inserts hidden Rate Transition blocks between blocks that have different sample rates. Set by **Automatically handle rate transition for data transfer** on the **Solver** pane of the Configuration Parameters dialog box.	`'on'` | `{'off'}`
`BlockDescription-StringDataTip`	Specifies whether to display the user description for a block as a data tip. In the Simulink Editor, set by **Description** on the **Display > Blocks > Block Tool Tip Options** menu.	`'on'` | `{'off'}`
`BlockNameDataTip`	Specifies whether to display the block name as a data tip. In the Simulink Editor, set by **Block Name** on the **Display > Blocks > Block Tool Tip Options** menu.	`'on'` | `{'off'}`
`BlockParametersDataTip`	Specifies whether to display a block parameter in a data tip. In the Simulink Editor, set by **Parameter Names & Values** on the **Display > Blocks > Block Tool Tip Options** menu.	`'on'` | `{'off'}`

Parameter	Description	Values
`BlockPriority-` `ViolationMsg`	Select the diagnostic action to take if Simulink software detects a block priority specification error. Set by **Block priority violation** on the **Solver** section of the **Diagnostics** pane of the Configuration Parameters dialog box.	`{'warning'}` `|` `'error'`
`BlockReduction`	Enables block reduction optimization. Set by **Block reduction** on the Configuration Parameters dialog box.	`{'on'}` `|` `'off'`
`BlockReductionOpt`	See `BlockReduction` parameter for more information.	
`BooleanDataType`	Enable Boolean mode. Set by **Implement logic signals as Boolean data (vs. double)** on the Configuration Parameters dialog box.	`{'on'}` `|` `'off'`
`BrowserLookUnderMasks`	Show masked subsystems in the Model Browser. In the Simulink Editor, set by **Include Systems with Mask Parameters** on the **View > Model Browser** menu.	`'on'` `|` `{'off'}`

Parameter	Description	Values
BrowserShowLibraryLinks	Show library links in the Model Browser. In the Simulink Editor, set by **Include Library Links** on the **View > Model Browser** menu.	'on' | {'off'}
BufferReusableBoundary	Insert buffers at reusable subsystem boundaries if needed.	'on' | {'off'}
BufferReuse	Enable reuse of block I/O buffers. Set by **"Reuse local block outputs" (Simulink Coder)** on the **Optimization** pane of the Configuration Parameters dialog box.	{'on'} | 'off'
BusNameAdapt	Repair broken selections in the Bus Selector and Bus Assignment block parameters dialog boxes that are due to upstream bus hierarchy changes. Set by **"Repair bus selections"** on the **Diagnostics > Connectivity** pane of the Configuration Parameters dialog box.	{'WarnAndRepair'} | 'ErrorWithoutRepair'

Parameter	Description	Values
`BusObjectLabelMismatch`	Select the diagnostic action to take if the name of a bus element does not match the name specified by the corresponding bus object. Set by **Element name mismatch** on the **Diagnostics > Connectivity** pane of the Configuration Parameters dialog box.	`'none' | {'warning'} | 'error'`
`CheckExecutionContext-RuntimeOutputMsg`	Specify whether to display a warning if Simulink software detects potential output differences from previous releases. Set by **Check runtime output of execution context** on the Configuration Parameters dialog box.	`'on' | {'off'}`
`CheckForMatrix-Singularity`	See `CheckMatrixSingularityMsg` parameter for more information.	
`CheckMatrix-SingularityMsg`	Select the diagnostic action to take if the Product block detects a singular matrix while inverting one of its inputs in matrix multiplication mode. Set by **Division by singular matrix** on the **Data Validity Diagnostics** pane of the Configuration Parameters dialog box.	`{'none'} | 'warning' | 'error'`

Parameter	Description	Values
`CheckModelReference-TargetMessage`	Select the diagnostic action to take if Simulink software detects a target that needs to be rebuilt. Set by **"Never rebuild diagnostic"** on the **Model Referencing** pane of the Configuration Parameters dialog box.	`'none'` | `'warning'` | `{'error'}`
`CheckSSInitialOutputMsg`	Enable checking for undefined initial subsystem output. Set by **Check undefined subsystem initial output** on the Configuration Parameters dialog box.	`{'on'}` | `'off'`
`CloseFcn`	Set the close callback function, which can be a command or a variable. Set by **Model close function** on the **Callbacks** pane of the Model Properties dialog box. See "Create Model Callbacks" for more information.	`{''}`
`CompiledBusType`	Return information about whether the signal connected to a port is not a bus, or whether it is a virtual or nonvirtual bus. (Read-only) Get with the `get_param` command. Specify a port or line handle. See "Display Information About Buses".	Return values are `'NOT_BUS'`, `VIRTUAL_BUS`, and `NON_VIRTUAL_BUS`

Parameter	Description	Values
`CompiledModelBlockNormal ModeVisibility`	For a top model that is being simulated or that is in a compiled state, return information about which Model blocks have normal mode visibility enabled.	Return values indicate which Model blocks have normal mode visibility enabled.
`ConditionallyExecute- Inputs`	Enable conditional input branch execution optimization. Set by **Conditional input branch execution** on the Configuration Parameters dialog box.	`{'on'}	'off'`
`ConsecutiveZCsStepRelTol`	Relative tolerance associated with the time difference between zero-crossing events. Set by **Time tolerance** on the **Solver** pane of the Configuration Parameters dialog box.	`{'10*128*eps'}`
`ConsistencyChecking`	Select the diagnostic action to take if S-functions have continuous sample times, but do not produce consistent results when executed multiple times. Set by **Solver data inconsistency** on the **Solver** section of the **Diagnostics** pane of the Configuration Parameters dialog box.	`{'none'}	'warning'	'error'`

Parameter	Description	Values
ContinueFcn	Continue simulation callback. Set by **Simulation continue function** on the **Callbacks** pane of the Model Properties dialog box.	{''}
CovCompData	If `CovHtmlReporting` is set to `on` and `CovCumulativeReport` is set to `on`, this parameter specifies `cvdata` objects containing additional model coverage data to include in the model coverage report. Set by **Additional data to include in report (cvdata objects)** on the **Reporting** pane of the Configuration Parameters dialog box.	{''}

Parameter	Description	Values
`CovCumulativeReport`	If `CovHtmlReporting` is set to `on`, this parameter allows the `CovCumulativeReport` and `CovCompData` parameters to specify the number of coverage results displayed in the model coverage report. If set to `on`, the Simulink Coverage™ software displays the coverage results from successive simulations in the report. If set to `off`, the software displays the coverage results for the last simulation in the report. Set by the **Cumulative runs** (on) / **Last run** (off) options on the **Reporting** pane of the Configuration Parameters dialog box.	`'on'` | `{'off'}`
`CovDataFileName`	If `CovEnable` is set to `on`, specifies the name of the file to which Simulink Coverage saves the coverage data results.	`{''}`
`CovCumulativeVarName`	If `CovSaveCumulativeTo-WorkspaceVar` is set to `on`, the Simulink Coverage software saves the results of successive simulations in the workspace variable specified by this property.	`{'covCumulativeData'}`

Parameter	Description	Values
CovEnable	Enables coverage analysis for Simulink Coverage. Set by **Enable coverage analysis** on the **Coverage** pane of the Configuration Parameters dialog box.	`'on'` | `{'off'}`
CovEnableCumulative	Accumulates model coverage results for Simulink Coverage from successive simulations. Set this and `CovSaveCumulativeToWorkspaceVar` to on to collect model coverage results for multiple simulations in one `cvdata` object.	`'on'` | `{'off'}`
CovExternalEMLEnable	Enables coverage for any external MATLAB functions that MATLAB functions for code generation call in your model. The functions can be defined in a MATLAB Function block or in a Stateflow chart. Enable this feature by checking **MATLAB Files** on the **Coverage** pane of the Configuration Parameters dialog box.	`{'on'}` | `'off'`
CovForceBlockReductionOff	If `CovForceBlockReductionOff` is set to on, the Simulink Coverage software ignores the value of the Simulink **Block reduction** parameter. The software provides coverage data for every block in the model that collects coverage.	`{'on'}` | `'off'`

Parameter	Description	Values
CovHighlightResults	Enable model coloring for coverage results. Enabled by selecting **Display coverage results using model coloring** on the **Coverage** > **Results** pane of the Configuration Parameters dialog box.	'on' | {'off'}

Parameter	Description	Values
CovHTMLOptions	If `CovHtmlReporting` is set to `on`, use this parameter to select from a set of display options for the resulting model coverage report. Select these options in the **Results Explorer** settings after you record coverage for a model.	Character vector of appended character sets separated by a space. HTML options are enabled or disabled through a value of 1 or 0, respectively, in the following character sets (default values shown): • `'-sRT=1'` — Show report • `'-sVT=0'` — Web view mode • `'-aTS=1'` — Include each test in the model summary • `'-bRG=1'` — Produce bar graphs in the model summary • `'-bTC=0'` — Use two color bar graphs (red, blue) • `'-hTR=0'` — Display hit/count ratio in the model summary • `'-xEM=0'` — Exclude execution metric details from report • `'-nFC=0'` — Exclude fully covered model objects from report • `'-nFD=1'` — Exclude fully covered model object details from report • `'-scm=1'` — Include cyclomatic complexity numbers in summary • `'-bcm=1'` — Include cyclomatic complexity numbers in block details • `'-xEv=0'` — Filter Stateflow events from report

Parameter	Description	Values
		• `'-xEM=0'` — Filter Execution metric from report
`CovIncludeTopModel`	Option to include the top-level model in the coverage analysis.	`{'on'}	'off'`
`CovHtmlReporting`	Set to on to tell the Simulink Coverage software to create an HTML report containing the coverage data at the end of simulation. Set by **Generate report automatically after analysis** on the **Coverage** > **Results** pane of the Configuration Parameters dialog box.	`'on'	{'off'}`
`CovLogicBlockShortCircuit`	Enables the option to treat Simulink logic blocks as short-circuited for coverage analysis. Enabled by selecting **Treat Simulink logic blocks as short-circuited** on the **Coverage** pane of the Configuration Parameters dialog box.	`'on'	{'off'}`

Parameter	Description	Values
CovMcdcMode	Determines the definition of Modified Condition Decision Coverage (MCDC) to use during coverage analysis. To record model coverage using the masking MCDC definition, set CovMcdcMode to 'Masking'. To record model coverage using the unique-cause MCDC definition, set CovMcdcMode to 'UniqueCause'.	{'Masking'} | 'UniqueCause'

Parameter	Description	Values
`CovMetricSettings`	Selects coverage metrics for a coverage report. Coverage metrics are enabled by selecting the check boxes for individual coverages in the **Coverage metrics** section of the **Coverage** pane of the Configuration Parameters dialog box. Enable options `'s'` and `'w'` by selecting **Treat Simulink Logic blocks as short-circuited** and **Warn when unsupported blocks exist in model**, respectively, on the **Coverage** pane of the Configuration Parameters dialog box. Disable option `'e'` by selecting **Display coverage results using model coloring** in the **Results Explorer** settings after you record coverage for a model. **Note** The metrics and options set by this parameter can also be set by the following parameters: • CovHighlightResults • CovLogicBlockShortCircuit • CovMetricStructuralLevel • CovMetricLookupTable	`{'dwe'}` Each order-independent value enables a coverage metric or option as follows: • `'d'` — Enable decision coverage • `'c'` — Enable condition coverage and decision coverage • `'m'` — Enable MCDC coverage, condition coverage, and decision coverage • `'t'` — Enable lookup table coverage • `'r'` — Enable signal range coverage • `'z'` — Enable signal size coverage • `'o'` — Enable coverage for Simulink Design Verifier blocks • `'i'` — Enable saturation on integer overflow coverage • `'b'` — Enable relational boundary coverage • `'s'` — Treat Simulink logic blocks as short-circuited • `'w'` — Warn when unsupported blocks exist in model • `'e'` — Eliminate model coloring for coverage results

Parameter	Description	Values
	• CovMetricSignalRange • CovMetricSignalSize • CovMetricObjectiveConstraint • CovMetricSaturateOnIntegerOverflow • CovMetricRelationalBoundary • CovUnsupportedBlockWarning	
CovMetricLookupTable	Enable lookup table coverage. Enabled by selecting **Lookup Table** in the **Coverage metrics** section of the **Coverage** pane of the Configuration Parameters dialog box.	`'on'	{'off'}`
CovMetricObjectiveConstraint	Enable Simulink Design Verifier objectives and constraints coverage. Enabled by selecting **Objectives and Constraints** in the **Coverage metrics** section of the **Coverage** pane of the Configuration Parameters dialog box.	`'on'	{'off'}`
CovMetricRelationalBoundary	Enable relational boundary coverage. Enabled by selecting **Relational Boundary** in the **Coverage metrics** section of the **Coverage** pane of the Configuration Parameters dialog box.	`'on'	{'off'}`

Parameter	Description	Values
`CovMetricSaturateOnIntegerOverflow`	Enable saturate on integer overflow coverage. Enabled by selecting **Saturate on Integer Overflow** in the **Coverage metrics** section of the **Coverage** pane of the Configuration Parameters dialog box.	`'on'	{'off'}`
`CovMetricSignalRange`	Enable signal range coverage. Enabled by selecting **Signal Range** in the **Coverage metrics** section of the **Coverage** pane of the Configuration Parameters dialog box.	`'on'	{'off'}`
`CovMetricSignalSize`	Enable signal size coverage. Enabled by selecting **Signal Size** in the **Coverage metrics** section of the **Coverage** pane of the Configuration Parameters dialog box.	`'on'	{'off'}`
`CovMetricStructuralLevel`	Define the level of structural coverage. Set by **Structural coverage level** on the **Coverage** pane of the Configuration Parameters dialog box.	`'BlockExecution'	{'Decision'}	'ConditionDecision'	'MCDC'`

Parameter	Description	Values
CovModelRefEnable	If CovModelRefEnable is set to on or all, the Simulink Coverage software generates coverage data for all referenced models. If CovModelRefEnable is set to filtered, coverage data is collected for all referenced models except those specified by the parameter CovModelRefExcluded. Set by **Coverage for referenced models** on the **Coverage** pane of the Configuration Parameters dialog box.	'on' | {'off'} | 'all' | 'filtered'
CovModelRefExcluded	If CovModelRefEnable is set to filtered, this parameter stores a comma-separated list of referenced models for which coverage is disabled. Set by selecting **Coverage for referenced models** on the **Coverage** pane of the Configuration Parameters dialog box and then clicking **Select Models**.	{''}

Parameter	Description	Values
CovNameIncrementing	If CovSaveSingleToWorkspaceVar is set to on, setting CovNameIncrementing to on causes the Simulink Coverage software to append numerals to the workspace variable names for results so that earlier results are not overwritten (for example, covdata1, covdata2, etc.) Set by **Increment variable name with each simulation** below the selected **Save last run in workspace variable** check box on the **Coverage > Results** pane of the Configuration Parameters dialog box.	'on' | {'off'}
CovOutputDir	If CovEnable is set to on, specifies the directory in which Simulink Coverage saves the coverage output files.	{''}
CovPath	Model path of the subsystem for which the Simulink Coverage software gathers and reports coverage data. Set by selecting **Subsystem** on the **Coverage** pane of the Configuration Parameters dialog box and then clicking **Select Subsystem**.	{'/'}

Parameter	Description	Values
`CovReportOnPause`	Specifies that when you pause during simulation, the model coverage report appears in updated form, with coverage results up to the current pause or stop time.	`{'on'}	'off'`
`CovSaveCumulativeTo-WorkspaceVar`	If set to on, the Simulink Coverage software accumulates and saves the results of successive simulations in the workspace variable specified by `CovCumulativeVarName`.	`'on'	{'off'}`
`CovSaveName`	If `CovSaveSingleToWorkspaceVar` is set to on, the Simulink Coverage software saves the results of the last simulation run in the workspace variable specified by this property. Set by **cvdata object name** below the selected **Save last run in workspace variable** check box on the **Coverage** > **Results** pane of the Configuration Parameters dialog box.	`{'covdata'}`

Parameter	Description	Values
`CovSaveSingleTo-WorkspaceVar`	If set to on, the Simulink Coverage software saves the results of the last simulation run in the workspace variable specified by `CovSaveName`. Set by **Save last run in workspace variable** on the **Coverage > Results** pane of the Configuration Parameters dialog box.	`'on'` | `{'off'}`
`CovScope`	Sets the scope of analysis for coverage recording. Set by the **Scope of analysis section** of the **Coverage** pane in the Configuration Parameters dialog box.	`{'EntireSystem'}` | `'ReferencedModels'` | `'Subsystem'`
`CovSFcnEnable`	Enables coverage for C/C++ S-Function blocks in your model. Enable this feature by checking **C/C++ S-Functions** on the **Coverage** pane of the Configuration Parameters dialog box. For more information, see "Coverage for C and C++ S-Functions" (Simulink Coverage).	`'on'` | `{'off'}`
`CovShowResultsExplorer`	Option to shows the results explorer after simulation. Enabled by selecting **Show Results Explorer** on the **Coverage > Results** pane of the Configuration Parameters dialog box.	`{'on'}` | `'off'`

Parameter	Description	Values
CovUnsupportedBlockWarning	Warn when unsupported blocks exist in model. Enabled by selecting **Warn when unsupported blocks exist in model** on the **Coverage** pane of the Configuration Parameters dialog box.	`'on'` | `{'off'}`
Created	Date and time model was created. Set by **Created on** on the **History** pane of the Model Properties dialog box. See "Model Information and History" for more information.	character vector
Creator	Name of model creator. Set by **Created by** on the **History** pane of the Model Properties dialog box. See "Model Information and History" for more information.	character vector
CurrentBlock	For internal use.	
CurrentOutputPort	For internal use.	
CurrentSimState	Save the SimState snapshot of the simulation if the simulation is in a paused state.	`Simulink.SimState.ModelSimState` object | `{[]}`

Parameter	Description	Values
DataDictionary	Simulink data dictionary to which this model is linked. Set by **Data Dictionary** and **Base Workspace** on the **Data** pane of the Model Properties dialog box. For basic information about data dictionaries, see "What Is a Data Dictionary?". To use this parameter programmatically, see "Store Data in Dictionary Programmatically".	{''}
DataLoggingOverride	A Simulink.SimulationData.ModelLoggingInfo object that specifies the signal logging override settings for a model. See "Override Signal Logging Settings".	Simulink.SimulationData.ModelLoggingInfo — {'OverrideSignals'} | 'LogAllAsSpecifiedInModel'
DatasetSignalFormat	Format for logged Dataset leaf elements. For details, see "Dataset signal format".	'timetable' | {'timeseries'}
DataTransfer	A Simulink.GlobalDataTransfer object that configures data transfers for models configured for concurrent execution.	'on' | {'off'}

Parameter	Description	Values
DataTypeOverride	Specifies data type used to override fixed-point data types. Set by **Data type override** on the Fixed-Point Tool.	{'UseLocalSettings'} | 'ScaledDouble' | 'Double' | 'Single' | 'Off'
Decimation	Specify that Simulink software output only every N points, where N is the specified decimation factor. Set by **"Decimation"** on the **Data Import/Export** pane of the Configuration Parameters dialog box.	{'1'}
DefaultParameterBehavior	Enable inlining of block parameters in generated code. Set by **Default parameter behavior**, see "Default parameter behavior" (Simulink Coder).	'Inlined' | {'Tunable'}
DefaultAnnotationFontName DefaultBlockFontName DefaultLineFontName	Name of font to use for new annotation text, block text, or signal line labels and on existing annotations, block names, or signal lines whose FontName property is set to 'auto'. Set with **Diagram > Format > Font Styles for Model** dialog box.	character vector

Parameter	Description	Values

`DefaultAnnotationFontSize`
 	
`DefaultBlockFontSize`
 	
`DefaultLineFontSize`
	Size of font to use for new annotation text, block text, or signal line labels and on existing annotations, blocks, or signal lines whose `FontSize` property is set to `-1`.
	
	Set with **Diagram > Format > Font Styles for Model** dialog box.
		positive integer

`DefaultAnnotationFontAngle`
 	
`DefaultBlockFontAngle`
 	
`DefaultLineFontAngle`
	Angle of font for new annotation text, block text, or signal line labels and on existing annotations, blocks, or signal lines whose `FontAngle` property is set to `'auto'`.
	
	Set with **Diagram > Format > Font Styles for Model** dialog box.
		`{'normal'}	'italic'`

`DefaultAnnotationFontWeight`
 	
`DefaultBlockFontWeight`
 	
`DefaultLineFontWeight`
	Weight of font for new annotation text, block text, or signal line labels and on existing annotations, blocks, or signal lines whose `FontWeight` property is set to `'auto'`.
	
	Set with **Diagram > Format > Font Styles for Model** dialog box.
		`{'normal'}	'bold'`

Parameter	Description	Values
`DefaultUnderspecifiedDataType`	Specify data type to use if Simulink cannot infer the type of a signal during data type propagation. Set by **"Default for underspecified data type"** on the **Math and Data Types** pane of the Configuration Parameters dialog box.	`{'double'}	'single'`
`DeleteChildFcn`	Delete child callback function. Created on the **Callbacks** pane of the Block Properties dialog box. See "Specify Block Callbacks" for more information.	`{''}`
`Description`	Description of this model. Set by **Model description** on the **Description** pane of the Model Properties dialog box.	`{''}`
`Dirty`	If the parameter is on, the model has unsaved changes.	`'on'	{'off'}`
`DiscreteInherit-ContinuousMsg`	For internal use.	
`DisplayBdSearchResults`	For internal use.	
`DisplayBlockIO`	For internal use.	
`DisplayCallgraph-Dominators`	For internal use	
`DisplayCompileStats`	For internal use.	
`DisplayCondInputTree`	For internal use.	
`DisplayCondStIdTree`	For internal use.	

Parameter	Description	Values
`DisplayErrorDirections`	For internal use.	
`DisplayInvisibleSources`	For internal use.	
`DisplaySortedLists`	For internal use.	
`DisplayVectorAnd-FunctionCounts`	For internal use.	
`DisplayVect-PropagationResults`	For internal use.	
`ExecutionContextIcon`	Show execution context bars on conditional subsystems that do not propagate execution context across the subsystem boundaries. In the Simulink Editor, set by **Execution Context Indicator** on the **Display** > **Signals & Ports** menu.	`'on'` | `{'off'}`
`ExplicitPartitioning`	Specifies whether or not to manually map tasks (explicit mapping) or use the rate-based tasks.	`'on'` | `{'off'}`
`ExpressionFolding`	Enables expression folding. Set by **"Eliminate superfluous local variables (Expression folding)" (Simulink Coder)** on the Configuration Parameters dialog box.	`{'on'}` | `'off'`

Parameter	Description	Values
`ExternalInput`	Names of MATLAB workspace variables used to designate data and times to be loaded from the workspace. Set by the **Input** field on the **Data Import/Export** pane of the Configuration Parameters dialog box.	`{'[t, u]'}`
`ExtMode...`	Parameters whose names start with `ExtMode` apply to Simulink external mode simulations. For more information, see "Host-Target Communication with External Mode Simulation" (Simulink Coder).	
`ExtrapolationOrder`	Extrapolation order of the `ode14x` implicit fixed-step solver. Set by **Extrapolation order** on the **Solver** pane of the Configuration Parameters dialog box.	integer — 1 | 2 | 3 | {4}
`FastRestart`	Enable or disable fast restart mode. In the Simulink Editor toolbar, click the **Fast restart** button on or off.	`{'on'} | 'off'`

Parameter	Description	Values
FcnCallInpInside- ContextMsg	Specifies diagnostic action to take when Simulink software must compute any function-call subsystem inputs directly or indirectly during execution of a call to a function-call subsystem. Set by **Context-dependent inputs** on the **Connectivity Diagnostics** pane of the Configuration Parameters dialog box.	{'Error'} | 'Warning'
FileName	For internal use.	
FinalStateName	Names of final states to save to the workspace after a simulation ends. Set by the **Final states** field on the **Data Import/Export** pane of the Configuration Parameters dialog box.	{'xFinal'}
FixedStep	Fixed-step size. Set by **Fixed-step size (fundamental sample time)** on the **Solver** pane of the Configuration Parameters dialog box.	{'auto'}

Parameter	Description	Values
FixptConstOverflowMsg	Specifies diagnostic action to take when a fixed-point constant overflow occurs during simulation. Set by **Detect overflow** on the **Type Conversion Diagnostics** pane of the Configuration Parameters dialog box.	{'none'} | 'warning' | 'error'
FixptConstPrecisionLossMsg	Specifies diagnostic action to take when a fixed-point constant precision loss occurs during simulation. Set by **Detect precision loss** on the **Type Conversion Diagnostics** pane of the Configuration Parameters dialog box.	{'none'} | 'warning' | 'error'
FixptConstUnderflowMsg	Specifies diagnostic action to take when a fixed-point constant underflow occurs during simulation. Set by **Detect underflow** on the **Type Conversion Diagnostics** pane of the Configuration Parameters dialog box.	{'none'} | 'warning' | 'error'
FixPtInfo	For internal use.	
FollowLinksWhen-OpeningFromGotoBlocks	Specifies whether to search for Goto tags in libraries referenced by the model when opening the From block dialog box.	'on' | {'off'}
ForceArrayBoundsChecking	For internal use.	

Parameter	Description	Values
`ForceConsistencyChecking`	For internal use.	
`ForceModelCoverage`	For internal use.	

`ForwardingTable`	Specifies the forwarding table for this library.
	
	See "Create Forwarding Table" for more information.
		`{{'old_path_1',`
		`'new_path_1'} ...`
		`{'old_path_n',`
		`'new_path_n'}}`

`ForwardingTableString`	For internal use.	
`GeneratePreprocessorConditionals`	When generating code for an ERT target, this parameter determines whether variant choices are enclosed within C preprocessor conditional statements (`#if`). When you select this option, Simulink analyzes all variant choices during an update diagram or simulation. This analysis provides early validation of the code generation readiness of all variant choices.	`{'off'}	'on'`
`GridSpacing`	Has no effect in Simulink Editor. This parameter will be removed in a future release.	integer — `{20}`
`Handle`	Handle of the block diagram for this model.	double
`HardwareBoard`	Select the type of hardware on which to run your model. Set by **"Hardware board"** on the **Hardware Implementation** pane of the Configuration Parameters dialog box.	`{'none'}`

Parameter	Description	Values
HideAutomaticNames	Hides block names given automatically by the Simulink Editor. See "Hide or Display Block Names".	`{'on'}	'off'`
HiliteAncestors	For internal use.	
IgnoreBidirectionalLines	For internal use.	
IgnoredZcDiagnostic	Control diagnostic messages related to zero-crossings that are being ignored.	`'none'	{'warning'}	'error'`
InheritedTsInSrcMsg	Message behavior when the sample time is inherited. Set by **Source block specifies -1 sample time** on the **Sample Time Diagnostics** pane of the Configuration Parameters dialog box.	`'none'	{'warning'}	'error'`
InitFcn	Function that is called when this model is first compiled for simulation. Set by **Model initialization function** on the **Callbacks** pane of the Model Properties dialog box. See "Create Model Callbacks" for more information.	`{''}`
InitialState	Initial state name or values. Set by the **Initial state** field on the **Data Import/Export** pane of the Configuration Parameters dialog box.	variable or vector — `{'xInitial'}`

Parameter	Description	Values
`InitialStep`	Initial step size. Set by **Initial step size** on the **Solver** pane of the Configuration Parameters dialog box.	`{'auto'}`
`InitialStep`	Initial step size. Set by **Initial step size** on the **Solver** pane of the Configuration Parameters dialog box.	`{'auto'}`
`InitialStep`	Initial step size. Set by **Initial step size** on the **Solver** pane of the Configuration Parameters dialog box.	`{'auto'}`

Parameter	Description	Values
`InitInArrayFormatMsg`	Message behavior when the initial state is an array. You set with the initial state with the **Initial state** configuration parameter. Avoid using an array for the initial state. If the order of the elements in the array does not match the order in which blocks initialize, the simulation can produce unexpected results. To promote deterministic simulation results, use the default setting or set the diagnostic to `error`. Alternatively, you can set the message behavior using the **"InitInArrayFormatMsg"** on the Configuration Parameters dialog box.	`'none'` | `{'warning'}` | `'error'`
`InsertRTBMode`	Control whether the Rate Transition block parameter **Ensure deterministic data transfer (maximum delay)** is set for auto-inserted Rate Transition blocks. Set by **Deterministic data transfer** on the **Solver** pane of the Configuration Parameters dialog box.	`'Always'` | `{'Whenever possible'}` | `'Never (minimum delay)'`

Parameter	Description	Values
`InspectSignalLogs`	Enable Simulink software to display logged signals in the Simulation Data Inspector tool at the end of a simulation or whenever you pause the simulation. Set by **"Record logged workspace data in Simulation Data Inspector"** on the **Data Import/Export** pane of the Configuration Parameters dialog box.	`'on'	{'off'}`
`InstrumentedSignals`	Returns a `Simulink.HMI.InstrumentedSignals` object with the properties of model name and the number of signals that are marked for streaming. From this object, you can control signal streaming using the block path and output port index.	object — `Simulink.HMI.InstrumentedSignals`
`Int32ToFloatConvMsg`	Specify message behavior when a 32-bit integer is converted to a single-precision float. Set by **32-bit integer to single precision float conversion** on the **Type Conversion Diagnostics** pane of the Configuration Parameters dialog box.	`'none'	{'warning'}`

Parameter	Description	Values
`IntegerOverflowMsg`	Specify message behavior when an integer overflow occurs. Set by **"Wrap on overflow"** in the **Signals** section on the **Data Validity Diagnostics** pane of the Configuration Parameters dialog box.	`'none'` | `{'warning'}` | `'error'`
`IntegerSaturationMsg`	Specify message behavior when an integer saturation occurs. Set by **"Saturate on overflow"** in the **Signals** section on the **Data Validity Diagnostics** pane of the Configuration Parameters dialog box.	`'none'` | `{'warning'}` | `'error'`
`InvalidFcnCallConnMsg`	Specify message behavior when an invalid function-call connection exists. Set by **Invalid function-call connection** on the **Connectivity Diagnostics** pane of the Configuration Parameters dialog box.	`'warning'` | `{'error'}`
`Jacobian`	For internal use.	
`LastModifiedBy`	User name of the person who last modified this model.	character vector
`LastModifiedDate`	Date when the model was last saved.	character vector

Parameter	Description	Values
LibraryLinkDisplay	Displays the blocks in the model that are linked or have disabled or modified links. In the Simulink Editor, set by **Library Links** on the **Display** menu.	`'none'` | `{'disabled'}` | `'user'` | `'all'` Set to `none`, does not display the link badge on the block. Set to `disabled`, displays the disabled link badge on the block. Set to `user`, displays only links to the user libraries. Set to `all`, displays all links.
LibraryType	For internal use.	
LifeSpan	Specify how long (in days) an application that contains blocks depending on elapsed or absolute time should be able to execute before timer overflow. Set by **Application lifespan (days)** on the **Math and Data Types** pane of the Configuration Parameters dialog box.	`{'auto'}` | any positive, nonzero scalar value
LimitDataPoints	Specify that the number of data points exported to the MATLAB workspace be limited to the number specified. Set by the **Limit data points** configuration parameter	`{'on'}` | `'off'`
LinearizationMsg	For internal use.	
Lines	For internal use.	

Parameter	Description	Values
`LoadExternalInput`	Load input from workspace. Set by the **Input** check box on the **Data Import/Export** pane of the Configuration Parameters dialog box.	`'on'` | `{'off'}`
`LoadInitialState`	Load initial state from workspace. Set by the **Initial state** check box on the **Data Import/Export** pane of the Configuration Parameters dialog box.	`'on'` | `{'off'}`
`Location`	For internal use.	
`Lock`	Lock or unlock a block library. Setting this parameter to `on` prevents a user from inadvertently changing a library.	`'on'` | `{'off'}`
`LockLinksToLibrary`	Lock or unlock links to a library. Setting this parameter to `on` prevents a user from inadvertently changing linked blocks from the Simulink Editor.	`'on'` | `{'off'}`
`LoggingFileName`	Use when you enable `LoggingToFile` parameter for logging to persistent storage. Specify the destination MAT-file for data logging.	`{'out.mat'}` For details, see "Log Data to Persistent Storage".

Parameter	Description	Values
`LoggingToFile`	Store logging data that uses `Dataset` format to persistent storage (MAT-file). Using a `Simulink.SimlationData.DatasetRef` object to access signal logging and states logging data loads data into the model workspace incrementally. Accessing data for other kinds of logging loads all of the data at once. Use this feature when logging large amounts of data that can cause memory issues. For details, see "Log Data to Persistent Storage".	`'on'` | `{'off'}` For details, see "Log Data to Persistent Storage".
`MAModelExclusionFile`	Specifies the location of the Model Advisor exclusion file. Set by the **File Name** field on the Model Advisor Exclusion Editor dialog box.	`{' '}`
`MaskedZcDiagnostic`	Control diagnostic messages related to zero-crossings that are being masked.	`'none'` | `{'warning'}` | `'error'`

Parameter	Description	Values
`MaxConsecutiveMinStep`	Maximum number of minimum step size violations allowed during simulation. This option appears when the solver type is `Variable-step` and the solver is an ode one. Set by **Number of consecutive min steps** on the **Solver** pane of the Configuration Parameters dialog box.	`{'1'}`
`MaxConsecutiveZCs`	Maximum number of consecutive zero crossings allowed during simulation. This option appears when the solver type is `Variable-step` and the solver is an ode one. Set by **Number of consecutive zero crossings** on the **Solver** pane of the Configuration Parameters dialog box.	`{'1000'}`

Parameter	Description	Values
MaxConsecutiveZCsMsg	Specifies diagnostic action to take when Simulink software detects the maximum number of consecutive zero crossings allowed. This option appears when the solver type is Variable-step and the solver is an ode one. Set by **Consecutive zero crossings violation** on the **Solver** section of the **Diagnostics** pane of the Configuration Parameters dialog box.	'none' | 'warning' | {'error'}
MaxDataPoints	Maximum number of output data points to save. Set by the **Limit data points to last** field on the **Data Import/Export** pane of the Configuration Parameters dialog box.	{'1000'}
MaxMDLFileLineLength	Controls the line lengths in the model file. Use this to avoid line-wrapping, which can be important for source control tools. Specifies the maximum length in bytes, which may different from the number of characters in Japanese, and is different from the number of columns when tabs are present.	integer — -1 (unlimited) or >= 80. Default is 120.

Parameter	Description	Values
`MaxNumMinSteps`	Maximum number of times the solver uses the minimum step size.	`{'-1'}`
`MaxOrder`	Maximum order for `ode15s`. Set by **Maximum order** on the **Solver** pane of the Configuration Parameters dialog box.	`'1'` | `'2'` | `'3'` | `'4'` | `{'5'}`
`MaxStep`	Maximum step size. Set by **Max step size** on the **Solver** pane of the Configuration Parameters dialog box.	`{'auto'}`
`MdlSubVersion`	For internal use	
`MergeDetectMultiDriving-BlocksExec`	Select the diagnostic action to take when the software detects a Merge block with more than one driving block executing at the same time step. Set by **Detect multiple driving blocks executing at the same time step** on the Configuration Parameters dialog box.	`{'none'}` | `'warning'` | `'error'`
`Metadata`	Names and attributes of arbitrary data associated with the model. To extract this metadata structure without needing to load the model, use the method `Simulink.MDLInfo.getMetadata`.	Structure. Fields can be character vectors, numeric matrices of type "double", or more structures.

Parameter	Description	Values
MinMaxOverflow-ArchiveData	For internal use	
MinMaxOverflow-ArchiveMode	Logging type for fixed-point logging. Set by **Overwrite or merge model simulation results** in the Fixed-Point Tool.	{'Overwrite'} | 'Merge'
MinMaxOverflowLogging	Setting for fixed-point logging. Set by **Fixed-point instrumentation mode** in the Fixed-Point Tool.	{'UseLocalSettings'} | 'MinMaxAndOverflow' | 'OverflowOnly' | 'ForceOff'
MinStep	Minimum step size for the solver. Set by **Min step size** on the **Solver** pane of the Configuration Parameters dialog box.	{'auto'}
MinStepSizeMsg	Message shown when minimum step size is violated. Set by **Min step size violation** on the **Solver** section of the **Diagnostics** pane of the Configuration Parameters dialog box.	{'warning'} | 'error'

Parameter	Description	Values
`ModelBlockNormalModeVisibility`	Use with `set_param` to set normal mode visibility on for the specified Model blocks. You can set this parameter with the Model Block Normal Mode Visibility dialog box. For details, see "Specify the Instance Having Normal Mode Visibility".	With `set_param`, use an array of `Simulink.BlockPath` objects or cell array of cell arrays of character vectors of paths to blocks or models. With `set_param`, an empty array specifies to use the Simulink default selection for the instance to have normal mode visibility enabled.
`ModelBlockNormaModeVisibilityBlockPath`	Return information about which Model blocks have normal mode visibility enabled. Use with a model that you are editing.	Return values indicate which Model blocks have normal mode visibility enabled. See "Simulate Models with Multiple Referenced Model Instances".
`ModelBrowserVisibility`	Show the Model Browser. In the Simulink Editor, set by **Model Browser** on the **View** menu.	`'on'	{'off'}`
`ModelBrowserWidth`	Width of the Model Browser pane in the model window. To display the Model Browser pane, see the `ModelBrowserVisibility` parameter.	integer — {200}
`ModelDataFile`	For internal use.	{''}
`ModelDependencies`	List of model dependencies. Set by **Model dependencies** on the **Model Referencing** pane of the Configuration Parameters dialog box.	{''}

Parameter	Description	Values
ModelReferenceCS-MismatchMessage	This parameter is maintained for compatibility purposes only. Do not use this parameter. You can use the Model Advisor to identify models referenced in Accelerator mode for which Simulink ignores certain configuration parameters. 1 In the Simulink Editor, select **Analysis > Model Advisor**. 2 Select **By Task**. 3 Run the **Check diagnostic settings ignored during accelerated model reference simulation** check. For more information, see "Diagnostic Configuration Parameters Ignored in Accelerator Mode".	`{'none'}` | `'warning'` | `'error'` Simulink ignores this parameter if you set it to `warning` or `error`.
ModelReferenceData-LoggingMessage	Message shown when there is unsupported data logging. Set by **Unsupported data logging** on the **Model Referencing Diagnostics** pane of the Configuration Parameters dialog box.	`'none'` | `{'warning'}` | `'error'`

Parameter	Description	Values
`ModelReferenceExtra-NoncontSigs`	Specifies diagnostic action to take when a discrete signal appears to pass through a Model block to the input of a block with continuous states. Set by **Extraneous discrete derivative signals** on the **Solver** section of the **Diagnostics** pane of the Configuration Parameters dialog box.	`'none'` | `'warning'` | `{'error'}`
`ModelReferenceIO-MismatchMessage`	Message shown when there is a port and parameter mismatch. Set by **Port and parameter mismatch** on the **Model Referencing Diagnostics** pane of the Configuration Parameters dialog box.	`{'none'}` | `'warning'` | `'error'`
`ModelReferenceIOMsg`	Message shown when there is an invalid root Inport or Outport block connection. Set by **Invalid root Inport/Outport block connection** on the **Model Referencing Diagnostics** pane of the Configuration Parameters dialog box.	`{'none'}` | `'warning'` | `'error'`

Parameter	Description	Values
`ModelReferenceMin-AlgLoopOccurrences`	Toggles the minimization of algebraic loop occurrences. Set by **Minimize algebraic loop occurrences** on the **Model Referencing** pane of the Configuration Parameters dialog box.	`'on'` | `{'off'}`
`ModelReferenceNum-InstancesAllowed`	Total number of model reference instances allowed per top model. Set by **Total number of instances allowed per top model** on the **Model Referencing** pane of the Configuration Parameters dialog box.	`'Zero'` | `'Single'` | `{'Multi'}`
`ModelReferencePass-RootInputsByReference`	Toggles the passing of scalar root inputs by value. Set by "Pass fixed-size scalar root inputs by value for code generation" on the **Model Referencing** pane of the Configuration Parameters dialog box.	`{'on'}` | `'off'`
`ModelReferenceSim-TargetVerbose`	This parameter is deprecated and has no effect. Use `AccelVerboseBuild` instead.	
`ModelReferenceSymbol-NameMessage`	For referenced models, specifies diagnostic action to take when the **Maximum identifier length** does not provide enough space to make global identifiers unique across models.	`'none'` | `{'warning'}` | `'error'`

Parameter	Description	Values
`ModelReferenceTargetType`	For internal use.	
`ModelReferenceVersion-MismatchMessage`	Message shown when there is a model block version mismatch. Set by **Model block version mismatch** on the **Model Referencing Diagnostics** pane of the Configuration Parameters dialog box.	`{'none'}	'warning'	'error'`
`ModelVersion`	Version number of model.	`{'1.1'}`
`ModelVersionFormat`	Format of model's version number. Set by **Model version** on the **History** pane of the Model Properties dialog box. See "Model Information and History" for more information.	`{'1.%<AutoIncrement: 0>'}`
`ModelWorkspace`	References this model's model workspace object.	an instance of the `Simulink.ModelWorkspace` class
`ModifiedByFormat`	Format for the display of last modifier. Set by **Last saved by** on the **History** pane of the Model Properties dialog box. See "Model Information and History" for more information. Can also be set by **Last saved by** on the **Model history** field on the **History** pane of the Model Explorer.	`{'%<Auto>'}`

Parameter	Description	Values
`ModifiedComment`	Field for user comments.	`{''}`
`ModifiedDateFormat`	Format used to generate the value of the `LastModifiedDate` parameter. Set by **Last saved on** on the **History** pane of the Model Properties dialog box. See "Model Information and History" for more information.	`{'%<Auto>'}`
`ModifiedHistory`	Area for keeping notes about the history of the model. Set by the **Model history** field on the **History** pane of the Model Properties dialog box. See "Model Information and History" for more information. Can also be set by the **Model history** field on the **History** pane of the Model Explorer.	`{''}`
`MultiTaskCondExecSysMsg`	Select the diagnostic action to take if Simulink software detects a subsystem that might cause data corruption or nondeterministic behavior. Set by **Multitask conditionally executed subsystem** on the **Sample Time Diagnostics** pane of the Configuration Parameters dialog box.	`'none'` | `'warning'` | `{'error'}`

Parameter	Description	Values
`MultiTaskDSMMsg`	Specifies diagnostic action to take when one task reads data from a Data Store Memory block to which another task writes data. Set by **Multitask data store** on the **Data Validity Diagnostics** pane of the Configuration Parameters dialog box.	`'none'` | `'warning'` | `{'error'}`
`MultiTaskRateTransMsg`	Specifies diagnostic action to take when an invalid rate transition takes place between two blocks operating in multitasking mode. Set by **Multitask rate transition** on the **Sample Time Diagnostics** pane of the Configuration Parameters dialog box.	`'warning'` | `{'error'}`
`Name`	Model name.	character vector
`NonBusSignalsTreatedAsBus`	Detect when Simulink implicitly converts a non-bus signal to a bus signal to support connecting the signal to a block expecting a bus signal. **"Non-bus signals treated as bus signals"** on the **Diagnostics > Connectivity** pane of the Configuration Parameters dialog box.	`{'none'}` | `'warning'` | `'error'`

Parameter	Description	Values
`NumberNewtonIterations`	Number of Newton's method iterations performed by the `ode14x` implicit fixed-step solver. Set by **Number Newton's iterations** on the **Solver** pane of the Configuration Parameters dialog box.	integer — {1}
`NumStatesForStiffnessChecking`	Threshold value of number of continuous states in model for stiffness calculation. If the number of continuous states in the model exceeds the `NumStatesForStiffnessChecking` value, auto solver uses `ode15s`. For more information, see "Use Auto Solver to Select a Solver".	{''}
`ObjectParameters`	Names and attributes of model parameters.	structure
`Open`	For internal use.	
`OptimizeBlockIOStorage`	Enables signal storage reuse optimization. Set by **Signal storage reuse** on the Configuration Parameters dialog box.	{'on'} | 'off'

Parameter	Description	Values
OutputOption	Time step output options for variable-step solvers. Set by **Output options** parameter under **Configuration Parameters > Data Import/Export > Additional parameters**.	`'AdditionalOutputTimes'` | `{'RefineOutputTimes'}` | `'SpecifiedOutputTimes'`
OutputSaveName	Workspace variable to store the model outputs. Set by the **Output** field on the **Data Import/Export** pane of the Configuration Parameters dialog box.	`{'yout'}`
OutputTimes	Output times set when Set by **Output options** parameter under **Configuration Parameters** > **Data Import/Export** > **Additional parameters** is set to `Produce additional output`. Set using the **Output times** parameter.	`{'[]'}` **Note** If the value of **Output options** is `Produce additional output` or `Produce specified output only`, set to a value other than the default value of `'[]'`.
PaperOrientation	Printing paper orientation.	`'portrait'` | `{'landscape'}`
PaperPosition	When `PaperPositionMode` is set to `manual`, this parameter determines the position and size of a diagram on paper and the size of the diagram exported as a graphic file in the units specified by `PaperUnits`.	vector — `[left, bottom, width, height]`

Parameter	Description	Values

PaperPositionMode	Paper position mode.
	
	• auto
	
	  When printing, Simulink software sizes the diagram to fit the printed page. When exporting a diagram as a graphic image, Simulink software sizes the exported image to be the same size as the diagram's normal size on screen.
	
	• manual
	
	  When printing, Simulink software positions and sizes the diagram on the page as indicated by PaperPosition. When exporting a diagram as a graphic image, Simulink software sizes the exported graphic to have the height and width specified by PaperPosition.
	
	• tiled
	
	  Enables tiled printing.
	
	  See "Tiled Printing" for more information.
		{'auto'} | 'manual' | 'tiled'

PaperSize	Size of PaperType in PaperUnits.	vector — [width height] (read only)

Parameter	Description	Values
PaperType	Printing paper type.	`'usletter'` | `'uslegal'` | `'a0'` | `'a1'` | `'a2'` | `'a3'` | `'a4'` | `'a5'` | `'b0'` | `'b1'` | `'b2'` | `'b3'` | `'b4'` | `'b5'` | `'arch-A'` | `'arch-B'` | `'arch-C'` | `'arch-D'` | `'arch-E'` | `'A'` | `'B'` | `'C'` | `'D'` | `'E'` | `'tabloid'`
PaperUnits	Printing paper size units.	`'normalized'` | `{'inches'}` | `'centimeters'` | `'points'`

Parameter	Description	Values
ParallelModelReferenceErrorOnInvalidPool	Specify if you want the Simulink software to perform a consistency check on the parallel pool before starting a parallel build. If you set the parameter to on, the client and the remote workers must meet the following criteria for the parallel build to initiate: • The parallel pool is open. • The pool is spmd compatible. • The platform is consistent between workers and client. • The workers have a Simulink Real-Time license. • A common compiler exists across workers and client. If you set the parameter to off, the software displays a warning for the first condition that fails and then performs a sequential build.	{'on'} | 'off'

Parameter	Description	Values
`ParameterArgumentNames`	List of parameters used as arguments when this model is called as a reference. Set by checking the **Argument** column for variables in the model workspace of the referenced model. See "Parameterize Instances of a Reusable Referenced Model".	`{''}`
`ParameterDowncastMsg`	Specifies diagnostic action to take when a parameter downcast occurs during simulation. Set by **Detect downcast** on the **Data Validity Diagnostics** pane of the Configuration Parameters dialog box.	`'none'` | `'warning'` | `{'error'}`
`ParameterOverflowMsg`	Specifies diagnostic action to take when a parameter overflow occurs during simulation. Set by **Detect overflow** on the **Data Validity Diagnostics** pane of the Configuration Parameters dialog box.	`'none'` | `'warning'` | `{'error'}`

Parameter	Description	Values
`ParameterPrecision-LossMsg`	Specifies diagnostic action to take when parameter precision loss occurs during simulation. Set by **Detect precision loss** on the **Data Validity Diagnostics** pane of the Configuration Parameters dialog box.	`'none'` | `{'warning'}` | `'error'`
`ParameterTunabilityLossMsg`	Specifies diagnostic action to take when a parameter cannot be tuned because it uses unsupported functions or operators. Set by **Detect loss of tunability** on the **Data Validity Diagnostics** pane of the Configuration Parameters dialog box.	`'none'` | `{'warning'}` | `'error'`
`ParameterUnderflowMsg`	Specifies diagnostic action to take when a parameter underflow occurs during simulation. Set by **Detect underflow** on the **Data Validity Diagnostics** pane of the Configuration Parameters dialog box.	`{'none'}` | `'warning'` | `'error'`
`ParamWorkspaceSource`	For internal use.	
`Parent`	Name of the model or subsystem that owns this object. The value of this parameter for a model is an empty character vector.	`{''}`

Parameter	Description	Values
Pause	Pause simulation callback. Set by **Simulation pause function** on the **Callbacks** pane of the Model Properties dialog box.	{''}
PortDataTypeDisplayFormat	When you display port data types in a model by selecting **Display > Signals and Ports > Port Data Types**, choose whether to display data type aliases, base data types, or both. In the Simulink Editor, set by **Display > Signals and Ports > Port Data Type Display Format**.	{'AliasTypeOnly'} | 'BaseTypeOnly' | 'BaseAndAliasTypes'
PositivePriorityOrder	Choose the appropriate priority ordering for the real-time system targeted by this model. The Simulink Coder software uses this information to implement asynchronous data transfers. Set by **Higher priority value indicates higher task priority** on the **Solver** pane of the Configuration Parameters dialog box.	'on' | {'off'}

Parameter	Description	Values
PostLoadFcn	Function invoked just after this model is loaded. Set by **Model post-load function** on the **Callbacks** pane of the Model Properties dialog box. See "Create Model Callbacks" for more information.	{''}
PostSaveFcn	Function invoked just after this model is saved to disk. Not executed for blocks inside library links. Set by **Model post-save function** on the **Callbacks** pane of the Model Properties dialog box. See "Create Model Callbacks" for more information.	{''}
PreLoadFcn	Preload callback. Set by **Model pre-load function** on the **Callbacks** pane of the Model Properties dialog box. See "Create Model Callbacks" for more information.	{''}

Parameter	Description	Values
PreSaveFcn	Function invoked just before this model is saved to disk. Not executed for blocks inside library links, except when you are breaking the link, e.g., with save_system(A, B, 'BreakUserLinks', 'on'). Set by **Model pre-save function** on the **Callbacks** pane of the Model Properties dialog box. See "Create Model Callbacks" for more information.	{''}
ProdBitPerChar	Describes the length in bits of the C char data type supported by the hardware board to be used by this model. Set by **Number of bits: char** on the **Hardware Implementation** pane of the Configuration Parameters dialog box.	integer — {8}
ProdBitPerInt	Describes the length in bits of the C int data type supported by the hardware board to be used by this model. Set by **Number of bits: int** on the **Hardware Implementation** pane of the Configuration Parameters dialog box.	integer — {32}

Parameter	Description	Values
ProdBitPerLong	Describes the length in bits of the C `long` data type supported by the hardware board to be used by this model. Set by **Number of bits: long** on the **Hardware Implementation** pane of the Configuration Parameters dialog box.	integer — {32}
ProdBitPerLongLong	Describes the length in bits of the C `long` data type supported by the hardware board to be used by this model. Set by **"Number of bits: long long"** on the **Hardware Implementation** pane of the Configuration Parameters dialog box. The value of this parameter must be greater than or equal to the value of `ProdBitPerLong`.	integer — {64}
ProdBitPerShort	Describes the length in bits of the C `short` data type supported by the hardware board to be used by this model. Set by **Number of bits: short** on the **Hardware Implementation** pane of the Configuration Parameters dialog box.	integer — {16}

Parameter	Description	Values
ProdEndianess	Describes the significance of the first byte of a data word of the hardware board to be used by this model. Set by **Byte ordering** on the **Hardware Implementation** pane of the Configuration Parameters dialog box.	`{'Unspecified'}` | `'LittleEndian'` | `'BigEndian'`
ProdEqTarget	Specifies that the hardware used to test the code generated from this model is the same as the production hardware or has the same characteristics.	`{'on'}` | `'off'`
ProdHWDeviceType	Predefined hardware device to specify the C language constraints for your microprocessor. Set by **"Device vendor"** and **Device type** on the **Hardware Implementation** pane of the Configuration Parameters dialog box.	`{'Generic->Unspecified (assume 32-bit Generic)'}`
ProdIntDivRoundTo	Describes how the C compiler that creates production code for this model rounds the result of dividing one signed integer by another to produce a signed integer quotient. Set by **Signed integer division rounds to** on the **Hardware Implementation** pane of the Configuration Parameters dialog box.	`'Floor'` | `'Zero'` | `{'Undefined'}`

Parameter	Description	Values
ProdLargestAtomicFloat	Specify the largest floating-point data type that can be atomically loaded and stored on the hardware board. Set by **"Largest atomic size: floating-point"** on the **Hardware Implementation** pane of the Configuration Parameters dialog box.	'Float' | 'Double' | {'None'}
ProdLargestAtomicInteger	Specify the largest integer data type that can be atomically loaded and stored on the hardware board. Set this parameter to 'LongLong' only if the production hardware supports the C long long data type and you have set ProdLongLongMode to 'on'. Set by **"Largest atomic size: integer"** on the **Hardware Implementation** pane of the Configuration Parameters dialog box.	{'Char'} | 'Short' | 'Int' | 'Long' | 'LongLong'
ProdLongLongMode	Specify that your C compiler supports the C long long data type. Most C99 compilers support long long. Set by **"Support long long"** on the **Hardware Implementation** pane of the Configuration Parameters dialog box.	'on' | {'off'}

Parameter	Description	Values
ProdShiftRightIntArith	Describes whether the C compiler that creates production code for this model implements a signed integer right shift as an arithmetic right shift. Set by **Shift right on a signed integer as arithmetic shift** on the **Hardware Implementation** pane of the Configuration Parameters dialog box.	{'on'} | 'off'
ProdWordSize	Describes the word length in bits of the hardware board to be used by this model. Set by **Number of bits: native** on the **Hardware Implementation** pane of the Configuration Parameters dialog box.	integer — {32}
Profile	Enables the simulation profiler for this model. In the Simulink Editor, set by **Show Profiler Report** on the **Analysis** menu.	'on' | {'off'}

Parameter	Description	Values
PropagateSignalLabelsOut OfModel	Pass propagated signal names to output signals of Model block. Set by **Propagate all signal labels out of the model** on the **Model Referencing** pane of the Configuration Parameters dialog box. See "Propagate all signal labels out of the model" for more information.	{'on'} | 'off'
PropagateVarSize	Select how variable-size signals propagate through referenced models. Set by **Propagate sizes of variable-size signals** on the **Model Referencing** pane of the Configuration Parameters dialog box. See **"Model Configuration Parameters: Model Referencing"** for more information.	| 'Infer from blocks in model' | 'Only when enabling' | 'During execution'
ReadBeforeWriteMsg	Specifies diagnostic action to take when the model attempts to read data from a data store before it has stored data at the current time step. Set by **Detect read before write** on the **Data Validity Diagnostics** pane of the Configuration Parameters dialog box.	{'UseLocalSettings'} | 'DisableAll' | 'EnableAllAsWarning' | 'EnableAllAsError'

Parameter	Description	Values
RecordCoverage	If RecordCoverage is set to on, Simulink collects and reports model coverage data during simulation. The format of this report is controlled by the values of the following parameters: CovCompData CovCumulativeReport CovCumulativeVarName CovHTMLOptions CovHtmlReporting CovMetricSettings CovModelRefEnable CovModelRefExcluded CovNameIncrementing CovPath CovReportOnPause CovSaveCumulativeToWork-SpaceVar CovSaveName CovSaveSingleToWorkspaceVar If set to off, no model coverage data is collected or reported.	'on' | {'off'}

Parameter	Description	Values
	Set by **Entire System** on the **Coverage** pane of the Configuration Parameters dialog box.	
Refine	Refine factor. Set by **Refine factor** parameter under parameter under **Configuration Parameters > Data Import/ Export > Additional parameters**.	{'1'}
RelTol	Relative error tolerance. Set by **Relative tolerance** on the **Solver** pane of the Configuration Parameters dialog box.	{'1e-3'}
RemoveDisableFunc	For model referencing contexts for ERT targets, remove the generated disable functions that cannot be reached from anywhere in the generated code. Set by the **"Remove disable function" (Embedded Coder)** configuration parameter.	'on' | {'off'}

Parameter	Description	Values
RemoveResetFunc	For model referencing contexts for ERT targets, remove the generated reset functions that cannot be reached from anywhere in the generated code. Set by the **"Remove reset function" (Embedded Coder)** configuration parameter.	{'on'} | 'off'
ReportName	Name of the associated file for the Report Generator.	{'simulink-default.rpt'}
ReqHilite	Highlights all the blocks in the Simulink diagram that have requirements associated with them. In the Simulink Editor, set by **Highlight Model** on the **Analysis > Requirements** menu.	'on' | {'off'}
RequirementInfo	For internal use.	
RootOutportRequire-BusObject	Specifies diagnostic action to take when a bus enters a root model Outport block for which a bus object has not been specified. Set by **Unspecified bus object at root Outport block** on the **Connectivity Diagnostics** pane of the Configuration Parameters dialog box.	'none' | {'warning'} | 'error'

Parameter	Description	Values
RTPrefix	Specifies diagnostic action to take when Simulink software encounters an object name that begins with rt. Set by **"rt" prefix for identifiers** on the **Data Validity Diagnostics** pane of the Configuration Parameters dialog box.	'none' | 'warning' | {'error'}
RTW...	For information about model parameters beginning with RTW, see Configuration Parameters for Simulink Models and Parameter Reference in the Simulink Coder documentation.	
SampleTimeAnnotations	In the Simulink Editor, set by **Annotations** on the **Display > Sample Time** menu.	'on' | {'off'}
SampleTimeColors	In the Simulink Editor, set by **Colors** on the **Display > Sample Time Display** menu.	'on' | {'off'}
SampleTimeConstraint	This option appears when the solver type is Fixed-step. Set by **Periodic sample time constraint** on the **Solver** pane of the Configuration Parameters dialog box.	{'Unconstrained'} | 'STIndependent' | 'Specified'

Parameter	Description	Values
SampleTimeProperty	Specifies and assigns priorities to the sample times implemented by the model. This option appears when **Periodic sample time constraint** is set to Specified. Set by **Sample time properties** on the **Solver** pane of the Configuration Parameters dialog box.	Structure containing the fields SampleTime, Offset, and Priority
SavedCharacterEncoding	Specifies the character set used to encode this model. See the slCharacterEncoding command for more information.	character vector
SaveDefaultBlockParams	For internal use.	
SavedSinceLoaded	Indicates whether the model has been saved since it was loaded. 'on' indicates the model has been saved.	'on' | 'off'
SaveFinalState	Save final states to workspace. Set by the **Final states** check box on the **Data Import/ Export** pane of the Configuration Parameters dialog box.	'on' | {'off'}
SaveFormat	Format used to save data to the MATLAB workspace. Set by **Format** on the **Data Import/Export** pane of the Configuration Parameters dialog box.	{'Dataset'} | 'Structure' | 'StructureWithTime'| 'Array'

Parameter	Description	Values
SaveOutput	Save simulation output to workspace. Set by the **Output** check box on the **Data Import/Export** pane of the Configuration Parameters dialog box. Do not use a variable name that is the same as a `Simulink.SimulationOutput` object function name or property name.	`{'on'}	'off'`
SaveState	Save states to workspace. Set by the **States** check box on the **Data Import/Export** pane of the Configuration Parameters dialog box.	`'on'	{'off'}`
SaveTime	Save simulation time to workspace. Set by the **Time** check box on the **Data Import/Export** pane of the Configuration Parameters dialog box. Do not use a variable name that is the same as a `Simulink.SimulationOutput` object function name or property name.	`{'on'}	'off'`

Parameter	Description	Values
`SaveWithDisabledLinksMsg`	Specifies diagnostic action to take when saving a block diagram having disabled library links. Set by **Block diagram contains disabled library links** on the **Saving Diagnostics** pane of the Configuration Parameters dialog box.	`'none'` | `{'warning'}` | `'error'`
`SaveWithParameterized-LinksMsg`	Specifies diagnostic action to take when saving a block diagram having parameterized library links. Set by **Block diagram contains parameterized library links** on the **Saving Diagnostics** pane of the Configuration Parameters dialog box.	`'none'` | `{'warning'}` | `'error'`
`ScreenColor`	Background color of the model window. In the Simulink Editor, set by **Canvas Color** on the **Diagram > Format** menu.	`'black'` | `{'white'}` | `'red'` | `'green'` | `'blue'` | `'cyan'` | `'magenta'` | `'yellow'` | `'gray'` | `'lightBlue'` | `'orange'` | `'darkGreen'` | `[r,g,b,a]` where `r`, `g`, `b`, and `a` are the red, green, blue, and alpha values of the color normalized to the range 0.0 to 1.0. The alpha value is ignored.
`ScrollbarOffset`	For internal use.	

Parameter	Description	Values
`SFcnCompatibilityMsg`	Specifies diagnostic action to take when S-function upgrades are needed. Set by **S-function upgrades needed** on the **Compatibility Diagnostics** pane of the Configuration Parameters dialog box.	`{'none'} | 'warning' | 'error'`
`SFExecutionAtInitializationDiag`	Select the diagnostic action to take when Stateflow detects triggered or enabled charts that are not running at initialization. Set by **"Execute-at-Initialization disabled in presence of input events"** on the **Compatibility Diagnostics** pane of the Configuration Parameters dialog box.	

Parameter	Description	Values
`SFInvalidInputDataAccess-InChartInitDiag`	Select the diagnostic action to take when a chart: • Has the `ExecuteAtInitializati on` property set to `true` • Accesses input data on a default transition or associated state entry actions, which execute at chart initialization Set by **Invalid input data access in chart initialization** on the **Diagnostics > Stateflow** pane of the Configuration Parameters dialog box.	`'none'` | `{'warning'}` | `'error'`
`SFMachineParented-DataDiag`	Select the diagnostic action to take when Stateflow detects machine-parented data that you can replace with chart-parented data of scope Data Store Memory. Set by **"Use of machine-parented data instead of Data Store Memory"** on the **Diagnostics > Stateflow** pane of the Configuration Parameters dialog box.	`'none'` | `{'warning'}` | `'error'`

Parameter	Description	Values
`SFNoUnconditionalDefault-TransitionDiag`	Select the diagnostic action to take when a chart does not have an unconditional default transition to a state or a junction. Set by **No unconditional default transitions** on the **Diagnostics > Stateflow** pane of the Configuration Parameters dialog box.	`'none'` | `{'warning'}` | `'error'`
`SFSelfTransitionDiag`	Select the diagnostic action to take when you can remove a self-transition on a leaf state. Set by **"Self transition on leaf state"** on the **Diagnostics > Stateflow** pane of the Configuration Parameters dialog box.	`'none'` | `{'warning'}` | `'error'`
`SFSimEcho`	Enables output to appear in the MATLAB Command Window during simulation of a model that contains MATLAB Function blocks, Stateflow charts, or Truth Table blocks. Set by **Echo expressions without semicolons** on the **Simulation Target** pane of the Configuration Parameters dialog box.	`{'on'}` | `'off'`

Parameter	Description	Values
`SFTemporalDelaySmallerThanSampleTimeDiag`	Select the diagnostic action to take when a state or transition absolute time operator uses a time value that is shorter than the sample time for the Stateflow block. Set by **"Absolute time temporal value shorter than sampling period"** on the **Simulation Target** pane of the Configuration Parameters dialog box.	`'none' | {'warning'} | 'error'`
`SFTransitionActionBeforeConditionDiag`	Select the diagnostic action to take when a transition action is specified before a condition action in a transition path containing multiple segmented transitions. Set by **"Transition action specified before condition action"** on the **Diagnostics > Stateflow** pane of the Configuration Parameters dialog box.	`'none' | {'warning'} | 'error'`
`SFTransitionOutsideNaturalParentDiag`	Select the diagnostic action to take when a chart contains a transition that loops outside the parent state or junction. Set by **Transition outside natural parent** on the **Diagnostics > Stateflow** pane of the Configuration Parameters dialog box.	`'none' | {'warning'} | 'error'`

Parameter	Description	Values
`SFUndirectedBroadcast-EventsDiag`	Select the diagnostic action to take when a chart contains undirected local event broadcasts. Set by **Undirected event broadcasts** on the **Diagnostics > Stateflow** pane of the Configuration Parameters dialog box.	`'none'` | `{'warning'}` | `'error'`
`SFUnexpectedBacktracking-Diag`	Select the diagnostic action to take when a chart junction: • Does not have an unconditional transition path to a state or a terminal junction • Has multiple transition paths leading to it Set by **Unexpected backtracking** on the **Diagnostics > Stateflow** pane of the Configuration Parameters dialog box.	`'none'` | `{'warning'}` | `'error'`
`SFUnreachableExecution-PathDiag`	Select the diagnostic action to take when there are chart constructs not on a valid execution path. Set by **"Unreachable execution path"** on the **Diagnostics > Stateflow** pane of the Configuration Parameters dialog box.	`'none'` | `{'warning'}` | `'error'`

Parameter	Description	Values
`SFUnusedDataAndEventsDiag`	Select the diagnostic action to take for detection of unused data and events in a chart. Set by **Unused data and events** on the **Diagnostics > Stateflow** pane of the Configuration Parameters dialog box.	`'none'` | `{'warning'}` | `'error'`
`ShapePreserveControl`	At each time step, use derivative information to improve integration accuracy. Set by **Shape preservation** on the **Solver** pane of the Configuration Parameters dialog box.	`'EnableAll'` | `{'DisableAll'}`
`ShowGrid`	Has no effect in Simulink Editor. This parameter will be removed in a future release.	`'on'` | `{'off'}`
`ShowLinearization-Annotations`	Toggles linearization icons in the model.	`{'on'}` | `'off'`
`ShowLineDimensions`	Show signal dimensions on this model's block diagram. In the Simulink Editor, set by **Signal Dimensions** on the **Display > Signal & Ports** menu.	`'on'` | `{'off'}`
`ShowLineDimensions-OnError`	For internal use.	
`ShowLineWidths`	Deprecated. Use `ShowLineDimensions` instead.	
`ShowLoopsOnError`	Highlight invalid loops graphically.	`{'on'}` | `'off'`

Parameter	Description	Values
ShowModelReference-BlockIO	Toggles display of I/O mismatch on block. In the Simulink Editor, set by **Block I/O Mismatch for Referenced Model** on the **Display > Blocks** menu.	'on' | {'off'}
ShowModelReference-BlockVersion	Toggles display of version on block. In the Simulink Editor, set by **Block Version for Referenced Models** on the **Display > Blocks** menu.	'on' | {'off'}
Shown	For internal use.	
ShowPageBoundaries	Toggles display of page boundaries on the Simulink Editor canvas. In the Simulink Editor, set by **Show Page Boundaries** on the **File > Print** menu.	'on' | {'off'}
ShowPortDataTypes	Show data types of ports on this model's block diagram. In the Simulink Editor, set by **Port Data Types** on the **Display > Signals & Ports** menu.	'on' | {'off'}
ShowPortDataTypesOnError	For internal use.	

