- Select `rising` to reset the states when the reset signal rises from zero to a positive value, from a negative to a positive value, or a negative value to zero.
- Select `falling` to reset the states when the reset signal falls from a positive value to zero, from a positive to a negative value, or from zero to negative.
- Select `either` to reset the states when the reset signal changes from zero to a nonzero value or changes sign.

The reset port has direct feedthrough. If the block output feeds back into this port, either directly or through a series of blocks with direct feedthrough, an algebraic loop results (see “Algebraic Loops”).

Enabling Zero-Crossing Detection

This parameter controls whether zero-crossing detection is enabled for this block. By default, the **Enable zero-crossing detection** parameter is selected on the **Attributes** pane. However, this parameter is only in affect if the **Zero-crossing control**, on the **Solver** pane of the Configuration Parameters dialog box, is set to `Use local settings`. For more information, see “Zero-Crossing Detection”.

Reinitializing *dx/dt* When *x* Reaches Saturation

For certain modeling applications, *dx/dt* must be reinitialized when state *x* reaches its limits in order to pull *x* out of saturation immediately. You can achieve this by selecting **Reinitialize dx/dt when x reaches saturation** on the **Attributes** pane.

If this option is on, then at the instant when *x* reaches saturation, Simulink checks whether the current value of the *dx/dt* initial condition (parameter or signal) allows the state *x* to leave saturation immediately. If so, Simulink reinitializes state *dx/dt* with the value of the initial condition (parameter or signal) at that instant. If not, Simulink ignores this parameter at the current instant and sets *dx/dt* to zero to make the block states consistent.

This parameter only applies at the time when *x* actually reaches saturation limit. It does not apply at any future time when *x* is being held at saturation.

Refer to the sections on limiting the states for more information. For an example, see “Simulation of a Bouncing Ball”.

Disregarding State Limits and External Reset for Linearization

For cases where you simplify your model by linearizing it, you can have Simulink disregard the limits of the states and the external reset by selecting **Ignore state limits and the reset for linearization**.

Specifying the Absolute Tolerance for the Block Outputs

By default Simulink software uses the absolute tolerance value specified in the Configuration Parameters dialog box (see “Error Tolerances for Variable-Step Solvers”) to compute the output of the integrator blocks. If this value does not provide sufficient error control, specify a more appropriate value for state *x* in the **Absolute tolerance x** field and for state *dx/dt* in the **Absolute tolerance dx/dt** field of the parameter dialog box. Simulink uses the values that you specify to compute the state values of the block.

Specifying the Display of the Output Ports

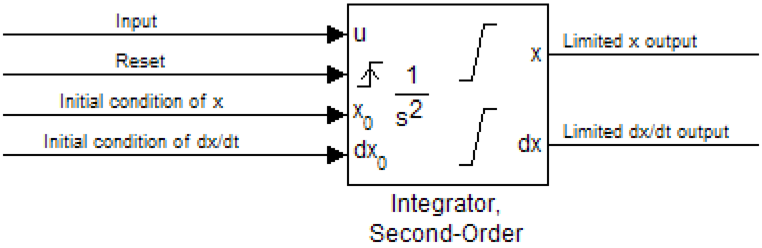
You can control whether to display the *x* or the *dx/dt* output port using the `ShowOutput` parameter. You can display one output port or both; however, you must select at least one.

Specifying the State Names

You can specify the name of *x* states and *dx/dt* states using the `StateNameX` and `StateNameDXDT` parameters. However, you must specify names for both or neither; you cannot specify names for just *x* or just *dx/dt*. Both state names must have identical type and length. Furthermore, the number of names must evenly divide the number of states.

Selecting All Options

When you select all options, the block icon looks like this.



Ports

Input

u — Input signal `u`
scalar | vector | matrix

Input signal `u` to the integrator system, specified as a scalar, vector, or matrix.

Data Types: `double`

x0 — Initial condition `x0`
scalar | vector | matrix

External signal specifying the initial condition `x0` to the integrator system. You can specify the initial condition as a scalar, vector, or matrix.

Dependencies

To enable this input port, set the **Initial condition source x** parameter to `external`.

Data Types: `double`

`dx0` — Initial condition `dx0`

scalar | vector | matrix

External signal specifying the initial condition `dx0` to the integrator system. You can specify the initial condition `dx0` as a scalar, vector, or matrix.

Dependencies

To enable this input port, set the **Initial condition source dx/dt** parameter to `external`.

Data Types: `double`

Output

x — Output signal x

scalar | vector | matrix

`x` state output signal, provided as a scalar, vector, or matrix.

Data Types: `double`

dx — Output signal dx

scalar | vector | matrix

`dx` state output signal, specified as a scalar, vector, or matrix.

Data Types: `double`

Parameters

x

`Initial condition source x` — Source of initial condition for state *x*

`internal` (default) | `external`

Specify the source of the initial conditions for state *x*.

- `internal` — Get the initial conditions of state *x* from the **Initial condition x** parameter.
- `external` — Get the initial conditions of state *x* from an external block connected to the $\mathbf{X_0}$ input port.

Limitations

Simulink software does not allow the initial condition of this block to be `inf` or `NaN`.

Dependencies

Selecting `internal` enables the **Initial condition x** parameter and removes the $\mathbf{X_0}$ input port.

Selecting `external` disables the **Initial condition x** parameter and enables the $\mathbf{X_0}$ input port.

Programmatic Use

Block Parameter: `ICSourceX`
Type: character vector, string
Values: `'internal'` | `'external'`
Default: `'internal'`

`Initial condition x` — Initial condition of state *x*

`0.0` (default) | scalar | vector | matrix

Specify the initial condition of state *x*.

Limitations

Simulink software does not allow the initial condition of this block to be `inf` or `NaN`.

Dependencies

To enable this parameter, set **Initial condition source x** to `internal`.

Setting **Initial condition source x** to `external` disables this parameter and enables the $\mathbf{X_0}$ input port.

Programmatic Use

Block Parameter: `ICX`
Type: character vector, string

Values: scalar | vector | matrix
Default: `'0.0'`

`Limit x` — Limit values of state *x*

`off` | `on`

Limit state *x* of the block to a value between the **Lower limit x** and **Upper limit x** parameters. The default value of the Second-Order Integrator block is `off`. The default value of the Second-Order Integrator Limited is `on`.

- To limit state *x* to a value between the **Lower limit x** and **Upper limit x** parameters, select this check box.
- To remove range limitations on state *x*, clear this check box.

Dependencies

Selecting this check box enables the **Upper limit x** and **Lower limit x** parameters.

Programmatic Use

Block Parameter: `LimitX`
Type: character vector, string
Values: `'off'` | `'on'`
Default: `'off'` (Second-Order Integrator) | `'on'` (Second-Order Integrator Limited)

`Upper limit x` — Upper limit of state *x*

`1` | `inf` | scalar | vector | matrix

Specify the upper limit of state *x*. The default value for the Second-Order Integrator block is `inf`. The default value for the Second-Order Integrator Limited block is `1`.

Tips

The upper saturation limit for state *x* must be strictly greater than the lower saturation limit.

Dependencies

To enable this parameter, select the **Limit x** check box.

Programmatic Use

Block Parameter: `UpperLimitX`
Type: character vector, string
Values: `'1' | 'inf' |` scalar | vector | matrix

Default: `'1'` (Second-Order Integrator Limited) | `'inf'` (Second-Order Integrator)

`Lower limit x` — Lower limit of state *x*

`0` (default) | `-inf` | scalar | vector | matrix

Specify the lower limit of state *x*. The default value for the Second-Order Integrator block is `-inf`. The default value for the Second-Order Integrator Limited block is `0`.

Tip

The lower saturation limit for state *x* must be strictly less than the upper saturation limit.

Dependencies

To enable this parameter, select the **Limit x** check box.

Programmatic Use
Block Parameter: `LowerLimitX`
Type: character vector, string
Values: `'0' | '-inf' |` scalar | vector | matrix
Default: `'0'` (Second-Order Integrator Limited) | `'-inf'` (Second-Order Integrator)

`Wrap x` — Enable wrapping of x

`off` (default) | `on`

Enable wrapping of *x* between the **Wrapped upper value x** and **Wrapped lower value x** parameters. Enabling wrapping of *x* eliminates the need for zero-crossing detection, reduces solver resets, improves solver performance and accuracy, and increases simulation time span when modeling rotary and cyclic state trajectories.

If you specify **Wrapped upper value x** as `inf` and **Wrapped lower value x** as `-inf`, wrapping will never occur.

Dependencies

Selecting this check box enables **Wrapped upper value x** and **Wrapped lower value x**.

Programmatic Use
Block Parameter: `WrapX`
Type: character vector, string
Values: `'off'` | `'on'`
Default: `'off'`

`Wrapped upper value x` — Upper value for wrapping x

`pi` (default) | scalar | vector | matrix

Specify the upper value for wrapping *x*.

Dependencies

To enable this parameter, select the **Wrap x** check box.

Programmatic Use

Block Parameter: `WrappedUpperValueX`
Type: character vector, string
Values: scalar | vector | matrix
Default: `'pi'`

`Wrapped lower value x` — Lower value for wrapping x

`-pi` (default) | scalar | vector | matrix

Specify the lower value for wrapping *x*.

Dependencies

To enable this parameter, select the **Wrap x** check box.

Programmatic Use

Block Parameter: `WrappedLowerValueX`
Type: character vector, string
Values: scalar | vector | matrix
Default: `'-pi'`

`Absolute tolerance x` — Absolute tolerance for computing state *x*

`auto` (default) | `-1` | scalar | vector

Specify the absolute tolerance for computing state *x*.

- You can enter `auto`, –1, a positive real scalar or vector.
- If you enter `auto` or –1, Simulink uses the absolute tolerance value in the Configuration Parameters dialog box (see “Solver Pane”) to compute state *x*.
- If you enter a real scalar value, that value overrides the absolute tolerance in the Configuration Parameters dialog box and is used for computing all *x* states.
- If you enter a real vector, the dimension of that vector must match the dimension of state *x*. These values override the absolute tolerance in the Configuration Parameters dialog box.

Programmatic Use
Block Parameter: `AbsoluteToleranceX`
Type: character vector, string
Values: `'auto'` | `'-1'` | any positive real scalar or vector
Default: `'auto'`

`State name x` — Name for state *x*

`''` (default) | character vector | string

Assign a unique name to state *x*.

Tips

- To assign a name to a single state, enter the name between quotes, for example, position'.
- To assign names to multiple *x* states, enter a comma-delimited list surrounded by braces, for example, {'a', 'b', 'c'}. Each name must be unique.
- The state names apply only to the selected block.
- If you specify a state name for *x*, you must also specify a state name for *dx/dt*.
- State names for *x* and *dx/dt* must have identical types and lengths.
- The number of states must be evenly divided by the number of state names. You can specify fewer names than *x* states, but you cannot specify more names than *x* states. For example, you can specify two names in a system with four states. The first name applies to the first two states and the second name to the last two states. However, you must be consistent and apply the same scheme to the state names for *dx/dt*.
- To assign state names with a variable in the MATLAB workspace, enter the variable without quotes. A variable can be a character vector, string or a cell array.

Programmatic Use
Block Parameter: `StateNameX`
Type: character vector, string
Values: `' '` | user-defined
Default: `' '`

dx/dt

`Initial condition source dx/dt` — Source of initial condition for state *dx/dt*

`internal` (default) | `external`

Specify the source of initial conditions for state *dx/dt* as `internal` or `external`.

Limitations

Simulink software does not allow the initial condition of this block to be `inf` or `NaN`.

Dependencies

- Selecting `internal` enables the **Initial condition dx/dt** parameter and removes the **$\mathbf{dx_0}$** input port.
- Selecting `external` disables the **Initial condition dx/dt** parameter and enables the **$\mathbf{dx_0}$** input port.

Programmatic Use

Block Parameter: `ICSourceDXDT`
Type: character vector
Values: `'internal'` | `'external'`
Default: `'internal'`

`Initial condition dx/dt` — Initial condition of state *dx/dt*

`0.0` (default) | scalar | vector | matrix

Specify the initial condition of state *dx/dt*.

Limitations

Simulink software does not allow the initial condition of this block to be `inf` or `NaN`.

Dependencies

- Setting **Initial condition source dx/dt** to `internal` enables this parameter.
- Setting **Initial condition source dx/dt** to `external` disables this parameter.

Programmatic Use

Block Parameter: `ICDXDT`
Type: character vector
Values: scalar | vector | matrix
Default: `'0.0'`

`Limit dx/dt` — Limit values of state *dx/dt*

`off` | `on`

Limit the *dx/dt* state of the block to a value between the **Lower limit dx/dt** and **Upper limit dx/dt** parameters. The default value of the Second-Order Integrator block is `off`. The default value of the Second-Order Integrator Limited is `on`.

Tip

If you set saturation limits for *x*, then the interval defined by the **Upper limit dx/dt** and **Lower limit dx/dt** must contain zero.

Dependencies

Selecting this check box enables the **Upper limit dx/dt** and **Lower limit dx/dt** parameters.

Programmatic Use

Parameter: `LimitDXDT`
Type: character vector
Values: `'off'` | `'on'`
Default: `'off'` (Second-Order Integrator) | `'on'` (Second-Order Integrator Limited)

`Upper limit dx/dt` — Upper limit of state *dx/dt*

`inf` (default) | scalar | vector | matrix

Specify the upper limit for state *dx/dt*.

Dependencies

If you limit *x*, then this parameter must have a strictly positive value.

To enable this parameter, select the **Limit dx/dt** check box.

Programmatic Use

Block Parameter: `UpperLimitDXDT`
Type: character vector
Values: scalar | vector | matrix
Default: `'inf'`

`Lower limit dx/dt` — Lower limit of state *dx/dt*

`-inf` (default) | scalar | vector | matrix

Specify the lower limit for state *dx/dt*.

Dependencies

If you limit *x*, then this parameter must have a strictly negative value.

To enable this parameter, select the **Limit dx/dt** check box.

Programmatic Use

Block Parameter: `LowerLimitDXDT`
Type: character vector
Values: scalar | vector | matrix
Default: `'-inf'`

`Absolute tolerance dx/dt` — Absolute tolerance for computing state *dx/dt*

`auto` (default) | `-1` | scalar | vector

Specify the absolute tolerance for computing state *dx/dt*.

- You can enter `auto`, `–1`, a positive real scalar or vector.
- If you enter `auto` or `–1`, then Simulink uses the absolute tolerance value in the Configuration Parameters dialog box (see "Solver Pane") to compute the *dx/dt* output of the block.
- If you enter a numeric value, that value overrides the absolute tolerance in the Configuration Parameters dialog box.

Programmatic Use

Block Parameter: `AbsoluteToleranceDXDT`
Type: character vector, string, scalar, or vector
Values: `'auto'` | `'-1'` | any positive real scalar or vector
Default: `'auto'`

`State name dx/dt` — Name for state *dx/dt*

`' '` (default) | character vector | string

Assign a unique name to state *dx/dt*.

Tips

- To assign a name to a single state, enter the name between quotes, for example, 'velocity'.
- To assign names to multiple *dx/dt* states, enter a comma-delimited list surrounded by braces, for example, {'a', 'b', 'c'}. Each name must be unique.
- The state names apply only to the selected block.
- If you specify a state name for *dx/dt*, you must also specify a state name for *x*.
- State names for *x* and *dx/dt* must have identical types and lengths.
- The number of states must be evenly divided by the number of state names. You can specify fewer names than *dx/dt* states, but you cannot specify more names than *dx/dt*

states. For example, you can specify two names in a system with four states. The first name applies to the first two states and the second name to the last two states. However, you must be consistent and apply the same scheme to the state names for *x*.

- To assign state names with a variable in the MATLAB workspace, enter the variable without quotes. A variable can be a character vector, string, or a cell array.

Programmatic Use
Block Parameter: `StateNameDXDT`
Type: character vector, string
Values: `' '` | user-defined
Default: `' '`

Attributes

`External reset` — Reset states to their initial conditions

`none` (default) | `rising` | `falling` | `either`

Reset the states to their initial conditions when a trigger event occurs in the reset signal.

- `none` — Do not reset the state to initial conditions.
- `rising` — Reset the state when the reset signal rises from a zero to a positive value or from a negative to a positive value.
- `falling` — Reset the state when the reset signal falls from a positive value to zero or from a positive to a negative value.
- `either` — Reset the state when the reset signal changes from zero to a nonzero value or changes sign.

Programmatic Use
Block Parameter: `ExternalReset`
Type: character vector, string
Values: `'none'` | `'rising'` | `'falling'` | `'either'`
Default: `'none'`

`Enable zero-crossing detection` — Enable zero-crossing detection

`on` (default) | `off`

Select to enable zero-crossing detection. For more information, see “Zero-Crossing Detection”.

Programmatic Use
Parameter:`ZeroCross`
Type: character vector, string
Values: `'on'` | `'off'`
Default: `'on'`

`Reinitialize dx/dt when x reaches saturation` — Reset *dx/dt* when *x* reaches saturation

`off` (default) | `on`

At the instant when state *x* reaches saturation, reset *dx/dt* to its current initial conditions.

Tip

The *dx/dt* initial condition must have a value that enables *x* to leave saturation immediately. Otherwise, Simulink ignores the initial conditions for *dx/dt* to preserve mathematical consistency of block states.

Programmatic Use
Block Parameter: `ReinitDXDTwhenXreachesSaturation`
Type: character vector, string
Values: `'off'` | `'on'`
Default: `'off'`

`Ignore state limits and the reset for linearization` — Ignore state limits and external reset for linearization

`off` (default) | `on`

For linearization purposes, have Simulink ignore the specified state limits and the external reset.

Programmatic Use
Block Parameter: `IgnoreStateLimitsAndResetForLinearization`
Type: character vector, string
Values: `'off'` | `'on'`
Default: `'off'`

`Show output` — Output ports to display

`both` (default) | `x` | `dxdt`

Specify the output ports on the block.

- `both` — Show both *x* and *dx/dt* output ports.

- `x` — Show only the *x* output port.
- `dx/dt` — Show only the *dx/dt* output port.

Programmatic Use
Block Parameter: `ShowOutput`
Type: character vector, string
Values: `'both'` | `'x'` | `'dxdt'`
Default: `'both'`

Block Characteristics

Data Types	`double`
Multidimensional Signals	`No`
Variable-Size Signals	`No`

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Not recommended for production-quality code. Relates to resource limits and restrictions on speed and memory often found in embedded systems. The code generated can contain dynamic allocation and freeing of memory, recursion, additional memory overhead, and widely-varying execution times. While the code is functionally valid and generally acceptable in resource-rich environments, smaller embedded targets often cannot support such code.

In general, consider using the Simulink Model Discretizer to map continuous blocks into discrete equivalents that support production code generation. To start the Model Discretizer, select `Analysis > Control Design > Model Discretizer`. One exception is the Second-Order Integrator block because, for this block, the Model Discretizer produces an approximate discretization.

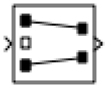
Selector

Select input elements from vector, matrix, or multidimensional signal
Library: Simulink / Signal Routing



Description

The Selector block generates as output selected or reordered elements of an input vector, matrix, or multidimensional signal.

Based on the value you enter for the **Number of input dimensions** parameter, a table of indexing settings is displayed. Each row of the table corresponds to one of the input dimensions in **Number of input dimensions**. For each dimension, you define the elements of the signal to work with. Specify a vector signal as a 1-D signal and a matrix signal as a 2-D signal. When you configure the Selector block for multidimensional signal operations, the block icon changes.

For example, assume a 6-D signal with a one-based index mode. The table of the Selector block dialog changes to include one row for each dimension. If you define dimensions as shown in the next table, the output is `Y = U(1:end,2:6,[1 3 5],Idx4:Idx4+7,Idx5,Idx6(1):Idx6(2))`, where `Idx4`, `Idx5`, and `Idx6` are the index ports for dimensions 4, 5, and 6.

Row	Index Option	Index	Output Size
1	`Select all`		
2	`Starting index (dialog)`	2	5
3	`Index vector (dialog)`	[1 3 5]	

Row	Index Option	Index	Output Size
4	`Starting index (port)`		8
5	`Index vector (port)`		
6	`Starting and ending indices (port)`		

You can use an array of buses as an input signal to a Selector block. For details about defining and using an array of buses, see "Combine Buses into an Array of Buses".

Ports

Input

`Port_1` — Input signal

scalar | vector | matrix | multidimensional

Input signal and source of elements to output signal.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

`IndxN` — Nth index signal

scalar | vector | matrix

External port specifying an index for the selection of the corresponding output element.

Dependencies

To enable an external index port, in the corresponding row of the **Index Option** table, set **Index Option** to `Index vector (port)`, `Starting index (port)`, or `Starting and ending indices (port)`.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `enumerated`

Output

`Port_1` — Output signal

scalar | vector | matrix | multidimensional

Output signal generated from selected or reordered elements of input signal.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Parameters

`Number of input dimensions` — Number of dimensions of the input signal

`1` (default) | integer

Specifies the number of dimensions of the output signal.

Programmatic Use
Block Parameter: `NumberOfDimensions`
Type: character vector
Values: `integer`
Default: `'1'`

`Index mode` — Index mode

`One-based` (default) | `Zero-based`

Specifies the indexing mode. If `One-based` is selected, an index of 1 specifies the first element of the input vector. If `Zero-based` is selected, an index of 0 specifies the first element of the input vector.

Programmatic Use
Block Parameter: `IndexMode`
Type: character vector
Values: `'One-based' | 'Zero-based'`
Default: `'One-based'`

`Index Option` — Index method for elements

`Index vector (dialog)` (default) | `Select all` | `Index vector (port)` | `Starting index (dialog)` | `Starting index (port)` | `Starting and ending indices (port)`

Defines, by dimension, how the elements of the signal are to be indexed. From the list, select:

- `Select all`

  No further configuration is required. All elements are selected.
- `Index vector (dialog)`

  Enables the **Index** column. Enter the vector of indices of the elements.
- `Index vector (port)`

  No further configuration is required.
- `Starting index (dialog)`

  Enables the **Index** and **Output Size** columns. Enter the starting index of the range of elements to select in the **Index** column and the number of elements to select in the **Output Size** column.
- `Starting index (port)`

  Enables the **Output Size** column. Enter the number of elements to be selected in the **Output Size** column.
- `Starting and ending indices (port)`

  No further configuration is required.

  Using this option results in a variable-size output signal. When you update, the output dimension is set to be the same as the input signal dimension. During execution, the output dimension is updated based on the signal feeding the index.

  When logging output signal data, signals not selected are padded with NaN values.

The **Index** and **Output Size** columns appear as needed.

Programmatic Use
Block Parameter: `IndexOptionArray`
Type: character vector
Values: `'Select all'`|`'Index vector (dialog)'`|`'Index option (port)'`|`'Starting index (dialog)'`|`'Starting index (port)'`|`Starting and ending indices (port)`
Default: `'Index vector (dialog)'`

Index — Index of elements

1 (default) | integer

If the **Index Option** is `Index vector (dialog)`, enter the index of each element you are interested in.

If the **Index Option** is `Starting index (dialog)`, enter the starting index of the range of elements to be selected.

Programmatic Use
Block Parameter: `IndexParamArray`
Type: character vector
Values: cell array
Default: `'{ }'`

`Output Size` — Width of the block output signal

1 (default) | integer

Specifies the width of the block output signal.

Programmatic Use
Block Parameter: `OutputSizeArray`
Type: character vector
Values: cell array
Default: `'{ }'`

`Input port size` — Width of the input signal

3 (default) | integer

Specify the width of the block input signal for 1-D signals. Enter `-1` to inherit from the driving block.

Programmatic Use
Block Parameter: `InputPortWidth`
Type: character vector
Values: `integer`
Default: `'1'`

`Sample time` — Specify sample time as a value other than `-1`

`-1` (default) | scalar

Specify the sample time as a value other than -1. For more information, see “Specify Sample Time”.

Dependencies

This parameter is not visible unless it is explicitly set to a value other than `-1`. To learn more, see “Blocks for Which Sample Time Is Not Recommended”.

Programmatic Use
Block Parameter: `SampleTime`
Type: character vector
Values: scalar
Default: `'-1'`

Block Characteristics

Data Types	`double` | `single` | `Boolean` | `base integer` | `fixed point` | `enumerated`
Direct Feedthrough	`No`
Multidimensional Signals	`Yes`
Variable-Size Signals	`Yes`
Zero-Crossing Detection	`No`

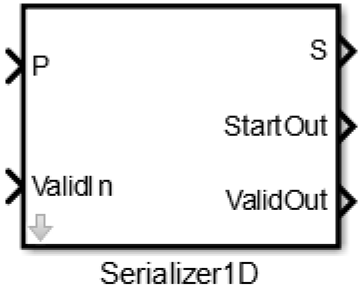
Serializer1D

Convert vector signal to scalar or smaller vectors



Library

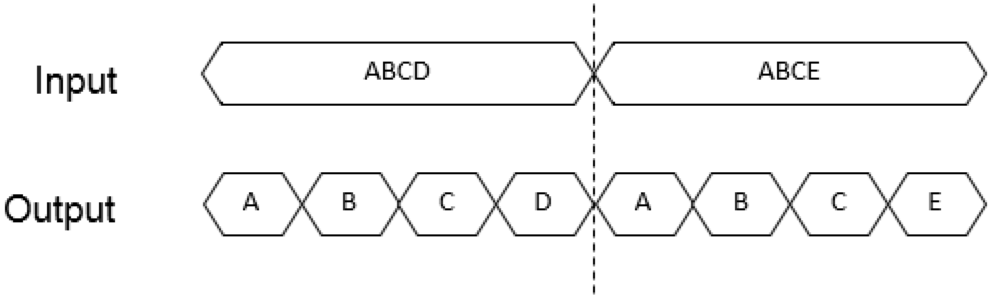
HDL Coder / HDL Operations

Description

The Serializer1D block converts a slower vector signal into a faster stream of scalar signals or smaller size vector signals based on the **Ratio** and **Idle Cycle** values. To match the faster serialized output, the sample time changes according to this equation:

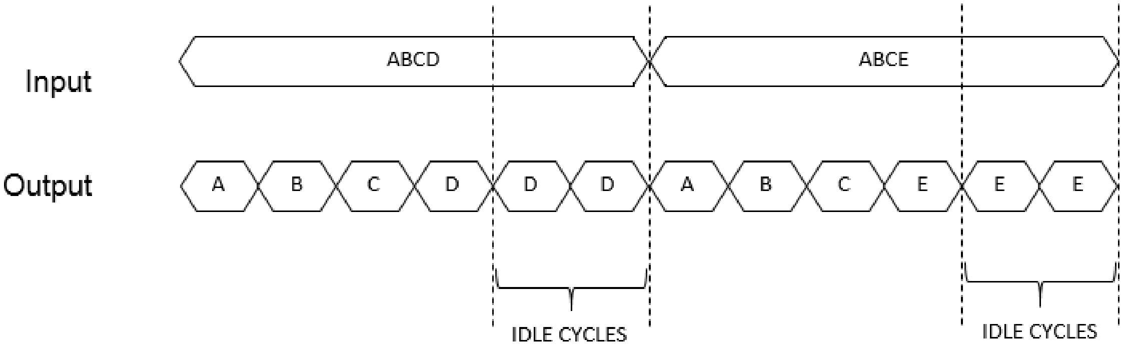
$$Output\ Sample\ Time = Input\ Sample\ Time\,/\,(Ratio + Idle\ Cycles)$$

Consider this example where the input data is a vector of size 4 and the **Ratio** is set to 4.



The output data serializes each of the vector signals into four scalar signals. The sample time at the output is: $Output\ Sample\ Time = Input\ Sample\ Time\,/\,4$.

To add idle cycles at the end of each output, for **Idle Cycles**, specify an integer greater than zero. Consider this example with **Ratio** set to 4 and **Idle Cycles** set to 2.

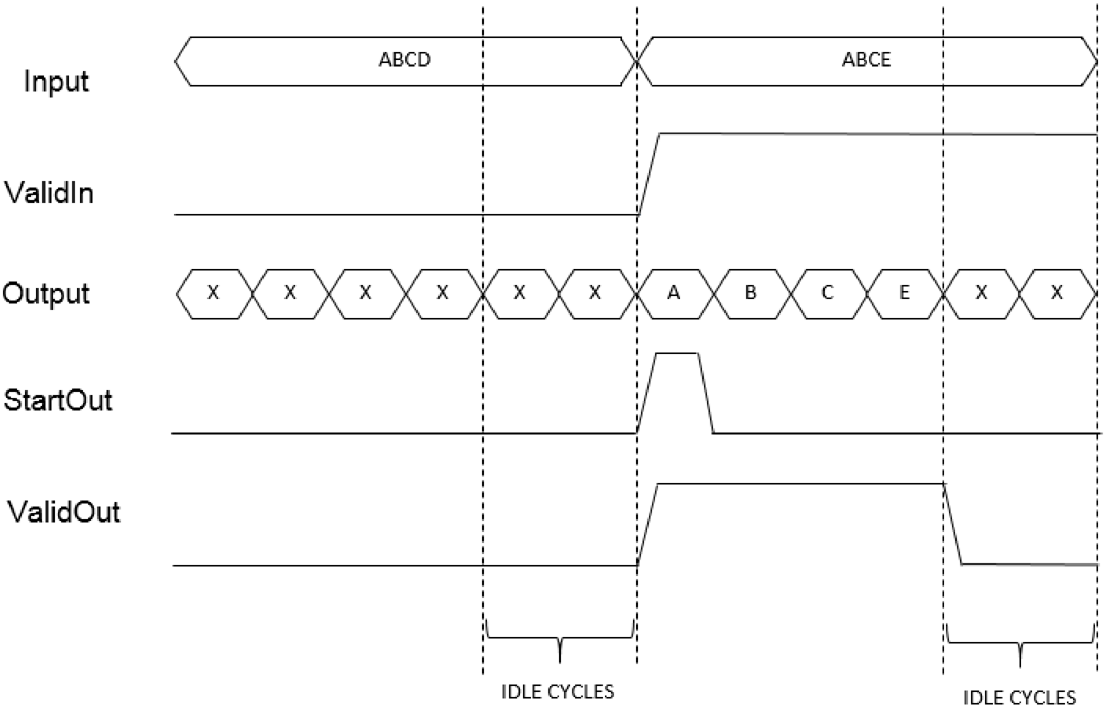


For each slow vector signal, the output has six fast cycles consisting of the four serialized scalar signals and two idle cycles. The sample time at the output is

$Output\ Sample\ Time = Input\ Sample\ Time\,/\,6$.

The Serializer1D block provides three control signals: **ValidIn**, **ValidOut**, and **StartOut**. You can use **ValidIn** to control **ValidOut** and **StartOut**. The serialized output does not depend on **ValidIn**. To determine whether the output serialized data is valid, use **ValidIn** and **ValidOut**. If you give a high input to **ValidIn**, and if there are no idle cycles, **ValidOut** gives a high output, which indicates that the output serialized data is valid.

Consider an example that has input data as a vector of size 4, **Ratio** set to 4, **Idle Cycles** set to 2, and uses all three control signals.



For the first input vector, ABCD, **ValidIn** is false. **StartOut** and **ValidOut** become false. This means that the output data values are not valid. In the waveform, the data values are represented as X, which correspond to *don't care* values.

For the second input vector, ABCE, **ValidIn** is true. The output data serializes the vector into four scalar signals. The control signal **StartOut** becomes true at output A to indicate the start of deserialization. In the next cycle, the **StartOut** signal becomes false. **ValidOut** is true for all four output signals indicating valid output data for the four cycles.

ValidOut becomes false for the idle cycles, and the output data values are *don't care* values.

HDL Code Generation

For simulation results that match the generated HDL code, in the Solver pane of the Configuration Parameters dialog box, clear the checkbox for **Treat each discrete rate as a separate task**. When the checkbox is cleared, single-tasking mode is enabled.

If you simulate this block with **Treat each discrete rate as a separate task** selected, multitasking mode is enabled. The output data can update in the same cycle but in the generated HDL code, the output data is updated one cycle later.

Parameters

Ratio

Serialization factor, specified as a positive scalar. Default is `1`.

The ratio is equal to the size of the input vector divided by the size of the output vector. Input vector size must be divisible by the ratio.

Idle Cycles

Number of idle cycles to add at the end of each output. Default is `0`.

ValidIn

Activates the **ValidIn** port. Default is `off`.

StartOut

Activates the **StartOut** port. Default is `off`.

ValidOut

Activates the **ValidOut** port. Default is `off`.

Input data port dimensions (-1 for inherited)

Size of the input data signal. Input vector size must be divisible by the ratio. By default, the block inherits size based on the context within the model.

Input sample time (-1 for inherited)

Time interval between sample time hits, or another appropriate sample time such as continuous. By default, the block inherits sample time based on context within the model. For more information, see "Sample Time".

Input signal type

Input signal type of the block, specified as `auto`, `real`, or `complex`. Default is `auto`.

Ports

`P`

Input signal to serialize. Bus data types are not supported.

`ValidIn`

Input control signal. This port is available when you select the **ValidIn** check box.

Data type: Boolean

`S`

Serialized output signal. Bus data types are not supported.

`StartOut`

Output control signal that indicates where to start deserialization. You can use this signal as the **StartIn** input to the Deserializer1D block. To use this port, select the **StartOut** check box.

Data type: Boolean

`ValidOut`

Output control signal that indicates valid output signal. You can use this signal as the **ValidIn** input to the Deserializer1D block. This port is available when you select the **ValidOut** check box.

Data type: Boolean

Deserializer1D

Introduced in R2014b

S-Function

Include S-function in model

Library: Simulink / User-Defined Functions

Description

The S-Function block provides access to S-functions from a block diagram. The S-function named as the **S-function name** parameter can be a Level-2 MATLAB or a Level-1 or Level-2 C MEX S-function (see “MATLAB S-Function Basics” for information on how to create S-functions).

Note Use the Level-2 MATLAB S-Function block to include a Level-2 MATLAB S-function in a block diagram.

The S-Function block displays the name of the specified S-function and the number of input and output ports specified by the S-function. Signals connected to the inputs must have the dimensions specified by the S-function for the inputs.

Parameters

`S-function name` — Name of the S-function

character array (default)

Use this parameter to specify the name of your S-function.

Programmatic Use

Block Parameter: `FunctionName`
Type: character vector
Value: name of the S-function
Default: `'system'`

`S-function parameters` — Additional S-function parameters

cell array (default)

Specify the additional S-function parameters.

The function parameters can be specified as MATLAB expressions or as variables separated by commas. For example,

```
A, B, C, D, [eye(2,2);zeros(2,2)]
```

Note that although individual parameters can be enclosed in brackets, the list of parameters must not be enclosed in brackets.

Programmatic Use
Block Parameter: `Parameters`
Type: character vector
Value: S-function parameters
Default: `' '`

`S-function modules` — List additional files for code generation

cell array (default)

This parameter applies only if this block represents a C MEX S-function and you intend to use the Simulink Coder software to generate code from the model containing the block. If you use it, when you are ready to generate code, you must force the coder to rebuild the top model as explained in “Control Regeneration of Top Model Code” (Simulink Coder).

For more information on using this parameter, see “Specify Additional Source Files for an S-Function” (Simulink Coder).

Programmatic Use
Block Parameter: `SFunctionModules`
Type: character vector
Value: character vector of file names
Default: `' '`

Block Characteristics

Data Types	`double`[a] | `single`[a] | `Boolean`[a] | `base integer`[a] | `fixed point`[ba] | `bus`[a] | `string`[a]

Direct Feedthrough	`Yes`[a]
Multidimensional Signals	`Yes`[a]
Variable-Size Signals	`Yes`[a]
Zero-Crossing Detection	`Yes`[a]

[a] Actual data type or capability support depends on block implementation.

[b] See Writing Fixed-Point S-Functions for details on using fixed-point data types in S-functions.

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

- Actual code generation support depends on block implementation.
- S-functions that call into MATLAB are not supported for code generation.

Fixed-Point Conversion

Convert floating-point algorithms to fixed point using Fixed-Point Designer™.

- Actual data type support depends on block implementation.
- See “Integrate External Code” (Fixed-Point Designer) for details on using fixed-point data types in S-functions.

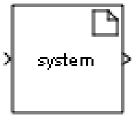
S-Function Builder

Integrate C or C++ code to create S-functions

Library: Simulink / User-Defined Functions



Description

The S-function builder integrates new or existing C or C++ code and creates a C MEX S-function from specifications you provide. See “Build S-Functions Automatically” for detailed instructions on using the S-Function Builder block to generate an S-function.

Instances of the S-Function Builder block also serve as wrappers for generated S-functions in Simulink models. When simulating a model containing instances of an S-Function Builder block, Simulink software invokes the generated S-function in order to call your C or C++ code in the instance's `mdlStart`, `mdlOutputs`, `mdlDerivatives`, `mdlUpdate` and `mdlTerminate` methods. To learn how Simulink engine interacts with S-functions, see “Simulink Engine Interaction with C S-Functions”.

Note The S-Function Builder block does not support masking. However, you can mask a Subsystem block that contains an S-Function Builder block. For more information, see “Dynamic Masked Subsystem”.

Ports

Input

In — Input to an S-function builder

scalar | vector | matrix

The S-Function Builder can accept and complex, 1-D, or 2-D signals and nonvirtual buses. For each of these cases, the signals must have a data type that Simulink supports.

For more information, see “Data Types Supported by Simulink” in the Simulink documentation.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Output

`Out` — Output from an S-function builder
scalar | vector | matrix

The S-Function Builder can output complex, 1-D, or 2-D signals and nonvirtual buses. For each of these cases, the signals must have a data type that Simulink supports.

For more information, see “Data Types Supported by Simulink” in the Simulink documentation.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Parameters

See “S-Function Builder Dialog Box” in the online documentation for information on using the S-Function Builder block's parameter dialog box.

Block Characteristics

Data Types	`double` | `single` | `Boolean` | `base integer` | `fixed point`
Direct Feedthrough	`No`
Multidimensional Signals	`Yes`

Variable-Size Signals	`No`
Zero-Crossing Detection	`No`

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

S-functions that call into MATLAB are not supported for code generation.

Fixed-Point Conversion

Convert floating-point algorithms to fixed point using Fixed-Point Designer™.

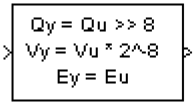
Shift Arithmetic

Shift bits or binary point of signal



Library

Logic and Bit Operations

Description

Supported Shift Operations

The Shift Arithmetic block can shift the bits or the binary point of an input signal, or both.

For example, shifting the binary point on an input of data type `sfix(8)`, by two places to the right and left, gives these decimal values.

Shift Operation	Binary Value	Decimal Value
No shift (original number)	11001.011	–6.625
Binary point shift right by two places	1100101.1	–26.5
Binary point shift left by two places	110.01011	–1.65625

This block performs arithmetic bit shifts on signed numbers. Therefore, the block recycles the most significant bit for each bit shift. Shifting the bits on an input of data type `sfix(8)`, by two places to the right and left, gives these decimal values.

Shift Operation	Binary Value	Decimal Value
No shift (original number)	11001.011	–6.625
Bit shift right by two places	11110.010	–1.75

Shift Operation	Binary Value	Decimal Value
Bit shift left by two places	00101.100	5.5

Data Type Support

The block supports input signals of the following data types:

Input Signal	Supported Data Types
`u`	• Floating point • Built-in integer • Fixed point
`s`	• Floating point • Built-in integer • Fixed-point integer

The following rules determine the output data type:

Data Type of Input u	Output Data Type
Floating point	Same as input `u`
Built-in integer or fixed point	• Sign of `u` • Word length of `u` • Slope of `u * 2^(max(binary points to shift))` • Bias of `u * 2^(max(binary points to shift – bits to shift))` , for bit shifts where the direction is bidirectional or right • Bias of `u * 2^(max(binary points to shift + bits to shift))`, for bit shifts where the direction is left

The block parameters support the following data types:

Parameter	Supported Data Types
Bits to shift: Number	• Built-in integer • Fixed-point integer
Binary points to shift	• Built-in integer • Fixed-point integer

For more information, see “Data Types Supported by Simulink” in the Simulink documentation.

Parameters

Bits to shift: Source

Specify whether to enter the bits to shift on the dialog box or to inherit the values from an input port.

Bits to shift: Direction

Specify the direction in which to shift bits: left, right, or bidirectional.

Bits to shift: Number

Specify a scalar, vector, or array of bit shift values. This parameter is available when **Bits to shift: Source** is `Dialog`.

If the direction is...	Then...
`Left` or `Right`	Use positive integers to specify bit shifts.
`Bidirectional`	Use positive integers for right shifts and negative integers for left shifts.

Binary points to shift

Specify an integer number of places to shift the binary point of the input signal. A positive value indicates a right shift, while a negative value indicates a left shift.

Diagnostic for out-of-range shift value

Specify whether to produce a warning or error during simulation when the block contains an out-of-range shift value. Options include:

- `None` — Simulink software takes no action.

- `Warning` — Simulink software displays a warning and continues the simulation.
- `Error` — Simulink software terminates the simulation and displays an error

For more information, see "Simulation and Accelerator Mode Results for Out-of-Range Bit Shift Values" on page 1-1720.

Check for out-of-range 'Bits to shift' in generated code

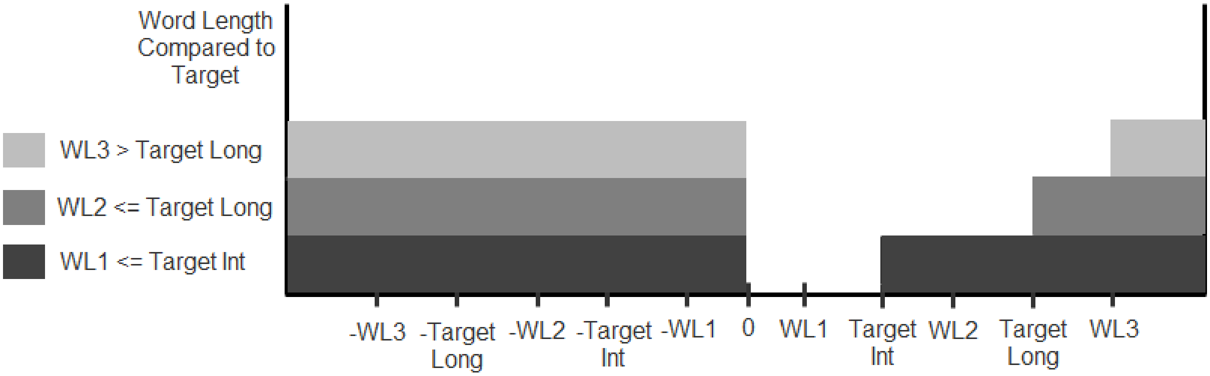
Select this check box to include conditional statements in the generated code that protect against out-of-range bit shift values. This check box is available when **Bits to shift: Source** is `Input port`.

For more information, see "Code Generation for Out-of-Range Bit Shift Values" on page 1-1722.

Out-of-Range Bit Shifts

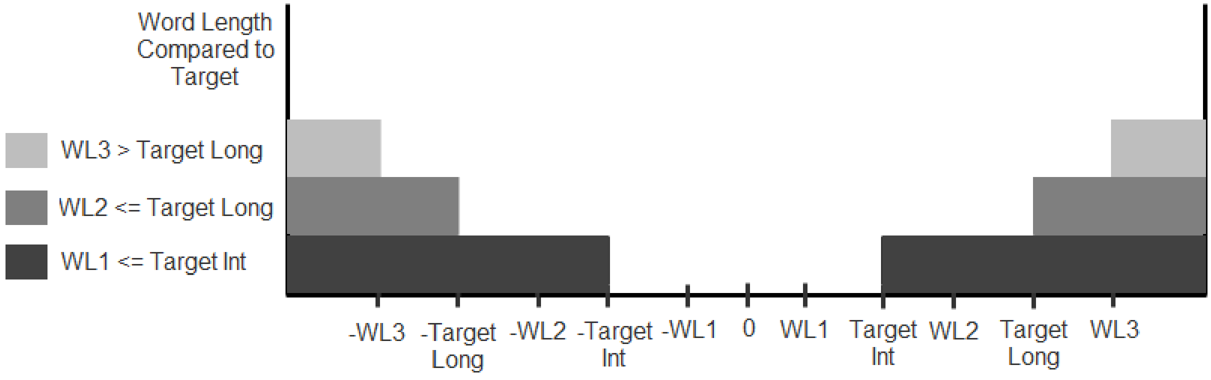
Definition of an Out-of-Range Bit Shift

Suppose that `WL` is the input word length. The shaded regions in the following diagram show out-of-range bit shift values for left and right shifts.



Out-of-Range Bit Shift Values for Left and Right Shifts

Similarly, the shaded regions in the following diagram show out-of-range bit shift values for bidirectional shifts.



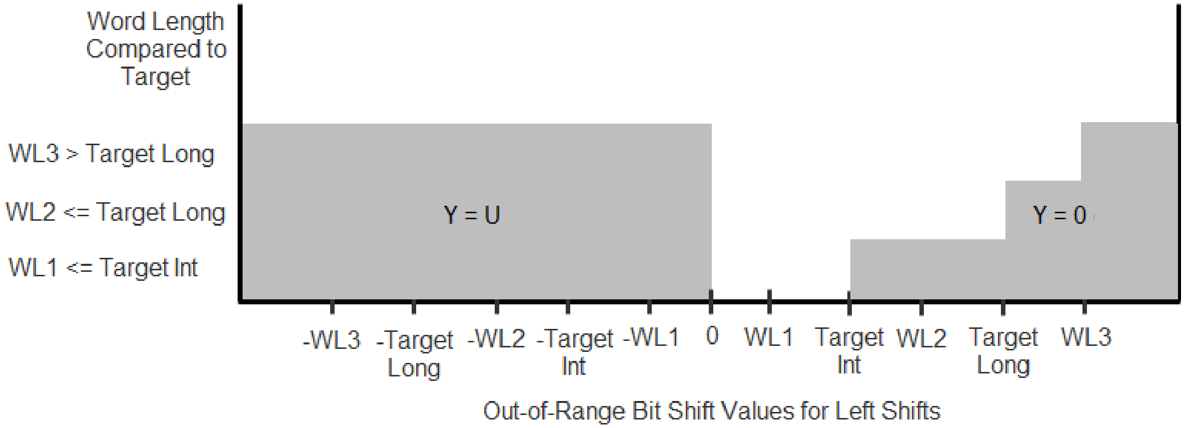
Out-of-Range Bit Shift Values for Bidirectional Shifts

The diagnostic for out-of-range bit shifts responds as follows, depending on the mode of operation:

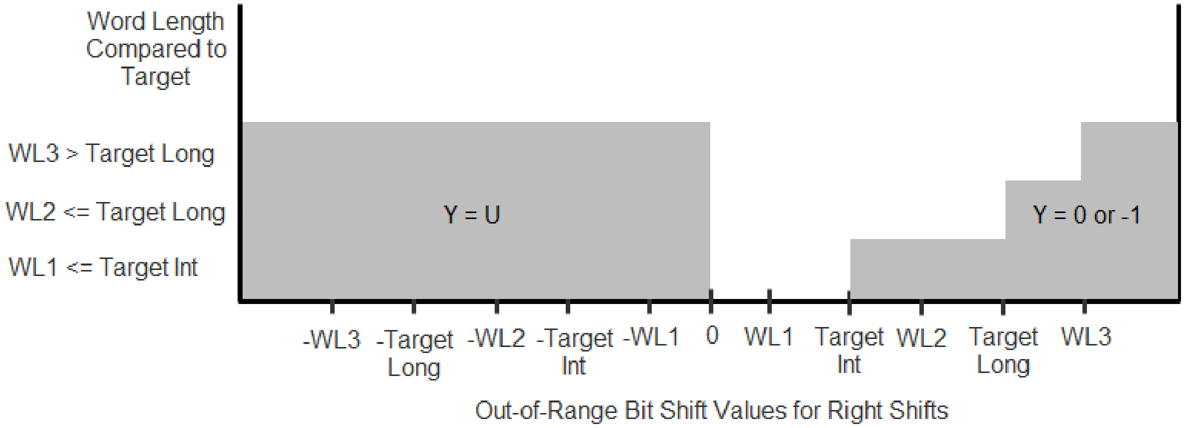
Mode	Diagnostic for out-of-range shift value		
	None	Warning	Error
Simulation	Do not report any warning or error.	Report a warning but continue simulation.	Report an error and stop simulation.
Accelerator modes and code generation	Has no effect.		

Simulation and Accelerator Mode Results for Out-of-Range Bit Shift Values

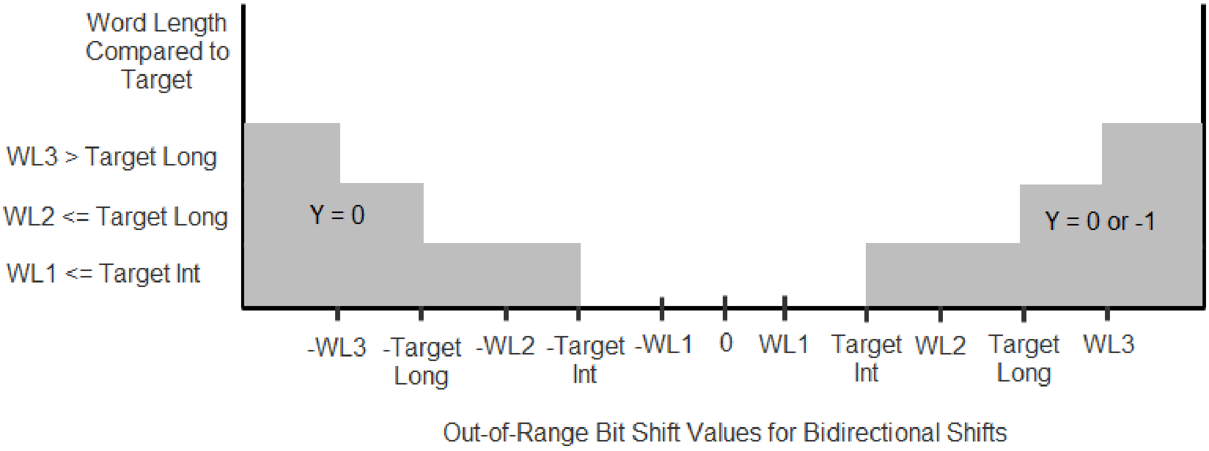
Suppose that `U` is the input, `WL` is the input word length, and `Y` is the output. The output for an out-of-range bit shift value for left shifts is as follows:



Similarly, the output for an out-of-range bit shift value for right shifts is as follows:



For bidirectional shifts, the output for an out-of-range bit shift value is as follows:



Code Generation for Out-of-Range Bit Shift Values

For the generated code, the method for handling out-of-range bit shifts depends on the setting of **Check for out-of-range 'Bits to shift' in generated code**.

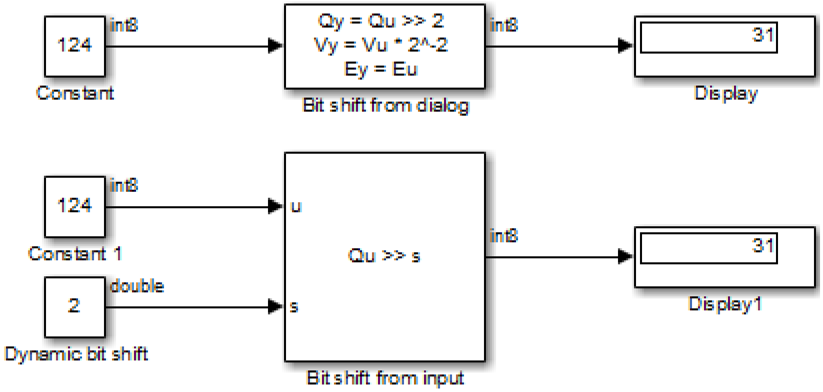
Check Box Setting	Generated Code	Simulation Results Compared to Generated Code
Selected	Includes conditional statements to protect against out-of-range bit shift values.	Simulation and Accelerator mode results match those of code generation.
Cleared	Does not protect against out-of-range bit shift values.	• For in-range values, simulation and Accelerator mode results match those of code generation. • For out-of-range values, the code generation results are compiler specific.

For right shifts on signed negative inputs, most C compilers use an arithmetic shift instead of a logical shift. Generated code for the Shift Arithmetic block depends on this compiler behavior.

Examples

Block Output for Right Bit Shifts

The following model compares the behavior of right bit shifts using the dialog box versus the block input port.



The key block parameter settings of the Constant blocks are:

Block	Parameter	Setting
`Constant` and `Constant1`	**Constant value**	`124`
	Output data type	`int8`
`Dynamic bit shift`	**Constant value**	`2`
	Output data type	`Inherit: Inherit from 'Constant value'`

The key block parameter settings of the Shift Arithmetic blocks are:

Block	Parameter	Setting
`Bit shift from dialog`	**Bits to shift: Source**	`Dialog`
	Bits to shift: Direction	`Right`
	Bits to shift: Number	`2`

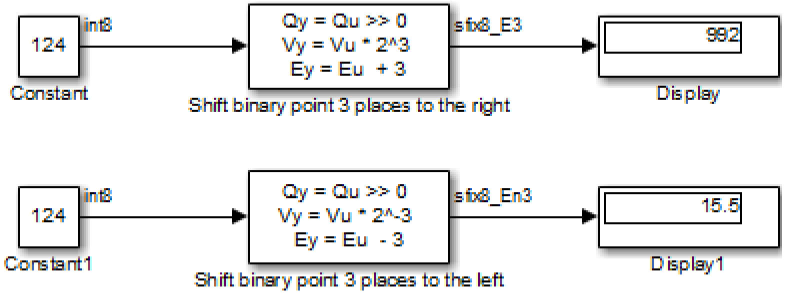
Block	Parameter	Setting
Bit shift from input	**Bits to shift: Source**	Input port
	Bits to shift: Direction	Right

The top Shift Arithmetic block takes an input of 124, which corresponds to 01111100 in binary format. Shifting the number of bits two places to the right produces 00011111 in binary format. Therefore, the block outputs 31.

The bottom Shift Arithmetic block performs the same operation as the top block. However, the bottom block receives the bit shift value through an input port instead of the dialog box. By supplying this value as an input signal, you can change the number of bits to shift during simulation.

Block Output for Binary Point Shifts

The following model shows the effect of binary point shifts.



The key block parameter settings of the Constant blocks are:

Block	Parameter	Setting
Constant and Constant1	**Constant value**	124
	Output data type	int8

The key block parameter settings of the Shift Arithmetic blocks are:

Block	Parameter	Setting
`Shift binary point 3 places to the right`	**Bits to shift: Source**	`Dialog`
	Bits to shift: Direction	`Bidirectional`
	Bits to shift: Number	`0`
	Binary points to shift: Number	`3`
`Shift binary point 3 places to the left`	**Bits to shift: Source**	`Dialog`
	Bits to shift: Direction	`Bidirectional`
	Bits to shift: Number	`0`
	Binary points to shift: Number	`-3`

The top Shift Arithmetic block takes an input of 124, which corresponds to 01111100 in binary format. Shifting the binary point three places to the right produces 01111100000 in binary format. Therefore, the top block outputs 995.

The bottom Shift Arithmetic block also takes an input of 124. Shifting the binary point three places to the left produces 01111.100 in binary format. Therefore, the bottom block outputs 15.5.

Characteristics

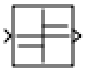
Data Types	Double | Single | Base Integer | Fixed-Point
Sample Time	Inherited from driving block
Direct Feedthrough	Yes
Multidimensional Signals	No
Variable-Size Signals	No
Zero-Crossing Detection	No
Code Generation	Yes

Introduced before R2006a

Sign

Indicate sign of input

Library: Simulink / Math Operations



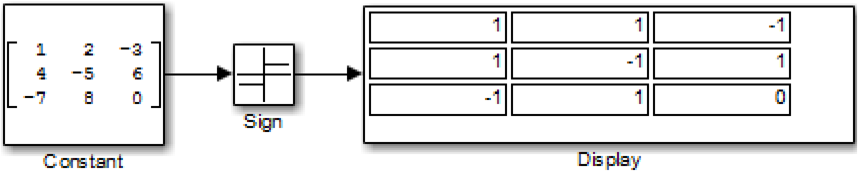
Description

Block Behavior for Real Inputs

For real inputs, the Sign block outputs the sign of the input:

Input	Output
Greater than zero	1
Equal to zero	0
Less than zero	-1

For vector and matrix inputs, the block outputs a vector or matrix where each element is the sign of the corresponding input element, as shown in this example:

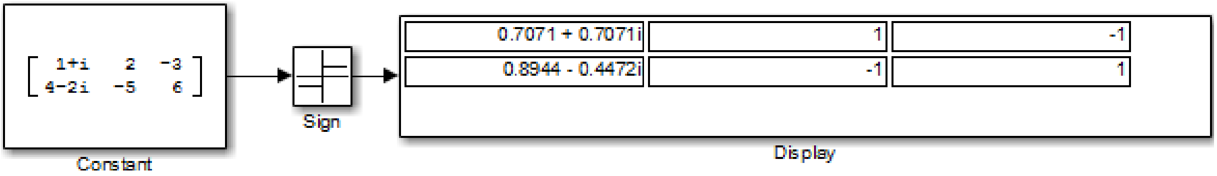


Block Behavior for Complex Inputs

When the input u is a complex scalar, the block output matches the MATLAB result for:

```
sign(u)            =            u./            abs(u)
```

When an element of a vector or matrix input is complex, the block uses the same formula that applies to scalar input, as shown in this example:



Ports

Input

`Port_1` — Input signal

scalar | vector | matrix

Input signal whose sign will determine the output.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point`

Output

`Port_1` — Output signal

scalar | vector | matrix

Output signal that is the sign of the input signal.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point`

Parameters

`Enable zero-crossing detection` — Enable zero-crossing detection

on (default) | Boolean

Select to enable zero-crossing detection. For more information, see “Zero-Crossing Detection” in the Simulink documentation.

Programmatic Use
Block Parameter: `ZeroCross`
Type: character vector, string
Values: `'off'` | `'on'`
Default: `'on'`

`Sample time` — Specify sample time as a value other than `-1`

`-1` (default) | scalar

Specify the sample time as a value other than -1. For more information, see “Specify Sample Time”.

Dependencies

This parameter is not visible unless it is explicitly set to a value other than `-1`. To learn more, see “Blocks for Which Sample Time Is Not Recommended”.

Programmatic Use
Block Parameter: `SampleTime`
Type: character vector
Values: scalar
Default: `'-1'`

Block Characteristics

Data Types	`double` | `single` | `Boolean` | `base integer` | `fixed point`
Direct Feedthrough	`No`
Multidimensional Signals	`No`
Variable-Size Signals	`No`
Zero-Crossing Detection	`Yes`

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

This block has a single, default HDL architecture.

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

Fixed-Point Conversion

Convert floating-point algorithms to fixed point using Fixed-Point Designer™.

Abs

Introduced before R2006a

Signal Builder

Create and generate interchangeable groups of signals whose waveforms are piecewise linear

Library: Simulink / Sources

Description

The Signal Builder block allows you to create interchangeable groups of piecewise linear signal sources and use them in a model. You can quickly switch the signal groups into and out of a model to facilitate testing. In the Signal Builder window, create signals and define the output waveforms.To open the window, double-click the block. See “Signal Groups”.

Note Use the `signalbuilder` function to create and access Signal Builder blocks programmatically.

Ports

Output

`Signal 1` — First output signal
scalar | vector | matrix

First output signal from the signal group currently visible in the Signal Builder window.

Data Types: `double` | `bus`

`Signal n` — nth output signal
scalar | vector | matrix

`n`th output signal from the signal group currently visible in the Signal Builder window. `n` corresponds to the signal index.

Data Types: `double` | `bus`

Block Characteristics

Data Types	`double`
Direct Feedthrough	`No`
Multidimensional Signals	`No`
Variable-Size Signals	`No`
Zero-Crossing Detection	`Yes`

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Not recommended for production code.

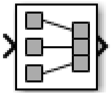
Signal Conversion

Convert signal to new type without altering signal values
Library: Simulink / Signal Attributes



Description

The Signal Conversion block converts a signal from one type to another. Use the **Output** parameter to select the type of conversion to perform.

Ports

Input

`Port_1` — Input signal to convert
scalar | vector | matrix | N-D array

Input signal to convert, specified as a scalar, vector, matrix, or N-D array.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Output

`Port_1` — Converted signal
scalar | vector | matrix | N-D array

Output signal is the input signal converted to the specified type.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Parameters

`Output` — Type of conversion

`Signal copy` (default) | `Virtual bus` | `Nonvirtual bus`

Specify the type of conversion to perform. The type of conversion that you use depends on your modeling goal.

Modeling Goal	Output Option
Reduce generated code for a muxed signal. For an example involving Simulink Coder software, see "Generate Reentrant Code from Subsystems" (Simulink Coder).	`Signal copy`
Connect a block with a constant sample time to an output port of an enabled subsystem.	`Signal copy`
Pass a bus signal, or array of buses signal, whose components have different data types to a nonvirtual Inport block in an atomic subsystem that has direct feedthrough. For more information, see "Composite Signals".	`Signal copy`
Save memory by converting a nonvirtual bus to a virtual bus.	`Virtual bus`
Pass a virtual bus signal to a modeling construct that requires a nonvirtual bus, such as a Model block.	`Nonvirtual bus`

- The `Signal copy` option is the default. The type of conversion that the Signal Conversion block performs using the `Signal copy` option depends on the type of input signal.

Type of Input Signal	Conversion That the Signal Copy Option Performs
Muxed (nonbus) signal	Converts the muxed signal, whose elements occupy discontiguous areas of memory, to a vector signal, whose elements occupy contiguous areas of memory. The conversion allocates a contiguous area of memory for the elements of the muxed signal and copies the values from the discontiguous areas (represented by the block input) to the contiguous areas (represented by the block output) at each time step.
Bus signal	Outputs a contiguous copy of the bus signal that is the input to the Signal Conversion block.

For an array of buses input signal, use the `Signal copy` option.

- The `Virtual bus` option converts a nonvirtual bus to a virtual bus.
- The `Nonvirtual bus` option converts a virtual bus to a nonvirtual bus.

Programmatic Use

Block Parameter: `ConversionOutput`
Type: character vector
Values: `'Signal copy' | 'Virtual bus' | 'Nonvirtual bus'`
Default: `'Signal copy'`

`Data type` — Nonvirtual bus data type

`Inherit: auto` (default) | `Bus: <object name>` | `<data type expression>`

Specify the output data type of the nonvirtual bus that the Signal Conversion block produces.

This option is available only when you set the **Output** parameter to `Nonvirtual bus`.

The default option is `Inherit: auto`, which uses a rule that inherits a data type.

Specify a `Simulink.Bus` object in the **Data type** parameter for one or both of the following blocks:

- Signal Conversion block
- An upstream Bus Creator block

If you specify a bus object for the Signal Conversion block, but not for its upstream Bus Creator block, then use a bus object that matches the hierarchy of the bus that upstream Bus Creator block outputs.

If you specify a bus object for both the Signal Conversion block and its upstream Bus Creator block, use the same bus object for both blocks.

Click the **Show data type assistant** button >> to display the **Data Type Assistant**, which helps you set the data type attributes. For more information, see “Specify Data Types Using Data Type Assistant”.

Dependencies

To enable this parameter, set **Output** to `Nonvirtual bus`.

Programmatic Use
Block Parameter: `OutDataTypeStr`
Type: character vector
Values: `'Inherit: auto' | 'Bus: <object name>' | '<data type expression>'`
Default: `'Inherit: auto'`

`Exclude this block from 'Block reduction' optimization` — Exclude from block reduction optimization

`off` (default) | `on`

This option is available only when you set the **Output** parameter to `Signal copy`. If the elements of the input signal occupy contiguous areas of memory, then as an optimization, Simulink software eliminates the block from the compiled model. If you select the **Exclude this block from 'Block reduction' optimization** check box, the optimization occurs the next time you compile the model. For more information, see “Block reduction”.

Programmatic Use
Block Parameter: `OverrideOpt`
Type: character vector
Values: `'off' | 'on'`
Default: `'off'`

Block Characteristics

Data Types	`double` | `single` | `Boolean` | `base integer` | `fixed point` | `enumerated` | `string`
Direct Feedthrough	`Yes`
Multidimensional Signals	`Yes`
Variable-Size Signals	`Yes`
Zero-Crossing Detection	`No`

Extended Capabilities

Introduced before R2006a

Signal Editor

Display, create, edit, and switch interchangeable scenarios

Library: Simulink / Sources

Scenario
Signal 1

Description

The Signal Editor block displays, creates, and edits interchangeable scenarios. You can also use the block to switch scenarios in and out of models.

The Signal Editor block supports MAT-files that contain one or more scalar `Simulink.SimulationData.Dataset` objects.

You can port Signal Builder block configurations to the Signal Editor block using the `signalBuilderToSignalEditor` function. Internal storage format and preprocessing of data differs between the Signal Builder and Signal Editor blocks. When using the variable step solver, this difference causes different simulation time steps and mismatched output between the two blocks. The difference between the outputs of both blocks can be minimized by reducing the value of **Max step size** of the variable step solver. Another option is to insert more data points in the input signal of Signal Editor to better represent its shape. This can be done using the Signal Editor user interface. To better match the output from both blocks, use the fixed-step solver or set the sample time for both blocks to the same discrete sample time (greater than 0). For more information on discrete sample times, see “Discrete Sample Time”.

To programmatically get the total number of scenarios and signals in the block, use the `get_param` `NumberOfScenarios` and `NumberOfSignals` properties. These properties contain these values as character vectors. To convert these values to doubles, use the `str2double` function.

Limitations

The Signal Editor block does not support:

- Function-calls
- Array of buses
- Buses while using rapid accelerator mode
- `timetable` objects
- Ground signals

The Signal Editor block supports dynamic strings. It does not support strings with maximum length. In addition, strings in the Signal Editor block cannot output:

- Non-scalar MATLAB strings.
- String data that contains missing values.
- String data that contains non-ASCII characters.

Ports

Output Arguments

`Signal1` — Signals in scenario

multidimensional

One or more signals, which can be:

- A MATLAB `timeseries` object
- A structure of MATLAB `timeseries` objects
- A two-dimensional matrix

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `string` | `fixed point` | `enumerated` | `bus`

Parameters

`File name` — Data set file

`untitled.mat` (default) | character vector

Data set file, specified as character vector, containing one or more scalar `Simulink.SimulationData.Dataset` objects. Do not use a file name from one locale in a different locale. When using the block on multiple platforms, consider specifying just the MAT-file name and having the MAT-file be on the MATLAB path.

Dependencies

- If `untitled.mat` does not exist in the current folder, these parameters are disabled:
  - **Active scenario**
  - **Signals**
  - **Output a bus signal**
  - **Unit**
  - **Sample time**
  - **Interpolate data**
  - **Enable zero-crossing detection**
  - **Form output after final data value by**
- To create a MAT-file, click . This button starts the Signal Editor user interface, which lets you create and edit scenario MAT-files.

Programmatic Use

Block Parameter: `Filename`
Type: character vector
Values: character vector
Default: `'untitled.mat'`

`Active scenario` — Active scenario

`Scenario` (default) | character vector

Active scenario, specified as a character vector. The specified MAT-file must exist.

Dependencies

- To enable this parameter, ensure that the specified MAT-file exists.
- With fast restart enabled, you can:
  - Change the active scenario
  - Change the active signal
  - Start the Signal Editor user interface and edit data

While you can change the active signal, you cannot edit the signal properties in the block.

Programmatic Use
Block Parameter: `ActiveScenario`
Type: character vector | numeric
Values: character vector | index value
Default: `'Scenario'`

`To create and edit scenarios, launch Signal Editor user interface` — Start Signal Editor

button click

To start Signal Editor user interface, click .

`Active signal` — Signal to configure

`Signal 1` (default) | character vector

Signal to configure, specified as a signal name. This signal is considered the active signal. The MAT-file must exist before you can configure signals.

To enable this parameter, ensure that the specified MAT-file exists.

Tip Do not use the `set_param` function to set the active signal property Name-Value argument (`'ActiveSignal'`) in combination with another Name-Value pair argument for the Signal Editor block.

Programmatic Use
Block Parameter: `ActiveSignal`
Type: character vector | numeric
Values: character vector | index vector
Default: `'Signal 1'`

`Output a bus signal` — Configure signal as bus

off (default) | on

Configure signal as a bus:

☑ On

Configure signal as a bus.

□ Off

Do not configure signal as a bus.

The specified MAT-file must exist.

Dependencies

- Selecting **Output a bus signal** check box enables the **Select bus object** parameter.
- To enable this parameter, ensure that the specified MAT-file exists.

Programmatic Use

Block Parameter: `IsBus`
Type: character vector
Values: `'off' | 'on'`
Default: `'off'`

`Select bus object` — Bus object

`Bus: BusObject` (default) | bus object name

Select the bus object name. To edit the bus object or create a bus object using the Data Type Assistant, click **>>**. The specified MAT-file must exist.

Dependencies

To enable this parameter, ensure that the specified MAT-file exists.

Programmatic Use

Block Parameter: `OutputBusObjectStr`
Type: character vector
Values: bus object name
Default: `'Bus: BusObject'`

`Mode` — Bus object mode

`Bus Object` (default) | bus object data type

Select the bus object name. If you do not have a bus object, create one by clicking **Edit**, which starts the Bus Editor. For more information, see “Create Bus Objects with the Bus Editor”.

`Unit` — Physical unit

inherit (default) | supported physical unit

Physical unit of the signal, specified as an allowed unit. To specify a unit, begin typing in the text box. As you type, the parameter displays potential matching units. For more information, see “Unit Specification in Simulink Models”. For a list of supported units, see Allowed Unit Systems.

To constrain the unit system, click the link to the right of the parameter:

- If a Unit System Configuration block exists in the component, its dialog box opens. Use that dialog box to specify allowed and disallowed unit systems for the component.
- If a Unit System Configuration block does not exist in the component, the model Configuration Parameters dialog box displays. Use that dialog box to specify allowed and disallowed unit systems for the model.

The specified MAT-file must exist.

Dependencies

To enable this parameter, ensure that the specified MAT-file exists.

Programmatic Use

Block Parameter: `Unit`
Type: character vector
Values: `'inherit'` | supported physical unit
Default: `'inherit'`

`Sample time` — Time interval between samples

`0` (default) | `-1` | sample time in seconds

Time interval between samples, specified in seconds. The specified MAT-file must exist.

Dependencies

To enable this parameter, ensure that the specified MAT-file exists.

Programmatic Use

Block Parameter: `SampleTime`
Type: character vector
Values: `-1` | sample time in seconds
Default: `'0'`

`Interpolate data` — Linearly interpolate data

off (default) | on

Linearly interpolate data at time hits for which no corresponding workspace data exist. The specified MAT-file must exist.

The Signal Editor block linearly interpolates:

☑ On

Linearly interpolate at time hits for which no corresponding workspace data exist, select this option.

□ Off

The current output equals the output at the most recent time for which data exists.

The Signal Editor block interpolates by using the two corresponding workspace samples:

- For `double` data, linearly interpolates the value by using the two corresponding samples
- For `Boolean` data, uses `false` for the first half of the time between two time values and `true` for the second half
- For a built-in data type other than `double` or `Boolean`:
  - Upcasts the data to `double`
  - Performs linear interpolation (as described for `double` data)
  - Downcasts the interpolated value to the original data type

You cannot use linear interpolation with enumerated (`enum`) data.

The block uses the value of the last known data point as the value of time hits that occur after the last known data point.

To determine the block output after the last time hit for which data is available, combine the settings of these parameters:

- **Interpolate data**
- **Form output after final data value by**

For details, see the **Form output after final data value by** parameter.

Dependencies

To enable this parameter, ensure that the specified MAT-file exists.

Programmatic Use
Block Parameter: `Interpolate`
Type: character vector
Values: `'off' | 'on'`
Default: `'off'`

`Enable zero-crossing detection` — Detect zero-crossings

off (default) | on

If you select the **Enable zero-crossing detection** parameter, then when the input array contains multiple entries for the same time hit, Simulink detects a zero crossing. For example, suppose that the input array has this data:

```
time:     0 1 2 2 3
signal:   2 3 4 5 6
```

At time 2, there is a zero crossing from input signal discontinuity. For more information, see “Zero-Crossing Detection”.

For bus signals, Simulink detects zero crossings across all leaf bus elements.

The specified MAT-file must exist.

Dependencies

To enable this parameter, ensure that the specified MAT-file exists.

Programmatic Use
Block Parameter: `ZeroCross`
Type: character vector
Values: `'off' | 'on'`
Default: `'off'`

`Form output after final data value by` — Block output after the last time hit for which data is available

`Setting to zero` (default) | `Extrapolation` | `Holding final value`

To determine the block output after the last time hit for which workspace data is available, combine the settings of these parameters:

- **Interpolate data**
- **Form output after final data value by**

This table lists the block output, based on the values of the two options.

Setting for Form Output After Final Data Value By	Setting for Interpolate Data	Block Output After Final Data
Extrapolation	On	Extrapolated from final data value
	Off	Error
Setting to zero	On	Zero
	Off	Zero
Holding final value	On	Final value from workspace
	Off	Final value from workspace

For example, the block uses the last two known data points to extrapolate data points that occur after the last known point if you:

- Select **Interpolate data**.
- Set **Form output after final data value by** to `Extrapolation`.

The specified MAT-file must exist.

Dependencies

To enable this parameter, ensure that the specified MAT-file exists.

Programmatic Use

Block Parameter: `OutputAfterFinalValue`
Type: character vector
Values: `'Setting to zero' | 'Extrapolation' | 'Holding final value'`
Default: `'Setting to zero'`

Block Characteristics

Data Types	`double` | `single` | `Boolean` | `base integer` | `fixed point` | `enumerated` | `bus`
Direct Feedthrough	`No`

Multidimensional Signals	`Yes`
Variable-Size Signals	`No`
Zero-Crossing Detection	`Yes`

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Not recommended for production code.

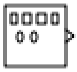
Signal Generator

Generate various waveforms
Library: Simulink / Sources



Description

Supported Operations

The Signal Generator block can produce one of four different waveforms:

- sine
- square
- sawtooth
- random

You can express signal parameters in hertz or radians per second. Using default parameter values, you get one of the following waveforms:

Waveform	Scope Output
Sine wave	 Scope File Tools View Simulation Help 1 0.5 0 -0.5 -1 0 2 4 6 8 10 Ready T=10.000

Waveform	Scope Output
Square wave	 Scope File Tools View Simulation Help 1 0.5 0 -0.5 -1 0 2 4 6 8 10 Ready T=10.000

Waveform	Scope Output
Sawtooth wave	 Scope File Tools View Simulation Help 1 0.5 0 -0.5 -1 0 2 4 6 8 10 Ready T=10.000

Waveform	Scope Output
Random wave	 Scope File Tools View Simulation Help 1 0.5 0 -0.5 -1 0 2 4 6 8 10 Ready T=10.000

A negative **Amplitude** parameter value causes a 180-degree phase shift. You can generate a phase-shifted wave at other than 180 degrees in many ways. For example, you can connect a Clock block signal to a MATLAB Function block and write the equation for the specific wave.

You can vary the output settings of the Signal Generator block while a simulation is in progress to determine quickly the response of a system to different types of inputs.

The **Amplitude** and **Frequency** parameters determine the amplitude and frequency of the output signal. The parameters must be of the same dimensions after scalar expansion. If you clear the **Interpret vector parameters as 1-D** check box, the block outputs a signal of the same dimensions as the **Amplitude** and **Frequency** parameters (after scalar expansion). If you select the **Interpret vector parameters as 1-D** check box, the block outputs a vector (1-D) signal if the **Amplitude** and **Frequency** parameters are row or column vectors, that is, single-row or column 2-D arrays. Otherwise, the block outputs a signal of the same dimensions as the parameters.

Solver Considerations

If your model uses a fixed-step solver, Simulink uses the same step size for the entire simulation. In this case, the Signal Generator block output provides a uniformly sampled representation of the ideal waveform.

If your model uses a variable-step solver, Simulink might use different step sizes during the simulation. In this case, the Signal Generator block output does not always provide a uniformly sampled representation of the ideal waveform. To ensure that the block output is a uniformly sampled representation, add a Hit Crossing block directly downstream of the Signal Generator block. These models show the difference in Signal Generator block output with and without the Hit Crossing block.

Model That Uses a Variable-Step Solver	Signal Generator Block Output
	 Scope File Tools View Simulation Help 1 0.5 0 -0.5 -1 0 2 4 6 8 Ready T=10.000

Model That Uses a Variable-Step Solver	Signal Generator Block Output
	 Scope File Tools View Simulation Help 1 0.5 0 -0.5 -1 5 0 -5 0 2 4 6 8 10 Ready T=10.000

Ports

Output

Port_1 — Generated output signal
scalar | vector | matrix

Output signal specified as one of these waveforms.

- sine
- square
- sawtooth
- random

Data Types: `double`

Parameters

`Wave form` — Wave form to generate

`sine` (default) | `square` | `sawtooth` | `random`

Specify the wave form.

Programmatic Use
Block Parameter: `WaveForm`
Type: character vector
Values: `'sine'` | `'square'` | `'sawtooth'` | `'random'`
Default: `'sine'`

`Time (t)` — Source of time variable

`Use simulation time` (default) | `Use external signal`

Specify whether to use simulation time or an external signal as the source of values for the waveform time variable. If you specify an external source, the block displays an input port for connecting the source.

Programmatic Use
Block Parameter: `TimeSource`
Type: character vector
Values: `'Use simulation time'` | `'Use external signal'`
Default: `'Use simulation time'`

`Amplitude` — Signal amplitude

`1` (default) | scalar

Specify the amplitude of the generated waveform.

Programmatic Use
Block Parameter: `Amplitude`

Type: character vector
Values: real scalar
Default: '1'

Frequency — Signal frequency

1 (default) | scalar

Specify the frequency of the generated waveform.

Programmatic Use
Block Parameter: Frequency
Type: character vector
Values: real scalar
Default: '1'

Units — Signal units

rad/sec (default) | Hertz

Specify the signal units as Hertz or rad/sec.

Programmatic Use
Block Parameter: Units
Type: character vector
Values: 'rad/sec' | 'Hertz'
Default: 'rad/sec'

Interpret vector parameters as 1-D — Treat vectors as 1-D

on (default) | off

Select this check box to output a vector of length N if the **Constant value** parameter evaluates to an N-element row or column vector.

- When you select this check box, the block outputs a vector of length N if the **Constant value** parameter evaluates to an N-element row or column vector. For example, the block outputs a matrix of dimension 1-by-N or N-by-1.
- When you clear this check box, the block does not output a vector of length N if the **Constant value** parameter evaluates to an N-element row or column vector.

Programmatic Use
Block Parameter: VectorParams1D
Type: character vector
Values: 'on' | 'off'

Default: `'on'`

Block Characteristics

Data Types	`double`
Direct Feedthrough	`Yes`
Multidimensional Signals	`Yes`
Variable-Size Signals	`No`
Zero-Crossing Detection	`No`

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Cannot be used inside a triggered subsystem hierarchy.

These blocks do not reference absolute time when configured for sample-based operation. In time-based operation, they depend on absolute time.

Signal Specification

Specify desired dimensions, sample time, data type, numeric type, and other attributes of signal

Library: Simulink / Signal Attributes

Description

The Signal Specification block allows you to specify the attributes of the signal connected to its input and output ports. If the specified attributes conflict with the attributes specified by the blocks connected to its ports, Simulink software displays an error when it compiles the model. For example, at the beginning of a simulation, if no conflict exists, Simulink eliminates the Signal Specification block from the compiled model. In other words, the Signal Specification block is a virtual block. It exists only to specify the attributes of a signal and plays no role in the simulation of the model.

You can use the Signal Specification block to ensure that the actual attributes of a signal meet desired attributes. For example, suppose that you and a colleague are working on different parts of the same model. You use Signal Specification blocks to connect your part of the model with your colleague's. If your colleague changes the attributes of a signal without informing you, the attributes entering the corresponding Signal Specification block do not match. When you try to simulate the model, you get an error.

You can also use the Signal Specification block to ensure correct propagation of signal attributes throughout a model. The capability of allowing the Simulink to propagate attributes from block to block is powerful. However, if some blocks have unspecified attributes for the signals they accept or output, the model does not have enough information to propagate attributes correctly. For these cases, the Signal Specification block is a good way of providing the information Simulink needs. Using the Signal Specification block also helps speed up model compilation when blocks are missing signal attributes.

The Signal Specification block supports signal label propagation.

Ports

Input

`Port_1` — Input signal

scalar | vector | matrix | N-D array

Input signal to check attributes of, specified as a scalar, vector, matrix, or N-D array. The block checks the attributes of the input signal against the desired attributes you specify in the block dialog box. If the attributes do not match, the block generates an error.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Output

`Port_1` — Output signal

scalar | vector | matrix | N-D array

Output signal is the input signal when all attributes of the signal match those specified in the dialog box. If the attributes do not match, the block generates an error.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Parameters

`Minimum` — Minimum value for range checking

`[]` (default) | scalar

Specify the minimum value for the block output as a finite real double scalar value.

Note If you specify a bus object as the data type for this block, do not set the minimum value for bus data on the block. Simulink ignores this setting. Instead, set the minimum values for bus elements of the bus object specified as the data type. For information on the Minimum property of a bus element, see `Simulink.BusElement`.

Simulink uses this value to perform:

- Simulation range checking (see “Signal Ranges”)
- Automatic scaling of fixed-point data types

Programmatic Use
Block Parameter: `OutMin`
Type: character vector
Values: scalar
Default: `'[ ]'`

`Maximum` — Maximum value for range checking

`[ ]` (default) | scalar

Specify the maximum value for the block output as a finite real double scalar value.

This number must be a finite real double scalar value.

Note If you specify a bus object as the data type for this block, do not set the maximum value for bus data on the block. Simulink ignores this setting. Instead, set the maximum values for bus elements of the bus object specified as the data type. For information on the Maximum property of a bus element, see `Simulink.BusElement`.

Simulink uses this value to perform:

- Simulation range checking (see “Signal Ranges”)
- Automatic scaling of fixed-point data types

Programmatic Use
Block Parameter: `OutMax`
Type: character vector
Values: scalar
Default: `'[ ]'`

`Data type` — Output data type

`Inherit: auto` (default) | `double` | `single` | `int8` | `uint8` | `int16` | `uint16` | `int32` | `uint32` | `boolean` | `fixdt(1,16)` | `fixdt(1,16,0)` | `fixdt(1,16,2^0,0)` | `Enum: <class name>` | `Bus: <object name>` | `<data type expression>`

Specify the desired output data type. If the data type of the input signal does not match the value you specify, the block generates an error.

Click the **Show data type assistant** button >> to display the **Data Type Assistant**, which helps you set the data type attributes. For more information, see “Specify Data Types Using Data Type Assistant”.

Programmatic Use

Block Parameter: `OutDataTypeStr`
Type: character vector
Value: `'Inherit: auto' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'boolean' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)' | 'Enum: <class name>' | 'Bus: <object name>' | <data type expression>`
Default: `'Inherit: auto'`

`Lock output data type setting against changes by the fixed-point tools` — Prevent fixed-point tools from overriding Output data type

`off` (default) | `on`

Select this parameter to prevent the fixed-point tools from overriding the **Output** data type you specify on the block. For more information, see “Use Lock Output Data Type Setting” (Fixed-Point Designer).

Programmatic Use

Block Parameter: `LockScale`
Type: character vector
Values: `'off' | 'on'`
Default: `'off'`

`Require nonvirtual bus` — Accept only nonvirtual bus signals

`off` (default) | `on`

If you specify a bus object as the data type, use this parameter to specify whether to accept only nonvirtual bus signals.

- `off` — Specifies that a signal must come from a *virtual* bus.
- `on` — Specifies that a signal must come from a *nonvirtual* bus.

Dependencies

To enable this parameter, set **Data type** to one of these values:

- `Bus: <object name>`

- `<data type expression>` that specifies a bus object

Programmatic Use
Block Parameter: `BusOutputAsStruct`
Type: character vector
Value: `'off'` | `'on'`
Default: `'off'`

`Unit (e.g., m, m/s^2, N*m)` — Physical unit of the input signal to the block

`inherit` (default) | `<Enter unit>`

Specify the physical unit of the input signal to the block. To specify a unit, begin typing in the text box. As you type, the parameter displays potential matching units. For a list of supported units, see Allowed Unit Systems.

To constrain the unit system, click the link to the right of the parameter:

- If a Unit System Configuration block exists in the component, its dialog box opens. Use that dialog box to specify allowed and disallowed unit systems for the component.
- If a Unit System Configuration block does not exist in the component, the model Configuration Parameters dialog box displays. Use that dialog box to specify allowed and disallowed unit systems for the model.

Programmatic Use
Block Parameter: `Unit`
Type: character vector
Values: `'inherit'` | `'<Enter unit>'`
Default: `'inherit'`

`Dimensions (-1 for inherited)` — Dimensions of input and output signals

`-1` (default) | `n` | `[m n]`

Specify the dimensions of the input and output signals.

- `-1` — Specifies that signals inherit dimensions.
- `n` — Specifies a vector of width `n`.
- `[m n]` — Specifies a matrix with `m` rows and `n` columns.

Programmatic Use
Block Parameter: `Dimensions`
Type: character vector

Values: `'-1'` | `n` | `[m n]`
Default: `'-1'`

`Variable-size signal` — Allow signal to be variable-size, fixed-size, or both

`Inherit` (default) | `No` | `Yes`

Specify the signal to be of variable-size, fixed size, or both.

- `Inherit` — Allows variable-size and fixed-size signals.
- `No` — Does not allow variable-size signals.
- `Yes` — Allows only variable-size signals.

Dependencies

When the signal is a variable-size signal, the **Dimensions** parameter specifies the maximum dimensions of the signal.

If you specify a bus object, the simulation allows variable-size signals only with a disabled bus object.

Programmatic Use

Block Parameter: `VarSizeSig`
Type: character vector
Values: `'Inherit'` | `'No'` | `'Yes'`
Default: `'Inherit'`

`Sample time (-1 for inherited)` — Time interval between samples

`-1` (default) | scalar | vector

Specify the time interval between samples. To inherit the sample time, set this parameter to `-1`. See “Specify Sample Time” for more information.

Programmatic Use

Parameter: `SampleTime`
Type: character vector
Values: Any valid sample time
Default: `'-1'`

`Signal type` — Complexity of signal

`auto` (default) | `real` | `complex`

Specify the complexity of the input and output signals.

- `auto` — Accepts either `real` or `complex` as the numeric type.
- `real` — Specifies the numeric type as a real number.
- `complex` — Specifies the numeric type as a complex number.

Programmatic Use
Parameter: `SignalType`
Type: character vector
Values: `'auto'` | `'real'` | `'complex'`
Default: `'auto'`

Block Characteristics

Data Types	`double` | `single` | `Boolean` | `base integer` | `fixed point` | `enumerated` | `bus` | `string`
Direct Feedthrough	`No`
Multidimensional Signals	`Yes`
Variable-Size Signals	`Yes`
Zero-Crossing Detection	`No`

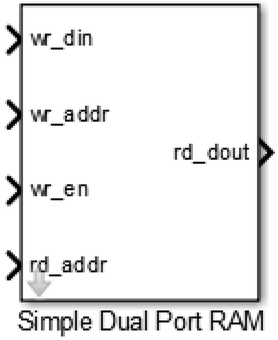
Simple Dual Port RAM

Dual port RAM with single output port



Library

HDL Coder / HDL Operations

Description

The Simple Dual Port RAM block models RAM that supports simultaneous read and write operations, and has a single output port for read data. You can use this block to generate HDL code that maps to RAM in most FPGAs.

The Simple Dual Port RAM is similar to the Dual Port RAM, but the Dual Port RAM has both a write data output port and a read data output port.

Read-During-Write Behavior

During a write operation, if a read operation occurs at the same address, old data appears at the output.

Parameters

Address port width

Address bit width. Minimum bit width is 2, and maximum bit width is 29. The default is 8.

Ports

The block has the following ports:

`wr_din`

Write data input. The data can have any width. It inherits the width and data type from the input signal.

Data type: scalar fixed point, integer, or complex

`wr_addr`

Write address.

Data type: scalar unsigned integer (`uintN`) or unsigned fixed point (`ufixN`) with a fraction length of `0`

`wr_en`

Write enable.

Data type: Boolean

`rd_addr`

Read address.

Data type: scalar unsigned integer (`uintN`) or unsigned fixed point (`ufixN`) with a fraction length of `0`

`rd_dout`

Output data from read address, `rd_addr`.

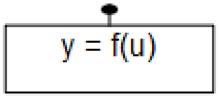
Simulink Function

Function defined with Simulink blocks
Library: Simulink / User-Defined Functions



Description

The Simulink Function block is a Subsystem block preconfigured as a starting point for graphically defining a function with Simulink blocks. The block provides a text interface to function callers. You can call a Simulink Function block from a Function Caller block, a MATLAB Function block, or a Stateflow Chart.

For a description of the block parameters, see the Subsystem block reference page in the Simulink documentation.

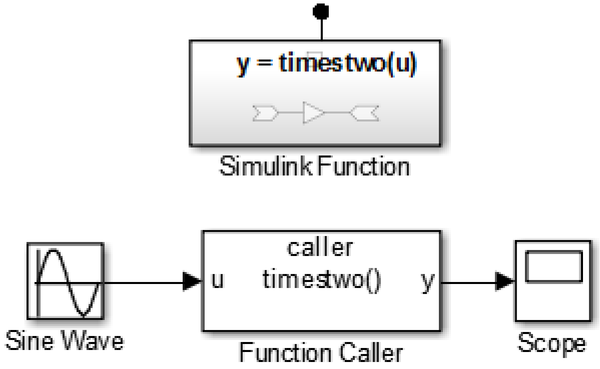
You can visualize Simulink Function calls in the Sequence Viewer. The viewer shows when calls were made with the argument and the return values. See Sequence Viewer block reference.

Function Interface

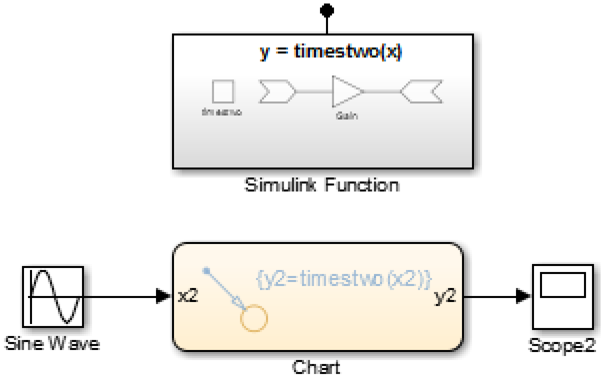
The function interface appears on the face of a Simulink Function block. Editing the block text adds and deletes Argument Inport blocks and Argument Outport blocks from the function definition. Editing also sets the **Function name** parameter in the Trigger block within the Simulink Function block.

For example, entering `y = myfunction(u)` on the face of a Simulink Function block adds one Argument Inport block (`u`) and one Argument Outport block (`y`) within the subsystem.

When calling a function using a Function Caller block, the parameter **Function prototype** in the Function Caller block must match exactly the function interface you specify on the Simulink Function block. This match includes the name of the function and the names of input and output arguments. For example, the Simulink Function block and the Function Caller block both use the argument names `u` and `y`.



When calling a function from a Stateflow transition or state label, you can use different argument names. For example, the Simulink Function block uses x and y arguments while the Stateflow transition uses x2 and y2 arguments to call the function.



Function-Call Subsystems Versus Simulink Function Blocks

In general, a Function-Call Subsystem block provides better signal traceability with direct signal connections than a Simulink Function block. While a Simulink Function block eliminates the need for routing input and output signal lines through the model hierarchy.

Attribute	Function-Call Subsystem block	Simulink Function block
Method of executing/invoking function	Triggered using a signal line	Called by reference using the function name
Formal input arguments (Argument Inport blocks) and output arguments (Argument Outport blocks)	No	Yes
Local inputs (Inport block) and outputs (Outport block)	Yes	Yes

Ports

Input

`In` — Signal input to a subsystem block

scalar | vector | matrix

Placing an Inport block in a subsystem block adds an external input port to the Simulink Function block. The port label matches the name of the Inport block.

Use Inport blocks to get signals from the local environment.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus` | `struct`

`ArgIn` — Argument input to a subsystem block

scalar | vector | matrix

An Argument Inport block in a subsystem block provides an input port corresponding to an input argument. A port is not displayed on the subsystem block.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus` | `struct`

Output

`Out` — Signal output from a subsystem

scalar | vector | matrix

Placing an Outport block in a subsystem block adds an output port from the block. The port label on the subsystem block is the name of the Outport block.

Use Outport blocks to send signals to the local environment.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus` | `struct`

`ArgOut` — Argument output from a subsystem block
scalar | vector | matrix

An Argument Outport block in a subsystem block provides an output port corresponding to an out put argument. A port is not displayed on the subsystem block.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus` | `struct`

Block Characteristics

Data Types	`double`[a] | `single`[a] | `Boolean`[a] | `base integer`[a] | `fixed point`[a] | `enumerated`[a] | `bus`[a] | `string`[a]
Direct Feedthrough	`No`
Multidimensional Signals	`Yes`[a]
Variable-Size Signals	`No`
Zero-Crossing Detection	`No`

[a] Actual data type or capability support depends on block implementation.

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Actual code generation support depends on block implementation.

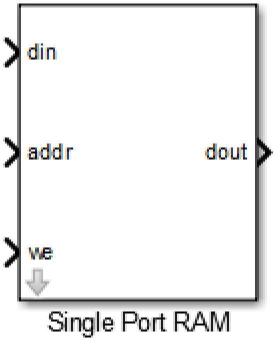
Single Port RAM

Single port RAM



Library

HDL Coder / HDL Operations

Description

The Single Port RAM block models RAM that supports sequential read and write operations.

If you want to model RAM that supports simultaneous read and write operations, use the Dual Port RAM or Simple Dual Port RAM.

Parameters

Address port width

Address bit width. Minimum bit width is 2, and maximum bit width is 29. The default is 8.

Output data during write

Controls the output data, `dout`, during a write access.

- `New data` (default): During a write, new data appears at the output port, `dout`.
- `Old data`: During a write, old data appears at the output port, dout.

Ports

The block has the following ports:

`din`

Data input. The data can have any width. It inherits the width and data type from the input signal.

Data type: scalar fixed point, integer, or complex

`addr`

Write address.

Data type: scalar unsigned integer (`uintN`) or unsigned fixed point (`ufixN`) with a fraction length of `0`

`we`

Write enable.

Data type: Boolean

`dout`

Output data from address, `addr`.

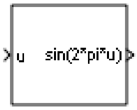
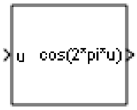
Sine, Cosine

Implement fixed-point sine or cosine wave using lookup table approach that exploits quarter wave symmetry

Library: Simulink / Lookup Tables





Description

The Sine and Cosine block implements a sine and/or cosine wave in fixed point using a lookup table method that exploits quarter wave symmetry. The block can output the following functions of the input signal, depending upon what you select for the **Output formula** parameter:

- sin(2π*u*)
- cos(2π*u*)
- exp(*j*2π*u*)
- sin(2π*u*) and cos(2π*u*)

You define the number of lookup table points in the **Number of data points for lookup table** parameter. The block implementation is most efficient when you specify the lookup table data points to be `(2^n)+1`, where *n* is an integer.

Use the **Output word length** parameter to specify the word length of the fixed-point output data type. The fraction length of the output is the output word length minus 2.

Tip To simulate a model containing this block without a Fixed-Point Designer license, you must use data type override. For more information, see “Share Fixed-Point Models”.

Ports

Input

u — Input signal to implement as fixed-point sine or cosine wave

real-valued signal

Input signal, u, specified as a real-valued scalar, vector, matrix, or array.

Tip To obtain meaningful block output, the block input values should fall within the range [0, 1). For input values that fall outside this range, the values are cast to an unsigned data type, where overflows wrap. For these out-of-range inputs, the block output might not be meaningful.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point`

Output

`sin(2*pi*u)` — Fixed-point sine wave

real-valued fixed-point signal

Fixed-point sine wave, implemented using a lookup table approach.

Dependencies

This port is enabled when the **Output formula** is set to `sin(2*pi*u)` or `sin(2*pi*u) and cos(2*pi*u)`.

Data Types: `fixed point`

`cos(2*pi*u)` — Fixed-point cosine wave

real-valued fixed-point signal

Fixed-point cosine wave, implemented using a lookup table approach.

Dependencies

This port is enabled when the **Output formula** is set to cos(2*pi*u) or sin(2*pi*u) and cos(2*pi*u).

Data Types: fixed point

exp(j*2*pi*u) — exp(j*2*pi*u)

complex-valued fixed-point signal

exp(j*2*pi*u), implemented using a lookup table approach.

Dependencies

This port is enabled when the **Output formula** is set to exp(j*2*pi*u).

Data Types: fixed point

Parameters

Output formula — Select the signal(s) to output

cos(2*pi*u) | sin(2*pi*u) | exp(j*2*pi*u) | sin(2*pi*u) and cos(2*pi*u)

Programmatic Use
Block Parameter: Formula
Values: 'sin(2*pi*u)' | 'cos(2*pi*u)' | 'exp(j*2*pi*u)' | 'sin(2*pi*u) and cos(2*pi*u)'

Number of data points for lookup table — Specify the number of data points to retrieve from the lookup table

(2^5)+1 (default) | integer, greater than or equal to 2

The implementation is most efficient when you specify the lookup table data points to be (2^*n*)+1, where *n* is an integer. To be compatible with the **Output word length** parameter, the **Number of data points for lookup table** must be less than or equal to (2^(**Output word length**-2)+1).

Programmatic Use
Block Parameter: NumDataPoints
Type: scalar
Value: integer >= 2
Default: '(2^5)+1'

`Output word length` — Specify the word length for the fixed-point data type of the output signal

`16` (default) | integer from 2 to 53

The fraction length of the output is the output word length minus 2. To be compatible with the **Number of data points for lookup table** parameter, (2^(**Output word length** - 2) +1) must be greater than or equal to **Number of data points for lookup table**.

Note The block uses double-precision floating-point values to construct lookup tables. Therefore, the maximum amount of precision you can achieve in your output is 53 bits. Setting the word length to values greater than 53 bits does not improve the precision of your output.

Programmatic Use
Block Parameter: `OutputWordLength`
Type: scalar
Value: `integer from 2 to 53`
Default: `'16'`

`Internal rule priority for lookup table` — Specify the internal rule for intermediate calculations

`Speed` (default) | `Precision`

Select `Speed` for faster calculations. If you do, a loss of accuracy might occur, usually up to 2 bits.

Programmatic Use
Block Parameter: `InternalRulePriority`
Values: `'Speed' | 'Precision'`
Default: `'Speed'`

Block Characteristics

Data Types	`double` | `single` | `Boolean` | `base integer` | `fixed point`
Direct Feedthrough	`No`

Multidimensional Signals	No
Variable-Size Signals	No
Zero-Crossing Detection	No

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

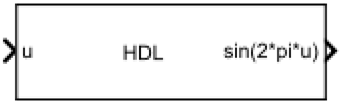
“About Lookup Table Blocks”

Introduced before R2006a

Sine HDL Optimized

Implement fixed-point sine wave by using lookup table approach that exploits quarter wave symmetry



Sine
HDL Optimized

Library

HDL Coder / Lookup Tables

Description

The Sine HDL Optimized block implements a fixed-point sine wave by using a lookup table method that exploits quarter-wave symmetry.

You define the number of lookup table points in the **Number of data points** parameter. The block implementation is most efficient for HDL code generation when you specify the lookup table data points to be `(2^n)`, where *n* is an integer. For information about the behavior of this block in HDL Coder, see Sine HDL Optimized.

Depending on your selection of the **Output formula** parameter, the blocks can output these functions of the input signal:

- sin(2π*u*)
- cos(2π*u*)
- exp(*i*2π*u*)
- sin(2π*u*) and cos(2π*u*)

Use the **Table data type** parameter to specify the word length of the fixed-point output data type. The fraction length of the output is the output word length minus 2.

Data Type Support

The Sine HDL Optimized block accepts signals of these data types:

- Floating point
- Built-in integer
- Fixed point
- Boolean

The output of the block is a fixed-point data type.

For more information, see “Data Types Supported by Simulink” in the Simulink documentation.

Parameters

Output formula

Select the signal(s) to output.

Number of data points

Specify the number of data points to retrieve from the lookup table. The implementation is most efficient when you specify the lookup table data points to be `(2^`*`n`*`)`, where *n* is an integer.

Table data type

Specify the table data type. You can specify an expression that evaluates to a data type, for example, `fixdt(1,16,0)`.

Click the **Show data type assistant** button >> to display the **Data Type Assistant**, which helps you set the table data type.

Show data type assistant

Display the **Data Type Assistant**. In the **Data Type Assistant**, you can select the mode to specify the data type.

Mode

Select the mode of data type specification. If you select `Expression`, enter an expression that evaluates to a data type, for example, `fixdt(1,16,0)`.

If you select `Fixed point`, you can use the options in the **Data Type Assistant** to specify the fixed-point data type. In the `Fixed point` mode, you can choose binary point scaling, and specify the signedness, word length, fraction length, and the data type override setting.

Characteristics

Data Types	Double | Single | Boolean | Base Integer | Fixed-Point
Sample Time	Inherited from driving block
Direct Feedthrough	Yes
Multidimensional Signals	No
Variable-Size Signals	No
Zero-Crossing Detection	No
Code Generation	Yes

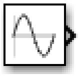
Introduced in R2016b

Sine Wave

Generate sine wave, using simulation time as time source

Library: Simulink / Sources



Description

The Sine Wave block outputs a sinusoidal waveform. The block can operate in time-based or sample-based mode.

Note This block is the same as the Sine Wave Function block that appears in the Math Operations library. If you select `Use external signal` for the **Time** parameter in the block dialog box, you get the Sine Wave Function block.

Time-Based Mode

The block calculates the output waveform.

$$y = amplitude \times \sin(frequency \times time + phase) + bias.$$

In time-based mode, the value of the **Sample time** parameter determines whether the block operates in continuous mode or discrete mode.

- `0` (the default) causes the block to operate in continuous mode.
- `>0` causes the block to operate in discrete mode.

For more information, see “Specify Sample Time”.

When operating in continuous mode, the Sine Wave block can become inaccurate due to loss of precision as time becomes very large.

A **Sample time** parameter value greater than zero causes the block to behave as if it were driving a Zero-Order Hold block whose sample time is set to that value.

This way, you can build models with sine wave sources that are purely discrete, rather than models that are hybrid continuous/discrete systems. Hybrid systems are inherently more complex and as a result take more time to simulate.

In discrete mode, this block uses a differential incremental algorithm instead of one based on absolute time. As a result, the block can be useful in models intended to run for an indefinite length of time, such as in vibration or fatigue testing.

The differential incremental algorithm computes the sine based on the value computed at the previous sample time. This method uses the following trigonometric identities:

$$\sin(t+\Delta t)=\sin(t)\cos(\Delta t)+\sin(\Delta t)\cos(t)$$
$$\cos(t+\Delta t)=\cos(t)\cos(\Delta t)-\sin(t)\sin(\Delta t)$$

In matrix form, these identities are:

$$\begin{bmatrix}\sin(t+\Delta t)\\ \cos(t+\Delta t)\end{bmatrix}=\begin{bmatrix}\cos(\Delta t) & \sin(\Delta t)\\ -\sin(\Delta t) & \cos(\Delta t)\end{bmatrix}\begin{bmatrix}\sin(t)\\ \cos(t)\end{bmatrix}$$

Because Δt is constant, the following expression is a constant:

$$\begin{bmatrix}\cos(\Delta t) & \sin(\Delta t)\\ -\sin(\Delta t) & \cos(\Delta t)\end{bmatrix}$$

Therefore, the problem becomes one of a matrix multiplication of the value of $\sin(t)$ by a constant matrix to obtain $\sin(t+\Delta t)$.

Discrete mode reduces but does not eliminate the accumulation of round-off errors, for example, `(4*eps)`. This accumulation can happen because computation of the block output at each time step depends on the value of the output at the previous time step.

To handle round-off errors when the Sine Wave block operates in time-based discrete mode, use one of these methods.

Method	Rationale
Insert a Saturation block directly downstream of the Sine Wave block.	By setting saturation limits on the Sine Wave block output, you can remove overshoot due to accumulation of round-off errors.
Set up the Sine Wave block to use the `sin()` math library function to calculate block output. **1** On the Sine Wave block dialog box, set **Time** to `Use external signal` so that an input port appears on the block icon. **2** Connect a clock signal to this input port using a Digital Clock block. **3** Set the sample time of the clock signal to the sample time of the Sine Wave block.	The `sin()` math library function computes block output at each time step *independently* of output values from other time steps, preventing the accumulation of round-off errors.

Sample-Based Mode

Sample-based mode uses this formula to compute the output of the Sine Wave block.

$$y = A\sin(2\pi(k+o)/p)+b$$

- A is the amplitude of the sine wave.
- p is the number of time samples per sine wave period.
- k is a repeating integer value that ranges from 0 to p–1.
- o is the offset (phase shift) of the signal.
- b is the signal bias.

In this mode, Simulink sets k equal to `0` at the first time step and computes the block output, using the formula. At the next time step, Simulink increments k and recomputes the output of the block. When k reaches p, Simulink resets k to `0` before computing the block output. This process continues until the end of the simulation.

The sample-based method of computing block output at a given time step does not depend on the output of the previous time steps. Therefore, this mode avoids the accumulation of round-off errors. Sample-based mode supports reset semantics in subsystems that offer it. For example, if a Sine Wave block is in a resettable subsystem that receives a reset trigger, the repeating integer `k` resets and the block output resets to its initial condition.

Ports

Output

`Port_1` — Sine wave output signal

scalar | vector

Output sine wave signal created based on the block parameter values.

Data Types: `double`

Parameters

`Sine type` — Type of sine wave

`Time based` (default) | `Sample based`

Specify the type of sine wave that this block generates. Some parameters in the dialog box appear depending on whether you select time-based or sample-based.

Programmatic Use
Block Parameter: `SineType`
Type: character vector
Values: `'Time based'` | `'Sample based'`
Default: `'Time based'`

`Time (t)` — Source of time variable

`Use simulation time` (default) | `Use external signal`

Specify whether to use simulation time as the source of values for the time variable, or an external source. If you specify an external time source, the block creates an input port for the time source. When you select an external time source, the block is the same as the Sine Wave Function block.

Programmatic Use

Block Parameter: `TimeSource`
Type: character vector
Values: `'Use simulation time'` | `'Use external signal'`
Default: `'Use simulation time'`

`Amplitude` — Amplitude of the sine wave

`1` (default) | scalar

Specify the amplitude of the output sine wave signal.

Programmatic Use

Block Parameter: `Amplitude`
Type: character vector
Value: scalar
Default: `'1'`

`Bias` — Constant added to sine wave

`0` (default) | scalar

Specify the constant value added to the sine to produce the output.

Programmatic Use

Block Parameter: `Bias`
Type: character vector
Value: scalar
Default: `'0'`

`Frequency (rad/sec)` — Frequency of sine wave

`1` (default) | scalar

Specify the frequency, in rad/sec.

Dependencies

To enable this parameter, set **Sine type** to `Time based`.

Programmatic Use

Block Parameter: `Frequence`
Type: character vector
Value: scalar
Default: `'1'`

`Phase (rad)` — Phase shift of sine wave

`0` (default) | scalar

Specify the phase shift of the sine wave.

You cannot configure this parameter to appear in the generated code as a tunable global variable if you set **Time (t)** to `Use simulation time`. For example, if you set **Default parameter behavior** to `Tunable` or apply a storage class to a `Simulink.Parameter` object, the **Phase** parameter does not appear in the generated code as a tunable global variable.

To generate code so that you can tune the phase during execution, set **Time (t)** to `Use external signal`. You can provide your own time input signal or use a Digital Clock block to generate the time signal. For an example, see "Tune Phase Parameter of Sine Wave Block During Code Execution" (Simulink Coder).

Dependencies

To enable this parameter, set **Sine type** to `Time based`.

Programmatic Use

Block Parameter: `Phase`
Type: character vector
Value: scalar
Default: `'0'`

`Samples per period` — Samples per period

`0` (default) | `integer`

Specify the number of samples per period.

Dependencies

To enable this parameter, set **Sine type** to `Sample based`.

Programmatic Use

Block Parameter: `Samples`
Type: character vector
Value: scalar
Default: `'10'`

`Number of offset samples` — Offset in number of time samples

`0` (default) | `integer`

Specify the offset (discrete phase shift) in number of sample times.

Dependencies

To enable this parameter, set **Sine type** to `Sample based`.

Programmatic Use

Block Parameter: `Offset`
Type: character vector
Value: scalar
Default: `'0'`

`Sample time` — Sample period

`0` (default) | scalar

Specify the sample period in seconds. The default is `0`. If the sine type is sample-based, the sample time must be greater than 0. See “Specify Sample Time”.

Programmatic Use

Block Parameter: `SampleTime`
Type: character vector
Value: scalar
Default: `'0'`

`Interpret vector parameters as 1-D` — Output dimensions for one-row or one-column matrices

`off` (default) | `on`

Specify the output dimensions to be a 1-D vector signal when other parameters are one-row and one-column matrices. If you do not select this box, the block outputs a signal of the same dimensionality as the numeric parameters. See “Determining the Output Dimensions of Source Blocks” in the Simulink documentation. This parameter is not available when an external signal specifies time. In this case, if numeric parameters are column or row matrix values, the output is a 1-D vector.

Programmatic Use

Block Parameter: `VectorParams1D`
Type: character vector
Values: `'off'` | `'on'`
Default: `'on'`

Block Characteristics

Data Types	`double`
Direct Feedthrough	`Yes`
Multidimensional Signals	`No`
Variable-Size Signals	`No`
Zero-Crossing Detection	`No`

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Depends on absolute time when placed inside a triggered subsystem hierarchy. These blocks do not reference absolute time when configured for sample-based operation. In time-based operation, they depend on absolute time.

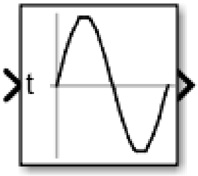
Introduced before R2006a

Sine Wave Function

Generate sine wave, using external signal as time source

Library: Simulink / Math Operations



Description

The Sine Wave Function block outputs a sinusoidal waveform. The block can operate in time-based or sample-based mode.

Note This block is the same as the Sine Wave block that appears in the Math Operations library. If you select `Use simulation time` for the **Time** parameter in the block dialog box, you get the Sine Wave Function block.

Time-Based Mode

The block calculates the output waveform.

$$y = amplitude \times \sin(frequency \times time + phase) + bias.$$

In time-based mode, the value of the **Sample time** parameter determines whether the block operates in continuous mode or discrete mode.

- `0` (the default) causes the block to operate in continuous mode.
- `>0` causes the block to operate in discrete mode.

For more information, see “Specify Sample Time”.

When operating in continuous mode, the Sine Wave block can become inaccurate due to loss of precision as time becomes very large.

A **Sample time** parameter value greater than zero causes the block to behave as if it were driving a Zero-Order Hold block whose sample time is set to that value.

This way, you can build models with sine wave sources that are purely discrete, rather than models that are hybrid continuous/discrete systems. Hybrid systems are inherently more complex and as a result take more time to simulate.

In discrete mode, this block uses a differential incremental algorithm instead of one based on absolute time. As a result, the block can be useful in models intended to run for an indefinite length of time, such as in vibration or fatigue testing.

The differential incremental algorithm computes the sine based on the value computed at the previous sample time. This method uses the following trigonometric identities:

$$\sin(t+\Delta t) = \sin(t)\cos(\Delta t) + \sin(\Delta t)\cos(t)$$
$$\cos(t+\Delta t) = \cos(t)\cos(\Delta t) - \sin(t)\sin(\Delta t)$$

In matrix form, these identities are:

$$\begin{bmatrix} \sin(t+\Delta t) \\ \cos(t+\Delta t) \end{bmatrix} = \begin{bmatrix} \cos(\Delta t) & \sin(\Delta t) \\ -\sin(\Delta t) & \cos(\Delta t) \end{bmatrix} \begin{bmatrix} \sin(t) \\ \cos(t) \end{bmatrix}$$

Because Δt is constant, the following expression is a constant:

$$\begin{bmatrix} \cos(\Delta t) & \sin(\Delta t) \\ -\sin(\Delta t) & \cos(\Delta t) \end{bmatrix}$$

Therefore, the problem becomes one of a matrix multiplication of the value of $\sin(t)$ by a constant matrix to obtain $\sin(t+\Delta t)$.

Discrete mode reduces but does not eliminate the accumulation of round-off errors, for example, `(4*eps)`. This accumulation can happen because computation of the block output at each time step depends on the value of the output at the previous time step.

To handle round-off errors when the Sine Wave block operates in time-based discrete mode, use one of these methods.

Method	Rationale
Insert a Saturation block directly downstream of the Sine Wave block.	By setting saturation limits on the Sine Wave block output, you can remove overshoot due to accumulation of round-off errors.
Set up the Sine Wave block to use the `sin()` math library function to calculate block output. **1** On the Sine Wave block dialog box, set **Time** to `Use external signal` so that an input port appears on the block icon. **2** Connect a clock signal to this input port using a Digital Clock block. **3** Set the sample time of the clock signal to the sample time of the Sine Wave block.	The `sin()` math library function computes block output at each time step *independently* of output values from other time steps, preventing the accumulation of round-off errors.

Sample-Based Mode

Sample-based mode uses this formula to compute the output of the Sine Wave block.

$$y = A\sin(2\pi(k+o)/p)+b$$

- A is the amplitude of the sine wave.
- p is the number of time samples per sine wave period.
- k is a repeating integer value that ranges from 0 to p–1.
- o is the offset (phase shift) of the signal.
- b is the signal bias.

In this mode, Simulink sets k equal to `0` at the first time step and computes the block output, using the formula. At the next time step, Simulink increments k and recomputes the output of the block. When k reaches p, Simulink resets k to `0` before computing the block output. This process continues until the end of the simulation.

The sample-based method of computing block output at a given time step does not depend on the output of the previous time steps. Therefore, this mode avoids the accumulation of round-off errors. Sample-based mode supports reset semantics in subsystems that offer it. For example, if a Sine Wave block is in a resettable subsystem that receives a reset trigger, the repeating integer `k` resets and the block output resets to its initial condition.

Ports

Input

`Port_1` — Time source signal

scalar

Input signal representing the time source in the sine wave calculation.

Data Types: `double`

Output

`Output 1` — Output sine wave signal

scalar

Output signal that is the created sine wave.

Data Types: `double`

Parameters

`Sine type` — Type of sine wave

`Time based` (default) | `Sample based`

Specify the type of sine wave that this block generates. Some parameters in the dialog box appear depending on whether you select time-based or sample-based.

Programmatic Use
Block Parameter: `SineType`
Type: character vector
Values: `'Time based'` | `'Sample based'`
Default: `'Time based'`

`Time (t)` — Source of time variable

`Use external signal` (default) | `Use simulation time`

Specify whether to use simulation time as the source of values for the time variable, or an external source. If you specify an external time source, the block creates an input port for the time source.

Programmatic Use

Block Parameter: `TimeSource`
Type: character vector
Values: `'Use simulation time'` | `'Use external signal'`
Default: `'Use external signal'`

`Amplitude` — Amplitude of the sine wave

`1` (default) | scalar

Specify the amplitude of the output sine wave signal.

Programmatic Use

Block Parameter: `Amplitude`
Type: character vector
Value: scalar
Default: `'1'`

`Bias` — Constant added to sine wave

`0` (default) | scalar

Specify the constant value added to the sine to produce the output.

Programmatic Use

Block Parameter: `Bias`
Type: character vector
Value: scalar
Default: `'0'`

`Frequency (rad/sec)` — Frequency of sine wave

`1` (default) | scalar

Specify the frequency, in radians per second.

Dependency

To enable this parameter, set **Sine type** to `Time based`.

Programmatic Use

Block Parameter: `Frequence`
Type: character vector
Value: scalar
Default: `'1'`

`Phase (rad)` — Phase shift of sine wave

`0` (default) | scalar

Specify the phase shift of the sine wave.

You cannot configure this parameter to appear in the generated code as a tunable global variable if you set **Time (t)** to `Use simulation time`. For example, if you set **Default parameter behavior** to `Tunable` or apply a storage class to a `Simulink.Parameter` object, the **Phase** parameter does not appear in the generated code as a tunable global variable.

To generate code so that you can tune the phase during execution, set **Time (t)** to `Use external signal`. You can provide your own time input signal or use a Digital Clock block to generate the time signal. For an example, see “Tune Phase Parameter of Sine Wave Block During Code Execution” (Simulink Coder).

Dependencies

To enable this parameter, set **Sine type** to `Time based`.

Programmatic Use

Block Parameter: `Phase`
Type: character vector
Value: scalar
Default: `'0'`

`Samples per period` — Samples per period

`0` (default) | `integer`

Specify the number of samples per period.

Dependencies

To enable this parameter, set **Sine type** to `Sample based`.

Programmatic Use

Block Parameter: `Samples`

Type: character vector
Value: scalar
Default: `'10'`

`Number of offset samples` — Offset in number of time samples

`0` (default) | `integer`

Specify the offset (discrete phase shift) in number of sample times.

Dependencies

To enable this parameter, set **Sine type** to `Sample based`.

Programmatic Use
Block Parameter: `Offset`
Type: character vector
Value: scalar
Default: `'0'`

`Sample time` — Sample period

`0` (default) | scalar

Specify the sample period in seconds. The default is `0`. If the sine type is sample-based, the sample time must be greater than 0. See “Specify Sample Time”.

Programmatic Use
Block Parameter: `SampleTime`
Type: character vector
Value: scalar
Default: `'0'`

`Interpret vector parameters as 1-D` — Output dimensions for one-row or one-column matrices

`off` (default) | `on`

Specify the output dimensions to be a 1-D vector signal when other parameters are one-row and one-column matrices. If you do not select this box, the block outputs a signal of the same dimensionality as the numeric parameters. See “Determining the Output Dimensions of Source Blocks” in the Simulink documentation. This parameter is not available when an external signal specifies time. In this case, if numeric parameters are column or row matrix values, the output is a 1-D vector.

Programmatic Use
Block Parameter: `VectorParams1D`
Type: character vector
Values: `'off'` | `'on'`
Default: `'on'`

Block Characteristics

Data Types	`double`
Direct Feedthrough	`Yes`
Multidimensional Signals	`No`
Variable-Size Signals	`No`
Zero-Crossing Detection	`No`

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Depends on absolute time when placed inside a triggered subsystem hierarchy. These blocks do not reference absolute time when configured for sample-based operation. In time-based operation, they depend on absolute time.

Sine Wave | Sine, Cosine

Introduced before R2006a

Slider

Tune parameter value with sliding scale

Library: Simulink / Dashboard

Description

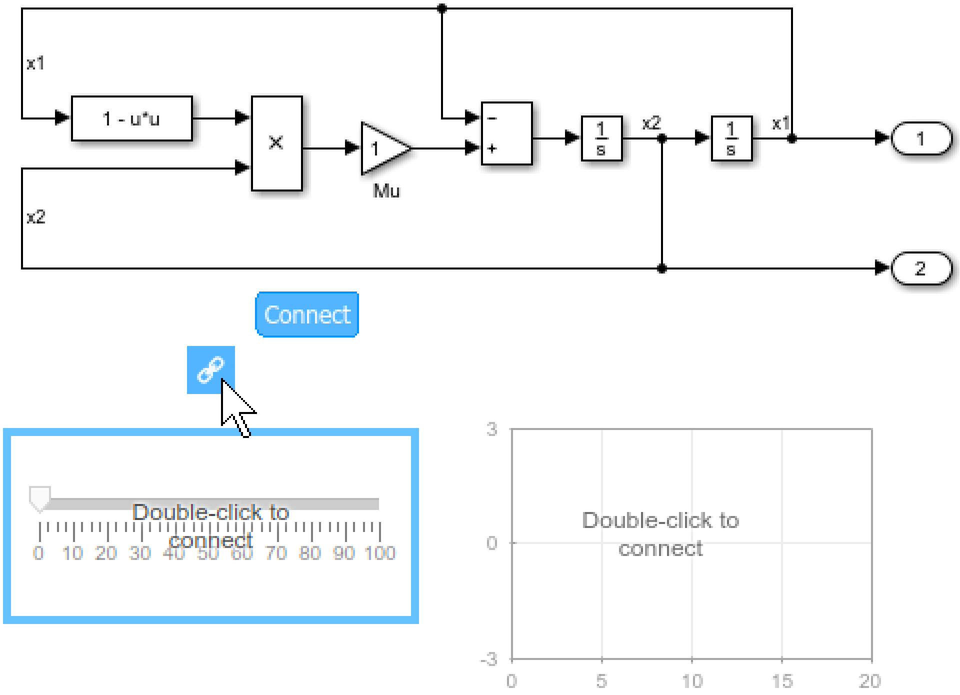
The Slider block tunes the value of the connected block parameter during simulation. For example, you can connect the Slider block to a Gain block in your model and adjust its value during simulation. You can modify the range of the Slider block's scale to fit your data. Use the Slider block with other Dashboard blocks to create an interactive dashboard to control your model.

Connecting Dashboard Blocks

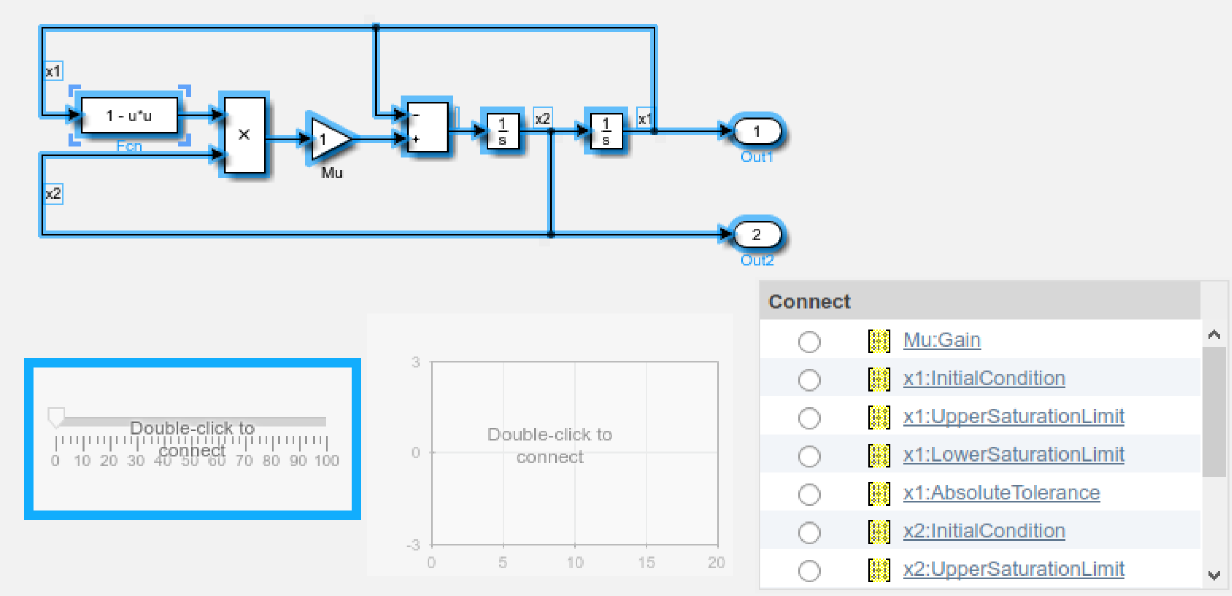
Dashboard blocks do not use ports to make connections. To connect Dashboard blocks to variables and block parameters in your model, use connect mode. Connect mode facilitates the process of connecting Dashboard blocks in your model, especially when you want to connect multiple blocks at once. If you only want to connect a single Dashboard block, you can also use the **Connection** table in the block dialog box to make the connection.

Note Dashboard blocks cannot connect to variables until you update your model diagram. To connect Dashboard blocks to variables or modify variable values between opening your model and running a simulation, update your model diagram using **Ctrl+D**.

To enter connect mode, click the **Connect** button that appears above your unconnected Dashboard block when you pause on it.



In connect mode, when you select one or more signals or blocks, a list of parameters and signals available for connection appears. Select a signal or parameter from the list to connect the selected Dashboard block. To connect another Dashboard block, pause on the block and click the **Connect** button above it. Then, make a selection of signals and blocks in your model, and choose a signal or parameter to connect.



Connect

○ Mu:Gain
○ x1:InitialCondition
○ x1:UpperSaturationLimit
○ x1:LowerSaturationLimit
○ x1:AbsoluteTolerance
○ x2:InitialCondition
○ x2:UpperSaturationLimit

When you finish connecting the Dashboard blocks in your model, click the **Exit** button in the upper-right of the canvas to exit connect mode.

Parameter Logging

Tunable parameters connected to Dashboard blocks are logged to the Simulation Data Inspector, where you can view parameter values along with logged signal data. You can access logged parameter data in the MATLAB workspace by exporting the parameter data from the Simulation Data Inspector UI or by using the `Simulink.sdi.exportRun` function. For more information about exporting data with the Simulation Data Inspector UI, see “Export Data from the Simulation Data Inspector”. The parameter data is stored in a `Simulink.SimulationData.Parameter` object, accessible as an element in the exported `Simulink.SimulationData.Dataset`.

Limitations

- Dashboard blocks can only connect to real scalar signals.
- You cannot use the **Connection** table to connect a Dashboard block to a block that is commented out. When you connect a Dashboard block to a commented block using

connect mode, the Dashboard block does not display the connected value until the you uncomment the block.

- Dashboard blocks cannot connect to signals inside referenced models.
- Parameters specified by indexing a variable array do not appear in the **Connection** table. For example, a block parameter defined as `engine(1)` using the variable `engine` does not appear in the table.

  To access the parameter in the **Connection** table, assign the indexed value to a scalar variable, such as `engine_1`. Then, use the scalar variable to define the block parameter.

Parameters

`Connection` — Select a variable or block parameter to connect

variable and parameter connection options

Select the variable or block parameter to control using the **Connection** table. Populate the **Connection** table by selecting one or more blocks in your model. Select the radio button next to the variable or parameter you want to control, and click **Apply**.

Note To see workspace variables in the connection table, update the model diagram using **Ctrl+D**.

`Scale Type` — Type of scale

'Linear' (default) | 'Log'

Type of scale displayed on the control. **Linear** specifies a linear scale, and **Log** specifies a logarithmic scale.

`Minimum` — Minimum tick mark value

0 (default) | scalar

A finite, real, double, scalar value specifying the minimum tick mark value for the arc. The minimum must be less than the value entered for the maximum.

`Maximum` — Maximum tick mark value

100 (default) | scalar

A finite, real, double, scalar value specifying the maximum tick mark value for the arc. The maximum must be greater than the value entered for the minimum.

`Tick Interval` — Interval between major tick marks

auto (default) | scalar

A finite, real, positive, integer, scalar value specifying the interval of major tick marks on the arc. When set to `auto`, the block automatically adjusts the tick interval based on the minimum and maximum values.

`Label` — Block label position

'Top' (default) | 'Bottom' | 'Hide'

Position of the block label. When the block is connected to a signal, the label is the name of the connected signal.

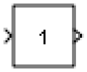
"Tune and Visualize Your Model with Dashboard Blocks"
"Decide How to Visualize Simulation Data"

Introduced in R2015b

Slider Gain

Vary scalar gain using slider
Library: Simulink / Math Operations



Description

The Slider Gain block performs a scalar gain that you can modify during simulation. Modify the gain using the slider parameter.

Ports

Input

`Port_1` — Input signal
scalar | vector | matrix

The Slider Gain block accepts real or complex-valued scalar, vector, or matrix input. The block supports fixed-point data types. If the input of the Slider Gain block is real and gain is complex, the output is complex.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated`

Output

`Port_1` — Input multiplied by gain
scalar | vector | matrix

The Slider Gain block outputs the input multiplied by a constant gain value. When the input to the block is real and gain is complex, the output is complex.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated

Parameters

Slider gain — Gain value

0 (default) | real value

Chose the gain value applied to the input.

Programmatic Use
Block Parameter: gain
Type: character vector
Values: real scalar
Default: '1'

Low — Lower limit of the slider range

0 (default) | real value

Specify the lower limit of the slider range.

Programmatic Use
Block Parameter: low
Type: character vector
Values: real scalar
Default: '0'

High — Upper limit of slider range

2 (default) | real value

Specify the upper limit of the slider range. The default is 2.

Programmatic Use
Block Parameter: high
Type: character vector
Values: real scalar
Default: '2'

Block Characteristics

Data Types	`double` | `single` | `Boolean` | `base integer` | `fixed point`
Direct Feedthrough	`No`
Multidimensional Signals	`Yes`
Variable-Size Signals	`Yes`
Zero-Crossing Detection	`No`

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

Fixed-Point Conversion

Convert floating-point algorithms to fixed point using Fixed-Point Designer™.

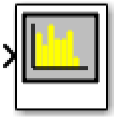
Gain

Introduced before R2006a

Spectrum Analyzer

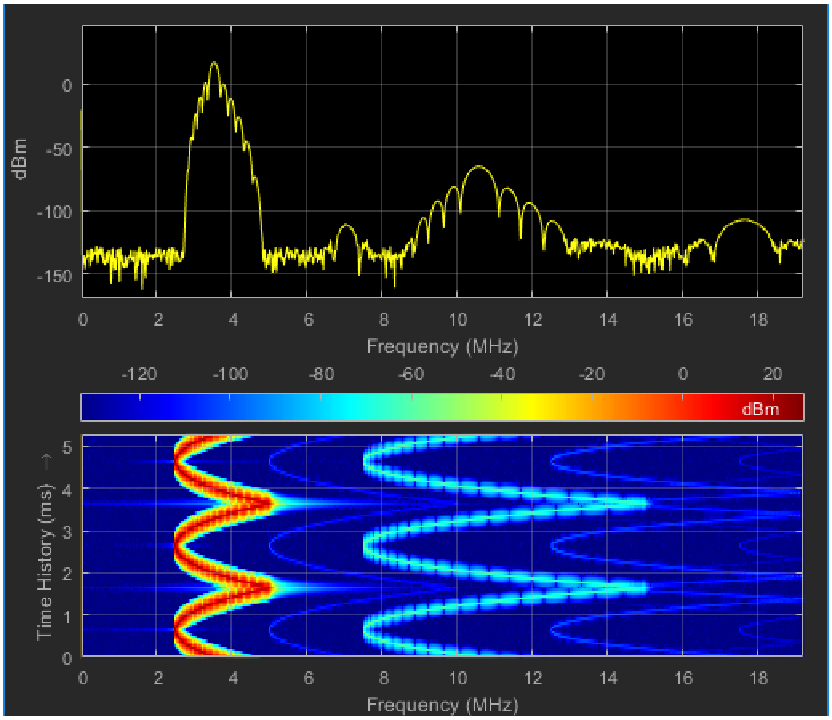
Display frequency spectrum

Library: DSP System Toolbox / Sinks



Description

The Spectrum Analyzer block, referred to here as the scope, displays the frequency spectra of signals.



You can use the Spectrum Analyzer block in models running in Normal or Accelerator simulation modes. You can also use the Spectrum Analyzer block in models running in Rapid Accelerator or External simulation modes, with some limitations.

You can use the Spectrum Analyzer block inside all subsystems and conditional subsystems. Conditional subsystems include enabled subsystems, triggered subsystems, enabled and triggered subsystems, and function-call subsystems. See “Conditionally Executed Subsystems Overview” for more information.

You can configure and display Spectrum Analyzer settings from the command line with `spbscopes.SpectrumAnalyzerConfiguration`.

For information about the Spectrum Analyzer System object, see `dsp.SpectrumAnalyzer`.

Ports

Input

`Port_1` — Signals to visualize

scalar | vector | matrix | array

Connect the signals you want to visualize. You can have up to 96 input ports. Input signals can have these characteristics:

- **Signal Domain** — Frequency or time signals
- **Type** — Discrete (sample-based and frame-based).
- **Data type** — Any data type that Simulink supports. See “Data Types Supported by Simulink”.
- **Dimension** — One dimensional (vector), two dimensional (matrix), or multidimensional (array). Input must have fixed number of channels. See “Signal Dimensions” and “Determine Output Signal Dimensions”.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fixed point`

Parameters

Spectrum Settings

The **Spectrum Settings** pane appears at the right side of the Spectrum Analyzer window. This pane controls how the spectrum is calculated. To show the Spectrum Settings, in the Spectrum Analyzer menu, select **View** > **Spectrum Settings** or use the 📊 button in the toolbar.

Main options

`Input domain` — Domain of the input signal

`Time` (default) | `Frequency`

The domain of the input signal you want to visualize. If you visualize time-domain signals, the signal is transformed to the frequency spectrum based on the algorithm specified by the Method parameter.

Programmatic Use

See InputDomain.

Type — Type of spectrum to display

`Power` (default) | `Power density` | `RMS`

`Power` — Spectrum Analyzer shows the power spectrum.

`Power density` — Spectrum Analyzer shows the power spectral density. The power spectral density is the magnitude of the spectrum normalized to a bandwidth of 1 hertz.

`RMS` — Spectrum Analyzer shows the root mean squared spectrum.

Tunable: Yes

Dependency

To use this parameter, set “Input domain” (DSP System Toolbox) to `Time`.

Programmatic Use

See SpectrumType.

View — Spectrum view

Spectrum (default) | Spectrogram | Spectrum and spectrogram

Spectrum — Spectrum Analyzer shows the spectrum.

Spectrogram — Spectrum Analyzer shows the spectrogram, which displays frequency content over time. The most recent spectrogram update is at the bottom of the display, and time scrolls from the bottom to the top of the display.

Spectrum and spectrogram — Spectrum Analyzer shows both the spectrum and spectrogram.

Tunable: Yes

Programmatic Use

See ViewType.

Sample rate — Sample rate of the input signal in hertz

Inherited (default) | positive scalar

Select Inherited to use the same sample rate as the input signal. To specify a sample rate, delete Inherited and enter a sample rate value.

Programmatic Use

See SampleRate.

Method — Spectrum estimation method

Welch (default) | Filter Bank

Select Welch or Filter Bank as the spectrum estimation method. For more details about the two spectrum estimation algorithms, see “Algorithms” (DSP System Toolbox).

Tunable: No

Dependency

To use this parameter, set “Input domain” (DSP System Toolbox) to Time.

Programmatic Use

See Method.

`Full frequency span` — Use entire Nyquist frequency interval

on (default) | off

Select this check box to compute and plot the spectrum over the entire “Nyquist frequency interval” (DSP System Toolbox).

Tunable: Yes

Dependency

To use this parameter, set “Input domain” (DSP System Toolbox) to `Time`.

Programmatic Use

See FrequencySpan.

`Span (Hz)` — Frequency span in hertz

`10e3` (default) | real positive scalar

Specify the frequency span in hertz. Use this parameter with the CF (Hz) parameter to define the frequency span around a center frequency. This parameter defines the range of values shown on the Frequency axis in the Spectrum Analyzer window.

Tunable: Yes

Dependencies

To use this parameter, you must:

- Set “Input domain” (DSP System Toolbox) to `Time`.
- Clear the “Full frequency span” (DSP System Toolbox) check box.
- Set the **Span (Hz)/Fstart (Hz)** dropdown to `Span (Hz)`.

Programmatic Use

See FrequencySpan and Span.

`CF (Hz)` — Center frequency in hertz

`0` (default) | scalar

Specify the center frequency, in hertz. Use this parameter with the “Span (Hz)” (DSP System Toolbox) parameter to define the frequency span around a center frequency. This parameter defines the value shown at the middle point of the Frequency axis on the Spectrum Analyzer window.

Tunable: Yes

Dependencies

To use this parameter, you must:

- Set “Input domain” (DSP System Toolbox) to `Time`.
- Clear the “Full frequency span” (DSP System Toolbox) check box.
- Set the **Span (Hz)/Fstart (Hz)** dropdown to “Span (Hz)” (DSP System Toolbox).

Programmatic Use

See CenterFrequency.

`FStart (Hz)` — Start frequency in hertz

`-5e3` (default) | scalar

Specify the start frequency in hertz. Use this parameter with the “FStop (Hz)” (DSP System Toolbox) parameter to define the range of frequency-axis values using start frequency and stop frequency. This parameter defines the value shown at the leftmost side of the Frequency axis on the Spectrum Analyzer window.

Tunable: Yes

Dependencies

To use this parameter, you must:

- Set “Input domain” (DSP System Toolbox) to `Time`.
- Clear the “Full frequency span” (DSP System Toolbox) check box.
- Set the **Span (Hz)/FStart (Hz)** dropdown to `FStart (Hz)`.

Programmatic Use

See StartFrequency.

`FStop (Hz)` — Stop frequency in hertz

`5e3` (default) | scalar

Specify the stop frequency, in hertz. Use this parameter with the “FStart (Hz)” (DSP System Toolbox) parameter to define the range of Frequency axis values. This parameter defines the value shown at the rightmost side of the Frequency axis on the Spectrum Analyzer window.

Tunable: Yes

Dependencies

To use this parameter, you must:

- Set “Input domain” (DSP System Toolbox) to `Time`.
- Clear the “Full frequency span” (DSP System Toolbox) check box.
- Set the **Span (Hz)/FStart (Hz)** dropdown to “FStart (Hz)” (DSP System Toolbox).

Programmatic Use

See StopFrequency.

`Frequency (Hz)` — Frequency vector

`Auto` (default) | `Input port` | monotonically increasing vector

Set the frequency vector which determines the *x*-axis of the display.

- `Auto` — The frequency vector is calculated from the length of the input. See “Frequency Vector” (DSP System Toolbox).
- `Input port` — When selected, an input port appears on the block for the frequency vector input.
- Custom vector — Enter a custom vector as the frequency vector. The length of the custom vector must be equal to the frame size of the input signal.

Tunable: No

Dependency

To use this parameter, set “Input domain” (DSP System Toolbox) to `Frequency`.

Programmatic Use

See FrequencyVector.

`RBW (Hz)` — Resolution bandwidth

`Auto` (default) | `Input port` | positive scalar

The resolution bandwidth in hertz. This parameter defines the smallest positive frequency that can be resolved. By default, this parameter is set to `Auto`. In this case, the Spectrum Analyzer determines the appropriate value to ensure that there are 1024 RBW intervals over the specified frequency span.

If you set this parameter to a numeric value, the value must allow at least two RBW intervals over the specified frequency span. In other words, the ratio of the overall frequency span to RBW must be greater than two:

$$\frac{span}{RBW} > 2$$

For frequency input only, you can use an input port to set the RBW value.

Tunable: Yes

Dependency

To use this parameter, set either:

- “Input domain” (DSP System Toolbox) to `Time` and the **RBW (Hz)/Window length/ Number of frequency bands** dropdown to `RBW (Hz)`.
- “Input domain” (DSP System Toolbox) to `Frequency`.

Programmatic Use

See RBW.

`Input units` — Units of frequency input

`Auto` (default) | `dBm` | `dBV` | `dBW` | `Vrms` | `Watts`

Select the units of the frequency-domain input. This property allows the Spectrum Analyzer to scale frequency data if you choose a different display unit with the “Units” (DSP System Toolbox) property.

Tunable: No

Dependency

This option is only available when “Input domain” (DSP System Toolbox) is set to `Frequency`.

Programmatic Use

See InputUnits.

`Window length` — Length of window in samples

`1024` (default) | integer greater than 2

The length of the window, in samples. The window length used to control the frequency resolution and compute the spectral estimates. The window length must be an integer greater than 2.

Dependencies

To use this parameter, set:

- "Method" (DSP System Toolbox) to `Welch`
- Set the **RBW (Hz)/Window length/Number of frequency bands** dropdown to `Window Length`

Dependency

To use this parameter, set "Input domain" (DSP System Toolbox) to `Time`.

Programmatic Use

See WindowLength.

`Number of frequency bands` — FFT length

`Auto` (default) | positive integer

Specify the fast Fourier transform (FFT) length to control the number of frequency bands. If the value is `Auto`, the Spectrum Analyzer uses the entire frame size to estimate the spectrum. If you specify the number of frequency bands, you set the input buffer size.

Dependencies

To use this parameter, set:

- "Method" (DSP System Toolbox) to `Filter Bank`
- Set the **RBW (Hz)/Window length/Number of frequency bands** dropdown to `Number of frequency bands`

Programmatic Use

See FFTLength

`Taps per band` — Number of filter taps

`12` (default) | positive even integer

Specify the number of filter taps or coefficients for each frequency band. This number must be a positive even integer. This value corresponds to the number of filter coefficients per polyphase branch. The total number of filter coefficients is equal to *Taps Per Band* + *FFT Length*.

Dependency

To use this parameter, you must set the **RBW (Hz)/Window length/Number of frequency bands** dropdown to “Number of frequency bands” (DSP System Toolbox).

Programmatic Use

See NumTapsPerBand.

`NFFT` — Number of FFT points

`Auto` (default) | positive integer

Specify the length of the FFT that Spectrum Analyzer uses to compute spectral estimates. Acceptable options are `Auto` or a positive integer.

The **NFFT** value must be greater than or equal to the value of the **Window length** parameter. By default, when **NFFT** is set to `Auto`, the Spectrum Analyzer sets **NFFT** equal to the value of **Window length**. When in RBW mode, the specified RBW value is used to calculate an FFT length that equals the window length.

When this parameter is set to a positive integer, this parameter is equivalent to the `n` parameter of the `fft` function.

Dependencies

To use this parameter, you must set the **RBW (Hz)/Window length/Number of frequency bands** dropdown to “Window length” (DSP System Toolbox).

Programmatic Use

See FFTLength.

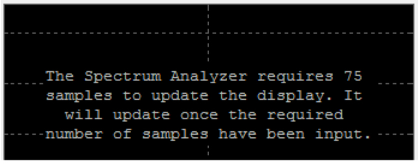
`Samples/update` — Required number of input samples

positive scalar

This property is read-only.

The number of input samples required to compute one spectral update. You cannot modify this parameter; it is shown in the spectrum analyzer for informational purposes only. This parameter is directly related to **RBW (Hz)/Window length/Number of frequency bands**. For more details, see “Algorithms” (DSP System Toolbox).

If the input does not have enough samples to achieve the resolution bandwidth that you specify, Spectrum Analyzer produces a message on the display.



The Spectrum Analyzer requires 75 samples to update the display. It will update once the required number of samples have been input.

Spectrogram Settings

`Channel` — Spectrogram channel

channel name

Select the signal channel for which the spectrogram settings apply.

Dependencies

To use this option, set “View” (DSP System Toolbox) to `Spectrogram` or `Spectrum and spectrogram`.

Programmatic Use

See SpectrogramChannel.

`Time res. (s)` — Time resolution in seconds

`Auto` (default) | positive number

Time resolution is the amount of data, in seconds, used to compute a spectrogram line. The minimum attainable resolution is the amount of time it takes to compute a single spectral estimate. The tooltip displays the minimum attainable resolution given the current settings.

The time resolution value is determined based on frequency resolution method, the RBW setting, and the time resolution setting.

Method	Frequency Resolution Method	Frequency Resolution Setting	Time Resolution Setting	Resulting Time Resolution in Seconds
Welch or Filter Bank	RBW (Hz)	Auto	Auto	1/RBW
Welch or Filter Bank	RBW (Hz)	Auto	Manually entered	Time Resolution
Welch or Filter Bank	RBW (Hz)	Manually entered	Auto	1/RBW
Welch or Filter Bank	RBW (Hz)	Manually entered	Manually entered	Must be equal to or greater than the minimum attainable time resolution, 1/RBW. Several spectral estimates are combined into one spectrogram line to obtain the desired time resolution. Interpolation is used to obtain time resolution values that are not integer multiples of 1/RBW.
Welch	Window length	—	Auto	1/RBW

Method	Frequency Resolution Method	Frequency Resolution Setting	Time Resolution Setting	Resulting Time Resolution in Seconds
Welch	Window length	—	Manually entered	Must be equal to or greater than the minimum attainable time resolution. Several spectral estimates are combined into one spectrogram line to obtain the desired time resolution. Interpolation is used to obtain time resolution values that are not integer multiples of 1/RBW.
Filter Bank	Number of frequency bands	—	Auto	1/RBW
Filter Bank	Number of frequency bands	—	Manually entered	Must be equal to or greater than the minimum attainable time resolution, 1/RBW.

Tunable: Yes

Dependency

To use this option, set “View” (DSP System Toolbox) to Spectrogram or Spectrum and spectrogram.

Programmatic Use

See TimeResolution.

Time span — Time span in seconds

Auto (default) | positive scalar

The time span over which the Spectrum Analyzer displays the spectrogram specified in seconds. The time span is the product of the desired number of spectral lines and the time resolution. The tooltip displays the minimum allowable time span, given the current settings. If the time span is set to `Auto`, 100 spectral lines are used.

Tunable: Yes

Dependency

To use this option, set "View" (DSP System Toolbox) to `Spectrogram` or `Spectrum and spectrogram`.

Programmatic Use

See TimeSpan.

Window Options

`Overlap (%)` — Segment overlap percentage

0 (default) | scalar between 0 and 100

This parameter defines the amount of overlap between the previous and current buffered data segments. The overlap creates a window segment that is used to compute a spectral estimate. The value must be greater than or equal to zero and less than 100.

Tunable: Yes

Programmatic Use

See OverlapPercent.

`Window` — Windowing method

`Hann` (default) | `Rectangular` | `Blackman-Harris` | `Chebyshev` | `Flat Top` | `Hamming` | `Kaiser` | custom window function name

The windowing method to apply to the spectrum. Windowing is used to control the effect of sidelobes in spectral estimation. The window you specify affects the window length required to achieve a resolution bandwidth and the required number of samples per update. For more information about windowing, see "Windows" (Signal Processing Toolbox).

Tunable: Yes

Programmatic Use

See Window.

Attenuation — Sidelobe attenuation

60 (default) | scalar greater than or equal to 45

The sidelobe attenuation in decibels (dB). The value must be greater than or equal to 45.

Dependency

This parameter applies only when you set the **Window** parameter to Chebyshev or Kaiser.

Programmatic Use

See SidelobeAttenuation.

NENBW — Normalized effective noise bandwidth

scalar

This property is read-only.

The normalized effective noise bandwidth of the window. You cannot modify this parameter; it is shown for informational purposes only. This parameter is a measure of the noise performance of the window. The value is the width of a rectangular filter that accumulates the same noise power with the same peak power gain.

The rectangular window has the smallest NENBW, with a value of 1. All other windows have a larger NENBW value. For example, the Hann window has an NENBW value of approximately 1.5.

Trace Options

Units — Spectrum units

dBm (default) | dBW | Watts | Vrms | dBV | dBFS

The units of the spectrum. The available values depend on the value of the “Type” (DSP System Toolbox) parameter.

Tunable: Yes

Programmatic Use

See SpectrumUnits.

`Full scale` — Full scale for dBFS units

`Auto` (default) | positive real scalar

The full scale used for the dBFS units. By default, the Spectrum Analyzer uses the entire spectrum scale. Specify a positive real scalar for the dBFS full scale.

Tunable: Yes

Dependencies

To enable this parameter, set:

- "Input domain" (DSP System Toolbox) to `Time`
- "Units" on page 1-0 to `dBFS`

Programmatic Use

See FullScale.

`Averages` — Number of spectral averages

`1` (default) | positive integer

Specify the number of spectral averages as a positive integer. The spectrum analyzer computes the current power spectrum estimate by computing a running average of the last *N* power spectrum estimates. This parameter defines the number of spectral averages, *N*.

Dependency

This parameter applies only when the "View" (DSP System Toolbox) parameter is `Spectrum` or `Spectrum and spectrogram`.

Programmatic Use

See SpectralAverages.

`Reference load` — Reference load

`1` (default) | positive real scalar

The reference load in ohms that the Spectrum Analyzer uses as a reference to compute power values.

Dependency

To use this parameter, set "Input domain" (DSP System Toolbox) to `Time`.

Programmatic Use

See ReferenceLoad.

`Scale` — Scale of frequency axis

`Linear` (default) | `Logarithmic`

Choose a linear or logarithm scale for the frequency axis. When the frequency span contains negative frequency values, you cannot choose the logarithmic option.

Programmatic Use

See FrequencyScale.

`Offset` — Constant frequency offset

`0` (default) | scalar

The constant frequency offset to apply to the entire spectrum, or a vector of frequencies to apply to each spectrum for multiple inputs. The offset parameter is added to the values on the Frequency axis in the Spectrum Analyzer window. This parameter is not used in any spectral computations. You must take the parameter into consideration when you set the **Span (Hz)** and **CF (Hz)** parameters to ensure that the frequency span is within the "Nyquist frequency interval" (DSP System Toolbox).

Dependency

To use this parameter, set "Input domain" (DSP System Toolbox) to `Time`.

Programmatic Use

See "FrequencyOffset" (DSP System Toolbox).

`Normal trace` — Normal trace view

on (default) | off

When this check box is selected, the Spectrum Analyzer calculates and plots the power spectrum or power spectrum density. Spectrum Analyzer performs a smoothing operation by averaging several spectral estimates.

Dependencies

To clear this check box, you must first select either the "Max hold trace" (DSP System Toolbox) or the "Min hold trace" (DSP System Toolbox) parameter. This parameter applies only when "View" (DSP System Toolbox) is `Spectrum` or `Spectrum and spectrogram`.

Programmatic Use

See PlotNormalTrace.

`Max hold trace` — Maximum hold trace view

off (default) | on

Select this check box to enable Spectrum Analyzer to plot the maximum spectral values of all the estimates obtained.

Dependency

This parameter applies only when "View" (DSP System Toolbox) is `Spectrum` or `Spectrum and spectrogram`.

Programmatic Use

See PlotMaxHoldTrace.

`Min hold trace` — Minimum hold trace view

off (default) | on

Select this check box to enable Spectrum Analyzer to plot the minimum spectral values of all the estimates obtained.

Dependency

This parameter applies only when "View" (DSP System Toolbox) is `Spectrum` or `Spectrum and spectrogram`.

Programmatic Use

See PlotMinHoldTrace.

`Two-sided spectrum` — Enable two-sided spectrum view

off (default) | on

Select this check box to enable a two-sided spectrum view. In this view, both negative and positive frequencies are shown. If you clear this check box, Spectrum Analyzer shows a one-sided spectrum with only positive frequencies. Spectrum Analyzer requires that this parameter is selected when the input signal is complex-valued.

Programmatic Use

See PlotAsTwoSidedSpectrum.

Configuration Properties

The **Configuration Properties** dialog box controls visual aspects of the Spectrum Analyzer. To open the Configuration Properties, in the Spectrum Analyzer menu, select **View** > **Configuration Properties** or select the ⚙ button in the toolbar dropdown.

`Title` — Display title

character vector | string

Specify the display title. Enter `%<SignalLabel>` to use the signal labels in the Simulink model as the axes titles.

Tunable: Yes

Programmatic Use

See Title.

`Show legend` — Display signal legend

off (default) | on

Show signal legend. The names listed in the legend are the signal names from the model. For signals with multiple channels, a channel index is appended after the signal name. Continuous signals have straight lines before their names and discrete signals have step-shaped lines.

From the legend, you can control which signals are visible. This control is equivalent to changing the visibility in the **Style** parameters. In the scope legend, click a signal name to hide the signal in the scope. To show the signal, click the signal name again. To show only one signal, right-click the signal name, which hides all other signals. To show all signals, press **ESC**.

Dependency

To enable this parameter, set “View” (DSP System Toolbox) to `Spectrum` or `Spectrum and spectrogram`.

Programmatic Use

See ShowLegend.

`Show grid` — Show internal grid lines

off (default) | on

Show internal grid lines on the Spectrum Analyzer

Programmatic Use

See ShowGrid.

`Y-limits (minimum)` — Y-axis minimum

`-80` (default) | scalar

Specify the minimum value of the *y*-axis.

Programmatic Use

See YLimits.

`Y-limits (maximum)` — Y-axis maximum

`20` (default) | scalar

Specify the maximum value of the *y*-axis.

Programmatic Use

See YLimits.

`Y-label` — Y-axis label

character vector | string

To display signal units, add `(%<SignalUnits>)` to the label. At the beginning of a simulation, Simulink replaces `(%SignalUnits)` with the units associated with the signals. For example, if you have a signal for velocity with units of m/s enter

```
Velocity (%<SignalUnits>)
```

Programmatic Use

See YLabel.

`Color map` — Spectrogram colormap

`jet(256)` (default) | `hot(256)` | `bone(256)` | `cool(256)` | `copper(256)` | `gray(256)` | `parula(256)` | 3-column matrix

Select the colormap for the spectrogram, or enter a three-column matrix expression for the colormap. For more information about colormaps, see `colormap`.

Tunable: Yes

Dependency

To use this parameter, set “View” (DSP System Toolbox) to `Spectrogram` or `Spectrum and spectrogram`.

`Color-limits (minimum)` — Spectrogram minimum

`-80` (default) | scalar

Specify the signal power for the minimum color value of the spectrogram.

Tunable: Yes

Dependency

To use this parameter, set “View” (DSP System Toolbox) to `Spectrogram` or `Spectrum and spectrogram`.

Programmatic Use

See ColorLimits.

`Color-limits (maximum)` — Spectrogram maximum

20 (default) | scalar

Specify the signal power for the maximum color value of the spectrogram.

Tunable: Yes

Dependency

To use this parameter, set “View” (DSP System Toolbox) to `Spectrogram` or `Spectrum and spectrogram`.

Programmatic Use

See ColorLimits.

Style

The **Style** dialog box controls how to Spectrum Analyzer appears. To open the Style properties, in the Spectrum Analyzer menu, select **View > Style** or select the button in the toolbar dropdown.

`Figure color` — Window background

gray (default) | color picker

Specify the color that you want to apply to the background of the scope figure.

`Plot type` — Plot type

`Line` (default) | `Stem`

Specify whether to display a `Line` or `Stem` plot.

Programmatic Use

See PlotType.

`Axes colors` — Axes background color

black (default) | color picker

Specify the color that you want to apply to the background of the axes.

`Properties for line` — Channel for visual property settings

channel names

Specify the channel for which you want to modify the visibility, line properties, and marker properties.

`Visible` — Channel visibility

on (default) | off

Specify whether the selected channel is visible. If you clear this check box, the line disappears. You can also change signal visibility using the scope legend.

`Line` — Line style

line, 0.5, yellow (default)

Specify the line style, line width, and line color for the selected channel.

`Marker` — Data point markers

`none` (default)

Specify marks for the selected channel to show at its data points. This parameter is similar to the 'Marker' property for plots. You can choose any of the marker symbols from the dropdown.

Axes Scaling

The **Axes Scaling** dialog box controls the axes limits of the Spectrum Analyzer. To open the Axes Scaling properties, in the Spectrum Analyzer menu, select **Tools** > **Axes Scaling** > **Axes Scaling Properties**.

`Axes scaling/Color scaling` — Automatic axes scaling

`Auto` (default) | `Manual` | `After N Updates`

Specify when the scope automatically scales the y-axis. If the spectrogram is displayed, specify when the scope automatically scales the color axis. By default, this parameter is set to `Auto`, and the scope does not shrink the y-axis limits when scaling the axes or color. You can select one of the following options:

- `Auto` — The scope scales the axes or color as needed, both during and after simulation. Selecting this option shows the **Do not allow Y-axis limits to shrink** or **Do not allow color limits to shrink**.
- `Manual` — When you select this option, the scope does not automatically scale the axes or color. You can manually scale the axes or color in any of the following ways:

  - Select **Tools** > **Scaling Properties**.
  - Press one of the **Scale Axis Limits** toolbar buttons.
  - When the scope figure is the active window, press **Ctrl+A**.
- `After N Updates` — Selecting this option causes the scope to scale the axes or color after a specified number of updates. This option is useful, and most efficient, when your frequency signal values quickly reach steady-state after a short period. Selecting this option shows the **Number of updates** edit box where you can modify the number of updates to wait before scaling.

Tunable: Yes

Programmatic Use

See AxesScaling.

`Do not allow Y-axis/color limits to shrink` — Axes scaling limits

on (default) | off

When you select this parameter, the y-axis is allowed to grow during axes scaling operations. If the spectrogram is displayed, selecting this parameter allows the color limits to grow during axis scaling. If you clear this check box, the y-axis or color limits can shrink during axes scaling operations.

Dependency

This parameter appears only when you select `Auto` for the **Axis scaling** or **Color scaling** parameter. When you set the **Axes scaling** or **Color scaling** parameter to `Manual` or `After N Updates`, the *y*-axis or color limits can shrink.

`Number of updates` — Number of updates before scaling

`10` (default) | positive number

The number of updates after which the axes scale, specified as a positive integer. If the spectrogram is displayed, this parameter specifies the number of updates after which the color axes scales.

Tunable: Yes

Dependency

This parameter appears only when you set “Axes scaling/Color scaling” (DSP System Toolbox) to `After N Updates`.

Programmatic Use

See AxesScalingNumUpdates.

`Scale limits at stop` — Scale axes at stop

off (default) | on

Select this check box to scale the axes when the simulation stops. If the spectrogram is displayed, select this check box to scale the color when the simulation stops. The *y*-axis is always scaled. The *x*-axis limits are only scaled if you also select the **Scale X-axis limits** check box.

`Data range (%)` — Percent of axes

100 (default) | number in the range [1,100]

Set the percentage of the axis that the scope uses to display the data when scaling the axes. If the spectrogram is displayed, set the percentage of the power values range within the colormap. Valid values are from 1 through 100. For example, if you set this parameter to `100`, the scope scales the axis limits such that your data uses the entire axis range. If you then set this parameter to `30`, the scope increases the *y*-axis or color range such that your data uses only 30% of the axis range.

Tunable: Yes

Align — Alignment along axes
Center (default) | Bottom | Top | Left | Right

Specify where the scope aligns your data along the axis when it scales the axes. If the spectrogram is displayed, specify where the scope aligns your data along the axis when it scales the color. If you are using CCDF Measurements (DSP System Toolbox), the x axis is also configurable.

Tunable: Yes

Block Characteristics

Data Types	double | single | Boolean | base integer | fixed point | enumerated
Direct Feedthrough	No
Multidimensional Signals	Yes
Variable-Size Signals	Yes
Zero-Crossing Detection	No

Algorithms

Welch's Method

When you set the **Method** property to Welch, the following algorithms apply. The Spectrum Analyzer uses the RBW or the Window Length setting in the **Spectrum Settings** pane to determine the data window length. Then, it partitions the input signal into a number of windowed data segments. Finally, Spectrum Analyzer uses the modified periodogram method to compute spectral updates, averaging the windowed periodograms for each segment.

Spectrum Analyzer requires that a minimum number of samples to compute a spectral estimate. This number of input samples required to compute one spectral update is shown as **Samples/update** in the **Main options** pane. This value is directly related to resolution bandwidth, *RBW*, by the following equation, or to the window length, by the equation shown in step 2.

$$N_{samples} = \frac{\left(1 - \frac{O_p}{100}\right) \times NENBW \times F_s}{RBW}$$

The normalized effective noise bandwidth, *NENBW*, is a factor that depends on the windowing method. Spectrum Analyzer shows the value of *NENBW* in the **Window Options** pane of the **Spectrum Settings** pane. Overlap percentage, O_p, is the value of the **Overlap %** parameter in the **Window Options** pane of the **Spectrum Settings** pane. F_s is the sample rate of the input signal. Spectrum Analyzer shows sample rate in the **Main Options** pane of the **Spectrum Settings** pane.

1. When in **RBW (Hz)** mode, the window length required to compute one spectral update, N_{window}, is directly related to the resolution bandwidth and normalized effective noise bandwidth:

   $$N_{window} = \frac{NENBW \times F_s}{RBW}$$

   When in **Window Length** mode, the window length is used as specified.

2. The number of input samples required to compute one spectral update, $N_{samples}$, is directly related to the window length and the amount of overlap by the following equation.

   $$N_{samples} = \left(1 - \frac{O_p}{100}\right) N_{window}$$

   When you increase the overlap percentage, fewer new input samples are needed to compute a new spectral update. For example, if the window length is 100, then the number of input samples required to compute one spectral update is given as shown in the following table.

O_p	$N_{samples}$
0%	100
50%	50
80%	20

3 The normalized effective noise bandwidth, *NENBW*, is a window parameter determined by the window length, N_{window}, and the type of window used. If $w(n)$ denotes the vector of N_{window} window coefficients, then *NENBW* is given by the following equation.

$$NENBW = N_{window} \frac{\sum_{n=1}^{N_{window}} w^2(n)}{\left[\sum_{n=1}^{N_{window}} w(n)\right]^2}$$

4 When in **RBW (Hz)** mode, you can set the resolution bandwidth using the value of the **RBW (Hz)** parameter on the **Main options** pane of the **Spectrum Settings** pane. You must specify a value to ensure that there are at least two RBW intervals over the specified frequency span. The ratio of the overall span to RBW must be greater than two:

$$\frac{span}{RBW} > 2$$

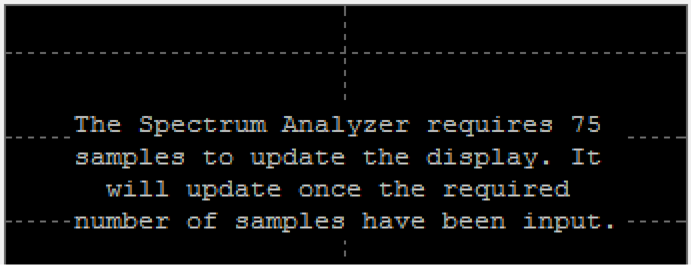
By default, the **RBW (Hz)** parameter on the **Main options** pane is set to `Auto`. In this case, the Spectrum Analyzer determines the appropriate value to ensure that there are 1024 RBW intervals over the specified frequency span. When you set **RBW (Hz)** to `Auto`, *RBW* is calculated as:

$$RBW_{auto} = \frac{span}{1024}$$

5 When in **Window Length** mode, you specify N_{window} and the resulting *RBW* is:

$$\frac{NENBW * Fs}{N_{window}}$$

Sometimes, the number of input samples provided are not sufficient to achieve the resolution bandwidth that you specify. When this situation occurs, Spectrum Analyzer displays a message:



```
The Spectrum Analyzer requires 75
samples to update the display. It
  will update once the required
number of samples have been input.
```

Spectrum Analyzer removes this message and displays a spectral estimate when enough data has been input.

Note The number of FFT points (N_{fft}) is independent of the window length (N_{window}). You can set them to different values if N_{fft} is greater than or equal to N_{window}.

Filter Bank

When you set the **Method** property to `Filter Bank`, the following algorithms apply. The Spectrum Analyzer uses the **RBW (Hz)** or the **Number of frequency band** property in the **Spectrum Settings** pane to determine the input frame length.

Spectrum Analyzer requires a minimum number of samples to compute a spectral estimate. This number of input samples required to compute one spectral update is shown as **Samples/update** in the **Main options** pane. This value is directly related to resolution bandwidth, *RBW*, by the following equation.

$$N_{samples} = \frac{F_s}{RBW}$$

F_s is the sample rate of the input signal. Spectrum Analyzer shows sample rate in the **Main Options** pane of the **Spectrum Settings** pane.

1 When in **RBW (Hz)** mode, you can set the resolution bandwidth using the value of the **RBW (Hz)** parameter on the **Main options** pane of the **Spectrum Settings**

pane. You must specify a value to ensure that there are at least two RBW intervals over the specified frequency span. The ratio of the overall span to RBW must be greater than two:

$$\frac{span}{RBW} > 2$$

By default, the **RBW** parameter on the **Main options** pane is set to Auto. In this case, the Spectrum Analyzer determines the appropriate value to ensure that there are 1024 RBW intervals over the specified frequency span. Thus, when you set **RBW** to Auto, it is calculated by the following equation. $RBW_{auto} = \frac{span}{1024}$

2 When in **Number of frequency bands** mode, you specify the input frame size. When the number of frequency bands is Auto, the resulting RBW is:

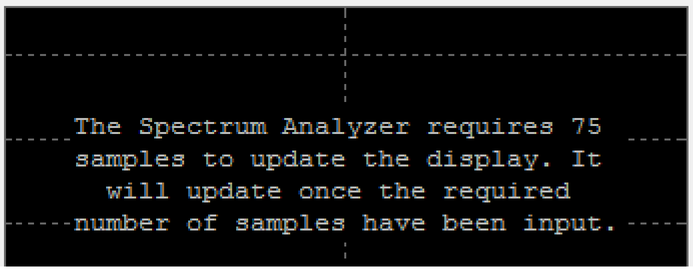
$$RBW = \frac{F_s}{\text{Input Frame Size}}$$

When the number of frequency bands is manually specified, the resulting RBW is:

$$RBW = \frac{F_s}{FFTLength}$$

For more information about the filter bank algorithm, see “Polyphase Implementation” (DSP System Toolbox).

Sometimes, the number of input samples provided are not sufficient to achieve the resolution bandwidth that you specify. When this situation occurs, Spectrum Analyzer displays a message:



The Spectrum Analyzer requires 75 samples to update the display. It will update once the required number of samples have been input.

Spectrum Analyzer removes this message and displays a spectral estimate when enough data has been input.

Nyquist frequency interval

When the PlotAsTwoSidedSpectrum property is set to `true`, the interval is

$$\left[-\frac{SampleRate}{2},\frac{SampleRate}{2}\right]+FrequencyOffset \text{ hertz.}$$

When the `PlotAsTwoSidedSpectrum` property is set to `false`, the interval is

$$\left[0,\frac{SampleRate}{2}\right]+FrequencyOffset \text{ hertz.}$$

Periodogram and Spectrogram

Spectrum Analyzer calculates and plots the power spectrum, power spectrum density, and RMS computed by the modified Periodogram estimator. For more information about the Periodogram method, see `periodogram`.

Power Spectral Density — The power spectral density (PSD) is given by the following equation.

$$PSD(f)=\frac{1}{P}\sum_{p=1}^{P}\frac{\left|\sum_{n=1}^{N_{FFT}} x^{(p)}[n]e^{-j2\pi f(n-1)T}\right|^2}{F_s\times\sum_{n=1}^{N_{window}} w^2[n]}$$

In this equation, $x[n]$ is the discrete input signal. On every input signal frame, Spectrum Analyzer generates as many overlapping windows as possible, with each window denoted as $x^{(p)}[n]$, and computes their periodograms. Spectrum Analyzer displays a running average of the P most current periodograms.

Power Spectrum — The power spectrum is the product of the power spectral density and the resolution bandwidth, as given by the following equation.

$$P_{spectrum}(f) = PSD(f) \times RBW = PSD(f) \times \frac{F_s \times NENBW}{N_{window}} = \frac{1}{P} \sum_{p=1}^{P} \frac{\left| \sum_{n=1}^{N_{FFT}} x^{(p)}[n] e^{-j2\pi f(n-1)T} \right|^2}{\left[\sum_{n=1}^{N_{window}} w[n] \right]^2}$$

Frequency Vector

When set to `Auto`, the frequency vector for frequency-domain input is calculated by the software.

When the PlotAsTwoSidedSpectrum property is set to true, the frequency vector is:

$$\left[-\frac{SampleRate}{2}, \frac{SampleRate}{2} \right]$$

When the PlotAsTwoSidedSpectrum property is set to false, the frequency vector is:

$$\left[0, \frac{SampleRate}{2} \right]$$

Occupied BW

The *Occupied BW* is calculated as follows.

1. Calculate the total power in the measured frequency range.
2. Determine the lower frequency value. Starting at the lowest frequency in the range and moving upward, the power distributed in each frequency is summed until this result is

   $$\frac{\textit{100 - Occupied BW \%}}{\textit{2}}$$

   of the total power.

3 Determine the upper frequency value. Starting at the highest frequency in the range and moving downward, the power distributed in each frequency is summed until the result reaches

$$\frac{100 - \textit{Occupied BW \%}}{2}$$

of the total power.

4 The bandwidth between the lower and upper power frequency values is the occupied bandwidth.

5 The frequency halfway between the lower and upper frequency values is the center frequency.

Distortion Measurements

The *Distortion Measurements* are computed as follows.

1 Spectral content is estimated by finding peaks in the spectrum. When the algorithm detects a peak, it records the width of the peak and clears all monotonically decreasing values. That is, the algorithm treats all these values as if they belong to the peak. Using this method, all spectral content centered at DC (0 Hz) is removed from the spectrum and the amount of bandwidth cleared (W_0) is recorded.

2 The fundamental power (P_1) is determined from the remaining maximum value of the displayed spectrum. A local estimate (Fe_1) of the fundamental frequency is made by computing the central moment of the power near the peak. The bandwidth of the fundamental power content (W_1) is recorded. Then, the power from the fundamental is removed as in step 1.

3 The power and width of the higher-order harmonics (P_2, W_2, P_3, W_3, etc.) are determined in succession by examining the frequencies closest to the appropriate multiple of the local estimate (Fe_1). Any spectral content that decreases monotonically about the harmonic frequency is removed from the spectrum first before proceeding to the next harmonic.

4 Once the DC, fundamental, and harmonic content is removed from the spectrum, the power of the remaining spectrum is examined for its sum ($P_{remaining}$), peak value ($P_{maxspur}$), and median value ($P_{estnoise}$).

5 The sum of all the removed bandwidth is computed as $W_{sum} = W_0 + W_1 + W_2 +...+ W_n$.

The sum of powers of the second and higher-order harmonics are computed as $P_{harmonic} = P_2 + P_3 + P_4 + \ldots + P_n$.

6 The sum of the noise power is estimated as:

$$P_{noise} = (P_{remaining} \cdot dF + P_{est.noise} \cdot W_{sum}) / RBW$$

Where *dF* is the absolute difference between frequency bins, and *RBW* is the resolution bandwidth of the window.

7 The metrics for SNR, THD, SINAD, and SFDR are then computed from the estimates.

$$THD = 10 \cdot \log_{10}\left(\frac{P_{harmonic}}{P_1}\right)$$

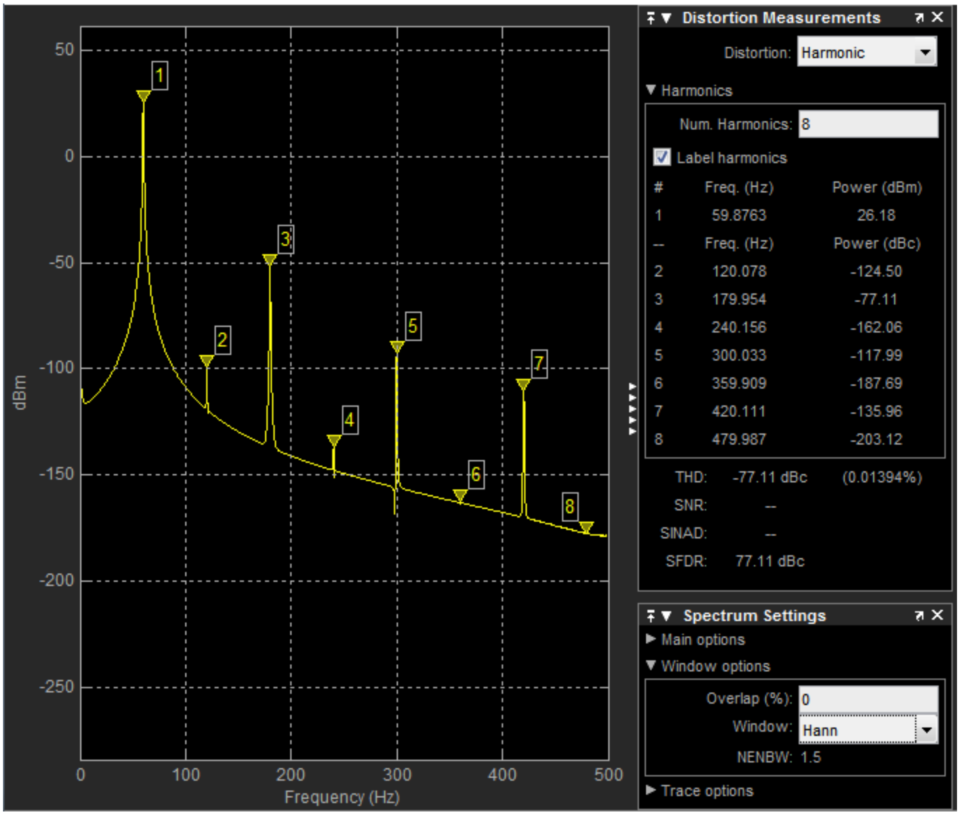
$$SINAD = 10 \cdot \log_{10}\left(\frac{P_1}{P_{harmonic} + P_{noise}}\right)$$

$$SNR = 10 \cdot \log_{10}\left(\frac{P_1}{P_{noise}}\right)$$

$$SFDR = 10 \cdot \log_{10}\left(\frac{P_1}{\max\left(P_{maxspur}, \max(P_2, P_3, \ldots, P_n)\right)}\right)$$

Harmonic Measurements

1 The harmonic distortion measurements use the spectrum trace shown in the display as the input to the measurements. The default Hann window setting of the Spectrum Analyzer may exhibit leakage that can completely mask the noise floor of the measured signal.



Distortion: Harmonic

Harmonics

Num. Harmonics: 8

☑ Label harmonics

#	Freq. (Hz)	Power (dBm)
1	59.8763	26.18

3	179.954	-77.11
4	240.156	-162.06
5	300.033	-117.99
6	359.909	-187.69
7	420.111	-135.96
8	479.987	-203.12

THD: -77.11 dBc (0.01394%)
SNR: --
SINAD: --
SFDR: 77.11 dBc

Overlap (%): 0
Window: Hann
NENBW: 1.5

The harmonic measurements attempt to correct for leakage by ignoring all frequency content that decreases monotonically away from the maximum of harmonic peaks. If the window leakage covers more than 70% of the frequency bandwidth in your spectrum, you may see a blank reading (–) reported for **SNR** and **SINAD**. If your application can tolerate the increased equivalent noise bandwidth (ENBW), consider using a Kaiser window with a high attenuation (up to 330 dB) to minimize spectral leakage.

Attenuation (dB): 300

NENBW: 3.229

2 The DC component is ignored.

3 After windowing, the width of each harmonic component masks the noise power in the neighborhood of the fundamental frequency and harmonics. To estimate the noise power in each region, Spectrum Analyzer computes the median noise level in the nonharmonic areas of the spectrum. It then extrapolates that value into each region.

4 Nth order intermodulation products occur at $A*F1 + B*F2$,

where $F1$ and $F2$ are the sinusoid input frequencies and $|A| + |B| = N$. A and B are integer values.

5 For intermodulation measurements, the third-order intercept (TOI) point is computed as follows, where P is power in decibels of the measured power referenced to 1 milliwatt (dBm):

- $TOI_{lower} = P_{F1} + (P_{F2} - P_{(2F1-F2)})/2$
- $TOI_{upper} = P_{F2} + (P_{F1} - P_{(2F2-F1)})/2$
- $TOI = + (TOI_{lower} + TOI_{upper})/2$

Extended Capabilities

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

This block can be used for simulation visibility in subsystems that generate HDL code, but is not included in the hardware implementation.

Slider Switch

Toggle parameter between two values
Library: Simulink / Dashboard

Description

The Slider Switch block toggles the value of the connected block parameter between two values during simulation. For example, you can connect the Slider Switch block to a Switch block in your model and change its state during simulation. Use the Slider Switch block with other Dashboard blocks to create an interactive dashboard for your model.

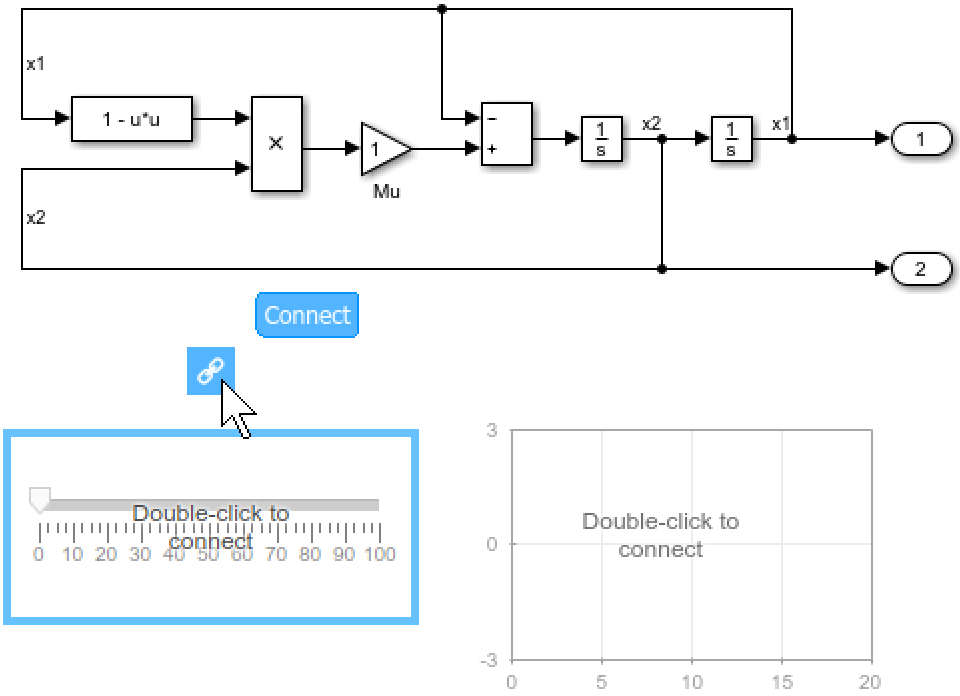
Double-clicking the Slider Switch block does not open its dialog box during simulation and when the block is selected. To edit the block's parameters, you can use the **Property Inspector**, or you can right-click the block and select **Block Parameters** from the context menu.

Connecting Dashboard Blocks

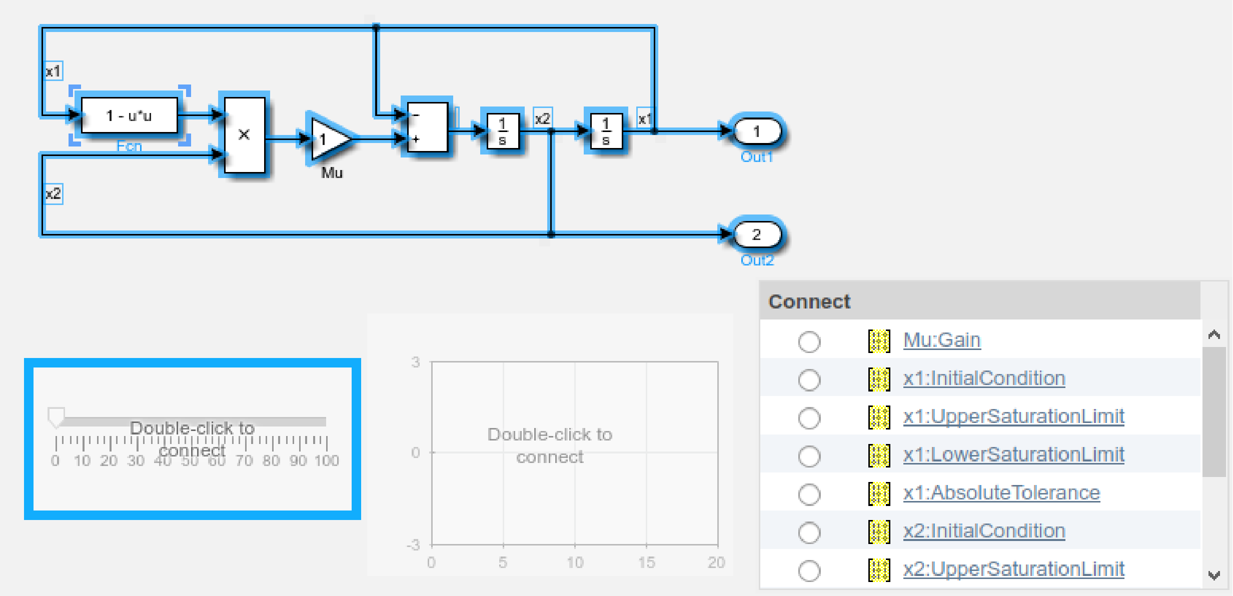
Dashboard blocks do not use ports to make connections. To connect Dashboard blocks to variables and block parameters in your model, use connect mode. Connect mode facilitates the process of connecting Dashboard blocks in your model, especially when you want to connect multiple blocks at once. If you only want to connect a single Dashboard block, you can also use the **Connection** table in the block dialog box to make the connection.

Note Dashboard blocks cannot connect to variables until you update your model diagram. To connect Dashboard blocks to variables or modify variable values between opening your model and running a simulation, update your model diagram using **Ctrl+D**.

To enter connect mode, click the **Connect** button that appears above your unconnected Dashboard block when you pause on it.



In connect mode, when you select one or more signals or blocks, a list of parameters and signals available for connection appears. Select a signal or parameter from the list to connect the selected Dashboard block. To connect another Dashboard block, pause on the block and click the **Connect** button above it. Then, make a selection of signals and blocks in your model, and choose a signal or parameter to connect.



Connect	
○	Mu:Gain
○	x1:InitialCondition
○	x1:UpperSaturationLimit
○	x1:LowerSaturationLimit
○	x1:AbsoluteTolerance
○	x2:InitialCondition
○	x2:UpperSaturationLimit

When you finish connecting the Dashboard blocks in your model, click the **Exit** button in the upper-right of the canvas to exit connect mode.

Parameter Logging

Tunable parameters connected to Dashboard blocks are logged to the Simulation Data Inspector, where you can view parameter values along with logged signal data. You can access logged parameter data in the MATLAB workspace by exporting the parameter data from the Simulation Data Inspector UI or by using the `Simulink.sdi.exportRun` function. For more information about exporting data with the Simulation Data Inspector UI, see “Export Data from the Simulation Data Inspector”. The parameter data is stored in a `Simulink.SimulationData.Parameter` object, accessible as an element in the exported `Simulink.SimulationData.Dataset`.

Limitations

- Dashboard blocks can only connect to real scalar signals.
- You cannot use the **Connection** table to connect a Dashboard block to a block that is commented out. When you connect a Dashboard block to a commented block using

connect mode, the Dashboard block does not display the connected value until the you uncomment the block.

- Dashboard blocks cannot connect to signals inside referenced models.
- Parameters specified by indexing a variable array do not appear in the **Connection** table. For example, a block parameter defined as `engine(1)` using the variable `engine` does not appear in the table.

  To access the parameter in the **Connection** table, assign the indexed value to a scalar variable, such as `engine_1`. Then, use the scalar variable to define the block parameter.

Parameters

`Connection` — Select a variable or block parameter to connect

variable and parameter connection options

Select the variable or block parameter to control using the **Connection** table. Populate the **Connection** table by selecting one or more blocks in your model. Select the radio button next to the variable or parameter you want to control, and click **Apply**.

Note To see workspace variables in the connection table, update the model diagram using **Ctrl+D**.

States

`Label (Left)` — Label for left switch position

'On' (default) | character vector

Labels the left switch position. You can use the **Label** to display the value the connected parameter takes when the switch is positioned at the left, or you can enter a text label.

Example: `Gain = 2`

`Value (Left)` — Value for left switch position

1 (default) | scalar

The value assigned to the connected parameter when the switch is positioned at the left.

`Label (Right)` — Label for right switch position

'Off' (default) | character vector

Labels the right switch position. You can use the **Label** to display the value the connected parameter takes when the switch is positioned at the right, or you can enter a text label.

Example: `Gain = 1`

`Value (Right)` — Value for right switch position

0 (default) | scalar

The value assigned to the connected parameter when the switch is positioned at the right.

`Label` — Block label position

'Top' (default) | 'Bottom' | 'Hide'

Position of the block label. When the block is connected to a signal, the label is the name of the connected signal.

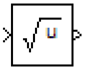
Sqrt

Calculate square root, signed square root, or reciprocal of square root

Library: Simulink / Math Operations



Description

The Sqrt block calculates the square root, signed square root, or reciprocal of square root on the input signal. Select one of the following functions from the **Function** parameter list.

Function	Description	Mathematical Expression	MATLAB Equivalent
sqrt	Square root of the input	$u^{0.5}$	sqrt
signedSqrt	Square root of the absolute value of the input, multiplied by the sign of the input	$\mathrm{sign}(u)*\lvert u\rvert^{0.5}$	—
rSqrt	Reciprocal of the square root of the input	$u^{-0.5}$	—

The block icon changes to match the function.

Ports

Input

Port_1 — Input signal

scalar | vector | matrix

Input signal to the block to calculate the square root, signed square root, or reciprocal of square root. The `sqrt` function accepts real or complex inputs, except for complex fixed-point signals. `signedSqrt` and `rSqrt` do not accept complex inputs.

If the input is negative, set the **Output signal** to complex.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fixed point`

Output

`Port_1` — Output signal

scalar | vector | matrix

Output signal that is the square root, signed square root, or reciprocal of square root of the input signal. When the input is an integer or fixed-point type, the output must be floating point.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fixed point`

Parameters

Main

`Function` — Function the block performs

`sqrt` (default) | `signedSqrt` | `rSqrt`

Specify the mathematical function that the block calculates. The block icon changes to match the function you select.

Function	Block Icon
`sqrt`	$\sqrt{u}$
`signedSqrt`	$\pm\sqrt{\lvert u \rvert}$

Function	Block Icon
rSqrt	
Programmatic Use
Block Parameter: `Operator`
Type: character vector
Values: `'sqrt'` | `'signedSqrt'` | `'rSqrt'`
Default: `'sqrt'`

`Output signal type` — Output signal type

`auto` (default) | `real` | `complex`

Specify the output signal type of the block.

Function	Input Signal Type	Output Signal Type		
		Auto	Real	Complex
`sqrt`	`real`	`real` for nonnegative inputs `NaN` for negative inputs	`real` for nonnegative inputs `NaN` for negative inputs	`complex`
	`complex`	`complex`	`error`	`complex`
`signedSqrt`	`real`	`real`	`real`	`complex`
	`complex`	`error`	`error`	`error`
`rSqrt`	`real`	`real`	`real`	`error`
	`complex`	`error`	`error`	`error`

Programmatic Use
Block Parameter: `OutputSignalType`
Type: character vector
Values: `'auto'` | `'real'` | `'complex'`
Default: `'auto'`

`Sample time` — Specify sample time as a value other than -1

`-1` (default) | scalar

Specify the sample time as a value other than -1. For more information, see “Specify Sample Time”.

Dependencies

This parameter is not visible unless it is explicitly set to a value other than `-1`. To learn more, see “Blocks for Which Sample Time Is Not Recommended”.

Programmatic Use
Block Parameter: `SampleTime`
Type: character vector
Values: scalar
Default: `'-1'`

Algorithm

`Method` — Method to compute reciprocal of square root

`Exact` (default) | `Newton-Raphson`

Specify the method for computing the reciprocal of a square root. This parameter is only valid for the `rSqrt` function.

Method	Data Types Supported	When to Use This Method
`Exact`	Floating point If you use a fixed-point or built-in integer type, an upcast to a floating-point type occurs.	You do not want an approximation. **Note** The input or output must be floating point.
`Newton-Raphson`	Floating-point, fixed-point, and built-in integer types	You want a fast, approximate calculation.

The `Exact` method provides results that are consistent with MATLAB computations.

Note The algorithms for `sqrt` and `signedSqrt` are always of `Exact` type, no matter what selection appears on the block dialog box.

Programmatic Use
Block Parameter: `AlgorithmType`

Type: character vector
Values: `'Exact'` | `'Newton-Raphson'`
Default: `'Exact'`

`Number of iterations` — Number of iterations used for Newton Raphson algorithm

3 (default) | integer

Specify the number of iterations to perform the Newton-Raphson algorithm. This parameter is valid with the `rSqrt` function and the `Newton-Raphson` value for **Method**.

Note If you enter 0, the block output is the initial guess of the Newton-Raphson algorithm.

Programmatic Use
Block Parameter: `Iterations`
Type: character vector
Values: integer
Default: `'3'`

Data Types

Click the **Show data type assistant** button >> to display the **Data Type Assistant**, which helps you set the data type attributes. For more information, see “Specify Data Types Using Data Type Assistant”.

`Intermediate results data type` — Data type of intermediate results

`Inherit:Inherit via internal rule` (default) | `Inherit: Inherit: Inherit from input` | `Inherit: Inherit: Inherit from output` | `double` | `single` | `int8` | `int32` | `uint32` | `fixdt(1,16,2^0,0)` | `<data type expression>`

Specify the data type for intermediate results when you set **Function** to `sqrt` or `rSqrt` on the **Main** pane.

The type can be inherited, specified directly, or expressed as a data type object such as `Simulink.NumericType`.

Follow these guidelines on setting an intermediate data type explicitly for the square root function, `sqrt`:

Input and Output Data Types	Intermediate Data Type
Input or output is double.	Use double.
Input or output is single, and any non-single data type is *not* double.	Use single or double.
Input and output are fixed point.	Use fixed point.

Follow these guidelines on setting an intermediate data type explicitly for the reciprocal square root function, `rSqrt`:

Input and Output Data Types	Intermediate Data Type
Input is double and output is not single.	Use double.
Input is not single and output is double.	Use double.
Input and output are fixed point.	Use fixed point.

Caution Do not set **Intermediate results data type** to `Inherit:Inherit from output` when:

- You select `Newton-Raphson` to compute the reciprocal of a square root.
- The input data type is floating point.
- The output data type is fixed point.

Under these conditions, selecting `Inherit:Inherit from output` yields suboptimal performance and produces an error.

To avoid this error, convert the input signal from a floating-point to fixed-point data type. For example, insert a Data Type Conversion block in front of the Sqrt block to perform the conversion.

Programmatic Use
Block Parameter: `IntermediateResultsDataTypeStr`
Type: character vector
Values: `'Inherit: Inherit via internal rule'` | `'Inherit: Inherit from input'` | `'Inherit: Inherit from output'` | `'double'` | `'single'`, `'int8'`, `'uint8'`, `int16`, `'uint16'`, `'int32'`, `'uint32'`, `fixdt(1,16,0)`, `fixdt(1,16,2^0,0)`, `fixdt(1,16,2^0,0)`. `'<data type expression>'`
Default: `'Inherit: Inherit via internal rule'`

Output — Output data type

Inherit: Same as first input (default) | Inherit: Inherit via internal rule | Inherit: Inherit via back propagation | double | single | int8 | int32 | uint32 | fixdt(1,16,2^0,0) | <data type expression> | ...

Specify the output data type. The type can be inherited, specified directly, or expressed as a data type object such as Simulink.NumericType.

Programmatic Use
Block Parameter: OutDataTypeStr
Type: character vector
Values: 'Inherit: Inherit via internal rule' | 'Inherit: Inherit via back propagation' | 'Inherit: Same as first input' | 'double' | 'single', 'int8', 'uint8', int16, 'uint16', 'int32', 'uint32', fixdt(1,16,0), fixdt(1,16,2^0,0), fixdt(1,16,2^0,0). '<data type expression>'
Default: 'Inherit: Same as first input'

Lock output data type setting against changes by the fixed-point tools — Prevent fixed-point tools from overriding data types

off (default) | on

Select to lock the output data type setting of this block against changes by the Fixed-Point Tool and the Fixed-Point Advisor. For more information, see "Use Lock Output Data Type Setting" (Fixed-Point Designer).

Programmatic Use
Block Parameter: LockScale
Type: character vector
Values: 'off' | 'on'
Default: 'off'

Saturate on integer overflow — Choose the behavior when integer overflow occurs

on (default) | boolean

Action	Reasons for Taking This Action	What Happens for Overflows	Example
Select this check box.	Your model has possible overflow, and you want explicit saturation protection in the generated code.	Overflows saturate to either the minimum or maximum value that the data type can represent.	The maximum value that the `int8` (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box selected, the block output saturates at 127. Similarly, the block output saturates at a minimum output value of -128.
Do not select this check box.	You want to optimize efficiency of your generated code. You want to avoid overspecifying how a block handles out-of-range signals. For more information, see “Check for Signal Range Errors”.	Overflows wrap to the appropriate value that is representable by the data type.	The maximum value that the `int8` (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box cleared, the software interprets the overflow-causing value as `int8`, which can produce an unintended result. For example, a block result of 130 (binary 1000 0010) expressed as `int8`, is -126.

When you select this check box, saturation applies to every internal operation on the block, not just the output or result. Usually, the code generation process can detect when overflow is not possible. In this case, the code generator does not produce saturation code.

Programmatic Use

Block Parameter: `SaturateOnIntegerOverflow`
Type: character vector
Value: `'off'` | `'on'`
Default: `'on'`

Block Characteristics

Data Types	`double` | `single` | `base integer` | `fixed point`
Direct Feedthrough	`No`
Multidimensional Signals	`Yes`
Variable-Size Signals	`Yes`
Zero-Crossing Detection	`No`

Extended Capabilities

C/C++ Code Generation

Squeeze

Remove singleton dimensions from multidimensional signal
Library: Simulink / Math Operations

Description

The Squeeze block removes singleton dimensions from its multidimensional input signal. A singleton dimension is any dimension whose size is one. The Squeeze block operates only on signals whose number of dimensions is greater than two. Scalar, vector, and matrix signals pass through the Squeeze block unchanged.

Ports

Input

`Port_1` — Multidimensional input signal
multidimensional signal

Input signal that has any singleton dimensions removed in the output.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Output

`Port_1` — Output signal with no singleton dimensions
multidimensional signal

Output signal with no singleton dimensions. For example, a multidimensional array of size 3-by-1-by-2 changes into a 3-by-2 signal. If there are no singleton dimensions in the input, then the input signal is passed through unchanged to the output.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Block Characteristics

Data Types	`double` | `single` | `Boolean` | `base integer` | `fixed point` | `enumerated`
Direct Feedthrough	`No`
Multidimensional Signals	`Yes`
Variable-Size Signals	`No`
Zero-Crossing Detection	`No`

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

Fixed-Point Conversion

Convert floating-point algorithms to fixed point using Fixed-Point Designer™.

Reshape

Introduced in R2007b

State Control

Specify synchronous reset and enable behavior for blocks with state

Library

HDL Coder / HDL Subsystems

Description

The State Control block in `Synchronous` mode improves the HDL simulation behavior of blocks with state, or blocks that have reset or enable ports. The simulation behavior in `Classic` mode is the same as when you do not add the State Control block inside the subsystem.

When use the `Synchronous` mode of the block, the Simulink simulation behavior closely matches that of the digital hardware.

If you have HDL Coder installed, you can generate cleaner HDL code with the `Synchronous` mode of the State Control block. For more information, see State Control.

Parameters

State control

Specify whether to use synchronous or classic semantics. The default is `Synchronous`.

Limitations

The following limitations apply to using the State Control block in Simulink. For information about this block in HDL Coder, see State Control in the HDL Coder documentation.

Block-Level Limitations

- For synchronous semantics in S-function blocks, set the method `ssSetStateSemanticsClassicAndSynchronous` to `true`.
- Discrete-Time Integrator blocks with a reset port do not support synchronous semantics.
- All action subsystems connected to If and Switch Case blocks must have the same semantics, either classic or synchronous.
- The following blocks are not allowed in synchronous mode:
  - Continuous time blocks and blocks with continuous rate
  - Simulink blocks with **Input processing** set to `Columns as channels (frame based)`, where this parameter applies.
  - Trigger block
  - From Workspace block
  - The set of unit delay blocks in the **Additional Math & Discrete** > **Additional Discrete** sublibrary in Simulink, such as the Unit Delay Resettable and Unit Delay External IC blocks

Subsystem-level Limitations

- Conditional subsystems using classic semantics cannot have subsystems with synchronous semantics inside them.
- Conditional subsystems must be single rate when you use the State Control block in synchronous mode.
- Synchronous Enabled Subsystem cannot contain reset subsystems or a reset parameter port. For example, you cannot have a Delay block with an external reset port inside the subsystem.
- These blocks are not supported in synchronous mode:

- For Iterator Subsystem
- While Iterator Subsystem
- Function-Call Subsystem
- Triggered Subsystem

Model-Level Limitations

- Variable-size signals are not supported with synchronous semantics.
- Synchronous semantics do not propagate across model boundaries. If your parent model has synchronous semantics, any referenced model must have synchronous semantics explicitly specified. At the root level of each referenced model, add a State Control block with the **State control** parameter set to `Synchronous`.

See Also

Enable | Enabled Subsystem | Enabled Synchronous Subsystem | Resettable Synchronous Subsystem | Synchronous Subsystem

Introduced in R2016a

State Reader

Read a block state

Library: Simulink / Signal Routing

Description

The State Reader block reads the current state of a supported state owner block.

Add a State Reader block to your model from the Simulink Library Browser.

State Reader blocks can read state from these state owner blocks:

- Discrete State-Space
- Discrete-Time Integrator
- Delay
- Unit Delay
- Discrete Transfer Fcn
- Discrete Filter
- Discrete FIR Filter
- Integrator
- Second-Order Integrator
- Conditional susystem blocks such as Enabled Subsystem, Triggered Subsystem, and Function-Call Subsystem.
- S-Function (with one data type work vector declared as a discrete-state vector)

Ports

Output

`Out` — State value

scalar | vector

State value read from a state owner block.

The dimension of the output is the dimension of the full state vector. Refer to the **Initial conditions** parameter for specific blocks. For example, for a Delay block with a **Delay length** of `N`, the State Reader block returns a state vector of length `[1xN]`.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fixed point`

Parameters

`State owner block` — Show the state owner block

none (default)

Show the state owner block whose state this block is reading. To change the state owner block, select a block from the **State Owner Selector Tree**.

Programmatic Use
Block Parameter: `StateOwnerBlock`
Type: character vector
Value: `''` | `'<model path/block name>'`
Default: `''`

Block Characteristics

Data Types	`double` | `single` | `Boolean` | `base integer` | `fixed point` | `enumerated` | `bus`
Direct Feedthrough	`No`
Multidimensional Signals	`Yes`
Variable-Size Signals	`No`
Zero-Crossing Detection	`No`

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Fixed-Point Conversion

Convert floating-point algorithms to fixed point using Fixed-Point Designer™.

State Writer

Write to a block state
Library: Simulink / Signal Routing

Description

The State Writer block sets the state of a supported state owner block.

Add a State Writer block to your model from the Simulink Library Browser.

State Writer blocks can write state to these state owner blocks:

- Discrete State-Space
- Discrete-Time Integrator
- Delay
- Unit Delay
- Discrete Transfer Fcn
- Discrete Filter
- Discrete FIR Filter
- Integrator
- Second-Order Integrator
- Conditional susystem blocks such as Enabled Subsystem, Triggered Subsystem, and Function-Call Subsystem.
- S-Function (with one data type work vector declared as a discrete-state vector)

Ports

Input

In — State value
scalar | vector

State value written to a state owner block.

When writing to a state owner block with an input scalar, the scalar value is expanded to match the dimension of the state. All elements of the state are set to the same value.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fixed point`

Parameters

`State owner block` — Show the state owner block

none (default)

Show the state owner block whose state this block is writing. To change the state owner block, select a block from the **State Owner Selector Tree**.

Programmatic Use
Block Parameter: `StateOwnerBlock`
Type: character vector
Value: `''` | `'<model path/block name>'`
Default: `''`

Block Characteristics

Data Types	`double` | `single` | `Boolean` | `base integer` | `fixed point` | `enumerated` | `bus`
Direct Feedthrough	`No`
Multidimensional Signals	`Yes`
Variable-Size Signals	`No`
Zero-Crossing Detection	`No`

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Fixed-Point Conversion

Convert floating-point algorithms to fixed point using Fixed-Point Designer™.

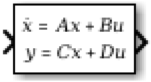
State-Space

Implement linear state-space system
Library: Simulink / Continuous



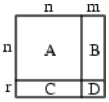
Description

The State-Space block implements a system whose behavior you define as

$$\dot{x} = Ax + Bu$$
$$y = Cx + Du$$
$$x\big|_{t=t_0} = x_0,$$

where *x* is the state vector, *u* is the input vector, *y* is the output vector, and *x*0 is the initial condition of the state vector. The matrix coefficients must have these characteristics:

- *A* must be an *n*-by-*n* matrix, where *n* is the number of states.
- *B* must be an *n*-by-*m* matrix, where *m* is the number of inputs.
- *C* must be an *r*-by-*n* matrix, where *r* is the number of outputs.
- *D* must be an *r*-by-*m* matrix.



$$\begin{array}{c|c|c|} & n & m \\ \hline n & A & B \\ \hline r & C & D \\ \hline \end{array}$$

In general, the block has one input port and one output port. The number of rows in C or D matrix is the same as the width of the output port. The number of columns in the B or D matrix are the same as the width of the input port. If you want to model an autonomous linear system with no inputs, set the B and D matrices to empty. In this case, the block acts as a source block with no input port and one output port, and implements the following system:

$$\dot{x} = Ax$$
$$y = Cx$$
$$x\big|_{t=t_0} = x_0.$$

Simulink software converts a matrix containing zeros to a sparse matrix for efficient multiplication.

Ports

Input

`Port_1` — Input signal

scalar | vector

Real-valued input vector of type `double`, where the width equals the number of columns in the **B** and **D** matrices. For more information, see “Description” on page 1-1872.

Data Types: `double`

Output

`Port_1` — Output vector

scalar | vector

Real-valued output vector of data type `double`, with width equal to the number of rows in the **C** and **D** matrices. For more information, see “Description” on page 1-1872.

Data Types: `double`

Parameters

`A` — Matrix coefficient, A

`1` (default) | scalar | vector | matrix

Specify the matrix coefficient `A`, as a real-valued *n*-by-*n* matrix, where *n* is the number of states. For more information on the matrix coefficients, see “Description” on page 1-1872.

Programmatic Use
Block Parameter: `A`
Type: character vector, string
Values: scalar | vector | matrix
Default: `'1'`

`B` — Matrix coefficient, B

1 (default) | scalar | vector | matrix

Specify the matrix coefficient `B`, as a real-valued *n*-by-*m* matrix, where *n* is the number of states and *m* is the number of inputs. For more information on the matrix coefficients, see “Description” on page 1-1872.

Programmatic Use
Block Parameter: `B`
Type: character vector, string
Values: scalar | vector | matrix
Default: `'1'`

`C` — Matrix coefficient, C

1 (default) | scalar | vector | matrix

Specify the matrix coefficient **C** as a real-valued *r*-by-*n* matrix, where *r* is the number of outputs and *n* is the number of states. For more information on the matrix coefficients, see “Description” on page 1-1872.

Programmatic Use
Block Parameter: `C`
Type: character vector, string
Values: scalar | vector | matrix
Default: `'1'`

`D` — Matrix coefficient, D

1 (default) | scalar | vector | matrix

Specify the matrix coefficient **D** as a real-valued *r*-by-*m* matrix, where *r* is the number of outputs and *m* is the number of inputs. For more information on the matrix coefficients, see “Description” on page 1-1872.

Programmatic Use
Block Parameter: `D`
Type: character vector, string

Values: scalar | vector | matrix
Default: '1'

Initial conditions — Initial state vector

0 (default) | scalar | vector

Specify the initial state vector.

Limitations

The initial conditions of this block cannot be inf or NaN.

Programmatic Use

Block Parameter: X0
Type: character vector, string
Values: scalar | vector
Default: '0'

Absolute tolerance — Absolute tolerance for computing block states

auto (default) | scalar | vector

Absolute tolerance for computing block states, specified as a positive, real-valued, scalar or vector. To inherit the absolute tolerance from the Configuration Parameters, specify auto or -1.

- If you enter a real scalar, then that value overrides the absolute tolerance in the Configuration Parameters dialog box for computing all block states.
- If you enter a real vector, then the dimension of that vector must match the dimension of the continuous states in the block. These values override the absolute tolerance in the Configuration Parameters dialog box.
- If you enter auto or –1, then Simulink uses the absolute tolerance value in the Configuration Parameters dialog box (see "Solver Pane") to compute block states.

Programmatic Use

Block Parameter: AbsoluteTolerance
Type: character vector, string
Values: 'auto' | '-1' | any positive real-valued scalar or vector
Default: 'auto'

State Name (e.g., 'position') — Assign unique name to each state

' ' (default) | 'position' | {'a', 'b', 'c'} | a | ...

Assign a unique name to each state. If this field is blank (`' '`), no name assignment occurs.

- To assign a name to a single state, enter the name between quotes, for example, `'position'`.
- To assign names to multiple states, enter a comma-delimited list surrounded by braces, for example, `{'a', 'b', 'c'}`. Each name must be unique.
- To assign state names with a variable in the MATLAB workspace, enter the variable without quotes. A variable can be a character vector, string, cell array, or structure.

Limitations

- The state names apply only to the selected block.
- The number of states must divide evenly among the number of state names.
- You can specify fewer names than states, but you cannot specify more names than states.

  For example, you can specify two names in a system with four states. The first name applies to the first two states and the second name to the last two states.

Programmatic Use

Block Parameter: `ContinuousStateAttributes`
Type: character vector, string
Values: `' '` | user-defined
Default: `' '`

Block Characteristics

Data Types	`double`
Direct Feedthrough	`No`
Multidimensional Signals	`No`
Variable-Size Signals	`No`

Zero-Crossing Detection	`No`

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Not recommended for production-quality code. Relates to resource limits and restrictions on speed and memory often found in embedded systems. The code generated can contain dynamic allocation and freeing of memory, recursion, additional memory overhead, and widely-varying execution times. While the code is functionally valid and generally acceptable in resource-rich environments, smaller embedded targets often cannot support such code.

In general, consider using the Simulink Model Discretizer to map continuous blocks into discrete equivalents that support production code generation. To start the Model Discretizer, select **Analysis > Control Design > Model Discretizer**. One exception is the Second-Order Integrator block because, for this block, the Model Discretizer produces an approximate discretization.

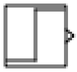
Step

Generate step function

Library: Simulink / Sources



Description

The Step block provides a step between two definable levels at a specified time. If the simulation time is less than the **Step time** parameter value, the block's output is the **Initial value** parameter value. For simulation time greater than or equal to the **Step time**, the output is the **Final value** parameter value.

The numeric block parameters must be of the same dimensions after scalar expansion. If the **Interpret vector parameters as 1-D** option is off, the block outputs a signal of the same dimensions and dimensionality as the parameters. If the **Interpret vector parameters as 1-D** option is on and the numeric parameters are row or column vectors (that is, single-row or column 2-D arrays), the block outputs a vector (1-D array) signal. Otherwise, the block outputs a signal of the same dimensionality and dimensions as the parameters.

Ports

Output

`Port_1` — Output step signal
scalar | vector

Output step function signal defined by the parameters **Step time**, **Initial value**, and **Final value**.

Data Types: `double`

Parameters

`Step time` — Time when step occurs

`1` (default) | scalar

Specify the time, in seconds, when the output jumps from the **Initial value** parameter to the **Final value** parameter.

Programmatic Use
Block Parameter: `Time`
Type: character vector
Values: scalar
Default: `'1'`

`Initial value` — Output value before step

`0` (default) | scalar

Specify the block output until the simulation time reaches the **Step time** parameter.

Programmatic Use
Block Parameter: `Before`
Type: character vector
Values: scalar
Default: `'0'`

`Final value` — Output value after step

`1` (default) | scalar

Specify the block output when the simulation time reaches and exceeds the **Step time** parameter.

Programmatic Use
Block Parameter: `After`
Type: character vector
Values: scalar
Default: `'1'`

`Sample time` — Sample rate

`0` (default) | scalar

Specify the sample rate of step. See “Specify Sample Time” for more information.