Parameter	Description	Values
`ShowPortUnits`	Show units of ports, subsystem, and model block icons on the model block diagram. In the Simulink Editor, set **Port Units** on the **Display > Signals & Ports** menu.	`'on'` | `{'off'}`
`ShowStorageClass`	Show storage classes of signals on this model's block diagram. In the Simulink Editor, set by **Storage Class** on the **Format > Signals & Ports** menu.	`'on'` | `{'off'}`
`ShowTestPointIcons`	Show test point icons on this model's block diagram. In the Simulink Editor, set by **Testpoint & Logging Indicators** on the **Display > Signals & Ports** menu.	`{'on'}` | `'off'`
`ShowViewerIcons`	Show viewer icons on this model's block diagram. In the Simulink Editor, set by **Viewer Indicator** on the **Display > Signals & Ports** menu.	`{'on'}` | `'off'`

Parameter	Description	Values
`SignalHierarchy`	If the signal is a bus, returns the name and hierarchy of the signals in the bus. (Read-only) Get with the `get_param` command. Specify a port or line handle. See "Display Information About Buses".	Return values reflect the structure of the signal that you specify.
`SignalInfNanChecking`	Specifies diagnostic action to take when the value of a block output is `Inf` or `NaN` at the current time step. Set by **Inf or NaN block output** on the **Data Validity Diagnostics** pane of the Configuration Parameters dialog box.	`{'none'}` | `'warning'` | `'error'`
`SignalLabelMismatchMsg`	Specifies diagnostic action to take when a signal label mismatch occurs. Set by **Signal label mismatch** on the **Connectivity Diagnostics** pane of the Configuration Parameters dialog box.	`{'none'}` | `'warning'` | `'error'`
`SignalLogging`	Globally enable signal logging for this model. Set by the **Signal logging** check box on the **Data Import/Export** pane of the Configuration Parameters dialog box.	`{'on'}` | `'off'`

Parameter	Description	Values
`SignalLoggingName`	Name for saving signal logging data to a workspace. Set by the **Signal logging** field on the **Data Import/Export** pane of the Configuration Parameters dialog box. Do not use a variable name that is the same as a `Simulink.SimulationOutput` object function name or property name.	`{'logsout'}`
`SignalLoggingSaveFormat`	Format for saving signal logging data.	`{'Dataset'}` `'ModelDataLogs'` is supported for backward compatibility. However, when you open a model in R2016a or later, signal logging uses `Dataset` format, regardless of the setting of this parameter.
`SignalNameFromLabel`	Propagate signal names for Bus Creator block input signals whenever you change the name of an input signal programmatically. Set with the `set_param` command, using either a port or line handle and a character vector specifying the signal name to propagate.	`{''}`

Parameter	Description	Values
SignalRangeChecking	Select the diagnostic action to take when signals exceed specified minimum or maximum values. Set by **Simulation range checking** on the **Data Validity Diagnostics** pane of the Configuration Parameters dialog box.	{'none'} | 'warning' | 'error'
SignalResolutionControl	Control which named states and signals get resolved to Simulink signal objects. Set by **Signal resolution** on the **Data Validity Diagnostics** pane of the Configuration Parameters dialog box.	'None' | {'UseLocalSettings'} | 'TryResolveAll' | 'TryResolveAllWithWarning'
SigSpecEnsureSample-TimeMsg	Specifies diagnostic action to take when the sample time of the source port of a signal specified by a Signal Specification block differs from the signal's destination port. Set by **Enforce sample times specified by Signal Specification blocks** on the **Sample Time Diagnostics** pane of the Configuration Parameters dialog box.	'none' | {'warning'} | 'error'

Parameter	Description	Values
SimBuildMode	Specifies how you build the simulation target for a model that contains MATLAB Function blocks, Stateflow charts, or Truth Table blocks. Set by **Simulation target build mode** on the **Simulation Target** pane of the Configuration Parameters dialog box.	`{'sf_incremental_build'}	'sf_nonincremental_build'	'sf_make'	'sf_make_clean'	'sf_make_clean_objects'`
SimCompilerOptimization	Specifies the compiler optimization level during acceleration code generation. Set by **Compiler optimization level** on the Configuration Parameters dialog box.	`'on'	{'off'}`
SimCtrlC	Enables responsiveness checks in code generated for MATLAB Function blocks. Set by **"Ensure responsiveness"** on the **Simulation Target** pane of the Configuration Parameters dialog box.	`{'on'}	'off'`

Parameter	Description	Values
SimCustomHeaderCode	Enter code lines to appear near the top of a generated header file for a model that contains MATLAB Function blocks, Stateflow charts, or Truth Table blocks. Set by **Header file** on the **Simulation Target > Custom Code** pane of the Configuration Parameters dialog box.	{''}
SimCustomInitializer	Enter code statements that execute once at the start of simulation for a model that contains MATLAB Function blocks, Stateflow charts, or Truth Table blocks. Set by **Initialize function** on the **Simulation Target > Custom Code** pane of the Configuration Parameters dialog box.	{''}
SimCustomSourceCode	Enter code lines to appear near the top of a generated source code file for a model that contains MATLAB Function blocks, Stateflow charts, or Truth Table blocks. Set by **Source file** on the **Simulation Target > Custom Code** pane of the Configuration Parameters dialog box.	{''}

Parameter	Description	Values
`SimCustomTerminator`	Enter code statements that execute at the end of simulation for a model that contains MATLAB Function blocks, Stateflow charts, or Truth Table blocks. Set by **Terminate function** on the **Simulation Target > Custom Code** pane of the Configuration Parameters dialog box.	`{''}`
`SimIntegrity`	Detects violations of memory integrity while building MATLAB Function blocks and stops simulation with a diagnostic. Set by **"Ensure memory integrity"** on the **Simulation Target** pane of the Configuration Parameters dialog box.	`{'on'} | 'off'`
`SimParseCustomCode`	Specify whether or not to parse the custom code and report unresolved symbols in the model. Set by **Parse custom code symbols** on the **Simulation Target > Custom Code** pane of the Configuration Parameters dialog box.	`{'on'} | 'off'`

Parameter	Description	Values
`SimReservedNameArray`	Enter the names of variables or functions in the generated code that match the names of variables or functions specified in custom code. This action prevents naming conflicts between identifiers in the generated code and in custom code for a model that contains MATLAB Function blocks, Stateflow charts, or Truth Table blocks. Set by **Reserved names** on the **Simulation Target > Symbols** pane of the Configuration Parameters dialog box.	character vector array — `{{}}`
`SimulationCommand`	Executes a simulation command. **Note** You cannot use `set_param` to run a simulation in a MATLAB session that does not have a display, i.e., if you used `matlab -nodisplay` to start the session.	`'start'` | `'stop'` | `'pause'` | `'continue'` | `'step'` | `'update'` | `'WriteDataLogs'` | `'SimParamDialog'` | `'connect'` | `'disconnect'` | `'WriteExtModeParamVect'` | `'AccelBuild'`
`SimulationMode`	Indicates whether Simulink software should run in Normal, Accelerator, Rapid Accelerator, SIL, PIL, or External mode. In the Simulink Editor, set by the **Simulation > Mode** menu.	`{'normal'}` | `'accelerator'` | `'rapid-accelerator'` | `'external'` | `'Software-in-the-loop (SIL)'` | `'Processor-in-the-loop (PIL)'`

Parameter	Description	Values
`SimulationStatus`	Indicates simulation status.	`{'stopped'} | 'updating' | 'initializing' | 'running' | 'compiled' | 'paused' | 'terminating' | 'external'`
`SimulationTime`	Current time value for the simulation.	`double — {0}`
`SimStateInterfaceChecksumMismatchMsg`	Check to ensure that the interface checksum is identical to the model checksum before loading the SimState.	`'none'|'warning'|error'`
`SimStateOlderReleaseMsg`	Check to report that the SimState was generated by an earlier version of Simulink. In the **Diagnostics** pane of the Configuration Parameters dialog box, configure the diagnostic to allow Simulink to report the message as error or warning.	`'error'|'warning'`
`SimUserDefines`	Enter a space-separated list of preprocessor macro definitions to be added to the generated code for a model that contains MATLAB Function blocks, Stateflow charts, or Truth Table blocks. Set by **Defines** on the **Simulation Target > Custom Code** pane of the Configuration Parameters dialog box.	`{''}`

Parameter	Description	Values

`SimUserIncludeDirs`	Enter a space-separated list of directory paths that contain files you include in the compiled target for a model that contains MATLAB Function blocks, Stateflow charts, or Truth Table blocks.
	
	Set by **Include directories** on the **Simulation Target > Custom Code** pane of the Configuration Parameters dialog box.
		`{''}`
		
		Note If your list includes any Windows path names that contain spaces, each instance must be enclosed in double quotes within the argument, for example,
		
		`'C:\Project "C:\Custom Files"'`

`SimUserLibraries`	Enter a space-separated list of static libraries that contain custom object code to link into the target for a model that contains MATLAB Function blocks, Stateflow charts, or Truth Table blocks. Set by **Libraries** on the **Simulation Target > Custom Code** pane of the Configuration Parameters dialog box.	`{''}`
`SimUserSources`	Enter a space-separated list of source files to compile and link into the target for a model that contains MATLAB Function blocks, Stateflow charts, or Truth Table blocks. Set by **Source files** on the **Simulation Target > Custom Code** pane of the Configuration Parameters dialog box.	`{''}`

Parameter	Description	Values
SingleTaskRateTransMsg	Specifies diagnostic action to take when a rate transition takes place between two blocks operating in single-tasking mode. Set by **Single task rate transition** on the **Sample Time Diagnostics** pane of the Configuration Parameters dialog box.	`{'none'} | 'warning' | 'error'`
Solver	Solver used for the simulation. Set by the **Solver** drop-down list on the **Solver** pane of the Configuration Parameters dialog box.	`'VariableStepDiscrete' | {'ode45'} | 'ode23' | 'ode113' | 'ode15s' | 'ode23s' | 'ode23t' | 'ode23tb' | 'FixedStepDiscrete' |'ode8'| 'ode5' | 'ode4' | 'ode3' | 'ode2' | 'ode1' | 'ode14x'`
EnableMultiTasking	Solver mode for this model. This option appears when the solver type is Fixed-step. Set by **"Treat each discrete rate as a separate task"** on the **Solver** pane of the Configuration Parameters dialog box.	`'On' | {'Off'}`
SolverName	Solver used for the simulation. See Solver parameter for more information.	

Parameter	Description	Values
SolverPrmCheckMsg	Enables diagnostics to control when Simulink software automatically selects solver parameters. This option notifies you if: • Simulink software changes a user-modified parameter to make it consistent with other model settings • Simulink software automatically selects solver parameters for the model, such as **FixedStepSize** Set by **Automatic solver parameter selection** on the **Solver** section of the **Diagnostics** pane of the Configuration Parameters dialog box.	'none' | {'warning'} | 'error'
SolverResetMethod	This option appears when the solver type is Variable-step and the solver is ode15s (stiff/NDF), ode23t (Mod. stiff/ Trapezoidal), or ode23tb (stiff/TR-BDF2). Set by **Solver reset method** on the **Solver** pane of the Configuration Parameters dialog box.	{'Fast'} | 'Robust'

Parameter	Description	Values
SolverType	Solver type used for the simulation. Set by **Type** on the **Solver** pane of the Configuration Parameters dialog box.	{'Variable-step'} | 'Fixed-step'
SortedOrder	Show the sorted order of this model's blocks on the block diagram. In the Simulink Editor, set by **Sorted Execution Order** on the **Display > Blocks** menu.	'on' | {'off'}
StartFcn	Start simulation callback. Set by **Simulation start function** on the **Callbacks** pane of the Model Properties dialog box. See "Create Model Callbacks" for more information.	{''}
StartTime	Simulation start time. Set by **Start time** on the **Solver** pane of the Configuration Parameters dialog box.	{'0.0'}

Parameter	Description	Values
StateNameClashWarn	Select the diagnostic action to take when a name is used for more than one state in the model. Set by **State name clash** on the **Solver** section of the **Diagnostics** pane of the Configuration Parameters dialog box.	'none' | {'warning'}
StateSaveName	State output name to be saved to workspace. Set by the **States** field on the **Data Import/Export** pane of the Configuration Parameters dialog box.	{'xout'}
StatusBar	Has no effect in Simulink Editor. This parameter will be removed in a future release. In the Simulink Editor, set by **Status Bar** on the **View** menu.	{'on'} | 'off'
StiffnessThreshold	Threshold value to determine if the model is stiff. A model is stiff if the stiffness exceeds the StiffnessThreshold value. The default value for this parameter is 1000. For more information, see "Use Auto Solver to Select a Solver".	{''}

Parameter	Description	Values
`StopFcn`	Stop simulation callback. Set by **Simulation stop function** on the **Callbacks** pane of the Model Properties dialog box. See "Create Model Callbacks" for more information.	`{''}`
`StopTime`	Simulation stop time. Set by **Stop time** on the **Solver** pane of the Configuration Parameters dialog box.	`{'10.0'}`
`StrictBusMsg`	Specifies diagnostic action to take when Simulink software detects a signal that some blocks treat as a mux or vector, while other blocks treat the signal as a bus. To be enabled, several options in MathWorks products require this parameter be set to `'ErrorLevel1'` or `'ErrorOnBusTreatedAsVector'`. Set by **Bus signal treated as vector** on the **Diagnostics Connectivity** pane of the Configuration Parameters dialog box.	`{'ErrorLevel1'}` `'WarnOnBusTreatedAsVector'` `|` `'ErrorOnBusTreatedAsVector'`

Parameter	Description	Values
SupportModelReferenceSim TargetCustomCode	Use custom C code with Stateflow or with MATLAB Function blocks during referenced model simulation (SIM) target build for accelerator mode **Caution** Using custom C code for referenced models in accelerator mode can produce different results than if you simulate the model without using the custom code. If the custom code includes declarations of structures for buses or enumerations, the SIM target generation fails if the build results in duplicate declarations of those structures. Also, if the custom code uses a structure representing a bus or enumeration, you could get unexpected simulation results.	'on' | {'off'}
Tag	User-specified text that is assigned to the model's Tag parameter and saved with the model.	{''}
TargetBitPerChar	Describes the length in bits of the C char data type supported by the hardware used to test generated code.	integer — {8}
TargetBitPerInt	Describes the length in bits of the C int data type supported by the hardware used to test generated code.	integer — {32}

Parameter	Description	Values
`TargetBitPerLong`	Describes the length in bits of the C `long` data type supported by the hardware used to test generated code.	integer — {32}
`TargetBitPerLongLong`	Describes the length in bits of the C `long long` data type supported by the hardware used to test generated code. The value of this parameter must be greater than or equal to the value of `TargetBitPerLong`.	integer — {64}
`TargetBitPerShort`	Describes the length in bits of the C `short` data type supported by the hardware used to test generated code.	integer — {16}
`TargetEndianess`	Describes the significance of the first byte of a data word of the hardware used to test generated code.	{'Unspecified'} | 'LittleEndian' | 'BigEndian'
`TargetHWDeviceType`	Describes the characteristics of the hardware used to test generated code.	{'Generic->Unspecified (assume 32-bit Generic)'}
`TargetIntDivRoundTo`	Describes how the C compiler that creates test code for this model rounds the result of dividing one signed integer by another to produce a signed integer quotient.	'Floor' | 'Zero' | {'Undefined'}
`TargetLargestAtomicFloat`	Specify the largest floating-point data type that can be atomically loaded and stored on the hardware used to test code.	'Float' | 'Double' | {'None'}

Parameter	Description	Values
`TargetLargestAtomicInteger`	Specify the largest integer data type that can be atomically loaded and stored on the hardware used to test code. Set this parameter to `'LongLong'` only if the test hardware supports the C long long data type and you have set `TargetLongLongMode` to `'on'`.	`{'Char'}` | `'Short'` | `'Int'` | `'Long'` | `'LongLong'`
`TargetLongLongMode`	Specify that your C compiler supports the C long long data type. Most C99 compilers support long long.	`'on'` | `{'off'}`
`TargetShiftRightIntArith`	Describes whether the C compiler that creates test code for this model implements a signed integer right shift as an arithmetic right shift.	`{'on'}` | `'off'`
`TargetTypeEmulationWarnSuppressLevel`	Specifies whether Simulink Coder software displays or suppresses warning messages when emulating integer sizes in rapid prototyping environments.	integer — {0}
`TargetWordSize`	Describes the word length in bits of the hardware used to test generated code.	integer — {32}

Parameter	Description	Values
TasksWithSamePriorityMsg	Specifies diagnostic action to take when tasks have equal priority. Set by **Tasks with equal priority** on the **Sample Time Diagnostics** pane of the Configuration Parameters dialog box.	`'none'` | `{'warning'}` | `'error'`
TiledPageScale	Scales the size of the tiled page relative to the model.	`{'1'}`
TiledPaperMargins	Controls the size of the margins associated with each tiled page. Each element in the vector represents a margin at the particular edge.	vector — `[left, top, right, bottom]`
TimeAdjustmentMsg	Specifies diagnostic action to take if Simulink software makes a minor adjustment to a sample hit time while running the model. Set by **Sample hit time adjusting** on the Configuration Parameters dialog box.	`{'none'}` | `'warning'`
TimeSaveName	Simulation time name. Set by the **Time** field on the **Data Import/Export** pane of the Configuration Parameters dialog box.	variable — `{'tout'}`
TLC...	Parameters whose names begin with TLC are used for code generation. See the Simulink Coder documentation for more information.	

Parameter	Description	Values
ToolBar	Has no effect in Simulink Editor. This parameter will be removed in a future release. In the Simulink Editor, hide or display all toolbars with **Toolbars** on the **View** menu or, hide or display specific toolbars using **File** > **Simulink Preferences** > **Editor Default** toolbar options.	{'on'} | 'off'
TryForcingSFcnDF	This flag is used for backward compatibility with user S-functions that were written prior to R12.	'on' | {'off'}
TunableVars	List of global (tunable) parameters. Set in the Model Parameter Configuration dialog box.	{''}
TunableVarsStorageClass	List of storage classes for their respective tunable parameters. Set in the Model Parameter Configuration dialog box.	{''}
TunableVarsTypeQualifier	List of storage type qualifiers for their respective tunable parameters. Set in the Model Parameter Configuration dialog box.	{''}
Type	Simulink object type (read only).	{'block_diagram'}

Parameter	Description	Values
`UnconnectedInputMsg`	Unconnected input ports diagnostic. Set by **Unconnected block input ports** on the **Connectivity Diagnostics** pane of the Configuration Parameters dialog box.	`'none'` | `{'warning'}` | `'error'`
`UnconnectedLineMsg`	Unconnected lines diagnostic. Set by **Unconnected line** on the **Connectivity Diagnostics** pane of the Configuration Parameters dialog box.	`'none'` | `{'warning'}` | `'error'`
`UnconnectedOutputMsg`	Unconnected block output ports diagnostic. Set by **Unconnected block output ports** on the **Connectivity Diagnostics** pane of the Configuration Parameters dialog box.	`'none'` | `{'warning'}` | `'error'`
`UnderSpecifiedData-TypeMsg`	Detect usage of heuristics to assign signal data types. Set by **Underspecified data types** on the **Data Validity Diagnostics** pane of the Configuration Parameters dialog box.	`{'none'}` | `'warning'` | `'error'`

Parameter	Description	Values
`UnderspecifiedInitial-izationDetection`	Select how Simulink software handles initialization of initial conditions for conditionally executed subsystems, Merge blocks, subsystem elapsed time, and Discrete-Time Integrator blocks. Set by **Underspecified initialization detection** on the Configuration Parameters dialog box.	`{'classic'} | 'simplified'`
`UniqueDataStoreMsg`	Specifies diagnostic action to take when the model contains multiple Data Store Memory blocks that specify the same data store name. Set by **Duplicate data store names** on the **Data Validity Diagnostics** pane of the Configuration Parameters dialog box.	`{'none'} | 'warning' | 'error'`
`UnknownTsInhSupMsg`	Detect blocks that have not set whether they allow the model containing them to inherit a sample time. Set by **Unspecified inheritability of sample time** on the **Diagnostics > Sample Time** pane of the Configuration Parameters dialog box.	`'none' | {'warning'} | 'error'`

Parameter	Description	Values
UnnecessaryDatatype-ConvMsg	Detect unnecessary data type conversion blocks. Set by **Unnecessary type conversions** on the **Type Conversion Diagnostics** pane of the Configuration Parameters dialog box.	{'none'} | 'warning'
UpdateHistory	Specifies when to prompt the user about updating the model history. Set by **Prompt to update model history** on the **History** pane of the Model Properties dialog box or **Prompt to update model history** on the **History** pane of the Model Explorer. See "Model Information and History" for more information.	{'UpdateHistoryNever'} | 'UpdateHistoryWhenSave'
UpdateModelReference-Targets	Specify whether to rebuild simulation and Simulink Coder targets for referenced models before updating, simulating, or generating code for this model. Set by **Rebuild** on the **Model Referencing** pane of the Configuration Parameters dialog box.	'IfOutOfDate' | 'Force' | 'AssumeUpToDate' | {'IfOutOfDateOrStructuralChange'}
UseAnalysisPorts	For internal use.	

Parameter	Description	Values
UseDivisionForNetSlopeComputation	Use division to handle net slope computations when simplicity and accuracy conditions are met.	{'off'} | 'on' | 'UseDivisionForReciprocalsOfIntegersOnly'
VectorMatrix-ConversionMsg	Detect vector-to-matrix or matrix-to-vector conversions. Set by **Vector/matrix block input conversion** on the **Type Conversion Diagnostics** pane of the Configuration Parameters dialog box.	{'none'} | 'warning' | 'error'
Version	Simulink version you are currently running, e.g., '7.6'. If you are using a service pack, the ver function returns an additional digit, e.g., 7.4.1 (R2009bSP1). To get version information without loading the block diagram into memory, see Simulink.MDLInfo.	double (read only)
VersionLoaded	Simulink version that last saved the model, e.g., '7.6'. If you are using a service pack, the ver function returns an additional digit, e.g., 7.4.1 (R2009bSP1). See also SavedSinceLoaded. To get version information without loading the block diagram into memory, see Simulink.MDLInfo.	double (read only)

Parameter	Description	Values
`VisualizeLoggedSignalsWhenLoggingToFile`	Control visualization of logged signals when `LoggingToFile` is enabled. The default is `'off'`, which logs to a MAT-file without the overhead of visualizing signals. Set the value to `'on'` to stream logged data to these visualization tools also: • Simulation Data Inspector • Message Viewer blocks • Dashboard blocks • Logic Analyzer Logging big data to visualization tools can cause memory and disk space overhead.	`'on'` | `{'off'}`
`WideLines`	Draws lines that carry vector or matrix signals wider than lines that carry scalar signals. In the Simulink Editor, set by **Wide Nonscalar Lines** on the **Display** > **Signals & Ports** menu.	`'on'` | `{'off'}`
`WideVectorLines`	Deprecated. Use `WideLines` instead.	

Parameter	Description	Values
`WriteAfterReadMsg`	Specifies diagnostic action to take when the model attempts to store data in a data store after previously reading data from it in the current time step. Set by **Detect write after read** on the **Data Validity Diagnostics** pane of the Configuration Parameters dialog box.	`{'UseLocalSettings'}` | `'DisableAll'` | `'EnableAllAsWarning'` | `'EnableAllAsError'`
`WriteAfterWriteMsg`	Specifies diagnostic action to take when the model attempts to store data in a data store twice in succession in the current time step. Set by **Detect write after write** on the **Data Validity Diagnostics** pane of the Configuration Parameters dialog box.	`{'UseLocalSettings'}` | `'DisableAll'` | `'EnableAllAsWarning'` | `'EnableAllAsError'`
`ZCThreshold`	Specifies the deadband region used during the detection of zero crossings. Signals falling within this region are defined as having crossed through zero. Set by **Signal threshold** on the **Solver** pane of the Configuration Parameters dialog box.	`{'auto'}` | any real number greater than or equal to zero
`ZeroCross`	For internal use.	

Parameter	Description	Values
ZeroCrossAlgorithm	Specifies the algorithm to detect zero crossings when you select a variable-step solver. Set by **Algorithm** on the **Solver** pane of the Configuration Parameters dialog box.	{'Nonadaptive'} | 'Adaptive'
ZeroCrossControl	Enable zero-crossing detection. Set by **Zero-crossing control** on the **Solver** pane of the Configuration Parameters dialog box.	{'UseLocalSettings'} | 'EnableAll' | 'DisableAll'
ZoomFactor	Zoom factor of the Simulink Editor window expressed as a percentage of normal (100%) or by the keywords FitSystem or FitSelection. In the Simulink Editor, set by the zoom commands on the **View** menu.	{'100'} | 'FitSystem' | 'FitSelection'

Examples of Setting Model Parameters

These examples show how to set model parameters for the mymodel system.

This command sets the simulation start and stop times.

```
set_param('mymodel','StartTime','5','StopTime','100')
```

This command sets the solver to ode15s and changes the maximum order.

```
set_param('mymodel','Solver','ode15s','MaxOrder','3')
```

This command associates a `PostSaveFcn` callback.

```
set_param('mymodel','PostSaveFcn','my_save_cb')
```

Common Block Properties

In this section...
"About Common Block Properties" on page 6-111
"Examples of Setting Block Properties" on page 6-128

About Common Block Properties

This table lists the properties common to all Simulink blocks, including block callback properties (see "Callbacks for Customized Model Behavior"). Examples of commands that change these properties follow this table (see "Examples of Setting Block Properties" on page 6-128).

Common Block Properties

Property	Description	Values
AncestorBlock	Name of the library block that the block is linked to (for blocks with a disabled link).	character vector
AttributesFormatString	Block annotation text (corresponds to block properties).	character vector
BackgroundColor	Block background color.	color value |'[r,g,b]' | '[r,g,b,a]' r, g, and b, are the red, green, blue values of the color in the range 0.0 to 1.0. If specified, the alpha value (a) is ignored. Possible color values are 'black', 'white', 'red', 'green', 'blue', 'cyan', 'magenta', 'yellow', 'gray', 'lightBlue', 'orange', 'darkGreen'.
BlockDescription	Block description shown in the Block Properties dialog box.	character array
BlockDiagramType	Returns model if it is in an open Simulink block diagram. Returns library if it is a Simulink library.	'model' | 'library'
BlockType	Block type (read only).	character array
ClipboardFcn	Function called when block is copied to the clipboard (**Ctrl +C**) or when the menu item **Copy** is selected.	function | character vector
CloseFcn	Function called when close_system is run on block.	function | character vector

Property	Description	Values
`Commented`	Exclude block from simulation.	`{'off'}` | `'on'` | `'through'`

`CompiledPort-ComplexSignals`	Complexity of port signals after updating diagram. You must compile the model before querying this property. For example:
	
	`vdp([],[],[],'compile');`
	`d = get_param(gcb,'CompiledPortComplexSignals');`
	`vdp([],[],[],'term');`
		structure array

`CompiledIsActive`	Specifies whether the block status is active or not at compile time. `CompiledIsActive` returns `off` if any one of these conditions is true at compile time: • Block is inactive path of Inline Variant. • Block is inactive choice of Variant Subsystem. • Block is commented out is within a Subsystem block that is commented out. • Block is inactive due to condition propagated from Variant Subsystem block. `CompiledisActive` returns `off` for inactive choices and returns `on` for active choices of Variant Subsystem.	`'off'` | `'on'`

Property	Description	Values
`CompiledPortDataTypes`	Data types of port signals after updating diagram. You must compile the model before querying this property. See `CompiledPortComplexSignals`.	structure array

`CompiledPortDesignMin`	Design minimum of port signals after updating diagram. You must compile the model before querying this property. For example:
	
	`feval(gcs, [],[],[],'compile');`
	`ports = get_param(gcb,'PortHandles');`
	`min = get_param(ports.Outport, 'CompiledPortDesignMin')`
	`feval(model, [],[],[],'term');`
		structure array

`CompiledPortDesignMax`	Design maximum of port signals at compile time. You must compile the model before querying this property. For example:
	
	`feval(gcs, [],[],[],'compile');`
	`ports = get_param(gcb,'PortHandles');`
	`max = get_param(ports.Outport, 'CompiledPortDesignMax')`
	`feval(model, [],[],[],'term');`
		structure array

`CompiledPortDimensions`	Dimensions of port signals after updating diagram. You must compile the model before querying this property. For details, see "Get Compiled Port Dimensions".	numeric array

Property	Description	Values
`CompiledPortDimensionsMode`	Indication whether the port signal has a variable size (after updating diagram). You must compile the model before querying this property. See "Programmatically Determine Whether Signal Line Has Variable Size".	`double` number. `0` indicates the signal does not have a variable size. `1` indicates the signal has a variable size.
`CompiledPortFrameData`	Frame mode of port signals after updating diagram. You must compile the model before querying this property.	structure array
`CompiledPortWidths`	Structure of port widths after updating diagram. You must compile the model before querying this property.	structure array
`CompiledSampleTime`	Block sample time after updating diagram. You must compile the model before querying this property.	vector [sample time, offset time] or cell {[sample time 1, offset time 1]; [sample time 2, offset time 2];.....[sample time n, offset time n]}
`ContinueFcn`	Function called at the restart of a simulation (after a pause).	function | character vector
`CopyFcn`	Function called when block is copied. See "Block Callback Parameters" for details.	function | character vector
`DataTypeOverrideCompiled`	For internal use.	
`DeleteFcn`	Function called when block is deleted. See "Block Callback Parameters" for details.	MATLAB expression

Property	Description	Values
DestroyFcn	Function called when block is destroyed. See "Block Callback Parameters" for details.	MATLAB expression
Description	Description of block. Set by the **Description** field in the **General** pane of the Block Properties dialog box.	text and tokens
Diagnostics	For internal use.	
DialogParameters	List of names/attributes of block-specific parameters for an unmasked block, or mask parameters for a masked block.	structure
DropShadow	Display drop shadow.	{'off'} | 'on'
ExtModeLoggingSupported	Enable a block to support uploading of signal data in external mode (for example, with a scope block).	{'off'} | 'on'
ExtModeLoggingTrig	Enable a block to act as the trigger block for external mode signal uploading.	{'off'} | 'on'
ExtModeUploadOption	Enable a block to upload signal data in external mode when the **Select all** check box on the External Signal & Triggering dialog box is not selected. A value of log indicates the block uploads signals. A value of none indicates the block does not upload signals. The value monitor is currently not in use. If the **Select all** check box on the External Signal & Triggering dialog box is selected, it overrides this parameter setting.	{'none'} | 'log' | 'monitor'

Property	Description	Values
FontAngle	Font angle.	`'normal'` | `'italic'` | `'oblique'` | `{'auto'}`
FontName	Font name.	character array
FontSize	Font size. A value of -1 specifies that this block inherits the font size specified by the `DefaultBlockFontSize` model parameter.	real `{'-1'}`
FontWeight	Font weight.	`'light'` | `'normal'` | `'demi'` | `'bold'` | `{'auto'}`
ForegroundColor	Foreground color of block icon.	color value |`'[r,g,b]'` | `'[r,g,b,a]'` r, g, and b, are the red, green, blue values of the color in the range 0.0 to 1.0. The value changes if it is too similar to the canvas color (`ScreenColor` parameter). Use `get_param` to return the actual value. If specified, the alpha value (a) is ignored. Possible color values are `'black'`, `'white'`, `'red'`, `'green'`, `'blue'`, `'cyan'`, `'magenta'`, `'yellow'`, `'gray'`, `'lightBlue'`, `'orange'`, `'darkGreen'`.
Handle	Block handle.	real

Property	Description	Values
HideAutomaticName	Specify whether the block name given automatically by the Simulink Editor displays in the model. To hide automatic names, use the default setting of 'on'. (The HideAutomaticNames parameter for the model must also be set to 'on'.) Set to 'off' to display the name, and also set the block ShowName parameter to 'on'. Blocks whose ShowName parameter is 'off' are hidden regardless of this setting. For more information on how the parameters interact, see "Hide or Display Block Names".	{'on'} | 'off'
HiliteAncestors	For internal use.	
InitFcn	Initialization function for a block. Created on the **Callbacks** pane of the Model Properties dialog box. For more information, see "Create Model Callbacks". On non-masked blocks, updating the diagram or running the simulation call this function.	MATLAB expression
InputSignalNames	Names of input signals.	cell array

Property	Description	Values
IntrinsicDialogParameters	List of names/attributes of block-specific parameters (regardless of whether the block is masked or unmasked). Use instead of DialogParameters if you want block-specific parameters for masked or unmasked blocks.	structure
IOSignalStrings	Block paths to objects that are connected to the Signal & Scope Manager. Simulink software saves these paths when the model is saved.	list
IOType	Signal & Scope Manager type. For internal use.	
LibraryVersion	For a linked block, the initial value of this property is the ModelVersion of the library at the time the link was created. The value updates with increments in the model version of the library.	character vector — {'1.1'}
LineHandles	Handles of lines connected to block.	structure
LinkData	Array of details about changes to the blocks inside the link that differ between a parameterized link and its library, listing the block names and parameter values. Use [] to reset to deparameterized, e.g., set_param(gcb,'linkData',[]). See "Restore Disabled or Parameterized Links".	cell array

Property	Description	Values
LinkStatus	Link status of block. Updates out-of-date linked blocks when queried using get_param. See "Control Linked Block Programmatically".	'none' | 'resolved' | 'unresolved' | 'implicit' | 'inactive' | 'restore' | 'propagate' | 'propagateHierarchy' | 'restoreHierarchy'
LoadFcn	Function called when block is loaded.	MATLAB expression
MinMaxOverflow-Logging_Compiled	For internal use.	
ModelCloseFcn	Function called when model is closed. The ModelCloseFcn is called prior to the block's DeleteFcn and DestroyFcn callbacks, if either are set.	MATLAB expression
ModelParamTableInfo	For internal use.	
MoveFcn	Function called when block is moved.	MATLAB expression
Name	Block name.	character vector
NameChangeFcn	Function called when block name is changed.	MATLAB expression
NamePlacement	Position of block name.	{'normal'} | 'alternate'
ObjectParameters	Names/attributes of block's parameters.	structure
OpenFcn	Function called when this Block Parameters dialog box opens.	MATLAB expression
Orientation	Where block faces.	{'right'} | 'left' | 'up' | 'down'
OutputSignalNames	Names of output signals.	cell array
Parent	Name of the system that owns the block.	character vector {'untitled'}

Property	Description	Values
`ParentCloseFcn`	Function called when parent subsystem is closed. The `ParentCloseFcn` of blocks at the root model level is not called when the model is closed.	MATLAB expression
`PauseFcn`	Function called at the pause of a simulation.	function | character vector

Property	Description	Values

PortConnectivity	The value of this property is an array of structures, each of which describes one of the block's input or output ports. Each port structure has the following fields:
	
	• Type
	
	  Specifies the port's type and/or number. The value of this field can be:
	
	    • *n*, where *n* is the number of the port for data ports
	    • 'enable' if the port is an enable port
	    • 'trigger' if the port is a trigger port
	    • 'state' for state ports
	    • 'ifaction' for action ports
	    • 'LConn#' for a left connection port where *#* is the port's number
	    • 'RConn#' for a right connection port where *#* is the port's number
	
	• Position
	
	  The value of this field is a two-element vector, [*x y*], that specifies the port's position.
	
	• SrcBlock
	
	  Handle of the block connected to this port. This
		structure array

Property	Description	Values
	field is null for output ports and `-1` for unconnected input ports. `SrcBlock` property is a valid source handle for Variant Subsystem blocks. • `SrcPort` Number of the port connected to this port, starting at zero. This field is null for both output ports and unconnected input ports. • `DstBlock` Handle of the block to which this port is connected. This field is null for input ports and contains a 1-by-0 empty matrix for unconnected output ports. • `DstPort` Number of the port to which this port is connected, starting at zero. This field is null for input ports and contains a 1-by-0 empty matrix for unconnected output ports.	

Property	Description	Values

PortHandles	The value of this property is a structure that specifies the handles of the block's ports. The structure has the following fields:
	
	• Inport
	
	  Handles of the block's input ports.
	• Outport
	
	  Handles of the block's output ports.
	• Enable
	
	  Handle of the block's enable port.
	• Trigger
	
	  Handle of the block's trigger port.
	• State
	
	  Handle of the block's state port.
	• LConn
	
	  Handles of the block's left connection ports (for blocks that support Physical Modeling tools).
	• RConn
	
	  Handles of the block's right connection ports (for blocks that support Physical Modeling tools).
		structure array

Property	Description	Values
	• `Ifaction` Handle of the block's action port. • `Reset` Handle of the block's reset port.	
`PortRotationType`	Type of port rotation used by this block. This is a read-only property.	`'default'` | `'physical'`
`Ports`	A vector that specifies the number of each kind of port this block has. The order of the vector's elements corresponds to the following port types: • `Inport` • `Outport` • `Enable` • `Trigger` • `State` • `LConn` • `RConn` • `Ifaction` • `Reset`	vector

Property	Description	Values
Position	Position of block in model window. To help with block alignment, the position you set can differ from the actual block position by a few pixels. Use `get_param` to return the actual position.	vector of coordinates, in pixels: `[left top right bottom]` The origin is the upper-left corner of the Simulink Editor canvas before any canvas resizing. The maximum absolute value for a coordinate is 32767. Positive values are to the right of and down from the origin. Negative values are to the left of and up from the origin.
PostSaveFcn	Function called after the block is saved.	MATLAB expression
PreCopyFcn	Function called before the block is copied. See "Block Callback Parameters" for details.	MATLAB expression
PreDeleteFcn	Function called before the block is deleted. See "Block Callback Parameters" for details.	MATLAB expression
PreSaveFcn	Function called before the block is saved. See "Block Callback Parameters" for details.	MATLAB expression
Priority	Specifies the block's order of execution relative to other blocks in the same model. Set by the **Priority** field on the **General** pane of the Block Properties dialog box.	character vector {''}
ReferenceBlock	Name of the library block to which this block links.	character vector {''}
RequirementInfo	For internal use.	

Property	Description	Values
RTWData	User specified data, used by Simulink Coder software. Intended only for use with user written S-functions. See the section "S-Function RTWdata" (Simulink Coder) for details.	
SampleTime	Value of the sample time parameter. See "Specify Sample Time" for more details.	character vector
Selected	Status of whether or not block is selected.	{'on'} | 'off'
ShowName	Display or hide block name. To display a block name given by the Simulink Editor (automatic names), set the block 'HideAutomaticName' parameter to 'off' and ShowName to 'on'. To hide an automatic block name given by the Editor, set ShowName to 'on', HideAutomaticName to 'on', and HideAutomaticNames on the model to 'on'. For more information on how the parameters interact, see "Hide or Display Block Names".	{'on'} | 'off'
StartFcn	Function called at the start of a simulation.	MATLAB expression
StatePerturbation-ForJacobian	State perturbation size to use during linearization. See "Change Perturbation Level of Blocks Perturbed During Linearization" (Simulink Control Design) for details.	character vector

Property	Description	Values
StaticLinkStatus	Link status of block. Does not update out-of-date linked blocks when queried using get_param. See also LinkStatus.	'none' | 'resolved' | 'unresolved' | 'implicit' | 'inactive' | 'restore' | 'propagate' | 'propagateHierarchy' | 'restoreHierarchy'
StopFcn	Function called at the termination of a simulation.	MATLAB expression
Tag	Text that appears in the block label that Simulink software generates. Set by the **Tag** field on the **General** pane of the Block Properties dialog box.	character vector {''}
Type	Simulink object type (read only).	'block'
UndoDeleteFcn	Function called when block deletion is undone.	MATLAB expression
UserData	User-specified data that can have any MATLAB data type.	{'[]'}
UserDataPersistent	Status of whether or not UserData will be saved in the model file.	'on' | {'off'}

Examples of Setting Block Properties

These examples illustrate how to change common block properties.

This command changes the orientation of the Gain block in the mymodel system so it faces the opposite direction (right to left).

```
set_param('mymodel/Gain','Orientation','left')
```

This command associates an OpenFcn callback with the Gain block in the mymodel system.

```
set_param('mymodel/Gain','OpenFcn','my_open_cb')
```

This command sets the `Position` property of the Gain block in the `mymodel` system. The block is 75 pixels wide by 25 pixels high.

```
set_param('mymodel/Gain','Position',[50 250 125 275])
```

Block-Specific Parameters

To write scripts that create and modify models, you can use the `get_param` and `set_param` functions to query and modify the properties and parameters of a block or diagram. Use the tables to determine the programmatic name of a parameter or property in a block dialog box.

Programmatic Parameters of Blocks and Models

Programmatic parameters that describe a model are model parameters (see "Model Parameters" on page 6-2). Parameters that describe a block are block parameters. Parameters that are common to all Simulink blocks are common block parameters (see "Common Block Properties" on page 6-111). Many blocks also have unique block-specific parameters. A masked block can have mask parameters (see "Mask Parameters" on page 6-280).

The model and block properties also include callbacks, which are commands that execute when a certain model or block event occurs. These events include opening a model, simulating a model, copying a block, opening a block, etc. See "Model, Block, and Port Callbacks".

Tip For block parameters that accept array values, the number of elements in the array cannot exceed what `int_T` can represent. This limitation applies to both simulation and Simulink Coder code generation.

The maximum number of characters that a parameter edit field can contain is 49,000.

Block-Specific Parameters and Programmatic Equivalents

The tables list block-specific parameters for Simulink blocks. The type of the block appears in parentheses after the block name. Some Simulink blocks work as masked subsystems. The tables indicate masked blocks by adding the designation "masked subsystem" after the block type.

The type listed for nonmasked blocks is the value of the `BlockType` parameter (see "Common Block Properties" on page 6-111). The type listed for masked blocks is the value of the `MaskType` parameter (see "Mask Parameters" on page 6-280).

The **Dialog Box Prompt** column indicates the text of the prompt for the parameter in the block dialog box. The **Values** column shows the type of value required (scalar, vector, variable), the possible values (separated with a vertical line), and the default value (enclosed in braces).

Continuous Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Derivative (`Derivative`)		
`CoefficientInTFapproximation`	Coefficient c in the transfer function approximation `s/(c*s+1)` used for linearization	`{'inf'}`
Integrator (`Integrator`)		
`ExternalReset`	External reset	`{'none'}` | `'rising'` | `'falling'` | `'either'` | `'level'` | `'level hold'`
`InitialConditionSource`	Initial condition source	`{'internal'}` | `'external'`
`InitialCondition`	Initial condition	scalar or vector — `{'0'}`
`LimitOutput`	Limit output	`{'off'}` | `'on'`
`UpperSaturationLimit`	Upper saturation limit	scalar or vector — `{'inf'}`
`LowerSaturationLimit`	Lower saturation limit	scalar or vector — `{'-inf'}`
`ShowSaturationPort`	Show saturation port	`{'off'}` | `'on'`
`ShowStatePort`	Show state port	`{'off'}` | `'on'`
`AbsoluteTolerance`	Absolute tolerance	character vector, scalar, or vector — `{'auto'}` | `{'-1'}` | any real scalar or vector
`IgnoreLimit`	Ignore limit and reset when linearizing	`{'off'}` | `'on'`
`ZeroCross`	Enable zero–crossing detection	`'off'` | `{'on'}`
`ContinuousStateAttributes`	State Name	`{''}` | user-defined
`WrapState`	Wrap state	`{'off'}` | `'on'`
`WrappedStateUpperValue`	Upper value of wrapped state	scalar or vector — `{'pi'}`
`WrappedStateLowerValue`	Lower value of wrapped state	scalar or vector — `{'-pi'}`
Second-Order Integrator (`SecondOrderIntegrator`)		
`ICSourceX`	Initial condition source x	`{'internal'}` | `'external'`

Block (Type)/Parameter	Dialog Box Prompt	Values
ICX	Initial condition x	scalar or vector — {'0'}
LimitX	Limit x	{'off'} | 'on'
UpperLimitX	Upper limit x	scalar or vector — {'inf'}
LowerLimitX	Lower limit x	scalar or vector — {'-inf'}
WrapStateX	Enable wrapping of x	{'off'} | 'on'
WrappedUpperValueX	Upper value for wrapping x	scalar or vector — {'pi'}
WrappedLowerValueX	Lower value for wrapping x	scalar or vector — {'-pi'}
AbsoluteToleranceX	Absolute tolerance x	character vector, scalar, or vector — {'auto'} | {'−1'} | any real scalar or vector
StateNameX	State name x	{} | user-defined
ICSourceDXDT	Initial condition source dx/dt	{'internal'} | 'external'
ICDXDT	Initial condition dx/dt	scalar or vector — {'0'}
LimitDXDT	Limit dx/dt	{'off'} | 'on'
UpperLimitDXDT	Upper limit dx/dt	scalar or vector — {'inf'}
LowerLimitDXDT	Lower limit dx/dt	scalar or vector — {'-inf'}
AbsoluteToleranceDXDT	Absolute tolerance dx/dt	character vector, scalar, or vector — {'auto'} | {'−1'} | any real scalar or vector
StateNameDXDT	State name dx/dt	{} | user-defined
ExternalReset	External reset	{'none'} | 'rising' | 'falling' | 'either'
ZeroCross	Enable zero-crossing detection	{'on'} | 'off'
ReinitDXDTwhenXreachesSaturation	Reinitialize dx/dt when x reaches saturation	{'off'} | 'on'
IgnoreStateLimitsAndResetForLinearization	Ignore state limits and the reset for linearization	{'off'} | 'on'
ShowOutput	Show output	{'both'} | 'x' | 'dxdt'
State-Space (StateSpace)		
A	A	matrix — {'1'}

Block (Type)/Parameter	Dialog Box Prompt	Values
`B`	B	matrix — `{'1'}`
`C`	C	matrix — `{'1'}`
`D`	D	matrix — `{'1'}`
`InitialCondition`	Initial conditions	vector — `{'0'}`
`AbsoluteTolerance`	Absolute tolerance	character vector, scalar, or vector — `{'auto'}` | `{'-1'}` | any real scalar or vector
`ContinuousStateAttributes`	State Name	`{''}` | user-defined
Transfer Fcn (`TransferFcn`)		
`Numerator`	Numerator coefficients	vector or matrix — `{'[1]'}`
`Denominator`	Denominator coefficients	vector — `{'[1 1]'}`
`AbsoluteTolerance`	Absolute tolerance	character vector, scalar, or vector — `{'auto'}` | `{'-1'}` | any real scalar or vector
`ContinuousStateAttributes`	State Name	`{''}` | user-defined
Transport Delay (`TransportDelay`)		
`DelayTime`	Time delay	scalar or vector — `{'1'}`
`InitialOutput`	Initial output	scalar or vector — `{'0'}`
`BufferSize`	Initial buffer size	scalar — `{'1024'}`
`FixedBuffer`	Use fixed buffer size	`{'off'}` | `'on'`
`TransDelayFeedthrough`	Direct feedthrough of input during linearization	`{'off'}` | `'on'`
`PadeOrder`	Pade order (for linearization)	`{'0'}`
Variable Time Delay (`VariableTimeDelay`)		
`VariableDelayType`	Select delay type	`'Variable transport delay'` | `{'Variable time delay'}`
`MaximumDelay`	Maximum delay	scalar or vector — `{'10'}`

Block (Type)/Parameter	Dialog Box Prompt	Values
InitialOutput	Initial output	scalar or vector — {'0'}
MaximumPoints	Initial buffer size	scalar — {'1024'}
FixedBuffer	Use fixed buffer size	{'off'} | 'on'
ZeroDelay	Handle zero delay	{'off'} | 'on'
TransDelayFeedthrough	Direct feedthrough of input during linearization	{'off'} | 'on'
PadeOrder	Pade order (for linearization)	{'0'}
ContinuousStateAttributes	State Name	{''} | user-defined
Variable Transport Delay (VariableTransportDelay)		
VariableDelayType	Select delay type	{'Variable transport delay'} | 'Variable time delay'
MaximumDelay	Maximum delay	scalar or vector — {'10'}
InitialOutput	Initial output	scalar or vector — {'0'}
MaximumPoints	Initial buffer size	scalar — {'1024'}
FixedBuffer	Use fixed buffer size	{'off'} | 'on'
TransDelayFeedthrough	Direct feedthrough of input during linearization	{'off'} | 'on'
PadeOrder	Pade order (for linearization)	{'0'}
AbsoluteTolerance	Absolute tolerance	character vector, scalar, or vector — {'auto'} | {'−1'} | any positive real scalar or vector
ContinuousStateAttributes	State Name	{''} | user-defined
Zero-Pole (ZeroPole)		
Zeros	Zeros	vector — {'[1]'}
Poles	Poles	vector — {'[0 -1]'}
Gain	Gain	vector — {'[1]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
`AbsoluteTolerance`	Absolute tolerance	character vector, scalar, or vector — {`'auto'`} | {`'−1'`} | any positive real scalar or vector
`ContinuousStateAttributes`	State Name	{`''`} | user-defined

Discontinuities Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Backlash (`Backlash`)		
`BacklashWidth`	Deadband width	scalar or vector — {'1'}
`InitialOutput`	Initial output	scalar or vector — {'0'}
`ZeroCross`	Enable zero-crossing detection	'off' | {'on'}
`SampleTime`	Sample time (-1 for inherited)	{'-1'}
Coulomb & Viscous Friction (`Coulombic and Viscous Friction`) (masked subsystem)		
`offset`	Coulomb friction value (Offset)	{'[1 3 2 0]'}
`gain`	Coefficient of viscous friction (Gain)	{'1'}
Dead Zone (`DeadZone`)		
`LowerValue`	Start of dead zone	scalar or vector — {'-0.5'}
`UpperValue`	End of dead zone	scalar or vector — {'0.5'}
`SaturateOnIntegerOverflow`	Saturate on integer overflow	'off' | {'on'}
`LinearizeAsGain`	Treat as gain when linearizing	'off' | {'on'}
`ZeroCross`	Enable zero-crossing detection	'off' | {'on'}
`SampleTime`	Sample time (-1 for inherited)	{'-1'}
Dead Zone Dynamic (`Dead Zone Dynamic`) (masked subsystem)		
Hit Crossing (`HitCross`)		
`HitCrossingOffset`	Hit crossing offset	scalar or vector — {'0'}
`HitCrossingDirection`	Hit crossing direction	'rising' | 'falling' | {'either'}
`ShowOutputPort`	Show output port	'off' | {'on'}
`ZeroCross`	Enable zero-crossing detection	'off' | {'on'}
`SampleTime`	Sample time (-1 for inherited)	{'-1'}
Quantizer (`Quantizer`)		
`QuantizationInterval`	Quantization interval	scalar or vector — {'0.5'}

Block (Type)/Parameter	Dialog Box Prompt	Values
LinearizeAsGain	Treat as gain when linearizing	'off' | {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Rate Limiter (RateLimiter)		
RisingSlewLimit	Rising slew rate	{'1'}
FallingSlewLimit	Falling slew rate	{'-1'}
SampleTimeMode	Sample time mode	'continuous' | {'inherited'}
InitialCondition	Initial condition	{'0'}
LinearizeAsGain	Treat as gain when linearizing	'off' | {'on'}
Rate Limiter Dynamic (Rate Limiter Dynamic) (masked subsystem)		
Relay (Relay)		
OnSwitchValue	Switch on point	{'eps'}
OffSwitchValue	Switch off point	{'eps'}
OnOutputValue	Output when on	{'1'}
OffOutputValue	Output when off	{'0'}
ZeroCross	Enable zero-crossing detection	'off' | {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	'Inherit: Inherit via back propagation' | {'Inherit: All ports same datatype'} | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16)' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)' | 'Enum: <class name>'

Block (Type)/Parameter	Dialog Box Prompt	Values
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
Saturation (Saturate)		
UpperLimit	Upper limit	scalar or vector — {'0.5'}
LowerLimit	Lower limit	scalar or vector — {'-0.5'}
LinearizeAsGain	Treat as gain when linearizing	'off' | {'on'}
ZeroCross	Enable zero-crossing detection	'off' | {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	'Inherit: Inherit via back propagation' | {'Inherit: Same as input'} | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
Saturation Dynamic (Saturation Dynamic) (masked subsystem)		
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output data type	{'Inherit: Same as second input'} | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
OutputDataTypeScalingMode	Deprecated in R2007b	
OutDataType	Deprecated in R2007b	
OutScaling	Deprecated in R2007b	
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
DoSatur	Saturate on integer overflow	{'off'} | 'on'
Wrap To Zero (Wrap To Zero) (masked subsystem)		
Threshold	Threshold	{'255'}

Discrete Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Delay (Delay)		
DelayLengthSource	Delay length > Source	{'Dialog'} | 'Input port'
DelayLength	Delay length > Value	{'2'}
DelayLengthUpperLimit	Delay length > Upper limit	{'100'}
InitialConditionSource	Initial condition > Source	{'Dialog'} | 'Input port'
InitialCondition	Initial condition > Value	{'0.0'}
ExternalReset	External reset	{'None'} | 'Rising' | 'Falling' | 'Either' | 'Level' | 'Level hold'
InputProcessing	Input processing	'Columns as channels (frame based)' | {'Elements as channels (sample based)'} | 'Inherited'
UseCircularBuffer	Use circular buffer for state	{'off'} | 'on'
PreventDirectFeedthrough	Prevent direct feedthrough	{'off'} | 'on'
RemoveDelayLengthCheckInGeneratedCode	Remove delay length check in generated code	{'off'} | 'on'
DiagnosticForDelayLength	Diagnostic for delay length	{'None'} | 'Warning' | 'Error'
SampleTime	Sample time (–1 for inherited)	{'-1'}
StateName	State name	{''}
StateMustResolveToSignalObject	State name must resolve to Simulink signal object	{'off'} | 'on'
StateSignalObject	Signal object class	Simulink.Signal object
	Code generation storage class	Object of a class that is derived from Simulink.Signal

Block (Type)/Parameter	Dialog Box Prompt	Values
StateStorageClass	Code generation storage class	{'Auto'} | 'Model default' | 'ExportedGlobal' | 'ImportedExtern' | 'ImportedExternPointer' | 'Custom'
CodeGenStateStorageTypeQualifier	Code generation storage type qualifier	{''}
Difference (Difference) (masked subsystem)		
ICPrevInput	Initial condition for previous input	{'0.0'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Inherit via back propagation' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
OutputDataTypeScalingMode	Deprecated in R2007b	
OutDataType	Deprecated in R2007b	
OutScaling	Deprecated in R2007b	
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'

Block (Type)/Parameter	Dialog Box Prompt	Values
`DoSatur`	Saturate to max or min when overflows occur	`{'off'}	'on'`
Discrete Derivative (`Discrete Derivative`) (masked subsystem)		
`gainval`	Gain value	`{'1.0'}`
`ICPrevScaledInput`	Initial condition for previous weighted input K*u/Ts	`{'0.0'}`
`OutMin`	Output minimum	`{'[]'}`
`OutMax`	Output maximum	`{'[]'}`
`OutDataTypeStr`	Output data type	`{'Inherit: Inherit via internal rule'}	'Inherit: Inherit via back propagation'	'double'	'single'	'int8'	'uint8'	'int16'	'uint16'	'int32'	'uint32'	'fixdt(1,16,0)'	'fixdt(1,16,2^0,0)'`
`OutputDataTypeScalingMode`	Deprecated in R2007b	
`OutDataType`	Deprecated in R2007b	
`OutScaling`	Deprecated in R2007b	
`LockScale`	Lock output data type setting against changes by the fixed-point tools	`{'off'}	'on'`
`RndMeth`	Integer rounding mode	`'Ceiling'	'Convergent'	{'Floor'}	'Nearest'	'Round'	'Simplest'	'Zero'`
`DoSatur`	Saturate to max or min when overflows occur	`{'off'}	'on'`
Discrete FIR Filter (`Discrete FIR Filter`)		

Block (Type)/Parameter	Dialog Box Prompt	Values
CoefSource	Coefficient source	{'Dialog parameters'} | 'Input port'
FilterStructure	Filter structure	{'Direct form'} | 'Direct form symmetric' | 'Direct form antisymmetric' | 'Direct form transposed' | 'Lattice MA' **Note** You must have a DSP System Toolbox license to use a filter structure other than Direct form.
Coefficients	Coefficients	vector — {'[0.5 0.5]'}
InputProcessing	Input processing	'Columns as channels (frame based)' | {'Elements as channels (sample based)'}
InitialStates	Initial states	scalar or vector — {'0'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
CoefMin	Coefficients minimum	{'[]'}
CoefMax	Coefficients maximum	{'[]'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
TapSumDataTypeStr	Tap sum data type	{'Inherit: Same as input'} | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
`CoefDataTypeStr`	Coefficients data type	`{'Inherit: Same word length as input'}` | `'int8'` | `'uint8'` | `'int16'` | `'uint16'` | `'int32'` | `'uint32'` | `'fixdt(1,16)'` | `'fixdt(1,16,0)'`
`ProductDataTypeStr`	Product output data type	`{'Inherit: Inherit via internal rule'}` | `'Inherit: Same as input'` | `'int8'` | `'uint8'` | `'int16'` | `'uint16'` | `'int32'` | `'uint32'` | `'fixdt(1,16,0)'`
`AccumDataTypeStr`	Accumulator data type	`{'Inherit: Inherit via internal rule'}` | `'Inherit: Same as input'` | `'Inherit: Same as product output'` | `'int8'` | `'uint8'` | `'int16'` | `'uint16'` | `'int32'` | `'uint32'` | `'fixdt(1,16,0)'`
`StateDataTypeStr`	State data type	`'Inherit: Same as input'` | `{'Inherit: Same as accumulator'}` | `'int8'` | `'uint8'` | `'int16'` | `'uint16'` | `'int32'` | `'uint32'` | `'fixdt(1,16,0)'`

Block (Type)/Parameter	Dialog Box Prompt	Values
`OutDataTypeStr`	Output data type	`'Inherit: Same as input'` `| {'Inherit: Same as accumulator'} | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16)' | 'fixdt(1,16,0)'`
`LockScale`	Lock data type settings against changes by the fixed-point tools	`{'off'} | 'on'`
`RndMeth`	Integer rounding mode	`'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'`
`SaturateOnIntegerOverflow`	Saturate on integer overflow	`{'off'} | 'on'`
Discrete Filter (`DiscreteFilter`)		
`Numerator`	Numerator coefficients	vector — `{'[1]'}`
`Denominator`	Denominator coefficients	vector — `{'[1 0.5]'}`
`IC`	Initial states	`{'0'}`
`SampleTime`	Sample time (-1 for inherited)	`{'1'}`
`a0EqualsOne`	Optimize by skipping divide by leading denominator coefficient (a0)	`{'off'} | 'on'`
`NumCoefMin`	Numerator coefficient minimum	`{'[]'}`
`NumCoefMax`	Numerator coefficient maximum	`{'[]'}`
`DenCoefMin`	Denominator coefficient minimum	`{'[]'}`
`DenCoefMax`	Denominator coefficient maximum	`{'[]'}`
`OutMin`	Output minimum	`{'[]'}`
`OutMax`	Output maximum	`{'[]'}`

Block (Type)/Parameter	Dialog Box Prompt	Values
StateDataTypeStr	State data type	{'Inherit: Same as input'} | 'int8' | 'int16' | 'int32' | 'fixdt(1,16,0)'
NumCoefDataTypeStr	Numerator coefficient data type	{'Inherit: Inherit via internal rule'} | 'int8' | 'int16' | 'int32' | 'fixdt(1,16)' | 'fixdt(1,16,0)'
DenCoefDataTypeStr	Denominator coefficient data type	{'Inherit: Inherit via internal rule'} | 'int8' | 'int16' | 'int32' | 'fixdt(1,16)' | 'fixdt(1,16,0)'
NumProductDataTypeStr	Numerator product output data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Same as input' | 'int8' | 'int16' | 'int32' | 'fixdt(1,16,0)'
DenProductDataTypeStr	Denominator product output data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Same as input' | 'int8' | 'int16' | 'int32' | 'fixdt(1,16,0)'
NumAccumDataTypeStr	Numerator accumulator data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Same as input' | 'Inherit: Same as product output' | 'int8' | 'int16' | 'int32' | 'fixdt(1,16,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
DenAccumDataTypeStr	Denominator accumulator data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Same as input' | 'Inherit: Same as product output' | 'int8' | 'int16' | 'int32' | 'fixdt(1,16,0)'
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Same as input' | 'int8' | 'int16' | 'int32' | 'fixdt(1,16,0)'
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
SaturateOnIntegerOverflow	Saturate on integer overflow	{'off'} | 'on'
StateName	State name	{''}
StateMustResolveToSignalObject	State name must resolve to Simulink signal object	{'off'} | 'on'
StateSignalObject	Signal object class Code generation storage class	Simulink.Signal object Object of a class that is derived from Simulink.Signal
StateStorageClass	Code generation storage class	{'Auto'} | 'Model default' | 'ExportedGlobal' | 'ImportedExtern' | 'ImportedExternPointer' | 'Custom'

Block (Type)/Parameter	Dialog Box Prompt	Values
RTWStateStorageTypeQualifier	Code generation storage type qualifier	{''}
Discrete State-Space (DiscreteStateSpace)		
A	A	matrix — {'1'}
B	B	matrix — {'1'}
C	C	matrix — {'1'}
D	D	matrix — {'1'}
InitialCondition	Initial conditions	vector — {'0'}
SampleTime	Sample time (-1 for inherited)	{'1'}
StateName	State name	{''}
StateMustResolveToSignalObject	State name must resolve to Simulink signal object	{'off'} | 'on'
StateSignalObject	Signal object class Code generation storage class	Simulink.Signal object Object of a class that is derived from Simulink.Signal
StateStorageClass	Code generation storage class	{'Auto'} | 'Model default' | 'ExportedGlobal' | 'ImportedExtern' | 'ImportedExternPointer' | 'Custom'
RTWStateStorageTypeQualifier	Code generation storage type qualifier	{''}
Discrete Transfer Fcn (DiscreteTransferFcn)		
Numerator	Numerator coefficients	vector — {'[1]'}
Denominator	Denominator coefficients	vector — {'[1 0.5]'}
InitialStates	Initial states	{'0'}
SampleTime	Sample time (-1 for inherited)	{'1'}

Block (Type)/Parameter	Dialog Box Prompt	Values
a0EqualsOne	Optimize by skipping divide by leading denominator coefficient (a0)	{'off'} | 'on'
NumCoefMin	Numerator coefficient minimum	{'[]'}
NumCoefMax	Numerator coefficient maximum	{'[]'}
DenCoefMin	Denominator coefficient minimum	{'[]'}
DenCoefMax	Denominator coefficient maximum	{'[]'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
StateDataTypeStr	State data type	{'Inherit: Same as input'} | 'int8' | 'int16' | 'int32' | 'fixdt(1,16,0)'
NumCoefDataTypeStr	Numerator coefficient data type	{'Inherit: Inherit via internal rule'} | 'int8' | 'int16' | 'int32' | 'fixdt(1,16,0)'
DenCoefDataTypeStr	Denominator coefficient data type	{'Inherit: Inherit via internal rule'} | 'int8' | 'int16' | 'int32' | 'fixdt(1,16,0)'
NumProductDataTypeStr	Numerator product output data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Same as input' | 'int8' | 'int16' | 'int32' | 'fixdt(1,16,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
DenProductDataTypeStr	Denominator product output data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Same as input' | 'int8' | 'int16' | 'int32' | 'fixdt(1,16,0)'
NumAccumDataTypeStr	Numerator accumulator data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Same as input' | 'Inherit: Same as product output' | 'int8' | 'int16' | 'int32' | 'fixdt(1,16,0)'
DenAccumDataTypeStr	Denominator accumulator data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Same as input' | 'Inherit: Same as product output' | 'int8' | 'int16' | 'int32' | 'fixdt(1,16,0)'
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Same as input' | 'int8' | 'int16' | 'int32' | 'fixdt(1,16,0)'
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
SaturateOnIntegerOverflow	Saturate on integer overflow	{'off'} | 'on'
StateName	State name	{''}

Block (Type)/Parameter	Dialog Box Prompt	Values
`StateMustResolveToSignalObject`	State name must resolve to Simulink signal object	`{'off'}` | `'on'`
`StateSignalObject`	Signal object class	`Simulink.Signal` object
	Code generation storage class	Object of a class that is derived from `Simulink.Signal`
`StateStorageClass`	Code generation storage class	`{'Auto'}` | `'Model default'` | `'ExportedGlobal'` | `'ImportedExtern'` | `'ImportedExternPointer'` | `'Custom'`
`RTWStateStorageTypeQualifier`	Code generation storage type qualifier	`{''}`
Discrete Zero-Pole (`DiscreteZeroPole`)		
`Zeros`	Zeros	vector — `{'[1]'}`
`Poles`	Poles	vector — `{'[0 0.5]'}`
`Gain`	Gain	`{'1'}`
`SampleTime`	Sample time (-1 for inherited)	`{'1'}`
`StateName`	State name	`{''}`
`StateMustResolveToSignalObject`	State name must resolve to Simulink signal object	`{'off'}` | `'on'`
`StateSignalObject`	Signal object class	`Simulink.Signal` object
	Code generation storage class	Object of a class that is derived from `Simulink.Signal`
`StateStorageClass`	Code generation storage class	`{'Auto'}` | `'Model default'` | `'ExportedGlobal'` | `'ImportedExtern'` | `'ImportedExternPointer'` | `'Custom'`

Block (Type)/Parameter	Dialog Box Prompt	Values
RTWStateStorageType Qualifier	Code generation storage type qualifier	{''}
Discrete-Time Integrator (DiscreteIntegrator)		
IntegratorMethod	Integrator method	{'Integration: Forward Euler'} | 'Integration: Backward Euler' | 'Integration: Trapezoidal' | 'Accumulation: Forward Euler' | 'Accumulation: Backward Euler' | 'Accumulation: Trapezoidal'
gainval	Gain value	{'1.0'}
ExternalReset	External reset	{'none'} | 'rising' | 'falling' | 'either' | 'level' | 'sampled level'
InitialConditionSource	Initial condition source	{'internal'} | 'external'
InitialCondition	Initial condition	scalar or vector — {'0'}
InitialConditionSetting	Initial condition setting	{'State (most efficient)'} | 'Output' | 'Compatibility'
SampleTime	Sample time (-1 for inherited)	{'1'}
LimitOutput	Limit output	{'off'} | 'on'
UpperSaturationLimit	Upper saturation limit	scalar or vector — {'inf'}
LowerSaturationLimit	Lower saturation limit	scalar or vector — {'-inf'}
ShowSaturationPort	Show saturation port	{'off'} | 'on'
ShowStatePort	Show state port	{'off'} | 'on'
IgnoreLimit	Ignore limit and reset when linearizing	{'off'} | 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Inherit via back propagation' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} | 'on'
StateName	State name	{''}
StateMustResolveTo SignalObject	State name must resolve to Simulink signal object	{'off'} | 'on'
StateSignalObject	Signal object class Code generation storage class	Simulink.Signal object Object of a class that is derived from Simulink.Signal
StateStorageClass	Code generation storage class	{'Auto'} | 'Model default' | 'ExportedGlobal' | 'ImportedExtern' | 'ImportedExternPointer' | 'Custom'

Block (Type)/Parameter	Dialog Box Prompt	Values
RTWStateStorageType Qualifier	Code generation storage type qualifier	{''}
First-Order Hold (First-Order Hold) (masked subsystem)		
Ts	Sample time	{'1'}
Memory (Memory)		
InitialCondition	Initial condition	scalar or vector — {'0'}
InheritSampleTime	Inherit sample time	{'off'} | 'on'
LinearizeMemory	Direct feedthrough of input during linearization	{'off'} | 'on'
LinearizeAsDelay	Treat as a unit delay when linearizing with discrete sample time	{'off'} | 'on'
StateName	State name	{''}
StateMustResolveTo SignalObject	State name must resolve to Simulink signal object	{'off'} | 'on'
StateSignalObject	Signal object class Code generation storage class	Simulink.Signal object Object of a class that is derived from Simulink.Signal
StateStorageClass	Code generation storage class	{'Auto'} | 'Model default' | 'ExportedGlobal' | 'ImportedExtern' | 'ImportedExternPointer' | 'Custom'
RTWStateStorageType Qualifier	Code generation storage type qualifier	{''}
Tapped Delay (S-Function) (Tapped Delay Line) (masked subsystem)		
vinit	Initial condition	{'0.0'}
samptime	Sample time	{'-1'}
NumDelays	Number of delays	{'4'}

Block (Type)/Parameter	Dialog Box Prompt	Values
DelayOrder	Order output vector starting with	{'Oldest'} | 'Newest'
includeCurrent	Include current input in output vector	{'off'} | 'on'
Transfer Fcn First Order (First Order Transfer Fcn) (masked subsystem)		
PoleZ	Pole (in Z plane)	{'0.95'}
ICPrevOutput	Initial condition for previous output	{'0.0'}
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'} | 'on'
Transfer Fcn Lead or Lag (Lead or Lag Compensator) (masked subsystem)		
PoleZ	Pole of compensator (in Z plane)	{'0.95'}
ZeroZ	Zero of compensator (in Z plane)	{'0.75'}
ICPrevOutput	Initial condition for previous output	{'0.0'}
ICPrevInput	Initial condition for previous input	{'0.0'}
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'} | 'on'
Transfer Fcn Real Zero (Transfer Fcn Real Zero) (masked subsystem)		
ZeroZ	Zero (in Z plane)	{'0.75'}
ICPrevInput	Initial condition for previous input	{'0.0'}

Block (Type)/Parameter	Dialog Box Prompt	Values
RndMeth	Integer rounding mode	`'Ceiling'` | `'Convergent'` | `{'Floor'}` | `'Nearest'` | `'Round'` | `'Simplest'` | `'Zero'`
DoSatur	Saturate to max or min when overflows occur	`{'off'}` | `'on'`
Unit Delay (`UnitDelay`)		
InitialCondition	Initial condition	scalar or vector — `{'0'}`
InputProcessing	Input processing	`'Columns as channels (frame based)'` | `{'Elements as channels (sample based)'}` | `'Inherited'`
SampleTime	Sample time (-1 for inherited)	`{'-1'}`
StateName	State name	`{''}`
StateMustResolveTo SignalObject	State name must resolve to Simulink signal object	`{'off'}` | `'on'`
StateSignalObject	Signal object class Code generation storage class	`Simulink.Signal` object Object of a class that is derived from `Simulink.Signal`
StateStorageClass	Code generation storage class	`{'Auto'}` | `'Model default'` | `'ExportedGlobal'` | `'ImportedExtern'` | `'ImportedExternPointer'` | `'Custom'`
CodeGenStateStorageTy pe Qualifier	Code generation storage type qualifier	`{''}`
Zero-Order Hold (`ZeroOrderHold`)		
SampleTime	Sample time (-1 for inherited)	`{'1'}`

Logic and Bit Operations Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Bit Clear (`Bit Clear`) (masked subsystem)		
iBit	Index of bit (0 is least significant)	{'0'}
Bit Set (`Bit Set`) (masked subsystem)		
iBit	Index of bit (0 is least significant)	{'0'}
Bitwise Operator (S-Function) (`Bitwise Operator`) (masked subsystem)		
logicop	Operator	{'AND'} | 'OR' | 'NAND' | 'NOR' | 'XOR' | 'NOT'
UseBitMask	Use bit mask ...	'off' | {'on'}
NumInputPorts	Number of input ports	{'1'}
BitMask	Bit Mask	{'bin2dec('11011001')'}
BitMaskRealWorld	Treat mask as	'Real World Value' | {'Stored Integer'}
Combinatorial Logic (`CombinatorialLogic`)		
TruthTable	Truth table	{'[0 0;0 1;0 1;1 0;0 1;1 0;1 0;1 1]'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Compare To Constant (`Compare To Constant`) (masked subsystem)		
relop	Operator	'==' | '~=' | '<' | {'<='} | '>=' | '>'
const	Constant value	{'3.0'}
OutDataTypeStr	Output data type	{'boolean'} | 'uint8'
ZeroCross	Enable zero-crossing detection	'off' | {'on'}
Compare To Zero (`Compare To Zero`) (masked subsystem)		
relop	Operator	'==' | '~=' | '<' | {'<='} | '>=' | '>'
OutDataTypeStr	Output data type	{'boolean'} | 'uint8'
ZeroCross	Enable zero-crossing detection	'off' | {'on'}

Block (Type)/Parameter	Dialog Box Prompt	Values
Detect Change (`Detect Change`) (masked subsystem)		
`vinit`	Initial condition	`{'0'}`
`OutDataTypeStr`	Output data type	`{'boolean'}	'uint8'`
Detect Decrease (`Detect Decrease`) (masked subsystem)		
`vinit`	Initial condition	`{'0.0'}`
`OutDataTypeStr`	Output data type	`{'boolean'}	'uint8'`
Detect Fall Negative (`Detect Fall Negative`) (masked subsystem)		
`vinit`	Initial condition	`{'0'}`
`OutDataTypeStr`	Output data type	`{'boolean'}	'uint8'`
Detect Fall Nonpositive (`Detect Fall Nonpositive`) (masked subsystem)		
`vinit`	Initial condition	`{'0'}`
`OutDataTypeStr`	Output data type	`{'boolean'}	'uint8'`
Detect Increase (`Detect Increase`) (masked subsystem)		
`vinit`	Initial condition	`{'0.0'}`
`OutDataTypeStr`	Output data type	`{'boolean'}	'uint8'`
Detect Rise Nonnegative (`Detect Rise Nonnegative`) (masked subsystem)		
`vinit`	Initial condition	`{'0'}`
`OutDataTypeStr`	Output data type	`{'boolean'}	'uint8'`
Detect Rise Positive (`Detect Rise Positive`) (masked subsystem)		
`vinit`	Initial condition	`{'0'}`
`OutDataTypeStr`	Output data type	`{'boolean'}	'uint8'`
Extract Bits (`Extract Bits`) (masked subsystem)		
`bitsToExtract`	Bits to extract	`{'Upper half'}	'Lower half'	'Range starting with most significant bit'	'Range ending with least significant bit'	'Range of bits'`
`numBits`	Number of bits	`{'8'}`

Block (Type)/Parameter	Dialog Box Prompt	Values
`bitIdxRange`	Bit indices ([start end], 0-based relative to LSB)	`{'[0 7]'}`
`outScalingMode`	Output scaling mode	`{'Preserve fixed-point scaling'}	'Treat bit field as an integer'`
Interval Test (`Interval Test`) (masked subsystem)		
`IntervalClosedRight`	Interval closed on right	`'off'	{'on'}`
`uplimit`	Upper limit	`{'0.5'}`
`IntervalClosedLeft`	Interval closed on left	`'off'	{'on'}`
`lowlimit`	Lower limit	`{'-0.5'}`
`OutDataTypeStr`	Output data type	`{'boolean'}	'uint8'`
Interval Test Dynamic (`Interval Test Dynamic`) (masked subsystem)		
`IntervalClosedRight`	Interval closed on right	`'off'	{'on'}`
`IntervalClosedLeft`	Interval closed on left	`'off'	{'on'}`
`OutDataTypeStr`	Output data type	`{'boolean'}	'uint8'`
Logical Operator (`Logic`)		
`Operator`	Operator	`{'AND'}	'OR'	'NAND'	'NOR'	'XOR'	'NXOR'	'NOT'`
`Inputs`	Number of input ports	`{'2'}`
`IconShape`	Icon shape	`{'rectangular'}	'distinctive'`
`SampleTime`	Sample time (-1 for inherited)	`{'-1'}`
`AllPortsSameDT`	Require all inputs and output to have the same data type	`{'off'}	'on'`
`OutDataTypeStr`	Output data type	`'Inherit: Logical (see Configuration Parameters: Optimization)'	{'boolean'}	'fixdt(1,16)'`

Block (Type)/Parameter	Dialog Box Prompt	Values
Relational Operator (`RelationalOperator`)		
`Operator`	Relational operator	`'=='` | `'~='` | `'<'` | `{'<='}` | `'>='` | `'>'` | `'isInf'` | `'isNaN'` | `'isFinite'`
`ZeroCross`	Enable zero-crossing detection	`'off'` | `{'on'}`
`SampleTime`	Sample time (-1 for inherited)	`{'-1'}`
`InputSameDT`	Require all inputs to have the same data type	`{'off'}` | `'on'`
`OutDataTypeStr`	Output data type	`'Inherit: Logical (see Configuration Parameters: Optimization)'` | `{'boolean'}` | `'fixdt(1,16)'`
Shift Arithmetic (`ArithShift`)		
`BitShiftNumberSource`	Bits to shift > Source	`{'Dialog'}` | `'Input port'`
`BitShiftDirection`	Bits to shift > Direction	`'Left'` | `'Right'` | `{'Bidirectional'}`
`BitShiftNumber`	Bits to shift > Number	`{'8'}`
`BinPtShiftNumber`	Binary points to shift > Number	`{'0'}`
`DiagnosticForOORShift`	Diagnostic for out-of-range shift value	`{'None'}` | `'Warning'` | `'Error'`
`CheckOORBitShift`	Check for out-of-range 'Bits to shift' in generated code	`{'off'}` | `'on'`
`nBitShiftRight`	Deprecated in R2011a	
`nBinPtShiftRight`	Deprecated in R2011a	

Lookup Tables Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Cosine (`Cosine`) (masked subsystem)		
Formula	Output formula	`'sin(2*pi*u)'` | `{'cos(2*pi*u)'}` | `'exp(j*2*pi*u)'` | `'sin(2*pi*u) and cos(2*pi*u)'`
NumDataPoints	Number of data points for lookup table	`{'(2^5)+1'}`
OutputWordLength	Output word length	`{'16'}`
InternalRulePriority	Internal rule priority for lookup table	`{'Speed'}` | `'Precision'`
Direct Lookup Table (n-D) (`LookupNDDirect`)		
NumberOfTableDimensions	Number of table dimensions	`'1'` | `{'2'}` | `'3'` | `'4'`
InputsSelectThisObjectFromTable	Inputs select this object from table	`{'Element'}` | `'Vector'` | `'2-D Matrix'`
TableIsInput	Make table an input	`{'off'}` | `'on'`
Table	Table data	`{'[4 5 6;16 19 20;10 18 23]'}`
DiagnosticForOutOfRangeInput	Diagnostic for out-of-range input	`'None'` | `{'Warning'}` | `'Error'`
SampleTime	Sample time (-1 for inherited)	`{'-1'}`
TableMin	Table minimum	`{'[]'}`
TableMax	Table maximum	`{'[]'}`
TableDataTypeStr	Table data type	`{'Inherit: Inherit from 'Table data''}` | `'double'` | `'single'` | `'int8'` | `'uint8'` | `'int16'` | `'uint16'` | `'int32'` | `'uint32'` | `'boolean'` | `'fixdt(1,16)'` | `'fixdt(1,16,0)'` | `'fixdt(1,16,2^0,0)'`

Block (Type)/Parameter	Dialog Box Prompt	Values
`LockScale`	Lock data type settings against changes by the fixed-point tools	`{'off'} | 'on'`
`maskTabDims`	Deprecated in R2009b	
`explicitNumDims`	Deprecated in R2009b	
`outDims`	Deprecated in R2009b	
`tabIsInput`	Deprecated in R2009b	
`mxTable`	Deprecated in R2009b	
`clipFlag`	Deprecated in R2009b	
`samptime`	Deprecated in R2009b	
Interpolation Using Prelookup (`Interpolation_n-D`)		
`NumberOfTableDimensions`	Number of table dimensions	`'1' | {'2'} | '3' | '4'`
`Table`	Table data > Value	`{'sqrt([1:11]' * [1:11])'}`
`TableSource`	Table data > Source	`{'Dialog'} | 'Input port'`

`TableSpecification`	Specification	`{'Explicit values'} | | 'Lookup table object'`
		
		To set this parameter from `'Explicit values'` to `'Lookup table object'`, use the same call to `set_param` to set the parameter `LookupTableObject`. For example:
		
		`set_param('myModel/myInterpBlock',...` `'TableSpecification',...` `'Lookup table object',...` `'LookupTableObject','myLUTObject')`

`LookupTableObject`	Name of lookup table object	`{''}`
`InterpMethod`	Interpolation method	`'Flat' | {'Linear point-slope'} | 'Nearest' | 'Linear Lagrange'`
`ExtrapMethod`	Extrapolation method	`'Clip' | {'Linear'}`

Block (Type)/Parameter	Dialog Box Prompt	Values
ValidIndexMayReachLast	Valid index input may reach last index	{'off'} | 'on'
DiagnosticForOutOfRange Input	Diagnostic for out-of-range input	{'None'} | 'Warning' | 'Error'
RemoveProtectionIndex	Remove protection against out-of-range index in generated code	{'off'} | 'on'
NumSelectionDims	Number of sub-table selection dimensions	{'0'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
TableDataTypeStr	Table data > Data Type	'Inherit: Inherit from 'Table data'' | {'Inherit: Same as output'} | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16)' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
TableMin	Table data > Minimum	{'[]'}
TableMax	Table data > Maximum	{'[]'}
IntermediateResultsDat aTypeStr	Intermediate results > Data Type	{'Inherit: Inherit via internal rule'} | 'Inherit: Same as output' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
`OutDataTypeStr`	Output > Data Type	`'Inherit: Inherit via back propagation'` | `{'Inherit: Inherit from table data'}` | `'double'` | `'single'` | `'int8'` | `'uint8'` | `'int16'` | `'uint16'` | `'int32'` | `'uint32'` | `'fixdt(1,16,0)'` | `'fixdt(1,16,2^0,0)'`
`OutMin`	Output > Minimum	`{'[]'}`
`OutMax`	Output > Maximum	`{'[]'}`
`InternalRulePriority`	Internal rule priority	`{'Speed'}` | `'Precision'`
`LockScale`	Lock data type settings against changes by the fixed-point tools	`{'off'}` | `'on'`
`RndMeth`	Integer rounding mode	`'Ceiling'` | `'Convergent'` | `{'Floor'}` | `'Nearest'` | `'Round'` | `'Simplest'` | `'Zero'`
`SaturateOnIntegerOverflow`	Saturate on integer overflow	`{'off'}` | `'on'`
`CheckIndexInCode`	Deprecated in R2011a	
n-D Lookup Table, 1-D Lookup Table, 2-D Lookup Table (`Lookup_n-D`)		
`NumberOfTableDimensions`	Number of table dimensions	`'1'` | `'2'` | `'3'` | `'4'`. Default is '1' for 1-D Lookup Table, '2' for 2-D Lookup Table, '3' for n-D Lookup Table.

Block (Type)/Parameter	Dialog Box Prompt	Values
DataSpecification	(n-D Lookup Table) Data specification	{'Table and breakpoints'} | 'Lookup table object' To set this parameter from 'Table and breakpoints' to 'Lookup table object', use the same call to set_param to set the parameter LookupTableObject. For example: set_param('myModel/myLookupBlock',... 'DataSpecification','Lookup table... object',... 'LookupTableObject','myLUTObject')
LookupTableObject	Name of lookup table object.	{''}
Table	Table data	{'reshape(repmat([4 5 6;16 19 20;10 18 23],1,2),[3,3,2])'}
BreakpointsSpecification	Breakpoints specification	{'Explicit values'} | 'Even spacing'
BreakpointsForDimension1FirstPoint	First point	{'1'}
BreakpointsForDimension2FirstPoint	First point	{'1'}
BreakpointsForDimension3FirstPoint	First point	{'1'}
...	...	...
BreakpointsForDimension30FirstPoint	First point	{'1'}
BreakpointsForDimension1Spacing	Spacing	{'1'}
BreakpointsForDimension2Spacing	Spacing	{'1'}
BreakpointsForDimension3Spacing	Spacing	{'1'}

Block (Type)/Parameter	Dialog Box Prompt	Values
...	...	...
`BreakpointsFor-Dimension30Spacing`	Spacing	`{'1'}`
`BreakpointsFor-Dimension1`	Breakpoints 1	`{'[10,22,31]'}`
`BreakpointsForDimension2`	Breakpoints 2	`{'[10,22,31]'}`
`BreakpointsFor-Dimension3`	Breakpoints 3	`{'[5, 7]'}`
...	...	...
`BreakpointsFor-Dimension30`	Breakpoints 30	`{'[1:3]'}`
`SampleTime`	Sample time (-1 for inherited)	`{'-1'}`
`InterpMethod`	Interpolation method	`'Flat'` | `'Nearest'` | `{'Linear point-slope'}` | `'Linear Lagrange'` | `'Cubic spline'`
`ExtrapMethod`	Extrapolation method	`'Clip'` | `{'Linear'}` | `'Cubic spline'`
`UseLastTableValue`	Use last table value for inputs at or above last breakpoint	`{'off'}` | `'on'`
`DiagnosticForOutOfRange Input`	Diagnostic for out-of-range input	`{'None'}` | `'Warning'` | `'Error'`
`RemoveProtectionInput`	Remove protection against out-of-range input in generated code	`{'off'}` | `'on'`
`IndexSearchMethod`	Index search method	`'Evenly spaced points'` | `'Linear search'` | `{'Binary search'}`
`BeginIndexSearchUsing PreviousIndexResult`	Begin index search using previous index result	`{'off'}` | `'on'`

6-167

Block (Type)/Parameter	Dialog Box Prompt	Values
UseOneInputPortForAll InputData	Use one input port for all input data	{'off'} | 'on'
SupportTunableTableSize	Support tunable table size in code generation	{'off'} | 'on'
MaximumIndicesForEach Dimension	Maximum indices for each dimension	{'[]'}
TableDataTypeStr	Table data > Data Type	'Inherit: Inherit from 'Table data'' | {'Inherit: Same as output'} | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16)' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
TableMin	Table data > Minimum	{'[]'}
TableMax	Table data > Maximum	{'[]'}
BreakpointsForDimension1 DataTypeStr	Breakpoints 1 > Data Type	{'Inherit: Same as corresponding input'} | 'Inherit: Inherit from 'Breakpoint data'' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16)' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
BreakpointsForDimension1 Min	Breakpoints 1 > Minimum	{'[]'}
BreakpointsForDimension1 Max	Breakpoints 1 > Maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
`BreakpointsForDimension2` `DataTypeStr`	Breakpoints 2 > Data Type	`{'Inherit: Same as corresponding input'} | 'Inherit: Inherit from 'Breakpoint data'' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16)' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'`
`BreakpointsForDimension2` `Min`	Breakpoints 2 > Minimum	`{'[]'}`
`BreakpointsForDimension2` `Max`	Breakpoints 2 > Maximum	`{'[]'}`
`...`	`...`	`...`
`BreakpointsForDimension30` `DataTypeStr`	Breakpoints 30 > Data Type	`{'Inherit: Same as corresponding input'} | 'Inherit: Inherit from 'Breakpoint data'' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16)' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'`
`BreakpointsForDimension30` `Min`	Breakpoints 30 > Minimum	`{'[]'}`
`BreakpointsForDimension30` `Max`	Breakpoints 30 > Maximum	`{'[]'}`

Block (Type)/Parameter	Dialog Box Prompt	Values
`FractionDataTypeStr`	Fraction > Data Type	`{'Inherit: Inherit via internal rule'}	'double'	'single'	'fixdt(1,16,0)'`
`IntermediateResults DataTypeStr`	Intermediate results > Data Type	`'Inherit: Inherit via internal rule'	{'Inherit: Same as output'}	'double'	'single'	'int8'	'uint8'	'int16'	'uint16'	'int32'	'uint32'	'fixdt(1,16,0)'	'fixdt(1,16,2^0,0)'`
`OutDataTypeStr`	Output > Data Type	`'Inherit: Inherit via back propagation'	'Inherit: Inherit from table data'	{'Inherit: Same as first input'}	'double'	'single'	'int8'	'uint8'	'int16'	'uint16'	'int32'	'uint32'	'fixdt(1,16,0)'	'fixdt(1,16,2^0,0)'`
`OutMin`	Output > Minimum	`{'[]'}`
`OutMax`	Output > Maximum	`{'[]'}`
`InternalRulePriority`	Internal rule priority	`{'Speed'}	'Precision'`
`InputSameDT`	Require all inputs to have the same data type	`'off'	{'on'}`
`LockScale`	Lock data type settings against changes by the fixed-point tools	`{'off'}	'on'`
`RndMeth`	Integer rounding mode	`'Ceiling'	'Convergent'	'Floor'	'Nearest'	'Round'	{'Simplest'}	'Zero'`
`SaturateOnInteger Overflow`	Saturate on integer overflow	`{'off'}	'on'`
`ProcessOutOfRangeInput`	Deprecated in R2009b	
Lookup Table Dynamic (`Lookup Table Dynamic`) (masked subsystem)		

Block (Type)/Parameter	Dialog Box Prompt	Values
`LookUpMeth`	Lookup Method	`'Interpolation-Extrapolation'` `| {'Interpolation-Use End Values'} | 'Use Input Nearest' | 'Use Input Below' | 'Use Input Above'`
`OutDataTypeStr`	Output data type	`{'fixdt('double')'} | 'Inherit: Inherit via back propagation' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'boolean' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'`
`OutputDataTypeScaling Mode`	Deprecated in R2007b	
`OutDataType`	Deprecated in R2007b	
`OutScaling`	Deprecated in R2007b	
`LockScale`	Lock output data type setting against changes by the fixed-point tools	`{'off'} | 'on'`
`RndMeth`	Integer rounding mode	`'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round'| 'Simplest' | 'Zero'`
`DoSatur`	Saturate to max or min when overflows occur	`{'off'} | 'on'`
Prelookup (`PreLookup`)		

Block (Type)/Parameter	Dialog Box Prompt	Values
BreakpointsSpecification	Specification	{'Explicit values'} | 'Even spacing' | 'Breakpoint object' To set this parameter from 'Explicit values' or 'Even spacing' to 'Breakpoint object', use the same call to set_param to set the parameter BreakpointObject. For example: set_param('myModel/myPrelookupBlock',... 'BreakpointsSpecification',... 'Breakpoint object',... 'BreakpointObject','myBPObject')
BreakpointObject	Name of breakpoint object	{''}
BreakpointsFirstPoint	First point	{'10'}
BreakpointsSpacing	Spacing	{'10'}
BreakpointsNumPoints	Number of points	{'11'}
BreakpointsData	Value	{'[10:10:110]'}
BreakpointsDataSource	Source	{'Dialog'} | 'Input port'
IndexSearchMethod	Index search method	'Evenly spaced points' | 'Linear search' | {'Binary search'}
BeginIndexSearchUsing PreviousIndexResult	Begin index search using previous index result	{'off'} | 'on'
OutputOnlyTheIndex	Output only the index	{'off'} | 'on'
ExtrapMethod	Extrapolation method	'Clip' | {'Linear'}
UseLastBreakpoint	Use last breakpoint for input at or above upper limit	{'off'} | 'on'
DiagnosticForOutOfRange Input	Diagnostic for out-of-range input	{'None'} | 'Warning' | 'Error'

Block (Type)/Parameter	Dialog Box Prompt	Values
RemoveProtectionInput	Remove protection against out-of-range input in generated code	`{'off'} | 'on'`
SampleTime	Sample time (-1 for inherited)	`{'-1'}`
BreakpointDataTypeStr	Breakpoint > Data Type	`{'Inherit: Same as input'} | 'Inherit: Inherit from 'Breakpoint data'' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16)' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'`
BreakpointMin	Breakpoint > Minimum	`{'[]'}`
BreakpointMax	Breakpoint > Maximum	`{'[]'}`
IndexDataTypeStr	Index > Data Type	`'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | {'uint32'} | 'fixdt(1,16)'`
FractionDataTypeStr	Fraction > Data Type	`{'Inherit: Inherit via internal rule'} | 'double' | 'single' | 'fixdt(1,16,0)'`
LockScale	Lock output data type setting against changes by the fixed-point tools	`{'off'} | 'on'`
RndMeth	Integer rounding mode	`'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'`
ProcessOutOfRangeInput	Deprecated in R2011a	
Sine (`Sine`) (masked subsystem)		
Formula	Output formula	`{'sin(2*pi*u)'} | 'cos(2*pi*u)' | 'exp(j*2*pi*u)' | 'sin(2*pi*u) and cos(2*pi*u)'`

6-173

Block (Type)/Parameter	Dialog Box Prompt	Values
NumDataPoints	Number of data points for lookup table	{'(2^5)+1'}
OutputWordLength	Output word length	{'16'}
InternalRulePriority	Internal rule priority for lookup table	{'Speed'} | 'Precision'

Math Operations Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Abs (Abs)		
ZeroCross	Enable zero-crossing detection	'off' | {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	'Inherit: Inherit via internal rule' | 'Inherit: Inherit via back propagation' | {'Inherit: Same as input'} | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} | 'on'
Add (Sum)		
IconShape	Icon shape	{'rectangular'} | 'round'
Inputs	List of signs	{'++'}
CollapseMode	Sum over	{'All dimensions'} | 'Specified dimension'

Block (Type)/Parameter	Dialog Box Prompt	Values
CollapseDim	Dimension	{'1'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all inputs to have the same data type	{'off'} | 'on'
AccumDataTypeStr	Accumulator data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Same as first input' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Inherit via back propagation' | 'Inherit: Same as first input' | 'Inherit: Same as accumulator' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'

Block (Type)/Parameter	Dialog Box Prompt	Values
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} | 'on'
Algebraic Constraint (Algebraic Constraint)		
Constraint	Constraint on input signal	{'f(z) = 0'} | 'f(z) = z'
Solver	Algebraic Loop Solver	{'auto'} | 'Trust Region' | 'Line Search'
Tolerance	Solver Tolerance	{'auto'}
InitialGuess	Initial guess	{'0'}
Assignment (Assignment)		
NumberOfDimensions	Number of output dimensions	{'1'}
IndexMode	Index mode	'Zero-based' | {'One-based'}
OutputInitialize	Initialize output (Y)	{'Initialize using input port <Y0>'} | 'Specify size for each dimension in table'
IndexOptionArray	Index Option	'Assign all' | {'Index vector (dialog)'} | 'Index vector (port)' | 'Starting index (dialog)' | 'Starting index (port)'
IndexParamArray	Index	cell array
OutputSizeArray	Output Size	cell array
DiagnosticForDimensions	Action if any output element is not assigned	'Error' | 'Warning' | {'None'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
IndexOptions	See the **IndexOptionArray** parameter for more information.	
Indices	See the **IndexParamArray** parameter for more information.	

Block (Type)/Parameter	Dialog Box Prompt	Values
OutputSizes	See the **OutputSizeArray** parameter for more information.	
Bias (`Bias`)		
Bias	Bias	`{'0.0'}`
SaturateOnInteger Overflow	Saturate on integer overflow	`{'off'} | 'on'`
Complex to Magnitude-Angle (`ComplexToMagnitudeAngle`)		
Output	Output	`'Magnitude' | 'Angle' | {'Magnitude and angle'}`
SampleTime	Sample time (-1 for inherited)	`{'-1'}`
Complex to Real-Imag (`ComplexToRealImag`)		
Output	Output	`'Real' | 'Imag' | {'Real and imag'}`
SampleTime	Sample time (-1 for inherited)	`{'-1'}`
Divide (`Product`)		
Inputs	Number of inputs	`{'*/'}`
Multiplication	Multiplication	`{'Element-wise(.*)'} | 'Matrix(*)'`
SampleTime	Sample time (-1 for inherited)	`{'-1'}`
InputSameDT	Require all inputs to have same data type	`{'off'} | 'on'`
OutMin	Output minimum	`{'[]'}`
OutMax	Output maximum	`{'[]'}`

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Inherit via back propagation' | 'Inherit: Same as first input' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} | 'on'
Dot Product (DotProduct)		
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all inputs to have same data type	'off' | {'on'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
`OutDataTypeStr`	Output data type	`{'Inherit: Inherit via internal rule'} | 'Inherit: Inherit via back propagation' | 'Inherit: Same as first input' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'`
`OutputDataTypeScaling Mode`	Deprecated in R2007b	
`OutDataType`	Deprecated in R2007b	
`OutScaling`	Deprecated in R2007b	
`LockScale`	Lock output data type setting against changes by the fixed-point tools	`{'off'} | 'on'`
`RndMeth`	Integer rounding mode	`'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'`
`SaturateOnInteger Overflow`	Saturate on integer overflow	`{'off'} | 'on'`
Find (`Find`)		
`IndexOutputFormat`	Index output format	`{'Linear indices'} | 'Subscripts'`
`NumberOfInputDimensions`	Number of input dimensions	`integer — {'1'}`
`IndexMode`	Index mode	`{'Zero-based'} | 'One-based'`
`ShowOutputForNonzero InputValues`	Show output port for nonzero input values	`{'off'} | 'on'`

Block (Type)/Parameter	Dialog Box Prompt	Values
SampleTime	Sample time (–1 for inherited)	{'-1'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16)'
Gain (Gain)		
Gain	Gain	{'1'}
Multiplication	Multiplication	{'Element-wise(K.*u)'} | 'Matrix(K*u)' | 'Matrix(u*K)' | 'Matrix(K*u) (u vector)'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Inherit via back propagation' | 'Inherit: Same as input' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'

Block (Type)/Parameter	Dialog Box Prompt	Values
`SaturateOnInteger Overflow`	Saturate on integer overflow	`{'off'} | 'on'`
`ParamMin`	Parameter minimum	`{'[]'}`
`ParamMax`	Parameter maximum	`{'[]'}`
`ParamDataTypeStr`	Parameter data type	`{'Inherit: Inherit via internal rule'} | 'Inherit: Same as input' | 'Inherit: Inherit from 'Gain'' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16)' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'`
Magnitude-Angle to Complex (`MagnitudeAngleToComplex`)		
`Input`	Input	`'Magnitude' | 'Angle' | {'Magnitude and angle'}`
`ConstantPart`	Magnitude or Angle	`{'0'}`
`ApproximationMethod`	Approximation method	`{'None'} | 'CORDIC'`
`NumberOfIterations`	Number of iterations	`{'11'}`
`ScaleReciprocalGainFactor`	Scale output by reciprocal of gain factor	`'off' | {'on'}`
`SampleTime`	Sample time (-1 for inherited)	`{'-1'}`
Math Function (`Math`)		
`Operator`	Function	`{'exp'} | 'log' | '10^u' | 'log10' | 'magnitude^2' | 'square' | 'pow' | 'conj' | 'reciprocal' | 'hypot' | 'rem' | 'mod' | 'transpose' | 'hermitian'`

Block (Type)/Parameter	Dialog Box Prompt	Values
OutputSignalType	Output signal type	{'auto'} | 'real' | 'complex'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	'Inherit: Inherit via internal rule' | 'Inherit: Inherit via back propagation' | {'Inherit: Same as first input'} | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'

Iterations	Number of iterations	`{'3'}`

Block (Type)/Parameter	Dialog Box Prompt	Values
Sine Wave Function (`Sin`)		
`SineType`	Sine type	`{'Time based'} | 'Sample based'`
`TimeSource`	Time	`'Use simulation time' | {'Use external signal'}`
`Amplitude`	Amplitude	`{'1'}`
`Bias`	Bias	`{'0'}`
`Frequency`	Frequency	`{'1'}`
`Phase`	Phase	`{'0'}`
`Samples`	Samples per period	`{'10'}`
`Offset`	Number of offset samples	`{'0'}`
`SampleTime`	Sample time	`{'0'}`
`VectorParams1D`	Interpret vector parameters as 1-D	`'off' | {'on'}`
Slider Gain (`Slider Gain`) (masked subsystem)		
`low`	Low	`{'0'}`
`gain`	Gain	`{'1'}`
`high`	High	`{'2'}`
Sqrt (`Sqrt`)		
`Operator`	Function	`{'sqrt'} | 'signedSqrt' | 'rSqrt'`
`OutputSignalType`	Output signal type	`{'auto'} | 'real' | 'complex'`
`SampleTime`	Sample time (-1 for inherited)	`{'-1'}`
`OutMin`	Output minimum	`{'[]'}`
`OutMax`	Output maximum	`{'[]'}`

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output data type	`'Inherit: Inherit via internal rule'` | `'Inherit: Inherit via back propagation'` | `{'Inherit: Same as first input'}` | `'double'` | `'single'` | `'int8'` | `'uint8'` | `'int16'` | `'uint16'` | `'int32'` | `'uint32'` | `'fixdt(1,16,0)'` | `'fixdt(1,16,2^0,0)'`
LockScale	Lock output data type setting against changes by the fixed-point tools	`{'off'}` | `'on'`
RndMeth	Integer rounding mode	`'Ceiling'` | `'Convergent'` | `{'Floor'}` | `'Nearest'` | `'Round'` | `'Simplest'` | `'Zero'`
SaturateOnInteger Overflow	Saturate on integer overflow	`'off'` | `{'on'}`
IntermediateResults DataTypeStr	Intermediate results data type	`{'Inherit: Inherit via internal rule'}` | `'Inherit: Inherit from input'` | `'Inherit: Inherit from output'` | `'double'` | `'single'` | `'int8'` | `'uint8'` | `'int16'` | `'uint16'` | `'int32'` | `'uint32'` | `'fixdt(1,16,0)'` | `'fixdt(1,16,2^0,0)'`
AlgorithmType	Method	`{'Exact'}` | `'Newton-Raphson'`
Iterations	Number of iterations	`{'3'}`

Block (Type)/Parameter	Dialog Box Prompt	Values
Squeeze (Squeeze) (masked subsystem)		
None	None	None
Subtract (Sum)		
IconShape	Icon shape	{'rectangular'} | 'round'
Inputs	List of signs	{'+-'}
CollapseMode	Sum over	{'All dimensions'} | 'Specified dimension'
CollapseDim	Dimension	{'1'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all inputs to have the same data type	{'off'} | 'on'
AccumDataTypeStr	Accumulator data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Same as first input' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Inherit via back propagation' | 'Inherit: Same as first input' | 'Inherit: Same as accumulator' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} | 'on'
Sum (Sum)		
IconShape	Icon shape	'rectangular' | {'round'}
Inputs	List of signs	{'|++'}
CollapseMode	Sum over	{'All dimensions'} | 'Specified dimension'
CollapseDim	Dimension	{'1'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all inputs to have the same data type	{'off'} | 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
`AccumDataTypeStr`	Accumulator data type	`{'Inherit: Inherit via internal rule'}	'Inherit: Same as first input'	'double'	'single'	'int8'	'uint8'	'int16'	'uint16'	'int32'	'uint32'	'fixdt(1,16,0)'	'fixdt(1,16,2^0,0)'`
`OutMin`	Output minimum	`{'[]'}`
`OutMax`	Output maximum	`{'[]'}`
`OutDataTypeStr`	Output data type	`{'Inherit: Inherit via internal rule'}	'Inherit: Inherit via back propagation'	'Inherit: Same as first input'	'Inherit: Same as accumulator'	'double'	'single'	'int8'	'uint8'	'int16'	'uint16'	'int32'	'uint32'	'fixdt(1,16,0)'	'fixdt(1,16,2^0,0)'`
`LockScale`	Lock data type settings against changes by the fixed-point tools	`{'off'}	'on'`
`RndMeth`	Integer rounding mode	`'Ceiling'	'Convergent'	{'Floor'}	'Nearest'	'Round'	'Simplest'	'Zero'`
`SaturateOnInteger Overflow`	Saturate on integer overflow	`{'off'}	'on'`
Sum of Elements (`Sum`)		

Block (Type)/Parameter	Dialog Box Prompt	Values
IconShape	Icon shape	{'rectangular'} | 'round'
Inputs	List of signs	{'+'}
CollapseMode	Sum over	{'All dimensions'} | 'Specified dimension'
CollapseDim	Dimension	{'1'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all inputs to have the same data type	{'off'} | 'on'
AccumDataTypeStr	Accumulator data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Same as first input' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Inherit via back propagation' | 'Inherit: Same as first input' | 'Inherit: Same as accumulator' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} | 'on'
Trigonometric Function (Trigonometry)		
Operator	Function	{'sin'} | 'cos' | 'tan' | 'asin' | 'acos' | 'atan' | 'atan2' | 'sinh' | 'cosh' | 'tanh' | 'asinh' | 'acosh' | 'atanh' | 'sincos' | 'cos + jsin'
ApproximationMethod	Approximation method	{'None'} | 'CORDIC'
NumberOfIterations	Number of iterations	{'11'}
OutputSignalType	Output signal type	{'auto'} | 'real' | 'complex'
SampleTime	Sample time (-1 for inherited)	{'-1'}
Unary Minus (UnaryMinus)		
SampleTime	Sample time (-1 for inherited)	{'-1'}
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} | 'on'
Vector Concatenate (Concatenate)		
NumInputs	Number of inputs	{'2'}
Mode	Mode	{'Vector'} | 'Multidimensional array'
Weighted Sample Time Math (SampleTimeMath)		

Block (Type)/Parameter	Dialog Box Prompt	Values
`TsampMathOp`	Operation	`{'+'} | '-' | '*' | '/' | 'Ts Only' | '1/Ts Only'`
`weightValue`	Weight value	`{'1.0'}`
`TsampMathImp`	Implement using	`{'Online Calculations'} | 'Offline Scaling Adjustment'`
`OutDataTypeStr`	Output data type	`{'Inherit via internal rule'} | 'Inherit via back propagation'`
`RndMeth`	Integer rounding mode	`'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'`
`SaturateOnInteger Overflow`	Saturate on integer overflow	`{'off'} | 'on'`
`OutputDataTypeScaling Mode`	Deprecated in R2009b	
`DoSatur`	Deprecated in R2009b	

Model Verification Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Assertion (`Assertion`)		
Enabled	Enable assertion	`'off'` | `{'on'}`
AssertionFailFcn	Simulation callback when assertion fails	`{''}`
StopWhenAssertionFail	Stop simulation when assertion fails	`'off'` | `{'on'}`
SampleTime	Sample time (-1 for inherited)	`{'-1'}`
Check Dynamic Gap (`Checks_DGap`) (masked subsystem)		
enabled	Enable assertion	`'off'` | `{'on'}`
callback	Simulation callback when assertion fails (optional)	`{''}`
stopWhenAssertionFail	Stop simulation when assertion fails	`'off'` | `{'on'}`
export	Output assertion signal	`{'off'}` | `'on'`
icon	Select icon type	`{'graphic'}` | `'text'`
Check Dynamic Range (`Checks_DRange`) (masked subsystem)		
enabled	Enable assertion	`'off'` | `{'on'}`
callback	Simulation callback when assertion fails (optional)	`{''}`
stopWhenAssertionFail	Stop simulation when assertion fails	`'off'` | `{'on'}`
export	Output assertion signal	`{'off'}` | `'on'`
icon	Select icon type	`{'graphic'}` | `'text'`
Check Static Gap (`Checks_SGap`) (masked subsystem)		
max	Upper bound	`{'100'}`
max_included	Inclusive upper bound	`'off'` | `{'on'}`
min	Lower bound	`{'0'}`
min_included	Inclusive lower bound	`'off'` | `{'on'}`

Block (Type)/Parameter	Dialog Box Prompt	Values
enabled	Enable assertion	'off' | {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off' | {'on'}
export	Output assertion signal	{'off'} | 'on'
icon	Select icon type	{'graphic'} | 'text'
Check Static Range (Checks_SRange) (masked subsystem)		
max	Upper bound	{'100'}
max_included	Inclusive upper bound	'off' | {'on'}
min	Lower bound	{'0'}
min_included	Inclusive lower bound	'off' | {'on'}
enabled	Enable assertion	'off' | {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off' | {'on'}
export	Output assertion signal	{'off'} | 'on'
icon	Select icon type	{'graphic'} | 'text'
Check Discrete Gradient (Checks_Gradient) (masked subsystem)		
gradient	Maximum gradient	{'1'}
enabled	Enable assertion	'off' | {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off' | {'on'}
export	Output assertion signal	{'off'} | 'on'
icon	Select icon type	{'graphic'} | 'text'
Check Dynamic Lower Bound (Checks_DMin) (masked subsystem)		

Block (Type)/Parameter	Dialog Box Prompt	Values
Enabled	Enable assertion	'off' | {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off' | {'on'}
export	Output assertion signal	{'off'} | 'on'
icon	Select icon type	{'graphic'} | 'text'
Check Dynamic Upper Bound (Checks_DMax) (masked subsystem)		
enabled	Enable assertion	'off' | {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off' | {'on'}
export	Output assertion signal	{'off'} | 'on'
icon	Select icon type	{'graphic'} | 'text'
Check Input Resolution (Checks_Resolution) (masked subsystem)		
resolution	Resolution	{'1'}
enabled	Enable assertion	'off' | {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off' | {'on'}
export	Output assertion signal	{'off'} | 'on'
Check Static Lower Bound (Checks_SMin) (masked subsystem)		
min	Lower bound	{'0'}
min_included	Inclusive boundary	'off' | {'on'}
enabled	Enable assertion	'off' | {'on'}
callback	Simulation callback when assertion fails (optional)	{''}

Block (Type)/Parameter	Dialog Box Prompt	Values
`stopWhenAssertionFail`	Stop simulation when assertion fails	`'off'` | `{'on'}`
`export`	Output assertion signal	`{'off'}` | `'on'`
`icon`	Select icon type	`{'graphic'}` | `'text'`
Check Static Upper Bound (`Checks_SMax`) (masked subsystem)		
`max`	Upper bound	`{'0'}`
`max_included`	Inclusive boundary	`'off'` | `{'on'}`
`enabled`	Enable assertion	`'off'` | `{'on'}`
`callback`	Simulation callback when assertion fails (optional)	`{''}`
`stopWhenAssertionFail`	Stop simulation when assertion fails	`'off'` | `{'on'}`
`export`	Output assertion signal	`{'off'}` | `'on'`
`icon`	Select icon type	`{'graphic'}` | `'text'`

Model-Wide Utilities Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Block Support Table (`Block Support Table`) (masked subsystem)		
DocBlock (`DocBlock`) (masked subsystem)		
`ECoderFlag`	Embedded Coder Flag	`{''}`
`DocumentType`	Document Type	`{'Text'}	'RTF'	'HTML'`
Model Info (`CMBlock`) (masked subsystem)		
`InitialSaveTempField`	InitialSaveTempField	`{''}`
`InitialBlockCM`	InitialBlockCM	`{'None'}`
`BlockCM`	BlockCM	`{'None'}`
`Frame`	Show block frame	`'off'	{'on'}`
`SaveTempField`	SaveTempField	`{''}`
`DisplayStringWithTags`	DisplayStringWithTags	`{'Model Info'}`
`MaskDisplayString`	MaskDisplayString	`{'Model Info'}`
`HorizontalTextAlignment`	Horizontal text alignment	`{'Center'}`
`LeftAlignmentValue`	LeftAlignmentValue	`{'0.5'}`
`SourceBlockDiagram`	SourceBlockDiagram	`{'untitled'}`
`TagMaxNumber`	TagMaxNumber	`{'20'}`
`CMTag1`	CMTag1	`{''}`
`CMTag2`	CMTag2	`{''}`
`CMTag3`	CMTag3	`{''}`
`CMTag4`	CMTag4	`{''}`
`CMTag5`	CMTag5	`{''}`
`CMTag6`	CMTag6	`{''}`
`CMTag7`	CMTag7	`{''}`
`CMTag8`	CMTag8	`{''}`
`CMTag9`	CMTag9	`{''}`
`CMTag10`	CMTag10	`{''}`

Block (Type)/Parameter	Dialog Box Prompt	Values
CMTag11	CMTag11	{''}
CMTag12	CMTag12	{''}
CMTag13	CMTag13	{''}
CMTag14	CMTag14	{''}
CMTag15	CMTag15	{''}
CMTag16	CMTag16	{''}
CMTag17	CMTag17	{''}
CMTag18	CMTag18	{''}
CMTag19	CMTag19	{''}
CMTag20	CMTag20	{''}
Timed-Based Linearization (`Timed Linearization`) (masked subsystem)		
LinearizationTime	Linearization time	{'1'}
SampleTime	Sample time (of linearized model)	{'0'}
Trigger-Based Linearization (`Triggered Linearization`) (masked subsystem)		
TriggerType	Trigger type	{'rising'} | 'falling' | 'either' | 'function-call'
SampleTime	Sample time (of linearized model)	{'0'}

Ports & Subsystems Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Action Port (`ActionPort`)		
`InitializeStates`	States when execution is resumed	`{'held'}` | `'reset'`
`PropagateVarSize`	Propagate sizes of variable-size signals	`{'Only when execution is resumed'}` | `'During execution'`
Atomic Subsystem (`SubSystem`)		
`ShowPortLabels`	Show port labels **Note** The values `'off'` and `'on'` are for backward compatibility only and should not be used in new models or when updating existing models.	`'none'` | `{'FromPortIcon'}` | `'FromPortBlockName'` | `'SignalName'` | `'off'` | `'on'`
`BlockChoice`	Block choice	`{''}`
`TemplateBlock`	Template block	`{''}`
`MemberBlocks`	Member blocks	`{''}`
`Permissions`	Read/Write permissions	`{'ReadWrite'}` | `'ReadOnly'` | `'NoReadOrWrite'`
`ErrorFcn`	Name of error callback function	`{''}`
`PermitHierarchical Resolution`	Permit hierarchical resolution	`{'All'}` | `'ExplicitOnly'` | `'None'`
`TreatAsAtomicUnit`	Treat as atomic unit	`'off'` | `{'on'}`
`TreatAsGroupedWhenPropa gatingVariantConditions`	Treat as grouped when propagating variant conditions	`'off'` | `{'on'}`
`MinAlgLoopOccurrences`	Minimize algebraic loop occurrences	`{'off'}` | `'on'`
`PropExecContext OutsideSubsystem`	Propagate execution context across subsystem boundary	`{'off'}` | `'on'`

Block (Type)/Parameter	Dialog Box Prompt	Values
CheckFcnCallInp InsideContextMsg	Warn if function-call inputs are context-specific	{'off'} | 'on'
SystemSampleTime	Sample time (-1 for inherited)	{'-1'}
RTWSystemCode	Function packaging	{'Auto'} | 'Inline' | 'Nonreusable function' | 'Reusable function'
RTWFcnNameOpts	Function name options	{'Auto'} | 'Use subsystem name' | 'User specified'
RTWFcnName	Function name	{''}
RTWFileNameOpts	File name options	{'Auto'} | 'Use subsystem name' | 'Use function name' | 'User specified'
RTWFileName	File name (no extension)	{''}
FunctionInterfaceSpec	Function interface This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'void_void'} | 'Allow arguments'
FunctionWithSeparateData	"Function with separate data" on page 1-0 This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'off'} | 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
RTWMemSecFuncInitTerm	"Memory section for initialize/ terminate functions" on page 1-0 This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'Inherit from model'} | 'Default' | list of memory sections from model's package
RTWMemSecFuncExecute	"Memory section for execution functions" on page 1-0 This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'Inherit from model'} | 'Default' | list of memory sections from model's package
RTWMemSecDataConstants	"Memory section for constants" on page 1-0 This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'Inherit from model'} | 'Default' | list of memory sections from model's package
RTWMemSecDataInternal	"Memory section for internal data" on page 1-0 This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'Inherit from model'} | 'Default' | list of memory sections from model's package
RTWMemSecDataParameters	"Memory section for parameters" on page 1-0 This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'Inherit from model'} | 'Default' | list of memory sections from model's package

Block (Type)/Parameter	Dialog Box Prompt	Values
DataTypeOverride	No dialog box prompt Specifies data type used to override fixed-point data types. Set by **Data type override** on the Fixed-Point Tool.	{'UseLocalSettings'} | 'ScaledDouble' | 'Double' | 'Single' | 'Off'
MinMaxOverflowLogging	No dialog box prompt Setting for fixed-point instrumentation. Set by **Fixed-point instrumentation mode** on the Fixed-Point Tool.	{'UseLocalSettings'} | 'MinMaxAndOverflow' | 'OverflowOnly' | 'ForceOff'
SimViewingDevice	No dialog box prompt If set to 'on', designates the block as a Signal Viewing Subsystem — an atomic subsystem that encapsulates processing and viewing of signals received from the target system in External mode. For more information, see "Signal Viewing Subsystems" (Simulink Coder).	{'off'} | 'on'
IsSubsystemVirtual		boolean — {'off'} | 'on' Read-only
Code Reuse Subsystem (SubSystem)		
ShowPortLabels	Show port labels **Note** The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none' | {'FromPortIcon'} | 'FromPortBlockName' | 'SignalName' | 'off' | 'on'
BlockChoice	Block choice	{''}

Block (Type)/Parameter	Dialog Box Prompt	Values
TemplateBlock	Template block	{''}
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'} | 'ReadOnly' | 'NoReadOrWrite'
ErrorFcn	Name of error callback function	{''}
PermitHierarchical Resolution	Permit hierarchical resolution	{'All'} | 'ExplicitOnly' | 'None'
TreatAsAtomicUnit	Treat as atomic unit	'off' | {'on'}
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'} | 'on'
PropExecContext OutsideSubsystem	Propagate execution context across subsystem boundary	{'off'} | 'on'
CheckFcnCallInp InsideContextMsg	Warn if function-call inputs are context-specific	{'off'} | 'on'
SystemSampleTime	Sample time (-1 for inherited)	{'-1'}
RTWSystemCode	Function packaging	'Auto' | 'Inline' | 'Nonreusable function' | {'Reusable function'}
RTWFcnNameOpts	Function name options	'Auto' | {'Use subsystem name'} | 'User specified'
RTWFcnName	Function name	{''}
RTWFileNameOpts	File name options	'Auto' | {'Use subsystem name'} | 'Use function name' | 'User specified'
RTWFileName	File name (no extension)	{''}

Block (Type)/Parameter	Dialog Box Prompt	Values
RTWMemSecFuncInitTerm	"Memory section for initialize/terminate functions" on page 1-0 This parameter requires a license for Embedded Coder software and an ERT-based system target file.	`{'Inherit from model'}` | `'Default'` | list of memory sections from model's package
RTWMemSecFuncExecute	"Memory section for execution functions" on page 1-0 This parameter requires a license for Embedded Coder software and an ERT-based system target file.	`{'Inherit from model'}` | `'Default'` | list of memory sections from model's package
RTWMemSecDataConstants	"Memory section for constants" on page 1-0 This parameter requires a license for Embedded Coder software and an ERT-based system target file.	`{'Inherit from model'}` | `'Default'` | list of memory sections from model's package
RTWMemSecDataInternal	"Memory section for internal data" on page 1-0 This parameter requires a license for Embedded Coder software and an ERT-based system target file.	`{'Inherit from model'}` | `'Default'` | list of memory sections from model's package
RTWMemSecDataParameters	"Memory section for parameters" on page 1-0 This parameter requires a license for Embedded Coder software and an ERT-based system target file.	`{'Inherit from model'}` | `'Default'` | list of memory sections from model's package

Block (Type)/Parameter	Dialog Box Prompt	Values
DataTypeOverride	No dialog box prompt Specifies data type used to override fixed-point data types. Set by **Data type override** on the Fixed-Point Tool.	`{'UseLocalSettings'}` | `'ScaledDouble'` | `'Double'` | `'Single'` | `'Off'`
MinMaxOverflowLogging	No dialog box prompt Setting for fixed-point instrumentation. Set by **Fixed-point instrumentation mode** on the Fixed-Point Tool.	`{'UseLocalSettings'}` | `'MinMaxAndOverflow'` | `'OverflowOnly'` | `'ForceOff'`
IsSubsystemVirtual		boolean — `{'off'}` | `'on'` Read-only
Configurable Subsystem (`SubSystem`)		
ShowPortLabels	Show port labels **Note** The values `'off'` and `'on'` are for backward compatibility only and should not be used in new models or when updating existing models.	`'none'` | `{'FromPortIcon'}` | `'FromPortBlockName'` | `'SignalName'` | `'off'` | `'on'`
BlockChoice	Block choice	`{''}`
TemplateBlock	Template block	`{'self'}`
MemberBlocks	Member blocks	`{''}`
Permissions	Read/Write permissions	`{'ReadWrite'}` | `'ReadOnly'` | `'NoReadOrWrite'`
ErrorFcn	Name of error callback function	`{''}`
PermitHierarchical Resolution	Permit hierarchical resolution	`{'All'}` | `'ExplicitOnly'` | `'None'`
TreatAsAtomicUnit	Treat as atomic unit	`{'off'}` | `'on'`

Block (Type)/Parameter	Dialog Box Prompt	Values
`MinAlgLoopOccurrences`	Minimize algebraic loop occurrences	`{'off'}	'on'`
`PropExecContext OutsideSubsystem`	Propagate execution context across subsystem boundary	`{'off'}	'on'`
`CheckFcnCallInp InsideContextMsg`	Warn if function-call inputs are context-specific	`{'off'}	'on'`
`SystemSampleTime`	Sample time (-1 for inherited)	`{'-1'}`
`RTWSystemCode`	Function packaging	`{'Auto'}	'Inline'	'Nonreusable function'	'Reusable function'`
`RTWFcnNameOpts`	Function name options	`{'Auto'}	'Use subsystem name'	'User specified'`
`RTWFcnName`	Function name	`{''}`
`RTWFileNameOpts`	File name options	`{'Auto'}	'Use subsystem name'	'Use function name'	'User specified'`
`RTWFileName`	File name (no extension)	`{''}`
`DataTypeOverride`	No dialog box prompt Specifies data type used to override fixed-point data types. Set by **Data type override** on the Fixed-Point Tool.	`{'UseLocalSettings'}	'ScaledDouble'	'Double'	'Single'	'Off'`
`MinMaxOverflowLogging`	No dialog box prompt Setting for fixed-point instrumentation. Set by **Fixed-point instrumentation mode** on the Fixed-Point Tool.	`{'UseLocalSettings'}	'MinMaxAndOverflow'	'OverflowOnly'	'ForceOff'`

Block (Type)/Parameter	Dialog Box Prompt	Values
SimViewingDevice	No dialog box prompt If set to 'on', designates the block as a Signal Viewing Subsystem — an atomic subsystem that encapsulates processing and viewing of signals received from the target system in External mode. For more information, see "Signal Viewing Subsystems" (Simulink Coder).	{'off'} | 'on'
DataTypeOverride	No dialog box prompt Specifies data type used to override fixed-point data types. Set by **Data type override** on the Fixed-Point Tool.	{'UseLocalSettings'} | 'ScaledDouble' | 'Double' | 'Single' | 'Off'
MinMaxOverflowLogging	No dialog box prompt Setting for fixed-point instrumentation. Set by **Fixed-point instrumentation mode** on the Fixed-Point Tool.	{'UseLocalSettings'} | 'MinMaxAndOverflow' | 'OverflowOnly' | 'ForceOff'
IsSubsystemVirtual	No dialog box prompt	boolean — {'on'} | 'off' Read-only
Enable (EnablePort)		
StatesWhenEnabling	States when enabling	{'held'} | 'reset'
PropagateVarSize	Propagate sizes of variable-size signals	{'Only when enabling'} | 'During execution'
ShowOutputPort	Show output port	{'off'} | 'on'
ZeroCross	Enable zero-crossing detection	'off' | {'on'}
Enabled and Triggered Subsystem (SubSystem)		

Block (Type)/Parameter	Dialog Box Prompt	Values
ShowPortLabels	Show port labels **Note** The values `'off'` and `'on'` are for backward compatibility only and should not be used in new models or when updating existing models.	`'none'` | `{'FromPortIcon'}` | `'FromPortBlockName'` | `'SignalName'` | `'off'` | `'on'`
BlockChoice	Block choice	`{''}`
TemplateBlock	Template block	`{''}`
MemberBlocks	Member blocks	`{''}`
Permissions	Read/Write permissions	`{'ReadWrite'}` | `'ReadOnly'` | `'NoReadOrWrite'`
ErrorFcn	Name of error callback function	`{''}`
PermitHierarchical Resolution	Permit hierarchical resolution	`{'All'}` | `'ExplicitOnly'` | `'None'`
TreatAsAtomicUnit	Treat as atomic unit	`'off'` | `{'on'}`
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	`{'off'}` | `'on'`
PropExecContext OutsideSubsystem	Propagate execution context across subsystem boundary	`{'off'}` | `'on'`
CheckFcnCallInp InsideContextMsg	Warn if function-call inputs are context-specific	`{'off'}` | `'on'`
SystemSampleTime	Sample time (-1 for inherited)	`{'-1'}`
RTWSystemCode	Function packaging	`{'Auto'}` | `'Inline'` | `'Nonreusable function'` | `'Reusable function'`
RTWFcnNameOpts	Function name options	`{'Auto'}` | `'Use subsystem name'` | `'User specified'`
RTWFcnName	Function name	`{''}`

Block (Type)/Parameter	Dialog Box Prompt	Values
RTWFileNameOpts	File name options	{'Auto'} | 'Use subsystem name' | 'Use function name' | 'User specified'
RTWFileName	File name (no extension)	{''}
DataTypeOverride	No dialog box prompt Specifies data type used to override fixed-point data types. Set by **Data type override** on the Fixed-Point Tool.	{'UseLocalSettings'} | 'ScaledDouble' | 'Double' | 'Single' | 'Off'
MinMaxOverflowLogging	No dialog box prompt Setting for fixed-point instrumentation. Set by **Fixed-point instrumentation mode** on the Fixed-Point Tool.	{'UseLocalSettings'} | 'MinMaxAndOverflow' | 'OverflowOnly' | 'ForceOff'
IsSubsystemVirtual		boolean — {'off'} | 'on' Read-only
Enabled Subsystem (SubSystem)		
ShowPortLabels	Show port labels **Note** The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none' | {'FromPortIcon'} | 'FromPortBlockName' | 'SignalName' | 'off' | 'on'
BlockChoice	Block choice	{''}
TemplateBlock	Template block	{''}
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'} | 'ReadOnly' | 'NoReadOrWrite'

Block (Type)/Parameter	Dialog Box Prompt	Values
`ErrorFcn`	Name of error callback function	`{''}`
`PermitHierarchical Resolution`	Permit hierarchical resolution	`{'All'}` | `'ExplicitOnly'` | `'None'`
`TreatAsAtomicUnit`	Treat as atomic unit	`'off'` | `{'on'}`
`MinAlgLoopOccurrences`	Minimize algebraic loop occurrences	`{'off'}` | `'on'`
`PropExecContext OutsideSubsystem`	Propagate execution context across subsystem boundary	`{'off'}` | `'on'`
`CheckFcnCallInp InsideContextMsg`	Warn if function-call inputs are context-specific	`{'off'}` | `'on'`
`SystemSampleTime`	Sample time (-1 for inherited)	`{'-1'}`
`RTWSystemCode`	Function packaging	`{'Auto'}` | `'Inline'` | `'Nonreusable function'` | `'Reusable function'`
`RTWFcnNameOpts`	Function name options	`{'Auto'}` | `'Use subsystem name'` | `'User specified'`
`RTWFcnName`	Function name	`{''}`
`RTWFileNameOpts`	File name options	`{'Auto'}` | `'Use subsystem name'` | `'Use function name'` | `'User specified'`
`RTWFileName`	File name (no extension)	`{''}`
`DataTypeOverride`	No dialog box prompt Specifies data type used to override fixed-point data types. Set by **Data type override** on the Fixed-Point Tool.	`{'UseLocalSettings'}` | `'ScaledDouble'` | `'Double'` | `'Single'` | `'Off'`

Block (Type)/Parameter	Dialog Box Prompt	Values
MinMaxOverflowLogging	No dialog box prompt Setting for fixed-point instrumentation. Set by **Fixed-point instrumentation mode** on the Fixed-Point Tool.	`{'UseLocalSettings'}` | `'MinMaxAndOverflow'` | `'OverflowOnly'` | `'ForceOff'`
IsSubsystemVirtual		boolean — `{'off'}` | `'on'` Read-only
For Each(`ForEach`)		
InputPartition	Partition	cell array of character vectors
InputPartitionDimension	Partition dimension for input signal	cell array of character vectors
InputPartitionWidth	Width of partition for input signal	cell array of character vectors
OutputConcatenationDimension	Concatenation dimension of output signal	cell array of character vectors
For Iterator (`ForIterator`)		
ResetStates	States when starting	`{'held'}` | `'reset'`
IterationSource	Iteration limit source	`{'internal'}` | `'external'`
IterationLimit	Iteration limit	`{'5'}`
ExternalIncrement	Set next i (iteration variable) externally	`{'off'}` | `'on'`
ShowIterationPort	Show iteration variable	`'off'` | `{'on'}`
IndexMode	Index mode	`'Zero-based'` | `{'One-based'}`
IterationVariable DataType	Iteration variable data type	`{'int32'}` | `'int16'` | `'int8'` | `'double'`
For Iterator Subsystem (`SubSystem`)		

Block (Type)/Parameter	Dialog Box Prompt	Values
ShowPortLabels	Show port labels **Note** The values `'off'` and `'on'` are for backward compatibility only and should not be used in new models or when updating existing models.	`'none'` | `{'FromPortIcon'}` | `'FromPortBlockName'` | `'SignalName'` | `'off'` | `'on'`
BlockChoice	Block choice	`{''}`
TemplateBlock	Template block	`{''}`
MemberBlocks	Member blocks	`{''}`
Permissions	Read/Write permissions	`{'ReadWrite'}` | `'ReadOnly'` | `'NoReadOrWrite'`
ErrorFcn	Name of error callback function	`{''}`
PermitHierarchical Resolution	Permit hierarchical resolution	`{'All'}` | `'ExplicitOnly'` | `'None'`
TreatAsAtomicUnit	Treat as atomic unit	`'off'` | `{'on'}`
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	`{'off'}` | `'on'`
PropExecContext OutsideSubsystem	Propagate execution context across subsystem boundary	`{'off'}` | `'on'`
CheckFcnCallInp InsideContextMsg	Warn if function-call inputs are context-specific	`{'off'}` | `'on'`
SystemSampleTime	Sample time (-1 for inherited)	`{'-1'}`
RTWSystemCode	Function packaging	`{'Auto'}` | `'Inline'` | `'Nonreusable function'` | `'Reusable function'`
RTWFcnNameOpts	Function name options	`{'Auto'}` | `'Use subsystem name'` | `'User specified'`
RTWFcnName	Function name	`{''}`

Block (Type)/Parameter	Dialog Box Prompt	Values
`RTWFileNameOpts`	File name options	`{'Auto'} | 'Use subsystem name' | 'Use function name' | 'User specified'`
`RTWFileName`	File name (no extension)	`{''}`
`DataTypeOverride`	No dialog box prompt Specifies data type used to override fixed-point data types. Set by **Data type override** on the Fixed-Point Tool.	`{'UseLocalSettings'} | 'ScaledDouble' | 'Double' | 'Single' | 'Off'`
`MinMaxOverflowLogging`	No dialog box prompt Setting for fixed-point instrumentation . Set by **Fixed-point instrumentation mode** on the Fixed-Point Tool.	`{'UseLocalSettings'} | 'MinMaxAndOverflow' | 'OverflowOnly' | 'ForceOff'`
`IsSubsystemVirtual`		boolean — `{'off'} | 'on'` Read-only
Function-Call Generator (`Function-Call Generator`) (masked subsystem)		
`sample_time`	Sample time	`{'1'}`
`numberOfIterations`	Number of iterations	`{'1'}`
Function-Call Subsystem (`SubSystem`)		
`ShowPortLabels`	Show port labels **Note** The values `'off'` and `'on'` are for backward compatibility only and should not be used in new models or when updating existing models.	`'none' | {'FromPortIcon'} | 'FromPortBlockName' | 'SignalName' | 'off' | 'on'`
`BlockChoice`	Block choice	`{''}`
`TemplateBlock`	Template block	`{''}`

Block (Type)/Parameter	Dialog Box Prompt	Values
`MemberBlocks`	Member blocks	`{''}`

`Permissions`	Read/Write permissions	`{'ReadWrite'} |`
		`'ReadOnly' |`
		`'NoReadOrWrite'`

`ErrorFcn`	Name of error callback function	`{''}`
`PermitHierarchical` `  Resolution`	Permit hierarchical resolution	`{'All'} | 'ExplicitOnly'` `| 'None'`
`TreatAsAtomicUnit`	Treat as atomic unit	`'off' | {'on'}`
`MinAlgLoopOccurrences`	Minimize algebraic loop occurrences	`{'off'} | 'on'`
`PropExecContext` `  OutsideSubsystem`	Propagate execution context across subsystem boundary	`{'off'} | 'on'`
`CheckFcnCallInp` `  InsideContextMsg`	Warn if function-call inputs are context-specific	`{'off'} | 'on'`
`SystemSampleTime`	Sample time (-1 for inherited)	`{'-1'}`

`RTWSystemCode`	Function packaging	`{'Auto'} | 'Inline' |`
		`'Nonreusable function' |`
		`'Reusable function'`

`RTWFcnNameOpts`	Function name options	`{'Auto'} | 'Use`
		`subsystem name' | 'User`
		`specified'`

`RTWFcnName`	Function name	`{''}`

`RTWFileNameOpts`	File name options	`{'Auto'} | 'Use`
		`subsystem name' | 'Use`
		`function name' | 'User`
		`specified'`

`RTWFileName`	File name (no extension)	`{''}`

`DataTypeOverride`	No dialog box prompt
	
	Specifies data type used to override fixed-point data types. Set by **Data type override** on the Fixed-Point Tool.
		`{'UseLocalSettings'} |`
		`'ScaledDouble' |`
		`'Double' | 'Single' |`
		`'Off'`

Block (Type)/Parameter	Dialog Box Prompt	Values
MinMaxOverflowLogging	No dialog box prompt Setting for fixed-point instrumentation. Set by **Fixed-point instrumentation mode** on the Fixed-Point Tool.	`{'UseLocalSettings'}` | `'MinMaxAndOverflow'` | `'OverflowOnly'` | `'ForceOff'`
IsSubsystemVirtual		boolean — `{'off'}` | `'on'` Read-only
If (`If`)		
NumInputs	Number of inputs	`{'1'}`
IfExpression	If expression (e.g., u1 ~= 0)	`{'u1 > 0'}`
ElseIfExpressions	Elseif expressions (comma-separated list, e.g., u2 ~= 0, u3(2) < u2)	`{''}`
ShowElse	Show else condition	`'off'` | `{'on'}`
ZeroCross	Enable zero-crossing detection	`'off'` | `{'on'}`
SampleTime	Sample time (-1 for inherited)	`{'-1'}`
If Action Subsystem (`SubSystem`)		
ShowPortLabels	Show port labels **Note** The values `'off'` and `'on'` are for backward compatibility only and should not be used in new models or when updating existing models.	`'none'` | `{'FromPortIcon'}` | `'FromPortBlockName'` | `'SignalName'` | `'off'` | `'on'`
BlockChoice	Block choice	`{''}`
TemplateBlock	Template block	`{''}`
MemberBlocks	Member blocks	`{''}`
Permissions	Read/Write permissions	`{'ReadWrite'}` | `'ReadOnly'` | `'NoReadOrWrite'`

Block (Type)/Parameter	Dialog Box Prompt	Values
`ErrorFcn`	Name of error callback function	`{''}`
`PermitHierarchical Resolution`	Permit hierarchical resolution	`{'All'}` | `'ExplicitOnly'` | `'None'`
`TreatAsAtomicUnit`	Treat as atomic unit	`'off'` | `{'on'}`
`MinAlgLoopOccurrences`	Minimize algebraic loop occurrences	`{'off'}` | `'on'`
`PropExecContext OutsideSubsystem`	Propagate execution context across subsystem boundary	`{'off'}` | `'on'`
`CheckFcnCallInp InsideContextMsg`	Warn if function-call inputs are context-specific	`{'off'}` | `'on'`
`SystemSampleTime`	Sample time (-1 for inherited)	`{'-1'}`
`RTWSystemCode`	Function packaging	`{'Auto'}` | `'Inline'` | `'Nonreusable function'` | `'Reusable function'`
`RTWFcnNameOpts`	Function name options	`{'Auto'}` | `'Use subsystem name'` | `'User specified'`
`RTWFcnName`	Function name	`{''}`
`RTWFileNameOpts`	File name options	`{'Auto'}` | `'Use subsystem name'` | `'Use function name'` | `'User specified'`
`RTWFileName`	File name (no extension)	`{''}`
`DataTypeOverride`	No dialog box prompt Specifies data type used to override fixed-point data types. Set by **Data type override** on the Fixed-Point Tool.	`{'UseLocalSettings'}` | `'ScaledDouble'` | `'Double'` | `'Single'` | `'Off'`

Block (Type)/Parameter	Dialog Box Prompt	Values
MinMaxOverflowLogging	No dialog box prompt Setting for fixed-point instrumentation. Set by **Fixed-point instrumentation mode** on the Fixed-Point Tool.	{'UseLocalSettings'} | 'MinMaxAndOverflow' | 'OverflowOnly' | 'Off'
IsSubsystemVirtual		boolean — {'off'} | 'on' Read-only
In1 (Inport)		
Port	Port number	{'1'}
IconDisplay	Icon display	'Signal name' | {'Port number'} | 'Port number and signal name'
LatchByDelaying OutsideSignal	Latch input by delaying outside signal	{'off'} | 'on'
LatchInputFor FeedbackSignals	Latch input for feedback signals of function-call subsystem outputs	{'off'} | 'on'
Interpolate	Interpolate data	'off' | {'on'}
UseBusObject	Specify properties via bus object	{'off'} | 'on'
BusObject	Bus object for specifying bus properties	{'BusObject'}
BusOutputAsStruct	Output as nonvirtual bus	{'off'} | 'on'
PortDimensions	Port dimensions (-1 for inherited)	{'-1'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
`OutDataTypeStr`	Data type	`{'Inherit: auto'} | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'boolean' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)' | 'Enum: <class name>'`
`LockScale`	Lock output data type setting against changes by the fixed-point tools	`{'off'} | 'on'`
`Unit`	Specify physical unit of the input signal to the block.	`{'inherit'}| '<Enter unit>'`
`UnitNoProp`	Specify physical unit of the input signal to the block without propagation. For a list of acceptable units, see Allowed Units.	`'<Enter unit>'`
`SignalType`	Signal type	`{'auto'} | 'real' | 'complex'`
Model (`ModelReference`)		
`ModelNameDialog`	The name of the referenced model exactly as you typed it in, with any surrounding whitespace removed. When you set `ModelNameDialog` programmatically or with the GUI, Simulink automatically sets the values of `ModelName` and `ModelFile` based on the value of `ModelNameDialog`.	`{'<Enter Model Name>'}`

Block (Type)/Parameter	Dialog Box Prompt	Values
ModelName	The value of `ModelNameDialog` stripped of any filename extension that you provided. For backward compatibility, setting `ModelName` programatically actually sets `ModelNameDialog`, which then sets `ModelName` as described. You cannot use `get_param` to obtain the `ModelName` of a protected model, because the name without a suffix would be ambiguous. Use `get_param` on `ModelFile` instead. You can test `ProtectedModel` to determine programmatically whether a referenced model is protected.	character vector — Set automatically when `ModelNameDialog` is set.
ModelFile	The value of `ModelNameDialog` with a filename extension. The suffix of the first match Simulink finds becomes the suffix of `ModelFile`. Setting `ModelFile` programmatically actually sets `ModelNameDialog`, which then sets `ModelFile` as described.	character vector — Set automatically when `ModelNameDialog` is set.
ProtectedModel	Read-only boolean indicating whether the model referenced by the block is protected (`on`) or unprotected (`off`).	boolean — `'off'` | `'on'` — Set automatically when `ModelNameDialog` is set.
ParameterArgumentNames	Names of model arguments that the referenced model defines. Corresponds to the **Name** column in the table under **Arguments > Model arguments**.	`{''}`

Block (Type)/Parameter	Dialog Box Prompt	Values
ParameterArgumentValues	Values for model arguments. Corresponds to the **Value** column in the table under **Arguments > Model arguments**.	structure with no fields
SimulationMode	Specifies whether to simulate the model by generating and executing code or by interpreting the model in Simulink software.	{'Normal'} | 'Accelerator' | 'Software-in-the-loop (SIL)' | 'Processor-in-the-loop (PIL)'
Variant	Specifies whether the Model block references variant models. **Note** For new models, use a Model block for model variants only if you need to use variants that are conditionally executed models (models with control ports). Model variants are supported for backward compatibility. However, support for model variants will be removed in a future release. To convert a Model block that contains variant models to a Variant Subsystem block, right-click the Model block and select **Subsystems & Model Reference > Convert to > Variant Subsystem**. This conversion can require that you update scripts that use the Variants command-line parameter.	{'off'} | 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
Variants	An array of `variant` structures where each element specifies one variant. The structure fields are as follows:	array — [ ]
	`variant.Name` – The name of the `Simulink.Variant` object that represents the variant to which this element applies.	{''}
	`variant.ModelName` – The name of the referenced model associated with the specified variant object in the Model block.	{''}
	`variant.ParameterArgument` Names – Read-only character vector containing the names of the model arguments for which the Model block must supply values.	{''}
	`variant.ParameterArgument` Values – The values to supply for the model arguments when this variant is the active variant.	{''}
	`variant.SimulationMode` – The execution mode to use when this variant is the active variant.	{'Accelerator'} | 'Normal' | 'Processor-in-the-loop (PIL)'

Block (Type)/Parameter	Dialog Box Prompt	Values
`VariantConfigurationObject`	Specifies the variant configuration object that is associated with the model.	`{''}` The value is an empty character vector if no configuration object is associated; otherwise, it is the name of a `Simulink.VariantConfigurationData` object.
`OverrideUsingVariant`	Whether to override the variant conditions and make a specified variant the active variant, and if so, the name of that variant.	`{''}` The value is the empty character vector if no overriding variant object is specified; or the name of the overriding object.
`ActiveVariant`	The variant that is currently active, either because its variant condition is `true` or `OverrideUsingVariant` has overridden the variant conditions and specified this variant.	`{''}` The value is the empty character vector if no variant is active; or the name of the active variant.
`GeneratePreprocessor Conditionals`	Locally controls whether generated code contains preprocessor conditionals. This parameter applies only to Simulink Coder code generation and has no effect on the behavior of a model in Simulink. The parameter is available only for ERT targets. For more information, see "Variant Systems" (Embedded Coder).	`{'off'}` | `'on'`
`DefaultDataLogging`		`{'off'}` | `'on'`
Out1 (`Outport`)		
`Port`	Port number	`{'1'}`

Block (Type)/Parameter	Dialog Box Prompt	Values
`IconDisplay`	Icon display	`'Signal name' | {'Port number'} | 'Port number and signal name'`
`UseBusObject`	Specify properties via bus object	`{'off'} | 'on'`
`BusObject`	Bus object for validating input bus	`{'BusObject'}`
`BusOutputAsStruct`	Output as nonvirtual bus in parent model	`{'off'} | 'on'`
`PortDimensions`	Port dimensions (-1 for inherited)	`{'-1'}`
`VarSizeSig`	Variable-size signal	`{'Inherit'} | 'No' | 'Yes'`
`SampleTime`	Sample time (-1 for inherited)	`{'-1'}`
`OutMin`	Minimum	`{'[]'}`
`OutMax`	Maximum	`{'[]'}`
`OutDataTypeStr`	Data type	`{'Inherit: auto'} | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'boolean' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)' | 'Enum: <class name>' | 'Bus: <object name>'`
`LockScale`	Lock output data type setting against changes by the fixed-point tools	`{'off'} | 'on'`
`Unit`	Specify physical unit of the input signal to the block. For a list of acceptable units, see Allowed Units.	`{'inherit'}| '<Enter unit>'`