Programmatic Use

Block Parameter: `SampleTime`
Type: character vector
Values: scalar
Default: `'0'`

`Interpret vector parameters as 1-D` — Treat vectors as 1-D

`on` (default) | `off`

Select this check box to output a vector of length `N` if the **Constant value** parameter evaluates to an `N`-element row or column vector.

- When you select this check box, the block outputs a vector of length `N` if the **Constant value** parameter evaluates to an `N`-element row or column vector. For example, the block outputs a matrix of dimension `1-by-N` or `N-by-1`.
- When you clear this check box, the block does not output a vector of length `N` if the **Constant value** parameter evaluates to an `N`-element row or column vector.

Programmatic Use

Block Parameter: `VectorParams1D`
Type: character vector
Values: `'on' | 'off'`
Default: `'on'`

`Enable zero-crossing detection` — Enable zero-crossing detection

`on` (default) | Boolean

Select to enable zero-crossing detection. For more information, see “Zero-Crossing Detection” in the Simulink documentation.

Programmatic Use

Block Parameter: `ZeroCross`
Type: character vector, string
Values: `'off'` | `'on'`
Default: `'on'`

Block Characteristics

Data Types	`double`

Direct Feedthrough	`No`
Multidimensional Signals	`No`
Variable-Size Signals	`No`
Zero-Crossing Detection	`Yes`

Extended Capabilities

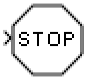
Introduced before R2006a

Stop Simulation

Stop simulation when input is nonzero
Library: Simulink / Sinks



Description

The Stop Simulation block stops the simulation when the input is nonzero. The simulation completes the current time step before terminating. If the block input is a vector, any nonzero vector element causes the simulation to stop.

When you use the Stop Simulation block in a For Iterator subsystem, the stop action occurs after execution of *all* iterations in the subsystem during a time step. The stop action does not interrupt execution until the start of the next time step.

You cannot use the Stop Simulation block to pause the simulation. To create a block that pauses the simulation, see “Pause Simulation Using Assertion Blocks”.

Ports

Input

`Port_1` — Input signal
scalar | vector | matrix

Stop simulation when input signal is nonzero. This port accepts real signals of `double` or `Boolean` data types.

Data Types: `double` | `Boolean`

Block Characteristics

Data Types	`double` | `Boolean`
Direct Feedthrough	No
Multidimensional Signals	No
Variable-Size Signals	No
Zero-Crossing Detection	No

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Not recommended for production code. Relates to resource limits and restrictions on speed and memory often found in embedded systems. Generated code can contain dynamic allocation and freeing of memory, recursion, additional memory overhead, and widely varying execution times. While the code is functionally valid and acceptable in resource-rich environments, smaller embedded targets often cannot support such code. Usually, blocks evolve toward being suitable for production code. Thus, blocks suitable for production code remain suitable.

Generated code stops executing when the stop condition is true.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

When you use this block in your model, HDL Coder™ does not generate HDL code for it. See Stop Simulation.

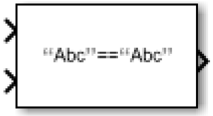
String Compare

Compare two input strings

Library: Simulink / String



Description

String Compare compares two strings. To see if two strings are identical, use this block. You can specify if the match is case sensitive and how much of the string to compare.

Ports

Input

`Port_1` — First string to compare
scalar

First string to compare, specified as a scalar.

Data Types: `string`

`Port_2` — Second string to compare
scalar

Second string to compare, specified as a scalar.

Data Types: `string`

Output

`Port_1` — True or false result
scalar

True or false result, specified as a scalar:

- `1` — Match.
- `0` — No match.

Data Types: `Boolean`

Parameters

`Case sensitive` — Case sensitivity for string comparison

on (default) | off

Case sensitivity for string comparison:

☑ on

Consider string case when comparing strings.

□ off

Do not consider string case when comparing strings.

`Compare Option` — Amount of characters to compare

`Entire string` (default) | `First N characters`

Amount of string to compare:

- `Entire string` — Compare both entire strings.
- `First N characters` — Compare the first *N* characters of both strings.

Dependencies

Setting this parameter to `First N characters` enables the **Number of characters** parameter.

`Number of characters` — Number of characters to compare

1 (default) | scalar

Number of characters to compare

Dependencies

This parameter is enabled when the **Compare Option** parameter is set to `First N characters`.

Data Types: `double`

Block Characteristics

Data Types	`Boolean` | `string`
Direct Feedthrough	`No`
Multidimensional Signals	`No`
Variable-Size Signals	`No`
Zero-Crossing Detection	`No`

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

String Concatenate

Concatenate input strings to form one output string

Library: Simulink / String

Description

The String Concatenate block concatenates multiple input strings, in order of their input, to form one output string. Use this block if you want to combine multiple strings into a single string.

Ports

Input

`Port_1` — First input string
scalar

First input string, specified as a scalar.

Data Types: `string`

`Port_2` — Second input string
scalar

Second input string, specified as a scalar.

Data Types: `string`

Output

`Port_1` — Concatenated string
scalar

Concatenated string, specified as a scalar.

Data Types: `string`

Parameters

`Number of Inputs` — Number of input strings
scalar

Number of input strings to concatenate, specified as a scalar. You can specify from 2 to 512 input ports.

`Output data type` — Output data type
`string` (default) | `scalar`

Output data type, specified using the string data type to specify a string with no maximum length.

To specify a string data type with a maximum length, specify `stringtype(N)`. For example, `stringtype(128)` creates a string data type with a maximum length of 128 characters.

Click the **Show data type assistant** button >> to display the **Data Type Assistant**, which helps you set the data type attributes. See “Specify Data Types Using Data Type Assistant” in the *Simulink User's Guide* for more information.

`Mode` — Category of data
`stringtype(128)` (default) | `scalar`

Use the `stringtype` function, for example, `stringtype(128)`.

Dependency

Clicking the **Show data type assistant** button enables this parameter.

Block Characteristics

Data Types	`string`
Direct Feedthrough	`No`
Multidimensional Signals	`No`
Variable-Size Signals	`No`
Zero-Crossing Detection	`No`

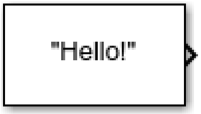
String Constant

Output specified string
Library: Simulink / String



Description

The String Constant block outputs a string specified by the **String** parameter. Use this block when you want a constant whose type is string.

Ports

Output

`Port_1` — Output string
scalar

Output string, specified as a scalar.

Data Types: `string`

Parameters

`String` — Input string
"Hello!" (default) | scalar

Input string, specified as a scalar.

`Output data type` — Output data type
`string` (default) | `scalar`

Output data type, specified using the string data type to specify a string with no maximum length.

To specify a string data type with a maximum length, specify `stringtype(`*`N`*`)`. For example, `stringtype(31)` creates a string data type with a maximum length of 31 characters.

Click the **Show data type assistant** button >> to display the **Data Type Assistant**, which helps you set the data type attributes. See “Specify Data Types Using Data Type Assistant” in the *Simulink User's Guide* for more information.

Block Characteristics

Data Types	`string`
Direct Feedthrough	`No`

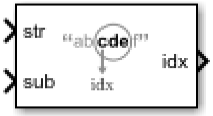
String Find

Return index of first occurrence of pattern string
Library: Simulink / String



Description

The String Find block returns the index of the first occurrence of the pattern string **sub** in the text string **str**.

Ports

Input

`str` — String in which to find pattern
scalar

String in which to find pattern (`sub`), specified as a scalar.

Data Types: `string`

`sub` — Pattern
scalar

Pattern to be found in string (`str`), specified as a scalar.

Data Types: `string`

Output

`idx` — Position index of found pattern
scalar

Position index of the found pattern, specified as a positive integer scalar.

- If the block does not find the pattern, it returns `-1`.
- If the **sub** parameter is empty (`""`), the block returns `1`, indicating that it matched the beginning of the searched string.

Data Types: `int32`

Block Characteristics

Data Types	`base integer	string`
Direct Feedthrough	`No`
Multidimensional Signals	`No`
Variable-Size Signals	`No`
Zero-Crossing Detection	`No`

Extended Capabilities

C/C++ Code Generation

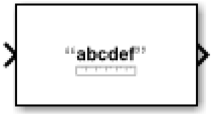
Introduced in R2018a

String Length

Output number of characters in input string

Library: Simulink / String



Description

The String Length block outputs the number of characters in the input string. For example, you can use the String Length block to move focus of attention to a particular location in a string.

Ports

Input

`Port_1` — Input string
scalar

Input string, specified as a scalar.

Data Types: `string`

Output

`Port_1` — Number of characters
scalar

Number of characters in the input string, specified as a scalar.

Data Types: `uint32`

Block Characteristics

Data Types	`base integer	string`
Direct Feedthrough	No
Multidimensional Signals	No
Variable-Size Signals	No
Zero-Crossing Detection	No

Extended Capabilities

String to ASCII

Convert string signal to uint8 vector
Library: Simulink / String

Description

The String To ASCII block converts a string signal to a uint8 vector. The block converts each character in the string to its corresponding ASCII value. For example, the block converts the input string `"Hello"` to `[72 101 108 108 111]`.

Ports

Input

`Port_1` — Input string signal
scalar

Input string signal, specified as a scalar.

Data Types: `string`

Output

`Port_1` — Converted uint8 vector signal
vector

Converted `uint8` vector signal of ASCII characters from input string signal, specified as a vector. The block converts each element in the string into its ASCII character equivalent and outputs the ASCII equivalents as a vector. If there are fewer characters than the maximum length, the block fills the remaining space with zeros at simulation. At code generation, the block fills the remaining space with null characters.

Data Types: `uint8`

Parameters

`Maximum length` — Maximum length of output vector
31 (default) | scalar

Maximum length of output string, specified as a scalar.

Block Characteristics

Data Types	`base integer` | `string`
Direct Feedthrough	`No`
Multidimensional Signals	`No`
Variable-Size Signals	`No`
Zero-Crossing Detection	`No`

Extended Capabilities

Introduced in R2018a

String to Double

Convert string signal to double signal
Library: Simulink / String

str
scan
"%lf"
lf

Description

Scan String scans an input string and converts it to signals per the format specified by the **Format** parameter. The block converts values to their decimal (base 10) representation and outputs the results as numeric or string signals. For example, if the **Format** parameter is set to `"%s is %f."`, the block outputs two parts, a string signal and a single signal. If the input is the string `"Pi is 3.14"`, the two outputs are `"Pi"` and `"3.14"`.

The Scan String, String to Double, and String to Single blocks are identical blocks. When configured for String to Double, the block converts the input string signal to a double numerical output. When configured for String to Single, the block converts the input string signal to a single numerical output.

For code generation, configure models that contain this block for non-finite number support by selecting the **Configuration Parameters** > **Code Generation** > **Interface** > **Support non-finite numbers** check box.

Ports

Input

`Port_1` — Input string
scalar

Input string, specified as a scalar.

Data Types: `string`

Output

d — Output data whose format matches %d format
scalar

Output data whose format matches specified format, defined as a scalar. Total maximum number of outputs is 128.

If the block cannot match an input string to a format operator specified in **Format**, it returns a warning and outputs an appropriate value (`0` or `""`) for each unmatched format operator.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

`f` — Output data whose format matches %f format
scalar

Output data whose format matches the `%f` format, specified as a scalar. Total maximum number of outputs is 128.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

`Port_N` — Output data whose format matches N format
scalar

Output data whose format matches *N* format, specified as a scalar. Total maximum number of outputs is 128.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Parameters

`Format` — Format operator for input
"%lf" (default) | scalar

Format operator for input, specified as a scalar. If the block cannot match the input string with the specified format, it returns `0`. The return of `0` differs from the `sscanf` function return, which is an empty matrix if the function cannot match the input with the specified format.

- For the String to Double block, this parameter has a default value of `%lf`.
- For the String to Single block, this parameter has a default value of `%f`.

For more information about acceptable format operators, see the Algorithms section.

Block Characteristics

Data Types	`double` | `single` | `base integer` | `string`
Direct Feedthrough	No
Multidimensional Signals	No
Variable-Size Signals	No
Zero-Crossing Detection	No

Algorithms

The Scan String block uses this format specifier prototype:

```
%[width][length]specifier
```

Numeric Fields

This table lists available conversion specifiers to convert text to numeric outputs. The block converts values to their decimal (base 10) representation.

Output Port Data Type	Conversion Specifier	Description
Integer, signed	%d	Base 10
Integer, unsigned	%u	Base 10

Output Port Data Type	Conversion Specifier	Description
Floating-point number	`%f`, `%e`, or `%g`	Floating-point values. Input fields can contain any of the following (not case sensitive): `Inf`, `-Inf`, `NaN`, or `-NaN`. Input fields that represents floating-point numbers can include leading `+` or `-` symbols and exponential notation using `e` or `E`. The conversion specifiers `%f`, `%e`, and `%g` all treat input fields the same way.

Character Fields

This table lists available conversion specifiers to convert text so that the output is a character array.

Character Field Type	Conversion Specifier	Description
String scalar	`%s`	Read the text until the block encounters whitespace.
	`%c`	Read any single character, including whitespace. To read multiple characters at a time, specify field width. For example, `%10c` reads 10 characters at a time.
Pattern-matching	`%[...]`	Read only characters in the brackets up to the first nonmatching character or whitespace. Example: `%[mus]` reads `'summer'` as `'summ'`.

Character Field Type	Conversion Specifier	Description
	%[^...]	Do not read characters in the brackets up to the first nonmatching character or whitespace. Example: %[m] reads 'summer' as 'su'.

Optional Operators

- Field Width — To specify the maximum number of digits or text characters to read at a time, insert a number after the percent character. For example, %10s reads up to 10 characters at a time, including whitespace. %4f reads up to four digits at a time, including the decimal point.
- Literal Text to Ignore — This block must match the specified text immediately before or after the conversion specifier.

  Example: Hell%s reads "Hello!" as "o!".

Length Specifiers

The Scan String block supports the h and l length subspecifiers. These specifiers can change according to the **Configuration Parameters** > **Hardware Implementation** > **Number of bits** settings.

Length	i	u	f e g	s c
No length specifier	int	unsigned int	single	string
h	short	unsigned short	—	—
l	long	unsigned long	double	—

Notes for Specifiers that Specify Integer Data Types (d, u)

- Target int, long, short type sizes are controlled by settings in the **Configuration Parameters** > **Hardware Implementation** pane. For example, if the target int is 32 bits and the specifier is %u, then the expected input type will be uint32. For this example, the Scan String block requires that the output type be exactly `int32`. It cannot be any other data type.

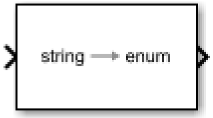
String to Enum

Input string signal to enumerated signal

Library: Simulink / String



Description

The String To Enum block converts the input string signal to an enumerated signal. To use this block, create an enumeration class in the current folder and use that class name in the **Output data type** parameter.

Ports

Input

`Port_1` — Input string signal
scalar

Input string signal, specified as a scalar.

Data Types: `string`

Output

`Output 1` — Enumerated number
scalar

Enumerated number associated with the input string, specified as a scalar.

Data Types: `enumerated`

Parameters

`Output data type` — Output data type

`SlDemoSign` (default) | `<data type expression>`

Use a data type object, for example, `Simulink.IntEnumType`.

Click the **Show data type assistant** button >> to display the **Data Type Assistant**, which helps you set the data type attributes. See "Specify Data Types Using Data Type Assistant" in the *Simulink User's Guide* for more information.

`Mode` — Category of data

`Enumerated` (default) | `<data type expression>`

Use a data type object, for example, `Simulink.IntEnumType`.

- `Enumerated` — Enumerated data class object.
- `<data type expression>` — Expressions that evaluate to data types. Selecting `Expression` enables a second menu/text box to the right, where you can enter the expression.

Dependency

Clicking the **Show data type assistant** button enables this parameter.

Block Characteristics

Data Types	`enumerated` | `string`
Direct Feedthrough	`No`
Multidimensional Signals	`No`
Variable-Size Signals	`No`
Zero-Crossing Detection	`No`

Extended Capabilities

C/C++ Code Generation

String to Single

Convert string signal to single signal
Library: Simulink / String

Description

Scan String scans an input string and converts it to signals per the format specified by the **Format** parameter. The block converts values to their decimal (base 10) representation and outputs the results as numeric or string signals. For example, if the **Format** parameter is set to `"%s is %f."`, the block outputs two parts, a string signal and a single signal. If the input is the string `"Pi is 3.14"`, the two outputs are `"Pi"` and `"3.14"`.

The Scan String, String to Double, and String to Single blocks are identical blocks. When configured for String to Double, the block converts the input string signal to a double numerical output. When configured for String to Single, the block converts the input string signal to a single numerical output.

For code generation, configure models that contain this block for non-finite number support by selecting the **Configuration Parameters** > **Code Generation** > **Interface** > **Support non-finite numbers** check box.

Ports

Input

`Port_1` — Input string
scalar

Input string, specified as a scalar.

Data Types: `string`

Output

d — Output data whose format matches %d format

scalar

Output data whose format matches specified format, defined as a scalar. Total maximum number of outputs is 128.

If the block cannot match an input string to a format operator specified in **Format**, it returns a warning and outputs an appropriate value (`0` or `""`) for each unmatched format operator.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

f — Output data whose format matches %f format

scalar

Output data whose format matches the `%f` format, specified as a scalar. Total maximum number of outputs is 128.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

`Port_N` — Output data whose format matches N format

scalar

Output data whose format matches *N* format, specified as a scalar. Total maximum number of outputs is 128.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Parameters

`Format` — Format operator for input

"%f" (default) | scalar

Format operator for input, specified as a scalar. If the block cannot match the input string with the specified format, it returns `0`. The return of `0` differs from the `sscanf` function return, which is an empty matrix if the function cannot match the input with the specified format.

- For the String to Double block, this parameter has a default value of `%lf`.
- For the String to Single block, this parameter has a default value of `%f`.

For more information about acceptable format operators, see the Algorithms section.

Block Characteristics

Data Types	`double` | `single` | `base integer` | `string`
Direct Feedthrough	No
Multidimensional Signals	No
Variable-Size Signals	No
Zero-Crossing Detection	No

Algorithms

The Scan String block uses this format specifier prototype:

```
%[width][length]specifier
```

Numeric Fields

This table lists available conversion specifiers to convert text to numeric outputs. The block converts values to their decimal (base 10) representation.

Output Port Data Type	Conversion Specifier	Description
Integer, signed	%d	Base 10
Integer, unsigned	%u	Base 10

Output Port Data Type	Conversion Specifier	Description
Floating-point number	`%f`, `%e`, or `%g`	Floating-point values. Input fields can contain any of the following (not case sensitive): `Inf`, `-Inf`, `NaN`, or `-NaN`. Input fields that represents floating-point numbers can include leading `+` or `-` symbols and exponential notation using `e` or `E`. The conversion specifiers `%f`, `%e`, and `%g` all treat input fields the same way.

Character Fields

This table lists available conversion specifiers to convert text so that the output is a character array.

Character Field Type	Conversion Specifier	Description
String scalar	`%s`	Read the text until the block encounters whitespace.
	`%c`	Read any single character, including whitespace. To read multiple characters at a time, specify field width. For example, `%10c` reads 10 characters at a time.
Pattern-matching	`%[...]`	Read only characters in the brackets up to the first nonmatching character or whitespace. Example: `%[mus]` reads `'summer'` as `'summ'`.

Character Field Type	Conversion Specifier	Description
	`%[^...]`	Do not read characters in the brackets up to the first nonmatching character or whitespace. Example: `%[m]` reads `'summer'` as `'su'`.

Optional Operators

- Field Width — To specify the maximum number of digits or text characters to read at a time, insert a number after the percent character. For example, `%10s` reads up to 10 characters at a time, including whitespace. `%4f` reads up to four digits at a time, including the decimal point.
- Literal Text to Ignore — This block must match the specified text immediately before or after the conversion specifier.

  Example: `Hell%s` reads `"Hello!"` as `"o!"`.

Length Specifiers

The Scan String block supports the `h` and `l` length subspecifiers. These specifiers can change according to the **Configuration Parameters** > **Hardware Implementation** > **Number of bits** settings.

Length	i	u	f e g	s c
No length specifier	`int`	`unsigned int`	`single`	`string`
`h`	`short`	`unsigned short`	—	—
`l`	`long`	`unsigned long`	`double`	—

Notes for Specifiers that Specify Integer Data Types (d, u)

- Target `int`, `long`, `short` type sizes are controlled by settings in the **Configuration Parameters** > **Hardware Implementation** pane. For example, if the target `int` is 32 bits and the specifier is `%u`, then the expected input type will be `uint32`. For this example, the Scan String block requires that the output type be exactly `int32`. It cannot be any other data type.

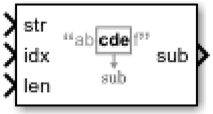
Substring

Extract substring from input string signal
Library: Simulink / String



Description

The Substring block extracts a substring from the input string signal. The block extracts the substring starting from the letter corresponding to **idx** and includes a **len** number of characters starting at **idx**. For example, if the input string is `"hello 123"`, input **idx** is `1`, and input **len** is `5`, the output is `"hello"`. The block extracts a substring starting at `1` and the next 4 characters for a total of 5 characters (`hello`).

Ports

Input

`str` — Input string signal
scalar

Input string signal, specified as a string.

Data Types: `string`

`idx` — Start of string to extract
scalar

Start of string to extract, specified as a positive scalar integer.

Data Types: `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32`

`len` — Length of string to extract
scalar

Length of string to extract, specified as a scalar. If **len** causes the substring to extend beyond the end of the string, the output signal contains few than **len** characters.

Data Types: `uint8` | `uint16` | `uint32`

Output

`sub` — Extracted string

scalar

Extracted string, specified as a scalar.

Data Types: `string`

Parameters

`Inherit maximum length from input` — Use same maximum length as input string

`off` (default) | `on`

Use same maximum length as the input string source block.

☑ on

Use same maximum length. The substring includes the characters starting from the character at **idx** to the end of the string.

□ off

Do not use same maximum length.

`Output string from 'idx' to end` — Extract string from idx to end

`off` (default) | `on`

Extract string from `idx` to end of input string.

☑ on

Extract string from `idx` to end of input string.

□ off

Do not extract string from `idx` to end of input string.

Dependencies

Selecting this parameter removes the third input port.

Block Characteristics

Data Types	`base integer` | `string`
Direct Feedthrough	`No`
Multidimensional Signals	`No`
Variable-Size Signals	`No`
Zero-Crossing Detection	`No`

Subsystem, Atomic Subsystem, Nonvirtual Subsystem, CodeReuse Subsystem

Group blocks to create model hierarchy
Library: Simulink / Ports & Subsystems

Description

A Subsystem block contains a subset of blocks within a model or system. The Subsystem block can represent a virtual subsystem or a nonvirtual subsystem.

- Nonvirtual subsystem – Control when the contents of the subsystem are evaluated as a single unit (atomic execution). Create conditionally executed subsystems that run only when an event occurs on a triggering, function-call, action, or enabling input (see "Conditionally Executed Subsystems and Models").
- Virtual subsystem – Subsystem is neither conditionally nor atomically executed. Virtual subsystems do not have checksums. To determine if a subsystem is virtual, use the `get_param` function for the Boolean block parameter `IsSubsystemVirtual`.

An atomic subsystem is a Subsystem block with the block parameter **Treat as atomic unit** selected.

A codereuse subsystem is a Subsystem block with the parameter **Treat as atomic unit** selected and the parameter **Function packaging** set to `Reusable function`, specifying the function code generation format for the subsystem.

To create a subsystem, do one of the following:

- Copy a Subsystem block from the Ports & Subsystems library into your model. Then add blocks to the subsystem by opening the Subsystem block and copying blocks into it.
- Select all blocks and lines that make up the subsystem, and select **Diagram > Subsystem & Model Reference > Create Subsystem from Selection**. Simulink replaces the blocks with a Subsystem block, along with the necessary Inport and Outport blocks to reflect signals entering and leaving the subsystem.

The number of input ports drawn on the Subsystem block icon corresponds to the number of Inport blocks in the subsystem. Similarly, the number of output ports drawn on the block corresponds to the number of Outport blocks in the subsystem.

The Subsystem block supports signal label propagation through subsystem Inport and Outport blocks.

Ports

Input

`In` — Signal input to a subsystem block

scalar | vector | matrix

Placing an Inport block in a subsystem block adds an external input port to the block. The port label matches the name of the Inport block.

Use Inport blocks to get signals from the local environment.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Output

`Out` — Signal output from a subsystem

scalar | vector | matrix

Placing an Outport block in a subsystem block adds an output port from the block. The port label on the subsystem block is the name of the Outport block.

Use Outport blocks to send signals to the local environment.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Parameters

Parameters on the Code Generation tab require a Simulink Coder or Embedded Coder license.

Main

`Show port labels` — Select how to display port labels

`FromPortIcon` (default) | `FromPortBlockName` | `SignalName`

Select how to display port labels on the Subsystem block icon.

`none`

Do not display port labels.

`FromPortIcon`

If the corresponding port icon displays a signal name, display the signal name on the Subsystem block. Otherwise, display the port block name.

`FromPortBlockName`

Display the name of the corresponding port block on the Subsystem block.

`SignalName`

If a signal name exists, display the name of the signal connected to the port on the Subsystem block. Otherwise, display the name of the corresponding port block.

Programmatic Use

Parameter: `ShowPortLabels`
Type: character vector
Value: `'FromPortIcon'` | `'FromPortBlockName'` | `'SignalName'`
Default: `'FromPortIcon'`

`Read/Write permissions` — Select access to contents of subsystem

`ReadWrite` (default) | `ReadOnly` | `NoReadOrWrite`

Control user access to the contents of the subsystem.

`ReadWrite`

Enable opening and modification of subsystem contents.

`ReadOnly`

Enable opening but not modification of the subsystem. If the subsystem resides in a block library, you can create and open links to the subsystem and can make and modify local copies of the subsystem but cannot change the permissions or modify the contents of the original library instance.

`NoReadOrWrite`

> Disable opening or modification of subsystem. If the subsystem resides in a library, you can create links to the subsystem in a model but cannot open, modify, change permissions, or create local copies of the subsystem.

Programmatic Use
Parameter: `Permissions`
Type: character vector
Value: `'ReadWrite'` | `'ReadOnly'` | `'NoReadOrWrite'`
Default: `'ReadWrite'`

`Name of error callback function` — Specify name of function

`''` (default) | function name

Enter name of a function to be called if an error occurs while Simulink is executing the subsystem.

Simulink passes two arguments to the function: the handle of the subsystem and a character vector that specifies the error type. If no function is specified, Simulink displays a generic error message if executing the subsystem causes an error.

Programmatic Use
Parameter: `ErrorFcn`
Type: character vector
Value: `''` | `'<function name>'`
Default: `''`

`Permit hierarchical resolution` — Select how to resolve workspace variable names

`All` (default) | `ExplicitOnly` | `None`

Select whether to resolve names of workspace variables referenced by this subsystem.

See “Symbol Resolution” and “Symbol Resolution Process” in the Simulink User's Guide for more information.

`All`

> Resolve all names of workspace variables used by this subsystem, including those used to specify block parameter values and Simulink data objects (for example, `Simulink.Signal` objects).

`ExplicitOnly`

Resolve only names of workspace variables used to specify block parameter values, data store memory (where no block exists), signals, and states marked as “must resolve”.

`None`

Do not resolve any workspace variable names.

Programmatic Use
Parameter: `PermitHierarchicalResolution`
Type: character vector
Value: `'All'` | `'ExplicitOnly'` | `'None'`
Default: `'All'`

`Treat as atomic unit` — Control execution of a subsystem as one unit

off (default) | on

Causes Simulink to treat the subsystem as a unit when determining the execution order of block methods.

☐ off

Treat all blocks in the subsystem as being at the same level in the model hierarchy as the subsystem when determining block method execution order. This can cause execution of methods of blocks in the subsystem to be interleaved with execution of methods of blocks outside the subsystem.

☑ on

Treat the subsystem as a unit when determining the execution order of block methods. For example, when it needs to compute the output of the subsystem, Simulink invokes the output methods of all the blocks in the subsystem before invoking the output methods of other blocks at the same level as the subsystem block.

Dependency

Selecting this parameter, enables the **Minimize algebraic loop occurrences**, **Sample time**, and **Function packaging** parameters. Using **Function packaging** requires a Simulink Coder license.

Programmatic Use
Parameter: `TreatAsAtomicUnit`
Type: character vector

Value: `'off'` | `'on'`
Default: `'off'`

`Minimize algebraic loop occurrences` — Control elimination of algebraic loops

off (default) | on

Try to eliminate any artificial algebraic loops that include the atomic subsystem

☐ off

Do not try to eliminate any artificial algebraic loops that include the atomic subsystem.

☑ on

Try to eliminate any artificial algebraic loops that include the atomic subsystem.

Dependency

To enable this parameter, select the **Treat as atomic unit** parameter.

Programmatic Use

Parameter: `MinAlgLoopOccurrences`
Type: character vector
Value: `'off'` | `'on'`
Default: `'off'`

`Sample time` — Specify time interval

`-1` (default) | `[Ts 0]`

Specify whether all blocks in this subsystem must run at the same rate or can run at different rates.

- If the blocks in the subsystem can run at different rates, specify the subsystem's sample time as inherited (`-1`).
- If all blocks must run at the same rate, specify the sample time corresponding to this rate as the value of the **Sample time** parameter.
- If any of the blocks in the subsystem specify a different sample time (other than `-1` or `inf`), Simulink displays an error message when you update or simulate the model. For example, suppose all the blocks in the subsystem must run `5` times a second. To ensure this, specify the sample time of the subsystem as `0.2`. In this example, if any of the

blocks in the subsystem specify a sample time other than `0.2`, `-1`, or `inf`, Simulink displays an error when you update or simulate the model.

`-1`

Specify inherited sample time. Use this sample time if the blocks in the subsystem can run at different rates.

`[Ts 0]`

Specify periodic sample time.

Dependency

To enable this parameter, select the **Treat as atomic unit** parameter.

Programmatic Use

Parameter: `SystemSampleTime`
Type: character vector
Value: `'-1'` | `'[Ts 0]'`
Default: `'-1'`

`Propagate execution context across subsystem boundary` — Control execution across block boundary

off (default) | on

Enable execution context propagation across the boundary of this subsystem.

□ off

Do not enable execution context propagation across this subsystem's boundary.

☑ on

Enable execution context propagation across this subsystem's boundary.

Dependency

Enable this parameter by adding an Enable port or Trigger port block to the Subsystem block.

Programmatic Use

Parameter: `PropExecContextOutsideSubsystem`
Type: character vector
Value: `'off'` | `'on'`
Default: `'off'`

`Variant control` — Specify variant control (condition) expression

`Variant` (default) | logical expression

Specify variant control (condition) expression that executes a variant Simulink Function block when the expression evaluates to `true`.

See also `Simulink.Variant`

`Variant`

Default name for a logical (Boolean) expression.

logical expression

A logical (Boolean) expression or a `Simulink.Variant` object representing a logical expression.

The function is activated when the expression evaluates to `true`.

If you want to generate code for your model, define the variables in the expression as `Simulink.Parameter` objects.

Dependency

Enable this parameter by adding a Subsystem block inside a Variant Subsystem block.

Programmatic Use

Block parameter: `VariantControl`
Type: character vector
Value: `'Variant'` | `'<logical expression>'`
Default: `'Variant'`

`Treat as grouped when propagating variant conditions` — Control treating subsystem as unit

`on` (default) | `off`

Causes Simulink to treat the subsystem as a unit when propagating variant conditions from Variant Source blocks or to Variant Sink blocks.

☑ on

Simulink treats the subsystem as a unit when propagating variant conditions from Variant Source blocks or to Variant Sink blocks. For example, when Simulink computes the variant condition of the subsystem, it propagates that condition to all the blocks in the subsystem.

□ off

Simulink treats all blocks in the subsystem as being at the same level in the model hierarchy as the subsystem itself when determining their variant condition.

Programmatic Use
Parameter: `TreatAsGroupedWhenPropagatingVariantConditions`
Type: character vector
Value: `'on'` | `'off'`
Default: `'on'`

Code Generation

Function packaging — Select code format

`Auto` (default) | `Inline` | `Nonreusable function` | `Reusable function`

Select the code format to be generated for an atomic (nonvirtual) subsystem.

`Auto`

Simulink Coder chooses the optimal format for you based on the type and number of instances of the subsystem that exist in the model.

`Inline`

Simulink Coder inlines the subsystem unconditionally.

`Nonreusable function`

Simulink Coder explicitly generates a separate function in a separate file. Subsystems with this setting generate functions that might have arguments depending on the "Function interface" on page 1-0 parameter setting. You can name the generated function and file using parameters "Function name" on page 1-0 and "File name (no extension)" on page 1-0 . These functions are not reentrant.

`Reusable function`

Simulink Coder generates a function with arguments that allows reuse of subsystem code when a model includes multiple instances of the subsystem.

This option also generates a function with arguments that allows subsystem code to be reused in the generated code of a model reference hierarchy that includes multiple instances of a subsystem across referenced models. In this case, the subsystem must be in a library.

Tips

- When you want multiple instances of a subsystem to be represented as one reusable function, you can designate each one of them as `Auto` or as `Reusable function`. It is best to use one or the other, as using both creates two reusable functions, one for each designation. The outcomes of these choices differ only when reuse is not possible. Selecting `Auto` does not allow control of the function or file name for the subsystem code.
- The `Reusable function` and `Auto` options both try to determine if multiple instances of a subsystem exist and if the code can be reused. The difference between the options' behavior is that when reuse is not possible:

  - `Auto` yields inlined code, or if circumstances prohibit inlining, separate functions for each subsystem instance.
  - `Reusable function` yields a separate function with arguments for each subsystem instance in the model.
- If you select `Reusable function` while your generated code is under source control, set **File name options** to `Use subsystem name`, `Use function name`, or `User specified`. Otherwise, the names of your code files change whenever you modify your model, which prevents source control on your files.

Dependency

- This parameter requires Simulink Coder for code generation.
- To enable this parameter, select **Treat as atomic unit**.
- Setting this parameter to `Nonreusable function` or `Reusable function` enables the following parameters:

  - **Function name options**
  - **File name options**
  - Memory section for initialize/terminate functions (requires a license for Embedded Coder and an ERT-based system target file)
  - Memory section for execution functions (requires a license for Embedded Coder and an ERT-based system target file)
- Setting this parameter to `Nonreusable function` enables **Function with separate data** (requires a license for Embedded Coder and an ERT-based system target file).

Programmatic Use

Parameter: `RTWSystemCode`
Type: character vector
Value: `'Auto'` | `'Inline'` | `'Nonreusable function'` | `'Reusable function'`
Default: `'Auto'`

- "Generate Reusable Code from Library Subsystems Shared Across Models" (Simulink Coder)

`Function name options` — Select how to name generated function

`Auto` (default) | `Use subsystem name` | `User specified`

Select how Simulink Coder names the function it generates for the subsystem.

If you have an Embedded Coder license, you can control function names with options on the Configuration Parameter **Code Generation** > **Symbols** pane.

`Auto`

Assign a unique function name using the default naming convention, *`model_subsystem`*`()`, where *`model`* is the name of the model and *`subsystem`* is the name of the subsystem (or that of an identical one when code is being reused).

If you select `Reusable function` for the **Function packaging** parameter and there are multiple instances of the reusable subsystem in a model reference hierarchy, in order to generate reusable code for the subsystem, **Function name options** must be set to `Auto`.

`Use subsystem name`

Use the subsystem name as the function name. By default, the function name uses the naming convention *`model_subsystem`*.

> **Note** When a subsystem is in a library block and the subsystem parameter “Function packaging” on page 1-0 is set to `Reusable function`, if you set the `Use subsystem name` option, the code generator uses the name of the library block for the subsystem's function name and file name.

`User specified`

Enable the **Function name** field. Enter any legal C or C++ function name, which must be unique.

Dependency

- This parameter requires a Simulink Coder license.
- Setting Code generation function packaging to `Nonreusable function` or `Reusable function` enables this parameter.
- Setting this parameter to `User specified` enables the Code generation function name parameter.

Programmatic Use
Parameter: `RTWFcnNameOpts`
Type: character vector
Value: `'Auto'` | `'Use subsystem name'` | `'User specified'`
Default: `'Auto'`

See also

For more information, see “Control Generation of Subsystem Functions” (Simulink Coder).

`Function name` — Specify function name

`''` (default) | function name

Specify a unique, valid C or C++ function name for subsystem code.

Use this parameter if you want to give the function a specific name instead of allowing the Simulink Coder code generator to assign its own autogenerated name or use the subsystem name. For more information, see “Control Generation of Subsystem Functions” (Simulink Coder).

Dependency

- This parameter requires a Simulink Coder license.

- To enable this parameter, set the **Function name options** parameter to `User specified`.

Programmatic Use
Parameter: `RTWFcnName`
Type: character vector
Value: `''` | `'<function name>'`
Default: `''`

`File name options` — Specify how to name generated file

`Auto` (default) | `Use subsystem name` | `Use function name` | `User specified`

Select how Simulink Coder names the separate file for the function it generates for the subsystem.

See "Block-Specific Parameters" on page 6-128 for the command-line information.

`Auto`

Depending on the configuration of the subsystem and how many instances are in the model, `Auto` yields different results:

- If the code generator does *not* generate a separate file for the subsystem, the subsystem code is generated within the code module generated from the subsystem's parent system. If the subsystem's parent is the model itself, the subsystem code is generated within *`model`*`.c` or *`model`*`.cpp`.
- If you select `Reusable function` for the **Function packaging** parameter and your generated code is under source control, consider specifying a **File name options** value other than `Auto`. This prevents the generated file name from changing due to unrelated model modifications, which is problematic for using source control to manage configurations.
- If you select `Reusable function` for the **Function packaging** parameter and there are multiple instances of the reusable subsystem in a model reference hierarchy, in order to generate reusable code for the subsystem, **File name options** must be set to `Auto`.

`Use subsystem name`

The code generator generates a separate file, using the subsystem (or library block) name as the file name.

Note When **File name options** is set to `Use subsystem name`, the subsystem file name is mangled if the model contains Model blocks, or if a model reference target is being generated for the model. In these situations, the file name for the subsystem consists of the subsystem name prefixed by the model name.

`Use function name`

The code generator uses the function name specified by **Function name options** as the file name.

`User specified`

This option enables the **File name (no extension)** text entry field. The code generator uses the name you enter as the file name. Enter any file name, but do not include the `.c` or `.cpp` (or any other) extension. This file name need not be unique.

Note While a subsystem source file name need not be unique, you must avoid giving nonunique names that result in cyclic dependencies (for example, `sys_a.h` includes `sys_b.h`, `sys_b.h` includes `sys_c.h`, and `sys_c.h` includes `sys_a.h`).

Dependency

- This parameter requires a Simulink Coder license.
- To enable this parameter, set **Function packaging** to `Nonreusable function` or `Reusable function`.
- Setting this parameter to `User specified` enables the **File name (no extension)** parameter.

Programmatic Use

Parameter: `RTWFileNameOpts`
Type: character vector
Value: `'Auto'` | `'Use subsystem name'` | `'Use function name'` | `'User specified'`
Default: `'Auto'`

`File name (no extension)` — Specify file name

`''` (default) | file name

The file name that you specify does not have to be unique. However, avoid giving non-unique names that result in cyclic dependencies (for example, `sys_a.h` includes `sys_b.h`, `sys_b.h` includes `sys_c.h`, and `sys_c.h` includes `sys_a.h`).

For more information, see “Control Generation of Subsystem Functions” (Simulink Coder).

Dependency

- This parameter requires a Simulink Coder license.
- To enable this parameter, set **File name options** to `User specified`.

Programmatic Use
Parameter: `RTWFileName`
Type: character vector
Value: `''` | `'<file name>'`
Default: `''`

`Function with separate data` — Control code generation for subsystem

off (default) | on

Generate subsystem function code in which the internal data for an atomic subsystem is separated from its parent model and is owned by the subsystem.

□ off

Do not generate subsystem function code in which the internal data for an atomic subsystem is separated from its parent model and is owned by the subsystem.

☑ on

Generate subsystem function code in which the internal data for an atomic subsystem is separated from its parent model and is owned by the subsystem. The subsystem data structure is declared independently from the parent model data structures. A subsystem with separate data has its own block I/O and `DWork` data structure. As a result, the generated code for the subsystem is easier to trace and test. The data separation also tends to reduce the maximum size of global data structures throughout the model, because they are split into multiple data structures.

Dependency

- This parameter requires a license for Embedded Coder and an ERT-based system target file.
- To enable this parameter, set **Function packaging** to `Nonreusable function`.
- Selecting this parameter enables these parameters:

- **Memory section for constants**
- **Memory section for internal data**
- **Memory section for parameters**

Programmatic Use

Parameter: `FunctionWithSeparateData`
Type: character vector
Value: `'off'` | `'on'`
Default: `'off'`

See also

- See the Subsystem block reference page for more information.
- For details on how to generate modular function code for an atomic subsystem, see "Generate Modular Function Code for Nonvirtual Subsystems" (Embedded Coder).
- For details on how to apply memory sections to atomic subsystems, see "Override Default Memory Placement for Subsystem Functions and Data" (Embedded Coder).

`Function interface` — Select to use arguments with generate function

`void_void` (default) | `Allow arguments`

Select to use arguments with generated function.

`void_void`

Generate a function without arguments and pass data as global variables. For example:

```
void subsystem_function(void)
```

`Allow arguments`

Generate a function that uses arguments instead of passing data as global variables. This specification reduces global RAM. It might reduce code size and improve execution speed, and allow the code generator to apply additional optimizations. For example:

```
void subsystem_function(real_T rtu_In1, real_T rtu_In2,
                        real_T *rty_Out1)
```

Dependency

- This parameter requires an Embedded Coder license and an ERT-based system target file.

- To enable this parameter, set **Function packaging** to `Nonreusable function`.

Programmatic Use

Parameter: `FunctionInterfaceSpec`
Type: character vector
Value: `'void_void'` | `'Allow arguments'`
Default: `'void_void'`

- “Generate Modular Function Code for Nonvirtual Subsystems” (Embedded Coder)

`Memory section for initialize/terminate functions` — Select how to apply memory sections

`Inherit from model` (default) | `Default` | `The memory section of interest`

Select how Embedded Coder applies memory sections to the subsystem initialization and termination functions.

`Inherit from model`

Apply the root model's memory sections to the subsystem's function code

`Default`

Do not apply memory sections to the subsystem's system code, overriding any model-level specification

`The memory section of interest`

Apply one of the model's memory sections to the subsystem

Tips

- The possible values vary depending on what (if any) package of memory sections you have set for the model's configuration. See “Control Data and Function Placement in Memory by Inserting Pragmas” (Embedded Coder) and “Model Configuration Parameters: Code Generation” (Simulink Coder).
- If you have not configured the model with a package, `Inherit from model` is the only value that appears. Otherwise, the list includes `Default` and all memory sections the model's package contains.
- These options can be useful for overriding the model's memory section settings for the given subsystem.

Dependency

- This parameter requires a license for Embedded Coder software and an ERT-based system target file.
- To enable this parameter, set **Function packaging** to `Nonreusable function` or `Reusable function`.

Programmatic Use

Parameter: `RTWMemSecFuncInitTerm`
Type: character vector
Value: `'Inherit from model'` | `'Default'` | `'The memory section of interest'`
Default: `'Inherit from model'`

See also

- See the Subsystem block reference page for more information.
- For details on how to apply memory sections to atomic subsystems, see “Override Default Memory Placement for Subsystem Functions and Data” (Embedded Coder).

`Memory section for execution functions` — Select how to apply memory sections

`Inherit from model` (default) | `Default` | `The memory section of interest`

Select how Embedded Coder applies memory sections to the subsystem's execution functions.

`Inherit from model`

Apply the root model's memory sections to the subsystem's function code

`Default`

Do not apply memory sections to the subsystem system code, overriding any model-level specification

`The memory section of interest`

Apply one of the model's memory sections to the subsystem

Tips

- The possible values vary depending on what (if any) package of memory sections you have set for the model's configuration. See “Control Data and Function Placement in Memory by Inserting Pragmas” (Embedded Coder) and “Model Configuration Parameters: Code Generation” (Simulink Coder).

- If you have not configured the model with a package, `Inherit from model` is the only value that appears. Otherwise, the list includes `Default` and all memory sections the model's package contains.
- These options can be useful for overriding the model's memory section settings for the given subsystem.

Dependency

- This parameter requires a license for Embedded Coder software and an ERT-based system target file.
- To enable this parameter, set **Function packaging** to `Nonreusable function` or `Reusable function`.

Programmatic Use

Parameter: `RTWMemSecFuncExecute`
Type: character vector
Value: `'Inherit from model'` | `'Default'` | `'The memory section of interest'`
Default: `'Inherit from model'`

See also

- See the Subsystem block reference page for more information.
- For details on how to apply memory sections to atomic subsystems, see “Override Default Memory Placement for Subsystem Functions and Data” (Embedded Coder).

`Memory section for constants` — Select how to apply memory sections

`Inherit from model` (default) | `Default` | `The memory section of interest`

Select how Embedded Coder applies memory sections to the subsystem constants.

`Inherit from model`

Apply the root model's memory sections to the subsystem's data

`Default`

Not apply memory sections to the subsystem's data, overriding any model-level specification

`The memory section of interest`

Apply one of the model's memory sections to the subsystem

Tips

- The memory section that you specify applies to the corresponding global data structures in the generated code. For basic information about the global data structures generated for atomic subsystems, see “Standard Data Structures in the Generated Code” (Simulink Coder).
- Can be useful for overriding the model's memory section settings for the given subsystem.
- The possible values vary depending on what (if any) package of memory sections you have set for the model's configuration. See “Control Data and Function Placement in Memory by Inserting Pragmas” (Embedded Coder).
- If you have not configured the model with a package, `Inherit from model` is the only value that appears. Otherwise, the list includes `Default` and all memory sections the model's package contains.

Dependency

- This parameter requires a license for Embedded Coder and an ERT-based system target file.
- To enable this parameter, set **Function packaging** to `Nonreusable function` and select the **Function with separate data** parameter

Programmatic Use

Parameter: `RTWMemSecDataConstants`
Type: character vector
Value: `'Inherit from model'` | `'Default'` | `'The memory section of interest'`
Default: `'Inherit from model'`

See also

- See the Subsystem block reference page for more information.
- For details on how to apply memory sections to atomic subsystems, see “Override Default Memory Placement for Subsystem Functions and Data” (Embedded Coder).

`Memory section for internal data` — Select how to apply memory sections

`Inherit from model` (default) | `Default` | `The memory section of interest`

Select how Embedded Coder applies memory sections to the subsystem internal data.

`Inherit from model`

Apply the root model's memory sections to the subsystem's data

`Default`

Not apply memory sections to the subsystem's data, overriding any model-level specification

`The memory section of interest`

Apply one of the model's memory sections to the subsystem

Tips

- The memory section that you specify applies to the corresponding global data structures in the generated code. For basic information about the global data structures generated for atomic subsystems, see “Standard Data Structures in the Generated Code” (Simulink Coder).
- Can be useful for overriding the model's memory section settings for the given subsystem.
- The possible values vary depending on what (if any) package of memory sections you have set for the model's configuration. See “Control Data and Function Placement in Memory by Inserting Pragmas” (Embedded Coder).
- If you have not configured the model with a package, `Inherit from model` is the only value that appears. Otherwise, the list includes `Default` and all memory sections the model's package contains.

Dependency

- This parameter requires a license for Embedded Coder and an ERT-based system target file.
- To enable this parameter, set **Function packaging** to `Nonreusable function` and select the **Function with separate data** parameter.

Programmatic Use

Parameter: `RTWMemSecDataInternal`
Type: character vector
Value: `'Inherit from model'` | `'Default'` | `'The memory section of interest'`
Default: `'Inherit from model'`

See also

- See the Subsystem block reference page for more information.
- For details on how to apply memory sections to atomic subsystems, see “Override Default Memory Placement for Subsystem Functions and Data” (Embedded Coder).

`Memory section for parameters` — Select how to apply memory sections

`Inherit from model` (default) | `Default` | `The memory section of interest`

Select how Embedded Coder applies memory sections to the subsystem parameters.

`Inherit from model`

Apply the root model's memory sections to the subsystem's function code

`Default`

Not apply memory sections to the subsystem's system code, overriding any model-level specification

The memory section of interest

Apply one of the model's memory sections to the subsystem

Tips

- The memory section that you specify applies to the corresponding global data structure in the generated code. For basic information about the global data structures generated for atomic subsystems, see “Standard Data Structures in the Generated Code” (Simulink Coder).
- Can be useful for overriding the model's memory section settings for the given subsystem.
- The possible values vary depending on what (if any) package of memory sections you have set for the model's configuration. See “Control Data and Function Placement in Memory by Inserting Pragmas” (Embedded Coder).
- If you have not configured the model with a package, `Inherit from model` is the only value that appears. Otherwise, the list includes `Default` and all memory sections the model's package contains.

Dependency

- This parameter requires a license for Embedded Coder and an ERT-based system target file.

- To enable this parameter, set **Function packaging** to `Nonreusable function` and select the **Function with separate data** parameter.

Programmatic Use
Parameter: `RTWMemSecDataParameters`
Type: character vector
Value: `'Inherit from model'` | `'Default'` | `'The memory section of interest'`
Default: `'Inherit from model'`

See also

- See the Subsystem block reference page for more information.
- For details on how to apply memory sections to atomic subsystems, see “Override Default Memory Placement for Subsystem Functions and Data” (Embedded Coder).

Block Characteristics

Data Types	double[a] | single[a] | Boolean[a] | base integer[a] | fixed point[a] | enumerated[a] | bus[a] | string[a]
Direct Feedthrough	No
Multidimensional Signals	Yes[a]
Variable-Size Signals	Yes[a]
Zero-Crossing Detection	No

[a] Actual data type or capability support depends on block implementation.

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

Fixed-Point Conversion

Convert floating-point algorithms to fixed point using Fixed-Point Designer™.

AddSubtractSum of ElementsSum

Add or subtract inputs

Library: Simulink / Math Operations

Description

The Sum block performs addition or subtraction on its inputs. The Add, Subtract, Sum of Elements, and Sum blocks are identical blocks. This block can add or subtract scalar, vector, or matrix inputs. It can also collapse the elements of a signal and perform a summation.

You specify the operations of the block with the **List of signs** parameter with plus (+), minus (-), and spacer (|).

- The number of + and - characters equals the number of inputs. For example, +-+ requires three inputs. The block subtracts the second (middle) input from the first (top) input, and then adds the third (bottom) input.
- A spacer character creates extra space between ports on the block icon.
- If performing only addition, you can use a numerical value equal to the number of inputs.
- If only there is only one input port, a single + or - adds or subtracts the elements over all dimensions or in the specified dimension.

The Sum block first converts the input data type to its accumulator data type, then performs the specified operations. The block converts the result to its output data type using the specified rounding and overflow modes.

Calculation of Block Output

Output calculation for the Sum block depends on the number of block inputs and the sign of input ports:

If the Sum block has...	And...	The formula for output calculation is...	Where...
One input port	The input port sign is +	y = e[0] + e[1] + e[2] ... + e[m]	`e[i]` is the ith element of input u
	The input port sign is –	y = 0.0 – e[0] – e[1] – e[2] ... – e[m]	
Two or more input ports	All input port signs are –	y = 0.0 – u[0] – u[1] – u[2] ... – u[n]	`u[i]` is the input to the ith input port
	The kth input port is the first port where the sign is +	y = u[k] – u[0] – u[1] – u[2] – u[k–1] (+/–) u[k+1] ... (+/–) u[n]	

Ports

Inputs

The inputs can be of different data types, unless you select the **Require all inputs to have the same data type** parameter.

`Port_1` — First input operand signal

scalar | vector | matrix

Input signal to the addition or subtraction operation. If there is only one input signal, then addition or subtraction is performed on the elements over all dimensions or the specified dimension.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point`

`Port_n` — nth input operand signal

scalar | vector | matrix

`n`th input signal to the operations. The number of inputs matches the number of signs in the **List of signs** parameter. The block applies the operations to the inputs in the order listed. You can also use a numerical value equal to the number of input ports as the **List of signs** parameter. The block creates the input ports and applies addition to all inputs. For example, if you assign 5 for the **List of signs** parameter, the block creates 5 input ports and adds them together to produce the output.

All nonscalar inputs must have the same dimensions. Scalar inputs are expanded to have the same dimensions as other inputs.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point`

Output

`Port_1` — Output signal

scalar | vector | matrix

Output signal resulting from addition and/or subtraction operations. The output signal has the same dimension as the input signals.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point`

Parameters

Main

`Icon shape` — Block icon shape

rectangular (default) | **round**

Designate the icon shape of the block as rectangular or round.

For a rectangular block, the first input port is the top port. For a round Sum block, the first input port is the port closest to the 12 o'clock position going in a counterclockwise direction around the block. Similarly, other input ports appear in counterclockwise order around the block.

Programmatic Use
Block Parameter: `IconShape`
Type: character vector
Values: `'rectangular'` | `'round'`

Default: `'on'`

`List of signs` — Operations performed on inputs

++ (default) | + | - | | | `integer`

Enter addition and subtraction operations performed on the inputs. An input port is created for each operation. A spacer (`|`) creates extra space between the input ports on the block icon. Addition is the default operation. If you only want to add the inputs, enter the number of input ports. The operations are performed in the order listed.

When you enter only one element, the block enables the **Sum over** parameter. For a single vector input, `+` or `-` adds or subtracts the elements over all dimensions or in the specified dimension.

Tips

You can manipulate the positions of the input ports on the block by inserting spacers (`|`) between the signs in the **List of signs** parameter. For example, "`++|--`" creates an extra space between the second and third input ports.

Programmatic Use

Block Parameter: `Inputs`
Type: character vector
Values: `'+'` | `'-'` | `|` | integer
Default: `'++'`

`Sum over` — Dimensions for operations on a single vector input

All dimensions (default) | **Specified dimension**

Select the dimension over which the block performs the sum-over operation.

For **All dimensions**, all input elements are summed. When you select configuration parameter **Use algorithms optimized for row-major array layout**, Simulink enables row-major algorithms for simulation. To generate row-major code, set configuration parameter **Array layout** (Simulink Coder) to `Row-major` in addition to selecting **Use algorithms optimized for row-major array layout**. The column-major and row-major algorithms differ only in the summation order. In some cases, due to different operation order on the same data set, you might experience minor numeric differences in the outputs of column-major and row-major algorithms.

When you select **Specified dimensions**, another parameter **Dimension** appears. Choose the specific dimension for summing the vector input.

Dependency

Enabled when you list only one sign in the **List of signs** parameter.

Programmatic Use

Block Parameter: `CollapseMode`
Type: character vector
Values: `'All dimensions'` | `'Specified dimension'`
Default: `'All dimensions'`

`Dimension` — Dimension for summation on vector input

`1` (default) | `integer`

When you choose **Specified dimension** for the **Sum over** parameter, specify the dimension over which to perform the operation.

The block follows the same summation rules as the MATLAB `sum` function.

Suppose that you have a 2-by-3 matrix *U*.

- Setting **Dimension** to `1` results in the output *Y* being computed as:

  $$Y = \sum_{i=1}^{2} U(i, j)$$

- Setting **Dimension** to `2` results in the output *Y* being computed as:

  $$Y = \sum_{j=1}^{3} U(i, j)$$

If the specified dimension is greater than the dimension of the input, an error message appears.

Dependency

Enabled when you choose `Specified dimension` for the **Sum over** parameter.

Programmatic Use

Block Parameter: `CollapseDim`
Type: character vector
Value: `integer`
Default: `'1'`

Sample time — Specify sample time as a value other than -1

-1 (default) | scalar

Specify the sample time as a value other than -1. For more information, see “Specify Sample Time”.

Dependencies

This parameter is not visible unless it is explicitly set to a value other than -1. To learn more, see “Blocks for Which Sample Time Is Not Recommended”.

Programmatic Use

Block Parameter: SampleTime
Type: character vector
Values: scalar
Default: '-1'

Signal Attributes

Click the **Show data type assistant** button >> to display the **Data Type Assistant**, which helps you set the data type attributes. For more information, see “Specify Data Types Using Data Type Assistant”.

Require all inputs to have the same data type — Require that all inputs have the same data type

off (default) | on

Specify if input signals must all have the same data type. If you enable this parameter, then an error occurs during simulation if the input signal types are different.

Programmatic Use

Block Parameter: InputSameDT
Type: character vector
Values: 'off' | 'on'
Default: 'off'

Accumulator data type — Data type of the accumulator

Inherit: Inherit via internal rule (default) | Inherit: Same as first input | double | single | int8 | uint8 | int16 | uint16 | int32 | uint32 | fixdt(1,16) | fixdt(1,16,0) | fixdt(1,16,2^0,0) | <data type expression>

Choose the data type of the accumulator. The type can be inherited, specified directly, or expressed as a data type object such as `Simulink.NumericType`. When you choose `Inherit: Inherit via internal rule`, Simulink chooses a data type to balance numerical accuracy, performance, and generated code size, while taking into account the properties of the embedded target hardware.

Programmatic Use
Block Parameter: `AccumDataTypeStr`
Type: character vector
Values: `'Inherit: Inherit via internal rule'` | `'Inherit: Same as first input'` | `'double'` `'single'` | `'int8'` | `'uint8'` | `'int16'` | `'uint16'`, `'int32'` | `'uint32'` | `'fixdt(1,16)'` | `'fixdt(1,16,0)'` | `'fixdt(1,16,2^0,0)'` | `'<data type expression>'`
Default: `'Inherit: Inherit via internal rule'`

`Output minimum` — Minimum output value for range checking

`[ ]` (default) | scalar

Lower value of the output range that Simulink checks.

Simulink uses the minimum to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
- Simulation range checking (see “Signal Ranges” and “Enable Simulation Range Checking”).
- Automatic scaling of fixed-point data types.
- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Simulink Coder).

Note **Output minimum** does not saturate or clip the actual output signal. Use the Saturation block instead.

Programmatic Use
Block Parameter: `OutMin`
Type: character vector
Values: `'[ ]'` | scalar

Default: `'[ ]'`

`Output maximum` — Maximum output value for range checking

[ ] (default) | scalar

Upper value of the output range that Simulink checks.

Simulink uses the maximum value to perform:

- Parameter range checking (see "Specify Minimum and Maximum Values for Block Parameters") for some blocks.
- Simulation range checking (see "Signal Ranges" and "Enable Simulation Range Checking").
- Automatic scaling of fixed-point data types.
- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see "Optimize using the specified minimum and maximum values" (Simulink Coder).

Note **Output maximum** does not saturate or clip the actual output signal. Use the Saturation block instead.

Programmatic Use
Block Parameter: `OutMax`
Type: character vector
Values: `'[ ]'`| scalar
Default: `'[ ]'`

`Output data type` — Specify the output data type

`Inherit: Inherit via internal rule` (default) | `Inherit: Inherit via back propagation` | `Inherit: Same as first input` | `Inherit: Same as accumulator` | `double` | `single` | `int8` | `uint8` | `int16` | `uint16` | `int32` | `uint32` | `fixdt(1,16)` | `fixdt(1,16,0)` | `fixdt(1,16,2^0,0)` | `<data type expression>`

Choose the data type for the output. The type can be inherited, specified directly, or expressed as a data type object such as `Simulink.NumericType`.

When you select an inherited option, the block behaves as follows:

- `Inherit: Inherit via internal rule`—Simulink chooses a data type to balance numerical accuracy, performance, and generated code size, while taking into account the properties of the embedded target hardware. If you change the embedded target settings, the data type selected by the internal rule might change. It is not always possible for the software to optimize code efficiency and numerical accuracy at the same time. If the internal rule doesn’t meet your specific needs for numerical accuracy or performance, use one of the following options:

  - Specify the output data type explicitly.
  - Use the simple choice of `Inherit: Same as first input`.
  - Explicitly specify a default data type such as `fixdt(1,32,16)` and then use the Fixed-Point Tool to propose data types for your model. For more information, see `fxptdlg`.
  - To specify your own inheritance rule, use `Inherit: Inherit via back propagation` and then use a Data Type Propagation block. Examples of how to use this block are available in the Signal Attributes library Data Type Propagation Examples block.

  Note The accumulator internal rule favors greater numerical accuracy, possibly at the cost of less efficient generated code. To get the same accuracy for the output, set the output data type to `Inherit: Inherit same as accumulator`.

- `Inherit: Inherit via back propagation` — Use data type of the driving block.
- `Inherit: Same as first input` — Use data type of the first input signal.
- `Inherit: Inherit same as accumulator`— Use data type of the accumulator.

Programmatic Use

Block Parameter: `OutDataTypeStr`
Type: character vector
Values: `'Inherit: Inherit via internal rule` | `'Inherit: Inherit via back propagation'` `'Inherit: Same as first input'` | `'Inherit: Same as accumulator'` | `'double'` | `'single'` | `'int8'` | `'uint8'` | `'int16'` | `'uint16'`, `'int32'` | `'uint32'` | `'fixdt(1,16)'` | `'fixdt(1,16,0)'` | `'fixdt(1,16,2^0,0)'` | `'<data type expression>'`
Default: `'Inherit: Inherit via internal rule'`

Lock data type settings against changes by the fixed-point tools — Prevent fixed-point tools from overriding data types

`off` (default) | `on`

Select to lock data type settings of this block against changes by the Fixed-Point Tool and the Fixed-Point Advisor. For more information, see “Lock the Output Data Type Setting” (Fixed-Point Designer).

Programmatic Use
Block Parameter: `LockScale`
Values: `'off' | 'on'`
Default: `'off'`

`Integer rounding mode` — Rounding mode for fixed-point operations

`Floor` (default) | `Ceiling` | `Convergent` | `Nearest` | `Round` | `Simplest` | `Zero`

Specify the rounding mode for fixed-point operations. For more information, see “Rounding” (Fixed-Point Designer).

Block parameters always round to the nearest representable value. To control the rounding of a block parameter, enter an expression using a MATLAB rounding function into the mask field.

Programmatic Use
Block Parameter: `RndMeth`
Type: character vector
Values: `'Ceiling' | 'Convergent' | 'Floor' | 'Nearest' | 'Round' | 'Simplest' | 'Zero'`
Default: `'Floor'`

`Saturate on integer overflow` — Method of overflow action

`off` (default) | `on`

Specify whether overflows saturate or wrap.

Action	Rationale	Impact on Overflows	Example
Select this check box (`on`).	Your model has possible overflow, and you want explicit saturation protection in the generated code.	Overflows saturate to either the minimum or maximum value that the data type can represent.	The maximum value that the `int8` (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box selected, the block output saturates at 127. Similarly, the block output saturates at a minimum output value of -128.
Do not select this check box (`off`).	You want to optimize efficiency of your generated code. You want to avoid overspecifying how a block handles out-of-range signals. For more information, see “Check for Signal Range Errors”.	Overflows wrap to the appropriate value that is representable by the data type.	The maximum value that the `int8` (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box cleared, the software interprets the overflow-causing value as `int8`, which can produce an unintended result. For example, a block result of 130 (binary 1000 0010) expressed as `int8`, is -126.

When you select this check box, saturation applies to every internal operation on the block, not just the output, or result. Usually, the code generation process can detect when overflow is not possible. In this case, the code generator does not produce saturation code.

Programmatic Use
Block Parameter: `SaturateOnIntegerOverflow`
Type: character vector
Values: `'off' | 'on'`
Default: `'off'`

Block Characteristics

Data Types	`double` | `single` | `Boolean` | `base integer` | `fixed point`
Direct Feedthrough	`No`
Multidimensional Signals	`Yes`
Variable-Size Signals	`Yes`
Zero-Crossing Detection	`No`

Topics

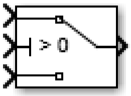
"Control Signal Data Types"

Introduced before R2006a

Switch

Combine multiple signals into single signal

Library: Simulink / Commonly Used Blocks
Simulink / Signal Routing



Description

The Switch block passes through the first input or the third input signal based on the value of the second input. The first and third inputs are data input. The second input is a control input. Specify the condition under which the block passes the first input by using the **Criteria for passing first input** and **Threshold** parameters.

Bus Support

The Switch block is a bus-capable block. The data inputs can be virtual or nonvirtual bus signals subject to the following restrictions:

- All the buses must be equivalent (same hierarchy with identical names and attributes for all elements).
- All signals in a nonvirtual bus input to a Switch block must have the same sample time. The requirement holds even if the elements of the associated bus object specify inherited sample times.

You can use a Rate Transition block to change the sample time of an individual signal, or of all signals in a bus. See “Specify Bus Signal Sample Times” and Bus-Capable Blocks for more information.

You can use an array of buses as an input signal to a Switch block. For details about defining and using an array of buses, see “Combine Buses into an Array of Buses”. When using an array of buses, set the **Threshold** parameter to a scalar value.

Limitations

- If the data inputs to the Switch block are buses, the element names of both buses must be the same. Using the same element names ensures that the output bus has the same element names no matter which input bus the block selects. To ensure that your model meets this requirement, use a bus object to define the buses and set the **Element name mismatch** diagnostic to `error`. See “Connectivity Diagnostics Overview” for more information.

Ports

Input

`Port_1` — First data input signal

scalar | vector

First of two data inputs. The block propagates either the first or second data input to the output. The block selects which input to pass based on the control input. Specify the condition for the control input to pass the first input using the **Criteria for passing first input** and **Threshold** parameters.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

`Port_2` — Control input signal

scalar | vector

Control signal the block uses to determine whether to pass the first or second data input to the output. If the control input meets the condition set in the **Criteria for passing first input** parameter, then the block passes the first data input. Otherwise, the block passes the second data input.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

`Port_3` — Second data input signal

scalar | vector

Second of two data inputs. The block propagates either the first or second data input to the output. The block selects which input to pass based on the control input. Specify the condition for the control input to pass the first or second input using the **Criteria for passing first input** and **Threshold** parameters.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Output

Port_1 — Output signal

scalar | vector

Output signal propagated from either the first or second input signal, based on the control signal value.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Parameters

Main

Criteria for passing first input — Selection criteria to pass first data input

u2 >= Threshold (default) | u2 > Threshold | u2 ~= 0

Select the condition under which the block passes the first data input. If the control input meets the condition set in the **Criteria for passing first input** parameter, the block passes the first input. Otherwise, the block passes the second data input signal from input Port_3.

u2 >= Threshold

Checks whether the control input is greater than or equal to the threshold value.

u2 > Threshold

Checks whether the control input is greater than the threshold value.

u2 ~=0

Checks whether the control input is nonzero.

Note The Switch block does not support u2 ~=0 mode for enumerated data types.

Tip

When the control input is a Boolean signal, use one of these combinations of condition and threshold value:

- `u2 >= Threshold`, where the threshold value equals 1
- `u2 > Threshold`, where the threshold value equals 0
- `u2 ~=0`

Otherwise, the Switch block ignores threshold values and uses the Boolean value for signal routing. For a value of 1, the block passes the first input, and for a value of 0, the block passes the third input. A warning message that describes this behavior also appears in the MATLAB Command Window.

Programmatic Use

Block Parameter: `Criteria`
Type: character vector
Value: `'u2 >= Threshold'` | `'u2 > Threshold'` | `'u2 ~=0'`
Default: `'u2 >= Threshold'`

`Threshold` — Threshold used in criteria

`0` (default) | `scalar`

Assign the threshold used in the **Criteria for passing first input** that determines which input the block passes to the output. **Threshold** must be greater than **Output minimum** and less than **Output maximum**.

To specify a nonscalar threshold, use brackets. For example, the following entries are valid:

- `[1 4 8 12]`
- `[MyColors.Red, MyColors.Blue]`

Dependencies

Setting **Criteria for passing first input** to `u2 ~=0` disables this parameter.

Programmatic Use

Block Parameter: `Threshold`
Type: character vector
Value: `'off' | 'on'`
Default: `'off'`

`Enable zero-crossing detection` — Enable zero-crossing detection

`on` (default) | Boolean

Select to enable zero-crossing detection. For more information, see “Zero-Crossing Detection” in the Simulink documentation.

Programmatic Use
Block Parameter: `ZeroCross`
Type: character vector, string
Values: `'off'` | `'on'`
Default: `'on'`

Signal Attributes

Click the **Show data type assistant** button >> to display the **Data Type Assistant**, which helps you set the data type attributes. For more information, see “Specify Data Types Using Data Type Assistant”.

`Require all data port inputs to have the same data type` — Require data ports to have the same data type

`off` (default) | `on`

Require all data inputs to have the same data type.

Programmatic Use
Block Parameter: `InputSameDT`
Type: character vector
Value:
Default: `'0'`

`Output minimum` — Minimum output value for range checking

`[]` (default) | scalar

Lower value of the output range that Simulink checks.

Simulink uses the minimum to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
- Simulation range checking (see “Signal Ranges” and “Enable Simulation Range Checking”).

- Automatic scaling of fixed-point data types.
- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Simulink Coder).

Note **Output minimum** does not saturate or clip the actual output signal. Use the Saturation block instead.

Programmatic Use
Block Parameter: `OutMin`
Type: character vector
Values: `'[ ]'`| scalar
Default: `'[ ]'`

`Output maximum` — Maximum output value for range checking

`[ ]` (default) | scalar

Upper value of the output range that Simulink checks.

Simulink uses the maximum value to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
- Simulation range checking (see “Signal Ranges” and “Enable Simulation Range Checking”).
- Automatic scaling of fixed-point data types.
- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Simulink Coder).

Note **Output maximum** does not saturate or clip the actual output signal. Use the Saturation block instead.

Programmatic Use
Block Parameter: `OutMax`
Type: character vector
Values: `'[ ]'` | scalar
Default: `'[ ]'`

`Output data type` — Output data type

`Inherit: Inherit via internal rule` (default) | `Inherit: Inherit via back propagation` | `double` | `single` | `int8` | `uint8` | `int16` | `uint16` | `int32` | `uint32` | `fixdt(1,16)` | `fixdt(1,16,0)` | `fixdt(1,16,2^0,0)` | `Enum: <class name>` | `<data type expression>`

Specify the output data type.

`Inherit: Inherit via internal rule`

Uses the following rules to determine the output data type.

Data Type of First Input Port	Output Data Type
Has a larger positive range than the third input port	Inherited from the first input port
Has the same positive range as the third input port	Inherited from the third input port
Has a smaller positive range than the third input port	

`Inherit: Inherit via back propagation`

Uses data type of the driving block.

`double`

Specifies output data type is `double`.

`single`

Specifies output data type is `single`.

`int8`

Specifies output data type is `int8`.

`uint8`

Specifies output data type is `uint8`.

`int16`

Specifies output data type is `int16`.

`uint16`

Specifies output data type is `uint16`.

`int32`

Specifies output data type is `int32`.

`uint32`

Specifies output data type is `uint32`.

`fixdt(1,16,0)`

Specifies output data type is fixed point `fixdt(1,16,0)`.

`fixdt(1,16,2^0,0)`

Specifies output data type is fixed point `fixdt(1,16,2^0,0)`.

`Enum: <class name>`

Uses an enumerated data type, for example, `Enum: BasicColors`.

`<data type expression>`

Uses a data type object, for example, `Simulink.NumericType`.

Tip

When the output is of enumerated type, both data inputs should use the same enumerated type as the output.

Programmatic Use
Block Parameter: `OutDataTypeStr`
Type: character vector
Values: `'Inherit: Inherit via internal rule` | `'Inherit: Inherit via back propagation'` | `'double'` | `'single'` | `'int8'` | `'uint8'` | `'int16'` | `'uint16'`, `'int32'` | `'uint32'` | `'fixdt(1,16)'` | `'fixdt(1,16,0)'` | `'fixdt(1,16,2^0,0)'` | `Enum: <class name>` | `'<data type expression>'`
Default: `'Inherit: Inherit via internal rule'`

Lock data type settings against changes by the fixed-point tools — Prevent fixed-point tools from overriding data types

`off` (default) | `on`

Select this parameter to prevent the fixed-point tools from overriding the data types you specify on this block. For more information, see "Lock the Output Data Type Setting" (Fixed-Point Designer).

Programmatic Use
Block Parameter: `LockScale`
Type: character vector
Values: `'off' | 'on'`
Default: `'off'`

`Integer rounding mode` — Specify the rounding mode for fixed-point operations
`Floor` (default) | `Ceiling` | `Convergent` | `Nearest` | `Round` | `Simplest` | `Zero`

Choose one of these rounding modes.

`Ceiling`

Rounds both positive and negative numbers toward positive infinity. Equivalent to the MATLAB `ceil` function.

`Convergent`

Rounds number to the nearest representable value. If a tie occurs, rounds to the nearest even integer. Equivalent to the Fixed-Point Designer `convergent` function.

`Floor`

Rounds both positive and negative numbers toward negative infinity. Equivalent to the MATLAB `floor` function.

`Nearest`

Rounds number to the nearest representable value. If a tie occurs, rounds toward positive infinity. Equivalent to the Fixed-Point Designer `nearest` function.

`Round`

Rounds number to the nearest representable value. If a tie occurs, rounds positive numbers toward positive infinity and rounds negative numbers toward negative infinity. Equivalent to the Fixed-Point Designer `round` function.

`Simplest`

Automatically chooses between round toward floor and round toward zero to generate rounding code that is as efficient as possible.

`Zero`

Rounds number toward zero. Equivalent to the MATLAB `fix` function.

Programmatic Use

Block Parameter: `RndMeth`
Type: character vector
Values: `'Ceiling'` | `'Convergent'` | `'Floor'` | `'Nearest'` | `'Round'` | `'Simplest'` | `'Zero'`
Default: `'Floor'`

See Also

For more information, see "Rounding" (Fixed-Point Designer).

`Saturate on integer overflow` — Method of overflow action

`off` (default) | `on`

Specify whether overflows saturate or wrap.

- `off` — Overflows wrap to the appropriate value that the data type can represent.

  For example, the number 130 does not fit in a signed 8-bit integer and wraps to -126.
- `on` — Overflows saturate to either the minimum or maximum value that the data type can represent.

  For example, an overflow associated with a signed 8-bit integer can saturate to -128 or 127.

Tip

- Consider selecting this check box when your model has a possible overflow and you want explicit saturation protection in the generated code.
- Consider clearing this check box when you want to optimize efficiency of your generated code.

  Clearing this check box also helps you to avoid overspecifying how a block handles out-of-range signals. For more information, see "Check for Signal Range Errors".
- When you select this check box, saturation applies to every internal operation on the block, not just the output or result.
- In general, the code generation process can detect when overflow is not possible. In this case, the code generator does not produce saturation code.

Programmatic Use
Block Parameter: `SaturateOnIntegerOverflow`
Type: character vector
Values: `'off' | 'on'`
Default: `'off'`

`Allow different data input sizes` — Allow different data input sizes

`off` (default) | `on`

Select this check box to allow input signals with different sizes. The block propagates the input signal size to the output signal. If the two data inputs are variable-size signals, the maximum size of the signals can be equal or different.

Programmatic Use
Block Parameter: `AllowDiffInputSizes`
Type: character vector
Value: `'on'` | `'off'`
Default: `'off'`

Block Characteristics

Data Types	`double` | `single` | `Boolean` | `base integer` | `fixed point` | `enumerated` | `bus` | `string`
Direct Feedthrough	`No`
Multidimensional Signals	`Yes`
Variable-Size Signals	`Yes`
Zero-Crossing Detection	`Yes`

Manual Switch | Multiport Switch

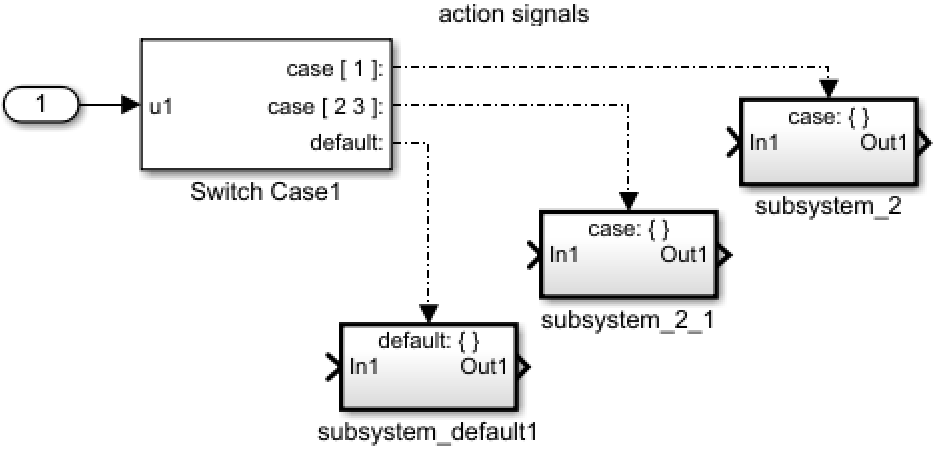
Introduced before R2006a

Switch Case

Select subsystem execution using logic similar to a switch statement
Library: Simulink / Ports & Subsystems

Description

The Switch Case block with Switch Case Action Subsystem blocks containing Action Port blocks, implements switch logic to control subsystem execution.



A Switch Case block has a single input. To select a case, define the input value using the **Case conditions** parameter. The cases are evaluated top down starting with the first case.

Each case is associated with an output port that is attached to a Switch Case Action Subsystem block. When a case is selected, the associated output port sends an action signal to execute the subsystem.

A `default` case is selected after all of the other case conditions evaluate to false. Providing a `default` case is optional, even if the other case conditions do not exhaust every possible input value.

Cases for the Switch Case block contain an implied break after a Switch Case Action Subsystem block is executed. Therefore, there is no fall through behavior for the Simulink Switch Case block as found in standard C `switch` statements.

Ports

Input

`u1 (logical operator)` — Value for case selection

scalar

Input to the port labeled **u1** of a Switch Case block can be:

- A scalar value with a built-in data type that Simulink supports. However, the Switch Case block does not support Boolean or fixed-point data types, and it truncates numeric inputs to 32-bit signed integers.
- A scalar value of any enumerated data type.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `enumerated`

Output

`case` — Action signal for a Switch Case Action Subsystem block

scalar

Output from the **Case** and **default** ports are action signals connected to Switch Case Action Subsystem blocks.

Parameters

`Case conditions` — Specify case values

`{1}` (default) | list of cases

Specify the cases values using MATLAB cell notation.

{1}

Specify the output port labeled `case[1]`outputs an action signal when the input port value is `1`.

list of ports with case assignments

Specify multiple cases and ports using MATLAB cell notation. For example, entering `{1,[7,9,4]}` specifies that output port `case[1]` is run when the input value is `1`, and output port `case [7 9 4]` is run when the input value is `7`, `9`, or `4`.

You can use colon notation to specify a range of integer case conditions. For example, entering `{[1:5]}` specifies that output port **case[1 2 3 4 5]** is run when the input value is `1`, `2`, `3`, `4`, or `5`.

Depending on block size, cases from a long list of case conditions are displayed in shortened form on the face of the Switch Case block, using a terminating ellipsis (...).

You can use the `enumeration` function to specify case conditions that include a case for every value in an enumerated type.

Programmatic Use
Block Parameter: `CaseConditions`
Type: character vector
Values: `'{1}'` | `'<list of cases>'`
Default: `'{1}'`

`Show default case` — Control display of default output port

off (default) | on

Control display of default output port.

off

Hide default output port.

on

Display default output port as the last case on the Switch Case block. This allows you to specify a default case that executes when the input value does not match any of the other case values.

Programmatic Use
Block Parameter: `ShowDefaultCase`

Type: character vector
Values: `'off'` | `'on'`
Default: `'off'`

`Enable zero-crossing detection` — Control zero-crossing detection

on (default) | off

Control zero-crossing detection.

☑ on

Detect zero crossings.

□ off

Do not detect zero crossings.

Programmatic Use
Block Parameter: `ZeroCross`
Type: character vector
Values: `'on'` | `'off'`
Default: `'on'`

Block Characteristics

Data Types	`double` | `single` | `base integer` | `enumerated`
Direct Feedthrough	`No`
Multidimensional Signals	`No`
Variable-Size Signals	`No`
Zero-Crossing Detection	`Yes`

Extended Capabilities

Action Port | Subsystem | Switch Case Action Subsystem

Topics

Select Subsystem Execution

Introduced before R2006a

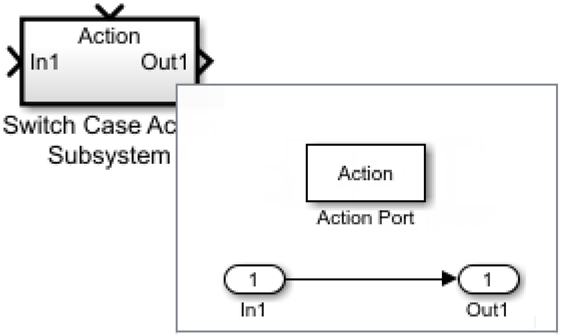
Switch Case Action Subsystem

Subsystem whose execution is enabled by a Switch Case block

Library: Simulink / Ports & Subsystems

Description

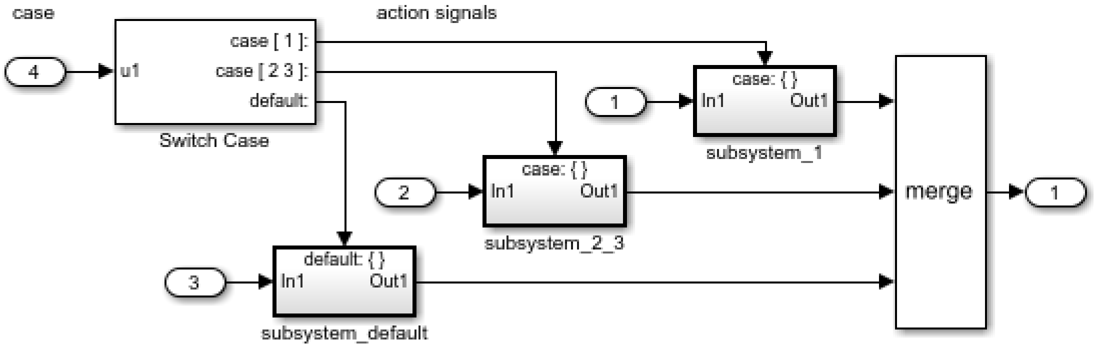
The Switch Case Action Subsystem block is a Subsystem block preconfigured as a starting point for creating a subsystem whose execution is controlled by a Switch Case block. The input port to a Switch Case block selects a case defined using the **Case conditions** parameter. Depending on input value and case selected, an action signal is sent to execute a Switch Case Action Subsystem block.



All blocks in a Switch Case Action Subsystem block must run at the same rate as the driving Switch Case block. You can achieve this requirement by setting each block sample time parameter to be either inherited (`-1`) or the same value as the Switch Case block sample time.

Merge signals from Switch Case Subsystem blocks

This example shows how to create a one signal from multiple subsystem output signals. The Switch Case block selects the execution of one If Action Subsystem block from a set of subsystems. Regardless of which subsystem the Switch Case block selects, you can create a one resulting signal with a Merge block.



Ports

Input

`In1` — Signal input to a subsystem block

scalar | vector | matrix

Placing an Inport block in a subsystem block adds an external input port to the block. The port label matches the name of the Inport block.

Use Inport blocks to get signals from the local environment.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

`Action` — Control signal input to a subsystem block

scalar | vector | matrix

Placing an Action Port block in a subsystem block adds an external input port to the block and changes the block to a Switch Case Action Subsystem block.

Dot-dash lines from a Switch Case block to an Switch Case Action Subsystem block represent *action* signals. An action signal is a control signal connected to the action port of an Switch Case Action Subsystem block. A message on the action signal initiates executition of the subsystem.

Data Types: `action`

Output

`Out1` — Signal output from a subsystem
scalar | vector | matrix

Placing an Outport block in a subsystem block adds an output port from the block. The port label on the subsystem block is the name of the Outport block.

Use Outport blocks to send signals to the local environment.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Block Characteristics

Data Types	`double`[a] | `single`[a] | `Boolean`[a] | `base integer`[a] | `fixed point`[a] | `enumerated`[a] | `bus`[a] | `string`[a]
Direct Feedthrough	`No`
Multidimensional Signals	`Yes`[a]
Variable-Size Signals	`Yes`[a]
Zero-Crossing Detection	`No`

a. Actual data type or capability support depends on block implementation.

Select Subsystem Execution

Introduced before R2006a

Synchronous Subsystem

Represent subsystem that has synchronous reset and enable behavior

Library

HDL Coder / HDL Subsystems

Description

A Synchronous Subsystem is a subsystem that uses the `Synchronous` mode of the State Control block. If an **S** symbol appears in the subsystem, then it is synchronous.

To create a Synchronous Subsystem, add the block to your Simulink model from the HDL Subsystems block library. You can also add a State Control block with **State control** set to `Synchronous` inside a subsystem. For more information about the State Control block, see State Control.

Data Type Support

See Inport for information on the data types accepted by a subsystem's input ports. See Outport for information on the data types output by a subsystem's output ports.

For more information, see “Data Types Supported by Simulink” in the Simulink documentation.

Parameters

Show port labels

Cause Simulink software to display labels for the subsystem's ports on the subsystem's icon.

Default: `FromPortIcon`

`none`

Does not display port labels on the subsystem block.

`FromPortIcon`

If the corresponding port icon displays a signal name, display the signal name on the subsystem block. Otherwise, display the port block's name.

`FromPortBlockName`

Display the name of the corresponding port block on the subsystem block.

`SignalName`

If a name exists, display the name of the signal connected to the port on the subsystem block; otherwise, the name of the corresponding port block.

See “Block-Specific Parameters” on page 6-128 for the command-line information.

Read/Write permissions

Control user access to the contents of the subsystem.

Default: `ReadWrite`

`ReadWrite`

Enables opening and modification of subsystem contents.

`ReadOnly`

Enables opening but not modification of the subsystem. If the subsystem resides in a block library, you can create and open links to the subsystem and can make and modify local copies of the subsystem but cannot change the permissions or modify the contents of the original library instance.

`NoReadOrWrite`

Disables opening or modification of subsystem. If the subsystem resides in a library, you can create links to the subsystem in a model but cannot open, modify, change permissions, or create local copies of the subsystem.

See “Block-Specific Parameters” on page 6-128 for the command-line information.

Name of error callback function

Enter name of a function to be called if an error occurs while Simulink software is executing the subsystem.

Default: `' '`

Simulink software passes two arguments to the function: the handle of the subsystem and a character vector that specifies the error type. If no function is specified, Simulink software displays a generic error message if executing the subsystem causes an error.

See “Block-Specific Parameters” on page 6-128 for the command-line information.

Permit hierarchical resolution

Specify whether to resolve names of workspace variables referenced by this subsystem.

Default: `All`

`All`

Resolve all names of workspace variables used by this subsystem, including those used to specify block parameter values and Simulink data objects (for example, `Simulink.Signal` objects).

`ExplicitOnly`

Resolve only names of workspace variables used to specify block parameter values, data store memory (where no block exists), signals, and states marked as “must resolve”.

`None`

Do not resolve any workspace variable names.

See “Block-Specific Parameters” on page 6-128 for the command-line information.

Treat as atomic unit

Causes Simulink software to treat the subsystem as a unit when determining the execution order of block methods.

Default: Off

☑ On

Cause Simulink software to treat the subsystem as a unit when determining the execution order of block methods. For example, when it needs to compute the output of the subsystem, Simulink software invokes the output methods of all the blocks in the subsystem before invoking the output methods of other blocks at the same level as the subsystem block.

☐ Off

Cause Simulink software to treat all blocks in the subsystem as being at the same level in the model hierarchy as the subsystem when determining block method execution order. This can cause execution of methods of blocks in the subsystem to be interleaved with execution of methods of blocks outside the subsystem.

This parameter enables:

- “Minimize algebraic loop occurrences” on page 1-0 .
- “Sample time” on page 1-0
- “Function packaging” on page 1-0 (requires a Simulink Coder license)

See “Block-Specific Parameters” on page 6-128 for the command-line information.

Treat as grouped when propagating variant conditions

Causes Simulink software to treat the subsystem as a unit when propagating variant conditions from Variant Source blocks or to Variant Sink blocks.

Default: On

☑ On

Simulink treats the subsystem as a unit when propagating variant conditions from Variant Source blocks or to Variant Sink blocks. For example, when Simulink computes the variant condition of the subsystem, it propagates that condition to all the blocks in the subsystem.

☐ Off

Simulink treats all blocks in the subsystem as being at the same level in the model hierarchy as the subsystem itself when determining their variant condition.

“Treat as grouped when propagating variant conditions” on page 1-0 enables this parameter.

See “Block-Specific Parameters” on page 6-128 for the command-line information.

Function packaging

Specify the code format to be generated for an atomic (nonvirtual) subsystem.

Default: `Auto`

`Auto`

Simulink Coder software chooses the optimal format for you based on the type and number of instances of the subsystem that exist in the model.

`Inline`

Simulink Coder software inlines the subsystem unconditionally.

`Nonreusable function`

Simulink Coder software explicitly generates a separate function in a separate file. Subsystems with this setting generate functions that might have arguments depending on the “Function interface” on page 1-0 parameter setting. You can name the generated function and file using parameters “Function name” on page 1-0 and “File name (no extension)” on page 1-0 . These functions are not reentrant.

`Reusable function`

Simulink Coder software generates a function with arguments that allows reuse of subsystem code when a model includes multiple instances of the subsystem.

This option also generates a function with arguments that allows subsystem code to be reused in the generated code of a model reference hierarchy that includes multiple instances of a subsystem across referenced models. In this case, the subsystem must be in a library.

See “Block-Specific Parameters” on page 6-128 for the command-line information.

Characteristics

Data Types	Double | Single | Boolean | Base Integer | Fixed-Point | Enumerated | Bus

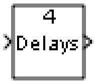
Tapped Delay

Delay scalar signal multiple sample periods and output all delayed versions
Library: Simulink / Discrete



Description

The Tapped Delay block delays an input by the specified number of sample periods and outputs all the delayed versions. Use this block to discretize a signal in time or resample a signal at a different rate.

The block accepts one scalar input and generates an output vector that contains each delay. Specify the order of the delays in the output vector with the **Order output vector starting with** parameter:

- `Oldest` orders the output vector starting with the oldest delay version and ending with the newest delay version.
- `Newest` orders the output vector starting with the newest delay version and ending with the oldest delay version.

Specify the output vector for the first sampling period with the **Initial condition** parameter. Careful selection of this parameter can minimize unwanted output behavior.

Specify the time between samples with the **Sample time** parameter. Specify the number of delays with the **Number of delays** parameter. A value of `-1` instructs the block to inherit the number of delays by backpropagation. Each delay is equivalent to the z^{-1} discrete-time operator, which the Unit Delay block represents.

Ports

Input

`Port_1` — Input signal

scalar

Input signal to delay, specified as a scalar.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point`

Output

`Port_1` — Delayed versions of input signal

scalar | vector

Output signal is all delayed versions of the input signal. Use the **Order output vector starting with** parameter to specify the order of delayed signals in the output vector.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point`

Parameters

`Initial condition` — Initial output

`0.0` (default) | scalar | vector | matrix

Specify the initial output of the simulation. The **Initial condition** parameter is converted from a double to the input data type offline using round-to-nearest and saturation.

Limitations

The initial condition of this block cannot be `inf` or `NaN`.

Programmatic Use
Block Parameter: `vinit`
Type: character vector
Values: scalar | vector | matrix
Default: `'0.0'`

`Sample time` — Time between samples

`-1` (default) | scalar | vector

Specify the time interval between samples. To inherit the sample time, set this parameter to `-1`. For more information, see “Specify Sample Time”.

Programmatic Use
Block Parameter: `samptime`
Type: character vector
Values: scalar | vector
Default: `'-1'`

`Number of delays` — Number of discrete-time operators

`4` (default) | positive scalar | `-1` (for inherited)

Specify the number of discrete-time operators as a positive scalar, or `-1` for inherited.

Programmatic Use
Block Parameter: `NumDelays`
Type: character vector
Values: positive scalar | `-1` (inherited)
Default: `'4'`

`Order output vector starting with` — Order of output

`Oldest` (default) | `Newest`

Specify whether to output the oldest delay version first, or the newest delay version first.

Programmatic Use
Block Parameter: `DelayOrder`
Type: character vector
Values: `'Oldest' | 'Newest'`
Default: `'Oldest'`

`Include current input in output vector` — Include current input in output vector

`off` (default) | `on`

Select this check box to include the current input in the output vector.

Programmatic Use
Block Parameter: `includeCurrent`
Type: character vector

Values: `'off'` | `'on'`
Default: `'off'`

Block Characteristics

Data Types	`double` | `single` | `Boolean` | `base integer` | `fixed point`
Direct Feedthrough	`No`
Multidimensional Signals	`No`
Variable-Size Signals	`No`
Zero-Crossing Detection	`No`

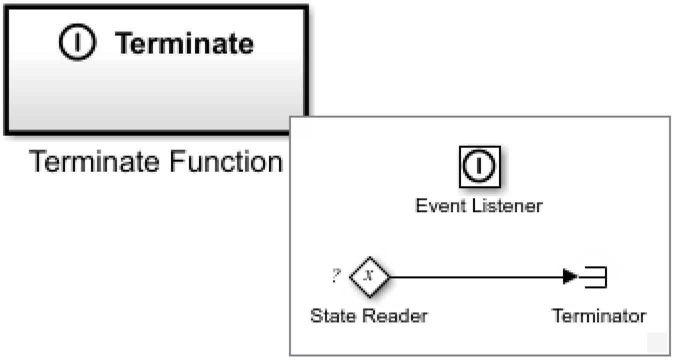
Terminate Function

Execute contents on a model terminate event

Library: Simulink / User-Defined Functions

Description

The Terminate Function block is a pre-configured subsystem block that executes on a model terminate event. By default, the Terminate Function block includes an Event Listener block with **Event** set to `Terminate`, a Terminator block, and a State Reader block.



Replace the Terminator block with blocks to save the state value from the State Reader block.

For a list of unsupported blocks and features, see “Initialize, Reset, and Terminate Function Limitations”.

The input and output ports of a component containing Initialize Function and Terminate Function blocks must connect to input and output port blocks.

The code generated from this block is part of the `model_terminate` function that is called once at the end of model execution.

Block Characteristics

Data Types	double[a] | single[a] | Boolean[a] | base integer[a] | fixed point[a] | enumerated[a] | bus[a] | string[a]
Direct Feedthrough	No
Multidimensional Signals	Yes[a]
Variable-Size Signals	No
Zero-Crossing Detection	No

[a] Actual data type or capability support depends on block implementation.

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Fixed-Point Conversion

Terminator

Terminate unconnected output port

Library: Simulink / Commonly Used Blocks
Simulink / Sinks

Description

Use the Terminator block to cap blocks whose output ports do not connect to other blocks. If you run a simulation with blocks having unconnected output ports, Simulink issues warning messages. Using Terminator blocks to cap those blocks helps prevent warning messages.

Ports

Input

`Port_1` — Input signal
scalar | vector | matrix | n-D array | bus

Use this port to direct signals from output ports that are otherwise unconnected during a simulation. The port accepts real or complex signals of all data types.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Block Characteristics

Data Types	`double` | `single` | `Boolean` | `base integer` | `fixed point` | `enumerated` | `bus` | `string`
Direct Feedthrough	`No`

Multidimensional Signals	Yes
Variable-Size Signals	No
Zero-Crossing Detection	No

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

When you use this block in your model, HDL Coder does not generate code for it.

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

Fixed-Point Conversion

Convert floating-point algorithms to fixed point using Fixed-Point Designer™.

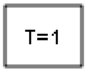
Timed-Based Linearization

Generate linear models in base workspace at specific times
Library: Simulink / Model-Wide Utilities



Description

This block calls `linmod` or `dlinmod` to create a linear model for the system when the simulation clock reaches the time specified by the **Linearization time** parameter. No trimming is performed. The linear model is stored in the base workspace as a structure, along with information about the operating point at which the snapshot was taken. Multiple snapshots are appended to form an array of structures.

The block sets the following model parameters to the indicated values:

- `BufferReuse = 'off'`
- `RTWInlineParameters = 'on'`
- `BlockReductionOpt = 'off'`

The name of the structure used to save the snapshots is the name of the model appended by `_Timed_Based_Linearization`, for example, `vdp_Timed_Based_Linearization`. The structure has the following fields:

Field	Description
`a`	The A matrix of the linearization
`b`	The B matrix of the linearization
`c`	The C matrix of the linearization
`d`	The D matrix of the linearization
`StateName`	Names of the model's states
`OutputName`	Names of the model's output ports

Field	Description
`InputName`	Names of the model's input ports
`OperPoint`	A structure that specifies the operating point of the linearization. The structure specifies the operating point time (`OperPoint.t`). The states (`OperPoint.x`) and inputs (`OperPoint.u`) fields are not used.
`Ts`	The sample time of the linearization for a discrete linearization

Tip To generate models conditionally, use the Trigger-Based Linearization block.

Parameters

`Linearization time` — Time at which to generate a linear model

`1` (default) | scalar | vector

Time at which you want the block to generate a linear model. Enter a vector of times if you want the block to generate linear models at more than one time step.

Programmatic Use
Block Parameter: `LinearizationTime`
Type: character vector
Values: scalar | vector
Default: `'1'`

`Sample time (of linearized model)` — Sample time

`0` (default) | scalar | vector

Specify a sample time to create discrete-time linearizations of the model (see “Discrete-Time System Linearization” on page 2-54).

Programmatic Use
Block Parameter: `SampleTime`
Type: character vector
Values: scalar | vector
Default: `'0'`

Block Characteristics

Data Types	
Direct Feedthrough	No
Multidimensional Signals	No
Variable-Size Signals	No
Zero-Crossing Detection	No

Introduced in R2010a

To File

Write data to file
Library: Simulink / Sinks

Description

The To File block writes input signal data into a MAT-file. The block writes to the output file incrementally, with minimal memory overhead during simulation. If the output file exists when the simulation starts, the block overwrites the file. The file automatically closes when you pause the simulation or the simulation completes. If simulation terminates abnormally, the To File block saves the data it has logged up until the point of the abnormal termination.

The To File block icon shows the name of the output file.

Control Amount of Data Saved

If you specify data logging intervals with the **Configuration Parameters > Data Import/Export > Logging intervals** parameter, the To File block logs only data inside of the intervals. For example, the block logs no data if the intervals are empty (`[]`). The block stores the logged data in the file associated with the block instead of in the variable that you specify for the **Single simulation output** parameter.

For variable-step solvers, to control the amount of data available to the To File block, use the **Configuration Parameters > Data Import/Export > Additional parameters > Output options** parameter. For example, to write data at identical time points over multiple simulations, select the `Produce specified output only` option.

Block parameters also control the amount of data saved. See “Decimation” on page 1-0 and “Sample time” on page 1-0 .

Pause Simulation

After pausing a simulation, do not alter any file that a To File block logs into. For example, do not save such a file with the MATLAB `save` command. Altering the file can cause an error when you resume the simulation. If you want to alter the file after pausing, copy the file and work with the copy of the file.

If you pause using the Simulation Stepper, the To File block captures the simulation data up to the point of the pause. When you step back, the To File data file no longer contains any simulation data past the new reduced time of the last output.

Limitations

When a To File block is in a referenced model, that model must be a single-instance model. Only one instance of such a model can exist in a model hierarchy. See "Model Reuse" for more information.

Ports

Input

`Port_1` — Input signal
scalar | vector | matrix | N-D array

Signal to store in file. Each sample consists of a timestamp and an associated data value. The data can be in array format or MATLAB `timeseries` format. The To File block accepts real or complex signal data of any data type that Simulink software supports, except fixed-point data with a word length greater than 32 bits.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Parameters

`File name` — Path or file name
`untitled.mat` (default) | MAT-file path or name

Specify the path or file name of the MAT-file in which to store the output. On UNIX systems, the path name can start with a tilde (~) character signifying your home folder. If you specify a file name without path information, Simulink software stores the file in the

MATLAB working folder. (To determine the working folder, at the MATLAB command line, enter pwd.) If the file exists, Simulink software overwrites it.

Programmatic Use
Block Parameter: `FileName`
Type: character vector
Values: MAT-file path or name
Default: `'untitled.mat'`

`Variable name` — Matrix name

`ans` (default) | character vector

Specify the name of the matrix contained in the file.

Programmatic Use
Block Parameter: `MatrixName`
Type: character vector
Values: character vector
Default: `'ans'`

`Save format` — Data format

`Timeseries` (default) | `Array`

Specify the data format that the To File block uses for writing data.

Use the `Array` format only for vector, double, noncomplex signals.

For the `Timeseries` format, the To File block:

- Writes data in a MATLAB `timeseries` object.
- Supports writing multidimensional, real, or complex output values.
- Supports writing output values that have any built-in data type, including `Boolean`, enumerated (`enum`), and fixed-point data with a word length of up to 32 bits.
- For virtual and nonvirtual bus input signals, creates a MATLAB structure that matches the bus hierarchy. Each leaf of the structure is a MATLAB `timeseries` object.

For the `Array` format, the To File block:

- Writes data into a matrix containing two or more rows. The matrix has the following form:

$$\begin{bmatrix} t_1 & t_2 & \dots & t_{final} \\ u1_1 & u1_2 & \dots & u1_{final} \\ \dots & & & \\ un_1 & un_2 & \dots & un_{final} \end{bmatrix}$$

Simulink software writes one column to the matrix for each data sample. The first element of the column contains the timestamp. The remainder of the column contains data for the corresponding output values.

- Supports writing data that is one-dimensional, double, and noncomplex.

The From File block can use data written by a To File block in any format (`Timeseries` or `Array`) without any modifications to the data or other special provisions.

The From Workspace block can read data that is in the `Array` format and is the transposition of the data written by the To File block. To provide the required format, use MATLAB commands to load and transpose the data from the MAT-file.

The following table shows how simulation mode support depends on the **Save format** value.

Simulation Mode	`Timeseries`	`Array`
Normal	Supported	Supported
Accelerator	Supported	Supported
Rapid Accelerator	Supported	Supported
Software-in-the-loop (SIL)	Not supported	Supported if MAT-file logging is enabled
Processor-in-the-loop (PIL)	Not supported	Supported if MAT-file logging is available and enabled
External	Not supported	Supported if MAT-file logging is enabled
RSim target	Supported	Supported if MAT-file logging is enabled

Programmatic Use
Block Parameter: `SaveFormat`
Type: character vector

Values: `'Timeseries' | 'Array'`
Default: `'Timeseries'`

`Decimation` — Decimation factor that determines when data writes

1 (default) | scalar | vector

Specify the decimation factor, *n*, that writes data at every *n*th time that the block executes. The default value has this block writing data at every time step.

Programmatic Use
Block Parameter: `Decimation`
Type: character vector
Values: scalar | vector
Default: `'1'`

`Sample time` — Sample period and offset

-1 (default) | scalar | vector

Specifies the sample period and offset at which to collect data points. This parameter is useful when you are using a variable-step solver where the interval between time steps is not constant. The default value causes the block to inherit the sample time from the driving block. See "Specify Sample Time".

Programmatic Use
Block Parameter: `SampleTime`
Type: character vector
Values: scalar | vector
Default: `'-1'`

Block Characteristics

Data Types	`double` | `single` | `Boolean` | `base integer` | `fixed point`[a] | `enumerated` | `bus`
Direct Feedthrough	`No`
Multidimensional Signals	`Yes`

Variable-Size Signals	No
Zero-Crossing Detection	No

a. Supports up to 32-bit fixed-point data types.

Tips

- If MATLAB encounters memory issues when you log many signals in a long simulation that has many time steps, consider logging to persistent storage. When you log to persistent storage, the `Dataset` format logging data is stored in a MAT-file. Compared to logging to persistent storage, connecting a To File block to signals:

  - Is a per-signal approach that can clutter a model with several To File blocks attached to individual signals.
  - Creates a separate MAT-file for each To File block, compared to the one MAT-file that logging to persistent storage uses.

  For details, see “Log Data to Persistent Storage”.
- To avoid the overhead of compressing data in real time, the To File block writes an uncompressed Version 7.3 MAT-file. To compress the data within the MAT-file, load and save the file in MATLAB. The resaved file is smaller than the original MAT-file that the To File block created, because the **Save** command compresses the data in the MAT-file.

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Not recommended for production code. Relates to resource limits and restrictions on speed and memory often found in embedded systems. Generated code can contain dynamic allocation and freeing of memory, recursion, additional memory overhead, and widely-varying execution times. While the code is functionally valid and generally acceptable in resource-rich environments, smaller embedded targets often cannot support such code. Usually, blocks evolve toward being suitable for production code. Thus, blocks suitable for production code remain suitable.

Code generation for RSim target provides identical support as Simulink; all other code generation targets support only double, one-dimensional, real signals in array with time format.

To generate code for a To File block, on the **Code Generation** > **Interface** pane, select the configuration parameter “MAT-file logging” (Simulink Coder).

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

When you use this block in your model, HDL Coder™ does not generate HDL code for it. See To File.

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

Fixed-Point Conversion

Convert floating-point algorithms to fixed point using Fixed-Point Designer™.

Supports up to 32-bit fixed-point data types.

To Workspace

Write data to workspace

Library: Simulink / Sinks

Description

The To Workspace block writes input signal data to a workspace. During simulation, the block writes data to an internal buffer. When you pause the simulation or the simulation completes, that data is written to the workspace. Data is not available until the simulation pauses or stops.

The To Workspace block typically writes data to the MATLAB base workspace. For a `sim` command in a MATLAB function, the To Workspace block sends data to the workspace of the calling function, not to the MATLAB base workspace. To send the logged data to the base workspace, use an `assignin` command in the function.

```
function myfunc
    a = sim('mTest','SimulationMode','normal');
    b = a.get('simout')
    assignin('base','b',b);
end
```

The To Workspace block icon shows the name of the variable to which the data is written.

Control Amount of Data Saved

If you specify data logging intervals with the **Configuration Parameters > Data Import/Export > Logging intervals** parameter, the To Workspace block does not log data outside of the intervals. For example, the block logs no data if the intervals are empty (`[]`). The block stores the logged data in the variable that you specify for the **Single simulation output** parameter.

For variable-step solvers, to control the amount of data available to the To Workspace block, use the **Configuration Parameters > Data Import/Export > Additional parameters > Output options** parameter. For example, to write data at identical time points over multiple simulations, select the `Produce specified output only` option.

Block parameters also control the amount of data saved. See “Limit data points to last” on page 1-0 , “Decimation” on page 1-0 , and “Sample time” on page 1-0 .

Log to MAT-File

When you enable the **MAT-file logging** parameter in **Configuration Parameters**, the To Workspace block logs its data to a MAT-file. For information about this parameter, see “MAT-file logging” (Simulink Coder).

Ports

Input

`Port_1` — Input signal
scalar | vector | matrix | N-D array

Workspace data created from input signal. The To Workspace block can save real or complex inputs of any data type that Simulink supports, including fixed-point and enumerated data types, and bus objects.

By default, the To Workspace block treats input signals as sample-based. To have the To Workspace block treat input signals as frame-based, set:

1 **Save format** to either `Array` or `Structure`
2 **Save 2-D signals as** to `2-D array (concatenate along first dimension)`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Parameters

`Variable name` — Name of variable for saved data
`simout` (default) | character vector

Specify the name of the variable for the saved data.

Programmatic Use
Block Parameter: `VariableName`
Type: character vector
Values: character vector
Default: `'simout'`

`Limit data points to last` — Maximum number of input samples to save

`inf` (default) | scalar | vector

Specify the maximum number of input samples to save. If the simulation generates more data points than the specified maximum, the simulation saves only the most recently generated samples. The default value causes the block to write all data.

Programmatic Use
Block Parameter: `MaxDataPoints`
Type: character vector
Values: scalar | vector
Default: `'inf'`

`Decimation` — Decimation factor that determines when data writes

`1` (default) | scalar | vector

Specify the decimation factor, *n*, which writes data at every *n*th time that the block executes. The default value causes the block to write data at every time step.

Programmatic Use
Block Parameter: `Decimation`
Type: character vector
Values: scalar | vector
Default: `'1'`

`Save format` — Format for saving simulation output

`Timeseries` (default) | `Structure With Time` | `Structure` | `Array`

Specify the format for saving simulation output to the workspace.

The default `Timeseries` format saves nonbus signals as a MATLAB `timeseries` object and bus signals as a structure of MATLAB `timeseries` objects.

The `Array` format saves the input as an *N*-dimensional array where *N* is one more than the number of dimensions of the input signal. For example, if the input signal is a vector, the resulting workspace array is two-dimensional. If the input signal is a matrix, then the array is three-dimensional. How Simulink stores samples in the array depends on whether the input signal is a scalar, vector, or matrix.

- If the input signal is a scalar or a vector, each input sample is output as a row of the array. Suppose that the name of the output array is `simout`. Then, `simout(1,:)` corresponds to the first sample, `simout(2,:)` corresponds to the second sample, and so on.
- If the input signal is a matrix, time corresponds to the third dimension. Suppose again that `simout` is the name of the resulting workspace array. Then, `simout(:,:,1)` is the input signal value at the first sample point, `simout(:,:,2)` is the input signal value at the second sample point, and so on.

The `Structure` format consists of a structure with three fields:

- `time` — Empty field for this format.
- `signals` — Structure with three fields: `values`, `dimensions`, and `label`. The `values` field contains the array of signal values. The `dimensions` field specifies the dimensions of the corresponding signals. The `label` field contains the label of the input line.
- `blockName` — Name of the To Workspace block.

The `Structure With Time` format is the same as `Structure`, except that the time field contains a vector of simulation time hits.

If you select `Array` or `Structure`, the **Save 2-D signals as** parameter appears.

To read the To Workspace block output directly with a From Workspace block, use either the `Timeseries` or `Structure with Time` format. The From Workspace block can read sample-based data from a To Workspace block that was saved in a previous simulation. For details, see “Comparison of Signal Loading Techniques”.

The following table shows how simulation mode support depends on the **Save format** value.

Simulation Mode	**`Timeseries`**	**`Array`, `Structure`, or `Structure With Time`**
Normal	Supported	Supported
Accelerator	Supported	Supported only in top model, not referenced models

Simulation Mode	`Timeseries`	`Array`, `Structure`, or `Structure With Time`
Rapid Accelerator	Not supported	Supported only in top model, not referenced models
Software-in-the-loop (SIL)	Not supported	If MAT-file logging is enabled, supported only in top model, not referenced models
Processor-in-the-loop (PIL)	Not supported	If MAT-file logging is available and enabled, supported only in top model, not referenced models
External	Not supported	Supported only in top model, not referenced models
Simulink Coder Targets	Not supported	If MAT-file logging is enabled, supported only in top model, not referenced models

Programmatic Use
Block Parameter: `SaveFormat`
Type: character vector
Values: `'Timeseries'` | `'Structure with Time'` | `'Structure'` | `'Array'`
Default: `'Timeseries'`

`Save 2-D signal as` — Format for saving 2-D signals

`3-D array (concatenate along third dimension)` (default) | `2-D array (concatenate along first dimension)` | `Inherit from input (this choice will be removed - see release notes)`

Specify one of these formats for saving 2-D signals to the workspace:

- `3-D array (concatenate along third dimension)` (Default)

  This setting is well-suited for sample-based signals. Data is concatenated along the third dimension. For example, 2-by-4 matrix input for 10 samples is stored as a 2-by-4-by-10 array.

- `2-D array (concatenate along first dimension)`

  This setting is well-suited for frame-based signals. Data is concatenated along the first dimension. For example, 2-by-4 matrix input for 10 samples is stored as a 20-by-4 array.

- `Inherit from input (this choice will be removed — see release notes)`

  This setting is for backward compatibility. To configure this block to treat input signals as frame-based in future releases, set this parameter to `2-D array (concatenate along first dimension)`. To configure this block to treat input signals as sample-based in future releases, set this parameter to `3-D array (concatenate along third dimension)`.

When the **Save format** is set to `Array` or `Structure`, the dimensions of the output depend on the input dimensions and the setting of the **Save 2-D signals as** parameter. The following table summarizes the output dimensions under various conditions. In the table, *K* represents the value of the **Limit data points to last** parameter.

Input Signal Dimensions	Save 2-D Signals As ...	Signal to Workspace Output Dimension
M-by-*N* matrix	`2-D array (concatenate along first dimension)`	*K*-by-*N* matrix. If you set the **Limit data points to last** parameter to `inf`, *K* represents the total number of samples acquired in each column by the end of simulation. This setting is equivalent to multiplying the input frame size (*M*) by the total number of *M*-by-*N* inputs acquired by the block.
M-by-*N* matrix	`3-D array (concatenate along third dimension)`	*M*-by-*N*-by-*K* array. If you set the **Limit data points to last** parameter to `inf`, *K* represents the total number of *M*-by-*N* inputs acquired by the end of the simulation.
Length-*N* unoriented vector	Any setting	*K*-by-*N* matrix

Input Signal Dimensions	Save 2-D Signals As ...	Signal to Workspace Output Dimension
N-dimensional array where *N* > 2	Any setting	Array with *N + 1* dimensions, where the size of the last dimension is equal to *K*. If you set the **Limit data points to last** parameter to `inf`, *K* represents the total number of *M*-by-*N* inputs acquired by the end of simulation

Dependencies

To enable the **Save 2-D signals as** parameter, set the **Save format** to `Array` or `Structure`.

Programmatic Use
Block Parameter: `Save2DSignal`
Type: character vector
Values: `'2-D array (concatenate along first dimension)'` | `'3-D array (concatenate along third dimension)'` | `'Inherit from input (this choice will be removed - see release notes)'`
Default: `'3-D array (concatenate along third dimension)'`

`Log fixed-point data as a fi object` — Log fixed-point data as a fi object or double

`off` (default) | `on`

By default, the To Workspace block logs fixed-point data to the MATLAB workspace as a Fixed-Point Designer `fi` object. If you clear this parameter, Simulink software logs fixed-point data to the workspace as `double`.

Programmatic Use
Block Parameter: `FixptAsFi`
Type: character vector
Values: `'off'` | `'on'`
Default: `'off'`

`Sample time` — Sample period and offset

-1 (default) | scalar | vector

Specifies the sample period and offset at which to collect data points. This parameter is useful when you are using a variable-step solver where the interval between time steps is not constant. The default value causes the block to inherit the sample time from the driving block. See “Specify Sample Time”.

Programmatic Use
Block Parameter: `SampleTime`
Type: character vector
Values: scalar | vector
Default: `'-1'`

Block Characteristics

Data Types	`double` | `single` | `Boolean` | `base integer` | `fixed point` | `enumerated` | `bus`
Direct Feedthrough	`No`
Multidimensional Signals	`Yes`
Variable-Size Signals	`Yes`
Zero-Crossing Detection	`No`

Tips

To make post-processing easier, you can convert data saved by this block to `Dataset` format. This conversion is useful when post processing this data with other logged data that can use `Dataset` format (for example, logged states). See “Convert Logged Data to Dataset Format”. You can also use signal logging with a variable-size signal exception.

Extended Capabilities

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

When you use this block in your model, HDL Coder™ does not generate HDL code for it. See To Workspace.

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

Toggle Switch

Toggle parameter between two values

Library: Simulink / Dashboard

Description

The Toggle Switch block toggles the value of the connected block parameter between two values during simulation. For example, you can connect the Toggle Switch block to a Switch block in your model and change its state during simulation. Use the Toggle Switch block with other Dashboard blocks to create an interactive dashboard for your model.

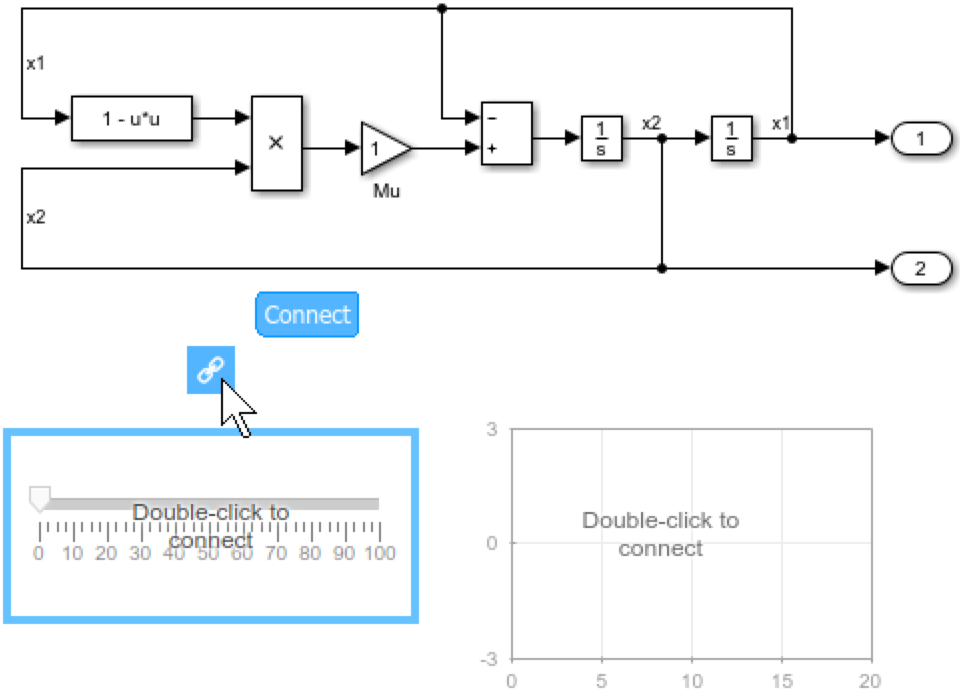
Double-clicking the Toggle Switch block does not open its dialog box during simulation and when the block is selected. To edit the block's parameters, you can use the **Property Inspector**, or you can right-click the block and select **Block Parameters** from the context menu.

Connecting Dashboard Blocks

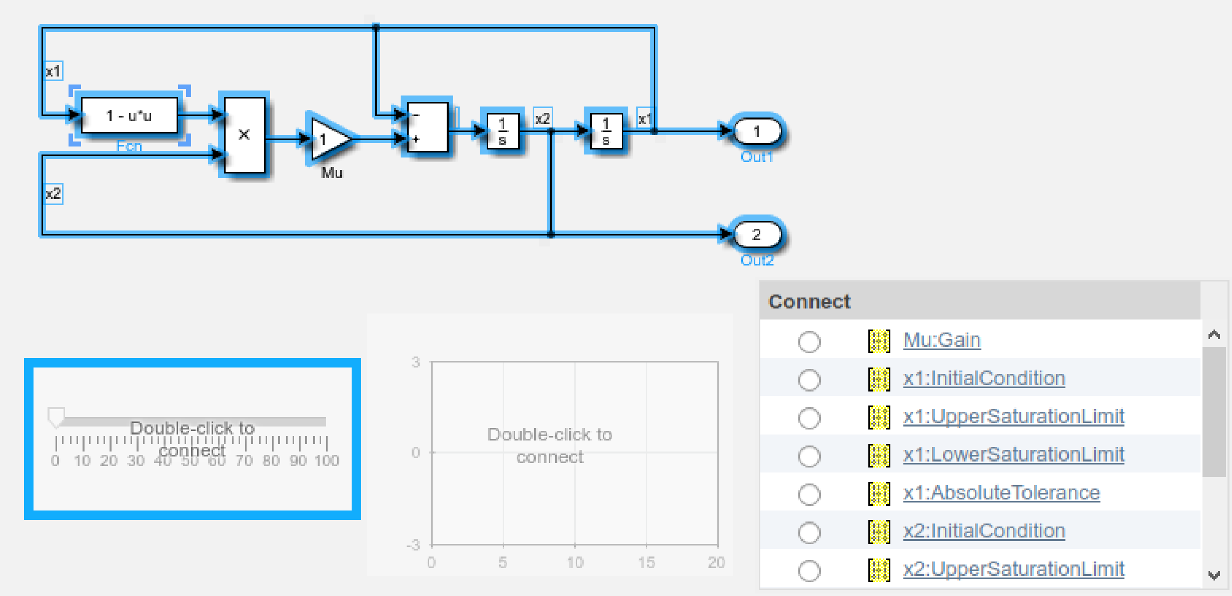
Dashboard blocks do not use ports to make connections. To connect Dashboard blocks to variables and block parameters in your model, use connect mode. Connect mode facilitates the process of connecting Dashboard blocks in your model, especially when you want to connect multiple blocks at once. If you only want to connect a single Dashboard block, you can also use the **Connection** table in the block dialog box to make the connection.

Note Dashboard blocks cannot connect to variables until you update your model diagram. To connect Dashboard blocks to variables or modify variable values between opening your model and running a simulation, update your model diagram using **Ctrl+D**.

To enter connect mode, click the **Connect** button that appears above your unconnected Dashboard block when you pause on it.



In connect mode, when you select one or more signals or blocks, a list of parameters and signals available for connection appears. Select a signal or parameter from the list to connect the selected Dashboard block. To connect another Dashboard block, pause on the block and click the **Connect** button above it. Then, make a selection of signals and blocks in your model, and choose a signal or parameter to connect.



Connect

○ Mu:Gain
○ x1:InitialCondition
○ x1:UpperSaturationLimit
○ x1:LowerSaturationLimit
○ x1:AbsoluteTolerance
○ x2:InitialCondition
○ x2:UpperSaturationLimit

When you finish connecting the Dashboard blocks in your model, click the **Exit** button in the upper-right of the canvas to exit connect mode.

Parameter Logging

Tunable parameters connected to Dashboard blocks are logged to the Simulation Data Inspector, where you can view parameter values along with logged signal data. You can access logged parameter data in the MATLAB workspace by exporting the parameter data from the Simulation Data Inspector UI or by using the `Simulink.sdi.exportRun` function. For more information about exporting data with the Simulation Data Inspector UI, see “Export Data from the Simulation Data Inspector”. The parameter data is stored in a `Simulink.SimulationData.Parameter` object, accessible as an element in the exported `Simulink.SimulationData.Dataset`.

Limitations

- Dashboard blocks can only connect to real scalar signals.
- You cannot use the **Connection** table to connect a Dashboard block to a block that is commented out. When you connect a Dashboard block to a commented block using

connect mode, the Dashboard block does not display the connected value until the you uncomment the block.

- Dashboard blocks cannot connect to signals inside referenced models.
- Parameters specified by indexing a variable array do not appear in the **Connection** table. For example, a block parameter defined as `engine(1)` using the variable `engine` does not appear in the table.

  To access the parameter in the **Connection** table, assign the indexed value to a scalar variable, such as `engine_1`. Then, use the scalar variable to define the block parameter.

Parameters

`Connection` — Select a variable or block parameter to connect

variable and parameter connection options

Select the variable or block parameter to control using the **Connection** table. Populate the **Connection** table by selecting one or more blocks in your model. Select the radio button next to the variable or parameter you want to control, and click **Apply**.

Note To see workspace variables in the connection table, update the model diagram using **Ctrl+D**.

States

`Label (Top)` — Label for top switch position

'On' (default) | character vector

Labels the top switch position. You can use the **Label** to display the value the connected parameter takes when the switch is positioned at the top, or you can enter a text label.

Example: `Gain = 2`

`Value (Top)` — Value for top switch position

1 (default) | scalar

The value assigned to the connected parameter when the switch is positioned at the top.

`Label (Bottom)` — Label for bottom switch position

'Off' (default) | character vector

Labels the bottom switch position. You can use the **Label** to display the value the connected parameter takes when the switch is positioned at the bottom, or you can enter a text label.

Example: `Gain = 1`

`Value (Bottom)` — Value for bottom switch position

0 (default) | scalar

The value assigned to the connected parameter when the switch is positioned at the bottom.

`Label` — Block label position

'Top' (default) | 'Bottom' | 'Hide'

Position of the block label. When the block is connected to a signal, the label is the name of the connected signal.

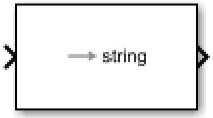
To String

Convert input signal to string signal

Library: Simulink / String



Description

The To String block creates a string signal from an input signal. For example, consider using this signal to convert a logical value `1` or `0` to its string equivalent `"false"` or `"true"`.

When a MinGW compiler compiles code generated from the block, running the compiled code may produce nonstandard results for floating-point inputs. For example, a numeric input of `501.987` returns the string `"5.019870e+002"` instead of the expected string `"5.019870e+02"`.

Ports

Input

`Port_1` — Input signal
scalar

Input signal, specified as a scalar.

Output

`Port_1` — Output string
scalar

Output string, specified as a scalar. This block returns the output as a string, surrounded by double quotes.

- If the input is a Boolean, the output is a logical value (`1` or `0`) and the block returns its textual equivalent (`true` or `false`).
- If the input is a numeric data type, such as an integer, single, double, or fixed point, the block returns the number as a string. For example, an input of `1` converts to `"1"` and an input of `0` converts to `"0"`.

Note The output string might not contain all the digits of the numeric value from the input port.

Data Types: `string`

Block Characteristics

Data Types	`double` | `single` | `Boolean` | `base integer` | `fixed point` | `enumerated` | `string`
Direct Feedthrough	`No`
Multidimensional Signals	`No`
Variable-Size Signals	`No`
Zero-Crossing Detection	`No`

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

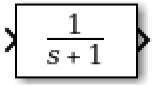
Transfer Fcn

Model linear system by transfer function
Library: Simulink / Continuous



Description

The Transfer Fcn block models a linear system by a transfer function of the Laplace-domain variable *s*. The block can model single-input single-output (SISO) and single-input multiple-output (SIMO) systems.

Conditions for Using This Block

The Transfer Fcn block assumes the following conditions:

- The transfer function has the form

  $$H(s)=\frac{y(s)}{u(s)}=\frac{num(s)}{den(s)}=\frac{num(1)s^{nn-1}+num(2)s^{nn-2}+\ldots+num(nn)}{den(1)s^{nd-1}+den(2)s^{nd-2}+\ldots+den(nd)},$$

  where *u* and *y* are the system input and outputs, respectively, *nn* and *nd* are the number of numerator and denominator coefficients, respectively. *num(s)* and *den(s)* contain the coefficients of the numerator and denominator in descending powers of *s*.
- The order of the denominator must be greater than or equal to the order of the numerator.
- For a multiple-output system, all transfer functions have the same denominator and all numerators have the same order.

Modeling a Single-Output System

For a single-output system, the input and output of the block are scalar time-domain signals. To model this system:

1 Enter a vector for the numerator coefficients of the transfer function in the **Numerator coefficients** field.

2 Enter a vector for the denominator coefficients of the transfer function in the **Denominator coefficients** field.

Modeling a Multiple-Output System

For a multiple-output system, the block input is a scalar and the output is a vector, where each element is an output of the system. To model this system:

1 Enter a matrix in the **Numerator coefficients** field.

   Each *row* of this matrix contains the numerator coefficients of a transfer function that determines one of the block outputs.

2 Enter a vector of the denominator coefficients common to all transfer functions of the system in the **Denominator coefficients** field.

Specifying Initial Conditions

A transfer function describes the relationship between input and output in Laplace (frequency) domain. Specifically, it is defined as the Laplace transform of the response (output) of a system with zero initial conditions to an impulse input.

Operations like multiplication and division of transfer functions rely on zero initial state. For example, you can decompose a single complicated transfer function into a series of simpler transfer functions. Apply them sequentially to get a response equivalent to that of the original transfer function. This will not be correct if one of the transfer functions assumes a non-zero initial state. Furthermore, a transfer function has infinitely many time domain realizations, most of whose states do not have any physical meaning.

For these reasons, Simulink presets the initial conditions of the Transfer Fcn block to zero. To specify initial conditions for a given transfer function, convert the transfer function to its controllable, canonical state-space realization using `tf2ss` . Then, use the State-Space block. The `tf2ss` utility provides the `A`, `B`, `C`, and `D` matrices for the system.

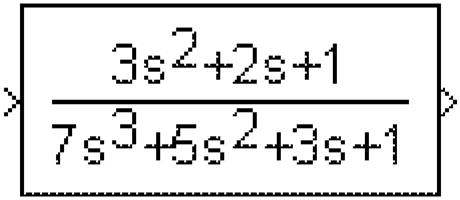
For more information, type `help tf2ss` or see the Control System Toolbox™ documentation.

Transfer Function Display on the Block

The Transfer Fcn block displays the transfer function depending on how you specify the numerator and denominator parameters.

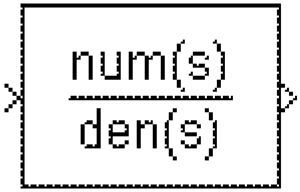
- If you specify each parameter as an expression or a vector, the block shows the transfer function with the specified coefficients and powers of *s*. If you specify a variable in parentheses, the block evaluates the variable.

  For example, if you specify **Numerator coefficients** as `[3,2,1]` and **Denominator coefficients** as `(den)`, where `den` is `[7,5,3,1]`, the block looks like this:

- If you specify each parameter as a variable, the block shows the variable name followed by `(s)`.

  For example, if you specify **Numerator coefficients** as `num` and **Denominator coefficients** as `den`, the block looks like this:

Ports

Input

`Port_1` — Input signal

scalar

Input signal, specified as a scalar with data type `double`.

Data Types: `double`

Output

`Port_1` — Output signal

scalar | vector

Output signal, provided as a scalar or vector with data type `double`.

- For a single-output system, the input and output of the block are scalar time-domain signals.
- For a multiple-output system, the input is a scalar, and the output is a vector, where each element is an output of the system.

Data Types: `double`

Parameters

`Numerator coefficients` — Vector or matrix of numerator coefficients

`[1]` (default) | vector | matrix

Define the numerator coefficients of the transfer function.

- For a single-output system, enter a vector for the numerator coefficients of the transfer function.
- For a multiple-output system, enter a matrix. Each row of this matrix contains the numerator coefficients of a transfer function that determines one of the block outputs.

Programmatic Use
Block Parameter: `Numerator`
Type: character vector, string
Values: vector | matrix
Default: `'[1]'`

`Denominator coefficients` — Row vector of denominator coefficients

`[1 1]` (default) | vector

Define the row vector of denominator coefficients.

- For a single-output system, enter a vector for the denominator coefficients of the transfer function.
- For a multiple-output system, enter a vector containing the denominator coefficients common to all transfer functions of the system.

Programmatic Use
Block Parameter: `Denominator`
Type: character vector, string
Values: vector
Default: `'[1 1]'`

`Absolute tolerance` — Absolute tolerance for computing block states

`auto` (default) | scalar | vector

Absolute tolerance for computing block states, specified as a positive, real-valued, scalar or vector. To inherit the absolute tolerance from the Configuration Parameters, specify `auto` or `-1`.

- If you enter a real scalar, then that value overrides the absolute tolerance in the Configuration Parameters dialog box for computing all block states.
- If you enter a real vector, then the dimension of that vector must match the dimension of the continuous states in the block. These values override the absolute tolerance in the Configuration Parameters dialog box.
- If you enter `auto` or –1, then Simulink uses the absolute tolerance value in the Configuration Parameters dialog box (see “Solver Pane”) to compute block states.

Programmatic Use
Block Parameter: `AbsoluteTolerance`
Type: character vector, string
Values: `'auto'` | `'-1'` | any positive real-valued scalar or vector
Default: `'auto'`

`State Name (e.g., 'position')` — Assign unique name to each state

`' '` (default) | `'position'` | `{'a', 'b', 'c'}` | `a` | ...

Assign a unique name to each state. If this field is blank (`' '`), no name assignment occurs.

- To assign a name to a single state, enter the name between quotes, for example, `'position'`.

- To assign names to multiple states, enter a comma-delimited list surrounded by braces, for example, `{'a', 'b', 'c'}`. Each name must be unique.
- To assign state names with a variable in the MATLAB workspace, enter the variable without quotes. A variable can be a character vector, string, cell array, or structure.

Limitations

- The state names apply only to the selected block.
- The number of states must divide evenly among the number of state names.
- You can specify fewer names than states, but you cannot specify more names than states.

  For example, you can specify two names in a system with four states. The first name applies to the first two states and the second name to the last two states.

Programmatic Use
Block Parameter: `ContinuousStateAttributes`
Type: character vector, string
Values: `' '` | user-defined
Default: `' '`

Block Characteristics

Data Types	`double`
Direct Feedthrough	`No`
Multidimensional Signals	`No`
Variable-Size Signals	`No`
Zero-Crossing Detection	`No`

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Not recommended for production-quality code. Relates to resource limits and restrictions on speed and memory often found in embedded systems. The code generated can contain dynamic allocation and freeing of memory, recursion, additional memory overhead, and widely-varying execution times. While the code is functionally valid and generally acceptable in resource-rich environments, smaller embedded targets often cannot support such code.

In general, consider using the Simulink Model Discretizer to map continuous blocks into discrete equivalents that support production code generation. To start the Model Discretizer, select **Analysis > Control Design > Model Discretizer**. One exception is the Second-Order Integrator block because, for this block, the Model Discretizer produces an approximate discretization.

Transfer Fcn Direct Form II

Implement Direct Form II realization of transfer function

Library: Simulink / Additional Math & Discrete / Additional Discrete

Description

The Transfer Fcn Direct Form II block implements a Direct Form II realization of the transfer function that the **Numerator coefficients** and **Denominator coefficients excluding lead** parameters specify. The block supports only single input-single output (SISO) transfer functions.

The block automatically selects the data types and scalings of the output, the coefficients, and any temporary variables.

Ports

Input

`Port_1` — Input signal

scalar | vector

Input signal, specified as a scalar or vector.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fixed point`

Output

`Port_1` — Output signal

scalar | vector

Output signal, specified as a scalar or vector.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fixed point`

Parameters

`Numerator coefficients` — Numerator coefficients

`[0.2 0.3 0.2]` (default) | vector

Specify the numerator coefficients as a vector.

Programmatic Use
Block Parameter: `NumCoefVec`
Type: character vector
Values: vector
Default: `'[0.2 0.3 0.2]'`

`Denominator coefficients excluding lead` — Denominator coefficient

`[-0.9 0.6]` (default) | vector

Specify the denominator coefficients, excluding the leading coefficient, which must be `1.0`.

Programmatic Use
Block Parameter: `DenCoeffVec`
Type: character vector
Values: vector
Default: `'[-0.9 0.6]'`

`Initial condition` — Initial condition

`0.0` (default) | scalar

Specify the initial condition as a scalar.

Programmatic Use
Block Parameter: `vinit`
Type: character vector
Values: scalar
Default: `'0.0'`

`Integer rounding mode` — Rounding mode for fixed-point operations

`Floor` (default) | `Ceiling` | `Convergent` | `Nearest` | `Round` | `Simplest` | `Zero`

Specify the rounding mode for fixed-point operations. For more information, see “Rounding” (Fixed-Point Designer).

Programmatic Use
Block Parameter: `RndMeth`
Type: character vector
Values: `'Ceiling' | 'Convergent' | 'Floor' | 'Nearest' | 'Round' | 'Simplest' | 'Zero'`
Default: `'Floor'`

`Saturate to max or min when overflows occur` — Method of overflow action

`off` (default) | `on`

When you select this check box, overflows saturate to the maximum or minimum value that the data type can represent. Otherwise, overflows wrap.

When you select this check box, saturation applies to every internal operation on the block, not just the output or result. In general, the code generation process can detect when overflow is not possible. In this case, the code generator does not produce saturation code.

Programmatic Use
Block Parameter: `DoSatur`
Type: character vector
Values: `'off' | 'on'`
Default: `'off'`

Block Characteristics

Data Types	`double` | `single` | `base integer` | `fixed point`
Direct Feedthrough	`No`
Multidimensional Signals	`No`
Variable-Size Signals	`No`

Zero-Crossing Detection	No

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

The code generator does not explicitly group primitive blocks that constitute a nonatomic masked subsystem block in the generated code. This flexibility allows for more efficient code generation. In certain cases, you can achieve grouping by configuring the masked subsystem block to execute as an atomic unit by selecting the **Treat as atomic unit** option.

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

Transfer Fcn Direct Form II Time Varying

Implement time varying Direct Form II realization of transfer function

Library: Simulink / Additional Math & Discrete / Additional Discrete

Description

The Transfer Fcn Direct Form II Time Varying block implements a Direct Form II realization of the specified transfer function. The block supports only single input-single output (SISO) transfer functions.

The input signal labeled **Den No Lead** contains the denominator coefficients of the transfer function. The full denominator has a leading coefficient of one, but it is excluded from the input signal. For example, to use a denominator of `[1 -1.7 0.72]`, specify a signal with the value `[-1.7 0.72]`. The input signal labeled **Num** contains the numerator coefficients. The data types of the numerator and denominator coefficients can be different, but the length of the numerator vector and the full denominator vector must be the same. Pad the numerator vector with zeros, if needed.

The block automatically selects the data types and scalings of the output, the coefficients, and any temporary variables.

Ports

Input

u — Input signal
scalar | vector

Input signal, specified as a scalar or vector.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point`

`Num` — Numerator coefficients

scalar | vector

Numerator coefficients of the transfer function, specified as a scalar or vector.

Dependencies

The data types of the numerator and denominator coefficients can be different, but the length of the numerator vector and the full denominator vector must be the same. Pad the numerator vector with zeros, if needed.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point`

`Den No Lead` — Denominator coefficients

scalar | vector

Denominator coefficients of the transfer function, specified as a scalar or vector, without the leading coefficient of one. The full denominator has a leading coefficient of one, but it is excluded from the input signal.

Example: For a denominator coefficient of `[1 -1.7 0.72]`, specify a signal with value `[-1.7 0.72]`.

Dependencies

The data types of the numerator and denominator coefficients can be different, but the length of the numerator vector and the full denominator vector must be the same.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point`

Output

y — Output signal

scalar | vector

Output signal, specified as a scalar or vector.

The block automatically selects the data types and scalings of the output and any temporary variables.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Parameters

`Initial condition` — Initial condition

`0.0` (default) | scalar

Specify the initial condition as a scalar.

Programmatic Use
Block Parameter: `vinit`
Type: character vector
Values: scalar
Default: `'0.0'`

`Integer rounding mode` — Rounding mode for fixed-point operations

`Floor` (default) | `Ceiling` | `Convergent` | `Nearest` | `Round` | `Simplest` | `Zero`

Specify the rounding mode for fixed-point operations. For more information, see "Rounding" (Fixed-Point Designer).

Programmatic Use
Block Parameter: `RndMeth`
Type: character vector
Values: `'Ceiling' | 'Convergent' | 'Floor' | 'Nearest' | 'Round' | 'Simplest' | 'Zero'`
Default: `'Floor'`

`Saturate to max or min when overflows occur` — Method of overflow action

`off` (default) | `on`

When you select this check box, overflows saturate to the maximum or minimum value that the data type can represent. Otherwise, overflows wrap.

When you select this check box, saturation applies to every internal operation on the block, not just the output or result. In general, the code generation process can detect when overflow is not possible. In this case, the code generator does not produce saturation code.

Programmatic Use
Block Parameter: `DoSatur`
Type: character vector
Values: `'off' | 'on'`
Default: `'off'`

Block Characteristics

Data Types	`double` | `single` | `Boolean`[a] | `base integer` | `fixed point`
Direct Feedthrough	`No`
Multidimensional Signals	`No`
Variable-Size Signals	`No`
Zero-Crossing Detection	`No`

[a] This block is not recommended for use with Boolean signals.

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

The code generator does not explicitly group primitive blocks that constitute a nonatomic masked subsystem block in the generated code. This flexibility allows for more efficient code generation. In certain cases, you can achieve grouping by configuring the masked subsystem block to execute as an atomic unit by selecting the **Treat as atomic unit** option.

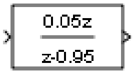
Transfer Fcn First Order

Implement discrete-time first order transfer function

Library: Simulink / Discrete



Description

The Transfer Fcn First Order block implements a discrete-time first order transfer function of the input. The transfer function has a unity DC gain.

Ports

Input

`Port_1` — Input signal
scalar | vector

Input signal to the first order transfer function algorithm.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point`

Output

`Port_1` — Transfer function output signal
scalar | vector

Output signal that is the discrete-time first order transfer function of the input with a unity DC gain.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point`

Parameters

`Pole (in Z plane)` — Pole

`0.95` (default) | scalar

Specify the pole.

Programmatic Use
Block Parameter: `PoleZ`
Type: character vector
Value: real scalar
Default: `'0.95'`

`Initial condition for previous output` — Initial condition for previous output

`0.0` (default) | scalar

Specify the initial condition for the previous output.

Programmatic Use
Block Parameter: `ICPrevOutput`
Type: character vector
Value: real scalar
Default: `'0.0'`

`Integer rounding mode` — Rounding mode for fixed-point operations

`Floor` (default) | `Ceiling` | `Convergent` | `Nearest` | `Round` | `Simplest` | `Zero`

Specify the rounding mode for fixed-point operations. For more information, see "Rounding" (Fixed-Point Designer).

Block parameters always round to the nearest representable value. To control the rounding of a block parameter, enter an expression using a MATLAB rounding function into the mask field.

Programmatic Use
Block Parameter: `RndMeth`
Type: character vector
Values: `'Ceiling' | 'Convergent' | 'Floor' | 'Nearest' | 'Round' | 'Simplest' | 'Zero'`
Default: `'Floor'`

`Saturate to max or min when overflows occur` — Method of overflow action
`off` (default) | `on`

When you select this check box, overflows saturate to the maximum or minimum value that the data type can represent. Otherwise, overflows wrap.

When you select this check box, saturation applies to every internal operation on the block, not just the output or result. In general, the code generation process can detect when overflow is not possible. In this case, the code generator does not produce saturation code.

Programmatic Use
Block Parameter: `DoSatur`
Type: character vector
Values: `'off' | 'on'`
Default: `'off'`

Block Characteristics

Data Types	`double` | `single` | `base integer` | `fixed point`
Direct Feedthrough	`No`
Multidimensional Signals	`No`
Variable-Size Signals	`Yes`
Zero-Crossing Detection	`No`

Extended Capabilities

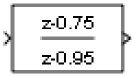
Transfer Fcn | Transfer Fcn Lead or Lag

Introduced before R2006a

Transfer Fcn Lead or Lag

Implement discrete-time lead or lag compensator

Library: Simulink / Discrete



Description

The Transfer Fcn Lead or Lag block implements a discrete-time lead or lag compensator of the input. The instantaneous gain of the compensator is 1, and the DC gain is equal to `(1-z)/(1-p)`, where `z` is the zero and `p` is the pole of the compensator.

The block implements a lead compensator when `0<z<p<1`, and implements a lag compensator when `0<p<z<1`.

Ports

Input

`Port_1` — Input signal
scalar | vector

Input signal that the block applies the discrete-time lead or lag compensation to.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fixed point`

Output

`Port_1` — Output signal
scalar | vector

Output signal that is discrete-time lead or lag compensation of the input sign.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fixed point`

Parameters

`Pole of compensator (in Z plane)` — Pole

`0.95` (default) | scalar

Specify the pole of the compensator.

Programmatic Use
Block Parameter: `PoleZ`
Type: character vector
Value: real scalar
Default: `'0.95'`

`Zero of compensator (in Z plane)` — Zero of compensator

`0.75` (default) | scalar

Specify the zero of compensator in the Z plane.

Programmatic Use
Block Parameter: `ZeroZ`
Type: character vector
Value: real scalar
Default: `'0.75'`

`Initial condition for previous output` — Initial condition for previous output

`0.0` (default) | scalar

Specify the initial condition for the previous output.

Programmatic Use
Block Parameter: `ICPrevOutput`
Type: character vector
Value: real scalar
Default: `'0.0'`

`Initial condition for previous input` — Initial condition for previous input

`0.0` (default) | scalar

Specify the initial condition for the previous input.

Programmatic Use
Block Parameter: `ICPrevInput`
Type: character vector
Value: real scalar
Default: `'0.0'`

`Initial condition for previous output` — Initial condition for previous output

`0.0` (default) | scalar

Specify the initial condition for the previous output.

Programmatic Use
Block Parameter: `ICPrevOutput`
Type: character vector
Value: real scalar
Default: `'0.0'`

`Integer rounding mode` — Rounding mode for fixed-point operations

`Floor` (default) | `Ceiling` | `Convergent` | `Nearest` | `Round` | `Simplest` | `Zero`

Specify the rounding mode for fixed-point operations. For more information, see “Rounding” (Fixed-Point Designer).

Block parameters always round to the nearest representable value. To control the rounding of a block parameter, enter an expression using a MATLAB rounding function into the mask field.

Programmatic Use
Block Parameter: `RndMeth`
Type: character vector
Values: `'Ceiling' | 'Convergent' | 'Floor' | 'Nearest' | 'Round' | 'Simplest' | 'Zero'`
Default: `'Floor'`

`Saturate to max or min when overflows occur` — Method of overflow action

`off` (default) | `on`

When you select this check box, overflows saturate to the maximum or minimum value that the data type can represent. Otherwise, overflows wrap.

When you select this check box, saturation applies to every internal operation on the block, not just the output or result. In general, the code generation process can detect when overflow is not possible. In this case, the code generator does not produce saturation code.

Programmatic Use
Block Parameter: `DoSatur`
Type: character vector
Values: `'off' | 'on'`
Default: `'off'`

Block Characteristics

Data Types	`double` | `single` | `Boolean`[a] | `base integer` | `fixed point`
Direct Feedthrough	`No`
Multidimensional Signals	`No`
Variable-Size Signals	`Yes`
Zero-Crossing Detection	`No`

[a] This block is not recommended for use with Boolean signals.

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

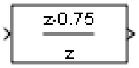
Transfer Fcn | Transfer Fcn First Order

Introduced before R2006a

Transfer Fcn Real Zero

Implement discrete-time transfer function that has real zero and no pole
Library: Simulink / Discrete



Description

The Transfer Fcn Real Zero block implements a discrete-time transfer function that has a real zero and effectively no pole.

Ports

Input

`Port_1` — Input signal
scalar | vector

Input signal to the discrete-time transfer function algorithm.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fixed point`

Output

`Port_1` — Output signal
scalar | vector

Output signal that is the discrete-time transfer function with a real zero and effectively no pole of the input signal.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fixed point`

Parameters

`Zero (in Z plane)` — Zero

`0.75` (default) | scalar

Specify the zero in the Z plane.

Programmatic Use
Block Parameter: `ZeroZ`
Type: character vector
Value: real scalar
Default: `'0.75'`

`Initial condition for previous input` — Initial condition for previous input

`0.0` (default) | scalar

Specify the initial condition for the previous input.

Programmatic Use
Block Parameter: `ICPrevInput`
Type: character vector
Value: real scalar
Default: `'0.0'`

`Input processing` — Specify sample- or frame-based processing

`Elements as channels (sample based)` (default) | `Columns as channels (frame based)`

Specify whether the block performs sample- or frame-based processing:

- `Columns as channels (frame based)` — Treat each column of the input as a separate channel (frame-based processing).

  Note Frame-based processing requires a DSP System Toolbox license.

  For more information, see "Sample- and Frame-Based Concepts" (DSP System Toolbox).

- `Elements as channels (sample based)` — Treat each element of the input as a separate channel (sample-based processing).

Use **Input processing** to specify whether the block performs sample- or frame-based processing. The block accepts frame-based signals for the input `u`. All other input signals must be sample-based.

Input Signal u	Input Processing Mode	Block Works?
Sample based	Sample based	Yes
Frame based		No, produces an error
Sample based	Frame based	Yes
Frame based		Yes
Sample based	Inherited	Yes
Frame based		Yes

For more information about these two processing modes, see “Sample- and Frame-Based Concepts” (DSP System Toolbox).

Programmatic Use
Block Parameter: `InputProcessing`
Type: character vector
Values: `'Columns as channels (frame based)'` | `'Elements as channels (sample based)'`
Default: `'Elements as channels (sample based)'`

`Integer rounding mode` — Rounding mode for fixed-point operations

`Floor` (default) | `Ceiling` | `Convergent` | `Nearest` | `Round` | `Simplest` | `Zero`

Specify the rounding mode for fixed-point operations. For more information, see “Rounding” (Fixed-Point Designer).

Block parameters always round to the nearest representable value. To control the rounding of a block parameter, enter an expression using a MATLAB rounding function into the mask field.

Programmatic Use
Block Parameter: `RndMeth`
Type: character vector
Values: `'Ceiling' | 'Convergent' | 'Floor' | 'Nearest' | 'Round' | 'Simplest' | 'Zero'`
Default: `'Floor'`

Saturate to max or min when overflows occur — Method of overflow action
off (default) | on

When you select this check box, overflows saturate to the maximum or minimum value that the data type can represent. Otherwise, overflows wrap.

When you select this check box, saturation applies to every internal operation on the block, not just the output or result. In general, the code generation process can detect when overflow is not possible. In this case, the code generator does not produce saturation code.

Programmatic Use
Block Parameter: DoSatur
Type: character vector
Values: 'off' | 'on'
Default: 'off'

Block Characteristics

Data Types	double | single | Boolean[a] | base integer | fixed point
Direct Feedthrough	No
Multidimensional Signals	No
Variable-Size Signals	Yes
Zero-Crossing Detection	No

[a] This block is not recommended for use with Boolean signals.

Extended Capabilities

Introduced before R2006a

Transport Delay

Delay input by given amount of time
Library: Simulink / Continuous

Description

The Transport Delay block delays the input by a specified amount of time. You can use this block to simulate a time delay. The input to this block should be a continuous signal.

At the start of simulation, the block outputs the **Initial output** parameter until the simulation time exceeds the **Time delay** parameter. Then, the block begins generating the delayed input. During simulation, the block stores input points and simulation times in a buffer. You specify this size with the **Initial buffer size** parameter.

When you want output at a time that does not correspond to times of the stored input values, the block interpolates linearly between points. When the delay is smaller than the step size, the block extrapolates from the last output point, which can produce inaccurate results. Because the block does not have direct feedthrough, it cannot use the current input to calculate an output value. For example, consider a fixed-step simulation with a step size of 1 and the current time at t = 5. If the delay is 0.5, the block must generate a point at t = 4.5. Because the most recent stored time value is at t = 4, the block performs forward extrapolation.

The Transport Delay block does not interpolate discrete signals. Instead, the block returns the discrete value at the required time.

This block differs from the Unit Delay block, which delays and holds the output on sample hits only.

Tip Avoid using `linmod` to linearize a model that contains a Transport Delay block. For more information, see “Linearizing Models”.

Ports

Input

`Port_1` — Input signal

scalar | vector | matrix

Input signal to delay, specified as a scalar, vector, or matrix.

Data Types: `double`

Output

`Port_1` — Delayed signal

scalar | vector | matrix

Input signal, delayed by specified amount of time. Output has the same dimensions and data type as the input signal.

Data Types: `double`

Parameters

`Time delay` — Time delay

`1` (default) | `scalar` | vector | matrix

Specify the amount of simulation time to delay the input signal before propagation to the output as a non-negative scalar, vector, or matrix.

Programmatic Use:
Block Parameter: `DelayTime`
Type: character vector, string
Values: non-negative scalar, vector, or matrix
Default: `'1'`

`Initial output` — Initial output value

`0` (default) | scalar | vector | matrix

Specify the output that the block generates until the simulation time first exceeds the time delay input as a scalar, vector, or matrix.

Limitations

The initial output of this block cannot be `inf` or `NaN`.

A `Run-to-run tunable parameter` cannot be changed during a simulation’s run time. However, changing it before a simulation begins will not cause Accelerator or Rapid Accelerator to regenerate code.

Programmatic Use

Block Parameter: `InitialOutput`
Type: character vector, string
Values: scalar | vector | matrix
Default: `'0'`

`Initial buffer size` — Initial memory allocation

`1024` (default) | positive integer scalar

Define the initial memory allocation for the number of input points to store.

- If the number of input points exceeds the initial buffer size, the block allocates additional memory.
- After simulation ends, a message shows the total buffer size needed.

Tips

- Because allocating memory slows down simulation, choose this value carefully if simulation speed is an issue.
- For long time delays, this block can use a large amount of memory, particularly for dimensionalized input.

Programmatic Use

Block Parameter: `BufferSize`
Type: character vector, string
Value: positive integer scalar
Default: `'1024'`

`Use fixed buffer size` — Use fixed-size buffer

`off` (default) | `on`

Select this check box to use a fixed-size buffer to save input data from previous time steps.

The **Initial buffer size** parameter specifies the size of the buffer. If the buffer is full, new data replaces data already in the buffer. Simulink software uses linear extrapolation to estimate output values that are not in the buffer.

Note If you have a Simulink Coder license, ERT or GRT code generation uses a fixed-size buffer even if you do not select this check box.

Tips

- If the input data is linear, selecting this check box can save memory.
- If the input data is nonlinear, do not select this check box. Doing so can yield inaccurate results.

Programmatic Use

Block Parameter: `FixedBuffer`
Type: character vector, string
Value: `'off'` | `'on'`
Default: `'off'`

`Direct feedthrough of input during linearization` — Enable direct feedthrough

`off` (default) | `on`

Cause the block to output its input during linearization and trim, which sets the block mode to direct feedthrough.

Tips

- Selecting this check box can cause a change in the ordering of states in the model when you use the functions `linmod`, `dlinmod`, or `trim`. To extract this new state ordering:

  1. Compile the model using the following command, where `model` is the name of the Simulink model.

     ```
     [sizes, x0, x_str] = model([],[],[],'lincompile');
     ```
  2. Terminate the compilation with the following command.

     ```
     model([],[],[],'term');
     ```
- The output argument `x_str`, which is a cell array of the states in the Simulink model, contains the new state ordering. When you pass a vector of states as input to the

linmod, dlinmod, or trim functions, the state vector must use this new state ordering.

Programmatic Use
Block Parameter: TransDelayFeedthrough
Type: character vector, string
Value: 'off' | 'on'
Default: 'off'

Pade order (for linearization) — Order of Pade approximation
0 (default) | scalar | vector | matrix

Set the order of the Pade approximation for linearization routines as a scalar, vector, or matrix of nonnegative integers.

- The default value is 0, which results in a unity gain with no dynamic states.
- Setting the order to a positive integer n adds n states to your model, but results in a more accurate linear model of the transport delay.

Programmatic Use
Block Parameter: PadeOrder
Type: character vector, string
Values: scalar | vector | matrix
Default: '0'

Block Characteristics

Data Types	double
Direct Feedthrough	Yes
Multidimensional Signals	No
Variable-Size Signals	No
Zero-Crossing Detection	No

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Not recommended for production-quality code. Relates to resource limits and restrictions on speed and memory often found in embedded systems. The code generated can contain dynamic allocation and freeing of memory, recursion, additional memory overhead, and widely-varying execution times. While the code is functionally valid and generally acceptable in resource-rich environments, smaller embedded targets often cannot support such code.

In general, consider using the Simulink Model Discretizer to map continuous blocks into discrete equivalents that support production code generation. To start the Model Discretizer, select **Analysis > Control Design > Model Discretizer**. One exception is the Second-Order Integrator block because, for this block, the Model Discretizer produces an approximate discretization.

Trigger

Add trigger port to subsystem or model
Library: Simulink / Ports & Subsystems

Description

The Trigger block allows an external signal to control the execution of a subsystem or a model. To enable this functionality, add this block to a Subsystem block or at the root level of a model that is referenced in a Model block.

Then, configure the Trigger block to execute a subsystem or model:

- Once at each time step, when the value of the trigger signal changes in a way that you specify.
- Multiple times during a time step, when the trigger signal is a function-call from a Stateflow chart, Function-Call Generator block, or S-Function block.

Ports

Output

`Trigger signal` — External trigger signal for a subsystem or model
scalar

Trigger signal attached externally to the outside of an Subsystem block or a Model block that is passed to the inside of the block. To enable this port, select **Show output port**.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `expression`

Parameters

Main

`Trigger type` — Select the type of event

`rising` (default) | `falling` | `either` | `function-call`

Select the type of event that triggers execution of the subsystem or model.

`rising`

Trigger execution of subsystem or model when the trigger signal rises from a negative or zero value to a positive value. If the initial value is negative, a rising signal to zero triggers execution.

`falling`

Trigger execution of subsystem or model when the trigger signal falls from a positive or a zero value to a negative value. If the initial value is positive, a falling signal to zero triggers execution.

`either`

Trigger execution of subsystem or model when the trigger signal is either rising or falling.

`function-call`

Trigger execution of subsystem or model when the trigger signal is a function-call event from a Stateflow chart, Function-Call Generator block, or an S-function block.

Programmatic Use

Block Parameter: `TriggerType`
Type: character vector
Values: `'rising'` | `'falling'` | `'either'` | `'function-call'`
Default: `'rising'`

`Treat as Simulink function` — Create Simulink Function block

off (default) | on

Create a Simulink Function block by configuring a Subsystem block that is callable with arguments from a function caller.

□ off

Remove configuration.

☑ on

Configure a Subsystem block as a Simulink Function block. The Trigger block must reside within the subsystem.

You can edit the function prototype that displays on the block face to specify input and output arguments for the block.

Dependency

To display and enable this parameter, select `function-call` from the **Trigger type** list.

Programmatic Use
Block Parameter: `IsSimulinkFunction`
Type: character vector
Values: `'off'` | `'on'`
Default: `'off'`

`Function name` — Specify function name for Simulink Function block

`f` (default) | function name

Specify the function name for a Simulink Function block. Alternatively, you can specify the name by editing the function prototype on the face of the block.

`f`

Default name for a Simulink Function block.

function name

Function name that displays on the face of a Simulink Function block.

Dependency

To display and enable this parameter, select `function-call` from the **Trigger type** list and select the **Treat as a Simulink Function** check box.

Programmatic Use
Block Parameter: `FunctionName`
Type: character vector
Values: `'f'` | `'<function name>'`
Default: `'f'`

`Enable variant condition` — Controls activating the variant control (condition)

on (default) | off

Control activating the variant control (condition) defined with the **Variant Control** parameter.

□ off

Deactivate variant control of subsystem.

☑ on

Activate variant control of subsystem. Selecting this parameter:

- Enables the **Variant control** parameter.
- Displays a variant badge ⧉ on the face of the block indicating variant conditions are enabled.

Dependency

To display and enable this parameter, select `function-call` from the **Trigger type** list and select the **Treat as a Simulink Function** check box..

Programmatic Use

Block Parameter: `Variant`
Type: character vector
Values: `'off'` | `'on'`
Default: `'off'`

`Variant control` — Specify variant control (condition) expression

`(inherit)` (default) | `<logical expression>`

Specify variant control (condition) expression that executes a variant Simulink Function block when the expression evaluates to `true`.

`(inherit)`

Default value for variant control. Inherits the variant condition from the corresponding Function Caller blocks in the model. When **Variant Control** is set as `(inherit)` the value for **Generate preprocessor conditionals** is inherited automatically from the Function Caller block in the model.

logical expression

A logical (Boolean) expression or a `Simulink.Variant` object representing a logical expression.

The function is activated when the expression evaluates to `true`.

If you want to generate code for your model, define the variables in the expression as `Simulink.Parameter` objects.

Dependency

To display and enable this parameter, select `function-call` from the **Trigger type** list, select the **Treat as a Simulink Function** check box and then select the **Enable variant condition** check box.

Programmatic Use
Block Parameter: `VariantControl`
Type: character vector
Values: `'(inherit)'`|`<logical expression>` | `Simulink.Variant object`
Default: `'(inherit)'`

`Generate preprocessor conditionals` — Control enclosing variant choices

off (default) | on

Control enclosing variant choices within C preprocessor conditional statements.

□ off

Do not enclose variant choices within C preprocessor conditional statements.

☑ on

When generating code for an ERT target, enclose variant choices within C preprocessor conditional statements (#if).

Dependency

To display and enable this parameter, select the **Enable variant condition** check box.

Programmatic Use
Block Parameter: `GeneratePreprocessorConditionals`
Type: character vector
Values: `'off'` | `'on'`
Default: `'off'`

`Function visibility` — Select scope visibility of function

`scoped` (default) | `global`

Select scope of Simulink Function block within subsystem or model.

`scoped`

Limit accessibility of function to:

- Hierarchic level containing the Simulink Function block and levels below.
- One hierarchical level above with qualification.

`global`

Function accessible from any part of the model hierarchy.

Dependency

To display and enable this parameter, select `function-call` from the **Trigger type** list and then select the **Treat as a Simulink Function** check box..

Programmatic Use

Block Parameter: `FunctionVisibility`
Type: character vector
Values: `'scoped'` | `'global'`
Default: `'scoped'`

`States when enabling` — Select how to set block state values

`held` (default) | `reset` | `inherit`

Select how to set block state values when the subsystem or model is disabled.

`held`

Leave the block states at their current values.

`reset`

Reset the block state values.

`inherit`

Use the `held` or `reset` setting from the parent subsystem initiating the function-call. If the parent of the initiator is the model root, the inherited setting is `held`. If the trigger has multiple initiators, set the parents of all initiators to either `held` or `reset`.

Dependencies

To enable this parameter, select `function-call` from the **Trigger Type** list.

This parameter setting applies only if the model explicitly enables and disables the function-call subsystem. For example:

- The function-call subsystem resides in an enabled subsystem. In this case, the model enables and disables the function-call subsystem along with the parent subsystem.
- The function-call initiator that controls the function-call subsystem resides in an enabled subsystem. In this case, the model enables and disables the function-call subsystem along with the enabled subsystem containing the function-call initiator.
- The function-call initiator is a Stateflow event bound to a particular state. See “Control Function-Call Subsystems by Using Bind Actions” (Stateflow).
- The function-call initiator is an S-function that explicitly enables and disables the function-call subsystem. See `ssEnableSystemWithTid` for an example.

Programmatic Use
Block Parameter: `StatesWhenEnabling`
Type: character vector
Values: `'held'` | `'reset'`| `'inherit'`
Default: `'held'`

Propagate sizes of variable-size signals — Select when to propagate variable-size signals

`During execution` (default) | `Only when enabling`

Select when to propagate variable-size signals.

`During execution`

Propagate variable-size signals at each time step.

`Only when enabling`

Propagate variable-size signals when executing a Subsystem block or Model block containing an Enable port, Trigger port with **Trigger type** set to `function- call`, or Action Port block. When you select this option, sample time must be periodic.

Dependencies

To display and enable this parameter for a Trigger port block, select `Function-call` from the **Trigger type** list.

Programmatic Use
Block Parameter: `PropagateVarSize`
Type: character vector
Values: `'During execution'` | `'Only when enabling'`
Default: `'During execution'`

`Show output port` — Control display of output port

off (default) | on

Control display of an output port for a signal that identifies the trigger signal.

☐ off

Remove the output port.

☑ on

Display the output port and determine which signal caused the trigger. The width of the output port signal is the width of the triggering signal. The signal value is:

- `1` for a signal that causes a rising trigger
- `-1` for a signal that causes a falling trigger
- `2` for a function-call trigger
- `0` in all other cases

Programmatic Use

Block Parameter: `ShowOutputPort`
Type: character vector
Values: `'off'` | `'on'`
Default: `'off'`

`Output data type` — Select output port data type

`auto` (default) | `double` | `int8`

Select output port data type for the signal that identifies the trigger signal.

`auto`

Data type is the same as the port connected to the output.

`double`

Double value.

`int8`

Integer value

Dependency

To enable this parameter, select the **Show output port** check box.

The Trigger block ignores the **Data type override** setting for the Fixed-Point Tool.

Programmatic Use

Block Parameter: `OutputDataType`
Type: character vector
Values: `'auto'` | `'double'` | `'int8'`
Default: `'auto'`

`Sample time type` — Select calling rate

`triggered` (default) | `periodic`

Select the calling rate for a subsystem or model.

`triggered`

Apply to applications that do not have a periodic calling frequency.

`periodic`

Apply if the caller of the parent function-call subsystem calls the subsystem once per time step when the subsystem is active (enabled). A Stateflow chart is an example of a caller.

Dependency

To enable this parameter, select `Function-call` from the **Trigger type** list.

Programmatic Use

Block Parameter: `SampleTimeType`
Type: character vector
Values: `'triggered'` | `'periodic'`
Default: `'triggered'`

`Sample time` — Specify time interval

`-1` (default) | `Ts` | `[Ts, To]`

Specify the time interval between function calls to a subsystem or model containing this Trigger port block. If the actual calling rate for the subsystem or model differs from the time interval this parameter specifies, Simulink displays an error.

`-1`

Inherit time interval from the trigger signal.

`Ts`

Scalar where Ts is the time interval.

`[Ts, To]`

Vector where Ts is the time interval and To is the initial time offset.

Dependencies

To enable this parameter, select `function-call` from the **Trigger type** list and `periodic` from the **Sample time type** list.

Programmatic Use
Block Parameter: `SampleTime`
Type: character vector
Values: `'-1'` | `'Ts'` | `'[Ts, To]'`
Default: `'-1'`

`Enable zero-crossing detection` — Control zero-crossing detection

on (default) | off

Control .

☑ on

Detect zero crossings.

□ off

Do not detect zero crossings.

Dependencies

To enable this parameter, select `rising`, `falling`, or `either` from the **Trigger type** list.

Programmatic Use
Block Parameter: `ZeroCross`
Type: character vector
Values: `'on'` | `'off'`
Default: `'on'`

`Initial trigger signal state` — Select the initial state of the trigger signal

`compatibility (no trigger on first evaluation)` (default) | `zero` | `positive` | `negative`

Select the initial state of the trigger signal.

`compatibility (no trigger on first evaluation)`

No trigger at the first evaluation of trigger signal. If you choose this option and the Trigger block is in a subsystem where the states are reset, the block does not reset.

`zero`

Zero. Helps to evaluate a rising or falling trigger signal at the first time step.

`positive`

Positive value. Helps to evaluate a falling trigger signal at the first time step.

`negative`

Negative value. Helps to evaluate a rising trigger signal at the first time step.

Dependency

To display and activate this parameter, select `rising`, `falling`, or `either` from the **Trigger type** list.

Programmatic Use

Block Parameter: `InitialTriggerSignalState`
Type: character vector
Values: `'compatibility (no trigger on first evaluation)'` | `'zero'` | `'positive'` | `'negative'`
Default: `'compatibility (no trigger on first evaluation)'`

Signal Attribute

`Port dimensions` — Specify dimensions for the trigger signal

`1` (default) | `[n]` | `[m n]`

Specify dimensions for the trigger signal attached externally to the Model block and passed to the inside of the block.

`1`

Scalar signal.

`[n]`

Vector signal of width `n`.

`[m n]`

Matrix signal having `m` rows and `n` columns.

Dependency

To display and enable this parameter for a Trigger port block at the root-level of a model, select `rising`, `falling`, or `either` from the **Trigger type** list.

Programmatic Use

Block Parameter: `PortDimensions`
Type: character vector
Values: `'1'` | `'[n]'` | `'[m n]'`
Default: `'1'`

`Trigger signal sample time` — Specify time interval

`-1` (default) | `Ts` | `[Ts, To]`

Specify time interval between block method executions for the block driving the trigger signal.

`-1`

Inherit time interval.

`Ts`

Scalar where Ts is the time interval.

`[Ts, To]`

Vector where Ts is the time interval and To is the initial time offset.

Dependency

To display and enable this parameter for a Trigger port block at the root-level of a model, select `rising`, `falling`, or `either` from the **Trigger type** list.

Programmatic Use

Block Parameter: `TriggerSignalSampleTime`
Type: character vector
Values: `'-1'` | `'Ts'`| `'[Ts, To]'`
Default: `'-1'`

`Minimum` — Specify minimum output value for the trigger signal

`[]` (default) | real scalar

Specify minimum value for the trigger signal attached externally to a Model block and passed to the inside of the block.

Simulink uses this value to perform:

- Simulation range checking. See “Signal Ranges”.
- Automatic scaling of fixed-point data types.
- Optimization of generated code. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. See “Optimize using the specified minimum and maximum values” (Simulink Coder).

`[]`

Unspecified minimum value.

real scalar

Real scalar value.

Dependency

To display and enable this parameter for a Trigger port block at the root-level of a model, select `rising`, `falling`, or `either` from the **Trigger type** list.

Programmatic Use

Block Parameter: `OutMin`
Type: character vector
Values: `'[]'|'<real scalar>'`
Default: `'[]'`

`Maximum` — Specify maximum output value for the trigger signal

`[]` (default) | real scalar

Specify maximum value for the trigger signal attached externally to a Model block and passed to the inside of the block.

Simulink uses this value to perform:

- Simulation range checking. See “Signal Ranges”.
- Automatic scaling of fixed-point data types.
- Optimization of generated code. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. See “Optimize using the specified minimum and maximum values” (Simulink Coder).

`[]`

Unspecified maximum value.

real scalar

Real scalar value.

Dependency

To display and enable this parameter for a Trigger port block at the root-level of a model, select `rising`, `falling`, or `either` from the **Trigger type** list.

Programmatic Use

Block Parameter: `OutMax`
Type: character vector
Values: `'[]'` | `'<real scalar>'`
Default: `'[]'`

`Data type` — Select output data type for the trigger signal

`double` (default) | `single` | `int8` | `uint8` | `int16` | `uint16` | `int32` | `uint32` | `boolean` | `fixdt(1,16)` | `fixdt(1,16,0)` | `fixdt(1,16,2^,0)` | `<data type expression>`

Select data type for the trigger signal attached externally to a Model block and passed to the inside of the block.

`double`

Double-precision floating point.

`single`

Single-precision floating point.

`int8`

Signed 8-bit integer.

`uint8`

Unsigned 8-bit integer.

`int16`

Signed 16-bit integer.

`uint16`

Unsigned 16-bit integer.

`int32`

Signed 32-bit integer.

`uint32`

Unsigned 32-bit integer.

`boolean`

Boolean with a value of `true` or `false`.

`fixdt(1,16)`

Signed 16-bit fixed point number with binary point undefined.

`fixdt(1,16,0)`

Signed 16-bit fixed point number with binary point set to zero.

`fixdt(1,16,2^,0)`

Signed 16-bit fixed point number with slope set to `2^0` and bias set to `0`.

`<data type expression>`

Data type object, for example `Simulink.NumericType`. Do not specify a bus object as the expression.

Dependency

To display and enable this parameter for a Trigger port block at the root-level of a model, select `rising`, `falling`, or `either` from the **Trigger type** list.

Programmatic Use

Block Parameter: `OutDataTypeStr`
Type: character vector
Values: `'double'` | `'single'` | `'int8'` | `'uint8'` | `'int16'` | `'uint16'` | `'int32'` | `'uint32'` | `'boolean'` | `'fixdt(1,16)'` | `'fixdt(1,16,0)'` | `'fixdt(1,16,2^0,0)'` | `'<data type expression>'`
Default: `'double'`

Mode — Select data type category

`Build in` (default) | `Fixed point` | `Expression`

Select data type category and display drop-down lists to help you define the data type.

`Build in`

Display drop-down lists for data type and **Data type override**.

`Fixed point`

Display drop-down lists for **Signedness**, **Scaling**, and **Data type override**.

`Expression`

Display text box for entering an expression.

Dependency

To enable this parameter, select the Show data type assistant button >>.

Programmatic Use

No equivalent command-line parameter.

`Interpolate data` — Control how missing workspace data is estimated

on (default) | off

Control how missing workspace data is estimated when loading data from the MATLAB workspace.

☑ on

Linearly interpolate output at time steps for which no corresponding workspace data exists.

□ off

Do not interpolate output at time steps. The current output equals the output at the most recent time step for which data exists.

Dependency

To display and enable this parameter for a Trigger port block at the root-level of a model, select `rising`, `falling`, or `either` from the **Trigger type** list.

Programmatic Use
Block Parameter: `Interpolate`
Type: character vector
Values: `'on'` | `'off'`
Default: `'on'`

Block Characteristics

Data Types	`double` | `single` | `Boolean` | `base integer` | `fixed point`
Direct Feedthrough	`No`
Multidimensional Signals	`Yes`

Variable-Size Signals	No
Zero-Crossing Detection	Yes

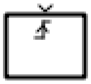
Trigger-Based Linearization

Generate linear models in base workspace when triggered
Library: Simulink / Model-Wide Utilities



Description

When triggered, this block calls `linmod` or `dlinmod` to create a linear model for the system at the current operating point. No trimming is performed. The linear model is stored in the base workspace as a structure, along with information about the operating point at which the snapshot was taken. Multiple snapshots are appended to form an array of structures.

The block sets the following model parameters to the indicated values:

- `BufferReuse = 'off'`
- `RTWInlineParameters = 'on'`
- `BlockReductionOpt = 'off'`

The name of the structure used to save the snapshots is the name of the model appended by `_Trigger_Based_Linearization`, for example, `vdp_Trigger_Based_Linearization`. The structure has the following fields:

Field	Description
`a`	The A matrix of the linearization
`b`	The B matrix of the linearization
`c`	The C matrix of the linearization
`d`	The D matrix of the linearization
`StateName`	Names of the model's states

Field	Description
`OutputName`	Names of the model's output ports
`InputName`	Names of the model's input ports
`OperPoint`	A structure that specifies the operating point of the linearization. The structure specifies the value of the model's states (`OperPoint.x`) and inputs (`OperPoint.u`) at the operating point time (`OperPoint.t`).
`Ts`	The sample time of the linearization for a discrete linearization

Tip Use the Timed-Based Linearization block to generate linear models at predetermined times.

Ports

Input

`Port_1` — Input signal

scalar

Input trigger signal specified as a scalar. You specify the type of event that triggers generation of a linear model using the **Trigger type** parameter.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `fixed point`

Parameters

`Trigger type` — Signal type that triggers generation of a linear model

`rising` | `falling` | `either` | `function-call`

Type of event on the trigger input signal that triggers generation of a linear model. You can select:

- `rising` — Trigger execution of subsystem or model when the trigger signal rises from a negative or zero value to a positive value. If the initial value is negative, a rising signal to zero triggers execution.

- `falling` — Trigger execution of subsystem or model when the trigger signal falls from a positive or a zero value to a negative value. If the initial value is positive, a falling signal to zero triggers execution.
- `either` — Trigger execution of subsystem or model when the trigger signal is either rising or falling.
- `function-call` — Trigger execution of subsystem or model when the trigger signal is a function-call event from a Stateflow chart, Function-Call Generator block, or an S-Function.

Programmatic Use
Block Parameter: `TriggerType`
Type: character vector
Values: `'rising'` | `'falling'` | `'either'` | `'function-call'`
Default: `'rising'`

Sample time (of linearized model) — Sample time

`0` (default) | scalar | vector

Specify a sample time to create a discrete-time linearization of the model (see “Discrete-Time System Linearization” on page 2-54).

Programmatic Use
Block Parameter: `SampleTime`
Type: character vector
Values: scalar | vector
Default: `'0'`

Block Characteristics

Data Types	`double` | `single` | `Boolean` | `base integer` | `fixed point`
Direct Feedthrough	`No`
Multidimensional Signals	`No`
Variable-Size Signals	`No`

Zero-Crossing Detection	No

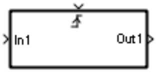
Triggered Subsystem

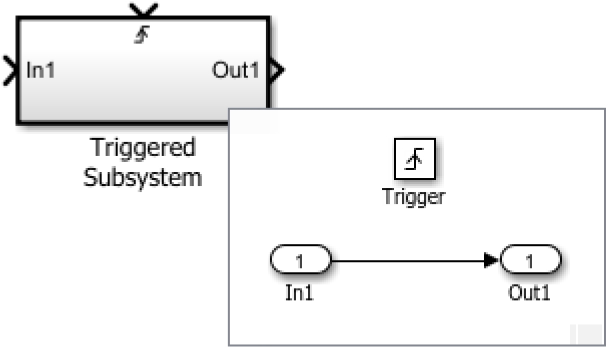
Subsystem whose execution is triggered by external input

Library: Simulink / Ports & Subsystems



Description

The Triggered Subsystem block is a Subsystem block preconfigured as a starting point for creating a subsystem that executes each time the control signal has a trigger event.



Use Trigger Subsystem blocks to model:

- A task that runs with the detection of an event.
- An interrupt from I/O hardware.
- A processor request to handle an exception or error.

Ports

Input

`In` — Signal input to a subsystem block

scalar | vector | matrix

Placing an Inport block in a subsystem block adds an external input port to the block. The port label matches the name of the Inport block.

Use Inport blocks to get signals from the local environment.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

`Trigger` — Control signal input to a subsystem block

scalar

Placing a Trigger block in a subsystem block adds an external input port to the block.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fixed point`

Output

`Out` — Signal output from a subsystem

scalar | vector | matrix

Placing an Outport block in a subsystem block adds an output port from the block. The port label on the subsystem block is the name of the Outport block.

Use Outport blocks to send signals to the local environment.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Block Characteristics

Data Types	double[a] | single[a] | Boolean[a] | base integer[a] | fixed point[a] | enumerated[a] | bus[a] | string[a]
Direct Feedthrough	No
Multidimensional Signals	Yes[a]
Variable-Size Signals	Yes[a]
Zero-Crossing Detection	No

[a] Actual data type or capability support depends on block implementation.

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Actual code generation support depends on block implementation.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

For more information about HDL code generation, see Triggered Subsystem.

Fixed-Point Conversion

Convert floating-point algorithms to fixed point using Fixed-Point Designer™.

Actual data type support depends on block implementation.

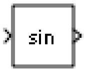
Trigonometric Function

Specified trigonometric function on input
Library: Simulink / Math Operations



Description

The Trigonometric Function block performs common trigonometric functions and outputs the result in rad.

Supported Functions

You can select one of these functions from the **Function** parameter list.

Function	Description	Mathematical Expression	MATLAB Equivalent
`sin`	Sine of the input	sin(*u*)	`sin`
`cos`	Cosine of the input	cos(*u*)	`cos`
`tan`	Tangent of the input	tan(*u*)	`tan`
`asin`	Inverse sine of the input	asin(*u*)	`asin`
`acos`	Inverse cosine of the input	acos(*u*)	`acos`
`atan`	Inverse tangent of the input	atan(*u*)	`atan`
`atan2`	Four-quadrant inverse tangent of the input	atan2(*u*)	`atan2`

Function	Description	Mathematical Expression	MATLAB Equivalent
sinh	Hyperbolic sine of the input	sinh(*u*)	sinh
cosh	Hyperbolic cosine of the input	cosh(*u*)	cosh
tanh	Hyperbolic tangent of the input	tanh(*u*)	tanh
asinh	Inverse hyperbolic sine of the input	asinh(*u*)	asinh
acosh	Inverse hyperbolic cosine of the input	acosh(*u*)	acosh
atanh	Inverse hyperbolic tangent of the input	atanh(*u*)	atanh
sincos	Sine of the input; cosine of the input	—	—
cos + jsin	Complex exponential of the input	—	—

CORDIC Approximation Method

If you use the CORDIC approximation method (see “Definitions” on page 1-2095), the block input has some further requirements.

When you set **Function** to sin, cos, sincos, or cos + jsin, and set the **Approximation method** to CORDIC, the block has these limitations:

- When you use signed fixed-point types, the input angle must fall within the range [–2π, 2π) rad.
- When you use unsigned fixed-point types, the input angle must fall within the range [0, 2π) rad.

When you set **Function** to atan2 and the **Approximation method** to CORDIC, the block has these limitations:

- Inputs must be the same size, or at least one value must be a scalar value.

- Both inputs must have the same data type.
- When you use signed fixed-point types, the word length must be `126` or less.
- When you use unsigned fixed-point types, the word length must be `125` or less.

This table summarizes what happens for an invalid input.

Block Usage	Effect of Invalid Input
Simulation	An error appears.
Generated code	Undefined behavior occurs. Avoid relying on undefined behavior for generated code or accelerator modes.
Accelerator modes	

Ports

Input

`Port_1` — Input signal

scalar | vector | matrix

Input specified as a scalar, vector, or matrix. The block accepts input signals of the following data types:

Functions	Input Data Types
• `sin` • `cos` • `sincos` • `cos + jsin` • `atan2`	• Floating point • Fixed point (only when **Approximation method** is `CORDIC`)

Functions	Input Data Types
• `tan` • `asin` • `acos` • `atan` • `sinh` • `cosh` • `tanh` • `asinh` • `acosh` • `atanh`	• Floating point

Dependencies

- When you set **Function** to `atan2`, the block shows two input ports. The first input (**Port_1**) is the *y*-axis or imaginary part of the function argument. The second input (**Port_2**) is the *x*-axis or real part of the function argument.
- You can use floating-point input signals when you set **Approximation method** to `None` or `CORDIC`. However, the block output data type depends on which of these approximation method options you choose.

Input Data Type	Approximation Method	Output Data Type
Floating point	`None`	Depends on your selection for **Output signal type**. Options are `auto` (same data type as input), `real`, or `complex`.
Floating point	`CORDIC`	Same as input. **Output signal type** is not available when you use the CORDIC approximation method to compute the block output.

For CORDIC approximations:

- Input must be real for the `sin`, `cos`, `sincos`, `cos + jsin`, and `atan2` functions.

- Output is real for the `sin`, `cos`, `sincos`, and `atan2` functions.
- Output is complex for the `cos + jsin` function.

Limitations

Complex input signals are supported for all functions in this block, except `atan2`.

You can use fixed-point input signals only when **Approximation method** is set to `CORDIC`. The CORDIC approximation is available for the `sin`, `cos`, `sincos`, `cos + jsin`, and `atan2` functions. For the `atan2` function, the relationship between input and output data types depends also on whether the fixed-point input is signed or unsigned.

Input Data Type	Function	Output Data Type
Fixed point, signed or unsigned	`sin`, `cos`, `sincos`, and `cos + jsin`	`fixdt(1, WL, WL - 2)` where *WL* is the input word length This fixed-point type provides the best precision for the CORDIC algorithm.
Fixed point, signed	`atan2`	`fixdt(1, WL, WL – 3)`
Fixed point, unsigned	`atan2`	`fixdt(1, WL, WL – 2)`

When you set **Function** to `sin`, `cos`, `sincos`, or `cos + jsin`, and set the **Approximation method** to `CORDIC`, the block has these limitations:

- When you use signed fixed-point types, the input angle must fall within the range [–2π, 2π) rad.
- When you use unsigned fixed-point types, the input angle must fall within the range [0, 2π) rad.

When you set **Function** to `atan2` and the **Approximation method** to `CORDIC`, the block has these limitations:

- Inputs must be the same size, or at least one value must be a scalar value.
- Both inputs must have the same data type.
- When you use signed fixed-point types, the word length must be `126` or less.
- When you use unsigned fixed-point types, the word length must be `125` or less.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fixed point`

`Port_2` — *x*-axis or real part of the function argument for `atan2`

scalar | vector | matrix

Input the *x*-axis or real part of the function argument for `atan2`. When you set **Function** to `atan2`, the block shows two input ports. The first input (**Port_1**) is the *y*-axis or imaginary part of the function argument. The second input (**Port_2**) is the *x*-axis or real part of the function argument. (See “Port Location After Rotating or Flipping” for a description of the port order for various block orientations.)

Dependencies

To enable this port, set **Function** to `atan2`.

Limitations

- Fixed-point input signals are supported only when you set **Approximation method** to `CORDIC`.
- When you set **Function** to `atan2` and **Approximation method** to `CORDIC`:
  - Inputs must be the same size, or at least one value must be a scalar value.
  - Both inputs must have the same data type.
  - When you use signed fixed-point types, the word length must be `126` or less.
  - When you use unsigned fixed-point types, the word length must be `125` or less.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fixed point`

Output

`Port_1` — Specified trigonometric function of input

scalar | vector | matrix

Result of applying the specified trigonometric function to one or more inputs in rad. Each function supports:

- Scalar operations
- Element-wise vector and matrix operations

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fixed point`

`sin` — Sine of input signal

scalar | vector | matrix

Sine of the input signal, in rad.

Dependencies

To enable this port, set **Function** to `sincos`.

Limitations

Fixed-point input signals are supported only when you set **Approximation method** to `CORDIC`.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fixed point`

`cos` — Cosine of input signal

scalar | vector | matrix

Cosine of the input signal, in rad.

Dependencies

To enable this port, set **Function** to `sincos`.

Limitations

Fixed-point input signals are supported only when you set **Approximation method** to `CORDIC`.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fixed point`

Parameters

`Function` — Trigonometric function

`sin` (default) | `cos` | `tan` | `asin` | `acos` | `atan` | `atan2` | `sinh` | `cosh` | `tanh` | `asinh` | `acosh` | `atanh` | `sincos` | `cos + jsin`

Specify the trigonometric function. The name of the function on the block icon changes to match your selection.

Limitations

When you set **Function** to `sin`, `cos`, `sincos`, or `cos + jsin`, and set the **Approximation method** to `CORDIC`, the block has these limitations:

- When you use signed fixed-point types, the input angle must fall within the range [–2π, 2π) rad.
- When you use unsigned fixed-point types, the input angle must fall within the range [0, 2π) rad.

When you set **Function** to `atan2` and the **Approximation method** to `CORDIC`, the block has these limitations:

- Inputs must be the same size, or at least one value must be a scalar value.
- Both inputs must have the same data type.
- When you use signed fixed-point types, the word length must be `126` or less.
- When you use unsigned fixed-point types, the word length must be `125` or less.

Programmatic Use

Block Parameter: `Operator`
Type: character vector
Values: `'sin'` | `'cos'` | `'tan'` | `'asin'` | `'acos'` | `'atan'` | `'atan2'` | `'sinh'` | `'cosh'` | `'tanh'` | `'asinh'` | `'acosh'` | `'atanh'` | `'sincos'` | `'cos + jsin'`
Default: `'sin'`

Approximation method — CORDIC or none

`None` (default) | `CORDIC`

Specify the type of approximation for computing output.

Approximation Method	Data Types Supported	When to Use This Method
`None` (default)	Floating point	You want to use the default Taylor series algorithm.
`CORDIC`	Floating point and fixed point	You want a fast, approximate calculation.

If you select `CORDIC` and enlarge the block from the default size, the block icon changes:

Function	Block Icon
`sin`	`cos`	`sincos`	`cos + jsin`	`atan2`	
Dependencies

To enable this parameter, set **Function** to `sin`, `cos`, `sincos`, `cos + jsin`, or `atan2`.

To use fixed-point input signals, you must set **Approximation method** to `CORDIC`.

Limitations

When you set **Function** to `sin`, `cos`, `sincos`, or `cos + jsin`, and set the **Approximation method** to `CORDIC`, the block has these limitations:

- When you use signed fixed-point types, the input angle must fall within the range [–2π, 2π) rad.
- When you use unsigned fixed-point types, the input angle must fall within the range [0, 2π) rad.

When you set **Function** to `atan2` and the **Approximation method** to `CORDIC`, the block has these limitations:

- Inputs must be the same size, or at least one value must be a scalar value.
- Both inputs must have the same data type.
- When you use signed fixed-point types, the word length must be `126` or less.
- When you use unsigned fixed-point types, the word length must be `125` or less.

Programmatic Use

Block Parameter: `ApproximationMethod`
Type: character vector
Values: `'None' | 'CORDIC'`
Default: `'None'`

`Number of iterations` — Number of iterations for CORDIC algorithm

`11` (default) | positive integer, less than or equal to word length of fixed-point input

Specify the number of iterations to perform the CORDIC algorithm. The default value is 11.

- When the block input uses a floating-point data type, the number of iterations can be a positive integer.
- When the block input is a fixed-point data type, the number of iterations cannot exceed the word length.

  For example, if the block input is `fixdt(1,16,15)`, the word length is 16. In this case, the number of iterations cannot exceed 16.

Dependencies

To enable this parameter, you must set the **Function** and **Approximation method** parameters as follows:

- Set **Function** to `sin`, `cos`, `sincos`, `cos + jsin`, or `atan2`.
- Set **Approximation method** to `CORDIC`.

Programmatic Use
Block Parameter: `NumberOfIterations`
Type: character vector
Values: positive integer, less than or equal to word length of fixed-point input
Default: `'11'`

`Output signal type` — complexity of output signal

`auto` (default) | `real` | `complex`

Specify the output signal type of the Trigonometric Function block as `auto`, `real`, or `complex`.

Function	Input Signal Type	Output Signal Type		
		Auto	Real	Complex
Any selection for the **Function** parameter	real	real	real	complex
	complex	complex	error	complex

Dependencies

Setting **Approximation method** to `CORDIC` disables this parameter.

Note When **Function** is `atan2`, complex input signals are not supported for simulation or code generation.

Programmatic Use
Block Parameter: `OutputSignalType`
Type: character vector
Values: `'auto' | 'real' | 'complex'`
Default: `'auto'`

`Sample time` — Specify sample time as a value other than `-1`

`-1` (default) | scalar

Specify the sample time as a value other than -1. For more information, see “Specify Sample Time”.

Dependencies

This parameter is not visible unless it is explicitly set to a value other than `-1`. To learn more, see “Blocks for Which Sample Time Is Not Recommended”.

Programmatic Use
Block Parameter: `SampleTime`
Type: character vector
Values: scalar
Default: `'-1'`

Block Characteristics

Data Types	`double` | `single`
Direct Feedthrough	`No`
Multidimensional Signals	`Yes`
Variable-Size Signals	`Yes`
Zero-Crossing Detection	`No`

Definitions

CORDIC

CORDIC is an acronym for COordinate Rotation DIgital Computer. The Givens rotation-based CORDIC algorithm is one of the most hardware-efficient algorithms available because it requires only iterative shift-add operations (see References). The CORDIC algorithm eliminates the need for explicit multipliers. Using CORDIC, you can calculate various functions, such as sine, cosine, arc sine, arc cosine, arc tangent, and vector magnitude. You can also use this algorithm for divide, square root, hyperbolic, and logarithmic functions.

Increasing the number of CORDIC iterations can produce more accurate results, but doing so also increases the expense of the computation and adds latency.

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Not all compilers support the `asinh`, `acosh`, and `atanh` functions. If you use a compiler that does not support those functions, a warning appears and the generated code fails to link.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

For more information about HDL code generation, see Trigonometric Function.

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

Fixed-Point Conversion

Convert floating-point algorithms to fixed point using Fixed-Point Designer™.

This block supports fixed-point and base integer data types when you set the **Function** to `sin`, `cos`, `sincos`, `cos + jsin`, or `atan2`, and set the **Approximation method** to `CORDIC`.

See Also

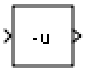
Math Function | Sine, Cosine | Sqrt

Introduced before R2006a

Unary Minus

Negate input

Library: Simulink / Math Operations



Description

The Unary Minus block negates the input.

Ports

Input

`Port_1` — Signal to negate
scalar | vector | matrix | N-D array

Input signal, specified as a scalar, vector, matrix, or N-D array.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `fixed point`

Output

`Port_1` — Negation of input signal
scalar | vector | matrix | N-D array

Negation of the input signal. The output has the same data type and dimensions as the input.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `fixed point`

Parameters

`Saturate on integer overflow` — Method of overflow action

`off` (default) | `on`

Select to have integer overflows saturate. Otherwise, overflows wrap.

When you select this check box, saturation applies to every internal operation on the block, not just the output, or result. In general, the code generation process can detect when overflow is not possible. In this case, the code generator does not produce saturation code.

For signed-integer data types, the unary minus of the most negative value is not representable by the data type. In this case, the **Saturate on integer overflow** check box controls the behavior of the block:

Parameter Setting	Block Behavior	Examples
Saturate on integer overflow = `on`	Values saturate to the most positive value of the integer data type	• For 8-bit signed integers, -128 maps to 127. • For 16-bit signed integers, -32768 maps to 32767. • For 32-bit signed integers, -2147483648 maps to 2147483647.
Saturate on integer overflow = `off`	Values wrap to the most negative value of the integer data type	• For 8-bit signed integers, -128 remains -128. • For 16-bit signed integers, -32768 remains -32768. • For 32-bit signed integers, -2147483648 remains -2147483648.

Programmatic Use

Block Parameter: `SaturateOnIntegerOverflow`
Type: character vector
Values: `'off' | 'on'`
Default: `'off'`

`Sample time` — Specify sample time as a value other than -1

`-1` (default) | scalar

Specify the sample time as a value other than -1. For more information, see “Specify Sample Time”.

Dependencies

This parameter is not visible unless it is explicitly set to a value other than `-1`. To learn more, see “Blocks for Which Sample Time Is Not Recommended”.

Programmatic Use
Block Parameter: `SampleTime`
Type: character vector
Values: scalar
Default: `'-1'`

Block Characteristics

Data Types	`double` | `single` | `base integer`[a] | `fixed point`[a]
Direct Feedthrough	`No`
Multidimensional Signals	`Yes`
Variable-Size Signals	`No`
Zero-Crossing Detection	`No`

a. This block only supports signed fixed-point data types.

Extended Capabilities

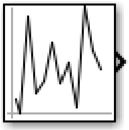
Introduced before R2006a

Uniform Random Number

Generate uniformly distributed random numbers
Library: Simulink / Sources



Description

The Uniform Random Number block generates uniformly distributed random numbers over an interval that you specify. To generate normally distributed random numbers, use the Random Number block.

You can generate a repeatable sequence using any Uniform Random Number block with the same nonnegative seed and parameters. The seed resets to the specified value each time a simulation starts.

Avoid integrating a random signal, because solvers must integrate relatively smooth signals. Instead, use the Band-Limited White Noise block.

The numeric parameters of this block must have the same dimensions after scalar expansion. If you select the **Interpret vector parameters as 1-D** check box and the numeric parameters are row or column vectors after scalar expansion, the block outputs a 1-D signal. If you clear the **Interpret vector parameters as 1-D** check box, the block outputs a signal of the same dimensionality as the parameters.

Ports

Output

`Port_1` — Random number output signal
scalar | vector

Output signal of generated uniformly distributed random numbers over the interval you specify.

Data Types: `double`

Parameters

`Minimum` — Minimum interval

`-1` (default) | scalar | vector

Specify the minimum of the interval.

Programmatic Use
Block Parameter: `Minimum`
Type: character vector
Values: scalar
Default: `'-1'`

`Maximum` — Maximum interval

`1` (default) | scalar | vector

Specify the maximum of the interval.

Programmatic Use
Block Parameter: `Maximum`
Type: character vector
Values: scalar
Default: `'1'`

Seed — Random number seed

`0` (default) | scalar

Specify the starting seed for the random number generator.

The seed must be 0 or a positive integer. Output is repeatable for a given seed.

Programmatic Use
Block Parameter: See
Type: character vector
Values: scalar
Default: `'0'`

`Sample time` — Sample time

`0.1` (default) | scalar

Specify the time interval between samples. See “Specify Sample Time” in the Simulink documentation for more information.

Programmatic Use
Block Parameter: `SampleTime`
Type: character vector
Values: scalar
Default: `'0.1'`

`Interpret vector parameters as 1-D` — Treat vectors as 1-D

`on` (default) | `off`

Select this check box to output a vector of length `N` if the **Constant value** parameter evaluates to an `N`-element row or column vector.

- When you select this check box, the block outputs a vector of length `N` if the **Constant value** parameter evaluates to an `N`-element row or column vector. For example, the block outputs a matrix of dimension `1-by-N` or `N-by-1`.
- When you clear this check box, the block does not output a vector of length `N` if the **Constant value** parameter evaluates to an `N`-element row or column vector.

Programmatic Use
Block Parameter: `VectorParams1D`
Type: character vector
Values: `'on' | 'off'`
Default: `'on'`

Block Characteristics

Data Types	`double`
Direct Feedthrough	`No`
Multidimensional Signals	`Yes`
Variable-Size Signals	`No`

Zero-Crossing Detection	No

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

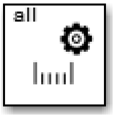
Unit System Configuration

Configure units

Library: Simulink / Ports & Subsystems



Description

The Unit System Configuration block specifies allowed and disallowed unit systems for the component. It restricts units systems for a subsystem or top model and all its children, unless you override it with another Unit System Configuration block in a child.

This block supports normal, accelerator, and rapid accelerator modes and fast restart.

Parameters

`Disallowed unit systems` — Disallowed unit systems

`SI | English | SI (extended) | CGS`

Displays a list of the disallowed unit systems. By default, the **Allow all unit systems** check box is selected, and all unit systems are allowed.

To designate a unit system as disallowed, select it in the **Allowed unit systems** column and click **<< Disallow**.

Dependencies

To enable changes to this parameter, you must first clear the **Allow all unit systems** check box.

`Allowed unit systems` — Allowed unit systems

`SI | English | SI (extended) | CGS`

Displays a list of the allowed unit systems. By default, the **Allow all unit systems** check box is selected, and all unit systems are allowed.

To designate a unit system as allowed, use the **Allow >>** and **<< Disallow** buttons to move unit systems between the **Disallowed unit systems** and **Allowed unit systems** columns.

Dependencies

To enable changes to this parameter, you must first clear the **Allow all unit systems** check box.

Programmatic Use
Block Parameter: `UnitSystems`
Type: cell array of character vectors
Values: cell array of the following character vectors: `'SI'` | `'English'` | `'SI (extended)'` | `'CGS'`
Default: `{'SI', 'English', 'SI (extended)', 'CGS'}`

`Allow all unit systems` — Allow all unit systems

`on` (default) | `off`

When you select this check box, all unit systems are allowed. To restrict the allowed unit systems to only the ones specified in the **Allowed unit systems** column, clear this check box.

Dependencies

Selecting the **Allow all unit systems** check box disables the **Disallowed unit systems** and **Allowed unit systems** parameters.

Programmatic Use
Block Parameter: `AllowAllUnitSystems`
Type: character vector
Values: `'on' | 'off'`
Default: `'on'`

Block Characteristics

Data Types	`double` | `single` | `Boolean` | `base integer` | `fixed point` | `enumerated` | `bus`
Direct Feedthrough	`No`

Multidimensional Signals	Yes
Variable-Size Signals	Yes
Zero-Crossing Detection	No

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Fixed-Point Conversion

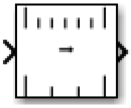
Unit Conversion

Convert units
Library: Simulink / Signal Attributes



Description

The Unit Conversion block converts the unit of the input signal to the output signal. The block can convert if the units are separated by a scaling factor or offset, or are inverse units, for example:

- $y=a*U$
- $y=a*U+b$, where a is the scale and b is the offset
- $y=a/U$

This block supports normal, accelerator, and rapid accelerator modes and fast restart.

Ports

Input

`Port_1` — Input signal
scalar | vector | matrix

Input signal to convert units on, specified as a scalar, vector, or matrix.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fixed point`

Output

`Port_1` — Output signal
scalar | vector | matrix

Output signal with converted units, specified as a scalar, vector, or matrix.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fixed point`

Parameters

`Output data type` — Output data type

`Inherit: Inherit via internal rule` (default) | `Inherit: Inherit via back propagation`

Specify the output data type.

- `Inherit: Inherit via internal rule` —Simulink chooses intermediate and output data types to balance numerical accuracy, performance, and generated code size, while accounting for the properties of the embedded target hardware. If you change the embedded target settings, the data type selected by the internal rule might change.
- `Inherit: Inherit via back propagation` — Output data type is inherited via back propagation. Internal rules determine the intermediate data types and Simulink casts the final results to the output data type.

Programmatic Use
Block Parameter: `OutDataTypeStr`
Type: character vector
Values: `'Inherit via internal rule' | 'Inherit via back propagation'`
Default: `'Inherit via internal rule'`

Block Characteristics

Data Types	`double` | `single` | `base integer` | `fixed point`
Direct Feedthrough	Yes
Multidimensional Signals	Yes

Variable-Size Signals	`Yes`
Zero-Crossing Detection	`No`

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

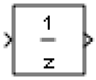
Unit Delay

Delay signal one sample period

Library: Simulink / Discrete



Description

The Unit Delay block holds and delays its input by the sample period you specify. When placed in an iterator subsystem, it holds and delays its input by one iteration. This block is equivalent to the z^{-1} discrete-time operator. The block accepts one input and generates one output. Each signal can be scalar or vector. If the input is a vector, the block holds and delays all elements of the vector by the same sample period.

You specify the block output for the first sampling period with the **Initial conditions** parameter. Careful selection of this parameter can minimize unwanted output behavior. You specify the time between samples with the **Sample time** parameter. A setting of -1 means the block inherits the **Sample time**.

Note The Unit Delay block errors out if you use it to create a transition between blocks operating at different sample rates. Use the Rate Transition block instead.

Comparison with Similar Blocks

The Memory, Unit Delay, and Zero-Order Hold blocks provide similar functionality but have different capabilities. Also, the purpose of each block is different.

This table shows recommended usage for each block.

Block	Purpose of the Block	Reference Examples
Unit Delay	Implement a delay using a discrete sample time that you specify. The block accepts and outputs signals with a discrete sample time.	• `sldemo_enginewc` (Compression subsystem)
Memory on page 1-1222	Implement a delay by one major integration time step. Ideally, the block accepts continuous (or fixed in minor time step) signals and outputs a signal that is fixed in minor time step.	• `sldemo_bounce` • `sldemo_clutch` (Friction Mode Logic/Lockup FSM subsystem)
Zero-Order Hold	Convert an input signal with a continuous sample time to an output signal with a discrete sample time.	• `sldemo_radar_eml` • `aero_dap3dof`

Each block has the following capabilities.

Capability	Memory	Unit Delay	Zero-Order Hold
Specification of initial condition	Yes	Yes	No, because the block output at time t = 0 must match the input value.
Specification of sample time	No, because the block can only inherit sample time from the driving block or the solver used for the entire model.	Yes	Yes
Support for frame-based signals	No	Yes	Yes
Support for state logging	No	Yes	No

Ports

Input

`Port_1` — Input signal

scalar | vector

Input signal that the block delays by one sample period.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Output

`Port_1` — Output signal

scalar | vector

Output signal that is the input delayed by one sample period.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Parameters

Main

`Initial condition` — First sample period output

`0` (default) | scalar | vector

Specify the output of the simulation for the first sampling period, during which the output of the Unit Delay block is otherwise undefined.

Programmatic Use
Block Parameter: `InitialCondition`
Type: character vector
Value: scalar | vector
Default: `'0'`

`Input processing` — Specify sample- or frame-based processing

`Elements as channels (sample based)` (default) | `Columns as channels (frame based)`

Specify whether the block performs sample- or frame-based processing:

- `Columns as channels (frame based)` — Treat each column of the input as a separate channel (frame-based processing).

  Note Frame-based processing requires a DSP System Toolbox license.

  For more information, see “Sample- and Frame-Based Concepts” (DSP System Toolbox).

- `Elements as channels (sample based)` — Treat each element of the input as a separate channel (sample-based processing).

Use **Input processing** to specify whether the block performs sample- or frame-based processing. The block accepts frame-based signals for the input `u`. All other input signals must be sample-based.

Input Signal u	Input Processing Mode	Block Works?
Sample based	Sample based	Yes
Frame based		No, produces an error
Sample based	Frame based	Yes
Frame based		Yes
Sample based	Inherited	Yes
Frame based		Yes

For more information about these two processing modes, see “Sample- and Frame-Based Concepts” (DSP System Toolbox).

Programmatic Use

Block Parameter: `InputProcessing`
Type: character vector
Values: `'Columns as channels (frame based)'` | `'Elements as channels (sample based)'`
Default: `'Elements as channels (sample based)'`

`Sample time (-1 for inherited)` — Discrete interval between sample time hits

`-1` (default) | `scalar`

Enter the discrete interval between sample time hits or specify `-1` to inherit the sample time.

See also “Specify Sample Time”.

Programmatic Use
Block Parameter: `SampleTime`
Type: character vector
Value: real scalar
Default: `'-1'`

State Attributes

`State name` — Unique name for block state

`''` (default) | alphanumeric string

Use this parameter to assign a unique name to the block state. The default is `' '`. When this field is blank, no name is assigned. When using this parameter, remember these considerations:

- A valid identifier starts with an alphabetic or underscore character, followed by alphanumeric or underscore characters.
- The state name applies only to the selected block.

This parameter enables **State name must resolve to Simulink signal object** when you click **Apply**.

For more information, see “Apply Storage Classes to Individual Signal, State, and Parameter Data Elements” (Simulink Coder).

Programmatic Use
Block Parameter: `StateName`
Type: character vector
Values: unique name
Default: `''`

`State name must resolve to Simulink signal object` — Require state names resolve to signal object

`Off` (default) | Boolean

Specify if requiring that state name resolve to Simulink signal objects or not. If selected, the software generates an error at run time if you specify a state name that does not match the name of a Simulink signal object.

Dependency

Enabled when you give the parameter **State name** a value and set the model configuration parameter **Signal resolution** to a value other than `None`.

Selecting this check box disables **Code generation storage class**.

Programmatic Use
Block Parameter: `StateMustResolveToSignalObject`
Type: character vector
Values: `'off'` | `'on'`
Default: `'off'`

`Signal object class` — Custom storage class package name

`Simulink.Signal` (default)

Choose a custom storage class package by selecting a signal object class that the target package defines. For example, to apply custom storage classes from the built-in package `mpt`, select `mpt.Signal`. Unless you use an ERT-based code generation target with Embedded Coder, custom storage classes do not affect the generated code.

If the class that you want does not appear in the list, select `Customize class lists`. For instructions, see “Target Class Does Not Appear in List of Signal Object Classes” (Embedded Coder).

For information about storage classes, see “Apply Storage Classes to Individual Signal, State, and Parameter Data Elements” (Simulink Coder). For information about custom storage classes, see “Apply Custom Storage Classes to Individual Signal, State, and Parameter Data Elements” (Embedded Coder).

Programmatic Use
Block Parameter: `StateSignalObject`
Type: character vector
Values: `'Simulink.Signal' | '<StorageClass.PackageName>'`

Default: `'Simulink.Signal'`

`Code generation storage class` — Storage class for code generation
`Auto` (default) | `Model default` | `ExportedGlobal` | `ImportedExtern` | `ImportedExternPointer` | `Bitfield (Custom)` | `Volatile (Custom)` | `ExportToFile (Custom)` | `ImportFromFile (Custom)` | `FileScope (Custom)` | `Struct (Custom)` | `GetSet (Custom)` | `Reusable (Custom)`

Select state storage class for code generation. If you do not need to interface to external code, select `Auto`.

For more information, see “Apply Storage Classes to Individual Signal, State, and Parameter Data Elements” (Simulink Coder) and “Apply Custom Storage Classes to Individual Signal, State, and Parameter Data Elements” (Embedded Coder).

Programmatic Use
Block Parameter: `StateStorageClass`
Type: character vector
Values: `'Auto'` | `'Model default'` | `'ExportedGlobal''` | `'ImportedExtern'` | `'ImportedExternPointer'` | `'Custom'`
Default: `'Auto'`

Block Characteristics

Data Types	`double` | `single` | `Boolean` | `base integer` | `fixed point` | `enumerated` | `bus`
Direct Feedthrough	`Yes`
Multidimensional Signals	`Yes`
Variable-Size Signals	`Yes`
Zero-Crossing Detection	`No`

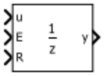
Unit Delay Enabled Resettable Synchronous

Delay input signal by one sample period when external Enable signal is true and external Reset signal is false

Library: HDL Coder / Discrete / Unit Delay Enabled Resettable Synchronous



Unit Delay Enabled Resettable Synchronous

Description

The Unit Delay Enabled Resettable Synchronous block combines the functionality of the Unit Delay Enabled Synchronous block and the Unit Delay Resettable Synchronous block.

The Unit Delay Enabled Resettable Synchronous block delays the input signal u by one sample period when the external Enable signal is true and when the external Reset signal is false. When the Enable signal is false, the state and output signal hold the previous value. When the Reset signal is true, the state and output signal take the value of the **Initial condition** parameter. The Enable and Reset signals are true when E and R are nonzero and false when E and R equal zero.