Block (Type)/Parameter	Dialog Box Prompt	Values
UnitNoProp	Specify physical unit of the input signal to the block without propagation. For a list of acceptable units, see Allowed Units.	`'<Enter unit>'`
SignalObject	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See "Design Data Interface by Configuring Inport and Outport Blocks" (Simulink Coder).	`Simulink.Signal` object Object of a class that is derived from `Simulink.Signal`
StorageClass	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See "Design Data Interface by Configuring Inport and Outport Blocks" (Simulink Coder).	`{'Auto'}` | `'Model default'` | `'ExportedGlobal'` | `'ImportedExtern'` | `'ImportedExternPointer'` | `'Custom'`
SignalName	Signal name	character vector
SignalType	Signal type	`{'auto'}` | `'real'` | `'complex'`
OutputWhenDisabled	Output when disabled	`{'held'}` | `'reset'`
InitialOutput	Initial output	`{'[]'}`
MustResolveToSignalObject	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See "For Signals".	`{'off'}` | `'on'`
Subsystem (SubSystem)		
ShowPortLabels	Show port labels **Note** The values `'off'` and `'on'` are for backward compatibility only and should not be used in new models or when updating existing models.	`'none'` | `{'FromPortIcon'}` | `'FromPortBlockName'` | `'SignalName'` | `'off'` | `'on'`

Block (Type)/Parameter	Dialog Box Prompt	Values
BlockChoice	Block choice	{''}
TemplateBlock	Template block	{''}
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'} | 'ReadOnly' | 'NoReadOrWrite'
ErrorFcn	Name of error callback function	{''}
PermitHierarchical Resolution	Permit hierarchical resolution	{'All'} | 'ExplicitOnly' | 'None'
TreatAsAtomicUnit	Treat as atomic unit	{'off'} | 'on'
TreatAsGroupedWhenPropagatingVariantConditions	Treat as grouped when propagating variant conditions	'off' | {'on'}
VariantControl	Variant control	{'Variant'} | '(default)'
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'} | 'on'
PropExecContext OutsideSubsystem	Propagate execution context across subsystem boundary	{'off'} | 'on'
CheckFcnCallInp InsideContextMsg	Warn if function-call inputs are context-specific	{'off'} | 'on'
SystemSampleTime	Sample time (-1 for inherited)	{'-1'}
RTWSystemCode	Code generation function packaging	{'Auto'} | 'Inline' | 'Nonreusable function' | 'Reusable function'
RTWFcnNameOpts	Code generation function name options	{'Auto'} | 'Use subsystem name' | 'User specified'
RTWFcnName	Code generation function name	{''}
RTWFileNameOpts	Code generation file name options	{'Auto'} | 'Use subsystem name' | 'Use function name' | 'User specified'

Block (Type)/Parameter	Dialog Box Prompt	Values
`RTWFileName`	Code generation file name (no extension)	`{''}`
`DataTypeOverride`	Specifies data type used to override fixed-point data types. Set by **Data type override** on the Fixed-Point Tool.	`{'UseLocalSettings'}` | `'ScaledDouble'` | `'Double'` | `'Single'` | `'Off'`
`MinMaxOverflowLogging`	No dialog box prompt Setting for fixed-point instrumentation. Set by **Fixed-point instrumentation mode** on the Fixed-Point Tool.	`{'UseLocalSettings'}` | `'MinMaxAndOverflow'` | `'OverflowOnly'` | `'ForceOff'`
`IsSubsystemVirtual`		boolean — `{'on'}` | `'off'` Read-only
`Virtual`	For internal use	
Switch Case (`SwitchCase`)		
`CaseConditions`	Case conditions (e.g., {1,[2,3]})	`{'{1}'}`
`ShowDefaultCase`	Show default case	`'off'` | `{'on'}`
`ZeroCross`	Enable zero-crossing detection	`'off'` | `{'on'}`
`SampleTime`	Sample time (-1 for inherited)	`{'-1'}`
`CaseShowDefault`	Deprecated in R2009b	
Switch Case Action Subsystem (`SubSystem`)		
`ShowPortLabels`	Show port labels **Note** The values `'off'` and `'on'` are for backward compatibility only and should not be used in new models or when updating existing models.	`'none'` | `{'FromPortIcon'}` | `'FromPortBlockName'` | `'SignalName'` | `'off'` | `'on'`
`BlockChoice`	Block choice	`{''}`
`TemplateBlock`	Template block	`{''}`

Block (Type)/Parameter	Dialog Box Prompt	Values
`MemberBlocks`	Member blocks	`{''}`
`Permissions`	Read/Write permissions	`{'ReadWrite'} | 'ReadOnly' | 'NoReadOrWrite'`
`ErrorFcn`	Name of error callback function	`{''}`
`PermitHierarchical Resolution`	Permit hierarchical resolution	`{'All'} | 'ExplicitOnly' | 'None'`
`TreatAsAtomicUnit`	Treat as atomic unit	`'off' | {'on'}`
`MinAlgLoopOccurrences`	Minimize algebraic loop occurrences	`{'off'} | 'on'`
`PropExecContext OutsideSubsystem`	Propagate execution context across subsystem boundary	`{'off'} | 'on'`
`CheckFcnCallInp InsideContextMsg`	Warn if function-call inputs are context-specific	`{'off'} | 'on'`
`SystemSampleTime`	Sample time (-1 for inherited)	`{'-1'}`
`RTWSystemCode`	Code generation function packaging	`{'Auto'} | 'Inline' | 'Nonreusable function' | 'Reusable function'`
`RTWFcnNameOpts`	Code generation function name options	`{'Auto'} | 'Use subsystem name' | 'User specified'`
`RTWFcnName`	Code generation function name	`{''}`
`RTWFileNameOpts`	Code generation file name options	`{'Auto'} | 'Use subsystem name' | 'Use function name' | 'User specified'`
`RTWFileName`	Code generation file name (no extension)	`{''}`

Block (Type)/Parameter	Dialog Box Prompt	Values
DataTypeOverride	No dialog box prompt Specifies data type used to override fixed-point data types. Set by **Data type override** on the Fixed-Point Tool.	{'UseLocalSettings'} | 'ScaledDouble' | 'Double' | 'Single' | 'Off'
MinMaxOverflowLogging	No dialog box prompt Setting for fixed-point instrumentation. Set by **Fixed-point instrumentation mode** on the Fixed-Point Tool.	{'UseLocalSettings'} | 'MinMaxAndOverflow' | 'OverflowOnly' | 'ForceOff'
IsSubsystemVirtual		boolean — {'off'} | 'on' Read-only
Trigger (TriggerPort)		
TriggerType	Trigger type	{'rising'} | 'falling' | 'either' | 'function-call'
IsSimulinkFunction	Configure the Function-call subsystem to be a Simulink Function	{'off'} | 'on'
StatesWhenEnabling	States when enabling	{'held'} | 'reset' | 'inherit'
PropagateVarSize	Propagate sizes of variable-size signals	{'During execution'} | 'Only when enabling'
ShowOutputPort	Show output port	{'off'} | 'on'
OutputDataType	Output data type	{'auto'} | 'double' | 'int8'
SampleTimeType	Sample time type	{'triggered'} | 'periodic'
SampleTime	Sample time	{'1'}
ZeroCross	Enable zero-crossing detection	'off' | {'on'}

Block (Type)/Parameter	Dialog Box Prompt	Values
PortDimensions	Port dimensions (-1 for inherited)	{'-1'}
TriggerSignalSampleTime	Trigger signal sample time	{'-1'}
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}
OutDataTypeStr	Data type	{'Inherit: auto'} | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'boolean' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)' | 'Enum: <class name>'
Interpolate	Interpolate data	'off' | {'on'}
Triggered Subsystem (SubSystem)		
ShowPortLabels	Show port labels **Note** The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none' | {'FromPortIcon'} | 'FromPortBlockName' | 'SignalName' | 'off' | 'on'
BlockChoice	Block choice	{''}
TemplateBlock	Template block	{''}
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'} | 'ReadOnly' | 'NoReadOrWrite'
ErrorFcn	Name of error callback function	{''}
PermitHierarchical Resolution	Permit hierarchical resolution	{'All'} | 'ExplicitOnly' | 'None'

Block (Type)/Parameter	Dialog Box Prompt	Values
`TreatAsAtomicUnit`	Treat as atomic unit	`'off'` | `{'on'}`
`MinAlgLoopOccurrences`	Minimize algebraic loop occurrences	`{'off'}` | `'on'`
`PropExecContext` `OutsideSubsystem`	Propagate execution context across subsystem boundary	`{'off'}` | `'on'`
`CheckFcnCallInp` `InsideContextMsg`	Warn if function-call inputs are context-specific	`{'off'}` | `'on'`
`SystemSampleTime`	Sample time (-1 for inherited)	`{'-1'}`
`RTWSystemCode`	Code generation function packaging	`{'Auto'}` | `'Inline'` | `'Nonreusable function'` | `'Reusable function'`
`RTWFcnNameOpts`	Code generation function name options	`{'Auto'}` | `'Use subsystem name'` | `'User specified'`
`RTWFcnName`	Code generation function name	`{''}`
`RTWFileNameOpts`	Code generation file name options	`{'Auto'}` | `'Use subsystem name'` | `'Use function name'` | `'User specified'`
`RTWFileName`	Code generation file name (no extension)	`{''}`
`DataTypeOverride`	No dialog box prompt Specifies data type used to override fixed-point data types. Set by **Data type override** on the Fixed-Point Tool.	`{'UseLocalSettings'}` | `'ScaledDouble'` | `'Double'` | `'Single'` | `'Off'`
`MinMaxOverflowLogging`	No dialog box prompt Setting for fixed-point instrumentation. Set by **Fixed-point instrumentation mode** on the Fixed-Point Tool.	`{'UseLocalSettings'}` | `'MinMaxAndOverflow'` | `'OverflowOnly'` | `'ForceOff'`

Block (Type)/Parameter	Dialog Box Prompt	Values
IsSubsystemVirtual		boolean — {'off'} | 'on' Read-only
Unit Conversion		
OutDataTypeStr	Output data type	{'Inherit via internal rule'} | 'Inherit via back propagation'
Unit System Configuration		
AllowAllUnitSystems	Allow or restrict unit systems.	boolean — {'on'} | 'off'
UnitSystems	Displays allowed unit system.	cell array of character vectors — {'SI','English',SI (extended)','CGS'}
While Iterator (WhileIterator)		
MaxIters	Maximum number of iterations (-1 for unlimited)	{'5'}
WhileBlockType	While loop type	{'while'} | 'do-while'
ResetStates	States when starting	{'held'} | 'reset'
ShowIterationPort	Show iteration number port	{'off'} | 'on'
OutputDataType	Output data type	{'int32'} | 'int16' | 'int8' | 'double'
While Iterator Subsystem (SubSystem)		
ShowPortLabels	Show port labels **Note** The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none' | {'FromPortIcon'} | 'FromPortBlockName' | 'SignalName' | 'off' | 'on'
BlockChoice	Block choice	{''}
TemplateBlock	Template block	{''}
MemberBlocks	Member blocks	{''}

Block (Type)/Parameter	Dialog Box Prompt	Values
Permissions	Read/Write permissions	{'ReadWrite'} | 'ReadOnly' | 'NoReadOrWrite'
ErrorFcn	Name of error callback function	{''}
PermitHierarchical Resolution	Permit hierarchical resolution	{'All'} | 'ExplicitOnly' | 'None'
TreatAsAtomicUnit	Treat as atomic unit	'off' | {'on'}
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'} | 'on'
PropExecContext OutsideSubsystem	Propagate execution context across subsystem boundary	{'off'} | 'on'
CheckFcnCallInp InsideContextMsg	Warn if function-call inputs are context-specific	{'off'} | 'on'
SystemSampleTime	Sample time (-1 for inherited)	{'-1'}
RTWSystemCode	Code generation function packaging	{'Auto'} | 'Inline' | 'Nonreusable function' | 'Reusable function'
RTWFcnNameOpts	Code generation function name options	{'Auto'} | 'Use subsystem name' | 'User specified'
RTWFcnName	Code generation function name	{''}
RTWFileNameOpts	Code generation file name options	{'Auto'} | 'Use subsystem name' | 'Use function name' | 'User specified'
RTWFileName	Code generation file name (no extension)	{''}
DataTypeOverride	No dialog box prompt Specifies data type used to override fixed-point data types. Set by **Data type override** on the Fixed-Point Tool.	{'UseLocalSettings'} | 'ScaledDouble' | 'Double' | 'Single' | 'Off'

Block (Type)/Parameter	Dialog Box Prompt	Values
MinMaxOverflowLogging	No dialog box prompt Setting for fixed-point instrumentation. Set by **Fixed-point instrumentation mode** on the Fixed-Point Tool.	{'UseLocalSettings'} | 'MinMaxAndOverflow' | 'OverflowOnly' | 'ForceOff'
IsSubsystemVirtual		boolean — {'off'} | 'on' Read-only

Signal Attributes Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Bus to Vector (`BusToVector`)		
Data Type Conversion (`DataTypeConversion`)		
`OutMin`	Output minimum	`{'[]'}`
`OutMax`	Output maximum	`{'[]'}`
`OutDataTypeStr`	Output data type	`{'Inherit: Inherit via back propagation'} | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'boolean' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)' | 'Enum: <class name>'`
`LockScale`	Lock output data type setting against changes by the fixed-point tools	`{'off'} | 'on'`
`ConvertRealWorld`	Input and output to have equal	`{'Real World Value (RWV)'} | 'Stored Integer (SI)'`
`RndMeth`	Integer rounding mode	`'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'`
`SaturateOnInteger Overflow`	Saturate on integer overflow	`{'off'} | 'on'`
`SampleTime`	Sample time (-1 for inherited)	`{'-1'}`
Data Type Conversion Inherited (`Conversion Inherited`) (masked subsystem)		
`ConvertRealWorld`	Input and Output to have equal	`{'Real World Value'} | 'Stored Integer'`

Block (Type)/Parameter	Dialog Box Prompt	Values
`RndMeth`	Integer rounding mode	`'Ceiling'` | `'Convergent'` | `{'Floor'}` | `'Nearest'` | `'Round'` | `'Simplest'` | `'Zero'`
`DoSatur`	Saturate to max or min when overflows occur	`{'off'}` | `'on'`
Data Type Duplicate (`DataTypeDuplicate`)		
`NumInputPorts`	Number of input ports	`{'2'}`
Data Type Propagation (`Data Type Propagation`) (masked subsystem)		
`PropDataTypeMode`	1. Propagated data type	`'Specify via dialog'` | `{'Inherit via propagation rule'}`
`PropDataType`	1.1. Propagated data type (e.g., `fixdt(1,16)`, `fixdt('single')`)	`{'fixdt(1,16)'}`
`IfRefDouble`	1.1. If any reference input is double, output is	`{'double'}` | `'single'`
`IfRefSingle`	1.2. If any reference input is single, output is	`'double'` | `{'single'}`
`IsSigned`	1.3. Is-Signed	`'IsSigned1'` | `'IsSigned2'` | `{'IsSigned1 or IsSigned2'}` | `'TRUE'` | `'FALSE'`
`NumBitsBase`	1.4.1. Number-of-Bits: Base	`'NumBits1'` | `'NumBits2'` | `{'max([NumBits1 NumBits2])'}` | `'min([NumBits1 NumBits2])'` | `'NumBits1+NumBits2'`
`NumBitsMult`	1.4.2. Number-of-Bits: Multiplicative adjustment	`{'1'}`

Block (Type)/Parameter	Dialog Box Prompt	Values
`NumBitsAdd`	1.4.3. Number-of-Bits: Additive adjustment	`{'0'}`
`NumBitsAllowFinal`	1.4.4. Number-of-Bits: Allowable final values	`{'1:128'}`
`PropScalingMode`	2. Propagated scaling	`'Specify via dialog' | {'Inherit via propagation rule'} | 'Obtain via best precision'`
`PropScaling`	2.1. Propagated scaling: Slope or [Slope Bias] ex. 2^-9	`{'2^-10'}`
`ValuesUsedBestPrec`	2.1. Values used to determine best precision scaling	`{'[5 -7]'}`
`SlopeBase`	2.1.1. Slope: Base	`'Slope1' | 'Slope2' | 'max([Slope1 Slope2])' | {'min([Slope1 Slope2])'} | 'Slope1*Slope2' | 'Slope1/Slope2' | 'PosRange1' | 'PosRange2' | 'max([PosRange1 PosRange2])' | 'min([PosRange1 PosRange2])' | 'PosRange1*PosRange2' | 'PosRange1/PosRange2'`
`SlopeMult`	2.1.2. Slope: Multiplicative adjustment	`{'1'}`
`SlopeAdd`	2.1.3. Slope: Additive adjustment	`{'0'}`

Block (Type)/Parameter	Dialog Box Prompt	Values
BiasBase	2.2.1. Bias: Base	{'Bias1'} | 'Bias2' | 'max([Bias1 Bias2])' | 'min([Bias1 Bias2])' | 'Bias1*Bias2' | 'Bias1/Bias2' | 'Bias1+Bias2' | 'Bias1-Bias2'
BiasMult	2.2.2. Bias: Multiplicative adjustment	{'1'}
BiasAdd	2.2.3. Bias: Additive adjustment	{'0'}
Data Type Scaling Strip (Scaling Strip) (masked subsystem)		
IC (InitialCondition)		
Value	Initial value	{'1'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Probe (Probe)		
ProbeWidth	Probe width	'off' | {'on'}
ProbeSampleTime	Probe sample time	'off' | {'on'}
ProbeComplexSignal	Detect complex signal	'off' | {'on'}
ProbeSignalDimensions	Probe signal dimensions	'off' | {'on'}
ProbeFramedSignal	Detect framed signal	'off' | {'on'}
ProbeWidthDataType	Data type for width	{'double'} | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'Same as input'
ProbeSampleTimeDataType	Data type for sample time	{'double'} | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'Same as input'

Block (Type)/Parameter	Dialog Box Prompt	Values
ProbeComplexityDataType	Data type for signal complexity	{'double'} | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'boolean' | 'Same as input'
ProbeDimensionsDataType	Data type for signal dimensions	{'double'} | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'Same as input'
ProbeFrameDataType	Data type for signal frames	{'double'} | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'boolean' | 'Same as input'
Rate Transition (RateTransition)		
Integrity	Ensure data integrity during data transfer	'off' | {'on'}
Deterministic	Ensure deterministic data transfer (maximum delay)	'off' | {'on'}
InitialCondition	Initial conditions	{'0'}
OutPortSampleTimeOpt	Output port sample time options	{'Specify'} | 'Inherit' | 'Multiple of input port sample time'
OutPortSampleTimeMultiple	Sample time multiple (>0)	{'1'}
OutPortSampleTime	Output port sample time	{'-1'}
Signal Conversion (SignalConversion)		
ConversionOutput	Output	{'Signal copy'} | 'Virtual bus' | 'Nonvirtual bus'

Block (Type)/Parameter	Dialog Box Prompt	Values
`OutDataTypeStr`	Data type	`{'Inherit: auto'} | 'Bus: <object name>'`
`OverrideOpt`	Exclude this block from 'Block reduction' optimization	`{'off'} | 'on'`
Signal Specification (`SignalSpecification`)		
`Dimensions`	Dimensions (-1 for inherited)	`{'-1'}`
`VarSizeSig`	Variable-size signal	`{'Inherit'} | 'No' | 'Yes'`
`SampleTime`	Sample time (-1 for inherited)	`{'-1'}`
`OutMin`	Minimum	`{'[]'}`
`OutMax`	Maximum	`{'[]'}`
`OutDataTypeStr`	Data type	`{'Inherit: auto'} | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'boolean' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)' | 'Enum: <class name>' | 'Bus: <object name>'`
`BusOutputAsStruct`	Require nonvirtual bus	`{'off'} | 'on'`
`Unit`	Specify physical unit of the input signal to the block. For a list of acceptable units, see Allowed Units.	`{'inherit'}| '<Enter unit>'`
`UnitNoProp`	Specify physical unit of the input signal to the block without propagation. For a list of acceptable units, see Allowed Units.	`'<Enter unit>'`

Block (Type)/Parameter	Dialog Box Prompt	Values
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
SignalType	Signal type	{'auto'} | 'real' | 'complex'
Weighted Sample Time (SampleTimeMath)		
TsampMathOp	Operation	'+' | '-' | '*' | '/' | {'Ts Only'} | '1/Ts Only'
weightValue	Weight value	{'1.0'}
TsampMathImp	Implement using	{'Online Calculations'} | 'Offline Scaling Adjustment'
OutDataTypeStr	Output data type	{'Inherit via internal rule'} | 'Inherit via back propagation'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} | 'on'
OutputDataTypeScaling Mode	Deprecated in R2009b	
DoSatur	Deprecated in R2009b	
Width (Width)		
OutputDataTypeScaling Mode	Output data type mode	{'Choose intrinsic data type'} | 'Inherit via back propagation' | 'All ports same datatype'

Block (Type)/Parameter	Dialog Box Prompt	Values
DataType	Output data type	{'double'} | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32'

Signal Routing Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Bus Assignment (`BusAssignment`)		
AssignedSignals	Signals that are being assigned	{''}
InputSignals	Signals in the bus	matrix — {'{}'}
Bus Creator (`BusCreator`)		
InheritFromInputs	Override bus signal names from inputs	{'on'} | 'off' If set to 'on', overrides bus signal names from inputs. Otherwise, inherits bus signal names from a bus object.
Inputs	Number of inputs	{'2'}
DisplayOption		'none' | 'signals' | {'bar'}
NonVirtualBus	Output as nonvirtual bus	{'off'} | 'on'
OutDataTypeStr	Data type	{'Inherit: auto'} | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'boolean' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)' | 'Enum: <class name>' | 'Bus: <object name>'
Bus Selector (`BusSelector`)		
OutputSignals	Selected signals	character vector — in the form 'signal1,signal2'
OutputAsBus	Output as bus	{'off'} | 'on'
InputSignals	Signals in bus	matrix — {'{}'}
Data Store Memory (`DataStoreMemory`)		
DataStoreName	Data store name	{'A'}

Block (Type)/Parameter	Dialog Box Prompt	Values
`ReadBeforeWriteMsg`	Detect read before write	`'none'` | `{'warning'}` | `'error'`
`WriteAfterWriteMsg`	Detect write after write	`'none'` | `{'warning'}` | `'error'`
`WriteAfterReadMsg`	Detect write after read	`'none'` | `{'warning'}` | `'error'`
`InitialValue`	Initial value	`{'0'}`
`StateMustResolveTo SignalObject`	Data store name must resolve to Simulink signal object	`{'off'}` | `'on'`
`DataLogging`	Log Signal Data	`'off'` | `{'on'}`
`DataLoggingNameMode`	Logging Name	`{'SignalName'}` | `'Custom'`
`DataLoggingName`	Logging Name	`{''}`
`DataLoggingLimit DataPoints`	Limit data points to last	`'off'` | `{'on'}`
`DataLoggingMaxPoints`	Limit data points to last	non-zero integer {5000}
`DataLoggingDecimateData`	Decimation	`'off'` | `{'on'}`
`DataLoggingLimit DataPoints`	Decimation	non-zero integer {2}
`StateStorageClass`	Storage class	`{'Auto'}` | `'Model default'` | `'ExportedGlobal'` | `'ImportedExtern'` | `'ImportedExternPointer'` | `'Custom'`
`StateSignalObject`	Signal object class Storage class	`Simulink.Signal` object Object of a class that is derived from `Simulink.Signal`
`RTWStateStorageType Qualifier`	Code generation type qualifier	`{''}`
`VectorParams1D`	Interpret vector parameters as 1-D	`'off'` | `{'on'}`

Block (Type)/Parameter	Dialog Box Prompt	Values
ShowAdditionalParam	Show additional parameters	{'off'} | 'on'
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}
OutDataTypeStr	Data type	{'Inherit: auto'} | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'boolean' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)' | 'Enum: <class name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
SignalType	Signal type	{'auto'} | 'real' | 'complex'
Data Store Read (DataStoreRead)		
DataStoreElements	Corresponds to the parameters on the **Element Selection** tab of the block dialog box. See "Specification using the command line".	
DataStoreName	Data store name	{'A'}
SampleTime	Sample time	{'0'}
Data Store Write (DataStoreWrite)		
DataStoreElements	Corresponds to the parameters on the **Element Assignment** tab of the block dialog box. See "Specification using the command line".	
DataStoreName	Data store name	{'A'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Demux (Demux)		

Block (Type)/Parameter	Dialog Box Prompt	Values
Outputs	Number of outputs	{'2'}
DisplayOption	Display option	'none' | {'bar'}
BusSelectionMode	Bus selection mode	{'off'} | 'on'
Environment Controller (Environment Controller) (masked subsystem)		
From (From)		
GotoTag	Goto tag	{'A'}
IconDisplay	Icon display	'Signal name' | {'Tag'} | 'Tag and signal name'
Goto (Goto)		
GotoTag	Tag	{'A'}
IconDisplay	Icon display	'Signal name' | {'Tag'} | 'Tag and signal name'
TagVisibility	Tag visibility	{'local'} | 'scoped' | 'global'
Goto Tag Visibility (GotoTagVisibility)		
GotoTag	Goto tag	{'A'}
Index Vector (MultiPortSwitch)		
DataPortOrder	Data port order	{'Zero-based contiguous'} | 'One-based contiguous' | 'Specify indices'
Inputs	Number of data ports	{'1'}
zeroidx	Deprecated in R2010a	
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all data port inputs to have the same data type	{'off'} | 'on'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
`OutDataTypeStr`	Output data type	`{'Inherit: Inherit via internal rule'}` | `'Inherit: Inherit via back propagation'` | `'double'` | `'single'` | `'int8'` | `'uint8'` | `'int16'` | `'uint16'` | `'int32'` | `'uint32'` | `'fixdt(1,16,0)'` | `'fixdt(1,16,2^0,0)'`
`LockScale`	Lock output data type setting against changes by the fixed-point tools	`{'off'}` | `'on'`
`RndMeth`	Integer rounding mode	`'Ceiling'` | `'Convergent'` | `{'Floor'}` | `'Nearest'` | `'Round'` | `'Simplest'` | `'Zero'`
`SaturateOnInteger Overflow`	Saturate on integer overflow	`{'off'}` | `'on'`
`AllowDiffInputSizes`	Allow different data input sizes (Results in variable-size output signal)	`{'off'}` | `'on'`
Manual Switch (`Manual Switch`) (masked subsystem)		
`varsize`	Allow different input sizes (Results in variable-size output signal)	`{'off'}` | `'on'`
`SampleTime`	Sample time (-1 for inherited)	`{'-1'}`
Merge (`Merge`)		
`Inputs`	Number of inputs	`{'2'}`
`InitialOutput`	Initial output	`{'[]'}`
`AllowUnequalInput PortWidths`	Allow unequal port widths	`{'off'}` | `'on'`
`InputPortOffsets`	Input port offsets	`{'[]'}`
Multiport Switch (`MultiPortSwitch`)		

Block (Type)/Parameter	Dialog Box Prompt	Values
`DataPortOrder`	Data port order	`'Zero-based contiguous'` | `{'One-based contiguous'}` | `'Specify indices'`
`Inputs`	Number of data ports	`{'3'}`
`zeroidx`	Deprecated in R2010a	
`DataPortIndices`	Data port indices	`{'{1,2,3}'}`
`DataPortForDefault`	Data port for default case	`{'Last data port'}` | `'Additional data port'`
`DiagnosticForDefault`	Diagnostic for default case	`'None'` | `'Warning'` | `{'Error'}`
`SampleTime`	Sample time (-1 for inherited)	`{'-1'}`
`InputSameDT`	Require all data port inputs to have the same data type	`{'off'}` | `'on'`
`OutMin`	Output minimum	`{'[]'}`
`OutMax`	Output maximum	`{'[]'}`
`OutDataTypeStr`	Output data type	`{'Inherit: Inherit via internal rule'}` | `'Inherit: Inherit via back propagation'` | `'double'` | `'single'` | `'int8'` | `'uint8'` | `'int16'` | `'uint16'` | `'int32'` | `'uint32'` | `'fixdt(1,16,0)'` | `'fixdt(1,16,2^0,0)'`
`LockScale`	Lock output data type setting against changes by the fixed-point tools	`{'off'}` | `'on'`
`RndMeth`	Integer rounding mode	`'Ceiling'` | `'Convergent'` | `{'Floor'}` | `'Nearest'` | `'Round'` | `'Simplest'` | `'Zero'`
`SaturateOnInteger Overflow`	Saturate on integer overflow	`{'off'}` | `'on'`

Block (Type)/Parameter	Dialog Box Prompt	Values
`AllowDiffInputSizes`	Allow different data input sizes (Results in variable-size output signal)	`{'off'}` | `'on'`
Mux (`Mux`)		
`Inputs`	Number of inputs	`{'2'}`
`DisplayOption`	Display option	`'none'` | `'signals'` | `{'bar'}`
`UseBusObject`	For internal use	
`BusObject`	For internal use	
`NonVirtualBus`	For internal use	
Selector (`Selector`)		
`NumberOfDimensions`	Number of input dimensions	`{'1'}`
`IndexMode`	Index mode	`'Zero-based'` | `{'One-based'}`
`IndexOptionArray`	Index Option	`'Select all'` | `{'Index vector (dialog)'}` | `'Index vector (port)'` | `'Starting index (dialog)'` | `'Starting index (port)'`
`IndexParamArray`	Index	cell array
`OutputSizeArray`	Output Size	cell array
`InputPortWidth`	Input port size	`{'1'}`
`SampleTime`	Sample time (-1 for inherited)	`{'-1'}`
`IndexOptions`	See the **IndexOptionArray** parameter for more information.	
`Indices`	See the **IndexParamArray** parameter for more information.	
`OutputSizes`	See the **IndexParamArray** parameter for more information.	

Block (Type)/Parameter	Dialog Box Prompt	Values
Switch (Switch)		
Criteria	Criteria for passing first input	{'u2 >= Threshold'} | 'u2 > Threshold' | 'u2 ~= 0'
Threshold	Threshold	{'0'}
ZeroCross	Enable zero-crossing detection	'off' | {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all data port inputs to have the same data type	{'off'} | 'on'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Inherit via back propagation' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)' | 'Enum: <class name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} | 'on'
AllowDiffInputSizes	Allow different input sizes (Results in variable-size output signal)	{'off'} | 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
Variant Source (tVariantSource)		
VariantControls	Variant control	{'Variant'} | '(default)'
OverrideUsingVariant	Override variant conditions and use the following variant	{''}
AllowZeroVariantControls	Allow zero active variant controls	{'off'} | 'on'
ShowConditionOnBlock	Show variant condition on block	{'off'} | 'on'
GeneratePreprocessorConditionals	Analyze all choices during update diagram and generate preprocessor conditionals	{'off'} | 'on'
CompiledActiveVariantControl		string — {''} The value is a empty string if no variant is active; or the name of the active variant. Compile the model before querying this property.
CompiledActiveVariantPort		string — {'-1'} The value is -1 if no variant is active; or the index of the active variant. Compile the model before querying this property.
Variant Sink (VariantSink)		
VariantControls	Variant control	{'Variant'} | '(default)'
OverrideUsingVariant	Override variant conditions and use the following variant	{''}
AllowZeroVariantControls	Allow zero active variant controls	{'off'} | 'on'
ShowConditionOnBlock	Show variant condition on block	{'off'} | 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
`GeneratePreprocessorConditionals`	Analyze all choices during update diagram and generate preprocessor conditionals	`{'off'}	'on'`
`CompiledActiveVariantControl`		`string — {''}` The value is a empty string if no variant is active; or the name of the active variant. Compile the model before querying this property.
`CompiledActiveVariantPort`		`string — {'-1'}` The value is -1 if no variant is active; or the index of the active variant. Compile the model before querying this property.
Vector Concatenate (`Concatenate`)		
`NumInputs`	Number of inputs	`{'2'}`
`Mode`	Mode	`{'Vector'}	'Multidimensional array'`

Sinks Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Display (`Display`)		
`Format`	Format	`{'short'}` | `'long'` | `'short_e'` | `'long_e'` | `'bank'` | `'hex (Stored Integer)'` | `'binary (Stored Integer)'` | `'decimal (Stored Integer)'` | `'octal (Stored Integer)'`
`Decimation`	Decimation	`{'1'}`
`Floating`	Floating display	`{'off'}` | `'on'`
`SampleTime`	Sample time (-1 for inherited)	`{'-1'}`
Floating Scope (`Scope`)		
`Floating`		`'off'` | `{'on'}`
`Location`		vector — `{'[376 294 700 533]'}`
`Open`		`{'off'}` | `'on'`
`NumInputPorts`		Do not change this parameter with the command-line. Instead, use the **Number of axes** parameter in the Scope parameters dialog.
`TickLabels`		`'on'` | `'off'` | `{'OneTimeTick'}`
`ZoomMode`		`{'on'}` | `'xonly'` | `'yonly'`
`AxesTitles`		character vector
`Grid`		`'off'` | `{'on'}` | `'xonly'` | `'yonly'`
`TimeRange`		`{'auto'}`
`YMin`		`{'-5'}`

Block (Type)/Parameter	Dialog Box Prompt	Values
YMax		{'5'}
SaveToWorkspace		{'off'} | 'on'
SaveName		{'ScopeData'}
DataFormat		{'StructureWithTime'} | 'Structure' | 'Array'
LimitDataPoints		'off' | {'on'}
MaxDataPoints		{'5000'}
Decimation		{'1'}
SampleInput		{'off'} | 'on'
SampleTime		{'0'}
Out1 (Outport)		
Port	Port number	{'1'}
IconDisplay	Icon display	'Signal name' | {'Port number'} | 'Port number and signal name'
BusOutputAsStruct	Output as nonvirtual bus in parent model	{'off'} | 'on'
PortDimensions	Port dimensions (-1 for inherited)	{'-1'}
VarSizeSig	Variable-size signal	{'Inherit'} | 'No' | 'Yes'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
`OutDataTypeStr`	Data type	`{'Inherit: auto'} | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'boolean' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)' | 'Enum: <class name>' | 'Bus: <object name>'`
`LockScale`	Lock output data type setting against changes by the fixed-point tools	`{'off'} | 'on'`
`SignalObject`	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See "Design Data Interface by Configuring Inport and Outport Blocks" (Simulink Coder).	`Simulink.Signal` object Object of a class that is derived from `Simulink.Signal`
`StorageClass`	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See "Design Data Interface by Configuring Inport and Outport Blocks" (Simulink Coder).	`{'Auto'} | 'Model default' | 'ExportedGlobal' | 'ImportedExtern' | 'ImportedExternPointer' | 'Custom'`
`SignalName`	Signal name	character vector
`SignalType`	Signal type	`{'auto'} | 'real' | 'complex'`
`OutputWhenDisabled`	Output when disabled	`{'held'} | 'reset'`
`InitialOutput`	Initial output	`{'[]'}`
`MustResolveToSignalObject`	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See "For Signals".	`{'off'} | 'on'`
Scope (`Scope`)		

Block (Type)/Parameter	Dialog Box Prompt	Values
Floating		{'off'} | 'on'
Location		vector — {'[188 390 512 629]'}
Open		{'off'} | 'on'
NumInputPorts		Do not change this parameter with the command-line. Instead, use the **Number of axes** parameter in the Scope parameters dialog.
TickLabels		'on' | 'off' | {'OneTimeTick'}
ZoomMode		{'on'} | 'xonly' | 'yonly'
AxesTitles		character vector
Grid		'off' | {'on'} | 'xonly' | 'yonly'

SampleTime		{'0'}
Stop Simulation		
Terminator		

Block (Type)/Parameter	Dialog Box Prompt	Values
To File (`ToFile`)		
`FileName`	File name	`{'untitled.mat'}`
`MatrixName`	Variable name	`{'ans'}`
`SaveFormat`	Save format	`{'Timeseries'}` | `'Array'`
`Decimation`	Decimation	`{'1'}`
`SampleTime`	Sample time (-1 for inherited)	`{'-1'}`
To Workspace (`ToWorkspace`)		
`VariableName`	Variable name	`{'simout'}`
`MaxDataPoints`	Limit data points to last	`{'inf'}`
`Decimation`	Decimation	`{'1'}`
`SampleTime`	Sample time (-1 for inherited)	`{'-1'}`
`SaveFormat`	Save format	`{'Timeseries'}` | `'Structure With Time'` | `'Structure'` | `'Array'`
`FixptAsFi`	Log fixed-point data as an fi object	`{'off'}` | `'on'`
XY Graph (`XY scope`) (masked subsystem)		
`xmin`	x-min	`{'-1'}`
`xmax`	x-max	`{'1'}`
`ymin`	y-min	`{'-1'}`
`ymax`	y-max	`{'1'}`
`st`	Sample time	`{'-1'}`

Sources Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Band-Limited White Noise (`Band-Limited White Noise`) (masked subsystem)		
`Cov`	Noise power	`{'[0.1]'}`
`Ts`	Sample time	`{'0.1'}`
`seed`	Seed	`{'[23341]'}`
`VectorParams1D`	Interpret vector parameters as 1-D	`'off'	{'on'}`
Chirp Signal (`chirp`) (masked subsystem)		
`f1`	Initial frequency	`{'0.1'}`
`T`	Target time	`{'100'}`
`f2`	Frequency at target time	`{'1'}`
`VectorParams1D`	Interpret vectors parameters as 1-D	`'off'	{'on'}`
Clock (`Clock`)		
`DisplayTime`	Display time	`{'off'}	'on'`
`Decimation`	Decimation	`{'10'}`
Constant (`Constant`)		
`Value`	Constant value	`{'1'}`
`VectorParams1D`	Interpret vector parameters as 1-D	`'off'	{'on'}`
`SampleTime`	Sampling time	`{'Sample based'}	'Frame based'`
`OutMin`	Output minimum	`{'[]'}`
`OutMax`	Output maximum	`{'[]'}`

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output data type	{'Inherit: Inherit from 'Constant value''} | 'Inherit: Inherit via back propagation' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'boolean' | 'fixdt(1,16)' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)' | 'Enum: <class name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
SampleTime	Sample time	{'inf'}
FramePeriod	Frame period	{'inf'}
Counter Free-Running (Counter Free-Running) (masked subsystem)		
NumBits	Number of Bits	{'16'}
tsamp	Sample time	{'-1'}
Counter Limited (Counter Limited) (masked subsystem)		
uplimit	Upper limit	{'7'}
tsamp	Sample time	{'-1'}
Digital Clock (DigitalClock)		
SampleTime	Sample time	{'1'}
Enumerated Constant (EnumeratedConstant)		
OutDataTypeStr	Output data type	{'Enum: SlDemoSign'}
Value	Value	{'SlDemoSign.Positive'} | 'SlDemoSign.Zero' | 'SlDemoSign.Negative'
SampleTime	Sample time	{'inf'}

Block (Type)/Parameter	Dialog Box Prompt	Values
From File (`FromFile`)		
`FileName`	File name	`{'untitled.mat'}`
`ExtrapolationBeforeFirstDataPoint`	Data extrapolation before first data point	`{'Linear extrapolation'}	'Hold first value'	'Ground value'`
`InterpolationWithinTimeRange`	Data interpolation within time range	`{'Linear interpolation'}	'Zero order hold'`
`ExtrapolationAfterLastDataPoint`	Data extrapolation after last data point	`{'Linear extrapolation'}	'Hold last value'	'Ground value'`
`SampleTime`	Sample time	`{'0'}`
From Workspace (`FromWorkspace`)		
`VariableName`	Data	`{'simin'}`
`OutDataTypeStr`	Output Data type	`{'Inherit: auto'}	'double'	'single'	'int8'	'uint8'	'int16'	'uint16'	'int32'	'uint32'	'boolean'	'fixdt(1,16,0)'	'fixdt(1,16,2^0,0)'	'Enum: <class name>'	'Bus: <object name>'`
`SampleTime`	Sample time	`{'0'}`
`Interpolate`	Interpolate data	`'off'	{'on'}`
`ZeroCross`	Enable zero-crossing detection	`'off'	{'on'}`
`OutputAfterFinalValue`	Form output after final data value by	`{'Extrapolation'}	'Setting to zero'	'Holding final value'	'Cyclic repetition'`
Ground		
In1 (`Inport`)		

Block (Type)/Parameter	Dialog Box Prompt	Values
Port	Port number	{'1'}
IconDisplay	Icon display	'Signal name' | {'Port number'} | 'Port number and signal name'
BusOutputAsStruct	Output as nonvirtual bus	{'off'} | 'on'
PortDimensions	Port dimensions (-1 for inherited)	{'-1'}
VarSizeSig	Variable-size signal	{'Inherit'} | 'No' | 'Yes'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}
OutDataTypeStr	Data type	{'Inherit: auto'} | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'boolean' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)' | 'Enum: <class name>' | 'Bus: <object name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
Unit	Specify physical unit of the input signal to the block. For a list of acceptable units, see Allowed Units.	{'inherit'}| '<Enter unit>'
UnitNoProp	Specify physical unit of the input signal to the block without propagation. For a list of acceptable units, see Allowed Units.	'<Enter unit>'

Block (Type)/Parameter	Dialog Box Prompt	Values
SignalType	Signal type	{'auto'} | 'real' | 'complex'
LatchByDelaying OutsideSignal	Latch input by delaying outside signal	{'off'} | 'on'
LatchInputFor FeedbackSignals	Latch input for feedback signals of function-call subsystem outputs	{'off'} | 'on'
OutputFunctionCall	Output a function-call trigger signal	{'off'} | 'on'
Interpolate	Interpolate data	'off' | {'on'}
Pulse Generator (DiscretePulseGenerator)		
PulseType	Pulse type	{'Time based'} | 'Sample based'
TimeSource	Time (t)	{'Use simulation time'} | 'Use external signal'
Amplitude	Amplitude	{'1'}
Period	Period	{'10'}
PulseWidth	Pulse width	{'5'}
PhaseDelay	Phase delay	{'0'}
SampleTime	Sample time	{'1'}
VectorParams1D	Interpret vector parameters as 1-D	'off' | {'on'}
Ramp (Ramp) (masked subsystem)		
slope	Slope	{'1'}
start	Start time	{'0'}
InitialOutput	Initial output	{'0'}
VectorParams1D	Interpret vector parameters as 1-D	'off' | {'on'}
Random Number (RandomNumber)		
Mean	Mean	{'0'}

Block (Type)/Parameter	Dialog Box Prompt	Values
`Variance`	Variance	`{'1'}`
`Seed`	Seed	`{'0'}`
`SampleTime`	Sample time	`{'0.1'}`
`VectorParams1D`	Interpret vector parameters as 1-D	`'off' | {'on'}`
Repeating Sequence (`Repeating table`) (masked subsystem)		
`rep_seq_t`	Time values	`{'[0 2]'}`
`rep_seq_y`	Output values	`{'[0 2]'}`
Repeating Sequence Interpolated (`Repeating Sequence Interpolated`) (masked subsystem)		
`OutValues`	Vector of output values	`{'[3 1 4 2 1].''}`
`TimeValues`	Vector of time values	`{'[0 0.1 0.5 0.6 1].''}`
`LookUpMeth`	Lookup Method	`{'Interpolation-Use End Values'} | 'Use Input Nearest' | 'Use Input Below' | 'Use Input Above'`
`tsamp`	Sample time	`{'0.01'}`
`OutMin`	Output minimum	`{'[]'}`
`OutMax`	Output maximum	`{'[]'}`
`OutDataTypeStr`	Output data type	`'Inherit: Inherit via back propagation' | {'double'} | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'`
`OutputDataTypeScaling Mode`	Deprecated in R2007b	
`OutDataType`	Deprecated in R2007b	
`OutScaling`	Deprecated in R2007b	

Block (Type)/Parameter	Dialog Box Prompt	Values
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
Repeating Sequence Stair (`Repeating Sequence Stair`) (masked subsystem)		
OutValues	Vector of output values	{'[3 1 4 2 1].''}
tsamp	Sample time	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	'Inherit: Inherit via back propagation' | {'double'} | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'boolean' | 'fixdt(1,16)' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)' | 'Enum: <class name>'
OutputDataTypeScaling Mode	Deprecated in R2007b	
OutDataType	Deprecated in R2007b	
ConRadixGroup	Deprecated in R2007b	
OutScaling	Deprecated in R2007b	
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
Signal Builder (`Sigbuilder block`) (masked subsystem)		
Signal Editor (`SignalEditor`)		
Filename	File name	{'untitled.mat'}
ActiveScenario	Active scenario	{'Scenario'}
ActiveSignal	Signals	{'Signal 1'}

Block (Type)/Parameter	Dialog Box Prompt	Values
IsBus	Output a bus signal	'on' | {'off'}
OutputBusObjectStr	Select bus object	{'Bus: BusObject'}
SampleTIme	Sample time	{'0'}
Interpolate	Interpolate data	{'off'} | 'on'
ZeroCross	Enable zero-crossing detection	{'off'} | 'on'
OutputAfterFinalValue	Form output after final data value by	{'Setting to zero'} | 'Extrapolation' | 'Holding final value'
Unit	Unit	{'inherit'}
Signal Generator (SignalGenerator)		
WaveForm	Wave form	{'sine'} | 'square' | 'sawtooth' | 'random'
TimeSource	Time (t)	{'Use simulation time'} | 'Use external signal'
Amplitude	Amplitude	{'1'}
Frequency	Frequency	{'1'}
Units	Units	'rad/sec' | {'Hertz'}
VectorParams1D	Interpret vector parameters as 1-D	'off' | {'on'}
Sine Wave (Sin)		
SineType	Sine type	{'Time based'} | 'Sample based'
TimeSource	Time	{'Use simulation time'} | 'Use external signal'
Amplitude	Amplitude	{'1'}
Bias	Bias	{'0'}
Frequency	Frequency	{'1'}
Phase	Phase	{'0'}
Samples	Samples per period	{'10'}
Offset	Number of offset samples	{'0'}

Block (Type)/Parameter	Dialog Box Prompt	Values
SampleTime	Sample time	`{'0'}`
VectorParams1D	Interpret vector parameters as 1-D	`'off'` | `{'on'}`
Step (`Step`)		
Time	Step time	`{'1'}`
Before	Initial value	`{'0'}`
After	Final value	`{'1'}`
SampleTime	Sample time	`{'0'}`
VectorParams1D	Interpret vector parameters as 1-D	`'off'` | `{'on'}`
ZeroCross	Enable zero-crossing detection	`'off'` | `{'on'}`
Uniform Random Number (`UniformRandomNumber`)		
Minimum	Minimum	`{'-1'}`
Maximum	Maximum	`{'1'}`
Seed	Seed	`{'0'}`
SampleTime	Sample time	`{'0.1'}`
VectorParams1D	Interpret vector parameters as 1-D	`'off'` | `{'on'}`
Waveform Generator (`WaveformGenerator`)		
OutMin	Output minimum	`{'[]'}`
OutMax	Output maximum	`{'[]'}`

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output data type	'Inherit: Inherit via back propagation' | {'Inherit: Inherit from table data'} | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'boolean' | 'fixdt(1,16)' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | 'Floor' | {'Nearest'} | 'Round' | 'Simplest' | 'Zero'
SaturateOnIntegerOverflow	Saturate on integer overflow	{'off'} | 'on'
SelectedSignal	Output signal	{'1'}
SampleTime	Sample time	{'0'}

String Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Compose String (`Compose String`)		
`Format`	Format input data	scalar `{""%d %f""}`| `""%d""` | `""%i""` | `""%o""` | `""%x""` | `""%X""` | `""%f""` | `""%e""` | `""%E""` | `""%g""` | `""%G""` | `""%s""` | optional operators and text
`OutDataTypeStr`	Output data type	`{"stringtype(255)"}` | `"stringtype(N)"` | `"string"`
Scan String (`Scan String`)		
`Format`	Format input data	scalar `{""%d %f""}`| `""%d""` | `""%i""` | `""%o""` | `""%x""` | `""%X""` | `""%f""` | `""%e""` | `""%E""` | `""%g""` | `""%G""` | `""%s""` | optional operators and text
String Compare (`String Compare`)		
`CaseSensitive`	Case sensitivity for string compare	`'off'` | `{'on'}`
`CompareOption`	Amount of string to compare	`{"Entire string"}`|`"First N characters"`
`NumberOfCharacters`	Amount of string to compare	`{'1'}`| scalar
String Concatenate (`String Concatenate`)		
`Inputs`	Number of input strings	`{"2"}`
`OutDataTypeStr`	Output data type	`{"stringtype(128)"}` | `"stringtype(N)"` | `"string"`
String Constant (`String Constant`)		
`String`	Input string	`{"Hello!"}`| scalar

Block (Type)/Parameter	Dialog Box Prompt	Values
`OutDataTypeStr`	Output data type	`{"stringtype(31)"}|` `"stringtype(N)"|"string"`
String to ASCII (`String to ASCII`)		
`MaximumLength`	Maximum length of output vector	`{"31"}` | scalar
String to Double (`String to Double`)		
`Format`	Format input data	scalar `{""%d %f""}| ""%d""	""%i"" |` `""%o""	""%x""	""%X""	""%f""` `| ""%e""	""%E""	""%g"" |` `""%G""	""%s""` | optional operators and text
String to Enum (`String to Enum`)		
`OutDataTypeStr`	Output data type	`{"Enum: SlDemoSign"}|<data type expression>`
String to Single (`String to Single`)		
`Format`	Format input data	scalar `{""%f""}| ""%d""	""%i"" |` `""%o""	""%x""	""%X""	""%f""` `| ""%e""	""%E""	""%g"" |` `""%G""	""%s""` | optional operators and text
Substring (`Substring`)		
`InheritMaximumLength`	Use same maximum length as input string	`'off'	{'on'}`
`OutDataTypeStr`	Output data type	`{"stringtype(31)"}|` `"stringtype(N)"|"string"`
`StringFromIdxToEnd`	Extract string from idx to end	`{'off'}	'on'`

User-Defined Functions Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
MATLAB Function (`Stateflow`) (masked subsystem)		
MATLAB System (`MATLABSystem`)		
`System`	System object class name	`{''}`
Fcn (`Fcn`)		
`Expr`	Expression	`{'sin(u(1)*exp(2.3*(-u(2))))'}`
`SampleTime`	Sample time (-1 for inherited)	`{'-1'}`
Level-2 MATLAB S-Function (`M-S-Function`)		
`FunctionName`	S-function name	`{'mlfile'}`
`Parameters`	Arguments	`{''}`
Interpreted MATLAB Function (`MATLABFcn`)		
`MATLABFcn`	MATLAB function	`{'sin'}`
`OutputDimensions`	Output dimensions	`{'-1'}`
`OutputSignalType`	Output signal type	`{'auto'}`	'real'	'complex'`
`Output1D`	Collapse 2-D results to 1-D	`'off'	{'on'}`
`SampleTime`	Sample time (-1 for inherited)	`{'-1'}`
S-Function (`S-Function`)		
`FunctionName`	S-function name	`{'system'}`
`Parameters`	S-function parameters	`{''}`
`SFunctionModules`	S-function modules	`{''}`
S-Function Builder (`S-Function Builder`) (masked subsystem)		
`FunctionName`	S-function name	`{'system'}`
`Parameters`	S-function parameters	`{''}`
`SFunctionModules`	S-function modules	`{''}`

Additional Discrete Block Library Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Fixed-Point State-Space (`Fixed-Point State-Space`) (masked subsystem)		
A	State Matrix A	`{'[2.6020 -2.2793 0.6708; 1 0 0; 0 1 0]'}`
B	Input Matrix B	`{'[ 1; 0; 0]'}`
C	Output Matrix C	`{'[0.0184 0.0024 0.0055]'}`
D	Direct Feedthrough Matrix D	`{'[0.0033]'}`
InitialCondition	Initial condition for state	`{'0.0'}`
InternalDataType	Data type for internal calculations	`{'fixdt('double')'}`
StateEqScaling	Scaling for State Equation AX +BU	`{'2^0'}`
OutputEqScaling	Scaling for Output Equation CX +DU	`{'2^0'}`
LockScale	Lock output data type setting against changes by the fixed-point tools	`{'off'} | 'on'`
RndMeth	Integer rounding mode	`'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'`
DoSatur	Saturate to max or min when overflows occur	`{'off'} | 'on'`
Transfer Fcn Direct Form II (`Transfer Fcn Direct Form II`) (masked subsystem)		
NumCoefVec	Numerator coefficients	`{'[0.2 0.3 0.2]'}`
DenCoefVec	Denominator coefficients excluding lead (which must be 1.0)	`{'[-0.9 0.6]'}`
vinit	Initial condition	`{'0.0'}`

Block (Type)/Parameter	Dialog Box Prompt	Values
RndMeth	Integer rounding mode	`'Ceiling'` | `'Convergent'` | `{'Floor'}` | `'Nearest'` | `'Round'` | `'Simplest'` | `'Zero'`
DoSatur	Saturate to max or min when overflows occur	`{'off'}` | `'on'`
Transfer Fcn Direct Form II Time Varying (`Transfer Fcn Direct Form II Time Varying`) (masked subsystem)		
vinit	Initial condition	`{'0.0'}`
RndMeth	Integer rounding mode	`'Ceiling'` | `'Convergent'` | `{'Floor'}` | `'Nearest'` | `'Round'` | `'Simplest'` | `'Zero'`
DoSatur	Saturate to max or min when overflows occur	`{'off'}` | `'on'`
Unit Delay Enabled (`Unit Delay Enabled`) (masked subsystem)		
vinit	Initial condition	`{'0.0'}`
tsamp	Sample time	`{'-1'}`
Unit Delay Enabled External IC (`Unit Delay Enabled External Initial Condition`) (masked subsystem)		
tsamp	Sample time	`{'-1'}`
Unit Delay Enabled Resettable (`Unit Delay Enabled Resettable`) (masked subsystem)		
vinit	Initial condition	`{'0.0'}`
tsamp	Sample time	`{'-1'}`
Unit Delay Enabled Resettable External IC (`Unit Delay Enabled Resettable External Initial Condition`) (masked subsystem)		
tsamp	Sample time	`{'-1'}`
Unit Delay External IC (`Unit Delay External Initial Condition`) (masked subsystem)		
tsamp	Sample time	`{'-1'}`
Unit Delay Resettable (`Unit Delay Resettable`) (masked subsystem)		
vinit	Initial condition	`{'0.0'}`

Block (Type)/Parameter	Dialog Box Prompt	Values
`tsamp`	Sample time	`{'-1'}`
Unit Delay Resettable External IC (`Unit Delay Resettable External Initial Condition`) (masked subsystem)		
`tsamp`	Sample time	`{'-1'}`
Unit Delay With Preview Enabled (`Unit Delay With Preview Enabled`) (masked subsystem)		
`vinit`	Initial condition	`{'0.0'}`
`tsamp`	Sample time	`{'-1'}`
Unit Delay With Preview Enabled Resettable (`Unit Delay With Preview Enabled Resettable`) (masked subsystem)		
`vinit`	Initial condition	`{'0.0'}`
`tsamp`	Sample time	`{'-1'}`
Unit Delay With Preview Enabled Resettable External RV (`Unit Delay With Preview Enabled Resettable External RV`) (masked subsystem)		
`vinit`	Initial condition	`{'0.0'}`
`tsamp`	Sample time	`{'-1'}`
Unit Delay With Preview Resettable (`Unit Delay With Preview Resettable`) (masked subsystem)		
`vinit`	Initial condition	`{'0.0'}`
`tsamp`	Sample time	`{'-1'}`
Unit Delay With Preview Resettable External RV (`Unit Delay With Preview Resettable External RV`) (masked subsystem)		
`vinit`	Initial condition	`{'0.0'}`
`tsamp`	Sample time	`{'-1'}`

Additional Math: Increment - Decrement Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Decrement Real World (`Real World Value Decrement`) (masked subsystem)		
Decrement Stored Integer (`Stored Integer Value Decrement`) (masked subsystem)		
Decrement Time To Zero (`Decrement Time To Zero`) (masked subsystem)		
Decrement To Zero (`Decrement To Zero`) (masked subsystem)		
Increment Real World (`Real World Value Increment`) (masked subsystem)		
Increment Stored Integer (`Stored Integer Value Increment`) (masked subsystem)		

Mask Parameters

About Mask Parameters

This section lists parameters that describe masked blocks. You can use these descriptive parameters with `get_param` and `set_param` to obtain and specify the properties of a block mask.

The descriptive mask parameters listed in this section apply to all masks, and provide access to all mask properties. Be careful not to confuse these descriptive mask parameters with the mask-specific parameters defined for an individual mask in the Mask Editor **Parameters** pane.

See "Masking Fundamentals" and "Mask Editor Overview" for information about block masks and the Mask Editor.

Mask Parameters

Parameter	Description/Prompt	Values
`Mask`	Turns mask on or off.	`{'on'}	'off'`
`MaskCallbackString`	Mask parameter callbacks that are executed when the respective parameter is changed on the dialog. Set by the **Dialog callback** field on the **Parameters** pane of the Mask Editor dialog box. For more information, see "Mask Callback Code".	pipe-delimited character vector `{''}`
`MaskCallbacks`	Cell array version of `MaskCallbackString`.	cell array `{'[]'}`
`MaskDescription`	Block description. Set by the **Mask description** field on the **Documentation** pane of the Mask Editor dialog box.	character vector `{''}`
`MaskDisplay`	Drawing commands for the block icon. Set by the **Icon Drawing commands** field on the **Icon & Ports** pane of the Mask Editor dialog box.	character vector `{''}`
`MaskEditorHandle`	For internal use only.	
`MaskEnableString`	Option that determines whether a parameter is greyed out in the dialog. Set by the **Enable parameter** check box on the **Parameters** pane of the Mask Editor dialog box.	pipe-delimited character vector `{''}`
`MaskEnables`	Cell array version of `MaskEnableString`.	cell array of character vectors, each either `'on'` or `''off'` `{'[]'}`

Parameter	Description/Prompt	Values
`MaskHelp`	Block help. Set by the **Mask help** field on the **Documentation** pane of the Mask Editor dialog box.	character vector `{''}`
`MaskIconFrame`	Set the visibility of the icon frame (Visible is on, Invisible is off). Set by the **Block Frame** option on the **Icon & Ports** pane of the Mask Editor dialog box.	`{'on'}` | `'off'`
`MaskIconOpaque`	Set the transparency of the icon. Set by the **Icon Transparency** option on the **Icon & Ports** pane of the Mask Editor dialog box.	`{'opaque'}` | `'transparent'` | `'opaque-with-ports'`
`MaskIconRotate`	Set the rotation of the icon (Rotates is on, Fixed is off). Set by the **Icon Rotation** option on the **Icon & Ports** pane of the Mask Editor dialog box.	`'on'` | `{'off'}`
`MaskIconUnits`	Set the units for the drawing commands. Set by the **Icon Units** option on the **Icon & Ports** pane of the Mask Editor dialog box.	`'pixel'` | `{'autoscale'}` | `'normalized'`
`MaskInitialization`	Initialization commands. Set by the **Initialization commands** field on the **Initialization** pane of the Mask Editor dialog box.	MATLAB command `{''}`
`MaskNames`	Cell array of mask dialog parameter names. Set inside the **Variable** column in the **Parameters** pane of the Mask Editor dialog box.	matrix `{'[]'}`

Parameter	Description/Prompt	Values
MaskPortRotate	Specify the port rotation policy for the masked block. Set in the **Port Rotation** area on the **Icon & Ports** pane of the Mask Editor dialog box. For more information, see "Adjust Visual Presentation to Improve Model Readability".	{'default} | 'physical'
MaskPrompts	List of dialog parameter prompts (see below). Set inside the **Dialog parameters** area on the **Parameters** pane of the Mask Editor dialog box.	cell array of character vectors {'[]'}
MaskPromptString	List of dialog parameter prompts (see below). Set inside the **Dialog parameters** area on the **Parameters** pane of the Mask Editor dialog box.	character vector {''}
MaskPropertyName	Pipe-delimited version of MaskNames.	character vector {''}
MaskRunInitForIconRedraw	Specifies whether Simulink must run mask initialization before executing the mask icon commands.	{'auto'}|'on' |'off'
MaskSelfModifiable	Indicates that the block can modify itself. Set by the **Allow library block to modify its contents** check box on the **Initialization** pane of the Mask Editor dialog box.	'on' | {'off'}

Parameter	Description/Prompt	Values
MaskStyles	Determines whether the dialog parameter is a check box, edit field, or pop-up list. Set by the **Type** column in the **Parameters** pane of the Mask Editor dialog box.	cell array {'[]'}
MaskStyleString	Comma-separated version of MaskStyles.	character vector {''}
MaskTabNameString	For internal use only.	
MaskTabNames	For internal use only.	
MaskToolTipsDisplay	Determines which mask dialog parameters to display in the tooltip for this masked block. Specify as a cell array of 'on' or 'off' values, each of which indicates whether to display the parameter named at the corresponding position in the cell array returned by MaskNames.	cell array of 'on' and 'off' {''}
MaskToolTipString	Comma-delimited version of MaskToolTipsDisplay.	character vector {''}
MaskTunableValues	Allows the changing of mask dialog values during simulation. Set by the **Tunable** column in the **Parameters** pane of the Mask Editor dialog box.	cell array of character vectors {'[]'}
MaskTunableValueString	Comma-delimited character vector version of MaskTunableValues.	delimited character vector {''}
MaskType	Mask type. Set by the **Mask type** field on the **Documentation** pane of the Mask Editor dialog box.	character vector {'Stateflow'}
MaskValues	Dialog parameter values.	cell array {'[]'}

Parameter	Description/Prompt	Values
`MaskValueString`	Delimited character vector version of `MaskValues`.	delimited character vector {''}
`MaskVarAliases`	Specify aliases for a block's mask parameters. The aliases must appear in the same order as the parameters appear in the block's `MaskValues` parameter.	cell array {'[]'}
`MaskVarAliasString`	For internal use only.	
`MaskVariables`	List of the dialog parameters' variables (see below). Set inside the **Dialog parameters** area on the **Parameters** pane of the Mask Editor dialog box.	character vector {''}
`MaskVisibilities`	Specifies visibility of parameters. Set with the **Show parameter** check box in the **Options for selected parameter** area on the **Parameters** pane of the Mask Editor dialog box.	matrix {'[]'}
`MaskVisibilityString`	Delimited character vector version of `MaskVisibilities`.	character vector {''}
`MaskWSVariables`	List of the variables defined in the mask workspace (read only).	matrix {'[]'}

See Control Masks Programmatically, for more information on setting the mask parameters from the MATLAB command line.

Fixed-Point Tool

Fixed-Point Tool Parameters and Dialog Box
The Fixed-Point Tool includes the following components:

- **Main** toolbar
- **Model Hierarchy** pane
- **Contents** pane
- **Dialog** pane

Main Toolbar

The Fixed-Point Tool's main toolbar appears near the top of the Fixed-Point Tool window under the Fixed-Point Tool's menu.

The toolbar contains the following buttons that execute commonly used Fixed-Point Tool commands:

Button	Usage
	Open the Fixed-Point Advisor to prepare the model for conversion to fixed point.
	Simulate a model and store the run results.
	Pause a simulation.
	Stop a simulation.
	Analyze model and store derived minimum and maximum results.
DT	Propose data types. Propose fraction lengths for specified word lengths or propose word lengths for specified fraction lengths.
DT	Apply accepted data types.
	Compare selected runs.
	Create a difference plot for the selected signals.
	Plot the selected signal.

Button	Usage
	Create a histogram plot for the selected signal.

The toolbar also contains the **Show** option:
The **Show** option specifies the type of results to display in the **Contents** pane. The **Contents** pane displays information only after you simulate a system or propose fraction lengths. If there are no results that satisfy a particular filter option, the list will be blank.

Show Option	Result
All results	Displays all results for the selected tree node.
Signal Logging results	For the selected tree node, displays blocks whose output ports have logged signal data. The Fixed-Point tool marks these blocks with the logged signal icon . **Note** You can plot simulation results associated with logged signal data using the Simulation Data Inspector.
Min/Max results	For the selected tree node, displays blocks that record design Min/Max, simulation Min/Max, and overflow data. **Prerequisites**: **Fixed-point instrumentation mode** should not be set to `Force Off`.
Overflows	For the selected tree node, displays blocks that have non-zero overflows recorded. If a block has its **Saturate on integer overflow** option selected, overflow information appears in the **Saturations** column, otherwise it appears in the **OverflowWraps** column.

Show Option	Result
Conflicts with proposed data types	For the selected tree node, displays results that have potential data typing or scaling issues. **Prerequisites**: This information is available only after you propose data types. The Fixed-Point Tool marks these results with a yellow or red icon, as shown here: The proposed data type poses potential issues for this object. Open the Result Details tab to review these issues. The proposed data type will introduce errors if applied to this object. Open the Result Details tab for details about how to resolve these issues.
Groups that must share the same data type	For the selected tree node, displays blocks that must share the same data type because of data type propagation rules. **Prerequisites**: This information is available only after you propose fraction lengths. The Fixed-Point Tool allocates an identification tag to blocks that must share the same data type. This identification tag is displayed in the **DTGroup** column as follows: • If the selected tree node is the model root All results for the model are listed. The **DTGroup** column is sorted by default so that you can easily view all blocks in a group. • If the selected tree node is a subsystem The identification tags have a suffix that indicates the total number of results in each group. For example, G2(2) means group G2 has 2 members. This information enables you to see how many members of a group belong to the selected subsystem and which groups share data types across subsystem boundaries.

Model Hierarchy Pane

The **Model Hierarchy** pane displays a tree-structured view of the Simulink model hierarchy. The first node in the pane represents a Simulink model. Expanding the root node displays subnodes that represent the model's subsystems, MATLAB Function blocks, Stateflow charts, and referenced models.

The Fixed-Point Tool's **Contents** pane displays elements that comprise the object selected in the **Model Hierarchy** pane. The **Dialog** pane provides parameters for specifying the selected object's data type override and fixed-point instrumentation mode. You can also specify an object's data type override and fixed-point instrumentation mode by right-clicking on the object. The **Model Hierarchy** pane indicates the value of these parameters by displaying the following abbreviations next to the object name:

Abbreviation	Parameter Value
Fixed-point instrumentation mode	
mmo	Minimums, maximums and overflows
o	Overflows only
fo	Force off
Data type override	
scl	Scaled double
dbl	Double
sgl	Single
off	Off

Contents Pane

The **Contents** pane displays a tabular view of objects that log fixed-point data in the system or subsystem selected in the **Model Hierarchy** pane. The table rows correspond to model objects, such as blocks, block parameters, and Stateflow data. The table columns correspond to attributes of those objects, such as the data type, design minimum and maximum values, and simulation minimum and maximum values.

The **Contents** pane displays information only after you simulate a system, analyze the model to derive minimum and maximum values, or propose fraction lengths.

You can control which of the following columns the Fixed-Point Tool displays in this pane. For more information, see "Customizing the Contents Pane View" on page 7-8.

Column Label	Description
Accept	Check box that enables you to selectively accept the Fixed-Point Tool's data type proposal.
CompiledDesignMax	Compile-time information for **DesignMax**.
CompiledDesignMin	Compile-time information for **DesignMin**.
CompiledDT	Compile-time data type. This data type appears on the signal line in `sfix` format. See "Fixed-Point Data Type and Scaling Notation" (Fixed-Point Designer).
DerivedMax	Maximum value the Fixed-Point tool derives for this signal from design ranges specified for blocks.
DerivedMin	Minimum value the Fixed-Point tool derives for this signal from design ranges specified for blocks.
DesignMax	Maximum value the block specifies in its parameter dialog box, for example, the value of its **Output maximum** parameter.
DesignMin	Minimum value the block specifies in its parameter dialog box, for example, the value of its **Output minimum** parameter.
DivByZero	Number of divide-by-zero instances that occur during simulation.
DTGroup	Identification tag associated with objects that share data types.
InitValueMax	Maximum initial value for a signal or parameter. Some model objects provide parameters that allow you to specify the initial values of their signals. For example, the Constant block includes a **Constant value** that initializes the block output signal. **Note** The Fixed-Point Tool uses this parameter when it proposes data types.

Column Label	Description
InitValueMin	Minimum initial value for a signal or parameter. Some model objects provide parameters that allow you to specify the initial values of their signals. For example, the Constant block includes a **Constant value** that initializes the block output signal. **Note** The Fixed-Point Tool uses this parameter when it proposes data types.
LogSignal	Check box that allows you to enable or disable signal logging for an object.
ModelRequiredMin	Minimum value of a parameter used during simulation. For example, the n-D Lookup Table block uses the **Breakpoints** and **Table data** parameters to perform its lookup operation and generate output. In this example, the block uses more than one parameter so the Fixed-Point Tool sets **ModelRequiredMin** to the minimum of the minimum values of all these parameters. **Note** The Fixed-Point Tool uses this parameter when it proposes data types.
ModelRequiredMax	Maximum value of a parameter used during simulation. For example, the n-D Lookup Table block uses the **Breakpoints** and **Table data** parameters to perform its lookup operation and generate output. In this example, the block uses more than one parameter so the Fixed-Point Tool sets **ModelRequiredMax** to the maximum of the maximum values of all these parameters. **Note** The Fixed-Point Tool uses this parameter when it proposes data types.
Name	Identifies path and name of block.
OverflowWraps	Number of overflows that wrap during simulation.
ProposedDT	Data type that the Fixed-Point Tool proposes.

Column Label	Description
ProposedMax	Maximum value that results from the data type the Fixed-Point Tool proposes.
ProposedMin	Minimum value that results from the data type the Fixed-Point Tool proposes.
Run	Indicates the run name for these results.
Saturations	Number of overflows that saturate during simulation.
SimDT	Data type the block uses during simulation. This data type appears on the signal line in `sfix` format. See "Fixed-Point Data Type and Scaling Notation" (Fixed-Point Designer).
SimMax	Maximum value that occurs during simulation.
SimMin	Minimum value that occurs during simulation.
SpecifiedDT	Data type the block specifies in its parameter dialog box, for example, the value of its **Output data type** parameter.

Customizing the Contents Pane View

You can customize the **Contents** pane in the following ways:

- "Using Column Views" on page 7-8
- "Changing Column Order and Width" on page 7-10
- "Sorting by Columns" on page 7-10

Using Column Views

The Fixed-Point Tool provides the following standard Column Views:

View Name	Columns Provided	When Does the Fixed-Point Tool Display this View?
`Simulation View` (default)	**Name**, **Run**, **CompiledDT**, **SpecifiedDT**, **SimMin**, **SimMax**, **DesignMin**, **DesignMax**, **OverflowWraps**, **Saturations**	After a simulating minimum and maximum values.

View Name	Columns Provided	When Does the Fixed-Point Tool Display this View?
Automatic Data Typing View	**Name**, **Run**, **CompiledDT**, **CompiledDesignMax**, **CompiledDesignMin**,**Accept**, **ProposedDT**, **SpecifiedDT**, **DesignMin**, **DesignMax**, **DerivedMin**, **DerivedMax**, **SimMin**, **SimMax**, **OverflowWraps**, **Saturations**, **ProposedMin**, **ProposedMax**	After proposing data types if proposal is based on simulation, derived, and design min/max.
Automatic Data Typing With Simulation Min/Max View	**Name**, **Run**, **CompiledDT**, **Accept**, **ProposedDT**, **SpecifiedDT**, **SimMin**, **SimMax**, **DesignMin**, **DesignMax**, **OverflowWraps**, **Saturations**, **ProposedMin**, **ProposedMax**	After proposing data types if the proposal is based on simulation and design min/max.
Automatic Data Typing With Derived Min/Max View	**Name**, **Run**, **CompiledDesignMax**, **CompiledDesignMin**,**Accept**, **ProposedDT**, **SpecifiedDT**, **DerivedMin**, **DerivedMax**, **ProposedMin**, **ProposedMax**	After proposing data types if the proposal is based on design min/max and/or derived min/max.
Data Collection View	**Name**, **Run**, **CompiledDT**, **SpecifiedDT**, **DerivedMin**, **DerivedMax**, **SimMin**, **SimMax**, **OverflowWraps**, **Saturations**	After simulating or deriving minimum and maximum values if the results have simulation min/max, derived min/max, and design min/max.
Derived Min/Max View	**Name**, **Run**, **CompiledDesignMax**, **CompiledDesignMin**, **DerivedMin**, **DerivedMax**	After deriving minimum and maximum values.

By selecting **Show Details**, you can:

- Customize the standard column views
- Create your own column views

- Export and import column views saved in MAT-files, which you can share with other users

- Reset views to factory settings

  If you upgrade to a new release of Simulink, and the column views available in the Fixed-Point Tool do not match the views described in the documentation, reset your views to factory settings. When you reset all views, the Model Explorer removes all the custom views you have created. Before you reset views to factory settings, export any views that you will want to use in the future.

You can prevent the Fixed-Point Tool from automatically changing the column view of the contents pane by selecting **View > Lock Column View** in the Fixed-Point Tool menu. For more information on controlling views, see "Customize Model Explorer Views".

Changing Column Order and Width

You can alter the order and width of columns that appear in the **Contents** pane as follows:

- To move a column, click and drag the head of a column to a new location among the column headers.

- To make a column wider or narrower, click and drag the right edge of a column header. If you double-click the right edge of a column header, the column width changes to fit its contents.

Sorting by Columns

By default, the **Contents** pane displays its contents in ascending order of the **Name** column. You can alter the order in which the **Contents** pane displays its rows as follows:

- To sort all the rows in ascending order of another column, click the head of that column.

- To change the order from ascending to descending, simply click again on the head of that column.

Dialog Pane

Use the Dialog pane to view and change properties associated with the system under design.
The Dialog pane includes the following components:

Component	Description
System under design	Displays the system under design for conversion. You can change the selected system by clicking **Change**.

Component	Description
Fixed-point preparation	Contains the **Fixed-Point Advisor** button. Use this button to open the Fixed-Point Advisor to guide you through the tasks to prepare your floating-point model for conversion to fixed point. For more information, see "Fixed-Point Advisor" on page 7-12.
Configure model settings	Contains default configurations that set up run parameters, such as the run name and data type override settings, by clicking a button. For more information, see "Configure model settings" on page 7-13.
Range collection	Contains controls to collect simulation or derived minimum and maximum data for your model.
Automatic data typing	Contains controls to propose and, optionally, accept data type proposals.
Result Details tab	Use this tab to view data type information about the object selected in the **Contents** pane.

Tips

From the Fixed-Point Tool **View** menu, you can customize the layout of the **Dialog** pane. Select:

- **Show Fixed-Point Preparation** to show/hide the **Fixed-Point Advisor** button. By default, the Fixed-Point Tool displays this button.

- **Show Dialog View** to show/hide the **Dialog** pane. By default, the Fixed-Point Tool displays this pane.

- **Settings for selected system** to show/hide the **Settings for selected system** pane. By default, the Fixed-Point Tool displays this pane.

Fixed-Point Advisor

Open the Fixed-Point Advisor to guide you through the tasks to prepare a floating-point model for conversion to fixed point. Use the Fixed-Point Advisor if your model contains blocks that do not support fixed-point data types.

Configure model settings

Use the configurations to set up model-wide data type override and instrumentation settings prior to simulation. The Fixed-Point Tool provides:

- Frequently-used factory default configurations
- The ability to add and edit custom configurations

Note The factory default configurations apply to the whole model. You cannot use these shortcuts to configure subsystems.

Factory Defaults

Factory Default Configuration	Description
Range collection using double override	Use this configuration to observe ideal numeric behavior of the model and collect ranges for data type proposals. This configuration sets: • **Run name** to `DoubleOverride` • **Fixed-point instrumentation mode** to `Minimums, maximums and overflows` • **Data type override** to `Double` • **Data type override applies to** to `All numeric types` By default, a button for this configuration appears in the **Configure model settings** pane.

Factory Default Configuration	Description
Range collection with specified data types	Use this configuration to collect ranges of actual model and to validate current behavior. This configuration sets: • **Run name** to NoOverride • **Fixed-point instrumentation mode** to Minimums, maximums and overflows • **Data type override** to Use local settings By default, a button for this shortcut appears in the **Configure model settings** pane.
Remove overrides and disable range collection	Use this configuration to cleanup settings after finishing fixed-point conversion and to restore maximum simulation speed. This configuration sets: • **Fixed-point instrumentation mode** to Off • **Data type override** to Use local settings By default, a button for this shortcut appears in the **Configure model settings** pane.

Advanced settings

Use **Advanced settings** to add new configurations or edit existing user-defined configurations.

Run name

Specifies the run name

If you use a default configuration to set up a run, the Fixed-Point Tool uses the run name associated with this configuration. You can override the run name by entering a new name in this field.

Tips

- To store data for multiple runs, provide a different run name for each run. Running two simulations with the same run name overwrites the original run unless you select **Merge results from multiple simulations**.

- You can edit the run name in the Contents pane **Run** column.

For more information, see "Run Management" (Fixed-Point Designer).

Simulate

Simulates model and stores results.

Action

Simulates the model and stores the results with the run name specified in **Run name**. The Fixed-Point Tool displays the run name in the **Run** column of the **Contents** pane.

Merge instrumentation results from multiple simulations

Control how simulation results are stored

Settings

Default: Off

☑ On

Merges new simulation minimum and maximum results with existing simulation results in the run specified by the run name parameter. Allows you to collect complete range information from multiple test benches. Does not merge signal logging results.

☐ Off

Clears all existing simulation results from the run specified by the run name parameter before displaying new simulation results.

Command-Line Alternative
Parameter: `'MinMaxOverflowArchiveMode'`
Type: string
Value: `'Overwrite'` | `'Merge'`

Default: `'Overwrite'`

Tip

Select this parameter to log simulation minimum and maximum values captured over multiple simulations. For more information, see "Propose Data Types For Merged Simulation Ranges" (Fixed-Point Designer).

Derive ranges for selected system

Derive minimum and maximum values for signals for the selected system.

The Fixed-Point Tool analyzes the selected system to compute derived minimum and maximum values based on design minimum and maximum values specified on blocks. For example, using the **Output minimum** and **Output maximum** for block outputs.

Action

Analyzes the selected system to compute derived minimum and maximum information based on the design minimum and maximum values specified on blocks.

By default, the Fixed-Point Tool displays the `Derived Min/Max View` with the following information in the **Contents** pane.

Command-Line Alternative

No command line alternative available.

Dependencies

Range analysis:

• Requires a Fixed-Point Designer license.

Propose

Signedness

Select whether you want The Fixed-Point Tool to propose signedness for results in your model. The Fixed-Point Tool proposes signedness based on collected range data and block constraints. By default, the **Signedness** check box is selected.

When the check box is selected, signals that are always strictly positive get an unsigned data type proposal. If you clear the check box, the Fixed-Point Tool proposes a signed data type for all results that currently specify a floating-point or an inherited output data type unless other constraints are present. If a result specifies a fixed-point output data type, the Fixed-Point Tool will propose a data type with the same signedness as the currently specified data type unless other constraints are present.

Word length or fraction length

Select whether you want the Fixed-Point Tool to propose word lengths or fraction lengths for the objects in your system.

- If you select **Word length**, the Fixed-Point Tool proposes a data type with the specified fraction length and the minimum word length to avoid overflows.
- If you select **Fraction length**, the Fixed-Point Tool proposes a data type with the specified word length and best-precision fraction length while avoiding overflows.

If a result currently specifies a fixed-point data type, that information will be used in the proposal. If a result specifies a floating-point or inherited output data type, and the **Inherited** and **Floating point** check boxes are selected, the Fixed-Point Tool uses the settings specified under **Automatic data typing** to make a data type proposal.

Propose for

Inherited

Propose data types for results that specify one of the inherited output data types.

Floating-point

Propose data types for results that specify floating-point output data types.

Default fraction length

Specify the default fraction length for objects in your model. The Fixed-Point Tool proposes a data type with the specified fraction length and the minimum word length that avoids overflows.

Command-Line Alternative

No command line alternative available.

Default word length

Specify the default word length for objects in your model. The Fixed-Point Tool will propose best-precision fraction lengths based on the specified default word length.

Command-Line Alternative

No command line alternative available.

When proposing types use

Specify the types of ranges to use for data type proposals.

Design and derived ranges

The Fixed-Point Tool uses the design ranges in conjunction with derived ranges to propose data types. Design ranges take precedence over derived ranges.

Design and simulation ranges

The Fixed-Point Tool uses the design ranges in conjunction with collected simulation ranges to propose data types. Design ranges take precedence over simulation ranges.

The **Safety margin for simulation min/max (%)** parameter specifies a range that differs from that defined by the simulation range. For more information, see "Safety margin for simulation min/max (%)" on page 7-18

All collected ranges

The Fixed-Point Tool uses design ranges in addition to derived and simulation ranges to propose data types.

Design minimum and maximum values take precedence over simulation and derived ranges.

Command-Line Alternative

No command line alternative available.

Safety margin for simulation min/max (%)

Specify safety factor for simulation minimum and maximum values.

Settings

Default: 0

The simulation minimum and maximum values are adjusted by the percentage designated by this parameter, allowing you to specify a range different from that obtained from the simulation run. The specified safety margin must be a real number greater than -`100`. For example, a value of 55 specifies that a range *at least* 55 percent larger is desired. A value of -15 specifies that a range *up to* 15 percent smaller is acceptable.

Dependencies

Before performing automatic data typing, you must specify design minimum and maximum values or run a simulation to collect simulation minimum and maximum data, or collect derived minimum and maximum values.

Command-Line Alternative

No command line alternative available.

Advanced Settings

Advanced Settings Overview

Use the Advanced Settings dialog to control the fixed-point instrumentation mode, and data type override settings. You can also use the Advanced Settings dialog to add or edit user-defined configurations. You cannot modify the factory default configurations. If you add a new configuration and want it to appear as a button on the Fixed-Point Tool **Configure model settings** pane, use the controls in the **Shortcuts** tab.

Fixed-point instrumentation mode

Control which objects log minimum, maximum and overflow data during simulation.

Settings

Default: Use local settings

`Use local settings`

> Logs data according to the value of this parameter set for each subsystem. Otherwise, settings for parent systems always override those of child systems.

`Minimums, maximums and overflows`

> Logs minimum value, maximum value, and overflow data for all blocks in the current system or subsystem during simulation.

`Overflows only`

> Logs only overflow data for all blocks in the current system or subsystem.

`Force off`

> Does not log data for any block in the current system or subsystem. Use this selection to work with models containing fixed-point enabled blocks if you do not have a Fixed-Point Designer license.

Tips

- You cannot change the instrumentation mode for linked subsystems or referenced models.

Dependencies

The value of this parameter for parent systems controls min/max logging for all child subsystems, unless `Use local settings` is selected.

Command-Line Alternative
Parameter: `'MinMaxOverflowLogging'`
Type: string
Value: `'UseLocalSettings'` | `'MinMaxAndOverflow'` | `'OverflowOnly'` | `'ForceOff'`
Default: `'UseLocalSettings'`

Data type override

Control data type override of objects that allow you to specify data types in their dialog boxes.

Settings

Default: `Use local settings`

The value of this parameter for parent systems controls data type override for all child subsystems, unless `Use local settings` is selected.

`Use local settings`

Overrides data types according to the setting of this parameter for each subsystem.

`Scaled double`

Overrides the data type of all blocks in the current system and subsystem with doubles; however, the scaling and bias specified in the dialog box of each block is maintained.

`Double`

Overrides the output data type of all blocks in the current system or subsystem with doubles. The overridden values have no scaling or bias.

`Single`

Overrides the output data type of all blocks in the current system or subsystem with singles. The overridden values have no scaling or bias.

`Off`

No data type override is performed on any block in the current system or subsystem. The settings on the blocks are used.

Tips

- Set this parameter to `Double` or `Single` and the **Data type override applies to** parameter to `All numeric types` to work with models containing fixed-point enabled blocks if you do not have a Fixed-Point Designer license.

- You cannot change the **Data type override** setting on linked subsystems or referenced models.

- Data type override never applies to `boolean` data types.

- When you set the **Data type override** parameter of a parent system to `Double`, `Single`, `Scaled double` or `Off`, this setting also applies to all child subsystems and you cannot change the data type override setting for these child subsystems. When the **Data type override** parameter of a parent system is `Use local settings`, you can set the **Data type override** parameter for individual children.

- Use this parameter with the **Data type override applies to** parameter. The following table details how these two parameters affect the data types in your model.

Fixed-Point Tool Settings		Block Local Settings	
Data type override	**Data type override applies to**	**Floating-point types**	**Fixed-point types**
Use local settings/Off	N/A	Unchanged	Unchanged
Double	All numeric types	Double	Double
	Floating-point	Double	Unchanged
	Fixed-point	Unchanged	Double
Single	All numeric types	Single	Single
	Floating-point	Single	Unchanged
	Fixed-point	Unchanged	Single
Scaled double	All numeric types	Double	Scaled double equivalent of fixed-point type
	Floating-point	Double	Unchanged
	Fixed-point	Unchanged	Scaled double equivalent of fixed-point type

Dependencies

- The following Simulink blocks allow you to set data types in their block masks, but ignore the **Data type override** setting:

  - Probe
  - Trigger
  - Width

Command-Line Alternative
Parameter: `'DataTypeOverride'`
Type: string
Value: `'UseLocalSettings'` | `'ScaledDouble'` | `'Double'` | `'Single'` | `'Off'`
Default: `'UseLocalSettings'`

Data type override applies to

Specifies which data types the Fixed-Point Tool overrides

Settings

Default: `All numeric types`

`All numeric types`

> Data type override applies to all numeric types, floating-point and fixed-point. It does not apply to `boolean` or enumerated data types.

`Floating-point`

> Data type override applies only to floating-point data types, that is, `double` and `single`.

`Fixed-point`

> Data type override applies only to fixed-point data types, for example, `uint8`, `fixdt`.

Tips

- Use this parameter with the **Data type override** parameter.
- Data type override never applies to `boolean` or enumerated data types or to buses.
- When you set the **Data type override** parameter of a parent system to `Double`, `Single`, `Scaled double` or `Off`, this setting also applies to all child subsystems and you cannot change the data type override setting for these child subsystems. When the **Data type override** parameter of a parent system is `Use local setting`, you can set the **Data type override** parameter for individual children.
- The following table details how these two parameters affect the data types in your model.

Fixed-Point Tool Settings		Block Local Settings	
Data type override	**Data type override applies to**	**Floating-point types**	**Fixed-point types**
Use local settings/Off	N/A	Unchanged	Unchanged
Double	All numeric types	Double	Double
	Floating-point	Double	Unchanged
	Fixed-point	Unchanged	Double
Single	All numeric types	Single	Single
	Floating-point	Single	Unchanged
	Fixed-point	Unchanged	Single

Fixed-Point Tool Settings		Block Local Settings	
Data type override	Data type override applies to	Floating-point types	Fixed-point types
Scaled double	All numeric types	Double	Scaled double equivalent of fixed-point type
	Floating-point	Double	Unchanged
	Fixed-point	Unchanged	Scaled double equivalent of fixed-point type

Dependencies

This parameter is enabled only when **Data type override** is set to `Scaled double`, `Double` or `Single`.

Command-Line Alternative
Parameter: `'DataTypeOverrideAppliesTo'`
Type: string
Value: `'AllNumericTypes'` | `'Floating-point'` | `'Fixed-point'`
Default: `'AllNumericTypes'`

Name of shortcut

Enter a unique name for your shortcut. By default, the Fixed-Point Tool uses this name as the **Run name** for this shortcut.

If the shortcut name already exists, the new settings overwrite the existing settings.

See Also

• "Run Management" (Fixed-Point Designer)

Allow modification of fixed-point instrumentation settings

Select whether to change the model fixed-point instrumentation settings when you apply this shortcut to the model.

Settings

Default: On

☑ On

> When you apply this shortcut to the model, changes the fixed-point instrumentation settings of the model and its subsystems to the setting defined in this shortcut.

☐ Off

> Does not change the fixed-point instrumentation settings when you apply this shortcut to the model.

Tip

If you want to control data type override settings without altering the fixed-point instrumentation settings on your model, clear this option.

See Also

- "Run Management" (Fixed-Point Designer)

Allow modification of data type override settings

Select whether to change the model data type override settings when you apply this shortcut to the model

Settings

Default: On

☑ On

> When you apply this shortcut to the model, changes the data type override settings of the model and its subsystems to the settings defined in this shortcut .

☐ Off

> Does not change the fixed-point instrumentation settings when you apply this shortcut to the model.

Allow modification of run name

Select whether to change the run name on the model when you apply this shortcut to the model

Settings

Default: On

☑ On

> Changes the run name to the setting defined in this shortcut when you apply this shortcut to the model.

☐ Off

> Does not change the run name when you apply this shortcut to the model.

Run name

Specify the run name to use when you apply this shortcut.

By default, the run name uses the name of the shortcut. Run names are case sensitive.

Dependency

Allow modification of run name enables this parameter.

Capture system settings

Copy the model and subsystem fixed-point instrumentation mode and data type override settings into the Shortcut editor.

Fixed-point instrumentation mode

Control which objects in the shortcut editor log minimum, maximum and overflow data during simulation.

This information is stored in the shortcut. To use the current model setting, click **Capture system settings**.

Settings

Default: Same as model setting

`Use local settings`

> Logs data according to the value of this parameter set for each subsystem. Otherwise, settings for parent systems always override those of child systems.

`Minimums, maximums and overflows`

> Logs minimum value, maximum value, and overflow data for all blocks in the current system or subsystem during simulation.

`Overflows only`

> Logs only overflow data for all blocks in the current system or subsystem.

`Force off`

> Does not log data for any block in the current system or subsystem. Use this selection to work with models containing fixed-point enabled blocks if you do not have a Fixed-Point Designer license.

Dependency

Allow modification of fixed-point instrumentation settings enables this parameter.

Data type override

Control data type override of objects that allow you to specify data types in their dialog boxes.

This information is stored in the shortcut. To use the current model settings, click **Capture system settings**.

Settings

Default: Same as model

The value of this parameter for parent systems controls data type override for all child subsystems, unless `Use local settings` is selected.

`Use local settings`

> Overrides data types according to the setting of this parameter for each subsystem.

`Scaled double`

> Overrides the data type of all blocks in the current system and subsystem with doubles; however, the scaling and bias specified in the dialog box of each block is maintained.

`Double`

> Overrides the output data type of all blocks in the current system or subsystem with doubles. The overridden values have no scaling or bias.

`Single`

> Overrides the output data type of all blocks in the current system or subsystem with singles. The overridden values have no scaling or bias.

`Off`

> No data type override is performed on any block in the current system or subsystem. The settings on the blocks are used.

Dependency

Allow modification of data type override settings enables this parameter.

Data type override applies to

Specifies which data types to override when you apply this shortcut.

This information is stored in the shortcut. To use the current model setting, click **Capture system settings**.

Settings

Default: `All numeric types`

`All numeric types`

> Data type override applies to all numeric types, floating-point and fixed-point. It does not apply to `boolean` or enumerated data types.

`Floating-point`

> Data type override applies only to floating-point data types, that is, `double` and `single`.

`Fixed-point`

> Data type override applies only to fixed-point data types, for example, `uint8`, `fixdt`.

Dependency

Allow modification of data type override settings enables this parameter.

Migrating to Simplified Initialization Mode Overview

Simplified initialization mode was introduced in R2008b to improve the consistency of simulation results. This mode is especially important for models that do not specify initial conditions for conditionally executed subsystem output ports. For more information, see "Simplified Initialization Mode" and "Classic Initialization Mode".

Use the Model Advisor checks in **Migrating to Simplified Initialization Mode** to help migrate your model to simplified initialization mode.

Identify unconnected lines, input ports, and output ports

Check ID: `mathworks.design.UnconnectedLinesPorts`

Check for unconnected lines or ports.

Description

This check lists unconnected lines or ports. These can have difficulty propagating signal attributes such as data type, sample time, and dimensions.

Note Ports connected to ground/terminator blocks will pass this test.

Results and Recommended Actions

Condition	Recommended Action
Lines, input ports, or output ports are unconnected.	Connect the signals. Double-click the list of unconnected items to locate failure.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

Tips

Use the `PortConnectivity` command to obtain an array of structures describing block input or output ports.

See Also

"Common Block Properties" on page 6-111 for information on the `PortConnectivity` command.

"What Is a Model Advisor Exclusion?" (Simulink Check)

Check root model Inport block specifications

Check ID: `mathworks.design.RootInportSpec`

Check that root model Inport blocks fully define dimensions, sample time, and data type.

Description

Using root model Inport blocks that do not fully define dimensions, sample time, or data type can lead to undesired simulation results. Simulink software back-propagates dimensions, sample times and data types from downstream blocks unless you explicitly assign them values.

Results and Recommended Actions

Condition	Recommended Action
Root-level Inport blocks have undefined attributes.	Fully define the attributes of the root-level Inport blocks.

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

Tips

The following configurations pass this check:

- **Configuration Parameters > Solver > Periodic sample time constraint** is set to `Ensure sample time independent`
- For export-function models, *inherited sample time* is not flagged.

See Also

- "About Data Types in Simulink".
- "Determine Output Signal Dimensions".
- "Specify Sample Time".
- "What Is a Model Advisor Exclusion?" (Simulink Check)

Check optimization settings

Check ID: `mathworks.design.OptimizationSettings`

Check for optimizations that can lead to non-optimal code generation and simulation.

Description

This check reviews the status of optimizations that can improve code efficiency and simulation time.

Results and Recommended Actions

Condition	Recommended Action
The specified optimizations are off.	Select the following optimization check boxes on the **Optimization** pane in the Configuration Parameters dialog box: • "Remove root level I/O zero initialization" (Simulink Coder) • "Remove internal data zero initialization" (Simulink Coder) Select the following optimization check boxes on the **Optimization** pane in the Configuration Parameters dialog box: • "Inline invariant signals" (Simulink Coder) (only if you have a Simulink Coder license) Select the following optimization check boxes in the Configuration Parameters dialog box: • "Block reduction" • "Conditional input branch execution" • "Implement logic signals as Boolean data (vs. double)" • "Use memset to initialize floats and doubles to 0.0" (Simulink Coder) • "Remove code from floating-point to integer conversions that wraps out-of-range values" (Simulink Coder) (only if you have a Simulink Coder license) • "Signal storage reuse" • "Enable local block outputs" (Simulink Coder) • "Reuse local block outputs" (Simulink Coder) • "Eliminate superfluous local variables (Expression folding)" (Simulink Coder) Select the following optimization check boxes on the **Optimization** pane in the Configuration Parameters dialog box: **Note** Model Advisor checks these parameters only if there is a Stateflow chart in the model.

Condition	Recommended Action
	• "Use bitsets for storing state configuration" (Simulink Coder) • "Use bitsets for storing Boolean data" (Simulink Coder)
"Application lifespan (days)" is set as infinite. This could lead to expensive 64-bit counter usage.	Choose a stop time if this is not intended.
The specified diagnostics, which can increase the time it takes to simulate your model, are set to warning or error.	Select none for: • **Solver data inconsistency** • **Array bounds exceeded** • **Diagnostics** > **Data Validity** > **Simulation range checking**
The specified Embedded Coder parameters are off.	If you have an Embedded Coder license and you are using an ERT-based system target file: • Select **Single output/update function**. For details, see "Single output/update function" (Simulink Coder). • Select **Ignore test point signals**. For details, see "Ignore test point signals" (Simulink Coder). • Set **Pass reusable subsystem outputs as** to Individual arguments. For details, see "Pass reusable subsystem outputs as" (Simulink Coder).

Tips

If the system contains Model blocks and the referenced model is in Accelerator mode, simulating the model requires generating and compiling code.

See Also

• "Optimization Pane" (Simulink Coder)

Check diagnostic settings ignored during accelerated model reference simulation

Check ID: mathworks.design.ModelRefSIMConfigCompliance

Checks for referenced models for which Simulink changes configuration parameter settings during accelerated simulation.

Description

For models referenced in accelerator mode, Simulink ignores the settings of the following configuration parameters that you set to a value other than `None`.

- **Array bounds exceeded**
- **Diagnostics > Data Validity > Inf or NaN block output**
- **Diagnostics > Data Validity > Division by singular matrix**
- **Diagnostics > Data Validity > Wrap on overflow**

Also, for models referenced in accelerator mode, Simulink ignores the following **Configuration Parameters > Diagnostics > Data Validity > Data Store Memory block** parameters if you set them to a value other than `Disable all`. For details, see "Data Store Diagnostics".

- **Detect read before write**
- **Detect write after read**
- **Detect write after write**

Results and Recommended Actions

Condition	Recommended Action
You want to see the results of running the identified diagnostics with settings to produce warnings or errors.	Simulate the model in Normal mode and resolve diagnostic warnings or errors.

Check for parameter tunability information ignored for referenced models

Check ID: `mathworks.design.ParamTunabilityIgnored`

Checks if parameter tunability information is included in the Model Parameter Configuration dialog box.

Description

Simulink software ignores tunability information specified in the Model Parameter Configuration dialog box. This check identifies those models containing parameter tunability information that Simulink software will ignore if the model is referenced by other models.

Results and Recommended Actions

Condition	Recommended Action
Model contains ignored parameter tunability information.	Click the links to convert to equivalent Simulink parameter objects in the MATLAB workspace.

See Also

"Create Tunable Calibration Parameter in the Generated Code" (Simulink Coder).

Check for implicit signal resolution

Check ID: `mathworks.design.ImplicitSignalResolution`

Identify models that attempt to resolve named signals and states to `Simulink.Signal` objects.

Description

Requiring Simulink software to resolve all named signals and states is inefficient and slows incremental code generation and model reference. This check identifies those signals and states for which you may turn off implicit signal resolution and enforce resolution.

Results and Recommended Actions

Condition	Recommended Action
Not all signals and states are resolved.	Turn off implicit signal resolution and enforce resolution for each signal and state that does resolve.

See Also

"Resolve Signal Objects for Output Data".

Check for optimal bus virtuality

Check ID: `mathworks.design.OptBusVirtuality`

Identify virtual buses that could be made nonvirtual. Making these buses nonvirtual improves generated code efficiency.

Description

This check identifies blocks incorporating virtual buses that cross a subsystem boundary. Changing these to nonvirtual improves generated code efficiency.

Results and Recommended Actions

Condition	Recommended Action
Blocks that specify a virtual bus crossing a subsystem boundary.	Change the highlighted bus to nonvirtual.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

- "Signal Basics".
- "Virtual and Nonvirtual Buses".
- "What Is a Model Advisor Exclusion?" (Simulink Check)

Check for Discrete-Time Integrator blocks with initial condition uncertainty

Check ID: `mathworks.design.DiscreteTimeIntegratorInitCondition`

Identify Discrete-Time Integrator blocks with state ports and initial condition ports that are fed by neither an Initial Condition nor a Constant block.

Description

Discrete-Time Integrator blocks with state port and initial condition ports might not be suitably initialized unless they are fed from an Initial Condition or Constant block. This is more likely to happen when Discrete-Time Integrator blocks are used to model second-order or higher-order dynamic systems.

Results and Recommended Actions

Condition	Recommended Action
Discrete-Time Integrator blocks are not initialized during the model initialization phase.	Add a Constant or Initial Condition block to feed the external Initial Condition port.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

- IC block
- Discrete-Time Integrator block
- Constant block
- "What Is a Model Advisor Exclusion?" (Simulink Check)

Identify disabled library links

Check ID: `mathworks.design.DisabledLibLinks`

Search model for disabled library links.

Description

Disabled library links can cause unexpected simulation results. Resolve disabled links before saving a model.

Note This check may overlap with "Check model for block upgrade issues" on page 8-57.

Results and Recommended Actions

Condition	Recommended Action
Library links are disabled.	Click the **Library Link > Resolve link** option in the context menu.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

Tips

- Use the Model Browser to find library links.
- To enable a broken link, right-click a block in your model to display the context menu. Select **Library Link > Resolve link**.

See Also

"Restore Disabled or Parameterized Links"

"What Is a Model Advisor Exclusion?" (Simulink Check)

Check for large number of function arguments from virtual bus across model reference boundary

Check ID: `mathworks.design.CheckVirtualBusAcrossModelReferenceArgs`

Checks virtual bus signals that cross model reference boundaries and flags cases where using virtual buses across a model reference boundary increases the number of function arguments significantly.

Description

To improve the speed of the code generation process, you can use this check to reduce the number of generated function arguments. If the check finds a model that where many arguments will be generated for a function, you can click **Update Model** to modify the model so that it generates fewer arguments.

Results and Recommended Action

Methods that generate many function arguments as the result of a virtual bus signal crossing model reference boundary slow down the code generation process.

Condition	Recommended Action
Methods are listed that generate a large number of arguments for the current the model configuration that this check can reduce by modifying the model.	Click **Update Model**.

Clicking **Update Model** resets Inport and Outport block parameters and inserts Signal Conversion blocks, as necessary, to reduce the number of generated function arguments for the model.

See Also

"Bus Data Crossing Model Reference Boundaries"

Identify parameterized library links

Check ID: `mathworks.design.ParameterizedLibLinks`

Search model for parameterized library links.

Description

Parameterized library links that are unintentional can result in unexpected parameter settings in your model. This can result in improper model operation.

Results and Recommended Actions

Condition	Recommended Action
Parameterized links are listed.	Verify that the links are intended to be parameterized.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

Tips

- Right-click a block in your model to display the context menu. Choose `Link Options` and click `Go To Library Block` to see the original block from the library.
- To parameterize a library link, choose `Look Under Mask`, from the context menu and select the parameter.

See Also

"Restore Disabled or Parameterized Links"

"What Is a Model Advisor Exclusion?" (Simulink Check)

Identify unresolved library links

Check ID: `mathworks.design.UnresolvedLibLinks`

Search the model for unresolved library links, where the specified library block cannot be found.

Description

Check for unresolved library links. Models do not simulate while there are unresolved library links.

Results and Recommended Actions

Condition	Recommended Action
Library links are unresolved.	Locate missing library block or an alternative.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

"Fix Unresolved Library Links"

"What Is a Model Advisor Exclusion?" (Simulink Check)

Identify model reference variants and variant subsystems that override variant choice

Check ID: `mathworks.design.VariantOverride`

Identify model or subsystem for model reference variants and variant subsystems that specify variant choice using the override option instead of using the active variant object.

Results and Recommended Actions

Condition	Recommended Action
Model reference variants or variant subsystems that override variant choice are identified.	Specify variant choice using active variant object.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

"Working with Variant Choices"

"What Is a Model Advisor Exclusion?" (Simulink Check)

Identify configurable subsystem blocks for converting to variant subsystem blocks

Check ID: `mathworks.design.CSStoVSSConvert`

Search the model to identify configurable subsystem blocks at the model or subsystem level.

Results and Recommended Actions

Condition	Recommended Action
Configurable subsystem blocks are identified.	Convert these blocks to variant subsystem blocks to avoid compatibility issues. See Configurable Subsystem.

Capabilities and Limitations

You can run this check on your library models.

See Also

"Set up Model Variants Using a Model Block"

Identify Variant Model blocks and convert those to Variant Subsystem containing Model block choices

Check ID: `mathworks.design.ConvertMdlrefVarToVSS`

Search the model to identify Variant Model blocks.

Results and Recommended Actions

Condition	Recommended Action
Variant Model blocks available in the model are listed.	Convert these blocks to Variant Subsystem blocks.

See Also

"Convert to Variants"

Check usage of function-call connections

Check ID: `mathworks.design.CheckForProperFcnCallUsage`

Check model diagnostic settings that apply to function-call connectivity and that might impact model execution.

Description

Check for connectivity diagnostic settings that might lead to non-deterministic model execution.

Results and Recommended Actions

Condition	Recommended Action
Diagnostics > Connectivity > Invalid function-call connection is set to `warning`. This might lead to non-deterministic model execution.	Set **Diagnostics > Connectivity > Invalid function-call connection** to `error`.
Diagnostic > Connectivity > Context-dependent inputs is set to `Disable All` or `Use local settings`. This might lead to non-deterministic model execution.	Set **Diagnostics > Connectivity > Context-dependent inputs** to `Enable all as errors`.

See Also

Function-Call Subsystem

Check model for upgradable Simulink Scope blocks

Check model for Simulink Scope blocks that you can upgrade to Simulink Time Scope blocks

Description

In a future release, Simulink Scope blocks will be removed and replaced with Simulink Time Scope blocks.

Results and Recommended Actions

Condition	Recommended Action
Model does not have Simulink Scope blocks.	No action required.
Model includes at least one Simulink Scope block.	Select the **Check model for upgradable Simulink Scope blocks** check, click the **Run This Check** button, review the list of scope blocks, and then click the **Upgrade** button.

Check Data Store Memory blocks for multitasking, strong typing, and shadowing issues

Check ID: `mathworks.design.DataStoreMemoryBlkIssue`

Look for modeling issues related to Data Store Memory blocks.

Description

Checks for multitasking data integrity, strong typing, and shadowing of data stores of higher scope.

Results and Recommended Actions

Condition	Recommended Action
The **Duplicate data store names** check is set to `none` or `warning`.	Consider setting the "Duplicate data store names" check to `error` in the Configuration Parameters dialog box, on the **Diagnostics > Data Validity** pane.
The data store variable names are not strongly typed in one of the following: • **Signal Attributes** pane of the **Block Parameters** dialog for the Date Store Memory block • Global data store name	Specify a data type other than auto by taking one of the following actions: • Choose a data type other than `Inherit: auto` on the **Signal Attributes** pane of the **Block Parameters** dialog for the Date Store Memory block. • If you are using a global data store name, then specify its data type in the `Simulink.Signal` object.
The **Multitask data store** check is set to `none` or `warning`.	Consider setting the "Multitask data store" check to `error` in the Configuration Parameters dialog box, on the **Diagnostics > Data Validity** pane.

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

See Also

• "Local and Global Data Stores"
• "Storage Classes for Data Store Memory Blocks" (Simulink Coder)
• Data Store Memory
• Data Store Read
• Data Store Write
• "Duplicate data store names"
• "Multitask data store"
• "What Is a Model Advisor Exclusion?" (Simulink Check)

Check if read/write diagnostics are enabled for data store blocks

Check ID: `mathworks.design.DiagnosticDataStoreBlk`

For data store blocks in the model, enable the read-and-write diagnostics order checking to detect run-time issues.

Description

Check for the read-and-write diagnostics order checking. By enabling the read-and-write diagnostics, you detect potential run-time issues.

Results and Recommended Actions

Condition	Recommended Action
The **Detect read before write** check is disabled.	Consider enabling "Detect read before write" in the Configuration Parameter dialog box **Diagnostics> Data Validity** pane.
The **Detect write after read** check is disabled.	Consider enabling "Detect write after read" in the Configuration Parameter dialog box **Diagnostics> Data Validity** pane.
The **Detect write after write** check is disabled.	Consider enabling "Detect write after write" in the Configuration Parameter dialog box **Diagnostics> Data Validity** pane.

Capabilities and Limitations

Exclude blocks and charts from this check if you have a Simulink Check license.

Tips

.

• The run-time diagnostics can slow simulations down considerably. Once you have verified that Simulink does not generate warnings or errors during simulation, set them to `Disable all`.

See Also

- "Local and Global Data Stores"
- Data Store Memory
- Data Store Read
- Data Store Write

- "What Is a Model Advisor Exclusion?" (Simulink Check)

Check data store block sample times for modeling errors

Check ID: `mathworks.design.DataStoreBlkSampleTime`

Identify modeling errors due to the sample times of data store blocks.

Description

Check data store blocks for continuous or fixed-in-minor-step sample times.

Results and Recommended Actions

Condition	Recommended Action
Data store blocks in your model have continuous or fixed-in-minor-step sample times.	Consider making the listed blocks discrete or replacing them with either Memory or Goto and From blocks.

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

See Also

- "Local and Global Data Stores"
- Data Store Memory

- Data Store Read
- Data Store Write
- "Fixed-in-Minor-Step"
- "What Is a Model Advisor Exclusion?" (Simulink Check)

Check for potential ordering issues involving data store access

Check ID: `mathworks.design.OrderingDataStoreAccess`

Look for read/write issues which may cause inaccuracies in the results.

Description

During an **Update Diagram**, identify potential issues relating to read-before-write, write-after-read, and write-after-write conditions for data store blocks.

Results and Recommended Actions

Condition	Recommended Action
Reading and writing (read-before-write or write-after-read condition) occur out of order.	Consider restructuring your model so that the Data Store Read block executes before the Data Store Write block.
Multiple writes occur within a single time step.	Change the model to write data only once per time step or refer to the following Tips section.

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

Tips

This check performs a static analysis which might not identify every instance of improper usage. Specifically, Function-Call Subsystems, Stateflow Charts, MATLAB for code generation, For Iterator Subsystems, and For Each Subsystems can cause both missed detections and false positives. For a more comprehensive check, consider enabling the following diagnostics on the **Diagnostics > Data Validity** pane in the Configuration

Parameters dialog box: "Detect read before write", "Detect write after read", and "Detect write after write".

See Also

- "Local and Global Data Stores"
- Data Store Memory
- Data Store Read

Check structure parameter usage with bus signals

Check ID: `mathworks.design.MismatchedBusParams`

Identify blocks and `Simulink.Signal` objects that initialize bus signals by using mismatched structures.

Description

In a model, you can use a MATLAB structure to initialize a bus signal. For example, if you pass a bus signal through a Unit Delay block, you can set the **Initial condition** parameter to a structure. For basic information about initializing buses by using structures, see "Specify Initial Conditions for Bus Signals".

Run this check to generate efficient and readable code by matching the shape and numeric data types of initial condition structures with those of bus signals. Matching these characteristics avoids unnecessary explicit typecasts and replaces field-by-field structure assignments with, for example, calls to `memcpy`.

Partial Structures

This check lists blocks and `Simulink.Signal` objects that initialize bus signals by using partial structures. During the iterative process of creating a model, you can use partial structures to focus on a subset of signal elements in a bus. For a mature model, use full structures to:

- Generate readable and efficient code.
- Support a modeling style that explicitly initializes unspecified signals. When you use partial structures, Simulink implicitly initializes unspecified signals.

For more information about full and partial structures, see "Create Full Structures for Initialization" and "Create Partial Structures for Initialization".

Data Type Mismatches

This check lists blocks and `Simulink.Signal` objects whose initial condition structures introduce data type mismatches. The fields of these structures have numeric data types that do not match the data types of the corresponding bus signal elements.

When you configure an initial condition structure to appear as a tunable global structure in the generated code, avoid unnecessary explicit typecasts by matching the data types. See "Generate Tunable Initial Condition Structure for Bus Signal" (Simulink Coder).

Results and Recommended Actions

Condition	Recommended Action
Block or signal object uses partial structure	Consider using the function `Simulink.Bus.createMATLABStructure` to create a full initial condition structure.
Data types of structure fields do not match data types of corresponding signal elements	Consider defining the structure as a `Simulink.Parameter` object, and creating a `Simulink.Bus` object to use as the data type of the bus signal and of the parameter object. To control numeric data types, use the `Simulink.BusElement` objects in the bus object.

See Also

- "Specify Initial Conditions for Bus Signals"

- `Simulink.Signal`

Check Delay, Unit Delay and Zero-Order Hold blocks for rate transition

Check ID: `mathworks.design.ReplaceZOHDelayByRTB`

Identify Delay, Unit Delay, or Zero-Order Hold blocks that are used for rate transition. Replace these blocks with actual Rate Transition blocks.

Description

If a model uses Delay, Unit Delay, or Zero-Order Hold blocks to provide rate transition between input and output signals, Simulink makes a hidden replacement of these blocks with built-in Rate Transition blocks. In the compiled block diagram, a yellow symbol and the letters "RT" appear in the upper-left corner of a replacement block. This replacement can affect the behavior of the model, as follows:

- These blocks lose their algorithmic design properties to delay a signal or implement zero-order hold. Instead, they acquire rate transition behavior.

- This modeling technique works only in specific transition configurations (slow-to-fast for Delay and Unit Delay blocks, and fast-to-slow for Zero-Order Hold block). Set the block sample time to be equal to the slower rate (source for the Delay and Unit Delay blocks and destination for the Zero-Order Hold block).

- When the block sample time of a downstream or upstream block changes, these Delay, Unit Delay and Zero-Order Hold blocks might not perform rate transition. For example, setting the source and destination sample times equal stops rate transition. The blocks then assume their original algorithmic design properties.

- The block sample time shows incomplete information about sample time rates. The block code runs at two different rates to handle data transfer. However, the block sample time and sample time color show it as a single-rate block. Tools and MATLAB scripts that use sample time information base their behavior on this information.

An alternative is to replace Delay, Unit Delay, or Zero-Order Hold blocks with actual Rate Transition blocks.

- The technique ensures unambiguous results in block behavior. Delay, Unit Delay, or Zero-Order Hold blocks act according to their algorithmic design to delay and hold signals respectively. Only Rate Transition blocks perform actual rate transition.

- Using an actual Rate Transition block for rate transition offers a configurable solution to handle data transfer if you want to specify deterministic behavior or the type of memory buffers to implement.

Use this check to identify instances in your model where Delay, Unit Delay or Zero-Order Hold blocks undergo hidden replacement to provide rate transition between signals. Click **Upgrade Model** to replace these blocks with actual Rate Transition blocks.

Results and Recommended Actions

Condition	Recommended Action
Model has no instances of Delay, Unit Delay, or Zero-Order Hold blocks used for rate transition.	No action required.
Model has instances of Delay, Unit Delay, or Zero-Order Hold blocks used for rate transition.	The check identifies these instances and allows you to upgrade the model. 1 Click **Upgrade Model** to replace with actual Rate Transition blocks. 2 Save changes to your model.

If you do not choose to replace the Delay, Unit Delay, and/or Zero-Order Hold blocks with actual Rate Transition blocks, Simulink continues to perform a hidden replacement of these blocks with built-in rate transition blocks.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

- "Run Model Checks"
- "Model Upgrades"
- Rate Transition
- "What Is a Model Advisor Exclusion?" (Simulink Check)

Check for calls to slDataTypeAndScale

Check ID: `mathworks.design.CallslDataTypeAndScale`

Identify calls to the internal function `slDataTypeAndScale`.

Description

In some previous versions of Simulink, opening a model that had been saved in an earlier version triggers an automatic upgrade to code for data type handling. The automatic upgrade inserts calls to the internal function `slDataTypeAndScale`. Although Simulink continues to support some uses of the function, if you eliminate calls to it, you get cleaner and faster code.

Simulink does not support calls to `slDataTypeAndScale` when:

- The first argument is a `Simulink.AliasType` object.
- The first argument is a `Simulink.NumericType` object with property `IsAlias` set to true.

Running **Check for calls to slDataTypeAndScale** identifies calls to `slDataTypeAndScale` that are required or recommended for replacement. In most cases, running the check and following the recommended action removes the calls. You can ignore calls that remain. Run the check unless you are sure there are not calls to `slDataTypeAndScale`.

Results and Recommended Actions

Condition	Recommended Action
Required Replacement Cases	Manually or automatically replace calls to `slDataTypeAndScale`. Cases listed require you to replace calls to `slDataTypeAndScale`.
Recommended Replacement Cases	For the listed cases, it is recommended that you manually or automatically replace calls to `slDataTypeAndScale`.
Manual Inspection Cases	Inspect each listed case to determine whether it should be manually upgraded.

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

Tips

- Do not manually insert a call to `slDataTypeAndScale` into a model. The function was for internal use only.

- Running **Check for calls to slDataTypeAndScale** calls the Simulink function `slRemoveDataTypeAndScale`. Calling this function directly provides a wider range of conversion options. However, you very rarely need more conversion options.

See Also

- For more information about upgrading data types and scales, in the MATLAB Command Window, execute the following:

  - `help slDataTypeAndScale`
  - `help slRemoveDataTypeAndScale`

- "What Is a Model Advisor Exclusion?" (Simulink Check)

Check bus signals treated as vectors

Check ID: `mathworks.design.BusTreatedAsVector`

Identify bus signals that Simulink treats as vectors.

Description

You cannot use bus signals that the Simulink software implicitly converts to vectors. Instead, either insert a Bus to Vector conversion block between the bus signal and the block input port that it feeds, or use the `Simulink.BlockDiagram.addBusToVector` command.

Results and Recommended Actions

Condition	Recommended Action
Bus signals are implicitly converted to vectors.	Use `Simulink.BlockDiagram.addBusToVector` or insert a Bus to Vector block.
Model is not configured to identify bus signals that Simulink treats as vectors.	In the Configuration Parameters dialog box, on the **Diagnostics > Connectivity** pane, set **Bus signal treated as vector** to `error`.

Action Results

Clicking **Modify** inserts a Bus to Vector block at the input ports of blocks that implicitly convert bus signals to vectors.

Tips

- Run this check before running **Check consistency of initialization parameters for Outport and Merge blocks**.
- For more information, see "Correct Buses Used as Vectors".

See Also

- "Correct Buses Used as Vectors"
- Bus to Vector block
- "Bus signal treated as vector"
- "Migrating to Simplified Initialization Mode Overview" on page 8-5
- `Simulink.BlockDiagram.addBusToVector`

Check for potentially delayed function-call subsystem return values

Check ID: `mathworks.design.DelayedFcnCallSubsys`

Identify function-call return values that might be delayed because Simulink software inserted an implicit Signal Conversion block.

Description

So that signals reside in contiguous memory, Simulink software can automatically insert an implicit Signal Conversion block in front of function-call initiator block input ports. This can result in a one-step delay in returning signal values from calling function-call subsystems. The delay can be avoided by ensuring the signal originates from a signal block within the function-call system. Or, if the delay is acceptable, insert a Unit Delay block in front of the affected input ports.

Results and Recommended Actions

Condition	Recommended Action
The listed block input ports could have an implicit Signal Conversion block.	Decide if a one-step delay in returning signal values is acceptable for the listed signals. • If the delay is not acceptable, rework your model so that the input signal originates from within the calling subsystem. • If the delay is acceptable, insert a Unit Delay block in front of each listed input port.

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

See Also

Signal Conversion block

Unit Delay block

"What Is a Model Advisor Exclusion?" (Simulink Check)

Identify block output signals with continuous sample time and non-floating point data type

Check ID: `mathworks.design.OutputSignalSampleTime`

Find continuous sample time, non-floating-point output signals.

Description

Non-floating-point signals might not represent continuous variables without loss of information.

Results and Recommended Actions

Condition	Recommended Action
Signals with continuous sample times have a non-floating-point data type.	On the identified signals, either change the sample time to be discrete or fixed-in-minor-step ([0 1]).

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

See Also

"What Is Sample Time?".

"What Is a Model Advisor Exclusion?" (Simulink Check)

Check usage of Merge blocks

Check ID: `mathworks.design.MergeBlkUsage`

Identify Merge blocks with parameter settings that can lead to unexpected behavior, and help migrate your model to simplified initialization mode.

Note Run this check along with the other checks in the "Migrating to Simplified Initialization Mode Overview" on page 8-5.

Description

Simplified initialization mode was introduced in R2008b to improve the consistency of simulation results. For more information, see "Simplified Initialization Mode" and "Classic Initialization Mode".

This Model Advisor check identifies settings in the Merge blocks in your model that can cause problems if you use classic initialization mode. It also recommends settings for consistent behavior of Merge blocks. The results of the subchecks contain two types of statements: Failed and Warning. Failed statements identify issues that you must address manually before you can migrate the model to the simplified initialization mode. Warning statements identify issues or changes in behavior that can occur after migration.

Results and Recommended Actions

Condition	Recommended Action
Check the run-time diagnostic setting of the Merge block.	**1** In the Configuration Parameters dialog box, set "Detect multiple driving blocks executing at the same time step" to `error`. **2** Verify that the model simulates without errors before running this check again.
Check for Model blocks that are using the PIL simulation mode.	The simplified initialization mode does not support the Processor-in-the-loop (PIL) simulation for model references.
Check for library blocks with instances that cannot be migrated.	Examine the failed subcheck results for each block to determine the corrective actions.
Check for single-input Merge blocks.	Replace both the Mux block used to produce the input signal and the Merge block with one multi-input Merge block. Single-input Merge blocks are not supported in the simplified initialization mode.
Check for root Merge blocks that have an unspecified **Initial output** value.	If you do not specify an explicit value for the **Initial output** parameter of root Merge blocks, then Simulink uses the default initial value of the output data type. A root Merge block is a Merge block with an output port that does not connect to another Merge block. For information on the default initial value, see "Initializing Signal Values".

Condition	Recommended Action
Check for Merge blocks with nonzero input port offsets.	Clear the **Allow unequal port widths** parameter of the Merge block. **Note** Consider using Merge blocks only for signal elements that require true merging. You can combine other elements with merged elements using the Concatenate block.
Check for Merge blocks that have unconnected inputs or that have inputs from non-conditionally executed subsystems.	Set the **Number of inputs** parameter of the Merge block to the number of Merge block inputs. You must connect each input to a signal. Verify that each Merge block input is driven by a conditionally executed subsystem. Merge blocks cannot be driven directly by an Iterator Subsystem or a block that is not a conditionally executed subsystem.
Check for Merge blocks with inputs that are combined or reordered outside of conditionally executed subsystems.	Verify that combinations or reordering of Merge block input signals takes place within a conditionally executed subsystem. Such designs may use Mux, Bus Creator, or Selector blocks.
Check for Merge blocks with inconsistent input sample times.	Verify that input signals to each Merge block have the same **Sample time**. Failure to do so could result in unpredictable behavior. Consequently, the simplified initialization mode does not allow inconsistent sample times.
Check for Merge blocks with multiple input ports that are driven by a single source.	Verify that the Merge block does not have multiple input signals that are driven by the same conditionally executed subsystem or conditionally executed Model block.

Condition	Recommended Action
Check for Merge blocks that use signal objects to specify the **Initial output** value.	Verify that the following behavior is acceptable. In the simplified initialization mode, signal objects cannot specify the **Initial output** parameter of the Merge block. While you can still initialize the output signal for a Merge block using a signal object, the initialization result may be overwritten by that of the Merge block. **Note** Simulink generates a warning that the initial value of the signal object has been ignored.

Check usage of Outport blocks

Check ID: `mathworks.design.InitParamOutportMergeBlk`

Identify Outport blocks and conditional subsystems with parameter settings that can lead to unexpected behavior, and help migrate your model to simplified initialization mode.

Note Run this check along with the other checks in the "Migrating to Simplified Initialization Mode Overview" on page 8-5.

Description

Simplified initialization mode was introduced in R2008b to improve the consistency of simulation results. This mode is especially important for models that do not specify initial conditions for conditionally executed subsystem output ports. For more information, see "Simplified Initialization Mode" and "Classic Initialization Mode".

This Model Advisor check identifies Outport blocks and conditional subsystems in your model that can cause problems if you use the simplified initialization mode. It also recommends settings for consistent behavior of Outport blocks. The results of the subchecks contain two types of statements: Failed and Warning. Failed statements identify issues that you must address manually before you can migrate the model to the simplified initialization mode. Warning statements identify issues or changes in behavior can occur after migration.

Results and Recommended Actions

Condition	Recommended Action
Check for blocks inside of the Iterator Subsystem that require elapsed time.	Within an Iterator Subsystem hierarchy, do not use blocks that require a service that maintains the time that has elapsed between two consecutive executions.
	Since an Iterator Subsystem can execute multiple times at a given time step, the concept of elapsed time is not well-defined between two such executions. Using these blocks inside of an Iterator Subsystem can cause unexpected behavior.

Condition	Recommended Action
Check for Outport blocks that have conflicting signal buffer requirements.	The Outport block has a function-call trigger or function-call data dependency signal passing through it, along with standard data signals. Some of the standard data signals require an explicit signal buffer for the initialization of the output signal of the corresponding subsystem. However, buffering function-call related signals lead to a function-call data dependency violation.

Consider modifying the model to pass function-call related signals through a separate Outport block. For examples of function-call data dependency violations, see the example model `sl_subsys_semantics`.

A standard data signal may require an additional signal copy for one of the following reasons:

• The Outport block is driven by a block with output that cannot be overwritten. The Ground block and the Constant block are examples of such blocks.

• The Outport block shares the same signal source with another Outport block in the same subsystem or in one nested within the current subsystem but having a different initial output value.

• The Outport block connects to the input of a Merge block

• One of the input signals of the Outport block is specifying a `Simulink.Signal` object with an explicit initial value. |

Condition	Recommended Action
Check for Outport blocks that are driven by a bus signal and whose **Initial output** value is not scalar.	For Outport blocks driven by bus signals, classic initialization mode does not support Initial Condition (IC) structures, while simplified initialization mode does. Hence, when migrating a model from classic to simplified mode, specify a scalar for the **Initial Output** parameter. After migration completes, to specify different initial values for different elements of the bus signal, use IC structures. For more information, see "Create Initial Condition Structures".

Condition	Recommended Action
Check for Outport blocks that require an explicit signal copy.	An explicit copy of the bus signal driving the Outport block is required for the initialization of the output signal of the corresponding subsystem. Insert a Signal Conversion block before the Outport block, then set the Output parameter of the Signal Conversion block to `Bus copy`. A standard data signal may require an additional signal copy for one or more of the following reasons: • A block with output that cannot be overwritten is driving the Outport block. The Ground block and the Constant block are examples of such blocks. • The Outport block shares the same signal source with another Outport block in the same subsystem or in one nested within the current subsystem but having a different initial output value. • The Outport block connects to the input of a Merge block • One of the input signals of the Outport block is specifying a `Simulink.Signal` object with an explicit initial value.
Check for merged Outport blocks that inherit the **Initial Output** value from Outport blocks that have been configured to reset when the blocks become disabled.	When Outport blocks are driving a Merge block, do not set their **Output when disabled** parameters to `reset`.
Check for merged Outport blocks that are driven by nested conditionally executed subsystems.	Determine if the new behavior of the Outport blocks is acceptable. If it is not acceptable, modify the model to account for the new behavior before migrating to the simplified initialization mode.

Condition	Recommended Action
Check for merged Outport blocks that reset when the blocks are disabled.	Set the **Output when disabled** parameter of the Outport block to `held`. This setting is required because the Outport block connects to a Merge block. For more information, see Outport.
Check for Outport blocks that have an undefined **Initial output** value with invalid initial condition sources.	Verify that the following behavior is acceptable. When the **Initial output** parameter is unspecified (`[]`), it inherits the initial output from the source blocks. If at least one of the sources of the Outport block is not a valid source to inherit the initial value, the block uses the default initial value for that data type. For simplified initialization mode, valid sources an Outport blocks can inherit the **Initial output** value from are: Constant, Initial Condition, Merge (with initial output), Stateflow chart, function-call model reference, or conditionally executed subsystem blocks.
Check Outport blocks that have automatic rate transitions.	Simulink has inserted a Rate Transition block at the input of the Outport block. Specify the **Initial output** parameter for each Outport block. Otherwise, perform the following procedure: 1 In the Configuration Parameters dialog box, on the **Solver** pane, clear the option "Automatically handle rate transition for data transfer". 2 Run this Model Advisor check again.

Condition	Recommended Action
Check Outport blocks that have a special signal storage requirement and have an undefined **Initial output** value.	Verify that the following behavior is acceptable. Specify the **Initial output** parameter for the Outport block. Set this value to [ ] (empty matrix) to use the default initial value of the output data type.
Check the **Initial output** setting of Outport blocks that reset when they are disabled.	Specify the **Initial output** parameter of the Outport block. You must specify the **Initial output** value for blocks that are configured to reset when they become disabled.
Check the **Initial output** setting for Outport blocks that pass through a function-call data dependency signal.	You cannot specify an **Initial output** value for the Outport block because function-call data dependency signals are passing through it. To set the **Initial output** value: 1 Set the **Initial output** parameter of the Outport block to [ ]. 2 Provide the initial value at the source of the data dependency signal rather than at the Outport block.

Condition	Recommended Action
Check for Outport blocks that use signal objects to specify the **Initial output** value.	Verify that the following behavior is acceptable.
	In the simplified initialization mode, signal objects cannot specify the **Initial output** parameter of an Outport block. You can still initialize the input or output signals for an Outport block using signal objects, but the initialization results may be overwritten by those of the Outport block.
	Note If you are working with a conditionally executed subsystem Outport block, Simulink generates a warning that the initial value of the signal object has been ignored.
Check for library blocks with instances that have warnings.	Examine the warning subcheck results for each block before migrating to the simplified initialization mode.
Check for merged Outport blocks that are either unconnected or connected to a Ground block.	Verify that the following behavior is acceptable.
	The Outport block is driving a Merge block, but its inputs are either unconnected or connected to Ground blocks. In the classic initialization mode, unconnected or grounded outports do not update the merge signal even when their parent conditionally executed subsystems are executing. In the simplified initialization mode, however, these outports will update the merge signal with a value of zero when their parent conditionally executed subsystems are executing.

Condition	Recommended Action
Check for Outport blocks that obtain the **Initial output** value from an input signal when they are migrated.	Verify that the following behavior is acceptable. The **Initial output** parameter of the Outport block is not specified. As a result, the simplified initialization mode will assume that the **Initial output** value for the Outport block is derived from the input signal. This assumption may result in different initialization behavior. If this behavior is not acceptable, modify your model before you migrate to the simplified initialization mode.
Check for outer Outport blocks that have an explicit **Initial output**.	Verify that the following behavior is acceptable. In classic initialization mode, the **Initial output** and **Output when disabled** parameters of the Outport block must match those of their source Outport blocks. In simplified initialization mode, Simulink sets the **Initial output** parameter of outer Outport blocks to [] (empty matrix) and **Output when disabled** parameter to held.
Check for conditionally executed subsystems that propagate execution context across the output boundary.	Verify that the following behavior is acceptable. The **Propagate execution context across subsystem boundary** parameter is selected for the subsystem. Execution context will still be propagated across input boundaries; however, the propagation will be disabled on the output side for the initialization in the simplified initialization mode.

Condition	Recommended Action
Check for blocks that read input from conditionally executed subsystems during initialization.	Verify that the following behavior is acceptable. Some blocks, such as the Discrete-Time Integrator block, read their inputs from conditionally executed subsystems during initialization in the classic initialization mode. Simulink performs this step as an optimization technique. This optimization is not allowed in the simplified initialization mode because the output of a conditionally executed subsystem at the first time step after initialization may be different than the initial value declared in the corresponding Outport block. In particular, this discrepancy occurs if the subsystem is active at the first time step.
Check for a migration conflict for Outport blocks that use a `Dialog` as the **Source of initial output value**.	Other instances of Outport blocks with the same library link either cannot be migrated or are being migrated in a different manner. Review the results from the **Check for library blocks with instances that cannot be migrated** to learn about the different migration paths for other instances of each Outport block. The Outport block will maintain its current settings and use its specified **Initial output** value.

Condition	Recommended Action
Check for a migration conflict for Outport blocks that use `Input signal` as the **Source of initial output** value.	Other instances of Outport blocks with the same library link either cannot be migrated or are being migrated in a different manner. Review the results from the **Check for library blocks with instances that cannot be migrated** to learn about the different migration paths for other instances of each Outport block. The Outport block currently specifies an **Initial output** of `[]` (empty matrix), and **the Output when disabled** as `held`. This means that each outport does not perform initialization, but implicitly relies on source blocks to initialize its input signal. After migration, the parameter **Source of initial output value** will be set to `Input signal` to reflect this behavior.
Check for a migration conflict for Outport blocks that have SimEvents semantics.	Other instances of Outport blocks with the same library link either cannot be migrated or are being migrated in a different manner. Review the results from the **Check for library blocks with instances that cannot be migrated** to learn about the different migration paths for other instances of each Outport block. The Outport blocks will continue to use an **Initial output** value of `[]` (empty matrix) and an **Output when disabled** setting of `held`. Simulink will maintain these settings because their parent conditionally executed subsystems are connected to SimEvents blocks.

Condition	Recommended Action
Check for a migration conflict for innermost Outport blocks with variable-size input and unspecified **Initial output**.	For these Outport blocks, the signal size varies only when the parent subsystem of the block is re-enabled. Therefore, Simulink implicitly assumes that the **Initial output** parameter is equal to 0, even though the parameter is unspecified, []. Consequently, unless you specify the parameter, the Model Advisor will explicitly set the parameter to 0 when the model is migrated to the simplified initialization mode.

Other instances of Outport blocks with the same library link either cannot be migrated or are being migrated in a different manner. Review the results from the **Check for library blocks with instances that cannot be migrated** to learn about the different migration paths for other instances of each Outport block. |
| Check for a migration conflict for Outport blocks that use a default ground value as the Initial output. | The parameter **Initial output** is set to [] (empty matrix) and the source of the Outport is an invalid initial condition source. Thus, the block uses the default initial value as the initial output in the simplified initialization mode. Other instances of Outport blocks with the same library link either have errors or are being migrated differently. |
| Check for a migration conflict for merged Outport blocks without explicit specification of **Initial output**. | Review the results from the subcheck **Check for library blocks with instances that cannot be migrated** to learn about different migration paths for other instances of each Outport block. For the remaining Outport blocks, **Initial output** is set to [] (empty matrix) and **Output when disabled** is set to held respectively, in simplified initialization mode. |

Check usage of Discrete-Time Integrator blocks

Check ID: `mathworks.design.DiscreteBlock`

Identify Discrete-Time Integrator blocks with parameter settings that can lead to unexpected behavior, and help migrate your model to simplified initialization mode.

Note Run this check along with the other checks in the "Migrating to Simplified Initialization Mode Overview" on page 8-5.

Description

Simplified initialization mode was introduced in R2008b to improve the consistency of simulation results. For more information, see "Simplified Initialization Mode" and "Classic Initialization Mode".

This Model Advisor check identifies settings in Discrete-Time Integrator blocks in your model that can cause problems if you use the simplified initialization mode. It also recommends settings for consistent behavior of Discrete-Time Integrator blocks. The results of the subchecks contain two types of statements: Failed and Warning. Failed statements identify issues that you must address manually before you can migrate the model to the simplified initialization mode. Warning statements identify issues or changes in behavior that can occur after migration.

Results and Recommended Actions

Condition	Recommended Action
Check for Discrete-Time Integrator blocks whose parameter **Initial condition setting** is set to `Output`.	Determine if the new behavior of the Discrete-Time Integrator blocks is acceptable. If it is not acceptable, modify the model to account for the new behavior before migrating to the simplified initialization mode.

Condition	Recommended Action
Check for Discrete-Time Integrator blocks whose **Initial condition setting** parameter is set to `State (most efficient)` and are in a subsystem that uses triggered sample time.	Use periodic sample time for the block, or set **Initial Condition setting** to `Output`.
Check for blocks inside of the Iterator Subsystem that require elapsed time.	Within an Iterator Subsystem hierarchy, do not use blocks that require a service that maintains the time that has elapsed between two consecutive executions. Since an Iterator Subsystem can execute multiple times at a given time step, the concept of elapsed time is not well-defined between two such executions. Using these blocks inside of an Iterator Subsystem can cause unexpected behavior.

Check model settings for migration to simplified initialization mode

Note Do not run this check in isolation. Run this check along with the other checks in the "Migrating to Simplified Initialization Mode Overview" on page 8-5.

Check ID: `mathworks.design.ModelLevelMessages`

Identify settings in Model blocks and model configuration parameters that can lead to unexpected behavior, and help migrate your model to simplified initialization mode.

Description

Simplified initialization mode was introduced in R2008b to improve consistency of simulation results. For more information, see "Simplified Initialization Mode" and "Classic Initialization Mode".

This Model Advisor check identifies issues in the model configuration parameters and Model blocks in your model that can cause problems when you migrate to simplified initialization mode. The results of the subchecks contain two types of statements: Failed and Warning. Failed statements identify issues that you must address manually before you can migrate the model to simplified initialization mode. Warning statements identify issues or changes in behavior that can occur after migration.

After running this Model Advisor consistency check, if you click **Explore Result** button, the messages pertain only to blocks that are not library-links.

Note Because it is difficult to undo these changes, select **File > Save Restore Point As** to back up your model before migrating to the simplified initialization mode.

For more information, see "Model Configuration Parameters: Connectivity Diagnostics".

Results and Recommended Actions

Condition	Recommended Action
Verify that all Model blocks are using the simplified initialization mode.	Migrate the model referenced by the Model block to the simplified initialization mode, then migrate the top model.
Verify simplified initialization mode setting	Set **Configuration Parameters > Underspecified initialization detection** to `Simplified`.

Action Results

Clicking **Modify Settings** causes the following:

- The Model parameter is set to `simplified`
- If an Outport block has the **Initial output** parameter set to the empty character vector, [], then the `SourceOfInitialOutputValue` parameter is set to **Input signal**.

- If an Outport has an empty **Initial output** and a variable-size signal, then the **Initial output** is set to zero.

See Also

- "Migrating to Simplified Initialization Mode Overview" on page 8-5

Check S-functions in the model

Check ID: `mathworks.design.SFuncAnalyzer`

Perform quality checks on S-functions in Simulink models or subsystems.

Description

The S-function analyzer performs quality checks on S-functions to identify improvements and potential problems in the specified model.

Results and Recommended Actions

Condition	Recommended Action
Continuous states are modified in `mdlOutputs` method.	Modify Continuous States at a major time step and use `ssSetSolverNeedsReset` function in S-function code.
Continuous states are modified in the `mdlUpdate` method.	Modify Continuous States only at a major time step and use `ssSetSolverNeedsReset` function in S-function code.
S-function discrete states are modified in the `mdlOutputs` at a minor step.	Modify the discrete states only at a major step guarded by `ssIsMajorTimeStep` function.
S-function mode vector is modified in the `mdlOutputs` method at a minor step.	Modify the mode vector only at a major step guarded by `sslsMajorTimeStep` function.
S-function is using static or global variables to declare internal states.	Declare the states explicitly using `ssSetNumDiscStates` function or "Model Global Data by Creating Data Stores".

Condition	Recommended Action
S-function has continuous states but sample time is not declared continuous.	Specify continuous sample time using `ssSetSampleTime` function.
S-function has discrete states but the `mdlOutputs` and `mdlUpdate` methods are combined.	Define the `mdlOutputs` and `mdlUpdate` methods separately and modify discrete states only in `mdlUpdate` method.
S-function sets the `SS_OPTION_CAN_BE_CALLED_CONDITIONALLY` option when having state-like data or multiple sample times.	Remove the options when the S-function has state-like data or multiple sample times.
MEX compilers do not exist on the machine.	Check for the presence or install MEX compilers on the machine.
S-function encounters errors while compiling the model.	Check the **Diagnostic Viewer** output and recompile the model.

Check for non-continuous signals driving derivative ports

Check ID: `mathworks.design.NonContSigDerivPort`

Identify noncontinuous signals that drive derivative ports.

Description

Noncontinuous signals that drive derivative ports cause the solver to reset every time the signal changes value, which slows down simulation.

Results and Recommended Actions

Condition	Recommended Action
There are noncontinuous signals in the model driving derivative ports.	• Make the specified signals continuous. • Replace the continuous blocks receiving these signals with discrete state versions of the blocks.

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

See Also

- "Modeling Dynamic Systems"
- "Simulation Phases in Dynamic Systems"
- "What Is a Model Advisor Exclusion?" (Simulink Check)

Runtime diagnostics for S-functions

Check ID: `mathworks.design.DiagnosticSFcn`

Check array bounds and solver consistency if S-Function blocks are in the model.

Description

Validates whether S-Function blocks adhere to the ODE solver consistency rules that Simulink applies to its built-in blocks.

Results and Recommended Actions

Condition	Recommended Action
Solver data inconsistency is set to `none`.	In the Configuration Parameters dialog box, set **Solver data inconsistency** to `warning` or `error`.
Array bounds exceeded is set to `none`.	In the Configuration Parameters dialog box, set **Array bounds exceeded** to `warning` or `error`

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

Check model for foreign characters

Check ID: `mathworks.design.characterEncoding`

Check for characters that are incompatible with the current encoding

Description

Check for characters in the model file that cannot be represented in the current encoding. These can cause errors during simulation, and may be corrupted when saving the model.

Results and Recommended Actions

Condition	Recommended Action
Incompatible characters found	Change the current encoding to the encoding specified in the model file, using `slCharacterEncoding`. To change the current encoding you need to close the models, and this closes the Model Advisor.

Tips

The Upgrade Advisor report shows the encoding you need, or you can retrieve the encoding from the model using the command:

`get_param(modelname,'SavedCharacterEncoding')`

Use `slCharacterEncoding` to change the encoding. This setting applies to the current MATLAB session, so if you restart MATLAB and want to open the same model, you will need to make the same change to the current encoding again.

For more information see:

- `slCharacterEncoding`
- "Open a Model with Different Character Encoding"
- "Save Models with Different Character Encodings"

See Also

- "Consult the Upgrade Advisor".

- "Model Upgrades"

Identify unit mismatches in the model

Check ID: `mathworks.design.UnitMismatches`

Identify instances of unit mismatches between ports in the model.

Description

Check for instances of unit mismatches between ports in the model.

Results and Recommended Actions

Condition	Recommended Action
Unit mismatches found	Change one of the mismatched unit settings to match the unit settings for the other port.

See Also

- "Unit Specification in Simulink Models".

Identify automatic unit conversions in the model

Check ID: `mathworks.design.AutoUnitConversions`

Identify instances of automatic unit conversions in the model.

Description

Identify instances of automatic unit conversions in the model.

Results and Recommended Actions

Condition	Recommended Action
Automatic unit conversions found	Check that the converted units are expected for the model.