The Unit Delay Enabled Synchronous block implementation consists of a Synchronous Subsystem that contains an Enabled Delay block with a **Delay length** of one and a State Control block in `Synchronous` mode. When you use this block in your model and have HDL Coder installed, your model generates cleaner HDL code and uses fewer hardware resources due to the `Synchronous` behavior of the State Control block.

Limitations

- The block does not support vector inputs on the Reset and Enable ports.
- You cannot use the block inside Enabled Subsystem, Triggered Subsystem, or Resettable Subsystem blocks that use `Classic` semantics. The Subsystem must use `Synchronous` semantics.

Ports

Input

u — Input signal

Scalar | Vector | Matrix | Array | Bus

The Unit Delay Enabled Resettable Synchronous block accepts the input signal of the data types listed below. For more information, see “Data Types Supported by Simulink”.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Input

E — Enable signal

Scalar

The Unit Delay Enabled Synchronous block accepts the Enable signal of the data types listed below. For more information, see “Data Types Supported by Simulink”.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point

R — Reset signal

Scalar

The Unit Delay Resettable Synchronous block accepts the Reset signal of the data types listed below. For more information, see “Data Types Supported by Simulink”.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point

Output

y — Output signal

Scalar | Vector | Matrix | Array | Bus

Output data type always matches input.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Parameters

Initial condition — Initial output of simulation

0.0 (default) | Scalar | Vector | Matrix | Array | Bus

The **Initial condition** can take a scalar input or use the same data type as the input signal. You cannot run the simulation with NaN or Inf as the **Initial condition**.

Programmatic Use
Block parameter: InitialCondition
Type: character vector
Value: '0' | '[n]' | '[m n]'
Default: '0'

Sample time — Time interval between samples

-1 (default) | Scalar | Vector

The **Sample time** must be a real double scalar that specifies the period or a real double vector of length two that specifies the period and offset. The period and offset must be finite and non-negative with offset less than the period.

Programmatic Use
Block parameter: SampleTime
Type: character vector
Value: '-1' | '[n]' | '[m n]'
Default: '-1'

Block Characteristics

Data Types	double | single | base integer | fixed point | bus
Sample Time	Inherit
Direct Feedthrough	Yes
Multidimensional Signals	Scalar
Variable-Size Signals	Yes

Zero-Crossing Detection	`No`

Extended Capabilities

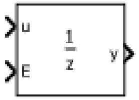
Unit Delay Enabled Synchronous

Delay input signal by one sample period when external Enable signal is true

Library: HDL Coder / Discrete / Unit Delay Enabled Synchronous



Unit Delay Enabled Synchronous

Description

The Unit Delay Enabled Synchronous block delays the input signal u by one sample period when the external Enable signal is true. When the Enable signal is false, the state and output signal hold the previous value. The Enable signal is true when E is not zero and false when E is zero.

The Unit Delay Enabled Synchronous block implementation consists of a Synchronous Subsystem that contains an Enabled Delay block with a **Delay length** of one and a State Control block in `Synchronous` mode. When you use this block in your model and have HDL Coder installed, your model generates cleaner HDL code and uses fewer hardware resources due to the `Synchronous` behavior of the State Control block.

Limitations

- The block does not support vector inputs on the Enable port.
- You cannot use the block inside Enabled Subsystem, Triggered Subsystem, or Resettable Subsystem blocks that use `Classic` semantics. The Subsystem must use `Synchronous` semantics.

Ports

Input

u — Input signal
Scalar | Vector | Matrix | Array | Bus

The Unit Delay Enabled Synchronous block accepts the input signal of the data types listed below. For more information, see “Data Types Supported by Simulink”.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Input

E — Enable signal
Scalar

The Unit Delay Enabled Synchronous block accepts the Enable signal of the data types listed below. For more information, see “Data Types Supported by Simulink”.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point

Output

y — Output signal
Scalar | Vector | Matrix | Array | Bus

Output data type always matches input.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Parameters

`Initial condition` — Initial output of simulation
0.0 (default) | Scalar | Vector | Matrix | Array | Bus

The **Initial condition** can take a scalar input or use the same data type as the input signal. You cannot run the simulation with `NaN` or `Inf` as the **Initial condition**.

Programmatic Use
Block parameter: `InitialCondition`
Type: character vector
Value: `'0'` | `'[n]'` | `'[m n]'`
Default: `'0'`

`Sample time` — Time interval between samples

-1 (default) | `Scalar` | `Vector`

The **Sample time** must be a real double scalar that specifies the period or a real double vector of length two that specifies the period and offset. The period and offset must be finite and non-negative with offset less than the period.

Programmatic Use
Block parameter: `SampleTime`
Type: character vector
Value: `'-1'` | `'[n]'` | `'[m n]'`
Default: `'-1'`

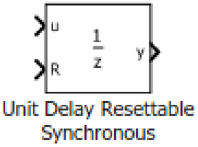
Introduced in R2017b

Unit Delay Resettable Synchronous

Delay input signal by one sample period when external Reset signal is false

Library: HDL Coder / Discrete / Unit Delay Resettable Synchronous



Description

The Unit Delay Resettable Synchronous block delays the input signal u by one sample period when the external Reset signal is false. When the Reset signal is true, the state and output signal take the value of the **Initial condition** parameter. The Reset signal is true when R is not zero and false when R is zero.

The Unit Delay Resettable Synchronous block implementation consists of a Synchronous Subsystem that contains a Resettable Delay block with a **Delay length** of one and a State Control block in `Synchronous` mode. When you use this block in your model and have HDL Coder installed, your model generates cleaner HDL code and uses fewer hardware resources due to the `Synchronous` behavior of the State Control block.

Limitations

- The block does not support vector inputs on the Reset port.
- You cannot use the block inside Enabled Subsystem, Triggered Subsystem, or Resettable Subsystem blocks that use `Classic` semantics. The Subsystem must use `Synchronous` semantics.

Ports

Input

u — Input signal
Scalar | Vector | Matrix | Array | Bus

The Unit Delay Resettable Synchronous block accepts the input signal of the data types listed below. For more information, see “Data Types Supported by Simulink”.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Input

R — Reset signal
Scalar

The Unit Delay Resettable Synchronous block accepts the Reset signal of the data types listed below. For more information, see “Data Types Supported by Simulink”.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point

Output

y — Output signal
Scalar | Vector | Matrix | Array | Bus

Output data type always matches input.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Parameters

Initial condition — Initial output of simulation
0.0 (default) | Scalar | Vector | Matrix | Array | Bus

The **Initial condition** can take a scalar input or use the same data type as the input signal. You cannot run the simulation with `NaN` or `Inf` as the **Initial condition**.

Programmatic Use
Block parameter: `InitialCondition`
Type: character vector
Value: `'0'` | `'[n]'` | `'[m n]'`
Default: `'0'`

`Sample time` — Time interval between samples

-1 (default) | `Scalar` | `Vector`

The **Sample time** must be a real double scalar that specifies the period or a real double vector of length two that specifies the period and offset. The period and offset must be finite and non-negative with offset less than the period.

Programmatic Use
Block parameter: `SampleTime`
Type: character vector
Value: `'-1'` | `'[n]'` | `'[m n]'`
Default: `'-1'`

Block Characteristics

Data Types	`double` | `single` | `base integer` | `fixed point` | `bus`
Sample Time	`Inherit`
Direct Feedthrough	`Yes`
Multidimensional Signals	`Scalar`
Variable-Size Signals	`Yes`
Zero-Crossing Detection	`No`

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

Fixed-Point Conversion

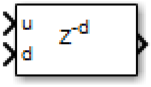
Introduced in R2017b

Variable Integer Delay

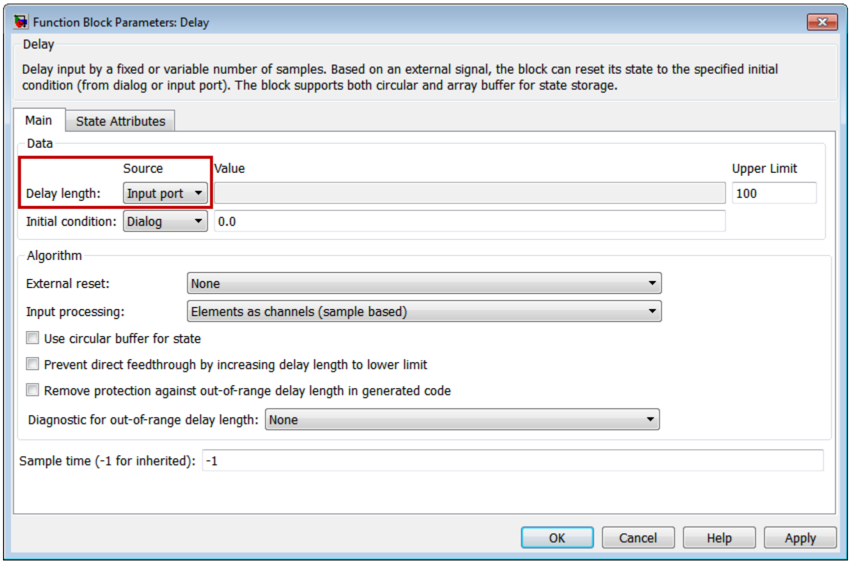
Delay input signal by variable sample period

Library: Simulink / Discrete



Description

The Variable Integer Delay block is a variant of the Delay block that has the source of the delay length set to `Input port`, by default.



Function Block Parameters: Delay

Delay

Delay input by a fixed or variable number of samples. Based on an external signal, the block can reset its state to the specified initial condition (from dialog or input port). The block supports both circular and array buffer for state storage.

Data

	Source	Value	Upper Limit
Delay length:	Input port		100
Initial condition:	Dialog	0.0	

Algorithm

External reset: None

Input processing: Elements as channels (sample based)

□ Use circular buffer for state

□ Prevent direct feedthrough by increasing delay length to lower limit

□ Remove protection against out-of-range delay length in generated code

Diagnostic for out-of-range delay length: None

Sample time (-1 for inherited): -1

Ports

Input

u — Data input signal

scalar | vector

Input data signal delayed according to parameters settings.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

d — Delay length

scalar

Delay length specified as inherited from an input port. Enabled when you select the **Delay length: Source** parameter as `Input port`.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fixed point`

`Enable` — External enable signal

scalar

Enable signal that enables or disables execution of the block. To create this port, select the **Show enable port** parameter.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point`

`External reset` — External reset signal

scalar

External signal that resets execution of the block to the initial condition. To create this port, select the **External reset** parameter.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point`

`x0` — Initial condition

scalar | vector

Initial condition specified as inherited from an input port. Enabled when you select the **Initial Condition: Source** parameter as `Input port`.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fixed point`

Output

`Port_1` — Output signal
scalar | vector

Output signal that is the input signal delayed by the length of time specified by the parameter **Delay length**. The initial value of the output signal depends on several conditions. See “Initial Block Output” on page 1-340.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Parameters

Main

`Delay length` — Delay length
`Dialog` (default) | `Input port`

Specify whether to enter the delay length directly on the dialog box (fixed delay) or to inherit the delay from an input port (variable delay).

- If you set **Source** to `Dialog`, enter the delay length in the edit field under **Value**.
- If you set **Source** to `Input port`, verify that an upstream signal supplies a delay length for the `d` input port. You can also specify its maximum value by specifying the parameter **Upper limit**.

Specify the scalar delay length as a real, non-negative integer. An out-of-range or non-integer value in the dialog box (fixed delay) returns an error. An out-of-range value from an input port (variable delay) casts it into the range. A non-integer value from an input port (variable delay) truncates it to the integer.

Programmatic Use

Block Parameter: `DelayLengthSource`
Type: character vector
Values: `'Dialog'` | `'Input port'` |
Default: `'Dialog'`
Block Parameter: `DelayLength`
Type: character vector
Values: scalar
Default: `'2'`
Block Parameter: `DelayLengthUpperLimit`
Type: character vector
Values: scalar
Default: `'100'`

`Initial condition` — Initial condition

`Dialog` (default) | `Input port`

Specify whether to enter the initial condition directly on the dialog box or to inherit the initial condition from an input port.

- If you set **Source** to `Dialog`, enter the initial condition in the edit field under **Value**.
- If you set **Source** to `Input port`, verify that an upstream signal supplies an initial condition for the `x0` input port.

Simulink converts offline the data type of **Initial condition** to the data type of the input signal `u` using a round-to-nearest operation and saturation.

Note When **State name must resolve to Simulink signal object** is selected on the **State Attributes** pane, the block copies the initial value of the signal object to the **Initial condition** parameter. However, when the source for **Initial condition** is `Input port`, the block ignores the initial value of the signal object.

Programmatic Use

Block Parameter: `InitialConditionSource`
Type: character vector
Values: `'Dialog'` | `'Input port'` |
Default: `'Dialog'`
Block Parameter: `InitialCondition`
Type: character vector

Values: scalar
Default: '0.0'

Input processing — Specify sample- or frame-based processing

Elements as channels (sample based) (default) | Columns as channels (frame based)

Specify whether the block performs sample- or frame-based processing:

- Columns as channels (frame based) — Treat each column of the input as a separate channel (frame-based processing).

  Note Frame-based processing requires a DSP System Toolbox license.

  For more information, see “Sample- and Frame-Based Concepts” (DSP System Toolbox).

- Elements as channels (sample based) — Treat each element of the input as a separate channel (sample-based processing).

Use **Input processing** to specify whether the block performs sample- or frame-based processing. The block accepts frame-based signals for the input u. All other input signals must be sample-based.

Input Signal u	Input Processing Mode	Block Works?
Sample based	Sample based	Yes
Frame based		No, produces an error
Sample based	Frame based	Yes
Frame based		Yes
Sample based	Inherited	Yes
Frame based		Yes

For more information about these two processing modes, see “Sample- and Frame-Based Concepts” (DSP System Toolbox).

Programmatic Use

Block Parameter: InputProcessing
Type: character vector

Values: `'Columns as channels (frame based)'` | `'Elements as channels (sample based)'`
Default: `'Elements as channels (sample based)'`

`Use circular buffer for state` — Circular buffer for storing state

`off` (default) | `on`

Select to use a circular buffer for storing the state in simulation and code generation. Otherwise, an array buffer stores the state.

Using a circular buffer can improve execution speed when the delay length is large. For an array buffer, the number of copy operations increases as the delay length goes up. For a circular buffer, the number of copy operations is constant for increasing delay length.

If one of the following conditions is true, an array buffer always stores the state because a circular buffer does not improve execution speed:

- For sample-based signals, the delay length is 1.
- For frame-based signals, the delay length is no larger than the frame size.

Programmatic Use

Block Parameter: `UseCircularBuffer`
Type: character vector
Values: `'off'` | `'on'`
Default: `'off'`

`Prevent direct feedthrough` — Prevent direct feedthrough

`off` (default) | `on`

Select to increase the delay length from zero to the lower limit for the **Input processing** mode:

- For sample-based signals, increase the minimum delay length to 1.
- For frame-based signals, increase the minimum delay length to the frame length.

Selecting this check box prevents direct feedthrough from the input port, `u`, to the output port. However, this check box cannot prevent direct feedthrough from the initial condition port, `x0`, to the output port.

Dependency

To enable this parameter, set **Delay length: Source** to `Input port`.

Programmatic Use

Block Parameter: `PreventDirectFeedthrough`
Type: character vector
Values: `'off'` | `'on'`
Default: `'off'`

`Remove delay length check in generated code` — Remove delay length out-of-range check

`off` (default) | `on`

Select to remove code that checks for out-of-range delay length.

Check Box	Result	When to Use
Selected	Generated code does not include conditional statements to check for out-of-range delay length.	For code efficiency
Cleared	Generated code includes conditional statements to check for out-of-range delay length.	For safety-critical applications

Dependency

To enable this parameter, set **Delay length: Source** to `Input port`.

Programmatic Use

Block Parameter: `RemoveDelayLengthCheckInGeneratedCode`
Type: character vector
Values: `'off'` | `'on'`
Default: `'off'`

`Diagnostic for delay length` — Diagnostic checks for delay length

`None` (default) | `Warning` | `Error`

Specify whether to produce a warning or error when the input `d` is less than the lower limit or greater than the **Delay length: Upper limit**. The lower limit depends on the setting for **Prevent direct feedthrough**.

- If the check box is cleared, the lower limit is zero.
- If the check box is selected, the lower limit is 1 for sample-based signals and frame length for frame-based signals.

Options for the diagnostic include:

- `None` — Simulink software takes no action.
- `Warning` — Simulink software displays a warning and continues the simulation.
- `Error` — Simulink software terminates the simulation and displays an error.

Dependency

To enable this parameter, set **Delay length: Source** to `Input port`.

Programmatic Use

Block Parameter: `DiagnosticForDelayLength`
Type: character vector
Values: `'None'` | `'Warning'` | `'Error'`
Default: `'None'`

`Show enable port` — Create enable port

`off` (default) | `on`

Select to control execution of this block with an enable port. The block is considered enabled when the input to this port is nonzero, and is disabled when the input is `0`. The value of the input is checked at the same time step as the block execution.

Programmatic Use

Block Parameter: `ShowEnablePort`
Type: character vector
Values: `'off' | 'on'`
Default: `'off'`

`External reset` — External state reset

`None` (default) | `Rising` | `Falling` | `Either` | `Level` | `Level hold`

Specify the trigger event to use to reset the states to the initial conditions.

Reset Mode	Behavior
`None`	No reset.
`Rising`	Reset on a rising edge.
`Falling`	Reset on a falling edge.
`Either`	Reset on either a rising or falling edge.

Reset Mode	Behavior
`Level`	Reset in either of these cases: • when the reset signal is nonzero at the current time step • when the reset signal value changes from nonzero at the previous time step to zero at the current time step
`Level hold`	Reset when the reset signal is nonzero at the current time step

Programmatic Use
Block Parameter: `ExternalReset`
Type: character vector
Values: `'None'` | `'Rising'` | `'Falling'` | `'Either'` | `'Level'` | `'Level hold'`
Default: `'None'`

`Sample time (-1 for inherited)` — Discrete interval between sample time hits

`-1` (default) | `scalar`

Specify the time interval between samples. To inherit the sample time, set this parameter to `-1`. This block supports discrete sample time, but not continuous sample time.

Programmatic Use
Block Parameter: `SampleTime`
Type: character vector
Value: real scalar
Default: `'-1'`

State Attributes

`State name` — Unique name for block state

`''` (default) | alphanumeric string

Use this parameter to assign a unique name to the block state. The default is `' '`. When this field is blank, no name is assigned. When using this parameter, remember these considerations:

- A valid identifier starts with an alphabetic or underscore character, followed by alphanumeric or underscore characters.

- The state name applies only to the selected block.

This parameter enables **State name must resolve to Simulink signal object** when you click **Apply**.

For more information, see “Apply Storage Classes to Individual Signal, State, and Parameter Data Elements” (Simulink Coder).

Programmatic Use

Block Parameter: `StateName`
Type: character vector
Values: unique name
Default: `''`

`State name must resolve to Simulink signal object` — Require state name resolve to a signal object

`off` (default) | `on`

Select this check box to require that the state name resolves to a Simulink signal object.

Dependencies

To enable this parameter, specify a value for **State name**. This parameter appears only if you set the model configuration parameter **Signal resolution** to a value other than `None`.

Selecting this check box disables **Code generation storage class**.

Programmatic Use

Block Parameter: `StateMustResolveToSignalObject`
Type: character vector
Values: `'off' | 'on'`
Default: `'off'`

`Signal object class` — Custom storage class package name

`Simulink.Signal` (default) | `<StorageClass.PackageName>`

Choose a custom storage class package by selecting a signal object class that the target package defines. For example, to apply custom storage classes from the built-in package `mpt`, select `mpt.Signal`. Unless you use an ERT-based code generation target with Embedded Coder, custom storage classes do not affect the generated code.

If the class that you want does not appear in the list, select `Customize class lists`. For instructions, see “Target Class Does Not Appear in List of Signal Object Classes” (Embedded Coder).

For information about storage classes, see “Apply Storage Classes to Individual Signal, State, and Parameter Data Elements” (Simulink Coder). For information about custom storage classes, see “Apply Custom Storage Classes to Individual Signal, State, and Parameter Data Elements” (Embedded Coder).

Programmatic Use
Block Parameter: `StateSignalObject`
Type: character vector
Values: `'Simulink.Signal' | '<StorageClass.PackageName>'`
Default: `'Simulink.Signal'`

`Code generation storage class` — State storage class for code generation

`Auto` (default) | `Model default` | `ExportedGlobal` | `ImportedExtern` | `ImportedExternPointer` | `BitField (Custom)` | `Model default` | `ExportToFile (Custom)` | `ImportFromFile (Custom)` | `FileScope (Custom)` | `AutoScope (Custom)` | `Struct (Custom)` | `GetSet (Custom)` | `Reusable (Custom)`

Select state storage class for code generation.

- `Auto` is the appropriate storage class for states that you do not need to interface to external code.
- *`StorageClass`* applies the storage class or custom storage class that you select from the list. For information about storage classes, see “Apply Storage Classes to Individual Signal, State, and Parameter Data Elements” (Simulink Coder). For information about custom storage classes, see “Apply Custom Storage Classes to Individual Signal, State, and Parameter Data Elements” (Embedded Coder).

Use **Signal object class** to select custom storage classes from a package other than `Simulink`.

Dependencies

To enable this parameter, specify a value for **State name**.

Programmatic Use
Block Parameter: `StateStorageClass`
Type: character vector
Values: `'Auto' | 'SimulinkGlobal' | 'ExportedGlobal' | 'ImportedExtern' | 'ImportedExternPointer' | 'Custom' | ...`
Default: `'Auto'`

Block Characteristics

Data Types	`double` | `single` | `Boolean` | `base integer` | `fixed point` | `enumerated` | `bus`
Direct Feedthrough	`Yes`
Multidimensional Signals	`Yes`
Variable-Size Signals	`Yes`
Zero-Crossing Detection	`No`

Introduced in R2012b

Variable Time Delay

Delay input by variable amount of time

Library: Simulink / Continuous

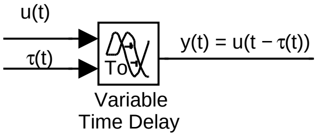
Description

The Variable Transport Delay and Variable Time Delay blocks appear as two blocks in the Simulink block library. However, they are the same Simulink block with different settings for the **Select delay type** parameter. Use this parameter to specify the mode in which the block operates.

Variable Time Delay

In this mode, the block has a data input, a time delay input, and a data output. (See “Port Location After Rotating or Flipping” for a description of the port order for various block orientations.) The output at the current time step equals the value of its data input at a previous time step. This time step is the current simulation time minus a delay time specified by the time delay input.

$$y(t) = u(t - t_0) = u(t - \tau(t))$$



During the simulation, the block stores time and input value pairs in an internal buffer. At the start of simulation, the block outputs the value of the **Initial output** parameter until the simulation time exceeds the time delay input. Then, at each simulation step, the block outputs the signal at the time that corresponds to the current simulation time minus the delay time.

If you want the output at a time between input storing times and the solver is a continuous solver, the block interpolates linearly between points. If the time delay is smaller than the step size, the block extrapolates an output point from a previous point. For example, consider a fixed-step simulation with a step size of `1` and the current time at `t = 5`. If the delay is `0.5`, the block must generate a point at `t = 4.5`, but the most recent stored time value is at `t = 4`. Thus, the block extrapolates the input at `4.5` from the input at `4` and uses the extrapolated value as its output at `t = 5`.

Extrapolating forward from the previous time step can produce a less accurate result than extrapolating back from the current time step. However, the block cannot use the current input to calculate its output value because the input port does not have direct feedthrough.

If the model specifies a discrete solver, the block does not interpolate between time steps. Instead, it returns the nearest stored value that precedes the required value.

Variable Transport Delay

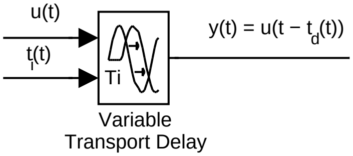
In this mode, the block output at the current time step is equal to the value of its data (top, or left) input at an earlier time step equal to the current time minus a transportation delay.

$$y(t) = u(t - t_d(t))$$

Simulink software finds the transportation delay, $t_d(t)$, by solving the following equation:

$$\int_{t-t_d(t)}^{t} \frac{1}{t_i(\tau)} d\tau = 1$$

This equation involves an instantaneous time delay, $t_i(t)$, given by the time delay (bottom, or right) input.



Suppose that you want to use this block to model the fluid flow through a pipe where the fluid speed varies with time. In this case, the time delay input to the block is

$$t_i(t) = \frac{L}{v_i(t)}$$

where L is the length of the pipe and $v_i(t)$ is the speed of the fluid.

Ports

Input

Port_1 — Input signal

scalar | vector | matrix

Input signal specified as a scalar, vector, or matrix.

Data Types: double

t_0 — Time delay input

scalar | vector | matrix

Time delay input specified as a scalar, vector, or matrix. When the block is in Variable time delay mode, this value specifies the time delay. For more information about that calculation, see "Variable Time Delay" on page 1-2145.

Dependencies

To enable this port, set **Select delay type** to Variable time delay.

Data Types: double

t_i — Instantaneous time delay input

scalar | vector | matrix

Instantaneous time delay input specified as a scalar, vector, or matrix. When the block is in Variable transport delay mode, this value is used to calculate the transportation delay. For more information about that calculation, see "Variable Transport Delay" on page 1-2146.

Dependencies

To enable this port, set **Select delay type** to Variable transport delay.

Data Types: double

Output

Port_1 — Delayed signal
scalar | vector | matrix

Output signal specified as a scalar, vector, or matrix.

Data Types: double

Parameters

Select delay type — Type of delay
Variable time delay | Variable transport delay

Specify the type of delay as Variable time delay or Variable transport delay.

The default value of this parameter depends on the block implementation: Variable time delay for the Variable Time Delay block, and Variable transport delay for the Variable Transport Delay block.

Dependencies

- Setting this parameter to Variable time delay enables the **Handle zero delay** parameter.
- Setting this parameter to Variable transport delay enables the **Absolute tolerance** and **State Name** parameters.

Programmatic Use
Block Parameter: VariableDelayType
Type: character vector, string
Values: 'Variable transport delay' | 'Variable time delay'

Maximum delay — Maximum value of time delay input
10 (default) | scalar | vector

Set the maximum value of the time delay input. This value defines the largest time delay input that this block allows. The block clips any delay that exceeds this value. This value cannot be negative. If the time delay becomes negative, the block clips it to zero and issues a warning message.

Programmatic Use

Block Parameter: `MaximumDelay`
Type: character vector, string
Value: scalar | vector
Default: `'10'`

`Initial output` — Initial output

`0` (default) | scalar | vector

Specify the output that the block generates until the simulation time first exceeds the time delay input.

Dependencies

- The initial output of this block cannot be `inf` or `NaN`.
- A `Run-to-run tunable parameter` cannot be changed during simulation run time. However, changing it before a simulation begins does not cause Accelerator or Rapid Accelerator to regenerate code.

Programmatic Use

Block Parameter: `InitialOutput`
Type: character vector, string
Values: scalar | vector
Default: `'0'`

`Initial buffer size` — Initial memory allocation

`1024` (default) | scalar

Define the initial memory allocation for the number of input points to store. The input points define the history of the input signal up to the current simulation time.

- If the number of input points exceeds the initial buffer size, the block allocates additional memory.
- After simulation ends, a message displays if the buffer is not sufficient and more memory must be allocated.

Tips

- Because allocating memory slows down simulation, choose this value carefully if simulation speed is an issue.
- For long time delays, this block might use a large amount of memory, particularly for dimensionalized input.

Programmatic Use

Block Parameter: `MaximumPoints`
Type: character vector, string
Values: scalar | vector
Default: `'1024'`

`Use fixed buffer size` — Use fixed-size buffer

`off` (default) | `on`

Selecting this check box uses a fixed-size buffer to save input data from previous time steps. When you clear this check box, the block does not use a fixed-size buffer.

The **Initial buffer size** parameter specifies the buffer size. If the buffer is full, new data replaces data already in the buffer. Simulink software uses linear extrapolation to estimate output values that are not in the buffer.

Note ERT or GRT code generation uses a fixed-size buffer even if you do not select this check box.

Tips

- If the input data is linear, selecting this check box can save memory.
- If the input data is nonlinear, do not select this check box. Doing so might yield inaccurate results.

Programmatic Use

Block Parameter: `FixedBuffer`
Type: character vector, string
Values: `'off'` | `'on'`
Default: `'off'`

`Handle zero delay` — Use direct feedthrough

`off` (default) | `on`

Selecting this check box converts this block to a direct feedthrough block. When you clear this check box, the block does not use direct feedthrough.

Dependencies

To enable this parameter, set **Select delay type** to `Variable time delay`.

Programmatic Use

Block Parameter: `ZeroDelay`
Type: character vector, string
Values: `'off'` | `'on'`
Default: `'off'`

`Direct feedthrough of input during linearization` — Use direct feedthrough during linearization

`off` (default) | `on`

When you selec this parameter, the block outputs its input during linearization and trim, which sets the block mode to direct feedthrough. To disable direct feedthrough, clear this check box.

Tips

- Selecting this check box can cause a change in the ordering of states in the model when you use the functions `linmod`, `dlinmod`, or `trim`. To extract this new state ordering:

  1. Compile the model using the following command, where `model` is the name of the Simulink model.

     ```
         [sizes, x0, x_str] = model([],[],[],'lincompile');
     ```
  2. Terminate the compilation with the following command.

     ```
     model([],[],[],'term');
     ```
- The output argument `x_str`, which is a cell array of the states in the Simulink model, contains the new state ordering. When you pass a vector of states as input to the `linmod`, `dlinmod`, or `trim` functions, the state vector must use this new state ordering.

Programmatic Use

Block Parameter: `TransDelayFeedthrough`
Type: character vector, string
Values: `'off'` | `'on'`
Default: `'off'`

`Pade order (for linearization)` — Order of Pade approximation

`0` (default) | scalar

Set the order of the Pade approximation for linearization routines.

- The default value is 0, which results in a unity gain with no dynamic states.
- Setting the order to a positive integer n adds n states to your model, but results in a more accurate linear model of the transport delay.

Programmatic Use
Block Parameter: PadeOrder
Type: character vector, string
Values: scalar
Default: '0'

Absolute tolerance — Absolute tolerance for computing block state

auto (default) | positive, real, scalar or vector

Specify the absolute tolerance for computing the block state.

Dependencies

To enable this parameter, set **Select delay type** to Variable transport delay.

Programmatic Use
Block Parameter: AbsoluteTolerance
Type: character vector, string
Values: 'auto' | '-1' | any positive real scalar or vector
Default: 'auto'

State Name (e.g., 'position') — Unique name for each state

' ' (default) | character vector, string

Assign a unique name to each state. If this field is blank, no name assignment occurs.

Tips

- To assign a name to a single state, enter the name between quotes, for example, 'velocity'.
- To assign names to multiple states, enter a comma-delimited list surrounded by braces, for example, {'a', 'b', 'c'}. Each name must be unique.
- The state names apply only to the selected block.
- The number of states must divide evenly among the number of state names.
- You can specify fewer names than states, but you cannot specify more names than states.

For example, you can specify two names in a system with four states. The first name applies to the first two states and the second name to the last two states.

- To assign state names with a variable in the MATLAB workspace, enter the variable without quotes. A variable can be a character vector, string, cell array, or structure.

Dependencies

To enable this parameter, set **Select delay type** to `Variable transport delay`.

Programmatic Use

Block Parameter: `ContinuousStateAttributes`
Type: character vector, string
Values: `' '` | user-defined character vector, user-defined string
Default: `' '`

Block Characteristics

Data Types	`double`
Direct Feedthrough	`Yes`
Multidimensional Signals	`No`
Variable-Size Signals	`No`
Zero-Crossing Detection	`No`

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Not recommended for production-quality code. Relates to resource limits and restrictions on speed and memory often found in embedded systems. The code generated can contain dynamic allocation and freeing of memory, recursion, additional memory overhead, and widely-varying execution times. While the code is functionally valid and generally acceptable in resource-rich environments, smaller embedded targets often cannot support such code.

In general, consider using the Simulink Model Discretizer to map continuous blocks into discrete equivalents that support production code generation. To start the Model Discretizer, select `Analysis > Control Design > Model Discretizer`. One exception is the Second-Order Integrator block because, for this block, the Model Discretizer produces an approximate discretization.

Library: Simulink / Continuous

Description

The Variable Transport Delay and Variable Time Delay blocks appear as two blocks in the Simulink block library. However, they are the same Simulink block with different settings for the **Select delay type** parameter. Use this parameter to specify the mode in which the block operates.

Variable Transport Delay

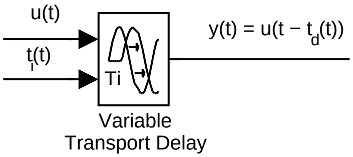
In this mode, the block output at the current time step is equal to the value of its data (top, or left) input at an earlier time step equal to the current time minus a transportation delay.

$$y(t) = u(t - t_d(t))$$

Simulink software finds the transportation delay, $t_d(t)$, by solving the following equation:

$$\int_{t-t_d(t)}^{t} \frac{1}{t_i(\tau)} d\tau = 1$$

This equation involves an instantaneous time delay, $t_i(t)$, given by the time delay (bottom, or right) input.



Suppose that you want to use this block to model the fluid flow through a pipe where the fluid speed varies with time. In this case, the time delay input to the block is

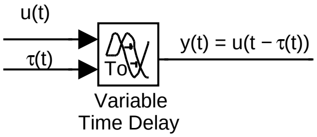
$$t_i(t) = \frac{L}{v_i(t)}$$

where L is the length of the pipe and $v_i(t)$ is the speed of the fluid.

Variable Time Delay

In this mode, the block has a data input, a time delay input, and a data output. (See “Port Location After Rotating or Flipping” for a description of the port order for various block orientations.) The output at the current time step equals the value of its data input at a previous time step. This time step is the current simulation time minus a delay time specified by the time delay input.

$$y(t) = u(t - t_0) = u(t - \tau(t))$$



During the simulation, the block stores time and input value pairs in an internal buffer. At the start of simulation, the block outputs the value of the **Initial output** parameter until the simulation time exceeds the time delay input. Then, at each simulation step, the block outputs the signal at the time that corresponds to the current simulation time minus the delay time.

If you want the output at a time between input storing times and the solver is a continuous solver, the block interpolates linearly between points. If the time delay is smaller than the step size, the block extrapolates an output point from a previous point. For example, consider a fixed-step simulation with a step size of `1` and the current time at `t = 5`. If the delay is `0.5`, the block must generate a point at `t = 4.5`, but the most recent stored time value is at `t = 4`. Thus, the block extrapolates the input at `4.5` from the input at `4` and uses the extrapolated value as its output at `t = 5`.

Extrapolating forward from the previous time step can produce a less accurate result than extrapolating back from the current time step. However, the block cannot use the current input to calculate its output value because the input port does not have direct feedthrough.

If the model specifies a discrete solver, the block does not interpolate between time steps. Instead, it returns the nearest stored value that precedes the required value.

Ports

Input

`Port_1` — Input signal

scalar | vector | matrix

Input signal specified as a scalar, vector, or matrix.

Data Types: `double`

t_0 — Time delay input

scalar | vector | matrix

Time delay input specified as a scalar, vector, or matrix. When the block is in `Variable time delay` mode, this value specifies the time delay. For more information about that calculation, see "Variable Time Delay" on page 1-2156.

Dependencies

To enable this port, set **Select delay type** to `Variable time delay`.

Data Types: `double`

t_i — Instantaneous time delay input

scalar | vector | matrix

Instantaneous time delay input specified as a scalar, vector, or matrix. When the block is in `Variable transport delay` mode, this value is used to calculate the transportation delay. For more information about that calculation, see "Variable Transport Delay" on page 1-2155.

Dependencies

To enable this port, set **Select delay type** to `Variable transport delay`.

Data Types: `double`

Output

`Port_1` — Delayed signal

scalar | vector | matrix

Output signal specified as a scalar, vector, or matrix.

Data Types: `double`

Parameters

`Select delay type` — Type of delay

`Variable time delay` | `Variable transport delay`

Specify the type of delay as `Variable time delay` or `Variable transport delay`.

The default value of this parameter depends on the block implementation: `Variable time delay` for the Variable Time Delay block, and `Variable transport delay` for the Variable Transport Delay block.

Dependencies

- Setting this parameter to `Variable time delay` enables the **Handle zero delay** parameter.
- Setting this parameter to `Variable transport delay` enables the **Absolute tolerance** and **State Name** parameters.

Programmatic Use

Block Parameter: `VariableDelayType`
Type: character vector, string
Values: `'Variable transport delay'` | `'Variable time delay'`

`Maximum delay` — Maximum value of time delay input

`10` (default) | scalar | vector

Set the maximum value of the time delay input. This value defines the largest time delay input that this block allows. The block clips any delay that exceeds this value. This value cannot be negative. If the time delay becomes negative, the block clips it to zero and issues a warning message.

Programmatic Use

Block Parameter: `MaximumDelay`
Type: character vector, string
Value: scalar | vector
Default: `'10'`

`Initial output` — Initial output

`0` (default) | scalar | vector

Specify the output that the block generates until the simulation time first exceeds the time delay input.

Dependencies

- The initial output of this block cannot be `inf` or `NaN`.
- A `Run-to-run tunable parameter` cannot be changed during simulation run time. However, changing it before a simulation begins does not cause Accelerator or Rapid Accelerator to regenerate code.

Programmatic Use

Block Parameter: `InitialOutput`
Type: character vector, string
Values: scalar | vector
Default: `'0'`

`Initial buffer size` — Initial memory allocation

`1024` (default) | scalar

Define the initial memory allocation for the number of input points to store. The input points define the history of the input signal up to the current simulation time.

- If the number of input points exceeds the initial buffer size, the block allocates additional memory.
- After simulation ends, a message displays if the buffer is not sufficient and more memory must be allocated.

Tips

- Because allocating memory slows down simulation, choose this value carefully if simulation speed is an issue.
- For long time delays, this block might use a large amount of memory, particularly for dimensionalized input.

Programmatic Use

Block Parameter: `MaximumPoints`
Type: character vector, string
Values: scalar | vector
Default: `'1024'`

`Use fixed buffer size` — Use fixed-size buffer

`off` (default) | `on`

Selecting this check box uses a fixed-size buffer to save input data from previous time steps. When you clear this check box, the block does not use a fixed-size buffer.

The **Initial buffer size** parameter specifies the buffer size. If the buffer is full, new data replaces data already in the buffer. Simulink software uses linear extrapolation to estimate output values that are not in the buffer.

Note ERT or GRT code generation uses a fixed-size buffer even if you do not select this check box.

Tips

- If the input data is linear, selecting this check box can save memory.
- If the input data is nonlinear, do not select this check box. Doing so might yield inaccurate results.

Programmatic Use

Block Parameter: `FixedBuffer`
Type: character vector, string
Values: `'off'` | `'on'`
Default: `'off'`

`Handle zero delay` — Use direct feedthrough

`off` (default) | `on`

Selecting this check box converts this block to a direct feedthrough block. When you clear this check box, the block does not use direct feedthrough.

Dependencies

To enable this parameter, set **Select delay type** to `Variable time delay`.

Programmatic Use

Block Parameter: `ZeroDelay`
Type: character vector, string
Values: `'off'` | `'on'`
Default: `'off'`

`Direct feedthrough of input during linearization` — Use direct feedthrough during linearization

`off` (default) | `on`

When you selec this parameter, the block outputs its input during linearization and trim, which sets the block mode to direct feedthrough. To disable direct feedthrough, clear this check box.

Tips

- Selecting this check box can cause a change in the ordering of states in the model when you use the functions `linmod`, `dlinmod`, or `trim`. To extract this new state ordering:

  1. Compile the model using the following command, where `model` is the name of the Simulink model.

     ```
     [sizes, x0, x_str] = model([],[],[],'lincompile');
     ```

  2. Terminate the compilation with the following command.

     ```
     model([],[],[],'term');
     ```

- The output argument `x_str`, which is a cell array of the states in the Simulink model, contains the new state ordering. When you pass a vector of states as input to the `linmod`, `dlinmod`, or `trim` functions, the state vector must use this new state ordering.

Programmatic Use

Block Parameter: `TransDelayFeedthrough`
Type: character vector, string
Values: `'off'` | `'on'`

Default: 'off'

Pade order (for linearization) — Order of Pade approximation

0 (default) | scalar

Set the order of the Pade approximation for linearization routines.

- The default value is 0, which results in a unity gain with no dynamic states.
- Setting the order to a positive integer n adds n states to your model, but results in a more accurate linear model of the transport delay.

Programmatic Use
Block Parameter: PadeOrder
Type: character vector, string
Values: scalar
Default: '0'

Absolute tolerance — Absolute tolerance for computing block state

auto (default) | positive, real, scalar or vector

Specify the absolute tolerance for computing the block state.

Dependencies

To enable this parameter, set **Select delay type** to Variable transport delay.

Programmatic Use
Block Parameter: AbsoluteTolerance
Type: character vector, string
Values: 'auto' | '-1' | any positive real scalar or vector
Default: 'auto'

State Name (e.g., 'position') — Unique name for each state

' ' (default) | character vector, string

Assign a unique name to each state. If this field is blank, no name assignment occurs.

Tips

- To assign a name to a single state, enter the name between quotes, for example, 'velocity'.
- To assign names to multiple states, enter a comma-delimited list surrounded by braces, for example, {'a', 'b', 'c'}. Each name must be unique.

- The state names apply only to the selected block.
- The number of states must divide evenly among the number of state names.
- You can specify fewer names than states, but you cannot specify more names than states.

  For example, you can specify two names in a system with four states. The first name applies to the first two states and the second name to the last two states.
- To assign state names with a variable in the MATLAB workspace, enter the variable without quotes. A variable can be a character vector, string, cell array, or structure.

Dependencies

To enable this parameter, set **Select delay type** to `Variable transport delay`.

Programmatic Use
Block Parameter: `ContinuousStateAttributes`
Type: character vector, string
Values: `' '` | user-defined character vector, user-defined string
Default: `' '`

Block Characteristics

Data Types	`double`
Direct Feedthrough	`Yes`
Multidimensional Signals	`No`
Variable-Size Signals	`No`
Zero-Crossing Detection	`No`

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Not recommended for production-quality code. Relates to resource limits and restrictions on speed and memory often found in embedded systems. The code generated can contain dynamic allocation and freeing of memory, recursion, additional memory overhead, and widely-varying execution times. While the code is functionally valid and generally acceptable in resource-rich environments, smaller embedded targets often cannot support such code.

In general, consider using the Simulink Model Discretizer to map continuous blocks into discrete equivalents that support production code generation. To start the Model Discretizer, select `Analysis > Control Design > Model Discretizer`. One exception is the Second-Order Integrator block because, for this block, the Model Discretizer produces an approximate discretization.

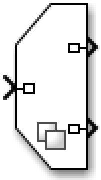
Introduced in R2007a

Variant Sink

Route amongst multiple outputs using Variants
Library: Simulink / Signal Routing



Description

The Variant Sink block has one input port and one or more output ports. You can define Variant choices as blocks that are connected to the output port so that, at most, one choice is active.

Each output port is associated with a Variant control. The Variant control that evaluates to `true`, determines which output port is active.

During simulation, Simulink connects the active choice directly to the input port of the Variant Sink block and ignores the inactive choices.

Ports

Input

`Port_1` — Input signal
scalar | vector | matrix

Input signal, specified as a scalar, vector, or matrix, to be connected to the active output port.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus` | `struct`

Output

Port_1 — Output from first Variant

scalar | vector | matrix

Output signal from the first Variant. The Variant control that evaluates to `true`, determines which output port is active.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Port_N — Output from Nth Variant

scalar | vector | matrix

Output signal from the Nth Variant. The Variant control that evaluates to `true`, determines which output port is active.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Parameters

Variant control mode — Name of the Variant control mode

`Expression` (default) | `Label`

To choose the active Variant based on the evaluation of the Variant conditions, use the `Expression` mode else select `Label` mode. When you select the **Variant control mode** as `Label`, the **Label mode active choice** option is available. In `Label` mode, Variant control need not be created in the global workspace. In `Label` mode, the Variant control is a string that is not evaluated and the choice used in simulation is determined by the **Label mode active choice** parameter. You can select an active Variant choice from **Label mode active choice** options.

When you select `Label` option, the Variant badge indicates the change.

Note When you promote **Label mode active choice** parameter to a mask, the **Variant control mode** is disabled.

- If the block is in `Expression` mode while promoting **Label mode active choice** parameter to mask, you can change the **Variant control mode** to `Label` by changing the promoted **Label mode active choice** parameter from the Mask dialog box.

- If the block is in `Label` mode while promoting **Label mode active choice** parameter to mask, you cannot change the **Variant control mode** to `Expression` mode.

For information about promoting parameters to mask, see “Promote Parameter to Mask”.

`Port` — Number of connected input port

no default

Number of the input port that is connected to one Variant choice upstream of the Variant Sink block. This value is read-only.

Click ➕ to add a port or ❌ to delete an existing one.

`Variant control expression` — Variant controls available in the global workspace

`'Variant'` (default) | boolean condition expression | `Simulink.Variant` object | `Simulink.Parameter` object | enum

Displays the Variant controls available in the global workspace. The Variant control can be a Boolean condition expression or a `Simulink.Variant` object representing a Boolean condition expression. If you want to generate code for your model, you must define the control variables as MATLAB variables.

To enter non-numeric Variant control values, use enumerated data. For information about using enumerated data, see “Use Enumerated Data in Simulink Models”

To enter a Variant name, double-click a **Variant control expression** cell in a new row and type in the Variant control expression. Click **Apply** after you edit a Variant control name. If you add or delete a Variant control without applying the changes, the previous edits on the Variant control name are lost.

Programmatic Use
Block Parameter: `VariantControls`
Type: cell array of character vectors
Values: Variant control that is associated with the Variant choice
Default: `'Variant'`

`Condition (read-only)` — Condition for Variant controls

no default

Displays the **Condition** for the Variant controls that are `Simulink.Variant` objects. Create or change a Variant condition in the `Simulink.Variant` parameter dialog box or in the global workspace.

For more information, see “Create Variant Controls Programmatically” and `Simulink.Variant`.

`Label mode active choice` — Name of Variant to use if Label control mode is selected

`Variant_1` (default) | name of variant control

When you select the **Variant control mode** as `Label`, the **Label mode active choice** option is available. You can select an active Variant choice from **Label mode active choice** options. You can also right-click the badge on the Variant Sink block and select **Label Mode Active Choice**.

The **Label mode active choice** drop-down list displays all Variant controls that are currently defined in the global workspace or a data dictionary. Use valid MATLAB identifiers to specify Variant controls. For more information, see `Simulink.Variant`.

Note **Label mode active choice** option is not available in `Expression` mode.

Dependencies

To enable this parameter, select `Label` mode.

Programmatic Use

Block Parameter: `LabelModeActivechoice`
Type: character vector
Values: Specified by the Variant control expression
Default: `Variant_1`

`Allow zero active variant controls` — Simulate model without active Variant choice

`off` (default) | `on`

To simulate a model (containing a Variant block) without an active Variant choice, select the **Allow zero active variant controls** option. When this option is selected and there is no active Variant choice, Simulink disables all the blocks connected to the input and output stream of Variant Sink block. The removed blocks are ignored from update diagram or simulation.

If you do not select this option, Simulink generates an error when there is no active Variant choice.

When you select this option, the Variant badge indicates the change.

Dependencies

`Expression` option from **Variant control mode** is selected.

Programmatic Use

Block Parameter: `AllowZeroVariantControls`
Type: character vector
Values: `'off'` | `'on'`
Default: `'off'`

`Show variant condition on block` — Annotate block ports

`off` (default) | `on`

When you select this option, Simulink annotates each Variant control (condition expression) on the Variant Sink block ports.

Programmatic Use

Block Parameter: `ShowConditionOnBlock`
Type: character vector
Values: `'off'` | `'on'`
Default: `'off'`

`Analyze all choices during update diagram and generate preprocessor conditionals` — Analyze all Variant choices during update diagram or simulation

`off` (default) | `on`

When you select this option, Simulink analyzes all Variant choices during an update diagram or simulation. This analysis helps Simulink to maintain consistency of all Variant branches during simulation and code generation. Simulink routes the output of the active and inactive regions to an internal `VariantMerge` block.

When you select this option, the preprocessor conditionals (`#if`) are generated in the code with ERT-based targets.

When you select this option, the Variant badge indicates the change.

For more information, see “Represent Variant Source and Sink Blocks in Generated Code” (Embedded Coder)

Dependencies

- `Expression` option from **Variant control mode** is selected.
- The check box is available for generating ERT targets only.

Programmatic Use
Block Parameter: `GeneratePreprocessorConditionals`
Type: character vector
Values: `'off'` | `'on'`
Default: `'off'`

Block Characteristics

Data Types	`double` | `single` | `Boolean` | `base integer` | `fixed point` | `enumerated` | `bus` | `string`
Direct Feedthrough	`No`
Multidimensional Signals	`No`
Variable-Size Signals	`No`
Zero-Crossing Detection	`No`

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Fixed-Point Conversion

Convert floating-point algorithms to fixed point using Fixed-Point Designer™.

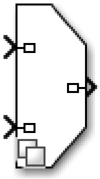
Variant Source

Route among multiple inputs using Variants
Library: Simulink / Signal Routing



Description

The Variant Source block has one or more input ports and one output port. You can define Variant choices as blocks that are connected to the input port so that, at most, one choice is active.

Each input port is associated with a Variant control. The Variant control that evaluates to `true`, determines which input port is active.

When the **Analyze all choices during update diagram and generate preprocessor conditionals** option in the block dialog box is cleared, then during simulation Simulink connects the active choice directly to the output port of the Variant Source block and ignores the inactive choices.

Ports

Input

`Port_1` — Input port associated with first Variant control
scalar | vector | matrix

Input port associated with the first Variant control. The Variant control that evaluates to `true`, determines which input port is active.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed-point` | `enumerated` | `bus`

`Port_N` — Input port associated with Nth Variant control

scalar | vector | matrix

Input port associated with the Nth Variant control. The Variant control that evaluates to `true`, determines which input port is active.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Output

`Port_1` — Output of active Variant

scalar | vector | matrix

Output signal from the active Variant.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed-point` | `enumerated` | `bus`

Parameters

`Variant control mode` — Name of the Variant control mode

`Expression` (default) | `Label`

To choose the active Variant based on the evaluation of the Variant conditions, use the `Expression` mode else select `Label` mode. When you select the **Variant control mode** as `Label`, the **Label mode active choice** option is available. In `Label` mode, Variant control need not be created in the global workspace. You can select an active Variant choice from **Label mode active choice** options.

When you select `Label` option, the Variant badge indicates the change.

Note When you promote **Label mode active choice** parameter to a mask, the **Variant control mode** is disabled.

- If the block is in `Expression` mode while promoting **Label mode active choice** parameter to mask, you can change the **Variant control mode** to `Label` by changing the promoted **Label mode active choice** parameter from the Mask dialog box.
- If the block is in `Label` mode while promoting **Label mode active choice** parameter to mask, you cannot change the **Variant control mode** to `Expression` mode.

For information about promoting parameters to mask, see “Promote Parameter to Mask”.

Port — Number of connected input port

no default

Number of the input port that is connected to one Variant choice upstream of the Variant Source block. This value is read-only.

Click ✚ to add a port or ✖ to delete an existing one.

`Variant control expression` — Variant controls available in the global workspace

`'Variant'` (default) | boolean condition expression | `Simulink.Variant` object | `Simulink.Parameter` object | enum

Displays the Variant controls available in the global workspace. The Variant control can be a Boolean condition expression or a `Simulink.Variant` object representing a Boolean condition expression. If you want to generate code for your model, you must define the control variables as `Simulink.Parameter` objects.

To enter non-numeric Variant control values, use enumerated data. For information about using enumerated data, see “Use Enumerated Data in Simulink Models”

To edit a Variant name, double-click a **Variant control expression** cell and type in the Variant control expression. Click **Apply** after you edit a Variant control name. If you add or delete a Variant control without applying the changes, the previous edits on the Variant control name are lost.

The **Variant control** that evaluates to `true` determines which input port must be active.

Programmatic Use

Block Parameter: `VariantControls`
Type: cell array of character vectors
Value: Variant control that is associated with the Variant choice

Default: `'Variant'`

`Condition (read-only)` — Condition for Variant controls

no default

Displays the **Condition** for the Variant controls that are `Simulink.Variant` objects. Create or change a Variant condition in the `Simulink.Variant` parameter dialog box or in the global workspace.

For more information, see "Create Variant Controls Programmatically" and `Simulink.Variant`.

`Label mode active choice` — Name of Variant to use if Label control mode is selected

`Variant_1` (default) | name of Variant control

When you select the **Variant control mode** as `Label`, the **Label mode active choice** option is available. You can select an active Variant choice from **Label mode active choice** options. You can also right-click the badge on the Variant Source block and select **Label Mode Active Choice**.

The **Label mode active choice** drop-down list displays all Variant controls that are currently defined in the global workspace or a data dictionary. Use valid MATLAB identifiers to specify Variant controls. For more information, see `Simulink.Variant`.

Note **Label mode active choice** option is not available in `Expression` mode.

Dependencies

To enable this parameter, select `Label` mode.

Programmatic Use

Block Parameter: `LabelModeActivechoice`
Type: character vector
Value: Specified by the Variant control expression.
Default: `Variant_1`

`Allow zero active variant controls` — Simulate model without active Variant choice

`off` (default) | `on`

To simulate a model (containing a Variant block) without an active Variant choice, select the **Allow zero active variant controls** option. When this option is selected and there is no active Variant choice, Simulink disables all the blocks connected to the input and output stream of Variant Source block. The removed blocks are ignored from update diagram or simulation.

If you do not select this option, Simulink generates an error when there is no active Variant choice.

When you select this option, the Variant badge indicates the change.

Dependencies

`Expression` option from **Variant control mode** is selected.

Programmatic Use

Block Parameter: `AllowZeroVariantControls`
Type: character vector
Values: `'off'` | `'on'`
Default: `'off'`

`Show variant condition on block` — Annotate block ports

`off` (default) | `on`

When you select this option, Simulink annotates each Variant control (condition expression) on the Variant Source block ports.

Programmatic Use

Block Parameter: `ShowConditionOnBlock`
Type: character vector
Value: `'off'` | `'on'`
Default: `'off'`

`Analyze all choices during update diagram and generate preprocessor conditionals` — Analyze all Variant choices during update diagram or simulation

`off` (default) | `on`

When you select this option, Simulink analyzes all Variant choices during an update diagram or simulation. This analysis helps Simulink to maintain consistency of all Variant branches during simulation and code generation. Simulink routes the output of the active and inactive regions to an internal `VariantMerge` block.

When this option is selected, the preprocessor conditionals (`#if`) are generated in the code with ERT-based targets.

If this option is selected during code generation, the data type and the semantics at all input ports of the Variant Source block must be same to avoid failure.

When you select this option, the Variant badge indicates the change.

For more information, see “Represent Variant Source and Sink Blocks in Generated Code” (Embedded Coder)

Dependencies

- `Expression` option from **Variant control mode** is selected.
- The check box is available for generating ERT targets only.

Programmatic Use

Block Parameter: `GeneratePreprocessorConditionals`
Type: character vector
Value: `'off'` | `'on'`
Default: `'off'`

Block Characteristics

Data Types	`double` | `single` | `Boolean` | `base integer` | `fixed point` | `enumerated` | `bus` | `string`
Direct Feedthrough	`No`
Multidimensional Signals	`No`
Variable-Size Signals	`No`
Zero-Crossing Detection	`No`

Extended Capabilities

Variant Subsystem

Template subsystem containing Subsystem blocks as Variant choices

Library: Simulink / Ports & Subsystems

Description

The Variant Subsystem block can have at most one active choice for simulation. The Variant Subsystem block is a template preconfigured to contain two Subsystem blocks to use as Variant Subsystem choices. The Variant Subsystem block can contain a mixture of Subsystem and Model blocks as Variant systems. The Variant Subsystem blocks can also include Inport, Outport, and Connection Port blocks. There are no drawn connections inside the Variant Subsystem blocks.

Each Variant system is associated with a Variant control that is created in the global workspace. The Variant control determines which Variant system is active. The Variant control can be a condition expression, a `Simulink.Variant` object specifying a condition expression, or a default Variant. The Variant control that evaluates to `true` determines the active Variant.

When you select the **Specify output when source is unconnected** option in the Outport block that is in a Variant Subsystem block, you can specify a non-ground value as its output.

Note You must specify the correct data type in the **Signal Attributes** section of the Outport block dialog box.

Ports

During simulation, Simulink disables the inactive ports in a Variant Subsystem block.

Input

`Input_Port_1` — Input port corresponding to root-level Inport blocks contained in Variant Subsystem

same data types accepted by Inport blocks

Each Subsystem or Model block contained within a Variant Subsystem represents one Variant system. If the inport names on a Variant system are a subset of the inport names used by the Variant Subsystem container block, then Variant system blocks can have different numbers of inports than the Variant Subsystem block has.

Output

`Output_Port_1` — Output port corresponding to root-level Outport blocks contained in Variant Subsystem

same data types accepted by Outport blocks

Each Subsystem or Model block contained within a Variant Subsystem represents one Variant system. If the outport names on a Variant system are a subset of the outport names used by the Variant Subsystem block, then Variant system blocks can have different numbers of outports than the Variant Subsystem block has.

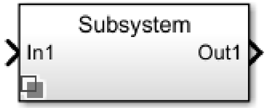
Parameters

`Variant control mode` — Name of the Variant control mode

`Expression` (default) | `Label`

To choose the active Variant based on the evaluation of the Variant conditions, use the `Expression` mode else select `Label` mode. When you select the **Variant control mode** as `Label`, the **Label mode active choice** option is available. In `Label` mode, Variant control need not be created in the global workspace. You can select an active Variant choice from **Label mode active choice** options.

When you select `Label` mode, the Variant badge indicates the change.



Note When you promote **Label mode active choice** parameter to a mask, the **Variant control mode** is disabled. While promoting **Label mode active choice** parameter to a mask in a nested model, ensure that you promote **Label mode active choice** parameter to the immediate parent Variant Subsystem block mask.

- If the block is in `Expression` mode while promoting **Label mode active choice** parameter to mask, you can change the **Variant control mode** to `Label` by changing the promoted **Label mode active choice** parameter from the Mask dialog box.
- If the block is in `Label` mode while promoting **Label mode active choice** parameter to mask, you cannot change the **Variant control mode** to `Expression` mode.

For information about promoting parameters to mask, see “Promote Parameter to Mask”.

`Variant choices (table of variant systems)` — Table of variant choices, variant controls, and conditions

empty table (default)

The table has a row for each Variant system contained in the Variant Subsystem. If there are no Variant systems, the table is empty.

You can use buttons to the left of the **Variant choices** table to modify the elements in the table.

To...	Click...
Create and add a new subsystem choice: Place a new Subsystem Variant choice in the table and create a Subsystem block in the Variant Subsystem block diagram.	
Create and add a new model variant choice: Place a new model Variant choice in the table and create a Model block in the Variant Subsystem block.	
Create/Edit selected variant object: Create a `Simulink.Variant` object in the global workspace and open the `Simulink.Variant` object parameter dialog box to specify the Variant **Condition**.	
Open selected variant choice block: Open the Subsystem block diagram for the selected row in the **Variant choices** table.	

To...	Click...
Refresh dialog information from Variant Subsystem contents: Update the **Variant choices** table according to the Variant system and values of the Variant control in the global workspace.	⟳

`Name (read-only)` — Variant system name

`''` (default) | name of Subsystem or Model block contained in the Variant Subsystem

This read-only field is based on the Variant system name. To add a Subsystem Variant choice, click ⊕. To add a model Variant choice, click ⊕.

`Variant control expression` — Variant control in global workspace

`Variant` (default) | boolean condition expression | a Simulink.Variant object representing a boolean condition expression | a Simulink.Parameter object (required for code generation) | enum

To enter a Variant name, double-click a **Variant control** cell in a new row and type in the Variant control expression.

To enter non-numeric Variant control values, use enumerated data. For information about using enumerated data, see "Use Enumerated Data in Simulink Models"

Programmatic Use

Structure field: Represented by the read-only `variant.Name` field in the `Variant` parameter structure
Type: character vector
Value: Variant control that is associated with the Variant choice
Default: `'variant'`

`Condition (read-only)` — Condition for Variant controls

`''` (default)

This read-only field is based on the condition for the associated Variant control in the global workspace. Create or change a Variant condition in the `Simulink.Variant` parameter dialog box or in the global workspace.

`Label mode active choice` — Name of Active choice if Label mode is selected

`off` (default) | `on`

When you select the **Variant control mode** as `Label`, the **Label mode active choice** option is available. You can select an active Variant choice from **Label mode active**

choice options. You can also right-click the badge on the Variant Subsystem block and select **Label Mode Active Choice**.

For **Label mode active choice** option, the Variant control need not be a Boolean condition expression or a `Simulink.Variant` object. Variant controls that start with a `%` symbol are ignored.

Tip You can use the **Label mode active choice** drop-down list to see a list of Variant controls that are specified in the Variant choice section.

Note **Label mode active choice** option is not available in `Expression` mode.

Dependencies

To enable this parameter, select `Label` option from **Variant control mode** parameter.

Programmatic Use

Parameter: `LabelModeActivechoice`
Type: character vector
Value: `''` if no Label mode active choice is specified, the value is empty or the name of the Label mode active choice.
Default: `''`

`Allow zero active variant controls` — Simulate model without using active Variant

`off` (default) | `on`

To simulate a model (containing a Variant system) without an active Variant choice, select the **Allow zero active variant controls** option. When you select this option and if there is no active Variant choice, Simulink disables all the blocks connected to the input and output stream of Variant Subsystem block. The disabled blocks are ignored from update diagram or simulation.

If you do not select this option, Simulink generates an error when there is no active Variant choice.

Dependencies

- The (default) option of Variant is not selected

- `Expression` option from **Variant control mode** is selected.

Programmatic Use
Parameter: `AllowZeroVariantControls`
Type: character vector
Value: `'off'` `'on'`
Default: `'off'`

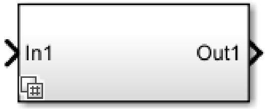
`Analyze all choices during update diagram and generate preprocessor conditionals` — Generate preprocessor conditionals

`off` (default) | `on`

When generating code for an ERT target, this parameter determines whether Variant choices are enclosed within C preprocessor conditional statements (`#if`).

When you select this option, Simulink analyzes all Variant choices during an update diagram or simulation. This analysis provides early validation of the code generation readiness of all Variant choices.

When you select this option, the Variant badge indicates the change.



Dependencies

- The check box is available for generating only ERT targets.
- `Expression` option from **Variant control mode** is selected.

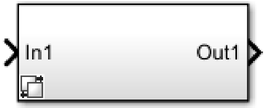
Programmatic Use
Parameter: `GeneratePreprocessorConditionals`
Type: character vector
Value: `'off'` `'on'`
Default: `'off'`

`Propagate conditions outside of Variant Subsystem` — Propagate Variant conditions outside of Variant Subsystem block

`off` (default) | `on`

When you select this option, Simulink propagates the Variant conditions outside of the Variant Subsystem block to determine which components of the model are active during simulation.

When you select this option, the Variant badge indicates the change.



Programmatic Use
Parameter: `PropagateVariantConditions`
Type: character vector
Value: `'off'` `'on'`
Default: `'off'`

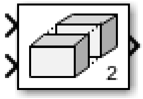
Vector Concatenate, Matrix Concatenate

Concatenate input signals of same data type to create contiguous output signal

Library: Simulink / Commonly Used Blocks
Simulink / Math Operations
Simulink / Signal Routing



Description

The Concatenate block concatenates the input signals to create an output signal whose elements reside in contiguous locations in memory.

Tip The Concatenate block is useful for creating an output signal that is nonvirtual. However, to create a vector of function calls, use a Mux block instead.

You use a Concatenate block to define an array of buses. For details about defining an array of buses, see “Combine Buses into an Array of Buses”.

The Concatenate block operates in either vector or multidimensional array concatenation mode, depending on the setting of its **Mode** parameter. In either case, the block concatenates the inputs from the top to bottom, or left to right, input ports.

Vector Mode

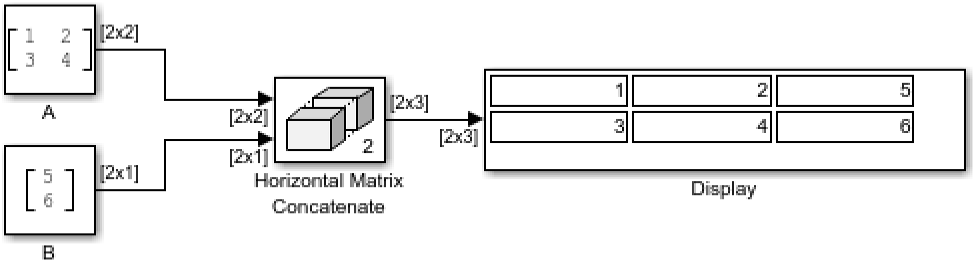
In vector mode, all input signals must be either vectors or row vectors (1-by-M matrices) or column vectors (M-by-1 matrices) or a combination of vectors and either row or column vectors. When all inputs are vectors, the output is a vector.

If any of the inputs are row or column vectors, the output is a row or column vector, respectively.

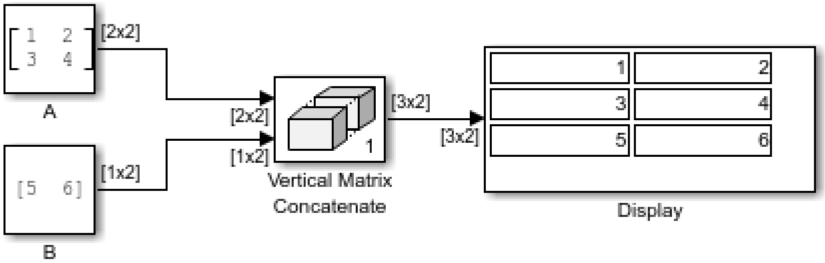
Multidimensional Array Mode

Multidimensional array mode accepts vectors and arrays of any size. It assumes that the trailing dimensions are all ones for input signals with lower dimensionality. For example, if the output is 4-D and the input is `[2x3]` (2-D), this block treats the input as `[2x3x1x1]`. The output is always an array. The **Concatenate dimension** parameter allows you to specify the output dimension along which the block concatenates its input arrays.

If you set the **Concatenate dimension** parameter to `2` and inputs are 2-D matrices, the block performs horizontal matrix concatenation and places the input matrices side-by-side to create the output matrix. For example, see the ex_concatenate_horizontal model:

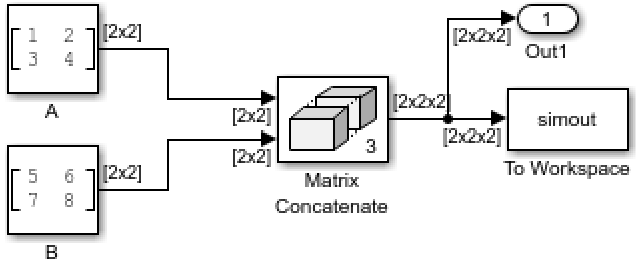


If you set the **Concatenate dimension** parameter to `1` and inputs are 2-D matrices, the block performs vertical matrix concatenation and stacks the input matrices on top of each other to create the output matrix. For example, see the ex_concatenate_vertical model:



For horizontal concatenation, the input matrices must have the same column dimension. For vertical concatenation, the input matrices must have the same row dimension. All input signals must have the same dimension for all dimensions other than the concatenation dimensions.

If you set the **Mode** parameter to `Multidimensional array`, the **Concatenate dimension** parameter to `3`, and the inputs are 2-D matrices, the block performs multidimensional matrix concatenation. For example, see the ex_concatenate_multidims model:



Ports

Input

`Port_1` — First input to concatenate

scalar | vector | matrix | N-D array

First input to concatenate, specified as a scalar, vector, matrix, or N-D array.

Dependencies

- Inputs must be of the same data type.
- Matrix and N-D array inputs are supported only when you set **Mode** to `Multidimensional array`.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

`Port_N` — Nth input to concatenate

scalar | vector | matrix | N-D array

Nth input to concatenate, specified as a scalar, vector, matrix, or N-D array.

Dependencies

- To enable this port, set **Number of inputs** to an integer greater than or equal to 2.
- Inputs must be of the same data type.
- Matrix and N-D array inputs are supported only when you set **Mode** to `Multidimensional array`.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Output

`Port_1` — Concatenation of input signals

scalar | vector | matrix | N-D array

Concatenation of input signals, along specified dimension. Outputs have the same data type as the input.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated`

Parameters

`Number of inputs` — Number of input ports

2 (default) | positive integer

Specify the number of inputs for the block as a real-valued, positive integer, less than or equal to 65536.

Programmatic Use

Block Parameter: `NumInputs`
Type: character vector
Values: positive integer
Default: `'2'`

`Mode` — Type of concatenation

`Vector` | `Multidimensional array`

Select the type of concatenation that this block performs. The default **Mode** of the Vector Concatenate block is `Vector`. The default **Mode** of the Matrix Concatenate block is `Multidimensional array`.

- When you select `Vector` the block performs vector concatenation (see “Vector Mode” on page 1-2187 for details).
- When you select `Multidimensional array`, the block performs matrix concatenation (see “Multidimensional Array Mode” on page 1-2188 for details).

Programmatic Use

Block Parameter: `Mode`
Type: character vector
Values: `'Vector' | 'Multidimensional array'`
Default: `'Vector'`

`Concatenate dimension` — Output dimension along which to concatenate input arrays

1 (default) | scalar integer

Specify the output dimension along which to concatenate the input arrays.

- To concatenate input arrays vertically, enter `1`.
- To concatenate input arrays horizontally, enter `2`.
- To perform multidimensional concatenation on the inputs, specify an integer greater than 2.

Dependencies

To enable this parameter, set **Mode** to `Multidimensional array`.

Programmatic Use

Block Parameter: `ConcatenateDimension`
Type: character vector
Values: scalar integer
Default: `'1'`

Block Characteristics

Data Types	`double` | `single` | `Boolean` | `base integer` | `fixed point` | `enumerated`
Direct Feedthrough	`No`

Multidimensional Signals	`No`
Variable-Size Signals	`Yes`
Zero-Crossing Detection	`No`

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

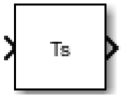
Weighted Sample Time

Support calculations involving sample time
Library: Simulink / Signal Attributes



Description

The Weighted Sample Time block outputs the weighted sample time or weighted sample rate. Because the Weighted Sample Time block is an implementation of the Weighted Sample Time Math, you can also add, subtract, multiply, or divide the input signal, `u`, by a weighted sample time, `Ts`. If the input signal is continuous, `Ts` is the sample time of the Simulink model. Otherwise, `Ts` is the sample time of the discrete input signal. If the input signal is constant, Simulink assigns a finite sample time to the block based on its connectivity and context.

You specify the math operation with the **Operation** parameter. The block can output just a weighted sample time (`Ts Only`) or a weighted sample rate (`1/Ts Only`).

Enter the weighting factor in the **Weight value** parameter. If the weight, `w`, is `1`, that value does not appear in the equation on the block icon.

Tip You can use the Weighted Sample Time and Weighted Sample Time Math blocks to extract the sample time from a Simulink signal. To do so, set the **Operation** parameter to `Ts` and the **Weight value** to `1.0`. In this configuration, the block outputs the sample time of the input signal.

The block computes its output using the precedence rules for MATLAB operators (see “Operator Precedence” (MATLAB) in the MATLAB documentation). For example, if the **Operation** parameter specifies `+`, the block calculates output using this equation:

```
u + (Ts * w)
```

However, if the **Operation** parameter specifies `/`, the block calculates output using this equation:

```
(u / Ts) / w
```

Ports

Input

`Port_1` — Input signal

scalar | vector | matrix

Specify the input signal, `u` as a scalar, vector, or matrix. Depending on the value of the **Operation** parameter, the block can add, subtract, multiply or divide the input signal by weighted sample time or just output the weighted sample time or weighted sample rate.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `bus`

Output

`Port_1` — Output signal

scalar | vector | matrix

Output the weighted sample time or sample rate of the input signal, or output the input signal adjusted by the weighted sample time, `Ts`. If the input signal is continuous, `Ts` is the sample time of the Simulink model. Otherwise, `Ts` is the sample time of the discrete input signal. When the input signal is constant, Simulink assigns a finite sample time to the block based on its connectivity and context.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `bus`

Parameters

Main

`Operation` — Math operation

`Ts Only` (default) | `+` | `-` | `*` | `/` | `1/Ts Only`

Specify the operation to use for adjusting the input signal. You can select: `+`, `-`, `*`, `/`, `Ts Only`, or `1/Ts Only`.

Programmatic Use
Block Parameter: `TsamMathOp`
Type: character vector
Values: `'+' | '-' | '*' | '/' | 'Ts Only' | '1/Ts Only'`
Default: `'Ts Only'`

`Weight value` — Weight of sample time

`1.0` (default) | real-valued scalar

Enter the weight of the sample time as a real-valued scalar.

Programmatic Use
Block Parameter: `weightValue`
Type: character vector
Values: real-valued scalar
Default: `'1.0'`

`Implement using` — Method for adjusting sample time

`Online Calculations` (default) | `Offline Scaling Adjustment`

Select one of two modes: online calculations or offline scaling adjustment.

Result of (Ts * w)	Output Data Type of Two Modes	Block Execution
A power of 2, or an integer value	The same, when **Output data type** is `Inherit: Inherit via internal rule`	Equally efficient in both modes
Not power of 2 and not an integer value	Different	More efficient for the offline scaling mode

Note When the **Implement using** parameter is not visible, operations default to online calculations.

Dependencies

To enable this parameter, set **Operation** to `*` or `/`.

Programmatic Use

Block Parameter: `TsampMathImp`
Type: character vector
Values: `'Online Calculations' | 'Offline Scaling Adjustment'`
Default: `'Online Calculations'`

Signal Attributes

`Output data type` — Data type of output signal

`Inherit: Inherit via internal rule` (default) | `Inherit: Inherit via back propagation` | `<data type expression>`

Specify the data type for the output.

Programmatic Use

Block Parameter: `OutDataTypeStr`
Type: character vector
Values: `'Inherit: Inherit via internal rule` | `'Inherit: Inherit via back propagation'` | `'<data type expression>'`
Default: `'Inherit: Inherit via internal rule'`

`Integer rounding mode` — Rounding mode for fixed-point operations

`Floor` (default) | `Ceiling` | `Convergent` | `Nearest` | `Round` | `Simplest` | `Zero`

Specify the rounding mode for fixed-point operations. For more information, see “Rounding” (Fixed-Point Designer).

Block parameters always round to the nearest representable value. To control the rounding of a block parameter, enter an expression using a MATLAB rounding function into the mask field.

Dependencies

To enable this parameter, set **Operation** to `+`, `-`, `*`, or `/`. If you set the **Operation** parameter to `*` or `/`, you must also set **Implement using** to `Online Calculations`.

Programmatic Use

Block Parameter: `RndMeth`
Type: character vector
Values: `'Ceiling' | 'Convergent' | 'Floor' | 'Nearest' | 'Round' | 'Simplest' | 'Zero'`
Default: `'Floor'`

`Saturate on integer overflow` — Method of overflow action

`off` (default) | `on`

Specify whether overflows saturate or wrap.

Action	Rationale	Impact on Overflows	Example
Select this check box (`on`).	Your model has possible overflow, and you want explicit saturation protection in the generated code.	Overflows saturate to either the minimum or maximum value that the data type can represent.	The maximum value that the `int8` (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box selected, the block output saturates at 127. Similarly, the block output saturates at a minimum output value of -128.
Do not select this check box (`off`).	You want to optimize efficiency of your generated code. You want to avoid overspecifying how a block handles out-of-range signals. For more information, see “Check for Signal Range Errors”.	Overflows wrap to the appropriate value that is representable by the data type.	The maximum value that the `int8` (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box cleared, the software interprets the overflow-causing value as `int8`, which can produce an unintended result. For example, a block result of 130 (binary 1000 0010) expressed as `int8`, is -126.

When you select this check box, saturation applies to every internal operation on the block, not just the output, or result. Usually, the code generation process can detect when

overflow is not possible. In this case, the code generator does not produce saturation code.

Dependencies

To enable this parameter, set **Operation** to `+`, `-`, `*`, or `/`. If you set the **Operation** parameter to `*` or `/`, you must also set **Implement using** to `Online Calculations`.

Programmatic Use

Block Parameter: `SaturateOnIntegerOverflow`
Type: character vector
Values: `'off' | 'on'`
Default: `'off'`

Block Characteristics

Data Types	`double` | `single` | `Boolean` | `base integer` | `fixed point`
Direct Feedthrough	`Yes`
Multidimensional Signals	`No`
Variable-Size Signals	`No`
Zero-Crossing Detection	`No`

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Fixed-Point Conversion

Convert floating-point algorithms to fixed point using Fixed-Point Designer™.

Waveform Generator

Output waveforms using signal notations

Description

The Waveform Generator block outputs waveforms based on signal notations that you enter in the **Waveform Definition** table.

This block supports these syntaxes for the signal notations:

- Function syntax — Specify all arguments in the specific order for the signal syntax (see “Algorithms” on page 1-2210).
- Name-value syntax — Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (`' '`). You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`. For more information, see “Algorithms” on page 1-2210.

This block supports normal, accelerator, and rapid accelerator modes and fast restart.

Supported Operators

Operation	Operator
Absolute value	`abs()`
Addition	`+`
Division	`/`
Multiplication	`*`
Parentheses	`()`
Subtraction	`-`
Unary minus	`-`

The Waveform block observes the following rules of operator precedence:

1 `( )`

2 `+ -` (unary)

3 `* /`

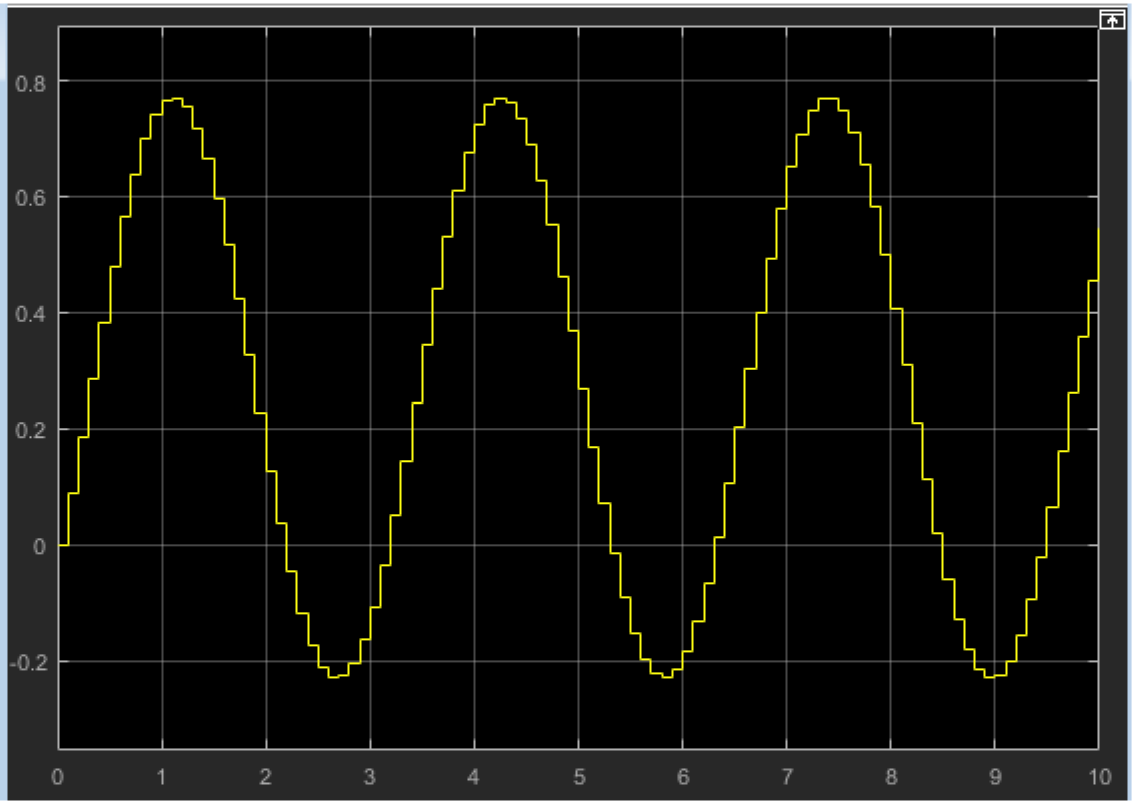
4 `+ -`

Supported Operations

The Waveform Generator block outputs one signal at a time. You can change this output signal. Express frequency and phase offset parameters in radians. You can also:

- Nest signal notations, for example:

  ```
  sin('Amplitude',sin('Amplitude',1,'Frequency',1,'Phase',0),'Frequency',1,'Phase',1)
  ```



- Reference real scalar variables in the base or model workspace, for example:

  ```
  sin('Amplitude',x,'Frequency',y,'Phase',z)
  ```

  x, *y*, and *z* exist in the base workspace.

For more information on waveforms, see the Algorithms section.

To quickly determine the response of a system to different types of inputs, you can vary the output signal of the Waveform Generator block while a simulation is in progress.

Limitations

- You cannot tune the parameters of a waveform, such as frequency or amplitude, during execution of the code that you generate by using Simulink Coder. Instead, you can generate code that enables you to switch between waveform variants that you specify. For more information, see “Switch Between Output Waveforms During Code Execution for Waveform Generator Block” (Simulink Coder).

Ports

Output

`Port_1` — Generated output signal

scalar | vector

Output signal specified by an entry in the **Waveform Definition** table.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `bus`

Parameters

Main

`Output Signal` — Waveform for output signal

1 (default) | integer

Select waveform definition to specify the output signal. The number corresponds to the line item in the **Waveform Definition** table. You can change this parameter while a simulation is running.

Programmatic Use
Block Parameter: `SelectedSignal`
Type: character vector
Values: scalar
Default: `'1'`

`Waveform Definition` — Waveform signal notations

constant | `gaussian(mean,variance,seed)` | `pulse(amplitude,trigger_time,duration)` | `sawtooth(amplitude,frequence,phase_offset)` | `sin(amplitude,frequence,phase_offset)` | `square(amplitude,frequence,phase_offset)` | `step(step_time,initial_value,final_value)`

Enter signal notations in the **Waveform Definition** table, one waveform definition per line. For syntax details, see Algorithms.

Signal Attributes

Click the **Show data type assistant** button >> to display the **Data Type Assistant**, which helps you set the data type attributes. For more information, see “Specify Data Types Using Data Type Assistant”.

`Output minimum` — Minimum output value for range checking

`[]` (default) | scalar

Lower value of the output range that Simulink checks.

Simulink uses the minimum to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
- Simulation range checking (see “Signal Ranges” and “Enable Simulation Range Checking”).
- Automatic scaling of fixed-point data types.

- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Simulink Coder).

Note **Output minimum** does not saturate or clip the actual output signal. Use the Saturation block instead.

Programmatic Use
Block Parameter: `OutMin`
Type: character vector
Values: `'[ ]'`| scalar
Default: `'[ ]'`

`Output maximum` — Maximum output value for range checking

[ ] (default) | scalar

Upper value of the output range that Simulink checks.

Simulink uses the maximum value to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
- Simulation range checking (see “Signal Ranges” and “Enable Simulation Range Checking”).
- Automatic scaling of fixed-point data types.
- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Simulink Coder).

Note **Output maximum** does not saturate or clip the actual output signal. Use the Saturation block instead.

Programmatic Use
Block Parameter: `OutMax`
Type: character vector

Values: `'[ ]'` | scalar
Default: `'[ ]'`

`Output data type` — Specify the output data type

`double` (default) | `Inherit: Inherit via back propagation` | `single` | `int8` | `int32` | `uint32` | `fixdt(1,16,2^0,0)` | `<data type expression>` | ...

Choose the data type for the output. The type can be inherited, specified directly, or expressed as a data type object such as `Simulink.NumericType`.

Programmatic Use
Block Parameter: `OutDataTypeStr`
Type: character vector
Values: , `'Inherit: Inherit via back propagation'`, `'single'`, `'int8'`, `'uint8'`, `int16`, `'uint16'`, `'int32'`, `'uint32'`, `fixdt(1,16,0)`, `fixdt(1,16,2^0,0)`, `fixdt(1,16,2^0,0)`. `'<data type expression>'`
Default: `'Double'`

`Lock output data type setting against changes by the fixed-point tools` — Prevent fixed-point tools from overriding data types

`off` (default) | `on`

Select to lock the output data type setting of this block against changes by the Fixed-Point Tool and the Fixed-Point Advisor. For more information, see “Use Lock Output Data Type Setting” (Fixed-Point Designer).

Programmatic Use
Block Parameter: `LockScale`
Type: character vector
Values: `'off'` | `'on'`
Default: `'off'`

`Lock data type settings against changes by the fixed-point tools` — Prevent fixed-point tools from overriding data types

`off` (default) | `on`

Select to lock data type settings of this block against changes by the Fixed-Point Tool and the Fixed-Point Advisor. For more information, see “Lock the Output Data Type Setting” (Fixed-Point Designer).

Programmatic Use
Block Parameter: `LockScale`

Values: 'off' | 'on'
Default: 'off'

Integer rounding mode — Specify the rounding mode for fixed-point operations
Floor (default) | Ceiling | Convergent | Nearest | Round | Simplest | Zero

Choose one of these rounding modes.

Ceiling

Rounds both positive and negative numbers toward positive infinity. Equivalent to the MATLAB ceil function.

Convergent

Rounds number to the nearest representable value. If a tie occurs, rounds to the nearest even integer. Equivalent to the Fixed-Point Designer convergent function.

Floor

Rounds both positive and negative numbers toward negative infinity. Equivalent to the MATLAB floor function.

Nearest

Rounds number to the nearest representable value. If a tie occurs, rounds toward positive infinity. Equivalent to the Fixed-Point Designer nearest function.

Round

Rounds number to the nearest representable value. If a tie occurs, rounds positive numbers toward positive infinity and rounds negative numbers toward negative infinity. Equivalent to the Fixed-Point Designer round function.

Simplest

Automatically chooses between round toward floor and round toward zero to generate rounding code that is as efficient as possible.

Zero

Rounds number toward zero. Equivalent to the MATLAB fix function.

Programmatic Use
Block Parameter: RndMeth
Type: character vector
Values: 'Ceiling' | 'Convergent' | 'Floor' | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
Default: 'Floor'

See Also

For more information, see “Rounding” (Fixed-Point Designer).

`Saturate on integer overflow` — Method of overflow action

`off` (default) | `on`

Specify whether overflows saturate or wrap.

Action	Rationale	Impact on Overflows	Example
Select this check box (`on`).	Your model has possible overflow, and you want explicit saturation protection in the generated code.	Overflows saturate to either the minimum or maximum value that the data type can represent.	The maximum value that the `int8` (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box selected, the block output saturates at 127. Similarly, the block output saturates at a minimum output value of -128.

Action	Rationale	Impact on Overflows	Example
Do not select this check box (`off`).	You want to optimize efficiency of your generated code. You want to avoid overspecifying how a block handles out-of-range signals. For more information, see “Check for Signal Range Errors”.	Overflows wrap to the appropriate value that is representable by the data type.	The maximum value that the `int8` (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box cleared, the software interprets the overflow-causing value as `int8`, which can produce an unintended result. For example, a block result of 130 (binary 1000 0010) expressed as `int8`, is -126.

When you select this check box, saturation applies to every internal operation on the block, not just the output, or result. Usually, the code generation process can detect when overflow is not possible. In this case, the code generator does not produce saturation code.

Programmatic Use
Block Parameter: `SaturateOnIntegerOverflow`
Type: character vector
Values: `'off' | 'on'`
Default: `'off'`

`Sample time` — Time interval between samples

`0.1` (default) | scalar

Specify the time interval between samples. To inherit the sample time, set this parameter to `-1`. See “Specify Sample Time” for more information.

Programmatic Use
Block Parameter: `SampleTime`
Type: character vector
Values: scalar

Default: `'0.1'`

Algorithms

Enter signal notations in the **Waveform Definition** table, one waveform definition per line. To add a waveform definition, click **Add**. The new waveform appears as an empty character vector. The block interprets empty character vectors or white space character vectors as ground.

To remove a waveform definition, click **Remove**. You can select multiple waveforms using **Ctrl+**click or **Shift+**click.

Constant

Constant values can be:

- Numbers
- Workspace variables
  - Scalar, real variables only
- Built-in MATLAB constant, `pi`

- `1`
- `1.1`
- `x`
- `pi`

Gaussian Noise

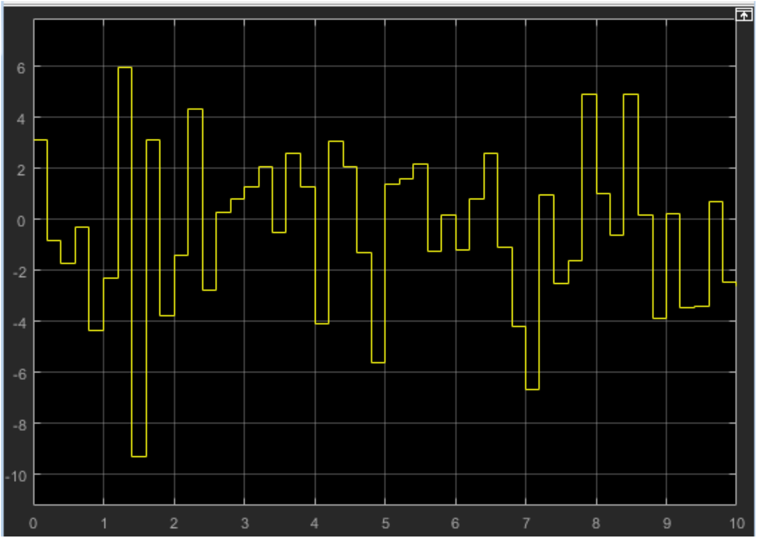
```
gaussian(mean,variance,seed)
```

```
gaussian('Mean',mean,'Variance',variance,'Seed',seed)
```

- `mean` — Mean value of the random variable output.

  - Default: 0
- `variance` — Standard deviation squared of the random variable output.
  - Default: 1
  - Value: Positive constant or positive real scalar variable
- `seed` — Initial seed value for the random number generator.
  - Default: 0
  - Value: Constant or real scalar variable

```
gaussian('Mean',0,'Variance',10,'Seed',1)
```



Pulse

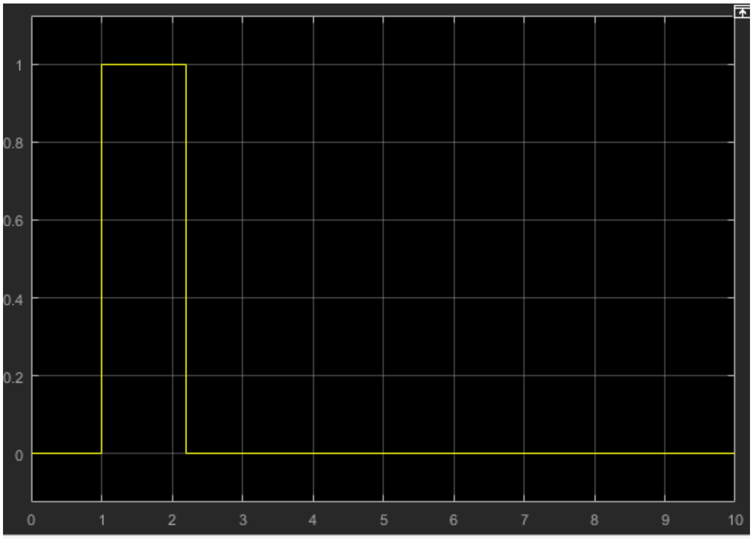
```
pulse(amplitude,trigger_time,duration)
```

```
pulse('Amplitude',amplitude,'TriggerTime',trigger_time,'Duration',duration)
```

- `amplitude` — Value of signal when pulse is high.

  - Default: 1
- `trigger_time` — Elapsed simulation time when signal changes to amplitude, in seconds.
  - Default: 1
  - Value: Constant or real scalar variable
- `duration` — How long the signal remains at the given amplitude before returning to ground, in seconds.
  - Default: 1
  - Value: Positive constant or positive real scalar variable

```
pulse('Amplitude',1,'TriggerTime',1,'Duration',1)
```



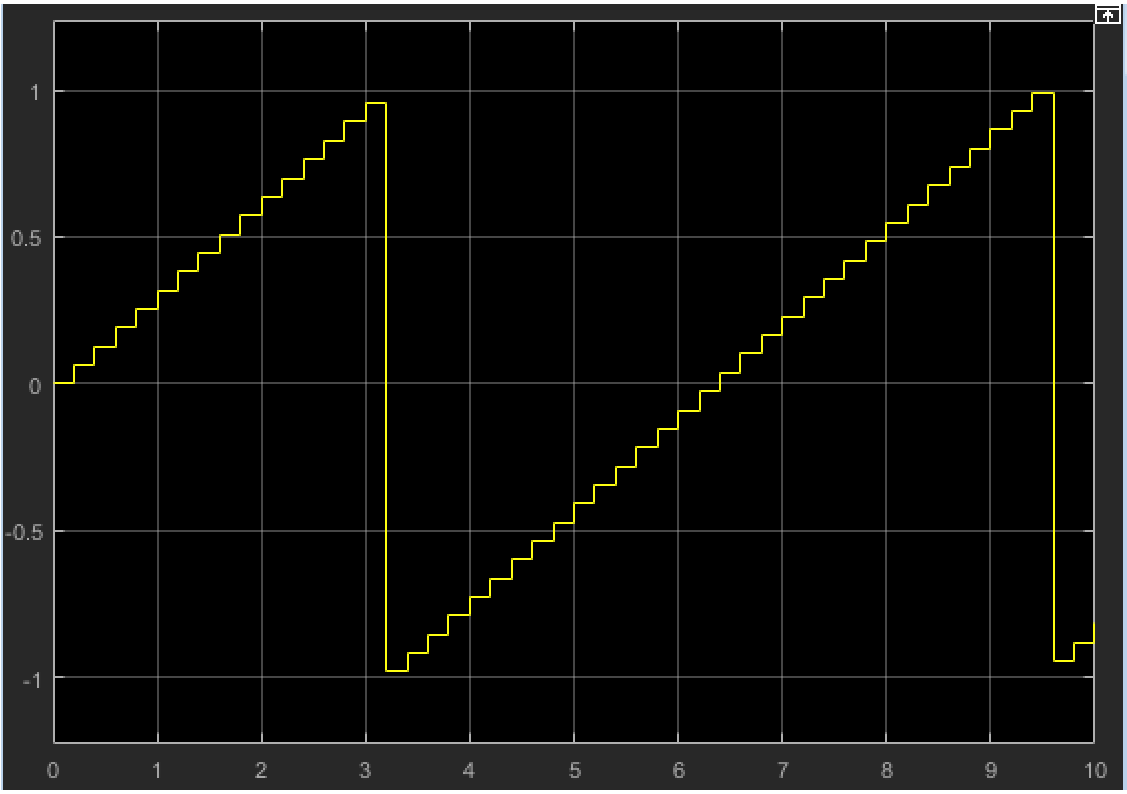
Sawtooth

```
sawtooth(amplitude,frequency,phase_offset)
```

```
sawtooth('Amplitude',amplitude,'Frequency',frequency,'Phase',phase_offset)
```

- `amplitude` — Sawtooth peak value.
  - Default: 1
- `frequency` — Waveform frequency, in rad/s.
  - Default: 1
- `phase_offset` — Horizontal signal shift, based on elapsed simulation time, in seconds.
  - Default: 0

```
sawtooth('Amplitude',1,'Frequency',1,'Phase',0)
```



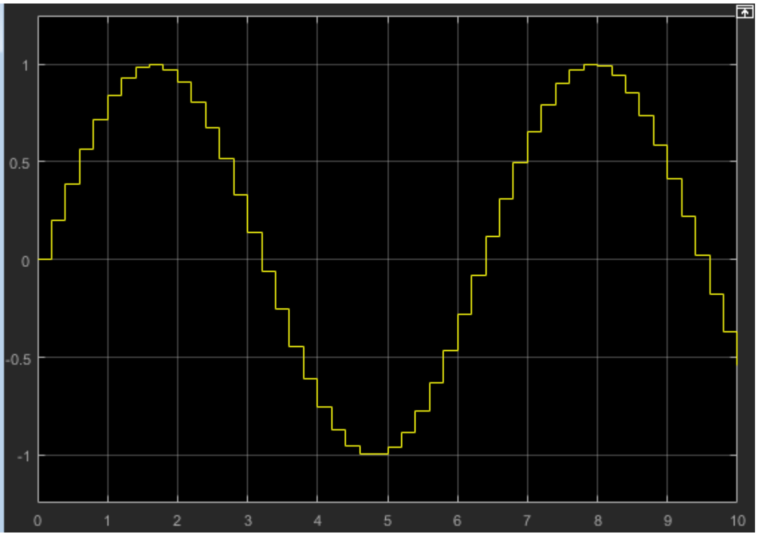
Sine Wave

```
sin(amplitude,frequency,phase_offset)
```

```
sin('Amplitude',amplitude,'Frequency',frequency,'Phase',phase_offset)
```

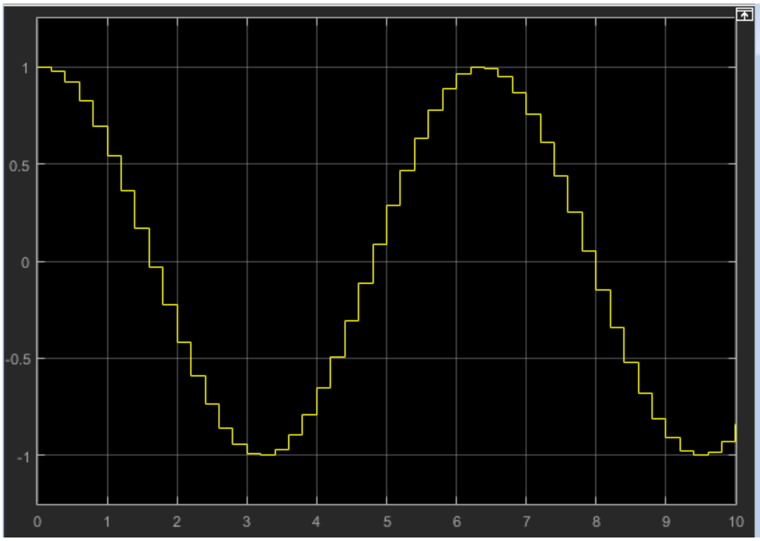
- `amplitude` — Amplitude of sine wave.
  - Default: 1
- `frequency` — Waveform frequency, in rad/s.
  - Default: 1
- `phase_offset` — Phase offset, in rads.
  - Default: 0

```
sin('Amplitude',1,'Frequency',1,'Phase',0)
```



To get the cosine waveform:

```
sin('Amplitude',1,'Frequency',1,'Phase',pi/2)
```



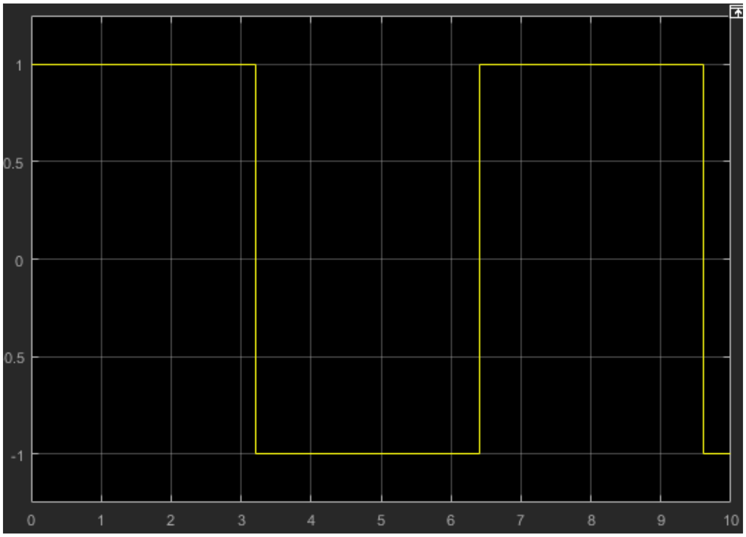
Square

```
square(amplitude,frequency,phase_delay,duty_cycle)

square('Amplitude',amplitude,'Frequency',frequency,'Phase',phase_delay,...
'DutyCycle',duty_cycle)
```

- `amplitude` — Amplitude of signal.
  - Default: 1
- `frequency` — Waveform frequency in rad/s.
  - Default: 1
- `phase_delay` — Horizontal signal shift based on elapsed simulation time, in seconds.
  - Default: 0
- `duty_cycle` — Percentage of high signal per period (0–100%). The block clips the minimum signal to 0% and the maximum signal to 100%.
  - Default: 50

```
square('Amplitude',1,'Frequency',1,'Phase',0,'DutyCycle',50)
```



Step

```
step(step_time,initial_value,final_value)
```

```
step('StepTime',step_time,'InitialValue',initial_value,'FinalValue',final_value)
```

- `step_time` — Elapsed simulation time when signal changes from `initial value` to `final value`, in seconds.
  - Default: 1
  - Value: Constant or positive real scalar variable.
- `initial_value` — Value of signal when elapsed simulation time is less than `step_time`, in seconds.
  - Default: 0
- `final_value` — Value of signal when elapsed simulation time is greater than or equal to step time, in seconds.

- Default: 1

```
step('StepTime',1,'InitialValue',0,'FinalValue',1)
```

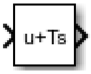
Weighted Sample Time Math

Support calculations involving sample time

Library: Simulink / Math Operations



Description

The Weighted Sample Time Math block adds, subtracts, multiplies, or divides its input signal, `u`, by a weighted sample time, `Ts`. If the input signal is continuous, `Ts` is the sample time of the Simulink model. Otherwise, `Ts` is the sample time of the discrete input signal. If the input signal is constant, Simulink assigns a finite sample time to the block based on its connectivity and context.

You specify the math operation with the **Operation** parameter. The block can output just a weighted sample time (`Ts Only`) or a weighted sample rate (`1/Ts Only`).

Enter the weighting factor in the **Weight value** parameter. If the weight, `w`, is `1`, that value does not appear in the equation on the block icon.

Tip You can use the Weighted Sample Time and Weighted Sample Time Math blocks to extract the sample time from a Simulink signal. To do so, set the **Operation** parameter to `Ts` and the **Weight value** to `1.0`. In this configuration, the block outputs the sample time of the input signal.

The block computes its output using the precedence rules for MATLAB operators (see “Operator Precedence” (MATLAB) in the MATLAB documentation). For example, if the **Operation** parameter specifies `+`, the block calculates output using this equation:

```
u + (Ts * w)
```

However, if the **Operation** parameter specifies `/`, the block calculates output using this equation:

```
(u / Ts) / w
```

Ports

Input

`Port_1` — Input signal

scalar | vector | matrix

Specify the input signal, `u` as a scalar, vector, or matrix. Depending on the value of the **Operation** parameter, the block can add, subtract, multiply or divide the input signal by weighted sample time or just output the weighted sample time or weighted sample rate.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `bus`

Output

`Port_1` — Output signal

scalar | vector | matrix

Output the weighted sample time or sample rate of the input signal, or output the input signal adjusted by the weighted sample time, `Ts`. If the input signal is continuous, `Ts` is the sample time of the Simulink model. Otherwise, `Ts` is the sample time of the discrete input signal. When the input signal is constant, Simulink assigns a finite sample time to the block based on its connectivity and context.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `bus`

Parameters

Main

`Operation` — Math operation

`+` (default) | `-` | `*` | `/` | `Ts Only` | `1/Ts Only`

Specify the operation to use for adjusting the input signal. You can select: `+`, `-`, `*`, `/`, `Ts Only`, or `1/Ts Only`.

Programmatic Use

Block Parameter: `TsamMathOp`
Type: character vector
Values: `'+'` | `'-'` | `'*'` | `'/'` | `'Ts Only'` | `'1/Ts Only'`
Default: `'+'`

`Weight value` — Weight of sample time

`1.0` (default) | real-valued scalar

Enter the weight of the sample time as a real-valued scalar.

Programmatic Use

Block Parameter: `weightValue`
Type: character vector
Values: real-valued scalar
Default: `'1.0'`

`Implement using` — Method for adjusting sample time

`Online Calculations` (default) | `Offline Scaling Adjustment`

Select one of two modes: online calculations or offline scaling adjustment.

Result of (Ts * w)	Output Data Type of Two Modes	Block Execution
A power of 2, or an integer value	The same, when **Output data type** is `Inherit: Inherit via internal rule`	Equally efficient in both modes
Not power of 2 and not an integer value	Different	More efficient for the offline scaling mode

Note When the **Implement using** parameter is not visible, operations default to online calculations.

Dependencies

To enable this parameter, set **Operation** to `*` or `/`.

Programmatic Use
Block Parameter: `TsampMathImp`
Type: character vector
Values: `'Online Calculations' | 'Offline Scaling Adjustment'`
Default: `'Online Calculations'`

Signal Attributes

`Output data type` — Data type of output signal

`Inherit: Inherit via internal rule` (default) | `Inherit: Inherit via back propagation` | `<data type expression>`

Specify the data type for the output.

Programmatic Use
Block Parameter: `OutDataTypeStr`
Type: character vector
Values: `'Inherit: Inherit via internal rule` | `'Inherit: Inherit via back propagation'` | `'<data type expression>'`
Default: `'Inherit: Inherit via internal rule'`

`Integer rounding mode` — Rounding mode for fixed-point operations

`Floor` (default) | `Ceiling` | `Convergent` | `Nearest` | `Round` | `Simplest` | `Zero`

Specify the rounding mode for fixed-point operations. For more information, see “Rounding” (Fixed-Point Designer).

Block parameters always round to the nearest representable value. To control the rounding of a block parameter, enter an expression using a MATLAB rounding function into the mask field.

Dependencies

To enable this parameter, set **Operation** to `+`, `-`, `*`, or `/`. If you set the **Operation** parameter to `*` or `/`, you must also set **Implement using** to `Online Calculations`.

Programmatic Use
Block Parameter: `RndMeth`
Type: character vector
Values: `'Ceiling' | 'Convergent' | 'Floor' | 'Nearest' | 'Round' | 'Simplest' | 'Zero'`
Default: `'Floor'`

`Saturate on integer overflow` — Method of overflow action

`off` (default) | `on`

Specify whether overflows saturate or wrap.

Action	Rationale	Impact on Overflows	Example
Select this check box (`on`).	Your model has possible overflow, and you want explicit saturation protection in the generated code.	Overflows saturate to either the minimum or maximum value that the data type can represent.	The maximum value that the `int8` (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box selected, the block output saturates at 127. Similarly, the block output saturates at a minimum output value of -128.
Do not select this check box (`off`).	You want to optimize efficiency of your generated code. You want to avoid overspecifying how a block handles out-of-range signals. For more information, see “Check for Signal Range Errors”.	Overflows wrap to the appropriate value that is representable by the data type.	The maximum value that the `int8` (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box cleared, the software interprets the overflow-causing value as `int8`, which can produce an unintended result. For example, a block result of 130 (binary 1000 0010) expressed as `int8`, is -126.

When you select this check box, saturation applies to every internal operation on the block, not just the output, or result. Usually, the code generation process can detect when

overflow is not possible. In this case, the code generator does not produce saturation code.

Dependencies

To enable this parameter, set **Operation** to `+`, `-`, `*`, or `/`. If you set the **Operation** parameter to `*` or `/`, you must also set **Implement using** to `Online Calculations`.

Programmatic Use
Block Parameter: `SaturateOnIntegerOverflow`
Type: character vector
Values: `'off' | 'on'`
Default: `'off'`

Block Characteristics

Data Types	double | single | Boolean | base integer | fixed point
Direct Feedthrough	Yes
Multidimensional Signals	No
Variable-Size Signals	No
Zero-Crossing Detection	No

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Fixed-Point Conversion

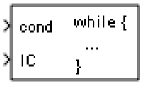
While Iterator

Repeat execution of a subsystem while a logical expression is true
Library: Ports & Subsystems



Description

The While Iterator block, when placed in a Subsystem block, repeatedly executes the contents of the subsystem during the current time step while the value of the input condition is true or `1`. Use this block to implement the block diagram equivalent of a `while` loop in a programming language.

The While Iterator Subsystem block is preconfigured with a While Iterator block. Placing a While Iterator block in a Subsystem block makes it an atomic subsystem.

Ports

Input

cond — Logical condition signal
scalar

Signal with the result from evaluating a logical condition. Because the subsystem is not externally triggered during a time step, evaluating a condition as true (`1`) or false (`0`) must reside within the subsystem.

The data type and values of the signal can be:

- Logical (Boolean) — true (`1`) or false (`0`) .
- Numerical — true (any positive or negative number) or false (`0`).

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point`

`IC` — Initial logical condition
scalar

Signal with the initial logical condition. At the beginning of each time step:

- If `IC` is false (`0`), the subsystem does not execute during the time step.
- If `IC` is true (value not equal to `0`), the subsystem starts executing and continues to repeat execution as long as the `cond` signal is true.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point`

Output Arguments

`Iteration number` — Signal with the number of iterations
scalar

Signal with the number of While Iterator Subsystem block executions during each time step.

Data Types: `double` | `int8` | `int16` | `int32`

Parameters

`Maximum number of iterations` — Specify maximum number of iterations
`-1` (default) | integer

Specify maximum number of iterations allowed during a time step.

`-1`

Any number of iterations as long as the `cond` signal is true (value not equal to `0`) . If you specify `-1` and the `cond` signal never becomes false (`0`), the simulation runs in an infinite loop. In this case, the only way to stop the simulation is to terminate MATLAB.

integer

Maximum number of iterations during a time step.

Programmatic Use
Block Parameter: `MaxIters`
Type: character vector
Values: `'5'` | `'-1'` | `'<integer>'`
Default: `'5'`

`While loop type` — Select type of block

`while` (default) | `do-while`

Select type of block.

`while`

> The While Iterator block has two inputs, a `cond` (logical condition) input and an `IC` (initial logical condition) input. The source of the `IC` signal must be external to the While Iterator Subsystem block.
>
> At the beginning of each time step:
>
> - If the `IC` input is true (value not equal to `0`), the blocks in the subsystem repeat execution while the `cond` input is true. This process continues during a time step as long as the `cond` input is true and the number of iterations is less than or equal to the **Maximum number of iterations**.
> - If the `IC` input is false, the While Iterator block does not execute the contents of the subsystem.

`do-while`

> The While Iterator block has one input, the `cond` (while condition) input.
>
> At each time step, the blocks in the subsystem repeat execution while the `cond` input is true (value not equal to `0`). This process continues as long as the `cond` input is true and the number of iterations is less than or equal to the **Maximum number of iterations**.

Programmatic Use
Block Parameter: `WhileBlockType`
Type: character vector
Values: `'while'` | `'do-while'`
Default: `'while'`

`States when starting` — Select block states between time steps

`held` (default) | `reset`

Select how to handle block states between time steps.

`held`

Hold block states between time steps. Block state values persist across time steps.

`reset`

Reset block states to their initial values at the beginning of each time step and before the first iteration loop.

Programmatic Use
Block Parameter: `ResetStates`
Type: character vector
Values: `'held'` | `'reset'`
Default: `'held'`

`Show iteration number port` — Control display of output port

clear | select

Control display of output port for signal with number of block executions. The value of the signal from this port starts at `1`and is incremented by `1` for each succeeding iteration.

☐ off

Remove output port.

☑ on

Display output port for signal with iteration number.

Dependencies

Selecting this parameter enables the **Output data type** parameter.

Programmatic Use
Block Parameter: `ShowIterationPort`
Type: character vector
Values: `'off'` | `'on'`
Default: `'off'`

`Output data type` — Select output data type for current iteration number

`int32` (default) | `int16` | `int8` | `double`

Select output data type for iteration number signal. The value of this signal is the number of iterations during a time step and the total number of iterations at the end of a time step.

`int32`

Signed 32-bit integer.

`int16`

Signed 16-bit integer.

`int8`

Signed 8-bit integer.

`double`

Double-precision floating point.

Dependencies

Select the **Show iteration number port** check box to enable this parameter.

Programmatic Use

Block Parameter: `OutputDataType`
Type: character vector
Value: `'int32'` | `'int16'` | `'int8'` | `'double'`
Default: `'int32'`

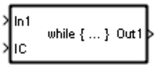
Iterator Subsystem Execution

Introduced before R2006a

While Iterator Subsystem

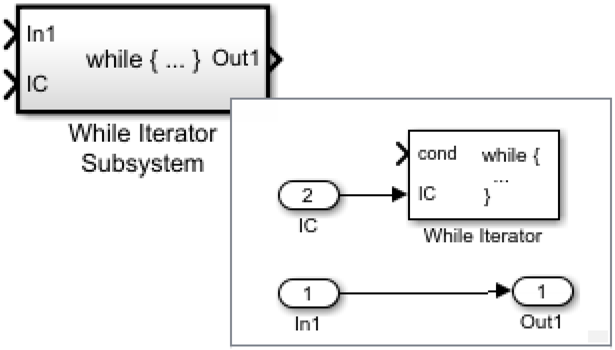
Subsystem that repeats execution during a simulation time step

Library: Simulink / Ports & Subsystems



Description

The While Iterator Subsystem block is a Subsystem block preconfigured as a starting point for creating a subsystem that repeats execution during a simulation time step while a logical condition is `true`.



Use While Iterator Subsystem blocks to model:

- Block diagram equivalent of a program `while` or `do-while` loop.
- An iterative algorithm that converges on a more accurate solution after multiple iterations.

When using simplified initialization mode, if you place a block that needs elapsed time (such as a Discrete-Time Integrator block) in a While Iterator Subsystem block, Simulink displays an error.

If the output signal from a While Iterator Subsystem block is a function-call signal, Simulink displays an error when you simulate the model or update the diagram.

Ports

Input

`In1` — Signal input to a subsystem block

scalar | vector | matrix

Placing an Inport block in a subsystem block adds an external input port to the block. The port label matches the name of the Inport block.

Use Inport blocks to get signals from the local environment.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

`IC (initial logical condition)` — Control initial execution of a subsystem block

scalar

Placing a While Iterator block connected to an Input block in a Subsystem block adds this external input port to the block.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point`

Output

`Out` — Signal output from a subsystem

scalar | vector | matrix

Placing an Outport block in a subsystem block adds an output port from the block. The port label on the subsystem block is the name of the Outport block.

Use Outport blocks to send signals to the local environment.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Block Characteristics

Data Types	double[a] | single[a] | Boolean[a] | base integer[a] | fixed point[a] | enumerated[a] | bus[a] | string[a]
Direct Feedthrough	No
Multidimensional Signals	Yes[a]
Variable-Size Signals	Yes[a]
Zero-Crossing Detection	No

[a] Actual data type or capability support depends on block implementation.

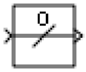
Width

Output width of input vector

Library: Simulink / Signal Attributes



Description

The Width block generates as output the width of its input vector.

You can use an array of buses as an input signal to a Width block. For details about defining and using an array of buses, see “Combine Buses into an Array of Buses”.

Ports

Input

`Port_1` — Input signal

scalar | vector | matrix | N-D array

Input signal specified as a scalar, vector, matrix, or N-D array.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Output

`Port_1` — Width of input signal

scalar

Output is the width of the input signal, specified as a scalar.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Parameters

Output data type mode — Output data type mode
Choose intrinsic data type (default) | Inherit via back propagation | All ports same datatype

Specify the output data type to be the same as the input, or inherit the data type by back propagation. You can also choose to specify a built-in data type from the drop-down list in the **Output data type** parameter.

Programmatic Use
Block Parameter: OutputDataTypeScalingMode
Type: character vector
Values: 'Choose intrinsic data type' | 'Inherit via back propagation' | 'All ports same datatype'
Default: 'Choose intrinsic data type'

Output data type — Output data type
double (default) | single | int8 | uint8 | int16 | uint16 | int32 | uint32

This parameter is visible when you select Choose intrinsic data type for **Output data type mode**. Select a built-in data type from the drop-down list.

Programmatic Use
Block Parameter: DataType
Type: character vector
Values: 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32'
Default: 'double'

Block Characteristics

Data Types	double | single | Boolean | base integer | fixed point | enumerated | bus | string

Direct Feedthrough	`Yes`
Multidimensional Signals	`Yes`
Variable-Size Signals	`Yes`
Zero-Crossing Detection	`No`

Extended Capabilities

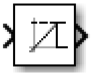
Wrap To Zero

Set output to zero if input is above threshold
Library: Simulink / Discontinuities



Description

The Wrap To Zero block sets the output to zero when the input is above the **Threshold** value. When the input is less than or equal to the **Threshold**, then the output is equal to the input.

Ports

Input

`Port_1` — Input signal
scalar | vector

Example:

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point`

Output

`Port_1` — Output signal
scalar | vector

Output signal set to the input signal value or zero. The data type of the output is the same data type as the input.

Tip If the input data type cannot represent zero, parameter overflow occurs. To detect this overflow, go to the **Diagnostics > Data Validity** pane of the Configuration Parameters dialog box and set **Parameters > Detect overflow** to `warning` or `error`.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point`

Parameters

To edit the parameters for the Wrap to Zero block, double-click the block icon.

`Threshold` — Threshold for outputting zero

`255` (default) | scalar

Threshold value for setting the output value to zero.

Programmatic Use

Block Parameter: `Threshold`
Type: character vector
Values: `scalar`
Default: `'255'`

Block Characteristics

Data Types	`double` | `single` | `Boolean` | `base integer` | `fixed point`
Direct Feedthrough	`No`
Multidimensional Signals	`Yes`
Variable-Size Signals	`No`
Zero-Crossing Detection	`No`

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

For more information on HDL code generation, see Wrap To Zero.

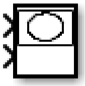
Saturation | Saturation Dynamic

Introduced before R2006a

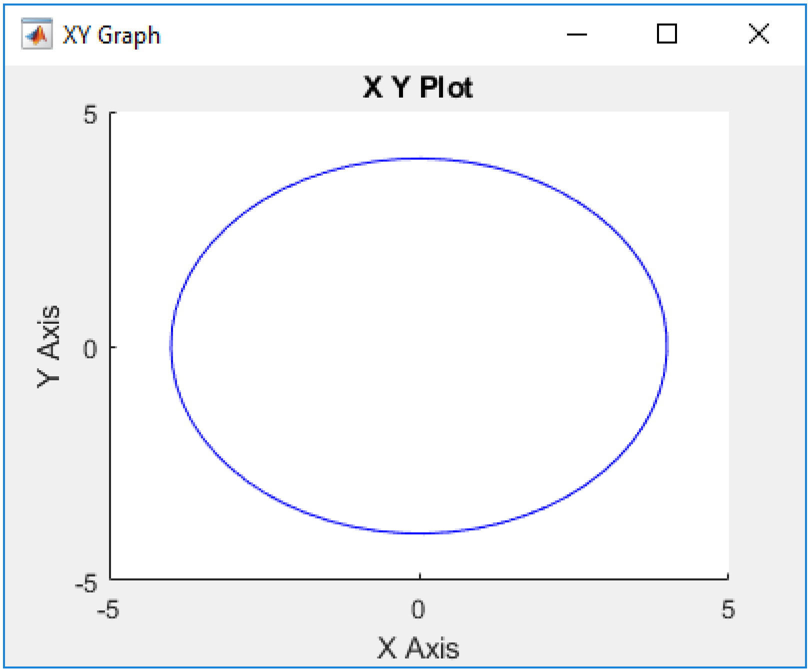
XY Graph

Display X-Y plot of signals using MATLAB figure window
Library: Simulink / Sinks



Description

The XY Graph block displays an X-Y plot of its inputs in a MATLAB figure window.



The block has two scalar inputs. The block plots data from the first input (the *x* direction) against data from the second input (the *y* direction). (See “Port Location After Rotating or Flipping” for a description of the port order for various block orientations.) This block is useful for examining limit cycles and other two-state data. Data outside the specified range does not appear.

A figure window appears for each XY Graph block in the model at the start of simulation.

Note The XY Graph block does not support stepping back in a simulation.

Ports

Input

`Port_1` — X-axis values

scalar

Plot input as *x* values on an X-Y plot. See “Port Location After Rotating or Flipping” for a description of the port order for various block orientations.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point`

`Port_2` — Y-axis values

scalar

Plot input as *y* values on an X-Y plot. See “Port Location After Rotating or Flipping” for a description of the port order for various block orientations.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point`

Parameters

`X-min` — Minimum x

`-1` (default) | real number

Specify the minimum *x*-axis value. Data below the minimum *x* is ignored.

Programmatic Use
Block Parameter: `xmin`

Type: character vector
Values: real number
Default: `'-1'`

`X-max` — Maximum x

`1` (default) | real number

Specify the maximum *x*-axis value. Data above the maximum *x* is ignored.

Programmatic Use
Block Parameter: `xmax`
Type: character vector
Values: real number
Default: `'1'`

`Y-min` — Minimum y

`-1` (default) | real number

Specify the minimum *y*-axis value. Data below the minimum *y* is ignored.

Programmatic Use
Block Parameter: `ymin`
Type: character vector
Values: real number
Default: `'-1'`

`Y-max` — Maximum y

`1` (default) | real number

Specify the maximum *y*-axis value. Data above the maximum *y* is ignored.

Programmatic Use
Block Parameter: `ymax`
Type: character vector
Values: real number
Default: `'1'`

`Sample time` — Sample time

`-1` (default) | positive number

Specify the time interval between samples. To inherit the sample time, set this parameter to `-1`. For more information, see “Specify Sample Time”.

Programmatic Use
Block Parameter: `st`
Type: character vector
Values: `'-1'` (for inherited) | positive number
Default: `'-1'`

Block Characteristics

Data Types	`double` | `single` | `Boolean` | `base integer` | `fixed point` | `enumerated`

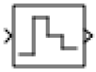
Zero-Order Hold

Implement zero-order hold sample period

Library: Simulink / Discrete



Description

The Zero-Order Hold block holds its input for the sample period you specify. If the input is a vector, the block holds all elements of the vector for the same sample period.

You specify the time between samples with the **Sample time** parameter. A setting of `-1` means the block inherits the **Sample time**.

Tip Do not use the Zero-Order Hold block to create a fast-to-slow transition between blocks operating at different sample rates. Instead, use the Rate Transition block.

Bus Support

The Zero-Order Hold block is a bus-capable block. The input can be a virtual or nonvirtual bus signal. No block-specific restrictions exist. All signals in a nonvirtual bus input to a Zero-Order Hold block must have the same sample time, even if the elements of the associated bus object specify inherited sample times. You can use a Rate Transition block to change the sample time of an individual signal, or of all signals in a bus. See “Specify Bus Signal Sample Times” and “Bus-Capable Blocks” for more information.

You can use an array of buses as an input signal to a Zero-Order Hold block. For details about defining and using an array of buses, see “Combine Buses into an Array of Buses”.

Comparison with Similar Blocks

The Memory, Unit Delay, and Zero-Order Hold blocks provide similar functionality but have different capabilities. Also, the purpose of each block is different.

This table shows recommended usage for each block.

Block	Purpose of the Block	Reference Examples
Unit Delay	Implement a delay using a discrete sample time that you specify. The block accepts and outputs signals with a discrete sample time.	• `sldemo_enginewc` (Compression subsystem)
Memory on page 1-1222	Implement a delay by one major integration time step. Ideally, the block accepts continuous (or fixed in minor time step) signals and outputs a signal that is fixed in minor time step.	• `sldemo_bounce` • `sldemo_clutch` (Friction Mode Logic/Lockup FSM subsystem)
Zero-Order Hold	Convert an input signal with a continuous sample time to an output signal with a discrete sample time.	• `sldemo_radar_eml` • `aero_dap3dof`

Each block has the following capabilities.

Capability	Memory	Unit Delay	Zero-Order Hold
Specification of initial condition	Yes	Yes	No, because the block output at time t = 0 must match the input value.
Specification of sample time	No, because the block can only inherit sample time from the driving block or the solver used for the entire model.	Yes	Yes
Support for frame-based signals	No	Yes	Yes
Support for state logging	No	Yes	No

Ports

Input

`Port_1` — Input signal

scalar | vector

Input signal that the block holds by one sample period.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Output

`Port_1` — Output signal

scalar | vector

Output signal that is the input held by one sample period.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Parameters

`Sample time (-1 for inherited)` — Discrete interval between sample time hits

`-1` (default) | `scalar`

Specify the time interval between samples. To inherit the sample time, set this parameter to `-1`. See “Specify Sample Time” in the online documentation for more information.

Do not specify a continuous sample time, either `0` or `[0,0]`. This block supports only discrete sample times. When this parameter is `-1`, the inherited sample time must be discrete and not continuous.

Block Characteristics

Data Types	`double` | `single` | `Boolean` | `base integer` | `fixed point` | `enumerated` | `bus`
Direct Feedthrough	`No`
Multidimensional Signals	`No`
Variable-Size Signals	`No`
Zero-Crossing Detection	`No`

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Generated code relies on `memcpy` or `memset` functions (`strong.h`) under certain conditions.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

For information about HDL code generation, see Zero-Order Hold.

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

Fixed-Point Conversion

Convert floating-point algorithms to fixed point using Fixed-Point Designer™.

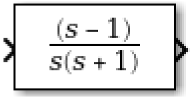
Zero-Pole

Model system by zero-pole-gain transfer function

Library: Simulink / Continuous



Description

The Zero-Pole block models a system that you define with the zeros, poles, and gain of a Laplace-domain transfer function. This block can model single-input single-output (SISO) and single-input multiple-output (SIMO) systems.

Conditions for Using This Block

The Zero-Pole block assumes the following conditions:

- The transfer function has the form

  $$H(s)=K\frac{Z(s)}{P(s)}=K\frac{(s-Z(1))(s-Z(2))\ldots(s-Z(m))}{(s-P(1))(s-P(2))\ldots(s-P(n))},$$

  where Z represents the zeros, P the poles, and K the gain of the transfer function.
- The number of poles must be greater than or equal to the number of zeros.
- If the poles and zeros are complex, they must be complex-conjugate pairs.
- For a multiple-output system, all transfer functions must have the same poles. The zeros can differ in value, but the number of zeros for each transfer function must be the same.

Note You cannot use a Zero-Pole block to model a multiple-output system when the transfer functions have a differing number of zeros or a single zero each. Use multiple Zero-Pole blocks to model such systems.

Modeling a Single-Output System

For a single-output system, the input and the output of the block are scalar time-domain signals. To model this system:

1. Enter a vector for the zeros of the transfer function in the **Zeros** field.
2. Enter a vector for the poles of the transfer function in the **Poles** field.
3. Enter a 1-by-1 vector for the gain of the transfer function in the **Gain** field.

Modeling a Multiple-Output System

For a multiple-output system, the block input is a scalar and the output is a vector, where each element is an output of the system. To model this system:

1. Enter a matrix of zeros in the **Zeros** field.

   Each *column* of this matrix contains the zeros of a transfer function that relates the system input to one of the outputs.
2. Enter a vector for the poles common to all transfer functions of the system in the **Poles** field.
3. Enter a vector of gains in the **Gain** field.

   Each element is the gain of the corresponding transfer function in **Zeros**.

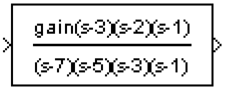
Each element of the output vector corresponds to a column in **Zeros**.

Transfer Function Display on the Block

The Zero-Pole block displays the transfer function depending on how you specify the zero, pole, and gain parameters.

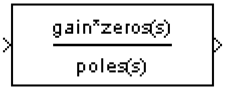
- If you specify each parameter as an expression or a vector, the block shows the transfer function with the specified zeros, poles, and gain. If you specify a variable in parentheses, the block evaluates the variable.

  For example, if you specify **Zeros** as `[3,2,1]`, **Poles** as `(poles)`, where `poles` is `[7,5,3,1]`, and **Gain** as `gain`, the block looks like this.



- If you specify each parameter as a variable, the block shows the variable name followed by `(s)` if appropriate.

  For example, if you specify **Zeros** as `zeros`, **Poles** as `poles`, and **Gain** as `gain`, the block looks like this.



Ports

Input

`Port_1` — Input signal

scalar

Input signal, specified as a scalar with data type `double`.

Data Types: `double`

Output

`Port_1` — Output signal

scalar | vector

System modeled by a zero-pole gain transfer function, provided as a scalar or vector signal with data type `double`.

- When modeling a single-output system, the block outputs a scalar time-domain signal. For more information, see “Modeling a Single-Output System” on page 1-2251.
- When modeling a multiple-output system, the block outputs a vector, where each element is an output of the system. For more information, see “Modeling a Multiple-Output System” on page 1-2251.

Data Types: `double`

Parameters

`Zeros` — Matrix of zeros

`[1]` (default) | vector | matrix

Define the matrix of zeros.

- For a single-output system, enter a vector for the zeros of the transfer function.
- For a multiple-output system, enter a matrix. Each *column* of this matrix contains the zeros of a transfer function that relates the system input to one of the outputs.

Programmatic Use
Block Parameter: `Zeros`
Type: character vector, string
Value: vector | matrix
Default: `'[1]'`

`Poles` — Vector of poles

`[0 -1]` (default) | vector

Define the vector of poles.

- For a single-output system, enter a vector for the poles of the transfer function.
- For a multiple-output system, enter a vector for the poles common to all transfer functions of the system.

Programmatic Use
Block Parameter: `Poles`
Type: character vector, string
Value: vector
Default: `'[0 -1]'`

`Gain` — Vector of gains

`[1]` (default) | vector

Define the vector of gains.

- For a single-output system, enter a 1-by-1 vector for the gain of the transfer function.
- For a multiple-output system, enter a vector of gains. Each element is the gain of the corresponding transfer function in **Zeros**.

Programmatic Use

Block Parameter: `Gain`
Type: character vector, string
Value: vector
Default: `'[1]'`

`Absolute tolerance` — Absolute tolerance for computing block states

`auto` (default) | scalar | vector

Absolute tolerance for computing block states, specified as a positive, real-valued, scalar or vector. To inherit the absolute tolerance from the Configuration Parameters, specify `auto` or `-1`.

- If you enter a real scalar, then that value overrides the absolute tolerance in the Configuration Parameters dialog box for computing all block states.
- If you enter a real vector, then the dimension of that vector must match the dimension of the continuous states in the block. These values override the absolute tolerance in the Configuration Parameters dialog box.
- If you enter `auto` or –1, then Simulink uses the absolute tolerance value in the Configuration Parameters dialog box (see “Solver Pane”) to compute block states.

Programmatic Use

Block Parameter: `AbsoluteTolerance`
Type: character vector, string
Values: `'auto'` | `'-1'` | any positive real-valued scalar or vector
Default: `'auto'`

`State Name (e.g., 'position')` — Assign unique name to each state

`' '` (default) | `'position'` | `{'a', 'b', 'c'}` | `a` | ...

Assign a unique name to each state. If this field is blank (`' '`), no name assignment occurs.

- To assign a name to a single state, enter the name between quotes, for example, `'position'`.
- To assign names to multiple states, enter a comma-delimited list surrounded by braces, for example, `{'a', 'b', 'c'}`. Each name must be unique.
- To assign state names with a variable in the MATLAB workspace, enter the variable without quotes. A variable can be a character vector, string, cell array, or structure.

Limitations

- The state names apply only to the selected block.
- The number of states must divide evenly among the number of state names.
- You can specify fewer names than states, but you cannot specify more names than states.

  For example, you can specify two names in a system with four states. The first name applies to the first two states and the second name to the last two states.

Programmatic Use
Block Parameter: `ContinuousStateAttributes`
Type: character vector, string
Values: `' '` | user-defined
Default: `' '`

Block Characteristics

Data Types	`double`
Direct Feedthrough	`No`
Multidimensional Signals	`No`
Variable-Size Signals	`No`
Zero-Crossing Detection	`No`

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Not recommended for production-quality code. Relates to resource limits and restrictions on speed and memory often found in embedded systems. The code generated can contain dynamic allocation and freeing of memory, recursion, additional memory overhead, and widely-varying execution times. While the code is functionally valid and generally acceptable in resource-rich environments, smaller embedded targets often cannot support such code.

In general, consider using the Simulink Model Discretizer to map continuous blocks into discrete equivalents that support production code generation. To start the Model Discretizer, select **Analysis > Control Design > Model Discretizer**. One exception is the Second-Order Integrator block because, for this block, the Model Discretizer produces an approximate discretization.

Functions — Alphabetical List

add_block

Add block to model

Syntax

```
h = add_block(source,dest)
h = add_block(source,dest,'MakeNameUnique','on')
h = add_block(sourceIn,destIn,'CopyOption','duplicate')
h = (___,Name,Value)
```

Description

`h = add_block(source,dest)` adds a copy of the block `source` from a library or model to the specified destination model and block name. This syntax creates the block at the same location as it appears in the model or the library model.

If you are copying between models or from a library, load the destination model first.

`h = add_block(source,dest,'MakeNameUnique','on')` ensures that the destination block name is unique in the model. This syntax adds a number to the destination block name if a block with that name exists, incrementing to ensure a unique name.

`h = add_block(sourceIn,destIn,'CopyOption','duplicate')` duplicates an inport block in a subsystem, giving the destination block the same port number as the source block. Duplicate an inport to branch a signal from an input port without creating a port or adding lines. For more information, see “Creating Duplicate Inports” on page 1-968.

`h = (___,Name,Value)` uses optional `Name,Value` arguments.

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

With the add_block function, you can use block parameter and value pairs. For a list of all the block parameters, see “Common Block Properties” on page 6-109 and “Block-Specific Parameters” on page 6-128.

Examples

Add Block to Model from a Library

Add the block from the Simulink library to the model f14.

Load or open the destination model.

```
open_system('f14');
```

Add the Scope block from the Simulink Sinks library to f14, naming the new block MyScope.

```
add_block('simulink/Sinks/Scope','f14/MyScope');
```

Add a Block from Another Model

Add a copy of a block from the model f14 to vdp.

Load or open the destination model.

```
open_system('vdp');
```

Add the Actuator Model block from f14 to vdp.

```
add_block('f14/Actuator Model','vdp/Actuator Model');
```

Add a Block Using a Unique Name

Add the block from the Simulink library to the model vdp. Because there is already a block named Scope in vdp, use the MakeNameUnique option to ensure that the new block name is unique.

Load or open the destination model.

```
open_system('vdp');
```

Add the Scope block from the Simulink Sinks library to vdp, ensuring that the name is unique.

```
add_block('simulink/Sinks/Scope','vdp/Scope','MakeNameUnique','on')
```

Duplicate an Inport Block in a Subsystem

Add an inport block in the f14/Controller subsystem that uses the same port number as another inport in that subsystem.

Duplicate the Stick Input (in) block in the Controller subsystem, naming the copy Stick Input (in)2. The resulting block uses the same port number as Stick Input (in) but does not add an inport on the parent subsystem. The signal that enters that port branches to both inports.

```
add_block('f14/Controller/Stick Input (in)',...
'f14/Controller/Stick Input (in)2','CopyOption','duplicate')
```

Add a Block and Set Parameters

Add a block from a library to a model and set parameters using a Name,Value pair.

Load or open the destination model.

```
open_system('vdp');
```

Add a Gain block from the library to vdp, and set the Gain value to 5.

```
add_block('simulink/Math Operations/Gain','vdp/Five','Gain','5')
```

Input Arguments

source — Block to copy to model

block path name | library block path name

Block to copy to model, specified as:

- The full block path name if you are copying the block from another model, for example, `'vdp/Mu'`. This usage copies the block and its settings.
- The library block path name if you want to add a block from a library, for example, `'simulink/Math Operations/Gain'`.

  To get the library block path name, you can hover over the block in the Library Browser. Alternatively, you can open the library model, select the block, and enter `gcb` at the command line. To open the library model, in the Library Browser, right-click the library name in the library list and select **Open *`library_name`* library**.

You can also use the syntax `'built-in/`*`blocktype`*`'` as the source block path name, where *`blocktype`* is the programmatic block name-—the value of the `BlockType` parameter (see “Common Block Properties” on page 6-109). However, blocks added using `'built-in/`*`blocktype`*`'` sometimes have different default parameter values from library blocks.

For subsystems and masked blocks, use the library block path name. Using the `BlockType` value (`SubSystem`) creates an empty subsystem.

Example: `'vdp/Mu'`, `'simulink/Sinks/Scope'`

`dest` — Name and location of new block

block path name

Name and location of the new block in the model, specified as the block path name.

Example: `'f14/Controller/MyNewBlock'`

`sourceIn` — Inport block whose port number to copy

block path name

Inport block whose port number to copy, specified as the block path name.

Example: `'f14/Controller/Stick Input (in)'`, `'myModel/mySubsystem/In1'`

`destIn` — Inport block to create

block path name

Inport block with duplicate port number to create, specified as the block path name. Create the destination block in the same system as the source block.

Example: `'myModel/mySubsystem/DupPortIn'`

Output Arguments

h — New block
handle

New block, returned as a handle.

“Create Annotations Programmatically”

Introduced before R2006a

add_exec_event_listener

Register listener for block method execution event

Syntax

```
h = add_exec_event_listener(blk,event,listener);
```

Description

`h = add_exec_event_listener(`*`blk`*`,`*`event`*`,`*`listener`*`)` registers a listener for a block method execution event where the listener is a MATLAB program that performs some task, such as logging runtime data for a block, when the event occurs (see “Listen for Method Execution Events”). Simulink software invokes the registered listener whenever the specified event occurs during simulation of the model. You cannot register a listener for virtual blocks.

Note Simulink software can register a listener only while a simulation is running. Invoking this function when no simulation is running results in an error message. To ensure that a listener catches all relevant events triggered by a model's simulation, you should register the listener in the model's `StartFcn` callback function (see “Callbacks for Customized Model Behavior”).

Input Arguments

`blk`

Specifies the block whose method execution event the listener is intended to handle. May be one of the following:

- Full pathname of a block
- A block handle
- A block runtime object (see “Access Block Data During Simulation”.)

`event`

Specifies the type of event for which the listener listens. It may be any of the following:

Event	Occurs...
`'PreDerivatives'`	Before a block's Derivatives method executes
`'PostDerivatives'`	After a block's Derivatives method executes
`'PreOutputs'`	Before a block's Outputs method executes.
`'PostOutputs'`	After a block's Outputs method executes
`'PreUpdate'`	Before a block's Update method executes
`'PostUpdate'`	After a block's Update method executes

`listener`

Specifies the listener to be registered. It may be either a character vector specifying a MATLAB expression, e.g., `'disp(''here'')'` or a handle to a MATLAB function that accepts two arguments. The first argument is the block runtime object of the block that triggered the event. The second argument is an instance of `EventData` class that specifies the runtime object and the name of the event that just occurred.

Output Arguments

`add_exec_event_listener` returns a handle to the listener that it registered. To stop listening for an event, use the MATLAB `clear` command to clear the listener handle from the workspace in which the listener was registered.

Introduced before R2006a

add_line

Add line to Simulink model

Syntax

```
h = add_line(sys,out,in)
h = add_line(sys,out,in,'autorouting',autoOption)
h = add_line(sys,points)
```

Description

`h = add_line(sys,out,in)` adds a line in the model or subsystem `sys` that connects one block's output port `out` to another block's input port `in`. This syntax draws the most direct route from port to port, for example, diagonal lines or lines that go through other blocks.

You can connect ports when:

- The input port does not already have a connection.
- The blocks are compatible for connecting.

`h = add_line(sys,out,in,'autorouting',autoOption)` connects blocks, specifying whether to route the lines around other blocks.

`h = add_line(sys,points)` adds a line drawn by (x,y) coordinate `points` relative to the upper-left corner of the Simulink Editor canvas before any canvas resizing. If either end of the line is within five pixels of a corresponding port, the function connects the line to it. The line can have multiple segments.

Examples

Connect Blocks Using Port Numbers

Use the block port numbers to add a line to connect blocks.

Create a model and open it.

```
open_system(new_system('connect_model'));
```

Add and position a Constant block and a Gain block.

```
add_block('simulink/Commonly Used Blocks/Constant','connect_model/Constant');
set_param('connect_model/Constant','position',[140,80,180,120]);
add_block('simulink/Commonly Used Blocks/Gain','connect_model/Gain');
set_param('connect_model/Gain','position',[220,80,260,120]);
```

Connect the blocks. Each block has one port, so specify port 1.

```
add_line('connect_model','Constant/1','Gain/1');
```

Connect Blocks Using Port Handles

Get the port handles and connect the ports using `add_line`.

Open the model `vdp`.

```
open_system('vdp');
```

Delete the line that connects the Mu gain block to the Sum block.

```
delete_line('vdp','Mu/1','Sum/2');
```

Get the port handles from the Mu block and the Sum block.

```
h = get_param('vdp/Mu','PortHandles');
h1 = get_param('vdp/Sum','PortHandles');
```

Look at the h1 structure. Notice the two handles for the Inport property.

```
h1
```

```
h1 =

  struct with fields:

      Inport: [47.0002 54.0002]
     Outport: 39.0002
      Enable: []
     Trigger: []
       State: []
       LConn: []
       RConn: []
    Ifaction: []
       Reset: []
```

Index into the Outport and Inport properties on the port handles to get the handles you want and connect them. Connect to the second inport.

```
add_line('vdp',h.Outport(1),h1.Inport(2));
```

Add a Branched Line

You can branch a line by adding a connection programmatically. You can use the `points` syntax to draw the segment, or you can draw the line by specifying the ports to connect. When using the port, use automatic line routing to improve the look of the branched line.

Add a scope to the `vdp` model above the outport.

```
vdp
add_block('simulink/Commonly Used Blocks/Scope','vdp/Scope1');
set_param('vdp/Scope1','position',[470,70,500,110]);
```

Connect the Integrator block x1 to Scope1. This code branches the existing line from the x1 output and connects it to the scope. With autorouting on, the resulting line is segmented.

```
add_line('vdp','x1/1','Scope1/1','autorouting','on')
```

Connect Blocks Using Points

You can use points on the canvas as the start and end of each segment. Get the port locations using `get_param` with the `'PortConnectivity'` option.

Open the model `vdp` and delete the line that connects the Mu and Sum blocks.

```
vdp
delete_line('vdp','Mu/1','Sum/2')
```

Get the port locations for Mu. Mu has two ports. The first is the input port, and the second is the output port.

```
mu = get_param('vdp/Mu','PortConnectivity');
mu.Position
```

```
ans =

   190   150

ans =

   225   150
```

Get the port locations for Sum, which has three ports. The second position is the lower input port.

```
s = get_param('vdp/Sum','PortConnectivity');
s.Position
```

```
ans =

   250   135

ans =

   250   150

ans =

   285   145
```

Connect the ports using the output and input points.

```
add_line('vdp',[225 150; 250 150])
```

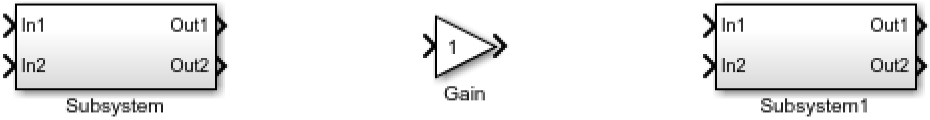
Connect Blocks Using Autorouting Options

This example shows the effect of adding lines with and without autorouting options.

Create a model `route`. Display default block names.

```
open_system(new_system('route'));
set_param('route','HideAutomaticNames','off')
```

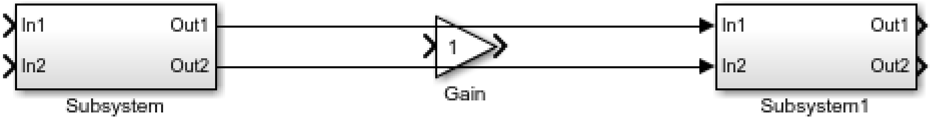
Add blocks as shown. Add an inport and outport to each subsystem.



Add lines to connect the outputs from Subsystem to the inputs of Subsystem1.

```
add_line('route',{'Subsystem/1','Subsystem/2'},...
      {'Subsystem1/1','Subsystem1/2'})
```

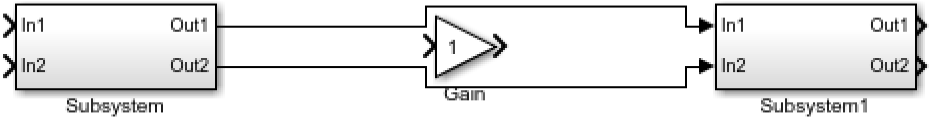
Because you did not use the autorouting options, the function draws straight lines, which pass through the Gain block.



Delete the lines. Add lines again, this time using the autorouting option set to `'on'`.

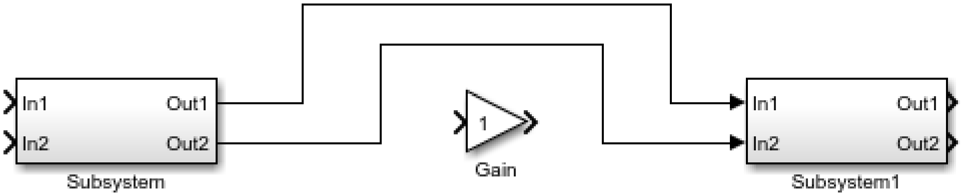
```
add_line('route',{'Subsystem/1','Subsystem/2'},...
      {'Subsystem1/1','Subsystem1/2'},'autorouting','on')
```

The lines route around the Gain block.



Delete the lines. Add lines again, using the `smart` autorouting option. When you use an array to connect two sets of inports and outports, `'smart'` autorouting routes them together if doing so makes better use of the space.

```
add_line('route',{'Subsystem/1','Subsystem/2'},...
      {'Subsystem1/1','Subsystem1/2'},'autorouting','smart')
```



Input Arguments

sys — Model or subsystem to add line to

character vector

Model or subsystem to add the line to, specified as character vector.

Example: `'vdp'` , `'f14/Controller'`

out — Block output port to connect line from

block/port name or number character vector | port handle | array of port designators

Block output port to connect line from, specified as:

- The block name, a slash, and the port name or number. Most block ports are numbered from top to bottom or from left to right. For a state port, use the port name State instead of a port number.
- The port handle that you want to connect from.
- An array of either of these port designators.

Use `'PortHandles'` with `get_param` to get the handles.

Example: `'Mu/1'`, `'Subsystem/2'`, `h.Outport(1)`{`'Subsystem/1','Subsystem/2'`}

`in` — Block input port to connect line to

block/port name or number character vector | port handle | array of port designators

Block input port to connect line to, specified as:

- The block name, a slash, and the port name or number. The port name on:
  - An enabled subsystem is Enable.
  - A triggered subsystem is Trigger.
  - If Action and Switch Case Action subsystems is Action.
- The port handle that you want to add the line to.
- An array of either of these port designators.

Use the `'PortHandles'` option with `get_param` to get handles.

Example: `'Mu/1'`, `'Subsystem/2'`, `h.Inport(1)`, `{'Subsystem/1','Subsystem/2'}`

`autoOption` — Type of automatic line routing

`'off'` (default) | `'on'` | `'smart'`

Type of automatic line routing around other blocks, specified as:

- `'off'` for no automatic line routing
- `'on'` for automatic line routing
- `'smart'` for automatic line routing that takes the best advantage of the blank spaces on the canvas and avoids overlapping other lines and labels

`points` — Points of the line to draw

matrix

Points of the line to draw, specified as at least a 2-by-2 matrix. Add a row for every segment you want to draw. Specify points as (x,y) coordinates from the upper-left corner of the Editor before any canvas resizing.

Example: `[100 300; 200 300; 200 300; 200 500]`

Output Arguments

h — Line
handle

Line created by `add_line`, returned as a handle.

add_param

Add parameter to Simulink system

Syntax

```
add_param('sys','parameter1',value1,'parameter2',value2,...)
```

Description

The `add_param` command adds the specified parameters to the specified system and initializes the parameters to the specified values. Case is ignored for parameter names. Value character vectors are case sensitive. The value of the parameter must be a character vector. Once the parameter is added to a system, `set_param` and `get_param` can be used on the new parameters as if they were standard Simulink parameters. Simulink software saves these new parameters with the model file.

Note If you attempt to add a parameter that has the same name as an existing parameter of the system, Simulink software displays an error.

Examples

This command

```
add_param('vdp','DemoName','VanDerPolEquation','EquationOrder','2')
```

adds the parameters `DemoName` and `EquationOrder` with `'VanDerPolEquation'` and `'2'` to the `vdp` system. Afterward, you can use the following command to retrieve the value of the `DemoName` parameter.

```
get_param('vdp','DemoName')
```

See Also

`delete_param` | `get_param` | `set_param`

Introduced before R2006a

addFile

Add file to Simulink Project

Syntax

```
addFile(proj,fileorfolder)
```

Description

`addFile(proj,fileorfolder)` adds a file to the project `proj`.

Examples

Add Files to a Project

Open the airframe project and create a project object.

```
sldemo_slproject_airframe
proj = simulinkproject;
```

Remove a file.

```
removeFile(proj,'models/AnalogControl.mdl')
```

Add the file back to the project.

```
addFile(proj,'models/AnalogControl.mdl');
```

Create and save a new model.

```
new_system('mymodel');
save_system('mymodel');
```

Add the new file to the project and return a project file object.

```
newPrjFile = addFile(proj,'mymodel.slx');
```

Use the project file object to manipulate the file, for example, adding a label.

```
addLabel(newPrjFile, 'Classification', 'Design')
```

Input Arguments

`proj` — Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

`fileorfolder` — Path of file or folder

character vector | cell array of character vectors | string array

Path of the file or folder to add relative to the project root folder, specified as a character vector, string, or array. Files must include the file extension. The file or folder must be within the root folder.

Example: ‘models/myModelName.slx’

Introduced in R2013a

addFolderIncludingChildFiles

Add folder and child files to Simulink Project

Syntax

```
addFolderIncludingChildFiles(proj,folder)
```

Description

`addFolderIncludingChildFiles(proj,folder)` adds a folder and all child files to the project `proj`.

Examples

Add Folders to a Project

Open the airframe project and create a project object.

```
sldemo_slproject_airframe
proj = simulinkproject;
```

Create a new folder in the project folder.

```
new_folder_path = fullfile(proj.RootFolder, 'new_folder')
mkdir(new_folder_path);
```

Create a new folder in the previous folder.

```
new_sub_folder_path = fullfile(new_folder_path, 'new_sub_folder')
mkdir(new_sub_folder_path);
```

Create a new file in the folder.

```
filepath = fullfile(new_sub_folder_path, 'new_model_in_subfolder.slx')
new_system('new_model_in_subfolder');
save_system('new_model_in_subfolder', filepath)
```

Add this new folder and child files to the project.

```
projectFile = addFolderIncludingChildFiles(proj, new_folder_path)
```

Input Arguments

`proj` — Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

`folder` — Path of folder

character vector | string

Path of the folder to add relative to the project root folder, specified as a character vector or string. The folder must be within the root folder.

Example: ‘models’

`slupdate`

Introduced before R2006a

attachComponent

Attach a component to a configuration set

Syntax

```
attachComponent(cs,component)
```

Description

`attachComponent(cs,component)` attaches a component to a `Simulink.ConfigSet` object.

Examples

Replace Solver Component for Active Configuration Set

Replace the solver component of the active configuration set of one model with the solver component of another model.

Get the active configuration set for `modelB`.

```
hCs = getActiveConfigSet('modelB');
```

Get the 'Solver' component for this configuration set.

```
hSolverConfig = getComponent(hCs,'Solver');
```

Create a copy of the component.

```
hSolverConfig = copy(hSolverConfig);
```

Get the active configuration set for `modelA`.

```
hCs = getActiveConfigSet('modelA');
```

Attach the copy of the 'Solver' component from `modelB` to `modelA`.

```
attachComponent(hCs,hSolverConfig);
```

Input Arguments

`cs` — Configuration set object

`ConfigSet` object

A configuration set object that you can attach a component to.

`component` — Component object

`SimulinkConfigComponent` object

A component that you can attach to configuration set.

See Also

`Simulink.ConfigSet`

Topics

“About Configuration Sets”
“Manage a Configuration Set”

Introduced before R2006a

attachConfigSet

Associate configuration set or configuration reference with model

Syntax

```
attachConfigSet(model, configObj)
```

```
attachConfigSet(model, configObj, allowRename)
```

Arguments

`model`

The name of an open model, or `gcs` to specify the current model

`configObj`

A configuration set (`Simulink.ConfigSet`) or configuration reference (`Simulink.ConfigSetRef`)

`allowRename`

Boolean that determines how Simulink software handles a name conflict

Description

`attachConfigSet` associates the configuration set or configuration reference (configuration object) specified by `configObj` with `model`.

You cannot attach a configuration object to a model if the configuration object is already attached to another model, or has the same name as another configuration object attached to the same model. The optional Boolean argument `allowRename` determines how Simulink software handles a name conflict between configuration objects. If `allowRename` is `false` and the configuration object specified by `configObj` has the same name as a configuration object already attached to `model`, Simulink software generates an error. If `allowRename` is `true` and a name conflict occurs, Simulink software provides a unique name for `configObj` before associating `configObj` with `model`.

Examples

The following example creates a copy of the current model's active configuration object and attaches it to the model, changing its name if necessary to be unique. The code is the same whether the object is a configuration set or configuration reference.

```
myConfigObj = getActiveConfigSet(gcs);
copiedConfig = myConfigObj.copy;
copiedConfig.Name = 'DevConfig';
attachConfigSet(gcs, copiedConfig, true);
```

See Also

`attachConfigSetCopy` | `closeDialog` | `detachConfigSet` | `getActiveConfigSet` | `getConfigSet` | `getConfigSets` | `openDialog` | `setActiveConfigSet`

Topics

“Manage a Configuration Set”
“Manage a Configuration Reference”

Introduced before R2006a

attachConfigSetCopy

Copy configuration set or configuration reference and associate it with model

Syntax

```
myConfigObj = attachConfigSetCopy(model, configObj)
```

```
myConfigObj = attachConfigSetCopy(model, configObj, allowRename)
```

Arguments

`model`

The name of an open model, or `gcs` to specify the current model

`configObj`

A configuration set (`Simulink.ConfigSet`) or configuration reference (`Simulink.ConfigSetRef`)

`allowRename`

Boolean that specifies how Simulink software handles a name conflict

Description

`attachConfigSetCopy` copies the configuration set or configuration reference (configuration object) specified by `configObj` and associates the copy with `model`. Simulink software returns the copied configuration object as `newConfigObj`.

You cannot attach a configuration object to a model if the configuration object has the same name as another configuration object attached to the same model. The optional Boolean argument `allowRename` determines how Simulink software handles a name conflict between configuration objects. If `allowRename` is `false` and the configuration object specified by `configObj` has the same name as a configuration object already attached to `model`, Simulink software generates an error. If `allowRename` is `true` and a name conflict occurs, Simulink software provides a unique name for the copy of `configObj` before associating it with `model`.

Examples

The following example creates a copy of `ModelA`'s active configuration object and attaches it to `ModelB`, changing the name if necessary to be unique. The code is the same whether the object is a configuration set or configuration reference.

```
myConfigObj = getActiveConfigSet('ModelA');
newConfigObj = attachConfigSetCopy('ModelB', myConfigObj, true);
```

addLabel

Attach label to Simulink Project file

Syntax

```
addLabel(file,categoryName,labelName)
addLabel(file,categoryName,labelName,labelData)
```

Description

`addLabel(file,categoryName,labelName)` attaches the specified label `labelName` in the category `categoryName` to the file.

`addLabel(file,categoryName,labelName,labelData)` attaches the label with data `labelData`.

Examples

Attach a Label to a Project File

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Get a particular file by name.

```
myfile = findFile(proj,'models/AnalogControl.mdl')
```

```
myfile = 

  ProjectFile with properties:

      Path: 'C:\Work\temp\slexamples\airframe\models\AnalogControl.mdl'
    Labels: [1x1 slproject.Label]
  Revision: '2'
SourceControlStatus: Unmodified
```

Get the `Labels` property of the file.

```
myfile.Labels
```

```
ans = 

  Label with properties:

            File: 'C:\Work\temp\slexamples\airframe\models\AnalogControl.mdl'
            Data: []
        DataType: 'none'
            Name: 'Design'
    CategoryName: 'Classification'
```

Attach the label `'Artifact'` to the file.

```
addLabel(myfile,'Classification','Artifact')
```

```
ans = 

  Label with properties:

            File: 'C:\Work\temp\slexamples\airframe\models\AnalogControl.mdl'
            Data: []
        DataType: 'none'
            Name: 'Artifact'
    CategoryName: 'Classification'
```

Index into the Labels property to get the label attached to this file.

```
reviewlabel = myfile.Labels(1)
```

```
reviewlabel = 

  Label with properties:

            File: 'C:\Work\temp\slexamples\airframe\models\AnalogControl.mdl'
            Data: []
        DataType: 'none'
            Name: 'Artifact'
    CategoryName: 'Classification'
```

Detach the new label from the file.

```
removeLabel(myfile,reviewlabel)
```

Attach a Label to a Subset of Files

Attach the 'Classification' category label 'Utility' to all files in the project that have the .m file extension.

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Get the list of files.

```
files = proj.Files;
```

Loop through each file. If a file has the extension .m, attach the label 'Utility'.

```
for fileIndex = 1:numel(files)
   file = files(fileIndex);
   [~, ~, fileExtension] = fileparts(file.Path);
   if strcmp(fileExtension,'.m')
       addLabel(file,'Classification','Utility');
   end
end
```

In the Simulink Project **Files** view, the **Classification** column displays the label Utility for each .m file in the utilities folder.

Attach a Label and Label Data to a File

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Create a new category 'Review'.

```
createCategory(proj,'Review','char');
```

For the new category, create a label 'To Review'.

```
reviewCategory = findCategory(proj,'Review');
createLabel(reviewCategory,'To Review');
```

Get a particular file by name.

```
myfile = findFile(proj,'models/AnalogControl.mdl')
```

```
myfile =

  ProjectFile with properties:

      Path: 'C:\Work\temp\slexamples\airframe\models\AnalogControl.mdl'
    Labels: [1x1 slproject.Label]
 Revision: '2'
SourceControlStatus: Unmodified
```

Attach the label `'To Review'` and a character vector of label data to the file.

```
addLabel(myfile,'Review','To Review','Whole team design review')
```

Index into the Labels property to get the second label attached to this particular file, and see the label data.

```
myfile.Labels(2)
```

```
ans =

  Label with properties:

            File: 'C:\Work\temp\slexamples\airframe\models\AnalogControl.mdl'
            Data: 'Whole team design review'
        DataType: 'char'
            Name: 'To Review'
    CategoryName: 'Review'
```

In the Simulink Project **Files** view, for the `AnalogControl.mdl` file, the **Review** column displays the `To Review` label with label data.

Alternatively, you can set or change label data using the data property.

```
mylabel = myfile.Labels(2);
mylabel.Data = 'Final review';
```

Input Arguments

`file` — File to attach label to

file object

File to attach the label to, specified as a file object. You can get the file object by examining the project’s Files property (`proj.Files`), or use `findFile` to find a file by name. The file must be in the project.

`categoryName` — Name of category for label

character vector

Name of the category for the label, specified as a character vector.

`labelName` — Name of label

character vector | label definition object

Name of the label to attach, specified as a character vector or a label definition object returned by the `file.Label` property or `findLabel`. You can specify a new label name that does not already exist in the project.

`labelData` — Data to attach to label

character vector | numeric

Data to attach to the label, specified as a character vector or numeric. Data type depends on the label definition. Get a label to examine its `DataType` property using `file.Label` or `findLabel`.

See Also

Functions

`createLabel` | `findFile` | `findLabel` | `removeLabel` | `simulinkproject`

Introduced in R2013a

batchsim

Offload simulations to run on a compute cluster

Syntax

```
simJob = batchsim(in)
simJob = batchsim(myCluster,in)
simJob = batchsim(...,Name1,Value1,...NameN,ValueN)
```

Description

`simJob = batchsim(in)` runs a batch job on a single worker to simulate a model using the inputs specified in the `SimulationInput` object, `in`.

`simJob = batchsim(myCluster,in)` runs a batch job on the cluster identified by the cluster object `myCluster`. If a cluster profile is not specified, `batchsim` uses a default cluster profile as set up in the parallel preferences. For more information, see “Discover Clusters and Use Cluster Profiles” (Parallel Computing Toolbox).

`simJob = batchsim(...,Name1,Value1,...NameN,ValueN)` runs a batch job that simulates a model using the inputs specified in the `SimulationInput` object and the options specified as `Name,Value` pair.

`batchsim` offloads simulations to a compute cluster, enabling you to carry out other tasks while the batch job is processing, or close the client MATLAB and access the batch job later. Use the `'Pool'` argument to run simulations in parallel.

The `batchsim` command uses the Parallel Computing Toolbox™ and MATLAB Distributed Computing Server™ licenses to run the simulations on compute cluster. `batchsim` runs the simulations in serial if a parallel pool cannot be created. If Parallel Computing Toolbox license is not available, `batchsim` errors out.

Examples

Run Parallel Simulations with batchsim

This example shows how to run parallel simulations in batch. batchsim offloads simulations to a compute cluster, enabling you to carry out other tasks while the batch job is processing, or close the client MATLAB and access the batch job later.

This example uses the sldemo_househeat model and runs simulations in batch to observe the model behavior for different temperature set points.

Open the model.

```
open_system('sldemo_househeat');
```

Define a set of values for different temperatures.

```
setPointValues = 65:2:85;
spv_Length = length(setPointValues);
```

Using the setPointValues, initialize an array of Simulink.SimulationInput objects.

```
in(1:spv_Length) = Simulink.SimulationInput('sldemo_househeat');
for i = 1:1:spv_Length
    in(i) = in(i).setBlockParameter('sldemo_househeat/Set Point',...
        'Value',num2str(setPointValues(i)));
end
```

Specify the pool size of the number of workers to use. In addition to the number of workers used to run simulations in parallel, a head worker is required. In this case, let's assume that three workers are available to run a batch job for the parallel simulations. The job object returns useful metadata as shown. You can use the job ID to access the job object later from any machine. NumWorkers tells you how many workers are running the simulations. NumWorkers is always the number of workers specified in the 'Pool' argument and an additional head worker.

```
simJob = batchsim(in,'Pool',3)

                  ID: 1
                Type: pool
          NumWorkers: 4
            Username: #####
               State: running
      SubmitDateTime: ##-###-#### ##:##:##
       StartDateTime: 
    Running Duration: 0 days 0h 0m 0s
```

Access the results of the batch job using the `fetchOutputs` method. `fetchOutputs` returns an array of `Simulink.SimulationOuput` objects.

```
out = fetchOutputs(job)
```

```
1x11 Simulink.SimulationOutput array
```

Input Arguments

`in` — `Simulink.SimulationInput` object used to simulate the model
object, array

Specified as a `Simulink.SimulationInput` object or an array of `Simulink.SimulationInput` objects that is used to specify changes to the model for simulation.

Example: `in = Simulink.SimulationInput('vdp')`

`myCluster` — parallel.Cluster object
object

Cluster object that is used to specify the cluster in which the batch job runs.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: `'Pool'`, 5

`AdditionalPaths` — Files to attach to parallel pool
character vector | cell array

Specified as a character vector, a cell array or an array of character vector to define paths to be added to the MATLAB search path of the workers before the simulations execute. The default search path might not be the same on the workers as it is on the client; the path difference could be the result of different current working folders (pwd), platforms, or network file system access. The '`AdditionalPaths`' property can assure that workers are looking in the correct locations for necessary code files, data files, model files, etc.

`AttachedFiles` — Files to attach to parallel pool
cell array

Specified as a cell array of additional files to attach to the parallel pool.

`AutoAddClientPath` — Whether user-added entries on client path are added to each worker path
true (default) | false

Specified as true or false to control whether user-added entries on the client path are added to each worker path.

`AutoAttachedFiles` — Whether code files should be automatically attached to the job
true (default) | false

Specified as true or false to control whether code files are automatically attached to the job.

`CaptureDiary` — Whether `diary` is collected
true (default) | false

Specified as true or false to indicate collection of the `diary`.

`CleanupFcn` — Function handle to run once per worker after running simulations
function handle

Specify a `function handle` to `'CleanupFcn'` to run once per worker after the simulations are completed.

`EnvironmentVariables` — Names of environment variables copied from client session to workers
character vector | cell array

Specifies the names of environment variables copied from the client session to the workers. The names specified here are appended to the '`EnvironmentVariables`' property specified in the applicable parallel profile to form the complete list of environment variables. Any variables listed which are not set are not copied to the workers. These environment variables will be set on the workers for the duration of the batch job.

`ManageDependencies` — Manage model dependencies
'on' (default) | 'off'

When `ManageDependencies` is set to `'on'`, model dependencies are automatically sent to the parallel workers if necessary. If `ManageDependencies` is set to `'off'`, explicitly attach model dependencies to the parallel pool.

`Pool` — Size of the number of workers for a parallel pool

integer

An integer specifying the number of workers to make into a parallel pool for the job *in addition* to the worker running the batch job itself. The simulations use this pool for execution. Because the pool requires N workers in addition to the worker running the batch, there must be at least N+1 workers available on the cluster.

`Profile` — Cluster profile name

profile name

The name of a cluster profile used to identify the cluster. If this option is omitted, the default profile is used to identify the cluster and is applied to the job and task properties.

`SetupFcn` — Function handle to run once per worker

function handle

Specify a `function handle` to `'SetupFcn'` to run once per worker before the start of the simulations.

Note When `buildRapidAcceleratorTarget` is used in the `SetupFcn` and the model has external inputs specified, either set '`LoadExternalInput`' to '`off`' or ensure that the specified external input is available on the workers to prevent compilation error.

`ShowProgress` — Show the progress of the simulations in `diary`

'on' | 'off'

Set to `'on'`, to copy the progress of the simulations in the command window to `diary` of `Simulink.Simulation.Job` object. The progress is hidden when set to `'off'`.

`TransferBaseWorkspaceVariables` — Transfer variables to the parallel workers

'off' (default) | 'on'

When `TransferBaseWorkspaceVariables` is set to `true`, variables used in the model and defined in the base workspace are transferred to the parallel workers.

Note Use of `TransferBaseWorkspaceVariables` requires model compilation.

`UseFastRestart` — Use fast restart

'off' (default) | 'on'

When `UseFastRestart` is set to `true`, simulations run on the workers using fast restart.

Note When using `batchsim`, use the `UseFastRestart` option and not the `FastRestart` option. See “Get Started with Fast Restart” for more information.

Output Arguments

`simJob` — `Simulink.Simulation.Job` job object

object

An object containing metadata of submitted batch job. Poll job object using it's ID to check the status of simulations or to access outputs on completion of the job.

Extended Capabilities

Automatic Parallel Support

Accelerate code by automatically running computation in parallel using Parallel Computing Toolbox™.

Using `batchsim` with Parallel Computing Toolbox installed, MATLAB automatically opens a worker and runs the job in the background on another session on your local machine. Specifying a pool size runs the simulations on the number of workers specified. Control parallel behavior with the parallel preferences, including scaling up to a cluster.

For details, see “Run Multiple Simulations”.

bdclose

Close any or all Simulink system windows unconditionally

Syntax

```
bdclose
bdclose('sys')

bdclose('all')
```

Description

`bdclose` with no arguments closes the current system window unconditionally and without confirmation. Any changes made to the system since it was last saved are lost.

`bdclose('sys')` closes the specified system window.

`bdclose('all')` closes all system windows.

Examples

This command closes the `vdp` system.

```
bdclose('vdp')
```

See Also

`close_system` | `new_system` | `open_system` | `save_system`

Introduced before R2006a

bdIsDirty

Whether block diagram has unsaved changes

Syntax

```
isDirty = bdIsDirty(bdname)
```

Description

`isDirty = bdIsDirty(bdname)` returns whether or not the loaded block diagram `bdname` has unsaved changes.

Examples

Check Models for Unsaved Changes

Check if models contain unsaved changes using `bdIsDirty`.

Check if a single model is dirty.

```
vdp
bdIsDirty('vdp')
```

```
ans =

  logical

   0
```

Check if a cell array of models are dirty.

```
vdp
sf_car
bdIsDirty({'sf_car','vdp'})
```

```
ans =

  1×2 logical array

   0   0
```

Input Arguments

bdname — Loaded block diagram name
character vector | cell array of character vectors | double array

Loaded block diagram name, specified as a character vector, a cell array of character vectors, or a double array. All character vectors must be the names of loaded block diagrams. All doubles must be the handles of loaded block diagrams. It is an error to supply an invalid handle, a handle to anything other than a block diagram, a path to a block or subsystem, or a block diagram that is not loaded.

Data Types: `double` | `char` | `cell`

Output Arguments

`isDirty` — Whether block diagram has unsaved changes
logical scalar | logical array

Whether block diagram has unsaved changes, returned as a logical array with one entry for each block diagram. The logical value is true if the block diagram has been modified in memory since it was loaded or last saved, and false if there are no unsaved changes.

See Also

`bdIsLoaded`

Topics

“Manage Shadowed and Dirty Models and Other Project Files”

Introduced in R2017a

bdIsLibrary

Whether block diagram is a library

Syntax

```
isLibrary = bdIsLibrary(bdnames)
```

Description

`isLibrary = bdIsLibrary(bdnames)` returns whether the loaded block diagrams specified by `bdnames` are libraries.

Examples

Check Whether Block Diagrams Are Libraries

Load some block diagrams and get a handle to one of them.

```
load_system({'sf_car','hydlib','vdp'})
h = get_param('hydlib','Handle');
```

Check whether `sf_car` is a library. The returned value 0 indicates that it is not.

```
bdIsLibrary('sf_car')
```

```
ans =
    0
```

Check whether `hydlib` and `vdp` are libraries. The returned value shows that `hydlib` is a library and `vdp` is not.

```
bdIsLibrary({'hydlib','vdp'})
```

```
ans =
1    0
```

Using the handle to `hydlib`, check whether `hdlib` is a library. The value returned shows that it is.

```
bdIsLibrary(h)
```

```
ans =
1
```

Input Arguments

`bdnames` — Names or handles of loaded block diagrams
character vector | cell array of character vectors | double | array of doubles

Names or handles of loaded block diagrams, specified as a character vector, a cell array of character vectors, a double, or a double array. All character vectors are names of loaded block diagrams. All doubles are handles of loaded block diagrams.

Data Types: `char` | `cell` | `double`

Output Arguments

`isLibrary` — Logical array showing whether block diagrams are libraries
logical scalar | logical array

Logical array showing whether block diagrams are libraries, returned as a logical scalar or array (`1` for a library, `0` otherwise).

See Also

`bdIsLoaded` | `bdroot` | `find_system`

Introduced in R2015a

bdIsLoaded

Whether block diagram is in memory

Syntax

```
isLoaded = bdIsLoaded(bdnames)
```

Description

`isLoaded = bdIsLoaded(`*`bdnames`*`)` returns whether or not a block diagram is in memory. `bdnames` can be a character vector or a cell array of character vectors. All character vectors must be valid block diagram names. It is an error to supply a path to a block or subsystem.

`isLoaded` is a logical array with one entry for each block diagram name.

Examples

```
bdIsLoaded('sf_car')
```

returns a logical scalar.

```
bdIsLoaded({'sf_car','vdp'})
```

returns a 1-by-2 logical array.

`bdIsDirty` | `bdIsLibrary` | `find_system`

Introduced in R2008a

bdroot

Top-level model of current system

Syntax

```
model = bdroot
model = bdroot(elements)
```

Description

`model = bdroot` returns the top-level model of the current system. The current system is the currently active Simulink Editor window or the system in which a block is selected.

`model = bdroot(elements)` returns the top-level model of the specified model elements. Before using `bdroot`, make sure the top-level model of each element in `elements` is loaded.

Examples

Get Top-Level Model of Current System

Open the system Controller in the model `f14`.

```
load_system('f14')
open_system('f14/Controller')
```

Get the top-level model of the current system.

```
bdroot
```

```
ans =

    'f14'
```

Get Top-Level Model of a System

Open the system Controller in the model `f14`.

```
load_system('f14')
open_system('f14/Controller')
```

Get the top-level model of the current system.

```
bdroot(gcs)
```

```
ans =

    'f14'
```

Input Arguments

`elements` — Model elements whose top-level models to return

model name | block path name | handle | cell array of character vectors | string array | numeric array

Model elements whose top-level model to return, specified as the model name, block or system path name, handle, cell array of character vectors or string array of system names, or numeric array of handles.

Tip Use `bdroot` with `gcs`, `gcb`, and `gcbh` to get the top-level model of the current system or block.

Output Arguments

`model` — Top-level model

character vector | cell array | string array

Top-level model, returned as a character vector of the model name. If the input was an array, `model` is returned as an array of the same type as the input.

`gcb` | `gcbh` | `gcs`

Introduced before R2006a

dlinmod

Extract discrete-time linear state-space model around operating point

Syntax

```
argout = dlinmod('sys', Ts)
```

```
argout = dlinmod('sys', Ts, x, u)
```

```
argout = dlinmod('sys', Ts, x, u, para, 'v5')
```

```
argout = dlinmod('sys', Ts, x, u, para, xpert, upert, 'v5')
```

Arguments

sys Name of the Simulink system from which the linear model is extracted.

x, *u* State (*x*) and the input (*u*) vectors. If specified, they set the operating point at which the linear model is extracted. When a model has model references using the Model block, you must use the Simulink structure format to specify `x`. To extract the `x` structure from the model, use the following command:

```
x = Simulink.BlockDiagram.getInitialState('sys');
```

You can then change the operating point values within this structure by editing `x.signals.values`.

If the state contains different data types (for example, `'double'` and `'uint8'`), then you cannot use a vector to specify this state. You must use a structure instead. In addition, you can only specify the state as a vector if the state data type is `'double'`.

Ts Sample time of the discrete-time linearized model 'v5' An optional argument that invokes the perturbation algorithm created prior to MATLAB 5.3. Invoking this optional argument is equivalent to calling linmodv5.

para A three-element vector of optional arguments:

- para(1) — Perturbation value of delta, the value used to perform the perturbation of the states and the inputs of the model. This is valid for linearizations using the 'v5' flag. The default value is 1e-05.
- para(2) — Linearization time. For blocks that are functions of time, you can set this parameter with a nonnegative value that gives the time (t) at which Simulink evaluates the blocks when linearizing a model. The default value is 0.
- para(3) — Set para(3)=1 to remove extra states associated with blocks that have no path from input to output. The default value is 0.

xpert, *upert* The perturbation values used to perform the perturbation of all the states and inputs of the model. The default values are

```
xpert = para(1) + 1e-3*para(1)*abs(x)
upert = para(1) + 1e-3*para(1)*abs(u)
```

When a model has model references using the Model block, you must use the Simulink structure format to specify xpert. To extract the xpert structure, use the following command:

```
xpert = Simulink.BlockDiagram.getInitialState('sys');
```

You can then change the perturbation values within this structure by editing xpert.signals.values.

The perturbation input arguments are only available when invoking the perturbation algorithm created prior to MATLAB 5.3, either by calling linmodv5 or specifying the 'v5' input argument to linmod.

argout

`linmod`, `dlinmod`, and `linmod2` return state-space representations if you specify the output (left-hand) side of the equation as follows:

- `[A,B,C,D] = linmod('sys', x, u)` obtains the linearized model of *sys* around an operating point with the specified state variables *x* and the input *u*. If you omit *x* and *u*, the default values are zero.

`linmod` and `dlinmod` both also return a transfer function and MATLAB data structure representations of the linearized system, depending on how you specify the output (left-hand) side of the equation. Using `linmod` as an example:

- `[num, den] = linmod('sys', x, u)` returns the linearized model in transfer function form.
- `sys_struc = linmod('sys', x, u)` returns a structure that contains the linearized model, including state names, input and output names, and information about the operating point.

Description

`dlinmod` compute a linear state-space model for a discrete-time system by linearizing each block in a model individually.

`linmod` obtains linear models from systems of ordinary differential equations described as Simulink models. Inputs and outputs are denoted in Simulink block diagrams using Inport and Outport blocks.

The default algorithm uses preprogrammed analytic block Jacobians for most blocks which should result in more accurate linearization than numerical perturbation of block inputs and states. A list of blocks that have preprogrammed analytic Jacobians is available in the Simulink Control Design documentation along with a discussion of the block-by-block analytic algorithm for linearization.

The default algorithm also allows for special treatment of problematic blocks such as the Transport Delay and the Quantizer. See the mask dialog of these blocks for more information and options.

Discrete-Time System Linearization

The function dlinmod can linearize discrete, multirate, and hybrid continuous and discrete systems at any given sampling time. Use the same calling syntax for dlinmod as for linmod, but insert the sample time at which to perform the linearization as the second argument. For example,

```
[Ad,Bd,Cd,Dd] = dlinmod('sys', Ts, x, u);
```

produces a discrete state-space model at the sampling time Ts and the operating point given by the state vector x and input vector u. To obtain a continuous model approximation of a discrete system, set Ts to 0.

For systems composed of linear, multirate, discrete, and continuous blocks, dlinmod produces linear models having identical frequency and time responses (for constant inputs) at the converted sampling time Ts, provided that

- Ts is an integer multiple of all the sampling times in the system.
- The system is stable.

For systems that do not meet the first condition, in general the linearization is a time-varying system, which cannot be represented with the [*A*,*B*,*C*,*D*] state-space model that dlinmod returns.

Computing the eigenvalues of the linearized matrix Ad provides an indication of the stability of the system. The system is stable if Ts>0 and the eigenvalues are within the unit circle, as determined by this statement:

```
all(abs(eig(Ad))) < 1
```

Likewise, the system is stable if Ts = 0 and the eigenvalues are in the left half plane, as determined by this statement:

```
all(real(eig(Ad))) < 0
```

When the system is unstable and the sample time is not an integer multiple of the other sampling times, dlinmod produces Ad and Bd matrices, which can be complex. The eigenvalues of the Ad matrix in this case still, however, provide a good indication of stability.

You can use dlinmod to convert the sample times of a system to other values or to convert a linear discrete system to a continuous system or vice versa.

You can find the frequency response of a continuous or discrete system by using the `bode` command.

Notes

By default, the system time is set to zero. For systems that are dependent on time, you can set the variable `para` to a two-element vector, where the second element is used to set the value of `t` at which to obtain the linear model.

The ordering of the states from the nonlinear model to the linear model is maintained. For Simulink systems, a character vector variable that contains the block name associated with each state can be obtained using

```
[sizes,x0,xstring] = sys
```

where `xstring` is a vector of strings whose *i*th row is the block name associated with the `i`th state. Inputs and outputs are numbered sequentially on the diagram.

For single-input multi-output systems, you can convert to transfer function form using the routine `ss2tf` or to zero-pole form using `ss2zp`. You can also convert the linearized models to LTI objects using `ss`. This function produces an LTI object in state-space form that can be further converted to transfer function or zero-pole-gain form using `tf` or `zpk`.

The default algorithms in `linmod` and `dlinmod` handle Transport Delay blocks by replacing the linearization of the blocks with a Pade approximation. For the `'v5'` algorithm, linearization of a model that contains Derivative or Transport Delay blocks can be troublesome. For more information, see “Linearizing Models”.

`linmod` | `linmod2` | `linmodv5`

Introduced in R2007a

close_system

Close Simulink system window or block dialog box

Syntax

```
close_system
```

```
close_system('sys')
```

```
close_system('sys', saveflag)
```

```
close_system('sys', 'newname')
```

```
close_system('sys', 'newname','ErrorIfShadowed', true)
```

Description

`close_system` with no arguments closes the current system or subsystem window. If the current system is the top-level system and it has been modified, `close_system` returns an error. The current system is defined in the description of the `gcs` command.

`close_system('sys')` closes the specified system, subsystem, or block window.

`close_system('sys')` unloads a model after specifying

- `load_system('sys')`.

`'sys'` can be a character vector (which can be a system, a subsystem, or a full block pathname), a cell array of character vectors, a numeric handle, or an array of numeric handles. This command displays an error if `'sys'` is a MATLAB keyword, `'simulink'`, or more than 63 characters long.

`close_system('sys', saveflag)`, if *`saveflag`* is 1, saves the specified top-level system to a file with its current name, then closes the specified top-level system window and removes it from memory. If *`saveflag`* is 0, the system is closed without saving. A single *`saveflag`* can be supplied, in which case it is applied to all block diagrams. Alternatively, separate *`saveflag`*s can be supplied for each block diagram, as a numeric array.

`close_system('*sys*', '*newname*')` saves the specified top-level system to a file with the specified new name, then closes the system.

Additional arguments can be supplied when saving a block diagram. These are exactly the same as for `save_system`:

- `ErrorIfShadowed`: true or false (default: false)
- `BreakAllLinks`: true or false (default: false)
- `SaveAsVersion`: MATLAB version name (default: current)
- `OverwriteIfChangedOnDisk`: true or false (default: false)
- `SaveModelWorkspace`: true or false (default: false)

If you try to specify additional options when you are doing something other than saving a block diagram, they are ignored. You see a warning if you try to save when closing something other than a block diagram (e.g., a subsystem or a Block Properties dialog).

Examples

This command closes the current system.

```
close_system
```

This command closes the `vdp` system, unless it has been modified, in which case it returns an error.

```
close_system('vdp')
```

This command saves the `engine` system with its current name, then closes it.

```
close_system('engine', 1)
```

This command saves the `mymdl12` system under the new name `testsys`, then closes it.

```
close_system('mymdl12', 'testsys')
```

This command tries to save the `vdp` system to a file with the name `'max'`, but returns an error because `'max'` is the name of an existing MATLAB function.

```
close_system('vdp','max','ErrorIfShadowed', true)
```

All three of the following commands save and close `mymodel` (saved with the same name), and replace links to library blocks with copies of the library blocks in the saved file:

```
close_system('mymodel',1,'BreakAllLinks',true)
close_system('mymodel','mymodel','BreakAllLinks',true)
close_system('mymodel',[],'BreakAllLinks',true)
```

This command closes the dialog box of the Unit Delay block in the `Combustion` subsystem of the `engine` system.

```
close_system('engine/Combustion/Unit Delay')
```

Note The `close_system` command cannot be used in a block or menu callback to close the root-level model. Attempting to close the root-level model in a block or menu callback results in an error and discontinues the callback's execution.

Introduced before R2006a

closeDialog

Close configuration parameters dialog

Syntax

```
closeDialog(configObj)
```

Arguments

configObj

A configuration set (`Simulink.ConfigSet`) or configuration reference (`Simulink.ConfigSetRef`)

Description

`closeDialog` closes an open configuration parameters dialog box. If *`configObj`* is a configuration set, the function closes the dialog box that displays the configuration set. If *`configObj`* is a configuration reference, the function closes the dialog box that displays the referenced configuration set, or generates an error if the reference does not specify a valid configuration set. If the dialog box is already closed, the function does nothing.

Examples

The following example closes a configuration parameters dialog box that shows the current parameters for the current model. The parameter values derive from the active configuration set or configuration reference (configuration object). The code is the same in either case; the only difference is which type of configuration object is currently active.

```
myConfigObj = getActiveConfigSet(gcs);
closeDialog(myConfigObj);
```

Introduced in R2006b

close

Close Simulink Project

Syntax

```
close(proj)
```

Description

`close(proj)` closes the project `proj`.

Examples

Open and Close a Simulink Project

Open a specified project and get a project object to manipulate the project at the command line. For example,

```
proj = simulinkproject('C:/projects/project1/myproject.prj')
```

Close the project.

```
close(proj)
```

Input Arguments

`proj` — Project
project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

See Also

Functions

`simulinkproject`

Introduced in R2013a

coder.allowpcode

Package: coder

Control code generation from protected MATLAB files

Syntax

```
coder.allowpcode('plain')
```

Description

`coder.allowpcode('plain')` allows you to generate protected MATLAB code (P-code) that you can then compile into optimized MEX functions or embeddable C/C++ code. This function does not obfuscate the generated MEX functions or embeddable C/C++ code.

With this capability, you can distribute algorithms as protected P-files that provide code generation optimizations, providing intellectual property protection for your source MATLAB code.

Call this function in the top-level function before control-flow statements, such as `if`, `while`, `switch`, and function calls.

MATLAB functions can call P-code. When the `.m` and `.p` versions of a file exist in the same folder, the P-file takes precedence.

`coder.allowpcode` is ignored outside of code generation.

Examples

Generate optimized embeddable code from protected MATLAB code:

1. Write an function `p_abs` that returns the absolute value of its input:

```
function out = p_abs(in)   %#codegen
% The directive %#codegen indicates that the function
% is intended for code generation
coder.allowpcode('plain');
out = abs(in);
```

2 Generate protected P-code. At the MATLAB prompt, enter:

```
pcode p_abs
```

The P-file, `p_abs.p`, appears in the current folder.

3 Generate a MEX function for `p_abs.p`, using the `-args` option to specify the size, class, and complexity of the input parameter (requires a MATLAB Coder license). At the MATLAB prompt, enter:

```
codegen p_abs -args { int32(0) }
```

`codegen` generates a MEX function in the current folder.

4 Generate embeddable C code for `p_abs.p` (requires a MATLAB Coder license). At the MATLAB prompt, enter:

```
codegen p_abs -config:lib -args { int32(0) };
```

`codegen` generates C library code in the `codegen\lib\p_abs` folder.

See Also

codegen | pcode

Introduced in R2011a

coder.ceval

Call external C/C++ function

Syntax

```
coder.ceval(cfun_name)
coder.ceval(cfun_name,cfun_arguments)

coder.ceval('-global',cfun_name)
coder.ceval('-global',cfun_name,cfun_arguments)

cfun_return = coder.ceval( ___ )
```

Description

`coder.ceval(cfun_name)` executes the external C/C++ function specified by `cfun_name`. Define `cfun_name` in an external C/C++ source file or library. Provide the external source, library, and header files to the code generator.

`coder.ceval(cfun_name,cfun_arguments)` executes `cfun_name` with arguments `cfun_arguments`. `cfun_arguments` is a comma-separated list of input arguments in the order that `cfun_name` requires.

By default, `coder.ceval` passes arguments by value to the C/C++ function whenever C/C++ supports passing arguments by value. To make `coder.ceval` pass arguments by reference, use the constructs `coder.ref`, `coder.rref`, and `coder.wref`. If C/C++ does not support passing arguments by value, for example, if the argument is an array, `coder.ceval` passes arguments by reference. If you do not use `coder.ref`, `coder.rref` or `coder.wref`, a copy of the argument can appear in the generated code to enforce MATLAB semantics for arrays.

`coder.ceval('-global',cfun_name)` executes `cfun_name` and indicates that `cfun_name` uses one or more MATLAB global variables. The code generator can then produce code that is consistent with this global variable usage.

`coder.ceval('-global',cfun_name,cfun_arguments)` executes `cfun_name` with arguments `cfun_arguments` and indicates that `cfun_name` uses one or more MATLAB global variables.

`cfun_return = coder.ceval(___)` executes `cfun_name` and returns a single scalar value, `cfun_return`, corresponding to the value that the C/C++ function returns in the `return` statement. To be consistent with C/C++, `coder.ceval` can return only a scalar value. It cannot return an array. Use this option with any of the input argument combinations in the previous syntaxes.

Examples

Call External C Function

Call a C function `foo(u)` from a MATLAB function from which you intend to generate C code.

Create a C header file `foo.h` for a function `foo` that takes two input parameters of type `double` and returns a value of type `double`.

```
double foo(double in1, double in2);
```

Write the C function `foo.c`.

```
#include <stdio.h>
#include <stdlib.h>
#include "foo.h"

double foo(double in1, double in2)
{
  return in1 + in2;
}
```

Write a function `callfoo` that calls `foo` by using `coder.ceval`. Provide the source and header files to the code generator in the function.

```
function y = callfoo  %#codegen
y = 0.0;
if coder.target('MATLAB')
    % Executing in MATLAB, call MATLAB equivalent of
    % C function foo
    y = 10 + 20;
else
    % Executing in generated code, call C function foo
    coder.updateBuildInfo('addSourceFiles','foo.c');
    coder.cinclude('foo.h');
    y = coder.ceval('foo', 10, 20);
end
end
```

Generate C library code for function `callfoo`. The `codegen` function generates C code in the `\codegen\lib\callfoo` subfolder.

```
codegen -config:lib callfoo -report
```

Call a C Library Function

Call a C library function from MATLAB code.

Write a MATLAB function `myabsval`.

```
function y = myabsval(u)
%#codegen
y = abs(u);
```

Generate a C static library for `myabsval`, using the `-args` option to specify the size, type, and complexity of the input parameter.

```
codegen -config:lib myabsval -args {0.0}
```

The `codegen` function creates the library file `myabsval.lib` and header file `myabsval.h` in the folder `\codegen\lib\myabsval`. (The library file extension can change depending on your platform.) It generates the functions `myabsval_initialize` and `myabsval_terminate` in the same folder.

Write a MATLAB function to call the generated C library function using `coder.ceval`.

```
function y = callmyabsval(y)
%#codegen
% Check the target. Do not use coder.ceval if callmyabsval is
% executing in MATLAB
if coder.target('MATLAB')
  % Executing in MATLAB, call function myabsval
  y = myabsval(y);
```

```
else
  % add the required include statements to generated function code
  coder.updateBuildInfo('addIncludePaths','$(START_DIR)\codegen\lib\myabsval');
  coder.cinclude('myabsval_initialize.h');
  coder.cinclude('myabsval.h');
  coder.cinclude('myabsval_terminate.h');

  % Executing in the generated code.
  % Call the initialize function before calling the
  % C function for the first time
  coder.ceval('myabsval_initialize');

  % Call the generated C library function myabsval
  y = coder.ceval('myabsval',y);

  % Call the terminate function after
  % calling the C function for the last time
  coder.ceval('myabsval_terminate');
end
```

Generate the MEX function `callmyabsval_mex`. Provide the generated library file at the command line.

```
codegen -config:mex callmyabsval codegen\lib\myabsval\myabsval.lib -args {-2.75}
```

Rather than providing the library at the command line, you can use `coder.updateBuildInfo` to specify the library within the function. Use this option to preconfigure the build. Add this line to the `else` block:

```
coder.updateBuildInfo('addLinkObjects','myabsval.lib','$(START_DIR)\codegen\lib\myabsva
```

Run the MEX function `callmyabsval_mex` which calls the library function `myabsval`.

```
callmyabsval_mex(-2.75)
```

```
ans =

    2.7500
```

Call the MATLAB function `callmyabsval`.

```
callmyabsval(-2.75)
```

```
ans =

    2.7500
```

The `callmyabsval` function exhibits the desired behavior for execution in MATLAB and in code generation.

Call C Function That Uses Global Variable

Use the `'-global'` flag when you call a C function that modifies a global variable.

Write a MATLAB function `useGlobal` that calls a C function `addGlobal`. Use the `'-global'` flag to indicate to the code generator that the C function uses a global variable.

```
function y = useGlobal()
global g;
t = g;
% compare execution with/without '-global' flag
coder.ceval('-global','addGlobal');
y = t;
end
```

Create a C header file `addGlobal.h` for the function `addGlobal`.

```
void addGlobal(void);
```

Write the C function `addGlobal` in the file `addGlobal.c`. This function includes the header file `useGlobal_data.h` that the code generator creates when you generate code for the function `useGlobal`. This header file contains the global variable declaration for `g`.

```
#include "addGlobal.h"
#include "useGlobal_data.h"
void addGlobal(void) {
    g++;
}
```

Generate the MEX function for `useGlobal`. To define the input to the code generator, declare the global variable in the workspace.

```
global g;
g = 1;
codegen useGlobal -report addGlobal.h addGlobal.c
y = useGlobal_mex();
```

With the `'-global'` flag, the MEX function produces the result `y = 1`. The `'-global'` flag indicates to the code generator that the C function possibly modifies the global variable. For `useGlobal`, the code generator produces this code:

```
real_T useGlobal(const emlrtStack *sp)
{
  real_T y;
  (void)sp;
  y = g;
  addGlobal();
  return y;
}
```

Without the `'-global'` flag, the MEX function produces `y = 2`. Because there is no indication that the C function modifies `g`, the code generator assumes that `y` and `g` are identical. This C code is generated:

```
real_T useGlobal(const emlrtStack *sp)
{
  (void)sp;
  addGlobal();
  return g;
}
```

Input Arguments

`cfun_name` — C/C++ function name

character vector | string scalar

Name of external C/C++ function to call.

Example: `coder.ceval('foo')`

Data Types: `char` | `string`

`cfun_arguments` — C/C++ function arguments

scalar variable | array | element of an array | structure | structure field | object property

Comma-separated list of input arguments in the order that `cfun_name` requires.

Example: `coder.ceval('foo', 10, 20);`

Example: `coder.ceval('myFunction', coder.ref(x));`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical` | `char` | `struct`
Complex Number Support: Yes

Limitations

- You cannot use `coder.ceval` on functions that you declare extrinsic with `coder.extrinsic`.
- When the LCC compiler creates a library, it adds a leading underscore to the library function names. If the compiler for the library was LCC and your code generation compiler is not LCC, you must add the leading underscore to the function name, for example, `coder.ceval('_mylibfun')`. If the compiler for a library was not LCC, you cannot use LCC to generate code from MATLAB code that calls functions from that library. Those library function names do not have the leading underscore that the LCC compiler requires.
- If a property has a get method, a set method, or validators, or is a System object property with certain attributes, then you cannot pass the property by reference to an external function. See “Passing By Reference Not Supported for Some Properties”.

Tips

- For code generation, before calling `coder.ceval`, you must specify the type, size, and complexity data type of return values and output arguments.
- Use `coder.ceval` only in MATLAB for code generation. `coder.ceval` generates an error in uncompiled MATLAB code. To determine if a MATLAB function is executing in MATLAB, use `coder.target`. If the function is executing in MATLAB, call the MATLAB version of the C/C++ function.

Topics

“Integrate C Code Using the MATLAB Function Block”
“Unknown Output Type for coder.ceval”

Introduced in R2011a

coder.cinclude

Include header file in generated code

Syntax

```
coder.cinclude(headerfile)
coder.cinclude(headerfile,'InAllSourceFiles',allfiles)
```

Description

`coder.cinclude(headerfile)` includes a header file in generated C/C++ source code.

MATLAB Coder generates the include statement in the C/C++ source files that are generated from the MATLAB code that contains the `coder.cinclude` call.

In a Simulink model, when a `coder.cinclude` call appears in a MATLAB Function block, the code generator puts the include statement in the model header file.

`coder.cinclude(headerfile,'InAllSourceFiles',allfiles)` uses the `allfiles` option to determine whether to include the header file in almost all C/C++ source files.

If `allfiles` is `true`, MATLAB Coder generates the include statement in almost all C/C++ source files, except for some utility files. This behavior is the `coder.cinclude` behavior from R2016a and earlier releases. The presence of the include statement in these additional files can increase compile time and make the generated code less readable. Use this option only if your code depends on the legacy behavior. If `allfiles` is `false`, the behavior is the same as the behavior of `coder.cinclude(headerfile)`.

In a MATLAB Function block, `coder.cinclude(headerfile,'InAllSourceFiles', allfiles)` is the same as `coder.cinclude(headerfile)`.

Examples

Include Header File in C/C++ Code Generated by Using the MATLAB Coder codegen Command

Generate code from a MATLAB function that calls an external C function. Use `coder.cinclude` to include the required header file in the generated C code.

In a writable folder, create a subfolder `mycfiles`.

Write a C function `myMult2.c` that doubles its input. Save it in `mycfiles`.

```
#include "myMult2.h"
double myMult2(double u)
{
    return 2 * u;
}
```

Write the header file `myMult2.h`. Save it in `mycfiles`.

```
#if !defined(MYMULT2)
#define MYMULT2
extern double myMult2(double);
#endif
```

Write a MATLAB function, `myfunc`, that includes `myMult2.h` and calls `myMult2` for code generation only.

```
function y = myfunc
%#codegen
y = 21;
if ~coder.target('MATLAB')
    % Running in generated code
    coder.cinclude('myMult2.h');
    y = coder.ceval('myMult2', y);
else
    % Running in MATLAB
    y = y * 2;
end
end
```

Create a code configuration object for a static library. Specify the locations of `myMult2.h` and `myMult2.c`

```
cfg = coder.config('lib');
cfg.CustomInclude = fullfile(pwd,'mycfiles');
cfg.CustomSource = fullfile(pwd,'mycfiles','myMult2.c');
```

Generate the code.

```
codegen -config cfg myfunc -report
```

The file `myfunc.c` contains this statement:

```
#include "myMult2.h"
```

The include statement does not appear in any other file.

Include Header File in C/C++ Code Generated from a MATLAB Function Block in a Simulink Model

Generate code from a MATLAB Function block that calls an external C function. Use `coder.cinclude` to include the required header file in the generated C code.

In a writable folder, create a subfolder `mycfiles`.

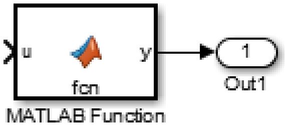
Write a C function `myMult2.c` that doubles its input. Save it in `mycfiles`.

```
#include "myMult2.h"
double myMult2(double u)
{
    return 2 * u;
}
```

Write the header file `myMult2.h`. Save it in `mycfiles`.

```
#if !defined(MYMULT2)
#define MYMULT2
extern double myMult2(double);
#endif
```

Create a Simulink model that contains a MATLAB Function block connected to an Outport block.



In the MATLAB Function block, add the function `myfunc` that includes `myMult2.h` and calls `myMult2`.

```
function y = myfunc
%#codegen
y = 21;
coder.cinclude('myMult2.h');
y = coder.ceval('myMult2', y);
% Specify the locations of myMult2.h and myMult2.c
coder.extrinsic('pwd', 'fullfile');
customDir = coder.const(fullfile(pwd, 'mycfiles'));
coder.updateBuildInfo('addIncludePaths', customDir);
coder.updateBuildInfo('addSourcePaths', customDir);
coder.updateBuildInfo('addSourceFiles', 'myMult2.c');
end
```

Open the Configuration Parameters dialog box.

On the **Solver** pane, select a fixed-step solver.

Save the model as `mymodel`.

Build the model.

The file `mymodel.h` contains this statement:

```
#include "myMult2.h"
```

To read more about integrating custom code in a MATLAB Function block, see “Integrate C Code Using the MATLAB Function Block”.

Input Arguments

`headerfile` — Name of header file

character vector | string scalar

Name of a header file specified as a character vector or string scalar. `headerfile` must be a compile-time constant.

Enclose a system header file name in angle brackets `< >`. The generated `#include` statement for a system header file has the format `#include <sysheader>`. A system header file must be in a standard location or on the include path. Specify the include path by using code generation custom code parameters.

Example: `coder.cinclude('<sysheader.h>')`

For a header file that is not a system header file, omit the angle brackets. The generated `#include` statement for a header file that is not a system header file has the format `#include "myHeader"`. The header file must be in the current folder or on the include path. Specify the include path by using code generation custom code parameters.

Example: `coder.cinclude('myheader.h')`

Data Types: `char`

`allfiles` — All source files option
true | false

Option to include header file in all generated C/C++ source files. If `allfiles` is `true`, MATLAB Coder generates the include statement in almost all of the C/C++ source files, except for some utility files. If `allfiles` is `false`, the behavior is the same as the behavior of `coder.cinclude(headerfile)`.

In a MATLAB Function block, the code generator ignores the all source files option.

Data Types: `logical`

Limitations

- Do not call `coder.cinclude` inside run-time conditional constructs such as `if` statements, `switch` statements, `while`-loops, and `for`-loops. You can call `coder.cinclude` inside compile-time conditional statements, such as `coder.target`. For example:

  ```
  ...
   if ~coder.target('MATLAB')
     coder.cinclude('foo.h');
     coder.ceval('foo');
  end
  ...
  ```

Tips

- Before a `coder.ceval` call, call `coder.cinclude` to include the header file required by the external function that `coder.ceval` calls.

- Extraneous include statements in generated C/C++ code can increase compile time and reduce code readability. To avoid extraneous include statements in code generated by MATLAB Coder, follow these best practices:

  - Place a `coder.cinclude` call as close as possible to the `coder.ceval` call that requires the header file.
  - Do not set `allfiles` to `true`.

  For the MATLAB Function block, the code generator generates the include statement in the model header file.
- In R2016a and earlier releases, for any `coder.cinclude` call, MATLAB Coder included the header file in almost all generated C/C++ source files, except for some utility files. If you have code that depends on this legacy behavior, you can preserve the legacy behavior by using this syntax:

  ```
  coder.cinclude(headerfile,'InAllSourceFiles',true)
  ```

Topics

"Model Configuration Parameters: Code Generation Custom Code" (Simulink Coder)

Introduced in R2013a

coder.const

Fold expressions into constants in generated code

Syntax

```
out = coder.const(expression)
[out1,...,outN] = coder.const(handle,arg1,...,argN)
```

Description

`out = coder.const(expression)` evaluates `expression` and replaces `out` with the result of the evaluation in generated code.

`[out1,...,outN] = coder.const(handle,arg1,...,argN)` evaluates the multi-output function having handle `handle`. It then replaces `out1,...,outN` with the results of the evaluation in the generated code.

Examples

Specify Constants in Generated Code

This example shows how to specify constants in generated code using `coder.const`.

Write a function `AddShift` that takes an input `Shift` and adds it to the elements of a vector. The vector consists of the square of the first 10 natural numbers. `AddShift` generates this vector.

```
function y = AddShift(Shift) %#codegen
y = (1:10).^2+Shift;
```

Generate code for `AddShift` using the `codegen` command. Open the Code Generation Report.

```
codegen -config:lib -launchreport AddShift -args 0
```

The code generator produces code for creating the vector. It adds Shift to each element of the vector during vector creation. The definition of AddShift in generated code looks as follows:

```
void AddShift(double Shift, double y[10])
{
  int k;
  for (k = 0; k < 10; k++) {
    y[k] = (double)((1 + k) * (1 + k)) + Shift;
  }
}
```

Replace the statement

```
y = (1:10).^2+Shift;
```

with

```
y = coder.const((1:10).^2)+Shift;
```

Generate code for AddShift using the codegen command. Open the Code Generation Report.

```
codegen -config:lib -launchreport AddShift -args 0
```

The code generator creates the vector containing the squares of the first 10 natural numbers. In the generated code, it adds Shift to each element of this vector. The definition of AddShift in generated code looks as follows:

```
void AddShift(double Shift, double y[10])
{
  int i0;
  static const signed char iv0[10] = { 1, 4, 9, 16, 25, 36,
                               49, 64, 81, 100 };

  for (i0 = 0; i0 < 10; i0++) {
    y[i0] = (double)iv0[i0] + Shift;
  }
}
```

Create Lookup Table in Generated Code

This example shows how to fold a user-written function into a constant in generated code.

Write a function `getsine` that takes an input `index` and returns the element referred to by `index` from a lookup table of sines. The function `getsine` creates the lookup table using another function `gettable`.

```
function y = getsine(index) %#codegen
  assert(isa(index, 'int32'));
  persistent tbl;
  if isempty(tbl)
           tbl = gettable(1024);
  end
  y = tbl(index);

function y = gettable(n)
      y = zeros(1,n);
      for i = 1:n
         y(i) = sin((i-1)/(2*pi*n));
      end
```

Generate code for `getsine` using an argument of type `int32`. Open the Code Generation Report.

```
codegen -config:lib -launchreport getsine -args int32(0)
```

The generated code contains instructions for creating the lookup table.

Replace the statement:

```
tbl = gettable(1024);
```

with:

```
tbl = coder.const(gettable(1024));
```

Generate code for `getsine` using an argument of type `int32`. Open the Code Generation Report.

The generated code contains the lookup table itself. `coder.const` forces the expression `gettable(1024)` to be evaluated during code generation. The generated code does not contain instructions for the evaluation. The generated code contains the result of the evaluation itself.

Specify Constants in Generated Code Using Multi-Output Function

This example shows how to specify constants in generated code using a multi-output function in a `coder.const` statement.

Write a function `MultiplyConst` that takes an input `factor` and multiplies every element of two vectors `vec1` and `vec2` with `factor`. The function generates `vec1` and `vec2` using another function `EvalConsts`.

```
function [y1,y2] = MultiplyConst(factor) %#codegen
  [vec1,vec2]=EvalConsts(pi.*(1./2.^(1:10)),2);
  y1=vec1.*factor;
  y2=vec2.*factor;

function [f1,f2]=EvalConsts(z,n)
  f1=z.^(2*n)/factorial(2*n);
  f2=z.^(2*n+1)/factorial(2*n+1);
```

Generate code for `MultiplyConst` using the `codegen` command. Open the Code Generation Report.

```
codegen -config:lib -launchreport MultiplyConst -args 0
```

The code generator produces code for creating the vectors.

Replace the statement

```
[vec1,vec2]=EvalConsts(pi.*(1./2.^(1:10)),2);
```

with

```
[vec1,vec2]=coder.const(@EvalConsts,pi.*(1./2.^(1:10)),2);
```

Generate code for `MultiplyConst` using the `codegen` command. Open the Code Generation Report.

```
codegen -config:lib -launchreport MultiplyConst -args 0
```

The code generator does not generate code for creating the vectors. Instead, it calculates the vectors and specifies the calculated vectors in generated code.

Read Constants by Processing XML File

This example shows how to call an extrinsic function using `coder.const`.

Write an XML file `MyParams.xml` containing the following statements:

```
<params>
    <param name="hello" value="17"/>
    <param name="world" value="42"/>
</params>
```

Save `MyParams.xml` in the current folder.

Write a MATLAB function `xml2struct` that reads an XML file. The function identifies the XML tag `param` inside another tag `params`.

After identifying `param`, the function assigns the value of its attribute `name` to the field name of a structure `s`. The function also assigns the value of attribute `value` to the value of the field.

```
function s = xml2struct(file)

s = struct();
doc = xmlread(file);
els = doc.getElementsByTagName('params');
for i = 0:els.getLength-1
    it = els.item(i);
    ps = it.getElementsByTagName('param');
    for j = 0:ps.getLength-1
        param = ps.item(j);
        paramName = char(param.getAttribute('name'));
        paramValue = char(param.getAttribute('value'));
        paramValue = evalin('base', paramValue);
        s.(paramName) = paramValue;
    end
end
```

Save `xml2struct` in the current folder.

Write a MATLAB function `MyFunc` that reads the XML file `MyParams.xml` into a structure `s` using the function `xml2struct`. Declare `xml2struct` as extrinsic using `coder.extrinsic` and call it in a `coder.const` statement.

```
function y = MyFunc(u) %#codegen
  assert(isa(u, 'double'));
  coder.extrinsic('xml2struct');
  s = coder.const(xml2struct('MyParams.xml'));
  y = s.hello + s.world + u;
```

Generate code for MyFunc using the codegen command. Open the Code Generation Report.

```
codegen -config:dll -launchreport MyFunc -args 0
```

The code generator executes the call to xml2struct during code generation. It replaces the structure fields s.hello and s.world with the values 17 and 42 in generated code.

Input Arguments

expression — MATLAB expression or user-written function

expression with constants | single-output function with constant arguments

MATLAB expression or user-defined single-output function.

The expression must have compile-time constants only. The function must take constant arguments only. For instance, the following code leads to a code generation error, because x is not a compile-time constant.

```
function y=func(x)
   y=coder.const(log10(x));
```

To fix the error, assign x to a constant in the MATLAB code. Alternatively, during code generation, you can use coder.Constant to define input type as follows:

```
codegen -config:lib func -args coder.Constant(10)
```

Example: 2*pi, factorial(10)

handle — Function handle

function handle

Handle to built-in or user-written function.