Identify disallowed unit systems in the model

Check ID: `mathworks.design.DisallowedUnitSystems`

Identify instances of disallowed unit systems in the model.

Description

Identify instances of disallowed unit systems in the model.

Results and Recommended Actions

Condition	Recommended Action
Disallowed unit systems found	Either choose a unit that conforms to the configured unit system, or select another unit system. For more information, see "Restricting Unit Systems".

See Also

• "Unit Specification in Simulink Models".

Identify undefined units in the model

Check ID: `mathworks.design.UndefinedUnits`

Identify instances of unit specifications, not defined in the unit database, in the model.

Description

Identify instances of unit specifications, not defined in the unit database, in the model.

Results and Recommended Actions

Condition	Recommended Action
Undefined units found	Change the unit to one that Simulink supports.

See Also

- "Unit Specification in Simulink Models".
- Allowed Units

Check model for block upgrade issues

Check ID: `mathworks.design.Update`

Check for common block upgrade issues.

Description

Check blocks in the model for compatibility issues resulting from using a new version of Simulink software.

Results and Recommended Actions

Condition	Recommended Action
Blocks with compatibility issues found.	Click **Modify** to fix the detected block issues.
Check update status for the Level 2 API S-functions.	Consider replacing Level 1 S-functions with Level 2.

Action Results

Clicking **Modify** replaces blocks from a previous release of Simulink software with the latest versions.

See Also

- "Write Level-2 MATLAB S-Functions".
- "Consult the Upgrade Advisor".

- "Model Upgrades"

Check model for block upgrade issues requiring compile time information

Check ID: `mathworks.design.UpdateRequireCompile`

Check for common block upgrade issues.

Description

Check blocks for compatibility issues resulting from upgrading to a new version of Simulink software. Some block upgrades require the collection of information or data when the model is in the compile mode. For this check, the model is set to compiled mode and then checked for upgrades.

Results and Recommended Actions

Condition	Recommended Action
Model contains Lookup Table or Lookup Table (2-D) blocks and some of the blocks specify **Use Input Nearest** or **Use Input Above** for a lookup method.	Replace Lookup Table blocks and Lookup Table (2-D) blocks with n-D Lookup Table blocks. Do not apply **Use Input Nearest** or **Use Input Above** for lookup methods; select another option.
Model contains Lookup Table or Lookup Table (2-D) blocks and some blocks perform multiplication first during interpolation.	Replace Lookup Table blocks and Lookup Table (2-D) blocks with n-D Lookup Table blocks. However, because the n-D Lookup Table block performs division first, this replacement might cause a numerical difference in the result.
Model contains Lookup Table or Lookup Table (2-D) blocks. Some of these blocks specify **Interpolation-Extrapolation** as the **Lookup method** but their input and output are not the same floating-point type.	Replace Lookup Table blocks and Lookup Table (2-D) blocks with n-D Lookup Table blocks. Then change the extrapolation method or the port data types for block replacement.

Condition	Recommended Action
Model contains Unit Delay blocks with **Sample time** set to -1 that inherit a continuous sample time.	Replace Unit Delay blocks with Memory blocks.

Check Data Store Memory blocks for multitasking

Action Results

Clicking **Modify** replaces blocks from a previous release of Simulink software with the latest versions.

Check that the model is saved in SLX format

Check ID: `mathworks.design.UseSLXFile`

Check that the model is saved in SLX format.

Description

Check whether the model is saved in SLX format.

Results and Recommended Actions

Condition	Recommended Action
Model not saved in SLX format	Consider upgrading to the SLX file format to use the latest features in Simulink.

Capabilities and Limitations

You can run this check on your library models.

Tips

Simulink Projects can help you upgrade models to SLX format and preserve file revision history in source control. See "Upgrade Model Files to SLX and Preserve Revision History".

Check model for SB2SL blocks

Check ID: `mathworks.simulink.SB2SL.Check`

Check that the model does not have outdated SB2SL blocks.

Description

Check if the model contains outdated SB2SL blocks.

Results and Recommended Actions

Condition	Recommended Action
Model contains outdated SB2SL blocks	Consider upgrading the model to current SB2SL blocks.

Action Results

Clicking **Update SB2SL Blocks** replaces blocks with the latest versions.

See Also

- "Consult the Upgrade Advisor".

Check Model History properties

Check ID: `mathworks.design.SLXModelProperties`

Check for edited model history properties

Description

Check models for edited Model History property values that could be used with source control tool keyword substitution. This keyword substitution is incompatible with SLX file format.

In the MDL file format you can configure some model properties to make use of source control tool keyword substitution. If you save your model in SLX format, source control tools cannot perform keyword substitution. Information in the model file from such keyword substitution is cached when you first save the MDL file as SLX, and is not updated again. The Model Properties History pane and Model Info blocks in your model show stale information from then on.

Results and Recommended Actions

Condition	Recommended Action
Edited model history properties	Manually or automatically reset the properties to the default values. Click the button to reset, or to inspect and change these properties manually, open the Model Properties dialog and look in the History pane.

Capabilities and Limitations

You can run this check on your library models.

See Also

- "Consult the Upgrade Advisor".
- "Model Upgrades"

Identify Model Info blocks that can interact with external source control tools

Check ID: `mathworks.design.ModelInfoKeywordSubstitution`

Use this check to find Model Info blocks that can be altered by external source control tools through keyword substitution.

Description

This check searches for character vectors in the Model Info block enclosed within dollar signs that can be overwritten by an external source control tool. Using third-party source control tool keyword expansion might corrupt your model files when you submit them. Keyword substitution is not available in SLX model file format.

For a more flexible interface to source control tools, use a Simulink project instead of the Model Info block. See "About Source Control with Projects".

Results and Recommended Actions

Condition	Recommended Action
The Model Info block contains fields like this: $keyword$	Review the list of fields in the report, then remove the keyword character vectors from the Model Info block.

See Also

- "Consult the Upgrade Advisor".
- "About Source Control with Projects"

Identify Model Info blocks that use the Configuration Manager

Check ID: `mathworks.design.ModelInfoConfigurationManager`

Use this check to find Model Info blocks that use the Configuration Manager.

Description

Model Info blocks using the Configuration Manager allow risky keyword substitution using external source control tools. Using third-party source control tool keyword expansion might corrupt your model files when you submit them. Keyword substitution is not available in SLX model file format. The Configuration Manager for the Model Info block will be removed in a future release.

For a more flexible interface to source control tools, use a Simulink project instead of the Model Info block. See "About Source Control with Projects".

Results and Recommended Actions

Condition	Recommended Action
A Model Info block is using the Configuration Manager.	Click **Remove the Configuration Manager**.

- "Consult the Upgrade Advisor".
- "About Source Control with Projects"

Check model for legacy 3DoF or 6DoF blocks

Check ID: `mathworks.design.Aeroblks.CheckDOF`

Lists 3DoF and 6DoF blocks are outdated.

Description

This check searches for 3DoF and 6DoF blocks from library versions prior to 3.13 (R2014a).

Results and Recommended Actions

Condition	Recommended Action
Blocks configured with old versions of 3DoF or 6DoF blocks found.	Click **Replace 3DoF and 6DoF Blocks** to replace the blocks with latest versions.

Action Results

Clicking **Replace 3DoF and 6DoF Blocks** replaces blocks with the latest versions.

See Also

- "Equations of Motion" (Aerospace Blockset)

Check model and local libraries for legacy Aerospace Blockset blocks

Check ID: `mathworks.design.Aeroblks.CheckFG`

Lists blocks configured to use FlightGear versions that are outdated or not supported.

Description

This check searches and lists blocks configured to use FlightGear versions that are outdated or not supported.

Results and Recommended Actions

Condition	Recommended Action
Blocks configured with old versions of FlightGear are found.	Click **Update FlightGear blocks** to change block settings to latest supported version of FlightGear. Then, download latest version of FlightGear that MATLAB supports.

Action Results

Clicking **Update FlightGear blocks** changes block settings to the latest supported version of FlightGear.

• "Flight Simulator Interfaces" (Aerospace Blockset)

Check model for Aerospace Blockset navigation blocks

Check ID: `mathworks.design.Aeroblks.CheckNAV`

Searches for Three-Axis Inertial Measurement Unit, Three-Axis Gyroscope, and Three-Axis Accelerometer blocks prior to 3.21 (R2018a).

Description

This check searches for Three-Axis Inertial Measurement Unit, Three-Axis Gyroscope, and Three-Axis Accelerometer blocks that have been updated in R2018a.

Results and Recommended Actions

Condition	Recommended Action
Three-Axis Inertial Measurement Unit, Three-Axis Gyroscope, and Three-Axis Accelerometer blocks prior to R2018a.	In R2018a or later, if you did not previously solve for steady state conditions, save the model now. If you previously solved for steady state conditions for the model, solve for these steady state conditions again, and then save the model.

See Also

- Three-Axis Accelerometer
- Three-Axis Gyroscope
- Three-Axis Inertial Measurement Unit

Check and update masked blocks in library to use promoted parameters

Check ID: `mathworks.design.CheckAndUpdateOldMaskedBuiltinBlocks`

Check for libraries that should be updated to use promoted parameters.

Description

This check searches libraries created before R2011b for masked blocks that should be updated to use promoted parameters. Since R2011b, if a block parameter is not promoted, its value in the linked block is locked to its value in the library block. This check excludes blocks of type Subsystem, Model reference, S-Function and M-S-Function.

Results and Recommended Actions

Condition	Recommended Action
Libraries that need to be updated are found	Click **Update**. Once the libraries have been updated, run the check again

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

- "Consult the Upgrade Advisor".
- "Model Upgrades"
- "What Is a Model Advisor Exclusion?" (Simulink Check)

Check and update mask image display commands with unnecessary imread() function calls

Check ID: `mathworks.design.CheckMaskDisplayImageFormat`

Check identifies masks using image display commands with unnecessary calls to the `imread()` function.

Description

This check searches for the mask display commands that make unnecessary calls to the `imread()` function, and updates them with mask display commands that do not call the `imread()` function. Since 2013a, a performance and memory optimization is available for mask images specified using the image path instead of the RGB triple matrix.

Results and Recommended Actions

Condition	Recommended Action
Mask display commands that make unnecessary calls to the `imread()` function are found.	Click **Update**. Once the blocks have been updated, run the check again.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

- "Consult the Upgrade Advisor".
- "Model Upgrades"
- "What Is a Model Advisor Exclusion?" (Simulink Check)

Check and update mask to affirm icon drawing commands dependency on mask workspace

Check ID: `mathworks.design.CheckMaskRunInitFlag`

Check identifies if the mask icon drawing commands have dependency on the mask workspace.

Description

This check identifies if the mask icon drawing commands have dependency on the mask workspace and updates the `RunInitForIconRedraw` property accordingly. If there is no mask workspace dependency, the value of `RunInitForIconRedraw` is set to `off`, whereas, if there is mask workspace dependency the values is set to `on`.

Setting the values of `RunInitForIconRedraw` to `off` when there is no mask workspace dependency optimizes the performance by not executing the mask initialization code before drawing the block icon.

Results and Recommended Actions

Condition	Recommended Action
Mask drawing commands that are dependent or independent of the mask workspace are found.	Click **Update**. Once the blocks have been updated, run the check again.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

- "Consult the Upgrade Advisor".
- "Model Upgrades"
- "What Is a Model Advisor Exclusion?" (Simulink Check)

Identify masked blocks that specify tabs in mask dialog using MaskTabNames parameter

Check ID: `mathworks.design.CheckAndUpdateOldMaskTabnames`

This check identifies masked blocks that specify tabs in mask dialog using the `MaskTabNames` parameter.

Description

This check identifies masked blocks that use the `MaskTabNames` parameter to programmatically create tabs in the mask dialog. Since R2013b, dialog controls are used to group parameters in a tab on the mask dialog.

Results and Recommended Actions

Condition	Recommended Action
Masked blocks that use the `MaskTabNames` parameter to create tabs programmatically in the mask dialog are found.	Click **Upgrade** available in the **Action** section. Once the blocks have been updated, run the check again.

Capabilities and Limitations

You can run this check on your library models.

See Also

- "Consult the Upgrade Advisor".
- "Model Upgrades"

Identify questionable operations for strict single-precision design

Check ID: `mathworks.design.StowawayDoubles`

For a strict single-precision design, this check identifies the blocks that introduce double-precision operations, and non-optimal model settings.

Description

For a strict single-precision design, this check identifies the blocks that introduce double-precision operations, and non-optimal model settings.

Results and Recommended Actions

Condition	Recommended Action
Double-precision floating-point operations found in model.	Verify that: • Block input and output data types are set correctly. • In the Configuration Parameters dialog box, **Default for underspecified data type** is set to `single`.
Model uses a library standard that is not optimal for strict-single designs.	Verify that: • All target-specific math libraries used by the model support single-precision implementations. Set **Configuration Parameters > Standard math library** to `C99 (ISO)`.

Condition	Recommended Action
Logic signals are not implemented as Boolean data.	Verify that: • In the Configuration Parameters dialog box, **Implement logic signals as Boolean data** is selected.

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

See Also

• "Validate a Floating-Point Embedded Model"
• "Consult the Upgrade Advisor".
• "Model Upgrades"
• "What Is a Model Advisor Exclusion?" (Simulink Check)

Check get_param calls for block CompiledSampleTime

Check ID: mathworks.design.CallsGetParamCompiledSampleTime

Use this check to identify MATLAB files in your working environment that contain get_param function calls to return the block CompiledSampleTime parameter.

Description

For multi-rate blocks (including subsystems), Simulink returns the block compiled sample time as a cell array of the sample rates in the block. The return value is a cell array of pairs of doubles. MATLAB code that accepts this return value only as pairs of doubles can return an error when called with a multi-rate block. Use this check to identify such code in your environment. Modify these instances of code to accept a cell array of pairs of doubles instead.

For example, consider a variable blkTs, which has been assigned the compiled sample time of a multi-rate block.

```
blkTs = get_param(block,'CompiledSampleTime');
```

Here are some examples in which the original code works only if blkTs is a pair of doubles and the block is a single-rate block:

- Example 1

  ```
  if isinf(blkTs(1))
      disp('found constant sample time')
  end
  ```

  Since blkTs is now a cell array, Simulink gives this error message:

  ```
  Undefined function 'isinf' for input arguments of type 'cell'
  ```

  Instead, use this code, for which blkTs can be a cell array or a pair of doubles.

  ```
  if isequal(blkTs, [inf,0])
      disp('found constant sample time')
  end
  ```

- Example 2

  ```
  if all(blkTs == [-1,-1])
      disp('found triggered sample time')
  end
  ```

  For the above example, since blkTs is now a cell array, Simulink gives this error:

  ```
  Undefined function 'eq' for input arguments of type 'cell'
  ```

  Instead, use this code, for which blkTs can be a cell array or a pair of doubles.

  ```
  if isequal(blkTs, [-1,-1])
      disp('found triggered sample time')
  end
  ```

- Example 3

  ```
  if (blkTs(1) == -1)
      disp('found a triggered context')
  end
  ```

  Again, since blkTs is now a cell array, Simulink gives this error:

  ```
  Undefined function 'eq' for input arguments of type 'cell'
  ```

  Instead, use this code.

```
if ~iscell(blkTs)
    blkTs = {blkTs};
end
for idx = 1:length(blkTs)
    thisTs = blkTs{idx};
    if (thisTs(1) == -1)
        disp('found a triggered context')
    end
end
```

The above code checks for a triggered type sample time (triggered or async). In cases in which a block has constant sample time ([inf,0]) in addition to triggered or async or when a block has multiple async rates, this alternative property detects the triggered type sample time.

This check scans MATLAB files in your environment. If the check finds instances of MATLAB code that contain `get_param` calls to output the block compiled sample time, Upgrade Advisor displays these results. It suggests that you modify code that accepts the block compiled sample time from multi-rate blocks.

Results and Recommended Actions

Condition	Recommended Action
No MATLAB files call `get_param(block,CompiledSampleTime)`	None
Some MATLAB files call `get_param(block,CompiledSampleTime)`	If files use the block `CompiledSampleTime` parameter from multi-rate blocks, modify these files to accept the parameter as a cell array of pairs of doubles.

See Also

- "Sample Times in Subsystems"
- "Block Compiled Sample Time"

Check model for parameter initialization and tuning issues

Check ID: `mathworks.design.ParameterTuning`

Use this check to identify issues in the model that occur when you initialize parameters or tune them.

Description

This check scans your model for parameter initialization and tuning issues like:

- Rate mismatch between blocks
- Divide by zero issue in conditionally executed subsystems
- Invalid control port value in Index Vector blocks

Results and Recommended Actions

Condition	Recommended Action
The model has rate transition issues.	Select **Automatically handle rate transition for data transfer** in the **Solver** pane of the model configuration parameters.
The model has a divide by zero issue in a conditionally executed subsystem with a control port.	At the command prompt, run `set_param(control_port,'DisallowConstTsAndPrmTs'`
The model has an invalid control port value in a conditionally executed subsystem.	At the command prompt, run `set_param(control_port,'DisallowConstTsAndPrmTs'`

Action Results

Select **Upgrade model** to resolve issues in the model related to parameter initialization and tuning.

See Also

- "Automatic Rate Transition"

Check for virtual bus across model reference boundaries

Check ID: `mathworks.design.CheckVirtualBusAcrossModelReference`

Check virtual bus signals that cross model reference boundaries.

Description

This check identifies root-level Inport and Outport blocks in referenced models and Model blocks with virtual bus outputs that require updates to change to nonvirtual bus signals.

If the check identifies issues, click **Update Model** to convert root-level Inport and Outport blocks configured for virtual buses to use nonvirtual buses in these situations:

- For root-level Inport blocks — Enable the **Output as nonvirtual bus** parameter and insert a Signal Conversion block after the Inport block. The Signal Conversion block is configured to output a virtual bus.
- For root-level Outport blocks — Enable the **Output as nonvirtual bus in parent model** parameter.
- For Model blocks — For ports whose Outport blocks were updated to address issues, insert a Signal Conversion block after the corresponding ports of the Model block. The Signal Conversion block is configured to output a virtual bus.

Recommended Action and Results

To resolve issues, click **Upgrade Model**.

Note Run the **Analyze model hierarchy and continue upgrade sequence** check on the top-level model and then down through the model reference hierarchy.

Clicking **Upgrade Model** converts affected root-level Inport and Outport blocks configured for virtual buses to use nonvirtual buses in models where you:

- Use function prototype control
- Perform C++ code generation with the `I/O arguments step method` option.

  Alternatively, you can change the C++ code generation function specification setting to `Default step method`:

  1. In the **Configuration Parameters** > **Code Generation** > **Interface** pane, click **Configure C++ Class Interface**.
  2. In the dialog box, set the **Function specification** parameter to `Default step method`.
- Use buses that have variable-dimension signals

- Use an associated non-auto storage class for Outport block signals

  - The conversion for non-auto storage class occurs only if you have the target generation license that the model requires. For example, an ERT target requires an Embedded Coder license.

- Use Export-function models where an Outport block is driven by a nonvirtual bus

- Have Model blocks that reference models containing Outport blocks that have been fixed — Clicking **Upgrade Model** updates Model blocks referencing the models that had Outport blocks fixed by the **Analyze model hierarchy and continue upgrade sequence** check.

See Also

- "Bus Data Crossing Model Reference Boundaries"

Check model for custom library blocks that rely on frame status of the signal

Check ID: `mathworks.design.DSPFrameUpgrade`

This check identifies custom library blocks in the model that depend on the frame status of the signal.

Description

This check searches for the custom library blocks in a model that depend on the frame status of the signal. The check analyzes the blocks, recommends fixes, and gives reasons for the fixes. You must make the fixes manually.

Results and Recommended Actions

Condition	Recommended Action
The check finds custom library blocks that depend on the frame status of the signal.	Follow the recommendation given by the Upgrade Advisor.

Capabilities and Limitations

You can run this check only on custom library blocks in your model.

You must make the fixes manually.

This check appears only if you have the DSP System Toolbox installed.

See Also

"Frame-based processing" (DSP System Toolbox)

Check model for S-function upgrade issues

Check ID: 'mathworks.design.CheckForSFcnUpgradeIssues'

Use this check on your model to identify your S-function's upgrade compatibility issues. These issues may include the use of 32-bit APIs, compilation with incompatible options, or use of deprecated separate complex APIs. Some common issues and information related to the fixes are described in results and recommendations section below.

Description

When upgrading your S-functions to use the features in the latest release, this check scans your model to warn against S-function upgrade incompatibility issues. If the result of this check gives a warning or error, fix your C MEX S-functions according to the description.

Results and Recommended Actions

Condition	Recommended Action
Custom-built S-functions are not supported.	Recompile your S-function with available compatible options. See "Custom-built MEX File Not Supported In Current Release" (MATLAB) for more information.
S-function is not compiled with the latest API (mex -R2018a).	Recompile using the latest flag (mex -R2018a). See "MEX File Is Compiled With Outdated Option" (MATLAB) for more information.
S-function uses 32-bit functions.	Modify your code according to the instructions in "MEX File Calls A 32-bit Function" (MATLAB).

Condition	Recommended Action
S-function is using deprecated separate complex APIs (mexGetPi, mexSetPi, mexGetImagData, mexSetImagData).	Use interleaved complex APIs and recompile your code with the latest flag (`mex -R2018a`). See "Upgrade MEX Files to Use Interleaved Complex API" (MATLAB) for more information.
S-function is using deprecated type-unsafe data API (mxGetData, mexSetData).	Use type-safe data APIs and recompile your code. See "MEX File Calls An Untyped Data Access Function" (MATLAB) for more information.
S-function is compiled with a future release and not supported in current release.	See "MEX File Built In MATLAB Release Not Supported In Current Release" (MATLAB) to recompile your files.

- "MATLAB Data in C S-Functions"

Check Rapid accelerator signal logging

Check ID: `mathworks.design.CheckRapidAcceleratorSignalLogging`

When simulating your model in rapid accelerator mode, use this check to find signals logged in your model that are globally disabled. Rapid accelerator mode supports signal logging. Use this check to enable signal logging globally.

Description

This check scans your model to see if a simulation is in rapid accelerator mode and whether the model contains signals with signal logging. If the check finds an instance and signal logging is globally disabled, an option to turn on signal logging globally appears.

Results and Recommended Actions

Condition	Recommended Action
Simulation mode is not rapid accelerator.	None. You can enable signal logging in rapid accelerator mode.

Condition	Recommended Action
Simulation mode is rapid accelerator. Upgrade Advisor did not find signals with signal logging enabled.	None. The model does not use signal logging. Enable signal logging for signals and globally if you want to log signals.
Simulation mode is rapid accelerator. Upgrade Advisor found signals with signal logging enabled. However, global setting for signal logging was disabled.	Enable signal logging globally if you want to log signals with signal logging enabled.
Signal logging was already globally enabled.	None.

Action Results

Selecting **Modify** enables signal logging globally in your model.

See Also

- "Signal Logging in Rapid Accelerator Mode"
- "Consult the Upgrade Advisor".

Check virtual bus inputs to blocks

Check ID: `mathworks.design.VirtualBusUsage`

Check bus input signals for a set of blocks.

Description

Check bus input signals for a set of blocks.

Starting in R2015b, virtual bus signal inputs to blocks that require nonbus or nonvirtual bus input can cause an error. Examples of blocks that can specify a bus object as their output data type include a Bus Creator block and a root Inport block. The blocks that cause an error when they have a virtual bus input in this situation are:

- Assignment
- Delay

  The Delay block causes an error only if you use the Block Parameters dialog box to:

- • Set an initial condition that is a MATLAB structure or zero.
  - • Specify a value for **State name**.
- • Permute Dimension
- • Reshape
- • Selector
- • Unit Delay

  The Unit Delay block causes an error only if you use the Block Parameters dialog box to:

  - • Set an initial condition that is a MATLAB structure or zero.
  - • Specify a value for **State name**.
- • Vector Concatenate

Results and Recommended Actions

Condition	Recommended Action
Virtual bus signal input to these blocks: • Assignment • Delay (if you specify an initial condition from the dialog box that is a MATLAB structure or zero and the value for **State name** is not empty) • Permute Dimension • Reshape • Selector • Unit Delay (if you specify an initial condition that is a MATLAB structure or zero and the value for **State name** is not empty) • Vector Concatenate	In the Upgrade Advisor, click **Modify**. The check inserts a Bus to Vector block to attempt to convert virtual bus input signals to vector signals. For issues that the Upgrade Advisor identifies but cannot fix, modify the model manually. For details, see "Correct Buses Used as Vectors".

Action Results

Clicking **Modify** inserts a Bus to Vector block at the input ports of blocks.

For many models, running the Upgrade Advisor modifies your model so that bus signals are not treated as vectors. However, for some models you can encounter compatibility issues even after running the check. Modify your model manually to address those issues.

After you compile the model using Upgrade Advisor, the Simulink Editor sometimes indicates that you need to save the model (the model is dirty), even though you did not make changes. To prevent this issue from reoccurring for this model, save the model.

Modeling Pattern	Issue	Solution
Data Store Memory block with **Data Type** set to `Inherit: auto`	A Data Store Memory block whose associated Data Store Read or Data Store Write blocks read or write bus signal data must use a bus object.	In the Data Store Memory block, set the **Data Type** signal attribute to `Bus: <BusObject>`.
Signal Conversion block **Output** parameter matches input bus type	A Signal Conversion block whose **Output** parameter is set to `Nonvirtual bus` requires a virtual bus input. A Signal Conversion block whose **Output** parameter is set to `Virtual bus` requires a nonvirtual bus input.	To create a copy of the input signal, set **Output** to `Signal copy`.
Merge, Switch, or Multiport Switch block with multiple bus inputs	Merge, Switch, or Multiport Switch blocks with multiple bus inputs require those inputs to have the same names and hierarchy.	Reconfigure the model so that the bus inputs have the same names and hierarchy.
Root Inport block outputting a virtual bus and specifying a value for **Port dimensions**	A root Inport block that outputs to a virtual bus must inherit the dimensions.	Set the Inport block **Port dimensions** signal attribute to `1` or `-1 (inherit)`.

Modeling Pattern	Issue	Solution
Mux block with nonvirtual bus inputs	A Mux block cannot accept nonvirtual bus signals.	To treat the output as an array, replace the Mux block with a Vector Concatenate block. If you want a virtual bus output, use a Bus Creator block to combine the signals.
Bus to Vector block without a virtual bus signal input	A nonbus signal does not need a Bus to Vector block.	Remove the Bus to Vector block.
Assignment block with virtual bus inputs	The Upgrade Advisor converts the Assignment block Y0 port bus input to a vector.	Add a Bus to Vector block before the Assignment block.
S-function using a nonvirtual bus	An S-function that is not a Level-2 C S-function does not support nonvirtual bus signals.	Change the S-function to be a Level-2 C S-function. Consider using an S-Function Builder block to create a Level-2 C S-function.
Stateflow chart with parameterized data type	In a Stateflow chart, you cannot parameterize the data type of an input or output in terms of another input or output if the data type is a bus object.	For the parameterized port, set **Data Type** to `Bus: <object name>`.
Subsystem with bus operations in a Stateflow chart	An Inport block inside a subsystem in a Stateflow chart requires a bus object data type if its signal is a bus.	In the Inport block, set **Data type** to `Bus: <object name>`.
Ground block used as a bus source	The output signal of a Ground block cannot be a source for a bus.	Use a Constant block with **Constant value** set to 0 and the **Output data type** signal attribute set to `Bus: <object name>`.
Root Outport block with a single-element bus object data type	The input to the Outport block must be a bus if it specifies a bus object as its data type.	In the Outport block, set **Data type** to `Inherit: auto`.

Check for root outports with constant sample time

Check ID: `mathworks.design.CheckConstRootOutportWithInterfaceUpgrade`

Use this check to identify root outports with a constant sample time used with an AUTOSAR target, Function Prototype Control, or the model C++ class interface.

Description

Root outports with constant sample time are not supported when using an AUTOSAR target, Function Prototype Control, or the model C++ class interface. Use this check to identify root Outport blocks with this condition and modify the blocks as recommended.

Results and Recommended Actions

Condition	Recommended Action
Root outport with constant sample time used with an AUTOSAR target, Function Prototype Control or the model C++ class interface.	Consider one of the following: - Set the sample time of the block to the fundamental sample time. - Identify the source of the constant sample time and set its sample time to the fundamental sample time. - Place a Rate Transition block with inherited sample time (-1) before the block.

See Also

- "Consult the Upgrade Advisor".

Analyze model hierarchy and continue upgrade sequence

Check ID: `com.mathworks.Simulink.UpgradeAdvisor.UpgradeModelHierarchy`

Check for child models and guide you through upgrade checks.

Description

This check identifies child models of this model, and guides you through upgrade checks to run both non-compile and compile checks. The Advisor provides tools to help with these tasks:

- If the check finds child models, it offers to run the Upgrade Advisor upon each child model in turn and continue the upgrade sequence. If you have a model hierarchy you need to check and update each child model in turn.
- If there are no child models, you still need to continue the check sequence until you have run both non-compile and compile checks.

You must run upgrade checks in this order: first the checks that do not require compile time information and do not trigger an Update Diagram, then the compile checks.

Click **Continue Upgrade Sequence** to run the next checks. If there are child models, this will open the next model. Keep clicking **Continue Upgrade Sequence** until the check passes.

Results and Recommended Actions

Condition	Recommended Action
Child models found	Click **Continue Upgrade Sequence** to run the next checks. If there are child models, this will close the current Upgrade Advisor session, and open Upgrade Advisor for the next model in the hierarchy.

Condition	Recommended Action
No child models, but more checks to run	If there are no child models, click **Continue Upgrade Sequence** to refresh the Upgrade Advisor with compilation checks selected. The compile checks trigger an Update Diagram (marked with ^). Run the next checks and take advised actions. When you return to this check, click **Continue Upgrade Sequence** until this check passes.

Tips

Best practice for upgrading a model hierarchy is to check and upgrade each model starting at the leaf end and working up to the root model.

When you click **Continue Upgrade Sequence**, the Upgrade Advisor opens the leaf model as far inside the hierarchy as it can find. Subsequent steps guide you through upgrading your hierarchy from leaf to root model.

When you open the Upgrade Advisor, the checks that are selected do not require compile time information and do not trigger an Update Diagram. Checks that trigger an Update Diagram are not selected to run by default, and are marked with ^. When you use the Upgrade Advisor on a hierarchy, keep clicking **Continue Upgrade Sequence** to move through this sequence of analysis:

1 The Upgrade Advisor opens each model and library in turn, from leaf to root, and selects the non-compile checks. Run the checks, take any advised actions, then click **Continue Upgrade Sequence** to open the next model and continue.

2 When you reach the root end of the hierarchy, the Upgrade Advisor then opens each model again in the same order (but not libraries) and selects only the checks that require a model compile. Run the checks, take any advised actions, then click **Continue Upgrade Sequence** to open the next model. Continue until you reach the end of the hierarchy and this check passes.

Check Access to Data Stores

Check ID: mathworks.design.ConflictsForDataStoreReadWriters

Identify potential execution order sensitivity when reading and writing to data stores.

Description

The execution order of blocks that read and write to the same data store can change the simulation result. When blocks in the same hierarchy access the same data store, the execution order is not deterministic.

Results and Recommended Actions

Condition	Recommended Action
Data Store Memory block accessed by multiple blocks in the same hierarchy.	To enforce execution order for the blocks, consider the following: • Add a data dependency between the blocks. • Set block priority. • Move blocks into separate Function-Call Subsystem blocks and schedule them.

See Also

• "Local and Global Data Stores"
• Data Store Memory
• Data Store Read
• Data Store Write

Model Reference Conversion Advisor

Model Reference Conversion Advisor

Check Conversion Input Parameters

Use input parameters to configure the actions the advisor performs and the output it produces.

You can use the default parameters to run the advisor without changing any parameters.

Input Parameter	Description
New model name	The advisor provides a model name that is based on the Subsystem block name and is unique in the MATLAB path. The model name cannot exceed 59 characters. **Tip** If the advisor generates an error indicating that the target referenced model already exists, then use the **New model name** parameter to specify a new file name.
Conversion data file name	The advisor creates a file for storing data created during the conversion. By default, the advisor uses the model name at the beginning of the file name and appending `_conversion_data.mat`. For example, if the subsystem is in a model named `myModel`, the conversion file name is `myModel_conversion_data.mat`. You can save the conversion data in a MAT-file (default) or a MATLAB file. If you use a `.m` file extension, the advisor serializes all variables to a MATLAB file. **Note** If the top model uses a data dictionary, you cannot select this option.
Fix errors automatically	By default, if an advisor check finds any errors and the advisor can fix the error, the advisor provides a **Fix** button that you can click to have the advisor fix the issue. If you enable this parameter, the advisor fixes all conversion errors that it can, without displaying the **Fix** button.

Input Parameter	Description
Replace content of a subsystem with a Model block	By default, the advisor updates the original model by inserting a Model block in the model. The advisor action depends on whether you use the automatic fix options. • If you use the automatic fixes, then the advisor replaces the Subsystem block with a Model block unless the automatic fixes change the input or output ports. If the ports change, then the advisor includes the contents of the subsystem in a Model block that is inserted in the Subsystem block. • If you do not use the automatic fixes, then the advisor replaces the Subsystem block with a Model block. Clear this parameter to have the advisor open a new Simulink Editor window that contains only a Model block that references the newly created referenced model. The advisor does not update the original model in the other Simulink Editor window. **Note** If you are converting a variant subsystem, do not use this option. See "Convert Each Variant Subsystem".

Input Parameter	Description
Check simulation results after conversion	Compare the results of simulating the top model for the referenced model to the results of simulating the baseline model that has the subsystem. To use this option, before performing the conversion, enable signal logging for the subsystem output signals of interest in the model. Set these advisor options: • **Model block simulation mode** — Use the same simulation mode as in the original model. • **Replace content of a subsystem with a Model block** — Enable this option. • **Stop time** — Specify when you want the simulations to end. The default is the stop time of the top model. If the top model stop time is set to `inf`, the advisor stops after 10 seconds. • **Absolute tolerance** — Specify a value if you do not want to use the default of `'1e-06'`. • **Relative tolerance** — Specify a value if you do not want to use the default of `'1e-03'`. To see the results after the conversion is complete, click **View comparison results**. The advisor displays the results of the comparison in the Simulation Data Inspector. For more information, see "Compare Simulation Results Before and After Conversion".
Stop time	By default, the advisor uses the stop time of the top model, unless the stop time of the top model is `inf`. If the stop time of the top model is `inf`, the advisor uses a default stop time of `10`. You can specify a different stop time. For details, see "Specify Simulation Start and Stop Time". To use this option, select **Check simulation results after conversion**.

Input Parameter	Description
Absolute tolerance	The absolute signal tolerance for the simulation run comparison. The default is `1e-06`. To use this option, select **Check simulation results after conversion**.
Relative tolerance	The relative signal tolerance for the simulation run comparison. The default is `1e-03`. To use this option, select **Check simulation results after conversion**.
Model block simulation mode	Simulation mode for the new Model block that references the referenced model. • `Normal` (default) • `Accelerator`

After you configure the advisor, to start the conversion checks, click **Run this task**.

Performance Advisor Checks

Simulink Performance Advisor Checks

Simulink Performance Advisor Check Overview

Use Performance Advisor checks to improve model simulation time.

See Also

"Improve Simulation Performance Using Performance Advisor"

Baseline

Establish a measurement to compare the performance of a simulation after Performance Advisor implements improvements.

See Also

"Create a Performance Advisor Baseline Measurement"

Checks that Require Update Diagram

These checks require that **Update Diagram** occurs in order to run.

See Also

"Improve Simulation Performance Using Performance Advisor"

Checks that Require Simulation to Run

These checks require simulation to run in order to collect sufficient performance data. Performance Advisor reports the results after simulation completes.

See Also

"Improve Simulation Performance Using Performance Advisor"

Check Simulation Modes Settings

These checks evaluate simulation modes (Normal, Accelerator, Rapid Accelerator, Rapid Accelerator with up-to-date check off) and identify the optimal mode to achieve fastest simulation.

See Also

"What Is Acceleration?"

Check Compiler Optimization Settings

Use these checks to select compiler optimization settings for improved performance.

See Also

"Compiler optimization level"

Create baseline

Select this check to create a baseline when Performance Advisor runs. You can also create a baseline manually. A baseline is the measurement of simulation performance before you run checks in Performance Advisor. The baseline includes the time to run the simulation and the simulation results (signals logged). Before you create a baseline for a model, in the **Data Import/Export** pane of the Configuration Parameters dialog box:

- Select the **States** check box.
- Set the **Format** parameter to `Structure with time`.

Identify resource-intensive diagnostic settings

To improve simulation speed, disable diagnostics where possible. For example, some diagnostics, such as **Solver data inconsistency** or **Array bounds exceeded**, incur run-time overheads during simulations.

See Also

- "Diagnostics"
- "Improve Simulation Performance Using Performance Advisor"

Check optimization settings

To improve simulation speed, enable optimizations where possible. For example, if some optimizations, such as Block Reduction, are disabled, enable these optimizations to improve simulation speed.

You can also trade off compile-time speed for simulation speed by setting the compiler optimization level. Compiler optimizations for accelerations are disabled by default. Enabling them accelerates simulation runs but results in longer build times. The speed and efficiency of the C compiler used for Accelerator and Rapid Accelerator modes also affects the time required in the compile step.

Check MATLAB System block simulation mode

In general, to improve simulation speed, choose `Code generation` for the **Simulate using** parameter of the MATLAB System block. Because data exchange between MATLAB and Simulink passes through several software layers, `Interpreted execution` usually slows simulations, particularly if the model needs many data exchanges.

This check identifies which MATLAB System blocks can generate code and changes the **Simulate using** parameter value to `Code generation` where possible.

While `Code generation` does not support all MATLAB functions, the subset of the MATLAB language that it does support is extensive. By using this `Code generation`, you can improve performance.

- MATLAB System
- "Simulation Modes"
- "Improve Simulation Performance Using Performance Advisor"

Identify Interpreted MATLAB Function blocks

To improve simulation speed, replace Interpreted MATLAB Function blocks with MATLAB Function blocks where possible. Because data exchange between MATLAB and Simulink passes through several software layers, Interpreted MATLAB Function blocks usually slow simulations, particularly if the model needs many data exchanges.

Additionally, because you cannot compile an Interpreted MATLAB Function, an Interpreted MATLAB Function block impedes attempts to use an acceleration mode to speed up simulations.

While MATLAB Function blocks do not support all MATLAB functions, the subset of the MATLAB language that it does support is extensive. By replacing your interpreted MATLAB code with code that uses only this embeddable MATLAB subset, you can improve performance.

Identify simulation target settings

To improve simulation speed, disable simulation target settings where possible. For example, in the Configuration Parameters dialog box, clear the **Simulation Target > Echo expression without semicolons** check box to improve simulation speed.

See Also

- "Model Configuration Parameters: Simulation Target"
- "Improve Simulation Performance Using Performance Advisor"

Check model reference rebuild setting

To improve simulation speed, in the Configuration Parameters dialog box, verify that the **Model Referencing** > **Rebuild** parameter is set to `If any changes in known dependencies detected`.

See Also

- "Rebuild"
- "Improve Simulation Performance Using Performance Advisor"

Identify Scope blocks

Opened and uncommented Scope blocks can impact simulation performance. To improve simulation performance, close and comment out Scope blocks. Right-click a scope block, and then select **Comment Out**.

For opened Scopes, you can improve simulation speed by reducing updates. From the Scope **Simulation** menu, select **Reduce Updates to Improve Performance**.

- "Improve Simulation Performance Using Performance Advisor"

Identify active instrumentation settings on the model

Identify active instrumentation settings on the model. The fixed-point instrumentation mode controls which objects log minimum, maximum, and overflow data during simulation. Instrumentation is required to collect simulation ranges using the Fixed-Point Tool. These ranges are used to propose data types for the model (requires Fixed-Point Designer). When you are not actively converting your model to fixed point, disable the fixed-point instrumentation to restore the maximum simulation speed to your model.

From the model **Analysis** menu, select **Data Type Design** > **Fixed-Point Tool**. Under **System under design**, click **Continue**.

In the Model Hierarchy pane, the Fixed-Point Tool denotes systems that currently have instrumentation turned on with (`mmo`), or (`o`). Right-click the system in the model hierarchy and, under `Fixed-point instrumentation mode`, select `Use local settings` or `Force off`.

See Also

- Fixed-Point Instrumentation and Data Type Override (Fixed-Point Designer)

Check model reference parallel build

To improve simulation, verify the number of referenced models in the model. If there are two or more referenced models, build the model in parallel if possible.

Performance Advisor analyzes the model and estimates the build time on the current computer as if it were using several cores. It also estimates the parallel build time for the model in the same way an estimation would be performed if Parallel Computing Toolbox or MATLAB Distributed Computing Server™ software were installed on the computer. Performance Advisor performs this estimate as follows:

1 Search the model for referenced models that do not refer to other referenced models.
2 Calculate the average number of blocks in each of the referenced models that do not refer to other referenced models.
3 Of the list of referenced models that do not refer to others, select a referenced model whose number of blocks is closest to the calculated average.
4 Build this model to obtain the build time.
5 Based on the number of blocks and the build time for this referenced model, estimate the build time for all other referenced models.
6 Based on these build times, estimate the parallel build time for the top model.

Parallel Build Time Estimate for Model 'top': Update Diagram"
Sequential Build Time with One Core is @ 470 sec
To calculate the overhead time introduced by the parallel build mechanism, set the Parallel Build Overhead Time Estimation Factor. Performance Advisor calculates the estimated build time with overhead as:

(1 + Parallel Build Overhead Time Estimation Factor)*(Build time on a single machine)

Check Delay block circular buffer setting

To improve simulation, check that each Delay block in the model uses the appropriate buffer type. By default, the block uses an array buffer (the **Use circular buffer for state** option is not selected). However, when the delay length is large, a circular buffer can improve execution speed by keeping the number of copy operations constant.

If the Delay block is currently using an array buffer, and all of the following conditions are true, Performance Advisor selects a circular buffer:

- The Delay block is in sample-based mode, i.e,either the **Input processing** parameter is set to `Elements as channels (sample based)`, or the input signal type is set to `Sample based`.
- The value or upper limit of the delay length is 10 or greater.
- The size of the state—equal to the delay length multiplied by the total of all output signal widths—is 1000 or greater.

See Also

- Delay
- "Improve Simulation Performance Using Performance Advisor"

Check continuous and discrete rate coupling

If your model contains both discrete and continuous rates, the coupling between these rates can slow down simulation. Performance Advisor checks for these conditions in your model.

- The model is using a variable step solver.
- The model contains both continuous and discrete rates.
- The fastest discrete rate is relatively smaller than **Max step size** determined by the solver.

Setting the `DecoupledContinuousIntegration` parameter to `on` might speed up simulation.

Check zero-crossing impact on continuous integration

If your model contains zero-crossings which do not impact the continuous integration, the simulation might slow down when all the following conditions are satisfied:

- The model uses a variable-step solver.
- The model contains blocks that have continuous states and zero-crossings.
- Some of the zero-crossings do not affect the integration of the continuous states.

Setting the `MinimalZcImpactIntegration` parameter to `On` might speed up simulation.

Check discrete signals driving derivative port

Run this check if your simulation has many unnecessary resets. A discrete signal driving a block with continuous states triggers a reset at every sample time hit of the block. These resets are computationally expensive. Performance Advisor checks for these signals and blocks and provides a list of the same.

You can edit the model around the discovered discrete signals that drive these blocks to remove such cases. For example, inserting a Zero Order Hold block between the discrete signal and the corresponding block with continuous states might help resolve the issue.

Check solver type selection

To improve simulation, check that the model uses the appropriate solver type.

Explicit vs. Implicit Solvers

Selecting a solver depends on the approximation of the model stiffness at the beginning of the simulation. A stiff system has both slowly and quickly varying continuous dynamics. Implicit solvers are specifically designed for stiff problems, whereas explicit solvers are designed for non-stiff problems. Using non-stiff solvers to solve stiff systems is inefficient and can lead to incorrect results. If a non-stiff solver uses a very small step size to solve your model, check to see if you have a stiff system.

Model	Recommended Solver
Represents a stiff system	ode15s
Does not represent a stiff system	ode45

Performance Advisor uses the heuristic shown in the table to choose between explicit and implicit solvers.

Original Solver	Performance Advisor Action
Variable step solver	Calculates the system stiffness at 0 first. Then: • If the stiffness is greater than 1000, Performance Advisor chooses ode15s. • If the stiffness is less than 1000, Performance Advisor chooses ode45.
Fixed-step continuous solver	• If the stiffness is greater than 1000, Performance Advisor chooses ode14x. • If the stiffness is less than 1000, Performance Advisor chooses ode3.

This heuristic works best if the system stiffness does not vary during simulation. If the system stiffness varies with time, choose the most appropriate solver for that system rather than the one Performance Advisor suggests.

Select simulation mode

To achieve fastest simulation time, use this check to evaluate the following modes and identify the optimal selection:

- Normal
- Accelerator
- Rapid Accelerator
- Rapid Accelerator with up-to-date check off

In Normal mode,Simulink interprets your model during each simulation run. If you change the model frequently, this is generally the preferred mode to use because it requires no separate compilation step. It also offers the most flexibility to make changes to your model.

In Accelerator mode,Simulink compiles a model into a binary shared library or DLL where possible, eliminating the block-to-block overhead of an interpreted simulation in Normal mode. Accelerator mode supports the debugger and profiler, but not runtime diagnostics.

In Rapid Accelerator mode, simulation speeds are fastest but this mode only works with models where C-code is available for all blocks in the model. Also, this mode does not support the debugger or profiler.

When choosing Rapid Accelerator with up-to-date check off, Performance Advisor does not perform an up-to-date check during simulation. You can run the Rapid Accelerator executable repeatedly while tuning parameters without incurring the overhead of up-to-date checks. For instance, if you have a large model or a model that makes extensive use of model reference, this method of execution can increase efficiency.

For models with 3–D signals, Normal or Accelerator modes work best.

Final Validation

This check validates the overall performance improvement of simulation time and accuracy in a model. If the performance is worse than the original model, Performance Advisor discards all changes to the model and loads the original model.

Global settings for validation do not apply to this check. If you have not validated the performance improvement from changes resulting from other checks, use this check to perform a final validation of all changes to a model.

Simulink Limits

Maximum Size Limits of Simulink Models

The following table documents some limits on the size and complexity of Simulink models.

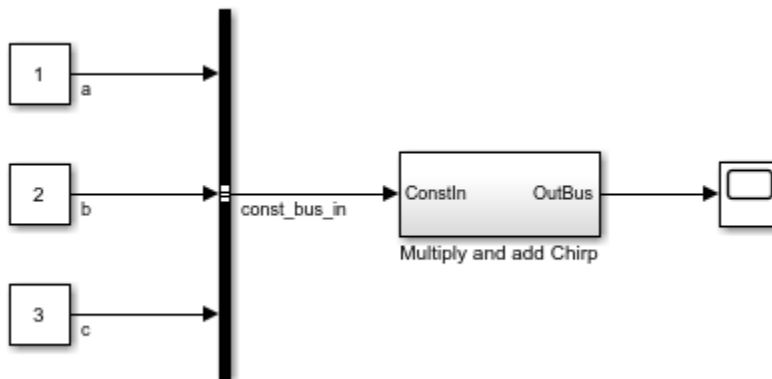
Model Feature	Limit
Maximum number of levels in a block diagram	1024
Maximum number of branches in a line	1024
Maximum length of a parameter name	63
Maximum length of a parameter character vector value	32768
Maximum value of a model window coordinate	32768
Maximum number of bytes of logged simulation data	2^31-1 bytes on 32-bit systems, 2^48-1 bytes on 64-bit systems
Maximum number of bytes for the total block I/O buffer length in a model	2^31-1 bytes on 32-bit systems and on 64-bit systems
Maximum length of integer and fixed-point data types	128 bits

Block Reference Page Examples

Create Bus Ports in a Subsystem

This example shows adding In Bus Element and Out Bus Element blocks to create bus element ports in a subsystem for selecting signals from an input bus and creating an output bus signal.

Model Structure

Open the model. The top model has three constant signals combined into a bus that feeds a subsystem input port and outputs a bus signal to a Scope block.


The subsystem includes two In Bus Element and Out Bus Element blocks.
Set the Port Name and Color for an In Bus Element Block

Open the Block Parameters dialog box for the ConstIn.a block. The Port name parameter is set to `ConstIn`, which changes the subsystem input port name from the default InBus. This block selects the `a` signal. The block color is set to green instead of the default black.
The In Bus Element block feeds a Gain block, and the Gain block connects to an Out Bus Element block that includes an `a*3` signal in the output bus signal.

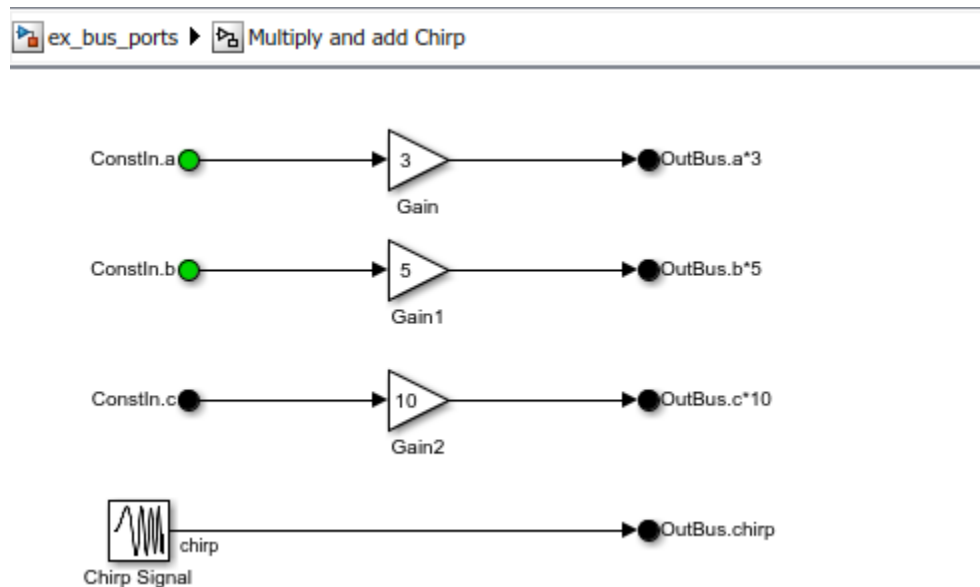
Create an In Bus Element Block and an Out Bus Element Block

Create a third In Bus Element block for the `c` signal. In the Simulink Editor, right-click and drag the ConstIn.b block to make a copy of the block. Specify to use the existing port. Edit the block icon text to say `ConstIn.c`. Select the block and override the green block color by specifying black. Feed the output of the In Bus Element block to a third Gain block and set the gain to 10.

Copy the OutBus.b*5 block to create another Out Bus Element block, specifying to use the same port. Connect the Gain block to the Out Bus Element block that uses the same port. Connect the Gain block output signal to the Out Bus Element block and edit the icon text to say `OutBus.c*10`.

Add a Chirp Block and Include Its Output Signal in the Bus Output Signal

Add a Chirp Signal block and connect it to a new Out Bus Element block that uses the same port as the other Out Bus Element blocks (OutBus). Open the Out Bus Element dialog box, double-click the selected signal, and change the signal name to chirp.

The virtual bus signal that the subsystem outputs contains the output signals of the three Gain blocks and the Chirp block.


Convert Bus Signal to a Vector

This example shows how to use a Bus to Vector block to convert a bus signal to a vector, to provide a signal that the Gain block can accept.

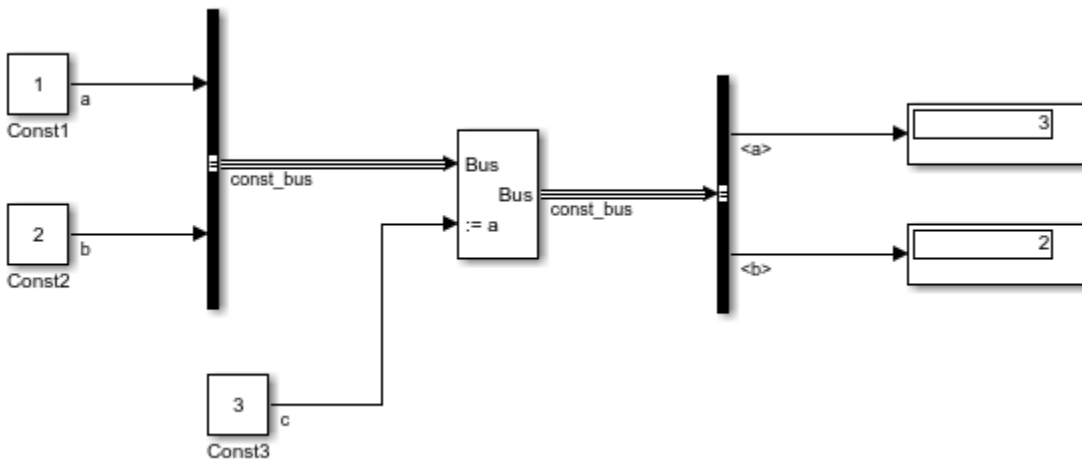
Open a Simulink® model and simulate it.

```
model = fullfile(matlabroot,'examples','simulink','ex_bus_to_mux_ok');
open_system(model);
sim(model)
```

The Gain block cannot accept a bus signal. Inserting a Bus to Vector block provides the type of input signal (a vector) that the Gain block can accept. The Bus to Vector block has no user-accessible parameters.

Assign Signal Values to a Bus

This example shows how to use a Bus Assignment block to change a bus element value without adding Bus Selector and Bus Creator blocks to select bus elements and reassemble them into a bus.

Open the model and simulate it.


Initially, the value of signal a is 1. However, the Bus Assignment block replaces that initial value of signal a with the value of signal c, which is 3. The const_bus output signal has a value of 3 for signal a, as the Display block shows.

Initialize Your Model Using the Callback Button Block

This example shows how to use the Callback Button block to perform initialization routines on your model.

Explore the Model

The example model builds on the `sldemo_fuelsys` featured model. When you open the model, to bind the workspace variables to their Dashboard blocks, you have to update the model diagram. Here, the Callback Button block at the bottom of the Dashboard subsystem in the model has been configured to update the diagram on the release of the mouse button when you click the block.
You do not need to start a simulation for the Callback Button to react to your input. Just select and then click the Callback Button to run the initialization code. Double-click the Callback Button block to view and edit its parameters, including the press and click scripts.

Callback Button

"Control a Parameter Value with Callback Button Blocks" on page 12-12

Control a Parameter Value with Callback Button Blocks

This example models control of a system that consists of two masses attached on either side of a spring. A control loop damps the oscillation of the spring that results when an external force acts on the system. The model uses Callback Button blocks to provide an interface for you to adjust the frequency of the external force before and during simulation.

Explore the Model

The model for this example adds two Callback Button blocks, labeled `Frequency +` and `Frequency -` to the Double Mass-Spring System model. When you simulate the model, an animation visualizes the system.

Double Mass-Spring System

$$\dot{x} = Ax + Bu$$
$$y = Cx + Du$$

Select3

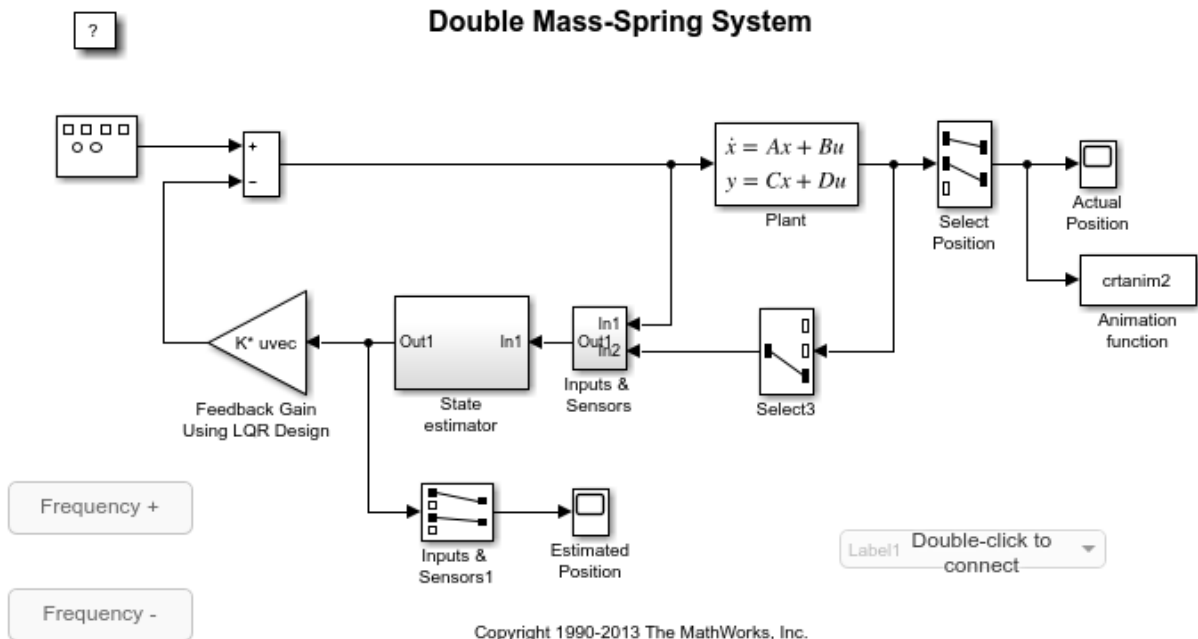
Frequency +

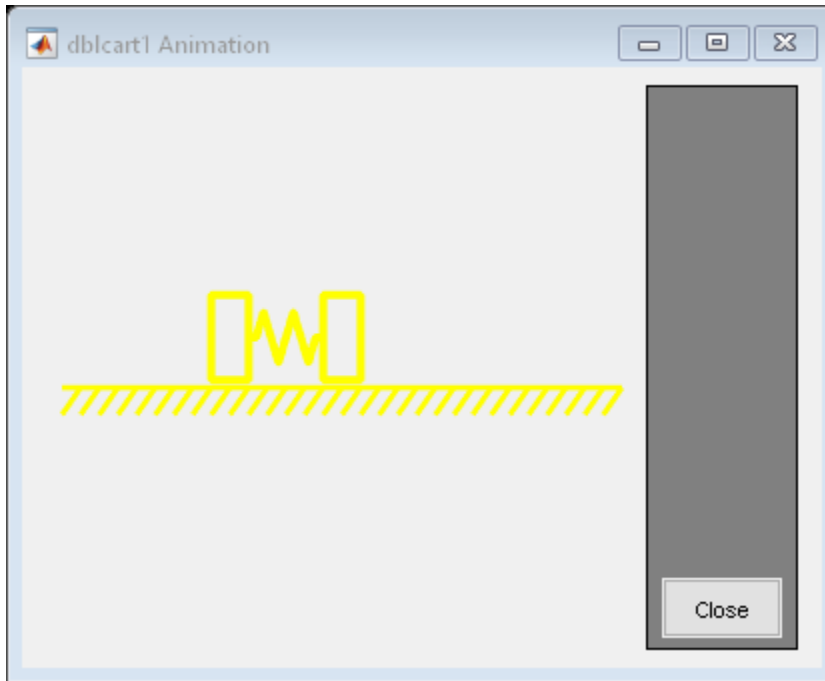
Inputs & Sensors1

Estimated Position

Label1 Double-click to connect

Frequency -

Copyright 1990-2013 The MathWorks, Inc.




Click the button labeled `Frequency +` to increase the oscillation frequency. When you adjust the frequency of the external force, the Callback Button block displays a message in the command window indicating the new frequency value. You can adjust the parameter during a simulation and while the model is idle.

Both Callback Button blocks in this model are configured with a `ClickFcn` that responds to your clicks and a `PressFcn` that executes when you press the Callback Button block. Double-click the `Frequency +` Callback Button block to view its parameters.

When you click the `Frequency +` Callback Button block, the `ClickFcn` increases the frequency of the external force by `0.1`. If you press the Callback Button block for more than the `500` ms Press Delay, the `PressFcn` increases the frequency of the external force by `0.1` every second.

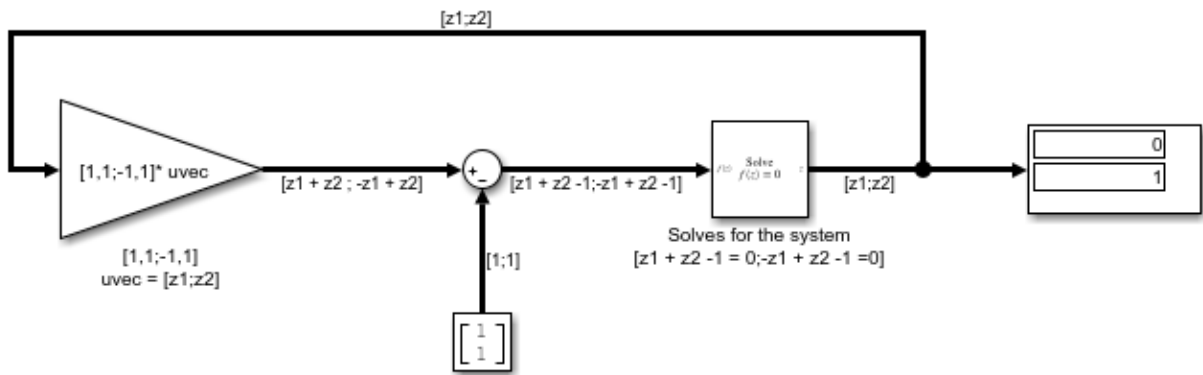
"Initialize Your Model Using the Callback Button Block" on page 12-10

Solve a Linear System of Algebraic Equations

Use the Algebraic Constraint block to solve the system

$$z_1 + z_2 = 1$$
$$z_2 - z_1 = 1$$

The model represents the problem in a vectorized form as

$$\begin{bmatrix} 1 & 1 \\ -1 & 1 \end{bmatrix} \begin{bmatrix} z_1 \\ z_2 \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$


The signal fed to the Algebraic Constraint block $f(z)$ is a 2×1 vector of the form

$$\begin{bmatrix} z_1 + z_2 - 1 \\ -z - 1 + z_2 - 1 \end{bmatrix}$$

The block is configured to constrain $f(z)$ to 0. Thus solving for $f(z) = 0$ yields the solution $z_1 = 0, \ z_2 = 1$

Model a Planar Pendulum

Consider a point mass m suspended by a massless rod of length l under the influence of gravity. The position of the mass can be expressed in in Cartesian coordinates by *(x,y)*.
Modeling the System

A force balance of the mass gives the equations of motion in the x and y directions.

$$
\begin{array}{rcl}
m\ddot{x} & = & F\sin\theta \quad (1) \\
m\ddot{y} + F\cos\theta & = & -mg \quad (2)
\end{array}
$$

Let *(u, v)* be the velocities in *(x, y)* respectively. The system can be rewritten as a system of first order ODEs

$$\begin{array}{rcll}
\dot{x} & = & u & (3) \\
\dot{u} & = & -F\frac{x}{ml} & (4) \\
\dot{y} & = & v & (5) \\
\dot{v} & = & -F\frac{y}{ml} - g & (6)
\end{array}$$

where F is the tension in the rod. The system also possesses the geometric constraint

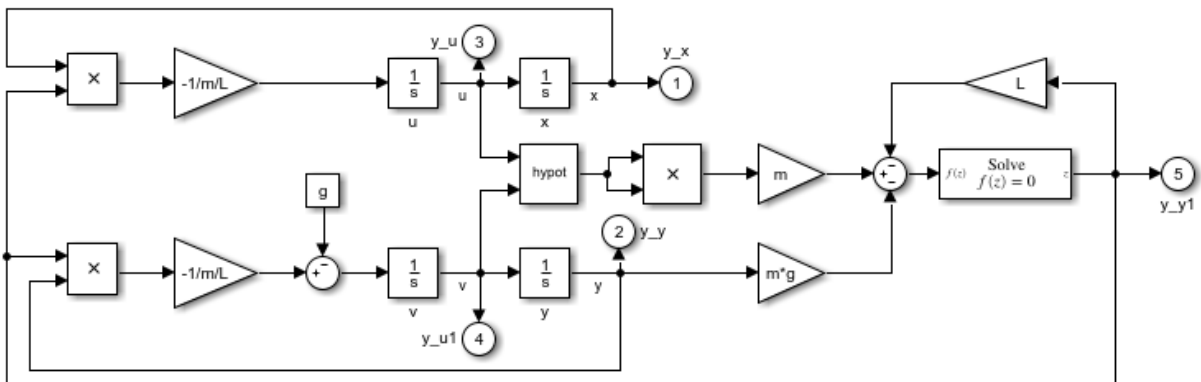
$$x^2 + y^2 = l^2 \qquad (7)$$

Differentiate (7) twice with respect to time t to arrive at

$$m(u^2 + v^2) - Fl - mgy = 0 \qquad (8)$$

This relationship is useful since it allows F to determined at every step for use in modeling the kinematics of the system.

Simulating the System

The system is simulated as shown in the figure below


Equation (8) contains one unknown F and is of the form $f(z) = 0$ where $f(z) = m(u^2 + v^2) - Fl - mgy$. The Algebraic Constraint block constrains $f(z)$ to 0 and solves for F in accordance with (8).

Position and velocity in x over time

Position and velocity in y over time

Hairer, Ernst, Christian Lubich, and Michel Roche. "The Numerical Solution Of Differential-Algebraic Systems By Runge-Kutta Methods." *Lecture Notes in Mathematics.* Vol. 1409, Berlin: Springer-Verlag, 1989: pp. 8-9.

Improved Linearization with Transfer Fcn Blocks

The Laplace domain transfer function for the operation of differentiation is:

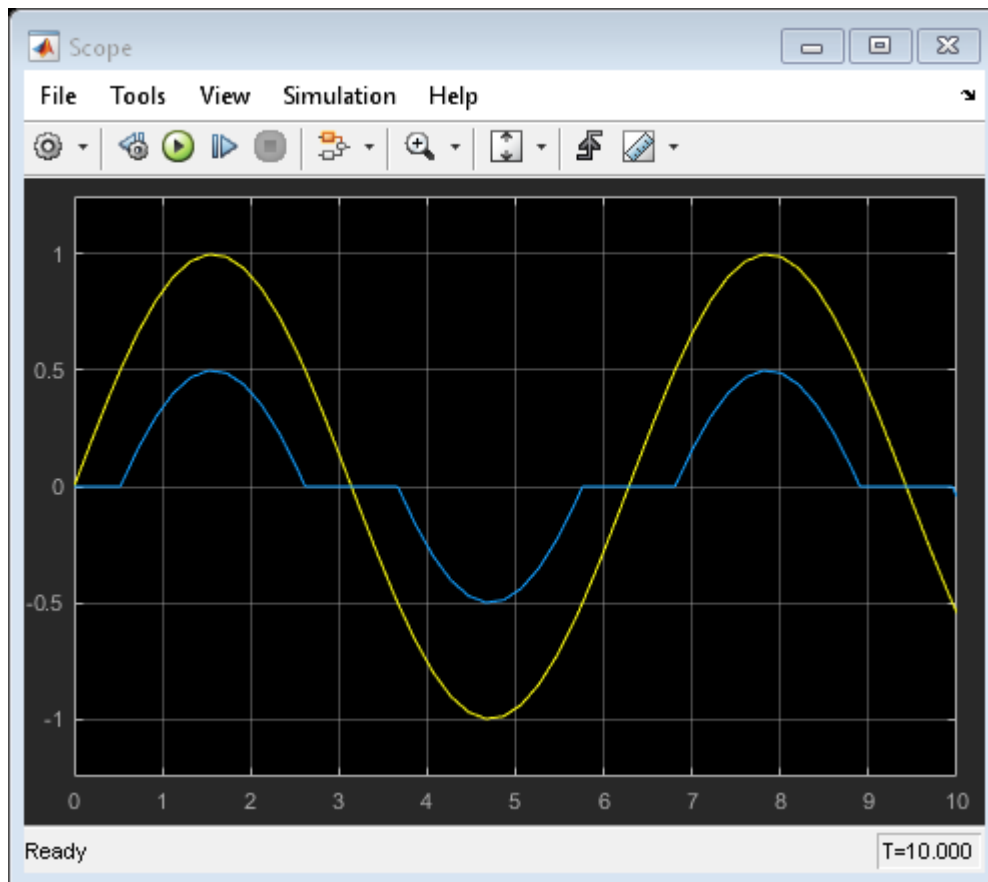
$$\frac{Y(s)}{X(s)} = s$$

This equation is not a proper transfer function, nor does it have a state-space representation. As such, the Simulink software linearizes this block as an effective gain of 0 unless you explicitly specify that a proper first-order transfer function should be used to approximate the linear behavior of this block.

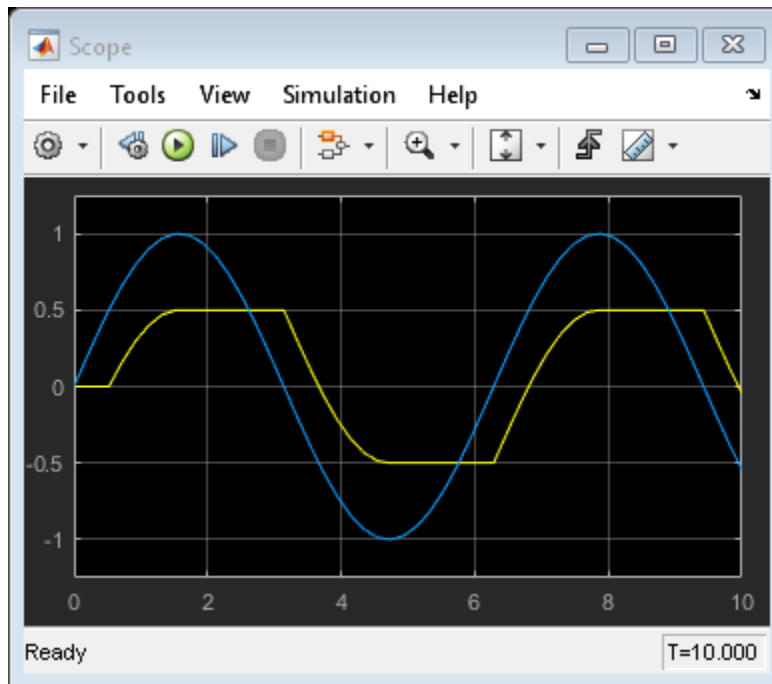
To improve linearization, you can also try to incorporate the derivative term in other blocks. For example, if you have a Derivative block in series with a Transfer Fcn block, try using a single Transfer Fcn block of the form

$$\frac{s}{s+a}$$

For example, you can replace the first set of blocks in this figure with the blocks below them:
View Dead Zone Output on Sine Wave

This example shows the effect of the Dead Zone block on a sine wave. The model uses a dead zone lower limit of -0.5 and an upper limit as 0.5. Set these values through the parameters **Start of Dead Zone** and **End of Dead Zone** .