Example: @log, @sin

Data Types: function_handle

arg1,...,argN — Arguments to the function with handle handle

function arguments that are constants

Arguments to the function with handle `handle`.

The arguments must be compile-time constants. For instance, the following code leads to a code generation error, because `x` and `y` are not compile-time constants.

```
function y=func(x,y)
   y=coder.const(@nchoosek,x,y);
```

To fix the error, assign `x` and `y` to constants in the MATLAB code. Alternatively, during code generation, you can use `coder.Constant` to define input type as follows:

```
codegen -config:lib func -args {coder.Constant(10),coder.Constant(2)}
```

Output Arguments

out — Value of expression

value of the evaluated expression

Value of `expression`. In the generated code, MATLAB Coder replaces occurrences of `out` with the value of `expression`.

out1,...,outN — Outputs of the function with handle handle

values of the outputs of the function with handle `handle`

Outputs of the function with handle `handle`.MATLAB Coder evaluates the function and replaces occurrences of `out1,...,outN` with constants in the generated code.

Tips

- When possible, the code generator constant-folds expressions automatically. Typically, automatic constant-folding occurs for expressions with scalars only. Use `coder.const` when the code generator does not constant-fold expressions on its own.
- When constant-folding computationally intensive function calls, to reduce code generation time, make the function call extrinsic. The extrinsic function call causes evaluation of the function call by MATLAB instead of by the code generator. For example:

```
function j = fcn(z)
zTable = coder.const(0:0.01:100);
jTable = coder.const(feval('besselj',3,zTable));
j = interp1(zTable,jTable,z);
end
```

See “Use coder.const with Extrinsic Function Calls” (MATLAB Coder).

- If `coder.const` is unable to constant-fold a function call, try to force constant-folding by making the function call extrinsic. The extrinsic function call causes evaluation of the function call by MATLAB instead of by the code generator. For example:

  ```
  function yi = fcn(xi)
  y = coder.const(feval('rand',1,100));
  yi = interp1(y,xi);
  end
  ```

  See “Use coder.const with Extrinsic Function Calls” (MATLAB Coder).

Introduced in R2013b

coder.cstructname

Package: coder

Name C structure type in generated code

`coder.cstructname` names the generated or externally defined C structure type to use for MATLAB variables that are represented as structures in generated code.

Syntax

```
coder.cstructname(var,structName)
coder.cstructname(var,structName,'extern','HeaderFile',headerfile)
coder.cstructname(var,structName,'extern','HeaderFile',
headerfile,'Alignment',alignment)

outtype = coder.cstructname(intype,structName)
outtype = coder.cstructname(intype,structName,'extern','HeaderFile',
headerfile)
outtype = coder.cstructname(intype,structName,'extern','HeaderFile',
headerfile,'Alignment',alignment)
```

Description

`coder.cstructname(var,structName)` names the C structure type generated for the MATLAB variable `var`. The input `var` can be a structure or a cell array. Use this syntax in a function from which you generate code. Place `coder.cstructname` after the definition of `var` and before the first use of `var`. If `var` is an entry-point (top-level) function input argument, place `coder.cstructname` at the beginning of the function, before any control flow statements.

`coder.cstructname(var,structName,'extern','HeaderFile',headerfile)` specifies that the C structure type to use for `var` has the name `structName` and is defined in the external file, `headerfileName`.

It is possible to use the `'extern'` option without specifying the header file. However, it is a best practice to specify the header file so that the code generator produces the `#include` statement in the correct location.

`coder.cstructname(var,structName,'extern','HeaderFile', headerfile,'Alignment',alignment)` also specifies the run-time memory alignment for the externally defined structure type `structName`. If you have Embedded Coder and use custom Code Replacement Libraries (CRLs), specify the alignment so that the code generator can match CRL functions that require alignment for structures. See “Data Alignment for Code Replacement” (Embedded Coder).

`outtype = coder.cstructname(intype,structName)` returns a structure or cell array type object `outtype` that specifies the name of the C structure type to generate. `coder.cstructname` creates `outtype` with the properties of the input type `intype`. Then, it sets the `TypeName` property to `structName`. Use this syntax to create a type object that you use with the `codegen -args` option. You cannot use this syntax in a function from which you generate code.

You cannot use this syntax in a MATLAB Function block.

`outtype = coder.cstructname(intype,structName,'extern','HeaderFile', headerfile)` returns a type object `outtype` that specifies the name and location of an externally defined C structure type. The code generator uses the externally defined structure type for variables with type `outtype`.

You cannot use this syntax in a MATLAB Function block.

`outtype = coder.cstructname(intype,structName,'extern','HeaderFile', headerfile,'Alignment',alignment)` creates a type object `outtype` that also specifies the C structure type alignment.

You cannot use this syntax in a MATLAB Function block.

Examples

Name the C Structure Type for a Variable in a Function

In a MATLAB function, `myfun`, assign the name `MyStruct` to the generated C structure type for the variable `v`.

```
function y = myfun()
%#codegen
v = struct('a',1,'b',2);
coder.cstructname(v, 'myStruct');
y = v;
end
```

Generate standalone C code. For example, generate a static library.

```
codegen -config:lib myfun -report
```

To see the generated structure type, open `codegen/lib/myfun/myfun_types.h` or view `myfun_types.h` in the code generation report. The generated C structure type is:

```
typedef struct {
  double a;
  double b;
} myStruct;
```

Name the C Structure Type Generated for a Substructure

In a MATLAB function, `myfun1`, assign the name `MyStruct` to the generated C structure type for the structure `v`. Assign the name `mysubStruct` to the structure type generated for the substructure `v.b`.

```
function y = myfun()
%#codegen
v = struct('a',1,'b',struct('f',3));
coder.cstructname(v, 'myStruct');
coder.cstructname(v.b, 'mysubStruct');
y = v;
end
```

The generated C structure type `mysubStruct` is:

```
typedef struct {
  double f;
} mysubStruct;
```

The generated C structure type `myStruct` is:

```
typedef struct {
  double a;
  mysubStruct b;
} myStruct;
```

Name the Structure Type Generated for a Cell Array

In a MATLAB function, `myfun2`, assign the name `myStruct` to the generated C structure type for the cell array`c`.

```
function z = myfun2()
c = {1 2 3};
coder.cstructname(c,'myStruct')
z = c;
```

The generated C structure type for `c` is:

```
typedef struct {
  double f1;
  double f2;
  double f3;
} myStruct;
```

Name an Externally Defined C Structure Type

Specify that a structure passed to a C function has a structure type defined in a C header file.

Create a C header file `mycadd.h` for the function `mycadd` that takes a parameter of type `mycstruct`. Define the type `mycstruct` in the header file.

```
#ifndef MYCADD_H
#define MYCADD_H

typedef struct {
    double f1;
    double f2;
} mycstruct;

double mycadd(mycstruct *s);
#endif
```

Write the C function `mycadd.c`.

```
#include <stdio.h>
#include <stdlib.h>

#include "mycadd.h"

double mycadd(mycstruct *s)
{
  return  s->f1 + s->f2;
}
```

Write a MATLAB function `mymAdd` that passes a structure by reference to `mycadd`. Use `coder.cstructname` to specify that in the generated code, the structure has the C type `mycstruct`, which is defined in `mycadd.h`.

```
function y = mymAdd
%#codegen
s = struct('f1', 1, 'f2', 2);
coder.cstructname(s, 'mycstruct', 'extern', 'HeaderFile', 'mycadd.h');
y = 0;
y = coder.ceval('mycadd', coder.ref(s));
```

Generate a C static library for function `mymAdd`.

```
codegen -config:lib mymAdd mycadd.c
```

The generated header file `mymadd_types.h` does not contain a definition of the structure `mycstruct` because `mycstruct` is an external type.

Create a Structure Type Object That Names the Generated C Structure Type

Suppose that the entry-point function `myFunction` takes a structure argument. To specify the type of the input argument at the command line:

1. Define an example structure `S`.
2. Create a type `T` from `S` by using `coder.typeof`.
3. Use `coder.cstructname` to create a type `T1` that:
   - Has the properties of `T`.
   - Names the generated C structure type `myStruct`.
4. Pass the type to `codegen` by using the `-args` option.

For example:

```
S = struct('a',double(0),'b',single(0));
T = coder.typeof(S);
T1 = coder.cstructname(T,'myStruct');
codegen -config:lib myFunction -args T1
```

Alternatively, you can create the structure type directly from the example structure.

```
S = struct('a',double(0),'b',single(0));
T1 = coder.cstructname(S,'myStruct');
codegen -config:lib myFunction -args T1
```

Input Arguments

var — MATLAB structure or cell array variable

structure | cell array

MATLAB structure or cell array variable that is represented as a structure in the generated code.

structName — Name of C structure type

character vector | string scalar

Name of generated or externally defined C structure type, specified as a character vector or string scalar.

headerfile — Header file that contains the C structure type definition

character vector | string scalar

Header file that contains the C structure type definition, specified as a character vector or string scalar.

To specify the path to the file:

- Use the `codegen -I` option or the **Additional include directories** parameter on the MATLAB Coder app settings **Custom Code** tab.
- For a MATLAB Function block, on the **Simulation Target** and the **Code Generation > Custom Code** panes, under **Additional build information**, set the **Include directories** parameter.

Alternatively, use `coder.updateBuildInfo` with the `'addIncludePaths'` option.

Example: `'mystruct.h'`

`alignment` — Run-time memory alignment for structure
-1 (default) | power of 2 not greater than 128

Run-time memory alignment for generated or externally defined structure.

`intype` — Type object or variable for creation of new type object
`coder.StructType` | `coder.CellType` | structure | cell array

Structure type object, cell array type object, structure variable, or cell array variable from which to create a type object.

Limitations

- You cannot apply `coder.cstructname` directly to a global variable. To name the structure type to use with a global variable, use `coder.cstructname` to create a type object that names the structure type. Then, when you run `codegen`, specify that the global variable has that type. See “Name the C Structure Type to Use With a Global Structure Variable” (MATLAB Coder).
- For cell array inputs, the field names of externally defined structures must be `f1`, `f2`, and so on.

Tips

- For information about how the code generator determines the C/C++ types of structure fields, see “Mapping MATLAB Types to Types in Generated Code” (MATLAB Coder).
- Using `coder.cstructname` on a structure array sets the name of the structure type of the base element, not the name of the array. Therefore, you cannot apply `coder.cstructname` to a structure array element, and then apply it to the array with a different C structure type name. For example, the following code is not allowed. The second `coder.cstructname` attempts to set the name of the base type to `myStructArrayName`, which conflicts with the previously specified name, `myStructName`.

  ```
  % Define scalar structure with field a
  myStruct = struct('a', 0);
  ```

```
coder.cstructname(myStruct,'myStructName');
% Define array of structure with field a
myStructArray = repmat(myStruct,k,n);
coder.cstructname(myStructArray,'myStructArrayName');
```

- Applying `coder.cstructname` to an element of a structure array produces the same result as applying `coder.cstructname` to the entire structure array. If you apply `coder.cstructname` to an element of a structure array, you must refer to the element by using a single subscript. For example, you can use `var(1)`, but not `var(1,1)`. Applying `coder.cstructname` to `var(:)` produces the same result as applying `coder.cstructname` to `var` or `var(n)`.
- Heterogeneous cell arrays are represented as structures in the generated code. Here are considerations for using `coder.cstructname` with cell arrays:

  - In a function from which you generate code, using `coder.cstructname` with a cell array variable makes the cell array heterogeneous. Therefore, if a cell array is an entry-point function input and its type is permanently homogeneous, then you cannot use `coder.cstructname` with the cell array.
  - Using `coder.cstructname` with a homogeneous `coder.CellType` object `intype` makes the returned object heterogeneous. Therefore, you cannot use `coder.cstructname` with a permanently homogeneous `coder.CellType` object. For information about when a cell array is permanently homogeneous, see “Specify Cell Array Inputs at the Command Line” (MATLAB Coder).
  - When used with a `coder.CellType` object, `coder.cstructname` creates a `coder.CellType` object that is permanently heterogeneous.
- When you use a structure named by `coder.cstructname` in a project with row-major and column-major array layouts, the code generator renames the structure in certain cases, appending `row_` or `col_` to the beginning of the structure name. This renaming provides unique type definitions for the types that are used in both array layouts.
- These tips apply only to MATLAB Function blocks:

  - MATLAB Function block input and output structures are associated with bus signals. The generated name for the structure type comes from the bus signal name. Do not use `coder.cstructname` to name the structure type for input or output signals. See “Create Structures in MATLAB Function Blocks”.
  - The code generator produces structure type names according to identifier naming rules, even if you name the structure type with `coder.cstructname`. If you have Embedded Coder, you can customize the naming rules. See “Construction of Generated Identifiers” (Embedded Coder).

Introduced in R2011a

coder.extrinsic

Package: coder

Declare extrinsic function or functions

Syntax

```
coder.extrinsic('function_name');

coder.extrinsic('function_name_1', ... , 'function_name_n');

coder.extrinsic('-sync:on', 'function_name');

coder.extrinsic('-sync:on', 'function_name_1', ... ,
'function_name_n');

coder.extrinsic('-sync:off','function_name');

coder.extrinsic('-sync:off', 'function_name_1', ... ,
'function_name_n');
```

Arguments

function_name
function_name_1, ... , *function_name_n*

Declares *function_name* or *function_name_1* through *function_name_n* as extrinsic functions.

–*sync:on*

function_name or *function_name_1* through *function_name_n*.

Enables synchronization of global data between MATLAB and MEX functions before and after calls to the extrinsic functions, *function_name* or *function_name_1* through *function_name_n*. If only a few extrinsic calls modify global data, turn off synchronization before and after all extrinsic function calls by setting the global synchronization mode to `At MEX-function entry and exit`. Use the –*sync:on* option to turn on synchronization for only the extrinsic calls that *do* modify global data.

–sync:off

Disables synchronization of global data between MATLAB and MEX functions before and after calls to the extrinsic functions, *`function_name`* or *`function_name_1`* through *`function_name_n`*. If most extrinsic calls modify global data, but a few do not, you can use the *–sync:off* option to turn off synchronization for the extrinsic calls that *do not* modify global data.

Description

`coder.extrinsic` declares extrinsic functions. During simulation, the code generator produces code for the call to an extrinsic function, but does not produce the function's internal code. Therefore, simulation can run only on platforms where MATLAB software is installed. During standalone code generation, MATLAB attempts to determine whether the extrinsic function affects the output of the function in which it is called — for example by returning `mxArrays` to an output variable. Provided that there is no change to the output, MATLAB proceeds with code generation, but excludes the extrinsic function from the generated code. Otherwise, compilation errors occur.

You cannot use `coder.ceval` on functions that you declare extrinsic by using `coder.extrinsic`.

`coder.extrinsic` is ignored outside of code generation.

Limitations

- Extrinsic function calls have some overhead that can affect performance. Input data that is passed in an extrinsic function call must be provided to MATLAB, which requires making a copy of the data. If the function has any output data, this data must be transferred back into the MEX function environment, which also requires a copy.
- The code generator does not support the use of `coder.extrinsic` to call functions that are located in a private folder.
- The code generator does not support the use of `coder.extrinsic` to call local functions.

Tips

- The code generator detects calls to many common visualization functions, such as plot, disp, and figure. The software treats these functions like extrinsic functions, but you do not have to declare them extrinsic using the coder.extrinsic function.
- Use the coder.screener function to detect which functions you must declare extrinsic. This function opens the code generations readiness tool that detects code generation issues in your MATLAB code.

Examples

The following code declares the MATLAB function patch as extrinsic in the MATLAB local function create_plot.

```
function c = pythagoras(a,b,color) %#codegen
% Calculates the hypotenuse of a right triangle
%  and displays the triangle as a patch object.

c = sqrt(a^2 + b^2);

create_plot(a, b, color);

function create_plot(a, b, color)

%Declare patch as extrinsic
coder.extrinsic('patch');

x = [0;a;a];
y = [0;0;b];
patch(x, y, color);
axis('equal');
```

By declaring patch as extrinsic, you instruct the code generator not to compile or produce code for patch. Instead, the code generator dispatches patch to MATLAB for execution.

coder.ignoreConst

Prevent use of constant value of expression for function specializations

Syntax

`coder.ignoreConst(expression)`

Description

`coder.ignoreConst(expression)` prevents the code generator from using the constant value of `expression` to create function specializations on page 2-102. `coder.ignoreConst(expression)` returns the value of `expression`.

Examples

Prevent Function Specializations Based on Constant Input Values

Use `coder.ignoreConst` to prevent function specializations for a function that is called with constant values.

Write the function `call_myfn`, which calls `myfcn`.

```
function [x, y] = call_myfcn(n)
%#codegen
x = myfcn(n, 'mode1');
y = myfcn(n, 'mode2');
end

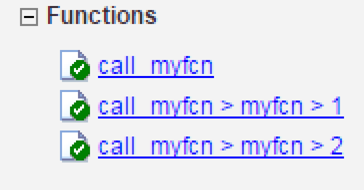
function y = myfcn(n,mode)
coder.inline('never');
if strcmp(mode,'mode1')
    y = n;
else
    y = -n;
```

```
end
end
```

Generate standalone C code. For example, generate a static library. Enable the code generation report.

```
codegen -config:lib call_myfcn -args {1} -report
```

In the code generation report, you see two function specializations for `call_myfcn`.



⊟ Functions

- call_myfcn
- call_myfcn > myfcn > 1
- call_myfcn > myfcn > 2

The code generator creates `call_myfcn>myfcn>1` for `mode` with a value of `'mode1'`. It creates `call_myfcn>myfcn>2` for `mode` with a value of `'mode2'`.

In the generated C code, you see the specializations `my_fcn` and `b_my_fcn`.

```
static double b_myfcn(double n)
{
  return -n;
}

static double myfcn(double n)
{
  return n;
}
```

To prevent the function specializations, instruct the code generator to ignore that values of the `mode` argument are constant.

```
function [x, y] = call_myfcn(n)
%#codegen
x = myfcn(n, coder.ignoreConst('mode1'));
y = myfcn(n, coder.ignoreConst('mode2'));
end

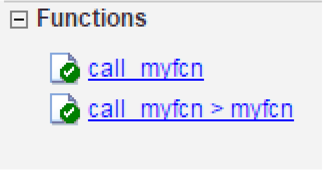
function y = myfcn(n,mode)
coder.inline('never');
if strcmp(mode,'mode1')
```

```
    y = n;
else
    y = -n;
end
end
```

Generate the C code.

```
codegen -config:lib call_myfcn -args {1} -report
```

In the code generation report, you do not see multiple function specializations.



⊟ Functions

call_myfcn

call_myfcn > myfcn

In the generated C code, you see one function for `my_fcn`.

Input Arguments

`expression` — Expression whose value is to be treated as a nonconstant
MATLAB expression

Definitions

Function Specialization

Version of a function in which an input type, size, complexity, or value is customized for a particular invocation of the function.

Function specialization produces efficient C code at the expense of code duplication. The code generation report shows all MATLAB function specializations that the code generator creates. However, the specializations might not appear in the generated C/C++ code due to later transformations or optimizations.

Tips

- For some recursive function calls, you can use `coder.ignoreConst` to force run-time recursion. See “Force Code Generator to Use Run-Time Recursion”.
- `coder.ignoreConst(expression)` prevents the code generator from using the constant value of `expression` to create function specializations. It does not prevent other uses of the constant value during code generation.

`coder.inline`

Topics

“Force Code Generator to Use Run-Time Recursion”
“Compile-Time Recursion Limit Reached”

Introduced in R2017a

coder.inline

Package: coder

Control inlining in generated code

Syntax

```
coder.inline('always')
coder.inline('never')
coder.inline('default')
```

Description

`coder.inline('always')` forces inlining on page 2-105 of the current function in the generated code. Place the `coder.inline` directive inside the function to which it applies. The code generator does not inline entry-point functions, inline functions into `parfor` loops, or inline functions called from `parfor` loops.

`coder.inline('never')` prevents inlining of the current function in the generated code. Prevent inlining when you want to simplify the mapping between the MATLAB source code and the generated code.

`coder.inline('default')` uses internal heuristics to determine whether to inline the current function. Usually, the heuristics produce highly optimized code. Use `coder.inline` only when you need to fine-tune these optimizations.

Examples

- "Prevent Function Inlining" on page 2-104
- "Use coder.inline in Control Flow Statements" on page 2-105

Prevent Function Inlining

In this example, function `foo` is not inlined in the generated code:

```
function y = foo(x)
  coder.inline('never');
  y = x;
end
```

Use coder.inline in Control Flow Statements

You can use `coder.inline` in control flow code. If the software detects contradictory `coder.inline` directives, the generated code uses the default inlining heuristic and issues a warning.

Suppose that you want to generate code for a division function used by a system with limited memory. To optimize memory use in the generated code, the `inline_division` function manually controls inlining based on whether it performs scalar division or vector division:

```
function y = inline_division(dividend, divisor)

% For scalar division, inlining produces smaller code
% than the function call itself.
if isscalar(dividend) && isscalar(divisor)
   coder.inline('always');
else
% Vector division produces a for-loop.
% Prohibit inlining to reduce code size.
   coder.inline('never');
end

if any(divisor == 0)
   error('Cannot divide by 0');
end

y = dividend / divisor;
```

Definitions

Inlining

Technique that replaces a function call with the contents (body) of that function. Inlining eliminates the overhead of a function call, but can produce larger C/C++ code. Inlining can create opportunities for further optimization of the generated C/C++ code.

Introduced in R2011a

coder.load

Load compile-time constants from MAT-file or ASCII file into caller workspace

Syntax

```
S = coder.load(filename)
S = coder.load(filename,var1,...,varN)
S = coder.load(filename,'-regexp',expr1,...,exprN)
S = coder.load(filename,'-ascii')
S = coder.load(filename,'-mat')
S = coder.load(filename,'-mat',var1,...,varN)
S = coder.load(filename,'-mat','-regexp', expr1,...,exprN)
```

Description

`S = coder.load(filename)` loads compile-time constants from `filename`.

- If `filename` is a MAT-file, then `coder.load` loads variables from the MAT-file into a structure array.
- If `filename` is an ASCII file, then `coder.load` loads data into a double-precision array.

`S = coder.load(filename,var1,...,varN)` loads only the specified variables from the MAT-file `filename`.

`S = coder.load(filename,'-regexp',expr1,...,exprN)` loads only the variables that match the specified regular expressions.

`S = coder.load(filename,'-ascii')` treats `filename` as an ASCII file, regardless of the file extension.

`S = coder.load(filename,'-mat')` treats `filename` as a MAT-file, regardless of the file extension.

`S = coder.load(filename,'-mat',var1,...,varN)` treats `filename` as a MAT-file and loads only the specified variables from the file.

`S = coder.load(filename,'-mat','-regexp', expr1,...,exprN)` treats `filename` as a MAT-file and loads only the variables that match the specified regular expressions.

Examples

Load compile-time constants from MAT-file

Generate code for a function `edgeDetect1` which given a normalized image, returns an image where the edges are detected with respect to the threshold value. `edgeDetect1` uses `coder.load` to load the edge detection kernel from a MAT-file at compile time.

Save the Sobel edge-detection kernel in a MAT-file.

```
k = [1 2 1; 0 0 0; -1 -2 -1];
```

```
save sobel.mat k
```

Write the function `edgeDetect1`.

```
function edgeImage = edgeDetect1(originalImage, threshold) %#codegen
assert(all(size(originalImage) <= [1024 1024]));
assert(isa(originalImage, 'double'));
assert(isa(threshold, 'double'));

S = coder.load('sobel.mat','k');
H = conv2(double(originalImage),S.k, 'same');
V = conv2(double(originalImage),S.k','same');
E = sqrt(H.*H + V.*V);
edgeImage = uint8((E > threshold) * 255);
```

Create a code generation configuration object for a static library.

```
cfg = coder.config('lib');
```

Generate a static library for `edgeDetect1`.

```
codegen -report -config cfg edgeDetect1
```

`codegen` generates C code in the `codegen\lib\edgeDetect1` folder.

Load compile-time constants from ASCII file

Generate code for a function `edgeDetect2` which given a normalized image, returns an image where the edges are detected with respect to the threshold value. `edgeDetect2` uses `coder.load` to load the edge detection kernel from an ASCII file at compile time.

Save the Sobel edge-detection kernel in an ASCII file.

```
k = [1 2 1; 0 0 0; -1 -2 -1];
save sobel.dat k -ascii
```

Write the function `edgeDetect2`.

```
function edgeImage = edgeDetect2(originalImage, threshold) %#codegen
assert(all(size(originalImage) <= [1024 1024]));
assert(isa(originalImage, 'double'));
assert(isa(threshold, 'double'));

k = coder.load('sobel.dat');
H = conv2(double(originalImage),k, 'same');
V = conv2(double(originalImage),k','same');
E = sqrt(H.*H + V.*V);
edgeImage = uint8((E > threshold) * 255);
```

Create a code generation configuration object for a static library.

```
cfg = coder.config('lib');
```

Generate a static library for `edgeDetect2`.

```
codegen -report -config cfg edgeDetect2
```

`codegen` generates C code in the `codegen\lib\edgeDetect2` folder.

Input Arguments

`filename` — Name of file

character vector | string scalar

Name of file. `filename` must be a compile-time constant.

filename can include a file extension and a full or partial path. If filename has no extension, load looks for a file named filename.mat. If filename has an extension other than .mat, load treats the file as ASCII data.

ASCII files must contain a rectangular table of numbers, with an equal number of elements in each row. The file delimiter (the character between elements in each row) can be a blank, comma, semicolon, or tab character. The file can contain MATLAB comments (lines that begin with a percent sign, %).

Example: 'myFile.mat'

var1,...,varN — Names of variables to load

character vector | string scalar

Names of variables, specified as one or more character vectors or string scalars. Each variable name must be a compile-time constant. Use the * wildcard to match patterns.

Example: coder.load('myFile.mat','A*') loads all variables in the file whose names start with A.

expr1,...,exprN — Regular expressions indicating which variables to load

character vector | string scalar

Regular expressions indicating which variables to load specified as one or more character vectors or string scalars. Each regular expression must be a compile-time constant.

Example: coder.load('myFile.mat', '-regexp', '^A') loads only variables whose names begin with A.

Output Arguments

S — Loaded variables or data

structure array | m-by-n array

If filename is a MAT-file, S is a structure array.

If filename is an ASCII file, S is an m-by-n array of type double. m is the number of lines in the file and n is the number of values on a line.

Limitations

- Arguments to `coder.load` must be compile-time constants.
- The output `S` must be the name of a structure or array without any subscripting. For example, `S(i) = coder.load('myFile.mat')` is not allowed.
- You cannot use `save` to save workspace data to a file inside a function intended for code generation. The code generator does not support the `save` function. Furthermore, you cannot use `coder.extrinsic` with `save`. Prior to generating code, you can use `save` to save workspace data to a file.

Tips

- `coder.load` loads data at compile time, not at run time. If you are generating MEX code or code for Simulink simulation, you can use the MATLAB function `load` to load run-time values.
- If the MAT-file contains unsupported constructs, use `coder.load(filename,var1,...,varN)` to load only the supported constructs.
- If you generate code in a MATLAB Coder project, the code generator practices incremental code generation for the `coder.load` function. When the MAT-file or ASCII file used by `coder.load` changes, the software rebuilds the code.

See Also

`matfile` | `regexp` | `save`

Topics

"Regular Expressions" (MATLAB)

Introduced in R2013a

coder.nullcopy

Package: coder

Declare uninitialized variables

Syntax

`X = coder.nullcopy(A)`

Description

`X = coder.nullcopy(A)` copies type, size, and complexity of *A* to *X*, but does not copy element values. Preallocates memory for *X* without incurring the overhead of initializing memory.

Use With Caution

Use this function with caution. See “How to Eliminate Redundant Copies by Defining Uninitialized Variables”.

Examples

The following example shows how to declare variable *X* as a 1-by-5 vector of real doubles without performing an unnecessary initialization:

```
function X = foo

N = 5;
X = coder.nullcopy(zeros(1,N));
for i = 1:N
   if mod(i,2) == 0
      X(i) = i;
   else
      X(i) = 0;
```

```
    end
end
```

Using `coder.nullcopy` with `zeros` lets you specify the size of vector *X* without initializing each element to zero.

Limitations

- You cannot use `coder.nullcopy` on sparse matrices, or on structures, cell arrays, or classes that contain sparse matrices.

See Also

Topics

“Eliminate Redundant Copies of Variables in Generated Code”

Introduced in R2011a

coder.opaque

Declare variable in generated code

Syntax

```
y = coder.opaque(type)
y = coder.opaque(type,value)
y = coder.opaque( ___ ,'Size',Size)
y = coder.opaque( ___ ,'HeaderFile',HeaderFile)
```

Description

`y = coder.opaque(type)` declares a variable `y` with the specified type and no initial value in the generated code.

- `y` can be a variable or a structure field.
- MATLAB code cannot set or access `y`, but external C functions can accept `y` as an argument.
- `y` can be an:
  - Argument to `coder.rref`, `coder.wref`, or `coder.ref`
  - Input or output argument to `coder.ceval`
  - Input or output argument to a user-written MATLAB function
  - Input to a subset of MATLAB toolbox functions supported for code generation
- Assignment from `y` declares another variable with the same type in the generated code. For example:

  ```
  y = coder.opaque('int');
  z = y;
  ```

  declares a variable `z` of type `int` in the generated code.
- You can assign `y` from another variable declared using either `coder.opaque` or assignment from a variable declared using `coder.opaque`. The variables must have identical types.

- You can compare `y` to another variable declared using either `coder.opaque` or assignment from a variable declared using `coder.opaque`. The variables must have identical types.

`y = coder.opaque(type,value)` specifies the type and initial value of `y`.

`y = coder.opaque( ___ ,'Size',Size)` specifies the size, in bytes, of `y`. You can specify the size with any of the previous syntaxes.

`y = coder.opaque( ___ ,'HeaderFile',HeaderFile)` specifies the header file that contains the type definition. The code generator produces the `#include` statement for the header file where the statement is required in the generated code. You can specify the header file with any of the previous syntaxes.

Examples

Declare Variable Specifying Initial Value

Generate code for a function `valtest` which returns `1` if the call to `myfun` is successful. This function uses `coder.opaque` to declare a variable `x1` with type `int` and initial value `0`. The assignment `x2 = x1` declares `x2` to be a variable with the type and initial value of `x1`.

Write a function `valtest`.

```
function y = valtest
%codegen
%declare x1 to be an integer with initial value '0'
x1 = coder.opaque('int','0');
%Declare x2 to have same type and initial value as x1
x2 = x1;
x2 = coder.ceval('myfun');
%test the result of call to 'myfun' by comparing to value of x1
if x2 == x1
  y = 0;
else
  y = 1;
```

```
end
end
```

Declare Variable Specifying Initial Value and Header File

Generate code for a MATLAB function `filetest` which returns its own source code using `fopen/fread/fclose`. This function uses `coder.opaque` to declare the variable that stores the file pointer used by `fopen/fread/fclose`. The call to `coder.opaque` declares the variable `f` with type `FILE *`, initial value `NULL`, and header file `<stdio.h>`.

Write a MATLAB function `filetest`.

```
function buffer = filetest
%#codegen

% Declare 'f' as an opaque type 'FILE *' with initial value 'NULL"
%Specify the header file that contains the type definition of 'FILE *';

f = coder.opaque('FILE *', 'NULL','HeaderFile','<stdio.h>');
% Open file in binary mode
f = coder.ceval('fopen', cstring('filetest.m'), cstring('rb'));

% Read from file until end of file is reached and put
% contents into buffer
n = int32(1);
i = int32(1);
buffer = char(zeros(1,8192));
while n > 0
    % By default, MATLAB converts constant values
    % to doubles in generated code
    % so explicit type conversion to int32 is inserted.
    n = coder.ceval('fread', coder.ref(buffer(i)), int32(1), ...
        int32(numel(buffer)), f);
    i = i + n;
end
coder.ceval('fclose',f);

buffer = strip_cr(buffer);

% Put a C termination character '\0' at the end of MATLAB character vector
function y = cstring(x)
    y = [x char(0)];

% Remove all character 13 (CR) but keep character 10 (LF)
function buffer = strip_cr(buffer)
j = 1;
for i = 1:numel(buffer)
    if buffer(i) ~= char(13)
        buffer(j) = buffer(i);
        j = j + 1;
    end
```

```
end
buffer(i) = 0;
```

Compare Variables Declared Using coder.opaque

Compare variables declared using coder.opaque to test for successfully opening a file.

Use coder.opaque to declare a variable null with type FILE * and initial value NULL.

```
null = coder.opaque('FILE *', 'NULL', 'HeaderFile', '<stdio.h>');
```

Use assignment to declare another variable ftmp with the same type and value as null.

```
ftmp = null;
ftmp = coder.ceval('fopen', ['testfile.txt', char(0)], ['r', char(0)]);
```

Compare the variables.

```
if ftmp == null
        %error condition
end
```

Cast to and from Types of Variables Declared Using coder.opaque

This example shows how to cast to and from types of variables that are declared using coder.opaque. The function castopaque calls the C run-time function strncmp to compare at most n characters of the strings s1 and s2. n is the number of characters in the shorter of the strings. To generate the correct C type for the strncmp input nsizet, the function casts n to the C type size_t and assigns the result to nsizet. The function uses coder.opaque to declare nsizet. Before using the output retval from strncmp, the function casts retval to the MATLAB type int32 and stores the results in y.

Write this MATLAB function:

```
function y = castopaque(s1,s2)

%  <0 - the first character that does not match has a lower value in s1 than in s2
%   0 - the contents of both strings are equal
%  >0 - the first character that does not match has a greater value in s1 than in s2
%
%#codegen
```

```
coder.cinclude('<string.h>');
n = min(numel(s1), numel(s2));

% Convert the number of characters to compare to a size_t

nsizet = cast(n,'like',coder.opaque('size_t','0'));

% The return value is an int
retval = coder.opaque('int');
retval = coder.ceval('strncmp', cstr(s1), cstr(s2), nsizet);

% Convert the opaque return value to a MATLAB value
y = cast(retval, 'int32');

%--------------
function sc = cstr(s)
% NULL terminate a MATLAB character vector for C
sc = [s, char(0)];
```

Generate the MEX function.

```
codegen castopaque -args {blanks(3), blanks(3)} -report
```

Call the MEX function with inputs `'abc'` and `'abc'`.

```
castopaque_mex('abc','abc')
```

```
ans =

           0
```

The output is `0` because the strings are equal.

Call the MEX function with inputs `'abc'` and `'abd'`.

```
castopaque_mex('abc','abd')
```

```
ans =

          -1
```

The output is `-1` because the third character `d` in the second string is greater than the third character `c` in the first string.

Call the MEX function with inputs `'abd'` and `'abc'`.

```
castopaque_mex('abd','abc')
```

```
ans =

           1
```

The output is 1 because the third character d in the first string is greater than the third character c in the second string.

In the MATLAB workspace, you can see that the type of y is int32.

Declare Variable Specifying Initial Value and Size

Declare y to be a 4-byte integer with initial value 0.

```
y = coder.opaque('int','0', 'Size', 4);
```

Input Arguments

type — Type of variable
character vector | string scalar

Type of variable in generated code. type must be a compile-time constant. The type must be a:

- Built-in C data type or a type defined in a header file
- C type that supports copy by assignment
- Legal prefix in a C declaration

Example: 'FILE *'

value — Initial value of variable
character vector | string scalar

Initial value of variable in generated code. value must be a compile-time constant. Specify a C expression not dependent on MATLAB variables or functions.

If you do not provide the initial value in value, initialize the value of the variable before using it. To initialize a variable declared using coder.opaque:

- Assign a value from another variable with the same type declared using either `coder.opaque` or assignment from a variable declared using `coder.opaque`.
- Assign a value from an external C function.
- Pass the address of the variable to an external function using `coder.wref`.

Specify a `value` that has the type that `type` specifies. Otherwise, the generated code can produce unexpected results.

Example: `'NULL'`

`Size` — Size of variable

integer

Number of bytes for the variable in the generated code, specified as an integer. If you do not specify the size, the size of the variable is 8 bytes.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64`

`HeaderFile` — Name of header file

character vector | string scalar

Name of header file that contains the definition of `type`. `HeaderFile` must be a compile-time constant.

For a system header file, use angle brackets.

Example: `'<stdio.h>'` generates `#include <stdio.h>`

For an application header file, use double quotes.

Example: `'"foo.h"'` generates `#include "foo.h"`

If you omit the angle brackets or double quotes, the code generator produces double quotes.

Example: `'foo.h'` generates `#include "foo.h"`

Specify the include path in the build configuration parameters.

Example: `cfg.CustomInclude = 'c:\myincludes'`

Tips

- Specify a `value` that has the type that `type` specifies. Otherwise, the generated code can produce unexpected results. For example, the following `coder.opaque` declaration can produce unexpected results.

  ```
  y = coder.opaque('int', '0.2')
  ```
- `coder.opaque` declares the type of a variable. It does not instantiate the variable. You can instantiate a variable by using it later in the MATLAB code. In the following example, assignment of `fp1` from `coder.ceval` instantiates `fp1`.

  ```
  % Declare fp1 of type FILE *
  fp1 = coder.opaque('FILE *');
  %Create the variable fp1
  fp1 = coder.ceval('fopen', ['testfile.txt', char(0)], ['r', char(0)]);
  ```
- In the MATLAB environment, `coder.opaque` returns the value specified in `value`. If `value` is not provided, it returns an empty character vector.
- You can compare variables declared using either `coder.opaque` or assignment from a variable declared using `coder.opaque`. The variables must have identical types. The following example demonstrates how to compare these variables. "Compare Variables Declared Using coder.opaque" on page 2-117
- To avoid multiple inclusions of the same header file in generated code, enclose the header file in the conditional preprocessor statements `#ifndef` and `#endif`. For example:

  ```
  #ifndef MyHeader_h
  #define MyHeader_h
  <body of header file>
  #endif
  ```
- You can use the MATLAB `cast` function to cast a variable to or from a variable that is declared using `coder.opaque`. Use `cast` with `coder.opaque` only for numeric types.

  To cast a variable declared by `coder.opaque` to a MATLAB type, you can use the `B = cast(A,type)` syntax. For example:

  ```
  x = coder.opaque('size_t','0');
  x1 = cast(x, 'int32');
  ```

  You can also use the `B = cast(A,'like',p)` syntax. For example:

```
x = coder.opaque('size_t','0');
x1 = cast(x, 'like', int32(0));
```

To cast a MATLAB variable to the type of a variable declared by `coder.opaque`, you must use the `B = cast(A,'like',p)` syntax. For example:

```
x = int32(12);
x1 = coder.opaque('size_t', '0');
x2 = cast(x, 'like', x1));
```

Use `cast` with `coder.opaque` to generate the correct data types for:

- Inputs to C/C++ functions that you call using `coder.ceval`.
- Variables that you assign to outputs from C/C++ functions that you call using `coder.ceval`.

Without this casting, it is possible to receive compiler warnings during code generation.

Topics

"Integrate C Code Using the MATLAB Function Block"

Introduced in R2011a

coder.ref

Indicate data to pass by reference

Syntax

```
coder.ref(arg)
```

Description

`coder.ref(arg)` indicates that `arg` is an expression or variable to pass by reference to an external C/C++ function. Use `coder.ref` inside a `coder.ceval` call only. The C/C++ function can read from or write to the variable passed by reference. Use a separate `coder.ref` construct for each argument that you pass by reference to the function.

See also `coder.rref` and `coder.wref`.

Examples

Pass Scalar Variable by Reference

Consider the C function `addone` that returns the value of an input plus one:

```
double addone(double* p) {
  return *p + 1;
}
```

The C function defines the input variable `p` as a pointer to a double.

Pass the input by reference to `addone`:

```
...
y = 0;
u = 42;
```

```
y = coder.ceval('addone', coder.ref(u));
...
```

Pass Multiple Arguments by Reference

```
...
u = 1;
v = 2;
y = coder.ceval('my_fcn', coder.ref(u), coder.ref(v));
...
```

Pass Class Property by Reference

```
...
x = myClass;
x.prop = 1;
coder.ceval('foo', coder.ref(x.prop));
...
```

Pass a Structure by Reference

To indicate that the structure type is defined in a C header file, use `coder.cstructname`.

Suppose that you have the C function `incr_struct`. This function reads from and writes to the input argument.

```
#include "MyStruct.h"

void incr_struct(struct MyStruct *my_struct)
{
  my_struct->f1 =  my_struct->f1 + 1;
  my_struct->f2 =  my_struct->f2 + 1;
}
```

The C header file, `MyStruct.h`, defines a structure type named `MyStruct`:

```
#ifndef MYSTRUCT
#define MYSTRUCT

typedef struct MyStruct
{
    double f1;
    double f2;
} MyStruct;

void incr_struct(struct MyStruct *my_struct);

#endif
```

In your MATLAB function, pass a structure by reference to `incr_struct`. To indicate that the structure type for `s` has the name `MyStruct` that is defined in the C header file `MyStruct.h`, use `coder.cstructname`.

```
function y = foo
%#codegen
y = 0;
coder.updateBuildInfo('addSourceFiles','incr_struct.c');

s = struct('f1',1,'f2',2);
coder.cstructname(s,'MyStruct','extern','HeaderFile','MyStruct.h');
coder.ceval('incr_struct', coder.ref(s));
```

To generate standalone library code, enter:

```
codegen -config:lib foo -report
```

Pass Structure Field by Reference

```
...
s = struct('s1', struct('a', [0 1]));
coder.ceval('foo', coder.ref(s.s1.a));
...
```

You can also pass an element of an array of structures:

```
...
c = repmat(struct('u',magic(2)),1,10);
b = repmat(struct('c',c),3,6);
a = struct('b',b);
coder.ceval('foo', coder.ref(a.b(3,4).c(2).u));
...
```

Input Arguments

arg — Argument to pass by reference

scalar variable | array | element of an array | structure | structure field | object property

Argument to pass by reference to an external C/C++ function. The argument cannot be a class, a System object, a cell array, or an index into a cell array.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical` | `char` | `struct`
Complex Number Support: Yes

Limitations

- You cannot pass these data types by reference:
  - Class or System object
  - Cell array or index into a cell array
- If a property has a get method, a set method, or validators, or is a System object property with certain attributes, then you cannot pass the property by reference to an external function. See “Passing By Reference Not Supported for Some Properties”.

Tips

- If `arg` is an array, then `coder.ref(arg)` provides the address of the first element of the array. The `coder.ref(arg)` function does not contain information about the size of the array. If the C function must know the number of elements of your data, pass that information as a separate argument. For example:

  ```
  coder.ceval('myFun',coder.ref(arg),int32(numel(arg));
  ```
- When you pass a structure by reference to an external C/C++ function, use `coder.cstructname` to provide the name of a C structure type that is defined in a C header file.
- In MATLAB, `coder.ref` results in an error. To parameterize your MATLAB code so that it can run in MATLAB and in generated code, use `coder.target`.
- You can use `coder.opaque` to declare variables that you pass to and from an external C/C++ function.

`coder.ceval` | `coder.cstructname` | `coder.opaque` | `coder.rref` | `coder.wref` | `numel`

Topics

"Integrate C Code Using the MATLAB Function Block"

Introduced in R2011a

coder.rref

Indicate read-only data to pass by reference

Syntax

`coder.rref(arg)`

Description

`coder.rref(arg)` indicates that `arg` is a read-only expression or variable to pass by reference to an external C/C++ function. Use `coder.rref` only inside a `coder.ceval` call.

The `coder.rref` function can enable the code generator to optimize the generated code. Because the external function is assumed to not write to `coder.rref(arg)`, the code generator can perform optimizations such as expression folding on assignments to `arg` that occur before and after the `coder.ceval` call. Expression folding is the combining of multiple operations into one statement to avoid the use of temporary variables and improve code performance.

Note The code generator assumes that the memory that you pass with `coder.rref(arg)` is read-only. To avoid unpredictable results, the C/C++ function must not write to this variable.

See also `coder.ref` and `coder.wref`.

Examples

Pass Scalar Variable as a Read-Only Reference

Consider the C function `addone` that returns the value of a constant input plus one:

```
double addone(const double* p) {
  return *p + 1;
}
```

The C function defines the input variable `p` as a pointer to a constant double.

Pass the input by reference to `addone`:

```
...
y = 0;
u = 42;
y = coder.ceval('addone', coder.rref(u));
...
```

Pass Multiple Arguments as a Read-Only Reference

```
...
u = 1;
v = 2;
y = coder.ceval('my_fcn', coder.rref(u), coder.rref(v));
...
```

Pass Class Property as a Read-Only Reference

```
...
x = myClass;
x.prop = 1;
y = coder.ceval('foo', coder.rref(x.prop));
...
```

Pass Structure as a Read-Only Reference

To indicate that the structure type is defined in a C header file, use `coder.cstructname`.

Suppose that you have the C function `use_struct`. This function reads from the input argument but does not write to it.

```
#include "MyStruct.h"

double use_struct(const struct MyStruct *my_struct)
{
  return my_struct->f1 + my_struct->f2;
}
```

The C header file, MyStruct.h, defines a structure type named MyStruct:

```
#ifndef MYSTRUCT
#define MYSTRUCT

typedef struct MyStruct
{
    double f1;
    double f2;
} MyStruct;

double use_struct(const struct MyStruct *my_struct);

#endif
```

In your MATLAB function, pass a structure as a read-only reference to use_struct. To indicate that the structure type for s has the name MyStruct that is defined in the C header file MyStruct.h, use coder.cstructname.

```
function y = foo
%#codegen
y = 0;
coder.updateBuildInfo('addSourceFiles','use_struct.c');

s = struct('f1',1,'f2',2);
coder.cstructname(s,'MyStruct','extern','HeaderFile','MyStruct.h');
y = coder.ceval('use_struct', coder.rref(s));
```

To generate standalone library code, enter:

```
codegen -config:lib foo -report
```

Pass Structure Field as a Read-Only Reference

```
...
s = struct('s1', struct('a', [0 1]));
y = coder.ceval('foo', coder.rref(s.s1.a));
...
```

You can also pass an element of an array of structures:

```
...
c = repmat(struct('u',magic(2)),1,10);
b = repmat(struct('c',c),3,6);
a = struct('b',b);
coder.ceval('foo', coder.rref(a.b(3,4).c(2).u));
...
```

Input Arguments

arg — Argument to pass by reference
scalar variable | array | element of an array | structure | structure field | object property

Argument to pass by reference to an external C/C++ function. The argument cannot be a class, a System object, a cell array, or an index into a cell array.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical` | `char` | `struct`
Complex Number Support: Yes

Limitations

- You cannot pass these data types by reference:
  - Class or System object
  - Cell array or index into a cell array
- If a property has a get method, a set method, or validators, or is a System object property with certain attributes, then you cannot pass the property by reference to an external function. See “Passing By Reference Not Supported for Some Properties”.

Tips

- If `arg` is an array, then `coder.rref(arg)` provides the address of the first element of the array. The `coder.rref(arg)` function does not contain information about the size of the array. If the C function must know the number of elements of your data, pass that information as a separate argument. For example:

  ```
  coder.ceval('myFun',coder.rref(arg),int32(numel(arg));
  ```

- When you pass a structure by reference to an external C/C++ function, use `coder.cstructname` to provide the name of a C structure type that is defined in a C header file.
- In MATLAB, `coder.rref` results in an error. To parametrize your MATLAB code so that it can run in MATLAB and in generated code, use `coder.target`.
- You can use `coder.opaque` to declare variables that you pass to and from an external C/C++ function.

Topics

"Integrate C Code Using the MATLAB Function Block"

Introduced in R2011a

coder.screener

Determine if function is suitable for code generation

Syntax

```
coder.screener(fcn)
coder.screener(fcn_1,...,fcn_n )
```

Description

`coder.screener(fcn)` analyzes the entry-point MATLAB function, `fcn`. It identifies unsupported functions and language features as code generation compliance issues. It displays the code generation compliance issues in a report. If `fcn` calls other functions directly or indirectly that are not MathWorks® functions, `coder.screener` analyzes these functions. It does not analyze MathWorks functions. It is possible that `coder.screener` does not detect all code generation issues. Under certain circumstances, it is possible that `coder.screener` reports false errors.

`coder.screener(fcn_1,...,fcn_n )` analyzes entry-point functions (`fcn_1,...,fcn_n`).

Input Arguments

`fcn`

Name of entry-point MATLAB function that you want to analyze. Specify as a character vector or a string scalar.

`fcn_1,...,fcn_n`

Comma-separated list of names of entry-point MATLAB functions that you want to analyze. Specify as character vectors or string scalars.

Examples

Identify Unsupported Functions

The `coder.screener` function identifies calls to functions that are not supported for code generation. It checks both the entry-point function, `foo1`, and the function `foo2` that `foo1` calls.

Write the function `foo2` and save it in the file `foo2.m`.

```
function out = foo2(in)
  out = eval(in);
end
```

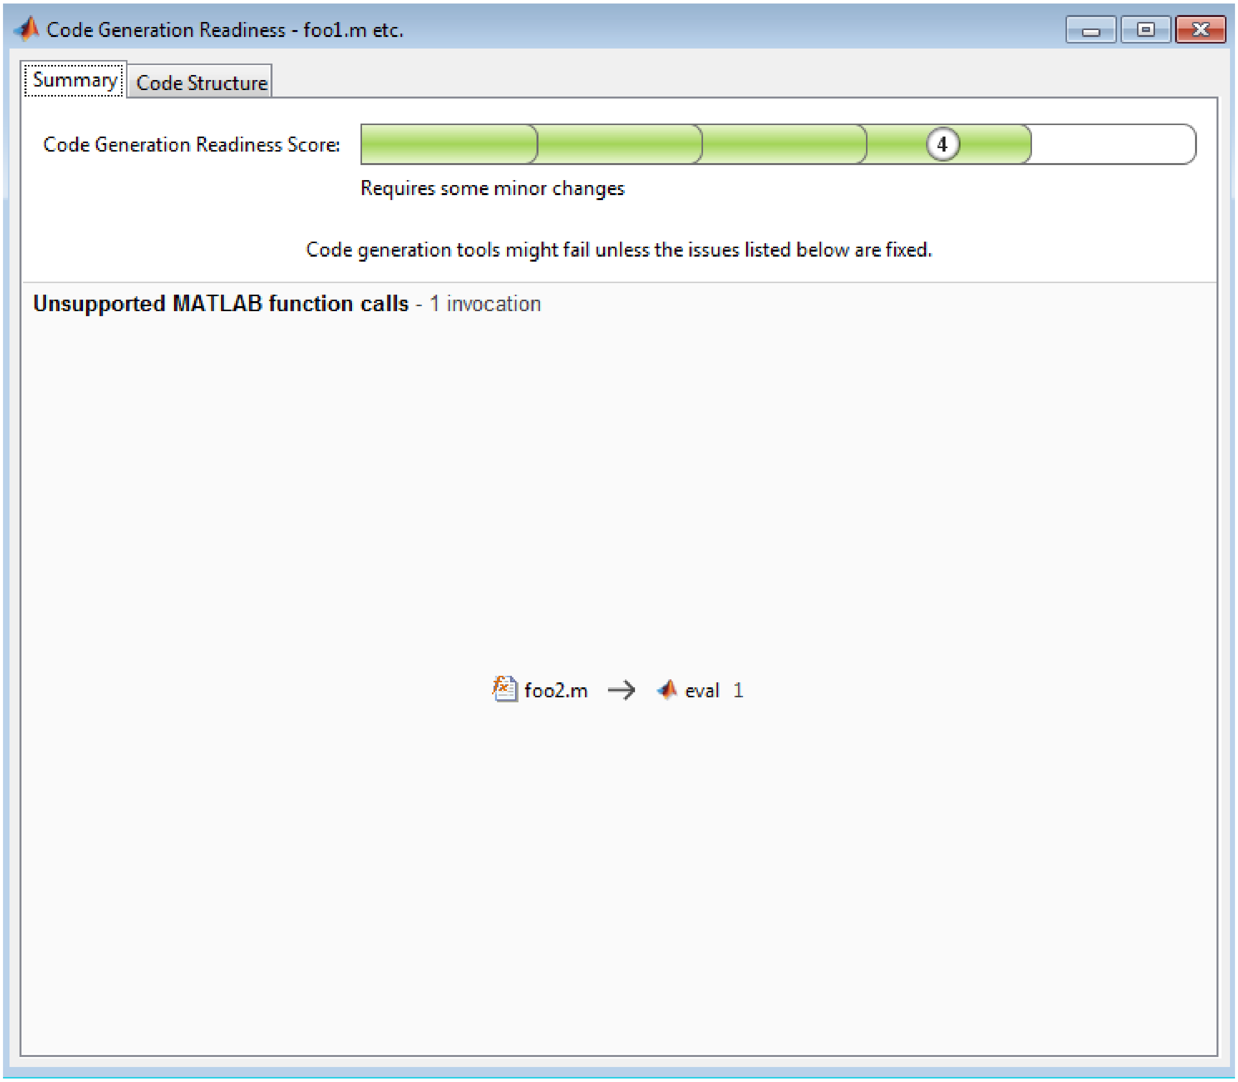
Write the function `foo1` that calls `foo2`. Save `foo1` in the file `foo1.m`.

```
function out = foo1(in)
  out = foo2(in);
  disp(out);
end
```

Analyze `foo1`.

```
coder.screener('foo1')
```

The code generation readiness report displays a summary of the unsupported MATLAB function calls. The function `foo2` calls one unsupported MATLAB function.



Code Generation Readiness Score: 4

Requires some minor changes

Code generation tools might fail unless the issues listed below are fixed.

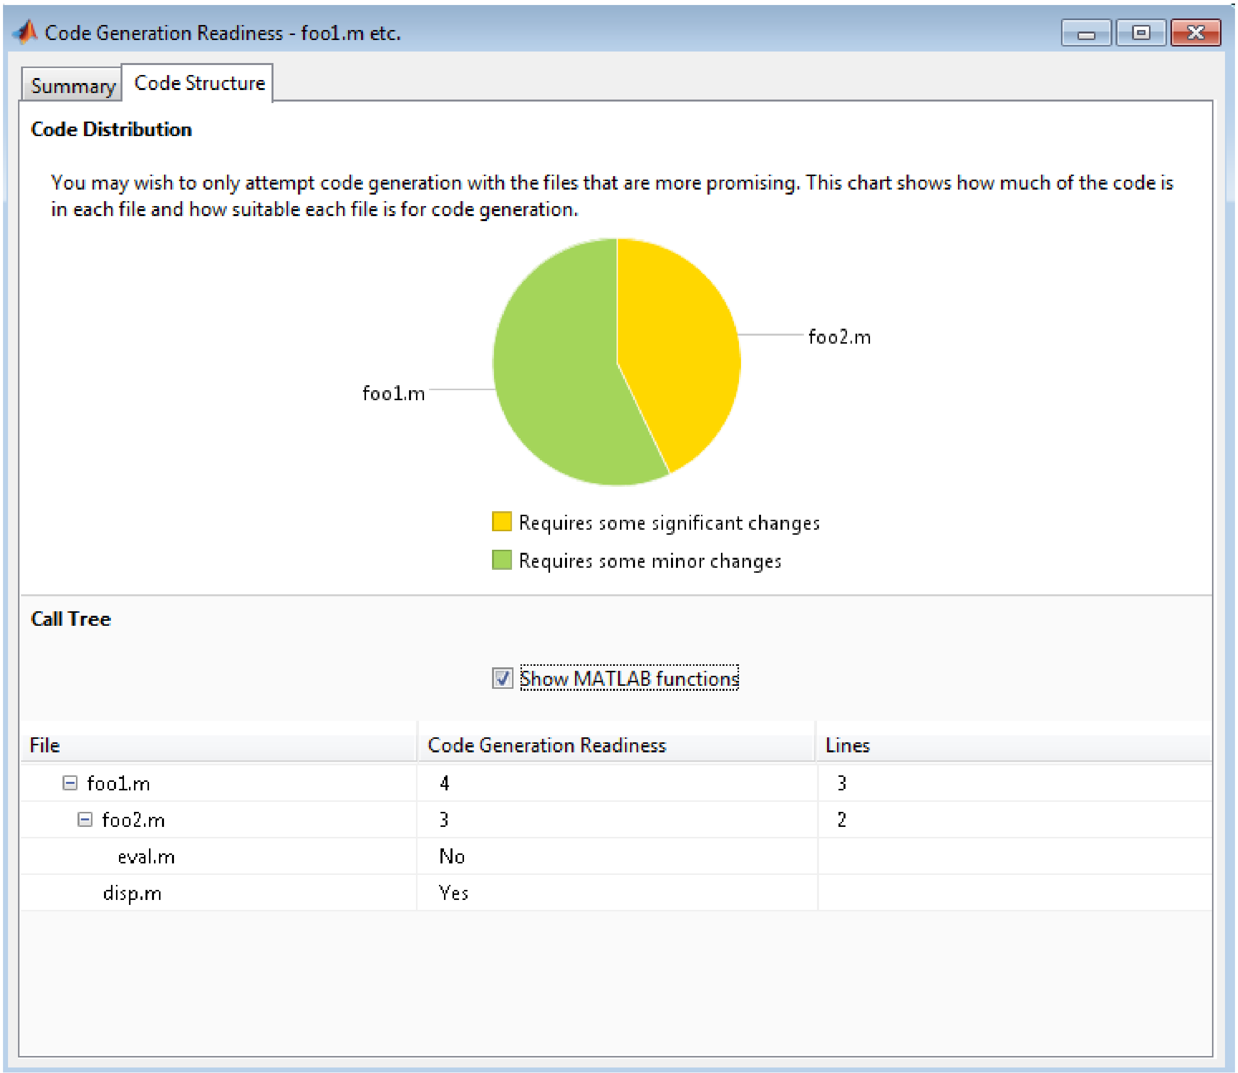
Unsupported MATLAB function calls - 1 invocation

foo2.m → eval 1

In the report, click the **Code Structure** tab and select the **Show MATLAB functions** check box.

This tab displays a pie chart showing the relative size of each file and how suitable each file is for code generation. In this case, the report:

- Colors `foo1.m` green to indicate that it is suitable for code generation.
- Colors `foo2.m` yellow to indicate that it requires significant changes.
- Assigns `foo1.m` a code generation readiness score of 4 and `foo2.m` a score of 3. The score is based on a scale of 1–5. 1 indicates that significant changes are required; 5 indicates that the code generation readiness tool does not detect issues.
- Displays a call tree.



Code Generation Readiness - foo1.m etc.
Summary
Code Structure
foo2.m
foo1.m
🟨 Requires some significant changes
🟩 Requires some minor changes

Code Distribution

You may wish to only attempt code generation with the files that are more promising. This chart shows how much of the code is in each file and how suitable each file is for code generation.

Call Tree

☑ Show MATLAB functions

File	Code Generation Readiness	Lines
⊟ foo1.m	4	3
⊟ foo2.m	3	2
eval.m	No	
disp.m	Yes	

The report **Summary** tab indicates that `foo2.m` contains one call to the `eval` function, which code generation does not support. To generate a MEX function for `foo2.m`, modify the code to make the call to `eval` extrinsic.

```
function out = foo2(in)
  coder.extrinsic('eval');
  out = eval(in);
end
```

Rerun the code generation readiness tool.

```
coder.screener('foo1')
```

The report no longer flags that code generation does not support the `eval` function. When you generate a MEX function for `foo1`, the code generator dispatches `eval` to MATLAB for execution. For standalone code generation, the code generator does not generate code for `eval`.

Identify Unsupported Data Types

The `coder.screener` function identifies MATLAB data types that code generation does not support.

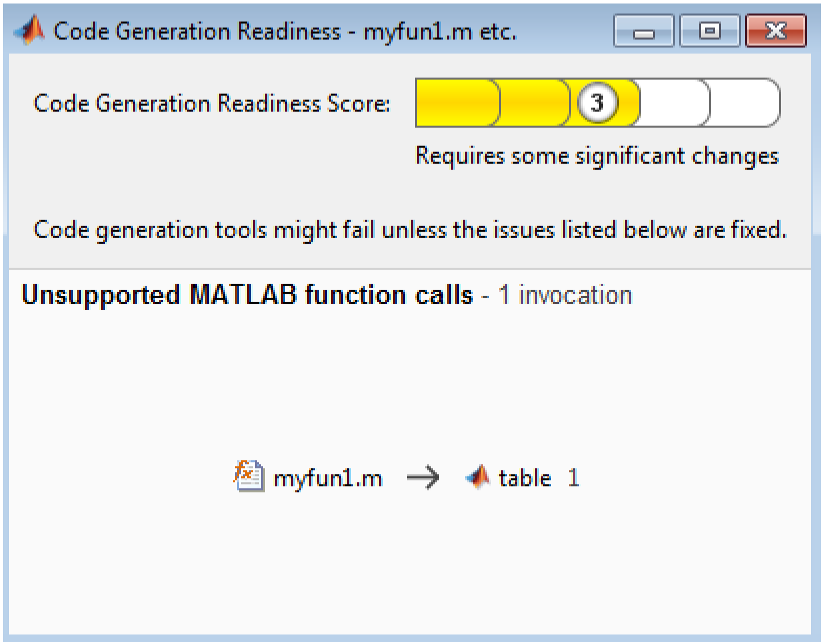
Write the function `myfun` that contains a MATLAB table.

```
function outTable = myfun1(A)
outTable = table(A);
end
```

Analyze `myfun`.

```
coder.screener('myfun1');
```

The code generation readiness report indicates that table data types are not supported for code generation.



Code Generation Readiness - myfun1.m etc.

Code Generation Readiness Score: 3

Requires some significant changes

Code generation tools might fail unless the issues listed below are fixed.

Unsupported MATLAB function calls - 1 invocation

myfun1.m → table 1

The report assigns `myfun1` a code readiness score of `3`. Before generating code, you must fix the reported issues.

Tips

- Before using `coder.screener`, fix issues that the Code Analyzer identifies.
- Before generating code, use `coder.screener` to check that a function is suitable for code generation. Fix all the issues that it detects.

Alternatives

- “Run the Code Generation Readiness Tool From the Current Folder Browser”

“Code Generation Readiness Tool”

Introduced in R2012b

coder.target

Determine if code generation target is specified target

Syntax

```
tf = coder.target(target)
```

Description

`tf = coder.target(target)` returns true (1) if the code generation target is `target`. Otherwise, it returns false (0).

If you generate code for MATLAB classes, MATLAB computes class initial values at class loading time before code generation. If you use `coder.target` in MATLAB class property initialization, `coder.target('MATLAB')` returns true.

Examples

Use `coder.target` to Parametrize a MATLAB Function

Parametrize a MATLAB function so that it works in MATLAB or in generated code. When the function runs in MATLAB, it calls the MATLAB function `myabsval`. The generated code, however, calls a C library function `myabsval`.

Write a MATLAB function `myabsval`.

```
function y = myabsval(u)
%#codegen
y = abs(u);
```

Generate a C static library for `myabsval`, using the `-args` option to specify the size, type, and complexity of the input parameter.

```
codegen -config:lib myabsval -args {0.0}
```

The `codegen` function creates the library file `myabsval.lib` and header file `myabsval.h` in the folder `\codegen\lib\myabsval`. (The library file extension can change depending on your platform.) It generates the functions `myabsval_initialize` and `myabsval_terminate` in the same folder.

Write a MATLAB function to call the generated C library function using `coder.ceval`.

```
function y = callmyabsval(y)
%#codegen
% Check the target. Do not use coder.ceval if callmyabsval is
% executing in MATLAB
if coder.target('MATLAB')
  % Executing in MATLAB, call function myabsval
  y = myabsval(y);
else
  % add the required include statements to generated function code
  coder.updateBuildInfo('addIncludePaths','$(START_DIR)\codegen\lib\myabsval');
  coder.cinclude('myabsval_initialize.h');
  coder.cinclude('myabsval.h');
  coder.cinclude('myabsval_terminate.h');

  % Executing in the generated code.
  % Call the initialize function before calling the
  % C function for the first time
  coder.ceval('myabsval_initialize');

  % Call the generated C library function myabsval
  y = coder.ceval('myabsval',y);

  % Call the terminate function after
  % calling the C function for the last time
  coder.ceval('myabsval_terminate');
end
```

Generate the MEX function `callmyabsval_mex`. Provide the generated library file at the command line.

```
codegen -config:mex callmyabsval codegen\lib\myabsval\myabsval.lib -args {-2.75}
```

Rather than providing the library at the command line, you can use `coder.updateBuildInfo` to specify the library within the function. Use this option to preconfigure the build. Add this line to the `else` block:

```
coder.updateBuildInfo('addLinkObjects','myabsval.lib','$(START_DIR)\codegen\lib\myabsva
```

Run the MEX function `callmyabsval_mex` which calls the library function `myabsval`.

```
callmyabsval_mex(-2.75)
```

```
ans =

    2.7500
```

Call the MATLAB function `callmyabsval`.

```
callmyabsval(-2.75)
```

```
ans =

    2.7500
```

The `callmyabsval` function exhibits the desired behavior for execution in MATLAB and in code generation.

Input Arguments

target — code generation target

'MATLAB' | 'MEX' | 'Sfun' | 'Rtw' | 'HDL ' | 'Custom'

Code generation target, specified as a character vector or a string scalar. Specify one of these targets.

'MATLAB'	Running in MATLAB (not generating code)
'MEX'	Generating a MEX function
'Sfun'	Simulating a Simulink model
'Rtw'	Generating a LIB, DLL, or EXE target
'HDL'	Generating an HDL target
'Custom'	Generating a custom target

Example: `tf = coder.target('MATLAB')`

Example: `tf = coder.target("MATLAB")`

Introduced in R2011a

coder.unroll

Unroll `for`-loop by making a copy of the loop body for each loop iteration

Syntax

```
coder.unroll()
coder.unroll(flag)
```

Description

`coder.unroll()` unrolls a `for`-loop. The `coder.unroll` call must be on a line by itself immediately preceding the `for`-loop that it unrolls.

Instead of producing a `for`-loop in the generated code, loop unrolling produces a copy of the `for`-loop body for each loop iteration. In each iteration, the loop index becomes constant. To unroll a loop, the code generator must be able to determine the bounds of the `for-`loop.

For small, tight loops, unrolling can improve performance. However, for large loops, unrolling can increase code generation time significantly and generate inefficient code.

`coder.unroll` is ignored outside of code generation.

`coder.unroll(flag)` unrolls a `for`-loop if `flag` is `true`. `flag` is evaluated at code generation time. The `coder.unroll` call must be on a line by itself immediately preceding the `for`-loop that it unrolls.

Examples

Unroll a `for`-loop

To produce copies of a `for`-loop body in the generated code, use `coder.unroll`.

In one file, write the entry-point function `call_getrand` and a local function `getrand`. `getrand` unrolls a `for`-loop that assigns random numbers to an n-by-1 array. `call_getrand` calls `getrand` with the value 3.

```
function z = call_getrand
%#codegen
z = getrand(3);
end

function y = getrand(n)
coder.inline('never');
y = zeros(n, 1);
coder.unroll();
for i = 1:n
    y(i) = rand();
end
end
```

Generate a static library.

```
codegen -config:lib call_getrand -report
```

In the generated code, the code generator produces a copy of the `for`-loop body for each of the three loop iterations.

```
static void getrand(double y[3])
{
  y[0] = b_rand();
  y[1] = b_rand();
  y[2] = b_rand();
}
```

Control for-loop Unrolling with Flag

Control loop unrolling by using `coder.unroll` with the `flag` argument.

In one file, write the entry-point function `call_getrand_unrollflag` and a local function `getrand_unrollflag`. When the number of loop iterations is less than 10, `getrand_unrollflag` unrolls the `for`-loop. `call_getrand` calls `getrand` with the value 50.

```
function z = call_getrand_unrollflag
%#codegen
z = getrand_unrollflag(50);
```

```
end

function y = getrand_unrollflag(n)
coder.inline('never');
unrollflag = n < 10;
y = zeros(n, 1);
coder.unroll(unrollflag)
for i = 1:n
    y(i) = rand();
end
end
```

Generate a static library.

```
codegen -config:lib call_getrand_unrollflag -report
```

The number of iterations is not less than 10. Therefore, the code generator does not unroll the `for`-loop. It produces a `for`-loop in the generated code.

```
static void getrand_unrollflag(double y[50])
{
  int i;
  for (i = 0; i < 50; i++) {
    y[i] = b_rand();
  }
}
```

Use Legacy Syntax to Unroll `for`-Loop

```
function z = call_getrand
%#codegen
z = getrand(3);
end

function y = getrand(n)
coder.inline('never');
y = zeros(n, 1);
for i = coder.unroll(1:n)
    y(i) = rand();
end
end
```

Use Legacy Syntax to Control for-Loop Unrolling

```
function z = call_getrand_unrollflag
%#codegen
z = getrand_unrollflag(50);
end

function y = getrand_unrollflag(n)
coder.inline('never');
unrollflag = n < 10;
y = zeros(n, 1);
for i = coder.unroll(1:n, unrollflag)
    y(i) = rand();
end
end
```

Input Arguments

flag — Indicates whether to unroll the for-loop

true (default) | false

When `flag` is `true`, the code generator unrolls the `for`-loop. When `flag` is `false`, the code generator produces a `for`-loop in the generated code. `flag` is evaluated at code generation time.

Tips

- Sometimes, the code generator unrolls a `for`-loop even though you do not use `coder.unroll`. For example, if a `for`-loop indexes into a heterogeneous cell array or into `varargin` or `varargout`, the code generator unrolls the loop. By unrolling the loop, the code generator can determine the value of the index for each loop iteration. The code generator uses heuristics to determine when to unroll a `for`-loop. If the heuristics fail to identify that unrolling is warranted, or if the number of loop iterations exceeds a limit, code generation fails. In these cases, you can force loop unrolling by using `coder.unroll`. See “Nonconstant Index into varargin or varargout in a for-Loop”.

Introduced in R2011a

coder.updateBuildInfo

Update build information object `RTW.BuildInfo`

Syntax

```
coder.updateBuildInfo('addCompileFlags',options)
coder.updateBuildInfo('addLinkFlags',options)
coder.updateBuildInfo('addDefines',options)
coder.updateBuildInfo( ___ ,group)

coder.updateBuildInfo('addLinkObjects',filename,path)
coder.updateBuildInfo('addLinkObjects',filename,path,priority,
precompiled)
coder.updateBuildInfo('addLinkObjects',filename,path,priority,
precompiled,linkonly)
coder.updateBuildInfo( ___ ,group)

coder.updateBuildInfo('addNonBuildFiles',filename)
coder.updateBuildInfo('addSourceFiles',filename)
coder.updateBuildInfo('addIncludeFiles',filename)
coder.updateBuildInfo( ___ ,path)
coder.updateBuildInfo( ___ ,path,group)

coder.updateBuildInfo('addSourcePaths',path)
coder.updateBuildInfo('addIncludePaths',path)
coder.updateBuildInfo( ___ ,group)
```

Description

`coder.updateBuildInfo('addCompileFlags',options)` adds compiler options to the build information object.

`coder.updateBuildInfo('addLinkFlags',options)` adds link options to the build information object.

coder.updateBuildInfo('addDefines',options) adds preprocessor macro definitions to the build information object.

coder.updateBuildInfo(___ ,group) assigns a group name to options for later reference.

coder.updateBuildInfo('addLinkObjects',filename,path) adds a link object from a file to the build information object.

coder.updateBuildInfo('addLinkObjects',filename,path,priority, precompiled) specifies if the link object is precompiled.

coder.updateBuildInfo('addLinkObjects',filename,path,priority, precompiled,linkonly) specifies if the object is to be built before being linked or used for linking alone. If the object is to be built, it specifies if the object is precompiled.

coder.updateBuildInfo(___ ,group) assigns a group name to the link object for later reference.

coder.updateBuildInfo('addNonBuildFiles',filename) adds a nonbuild-related file to the build information object.

coder.updateBuildInfo('addSourceFiles',filename) adds a source file to the build information object.

coder.updateBuildInfo('addIncludeFiles',filename) adds an include file to the build information object.

coder.updateBuildInfo(___ ,path) adds the file from specified path.

coder.updateBuildInfo(___ ,path,group) assigns a group name to the file for later reference.

coder.updateBuildInfo('addSourcePaths',path) adds a source file path to the build information object.

coder.updateBuildInfo('addIncludePaths',path) adds an include file path to the build information object.

coder.updateBuildInfo(___ ,group) assigns a group name to the path for later reference.

Examples

Add Multiple Compiler Options

Add the compiler options `-Zi` and `-Wall` during code generation for function, `func`.

Anywhere in the MATLAB code for `func`, add the following line:

```
coder.updateBuildInfo('addCompileFlags','-Zi -Wall');
```

Generate code for `func` using the `codegen` command. Open the Code Generation Report.

```
codegen -config:lib -launchreport func
```

Add Source File Name

Add a source file to the project build information while generating code for a function, `calc_factorial`.

1. Write a header file `fact.h` that declares a C function `factorial`.

   ```
    double factorial(double x);
   ```

   `fact.h` will be included as a header file in generated code. This inclusion ensures that the function is declared before it is called.

   Save the file in the current folder.
2. Write a C file `fact.c` that contains the definition of `factorial`. `factorial` calculates the factorial of its input.

   ```
   #include "fact.h"

         double factorial(double x)
         {
             int i;
             double fact = 1.0;
             if (x == 0 || x == 1) {
                return 1.0;
            } else {
                for (i = 1; i <= x; i++) {
   ```

```
                fact *= (double)i;
            }
            return fact;
        }
    }
```

`fact.c` is used as a source file during code generation.

Save the file in the current folder.

3 Write a MATLAB function `calc_factorial` that uses `coder.ceval` to call the external C function `factorial`.

Use `coder.updateBuildInfo` with option `'addSourceFiles'` to add the source file `fact.c` to the build information. Use `coder.cinclude` to include the header file `fact.h` in the generated code.

```
function y = calc_factorial(x) %#codegen

  coder.cinclude('fact.h');
  coder.updateBuildInfo('addSourceFiles', 'fact.c');

  y = 0;
  y = coder.ceval('factorial', x);
```

4 Generate code for `calc_factorial` using the `codegen` command.

```
 codegen -config:dll -launchreport calc_factorial -args 0
```

Add Link Object

Add a link object `LinkObj.lib` to the build information while generating code for a function `func`. For this example, you must have a link object `LinkObj.lib` saved in a local folder, for example, `c:\Link_Objects`.

Anywhere in the MATLAB code for `func`, add the following lines:

```
libPriority = '';
libPreCompiled = true;
libLinkOnly = true;
libName = 'LinkObj.lib';
libPath = 'c:\Link_Objects';
```

```
coder.updateBuildInfo('addLinkObjects', libName, libPath, ...
     libPriority, libPreCompiled, libLinkOnly);
```

Generate a MEX function for `func` using the `codegen` command. Open the Code Generation Report.

```
codegen -launchreport func
```

Add Include Paths

Add an include path to the build information while generating code for a function, `adder`. Include a header file, `adder.h`, existing on the path.

When header files do not reside in the current folder, to include them, use this method:

1. Write a header file `mysum.h` that contains the declaration for a C function `mysum`.

   ```
   double mysum(double, double);
   ```

   Save it in a local folder, for example `c:\coder\myheaders`.
2. Write a C file `mysum.c` that contains the definition of the function `mysum`.

   ```
   #include "mysum.h"

   double mysum(double x, double y)
    {
     return(x+y);
    }
   ```

   Save it in the current folder.
3. Write a MATLAB function `adder` that adds the path `c:\coder\myheaders` to the build information.

   Use `coder.cinclude` to include the header file `mysum.h` in the generated code.

   ```
   function y = adder(x1, x2) %#codegen
      coder.updateBuildInfo('addIncludePaths','c:\coder\myheaders');
      coder.updateBuildInfo('addSourceFiles','mysum.c');
        %Include the source file containing C function definition
      coder.cinclude('mysum.h');
      y = 0;
   ```

```
    if coder.target('MATLAB')
       % This line ensures that the function works in MATLAB
         y = x1 + x2;
    else
        y = coder.ceval('mysum', x1, x2);
     end
end
```

4 Generate code for `adder` using the `codegen` command.

```
codegen -config:lib -launchreport adder -args {0,0}
```

Input Arguments

options — Build options

character vector | string scalar

Build options, specified as a character vector or string scalar. The value must be a compile-time constant.

Depending on the leading argument, `options` specifies the relevant build options to be added to the project's build information.

Leading Argument	Values in options
`'addCompileFlags'`	Compiler options
`'addLinkFlags'`	Link options
`'addDefines'`	Preprocessor macro definitions

The function adds the options to the end of an option vector.

Example: `coder.updateBuildInfo('addCompileFlags','-Zi -Wall')`

group — Group name

character vector | string scalar

Name of user-defined group, specified as a character vector or string scalar. The value must be a compile-time constant.

The `group` option assigns a group name to the parameters in the second argument.

Leading Argument	**Second Argument**	**Parameters Named by `group`**
`'addCompileFlags'`	`options`	Compiler options
`'addLinkFlags'`	`options`	Link options
`'addLinkObjects'`	`filename`	Name of file containing linkable objects
`'addNonBuildFiles'`	`filename`	Name of nonbuild-related file
`'addSourceFiles'`	`filename`	Name of source file
`'addSourcePaths'`	`path`	Name of source file path

You can use `group` to:

- Document the use of specific parameters.
- Retrieve or apply multiple parameters together as one group.

`filename` — File name

character vector | string scalar

File name, specified as a character vector or string scalar. The value must be a compile-time constant.

Depending on the leading argument, `filename` specifies the relevant file to be added to the project's build information.

Leading Argument	**File Specified by `filename`**
`'addLinkObjects'`	File containing linkable objects
`'addNonBuildFiles'`	Nonbuild-related file
`'addSourceFiles'`	Source file

The function adds the file name to the end of a file name vector.

Example: `coder.updateBuildInfo('addSourceFiles', 'fact.c')`

`path` — Path name

character vector | string scalar

Relative path name, specified as a character vector or string scalar. The value must be a compile-time constant.

Depending on the leading argument, `path` specifies the relevant path name to be added to the project’s build information. The function adds the path to the end of a path name vector.

Leading Argument	Path Specified by path
'addLinkObjects'	Path to linkable objects
'addNonBuildFiles'	Path to nonbuild-related files
'addSourceFiles', 'addSourcePaths'	Path to source files

The relative path starts from the *build folder*. If you have a function `foo` contained in the folder `C:\myCode`, and you generate MEX code by using:

```
codegen foo -report
```

then the build folder is `C:\myCode\codegen\mex\foo`. You can write the path from the build folder or write the path from the current working folder in which you generate code. Reference the current working folder by using the `START_DIR` macro. For example, suppose that your source file is contained in `C:\myCode\mySrcDir`, and you generate code from `C:\myCode`. Write the path as in these examples:

Example: `coder.updateBuildInfo('addSourceFiles','fact.c','..\..\..\mySrcDir')`

Example: `coder.updateBuildInfo('addSourceFiles','fact.c','$(START_DIR)\mySrcDir')`

priority — Relative priority of link object

''

Priority of link objects.

This feature applies only when several link objects are added. Currently, only a single link object file can be added for every `coder.updateBuildInfo` statement. Therefore, this feature is not available for use.

To use the succeeding arguments, include `''` as a placeholder argument.

precompiled — Variable indicating if link objects are precompiled

logical value

Variable indicating if the link objects are precompiled, specified as a logical value. The value must be a compile-time constant.

If the link object has been prebuilt for faster compiling and linking and exists in a specified location, specify `true`. Otherwise, the MATLAB Coder build process creates the link object in the build folder.

If `linkonly` is set to `true`, this argument is ignored.

Data Types: `logical`

`linkonly` — Variable indicating if objects must be used for linking only
logical value

Variable indicating if objects must be used for linking only, specified as a logical value. The value must be a compile-time constant.

If you want that the MATLAB Coder build process must not build or generate rules in the makefile for building the specified link object, specify `true`. Instead, when linking the final executable, the process should just include the object. Otherwise, rules for building the link object are added to the makefile.

You can use this argument to incorporate link objects for which source files are not available.

If `linkonly` is set to `true`, the value of `precompiled` is ignored.

Data Types: `logical`

coder.varsize

Package: coder

Declare variable-size array

Syntax

```
coder.varsize('var1', 'var2', ...)
coder.varsize('var1', 'var2', ..., ubound)
coder.varsize('var1', 'var2', ..., ubound, dims)
coder.varsize('var1', 'var2', ..., [], dims)
```

Description

`coder.varsize('`*`var`*$_1$`', '`*`var`*$_2$`', ...)` declares one or more variables as variable-size data, allowing subsequent assignments to extend their size. Each `'`*`var`*$_n$`'` is the name of a variable or structure field enclosed in quotes. If the structure field belongs to an array of structures, use colon (`:`) as the index expression to make the field variable-size for all elements of the array. For example, the expression `coder.varsize('data(:).A')` declares that the field `A` inside each element of `data` is variable sized.

`coder.varsize('`*`var`*$_1$`', '`*`var`*$_2$`', ..., `*`ubound`*`)` declares one or more variables as variable-size data with an explicit upper bound specified in *`ubound`*. The argument *`ubound`* must be a constant, integer-valued vector of upper bound sizes for every dimension of each `'`*`var`*$_n$`'`. If you specify more than one `'`*`var`*$_n$`'`, each variable must have the same number of dimensions.

`coder.varsize('`*`var`*$_1$`', '`*`var`*$_2$`', ..., `*`ubound`*`, `*`dims`*`)` declares one or more variables as variable size with an explicit upper bound and a mix of fixed and varying dimensions specified in *`dims`*. The argument *`dims`* is a logical vector, or double vector containing only zeros and ones. Dimensions that correspond to zeros or `false` in *`dims`* have fixed size; dimensions that correspond to ones or `true` vary in size. If you specify more than one variable, each fixed dimension must have the same value across all `'`*`var`*$_n$`'`.

coder.varsize('*var*$_1$', '*var*$_2$', ..., [], *dims*) declares one or more variables as variable size with a mix of fixed and varying dimensions. The empty vector [] means that you do not specify an explicit upper bound.

When you do *not* specify *ubound*, the upper bound is computed for each '*var*$_n$' in generated code.

When you do *not* specify *dims*, dimensions are assumed to be variable except the singleton ones. A singleton dimension is a dimension for which size(A,dim) = 1.

You must add the coder.varsize declaration before each '*var*$_n$' is used (read). You can add the declaration before the first assignment to each '*var*$_n$'. However, for a cell array element, the coder.varsize declaration must follow the first assignment to the element. For example:

```
...
x = cell(3, 3);
x{1} = [1 2];
coder.varsize('x{1}');
...
```

You cannot use coder.varsize outside the MATLAB code intended for code generation. For example, the following code does not declare the variable, var, as variable-size data:

```
coder.varsize('var',10);
codegen -config:lib MyFile -args var
```

Instead, include the coder.varsize statement inside MyFile to declare var as variable-size data.

Examples

Develop a Simple Stack That Varies in Size up to 32 Elements as You Push and Pop Data at Run Time.

Write primary function test_stack to issue commands for pushing data on and popping data from a stack.

```
function test_stack %#codegen
    % The directive %#codegen indicates that the function
    % is intended for code generation
    stack('init', 32);
    for i = 1 : 20
        stack('push', i);
    end
    for i = 1 : 10
        value = stack('pop');
        % Display popped value
        value
    end
end
```

Write local function `stack` to execute the push and pop commands.

```
function y = stack(command, varargin)
    persistent data;
    if isempty(data)
        data = ones(1,0);
    end
    y = 0;
    switch (command)
    case {'init'}
        coder.varsize('data', [1, varargin{1}], [0 1]);
        data = ones(1,0);
    case {'pop'}
        y = data(1);
        data = data(2:size(data, 2));
    case {'push'}
        data = [varargin{1}, data];
    otherwise
        assert(false, ['Wrong command: ', command]);
    end
end
```

The variable `data` is the stack. The statement `coder.varsize('data', [1, varargin{1}], [0 1])` declares that:

- `data` is a row vector
- Its first dimension has a fixed size
- Its second dimension can grow to an upper bound of 32

Generate a MEX function for `test_stack`:

```
codegen -config:mex test_stack
```

`codegen` generates a MEX function in the current folder.

Run `test_stack_mex` to get these results:

```
value =
    20

value =
    19

value =
    18

value =
    17

value =
    16

value =
    15

value =
    14

value =
    13

value =
    12

value =
    11
```

At run time, the number of items in the stack grows from zero to 20, and then shrinks to 10.

Declare a Variable-Size Structure Field.

Write a function `struct_example` that declares an array `data`, where each element is a structure that contains a variable-size field:

```
function y=struct_example() %#codegen

  d = struct('values', zeros(1,0), 'color', 0);
  data = repmat(d, [3 3]);
  coder.varsize('data(:).values');

  for i = 1:numel(data)
      data(i).color = rand-0.5;
      data(i).values = 1:i;
  end

  y = 0;
  for i = 1:numel(data)
      if data(i).color > 0
          y = y + sum(data(i).values);
      end;
  end
```

The statement `coder.varsize('data(:).values')` marks as variable-size the field `values` inside each element of the matrix `data`.

Generate a MEX function for `struct_example`:

```
codegen -config:mex struct_example
```

Run `struct_example`.

Each time you run `struct_example` you get a different answer because the function loads the array with random numbers.

Make a Cell Array Variable-Size

Write the function `make_varsz_cell` that defines a local cell array variable `c` whose elements have the same class, but different sizes. Use `coder.varsize` to indicate that `c` has variable-size.

```
function y =  make_varsz_cell()
c = {1 [2 3]};
coder.varsize('c', [1 3], [0 1]);
y = c;
end
```

Generate a C static library.

```
codegen -config:lib make_varsz_cell -report
```

In the report, view the MATLAB variables.

`c` is a 1x:3 homogeneous cell array whose elements are 1x:2 double.

Make the Elements of a Cell Array Variable-Size

Write the function `mycell` that defines a local cell array variable `c`. Use `coder.varsize` to make the elements of `c` variable-size.

```
function y =  mycell()
c = {1 2 3};
coder.varsize('c{:}', [1 5], [0 1]);
y = c;
end
```

Generate a C static library.

```
codegen -config:lib mycell -report
```

In the report, view the MATLAB variables.

The elements of `c` are 1-by-:5 arrays of doubles.

Limitations

- If you use the cell function to create a `cell` array, you cannot use `coder.varsize` with that cell array.
- If you use `coder.varsize` with a cell array element, the `coder.varsize` declaration must follow the first assignment to the element. For example:

  ```
  ...
  x = cell(3, 3);
  x{1} = [1 2];
  coder.varsize('x{1}');
  ...
  ```
- You cannot use `coder.varsize` with global variables.
- You cannot use `coder.varsize` with MATLAB class properties.

- You cannot use `coder.varsize` with string scalars.
- For sparse matrices, `coder.varsize` drops upper bounds for variable-size dimensions.

Tips

- `coder.varsize` fixes the size of a singleton dimension unless the `dims` argument explicitly specifies that the singleton dimension has a variable size.

  For example, the following code specifies that `v` has size 1-by-:10. The first dimension (the singleton dimension) has a fixed size. The second dimension has a variable size.

  ```
  coder.varsize('v', [1 10])
  ```

  By contrast, the following code specifies that `v` has size :1-by-:10. Both dimensions have a variable size.

  ```
  coder.varsize('v',[1,10],[1,1])
  ```

  Note For a MATLAB Function block, singleton dimensions of input or output signals cannot have a variable size.

- If you use input variables (or result of a computation using input variables) to specify the size of an array, it is declared as variable-size in the generated code. Do not use `coder.varsize` on the array again, unless you also want to specify an upper bound for its size.
- Using `coder.varsize` on an array without explicit upper bounds causes dynamic memory allocation of the array. This dynamic memory allocation can reduce the speed of generated code. To avoid dynamic memory allocation, use the syntax `coder.varsize('`*var_1*`', '`*var_2*`', ..., `*`ubound`*`)` to specify an upper bound for the array size (if you know it in advance).
- A cell array can be variable size only if it is homogeneous. When you use `coder.varsize` with a cell array, the code generator tries to make the cell array homogeneous. It tries to find a class and size that apply to all elements of the cell array. For example, if the first element is double and the second element is 1x2 double, all elements can be represented as 1x:2 double. If the code generator cannot find a common class and size, code generation fails. For example, suppose that the first element of a cell array is char and the second element is double. The code generator cannot find a class that can represent both elements.

coder.wref

Indicate write-only data to pass by reference

Syntax

`coder.wref(arg)`

Description

`coder.wref(arg)` indicates that `arg` is a write-only expression or variable to pass by reference to an external C/C++ function. Use `coder.wref` only inside a `coder.ceval` call. This function enables the code generator to optimize the generated code by ignoring prior assignments to `arg` in your MATLAB code, because the external function is assumed to not read from the data. Write to all the elements of `arg` in your external code to fully initialize the memory.

Note The C/C++ function must fully initialize the memory referenced by `coder.wref(arg)`. Initialize the memory by assigning values to every element of `arg` in your C/C++ code. If the generated code tries to read from uninitialized memory, it can cause undefined run-time behavior.

See also `coder.ref` and `coder.rref`.

Examples

Pass Array by Reference as Write-Only

Suppose that you have a C function `init_array`.

```
void init_array(double* array, int numel) {
  for(int i = 0; i < numel; i++) {
    array[i] = 42;
  }
}
```

The C function defines the input variable `array` as a pointer to a double.

Call the C function `init_array` to initialize all elements of `y` to 42:

```
...
Y = zeros(5, 10);
coder.ceval('init_array', coder.wref(Y), int32(numel(Y)));
...
```

Pass Multiple Arguments as a Write-Only Reference

```
...
U = zeros(5, 10);
V = zeros(5, 10);
coder.ceval('my_fcn', coder.wref(U), int32(numel(U)), coder.wref(V), int32(numel(V)));
...
```

Pass Class Property as a Write-Only Reference

```
...
x = myClass;
x.prop = 1;
coder.ceval('foo', coder.wref(x.prop));
...
```

Pass Structure as a Write-Only Reference

To indicate that the structure type is defined in a C header file, use `coder.cstructname`.

Suppose that you have the C function `init_struct`. This function writes to the input argument but does not read from it.

```
#include "MyStruct.h"

void init_struct(struct MyStruct *my_struct)
{
   my_struct->f1 = 1;
   my_struct->f2 = 2;
}
```

The C header file, MyStruct.h, defines a structure type named MyStruct:

```
#ifndef MYSTRUCT
#define MYSTRUCT

typedef struct MyStruct
{
    double f1;
    double f2;
} MyStruct;

void init_struct(struct MyStruct *my_struct);

#endif
```

In your MATLAB function, pass a structure as a write-only reference to init_struct. Use coder.cstructname to indicate that the structure type for s has the name MyStruct that is defined in the C header file MyStruct.h.

```
function y = foo
%#codegen
y = 0;
coder.updateBuildInfo('addSourceFiles','init_struct.c');

s = struct('f1',1,'f2',2);
coder.cstructname(s,'MyStruct','extern','HeaderFile','MyStruct.h');
coder.ceval('init_struct', coder.wref(s));
```

To generate standalone library code, enter:

```
codegen -config:lib foo -report
```

Pass Structure Field as a Write-Only Reference

```
...
s = struct('s1', struct('a', [0 1]));
coder.ceval('foo', coder.wref(s.s1.a));
...
```

You can also pass an element of an array of structures:

```
...
c = repmat(struct('u',magic(2)),1,10);
b = repmat(struct('c',c),3,6);
```

```
a = struct('b',b);
coder.ceval('foo', coder.wref(a.b(3,4).c(2).u));
...
```

Input Arguments

arg — Argument to pass by reference

scalar variable | array | element of an array | structure | structure field | object property

Argument to pass by reference to an external C/C++ function. The argument cannot be a class, a System object, a cell array, or an index into a cell array.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical` | `char` | `struct`
Complex Number Support: Yes

Limitations

- You cannot pass these data types by reference:
  - Class or System object
  - Cell array or index into a cell array
- If a property has a get method, a set method, or validators, or is a System object property with certain attributes, then you cannot pass the property by reference to an external function. See “Passing By Reference Not Supported for Some Properties”.

Tips

- If `arg` is an array, then `coder.wref(arg)` provides the address of the first element of the array. The `coder.wref(arg)` function does not contain information about the size of the array. If the C function must know the number of elements of your data, pass that information as a separate argument. For example:

  ```
  coder.ceval('myFun',coder.wref(arg),int32(numel(arg)));
  ```
- When you pass a structure by reference to an external C/C++ function, use `coder.cstructname` to provide the name of a C structure type that is defined in a C header file.

- In MATLAB, `coder.wref` results in an error. To parametrize your MATLAB code so that it can run in MATLAB and in generated code, use `coder.target`.
- You can use `coder.opaque` to declare variables that you pass to and from an external C/C++ function.

`coder.ceval` | `coder.cstructname` | `coder.opaque` | `coder.ref` | `coder.rref`

Topics

"Integrate C Code Using the MATLAB Function Block"

Introduced in R2011a

createInputDataset

Generate dataset object for root-level Inport blocks in model

Syntax

```
[inports_dataset] = createInputDataset(model)
```

Description

`[inports_dataset] = createInputDataset(model)` generates a `Simulink.SimulationData.Dataset` object from the root-level Inport blocks in a model. Signals in the generated dataset have the properties of the root inports and the corresponding ground values at model start and stop times. You can create `timetable` or `timeseries` objects for the time and values for signals for which you want to load data for simulation. The other signals use ground values.

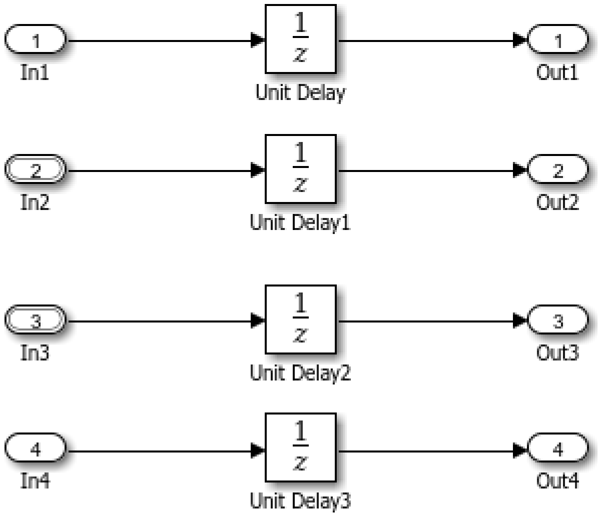
Examples

Generate and Populate Dataset for Root-Level Inport Blocks

Create a dataset with elements for the four root-level Inport blocks in a model. Use that dataset as a basis for creating a dataset to load signal data into the model.

Open the model. The `In1` block outputs a double, `In2` and `In3` each output a nonvirtual bus, and `In4` outputs an `int16`.

```
mdl = 'ex_dataset_for_inports';
open_system(mdl)
```



Create a `Dataset` object for the root-level Inport blocks.

```
ds = createInputDataset(mdl)
```

```
Simulink.SimulationData.Dataset '' with 4 elements

                           Name   BlockPath
                           ____   _________

    1  [1x1 timeseries]    In1    ''
    2  [1x1 struct    ]    In2    ''
    3  [1x1 struct    ]    In3    ''
    4  [1x1 timeseries]    In4    ''

  - Use braces { } to access, modify, or add elements using index.
```

Replace the placeholder value for the first signal in the `Dataset` with actual signal values that you want to load into the model.

```
ds{1} = ds{1}.delsample('Index',[1,2]);
ds{1} = ds{1}.addsample('time',[1 3 3 10]','data',[1 1 5 5]');
```

Examine the `In2` signal.

```
ds{2}
```

```
ans = 

  struct with fields:

    a: [1×1 timeseries]
    b: [1×1 timeseries]
```

For In2, create data for bus elements a and b.

```
ds{2}.a = ds{2}.a.delsample('Index',[1,2]);
ds{2}.a = addsample(ds{2}.a,'time',[1:10]','data',[1:10]');
ds{2}.b = timeseries((1:10)',0.1:.1:1,'Name','sig2_b');
```

For In3, specify data for element a of the bus, and use ground values for element b.

```
ds{3}.a = timeseries((1:10)',0.1:.1:1,'Name','sig3_a');
```

Plot ds. For more information, see the Simulink.SimulationData.Dataset.plot documentation.

```
plot(ds)
```

Set the **Input** configuration parameter to ds.

```
set_param(mdl,'LoadExternalInput','on');
set_param(mdl,'ExternalInput','ds');
```

Tip Alternatively, you can use the Root Inport Mapper tool to set the **Input** parameter. For details, see “Map Root Inport Signal Data”.

Run the simulation. The Inport blocks use the signal data specified in ds or ground values for elements that do not have specified signal data.

```
sim(mdl)
```

Input Arguments

model — Model for which to generate dataset for root-level Inport blocks
character vector | model handle

Model for which to generate a dataset with an element for each root-level Inport block, specified as a character vector or model handle.

Output Arguments

`inports_dataset` — Dataset with an element for each root-level Inport block
a `Simulink.SimulationData.Dataset` object

Dataset with an element for each root-level Inport block, returned as a `Simulink.SimulationData.Dataset` object.

`Simulink.SimulationData.Dataset` MATLAB `timeseries` `timetable` “Create a Dataset Object for Inport Blocks”

Introduced in R2017a

getHardwareImplementation

Class: coder.BuildConfig
Package: coder

Get handle of copy of hardware implementation object

Syntax

```
hw = bldcfg.getHardwareImplementation()
```

Description

`hw = bldcfg.getHardwareImplementation()` returns the handle of a copy of the hardware implementation object.

Input Arguments

`bldcfg`

`coder.BuildConfig` object.

Output Arguments

`hw`

Handle of copy of hardware implementation object.

See Also

getStdLibInfo

Class: coder.BuildConfig
Package: coder

Get standard library information

Syntax

```
[linkLibPath,linkLibExt,execLibExt,libPrefix]=
bldcfg.getStdLibInfo()
```

Description

`[linkLibPath,linkLibExt,execLibExt,libPrefix]= bldcfg.getStdLibInfo()` returns character vectors representing the:

- Standard MATLAB architecture-specific library path
- Platform-specific library file extension for use at link time
- Platform-specific library file extension for use at run time
- Standard architecture-specific library name prefix

Input Arguments

`bldcfg`

`coder.BuildConfig` object.

Output Arguments

`linkLibPath`

Standard MATLAB architecture-specific library path specified as a character vector. The character vector can be empty.

`linkLibExt`

Platform-specific library file extension for use at link time, specified as a character vector. The value is one of `'.lib'`,`'.dylib'`,`'.so'`, `''`.

`execLibExt`

Platform-specific library file extension for use at run time, specified as a character vector. The value is one of `'.dll'`,`'.dylib'`,`'.so'`, `''`.

`linkPrefix`

Standard architecture-specific library name prefix, specified as a character vector. The character vector can be empty.

getTargetLang

Class: coder.BuildConfig
Package: coder

Get target code generation language

Syntax

```
lang = bldcfg.getTargetLang()
```

Description

`lang = bldcfg.getTargetLang()` returns a character vector containing the target code generation language.

Input Arguments

`bldcfg`

`coder.BuildConfig` object.

Output Arguments

`lang`

A character vector containing the target code generation language. The value is `'C'` or `'C++'`.

getToolchainInfo

Class: coder.BuildConfig
Package: coder

Returns handle of copy of toolchain information object

Syntax

```
tc = bldcfg.getToolchainInfo()
```

Description

`tc = bldcfg.getToolchainInfo()` returns a handle of a copy of the toolchain information object.

Input Arguments

`bldcfg`

`coder.BuildConfig` object.

Output Arguments

`tc`

Handle of copy of toolchain information object.

See Also

isCodeGenTarget

Class: coder.BuildConfig
Package: coder

Determine if build configuration represents specified target

Syntax

```
tf = bldcfg.isCodeGenTarget(target)
```

Description

`tf = bldcfg.isCodeGenTarget(target)` returns true (1) if the code generation target of the current build configuration represents the code generation target specified by `target`. Otherwise, it returns false (0).

Input Arguments

`bldcfg`

`coder.BuildConfig` object.

`target`

Code generation target specified as a character vector or cell array of character vectors.

Specify	For code generation target
`'rtw'`	C/C++ dynamic Library, C/C++ static library, or C/C ++ executable
`'sfun'`	S-function (Simulation)
`'mex'`	MEX-function

Specify `target` as a cell array of character vectors to test if the code generation target of the build configuration represents one of the targets specified in the cell array.

For example:

```
...
mytarget = {'sfun','mex'};
tf = bldcfg.isCodeGenTarget(mytarget);
...
```

tests whether the build context represents an S-function target or a MEX-function target.

Output Arguments

`tf`

The value is true (1) if the code generation target of the build configuration represents the code generation target specified by `target`. Otherwise, the value is false (0).

See Also

`coder.target`

isMatlabHostTarget

Class: coder.BuildConfig
Package: coder

Determine if hardware implementation object target is MATLAB host computer

Syntax

```
tf = bldcfg.isMatlabHostTarget()
```

Description

`tf = bldcfg.isMatlabHostTarget()` returns true (1) if the current hardware implementation object targets the MATLAB host computer. Otherwise, it returns false (0).

Input Arguments

`bldcfg`

`coder.BuildConfig` object.

Output Arguments

`tf`

Value is true (1) if the current hardware implementation object targets the MATLAB host computer. Otherwise, the value is false (0).

See Also

coder.ExternalDependency.getDescriptiveName

Class: coder.ExternalDependency
Package: coder

Return descriptive name for external dependency

Syntax

```
extname = coder.ExternalDependency.getDescriptiveName(bldcfg)
```

Description

`extname = coder.ExternalDependency.getDescriptiveName(bldcfg)` returns the name that you want to associate with an “external dependency” on page 2-185. The code generator uses the external dependency name for error messages.

Input Arguments

`bldcfg`

`coder.BuildConfig` object. Use `coder.BuildConfig` methods to get information about the “build context” on page 2-185

You can use this information when you want to return different names based on the build context.

Output Arguments

`extname`

External dependency name returned as a character vector.

Examples

Return external dependency name

Define a method that always returns the same name.

```
function myextname = getDescriptiveName(~)
   myextname = 'MyLibrary'
end
```

Return external library name based on the code generation target

Define a method that uses the build context to determine the name.

```
function myextname = getDescriptiveName(context)
    if context.isMatlabHostTarget()
        myextname = 'MyLibary_MatlabHost';
    else
        myextname = 'MyLibrary_Local';
    end
end
```

Definitions

external dependency

External code interface represented by a class derived from a `coder.ExternalDependency` class. The external code can be a library, object files, or C/C++ source.

build context

Information used by the build process including:

- Target language
- Code generation target

- Target hardware
- Build toolchain

See Also

`coder.BuildConfig` | `coder.ExternalDependency` | `coder.ceval` | `coder.updateBuildInfo`

Topics

"Develop Interface for External C/C++ Code" (MATLAB Coder)
"Build Process Customization" (MATLAB Coder)

coder.ExternalDependency.isSupportedContext

Class: coder.ExternalDependency
Package: coder

Determine if build context supports external dependency

Syntax

```
tf = coder.ExternalDependency.isSupportedContext(bldcfg)
```

Description

`tf = coder.ExternalDependency.isSupportedContext(bldcfg)` returns true (1) if you can use the "external dependency" on page 2-188 in the current "build context" on page 2-188 . You must provide this method in the class definition for a class that derives from `coder.ExternalDependency`.

If you cannot use the "external dependency" on page 2-188 in the current "build context" on page 2-188, display an error message and stop code generation. The error message must describe why you cannot use the external dependency in this build context. If the method returns false (0), the code generator uses a default error message. The default error message uses the name returned by the `getDescriptiveName` method of the `coder.ExternalDependency` class.

Use `coder.BuildConfig` methods to determine if you can use the external dependency in the current build context.

Input Arguments

`bldcfg`

`coder.BuildConfig` object. Use `coder.BuildConfig` methods to get information about the "build context" on page 2-188.

Output Arguments

tf

Value is true (1) if the build context supports the external dependency.

Examples

Report error when build context does not support external library

This method returns true(1) if the code generation target is a MATLAB host target. Otherwise, the method reports an error and stops code generation.

Write isSupportedContext method.

```
function tf = isSupportedContext(ctx)
    if  ctx.isMatlabHostTarget()
        tf = true;
    else
        error('adder library not available for this target');
    end
end
```

Definitions

external dependency

External code interface represented by a class derived from coder.ExternalDependency class. The external code can be a library, object file, or C/C++ source.

build context

Information used by the build process including:

- Target language

- Code generation target
- Target hardware
- Build toolchain

coder.ExternalDependency.updateBuildInfo

Class: coder.ExternalDependency
Package: coder

Update build information

Syntax

```
coder.ExternalDependency.updateBuildInfo(buildInfo, bldcfg)
```

Description

`coder.ExternalDependency.updateBuildInfo(buildInfo, bldcfg)` updates the build information object whose handle is `buildInfo`. After code generation, the build information object has standard information. Use this method to provide additional information required to link to external code. Use `coder.BuildConfig` methods to get information about the “build context” on page 2-191.

You must implement this method in a subclass of `coder.ExternalDependency`. For an example, see `coder.ExternalDependency`.

Input Arguments

`buildInfo`

Handle of build information object.

`bldcfg`

`coder.BuildConfig` object. Use `coder.BuildConfig` methods to get information about the “build context” on page 2-191.

Limitations

- The build information method `AddIncludeFiles` has no effect in a `coder.ExternalDependency` `updateBuildInfo` method.

Definitions

build context

Information used by the build process including:

- Target language
- Code generation target
- Target hardware
- Build toolchain

convertToSLDataset

Convert contents of MAT-file to `Simulink.SimulationData.Dataset` object

Syntax

```
success=convertToSLDataset(source,destination)
success=convertToSLDataset(source,destination,datasetname)
```

Description

`success=convertToSLDataset(source,destination)` converts the contents of a MAT-file (`source`) to a destination MAT-file (`destination`).

`success=convertToSLDataset(source,destination,datasetname)` names the dataset `datasetname`.

When converting structure signal data, the function names the signal using the value contained in the label field of the structure signal field, such as: `mySignal.signal(1).label`.

This function ignores time expressions in source.

Examples

Save Signals to Dataset in file2.mat

Save signals from `file1.mat` to a dataset named `file1` in `file2.mat`.

```
success=convertToSLDataset('file1.mat','file2.mat')
```

Save Signals to Dataset Named myDataset in file2.mat

Save signals from `file1.mat` to a dataset named `myDataset` in `file2.mat`.

```
success=convertToSLDataset('file1.mat','file2.mat','myDataset')
```

Input Arguments

`source` — MAT-file

character vector

MAT–file that contains Simulink inputs.

`destination` — MAT-file

character vector

MAT–file to contain `Simulink.SimulationData.Dataset` converted from contents of `source`.

`datasetname` — Data set name

character vector

Data set name for new `Simulink.SimulationData.Dataset` object.

Output Arguments

`success` — Outcome of conversion

binary

Outcome of conversion, specified as binary:

- `1`

  Conversion is successful.
- `0`

  Conversion is not successful.

Introduced in R2016a

copy

Copy a configuration set

Syntax

```
copyCs = copy(cs)
```

Description

`copyCs = copy(cs)` returns a copy of a configuration set.

Examples

Attach New Configuration Set to a Model

Create a copy of a configuration set and attach it to a model.

Get the active configuration set for your model.

```
activeConfig = getActiveConfigSet ('vdp');
```

Copy the active configuration set.

```
develConfig = copy(activeConfig);
```

Give the copied configuration set a name.

```
develConfig.Name = 'develConfig';
```

Attach the new configuration set to the model.

```
attachConfigSet('vdp',develConfig);
```

Input Arguments

cs — Configuration set
ConfigSet object

Configuration set object to copy, specified as a `ConfigSet` object.

Output Arguments

copyCs — Copy of configuration set
ConfigSet object

A copy of the configuration set, specified as a `ConfigSet` object.

createCategory

Create category of Simulink Project labels

Syntax

```
createCategory(proj,categoryName)
createCategory(proj,categoryName,dataType)
createCategory(proj,categoryName,dataType, single-valued)
```

Description

`createCategory(proj,categoryName)` creates a new category of labels `categoryName` in the project `proj`.

`createCategory(proj,categoryName,dataType)` specifies the class of data to store in labels of the new category.

`createCategory(proj,categoryName,dataType, single-valued)` specifies a single-valued category, where you can attach only one label from the category to a file. If you do not specify single-valued, then you can attach multiple labels from the category to a file.

Examples

Create a New Category of Labels for File Ownership

Create a new category of labels for file ownership, and attach a new label and label data to a file.

Open the airframe project and create a project object.

```
sldemo_slproject_airframe
proj = simulinkproject;
```

Create a new category of labels, called `Engineers`, to denote file ownership in a project. These labels have the char `datatype` for attaching character vector data.

```
createCategory(proj,'Engineers','char');
```

Use `findCategory` to get the new category.

```
engineersCategory = findCategory(proj,'Engineers');
```

Create labels in the new category.

```
createLabel(engineersCategory,'Tom');
createLabel(engineersCategory,'Dick')
createLabel(engineersCategory,'Harry')
```

Attach one of the new labels to a file in the project.

```
myfile = findFile(proj,'models/AnalogControl.mdl')
addLabel(myfile,'Engineers','Tom');
```

Get the label and add data.

```
label = findLabel(file,'Engineers','Tom');
label.Data = 'Maintenance responsibility';
disp(label)
```

```
Label with properties:

            File: [1x80 char]
            Data: 'Maintenance responsibility'
        DataType: 'char'
            Name: 'Tom'
    CategoryName: 'Engineers'
```

Create a New Category of Labels with Datatype Double

Open the airframe project and create a project object.

```
sldemo_slproject_airframe
proj = simulinkproject;
```

Create a new category of labels.

```
createCategory(proj,'Coverage','double')
```

```
category = 

  Category with properties:

                Name: 'Coverage'
            DataType: 'double'
    LabelDefinitions: []
```

Find out what you can do with the new category.

```
category = findCategory(proj, 'Coverage');
methods(category)
```

```
Methods for class slproject.Category:

findLabel  removeLabel  createLabel
```

Create a Single-Valued Category

Open the airframe project and create a project object.

```
sldemo_slproject_airframe
proj = simulinkproject;
```

Create a category of labels for file ownership, and specify single-valued to restrict only one label in the category per file.

```
createCategory(proj,'Engineers','char', 'single-valued');
```

Input Arguments

`proj` — Project
project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

`categoryName` — Name of category
character vector

Name of the category of labels to create, specified as a character vector.

`dataType` — Class of data to store in labels

character vector

The class of data to store in labels in the new category, specified as a character vector.

`single-valued` — Single-valued category

character vector

Single-valued category, specified as a character vector. Single-valued means you can attach only one label from the category to a file. If you do not specify single-valued, then you can attach multiple labels from the category to a file.

Tips

After you create a new category, you can create labels in the new category. See `createLabel`.

See Also

Functions

`createLabel` | `simulinkproject`

Introduced in R2013a

createLabel

Define Simulink Project label

Syntax

```
createLabel(category,newLabelName)
```

Description

`createLabel(category,newLabelName)` creates a new label, `newLabelName`, in a category. Use this syntax if you previously got a `category` by accessing a `Categories` property, e.g., using a command like `proj.Categories(1)`.

Use `addLabel` instead to create and attach a new label in an existing category using a single step.

Use `createCategory` first if you want to make a new category of labels.

Examples

Create a New Label

Open the airframe project and create a project object.

```
sldemo_slproject_airframe
proj = simulinkproject;
```

Examine the first existing category.

```
cat = proj.Categories(1)
```

```
cat = 

  Category with properties:
```

```
                Name: 'Classification'
            DataType: 'none'
    LabelDefinitions: [1x8 slproject.LabelDefinition]
```

Define a new label in the category.

```
createLabel(cat,'Future');
```

Create a New Category of Labels for File Ownership

Open the airframe project and create a project object.

```
sldemo_slproject_airframe
proj = simulinkproject;
```

Create creates a new category of labels called `Engineers` which can be used to denote file ownership in a project. These labels have the char `datatype` for attaching character vector data.

```
createCategory(proj,'Engineers','char');
```

Use `findCategory` to get the new category.

```
engineersCategory = findCategory(proj,'Engineers');
```

Create labels in the new category.

```
createLabel(engineersCategory,'Tom');
createLabel(engineersCategory,'Dick');
createLabel(engineersCategory,'Harry');
```

Attach one of the new labels to a file in the project.

```
myfile = findFile(proj,'models/AnalogControl.mdl')
addLabel(myfile,'Engineers', 'Tom');
```

Get the label and add data.

```
label = findLabel(myfile,'Engineers','Tom');
label.Data = 'Maintenance responsibility';
disp(label)
```

```
Label with properties:
```

```
            File: [1x80 char]
            Data: 'Maintenance responsibility'
        DataType: 'char'
            Name: 'Tom'
    CategoryName: 'Engineers'
```

Input Arguments

`category` — Category
category object

Category for the new label, specified as a category object. Get the category by accessing a `Categories` property, e.g. with a command like `proj.Categories(1)`, or use `findCategory`. To create a new category, use `createCategory`.

`newLabelName` — The name of the new label to define
character vector

The name of the new label to define, specified as a character vector.

See Also

Functions
`addLabel` | `createCategory`

Introduced in R2013a

addStartupFile

Add startup file to project

Syntax

```
addStartupFile(proj, file)
```

Description

`addStartupFile(proj, file)` adds a startup file to the project `proj`. Startup files automatically run (`.m` and `.p` files), load (.mat files), or open (Simulink models) when you open the project.

Examples

Add a Startup File

Open the airframe project and create a project object.

```
sldemo_slproject_airframe
proj = simulinkproject;
```

Create a new file.

```
filepath = fullfile(proj.RootFolder, 'new_model.slx')
     new_system('new_model');
     save_system('new_model', filepath)
```

Add the new model to the project.

```
 projectFile = addFile(proj, filepath)
```

Automatically open the model when the project opens, by making it a startup file.

```
addStartupFile(proj, filepath);
```

Input Arguments

`proj` — Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

`file` — Path of file

character vector

Path of the file to add relative to the project root folder, including the file extension, specified as a character vector. The file must be within the root folder.

Example: ‘models/myModelName.slx’

See Also

`simulinkproject`

Introduced in R2017b

addShutdownFile

Add shutdown file to project

Syntax

```
addShutdownFile(proj, file)
```

Description

`addShutdownFile(proj, file)` adds a shutdown file to the project `proj`. When you close the project, it runs the shutdown file automatically. Use the shutdown list to specify executable MATLAB code to run as the project shuts down.

Examples

Add a Shutdown File

Open the airframe project and create a project object.

```
sldemo_slproject_airframe
proj = simulinkproject;
```

Specify executable MATLAB code to run as the project shuts down.

```
     filepath = fullfile('utilities', 'rebuild_s_functions.m');
```

Automatically run the file when the project closes, by making it a shutdown file.

```
addShutdownFile(project, filepath);
```

Input Arguments

`proj` — Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

`file` — Path of file

character vector

Path of the MATLAB file to add relative to the project root folder, including the file extension, specified as a character vector. The file must be within the root folder.

Example: ‘utilities/myscript.m’

See Also

`simulinkproject`

Introduced in R2017b

removeStartupFile

Remove startup file from project startup list

Syntax

```
removeStartupFile(proj, file)
```

Description

`removeStartupFile(proj, file)` removes the startup file from the startup list in the project `proj`.

Examples

Remove a Startup File

Open the airframe project and create a project object.

```
sldemo_slproject_airframe
proj = simulinkproject;
```

Create a new file.

```
filepath = fullfile(proj.RootFolder, 'new_model.slx')
     new_system('new_model');
     save_system('new_model', filepath)
```

Add the new model to the project.

```
 projectFile = addFile(proj, filepath)
```

Automatically open the model when the project opens, by making it a startup file.

```
addStartupFile(proj, filepath);
```

Remove the startup file.

```
removeStartupFile(proj, filepath);
```

Input Arguments

`proj` — Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

`file` — Path of file

character vector

Path of the file to add relative to the project root folder, including the file extension, specified as a character vector. The file must be within the root folder.

Example: ‘models/myModelName.slx’

See Also

`simulinkproject`

Introduced in R2017b

removeShutdownFile

Remove shutdown file from project shutdown list

Syntax

```
removeShutdownFile(proj, file)
```

Description

`removeShutdownFile(proj, file)` removes the shutdown file from the shutdown list in the project `proj`.

Examples

Remove a Shutdown File

Open the airframe project and create a project object.

```
sldemo_slproject_airframe
proj = simulinkproject;
```

Specify executable MATLAB code to run as the project shuts down.

```
     filepath = fullfile('utilities', 'rebuild_s_functions.m');
```

Automatically run the file when the project closes, by making it a shutdown file.

```
addShutdownFile(project, filepath);
```

Remove the shutdown file.

```
removeShutdownFile(project, filepath);
```

Input Arguments

`proj` — Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

`file` — Path of file

character vector

Path of the MATLAB file to add relative to the project root folder, including the file extension, specified as a character vector. The file must be within the root folder.

Example: ‘utilities/myscript.m’

See Also

`simulinkproject`

Introduced in R2017b

delete_block

Delete blocks from Simulink system

Syntax

```
delete_block(blockArg)
```

Description

`delete_block(blockArg)` deletes the specified blocks from a system. Open the system before you delete blocks.

Examples

Delete Block Using Full Path Name

Delete the block Mu from the `vdp` system.

```
open_system('vdp')
delete_block('vdp/Mu')
```

Delete Block Using Block Handle

Delete the block Out2 from the `vdp` system using the block handle.

Open the `vdp` system.

```
open_system('vdp')
```

Interactively select the block Out1. Get the block's handle and assign it to the variable `Out1_handle`. Delete the block using the handle.

```
Out1_handle = get_param(gcb,'Handle');
delete_block(Out1_handle)
```

Delete Blocks Using Vector of Handles

Delete three blocks from the vdp system.

Open the vdp system. Add three blocks and assign their handles to variables.

```
open_system('vdp')
Constant_handle = add_block('built-in/Constant','vdp/MyConstant');
Gain_handle = add_block('built-in/Gain','vdp/MyGain');
Outport_handle = add_block('built-in/Outport','vdp/MyOutport');
```

Delete the blocks you added using a vector of handles.

```
delete_block([Constant_handle Gain_handle Outport_handle])
```

Input Arguments

blockArg — Blocks to delete

full path name | handle | vector of handles | 1-D cell array of handles or block path names

Blocks to delete, specified as the full block path name, a handle, a vector of handles, or a 1-D cell array of handles or block path names.

Example: `'vdp/Mu'`

Example: `[handle1 handle2]`

Example: `{'vdp/Mu' 'vdp/Out1' 'vdp/Out2'}`

See Also

add_block

Introduced before R2006a

delete_line

Delete line from Simulink model

Syntax

```
delete_line(sys,out,in)
delete_line(sys,point)
delete_line(lineHandle)
```

Description

`delete_line(sys,out,in)` deletes the line from the model or subsystem `sys` that connects the output port `out` to the input port `in`.

`delete_line(sys,point)` deletes the line that includes the point `point`.

`delete_line(lineHandle)` deletes the line using the line handle.

Examples

Remove Line Using Block Port Names

For the model `vdp`, remove the line connecting the Product block with the Gain block.

```
load_system('vdp');
delete_line('vdp','Product/1','Mu/1');
```

Remove Line Using Line Handle

For the model `vdp`, remove a line using the line handle. You can get the line handle using different techniques.

```
load_system('vdp');
h = get_param('vdp/Mu','LineHandles');
delete_line(h.Outport(1));
```

Get a line handle when you create the line. Delete the line using that handle.

```
a = add_line('vdp','Mu/1','Sum/2');
delete_line(a)
```

Delete a Line Using a Point

You can use a point on the line to delete the whole line.

Find the port coordinates for the block Mu in the model `vdp`.

```
open_system('vdp');
mu = get_param('vdp/Mu','PortConnectivity');
mu.Position
```

```
ans = 1×2

   190   150

ans = 1×2

   225   150
```

The line that connects the Mu block to the Sum block starts at the output port, which is at (225,150). You can use any point to the right of that point along the same *x*-axis to delete the line.

```
delete_line('vdp',[230,150]);
```

Delete Segments of Branched Lines

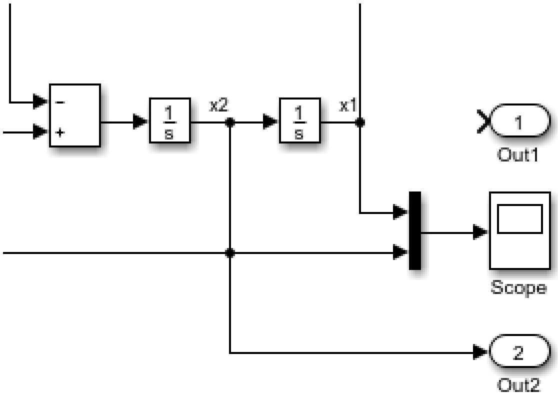
Use `delete_line` with branched lines to remove the segment for any connection.

Open the model `vdp`.

```
open_system('vdp');
```

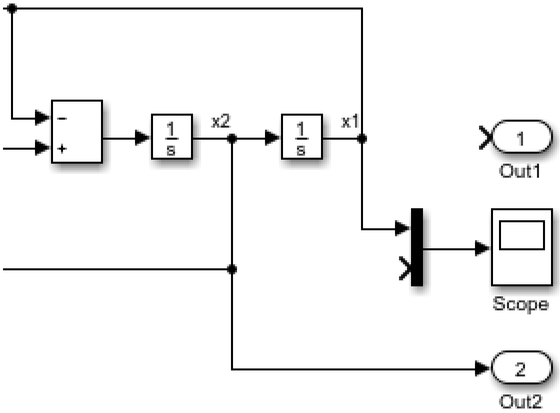
Delete the line from x1 to the Out1 block. This command deletes only the segment of the line that connects the branch to the specified block.

```
delete_line('vdp','x1/1','Out1/1')
```



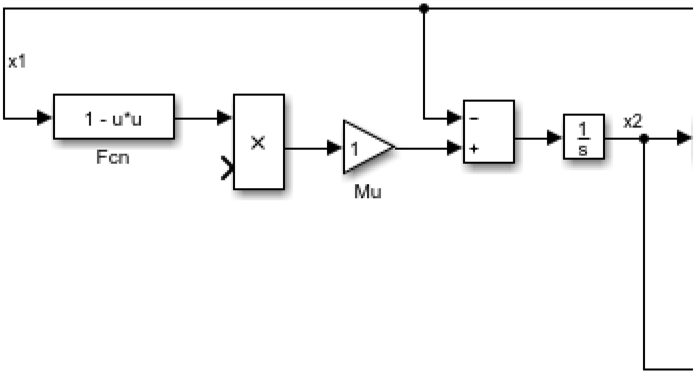
Delete the line segment from x2 to the Mux.

```
delete_line('vdp','x2/1','Mux/2')
```



Delete the line segment from x2 to the Product block.

```
delete_line('vdp','x2/1','Product/2')
```



Input Arguments

sys — Model or subsystem to delete line from

character vector

Model or subsystem to delete the line from, specified as a character vector.

Example: `'vdp'` , `'f14/Controller'`

out — Block output port to delete line from

block/port name or number character vector | port handle

Block output port to delete line from, specified as either:

- The block name, a slash, and the port name or number. Most block ports are numbered from top to bottom or from left to right. For a state port, use the port name State instead of a port number.
- The port handle that you want to delete the line from.

Use `'PortHandles'` with `get_param` to get the handles.

Example: `'Mu/1'`, `'Subsystem/2'`

in — Block input port to delete line from

block/port name or number character vector | port handle

Block input port to delete line from, specified as either:

- The block name, a slash, and the port name or number. The port name on:
  - An enabled subsystem is Enable.
  - A triggered subsystem is Trigger.
  - If Action and Switch Case Action subsystems is Action.
- The port handle that you want to delete the line from.

Use `'PortHandles'` with `get_param` to get handles.

Example: `'Mu/1'`, `'Subsystem/2'`

`point` — Point on the line you want to delete

1-by-2 matrix

Point that falls on the line you want to delete, specified as a 1-by-2 matrix.

Example: `[150 200]`

`lineHandle` — Handle of the line you want to delete

handle

Handle of the line you want to delete. You can get the line handle by using `get_param` with the `'LineHandles'` option or by assigning the line to a handle when you create it programmatically.

See Also

`add_line` | `get_param`

Introduced before R2006a

delete_param

Delete system parameter added via `add_param` command

Syntax

```
delete_param('sys','parameter1','parameter2',...)
```

Description

This command deletes parameters that were added to the system using the `add_param` command. The command displays an error message if a specified parameter was not added with the `add_param` command.

Examples

The following example

```
add_param('vdp','DemoName','VanDerPolEquation','EquationOrder','2')
delete_param('vdp','DemoName')
```

adds the parameters `DemoName` and `EquationOrder` to the `vdp` system, then deletes `DemoName` from the system.

See Also

`add_param`

Introduced before R2006a

dependencies.fileDependencyAnalysis

Find model file dependencies

Syntax

```
files = dependencies.fileDependencyAnalysis('modelname')
[files, missing] = dependencies.fileDependencyAnalysis('modelname')
[files, missing, depfile] = dependencies.fileDependencyAnalysis('
modelname')
[files, missing, depfile, manifestfile] =
dependencies.fileDependencyAnalysis('modelname', 'manifestfile')
```

Description

`files = dependencies.fileDependencyAnalysis('modelname')` returns `files`, a cell array of character vectors containing the full paths of all existing files referenced by the model `modelname`.

`[files, missing] = dependencies.fileDependencyAnalysis('modelname')` returns `files`, all existing files referenced by the model `modelname`, and any referenced files that cannot be found in *`missing`*.

`[files, missing, depfile] = dependencies.fileDependencyAnalysis(' modelname')` also returns `depfile`, the full path of the user dependencies (`.smd`) file, if it exists, that stores the names of any files you manually added or excluded.

`[files, missing, depfile, manifestfile] = dependencies.fileDependencyAnalysis('modelname', 'manifestfile')` also creates a manifest file with the name and path specified in `manifestfile`.

Input Arguments

`modelname`

Character vector specifying the name of the model to analyze for dependencies.

manifestfile

(Optional) Character vector to specify the name of the manifest file to create. You can specify a full path or just a file name (in which case the file is created in the current folder). The function adds the suffix `.smf` to the user-specified name.

Output Arguments

files

A cell array of character vectors containing the full-paths of all existing files referenced by the model `modelname`. If there is only one dependency, the return is a character vector. If there are no dependencies, the return is empty.

Default: [ ]

missing

A cell array of character vectors containing the names of any files that are referenced by the model `modelname`, but cannot be found.

Default: [ ]

depfile

Character vector containing the full path of a user dependencies (`.smd`) file, if it exists, that stores the names of any files you manually added or excluded. Simulink uses the `.smd` file to remember your changes the next time you generate a manifest. See "Edit Manifests".

Default: [ ]

manifestfile

Character vector containing the name and path of the new manifest file.

Default: [ ]

Examples

The following code analyses the model *`mymodel`* for file dependencies:

```
files = dependencies.fileDependencyAnalysis('mymodel')
```

If you try dependency analysis on an example model, it returns an empty list of required files because the standard MathWorks installation includes all the files required for the example models.

Tip

If you try dependency analysis on an example model, it returns an empty list of required files because the standard MathWorks installation includes all the files required for the example models.

Alternatives

If your file is in a Simulinkproject, use `listRequiredFiles` instead.

You can interactively run dependency analysis in Simulink Project. See “Run Dependency Analysis”.

To create a report to identify where dependencies arise, find required toolboxes, and for more control over dependency analysis options, you can interactively generate a manifest and report. See “Analyze Model Dependencies”.

To programmatically check which *toolboxes* are required, see `dependencies.toolboxDependencyAnalysis`.

See Also

`dependencies.toolboxDependencyAnalysis` | `listRequiredFiles`

Topics

“What Are Model Dependencies?”

Introduced in R2012a

dependencies.toolboxDependencyAnalysis

Find toolbox dependencies

Syntax

```
names = dependencies.toolboxDependencyAnalysis(files_in)
[names, folders] = dependencies.toolboxDependencyAnalysis(files_in)
```

Description

`names = dependencies.toolboxDependencyAnalysis(files_in)` returns `names`, a cell array of toolbox names required by the files in `files_in`.

`[names, folders] = dependencies.toolboxDependencyAnalysis(files_in)` returns toolbox names and also a cell array of the toolbox folders.

Tip In a Simulink project, you can interactively run dependency analysis. You can find the required toolboxes for the whole project or for selected files. You can see which products a new team member requires to use the project, or find which file is introducing a product dependency. See “Find Required Toolboxes”.

Input Arguments

`files_in`

Cell array of character vectors containing `.m`, `.mdl`, or `.slx` files on the MATLAB path. Simulink model names (without file extension) are also allowed.

Default: [ ]

Output Arguments

names

Cell array of toolbox names required by the files in `files_in`.

folders

(Optional) Cell-array of the required toolbox folders.

Examples

The following code reports the detectable required toolboxes for the model `vdp`:

```
files_in={'vdp'};
names = dependencies.toolboxDependencyAnalysis(files_in)
```

```
names =

    'MATLAB'    'Simulink'    'Simulink Coder'
```

To find all detectable toolbox dependencies of your model *and* the files it depends on:

1. Call `fileDependencyAnalysis` on your model.

   For example:

   ```
   files = dependencies.fileDependencyAnalysis('mymodel')
   ```

   ```
   files =
       'C:\Work\foo.m'
       'C:\Work\mymodel.mdl'
   ```
2. Call `toolboxDependencyAnalysis` on the `files` output of step 1.

   For example:

   ```
   tbxes = dependencies.toolboxDependencyAnalysis(files)
   ```

   ```
   tbxes =
   [1x24 char]    'MATLAB'    'Simulink Coder'    'Simulink'
   ```

   To view long product names examine the `tbxes` cell array as follows:

```
tbxes{:}

ans =
Image Processing Toolbox

ans =
MATLAB

ans =
Simulink Coder

ans =

Simulink
```

Tips

The function `dependencies.toolboxDependencyAnalysis` looks for toolbox dependencies of the files in `files_in` but does *not* analyze any subsequent dependencies. See “Examples” on page 2-224.

For command-line dependency analysis, the analysis uses the default settings for analysis scope to determine required toolboxes. For example, if you have code generation products, then the check **Find files required for code generation** is on by default and Simulink Coder is always reported as required. See “Required Toolboxes” in the manifest documentation for more examples of how your installed products and analysis scope settings can affect reported toolbox requirements.

Alternatives

In a Simulink project, you can interactively run dependency analysis and find the required toolboxes for the whole project or for selected files. See “Find Required Toolboxes”.

For a model that is not in a project, you can interactively generate a manifest and report. You can create a report to identify where dependencies arise, and control dependency analysis options. See “Analyze Model Dependencies”.

To programmatically check which *files* are required, see `dependencies.fileDependencyAnalysis`.

Introduced in R2012a

depview

Display graph of model referencing dependencies with or without library dependencies

`depview` opens the “Model Dependency Viewer”. While `view_mdlrefs` also opens the Model Dependency Viewer, `depview` provides programmatic options that allow you to open a specific configuration of the Model Dependency Viewer.

Syntax

```
depview(sys)
depview(sys,Name,Value)
```

Description

`depview(sys)` opens the Model Dependency Viewer, which displays a graph of dependencies for the model or library specified by `sys`.

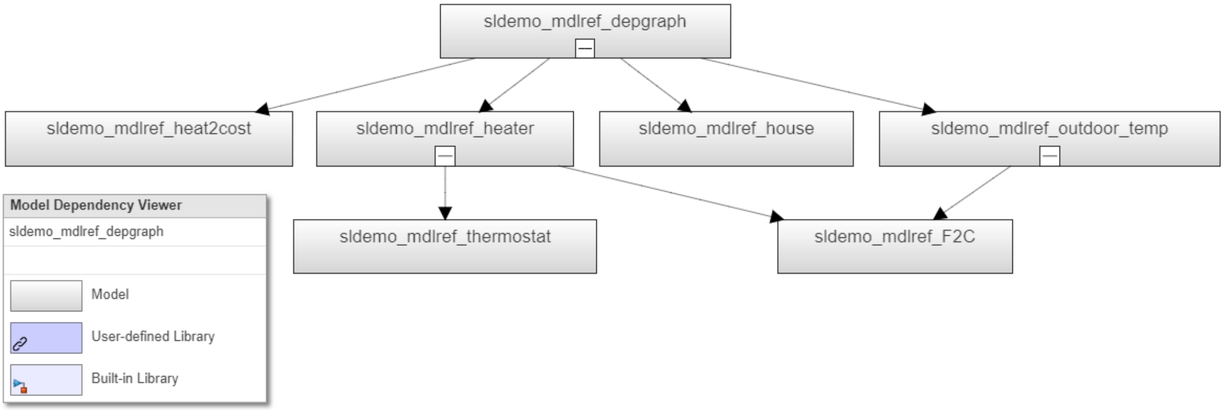
`depview(sys,Name,Value)` opens the Model Dependency Viewer as specified by one or more `Name,Value` pair arguments.

Examples

Open Model Dependency Viewer with Default Settings

Open the default Model Dependency Viewer for the model `sldemo_mdlref_depgraph`.

```
depview('sldemo_mdlref_depgraph');
```

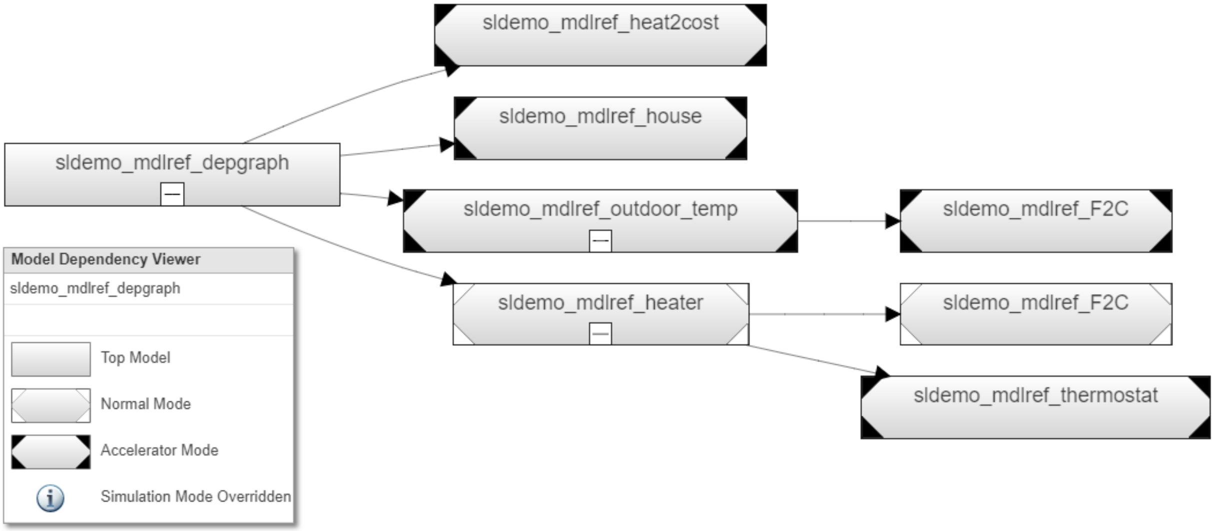


In **Model Files** view, node appearance corresponds to file type.

Open Model Dependency Viewer with Custom Settings

Open the Model Dependency Viewer for the model `sldemo_mdlref_depgraph` in **Model Instances** view with a **Horizontal** layout.

```
depview('sldemo_mdlref_depgraph','ModelReferenceInstance',true,'ShowHorizontal',true);
```



In **Model Instances** view, node appearance corresponds to simulation mode.

Input Arguments

sys — Name or path of model or library

`' '` (default) | character vector

Name or path of model or library, specified as a character vector.

Data Types: `char`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example:

```
depview('sldemo_mdlref_depgraph','ModelReferenceInstance',true,'ShowFullPath',true,'ShowHorizontal',true)
```

`FileDependenciesExcludingLibraries` — Graph with only models

false (default) | true

To open a Model Dependency Viewer that shows only models, set this parameter to `'true'`. In this view, node appearance corresponds to file type.

Dependencies

You can only set one of `'FileDependenciesExcludingLibraries'`, `'FileDependenciesIncludingLibraries'`, and `'ModelReferenceInstance'` to `'true'`.

`FileDependenciesIncludingLibraries` — Graph with models and user-defined libraries

true (default) | false

To open a Model Dependency Viewer that shows models and user-defined libraries, use the default setting. In this view, node appearance corresponds to file type.

Dependencies

To set this parameter to `'false'`, enable `'FileDependenciesExcludingLibraries'` or `'ModelReferenceInstance'`. You can only set one of `'FileDependenciesExcludingLibraries'`, `'FileDependenciesIncludingLibraries'`, and `'ModelReferenceInstance'` to `'true'`.

`FactoryDependencies` — Graph with models, user-defined libraries, and built-in libraries

false (default) | true

To open a Model Dependency Viewer that shows models, user-defined libraries, and built-in libraries, set this parameter to `'true'`. In this view, node appearance corresponds to file type.

Dependencies

To enable this option, set `'FileDependenciesIncludingLibraries'` to `'true'`.

`ModelReferenceInstance` — Graph with only models that shows each model instance separately

false (default) | true

To open a Model Dependency Viewer that shows each instance of a model as a separate node in the graph, set this parameter to `'true'`. In this view, node appearance corresponds to simulation mode.

Dependencies

You can only set one of `'FileDependenciesExcludingLibraries'`, `'FileDependenciesIncludingLibraries'`, and `'ModelReferenceInstance'` to `'true'`.

`ShowFullPath` — Full path for referenced models and libraries

false (default) | true

To open a Model Dependency Viewer that shows the full path from the top model to each referenced model or library, set this parameter to `'true'`. By default, the Model Dependency Viewer shows only the file name in each node. This parameter is available for only the **Model Instances** view.

Dependencies

To enable this option, set `'ModelReferenceInstance'` to `'true'`.

`ShowHorizontal` — Horizontal dependency display

false (default) | true

To open a Model Dependency Viewer that shows referenced models and libraries to the right of their parents, set this parameter to `'true'`. By default, the Model Dependency Viewer shows referenced models and libraries below their parents.

Introduced in R2006b

detachConfigSet

Dissociate configuration set or configuration reference from model

Syntax

```
detachConfigSet(model, configObjName)
```

Arguments

`model`

The name of an open model, or `gcs` to specify the current model

`configObjName`

The name of a configuration set (`Simulink.ConfigSet`) or configuration reference (`Simulink.ConfigSetRef`)

Description

`detachConfigSet` detaches the configuration set or configuration reference (configuration object) specified by `configObjName` from `model`. If no such configuration object is attached to the model, an error occurs.

Examples

The following example detaches the configuration object named `DevConfig` from the current model. The code is the same whether `DevConfig` is a configuration set or configuration reference.

```
detachConfigSet(gcs, 'DevConfig');
```

Introduced in R2006a

removeLabel(was detachLabelFromFile)

REMOVE — RENAMED TO REMOVELABEL — consolidate with existing removeLabel page. was: Detach label from Simulink Project file

Syntax

```
removeLabel(file,labelDefinition)
```

Description

`removeLabel(file,labelDefinition)` detaches the specified label `labelDefinition` from the file. Before you can detach the label, you need to get the label from the `file.Label` property or by using `findLabel`.

Examples

Detach a Label from a File

Remove a label from a particular project file.

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Get a particular file by name.

```
myfile = findFile(proj,'models/AnalogControl.mdl')
```

```
myfile = 

  ProjectFile with properties:

      Path: [1x86 char]
    Labels: [1x1 slproject.Label]
```

Get the `Labels` property of the file.

```
myfile.Labels
```

```
ans = 

  Label with properties:

            File: 'C:\work\airframe\models\AnalogControl.mdl'
            Data: []
        DataType: 'none'
            Name: 'Design'
    CategoryName: 'Classification'
```

Attach the label `'To Review'` to the file.

```
addLabel(myfile,'Review','To Review')
```

Get the label you want to remove. Index into the Labels property to get the second label attached to the file.

```
 labeltoremove = myfile.Labels(2)
```

```
labeltoremove = 

  Label with properties:

            File: [1x86 char]
            Data: []
        DataType: 'char'
            Name: 'To Review'
    CategoryName: 'Review'
```

Remove the label from the file.

```
removeLabel(myfile,labeltoremove)
myfile.Labels
```

```
ans = 

  Label with properties:

            File: [1x86 char]
            Data: []
        DataType: 'none'
```

```
            Name: 'Design'
    CategoryName: 'Classification'
```

Input Arguments

`file` — File to detach label from

file object

File to detach the label from, specified as a file object. You can get the file object by examining the project’s Files property (`proj.Files`), or use `findFile` to find a file by name. The file must be within the root folder.

`labelDefinition` — Label to detach

label definition object

Name of the label to detach, specified as a label definition object returned by the `file.Label` property or `findLabel`.

Functions

`addLabel` | `createLabel` | `findFile` | `findLabel` | `simulinkproject`

disableimplicitsignalresolution

Convert model to use only explicit signal resolution

Syntax

```
retVal = disableimplicitsignalresolution('model')
retVal = disableimplicitsignalresolution('model', displayOnly)
```

Description

`retVal = disableimplicitsignalresolution('model')` inputs a model, reports all signals and states that implicitly resolve to signal objects, and converts the model to resolve only signals and states that explicitly require it. The report and any changes are limited to the model itself; they do not include blocks that are library links.

Before executing this function, ensure that all relevant Simulink data objects are defined in the base workspace or a data dictionary to which the model is linked. The function ignores any data objects that are defined elsewhere.

The function scans *`model`*, returns a structure of handles to signals and states that resolve implicitly to signal objects, and performs the following operations on *`model`*:

- Search the model for all output ports and block states that resolve to Simulink signal objects.
- Modify these ports and blocks to enforce signal object resolution in the future.
- Set the model's `SignalResolutionControl` parameter to `'UseLocalSettings'` (GUI: **Explicit Only**).

  If `SignalResolutionControl` is already set to `'UseLocalSettings'` or to `'None'`, the function takes no action and returns a warning.
- If any Stateflow output data resolves to a Simulink signal object:
  - Turn off hierarchical scoping of signal objects from within the Stateflow chart.
  - Explicitly label the output signal of the Stateflow chart.

- Enforce signal object resolution for this signal in the future.

Any changes made by `disableimplicitsignalresolution` permanently change the model. Be sure to back up the model before calling the function with *`displayOnly`* defaulted to or specified as `false`.

`retVal` `= disableimplicitsignalresolution('`*`model`*`',` *`displayOnly`*`)` is equivalent to `disableimplicitsignalresolution(`*`model`*`)` if *`displayOnly`* is `false`.

If *`displayOnly`* is `true`, the function returns a structure of handles to signals and states that resolve implicitly to signal objects, but leaves the model unchanged.

Input Arguments

`displayOnly`

Boolean specifying whether to change the model (`false`) or just generate a report (`true`)

Default: `false`

`model`

Model name or handle

Output Arguments

`retVal`

A MATLAB structure containing:

`Signals`	Handles to ports with signal names that resolve to signal objects
`States`	Handles to blocks with states that resolve to signal objects

Introduced in R2007a

docblock

Get or set editor invoked by Simulink DocBlock

Syntax

```
docblock(setEditorType,command)
```

```
editCommand = docblock(getEditorType)
```

Description

`docblock(setEditorType,command)` uses the specified command to set the editor opened by double-clicking a DocBlock block.

By default, a DocBlock block opens Microsoft Word to edit HTML or RTF files. If Word is not available on your system, the block opens these file types using the text editor specified on the **Editor/Debugger Preferences** pane of the MATLAB Preferences dialog box. For text files, the default editor is the text editor specified in the MATLAB preferences.

`editCommand = docblock(getEditorType)` returns the current command to open the specified editor from a DocBlock block.

Input Arguments

`setEditorType` — File type whose editor command to set
`'setEditorHTML'` | `'setEditorDOC'` | `'setEditorTXT'`

File type whose editor command you want to set, specified as `'setEditorHTML'`, `'setEditorDOC'`, or `'setEditorTXT'`.

command — Command to open file in editor
character vector | `''`

Command to open the specified file type in an editor from the MATLAB command prompt, specified as a character vector. Use `''` to reset to the default editor for that file type.

In the command, use the `"%<FileName>"` token to represent the full pathname to the document.

`getEditorType` — File type of the editor command to return
`'getEditorHTML'` | `'getEditorDOC'` | `'getEditorTXT'`

File type of the editor command to return, specified as `'getEditorHTML'`, `'getEditorDOC'`, or `'getEditorTXT'`.

Output Arguments

`editCommand` — Command to open the editor
character vector

Command to open the editor, returned as a character vector.

Examples

Set DocBlock Text Editor

Specify Notepad as the DocBlock editor for text files.

```
docblock('setEditorTXT','system(''notepad "%<FileName>"'');')
```

Set and Get Current HTML Editor

You can use the `docblock` command to get the current editor.

Set your HTML editor for the DocBlock block to Mozilla Composer. The ampersand executes the command in the background.

```
docblock('setEditorHTML',...
   'system(''/usr/local/bin/mozilla -edit "%<FileName>" &'');')
```

Get the current HTML editor.

```
htmlEd = docblock('getEditorHTML')
htmlEd =

    'system('/usr/local/bin/mozilla -edit "%<FileName>" &');'
```

Reset Text Editor to Default

Specify Notepad as the DocBlock editor for text files.

```
docblock('setEditorTXT','system(''notepad "%<FileName>"'');')
```

Get the current text editor.

```
txtEd = docblock('getEditorTXT')
txtEd =

    'system('notepad "%<FileName>"');'
```

Reset the editor to the default editor.

```
docblock('setEditorTXT','')
```

Introduced in R2007a

export

Export Simulink Project to zip

Syntax

```
export(proj,zipFileName)
export(proj,zipFileName,definitionType)
```

Description

`export(proj,zipFileName)` exports the project `proj` to a zip file specified by `zipFileName`. The zip archive preserves the project files, structure, labels, and shortcuts, and does not include any source control information. You can use the zip archive to send the project to customers, suppliers, or colleagues who do not have access to your source control repository. Recipients can create a new project from the zip archive by clicking **New** in the Simulink Project Tool, and then in the start page, clicking **Archive**.

`export(proj,zipFileName,definitionType)` exports the project using the specified `definitionType` for the project definition files, single or multiple. If you do not specify `definitionType`, the project's current setting is used. Use the `definitionType` export option if you want to change project definition file management from the type selected when the project was created. You can control project definition file management in the preferences.

Examples

Export a Project to a Zip File

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Export the project to a zip file.

```
export(proj,'airframeproj.zip')
```

Input Arguments

proj — Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

zipFileName — Zip file name or path

character vector

Zip file name or path, specified as a character vector ending in the file extension `.zip`. If `zipFileName` is a filename, Simulink exports the file to the current folder. You can also specify a fully qualified path name.

Example: `'project.zip'`

Data Types: `char`

definitionType — Definition file type

slproject.DefinitionFiles.SingleFile | slproject.DefinitionFiles.MultiFile

Definition file type, specified as `slproject.DefinitionFiles.SingleFile`, `slproject.DefinitionFiles.MultiFile`, or `slproject.DefinitionFiles.FixedPathMultiFile` . Use the `definitionType` export option if you want to change project definition file management from the type selected when the project was created. `MultiFile` is better for avoiding merging issues on shared projects. `SingleFile` is faster but is likely to cause merge issues when two users submit changes in the same project to a source control tool. If you need to work with long file paths, use `FixedPathMultiFile`.

Example: `export(proj,'proj.zip',slproject.DefinitionFiles.SingleFile)`

Topics

“Archive Projects in Zip Files”

Introduced in R2013a

findCategory

Get Simulink Project category of labels

Syntax

```
category = findCategory(proj,categoryName)
```

Description

`category = findCategory(proj,categoryName)` returns the project category specified by `categoryName`. You need to get a category before you can use `createLabel` or `removeLabel`.

Examples

Get a Category of Project Labels

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Use `findCategory` to get a category of labels by name.

```
category = findCategory(proj,'Classification')
```

```
category = 

  Category with properties:

                Name: 'Classification'
            DataType: 'none'
    LabelDefinitions: [1x8 slproject.LabelDefinition]]
```

Alternatively, you can examine categories by index. Get the first category.

```
proj.Categories(1)

ans = 

  Category with properties:

                Name: 'Classification'
            DataType: 'none'
    LabelDefinitions: [1x8 slproject.LabelDefinition]
```

Find out what you can do with the category.

```
methods(category)

Methods for class slproject.Category:

createLabel          findLabel  removeLabel
```

Input Arguments

`proj` — Project
project

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

`categoryName` — Name of category
character vector

Name of the category to get, specified as a character vector.

Output Arguments

`category` — Category of labels
category object

Category of labels, returned as a category object that you can query or modify. If the specified category is not found, the function returns an empty array.

See Also

Functions

`createLabel` | `removeLabel` | `simulinkproject`

Introduced in R2013a

findFile

Get Simulink Project file by name

Syntax

```
file = findFile(proj,fileorfolder)
```

Description

`file = findFile(proj,fileorfolder)` returns a specific project file by name. You need to get a file before you can query labels, or use `addLabel` or `removeLabel`.

Examples

Find a File By Name

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Use `findFile` to get a file by name. You need to know the path if it is inside subfolders under the project root.

```
myfile = findFile(proj,'models/AnalogControl.mdl')
```

```
myfile = 

  ProjectFile with properties:

      Path: [1x86 char]
    Labels: [1x1 slproject.Label]
  Revision: '2'
SourceControlStatus: Unmodified
```

Alternatively, you can examine files by index. Get the first file.

```
file = proj.Files(1);
```

Find out what you can do with the file.

```
methods(file)
```

```
Methods for class slproject.ProjectFile:

addLabel    removeLabel  findLabel
```

Input Arguments

`proj` — Project
project

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

`fileorfolder` — Path of file or folder
character vector | cell array of character vectors | string array

Path of the file or folder to find relative to the project root folder, specified as a character vector, string, or array. Files must include any subfolders under the project root and the file extension. The file or folder must be within the root folder.

Example: ‘models/myModelName.slx’

Output Arguments

`file` — Project file
file object

Project file, returned as a file object that you can query or modify.

Functions
`addLabel` | `findCategory` | `findLabel` | `removeLabel` | `simulinkproject`

Introduced in R2013a

findLabel

Get Simulink Project file label

Syntax

```
label = findLabel(file,categoryName,labelName)
label = findLabel(file,labelDefinition)
label = findLabel(category,labelName)
```

Description

`label = findLabel(file,categoryName,labelName)` returns the label and its attached data for the label `labelName` in the category `categoryName` that is attached to the specified `file` or files. Use this syntax when you know the label name and category.

`label = findLabel(file,labelDefinition)` returns the file label and its attached data for the label name and category specified by `labelDefinition`. Use this syntax if you previously got a `labelDefinition` by accessing a `Labels` property, e.g., using a command like `myfile.Labels(1)`.

`label = findLabel(category,labelName)` returns the label definition of the label in this category specified by `labelName`. Returns an empty array if the label is not found.

Examples

Find Files with the Label `Utilility`

Find all project files with a particular label.

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Get the list of project files.

```
files = proj.Files;
```

Loop through each file. If the file has the extension `.m`, attach the label `Utility`.

```
for fileIndex = 1:numel(files)
   file = files(fileIndex);
   [~, ~, fileExtension] = fileparts(file.Path);
   if strcmp(fileExtension,'.m')
      addLabel(file,'Classification','Utility');
   end
end
```

Find all the files with the label `Utility` and add them to a list returned in `utility_files_to_review`.

```
utility_files_to_review = {};
for jj=1:numel(files)
   this_file = files(jj);

   label = findLabel(this_file,'Classification','Utility');

   if ( ~isempty(label))
      % This is a file labeled 'Utility'. Add to the
      % list of utility files.
      utility_files_to_review = [utility_files_to_review; this_file];
   end
end
```

Find a Label by Name or Definition

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Get a particular file by name.

```
myfile = findFile(proj,'models/AnalogControl.mdl');
```

Get a label by name.

```
label = findLabel(myfile,'Classification','Design');
```

Alternatively, examine the `Labels` property of the file to get an array of Label objects, one for each label attached to the file.

```
labels = myfile.Labels
```

Index into the Labels property to get the label attached to the particular file.

```
labeldefinition = myfile.Labels(1)
```

After you get the label definition from the Labels property, you can use it with `findLabel`.

```
label = findLabel(myfile,labeldefinition);
```

Find Labels by Name or Definition

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Get a category.

```
category = proj.Categories(1)
```

```
category = 

  Category with properties:

                Name: 'Classification'
            DataType: 'none'
    LabelDefinitions: [1x8 slproject.LabelDefinition]
```

Get a label definition.

```
ld = findLabel(category,'Design')
```

```
ld = 

  LabelDefinition with properties:
```

```
            Name: 'Design'
    CategoryName: 'Classification'
```

Input Arguments

`file` — File to search labels of
file object

File to search the labels of, specified as a file object or an array of file objects. You can get the file object by examining the project’s Files property (`proj.Files`), or use `findFile` to get a file by name. The file must be in the project.

`categoryName` — Name of category
character vector

Name of the parent category for the label, specified as a character vector.

`labelName` — Name of label
character vector

Name of the label to get, specified as a character vector.

`labelDefinition` — Name of label
label definition object

Name of the label to get, specified as a label definition object returned by the `file.Label` property.

`category` — Category of labels
category object

Category of labels, specified as a category object. Get a category object from the `proj.Categories` property or by using `findCategory`.

Output Arguments

`label` — Label
label object

Label, returned as a label object.

See Also

Functions
`addLabel` | `createLabel` | `findFile` | `simulinkproject`

Introduced in R2013a

findLabelDefinition(renamed to findLabel)

Get Simulink Project label definition

Syntax

```
labelDefinition = findLabelDefinition(category,labelName)
```

Description

`labelDefinition = findLabelDefinition(category,labelName)` returns the label definition of the label in this category specified by `labelName`. Returns an empty array if the label is not found.

Examples

Find Labels by Name or Definition

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Get a category.

```
category = proj.Categories(1)
```

```
category = 

  Category with properties:

                Name: 'Review'
            DataType: 'char'
    LabelDefinitions: [1x4 slproject.LabelDefinition]
```

Get a label definition.

```
ld = findLabelDefinition(category,'To Review')
```

```
ld = 

  LabelDefinition with properties:

            Name: 'To Review'
    CategoryName: 'Review'
```

Alternatively, get a file and examine the `Labels` property to get an array of Label objects, one for each label attached to the file.

```
myfile = findFile(proj,'models/AnalogControl.mdl');
labels = myfile.Labels
```

Index into the Labels property to get the second label attached to the particular file.

```
labeldefinition = myfile.Labels(1)
```

After you get the label definition from the Labels property, you can use it with `findLabel`.

```
label = findLabel(myfile,labeldefinition);
```

Alternatively, get a particular file by name, and then get one of its labels by name.

```
myfile = findFile(proj,'models/AnalogControl.mdl');
label = findLabel(myfile,'Review','To Review');
```

Input Arguments

`labelName` — Name of label

character vector

Name of the label to get, specified as a character vector.

`category` — Category of labels

category object

Category of labels, specified as a category object. Get a category object from the `proj.Categories` property or by using `findCategory`.

Output Arguments

`labelDefinition` — Label definition

label definition object

Label definition, returned as a label definition object. Query the label definition properties to find the label data type.

Introduced in R2013a

find_mdlrefs

Find Model blocks and referenced models at all levels or at top level only

Syntax

```
[refMdls,mdlBlks] = find_mdlrefs(system)
[refMdls,mdlBlks] = find_mdlrefs(system,Name,Value)
[refMdls,mdlBlks] = find_mdlrefs(system,allLevels)
```

Description

`[refMdls,mdlBlks] = find_mdlrefs(system)` finds all referenced models and Model blocks contained by the subsystem or model reference hierarchy that `system` is the top level of.

`[refMdls,mdlBlks] = find_mdlrefs(system,Name,Value)` finds referenced models and Model blocks with additional options specified by one or more `Name,Value` pair arguments.

`[refMdls,mdlBlks] = find_mdlrefs(system,allLevels)` specifies the levels of the system to search.

Tip The `find_mdlrefs` function provides two different ways to specify the levels of the system to search. Both techniques give the same results, but only the name and value technique allows you to control inclusion of protected models in `refMdls`.

Examples

Find Referenced Models in Model Hierarchy

Find referenced models and Model blocks for all models referenced by the specified model.

```
load_system('sldemo_mdlref_basic');
[myModels,myModelBlks] = find_mdlrefs('sldemo_mdlref_basic')
```

```
myModels = 2x1 cell array
    {'sldemo_mdlref_counter'}
    {'sldemo_mdlref_basic'  }

myModelBlks = 3x1 cell array
    {'sldemo_mdlref_basic/CounterA'}
    {'sldemo_mdlref_basic/CounterB'}
    {'sldemo_mdlref_basic/CounterC'}
```

Input Arguments

`system` — System to search

character vector | handle

System to search, specified as a character vector or a handle.

- The character vector can be the path to a Model block, subsystem, or a model in a model reference hierarchy.
- The handle can be for a Model block, subsystem, or model in a model reference hierarchy.

`allLevels` — Levels to search

`true` (default) | `false`

Levels to search, specified as `true` or `false`.

- `true` — Search all Model blocks in the model reference hierarchy for which the system is the top model.
- `false` — Search only the top-level system.

Data Types: `logical`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes.

You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: `refModels = find_mdlrefs(top_model,'IncludeProtectedModels',true)`

`AllLevels` — Levels to search
`true` (default) | `false`

Levels to search, specified as a `true` or `false`.

- `true` — Search all Model blocks in the model reference hierarchy for which the system is the top model.
- `false` — Search only the top-level system.

Data Types: `logical`

`IncludeProtectedModels` — Include protected models in search results
`false` (default) | `true`

Include protected models in search, specified as `true` or `false`. This setting does not affect the list of Model blocks returned.

Data Types: `logical`

`Variants` — Include model variants in search
`'ActivePlusCodeVariants'` (default) | `'ActiveVariants'` | `'AllVariants'`

Include model variants in search, specified as `'ActivePlusCodeVariants'`, `'ActiveVariants'`, or `'AllVariants'`.

- `'ActivePlusCodeVariants'` — Include all model variants in Variant Subsystem blocks for which you select the **Analyze all choices during update diagram and generate preprocessor conditionals** option.
- `'ActiveVariants'` — Include active model variants for Variant Subsystem blocks.
- `'AllVariants'` — Include all model variants in Variant Subsystem blocks.

`IncludeCommented` — Include commented blocks in search
`false` (default) | `true`

Include commented blocks in search, specified as `false` or `true`.

Data Types: `logical`

`KeepModelsLoaded` — Keep loaded models that function loads

`false` (default) | `true`

The `find_mdlrefs` function loads the models in the model reference hierarchy of the model that you specify. By default, the function closes those models, except for models that were already loaded before execution of the function. To keep all the models loaded that the function loads, set this argument to `true`.

Data Types: `logical`

Output Arguments

`refMdls` — Names of referenced models

cell array of character vectors

Names of referenced models, returned as a cell array of character vectors. The last element is the system you specified in the `system` input argument or the parent model of that system.

`mdlBlks` — Names of Model blocks

cell array of character vectors

Names of Model blocks, returned as a cell array of character vectors.

Introduced before R2006a

find_system

Find systems, blocks, lines, ports, and annotations

Syntax

```
Objects = find_system
Objects = find_system(System)
Objects = find_system(Name,Value)
Objects = find_system(System,Name,Value)
```

Description

`Objects = find_system` returns loaded systems and their blocks, including subsystems.

`Objects = find_system(System)` returns the specified system and its blocks.

`Objects = find_system(Name,Value)` returns loaded systems and the objects in those systems that meet the criteria specified by one or more `Name,Value` pair arguments. You can use this syntax to specify search constraints and to search for specific parameter values. Specify the search constraints before the parameter and value pairs.

`Objects = find_system(System,Name,Value)` returns the objects in the specified system that meet the specified criteria.

Input Arguments

`System` — System to search

path name | cell array of path names | handle | vector of handles

System to search, specified as the full system path name, a cell array of system path names, a handle, or a vector of handles.

Example: `'MyModel/Subsystem1'`

Example: `{'vdp','fuelsys'}`

Name-Value Pair Arguments

Specify optional comma-separated pairs of Name,Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1,Value1,...,NameN,ValueN.

When you use the find_system function, Name,Value pair arguments can include search constraints and parameter name and value pairs. You can specify search constraints in any order, but they must precede the parameter name and value pairs.

See "Model Parameters" on page 6-2 and "Block-Specific Parameters" on page 6-128 for the lists of model and block parameters.

Example: 'SearchDepth','0','LookUnderMasks','none','BlockType','Goto' searches in loaded systems, excluding masked subsystems, for Goto blocks.

The table lists the possible search constraint pairs. Braces indicate default values.

Name	Value Type	Description
'BlockDialogParams'	character vector	Search block dialog box parameters for the specified value. This pair, like parameter and value pairs, must follow the other search constraint pairs.
'CaseSensitive'	{'on'} | 'off'	If 'on', search considers case when matching.
'FindAll'	'on' | {'off'}	If 'on', search includes lines, ports, and annotations within systems. find_system returns a vector of handles when this option is set to 'on', regardless of how you specify System.
'FirstResultOnly'	'on' | {'off'}	Return only the first result found and stop the search.

Name	Value Type	Description
'FollowLinks'	'on' | {'off'}	If 'on', search follows links into library blocks. If you do not specify a system to search, find_system includes loaded libraries in the results, whether you set 'FollowLinks' to 'on' or 'off'. You can use 'FollowLinks' with 'LookUnderMasks' to update library links in subsystems. See “Update Library Links in a Subsystem” on page 2-272.
'IncludeCommented'	'on' | {'off'}	Specify whether to include commented blocks in the search.
'LoadFullyIfNeeded'	{'on'} | 'off'	If 'on', attempts to load any partially loaded models. If 'off', disables model loading. Use this pair, for example, to prevent load warnings.
'LookUnderMasks'	{'graphical'}	Search includes masked subsystems that have no workspaces and no dialogs.
	'none'	Search skips masked subsystems.
	'functional'	Search includes masked subsystems that do not have dialogs.
	'all'	Search includes all masked subsystems.
	'on' | 'off'	If 'on', search includes all masked subsystems. If 'off', search skips masked subsystem.
'RegExp'	'on' | {'off'}	If 'on', search treats search expressions as regular expressions. To learn more about MATLAB regular expressions, see “Regular Expressions” (MATLAB).

Name	Value Type	Description
'SearchDepth'	positive integer character vector	Restricts the search depth to the specified level ('0' for loaded systems only, '1' for blocks and subsystems of the top-level system, '2' for the top-level system and its children, etc.). The default is all levels.
'Variants' This search constraint applies only to variant subsystems and model variants.	{'ActiveVariants'}	Search in only the active variant subsystems.
	'AllVariants'	Search in all variants.
	'ActivePlusCodeVariants'	Search all variants if any generate preprocessor conditionals. Otherwise, search only the active variant.

Output Arguments

Objects — Matching objects

cell array of path names | vector of handles

Matching objects found, returned as:

- A cell array of path names if you specified System as a path name or cell array of path names, or if you did not specify a system
- A vector of handles if you specified System as a handle or vector of handles

Examples

Find Loaded Systems and Their Blocks

Return the names of all loaded systems and their blocks.

```
load_system('vdp')
find_system
```

```
ans = 13x1 cell array
    {'vdp'                     }
    {'vdp/Fcn'                  }
    {'vdp/More Info'            }
    {'vdp/More Info/Model Info'}
    {'vdp/Mu'                   }
    {'vdp/Mux'                  }
    {'vdp/Product'              }
    {'vdp/Scope'                }
    {'vdp/Sum'                  }
    {'vdp/x1'                   }
    {'vdp/x2'                   }
    {'vdp/Out1'                 }
    {'vdp/Out2'                 }
```

Returns loaded systems and libraries, including vdp.

Find Specific System and Its Blocks

Return vdp system and its blocks.

```
load_system({'vdp','fuelsys'})
find_system('vdp')
```

```
ans = 13x1 cell array
    {'vdp'                      }
    {'vdp/Fcn'                  }
    {'vdp/More Info'            }
    {'vdp/More Info/Model Info'}
    {'vdp/Mu'                   }
    {'vdp/Mux'                  }
    {'vdp/Product'              }
    {'vdp/Scope'                }
    {'vdp/Sum'                  }
    {'vdp/x1'                   }
    {'vdp/x2'                   }
    {'vdp/Out1'                 }
    {'vdp/Out2'                 }
```

Return Names of Loaded Models

Return the names of only the loaded models, i.e., block diagrams. This command returns library names as well, because libraries are treated as models.

```
load_system('vdp');
open_bd = find_system('type','block_diagram')
```

```
open_bd = 1x1 cell array
    {'vdp'}
```

Search Children of Subsystem

Return the names of all Goto blocks that are children of the Unlocked subsystem in the `sldemo_clutch` system.

```
load_system('sldemo_clutch');
find_system('sldemo_clutch/Unlocked','SearchDepth',1,'BlockType','Goto')
```

```
ans = 2x1 cell array
    {'sldemo_clutch/Unlocked/Goto' }
    {'sldemo_clutch/Unlocked/Goto1'}
```

Search Using Multiple Criteria

Search in the `vdp` system and return the names of all Gain blocks whose **Gain** value is set to `1`.

```
load_system('vdp');
find_system('vdp','BlockType','Gain','Gain','1')
```

```
ans = 1x1 cell array
    {'vdp/Mu'}
```

Return Lines and Annotations as Handles

Get the handles of all lines and annotations in the `vdp` system. With `'FindAll'`, the function returns handles regardless of how you specify the system to search.

```
load_system('vdp');
L = find_system('vdp','FindAll','on','type','line')
```

```
L = 17×1

   32.0020
   31.0020
   30.0020
   29.0020
   28.0020
   27.0020
   26.0020
   25.0020
   24.0020
   23.0020
      ⋮
```

```
A = find_system('vdp','FindAll','on','type','annotation')
```

```
A = 2×1

   34.0020
   33.0020
```

Search for Specific Block Parameter Value

Find any block dialog box parameters with a value of `0` in the `vdp` and `fuelsys` systems.

```
load_system({'vdp','fuelsys'})
find_system({'vdp','fuelsys'},'BlockDialogParams','0')
```

```
ans =

    'vdp/x2'
    'vdp/Out1'
    'vdp/Out2'
    'fuelsys/Constant2'
    'fuelsys/Constant4'
    'fuelsys/Constant5'
    'fuelsys/engine …'
    'fuelsys/engine …'
    'fuelsys/engine …'
    'fuelsys/engine …'
                .
                .
                .
```

Search Using Regular Expressions

Find all blocks in the top level of the currently loaded systems with a block dialog parameter value that starts with 3.

```
load_system({'fuelsys','vdp'});
find_system('SearchDepth','1','regexp','on','BlockDialogParams','^3')
```

```
ans = 3x1 cell array
    {'vdp/Scope'         }
    {'vdp/Scope'         }
    {'fuelsys/Nominal...'}
```

Regular Expression Search for Partial Match

When you search using regular expressions, you can specify a part of the character vector you want to match to return all objects that contain that character vector. Find all the inport and outport blocks in the sldemo_clutch model.

```
load_system('sldemo_clutch');
find_system('sldemo_clutch','regexp','on','blocktype','port')
```

```
ans = 39x1 cell array
    {'sldemo_clutch/Friction...'                              }
    {'sldemo_clutch/Friction...'                              }
    {'sldemo_clutch/Friction...'                              }
    {'sldemo_clutch/Friction Mode Logic/Tin'                  }
    {'sldemo_clutch/Friction Mode Logic/Tfmaxs'               }
    {'sldemo_clutch/Friction Mode Logic/Break Apart...'        }
    {'sldemo_clutch/Friction Mode Logic/Break Apart...'        }
    {'sldemo_clutch/Friction Mode Logic/Break Apart...'        }
    {'sldemo_clutch/Friction Mode Logic/Lockup...'             }
    {'sldemo_clutch/Friction Mode Logic/Lockup...'             }
    {'sldemo_clutch/Friction Mode Logic/Lockup...'             }
    {'sldemo_clutch/Friction Mode Logic/Lockup...'             }
    {'sldemo_clutch/Friction Mode Logic/Lockup...'             }
    {'sldemo_clutch/Friction Mode Logic/Lockup...'             }
    {'sldemo_clutch/Friction Mode Logic/Lockup...'             }
    {'sldemo_clutch/Friction Mode Logic/Lockup...'             }
    {'sldemo_clutch/Friction Mode Logic/Lockup FSM/lock'       }
    {'sldemo_clutch/Friction Mode Logic/Lockup FSM/unlock'     }
    {'sldemo_clutch/Friction Mode Logic/Lockup FSM/locked'     }
    {'sldemo_clutch/Friction Mode Logic/Requisite Friction/Tin'}
    {'sldemo_clutch/Friction Mode Logic/Requisite Friction/Tf' }
    {'sldemo_clutch/Friction Mode Logic/locked'                }
    {'sldemo_clutch/Friction Mode Logic/lock'                  }
    {'sldemo_clutch/Friction Mode Logic/unlock'                }
    {'sldemo_clutch/Friction Mode Logic/Tf'                    }
    {'sldemo_clutch/Locked/Tin'                                }
    {'sldemo_clutch/Locked/w'                                  }
    {'sldemo_clutch/Unlocked/Tfmaxk'                           }
    {'sldemo_clutch/Unlocked/Tin'                              }
    {'sldemo_clutch/Unlocked/we'                               }
    {'sldemo_clutch/Unlocked/wv'                               }
    {'sldemo_clutch/we'                                        }
    {'sldemo_clutch/wv'                                        }
    {'sldemo_clutch/w'                                         }
    {'sldemo_clutch/Locked Flag'                               }
    {'sldemo_clutch/Lockup Flag'                               }
    {'sldemo_clutch/Break-Apart Flag'                          }
    {'sldemo_clutch/FrictionTorque...'                         }
    {'sldemo_clutch/Max Static...'                             }
```

Update Library Links in a Subsystem

In this example, `myModel` contains a single subsystem, which is a library link. After the model was last opened, a Gain block was added to the corresponding subsystem in the library.

Open the model. Use find_system with 'FollowLinks' set to 'off'. The command does not follow the library links into the subsystem and returns only the subsystem at the top level.

```
open_system('myModel')
find_system(bdroot,'LookUnderMasks','on','FollowLinks', 'off')
```

```
ans =

    'myModel'
    'myModel/Subsystem'
```

Use find_system with 'FollowLinks' set to 'on'. find_system updates the library links and returns the block in the subsystem.

```
find_system(bdroot,'LookUnderMasks','on','FollowLinks','on')
```

```
Updating Link: myModel/Subsystem/Gain
Updating Link: myModel/Subsystem/Gain

ans =

    'myModel'
    'myModel/Subsystem'
    'myModel/Subsystem/Gain'
```

Return Values as Handles

Provide the system to find_system as a handle. Search for block dialog box parameters with a value of 0. If you make multiple calls to get_param for the same block, then using the block handle is more efficient than specifying the full block path as a character vector.

```
load_system('vdp');
sys = get_param('vdp','Handle');
find_system(sys,'BlockDialogParams','0')
```

```
ans = 6×1

   10.0001
   13.0001
   14.0001
   14.0001
   15.0001
```

```
    15.0001
```

Introduced before R2006a

fixdt

Create `Simulink.NumericType` object describing fixed-point or floating-point data type

Syntax

```
a = fixdt(Signed, WordLength)
a = fixdt(Signed, WordLength, FractionLength)
a = fixdt(Signed, WordLength, TotalSlope, Bias)
a = fixdt(Signed, WordLength, SlopeAdjustmentFactor, FixedExponent,
Bias)
a = fixdt(DataTypeNameString)
a = fixdt(..., 'DataTypeOverride', 'Off')
[DataType,IsScaledDouble] = fixdt(DataTypeNameString)
[DataType,IsScaledDouble] = fixdt(DataTypeNameString,
'DataTypeOverride', 'Off')
```

Description

`a = fixdt(Signed, WordLength)` returns a `Simulink.NumericType` object describing a fixed-point data type with unspecified scaling. The scaling would typically be determined by another block parameter. `Signed` can be `0` (false) for unsigned or `1` (true) for signed.

`a = fixdt(Signed, WordLength, FractionLength)` returns a `Simulink.NumericType` object describing a fixed-point data type with binary point scaling. `FractionLength` can be greater than `WordLength`. For more information, see “Binary Point Interpretation” (Fixed-Point Designer).

`a = fixdt(Signed, WordLength, TotalSlope, Bias)` or `a = fixdt(Signed, WordLength, SlopeAdjustmentFactor, FixedExponent, Bias)` returns a `Simulink.NumericType` object describing a fixed-point data type with slope and bias scaling.

`a = fixdt(DataTypeNameString)` returns a `Simulink.NumericType` object describing an integer, fixed-point, or floating-point data type specified by a data type name. The data type name can be either the name of a built-in Simulink data type or the name of a fixed-point data type that conforms to the naming convention for fixed-point names established by the Fixed-Point Designer product. For more information, see “Fixed-Point Data Type and Scaling Notation” (Fixed-Point Designer).

`a = fixdt(..., 'DataTypeOverride', 'Off')` returns a `Simulink.NumericType` object with its `DataTypeOverride` parameter set to `Off`. The default value for this property is `Inherit`. You can specify the `DataTypeOverride` parameter after any combination of other input parameters.

`[DataType,IsScaledDouble] = fixdt(DataTypeNameString)` returns a `Simulink.NumericType` object describing an integer, fixed-point, or floating-point data type specified by a data type name and a flag that indicates whether the specified data type name was the name of a scaled double data type.

`[DataType,IsScaledDouble] = fixdt(DataTypeNameString, 'DataTypeOverride', 'Off')` returns:

- A `Simulink.NumericType` object describing an integer, fixed-point, or floating-point data type specified by a data type name. The `DataTypeOverride` parameter of the `Simulink.NumericType` object is set to `Off`.
- A flag that indicates whether the specified data type name was the name of a scaled double data type.

Examples

Return a `Simulink.NumericType` object describing a fixed-point data type with unspecified scaling:

```
a = fixdt(1,16)

a =

Simulink.NumericType
    DataTypeMode: 'Fixed-point: unspecified scaling'
      Signedness: 'Signed'
      WordLength: 16
         IsAlias: false
      HeaderFile: ''
     Description: ''
```

Return a Simulink.NumericType object describing a fixed-point data type with binary point scaling :

```
a = fixdt(1,16,2)

a =

Simulink.NumericType
    DataTypeMode: 'Fixed-point: binary point scaling'
      Signedness: 'Signed'
      WordLength: 16
  FractionLength: 2
         IsAlias: false
      HeaderFile: ''
     Description: ''
```

Return a Simulink.NumericType object describing a fixed-point data type with slope and bias scaling:

```
a = fixdt(1, 16, 2^-2, 4)

a =

Simulink.NumericType
    DataTypeMode: 'Fixed-point: slope and bias scaling'
      Signedness: 'Signed'
      WordLength: 16
           Slope: 0.25
            Bias: 4
         IsAlias: false
      HeaderFile: ''
     Description: ''
```

Return a Simulink.NumericType object describing an integer, fixed-point, or floating-point data type specified by a data type name:

```
[DataType,IsScaledDouble] = fixdt('ufix8')

DataType =

Simulink.NumericType
    DataTypeMode: 'Fixed-point: binary point scaling'
      Signedness: 'Unsigned'
      WordLength: 8
  FractionLength: 0
```

```
         IsAlias: false
      HeaderFile: ''
     Description: ''
IsScaledDouble =

     0
```

Return a `Simulink.NumericType` object with its `DataTypeOverride` property set to `Off`:

```
 a = fixdt(0, 8, 2, 'DataTypeOverride', 'Off')

a =

Simulink.NumericType
    DataTypeMode: 'Fixed-point: binary point scaling'
      Signedness: 'Unsigned'
      WordLength: 8
  FractionLength: 2
DataTypeOverride: Off
         IsAlias: false
      HeaderFile: ''
     Description: ''
```

fixpt_evenspace_cleanup

Modify breakpoints of lookup table to have even spacing

Syntax

`xdata_modified = fixpt_evenspace_cleanup(xdata,xdt,xscale)`

Description

xdata_modified = fixpt_evenspace_cleanup(*xdata*,*xdt*,*xscale*) modifies breakpoints of a lookup table to have even spacing after quantization. By adjusting breakpoints to have even spacing after quantization, Simulink Coder generated code can exclude breakpoints from memory.

xdata is the breakpoint vector of a lookup table to make evenly spaced, such as 0:0.005:1. *xdt* is the data type of the breakpoints, such as sfix(16). *xscale* is the scaling of the breakpoints, such as 2^-12. Using these three inputs, fixpt_evenspace_cleanup returns the modified breakpoints in *xdata_modified*.

This function works only with nontunable data and considers data to have even spacing relative to the scaling slope. For example, the breakpoint vector [0 2 5], which has spacing value 2 and 3, appears to have uneven spacing. However, the difference between the maximum spacing 3 and the minimum spacing 2 equals 1. If the scaling slope is 1 or greater, a spacing variation of 1 represents a 1-bit change or less. In this case, the fixpt_evenspace_cleanup function considers a spacing variation of 1 bit or less to be even.

Modifications to breakpoints can change the numerical behavior of a lookup table. To check for changes, test the model using simulation, rapid prototyping, or other appropriate methods.

Examples

Modify breakpoints of a lookup table to have even spacing after quantization:

```
xdata = 0:0.005:1;
xdt = sfix(16);
xscale = 2^-12;
xdata_modified = fixpt_evenspace_cleanup(xdata,xdt,xscale)
```

Introduced before R2006a

fixpt_interp1

Implement 1-D lookup table

Syntax

y = fixpt_interp1(*xdata*,*ydata*,*x*,*xdt*,*xscale*,*ydt*,*yscale*,*rndmeth*)

Description

y = fixpt_interp1(*xdata*,*ydata*,*x*,*xdt*,*xscale*,*ydt*,*yscale*,*rndmeth*) implements a one-dimensional lookup table to find output *y* for input *x*. If *x* falls between two *xdata* values (breakpoints), *y* is the result of interpolating between the corresponding *ydata* values. If *x* is greater than the maximum value in *xdata*, *y* is the maximum *ydata* value. If *x* is less than the minimum value in *xdata*, *y* is the minimum *ydata* value.

If the input data type *xdt* or the output data type *ydt* is floating point, fixpt_interp1 performs the interpolation using floating-point calculations. Otherwise, fixpt_interp1 uses integer-only calculations. These calculations handle the input scaling *xscale* and the output scaling *yscale* and obey the rounding method *rndmeth*.

Input Arguments

xdata

Vector of breakpoints for the lookup table, such as linspace(0,8,33).

ydata

Vector of table data that correspond to the breakpoints for the lookup table, such as sin(xdata).

x

Vector of input values for the lookup table to process, such as linspace(-1,9,201).

xdt

Data type of input x, such as sfix(8).

xscale

Scaling for input x, such as 2^-3.

ydt

Data type of output y, such as sfix(16).

yscale

Scaling for output y, such as 2^-14.

rndmeth

Rounding mode supported by fixed-point Simulink blocks:

'Ceiling'	Round to the nearest representable number in the direction of positive infinity.
'Floor' (default)	Round to the nearest representable number in the direction of negative infinity.
'Nearest'	Round to the nearest representable number.
'Toward Zero'	Round to the nearest representable number in the direction of zero.

Examples

Interpolate outputs for x using a 1-D lookup table that approximates the sine function:

```
xdata = linspace(0,8,33).';
ydata = sin(xdata);
% Define input x as a vector of 201 evenly
% spaced points between -1 and 9 (includes
% values both lower and higher than the range
% of breakpoints in xdata)
x = linspace(-1,9,201).';
% Interpolate output values for x
```

```
y = fixpt_interp1(xdata,ydata,x,sfix(8),2^-3,sfix(16),...
 2^-14,'Floor')
```

fixpt_look1_func_approx

Optimize fixed-point approximation of nonlinear function by interpolating lookup table data points

Syntax

```
[xdata,ydata,errworst] = fixpt_look1_func_approx('func',...
xmin,xmax,xdt,xscale,ydt,yscale,rndmeth,errmax,nptsmax)
[xdata,ydata,errworst] = fixpt_look1_func_approx('func',...
xmin,xmax,xdt,xscale,ydt,yscale,rndmeth,errmax,[])
[xdata,ydata,errworst] = fixpt_look1_func_approx('func',...
xmin,xmax,xdt,xscale,ydt,yscale,rndmeth,[],nptsmax)
[xdata,ydata,errworst] = fixpt_look1_func_approx('func',...
xmin,xmax,xdt,xscale,ydtydt,yscale,rndmeth,errmax,nptsmax,spacing)
```

Description

`[xdata,ydata,errworst] = fixpt_look1_func_approx('func',...`
`xmin,xmax,xdt,xscale,ydt,yscale,rndmeth,errmax,nptsmax)` returns the optimal breakpoints of a lookup table, an ideal function applied to the breakpoints, and the worst-case approximation error. The lookup table satisfies the maximum acceptable error and maximum number of points that you specify.

`[xdata,ydata,errworst] = fixpt_look1_func_approx('func',...`
`xmin,xmax,xdt,xscale,ydt,yscale,rndmeth,errmax,[])` returns the optimal breakpoints of a lookup table, an ideal function applied to the breakpoints, and the worst-case approximation error. The lookup table satisfies the maximum acceptable error that you specify.

`[xdata,ydata,errworst] = fixpt_look1_func_approx('func',...`
`xmin,xmax,xdt,xscale,ydt,yscale,rndmeth,[],nptsmax)` returns the optimal breakpoints of a lookup table, an ideal function applied to the breakpoints, and the worst-case approximation error. The lookup table satisfies the maximum number of points that you specify.

`[xdata,ydata,errworst] = fixpt_look1_func_approx('func',...`

xmin,*xmax*,*xdt*,*xscale*,*ydtydt*,*yscale*,*rndmeth*,*errmax*,*nptsmax*,*spacing*) returns the optimal breakpoints of a lookup table, an ideal function applied to the breakpoints, and the worst-case approximation error. The lookup table satisfies the maximum acceptable error, maximum number of points, and breakpoint spacing that you specify.

In each case, `fixpt_look1_func_approx` interpolates between lookup table data points to optimize the fixed-point approximation. The inputs *xmin* and *xmax* specify the range over which to approximate the breakpoints. The inputs *xdt*, *xscale*, *ydt*, *yscale*, and *rndmeth* follow conventions used by fixed-point Simulink blocks.

The inputs *errmax*, *nptsmax*, and *spacing* are optional. Of these inputs, you must specify at least *errmax* or *nptsmax*. If you omit one of those two inputs, you must use brackets, `[]`, in place of the omitted input. `fixpt_look1_func_approx` ignores that requirement for the lookup table.

If you do not specify spacing, and more than one spacing satisfies *errmax* and *nptsmax*, `fixpt_look1_func_approx` chooses in this order: power-of-2 spacing, even spacing, uneven spacing. This behavior applies when you specify both *errmax* and *nptsmax*, but not when you specify just one of the two.

Input Arguments

func

Function of `x` for which to approximate breakpoints. Enclose this expression in single quotes, for example, `'sin(2*pi*x)'`.

xmin

Minimum value of `x`.

xmax

Maximum value of `x`.

xdt

Data type of `x`.

xscale

Scaling for the x values.

ydt

Data type of y.

yscale

Scaling for the y values.

rndmeth

Rounding mode supported by fixed-point Simulink blocks:

'Ceiling'	Round to the nearest representable number in the direction of positive infinity.
'Floor' (default)	Round to the nearest representable number in the direction of negative infinity.
'Nearest'	Round to the nearest representable number.
'Toward Zero'	Round to the nearest representable number in the direction of zero.

errmax

Maximum acceptable error between the ideal function and the approximation given by the lookup table.

nptsmax

Maximum number of points for the lookup table.

spacing

Spacing of breakpoints for the lookup table:

'even'	Even spacing
'pow2'	Even, power-of-2 spacing
'unrestricted' (default)	Uneven spacing

If you specify...	The breakpoints of the lookup table...
errmax and *nptsmax*	Meet both criteria, if possible. The *errmax* requirement has higher priority than *nptsmax*. If the breakpoints cannot meet both criteria with the specified spacing, *nptsmax* does not apply.
errmax only	Meet the error criteria, and `fixpt_look1_func_approx` returns the fewest number of points.
nptsmax only	Meet the points criteria, and `fixpt_look1_func_approx` returns the smallest worst-case error.

Output Arguments

xdata

Vector of breakpoints for the lookup table.

ydata

Vector of values from applying the ideal function to the breakpoints.

errworst

Worst-case error, which is the maximum absolute error between the ideal function and the approximation given by the lookup table.

Examples

Approximate a fixed-point sine function using a lookup table:

```
func = 'sin(2*pi*x)';
% Define the range over which to optimize breakpoints
xmin = 0;
xmax = 0.25;
% Define the data type and scaling for the inputs
```

```
xdt = ufix(16);
xscale = 2^-16;
% Define the data type and scaling for the outputs
ydt = sfix(16);
yscale = 2^-14;
% Specify the rounding method
rndmeth = 'Floor';
% Define the maximum acceptable error
errmax = 2^-10;
% Choose even, power-of-2 spacing for breakpoints
spacing = 'pow2';
% Create the lookup table
[xdata,ydata,errworst] = fixpt_look1_func_approx(func,...
 xmin,xmax,xdt,xscale,ydt,yscale,rndmeth,errmax,[],spacing);
```

`fixpt_evenspace_cleanup` | `fixpt_interp1` | `fixpt_look1_func_plot`

Topics

"Producing Lookup Table Data" (Fixed-Point Designer)
"Use Lookup Table Approximation Functions" (Fixed-Point Designer)

Introduced before R2006a

fixpt_look1_func_plot

Plot fixed-point approximation function for lookup table

Syntax

```
fixpt_look1_func_plot(xdata,ydata,'func',...
xmin,xmax,xdt,xscale,ydt,yscale,rndmeth)
errworst = fixpt_look1_func_plot(xdata,ydata,'func',...
xmin,xmax,xdt,xscale,ydt,yscale,rndmeth)
```

Description

`fixpt_look1_func_plot(`*`xdata`*`,`*`ydata`*`,'`*`func`*`',...` *`xmin`*`,`*`xmax`*`,`*`xdt`*`,`*`xscale`*`,`*`ydt`*`,`*`yscale`*`,`*`rndmeth`*`)` plots a lookup table approximation function and the error from the ideal function.

`errworst` `= fixpt_look1_func_plot(`*`xdata`*`,`*`ydata`*`,'`*`func`*`',...` *`xmin`*`,`*`xmax`*`,`*`xdt`*`,`*`xscale`*`,`*`ydt`*`,`*`yscale`*`,`*`rndmeth`*`)` plots a lookup table approximation function and the error from the ideal function. The output *`errworst`* is the maximum absolute error.

You can use `fixpt_look1_func_approx` to generate *`xdata`* and *`ydata`*, the breakpoints and table data for the lookup table, respectively. `fixpt_look1_func_approx` applies the ideal function to the breakpoints in *`xdata`* to produce *`ydata`*. While this method is the easiest way to generate *`ydata`*, you can choose other values for *`ydata`* as input for `fixpt_look1_func_plot`. Choosing different values for *`ydata`* can, in some cases, produce a lookup table with a smaller maximum absolute error.

Input Arguments

`xdata`

Vector of breakpoints for the lookup table.

ydata

Vector of values from applying the ideal function to the breakpoints.

func

Function of `x` for which to approximate breakpoints. Enclose this expression in single quotes, for example, `'sin(2*pi*x)'`.

xmin

Minimum value of `x`.

xmax

Maximum value of `x`.

xdt

Data type of `x`.

xscale

Scaling for the `x` values.

ydt

Data type of `y`.

yscale

Scaling for the `y` values.

rndmeth

Rounding mode supported by fixed-point Simulink blocks:

`'Ceiling'`	Round to the nearest representable number in the direction of positive infinity.
`'Floor'` (default)	Round to the nearest representable number in the direction of negative infinity.
`'Nearest'`	Round to the nearest representable number.

'Toward Zero'	Round to the nearest representable number in the direction of zero.

Examples

Plot a fixed-point approximation of the sine function using data points generated by fixpt_look1_func_approx:

```
func = 'sin(2*pi*x)';
% Define the range over which to optimize breakpoints
xmin = 0;
xmax = 0.25;
% Define the data type and scaling for the inputs
xdt = ufix(16);
xscale = 2^-16;
% Define the data type and scaling for the outputs
ydt = sfix(16);
yscale = 2^-14;
% Specify the rounding method
rndmeth = 'Floor';
% Define the maximum acceptable error
errmax = 2^-10;
% Choose even, power-of-2 spacing for breakpoints
spacing = 'pow2';
% Generate data points for the lookup table
[xdata,ydata,errworst]=fixpt_look1_func_approx(func,...
 xmin,xmax,xdt,xscale,ydt,yscale,rndmeth,errmax,[],spacing);
% Plot the sine function (ideal and fixed-point) & errors
fixpt_look1_func_plot(xdata,ydata,func,xmin,xmax,...
 xdt,xscale,ydt,yscale,rndmeth);
```

fixpt_look1_func_plot plots the fixed-point sine function, using generated data points, and plots the error between the ideal function and the fixed-point function. The maximum absolute error and the number of points required appear on the plot. The error drops to zero at a breakpoint, but increases between breakpoints due to curvature differences between the ideal function and the line drawn between breakpoints.

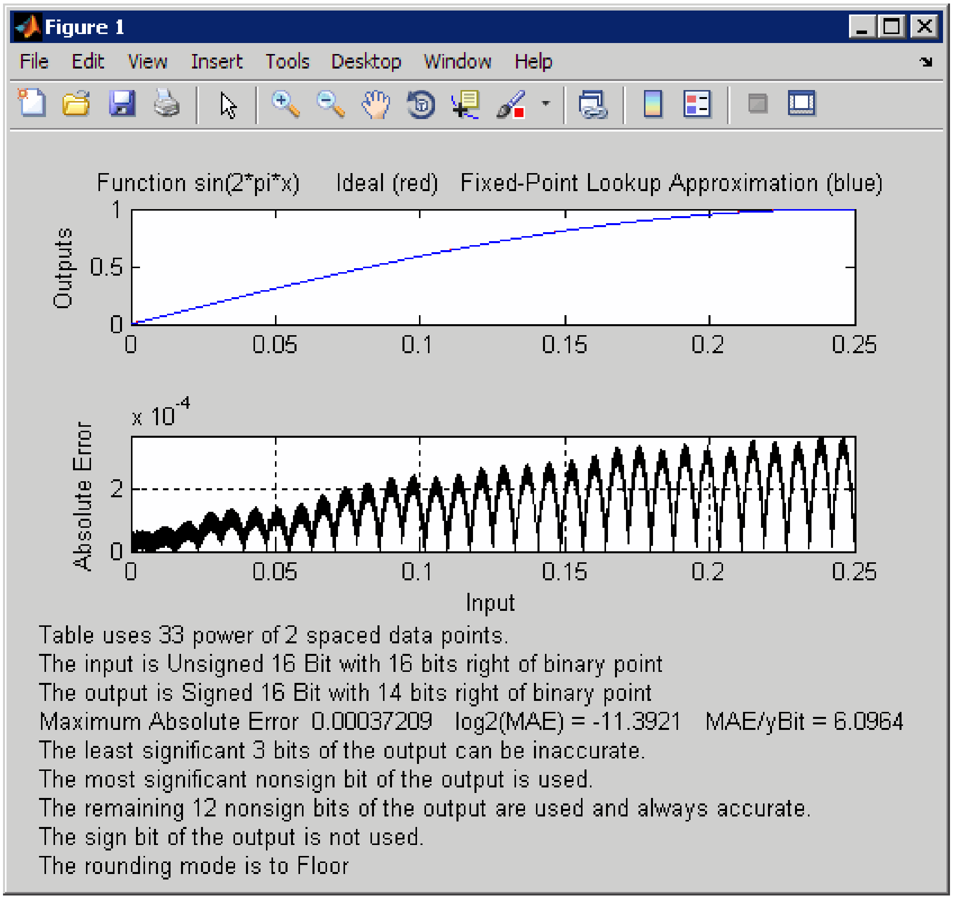

Figure 1

Topics

"Producing Lookup Table Data" (Fixed-Point Designer)
"Use Lookup Table Approximation Functions" (Fixed-Point Designer)

Introduced before R2006a

fixpt_set_all

Set property for each fixed-point block in subsystem

Syntax

`fixpt_set_all(`*`SystemName`*`,`*`fixptPropertyName`*`,`*`fixptPropertyValue`*`)`

Description

`fixpt_set_all(`*`SystemName`*`,`*`fixptPropertyName`*`,`*`fixptPropertyValue`*`)` sets the property `fixptPropertyName` of every applicable block in the model or subsystem *`SystemName`* to the value *`fixptPropertyValue`*

Examples

Set each fixed-point block in a model `Filter_1` to round towards the floor and saturate upon overflow:

```
% Round towards the floor
fixpt_set_all('Filter_1','RndMeth','Floor')

% Saturate upon overflow
fixpt_set_all('Filter_1','DoSatur','on')
```

Introduced before R2006a

fixptbestexp

Exponent that gives best precision for fixed-point representation of value

Syntax

```
out = fixptbestexp(RealWorldValue, TotalBits, IsSigned)
out = fixptbestexp(RealWorldValue, FixPtDataType)
```

Description

out = fixptbestexp(*RealWorldValue*, *TotalBits*, *IsSigned*) returns the exponent that gives the best precision for the fixed-point representation of *RealWorldValue*. *TotalBits* specifies the number of bits for the fixed-point number. *IsSigned* specifies whether the fixed-point number is signed: 1 indicates the number is signed and 0 indicates the number is not signed.

out = fixptbestexp(*RealWorldValue*, *FixPtDataType*) returns the exponent that gives the best precision based on the data type *FixPtDataType*.

Examples

Get the exponent that gives the best precision for the real-world value 4/3 using a signed, 16-bit number:

```
out = fixptbestexp(4/3,16,1)

out =
   -14
```

Alternatively, specify the fixed-point data type:

```
out = fixptbestexp(4/3,sfix(16))

out =
   -14
```

This shows that the maximum precision representation of 4/3 is obtained by placing 14 bits to the right of the binary point:

```
01.01010101010101
```

You can specify the precision of this representation in fixed-point blocks by setting the scaling to `2^-14` or `2^fixptbestexp(4/3,16,1)`.

See Also

`fixptbestprec`

Introduced before R2006a

fixptbestprec

Determine maximum precision available for fixed-point representation of value

Syntax

```
out = fixptbestprec(RealWorldValue,TotalBits,IsSigned)
out = fixptbestprec(RealWorldValue,FixPtDataType)
```

Description

`out = fixptbestprec(RealWorldValue,TotalBits,IsSigned)` determines the maximum precision for the fixed-point representation of the real-world value specified by `RealWorldValue`. You specify the number of bits for the fixed- point number with `TotalBits`, and you specify whether the fixed-point number is signed with `IsSigned`. If `IsSigned` is `1`, the number is signed. If `IsSigned` is `0`, the number is not signed. The maximum precision is returned to `out`.

`out = fixptbestprec(RealWorldValue,FixPtDataType)` determines the maximum precision based on the data type specified by `FixPtDataType`.

Examples

Example 1

The following command returns the maximum precision available for the real-world value 4/3 using a signed, 8-bit number:

```
out = fixptbestprec(4/3,8,1)
```

```
out =
   0.015625
```

Alternatively, you can specify the fixed-point data type:

```
out = fixptbestprec(4/3,sfix(8))
out =
   0.015625
```

This value means that the maximum precision available for 4/3 is obtained by placing six bits to the right of the binary point since 2^{-6} equals 0.015625:

```
01.010101
```

Example 2

You can use the maximum precision as the scaling in fixed-point blocks. This enables you to use `fixptbestprec` to perform a type of autoscaling if you would like to designate a known range of your simulation. For example, if your known range is -13 to 22, and you are using a safety margin of 30%:

```
knownMax = 22;
knownMin = -13;
localSafetyMargin = 30;
slope = max( fixptbestprec( (1+localSafetyMargin/100)* ...
 [knownMax,knownMin], sfix(16) ) );
```

The variable `slope` can then be used in the expression that you specify for the **Output data type** parameter in a block mask. Be sure to select the **Lock output data type setting against changes by the fixed-point tools** check box in the same block to prevent the Fixed-Point Tool from overriding the scaling. If you know the range, you can use this technique in place of relying on a model simulation to provide the range to the autoscaling tool, as described in `autofixexp` in the Fixed-Point Designer documentation.

`fixptbestexp`

Introduced before R2006a

float

Create `Simulink.NumericType` object describing floating-point data type

Syntax

```
a = float('single')
a = float('double')
```

Description

`a = float('single')` returns a `Simulink.NumericType` object that describes the data type of an IEEE single (32 total bits, 8 exponent bits).

`a = float('double')` returns a `Simulink.NumericType` object that describes the data type of an IEEE double (64 total bits, 11 exponent bits).

Note `float` is a legacy function. In new code, use `fixdt` instead. In existing code, replace `float('single')` with `fixdt('single')` and `float('double')` with `fixdt('double')`.

Examples

Define an IEEE single data type.

```
>> a = float('single')

a = 

  NumericType with properties:

    DataTypeMode: 'Single'
         IsAlias: 0
       DataScope: 'Auto'
      HeaderFile: ''
     Description: ''
```

See Also

Introduced before R2006a

frameedit

Edit print frames for Simulink and Stateflow block diagrams

Syntax

```
frameedit
frameedit filename
```

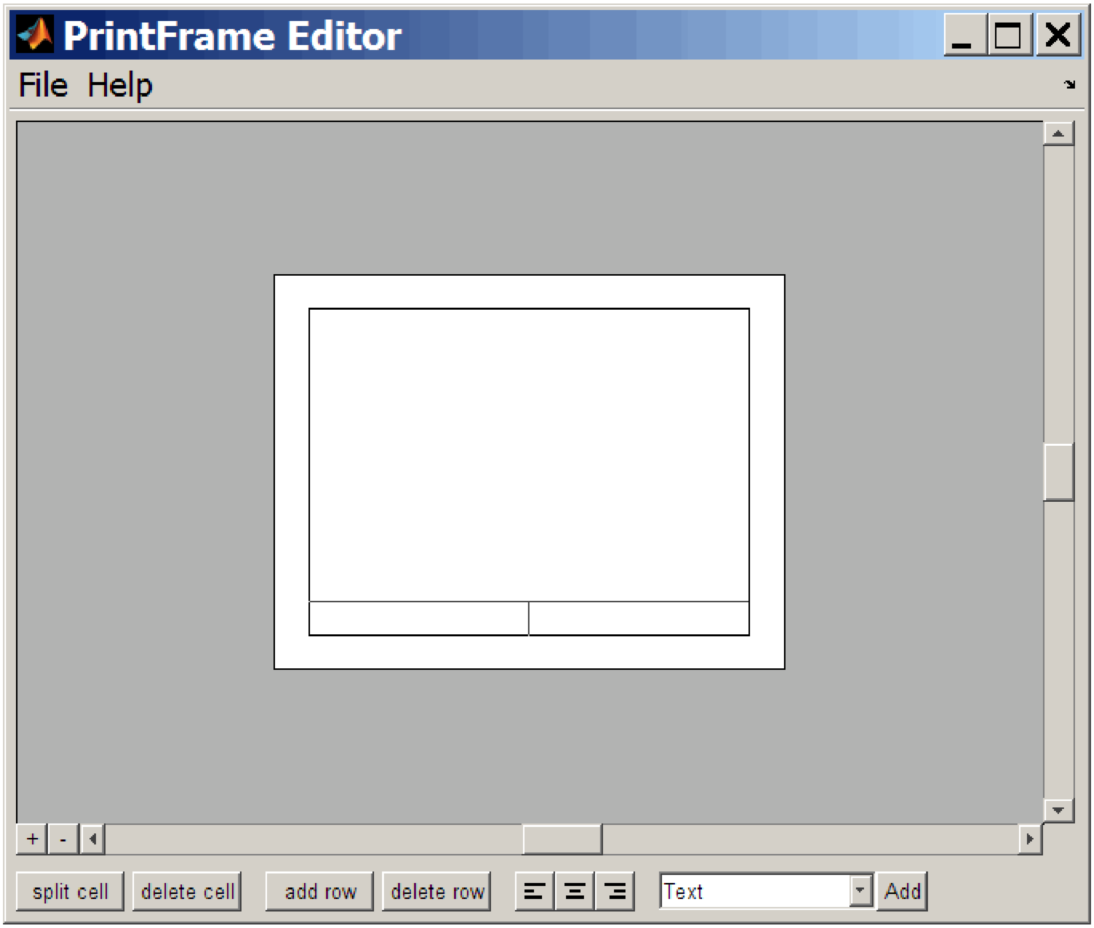
Description

`frameedit` starts the PrintFrame Editor, a graphical user interface you use to create borders for Simulink and Stateflow block diagrams. With no argument, `frameedit` opens the **PrintFrame Editor** window with a new file.

`frameedit filename` opens the **PrintFrame Editor** window with the specified filename, where `filename` is a figure file (`.fig`) previously created and saved using `frameedit`.

Tips

This illustrates the main features of the PrintFrame Editor.



Closing the PrintFrame Editor

To close the **PrintFrame Editor** window, click the close box in the upper right corner, or select **Close** from the **File** menu.

Printing Simulink Block Diagrams with Print Frames

Select **Print** from the Simulink **File** menu. Check the **Frame** box and supply the filename for the print frame you want to use. Click **OK** in the **Print** dialog box.

Getting Help for the PrintFrame Editor

For further instructions on using the PrintFrame Editor, select **PrintFrame Editor Help** from the **Help** menu in the PrintFrame Editor.

Introduced in R2008b

fxptdlg

Start Fixed-Point Tool

Syntax

```
fxptdlg('modelname')
```

Description

`fxptdlg('modelname')` starts the Fixed-Point Tool for the Simulink model specified by `modelname`. You can also access this tool by the following methods:

- From the Simulink **Analysis** menu, select **Data Type Design** > **Fixed-Point Tool**.
- From a subsystem context (right-click) menu, select **Fixed-Point Tool**.

In conjunction with Fixed-Point Designer software, the Fixed-Point Tool provides convenient access to:

- Model and subsystem parameters that control the signal logging, fixed-point instrumentation mode, and data type override. (see “Model Parameters” on page 6-2)
- Plotting capabilities that enable you to plot data that resides in the MATLAB workspace, namely, simulation results associated with Scope, To Workspace, and root-level Outport blocks, in addition to logged signal data (see “Signal Logging” in the *Simulink User*'s *Guide*)
- An interactive automatic data typing feature that proposes fixed-point data types for appropriately configured objects in your model, and then allows you to selectively accept and apply the data type proposals

You can launch the Fixed-Point Tool for any system or subsystem, and the tool controls the object selected in its **System under design** pane. If Fixed-Point Designer software is installed, the Fixed-Point Tool displays the name, data type, design minimum and maximum values, minimum and maximum simulation values, and scaling of each model object that logs fixed-point data. Additionally, if a signal saturates or overflows, the tool displays the number of times saturation or overflow occurred.

Note The Fixed-Point Tool works only for models that simulate in Normal mode. The tool does not work when you simulate your model in Accelerator or Rapid Accelerator mode.

Overriding Fixed-Point Specifications

Most of the functionality in the Fixed-Point Tool is for use with the Fixed-Point Designer software. However, even if you do not have Fixed-Point Designer software, you can configure data type override settings to simulate a model that specifies fixed-point data types. In this mode, the Simulink software temporarily overrides fixed-point data types with floating-point data types when simulating the model.

Note If you use fi objects or embedded numeric data types in your model or workspace, you might introduce fixed-point data types into your model. You can set fipref to prevent the checkout of a Fixed-Point Designer license.

To simulate a model without using Fixed-Point Designer:

1 Enter the following at the command line.

```
set_param(gcs, 'DataTypeOverride', 'Double',...
 'DataTypeOverrideAppliesTo','AllNumericTypes',...
 'MinMaxOverflowLogging','ForceOff')
```

2 If you use `fi` objects or embedded numeric data types in your model, set the `fipref` `DataTypeOverride` property to `TrueDoubles` or `TrueSingles` (to be consistent with the model-wide data type override setting) and the `DataTypeOverrideAppliesTo` property to `All numeric types`.

   For example, at the MATLAB command line, enter:

```
 p = fipref('DataTypeOverride', 'TrueDoubles', ...
        'DataTypeOverrideAppliesTo', 'AllNumericTypes');
```

“Propose Fraction Lengths Using Simulation Range Data” (Fixed-Point Designer) | Fixed-Point Tool

Introduced before R2006a

gcb

Get path name of current block

Syntax

```
bl = gcb
bl = gcb(sys)
```

Description

`bl = gcb` returns the full block path name of the current block in the current system. The current block is:

- The most recently clicked block
- The S-Function block currently executing its corresponding MATLAB function
- The block whose callback routine is being executed
- The block whose mask is being evaluated as part of the `MaskInitialization` parameter evaluation
- The last block loaded after opening a model

`bl = gcb(sys)` returns the full block path name of the current block in the specified system. Load the system first.

Input Arguments

sys — System that contains the block

character vector

System that contains the block, specified as a character vector.

Example: `'vdp'` `'sldemo_fuelsys/fuel_rate_control'`

Examples

Get Path Name of Most Recently Selected Block

Open a model.

```
vdp
```

In the model, select a block. For example, select the Gain block. Then, enter `gcb` at the command prompt.

```
gcb
```

```
ans =

vdp/Mu
```

Get Parameters of Current Block

Open a model.

```
vdp
```

Select the Gain block.

Use the value of `gcb` with `get_param` to get the value of the `Gain` parameter.

```
x = get_param(gcb,'Gain')
```

```
x =

1
```

Get Current Block in Specified System

Load the model.

```
load_system('sldemo_fuelsys');
```

Get the current block in the `fuel_rate_control` subsystem.

```
bl = gcb('sldemo_fuelsys/fuel_rate_control')
```

```
bl =

sldemo_fuelsys/fuel_rate_control/validate_sample_time
```

See Also

gcbh | gcs | get_param

Topics

"Mask Callback Code"

Introduced before R2006a

gcbh

Get handle of current block

Syntax

```
gcbh
```

Description

`gcbh` returns the handle of the current block in the current system.

You can use this command to identify or address blocks that have no parent system. The command should be most useful to blockset authors.

Examples

This command returns the handle of the most recently selected block.

```
gcbh

ans =

   281.0001
```

See Also

`gcb` | `getSimulinkBlockHandle`

Introduced before R2006a

gcs

Get path name of current system

Syntax

```
gcs
```

Description

`gcs` returns the path name of the current system. The current system is one of these:

- During editing, the system or subsystem most recently clicked or that contains the block most recently clicked
- During simulation of a system that contains an S-Function block, the system or subsystem containing the S-Function block currently being evaluated
- During callbacks, the system containing any block whose callback routine is being executed
- During evaluation of `MaskInitialization`, the system containing the block whose mask is being evaluated
- The system most recently loaded into memory with `load_system`; only the first use of `load_system` makes the model the current system

The current system is the current model or a subsystem of the current model. Use `bdroot` to get the current model.