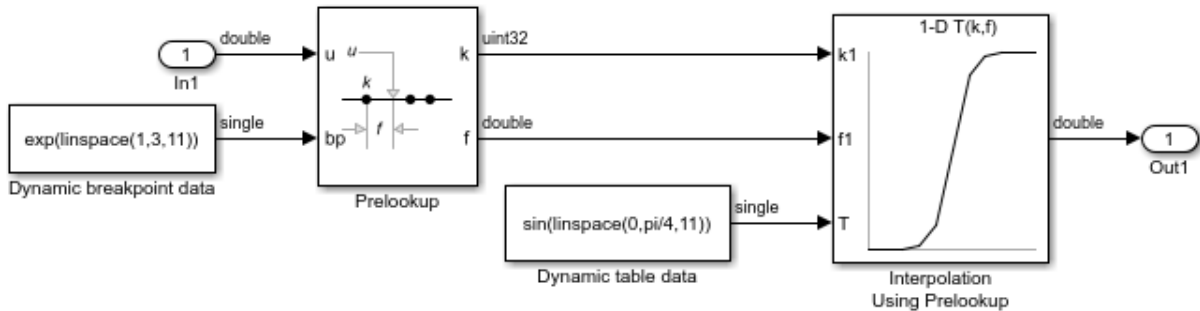
View Backlash Output on Sine Wave

This example shows the effect of the Backlash block on a sine wave using default parameters. The initial **Deadband width** is 1 and the **Initial output** is 0.


The initial deadband is centered around 0 and has a width of 1, which extends .5 in each direction. The output from the Backlash block begins at 0 and does not change until the input reaches the edge of the deadzone at .5. Then the output engages in a positive direction and changes an equal amount as the input. After the input reaches a value of 1, it starts moving in a negative direction. At this point the output disengages and stays flat

until the input passes through the deadband width of 1. Once the input reaches the end of the deadband zone at 0, then the output engages and starts moving in a negative direction with the input.

Prelookup With External Breakpoint Specification

This example shows how to feed a breakpoint dataset from a Constant block to the bp input port of the Prelookup block.


The Prelookup block inherits the following breakpoint attributes from the bp input port:

- **Minimum**: Inf
- **Maximum**: Inf
- **Data type**: single

Similarly, a Constant block feeds the table data values to the T input port of the Interpolation Using Prelookup block, which inherits the following attributes:

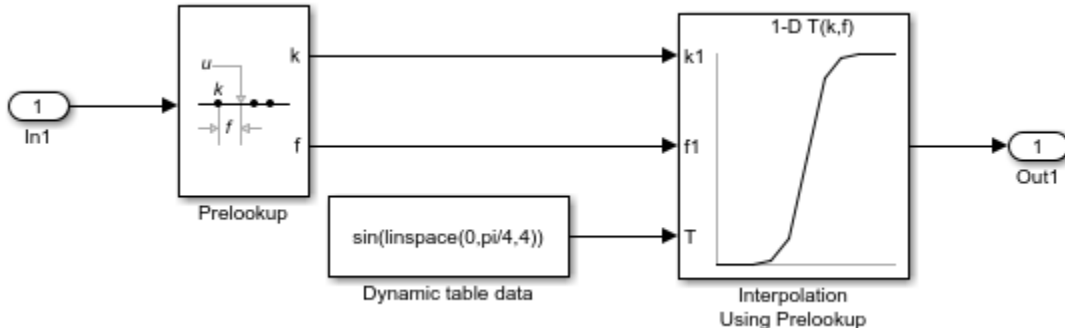
- **Minimum**: Inf
- **Maximum**: Inf
- **Data type**: single

Simulink® uses double-precision, floating-point data to perform the computations in this model. However, the model stores the breakpoint and table data as single-precision, floating-point data. Using a lower-precision data type to store breakpoint and table data reduces the memory requirement.

Prelookup with Evenly Spaced Breakpoints

This example shows how to specify evenly spaced breakpoint data in the Prelookup block.

In the **Breakpoints data** section, the **Specification** parameter is set to Even spacing. The parameters **First point**, **Spacing**, and **Number of points** are set to 25, 12, and 4 respectively. Specifying these parameters creates four evenly spaced breakpoints: [25, 37, 49, 61].

An alternative way to specify evenly spaced breakpoints is to set **Specification** to Explicit values and set **Value** to [25:12:61].


Simulink® uses double-precision, floating-point data to perform the computations in this model. However, the model stores the breakpoints and table data as double.

Configure the Prelookup Block to Output Index and Fraction as a Bus

This example shows how to output a bus containing the index (`k`) and fraction (`f`) from Prelookup block. The bus object can then be used as an input to the Interpolation Using Prelookup block. The example also shows how to get the same results without using a bus object.

Open and simulate the model.
At the top of the model, open the Prelookup block parameters dialog box. In the **Main** tab, note that **Output selection** is set to `Index and fraction as bus`. In the **Data Types** tab, note that **Output** is set to `Bus: myBus`. In the Simulink® Editor, select **File>Model Properties** and open the **Callbacks** tab. In the model's `PreLoadFcn`, the code defines the bus object `myBus`, which specifies the index as the first bus element and the fraction as the second element.

Open the Interpoloation Using Prelookup block parameters dialog box. In the **Main** tab, note that **Require index and fraction as bus** check box is selected. That option configures the block to use the bus output from the Prelookup block.

Approximating the sinh Function Using the Lookup Table Dynamic Block

This example shows how to use the Lookup Table Dynamic block to approximate the `sinh` function. The breakpoint data is given by the vector `[-5:5]` and the table data is given by the vector `sinh([-5:5])`. The input `x` is provided by the Constant block as a 1-by-3 vector containing values that are below, within, and above the breakpoint data values.

To see how each lookup method handles input values that are below, within, and above the breakpoint data values, change the value of the **Lookup Method** parameter on the Lookup Table Dynamic block.
The Lookup Table Dynamic block outputs the following values when using the specified lookup methods and inputs.

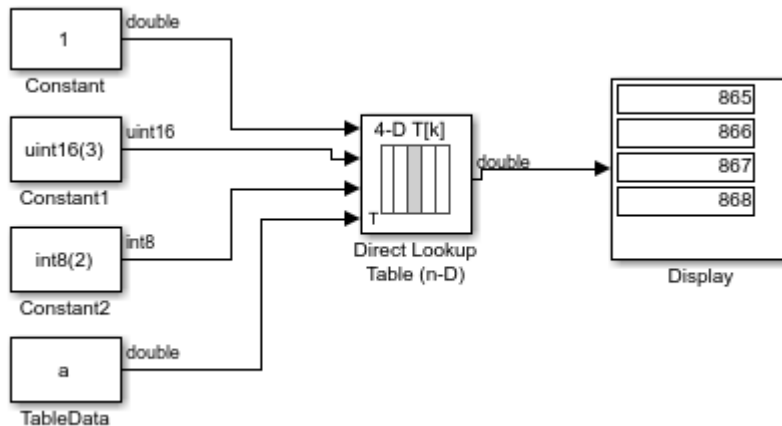
Lookup Method	Input	Output	Comment
Interpolation-Extrapolation	1.4	2.156	N/A
	5.2	83.59	N/A
Interpolation-Use End Values	1.4	2.156	N/A
	5.2	74.2	The block uses the value for `sinh(5.0)`.
Use Input Above	1.4	3.627	The block uses the value for `sinh(2.0)`.
	5.2	74.2	The block uses the value for `sinh(5.0)`.
Use Input Below	1.4	1.175	The block uses the value for `sinh(1.0)`.
	-5.2	-74.2	The block uses the value for `sinh(-5.0)`.
Use Input Nearest	1.4	1.175	The block uses the value for `sinh(1.0)`.

Create a Logarithm Lookup Table

This example shows how to use the n-D Lookup Table block to create a logarithm lookup table. The lookup table allows you to approximate the common logarithm (base 10) over the input range [1,10] without performing an expensive computation.
Providing Table Data as an Input to the Direct Lookup Table Block

This example shows how to provide table data as an input to the Direct Lookup Table block. In the following model, a is a 4-D array of linearly increasing values that you define with the following model preload function:

```
a = reshape(1:2800, [4 5 20 7]);
```

When you run the model, you get the following results:


The block labeled TableData feeds a 4-D array to the Direct Lookup Table (n-D) block, with a data type of double. Because the Direct Lookup Table (n-D) block uses zero-based indexing, the output is:

```
a(:,2,4,3)
```

The output has the same data type as the table data input signal: double.

Specifying Table Data in the Direct Lookup Table Block Dialog Box

This example shows how to specify table data on the dialog box of the Direct Lookup Table (n-D) block. In the following model, the table data is a is a 4-D array of linearly increasing values that you define with the following model preload function:

```
a = reshape(1:2800, [4 5 20 7]);
```

When you run the model, you get the following results:
Because the Direct Lookup Table (n-D) block uses zero-based indexing, the output is:

```
a(:,2,4,3)
```

The output data type matches the Direct Lookup Table block's **Table data type**, which is set to `int16`.

12-33

Using the Quantizer and Saturation blocks in sldemo_boiler

This example shows how the Quantizer and Saturation blocks are used in the model ex_sldemo_boiler. The ADC subsystem digitizes the input analog voltage by:

- Multiplying the analog voltage by 256/5 with the Gain block
- Rounding the value to integer floor with the Quantizer block
- Limiting the output to a maximum of 255 (the largest unsigned 8-bit integer value) with the Saturation block
This subsystem models a typical
8-bit analog-to-digital converter
having an input range of 0-5 volts

Scalar Expansion with the Coulomb and Viscous Friction Block

This example shows a model with a scalar input to a Coulomb & Viscous Friction block that uses scalar expansion to output a vector.
Double click the friction block to see the parameters. **Coefficient of viscous friction (Gain)** is a scalar value 2, but **Coulomb friction value (Offset)** is a vector value [1 3 2 0] . Therefore, the block uses element-wise scalar expansion to compute the output.

Each output is calculated using this formula.

$$y = sign(x). * (Gain. * abs(x) + Offset)$$

For example, the first offset 1 is calculated as follows.

$$y = - * ((2 * 5) + 1)$$

$$y = -11$$

If the dimensions for the input and Offset are the same, then no expansion is necessary.

Sum Block Reorders Inputs

This example shows how the Sum block reorders inputs. If you use a - sign as the first operation, the block reorders the inputs, if possible, to use a + operation. For example, in the expression `output = -a-b+c`, the Sum block reorders the input so that `output = c-a-b`. To initialize the accumulator, the Sum block uses the first + input port.

The block avoids performing a unary minus operation on the first operand `a` because doing so can change the value of `a` for fixed-point data types. In that case, the output value differs from the result of accumulating the values for `a`, `b`, and `c`.
Both the constant inputs use `int8` data types The Sum block also uses `int8` for the accumulator and output data types and has **Saturate on integer overflow** turned on. The Sum block reorders the inputs to give the ideal result of 127.

1. Reorders inputs from (`-Input1 + Input2`) to (`Input2 - Input1`).
2. Initializes the accumulator by using the first + input port. `Accumulator = int8(-1) = -1`
3. Continues to accumulate values. `Accumulator = Accumulator - int8(-12) = 127`
4. Caclulates the block output. `Output = int8(127) = 127`

If the Sum block does not reorder the inputs, then you get the nonideal result of 126.

1. Initializes the accumulator by using the first input port. `Accumulator = int8(-(-128)) = 127`
2. Because saturation is on, the initial value of the accumulator saturates at 127 and does not wrap.
3. Continues to accumulate values. `Accumulator = Accumulator + int8(-1) = 126`

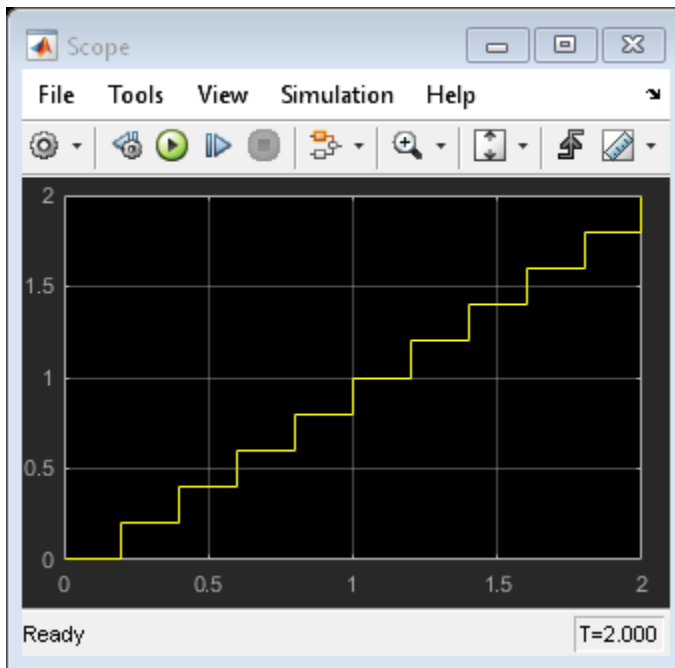
4   Calculates the block output. `Output = int8(126) = 126`

To explicitly specify a unary minus operation for `output = -a-b+c`, you can use the Unary Minus block in the Math Operations library.

Iterated Assignment with the Assignment Block

This example shows using the Assignment block to assign values computed in a For or While Iterator loop to successive elements. You can use vector, matrix or multidemensional signals and do the assignment in a single time step. In this model, the For Iterator block creates a vector signal each of whose elements equals $3 * i$ where i is the index of the element.
The iterator generates indices for the Assignment block. On the first iteration, the Assignment block copies the first input (Y0) to the output (Y) and assigns the second input (U) to the output Y(E1). On successive iterations, the Assignment block assigns the current value of U to Y(Ei), that is, without first copying Y0 to Y. These actions occur in a single time step.

View Sample Time Using the Digital Clock Block

This example shows how to view the simulation sample time at a specified sampling interval using the Digital Clock block. In this model, the Scope shows the output of a Digital Clock block with the **Sample time** set to 0.2.


In this configuration, the Digital Clock block outputs the simulation time every 0.2 seconds. Otherwise, the block holds the output at the previous value.

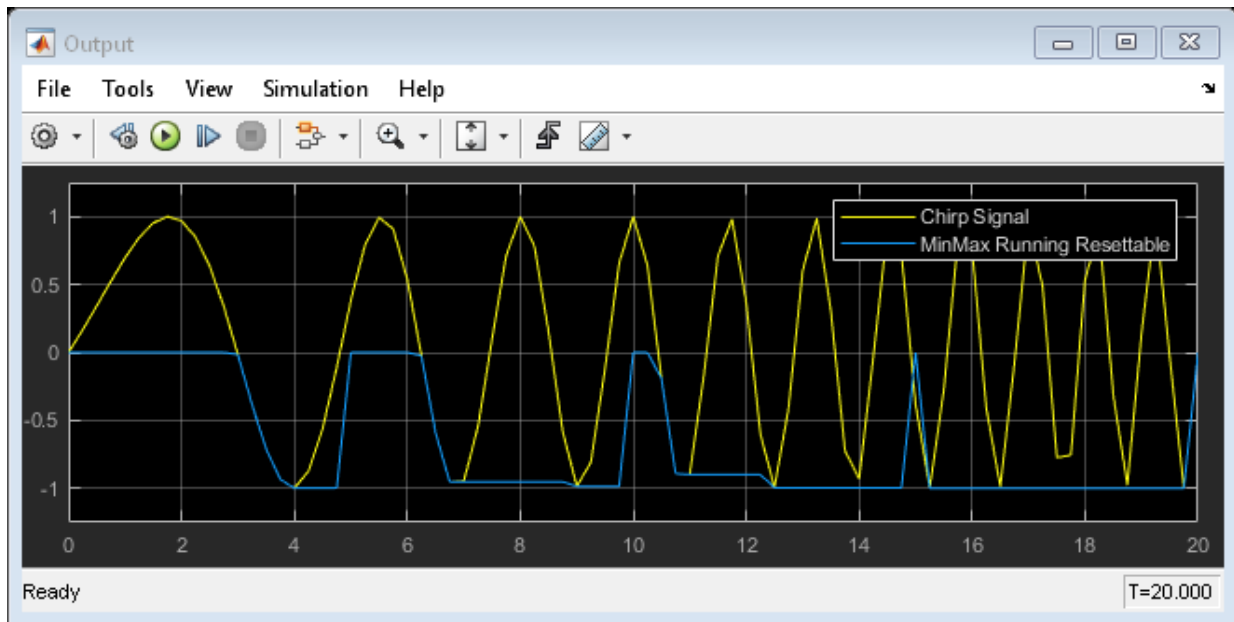
Bit Specification Using a Positive Integer

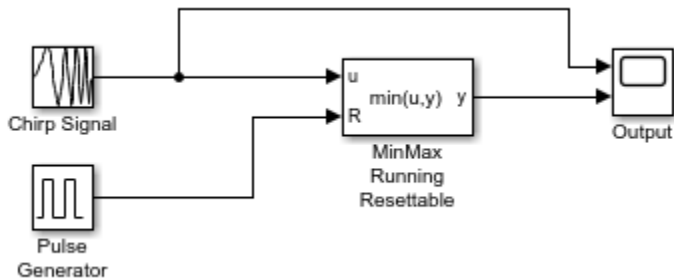
This example shows how to specify the **Number of bits** in the Counter Free-Running block as a positive integer.
At t = 255, the counter reaches the maximum value of (2^8) - 1. If you increase the stop time of the simulation to 256, the counter wraps to zero.

Bit Specification Using an Unsigned Integer Expression

This example shows how to specify the **Number of bits** in the Counter Free-Running block as an unsigned integer expression.
At t = 254, the counter reaches the maximum value of `uint8(2^(uint8(8))-1)`. If you increase the stop time of the simulation to 255, the counter wraps to zero.

Track Running Minimum Value of Chirp Signal

This example shows how to track the running minimum value of a signal generated by the Chirp Signal block.




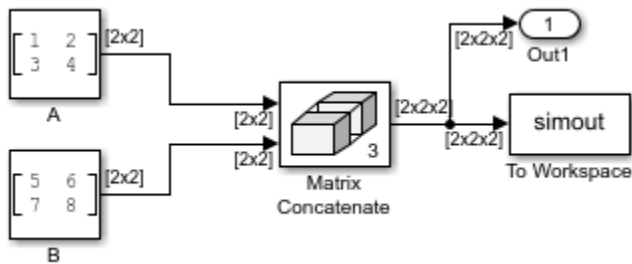
The Chirp Signal block generates a sine wave whose frequency increases at a linear rate with time. The MinMax Running Resettable block tracks the minimum value of that chirp

signal over time. The running minimum value is reset every 5 seconds by the Pulse Generator block.

Horizontal Matrix Concatenation

This example shows how to perform a horizontal matrix concatenation with the Matrix Concatenate block. When you set the **Concatenate dimension** parameter to 2 and the inputs are 2-D matrices, the block performs horizontal matrix concatenation and places the input matrices side-by-side to create the output matrix.
Vertical Matrix Concatenation

This example shows how to perform a vertical matrix concatenation with the Matrix Concatenate block. When you set the **Concatenate dimension** parameter to 1 and the inputs are 2-D matrices, the block performs vertical matrix concatenation and places the input matrices on top of each other to create the output matrix.
Multidimensional Matrix Concatenation

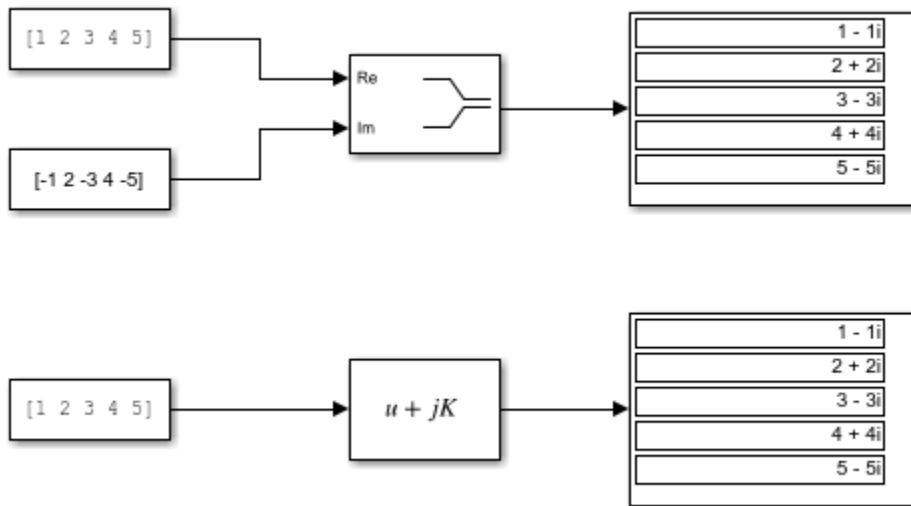
This example shows how to perform multidimensional matrix concatenation with the Matrix Concatenate block. When you set the **Concatenate dimension** parameter to 3 and the inputs are 2-D matrices, the block performs multidimensional matrix concatenation.


Unary Minus of Matrix Input

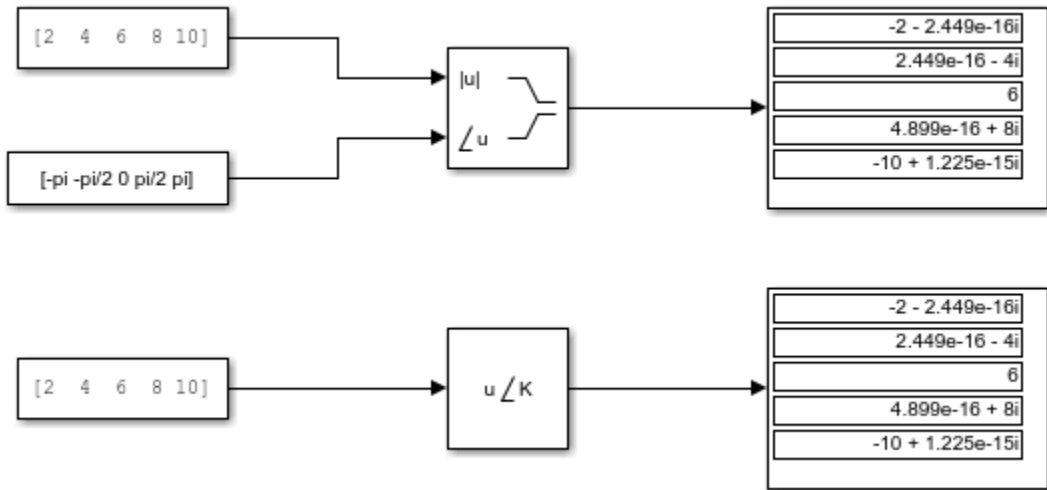
This example shows how to compute the unary minus of a matrix input.
Sample Time Math Operations Using the Weighted Sample Time Math Block

This example shows how to add the sample time value to a signal using the Weighted Sample Time Math block.
Using the Probe block, you can see the sample time of this model is 0.2. When you set the **Operation** to + and the **Weight value** to 1 on the Weighted Sample Time Math block, the block adds the sample time value of 0.2 to the input signal. When you set the **Weight value** to 3, the Weighted Sample Time Math block adds Ts*3 to the input signal, thus increasing each value by 0.6.

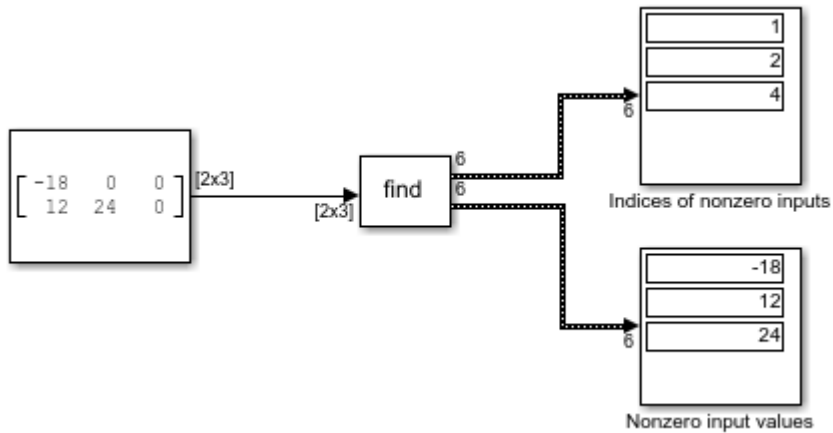
Construct Complex Signal from Real and Imaginary Parts

This example shows how to use the Real-Imag to Complex block to construct a complex-valued signal from real and imaginary parts. You can provide both the real and imaginary parts as block inputs, or provide one value as an input, and the other on the block dialog box.


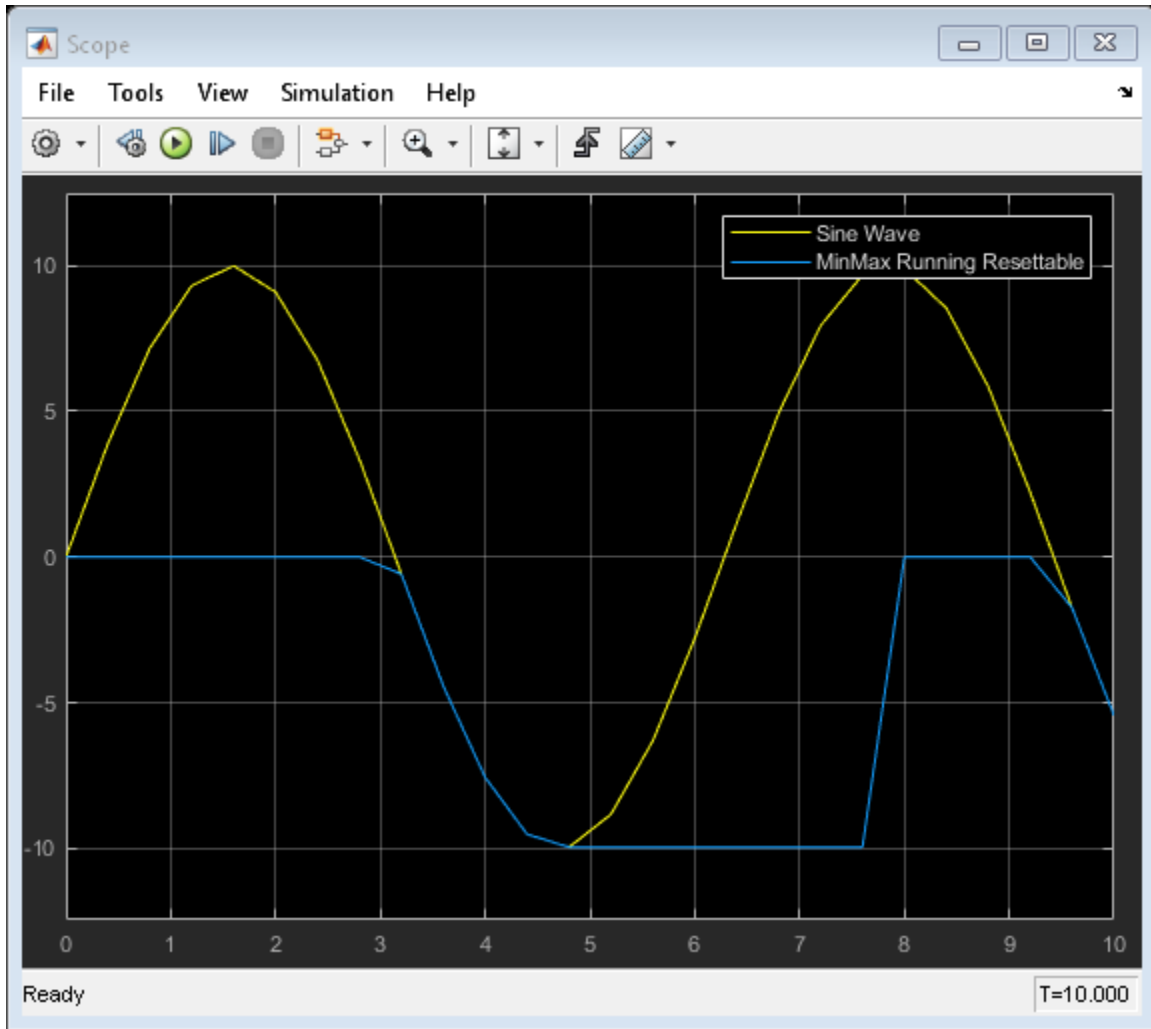
Construct Complex Signal from Magnitude and Phase Angle

This example shows how to use the Magnitude-Angle to Complex block to construct a complex-valued signal. You can provide both the magnitude and phase angle as block inputs, or provide one value as an input, and the other on the block dialog box.


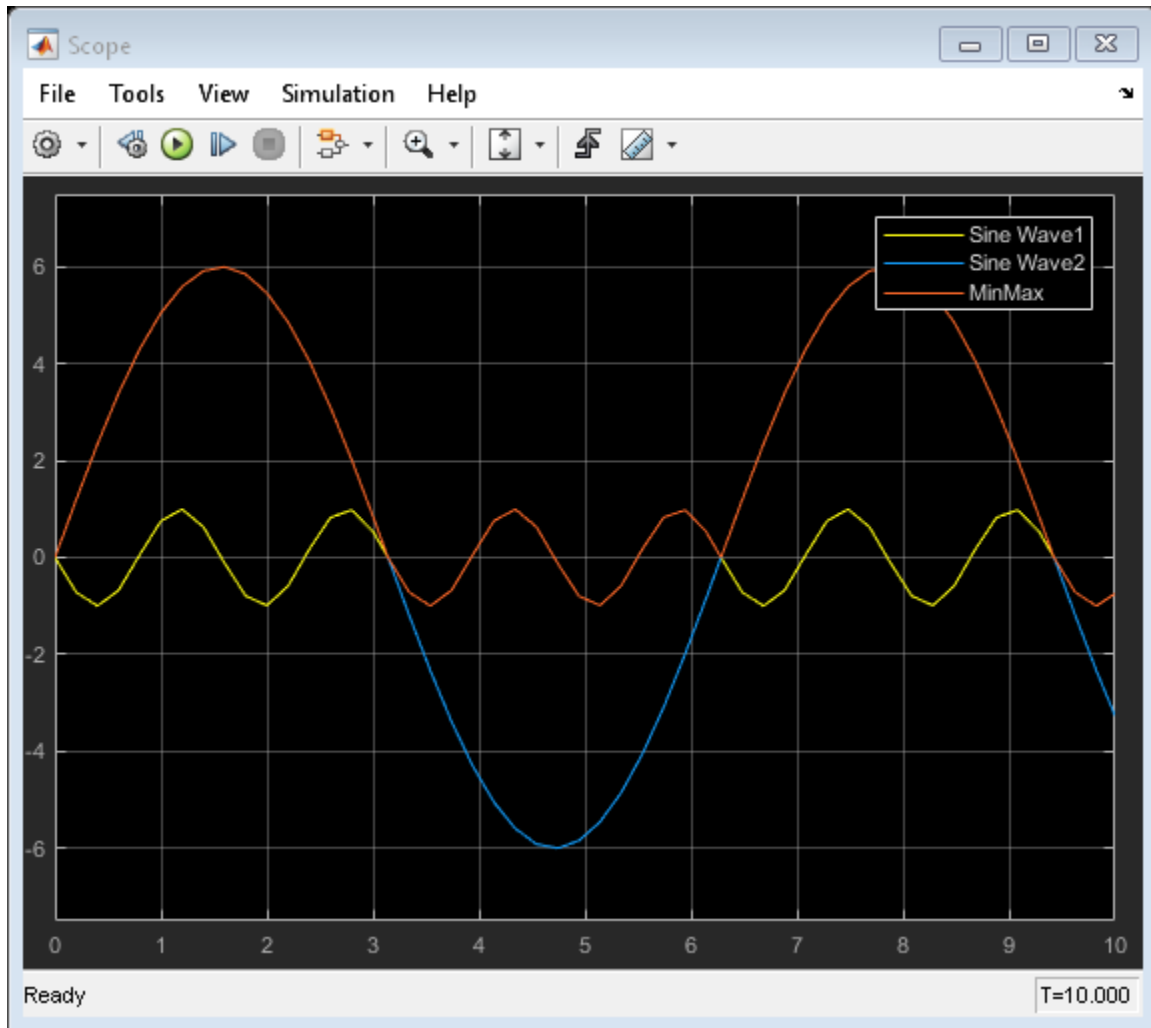
Find Nonzero Elements in an Array

This example shows how to use the Find block to find nonzero elements in an array. In the following model, the block is configured to output both the one-based linear index and the value of each nonzero element.


Calculate the Running Minimum Value with the MinMax Running Resettable Block

This example shows how to use the MinMax Running Resettable block to calculate the running minimum value. To watch how the running minimum value changes at each time step, you can use the Step Forward button to advance the simulation one step at a time.
After running the full simulation, you can view the results in the Scope. The initial value of the running minimum is 0. It begins tracking the Sine Wave signal when the sine wave values turn negative. When the MinMax Running Resettable block receives a reset signal at T=8, the block resets the running minimum value to 0. The running minimum value tracks at 0 for a few time steps, until the sine wave values turn negative again.


Find Maximum Value of Input

This example shows how to use the MinMax block to output the maximum value of two sine waves.
After running the full simulation, you can view the results in the Scope. Initially, the maximum value (orange line) tracks SineWave2. When the SineWave2 values turn negative, the maximum value begins tracking SineWave1. When the SineWave2 values become positive again, the maximum value resumes tracking SineWave2.


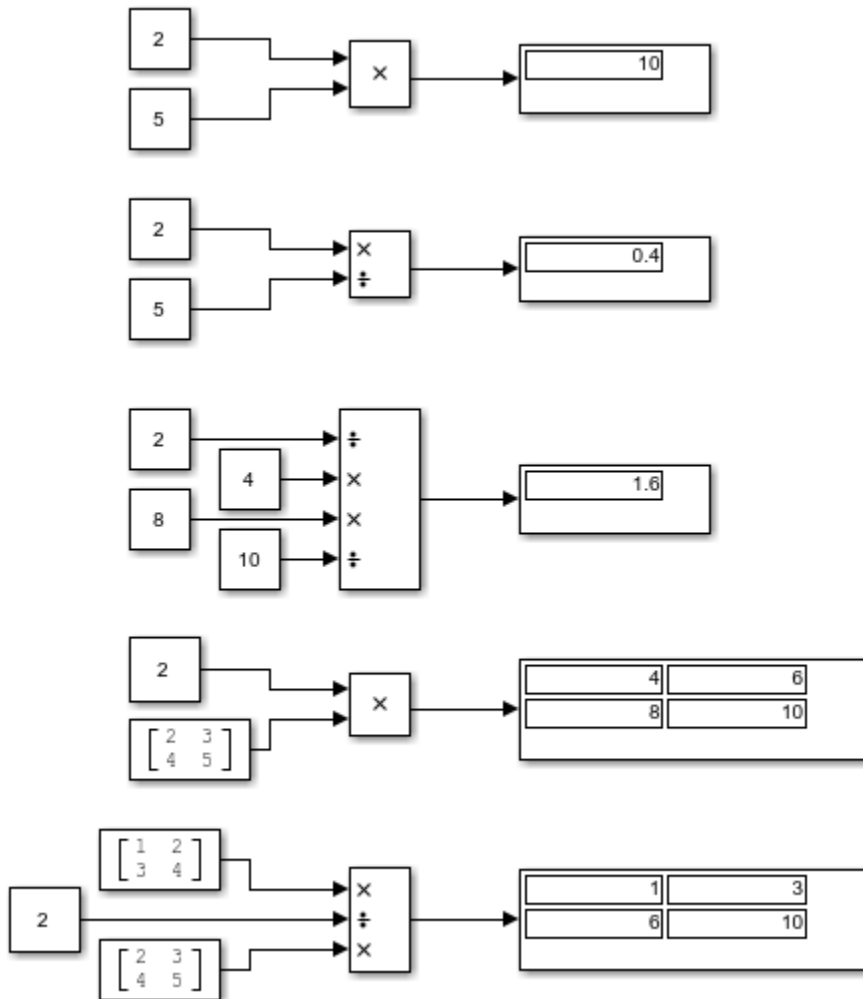
Permute Array Dimensions

This example shows how to use the Permute Dimensions block to permute the first and third dimensions of a 3-by-4-by-5 input array.

When you set the **Order** parameter to [3,2,1], the block permutes the first and third dimensions, and outputs a 5-by-4-by-3 array.

Multiply Inputs of Different Dimensions with the Product Block

This example shows how to perform element-wise (.*) multiplication of inputs using the Product block. In this example, the Product block multiplies two scalars, a scalar and a vector, and two 2x2 matrices.
Multiply and Divide Inputs Using the Product Block

This example shows how to multiply and divide several input signals using the Product block.


Divide Inputs of Different Dimensions Using the Divide Block

This example shows how to perform element-wise (.*) division of two inputs using the Divide block. In this example, the Divide block divides two scalars, a vector by a scalar, a scalar by a vector, and two matrices.
Complex Division Using the Product of Elements Block

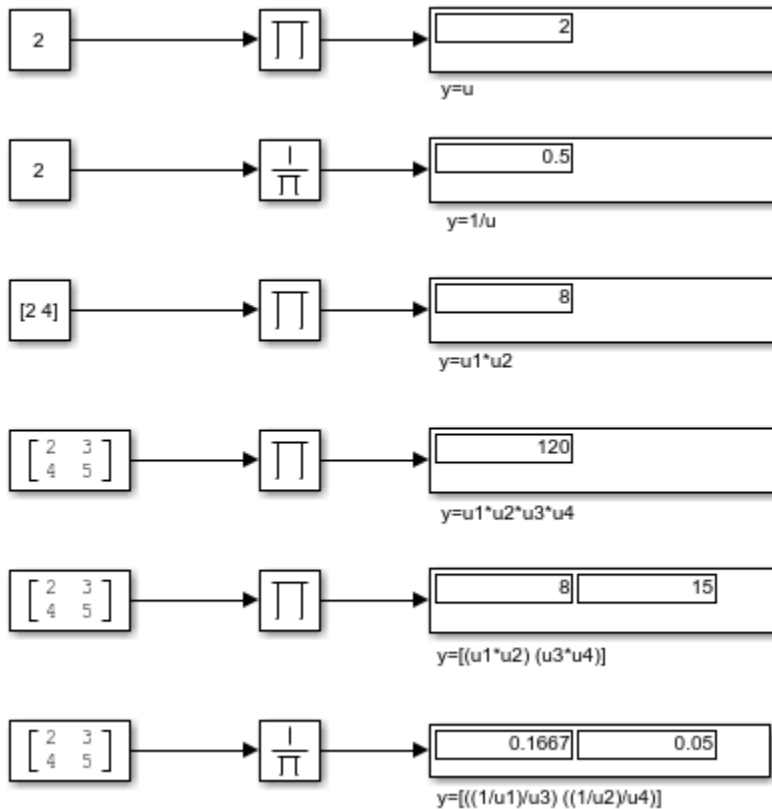
This example shows how to perform element-wise complex division using the Product of Elements block.
The top Product of Elements block collapses the matrix input to a scalar by taking successive inverses of the four elements:

- `y = ((((1/2+i)/3)/4-i)/5)`

The bottom Product of Elements block collapses the matrix input to a vector by taking successive inverses along the second dimension:

- `y(1) = ((1/2+i)/3)`
- `y(2) = ((1/4-i)/5)`

Element-Wise Multiplication and Division Using the Product of Elements Block

This example shows how to use the Product of Elements block to perform element-wise multiplication and division of inputs.


sin Function with Floating-Point Input

This example shows how to use the Trigonometric Function block to compute the sine of a floating-point input. The output of the Trigonometric Function block has the same data type as the input because the input data type is floating-point and the **Approximation method** is none.
sincos Function with Fixed-Point Input

This example shows how to use the Trigonometric Function block to compute the CORDIC approximation of `sincos` for a fixed-point input signal.
The Trigonometric Function block parameters are:

- **Function**: `sincos`
- **Approximation method**: `CORDIC`
- **Number of iterations**: `11`

When using the CORDIC approximation method, the input to the Trigonometric Function block must be in the range `[-2pi,2pi)`. The output type of the Trigonometric Function block is `fixdt(1,13,11)` because the input is a fixed-point signal and the **Approximation method** is set to `CORDIC`. The output fraction length equals the input word length minus two.

Trigonometric Function Block Behavior for Complex Exponential Output

This example compares the complex exponential output for two different configurations of the Trigonometric Function block.
When the **Approximation method** is CORDIC, the input data type can be fixed point, in this case: fixdt(1,16,2). The output data type is fixdt(1,16,14) because the output fraction length equals the input word length minus two.

When the **Approximation method** is None, the input data type must be floating point. The output data type is the same as the input data type.

Output a Bus Object from the Constant Block

This example shows how to output a bus object from the Constant block. The six Constant blocks used to create a bus object in the `ex_busic` example (see "Create Partial Structures for Initialization") are replaced by a single constant block in this example.
To verify that the output from the Constant block reflects the values from the `constant_value_struct`, enter the following at the MATLAB command line:

```
constant_value_struct
```

```
constant_value_struct =

  struct with fields:

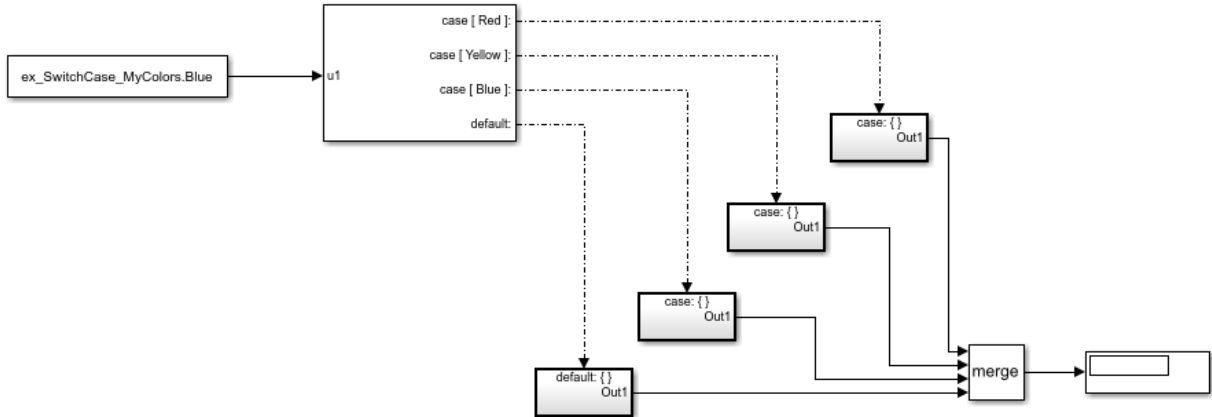
    A: [1x1 struct]
    B: 5
    C: [1x1 struct]
```

Examine the logged data in the logsout variable, focusing on the A1 bus signal. The `constant_value_struct` structure sets the B element to 5.

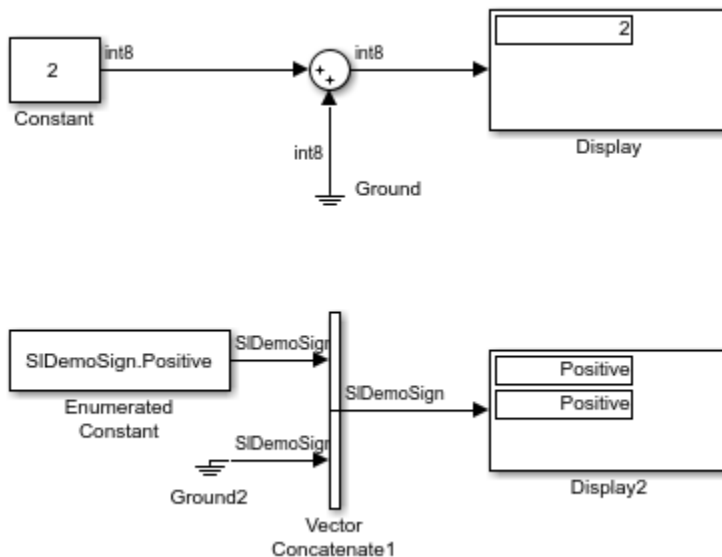
```
logsout.get('A1').Values.B.Data(1)
```

```
ans =

    5
```

Control Algorithm Execution Using Enumerated Signal


Integer and Enumerated Data Type Support in the Ground Block

This example shows how to use the Ground block to ground block input ports that have integer and enumerated data types. In top row of this example, the output of the Constant block determines the data type (`int8`) of the port to which the Ground block is connected. That port determines the output data type of the Ground block, and the Ground block outputs a signal with zero value, and data type `int8`.


In the bottom row of this example, the Ground block is connected to a port with an enumerated data type. For enumerated data types, the Ground block outputs the default value of the enumeration. This behavior applies whether or not:

- The enumeration can represent zero
- The default value of the enumeration is zero

If the enumerated type does not have a default value, the Ground block outputs the first enumeration value in the type definition.

Fixed-Point Data Type Support in the Ground Block

This example shows how to use the Ground block to ground block input ports that have fixed-point data types. The top row of this example illustrates the Ground block behavior when the fixed-point data type can represent zero. In that case, the Ground block outputs a signal with zero value, and the same fixed-point data type as the port it is connected to.
In the bottom row of this example, the output of the Constant block determines the data type of the port to which the Ground block is connected (`fixdt(0,8,1,1)`). Because zero cannot be represented exactly by the data type `fixdt(0,8,1,1)`, the Ground block outputs a nonzero value that is the closest possible value to zero (in this case, 1).

Read 1-D Array and Structure From Workspace

This example shows how to read 1-D signals from the MATLAB workspace. When you open the model, the following code is executed by a `PreLoadFcn` callback:

```
t = 0.2 * [0:49]';
x = sin(t);
y = 10*sin(t);
wave.time = t;
wave.signals.values = [x,y];
wave.signals.dimensions =2;
```

In the top row of the model, the From Workspace block reads the array `[t,x,y]` from the MATLAB workspace.
In the bottom row of the model, the From Workspace block reads the same values from the workspace, but this time they are read from a structure named `wave`.

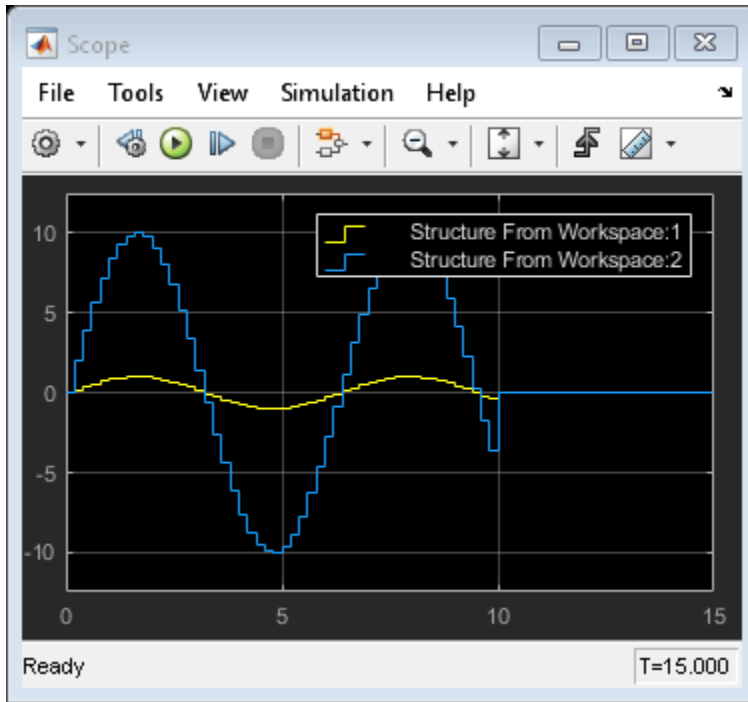
Read Structure From Workspace Using Model Sample Time

This example shows how to read a structure from the MATLAB workspace using a sample time specified in the From Workspace block. When you open the model, the following code is executed by a `PreLoadFcn` callback:

```
t = 0.2 * [0:49]';
x = sin(t);
y = 10*sin(t);
wave.time = [];
wave.signals.values = [x,y];
wave.signals.dimensions =2;
```

The From Workspace block is configured as follows:

- **Sample time**: `0.2`
- **Interpolate data**: off
- **Form output after final value by**: `Setting to zero`

When you run the model, the From Workspace block reads the structure `wave` from the workspace. After the last time hit for which workspace data is available, the block outputs `0`.


Read 2-D Signals in Structure Format From Workspace

This example shows how to read a 2-D structure from the MATLAB workspace. When you open the model, the following code is executed by a `PreLoadFcn` callback:

```
t1 = 0.2 * [0:49]';
m = magic(10);
M = repmat(m,[1 1 length(t1)]);
data.time=t1;
data.signals.values = M;
data.signals.dimensions=[10 10];
```

This code creates 10-by-10 matrix (2-D signal) by using the `magic` function, and then creates a 3-D matrix by adding a time vector. The time vector must be a column vector. The `signals.values` field is a 3-D matrix where the third dimension corresponds to time. The `signals.dimensions` field is a two-element vector. The first element is the number of rows and the second element is the number of columns in the `signals.values` field.

When you run the model, the From Workspace block reads the structure `data` from the workspace.
From File Block Loading Timeseries Data

Create a MATLAB® `timeseries` object with time and signal values. Save the timeseries object to a MAT-file and load into a model using a From File block.

Create an array with the time and signal data, specifying signal data for 10 time steps.

```
t = .1*(1:10);
d = .2*(1:10);
x = [t;d];
```

Create a MATLAB `timeseries` object.

```
ts = timeseries(x(2:end,:),x(1,:))

  timeseries

  Common Properties:
          Name: 'unnamed'
          Time: [10x1 double]
       TimeInfo: tsdata.timemetadata
          Data: [1x1x10 double]
       DataInfo: tsdata.datametadata
```

Save the `timeseries` object in a Version 7.3 MAT-file.

```
save('mySignals','ts','-v7.3')
```

Add a From File block and set the **File name** parameter of that block to `mySignals.mat`.

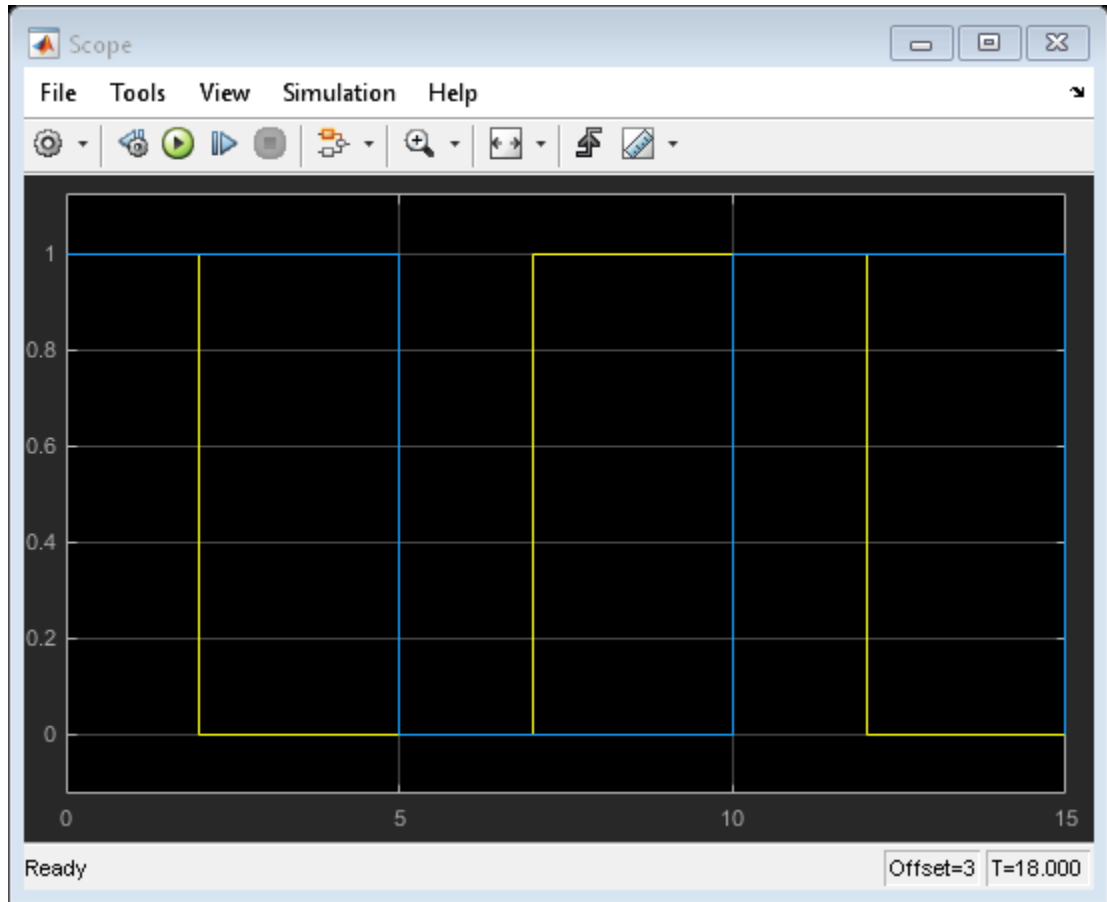
Simulate the model. The Scope block reflects the data loaded from the `mySignals.mat` file.

Eliminate Singleton Dimension with the Squeeze Block

This example shows a model using the Squeeze block to eliminate a dimension of size 1.
The Squeeze block converts a multidimensional array from the Constant block of size 3-by-1-by-2 into a 3-by-2 signal.

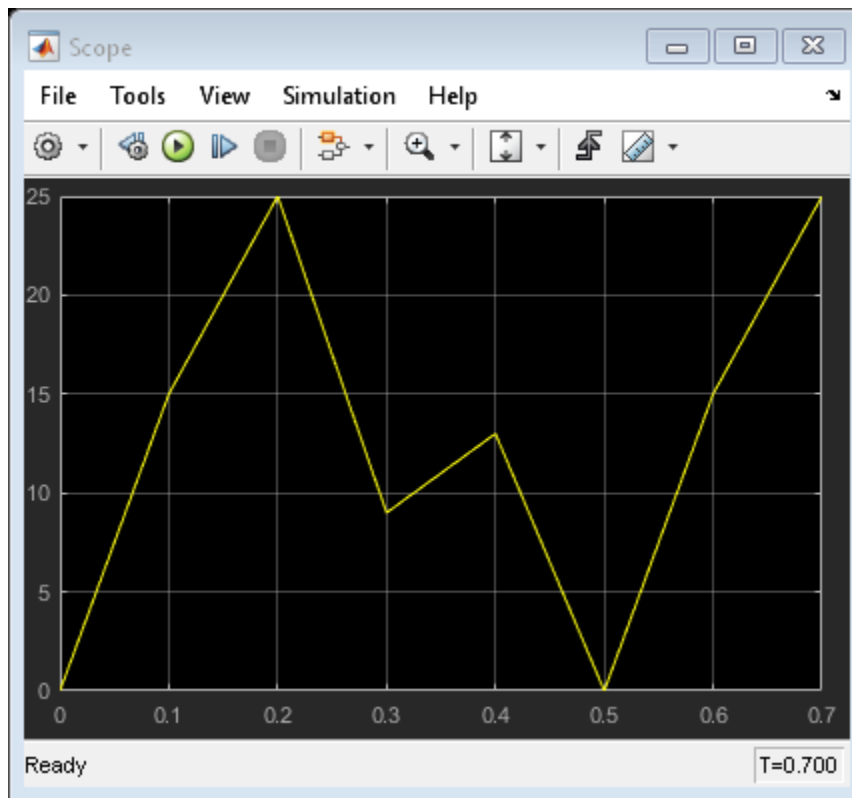
Difference Between Time- and Sample-Based Pulse Generation

This example shows the difference in behavior of the Pulse Generator block in time-based and sample-based modes.

Consider this model, with two Pulse Generator blocks. One block has the **Pulse type** parameter set to Time based, and the other to Sample based. Both blocks are configured to output a pulse with an amplitude of one that is on for five seconds, followed by off for five seconds. The simulation time runs from three seconds to a stop time of 18 seconds. Notice the time offset notice in the lower right corner.


Notice that the time-based Pulse Generator produces an on signal for only two seconds and then switches to off. This is due to the block starting to compute the output from t=0 even though it does not output the simulation until t=3. The sample-based block outputs a pulse of five seconds on followed by five seconds off. In this case, the block output does not depend on simulation time and starts only when the simulation starts.

Specify a Waveform with the Repeating Sequence Block

This example shows how you specify a waveform with the Repeating Sequence block. In this model, the block defines the **Time values** parameter as `[0:0.1:0.5]` and the **Output values** parameter as `[0 15 25 09 13 17]`. The stop time of the simulation is `0.7` second.


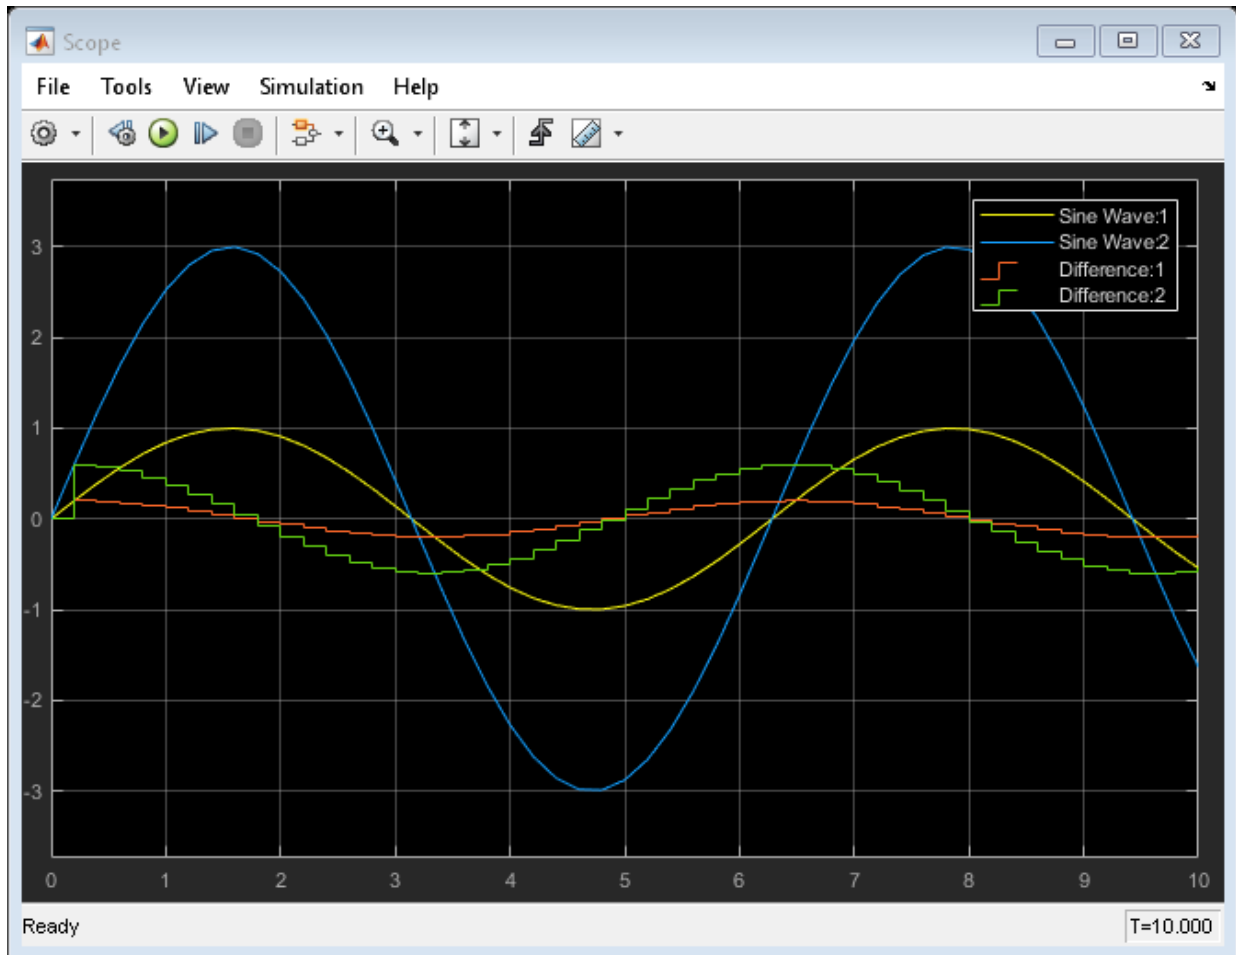
- Input period is `0.5`.
- Output at any time `t` is the output at time `t = t-0.5n`, where n = 0,1,2, and so on.
- Sequence repeats at `t = 0.5n`.

At `t = 0.5`, the expected output is equal to the output at `t = 0`, which is `0`. Therefore, the last value in the **Output values** parameter vector `[0 15 25 09 13 17]` does not appear.

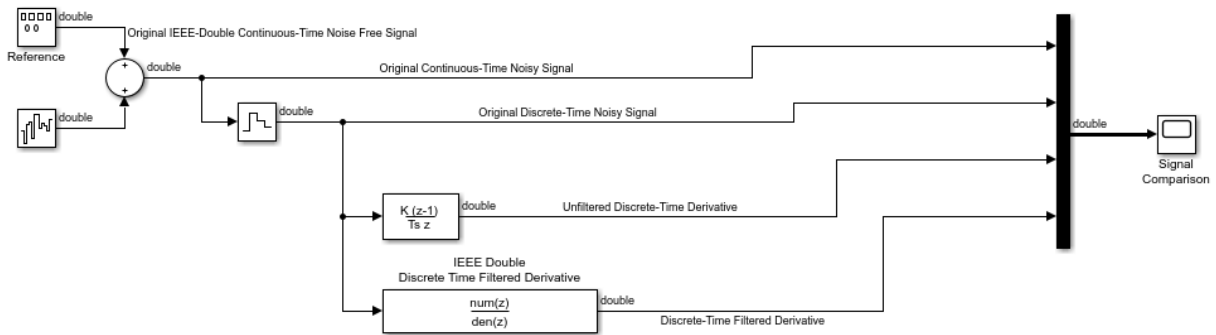
Tune Phase Delay on Pulse Generator During Simulation

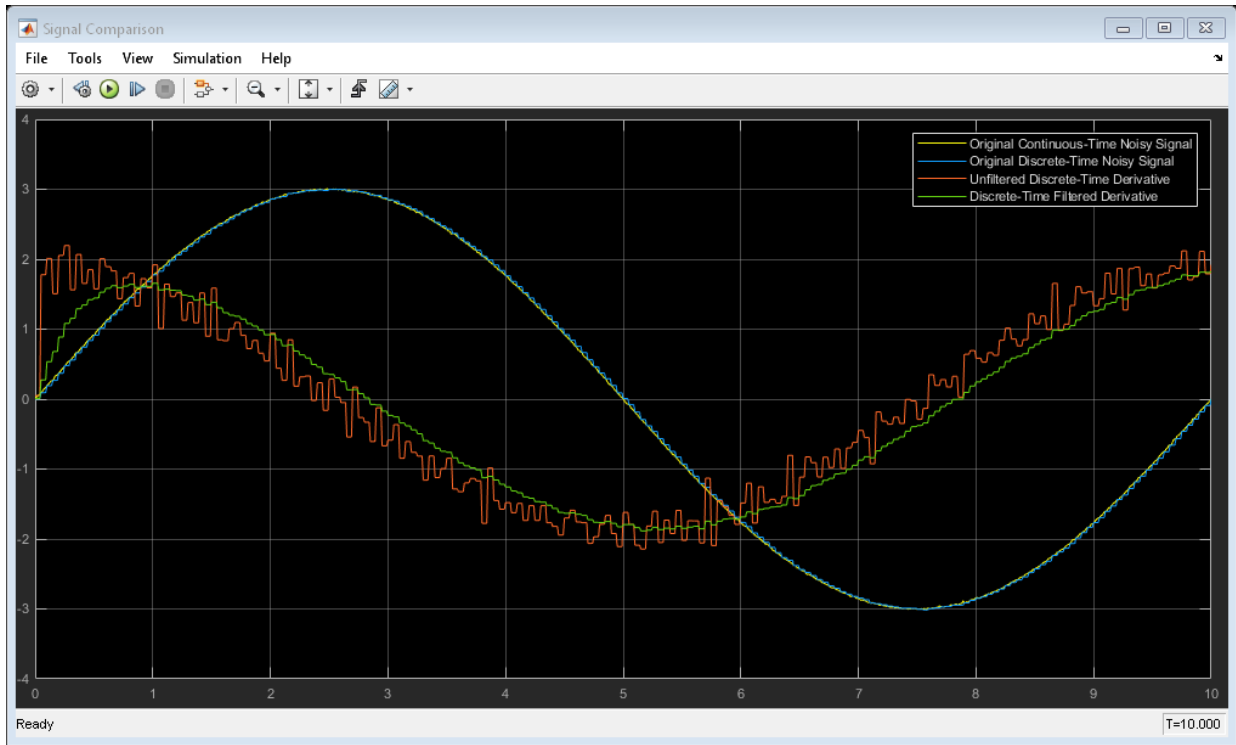
This example shows how to modify a model so that you can change a phase delay for a Pulse Generation block during simulation. You cannot tune the value of the **Phase delay** parameter during simulation. As a workaround, add a Constant block and a Variable Time Delay block.
In the Pulse Generator block, set the value of the **Phase delay** parameter to zero. Use the Constant block to specify the delay time in seconds. To tune the delay time during simulation, change the value stored in the Constant block.

Difference Sine Wave Signal

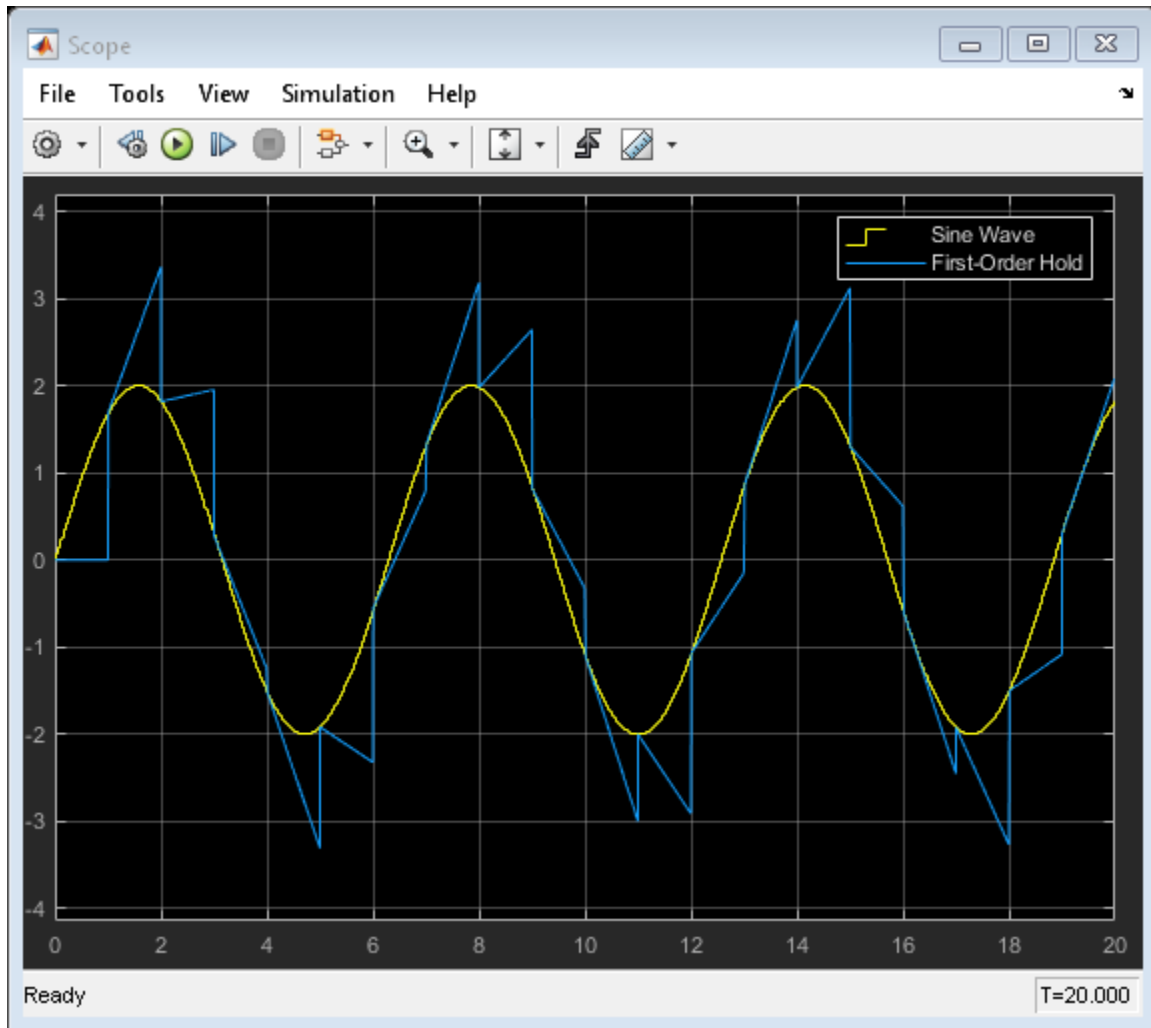
This example shows how to calculate the difference in a sine wave signal at each time step. The input is a 1-by-2 vector of sine waves, with amplitude 1 and 3. The difference block calculates the difference in each sine wave signal at every time step. The Scope block displays both the original sine waves and the output of the difference block.


Discrete-Time Derivative of Floating-Point Input

This example shows how to use the Discrete Derivative block to compute the discrete-time derivative of a floating-point input signal. The unfiltered discrete-time derivative is compared to a filtered discrete-time derivative that is computed by the Discrete Filter block.