If you close the model that contains the current system, another open or loaded system becomes the current one. Use `gcs` to find out the new current system.

To explicitly set the current system, you can either:

- Use `set_param` with the `'CurrentSystem'` parameter on the root Simulink model, for example:

  ```
  set_param(0,'CurrentSystem','mymodel')
  ```

- Open the model by using `open_system` or the model name at the MATLAB command prompt.

Examples

Get Current System That Contains a Block

Return the path of the system that contains the most recently selected block.

Open the model `sldemo_fuelsys`. Open the subsystem To Controller.

```
sldemo_fuelsys
open_system('sldemo_fuelsys/To Controller')
```

Click the Rate Transition block. Get the current system.

```
gcs

ans =

    'sldemo_fuelsys/To Controller'
```

Get Current System After Loading a Model

Open the model `f14` and get the current system.

```
f14
gcs

ans =

    'f14'
```

Load the model `vdp` using `load_system`. Then get the current system.

```
load_system('vdp');
gcs

ans =

    'vdp'
```

To remove `vdp` from memory, close it. In this example, the current system becomes the open model, `f14`.

```
close_system('vdp');
gcs
```

```
ans =

    'f14'
```

See Also

`bdroot` | `gcb`

Introduced before R2006a

get_param

Get parameter names and values

Syntax

```
ParamValue = get_param(Object,Parameter)
```

Description

`ParamValue = get_param(Object,Parameter)` returns the name or value of the specified parameter for the specified model or block object. Open or load the Simulink model first.

Tip If you make multiple calls to `get_param` for the same block, then specifying the block using a numeric handle is more efficient than using the full block path. Use `getSimulinkBlockHandle` to get a block handle.

For parameter names, see:

- "Model Parameters" on page 6-2
- "Block-Specific Parameters" on page 6-128
- "Common Block Properties" on page 6-109

Examples

Get a Block Parameter Value and a Model Parameter Value

Load the `vdp` model.

```
load_system('vdp');
```

Get the value for the `Expression` block parameter.

```
BlockParameterValue = get_param('vdp/Fcn','Expression')

BlockParameterValue =
    1 - u*u
```

Get the value for the `SolverType` model parameter.

```
SolverType = get_param('vdp','SolverType')

SolverType =
   Variable-step
```

Get Root Parameter Names and Values

Get a list of global parameter names by finding the difference between the Simulink root parameter names and the model parameter names.

```
RootParameterNames = fieldnames(get_param(0,'ObjectParameters'));
load_system('vdp')
ModelParameterNames = fieldnames(get_param('vdp','ObjectParameters'));
GlobalParameterNames = setdiff(RootParameterNames,ModelParameterNames)

GlobalParameterNames =
          'AutoSaveOptions'
          'CacheFolder'
          'CallbackTracing'
          'CharacterEncoding'
                 . . .
          'CurrentSystem'
```

Get the value of a global parameter.

```
GlobalParameterValue = get_param(0,'CurrentSystem')

GlobalParameterValue =
          vdp
```

Get Model Parameter Names and Values

Get a list of model parameters for the `vdp` model .

```
load_system('vdp')
ModelParameterNames = get_param('vdp','ObjectParameters')
```

```
ModelParameterNames =
              Name: [1x1 struct]
               Tag: [1x1 struct]
       Description: [1x1 struct]
              Type: [1x1 struct]
            Parent: [1x1 struct]
            Handle: [1x1 struct]
                       . . .
           Version: [1x1 struct]
```

Get the current value of the `ModelVersion` model parameter for the `vdp` model.

```
ModelParameterValue = get_param('vdp','ModelVersion')
```

```
ModelParameterValue =
          1.6
```

Get All Blocks and a Parameter Value

Get a list of block paths and names for the `vdp` model.

```
load_system('vdp')
BlockPaths = find_system('vdp','Type','Block')
```

```
BlockPaths =
    'vdp/Fcn'
    'vdp/More Info'
    'vdp/More Info/Model Info'
    'vdp/Mu'
    'vdp/Mux'
    'vdp/Product'
    'vdp/Scope'
    'vdp/Sum'
    'vdp/x1'
    'vdp/x2'
    'vdp/Out1'
    'vdp/Out2'
```

Get a list of block dialog parameters for the `Fcn` block.

```
BlockDialogParameters = get_param('vdp/Fcn','DialogParameters')
BlockDialogParameters =
                Expr: [1x1 struct]
          SampleTime: [1x1 struct]
```

Get the value for the `Expr` block parameter.

```
BlockParameterValue = get_param('vdp/Fcn','Expr')
```

```
BlockParameterValue =
    1 - u*u
```

Get a Block Parameter Value Using a Block Handle

If you make multiple calls to `get_param` for the same block, then using the block handle is more efficient than specifying the full block path as a character vector, e.g., `'vdp/Fcn'`.

You can use the block handle in subsequent calls to `get_param` or `set_param`. If you examine the handle, you can see that it contains a double. Do not try to use the number of a handle alone (e.g., `5.007`) because you usually need to specify many more digits than MATLAB displays. Instead, assign the handle to a variable and use that variable name to specify a block.

Use `getSimulinkBlockHandle` to load the `vdp` model if necessary (by specifying `true`), and get a handle to the `FCN` block.

```
fcnblockhandle = getSimulinkBlockHandle('vdp/Fcn',true);
```

Use the block handle with `get_param` and get the value for the `Expr` block parameter.

```
BlockParameterValue = get_param(fcnblockhandle,'Expression')
```

```
BlockParameterValue =
    1 - u*u
```

Display Block Types for all Blocks in a Model

Get a list of block paths and names for the `vdp` model.

```
load_system('vdp')
BlockPaths = find_system('vdp','Type','Block')
BlockPaths =
    'vdp/Fcn'
    'vdp/More Info'
    'vdp/More Info/Model Info'
    'vdp/Mu'
    'vdp/Mux'
    'vdp/Product'
    'vdp/Scope'
    'vdp/Sum'
    'vdp/x1'
    'vdp/x2'
    'vdp/Out1'
    'vdp/Out2'
```

Get the value for the `BlockType` parameter for each of the blocks in the `vdp` model.

```
BlockTypes = get_param(BlockPaths,'BlockType')
```

```
BlockTypes =
    'Fcn'
    'SubSystem'
    'SubSystem'
    'Gain'
    'Mux'
    'Product'
    'Scope'
    'Sum'
    'Integrator'
    'Integrator'
    'Outport'
    'Outport'
```

Input Arguments

`Object` — Name or handle of a model or block, or root

handle | character vector | cell array of character vectors | 0

Handle or name of a model or block, or root, specified as a numeric handle or a character vector, a cell array of character vectors for multiple blocks, or `0` for root. A numeric handle must be a scalar. You can also get parameters of lines and ports, but you must use numeric handles to specify them.

Tip If you make multiple calls to `get_param` for the same block, then specifying a block using a numeric handle is more efficient than using the full block path. Use `getSimulinkBlockHandle` to get a block handle. Do not try to use the number of a handle alone (e.g., `5.007`) because you usually need to specify many more digits than MATLAB displays. Assign the handle to a variable and use that variable name to specify a block.

Specify `0` to get root parameter names, including global parameters and model parameters for the current Simulink session.

- Global parameters include Editor preferences and Simulink Coder parameters.
- Model parameters include configuration parameters, Simulink Coder parameters, and Simulink Code Inspector™ parameters.

Example: `'vdp/Fcn'`

`Parameter` — Parameter of model or block, or root

character vector

Parameter of model or block, or root, specified as a character vector or `0` for root. The table shows special cases.

Specified Parameter	Result
`'ObjectParameters'`	Returns a structure array with the parameter names of the specified object (model, block, or root) as separate fields in the structure.
`'DialogParameters'`	Returns a structure array with the block dialog box parameter names as separate fields in the structure. If the block has a mask, the function instead returns the mask parameters.

Specified Parameter	Result
Parameter name, e.g., `'BlockType'`. Specify any model or block parameter, or block dialog box parameter.	Returns the value of the specified model or block parameter. If you specified multiple blocks as a cell array, returns a cell array with the values of the specified parameter common to all blocks. All of the specified blocks in the cell array must contain the parameter, otherwise the function returns an error.

Example: `'ObjectParameters'`

Data Types: `char`

Output Arguments

`ParamValue` — The name or value of the specified parameter for the specified model or block, or root

any data type, depending on the parameter

The name or value of the specified parameter for the specified model or block, or root. If you specify multiple objects, the output is a cell array of objects. The table shows special cases.

Specified Parameter	ParamValue Returned
`'ObjectParameters'`	A structure array with the parameter names of the specified object (model, block, or root) as separate fields in the structure.
`'DialogParameters'`	A structure array with the block dialog box parameter names as separate fields in the structure. If the block has a mask, the function instead returns the mask parameters.

Specified Parameter	ParamValue Returned
Parameter name, e.g., `'BlockType'`	The value of the specified model or block parameter. If multiple blocks are specified as a cell array, returns a cell array with the values of the specified parameter common to all blocks.

If you get the root parameters by specifying `get_param(0,'ObjectParameters')`, then the output `ParamValue` is a structure array with the root parameter names as separate fields in the structure. Each parameter field is a structure containing these fields:

- Type — Parameter type values are: `'boolean'`, `'string'`, `'int'`, `'real'`, `'point'`, `'rectangle'`, `'matrix'`, `'enum'`, `'ports'`, or `'list'`
- Enum — Cell array of enumeration character vector values that applies only to `'enum'` parameter types
- Attributes — Cell array of character vectors defining the attributes of the parameter. Values are: `'read-write'`, `'read-only'`, `'read-only-if-compiled'`, `'write-only'`, `'dont-eval'`, `'always-save'`, `'never-save'`, `'nondirty'`, or `'simulation'`

Introduced before R2006a

getActiveConfigSet

Get model's active configuration set or configuration reference

Syntax

```
myConfigObj = getActiveConfigSet(model)
```

Arguments

`model`

The name of an open model, or `gcs` to specify the current model

Description

`getActiveConfigSet` returns the configuration set or configuration reference (configuration object) that is the active configuration object of `model`.

Examples

The following example returns the active configuration object of the current model. The code is the same whether the object is a configuration set or configuration reference.

```
myConfigObj = getActiveConfigSet(gcs);
```

Introduced before R2006a

getCallbackAnnotation

Get annotation executing callback

Syntax

```
ann = getCallbackAnnotation
```

Description

`ann = getCallbackAnnotation` gets the annotation from which a callback was invoked. Invoke a callback from an annotation click function. After you get the annotation, you can, for example, get text or parameters from the annotation to use someplace else in your model.

For information on click functions, see “Associate a Click Function with an Annotation”.

Examples

Click Annotation to Change Parameter Value

Invoke a callback by way of an annotation click function. This example shows how to change a parameter value on a block to the value shown on an annotation.

Open `vdp`. Add and position two annotations. Each annotation displays a different value.

```
open_system('vdp');
an1 = Simulink.Annotation('vdp/1');
an1.position = [100,300];
an2 = Simulink.Annotation('vdp/3');
an2.position = [150,300];
```

Assign a click function to each annotation. The click function uses `getAnnotationCallback` to get the annotation instance. Get the text from each annotation and use it to set the parameter on the Gain block (Mu).

```
an1.ClickFcn = 'ann = getCallbackAnnotation; v = ann.Text; set_param(''vdp/Mu'',''Gain
an2.ClickFcn = 'ann = getCallbackAnnotation; v = ann.Text; set_param(''vdp/Mu'',''Gain
```

Click each annotation. When you click, the gain value on the Mu block changes to the number shown on the annotation.

Output Arguments

ann — Annotation

Simulink.Annotation instance

Annotation, returned as a Simulink.Annotation instance.

See Also

Simulink.Annotation

Topics

"Associate a Click Function with an Annotation"

Introduced before R2006a

getComponent

Get a configuration set component

Syntax

```
component = getComponent(cs,componentName)
```

Description

`component = getComponent(cs,componentName)` returns the specified component from a configuration set. With no component name specified, returns a list of the components contained in the configuration set.

Examples

Get a Component for a Configuration Set

Get the solver component for the active configuration set.

Get the active configuration set of the currently selected model.

```
hCs = getActiveConfigSet(gcs);
```

Get the solver component of the active configuration set.

```
hSolverConfig = getComponent(hCs, 'Solver');
```

Get List of Components for an Active Configuration Set

Get a list of the components contained in the active configuration set.

Get the active configuration set of the currently selected model.

```
hCs = getActiveConfigSet(gcs);
```

Get the list of components contained in the configuration set.

```
getComponent(hCs)
```

The code displays the names of the components at the MATLAB command line.

Input Arguments

`cs` — Configuration set object

`ConfigSet` object

Configuration set, specified as a `ConfigSet` object

`componentName` — Component name

character vector

Name of a component object, specified as a character vector. If a component name is not specified, the function displays a list of the components contained in the configuration set at the MATLAB command line.

Example: 'Solver'

Output Arguments

`component` — Component

`Simulink.ConfigComponent object`

A component in the configuration set, returned as an instance of a `Simulink.ConfigComponent` object

See Also

Topics

"Manage a Configuration Set"

Introduced before R2006a

getConfigSet

Get one of model's configuration sets or configuration references

Syntax

```
myConfigObj = getConfigSet(model, configObjName)
```

Arguments

`model`

The name of an open model, or `gcs` to specify the current model

`configObjName`

The name of a configuration set (`Simulink.ConfigSet`) or configuration reference (`Simulink.ConfigSetRef`)

Description

`getConfigSet` returns the configuration set or configuration reference (configuration object) that is attached to `model` and is named `configObjName`. If no such object exists, the function returns an empty object.

Examples

The following example returns the configuration object that is named `DevConfig` and attached to the current model. The code is the same whether `DevConfig` is a configuration set or configuration reference.

```
myConfigObj = getConfigSet(gcs, 'DevConfig');
```

getConfigSets

Get names of all of model's configuration sets or configuration references

Syntax

```
myConfigObjNames = getConfigSets(model)
```

Arguments

`model`

The name of an open model, or `gcs` to specify the current model

Description

`getConfigSets` returns a cell array of character vectors specifying the names of all configuration sets and configuration references (configuration objects) attached to `model`.

Examples

The following example obtains the names of the configuration objects attached to the current model.

```
myConfigObjNames = getConfigSets(gcs)
```

getfullname

Get pathname of block or line

Syntax

```
path=getfullname(handle)
```

Description

`path=getfullname(handle)` returns the full pathname of the block or line specified by `handle`.

Examples

`getfullname(gcb)` returns the pathname of the block currently selected in the model editor's window.

The following code returns the pathname of the line currently selected in the model editor's window.

```
line = find_system(gcs, 'SearchDepth', 1, 'FindAll', 'on', ...
      'Type', 'line', 'Selected', 'on');
path = getfullname(line);
```

See Also

`find_system` | `gcb`

Introduced in R2007a

getInputString

Create comma-separated list of variables to map

Syntax

```
externalInputString = getInputString(inputmap,'base')
```

```
externalInputString = getInputString(inputmap,filename)
```

```
externalInputString = getInputString(inputmap)
```

Description

`externalInputString = getInputString(inputmap,'base')` creates an input character vector using the supplied mapping `inputmap` and the variables loaded in the base workspace (`'base'`).

This function generates a comma-separated list of variables (input character vector) to be mapped. You can then use this list:

- As input to the `sim` command. Load the variables in the base workspace first.
- As input for the **Configuration Parameters** > **Data Import/Export** > **Input** parameter. Copy the contents of the input character vector into the text field.

This function is most useful if you have created a custom mapping.

`externalInputString = getInputString(inputmap,filename)` creates an input character vector using the supplied mapping `inputmap` and the variables defined in `filename`.

`externalInputString = getInputString(inputmap)` creates an input character vector using the signals from the most recently created mapping.

Examples

Create an input character vector from the base workspace

Create an input character vector from the base workspace and simulate a model.

Open the model

```
slexAutotransRootInportsExample;
```

Create signal variables in the base workspace

```
Throttle = timeseries(ones(10,1)*10);
Brake    = timeseries(zeros(10,1));
```

Create a mapping (`inputMap`) for the model.

```
inputMap = getRootInportMap('model',...
'slexAutotransRootInportsExample',...
'signalName',{'Throttle','Brake'},...
'blockName',{'Throttle','Brake'});
```

Call `getInputString` with `inputMap` and `'base'` as inputs.

```
externalInputString = getInputString(inputMap,'base')
```

```
externalInputString =

Throttle,Brake
```

Simulate the model with the input character vector.

```
sim('slexAutotransRootInportsExample','ExternalInput',...
externalInputString);
```

Create an external input character vector from variables in a MAT-file

Create an external input character vector from variables in a MAT-file named `input.mat`.

In a writable folder, create a MAT-file with input variables.

```
Throttle = timeseries(ones(10,1)*10);
Brake    = timeseries(zeros(10,1));
save('input.mat','Throttle','Brake');
```

Open the model.

```
slexAutotransRootInportsExample;
```

Create map object.

```
inputMap = getRootInportMap('model',...
'slexAutotransRootInportsExample',...
'signalName',{'Throttle','Brake'},...
'blockName',{'Throttle','Brake'});
```

Get the resulting input character vector.

```
externalInputString = getInputString(inputMap,'input.mat')
```

```
externalInputString =

Throttle,Brake
```

Load variables from the base workspace for the simulation.

```
load('input.mat');
```

Simulate the model.

```
sim('slexAutotransRootInportsExample','ExternalInput',...
externalInputString);
```

Create an external input character vector from only an input map

Create an input character vector from only an input map vector and simulate the model.

Open the model.

```
slexAutotransRootInportsExample;
```

Create signal variables in the base workspace

```
Throttle = timeseries(ones(10,1)*10);
Brake    = timeseries(zeros(10,1));
```

Create a mapping vector for the model.

```
inputMap = getSlRootInportMap('model', 'slexAutotransRootInportsExample',...
'MappingMode','BlockName',...
'signalName',{'Throttle', 'Brake'},...
'signalValue',{Throttle, Brake});
```

Get the resulting input character vector.

```
externalInputString = getInputString(inputMap)
```

Simulate the model with the input character vector.

```
sim('slexAutotransRootInportsExample','ExternalInput',...
externalInputString);
```

Alternatively, if you want to input the list of variables through the Configuration Parameters dialog, copy the contents of `externalInputString` (`Throttle,Brake`) into the **Data Import/Export** > **Input** parameter. Apply the changes, and then simulate the model.

Input Arguments

`inputmap` — Map object

character vector

Map object, as returned from the `getRootInportMap` or `getSlRootInportMap` functions.

`filename` — Input variables

MAT-file name as character vector

Input variables, contained in a MAT-file. The file contains variables to map.

Example: `'data.mat'`

Data Types: `char`

Output Arguments

`externalInputString` — External input

comma-separated character vector

External input, returned as a comma-separated character vector. The character vector contains root inport information that you can specify to the `sim` command or the **Configuration Parameters** > **Data Import/Export** > **Input** parameter.

Topics

“Map Root Inport Signal Data”

Introduced in R2013a

getRootInportMap

Create custom object to map signals to root-level inports

Syntax

```
map = getRootInportMap('Empty');
map = getRootInportMap(model,mdl,Name,Value);
map = getRootInportMap(inputmap,map,Name,Value);
```

Description

`map = getRootInportMap('Empty');` creates an empty map object, *map*. Use this map object to set up an empty custom mapping object. Load the model before using this function. If you do not load the model first, the function loads the model to make the mapping and then closes the model afterwards.

`map = getRootInportMap(model,mdl,Name,Value);` creates a map object for `model`, `mdl`, with block names and signal names specified. Load the model before using this function. If you do not load the model first, the function loads the model to make the mapping and then closes the model afterwards. To create a comma-separated list of variables to map from this object, use the `getInputString` function.

`map = getRootInportMap(inputmap,map,Name,Value);` overrides the mapping object with the specified property. You can override only the properties `model`, `blockName`, and `signalName`. Load the model before using this function. If you do not load the model first, the function loads the model to make the mapping and then closes the model afterwards. To create a comma-separated list of variables to map from this object, use the `getInputString` function.

Use the `getRootInportMap` function when creating a custom mapping mode to map data to root-level inports. See the example file `BlockNameIgnorePrefixMap.m`, located in *`matlabroot`*`/help/toolbox/simulink/examples`, for an example of a custom mapping algorithm.

Input Arguments

`Empty`

Create an empty map object.

Default: none

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

`model`

Name of model to associate with the root inport map.

Default: None

`blockName`

Block names of root-level input ports. The tool assigns data to ports according to the name of the root-inport block. If the tool finds a data element whose name matches the name of a root-inport block, it maps the data to the corresponding port.

The value for this argument can be:
Block name of root-level input ports.
Cell array containing multiple block names of root-level input ports.

Default: None

`signalName`

Signal names to be mapped. The tool assigns data to ports according to the name of the signal on the port. If the tool finds a data element whose name matches the name of a signal at a port, it maps the data to the corresponding port.

The value for this argument can be:
Signal name to be mapped.

Cell array containing multiple signal names of signals to be mapped.

Default: None

`inputmap`

Name of mapping object to override.

Default: None

Output Arguments

`map`

Custom object that you can use to map data to root-level input port. To create a comma-separated list of variables to map from this object, use the `getInputString` function.

Examples

Empty Mapping Object

Create an empty custom mapping object.

```
map = getRootInportMap('Empty')
```

```
map = 

  1x0 InputMap array with properties:

    Type
    DataSourceName
    Destination
```

Simple Mapping Object

Create a simple mapping object using a MATLAB time series object.

Create a time series object, `signalIn1`.

```
signalIn1 = timeseries((1:10)')

Common Properties:
            Name: 'unnamed'
            Time: [10x1 double]
        TimeInfo: [1x1 tsdata.timemetadata]
            Data: [10x1 double]
        DataInfo: [1x1 tsdata.datametadata]
```

Create a mapping object for the time series object for the model, `ex_minportsOnlyModel`.

```
modelFile = fullfile(matlabroot,'help','toolbox','simulink',...
'examples','ex_minportsOnlyModel');
load_system(modelFile);
map = getRootInportMap('model','ex_minportsOnlyModel',...
'blockName','In1','signalname','signalIn1')

map = 

  InputMap with properties:

              Type: 'Inport'
    DataSourceName: 'signalIn1'
       Destination: [1x1 Simulink.iospecification.Destination]
```

Mapping Object with Vectors

Create a mapping object using vectors of block names and signal names for the model `ex_minportsOnlyModel`.

Create a mapping object of vectors.

```
modelFile = fullfile(matlabroot,'help','toolbox','simulink',...
'examples','ex_minportsOnlyModel');
load_system(modelFile);
map = getRootInportMap('model','ex_minportsOnlyModel',...
'blockName',{'In1' 'In2'}, ...
'signalname',{'signalIn1' 'signalIn2'})

map = 

  1x2 InputMap array with properties:
    Type
    DataSourceName
    Destination
```

Overriding Maps

Create a mapping object that contains the signal *var2*, then override *var2* with *var1*.

Create a mapping object of vectors.

```
% Load the model and define variables
modelFile = fullfile(matlabroot,'help','toolbox','simulink',...
'examples','ex_minportsOnlyModel');
load_system(modelFile);
modelValue = 'ex_minportsOnlyModel';
blockNameValue = 'In1';
signalNameValue = 'var2';
portType = 'Inport';

% Define var1 and override var2 with var1
signalNameToOverload = 'var1';
mapToOverload = getRootInportMap('model',modelValue,...
'blockName',blockNameValue,...
 'signalName',signalNameToOverload)
```

```
mapToOverload = 

  InputMap with properties:

              Type: 'Inport'
    DataSourceName: 'var1'
       Destination: [1x1 Simulink.iospecification.Destination]
```

Tips

- Load the model before running this function.
- If your custom mapping mode similar to an existing Simulink mapping mode, consider using the `getSlRootInportMap` function instead.

Topics

“Create Custom Mapping File Function”

Introduced in R2012b

getSimulinkBlockHandle

Get block handle from block path

Syntax

```
handle = getSimulinkBlockHandle(path)
handle = getSimulinkBlockHandle(path,true)
```

Description

`handle = getSimulinkBlockHandle(path)` returns the numeric handle of the block specified by `path`, if it exists in a loaded model or library. Returns `-1` if the block is not found. Library links are resolved where necessary.

Use the numeric handle returned by `getSimulinkBlockHandle` to manipulate the block in subsequent calls to `get_param` or `set_param`. This approach is more efficient than making multiple calls to these functions using the full block path. Do not try to use the number of a handle alone (e.g., `5.007`) because you usually need to specify many more digits than MATLAB displays. Assign the handle to a variable and use that variable name to specify a block. The handle applies only to the current MATLAB session.

Use `getSimulinkBlockHandle` to check whether a block path is valid. This approach is more efficient than calling `get_param` inside a `try` statement.

`handle = getSimulinkBlockHandle(path,true)` attempts to load the model or library containing the specified block `path`, and then checks if the block exists. No error is returned if the model or library is not found. Any models or libraries loaded this way remain in memory even if the function does not find a block with the specified path.

Examples

Get the Handle of a Block

Get the handle of the `Pilot` block.

```
load_system('f14')
handle = getSimulinkBlockHandle('f14/Pilot')
```

```
handle =

  562.0004
```

You can use the handle in subsequent calls to `get_param` or `set_param`.

Load the Model and Get the Block Handle

Load the model `f14` if necessary (by specifying `true`), and get the handle of the `Pilot` block.

```
handle = getSimulinkBlockHandle('f14/Pilot',true)
```

```
handle =

  562.0004
```

You can use the handle in subsequent calls to `get_param` or `set_param`.

Check If a Model Contains a Specific Block

Check whether the model `f14` is loaded and contains a block named `Pilot`. Valid handles are always greater than zero. If the function does not find the block, it returns `-1`.

```
valid_block_path = getSimulinkBlockHandle('f14/Pilot') > 0
```

```
valid_block_path =

     0
```

The model contains the block but the model is not loaded, so this command returns `0` because it cannot find the block.

Using `getSimulinkBlockHandle` to check whether a block path is valid is more efficient than calling `get_param` inside a `try` statement.

Input Arguments

`path` — Block path name

character vector | cell array of character vectors

Block path name, specified as a character vector or a cell array of character vectors.

Example: `'f14/Pilot'`

Data Types: `char`

Output Arguments

`handle` — Numeric handle of a block

double | array of doubles

Numeric handle of a block, returned as a double or an array of doubles. Valid handles are always greater than zero. If the function does not find the block, it returns `-1`. If the `path` input is a cell array of character vectors, then the output is a numeric array of handles.

Data Types: `double`

`get_param` | `set_param`

Introduced in R2015a

getSlRootInportMap

Create custom object to map signals to root-level inports using Simulink mapping mode

Syntax

```
inputMap = getSlRootInportMap('model',modelname,'MappingMode',
mappingmode,'SignalName',signalname,'SignalValue',signalvalue)
[inputMap, hasASignal] = getSlRootInportMap('model',
modelname,'MappingMode',mappingmode,'SignalName',
signalname,'SignalValue',signalvalue)
```

```
inputMap = getSlRootInportMap('model',
modelname,'MappingMode','Custom','CustomFunction',
customfunction,'SignalName',signalname,'SignalValue',signalvalue)
[inputMap,hasASignal] = getSlRootInportMap('model',
modelname,'MappingMode','Custom','CustomFunction',
customfunction,'SignalName',signalname,'SignalValue',signalvalue)
```

Description

`inputMap = getSlRootInportMap('model',modelname,'MappingMode', mappingmode,'SignalName',signalname,'SignalValue',signalvalue)` creates a root inport map using one of the Simulink mapping modes. Load the model before using this function. If you do not load the model first, the function loads the model to make the mapping and then closes the model afterwards. To create a comma-separated list of variables to map from this object, use the `getInputString` function.

`[inputMap, hasASignal] = getSlRootInportMap('model', modelname,'MappingMode',mappingmode,'SignalName', signalname,'SignalValue',signalvalue)` returns a vector of logical values specifying whether or not the root inport map has a signal associated with it. To create a comma-separated list of variables to map from this object, use the `getInputString` function.

`inputMap = getSlRootInportMap('model', modelname,'MappingMode','Custom','CustomFunction',`

customfunction,'SignalName',signalname,'SignalValue',signalvalue) creates a root inport map using a custom mapping mode specified in customfunction. Load the model before using this function. If you do not load the model first, the function loads the model to make the mapping and then closes the model afterwards. To create a comma-separated list of variables to map from this object, use the getInputString function.

[inputMap,hasASignal] = getSlRootInportMap('model', modelname,'MappingMode','Custom','CustomFunction', customfunction,'SignalName',signalname,'SignalValue',signalvalue) returns a vector of logical values specifying whether or not the root inport map has a signal associated with it. To create a comma-separated list of variables to map from this object, use the getInputString function.

To map signals to root-level inports using custom mapping modes, you can use getSlRootInport with the Root Inport Mapper dialog box custom mapping capability.

Examples

Create inport map using Simulink mapping mode

Create a vector of inport maps using a built-in mapping mode.

```
Throttle = timeseries(ones(10,1)*10);
Brake    = timeseries(zeros(10,1));
inputMap = getSlRootInportMap('model','slexAutotransRootInportsExample',...
              'MappingMode','BlockName', ...
              'SignalName',{'Throttle' 'Brake'},...
              'SignalValue',{Throttle Brake});
```

Create inport map using custom function

Create a vector of inport maps using a custom function

```
port1    = timeseries(ones(10,1)*10);
port2    = timeseries(zeros(10,1));
inputMap = getSlRootInportMap('model','slexAutotransRootInportsExample',...
              'MappingMode','Custom', ...
              'CustomFunction','slexCustomMappingMyCustomMap',...
```

```
    'SignalName',{'port1' 'port2'},...
    'SignalValue',{port1 port2});
```

Input Arguments

`modelname` — Model name

character vector

Specify the model to associate with the root inport map.

Data Types: `char`

`mappingmode` — Simulink mapping mode

character vector

Specify the mapping mode to use with model name and data source. Possible values are:

`'Index'` Assign sequential index numbers, starting at 1, to the data in the MAT-file, and map this data to the corresponding inport.

`'BlockName’` Assign data to ports according to the name of the root-inport block. If the block name of a data element matches the name of a root-inport block, map the data to the corresponding port.

`‘SignalName'` Assign data to ports according to the name of the signal on the port. If the signal name of a data element matches the name of a signal at a port, map the data to the corresponding port.

`'BlockPath'` Assign data to ports according to the block path of the root-inport block. If the block path of a data element matches the block path of a root-inport block, map the data to the corresponding port.

`'Custom'` Apply mappings according to the definitions in a custom file.

Data Types: `char`

`customfunction` — Custom function file name

character vector

Specify name of file that implements a custom method to map signals to root-level ports. This function must be on the MATLAB path.

Data Types: `char`

`signalname` — signal name

scalar | cell array of character vectors

Specify the signal name(s) of the signal to associate with the root inport map.

Data Types: `char` | `cell`

`signalvalue` — signal value

scalar | cell arrays

Specify the values of the signals to map to the root inport map. For the list of supported data types for the values, see “Choose a Base Workspace and MAT-File Format”.

Output Arguments

`inputMap` — input map

scalar | vector

Mapping object that defines the mapping of input signals to root-level ports. To create a comma-separated list of variables to map from this object, use the `getInputString` function.

`hasASignal` — signal presence indicator

scalar | vector

A vector of logical values with the same length as `inputMap`. If the value is true the inputMap has a signal associated with it. If the value is false the inputMap does not have a signal associated with it and will use a ground value as an input

Data Types: `logical`

Tips

- Load the model before running this function.
- If your custom mapping mode is not similar to an existing Simulink mapping mode, consider using the `getRootInportMap` function instead.

`getInputString` | `getRootInportMap`

Topics

"Map Root Inport Signal Data"

Introduced in R2013b

hdllib

Display blocks that are compatible with HDL code generation

Syntax

```
hdllib
hdllib('off')
hdllib('html')
hdllib('librarymodel')
```

Description

`hdllib` displays the blocks that are supported for HDL code generation, and for which you have a license, in the Library Browser. To build models that are compatible with the HDL Coder software, use blocks from this Library Browser view.

If you close and reopen the Library Browser in the same MATLAB session, the Library Browser continues to show only the blocks supported for HDL code generation. To show all blocks, regardless of HDL code generation compatibility, at the command prompt, enter `hdllib('off')`.

`hdllib('off')` displays all the blocks for which you have a license in the Library Browser, regardless of HDL code generation compatibility.

`hdllib('html')` creates a library of blocks that are compatible with HDL code generation. It generates two additional HTML reports: a categorized list of blocks (`hdlblklist.html`) and a table of blocks and their HDL code generation parameters (`hdlsupported.html`).

To run `hdllib('html')`, you must have an HDL Coder license.

`hdllib('librarymodel')` displays blocks that are compatible with HDL code generation in the Library Browser. To build models that are compatible with the HDL Coder software, use blocks from this library.

The default library name is `hdlsupported`. After you generate the library, you can save it to a folder of your choice.

To keep the library current, you must regenerate it each time that you install a new software release.

To run `hdllib('librarymodel')`, you must have an HDL Coder license.

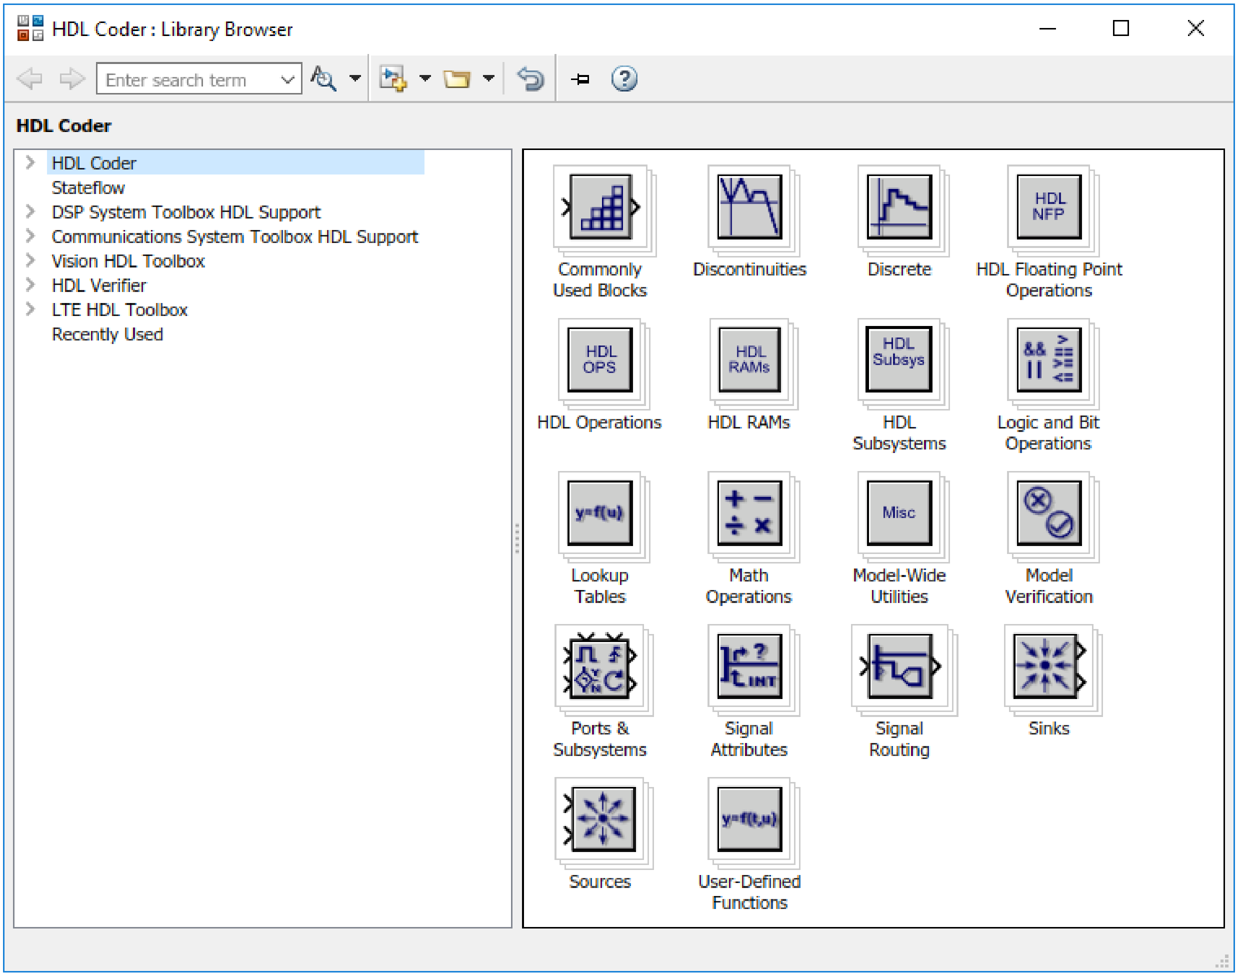
Examples

Display Supported Blocks in the Library Browser

To display blocks that are compatible with HDL code generation in the Library Browser:

```
hdllib
```

```
### Generating view of HDL Coder compatible blocks in Library Browser.
### To restore the Library Browser to the default Simulink view, enter "hdllib off".
```

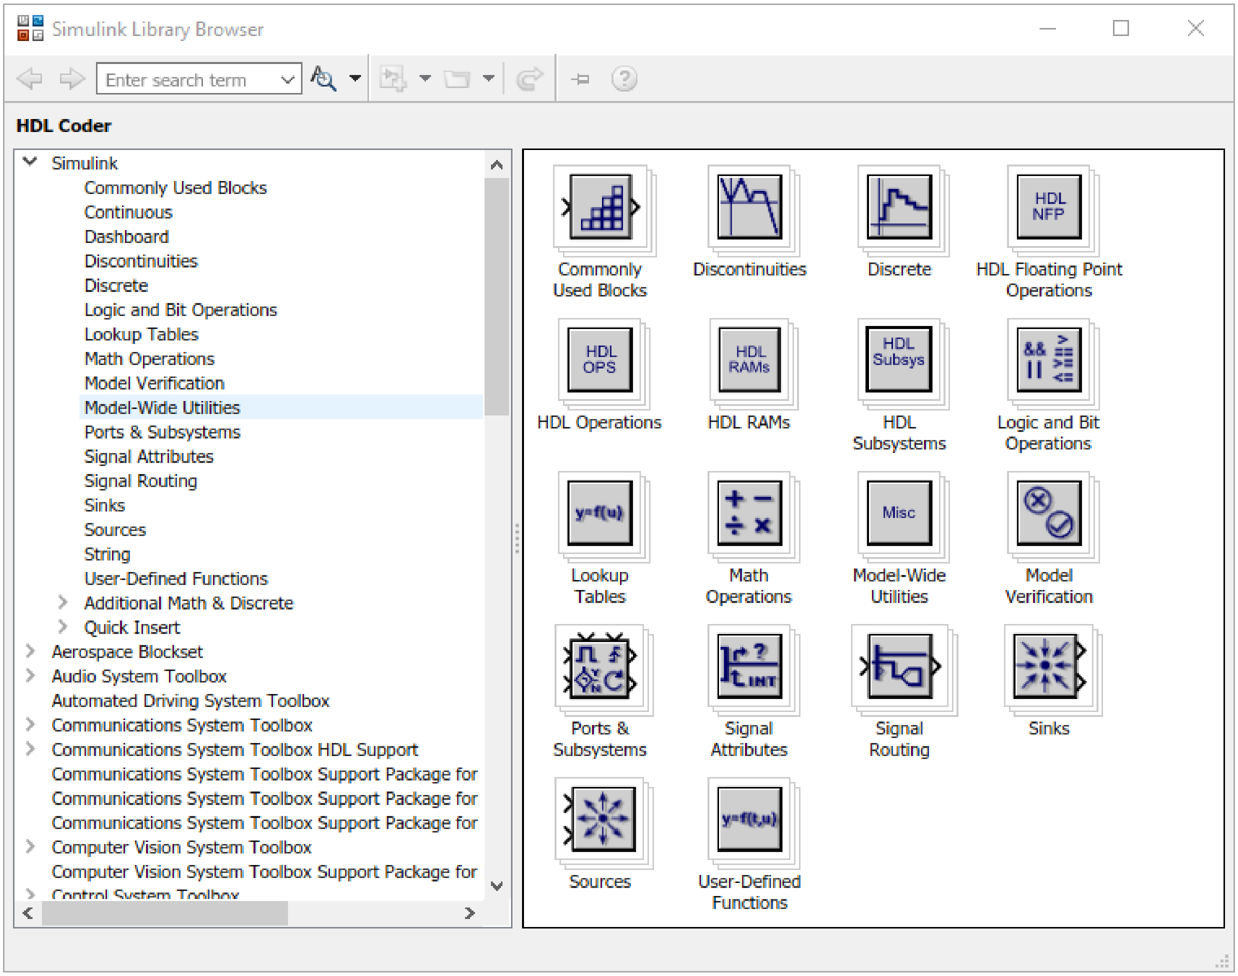


Display All Blocks in the Library Browser

To display all blocks in the Library Browser, regardless of HDL code generation compatibility:

```
hdllib('off')
```

```
### Restoring Library Browser to default view; removing the HDL Coder compatibility fi
```



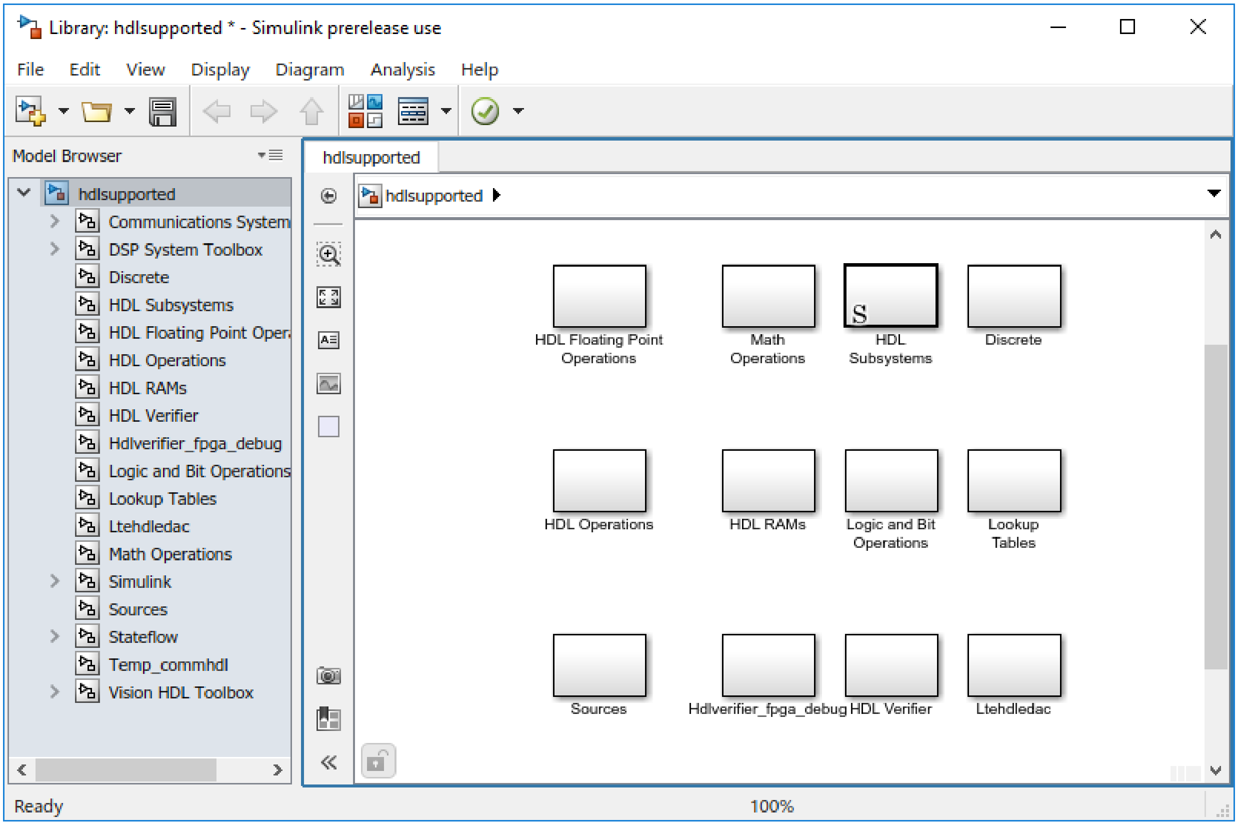
Create a Supported Blocks Library and HTML Reports

To create a library and HTML reports showing the blocks that are compatible with HDL code generation:

```
hdllib('html')
```

```
### HDL supported block list hdlblklist.html
### HDL implementation list hdlsupported.html
```

The `hdlsupported` library opens. To view the reports, click the `hdlblklist.html` and `hdlsupported.html` links.



Create a Supported Blocks Library

To create a library that contains blocks that are compatible with HDL code generation:

```
hdllib('librarymodel')
```

The `hdlsupported` block library opens.

Introduced in R2006b

hilite_system

Highlight block, signal line, port, or annotation

Syntax

```
hilite_system(obj)
hilite_system(obj,style)
```

Description

`hilite_system(obj)` highlights a block, line, port, or annotation in an open model using the default highlight style. Use `hilite_system` with a port to highlight the signal line attached to the port. Each use of `hilite_system` adds to the highlighting. Highlighting is not saved with the model.

`hilite_system(obj,style)` uses the specified highlighting style.

Input Arguments

obj — Block, port, line, or annotation to highlight

block path name | numeric handle | Simulink identifier | traceability tag

Block, port, line, or annotation to highlight, specified as:

- The full block path name
- A numeric handle for lines, ports, or annotations
- Simulink identifier
- A traceability tag from the comments of Simulink Coder generated code.

  Using a traceability tag requires a Simulink Coder license.

The format for a traceability tag is `<system>/block`, where `system` is either:

- `Root`
- A unique system number assigned by Simulink during code generation

Example: `'vdp/Mu'`, `'sldemo_fuelsys/fuel_rate_control/airflow_calc'`, `'vdp:3'`, `'<Root>/Mu'`

`style` — Highlighting style

`'default'` (default) | character vector

Highlighting style, specified as one of these values. You can customize the appearance of any of the styles. See “Customize a Highlighting Style” on page 2-361.

- `'default'` — Default color scheme: red outline, yellow fill.
- `'none'` — Clears the highlight.

  To clear all highlighting, in the Simulink Editor, select **Display** > **Remove Highlighting**.
- `'debug'` — Uses default color scheme.
- `'different'` — Applies red outline, white fill.
- `'error'` — Uses default color scheme.
- `'fade'` — Applies gray outline, white fill.
- `'find'` — Applies dark blue outline, blue fill.
- `'lineTrace'` — Applies red outline, blue fill.
- `'unique'` — Dark blue outline, white fill.
- `'user1'`, `'user2'`, `'user3'`, `'user4'`, `'user5'` — Applies custom highlight: black outline, white fill by default (i.e., no highlight).

In addition, you can use these color schemes. The first word is the outline and the second is the fill color.

- `'orangeWhite'`
- `'blackWhite'`
- `'redWhite'`
- `'blueWhite'`
- `'greenWhite'`

Examples

Highlight Block Using Default Highlight Style

Open the model `slexAircraftExample`.

```
slexAircraftExample
```

Highlight the Controller block. When you use the default highlight style, the block appears highlighted with a red outline and yellow fill.

```
hilite_system('slexAircraftExample/Controller')
```

Highlight a Block Using a Highlight Style

Open the model `vdp`.

```
vdp
```

Highlight the Mu block using the style `'fade'`.

```
hilite_system('vdp/Mu','fade')
```

Use Block Highlighting to Trace Generated Code

If you have a Simulink Coder license, you can trace generated code to the corresponding source block in a model.

Open the model `f14`.

```
f14
```

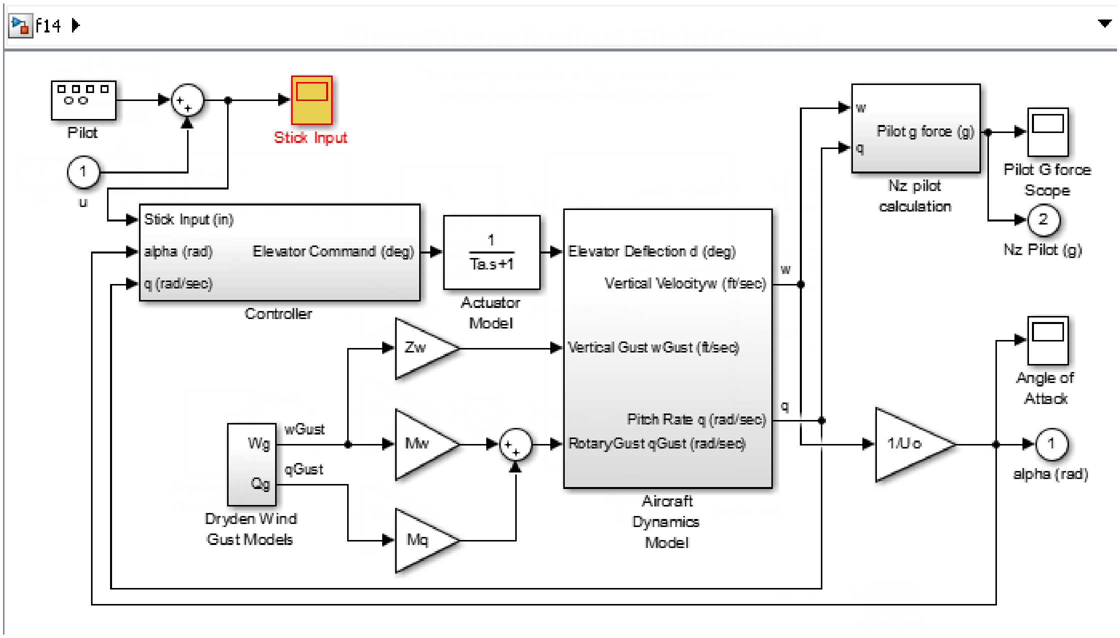
In the model configuration parameters, in the **Solver** pane, set **Type** to `Fixed-step`.

Generate code for the model using **Code** > **C/C++ Code** > **Build Model**.

In an editor or in the code generation report, open a generated source or header file. As you review lines of code, note traceability tags that correspond to code of interest.

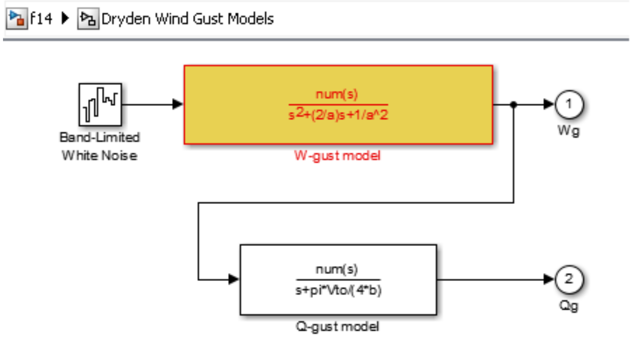
Highlight a block using a traceability tag.

```
hilite_system('<Root>/Stick Input')
```



Highlight a block in a subsystem.

```
hilite_system('<S3>/W-gust model')
```



Customize a Highlighting Style

You can customize a highlighting style by setting the 'HiliteAncestorsData' parameter on the root-level model using set_param in this form:

```
set_param(0,'HiliteAncestorsData',hiliteData)
```

Specify hiliteData as a structure array that has these fields:

- 'HiliteType' — Highlighting style to customize, such as 'user1', 'debug', or 'error'.
- 'ForegroundColor' — Color for block fill.
- 'BackgroundColor' — Color for block outline.

The supported values for 'ForegroundColor' and 'BackgroundColor' are:

- 'black'
- 'white'
- 'gray'
- 'red'
- 'orange'
- 'yellow'
- 'green'
- 'darkGreen'
- 'blue'
- 'lightBlue'
- 'cyan'
- 'magenta'

Define a highlight style for 'user1', and customize the style for 'debug'.

```
set_param(0,'HiliteAncestorsData',...
                    struct('HiliteType','user1',...
                           'ForegroundColor','darkGreen',...
                           'BackgroundColor','lightBlue'));
set_param(0,'HiliteAncestorsData',...
                    struct('HiliteType','debug',...
                           'ForegroundColor','red',...
                           'BackgroundColor','black'));
```

Use the defined style to highlight a block.

```
f14
hilite_system('f14/Controller/Alpha-sensor Low-pass Filter','user1')
```

See Also

`find_system` | `rtwtrace`

Introduced before R2006a

isLoaded

Determine if Simulink Project is loaded

Syntax

```
loaded = isLoaded(proj)
```

Description

`loaded = isLoaded(proj)` returns whether the project referenced by the project object `proj` is loaded.

Examples

Find Out if Project Is Loaded

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Find out if the project is still loaded.

```
loaded = isLoaded(proj)
```

```
loaded =

     1
```

Input Arguments

`proj` — Project
project

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

Output Arguments

`loaded` — Loaded status

1 | 0

Project loaded status, returned as true (`1`) if the project is loaded.

Data Types: `logical`

See Also

Functions
`reload` | `simulinkproject`

Introduced in R2013a

legacy_code

Use Legacy Code Tool

Syntax

```
legacy_code('help')
specs = legacy_code('initialize')
legacy_code('sfcn_cmex_generate', specs)
legacy_code('compile', specs, compilerOptions)
legacy_code('generate_for_sim', specs, modelname)
legacy_code('slblock_generate', specs, modelname)
legacy_code('sfcn_tlc_generate', specs)
legacy_code('sfcn_makecfg_generate', specs)
legacy_code('rtwmakecfg_generate', specs)
legacy_code('backward_compatibility')
```

Description

The `legacy_code` function creates a MATLAB structure for registering the specification for existing C or C++ code and the S-function being generated. In addition, the function can generate, compile and link, and create a masked block for the specified S-function. Other options include generating

- A TLC file for simulation in Accelerator mode or code generation
- An `rtwmakecfg.m` file that you can customize to specify dependent source and header files that reside in a different directory than that of the generated S-function

`legacy_code('help')` displays instructions for using Legacy Code Tool.

`*specs* = legacy_code('initialize')` initializes the Legacy Code Tool data structure, *`specs`*, which registers characteristics of existing C or C++ code and properties of the S-function that the Legacy Code Tool generates.

`legacy_code('sfcn_cmex_generate', *specs*)` generates an S-function source file as specified by the Legacy Code Tool data structure, *`specs`*.

`legacy_code('compile', *specs*, *compilerOptions*)` compiles and links the S-function generated by the Legacy Code Tool based on the data structure, *`specs`*, and compiler options that you might specify. The compiler options must be supported by the mex (MATLAB) function.

`legacy_code('generate_for_sim', *specs*, *modelname*)` generates, compiles, and links the S-function in a single step. If the `Options.useTlcWithAccel` field of the Legacy Code Tool data structure is set to logical 1 (`true`), the function also generates a TLC file for accelerated simulations.

`legacy_code('slblock_generate', *specs*, *modelname*)` generates a masked S-Function block for the S-function generated by the Legacy Code Tool based on the data structure, *`specs`*. The block appears in the Simulink model specified by `modelname`. If you omit `modelname`, the block appears in an empty model editor window.

`legacy_code('sfcn_tlc_generate', *specs*)` generates a TLC file for the S-function generated by the Legacy Code Tool based on the data structure, *`specs`*. This option is relevant if you want to:

- Force Accelerator mode in Simulink software to use the TLC inlining code of the generated S-function. See the description of the `ssSetOptions` SimStruct function and `SS_OPTION_USE_TLC_WITH_ACCELERATOR` S-function option for more information.
- Use Simulink Coder software to generate code from your Simulink model. For more information, see “Import Calls to External Code into Generated Code with Legacy Code Tool” (Simulink Coder).

`legacy_code('sfcn_makecfg_generate', *specs*)` generates an *`sFunction`*`_makecfg.m` file for the S-function generated by the Legacy Code Tool based on the data structure, *`specs`*. This option is relevant only if you use Simulink Coder software to generate code from your Simulink model. For more information, see “Use makecfg to Customize Generated Makefiles for S-Functions” (Simulink Coder) and “Import Calls to External Code into Generated Code with Legacy Code Tool” (Simulink Coder).

`legacy_code('rtwmakecfg_generate', *specs*)` generates an `rtwmakecfg.m` file for the S-function generated by the Legacy Code Tool based on the data structure, *`specs`*. This option is relevant only if you use Simulink Coder software to generate code from your Simulink model. For more information, see “Use rtwmakecfg.m API to Customize Generated Makefiles” (Simulink Coder) and “Import Calls to External Code into Generated Code with Legacy Code Tool” (Simulink Coder).

`legacy_code('backward_compatibility')` automatically updates syntax for using Legacy Code Tool to the supported syntax described in this reference page and in “Integrate C Functions Using Legacy Code Tool”.

Input Arguments

`specs`

A structure with the following fields:

Name the S-function

`SFunctionName` (Required) — A character vector specifying a name for the S-function to be generated by the Legacy Code Tool.

Define Legacy Code Tool Function Specifications

- `InitializeConditionsFcnSpec` — A nonempty character vector specifying a reentrant function that the S-function calls to initialize and reset states. You must declare this function by using tokens that Simulink software can interpret as explained in “Declaring Legacy Code Tool Function Specifications”.
- `OutputFcnSpec` — A nonempty character vector specifying the function that the S-function calls at each time step. You must declare this function by using tokens that Simulink software can interpret as explained in “Declaring Legacy Code Tool Function Specifications”.
- `StartFcnSpec` — A character vector specifying the function that the S-function calls when it begins execution. This function can access S-function parameter arguments only. You must declare this function by using tokens that Simulink software can interpret as explained in “Declaring Legacy Code Tool Function Specifications”.
- `TerminateFcnSpec` — A character vector specifying the function that the S-function calls when it terminates execution. This function can access S-function parameter arguments only. You must declare this function by using tokens that Simulink software can interpret as explained in “Declaring Legacy Code Tool Function Specifications”.

Define Compilation Resources

- `HeaderFiles` — A cell array of character vectors specifying the file names of header files required for compilation.

- SourceFiles — A cell array of character vectors specifying source files required for compilation. You can specify the source files using absolute or relative path names.
- HostLibFiles — A cell array of character vectors specifying library files required for host compilation. You can specify the library files using absolute or relative path names.
- TargetLibFiles — A cell array of character vectors specifying library files required for target (that is, standalone) compilation. You can specify the library files using absolute or relative path names.
- IncPaths — A cell array of character vectors specifying directories containing header files. You can specify the directories using absolute or relative path names.
- SrcPaths — A cell array of character vectors specifying directories containing source files. You can specify the directories using absolute or relative path names.
- LibPaths — A cell array of character vectors specifying directories containing host and target library files. You can specify the directories using absolute or relative path names.

Specify a Sample Time

SampleTime — One of the following:

- 'inherited' (default) — Sample time is inherited from the source block.
- 'parameterized' — Sample time is represented as a tunable parameter. Generated code can access the parameter by calling MEX API functions, such as mxGetPr or mxGetData.
- Fixed — Sample time that you explicitly specify. For information on how to specify sample time, see “Specify Sample Time”.

If you specify this field, you must specify it last.

Define S-Function Options

Options — A structure that controls S-function options. The structure's fields include:

- isMacro — A logical value specifying whether the legacy code is a C macro. By default, the value is false (0).
- isVolatile — A logical value specifying the setting of the S-function SS_OPTION_NONVOLATILE option. By default, the value is true (1).

- `canBeCalledConditionally` — A logical value specifying the setting of the S-function `SS_OPTION_CAN_BE_CALLED_CONDITIONALLY` option. By default, the value is true (1).
- `useTlcWithAccel` — A logical value specifying the setting of the S-function `SS_OPTION_USE_TLC_WITH_ACCELERATOR` option. By default, the value is true (1).
- `language` — A character vector specifying either `'C'` or `'C++'` as the target language of the S-function that Legacy Code Tool will produce. By default, the value is `'C'`.

Note The Legacy Code Tool can interface with C++ functions, but not C++ objects. For a work around, see “Legacy Code Tool Limitations” in the Simulink documentation.

- `singleCPPMexFile` — A logical value that, if `true`, specifies that generated code:

  - Requires you to generate and manage an inlined S-function as only one file (`.cpp`) instead of two (`.c` and `.tlc`).
  - Maintains model code style (level of parentheses usage and preservation of operand order in expressions and condition expressions in if statements) as specified by model configuration parameters.

  By default, the value is `false`.

Limitations You cannot set the `singleCPPMexFile` field to `true` if

- `Options.language='C++'`
- You use one of the following Simulink objects with the `IsAlias` property set to `true`:
  - `Simulink.Bus`
  - `Simulink.AliasType`
  - `Simulink.NumericType`
- The Legacy Code Tool function specification includes a `void*` or `void**` to represent scalar work data for a state argument
- `HeaderFiles` field of the Legacy Code Tool structure specifies multiple header files

- supportsMultipleExecInstances— A logical value specifying whether to include a call to the ssSupportsMultipleExecInstances function. By default, the value is false (0).
- convertNDArrayToRowMajor— A logical value specifying the automatic conversion of a matrix between a column-major format and a row-major format. The column-major format is used by MATLAB, Simulink, and the generated code. The row-major format is used by C. By default, the value is false (0). If you currently specify the previous version of the option, convert2DMatrixToRowMajor, the function automatically specifies the new convertNDArrayToRowMajor option.

  Note This option does not support a 2–D matrix of complex data.
- supportCoverage— A logical value specifying whether the generated S-function must be compatible with Model Coverage. By default, the value is false (0).
- supportCoverageAndDesignVerifier— A logical value specifying whether the generated S-function must be compatible with Model Coverage and Simulink Design Verifier™. By default, the value is false (0).
- outputsConditionallyWritten— A logical value specifying whether the legacy code conditionally writes the output ports. If true, the generated S-function specifies that the memory associated with each output port cannot be overwritten and is global (SS_NOT_REUSABLE_AND_GLOBAL). If false, the memory associated with each output port is reusable and is local (SS_REUSABLE_AND_LOCAL). By default, the value is false (0). For more information, see ssSetOutputPortOptimOpts.

modelname

The name of a Simulink model into which Legacy Code Tool is to insert the masked S-function block generated when you specify legacy_code with the action character vector 'slblock_generate'. If you omit this argument, the block appears in an empty model editor window.

Introduced in R2006b

libinfo

Get information about library blocks referenced by model

Syntax

```
libdata = libinfo('system')
libdata = libinfo('system', constraint1, value1, ...)
```

Description

`libdata = libinfo('system')` returns information about library blocks referenced by *`system`* and all the systems underneath it.

`libdata = libinfo('system', constraint1, value1, ...)` restricts the search as indicated by the search constraint(s) *`c1`*, *`v1`*, ...

Input Arguments

`system`

The system to search recursively for library blocks.

`constraint1, value1, ...`

One or more pairs, each consisting of a search constraint followed by a constraint value. You can specify any of the search constraints that you can use with `find_system`.

Output Arguments

`libdata`

An array of structures that describes each library block referenced by *`system`*. Each structure has the following fields:

`Block`	Path of the link to the library block
`Library`	Name of the library containing the referenced block
`ReferenceBlock`	Path of the library block
`LinkStatus`	Value of the `LinkStatus` parameter for the link to the library block

See Also

`find_system`

Topics

"Custom Libraries and Linked Blocks"

Introduced before R2006a

linmod

Extract continuous-time linear state-space model around operating point

Syntax

```
argout = linmod('sys');
argout = linmod('sys', x, u);
argout = linmod('sys', x, u, para);
argout = linmod('sys', x, u, 'v5');
argout = linmod('sys', x, u, para, 'v5');
argout = linmod('sys', x, u, para, xpert, upert, 'v5');
```

Arguments

sys

Name of the Simulink system from which the linear model is extracted.

`x` and `u`

State (`x`) and the input (`u`) vectors. If specified, they set the operating point at which the linear model is extracted. When a model has model references using the Model block, you must use the Simulink structure format to specify `x`. To extract the `x` structure from the model, use the following command:

```
x = Simulink.BlockDiagram.getInitialState('sys');
```

You can then change the operating point values within this structure by editing `x.signals.values`.

If the state contains different data types (for example, `'double'` and `'uint8'`), then you cannot use a vector to specify this state. You must use a structure instead. In addition, you can only specify the state as a vector if the state data type is `'double'`.

`Ts`

Sample time of the discrete-time linearized model

`'v5'`

An optional argument that invokes the perturbation algorithm created prior to MATLAB 5.3. Invoking this optional argument is equivalent to calling `linmodv5`.

`para`

A three-element vector of optional arguments:

- `para(1)` — Perturbation value of delta, the value used to perform the perturbation of the states and the inputs of the model. This is valid for linearizations using the `'v5'` flag. The default value is 1e-05.
- `para(2)` — Linearization time. For blocks that are functions of time, you can set this parameter with a nonnegative value that gives the time (`t`) at which Simulink evaluates the blocks when linearizing a model. The default value is 0.
- `para(3)` — Set `para(3)=1` to remove extra states associated with blocks that have no path from input to output. The default value is 0.

`xpert` and `upert`

The perturbation values used to perform the perturbation of all the states and inputs of the model. The default values are

```
xpert = para(1) + 1e-3*para(1)*abs(x)
upert = para(1) + 1e-3*para(1)*abs(u)
```

When a model has model references using the Model block, you must use the Simulink structure format to specify `xpert`. To extract the `xpert` structure, use the following command:

```
xpert = Simulink.BlockDiagram.getInitialState('sys');
```

You can then change the perturbation values within this structure by editing `xpert.signals.values`.

The perturbation input arguments are only available when invoking the perturbation algorithm created prior to MATLAB 5.3, either by calling `linmodv5` or specifying the `'v5'` input argument to `linmod`.

`argout`

`linmod`, `dlinmod`, and `linmod2` return state-space representations if you specify the output (left-hand) side of the equation as follows:

- `[A,B,C,D] = linmod('sys', x, u)` obtains the linearized model of *`sys`* around an operating point with the specified state variables *`x`* and the input *`u`*. If you omit *`x`* and *`u`*, the default values are zero.

`linmod` and `dlinmod` both also return a transfer function and MATLAB data structure representations of the linearized system, depending on how you specify the output (left-hand) side of the equation. Using `linmod` as an example:

- `[num, den] = linmod('sys', x, u)` returns the linearized model in transfer function form.
- `sys_struc = linmod('sys', x, u)` returns a structure that contains the linearized model, including state names, input and output names, and information about the operating point.

Description

`linmod` compute a linear state-space model by linearizing each block in a model individually.

`linmod` obtains linear models from systems of ordinary differential equations described as Simulink models. Inputs and outputs are denoted in Simulink block diagrams using Inport and Outport blocks.

The default algorithm uses preprogrammed analytic block Jacobians for most blocks which should result in more accurate linearization than numerical perturbation of block inputs and states. A list of blocks that have preprogrammed analytic Jacobians is available in the Simulink Control Design documentation along with a discussion of the block-by-block analytic algorithm for linearization.

The default algorithm also allows for special treatment of problematic blocks such as the Transport Delay and the Quantizer. See the mask dialog of these blocks for more information and options.

Notes

By default, the system time is set to zero. For systems that are dependent on time, you can set the variable `para` to a two-element vector, where the second element is used to set the value of `t` at which to obtain the linear model.

The ordering of the states from the nonlinear model to the linear model is maintained. For Simulink systems, a character vector variable that contains the block name associated with each state can be obtained using

```
[sizes,x0,xstring] = sys
```

where `xstring` is a vector of strings whose *i*th row is the block name associated with the `i`th state. Inputs and outputs are numbered sequentially on the diagram.

For single-input multi-output systems, you can convert to transfer function form using the routine `ss2tf` or to zero-pole form using `ss2zp`. You can also convert the linearized models to LTI objects using `ss`. This function produces an LTI object in state-space form that can be further converted to transfer function or zero-pole-gain form using `tf` or `zpk`.

The default algorithms in `linmod` handle Transport Delay blocks by replacing the linearization of the blocks with a Pade approximation. For the `'v5'` algorithm, linearization of a model that contains Derivative or Transport Delay blocks can be troublesome. For more information, see “Linearizing Models”.

`dlinmod` | `linmod2` | `linmodv5`

Introduced in R2007a

linmod2

Extract continuous-time linear state-space model around operating point

Syntax

```
argout = linmod2('sys', x, u);
argout = linmod2('sys', x, u, para);
```

Arguments

sys

Name of the Simulink system from which the linear model is extracted.

x, *u*

State (*x*) and the input (*u*) vectors. If specified, they set the operating point at which the linear model is extracted. When a model has model references using the Model block, you must use the Simulink structure format to specify `x`. To extract the `x` structure from the model, use the following command:

```
x = Simulink.BlockDiagram.getInitialState('sys');
```

You can then change the operating point values within this structure by editing `x.signals.values`.

If the state contains different data types (for example, `'double'` and `'uint8'`), then you cannot use a vector to specify this state. You must use a structure instead. In addition, you can only specify the state as a vector if the state data type is `'double'`.

para

A three-element vector of optional arguments:

- `para(1)` — Perturbation value of delta, the value used to perform the perturbation of the states and the inputs of the model. This is valid for linearizations using the `'v5'` flag. The default value is 1e-05.
- `para(2)` — Linearization time. For blocks that are functions of time, you can set this parameter with a nonnegative value that gives the time (`t`) at which Simulink evaluates the blocks when linearizing a model. The default value is 0.
- `para(3)` — Set `para(3)=1` to remove extra states associated with blocks that have no path from input to output. The default value is 0.

argout

`linmod`, `dlinmod`, and `linmod2` return state-space representations if you specify the output (left-hand) side of the equation as follows:

- `[A,B,C,D] = linmod('sys', x, u)` obtains the linearized model of *sys* around an operating point with the specified state variables *x* and the input *u*. If you omit *x* and *u*, the default values are zero.

`linmod` and `dlinmod` both also return a transfer function and MATLAB data structure representations of the linearized system, depending on how you specify the output (left-hand) side of the equation. Using `linmod` as an example:

- `[num, den] = linmod('sys', x, u)` returns the linearized model in transfer function form.
- `sys_struc = linmod('sys', x, u)` returns a structure that contains the linearized model, including state names, input and output names, and information about the operating point.

Description

`linmod2` computes a linear state-space model by perturbing the model inputs and model states, and uses an advanced algorithm to reduce truncation error.

linmod2 obtains linear models from systems of ordinary differential equations described as Simulink models. Inputs and outputs are denoted in Simulink block diagrams using Inport and Outport blocks.

Notes

By default, the system time is set to zero. For systems that are dependent on time, you can set the variable para to a two-element vector, where the second element is used to set the value of t at which to obtain the linear model.

The ordering of the states from the nonlinear model to the linear model is maintained. For Simulink systems, a character vector variable that contains the block name associated with each state can be obtained using

```
[sizes,x0,xstring] = sys
```

where xstring is a vector of strings whose *i*th row is the block name associated with the ith state. Inputs and outputs are numbered sequentially on the diagram.

For single-input multi-output systems, you can convert to transfer function form using the routine ss2tf or to zero-pole form using ss2zp. You can also convert the linearized models to LTI objects using ss. This function produces an LTI object in state-space form that can be further converted to transfer function or zero-pole-gain form using tf or zpk.

The default algorithms in linmod and dlinmod handle Transport Delay blocks by replacing the linearization of the blocks with a Pade approximation. For more information, see “Linearizing Models”.

dlinmod | linmod | linmodv5

Introduced in R2007a

linmodv5

Extract continuous-time linear state-space model around operating point

Syntax

```
argout = linmodv5('sys');
argout = linmodv5('sys',x,u);
argout = linmodv5('sys', x, u, para);
argout = linmodv5('sys', x, u, para, xpert, upert);
```

Arguments

sys

Name of the Simulink system from which the linear model is extracted.

x, *u*

State (*x*) and the input (*u*) vectors. If specified, they set the operating point at which the linear model is extracted. When a model has model references using the Model block, you must use the Simulink structure format to specify `x`. To extract the `x` structure from the model, use the following command:

```
x = Simulink.BlockDiagram.getInitialState('sys');
```

You can then change the operating point values within this structure by editing `x.signals.values`.

If the state contains different data types (for example, `'double'` and `'uint8'`), then you cannot use a vector to specify this state. You must use a structure instead. In addition, you can only specify the state as a vector if the state data type is `'double'`.

para A three-element vector of optional arguments:

- para(1) — Perturbation value of delta, the value used to perform the perturbation of the states and the inputs of the model. This is valid for linearizations using the 'v5' flag. The default value is 1e-05.
- para(2) — Linearization time. For blocks that are functions of time, you can set this parameter with a nonnegative value that gives the time (t) at which Simulink evaluates the blocks when linearizing a model. The default value is 0.
- para(3) — Set para(3)=1 to remove extra states associated with blocks that have no path from input to output. The default value is 0.

xpert, *upert* The perturbation values used to perform the perturbation of all the states and inputs of the model. The default values are

```
xpert = para(1) + 1e-3*para(1)*abs(x)
upert = para(1) + 1e-3*para(1)*abs(u)
```

When a model has model references using the Model block, you must use the Simulink structure format to specify xpert. To extract the xpert structure, use the following command:

```
xpert = Simulink.BlockDiagram.getInitialState('sys');
```

You can then change the perturbation values within this structure by editing xpert.signals.values.

The perturbation input arguments are only available when invoking the perturbation algorithm created prior to MATLAB 5.3, either by calling linmodv5 or specifying the 'v5' input argument to linmod.

`argout`

`linmod`, `dlinmod`, and `linmod2` return state-space representations if you specify the output (left-hand) side of the equation as follows:

- `[`*`A`*`,`*`B`*`,`*`C`*`,`*`D`*`] = linmod('`*`sys`*`', `*`x`*`, `*`u`*`)` obtains the linearized model of *`sys`* around an operating point with the specified state variables *`x`* and the input *`u`*. If you omit *`x`* and *`u`*, the default values are zero.

`linmod` and `dlinmod` both also return a transfer function and MATLAB data structure representations of the linearized system, depending on how you specify the output (left-hand) side of the equation. Using `linmod` as an example:

- `[num, den] = linmod('`*`sys`*`', `*`x`*`, `*`u`*`)` returns the linearized model in transfer function form.
- `sys_struc = linmod('`*`sys`*`', `*`x`*`, `*`u`*`)` returns a structure that contains the linearized model, including state names, input and output names, and information about the operating point.

Description

`linmodv5` computes a linear state space model using the full model perturbation algorithm created prior to MATLAB 5.3.

`linmodv5` obtains linear models from systems of ordinary differential equations described as Simulink models. Inputs and outputs are denoted in Simulink block diagrams using Inport and Outport blocks.

Notes

By default, the system time is set to zero. For systems that are dependent on time, you can set the variable `para` to a two-element vector, where the second element is used to set the value of `t` at which to obtain the linear model.

The ordering of the states from the nonlinear model to the linear model is maintained. For Simulink systems, a character vector variable that contains the block name associated with each state can be obtained using

```
[sizes,x0,xstring] = sys
```

where `xstring` is a vector of strings whose *i*th row is the block name associated with the `i`th state. Inputs and outputs are numbered sequentially on the diagram.

For single-input multi-output systems, you can convert to transfer function form using the routine `ss2tf` or to zero-pole form using `ss2zp`. You can also convert the linearized models to LTI objects using `ss`. This function produces an LTI object in state-space form that can be further converted to transfer function or zero-pole-gain form using `tf` or `zpk`.

The default algorithms in `linmod` and `dlinmod` handle Transport Delay blocks by replacing the linearization of the blocks with a Pade approximation. For the `'v5'` algorithm, linearization of a model that contains Derivative or Transport Delay blocks can be troublesome. For more information, see “Linearizing Models”.

`dlinmod` | `linmod` | `linmod2`

Introduced in R2011b

load_system

Load Simulink model into memory

Syntax

```
handle = load_system(sys)
```

Description

`handle = load_system(sys)` loads the model `sys` into memory without opening the model in the Simulink Editor. After you load a model into memory, you can work with it using Simulink API commands. Save changes to the model using `save_system`.

Examples

Load Model into Memory

Load the model `vdp` into memory and return the model handle.

```
h = load_system("vdp")
```

```
h =

  172.0004
```

Input Arguments

sys — Model to load into memory
character vector | string scalar

Model to load into memory, specified as a character vector or string scalar.

Example: `"vdp"`

Output Arguments

`handle` — Handle of loaded model

handle

Handle of loaded model.

See Also

`close_system` | `open_system` | `save_system`

Introduced before R2006a

loadIntoMemory

Load logged data into memory

Syntax

```
logs = loadIntoMemory(logs)
```

Description

`logs = loadIntoMemory(logs)` loads the data in `logs` into memory. Data is logged to a repository and brought into memory on an as-needed basis. When you want to work with all elements of a large set of logged data, use `loadIntoMemory` to bring all of the elements into memory at once. Loading all the data at once, rather than element by element, is much faster.

Examples

Load Logged Data into Memory

This example shows how to load a set of logged data into memory all at once, rather than element by element.

```
% Simulate model to generate logged data
sim('sldemo_fuelsys')
```

The simulation logs all of the instrumented signals in the model to the `Simulink.SimulationData.Dataset` object `sldemo_fuelsys_output`. At the end of simulation, the signal data remains in the repository until used in the MATLAB workspace. When you work with small sets of data or only postprocess a subset, leaving signals in the repository improves performance. But when you have a large set of data and need to postprocess all of the signals, you should bring them all into memory at once.

```
% Load all logged signals into memory
loadIntoMemory(sldemo_fuelsys_output);
```

All of the data in `sldemo_fuelsys_output` is now available for efficient postprocessing.

Input Arguments

`logs` — Data to load into memory
`'Simulink.SimulationData.Dataset'` | `'Simulink.SimulationOutput'`

Data to load into memory. The `loadIntoMemory` function can load `Simulink.SimulationData.Dataset` and `Simulink.SimulationOutput` data.

Example: `logsout`

Output Arguments

`logs` — Data
`'Simulink.SimulationData.Dataset'` | `'Simulink.SimulationOutput'`

Data loaded into memory.

See Also

`Simulink.SimulationData.Dataset` | `Simulink.SimulationOutput`

Introduced in R2017b

model

Execute particular phase of simulation of model

Syntax

```
[sys,x0,str,ts] = model([],[],[],'sizes');
[sys,x0,str,ts] = model([],[],[],'compile');
outputs = model(t,x,u,'outputs');
derivs = model(t,x,u,'derivs');
dstates = model(t,x,u,'update');
model([],[],[],'term');
```

Description

The `model` command executes a specific phase of the simulation of a Simulink model whose name is `model`. The command's last argument (`flag`) specifies the phase of the simulation to be executed. See “Simulation Phases in Dynamic Systems” for a description of the steps that Simulink software uses to simulate a model.

This command ignores the effects of state transitions and conditional execution. Therefore, it is not suitable for models which have such logic. Use this command for models which can be represented as simple dynamic systems. Such systems should meet these requirements.

- All states in the model must be built-in non-bus data types. For a discussion on built-in data types, see “About Data Types in Simulink”.
- If you are using vector format to specify the state, this command can access only non-complex states of `double` data type.
- There is minimal amount of state logic (Stateflow, conditionally executed subsystems etc.)
- The models are not mixed-domain models. That is, most blocks in the model are built-in Simulink blocks and do not include user-written S-functions or blocks from other Sim* products.

For models which do not comply with these requirements, using this command can cause Simulink to produce results which can only be interpreted by further analyzing and simplifying the model.

Note The state variable `x` can be represented in structure as well as vector formats. The variable follows the limitations of the format in which it is specified.

This command is also not intended to be used to run a model step-by-step, for example, to debug a model. Use the Simulink debugger if you need to examine intermediate results to debug a model.

Arguments

`sys`	Vector of model size data: • `sys(1)` = number of continuous states • `sys(2)` = number of discrete states • `sys(3)` = number of outputs • `sys(4)` = number of inputs • `sys(5)` = reserved • `sys(6)` = direct-feedthrough flag (1 = yes, 0 = no) • `sys(7)` = number of sample times (= number of rows in `ts`)
`x0`	Vector containing the initial conditions of the system's states
`str`	Vector of names of the blocks associated with the model's states. The state names and initial conditions appear in the same order in `str` and `x0`, respectively.
`ts`	An *m*-by-2 matrix containing the sample time (period, offset) information
outputs	Outputs of the model at time step `t`.
derivs	Derivatives of the continuous states of the model at time `t`.

dstates	States of the model at time `t` returned as either a structure or an array. Simulink returns a structure when the model has states and `x` is either empty (`[]`) or in structure format. Otherwise, Simulink returns an array. • If the return type is a vector or array, Simulink returns real double discrete states only. • If the return type is a structure, Simulink returns a structure that contains both continuous and discrete states of built-in types only. Non-built-in types are omitted.
`t`	Time step, specified as real double in scalar format.
`x`	State vector, specified as real double in structure or vector format.
`u`	Inputs, specified as real double in vector format.
`flag`	Specification of the simulation phase to be executed: • `'sizes'` executes the size computation phase of the simulation. This phase determines the sizes of the model's inputs, outputs, state vector, etc. • `'compile'` executes the compilation phase of the simulation. The compilation phase propagates signal and sample time attributes. • `'update'` computes the next values of the model's discrete states. • `'outputs'` computes the outputs of the model's blocks at time `t`. • `'derivs'`computes the derivatives of the model's continuous states at time step `t`. • `'term'` causes Simulink software to terminate simulation of the model. **Note** The `output`, `update`, and `derivs` flags are valid only for single-tasking models. For more information on single-tasking and multi-tasking, see “Tasking Modes” (Simulink Coder).

Examples

The following command executes the compilation phase of the `vdp` model that comes with Simulink software.

```
vdp([], [], [], 'compile')
```

The following command terminates the simulation initiated in the previous example.

```
vdp([], [], [], 'term')
```

Note Simulink does not let you close a model while it is compiling or simulating. For all phases except the `'sizes'` phase, before closing the model, you must invoke the model command with the `'term'` argument.

`sim`

Introduced in R2007a

modeladvisor

Open Model Advisor

Syntax

```
modeladvisor(model)
```

Description

`modeladvisor(model)` opens the Model Advisor for the model or subsystem specified by `model`. If the specified model or subsystem is not open, this command opens it.

Examples

Open Model Advisor for model

Open the Model Advisor for `vdp` example model:

```
modeladvisor('vdp')
```

Open Model Advisor for subsystem

Open the Model Advisor for the Aircraft Dynamics Model subsystem of the `f14` example model:

```
modeladvisor('f14/Aircraft Dynamics Model')
```

Open Model Advisor for currently selected model

Open the Model Advisor on the currently selected model:

```
modeladvisor(bdroot)
```

Open Model Advisor for currently selected subsystem

Open the Model Advisor on the currently selected subsystem:

```
modeladvisor(gcs)
```

Input Arguments

`model` — Model or subsystem name

character vector

Model or subsystem name or handle, specified as a character vector.

Data Types: `char`

See Also

"Run Model Checks"

Introduced before R2006a

new_system

Create Simulink model or library in memory

Syntax

```
h = new_system

h = new_system(name)
h = new_system(name,'FromTemplate',template)
h = new_system(name,'FromFile',file)
h = new_system( ___ ,'ErrorIfShadowed')

h = new_system(name,'Model')
h = new_system(name,'Model',subsys)
h = new_system(name,'Library')
h = new_system( ___ ,'ErrorIfShadowed')
```

Description

`h = new_system` creates a model named `untitled` (and then `untitled1`, `untitled2`, and so on) based on your default model template and returns the new model's numeric handle. Select your default model template on the Simulink start page or by using the `Simulink.defaultModelTemplate` function.

The `new_system` function does not open the new model. This function creates the model in memory. To save the model, use `save_system`, or open the model with `open_system` and then save it using the Simulink Editor.

`h = new_system(name)` creates a model based on your default model template and gives the new model the specified name. This function returns the new model's numeric handle. Select your default model template on the Simulink start page or by using the `Simulink.defaultModelTemplate` function.

If `name` is empty, the function creates a model named `untitled`, `untitled1`, `untitled2`, and so on.

The `new_system` function does not open the new model. This function creates the model in memory. To save the model, use `save_system`, or open the model with `open_system` and then save it using the Simulink Editor.

`h = new_system(name,'FromTemplate',template)` creates the model based on the specified template.

`h = new_system(name,'FromFile',file)` creates the model based on the specified model or template.

`h = new_system(___,'ErrorIfShadowed')` creates the model or returns an error if another model, MATLAB file, or variable with the same name is on the MATLAB path or in the workspace. It uses any of the input arguments in the previous syntaxes.

`h = new_system(name,'Model')` creates an empty model based on the Simulink default model and returns the new model's numeric handle. The Simulink default model is also known as the root block diagram and has the numeric handle `0`. If `name` is empty, the function creates a model or library named `untitled`, `untitled1`, `untitled2`, and so on.

The `new_system` function does not open the new model. This function creates the model in memory. To save the model, use `save_system`, or open the model with `open_system` and then save it using the Simulink Editor.

`h = new_system(name,'Model',subsys)` creates a model based on the subsystem `subsys` in a currently loaded model.

`h = new_system(name,'Library')` creates an empty library that has the specified name and returns a numeric handle.

`h = new_system(___,'ErrorIfShadowed')` returns an error if another model, MATLAB file, or variable with the same name is on the MATLAB path or in the workspace. This syntax uses any of the input arguments in the previous syntaxes.

Examples

Create a Model Based on Default Template

Create a model in memory called `untitled`.

```
h = new_system;
```

You can use `get_param` to get the name.

```
get_param(h,'Name')
open_system(h)
open_system('untitled')
open_system(get_param(h,'Name'))
```

```
ans =

untitled
```

Use the name, the handle, or `get_param` command as input to `open_system`. You can use any of these commands:

Create a Model Based on Named Template

Before you use this syntax, create a template. In the Simulink Editor, create the model you want to use as the template. Then select **File** > **Export Model to** > **Template**. For this example, name the template `mytemplate`.

By default, the template is on the MATLAB path, so if you change location, add the folder to the MATLAB path.

Create a model named `templateModel` based on the template `mytemplate`.

```
h = new_system('templateModel','FromTemplate','mytemplate');
```

```
Invoking template \\myuserdir\Documents\MATLAB\mytemplate.sltx
```

Create a Model Based on Another Model

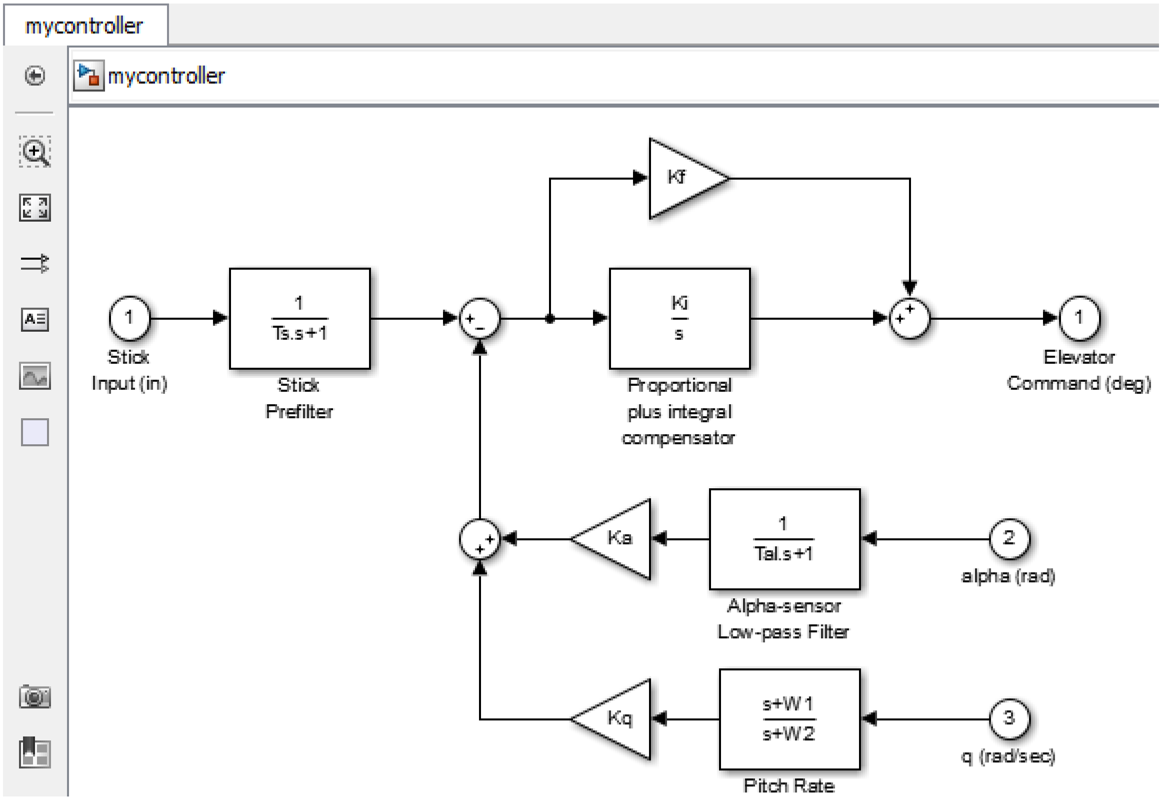
Create a model named `mynewmodel` based on `myoldmodel`, which is in the current folder.

```
h = new_system('mynewmodel','FromFile','myoldmodel.slx');
```

Create Model from Subsystem

Load the model `f14`. Create a model based on the Controller subsystem.

```
load_system('f14');
new_system('mycontroller','Model','f14/Controller');
open_system('mycontroller');
```



Create a Library

Create a library in memory and then open it.

```
new_system('mylib','Library')
open_system('mylib')
```

Ensure Model Name Is Unique

Create a variable with the name `myvar`.

```
myvar = 17
```

Try to create a model that uses the same name as the variable. When you use the `'ErrorIfShadowed'` option, the `new_system` function returns an error.

```
new_system('myvar2','Model','ErrorIfShadowed')
```

```
The model 'myvar2' cannot be created because this name is shadowing another name on the
path or in the workspace.  Choose another name, or do not use the option 'ErrorIfShadow
```

Input Arguments

name — Name of new model or library
character vector

Name of new model or library, specified as a character vector that:

- Has 63 or fewer characters
- Is not a MATLAB keyword
- Is not `'simulink'`
- Is unique among model names, variables, and MATLAB files on the MATLAB path and in the workspace

Example: `'mymodel'`, `'mylibrary'`

subsys — Subsystem to base new model on
subsystem block path name

Subsystem to base the new model on, specified as the subsystem block path name in a currently open model.

Example: `'f14/Controller'`

`template` — Name of template to base new model on

character vector

Name of the template to base the new model on, specified as a character vector of the name of a template on the MATLAB path. Create a template in the Simulink Editor using **File > Export Model to > Template**.

Example: `'mytemplate'`, `'mytemplate.sltx'`

`file` — Path name of model or template to base new model on

character vector

Path name of the model or template to base the new model on, specified as a character vector. You can use an `.mdl`, `.slx`, or `..sltx` file. Include the extension and use a full or relative path.

Example: `'Models/mymodel.slx'`, `'mytemplate.sltx'`, `'model.mdl'`

`Simulink.defaultModelTemplate` | `open_system` | `save_system`

Introduced before R2006a

num2fixpt

Convert number to nearest value representable by specified fixed-point data type

Syntax

```
outValue = num2fixpt(OrigValue, FixPtDataType, FixPtScaling,
    RndMeth, DoSatur)
```

Description

num2fixpt(OrigValue, FixPtDataType, FixPtScaling, RndMeth, DoSatur) returns the result of converting OrigValue to the nearest value representable by the fixed-point data type FixPtDataType. Both OrigValue and outValue are of data type double. As illustrated in the example that follows, you can use num2fixpt to investigate quantization error that might result from converting a number to a fixed-point data type. The arguments of num2fixpt include:

OrigValue	Value to be converted to a fixed-point representation. Must be specified using a double data type.
FixPtDataType	The fixed-point data type used to convert OrigValue.
FixPtScaling	Scaling of the output in either Slope or [Slope Bias] format. If FixPtDataType does not specify a generalized fixed-point data type using the sfix or ufix command, FixPtScaling is ignored.
RndMeth	Rounding technique used if the fixed-point data type lacks the precision to represent OrigValue. If FixPtDataType specifies a floating-point data type using the float command, RndMeth is ignored. Valid values are Zero, Nearest, Ceiling, or Floor (the default).

`DoSatur`	Indicates whether the output should be saturated to the minimum or maximum representable value upon underflow or overflow. If `FixPtDataType` specifies a floating-point data type using the `float` command, `DoSatur` is ignored. Valid values are `on` or `off` (the default).

Examples

Suppose you wish to investigate the quantization effect associated with representing the real-world value 9.875 as a signed, 8-bit fixed-point number. The command

```
num2fixpt(9.875, sfix(8), 2^-1)

ans =

   9.50000000000000
```

reveals that a slope of `2^-1` results in a quantization error of 0.375. The command

```
num2fixpt(9.875, sfix(8), 2^-2)

ans =

   9.75000000000000
```

demonstrates that a slope of `2^-2` reduces the quantization error to 0.125. But a slope of `2^-3`, as used in the command

```
num2fixpt(9.875, sfix(8), 2^-3)

ans =

   9.87500000000000
```

eliminates the quantization error entirely.

`fixptbestexp` | `fixptbestprec`

Introduced before R2006a

open_system

Open Simulink model, library, subsystem, or block dialog box

Syntax

```
open_system(obj)

open_system(sys,'loadonly')

open_system(sbsys,'window')
open_system(sbsys,'tab')

open_system(blk,'mask')
open_system(blk,'force')
open_system(blk,'parameter')
open_system(blk,'OpenFcn')
```

Description

`open_system(obj)` opens the specified model, library, subsystem, or block. This is equivalent to double-clicking the model or library in the Current Folder Browser, or the subsystem or block in the Simulink Editor.

A model or library opens in a new window. For a subsystem or block within a model, the behavior depends on the type of block and its properties.

- Any OpenFcn callback parameter is evaluated.
- If there is no OpenFcn callback, and a mask is defined, the mask parameter dialog box opens.
- Without an OpenFcn callback or a mask parameter, Simulink opens the object.
  - A referenced model opens in a new window.
  - A subsystem opens in a new tab in the same window.
  - For blocks, the parameters dialog box for the block opens.

To open a specific subsystem or block, you must load the model or library containing it. Otherwise Simulink returns an error.

You can override the default behavior by supplying a second input argument.

`open_system(sys,'loadonly')` loads the specified model or library without opening the Simulink Editor. This is equivalent to using `load_system`.

`open_system(sbsys,'window')` opens the subsystem `sbsys` in a new Simulink Editor window. Before opening a specific subsystem or block, load the model or library containing it. Otherwise Simulink returns an error.

`open_system(sbsys,'tab')` opens the subsystem in a new Simulink Editor tab in the same window. Before opening a specific subsystem or block, load the model or library containing it. Otherwise Simulink returns an error.

`open_system(blk,'mask')` opens the mask dialog box of the block or subsystem specified by `blk`. Load the model or library containing `blk` before opening it.

`open_system(blk,'force')` looks under the mask of a masked block or subsystem. It opens the dialog box of the block under the mask or opens a masked subsystems in a new Simulink Editor tab. This is equivalent to the **Look Under Mask** menu item. Before opening a specific subsystem or block, load the model or library containing it. Otherwise Simulink returns an error.

`open_system(blk,'parameter')` opens the block parameter dialog box.

`open_system(blk,'OpenFcn')` runs the block callback `OpenFcn`.

Examples

Open a Model

Open the `f14` model.

```
open_system('f14')
```

Load a Model Without Opening it

Load the `f14` model.

```
open_system('f14','loadonly')
```

Open a Subsystem

Open the Controller subsystem of the `f14` model.

```
load_system('f14')
open_system('f14/Controller')
```

Open a Subsystem in New Tab in Existing Window

Open the f14 model and open the `Controller` subsystem in a new tab.

```
f14
open_system('f14/Controller','tab')
```

Open a Subsystem in a Separate Window

Open a subsystem in its own Simulink Editor window.

```
open_system('f14')
open_system('f14/Controller','window')
```

Open a Referenced Model

Open the model `sldemo_mdlref_counter`, which is referenced by the CounterA model block in `sldemo_mdlref_basic`.

```
open_system('sldemo_mdlref_basic')
open_system('sldemo_mdlref_basic/CounterA')
```

The referenced model opens in its own Simulink Editor window.

Open Block Dialog Box

Open the block parameters dialog box for the first Gain block in the `Controller` subsystem.

```
load_system('f14')
open_system('f14/Controller/Gain')
```

Run Block Open Callback Function

Define an `OpenFcn` callback for a block and execute the block callback.

```
f14
set_param('f14/Pilot','OpenFcn','disp(''Hello World!'')')
open_system('f14/Pilot','OpenFcn')
```

The words `Hello World` appear on the MATLAB Command Prompt.

Open Masked Subsystem

Open the contents of the masked subsystem Vehicle in the model `sf_car`.

```
open_system('sf_car')
open_system('sf_car/Vehicle', 'force')
```

Open Multiple Systems with One Command

Create a cell array of two model names, `f14` and `vdp`. Open both models using `open_system` with the cell array name.

```
models = {'f14','vdp'}
open_system(models)
```

Input Arguments

obj — Model, referenced model, library, subsystem, or block path
character vector

Model, referenced model, library, subsystem, or block path, specified as a character vector. If the model is not on the MATLAB path, specify the full path to the model file. Specify the block or subsystem using its full name, e.g., `f14/Controller/Gain`, on an opened or loaded model. On UNIX systems, the fully qualified path name of a model can start with a tilde (~), signifying your home directory.

Data Types: `char`

`sys` — Model or library path
character vector

The full name or path of a model or library, specified as a character vector.

Data Types: `char`

`sbsys` — Subsystem path
character vector

The full name or path of a subsystem in an open or loaded model, specified as a character vector.

Data Types: `char`

`blk` — Block or subsystem path
character vector

The full name or path of a block or subsystem in an open or loaded model, specified as a character vector.

Data Types: `char`

`close_system` | `load_system` | `new_system` | `save_system`

Introduced before R2006a

openDialog

Open configuration parameters dialog

Syntax

```
openDialog(configObj)
```

Arguments

configObj

A configuration set (Simulink.ConfigSet) or configuration reference (Simulink.ConfigSetRef)

Description

openDialog opens a configuration parameters dialog box. If *configObj* is a configuration set, the dialog box displays the configuration set. If *configObj* is a configuration reference, the dialog box displays the referenced configuration set, or generates an error if the reference does not specify a valid configuration set. If the dialog box is already open, its window becomes selected.

Examples

The following example opens a configuration parameters dialog box that shows the current parameters for the current model. The parameter values derive from the active configuration set or configuration reference (configuration object). The code is the same in either case; the only difference is which type of configuration object is currently active.

```
myConfigObj = getActiveConfigSet(gcs);
openDialog(myConfigObj);
```

parsim

Simulate dynamic system multiple times in parallel or serial

Syntax

```
simOut = parsim(in)
simOut = parsim(in,'ShowSimulationManager','on')
simOut = parsim(in,Name,Value,...NameN,ValueN)
```

Description

`simOut = parsim(in)` simulates a model using the inputs specified in the `SimulationInput` object, in. The `parsim` command uses an array of `SimulationInput` objects to run multiple simulations.

`simOut = parsim(in,'ShowSimulationManager','on')` simulates a model in parallel using the inputs specified in the `SimulationInput` object and opens the Simulation Manager UI. For more information, see `Simulation Manager`.

`simOut = parsim(in,Name,Value,...NameN,ValueN)` simulates a model in parallel using the inputs specified in the `SimulationInput` object and the options specified as the `Name,Value` pair.

The `parsim` command uses the Parallel Computing Toolbox license to run the simulations in parallel. `parsim` runs the simulations in serial if a parallel pool cannot be created or if Parallel Computing Toolbox is not used.

Examples

Simulate Model in Parallel with parsim

Simulate the model, CSTR, in parallel by sweeping over a variable. An array of SimulationInput objects is used to perform the sweep.

Specify sweep values.

```
FeedTempSweep = 250:10:300;
```

Create an array of SimulationInput objects.

```
for i = length(FeedTempSweep):-1:1;
in(i) = Simulink.SimulationInput('CSTR');
in(i) = in(i).setVariable('FeedTemp0',FeedTempSweep(i));
end
```

Simulate the model in parallel.

```
out = parsim(in, 'ShowProgress', 'on')
```

```

[08-Jan-2018 14:12:09] Cleaning up parallel workers...

out = 

1x6 Simulink.SimulationOutput array
```

Using `parsim` with Rapid Accelerator

Simulate the model, `vdp`, in rapid accelerator mode.

Load the model.

```
model = 'vdp';
load_system(model)
```

This step builds the Rapid Accelerator target

```
Simulink.BlockDiagram.buildRapidAcceleratorTarget(model);
```

Create a `SimulationInput` object and use `setModelParameter` method to set `RapidAcceleratorUpToDateCheck` to `'off'`.

```
in = in.setModelParameter('SimulationMode', 'rapid-accelerator');
in = in.setModelParameter('RapidAcceleratorUpToDateCheck', 'off');
```

Simulate the model.

```
out = parsim(in)
```

Input Arguments

in — Simulink.SimulationInput object used to simulate the model

object, array

A `Simulink.SimulationInput` object or an array of `Simulink.SimulationInput` objects that is used to specify changes to the model for a simulation.

Example: `in = Simulink.SimulationInput('vdp')`

Name-Value Pair Arguments

Note All parameters passed to `parsim` command are unrelated to the parameters that are used with the `sim` command. To pass to the `parsim` command, use the list of following input arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` and `Value` must appear inside single quotes (`' '`). You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: `'ShowProgress'`, `'on'`

AttachedFiles — Files to attach to parallel pool

cell array

Specified as a cell array of additional files to attach to the parallel pool.

`ShowProgress` — Show the progress of the simulations

'on'(default) | 'off'

Set to `'on'`, to see the progress of the simulations in the command window. The progress is hidden when set to `'off'`.

Note When the progress is shown, a message `'Cleaning up parallel workers..'` may be displayed before the completion of the last few simulations. This message does not depend on the completion of the simulations. Simulations complete when the outputs are fetched from the `future`. For more information, see `Simulink.Simulation.Future`.

`RunInBackground` — Run simulations in background

'off' (default) | 'on'

Set to `'on'` to run simulations asynchronously, keeping the MATLAB command prompt available for use.

`SetupFcn` — Function handle to run once per worker

function handle

Specify a `function handle` to `'SetupFcn'` to run once per worker before the start of the simulations.

Example: `'SetupFcn',@()simulinkproject('OCRAex/OCRA_example.prj')`

Note When `buildRapidAcceleratorTarget` is used in the SetupFcn and the model has external inputs specified, either set `'LoadExternalInput'` to `'off'` or ensure that the specified external input is available on the workers to prevent compilation error.

`CleanupFcn` — Function handle to run once per worker after running simulations

function handle

Specify a `function handle` to `'CleanupFcn'` to run once per worker after the simulations are completed.

`ManageDependencies` — Manage model dependecies

'on' (default) | 'off'

When `ManageDependencies` is set to `on`, model dependencies are automatically sent to the parallel workers if required. If `ManageDependencies` is set to `off`, explicitly attache model dependencies to the parallel pool.

`UseFastRestart` — Use fast restart

'off' (default) | 'on'

When `UseFastRestart` is set to `true`, simulations run on the workers using fast restart.

Note When using `parsim`, use the `UseFastRestart` option and not the `FastRestart` option. See “Get Started with Fast Restart” for more information.

`TransferBaseWorkspaceVariables` — Transfer variables to the parallel workers

'off' (default) | 'on'

When `TransferBaseWorkspaceVariables` is set to `true`, variables used in the model and defined in the base workspace are transferred to the parallel workers.

Note Use of `TransferBaseWorkspaceVariables` requires model compilation.

`ShowSimulationManager` — Starts the Simulation Manager app

'off' (default) | 'on'

When `'ShowSimulationManager'` is set to `'on'`, you can use the Simulation Manager App to monitor simulations.

`StopOnError` — Starts the Simulation Manager app

'off' (default) | 'on'

Setting `'StopOnError'` to `'on'` stops the execution of simulations if an error is encountered.

Output Arguments

`simOut` — Simulation object containing logged simulation results

object

Array of `Simulink.SimulationOutput` objects that contains all of the logged simulation results. The size of the array is equal to the size of the array of `Simulink.SimulationInput` objects.

All simulation outputs (logged time, states, and signals) are returned in a single `Simulink.SimulationOutput` object. You define the model time, states, and output that is logged using the **Data Import/Export** pane of the Model Configuration Parameters dialog box. You can log signals using blocks such as the To Workspace and Scope blocks. The **Signal & Scope Manager** can directly log signals.

Extended Capabilities

Automatic Parallel Support

Accelerate code by automatically running computation in parallel using Parallel Computing Toolbox™.

If you have Parallel Computing Toolbox installed, then when you use `parsim`, MATLAB automatically opens a parallel pool of workers on your local machine. MATLAB runs the simulations across the available workers. Control parallel behavior with the parallel preferences, including scaling up to a cluster.

For details, see “Run Multiple Simulations”.

performanceadvisor

Open Performance Advisor

Syntax

```
performanceadvisor(model)
```

Description

`performanceadvisor(model)` opens the Performance Advisor on the model or subsystem specified by model. If the specified model or subsystem is not open, this command opens it.

Input Arguments

`model`

A character vector specifying the name or handle to the model or subsystem.

Examples

Open Performance Advisor

Open Performance Advisor on the `vdp` example model.

```
performanceadvisor('vdp')
```

Performance Advisor opens the `vdp` model and opens Performance Advisor on the model.

Alternatives

In the Simulink Editor, select **Analysis** > **Performance Tools** > **Performance Advisor**.

reload

Reload Simulink Project

Syntax

```
reload(proj)
```

Description

`reload(proj)` reloads the project. Use `reload` when you want to run the project startup shortcuts.

Examples

Reload Project

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

When you want to run the startup shortcuts again, reload the project.

```
reload(proj)
```

Input Arguments

`proj` — Project
project object

Project, specified as a project object already created with `simulinkproject` to manipulate a Simulink Project at the command line.

See Also

Functions
`isLoaded` | `simulinkproject`

Introduced in R2013a

removeCategory

Remove Simulink Project category of labels

Syntax

```
removeCategory(proj,categoryName)
```

Description

`removeCategory(proj,categoryName)` removes a category of labels, `categoryName`, from the Simulink Project specified by `proj`.

Examples

Remove Category

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Create a new category of labels.

```
createCategory(proj,'Engineers','char');
```

Remove the new category of labels.

```
removeCategory(proj,'Engineers');
```

A message appears warning you that you cannot undo the operation. Click **Continue**. You can configure warnings in the Preferences in the Simulink Project Tool.

Input Arguments

`proj` — Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

`categoryName` — Name of category

character vector

Name of the category to remove, which exists in the project, specified as a character vector.

See Also

Functions

`createCategory` | `findCategory` | `simulinkproject`

Introduced in R2013a

removeFile

Remove file from Simulink Project

Syntax

```
removeFile(proj,file)
```

Description

`removeFile(proj,file)` removes a file from the project `proj`.

Examples

Remove File from Project

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Remove a file.

```
removeFile(proj,'models/AnalogControl.mdl')
```

Add the file back to the project.

```
addFile(proj,'models/AnalogControl.mdl')
```

Input Arguments

`proj` — Project
project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

`file` — Path of file
character vector | file object

Path of the file to remove relative to the project root folder, including the file extension, specified as a character vector or a file object returned by `findFile`. The file must be in the project.

Example: `'models/myModelName.slx'`

See Also

Functions
`addFile` | `findFile` | `simulinkproject`

Introduced in R2013a

removeLabel

Remove label from Simulink Project

Syntax

```
removeLabel(category,labelName)
removeLabel(file,categoryName,labelName)
removeLabel(file,labelDefinition)
```

Description

`removeLabel(category,labelName)` removes the label from the specified category of labels in the currently loaded project.

`removeLabel(file,categoryName,labelName)` removes the specified label in the category `categoryName` from the file. Use this syntax to specify category and label by name.

`removeLabel(file,labelDefinition)` removes the specified label `labelDefinition` from the file. Before you can remove the label, you need to get the label from the `file.Label` property or by using `findLabel`.

Examples

Remove a Label

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Examine the first existing category.

```
cat = proj.Categories(1)
cat = 

  Category with properties:

                Name: 'Classification'
            DataType: 'none'
    LabelDefinitions: [1x8 slproject.LabelDefinition]
```

Define a new label in the category.

```
createLabel(cat,'Future');
```

Remove the new label.

```
removeLabel(cat,'Future');
```

Input Arguments

category — Category of labels
category object

Category of labels, specified as a category object. Get a category object from the `proj.Categories` property or by using `findCategory`.

labelName — Name of label
character vector

Name of the label to remove, specified as a character vector.

file — File to detach label from
file object

File to detach the label from, specified as a file object. You can get the file object by examining the project’s Files property (`proj.Files`), or use `findFile` to find a file by name. The file must be within the root folder.

categoryName — Name of category that contains label
character vector

Name of the category that contains the label to remove, specified as a character vector.

`labelDefinition` — Label to detach

label definition object

Name of the label to detach, specified as a label definition object returned by the `file.Label` property or `findLabel`.

`addLabel` | `createLabel` | `findCategory` | `findLabel` | `simulinkproject`

Introduced in R2013a

replace_block

Replace blocks in Simulink model

Syntax

```
replBlks = replace_block(sys,current,new)
replBlks = replace_block(sys,Name,Value,new)
replBlks = replace_block( ___ ,'noprompt')
```

Description

`replBlks = replace_block(sys,current,new)` replaces the blocks `current` in the model `sys` with blocks of type `new`. You can use a block from a Simulink library or from another model as the replacement block.

Load the model `sys` before using this function. The function prompts you to select the blocks you want to replace from a list of blocks that match the `current` argument.

Tip Save the model before using this command.

`replBlks = replace_block(sys,Name,Value,new)` replaces the blocks that match the block parameters specified by the `Name,Value` pair arguments. You can also use `find_system` `Name,Value` pairs to qualify the search for blocks to replace.

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

With the `replace_block` function, you can use block parameter and value pairs. For a list of all the block parameters, see “Common Block Properties” on page 6-109 and “Block-Specific Parameters” on page 6-128.

To specify additional information about the search for blocks to replace, you use `find_system` `Name,Value` pairs before the block parameters. For example, you can use

'CaseSensitive','off' to make the search for blocks case insensitive or 'FollowLinks','on' to follow links into library links. See find_system for that list of Name,Value pairs.

replBlks = replace_block(___ ,'noprompt') replaces the blocks without prompting you to select them from a dialog box.

Examples

Replace Blocks in a Model

Replace blocks in the 'vdp' model.

Load the model 'vdp'.

```
load_system('vdp');
```

Replace Gain blocks with Integrator blocks.

```
RepNames = replace_block('vdp','Gain','Integrator');
```

A dialog box prompts you to select the blocks you want to replace.

With vdp/Mu selected in the dialog box, click **OK**.

Replace Scope blocks with To Workspace blocks.

```
RepNames = replace_block('vdp','Scope','simulink/Sinks/To Workspace');
```

A dialog box prompts you to select the blocks you want to replace.

With vdp/Scope selected in the dialog box, click **OK**.

Replace Blocks in a Subsystem Using Parameter Values

Replace blocks in the Unlocked subsystem of the sldemo_clutch model. Replace blocks whose Gain parameter is set to bv.

Load the model sldemo_clutch.

```
load_system('sldemo_clutch');
```

In the `'Unlocked'` subsystem, replace blocks whose `Gain` value is `bv` with Integrator blocks.

```
replace_block('sldemo_clutch/Unlocked','Gain','bv','Integrator');
```

A dialog box prompts you to select the blocks to replace.

With `sldemo_clutch/Unlocked/VehicleDamping` selected in the dialog box, click **OK**.

Replace Blocks Without Dialog Box

Load the model `f14`.

```
load_system('f14')
```

Replace Gain blocks with Integrator blocks. The command returns the blocks it found to replace and replaces the blocks.

```
repl = replace_block('f14','Gain','Integrator','noprompt')
```

```
repl = 13x1 cell array
    {'f14/Aircraft...'     }
    {'f14/Aircraft...'     }
    {'f14/Aircraft...'     }
    {'f14/Aircraft...'     }
    {'f14/Controller/Gain' }
    {'f14/Controller/Gain2'}
    {'f14/Controller/Gain3'}
    {'f14/Gain'            }
    {'f14/Gain1'           }
    {'f14/Gain2'           }
    {'f14/Gain5'           }
    {'f14/Nz pilot...'     }
    {'f14/Nz pilot...'     }
```

Use find_system Pairs with replace_block

Select a block that is a library link. Follow the library links and replace Gain blocks with Integrator blocks within them.

```
replace_block(gcb, 'FollowLinks', 'on', 'BlockType', 'Gain', 'Integrator', 'noprompt')
```

Input Arguments

sys — Model or subsystem whose blocks to replace

character vector

Name of model whose blocks to replace, specified as a character vector. If you specify a model, the command replaces all blocks that match in the model. If you specify a subsystem, the command replaces blocks in that subsystem and below.

Example: `'vdp'`, `'sldemo_fuelsys/fuel_rate_control'`

`current` — Type of block to replace

`BlockType` value | `MaskType` value

Type of block to replace, specified as a `BlockType` or `MaskType` value. To find out the block type, select the block and, at the command prompt, enter:

```
get_param(gcb,'BlockType')
```

For masked blocks, to find out the mask type, select the block and enter:

```
get_param(gcb,'MaskType')
```

new — Block to replace current blocks

`BlockType` value | `MaskType` value | library path | block path name from a model

Block to replace the current block, specified in one of these forms:

- `BlockType` value of the replacement block. Specifying this value uses a library block as the replacement block.
- `MaskType` value of the replacement block. Specifying this value uses a library block as the replacement block.
- Library path of the replacement block, for example, `'simulink/Sinks/To Workspace'`. Hover over the block in the library to see the library path.

- Block path name of a block from a different model, for example, `'vdp/Mu'`. Use this value to reuse an instance of a block from another model in your model.

Output Arguments

`replBlks` — Blocks returned by the `current` argument
cell array of character vectors

Blocks returned by the `current` argument, returned as a cell array of character vectors. The function returns the values regardless of whether you complete the replacement.

Introduced before R2006a

save_system

Save Simulink model

Syntax

```
filename = save_system
filename = save_system(sys)
filename = save_system(sys,newsys)
filename = save_system(sys,newsys,Name,Value)
```

Description

`filename = save_system` saves the current top-level model. If the model was not previously saved, `save_system` creates a file in the current folder.

To save a subsystem, instead use `Simulink.SubSystem.copyContentsToBlockDiagram` to copy the subsystem contents to a new model. You can then save that model using `save_system`. See `Simulink.SubSystem.copyContentsToBlockDiagram`.

If you set the model `UpdateHistory` property to `UpdateHistoryWhenSave`, no dialog box prompt appears when you use `save_system` to save the model. If you want to update the comment, use the `'ModifiedComment'` parameter with `set_param` before saving, for example:

```
set_param('mymodel','ModifiedComment','Here is my comment.')
```

`filename = save_system(sys)` saves the model `sys`. The model must be open or loaded.

`filename = save_system(sys,newsys)` saves the model to a new file `newsys`. If you do not specify an extension, then `save_system` uses the file format specified in your Simulink preferences.

`filename = save_system(sys,newsys,Name,Value)` saves the system with additional options specified by one or more `Name,Value` pair arguments. To use `Name,Value` pairs without saving to a new file, use `[]` for `newsys`.

Input Arguments

sys — Name of model to save

character vector | cell array of character vectors | string array | handle | array of handles

Name of model to save, specified as a character, cell array of character vectors, string array, handle, or array of handles. Do not use a file extension.

newsys — File to save to

character vector | cell array of character vectors | string array | [ ]

File to save to, specified as a character vector, cell array of character vectors, string array, or, to use Name,Value pairs without changing the file name, []. You can specify a model name in the current folder or the full path name, with or without an extension.

With no an extension, save_system saves to the file format specified in your Simulink preferences. Possible model extensions are .slx and .mdl. With the 'ExportToXML' option, use the extension .xml.

For information on rules for naming models, see “Model Names”.

Name-Value Pair Arguments

Specify optional comma-separated pairs of Name,Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1,Value1,...,NameN,ValueN.

Example:

```
save_system('mymodel','newmodel','SaveModelWorkspace',true,'BreakUse
rLinks',true,'OverwriteIfChangedOnDisk',true)
```

AllowPrompt — Allow dialog box prompts

false (default) | true | 'on' | 'off'

Option to allow dialog box prompts, specified as true, false, 'on', or 'off'. By default, warnings and error messages appear at the command line.

BreakAllLinks — Replace links to library blocks

false (default) | true | 'on' | 'off'

Option to, in the saved file, replace links to library blocks with copies of the library blocks, specified as `true`, `false`, `'on'`, or `'off'`. This option affects user-defined blocks and Simulink library blocks.

Caution The `'BreakAllLinks'` option can result in compatibility issues when upgrading to newer versions of Simulink. For example:

- Any masks on top of library links to Simulink S-functions do not upgrade to the new version of the S-function.
- Any library links to masked subsystems in a Simulink library do not upgrade to the new subsystem behavior.
- Any broken links prevent the library forwarding mechanism from upgrading the link.

If you saved a model with broken links to built-in libraries, use the Upgrade Advisor to scan the model for out-of-date blocks. Then upgrade the Simulink blocks to their current versions.

`BreakUserLinks` — Replace links to user-defined blocks

`false` (default) | `true` | `'on'` | `'off'`

Option to, in the saved file, replace links to user-defined library blocks with copies of the library blocks, specified as `true`, `false`, `'on'`, or `'off'`.

`BreakToolboxLinks` — Replace links to built-in library block

`false` (default) | `true` | `'on'` | `'off'`

Option to, in the saved file, replace links to built-in library blocks with copies of the library blocks, specified as `true`, `false`, `'on'`, or `'off'`. This option affects Simulink library blocks and blocks from libraries supplied with MathWorks toolboxes or blocksets.

`ErrorIfShadowed` — Return an error if name exists

`false` (default) | `true` | `'on'` | `'off'`

Option to return an error if the new name exists on the MATLAB path or workspace, specified as `true`, `false`, `'on'`, or `'off'`.

`ExportToXML` — Export model to XML format

`false` (default) | `true` | `'on'` | `'off'`

Option to export the model to a file in a simple XML format, specified as `true`, `false`, `'on'`, or `'off'`. Specify the full name of the file, including the `.xml` extension. The block diagram in memory does not change and no callbacks execute. Use this option without any other Name,Value pair arguments. This option warns and will be removed in a future release.

Example: save_system('mymodel','exportfile.xml','ExportToXML',true)

ExportToVersion — MATLAB release name to export to

character vector | string scalar

MATLAB release name to export to, specified in either of these forms (not case sensitive). You can export to seven years of previous releases.

- Release name, for example, 'R2012A', 'R2016B'
- Release name, followed by an underscore and then the extension, for example, 'R2016A_SLX', 'R2014A_MDL'. For releases before R2012a, you can specify only to .mdl files. If you do not specify an extension, you export to the file format specified in your Simulink preferences.

save_system exports the system such that the specified Simulink version can load it. If the system contains functionality not supported by the specified Simulink version, the command removes the functionality in the exported file. It also replaces unsupported blocks with empty masked subsystem blocks colored yellow. As a result, the exported system might generate different results.

Alternatively, use Simulink.exportToVersion or, interactively, the Export to Previous Version dialog box.

OverwriteIfChangedOnDisk — Overwrite file

false (default) | true | 'on' | 'off'

Option to overwrite the file on disk even if it has been modified since the system was loaded, specified as true, false, 'on', or 'off'. By default, if the file changed on disk since the model was loaded, save_system displays an error to prevent the changes on disk from being overwritten.

You can control whether save_system displays an error if the file has changed on disk using a Simulink preference. In the **Model File** pane of the Simulink Preferences dialog box, under **Change Notification**, select **Saving the model**. This preference is on by default.

SaveDirtyReferencedModels — Save referenced models with unsaved changes

false (default) | true | 'on' | 'off'

Option to save referenced models that contain unsaved changes while also saving the model, specified as `true`, `false`, `'on'`, or `'off'`. By default, attempting to save a model that contains unsaved referenced models return an error.

`SaveModelWorkspace` — Save model workspace
`false` (default) | `true` | `'on'` | `'off'`

Option to save the contents of the model workspace, specified as `true`, `false`, `'on'`, or `'off'`. The model workspace `DataSource` must be a MAT-file. If the data source is not a MAT-file, `save_system` does not save the workspace. See “Specify Source for Data in Model Workspace”.

Output Arguments

`filename` — Name of saved file
character vector | cell array of character vectors

Full name of saved file, returned as a character vector or a cell array of character vectors.

Examples

Save Named Model

Create a model.

```
new_system('newmodel')
```

Save the model.

```
save_system('newmodel')
```

Save Model with Another Name

Open the model `vdp`. Save it to a model named `myvdp` in the current folder. Without a file extension, the function saves the model using the format specified in your Simulink preferences.

```
open_system('vdp')
save_system('vdp','myvdp')
```

After you save the model by another name, the model is no longer open under its original name. Open vdp again and save it as an .mdl file in the current folder.

```
open_system('vdp')
save_system('vdp','mynewvdp.mdl')
```

Return Error If Name Exists

Save a model with a new name and return an error if something with this name exists on the MATLAB path. In this case, save_system displays an error because max is the name of a MATLAB function. The model is not saved.

```
open_system('vdp')
save_system('vdp','max','ErrorIfShadowed',true)
```

```
Error using save_system (line 38)
The model 'vdp' cannot be saved with the new name 'max', because this name is
shadowing another name on the MATLAB path or in the workspace.  Choose another
name, or do not use the option 'ErrorIfShadowed'
```

Save Model with Options

Suppose that you have a model named mymodel. Open the model and save it to a model named newmodel. Also save the model workspace, break links to user-defined library blocks, and overwrite if the file has changed on disk,

```
open_system('mymodel')
save_system('mymodel','mynewmodel','SaveModelWorkspace',
true,'BreakUserLinks',true,'OverwriteIfChangedOnDisk',true)
```

Save Model to Same Name and Use Options

Save the model mymodel, breaking links to user-defined library blocks in the model.

```
save_system('mymodel',[],'BreakUserLinks',true)
```

Topics

“Save a Model”

Introduced before R2006a

set_param

Set system and block parameter values

Syntax

```
set_param(Object,ParameterName,Value,...ParameterNameN,ValueN)
```

Description

`set_param(Object,ParameterName,Value,...ParameterNameN,ValueN)` sets the parameter to the specified value on the specified model or block object.

When you set multiple parameters on the same model or block, use a single `set_param` command with multiple pairs of `ParameterName`, `Value` arguments, rather than multiple `set_param` commands. This technique is efficient because using a single call requires evaluating parameters only once. If any parameter names or values are invalid, then the function doesn't set any parameters.

Tips:

- If you make multiple calls to `set_param` for the same block, then specifying the block using a numeric handle is more efficient than using the full block path. Use `getSimulinkBlockHandle` to get a block handle.
- If you use `matlab -nodisplay` to start a session, you cannot use `set_param` to run your simulation. The `-nodisplay` mode does not support simulation using `set_param`. Use the `sim` command instead.
- After you set parameters in the MATLAB workspace, to see the changes in a model, update the diagram.

  ```
  set_param(model,'SimulationCommand','Update')
  ```

For parameter names, see:

- "Model Parameters" on page 6-2
- "Block-Specific Parameters" on page 6-128

- “Common Block Properties” on page 6-109

Examples

Set Model Configuration Parameters for a Model

Open vdp and set the Solver and StopTime parameters.

```
vdp
set_param('vdp','Solver','ode15s','StopTime','3000')
```

Set Model Configuration Parameters for Current Model

Open a model and set the Solver and StopTime parameters. Use bdroot to get the current top-level model.

```
vdp
set_param(bdroot,'Solver','ode15s','StopTime','3000')
```

Set a Gain Block Parameter Value

Open vdp and set a Gain parameter value in the Mu block.

```
vdp
set_param('vdp/Mu','Gain','10')
```

Set Position of Block

Open vdp and set the position of the Fcn block.

```
vdp
set_param('vdp/Fcn','Position',[50 100 110 120])
```

Set Position of Block Using a Handle

Set the position of the `Fcn` block in the `vdp` model.

Use `getSimulinkBlockHandle` to load the `vdp` model if necessary (by specifying `true`), and get a handle to the `Fcn` block. If you make multiple calls to `set_param` for the same block, then using the block handle is more efficient than specifying the full block path as a character vector.

```
fcnblockhandle = getSimulinkBlockHandle('vdp/Fcn',true);
```

You can use the block handle in subsequent calls to `get_param` or `set_param`. If you examine the handle, you can see that it contains a double. Do not try to use the number of a handle alone (e.g., `5.007`) because you usually need to specify many more digits than MATLAB displays. Instead, assign the handle to a variable and use that variable name to specify a block.

Use the block handle with `set_param` to set the position.

```
set_param(fcnblockhandle,'Position',[50 100 110 120])
```

Input Arguments

`Object` — Name or handle of a model or block

character vector | handle

Handle or name of a model or block, specified as a numeric handle or a character vector. A numeric handle must be a scalar. You can also set parameters of lines and ports, but you must use numeric handles to specify them.

Tip If you make multiple calls to `set_param` for the same block, then specifying a block using a numeric handle is more efficient than using the full block path with `set_param`. Use `getSimulinkBlockHandle` to get a block handle. Do not try to use the number of a handle alone (e.g., `5.007`) because you usually need to specify many more digits than MATLAB displays. Assign the handle to a variable and use that variable name to specify a block.

Example: `'vdp/Fcn'`

`ParameterName` — Model or block parameter name

character vector

Model or block parameter name, specified as the comma-separated pair consisting of the parameter name, specified as a character vector, and the value, specified in the format determined by the parameter type. Parameter names and values are case sensitive. Values are often character vectors, but they can also be numeric, arrays, and other types. Many block parameter values are specified as character vectors, but two exceptions are these parameters: `Position`, specified as a vector, and `UserData`, which can be any data type.

Example: `'Solver','ode15s','StopTime','3000'`

Example: `'SimulationCommand', 'start'`

Example: `'Position',[50 100 110 120]`

Data Types: `char`

Introduced before R2006a

setActiveConfigSet

Specify model's active configuration set or configuration reference

Syntax

```
setActiveConfigSet(model, configObjName)
```

Arguments

`model`

The name of an open model, or `gcs` to specify the current model

`configObjName`

The name of a configuration set (`Simulink.ConfigSet`) or configuration reference (`Simulink.ConfigSetRef`)

Description

`setActiveConfigSet` specifies the active configuration set or configuration reference (configuration object) of `model` to be the configuration object specified by `configObjName`. If no such configuration object is attached to the model, an error occurs. The previously active configuration object becomes inactive.

Examples

The following example makes `DevConfig` the active configuration object of the current model. The code is the same whether `DevConfig` is a configuration set or configuration reference.

```
setActiveConfigSet(gcs, 'DevConfig');
```

Introduced before R2006a

sfix

Create `Simulink.NumericType` object describing signed fixed-point data type

Syntax

```
a = sfix(WordLength)
```

Description

`sfix(`*`WordLength`*`)` returns a `Simulink.NumericType` object that describes a signed fixed-point number with the specified word length and unspecified scaling.

Note `sfix` is a legacy function. In new code, use `fixdt` instead. In existing code, replace `sfix(WordLength)` with `fixdt(1,WordLength)`.

Examples

Define a 16-bit signed fixed-point data type.

```
a = sfix(16)
```

```
a =

  NumericType with properties:

    DataTypeMode: 'Fixed-point: unspecified scaling'
      Signedness: 'Signed'
      WordLength: 16
         IsAlias: 0
       DataScope: 'Auto'
      HeaderFile: ''
     Description: ''
```

See Also

`Simulink.NumericType` | `fixdt` | `float` | `sfrac` | `sint` | `ufix` | `ufrac` | `uint`

Introduced before R2006a

sfrac

Create `Simulink.NumericType` object describing signed fractional data type

Syntax

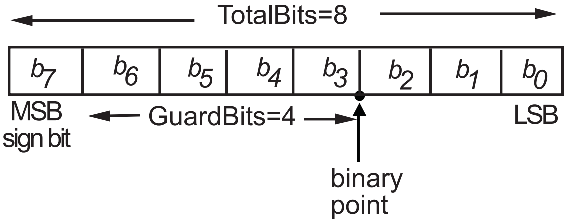
```
a = sfrac(WordLength)
a = sfrac(WordLength, GuardBits)
```

Description

`sfrac(`*`WordLength`*`)` returns a `Simulink.NumericType` object that describes the data type of a signed fractional data type with a word size given by *`WordLength`*.

`sfrac(`*`WordLength`*`, `*`GuardBits`*`)` returns a `Simulink.NumericType` object that describes the data type of a signed fractional number. The total word size is given by *`WordLength`* with *`GuardBits`* bits located to the left of the binary point.

The most significant (leftmost) bit is the sign bit. The default binary point for this data type is assumed to lie immediately to the right of the sign bit. If guard bits are specified, they lie to the left of the binary point and to right of the sign bit. For example, the structure for an 8-bit signed fractional data type with 4 guard bits is:



Note `sfrac` is a legacy function. In new code, use `fixdt` instead. In existing code, replace `sfrac(WordLength,GuardBits)` with `fixdt(1,WordLength,(WordLength-1-GuardBits))` and `sfrac(WordLength)` with `fixdt(1,WordLength,(WordLength-1))`.

Examples

Define an 8-bit signed fractional data type with 4 guard bits. Note that the range of this data type is $-2^4 = -16$ to $(1 - 2^{(1 - 8)}).2^4 = 15.875$.

```
a = sfrac(8,4)

a =

  NumericType with properties:

signalbuilder

Create and access Signal Builder blocks

Syntax

```
[time, data] = signalbuilder(block)
[time, data, signames] = signalbuilder(block)
[time, data, signames, groupnames] = signalbuilder(block)
block = signalbuilder([], 'create', time, data, signames,
groupnames)
block = signalbuilder(path, 'create', time, data, signames,
groupnames)
block = signalbuilder(path,'create', time, data, signames,
groupnames, vis)
block = signalbuilder(path,'create', time, data, signames,
groupnames, vis, pos)
block = signalbuilder(path,'create', time, data, signames,
groupnames, vis, pos,{openui openmodel})
block = signalbuilder(block, 'append', time, data, signames,
groupnames)
block = signalbuilder(block, 'appendgroup', time, data, signames,
groupnames)
signalbuilder(block,'append',ds)
signalbuilder(block,'appendgroup',ds)
signalbuilder(block,'append',[ds ds2])
signalbuilder(block,'appendgroup',[ds ds2])
signalbuilder(block,'appendsignal', time, data, signames)
signalbuilder(block, 'showsignal', signal, group)
signalbuilder(block, 'hidesignal', signal, group)
[time, data] = signalbuilder(block, 'get', signal, group)
ds=signalbuilder(block,'get',group)
[ds1 ds2] =signalbuilder(block,'get',group)
signalbuilder(block, 'set', signal, group, time, data)
signalbuilder(block,'set',groupid,ds)
signalbuilder(block,'set',groupid,[ds1 ds2])
index = signalbuilder(block, 'activegroup')
```

```
[index, activeGroupLabel]= signalbuilder(block, 'activegroup')
signalbuilder(block, 'activegroup', index)
signalbuilder(block, 'annotategroup', onoff)
signalbuilder(block, 'print', [])
signalbuilder(block, 'print', config, printArgs)
figh = signalbuilder(block, 'print', config, 'figure')
```

Description

Use the `signalbuilder` command to interact programmatically with Signal Builder blocks.

- "Creating and Accessing Signal Builder Blocks" on page 2-453
- "Adding New Groups" on page 2-455
- "Working with Signals" on page 2-456
- "Using Get/Set Methods for Specific Signals and Groups" on page 2-457
- "Querying, Labelling, and Setting the Active Group" on page 2-458
- "Enabling Current Group Display" on page 2-458
- "Printing Signal Groups" on page 2-458
- "Interpolating Missing Data Values" on page 2-459

Note When you use the `signalbuilder` command to interact with a Signal Builder block, the **Undo last edit** and **Redo last edit** buttons on the block dialog box are grayed out. You cannot undo the results of using the `signalbuilder` command.

Creating and Accessing Signal Builder Blocks

`[time, data] = signalbuilder(`*`block`*`)` returns the time (*x*-coordinate) and amplitude (*y*-coordinate) data of the Signal Builder block, *`block`*.

The output arguments, `time` and `data`, take different formats depending on the block configuration:

Configuration	Time/Data Format
1 signal, 1 group	Row vector of break points.
>1 signal, 1 group	Column cell vector where each element corresponds to a separate signal and contains a row vector of points.
1 signal, >1 group	Row cell vector where each element corresponds to a separate group and contains a row vector of points.
>1 signal, >1 group	Cell matrix where each element (i, j) corresponds to signal i and group j.

`[time, data, signames] = signalbuilder(`*`block`*`)` returns the signal names, `signames`, in a character vector or a cell array of character vectors.

`[time, data, signames, groupnames] = signalbuilder(`*`block`*`)` returns the group names, `groupnames`, in a character vector or a cell array of character vectors.

`block = signalbuilder([], 'create',` *`time`*`,` *`data`*`,` *`signames`*`,` *`groupnames`*`)` creates a Signal Builder block in a new Simulink model using the specified values. The preceding table describes the allowable formats of *`time`* and *`data`*. If *`data`* is a cell array and *`time`* is a vector, the *`time`* values are duplicated for each element of *`data`*. Each vector in *`time`* and *`data`* must be the same length and have at least two elements. If *`time`* is a cell array, all elements in a column must have the same initial and final value. Signal names, *`signames`*, and group names, *`groupnames`*, can be omitted to use default values. The function returns the path to the new block, `block`. Always provide `time` and `data` when using the `create` command. These two parameters are always required.

`block = signalbuilder(`*`path`*`, 'create',` *`time`*`,` *`data`*`,` *`signames`*`,` *`groupnames`*`)` creates a new Signal Builder block at *`path`* using the specified values. If *`path`* is empty, the function creates a block in a new model, which has a default name. If *`data`* is a cell array and *`time`* is a vector, the *`time`* values are duplicated for each element of *`data`*. Each vector within *`time`* and *`data`* must be the same length and have at least two elements. If *`time`* is a cell array, all elements in a column must have the same initial and final value. Signal names, *`signames`*, and group names, *`groupnames`*, can be omitted to use default values. The function returns the path to the new block, *`block`*. Always provide `time` and `data` when using the `create` command. These two parameters are always required.

block = signalbuilder(*path*,'create', *time*, *data*, *signames*, *groupnames*, *vis*) creates a new Signal Builder block and sets the visible signals in each group based on the values of the matrix vis. This matrix must be the same size as the cell array, *data*. Always provide time and data when using the create command. These two parameters are always required. You cannot create Signal Builder blocks in which all signals are invisible. For example, if you set the *vis* parameter for all signals to 0, the first signal is still visible.

block = signalbuilder(*path*,'create', *time*, *data*, *signames*, *groupnames*, *vis*, *pos*) creates a new Signal Builder block and sets the block position to *pos*. Always provide time and data when using the create command. These two parameters are always required. You cannot create Signal Builder blocks in which all signals are invisible. For example, if you set the *vis* parameter for all signals to 0, the first signal is still visible.

If you create signals that are smaller than the display range or do not start from 0, the Signal Builder block extrapolates the undefined signal data. It does so by holding the final value.

block = signalbuilder(*path*,'create', *time*, *data*, *signames*, *groupnames*, *vis*, *pos*,{*openui openmodel*}) creates a new Signal Builder block and opens or invisibly loads the model and Signal Builder block window.

- Set *openui* to 1 to open the Signal Builder block window when you create the Signal Builder block. Set *openui* to 0 keep this window closed upon block creation.
- Set *openmodel* to 1 to open the model when you create the Signal Builder block. Set *openmodel* to 0 to invisibly load the model upon block creation.

Adding New Groups

block = signalbuilder(*block*, 'append', *time*, *data*, *signames*, *groupnames*) or block = signalbuilder(*block*, 'appendgroup', *time*, *data*, *signames*, *groupnames*) appends new groups to the Signal Builder block, *block*. The *time* and *data* arguments must have the same number of signals as the existing block.

signalbuilder(block,'append',ds) or signalbuilder(block,'appendgroup',ds) appends one data set.

signalbuilder(block,'append',[ds ds2]) or signalbuilder(block,'appendgroup',[ds ds2]) appends *N* data sets.

Data sets must have the same number of elements as the signals in a signal group. Data set format limitations for the `set`, `append`, and `appendgroup` functions include:

- Elements must be MATLAB timeseries data.
- Timeseries data and/or time must not be empty.
- Timeseries data must be of type double.
- Timeseries data must be 1-D (scalar value at each time).

Note

- If you specify a value of `' '` or `{}` for *`signames`*, the function uses existing signal names for the new groups.
- If you do not specify a value for *`groupnames`*, the function creates the new signal groups with the default group name pattern, `GROUP` *`#n`*.

Working with Signals

`signalbuilder(`*`block`*`,'appendsignal',` *`time`*`,` *`data`*`,` *`signames`*`)` appends new signals to all signal groups in the Signal Builder block, *`block`*. You can append either the same signals to all groups, or append different signals to different groups. Regardless of which signals you append, append the same number of signals to all the groups. Append signals to all the groups in the block; you cannot append signals to a subset of the groups. Correspondingly, provide *`time`* and *`data`* arguments for either one group (append the same information to all groups) or different *`time`* and *`data`* arguments for different groups. To use default signal names, omit the signal names argument, *`signames`*.

`signalbuilder(`*`block`*`, 'showsignal',` *`signal`*`,` *`group`*`)` makes *`signals`* that are hidden from the Signal Builder block visible. By default, signals in the current active group are visible when created. You control the visibility of a signal at creation with the *`vis`* parameter. *`signal`* can be a unique signal name, a signal scalar index, or an array of signal indices. `group` is the list of one or more signal groups that contains the affected signals. *`group`* can be a unique group name, a scalar index, or an array of indices.

`signalbuilder(`*`block`*`, 'hidesignal',` *`signal`*`,` *`group`*`)` makes signals, *`signal`*, hidden from the Signal Builder block. By default, all signals are visible when created. *`signal`* can be a unique signal name, a signal scalar index, or an array of signal indices. `group` is the list of one or more signal groups that contains the affected signals. *`group`* can be a unique group name, a scalar index, or an array of indices.

Note For the `showsignal` and `hidesignal` methods, if you do not specify a value for the `group` argument, `signalbuilder` applies the operation to all the signals and groups.

Using Get/Set Methods for Specific Signals and Groups

`[time, data] = signalbuilder(`*`block`*`, 'get', `*`signal`*`, `*`group`*`)` gets the time and data values for the specified signal(s) and group(s). The signal argument can be the name of a signal, a scalar index of a signal, or an array of signal indices. The group argument can be a group name, a scalar index, or an array of indices.

`ds=signalbuilder(block,'get',`*`group`*`)` gets one data set for one requested signal Builder group.

`[ds1 ds2] =signalbuilder(block,'get',`*`group`*`)` gets *N* data sets for *N* requested Signal Builder groups.

`signalbuilder(`*`block`*`, 'set', `*`signal`*`, `*`group`*`, `*`time`*`, `*`data`*`)` sets the time and data values for the specified signal(s) and group(s). Use empty values of *`time`* and *`data`* to remove groups and signals. To remove a signal group, you must also remove all the signals in that group in the same command.

`signalbuilder(block,'set',groupid,ds)` sets one data set for the requested Signal Builder group. Specifying an empty data set deletes the groups specified in *groupid*.

`signalbuilder(block,'set',groupid,[ds1 ds2])` sets *N* data sets for *N* requested groups.

Data sets must have the same number of elements as the signals in a signal group. Data set format limitations for the `set`, `append`, and `appendgroup` functions include:

- Elements must be MATLAB timeseries data.
- Timeseries data and/or time must not be empty.
- Timeseries data must be of type double.
- Timeseries data must be 1-D (scalar value at each time).

Note For the `set` method, if you do not specify a value for the `group` argument, `signalbuilder` applies the operation to all signals and groups.

When removing signals, you remove all signals from all groups. You cannot select a subset of groups from which to remove signals, unless you are also going to also remove that group.

Note The `signalbuilder` function does not allow you to alter and delete data in the same invocation. It also does not allow you to delete all the signals and groups from the application.

If you set signals that are smaller than the display range or do not start from 0, the Signal Builder block extrapolates the undefined signal data by holding the final value.

Querying, Labelling, and Setting the Active Group

`index = signalbuilder(`*`block`*`, 'activegroup')` gets the index of the active group.

`[index, activeGroupLabel]= signalbuilder(`*`block`*`, 'activegroup')` gets the label value of the active group.

`signalbuilder(`*`block`*`, 'activegroup', `*`index`*`)` sets the active group index to *`index`*.

Enabling Current Group Display

`signalbuilder(`*`block`*`, 'annotategroup', `*`onoff`*`)` controls the display of the current group name on the mask of the Signal Builder block.

***onoff* Value**	**Description**
`'on'`	Default. Displays the current group name on the block mask.
`'off'`	Does not display the current group name on the block mask.

Printing Signal Groups

`signalbuilder(`*`block`*`, 'print', [])` prints the currently active signal group.

`signalbuilder(`*`block`*`, 'print', `*`config`*`, `*`printArgs`*`)` prints the currently active signal group or the signal group that *`config`* specifies. The argument *`config`* is a structure that allows you to customize the printed appearance of a signal group. The *config* structure may contain any of the following fields:

Field	Description	Example Value
groupIndex	Scalar specifying index of signal group to print	2
timeRange	Two-element vector specifying the time range to print (must not exceed the block's time range)	[3 6]
visibleSignals	Vector specifying index of signals to print	[1 2]
yLimits	Cell array specifying limits for each signal's *y*-axis	{[-1 1], [0 1]}
extent	Two-element vector of the form: [width, height] specifying the dimensions (in pixels) of the area in which to print the signals	[500 300]
showTitle	Logical value specifying whether to print a title; true (1) prints the title	false

Set up the structure with one or more of these fields before you print. For example, if you want to print just group 2 using a configuration structure, configstruct, set up the structure as follows. You do not need to specify any other fields.

```
configstruct.groupIndex=2
```

The optional argument *printArgs* allows you to configure print options (see print in the MATLAB Function Reference).

fighs = signalbuilder(*block*, 'print', *config*, 'figure') prints the currently active signal group or the signal group that *config* specifies to a new hidden figure handle, figh.

Interpolating Missing Data Values

When specifying a periodic signal such as a Sine Wave, the signalbuilder function uses linear Lagrangian interpolation to compute data values for time steps that occur between time steps for which the signalbuilder function supplies data. When specifying periodic signals, specify them as a time vector that is defined as multiples of sample time, for example:

```
t = 0.2*[0:49]';
```

Examples

Example 1

Create a Signal Builder block in a new model editor window:

```
block = signalbuilder([], 'create', [0 5], {[2 2];[0 2]});
```

Get signal builder data from this block.

```
[time, data, signames, groupnames] = signalbuilder('untitled/Signal Builder')
```

```
time =

    [1x2 double]
    [1x2 double]

data =

    [1x2 double]
    [1x2 double]

signames =

    'Signal 1'    'Signal 2'

groupnames =

    'Group 1'
```

The Signal Builder block contains two signals in one group. Alter the second signal in the group:

```
signalbuilder(block, 'set', 2, 1, [0 5], [2 0])
```

To make this same change using the signal name and group name:

```
signalbuilder(block, 'set', 'Signal 2', 'Group 1', [0 5], [2 0])
```

Delete the first signal from the group:

```
signalbuilder(block, 'set', 1, 1, [], [])
```

Append the group with a new signal:

```
signalbuilder(block, 'append', [0 2.5 5], [0 2 0], 'Signal 2', 'Group 2');
```

Append another group with a new signal using `appendgroup`:

```
signalbuilder(block, 'appendgroup', [0 2.5 5], [0 2 0], 'Signal 2', 'Group 3');
```

Example 2

Create a Signal Builder block in a new model editor window:

```
block = signalbuilder([], 'create', [0 2], {[0 1],[1 0]});
```

The Signal Builder block has two groups, each of which contains a signal. To delete the second group, also delete its signal:

```
signalbuilder(block, 'set', 1, 2, [], [])
```

Example 3

Create a Signal Builder block in a new model editor window:

```
block = signalbuilder([], 'create', [0 1], ...
         {[0 0],[1 1];[1 0],[0 1];[1 1],[0 0]});
```

The Signal Builder block has two groups, each of which contains three signals.

Example 4

Create a Signal Builder block in a new model editor window:

```
block = signalbuilder([],'create',{[0 10],[0 20]},{[6 -6],...
[2 5]});
```

The Signal Builder block has two groups. Each group contains one signal.

Append a new signal group to the existing block.

```
block = signalbuilder(block,'append',[0 30],[10 -10]);
```

Append a new signal, `sig3`, to all groups.

```
signalbuilder(block,'appendsignal',[0 30],[0 10],'sig3');
```

Example 5

Create a Signal Builder block in a new model editor window:

```
time = [0 1];
data = {[0 0],[1 1];[1 0],[0 1];[1 1],[0 0]};
block = signalbuilder([], 'create', time, data);
```

The Signal Builder block has two groups. Each group contains three signals.

Delete the second group. To delete a signal group, also delete all the signals in the group.

```
signalbuilder(block, 'set',[1,2,3],'Group 2',[]);
```

Example 6

Create a Signal Builder block in a new model editor window:

```
block = signalbuilder([], 'create', [0 5], {[2 2];[0 2]});
```

The Signal Builder block has one group that contains two signals.

Hide the signal, `Signal 1`.

```
signalbuilder(block,'hidesignal','Signal 1', 'Group 1')
```

`Signal 1` is no longer visible in the Signal Builder block.

Make `Signal 1` visible again.

```
signalbuilder(block,'showsignal','Signal 1', 'Group 1')
```

Example 7

Create a Signal Builder block in a new model editor window:

```
block = signalbuilder([], 'create', [0 5], {[2 2] [0 2]});
```

The Signal Builder block has two groups, each with one signal.

Create a structure, `configstruct`, to customize the Signal Builder block that you want to print.

```
configstruct.groupIndex = 2;
configstruct.timeRange = [0 2];
configstruct.visibleSignals = 1;
configstruct.yLimits = {[0 1]};
configstruct.extent = [500 300];
configstruct.showTitle = true;
```

This sequence fills all the fields of the `configstruct` structure.

Print a view of the Signal Builder block to the default printer. The `configstruct` structure defines the view to print.

```
signalbuilder(block,'print',configstruct)
```

Print with print options, for example `-dps`.

```
signalbuilder(block,'print',configstruct,'-dps')
```

Print a view of the Signal Builder block as defined by the `configstruct` structure to a new hidden figure handle, `figH`.

```
figH = signalbuilder(block,'print',configstruct,'figure')
figure(figH)
```

Example 8

Create two Signal Builder blocks in new model editor windows:

```
block = signalbuilder([], 'create', [0 5], {[2 2];[0 2]});
block1 = signalbuilder('untitled/Signal Builder1', 'create', [1 2], {[1 2];[0 10]});
```

Get a data set for group 1 of *`block`*.

```
ds=signalbuilder(block,'get',1);
```

Get a data set for group 1 of *`block1`*.

```
ds1=signalbuilder(block1,'get',1);
```

Set the data set for group 1 of *`block`* to *`ds1`*.

```
signalbuilder(block,'set',1,ds1);
```

Append the original data set for group 1 of *block* (*ds*) to *block*.

```
signalbuilder(block,'append',ds);
```

To create a third group in *block*, append *ds1* to the end of the groups in *block*.

```
signalbuilder(block,'appendgroup',ds1);
```

“Signal Groups”

Introduced in R2007a

signalEditor

Start Signal Editor

Syntax

```
signalEditor
signalEditor(Name,Value)
```

Description

`signalEditor` starts Signal Editor without an associated model.

`signalEditor(Name,Value)` starts signal Editor using additional options specified by one or more name-value pair arguments.

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (`' '`). You can specify the name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

- Model - Model name, specified as a character array, for which Signal Editor is to start. You can specify one model per call to the `signalEditor` function.

  Note Load the model before starting Signal Editor for it.

- DataSource - Data set name, specified as a character array, to be edited. You can specify one data set file per call to the `signalEditor` function.

  Note You can start multiple sessions of Signal Editor for the same model. However, you can associate a data set file with only one Signal Editor at a time. A data set file cannot have multiple Signal Editor sessions associated with it.

Examples

Start Signal Editor for a Model

Start the Signal Editor for the model, slexAutotransRootInportsExample.

Load the slexAutotransRootInportsExample model, then start Signal Editor for it.

```
open_system('slexAutotransRootInportsExample')
signalEditor('Model', 'slexAutotransRootInportsExample');
```

Start Signal Editor to Edit a Data Set File

Start Signal Editor to edit `myFile.mat`.

```
signalEditor('DataSource','myFile.mat');
```

Start Signal Editor and Data Set File for a Model

Load the slexAutotransRootInportsExample model, then start Signal Editor for the model, and edit `myFile.mat`.

```
open_system('slexAutotransRootInportsExample')
signalEditor('Model','slexAutotransRootInportsExample','DataSource','myFile.mat');
```

"Create and Edit Signal Data"

Introduced in R2017b

sim

Simulate dynamic system

Syntax

```
simOut = sim(model,Name,Value)
simOut = sim(model,ParameterStruct)
simOut = sim(model,ConfigSet)
simOut = sim(model)
simOut = sim(model,'ReturnWorkspaceOutputs','on')
simOut = sim(simIn)
simOut = sim(simIn,'ShowProgress',true)
```

Description

`simOut = sim(model,Name,Value)` simulates the specified model using parameter name-value pairs.

`simOut = sim(model,ParameterStruct)` simulates the specified model using the parameter values specified in the structure `ParameterStruct`.

`simOut = sim(model,ConfigSet)` simulates the specified model using the configuration settings specified in the model configuration set `ConfigSet`.

`simOut = sim(model)` simulates the specified model using existing model configuration parameters, and returns the result as either a `Simulink.SimulationOutput` object (single-output format) or as a time vector compatible with Simulink version R2009a or earlier.

To return simulation results using the single-output format (simulation object), select **Single simulation output** on the Data Import/Export pane of the Configuration Parameters dialog box. This selection overrides the `Dataset` format used for signal logging.

To return simulation results using the backward-compatible format (time vector), see "Backward-Compatible Syntax" on page 2-475.

`simOut = sim(model,'ReturnWorkspaceOutputs','on')` simulates the specified model using existing model configuration parameters, and returns the result as a `Simulink.SimulationOutput` object (single-output format).

`simOut = sim(simIn)` simulates a model using the inputs specified in the SimulationInput object, `simIn` . The sim command is also used with an array of SimulationInput objects to run multiple simulations in a series.

`simOut = sim(simIn,'ShowProgress',true)` simulates a model in a series using an array of SimulationInput objects and shows the progress of these simulations at the command line.

Examples

Simulate Model with `sim` Command-Line Options

Simulate the model, `vdp`, in Rapid Accelerator mode for an absolute tolerance of `1e-5` and save the states in `xoutNew` and the output in `youtNew`.

Specify parameters as name-value pairs to the `sim` command:

```
rtp = Simulink.BlockDiagram.buildRapidAcceleratorTarget('vdp');
```

```
### Building the rapid accelerator target for model: vdp
### Successfully built the rapid accelerator target for model: vdp
```

```
simOut = sim('vdp','SimulationMode','rapid','AbsTol','1e-5',...
            'StopTime', '30', ...
            'ZeroCross','on', ...
            'SaveTime','on','TimeSaveName','tout', ...
            'SaveState','on','StateSaveName','xoutNew',...
            'SaveOutput','on','OutputSaveName','youtNew',...
            'SignalLogging','on','SignalLoggingName','logsout')
```

```
simOut = 
  Simulink.SimulationOutput:

                 tout: [86x1 double] 
              xoutNew: [86x2 double] 
              youtNew: [86x2 double] 

   SimulationMetadata: [1x1 Simulink.SimulationMetadata]
```

```
           ErrorMessage: [0x0 char]
```

Simulate Model with sim Command-Line Options in Structure

Simulate the model, vdp, in Rapid Accelerator mode for an absolute tolerance of 1e-5 and save the states in xoutNew and the output in youtNew.

Specify parameters using a name-value pairs structure paramNameValStruct for the sim command:

```
paramNameValStruct.SimulationMode = 'rapid';
paramNameValStruct.AbsTol         = '1e-5';
paramNameValStruct.SaveState      = 'on';
paramNameValStruct.StateSaveName  = 'xoutNew';
paramNameValStruct.SaveOutput     = 'on';
paramNameValStruct.OutputSaveName = 'youtNew';
simOut = sim('vdp',paramNameValStruct)
```

```
### Building the rapid accelerator target for model: vdp
### Successfully built the rapid accelerator target for model: vdp

simOut =
  Simulink.SimulationOutput:

                xoutNew: [65x2 double]
                youtNew: [65x2 double]

     SimulationMetadata: [1x1 Simulink.SimulationMetadata]
           ErrorMessage: [0x0 char]
```

Simulate Model with sim Command-Line Options in Configuration Set

Simulate the model, vdp, in Rapid Accelerator mode for an absolute tolerance of 1e-5 and save the states in xoutNew and the output in youtNew.

Specify parameters as name-value pairs in configuration set mdl_cs for the sim command:

```
mdl = 'vdp';
load_system(mdl)
simMode = get_param(mdl, 'SimulationMode');
set_param(mdl, 'SimulationMode', 'rapid')
cs = getActiveConfigSet(mdl);
mdl_cs = cs.copy;
set_param(mdl_cs,'AbsTol','1e-5',...
         'SaveState','on','StateSaveName','xoutNew',...
         'SaveOutput','on','OutputSaveName','youtNew')
simOut = sim(mdl, mdl_cs);
```

```
### Building the rapid accelerator target for model: vdp
### Successfully built the rapid accelerator target for model: vdp
```

```
set_param(mdl, 'SimulationMode', simMode)
```

Simulate Model with Default Parameter Settings

Simulate the model `vdp` using default model configuration parameters.

```
simOut = sim('vdp','ReturnWorkspaceOutputs','on')
```

Input Arguments

`model` — Model to simulate
character vector

Name of model to simulate, specified as a character vector.

Example: `simOut = sim('vdp')`

`ParameterStruct` — Structure containing parameter settings
structure

Structure with fields that are the names of the configuration parameters for the simulation. The corresponding values are the parameter values.

Example: `simOut = sim('vdp',paramNameValStruct)`

`ConfigSet` — Configuration set
object

The set of configuration parameters for a model.

Example: `simOut = sim('vdp',mdl_cs)`

`simIn` — SimulationInput object for a model
object

SimulationInput object created by specifying the model name. For more information, see `Simulink.SimulationInput`.

Example: `simIn = Simulink.SimulationInput('CSTR')`

Use the SimulationInput object to specify Block Parameters, Model Parameters, Variables and External Inputs to a model to be simulated.

Example: `simIn.setBlockParameter('CSTR/Feed Temperature', 'Value', '300'); simIn.setModelParameter('StartTime', '1'); simIn.setVariable('FeedTemp0', 320)`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: `'Solver','ode15s','TimeOut',30` specifies that the model is simulated using the ode15s solver with a maximum simulation time of 30 seconds.

The `sim` command accepts all simulation parameters as name-value pair arguments. See “Model Parameters” on page 6-2 for a list of all simulation parameters.

In addition, the `sim` command accepts the following parameters.

`CaptureErrors` — Save errors to `SimulationMetadata` object
off (default) | on

By default, if an error occurs during simulation, the `sim` command stops and reports the error in the MATLAB Command Window. If you specify `'CaptureErrors','on'`, the `sim` command does not stop, but instead saves any errors to the `ErrorDiagnostic` structure within the `SimulationMetadata` object. The error message is saved in the `ErrorMessage` property of the `SimulationOutput` object.

This option is useful when running multiple simulations in a loop, so that one simulation error will not stop a script or function from continuing.

If you specify an array of input objects, the `sim` commands runs with `CaptureErrors` enabled. If an error occurs, the error messages are included in the `Simulink.SimulationMetadata` object for the simulation, as well as simulation data up to the point of the failure.

This option is not available for simulation in SIL and PIL modes.

Example: `'CaptureErrors','on'`

`ConcurrencyResolvingToFileSuffix` — Append suffix to model name

character vector

(Rapid Accelerator mode only) Appends this suffix character vector to the filename of a model (before the file extension) if:

- The model contains a To File block.
- You call the `sim` command from `parfor`.

Example: `'ConcurrencyResolvingToFileSuffix','model'`

Debug — Run simulation in debug mode

off (default) | on | cmds

Starts the simulation in debug mode (see “Debugger Graphical User Interface” for more information). The value of this option can be a cell array of commands to be sent to the debugger after it starts.

Example: `'Debug','on'`

`LoggingFileName` — Specify name of MAT-file to log data

out.mat (default) | character vector

Use when you enable the `LoggingToFile` name-value pair for logging to persistent storage. Specify the destination MAT-file for data logging.

Tip Do not use a file name from one locale in a different locale.

Example: `'LoggingFileName','out.mat'`

`LoggingToFile` — Log simulation data to MAT-file

off (default) | on

Store logged data that uses `Dataset` format to persistent storage (MAT-file).

Use this feature when logging large amounts of data that can cause memory issues. For details, see “Log Data to Persistent Storage”.

Tip To avoid running out of memory when accessing stored data, you can use a reference to access the object stored in the MAT-file. Use a `Simulink.SimulationData.DatasetRef` object to access stored data by reference. Using this object loads signal logging and states data into the model workspace incrementally (signal by signal). Accessing data for other kinds of logging loads all of the data at once.

Example: `'LoggingToFile','on'`

`RapidAcceleratorParameterSets` — Pass run-time parameters directly to Rapid Accelerator simulations

structure

(Rapid Accelerator mode only) Returns structure that contains run-time parameters for running Rapid Accelerator simulations in `parfor`.

Example: `'RapidAcceleratorParameterSets',parameterSet(idx)`

`RapidAcceleratorUpToDateCheck` — Perform up-to-date check before simulation

on (default) | off

(Rapid Accelerator mode only) Enables/disables up-to-date check. If you set this value to `'off'`, Simulink does not perform an up-to-date check. It skips the start/stop callbacks in blocks. If you call the `sim` command from `parfor`, set this value to `'off'`.

When you set this option to `'off'`, changes that you make to block parameter values in the model (for example, by using block dialog boxes, by using the `set_param` function, or by changing the values of MATLAB variables) do not affect the simulation. Instead, use `RapidAcceleratorParameterSets` to pass new parameter values directly to the simulation.

Example: `'RapidAcceleratorUpToDateCheck','off'`

`SrcWorkspace` — Workspace in which to evaluate MATLAB expressions

`base` (default) | `current` | `parent`

Specifies the workspace in which to evaluate MATLAB expressions defined in the model. Setting `SrcWorkspace` has no effect on a referenced model that executes in Accelerator mode. Setting `SrcWorkspace` to `current` within a `parfor` loop causes a transparency violation.

Example: `'SrcWorkspace','current'`

`TimeOut` — Maximum simulation run time

positive scalar

Specify the time, in seconds, to allow the simulation to run. If you run your model for a period longer than the value of `TimeOut`, the software issues a warning and stops the simulation. `TimeOut` refers to the time spent for a simulation.

Example: `'TimeOut',60`

`Trace` — Enables simulation tracing facilities

`minstep` | `siminfo` | `compile`

Enables simulation tracing facilities (specify one or more as a comma-separated list):

- `'minstep'` specifies that simulation stops when the solution changes so abruptly that the variable-step solvers cannot take a step and satisfy the error tolerances.
- `'siminfo'` provides a short summary of the simulation parameters in effect at the start of simulation.
- `'compile'` displays the compilation phases of a block diagram model.

By default, Simulink issues a warning message and continues the simulation.

Example: `'Trace','minstep','Trace','siminfo','Trace','compile'`

Output Arguments

`simOut` — Simulation object containing logged simulation results

object

`Simulink.SimulationOutput` object that contains all of the logged simulation results.

All simulation outputs (logged time, states, and signals) are returned in a single `Simulink.SimulationOutput` object. You define the model time, states, and output that is logged using the **Data Import/Export** pane of the **Model Configuration Parameters** dialog box. You can log signals using blocks such as the To Workspace and Scope blocks. The **Signal & Scope Manager** can directly log signals.

Note The output of the `sim` command always returns to `SimOut`, the single simulation output object. The simulation output object in turn, is returned to the workspace.

Definitions

Backward-Compatible Syntax

Starting with R2009b, the `sim` command was enhanced to provide greater compatibility with parallel computing. The improved single-output format saves all simulation results to a single object, simplifying the management of output variables.

For backward compatibility with R2009a or earlier releases, use the backward-compatible syntax:

```
[T,X,Y] = sim('model',Timespan, Options, UT)
[T,X,Y1,...,Yn] = sim('model',Timespan, Options, UT)
```

If you specify only the `model` argument, Simulink automatically saves the time, state, and output to the specified output arguments.

If you do not specify any output arguments, Simulink determines what data to log based on the settings for the **Configuration Parameters > Data Import/Export** pane. Simulink stores the simulation output either in the current workspace or in the variable *ans*, based on the setting for **Save simulation output as a single object** parameter.

Argument	Description
T	The time vector returned.
X	The state returned in matrix or structure format. The state matrix contains continuous states followed by discrete states.

Argument	Description
Y	The output returned in matrix or structure format. For block diagram models, this variable contains all root-level blocks.
Y1,...,*Yn*	The outports, which can only be specified for diagram models. Here, *n* must be the number of root-level blocks. Each outport will be returned in the *Y*1,...,*Yn* variables.
'*model*'	The name of the model to simulate.
Timespan	The timespan can be `TFinal`, `[TStart TFinal]`, or `[TStart OutputTimes TFinal]`. Output times are time points returned in *T*, but in general, *T* includes additional time points.
Options	Optional simulation parameters created in a structure by the `simset` command using name-value pairs.
UT	Optional external inputs. For supported expressions, see "Load Data to Root-Level Input Ports".

Simulink requires only the `model` argument. Simulink takes all defaults from the block diagram, including unspecified options. If you specify any optional arguments, your specified settings override the settings in the block diagram.

Specifying an input argument of `sim` as the empty matrix, `[ ]`, causes Simulink to use the default for that argument.

This command simulates the Van der Pol equations, using the `vdp` model. The command uses all default parameters.

```
[t,x,y] = sim('vdp')
```

This command simulates the Van der Pol equations, using the parameter values associated with the `vdp` model, but defines a value for the `Refine` parameter.

```
[t,x,y] = sim('vdp', [], simset('Refine',2));
```

This command simulates the Van der Pol equations for 1,000 seconds, saving the last 100 rows of the return variables. The simulation outputs values for `t` and `y` only, but saves the final state vector in a variable called `xFinal`.

```
[t,x,y] = sim('vdp', 1000, simset('MaxRows', 100,
            'OutputVariables', 'ty', 'FinalStateName', 'xFinal'));
```

Tips

- Parameters specified using the `sim` command override the values defined in the **Model Configuration Parameters** dialog box. The software restores the original configuration values at the end of simulation.

- In the case of a model with a model reference block, the parameter specifications are applied to the top model.
- When simulating a model with infinite stop time, to stop the simulation, you must press **Ctrl+C**. **Ctrl+C** breaks the simulation and the simulation results are not saved in the MATLAB workspace.
- To specify the time span for a simulation, you must specify the `StartTime` and `StopTime` parameters.
- To log the model time, states, or outputs, use the **Data Import/Export** pane of the Model Configuration Parameters dialog box.
- To log signals, either use a block such as the To Workspace block or the Scope block, or use the Signal and Scope Manager to log results directly.
- To get a list of simulation parameters for the model `vdp`, in the MATLAB Command Window, enter:

  ```
  configSet = getActiveConfigSet('vdp')
  configSetNames = get_param(configSet, 'ObjectParameters')
  ```

  This command lists several object parameters, including simulation parameters such as `'StopTime'`, `'SaveTime'`, `'SaveState'`, `'SaveOutput'`, and `'SignalLogging'`.

simplot

Redirects to the Simulation Data Inspector

Note `simplot` will be removed in a future release. Use the Simulation Data Inspector instead.

Syntax

```
simplot
```

Description

`simplot` redirects to the Simulation Data Inspector and returns empty handles. This function is no longer supported and has been replaced by the Simulation Data Inspector. Use the **Simulation Data Inspector** button in the Simulink Editor to capture simulation output in the Simulation Data Inspector. Programmatically, use the function `Simulink.sdi.view` instead.

See Also

`Simulink.sdi.view`

Simulation Manager

Monitor multiple simulations in one window

Description

Simulation Manager allows you to monitor the status of multiple simulations. Using this app, you can:

- View the progress of the simulations in a high-level grid view or a detailed list view.
- Find the simulations that error out.
- Abort simulations.
- Select a simulation run and open the model in Simulink, with all of the simulation's settings applied to the model.
- View simulation results in the **Simulation Data Inspector**.

Open the Simulation Manager App

- `sim` command – You can use `sim` with `SimulationInput` object to open the UI. Set the argument `ShowSimulationManager` to `on`.

  ```
  out = sim(in, 'ShowSimulationManager', 'on')
  ```
- `parsim` command – Set the argument `ShowSimulationManager` to `on` with Parallel Computing Toolbox. `parsim` command uses a SimulationInput object to run simulations. For more information, see `Simulink.SimulationInput`.

  ```
  out = parsim(in, 'ShowSimulationManager', 'on')
  ```
- To reopen the Simulation Manager, use the command `openSimulationManager('modelName')`. This command lets you reopen the last running session.

  Note You can use this command to reopen the Simulation Manager, if you close the window unintentionally.

Examples

Open Simulation Manager

Open the model `sldemo_suspn_3dof` and create a set of sweep values.

```
mdl = 'sldemo_suspn_3dof';
open_system(mdl);
Cf_sweep = Cf*(0.05:0.1:0.95);
numSims = length(Cf_sweep);
```

Create an array of `Simulink.SimulationInput` objects to modify the block parameter **Road-Suspension Interaction** with the sweep values.

```
for i = numSims:-1:1
 in(i) = Simulink.SimulationInput(mdl);
 in(i) = setBlockParameter(in(i), [mdl '/Road-Suspension Interaction'], 'Cf', num2str(Cf_sweep(i)));
end
```

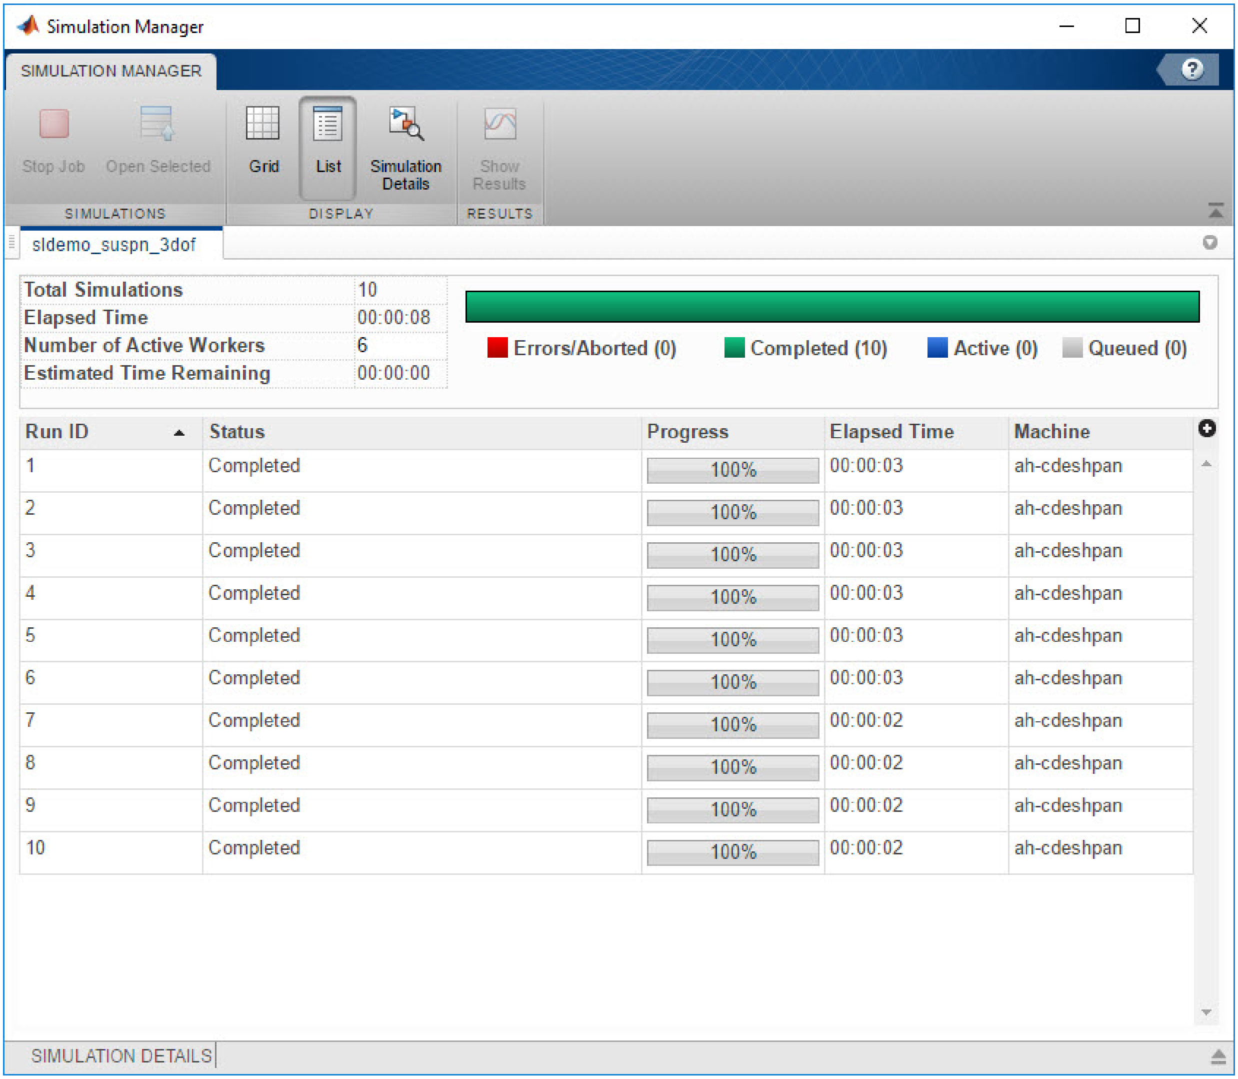
Run multiple simulations and open the Simulation Manager to monitor them.

```
out = parsim(in, 'ShowSimulationManager', 'on')
```

In the absence of Parallel Computing Toolbox, the simulations run in serial.

Using Simulation Manager

Once you run the `parsim` command, the Simulation Manager UI opens up as follows:



Total Simulations	10
Elapsed Time	00:00:08
Number of Active Workers	6
Estimated Time Remaining	00:00:00

🟥 Errors/Aborted (0) 🟩 Completed (10) 🟦 Active (0) ⬜ Queued (0)

Run ID ▲	Status	Progress	Elapsed Time	Machine
1	Completed	100%	00:00:03	ah-cdeshpan
2	Completed	100%	00:00:03	ah-cdeshpan
3	Completed	100%	00:00:03	ah-cdeshpan
4	Completed	100%	00:00:03	ah-cdeshpan
5	Completed	100%	00:00:03	ah-cdeshpan
6	Completed	100%	00:00:03	ah-cdeshpan

To hide the details of the selected run, click the **Simulation Details** button, .

Open Selected button, , allows you to open the model with the specifications of the selected run.

You can view the results of one or more runs in the Simulation Data Inspector by clicking the Show Results button, . Clicking on Show Results creates a Simulation Data Inspector run from the `Simulink.SimulationOutput` object and is displayed in Simulation Data Inspector. You can also return your results in the `Simulink.SimulationOutput` object.

To stop the job at the beginning of your simulations, you can use the **Stop Job** button, 🟥.

simulink

Open Simulink Start Page

Syntax

```
simulink
```

Description

`simulink` opens the Simulink Start Page. Choose a model or project template, or browse the examples. See “Create and Open Models”.

The behavior of the `simulink` function changed in R2016a. Formerly it opened the Simulink Library Browser and loaded the Simulink block library. If you wish to preserve that behavior, use `slLibraryBrowser` instead to open the Library Browser, or `load_system simulink` to load the Simulink block library.

If you want to start Simulink without opening the Library Browser or Start Page, use the faster `start_simulink` instead.

Introduced before R2006a

simulinkproject

Open Simulink Project and get project object

Syntax

```
simulinkproject
simulinkproject(projectPath)

proj = simulinkproject
proj = simulinkproject(projectPath)
```

Description

`simulinkproject` opens Simulink Project or brings focus to the tool if it is already open. After you open the tool, you can create new projects or access recent projects using the **Simulink Project** tab.

`simulinkproject(projectPath)` opens the Simulink project specified by any file or folder under the project root in `projectPath` and gives focus to Simulink Project.

`proj = simulinkproject` returns a project object `proj` you can use to manipulate the project at the command line. You need to get a project object before you can use any of the other project functions.

If you want to avoid giving focus to Simulink Project in your startup script, specify an output argument.

To avoid your startup script opening windows that take focus away from the MATLAB Desktop, use `start_simulink` instead of the `simulink` function, and use `simulinkproject` with an output argument instead of `uiopen`.

`proj = simulinkproject(projectPath)` opens the Simulink project specified by `projectPath` and returns a project object.

Examples

Open Simulink Project Tool

Open the Simulink Project Tool.

```
simulinkproject
```

Open a Simulink Project

Specify either the .prj file path or the folder that contains your .SimulinkProject folder and .prj file. The project opens and brings focus to Simulink Project.

```
simulinkproject('C:/projects/project1/')
```

Open a Simulink Project and Get a Project Object

Open a specified project and get a project object to manipulate the project at the command line. To avoid your startup script opening windows that take focus away from the MATLAB Desktop, use start_simulink instead of the simulink function, and use simulinkproject with an output argument instead of uiopen. If you use uiopen(myproject.prj) this calls simulinkproject with no output argument and gives focus to Simulink Project.

```
start_simulink
proj = simulinkproject('C:/projects/project1/myproject.prj')
```

Get Airframe Example Project

Open the Airframe project and create a project object to manipulate and explore the project at the command line.

```
sldemo_slproject_airframe
proj = simulinkproject
```

```
proj =
  ProjectManager with properties:

             Name: 'Simulink Project Airframe Example'
      Information: [1x1 slproject.Information]
     Dependencies: [1x1 slproject.Dependencies]
       Categories: [1×1 slproject.Category]
            Files: [1×31 slproject.ProjectFile]
        Shortcuts: [1×7 slproject.Shortcut]
      ProjectPath: [1×7 slproject.PathFolder]
ProjectReferences: [1×0 slproject.ProjectReference]
     StartupFiles: [1×0 slproject.StartupFile]
    ShutdownFiles: [1×0 slproject.ShutdownFile]
       RootFolder: 'C:\slexamples\airframe11'
```

Find Project Commands

Find out what you can do with your project.

```
methods(proj)
```

```
Methods for class slproject.ProjectManager:

addFile
addFolderIncludingChildFiles
addPath
addReference
addShortcut
addShutdownFile
addStartupFile
close
createCategory
export
findCategory
findFile
isLoaded
listModifiedFiles
listRequiredFiles
refreshSourceControl
reload
removeCategory
removeFile
removePath
```

```
removeReference
removeShortcut
removeShutdownFile
RemoveStartupFile
```

Examine Project Properties Programmatically

After you get a project object using the `simulinkproject` function, you can examine project properties.

Examine the project files.

```
files = proj.Files
```

```
files = 

  1x31 ProjectFile array with properties:

    Path
    Labels
    Revision
    SourceControlStatus
```

Use indexing to access files in this list. The following command gets file number 14. Each file has properties describing its path, attached labels, and source control information.

```
proj.Files(15)
```

```
ans = 

  ProjectFile with properties:

      Path: 'C:\slexamples\airframe24\models\DigitalControl.slx'
                 Labels: [1x1 slproject.Label]
               Revision: '2'
    SourceControlStatus: Unmodified
```

Examine the labels of the file.

```
proj.Files(15).Labels
```

```
ans = 
  Label with properties:

File: 'C:\slexamples\airframe24\models\DigitalControl.slx'
        DataType: 'none'
            Data: []
            Name: 'Design'
    CategoryName: 'Classification'
```

Get a particular file by name.

```
myfile = findFile(proj,'models/AnalogControl.mdl')
```

```
myfile = 

  ProjectFile with properties:

  Path: 'C:\slexamples\airframe24\models\AnalogControl.mdl'
                 Labels: [1×1 slproject.Label]
               Revision: '2'
    SourceControlStatus: Unmodified
```

Find out what you can do with the file.

```
methods(myfile)
```

```
Methods for class slproject.ProjectFile:

addLabel     findLabel    removeLabel
```

Update the file dependencies.

```
update(proj.Dependencies)
```

The project runs a dependency analysis to update the known dependencies between project files.

For more information on working with project files, including modified files and dependencies, see “Automate Simulink Project Tasks Using Scripts”.

Input Arguments

projectPath — Full path to project file or folder

character vector

Full path to project `.prj` file, or the path to the project root folder, or any subfolder or file under your project root, specified as a character vector.

Example: `'C:/projects/project1/myProject.prj'`

Example: `'C:/projects/project1/'`

Output Arguments

`proj` — Project

project object

Project, returned as a project object. Use the project object to manipulate the currently open Simulink project at the command line.

Properties of `proj` output argument.

Project Property	Description
Categories	Categories of project labels
Dependencies	Dependencies between project files in a MATLAB digraph object
Files	Paths and names of project files
Information	Information about the project such as the description, source control integration, repository location, and whether it is a top-level project
Name	Project name
ProjectPath	Folders that the project puts on the MATLAB path
ProjectReferences	Folders that contain referenced projects. Contains read-only project objects for referenced projects.
RootFolder	Full path to project root folder
Shortcuts	An array of the shortcuts in this project
ShutdownFiles	An array of the shutdown files in this project

Project Property	Description
StartupFiles	An array of the startup files in this project

Tips

Alternatively, you can use `slproject.loadProject` to load a project, and `slproject.getCurrentProjects` to get a project object. Use `simulinkproject` to open projects and explore projects interactively. Use `slproject.getCurrentProjects` and `slproject.loadProject` for project automation scripts.

Simulink.allBlockDiagrams

Find loaded Simulink models and libraries

Syntax

```
bd = Simulink.allBlockDiagrams()
bd = Simulink.allBlockDiagrams(type)
```

Description

`bd = Simulink.allBlockDiagrams()` returns all loaded block diagrams, including models and libraries.

`bd = Simulink.allBlockDiagrams(type)` returns either models or libraries.

Examples

Find Loaded Models

Find all loaded models in the current Simulink session, excluding libraries. The example shows a result from a typical session.

```
Simulink.allBlockDiagrams('model')
```

```
ans =

  237.0001
   56.0001
    2.0001
```

Get Names of Loaded Block Diagrams

Find all loaded models in the current Simulink session and return results as names. Use `Simulink.allBlockDiagrams` with `get_param` to get the names. The example shows a result from a typical session and includes loaded libraries and models.

```
get_param(Simulink.allBlockDiagrams(),'Name')
```

```
ans =

  5×1 cell array

    {'simulink_extras'}
    {'simulink'       }
    {'sldemo_fuelsys' }
    {'f14'            }
    {'vdp'            }
```

Get Loaded Block Diagrams Based on Parameter

Find all loaded models in the current Simulink session whose `'Dirty'` parameter is `'on'`.

```
bds = Simulink.allBlockDiagrams();
dirtyBds = bds(strcmp(get_param(bds,'Dirty'),'on'));
```

Input Arguments

type — Type of block diagram whose blocks to return
`'model'` | `'library'`

Type of block diagram whose blocks to return, specified as `'model'` or `'library'`.

Output Arguments

bd — Loaded block diagrams
array of handles

Loaded block diagrams, returned as an array of handles.

See Also

`Simulink.FindOptions` | `Simulink.findBlocks` | `Simulink.findBlocksOfType`

Introduced in R2018a

Simulink.architecture.add

Add tasks or triggers to selected architecture of model

Syntax

`Simulink.architecture.add(Type,Object)`

Description

`Simulink.architecture.add(Type,Object)` adds the new task or trigger `Object` of the specified `Type` to a model.

Examples

Add periodic trigger

Add a task, MyTask1, to the software node MulticoreProcessor of the selected architecture of the `slexMulticoreExample` model.

```
slexMulticoreExample;
Simulink.architecture.add('Task','slexMulticoreExample/MulticoreProcessor/Core2/MyTask1');
```

Input Arguments

Type — Object type

'PeriodicTrigger' | 'AperiodicTrigger' | 'Task'

Object type that identifies the kind of trigger or task to add, , specified as a `'PeriodicTrigger'`, `'AperiodicTrigger'`, or `'Task'`.

- `'PeriodicTrigger'`

  Adds a periodic trigger to the architecture. Set the properties of the trigger with the `Simulink.architecture.set_param` function.

- `'AperiodicTrigger'`

  Adds an aperiodic trigger to the architecture. Set the properties of the trigger with the `Simulink.architecture.set_param` function.
- `'Task'`

  Adds a task to the architecture. Set the properties of the task with the `Simulink.architecture.set_param` function.

`Object` — Trigger or task object identifier
character vector

Trigger or task object identifier to add to architecture, specified as a character vector.

Example: `'slexMulticoreExample/MulticoreProcessor/Core2/MyTask1'`

Data Types: `char`

Introduced in R2014a

Simulink.architecture.config

Create or convert configuration for concurrent execution

Syntax

```
Simulink.architecture.config(model,'Convert')
Simulink.architecture.config(model,'Add')
Simulink.architecture.config(model,'OpenDialog')
```

Description

`Simulink.architecture.config(model,'Convert')` converts the active configuration set in the specified model to one for concurrent execution.

`Simulink.architecture.config(model,'Add')` adds and activates a new configuration set for concurrent execution.

`Simulink.architecture.config(model,'OpenDialog')` opens the Concurrent Execution dialog box for a model configuration.

Examples

Convert existing configuration set

Convert existing configuration set for concurrent execution in the model vdp.

```
vdp;
Simulink.architecture.config('vdp','Convert');
```

Add new configuration set

Add a new configuration set (copied from the existing configuration set) for concurrent execution in the model vdp.

```
vdp;
Simulink.architecture.config('vdp','Add');
```

Open Concurrent Execution dialog box

Open the Concurrent Execution dialog box in the model `slexMulticoreExample`.

```
slexMulticoreExample;
Simulink.architecture.config('slexMulticoreExample','OpenDialog');
```

Input Arguments

`model` — Model name

character vector

Model name whose configuration set you want to convert or add to, specified as a character vector.

Example:

Data Types: `char`

Introduced in R2014a

signalBuilderToSignalEditor

Import signal data and properties from Signal Builder block to Signal Editor block

Syntax

```
signal_editor = signalBuilderToSignalEditor(signal_builder,Name,
Value)
[signal_editor,sorted_group_index,sorted_group_names] =
signalBuilderToSignalEditor(signal_builder,Name,Value)
```

Description

`signal_editor = signalBuilderToSignalEditor(signal_builder,Name,Value)` imports signal data and properties from Signal Builder block to the Signal Editor block. This function adds a Signal Editor block to the current model using the signal data and properties from the Signal Builder block.

During the port, the `signalBuilderToSignalEditor` function:

- Orders signal groups alphabetically.
- Removes spaces from group names.
- Creates unique group names from existing names following MATLAB conventions.

The `signalBuilderToSignalEditor` function does not support models that contain test case parameters. You can successfully port data from the Signal Builder block, but you cannot initialize parameters with the Signal Editor block in test harnesses generated by Simulink Design Verifier.

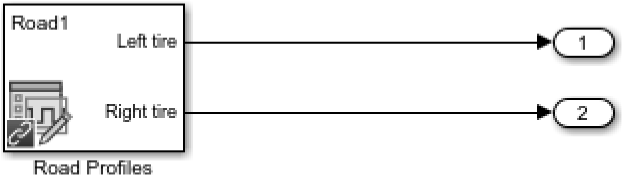
`[signal_editor,sorted_group_index,sorted_group_names] = signalBuilderToSignalEditor(signal_builder,Name,Value)` outputs vectors containing the signal groups and group names.

Examples

Replace Signal Builder Block with Signal Editor Block

This example shows how to replace an existing Signal Builder block with a Signal Editor block. To store signals from Signal Builder, the example uses `RoadProfiles.mat`.

```
model = 'ex_replace_signalbuilder';
open_system(model);
sbBlockH = [model '/Road Profiles'];
seBlockH = signalBuilderToSignalEditor(sbBlockH,...
'Replace',true,'FileName','RoadProfiles.mat');
```



Copyright 2018 The MathWorks, Inc.

Input Arguments

`signal_builder` — Signal Builder block to replace
current model (default) | scalar

Signal Builder block to replace, specified as a scalar.

Data Types: `char` | `string`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: 'FileName','RoadProfiles.mat'

`FileName` — MAT-file that stores signals
`'dataset.mat'` (default) | scalar

MAT-file that stores signals and properties, specified as a scalar. Do not use a file name from one locale in a different locale. When using the block on multiple platforms, consider specifying just the MAT-file name and having the MAT-file be on the MATLAB path.

Data Types: `char` | `string`

`Replace` — Replace Signal Builder block with Signal Editor block
`false` (default) | `true`

Replace Signal Builder block with Signal Editor block, specified as `true` or `false`.

Data Types: `logical`

Output Arguments

`signal_editor` — Signal Editor block handle
scalar

Signal Editor block handle, specified as a scalar.

`sorted_group_index` — List of Signal Builder group indices
vector

List of Signal Builder group indices, specified as a vector and ordered as they will appear in the Signal Editor.

`sorted_group_names` — List of Signal Builder group names
cell array

Signal Editor group names, specified as a cell array of vectors, in alphabetical order.

The names are unique valid MATLAB variable names generated from the Signal Builder group names.

Introduced in R2018a

Simulink.architecture.delete

Delete triggers and tasks from selected architecture of model

Syntax

```
Simulink.architecture.delete(Object)
```

Description

`Simulink.architecture.delete(Object)` deletes the specified object trigger or task.

Examples

Delete task Plant

Delete the task Task3 from the Core2 periodic trigger of the MulticoreProcessor software node of the selected architecture of the `slexMulticoreExample` model.

```
slexMulticoreExample
Simulink.architecture.delete('slexMulticoreExample/MulticoreProcessor/Core2/Task3')
```

Input Arguments

`Object` — Object to delete, specified as a character vector

character vector

Object to be deleted. Possible objects are:

- Periodic trigger

Note You cannot delete the last periodic trigger. The software node must contain at least one periodic trigger.

- Aperiodic trigger
- Task

Example: `[bdroot '/MulticoreProcessor/Core2/Task3']`

Data Types: `char`

`Simulink.architecture.add` | `Simulink.architecture.find_system` | `Simulink.architecture.get_param` | `Simulink.architecture.importAndSelect` | `Simulink.architecture.profile` | `Simulink.architecture.register`

Introduced in R2014a

Simulink.architecture.find_system

Find objects under architecture object

Syntax

```
object = Simulink.architecture.find_system(RootObject)
```

```
object = Simulink.architecture.find_system(RootObject,ParamName,
ParamValue)
```

Description

`object = Simulink.architecture.find_system(RootObject)` looks for all objects under `RootObject`.

`object = Simulink.architecture.find_system(RootObject,ParamName, ParamValue)` returns the object in `RootObject` whose parameter `ParamName` has the value `ParamValue`. Parameter name and value character vectors are case-sensitive.

Examples

Look for all objects

To find all the objects in `slexMulticoreExample`:

```
slexMulticoreExample
t = Simulink.architecture.find_system('slexMulticoreExample')
```

```
t =

    'slexMulticoreExample'
    'slexMulticoreExample/MulticoreProcessor'
    'slexMulticoreExample/MulticoreProcessor/Core1'
    'slexMulticoreExample/MulticoreProcessor/Core1/Task1'
    'slexMulticoreExample/MulticoreProcessor/Core1/Task2'
    'slexMulticoreExample/MulticoreProcessor/Core2'
    'slexMulticoreExample/MulticoreProcessor/Core2/Task3'
    'slexMulticoreExample/MulticoreProcessor/Core2/Task4'
```

Look for all tasks

To find all the tasks in `slexMulticoreExample`:

```
slexMulticoreExample
t = Simulink.architecture.find_system('slexMulticoreExample','Type','Task')
```

```
t =

    'slexMulticoreExample/MulticoreProcessor/Core1/Task1'
    'slexMulticoreExample/MulticoreProcessor/Core1/Task2'
    'slexMulticoreExample/MulticoreProcessor/Core2/Task3'
    'slexMulticoreExample/MulticoreProcessor/Core2/Task4'
```

Input Arguments

`RootObject` — Object to search

character vector

Object to search for parameter value, specified as a character vector giving the object full path name. Possible objects are:

- Model
- Software node
- Hardware node
- Periodic trigger
- Aperiodic trigger
- Task

Example: `'slexMulticoreExample'`

`ParamName` — Name of parameter to find

character vector | scalar | vector

Name of the parameter to find. Possible values are:

- `'Name'`
- `'Type'`
- `'ClockFrequency'`
- `'Color'`
- `'Period'`
- `'EventHandlerType'`
- `'SignalNumber'`
- `'EventName'`

Example: `'EventName'`

`ParamValue` — Parameter value to find
character vector | scalar | vector

Parameter value to find, specified as a character vector, a scalar, or a vector.

Example: `'ERTDefaultEvent'`

Introduced in R2014a

Simulink.architecture.get_param

Get configuration parameters of architecture objects

Syntax

```
ParamValue = Simulink.architecture.get_param(Object,ParamName)
```

Description

`ParamValue = Simulink.architecture.get_param(Object,ParamName)` returns the value of the specified parameter for the object, `Object`. `ParamName` is case-sensitive.

Examples

Get period

Get the period of task Task3 of trigger Core2 of software node MulticoreProcessor of the selected architecture for the model `slexMulticoreExample`.

```
slexMulticoreExample;
p = Simulink.architecture.get_param('slexMulticoreExample/MulticoreProcessor/Core2/Task3','Period')
```

```
p =

0.2
```

Input Arguments

`Object` — Object whose parameter value to return

character vector

Object whose parameter value to return, specified as a character vector giving the object full path name. Possible objects are:

- Software node
- Hardware node
- Periodic trigger
- Aperiodic trigger
- Task

`ParamName` — Parameter whose value to return
character vector

Name of a parameter for which `Simulink.architecture.get_param` returns a value.

The following are the possible `ParamName` values:

For a model:

- `'ArchitectureName'`
- `'Type'`

For a software node:

- `'Name'`
- `'Type'`

For a hardware node

- `'Name'`
- `'ClockFrequency'`
- `'Color'`
- `'Type'`

For a periodic trigger:

- `'Name'`
- `'Period'`
- `'Color'`
- `'Type'`

For an aperiodic trigger:

- 'Name'
- 'Color'
- 'EventHandlerType'
- 'SignalNumber'
- 'EventName'
- 'Type'

For a task:

- 'Name'
- 'Period'
- 'Color'
- 'Type'

Introduced in R2014a

Simulink.architecture.importAndSelect

Import and select target architecture for concurrent execution environment for model

Syntax

```
Simulink.architecture.importAndSelect(model,Architecture)
```

```
Simulink.architecture.importAndSelect(model,
CustomArchitectureDescriptionFile)
```

Description

`Simulink.architecture.importAndSelect(model,Architecture)` imports and selects the built-in target architecture for the concurrent execution environment for the model.

Importing and selecting target architectures requires that the associated support packages or hardware is installed on your computer.

`Simulink.architecture.importAndSelect(model, CustomArchitectureDescriptionFile)` imports and selects the architecture from an XML-based architecture description file.

Importing and selecting target architectures requires that the associated support packages or hardware is installed on your computer.

Examples

Import and select a different architecture

Import and select the sample architecture to the model `slexMulticoreExample`.

```
slexMulticoreExample
Simulink.architecture.importAndSelect('slexMulticoreExample','Sample Architecture')
```

Import and select a custom architecture

Import and select the custom architecture defined in the XML file `custom_arch.xml`. This example requires you to create a `custom_arch.xml` file first.

```
slexMulticoreExample
Simulink.architecture.importAndSelect('slexMulticoreExample','custom_arch.xml')
```

Input Arguments

`model` — Model

character vector

Model to import architecture to, specified as a character vector.

Data Types: `char`

`Architecture` — Target architecture name

character vector

Target architecture name to import into the concurrent execution environment for the model. Possible target names are:

Property	Description
`'Multicore'`	Single CPU with multiple cores
`'Sample Architecture'`	Example architecture consisting of single CPU with multiple cores and two FPGAs. You can use this architecture to model for concurrent execution.
`'Simulink Real-Time'`	Simulink Real-Time™ target
`'Xilinx Zynq ZC702 evaluation kit'`	Xilinx® Zynq® ZC702 evaluation kit target
`'Xilinx Zynq ZC706 evaluation kit'`	Xilinx Zynq ZC706 evaluation kit target

Property	Description
`'Xilinx Zynq Zedboard'`	Xilinx Zynq ZedBoard™ target

Data Types: `char`

`CustomArchitectureDescriptionFile` — Custom target architecture file
XML file

Custom target architecture file name, in XML format, that describes a custom target for the concurrent execution environment for the model, specified as a character vector giving the XML file name.

Example: `custom_arch.xml`

Introduced in R2014a

Simulink.architecture.profile

Generate profile report for model configured for concurrent execution

Syntax

```
Simulink.architecture.profile(model)
Simulink.architecture.profile(model,numSamples)
```

Description

`Simulink.architecture.profile(model)` generates a profile report for a model configured for concurrent execution. Subsequent calls to the command for the same model name overwrite the existing profile report.

`Simulink.architecture.profile(model,numSamples)` specifies the number of samples to generate a profile report.

Examples

Generate profile report

Generate profile report for the model `slexMulticoreExample`.

```
slexMulticoreExample;
Simulink.architecture.profile('slexMulticoreExample');
```

The command creates the file `slexMulticoreExample_ProfileReport.html` in the current folder and opens it.

Generate profile report for 120 time steps

Generate profile report for the model `slexMulticoreExample` with data for 120 time steps.

```
slexMulticoreExample;
Simulink.architecture.profile('slexMulticoreExample',120);
```

The command creates the file `slexMulticoreExample_ProfileReport.html` in the current folder.

Input Arguments

`model` — Model to profile

character vector

Model to profile, specified as a character vector. Specify a model that is configured for concurrent execution.

Data Types: `char`

`numSamples` — Number of time steps

100 (default) | real, positive integer

Number of time steps, specified as a real, positive integer. This value determines the number of steps to collect data for in the profiled model.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64`

Introduced in R2014a

Simulink.architecture.register

Add custom target architecture to concurrent execution target architecture selector

Syntax

```
Simulink.architecture.register(CustomArchFile)
```

Description

`Simulink.architecture.register(CustomArchFile)` adds an XML-format custom target architecture file `CustomArchFile` to the concurrent execution target architecture selector. To access this selector, click the **Select** button on the Concurrent Execution pane of the Concurrent Execution dialog box.

Examples

Add custom target architecture

Add custom target architecture defined in the XML file `custom_arch.xml` to the concurrent execution target architecture selector. This example requires you to create a `custom_arch.xml` first.

```
slexMulticoreExample
Simulink.architecture.register('custom_arch.xml')
```

Input Arguments

`CustomArchFile` — Custom target architecture file

XML file

Custom target architecture file that describes a custom target for concurrent execution, specified as an XML file.

Simulink.architecture.add | Simulink.architecture.delete | Simulink.architecture.find_system | Simulink.architecture.importAndSelect | Simulink.architecture.profile | Simulink.architecture.set_param

Introduced in R2014a

Simulink.architecture.set_param

Set architecture object properties

Syntax

`Simulink.architecture.set_param(Object,ParamName,ParamValue)`

Description

`Simulink.architecture.set_param(Object,ParamName,ParamValue)` sets the specified parameter of `Object` to the specified value. Parameter name and value character vectors are case sensitive.

Examples

Set software node name

Set the software node name from `MulticoreProcessor` to `MyCPUNewName`.

```
slexMulticoreExample
Simulink.architecture.set_param([bdroot '/MulticoreProcessor'],'Name','MyCPUNewName');
```

Change Periodic

Set Core2 trigger period to .01.

```
slexMulticoreExample
Simulink.architecture.set_param([bdroot '/MyCPUNewName/Core2'],'Period','.01')
```

Input Arguments

`Object` — Object whose parameter value to set

character vector

Object whose parameter value to set, specified as a character vector giving the object full path name. Possible objects are:

- Software node
- Hardware node
- Periodic trigger
- Aperiodic trigger
- Task

`ParamName` — Name of the parameter to set

character vector

Name of parameter whose value to set.

These are the possible parameters whose values you can set for each of the object types:

For software node:

- `'Name'` — Name of the software node.

For hardware node:

- `'Name'` — Name of the hardware node.
- `'ClockFrequency'` — Frequency of the hardware node clock.
- `'Color'` — Color of the trigger icon, specified as an RGB triplet (vector).

For a periodic trigger:

- `'Name'` — Name of the trigger.
- `'Period'` — Period of the trigger.
- `'Color'` — Color of the trigger icon, specified as an RGB triplet (vector).

For an aperiodic trigger:

- `'Name'` — Name of the trigger.
- `'Color'` — Color of the trigger icon, specified as an RGB triplet (vector).
- `'EventHandlerType'` — Trigger source for the interrupt-driven task. Possible values:

  - 'Event (Windows)'
  - 'Posix Signal (Linux/VxWorks 6.x)'
- 'SignalNumber' — Signal number for the trigger. You can set this value only if EventHandlerType is set to Event (Windows).
- 'EventName' — Event name for the trigger. You can set this value only if EventHandlerType is set to Posix Signal (Linux/VxWorks 6.x).

For task:

- 'Name' — Name of the task.
- 'Period' — Period of the task.
- 'Color' — Color of the task icon, specified as an RGB triplet (vector).

Data Types: char

ParamValue — Value to set the parameter to

character vector | vector

Value to set the parameter to, specified as a character vector, scalar, or vector. The possible values depend on the parameter.

Example: 'MyCPUNewName'

Introduced in R2014a

Simulink.Block.getSampleTimes

Return sample time information for a block

Syntax

```
ts = Simulink.Block.getSampleTimes(block)
```

Input Arguments

`block`

Full name or handle of a Simulink block

Output Arguments

`ts`

The command returns `ts` which is a `1xn` array of Simulink.SampleTime objects associated with the model passed to Simulink.Block.getSampleTimes. Here `n` is the number of sample times associated with the block. The format of the returns is:

```
1xn Simulink.SampleTime
Package: Simulink
value: [1x2 double]
Description: [char string]
ColorRGBValue: [1x3 double]
Annotation: [char string]
OwnerBlock: [char string]
ComponentSampleTimes: [1x2 struct]
Methods
```

- `value` — A two-element array of doubles that contains the sample time period and offset
- `Description` — A character vector or string that describes the sample time type
- `ColorRGBValue` — A 1x3 array of doubles that contains the red, green and blue (RGB) values of the sample time color

- `Annotation` — A character vector or string that represents the annotation of a specific sample time (e.g., 'D1')
- `OwnerBlock` — For asynchronous and variable sample times, a character vector or string containing the full path to the block that controls the sample time. For all other types of sample times, an empty character vector or string.
- `ComponentSampleTimes` — A structure array of elements of the same type as `Simulink.BlockDiagram.getSampleTimes` if the sample time is an async union or if the sample time is hybrid and the component sample times are available.

Description

`ts = Simulink.Block.getSampleTimes(`*`block`*`)` performs an update diagram and then returns the sample times of the block connected to the input argument *`mdl/signal`*. This method performs an update diagram to ensure that the sample time information returned is up-to-date. If the model is already in the compiled state via a call to the model API, then an update diagram is not necessary.

Using this method allows you to access all information in the Sample Time Legend programmatically.

`Simulink.BlockDiagram.getSampleTimes`

Introduced in R2009a

Simulink.BlockDiagram.addBusToVector

Convert virtual bus signals into vector signals by adding Bus to Vector blocks

Syntax

```
[destBlocks,busToVectorBlocks,ignoredBlocks] =
Simulink.BlockDiagram.addBusToVector(model)
[destBlocks,busToVectorBlocks,ignoredBlocks] =
Simulink.BlockDiagram.addBusToVector(model,includeLibs)
[destBlocks,busToVectorBlocks,ignoredBlocks] =
Simulink.BlockDiagram.addBusToVector(model,includeLibs,reportOnly)
[destBlocks,busToVectorBlocks,ignoredBlocks] =
Simulink.BlockDiagram.addBusToVector(model,includeLibs,reportOnly,
strictOnly)
```

Description

`[destBlocks,busToVectorBlocks,ignoredBlocks] = Simulink.BlockDiagram.addBusToVector(model)` searches a model, excluding any library blocks, for bus signals used implicitly as vectors, and returns the results of the search.

`[destBlocks,busToVectorBlocks,ignoredBlocks] = Simulink.BlockDiagram.addBusToVector(model,includeLibs)` searches a model, and if `includeLibs` is `true`, includes in the search library blocks for bus signals used implicitly as vectors.

`[destBlocks,busToVectorBlocks,ignoredBlocks] = Simulink.BlockDiagram.addBusToVector(model,includeLibs,reportOnly)` searches a model, and if `reportOnly` is set to `false`, then the function inserts a Bus to Vector block into each bus that is used as a vector in any block that it searches. The insertion replaces the implicit use of a bus as a vector with an explicit conversion of the bus to a vector. The source and destination blocks of the signal do not change.

If `Simulink.BlockDiagram.addBusToVector` adds Bus to Vector blocks to the model or any library, the function changes the saved copy of the diagram.

If `Simulink.BlockDiagram.addBusToVector` changes a library block, the change affects every instance of that block in every model that uses the library.

`[destBlocks,busToVectorBlocks,ignoredBlocks] = Simulink.BlockDiagram.addBusToVector(model,includeLibs,reportOnly,strictOnly)` searches a model, and if `strictOnly` is `true`, the function checks for input bus signals used implicitly as vectors that are fed into one of these blocks. These blocks cannot take virtual bus signals, but they can accept nonvirtual bus signals.

- Delay
- Selector
- Assignment
- Vector Concatenate
- Reshape
- Permute Dimensions

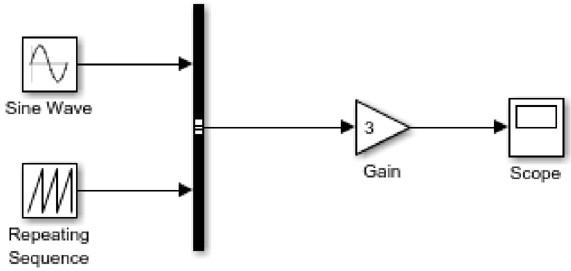
Examples

Insert Bus to Vector Block to Handle Bus Used as Vector

The `ex_bus_to_mux_ng` model simulates correctly, but the input to the Gain block is a bus, while the output is a vector. Therefore, the Gain block uses a bus signal as a vector.

Open the model.

```
open_system(fullfile(matlabroot,'examples','simulink',...
'ex_bus_to_mux_ng'))
```



Insert a Bus to Vector block to convert the bus input signal for the Gain block to a vector signal because the Gain block can accept only non-bus signals.

```
[blocks,busToVectors] = Simulink.BlockDiagram.addBusToVector(...
'ex_bus_to_mux_ng',true,false)
```

```
### Processing block diagram 'ex_bus_to_mux_ng'
### Number of blocks left that are connected to a bus being used as a vector: 1
### Successfully inserted Bus to Vector Blocks in model. Preparing to save model and/or libraries
### To eliminate modeling errors in the future, please enable strict bus modeling by setting the 'Bus signal
### Done processing block diagram 'ex_bus_to_mux_ng'

blocks = 

  struct with fields:

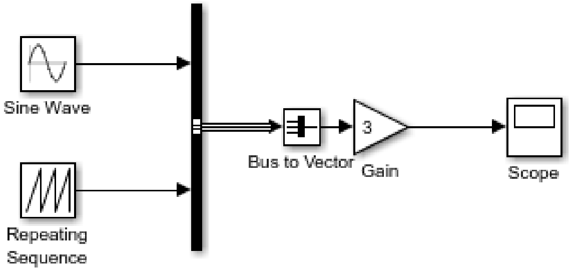
    BlockPath: 'ex_bus_to_mux_ng/Gain'
    InputPort: 1
      LibPath: ''

busToVectors =

  cell

    'ex_bus_to_mux_ng/Bus to Vector'
```

The Gain block no longer implicitly converts the bus to a vector. The inserted Bus to Vector block performs the conversion explicitly. The results of simulation are the same for both models. The Bus to Vector block is virtual and does not affect simulation results, code generation, or performance.



Input Arguments

`model` — Model name or handle

character vector

Model name or handle, specified as a character vector.

`includeLibs` — Search library blocks

`false` (default) | `true`

Search library blocks, specified as `false` or `true`.

- `false` — Search only the blocks in the model.
- `true` — Search library blocks for bus signals used implicitly as vectors.

Specify as the second argument.

Data Types: `logical`

`reportOnly` — Report results without changing model

`true` (default) | `false`

Choice to report results without changing the model, specified as `false` or `true`.

- `false` — Update the model by inserting Bus to Vector blocks for bus signals that are implicitly used as vectors.
- `true` — Report search results, but do not change the model.

Specify as the third argument. You must also specify the `model` and `includeLibs` arguments.

Data Types: `logical`

`strictOnly` — Check input bus signals used implicitly as vectors that feed blocks that can accept nonvirtual, but not virtual, bus signals

`false` (default) | `true`

Check input bus signals used implicitly as vectors that feed blocks that can accept nonvirtual, but not virtual, bus signals, specified as `false` or `true`. If `strictOnly` is `true`, the function checks for input bus signals used implicitly as vectors that are fed into one of these blocks. These blocks cannot take virtual bus signals, but they can accept nonvirtual bus signals.

- Delay
- Selector
- Assignment
- Vector Concatenate
- Reshape
- Permute Dimensions

Specify as the fourth argument. You must also specify the `model`, `includeLibs`, and `reportOnly` arguments.

Data Types: `logical`

Output Arguments

`destBlocks` — Blocks connected to buses but that treat buses as vectors

array of structures

Blocks connected to buses that treat buses as vectors, returned as an array of structures. Each structure in the array contains these fields:

- `BlockPath` — Character vector specifying the path to the block to which the bus connects.
- `InputPort` — Integer specifying the input port to which the bus connects.

- LibPath — If the block is a library block instance, and includeLibs is true, the field value is the path to the source library block. Otherwise, LibPath is empty ([]).

busToVectorBlocks — Bus to Vector blocks added by function

cell array

Bus to Vector blocks added by the function, specified as a cell array. If reportOnly is set to false, the cell array contains the paths to each Bus to Vector block that the function added to replace buses used as vectors. Otherwise, busToVectorBlocks is empty ([]).

ignoredBlocks — Cases where function cannot insert Bus to Vector block

array of structures

Cases where function cannot insert Bus to Vector block, specified as an array of structures. Each structure in the array contains these fields:

- BlockPath — Character vector specifying the path to the block to which the bus connects.
- InputPort — Integer specifying the input port to which the bus connects.

These cases occur when a Bus to Vector cannot be inserted because the input virtual bus signal consists of elements with mixed attributes.

Tips

- Before you execute this function:

  1. Ensure that the model compiles without error.
  2. Save the model.
- Back up the model and any libraries before calling the function with reportOnly set to false.
- To preview the effects of the change on blocks in all models, call Simulink.BlockDiagram.addBusToVector with includeLibs set to true and reportOnly set to true. Then, examine the information returned in the destBlocks output argument.

Bus to Vector

Introduced in R2007a

Simulink.BlockDiagram.buildRapidAcceleratorTarget

Build Rapid Accelerator target for model and return run-time parameter set

Syntax

```
rtp = Simulink.BlockDiagram.buildRapidAcceleratorTarget(mdl)
```

Description

`rtp = Simulink.BlockDiagram.buildRapidAcceleratorTarget(mdl)` builds a Rapid Accelerator target for model, `mdl`, and returns run-time parameter set, `rtp`.

Input Arguments

mdl

Name or handle of a Simulink model

Output Arguments

rtp

Run-time parameter set that contains two elements:

<table>
<tr><th>Element</th><th colspan="2">Description</th></tr>
<tr><td>modelChecksum</td><td colspan="2">1x4 vector that encodes the structure of the model.</td></tr>
<tr><td rowspan="2">parameters</td><td colspan="2">A structure of the tunable parameters in the model. This structure contains the following fields.</td></tr>
<tr><td>Field</td><td>Description</td></tr>
</table>

Element	Description		
	dataTypeName	The data type name, for example, `double`.	
	dataTypeId	Internal data type identifier for use by Simulink Coder.	
	complex	Complex type or real type specification. Value is `0` if real, `1` if complex.	
	dtTransIdx	Internal data type identifier for use by Simulink Coder.	
	values	All values associated with this entry in the `parameters` substructure.	
	map	Mapping structure information that correlates the values to the model tunable parameters. This structure contains the following fields.	
		Field	Description
		Identifier	Tunable parameter name.
		ValueIndices	Start and end indices into the values field, `[startIdx, endIdx]`.
		Dimensions	Dimension of this tunable parameter (matrices are generally stored in column-major format).

Examples

Build Rapid Accelerator Target for Model

In the MATLAB Command Window, type:

```
rtp = Simulink.BlockDiagram.buildRapidAcceleratorTarget('f14')

### Building the rapid accelerator target for model: f14
### Successfully built the rapid accelerator target for model: f14

rtp =
    modelChecksum: [2.6812e+09 2.7198e+09 589261472 4.0180e+09]
       parameters: [1x1 struct]
```

Simulink.BlockDiagram.copyContentsToSubsystem

Copy contents of block diagram to empty subsystem

Syntax

`Simulink.BlockDiagram.copyContentsToSubsystem(`*`bdiag`*`, `*`subsys`*`)`

Description

`Simulink.BlockDiagram.copyContentsToSubsystem(`*`bdiag`*`, `*`subsys`*`)` copies the contents of the block diagram *`bdiag`* to the subsystem *`subsys`*. The block diagram and subsystem must have already been loaded. The subsystem cannot be part of the block diagram.

The function affects only blocks, lines, and annotations; it does not affect nongraphical information such as configuration sets. You can use this function to convert a referenced model derived from an atomic subsystem into an atomic subsystem that is equivalent to the original subsystem.

This function cannot be used if the destination subsystem contains any blocks or signals. Other types of information can exist in the destination subsystem and are not affected by the function. Use `Simulink.SubSystem.deleteContents` if necessary to empty the subsystem before using `Simulink.BlockDiagram.copyContentsToSubsystem`.

Input Arguments

`bdiag`

Block diagram name or handle

`subsys`

Subsystem name or handle

Examples

Copy the contents of vdp to an empty subsystem named vdp_subsystem that is in the model named new_model_with_vdp:

```
open_system('vdp');
new_system('new_model_with_vdp')
open_system('new_model_with_vdp');
add_block('built-in/Subsystem', 'new_model_with_vdp/vdp_subsystem')
Simulink.BlockDiagram.copyContentsToSubsystem...
('vdp', 'new_model_with_vdp/vdp_subsystem')
```

Topics

“Systems and Subsystems”
“Create a Subsystem”

Introduced in R2007a

Simulink.BlockDiagram.createSubsystem

Create subsystem containing specified set of blocks

Syntax

```
Simulink.BlockDiagram.createSubsystem(blocks)
Simulink.BlockDiagram.createSubsystem()
```

Description

`Simulink.BlockDiagram.createSubsystem(blocks)` creates a new subsystem and moves the specified blocks into the subsystem. All of the specified blocks must originally reside at the top level of the model or in the same existing subsystem within the model.

If any of the blocks have unconnected input ports, the command creates input port blocks for each unconnected input port in the subsystem and connects the input port block to the unconnected input port. The command similarly creates and connects output port blocks for unconnected output ports on the specified blocks. If any of the specified blocks is an input port, the command creates an input port block in the parent system and connects it to the corresponding input port of the newly created subsystem. The command similarly creates and connects output port blocks for each of the specified blocks that is an output port block.

`Simulink.BlockDiagram.createSubsystem()` creates a new subsystem in the currently selected model and moves the currently selected blocks in the current model to the new subsystem.

Input Arguments

`blocks`

An array of block handles

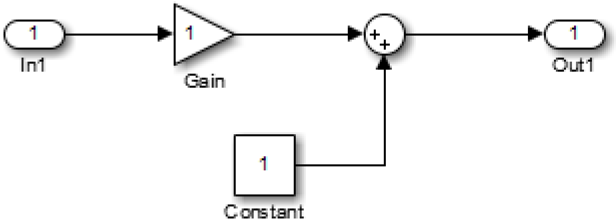
Default: `[]`

Examples

This function converts the contents of a model or subsystem into a subsystem.

```
function convert2subsys(sys)
  blocks = find_system(sys, 'SearchDepth', 1);
  bh = [];
  for i = 2:length(blocks)
    bh = [bh get_param(blocks{i}, 'handle')];
  end
  Simulink.BlockDiagram.createSubsystem(bh);
end
```

For example, suppose you create this model and save it as `initial_model.slx`.



Execute this code to convert the model to create a subsystem:

```
convert2subsys('initial_model');
```

Simulink.BlockDiagram.deleteContents

Delete contents of block diagram

Syntax

```
Simulink.BlockDiagram.deleteContents(bdiag)
```

Description

`Simulink.BlockDiagram.deleteContents(`*`bdiag`*`)` deletes the contents of the block diagram *`bdiag`*. The function affects only blocks, lines, and annotations. The block diagram must have already been loaded.

Input Arguments

`bdiag`

Block diagram name or handle

Examples

Delete the graphical content of an open block diagram named `f14`, including all subsystems:

```
load_system('f14')
Simulink.BlockDiagram.deleteContents('f14');
```

Simulink.BlockDiagram.expandSubsystem

Expand subsystem contents to containing model level

Syntax

```
Simulink.BlockDiagram.expandSubsystem(block)
```

Description

`Simulink.BlockDiagram.expandSubsystem(block)` expands the subsystem `block` into the system that contained the subsystem. Open or load the model first.

You can expand virtual subsystems that are not masked, linked, or commented. For details, see “Subsystems That You Can Expand”.

Input Arguments

`block` — Subsystem to expand
block path name | block handle

Subsystem to expand, specified as the block path name or block handle.

Example: `'sldemo_enginewc/Combustion'`

Examples

Expand Subsystem

Expand the Combustion subsystem. The blocks and signals that were in the Combustion subsystem become part of the system and replace the Subsystem block

Open the model `sldemo_enginewc`.

```
open_system('sldemo_enginewc')
```

The subsystem contents appear in the top level of the model.

Simulink.BlockDiagram.getChecksum

Return checksum of model

Syntax

```
[checksum,details] = Simulink.BlockDiagram.getChecksum('model')
```

Description

`[`*`checksum`*`,`*`details`*`] = Simulink.BlockDiagram.getChecksum('`*`model`*`')` returns the checksum of the specified model. Simulink software computes the checksum based on attributes of the model and the blocks the model contains.

One use of this command is to determine why the Accelerator mode in Simulink software regenerates code. For an example, see `slAccelDemoWhyRebuild`.

Note `Simulink.BlockDiagram.getChecksum` compiles the specified model, if the model is not already in a compiled state.

This command accepts the argument *`model`*, which is the full name or handle of the model for which you are returning checksum data.

This command returns the following output:

- *`checksum`* — Array of four 32-bit integers that represents the model's 128-bit checksum.
- *`details`* — Structure of the form

  ```
  ContentsChecksum: [1x1 struct]
  InterfaceChecksum: [1x1 struct]
  ContentsChecksumItems: [nx1 struct]
  InterfaceChecksumItems: [mx1 struct]
  ```

  - `ContentsChecksum` — Structure of the following form that represents a checksum that provides information about all blocks in the model.

```
Value: [4x1 uint32]
MarkedUnique: [bool]
```

  - `Value` — Array of four 32-bit integers that represents the model's 128-bit checksum.
  - `MarkedUnique` — True if any blocks in the model have a property that prevents code reuse.
- `InterfaceChecksum` — Structure of the following form that represents a checksum that provides information about the model.

  ```
  Value: [4x1 uint32]
  MarkedUnique: [bool]
  ```

  - `Value` — Array of four 32-bit integers that represents the model's 128-bit checksum.
  - `MarkedUnique` — Always true. Present for consistency with `ContentsChecksum` structure.
- `ContentsChecksumItems` and `InterfaceChecksumItems` — Structure arrays of the following form that contain information that Simulink software uses to compute the checksum for `ContentsChecksum` and `InterfaceChecksum`, respectively:

  ```
  Handle: [char array]
  Identifier: [char array]
  Value: [type]
  ```

  - `Handle` — Object for which Simulink software added an item to the checksum. For a block, the handle is a full block path. For a block port, the handle is the full block path and a character vector that identifies the port.
  - `Identifier` — Descriptor of the item Simulink software added to the checksum. If the item is a documented parameter, the identifier is the parameter name.
  - `Value` — Value of the item Simulink software added to the checksum. If the item is a parameter, `Value` is the value returned by

    ```
    get_param(handle, identifier)
    ```

`Simulink.BlockDiagram.getChecksum` returns a checksum that depends on why and how you compiled the model. This function also compiles the model if it is not in a compiled state. The model compiles for:

- Simulation— if the simulation mode is Accelerator or you have not installed Simulink Coder
- Code generation— in all other cases

To compile the model before calling `Simulink.BlockDiagram.getChecksum`, use this command:

```
modelName([],[],[],'compile')
```

Note The checksum that `Simulink.BlockDiagram.getChecksum` returns can vary from the checksum returned if you first compile the model at the command line (using the `model` command) before running `Simulink.BlockDiagram.getChecksum`.

Tip

The structural checksum reflects changes to the model that can affect the simulation results, including:

- Changing the solver type, for example from `Variable-step` to `Fixed-step`
- Adding or deleting blocks or connections between blocks
- Changing the values of nontunable block parameters, for example, the **Seed** parameter of the Random Number block
- Changing the number of inputs or outputs of blocks, even if the connectivity is vectorized
- Changing the number of states or the initial states in the model
- Selecting a different function in the Trigonometric Function block
- Changing signs used in a Sum block
- Adding a Target Language Compiler (TLC) file to inline an S-function

Examples of model changes that do not affect the structural checksum include:

- Changing the position of a block
- Changing the position of a line
- Resizing a block
- Adding, removing, or changing a model annotation

See Also

`Simulink.SubSystem.getChecksum` | `Simulink.getFileChecksum`

Introduced in R2006b

Simulink.BlockDiagram.getInitialState

Return initial state data of block diagram

Syntax

```
x0 = Simulink.BlockDiagram.getInitialState('model')
```

Description

`x0 = Simulink.BlockDiagram.getInitialState('model')` returns the initial state data of the block diagram specified by the input argument *`model`*. You can use this initial state data as the initial state for simulating a model or to provide an initial state condition to the linearization commands. To specify the initial state for a simulation, use the `LoadInitialState` model argument or the **Data Import/Export** > **Initial state** configuration parameter.

To specify the format for the initial state data, use the `SaveFormat` model argument. The default format is `'Dataset'`. Other formats `'Array'`, `'Structure'`, and `'StructureWithTime'`. Alternatively, you can set the initial state format using the **Data Import/Export** > **Format** configuration parameter.

- If format is `'Dataset'`, then the `Simulink.BlockDiagram.getInitialState` function returns a `Simulink.SimulationData.Dataset` object.
- For other format settings, the function returns a structure of the form:

  ```
  time: 0
  signals: [1xn struct]
  ```

  where `n` is the number of states contained in the model, including any models referenced by Model blocks. The `signals` field is a structure of the form:

  ```
  values: [1xm double]
  dimensions: [1x1 double]
  label: [char array]
  blockName: [char array]
  inReferencedModel: [bool]
  sampleTime: [1x2 double]
  ```

- `values` — Numeric array of length `m`, where `m` is the number of states in the signal
- `dimensions` — Length of the `values` vector
- `label` — Indication of whether the state is continuous (`CSTATE`) or discrete. If the state is discrete:

  The name of the discrete state is shown for S-function blocks.

  The name of the discrete state is shown for those built-in blocks that assign their own names to discrete states.

  `DSTATE` is used in all other cases.

- `blockName` — Full path to block associated with this state
- `inReferencedModel` — Indication of whether the state originates in a model referenced by a Model block (`1`) or in the top model (`0`)
- `sampleTime` — Array containing the sample time and offset of the block that owns the state

Using this function to return the initial state data simplifies specifying initial state values for models with multiple states. Each state is associated with the full path to its parent block.

Introduced in R2006b

Simulink.BlockDiagram.getSampleTimes

Return all sample times associated with model

Syntax

```
ts = Simulink.BlockDiagram.getSampleTimes('model')
```

Description

`ts = Simulink.BlockDiagram.getSampleTimes('`*`model`*`')` performs an update diagram and then returns the sample times associated with the block diagram *`model`*. The update diagram ensures that the sample time information returned is up to date. If the model is already in the compiled state via a call to the model API, then an update diagram is not necessary.

Using this method allows you to access all information in the Sample Time Legend programmatically.

Input Arguments

`model`

Name or handle of a Simulink model

Output Arguments

`ts`

The command returns a `1xn` array of `Simulink.SampleTime` objects associated with the model passed to `Simulink.BlockDiagram.getSampleTimes`. Here `n` is the number of sample times associated with the block diagram. The format of the returns is as follows:

```
1xn Simulink.SampleTime
Package: Simulink
```

```
value: [1x2 double]
Description: [char string]
ColorRGBValue: [1x3 double]
Annotation: [char string]
OwnerBlock: [char string]
ComponentSampleTimes: [1x2 struct]
Methods
```

- `value` — A two-element array of doubles that contains the sample time period and offset.
- `Description` — A character vector or string that describes the sample time type.
- `ColorRGBValue` — A `1x3` array of doubles that contains the red, green, and blue (RGB) values of the sample time color.
- `Annotation` — A character vector or string that represents the annotation of a specific sample time (e.g., `'D1'`).
- `OwnerBlock` — For asynchronous and variable sample times, a character vector or string containing the full path to the block that controls the sample time. For all other types of sample times, an empty character vector or string.
- `ComponentSampleTimes` — A structure array of elements of the same type as `Simulink.BlockDiagram.getSampleTimes` if the sample time is an async union or if the sample time is hybrid and the component sample times are available.

See Also

`Simulink.Block.getSampleTimes`

Introduced in R2009a

Simulink.BlockDiagram.loadActiveConfigSet

Package: Simulink.BlockDiagram

Load, associate, and activate configuration set with model

Syntax

`Simulink.BlockDiagram.loadActiveConfigSet(model, filename)`

Description

`Simulink.BlockDiagram.loadActiveConfigSet(model, filename)` loads a configuration set, associates it with a model, and makes it the active configuration set. `model` is the name or handle of a model. `filename` is the name of the file (`.m` or `.mat`) that creates or contains a configuration set object to load. If you do not provide a file extension, it defaults to `.m`. If the file name is the same as a model name on the MATLAB path, the software cannot determine which file contains the configuration set object and displays an error message.

Examples

Save the configuration set from the `sldemo_counters` model to `my_config_set.m`.

```
% Open the sldemo_counters model
sldemo_counters
% Save the active configuration set to my_config_set.m
Simulink.BlockDiagram.saveActiveConfigSet('sldemo_counters', 'my_config_set.m')
```

Load the configuration set from `my_config_set.m`, associate it with the `vdp` model, and make it the active configuration set.

```
% Open the vdp model
vdp
% Load the configuration set from my_config_set.m, making it the active
% configuration set for vdp.
Simulink.BlockDiagram.loadActiveConfigSet('vdp', 'my_config_set.m')
```

Tips

- If you load a configuration set with the same name as the active configuration set, the software overwrites the active configuration set.
- If you load a configuration set with the same name as an inactive configuration set associated with the model, the software detaches the inactive configuration from the model.
- If you load a configuration set object that contains an invalid custom target, the software sets the **“System target file” (Simulink Coder)** parameter to `ert.tlc`.

Simulink.BlockDiagram.propagateConfigSet

Propagate top model configuration reference to referenced models

Syntax

```
[isPropagated, convertedModels] =
Simulink.BlockDiagram.propagateConfigSet(model)
[isPropagated, convertedModels] =
Simulink.BlockDiagram.propagateConfigSet(model, 'include',
refModels)
[isPropagated, convertedModels] =
Simulink.BlockDiagram.propagateConfigSet(model, 'exclude',
refModels)
handle = Simulink.BlockDiagram.propagateConfigSet(model, 'gui')
```

Description

`[isPropagated, convertedModels] = Simulink.BlockDiagram.propagateConfigSet(model)` propagates the configuration reference for `model` to all referenced models. Execute the function from a writable folder.

`[isPropagated, convertedModels] = Simulink.BlockDiagram.propagateConfigSet(model, 'include', refModels)` propagates the configuration reference for `model` to the models in the `refModels` list. Execute the function from a writable folder.

`[isPropagated, convertedModels] = Simulink.BlockDiagram.propagateConfigSet(model, 'exclude', refModels)` propagates the configuration reference for `model` to all referenced models in the hierarchy except for the models in the `refModels` list. Execute the function from a writable folder.

`handle = Simulink.BlockDiagram.propagateConfigSet(model, 'gui')` opens the **Configuration Reference Propagation to Referenced Models** dialog box.

Examples

Propagate a Configuration Reference to All Referenced Models

```
[isPropagated,convertedModels] = ...
Simulink.BlockDiagram.propagateConfigSet('sldemo_mdlref_depgraph')
```

Propagate a Configuration Reference to Listed Referenced Models

```
[isPropagated,convertedModels] = ...
Simulink.BlockDiagram.propagateConfigSet(...
'sldemo_mdlref_depgraph','include',...
{'sldemo_mdlref_heater','sldemo_mdlref_house'})
```

Propagate a Configuration Reference to Referenced Models with Exclusions

```
[isPropagated,convertedModels] = ...
Simulink.BlockDiagram.propagateConfigSet(...
'sldemo_mdlref_depgraph','exclude',...
{'sldemo_mdlref_heater','sldemo_mdlref_house'})
```

Open the Configuration Reference Propagation to Referenced Models Dialog Box for a Model

```
Simulink.BlockDiagram.propagateConfigSet(...
'sldemo_mdlref_depgraph','gui')
```

Input Arguments

`model` — Top model

character vector | string scalar

Top model with configuration reference to propagate, specified as a character vector or string scalar.

Example: ‘mdl’

`refModels` — Referenced models

cell array of character vectors | string array

List of referenced models to be included or excluded in propagation, specified as a cell array of character vectors or string array.

Example: {'mdl1','mdl2','mdl3'}

Output Arguments

`isPropagated` — Success of propagation

false (default) | true

Indication of whether configuration reference propagation is successful, specified as a Boolean.

`convertedModels` — Converted models

cell array of character vectors

List of converted model names, specified as a cell array of character vectors.

`handle` — Handle to dialog box

handle

Handle to the **Configuration Reference Propagation to Referenced Models** dialog box. Returned when you specify the '`gui`' argument to the function.

See Also

`Simulink.BlockDiagram.restoreConfigSet`

Topics

"Share a Configuration Across Referenced Models"
"Manage a Configuration Reference"

Introduced in R2012b

Simulink.BlockDiagram.restoreConfigSet

Restore model configuration for converted models

Syntax

```
[isRestored, restoredModels] =
Simulink.BlockDiagram.restoreConfigSet(model)
```

Description

`[isRestored, restoredModels] = Simulink.BlockDiagram.restoreConfigSet(model)` restores the model configuration for all converted models after propagating a configuration reference from a top model to the referenced models. Execute the function from a writable folder.

Examples

Restore the Model Configuration for Converted Models

```
[isRestored,restoredModels] = ...
Simulink.BlockDiagram.restoreConfigSet('sldemo_mdlref_depgraph');
```

Input Arguments

`model` — Top model
character vector | string scalar

Name of top model, specified as a character vector or string scalar.

Example: ‘mdl’

Output Arguments

`isRestored` — Success of restoration

false (default) | true

Indication of whether configuration reference propagation is successful, specified as a Boolean.

`restoredModels` — Restored models

cell array of character vectors

List of restored model names, specified as a cell array of character vectors.

Topics

"Share a Configuration Across Referenced Models"
"Manage a Configuration Reference"

Introduced in R2012b

Simulink.BlockDiagram.saveActiveConfigSet

Package: Simulink.BlockDiagram

Save active configuration set of model

Syntax

`Simulink.BlockDiagram.saveActiveConfigSet(model, filename)`

Description

`Simulink.BlockDiagram.saveActiveConfigSet(model, filename)` saves the active configuration set of a model to a `.m` or `.mat` file. `model` is the name or handle of the model. `filename` is the name of the file to save the model configuration set. If you specify a `.m` extension, the file contains a function that creates a configuration set object. If you specify a `.mat` extension, the file contains a configuration set object. If you do not provide a file extension, the active configuration set is saved to a file with a `.m` extension. Do not specify `filename` to be the same as a model name; otherwise the software cannot determine which file contains the configuration set object when loading the file.

Note If you specify a `.mat` extension when you save the active configuration set, all of the parameters are preserved. If you specify a `.m` extension, the `.m` file does not include hidden or disabled parameters.

Examples

Save the configuration set from the `sldemo_counters` model to `my_config_set.m`.

```
% Open the sldemo_counters model
sldemo_counters
% Save the active configuration set to my_config_set.m
Simulink.BlockDiagram.saveActiveConfigSet('sldemo_counters', 'my_config_set.m')
```

“Save a Configuration Set”

Introduced in R2010b

Simulink.Bus.cellToObject

Convert cell array containing bus information to bus objects

Syntax

```
Simulink.Bus.cellToObject(busCells)
```

Description

`Simulink.Bus.cellToObject(busCells)` creates a set of bus objects in the MATLAB base workspace from a cell array of bus information.

Examples

Create Bus Objects from Cell Array of Bus Information

Create a cell array of cell arrays of bus information, and use that cell array to generate a bus object in the base workspace.

Create a cell array of bus information.

```
busCell = { ...
        { ...
            'myBusObj', ...
            'MyHeader.h', ...
            'My description', ...
            'Exported', ...
            '-1', ...
            {{'a',1,'double', [0.2 0],'real','Sample'}; ...
            {'b',1,'double', [0.2 0],'real','Sample',...
            'Fixed',-3,3,'m','b is distance from the origin'}},...
            }, ...
        };
```

Generate a bus object in the base workspace from the cell array.

```
Simulink.Bus.cellToObject(busCell)
```

Input Arguments

`busCells` — Bus object information

cell array of cell arrays

Bus object information, specified as a cell array of cell arrays. Each subordinate cell array must contain this bus object information:

1. Bus name
2. Header file
3. Description
4. Data scope
5. Alignment
6. Elements

The elements field is an array that must contain this data for each element:

1. Element name
2. Dimensions
3. Data type
4. Sample time
5. Complexity
6. Sampling mode

The elements field array can also contain this data:

1. Dimensions mode
2. Minimum
3. Maximum
4. Units
5. Description

Tips

The inverse function is `Simulink.Bus.objectToCell`.

Compatibility Considerations

`Simulink.BusElement` objects will no longer support the `SamplingMode` property

Not recommended starting in R2016b

In R2016b, the `SamplingMode` property of `Simulink.BusElement` objects was removed. Scripts that use the `SamplingMode` property of `Simulink.BusElement` objects continue to work. `Simulink.Bus.cellToObject` continues to require the `SamplingMode` field and `Simulink.Bus.objectToCell` continues to include the sampling mode in the output cell arrays.

In a future release, support for `SamplingMode` will be removed.

To specify whether a signal is sample-based or frame-based, define the sampling mode of input signals at the block level instead of at the signal level.

Introduced before R2006a

Simulink.Bus.createMATLABStruct

Create MATLAB structures using same hierarchy and attributes as bus signals

Syntax

```
structFromBus = Simulink.Bus.createMATLABStruct(busSource)
structFromBus = Simulink.Bus.createMATLABStruct(busSource,
partialValues)
structFromBus = Simulink.Bus.createMATLABStruct(busSource,
partialValues,dims)
```

```
structsForBuses = Simulink.Bus.createMATLABStruct(portHandles)
structsForBuses = Simulink.Bus.createMATLABStruct(portHandles,
partialStructures)
structsForBuses = Simulink.Bus.createMATLABStruct(busObjectNames)
```

Description

`structFromBus = Simulink.Bus.createMATLABStruct(busSource)` creates a MATLAB structure that has the same hierarchy and attributes (such as type and dimension) as the bus specified in `busSource`. The resulting structure uses the ground values of the bus signal.

`structFromBus = Simulink.Bus.createMATLABStruct(busSource, partialValues)` creates a structure that uses specified values of `partialValues` instead of the corresponding ground values of the bus signal.

`structFromBus = Simulink.Bus.createMATLABStruct(busSource, partialValues,dims)` creates a structure that has the specified dimensions. To create a structure for an array of buses, use `dims`.

`structsForBuses = Simulink.Bus.createMATLABStruct(portHandles)` creates a cell array of structures for bus signal ports, specified with port handles. The resulting cell array of structures uses ground values. Use this syntax to create initialization structures for multiple bus ports. This syntax improves performance compared to using separate `Simulink.Bus.createMATLABStruct` calls to create the structures.

`structsForBuses = Simulink.Bus.createMATLABStruct(portHandles, partialStructures)` creates a cell array of structures that uses the specified values of `partialStructures` instead of the ground values.

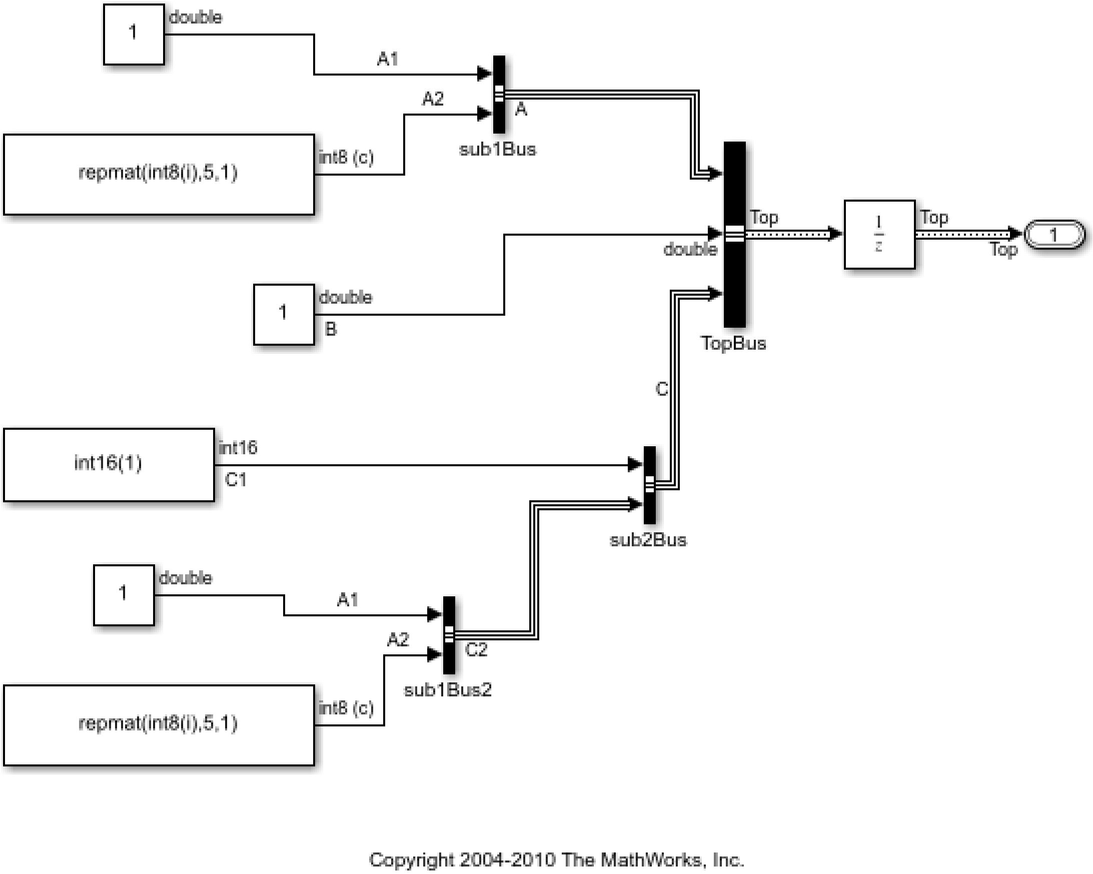
`structsForBuses = Simulink.Bus.createMATLABStruct(busObjectNames)` creates a cell array of structures based on the specified bus objects.

Examples

MATLAB Structure from Bus Object

Open a Simulink® model and simulate it.

```
model = fullfile(matlabroot,'examples','simulink','busic_example');
open_system(model);
sim('busic_example')
```



Create a MATLAB® structure using the bus object `Top`, which the `busic_example` model loads.

```
mStruct = Simulink.Bus.createMATLABStruct('Top')
```

```
mStruct = 

  struct with fields:

    A: [1x1 struct]
    B: 0
    C: [1x1 struct]
```

Set a value for the field of the `mStruct` structure that corresponds to bus element `A1` of bus `A`.

```
mStruct.A.A1 = 3;
mStruct.A
```

```
ans = 

  struct with fields:

    A1: 3
    A2: [5x1 int8]
```

Simulink sets the other fields in the structure to the ground values of the corresponding bus elements.

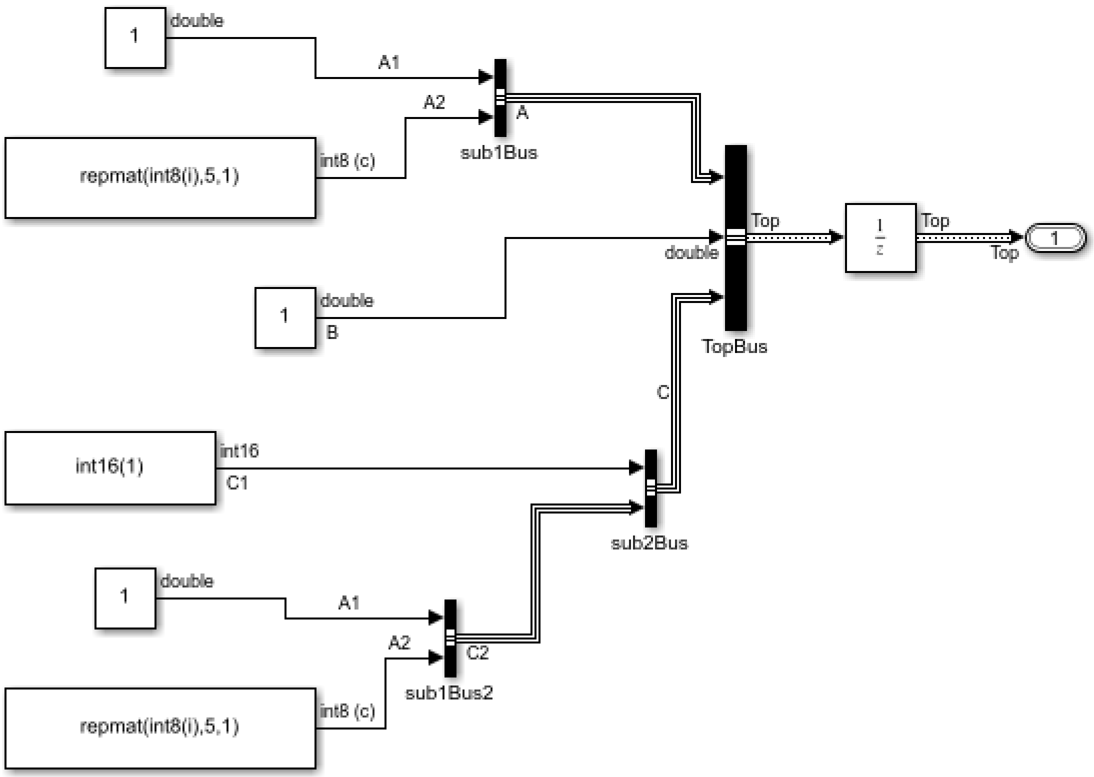
You can use `mStruct` as the initial condition structure for the Unit Delay block.

Initialize Signal Elements That Use a Data Type Other than double

Create a MATLAB® structure for a bus whose signal elements use a data type other than `double`. Use a partial structure to specify initialization values for a subset of the elements. When you create the partial structure, match the data types of the fields with the data types of the corresponding elements.

Open a Simulink® model.

```
model = fullfile(matlabroot,'examples','simulink','busic_example');
open_system(model);
sim('busic_example')
```



Copyright 2004-2010 The MathWorks, Inc.

The `C1` signal element that the Constant5 block produces uses the data type `int16`.

Find the port handle for the Bus Creator block port that produces the `Top` bus signal.

```
ph = get_param('busic_example/TopBus','PortHandles');
```

Create a partial structure that specifies values for a subset of the elements in the bus signal created by the TopBus block. To set the value of the `C.C1` field, use a typed expression. Match the data type in the expression with the data type of the signal element in the model (`int16`).

```
PartialstructForK = struct('B',3,'C',struct('C1',int16(5)));
```

Create a full structure by using the port handle (ph) for the TopBus block. Override the ground values for the C.C1 and B elements.

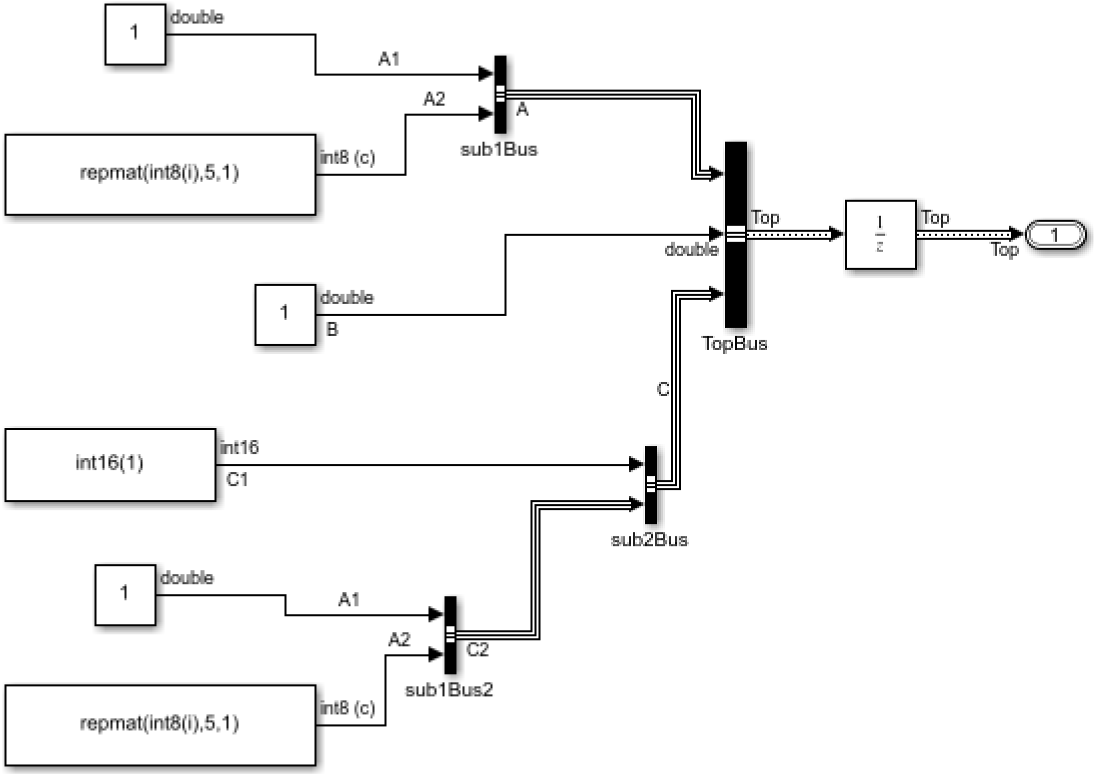
```
outPort = ph.Outport;
mStruct = Simulink.Bus.createMATLABStruct(outPort,PartialstructForK);
```

The field C.C1 in the output structure continues to use the data type int16.

MATLAB Structure with Specified Dimensions

Open a Simulink® model and simulate it.

```
model = fullfile(matlabroot,'examples','simulink','busic_example');
open_system(model);
sim('busic_example')
```



Create a partial structure, which is a MATLAB® structure that specifies values for a subset of bus elements for the bus signal created by the TopBus block.

```
PartialStructForK = struct('A',struct('A1',4),'B',3)
```

```
PartialStructForK = 

  struct with fields:

    A: [1x1 struct]
    B: 3
```

Create a MATLAB structure using the bus object `Top` (which the `busic_example` model loads), a partial structure, and dimensions for the resulting structure.

```
structFromBus = Simulink.Bus.createMATLABStruct...
     ('Top',PartialStructForK,[2 3])
```

```
structFromBus = 

  2x3 struct array with fields:

    A
    B
    C
```

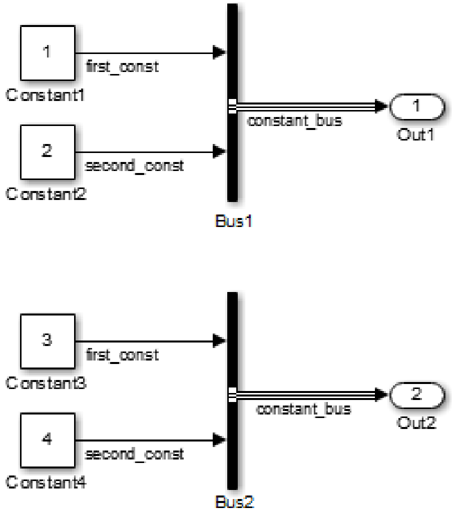
Close the system.

```
close_system('busic_example')
```

Cell Array of MATLAB Structures

Open a Simulink model and simulate it.

```
open_system(docpath(fullfile(docroot,'toolbox','simulink',...
'examples','ex_two_outports_create_struct')))
sim('ex_two_outports_create_struct')
```



Find the port handles for the Bus Creator blocks Bus1 and Bus2.

```
ph_1 = get_param...
     ('ex_two_outports_create_struct/Bus Creator','PortHandles')
ph_2 = get_param...
     ('ex_two_outports_create_struct/Bus Creator1','PortHandles')
```

Create a MATLAB structure using an array of port handles.

```
mStruct = Simulink.Bus.createMATLABStruct...
     ([ph_1.Outport ph_2.Outport])
```

```
mStruct =

    [1x1 struct]
    [1x1 struct]
```

Close the system.

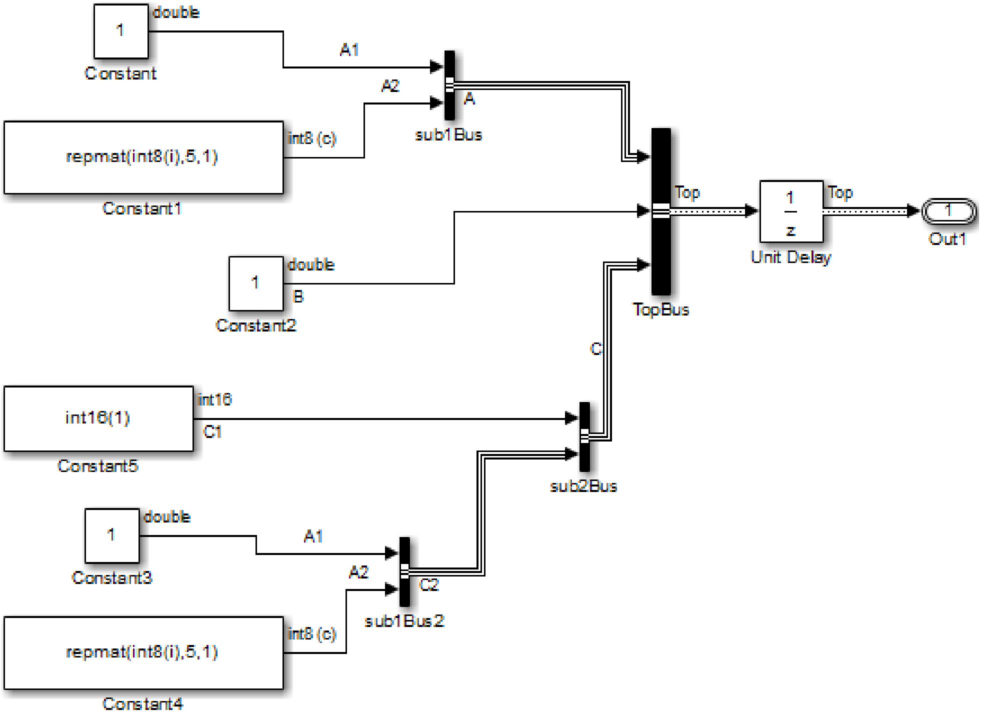
```
close_system('ex_two_outports_create_struct')
```

MATLAB Structure from Bus Port and Partial Structure

Create a MATLAB structure based on a port that connects to a bus signal. Use a partial structure to specify values for a subset of bus elements of the bus signal that connects to the port.

Open a Simulink model.

```
run([docroot '/toolbox/simulink/ug/examples/signals/busic_example.mdl']);
sim('busic_example')
```



Find the port handle for the Bus Creator block port that produces the `Top` bus signal. The `Outport` handle is the handle that you need.

```
ph = get_param('busic_example/TopBus','PortHandles')
```

```
ph =
      Inport: [143.0013 144.0013 145.0013]
     Outport: 34.0013
      Enable: []
     Trigger: []
       State: []
       LConn: []
       RConn: []
    Ifaction: []
```

Create a partial structure, which is a MATLAB structure that specifies values for a subset of bus elements for the bus signal created by the TopBus block.

```
PartialstructForK = struct('A',struct('A1',4),'B',3)
```

```
PartialstructForK =

    A: [1x1 struct]
    B: 3
```

Bus elements represented by structure fields `Top.B` and `Top.A` are at the same nesting level in the bus. You can use this partial structure to override the ground values for the `B` and `A` bus signal elements.

When you create a structure from a bus object or from a bus port, you can use a partial structure as an optional argument.

Create a MATLAB structure by using the port handle (`ph`) for the `TopBus` block. Override the ground values for the `A.A1` and `B` bus elements.

```
outPort = ph.Outport;
mStruct = Simulink.Bus.createMATLABStruct(outPort,PartialstructForK)
```

```
mStruct =

    A: [1x1 struct]
    B: 3
    C: [1x1 struct]
```

Input Arguments

busSource — Source representing a bus signal
a `Simulink.Bus` object | port handle

Source representing a bus signal to use for creating a MATLAB structure, specified as the name of a bus object or port handle.

- If you use the `dims` argument, then for `busSource`, use a bus object.
- For an array of buses signal, you cannot use a port handle.
- If you use a bus object name, then the bus object must be in the MATLAB base workspace. The data type for the bus object name is `char`.
- If you use a port handle, then the model must compile successfully before you use the `createMATLABStruct` method. The data type for the port handle is a `double`.

Example:

```
structFromBus = Simulink.Bus.createMATLABStruct('myBusObject');
structForPortHandle = Simulink.Bus.createMATLABStruct(port_handle_1);
```

`partialValues` — Values for a subset of leaf nodes of the resulting structure
partial structure | `[]`

Values for a subset of leaf nodes of the resulting structure, specified as a partial structure or empty array. Each field that you specify in a partial structure must match the data attributes of the corresponding bus element exactly. For details, see “Create Partial Structures for Initialization”.

Use an empty matrix `[]` when you use the `dims` argument and want to use ground values for all of the nodes in the resulting structure.

Data Types: `struct`

`dims` — Dimensions of the resulting structure
vector

Dimensions of the resulting structure, specified as a vector.

Each dimension element must be an integer that is greater than or equal to 1. If you specify `partialValues`, then each dimension element in `dims` must be greater than or equal to its corresponding dimension element in the partial structure.

To use ground values, use an empty matrix (`[]`) for `partialValues` .

Data Types: `double`

`portHandles` — Handles of bus signal ports
array

Handles of bus signal ports, specified as an array. If you use the `partialStructures` argument, then the number of port handles that you specify in `portHandles` must be the same as the number of partial structures.

Data Types: `double`

`partialStructures` — Partial structures
cell array

Partial structures specified as a cell array. The number of port handles that you specify in `portHandles` must be the same as the number of partial structures.

Data Types: `cell`

`busObjectNames` — Bus object names
cell array

Bus object names, specified as a cell array.

Data Types: `cell`

Output Arguments

`structFromBus` — Bus signal hierarchy and attributes
MATLAB structure

Bus signal hierarchy and attributes, returned as a MATLAB structure.

The dimensions of `structFromBus` depend on the input arguments:

- If you specify only `busSource`, then the dimension is 1.
- If you also specify `partialValues`, then the dimensions match the dimensions of `partialValues`.
- If you specify the `dims` argument, then the dimensions match the dimensions of `dims`.

`structsForBuses` — Structures having the same hierarchy and attributes as bus signals
cell array

Structures having the same hierarchy and attributes as bus signals, returned as a cell array of structures of data with same hierarchy and attributes as a bus signals that you specify with an array of port handles. The cell array of structures uses ground values of the bus signals.

The dimensions of `StructsForBuses` depend on the input arguments:

- If you specify only `portHandles`, then the dimension is 1.
- If you also specify `partialStructures`, then the dimensions match the dimensions of `partialStructures`.

Tips

- If you use the `Simulink.Bus.createMATLABStruct` function repeatedly for the same model (for example, in a loop in a script), you can improve performance by avoiding multiple model compilations. For improved speed, put the model in compile before using the function multiple times. For example, to put the `vdp` model in compile, use this command:

  ```
  [sys,x0,str,ts] = vdp([],[],[],'compile')
  ```

  After you create the MATLAB structure, terminate the compile. For example:

  ```
  vdp([],[],[],'term')
  ```
- You can use the Bus Editor to invoke the `Simulink.Bus.createMATLABStruct` function. Use one of these approaches:

  - Select the **File** > **Create a MATLAB structure** menu item.
  - Select the bus object for which you want to create a full MATLAB structure. Then, in the toolbar, click the **Create a MATLAB structure** button (⊞).

  You can then edit the MATLAB structure in the MATLAB Editor and evaluate the code to create or update the values in this structure.
- You can use the `Simulink.Bus.createMATLABStruct` function to specify the initial value of the output of a referenced model. For details, see the “Referenced Model: Setting Initial Value for Bus Output” section of the Detailed Workflow for Managing Data with Model Reference example.

Introduced in R2010a

Simulink.Bus.createObject

Create bus objects from blocks or MATLAB structures

Syntax

```
busInfo = Simulink.Bus.createObject(model,blocks)
busInfo = Simulink.Bus.createObject(struct)
busInfo = Simulink.Bus.createObject( ___ ,file)
busInfo = Simulink.Bus.createObject( ___ ,format)
```

Description

`busInfo = Simulink.Bus.createObject(model,blocks)` creates bus objects (instances of `Simulink.Bus` class in the MATLAB base workspace) for specified blocks, and returns information about the objects that it created.

`busInfo = Simulink.Bus.createObject(struct)` creates bus objects in the MATLAB workspace from a structure that can contain MATLAB `timeseries`, MATLAB `timetable`, and `matlab.io.datastore.SimulationDatastore` objects or a numeric structure.

`busInfo = Simulink.Bus.createObject( ___ ,file)` saves the bus objects in a MATLAB file that contains a cell array of cell arrays. Each subordinate cell array represents a bus object and contains this data:

- Bus name
- Header file
- Description
- Data scope
- Alignment
- Elements

The elements field is an array containing this data for each element:

- Element name
- Dimensions
- Data type
- Sample time
- Complexity
- Dimensions mode
- Minimum
- Maximum
- Units
- Description

`busInfo = Simulink.Bus.createObject( ___ ,format)` saves the bus objects in a file that contains either a cell array of bus information, or the bus objects themselves.

Examples

Create a Bus Object with Bus Creator Blocks

Create a bus object from the Bus Creator block called `Bus Creator2`.

```
open_system('busdemo')
bus2Info = Simulink.Bus.createObject...
('busdemo','busdemo/Bus Creator2')
close_system('busdemo')
```

Create a bus object from two Bus Creator blocks, using block handles to specify the blocks. Assign the block handles to variables and use the variables in a vector to specify the blocks used for creating the bus object.

Open the model.

```
clear;
open_system('busdemo')
```

In the Simulink Editor, select the `Bus Creator2` block. In MATLAB, assign the block handle to a variable.

```
bc2 = gcbh;
```

In the Simulink Editor, select the `Bus Creator` block. In MATLAB, assign the block handle to a variable.

```
bc1 = gcbh;
```

To create a bus object, use the block handle variables in a vector.

```
bus3Info = Simulink.Bus.createObject...
('busdemo', [bc2 bc1], 'busdemo_busobject')
close_system('busdemo')
```

Create Bus Objects from Cell Array of Bus Information

Create a cell array of cell arrays of bus information, and use that cell array to generate a bus object in the base workspace.

Create a cell array of bus information.

```
busCell = { ...
        { ...
            'myBusObj', ...
            'MyHeader.h', ...
            'My description', ...
            'Exported', ...
            '-1', ...
            {{'a',1,'double', [0.2 0],'real','Sample'}; ...
            {'b',1,'double', [0.2 0],'real','Sample',...
            'Fixed',-3,3,'m','b is distance from the origin'}},...
            }, ...
        };
```

Generate a bus object in the base workspace from the cell array.

```
Simulink.Bus.cellToObject(busCell)
```

Input Arguments

`model` — Model name or handle
character vector

Model name or handle, specified as a character vector.

`blocks` — Blocks to create bus objects for

character vector | cell array of block pathnames | vector of block names

Blocks to create bus object for, specified as a character vector, cell array of block pathnames, or vector of block names.

- For just one block, specify the full path name of the block.
- For multiple blocks, specify either a cell array of block pathnames or a vector of block names.
- If you specify a Bus Creator block that is at the highest level of a bus hierarchy, the function creates bus objects for all buses in the hierarchy.

`struct` — Structure used to create bus objects

structure of MATLAB `timeseries`, MATLAB `timetable`, and `matlab.io.datastore.SimulationDatastore` objects | numeric structure

Structure used to create bus objects, specified as a structure that can contain MATLAB `timeseries`, MATLAB `timetable`, and `matlab.io.datastore.SimulationDatastore` objects or a numeric structure.

`file` — File to save bus objects in

character vector

File to save bus objects in, specified as a character vector. The file name must be unique. If you omit this argument, the function saves the created bus objects in a cell array, not in a file.

`format` — Format for storing bus objects in file

`'cell'` (default) | `'object'`

Format for storing bus objects in file, specified as either `'cell'` or `'object'`. The cell format is more compact, but the object format is easier to read.

Output Arguments

`busInfo` — Bus information for specified blocks

structure array

Bus information for specified blocks, returned as a structure array. Each element of the structure array corresponds to one block and contains these fields:

- `block` – Handle of the block
- `busName` – Name of the bus object associated with the block

Tips

If you specify a model name, the model must compile successfully before you use the `Simulink.Bus.createObject` command.

Simulink.Bus.objectToCell

Use bus objects to create cell array containing bus information

Syntax

```
cells = Simulink.Bus.objectToCell(busNames)
cells = Simulink.Bus.objectToCell(busNames,scope)
```

Description

`cells = Simulink.Bus.objectToCell(busNames)` creates a cell array of bus information from a set of bus objects in the MATLAB base workspace. The cell array contains subordinate cell arrays that define each bus object. The order of elements in the output cell array corresponds to the order of names in the input cell array.

`cells = Simulink.Bus.objectToCell(busNames,scope)` specifies whether the bus objects reside in the MATLAB base workspace or a data dictionary.

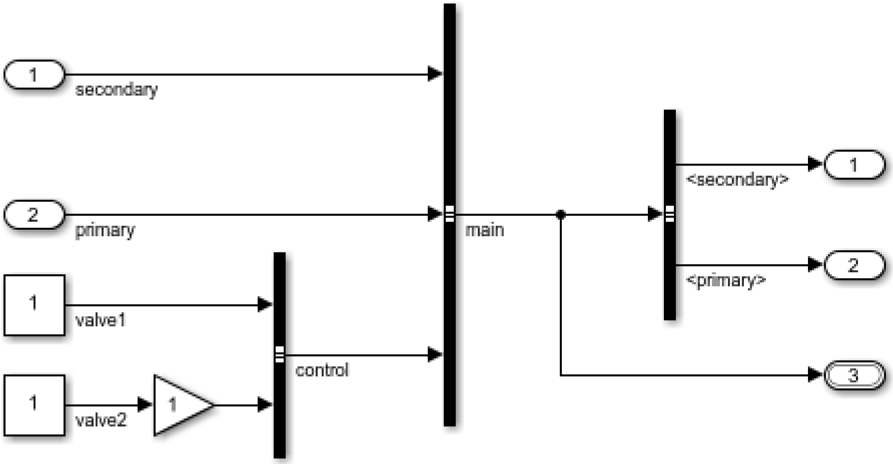
Examples

Create Cell Array Containing Bus Object Information

Use the `Simulink.Bus.objectToCell` function to create a cell array of information about bus objects in the base workspace.

Open a model that has two bus objects defined, `CONTROL` and `MAIN`.

```
open_system(fullfile(matlabroot,'examples','simulink',...
    'ex_bus_object_tutorial_using_objects'))
```



Create a cell array of information about the `CONTROL` bus object.

```
cells = Simulink.Bus.objectToCell({'CONTROL'});
cells{1}
```

```
ans =

  1x6 cell array

    {'CONTROL'}    {0x0 char}    {0x0 char}    {'Auto'}    {'-1'}    {2x1 cell}
```

Input Arguments

busNames — Names of bus objects

cell array of bus object names

Bus objects for which to create cell arrays of bus object information, specified as a cell array. Specify the bus object names as character vectors. If `busNames` is empty, the function converts all bus objects in the base workspace or data dictionary.

Example: `cells = Simulink.Bus.objectToCell({'busObject'})`

`scope` — Source of bus objects

character vector

Data dictionary or the MATLAB base workspace, specified as a character vector. If `scope` is empty, the function uses the base workspace.

Example: `cells = Simulink.Bus.objectToCell({},dataDictionaryObject)`

Output Arguments

`cells` — Bus object information

cell array of cell arrays

Bus object information, specified as a cell array of cell arrays. Each subordinate cell array contains this bus object information:

1. Bus name
2. Header file
3. Description
4. Data scope
5. Alignment
6. Elements

The elements field is an array that contains this data for each bus element:

1. Bus element name
2. Dimensions
3. Data type
4. Sample time
5. Complexity
6. Sampling mode

The elements field also contains this data if available:

1. Dimensions mode
2. Minimum

3. Maximum
4. Units
5. Description

Tips

The inverse function is `Simulink.Bus.cellToObject`.

Compatibility Considerations

`Simulink.BusElement` objects will no longer support the `SamplingMode` property

Not recommended starting in R2016b

In R2016b, the `SamplingMode` property of `Simulink.BusElement` objects was removed. Scripts that use the `SamplingMode` property of `Simulink.BusElement` objects continue to work. `Simulink.Bus.cellToObject` continues to require the `SamplingMode` field and `Simulink.Bus.objectToCell` continues to include the sampling mode in the output cell arrays.

In a future release, support for `SamplingMode` will be removed.

To specify whether a signal is sample-based or frame-based, define the sampling mode of input signals at the block level instead of at the signal level.

“Save and Import Bus Objects”

Introduced in R2007a

Simulink.Bus.save

Save bus objects in MATLAB file

Syntax

```
Simulink.Bus.save(fileName)
Simulink.Bus.save(fileName,format)
Simulink.Bus.save(fileName,format,busNames)
```

Description

`Simulink.Bus.save(fileName)` saves all bus objects (instances of `Simulink.Bus` class) that are in the MATLAB base workspace in a MATLAB file that contains a cell array of cell arrays. Each subordinate cell array represents a bus object and contains this data:

- Bus name
- Header file
- Description
- Data scope
- Alignment
- Elements

The elements field is an array containing this data for each element:

- Element name
- Dimensions
- Data type
- Sample time
- Complexity
- Dimensions mode
- Minimum

- Maximum
- Units
- Description

`Simulink.Bus.save(fileName,format)` saves the bus objects in a MATLAB file that contains either a cell array of bus information or the bus objects themselves.

`Simulink.Bus.save(fileName,format,busNames)` saves only those bus objects whose names appear in `busNames`.

Examples

Save a Bus Object

Use the `Simulink.Bus.save` function to save a bus object.

Define a cell array of bus object information.

```
busCell = { ...
        { ...
            'myBusObj', ...
            'MyHeader.h', ...
            'My description', ...
            'Exported', ...
            '-1', ...
            {{'a',1,'double',[0.2 0],'real','Frame'}; ...
            {'b',1,'double',[0.2 0],'real','Sample'}},...
            }, ...
        };
```

Create `myBusObj` bus object from the cell array.

```
Simulink.Bus.cellToObject(busCell);
```

Save the bus object in the `BusCellFile1` file, in cell format.

```
fileName = 'BusCellFile1';
Simulink.Bus.save(fileName);
```

Save the bus object in bus format.

```
Simulink.Bus.save('BusObjFile','object');
```

Save `myBusObj` in cell format in `BusCellFile2.m`.

```
Simulink.Bus.save('BusCellFile2','cell',{'myBusObj'});
```

Input Arguments

`fileName` — File in which to store bus objects

character vector

File in which to store bus objects, specified as a character vector.

`format` — Format for storing bus objects in file

`'cell'` (default) | `'object'`

Format for storing bus objects in file, specified as either `'cell'` or `'object'`. The cell format is more compact, but the object format is easier to read.

`busNames` — Bus objects to save

cell array of bus objects

Bus objects to save, specified as a cell array of bus objects. Only the specified bus objects in the base workspace are saved.

Tips

Executing a MATLAB file created by `Simulink.Bus.save` in cell array format calls `Simulink.Bus.cellToObject` to recreate the bus objects and returns the new bus objects in the cell array. To suppress the creation of bus objects, specify the optional argument `'false'` when you execute the MATLAB file.

Simulink.clearIntEnumType

Delete enumeration classes defined by `Simulink.defineIntEnumType`

Syntax

```
Simulink.clearIntEnumType(typeName)
Simulink.clearIntEnumType()
```

Description

`Simulink.clearIntEnumType(typeName)` deletes a specific enumeration class that is defined by `Simulink.defineIntEnumType`. The function generates a warning if the class name is invalid or if a class cannot be deleted because instances of the class exist.

`Simulink.clearIntEnumType()` deletes all enumeration classes that are defined by `Simulink.defineIntEnumType`. The function generates a warning if a class cannot be deleted because instances of the class exist.

Examples

Delete a Specific Dynamic Enumerated Data Type

Define an enumeration type and confirm that it has been created.

```
Simulink.defineIntEnumType('myEnumType', {'e1', 'e2'}, [1 2]);
myResult = Simulink.findIntEnumType('myEnumType')
```

Delete the enumeration type that you created and confirm that it is no longer there.

```
Simulink.clearIntEnumType('myEnumType');
myResult = Simulink.findIntEnumType('myEnumType')
```

Delete All Dynamic Enumerated Data Types

Define two enumeration types and confirm that they have been created.

```
Simulink.defineIntEnumType('myEnumType1', {'e1', 'e2'}, [1 2]);
Simulink.defineIntEnumType('myEnumType2', {'e3', 'e4'}, [3 4]);
myResult = Simulink.findIntEnumType()
```

Delete all enumeration types and confirm that no enumeration types exist.

```
Simulink.clearIntEnumType();
myResult = Simulink.findIntEnumType()
```

Input Arguments

`typeName` — Name of enumeration class

character vector or string

Name of a specific enumeration class that is defined by `Simulink.defineIntEnumType`, specified as a character vector or string.

Example: `'myEnumType'`

Data Types: `char` | `string`

See Also

`enumeration` | `Simulink.defineIntEnumType` | `Simulink.findIntEnumType`

Introduced in R2018b

Simulink.createFromTemplate

Create model or project from template

Syntax

```
Simulink.createFromTemplate(templatename)
h = Simulink.createFromTemplate(templatename)
h = Simulink.createFromTemplate(templatename,Name,Value)
```

Description

`Simulink.createFromTemplate(templatename)` creates a model or a project from the template file specified by `templatename`.

`h = Simulink.createFromTemplate(templatename)` creates a model or a project from the template file and returns `h`, either a numeric model handle or a `simulinkproject` object.

`h = Simulink.createFromTemplate(templatename,Name,Value)` specifies additional options as one or more Name, Value pair arguments.

Examples

Create a Model From a Template

```
Simulink.createFromTemplate('simple_simulation.sltx')
```

Create a Project From a Template and Get the Handle

Create a project from a template, specify the name and root folder, and return the handle to the new project (a `simulinkproject` object) for manipulating it programmatically.

```
proj = Simulink.createFromTemplate('code_generation_example.sltx','Name','myProject','F
```

Input Arguments

`templatename` — Template file name
character vector

Template file name, specified as a character vector. If the template is not on the MATLAB path, specify the fully-qualified path to the template file and `*.sltx` extension.

Example:

Data Types: `char`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example:

`Folder` — Project root folder
character vector

Project root folder, if creating a new project, specified as a character vector.

Data Types: `char`

`Name` — New model or project name
character vector

New model or project name, specified as a character vector.

Data Types: `char`

Output Arguments

`h` — Handle
numeric handle | `simulinkproject`

Handle to the new model project, returned either as a numeric model handle or a `simulinkproject` object.

Introduced in R2016a

Simulink.data.assigninGlobal

Modify variable values in context of Simulink model

Syntax

```
Simulink.data.assigninGlobal(modelName,varName,varValue)
```

Description

`Simulink.data.assigninGlobal(modelName,varName,varValue)` assigns the value `varValue` to the variable or data dictionary entry `varName` in the context of the Simulink model `modelName`. `assigninGlobal` creates the variable or data dictionary entry if it does not already exist. The function operates in the Design Data section of the data dictionary that is linked to the target model or in the MATLAB base workspace if the target model is not linked to any data dictionary.

If the target model is linked to a data dictionary that references other dictionaries, `assigninGlobal` searches for `varName` in the entire dictionary hierarchy. If `assigninGlobal` does not find a matching entry, the function creates an entry in the dictionary that is linked to the target model.

Examples

Modify Variable in Model With or Without Data Dictionary

Create a variable `myNewVariable` with value `237` in the context of the Simulink model `vdp.slx`, which is not linked to any data dictionary. `myNewVariable` appears as a variable in the MATLAB base workspace.

```
Simulink.data.assigninGlobal('vdp','myNewVariable',237)
```

Create a variable `myNewEntry` with value `true` in the context of the Simulink model `sldemo_fuelsys_dd_controller.slx`, which is linked to the data dictionary sldemo_fuelsys_dd_controller.sldd. The entry myNewEntry appears in the Design Data section of the dictionary.

```
Simulink.data.assigninGlobal('sldemo_fuelsys_dd_controller',...
'myNewEntry',true)
```

Confirm the addition of myNewEntry to the data dictionary sldemo_fuelsys_dd_controller.sldd by viewing the dictionary in Model Explorer.

```
myDictionaryObj = Simulink.data.dictionary.open(...
'sldemo_fuelsys_dd_controller.sldd');
show(myDictionaryObj)
```

Input Arguments

modelName — Name of target Simulink model

character vector

Name of target Simulink model, specified as a character vector.

Example: 'myTestModel'

Data Types: char

varName — Name of target variable or data dictionary entry

character vector

Name of target variable or data dictionary entry, specified as a character vector.

Example: 'myTargetVariable'

Data Types: char

varValue — Value to assign to variable or data dictionary entry

MATLAB expression

Value to assign to variable or data dictionary entry, specified as a MATLAB expression that returns any valid data type or data dictionary content.

Example: 27.5

Example: myBaseWorkspaceVariable

Example: Simulink.Parameter

Tips

- `assigninGlobal` helps you transition Simulink models to using data dictionaries. You can use the function to assign values to model variables before and after linking a model to a data dictionary.

See Also

`Simulink.data.dictionary.open` | `Simulink.data.evalinGlobal` | `Simulink.data.existsInGlobal`

Introduced in R2015a

Simulink.data.dictionary.cleanupWorkerCache

Restore defaults after parallel simulation with data dictionary

Syntax

```
Simulink.data.dictionary.cleanupWorkerCache
```

Description

`Simulink.data.dictionary.cleanupWorkerCache` restores default settings after you have finished parallel simulation of a model that is linked to a data dictionary. Use this function in a `spmd` block, after you finish parallel simulation using `parfor` blocks, to restore default settings that were altered by the `Simulink.data.dictionary.setupWorkerCache` function.

During parallel simulation of a model that is linked to a data dictionary, you can allow each worker to access and modify the data in the dictionary independently of other workers. The function `Simulink.data.dictionary.setupWorkerCache` grants each worker a unique dictionary cache to allow independent access to the data, and the function `Simulink.data.dictionary.cleanupWorkerCache` restores cache settings to their default values.

You must have a Parallel Computing Toolbox license to perform parallel simulation using a `parfor` block.

Examples

Sweep Variant Control Using Parallel Simulation

To use parallel simulation to sweep a variant control (a `Simulink.Parameter` object whose value influences the variant condition of a `Simulink.Variant` object) that you store in a data dictionary, use this code as a template. Change the names and values of the model, data dictionary, and variant control to match your application.

To sweep block parameter values or the values of workspace variables that you use to set block parameters, use `Simulink.SimulationInput` objects instead of the programmatic interface to the data dictionary. See “Optimize, Estimate, and Sweep Block Parameter Values”.

You must have a Parallel Computing Toolbox license to perform parallel simulation.

```
% For convenience, define names of model and data dictionary
model = 'mySweepMdl';
dd = 'mySweepDD.sldd';

% Define the sweeping values for the variant control
CtrlValues = [1 2 3 4];

% Grant each worker in the parallel pool an independent data dictionary
% so they can use the data without interference
spmd
    Simulink.data.dictionary.setupWorkerCache
end

% Determine the number of times to simulate
numberOfSims = length(CtrlValues);

% Prepare a nondistributed array to contain simulation output
simOut = cell(1,numberOfSims);

parfor index = 1:numberOfSims
    % Create objects to interact with dictionary data
    % You must create these objects for every iteration of the parfor-loop
    dictObj = Simulink.data.dictionary.open(dd);
    sectObj = getSection(dictObj,'Design Data');
    entryObj = getEntry(sectObj,'MODE');
    % Suppose MODE is a Simulink.Parameter object stored in the data dictionary

    % Modify the value of MODE
    temp = getValue(entryObj);
    temp.Value = CtrlValues(index);
    setValue(entryObj,temp);

    % Simulate and store simulation output in the nondistributed array
    simOut{index} = sim(model);
    % Each worker must discard all changes to the data dictionary and
    % close the dictionary when finished with an iteration of the parfor-loop
    discardChanges(dictObj);
    close(dictObj);
end

% Restore default settings that were changed by the function
% Simulink.data.dictionary.setupWorkerCache
% Prior to calling cleanupWorkerCache, close the model

spmd
    bdclose(model)
    Simulink.data.dictionary.cleanupWorkerCache
end
```

Note If data dictionaries are open, you cannot use the command `Simulink.data.dictionary.cleanupWorkerCache`. To identify open data dictionaries, use `Simulink.data.dictionary.getOpenDictionaryPaths`.

Introduced in R2015a

Simulink.data.dictionary.closeAll

Close all connections to all open data dictionaries

Syntax

```
Simulink.data.dictionary.closeAll
Simulink.data.dictionary.closeAll(dictFileName)
Simulink.data.dictionary.closeAll(___,unsavedAction)
```

Description

`Simulink.data.dictionary.closeAll` attempts to close all connections to all data dictionaries that are open. For example, if you create objects, such as `Simulink.data.Dictionary`, that refer to a dictionary, that dictionary is open.

Some commands and functions, such as `Simulink.data.dictionary.cleanupWorkerCache`, cannot operate when dictionaries are open. It is a best practice to close each connection individually by using functions and methods such as the `close` method of a `Simulink.data.Dictionary` object. To find dictionaries that are open, use `Simulink.data.dictionary.getOpenDictionaryPaths`. However, you can use this function to close all connections to all dictionaries.

You can also use this function to close dictionaries in a shutdown script that is part of a Simulink Project.

`Simulink.data.dictionary.closeAll(dictFileName)` closes all connections to the dictionary named `dictFileName`. If you open multiple dictionaries that use this file name (for example, if the dictionaries have different file paths), the function closes all connections to all of the dictionaries.

You cannot specify `dictFileName` as a full file path such as `'C:\temp\myDict.sldd'`.

`Simulink.data.dictionary.closeAll(___,unsavedAction)` closes all connections to the target dictionaries by discarding or saving unsaved changes. You can choose whether to save or discard all changes to all of the target dictionaries.

Examples

Close All Connections to All Open Dictionaries

Discard any unsaved changes. All of the entries in the dictionaries revert to the last saved state.

```
Simulink.data.dictionary.closeAll('-discard')
```

Close All Connections to Single Data Dictionary

Open multiple connections to a data dictionary, make a change, and close all of the connections by discarding the unsaved change.

At the command prompt, open a data dictionary by creating a `Simulink.data.Dictionary` object that refers to the dictionary.

```
dictObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd.sldd');
```

Display the dictionary in the Model Explorer

```
show(dictObj)
```

You now have two connections to this dictionary: The `Simulink.data.Dictionary` object and the Model Explorer.

Make a change to the dictionary by adding an entry.

```
dDataSectObj = getSection(dictObj,'Design Data');
addEntry(dDataSectObj,'myEntry',5.2);
```

The `Simulink.data.dictionary.Section` object `dDataSectObj` is a third connection to the dictionary.

Close the connections to the dictionary. Discard the unsaved change.

```
Simulink.data.dictionary.closeAll('sldemo_fuelsys_dd.sldd','-discard')
```

The dictionary no longer appears as a node in the **Model Hierarchy** pane of the Model Explorer. The `Simulink.data.Dictionary` object `dictObj` is disconnected from the dictionary. You cannot interact with the dictionary by using the `Simulink.data.dictionary.Section` object `dDataSectObj`.

Clear the objects that referred to the dictionary.

```
clear dictObj dDataSectObj
```

Input Arguments

`dictFileName` — File name of target data dictionary or dictionaries

character vector

File name of target data dictionary or dictionaries, specified as a character vector. Use the file extension `sldd`.

Example: `'myDict.sldd'`

Data Types: `char`

`unsavedAction` — Action for unsaved changes

`'-discard'` | `'-save'`

Action for unsaved changes, specified as `'-discard'` (to discard changes) or `'-save'` (to save changes).

Tips

A data dictionary is open if any of these conditions are true:

- The dictionary appears as a node in the **Model Hierarchy** pane of the Model Explorer. To close this connection to the dictionary, right-click the node in Model Explorer and select **Close**. Alternatively, use the `hide` method of a `Simulink.data.Dictionary` object.
- You created an object of any of these classes that refer to the dictionary:

  - `Simulink.data.Dictionary`
  - `Simulink.data.dictionary.Section`
  - `Simulink.data.dictionary.Entry`

To close these connections to the dictionary, use the `close` method of the `Simulink.data.Dictionary` object or clear the object. Clear the `Simulink.data.dictionary.Section` and `Simulink.data.dictionary.Entry` objects.

- A model that is linked to the dictionary is open. To close this connection to the dictionary, close the model.

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2016a

Simulink.data.dictionary.create

Create new data dictionary and create `Simulink.data.Dictionary` object

Syntax

```
dictionaryObj = Simulink.data.dictionary.create(dictionaryFile)
```

Description

`dictionaryObj = Simulink.data.dictionary.create(dictionaryFile)` creates a data dictionary file in your current working folder or in a file path you can specify in `dictionaryFile`. The function returns a `Simulink.data.Dictionary` object representing the new data dictionary.

Examples

Create New Data Dictionary and Data Dictionary Object

Create a data dictionary `myNewDictionary.sldd` in your current working folder and a `Simulink.data.Dictionary` object representing the new data dictionary. Assign the object to the variable `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.create('myNewDictionary.sldd')
```

```
myDictionaryObj = 

  data dictionary with properties:

          DataSources: {0x1 cell}
```

```
    HasUnsavedChanges: 0
          NumberOfEntries: 0
```

Input Arguments

`dictionaryFile` — Name of new data dictionary

character vector

Name of new data dictionary, specified as a character vector containing the file name and, optionally, path of the dictionary to create. If you do not specify a path, `Simulink.data.dictionary.create` creates the new data dictionary file in your working MATLAB folder. `Simulink.data.dictionary.create` also supports file paths specified relative to your working folder.

Example: `'myDictionary.sldd'`

Example: `'C:\Users\jsmith\myDictionary.sldd'`

Example: `'..\myOtherDictionary.sldd'`

Data Types: `char`

Output Arguments

`dictionaryObj` — Newly created data dictionary

`Simulink.data.Dictionary` object

Newly created data dictionary, returned as a `Simulink.data.Dictionary` object.

Alternatives

You can use the Simulink Editor to create a data dictionary and link it to a model. See “Migrate Single Model to Use Dictionary” for more information.

Introduced in R2015a

Simulink.data.dictionary.getOpenDictionaryPaths

Return file names and paths of open data dictionaries

Syntax

```
openDDs = Simulink.data.dictionary.getOpenDictionaryPaths
openDDs = Simulink.data.dictionary.getOpenDictionaryPaths(
dictFileName)
```

Description

`openDDs = Simulink.data.dictionary.getOpenDictionaryPaths` returns the file names and paths of all data dictionaries that are open. For example, a data dictionary is open if you create objects, such as `Simulink.data.Dictionary`, that refer to the dictionary. If you open two or more dictionaries that have the same file name but different file paths, this function returns multiple file paths.

Before executing commands and functions that cannot operate when dictionaries are open, use this function to identify open dictionaries so that you can close them. For example, when you run parallel simulations as described in “Sweep Variant Control Using Parallel Simulation”, this function helps you identify open dictionaries before executing the command `Simulink.data.dictionary.cleanupWorkerCache`.

`openDDs = Simulink.data.dictionary.getOpenDictionaryPaths( dictFileName)` returns the file paths of data dictionaries that have the file name `dictFileName`. If you open two or more dictionaries that have the same file name but different file paths, you can use this syntax to return all of the file paths.

Examples

Identify and Close All Open Data Dictionaries

Open, identify, and close a data dictionary. After you close the connections to the dictionary, you can use commands and functions, such as `Simulink.data.dictionary.cleanupWorkerCache`, that cannot operate when dictionaries are open.

At the command prompt, open a data dictionary by creating a `Simulink.data.Dictionary` object that refers to the dictionary.

```
dictObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd.sldd');
```

Display the dictionary in the Model Explorer

```
show(dictObj)
```

Identify all of the dictionaries that are open.

```
openDDs = Simulink.data.dictionary.getOpenDictionaryPaths;
```

The file path of the dictionary that you opened, `sldemo_fuelsys_dd.sldd`, appears in the cell array of character vectors `openDDs`.

Close the connection from the Model Explorer to the dictionary.

```
hide(dictObj)
```

The dictionary no longer appears as a node in the **Model Hierarchy** pane of the Model Explorer.

Close the connection from the `Simulink.data.Dictionary` object to the dictionary.

```
close(dictObj)
clear dictObj
```

Input Arguments

`dictFileName` — File name of target data dictionary or dictionaries

character vector

File name of target data dictionary or dictionaries, specified as a character vector. Use the file extension `sldd`.

Example: `'myDict.sldd'`

Data Types: `char`

Output Arguments

`openDDs` — File names and paths of open data dictionaries
cell array of character vectors

File names and paths of open data dictionaries, returned as a cell array of character vectors.

Tips

A data dictionary is open if any of these conditions are true:

- The dictionary appears as a node in the **Model Hierarchy** pane of the Model Explorer. To close this connection to the dictionary, right-click the node in Model Explorer and select **Close**. Alternatively, use the `hide` method of a `Simulink.data.Dictionary` object.
- You created an object of any of these classes that refer to the dictionary:
  - `Simulink.data.Dictionary`
  - `Simulink.data.dictionary.Section`
  - `Simulink.data.dictionary.Entry`

  To close these connections to the dictionary, use the `close` method of the `Simulink.data.Dictionary` object or clear the object. Clear the `Simulink.data.dictionary.Section` and `Simulink.data.dictionary.Entry` objects.
- A model that is linked to the dictionary is open. To close this connection to the dictionary, close the model.

See Also

Topics

"Store Data in Dictionary Programmatically"

Introduced in R2016a

Simulink.data.dictionary.open

Open data dictionary for editing

Syntax

```
dictionaryObj = Simulink.data.dictionary.open(dictionaryFile)
```

Description

`dictionaryObj = Simulink.data.dictionary.open(dictionaryFile)` opens the specified data dictionary and returns a `Simulink.data.Dictionary` object representing an existing data dictionary identified by its file name and, optionally, file path with `dictionaryFile`.

Make sure any dictionaries referenced by the target dictionary are on the MATLAB path.

Examples

Open Existing Data Dictionary

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd')
```

```
myDictionaryObj = 

  Dictionary with properties:

          DataSources: {'myRefDictionary_ex_API.sldd'}
```

```
    HasUnsavedChanges: 0
          NumberOfEntries: 4
```

Input Arguments

`dictionaryFile` — Target data dictionary

character vector

Target data dictionary, specified as a character vector containing the file name and, optionally, path of the dictionary. If you do not specify a path, `Simulink.data.dictionary.open` searches the MATLAB path for the specified file. `Simulink.data.dictionary.open` also supports paths specified relative to the MATLAB working folder.

Example: `'myDictionary_ex_API.sldd'`

Example: `'C:\Users\jsmith\myDictionary_ex_API.sldd'`

Example: `'..\myOtherDictionary.sldd'`

Data Types: `char`

Simulink.data.dictionary.setupWorkerCache

Enable parallel simulation with data dictionary

Syntax

```
Simulink.data.dictionary.setupWorkerCache
```

Description

`Simulink.data.dictionary.setupWorkerCache` prepares the workers in a parallel pool for simulating a model that is linked to a data dictionary. Use this function in a `spmd` block, prior to starting a `parfor` block, to provide the workers in a parallel pool a way to safely interact with a single data dictionary.

During parallel simulation of a model that is linked to a data dictionary, you can allow each worker to access and modify the data in the dictionary independently of other workers. `Simulink.data.dictionary.setupWorkerCache` temporarily provides each worker in the pool with its own data dictionary cache, allowing the workers to use the data in the dictionary without permanently changing it.

You must have a Parallel Computing Toolbox license to perform parallel simulation using a `parfor` block.

Examples

Sweep Variant Control Using Parallel Simulation

To use parallel simulation to sweep a variant control (a `Simulink.Parameter` object whose value influences the variant condition of a `Simulink.Variant` object) that you store in a data dictionary, use this code as a template. Change the names and values of the model, data dictionary, and variant control to match your application.

To sweep block parameter values or the values of workspace variables that you use to set block parameters, use `Simulink.SimulationInput` objects instead of the programmatic interface to the data dictionary. See “Optimize, Estimate, and Sweep Block Parameter Values”.

You must have a Parallel Computing Toolbox license to perform parallel simulation.

```
% For convenience, define names of model and data dictionary
model = 'mySweepMdl';
dd = 'mySweepDD.sldd';

% Define the sweeping values for the variant control
CtrlValues = [1 2 3 4];

% Grant each worker in the parallel pool an independent data dictionary
% so they can use the data without interference
spmd
    Simulink.data.dictionary.setupWorkerCache
end

% Determine the number of times to simulate
numberOfSims = length(CtrlValues);

% Prepare a nondistributed array to contain simulation output
simOut = cell(1,numberOfSims);

parfor index = 1:numberOfSims
    % Create objects to interact with dictionary data
    % You must create these objects for every iteration of the parfor-loop
    dictObj = Simulink.data.dictionary.open(dd);
    sectObj = getSection(dictObj,'Design Data');
    entryObj = getEntry(sectObj,'MODE');
    % Suppose MODE is a Simulink.Parameter object stored in the data dictionary

    % Modify the value of MODE
    temp = getValue(entryObj);
    temp.Value = CtrlValues(index);
    setValue(entryObj,temp);

    % Simulate and store simulation output in the nondistributed array
    simOut{index} = sim(model);

    % Each worker must discard all changes to the data dictionary and
    % close the dictionary when finished with an iteration of the parfor-loop
    discardChanges(dictObj);
    close(dictObj);
```

```
end

% Restore default settings that were changed by the function
% Simulink.data.dictionary.setupWorkerCache
% Prior to calling cleanupWorkerCache, close the model

spmd
    bdclose(model)
    Simulink.data.dictionary.cleanupWorkerCache
end
```

Note If data dictionaries are open, you cannot use the command `Simulink.data.dictionary.cleanupWorkerCache`. To identify open data dictionaries, use `Simulink.data.dictionary.getOpenDictionaryPaths`.

Introduced in R2015a

Simulink.data.evalinGlobal

Evaluate MATLAB expression in context of Simulink model

Syntax

```
returnValue = Simulink.data.evalinGlobal(modelName,expression)
```

Description

`returnValue = Simulink.data.evalinGlobal(modelName,expression)` evaluates the MATLAB expression `expression` in the context of the Simulink model `modelName` and returns the values returned by `expression`. `evalinGlobal` evaluates `expression` in the Design Data section of the data dictionary that is linked to the target model or in the MATLAB base workspace if the target model is not linked to any data dictionary.

Examples

Evaluate MATLAB Expression in Model With or Without Data Dictionary

Evaluate the MATLAB expression `myNewVariable = 237;` in the context of the model `vdp`, which is not linked to any data dictionary. `myNewVariable` appears as a variable in the MATLAB base workspace.

```
Simulink.data.evalinGlobal('vdp','myNewVariable = 237;')
```

Evaluate the MATLAB expression `myNewEntry = true;` in the context of the model `sldemo_fuelsys_dd_controller`, which is linked to the data dictionary `sldemo_fuelsys_dd_controller.sldd`. `myNewEntry` appears as an entry in the Design Data section of the dictionary.

```
Simulink.data.evalinGlobal('sldemo_fuelsys_dd_controller',...
'myNewEntry = true;')
```

Confirm the creation of the entry myNewEntry in the data dictionary sldemo_fuelsys_dd_controller.sldd by viewing the dictionary in Model Explorer.

```
myDictionaryObj = Simulink.data.dictionary.open(...
'sldemo_fuelsys_dd_controller.sldd');
show(myDictionaryObj)
```

Input Arguments

modelName — Name of target Simulink model

character vector

Name of target Simulink model, specified as a character vector.

Example: 'myTestModel'

Data Types: char

expression — MATLAB expression to evaluate

character vector

MATLAB expression to evaluate, specified as a character vector.

Example: 'a = 5.3'

Example: 'whos'

Example: 'CurrentSpeed.Value = 290.73'

Data Types: char

Output Arguments

returnValue — Value returned by specified expression

valid entry or variable value

Value returned by the specified MATLAB expression.

Tips

- `evalinGlobal` helps you transition Simulink models to the use of data dictionaries. You can use the function to manipulate model variables before and after linking a model to a data dictionary.

See Also

`Simulink.data.assigninGlobal` | `Simulink.data.existsInGlobal` | `evalin`

Topics

"Store Data in Dictionary Programmatically"

Introduced in R2015a

Simulink.data.existsInGlobal

Check existence of variable in context of Simulink model

Syntax

```
varExists = Simulink.data.existsInGlobal(modelName,varName)
```

Description

`varExists = Simulink.data.existsInGlobal(modelName,varName)` returns an indication of the existence of a variable or data dictionary entry `varName` in the context of the Simulink model `modelName`. `Simulink.data.existsInGlobal` searches the Design Data section of the data dictionary that is linked to the target model or the MATLAB base workspace if the target model is not linked to any data dictionary.

Examples

Determine Existence of Variable in Model With or Without Data Dictionary

Determine the existence of a variable `PressVect` in the context of the Simulink model `vdp.slx`, which is not linked to any data dictionary.

```
Simulink.data.existsInGlobal('vdp','PressVect')
```

```
ans =

     0
```

Because `vdp.slx` is not linked to any data dictionary, `existsInGlobal` searches only in the MATLAB base workspace for `PressVect`.

Determine the existence of a variable `PressVect` in the context of the Simulink model `sldemo_fuelsys_dd_controller.slx`, which is linked to the data dictionary `sldemo_fuelsys_dd_controller.sldd`.

```
Simulink.data.existsInGlobal('sldemo_fuelsys_dd_controller','PressVect')

ans =

     1
```

Because `sldemo_fuelsys_dd_controller.slx` is linked to the data dictionary `sldemo_fuelsys_dd_controller.sldd`, `existsInGlobal` searches for `PressVect` only in the Design Data section of the dictionary.

Input Arguments

`modelName` — Name of target Simulink model
character vector

Name of target Simulink model, specified as a character vector.

Example: `'myTestModel'`

Data Types: `char`

`varName` — Name of target variable or data dictionary entry
character vector

Name of target variable or data dictionary entry, specified as a character vector.

Example: `'myTargetVariable'`

Data Types: `char`

Output Arguments

`varExists` — Indication of existence of target variable or data dictionary entry
`1` | `0`

Indication of existence of target variable or data dictionary entry, returned as `1` to indicate existence or `0` to indicate absence.

Tips

- `existsInGlobal` helps you transition Simulink models to the use of data dictionaries. You can use the function to find model variables before and after linking a model to a data dictionary.

Alternatives

You can use Model Explorer to search a data dictionary or any workspace for entries or variables.

See Also

`Simulink.data.assigninGlobal` | `Simulink.data.evalinGlobal` | `exist`

Topics

"Store Data in Dictionary Programmatically"

Introduced in R2015a

Simulink.data.getEnumTypeInfo

Get information about enumerated data type

Syntax

```
information = Simulink.data.getEnumTypeInfo(enumTypeName,
infoRequest)
```

Description

`information = Simulink.data.getEnumTypeInfo(enumTypeName, infoRequest)` returns information about an enumerated data type `enumTypeName`.

Use this function only to return information about an enumerated data type. To customize an enumerated data type, for example, by specifying a default enumeration member or by controlling the scope of the type definition in generated code, see “Customize Simulink Enumeration”.

Examples

Return Default Value of Enumerated Data Type

Get the default enumeration member of an enumerated data type `LEDcolor`. Suppose `LEDcolor` defines two enumeration members, `GREEN` and `RED`, and uses `GREEN` as the default member.

```
Simulink.data.getEnumTypeInfo('LEDcolor','DefaultValue')
```

```
ans = 

    GREEN
```

Get Scope of Enumerated Data Type Definition in Generated Code

For an enumerated data type `LEDcolor`, find out if generated code exports or imports the definition of the type to or from a header file.

```
Simulink.data.getEnumTypeInfo('LEDcolor','DataScope')
Simulink.data.getEnumTypeInfo('LEDcolor','HeaderFile')
```

```
ans =

Auto

ans =

     ''
```

Because `DataScope` is `'Auto'` and `HeaderFile` is empty, generated code defines the enumerated data type `LEDcolor` in the header file *`model`*`_types.h` where *`model`* is the name of the model used to generate code.

Input Arguments

enumTypeName — Name of target enumerated data type
character vector

Name of the target enumerated data type, specified as a character vector.

Example: `'myFirstEnumType'`

Data Types: `char`

`infoRequest` — Information to return
valid character vector

Information to return, specified as one of the character vector options in the table.

Specified value	Information returned	Example return value
`'DefaultValue'`	The default enumeration member, returned as an instance of the enumerated data type.	`enumMember1`

Specified value	Information returned	Example return value
`'Description'`	The custom description of this data type, returned as a character vector. Returns an empty character vector if a description was not specified for the type.	`'My first enum type.'`
`'HeaderFile'`	The name of the custom header file that defines the data type in generated code, returned as a character vector. Returns an empty character vector if a header file was not specified for the type.	`'myEnumType.h'`
`'DataScope'`	Indication whether generated code imports or exports the definition of the data type. A return value of `'Auto'` indicates generated code defines the type in the header file *`model`*`_types.h` or imports the definition from the header file identified by `HeaderFile`. A return value of `'Exported'` or `'Imported'` indicates generated code exports or imports the definition to or from the header file identified by `HeaderFile`.	`'Exported'`
`'StorageType'`	The integer data type used by generated code to store the numeric values of the enumeration members, returned as a character vector. Returns `'int'` if you did not specify a storage type for the enumerated type, in which case generated code uses the native integer type of the hardware target.	`'int32'`
`'AddClassNameToEnumNames'`	Indication whether generated code prefixes the names of enumeration members with the name of the data type. Returned as `true` or `false`.	`true`

Introduced in R2014b

Simulink.defineIntEnumType

Define enumerated data type

Syntax

```
Simulink.defineIntEnumType(ClassName, CellOfEnums, IntValues)
Simulink.defineIntEnumType(ClassName, CellOfEnums, IntValues,
'Description', ClassDesc)
Simulink.defineIntEnumType(ClassName, CellOfEnums, IntValues,
'DefaultValue', DefValue)
Simulink.defineIntEnumType(ClassName, CellOfEnums, IntValues,
'DataScope', ScopeSelection)
Simulink.defineIntEnumType(ClassName, CellOfEnums, IntValues,
'HeaderFile', FileName)
Simulink.defineIntEnumType(ClassName, CellOfEnums, IntValues,
'AddClassNameToEnumNames', Flag)
Simulink.defineIntEnumType(ClassName, CellOfEnums, IntValues,
'StorageType', DataType)
```

Description

`Simulink.defineIntEnumType(`*`ClassName`*`, `*`CellOfEnums`*`, `*`IntValues`*`)` defines an enumeration named *`ClassName`* with enumeration values specified with *`CellOfEnums`* and underlying numeric values specified by *`IntValues`*.

`Simulink.defineIntEnumType(`*`ClassName`*`, `*`CellOfEnums`*`, `*`IntValues`*`, 'Description', `*`ClassDesc`*`)` defines the enumeration with a description (character vector).

`Simulink.defineIntEnumType(`*`ClassName`*`, `*`CellOfEnums`*`, `*`IntValues`*`, 'DefaultValue', `*`DefValue`*`)` defines a default value for the enumeration, which is one of the character vectors you specify for *`CellOfEnums`*.

`Simulink.defineIntEnumType(`*`ClassName`*`, `*`CellOfEnums`*`, `*`IntValues`*`, 'DataScope', `*`ScopeSelection`*`)` specifies whether the data type definition should be imported from, or exported to, a header file during code generation.

`Simulink.defineIntEnumType(`*`ClassName`*`, `*`CellOfEnums`*`, `*`IntValues`*`, 'HeaderFile', `*`FileName`*`)` specifies the name of a header file containing the enumeration class definition for use in code generated from a model.

`Simulink.defineIntEnumType(`*`ClassName`*`, `*`CellOfEnums`*`, `*`IntValues`*`, 'AddClassNameToEnumNames', `*`Flag`*`)` specifies whether the code generator applies the class name as a prefix to the enumeration values that you specify for *`CellOfEnums`*. For *`Flag`*, specify `true` or `false`. For example, if you specify `true`, the code generator would use `BasicColors.Red` instead of `Red` to represent an enumerated value.

`Simulink.defineIntEnumType(`*`ClassName`*`, `*`CellOfEnums`*`, `*`IntValues`*`, 'StorageType', `*`DataType`*`)` specifies the data type used to store the enumerations' underlying integer values in code generated from a model.

Input Arguments

ClassName

The name of the enumerated data type.

CellOfEnums

A cell array of character vectors that defines the enumerations for the data type.

IntValues

An array of numeric values that correspond to enumerations of the data type.

'Description', ClassDesc

Specifies a character vector that describes the enumeration data type.

'DefaultValue', DefValue

Specifies the default enumeration value.

'HeaderFile', FileName

Specifies a character vector naming the header file that is to contain the data type definition.

By default, the generated #include directive uses the preprocessor delimiter " instead of < and >. To generate the directive #include <myTypes.h>, specify FileName as '<myTypes.h>'.

'DataScope', 'Auto' | 'Exported' | 'Imported'

Specifies whether the data type definition should be imported from, or exported to, a header file during code generation.

Value	Action
Auto (default)	If no value is specified for Headerfile, export the type definition to *model*_types.h, where *model* is the model name. If a value is specified for Headerfile, import the data type definition from the specified header file.
Exported	Export the data type definition to a header file. If no value is specified for Headerfile, the header file name defaults to *type*.h, where *type* is the data type name.
Imported	Import the data type definition from a header file. If no value is specified for Headerfile, the header file name defaults to *type*.h, where *type* is the data type name.

'AddClassNameToEnumNames', Flag

A logical flag that specifies whether code generator applies the class name as a prefix to the enumerations.

'StorageType', DataType

Specifies a character vector that identifies the data type used to store the enumerations' underlying integer values in generated code. The following data types are supported: 'int8', 'int16', 'int32', 'uint8', or 'uint16'.

Examples

Assume an external data dictionary includes the following enumeration:

```
BasicColors.Red(0), BasicColors.Yellow(1), BasicColors.Blue(2)
```

Import the enumeration class definition into the MATLAB workspace while specifying `int16` as the underlying integer data type for generated code:

```
Simulink.defineIntEnumType('BasicColors', ...
    {'Red', 'Yellow', 'Blue'}, ...
    [0;1;2], ...
    'Description', 'Basic colors', ...
    'DefaultValue', 'Blue', ...
    'HeaderFile', 'mybasiccolors.h', ...
    'DataScope', 'Exported', ...
    'AddClassNameToEnumNames', true, ...
    'StorageType', 'int16');
```

Introduced in R2010b

Simulink.defaultModelTemplate

Set or get default model template

Syntax

```
Simulink.defaultModelTemplate(templatename)
templatepath = Simulink.defaultModelTemplate
```

Description

`Simulink.defaultModelTemplate(templatename)` sets the template file specified by `templatename` as the default model template to use for new models. This setting is persistent between Simulink sessions.

`templatepath = Simulink.defaultModelTemplate` gets the full path to the current default model template.

Examples

Set the default model template

```
Simulink.defaultModelTemplate('simple_simulation.sltx')
```

Get the default model template

```
mydefaulttemplate = Simulink.defaultModelTemplate
```

Clear and restore the default model template

Use `set_param` to set a root block diagram parameter. This clears the default template so that new models will inherit this property of the root block diagram, and warns.

```
set_param(0,'StopTime','99');
```

Restore the default template.

```
Simulink.defaultModelTemplate('$restore');
```

Input Arguments

`templatename` — Template file name

character vector

Template file name, specified as a character vector. If the template is not on the MATLAB path, specify the fully-qualified path to the template file and `*.sltx` extension.

Example: \\Home\username\Documents\MATLAB\template.sltx

Data Types: `char`

Output Arguments

`templatepath` — Template path

character vector

Template path, specified as a character vector, showing the full path to the current default model template.

Introduced in R2016b

Simulink.exportToTemplate

Create template from model or project

Syntax

```
templatefile = Simulink.exportToTemplate(obj,templatename)
templatefile = Simulink.exportToTemplate(obj,templatename,
Name,Value)
```

Description

`templatefile = Simulink.exportToTemplate(obj,templatename)` creates a template file (*`templatename`*`.sltx`) from a model or project specified by `obj`.

If you have project templates created in R2014a or earlier (`.zip` files), use `Simulink.exportToTemplate` to upgrade them to `.sltx` files, then you can use them in the start page.

`templatefile = Simulink.exportToTemplate(obj,templatename, Name,Value)` specifies additional template options as one or more Name, Value pair arguments.

Examples

Create a Template From a Model

Open the `vdp` model and create a template from it.

```
vdp
myvdptemplate = Simulink.exportToTemplate(bdroot,'vdptemplate')
```

Create a Template From a Model and Specify Description

Open the vdp model and create a template from it, specifying a description.

```
vdp
myvdptemplate = Simulink.exportToTemplate(bdroot,'vdptemplate','Description','Use this
```

Input Arguments

obj — Model, library, or project
character vector | numeric handle | slproject.ProjectManager

Model, library, or project, specified by name or numeric handle, or a slproject.ProjectManager object returned by the simulinkproject function.

Data Types: double | char

templatename — Template file name
character vector

Template file name, specified as a character vector that can optionally include the fully-qualified path to a template file and *.sltx extension.

Data Types: char

Name-Value Pair Arguments

Specify optional comma-separated pairs of Name,Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1,Value1,...,NameN,ValueN.

Example: Title,'My Project Template'

Group — Group of template
character vector

Group of template, specified as a character vector. On the Start Page, templates are shown under group headings.

Example: 'Simscape'

Data Types: char

`Author` — Author of template

character vector

Author of template, specified as a character vector.

Data Types: `char`

`Description` — Description of template

character vector

Description of template, specified as a character vector.

Data Types: `char`

`ThumbnailFile` — Thumbnail image file name

character vector

Thumbnail image file name, specified as a character vector.

Data Types: `char`

`Title` — Title of model or project template

character vector

Title of template, specified as a character vector. On the Start Page, the templates titles are shown on the tiles. The title can be different from the file name, and you can use any characters in the title. The default value is the name of the model or project.

Example: `'My Project Template'`

Data Types: `char`

Output Arguments

`templatefile` — Template file

character vector

Template file, returned as *`templatename`*`.sltx` file.

Simulink.exportToVersion

Export model or library for use in previous version of Simulink

Syntax

```
exported_file = Simulink.exportToVersion(modelname,target_filename,
version)
exported_file = Simulink.exportToVersion(modelname,target_filename,
version,Name,Value)
```

Description

`exported_file = Simulink.exportToVersion(modelname,target_filename, version)` exports the model or library `modelname` to a file named `target_filename` in a format that the specified previous Simulink `version` can load.

If the system contains functionality not supported by the specified Simulink software version, the command removes the functionality and replaces any unsupported blocks with empty masked subsystem blocks colored yellow. As a result, the converted system may generate different results.

The `save_system` `ExportToVersion` option is a legacy option for this functionality that is also supported.

`exported_file = Simulink.exportToVersion(modelname,target_filename, version,Name,Value)` specifies additional options as one or more Name, Value pair arguments.

Examples

Export a Model to a Previous Version

Get the current top-level system and export it.

```
Simulink.exportToVersion(bdroot,'mymodel.slx','R2014b');
```

Export a Model to a Previous Version and Break Links

Get the current top-level system and export it, replacing links to library blocks with copies of the library blocks in the saved file.

```
Simulink.exportToVersion(bdroot,'mymodel.slx','R2014b','BreakUserLinks',true);
```

Input Arguments

`modelname` — Model to export

character vector

Model to export, specified as a character vector, without any file extension. The model must be loaded and unmodified. The target file must not be the same as the model file.

Data Types: `char`

`target_filename` — Exported file name

character vector

Exported file name, specified as a character vector. The target file must not be the same as the model file.

Example: `'mymodel.slx'`

Data Types: `char`

`version` — MATLAB release name

`'R2012A'` | `'R2014A_MDL'` | `'R2016B_SLX'` | ...

MATLAB release name, specified as a character vector, which specifies a previous Simulink version. `Simulink.exportToVersion` exports the system to a format that the specified previous Simulink version can load. You cannot export to your current version. These version names are not case sensitive.

To export to Release 2012a and later, you can specify model file format as SLX or MDL using the suffix `_MDL` or `_SLX`. If you do not specify a format, you export your default model file format.

If you use the Export to Previous Version dialog box instead of `Simulink.exportToVersion`, then the **Save as type** list supports 7 years of previous releases.

Example: `'R2015B'`

Data Types: `char`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example:

`AllowPrompt` — Allow prompt or message dialog box

`false` (default) | `true` | `'on'` | `'off'`

Allow prompt or message dialog box, specified by a logical value that indicates whether to display any output prompt or message in a dialog box or only messages at the command line. For example, prompts to make files writable, or messages about exported versions. If you want to allow prompts, then set to `true`. or `on`.

`BreakUserLinks` — Break user-defined links

`false` (default) | `true` | `'on'` | `'off'`

Break user-defined links, specified by a logical value that indicates whether the function replaces links to user-defined library blocks with copies of the library blocks in the saved file.

`BreakToolboxLinks` — Break all toolbox links

`false` (default) | `true` | `'on'` | `'off'`

Break all toolbox links, specified by a logical value that indicates whether the function replaces links to built-in MathWorks library blocks with copies of the library blocks in the saved file. The `'BreakToolboxLinks'` option affects Simulink library blocks and blocks from any other libraries supplied with MathWorks toolboxes or blocksets.

Note The `'BreakToolboxLinks'` option can result in compatibility issues when upgrading to newer versions of Simulink software. For example:

- Any masks on top of library links to Simulink S-functions will not upgrade to the new version of the S-function.
- Any library links to masked subsystems in a Simulink library will not upgrade to the new subsystem behavior.
- Any broken links prevent the automatic library forwarding mechanism from upgrading the link.

  If you have saved a model with broken links to built-in libraries, use the Upgrade Advisor to scan the model for out-of-date blocks and upgrade the Simulink blocks to their current versions.

Output Arguments

`exported_file` — Exported file
character vector

Exported file, returned in the format that the specified previous Simulink version can load.

`save_system`

Topics

"Save a Model"

Introduced in R2016a

Simulink.fileGenControl

Specify root folders for files generated by diagram updates and model builds

Syntax

```
cfg = Simulink.fileGenControl('getConfig')
Simulink.fileGenControl(Action,Name,Value)
```

Description

`cfg = Simulink.fileGenControl('getConfig')` returns a handle to an instance of the `Simulink.FileGenConfig` object, which contains the current values of these file generation control parameters:

- `CacheFolder` – Specifies the root folder for model build artifacts that are used for simulation, including Simulink® cache files.
- `CodeGenFolder` – Specifies the root folder for code generation files.
- `CodeGenFolderStructure` – Controls the folder structure within the code generation folder.

To get or set the parameter values, use the `Simulink.FileGenConfig` object.

These Simulink preferences determine the initial parameter values for the MATLAB session:

- Simulation cache folder – `CacheFolder`
- Code generation folder – `CodeGenFolder`
- Code generation folder structure – `CodeGenFolderStructure`

`Simulink.fileGenControl(Action,Name,Value)` performs an action that uses the file generation control parameters of the current MATLAB session. Specify additional options with one or more `name,value` pair arguments.

Examples

Get File Generation Control Parameter Values

To obtain the file generation control parameter values for the current MATLAB session, use getConfig.

```
cfg = Simulink.fileGenControl('getConfig');

myCacheFolder = cfg.CacheFolder;
myCodeGenFolder = cfg.CodeGenFolder;
myCodeGenFolderStructure = cfg.CodeGenFolderStructure;
```

Set File Generation Control Parameters by Using Simulink.FileGenConfig Object

To set the file generation control parameter values for the current MATLAB session, use the setConfig action. First, set values in an instance of the Simulink.FileGenConfig object. Then, pass the object instance. This example assumes that your system has aNonDefaultCacheFolder and aNonDefaultCodeGenFolder folders.

```
% Get the current configuration
cfg = Simulink.fileGenControl('getConfig');

% Change the parameters to non-default locations
% for the cache and code generation folders
cfg.CacheFolder = fullfile('C:','aNonDefaultCacheFolder');
cfg.CodeGenFolder = fullfile('C:','aNonDefaultCodeGenFolder');
cfg.CodeGenFolderStructure = 'TargetEnvironmentSubfolder';

Simulink.fileGenControl('setConfig', 'config', cfg);
```

Set File Generation Control Parameters Directly

You can set file generation control parameter values for the current MATLAB session without creating an instance of the Simulink.FileGenConfig object. This example assumes that your system has aNonDefaultCacheFolder and aNonDefaultCodeGenFolder folders.

```
myCacheFolder = fullfile('C:','aNonDefaultCacheFolder');
myCodeGenFolder = fullfile('C:','aNonDefaultCodeGenFolder');

Simulink.fileGenControl('set', 'CacheFolder', myCacheFolder, ...
   'CodeGenFolder', myCodeGenFolder, ...
   'CodeGenFolderStructure', ...
    Simulink.filegen.CodeGenFolderStructure.TargetEnvironmentSubfolder);
```

If you do not want to generate code for different target environments in separate folders, for `'CodeGenFolderStructure'`, specify the value `Simulink.filegen.CodeGenFolderStructure.ModelSpecific`.

Reset File Generation Control Parameters

You can reset the file generation control parameters to values from Simulink preferences.

```
Simulink.fileGenControl('reset');
```

Create Simulation Cache and Code Generation Folders

To create file generation folders, use the `set` action with the `'createDir'` option. You can keep previous file generation folders on the MATLAB path through the `'keepPreviousPath'` option.

```
%
myCacheFolder = fullfile('C:','aNonDefaultCacheFolder');
myCodeGenFolder = fullfile('C:','aNonDefaultCodeGenFolder');

Simulink.fileGenControl('set', ...
   'CacheFolder',myCacheFolder, ...
   'CodeGenFolder',myCodeGenFolder, ...
   'keepPreviousPath',true, ...
   'createDir',true);
```

Input Arguments

Action — Specify action

`'reset'` | `'set'` | `'setConfig'`

Specify an action that uses the file generation control parameters of the current MATLAB session:

- `'reset'` – Reset file generation control parameters to values from Simulink preferences.
- `'set'` – Set file generation control parameters for the current MATLAB session by directly passing values.
- `'setConfig'` – Set file generation control parameters for the current MATLAB session by using an instance of a `Simulink.FileGenConfig` object.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: `Simulink.fileGenControl(`*`Action`*`, `*`Name`*`, `*`Value`*`);`

`config` — Specify instance of `Simulink.FileGenConfig`

object handle

Specify the `Simulink.FileGenConfig` object instance containing file generation control parameters that you want to set.

Option for `setConfig`.

Example: `Simulink.fileGenControl('setConfig', 'config', `*`cfg`*`);`

`CacheFolder` — Specify simulation cache folder

character vector

Specify a simulation cache folder path value for the `CacheFolder` parameter.

Option for `set`.

Example: `Simulink.fileGenControl('set', 'CacheFolder', `*`myCacheFolder`*`);`

`CodeGenFolder` — Specify code generation folder

character vector

Specify a code generation folder path value for the `CodeGenFolder` parameter. You can specify an absolute path or a path relative to build folders. For example:

- `'C:\Work\mymodelsimcache'` and `'/mywork/mymodelgencode'` specify absolute paths.
- `'mymodelsimcache'` is a path relative to the current working folder (`pwd`). The software converts a relative path to a fully qualified path at the time the `CacheFolder` or `CodeGenFolder` parameter is set. For example, if `pwd` is `'/mywork'`, the result is `'/mywork/mymodelsimcache'`.
- `'../test/mymodelgencode'` is a path relative to `pwd`. If `pwd` is `'/mywork'`, the result is `'/test/mymodelgencode'`.

Option for `set`.

Example: `Simulink.fileGenControl('set', 'CodeGenFolder', *myCodeGenFolder*);`

`CodeGenFolderStructure` — Specify generated code folder structure
`Simulink.filegen.CodeGenFolderStructure.ModelSpecific` (default) | `Simulink.filegen.CodeGenFolderStructure.TargetEnvironmentSubfolder`

Specify the layout of subfolders within the generated code folder:

- `Simulink.filegen.CodeGenFolderStructure.ModelSpecific` (default) – Place generated code in subfolders within a model-specific folder.
- `Simulink.filegen.CodeGenFolderStructure.TargetEnvironmentSubfolder` – If models are configured for different target environments, place generated code for each model in a separate subfolder. The name of the subfolder corresponds to the target environment.

Option for `set`.

Example: `Simulink.fileGenControl('set', 'CacheFolder', *myCacheFolder*, ... 'CodeGenFolder', *myCodeGenFolder*, ... 'CodeGenFolderStructure', ... Simulink.filegen.CodeGenFolderStructure.TargetEnvironmentSubfolder);`

`keepPreviousPath` — Keep previous folder paths on MATLAB path
false (default) | true

Specify whether to keep the previous values of `CacheFolder` and `CodeGenFolder` on the MATLAB path:

- `true` – Keep previous folder path values on MATLAB path.

- `false` (default) – Remove previous older path values from MATLAB path.

Option for `reset`, `set`, or `setConfig`.

Example: `Simulink.fileGenControl('reset', 'keepPreviousPath', true);`

`createDir` — Create folders for file generation
false (default) | true

Specify whether to create folders for file generation if the folders do not exist:

- `true` – Create folders for file generation.
- `false` (default) – Do not create folders for file generation.

Option for `set` or `setConfig`.

Example: `Simulink.fileGenControl('set', 'CacheFolder', *myCacheFolder*, 'CodeGenFolder', *myCodeGenFolder*, 'keepPreviousPath', true, 'createDir',true);`

Avoid Naming Conflicts

Using `Simulink.fileGenControl` to set `CacheFolder` and `CodeGenFolder` adds the specified folders to your MATLAB search path. This function has the same potential for introducing a naming conflict as using `addpath` to add folders to the search path. For example, a naming conflict occurs if the folder that you specify for `CacheFolder` or `CodeGenFolder` contains a model file with the same name as an open model. For more information, see “What Is the MATLAB Search Path?” (MATLAB) and “Files and Folders that MATLAB Accesses” (MATLAB).

To use a nondefault location for the simulation cache folder or code generation folder:

1. Delete any potentially conflicting artifacts that exist in:

   - The current working folder, `pwd`.
   - The nondefault simulation cache and code generation folders that you intend to use.
2. Specify the nondefault locations for the simulation cache and code generation folders by using `Simulink.fileGenControl` or Simulink preferences.

Output Arguments

`cfg` — Current values of file generation control parameters

object handle

Instance of a `Simulink.FileGenConfig` object, which contains the current values of file generation control parameters.

Introduced in R2010b

Simulink.findBlocks

Find blocks in Simulink models

Syntax

```
bl = Simulink.findBlocks(sys)
bl = Simulink.findBlocks(sys,options)
bl = Simulink.findBlocks(sys,Param1,Value1,...,ParamN,ValueN)
bl = Simulink.findBlocks(sys,Param1,Value1,...,ParamN,ValueN,
options)
```

Description

`bl = Simulink.findBlocks(sys)` returns handles to all blocks in the model or subsystem `sys`.

`bl = Simulink.findBlocks(sys,options)` finds blocks that match the criteria specified by a `Simulink.FindOptions` object.

`bl = Simulink.findBlocks(sys,Param1,Value1,...,ParamN,ValueN)` finds blocks whose block parameters have the specified values.

`bl = Simulink.findBlocks(sys,Param1,Value1,...,ParamN,ValueN,options)` finds blocks whose parameters have the specified values and that match the criteria specified by a `FindOptions` object.

Examples

Find Blocks in a Model

Return handles for all blocks in the model `vdp`.

```
load_system(vdp);
bl = Simulink.findBlocks('vdp')
bl =

    5.0001
   83.0001
   86.0001
    6.0001
    7.0001
    8.0001
    9.0001
   10.0001
   11.0001
   12.0001
   13.0001
   14.0001
   15.0001
   16.0001
```

Return block names.

```
bl = getfullname(Simulink.findBlocks('vdp'))
```

```
bl =

  12×1 cell array

    {'vdp/Fcn'                  }
    {'vdp/More Info'            }
    {'vdp/More Info/Model Info'}
    {'vdp/Mu'                   }
    {'vdp/Mux'                  }
    {'vdp/Product'              }
    {'vdp/Scope'                }
    {'vdp/Sum'                  }
    {'vdp/x1'                   }
    {'vdp/x2'                   }
    {'vdp/Out1'                 }
    {'vdp/Out2'                 }
```

Return block handles for the block whose name is `Mu`.

```
Simulink.findBlocks('vdp','Name','Mu')
```

```
ans =

    8.0001
```

Input Arguments

`sys` — Model or subsystem to find blocks in
character vector | string array

Model or subsystem to find blocks in, specified as a character vector or string array.

Example: `'vdp'` `"f14/Aircraft Dynamics Model"`

`options` — Search constraints
`Simulink.FindOptions` object

Search constraints, specified as a `Simulink.FindOptions` object.

Output Arguments

`bl` — Search results
array of handles

Search results, returned as an array of handles.

See Also

`Simulink.FindOptions` | `Simulink.allBlockDiagrams` | `Simulink.findBlocksOfType`

Topics

“Model Parameters” on page 6-2
“Block-Specific Parameters” on page 6-128

Introduced in R2018a

Simulink.findBlocksOfType

Find specified type of block in Simulink models

Syntax

```
bl = Simulink.findBlocksOfType(sys,type)
bl = Simulink.findBlocksOfType(sys,type,options)
bl = Simulink.findBlocksOfType(sys,
type,Param1,Value1,...,ParamN,ValueN)
bl = Simulink.findBlocksofType(sys,
type,Param1,Value1,...,ParamN,ValueN,options)
```

Description

`bl = Simulink.findBlocksOfType(sys,type)` returns handles to all blocks of the specified type in the model or subsystem `sys`.

`bl = Simulink.findBlocksOfType(sys,type,options)` matches the criteria specified by a `FindOptions` object.

`bl = Simulink.findBlocksOfType(sys, type,Param1,Value1,...,ParamN,ValueN)` finds blocks whose parameters have the specified values.

`bl = Simulink.findBlocksofType(sys, type,Param1,Value1,...,ParamN,ValueN,options)` finds blocks whose parameters have the specified values and that match the criteria specified by a `FindOptions` object.

Examples

Find Blocks of a Type in Model

Find all blocks of type Gain in the model `vdp`.

```
load_system('vdp');
Simulink.findBlocksOfType('vdp','Gain')

ans =

    7.0001
```

To return block names instead of handles, use `getfullname`.

```
getfullname(Simulink.findBlocksOfType('vdp','Gain'))

ans =

    'vdp/Mu'
```

Find Blocks of a Type Using Search Options

Load the model `sldemo_clutch`. Then, create a `FindOptions` object and use it to constrain the search of GoTo blocks in the model to the Unlocked system.

```
load_system('sldemo_clutch');
f = Simulink.FindOptions('SearchDepth',1);
bl = Simulink.findBlocksOfType('sldemo_clutch/Unlocked','Goto',f)

bl =

  166.0001
  167.0001
```

Input Arguments

sys — Model or subsystem to find blocks in

character vector | string array

Model or subsystem to find blocks in, specified as a character vector or string array.

Example: `'vdp'` `"f14/Aircraft Dynamics Model"`

type — Block type

character vector | string array

Block type, specified as a character vector or string array. Use `get_param` with the `'BlockType'` parameter to get the block type.

`options` — Search constraints
`simulink.FindOptions` object

Search constraints, specified as a `Simulink.FindOptions` object.

Example: `Simulink.FindOptions('SearchDepth',1)`

Output Arguments

`bl` — Search results
array of handles

Search results, returned as an array of handles.

Introduced in R2018a

Simulink.findIntEnumType

Find enumeration classes defined by `Simulink.defineIntEnumType`

Syntax

```
result = Simulink.findIntEnumType(typeName)
result = Simulink.findIntEnumType()
```

Description

`result = Simulink.findIntEnumType(typeName)` returns the `meta.class` object for class `type` that is defined by `Simulink.defineIntEnumType`. Use the returned `meta.class` object to query attributes of the enumeration class. If the class does not exist, the function returns an empty `meta.class` object.

`result = Simulink.findIntEnumType()` returns `meta.class` objects for all enumeration classes that are defined by `Simulink.defineIntEnumType`. Use the returned `meta.class` objects to query attributes of the enumeration classes.

Examples

Find a Specific Dynamic Enumerated Data Type

Define an enumeration type.

```
Simulink.defineIntEnumType('myEnumType', {'e1', 'e2'}, [1 2]);
```

Check for the enumeration type that you have created .

```
myResult = Simulink.findIntEnumType('myEnumType')
```

```
myResult = 

  class with properties:
```

```
                     Name: 'myEnumType'
              Description: ''
      DetailedDescription: ''
                   Hidden: 0
                   Sealed: 0
                 Abstract: 0
              Enumeration: 1
          ConstructOnLoad: 0
         HandleCompatible: 0
          InferiorClasses: {[1×1 meta.class]}
        ContainingPackage: [0×0 meta.package]
     RestrictsSubclassing: 0
             PropertyList: [0×1 meta.property]
               MethodList: [150×1 meta.method]
                EventList: [0×1 meta.event]
    EnumerationMemberList: [2×1 meta.EnumeratedValue]
           SuperclassList: [1×1 meta.class]
```

Find All Dynamic Enumerated Data Types

Define two enumeration types.

```
Simulink.defineIntEnumType('myEnumType1', {'e1', 'e2'}, [1 2]);
Simulink.defineIntEnumType('myEnumType2', {'e3', 'e4'}, [3 4]);
```

Check for the enumeration types that you have created.

```
myResult = Simulink.findIntEnumType()
```

Input Arguments

typeName — Name of enumeration class
character vector or string

Name of a specific enumeration class that is defined by `Simulink.defineIntEnumType`, specified as a character vector or string.

Example: 'myEnumType'

Data Types: char | string

Output Arguments

`result` — Search results

array of `meta.class` objects

Search result, returned as an array of `meta.class` objects. If there are no enumeration classes, the array is empty.

See Also

`enumeration` | `Simulink.clearIntEnumType` | `Simulink.defineIntEnumType`

Introduced in R2018b

Simulink.findTemplates

Find model or project templates with specified properties

Syntax

```
filename = Simulink.findTemplates(templatename)
filename = Simulink.findTemplates(templatename,Name,Value)
[filename,info] = Simulink.findTemplates(templatename)
```

Description

`filename = Simulink.findTemplates(templatename)` returns the names and `TemplateInfo` objects for all matching templates that include `templatename`.

`filename = Simulink.findTemplates(templatename,Name,Value)` also specifies additional template properties as one or more Name, Value pair arguments.

`[filename,info] = Simulink.findTemplates(templatename)` returns the names and `TemplateInfo` objects for all matching templates.

Examples

Find a Particular Template

Get the full path to the default model template.

```
filename = Simulink.findTemplates('factory_default_model');
```

Find All Templates With Specified Folders or Authors

Get all templates inside folders called `work`.

```
filename = Simulink.findTemplates('work/')
```

Get all templates for which the Author property includes the character vector Smith.

```
filename = Simulink.findTemplates('*','Author','Smith')
```

Find All DSP Templates and Get TemplateInfo Objects

Get the paths to all DSP model templates, and sltemplate.TemplateInfo objects for each of them.

```
[filename,info] = Simulink.findTemplates('dsp*','Type','Model');
```

Input Arguments

templatename — Template name
character vector

Template name, specified as a character vector containing a portion of a file name, which can contain the wildcard asterisk character “*”.

Example:

Data Types: char

Name-Value Pair Arguments

Specify optional comma-separated pairs of Name,Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1,Value1,...,NameN,ValueN.

You can specify regular expressions for any of the Value character vectors, e.g., including the wildcard asterisk character “*”.

Example: 'Author','*son'

Type — Model, library, or project
'Model' | 'Library' | 'Project'

Model, library, or project template type, specified as a character vector for model, library, or project.

Example: 'Simscape'

Data Types: char

Title — Title of template

character vector

Title of template, specified as a character vector.

Example: 'Simscape'

Data Types: char

Group — Group of template

character vector

Group of template, specified as a character vector. On the Start Page, templates are shown under group headings.

Example: 'Simscape'

Data Types: char

Author — Author of template

character vector

Author of template, specified as a character vector.

Data Types: char

Description — Description of template

character vector

Description of template, specified as a character vector.

Data Types: char

Output Arguments

filename — Template name

character vector | cell array of character vectors

Template names of matching templates, returned as character vectors.

`info` — Template information
template info objects | array of template info objects

Template information of matching templates, returned as `sltemplate.TemplateInfo` objects.

Simulink.findVars

Analyze relationship between variables and blocks in models

Syntax

```
[variables] = Simulink.findVars(context)
[variables] = Simulink.findVars(context,variablefilter)
[variables] = Simulink.findVars(___,Name,Value)
```

Description

`[variables] = Simulink.findVars(context)` finds and returns variables that are used in the blocks and models specified by `context`, including subsystems and referenced models. The function returns an empty vector if `context` does not use any variables.

`[variables] = Simulink.findVars(context,variablefilter)` finds only the variables or enumerated types that are specified by `variablefilter`. For example, use this syntax to determine where a variable is used in a model.

`[variables] = Simulink.findVars(___,Name,Value)` finds variables with additional options specified by one or more `Name,Value` pair arguments. For example, you can search for unused variables. You can also search for enumerated data types that are used in `context`, in addition to variables.

Examples

Variables in Use in a Model

Find variables used by `MyModel`.

```
variables = Simulink.findVars('MyModel');
```

Specific Variable in Use in a Model

Find all uses of the base workspace variable `k` by `MyModel`. Use the cached results to avoid compiling `MyModel`.

```
variables = Simulink.findVars('MyModel','Name','k',
'SearchMethod','cached','SourceType','base workspace');
```

Regular Expression Matching

Find all uses of a variable whose name matches the regular expression `^trans`.

```
variables = Simulink.findVars('MyModel','Regexp','on',
'Name','^trans');
```

Variables Common to Two Models

Given two models, find the variables used by the first model, the second, and both

```
model1Vars = Simulink.findVars('model1');
model2Vars = Simulink.findVars('model2');
commonVars = intersect(model1vars,model2Vars);
```

Variables Not Used in a Model

Find the variables that are defined in the model workspace of `MyModel` but that are not used by the model.

```
unusedVars = Simulink.findVars('MyModel','FindUsedVars','off',
'SourceType','model workspace');
```

Specific Variable Not Used in a Model

Determine if the base workspace variable `k` is not used by `MyModel`.

```
varObj = Simulink.VariableUsage('k','base workspace');
unusedVar = Simulink.findVars('MyModel',varObj,
'FindUsedVars','off');
```

Variables Used by a Block

Find the variables that are used by the block `Gain1` in `MyModel`.

```
variables = Simulink.findVars('MyModel',
'Users','MyModel/Gain1');
```

Variables Used in a Model Reference Hierarchy

Find the variables that are used in a model reference hierarchy. Begin the search with the model `MyNestedModel`, and search the entire hierarchy below `MyNestedModel`.

```
variables = Simulink.findVars('MyNestedModel','SearchReferencedModels','on');
```

Variables and Enumerated Types Used in a Model

Find variables and enumerated types that are used in `MyModel`.

```
varsAndEnumTypes = Simulink.findVars('MyModel','IncludeEnumTypes','on');
```

Input Arguments

`context` — Models and blocks to search

character vector | cell array of character vectors

Models and blocks to search, specified as a character vector or a cell array of character vectors. You can specify `context` in one of the following ways:

- The name of a model. For example, (`'vdp'`) specifies the model `vdp.slx`.
- The name or path of a block or masked block. For example, (`'vdp/Gain1'`) specifies a block named `Gain1` at the root level of the model `vdp.slx`.
- A cell array of model or block names.

Data Types: char | cell

variablefilter — Specific variables to find
array of Simulink.VariableUsage objects

Specific variables to find, specified as an array of Simulink.VariableUsage objects. Each Simulink.VariableUsage object identifies a variable to find.

Name-Value Pair Arguments

Specify optional comma-separated pairs of Name,Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1,Value1,...,NameN,ValueN.

Example: 'FindUsedVars','off'

FindUsedVars — Find variables that are used or not used
'on' (default) | 'off

Flag to find variables that are explicitly used or not used, specified as the comma-separated pair consisting of 'FindUsedVars' and 'on' or 'off. If you specify FindUsedVars as 'off', the function finds variables that are not used in context but that are defined in the workspace specified by SourceType.

Example: 'FindUsedVars','off'

IncludeEnumTypes — Find enumerated types that are used
'off' (default) | 'on'

Flag to find enumerated data types that are used, specified as the comma-separated pair consisting of 'IncludeEnumTypes' and 'on' or 'off'. The function finds enumerated types that are used explicitly in context as well as types that define variables that are used in context.

If you specify SourceType as 'base workspace', 'model workspace', or 'mask workspace', the function does not report enumerated types because those sources cannot define enumerated types.

You cannot find unused enumerated types by specifying FindUsedVars as 'off'.

Example: 'IncludeEnumTypes','on'

`RegExp` — Enable regular expression matching

`'off'` (default) | `'on'`

Flag to enable regular expression matching for input arguments, specified as the comma-separated pair consisting of `'RegExp'` and `'on'`. You can match only input arguments that have character vector values.

Example: `'RegExp','on'`

`SearchMethod` — Compile status

`'compiled'` (default) | `'cached'`

Compile status, specified as the comma-separated pair consisting of `'SearchMethod'` and one of these values:

- `'compiled'` — Return up-to-date results by compiling every model in the search context before search.
- `'cached'` — Return quicker results by using results cached during the previous compile.

Example: `'SearchMethod','compiled'`

`SearchReferencedModels` — Enable search in referenced models

`'off'` (default) | `'on'`

Flag to enable search in referenced models, specified as the comma-separated pair consisting of `'SearchReferencedModels'` and `'on'`.

Example: `'SearchReferencedModels','on'`

`Name` — Name of a variable or enumerated type to search for

character vector

Name of a variable or enumerated data type to search for, specified as the comma-separated pair consisting of `'Name'` and a character vector.

Example: `'Name','trans'`

Data Types: `char`

`SourceType` — Workspace or source defining the variables or enumerated types

character vector

Workspace or source defining the variables, specified as the comma-separated pair of `'SourceType'` and one of these options:

- `'base workspace'`
- `'model workspace'`
- `'mask workspace'`
- `'data dictionary'`

The function filters results for variables that are defined in the specified source.

Example: `'SourceType','base workspace'`

If you search for enumerated data types by specifying `'IncludeEnumTypes'` as `'on'`, `'SourceType'` represents the way an enumerated type is defined. You can specify one of these options:

- `'MATLAB file'`
- `'dynamic class'`
- `'data dictionary'`

The function filters results for enumerated types that are defined in the specified source.

Example: `'SourceType','MATLAB file'`

If you do not specify `SourceType`, the function does not filter results by source.

`Users` — Name of block to search for variables

character vector

Name of specific block to search for variables, specified as the comma-separated pair consisting of `'Users'` and a character vector.

To search a set of specific blocks, enable regular expression matching by specifying `RegExp` as `'on'` and use regular expressions in the character vector. For example, you can specify `'Users','MyModel/Gain*` to search all blocks in `MyModel` whose names begin with `Gain`.

Example: `'Users','MyModel/Gain1'`

Example: `'Users','MyModel/mySubsystem/Gain2'`

Example: `'Users','MyModel/Gain*`

Limitations

`Simulink.findVars` does not work with these constructs:

- MATLAB code in scripts and initialization and callback functions
- Libraries and blocks in libraries
- Variables in MATLAB Function blocks, except for input arguments

  However, `Simulink.findVars` can find enumerated types anywhere they are used in MATLAB Function blocks.
- Calls directly to MATLAB from the Stateflow action language
- S-functions that use data type variables registered using `ssRegisterDataType`

  To make the variables searchable, use `ssRegisterTypeFromNamedObject` instead.
- Variables referenced by machine-parented data in Stateflow

`Simulink.findVars` discovers variable usage in inactive subsystem variants only if you select **Analyze all choices during update diagram and generate preprocessor conditionals** in the Variant Subsystem block dialog box. If you do not select this check box, the function does not discover variable usage in inactive variants.

Introduced in R2010a

Simulink.getFileChecksum

Checksum of file

Syntax

```
checksum = Simulink.getFileChecksum(filename)
```

Description

`checksum = Simulink.getFileChecksum(filename)` returns the checksum of the specified file, using the MD5 checksum algorithm. Use the checksum to see if the file has changed compared to a previous checksum. You can use checksums as part of an audit trail.

Use `Simulink.getFileChecksum` to get a checksum for any file. If the file contents do not change from one checksum to the next, the checksum from `Simulink.getFileChecksum` stays the same. Otherwise, the checksum is different with each change to the file contents.

For functional information on a model, use `Simulink.BlockDiagram.getChecksum` instead. `Simulink.BlockDiagram.getChecksum` looks at the functional aspect of the model. If the functional aspect doesn't change, then `Simulink.BlockDiagram.getChecksum` returns the same checksum.

For example, if you moved a block, the file contents are different (measured by `Simulink.getFileChecksum`) but the function of the model is unchanged (measured by `Simulink.BlockDiagram.getChecksum`).

Examples

Get Checksum of a File

Use `fullfile` to specify a full path to a file and get the checksum.

```
filechecksum = Simulink.getFileChecksum(fullfile(matlabroot,'toolbox',...
'matlab','demos','gatlin.mat'));
```

Input Arguments

filename — File name to get checksum for
file of any type

File name to get checksum for, with file extension and optional full path. Use `fullfile` to specify a full path to a file, or use the form `'C:\Work\filename.mat'`.

Example: `'lengthofline.m'`

Data Types: `char`

Output Arguments

checksum — Checksum value
character vector

Checksum value in a 32-character vector.

See Also

`Simulink.BlockDiagram.getChecksum` | `Simulink.SubSystem.getChecksum`

Introduced in R2014b

Simulink.getSuppressedDiagnostics

Return Simulink.SuppressedDiagnostic objects associated with a block, subsystem, or model

Syntax

```
suppressed_diagnostics = Simulink.getSuppressedDiagnostics(source)
```

Description

suppressed_diagnostics = Simulink.getSuppressedDiagnostics(source) returns an array of Simulink.SuppressedDiagnostic objects that are associated with the specified source.

Examples

Get All Simulink.SuppressedDiagnostic Objects on a Specific Block

Using the model from “Suppress Diagnostic Messages Programmatically”, get all suppressed diagnostics associated with a specified block.

Use the Simulink.suppressDiagnostic function to suppress the parameter precision loss warning thrown by the Constant block, one.

```
Simulink.suppressDiagnostic('Suppressor_CLI_Demo/one',...
 'SimulinkFixedPoint:util:fxpParameterPrecisionLoss');
```

Get the Simulink.SuppressedDiagnostic objects associated with the block.

```
suppressed_diagnostic = Simulink.getSuppressedDiagnostics('Suppressor_CLI_Demo/one')
```

```
suppressed_diagnostic = 

  SuppressedDiagnostic with properties:
            Source: 'Suppressor_CLI_Demo/one'
                Id: 'SimulinkFixedPoint:util:fxpParameterPrecis…'
    LastModifiedBy: ''
          Comments: ''
      LastModified: '2016-Jul-04 14:12:24'
```

Input Arguments

source — System, block, or model object throwing warning

model | subsystem | block path | block handle

The source of the diagnostic, specified as a model, subsystem, block path, block handle, cell array of block paths, or cell array of block handles.

To get the block path, use the gcb function.

To get the block handle, use the getSimulinkBlockHandle function.

Data Types: char | cell

Output Arguments

suppressed_diagnostics — Suppressed diagnostics

array

Suppressed diagnostics, returned as an array of Simulink.SuppressedDiagnostic objects.

See Also

Simulink.SuppressedDiagnostic | Simulink.SuppressedDiagnostic.restore | Simulink.getSuppressedDiagnostics | Simulink.restoreDiagnostic | Simulink.suppressDiagnostic

Introduced in R2016b

Simulink.importExternalCTypes

Generate Simulink representations of custom data types defined by C or C++ code

Syntax

```
importInfo = Simulink.importExternalCTypes(headerFiles)
importInfo = Simulink.importExternalCTypes(modelName)
importInfo = Simulink.importExternalCTypes( ___ ,Name,Value)
```

Description

`importInfo = Simulink.importExternalCTypes(headerFiles)` parses the C or C++ header files (`.h` or `.hpp`) identified by `headerFiles` for `typedef`, `struct`, and `enum` type definitions, and generates Simulink representations of the types. The output, `importInfo`, identifies the successfully and unsuccessfully imported types.

You can use the Simulink representations to:

- Reuse your existing algorithmic C code and, through simulation, test its interaction with your Simulink control algorithm. For an example that shows how to use the Legacy Code Tool, see “Integrate C Function Whose Arguments Are Pointers to Structures”.
- Generate code (Simulink Coder) that reuses the types and data that your existing code defines. You can then integrate and compile the generated and existing code into a single application. For an example, see “Exchange Structured and Enumerated Data Between Generated and External Code” (Embedded Coder).
- Create and organize data (signals, parameters, and states) in a model by using standard data types that your organization defines in C code.

  - To create structures of signals in Simulink, use nonvirtual buses. See “Getting Started with Buses”.
  - To create structures of parameters, use MATLAB structures and `Simulink.Parameter` objects. See “Organize Related Block Parameter Definitions in Structures”.

- To create enumerated data, see “Use Enumerated Data in Simulink Models”.
- To match a primitive `typedef` statement, use a `Simulink.AliasType` object to set parameter and signal data types in a model.

By default, the function:

- Imports an enumerated type by generating a script file that derives an enumeration class from `Simulink.IntEnumType`, as described in “Define Simulink Enumerations”. If necessary, you can then edit the class definition to customize it (for example, by implementing the `addClassNameToEnumNames` method).
- Imports a structure type by generating a `Simulink.Bus` object in the base workspace.
- Imports a primitive `typedef` statement by generating a `Simulink.AliasType` object in the base workspace.
- Interprets generic C data types, such as `int` or `short`, according to the word lengths of your host computer. For example, for most modern machines, `int` has a 32-bit word length, so the function represents an `int` structure field as a bus element that uses the Simulink data type `int32`.

  To override this default behavior, identify your target hardware board by using the `HardwareImplementation` pair argument.

For additional information about default behavior, see “Tips” on page 2-696.

`importInfo = Simulink.importExternalCTypes(modelName)` generates Simulink representations of custom C data types by analyzing a model that you identify with `modelName`. When you use the **Simulation Target** configuration parameters in a model to identify header files for inclusion during simulation, use this syntax to import types for the purpose of simulating the model on your host computer. The function interprets generic C data types according to the word lengths of your host computer.

When you use this syntax, do not use pair arguments, such as `HardwareImplementation`, that can conflict with the configuration parameters of the target model. When you use such pair arguments with this syntax, the function generates a warning.

`importInfo = Simulink.importExternalCTypes( ___ ,Name,Value)` specifies additional options using one or more name-value pair arguments. You can use this syntax to:

- Specify the names of types to import by using the Names pair argument.
- Control the way that Simulink stores the imported types, for example, by generating the types in a Simulink data dictionary. Use the MATFile and DataDictionary pair arguments.
- Control the way that the function interprets generic C data types. Use the HardwareImplementation pair argument.
- Maintain synchrony between the C-code definitions and the Simulink representations by attempting to import the updated C-code definitions again. You can choose whether to overwrite the existing Simulink representations. Use the Overwrite and Verbose pair arguments.

Examples

Import Simple Structure and Enumerated Types

This example shows how to generate Simulink representations of a C structure type (struct) and an enumerated (enum) data type from a header file.

1. In your current folder, create the file ex_cc_simpleTypes.h.

   ```
   typedef enum {
     PWR_LOSS = 0,                 /* Default value */
     OVERSPD,
     PRESS_LOW,
   } fault_T;

   typedef struct {
       double coeff;
       double init;
   } params_T;
   ```
2. Generate Simulink representations of the types by calling Simulink.importExternalCTypes.

   ```
   Simulink.importExternalCTypes('ex_cc_simpleTypes.h');
   ```

   The function creates a Simulink.Bus object, params_T, in the base workspace.
3. To inspect the properties of the object, open the Bus Editor.

   ```
   buseditor
   ```

Each bus element uses a name and a data type (double) that match the corresponding structure field in ex_cc_simpleTypes.h.

4 In your current folder, inspect the generated file, fault_T.m, which defines the enumerated type fault_T as an enumeration class.

You can use the bus object and the eumeration class to set signal and parameter data types in Simulink models.

Import Structure Type Whose Fields Use Custom Data Types

This example shows how to generate a Simulink representation of a structure type whose fields use custom data types (typedef).

Create the file ex_integer_aliases.h in your current folder.

```
typedef int sint_32;

typedef unsigned short uint_16;
```

Create the file ex_cc_struct_alias.h in your current folder.

```
#include "ex_integer_aliases.h"

typedef struct {
    sint_32 accum;
    uint_16 index;
} my_ints_T;
```

Import the structure type into Simulink as a Simulink.Bus object in the base workspace. Import the typedef statements as Simulink.AliasType objects.

```
Simulink.importExternalCTypes('ex_cc_struct_alias.h');
```

Inspect the data types of the bus elements in the bus object. For example, inspect the DataType property of the first bus element, which corresponds to the structure field accum.

```
my_ints_T.Elements(1)
```

```
ans =
  BusElement with properties:

              Name: 'accum'
        Complexity: 'real'
        Dimensions: 1
          DataType: 'sint_32'
               Min: []
               Max: []
    DimensionsMode: 'Fixed'
        SampleTime: -1
              Unit: ''
       Description: ''
```

The Simulink.importExternalCTypes function uses the generated Simulink.AliasType objects to set the data types of the bus elements.

Inspect the Simulink.AliasType objects in the base workspace. For example, the object named sint_32 corresponds to one of the typedef statements in ex_integer_aliases.h.

```
sint_32
```

```
sint_32 =

  AliasType with properties:

    Description: ''
      DataScope: 'Imported'
     HeaderFile: 'ex_integer_aliases.h'
       BaseType: 'int32'
```

For most host computers (which the function targets by default), the word length of int is 32 bits and the word length of unsigned short is 16 bits. The function maps int and unsigned short to the Simulink types int32 and uint16.

If you have Embedded Coder, the code that you generate from the model can use sint_32 and uint_16 instead of the standard data type names, int32_T and uint16_T.

Store Imported Types in Data Dictionary

This example shows how to store the imported data types in a Simulink data dictionary. A data dictionary stores data specifications (such as for signals and block parameter values), data types, and other design data for one or more Simulink models.

In your current folder, create the file `ex_cc_simpleTypes.h`.

```
typedef enum {
  PWR_LOSS = 0,            /* Default value */
  OVERSPD,
  PRESS_LOW,
} fault_T;

typedef struct {
    double coeff;
    double init;
} params_T;
```

Create a subfolder called `myDictionaries`.

```
mkdir('myDictionaries')
```

Generate Simulink representations of the types by calling `Simulink.importExternalCTypes`. Permanently store the type definitions by creating a new data dictionary, `ex_cc_myTypes.sldd`, in the new subfolder.

```
Simulink.importExternalCTypes('ex_cc_simpleTypes.h',...
    'DataDictionary','ex_cc_myTypes.sldd',...
    'OutputDir','myDictionaries');
```

To inspect the contents of the dictionary, set your current folder to `myDictionaries` and double-click the dictionary file.

To use the Simulink representations in the dictionary, you must link a model or models to the dictionary. See “Migrate Models to Use Simulink Data Dictionary”.

Import Only Specified Types

This example shows how to generate Simulink representations only for enumerated and structure data types that you identify by name.

In your current folder, create the file ex_cc_manySimpleTypes.h. The file defines three structure types: params_T, signals_T, and states_T.

```
typedef struct {
    double coeff;
    double init;
} params_T;

typedef struct {
    double flow_rate;
    double steam_press;
} signals_T;

typedef struct {
    double accum;
    double error;
} states_T;
```

Generate Simulink representations only for params_T and signals_T.

```
Simulink.importExternalCTypes('ex_cc_manySimpleTypes.h',...
    'Names',{'params_T','signals_T'});
```

The Simulink.Bus objects, params_T and signals_T, appear in the base workspace.

Import Types for 16-Bit Hardware

By default, Simulink.importExternalCTypes represents an enumerated data type by creating an enumeration class that derives from the built-in class Simulink.IntEnumType. When you simulate or generate code from a model that uses the generated class, configuration parameters that you select for the model (for example, on the **Hardware Implementation** pane) determine the specific integer length that Simulink.IntEnumType and the enumeration class employ.

By default, the function interprets generic, primitive C data types, such as short and int, according to the word lengths of your host computer. For example, to represent an int structure field, the function typically applies the 32-bit data type int32 to the corresponding bus element. When you want to simulate and generate code for hardware other than your host computer, use the HardwareImplementation pair argument to identify the target hardware and, by extension, the word lengths of the hardware.

This example shows how to import data types from code that you intend to use on 16-bit hardware. For this board, int has a 16-bit length, and each item of enumerated data (enum) consumes 16 bits.

In your current folder, create the file ex_cc_intTypes.h.

```
typedef enum {
  PWR_LOSS = 0,            /* Default value */
  OVERSPD,
  PRESS_LOW,
} fault_T;

typedef struct {
    int coeff;
    int init;
} params_T;
```

The code defines an enumerated data type and a structure type whose fields use the generic C data type int.

To generate an accurate Simulink representation of the structure type, first open an existing model or create a new model. For this example, create a new model named ex_hdwImpl_16bit.

In the new model, set **Configuration Parameters > Hardware Implementation > Device vendor** to Atmel. Set **Device type** to AVR.

Alternatively, at the command prompt, use these commands to create and configure the model:

```
new_system('ex_hdwImpl_16bit','Model');
set_param('ex_hdwImpl_16bit','ProdHWDeviceType','Atmel->AVR')
```

Generate Simulink representations of the types. To specify the word lengths of the target 16-bit hardware, extract the model configuration parameters (which include the **Hardware Implementation** settings) as a Simulink.ConfigSet object.

```
configSet = getActiveConfigSet('ex_hdwImpl_16bit');
Simulink.importExternalCTypes('ex_cc_intTypes.h','HardwareImplementation',configSet);
```

The Simulink.Bus object params_T appears in the base workspace. The bus elements, such as coeff, use the Simulink data type int16.

```
params_T.Elements(1)
```

```
ans = 

  BusElement with properties:

              Name: 'coeff'
        Complexity: 'real'
        Dimensions: 1
          DataType: 'int16'
               Min: []
               Max: []
    DimensionsMode: 'Fixed'
        SampleTime: -1
              Unit: ''
       Description: ''
```

In your current folder, the file `fault_T.m` defines the enumeration class `fault_T`. The class derives from `Simulink.IntEnumType`, so you must use model configuration parameters to identify the target hardware and, by extension, the correct native integer length.

Import Structure Type Whose Fields Use 16-Bit Fixed-Point Data Types

Create the file `ex_cc_fixpt_struct.h` in your current folder.

```
typedef struct {

    int coeff;   /* Word length 16,
       binary fraction length 7 */

    int init;   /* Word length 16,
       binary fraction length 3 */

} params_T;
```

The file defines a structure type whose fields use fixed-point data types. For example, the structure stores the field `coeff` in a signed, 16-bit integer data type. A binary fraction length of 7 relates the stored integer value to the real-world value.

Suppose that this code operates on 16-bit hardware (such that the generic C data type `int` has a 16-bit word length). To generate a Simulink representation of the type, first create a `coder.HardwareImplementation` object that identifies the hardware.

```
hdw = coder.HardwareImplementation;
hdw.ProdHWDeviceType = 'Atmel->AVR';
```

Generate a Simulink representation of the structure type.

```
Simulink.importExternalCTypes('ex_cc_fixpt_struct.h',...
    'HardwareImplementation',hdw);
```

The `Simulink.Bus` object, `params_T`, appears in the base workspace. Each bus element, such as `coeff`, uses the data type `int16`.

```
params_T.Elements(1)
```

```
ans = 

  BusElement with properties:

              Name: 'coeff'
        Complexity: 'real'
        Dimensions: 1
          DataType: 'int16'
               Min: []
               Max: []
    DimensionsMode: 'Fixed'
        SampleTime: -1
              Unit: ''
       Description: ''
```

`Simulink.importExternalCTypes` cannot infer the fixed-point scaling (binary fraction length) from the C code. You must manually specify the data types of the bus elements. To specify the data types at the command prompt, use the `fixdt` function.

```
params_T.Elements(1).DataType = 'fixdt(1,16,7)';
params_T.Elements(2).DataType = 'fixdt(1,16,3)';
```

To specify the data types interactively (by using the Data Type Assistant), use the Bus Editor.

```
buseditor
```

Manually Synchronize Simulink Representations with C-Code Definitions

This example shows how to maintain the Simulink representations of C data types whose definitions you modify during the life of a modeling project.

Import Custom C Types

Create the file `ex_cc_myTypes_rec.h` in your current folder. The file defines a custom structure type.

```
typedef struct {
    double flow;
    double pres;
    double tqe;
} sigStructType;
```

Generate a `Simulink.Bus` object that represents the type.

```
Simulink.importExternalCTypes('ex_cc_myTypes_rec.h');
```

Modify Type Definition in C Code

In `ex_cc_myTypes_rec.h`, add a field named `spd` to `sigStructType`.

In the same file, create a new structure type, `stateStructType`.

```
typedef struct {
    double flow;
    double pres;
    double tqe;
    double spd;
} sigStructType;

typedef struct {
    double err;
    double read;
    double write;
} stateStructType;
```

Attempt to Import Types Again

Attempt to generate bus objects that represent the types.

```
importInfo = Simulink.importExternalCTypes('ex_cc_myTypes_rec.h');
```

The function generates warnings at the command prompt. Instead of relying on the warnings, you can inspect the output, `importInfo`, to determine whether the function failed to import any types.

```
importInfo.failedToImport.Bus
```

```
ans =

  1×1 cell array

    {'sigStructType'}
```

The function did not import `sigStructType`. The corresponding bus object in the base workspace still has only three bus elements. To determine the reason that the function did not import `sigStructType`, inspect the `report` field of `importInfo`.

Import `sigStructType` again. This time, overwrite the existing bus object.

```
importInfo = Simulink.importExternalCTypes('ex_cc_myTypes_rec.h',...
    'Names',importInfo.failedToImport.Bus,'Overwrite','on');
```

When you overwrite existing Simulink representations, any customizations that you made to the Simulink representations (such as the application of fixed-point data types to bus elements) are overwritten.

Input Arguments

`headerFiles` — Names and paths of header files to parse

character vector | cell array of character vectors | string scalar | string array

Names and paths of header files to parse, specified as a character vector, cell array of character vectors, string, or string array. Include the `.h` or `.hpp` file extension.

If you use a hierarchy of included (`#include`) header files to define your types, when you specify `HeaderFiles`, you need to identify only the entry-point files. The function parses the included files as well as the identified entry-point files. If the included files are not in the same folder as the corresponding entry-point file, use the `IncludeDirs` pair argument to identify the additional folders.

Example: `'myHeader.h'`

Example: `{'thisHeader.hpp','thatHeader.hpp'}`

Data Types: `char` | `cell` | `string`

`modelName` — Name of loaded Simulink model for which to import types
character vector | string scalar

Name of a loaded Simulink model for which to import types, specified as a character vector or string scalar. A model is loaded if, for example, you open the model or use the `load_system` function. When you use this argument, the function:

- Searches the model configuration parameters for custom header files and parses those header files for data types to import. Only the configuration parameters on the **Simulation Target** pane affect this search.

  For example, if in the model you set **Configuration Parameters** > **Simulation Target** > **Insert custom C code in generated** > **Header file** to `#include "myTypes.h"`, the function parses `myTypes.h` for types to import.
- Interprets generic C data types such as `int` or `short` according to the word lengths of your host computer. Do not use the `HardwareImplementation` pair argument to override this interpretation.

Example: `'myModel'`

Data Types: `char` | `string`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example:
`Simulink.importExternalCTypes('myHdr.h','DataDictionary','myDictionary.sldd')`

MATFile — Name and path of MAT-file to create for storing generated objects

'' (empty) (default) | character vector | string scalar

Name and, optionally, path of the MAT-file to create for storing generated Simulink.Bus and Simulink.AliasType objects, specified as a character vector or string. If you do not use MATFile, by default, the function generates the objects in the base workspace.

The function does not generate enumeration definitions in MAT-files.

If you import some struct types and primitive typedef statements by using MATFile and later import some of the same types again by using MATFile, the function entirely replaces the old MAT-file with a new one. The function discards any changes that you made to the contents of the old MAT-file.

You cannot use the MATFile and DataDictionary pair arguments simultaneously.

Example: 'myMat.mat'

Example: 'myMat'

Example: fullfile('subfolder','myMat')

Data Types: char | string

DataDictionary — Name and path of Simulink data dictionary to use or create for storing types

'' (default) | character vector | string scalar

Name and, optionally, path of the Simulink data dictionary to use or create for storing generated enumerations and objects, specified as a character vector or string. When you use this pair argument, the function imports enumerated types as Simulink.data.dictionary.EnumTypeDefinition objects, and stores those objects (as well as Simulink.Bus objects and Simulink.AliasType objects) in the target dictionary.

For information about data dictionaries, see “What Is a Data Dictionary?”.

You can optionally specify a .sldd extension.

You cannot use the DataDictionary and MATFile pair arguments simultaneously.

Example: 'myDict.sldd'

Example: 'myDict'

Example: `fullfile('subfolder','myDict.sldd')`

Data Types: `char` | `string`

`Names` — Names of types to import

`''` (default) | character vector | cell array of character vectors | string scalar | string array

Names of types to import, specified as a character vector, cell array of character vectors, string, or string array. By default, if you do not use `Names`, the function attempts to import all of the custom types that the identified header files define.

To match multiple type names with a single character vector, use an asterisk (*).

Example: `'myEnumType'`

Example: `{'myEnumType','myStructType'}`

Example: `'my*Type'`

Data Types: `char` | `cell` | `string`

`Defines` — Compiler options to define macros that influence type definitions

`''` (default) | character vector | string scalar

Compiler options to define macros that influence C type definitions, specified as a character vector, or string scalar. For example, a macro influences a type definition if you enclose the definition in an `#ifdef` block that checks whether the macro is defined.

Use `Defines` to specify macro definitions that you otherwise define through compiler options such as `-D`.

Example: `'SIGSTRUCT=1'`

Example: `'SIGSTRUCT=1 ENUM=1'`

Data Types: `char` | `string`

`UnDefines` — Compiler options to delete macros that influence type definitions

`''` (default) | character vector | string scalar

Compiler options to delete macros that influence C type definitions, specified as a character vector or string scalar. For example, a macro influences a type definition if you enclose the definition in an `#ifdef` block that checks whether the macro is defined.

Use `UnDefines` to specify macro deletions that you otherwise define through compiler options such as `-U`.

Example: `'SIGSTRUCT'`

Example: `'SIGSTRUCT ENUM'`

Data Types: `char` | `string`

`IncludeDirs` — Folders that contain subordinate, included header files
`''` (default) | character vector | cell array of character vectors | string scalar | string array

Folders that contain subordinate, included (`#include`) header files, specified as a character vector, cell array of character vectors, string, or string array. Use this pair argument to enable the function to locate and parse additional header files on which the primary header files (which you specify with the `headerFiles` argument) depend.

If you use the `modelName` syntax instead of the `headerFiles` syntax, in the target model, you can use the **Simulation Target** configuration parameters to specify include paths. In that case, you do not need to use the `IncludeDirs` pair argument.

Example: `'myHeaders'`

Example: `fullfile('myProject','myHeaders')`

Example: `{fullfile('myProject','myHeaders'),fullfile('myProject','myOtherHeaders')}`

Data Types: `char` | `cell` | `string`

`OutputDir` — Folder for storing generated files
`''` (default) | character vector | string scalar

Folder for storing generated files, specified as a character vector or string. The function places generated files, such as `classdef` script files and data dictionary files, in this folder.

The folder that you specify must exist before you use the function.

Example: `'myDictionaries'`

Example: `fullfile('myProject','myDictionaries')`

Data Types: `char` | `string`

`HardwareImplementation` — Word lengths for interpreting generic, primitive C data types

`''` (default) | `Simulink.ConfigSet` object | `coder.HardwareImplementation` object

Word lengths for interpreting generic, primitive C data types, specified as a `Simulink.ConfigSet` or `coder.HardwareImplementation` object.

- To use a `Simulink.ConfigSet` object, you can extract a configuration set from a model by using functions such as `getConfigSet` and `getActiveConfigSet`. This technique enables you to use the Configuration Parameters dialog box to identify your target hardware (through the **Hardware Implementation** configuration parameters).
- To use a `coder.HardwareImplementation` object (which you create and configure programmatically), specify properties of the object, such as `ProdHWDeviceType`, to identify your target hardware. The object then sets other properties, such as `ProdBitPerInt`, that reflect the native integer size of the hardware.

The function inspects the object to determine which Simulink integer data types to employ when interpreting generic C data types such as `int`. For example, if you create a `coder.HardwareImplementation` object to identify 16-bit hardware and then use the function to import a structure type whose fields use the C data type `int`, the function generates a bus object whose bus elements use the Simulink data type `int16`. The function uses the production hardware settings, not the test hardware settings.

For more information about hardware implementation settings for Simulink models, see “Configure Run-Time Environment Options” (Simulink Coder).

`Overwrite` — Specification to overwrite existing Simulink representations

`'off'` (default) | `'on'`

Specification to overwrite existing Simulink representations, specified as `'on'` or `'off'`. If an imported type already has a representation in Simulink:

- If you specify `'off'` or if you do not specify `Overwrite`, the function does not import the type. In the output argument, `importInfo`, the `failedToImport` field identifies the type.
- If you specify `'on'`, the function overwrites the existing Simulink representation.

If you use the function to import some types into the base workspace or a data dictionary and later customize the generated Simulink representations, when you use the function again and set `Overwrite` to `'on'`, the function does not preserve your customizations. These customizations can include:

- In an enumeration class definition, implementing extra methods or modifying the generated methods such as `getDataScope` (see "Customize Simulink Enumeration").
- Modifying the properties of a generated `Simulink.Bus` or `Simulink.AliasType` object (for example, manually setting the data types of bus elements to a fixed-point data type).

`Verbose` — Specification to generate messages for successful import operations
`'off'` (default) | `'on'`

Specification to generate messages for successful import operations, specified as `'on'` or `'off'`.

- If you specify `'off'` or if you do not specify `Verbose`, the function imports types silently. Messages do not appear in the Command Window unless the function cannot import a type.
- If you specify `'on'`, the function generates a message in the Command Window for each operation during the import process.

Output Arguments

`importInfo` — Information about types that were imported and not imported
structure

Information about types that were imported and not imported, returned as a structure with these fields.

`report` — Descriptions of types that were imported and not imported
character vector

Descriptions of types that were imported and not imported, returned as a character vector. Inspect the value of this field to determine the reason that the function could not import a type.

`failedToImport` — Types that were not imported
structure

Types that were not imported, returned as a structure with these fields.

Field Name	Field Value	Purpose
`Bus`	Cell array of character vectors	Names of structure (`struct`) types that were not imported.
`Enum`	Cell array of character vectors	Names of enumerated types (`enum`) that were not imported.
`AliasType`	Cell array of character vectors	Names of primitive `typedef` statements that were not imported.

`importedTypes` — Types that were successfully imported

structure

Types that were successfully imported, returned as a structure with these fields.

Field Name	Field Value	Purpose
`Bus`	Cell array of character vectors	Names of structure (`struct`) types that were imported. The generated `Simulink.Bus` objects use these names.
`Enum`	Cell array of character vectors	Names of enumerated types (`enum`) that were imported. The generated enumeration classes or `Simulink.data.dictionary.EnumTypeDefinition` objects use these names.
`AliasType`	Cell array of character vectors	Names of primitive `typedef` statements that were imported. The generated `Simulink.AliasType` objects use these names.

Limitations

- The function does not support:

  - C data types that do not correspond to a type that Simulink supports. For example, Simulink does not recognize an equivalent for `long double`. For information about data types that Simulink supports, see “Data Types Supported by Simulink”.
  - Pointer types, such as a structure that defines a field whose value is a pointer or a `typedef` statement whose base type is a pointer type.
  - Structures that define a field whose value has more than one dimension.

    If a field value is a 1-D array, the function creates a bus element that represents a vector, not a matrix.
  - Unions.
- If a structure field represents fixed-point data, or if a `typedef` statement maps to a fixed-point base type, the function sets the data type of the corresponding bus element or `Simulink.AliasType` object to the relevant Simulink integer type (such as `int16`). The importer cannot determine the fixed-point scaling by parsing the C code. After using the function, you must manually specify the data type of the bus element or the base type of the `Simulink.AliasType` object by using the `fixdt` function.

Tips

- If a MATLAB Function block or Stateflow chart in your model uses an imported enumeration or structure type, configure the model configuration parameters to include (`#include`) the type definition from your external header file. See “Control Imported Bus and Enumeration Type Definitions” (for a MATLAB Function block) and “Integrate Custom C/C++ Code for Simulation” (Stateflow) and “Integrate Custom Structures in Stateflow Charts” (Stateflow) (for a chart).
- By default:

  - For an imported enumeration, because the Simulink enumeration class derives from `Simulink.IntEnumType`, when you simulate or generate code from a model, the enumeration uses the integer size that is native to your target hardware. You specify the characteristics of your target hardware by using model configuration parameters such as **Production device vendor and type** and **Native word size in production hardware**.

  - For an imported structure type:

    - The function imports a structure field as numerically complex only if the field uses one of the corresponding Simulink Coder structure types as the data type. For example, if a structure field in your external code uses the data type `cint8_T`, the function imports the field as a bus element (`Simulink.BusElement` object) whose data type is `int8` and whose `Complexity` property is set to `'complex'`.
    - For nested structures, the function generates a bus object for each unique structure type.
  - For an imported structure type or enumeration, if your external code uses a `typedef` statement to name the type, the name of the generated bus object or Simulink enumeration class matches the `typedef` name. If your code does not use a `typedef` statement, the name of the object or class is `struct_`*`type`* or `enum_`*`type`* where *`type`* is the tag name of the type. If you do not specify a tag name or apply a `typedef` name, Simulink generates an arbitrary name for the object or class.
  - The function configures the generated Simulink representations as imported for the purposes of simulation and code generation. For example, for bus objects, the function sets the `DataScope` property to `'Imported'` and the `HeaderFile` property to the name of your external header file. To simulate or generate code from a model that uses one of these Simulink representations, you must make your header file available to the model.
- When you specify files for `Simulink.importExternalCTypes` to use or generate, for example, by using the `DataDictionary` pair argument:

  - If the existing files to use are in your current folder or on the MATLAB path, you do not need to specify a file path. You can specify the file name by itself.
  - To control the folder location of generated files, you can specify paths as well as file names. You can also use the `OutputDir` pair argument.

Introduced in R2017a

Simulink.ModelDataLogs.convertToDataset

Convert logging data from `Simulink.ModelDataLogs` format to `Simulink.SimulationData.Dataset` format

Syntax

```
convertedDataset =
sourceModelDataLogsObject.convertToDataset(convertedDatasetName)
```

Description

Note The `ModelDataLogs` class is supported for backwards compatibility. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format. In R2016a or later, when you open a model from an earlier release that had used `ModelDataLogs` format, the model simulated in use `Dataset` format.

You can convert signal logging data from `ModelDataLogs` to `Dataset` format. Converting to `Dataset` format makes it easier to post-process with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see “Convert Logged Data to Dataset Format”.

If you have legacy code that uses the `ModelDataLogs` API, you can encounter situations that require updates to your code or model. See “Migrate Scripts That Use Legacy ModelDataLogs API”.

`convertedDataset` `=` *`sourceModelDataLogsObject`*`.convertToDataset(`*`convertedDatasetName`*`)` converts the *`sourceModelDataLogsObject`* to a `Simulink.SimulationData.Dataset` object. The name of the converted object is based on *`convertedDatasetName`*.

The resulting `Simulink.SimulationData.Dataset` object is a flat list. This list has one element for each `Simulink.Timeseries` or `Simulink.TsArray` object in the `Simulink.ModelDataLogs` object.

Limitations

Source of Simulink.ModelDataLogs Logged Data	Conversion Limitation
Referenced model	Loads all ancestors of the referenced model not previously loaded. If any ancestor model does not appear on the MATLAB path, the conversion fails. If the model has changed, or the model ancestors have changed, after Simulink logged the data, the conversion can fail. For example, adding, deleting, or renaming a block after logging can cause conversion failure.
Variant model or subsystem	The current active variant must be the same one that was active when Simulink logged the data. Otherwise, the conversion fails.
Frame signal	The conversion fails.
Mux block	The conversion produces a different `Simulink.SimulationData.Dataset` object as the dataset than Simulink creates when you simulate the model using the `Dataset` format for the logged data.
Stateflow chart	Not supported.

Input Arguments

`sourceModelDataLogsObject`

A `Simulink.ModelDataLogs` object that you want to convert to a `Simulink.SimulationData.Dataset` object.

`convertedDatasetName`

Name of the dataset that the conversion process creates.

Output Arguments

convertedDataset

The Simulink.SimulationDataset object that the Simulink.ModelDataLogs.convertToDataset function creates.

For details about the converted dataset, see Simulink.SimulationData.Dataset.

Example

In releases before R2016a, you could log signals using ModelDataLogs format. If you have a MAT-file with signal logging data that uses the ModelDataLogs format, here is how you can convert that data to Dataset format. This example assumes that the model that generated the logging data had the **Configuration Parameters** > **Data Import/Export** > **Signal logging** name set to logsout.

1 Load the MAT-file.

2 Convert logsout to a dataset called myModel_dataset. (The elements information will be different for your data.)

```
dataset = logsout.convertToDataset('myModel_Dataset')

dataset =
  Simulink.SimulationData.Dataset
  Package: Simulink.SimulationData

  Characteristics:
              Name: 'myModel_Dataset'
    Total Elements: 2

  Elements:
    1: 'x1'
    2: 'x2'

  -Use get or getElement to access elements by index or name.
  -Use addElement or setElement to add or modify elements.

  Methods, Superclasses

Introduced in R2011a

Simulink.restoreDiagnostic

Restore diagnostic warnings to a specific block, subsystem, or model

Syntax

```
Simulink.restoreDiagnostic(source)
Simulink.restoreDiagnostic(source, message_id)
Simulink.restoreDiagnostic(diagnostic)
Simulink.restoreDiagnostic(system, 'FindAll', 'on')
```

Description

`Simulink.restoreDiagnostic(source)` restores all suppressed diagnostics associated with the blocks specified by `source`.

`Simulink.restoreDiagnostic(source, message_id)` restores all instances of `message_id` on the blocks specified by `source`.

`Simulink.restoreDiagnostic(diagnostic)` restores the suppressed diagnostics associated with `MSLDiagnostic` object `diagnostic`.

`Simulink.restoreDiagnostic(system, 'FindAll', 'on')` restores all suppressed diagnostics associated with the system specified by `system`.

Examples

Restore All Diagnostics for a Specified Block

Using the model from “Suppress Diagnostic Messages Programmatically”, restore all suppressed diagnostics on a specified block.

Create a cell array of message identifiers. Use the `Simulink.suppressDiagnostic` function to suppress these multiple diagnostics from the Constant block, `one`.

```
diags = {'SimulinkFixedPoint:util:fxpParameterPrecisionLoss',...
 'SimulinkFixedPoint:util:fxpParameterUnderflow'};
Simulink.suppressDiagnostic('Suppressor_CLI_Demo/one', diags);
```

Remove all suppressions and restore diagnostics to the block.

```
Simulink.restoreDiagnostic('Suppressor_CLI_Demo/one');
```

Restore a Diagnostic for a Specified Block

Using the model from “Suppress Diagnostic Messages Programmatically”, restore a suppressed diagnostic on a specified block.

Use the `Simulink.suppressDiagnostic` function to suppress the parameter precision loss warning thrown by the Constant block, `one`.

```
Simulink.suppressDiagnostic('Suppressor_CLI_Demo/one',...
 'SimulinkFixedPoint:util:fxpParameterPrecisionLoss');
```

Remove the suppression and restore diagnostics to the block.

```
Simulink.restoreDiagnostic('Suppressor_CLI_Demo/one',...
 'SimulinkFixedPoint:util:fxpParameterPrecisionLoss');
```

Restore All Diagnostics for a Specified System

Using the model from “Suppress Diagnostic Messages Programmatically”, restore all suppressed diagnostics on the specified subsystem.

To restore all diagnostics from a system, use `'FindAll'`, `'on'` to search within the system hierarchy. Specify the system or system handle within which to search.

```
Simulink.restoreDiagnostic('Suppressor_CLI_Demo/Convert',...
 'FindAll', 'On');
```

Input Arguments

`source` — Block or model object throwing diagnostic
block path | block handle

The source of the diagnostic, specified as a block path, block handle, cell array of block paths, or cell array of block handles.

To get the block path, use the `gcb` function.

To get the block handle, use the `getSimulinkBlockHandle` function.

Data Types: `char` | `cell`

`message_id` — message identifier of diagnostic
message identifier | cell array of message identifiers

Message identifier of the diagnostic, specified as a character vector or a cell array of character vectors. You can find the message identifier of warnings and errors thrown during simulation by accessing the `ExecutionInfo` property of the `Simulink.SimulationMetadata` object associated with a simulation. You can also use the `lastwarn` function.

Data Types: `char` | `cell`

`system` — Name of subsystem
character vector

The subsystem name, or handle, specified as a character vector.

Data Types: `char`

`diagnostic` — Diagnostic object
`MSLDiagnostic` object

Diagnostic specified as an `MSLDiagnostic` object. Access the `MSLDiagnostic` object through the `ExecutionInfo` property of the `Simulink.SimulationMetadata` object.

Data Types: `struct`

Topics

"Suppress Diagnostic Messages Programmatically"

Introduced in R2016b

getBlockSimState

Class: Simulink.SimState.ModelSimState
Package: Simulink.SimState

Access SimState of individual Stateflow Chart, MATLAB Function, or S-function block

Syntax

`blockSimState = getBlockSimState(x, 'blockpath')`

Description

`blockSimState = getBlockSimState(x, 'blockpath')` returns the SimState of the block specified as *`blockpath`*. *`blockpath`* must be either a Stateflow Chart, MATLAB Function, or S-function block. For other types of blocks, see the `loggedStates` property of the Simulink.SimState.ModelSimState class.

Input Arguments

x

The x argument is a `Simulink.SimState.ModelSimState` object.

blockpath

The path to the block for which you are requesting the SimState values.

Output Arguments

blockSimState

The SimState of the block specified.

Examples

```
chartState = getBlockSimState(x, 'mymodel/chart')
```

To get the SimState of a block that is in a referenced model, specify the full path of the block relative to the root model.

```
rootModel = 'sldemo_fuelsys_dd';
opt = struct('SaveFinalState','on','SaveCompleteFinalSimState','on','StopTime','1');
simOut = sim(rootModel,opt);
x = simOut.xFinal;
blockPath = 'sldemo_fuelsys_dd/Fuel Rate Controller|sldemo_fuelsys_dd_controller/contro
chartState = getBlockSimState(x,blockPath)
```

See Also

`Simulink.SimState.ModelState.setBlockSimState`

setBlockSimState

Class: Simulink.SimState.ModelSimState
Package: Simulink.SimState

Set SimState of individual Stateflow Chart, MATLAB Function, or S-function block

Syntax

`setBlockSimState(`*`x`*`,'`*`blockpath`*`', `*`blockSimState`*`)`

Description

`setBlockSimState(`*`x`*`,'`*`blockpath`*`', `*`blockSimState`*`)` sets the SimState of the block specified as *`blockpath`*. *`blockpath`* must be either a Stateflow Chart, MATLAB Function, or S-function block. For other types of blocks, see the `loggedStates` property of the Simulink.SimState.ModelSimState class.

Input Arguments

`x`

The argument *`x`* is a `Simulink.SimState.ModelSimState` object.

`blockpath`

The path to the block for which you are setting the SimState values

`blockSimState`

The SimState of the block specified.

Examples

```
newObj = setBlockSimState(obj, 'mymodel/chart', newChartState);
```

See Also

`Simulink.SimState.ModelState.getBlockSimState`

Simulink.saveVars

Save workspace variables and their values in MATLAB code format

Syntax

Note `Simulink.saveVars` is not recommended. Use `matlab.io.saveVariablesToScript` instead.

```
Simulink.saveVars(filename)
Simulink.saveVars(filename, VarNames)
Simulink.saveVars(filename, '-regexp', RegExps)
Simulink.saveVars(filename, Specifications, UpdateOption)
Simulink.saveVars(filename, Specifications, Configuration)
Simulink.saveVars(filename, Specifications, MatlabVer)
[r1, r2] = Simulink.saveVars(filename, Specifications)
```

Description

`Simulink.saveVars(`*`filename`*`)` saves all variables in the current workspace for which MATLAB code can be generated to a MATLAB file named *`filename`*`.m`. If MATLAB code cannot be generated for a variable, the variable is saved into a companion MAT-file named *`filename`*`.mat`, and a warning is generated. If either file already exists, it is overwritten. The *`filename`* cannot match the name of any variable in the current workspace, and can optionally include the suffix `.m`. Using `Simulink.saveVars` has no effect on the contents of any workspace.

Executing the MATLAB file restores the variables saved in the file to the current workspace. If a companion MAT-file exists, code in the MATLAB file loads the MAT-file, restoring its variables also. When both a MATLAB file and a MAT-file exist, do not load the MATLAB file unless the MAT file is available, or an error will occur. Do not load a MAT-file directly, or incomplete data restoration will result. No warning occurs if loading a file overwrites any existing variables.

You can edit a MATLAB file that `Simulink.saveVars` creates. You can insert comments between or within the MATLAB code sections for saved variables. However, if you later use `Simulink.saveVars` to update or append to the file, only comments between MATLAB code sections will be preserved. Internal comments should therefore be used only in files that you do not expect to change any further.

You must not edit the header section in the MATLAB file, which comprises the first five comment lines. Simulink does not check that a manually edited MATLAB file is syntactically correct. MathWorks recommends not editing any MATLAB code in the file. You cannot edit a MAT-file and should never attempt to do so.

`Simulink.saveVars(`*`filename`*`, `*`VarNames`*`)` saves only the variables specified in *`VarNames`*, which is a comma-separated list of variable names. You can use the wildcard character `*` to save all variables that match a pattern. The `*` matches one or more characters, including non-alphanumeric characters.

`Simulink.saveVars(`*`filename`*`, '-regexp', `*`RegExps`*`)` saves only variables whose names match one of the regular expressions in *`RegExps`*, which is a comma-separated list of expressions. See “Regular Expressions” (MATLAB) for more information. A call to the function can specify both *`VarNames`* and `-regexps` *`RegExps`*, in that order and comma-separated.

`Simulink.saveVars(`*`filename`*`, `*`Specifications`*`, `*`UpdateOption`*`)` saves the variables described by *`Specifications`* (which represents the variable specifications in any of the above syntaxes) as directed by *`UpdateOption`*, which can be any one of the following:

- `'-create'` — Create a new MATLAB file (and MAT-file if needed) as directed by the *`Specifications`*. If either file already exists, it is overwritten. This is the default behavior.
- `'-update'` — Update the existing MATLAB file (and MAT-file if needed) specified by *`filename`* by changing only variables that match the *`Specifications`* and already exist in any files. The order of the variables in files is preserved. Comments within MATLAB code sections are not preserved.
- `'-append'` — Update the existing MATLAB file (and MAT-file if needed) specified by *`filename`* by:

  - Updating variables that match the *`Specifications`* and already exist in the file or files, preserving the existing order in the file or files. Comments within MATLAB code sections are not preserved.

  - Appending variables that match the *`Specifications`* and do not exist in the file or files by appending the variables to the file or files. These new sections initially have no comments.

`Simulink.saveVars(`*`filename`*`, `*`Specifications`*`, `*`Configuration`*`)` saves the variables described by *`Specifications`* (which represents the variable specifications in any of the above syntaxes) according to the specified *`Configuration`*. The *`Configuration`* can contain any or all of the following options, in any order, separated by commas if more than one appears:

- `'-maxnumel'` *`MaxNum`* — Limits the number of elements saved for an array to *`MaxNum`*, which must be an integer between 1 and 10000. For a character array, the upper limit is set to twice the value that you specify with *`MaxNum`*. If an array is larger than *`MaxNum`*, the whole array appears in the MAT-file rather than the MATLAB file, generating a warning. Default: 1000
- `'-maxlevels'` *`MaxLevels`* limits the number of levels of hierarchy saved for a structure or cell array to *`MaxLevels`*, which must be an integer between 1 and 200. If a structure or cell array is deeper than *`MaxLevels`*, the whole entity appears in the MAT-file rather than the MATLAB file, generating a warning. Default: 20
- `'-textwidth'` *`TextWidth`* sets the text wrap width in the MATLAB file to *`TextWidth`*, which must be an integer between 32 and 256. Default: 76
- `'-2dslice'` — Sets two dimensions for 2-D slices that represent n-D (where `n` is greater than 2) char, logic, or numeric array data. `Simulink.saveVars` uses the first two dimensions of the n-D array to specify the size of the 2-D slice, unless you supply two positive integer arguments after the `-2dslice` option. If you specify two integer arguments:

  - The two integers must be positive.
  - The two integers must be less than or equal to the number of dimensions of the n-D array.
  - The second integer must be greater than the first.

`Simulink.saveVars(`*`filename`*`, `*`Specifications`*`, `*`MatlabVer`*`)` acts as described by *`Specifications`* (which represents the specifications after *`filename`* in any of the above syntaxes) saving any MAT-file that it creates in the format required by the MATLAB version specified by *`MatlabVer`*. Possible values:

- `'-v7.3'` — 7.3 or later
- `'-v7.0'` — 7.0 or later

- `'-v6'` — Version 6 or later
- `'-v4'` — Any MATLAB version

`[r1, r2] = Simulink.saveVars(filename, Specifications)` acts as described by *`Specifications`* (which represents the specifications after *`filename`* in any of the above syntaxes) and reports what variables it has saved:

- *`r1`* — A cell array of character vectors. The character vectors name all variables (if any) that were saved to a MATLAB file.
- *`r2`* — A cell array of character vectors. The character vectors name all variables (if any) that were saved to a MAT-file.

Input Arguments

`filename`

The name of the file or names of the files that the function creates or updates. The *`filename`* cannot match the name of any variable in the current workspace. The *`filename`* can have the suffix `.m`, but the function ignores it.

`VarNames`

A variable or sequence of comma-separated variables. The function saves only the specified variables to the output file. You can use the wildcard character * to save all variables that match a pattern. The * matches one or more characters, including non-alphanumeric characters.

`'-regexp', RegExps`

After the keyword, a regular expression or sequence of comma-separated regular expressions. The function saves to the output file only those variables whose names match one of the expressions. See “Regular Expressions” (MATLAB) for more information A call to the function can specify both *`VarNames`* and `-regexps` *`RegExps`*, in that order and comma-separated.

`UpdateOption`

Any of three keywords that control the action of the function. The possible values are:

- `'-create'` — Create a new MATLAB file (and MAT-file if needed) as directed by the *`Specifications`*.

- `'-update'` — Update the existing MATLAB file (and MAT-file if needed) specified by *`filename`* by changing only variables that match the *`Specifications`* and already exist in the file or files. The order of the variables in the file or files is preserved.
- `'-append'` — Update the existing MATLAB file (and MAT-file if needed) specified by *`filename`* by:

  - Updating variables that match the *`Specifications`* and already exist in the file or files, preserving the existing order in the file or files.
  - Appending variables that match the *`Specifications`* and do not exist in the file or files by appending the variables that match the *`Specifications`* to the file or files.

Default: `'-create'`

Configuration

Any or all of the following options, in any order, separated by commas if more than one appears:

- `'-maxnumel'` *`MaxNum`* — Limits the number of elements saved for an array to *`MaxNum`*, which must be an integer between 0 and 10000. If an array is larger than that, the whole array appears in the MAT-file rather than the MATLAB script file, generating a warning. Default: 1000
- `'-maxlevels'` *`MaxLevels`* — Limits the number of levels saved for a structure or cell array to *`MaxLevels`*, which must be an integer between 0 and 200. If a structure or cell array is deeper than that, the whole entity appears in the MAT-file rather than the MATLAB script file, generating a warning. Default: 20
- `'-textwidth'` *`TextWidth`* — Sets the text wrap width in the MATLAB script file to *`TextWidth`*, which must be an integer between 32 and 256. Default: 76
- `'-2dslice'` — Sets two dimensions for 2-D slices that represent n-D (where `n` is greater than 2) arrays of char, logic, or numeric data. Using the `'-2dslice'` option produces more readable generated code that is consistent with how MATLAB displays n-D array data.

  `Simulink.saveVars` uses the first two dimensions of the n-D array to specify the size of the 2-D slice, unless you supply two positive integer arguments after the `-2dslice` option. If you specify two integer arguments:

  - The two integers must be positive.

- The two integers must be less than or equal to the number of dimensions of the n-D array.
- The second integer must be greater than the first.

Note You can use the MATLAB Preferences to change the defaults for the `-maxnumel`, `-maxlevels`, `'-2dslice'`, and `-textwidth` configuration options. In the **Workspace** pane, use the options in the **Saving variables as MATLAB script files** group.

`MatlabVer`

Specifies the MATLAB version whose syntax will be used by any MAT-file saved by the function.

- `'-v7.3'` — 7.3 or later
- `'-v7.0'` — 7.0 or later
- `'-v6'` — Version 6 or later
- `'-v4'` — Any MATLAB version

Default: `'-v7.3'`

Output Arguments

`r1`

A list of the names of all variables (if any) that were saved to a MATLAB file.

`r2`

A list of the names of all variables (if any) that were saved to a MAT-file.

Examples

Define some base workspace variables, then save them all to a new MATLAB file named `MyVars.m` using the default values for all input arguments except the *`filename`*.

```
a = 1;
b = 2.5;
```

```
c = 'A string';
d = {a, b, c};
Simulink.saveVars('MyVars');
```

Define additional base workspace variables, then append them to the existing file `MyVars.m` without changing the values previously saved in the file:

```
K = Simulink.Parameter;
MyType = fixdt (1,16,3);
Simulink.saveVars('MyVars', '-append', 'K', 'MyType');
```

Update the variables `V1` and `V2` with their values in a MATLAB file, or for any whose value cannot be converted to MATLAB code, in a MAT-file. The file must already exist. Any array with more than 10 elements will be saved to a MAT-file that can be loaded on any version of MATLAB. The return argument `r1` lists the names of any variables saved to a MATLAB file; `r2` lists any saved to a MAT-file.

```
[r1, r2] = Simulink.saveVars('MyFile', 'V1', 'V2', '-update',
'-maxnumel', 10, '-v4');
```

Specify a 2-D slice for the output of the `my3Dtable` 3-D array. Specify that the 2-D slice expands along the first and third dimensions:

```
my3DTable = zeros(3, 4, 2, 'single');
Simulink.saveVars('mfile.m', 'my3DTable', '-2dslice', 1, 3);
```

The generated MATLAB code is:

```
my3DTable = zeros(3, 4, 2, 'single');
my3DTable (:,1,:) = single ( ...
  [1 13;
   5 17;
   9 21]);
my3DTable (:,2,:) = single( ...
  [2 14;
   6 18;
   10 22]);
my3DTable (:,3,:) = single( ...
  [3 15;
   7 19;
   11 23]);
my3DTable (:,4,:) = single( ...
  [4 16;
   8 20;
   12 24]);
```

Limitations

The `Simulink.saveVars` function:

- Does not preserve shared references.
- Ignores dynamic properties of objects.
- Saves the following to the MAT-file although they could appear in the MATLAB file:
  - `Simulink.ConfigSet` objects with custom target components. (Use the `Simulink.ConfigSet` method `saveAs` instead.)
  - `Simulink.Timeseries` and `Simulink.ModelDataLogs` objects.

If you save many variables, the generated MATLAB file can contain many lines of code and take a long time to execute. To avoid the long execution time, consider these alternatives:

- Permanently store variables in a data dictionary instead of using `Simulink.saveVars`. A data dictionary also provides more tools for managing variables. See "Determine Where to Store Variables and Objects for Simulink Models".
- Save variables in a MAT-file by using the `save` function.

Tips

- If you do not need to save variables in an easily-understood form, see the `save` function.
- If you need to save only bus objects, use the `Simulink.Bus.save` function.
- If you need to save only a configuration set, use the `Simulink.ConfigSet.saveAs` method.

See Also

`Simulink.Bus.save` | `Simulink.Bus.save` | `Simulink.ConfigSet` | `matlab.io.saveVariablesToScript` | `save`

Introduced in R2010a

Simulink.sdi.addToRun

Package: Simulink.sdi

Add one or more signals to existing run

Syntax

```
sigIDs = Simulink.sdi.addToRun(runID,'vars',var,var2,...,varn)
sigIDs = Simulink.sdi.addToRun(runID,'namevalue',sourceNames,
dataValues)
```

Description

`sigIDs = Simulink.sdi.addToRun(runID,'vars',var,var2,...,varn)` adds the data in the variables `var,var2,...,varn` to the run corresponding to the `runID` and returns the signal IDs for the signals added to the run.

`sigIDs = Simulink.sdi.addToRun(runID,'namevalue',sourceNames, dataValues)` adds the data in the cell array `dataValues` to the run corresponding to the `runID` and returns the signal IDs for the signals added to the run. The `sourceNames` argument specifies names to use for the source of the data in `dataValues` in the signal metadata.

Examples

Add Workspace Data to Run

This example shows how to use `Simulink.sdi.addToRun` to add workspace data to a run in the Simulation Data Inspector.

Generate Workspace Data

Generate workspace data to add to a simulation run in place of measured data, input data, or any other data that you want to associate with the simulation.

```
time = linspace(0, 60, 201);
cos_vals = 2*cos(2*pi/6.8*time);
cos_ts = timeseries(cos_vals, time);
cos_ts.Name = 'cosine';
```

Simulate Model

Simulate the `slexAircraftExample` model to create a run containing the simulation outputs.

```
load_system('slexAircraftExample');
sim('slexAircraftExample','SaveFormat','Dataset');
```

Add Workspace Data to Simulation Run

Add the workspace data to the run. Then, view the results in the Simulation Data Inspector.

```
% Get run ID
count = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(count);

% Add data to run
sigIDs = Simulink.sdi.addToRun(runID,'vars',cos_ts);

Simulink.sdi.view
```

Add States Data to a Run

The model `slexAircraftExample` is configured to log outputs, states, and time data. The output data automatically logs to the Simulation Data Inspector as well as the base workspace, but the states data does not. To bring the states data into the Simulation Data Inspector, you can record the data, or you can add it to the run created by simulating the model. This example shows how to add logged states data to a Simulation Data Inspector run programmatically.

Simulate the Model and Get States Data

Simulate the model using the `sim` function with `'ReturnWorkspaceOutputs'` set to `'on'`. Select the states data, `xout`, from the simulation outputs.

```
load_system('slexAircraftExample')
```

```
simOut = sim('slexAircraftExample','ReturnWorkspaceOutputs','on',...
    'SaveFormat','Dataset');

% Get states data from simulation output
states = simOut.xout;
```

Get the Run ID

Because the outputs data automatically logs to the Simulation Data Inspector, a run is created upon simulating `slexAircraftExample`. Get the run ID for the run using the Simulation Data Inspector programmatic interface.

```
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

Add States Data to the Run

Add the states data to the run with the output data.

```
sigIDs = Simulink.sdi.addToRun(runID,'namevalue',{'States'},{states});
```

Input Arguments

`runID` — Run ID to add data to

scalar

Run ID for the signal you want to add data to. The Simulation Data Inspector assigns a unique run ID when it creates a run. You can get the run ID for your run using `Simulink.sdi.getAllRunIDs` and `Simulink.sdi.getRunIDByIndex`.

`var` — Data to add to run

variable

Workspace data to add to the run. `Simulink.sdi.addToRun` supports all loading and logging data formats, including `timeseries` and `Simulink.SimulationData.Dataset`. Provide one or more `var` inputs when you specify `'vars'` as the second argument.

Example: `myData`

`sourceNames` — Cell array of names for signal metadata

cell array of character vectors

Names to use as the source of the data in the metadata for the added signals. Provide a `sourceNames` input when you specify `'namevalue'` as the second argument.

Example: `{'speed','position'}`

`dataValues` — Cell array of data to add to run
cell array

Cell array of data to add to the run. Provide a `dataValues` input when you specify `'namevalue'` as the second argument.

Example: `{sig1,sig2}`

Output Arguments

`sigIDs` — Matrix containing signal IDs for added signals
matrix

Matrix of signal IDs for signals added to the run.

"Inspect and Compare Data Programmatically"

Introduced in R2011b

Simulink.sdi.cleanupWorkerResources

Clean up worker repositories

Syntax

`Simulink.sdi.cleanupWorkerResources`

Description

`Simulink.sdi.cleanupWorkerResources` removes redundant data from each parallel worker repository file used by the Simulation Data Inspector. Call this function while worker pools are running. The Simulation Data Inspector automatically cleans up repository files when you close the worker pool.

Examples

Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport('local')

% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];
```

Initialize Parallel Workers

Use gcp to create a pool of local workers to run parallel simulations if you don't already have one. In an `spmd` code block, load the `slexAircraftExample` model and select signals to log. To avoid data concurrency issues using `sim` in `parfor`, create a temporary directory for each worker to use during simulations.

```
p = gcp;
```

```
Starting parallel pool (parpool) using the 'local' profile ...
connected to 4 workers.
```

```
spmd

    % Load system and select signals to log
    load_system('slexAircraftExample')
    Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
    Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',

    % Create temporary directory on each worker
    workDir = pwd;
    addpath(workDir)
    tempDir = tempname;
    mkdir(tempDir)
    cd(tempDir)

end
```

Run Parallel Simulations

Use `parfor` to run the seven simulations in parallel. Select the value for `Ts` for each simulation, and modify the value of `Ts` in the model workspace. Then, run the simulation and build an array of `Simulink.sdi.WorkerRun` objects to access the data with the Simulation Data Inspector. After the `parfor` loop, use another `spmd` segment to remove the temporary directories from the workers.

```
parfor index = 1:7

    % Select value for Ts
    Ts_val = Ts_vals(index);

    % Change the filter time constant and simulate
    modelWorkspace = get_param('slexAircraftExample','modelworkspace');
    modelWorkspace.assignin('Ts',Ts_val)
    sim('slexAircraftExample')

    % Create a worker run for each simulation
    workerRun(index) = Simulink.sdi.WorkerRun.getLatest

end

spmd

    % Remove temporary directories
    cd(workDir)
    rmdir(tempDir, 's')
    rmpath(workDir)

end
```

Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

```
ds(7) = Simulink.SimulationData.Dataset;

for a = 1:7
    ds(a) = workerRun(a).getDataset;
end
ds(1)
```

```
ans =
Simulink.SimulationData.Dataset '' with 2 elements

                         Name        BlockPath
                         __________  ________________________________________
    1  [1x1 Signal]      alpha, rad  ...rcraftExample/Aircraft Dynamics Model
    2  [1x1 Signal]      Stick       slexAircraftExample/Pilot

  - Use braces { } to access, modify, or add elements using index.
```

Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```
for b = 1:7
    datasetRef(b) = workerRun(b).getDatasetRef;
```

```
end

datasetRef(1)

ans = 
  DatasetRef with properties:

           Name: 'Run 3: slexAircraftExample'
            Run: [1×1 Simulink.sdi.Run]
    numElements: 2
```

Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local Run objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```
for c = 1:7

    Runs(c) = workerRun(c).getLocalRun;
    Ts_val_str = num2str(Ts_vals(c));
    desc = strcat('Ts = ', Ts_val_str);
    Runs(c).Description = desc;
    Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);

end
```

Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

```
Simulink.sdi.cleanupWorkerResources
```

Introduced in R2017b

Simulink.sdi.clear

Package: Simulink.sdi

Clear all data from the Simulation Data Inspector

Syntax

```
Simulink.sdi.clear
```

Description

`Simulink.sdi.clear` clears all data from the Simulation Data Inspector. `Simulink.sdi.clear` does not affect preferences or settings you have configured in the Simulation Data Inspector. Use `Simulink.sdi.clearPreferences` to reset the Simulation Data Inspector preferences to their default values.

Examples

Save a Simulation Data Inspector Session

This example shows how to create, save, and load a Simulation Data Inspector session. The example uses data logging to populate the Simulation Data Inspector with data and then uses the Simulation Data Inspector's programmatic interface to create plots to visualize the data. After saving the data and visualization settings in a session, the Simulation Data Inspector repository is emptied in order to demonstrate how to load the session.

Create Simulation Data

This example logs the `Stick`, `alpha, rad`, and `q, rad/sec` signals to generate simulation data using the model `slexAircraftExample` and creates two runs. The first uses a sine input, and the second has a square wave input.

```
% Ensure you start with an empty Simulation Data Inspector repository
Simulink.sdi.clear
```

```
% Load system
load_system('slexAircraftExample')

% Configure signals to log
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot',1,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',3,'on
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on

% Change Pilot signal to sine
set_param('slexAircraftExample/Pilot','WaveForm','sine')

% Simulate model
sim('slexAircraftExample')

% Change Pilot signal to square
set_param('slexAircraftExample/Pilot','WaveForm','square')

% Simulate model
sim('slexAircraftExample')
```

Access Simulation Data

Use the Simulation Data Inspector programmatic interface to access the simulation data so you can create plots to visualize the signals.

```
% Get run objects
runIDs = Simulink.sdi.getAllRunIDs;
sineRunID = runIDs(end-1);
squareRunID = runIDs(end);

sineRun = Simulink.sdi.getRun(sineRunID);
squareRun = Simulink.sdi.getRun(squareRunID);

% Get signal objects
sineOut = sineRun.getSignalByIndex(1);
sineIn = sineRun.getSignalByIndex(3);

squareOut = squareRun.getSignalByIndex(1);
squareIn = squareRun.getSignalByIndex(3);
```

Create Plots in the Simulation Data Inspector

Use the programmatic interface to visualize the signal data from the two simulation runs. You can set the plot layout and plot signals on specific subplots.

```
% Set subplot layout
Simulink.sdi.setSubPlotLayout(2,1)

% Plot sine data on top plot
sineIn.plotOnSubPlot(1,1,true)
sineOut.plotOnSubPlot(1,1,true)

% Plot square wave data on bottom plot
squareIn.plotOnSubPlot(2,1,true)
squareOut.plotOnSubPlot(2,1,true)
```

Save a Simulation Data Inspector Session

First, view the plots you just created. Then, save the Simulation Data Inspector session as an MLDATX-file to recover your data along with your preference selections and plots.

```
% View the visualized data in the Simulation Data Inspector
Simulink.sdi.view

% Save the Simulation Data Inspector session
Simulink.sdi.save('myData.mldatx')
```

Load a Simulation Data Inspector Session

First, clear the Simulation Data Inspector repository with `Simulink.sdi.clear` and reset visualization settings with `Simulink.sdi.clearPreferences`. Then, you can load the session to see how the data and settings are preserved.

```
% Clear Simulation Data Inspector repository and preferences
Simulink.sdi.clear
Simulink.sdi.clearPreferences

% Load session file to view data
Simulink.sdi.load('myData.mldatx');
```

Topics

"Inspect and Compare Data Programmatically"

Introduced in R2011b

Simulink.sdi.clearPreferences

Clear Simulation Data Inspector preference changes

Syntax

```
Simulink.sdi.clearPreferences
```

Description

`Simulink.sdi.clearPreferences` reverts all Simulation Data Inspector preferences to their default values.

Examples

Restore All Simulation Data Inspector Preferences to Default Values

You can restore default values to all Simulation Data Inspector preferences programmatically with `Simulink.sdi.clearPreferences`.

```
Simulink.sdi.clearPreferences
```

Modify Run Naming Rule Then Restore Default

This example shows how to use the Simulation Data Inspector API to modify the Simulation Data Inspector run naming rule, check a run's name, restore default preferences, and check the run naming rule.

```
% Load model
load_system('sldemo_fuelsys')

% Modify run naming rule
Simulink.sdi.setRunNamingRule('<model_name> Run <run_index>')
```

```
% Simulate system
sim('sldemo_fuelsys')

% Check run name
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
fuelRun = Simulink.sdi.getRun(runID);
fuelRun.name

ans =
'sldemo_fuelsys Run 1'

% Clear preferences to reset the run naming rule
Simulink.sdi.clearPreferences

% Check run naming rule
Simulink.sdi.getRunNamingRule

ans =
'Run <run_index>: <model_name>'
```

Introduced in R2017a

Simulink.sdi.close

Package: Simulink.sdi

Close the Simulation Data Inspector

Syntax

```
Simulink.sdi.close
Simulink.sdi.close('filename')
```

Description

`Simulink.sdi.close` closes the Simulation Data Inspector.

`Simulink.sdi.close('filename')` closes the Simulation Data Inspector and saves the data in the file, `filename`.

Examples

Close the Simulation Data Inspector from the Command Line

You can close the Simulation Data Inspector from the MATLAB command line when you have finished inspecting and analyzing your data.

```
Simulink.sdi.close
```

Create a Run and View the Data

This example shows how to create a run, add data to it, and then view the data in the Simulation Data Inspector.

Create Data for the Run

This example creates `timeseries` objects for a sine and a cosine. To visualize your data, the Simulation Data Inspector requires at least a time vector that corresponds with your data.

```
% Generate timeseries data
time = linspace(0, 20, 100);

sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals, time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals, time);
cos_ts.Name = 'Cosine, T=8';
```

Create a Simulation Data Inspector Run and Add Your Data

To give the Simulation Data Inspector access to your data, use the `create` method and create a run. This example modifies some of the run's properties to help identify the data. You can easily view run and signal properties with the Simulation Data Inspector.

```
% Create a run
sinusoidsRun = Simulink.sdi.Run.create;
sinusoidsRun.Name = 'Sinusoids';
sinusoidsRun.Description = 'Sine and cosine signals with different frequencies';

% Add timeseries data to run
sinusoidsRun.add('vars', sine_ts, cos_ts);
```

Plot Your Data Using the `Simulink.sdi.Signal` Object

The `getSignalByIndex` method returns a `Simulink.sdi.Signal` object that can be used to plot the signal in the Simulation Data Inspector. You can also programmatically control aspects of the plot's appearance, such as the color and style of the line representing the signal. This example customizes the subplot layout and signal characteristics.

```
% Get signal, modify its properties, and change Checked property to true
sine_sig = sinusoidsRun.getSignalByIndex(1);
sine_sig.LineColor = [0 0 1];
sine_sig.LineDashed = '-.';
sine_sig.Checked = true;
```

```
% Add another subplot for the cosine signal
Simulink.sdi.setSubPlotLayout(2, 1);

% Plot the cosine signal and customize its appearance
cos_sig = sinusoidsRun.getSignalByIndex(2);
cos_sig.LineColor = [0 1 0];
cos_sig.plotOnSubPlot(2, 1, true);

% View the signal in the Simulation Data Inspector
Simulink.sdi.view
```

Close the Simulation Data Inspector and Save Your Data

```
Simulink.sdi.close('sinusoids.mat')
```

Topics

"Inspect and Compare Data Programmatically"
"Save and Share Simulation Data Inspector Data and Views"

Introduced in R2013b

Simulink.sdi.compareRuns

Package: Simulink.sdi

Compare the data in two simulation runs

Syntax

```
diffResult = Simulink.sdi.compareRuns(runID1,runID2)
diffResult = Simulink.sdi.compareRuns(runID1,runID2,Name,Value)
```

Description

`diffResult = Simulink.sdi.compareRuns(runID1,runID2)` compares the data in the runs corresponding to `runID1` and `runID2`, returning the result in the `Simulink.sdi.DiffRunResult` object, `diffResult`.

`diffResult = Simulink.sdi.compareRuns(runID1,runID2,Name,Value)` compares the simulation runs corresponding to `runID1` and `runID2` using the options specified by one or more `Name,Value` pair arguments and returns the comparison result in the `Simulink.sdi.DiffRunResult` object, `diffResult`. For more information about how the Simulation Data Inspector aligns signals for comparison, see “How the Simulation Data Inspector Compares Data”.

Examples

Compare Simulation Data Inspector Runs Programmatically

This example shows how to compare runs of simulation data and analyze the comparison results with the Simulation Data Inspector programmatic interface.

Generate Runs of Simulation Data

Simulate the model with different `Desired relative slip` values to create runs of simulation data to analyze with the Simulation Data Inspector programmatic interface.

```
% Open model
load_system('ex_sldemo_absbrake')

% Set the desired slip ratio to 0.24 and simulate
set_param('ex_sldemo_absbrake/Desired relative slip','Value','0.24')
sim('ex_sldemo_absbrake');

% Change the desired slip ratio to 0.25 and simulate
set_param('ex_sldemo_absbrake/Desired relative slip','Value','0.25')
sim('ex_sldemo_absbrake');
```

Compare Runs with a Global Tolerance

Get the run IDs for the runs you just created with the `Simulink.sdi.getAllRunIDs` function. Then, compare the runs using a global relative tolerance and a global time tolerance to analyze whether your data meets specifications.

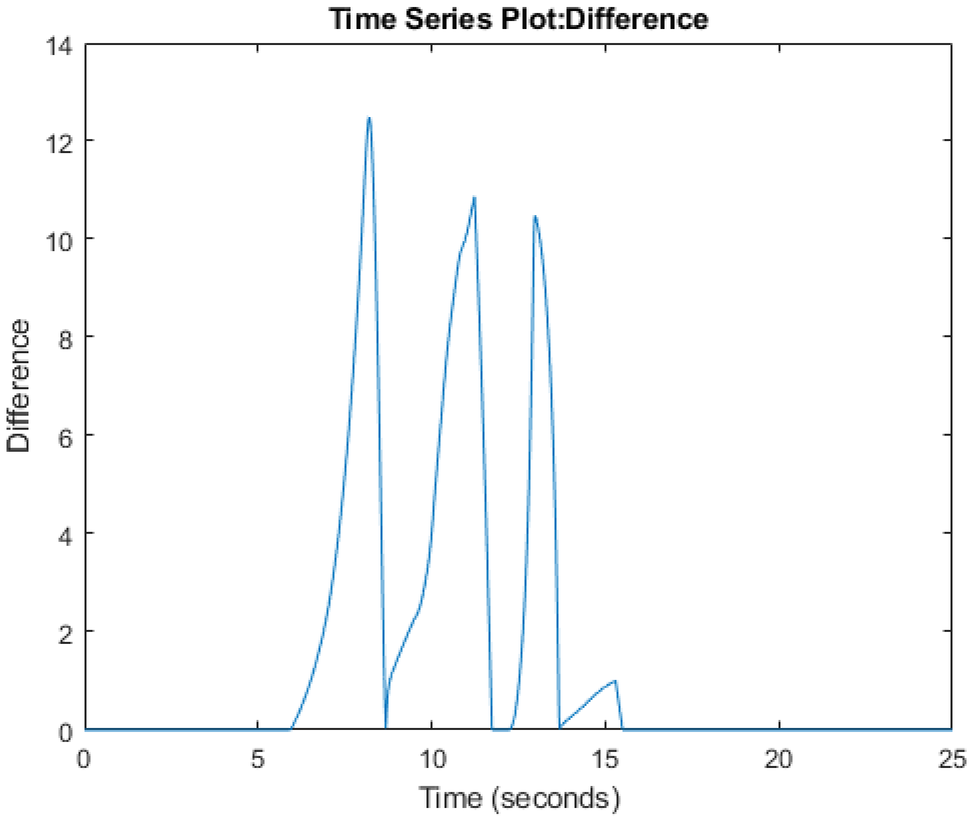
```
% Get run IDs for last two runs
runIDs = Simulink.sdi.getAllRunIDs;
runID1 = runIDs(end - 1);
runID2 = runIDs(end);

% Compare runs
runResult = Simulink.sdi.compareRuns(runID1,runID2,'reltol',0.2,'timetol',0.5);
```

Create a Plot of a Comparison Result

Use the `Simulink.sdi.DiffRunResult` object you created in the previous step with `Simulink.sdi.compareRuns` to access the data for the `Ww` signal result to plot it in a figure.

```
% Plot the |Ww| signal difference
signalResult_Ww = runResult.getResultByIndex(1);
figure(1)
plot(signalResult_Ww.Diff)
```



Analyze Simulation Data with Signal Tolerances

You can change tolerance values on a signal-by-signal basis to evaluate the effect of a model parameter change. This example uses the `slexAircraftExample` model and the Simulation Data Inspector to evaluate the effect of changing the time constant for the low-pass filter following the control input.

Setup

Load the model, and mark the `q, rad/sec` and `alpha, rad` signals for logging. Then, simulate the model to create the baseline run.

```
% Load example model
load_system('slexAircraftExample')

% Mark the q, rad/sec and alpha, rad signals for logging
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',3,'on
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on

% Simulate system
sim('slexAircraftExample')
```

Modify Model Parameter

Modify the model parameter Ts in the model workspace to change the time constant of the input low-pass filter.

```
% Change input filter time constant
modelWorkspace = get_param('slexAircraftExample','modelworkspace');
modelWorkspace.assignin('Ts',1)

% Simulate again
sim('slexAircraftExample')
```

Compare Runs and Inspect Results

Use the Simulink.sdi.compareRuns function to compare the data from the simulations. Then, inspect the match property of the signal result to see whether the signals fell within the default tolerance of 0.

```
% Get run data
runIDs = Simulink.sdi.getAllRunIDs;
runID1 = runIDs(end - 1);
runID2 = runIDs(end);

% Compare runs
diffRun1 = Simulink.sdi.compareRuns(runID1,runID2);

% Get signal result
sig1Result1 = diffRun1.getResultByIndex(1);
sig2Result1 = diffRun1.getResultByIndex(2);

% Check whether signals matched
sig1Result1.Match
```

```
ans = logical
   0
```

```
sig2Result1.Match
```

```
ans = logical
   0
```

Compare Runs with Signal Tolerances

The signals did not match within the default tolerance of 0. To further analyze the effect of the time constant change, add signal tolerances to the comparison with the baseline signal properties to determine the tolerance required for a pass. This example uses a combination of time and absolute tolerances.

```
% Get signal object for sigID1
run1 = Simulink.sdi.getRun(runID1);
sigID1 = run1.getSignalIDByIndex(1);
sigID2 = run1.getSignalIDByIndex(2);

sig1 = Simulink.sdi.getSignal(sigID1);
sig2 = Simulink.sdi.getSignal(sigID2);

% Set tolerances for q, rad/sec
sig1.AbsTol = 0.1;
sig1.TimeTol = 0.6;

% Set tolerances for alpha, rad
sig2.AbsTol = 0.2;
sig2.TimeTol = 0.8;

% Run the comparison again
diffRun2 = Simulink.sdi.compareRuns(runID1,runID2);
sig1Result2 = diffRun2.getResultByIndex(1);
sig2Result2 = diffRun2.getResultByIndex(2);

% Check the result
sig1Result2.Match
```

```
ans = logical
   1
```

```
sig2Result2.Match
```

```
ans = logical
   1
```

Compare Runs with Alignment Criteria

This example shows how to compare runs using your desired criteria for aligning signals between runs.

Generate Runs to Compare

This example simulates the `slexAircraftExample` model with two different values of `Ts` to generate two simulation runs for comparison.

```
% Configure model "slexAircraftExample" for logging and simulate
simOut = sim('slexAircraftExample', 'SaveOutput', 'on', 'SaveFormat', ...
                'Dataset', 'ReturnWorkspaceOutputs', 'on');

% Create a run from the simulation output
runID1 = Simulink.sdi.createRun('My Run', 'namevalue', {'simOut'}, ...
                                    {simOut});

% Get workspace and change workspace variable Ts
modelWorkspace = get_param('slexAircraftExample', 'modelworkspace');
modelWorkspace.assignin('Ts', 0.2);

% Simulate again
simOut = sim('slexAircraftExample', 'SaveOutput', 'on', 'SaveFormat', ...
                'Dataset', 'ReturnWorkspaceOutputs', 'on');

% Create another run and get signal IDs
runID2 = Simulink.sdi.createRun('New Run', 'namevalue', {'simOut'}, ...
                                    {simOut});
```

Define Alignment Criteria for the Comparison

Before running the comparison, define how you want the Simulation Data Inspector to align the signals between the runs. This example aligns signals by their name, then by their block path, and then by their Simulink identifier.

```
% Define the alignment criteria for the comparison to align signals by
% name, then by block path, then by SID
alignMethods = [Simulink.sdi.AlignType.SignalName
```

```
              Simulink.sdi.AlignType.BlockPath
              Simulink.sdi.AlignType.SID];
```

Compare the Runs with the Specified Alignment Criteria

Compare the simulation data in your two runs, with the alignment criteria you specified.

```
% Compare the runs
diffResults = Simulink.sdi.compareRuns(runID1 ,runID2, alignMethods);
```

Check the Comparison Results for the Aligned Signals

You can use the `getResultByIndex` method to access the aligned signals and the results of the comparison for each signal in the runs you compared.

```
% Check the number of comparisons in the result
numComparisons = diffResults.count;

% Iterate through each element and display results in command window
for k = 1:numComparisons

    resultAtIdx = diffResults.getResultByIndex(k);

    % Get signal IDs for each comparison result
    sigID1 = resultAtIdx.signalID1;
    sigID2 = resultAtIdx.signalID2;

    sig1 = Simulink.sdi.getSignal(sigID1);
    sig2 = Simulink.sdi.getSignal(sigID2);

    % Display whether signals match
    displayStr = 'Signals with IDs %s and %s %s \n';
    if resultAtIdx.match
       fprintf(displayStr, sig1.Name, sig2.Name, 'match');
    else
       fprintf(displayStr, sig1.Name, sig2.Name, 'do not match');
    end

end
```

```
Signals with IDs Actuator Model and Actuator Model do not match
Signals with IDs Integrate qdot and Integrate qdot do not match
Signals with IDs Integrate and Integrate do not match
Signals with IDs Alpha-sensor Low-pass Filter and Alpha-sensor Low-pass Filter do not
Signals with IDs Pitch Rate Lead Filter and Pitch Rate Lead Filter do not match
Signals with IDs Proportional plus integral compensator and Proportional plus integral
Signals with IDs Stick Prefilter and Stick Prefilter do not match
Signals with IDs Q-gust model and Q-gust model do not match
Signals with IDs W-gust model(1) and W-gust model(1) do not match
Signals with IDs W-gust model(2) and W-gust model(2) do not match
Signals with IDs alpha, rad and alpha, rad do not match
```

Input Arguments

`runID1` — Baseline run identifier

integer

Numerical identification for the **Baseline** run in the comparison.

`runID2` — Compare to run identifier

integer

Numerical identification for the **Compare to** run in the comparison.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: `'abstol',x,'align',alignOpts`

`align` — Signal alignment options

array

Array specifying alignment algorithms to use for pairing signals from the runs for comparison. The Simulation Data Inspector aligns signals first by the first element in the array, then by the second element in the array, and so on.