First-Order Sample-and-Hold of a Sine Wave

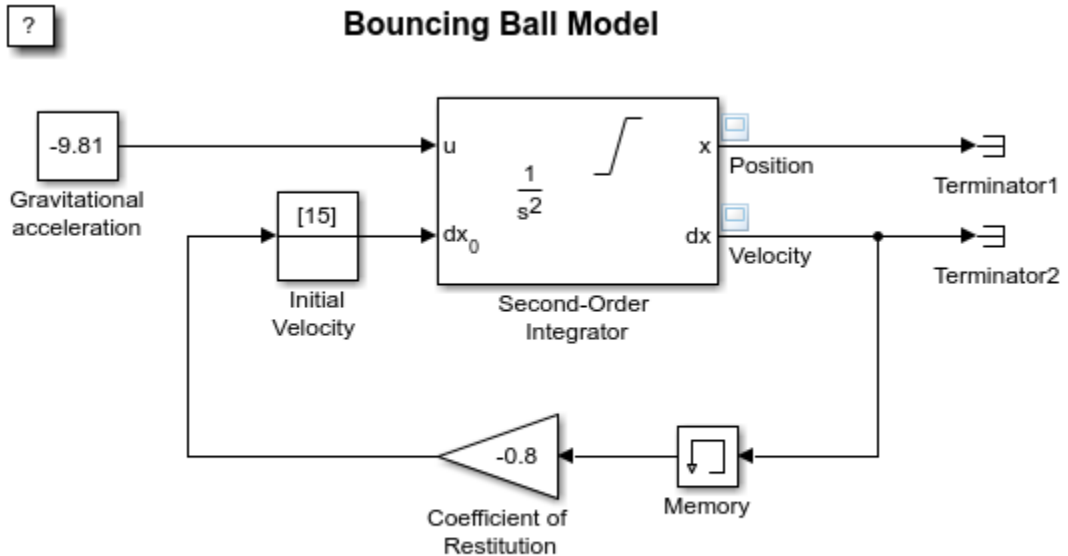
This example shows how to perform a first-order sample-and-hold of a sine wave signal using the First-Order Hold block.


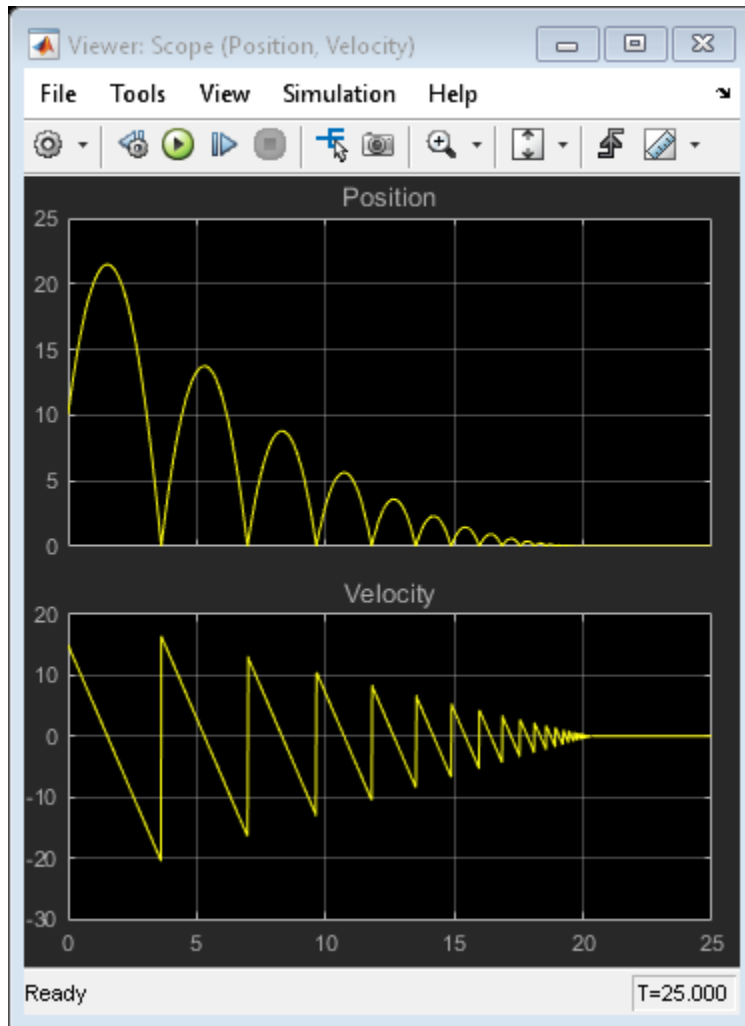
Calculate and Display Simulation Step Size using Memory and Clock Blocks

This example shows how to use the Memory and Clock blocks to calculate and display the step size in a simulation. The Sum block subtracts the time at the previous time step, which the Memory block generates, from the current time, which the Clock block generates.
Because **Inherit sample time** is not selected for the Memory block, the block sample time depends on the type of solver for simulating the model. In this case, the model uses a fixed-step solver. Therefore, the sample time of the Memory block is the solver step size, or 1.

If you replace the Memory block with a Unit Delay block, you get the same results. The Unit Delay block inherits a discrete sample time of 1.

Capture the Velocity of a Bouncing Ball with the Memory Block

The `sldemo_bounce` example shows how to use the Second-Order Integrator and Memory blocks to capture the velocity of a bouncing ball just before it hits the ground.


Because **Inherit sample time** is not selected for the Memory block, the block sample time depends on the type of solver for simulating the model. In this case, the model uses a variable-step (ode23) solver. Therefore, the sample time of the Memory block is continuous but fixed in minor time step: [0, 1]. When you run the model, you get the following results:


If you replace the Memory block with a Unit Delay block, you get the same results. However, a warning also appears due to the discrete Unit Delay block inheriting a continuous sample time.

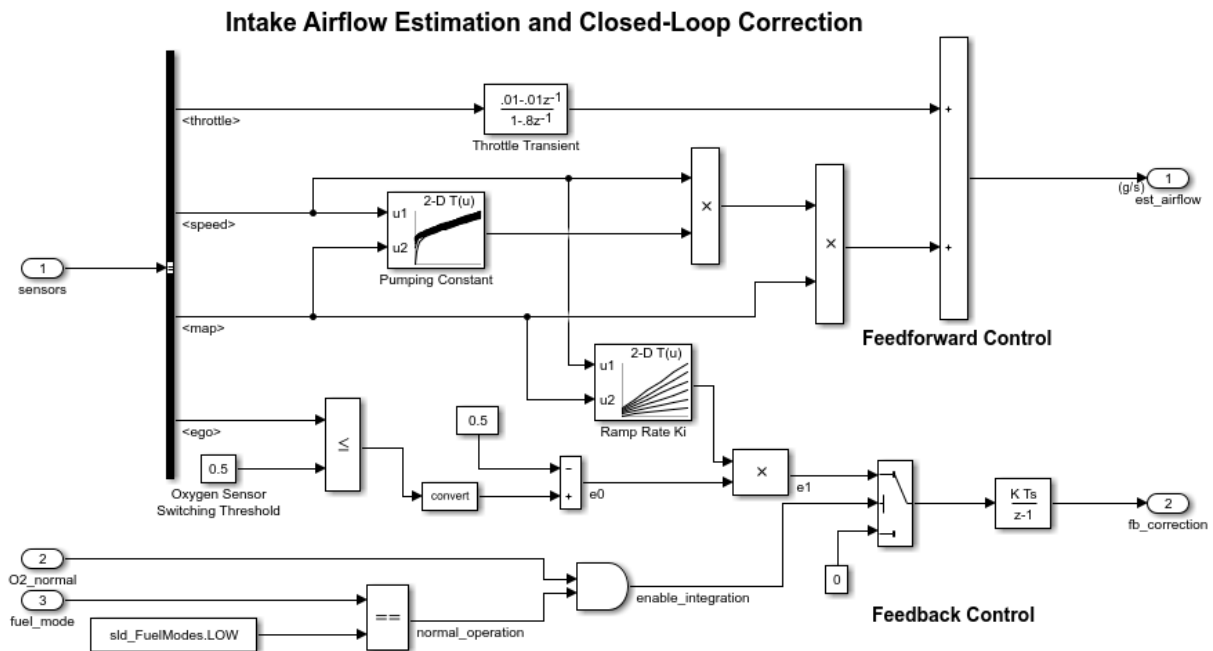
For more information, see the model description.

Implement a Finite-State Machine with the Combinatorial Logic and Memory Blocks

The `sldemo_clutch` example shows how you can use the Memory block with the Combinatorial Logic block to implement a finite-state machine. This construct appears in the `Friction Mode Logic/Lockup FSM` subsystem:
Because **Inherit sample time** is not selected for the Memory block, the block sample time depends on the type of solver for simulating the model. In this case, the model uses a variable-step (`ode23`) solver. Therefore, the sample time of the Memory block is continuous but fixed in minor time step: `[0, 1]`.

For more information, see the model description.

Discrete-Time Integration Using the Forward Euler Integration Method

The sldemo_fuelsys model uses a Discrete-Time Integrator block in the `fuel_rate_control/airflow_calc` subsystem. This block uses the Forward Euler integration method.


When the Switch block feeds a nonzero value into the Discrete-Time Integrator block, integration occurs. Otherwise, integration does not occur.

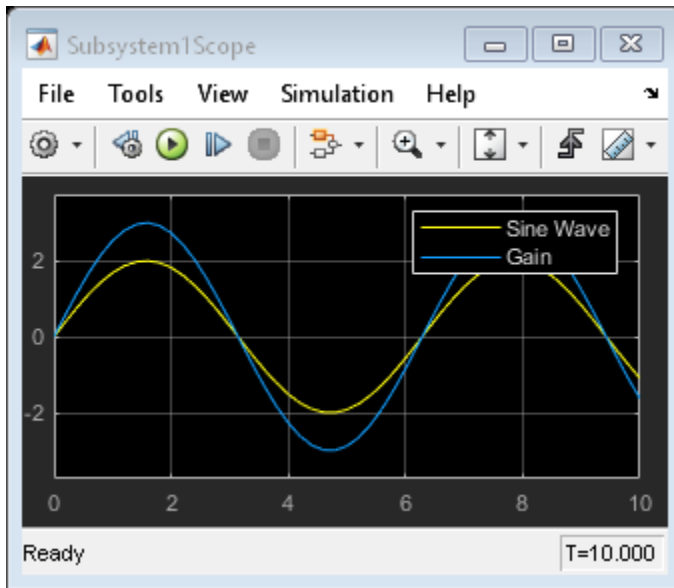
For more information, see the model description.

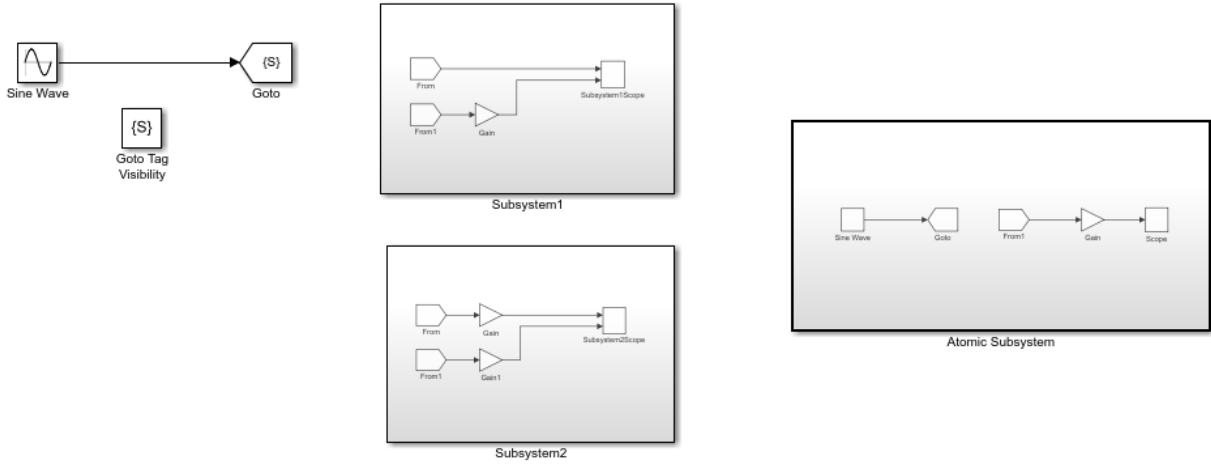
Signal Routing with the From, Goto, and Goto Tag Visibility Blocks

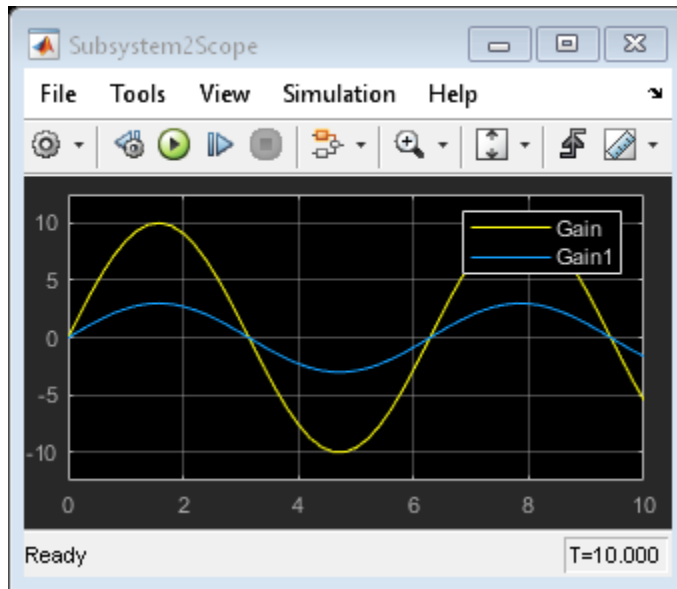
This example shows how to use the From, Goto, and Goto Tag Visibility blocks to route signals in your model. The GotoGlobal block at the top-level of the model has the **Goto tag** parameter set to G and the **Tag visibility** set to global. Thus, the G tag can be seen by From and Goto blocks at any level of the model hierarchy, except locations that span nonvirtual subsystem boundaries (like the Atomic Subsystem in this model). The From block at the top level of the model can see and connect to the global G tag, but cannot see or connect to the scoped S tag or L local tag that are specified on Goto blocks further down in the model hierarchy.
Inside of the Main Subsystem, the Goto block with **Goto tag** set to S has a **Tag visibility** of scoped. The Goto Tag Visibility block placed at the same level as that Goto block indicates the S tag can be seen by all From and Goto blocks at that level and below, except for locations that cross a nonvirtual subsystem boundary (i.e. the boundary with the Atomic Subsystem). Inside of Subsystem1 and Subsystem2, the From blocks can see and connect to the global Goto tag G, and the scoped Goto tag S.

Subsystem1

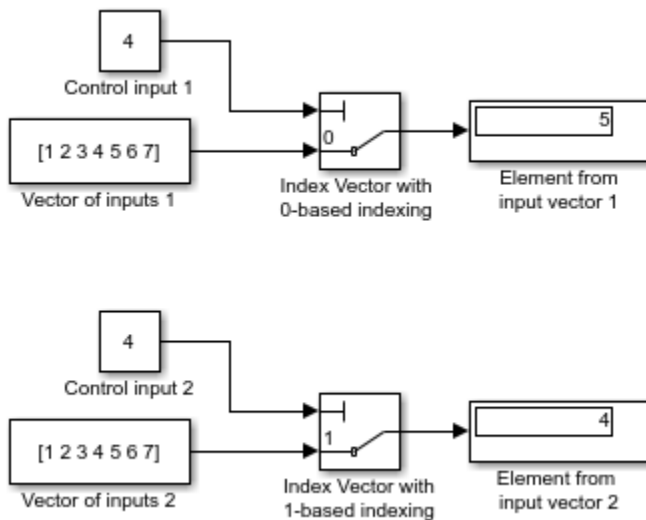
Atomic Subsystem

Subsystem2




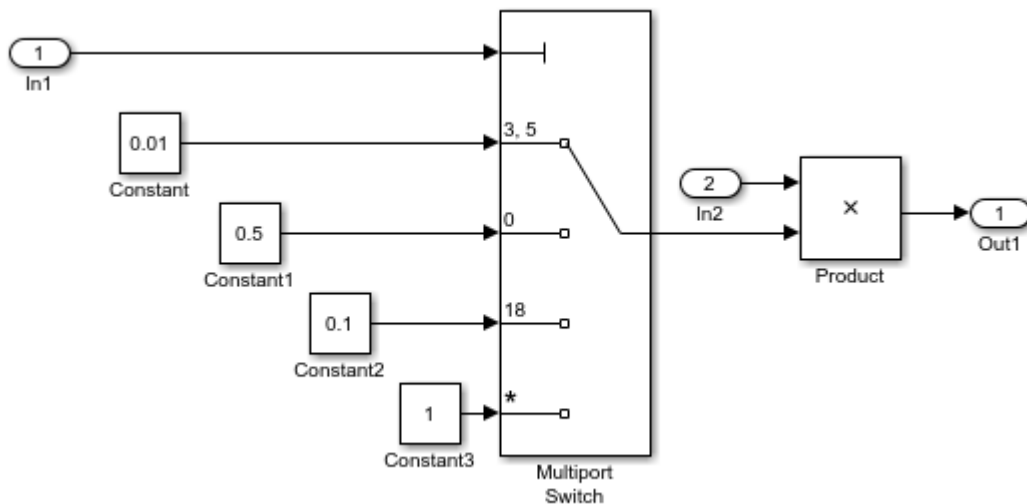


Zero-Based and One-Based Indexing with the Index Vector Block

This example shows how the Index Vector block works with zero-based and one-based indexing.


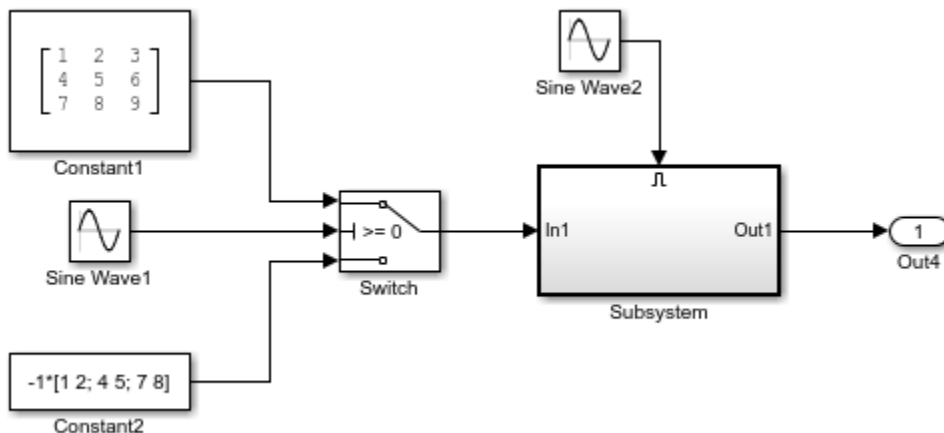
The Index Vector block is from the Simulink Signal Routing library. It is a special configuration of the Multiport Switch block. To configure the Multiport Switch block as an Index Vector block, set the **Number of data ports** to 1 and **Data port order** to Zero-based contiguous.

Noncontiguous Values for Data Port Indices of Multiport Switch Block

This example shows how to use a Multiport Switch block that specifies noncontiguous integer values for data ports. The values of the indices are visible on the data port labels. You do not have to open the block dialog box to determine which value maps to each data port.


When you set **Data port for default case** to `Additional data port`, an extra port with a * label appears. This port corresponds to the default case, which applies when the control input does not match the data port indices 3, 5, 0, or 18. When that happens in this example, the Multiport Switch block outputs a value of 1.

Using Variable-Size Signals on the Delay Block

This example shows how the Delay block supports vairable-size signals for sample-based processing. The Switch block controls whether the input signal to the enabled subsystem is a 3-by-3 or 3-by-2 matrix.


The Delay block appears inside the enabled subsystem.
The model follows these rules for variable-size signals while using sample-based processing.

- Signal dimensions change only during state reset when the block is enabled.

- Initial condition must be scalar.

The rules are implemented by these blocks.

- Enable block sets **Propagate sizes of variable-size signals** to `Only when enabling`.
- Delay block sets the **Initial condition** to the scalar value `0.0`.

Bus Signals with the Delay Block for Frame-Based Processing

This example shows how the Delay block supports bus signals for frame-based processing.
Each Constant block supplies an input signal to the Bus Creator block, which outputs a two-dimensional bus signal. After the Delay block delays the bus signal by three sample periods, the Bus Selector block separates the bus back into the two original signals.

The model follows these rules for bus signals.

- For the initial condition, set the value on the dialog box.
- For frame-based processing, signal dimensions of the data input port u cannot be larger than two.

The model implements the rules by:

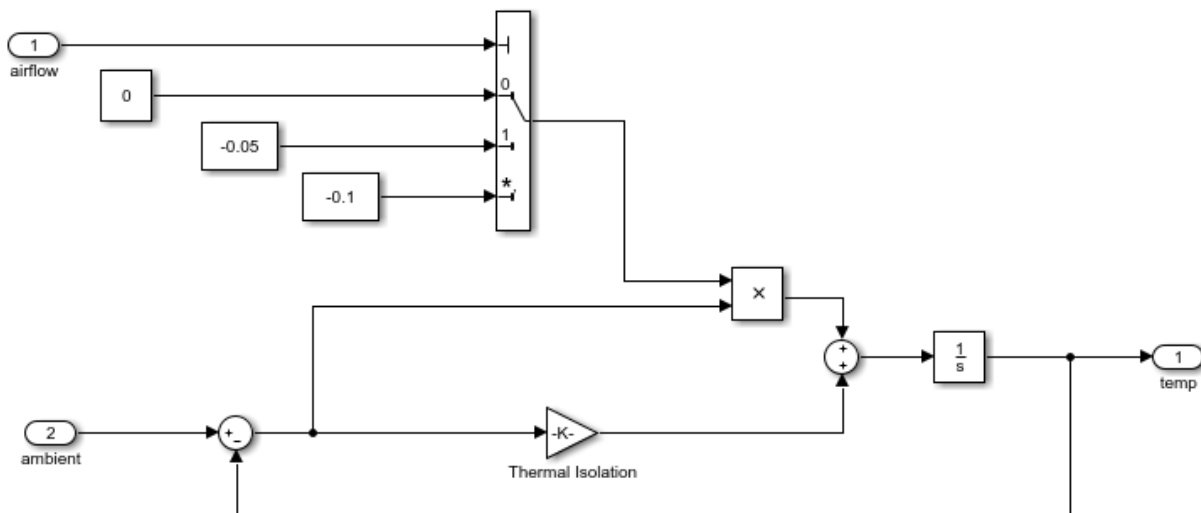
- Setting the **Initial condition** to a scalar value of 0.
- Setting bus input to the Delay block as two dimensions.

Control Execution of Delay Block with Enable Port

This example shows how you can enable or disable the execution of the Delay block using an enable port. In this model, a ramp input signal feeds into a Delay block. The execution of the block is controlled by an enabling signal from the Pulse Generator block.
The blue line shows that the Delay block outputs the input signal value delayed by one time step while the enabling signal has a value of one. At t=5 the enabling signal

transitions to zero and the Delay block stops executing. The output is held at the last value until the block is enabled again.

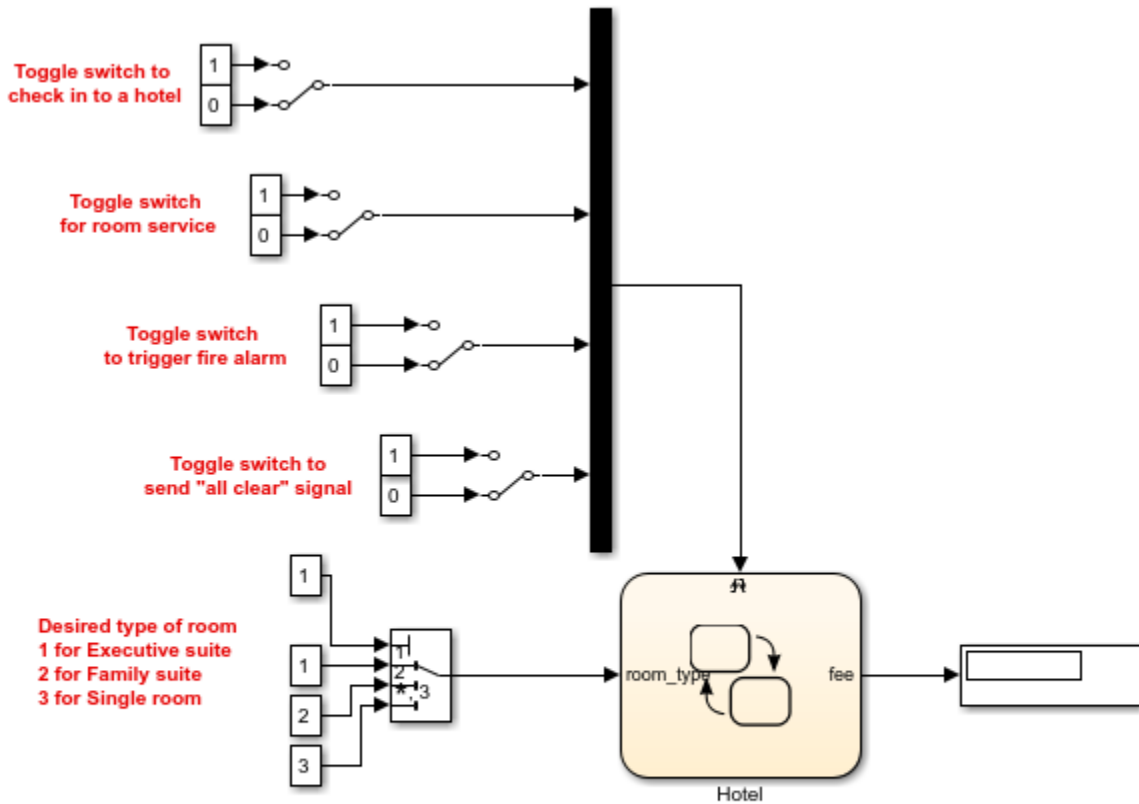
Zero-Based Indexing for Multiport Switch Data Ports

The sf_aircontrol model uses a Multiport Switch block in the `Physical Plant` subsystem. This block uses zero-based indexing for contiguous ordering of three data ports.


The indices are visible on the data port labels. You do not have to open the block dialog box to determine if the data ports use zero-based or one-based indexing.

When you set **Data port for default case** to `Last data port`, the last data port includes a * on the label (in this case, the label is *,2). The comma after the * indicates that the data port index has a value. This port corresponds to the default case, which applies when the control input does not match the data port indices. In this example, the Multiport Switch block outputs a value of -0.1 when the control input does not match the data port indices of 0, 1, or 2.

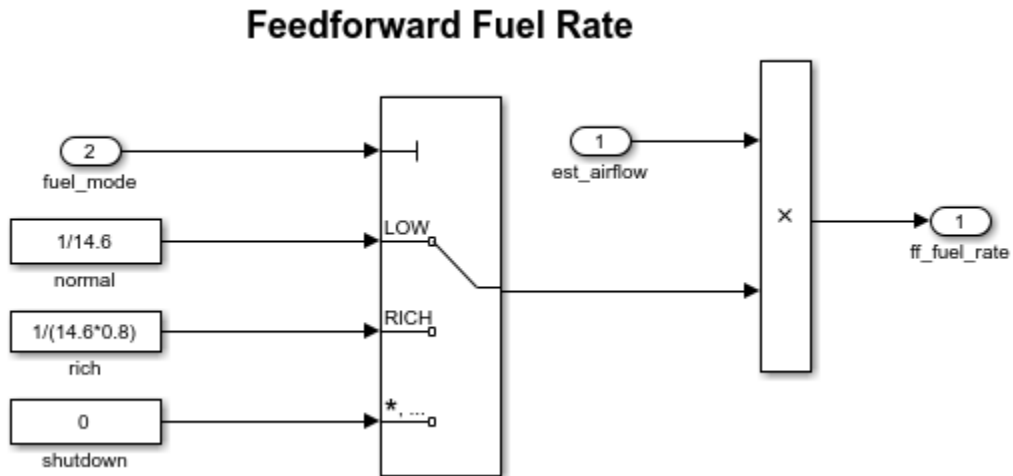
One-Based Indexing for Multiport Switch Data Ports

The sf_semantics_hotel_checkin model uses a Multiport Switch block. This block uses one-based indexing for contiguous ordering of three data ports.


Copyright 2008-2013 The MathWorks, Inc.

When you increase the size of the block icon, the indices are visible on the data port labels. You do not have to open the block dialog box to determine whether the data ports use zero-based or one-based indexing.

Enumerated Names for Data Port Indices of the Multiport Switch Block

The sldemo_fuelsys model uses a Multiport Switch block in the `fuel_rate_control/`
`fuel_calc/feedforward_fuel_rate` subsystem. This block uses the enumerated type
`sld_FuelModes` to specify three data port indices: `LOW`, `RICH`, and `DISABLED`.


Feedforward Fuel Rate

When you set **Data port for default case** to `Last data port`, the last data port
includes a * on the label. The comma and ellipsis after the * indicate that the data port
index has a value. This port corresponds to the default case, which applies when the
control input does not match the data port indices `LOW`, `RICH`, or `DISABLED`. In this case,
the Multiport Switch block outputs a value of `0`.

Prevent Block Wind-Up in Multiloop Control Approaches

This example shows how to use signal tracking to prevent block wind-up in multiloop control approaches.

The `Inner-Loop` subsystem contains the following blocks:
$$\frac{(s-1)}{s(s+1)}$$

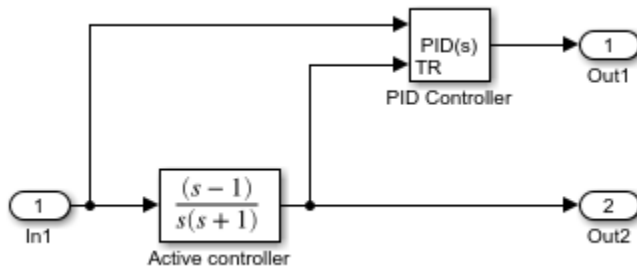
Zero-Pole

$$\frac{(s-1)}{s(s+1)}$$

Zero-Pole1

In this example, the inner loop has an effective gain of 1 when it does not saturate. Without signal tracking, the inner loop winds up in saturation. Signal tracking ensures that the PID Controller output does not exceed the saturated output of the inner loop.

Bumpless Control Transfer

This example shows how to use signal tracking to achieve bumpless control transfer in systems that switch between two controllers. You can make one controller track the output of the other controller by connecting the TR port to the signal you want to track. For example:


The outputs Out1 and Out2 can drive a controlled system (not shown) through a switch that transfers control between the Active controller (a Zero-Pole block) and the PID Controller. The signal tracking feature of the PID Controller block provides smooth operation upon transfer of control from one controller to another, ensuring that the two controllers have the same output at the time of transfer.

Using a Bit Set block

If the Bit Set block is turned on for bit 2 bit 2 is set to 1.

A vector of constants 2.^[0 1 2 3 4] is represented in binary as [00001 00010 00100 01000 10000].

With bit 2 set to 1, the result is [00101 00110 00100 01100 10100], which is represented in decimal as [5 6 4 12 20].

Using a Bit Clear block

If the Bit Clear block is turned on for bit 2, bit 2 is set to 0.

A vector of constants 2.^[0 1 2 3 4] is represented in binary as [00001 00010 00100 01000 10000].

With bit 2 set to 1, the result is [00101 00110 00100 01100 10100], which is represented in decimal as [5 6 4 12 20].

With bit 2 set to 0, the result is [00001 00010 00000 01000 10000], which is represented in decimal as [1 2 0 8 16]

Two-Input AND Logic

This example builds a two-input AND function, which returns 1 when both input elements are 1, and 0 otherwise. To implement this function, specify the **Truth table** parameter value as [0; 0; 0; 1] The portion of the model that provides the inputs to and the output from the Combinatorial Logic block might look like this:
The following table indicates the combination of inputs that generate each output. The input signal labeled `Input` corresponds to the column in the table labeled Input 1. Similarly, the input signal `Input 2` corresponds to the column with the same name. The combination of these values determines the row of the Output column of the table that is passed as block output. For example, if the input vector is [1 0], the input references the third row:

(2^1*1 + 1) The output value is 0.

Row	Input 1	Input 2	Output
1	0	0	0
2	0	1	0
3	1	0	0
4	1	1	1

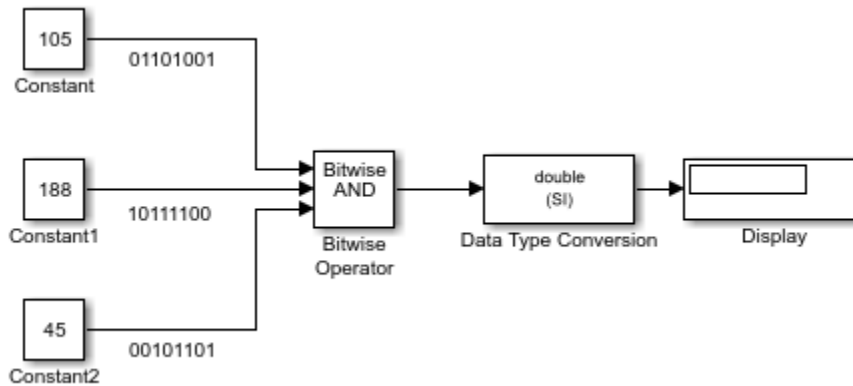
Circuit Logic

This sample circuit has three inputs: the two bits (**a** and **b**) to be summed and a carry-in bit (**c**). It has two outputs: the carry-out bit (**c'**) and the sum bit (**s**).
The truth table and corresponding outputs for each combination of input values for this circuit appear in the following table.

Inputs			Outputs	
a	b	c	c'	s
0	0	0	0	0
0	0	1	0	1
0	1	0	0	1
0	1	1	1	0
1	0	0	0	1
1	0	1	1	0
1	1	0	1	0
1	1	1	1	1

To implement this adder with the Combinatorial Logic block, you enter the 8-by-2 matrix formed by columns **c'** and **s** as the **Truth table** parameter. You can also implement sequential circuits (that is, circuits with states) with the Combinatorial Logic block by including an additional input for the state of the block and feeding the output of the block back into this state input.

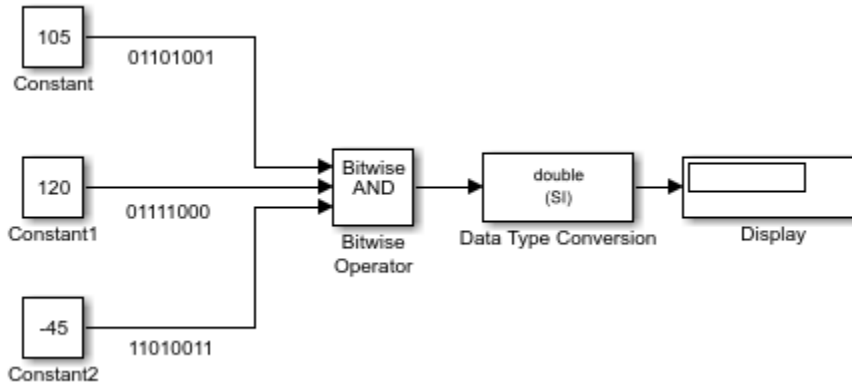
Unsigned Inputs for the Bitwise Operator Block

The following model shows how the Bitwise Operator block works for unsigned inputs.


Each Constant block outputs an 8-bit unsigned integer (uint8). To determine the binary value of each Constant block output, use the dec2bin function. The results for all logic operations appear in the next table.

Operation	Binary Value	Decimal Value
AND	00101000	40
OR	11111101	253
NAND	11010111	215
NOR	00000010	2
XOR	11111000	248
NOT	N/A	N/A

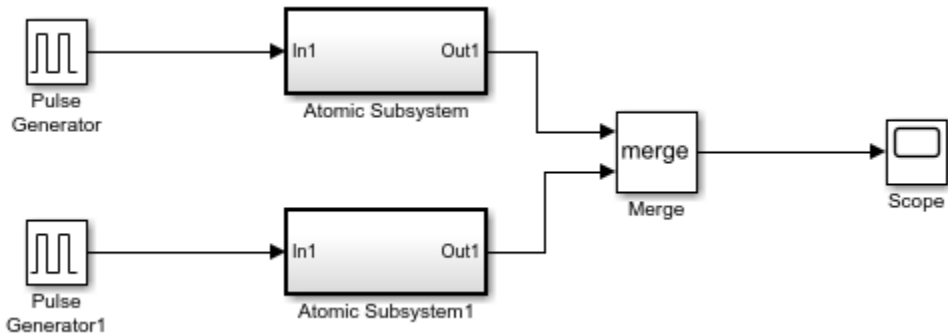
Signed Inputs for the Bitwise Operator Block

The following model shows how the Bitwise Operator block works for signed inputs.


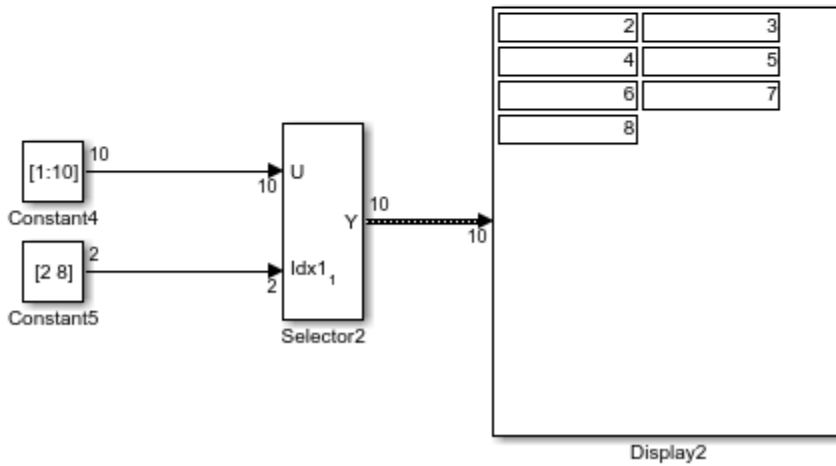
Each Constant block outputs an 8-bit signed integer (`int8`) . To determine the binary value of each Constant block output, use the dec2bin function. The results for all logic operations appear in the next table.

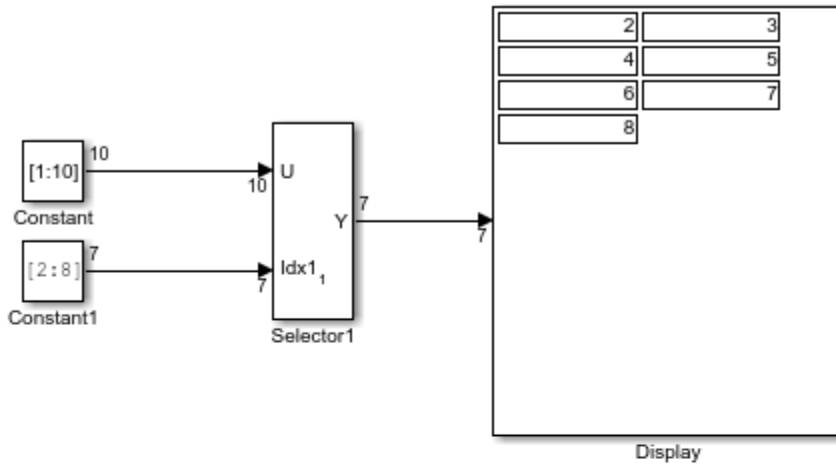
Operation	Binary Value	Decimal Value
AND	01000000	64
OR	11111011	−5
NAND	10111111	−65
NOR	00000100	4
XOR	11000010	−62
NOT	N/A	N/A

Merge Block with Input from Atomic Subsystems

This example shows a Merge block with inputs from two atomic subsystems.


Each Atomic Subsystem block contains an enabled subsystem. This satisfies the requirement that inputs to a Merge block are from a conditionally executed subsystem.
Index Options with the Selector Block

This example shows two Selector blocks with the same kind of input signals, but two different **Index Option** settings.




Both Selector blocks select 7 values from the input signal that feeds the input port. The `Selector1` block outputs a fixed-size signal, whereas the `Selector2` block outputs a variable-size signal whose compiled signal dimension is 10 instead of 7.

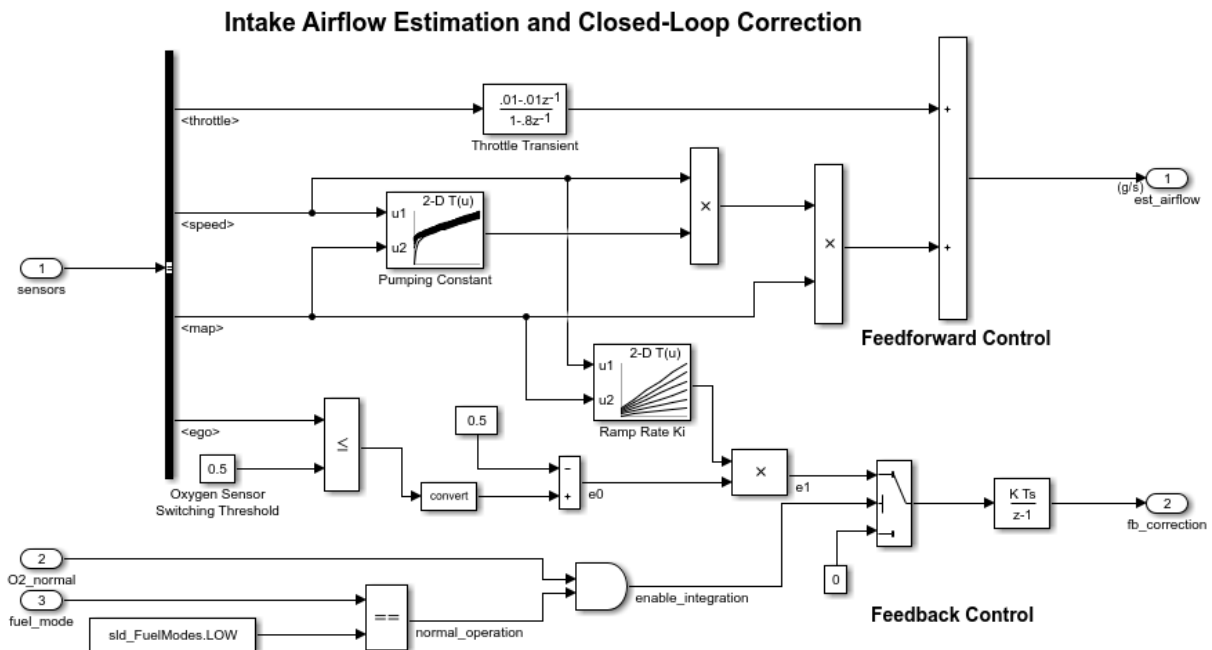
The `Selector1` block sets **Index Option** to `Index vector (port)`, which uses the input signal from `Constant1` as the index vector. The dimension of the input signal is 7, so the `Display` block shows the 7 values of the `Constant1` block. The `Selector2` block sets the **Input port size** parameter to 10, which is the size of the largest input signal to the `Selector2` block.

The `Selector2` block also sets the **Index Option** to `Starting and ending indices (port)`. The output is then set to the size of **Input port size** parameter (10), even though the size of the input signal is 7.

Switch Block with a Boolean Control Port Example

This example shows a Switch block with a Boolean input for the control port.

```
open_system('sldemo_fuelsys');
open_system('sldemo_fuelsys/fuel_rate_control/airflow_calc');
```

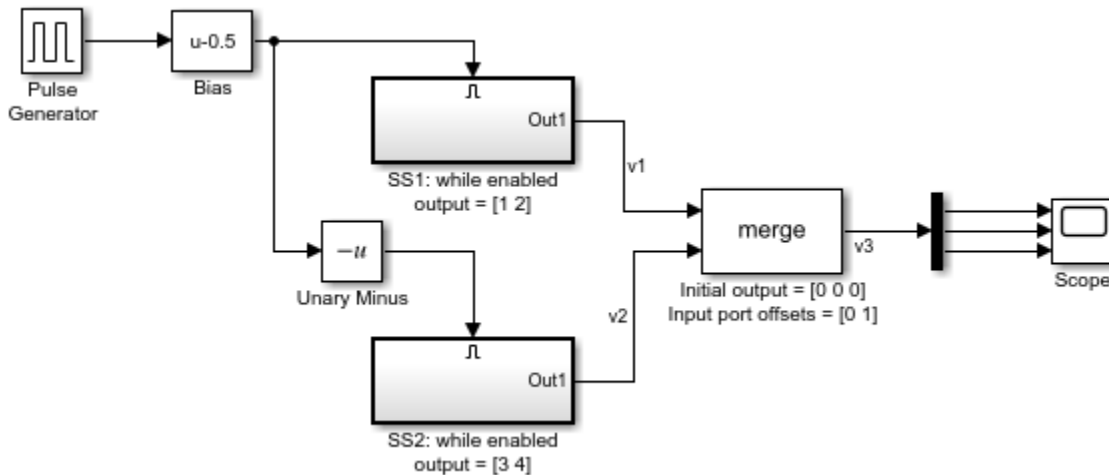
Intake Airflow Estimation and Closed-Loop Correction


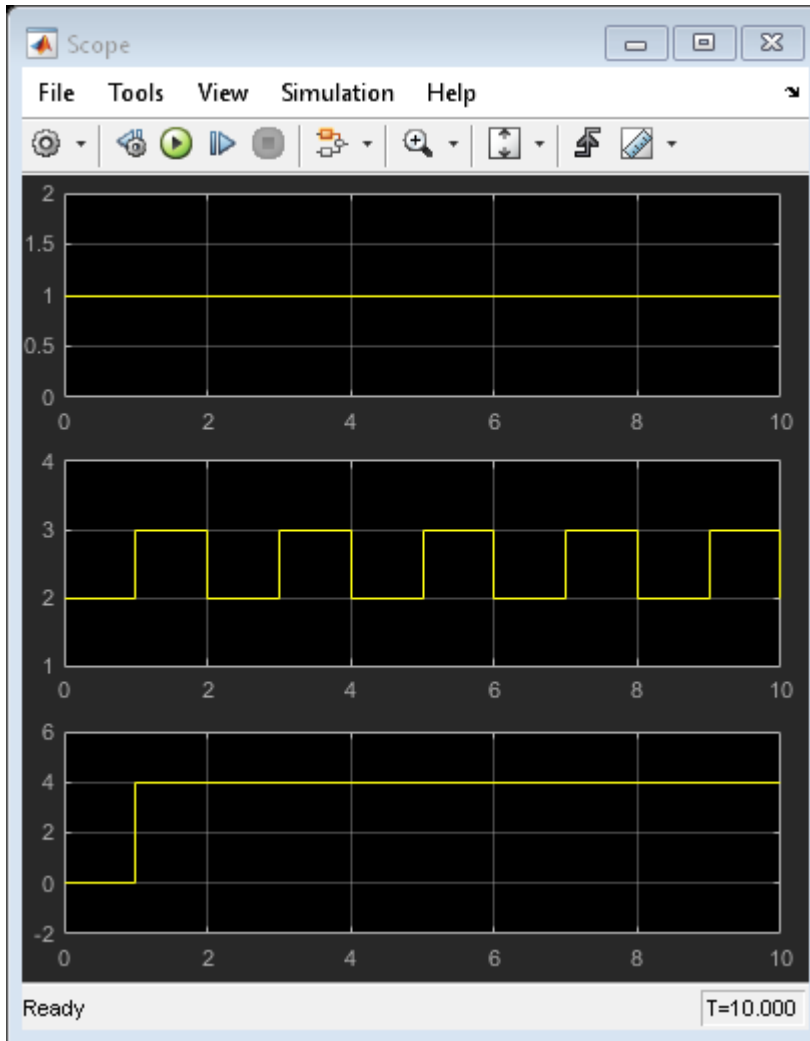
The value of the control port on the Switch block determines whether or not the feedback correction occurs. The control port value depends on the output of the Logical Operator block. When the Logical Operator block out is `true`, then the Switch block control port is 1 and the feedback control occurs. If the Logical Operator block outout is `false` then the feedback control does not occur.

Merge Block with Unequal Input Widths Example

This example shows how to use the Merge block with inputs ports that have different widths. If you select `Allow unequal port widths`, the block accepts scalar and vector inputs having differing numbers of elements. You can specify an offset for each input signal relative to the beginning of the output signal. The width of the output signal is:

$$max(w1 + o1, w2 + o2, ...wn + on)$$

where wn are the widths of the input signals, and on are the offsets.




The Merge block has the following output width.

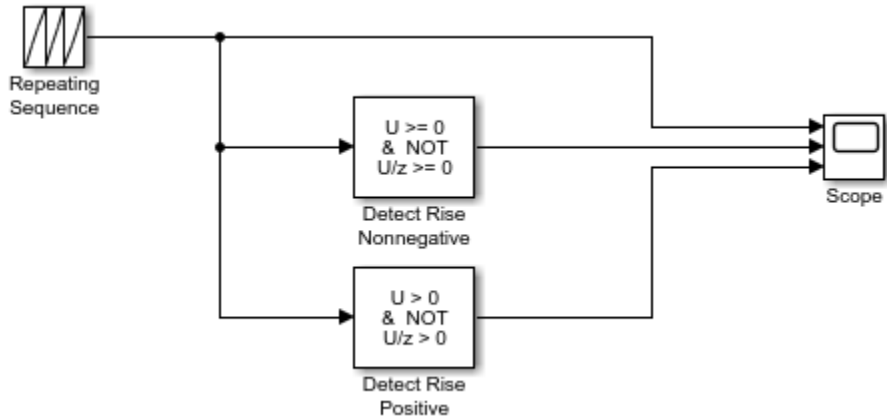
$$max(2 + 0, 2 + 1) = 3$$

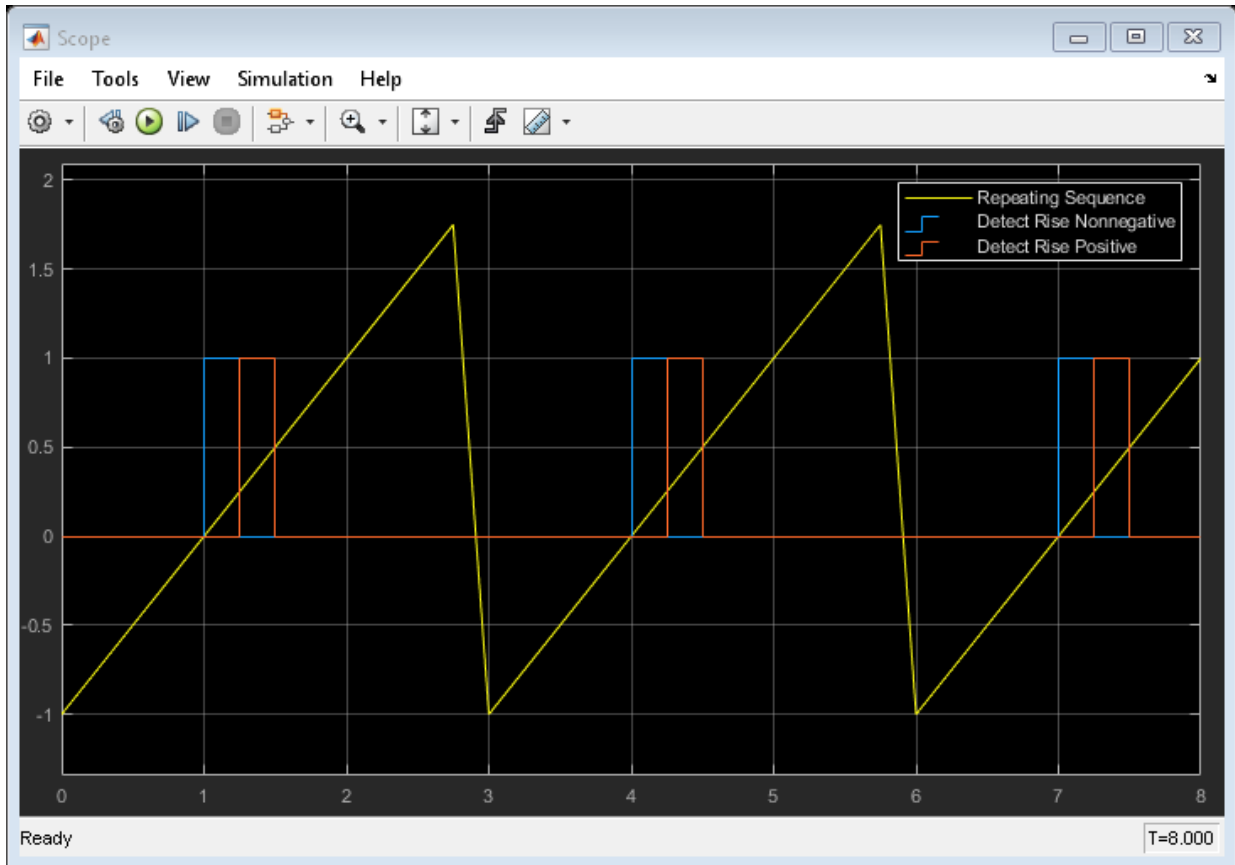
In this example, the offset of $v1$ is 0 and the offset of $v2$ is 1. The Merge block maps the elements of $v1$ to the first two elements of $v3$ and the elements of $v2$ to the last two

elements of $v3$. Only the second element of $v3$ is effectively merged, as show in the scope output.

If you use Simplified Initialization Mode, you must clear the `Allow unequal port widths` check box. The input port offsets for all signals must be zero.

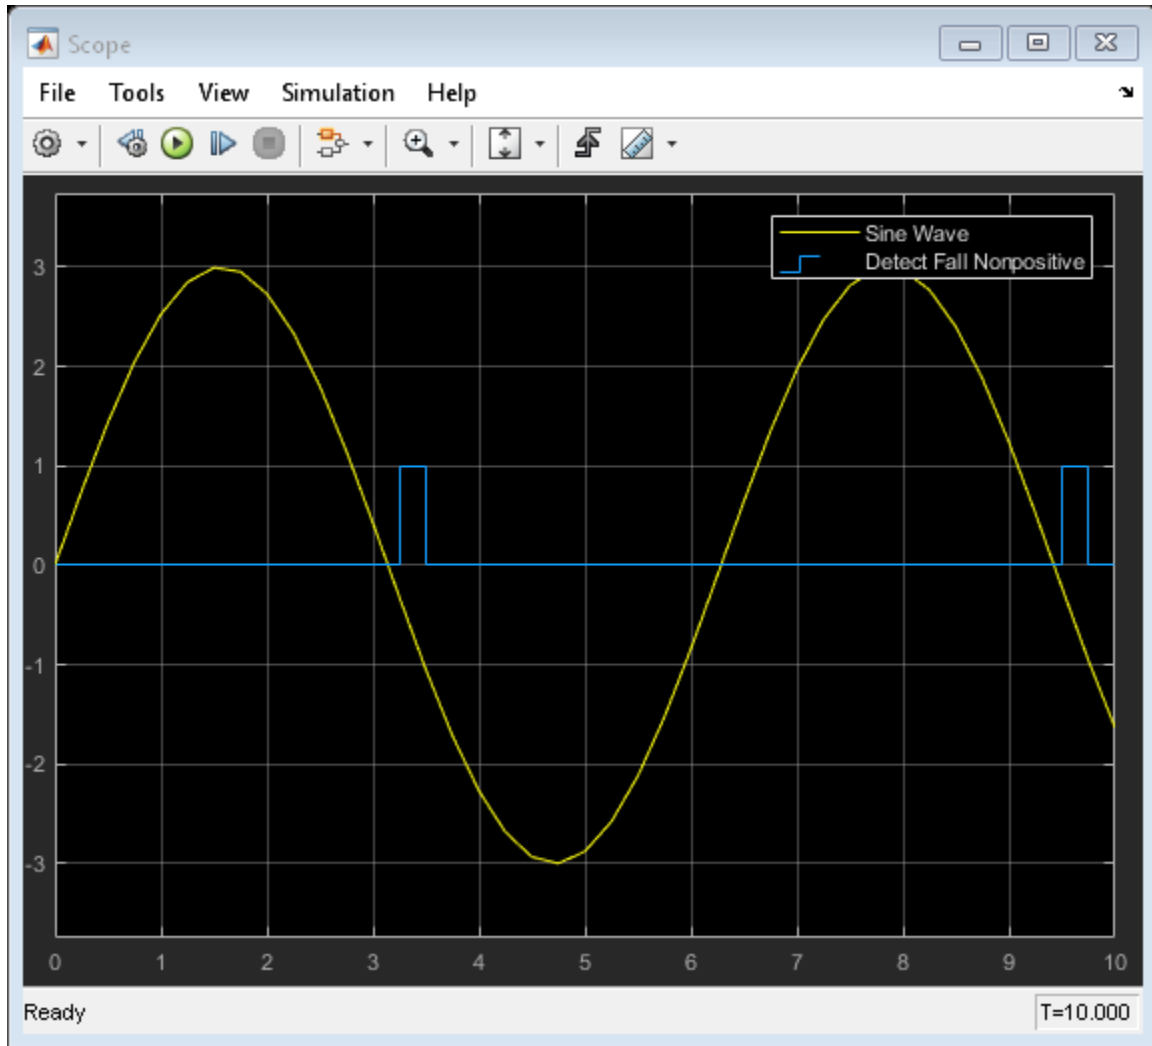
Detect Rising Edge of Signals

This example shows how to detect the rising edge of a signal using the Detect Rise Nonnegative and Detect Rise Positive blocks.


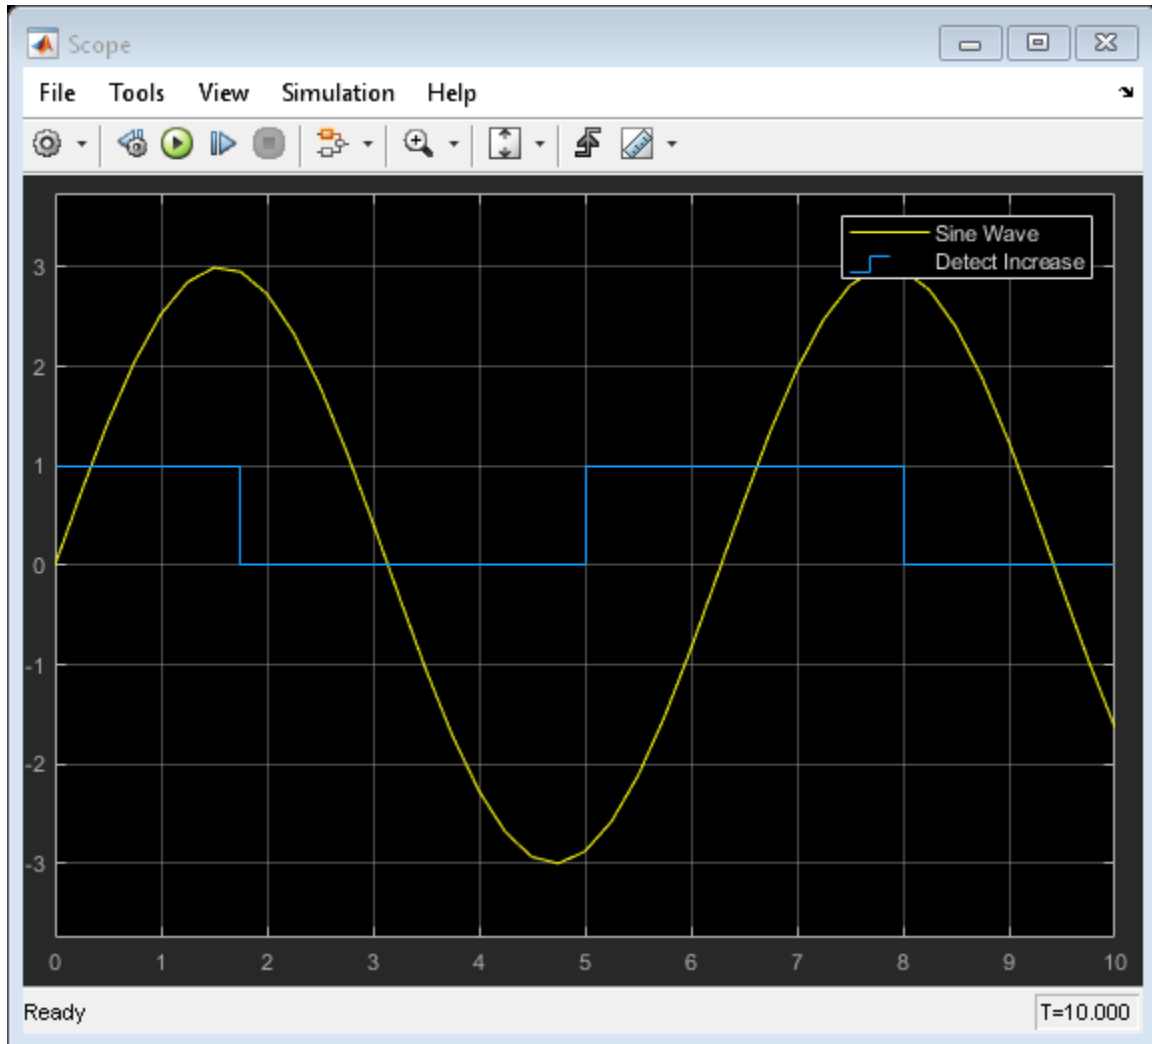


With a fixed-step size of 0.25, this example illustrates the difference between the Detect Rise Nonnegative and Detect Rise Positive blocks. The Detect Rise Nonnegative block outputs true (1) at t=1 because the input signal increased from a negative value to a nonnegative value (0). The Detect Rise Positive block outputs true (1) at t=1.25 because the input signal increased from a nonpositive value (0) to a strictly positive value.

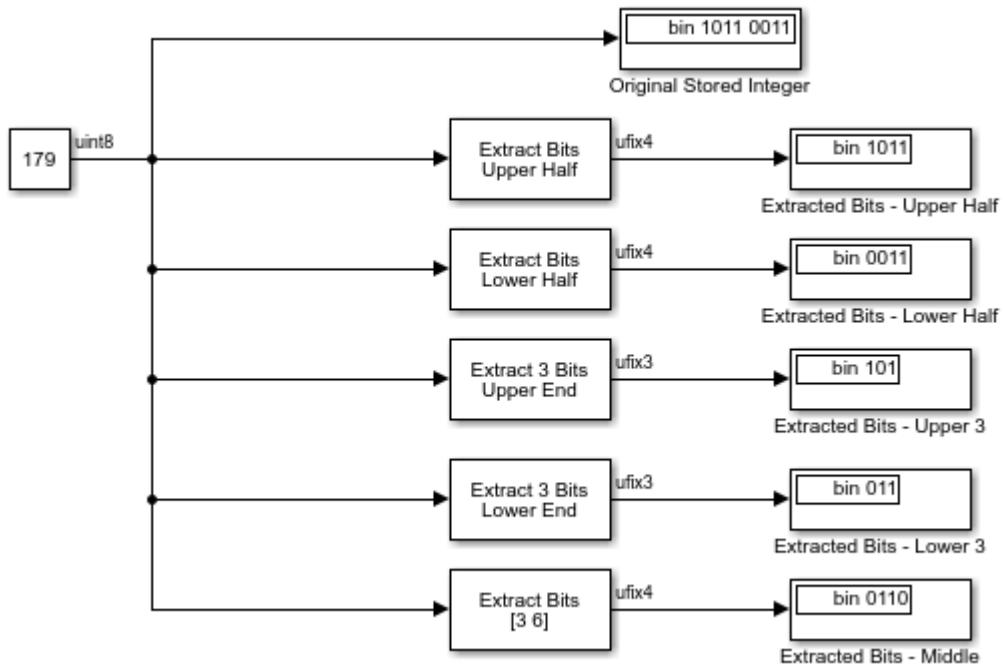
Detect Falling Edge Using the Detect Fall Nonpositive Block

This example shows how to use the Detect Fall Nonpositive block to detect a falling edge in the input signal. The block detects a falling edge when the signal value decreases from a strictly positive value to a nonpositive value. In this example, the **Initial condition** of the Detect Fall Nonpositive block is set to 1. This means that the Boolean expression U/z <= 0 evaluates to true and the block assumes the initial value of the input signal is nonpositive.


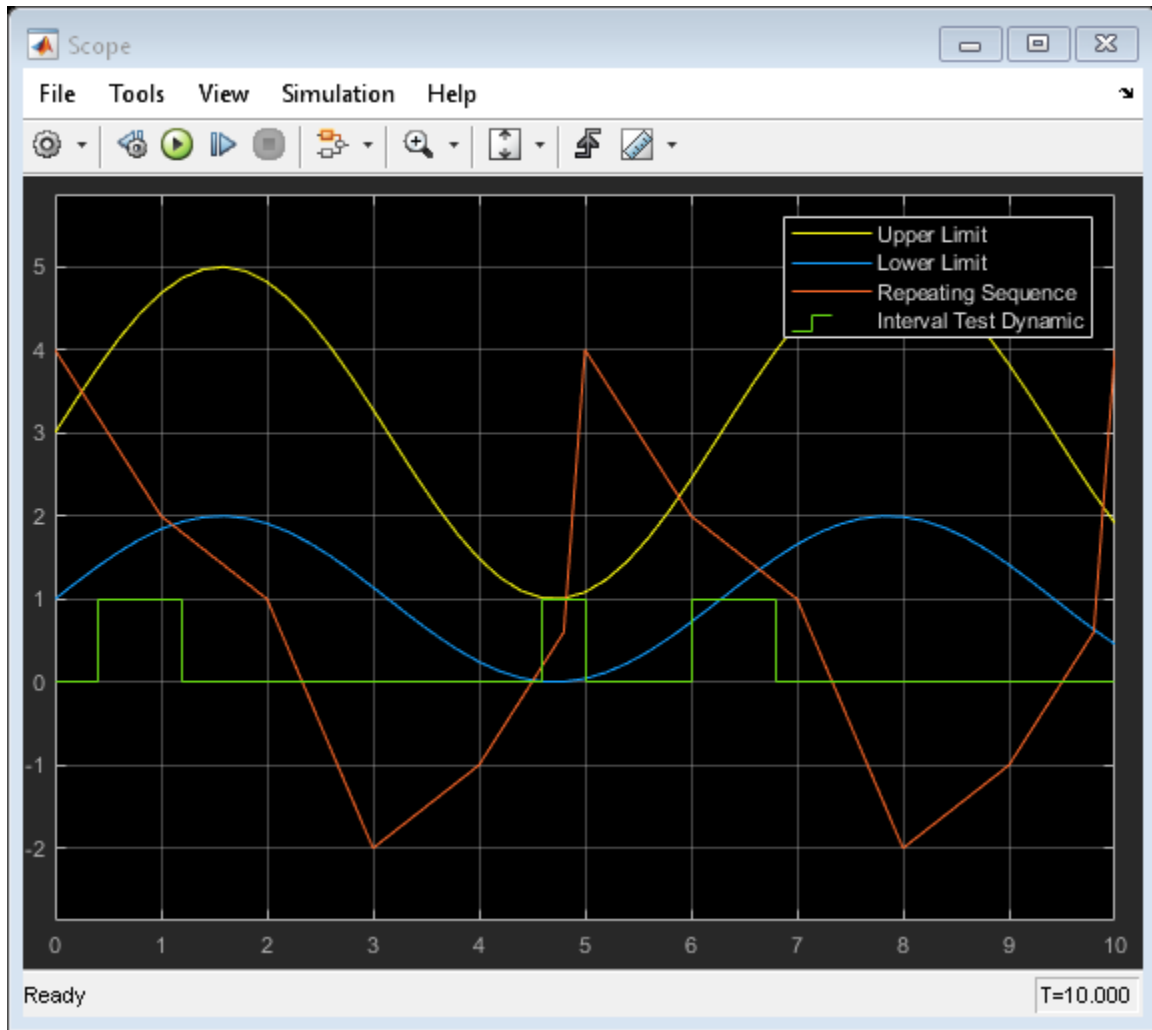
# Detect Increasing Signal Values with the Detect Increase Block

This example shows how to use the Detect Increase Block to detect increasing signal values. Because the **Initial condition** is set to -1, the block detects an increasing signal value starting at time t=0. If you change the **Initial condition** parameter to a nonnegative value, the block detects the first increasing signal value at t=0.25.


# Extract Bits from Stored Integer Value

This example shows how to extract specific bits from the stored integer value of an input signal.


Detect Signal Values Within a Dynamically Specified Interval

This example shows how to detect when an input signal falls within a dynamically specified interval. The interval is defined by two Sine Wave blocks. When the input to the Interval Test Dynamic block falls between those sine waves, the Interval Test Dynamic block outputs true (1).


Model a Digital Thermometer Using the Polynomial Block

This example shows how the sldemo_boiler uses the Polynomial block.

In the `Boiler Plant model/digital thermometer` subsystem, the Polynomial Block models a first-order polynomial using the coefficients [0.05 0.75]

For more information, see the model description.

Model Parameter Configuration Dialog Box

Model Parameter Configuration Dialog Box

The **Model Parameter Configuration** dialog box allows you to declare specific tunable parameters when you set **Default parameter behavior** to `Inlined`. The parameters that you select appear in the generated code as tunable parameters. For more information about **Default parameter behavior**, see "Default parameter behavior" (Simulink Coder).

To declare tunable parameters, use `Simulink.Parameter` objects instead of the **Model Parameter Configuration** dialog box. See "Create Tunable Calibration Parameter in the Generated Code" (Simulink Coder).
Note Simulink Coder software ignores the settings of this dialog box if a model contains references to other models. However, you can still generate code that uses tunable parameters with model references, using `Simulink.Parameter` objects. See "Create Tunable Calibration Parameter in the Generated Code" (Simulink Coder).

The dialog box has the following controls.

Source list

Displays a list of workspace variables. The options are:

- MATLAB workspace — Lists all variables in the MATLAB workspace that have numeric values.
- Referenced workspace variables — Lists only those variables referenced by the model.

Refresh list

Updates the source list. Click this button if you have added a variable to the workspace since the last time the list was displayed.

Add to table

Adds the variables selected in the source list to the adjacent table of tunable parameters.

New

Defines a new parameter and adds it to the list of tunable parameters. Use this button to create tunable parameters that are not yet defined in the MATLAB workspace.

Note This option does not create the corresponding variable in the MATLAB workspace. You must create the variable yourself.

Storage class

Used for code generation. For more information, see "Storage class".

Storage type qualifier

Used for code generation. For more information, see "Type qualifier".