Value	Aligns By
`Simulink.sdi.AlignType.BlockPath`	Path to the signal's source block
`Simulink.sdi.AlignType.SID`	Simulink identifier “Locate Diagram Components Using Simulink Identifiers”

Value	Aligns By
`Simulink.sdi.AlignType.SignalName`	Signal name
`Simulink.sdi.AlignType.DataSource`	Path of the variable in the MATLAB workspace

Example: `[Simulink.sdi.AlignType.SignalName,Simulink.sdi.AlignType.SID]` specifies signal alignment by name and then by SID.

`abstol` — Absolute tolerance for comparison

0 (default) | scalar

Positive-valued global absolute tolerance used for all signals in the run comparison. For more information about tolerances in the Simulation Data Inspector, see “How the Simulation Data Inspector Compares Data”.

Example: `0.5`

Data Types: `double`

`reltol` — Relative tolerance for comparison

0 (default) | scalar

Positive-valued global relative tolerance used for all signals in the run comparison. The relative tolerance is expressed as a fractional multiplier. For example, `0.1` specifies a 10 percent tolerance. For more information about how the relative tolerance is applied in the Simulation Data Inspector, see “How the Simulation Data Inspector Compares Data”.

Example: `0.1`

Data Types: `double`

`timetol` — Time tolerance for comparison

0 (default) | scalar

Positive-valued global time tolerance used for all signals in the run comparison. Specify the time tolerance with units of seconds. For more information about tolerances in the Simulation Data Inspector, see “How the Simulation Data Inspector Compares Data”.

Example: `0.2`

Data Types: `double`

Output Arguments

diffResult — Comparison results

'Simulink.sdi.diffRunResult'

Simulink.sdi.DiffRunResult object that provides access to comparison results.

"Compare Simulation Data"
"How the Simulation Data Inspector Compares Data"

Introduced in R2011b

Simulink.sdi.compareSignals

Package: Simulink.sdi

Compare data from two signals

Syntax

```
diff = Simulink.sdi.compareSignals(sigID1,sigID2)
```

Description

`diff = Simulink.sdi.compareSignals(sigID1,sigID2)` compares the signals corresponding to the signal IDs `sigID1` and `sigID2` and returns the results in a `Simulink.sdi.DiffSignalResult` object. For more information on how the comparison results are computed, see “How the Simulation Data Inspector Compares Data”.

Examples

Compare Signals Within a Simulation Run

This example uses the `slexAircraftExample` model to demonstrate the comparison of the input and output signals for a control system. The example marks the signals for streaming then gets the run object for a simulation run. Signal IDs from the run object specify the signals to be compared.

```
% Load model slexAircraftExample and mark signals for streaming
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot',1,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on

% Simulate model slexAircraftExample
sim('slexAircraftExample')
```

```
% Get run IDs for most recent run
allIDs = Simulink.sdi.getAllRunIDs;
runID = allIDs(end);

% Get Run object
aircraftRun = Simulink.sdi.getRun(runID);

% Get signal IDs
signalID1 = aircraftRun.getSignalIDByIndex(1);
signalID2 = aircraftRun.getSignalIDByIndex(2);

if (aircraftRun.isValidSignalID(signalID1))
    % Change signal tolerance
    signal1 = Simulink.sdi.getSignal(signalID1);
    signal1.AbsTol = 0.1;
end

if (aircraftRun.isValidSignalID(signalID1) && aircraftRun.isValidSignalID(signalID2))
    % Compare signals
    sigDiff = Simulink.sdi.compareSignals(signalID1,signalID2);

    % Check whether signals match within tolerance
    match = sigDiff.match
end
```

```
match = logical
   0
```

Compare Signals from Different Runs

This example shows how to compare signals from different simulation runs using the Simulation Data Inspector's `Simulink.sdi.compareSignals` function. When you only have one signal of interest to compare, using a signal comparison returns the `Simulink.sdi.diffSignalResult` object with the comparison data directly.

Generate Simulation Data

Use the `slexAircraftExample` model to generate simulation runs. Between the runs, change the time constant of the input filter.

```
% Load example model
load_system('slexAircraftExample')
```

```
% Mark the alpha, rad signal for streaming
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on

% Simulate system
sim('slexAircraftExample')

% Change input filter time constant
modelWorkspace = get_param('slexAircraftExample','modelworkspace');
modelWorkspace.assignin('Ts',0.2)

% Simulate again
sim('slexAircraftExample')
```

Get Signal IDs for the Signal Comparison

Create run objects using the run IDs, and then use `getSignalIDByIndex` to get the signal IDs to pass to `Simulink.sdi.compareSignals`.

```
% Get run data
runIDs = Simulink.sdi.getAllRunIDs;

runID1 = runIDs(end-1);
runID2 = runIDs(end);

run1 = Simulink.sdi.getRun(runID1);
run2 = Simulink.sdi.getRun(runID2);

sigID1 = run1.getSignalIDByIndex(1);
sigID2 = run2.getSignalIDByIndex(1);
```

Compare Signals

Compare the signals, and open the Simulation Data Inspector to view the results.

```
diffResult = Simulink.sdi.compareSignals(sigID1,sigID2);

Simulink.sdi.view
```

Input Arguments

sigID1 — Signal ID of Baseline signal
scalar

Signal ID for the **Baseline** signal. The Simulation Data Inspector assigns signal and run IDs when you create a run for your data. You can access the signal ID from a `Simulink.sdi.Run` object with the `getSignalIDByIndex` method.

`sigID2` — Signal ID of Compare to signal

scalar

Signal ID for the **Compare to** signal. The Simulation Data Inspector assigns signal and run IDs when you create a run for your data. You can access the signal ID from a `Simulink.sdi.Run` object with the `getSignalIDByIndex` method.

Output Arguments

`diff` — Comparison results

'Simulink.sdi.diffSignalResult'

`Simulink.sdi.DiffSignalResult` object containing the results of the signal comparison.

See Also

`Simulink.sdi.DiffSignalResult` | `Simulink.sdi.Run` | `Simulink.sdi.compareRuns`

Topics

"Inspect and Compare Data Programmatically"
"Compare Simulation Data"
"How the Simulation Data Inspector Compares Data"

Introduced in R2011b

Simulink.sdi.copyRun

Copy a Simulation Data Inspector run

Syntax

```
newRunID = Simulink.sdi.copyRun(runID)
[newRunID,runIndex] = Simulink.sdi.copyRun(runID)
[newRunID,runIndex,signalIDs] = Simulink.sdi.copyRun(runID)
```

Description

`newRunID = Simulink.sdi.copyRun(runID)` copies the run corresponding to `runID` and returns the run ID for the new run. The new run includes all the simulation data and metadata from the original run. You can modify the copy of the run by adding or deleting signals and metadata while still retaining the original run.

`[newRunID,runIndex] = Simulink.sdi.copyRun(runID)` copies the run corresponding to `runID` and returns the run ID and index in the Simulation Data Inspector repository for the new run. The new run includes all the simulation data and metadata from the original run.

`[newRunID,runIndex,signalIDs] = Simulink.sdi.copyRun(runID)` copies the run corresponding to `runID` and returns the signal IDs for the signals in the new run along with its run ID and index in the Simulation Data Inspector repository. The new run includes all the simulation data and metadata from the original run.

Examples

Compare a Subset of Signals

This example shows how to use `Simulink.sdi.copyRun` and `Simulink.sdi.deleteSignal` to create a copy of a run that contains a subset of the signals from the original run. You can use the copy to analyze and run comparisons on a subset of signals while still holding onto the original run that has all of the signals. For example, the model sldemo_fuelsys is configured to log ten signals. To compare the system's responses to different types of failures, you don't need to run the comparison on all of the logged signals. Deleting signals that do not represent the system's response before running the comparison saves processing time and simplifies the view of the results.

Create Runs

Load the model sldemo_fuelsys and run simulations to create runs in the Simulation Data Inspector. The first run simulates a failure of the throttle angle sensor, and the second run simulates a failure of the exhaust gas oxygen sensor.

```
load_system('sldemo_fuelsys')
modelWorkspace = get_param('sldemo_fuelsys','modelworkspace');
modelWorkspace.assignin('throttle_sw',0)
modelWorkspace.assignin('ego_sw',1)
sim('sldemo_fuelsys')

modelWorkspace.assignin('throttle_sw',1)
modelWorkspace.assignin('ego_sw',0)
sim('sldemo_fuelsys')
```

Copy the Run

Use the Simulation Data Inspector's programmatic interface to get Simulink.sdi.Run objects for the simulations, and then create copies of the runs.

```
% Get runs
runIDs = Simulink.sdi.getAllRunIDs;

runID1 = runIDs(end-1);
runID2 = runIDs(end);

run1 = Simulink.sdi.getRun(runID1);
run2 = Simulink.sdi.getRun(runID2);

% Create a copy of each run, truncRun
[truncRun1,runIndex1,signalIDs1] = Simulink.sdi.copyRun(runID1);
[truncRun2,runIndex2,signalIDs2] = Simulink.sdi.copyRun(runID2);
```

Delete Signals in Run Copy

The sldemo_fuelsys model is configured to log the values of the fault switches along with several signals representing the system's response. When you compare the system's response when a throttle angle sensor fails to its response when an exhaust gas oxygen sensor fails, comparing the fault switch states does not provide new information. Therefore, delete the switch signals before running the comparison to eliminate unnecessary computations.

```
Simulink.sdi.deleteSignal(signalIDs1(1))
Simulink.sdi.deleteSignal(signalIDs1(3))
Simulink.sdi.deleteSignal(signalIDs1(5))
Simulink.sdi.deleteSignal(signalIDs1(8))

Simulink.sdi.deleteSignal(signalIDs2(1))
Simulink.sdi.deleteSignal(signalIDs2(3))
Simulink.sdi.deleteSignal(signalIDs2(5))
Simulink.sdi.deleteSignal(signalIDs2(8))
```

Compare Truncated Runs

You can use the truncated runs you created with `Simulink.sdi.copyRun` and `Simulink.sdi.deleteSignal` to perform a comparison of the system's response to different types of failures. Then, open the Simulation Data Inspector to view the comparison results.

```
truncRunDiff = Simulink.sdi.compareRuns(truncRun1,truncRun2);

Simulink.sdi.view
```

Input Arguments

`runID` — Numeric run identifier

scalar

Run ID for the run you want to copy. The Simulation Data Inspector assigns run IDs when it creates runs. You can get the run ID for your run using `Simulink.sdi.getAllRunIDs` or `Simulink.sdi.getRunIDByIndex`.

Output Arguments

`newRunID` — Run ID for the copy

scalar

Run ID for the copy of the run.

`runIndex` — Run index for the copy

scalar

Index of the copy in the Simulation Data Inspector repository.

`signalIDs` — Numeric identifiers for the signals in the copy

matrix

Matrix containing the signal IDs for the copies of signals created in the copy of the run.

Topics

"Inspect and Compare Data Programmatically"

Introduced in R2011b

Simulink.sdi.copyRunViewSettings

Copy line style and color for signals from one run to another

Syntax

```
sigIDs = Simulink.sdi.copyRunViewSettings(run1,run2,plot)
```

Description

`sigIDs = Simulink.sdi.copyRunViewSettings(run1,run2,plot)` copies the line style and color specifications from `runID1` to `runID2` for matched signals. You can specify `run1` and `run2` with their run ID or as a `Simulink.sdi.Run` object. If `plot` is specified as `true`, `Simulink.sdi.copyRunViewSettings` also changes signal parameters in both runs so that aligned signals that are plotted come from the `run2`. The function returns an array of signal identifiers for the signals that the Simulation Data Inspector aligned between the two runs. To learn more about how the Simulation Data Inspector aligns signals between runs, see “How the Simulation Data Inspector Compares Data”.

Examples

Copy View Settings to a Run

This example shows how to copy the view settings for aligned signals from one run to another.

Simulate Your Model and get Run Object

Simulate the `vdp` model to create a run of data to visualize.

```
load_system('vdp')
set_param('vdp','SaveFormat','Dataset','SaveOutput','on')
sim('vdp')
```

```
runIndex = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(runIndex);
vdpRun = Simulink.sdi.getRun(runID);
```

Modify View Settings for Signals

Use the `Simulink.sdi.Run` object to access the signals in the run. Then, modify the signals' view settings, and plot them in the Simulation Data Inspector. Open the Simulation Data Inspector and use `Simulink.sdi.snapshot` to view the results.

```
sig1 = vdpRun.getSignalByIndex(1);
sig2 = vdpRun.getSignalByIndex(2);

sig1.LineColor = [0 0 1];
sig1.LineDashed = '-.';

sig2.LineColor = [1 0 0];
sig2.LineDashed = ':';
```

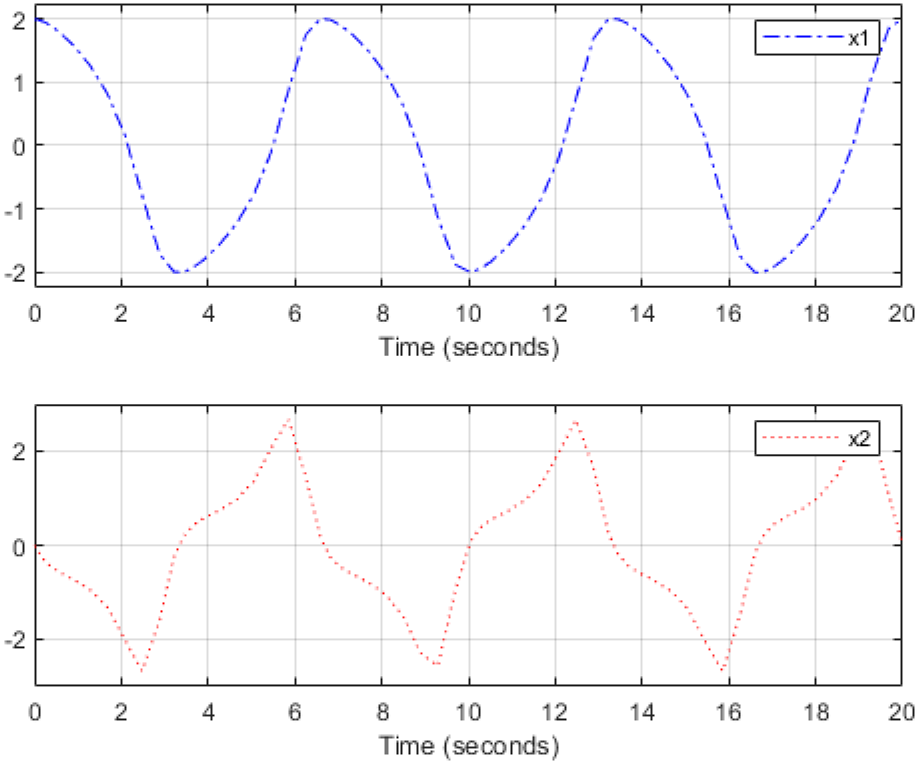
Capture a Snapshot from the Simulation Data Inspector

Create a `Simulink.sdi.CustomSnapshot` object and use the `Simulink.sdi.snapshot` function to programmatically capture a snapshot of the contents of the Simulation Data Inspector.

```
snap = Simulink.sdi.CustomSnapshot;

snap.Rows = 2;
snap.YRange = {[-2.25 2.25],[-3 3]};
snap.plotOnSubPlot(1,1,sig1,true)
snap.plotOnSubPlot(2,1,sig2,true)

fig = Simulink.sdi.snapshot("from","custom","to","figure","settings",snap);
```



Copy the View Settings to a New Simulation Run

Simulate the model again, with a different Mu value. Then, visualize the new run by copying the view settings from the first run. Specify the plot input as true to plot the signals from the new run.

```
set_param('vdp/Mu','Gain','5')
sim('vdp')

runIndex2 = Simulink.sdi.getRunCount;
runID2 = Simulink.sdi.getRunIDByIndex(runIndex2);
run2 = Simulink.sdi.getRun(runID2);

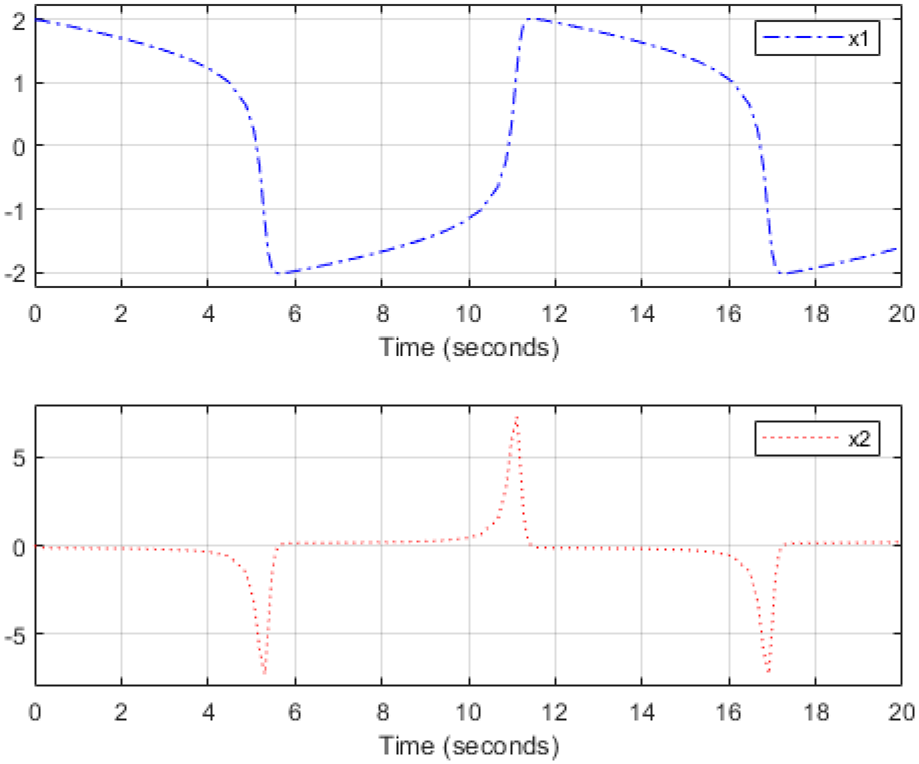
sigIDs = Simulink.sdi.copyRunViewSettings(runID,runID2,true);
```

Capture a Snapshot of the New Simulation Run

Use the `Simulink.sdi.CustomSnapshot` object to capture a snapshot of the new simulation run. First, clear the signals from the subplots. Then, plot the signals from the new run and capture another snapshot.

```
snap.clearSignals
snap.YRange = {[-2.25 2.25],[-8 8]};
snap.plotOnSubPlot(1,1,sigIDs(1),true)
snap.plotOnSubPlot(2,1,sigIDs(2),true)

fig = snap.snapshot("to","figure");
```



Input Arguments

run1 — Simulation Data Inspector run ID for source run

scalar | `'Simulink.sdi.Run'` object

Run with the view settings you want to copy specified with its run ID or `Simulink.sdi.Run` object. The Simulation Data Inspector assigns run IDs when it creates runs. You can get the run ID for your run using `Simulink.sdi.getAllRunIDs` or `Simulink.sdi.getRunIDByIndex`.

run2 — Simulation Data Inspector run ID for destination run

scalar | `'Simulink.sdi.Run'` object

Run you want to copy the view settings to, specified with its run ID or `Simulink.sdi.Run` object. The Simulation Data Inspector assigns run IDs when it creates runs. You can get the run ID for your run using `Simulink.sdi.getAllRunIDs` or `Simulink.sdi.getRunIDByIndex`.

`plot` — Specify whether to update plotted signals

`true` | `false`

Specifies whether the Simulation Data Inspector changes the plot settings in the runs corresponding to `run1` and `run2`.

- When `plot` is `true`, the Simulation Data Inspector modifies the signal parameters so that the aligned signals that are plotted come from `run2`.
- When `plot` is `false`, the Simulation Data Inspector does not change which signals are plotted.

Data Types: `logical`

Output Arguments

`sigIDs` — Signal IDs for aligned signals

matrix

Matrix containing the signal IDs for signals in `run2` that aligned with signals in `run1` and had view settings modified.

Topics

“Inspect and Compare Data Programmatically”
“Create Plots Using the Simulation Data Inspector”

Introduced in R2016a

Simulink.sdi.createRun

Package: Simulink.sdi

Create a run in the Simulation Data Inspector

Syntax

```
runID = Simulink.sdi.createRun
runID = Simulink.sdi.createRun(runName)
runID = Simulink.sdi.createRun(var)

runID = Simulink.sdi.createRun(runName,'vars',var,var2,...,varn)
runID = Simulink.sdi.createRun(runName,'namevalue',sourceNames,
sigValues)
runID = Simulink.sdi.createRun(runName,'file',filename)

[runID,runIndex] = Simulink.sdi.createRun( ___ )
[runID,runIndex,signalIDs] = Simulink.sdi.createRun( ___ )
```

Description

`runID = Simulink.sdi.createRun` creates an empty, unnamed run in the Simulation Data Inspector repository and returns the run ID. You can use `Simulink.sdi.getRun` to get a `Simulink.sdi.Run` object for the run, which allows you to add metadata and signals to the run.

`runID = Simulink.sdi.createRun(runName)` creates an empty run named `runName`.

`runID = Simulink.sdi.createRun(var)` creates a run named `var` containing the data in the workspace variable `var`.

`runID = Simulink.sdi.createRun(runName,'vars',var,var2,...,varn)` creates a run named `runName` containing data from one or more variables in the base workspace. The signals in the run take their names from the variable names.

runID = Simulink.sdi.createRun(runName,'namevalue',sourceNames, sigValues) creates a run named runName with the data in the cell array sigValues. The cell array of sourceNames specifies names to use as the source for the sigValues data.

runID = Simulink.sdi.createRun(runName,'file',filename) creates a run with data from the MAT, CSV, MDF, or Microsoft Excel file specified by filename.

[runID,runIndex] = Simulink.sdi.createRun(___) returns the run ID and run index for the run created in the Simulation Data Inspector repository.

[runID,runIndex,signalIDs] = Simulink.sdi.createRun(___) returns the run ID, run index within the Simulation Data Inspector, and the signal IDs for the signals in the run.

Examples

Create a Run in the Simulation Data Inspector

This example shows several ways to create a run in the Simulation Data Inspector for your data. You can create a run from simulation outputs, workspace data, and from a file.

Create Data

You can create Simulation Data Inspector runs from workspace data or from a file. The namevalue syntax for Simulink.sdi.createRun can be useful for hierarchical data. Create example data to use in each scenario.

```
% Create timeseries workspace data
time = linspace(0,20,101);

sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals,time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals,time);
cos_ts.Name = 'Cosine, T=8';

% Create Dataset workspace data
```

```
sinusoids_ds = Simulink.SimulationData.Dataset;
sinusoids_ds = sinusoids_ds.add(cos_ts);
sinusoids_ds = sinusoids_ds.add(sine_ts);

doubSine = 2*sine_ts;
doubCos = 2*cos_ts;

doubSinusoids_ds = Simulink.SimulationData.Dataset;
doubSinusoids_ds = doubSinusoids_ds.add(doubSine);
doubSinusoids_ds = doubSinusoids_ds.add(doubCos);

% Save workspace data to a MAT-file
save sinusoids.mat sine_ts cos_ts
```

Create a Run with a Run Object

You can create a run object using the `Simulink.sdi.Run` object's `create` method and then add data to the run using the `add` method. The `add` method supports all loading and logging data formats.

```
% Create a run
sinusoidsRun = Simulink.sdi.Run.create;
sinusoidsRun.Name = 'Sinusoids';
sinusoidsRun.Description = 'Sine and cosine signals of different frequencies';

% Add timeseries data to run
sinusoidsRun.add('vars',sine_ts,cos_ts);
```

Create a Run for a Variable

When you have only one signal of interest that you want to inspect and compare in the Simulation Data Inspector you can use a simple syntax to create the run. The run takes the same name as the variable.

```
runID = Simulink.sdi.createRun(sine_ts);
```

Create a Named Empty Run

With this syntax, you can create an empty run and specify its name. Then, you can use the returned runID to add data to the run.

```
runID = Simulink.sdi.createRun('My Waves');
signalID = Simulink.sdi.addToRun(runID,'vars',cos_ts);
```

Create a Run from Multiple Workspace Variables

When your signals of interest are in multiple variables in your workspace, use the 'vars' syntax. You can also use this syntax to provide a custom name for a run created from a single variable.

```
runID = Simulink.sdi.createRun(' My Sinusoids','vars',sine_ts,cos_ts);
```

Create a Run and Specify the Source for the Data

Providing a name for the source of the run data can be helpful, particularly with hierarchical data. Use the 'namevalue' syntax to specify data source names.

```
runID = Simulink.sdi.createRun('Waves','namevalue',{'Sinusoids',...
    'BigSinusoids'},{sinusoids_ds,doubSinusoids_ds});
```

Create a Run from Data in a File

You can create a run in the Simulation Data Inspector directly from a file of data using the 'file' syntax.

```
runID = Simulink.sdi.createRun('Wave Data','file','sinusoids.mat');
```

View Runs in the Simulation Data Inspector

Look at the runs in the Inspect pane to see the results from each run creation method. You can select a run or a signal to view its metadata.

```
Simulink.sdi.view
```

Create a Simulation Data Inspector Run and Access Signal Data

This example shows how to access signal data when you create a run in the Simulation Data Inspector.

Generate Data for Run

For this example, create timeseries data for sine and cosine signals.

```
% Create timeseries workspace data
time = linspace(0, 20, 101);

sine_vals = sin(2*pi/5*time);
```

```
sine_ts = timeseries(sine_vals,time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals,time);
cos_ts.Name = 'Cosine, T=8';
```

Create a Run and Return Signal IDs

You can use the `Simulink.sdi.createRun` syntax with multiple return arguments to get the signal IDs more directly instead of accessing the signal IDs through a `Simulink.sdi.Run` object.

```
[runID,runIndex,sigIDs] = Simulink.sdi.createRun('Sinusoids','vars',...
    sine_ts,cos_ts);

cosID = sigIDs(2);
cosSig = Simulink.sdi.getSignal(cosID);
```

Modify Signal Properties and View in the Simulation Data Inspector

You can use the `Simulink.sdi.Signal` object to view and modify signal properties and to plot signals in the Simulation Data Inspector.

```
cosSig.Checked = true;
cosSig.AbsTol = 0.05;
Simulink.sdi.view
cosSig.Name
```

```
ans =

    'Cosine, T=8'
```

Input Arguments

`runName` — Name for the run

character vector

Name for the run in the Simulation Data Inspector.

Example: `'Baseline Simulation'`

`var` — Variable name
variable

Variable in the base workspace containing the data you want to create a run for in the Simulation Data Inspector. The Simulation Data Inspector requires an associated time vector for your data. `Simulink.sdi.createRun` supports all loading and logging data formats, including `timeseries` and `Simulink.SimulationData.Dataset`.

Provide one `var` argument when `var` is the only argument and one or more `var` arguments when you specify `'vars'` for the second argument.

Example: `myData`

`sourceNames` — Cell array of signal names
cell array

Cell array of character vectors in which each element is the name of the source for data in the run. Provide a `sigNames` input when you specify `'namevalue'` for the second argument.

Example: `{'sig1','sig2'}`

`sigValues` — Signal data
cell array

Cell array of variables containing signal data for the run. Provide a `sigValues` input when you specify `'namevalue'` for the second argument.

Example: `{var1,var2}`

`filename` — Name of file containing data for run
character vector

File name of the file containing your run data. Provide a `filename` input when you specify `'file'` for the second argument. You can create a run from a MAT, CSV, or Microsoft Excel file. You can also create a run from an MDF-file with an mdf, mf4, mf3, data, or dat file extension.

Example: `'simulation.mat'`

Output Arguments

`runID` — Run identifier
scalar

Run identifier for the new run.

`runIndex` — Run index
scalar

Index of the new run in the Simulation Data Inspector repository.

`signalIDs` — Signal IDs for signals in run
vector

Vector containing the signal IDs for the signals in the run.

Introduced in R2011b

Simulink.sdi.createRunOrAddToStreamedRun

Package: Simulink.sdi

Create a single run for all simulation outputs

Syntax

```
runID = Simulink.sdi.createRunOrAddToStreamedRun(mdl,runName,
varSources,varValues)
```

Description

`runID = Simulink.sdi.createRunOrAddToStreamedRun(mdl,runName, varSources,varValues)` creates a run with the data `varValues` if no run exists in the Simulation Data Inspector repository for the model `mdl`. If one or more runs for the model `mdl` exist in the Simulation Data Inspector repository, the function adds `varValues` to the most recent run associated with `mdl`. The run is named according to `runName`, and the sources for the data in `varValues` are named according to `varSources`.

Examples

Add Signals to a Run

This example shows how to use `Simulink.sdi.createRunOrAddToStreamedRun` to add data to an existing run for a model. In this example, you add logged states data to the run created through simulation.

Simulate the Model

Simulate the model to generate data. The model `slexAircraftExample` is configured to log outputs, so the Simulation Data Inspector automatically creates a run with the logged outport data. Using this simulation syntax, `out` contains the outport data (`yout`) and the states data (`xout`).

```
load_system('slexAircraftExample')
out = sim('slexAircraftExample','ReturnWorkspaceOutputs','on',...
            'SaveFormat','Dataset');
```

Add Logged States Data to Run

The Simulation Data Inspector automatically created a run for the logged outport data. Add the logged state data to the existing run using `Simulink.sdi.createRunOrAddToStreamedRun`.

```
Simulink.sdi.createRunOrAddToStreamedRun('slexAircraftExample','Run 1',...
              {'out'},{out});
```

Open the Simulation Data Inspector to View Results

Using `Simulink.sdi.createRunOrAddToStreamedRun` avoids redundancy in the data shown in the Simulation Data Inspector. Using `Simulink.sdi.createRun` to bring the states data into the Simulation Data Inspector creates a second run. `Simulink.sdi.addToRun` creates a duplicate signal from the outport data. Using `Simulink.sdi.createRunOrAddToStreamedRun`, you can include all simulation data in a single run without duplicating any signals.

```
Simulink.sdi.view
```

Input Arguments

`mdl` — Name of model that created simulation data

character vector

Name of the model the simulation data is from, specified as a character vector.

Example: `'sldemo_absbrake'`

`runName` — Name for the run

character vector

Name for the new or augmented run. If `Simulink.sdi.createRunOrAddToStreamedRun` adds data to an existing run, the run is renamed according to `runName`.

Example: `'Run 1'`

varSources — Names to use for the sources of data

cell array of character vectors

Names for the sources of the data in varValues.

Example: {'sig1','sig2'}

varValues — Data to add to run

cell array

Cell array of data to incorporate into the run. Simulink.sdi.createRunOrAddToStreamedRun supports data in all logging and loading formats, including timeseries and Simulink.SimulationData.Dataset.

Example: {sig1,sig2}

Output Arguments

runID — Run identifier

scalar

Run identifier for the new or augmented run.

Introduced in R2017a

Simulink.sdi.deleteRun

Package: Simulink.sdi

Delete a run from the Simulation Data Inspector repository

Syntax

```
Simulink.sdi.deleteRun(runID)
```

Description

`Simulink.sdi.deleteRun(runID)` deletes the run corresponding to `runID`. When you delete a run, the indices of all runs following the deleted run change to account for the change in the run count. Deleting a run does not change any run IDs.

Examples

Delete a Run

You can delete a run from the Simulation Data Inspector repository to free up memory space or to declutter your workspace from data you do not need.

```
% Load and simulate sldemo_fuelsys model
load_system('sldemo_fuelsys')
sim('sldemo_fuelsys')

% Get the run ID for the run
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

```
% Delete the run
Simulink.sdi.deleteRun(runID)
```

Input Arguments

`runID` — Run identifier

scalar

Run ID for the run you want to delete. You can get the run ID for a run using `Simulink.sdi.getAllRunIDs` or `Simulink.sdi.getRunIDByIndex`.

See Also

`Simulink.sdi.clear` | `Simulink.sdi.copyRun` | `Simulink.sdi.deleteSignal` | `Simulink.sdi.getAllRunIDs` | `Simulink.sdi.getArchiveRunLimit` | `Simulink.sdi.getRunIDByIndex` | `Simulink.sdi.setArchiveRunLimit`

Topics

"Inspect and Compare Data Programmatically"

Introduced in R2011b

Simulink.sdi.deleteSignal

Package: Simulink.sdi

Delete a signal from the Simulation Data Inspector repository

Syntax

```
Simulink.sdi.deleteSignal(sigID)
```

Description

`Simulink.sdi.deleteSignal(sigID)` deletes the signal corresponding to `sigID` from the Simulation Data Inspector repository.

Examples

Compare a Subset of Signals

This example shows how to use `Simulink.sdi.copyRun` and `Simulink.sdi.deleteSignal` to create a copy of a run that contains a subset of the signals from the original run. You can use the copy to analyze and run comparisons on a subset of signals while still holding onto the original run that has all of the signals. For example, the model `sldemo_fuelsys` is configured to log ten signals. To compare the system's responses to different types of failures, you don't need to run the comparison on all of the logged signals. Deleting signals that do not represent the system's response before running the comparison saves processing time and simplifies the view of the results.

Create Runs

Load the model `sldemo_fuelsys` and run simulations to create runs in the Simulation Data Inspector. The first run simulates a failure of the throttle angle sensor, and the second run simulates a failure of the exhaust gas oxygen sensor.

```
load_system('sldemo_fuelsys')
modelWorkspace = get_param('sldemo_fuelsys','modelworkspace');
modelWorkspace.assignin('throttle_sw',0)
modelWorkspace.assignin('ego_sw',1)
sim('sldemo_fuelsys')

modelWorkspace.assignin('throttle_sw',1)
modelWorkspace.assignin('ego_sw',0)
sim('sldemo_fuelsys')
```

Copy the Run

Use the Simulation Data Inspector's programmatic interface to get `Simulink.sdi.Run` objects for the simulations, and then create copies of the runs.

```
% Get runs
runIDs = Simulink.sdi.getAllRunIDs;

runID1 = runIDs(end-1);
runID2 = runIDs(end);

run1 = Simulink.sdi.getRun(runID1);
run2 = Simulink.sdi.getRun(runID2);

% Create a copy of each run, truncRun
[truncRun1,runIndex1,signalIDs1] = Simulink.sdi.copyRun(runID1);
[truncRun2,runIndex2,signalIDs2] = Simulink.sdi.copyRun(runID2);
```

Delete Signals in Run Copy

The `sldemo_fuelsys` model is configured to log the values of the fault switches along with several signals representing the system's response. When you compare the system's response when a throttle angle sensor fails to its response when an exhaust gas oxygen sensor fails, comparing the fault switch states does not provide new information. Therefore, delete the switch signals before running the comparison to eliminate unnecessary computations.

```
Simulink.sdi.deleteSignal(signalIDs1(1))
Simulink.sdi.deleteSignal(signalIDs1(3))
Simulink.sdi.deleteSignal(signalIDs1(5))
Simulink.sdi.deleteSignal(signalIDs1(8))

Simulink.sdi.deleteSignal(signalIDs2(1))
Simulink.sdi.deleteSignal(signalIDs2(3))
Simulink.sdi.deleteSignal(signalIDs2(5))
Simulink.sdi.deleteSignal(signalIDs2(8))
```

Compare Truncated Runs

You can use the truncated runs you created with `Simulink.sdi.copyRun` and `Simulink.sdi.deleteSignal` to perform a comparison of the system's response to different types of failures. Then, open the Simulation Data Inspector to view the comparison results.

```
truncRunDiff = Simulink.sdi.compareRuns(truncRun1,truncRun2);

Simulink.sdi.view
```

Input Arguments

`sigID` — Signal ID

scalar

Unique number identifying the signal within the Simulation Data Inspector repository. You can get the signal ID for a signal as a return from `Simulink.sdi.createRun` or using the `Simulink.sdi.Run` object's methods.

See Also

`Simulink.sdi.Run` | `Simulink.sdi.Signal` | `Simulink.sdi.copyRun` | `Simulink.sdi.createRun`

Topics

“Inspect and Compare Data Programmatically”
“Organize Your Simulation Data Inspector Workspace”

Introduced in R2016a

Simulink.sdi.enablePCTSupport

Control how the Simulation Data Inspector works with the Parallel Computing Toolbox

Syntax

```
Simulink.sdi.enablePCTSupport(mode)
```

Description

`Simulink.sdi.enablePCTSupport(mode)` enables support for automatic data import from parallel workers into the Simulation Data Inspector, according to the mode specified by `mode`. You can configure the Simulation Data Inspector to import no worker data, only data from local workers, or data from all workers — local and remote. You can also configure the parallel worker support as manual, where you manually select runs to import to the Simulation Data Inspector using the `Simulink.sdi.sendWorkerRunToClient` function. By default, the Simulation Data Inspector automatically imports runs from local workers.

Examples

Enable Parallel Support for All Workers

Configure Simulation Data Inspector parallel worker support to import the output automatically from both local and remote workers.

```
Simulink.sdi.enablePCTSupport('all')
```

Disable Support for Parallel Workers

To prevent the output from any Parallel Computing Toolbox workers from automatically importing to the Simulation Data Inspector, disable Parallel Computing Toolbox support.

```
Simulink.sdi.enablePCTSupport('none')
```

Manually Send Runs from Parallel Workers to the Simulation Data Inspector

This example shows how to use `Simulink.sdi.sendWorkerRunToClient` to send runs created using parallel workers manually to the Simulation Data Inspector.

Setup

This example runs several simulations of the `vdp` model, varying the value of the gain, `Mu`. To set up for the parallel simulation, define a vector of `Mu` values and configure the Simulation Data Inspector for manual Parallel Computing Toolbox support.

```
% Enable manual Parallel Computing Toolbox support
Simulink.sdi.enablePCTSupport('manual');

% Choose several Mu values
MuVals = [1 2 3 4];
```

Initialize Parallel Workers

Use `parpool` to start a pool of four parallel workers. This example calls `parpool` inside an if statement so you only create a parallel pool if you don't already have one. You can use `spmd` to run initialization code common to all workers. For example, load the `vdp` model and select signals to log to runs that we can send to the Simulation Data Inspector on the client MATLAB. To avoid data concurrency issues when simulating with `sim` in `parfor`, create a temporary directory on each worker. After the simulations complete, another spmd block deletes the temporary directories.

```
p = gcp('nocreate');

if isempty(p)

    parpool(4);

end
```

```
Starting parallel pool (parpool) using the 'local' profile ...
connected to 4 workers.
```

```
spmd
```

```
    % Load system and select signals to log
    load_system('vdp')
    Simulink.sdi.markSignalForStreaming('vdp/x1',1,'on')
    Simulink.sdi.markSignalForStreaming('vdp/x2',1,'on')

    % Create temporary directory for simulation on worker
    workDir = pwd;
    addpath(workDir)
    tempDir = tempname;
    mkdir(tempDir)
    cd(tempDir)

end
```

Run Parallel Simulations with parfor

To stream data from parallel workers to the Simulation Data Inspector, you have to run parallel simulations using parfor. Each worker runs a vdp simulation with a different value of Mu. Simulink cannot access the contents of the parfor loop, so the variable MuVal is defined in the worker's workspace, where the vdp model can see it, using assignin.

```
parfor (index = 1:4)

    % Set value of Mu in the worker's base workspace
    assignin('base','MuVal',MuVals(index));

    % Modify the value of Mu in the model and simulate
    set_param('vdp/Mu','Gain','MuVal')
    sim('vdp')
```

Access Data and Send Run to Client MATLAB

You can use the Simulation Data Inspector programmatic interface on the worker the same way you would in the client MATLAB. This example creates a Simulink.sdi.Run object and attaches the value of Mu used in the simulation with the Tag property.

```
    % Attach metadata to the run
    IDs = Simulink.sdi.getAllRunIDs;
    lastIndex = length(IDs);
    runID = Simulink.sdi.getRunIDByIndex(lastIndex);
    parRun = Simulink.sdi.getRun(runID);
    parRun.Tag = strcat('Mu = ',num2str(MuVals(index)));

    % Send the run to the Simulation Data Inspector on the client MATLAB
    Simulink.sdi.sendWorkerRunToClient

end
```

Close Temporary Directories and View Runs in the Simulation Data Inspector

Use another `spmd` section to delete the temporary directories created on the workers once the simulations complete. In each simulation, `Simulink.sdi.sendWorkerRunToClient` imported runs from all the workers into the Simulation Data Inspector. You can view the data and check the run properties to see the value of `Mu` used during simulation.

```
spmd

    % Remove temporary directories
    cd(workDir)
    rmdir(tempDir, 's')
    rmpath(workDir)

end

Simulink.sdi.view
```

Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport('local')
```

```
% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];
```

Initialize Parallel Workers

Use gcp to create a pool of local workers to run parallel simulations if you don't already have one. In an `spmd` code block, load the `slexAircraftExample` model and select signals to log. To avoid data concurrency issues using `sim` in `parfor`, create a temporary directory for each worker to use during simulations.

```
p = gcp;
```

```
Starting parallel pool (parpool) using the 'local' profile ...
connected to 4 workers.
```

```
spmd

    % Load system and select signals to log
    load_system('slexAircraftExample')
    Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
    Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',

    % Create temporary directory on each worker
    workDir = pwd;
    addpath(workDir)
    tempDir = tempname;
    mkdir(tempDir)
    cd(tempDir)

end
```

Run Parallel Simulations

Use `parfor` to run the seven simulations in parallel. Select the value for `Ts` for each simulation, and modify the value of `Ts` in the model workspace. Then, run the simulation and build an array of `Simulink.sdi.WorkerRun` objects to access the data with the Simulation Data Inspector. After the `parfor` loop, use another `spmd` segment to remove the temporary directories from the workers.

```
parfor index = 1:7

    % Select value for Ts
    Ts_val = Ts_vals(index);
    % Change the filter time constant and simulate
    modelWorkspace = get_param('slexAircraftExample','modelworkspace');
    modelWorkspace.assignin('Ts',Ts_val)
    sim('slexAircraftExample')

    % Create a worker run for each simulation
    workerRun(index) = Simulink.sdi.WorkerRun.getLatest

end

spmd

    % Remove temporary directories
    cd(workDir)
    rmdir(tempDir, 's')
    rmpath(workDir)

end
```

Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

```
ds(7) = Simulink.SimulationData.Dataset;

for a = 1:7
    ds(a) = workerRun(a).getDataset;
end
ds(1)
```

```
ans = 
Simulink.SimulationData.Dataset '' with 2 elements

                         Name        BlockPath                               
                         __________  ________________________________________
    1  [1x1 Signal]      alpha, rad  ...rcraftExample/Aircraft Dynamics Model
    2  [1x1 Signal]      Stick       slexAircraftExample/Pilot               

  - Use braces { } to access, modify, or add elements using index.
```

Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```
for b = 1:7
    datasetRef(b) = workerRun(b).getDatasetRef;
end

datasetRef(1)

ans =
  DatasetRef with properties:

           Name: 'Run 3: slexAircraftExample'
            Run: [1×1 Simulink.sdi.Run]
    numElements: 2
```

Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local `Run` objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```
for c = 1:7

    Runs(c) = workerRun(c).getLocalRun;
    Ts_val_str = num2str(Ts_vals(c));
    desc = strcat('Ts = ', Ts_val_str);
    Runs(c).Description = desc;
    Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);

end
```

Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

```
Simulink.sdi.cleanupWorkerResources
```

Input Arguments

`mode` — Prallel worker support mode

`'local'` (default) | `'none'` | `'all'` | `'manual'`

Mode of Simulation Data Inspector support for importing runs from parallel workers.

- `'local'` — The default behavior configures automatic import for runs generated on local workers.
- `'none'` — Disables parallel worker support. No runs from local or remote workers import to the Simulation Data Inspector.
- `'all'` — Enables automatic import for runs created from local and remote workers.
- `'manual'` — Configures support for manual import of runs created by parallel workers using the `Simulink.sdi.sendWorkerRunToClient` function.

Data Types: `char` | `string`

Topics

"Inspect and Compare Data Programmatically"

Introduced in R2017b

Simulink.sdi.exportRun

Export run data to a Simulink.SimulationData.Dataset object

Syntax

```
dataset = Simulink.sdi.exportRun(runID)
```

Description

`dataset = Simulink.sdi.exportRun(runID)` creates a `Simulink.SimulationData.Dataset` object in the base workspace with the data in the Simulation Data Inspector run identified by `runID`.

Examples

Export Run Data

This example shows how to export data from a run in the Simulation Data Inspector to a `Simulink.SimulationData.Dataset` object in the base workspace you can use to further process your data. The method you choose to export your run depends on the processing you do in your script. If you have a run object for the run, you can use the `export` method to create a `Simulink.SimulationData.Dataset` object with the run's data in the base workspace. If you do not have a run object, use the `Simulink.sdi.exportRun` function to export the run to the workspace.

Export Run Using `Simulink.sdi.exportRun`

Use the `Simulink.sdi.export` function when your workflow does not include creating a run object.

```
% Load vdp model
load_system('vdp')

% Get handles for signal lines in model
```

```
SignalHandles = get_param('vdp', 'Lines');

% Mark signals for streaming
Simulink.sdi.markSignalForStreaming(SignalHandles(5).Handle, 'on')
Simulink.sdi.markSignalForStreaming(SignalHandles(6).Handle, 'on')

% Simulate vdp model
sim('vdp')

% Get run ID for simulation run
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Export run
simDataset = Simulink.sdi.exportRun(runID);
```

Export Run Using export Method

When you already have a `Simulink.sdi.Run` object for your run, you can use the `export` method to create a `Simulink.SimulationData.Dataset` object in the base workspace for further processing of the data.

```
% Load vdp model
load_system('vdp')

% Get handles for signal lines in model
SignalHandles = get_param('vdp', 'Lines');

% Mark signals for streaming
Simulink.sdi.markSignalForStreaming(SignalHandles(5).Handle, 'on')
Simulink.sdi.markSignalForStreaming(SignalHandles(6).Handle, 'on')

% Simulate model vdp and get run object
sim('vdp')

% Get run object for simulation run
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
vdpRun = Simulink.sdi.getRun(runID);

% Get signal ids for signals
sigID1 = vdpRun.getSignalIDByIndex(1);
sigID2 = vdpRun.getSignalIDByIndex(2);

% Compare signals
```

```
diffResult = Simulink.sdi.compareSignals(sigID1,sigID2);
diffResult.match

ans = logical
   0
```

```
% Export run
simDataset = vdpRun.export;
```

Input Arguments

runID — Run identifier
scalar

Run identifier for the run you want to export to a `Simulink.SimulationData.Dataset`. The Simulation Data Inspector assigns a unique run ID when it creates a run. You can get the run ID for your run using `Simulink.sdi.getAllRunIDs` and `Simulink.sdi.getRunIDByIndex`.

Output Arguments

dataset — Dataset containing run data
`Simulink.SimulationData.Dataset`

`Simulink.SimulationData.Dataset` object containing the data from the run identified by `runID`.

"Save and Share Simulation Data Inspector Data and Views"

Introduced in R2017a

Simulink.sdi.getAllRunIDs

Package: Simulink.sdi

Get all Simulation Data Inspector run identifiers

Syntax

```
runIDs = Simulink.sdi.getAllRunIDs
```

Description

`runIDs = Simulink.sdi.getAllRunIDs` returns a matrix of the run identifiers for all runs in the Simulation Data Inspector repository.

Examples

Get Run ID for a Simulation

Many workflows that use the Simulation Data Inspector programmatic interface start with obtaining the ID for a simulation run. This example shows two different methods to use the programmatic interface to get the run ID for a run. You can use the run ID to create a `Simulink.sdi.Run` object to access run data and metadata, or you can use the run ID for a comparison.

Simulate a Model to Create a Run

The model `sldemo_fuelsys` is already configured for logging. When you simulate the model, the Simulation Data Inspector automatically creates a run and assigns it a run ID.

```
% Load and simulate system
load_system('sldemo_fuelsys')
sim('sldemo_fuelsys')
```

Get Run ID Using Simulink.sdi.getAllRunIDs

`Simulink.sdi.getAllRunIDs` returns an array of all run IDs for runs in the Simulation Data Inspector repository in order, with the most recently created run at the end.

```
% Get runID for most recent run
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

Get Run ID Using Simulink.sdi.getRunIDByIndex

You can also use `Simulink.sdi.getRunCount` and `Simulink.sdi.getRunIDByIndex` to get the run ID for a run. This method is useful if you also want to use `count` as a counting variable to index through the runs in the Simulation Data Inspector repository.

```
count = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(count);
```

Analyze Simulation Data with Signal Tolerances

You can change tolerance values on a signal-by-signal basis to evaluate the effect of a model parameter change. This example uses the `slexAircraftExample` model and the Simulation Data Inspector to evaluate the effect of changing the time constant for the low-pass filter following the control input.

Setup

Load the model, and mark the `q, rad/sec` and `alpha, rad` signals for logging. Then, simulate the model to create the baseline run.

```
% Load example model
load_system('slexAircraftExample')

% Mark the q, rad/sec and alpha, rad signals for logging
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',3,'on
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on

% Simulate system
sim('slexAircraftExample')
```

Modify Model Parameter

Modify the model parameter `Ts` in the model workspace to change the time constant of the input low-pass filter.

```
% Change input filter time constant
modelWorkspace = get_param('slexAircraftExample','modelworkspace');
modelWorkspace.assignin('Ts',1)

% Simulate again
sim('slexAircraftExample')
```

Compare Runs and Inspect Results

Use the `Simulink.sdi.compareRuns` function to compare the data from the simulations. Then, inspect the `match` property of the signal result to see whether the signals fell within the default tolerance of 0.

```
% Get run data
runIDs = Simulink.sdi.getAllRunIDs;
runID1 = runIDs(end - 1);
runID2 = runIDs(end);

% Compare runs
diffRun1 = Simulink.sdi.compareRuns(runID1,runID2);

% Get signal result
sig1Result1 = diffRun1.getResultByIndex(1);
sig2Result1 = diffRun1.getResultByIndex(2);

% Check whether signals matched
sig1Result1.Match
```

```
ans = logical
   0
```

```
sig2Result1.Match
```

```
ans = logical
   0
```

Compare Runs with Signal Tolerances

The signals did not match within the default tolerance of 0. To further analyze the effect of the time constant change, add signal tolerances to the comparison with the baseline signal properties to determine the tolerance required for a pass. This example uses a combination of time and absolute tolerances.

```
% Get signal object for sigID1
run1 = Simulink.sdi.getRun(runID1);
sigID1 = run1.getSignalIDByIndex(1);
sigID2 = run1.getSignalIDByIndex(2);

sig1 = Simulink.sdi.getSignal(sigID1);
sig2 = Simulink.sdi.getSignal(sigID2);

% Set tolerances for q, rad/sec
sig1.AbsTol = 0.1;
sig1.TimeTol = 0.6;

% Set tolerances for alpha, rad
sig2.AbsTol = 0.2;
sig2.TimeTol = 0.8;

% Run the comparison again
diffRun2 = Simulink.sdi.compareRuns(runID1,runID2);
sig1Result2 = diffRun2.getResultByIndex(1);
sig2Result2 = diffRun2.getResultByIndex(2);

% Check the result
sig1Result2.Match

ans = logical
   1

sig2Result2.Match

ans = logical
   1
```

Output Arguments

runIDs — Matrix of Simulation Data Inspector run IDs
matrix

Matrix of run IDs in the Simulation Data Inspector repository.

Simulink.sdi.getArchiveRunLimit

Package: Simulink.sdi

Determine configured run limit for Simulation Data Inspector archive

Syntax

```
limit = Simulink.sdi.getArchiveRunLimit
```

Description

`limit = Simulink.sdi.getArchiveRunLimit` returns the limit configured for the number of runs the Simulation Data Inspector stores in the archive. When the number of runs in the archive reaches the limit, the Simulation Data Inspector starts to delete runs from the archive on a first-in, first-out basis. When another run enters the archive, the Simulation Data Inspector deletes the run that has been in the archive the longest. A `limit` of `-1` indicates the archive has no limit for the number of runs it stores. A `limit` of `0` means that the archive cannot contain any runs.

Tip To retain data for only the current run, configure the Simulation Data Inspector to automatically archive runs and set the archive run limit to `0`.

Examples

Configure the Simulation Data Inspector to Retain Only the Current Run

You can configure the Simulation Data Inspector to retain only the logged data for your current simulation. In iterative design and debugging workflows, this configuration helps prevent accumulation of unwanted logged data on disk. First, check the configuration of the Simulation Data Inspector archive. You can save the parameters to restore your preferences after you finish designing or debugging.

```
limit = Simulink.sdi.getArchiveRunLimit;
mode = Simulink.sdi.getAutoArchiveMode;
```

Set the archive limit to `0` and configure the Simulation Data Inspector to automatically archive simulation runs.

```
setArchiveRunLimit(0)
setAutoArchiveMode(true)
```

When you simulate your model, the Simulation Data Inspector deletes the previous run and updates the view to show signals in the current simulation.

When you finish designing or debugging your model, you can restore the Simulation Data Inspector archive back to its previous configuration.

```
Simulink.sdi.setArchiveRunLimit(limit)
Simulink.sdi.setAutoArchiveMode(mode)
```

Output Arguments

`limit` — Maximum number of runs to store in the Simulation Data Inspector archive

scalar

Limit for the number of runs stored in the Simulation Data Inspector archive. When the number of runs in the archive reaches the limit, the Simulation Data Inspector starts to delete runs from the archive, on a first-in, first-out basis. A `limit` of `-1` indicates there is no limit on the runs stored in the archive. A `limit` of `0` indicates that the archive cannot contain any runs.

Simulink.sdi.getAutoArchiveMode

Package: Simulink.sdi

Determine if the Simulation Data Inspector is configured to automatically archive

Syntax

```
mode = Simulink.sdi.getAutoArchiveMode
```

Description

`mode = Simulink.sdi.getAutoArchiveMode` returns a logical value that indicates whether the Simulation Data Inspector is configured to automatically archive simulation runs. When `mode` is `true`, the Simulation Data Inspector automatically archives simulation runs. When `mode` is `false`, the Simulation Data Inspector does not automatically archive.

Examples

Configure the Simulation Data Inspector to Retain Only the Current Run

You can configure the Simulation Data Inspector to retain only the logged data for your current simulation. In iterative design and debugging workflows, this configuration helps prevent accumulation of unwanted logged data on disk. First, check the configuration of the Simulation Data Inspector archive. You can save the parameters to restore your preferences after you finish designing or debugging.

```
limit = Simulink.sdi.getArchiveRunLimit;
mode = Simulink.sdi.getAutoArchiveMode;
```

Set the archive limit to `0` and configure the Simulation Data Inspector to automatically archive simulation runs.

```
setArchiveRunLimit(0)
setAutoArchiveMode(true)
```

When you simulate your model, the Simulation Data Inspector deletes the previous run and updates the view to show signals in the current simulation.

When you finish designing or debugging your model, you can restore the Simulation Data Inspector archive back to its previous configuration.

```
Simulink.sdi.setArchiveRunLimit(limit)
Simulink.sdi.setAutoArchiveMode(mode)
```

Output Arguments

`mode` — Logical indication of Simulation Data Inspector automatic archive configuration
logical

Logical value that indicates whether the Simulation Data Inspector is configured to automatically archive simulation runs.

- `true` — The Simulation Data Inspector automatically archives simulation runs.
- `false` — The Simulation Data Inspector does not automatically archive simulation runs.

Simulink.sdi.getMarkersOn

Package: Simulink.sdi

Return logical indication of marker property

Syntax

```
res = Simulink.sdi.getMarkersOn
```

Description

`res = Simulink.sdi.getMarkersOn` returns the logical value `res` indicating whether data markers are displayed on plots in the Simulation Data Inspector.

Examples

Save Marker State

You can use the `Simulink.sdi.getMarkersOn` property to save or query part of a Simulation Data Inspector configuration.

```
markerState = Simulink.sdi.getMarkersOn
```

Output Arguments

`res` — Logical indication of marker state
true | false

Logical indication of whether markers are displayed on plots in the Simulation Data Inspector.

- `true` indicates that markers are displayed.

- `false` indicates that markers are not displayed.

Simulink.sdi.getRun

Package: Simulink.sdi

Get a `Simulink.sdi.Run` object to access data

Syntax

```
run = Simulink.sdi.getRun(runID)
```

Description

`run = Simulink.sdi.getRun(runID)` returns a `Simulink.sdi.Run` object that provides access to the data in the run corresponding to the `runID`. The Simulation Data Inspector assigns run IDs when it creates a run. You can get the run ID for your run using `Simulink.sdi.getAllRunIDs` or `Simulink.sdi.getRunIDByIndex`.

Examples

Get a Run Object for Simulation Data

Many workflows using the Simulation Data Inspector programmatic interface start with acquiring a `Simulink.sdi.Run` object for your simulation data.

```
% Load and simulate system
load_system('sldemo_fuelsys')
sim('sldemo_fuelsys')

% Get runID for most recent run
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get run object
run = Simulink.sdi.getRun(runID);
```

You can use the Simulink.sdi.Run object to access signal data, add data, and inspect run metadata.

Plot Signals from a Simulation Run

This example demonstrates how to access the Simulink.sdi.Run object for a run created by logging signals to the Simulation Data Inspector. From the Simulink.sdi.Run object you can get Simulink.sdi.Signal objects that you can use to view data.

```
% Simulate model to create a run
sim('sldemo_fuelsys')

% Get runID for the run
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get run object for the run
fuelRun = Simulink.sdi.getRun(runID);

% Check signal count of the run
fuelRun.signalCount

ans = int32
    15

% Get signal objects for the signals in the run
signal1 = fuelRun.getSignalByIndex(4);
signal2 = fuelRun.getSignalByIndex(9);
signal3 = fuelRun.getSignalByIndex(10);

% Create subplot layout to display signals
Simulink.sdi.setSubPlotLayout(3, 1)

% Plot signals
signal1.checked = true;
signal2.plotOnSubPlot(2, 1, true);
signal3.plotOnSubPlot(3, 1, true);

% View plots in the Simulation Data Inspector
Simulink.sdi.view
```

Input Arguments

`runID` — Numeric run identifier
scalar

Run ID for the run you want a `Simulink.sdi.Run` object for. The Simulation Data Inspector assigns run IDs when it creates runs. You can get the run ID for a run using `Simulink.sdi.getAllRunIDs` or `Simulink.sdi.getRunIDByIndex`.

Output Arguments

`run` — `Simulink.sdi.Run` object
'`Simulink.sdi.Run`'

`Simulink.sdi.Run` object for the run corresponding to the run ID.

Topics

"Inspect and Compare Data Programmatically"

Introduced in R2011b

Simulink.sdi.getRunCount

Package: Simulink.sdi

Get number of runs in Simulation Data Inspector repository

Syntax

```
count = Simulink.sdi.getRunCount
```

Description

`count = Simulink.sdi.getRunCount` returns the number of runs in the Simulation Data Inspector repository. You can use the run count to loop over all runs in the Simulation Data Inspector repository to modify run or signal properties. For example, you could add an absolute tolerance to a signal in every run.

Examples

Modify Parameter for Several Runs

This example shows how to modify a parameter for all the runs in the Simulation Data Inspector programmatically.

Generate Runs

Load the `vdp` model and mark the `x1` and `x2` signals for logging. Then, run several simulations.

```
% Clear all data from the Simulation Data Inspector repository
Simulink.sdi.clear

% Load the model and mark signals of interest for streaming
load_system('vdp')
Simulink.sdi.markSignalForStreaming('vdp/x1',1,'on')
Simulink.sdi.markSignalForStreaming('vdp/x2',1,'on')

% Simulate the model with several Mu values
for gain = 1:5
    gainVal = num2str(gain);
    set_param('vdp/Mu','Gain',gainVal)
    sim('vdp')
end
```

Use Simulink.sdi.getRunCount to Assign Tolerance to x1 Signals

```
count = Simulink.sdi.getRunCount;

for a = 1:count
    runID = Simulink.sdi.getRunIDByIndex(a);
    vdpRun = Simulink.sdi.getRun(runID);
    sig = vdpRun.getSignalByIndex(1);
    sig.AbsTol = 0.1;
end

% Open the Simulation Data Inspector to view your data
Simulink.sdi.view
```

Output Arguments

count — Number of runs
scalar

Number of runs in the Simulation Data Inspector repository.

Topics

“Inspect and Compare Data Programmatically”

Introduced in R2011b

Simulink.sdi.getRunIDByIndex

Package: Simulink.sdi

Use Simulation Data Inspector run index to get run ID

Syntax

```
runID = Simulink.sdi.getRunIDByIndex(index)
```

Description

`runID = Simulink.sdi.getRunIDByIndex(index)` returns the run ID for the run with the specified `index` in the Simulation Data Inspector repository.

Examples

Get Run ID for a Simulation

Many workflows that use the Simulation Data Inspector programmatic interface start with obtaining the ID for a simulation run. This example shows two different methods to use the programmatic interface to get the run ID for a run. You can use the run ID to create a `Simulink.sdi.Run` object to access run data and metadata, or you can use the run ID for a comparison.

Simulate a Model to Create a Run

The model `sldemo_fuelsys` is already configured for logging. When you simulate the model, the Simulation Data Inspector automatically creates a run and assigns it a run ID.

```
% Load and simulate system
load_system('sldemo_fuelsys')
sim('sldemo_fuelsys')
```

Get Run ID Using `Simulink.sdi.getAllRunIDs`

`Simulink.sdi.getAllRunIDs` returns an array of all run IDs for runs in the Simulation Data Inspector repository in order, with the most recently created run at the end.

```
% Get runID for most recent run
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

Get Run ID Using `Simulink.sdi.getRunIDByIndex`

You can also use `Simulink.sdi.getRunCount` and `Simulink.sdi.getRunIDByIndex` to get the run ID for a run. This method is useful if you also want to use `count` as a counting variable to index through the runs in the Simulation Data Inspector repository.

```
count = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(count);
```

Input Arguments

`index` — Run index in Simulation Data Inspector
integer

Positive, whole number index of the run in the Simulation Data Inspector repository.

Example: 3

Output Arguments

`runID` — Numeric run identifier
scalar

Numeric run identification assigned by the Simulation Data Inspector.

Simulink.sdi.getRunNamingRule

Package: Simulink.sdi

Get the Simulation Data Inspector rule for naming runs

Syntax

`namingRule = Simulink.sdi.getRunNamingRule`

Description

`namingRule = Simulink.sdi.getRunNamingRule` returns the run naming rule as a character vector. The run naming rule can contain one or more tokens that update for each run, for example, `<run_index>`. The run naming rule applies to runs automatically created through simulating a model in Simulink.

Examples

Modify Run Naming Rule Then Restore Default

This example shows how to use the Simulation Data Inspector API to modify the Simulation Data Inspector run naming rule, check a run's name, restore default preferences, and check the run naming rule.

```
% Load model
load_system('sldemo_fuelsys')

% Modify run naming rule
Simulink.sdi.setRunNamingRule('<model_name> Run <run_index>')

% Simulate system
sim('sldemo_fuelsys')

% Check run name
```

```
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
fuelRun = Simulink.sdi.getRun(runID);
fuelRun.name

ans =
'sldemo_fuelsys Run 1'

% Clear preferences to reset the run naming rule
Simulink.sdi.clearPreferences

% Check run naming rule
Simulink.sdi.getRunNamingRule

ans =
'Run <run_index>: <model_name>'
```

Output Arguments

namingRule — Naming rule for Simulation Data Inspector runs

character vector

Character vector that specifies the naming rule the Simulation Data Inspector uses to name the runs automatically created through simulating a Simulink model. The run naming rule can contain any of the following tokens that represent information pulled for each run:

- `<run_index>` – Run's index in the Simulation Data Inspector repository.
- `<model_name>` – Name of the model simulated to create the run.
- `<time_stamp>` – Start time for the simulation that created the run.
- `<sim_mode>` – Simulation mode used for the simulation that created the run.

Alternatives

You can view the run naming rule using the Simulation Data Inspector UI. You can find the **New Run** options under the Simulation Data Inspector **Preferences** menu.

Simulink.sdi.getSignal

Package: Simulink.sdi

Get Simulink.sdi.Signal object for a signal

Syntax

```
signalObj = Simulink.sdi.getSignal(sigID)
```

Description

`signalObj = Simulink.sdi.getSignal(sigID)` returns a `Simulink.sdi.Signal` object for the signal in the Simulation Data Inspector repository that corresponds to the signal ID, `sigID`. The `Simulink.sdi.Signal` object manages signal data and metadata and allows you to view and modify signal properties.

Examples

Create a Simulation Data Inspector Run and Access Signal Data

This example shows how to access signal data when you create a run in the Simulation Data Inspector.

Generate Data for Run

For this example, create timeseries data for sine and cosine signals.

```
% Create timeseries workspace data
time = linspace(0, 20, 101);

sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals,time);
sine_ts.Name = 'Sine, T=5';
```

```
cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals,time);
cos_ts.Name = 'Cosine, T=8';
```

Create a Run and Return Signal IDs

You can use the `Simulink.sdi.createRun` syntax with multiple return arguments to get the signal IDs more directly instead of accessing the signal IDs through a `Simulink.sdi.Run` object.

```
[runID,runIndex,sigIDs] = Simulink.sdi.createRun('Sinusoids','vars',...
    sine_ts,cos_ts);

cosID = sigIDs(2);
cosSig = Simulink.sdi.getSignal(cosID);
```

Modify Signal Properties and View in the Simulation Data Inspector

You can use the `Simulink.sdi.Signal` object to view and modify signal properties and to plot signals in the Simulation Data Inspector.

```
cosSig.Checked = true;
cosSig.AbsTol = 0.05;
Simulink.sdi.view
cosSig.Name
```

```
ans =

    'Cosine, T=8'
```

Input Arguments

sigID — Signal ID

scalar

Signal identifier. The Simulation Data Inspector assigns signal IDs to signals when a run is created. You can get the signal ID for a signal as a return from `Simulink.sdi.createRun` or using the `Simulink.sdi.Run` object's methods.

Output Arguments

`signalObj` — Simulink.sdi.Signal object
'Simulink.sdi.Signal' object

Simulink.sdi.Signal object for the signal corresponding to `sigID`.

Simulink.sdi.isPCTSupportEnabled

Determine status and mode for Parallel Computing Toolbox support

Syntax

```
[enabled,mode] = Simulink.sdi.isPCTSupportEnabled
```

Description

`[enabled,mode] = Simulink.sdi.isPCTSupportEnabled` returns `enabled`, a logical indication of whether support for the Parallel Computing Toolbox is enabled, and `mode`, the mode of support enabled.

Examples

Check Status of Parallel Worker Support

Before running code that depends on whether automatic import of runs created by parallel workers is enabled, you can use the `Simulink.sdi.isPCTSupportEnabled` function to check the support status. The default behavior for the Simulation Data Inspector enables parallel worker support in `local` mode. In `local` mode, only runs created on local workers automatically import into the Simulation Data Inspector.

```
[enabled, mode] = Simulink.sdi.isPCTSupportEnabled
```

```
enabled =

  logical

   1

mode =
'local'
```

Output Arguments

`enabled` — Logical indicator of parallel worker support
logical

Logical indication of parallel worker support.

- `1` indicates that support for parallel workers is enabled.
- `0` indicates that support for parallel workers is not enabled.

`mode` — Parallel worker support mode
local (default)

Mode of Parallel Computing Toolbox support.

- `'local'` — Runs generated on local workers automatically import to the Simulation Data Inspector.
- `'none'` — Parallel worker support is disabled.
- `'all'` — Runs created from local and remote workers automatically import to the Simulation Data Inspector.
- `'manual'` — Support for manual import of runs created by parallel workers using the `Simulink.sdi.sendWorkerRunToClient` function.

"Inspect and Compare Data Programmatically"

Introduced in R2017b

Simulink.sdi.isValidRunID

Package: Simulink.sdi

Determine whether a run ID is valid

Syntax

```
valid = Simulink.sdi.isValidRunID(runID)
```

Description

`valid = Simulink.sdi.isValidRunID(runID)` returns `true` if `runID` corresponds to a run in the Simulation Data Inspector repository.

Examples

Check Run ID Validity

This example shows how to check whether a run ID is valid. You can use `Simulink.sdi.isValidRunID` to ensure you have valid data throughout your script.

Create a Simulation Run

Simulate the model `sldemo_fuelsys` to create a run in the Simulation Data Inspector, and use `Simulink.sdi.getAllRunIDs` to get its run ID.

```
% Simulate model
load_system('sldemo_fuelsys')
sim('sldemo_fuelsys')

% Get run ID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

Check Run ID Validity

Check to verify that the Simulation Data Inspector has a run corresponding to the run ID.

```
Simulink.sdi.isValidRunID(runID)
```

```
ans = logical
   1
```

Delete the Run and Check Validity

You can delete runs to clear out memory space or clean up the Simulation Data Inspector UI. When you delete a run, the run ID for that run becomes invalid.

```
Simulink.sdi.deleteRun(runID)
```

```
Simulink.sdi.isValidRunID(runID)
```

```
ans = logical
   0
```

Input Arguments

`runID` — Simulation Data Inspector run identifier
scalar

Unique numeric identification for the run. The Simulation Data Inspector assigns run IDs when it creates runs. You can get the run ID for your run using `Simulink.sdi.getAllRunIDs` or `Simulink.sdi.getRunIDByIndex`.

Output Arguments

`valid` — Run validity indicator
logical

Run validity indicator. When `valid` is `true`, the `runID` is valid. When `valid` is `false`, the `runID` is invalid.

See Also

Introduced in R2011b

Simulink.sdi.load

Package: Simulink.sdi

Load a Simulation Data Inspector session or view

Syntax

```
valid = Simulink.sdi.load(fileName)
```

Description

`valid = Simulink.sdi.load(fileName)` loads the data in the MLDATX-file or MAT-file specified by `fileName` and returns `1` when `fileName` is a valid file. A return value of `0` indicates that the file specified by `fileName` is invalid and cannot be loaded into the Simulation Data Inspector. You can use `Simulink.sdi.load` to load Simulation Data Inspector sessions and views. A view includes preferences and visualization options but does not save data. A session saves data along with preference selections and plot configurations.

Examples

Save a Simulation Data Inspector Session

This example shows how to create, save, and load a Simulation Data Inspector session. The example uses data logging to populate the Simulation Data Inspector with data and then uses the Simulation Data Inspector's programmatic interface to create plots to visualize the data. After saving the data and visualization settings in a session, the Simulation Data Inspector repository is emptied in order to demonstrate how to load the session.

Create Simulation Data

This example logs the `Stick`, `alpha, rad`, and `q, rad/sec` signals to generate simulation data using the model `slexAircraftExample` and creates two runs. The first uses a sine input, and the second has a square wave input.

```
% Ensure you start with an empty Simulation Data Inspector repository
Simulink.sdi.clear

% Load system
load_system('slexAircraftExample')

% Configure signals to log
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot',1,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',3,'on
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on

% Change Pilot signal to sine
set_param('slexAircraftExample/Pilot','WaveForm','sine')

% Simulate model
sim('slexAircraftExample')

% Change Pilot signal to square
set_param('slexAircraftExample/Pilot','WaveForm','square')

% Simulate model
sim('slexAircraftExample')
```

Access Simulation Data

Use the Simulation Data Inspector programmatic interface to access the simulation data so you can create plots to visualize the signals.

```
% Get run objects
runIDs = Simulink.sdi.getAllRunIDs;
sineRunID = runIDs(end-1);
squareRunID = runIDs(end);

sineRun = Simulink.sdi.getRun(sineRunID);
squareRun = Simulink.sdi.getRun(squareRunID);

% Get signal objects
sineOut = sineRun.getSignalByIndex(1);
sineIn = sineRun.getSignalByIndex(3);
```

```
squareOut = squareRun.getSignalByIndex(1);
squareIn = squareRun.getSignalByIndex(3);
```

Create Plots in the Simulation Data Inspector

Use the programmatic interface to visualize the signal data from the two simulation runs. You can set the plot layout and plot signals on specific subplots.

```
% Set subplot layout
Simulink.sdi.setSubPlotLayout(2,1)

% Plot sine data on top plot
sineIn.plotOnSubPlot(1,1,true)
sineOut.plotOnSubPlot(1,1,true)

% Plot square wave data on bottom plot
squareIn.plotOnSubPlot(2,1,true)
squareOut.plotOnSubPlot(2,1,true)
```

Save a Simulation Data Inspector Session

First, view the plots you just created. Then, save the Simulation Data Inspector session as an MLDATX-file to recover your data along with your preference selections and plots.

```
% View the visualized data in the Simulation Data Inspector
Simulink.sdi.view

% Save the Simulation Data Inspector session
Simulink.sdi.save('myData.mldatx')
```

Load a Simulation Data Inspector Session

First, clear the Simulation Data Inspector repository with `Simulink.sdi.clear` and reset visualization settings with `Simulink.sdi.clearPreferences`. Then, you can load the session to see how the data and settings are preserved.

```
% Clear Simulation Data Inspector repository and preferences
Simulink.sdi.clear
Simulink.sdi.clearPreferences
```

```
% Load session file to view data
Simulink.sdi.load('myData.mldatx');
```

Input Arguments

fileName — Name of file to load
character vector

Name of the file to load with the session or view data.

Example: 'myData.mldatx'

Example: 'myData.mat'

Output Arguments

valid — File validity indicator
logical

Validity indicator for the file. When the file specified by fileName is valid, valid is 1. A valid value of 0 indicates an invalid file.

Simulink.sdi.markSignalForStreaming

Package: Simulink.sdi

Turn logging on or off for a signal

Syntax

```
Simulink.sdi.markSignalForStreaming(block,portIndex,log)
Simulink.sdi.markSignalForStreaming(portHandle,log)
Simulink.sdi.markSignalForStreaming(lineHandle,log)
```

Description

`Simulink.sdi.markSignalForStreaming(block,portIndex,log)` marks the signal on the specified `portIndex` of the specified `block` for logging when you specify `log` as `'on'`. To stop logging a signal, specify `log` as `'off'`.

`Simulink.sdi.markSignalForStreaming(portHandle,log)` marks the signal on the port specified by `portHandle` for logging when you specify `log` as `'on'`. To stop logging a signal, specify `log` as `'off'`.

`Simulink.sdi.markSignalForStreaming(lineHandle,log)` marks the signal with the specified `lineHandle` for logging when you specify `log` as `'on'`. To stop logging a signal, specify `log` as `'off'`.

Examples

Compare Signals Within a Simulation Run

This example uses the `slexAircraftExample` model to demonstrate the comparison of the input and output signals for a control system. The example marks the signals for streaming then gets the run object for a simulation run. Signal IDs from the run object specify the signals to be compared.

```
% Load model slexAircraftExample and mark signals for streaming
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot',1,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on

% Simulate model slexAircraftExample
sim('slexAircraftExample')

% Get run IDs for most recent run
allIDs = Simulink.sdi.getAllRunIDs;
runID = allIDs(end);

% Get Run object
aircraftRun = Simulink.sdi.getRun(runID);

% Get signal IDs
signalID1 = aircraftRun.getSignalIDByIndex(1);
signalID2 = aircraftRun.getSignalIDByIndex(2);

if (aircraftRun.isValidSignalID(signalID1))
    % Change signal tolerance
    signal1 = Simulink.sdi.getSignal(signalID1);
    signal1.AbsTol = 0.1;
end

if (aircraftRun.isValidSignalID(signalID1) && aircraftRun.isValidSignalID(signalID2))
    % Compare signals
    sigDiff = Simulink.sdi.compareSignals(signalID1,signalID2);

    % Check whether signals match within tolerance
    match = sigDiff.match
end
```

```
match = logical
   0
```

Mark Signals for Logging with Port Handles

This example shows how to mark signals for logging using port handles.

Load Model and Mark Signals for Streaming

User get_param to get the port handles for the blocks with your signals of interest. Then, use the handle to mark the desired signals for logging.

```
load_system('vdp')

% Get port handles
x1_handles = get_param('vdp/x1','PortHandles');
x1 = x1_handles.Outport(1);
x2_handles = get_param('vdp/x2','PortHandles');
x2 = x2_handles.Outport(1);

% Mark signals for streaming
Simulink.sdi.markSignalForStreaming(x1,'on');
Simulink.sdi.markSignalForStreaming(x2,'on');
```

Simulate Model and View Signals in the Simulation Data Inspector

Simulate the model and then open the Simulation Data Inspector to view the logged signals.

```
sim('vdp')

Simulink.sdi.view
```

Mark Signals for Logging with Line Handles

This example shows how to mark signals for logging using their line handles.

Load System and Mark Signals for Logging

Load a model and use get_param to get handles for the signals in the model. Then, use the line handles to mark signals of interest for logging.

```
load_system('slexAircraftExample')

lines = get_param('slexAircraftExample','Lines');

sig1handle = lines(1).Handle;
sig2handle = lines(2).Handle;
```

```
Simulink.sdi.markSignalForStreaming(sig1handle,'on')
Simulink.sdi.markSignalForStreaming(sig2handle,'on')
```

Simulate Model and View Signals

Simulate the model and view the signals marked for logging in the Simulation Data Inspector.

```
sim('slexAircraftExample')
```

```
Simulink.sdi.view
```

Input Arguments

block — Source block path or handle

character vector

Block path for the block with the desired signal connected to one of its outports.

Example: `'slexAircraftExample/Pilot'`

portIndex — Source block output port index

integer

Index of the port connected to the signal you want to mark for streaming.

Example: `'slexAircraftExample/Pilot'`

log — Logging state

'on' | 'off'

Logging state desired for signal.

- `'on'` -- Turn logging on for a signal.
- `'off'` -- Turn logging off for a signal.

portHandle — Source block output port handle

handle

Port handle for the source block's output port that connects to the signal.

Example: `x1_handles.Outport(1)`

`lineHandle` — Signal line handle
handle

Line handle for the signal.

Example: `lines(1).Handle`

Topics

"Inspect and Compare Data Programmatically"
"View Data with the Simulation Data Inspector"

Introduced in R2015b

Simulink.sdi.report

Package: Simulink.sdi

Generate a Simulation Data Inspector report

Syntax

```
Simulink.sdi.report
Simulink.sdi.report(Name,Value)
```

Description

`Simulink.sdi.report` creates a Simulation Data Inspector report of the plotted data in the **Inspect** pane of the Simulation Data Inspector.

`Simulink.sdi.report(Name,Value)` uses additional options specified by one or more `Name,Value` pair arguments to generate a report of the specified view in the Simulation Data Inspector.

Examples

Generate a Simulation Data Inspector Report Programmatically

This example shows how to create reports using the Simulation Data Inspector programmatic interface. You can create a report for plotted signals in the Inspect pane or for comparison data in the Compare pane. This example first generates data by simulating a model, then shows how to create an `Inspect Signals` report. To run the example exactly as shown, ensure that the Simulation Data Inspector repository starts empty with the `Simulink.sdi.clear` function.

Generate Data

This example generates data using model `ex_sldemo_absbrake` with two different desired slip ratios.

```
% Ensure Simulation Data Inspector is empty
Simulink.sdi.clear

% Open model
load_system('ex_sldemo_absbrake')

% Set slip ratio and simulate model
set_param('ex_sldemo_absbrake/Desired relative slip','Value','0.24')
sim('ex_sldemo_absbrake')

% Set new slip ratio and simulate model again
set_param('ex_sldemo_absbrake/Desired relative slip','Value','0.25')
sim('ex_sldemo_absbrake')
```

Plot Signals in the Inspect Pane

The `Inspect Signals` report includes all signals plotted in the graphical viewing area of the Inspect pane and all displayed metadata for the plotted signals.

```
% Get Simulink.sdi.Run objects
runIDs = Simulink.sdi.getAllRunIDs;
runID1 = runIDs(end-1);
runID2 = runIDs(end);

run1 = Simulink.sdi.getRun(runID1);
run2 = Simulink.sdi.getRun(runID2);

% Get Simulink.sdi.Signal objects for slp signal
run1_slp = run1.getSignalByIndex(4);
run2_slp = run2.getSignalByIndex(4);

% Plot slp signals
run1_slp.plotOnSubPlot(1, 1, true)
run2_slp.plotOnSubPlot(1, 1, true)
```

Create a Report of Signals Plotted in Inspect Pane

You can include more data in the report by adding more columns using the Simulation Data Inspector UI, or you can specify the information you want in the report programmatically with Name-Value pairs and the enumeration class `Simulink.sdi.SignalMetaData`. This example shows how to specify the data in the report programmatically.

```
% Specify report parameters
reportType = 'Inspect Signals';
```

```
reportName = 'Data_Report.html';

signalMetadata = [Simulink.sdi.SignalMetaData.Run, ...
    Simulink.sdi.SignalMetaData.Line, ...
    Simulink.sdi.SignalMetaData.BlockName, ...
    Simulink.sdi.SignalMetaData.SignalName];

Simulink.sdi.report('ReportToCreate', reportType, 'ReportOutputFile', ...
    reportName, 'ColumnsToReport', signalMetadata);
```

Input Arguments

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: `'ReportToCreate','Compare Runs','ShortenBlockPath',true`

`ReportToCreate` — Information to include in the report

`'Inspect Signals'` (default) | `'Compare Runs'`

Simulation Data Inspector pane to capture in the report.

- `'Inspect Signals'` -- Create a report of the information on the **Inspect** pane.
- `'Compare Runs'` -- Create a report of the information on the **Compare** pane.

Example: `'ReportToCreate','Inspect Signals'`

Example: `'ReportToCreate','Compare Runs'`

`ReportOutputFolder` — Folder where report is saved

`<current working folder>/slprj/sdi` (default) | `path`

Folder where the report is saved. Specify the path to the folder where you want to save the report as a character vector.

Example: `'ReportOutputFolder','C:\Users\user1\Desktop'`

ReportOutputFile — Report file name

'SDI_report.html' (default) | character vector

File name for report.

Example: 'ReportOutputFile','MyReport.html'

PreventOverwritingFile — Report overwrite prevention

true (default) | false

File overwrite protection for the report. File overwrite protection prevents the Simulation Data Inspector from overwriting an existing file by appending the file name with a number that increments for subsequent reports. When you disable file overwrite protection, the Simulation Data Inspector overwrites the existing report file unless you specify a unique file name.

- true enables file overwrite protection.
- false disables file overwrite protection.

Example: 'PreventOverwritingFile',true

Example: 'PreventOverwritingFile',false

ColumnsToReport — Signal metadata to include in report

array

Signal metadata to include in report. By default, the Inspect Signals report includes the block path, name, line style and color, and data source parameters for each plotted signal. The Compare Runs report includes the signal name, absolute tolerance, relative tolerance, and maximum difference metadata by default.

Specify metadata to include as an array, using the enumeration class Simulink.sdi.SignalMetaData. For example, to include the name of the simulation run and signal name, create an array like signal_metadata:

```
signal_metadata = [Simulink.sdi.SignalMetaData.Run,...
                   Simulink.sdi.SignalMetaData.SignalName];
```

Then, specify ColumnsToReport as signal_metadata in the name-value pair:

```
Simulink.sdi.report('ColumnsToReport',signal_metadata)
```

The table summarizes the metadata available for Inspect Signals report.

Column Value	Description
SignalName (default)	Signal name
Line (default)	Signal line style and color
SID	Simulink identifier For more information about SIDs, see “Locate Diagram Components Using Simulink Identifiers”
Units	Signal measurement units
SigDataType	Signal data type
SigSampleTime	Method used to sample the signal
Model	Name of the model that generated the signal
BlockName	Name of the source block for the signal
BlockPath	Path to the source block for the signal
Port	Index of the signal on the output port of its block
Dimensions	Dimensions of the matrix containing the signal
Channel	Index of signal within matrix
Run	Name of the simulation run containing the signal
AbsTol	Absolute tolerance for the signal
RelTol	Relative tolerance for the signal
OverrideGlobalTol	Property that specifies whether signal tolerances take priority over global tolerances
TimeTol	Time tolerance for the signal
InterpMethod	Interpolation method
SyncMethod	Synchronization method used to coordinate signals for comparison

Column Value	Description
TimeSeriesRoot	Name of the variable associated with the signal for signals imported from the MATLAB workspace
TimeSource	Name of the array containing the time data for signals imported from the MATLAB workspace
DataSource	Name of the array containing the signal data for signals imported from the MATLAB workspace

The table provides a summary of the metadata available for the Compare Runs report.

Column Value	Description
Result (default)	Pass/fail result of the signal comparison between the **Baseline** and **Compare To** runs
Line1	Line style and color for the **Baseline** signal
Line2	Line style and color for the **Compare To** signal
AbsTol (default)	Absolute tolerance for the **Baseline** signal
RelTol (default)	Relative tolerance for the **Baseline** signal
MaxDifference	The maximum difference between the **Baseline** and **Compare To** signals
OverrideGlobalTol	Property that specifies whether the **Baseline** signal tolerances take priority over global tolerances
TimeTol	Time tolerance for the **Baseline** signal
SignalName1	Signal name from the **Baseline** run
SignalName2	Signal name from the **Compare To** run
Units1	Measurement units for the signal in the **Baseline** run
Units2	Measurement units for the signal in the **Compare To** run

Column Value	Description
SigDataType1	The data type for the signal in the **Baseline** run
SigDataType2	The data type for the signal in the **Compare To** run
SigSampleTime1	Method used to sample the signal in the **Baseline** run
SigSampleTime2	Method used to sample the signal in the **Compare To** run
Run1	Name of the **Baseline** run
Run2	Name of the **Compare To** run
AlignedBy (default)	Signal alignment method used to correlate **Baseline** and **Compare To** signals
Model1	Name of the model that generated the **Baseline** signals
Model2	Name of the model that generated the **Compare To** signals
BlockName1	Name of the source block for the **Baseline** signal
BlockName2	Name of the source block for the **Compare To** signal
BlockPath1	Path to the source block for the **Baseline** signal
BlockPath2	Path to the source block for the **Compare To** signal
Port1	Index of the **Baseline** signal on the output port of its block
Port2	Index of the **Compare To** signal on the output port of its block
Dimensions1	Dimensions of the matrix containing the **Baseline** signal
Dimensions2	Dimensions of the matrix containing the **Compare To** signal

Column Value	Description
`Channel1`	Index of the **Baseline** within its matrix
`Channel2`	Index of the **Compare To** within its matrix
`InterpMethod`	Interpolation method for the **Baseline** signal
`SyncMethod`	Synchronization method for the **Baseline** signal
`TimeSeriesRoot1`	Name of the variable associated with the **Baseline** signal for signals imported from the MATLAB workspace
`TimeSeriesRoot2`	Name of the variable associated with the **Compare To** signal for signals imported from the MATLAB workspace
`TimeSource1`	Name of the array containing the **Baseline** time data for signals imported from the MATLAB workspace
`TimeSource2`	Name of the array containing the **Compare To** time data for signals imported from the MATLAB workspace
`DataSource1`	Name of the array containing the **Baseline** signal data for signals imported from the MATLAB workspace
`DataSource2`	Name of the array containing the **Compare To** signal data for signals imported from the MATLAB workspace
`LinkToPlot` (default)	Link to a plot of each comparison result

Example: `'ColumnsToReport',metadata`

`ShortenBlockPath` — Block path length

`true` (default) | `false`

Block path length.

- `true` -– Report shortened block path length.
- `false` -– Include the full block path in the report.

Example: `'ShortenBlockPath',false`

`LaunchReport` — Open report when created

`true` (default) | `false`

Open report when created.

- `true` –– Open the report when it is created.
- `false` –– Do not open the report upon creation.

Example: `'LaunchReport',false`

`SignalsToReport` — Signals to include in a Compare Runs report

`'ReportOnlyMismatchedSignals'` (default) | `'ReportAllSignals'`

Signals to include in a `Compare Runs` report.

- `ReportOnlyMismatchedSignals` –– Include only signals that fall out of tolerance.
- `ReportAllSignals` –– Include all signals.

Example: `'SignalsToReport','ReportAllSignals'`

Simulink.sdi.resetRunNamingRule

Package: Simulink.sdi

Revert the Simulation Data Inspector run naming rule to default

Syntax

```
Simulink.sdi.resetRunNamingRule
```

Description

`Simulink.sdi.resetRunNamingRule` resets the run naming rule the Simulation Data Inspector uses to assign a name to runs created through simulating a Simulink model to its default `'Run <run_index>: <model_name>'`.

Examples

Modify then Reset Run Naming Rule

This example shows how to use the Simulation Data Inspector API to modify the Simulation Data Inspector run naming rule, check a run's name, reset the run naming rule to its default, and check the run naming rule.

```
% Load model
load_system('sldemo_fuelsys')

% Modify run naming rule
Simulink.sdi.setRunNamingRule('<model_name> Run <run_index>')

% Simulate system
sim('sldemo_fuelsys')

% Check run name
runIDs = Simulink.sdi.getAllRunIDs;
```

```
runID = runIDs(end);
run = Simulink.sdi.getRun(runID);
run.name

ans =
'sldemo_fuelsys Run 1'

% Reset the run naming rule
Simulink.sdi.resetRunNamingRule

% Check run naming rule
Simulink.sdi.getRunNamingRule

ans =
'Run <run_index>: <model_name>'
```

Alternatives

You can reset the run naming rule to its default using the Simulation Data Inspector UI. Use the **Restore Defaults** button on the **New Run** tab under Simulation Data Inspector **Preferences**.

`Simulink.sdi.clearPreferences` restores the run naming rule, along with all other Simulation Data Inspector preferences.

Introduced in R2015a

Simulink.sdi.save

Package: Simulink.sdi

Save Simulation Data Inspector session

Syntax

```
Simulink.sdi.save(fileName)
```

Description

`Simulink.sdi.save(fileName)` saves all runs, signals, and plot settings as a Simulation Data Inspector session in the file `fileName`.

Examples

Save a Simulation Data Inspector Session

This example shows how to create, save, and load a Simulation Data Inspector session. The example uses data logging to populate the Simulation Data Inspector with data and then uses the Simulation Data Inspector's programmatic interface to create plots to visualize the data. After saving the data and visualization settings in a session, the Simulation Data Inspector repository is emptied in order to demonstrate how to load the session.

Create Simulation Data

This example logs the `Stick`, `alpha, rad`, and `q, rad/sec` signals to generate simulation data using the model `slexAircraftExample` and creates two runs. The first uses a sine input, and the second has a square wave input.

```
% Ensure you start with an empty Simulation Data Inspector repository
Simulink.sdi.clear
```

```
% Load system
load_system('slexAircraftExample')

% Configure signals to log
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot',1,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',3,'on
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on

% Change Pilot signal to sine
set_param('slexAircraftExample/Pilot','WaveForm','sine')

% Simulate model
sim('slexAircraftExample')

% Change Pilot signal to square
set_param('slexAircraftExample/Pilot','WaveForm','square')

% Simulate model
sim('slexAircraftExample')
```

Access Simulation Data

Use the Simulation Data Inspector programmatic interface to access the simulation data so you can create plots to visualize the signals.

```
% Get run objects
runIDs = Simulink.sdi.getAllRunIDs;
sineRunID = runIDs(end-1);
squareRunID = runIDs(end);

sineRun = Simulink.sdi.getRun(sineRunID);
squareRun = Simulink.sdi.getRun(squareRunID);

% Get signal objects
sineOut = sineRun.getSignalByIndex(1);
sineIn = sineRun.getSignalByIndex(3);

squareOut = squareRun.getSignalByIndex(1);
squareIn = squareRun.getSignalByIndex(3);
```

Create Plots in the Simulation Data Inspector

Use the programmatic interface to visualize the signal data from the two simulation runs. You can set the plot layout and plot signals on specific subplots.

```
% Set subplot layout
Simulink.sdi.setSubPlotLayout(2,1)

% Plot sine data on top plot
sineIn.plotOnSubPlot(1,1,true)
sineOut.plotOnSubPlot(1,1,true)

% Plot square wave data on bottom plot
squareIn.plotOnSubPlot(2,1,true)
squareOut.plotOnSubPlot(2,1,true)
```

Save a Simulation Data Inspector Session

First, view the plots you just created. Then, save the Simulation Data Inspector session as an MLDATX-file to recover your data along with your preference selections and plots.

```
% View the visualized data in the Simulation Data Inspector
Simulink.sdi.view

% Save the Simulation Data Inspector session
Simulink.sdi.save('myData.mldatx')
```

Load a Simulation Data Inspector Session

First, clear the Simulation Data Inspector repository with `Simulink.sdi.clear` and reset visualization settings with `Simulink.sdi.clearPreferences`. Then, you can load the session to see how the data and settings are preserved.

```
% Clear Simulation Data Inspector repository and preferences
Simulink.sdi.clear
Simulink.sdi.clearPreferences

% Load session file to view data
Simulink.sdi.load('myData.mldatx');
```

Input Arguments

`fileName` — File name

character vector

Name for the session file.

Example: `'myData.mldatx'`

`Simulink.sdi.close` | `Simulink.sdi.load`

Topics

“Inspect and Compare Data Programmatically”
“Save and Share Simulation Data Inspector Data and Views”

Introduced in R2011b

Simulink.sdi.sendWorkerRunToClient

Package: Simulink.sdi

Send run created on parallel workers to the Simulation Data Inspector

Syntax

```
Simulink.sdi.sendWorkerRunToClient
Simulink.sdi.sendWorkerRunToClient(run)
```

Description

`Simulink.sdi.sendWorkerRunToClient` sends the run most recently generated by the worker to the client MATLAB and imports the run to the Simulation Data Inspector.

`Simulink.sdi.sendWorkerRunToClient(run)` sends the run corresponding to `run` to the client MATLAB and imports the run to the Simulation Data Inspector.

Examples

Manually Send Runs from Parallel Workers to the Simulation Data Inspector

This example shows how to use `Simulink.sdi.sendWorkerRunToClient` to send runs created using parallel workers manually to the Simulation Data Inspector.

Setup

This example runs several simulations of the `vdp` model, varying the value of the gain, `Mu`. To set up for the parallel simulation, define a vector of `Mu` values and configure the Simulation Data Inspector for manual Parallel Computing Toolbox support.

```
% Enable manual Parallel Computing Toolbox support
Simulink.sdi.enablePCTSupport('manual');
```

```
% Choose several Mu values
MuVals = [1 2 3 4];
```

Initialize Parallel Workers

Use `parpool` to start a pool of four parallel workers. This example calls `parpool` inside an if statement so you only create a parallel pool if you don't already have one. You can use `spmd` to run initialization code common to all workers. For example, load the `vdp` model and select signals to log to runs that we can send to the Simulation Data Inspector on the client MATLAB. To avoid data concurrency issues when simulating with `sim` in `parfor`, create a temporary directory on each worker. After the simulations complete, another spmd block deletes the temporary directories.

```
p = gcp('nocreate');

if isempty(p)

    parpool(4);

end
```

```
Starting parallel pool (parpool) using the 'local' profile ...
connected to 4 workers.
```

```
spmd

    % Load system and select signals to log
    load_system('vdp')
    Simulink.sdi.markSignalForStreaming('vdp/x1',1,'on')
    Simulink.sdi.markSignalForStreaming('vdp/x2',1,'on')

    % Create temporary directory for simulation on worker
    workDir = pwd;
    addpath(workDir)
    tempDir = tempname;
    mkdir(tempDir)
    cd(tempDir)

end
```

Run Parallel Simulations with `parfor`

To stream data from parallel workers to the Simulation Data Inspector, you have to run parallel simulations using `parfor`. Each worker runs a `vdp` simulation with a different value of Mu. Simulink cannot access the contents of the parfor loop, so the variable MuVal is defined in the worker's workspace, where the vdp model can see it, using assignin.

```
parfor (index = 1:4)

    % Set value of Mu in the worker's base workspace
    assignin('base','MuVal',MuVals(index));

    % Modify the value of Mu in the model and simulate
    set_param('vdp/Mu','Gain','MuVal')
    sim('vdp')
```

Access Data and Send Run to Client MATLAB

You can use the Simulation Data Inspector programmatic interface on the worker the same way you would in the client MATLAB. This example creates a Simulink.sdi.Run object and attaches the value of Mu used in the simulation with the Tag property.

```
    % Attach metadata to the run
    IDs = Simulink.sdi.getAllRunIDs;
    lastIndex = length(IDs);
    runID = Simulink.sdi.getRunIDByIndex(lastIndex);
    parRun = Simulink.sdi.getRun(runID);
    parRun.Tag = strcat('Mu = ',num2str(MuVals(index)));

    % Send the run to the Simulation Data Inspector on the client MATLAB
    Simulink.sdi.sendWorkerRunToClient

end
```

Close Temporary Directories and View Runs in the Simulation Data Inspector

Use another spmd section to delete the temporary directories created on the workers once the simulations complete. In each simulation, Simulink.sdi.sendWorkerRunToClient imported runs from all the workers into the Simulation Data Inspector. You can view the data and check the run properties to see the value of Mu used during simulation.

```
spmd

    % Remove temporary directories
    cd(workDir)
    rmdir(tempDir, 's')
    rmpath(workDir)

end

Simulink.sdi.view
```

Input Arguments

run — Run ID or `Simulink.sdi.Run` object

runID | `Simulink.sdi.Run` object

Run ID or `Simulink.sdi.Run` object corresponding to the run you want to import into the Simulation Data Inspector.

Introduced in R2018a

Simulink.sdi.setArchiveRunLimit

Package: Simulink.sdi

Specify a limit for the number of runs stored in the Simulation Data Inspector archive

Syntax

```
Simulink.sdi.setArchiveRunLimit(limit)
```

Description

`Simulink.sdi.setArchiveRunLimit(limit)` sets the Simulation Data Inspector archive limit as specified by `limit`. When the number of runs in the archive reaches the limit, the Simulation Data Inspector starts to delete runs from the archive on a first-in, first-out basis. When another run enters the archive, the Simulation Data Inspector deletes the run that has been in the archive the longest. A `limit` of `-1` indicates that the archive has no limit for the number of runs it stores. A `limit` of `0` means that the archive cannot contain any runs.

Tip To retain data for only the current run, configure the Simulation Data Inspector to automatically archive runs and set the archive run limit to `0`.

Examples

Configure the Simulation Data Inspector to Retain Only the Current Run

You can configure the Simulation Data Inspector to retain only the logged data for your current simulation. In iterative design and debugging workflows, this configuration helps prevent accumulation of unwanted logged data on disk. First, check the configuration of the Simulation Data Inspector archive. You can save the parameters to restore your preferences after you finish designing or debugging.

```
limit = Simulink.sdi.getArchiveRunLimit;
mode = Simulink.sdi.getAutoArchiveMode;
```

Set the archive limit to `0` and configure the Simulation Data Inspector to automatically archive simulation runs.

```
setArchiveRunLimit(0)
setAutoArchiveMode(true)
```

When you simulate your model, the Simulation Data Inspector deletes the previous run and updates the view to show signals in the current simulation.

When you finish designing or debugging your model, you can restore the Simulation Data Inspector archive back to its previous configuration.

```
Simulink.sdi.setArchiveRunLimit(limit)
Simulink.sdi.setAutoArchiveMode(mode)
```

Input Arguments

`limit` — Maximum number of runs to store in the Simulation Data Inspector archive

scalar

Limit for the number of runs stored in the Simulation Data Inspector archive. When the number of runs in the archive reaches the limit, the Simulation Data Inspector starts to delete runs from the archive, on a first-in, first-out basis. A `limit` of `-1` indicates that there is no limit on the runs stored in the archive. A `limit` of `0` indicates that the archive cannot contain any runs.

Example: `-1`

Example: `10`

Topics

“Iterate Model Design Using the Simulation Data Inspector”

Introduced in R2018b

Simulink.sdi.setAutoArchiveMode

Package: Simulink.sdi

Specify whether the Simulation Data Inspector automatically archives simulation runs

Syntax

```
Simulink.sdi.setAutoArchiveMode(mode)
```

Description

`Simulink.sdi.setAutoArchiveMode(mode)` configures the automatic archive behavior of the Simulation Data Inspector, according to `mode`. The Simulation Data Inspector automatically archives simulation runs when you specify `mode` as `true`. When you specify `mode` as `false`, the Simulation Data Inspector does not automatically archive.

Examples

Configure the Simulation Data Inspector to Retain Only the Current Run

You can configure the Simulation Data Inspector to retain only the logged data for your current simulation. In iterative design and debugging workflows, this configuration helps prevent accumulation of unwanted logged data on disk. First, check the configuration of the Simulation Data Inspector archive. You can save the parameters to restore your preferences after you finish designing or debugging.

```
limit = Simulink.sdi.getArchiveRunLimit;
mode = Simulink.sdi.getAutoArchiveMode;
```

Set the archive limit to `0` and configure the Simulation Data Inspector to automatically archive simulation runs.

```
setArchiveRunLimit(0)
setAutoArchiveMode(true)
```

When you simulate your model, the Simulation Data Inspector deletes the previous run and updates the view to show signals in the current simulation.

When you finish designing or debugging your model, you can restore the Simulation Data Inspector archive back to its previous configuration.

```
Simulink.sdi.setArchiveRunLimit(limit)
Simulink.sdi.setAutoArchiveMode(mode)
```

Input Arguments

`mode` — Logical specification of Simulation Data Inspector automatic archive behavior

`true` (default) | `false`

Logical value that specifies whether the Simulation Data Inspector automatically archives simulation runs.

- `true` — The Simulation Data Inspector automatically archives simulation runs.
- `false` — The Simulation Data Inspector does not automatically archive simulation runs.

Example: `false`

Data Types: `logical`

Simulink.sdi.setMarkersOn

Package: Simulink.sdi

Control whether markers are shown

Syntax

```
Simulink.sdi.setMarkersOn(value)
```

Description

`Simulink.sdi.setMarkersOn(value)` sets the show markers parameter in the Simulation Data Inspector according to `value`.

Examples

Display Markers in the Simulation Data Inspector

```
Simulink.sdi.setMarkersOn(true);
```

Input Arguments

`value` — Logical input
'true' | 'false'

Logical indication of whether markers are shown on plots in the Simulation Data Inspector.

- `True` shows markers on plots in the Simulation Data Inspector.
- `False` does not show markers on plots in the Simulation Data Inspector.

Data Types: `logical`

Simulink.sdi.setRunNamingRule

Package: Simulink.sdi

Specify the Simulation Data Inspector run naming rule

Syntax

`Simulink.sdi.setRunNamingRule('rule')`

Description

`Simulink.sdi.setRunNamingRule('rule')` sets the Simulation Data Inspector rule for naming runs created by simulating a Simulink model.

Examples

Modify Run Naming Rule Then Restore Default

This example shows how to use the Simulation Data Inspector API to modify the Simulation Data Inspector run naming rule, check a run's name, restore default preferences, and check the run naming rule.

```
% Load model
load_system('sldemo_fuelsys')

% Modify run naming rule
Simulink.sdi.setRunNamingRule('<model_name> Run <run_index>')

% Simulate system
sim('sldemo_fuelsys')

% Check run name
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

```
fuelRun = Simulink.sdi.getRun(runID);
fuelRun.name

ans =
'sldemo_fuelsys Run 1'

% Clear preferences to reset the run naming rule
Simulink.sdi.clearPreferences

% Check run naming rule
Simulink.sdi.getRunNamingRule

ans =
'Run <run_index>: <model_name>'
```

Input Arguments

'rule' — Simulation Data Inspector run naming rule

'Run <run_index>: <model_name> (default) | character vector

Simulation Data Inspector run naming rule for runs created by simulating a Simulink model. The character vector specifying the run naming rule can include plain text and any of the following tokens that represent data pulled from each run:

- `<run_index>` – Run's index in the Simulation Data Inspector repository.
- `<model_name>` – Name of the model simulated to create the run.
- `<time_stamp>` – Start time for the simulation that created the run.
- `<sim_mode>` – Simulation mode used for the simulation that created the run.

Example: `'<time_stamp> Simulation <run_index>: <model_name>'`

Example: `'<model_name> - <run_index>'`

Alternatives

You can modify the run naming rule using the Simulation Data Inspector UI in the **Preferences** menu. You can rename a run by modifying the `Name` property of its `Simulink.sdi.Run` object.

"Organize Your Simulation Data Inspector Workspace"

Introduced in R2011b

Simulink.sdi.setRunOverwrite

Package: Simulink.sdi

(Removed) Enable and disable run overwrite mode for a Simulation Data Inspector run

Note The `Simulink.sdi.setRunOverwrite` function has been removed. You can configure the Overwrite Run mode behavior using the `Simulink.sdi.setAutoArchiveMode` and `Simulink.sdi.setArchiveRunLimit` functions. For further details, see “Compatibility Considerations”.

Syntax

```
Simulink.sdi.setRunOverwrite(runID,overwrite)
```

Description

`Simulink.sdi.setRunOverwrite(runID,overwrite)` configures run overwrite mode for the run corresponding to `runID`, according to the value specified for `overwrite`.

Examples

Enable and Disable Run Overwrite for a Run

This example shows how to enable and disable run overwrite mode for a run in the Simulation Data Inspector. Run overwrite mode can help you avoid creating a large amount of intermediate data in an iterative design workflow.

Load the `sldemo_fuelsys` model, and then run a simulation to create a run in the Simulation Data Inspector. Use the Simulation Data Inspector programmatic interface to access the run ID for the run.

```
load_system('sldemo_fuelsys')
sim('sldemo_fuelsys')
```

```
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

Enable run overwrite for the run you created to start your iterative design process. When run overwrite is enabled for a run, the Simulation Data Inspector replaces that run's data with new simulation data for every subsequent simulation until you disable run overwrite mode for that run.

```
Simulink.sdi.setRunOverwrite(runID,true)
```

When you get to a stopping point or a meaningful intermediate stage and you want to retain the data for a run, you can disable run overwrite mode for the run.

```
Simulink.sdi.setRunOverwrite(runID,false)
```

Input Arguments

`runID` — Numeric run identifier

scalar

Run ID for the run you want to set run overwrite for. The Simulation Data Inspector assigns run IDs when it creates runs. You can get the run ID for a run using `Simulink.sdi.getAllRunIDs` or `Simulink.sdi.getRunIDByIndex`.

`overwrite` — Run overwrite enable/disable

true | false

Logical value for run overwrite mode. Specify `overwrite` as `true` to enable run overwrite mode for a run, and set `overwrite` to `false` to disable run overwrite mode for a run.

Compatibility Considerations

`Simulink.sdi.setRunOverwrite` function has been removed

Errors starting in R2018b

The `Simulink.sdi.setRunOverwrite` function is removed in R2018b with the introduction of the Simulation Data Inspector archive. You can configure the Overwrite Run mode behavior using the new `Simulink.sdi.setAutoArchiveMode` and

`Simulink.sdi.setArchiveRunLimit` functions. Enable the Simulation Data Inspector to automatically archive simulation runs, and set the archive limit to `0`.

```
Simulink.sdi.setAutoArchiveMode(true);
Simulink.sdi.setArchiveRunLimit(0);
```

With these settings, the Simulation Data Inspector retains the data for the current simulation run and discards the data for the previous simulation run. The view in the Simulation Data Inspector also updates to show signals in the current run, with consistent line styles and colors.

You can disable each aspect of the behavior separately. To retain prior run data, set the archive limit to a nonzero value. If you want no limit on the number of runs stored in the archive, you can specify `-1` as the archive limit. When you disable the **Automatically archive** setting, the Simulation Data Inspector does not move the prior run to the archive or update the view to show signals from the current run.

Topics

“Iterate Model Design Using the Simulation Data Inspector”

Introduced in R2011b

Simulink.sdi.setSubPlotLayout

Package: Simulink.sdi

Set subplot layout in the Simulation Data Inspector

Syntax

`Simulink.sdi.setSubPlotLayout(r,c)`

Description

`Simulink.sdi.setSubPlotLayout(r,c)` sets the grid layout of plots in the Simulation Data Inspector using the specified number of rows, `r`, and columns, `c`.

Examples

Change Subplot Layout

```
% Change subplot layout to 4 rows and 2 columns
Simulink.sdi.setSubPlotLayout(4,2);
```

Create a Run and View the Data

This example shows how to create a run, add data to it, and then view the data in the Simulation Data Inspector.

Create Data for the Run

This example creates `timeseries` objects for a sine and a cosine. To visualize your data, the Simulation Data Inspector requires at least a time vector that corresponds with your data.

```
% Generate timeseries data
time = linspace(0, 20, 100);
```

```
sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals, time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals, time);
cos_ts.Name = 'Cosine, T=8';
```

Create a Simulation Data Inspector Run and Add Your Data

To give the Simulation Data Inspector access to your data, use the `create` method and create a run. This example modifies some of the run's properties to help identify the data. You can easily view run and signal properties with the Simulation Data Inspector.

```
% Create a run
sinusoidsRun = Simulink.sdi.Run.create;
sinusoidsRun.Name = 'Sinusoids';
sinusoidsRun.Description = 'Sine and cosine signals with different frequencies';

% Add timeseries data to run
sinusoidsRun.add('vars', sine_ts, cos_ts);
```

Plot Your Data Using the `Simulink.sdi.Signal` Object

The `getSignalByIndex` method returns a `Simulink.sdi.Signal` object that can be used to plot the signal in the Simulation Data Inspector. You can also programmatically control aspects of the plot's appearance, such as the color and style of the line representing the signal. This example customizes the subplot layout and signal characteristics.

```
% Get signal, modify its properties, and change Checked property to true
sine_sig = sinusoidsRun.getSignalByIndex(1);
sine_sig.LineColor = [0 0 1];
sine_sig.LineDashed = '-.';
sine_sig.Checked = true;

% Add another subplot for the cosine signal
Simulink.sdi.setSubPlotLayout(2, 1);

% Plot the cosine signal and customize its appearance
cos_sig = sinusoidsRun.getSignalByIndex(2);
cos_sig.LineColor = [0 1 0];
cos_sig.plotOnSubPlot(2, 1, true);
```

```
% View the signal in the Simulation Data Inspector
Simulink.sdi.view
```

Close the Simulation Data Inspector and Save Your Data

```
Simulink.sdi.close('sinusoids.mat')
```

Input Arguments

r — Number of rows

integer

Number of rows in the subplot grid layout, specified as a whole number between 1 and 8, inclusive.

Example: 2

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | char

c — Number of columns

integer

Number of columns in the subplot grid layout, specified as a whole number between 1 and 8, inclusive.

Example: 2

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | char

Simulink.sdi.setTableGrouping

Package: Simulink.sdi

Change signal grouping hierarchy in Inspect pane

Syntax

```
Simulink.sdi.setTableGrouping
Simulink.sdi.setTableGrouping('group1')
Simulink.sdi.setTableGrouping('group1', 'group2')
Simulink.sdi.setTableGrouping('group1', 'group2', 'group3')
```

Description

`Simulink.sdi.setTableGrouping` groups signals in the **Inspect** pane of the Simulation Data Inspector as a flat list.

`Simulink.sdi.setTableGrouping('group1')` groups signals in the **Inspect** pane by the parameter specified by `group1`.

`Simulink.sdi.setTableGrouping('group1', 'group2')` groups signals in the **Inspect** pane first by the parameter specified by `group1` and then by the parameter specified by `group2`.

`Simulink.sdi.setTableGrouping('group1', 'group2', 'group3')` groups signals in the **Inspect** pane first by the parameter specified by `group1`, then by the parameter specified by `group2`, and finally by the parameter specified by `group3`. If you have a Simscape license, you have three options for table grouping.

Examples

Group Data by Model and Then Data Hierarchy

You can group your data in the navigation pane to visualize subsystem and data hierarchy relationships among signals clearly.

```
Simulink.sdi.setTableGrouping('Subsystems','DataHierarchy');
```

Input Arguments

`'group1'` — Signal grouping parameter

character vector

Parameter used to group signals in the **Inspect** pane of the Simulation Data Inspector. You can specify two grouping parameters, or three if you have a Simscape license.

- `DataHierarchy` groups signals according to any data hierarchy in the model, for example grouping signals in a bus together.
- `SubSystems` groups signals according to the model's subsystem hierarchy.
- `PhysmodHierarchy` groups signals according to the Simscape block structure. This parameter is only available with a Simscape license.

Example: `'SubSystems'`

Example: `'DataHierarchy'`

Data Types: `char`

Simulink.sdi.snapshot

Package: Simulink.sdi

Capture contents of Simulation Data Inspector plots

Syntax

```
fig = Simulink.sdi.snapshot
[fig,image] = Simulink.sdi.snapshot
Simulink.sdi.snapshot(Name,Value)
Simulink.sdi.snapshot(Name,Value)
Simulink.sdi.snapshot(Name,Value)
```

Description

`fig = Simulink.sdi.snapshot` creates a figure of the plotting area in the open Simulation Data Inspector session with the figure handle `fig`.

`[fig,image] = Simulink.sdi.snapshot` creates a figure of the plotting area in the open Simulation Data Inspector session with the figure handle `fig` and returns the image data in the array, `image`.

`Simulink.sdi.snapshot(Name,Value)` captures an image of the Simulation Data Inspector plots according to the options specified by name-value pairs.

`fig` = `Simulink.sdi.snapshot(Name,Value)` captures an image of the Simulation Data Inspector plots according to the options specified by name-value pairs. This syntax returns the figure handle, `fig`, if a figure is created.

[`fig`, `image`] = `Simulink.sdi.snapshot(Name,Value)` captures an image of the Simulation Data Inspector plots according to the options specified by name-value pairs. This syntax returns the figure handle, `fig`, and an array of image data, `image`, when appropriate for the specified options.

Examples

Copy View Settings to a Run

This example shows how to copy the view settings for aligned signals from one run to another.

Simulate Your Model and get Run Object

Simulate the `vdp` model to create a run of data to visualize.

```
load_system('vdp')
set_param('vdp','SaveFormat','Dataset','SaveOutput','on')
sim('vdp')

runIndex = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(runIndex);
vdpRun = Simulink.sdi.getRun(runID);
```

Modify View Settings for Signals

Use the `Simulink.sdi.Run` object to access the signals in the run. Then, modify the signals' view settings, and plot them in the Simulation Data Inspector. Open the Simulation Data Inspector and use `Simulink.sdi.snapshot` to view the results.

```
sig1 = vdpRun.getSignalByIndex(1);
sig2 = vdpRun.getSignalByIndex(2);

sig1.LineColor = [0 0 1];
sig1.LineDashed = '-.';

sig2.LineColor = [1 0 0];
sig2.LineDashed = ':';
```

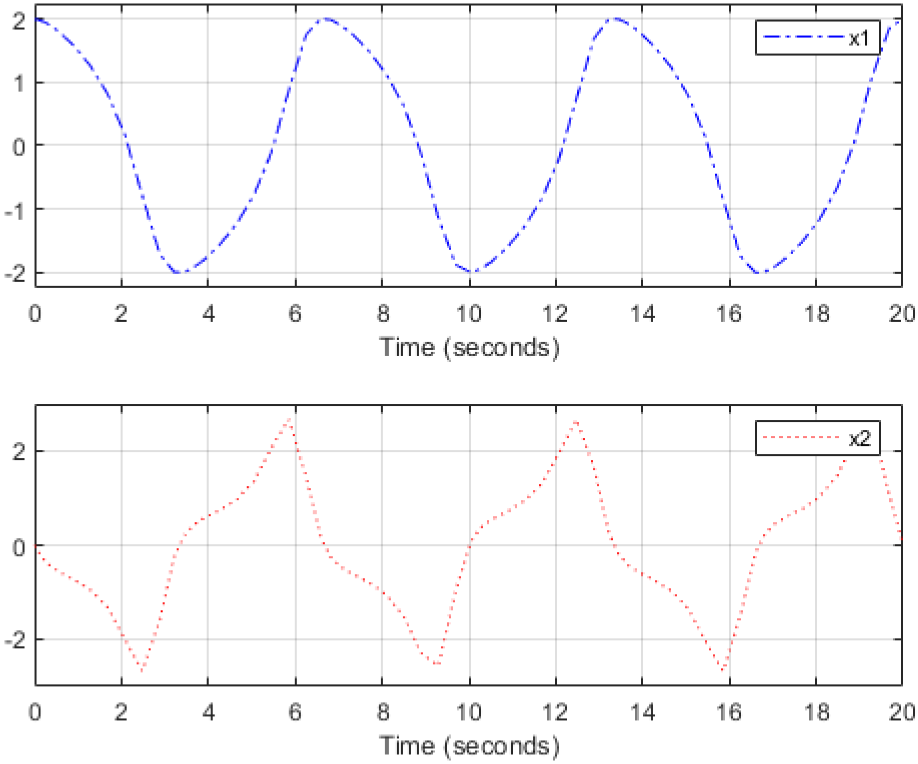
Capture a Snapshot from the Simulation Data Inspector

Create a `Simulink.sdi.CustomSnapshot` object and use the `Simulink.sdi.snapshot` function to programmatically capture a snapshot of the contents of the Simulation Data Inspector.

```
snap = Simulink.sdi.CustomSnapshot;

snap.Rows = 2;
snap.YRange = {[-2.25 2.25],[-3 3]};
snap.plotOnSubPlot(1,1,sig1,true)
snap.plotOnSubPlot(2,1,sig2,true)

fig = Simulink.sdi.snapshot("from","custom","to","figure","settings",snap);
```



Copy the View Settings to a New Simulation Run

Simulate the model again, with a different `Mu` value. Then, visualize the new run by copying the view settings from the first run. Specify the `plot` input as `true` to plot the signals from the new run.

```
set_param('vdp/Mu','Gain','5')
sim('vdp')
```

```
runIndex2 = Simulink.sdi.getRunCount;
runID2 = Simulink.sdi.getRunIDByIndex(runIndex2);
run2 = Simulink.sdi.getRun(runID2);

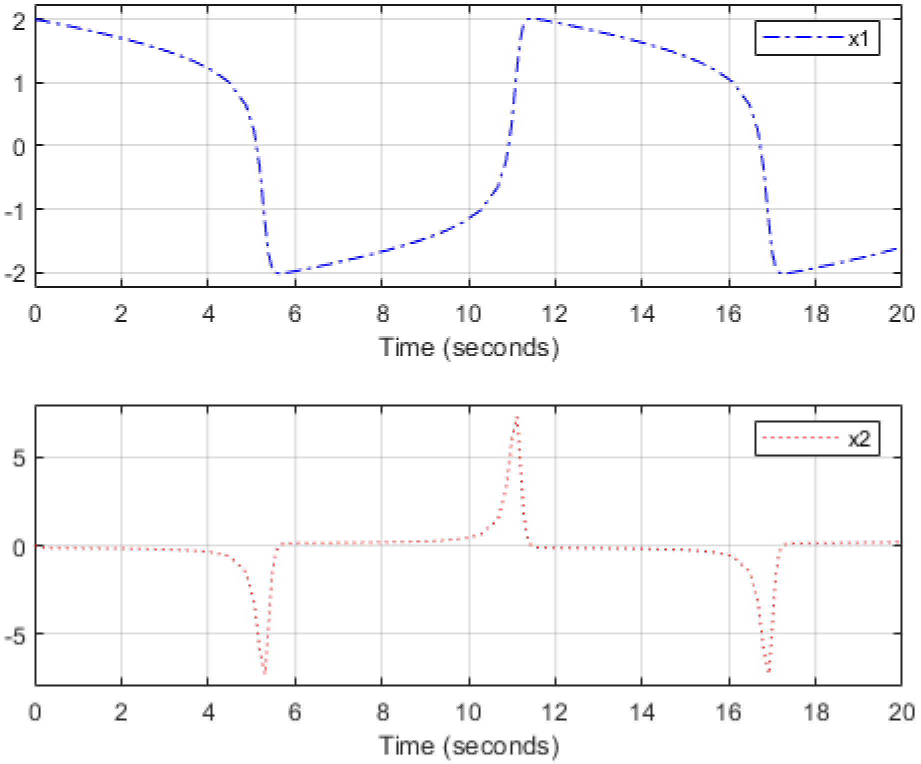
sigIDs = Simulink.sdi.copyRunViewSettings(runID,runID2,true);
```

Capture a Snapshot of the New Simulation Run

Use the `Simulink.sdi.CustomSnapshot` object to capture a snapshot of the new simulation run. First, clear the signals from the subplots. Then, plot the signals from the new run and capture another snapshot.

```
snap.clearSignals
snap.YRange = {[-2.25 2.25],[-8 8]};
snap.plotOnSubPlot(1,1,sigIDs(1),true)
snap.plotOnSubPlot(2,1,sigIDs(2),true)

fig = snap.snapshot("to","figure");
```



Input Arguments

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: `'to','figure','props',{'Name','My Data'}`

`from` — Content to include in the snapshot

`'opened'` (default) | `'active'` | `'comparison'` | `'custom'`

Content to include in the snapshot.

- `'opened'` — Include all subplots in the graphical viewing area of the open Simulation Data Inspector session.
- `'active'` — Include only the active (selected) subplot in the open Simulation Data Inspector session.
- `'comparison'` — Include the comparison plots for the selected comparison run or signal in the open Simulation Data Inspector session.
- `'custom'` — Include contents specified by the `settings` name-value pair `Simulink.sdi.CustomSnapshot` object. You can use the `'from','custom'` option to create a snapshot without opening the Simulation Data Inspector or affecting your open Simulation Data Inspector session. Include a `settings` name-value pair when you specify `'from','custom'`.

Example: `'from','comparison'`

Data Types: `char` | `string`

`to` — Type of snapshot to create

`'image'` (default) | `'figure'` | `'file'` | `'clipboard'`

Type of snapshot to create.

- `'image'` — Create a figure and return the figure handle and an array of image data. When you specify `'to','image'`, the `fig` and `image` outputs both have value.
- `'figure'` — Create a figure and return the figure handle. When you specify `'to','figure'` the `fig` output has value, and the `image` output is empty.
- `'file'` — Save to a PNG file with the name specified by the `filename` name-value pair. If you do not specify a `filename` name-value pair, the file is named `plots.png`. When you specify `'to','file'`, the `fig` and `image` outputs are both empty.
- `'clipboard'` — Copy the plots to your system clipboard. From the clipboard, you can paste the image into another program such as Microsoft Word. When you specify `'to','clipboard'`, the `fig` and `image` outputs are both empty.

Example: `'to','file'`

Data Types: `char` | `string`

`filename` — Name for image file

`'plots.png'` (default) | character array | string

Name of the image file to store the snapshot when you specify `'to','file'`.

Example: `'filename','MyImage.png'`

Data Types: `char` | `string`

`props` — Properties to customize the figure

cell array

Figure properties, specified as a cell array. You can include settings for the figure properties described in Figure Properties.

Example: `'props',{'Name','MyData','NumberTitle','off'}`

Data Types: `char` | `string`

`settings` — Custom snapshot settings

`Simulink.sdi.CustomSnapshot`

`Simulink.sdi.CustomSnapshot` object specifying custom snapshot settings. You can use the `settings` name-value pair to specify the dimensions of the image in pixels, subplot layout, and limits for the *x*- and *y*-axes.

Example: `'settings',customSnap`

Data Types: `char` | `string`

Output Arguments

`fig` — Figure handle

figure handle

Handle for the figure. When a figure is not created with your specified options, the `fig` output is empty.

`image` — Image data

array

Array of image data. The `image` output has value when you use `Simulink.sdi.snapshot` without any input arguments or without a `to` name-value pair and when you specify `'to','image'`.

Topics

"Inspect and Compare Data Programmatically"
"Create Plots Using the Simulation Data Inspector"

Introduced in R2018a

Simulink.sdi.view

Package: Simulink.sdi

Open the Simulation Data Inspector

Syntax

```
Simulink.sdi.view
```

Description

`Simulink.sdi.view` opens the Simulation Data Inspector. You can write a script to plot your data and customize the Simulation Data Inspector properties and then use `Simulink.sdi.view` to see the results.

Examples

Open the Simulation Data Inspector from the Command Line

You can open the Simulation Data Inspector from the MATLAB command line to visualize, inspect, and analyze your data.

```
Simulink.sdi.view
```

Create a Run and View the Data

This example shows how to create a run, add data to it, and then view the data in the Simulation Data Inspector.

Create Data for the Run

This example creates `timeseries` objects for a sine and a cosine. To visualize your data, the Simulation Data Inspector requires at least a time vector that corresponds with your data.

```
% Generate timeseries data
time = linspace(0, 20, 100);

sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals, time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals, time);
cos_ts.Name = 'Cosine, T=8';
```

Create a Simulation Data Inspector Run and Add Your Data

To give the Simulation Data Inspector access to your data, use the `create` method and create a run. This example modifies some of the run's properties to help identify the data. You can easily view run and signal properties with the Simulation Data Inspector.

```
% Create a run
sinusoidsRun = Simulink.sdi.Run.create;
sinusoidsRun.Name = 'Sinusoids';
sinusoidsRun.Description = 'Sine and cosine signals with different frequencies';

% Add timeseries data to run
sinusoidsRun.add('vars', sine_ts, cos_ts);
```

Plot Your Data Using the `Simulink.sdi.Signal` Object

The `getSignalByIndex` method returns a `Simulink.sdi.Signal` object that can be used to plot the signal in the Simulation Data Inspector. You can also programmatically control aspects of the plot's appearance, such as the color and style of the line representing the signal. This example customizes the subplot layout and signal characteristics.

```
% Get signal, modify its properties, and change Checked property to true
sine_sig = sinusoidsRun.getSignalByIndex(1);
sine_sig.LineColor = [0 0 1];
sine_sig.LineDashed = '-.';
sine_sig.Checked = true;
```

```
% Add another subplot for the cosine signal
Simulink.sdi.setSubPlotLayout(2, 1);

% Plot the cosine signal and customize its appearance
cos_sig = sinusoidsRun.getSignalByIndex(2);
cos_sig.LineColor = [0 1 0];
cos_sig.plotOnSubPlot(2, 1, true);

% View the signal in the Simulation Data Inspector
Simulink.sdi.view
```

Close the Simulation Data Inspector and Save Your Data

```
Simulink.sdi.close('sinusoids.mat')
```

Alternatives

You can open the Simulation Data Inspector from the Simulink Editor toolbar with the **Simulation Data Inspector** button .

Simulink.SimulationData.createStructOfTimeseries

Create a structure with MATLAB `timeseries` object leaf nodes

Syntax

```
struct_of_ts = Simulink.SimulationData.createStructOfTimeseries(
tsArrayObject)
```

```
struct_of_ts = Simulink.SimulationData.createStructOfTimeseries(
busObj,structOfTimeseries)
```

```
struct_of_ts = Simulink.SimulationData.createStructOfTimeseries(
busObj,cellOfTimeseries)
struct_of_ts = Simulink.SimulationData.createStructOfTimeseries(
busObj,cellOfTimeseries,dims)
```

Description

`struct_of_ts = Simulink.SimulationData.createStructOfTimeseries( tsArrayObject)` creates a structure of MATLAB `timeseries` objects from a `Simulink.TsArray` object. Use this syntax for signal logging data for a model simulated in a release earlier than R2016a that used `ModelDataLogs` signal logging format.

`struct_of_ts = Simulink.SimulationData.createStructOfTimeseries( busObj,structOfTimeseries)` creates a structure that matches the attributes of the bus object `busObj` and sets the values of structure leaf nodes using a structure of MATLAB `timeseries` objects `structOfTimeseries`. Use this syntax when using a partial structure as the basis for creating a full structure to load into a model.

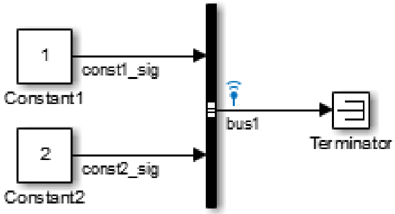
`struct_of_ts = Simulink.SimulationData.createStructOfTimeseries( busObj,cellOfTimeseries)` creates a structure that matches the attributes of the bus object `busObj` and sets the values of structure leaf nodes using a cell array of MATLAB `timeseries` objects `cellOfTimeseries`.

`struct_of_ts = Simulink.SimulationData.createStructOfTimeseries( busObj,cellOfTimeseries,dims)` creates a structure with the dimensions `dims`. Use this syntax to create a structure to load into an array of buses.

Examples

Structure Based on Simulink.TsArray

Suppose you had signal logging data from simulating a model in a release earlier than R2016a, using the `ModelDataLogs` format. The logged output is `logsout`.



View the logged data.

```
logsout
```

```
logsout =

Simulink.ModelDataLogs (log_modeldatalogs):
  Name                  Elements  Simulink Class

  bus1                     2      TsArray
```

Convert the logged data to a structure of MATLAB `timeseries` objects.

```
struct_of_ts = ...
Simulink.SimulationData.createStructOfTimeseries(logsout.bus1)
```

```
struct_of_ts =
    const1-sig: [1x1 timeseries]
    const2_sig: [1x1 timeseries]
```

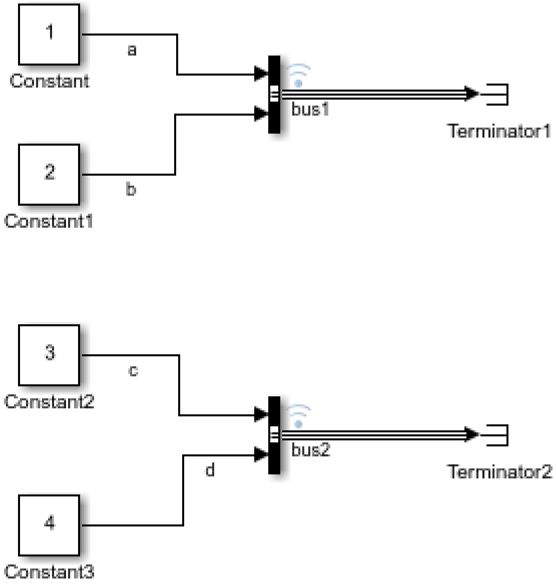
Structure Based on Bus Object and a Partial Structure of Timeseries Data

Create a structure of MATLAB `timeseries` objects based on a `Simulink.Bus` object and a partial structure of MATLAB `timeseries` objects. Then, load the structure into another model as simulation input.

Create a Structure of Timeseries

Open the `ex_logstructTimeSeries` model, and run a simulation to create the structure to load with signal logging.

```
open_system('ex_log_structTimeSeries')
sim('ex_log_structTimeSeries')
```



View Simulation Output

View the logged data.

```
ex_log_structTimeSeries_logsout
```

```
ex_log_structTimeSeries_logsout = 

Simulink.SimulationData.Dataset 'ex_log_structTimeSeries_logsout' with 2 elements

                         Name  BlockPath                          
                         ____  ____________________________________ 

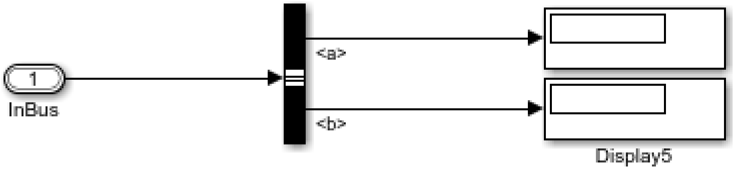
    1  [1x1 Signal]      bus1  ex_log_structTimeSeries/Bus Creator 
    2  [1x1 Signal]      bus2  ex_log_structTimeSeries/Bus Creator1

  - Use braces { } to access, modify, or add elements using index.
```

Open Model

Open the model that uses the logged simulation data as input.

```
open_system('ex_load_structTimeSeries_Bus')
```



Use `Simulink.SimulationData.createStructOfTimeseries` to Create Simulation Input

Open the `ex_load_structTimeSeries_Bus` model Configuration Parameters and view the specification for the Input parameter on the Data Import/Export pane. The `ex_load_structTimeSeries_Bus` model uses a variable, `ex_load_struct_TimeSeries_inputBus` as an input. Use `Simulink.SimulationData.createStructOfTimeseries` to create `ex_load_structTimeSeries_inputBus` in the base workspace from the data in | ex_log_structTimeSeries_logsout.

```
ex_load_structTimeSeries_inputBus = ...
Simulink.SimulationData.createStructOfTimeseries...
('bus', ex_log_structTimeSeries_logsout.get(2).Values)
```

```
ex_load_structTimeSeries_inputBus = 

  struct with fields:

    a: [1x1 timeseries]
    b: [1x1 timeseries]
```

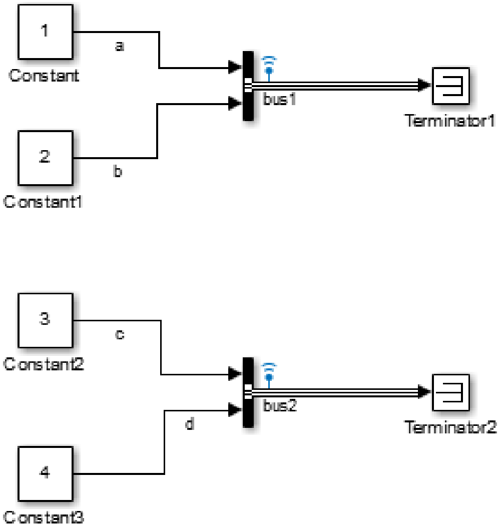
Structure to Use with an Array of Buses

Create a structure of MATLAB `timeseries` objects to load into an array of buses. Specify the dimensions of the created structure and a cell array of MATLAB `timeseries` objects.

Open a model and simulate it, producing signal logging data.

```
open_system(docpath(fullfile(docroot,'toolbox','simulink',...
'examples','ex_log_structTimeSeries')))
sim('ex_log_structTimeSeries')
```

The simulated `ex_log_structTimeseries` model looks like this:



View the logged signal data.

```
ex_log_structTimeSeries_logsout
```

```
Simulink.SimulationData.Dataset 'ex_log_structTimeSeries_logsout' with 2 elements

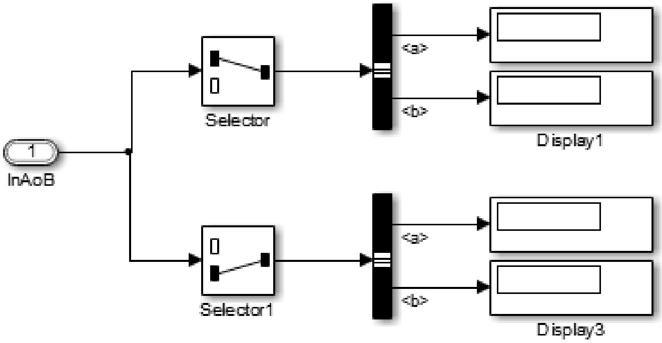
                         Name  BlockPath                            
                         ____  ____________________________________ 

    1  [1x1 Signal]      bus1  ex_log_structTimeSeries/Bus Creator  
    2  [1x1 Signal]      bus2  ex_log_structTimeSeries/Bus Creator1

  - Use braces { } to access, modify, or add elements using index.
```

Open the model to load the logged signal data into.

```
open_system(docpath(fullfile(docroot,'toolbox','simulink',...
'examples','ex_load_structTimeSeries_AoB')))
```



The `ex_load_structTimeSeries_AoB` model's **Configuration Parameters** > **Data Import/Export** > **Input** parameter lists the `ex_load_structTimeSeries_inputAoB` variable. However, you have not yet defined that variable in the MATLAB workspace. Use `Simulink.SimulationData.createStructOfTimeseries` to define that variable.

```
ex_load_structTimeSeries_inputAoB = ...
Simulink.SimulationData.createStructOfTimeseries...
('bus',{ex_log_structTimeSeries_logsout.get(1).Values.a,...
ex_log_structTimeSeries_logsout.get(1).Values.b,...
ex_log_structTimeSeries_logsout.get(2).Values.c,...
ex_log_structTimeSeries_logsout.get(2).Values.d},[2, 1])
```

```
ex_load_structTimeSeries_inputAoB =

2x1 struct array with fields:
    a
    b
```

Input Arguments

`tsArrayObject` — `Simulink.TsArray` object to convert
`Simulink.TsArray` object

`Simulink.TsArray` object to convert to a structure of MATLAB `timeseries` objects

In releases earlier than R2016a, when you log signals using the `ModelDataLogs` format, the logged data is a collection of `Simulink.TsArray` objects.

`busObj` — Bus object for creating a structure of MATLAB `timeseries` objects
`Simulink.Bus` object

Bus object for creating a structure of MATLAB `timeseries` objects, specified as the name of a `Simulink.Bus` object.

Data Types: `char`

`structOfTimeseries` — Structure object for values to override ground values, specified as a structure of MATLAB `timeseries` objects.
structure of MATLAB `timeseries` objects

Structure object for values to override ground values, specified as a structure of MATLAB `timeseries` objects. The structure must have the same hierarchy as the bus object. However, the names of the fields in the structure do not have to match the names of the corresponding bus object nodes.

Data Types: `struct`

`cellOfTimeseries` — Cell array objects for values to override ground values, specified as a cell array of MATLAB `timeseries` objects.
cell array of MATLAB `timeseries` objects

Cell array object for values to override ground values, specified as a cell array of MATLAB `timeseries` objects. If you specify a cell array of MATLAB `timeseries` objects and you specify a `dims` argument, then the length of the cell array must be equal to the result of

`Simulink.BusObject.getNumLeafBusElements` times the product of the specified dimensions.

Data Types: `cell`

`dims` — Dimensions of the structure that this function creates.
vector

Dimensions of the structure that this function creates, specified as a vector. The length of the cell array is equal to the result of `Simulink.BusObject.getNumLeafBusElements` times the product of the specified dimensions.

If you specify a dimension in the form `[n]`, then Simulink interprets the dimension to be `1xn`.

Data Types: `double`

Output Arguments

`struct_of_ts` — Structure of MATLAB `timeseries` objects.
MATLAB structure

MATLAB `timeseries` objects, returned as a structure. The structure has the same hierarchy and attributes as the `Simulink.TsArray` object or `Simulink.Bus` object that you specify.

The dimensions of `structOfTimeseries` depend on the input arguments:

- If you specify `tsArrayObject`, then the dimension is 1.
- If you specify the `busObj` and a structure of MATLAB `timeseries`, then the dimension matches the dimensions of the specified structure.
- If you specify only the `busObj` and a cell array of MATLAB `timeseries`, then the dimension is 1.
- If you specify the `busObj` argument, a cell array of MATLAB `timeseries`, and the `dims` argument, then the dimensions match the dimensions of `dims`.

Introduced in R2013a

getAsDatastore

Class: Simulink.SimulationData.DatasetRef
Package: Simulink.SimulationData

Get matlab.io.datastore.SimulationDatastore representation of element from referenced Dataset object

Syntax

```
element =
Simulink.SimulationData.DatasetRef.getAsDatastore(datasetref_element
s)
```

Description

`element = Simulink.SimulationData.DatasetRef.getAsDatastore(datasetref_elements)` returns a `matlab.io.datastore.SimulationDatastore` representation of an element or collection of elements from the referenced dataset, based on index, name, or block path of the element.

You can represent a `Dataset` element as a `matlab.io.datastore.SimulationDatastore` object if the element was placed into the MAT-file using either of these approaches:

- Log `Dataset` format data to persistent storage (MAT-file).
- Place the element into a `Simulink.SimulationData.Dataset` object and saved the `Dataset` object to a v7.3 MAT-file.

The `SimulationDatastore` representation for a `Dataset` element creates a SimulationDatastore object for the Values field of that element. The `SimulationDatastore` representation supports streaming of the data for the `Values` property of the element into other simulations or into MATLAB.

Note You cannot use create a SimulationDatastore for Dataset elements that contain these types of data:

- Array

You can use SimulationDatastore objects to:

- Refer to logged simulation data that is stored on disk in a MAT-file.
- Specify signals to stream incrementally from disk to a simulation.
- Provide a basis for big data analysis using MATLAB functions.

Input Arguments

datasetref_element — Element of referenced dataset in MAT-file
index of the element

Element of a referenced dataset in a MAT-file, specified as an index, name (as a character vector), or block path (as a character vector.

Output Arguments

element — Element accessed using SimulationDatastore object
matlab.io.datastore.SimulationDatastore object | Simulink.SimulationData.Signal, Simulink.SimulationData.State or similar object, whose Values data uses a matlab.io.datastore.SimulationDatastore object

Element accessed using SimulationDatastore object, returned as either a matlab.io.datastore.SimulationDatastore object or a Simulink.Signal, Simulink.State, or similar object, whose Values data uses a matlab.io.datastore.SimulationDatastore object.

Examples

Use a SimulationDatastore to Reference a Signal&#x2019;s Data in a DatasetRef

Log signal data to persistent storage (select the **Log Dataset data to file** configuration parameter) and simulate a model.

Create a `DatasetRef` for the signal logging `Dataset` data (`logsout`) in the `out.mat` MAT-file.

```
sigLogRef = Simulink.SimulationData.DatasetRef('out.mat','logsout');
firstSig = sigLogRef.getAsDatastore(1)
```

```
firstSig = 

  Simulink.SimulationData.Signal
  Package: Simulink.SimulationData

  Properties:
              Name: 'x1'
    PropagatedName: ''
         BlockPath: [1x1 Simulink.SimulationData.BlockPath]
          PortType: 'outport'
         PortIndex: 1
            Values: [1×1 matlab.io.datastore.SimulationDatastore]
```

Load the data into another model. This approach streams the values of the signal `x1` for another simulation.

```
ds = Simulink.SimulationData.Dataset;
ds{1} = sigLogRef{1};
sim('other_model','ExternalInput','ds');
```

Alternative

To streamline the use of indexing, you can use curly braces (`{}`) syntax to obtain a `SimulationDatastore` object for `DatasetRef` object signal values. The requirements and results are the same as using `getAsDatastore`. For example, if you log signal data to persistent storage (select the **Log Dataset data to file** configuration parameter) and simulate a model.

```
sigLogRef = Simulink.SimulationData.DatasetRef('out.mat','logsout');
firstSig = sigLogRef{1}
```

```
ans =
  Simulink.SimulationData.Signal
  Package: Simulink.SimulationData

  Properties:
              Name: 'x1'
    PropagatedName: ''
         BlockPath: [1x1 Simulink.SimulationData.BlockPath]
          PortType: 'outport'
         PortIndex: 1
            Values: [1×1 matlab.io.datastore.SimulationDatastore]
```

Topics

“Load Big Data for Simulations”

Introduced in R2017a

Simulink.SimulationData.DatasetRef.getDatasetVariableNames

List names of `Dataset` variables in MAT-file

Syntax

```
varNames =
Simulink.SimulationData.DatasetRef.getDatasetVariableNames(matFile)
```

Description

`varNames =`
`Simulink.SimulationData.DatasetRef.getDatasetVariableNames(matFile)`
lists the names of variables for `Dataset` data in a MAT-file.

Examples

List Variable Names in MAT-File

Suppose that you simulate a model using the default variable names for signal logging data and states data. You enable the **Configuration Parameters** > **Data Import/Export** > **Log Dataset data to file** and use the default MAT-file name of `out.mat`.

List the variable names in the MAT-file.

```
varNames = Simulink.SimulationData.DatasetRef.getDatasetVariableNames('out.mat')
varNames =

   'xout'  'logsout'
```

Tips

To get the names of `Dataset` variables in the MAT-file, using the `Simulink.SimulationData.DatasetRef.getDatasetVariableNames` function processes faster than using the `who`, or `whos` functions.

Input Arguments

`matFile` — MAT-file that contains `Dataset` variables

character vector

MAT-file that contains `Dataset` variables, specified as a character vector. The character vector specifies the path to the MAT-file.

Output Arguments

`varNames` — Names of `Dataset` variables in MAT-file

cell array

Names of `Dataset` variables in MAT-file, returned as a cell array.

Simulink.SimulationData.forEachTimeseries

Call function on each `timeseries` object

Syntax

```
dataResults = Simulink.SimulationData.forEachTimeseries(
functionHandle,inputData)
```

Description

`dataResults = Simulink.SimulationData.forEachTimeseries(functionHandle,inputData)` runs the specified function handle on all MATLAB `timeseries` objects contained in `inputData`.

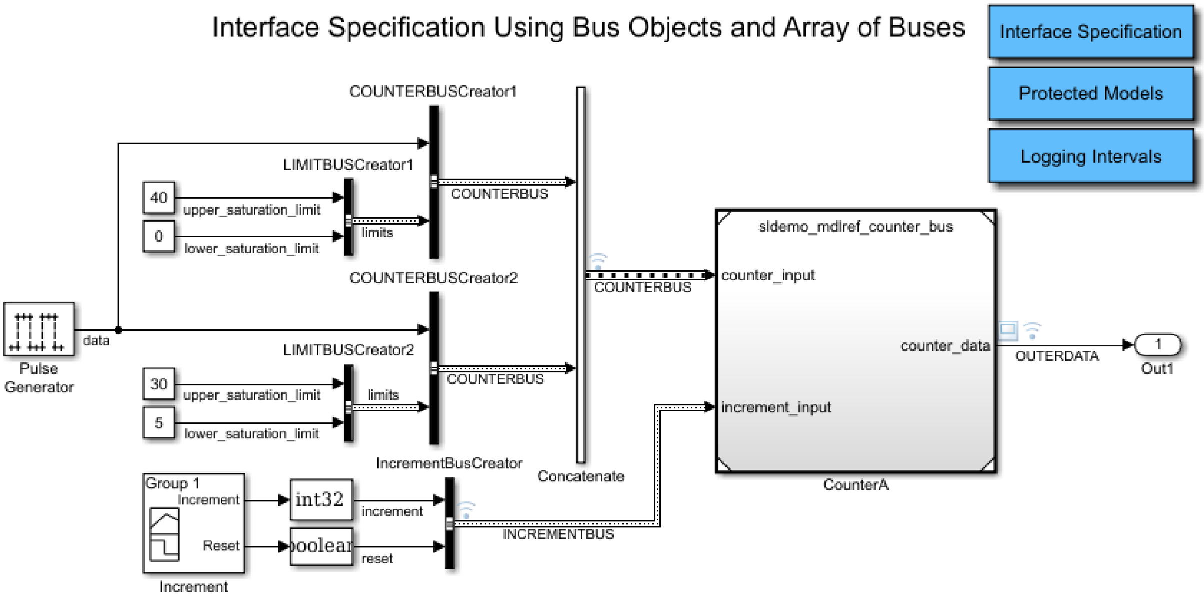
Examples

Find Minimum for Logged Bus Signal Data

This example shows how to use the `forEachTimeseries` function to run the `min` function on each `timeseries` object in the logged data for the `COUNTERBUS` signal.

Open the model and simulate it.

```
open_system('sldemo_mdlref_bus')
sim('sldemo_mdlref_bus');
```



Access the signal logging data. For this model, that data is stored in the `topOut` variable.

```
topOut
```

```
Simulink.SimulationData.Dataset 'topOut' with 4 elements

                         Name          BlockPath
                         ____________  ________________________________________
    1  [1x1 Signal]      COUNTERBUS    sldemo_mdlref_bus/Concatenate
    2  [1x1 Signal]      OUTERDATA     sldemo_mdlref_bus/CounterA
    3  [1x1 Signal]      INCREMENTBUS  sldemo_mdlref_bus/IncrementBusCreator
    4  [1x1 Signal]      INNERDATA     ...erA|sldemo_mdlref_counter_bus/COUNTER

  - Use braces { } to access, modify, or add elements using index.
```

Find the values for the `COUNTERBUS` element.

```
counterbusData = topOut{1}.Values
```

```
counterbusData = 

  2×1 struct array with fields:
    data
    limits
```

Run the `min` function on the `counterbus` data.

```
ret = Simulink.SimulationData.forEachTimeseries(@min,counterbusData)
```

```
ret = 

2x1 struct array with fields:
  data
limits
```

Explore the returned data.

```

  lower_saturation_limit: 0
```

Input Arguments

`functionHandle` — Function to run on MATLAB `timeseries` objects

function handle

Function to run on `timeseries` objects, specified as a function handle. For information about specifying function handles, see “Pass Function to Another Function” (MATLAB).

The function that you use with `forEachTimeseries`:

- Can be either a built-in function or a user-specified function
- Must return a scalar

If the function that you use with `forEachTimeseries` takes:

- One argument, specify the function handle and the input data. For example:

  ```
  ret = Simulink.SimulationData.forEachTimeseries(@min,data);
  ```
- More than one argument, specify the function handle as `@(x)` and then specify the function, using `x` as the first argument. For remaining arguments, specify values. For example, this command runs the `resample` function on MATLAB `timeseries` objects in data, for the time vector `[2.5 3]`.

  ```
  ret = Simulink.SimulationData.forEachTimeseries(@(x)...
   (resample(x,[2.5 3]),data);
  ```

`inputData` — Data to run specified function on
MATLAB `timeseries` object | array of `timeseries` | structure with `timeseries` at leaf nodes | array of structures with `timeseries` at leaf nodes

Data to run specified function on, specified as `timeseries` data.

Output Arguments

`dataResults` — Data resulting from running specified function
MATLAB `timeseries` object | array of `timeseries` | structure with `timeseries` at leaf nodes | array of structures with `timeseries` at leaf nodes

Data resulting from running specified function, returned using the format and hierarchy of the input data.

Introduced in R2016b

Simulink.SimulationData.signalLoggingSelector

Open Signal Logging Selector

Syntax

`Simulink.SimulationData.signalLoggingSelector(modelName)`

Description

`Simulink.SimulationData.signalLoggingSelector(modelName)` opens the Signal Logging Selector dialog box for the model that you specify with `modelName`.

Input Arguments

`modelName`

Character vector that specifies the name of the model for which you want to open the Signal Logging Selector dialog box.

Example

Open the Signal Logging Selector dialog box for the `sldemo_mdlref_bus.mdl`.

```
Simulink.SimulationData.signalLoggingSelector('sldemo_mdlref_bus')
```

setName

Class: Simulink.SimulationData.Unit
Package: Simulink.SimulationData

Specify name of logging data units

Syntax

```
unitObject = setName(unitObj,unitName)
```

Description

`unitObject = setName(unitObj,unitName)` sets the name for the `Simulink.SimulationData.Unit` object to the name specified in `unitName`.

Input Arguments

`unitObj` — Logging data unit object to name

`Simulink.SimulationData.Unit` object

Logging data unit object to name, specified as a `Simulink.SimulationData.Unit` object.

`unitName` — Name of logging data unit

character vector

Name of logging data unit, specified as a character vector.

Output Arguments

`name` — Name of logging data units

character vector

Name of logging data units, returned as a character vector.

Examples

Name a Logging Data Unit Object

```
inchesUnit = Simulink.SimulationData.Unit('in');
inchesUnit = setName(inchesUnit,'inches')
```

```
inchesUnit = 

  Units with properties:

    Name: 'inches'
```

Simulink.SimulationData.updateDatasetFormatLogging

Convert model and its referenced models to use `Dataset` format for signal logging

Syntax

```
Simulink.SimulationData.updateDatasetFormatLogging(top_model)
Simulink.SimulationData.updateDatasetFormatLogging(top_model,
variants)
```

Description

Note The `ModelDataLogs` class is supported for backwards compatibility. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format. In R2016a or later, when you open a model from an earlier release that had used `ModelDataLogs` format, the model simulated in use `Dataset` format. You do not need to use this command to update the signal logging format for a model that uses model referencing. Opening the model in R2016a or later uses `Dataset` format for all signal logging.

You can convert signal logging data from `ModelDataLogs` to `Dataset` format. Converting to `Dataset` format makes it easier to post-process with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see “Convert Logged Data to Dataset Format”.

If you have legacy code that uses the `ModelDataLogs` API, you can encounter situations that require updates to your code or model. See “Migrate Scripts That Use Legacy ModelDataLogs API”.

`Simulink.SimulationData.updateDatasetFormatLogging(top_model)` converts the top-level model and all of its referenced models to use the `Dataset` format for signal logging instead of the `ModelDataLogs` format. You can convert signal logging data from `ModelDataLogs` to `Dataset` format. Converting to `Dataset` format makes it easier to post-process with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see “Convert Logged Data to Dataset Format”.

If a Model block has the **Generate preprocessor conditionals** option selected, the function converts all the variants; otherwise, the function converts only the active variant.

`Simulink.SimulationData.updateDatasetFormatLogging(top_model, variants)` specifies which variant models to convert to use the `Dataset` signal logging format. For details about the `variants` argument, see “Input Arguments” on page 2-900

Input Arguments

`top_model`

Character vector that specifies the name of the top-level model.

`variants`

Character vector that specifies which variant models to update:

- `'ActivePlusCodeVariants'` — (Default) Search all variants if any generate preprocessor conditionals. Otherwise, search only the active variant.
- `'ActiveVariants'` — Convert only the active variant.
- `'AllVariants'` — Convert all variants.

Definitions

Dataset

The *`Dataset`* format causes Simulink to use a `Simulink.SimulationData.Dataset` object to store the logged signal data. The `Dataset` format use MATLAB `timeseries` objects to formatting the data.

ModelDataLogs

The *`ModelDataLogs`* format causes Simulink to use a `Simulink.ModelDataLogs` object to store the logged signal data.`Simulink.Timeseries` and `Simulink.TsArray` objects provide the format for the data.

Tips

- The conversion function sets the `SignalLoggingSaveFormat` parameter value to `Dataset` for all the updated models.
- If you want to save the format updates that the conversion function makes, then ensure that the top-level model, referenced models, and variant models are accessible and writable.
- If a model has no other unsaved changes, the conversion function saves the format updates to the model. If the model has unsaved changes, the function updates the format, but does not save those changes.
- If you use this function for a model that does not include any referenced models, the function converts the top-level model use the `Dataset` format.

Topics

"Migrate Scripts That Use Legacy ModelDataLogs API"

Introduced in R2011a

find

Class: Simulink.SimulationOutput
Package: Simulink

Access and display values of simulation results

Syntax

```
output = simOut.find('VarName')
```

Description

`output = simOut.find('VarName')` accepts one variable name. Specify *`VarName`* inside single quotes.

Input Arguments

`VarName`

Name of logged variable for which you seek values.

Default:

Output Arguments

`Value`

Value of the logged variable name specified in input.

Examples

Simulate `vdp` and store the values of the variable *youtNew* in *yout*.

```
simOut = sim('vdp','SimulationMode','rapid','AbsTol','1e-5',...
         'SaveState','on','StateSaveName','xoutNew',...
         'SaveOutput','on','OutputSaveName','youtNew');
yout = simOut.find('youtNew')
```

Alternatives

A simpler alternative is to use dot notation. For example, to access data for the `xoutNew` output variable, you can use this command:

```
simOut.xoutNew
```

Another alternative is to use `Simulink.SimulationOutput.who` and then `Simulink.SimulationOutput.get`.

See Also

`Simulink.SimulationOutput.get` | `Simulink.SimulationOutput.who`

get

Class: Simulink.SimulationOutput
Package: Simulink

Access and display values of simulation results

Syntax

```
output = simOut.get('VarName')
```

Description

`output = simOut.get('VarName')` accepts one variable name. Specify *`VarName`* inside single quotes.

Tip A simpler alternative to using the get function is to use dot notation. For example, to access data for the `xout` output variable, you can use this command:

```
simOut.xout
```

Input Arguments

`VarName`

Name of logged variable for which you seek values.

Default:

Output Arguments

`Value`

Value of the logged variable name specified in input.

Examples

Simulate `vdp` and store the values of the variable *youtNew* in *yout*.

```
simOut = sim('vdp','SimulationMode','rapid','AbsTol','1e-5',...
         'SaveState','on','StateSaveName','xoutNew',...
         'SaveOutput','on','OutputSaveName','youtNew');
yout = simOut.get('youtNew')
```

Alternatives

A simpler alternative is to use dot notation. For example, to access data for the `xout` output variable, you can use this command:

```
simOut.xout
```

Another alternative is to use `Simulink.SimulationOutput.who` and then `Simulink.SimulationOutput.find`.

See Also

`Simulink.SimulationOutput.find` | `Simulink.SimulationOutput.who`

getSimulationMetadata

Class: Simulink.SimulationOutput
Package: Simulink

Return `SimulationMetadata` object for simulation

Syntax

```
mData = simout.getSimulationMetadata()
```

Description

`mData = simout.getSimulationMetadata()` retrieves metadata information in a `SimulationMetadata` object from the `simout` `SimulationOutput` object.

Input Arguments

`simout` — Simulation object to get metadata from

object

Simulation object to get metadata from, specified as a `SimulationOutput` object.

Output Arguments

`mData` — `SimulationMetadata` object stored in the `simout` `SimulationOutput` object

object

`SimulationMetadata` object stored in the `simout` `SimulationOutput` object, returned as an object.

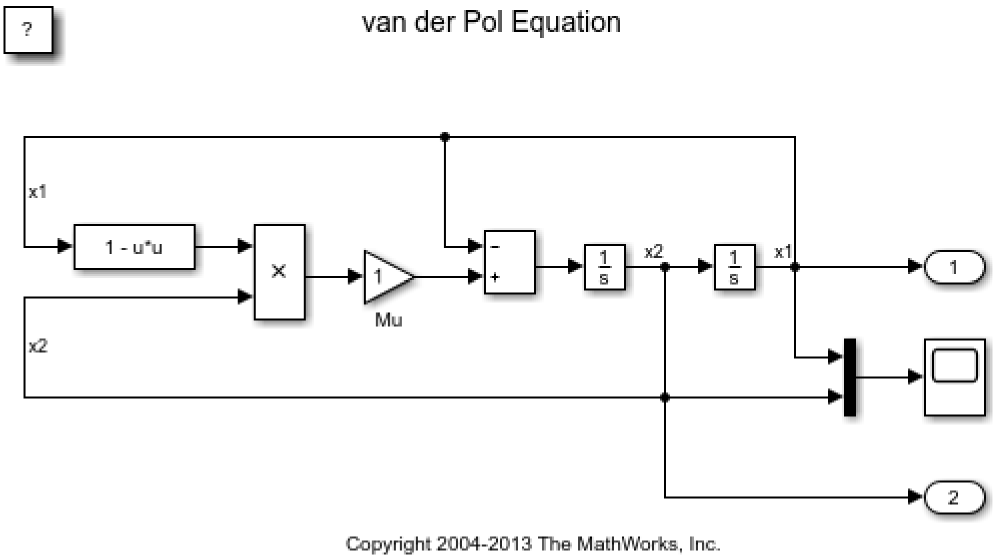
Examples

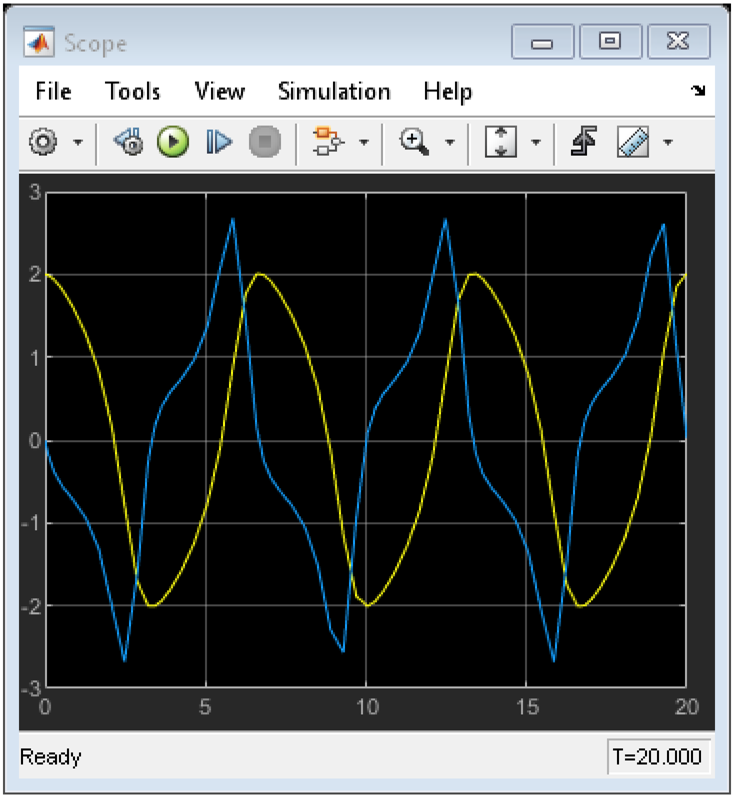
Retrieve Metadata From vdp Simulation

Simulate the `vdp` model and retrieve metadata information from the simulation.

Simulate the `vdp` model. Save the results of the `Simulink.SimulationOutput` object in `simout`

```
open_system('vdp')
simout = sim(bdroot,'ReturnWorkspaceOutputs','on');
```





Retrieve metadata information about this simulation using `mData`.

```
mData=simout.getSimulationMetadata()
```

```
mData = 

  SimulationMetadata with properties:

        ModelInfo: [1x1 struct]
       TimingInfo: [1x1 struct]
    ExecutionInfo: [1x1 struct]
       UserString: ''
```

```
          UserData: []
```

Alternatives

A simpler alternative to use dot notation with the `SimulationMetadata` property. For example:

```
simOut.SimulationMetadata.ModelInfo
```

Another alternative is to display simulation metadata in the Variable Editor using one of these approaches:

- Select the **Show Simulation Metadata** check box (which displays the data in a tree structure).
- Double-click the **SimulationMetadata** row.
- View the `SimulationMetadata` object.

See Also

`Simulink.SimulationMetadata` | `Simulink.SimulationOutput.setUserData` | `Simulink.SimulationOutput.setUserString`

setUserData

Class: Simulink.SimulationOutput
Package: Simulink

Store custom data in `SimulationMetadata` object that `SimulationOutput` object contains

Syntax

```
simoutNew = simout.setUserData(CustomData)
```

Description

`simoutNew = simout.setUserData(CustomData)` assigns a copy of the `simout` `SimulationOutput` object to `simoutNew`. The copy contains `CustomData` in its `SimulationMetadata` object.

Input Arguments

`simout` — Simulation object to get metadata from
object

Simulation object to get metadata from, specified as a `SimulationOutput` object.

`CustomData` — Data to store in a metadata object
data

Any custom data you want to store in the metadata object.

Output Arguments

`simoutNew` — Simulation object that stores metadata object with custom data
object

A copy of the simout SimulationOutput object that contains CustomData in its SimulationMetadata object, returned as an object.

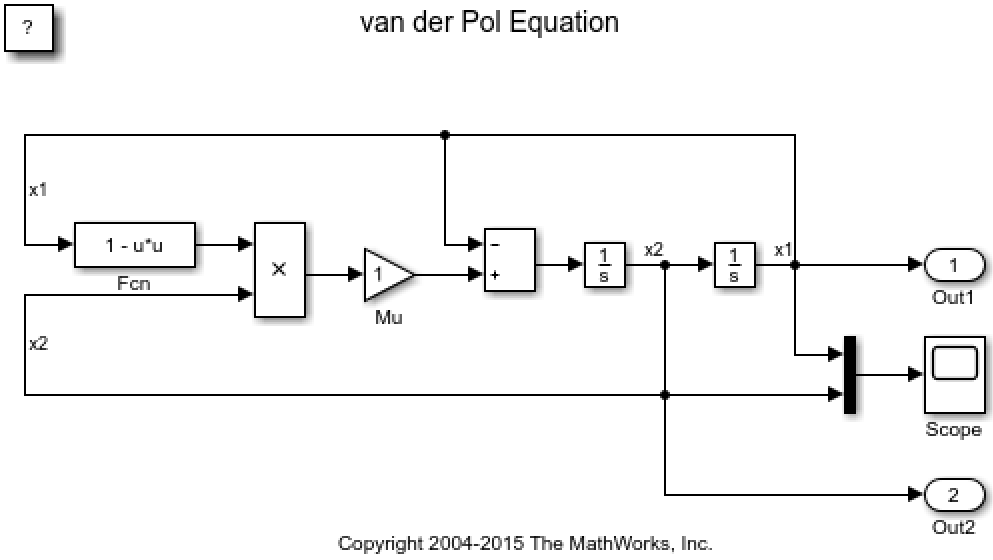
Examples

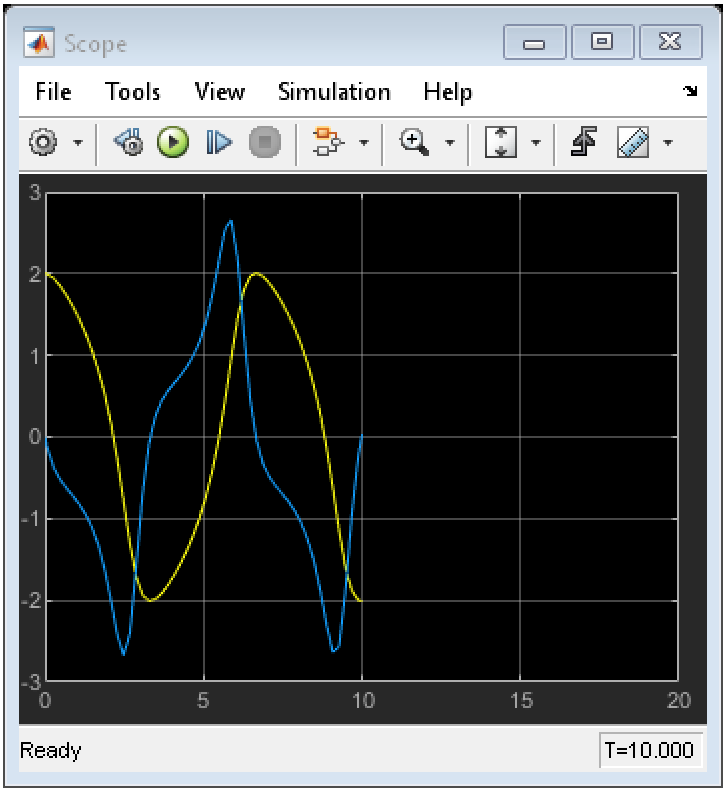
Store Data in SimulationMetadata Object of vdp Simulation

Simulate the vdp model. Store custom data in the SimulationMetadata object that the SimulationOutput object contains.

Simulate the vdp model. Save the results of the Simulink.SimulationOutput object in simout.

```
open_system('vdp')
simout=sim(bdroot,'ReturnWorkspaceOutputs','on');
```





Store custom data about the simulation in the `SimulationMetadata` object that `simout` contains.

```
simout=simout.setUserData(struct('param1','value1','param2','value2','param3','value3'
```

Use `SimulationOutput.getSimulationMetadata` to retrieve the information you stored.

```
mData=simout.getSimulationMetadata();
disp(mData.UserData)
```

```
    param1: 'value1'
    param2: 'value2'
    param3: 'value3'
```

See Also

Simulink.SimulationMetadata | Simulink.SimulationOutput.getSimulationMetadata | Simulink.SimulationOutput.setUserString

setUserString

Class: Simulink.SimulationOutput
Package: Simulink

Store custom character vector in `SimulationMetadata` object that `SimulationOutput` object contains

Syntax

```
simoutNew = simout.setUserString(CustomString)
```

Description

`simoutNew = simout.setUserString(CustomString)` assigns a copy of the `simout` `SimulationOutput` object to `simoutNew`. The copy contains `CustomString` in its `SimulationMetadata` object.

Input Arguments

`simout` — Simulation object to get metadata from

object

Simulation object to get metadata from, specified as a `SimulationOutput` object.

`CustomString` — Character vector to store in a metadata object

character vector

Any custom character vector you want to store in the metadata object.

Output Arguments

`simoutNew` — Simulation object that stores metadata object with custom character vector

object

A copy of the `simout` `SimulationOutput` object that contains `CustomString` in its `SimulationMetadata` object, returned as an object.

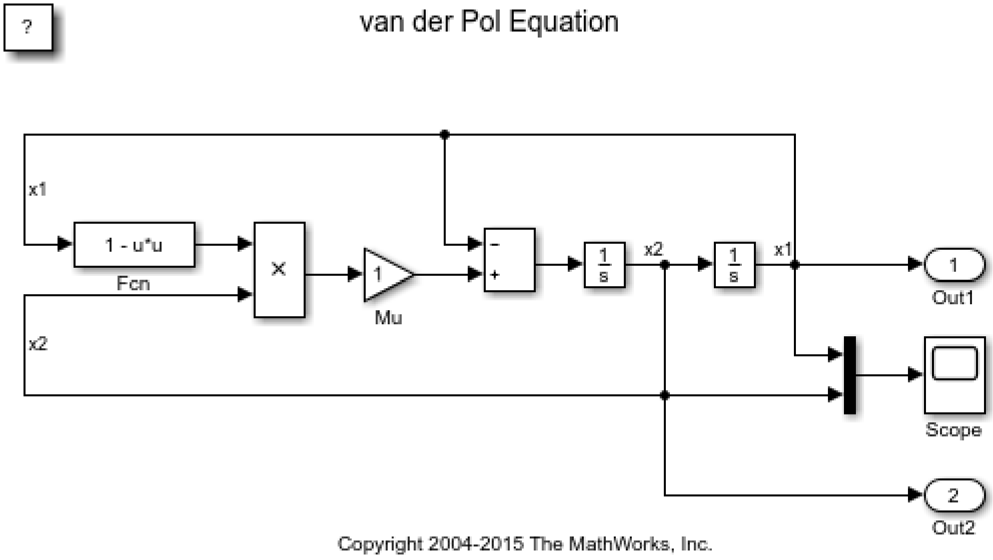
Examples

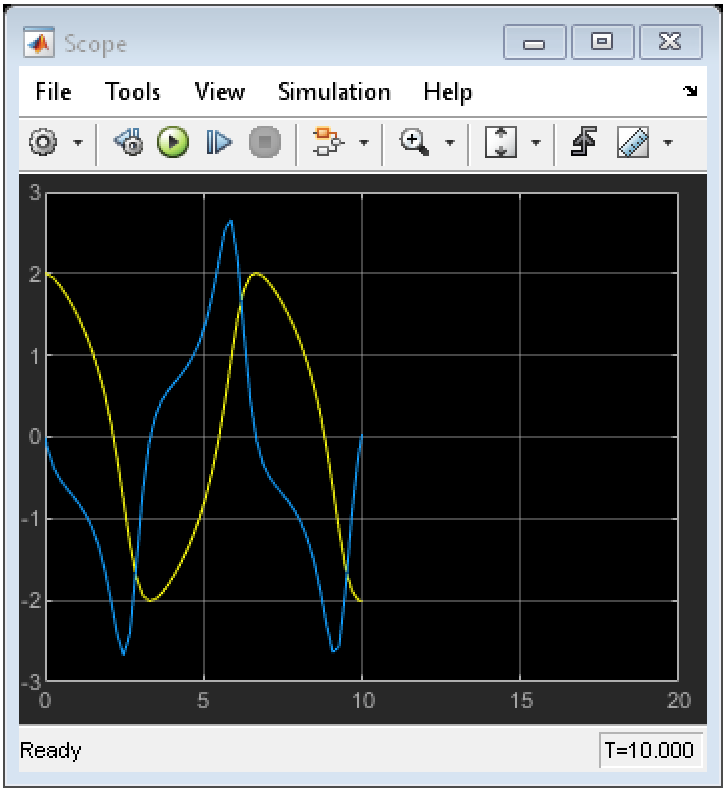
Store a Character Vector in SimulationMetadata Object of vdp Simulation

Simulate the `vdp` model. Store a custom character vector in the `SimulationMetadata` object that the `SimulationOutput` object contains.

Simulate the `vdp` model. Save the results of the `Simulink.SimulationOutput` object in `simout`.

```
open_system('vdp')
simout=sim(bdroot,'ReturnWorkspaceOutputs','on');
```





Store a character vector to describe the simulation.

```
simout=simout.setUserString('First Simulation');
```

Use `SimulationOutput.getSimulationMetadata` to retrieve the information you stored.

```
mData=simout.getSimulationMetadata();
disp(mData.UserString)
```

```
First Simulation
```

See Also

`Simulink.SimulationMetadata` | `Simulink.SimulationOutput.getSimulationMetadata` | `Simulink.SimulationOutput.setUserData`

who

Class: Simulink.SimulationOutput
Package: Simulink

Access and display output variable names of simulation

Syntax

simOutVar = simOut.who

Description

simOutVar = simOut.who returns the names of all simulation output variables, including workspace variables.

Output Arguments

simOutVar

Character vector array of output variable names of simulation.

Examples

Simulate vdp and store the character vector values of the output variable names.

```
simOut = sim('vdp','SimulationMode','rapid','AbsTol','1e-5',...
         'SaveState','on','StateSaveName','xoutNew',...
         'SaveOutput','on','OutputSaveName','youtNew');
simOutVar = simOut.who
```

Alternatives

A simpler alternative is to use dot notation. For example, to access data for the `xoutNew` output variable, you can use this command:

```
simOut.xoutNew
```

See Also

`Simulink.SimulationOutput.find` | `Simulink.SimulationOutput.get`

Simulink.SubSystem.convertToModelReference

Convert subsystem to model reference

Syntax

```
Simulink.SubSystem.convertToModelReference(gcb,'UseConversionAdvisor',true)
```

```
[success,mdlRefBlkHs] = Simulink.SubSystem.convertToModelReference(subsys,mdlRefs)
[success,mdlRefBlkHs] = Simulink.SubSystem.convertToModelReference(subsys,mdlRefs,Name,Value)
```

Description

`Simulink.SubSystem.convertToModelReference(gcb,'UseConversionAdvisor',true)` opens the Model Reference Conversion Advisor for the currently selected subsystem block.

`[success,mdlRefBlkHs] = Simulink.SubSystem.convertToModelReference(subsys,mdlRefs)` converts the specified subsystems to referenced models using the `mdlRefs` value.

For each subsystem that the function converts, it:

- Creates a model
- Copies the contents of the subsystem into the new model
- Updates any root-level Inport, Outport, Trigger, and Enable blocks and the configuration parameters of the model to match the compiled attributes of the original subsystem
- Copies the contents of the model workspace of the original model to the new model

Before you use the function, load the model containing the subsystem.

`[success,mdlRefBlkHs] = Simulink.SubSystem.convertToModelReference( subsys,mdlRefs,Name,Value)` uses additional options specified by one or more `Name,Value` pair arguments.

Examples

Open the Model Reference Conversion Advisor

Open the `f14` model.

```
open_system('f14');
```

In the `f14` model, select the Controller subsystem output signal, click the **Simulation Data Inspector** button arrow , and select **Log Selected Signals**.

In the Simulink Editor, select the `Controller` subsystem. Then open the Model Reference Conversion Advisor from the command line.

```
Simulink.SubSystem.convertToModelReference(gcb,'UseConversionAdvisor',true);
```

Perform the conversion using the advisor.

Convert Subsystem to Referenced Model

Convert the `Bus Counter` subsystem to a referenced model named `bus_counter_ref_model`.

```
open_system('sldemo_mdlref_conversion');
Simulink.SubSystem.convertToModelReference(...
   'sldemo_mdlref_conversion/Bus Counter', ...
   'bus_counter_ref_model', ...
   'AutoFix',true,...
   'ReplaceSubsystem',true,...
   'CheckSimulationResults',true);
```

```
### Successfully converted Subsystem to Model reference block

Copyright 1990-2014 The MathWorks, Inc.

Convert Multiple Subsystems to Referenced Models

Convert the two subsystems with one command.

```
open_system('f14');
set_param(gcs,'SaveOutput','on','SaveFormat','Dataset');
set_param(gcs,'SignalResolutionControl','UseLocalSettings');
Simulink.SubSystem.convertToModelReference(...
{'f14/Controller','f14/Aircraft Dynamics Model'},...
{'controller_ref_model','aircraft_dynamics_ref_model'},...
'ReplaceSubsystem',true,...
'AutoFix',true,...
'CheckSimulationResults',true)
```

Input Arguments

`subsys` — Subsystems to convert

character vector | subsystem handle | cell array of character vectors | array of subsystem handles

Subsystems to convert, specified as a character vector, subsystem handle, or cell array of strings or array of subsystem handles.

For information on which subsystems you can convert, see “Modify Referenced Models for Conditional Execution”.

Data Types: `double`

`mdlRefs` — Referenced model names

character vector | cell array of character vectors

Referenced model names, specified as a character vector or cell array of character vectors. Each model name must be 59 characters or less.

If you specify a cell array of subsystems to convert, specify a cell array of referenced model names. Each model name corresponds to the specified subsystem, in the same order.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: `Simulink.SubSystem.convertToModelReference...`
`(engineSubsys,engineModelRef,'ReplaceSubsystem',true)`

`AutoFix` — Fix all conversion issues that can be fixed automatically

`false` (default) | `true`

If you set `AutoFix` to `true`, the function fixes all conversion issues that it can fix.

For issues that the function cannot fix, the conversion process generates error messages that you address by modifying the model.

Note If you set `'Force'` to `true`, then the function does not automatically fix conversion issues.

Data Types: `logical`

`Force` — Complete conversion even with errors

`false` (default) | `true`

If you set `'Force'` to `true`, the function returns conversion errors as warnings and continues with the conversion without fixing the errors. This option allows you to use the function to do the initial steps of conversion and then complete the conversion process yourself.

If you set `Force` to `true`, then the function does not fix conversion issues, even if you set `'AutoFix'` to `true`. However, the `success` output argument is `true`, regardless of whether any conversion errors occurred.

`CheckSimulationResults` — Compare simulation results before and after conversion

`false` (default) | `true`

Compare simulation results before and after conversion, specified as `true` or `false`.

Before performing the conversion, enable signal logging for the subsystem output signals of interest in the model.

For the `Simulink.SubSystem.convertToModelReference` command, set:

- `'CheckSimulationResults'` to `true`
- `'AbsoluteTolerance'`
- `'RelativeTolerance'`
- `'SimulationModes'` to the same as the simulation mode as in the original model

If the difference between simulation results exceeds the tolerance level, the function displays a message.

`AbsoluteTolerance` — Absolute signal tolerance for comparison

`'1e-06'` (default) | double

Absolute signal tolerance for comparison, specified as a double. Use the option only if you set `CheckSimulationResults` to `true`.

Data Types: `double`

`RelativeTolerance` — Relative signal tolerance for comparison

`'1e-06'` (default) | double

Relative signal tolerance for comparison, specified as a double. Use the option only if you set `CheckSimulationResults` to `true`.

Data Types: `double`

`DataFileName` — Name of file for storing conversion data

character vector

Name of file for storing conversion data, specified as a character vector. You can specify an absolute or relative path.

You can save the conversion data in a MAT-file (default) or a MATLAB file. If you use a `.m` file extension, the function serializes all variables to a MATLAB file.

By default, the function uses a file name consisting of the model name plus `_conversion_data.mat`.

`ReplaceSubsystem` — Replace content of each subsystem with Model blocks

`false` (default) | `true`

Replace subsystem blocks with Model blocks, specified as `true` or `false`. The Model block references the referenced model.

By default, the function displays the referenced models in separate Simulink Editor windows.

If you set the value to `true`, consider making a backup of the original model before you convert the subsystems. If you want to undo the conversion, having a backup makes it easier to restore the model.

If you set `ReplaceSubsystem` to `true`, the conversion action depends on whether you use the automatic fix options.

- If you use the automatic fixes, then the conversion replaces the Subsystem block with a Model block unless the automatic fixes change the input or output ports. If the ports change, then the conversion includes the contents of the subsystem in a Model block that is inserted in the Subsystem block.
- If you do not use the automatic fixes, then the conversion replaces the Subsystem block with a Model block.

Data Types: `logical`

`CreateWrapperSubsystem` — Insert wrapper subsystem to preserve model layout
`false` (default) | `true`

Insert wrapper subsystem to preserve model layout, specified as `true` or `false`. When you convert a subsystem to a referenced model, you can have the conversion process insert a wrapper subsystem to preserve the layout of a model. The subsystem wrapper contains the Model block from the conversion.

The conversion creates a wrapper subsystem automatically if the conversion modifies the Model block interface by adding ports.

Data Types: `logical`

`SimulationModes` — Simulation mode for Model blocks
`'Normal'` (default) | `'Accelerator'`

Simulation mode for Model blocks, specified as a `'Normal'` or `'Accelerator'`. The simulation mode setting applies to the Model blocks that reference the models that the conversion creates.

`BuildTarget` — Model reference targets to generate
`'Sim'` | `'RTW'`

Model reference targets to generate.

- `'Sim'` — Model reference simulation target
- `'RTW'` — Code generation target

Output Arguments

`success` — Conversion status
`1` | `0`

Conversion status. A value of `1` indicates a successful conversion.

If you set `'Force'` to `true`, the function returns a value of `1` if the conversion completes. However, the simulation results can differ from the simulation results for the model before conversion.

`mdlRefBlkHs` — Handles of created Model blocks
handle of Model block | array of handles of Model blocks

Handles of created Model blocks, returned as a double or cell array.

Data Types: `double`

Tips

- You cannot convert a parent subsystem and a child of that subsystem at the same time.
- Specifying multiple subsystems to convert with one command can save time, compared to converting each subsystem separately. The multiple-subsystem conversion process compiles the model one time.
- If you specify multiple subsystems to convert, the conversion process attempts to convert each subsystem. Successfully converted subsystems produce referenced models, even if the conversions of other subsystems fail.
- If you specify multiple subsystems, consider:
  - Specifying these `'Autofix'`, `'ReplaceSubsystem'`, `'CheckSimulationResults'` name and value pairs, set to `true`.
  - In the model, setting a short simulation time.
- Simulink uses the data dictionary to save the bus objects that it creates as part of the conversion processing when both these conditions exist:
  - The top model uses a data dictionary.
  - All changes to the top model are saved.
- After you complete the conversion, update the model as necessary to meet your modeling requirements. For details, see “Integrate the Referenced Model into the Parent Model”.
- Converting a masked subsystem can require you to perform additional tasks to maintain the same general behavior that the masked subsystem provided.

If the subsystem that you convert contains a masked block, consider masking the Model block in your new referenced model (see “Create Block Masks”). Configure the referenced model to support the functionality of the masked subsystem.

Note A referenced model does not support the functionality that you can achieve with mask initialization code to create masked parameters.

For mask parameters, replace the mask parameters with model arguments (see “Parameterize Instances of a Reusable Referenced Model”):

1. In the model workspace of the referenced model, create a variable for each mask parameter.
2. In the Model Explorer, select the `Model Workspace` node. In the **Contents** pane, select the **Argument** check box to identify the variables as model arguments.
3. In the new Model block, on the **Arguments** tab, in the **Model arguments** table, specify the values for the model arguments.

For masked callbacks, icons, ports, and documentation:

1. In the backup copy, open the Mask Editor on the masked subsystem and copy the content you want into the masked Model block.
2. In the Mask Editor for the new Model block, paste the masked subsystem content.

Simulink.SubSystem.copyContentsToBlockDiagram

Copy contents of subsystem to empty block diagram

Syntax

`Simulink.SubSystem.copyContentsToBlockDiagram(*subsys*, *bdiag*)`

Description

`Simulink.SubSystem.copyContentsToBlockDiagram(subsys, bdiag)` copies the contents of the subsystem *`subsys`* to the block diagram *`bdiag`*. The subsystem and block diagram must have already been loaded. The subsystem cannot be part of the block diagram. The function affects only blocks, lines, and annotations; it does not affect nongraphical information such as configuration sets.

This function cannot be used if the destination block diagram contains any blocks or signals. Other types of information can exist in the destination block diagram and are unaffected by the function. Use `Simulink.BlockDiagram.deleteContents` if necessary to empty the block diagram before using `Simulink.SubSystem.copyContentsToBlockDiagram`.

Tip To flatten a model hierarchy by expanding the contents of a subsystem to the system that contains that subsystem, do not use the `Simulink.SubSystem.copyContentsToBlockDiagram` function. Instead, expand the subsystem, as described in “Expand Subsystem Contents”.

Input Arguments

`subsys`

Subsystem name or handle

bdiag

Block diagram name or handle

Examples

Copy the graphical contents of `f14/Controller`, including all nested subsystems, to a new block diagram:

```
% open f14
open_system('f14');

% create a new model
newbd = new_system;
open_system(newbd);

% copy the subsystem
Simulink.SubSystem.copyContentsToBlockDiagram('f14/Controller', newbd);

% close f14 and the new model
close_system('f14', 0);
close_system(newbd, 0);
```

Introduced in R2007a

Simulink.SubSystem.deleteContents

Delete contents of subsystem

Syntax

`Simulink.SubSystem.deleteContents(subsys)`

Description

`Simulink.SubSystem.deleteContents(subsys)` deletes the contents of the subsystem *`subsys`*. The function affects only blocks, lines, and annotations. The subsystem must have already been loaded.

Note This function does not delete library blocks in a subsystem.

Input Arguments

`subsys`

Subsystem name or handle

Examples

Delete the graphical contents of `Controller`, including all nested subsystems:

```
load_system('f14');
Simulink.SubSystem.deleteContents('f14/Controller');
```

See Also

`Simulink.BlockDiagram.copyContentsToSubsystem` | `Simulink.BlockDiagram.deleteContents` |

Introduced in R2007a

Simulink.SubSystem.getChecksum

Return checksum of nonvirtual subsystem

Syntax

```
[checksum,details] = Simulink.SubSystem.getChecksum(subsys)
```

Description

`[checksum,details] = Simulink.SubSystem.getChecksum(subsys)` returns the checksum of the specified nonvirtual subsystem. Simulink computes the checksum based on the subsystem parameter settings and the blocks the subsystem contains. Virtual subsystems do not have checksums.

One use of this command is to determine why code generated for a subsystem is not being reused.

Note `Simulink.SubSystem.getChecksum` compiles the model that contains the specified subsystem, if the model is not already in a compiled state. If you need to get the checksum for multiple subsystems and want to avoid multiple compiles, use the command , `*model*([], [], [], 'compile')` to place the model in a compiled state before using `Simulink.SubSystem.getChecksum`.

This command accepts the argument `subsys`, which is the full name or handle of the nonvirtual subsystem block for which you are returning checksum data.

Examples

Run getChecksum on Model

Run the function Simulink.SubSystem.getChecksum on the model rtwdemo_ssreuse. In the MATLAB editor window, both output structures are displayed. In the workspace pane, double-click on either of the structures to view its contents.

Load the model rtwdemo_ssreuse.

```
rtwdemo_ssreuse
```

Select subsystem SS1 and execute the follow line of code in the MATLAB editor to get the full name and path to the subsystem SS1:

```
path_ss1 = gcb
```

Run the function getChecksum on the subsystem with the following command:

```
[chksum1, chksum1_details] = Simulink.SubSystem.getChecksum(path_ss1)
```

The output structures chksum1 and chksum1_details will store the output of the getChecksum function call.

```
chksum1 =

  struct with fields:

           Value: [4×1 uint32]
    MarkedUnique: 0

chksum1_details =

  struct with fields:

          ContentsChecksum: [1×1 struct]
         InterfaceChecksum: [1×1 struct]
     ContentsChecksumItems: [359×1 struct]
    InterfaceChecksumItems: [60×1 struct]
```

Input Arguments

subsys — Name or handle of nonvirtual subsystem
character vector

Input the full name of the nonvirtual subsystem for which you want to calculate the checksum.

Data Types: `char`

Output Arguments

`checksum` — A structure that stores the value of the checksum and indicates whether `subsys` contains unique block or subsystem properties which prevent generated code reuse
structure

Checksum information, returned as a structure with the fields:

`Value` — Array of four 32-bit integers that represents the subsystem's 128-bit checksum
4x1 uint32

`MarkedUnique` — True if the subsystem or the blocks it contains have properties that would prevent the code generated for the subsystem from being reused; otherwise, false
bool

`details` — A structure that stores checksum data on model contents and the interface
structure

Checksum information, returned as a structure with the fields:

`ContentsChecksum` — A structure of the same form as `checksum`, representing a checksum that provides information about all blocks in the system
structure

`InterfaceChecksum` — A structure of the same form as`checksum`, representing a checksum that provides information about the subsystem's block parameters and connections
structure

`ContentsChecksumItems` — Structure array that Simulink uses to compute the checksum for `ContentsChecksum`
structure

Structure array returned with the following fields:

`Handle` — Object for which Simulink added an item to the checksum. For a block, the handle is a full block path. For a block port, the handle is the full block path and a character vector that identifies the port
char array

`Identifier` — Descriptor of the item Simulink added to the checksum. If the item is a documented parameter, the identifier is the parameter name
char array

`Value` — Value of the item Simulink added to the checksum. If the item is a parameter, `Value` is the value returned by `get_param(handle, identifier)`
`type`

`InterfaceChecksumItems` — Structure array that Simulink uses to compute the checksum for `InterfaceChecksum`
structure

Structure array returned with the following fields:

`Handle` — Object for which Simulink added an item to the checksum. For a block, the handle is a full block path. For a block port, the handle is the full block path and a character vector that identifies the port
char array

`Identifier` — Descriptor of the item Simulink added to the checksum. If the item is a documented parameter, the identifier is the parameter name
char array

`Value` — Value of the item Simulink added to the checksum. If the item is a parameter, `Value` is the value returned by `get_param(handle, identifier)`
`type`

`Simulink.BlockDiagram.getChecksum`

Introduced in R2006b

Simulink.suppressDiagnostic

Suppress a diagnostic from a specific block

Syntax

```
Simulink.suppressDiagnostic(source, message_id)
Simulink.suppressDiagnostic(diagnostic)
```

Description

`Simulink.suppressDiagnostic(source, message_id)` suppresses all instances of diagnostics represented by `message_id` thrown by the blocks specified by `source`.

`Simulink.suppressDiagnostic(diagnostic)` suppresses the diagnostics associated with `MSLDiagnostic` object `diagnostic`.

Examples

Suppress a Warning Thrown By a Block

Using the model from “Suppress Diagnostic Messages Programmatically”, use the `Simulink.suppressDiagnostic` function to suppress the parameter precision loss warning thrown by the Constant block, `one`.

```
Simulink.suppressDiagnostic('Suppressor_CLI_Demo/one',...
 'SimulinkFixedPoint:util:fxpParameterPrecisionLoss');
```

Input Arguments

`source` — Block or model object throwing the diagnostic
block path | block handle

The source of the diagnostic, specified as a block path, block handle, cell array of block paths, or cell array of block handles.

To get the block path, use the `gcb` function.

To get the block handle, use the `getSimulinkBlockHandle` function.

Data Types: `char` | `cell`

`message_id` — message identifier of diagnostic
message identifier | cell array of message identifiers

Message identifier of the diagnostic, specified as a character vector or a cell array of character vectors. You can find the message identifier of diagnostics thrown during simulation by accessing the `ExecutionInfo` property of the `Simulink.SimulationMetadata` object associated with a simulation. You can also use the `lastwarn` function.

Data Types: `char` | `cell`

`diagnostic` — Diagnostic object
`MSLDiagnostic` object

Diagnostic specified as an `MSLDiagnostic` object. Access the `MSLDiagnostic` object through the `ExecutionInfo` property of the `Simulink.SimulationMetadata` object.

Data Types: `struct`

sint

Create `Simulink.NumericType` object describing signed integer data type

Syntax

```
a = sint(WordLength)
```

Description

`sint(`*`WordLength`*`)` returns a `Simulink.NumericType` object that describes the data type of a signed integer with a word size given by *`WordLength`*.

Note `sint` is a legacy function. In new code, use `fixdt` instead. In existing code, replace `sint(WordLength)` with `fixdt(1,WordLength,0)`.

Examples

Define a 16-bit signed integer data type.

```
a = sint(16)
```

```
a = 

  NumericType with properties:

      DataTypeMode: 'Fixed-point: binary point scaling'
        Signedness: 'Signed'
        WordLength: 16
    FractionLength: 0
           IsAlias: 0
         DataScope: 'Auto'
        HeaderFile: ''
       Description: ''
```

See Also

Introduced before R2006a

slblocksearchdb.trainfrommodel

Train suggestion engine to improve quick insert results based on one model

Syntax

```
slblocksearchdb.trainfrommodel(model)
```

Description

`slblocksearchdb.trainfrommodel(model)` improves quick insert search results based on a single model.

Examples

Use a Single Model for Training

Train the suggestion engine to use a model to improve results. Assume `'MyModels'` is in the current folder. This code uses a relative path.

```
slblocksearchdb.trainfrommodel('MyModels/model.slx')
```

Input Arguments

`model` — Model for training the suggestion engine
model path

Model to train the suggestion engine, specified as a character vector or string scalar of the full model path or relative path. Include the `.slx` or `.mdl` extension

Example: `'H:/MyModels/model.slx'` `'mymodel.slx'`

See Also

`slblocksearchdb.trainfrommodelsindir` | `slblocksearchdb.untrainall` | `slblocksearchdb.untrainmodel` | `slblocksearchdb.untrainmodelsindir`

Topics

"Improve Quick Block Insert Results"

Introduced in R2018a

slblocksearchdb.trainfrommodelsindir

Train suggestion engine to improve quick insert results based on models in a folder

Syntax

```
slblocksearchdb.trainfrommodelsindir(folder)
slblocksearchdb.trainfrommodelsindir(folder,'exclude',exclusions)
```

Description

`slblocksearchdb.trainfrommodelsindir(folder)` improves search results based on the models in `folder`, recursively.

`slblocksearchdb.trainfrommodelsindir(folder,'exclude',exclusions)` excludes the specified models from updating the suggestion engine.

Examples

Train Suggestion Engine and Exclude Folders and Models

Create the cell array `exPath` for a folder you want to exclude and a model you want to exclude. To train the suggestion engine, use the cell array in the `slblocksearchdb.trainfrommodelsindir` command.

```
exPath = ('MyModels/testmodels' 'MyModels/myvdp.slx'}
slblocksearchdb.trainfrommodelsindir('MyModels','exclude',exPath)
```

The command uses the models in the folder `'MyModels'` with the exclusions you specified.

Input Arguments

`folder` — Folder whose models to use for training

folder path

Folder whose models to use for training the suggestion engine, specified as an absolute or relative path character vector or string scalar.

Example: `'H:/MyModels/trainingmodels'` `'MyModels'`

`exclusions` — Models to exclude from training models

cell array of character vectors | string array

Models to exclude from training the suggestion engine, specified as a cell array of character vectors or a string array. Specify folders or models to exclude as a full or relative path. Model names must include the file extension `.slx` or `.mdl`.

Example: `{'H:/MyModels/trainingmodels' 'MyModels/trainingmodels2' 'MyModels/myvdp.slx'}`

slblocksearchdb.untrainall

Remove the effects of all added models from the suggestion engine

Syntax

```
slblocksearchdb.untrainall
```

Description

`slblocksearchdb.untrainall` removes the models added to the suggestion engine to improve quick insert results. Use this function when you want to return the database to the default state.

Examples

Add Models and Remove All

Add some models to the suggestion engine.

```
slblocksearchdb.trainfrommodelsindir('MyModels')
slblocksearchdb.trainfrommmodel('C:/users/TrainingModels/mymodel.slx')
```

Remove all added models from the suggestion engine.

```
slblocksearchdb.untrainall
```

Topics

"Improve Quick Block Insert Results"

Introduced in R2018a

slblocksearchdb.untrainmodel

Remove the effect of a model from the suggestion engine

Syntax

```
slblocksearchdb.untrainmodel('model')
```

Description

`slblocksearchdb.untrainmodel('model')` removes the effects of a single model from the suggestion engine.

Examples

Remove a Model from the Suggestion Engine

Train the suggestion engine to use a model to improve results.

```
slblocksearchdb.trainfrommodel('MyModels/model.slx')
```

Remove the model from the suggestion engine.

```
slblocksearchdb.untrainmodel('MyModels/model.slx')
```

Input Arguments

`model` — Model to remove from the suggestion engine
model path

Model whose effects to remove from the suggestion engine, specified as the full or relative path character vector or string scalar. Include the `.slx` or `.mdl` extension.

Example: `'H:/MyModels/model.slx'`

See Also

`slblocksearchdb.trainfrommodel` | `slblocksearchdb.trainfrommodelsindir` | `slblocksearchdb.untrainall` | `slblocksearchdb.untrainmodelsindir`

Topics

"Improve Quick Block Insert Results"

Introduced in R2018a

slblocksearchdb.untrainmodelsindir

Remove the effects of models from the suggestion engine

Syntax

```
slblocksearchdb.untrainmodelsindir(folder)
slblocksearchdb.untrainmodelsindir(folder,'exclude',exclusions)
```

Description

`slblocksearchdb.untrainmodelsindir(folder)` removes models in `folder` from the suggestion engine, recursively.

`slblocksearchdb.untrainmodelsindir(folder,'exclude',exclusions)` excludes the specified models from updating the suggestion engine.

Examples

Remove the Effects of Models from Suggestion Engine

Create the cell array `exPath` for a folder and a model whose effects you do not want to remove from the suggestion engine. Then use the cell array in the `slblocksearchdb.untrainmodelsindir` command.

```
exPath = {'MyModels/subfolder' 'MyModels/myvdp.slx'}
slblocksearchdb.untrainmodelsindir('MyModels','exclude',exPath)
```

The command removes the models in the folder `'MyModels'` with the exclusions you specified.

Input Arguments

`folder` — Folder whose models to remove from the suggestion engine

folder path

Folder whose models to remove from the suggestion engine, specified as an absolute or relative path character vector or string scalar.

Example: `'H:/MyModels/trainingmodels'` `'MyModels'`

`exclusions` — Folders and models to exclude from removing

cell array of character vectors | string array

Folders or models to exclude from removing from the suggestion engine, specified as a cell array of character vectors or a string array. Specify the folders or models to exclude as a full or relative path. For models, include the `.slx` or `.mdl` extension.

Example: `{'H:/MyModels/trainingmodels' 'MyModels/trainingmodels2' 'MyModels/myvdp.slx'}`

Topics

"Improve Quick Block Insert Results"

Introduced in R2018a

slbuild

Build standalone executable or model reference target for model; except where noted, this function requires a Simulink Coder license

Syntax

`slbuild(model,buildSpec,varArgIn)`

Description

`slbuild(model,buildSpec,varArgIn)` builds a standalone Simulink Coder binary executable file from the *`model`*, using the current model configuration settings. If the *`model`* has not been loaded, `slbuild` loads it before initiating the build process. The *`buildSpec`* and *`varArgIn`* arguments are optional.

Do not use `rtwbuild`, `rtwrebuild`, or `slbuild` commands with parallel language features (Parallel Computing Toolbox) (for example, within a `parfor` or `spmd` loop). For information about parallel builds of referenced models, see “Reduce Build Time for Referenced Models” (Simulink Coder).

You cannot use `slbuild` to build subsystems.

Examples

Generate Code and Build Executable Image for Model

Generate C code for model `rtwdemo_rtwintro`.

```
slbuild('rtwdemo_rtwintro')
% same operation as ...
% slbuild('rtwdemo_rtwintro','StandaloneRTWTarget')
```

For the GRT target, the coder generates the following code files and places them in folders `rtwdemo_rtwintro_grt_rtw` and `slprj/grt/_sharedutils`.

Model Files	Shared Files	Interface Files	Other Files

`rtwdemo_rtwintro.c`
`rtwdemo_rtwintro.h`
`rtwdemo_rtwintro_private.h`
`rtwdemo_rtwintrotypes.h`
	`rtwtypes.h`
	`multiword_types.h`
	`builtin_typeid_types.h`
		`rtmodel.h`	none

If the following model configuration parameters settings apply, the coder generates additional results.

Parameter Setting	Results
Code Generation > Generate code only pane is cleared	Executable image `rtwdemo_rtwintro.exe`
Code Generation > Report > Create code generation report is selected	Report appears, providing information and links to generated code files, subsystem and code interface reports, entry-point functions, inports, outports, interface parameters, and data stores

Force Top Model Build

Generate code and build an executable image for `rtwdemo_mdlreftop`, which refers to model `rtwdemo_mdlrefbot`, regardless of model checksums and parameter settings.

```
slbuild('rtwdemo_mdlreftop','StandaloneRTWTarget', ...
    'ForceTopModelBuild',true)
```

Clean Top Model Build

Clean the model build area enough to trigger regeneration of the top model code at the next build.

```
slbuild('rtwdemo_rtwintro','CleanTopModel')
```

Input Arguments

`model` — Specifies model for the build process
handle | character vector

Model for which to build a standalone executable or model reference target, specified as a handle or a character vector representing the model name.

Example: `gcs`

buildSpec — Specifies the code generation action for the build process
`'StandaloneRTWTarget'` (default) | `'ModelReferenceSimTarget'` | `'ModelReferenceRTWTarget'` | `'ModelReferenceRTWTargetOnly'` | `'CleanTopModel'`

The *`buildSpec`* directs the code generator to perform the selected build action for the *`model`* and the build process:

- Honors the setting of the **Rebuild** parameter on the **Model Referencing** pane of the Configuration Parameters dialog box.
- Requires a Simulink Coder license only if you build a model reference Simulink Coder target, not if you build only a model reference simulation target.

The *`buildSpec`* argument must be one of the following:

buildSpec	Build Action
`'StandaloneRTWTarget'`	Builds a standalone Simulink Coder binary executable file from the *`model`*, using the current model configuration settings. If the *`model`* has not been loaded, `slbuild` loads it before initiating the build process.
`'ModelReferenceSimTarget'`	Builds a model reference simulation target (does not require a Simulink Coder license)
`'ModelReferenceRTWTarget'`	Builds a model reference Simulink Coder target and the corresponding model reference simulation target
`'ModelReferenceRTWTargetOnly'`	Builds only a model reference Simulink Coder target

buildSpec	Build Action
'CleanTopModel'	Cleans the model build area enough to trigger regeneration of the top model code at the next build

Example: 'ModelReferenceSimTarget'

varArgIn — Name-value pair parameters that provide added arguments for the build process
name-value pairs

```
slbuild(myModel,'StandaloneRTWTarget','ForceTopModelBuild',true)
```

Name-Value Pair Arguments

Specify optional comma-separated pairs of Name,Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1,Value1,...,NameN,ValueN.

Example: 'UpdateThisModelReferenceTarget','Force'

UpdateThisModelReferenceTarget — Specifies a conditional rebuild option for the model reference build
'Force' | 'IfOutOfDateOrStructuralChange' | 'IfOutOfDate'

The 'UpdateThisModelReferenceTarget' option only applies when the *buildSpec* selection is 'ModelReferenceSimTarget', 'ModelReferenceRTWTarget', or 'ModelReferenceRTWTargetOnly'.

The 'UpdateThisModelReferenceTarget' value specifies a conditional rebuild option for the model reference target build when the **Rebuild** parameter on the **Model Referencing** pane of the Configuration Parameters dialog box is set to Never.

The 'UpdateThisModelReferenceTarget' value applies only to *model*, not to any models referenced by *model*.

The 'UpdateThisModelReferenceTarget' value must be one of the following:

UpdateThisModelReferenceTarget	Conditional Rebuild Action
`'Force'`	Unconditionally rebuilds the model. This option is equivalent to the `Always` rebuild option on the **Model Referencing** pane of the Configuration Parameters dialog box.
`'IfOutOfDateOrStructuralChange'`	Rebuilds the model if the build process detects any changes. This option is equivalent to the `If any changes detected` rebuild option on the **Model Referencing** pane of the Configuration Parameters dialog box.
`'IfOutOfDate'`	Rebuilds the model if the build process detects any changes in known dependencies of this model. This option is equivalent to the `If any changes in known dependencies detected` rebuild option on the **Model Referencing** pane of the Configuration Parameters dialog box.

Example: `'UpdateThisModelReferenceTarget','Force'`

ForceTopModelBuild — Directs the code generator to generate code and build an executable image for the top model of the referenced model hierarchy, regardless of model checksums and parameter settings

`false` (default) | `true`

Use `'ForceTopModelBuild'` value `true` to force the top model build.

Example: `'ForceTopModelBuild',true`

OpenBuildStatusAutomatically — Display build information in the Build Process Status Window

`false` (default) | `true`

Display build information in the **Build Process Status** window, specified as `true` or `false`. For more information about using the status window, see “View Build Process Status” (Simulink Coder).

The **Build Process Status** window support parallel builds of referenced model hierarchies. Do not use the **Build Process Status** window for sequential (non-parallel) builds.

Action	Specify
Display build information in the Build Process Status Window	`true`
No action	`false`

slCharacterEncoding

Change MATLAB character set encoding

Syntax

```
currentCharacterEncoding = slCharacterEncoding()
slCharacterEncoding(encoding)
```

Description

This command allows you to change the current MATLAB character set encoding to be compatible with the character encoding of a model that you want to open.

`currentCharacterEncoding = slCharacterEncoding()` returns the current MATLAB character set encoding.

`slCharacterEncoding(encoding)` changes the MATLAB character set encoding to the specified `encoding`. You should only specify these values:

- `'US-ASCII'`
- `'Windows-1252'`
- `'ISO-8859-1'`
- `'Shift_JIS'`
- `'UTF-8'`

If you want to use a different character encoding, you need to start MATLAB with the appropriate locale settings for your operating system. Consult your operating system manual to change the locale setting. Simulink can support any character encoding that uses single-byte or double-byte characters.

If you open a model that uses a particular character set encoding in a MATLAB session that uses a different encoding, a warning appears. For example, suppose that you create a model in a MATLAB session configured for `Shift_JIS` and open it in a session configured for `US_ASCII`. The warning message shows the encoding of the current session and the encoding used to create the model. If you encounter any problems with corrupted characters, for example when using MATLAB files associated with the model, then try using the `slCharacterEncoding` function to change the character encoding

1. Close all open models.
2. Use `slCharacterEncoding` to change the character encoding of the current MATLAB session to match the model character encoding.
3. Reopen the model.

Note You must close all open models or libraries before changing the MATLAB character set encoding except when changing from `'US-ASCII'` to another encoding.

Introduced before R2006a

sldebug

Start simulation in debug mode

Syntax

```
sldebug('sys')
```

Description

`sldebug('sys')` starts a simulation in debug mode. See “Debugger Command-Line Interface” for information about using the debugger.

Examples

The following command:

```
sldebug('vdp')
```

loads the Simulink example model `vdp` into memory and starts the simulation in debug mode. Alternatively, you can achieve the same result by using the `sim` command:

```
sim('vdp', 'debug', 'on')
```

See Also

`sim`

Introduced in R2006a

sldiagnostics

Display diagnostic information about Simulink system

Syntax

```
sldiagnostics('sys')
[txtRpt, sRpt] = sldiagnostics('sys')
[txtRpt, sRpt] = sldiagnostics('sys', options)
[txtRpt, sRpt] = sldiagnostics('sys', 'CompileStats')
[txtRpt, sRpt] = sldiagnostics('sys', 'RTWBuildStats')
```

Description

`sldiagnostics('`*`sys`*`')` displays the following diagnostic information associated with the model or subsystem specified by `sys`:

- Number of each type of block
- Number of each type of Stateflow object
- Number of states, outputs, inputs, and sample times of the root model.
- Names of libraries referenced and instances of the referenced blocks
- Time and additional memory used for each compilation phase of the root model

If the model specified by `sys` is not loaded, then `sldiagnostics` loads the model before performing the analysis.

The command `sldiagnostics('`*`sys`*`', `*`options`*`)` displays only the diagnostic information associated with the specific operations listed as *`options`* character vectors. The table below summarizes the options available and their corresponding valid input and output.

With `sldiagnostics`, you can input the name of a model or the path to a subsystem. For some analysis options, `sldiagnostics` can analyze only a root model. If you provide an incompatible input for one of these analyses, then `sldiagnostics` issues a warning. Finally, if you input a Simulink Library, then `sldiagnostics` cannot perform options that require a model compilation (**Update Diagram**). Instead, `sldiagnostics` issues a warning.

During the analysis, `sldiagnostics` will follow library links but will not follow or analyze Model References. See `find_mdlrefs` for more information on finding all Model blocks and referenced models in a specified model.

Option	Valid Inputs	Output
`CountBlocks`	root model, library, or subsystem	Lists all unique blocks in the system and the number of occurrences of each. This includes blocks that are nested in masked subsystems or hidden blocks.
`CountSF`	root model, library, or subsystem	Lists all unique Stateflow objects in the system and the number of occurrences of each.
`Sizes`	root model	Lists the number of states, outputs, inputs, and sample times, as well as a flag indicating direct feedthrough, used in the root model.
`Libs`	root model, library, or subsystem	Lists all unique libraries referenced in the root model, as well as the names and numbers of the library blocks.
`CompileStats`	root model	Lists the time and additional memory used for each compilation phase of the root model. This information helps users troubleshoot model compilation speed and memory issues.
`RTWBuildStats`	root model	Lists the same information as the `CompileStats` diagnostic. When issued with the second output argument `sRpt`, it captures the same statistics included in `CompileStats` and also the Simulink Coder build statistics. You must explicitly specify this option, because it is not part of the default analysis.

Option	Valid Inputs	Output
`All`	not applicable	Performs all diagnostics.

Note Running the `CompileStats` diagnostic before simulating a model for the first time will show greater memory usage. However, subsequent runs of the `CompileStats` diagnostic on the model will require less memory usage.

`[txtRpt, sRpt] = sldiagnostics('sys')` returns the diagnostic information as a textual report `txtRpt` and a structure array `sRpt`, which contains the following fields that correspond to the diagnostic options:

- `blocks`
- `stateflow`
- `sizes`
- `links`
- `compilestats`

`[txtRpt, sRpt] = sldiagnostics('sys', *options*)` returns only the specified options. If your chosen options specify just one type of analysis, then `sRpt` contains the results of only that analysis.

`[txtRpt, sRpt] = sldiagnostics('sys', 'CompileStats')` returns information on time and memory usage in `txtRpt` and `sRpt`.

`[txtRpt, sRpt] = sldiagnostics('sys', 'RTWBuildStats')` includes Simulink Coder build statistics in addition to the information reported for `CompileStats` in the `sRpt` output.

- `txtRpt` contains the formatted textual output of time spent in each of the phases in Simulink and Simulink Coder (if you specified `RTWBuildStats`), for example:

  ```
  Compile Statistics For: rtwdemo_counter
      Cstat1: 0.00 seconds Model compilation pre-start
      Cstat2: 0.00 seconds Stateflow compile pre-start notification
      Cstat3: 0.10 seconds Post pre-comp-start engine event
      Cstat4: 10.00 seconds Stateflow compile start notification
      Cstat5: 0.00 seconds Model compilation startup completed
  ```
- `sRpt` is a MATLAB structure containing time and memory usage for each of the phases, for example:

```
sRpt =
Model:    'myModel1'
Statistics:    [1x134 struct]
```

The size of the `sRpt.Statistics` array indicates the number of compile and build phases executed during the operation. Examine the Statistics fields:

```
sRpt.Statistics(1) =
Description:    'Phase1'
CPUTime:    7.2490
WallClockTime    4.0092
ProcessMemUsage:    26.2148
ProcessMemUsagePeak:    28.6680
ProcessVMSize:    15.9531
```

`CPUTime` and `WallClockTime` show the elapsed time for the phase in seconds. `ProcessMemUsage`, `ProcessMemUsagePeak` and `ProcessVMSize` show the memory consumption during execution of the phase in MB.

Examine these key metrics to understand the performance:

- `WallClockTime`—The real-time elapsed in each phase in seconds. Sum the `WallClockTime` in each phase to get the total time taken to perform the operation:

  ```
  ElapsedTime = sum([statRpt.Statistics(:).WallClockTime]);
  ```
- `ProcessMemUsage`—The amount of memory consumed in each phase. Sum the `ProcessMemUsage` across all the phases to get the memory consumption during the entire operation:

  ```
  TotalMemory = sum([statRpt.Statistics(:).ProcessMemUsage]);
  ```
- `ProcessMemUsagePeak`—The maximum amount of allocated memory in each phase. Get the maximum of this metric across all the phases to find the peak memory allocation during the operation:

  ```
  PeakMemory = max([statRpt.Statistics(:).ProcessMemUsagePeak]);
  ```

Note Memory statistics are available only on the Microsoft Windows platform.

Examples

The following command counts and lists each type of block used in the `sldemo_bounce` model that comes with Simulink software.

```
sldiagnostics('sldemo_bounce', 'CountBlocks')
```

The following command counts and lists both the unique blocks and Stateflow objects used in the `sf_boiler` model that comes with Stateflow software; the textual report returned is captured as `myReport`.

```
myReport = sldiagnostics('sf_boiler', 'CountBlocks', 'CountSF')
```

The following commands open the `f14` model that comes with Simulink software, and counts the number of blocks used in the `Controller` subsystem.

```
sldiagnostics('f14/Controller', 'CountBlocks')
```

The following command runs the `Sizes` and `CompileStats` diagnostics on the `f14` model, capturing the results as both a textual report and structure array.

```
[txtRpt, sRpt] = sldiagnostics('f14', 'Sizes', 'CompileStats')
```

`find_system` | `get_param`

Introduced in R2006a

sldiagviewer.diary

Log simulation warnings and errors and build information to file

Syntax

```
sldiagviewer.diary
sldiagviewer.diary(filename)
sldiagviewer.diary(toggle)
sldiagviewer.diary(filename,'UTF-8')
```

Description

`sldiagviewer.diary` intercepts build information, warnings, and errors transmitted to the Command Window or the Diagnostic Viewer and logs them to a text file `diary.txt` in the current folder.

`sldiagviewer.diary(filename)` toggles the logging state of the text file specified by `filename`.

`sldiagviewer.diary(toggle)` turns logging to the log file on or off. The setting applies to the last file name you specified for logging or to `diary.txt` if you did not specify a file name.

`sldiagviewer.diary(filename,'UTF-8')` specifies the character encoding for the log file `filename`.

Examples

Log Build Information and Simulation Warnings and Errors

Start logging build information and simulation warnings and errors to `diary.txt`.

```
sldiagviewer.diary
open_system('vdp')
rtwbuild('vdp')
```

Open `diary.txt` to view logs.

```
### Starting build procedure for model: vdp
### Build procedure for model: 'vdp' aborted due to an error.
...
```

Log to Specific File

Set up logging to a file.

```
sldiagviewer.diary('C:\MyLogs\log1.txt')
```

Toggle File Logging State

Switch the logging state of a file.

```
sldiagviewer.diary('C:\MyLogs\log1.txt') % Start logging
open_system('vdp')
rtwbuild('vdp')

sldiagviewer.diary('off') % Switch off logging
open_system('sldemo_fuelsys')
rtwbuild('sldemo_fuelsys')

sldiagviewer.diary('on') % Resume logging
```

Specify Log File Name and Character Encoding

Set the file name to log to and the character encoding to use.

```
sldiagviewer.diary('C:\MyLogs\log1.txt','UTF-8')
```

Input Arguments

`toggle` — Logging state
`'off'` | `'on'`

Logging state, specified as `'on'` or `'off'`.

Example: `sldiagviewer.diary('on')`

`filename` — Name of file to log data to
character vector

Name of file to log data to, specified as a character vector.

Example: `sldiagviewer.diary('C:\Simulations\mySimulationDiary.txt')`

sldiscmdl

Discretize model that contains continuous blocks

Syntax

```
sldiscmdl('model_name',sample_time)
sldiscmdl('model_name',sample_time,method)
sldiscmdl('model_name',sample_time,options)
sldiscmdl('model_name',sample_time,method,freq)
sldiscmdl('model_name',sample_time,method,options)
sldiscmdl('model_name',sample_time,method,freq,options)
[old_blks,new_blks] =
sldiscmdl('model_name',sample_time,method,freq,options)
```

Description

sldiscmdl('*model_name*',*sample_time*) discretizes the model named '*model_name*' using the specified *sample_time*. The model does not need to be open, and the units for *sample_time* are simulation seconds.

sldiscmdl('*model_name*',*sample_time*,*method*) discretizes the model using *sample_time* and the transform method specified by *method*.

sldiscmdl('*model_name*',*sample_time*,*options*) discretizes the model using *sample_time* and criteria specified by the *options* cell array. This array consists of four elements: {*target*, *replace_with*, *put_into*, *prompt*}.

sldiscmdl('*model_name*',*sample_time*,*method*,*freq*) discretizes the model using *sample_time*, *method*, and the critical frequency specified by *freq*. The units for *freq* are Hz. When you specify *freq*, *method* must be 'prewarp'.

sldiscmdl('*model_name*',*sample_time*,*method*,*options*) discretizes the model using *sample_time*, *method*, and *options*.

`sldiscmdl('`*`model_name`*`',`*`sample_time`*`,`*`method`*`,`*`freq`*`,`*`options`*`)` discretizes the model using *`sample_time`*, *`method`*, *`freq`*, and *`options`*. When you specify *`freq`*, *`method`* must be `'prewarp'`.

`[`*`old_blks`*`,`*`new_blks`*`] =`
`sldiscmdl('`*`model_name`*`',`*`sample_time`*`,`*`method`*`,`*`freq`*`,`*`options`*`)` discretizes the model using *`sample_time`*, *`method`*, *`freq`*, and *`options`*. When you specify *`freq`*, *`method`* must be `'prewarp'`. The function also returns two cell arrays that contain full path names of the original, continuous blocks and the new, discretized blocks.

Input Arguments

model_name

Name of the model to discretize.

sample_time

Sample-time specification for the model:

Scalar value	Sample time with zero offset, such as `1`
Two-element vector	Sample time with nonzero offset, such as `[1 0.1]`

method

Method of converting blocks from continuous to discrete mode:

`'zoh'` (default)	Zero-order hold on the inputs
`'foh'`	First-order hold on the inputs
`'tustin'`	Bilinear (Tustin) approximation
`'prewarp'`	Tustin approximation with frequency prewarping
`'matched'`	Matched pole-zero method For single-input, single-output (SISO) systems only

`freq`

Critical frequency in Hz. This input applies only when the *`method`* input is `'prewarp'`.

`options`

Cell array {*`target`*, *`replace_with`*, *`put_into`*, *`prompt`*}, where each element can take the following values:

`target`	`'all'` (default)	Discretize all continuous blocks
	`'selected'`	Discretize only selected blocks in the model
	`'`*`full_blk_path`*`'`	Discretize specified block
`replace_with`	`'parammask'` (default)	Create discrete blocks whose parameters derive from the corresponding continuous blocks
	`'hardcoded'`	Create discrete blocks with hard-coded parameters placed directly into each block dialog box
`put_into`	`'copy'` (default)	Create discretization in a copy of the original model
	`'configurable'`	Create discretization candidate in a configurable subsystem
	`'current'`	Apply discretization to the current model
	`'untitled'`	Create discretization in a new untitled window
`prompt`	`'on'` (default)	Show discretization information at the command prompt
	`'off'`	Do not show discretization information at the command prompt

Examples

Discretize all continuous blocks in the `slexAircraftExample` model using a 1-second sample time:

```
sldiscmdl('slexAircraftExample',1);
```

Discretize the `Aircraft Dynamics Model` subsystem in the `slexAircraftExample` model using a 1-second sample time, a 0.1-second offset, and a first-order hold transform method:

```
sldiscmdl('slexAircraftExample',[1 0.1],'foh',...
{'slexAircraftExample/Aircraft Dynamics Model',...
'parammask','copy','on'});
```

Discretize the `Aircraft Dynamics Model` subsystem in the `slexAircraftExample` model and retrieve the full path name of the second discretized block:

```
[old_blks,new_blks] = sldiscmdl('slexAircraftExample',[1 0.1],...
'foh',{'slexAircraftExample/Aircraft Dynamics Model','parammask',...
'copy','on'});
% Get full path name of the second discretized block
new_blks{2}
```

Topics

"Discretize a Model with the sldiscmdl Function"

Introduced before R2006a

slexpr

Generate expression to use in value of parameter object

Syntax

```
expressionOut = slexpr(expressionIn)
```

Description

`expressionOut = slexpr(expressionIn)` converts the MATLAB-syntax expression `expressionIn` to an object, `expressionOut`, that you can use to set the `Value` property of a parameter object (such as `Simulink.Parameter`). When you use multiple parameter objects to set block parameter values, you can use the expression to model mathematical relationships between the objects. For more information, see “Set Variable Value by Using a Mathematical Expression”.

Examples

Model Relationship Between Mass, Length, and Moment of Inertia of Metronome

In the base workspace, create three `Simulink.Parameter` objects that represent the mass, length, and moment of inertia of a pointlike metronome.

```
m = Simulink.Parameter;
r = Simulink.Parameter;
J = Simulink.Parameter;
```

Set the mass to 0.1 kg and the length to 1.0 m.

```
m.Value = 0.1;
r.Value = 1.0;
```

Set the value of the moment of inertia to the mass times the square of the length.

```
J.Value = slexpr('m*r^2');
```

Simulink preserves the expression, `m*r^2`. If you change the value of the mass or the length, Simulink recalculates the value of the moment of inertia.

Input Arguments

`expressionIn` — Target expression

string | character vector

Target expression, specified as a string or character vector.

Example: `"myParam + myOtherParam"`

Data Types: `char` | `string`

Output Arguments

`expressionOut` — Simulink representation of expression

`Simulink.data.Expression` object

Simulink representation of the target expression, returned as a `Simulink.data.Expression` object. A `Simulink.data.Expression` object has no use outside the `Value` property of a parameter object.

slIsFileChangedOnDisk

Determine whether model has changed since it was loaded

Syntax

`Changed = slIsFileChangedOnDisk('sys')`

Description

`Changed = slIsFileChangedOnDisk('sys')` Returns true if the file which contains block diagram *sys* was changed on disk since the block diagram was loaded.

Examples

To ensure that code is not generated for a model whose file has changed on disk since it was loaded, include the following in the `'entry'` section of the *STF*`_make_rtw_hook.m` file:

```
if (slIsFileChangedOnDisk(sys))
    error('File has changed on disk since it was loaded. Aborting code generation.');
end
```

slLibraryBrowser

Open Simulink Library Browser

Syntax

```
slLibraryBrowser
slLibraryBrowser('open')
slLibraryBrowser('noshow')
libraryhandle = slLibraryBrowser
slLibraryBrowser('close')
```

Description

`slLibraryBrowser` opens the Simulink Library Browser.

If you want to load the Simulink block library, use `load_system simulink` instead.

If you want to start Simulink without opening any windows, use the faster `start_simulink` instead.

`slLibraryBrowser('open')` opens the Library Browser.

`slLibraryBrowser('noshow')` loads the Library Browser in memory without making it visible. Use this to make future calls to `slLibraryBrowser('open')` faster.

`libraryhandle = slLibraryBrowser` returns the handle of the Library Browser object.

`slLibraryBrowser('close')` closes the Library Browser.

Examples

Open and Close the Library Browser

```
slLibraryBrowser
slLibraryBrowser('close')
```

Load the Library Browser and Get a Handle

```
libraryhandle = slLibraryBrowser('noshow')
```

slmdldiscui

Open Model Discretizer GUI

Syntax

```
slmdldiscui
slmdldiscui('model')
```

Description

`slmdldiscui` opens the Model Discretizer. A model does not need to be open.

`slmdldiscui('`*`model`*`')` opens the Model Discretizer for the model or library called `'`*`name`*`'`.

To use the Model Discretizer, you must have a Control System Toolbox license, version 5.2 or later.

Examples

Open the Model Discretizer for the `slexAircraftExample` model:

```
slmdldiscui('slexAircraftExample')
```

Open the Model Discretizer for the `discretizing` library:

```
slmdldiscui('discretizing')
```

Introduced before R2006a

slprofreport

Regenerate profiler report from data, `ProfileData`, saved from previous run

Syntax

`slprofreport(`*`model_name`*`ProfileData)`

Description

When you run a model with the profiler enabled, the simulation generates the data and saves it in the variable, *`model_name`*`ProfileData`. `slprofreport(`*`model_name`*` ProfileData)` generates a profiler report based on the data in *`model_name`*`ProfileData`, saved from the model run.

Input Arguments

`ProfileData`

Variable that contains profiler data from a model run. The variable name consists of the model name and `ProfileData`, for example, `vdpProfileData`.

Default: None

Examples

Regenerate Simulink Profiler Results

Regenerate the Profiler report for model `vdp`

In the MATLAB Command Window, start the `vdp` model.

In the Simulink editor window, run `vdp` model with Simulink Profiler enabled.

Simulink stores the data to the variable `vdpProfileData`.

To review the report, in the MATLAB Command Window

```
slprofreport(vdpProfileData)
```

The Simulink Profiler Report window is displayed.

slproject.create

Create blank Simulink project

Syntax

```
proj = slproject.create
proj = slproject.create(path)
proj = slproject.create(name)
```

Description

`proj = slproject.create` creates and opens a Simulink project using the blank project template from the start page, and returns a project object. Use the project object to manipulate the currently open Simulink project at the command line. The new project is created in the default project folder. To change the default folder for new Simulink projects, on the Simulink Project tab, click **Preferences**, and then set the **Default folder**.

`proj = slproject.create(path)` creates the project at the location specified by path.

`proj = slproject.create(name)` creates the project in the default folder, with the name specified by `name`.

Examples

Create a Blank Project in the Default Folder

```
slproject.create
```

You can control the default folder for new projects using the project preferences.

Create a Blank Project in a Specified Folder

```
proj = slproject.create('C:\work\myprojectname');
```

Create a Named Blank Project in the Default Folder

```
proj = slproject.create('myprojectname');
```

Input Arguments

`path` — Path for the new project location

character vector

Path for the new project location, specified as a character vector. If you do not specify the path, `slproject.create` creates the project in the default location. You can change the default location in the project preferences.

Example: `C:\work\projectname`

Data Types: `char`

`name` — Name for the new project

character vector

Name for the new project, specified as a character vector.

Example: `myproject`

Data Types: `char`

Output Arguments

`proj` — Project

project object

Project, returned as a project object. Use the project object to manipulate the currently open Simulink project at the command line.

Properties of `proj` output argument.

Project Property	Description
Name	Project name
Information	Information about the project such as the description, source control integration, repository location, and whether it is a top-level project.
Dependencies	Dependencies between project files in a MATLAB digraph object.
Shortcuts	Shortcut files in the project.
ProjectPath	Folders that the project puts on the MATLAB path.
ProjectReferences	Folders that contain referenced projects. Contains read-only project objects for referenced projects.
Categories	Categories of project labels.
Files	Paths and names of project files.
RootFolder	Full path to project root folder.

addPath

Add folder to path of Simulink project

Syntax

```
folderpath = addPath(project, folder)
```

Description

`folderpath = addPath(project, folder)` adds a folder in a Simulink project to the current project path. The folder must be in the project. The project puts the folders on the MATLAB search path when it loads and removes them from the path when it closes. To learn more, see “Specify Project Path”.

Examples

Add a Folder to the Project Path

```
sldemo_slproject_airframe;
project = simulinkproject;
```

Create a new folder.

```
 folderpath = fullfile(project.RootFolder,'folder');
 mkdir(filepath);
```

Add this new folder to the project.

```
 projectFile = addFile(project,folderpath);
```

Add this new folder to the project path.

```
folderpath = addPath(project,folderpath);
```

Input Arguments

`project` — Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink project at the command line.

`folder` — Path of folder

character vector | string

Path of the folder to add relative to the project root folder, specified as a character vector or string. The folder must be within the root folder.

Example: models/myfolder

Output Arguments

`folderpath` — Path folder

path folder object

Path folder object containing the specified folder path. The project puts the folders on the MATLAB search path when it loads and removes them from the path when it closes.

See Also

`addFile` | `addFolderIncludingChildFiles` | `removePath` | `simulinkproject`

Topics

"Specify Project Path"

Introduced in R2017a

removePath

Remove folder from Simulink project path

Syntax

```
removePath(project, folder)
```

Description

`removePath(project, folder)` removes a folder in a Simulink project from the current project path. The folder must be in the project.

Examples

Remove a Folder from the Project Path

```
sldemo_slproject_airframe;
project = simulinkproject;
```

Create a new folder.

```
 folderpath = fullfile(project.RootFolder,'folder');
 mkdir(filepath);
```

Add this new folder to the project.

```
 projectFile = addFile(project,folderpath);
```

Add the new folder to the project path.

```
folderpath = addPath(project,folderpath);
```

Remove the new folder from the project path.

```
removePath(project,folderpath)
```

Input Arguments

`project` — Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink project at the command line.

`folder` — Path of folder

character vector

Path of the folder to remove relative to the project root folder, specified as a character vector. The folder must be within the root folder.

Example: models/myfolder

See Also

`addPath` | `simulinkproject`

Introduced in R2017a

addReference

Add referenced project to Simulink project

Syntax

```
projreference = addReference(project,folder)
projreference = addReference(project,folder,type)
```

Description

`projreference = addReference(project,folder)` adds a reference to the Simulink project specified by `folder`. The reference is added to the current project, `project`.

`projreference = addReference(project,folder,type)` specifies the type of reference to create. Specify relative or absolute reference.

Examples

Add a Referenced Project

Create a project and get a project object.

```
sldemo_slproject_airframe;
project = simulinkproject;
```

Create a new blank project.

```
projectToReference = slproject.create();
```

Reload the first project and add a reference to the new blank project.

```
reload(project);
addReference(project, projectToReference, 'absolute');
```

Find out if a project is a top-level project. 1 indicates a top-level project.

```
project.Information.TopLevel
```

```
ans =

  logical

   1
```

Input Arguments

`project` — Project
project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink project at the command line.

`folder` — Path of folder
character vector

Path of the folder to add the reference, relative to the project root folder, specified as a character vector. The folder must be within the root folder.

Example: models/myfolder

`type` — Type of reference
relative | absolute

Type of reference, relative to the project root folder, specified as a character vector.

Output Arguments

`projreference` — Project reference
project reference object

Project reference object containing information about the referenced project.

See Also

`removeReference` | `simulinkproject`

Introduced in R2017a

removeReference

Add folder to Simulink project path

Syntax

```
removeReference(project,folder)
```

Description

`removeReference(project,folder)` removes the reference to the Simulink project `project` from the current project.

Examples

Remove a Referenced Project

Create a project and get a project object.

```
sldemo_slproject_airframe;
project = simulinkproject;
```

Create a new blank project.

```
projectToReference = slproject.create();
```

Reload the first project and add a reference to the new blank project.

```
 project.reload();
addReference(project, projectToReference, 'absolute');
```

Remove the reference to the blank project.

```
removeReference(project, projectToReference);
```

Input Arguments

`project` — Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink project at the command line.

`folder` — Path of folder

character vector

Path of the folder to the reference to be removed, relative to the project root folder, specified as a character vector. The folder must be within the root folder.

Example: models/myfolder

See Also

`addReference` | `simulinkproject`

Introduced in R2017a

addShortcut

Add shortcut to Simulink project

Syntax

```
shortcut = addShortcut(project,file)
```

Description

`shortcut = addShortcut(project,file)` adds a shortcut to the specified file in the Simulink project.

To set the shortcut to run at startup or shutdown, use Simulink Project. See “Automate Startup Tasks”.

Examples

Add a Shortcut

Create a project and get a project object.

```
sldemo_slproject_airframe;
project = simulinkproject;
```

Create a new file.

```
filepath = fullfile(project.RootFolder, 'new_model.slx')
     new_system('new_model');
     save_system('new_model',filepath)
```

Add this new model to the project.

```
projectFile = addFile(project,filepath)
```

Add a new shortcut to the new model.

```
shortcut = addShortcut(project,filepath);
```

Input Arguments

`project` — Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink project at the command line.

`file` — Path of file

character vector

Path of the file to add a shortcut to, relative to the project root folder, including the file extension, specified as a character vector. The file must be within the root folder.

Example: 'models/myModelName.slx'

Output Arguments

`shortcut` — Shortcut

shortcut object

Shortcut object containing information about the shortcut.

See Also

`removeShortcut` | `simulinkproject`

Topics

"Automate Startup Tasks"

Introduced in R2017a

removeShortcut

Remove shortcut from Simulink project

Syntax

```
removeShortcut(project,file)
```

Description

`removeShortcut(project,file)` removes the shortcut to the specified file in the Simulink project.

Examples

Remove a Shortcut

Create a project and get a project object.

```
sldemo_slproject_airframe;
project = simulinkproject;
```

Create a new file.

```
filepath = fullfile(project.RootFolder, 'new_model.slx')
     new_system('new_model');
     save_system('new_model', filepath)
```

Add this new model to the project.

```
projectFile = addFile(project, filepath)
```

Add a new shortcut to the new model.

```
shortcut = addShortcut(project, filepath);
```

Remove the shortcut.

```
removeShortcut(project, shortcut);
```

Input Arguments

`project` — Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink project at the command line.

`file` — Path of file

character vector

Path of the shortcut file, relative to the project root folder, including the file extension, specified as a character vector. The file must be within the root folder.

Example: ‘models/myModelName.slx’

See Also

`addShortcut` | `simulinkproject`

Introduced in R2017a

slproject.getCurrentProject

Manipulate current Simulink Project at command line

Syntax

```
proj = slproject.getCurrentProject
```

Description

`proj = slproject.getCurrentProject` gets the current project open in the Simulink Project Tool and returns a project object `proj` that you can use to manipulate the project programmatically. If no project is open, then you see an error.

Note `slproject.getCurrentProject` will be removed in a future release. Use `slproject.getCurrentProjects` instead.

Examples

Get Airframe Example Project

Open the Airframe project and use `slproject.getCurrentProject` to get a project object to manipulate the project at the command line.

```
sldemo_slproject_airframe
proj = slproject.getCurrentProject
```

```
proj = 

  ProjectManager with properties:

          Name: 'Simulink Project Airframe Example'
    Categories: [1x1 slproject.Category]
     Shortcuts: [1x8 slproject.Shortcut]
   ProjectPath: [1x7 slproject.PathFolder]
```

```
    ProjectReferences: [1x0 slproject.ProjectReference]
                Files: [1x30 slproject.ProjectFile]
           RootFolder: 'C:\Work\Simulink\Projects\slexamples\airframe'
```

Output Arguments

proj — Project

project object

Project, returned as a project object. Use the project object to manipulate the currently open Simulink Project at the command line.

See Also

Functions

simulinkproject | slproject.getCurrentProjects | slproject.loadProject

Introduced in R2013a

slproject.getCurrentProjects

List all top-level Simulink projects

Syntax

```
projects = slproject.getCurrentProjects
```

Description

`projects = slproject.getCurrentProjects` returns a list of all top-level projects open in Simulink Project. Currently only one or zero top-level projects can be loaded. Returns an object array of 1 or 0 `ProjectManager` objects `projects` that you can use to manipulate the project programmatically. Use `slproject.getCurrentProjects` for project automation scripts.

If you execute `slproject.getCurrentProjects` inside a project shortcut, it returns only the project that the shortcut belongs to. If the shortcut belongs to a referenced project, it returns the referenced project.

Examples

Get Airframe Example Project

Open the Airframe project and use `slproject.getCurrentProjects` to get a project object to manipulate the project at the command line.

```
sldemo_slproject_airframe
proj = slproject.getCurrentProjects
```

```
proj = 

  ProjectManager with properties:

          Name: 'Simulink Project Airframe Example'
          Categories: [1x1 slproject.Category]
           Shortcuts: [1x8 slproject.Shortcut]
         ProjectPath: [1x7 slproject.PathFolder]
   ProjectReferences: [1x0 slproject.ProjectReference]
               Files: [1x30 slproject.ProjectFile]
          RootFolder: 'C:\Work\Simulink\Projects\airframe'
```

Find Project Commands

Open the airframe project and create a project object.

```
sldemo_slproject_airframe
proj = slproject.getCurrentProject
```

```
proj = 

  ProjectManager with properties:

         Name: 'Simulink Project Airframe Example'
          Categories: [1x1 slproject.Category]
           Shortcuts: [1x8 slproject.Shortcut]
         ProjectPath: [1x7 slproject.PathFolder]
   ProjectReferences: [1x0 slproject.ProjectReference]
               Files: [1x30 slproject.ProjectFile]
          RootFolder: 'C:\Work\Simulink\Projects\airframe'
```

Find out what you can do with your project.

```
methods(proj)
```

```
Methods for class slproject.ProjectManager:

addFile                       findCategory
addFolderIncludingChildFiles  findFile
close                         isLoaded
createCategory                listModifiedFiles
export                        refreshSourceControl

reload
removeCategory
removeFile
```

Examine Project Properties

After you get a project object, you can examine project properties.

Open the airframe project and create a project object.

```
sldemo_slproject_airframe
proj = slproject.getCurrentProjects;
```

Examine the project files.

```
files = proj.Files
```

```
files =

  1x30 ProjectFile array with properties:

    Path
    Labels
    Revision
    SourceControlStatus
```

Examine the labels of the eighth file.

```
proj.Files(8).Labels
```

```
ans =

  Label with properties:

File: 'C:\Work\airframe\data\system_model.sldd'
            Data: []
        DataType: 'none'
            Name: 'Design'
    CategoryName: 'Classification'
```

Get a particular file.

```
myfile = findFile(proj, 'models/AnalogControl.mdl')
```

```
myfile =

  ProjectFile with properties:

   Path:  'C:\Temp\airframe\models\AnalogControl.mdl'
    Labels: [1x1 slproject.Label]
  Revision: '2'
SourceControlStatus: Unmodified
```

Find out what you can do with the file.

```
methods(myfile)
```

```
Methods for class slproject.ProjectFile:

addLabel
removeLabel
findLabel
```

Output Arguments

projects — Projects

object array of 1 or 0 ProjectManager objects

Projects, returned as an object array of 1 or 0 ProjectManager objects. Use the project object to manipulate the currently open Simulink Project at the command line.

Properties of ProjectManager objects in output argument.

Project Property	Description
Name	Project name
Categories	Categories of project labels
Shortcuts	Shortcut files in project
ProjectPath	Folders that the project puts on the MATLAB path
ProjectReferences	Folders that contain referenced projects
Files	Paths and names of project files
RootFolder	Full path to project root folder

Tips

Alternatively, you can use simulinkproject to get a project object, but simulinkproject also opens and gives focus to the Simulink Project Tool. Use simulinkproject to open projects and explore projects interactively. Use slproject.getCurrentProjects for project automation scripts.

See Also

Functions
simulinkproject | slproject.getCurrentProject | slproject.loadProject

Introduced in R2016a

slproject.loadProject

Load Simulink project

Syntax

```
slproject.loadProject(projectPath);
proj = slproject.loadProject(projectPath)
```

Description

`slproject.loadProject(projectPath);` loads the project specified by the `.prj` file or folder `projectPath` in the Simulink Project Tool, and closes any currently open project.

`proj = slproject.loadProject(projectPath)` loads the project and returns a project object `proj` for manipulating the project. Use `slproject.loadProject` for project automation scripts.

Examples

Load Project

Load a project from a folder called `'C:/projects/project1/'`. Replace this path with the location of your project.

```
proj = slproject.loadProject('C:/projects/project1/')
```

Get Airframe Example Project

Open the Airframe project and use `slproject.getCurrentProjects` to get a project object to manipulate the project at the command line.

```
sldemo_slproject_airframe
proj = slproject.getCurrentProjects
```

```
proj = 

  ProjectManager with properties:

          Name: 'Simulink Project Airframe Example'
           Categories: [1x1 slproject.Category]
            Shortcuts: [1x8 slproject.Shortcut]
          ProjectPath: [1x7 slproject.PathFolder]
    ProjectReferences: [1x0 slproject.ProjectReference]
                Files: [1x30 slproject.ProjectFile]
           RootFolder: 'C:\Work\Simulink\Projects\airframe'
```

Find Project Commands

Get the Airframe project.

```
sldemo_slproject_airframe
proj = slproject.getCurrentProjects;
```

Find project commands.

```
methods(proj)
```

```
Methods for class slproject.ProjectManager:

addFile                       findCategory
addFolderIncludingChildFiles  findFile
close                         isLoaded
createCategory                listModifiedFiles
export                        refreshSourceControl

reload
removeCategory
removeFile
```

Examine Project Properties

After you get a project object, you can examine project properties.

Get the airframe project.

```
sldemo_slproject_airframe
proj = slproject.getCurrentProjects;
```

Examine the project files.

```
files = proj.Files
```

```
files =

  1x30 ProjectFile array with properties:

    Path
    Labels
    Revision
    SourceControlStatus
```

Examine the labels of the 13th file.

```
proj.Files(13).Labels
```

```
ans =

  Label with properties:

File:  'C:\Temp\airframe\models\AnalogControl.mdl'
            Data: []
        DataType: 'none'
            Name: 'Design'
    CategoryName: 'Classification'
```

Get a particular file by name.

```
myfile = findFile(proj, 'models/AnalogControl.mdl')
```

```
myfile =

  ProjectFile with properties:

      Path:  'C:\Temp\airframe\models\AnalogControl.mdl'
    Labels: [1x1 slproject.Label]
  Revision: '2'
SourceControlStatus: Unmodified
```

Find out what you can do with the file.

```
methods(myfile)

Methods for class slproject.ProjectFile:

addLabel
removeLabel
findLabel
```

Input Arguments

`projectPath` — Full path to project file or folder

character vector

Full path to project `.prj` file or the path to the project root folder, specified as a character vector.

Example: `'C:/projects/project1/myProject.prj'`

Example: `'C:/projects/project1/'`

Output Arguments

`proj` — Project

project object

Project, returned as a project object. Use the project object to manipulate and explore the Simulink Project at the command line.

Properties of `proj` output argument.

Project Property	Description
Name	Project name
Categories	Categories of project labels
Shortcuts	Shortcut files in project
ProjectPath	Folders that the project puts on the MATLAB path
ProjectReferences	Folders that contain referenced projects

Project Property	Description
Files	Paths and names of project files
RootFolder	Full path to project root folder

See Also

Functions

`simulinkproject` | `slproject.getCurrentProjects`

Topics

“What Are Simulink Projects?”

Introduced in R2013a

listModifiedFiles

List modified files in Simulink project

Syntax

```
modifiedfiles = listModifiedFiles(proj)
```

Description

`modifiedfiles = listModifiedFiles(proj)` returns the list of modified project files in the project object `proj`. `listModifiedFiles` refreshes the source control statuses in the project and then returns an array of the project files which are listed in the Modified Files view of the Simulink Project.

Examples

Get a List of Modified Files in the Project

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Modify a project model file by adding an arbitrary block.

```
open_system('AnalogControl')
add_block('built-in/SubSystem', 'AnalogControl/test')
save_system('AnalogControl')
```

Get all the modified files in the project.

```
modifiedfiles = listModifiedFiles(proj)
```

```
modifiedfiles =
  1x2 ProjectFile array with properties:

    Path
    Labels
    Revision
    SourceControlStatus
```

Observe two modified files. Compare with the Modified Files view in Simulink Project, where you can see a modified model file, and the corresponding `.SimulinkProject` definition file.

Get the second modified file.

```
modifiedfiles(2)
```

```
ans = 

  ProjectFile with properties:

Path: 'C:\Work\temp\slexamples\airframe2\models\AnalogControl.mdl'
                 Labels: [1x1 slproject.Label]
               Revision: '2'
    SourceControlStatus: Modified
```

Observe the file `SourceControlStatus` property is `Modified`. Similarly, `listModifiedFiles` returns any files that are added, conflicted, deleted, etc., that show up in the Modified Files view in Simulink Project.

Get all the project files with a particular source control status. For example, get the files that are `Unmodified`.

```
proj.Files(ismember([proj.Files.SourceControlStatus], matlab.sourcecontrol.Status.Unmod
```

```
ans = 

  1x29 ProjectFile array with properties:

    Path
    Labels
    Revision
    SourceControlStatus
```

Input Arguments

`proj` — Project
project

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

Output Arguments

`modifiedfiles` — Modified files
file object | array

Modified files, returned as an array of file objects.

See Also

Functions
`refreshSourceControl` | `simulinkproject`

Introduced in R2016a

listRequiredFiles

Get project file dependencies

Syntax

```
files = listRequiredFiles(proj,file)
```

Description

`files = listRequiredFiles(proj,file)` returns the files that the specified file requires to run.

Examples

Get Required Files

Open the airframe project, create a project object and get a file.

```
sldemo_slproject_airframe;
proj = simulinkproject;
file = 'models/slproject_f14.slx'
```

Get the files required by the specified file.

```
files = listRequiredFiles(proj, file);
```

Input Arguments

`proj` — Project
project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

`file` — Path of file

character vector | project file object

Path of the file relative to the project root folder, including the file extension, specified as a character vector, an absolute file path or an instance of a project file object. The file must be within the root folder.

Example: ‘models/myModelName.slx’

Output Arguments

`file` — Project file

cell array of character vectors

Required files, returned as a cell array of character vectors.

`simulinkproject`

Topics

“Perform Impact Analysis”

Introduced in R2017a

refreshSourceControl

Update source control status of Simulink project files

Syntax

```
refreshSourceControl(proj)
```

Description

`refreshSourceControl(proj)` updates the source control status for all files in the Simulink project `proj`. Use this to get the latest source control information before querying the `SourceControlStatus` property on individual files.

If you use `listModifiedFiles` to find all modified files in the project, you do not need to call `refreshSourceControl` first.

Examples

Refresh Source Control Information on Files in the Project

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Refresh source control status before querying individual files.

```
refreshSourceControl(proj)
```

Input Arguments

`proj` — Project
project

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

See Also

Functions
`listModifiedFiles` | `simulinkproject`

Introduced in R2016a

solverprofiler.profileModel

Examine model for performance analysis

Syntax

```
res = solverprofiler.profileModel(model)
res = solverprofiler.profileModel(model, Name,Value)
```

Description

`res = solverprofiler.profileModel(model)` runs the Solver Profiler on the specified `model` and stores the results in `res`

`res = solverprofiler.profileModel(model, Name,Value)`specifies the Solver Profiler parameters using one or more `Name, Value` pair arguments.

Examples

Examine a Model with Default Settings

Examine the model `f14` using the default commandline settings.

```
model = 'f14';
res = solverprofiler.profileModel(model);
```

You can see a summary of the results by calling `res.summary`.

```
res.summary
```

```
 struct with fields:

            solver: 'ode45'
            tStart: 0
             tStop: 60
            absTol: 1.0000e-06
```

```
             relTol: 1.0000e-04
               hMax: 0.1000
           hAverage: 0.0444
              steps: 1352
        profileTime: 0.9974
           zcNumber: 0
        resetNumber: 600
     jacobianNumber: 0
    exceptionNumber: 195
```

Open the results in the Solver Profiler dialog to visualize them. This step is equivalent to enabling `OpenSP` when calling the function.

```
solverprofiler.exploreResult(res)
```

Configure Solver Profiler and Examine a Model

Examine the model `ssc_actuator_custom_pneumatic` with a fully specified configuration.

```
model = 'ssc_actuator_custom_pneumatic';
res = solverprofiler.profileModel(model, ...
    'SaveStates' , 'on', ...
    'SaveSimscapeStates' , 'On', ...
    'SaveJacobian' , 'On', ...
    'StartTime' , 5, ...
    'StopTime' , 50, ...
    'BufferSize',  10000,...
    'TimeOut', 5,...
    'OpenSP', 'On',...
    'DataFullFile', fullfile(pwd, 'ssc_profiling_result.mat'));
```

Input Arguments

`model` — Model to examine

character vector (default)

Name of model to be profiled, specified as a character vector.

Example: `h = solverprofiler.profileModel('vdp')`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: `'StartTime',0,'StopTime',10,'SaveStates','On'`

`SaveStates` — Save model states to file

off (default) | on

By default, the profiler does not save the states of the model. Enabling this parameter configures the profiler to save the states to a MAT-file.

Example: `'SaveStates','On'`

`SaveSimscapeStates` — Save Simscape states to file

off (default) | on

Enable this parameter to save Simscape states to a MAT-file.

Example: `'SaveSimscapeStates', 'On'`

`SaveJacobian` — Save model Jacobian

off (default) | on

Option to log the solver Jacobian matrices to memory. This option is useful for simulations that use implicit solvers. For a comparison of solvers, see “Compare Solvers”.

Example: `'SaveJacobian', 'On'`

`StartTime` — Profiler start time

model start time (default) | scalar

Time, in seconds, of the simulation that the profiler starts analyzing the model. This is not the same as the start time of the simulation.

Example: `'StartTime',5`

`StopTime` — Profiler stop time

model stop time (default) | scalar

Time, in seconds, of the simulation to which the profiler should profile the model. By default, the analysis continues until the end of the simulation. Changing this parameter does not change the stop time of the model which you specify in the Model Configuration Parameters.

A value less than the configured stop time of the model stops the profiling and simulation at `StopTime`.

Example: `'StopTime',30`

`BufferSize` — Memory impact of logging

50000 (default) | positive scalar

Maximum number of events that are logged. If the number of logged events reaches this value and memory is available, increase `BufferSize`. If memory is limited, consider lowering the value.

Example: `'BufferSize',60000`

`TimeOut` — Maximum time to wait for solver to resume

positive scalar

Time, in seconds, to wait before the profiler stops running. This option is useful in situations where the simulation is unable to proceed. The profiler waits for the specified time and quits if no progress has been made.

Example: `'TimeOut', 10`

`OpenSP` — Open the Solver Profiler dialog box

off (default) | on

Option to open the Solver Profiler dialog box after profiling has completed.

Example: `'OpenSP','On'`

`DataFullFile` — Path and name of saved results

character vector of full file path

By default, the profiling results are saved in a MAT-file named `model_@_dd_Month_yyyy_hh_mm_ss.mat` in the current working folder. You can specify a different file name by which to save the results in the current working folder. To save the file in a different location, specify the full path of the file, including the file name.

Example: `'DataFullFile','C:\Users\myusername\Documents\profiled \vdp_results.mat'`

Output Arguments

res — High-level summary of profiling results

structure

Profiling results, returned as a structure with the fields:

file — Full path and name of saved results

character vector

Path and name of the MAT-file where the results of the profiling operation are stored as MAT file. By default, they are stored in the current working folder with a file name having the pattern: model_@_dd_Month_yyyy_hh_mm_ss.mat. To store them in a different location or by a different name, specify DataFullFile when calling solverprofiler.profileModel.

summary — Summary of profiling results

structure

A high-level summary of the results of the profiling operation, returned as a structure. The summary provides an overview of the performance of the simulation and health of the model.

The summary structure contains these fields.

Field	Purpose	Values	Description
solver	Solver used by simulation	any of the solvers supported by Solver Profiler	Solver used by the simulation as configured in the Configuration Parameters for the model. For a list of all the solvers, see “Solver”. The Solver Profiler does not support models without any continuous states.
tStart	Start time of simulation	scalar	Start time, in seconds, for the simulation of the model during the profiling operation.

Field	Purpose	Values	Description
`tStop`	Stop time of simulation	scalar	Stop time, in seconds, of the simulation during the profiling operation. If `StopTime` is set to be earlier than the configured Stop Time of the model, the simulation stops at `StopTime`.
`absTol`	Absolute tolerance of the solver	positive scalar	Absolute tolerance of the solver as specified in the configuration settings for the model. For more information, see “Absolute tolerance”
`relTol`	Relative tolerance of the solver	positive scalar	Relative tolerance of the solver as specified in the configuration settings of the model. For more information, see “Relative tolerance”
`hMax`	Maximum step size	positive scalar	Largest time step that the solver can take. See “Max step size”.
`hAverage`	Average step size	positive scalar	Average size of the time step taken by the solver.
`steps`	Total steps taken	positive scalar	Total number of time steps taken by the solver.
`profileTime`	Time to profile	positive scalar	Time, in seconds, taken by the Solver Profiler to examine the model.
`zcNumber`	Total number of zero crossings	nonnegative scalar	Number of times zero crossings occur during the simulation of the model. The detection of these zero crossings incurs computational cost and can slow down the simulation. For information on zero-crossing detection, see “Zero-Crossing Detection”.
`resetNumber`	Number of solver resets	nonnegative scalar	Number of times the solver has to reset its parameters.

Field	Purpose	Values	Description
`jacobianNumber`	Number of Jacobian updates	nonnegative scalar	Number of times the solver Jacobian matrix is updated during a simulation. For more information, see “Explicit Versus Implicit Continuous Solvers”.
`exceptionNumber`	Number of solver exceptions	nonnegative scalar	Total number of solver exceptions encountered during a simulation. These exceptions are events where the solver is unable to solve the model states to the specified accuracy. As a result, the solver runs adjusted trials which increase computational cost.

Data Types: `struct`

Introduced in R2017b

start_simulink

Start Simulink without opening any windows

Syntax

```
start_simulink
```

Description

`start_simulink` starts Simulink without opening any models, the Start Page, or the Simulink Library Browser. Use this in startup scripts to start Simulink without any other window taking the focus away from the MATLAB Desktop. For example, use `start_simulink` in the MATLAB `startup.m` file, when starting MATLAB with the `-r` command line option, or in Simulink project startup scripts. Opening a model for the first time in a MATLAB session is much quicker after running `start_simulink`.

If you want to open the Simulink Start Page to create or open models, use the `simulink` function instead.

If you want to open the Library Browser, use `slLibraryBrowser`.

Examples

Start Simulink When Starting MATLAB

Use the `-r` command line option to start Simulink when starting MATLAB, without opening any windows.

On Windows, create a desktop shortcut with the following target:

```
matlabroot\bin\win64\matlab.exe -r start_simulink
```

On Linux® and Mac, enter:

```
matlab -r start_simulink
```

See Also

simulink | simulinkproject | slLibraryBrowser

Topics

“Automate Startup Tasks”

Introduced in R2015b

slupdate

Replace blocks from previous releases with latest versions

Note `slupdate` will be removed in a future release. The `slupdate` command can only upgrade some parts of your model. Use the Upgrade Advisor instead. See “Model Upgrades”.

Syntax

```
slupdate('sys')
slupdate('sys', prompt)
AnalysisResult = slupdate('sys', 'OperatingMode', 'Analyze')
```

Description

`slupdate('`*`sys`*`')` replaces blocks in model *`sys`* from a previous release of Simulink software with the latest versions. The `slupdate` function alone cannot perform all upgrade checks on your model. Use the Upgrade Advisor to access the `slupdate` checks and also advice and fixes for all other upgrade checks. See “Model Upgrades”.

Note Best practice is to first open the model, and press CTRL+D to update the model, before you call `slupdate`.

`slupdate('`*`sys`*`', `*`prompt`*`)` specifies whether to prompt you before replacing a block. If *`prompt`* equals `1`, the command prompts you before replacing the block. The prompt asks whether you want to replace the block. Valid responses are

- `y`

  Replace the block (the default).

- `n`

Do not replace the block.

- `a`

  Replace this and all subsequent obsolete blocks without further prompting.

If *`prompt`* equals `0`, the command replaces all obsolete blocks without prompting you.

In addition to replacing obsolete blocks, `slupdate`

- Reconnects broken links to masked blocks in libraries provided by MathWorks to ensure that the model reflects changes made to the blocks in this release. This will overwrite any custom changes you made to the masks of these blocks.
- Updates obsolete configuration settings for the model.

`AnalysisResult = slupdate('`*`sys`*`', 'OperatingMode', 'Analyze')` performs only the analysis portion without updating or changing the model. This command analyzes referenced models, linked libraries, and S-functions, and then returns a data structure with the following fields:

- `Message` — character vector containing a message summarizing the results
- `blockList` — cell array listing blocks that need to be updated
- `blockReasons` — cell array listing reasons for updating the corresponding blocks
- `modelList` — cell array listing referenced models and the parent model
- `libraryList` — cell array listing non-MathWorks libraries referenced
- `configSetList` — for internal use
- `sfunList` — cell array listing S-functions referenced
- `sfunOK` — logical array representing S-function status, where `false` indicates that an S-function needs updating and `true` indicates otherwise
- `sfunType` — cell array listing apparent S-function type (e.g., `.mex`)

See Also

`upgradeadvisor`

“Model Upgrades”

Introduced before R2006a

stringtype

Create string data type

Syntax

```
string = stringtype(maximum_length)
stringtype(maximum_length)
```

Description

`string = stringtype(maximum_length)` creates a Simulink string data type with a maximum length. Alternatively, you can also create string data types using the String Constant, String Concatenate, and Compose String blocks.

`stringtype(maximum_length)` creates a Simulink string data type with a maximum length that you can type directly on the MATLAB command line or in the **Output data type** parameter of the String Constant, String Concatenate, or Compose String block.

Examples

Create a String Data Type of Maximum Length 10

Create a string data type of maximum length 10.

```
h=stringtype(10)
```

```
h = 

  StringType with properties:

    MaximumLength: 10
      Description: ''
```

```
         DataScope: 'Auto'
        HeaderFile: ''
```

Input Arguments

`maximum_length` — Maximum length
scalar

Maximum length of string data type, specified as a scalar, from 1 to 32766. This value can be an integer, MATLAB variable, or MATLAB expression.

Data Types: `double`

Output Arguments

`string` — String data type object
scalar

String object, specified as a scalar.

Introduced in R2018a

trim

Find trim point of dynamic system

Syntax

```
[x,u,y,dx] = trim('sys')
[x,u,y,dx] = trim('sys',x0,u0,y0)
[x,u,y,dx] = trim('sys',x0,u0,y0,ix,iu,iy)
[x,u,y,dx] = trim('sys',x0,u0,y0,ix,iu,iy,dx0,idx)
[x,u,y,dx,options] = trim('sys',x0,u0,y0,ix,iu,iy,dx0,idx,options)
[x,u,y,dx,options] = trim('sys',x0,u0,y0,ix,iu,iy,dx0,idx,options,t)
```

Description

A trim point, also known as an equilibrium point, is a point in the parameter space of a dynamic system at which the system is in a steady state. For example, a trim point of an aircraft is a setting of its controls that causes the aircraft to fly straight and level. Mathematically, a trim point is a point where the system's state derivatives equal zero. `trim` starts from an initial point and searches, using a sequential quadratic programming algorithm, until it finds the nearest trim point. You must supply the initial point implicitly or explicitly. If `trim` cannot find a trim point, it returns the point encountered in its search where the state derivatives are closest to zero in a min-max sense; that is, it returns the point that minimizes the maximum deviation from zero of the derivatives. `trim` can find trim points that meet specific input, output, or state conditions, and it can find points where a system is changing in a specified manner, that is, points where the system's state derivatives equal specific nonzero values.

`[x,u,y,dx] = trim('`*`sys`*`')` finds the equilibrium point of the model '*sys*', nearest to the system's initial state, `x0`. Specifically, `trim` finds the equilibrium point that minimizes the maximum absolute value of `[x-x0,u,y]`. If `trim` cannot find an equilibrium point near the system's initial state, it returns the point at which the system is nearest to equilibrium. Specifically, it returns the point that minimizes `abs(dx)` where `dx` represents the derivative of the system. You can obtain `x0` using this command.

```
[sizes,x0,xstr] = sys([],[],[],0)
```

`[x,u,y,dx] = trim('sys',x0,u0,y0)` finds the trim point nearest to `x0`, `u0`, `y0`, that is, the point that minimizes the maximum value of

```
abs([x-x0; u-u0; y-y0])
```

`[x,u,y,dx] = trim('sys',x0,u0,y0,ix,iu,iy)` finds the trim point closest to `x0`, `u0`, `y0` that satisfies a specified set of state, input, and/or output conditions. The integer vectors `ix`, `iu`, and `iy` select the values in `x0`, `u0`, and `y0` that must be satisfied. If `trim` cannot find an equilibrium point that satisfies the specified set of conditions exactly, it returns the nearest point that satisfies the conditions, namely,

```
abs([x(ix)-x0(ix); u(iu)-u0(iu); y(iy)-y0(iy)])
```

`[x,u,y,dx] = trim('sys',x0,u0,y0,ix,iu,iy,dx0,idx)` finds specific nonequilibrium points, that is, points at which the system's state derivatives have some specified nonzero value. Here, `dx0` specifies the state derivative values at the search's starting point and `idx` selects the values in `dx0` that the search must satisfy exactly.

`[x,u,y,dx,options] = trim('sys',x0,u0,y0,ix,iu,iy,dx0,idx,options)` specifies an array of optimization parameters that `trim` passes to the optimization function that it uses to find trim points. The optimization function, in turn, uses this array to control the optimization process and to return information about the process. `trim` returns the `options` array at the end of the search process. By exposing the underlying optimization process in this way, `trim` allows you to monitor and fine-tune the search for trim points.

The following table describes how each element affects the search for a trim point. Array elements 1, 2, 3, 4, and 10 are particularly useful for finding trim points.

No.	Default	Description
1	0	Specifies display options. 0 specifies no display; 1 specifies tabular output; -1 suppresses warning messages.
2	10^{-4}	Precision the computed trim point must attain to terminate the search.
3	10^{-4}	Precision the trim search goal function must attain to terminate the search.
4	10^{-6}	Precision the state derivatives must attain to terminate the search.
5	N/A	Not used.

No.	Default	Description
6	N/A	Not used.
7	N/A	Used internally.
8	N/A	Returns the value of the trim search goal function (λ in goal attainment).
9	N/A	Not used.
10	N/A	Returns the number of iterations used to find a trim point.
11	N/A	Returns the number of function gradient evaluations.
12	0	Not used.
13	0	Number of equality constraints.
14	100*(Number of variables)	Maximum number of function evaluations to use to find a trim point.
15	N/A	Not used.
16	10^{-8}	Used internally.
17	0.1	Used internally.
18	N/A	Returns the step length.

`[x,u,y,dx,options] = trim('sys',x0,u0,y0,ix,iu,iy,dx0,idx,options,t)` sets the time to `t` if the system is dependent on time.

Note If you fix any of the state, input or output values, `trim` uses the unspecified free variables to derive the solution that satisfies these constraints.

Examples

Consider a linear state-space system modeled using a State-Space block

$$\dot{x} = Ax + Bu$$
$$y = Cx + Du$$

The *A*, *B*, *C*, and *D* matrices to enter at the command line or in the block parameters dialog are:.

```
A = [-0.09 -0.01;  1   0];
B = [ 0    -7;     0  -2];
C = [ 0     2;     1  -5];
D = [-3     0;     1   0];
```

Example 1

To find an equilibrium point in this model called `sys`, use:

```
[x,u,y,dx,options] = trim('sys')
x =
   0
   0
u =
   0
   0
y =
   0
   0
dx =
   0
   0
```

The number of iterations taken is:

```
options(10)
ans =
      7
```

Example 2

To find an equilibrium point near `x = [1;1], u = [1;1]`, enter

```
x0 = [1;1];
u0 = [1;1];
[x,u,y,dx,options] = trim('sys', x0, u0);
x =
    1.0e-13 *
   -0.5160
   -0.5169
u =
    0.3333
    0.0000
```

```
y =
   -1.0000
    0.3333
dx =
    1.0e-12 *
    0.1979
    0.0035
```

The number of iterations taken is

```
options(10)
ans =
      25
```

Example 3

To find an equilibrium point with the outputs fixed to 1, use:

```
y = [1;1];
iy = [1;2];
[x,u,y,dx] = trim('sys', [], [], y, [], [], iy)
x =
    0.0009
   -0.3075
u =
   -0.5383
    0.0004
y =
    1.0000
    1.0000
dx =
    1.0e-15 *
   -0.0170
    0.1483
```

Example 4

To find an equilibrium point with the outputs fixed to 1 and the derivatives set to 0 and 1, use

```
y = [1;1];
iy = [1;2];
dx = [0;1];
```

```
idx = [1;2];
[x,u,y,dx,options] = trim('sys',[],[],y,[],[],iy,dx,idx)
x =
    0.9752
   -0.0827
u =
   -0.3884
   -0.0124
y =
    1.0000
    1.0000
dx =
    0.0000
    1.0000
```

The number of iterations taken is

```
options(10)
ans =
      13
```

Limitations

The trim point found by `trim` starting from any given initial point is only a local value. Other, more suitable trim points may exist. Thus, if you want to find the most suitable trim point for a particular application, it is important to try a number of initial guesses for `x`, `u`, and `y`.

Algorithms

`trim` uses a sequential quadratic programming algorithm to find trim points. See "Sequential Quadratic Programming (SQP)" (Optimization Toolbox) for a description of this algorithm.

Introduced before R2006a

tunablevars2parameterobjects

Create Simulink parameter objects from tunable parameters

Syntax

```
tunablevars2parameterobjects ('modelName')
tunablevars2parameterobjects ('modelName', class)
```

Description

`tunablevars2parameterobjects ('modelName')` creates `Simulink.Parameter` objects in the base workspace for the variables listed in the specified model's Tunable Parameters dialog, then deletes the source information from the dialog. To preserve the information, save the resulting Simulink parameter objects into a MAT-file.

If a tunable variable is already defined as a numeric variable in the base workspace, the variable will be replaced by a parameter object and the original variable will be copied to the object's Value property.

If a tunable variable is already defined as a Simulink parameter object, the object will not be modified but the information for the variable will still be deleted from the Tunable Parameters dialog.

If a tunable variable is defined as any other class of variable, the variable will not be modified and the information for the variable will not be deleted from the Tunable Parameters dialog.

`tunablevars2parameterobjects ('modelName', class)` creates objects of the specified class rather than `Simulink.Parameter` objects.

Input Arguments

`modelName`

Model name or handle

`class`

Parameter class to use for creating objects

Default: `Simulink.Parameter`

See Also

`Simulink.Parameter`

Topics

“Tunable Parameters”

Introduced in R2007b

ufix

Create `Simulink.NumericType` object describing unsigned fixed-point data type

Syntax

```
a = ufix(WordLength)
```

Description

`ufix(WordLength)` returns a `Simulink.NumericType` object that describes an unsigned fixed-point data type with the specified word length and unspecified scaling.

Note `ufix` is a legacy function. In new code, use `fixdt` instead. In existing code, replace `ufix(WordLength)` with `fixdt(0,WordLength)`.

Examples

Define a 16-bit unsigned fixed-point data type.

```
a = ufix(16)
```

```
a =

  NumericType with properties:

    DataTypeMode: 'Fixed-point: unspecified scaling'
      Signedness: 'Unsigned'
      WordLength: 16
         IsAlias: 0
       DataScope: 'Auto'
      HeaderFile: ''
     Description: ''
```

See Also

`Simulink.NumericType` | `fixdt` | `float` | `sfix` | `sfrac` | `sint` | `ufrac` | `uint`

Introduced before R2006a

ufrac

Create `Simulink.NumericType` object describing unsigned fractional data type

Syntax

```
a = ufrac(WordLength)
a = ufrac(WordLength, GuardBits)
```

Description

`ufrac(`*`WordLength`*`)` returns a `Simulink.NumericType` object that describes the data type of an unsigned fractional data type with a word size given by `WordLength`.

`ufrac(`*`WordLength`*`, `*`GuardBits`*`)` returns a `Simulink.NumericType` object that describes the data type of an unsigned fractional data type. The total word size is given by *`WordLength`* with *`GuardBits`* bits located to the left of the binary point.

Note `ufrac` is a legacy function. In new coder, use `fixdt` instead. In existing code, replace `ufrac(WordLength)` with `fixdt(0,WordLength,WordLength)` and `ufrac(WordLength,GuardBits)` with `fixdt(0,WordLength,(WordLength-GuardBits))`.

Examples

Define an 8-bit unsigned fractional data type with 4 guard bits. Note that the range of this data type is from 0 to $(1 - 2^{-8}).2^{4}$ = 15.9375.

```
a = ufrac(8,4)
```

```
a =

  NumericType with properties:

      DataTypeMode: 'Fixed-point: binary point scaling'
        Signedness: 'Unsigned'
        WordLength: 8
    FractionLength: 4
           IsAlias: 0
         DataScope: 'Auto'
        HeaderFile: ''
       Description: ''
```

See Also

Simulink.NumericType | fixdt | float | sfix | sfrac | sint | ufix | uint

Introduced before R2006a

uint

Create `Simulink.NumericType` object describing unsigned integer data type

Syntax

```
a = uint(WordLength)
```

Description

`uint(`*`WordLength`*`)` returns a `Simulink.NumericType` object that describes the data type of an unsigned integer with a word size given by `WordLength`.

Note `uint` is a legacy function. In new code, use `fixdt` instead. In existing code, replace `uint(WordLength)` with `fixdt(0,WordLength,0)`.

Examples

Define a 16-bit unsigned integer.

```
a = uint(16)
```

```
a =

  NumericType with properties:

      DataTypeMode: 'Fixed-point: binary point scaling'
        Signedness: 'Unsigned'
        WordLength: 16
    FractionLength: 0
           IsAlias: 0
         DataScope: 'Auto'
        HeaderFile: ''
       Description: ''
```

Introduced before R2006a

unpack

Extract signal logging objects from signal logs and write them into MATLAB workspace

Syntax

```
log.unpack
tsarray.unpack
log.unpack('systems')
log.unpack('all')
```

Description

Note The `ModelDataLogs` class is supported for backwards compatibility. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format. In R2016a or later, when you open a model from an earlier release that had used `ModelDataLogs` format, the model simulated in use `Dataset` format.

You can convert signal logging data from `ModelDataLogs` to `Dataset` format. Converting to `Dataset` format makes it easier to post-process with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see “Convert Logged Data to Dataset Format”.

If you have legacy code that uses the `ModelDataLogs` API, you can encounter situations that require updates to your code or model. See “Migrate Scripts That Use Legacy ModelDataLogs API”.

`log.unpack` or `unpack(log)` extracts the top level elements of the `Simulink.ModelDataLogs` or `Simulink.SubsysDataLogs` object named **`log`** (e.g., `logsout`).

`log.unpack('systems')` or `unpack(`*`log`*`, 'systems')` extracts `Simulink.Timeseries` and `Simulink.TsArray` objects from the `Simulink.ModelDataLogs` or `Simulink.SubsysDataLogs` object named `log` . This command does not extract `Simulink.Timeseries` objects from `Simulink.TsArray` objects nor does it write intermediate `Simulink.ModelDataLogs` or `Simulink.SubsysDataLogs` objects to the MATLAB workspace.

`log.unpack('all')` or `unpack(`*`log`*`, 'all')` extracts all the `Simulink.Timeseries` objects contained by the `Simulink.ModelDataLogs`, `Simulink.TsArray`, or `Simulink.SubsysDataLogs` object named `log`.

`tsarray.unpack` extracts the time-series objects of class `Simulink.Timeseries` from the `Simulink.TsArray` object named `tsarray`.

Topics

"Export Signal Data Using Signal Logging"

Introduced before R2006a

upgradeadvisor

Open Upgrade Advisor

Syntax

```
upgradeadvisor('modelname')
upgrader = upgradeadvisor('modelname')
```

Description

`upgradeadvisor('modelname')` opens the Upgrade Advisor for the model specified by `modelname`. This command loads the model if necessary, but does not open it in the Simulink Editor. Use the Upgrade Advisor to help you upgrade and improve models with the current release.

`upgrader = upgradeadvisor('modelname')` returns an object that you can use to analyze and upgrade a hierarchy of models programmatically. If you specify an output, then the Upgrade Advisor does not open. You can use the methods `analyze` and `upgrade` with the `upgrader` object output of the `upgradeadvisor` function.

- To programmatically analyze a model for recommended upgrades, create an `upgrader` object and use the method `analyze`.
- To programmatically analyze and upgrade a model, create an `upgrader` object and use the method `upgrade`.
- To configure options before running analyze or upgrade, see “Examples” on page 2-1047.

Tip For an example showing how to programmatically upgrade a whole project, see “Upgrade Simulink Models Using a Simulink Project”.

Input Arguments

`modelname`

Name or handle to the model, specified as a character vector.

Output Arguments

`upgrader`

Object for analyzing and upgrading the hierarchy of models programmatically.

Examples

Open Upgrade Advisor on a Model

To open the Upgrade Advisor on the `vdp` example model:

```
upgradeadvisor('vdp')
```

To open the Upgrade Advisor on the currently selected model:

```
upgradeadvisor(bdroot)
```

Programmatically Analyze and Upgrade a Model

1 Get an `upgrader` object. This example uses a writable copy of the `vdp` model.

```
load_system('vdp'); save_system('vdp',fullfile(tempdir, 'myvdp'))
upgrader = upgradeadvisor('myvdp')
```

```
upgrader = 

  Upgrader with properties:

     ChecksToSkip: {}
    SkipLibraries: 0
    SkipBlocksets: 1
     OneLevelOnly: 0
     ShowReport: 1
      RootModel: 'myvdp'
     ReportFile: ''
```

2 To analyze the model for recommended upgrades, following library links and model references, run:

```
analyze(upgrader);
```

You see a report of issues found.

3 To analyze the model and automatically fix all issues (where automated fixes are available), run:

```
upgrade(upgrader);
```

This command follows library links and model references, and saves any fixes to the model files.

You see a report of issues found and actions taken.

4 To find the location of the report:

```
reportLocation = upgrader.ReportFile
```

5 You can configure options before running analyze or upgrade.

- Specify checks to skip before running analyze or upgrade. Find the ID for a check in the Upgrade Advisor by right-clicking the check and selecting **Send Check ID to Workspace**. Then set the `advisor.ChecksToSkip` property. For example:

  ```
  advisor.ChecksToSkip = {'mathworks.design.CSStoVSSConvert'};
  upgrade(upgrader);
  ```

- Specify running the Upgrade Advisor on only the current model without following library links or model references:

  ```
  upgrader.OneLevelOnly = true; % default false
  ```

- Specify running the Upgrade Advisor on the current model, following model references but not library links:

  ```
  upgrader.SkipLibraries = true; % default false
  ```

- Specify running the Upgrade Advisor on the current model, including upgrading files in blocksets or toolboxes:

  ```
  upgrader.SkipBlocksets = false; % default true
  ```

By default, the Upgrade Advisor does not upgrade files in blocksets or toolboxes. The Upgrade Advisor detects blocksets from the output of `ver` and the existence of a `Contents.m` file.

- To turn off showing the report after analyze or upgrade, set:

  ```
  upgrader.ShowReport = false; % default true
  ```

Tip For an example showing how to programmatically upgrade a whole project, see "Upgrade Simulink Models Using a Simulink Project".

Tips

- The Upgrade Advisor can identify cases where you can benefit by changing your model to use new features and settings in Simulink. The Advisor provides advice for transitioning to new technologies, and upgrading a model hierarchy.

  The Upgrade Advisor can also identify cases where a model will not work because changes and improvements in Simulink require changes to a model.

  The Upgrade Advisor offers options to perform recommended actions automatically or instructions for manual fixes.

Alternatives

You can also open the Upgrade Advisor from the Simulink Editor, by selecting **Analysis** > **Model Advisor** > **Upgrade Advisor**.

Alternatively, you can open the Upgrade Advisor from the Model Advisor. In the Model Advisor, under `By Task` checks, expand the folder `Upgrading to the Current Simulink Version` and select the check `Open the Upgrade Advisor`.

view_mdlrefs

Display graph of model referencing dependencies without library dependencies

`view_mdlrefs` opens the “Model Dependency Viewer” with library dependencies omitted. To open a specific configuration of the Model Dependency Viewer, use `depview` with programmatic options. The Model Dependency Viewer provides the same options regardless of how you open it.

Syntax

```
view_mdlrefs(sys)
```

Description

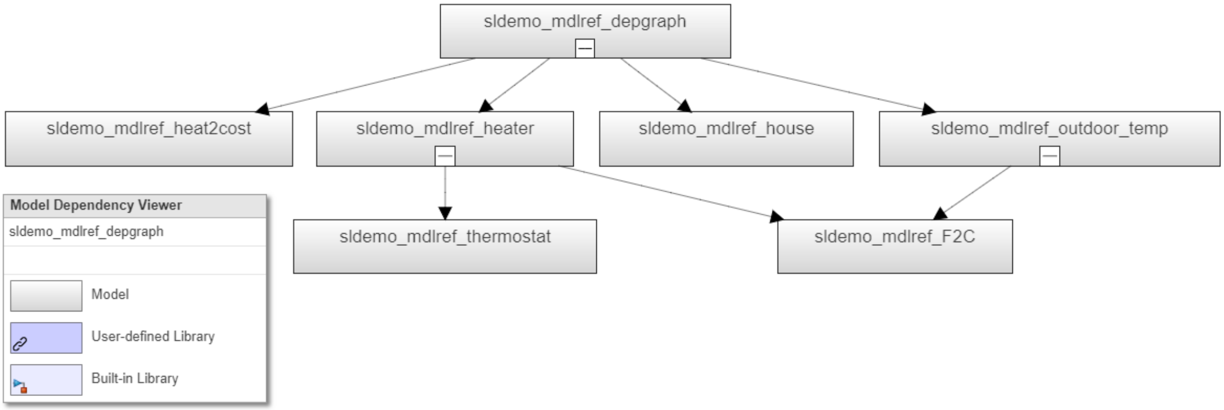
`view_mdlrefs(sys)` opens the Model Dependency Viewer, which displays a graph of model referencing dependencies for the specified model. The nodes in the graph represent Simulink models. The directed lines indicate model dependencies.

Examples

Open Model Dependency Viewer with Default Settings

Open the Model Dependency Viewer for the model `sldemo_mdlref_depgraph`.

```
view_mdlrefs('sldemo_mdlref_depgraph');
```



Input Arguments

sys — Model name or path

character vector

The full name or path of a model, specified as a character vector.

Data Types: `char`

See Also

Model | `depview` | `find_mdlrefs`

Topics

Introduced before R2006a

who

List names of top-level data logging objects in Simulink `ModelDataLogs` data log

Syntax

```
log.who
```

```
tsarray.who
```

```
log.who('systems')
```

```
log.who('all')
```

Description

Note To list names of top-level data logging objects in `Dataset` format, use `Simulink.SimulationData.Dataset.find`.

The `ModelDataLogs` class is supported for backwards compatibility. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format. In R2016a or later, when you open a model from an earlier release that had used `ModelDataLogs` format, the model simulated in use `Dataset` format.

You can convert signal logging data from `ModelDataLogs` to `Dataset` format. Converting to `Dataset` format makes it easier to post-process with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see “Convert Logged Data to Dataset Format”.

If you have legacy code that uses the `ModelDataLogs` API, you can encounter situations that require updates to your code or model. See “Migrate Scripts That Use Legacy ModelDataLogs API”.

`log.who` or `who(log)` lists the names of the top-level signal logging objects contained by `log`, where `log` is the handle of a `Simulink.ModelDataLogs` object name.

tsarray.who or who(tsarray) lists the names of Simulink.TimeSeries objects contained by the Simulink.TsArray object named tsarray.

log.who('systems') or who(log, 'systems') lists the names of all signal logging objects contained by log except for Simulink.Timeseries objects stored in Simulink.TsArray objects contained by log.

log.who('all') or who(log, 'all') lists the names of all the Simulink.Timeseries objects contained by the Simulink.ModelDataLogs, Simulink.TsArray, or Simulink.SubsysDataLogs object named log.

For information about other uses of who, execute help who in the MATLAB Command Window.

Tip To get the names of Dataset variables in the MAT-file, using the Simulink.SimulationData.DatasetRef.getDatasetVariableNames function processes faster than using the who or whos functions.

Introduced before R2006a

whos

List names and types of top-level data logging objects in Simulink `ModelDataLogs` data log

Syntax

```
log.whos
```

```
tsarray.whos
```

```
log.whos('systems')
```

```
log.whos('all')
```

Description

Note To list names of top-level data logging objects in `Dataset` format, use `Simulink.SimulationData.Dataset.find`.

The `ModelDataLogs` class is supported for backwards compatibility. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format. In R2016a or later, when you open a model from an earlier release that had used `ModelDataLogs` format, the model simulated in use `Dataset` format.

You can convert signal logging data from `ModelDataLogs` to `Dataset` format. Converting to `Dataset` format makes it easier to post-process with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see “Convert Logged Data to Dataset Format”.

If you have legacy code that uses the `ModelDataLogs` API, you can encounter situations that require updates to your code or model. See “Migrate Scripts That Use Legacy ModelDataLogs API”.

`log.whos` or `whos(log)` lists the names and types of the top-level signal logging objects contained by `log`, where `log` is the handle of a `Simulink.ModelDataLogs` object name.

tsarray.whos or whos(tsarray) lists the names and types of Simulink.TimeSeries objects contained by the Simulink.TsArray object named tsarray.

log.whos('systems') or whos(log, 'systems') lists the names and types of all signal logging objects contained by log except for Simulink.Timeseries objects stored in Simulink.TsArray objects contained by log.

log.whos('all') or whos(log, 'all') lists the names and types of all the Simulink.Timeseries objects contained by the Simulink.ModelDataLogs, Simulink.TsArray or Simulink.SubsysDataLogs object named log.

For information about other uses of whos, execute help whos in the MATLAB Command Window.

Tip To get the names of Dataset variables in the MAT-file, using the Simulink.SimulationData.DatasetRef.getDatasetVariableNames function processes faster than using the who or whos functions.

Mask Icon Drawing Commands

color	Change drawing color of subsequent mask icon drawing commands
disp	Display text on masked subsystem icon
dpoly	Display transfer function on masked subsystem icon
droots	Display transfer function on masked subsystem icon
fprintf	Display variable text centered on masked subsystem icon
image	Display RGB image on masked subsystem icon
patch	Draw color patch of specified shape on masked subsystem icon
plot	Draw graph connecting series of points on masked subsystem icon
port_label	Draw port label on masked subsystem icon
text	Display text at specific location on masked subsystem icon
	Promote a block icon image to the masked Subsystem

color

Change drawing color of subsequent mask icon drawing commands

Syntax

```
color(colorstr)
```

Here, *colorostr* must be a character vector.

Description

`color(colorstr)` sets the drawing color of all subsequent mask drawing commands to the color specified by the string *colorstr*.

colorstr must be one of the following supported color strings.

```
blue
green
red
cyan
magenta
yellow
black
```

Entering any other string or specifying the color using RGB values results in a warning at the MATLAB command prompt; Simulink ignores the color change. The specified drawing color does not influence the color used by the `patch` or `image` drawing commands.

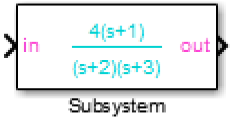
Examples

The following commands

```
color('cyan');
droots([-1], [-2 -3], 4)
color('magenta')
```

```
port_label('input',1,'in')
port_label('output',1,'out')
```

draw the following mask icon.



See Also

`droots` | `port_label`

Introduced in R2006b

disp

Display text on masked subsystem icon

Syntax

```
disp(text)
disp(text, 'texmode', 'on')
```

Description

disp(*text*) displays *text* centered on the block icon. *text* is any MATLAB expression that evaluates to a string.

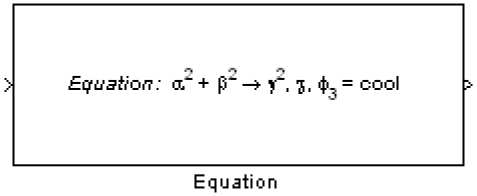
disp(text, 'texmode', 'on') allows you to use TeX formatting commands in *text*. The TeX formatting commands in turn allow you to include symbols and Greek letters in icon text. See “Interpreter” (MATLAB) for information on the TeX formatting commands supported by Simulink software.

Examples

The following command

```
disp('{\itEquation:}  \alpha^2 + \beta^2 \rightarrow \gamma^2,
\chi, \phi_3 = {\bfcool}', 'texmode','on')
```

draws the equation that appears on this masked block icon.



Equation: $\alpha^2 + \beta^2 \rightarrow \gamma^2, \chi, \phi_3 = \mathbf{cool}$
Equation

See Also

`fprintf` | `port_label` | `text`

Introduced in R2007a

dpoly

Display transfer function on masked subsystem icon

Syntax

```
dpoly(num, den)
```

```
dpoly(num, den, 'character')
```

Description

`dpoly(num, den)` displays the transfer function whose numerator is *num* and denominator is *den*.

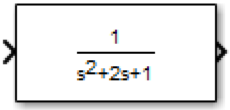
`dpoly(num, den, 'character')` specifies the name of the transfer function independent variable. The default is *s*.

When Simulink draws the block icon, the initialization commands execute and the resulting equation appears on the block icon, as in the following examples:

- To display a continuous transfer function in descending powers of *s*, enter

  ```
  dpoly(num, den)
  ```

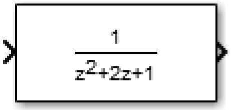
  For example, for `num = [0 0 1];` and `den = [1 2 1]` the icon looks like:

- To display a discrete transfer function in descending powers of *z*, enter

  ```
  dpoly(num, den, 'z')
  ```

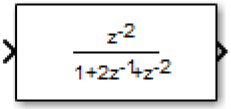
  For example, for `num = [0 0 1];` and `den = [1 2 1];` the icon looks like:



- To display a discrete transfer function in ascending powers of *1/z*, enter

  ```
  dpoly(num, den, 'z-')
  ```

  For example, for *num* and *den* as defined previously, the icon looks like:



If the parameters are not defined or have no values when you create the icon, Simulink software displays three question marks (`? ? ?`) in the icon. When you define parameter values in the Mask Settings dialog box, Simulink software evaluates the transfer function and displays the resulting equation in the icon.

See Also

`disp` | `droots` | `port_label` | `text`

droots

Display transfer function on masked subsystem icon

Syntax

```
droots(zero, pole, gain)
droots(zero, pole, gain,'z')
droots(zero, pole, gain,'z-')
```

Description

`droots(zero, pole, gain)` displays the transfer function whose zero is *`zero`*, pole is *`pole`*, and gain is *`gain`*.

`droots(zero, pole, gain,'z')` and `droots(zero, pole, gain,'z-')` expresses the transfer function in terms of *z* or *1/z*.

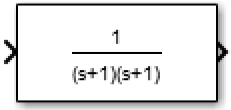
When Simulink draws the block icon, the initialization commands execute and the resulting equation appears on the block icon, as in the following examples:

- To display a zero-pole gain transfer function, enter

  ```
  droots(z, p, k)
  ```

  For example, the preceding command creates this icon for these values:

  ```
  z = []; p = [-1 -1]; k = 1;
  ```

If the parameters are not defined or have no values when you create the icon, Simulink software displays three question marks (`? ? ?`) in the icon. When you define parameter values in the Mask Settings dialog box, Simulink software evaluates the transfer function and displays the resulting equation in the icon.

See Also

`disp` | `dpoly` | `port_label` | `text`

Introduced in R2007a

fprintf

Display variable text centered on masked subsystem icon

Syntax

```
fprintf(text)
fprintf(formatSpec, var)
```

Description

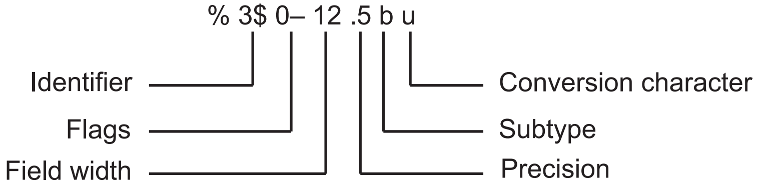
The `fprintf` command displays formatted text centered on the icon and can display *`formatSpec`* along with the contents of *`var`*.

Note While this `fprintf` function is identical in name to its corresponding MATLAB function, it provides only the functionality described on this page.

`formatSpec` can be a character vector in single quotes, or a string scalar.

Formatting Operator

A formatting operator starts with a percent sign, `%`, and ends with a conversion character. The conversion character is required. Optionally, you can specify identifier, flags, field width, precision, and subtype operators between `%` and the conversion character. (Spaces are invalid between operators and are shown here only for readability).



Conversion Character

This table shows conversion characters to format numeric and character data as text.

Value Type	Conversion	Details
Integer, signed	`%d` or `%i`	Base 10
Integer, unsigned	`%u`	Base 10
	`%o`	Base 8 (octal)
	`%x`	Base 16 (hexadecimal), lowercase letters `a`–`f`
	`%X`	Same as `%x`, uppercase letters `A`–`F`
Floating-point number	`%f`	Fixed-point notation (Use a precision operator to specify the number of digits after the decimal point.)
	`%e`	Exponential notation, such as `3.141593e+00` (Use a precision operator to specify the number of digits after the decimal point.)
	`%E`	Same as `%e`, but uppercase, such as `3.141593E+00` (Use a precision operator to specify the number of digits after the decimal point.)
	`%g`	The more compact of `%e` or `%f`, with no trailing zeros (Use a precision operator to specify the number of significant digits.)
	`%G`	The more compact of `%E` or `%f`, with no trailing zeros (Use a precision operator to specify the number of significant digits.)
Characters or strings	`%c`	Single character
	`%s`	Character vector or string array. The type of the output text is the same as the type of `formatSpec`.

Examples

The command

```
fprintf('Hello');
```

displays the text `'Hello'` on the icon.

The command

```
fprintf('Hello = %d',17);
```

uses the decimal notation format (`%d`) to display the variable `17`.

See Also

`disp` | `port_label` | `text`

Introduced before R2006a

image

Display RGB image on masked subsystem icon

Syntax

```
image(a)
image(a, position)
image(a, position, rotation)
```

Description

`image(a)` displays the image *a*, where *a* is an *m*-by-*n*-by-3 array of RGB values. If necessary, use the MATLAB commands `imread` and `ind2rgb` to read and convert bitmap files (such as GIF) to the necessary matrix format.

`image(a, position)` creates the image at the specified position as follows.

Position	Description
[*x*, *y*, *w*, *h*]	Position (*x*, *y*) and size (*w*, *h*) of the image where the position is relative to the lower-left corner of the mask. The image scales to fit the specified size.
`'center'`	Center of the mask
`'top-left'`	Top left corner of the mask, unscaled
`'bottom-left'`	Bottom left corner of the mask, unscaled
`'top-right'`	Top right corner of the mask, unscaled
`'bottom-right'`	Bottom right corner of the mask, unscaled

`image(a, position, rotation)` allows you to specify whether the image rotates (`'on'`) or remains stationary (`'off'`) as the icon rotates. The default is `'off'`.

Note Images in formats `.cur`, `.hdf4`, `.ico`, `.pcx`, `.ras`, `.xwd`, `.svg` (full version) cannot be used as block mask images.

Examples

You can use different commands depending on your requirement to add an image. These commands can be added in the **Icon & Ports** pane of the Mask Editor dialog box.

Syntax	Description
`image('icon.jpg')`	Reads the icon image from a JPEG file named `icon.jpg` in the MATLAB path.

`[data, map]=image('label.gif');`
`pic=ind2rgb(data,map);`
	Reads and converts a GIF file, `label.gif`, to the appropriate matrix format.

`image(pic)`	Reads the converted label image.

See Also

`patch` | `plot`

Introduced before R2006a

patch

Draw color patch of specified shape on masked subsystem icon

Syntax

```
patch(x, y)
patch(x, y, [r g b])
```

Description

`patch(x, y)` creates a solid patch having the shape specified by the coordinate vectors `x` and `y`. The patch's color is the current foreground color.

`patch(x, y, [r g b])` creates a solid patch of the color specified by the vector `[r g b]`, where `r` is the red component, `g` the green, and `b` the blue. For example,

```
patch([0 .5 1], [0 1 0], [1 0 0])
```

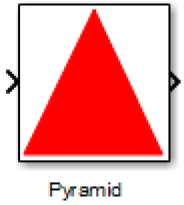
creates a red triangle on the mask's icon.

Examples

The command

```
patch([0 .5 1], [0 1 0], [1 0 0])
```

creates a red triangle on the mask's icon.



See Also

`image` | `plot`

Introduced before R2006a

plot

Draw graph connecting series of points on masked subsystem icon

Syntax

```
plot(Y)
plot(X1,Y1,X2,Y2,...)
```

Description

`plot(Y)` plots, for a vector *Y*, each element against its index. If *Y* is a matrix, it plots each column of the matrix as though it were a vector.

`plot(X1,Y1,X2,Y2,...)` plots the vectors *Y1* against *X1*, *Y2* against *X2*, and so on. Vector pairs must be the same length and the list must consist of an even number of vectors.

Plot commands can include `NaN` and `inf` values. When Simulink software encounters `NaN`s or `inf`s, it stops drawing, and then begins redrawing at the next numbers that are not `NaN` or `inf`. The appearance of the plot on the icon depends on the units defined by the **Icon units** option in the Mask Editor.

Simulink software displays three question marks (`? ? ?`) in the block icon and issues warnings in these situations:

- When you have not defined values for the parameters used in the drawing commands (for example, when you first create the mask, but have not yet entered values in the Mask Settings dialog box)
- When you enter a masked block parameter or drawing command incorrectly

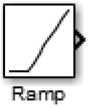
Note The plot command supports all numeric data types.

Examples

The command

```
plot([0 1 5], [0 0 4])
```

generates the plot that appears on the icon for the Ramp block, in the Sources library.



See Also

`image`

Introduced before R2006a

port_label

Draw port label on masked subsystem icon

Syntax

```
port_label('port_type', port_number, 'label')
port_label('port_type', port_number, 'label', 'texmode', 'on')
```

Description

`port_label('port_type', port_number, 'label')` draws a label on a port. Valid values for *port_type* include the following.

Value	Description
`input`	Simulink input port
`output`	Simulink output port
`lconn`	Physical Modeling connection port on the left side of a masked subsystem
`rconn`	Physical Modeling connection port on the right side of a masked subsystem
`Enable`	Label for the enable port in a masked Triggered or Enabled and Triggered subsystem.
`trigger`	Label for the trigger port in a masked Triggered or Enabled and Triggered subsystem.
`action`	Label for the action port in a masked Switch Case Action Subsystem.

The input argument *port_number* is an integer, and *label* is text specifying the port's label.

Note Physical Modeling port labels are assigned based on the nominal port location. If the masked subsystem has been rotated or flipped, for example, a port labeled using `'lconn'` as the `port_type` may not appear on the left side of the block.

`port_label('`*`port_type`*`', `*`port_number`*`, '`*`label`*`', 'texmode', 'on')` lets you use TeX formatting commands in `label`. The TeX formatting commands allow you to include symbols and Greek letters in the port label. See “Interpreter” (MATLAB) for information on the TeX formatting commands that the Simulink software supports.

Examples

The command

```
port_label('input', 1, 'a')
```

defines `a` as the label of input port 1.

The command

```
port_label('Enable','En')
```

defines `En` as the label of Enable port.

The command

```
port_label('trigger','Tr')
```

defines `Tr` as the label of trigger port.

The command

```
port_label('action','Switch():')
```

defines `Switch():` as the label of action port.

The command

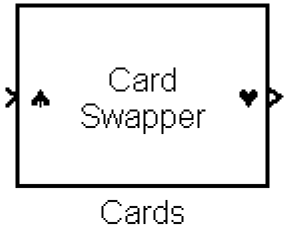
```
port_label('trigger','$\sqrt m$','interpreter','tex')
```

defines the label of trigger port with LaTeX interpretation.

The commands

```
disp('Card\nSwapper');
port_label('input',1,'\spadesuit','texmode','on');
port_label('output',1,'\heartsuit','texmode','on');
```

draw playing card symbols as the labels of the ports on a masked subsystem.



See Also

disp | fprintf | text

Introduced before R2006a

text

Display text at specific location on masked subsystem icon

Syntax

```
text(x, y, 'text')
text(x, y, 'text', 'horizontalAlignment', 'halign',
  'verticalAlignment', 'valign')
text(x, y, 'text', 'texmode', 'on')
```

Description

The `text` command places a character vector at a location specified by the point `(x,y)` whose units are defined by the **Icon units** option in the Mask Editor.

`text(x,y, text, 'texmode', 'on')` allows you to use TeX formatting commands in *`text`*. The TeX formatting commands in turn allow you to include symbols and Greek letters in icon text. See “Interpreter” (MATLAB) for information on the TeX formatting commands supported by Simulink software.

You can optionally specify the horizontal and/or vertical alignment of the text relative to the point (x, y) in the `text` command.

The `text` command offers the following horizontal alignment options.

Option	Aligns
`'left'`	The left end of the text at the specified point
`'right'`	The right end of the text at the specified point
`'center'`	The center of the text at the specified point

The `text` command offers the following vertical alignment options.

Option	Aligns
`'base'`	The baseline of the text at the specified point

Option	Aligns
'bottom'	The bottom line of the text at the specified point
'middle'	The midline of the text at the specified point
'cap'	The capitals line of the text at the specified point
'top'	The top of the text at the specified point

Note While this `text` function is identical in name to its corresponding MATLAB function, it provides only the functionality described on this page.

Examples

Text Alignment

Center the mask icon text `foobar`.

```
text(0.5, 0.5, 'foobar', 'horizontalAlignment', 'center')
```

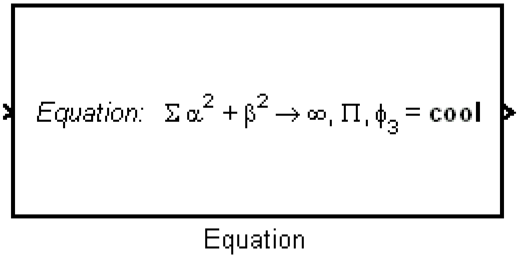
Equation in Mask Icon

Draw a left-aligned equation as the mask icon.

In the Icons & Ports dialog of the Mask Editor, set **Icon units** to `Normalized`.

In the **Icon drawing commands** text box, enter the following command.

```
text(.05,.5,'{\itEquation:}  \Sigma \alpha^2 +
\beta^2 \rightarrow \infty, \Pi, \phi_3 = {\bfcool}',
'hor','left','texmode','on')
```



Equation: $\Sigma\alpha^2 + \beta^2 \rightarrow \infty, \Pi, \phi_3 = \mathbf{cool}$
Equation

`disp` | `fprintf` | `port_label`

Introduced before R2006a

block_icon

Promote a block icon image to the masked Subsystem

Syntax

```
block_icon(BlockName)
```

Description

`block_icon(BlockName)` displays the underneath block icon image on the masked Subsystem icon. For more information, see slexblockicon.

Input Arguments

`BlockName` — Name of the underneath block
String

The name of the underneath block whose icon image you want to display on the Subsystem block that encapsulates the specified block. For more information, see slexblockicon

Data Types: `string`

See Also

`Simulink.Mask` | slexblockicon

Introduced in R2006b

4

Simulink Debugger Commands

ashow	Show algebraic loop
atrace	Set algebraic loop trace level
bafter	Insert breakpoint after specified method
break	Insert breakpoint before specified method
bshow	Show specified block
clear	Clear breakpoints from model
continue	Continue simulation
disp	Display block's I/O when simulation stops
ebreak	Enable (or disable) breakpoint on solver errors
elist	List simulation methods in order in which they are executed during simulation
emode	Toggle model execution between accelerated and normal mode
etrace	Enable or disable method tracing
help	Display help for debugger commands
nanbreak	Set or clear nonfinite value break mode
next	Advance simulation to start of next method at current level in model's execution list
probe	I/O and state data for blocks
quit	Stop simulation debugger
rbreak	Break simulation before solver reset
run	Run simulation to completion
slist	Sorted list of model blocks
states	Current state values
status	Debugging options in effect
step	Advance simulation by one or more methods
stimes	Model sample times
stop	Stop simulation
strace	Set solver trace level
systems	List nonvirtual systems of model
tbreak	Set or clear time breakpoint
trace	Display block's I/O each time block executes
undisp	Remove block from debugger's list of display points
untrace	Remove block from debugger's list of trace points
where	Display current location of simulation in simulation loop
xbreak	Break when debugger encounters step-size-limiting state
zcbreak	Toggle breaking at nonsampled zero-crossing events

ashow

Show algebraic loop

Syntax

```
ashow <gcb | s:b | s#n | clear>
```

```
as <gcb | s:b | s#n | clear>
```

Arguments

`gcb`	Current block.
`s:b`	The block whose system index is `s` and block index is `b`.
`s#n`	The algebraic loop numbered `n` in system `s`.
`clear`	Switch that clears loop coloring.

Description

`ashow` without any arguments lists all of a model's algebraic loops in the MATLAB Command Window. `ashow gcb` or `ashow s:b` highlights the algebraic loop that contains the specified block. `ashow s#n` highlights the `n`th algebraic loop in system `s`. The `ashow` **`clear`** command removes algebraic loop highlights from the model diagram.

See Also

`atrace` | `slist`

Introduced before R2006a

atrace

Set algebraic loop trace level

Syntax

```
atrace level
```

```
at level
```

Arguments

`level`	Trace level (0 = none, 4 = everything).

Description

The `atrace` command sets the algebraic loop trace level for a simulation.

Command	Displays for Each Algebraic Loop
`atrace 0`	No information
`atrace 1`	The loop variable solution, the number of iterations required to solve the loop, and the estimated solution error
`atrace 2`	Same as level 1
`atrace 3`	Level 2 plus Jacobian matrix used to solve loop
`atrace 4`	Level 3 plus intermediate solutions of the loop variable

See Also

`states` | `systems`

Introduced before R2006a

bafter

Insert breakpoint after specified method

Syntax

```
bafter
```

```
ba
```

`bafter` **`m:`***`mid`*

`bafter <`*`sysIdx`*`:`*`blkIdx`*` | `**`gcb`**`> [`*`mth`*`] [`**`tid:`***`TID`*`]`

`bafter <`**`s:`***`sysIdx`*` | `**`gcs`**`> [`*`mth`*`] [`**`tid:`***`TID`*`]`

`bafter `**`model`**` [`*`mth`*`] [`**`tid:`***`TID`*`]`

Arguments

`mid`	Method ID
`sysIdx``:`*`blkIdx`*	Block ID
`gcb`	Currently selected block
`sysIdx`	System ID
gcs	Currently selected system
`model`	Currently selected model
mth	A method name, e.g., `Outputs.Major`
TID	Task ID

Description

`bafter` inserts a breakpoint after the current method.

Instead of `bafter`, you can use the short form of `ba` with any of the syntaxes.

`bafter` **`m`**`:`*`mid`* inserts a breakpoint after the method specified by *`mid`* (see “Method ID”).

`bafter` *`sysIdx`*`:`*`blkIdx`* inserts a breakpoint after each invocation of the method of the block specified by *`sysIdx`*`:`*`blkIdx`* (see “Block ID”) in major time steps. `bafter gcb` inserts a breakpoint after each invocation of a method of the currently selected block (see `gcb`) in major times steps.

`bafter` **`s:`***`sysIdx`* inserts a breakpoint after each method of the root system or nonvirtual subsystem specified by the system ID: *`sysIdx`*.

Note The `systems` command displays the system IDs for all nonvirtual systems in the currently selected model.

`bafter` **`gcs`** inserts a breakpoint after each method of the currently selected nonvirtual system.

`bafter` **`model`** inserts a breakpoint after each method of the currently selected model.

The optional *`mth`* parameter allow you to set a breakpoint after a particular block, system, or model method and task. For example, `bafter` **`gcb`** `Outputs` sets a breakpoint after the Outputs method of the currently selected block.

The optional TID parameter allows you to set a breakpoint after invocation of a method by a particular task. For example, suppose that the currently selected nonvirtual subsystem operates on task 2 and 3. Then `bafter` **`gcs`** `Outputs` **`tid:`**`2` sets a breakpoint after the invocation of the subsystem's Outputs method that occurs when task 2 is active.

See Also

`break` | `clear` | `ebreak` | `nanbreak` | `rbreak` | `slist` | `systems` | `tbreak` | `where` | `xbreak` | `zcbreak`

Introduced before R2006a

break

Insert breakpoint before specified method

Syntax

```
break
```

```
b
```

```
break m:mid
break <sysIdx:blkIdx | gcb> [mth] [tid:TID]
```

```
break <s:sysIdx | gcs> [mth] [tid:TID]
```

```
break model [mth] [tid:TID]
```

Arguments

mid	Method ID
sysIdx:*blkIdx*	Block ID
gcb	Currently selected block
sysIdx	System ID
gcs	Currently selected system
model	Currently selected model
mth	A method name, e.g., `Outputs.Major`
TID	task ID

Description

`break` inserts a breakpoint before the current method.

Instead of `break`, you can use the short form of `b` with any of the syntaxes.

`break m:`*`mid`* inserts a breakpoint before the method specified by *`mid`* (see “Method ID”).

`break` *`sysIdx`*`:`*`blkIdx`* inserts a breakpoint before each invocation of the method of the block specified by *`sysIdx`*`:`*`blkIdx`* (see “Block ID”) in major time steps. `break` gcb inserts a breakpoint before each invocation of a method of the currently selected block (see `gcb`) in major times steps.

`break s:`*`sysIdx`* inserts a breakpoint at each method of the root system or nonvirtual subsystem specified by the system ID: *`sysIdx`*.

Note The `systems` command displays the system IDs for all nonvirtual systems in the currently selected model.

`break gcs` inserts a breakpoint at each method of the currently selected nonvirtual system.

`break model` inserts a breakpoint at each method of the currently selected model.

Note Do not use a model name instead of identifier `model` in the `break model` command.

The optional *`mth`* parameter allow you to set a breakpoint at a particular block, system, or model method. For example, `break gcb Outputs` sets a breakpoint at the Outputs method of the currently selected block.

The optional TID parameter allows you to set a breakpoint at the invocation of a method by a particular task. For example, suppose that the currently selected nonvirtual subsystem operates on task 2 and 3. Then `break gcs Outputs tid:2` sets a breakpoint at the invocation of the subsystem's Outputs method that occurs when task 2 is active.

See Also

`bafter` | `clear` | `ebreak` | `nanbreak` | `rbreak` | `slist` | `systems` | `tbreak` | `where` | `xbreak` | `zcbreak`

Introduced before R2006a

bshow

Show specified block

Syntax

```
bshow s:b
```

```
bshow modelName s:b
```

```
bs s:b
```

Arguments

`s:b`	The block whose system index is `s` and block index is `b`.

Description

The `bshow` command opens the model window containing the specified block and selects the block.

See Also

`slist`

Introduced before R2006a

clear

Clear breakpoints from model

Syntax

`clear`

`cl`

`clear` **`m:`**`m`*`id`*

`clear` *`id`*

`clear <`*`sysIdx:blkIdx`*` | `**`gcb`**`>`

Arguments

`mid`	Method ID
`id`	Breakpoint ID
`sysIdx``:`*`blkIdx`*	Block ID
`gcb`	Currently selected block

Description

`clear` clears a breakpoint from the current method.

Instead of `clear`, you can use the short form of `cl` with any of the syntaxes.

`clear` **`m:`***`mid`* clears a breakpoint from the method specified by *`mid`*.

`clear` *`id`* clears the breakpoint specified by the breakpoint ID *`id`*.

`clear` *`sysIdx`*`:`*`blkIdx`* clears any breakpoints set on the methods of the block specified by *`sysIdx:blkIdx`*.

`clear **gcb**` clears any breakpoints set on the methods of the currently selected block.

See Also

`bafter` | `break` | `slist`

Introduced before R2006a

continue

Continue simulation

Syntax

```
continue
```

```
c
```

Description

The `continue` command continues the simulation from the current breakpoint. If animation mode is not enabled, the simulation continues until it reaches another breakpoint or its final time step. If animation mode is enabled, the simulation continues in animation mode to the first method of the next major time step, ignoring breakpoints.

See Also

`quit` | `run` | `stop`

Introduced before R2006a

disp

Display block's I/O when simulation stops

Syntax

```
disp
```

```
d
```

```
disp gcb
```

```
disp s:b
```

```
disp  modelName s:b
```

Arguments

`s:b`	The block whose system index is `s` and block index is `b`.
`gcb`	Current block.

Description

The `disp` command registers a block as a display point. The debugger displays the inputs and outputs of all display points in the MATLAB Command Window whenever the simulation halts. Invoking `disp` without arguments shows a list of display points. Use `undisp` to unregister a block.

Instead of `disp`, you can use the short form of `d` with any of the syntaxes.

See Also

`probe` | `slist` | `trace` | `undisp`

Introduced before R2006a

ebreak

Enable (or disable) breakpoint on solver errors

Syntax

```
ebreak
```

```
eb
```

Description

This command causes the simulation to stop if the solver detects a recoverable error in the model. If you do not set or disable this breakpoint, the solver recovers from the error and proceeds with the simulation without notifying you.

See Also

`bafter` | `break` | `clear` | `nanbreak` | `rbreak` | `slist` | `systems` | `tbreak` | `where` | `xbreak` | `zcbreak`

Introduced before R2006a

elist

List simulation methods in order in which they are executed during simulation

Syntax

elist

el

elist **m:***mid* [**tid:***TID*]

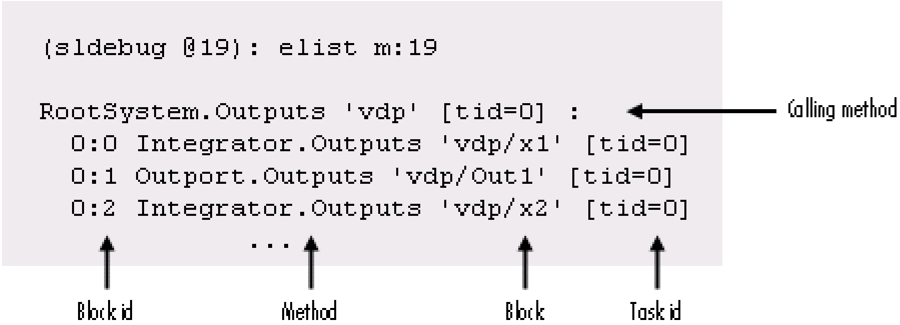
elist <**gcs** | **s:***sysIdx*> [*mth*] [**tid:***TID*]

elist <**gcb** | *sysIdx***:***blkIdx*> [*mth*] [**tid:***TID*]

Description

Instead of `elist`, you can use the short form of `el` with any of the syntaxes.

`elist` **m:***mid* lists the methods invoked by the system or nonvirtual subsystem method corresponding to the method id *mid* (see the `where` command for information on method IDs), e.g.,



```
(sldebug @19): elist m:19

RootSystem.Outputs 'vdp' [tid=0] :
  0:0 Integrator.Outputs 'vdp/x1' [tid=0]
  0:1 Outport.Outputs 'vdp/Out1' [tid=0]
  0:2 Integrator.Outputs 'vdp/x2' [tid=0]
         ...
```

The method list specifies the calling method followed by the methods that it calls in the order in which they are invoked. The entry for the calling method includes

- The name of the method

  The name of the method is prefixed by the type of system that defines the method, e.g., RootSystem.
- The name of the model or subsystem instance on which the method is invoked
- The ID of the task that invokes the method

The entry for each called method includes

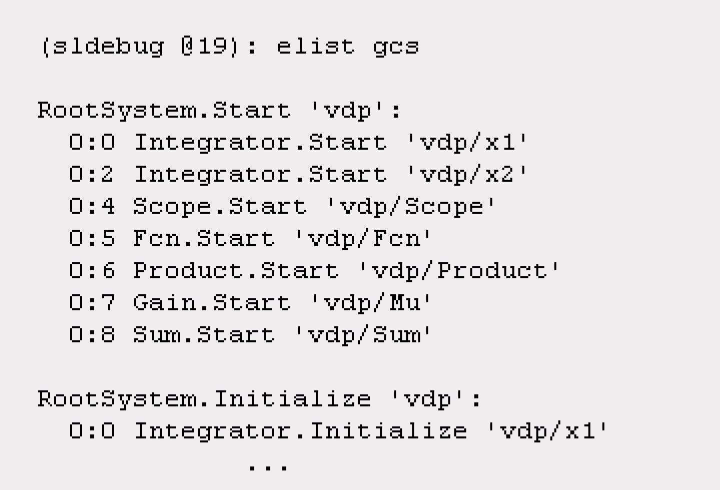
- The ID (*`sysIdx`*:*`blkIdx`*) of the block instance on which the method is invoked

  The block ID is prefixed by a number specifying the system that contains the block (the *`sysIdx`*). This allows Simulink software to assign the same block ID to blocks residing in different subsystems.
- The name of the method

  The method name is prefixed with the type of block that defines the method, e.g., Integrator.
- The name of the block instance on which the method is invoked
- The task that invokes the method

The optional task ID parameter (**`tid:`***`TID`*) allows you to restrict the displayed lists to methods invoked for a specified task. You can specify this option only for system or atomic subsystem methods that invoke Outputs or Update methods.

`elist <`**`gcs | s:`**`sysIdx>` lists the methods executed for the currently selected system (specified by the `gcs` command) or the system or nonvirtual subsystem specified by the system ID *`sysIdx`*, e.g.,



```
(sldebug @19): elist gcs

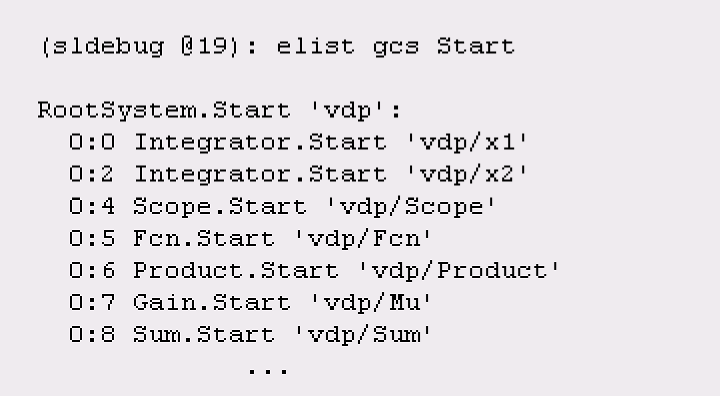
RootSystem.Start 'vdp':
  0:0 Integrator.Start 'vdp/x1'
  0:2 Integrator.Start 'vdp/x2'
  0:4 Scope.Start 'vdp/Scope'
  0:5 Fcn.Start 'vdp/Fcn'
  0:6 Product.Start 'vdp/Product'
  0:7 Gain.Start 'vdp/Mu'
  0:8 Sum.Start 'vdp/Sum'

RootSystem.Initialize 'vdp':
  0:0 Integrator.Initialize 'vdp/x1'
             ...
```

The system ID of a model's root system is 0. You can use the debugger's `systems` command to determine the system IDs of a model's subsystems.

Note The `elist` and `where` commands use block IDs to identify subsystems in their output. The block ID for a subsystem is not the same as the system ID displayed by the `systems` command. Use the `elist` *`sysIdx`*`:`*`blkIdx`* form of the `elist` command to display the methods of a subsystem whose block ID appears in the output of a previous invocation of the `elist` or `where` command.

`elist <`**`gcs | s:`**`sysIdx>` *`mth`* lists methods of type *`mth`* to be executed for the system specified by the `gcs` command or the system ID *`sysIdx`*, e.g.,



```
(sldebug @19): elist gcs Start

RootSystem.Start 'vdp':
  0:0 Integrator.Start 'vdp/x1'
  0:2 Integrator.Start 'vdp/x2'
  0:4 Scope.Start 'vdp/Scope'
  0:5 Fcn.Start 'vdp/Fcn'
  0:6 Product.Start 'vdp/Product'
  0:7 Gain.Start 'vdp/Mu'
  0:8 Sum.Start 'vdp/Sum'
             ...
```

Use `elist` **`gcb`** to list the methods invoked by the nonvirtual subsystem currently selected in the model.

See Also

`slist` | `systems` | `where`

Introduced before R2006a

emode

Toggle model execution between accelerated and normal mode

Syntax

```
emode
```

```
em
```

Description

Toggles the simulation between accelerated and normal mode when using the Accelerator mode in Simulink software. For more information, see “Run Accelerator Mode with the Simulink Debugger”.

Introduced before R2006a

etrace

Enable or disable method tracing

Syntax

```
etrace level level-number
```

```
et level level-number
```

Description

This command enables or disables method tracing, depending on the value of `level`:

Level	Description
`0`	Turn tracing off.
`1`	Trace model methods.
`2`	Trace model and system methods.
`3`	Trace model, system, and block methods.

When method tracing is on, the debugger prints a message at the command line every time a method of the specified level is entered or exited. The message specifies the current simulation time, whether the simulation is entering or exiting the method, the method id and name, and the name of the model, system, or block to which the method belongs.

`elist` | `trace` | `where`

Introduced before R2006a

help

Display help for debugger commands

Syntax

```
help
```

```
?
```

```
h
```

Description

The `help` command displays a list of debugger commands in the command window. The list includes the syntax and a brief description of each command.

Introduced before R2006a

nanbreak

Set or clear nonfinite value break mode

Syntax

```
nanbreak
```

```
na
```

Description

The `nanbreak` command causes the debugger to break whenever the simulation encounters a nonfinite (`NaN` or `Inf`) value. If nonfinite break mode is set, `nanbreak` clears it.

See Also

`bafter` | `break` | `rbreak` | `tbreak` | `xbreak` | `zcbreak`

Topics

`ebreak`

Introduced before R2006a

next

Advance simulation to start of next method at current level in model's execution list

Syntax

```
next
```

```
n
```

Description

The `next` command advances the simulation to the start of the next method at the current level in the model's method execution list.

Note The next command has the same effect as the `step over` command. See `step` for more information.

See Also

`step`

Introduced before R2006a

probe

I/O and state data for blocks

Syntax

```
probe
probe s:b
probe modelName s:b
probe gcb
probe level level-type
p
```

Description

`probe` sets the Simulink debugger to interactive probe mode. In this mode, the debugger displays the I/O of a selected block. To exit interactive probe mode, enter a debugger command or press the **Enter** key.

`probe` *`s`*`:`*`b`* displays the I/O of the block whose system index is *`s`* and block index is *`b`*.

`probe` *`modelName s`*`:`*`b`* displays the I/O of the block system index is *`s`* and block index is *`b`* in the *`modelName`* model.

`probe gcb` displays the I/O of the currently selected block.

`probe level` *`level-type`* sets the verbosity level for `probe`, `trace`, and `dis`. If *`level-type`* is `io`, the debugger displays block I/O. If *`level-type`* is `all` (default), the debugger displays all information for the current state of a block, including inputs and outputs, states, and zero crossings.

`p` is the short form of the command.

Examples

Display I/O for the currently selected block `Out2` in the model `vdp` using the Simulink debugger.

1. In the MATLAB Command Window, enter:

   ```
   sldebug 'vdp'
   ```

   The MATLAB command prompt >> changes to the Simulink debugger prompt (sldebug @0): >>.

2. Enter:

   ```
   probe gcb
   ```

   The MATLAB Command Window displays:

   ```
   probe: Data of 0:3 Outport block 'vdp/Out2':
   U1     = [0]
   ```

See Also

`disp` | `trace`

Introduced in R2007a

quit

Stop simulation debugger

Syntax

```
quit
q
```

Description

`quit` stops the Simulink debugger and returns to the MATLAB command prompt.

`q` is the short form of the command.

Examples

Start the Simulink debugger for the model `vdp` and then stop it.

1. In the MATLAB Command Window, enter:

   ```
   sldebug 'vdp'
   ```

   The MATLAB command prompt >> changes to the Simulink debugger prompt (sldebug @0): >>.
2. Enter:

   ```
   quit
   ```

See Also

`stop`

Introduced before R2006a

rbreak

Break simulation before solver reset

Syntax

```
rbreak
rb
```

Description

`rbreak` enables (or disables) a solver reset breakpoint if the breakpoint is disabled (or enabled). The breakpoint causes the debugger to halt the simulation whenever an event requires a solver reset. The halt occurs before the solver resets.

`rb` is the short form of the command.

Examples

Start Simulink debugger for the model `vdp` and a set breakpoint before a solver reset.

1. In the MATLAB Command Window, enter:

   ```
   sldebug 'vdp'
   ```

   The MATLAB command prompt >> is replaced with the Simulink debugger prompt (sldebug @0): >>.
2. Enter:

   ```
   rbreak
   ```

   The MATLAB Command Window displays:

   ```
   Break on solver reset request              : enabled
   ```

`bafter` | `break` | `ebreak` | `nanbreak` | `tbreak` | `xbreak` | `zcbreak`

Introduced before R2006a

run

Run simulation to completion

Syntax

```
run
r
```

Description

`run` starts the simulation from the current breakpoint to its final time step. It ignores breakpoints and display points.

`r` is the short form of the command

Examples

Continue the simulation for the model `vdp` using the Simulink debugger.

1 In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt >> changes to the Simulink debugger prompt (sldebug @0): >>.

2 Enter:

```
run
```

See Also

`continue` | `quit` | `stop`

Introduced before R2006a

slist

Sorted list of model blocks

Syntax

```
slist
sli
```

Description

`slist` displays a list of blocks for the root system and each nonvirtual subsystem sorted according to data dependencies and other criteria.

For each system (root or nonvirtual), `slist` displays:

- Title line specifying the name of the system, the number of nonvirtual blocks that the system contains, and the number of blocks in the system that have direct feedthrough ports.
- Entry for each block in the order in which the blocks appear in the sorted list.

For each block entry, `slist` displays the block ID and the name and type of the block. The block ID consists of a system index and a block index separated by a colon (`sysIdx:blkIdx`).

- Block index is the position of the block in the sorted list.
- System index is the order in which the Simulink software generated the system sorted list. The system index has no special significance. It simply allows blocks that appear in the same position in different sorted lists to have unique identifiers.

Simulink software uses sorted lists to create block method execution lists (see `elist`) for root system and nonvirtual subsystem methods. In general, root system and nonvirtual subsystem methods invoke the block methods in the same order as the blocks appear in the sorted list.

Exceptions occur in the execution order of block methods. For example, execution lists for multicast models group together all blocks operating at the same rate and in the same task. Slower groups appear later than faster groups. The grouping of methods by task can result in a block method execution order that is different from the block sorted order. However, within groups, methods execute in the same order as the corresponding blocks appear in the sorted list.

`sli` is the short form of the command.

Examples

Display a sorted list of the root system in the `vdp` model using the Simulink debugger.

1. In the MATLAB Command Window, enter:

   ```
   sldebug 'vdp'
   ```

   The MATLAB command prompt >> changes to the Simulink debugger prompt (sldebug @0): >>.
2. Enter:

   ```
   slist
   ```

   The MATLAB Command Window displays:

   ```
   ---- Sorted list for 'vdp' [9 nonvirtual blocks, directFeed=0]
     0:0    'vdp/x1' (Integrator)
     0:1    'vdp/Out1' (Outport)
     0:2    'vdp/x2' (Integrator)
     0:3    'vdp/Out2' (Outport)
     0:4    'vdp/Scope' (Scope)
     0:5    'vdp/Fcn' (Fcn)
     0:6    'vdp/Product' (Product)
     0:7    'vdp/Mu' (Gain)
     0:8    'vdp/Sum' (Sum)
   ```

See Also

`elist` | `systems`

Introduced before R2006a

states

Current state values

Syntax

```
states
```

Description

`states` displays a list of the current states of the model. The list includes the index, current value, system:block:element ID, state vector name, and block name for each state.

Examples

Display information about the states for the `vdp` model.

1. In the MATLAB Command Window, enter:

   ```
   sldebug 'vdp'
   ```

   The MATLAB command prompt >> changes to the Simulink debugger prompt (sldebug @0): >>.
2. Enter:

   ```
   states
   ```

   The MATLAB Command Window displays:

   ```
   Continuous States:
   Idx  Value                    (system:block:element  Name   'BlockName')
     0  0                        (0:0:0  CSTATE  'vdp/x1')
     1  0                        (0:2:0  CSTATE  'vdp/x2')
   ```

Introduced before R2006a

status

Debugging options in effect

Syntax

Description

Display a list of the debugging options in effect.

Examples

View Debugger Status for vdp

Start the debugger with vdp. The command prompt changes to the Simulink debugger prompt (sldebug @0): >>.

```
sldebug 'vdp'
```

Display the debugging status.

```
status
```

```

```

Introduced before R2006a

step

Advance simulation by one or more methods

Syntax

```
step
step in
step over
step out
step top
step blockmth
s
```

Description

`step` or `step in` advances the simulation to the next method in the current time step.

`step over` advances the simulation over the next method.

`step out` advances the simulation the end of the current simulation point hierarchy.

`step top` advances the simulation to the first method executed in the next time step.

`step blockmth` advances the simulation to the next method that operates on a block.

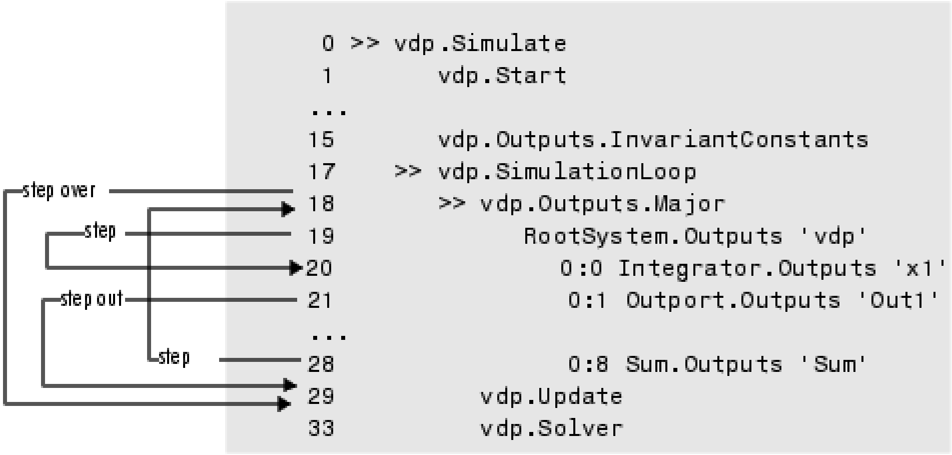
`s` is the short form of the command.

If `step` advances the simulation to the start of a block method, the debugger points at the block on which the method operates.

.

Examples

The following diagram illustrates the effect of various forms of the `step` command for the model `vdp`.



```
 0 >> vdp.Simulate
 1       vdp.Start
...
15       vdp.Outputs.InvariantConstants
17    >> vdp.SimulationLoop
18       >> vdp.Outputs.Major
19             RootSystem.Outputs 'vdp'
20                0:0 Integrator.Outputs 'x1'
21                 0:1  Outport.Outputs 'Out1'
...
28                 0:8 Sum.Outputs 'Sum'
29          vdp.Update
33          vdp.Solver
```

`elist` | `next` | `where`

Introduced in R2007a

stimes

Model sample times

Syntax

```
stimes
sti
```

Description

`stimes` displays information about the model sample times, including the sample time period, offset, and task ID.

`sti` is the short form of the command.

Examples

Display sample times for the model `vdp` using the Simulink debugger.

1. In the MATLAB Command Window, enter:

   ```
   sldebug 'vdp'
   ```

   The MATLAB command prompt >> changes to the Simulink debugger prompt (sldebug @0): >>.

2. Enter:

   ```
   stimes
   ```

   The MATLAB Command Window displays:

   ```
   --- Sample times  for 'vdp' [Number of sample times = 1]
     1. [0     , 0     ]  tid=0 (continuous sample time)
   ```

Introduced before R2006a

stop

Stop simulation

Syntax

```
stop
```

Description

`stop` stops the simulation of the model you are debugging.

Examples

Start and stop a simulation for the model `vdp` using the Simulink debugger.

1. Start a debugger session. In the MATLAB Command Window, enter:

   ```
   sldebug 'vdp'
   ```

   The MATLAB command prompt >> changes to the Simulink debugger prompt (sldebug @0): >>.
2. Start a simulation of the model. Enter:

   ```
   run
   ```
3. Stop the simulation. Enter:

   ```
   stop
   ```

See Also

`continue` | `quit` | `run`

Introduced before R2006a

strace

Set solver trace level

Syntax

```
strace level
i
```

Description

`strace level` causes the solver to display diagnostic information in the MATLAB Command Window, depending on the value of `level`. Values are `0` (no information) or `1` (maximum information about time steps, integration steps, zero crossings, and solver resets).

`i` is the short form of the command.

Examples

Display maximum information about a simulation for the model `vdp` using the Simulink debugger.

1 In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt `>>` changes to the Simulink debugger prompt (sldebug @0): `>>`.

2 Get information about the notation . Enter:

```
help time
```

The MATLAB Command Window displays:

```
Time is displayed as:
 TM = <time while in MajorTimeStep>
 Tm = <time while in MinorTImeStep>
 Tr = <time while in solver reset>
 Tz = <time at or just after zero crossing>
 TzL = <time while in major step just before (at left post of) zero crossing>
 TzR = <time while in major step at or just after (at right post of) zero crossing>
 Ts = <time of successful integration step>
 Tf = <time of failed integration step>
 Tn = <time while in Newton iteration> (when using implicit solvers)
 Tj = <time during Jacobian evaluation> (when using implicit solvers)

Step size is displayed as:
 Hm = <step size at the start of solver phase>
 Hs = <successful  integration step size>
 Hf = <failed integration step size>
 Hn = <step size during Newton iteration> (when using implicit solvers)
 Hz = <value of 'TM - TzL' during zero crossing search>
 Iz= <value of 'Tz - TzL' during zero crossing search>
```

3 Set trace to display all information. Enter:

```
strace 1
```

When diagnostic tracing is on, the debugger displays the sizes of major and minor time steps.

```
[TM = 13.21072088374186 ] Start of Major Time Step
[Tm = 13.21072088374186 ] Start of Minor Time Step
```

The debugger displays integration information. This information includes the time step of the integration method, step size of the integration method, outcome of the integration step, normalized error, and index of the state.

```
[Tm = 13.21072088374186 ] [H  = 0.2751116230148764 ] Begin Integration Step
[Tf = 13.48583250675674 ] [Hf = 0.2751116230148764 ] Fail  [Er = 1.0404e+000]
    [Ix = 1]
[Tm = 13.21072088374186 ] [H  = 0.2183536061326544 ] Retry
[Ts = 13.42907448987452 ] [Hs = 0.2183536061326539 ] Pass  [Er = 2.8856e-001]
    [Ix = 1]
```

For zero crossings, the debugger displays information about the iterative search algorithm when the zero crossing occurred. This information includes the time step of the zero crossing, step size of the zero crossing detection algorithm, length of the time interval bracketing the zero crossing, and a flag denoting the rising or falling direction of the zero crossing.

```
[Tz = 3.615333333333301 ] Detected 1 Zero Crossing Event 0[F]
                         Begin iterative search to bracket zero crossing event
[Tz = 3.621111157580072 ] [Hz = 0.005777824246771424 ] [Iz = 4.2222e-003] 0[F]
[Tz = 3.621116982080098 ] [Hz = 0.005783648746797265 ] [Iz = 4.2164e-003] 0[F]
[Tz = 3.621116987943544 ] [Hz = 0.005783654610242994 ] [Iz = 4.2163e-003] 0[F]
[Tz = 3.621116987943544 ] [Hz = 0.005783654610242994 ] [Iz = 1.1804e-011] 0[F]
[Tz = 3.621116987949452 ] [Hz = 0.005783654616151157 ] [Iz = 5.8962e-012] 0[F]
[Tz = 3.621116987949452 ] [Hz = 0.005783654616151157 ] [Iz = 5.1514e-014] 0[F]
                         End iterative search to bracket zero crossing event
```

When a solver resets occur, the debugger displays the time at which the solver was reset.

```
[Tr = 6.246905153573676 ] Process Solver Reset
[Tr = 6.246905153573676 ] Reset Zero Crossing Cache
[Tr = 6.246905153573676 ] Reset Derivative Cache
```

systems

List nonvirtual systems of model

Syntax

```
systems
sys
```

Description

`systems` displays the nonvirtual subsystems for a model in the MATLAB Command Window.

`sys` is the short form of the command.

Examples

Display the nonvirtual systems for the model `sldemo_enginewc` using the Simulink debugger.

1. In the MATLAB Command Window, enter:

   ```
   sldebug 'sldemo_enginewc'
   ```

   The MATLAB command prompt >> changes to the Simulink debugger prompt (sldebug @0): >>.
2. Enter:

   ```
   systems
   ```

   The MATLAB Command Window displays the nonvirtual subsystems.

   ```
    0   'sldemo_enginewc'
    2   'sldemo_enginewc/Compression'
    3   'sldemo_enginewc/Controller'
    4   'sldemo_enginewc/Throttle & Manifold/Throttle/TmpAtomicSubsysAtSwitchInport1'
    5   'sldemo_enginewc/valve timing/positive edge to dual edge conversion'
   ```

See Also

`slist`

Introduced before R2006a

tbreak

Set or clear time breakpoint

Syntax

```
tbreak
```

```
tb
```

```
tbreak t
```

Description

The `tbreak` command sets a breakpoint at the specified time step. If a breakpoint already exists at the specified time, `tbreak` clears the breakpoint. If you do not specify a time, `tbreak` toggles a breakpoint at the current time step.

Instead of `tbreak`, you can use the short form of `tb`, with or without `t`.

Topics

`ebreak`

Introduced before R2006a

trace

Display block's I/O each time block executes

Syntax

```
trace gcb
trace s:b
```

```
tr gcb
trace s:b
```

Arguments

`s:b`	The block whose system index is `s` and block index is `b`.
`gcb`	Current block.

Description

The `trace` command registers a block as a trace point. The debugger displays the I/O of each registered block each time the block executes.

See Also

`disp` | `probe` | `slist` | `strace` | `untrace`

Introduced before R2006a

undisp

Remove block from debugger's list of display points

Syntax

```
undisp gcb
```

```
und gcb
```

```
undisp s:b
```

```
und s:b
```

Arguments

`s:b`	The block whose system index is `s` and block index is `b`.
`gcb`	Current block.

Description

The `undisp` command removes the specified block from the debugger's list of display points.

See Also

`disp` | `slist`

Introduced before R2006a

untrace

Remove block from debugger's list of trace points

Syntax

```
untrace gcb
```

```
unt gcb
```

```
untrace s:b
```

```
unt s:b
```

Arguments

`s:b`	The block whose system index is `s` and block index is `b`.
`gcb`	Current block.

Description

The `untrace` command removes the specified block from the debugger's list of trace points.

See Also

`slist` | `trace`

Introduced before R2006a

where

Display current location of simulation in simulation loop

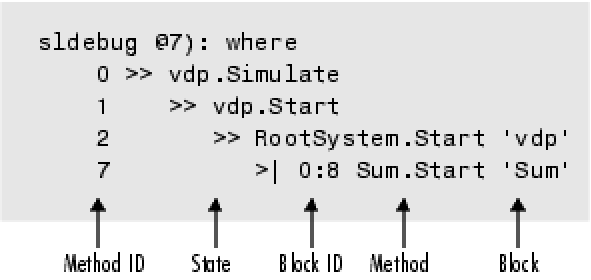
Syntax

```
where [detail]
```

```
w [detail]
```

Description

The `where` command displays the current location of the simulation in the simulation loop, for example,



```
sldebug @7): where
    0 >> vdp.Simulate
    1    >> vdp.Start
    2       >> RootSystem.Start 'vdp'
    7          >| 0:8 Sum.Start 'Sum'
```

The display consists of a list of simulation nodes with the last entry being the node that is about to be entered or exited. Each entry contains the following information:

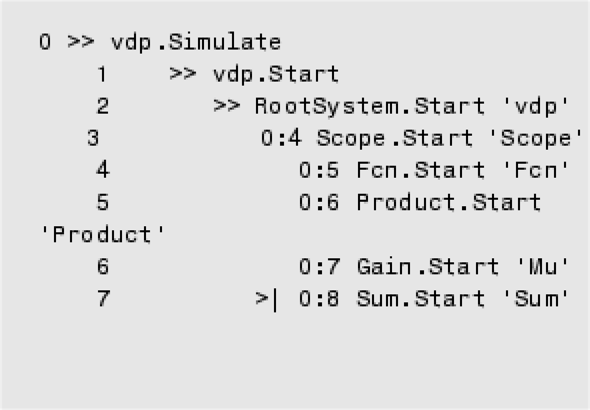
- Method ID

  The method ID identifies a specific invocation of a method.
- A symbol specifying its state:
  - `>>` (active)
  - `>|`(about to be entered)
  - `<|`(about to be exited)

- Name of the method invoked (e.g., RootSystem.Start)
- Name of the block or system on which the method is invoked (e.g., Sum)
- System and block ID (`sysIdx:blkIdx`) of the block on which the method is invoked

  For example, `0:8` indicates that the specified method operates on block `8` of system `0`.

`where detail`, where `detail` is any nonnegative integer, includes inactive nodes in the display.



```
0 >> vdp.Simulate
     1    >> vdp.Start
     2       >> RootSystem.Start 'vdp'
    3           0:4 Scope.Start 'Scope'
     4             0:5 Fcn.Start 'Fcn'
     5             0:6 Product.Start
'Product'
     6             0:7 Gain.Start 'Mu'
     7          >| 0:8 Sum.Start 'Sum'
```

See Also

`step`

Introduced before R2006a

xbreak

Break when debugger encounters step-size-limiting state

Syntax

```
xbreak
```

```
x
```

Description

The `xbreak` command pauses execution of the model when the debugger encounters a state that limits the size of the steps that the solver takes. If `xbreak` mode is already on, `xbreak` turns the mode off.

See Also

`bafter` | `break` | `nanbreak` | `rbreak` | `tbreak` | `zcbreak`

Topics

`ebreak`

Introduced before R2006a

zcbreak

Toggle breaking at nonsampled zero-crossing events

Syntax

```
zcbreak
```

```
zcb
```

Description

The `zcbreak` command causes the debugger to break when a nonsampled zero-crossing event occurs. If zero-crossing break mode is already on, `zcbreak` turns the mode off.

See Also

`bafter` | `break` | `nanbreak` | `tbreak` | `xbreak` | `zclist`

zclist

List blocks containing nonsampled zero crossings

Syntax

```
zclist
```

```
zcl
```

Description

The `zclist` command displays a list of blocks in which nonsampled zero crossings can occur. The command displays the list in the MATLAB Command Window.

See Also

`zcbreak`

Introduced before R2006a

Simulink Classes

eventData	Provide information about block method execution events
Simulink.Annotation	Specify properties of model annotation
Simulink.BlockCompDworkData	Provide postcompilation information about block's DWork vector
Simulink.BlockCompInputPortData	Provide postcompilation information about block input port
Simulink.BlockCompOutputPortData	Provide postcompilation information about block output port
Simulink.BlockData	Provide run-time information about block-related data, such as block parameters
Simulink.BlockPath	Fully specified Simulink block path
Simulink.BlockPortData	Describe block input or output port
Simulink.BlockPreCompInputPortData	Provide precompilation information about block input port
Simulink.BlockPreCompOutputPortData	Provide precompilation information about block output port
Simulink.ConfigSetRef	Link model to configuration set stored independently of any model
Simulink.GlobalDataTransfer	Configure concurrent execution data transfers
Simulink.MDLInfo	Extract model file information without loading block diagram into memory
getDescription	Extract model file description without loading block diagram into memory
getMetadata	Extract model file metadata without loading block diagram into memory
Simulink.ModelAdvisor	Run Model Advisor from MATLAB file
Simulink.ModelDataLogs	Container for signal data logs of a model
Simulink.SimState.ModelSimState	Access SimState snapshot data
Simulink.MSFcnRunTimeBlock	Get run-time information about Level-2 MATLAB S-function block
Simulink.RunTimeBlock	Allow Level-2 MATLAB S-function and other MATLAB programs to get information about block while simulation is running

matlab.io.datastore.sdidatastore class

Package: matlab.io.datastore

Datastore for Simulation Data Inspector signals

Description

A `matlab.io.datastore.sdidatastore` object provides access to signals logged to the Simulation Data Inspector that are too large to fit into memory. An `sdidatastore` object references the data for a single signal. The `read` method loads the signal data referenced by an `sdidatastore` object in a chunk-wise manner such that each chunk always fits into memory. You can use an `sdidatastore` object to create a tall timetable for your signal data. For more information about working with tall arrays, see “Tall Arrays” (MATLAB).

Note `matlab.io.datastore.sdidatastore` does not support parallel computations. If you have a Parallel Computing Toolbox license, use `mapreducer(0)` to set the execution environment to the local MATLAB client before creating a tall timetable from the `matlab.io.datastore.sdidatastore`.

Construction

`ds = dsrObj.getAsDatastore(arg)` creates the `sdidatastore`, `ds`, for the signal in the `Simulink.sdi.DatasetRef` object selected by the search criterion `arg`. You can specify `arg` as an integer representing the index of the desired signal within the `Simulink.sdi.DatasetRef` object, or as a character vector containing the name of the signal.

`ds = matlab.io.datastore.sdidatastore(signalID)` creates the `sdidatastore`, `ds`, for the signal corresponding to the specified `signalID`.

Input Arguments

arg — Element selection criterion
character vector | integer

Search criterion used to retrieve the element from the `Simulink.sdi.DatasetRef` object. For name-based searches, specify `arg` as a character vector. For index-based searches, `arg` is an integer, representing the index of the desired element.

Example: `'MySignal'`

Example: `3`

`signalID` — Numeric signal identifier

integer

Numeric signal identifier generated for the signal by the Simulation Data Inspector. You can get the signal ID for a signal using methods of the `Simulink.sdi.Run` object containing the signal or as a return from the `Simulink.sdi.createRun` function.

Properties

`Name` — Signal name

character vector

Name of the signal specified as a character vector.

Example: `'My Signal'`

`Signal` — Simulink.sdi.Signal object

`Simulink.sdi.Signal` object

`Simulink.sdi.Signal` object associated with the `sdidatastore`. The `Signal` property provides access to the signal data and metadata.

Methods

hasdata	Determine if data is available to read
preview	Return preview of data in sdidatstore
read	Read a chunk of data from an sdidatastore
readall	Read all data from an sdidatastore
reset	Reset the read position

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Create a Tall Timetable for a Simulation Data Inspector Signal

This example shows how to create a tall timetable for a signal in the Simulation Data Inspector repository. You can create the tall timetable using a `Simulink.sdi.Signal` object or by first creating a `matlab.io.datastore.sdidatastore` for the signal. You can use a `matlab.io.datastore.sdidatastore` to incrementally read and process signal data for signals that do not fit into memory. A tall timetable handles the data chunking and processing in the background. In general, you can work with tall timetables very similarly to how you work with in-memory data.

Create Data and Access Signal ID

Whether you create your tall timetable using a `Simulink.sdi.Signal` object or a `matlab.io.datastore.sdidatastore`, start by creating data and accessing the signal ID for a signal of interest. The `sldemo_fuelsys` model is configured to log signals which stream to the Simulation Data Inspector repository when you simulate the model.

```
open_system('sldemo_fuelsys')
sim('sldemo_fuelsys')
```

Then, use the Simulation Data Inspector programmatic interface to access the signal ID for a signal of interest. For example, access the `ego` signal.

```
runCount = Simulink.sdi.getRunCount;
latestRunID = Simulink.sdi.getRunIDByIndex(runCount);
latestRun = Simulink.sdi.getRun(latestRunID);

egoSigID = latestRun.getSignalIDByIndex(7);
```

Create a Tall Timetable Using a `matlab.io.datastore.sdidatastore`

In general, tall timetables are backed by datastores. Create a `matlab.io.datastore.sdidatastore` object to reference the signal data in the Simulation Data Inspector repository.

```
egoDs = matlab.io.datastore.sdidatastore(egoSigID);
```

Check the name of the datastore to verify you have the signal you expect.

```
egoDs.Name
```

```
ans = 
'ego'
```

Create a tall timetable from the `matlab.io.datastore.sdidatastore` to use for processing the signal data. When you have a Parallel Computing Toolbox™ license, you need to explicitly set the execution environment to the local MATLAB® session using `mapreducer` before creating the tall timetable. The `matlab.io.datastore.sdidatastore` object does not support parallel computations.

```
mapreducer(0);
```

```
egoTt = tall(egoDs)
```

```
egoTt =

  Mx1 tall timetable

         Time          Data
    ______________     ____

    0 sec               1  
    0.00056199 sec      1  
    0.0033719 sec       1  
    0.01 sec            1  
    0.02 sec            1  
    0.03 sec            1  
    0.04 sec            1  
    0.05 sec            1  
          :             :
          :             :
```

Create a Tall Timetable Using a `Simulink.sdi.Signal` Object

The `Simulink.sdi.Signal` class has a method to create a tall timetable directly, allowing you to skip the step of creating a datastore by creating it behind the scenes. Use the signal ID to access the `Simulink.sdi.Signal` object for the `ego` signal. Then, use the `getTable` method to create the tall timetable.

```
egoSig = Simulink.sdi.getSignal(egoSigID);

egoTt = egoSig.getAsTall

egoTt =

  Mx1 tall timetable

         Time          Data
    ______________    ____

    0 sec               1
    0.00056199 sec      1
    0.0033719 sec       1
    0.01 sec            1
    0.02 sec            1
    0.03 sec            1
    0.04 sec            1
    0.05 sec            1
          :             :
          :             :
```

Use the Tall Timetable to Process Your Signal Data

When you use the tall timetable egoTt, its underlying datastore reads chunks of data and passes them to the tall timetable to process. Neither the datastore nor the tall timetable retain any of the data in memory after processing. Also, the tall timetable defers processing for many operations. For example, calculate the mean value of the signal.

```
egoMean = mean(egoTt.Data)

egoMean =

  tall double

    ?
```

You can use the gather function to evaluate a variable and write its value to the workspace, or you can use the write function to write the results to disc. When you use gather, be sure the results fit into memory.

```
egoMean = gather(egoMean)
```

```
Evaluating tall expression using the Local MATLAB Session:
- Pass 1 of 1: Completed in 5.9 sec
Evaluation completed in 6.2 sec

egoMean = 0.5008
```

When you perform multiple operations on a tall timetable, evaluation of the results for each step is deferred until you explicitly request the results with `write` or `gather`. During evaluation, MATLAB optimizes the number of passes it makes through the tall timetable, which can significantly speed up processing time for analyzing very large signals. For more information about working with tall arrays, see “Tall Arrays” (MATLAB).

Process Signal Data Using a `matlab.io.datastore.sdidatastore`

A `matlab.io.datastore.sdidatastore` references signal data in the Simulation Data Inspector repository. When the signal is too large to fit into memory, you can use the `matlab.io.datastore.sdidatastore` to incrementally process the data manually or to create a tall timetable for the signal that handles the incremental processing for you. This example shows how to process data using a `matlab.io.datastore.sdidatastore`.

Create a `matlab.io.datastore.sdidatastore` for a Signal

Simulate the `sldemo_fuelsys` model, which is configured to log several signals, to create data in the Simulation Data Inspector repository.

```
sim('sldemo_fuelsys')
```

Use the Simulation Data Inspector programmatic interface to get the signal ID for the signal.

```
runCount = Simulink.sdi.getRunCount;

latestRunID = Simulink.sdi.getRunIDByIndex(runCount);

latestRun = Simulink.sdi.getRun(latestRunID);

speedSigID = latestRun.getSignalIDByIndex(4);
```

Use the signal ID to create a `matlab.io.datastore.sdidatastore` for the `speed` signal.

```
speedSDIds = matlab.io.datastore.sdidatastore(speedSigID);
```

Verify the Contents of the Datastore

Check the `Name` property of the `matlab.io.datastore.sdidatastore` to verify that it matches your expectations.

```
speedSDIds.Name
```

```
ans = 
'speed'
```

You can also use the `preview` method to check that the first ten samples in the signal look correct.

```
speedSDIds.preview
```

```
ans=10×1 timetable
         Time           Data
    ______________      ____

    0 sec               300 
    0.00056199 sec      300 
    0.0033719 sec       300 
    0.01 sec            300 
    0.02 sec            300 
    0.03 sec            300 
    0.04 sec            300 
    0.05 sec            300 
    0.055328 sec        300 
    0.055328 sec        300 
```

Process Signal Data with the `matlab.io.datastore.sdidatastore`

When your signal is too large to fit into memory, you can use the `readData` method to read chunks of data from the Simulation Data Inspector repository to incrementally process your data. Use the `hasdata` method as the condition for a while loop to incrementally process the whole signal. For example, find the maximum signal value.

```
latestMax = [];

while speedSDIds.hasdata

    speedChunk = speedSDIds.read;
    speedChunkData = speedChunk.Data;
    latestMax = max([speedChunkData; latestMax]);
```

```
end
```

```
latestMax
```

```
latestMax = 300
```

On each read operation, the `read` method updates the read position for the start of the next read operation. After reading some or all of the `matlab.io.datastore.sdidatastore`, you can reset the read position to start again from the beginning of the signal.

```
speedSDIds.reset
```

Process Signal Data in Memory

When the signal referenced by your `matlab.io.datastore.sdidatastore` fits into memory, you can use the `readall` method to read all the signal data into memory for processing, rather than reading and processing the data incrementally with the `read` method. The `readall` method returns a `timetable` with all the signal data.

```
speedTimetable = speedSDIds.readall;
```

```
speedMax = max(speedTimetable.Data)
```

```
speedMax = 300
```

matlab.io.datastore.sdidatastore.hasdata

Class: matlab.io.datastore.sdidatastore
Package: matlab.io.datastore

Determine if data is available to read

Syntax

```
tf = sdi_ds.hasdata
```

Description

`tf = sdi_ds.hasdata` returns logical `1` if the `matlab.io.datastore.sdidatastore`, `sdi_ds`, has data available to read. When `sdi_ds` does not have data available to read, `hasdata` returns `0`.

Output Arguments

`tf` — Data availability indication
logical

Logical indication of whether the `matlab.io.datastore.sdidatastore` has data available to read. When data is available, `tf` is `1`. When data is not available, `tf` is `0`.

Examples

matlab.io.datastore.sdidatastore.preview

Class: matlab.io.datastore.sdidatastore
Package: matlab.io.datastore

Return preview of data in sdidatstore

Syntax

```
dataPreview = sdi_ds.preview
```

Description

`dataPreview = sdi_ds.preview` returns the first 10 samples of signal data in the `matlab.io.datastore.sdidatastore`, `sdi_ds`. The `preview` method does not change the read position. Use the `preview` method to verify that the data in your `matlab.io.datastore.sdidatastore` appears as you expect.

Output Arguments

`dataPreview` — Preview of the data
`timetable`

First 10 samples of the signal referenced by the `matlab.io.datastore.sdidatastore` in a `timetable`.

Examples

Introduced in R2017b

matlab.io.datastore.simulationdatastore.sdidatastore.read

Read a chunk of data from an sdidatastore

Syntax

```
data = sdi_ds.read
```

Description

`data = sdi_ds.read` reads a chunk of samples from the `matlab.io.datastore.sdidatastore`, `sdi_ds`, and updates the read position for `sdi_ds` to the point following the endpoint of the returned data. The samples are returned in the `timetable`, `data`. The number of samples read by the `read` method vary, and the returned `timetable` always fits into memory. Use the `read` method to incrementally process signals that are too large to fit into memory.

Output Arguments

data — Chunk of data read from sdidatastore
`timetable`

Chunk of samples read from the `matlab.io.datastore.simulationdatastore`, returned as a `timetable`.

Examples

Process Signal Data Using a `matlab.io.datastore.sdidatastore`

A `matlab.io.datastore.sdidatastore` references signal data in the Simulation Data Inspector repository. When the signal is too large to fit into memory, you can use the `matlab.io.datastore.sdidatastore` to incrementally process the data manually or to create a tall timetable for the signal that handles the incremental processing for you. This example shows how to process data using a `matlab.io.datastore.sdidatastore`.

    0.05 sec              300
    0.055328 sec          300
    0.055328 sec          300
```

Process Signal Data with the `matlab.io.datastore.sdidatastore`

When your signal is too large to fit into memory, you can use the `readData` method to read chunks of data from the Simulation Data Inspector repository to incrementally process your data. Use the `hasdata` method as the condition for a while loop to incrementally process the whole signal. For example, find the maximum signal value.

```
latestMax = [];

while speedSDIds.hasdata

    speedChunk = speedSDIds.read;
    speedChunkData = speedChunk.Data;
    latestMax = max([speedChunkData; latestMax]);

end

latestMax
```

```
latestMax = 300
```

On each read operation, the `read` method updates the read position for the start of the next read operation. After reading some or all of the `matlab.io.datastore.sdidatastore`, you can reset the read position to start again from the beginning of the signal.

```
speedSDIds.reset
```

Process Signal Data in Memory

When the signal referenced by your `matlab.io.datastore.sdidatastore` fits into memory, you can use the `readall` method to read all the signal data into memory for

processing, rather than reading and processing the data incrementally with the `read` method. The `readall` method returns a `timetable` with all the signal data.

```
speedTimetable = speedSDIds.readall;
```

```
speedMax = max(speedTimetable.Data)
```

```
speedMax = 300
```

Alternatives

You can use your `matlab.io.datastore.sdidatastore` to create a tall timetable to process signals too large to fit into memory. The tall timetable handles loading and processing the chunks of signal data for you. The `matlab.io.datastore.sdidatastore` reference page includes an example that shows how to process your data using a tall timetable. For more information about working with tall timetables, see “Tall Arrays” (MATLAB).

`matlab.io.datastore.sdidatastore`

Topics

“Datastore” (MATLAB)

Introduced in R2017b

matlab.io.datastore.sdidatastore.readall

Class: matlab.io.datastore.sdidatastore
Package: matlab.io.datastore

Read all data from an sdidatastore

Syntax

```
data = sdi_ds.readall
```

Description

`data = sdi_ds.readall` reads all the data in the `matlab.io.datastore.sdidatastore`, `sdi_ds`, into memory, returning the `timetable`, `data`. Use `readall` only when the signal referenced by the `matlab.io.datastore.sdidatastore` fits into memory.

Output Arguments

`data` — timetable of data
`timetable`

All the data in the `matlab.io.datastore.sdidatastore`, returned in a `timetable`.

Examples

Process Signal Data Using a `matlab.io.datastore.sdidatastore`

A `matlab.io.datastore.sdidatastore` references signal data in the Simulation Data Inspector repository. When the signal is too large to fit into memory, you can use the `matlab.io.datastore.sdidatastore` to incrementally process the data manually or to create a tall timetable for the signal that handles the incremental processing for you.

This example shows how to process data using a `matlab.io.datastore.sdidatastore`.

Create a `matlab.io.datastore.sdidatastore` for a Signal

Simulate the `sldemo_fuelsys` model, which is configured to log several signals, to create data in the Simulation Data Inspector repository.

```
sim('sldemo_fuelsys')
```

Use the Simulation Data Inspector programmatic interface to get the signal ID for the signal.

```
runCount = Simulink.sdi.getRunCount;

latestRunID = Simulink.sdi.getRunIDByIndex(runCount);

latestRun = Simulink.sdi.getRun(latestRunID);

speedSigID = latestRun.getSignalIDByIndex(4);
```

Use the signal ID to create a `matlab.io.datastore.sdidatastore` for the `speed` signal.

```
speedSDIds = matlab.io.datastore.sdidatastore(speedSigID);
```

Verify the Contents of the Datastore

Check the `Name` property of the `matlab.io.datastore.sdidatastore` to verify that it matches your expectations.

```
speedSDIds.Name
```

```
ans = 
'speed'
```

You can also use the `preview` method to check that the first ten samples in the signal look correct.

```
speedSDIds.preview
```

```
ans=10×1 timetable
         Time          Data
    ______________    ____
    0 sec                 300
    0.00056199 sec        300
    0.0033719 sec         300
    0.01 sec              300
    0.02 sec              300
    0.03 sec              300
    0.04 sec              300
    0.05 sec              300
    0.055328 sec          300
    0.055328 sec          300
```

Process Signal Data with the `matlab.io.datastore.sdidatastore`

When your signal is too large to fit into memory, you can use the `readData` method to read chunks of data from the Simulation Data Inspector repository to incrementally process your data. Use the `hasdata` method as the condition for a while loop to incrementally process the whole signal. For example, find the maximum signal value.

```
latestMax = [];

while speedSDIds.hasdata

    speedChunk = speedSDIds.read;
    speedChunkData = speedChunk.Data;
    latestMax = max([speedChunkData; latestMax]);

end

latestMax
```

```
latestMax = 300
```

On each read operation, the `read` method updates the read position for the start of the next read operation. After reading some or all of the `matlab.io.datastore.sdidatastore`, you can reset the read position to start again from the beginning of the signal.

```
speedSDIds.reset
```

Process Signal Data in Memory

When the signal referenced by your `matlab.io.datastore.sdidatastore` fits into memory, you can use the `readall` method to read all the signal data into memory for

processing, rather than reading and processing the data incrementally with the `read` method. The `readall` method returns a `timetable` with all the signal data.

```
speedTimetable = speedSDIds.readall;

speedMax = max(speedTimetable.Data)

speedMax = 300
```

Alternatives

When your signals fit into memory, you can use other classes and functions of the Simulation Data Inspector programmatic interface, like the `Simulink.sdi.Signal` class, to access and process simulation data.

Topics

“Datastore” (MATLAB)

Introduced in R2017b

matlab.io.datastore.SimulationDatastore class

Package: matlab.io.datastore

Datastore for inputs and outputs of Simulink models

Description

A `matlab.io.datastore.SimulationDatastore` object enables a Simulink model to interact with big data. You can load big data as simulation input and log big output data from a simulation. To simulate models with big data, you store the data in a MAT-file and refer to the data through a `SimulationDatastore` object. See “Work with Big Data for Simulations”.

A `SimulationDatastore` object refers to big simulation data (which a MAT-file stores) for one signal. If the MAT-file stores simulation data for a bus signal, a `SimulationDatastore` object refers to the data for one leaf signal element in the bus. You can use the datastore object to inspect and access the data and, through a parent object such as `Simulink.SimulationData.Signal`, simulate a Simulink model with the data.

To analyze the datastore data, you can use the methods and properties of the `SimulationDatastore` object as well as MATLAB tools such as the `tall` function. For more information about the MATLAB tools, see “Getting Started with Datastore” (MATLAB).

Construction

After you store big simulation data in a `Simulink.SimulationData.Dataset` object in a MAT-file, a signal element in the `Dataset` object points to the big data. To create a `matlab.io.datastore.SimulationDatastore` object that refers to the big data:

1. At the command prompt or in a script, create a `Simulink.SimulationData.DatasetRef` object that refers to the `Dataset` object in the MAT-file.

2 Use one of these techniques:

- Use one-based, curly-brace indexing (for example, `{1}`) to return an object that represents the target signal element, such as `Simulink.SimulationData.Signal` or `Simulink.SimulationData.State`. For example, for a `DatasetRef` object named `logsout_ref`, to create a `Signal` object that refers to the second signal element, use this code:

  ```
  myLoggedSig = logsout_ref{2}
  ```
- Use the `getAsDatastore` method of the `DatasetRef` object to return an object that represents the target signal element. For more information, see `Simulink.SimulationData.DatasetRef.getAsDatastore`.

The `SimulationDatastore` object resides in the `Values` property of the returned object.

Properties

`FileName` — Name and path of file that contains big data

character vector

Name and path of the file that contains the big data, returned as a character vector. This property is read-only.

Data Types: `char`

`NumSamples` — Total number of samples (time steps) in the datastore

integer

Total number of samples (time steps) in the datastore, returned as an integer. The `readall` method extracts this many samples from the big data. This property is read-only.

Data Types: `uint64`

ReadSize — Amount of data to read at a time

`100` (default) | scalar double

Amount of data to read at a time, in number of samples (time steps), specified as a scalar double. The `read` method extracts this many samples from the big data.

Data Types: `double`

Methods

hasdata	Determine if data is available to read
preview	Return subset of data from datastore
progress	Return percentage of data that you have read from a datastore
read	Read data in datastore
readall	Read all data in datastore
reset	Reset datastore to initial state

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Limitations

- `SimulationDatastore` does not support using a parallel pool with Parallel Computing Toolbox installed. To analyze data using tall arrays or run MapReduce algorithms, set the global execution environment to be the local MATLAB session using `mapreducer`. Enter this code:

  ```
  mapreducer(0)
  ```

  For information about controlling parallel resources, see “Run mapreduce on a Parallel Pool” (Parallel Computing Toolbox).
- You cannot use a MATLAB tall variable as simulation input data.

Examples

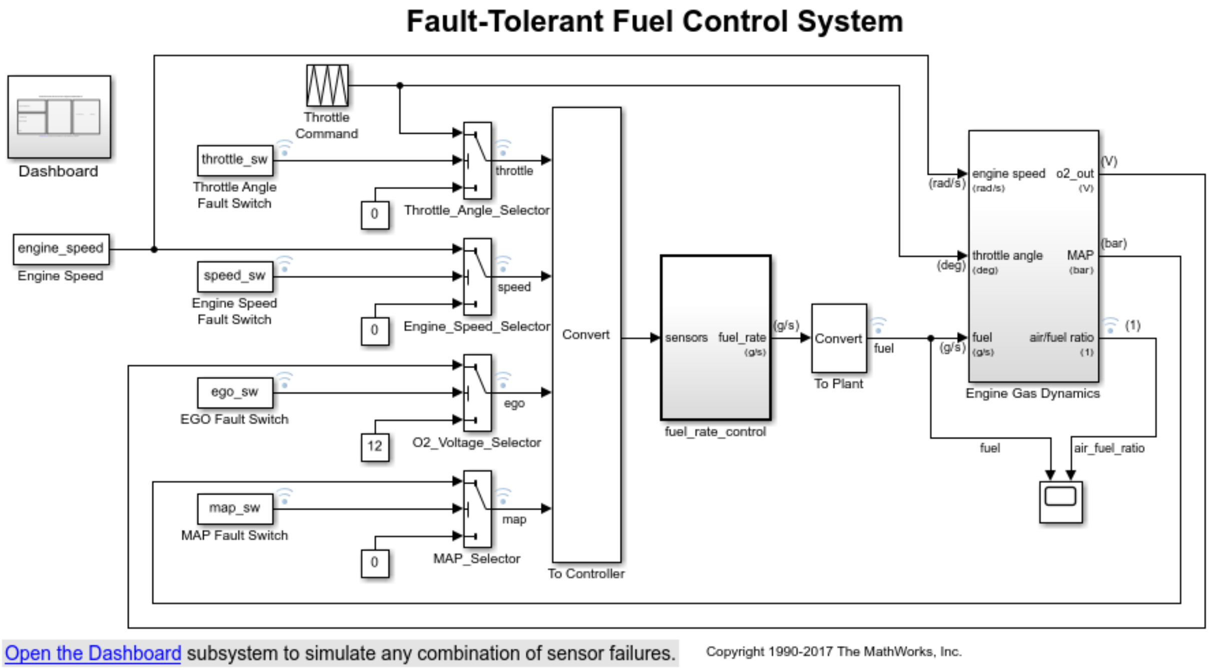
Inspect and Analyze Data in Simulation Datastore

This example shows how to log big data from a simulation and inspect and analyze portions of that data by interacting with a `matlab.io.datastore.SimulationDatastore` object.

Log Big Data from Model

Open the example model `sldemo_fuelsys`.

```
open_system('sldemo_fuelsys')
```



Fault-Tolerant Fuel Control System

Open the Dashboard subsystem to simulate any combination of sensor failures.

Copyright 1990-2017 The MathWorks, Inc.

Select **Configuration Parameters > Data Import/Export > Log Dataset data to file**.

```
set_param('sldemo_fuelsys','LoggingToFile','on')
```

Simulate the model.

```
sim('sldemo_fuelsys')
```

The MAT-file `out.mat` appears in your current folder. The file contains data for logged signals such as `fuel` (which is at the root level of the model).

At the command prompt, create a `DatasetRef` object that refers to the logging variable by name, `sldemo_fuelsys_output`.

```
DSRef = Simulink.SimulationData.DatasetRef('out.mat','sldemo_fuelsys_output');
```

Preview Big Data

Use curly braces ({ and }) to extract the signal element `fuel`, which is the tenth element in `DSRef`, as a `Simulink.SimulationData.Signal` object that contains a `SimulationDatastore` object.

```
SimDataSig = DSRef{10};
```

To more easily interact with the `SimulationDatastore` object that resides in the `Values` property of the `Signal` object, store a handle in a variable named `DStore`.

```
DStore = SimDataSig.Values;
```

Use the `preview` method to inspect the first five samples of logged data for the `fuel` signal.

```
preview(DStore)
```

```
ans =

  10x1 timetable

          Time            Data 
    ______________       ______

    0 sec                 1.209
    0.00056199 sec        1.209
    0.0033719 sec         1.209
    0.01 sec             1.1729
    0.02 sec             1.1409
    0.03 sec             1.1124
    0.04 sec             1.0873
    0.05 sec             1.0652
    0.055328 sec         1.0652
    0.055328 sec         1.0652
```

Inspect Specific Sample

Inspect the 603rd sample of logged `fuel` data.

Set the ReadSize property of DStore to a number that, considering memory resources, your computer can tolerate. For example, set ReadSize to 200.

```
DStore.ReadSize = 200;
```

Read from the datastore three times. Each read operation advances the reading position by 200 samples.

```
read(DStore);
read(DStore);
read(DStore);
```

Now that you are very close to the 603rd sample, set ReadSize to a smaller number. For example, set ReadSize to 5.

```
DStore.ReadSize = 5;
```

Read from the datastore again.

```
read(DStore)
```

```
ans =

  5x1 timetable

      Time       Data 
    ________    ______

    5.79 sec    1.6097
    5.8 sec     1.6136
    5.81 sec    1.6003
    5.82 sec    1.5904
    5.83 sec    1.5832
```

The third sample of read data is the 603rd sample in the datastore.

Inspect Earlier Sample

Inspect the 403rd sample of logged fuel data. Due to previous read operations, the datastore now reads starting from the 606th sample, so you must reset the datastore. Then, you can read from the first sample up to the 403rd sample.

Use the reset method to reset DStore.

```
reset(DStore);
```

Set ReadSize to 200 again.

```
DStore.ReadSize = 200;
```

Read from the datastore twice to advance the read position to the 401st sample.

```
read(DStore);
read(DStore);
```

Set ReadSize to 5 again.

```
DStore.ReadSize = 5;
```

Read from the datastore.

```
read(DStore)
```

```
ans =

  5x1 timetable

      Time        Data  
    ________    ________

    3.85 sec       0.999

    3.87 sec     0.98538
    3.88 sec     0.97858
    3.89 sec     0.97179
```

Extract Multiple Samples

Extract samples 1001 through 1020 (a total of 20 samples).

Reset the datastore.

```
reset(DStore)
```

Advance to sample 1001.

```
DStore.ReadSize = 200;
```

```
for i = 1:5
    read(DStore);
end
```

Prepare to extract 20 samples from the datastore.

```
DStore.ReadSize = 20;
```

Extract samples 1001 through 1020. Store the extracted data in a variable named `targetSamples`.

```
targetSamples = read(DStore)
```

```
targetSamples =

  20x1 timetable

      Time        Data 
    ________    ______

    9.7 sec     1.5828
    9.71 sec    1.5733
    9.72 sec    1.5664
    9.73 sec    1.5614
    9.74 sec    1.5579
    9.75 sec    1.5553
    9.76 sec    1.5703
    9.77 sec     1.582
    9.78 sec    1.5913
    9.79 sec    1.5988
    9.8 sec      1.605
    9.81 sec    1.6101
    9.82 sec    1.6145
    9.83 sec    1.6184
    9.84 sec    1.6049
    9.85 sec     1.595
    9.86 sec    1.5877
    9.87 sec    1.5824
    9.88 sec    1.5785
    9.89 sec    1.5757
```

Find Maximum Value of Data in Datastore

Reset the datastore.

```
reset(DStore)
```

Write a `while` loop, using the `hasdata` method, to incrementally analyze the data in chunks of 200 samples.

```
DStore.ReadSize = 200;
runningMax = [];
while hasdata(DStore)
    tt = read(DStore);
    rawChunk = tt.Data;
    runningMax = max([rawChunk; runningMax]);
end
```

Now, the variable `runningMax` stores the maximum value in the entire datastore.

```
runningMax
```

```
runningMax =

    1.6423
```

Topics

“Work with Big Data for Simulations”

Introduced in R2017a

hasdata

Class: matlab.io.datastore.SimulationDatastore
Package: matlab.io.datastore

Determine if data is available to read

Syntax

```
tf = hasdata(dst)
```

Description

`tf = hasdata(dst)` returns logical `1` (`true`) if there is data available to read from the datastore (`matlab.io.datastore.SimulationDatastore` object) specified by `dst`. Otherwise, it returns logical `0` (`false`).

Input Arguments

`dst` — Input datastore
`matlab.io.datastore.SimulationDatastore` object

Input datastore, specified as a `matlab.io.datastore.SimulationDatastore` object. To create a `SimulationDatastore` object, see `matlab.io.datastore.SimulationDatastore`.

Examples

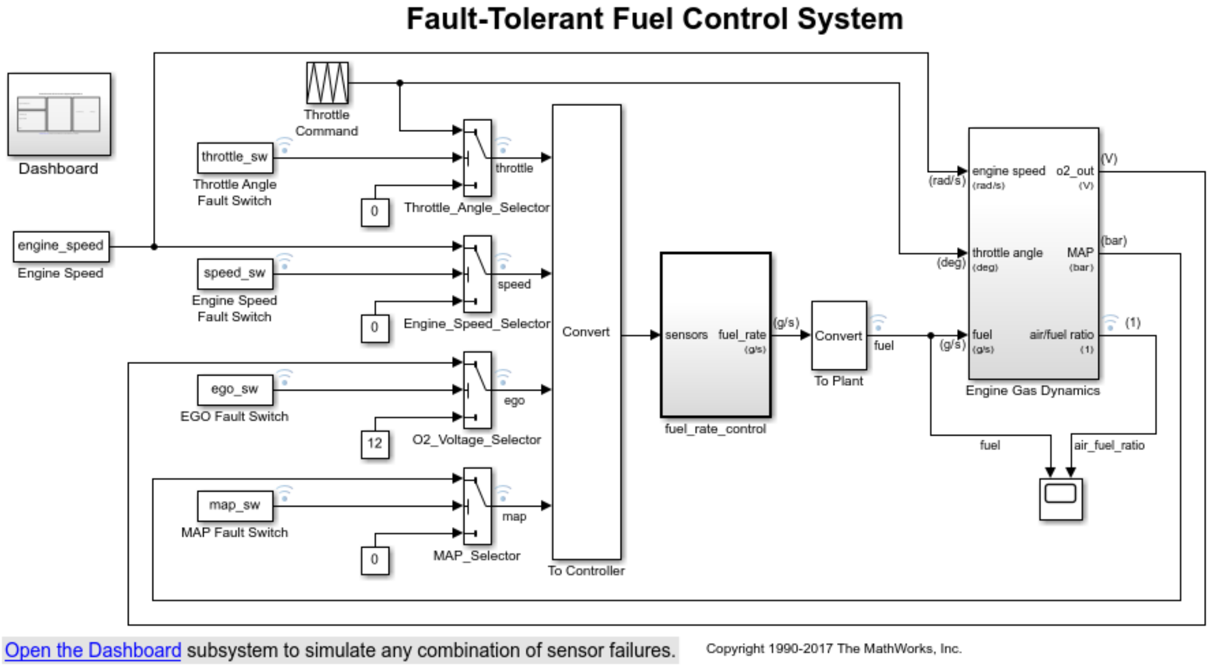
Inspect and Analyze Data in Simulation Datastore

This example shows how to log big data from a simulation and inspect and analyze portions of that data by interacting with a `matlab.io.datastore.SimulationDatastore` object.

Log Big Data from Model

Open the example model `sldemo_fuelsys`.

```
open_system('sldemo_fuelsys')
```



Fault-Tolerant Fuel Control System

Open the Dashboard subsystem to simulate any combination of sensor failures.

Copyright 1990-2017 The MathWorks, Inc.

Select **Configuration Parameters > Data Import/Export > Log Dataset data to file**.

```
set_param('sldemo_fuelsys','LoggingToFile','on')
```

Simulate the model.

```
sim('sldemo_fuelsys')
```

The MAT-file `out.mat` appears in your current folder. The file contains data for logged signals such as `fuel` (which is at the root level of the model).

At the command prompt, create a `DatasetRef` object that refers to the logging variable by name, `sldemo_fuelsys_output`.

```
DSRef = Simulink.SimulationData.DatasetRef('out.mat','sldemo_fuelsys_output');
```

Preview Big Data

Use curly braces ({ and }) to extract the signal element `fuel`, which is the tenth element in `DSRef`, as a `Simulink.SimulationData.Signal` object that contains a `SimulationDatastore` object.

```
SimDataSig = DSRef{10};
```

To more easily interact with the `SimulationDatastore` object that resides in the `Values` property of the `Signal` object, store a handle in a variable named `DStore`.

```
DStore = SimDataSig.Values;
```

Use the `preview` method to inspect the first five samples of logged data for the `fuel` signal.

```
preview(DStore)
```

```

Find Maximum Value of Data in Datastore

Reset the datastore.

```
reset(DStore)
```

Write a `while` loop, using the `hasdata` method, to incrementally analyze the data in chunks of 200 samples.

```
DStore.ReadSize = 200;
runningMax = [];
while hasdata(DStore)
    tt = read(DStore);
    rawChunk = tt.Data;
    runningMax = max([rawChunk; runningMax]);
end
```

Now, the variable `runningMax` stores the maximum value in the entire datastore.

```
runningMax
```

```
runningMax =

    1.6423
```

Topics

“Work with Big Data for Simulations”

Introduced in R2017a

preview

Class: matlab.io.datastore.SimulationDatastore
Package: matlab.io.datastore

Return subset of data from datastore

Syntax

```
data = preview(dst)
```

Description

`data = preview(dst)` returns a subset of data from datastore (`matlab.io.datastore.SimulationDatastore` object) `dst` without changing its current read position. `preview` returns only the first ten samples (time steps) of data in the datastore. Use this method to quickly inspect and verify that the data appears as you expect.

Input Arguments

`dst` — Input datastore
`matlab.io.datastore.SimulationDatastore` object

Input datastore, specified as a `matlab.io.datastore.SimulationDatastore` object. To create a `SimulationDatastore` object, see `matlab.io.datastore.SimulationDatastore`.

Output Arguments

`data` — Subset of data
`timetable` object

Subset of data, returned as a `timetable` object. For information about `timetable`, see “Timetables” (MATLAB).

Examples

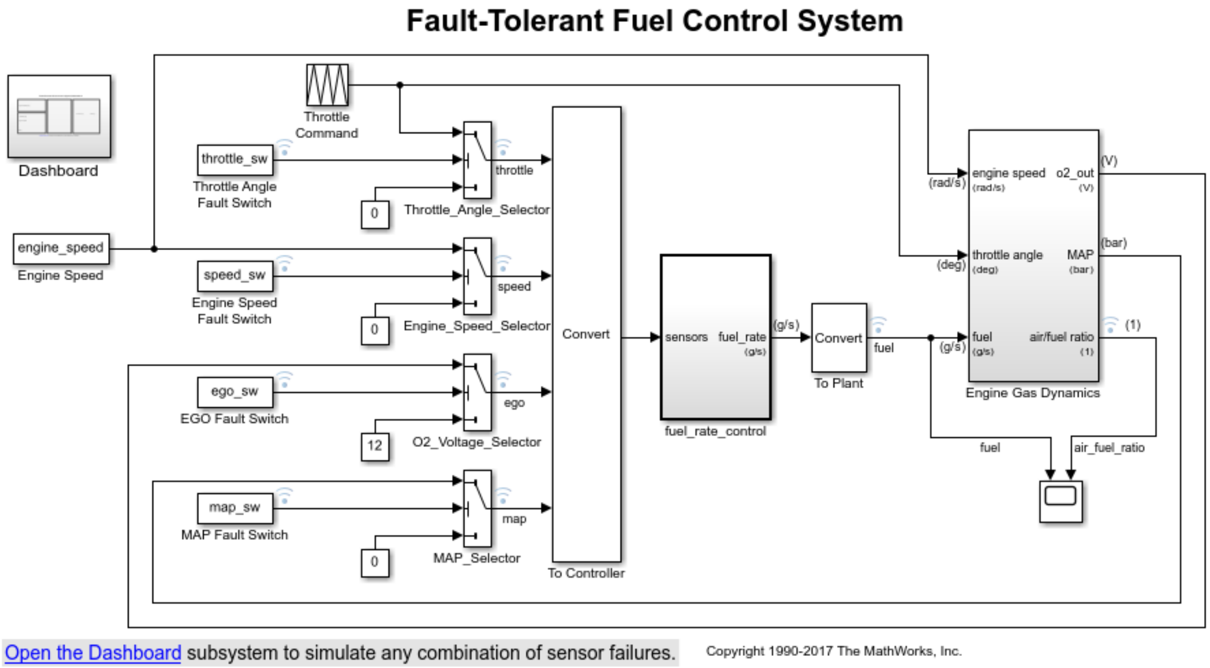
Inspect and Analyze Data in Simulation Datastore

This example shows how to log big data from a simulation and inspect and analyze portions of that data by interacting with a `matlab.io.datastore.SimulationDatastore` object.

Log Big Data from Model

Open the example model `sldemo_fuelsys`.

```
open_system('sldemo_fuelsys')
```



Open the Dashboard subsystem to simulate any combination of sensor failures.

Copyright 1990-2017 The MathWorks, Inc.

Select **Configuration Parameters > Data Import/Export > Log Dataset data to file**.

```
set_param('sldemo_fuelsys','LoggingToFile','on')
```

Simulate the model.

```
sim('sldemo_fuelsys')
```

The MAT-file `out.mat` appears in your current folder. The file contains data for logged signals such as `fuel` (which is at the root level of the model).

At the command prompt, create a `DatasetRef` object that refers to the logging variable by name, `sldemo_fuelsys_output`.

```
DSRef = Simulink.SimulationData.DatasetRef('out.mat','sldemo_fuelsys_output');
```

Preview Big Data

Use curly braces (`{` and `}`) to extract the signal element `fuel`, which is the tenth element in `DSRef`, as a `Simulink.SimulationData.Signal` object that contains a `SimulationDatastore` object.

```
SimDataSig = DSRef{10};
```

To more easily interact with the `SimulationDatastore` object that resides in the `Values` property of the `Signal` object, store a handle in a variable named `DStore`.

```
DStore = SimDataSig.Values;
```

Use the `preview` method to inspect the first five samples of logged data for the `fuel` signal.

```
preview(DStore)
```

```
ans =

  10x1 timetable

         Time            Data 
    ______________      ______

    0 sec                1.209
    0.00056199 sec       1.209
    0.0033719 sec        1.209
    0.01 sec          1.1729
    0.02 sec          1.1409
    0.03 sec          1.1124
    0.04 sec          1.0873
    0.05 sec          1.0652
    0.055328 sec      1.0652
    0.055328 sec      1.0652
```

Inspect Specific Sample

Inspect the 603rd sample of logged fuel data.

Set the ReadSize property of DStore to a number that, considering memory resources, your computer can tolerate. For example, set ReadSize to 200.

```
DStore.ReadSize = 200;
```

Read from the datastore three times. Each read operation advances the reading position by 200 samples.

```
read(DStore);
read(DStore);
read(DStore);
```

Now that you are very close to the 603rd sample, set ReadSize to a smaller number. For example, set ReadSize to 5.

```
DStore.ReadSize = 5;
```

Read from the datastore again.

```
read(DStore)
```

```
ans =

  5x1 timetable

      Time       Data 
    ________    ______

    5.8 sec     1.6136
    5.81 sec    1.6003
    5.82 sec    1.5904
    5.83 sec    1.5832
```

The third sample of read data is the 603rd sample in the datastore.

Inspect Earlier Sample

Inspect the 403rd sample of logged `fuel` data. Due to previous read operations, the datastore now reads starting from the 606th sample, so you must reset the datastore. Then, you can read from the first sample up to the 403rd sample.

Use the `reset` method to reset `DStore`.

```
reset(DStore);
```

Set `ReadSize` to `200` again.

```
DStore.ReadSize = 200;
```

Read from the datastore twice to advance the read position to the 401st sample.

```
read(DStore);
read(DStore);
```

Set `ReadSize` to `5` again.

```
DStore.ReadSize = 5;
```

Read from the datastore.

```
read(DStore)
```

```
ans =

  5x1 timetable

progress

Class: matlab.io.datastore.SimulationDatastore
Package: matlab.io.datastore

Return percentage of data that you have read from a datastore

Syntax

```
p = progress(dst)
```

Description

`p = progress(dst)` returns the percentage, as a number between 0 and 1, of the data that you have read from a datastore (`matlab.io.datastore.SimulationDatastore` object). For example, a return value of `0.55` means you have read 55% of the data. Use the `progress` method and the `NumSamples` property to determine the current read position.

You read data from a `SimulationDatastore` object by using the `read` method.

Input Arguments

`dst` — Input datastore

`matlab.io.datastore.SimulationDatastore` object

Input datastore, specified as a `matlab.io.datastore.SimulationDatastore` object. To create a `SimulationDatastore` object, see `matlab.io.datastore.SimulationDatastore`.

Output Arguments

p — Percentage of data that you have read from the datastore

scalar double

Percentage of data that you have read from the datastore, returned as a scalar double.

Data Types: `double`

read

Class: matlab.io.datastore.SimulationDatastore
Package: matlab.io.datastore

Read data in datastore

Syntax

```
data = read(dst)
[data,info] = read(dst)
```

Description

`data = read(dst)` returns data from a datastore (`matlab.io.datastore.SimulationDatastore` object). Subsequent calls to the `read` function continue reading from the endpoint of the previous call. Use the `ReadSize` property of the `SimulationDatastore` object to specify the amount of data, in samples (time steps), to read at a time. Use the `progress` method and the `NumSamples` property to determine the current read position.

`[data,info] = read(dst)` also returns information about the extracted data in `info`.

Input Arguments

`dst` — Input datastore

`matlab.io.datastore.SimulationDatastore` object

Input datastore, specified as a `matlab.io.datastore.SimulationDatastore` object. To create a `SimulationDatastore` object, see `matlab.io.datastore.SimulationDatastore`.

Output Arguments

data — Output data

timetable object

Output data, returned as a timetable object. For information about timetable, see “Timetables” (MATLAB).

info — Information about read data

structure array

Information about read data, returned as a structure. The structure has one field, FileName, which is a fully resolved path containing the path string, the name of the file, and the file extension.

Examples

Inspect and Analyze Data in Simulation Datastore

This example shows how to log big data from a simulation and inspect and analyze portions of that data by interacting with a matlab.io.datastore.SimulationDatastore object.

Log Big Data from Model

Open the example model sldemo_fuelsys.

Introduced in R2017a

readall

Class: matlab.io.datastore.SimulationDatastore
Package: matlab.io.datastore

Read all data in datastore

Syntax

```
data = readall(dst)
```

Description

`data = readall(dst)` returns all the data in the datastore (`matlab.io.datastore.SimulationDatastore` object) specified by `dst`.

If all the data in the datastore does not fit in memory, `readall` returns an error. To determine how many samples (time steps) a datastore holds, inspect the `NumSamples` property of the `SimulationDatastore` object.

Input Arguments

`dst` — Input datastore
`matlab.io.datastore.SimulationDatastore` object

Input datastore, specified as a `matlab.io.datastore.SimulationDatastore` object. To create a `SimulationDatastore` object, see `matlab.io.datastore.SimulationDatastore`.

Output Arguments

`data` — All data in the datastore
`timetable` object

All data in the datastore, returned as a `timetable` object. For information about `timetable`, see “Timetables” (MATLAB).

reset

Class: matlab.io.datastore.SimulationDatastore
Package: matlab.io.datastore

Reset datastore to initial state

Syntax

```
reset(dst)
```

Description

`reset(dst)` sets the read position of the datastore (`matlab.io.datastore.SimulationDatastore` object) specified by `dst` to the first sample in the datastore. Use `reset` to reread data from a datastore. You read from a datastore by using the `read` method.

Input Arguments

`dst` — Input datastore
`matlab.io.datastore.SimulationDatastore` object

Input datastore, specified as a `matlab.io.datastore.SimulationDatastore` object. To create a `SimulationDatastore` object, see `matlab.io.datastore.SimulationDatastore`.

Examples

    3.89 sec    0.97179
```

Extract Multiple Samples

Extract samples 1001 through 1020 (a total of 20 samples).

Reset the datastore.

```
reset(DStore)
```

Advance to sample 1001.

```
DStore.ReadSize = 200;

for i = 1:5
    read(DStore);
end
```

Prepare to extract 20 samples from the datastore.

```
DStore.ReadSize = 20;
```

Extract samples 1001 through 1020. Store the extracted data in a variable named `targetSamples`.

```
targetSamples = read(DStore)
```

```
targetSamples =

  20x1 timetable

      Time        Data 
    ________    ______

    9.7 sec     1.5828
    9.71 sec    1.5733
    9.72 sec    1.5664
    9.73 sec    1.5614
    9.74 sec    1.5579
    9.75 sec    1.5553
    9.76 sec    1.5703
    9.77 sec     1.582
    9.78 sec    1.5913
    9.79 sec    1.5988
    9.8 sec      1.605
    9.81 sec    1.6101
    9.82 sec    1.6145
    9.83 sec    1.6184
    9.84 sec    1.6049
    9.85 sec     1.595
    9.86 sec    1.5877
    9.87 sec    1.5824
    9.88 sec    1.5785
    9.89 sec    1.5757
```

Find Maximum Value of Data in Datastore

Reset the datastore.

```
reset(DStore)
```

Write a `while` loop, using the `hasdata` method, to incrementally analyze the data in chunks of 200 samples.

```
DStore.ReadSize = 200;
runningMax = [];
while hasdata(DStore)
    tt = read(DStore);
    rawChunk = tt.Data;
    runningMax = max([rawChunk; runningMax]);
end
```

Now, the variable `runningMax` stores the maximum value in the entire datastore.

```
runningMax
```

```
runningMax =

    1.6423
```

“Work with Big Data for Simulations”

Introduced in R2017a

eventData

Provide information about block method execution events

Description

Simulink software creates an instance of this class when a block method execution event occurs during simulation and passes it to any listeners registered for the event (see `add_exec_event_listener`). The instance specifies the type of event that occurred and the block whose method execution triggered the event. See “Access Block Data During Simulation” for more information.

Parent

None

Children

None

Property Summary

Name	Description
“Type” on page 5-75	Type of method execution event that occurred.
“Source” on page 5-75	Block that triggered the event.

Properties

Type

Type of method execution event that occurred. Possible values are:

event	Occurs...
`'PreOutputs'`	Before a block's Outputs method executes.
`'PostOutputs'`	After a block's Outputs method executes.
`'PreUpdate'`	Before a block's Update method executes.
`'PostUpdate'`	After a block's Update method executes.
`'PreDerivatives'`	Before a block's Derivatives method executes.
`'PostDerivatives'`	After a block's Derivatives method executes.

character vector

`RO`

Source

Block that triggered the event

`Simulink.RunTimeBlock`

`RO`

Introduced in R2009b

LibraryBrowser.LibraryBrowser2 class

Package: LibraryBrowser

Simulink Library Browser

Description

Programmatically display, hide, size, and position the Simulink Library Browser.

Construction

```
lb = LibraryBrowser.LibraryBrowser2
```

Properties

`IsOnTop` — Always put library window on top

`0` (default) | `1`

Always put library window on top of other Simulink Editor windows, specified as `1` for always on top.

Example: `lb.IsOnTop = 1`

Methods

Method	Meaning	Example

`refresh`	Update the library browser display with changes that affect the library browser. Examples include adding a library to the library browser, removing a library from the library browser, and changes to your custom libraries, `slblocks` function, or `sl_customization.m` file. In general, refresh the library browser when you have made any changes that affect libraries on your MATLAB path that are registered in the library browser. .	`lb = LibraryBrowser.LibraryBrowser2;`
		`refresh(lb)`

`show`	Display the library browser.	`lb = LibraryBrowser.LibraryBrowser2;`
		`show(lb)`

`hide`	Hide the library browser.	`lb = LibraryBrowser.LibraryBrowser2;`
		`hide(lb)`

`getPosition`	Get the position of the library browser. Returned as four integers, in pixels: upper-left x coordinate, upper-left y coordinate, width, and depth.	`lb = LibraryBrowser.LibraryBrowser2;`
		`getPosition(lb)`
		
		`ans =`
		
		`    50   279   600   600`

`setPosition`	Set the position of the library browser. Use an array of integers, in pixels: upper-left x coordinate, upper-left y coordinate, width, and depth.	`lb = LibraryBrowser.LibraryBrowser2;`
		`setPosition(lb,[70 250 500 500])`

Introduced in R2016b

allowModelReferenceDiscreteSampleTimeInheritanceImpl

Model reference sample time inheritance status for discrete sample times

Syntax

```
flag = allowModelReferenceDiscreteSampleTimeInheritanceImpl(obj)
```

Description

`flag = allowModelReferenceDiscreteSampleTimeInheritanceImpl(obj)` specifies whether a System object in a reference model is allowed to inherit the sample time of the parent model. Use this method only for System objects that use discrete sample time and are intended for inclusion in Simulink via the MATLAB System block.

During model compilation, Simulink sets the model reference sample time inheritance before the System object `setupImpl` method is called.

Note You must set `Access = protected` for this method.

Input Arguments

`obj`

System object handle

Output Arguments

`flag`

Flag indicating whether model reference discrete sample time inheritance is allowed for the MATLAB System block containing the System object, returned as a logical value.

The default value for this argument depends on the number of inputs to the System object. To use the default value, you do not need to include this method in your System object class definition file.

Number of System object Inputs	Default Value and Override Effects
No inputs	**Default:** `false` — Model reference discrete sample time inheritance is not allowed. If your System object uses discrete sample time in its algorithm, override the default by returning `true` from `allowModelReferenceDiscreteSampleTimeInheritanceImpl`.
One or more inputs	**Default:** `true` — If no other Simulink constraint prevents it, model reference sample time inheritance is allowed. If your System object does not use sample time in its algorithm, override the default by returning `false` from `allowModelReferenceDiscreteSampleTimeInheritanceImpl`.

Examples

Set Sample Time Inheritance for System Object

For a System object that has one or more inputs, to disallow model reference discrete sample time inheritance for that object, set the sample time inheritance to `false`. Include this code in your class definition file for the object.

```
methods (Access = protected)
   function flag = allowModelReferenceDiscreteSampleTimeInheritanceImpl(~)
      flag = false;
   end
end
```

getInputNamesImpl

Names of MATLAB System block input ports

Syntax

```
[name1,name2,...] = getInputNamesImpl(obj)
```

Description

`[name1,name2,...] = getInputNamesImpl(obj)` specifies the names of the input ports of the System object on a MATLAB System block. The number of returned input names matches the number of inputs returned by the `getNumInputs` method. If you change a property value that changes the number of inputs, the names of those inputs also change.

`getInputNamesImpl` is called by the `getInputNames` method by the MATLAB System block.

Note You must set `Access = protected` for this method.

Input Arguments

`obj`

System object

Output Arguments

`name1,name2,...`

Names of the inputs for the specified object, returned as character vectors

Default: empty character vector

Examples

Specify Input Port Name

Specify in your class definition file the names of two input ports as `'upper'` and `'lower'`.

```
methods (Access = protected)
   function varargout = getInputNamesImpl(obj)
      numInputs = getNumInputs(obj);
      varargout = cell(1,numInputs);
      varargout{1} = 'upper';
      if numInputs > 1
         varargout{2} = 'lower';
      end
   end
end
```

Topics

“Specify Input and Output Names”

getOutputNamesImpl

Names of MATLAB System block output ports

Syntax

```
[name1,name2,...] = getOutputNamesImpl(obj)
```

Description

`[name1,name2,...] = getOutputNamesImpl(obj)` returns the names of the output ports from System object, `obj` implemented in a MATLAB System block. The number of returned output names matches the number of outputs returned by the `getNumOutputs` method. If you change a property value that affects the number of outputs, the names of those outputs also change.

`getOutputNamesImpl` is called by the MATLAB System block.

Note You must set `Access = protected` for this method.

Input Arguments

`obj`

System object

Output Arguments

`name1,name2,...`

Names of the outputs for the specified object, returned as character vectors.

Default: empty character vector

Examples

Specify Output Port Name

Specify the name of an output port as `'count'`.

```
methods (Access = protected)
   function outputName = getOutputNamesImpl(~)
      outputName = 'count';
   end
end
```

See Also

`getInputNamesImpl` | `getNumOutputsImpl`

Topics

“Specify Input and Output Names”

getPropertyGroupsImpl

Property groups for System object display

Syntax

```
group = getPropertyGroupsImpl
```

Description

`group = getPropertyGroupsImpl` specifies how to group properties for display. You specify property sections (`matlab.system.display.Section`) and section groups (`matlab.system.display.SectionGroup`) within this method. Sections arrange properties into groups. Section groups arrange sections and properties into groups. If a System object, included through the MATLAB System block, has a section, but that section is not in a section group, its properties appear above the block dialog tab panels.

If you do not include a `getPropertyGroupsImpl` method in your code, all public properties are included in the dialog box by default. If you include a `getPropertyGroupsImpl` method but do not list a property, that property does not appear in the dialog box.

When the System object is displayed at the MATLAB command line, the properties are grouped as defined in `getPropertyGroupsImpl`. If your `getPropertyGroupsImpl` defines multiple section groups, only properties from the first section group are displayed at the command line. To display properties in other sections, a link is provided at the end of a System object property display. Group titles are also displayed at the command line. To omit the "Main" title for the first group of properties, set `TitleSource` to `'Auto'` in `matlab.system.display.SectionGroup`.

`getPropertyGroupsImpl` is called by the MATLAB System block and when displaying the object at the command line.

Note You must set `Access = protected` and `Static` for this method.

Output Arguments

`group`

Property group or groups

Examples

Define Block Dialog Tabs

Define two block dialog tabs, each containing specific properties. For this example, you use the `getPropertyGroupsImpl`, `matlab.system.display.SectionGroup`, and `matlab.system.display.Section` methods in your class definition file.

```
methods (Static, Access = protected)
   function groups = getPropertyGroupsImpl
      valueGroup = matlab.system.display.Section(...
           'Title','Value parameters',...
           'PropertyList',{'StartValue','EndValue'});

      thresholdGroup = matlab.system.display.Section(...
           'Title','Threshold parameters',...
           'PropertyList',{'Threshold','UseThreshold'});

      mainGroup = matlab.system.display.SectionGroup(...
           'Title','Main', ...
           'Sections',[valueGroup,thresholdGroup]);

      initGroup = matlab.system.display.SectionGroup(...
           'Title','Initial conditions', ...
           'PropertyList',{'IC1','IC2','IC3'});

      groups = [mainGroup,initGroup];
   end
end
```

The resulting dialog box appears as follows.

Topics

"Add Property Groups to System Object and MATLAB System Block"

getSimulateUsingImpl

Specify value for Simulate using parameter

Syntax

```
simmode = getSimulateUsingImpl
```

Description

`simmode = getSimulateUsingImpl` specifies the simulation mode of the System object implemented in a MATLAB System block. The simulation mode restricts your System object to simulation using either code generation or interpreted execution. The associated `showSimulateUsingImpl` method controls whether the **Simulate using** option is displayed on the dialog box.

`getSimulateUsingImpl` is called by the MATLAB System block.

Note You must set `Access = protected` and `Static` for this method.

Output Arguments

`simmode`

Simulation mode, returned as the character vector `'Code generation'` or `'Interpreted execution'`. If you do not include the `getSimulateUsingImpl` method in your class definition file, the simulation mode is unrestricted. Depending on the value returned by the associated `showSimulateUsingImpl` method, the simulation mode is displayed as either a dropdown list on the dialog box or not at all.

Examples

Specify the Simulation Mode

In the class definition file of your System object, define the simulation mode to display in the MATLAB System block. To prevent **Simulate using** from displaying, see `showSimulateUsingImpl`.

```
methods (Static, Access = protected)
   function simMode = getSimulateUsingImpl
      simMode = "Interpreted execution";
   end
end
```

See Also

`showSimulateUsingImpl`

Topics

"Control Simulation Type in MATLAB System Block"

showFiSettingsImpl

Fixed point data type tab visibility for System objects

Syntax

```
flag = showFiSettingsImpl
```

Description

`flag = showFiSettingsImpl` specifies whether the Data Types tab appears on the MATLAB System block dialog box. The Data Types tab includes parameters to control processing of fixed point data the MATLAB System block. You cannot specify which parameters appear on the tab. If you implement `showFiSettingsImpl`, the simulation mode is set code generation.

`showFiSettingsImpl` is called by the MATLAB System block.

The parameters that appear on the Data Types tab, which cannot be customized, are

- **Saturate on integer overflow** is a check box to control the action to take on integer overflow for built-in integer types. The default is that the box is checked, which indicates to saturate. This is also the default for when **Same as MATLAB** is selected as the **MATLAB System fimath** option.
- **Treat these inherited Simulink signal types as fi objects** is a pull down that indicates which inherited data types to treat as fi data types. Valid options are `Fixed point` and `Fixed point & integer`. The default value is `Fixed point`.
- **MATLAB System fimath** has two radio button options: **Same as MATLAB** and **Specify Other**. The default, **Same as MATLAB**, uses the current MATLAB fixed-point math settings. **Specify Other** enables the edit box for specifying the desired fixed-point math settings. For information on setting fixed-point math, see `fimath`, in the Fixed-Point Designer documentation.

Note If you do not want to display the tab, you do not need to implement this method in your class definition file.

You must set `Access = protected` and `Static` for this method.

Output Arguments

`flag`

Flag indicating whether to display the Data Types tab on the MATLAB System block mask, returned as a logical scalar value. Returning a `true` value displays the tab. A `false` value does not display the tab.

Default: `false`

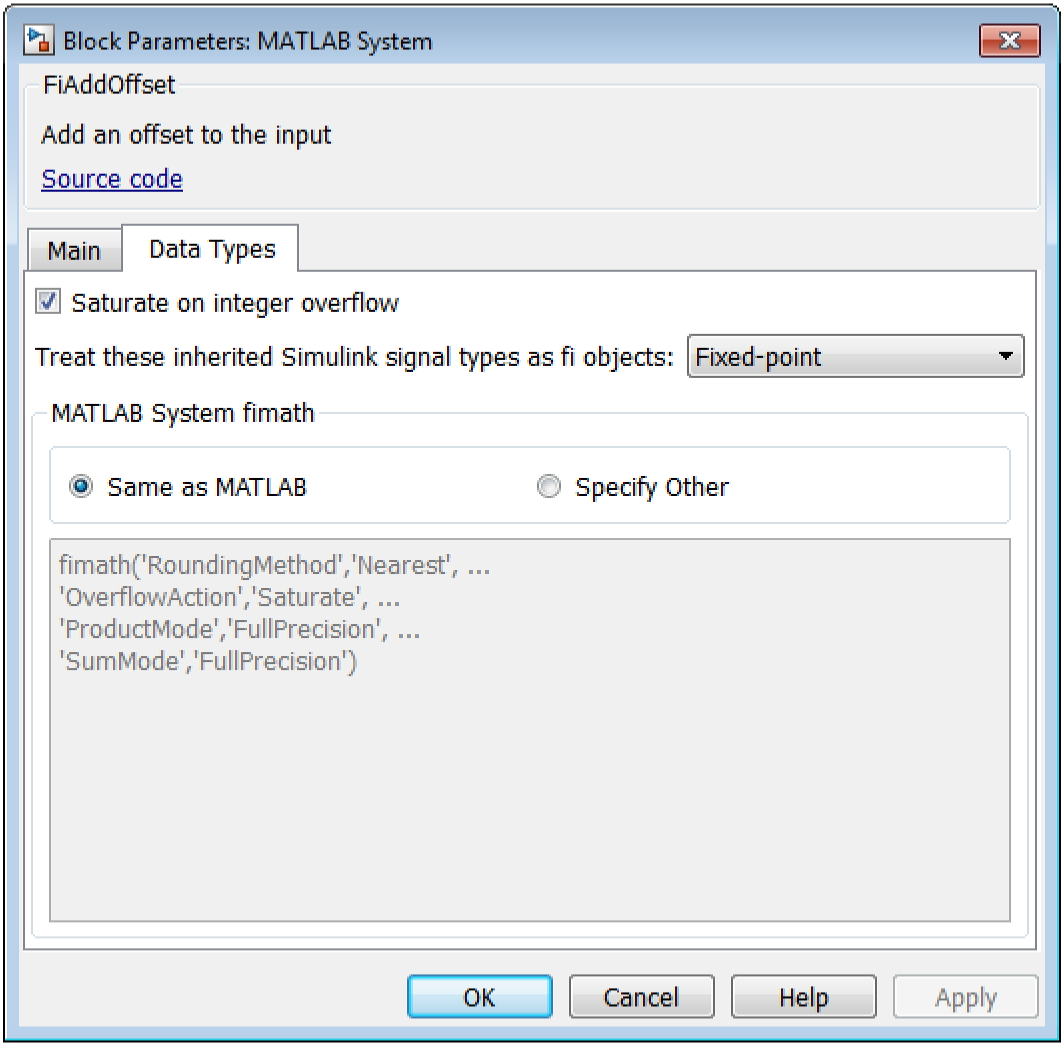
Examples

Show the Data Types Tab

Show the Data Types tab on the MATLAB System block dialog box.

```
methods (Static, Access = protected)
   function isVisible = showFiSettingsImpl
     isVisible = true;
   end
end
```

If you set the flag, `isVisible`, to `true`, the tab appears as follows when you add the object to Simulink with the MATLAB System block.



FiAddOffset

Add an offset to the input

Source code

☑ Saturate on integer overflow

Treat these inherited Simulink signal types as fi objects: Fixed-point

MATLAB System fimath

● Same as MATLAB ○ Specify Other

```
fimath('RoundingMethod','Nearest', ...
'OverflowAction','Saturate', ...
'ProductMode','FullPrecision', ...
'SumMode','FullPrecision')
```

showSimulateUsingImpl

Visibility of `Simulate using` parameter

Syntax

`flag = showSimulateUsingImpl`

Description

`flag = showSimulateUsingImpl` specifies whether **Simulation mode** appears on the MATLAB System block dialog box.

`showSimulateUsingImpl` is called by the MATLAB System block.

Note You must set `Access = protected` and `Static` for this method.

Output Arguments

`flag`

Flag indicating whether to display the **Simulate using** parameter and dropdown list on the MATLAB System block mask, returned as a logical scalar value. A `true` value displays the parameter and dropdown list. A `false` value hides the parameter and dropdown list.

Default: `true`

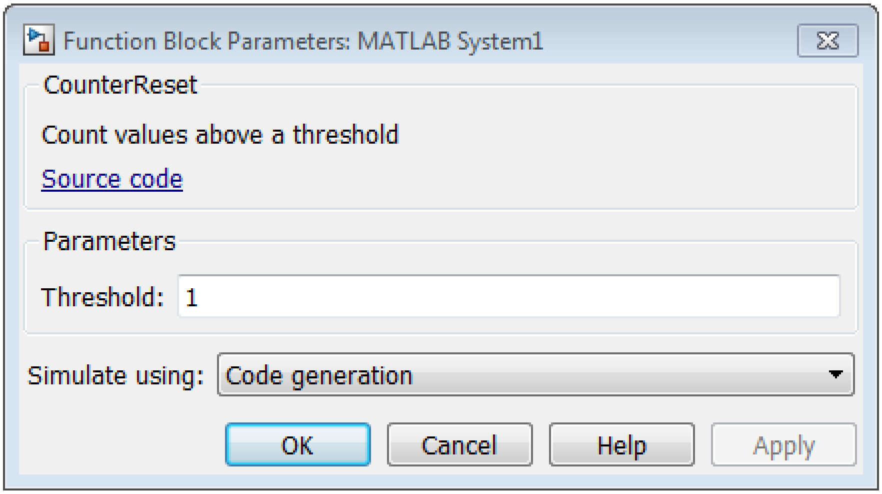
Examples

Hide the Simulate using Parameter

Hide the **Simulate using** parameter on the MATLAB System block dialog box.

```
methods (Static, Access = protected)
  function flag = showSimulateUsingImpl
    flag = false;
  end
end
```

If you set the flag to `true` or omit the `showSimulateUsingImpl` method, which defaults to `true`, the dialog appears as follows when you add the object to Simulink with the MATLAB System block.



CounterReset

Count values above a threshold

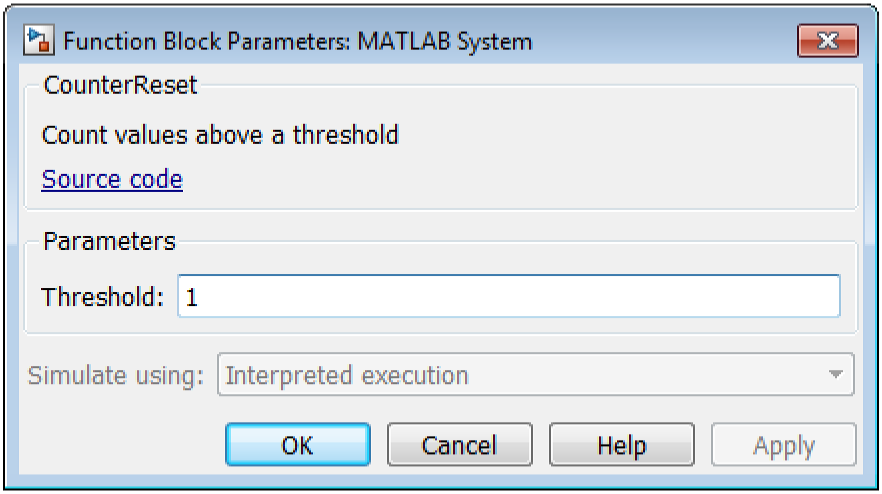
Source code

Parameters

Threshold: 1

Simulate using: Code generation

If you also specify a single value for `getSimulateUsingImpl`, the dialog appears as follows when you add the object to Simulink with the MATLAB System block.



Function Block Parameters: MATLAB System

CounterReset

Count values above a threshold

Source code

Parameters

Threshold: 1

Simulate using: Interpreted execution

`getSimulateUsingImpl`

Topics

"Control Simulation Type in MATLAB System Block"

getGlobalNamesImpl

Global variable names for MATLAB System block

Syntax

```
name = getGlobalNamesImpl(obj)
```

Description

`name = getGlobalNamesImpl(obj)` specifies the names of global variables that are declared in a System object for use in a Simulink P-code file. For P-code files, in addition to declaring your global variables in `stepImpl`, `outputImpl`, or `updateImpl`, you must include the `getGlobalNamesImpl` method. You declare global variables in a cell array in the `getGlobalNamesImpl` method. System objects that contain these global variables are included in Simulink using a MATLAB System block. To enable a global variable in Simulink, your model also must include a Data Store Memory block with a **Data Store Name** that matches the global variable name.

`getGlobalNamesImpl` is called by the MATLAB System block.

Note You must set `Access = protected` for this method.

Input Arguments

`obj`

System object

Output Arguments

name

Name of the cell array containing the global variable names. The elements of the cell array are character vectors.

Examples

Specify Global Names

Specify two global names in your class definition file.

```
methods(Access = protected)
    function glnames = getGlobalNamesImpl(obj)
      glnames = {"FEE","OTHERFEE"};
    end

    function y = stepImpl(obj,u)
      global FEE
      global OTHERFEE
      y = u - FEE * obj.lastData + OTHERFEE;
      obj.lastData = u;
    end
end
```

Introduced in R2016b

getHeaderImpl

Header for System object display

Syntax

`header = getHeaderImpl`

Description

`header = getHeaderImpl` specifies the dialog header to display on the MATLAB System block dialog box. If you do not specify the `getHeaderImpl` method, no title or text appears for the header in the block dialog box.

`getHeaderImpl` is called by the MATLAB System block.

Note You must set `Access = protected` and `Static` for this method.

Output Arguments

`header`

Header text

Examples

Define Header for System Block Dialog Box

Define a header in your class definition file for the `EnhancedCounter` System object.

```
methods (Static, Access = protected)
   function header = getHeaderImpl
      header = matlab.system.display.Header('EnhancedCounter',...
                'Title','Enhanced Counter');
        end
    end
```

See Also

getPropertyGroupsImpl

Topics

“Add Header to MATLAB System Block”

getDiscreteStateImpl

Discrete state property values

Syntax

```
s = getDiscreteStateImpl(obj)
```

Description

`s = getDiscreteStateImpl(obj)` returns a struct `s` of internal state value properties, which have the `DiscreteState` attribute. The field names of the struct are the object's `DiscreteState` property names. To restrict or change the values returned by `getDiscreteState` method, you can override this `getDiscreteStateImpl` method.

`getDiscreteStatesImpl` is called by the `getDiscreteState` method, which is called by the `setup` method.

Note You must set `Access = protected` for this method.

You cannot modify any properties in this method.

Input Arguments

`obj`

System object handle

Output Arguments

`s`

State values, returned as a struct

Examples

Get Discrete State Values

Use the `getDiscreteStateImpl` method in your class definition file to get the discrete states of the object.

```
methods (Access = protected)
   function s = getDiscreteStateImpl(obj)
   end
end
```

See Also

`setupImpl`

Topics

“Define Property Attributes” (MATLAB)

supportsMultipleInstanceImpl

Support System object in Simulink For Each subsystem

Syntax

```
flag = supportsMultipleInstanceImpl(obj)
```

Description

`flag = supportsMultipleInstanceImpl(obj)` specifies whether the System object can be used in a Simulink For Each subsystem via the MATLAB System block. To enable For Each support, you must include the `supportsMultipleInstanceImpl` in your class definition file and have it return `true`. Do not enable For Each support if your System object allocates exclusive resources that may conflict with other System objects, such as allocating file handles, memory by address, or hardware resources.

During Simulink model compilation and propagation, the MATLAB System block calls the `supportMultipleInstance` method, which then calls the `supportsMultipleInstanceImpl` method to determine For Each support.

Note You must set `Access = protected` for this method.

You cannot modify any properties in this method.

Input Arguments

obj

System object handle

Output Arguments

flag

Boolean value indicating whether the System object can be used in a For Each subsystem. The default value, if you do not include the `supportMultipleInstance` method, is `false`.

Examples

Enable For-Each Support for System Object

Specify in your class definition file that the System object can be used in a Simulink For Each subsystem.

```
methods (Access = protected)
   function flag = supportsMultipleInstanceImpl(obj)
       flag = true;
   end
end
```

See Also

`matlab.System`

Topics

"Enable For Each Subsystem Support"

processTunedPropertiesImpl

Action when tunable properties change

Syntax

```
processTunedPropertiesImpl(obj)
```

Description

`processTunedPropertiesImpl(obj)` specifies the algorithm to perform when one or more tunable property values change. This method is called as part of the next call to the System object after a tunable property value changes. A property is tunable only if its `Nontunable` attribute is `false`, which is the default.

`processTunedPropertiesImpl` is called when you run the System object.

Note You must set `Access = protected` for this method.

You cannot modify any tunable properties in this method if its System object will be used in the Simulink MATLAB System block.

Input Arguments

`obj`

System object

Examples

Specify Action When Tunable Property Changes

Use processTunedPropertiesImpl to recalculate the lookup table if the value of either the NumNotes or MiddleC property changes before the next call to the System object. propChange indicates if either property has changed.

```
methods (Access = protected)
   function processTunedPropertiesImpl(obj)
      propChange = isChangedProperty(obj,'NumNotes') ||...
         isChangedProperty(obj,'MiddleC')
      if propChange
         obj.pLookupTable = obj.MiddleC * (1+log(1:obj.NumNotes)/log(12));
      end
    end
end
```

Tips

Use this method when a tunable property affects the value of a different property.

To check if a property has changed since stepImpl was last called, use isChangedProperty within processTunedPropertiesImpl. See “Specify Action When Tunable Property Changes” on page 5-106 for an example.

In MATLAB when multiple tunable properties are changed before running the System object, processTunedPropertiesImpl is called only once for all the changes. isChangedProperty returns true for all the changed properties.

In Simulink, when a parameter is changed in a MATLAB System block dialog, the next simulation step calls processTunedPropertiesImpl before calling stepImpl. All tunable parameters are considered changed and processTunedPropertiesImpl method is called for each of them. isChangedProperty returns true for all the dialog properties.

"Define Property Attributes" (MATLAB)

matlab.system.mixin.CustomIcon class

Package: matlab.system.mixin

Custom icon mixin class

Description

matlab.system.mixin.CustomIcon is a class that specifies the getIcon method. This method customizes the name of the icon used for the System object implemented through a MATLAB System block.

To use this method, you must subclass from this class in addition to the matlab.System base class. Type the following syntax as the first line of your class definition file, where ObjectName is the name of your object:

```
classdef ObjectName < matlab.system &...
    matlab.system.mixin.CustomIcon
```

Methods

getIconImpl	Name to display as block icon

See Also

matlab.System | matlab.system.display.Icon

Topics

"Add Text to Block Icon"

getIconImpl

Class: matlab.system.mixin.CustomIcon
Package: matlab.system.mixin

Name to display as block icon

Syntax

```
icon = getIconImpl(obj)
```

Description

`icon = getIconImpl(obj)` specifies the text or image to display on the block icon of the MATLAB System block. If you do not specify the `getIconImpl` method, the block displays the class name of the System object as the block icon. For example, if you specify `pkg.MyObject` in the MATLAB System block, the default icon is labeled `MyObject`

`getIconImpl` is called by the MATLAB System block during Simulink model compilation.

Note You must set `Access = protected` for this method.

Input Arguments

`obj`

System object handle

Output Arguments

`icon`

The text or image to display as the block icon. Each cell is displayed as a separate line.

Examples

Add System Block Icon Name

Specify in your class definition file the name of the block icon as `'Enhanced Counter'` using two lines.

```
methods (Access = protected)
   function icon = getIconImpl(~)
      icon = {'Enhanced','Counter'};
   end
end
```

Add Image to MATLAB System Block

Define an image in your class definition file.

```
    methods(Access = protected)
        function icon = getIconImpl(~)
            % Define icon for System block
            icon = matlab.system.display.Icon('my_icon.png');
        end
    end
```

The image now appears on the System block icon.

Package: matlab.system.display

Header for System objects properties

Syntax

```
matlab.system.display.Header(N1,V1,...Nn,Vn)
matlab.system.display.Header(Obj,...)
```

Description

`matlab.system.display.Header(N1,V1,...Nn,Vn)` specifies a header for the System object, with the header properties defined in Name-Value (`N`,`V`) pairs. You use `matlab.system.display.Header` within the `getHeaderImpl` method. The available header properties are

- `Title` — Header title. The default value is an empty character vector.
- `Text` — Header description. The default value is an empty character vector.
- `ShowSourceLink` — Show link to source code for the object.

`matlab.system.display.Header(Obj,...)` creates a header for the specified System object (`Obj`) and sets the following property values:

- `Title` — Set to the `Obj` class name.
- `Text` — Set to help summary for `Obj`.
- `ShowSourceLink` — Set to `true` if `Obj` is MATLAB code. In this case, the **Source Code** link is displayed. If `Obj` is P-coded and the source code is not available, set this property to `false`.

You can use `mfilename('class')` from within this method to get the name of the System object. If you set any Name-Value pairs, those property values override the default settings.

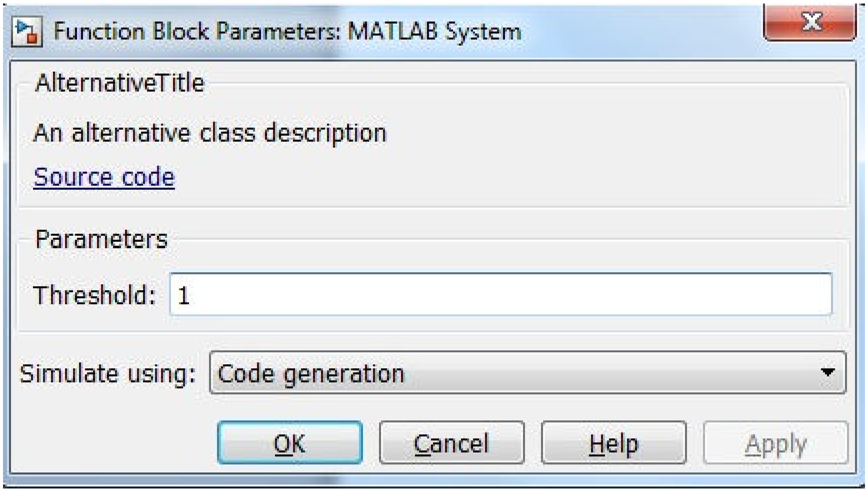
Examples

Define System Block Header

Define a header in your class definition file.

```
methods (Static, Access = protected)
   function header = getHeaderImpl
      header = matlab.system.display.Header(mfilename('class'), ...
          'Title','AlternativeTitle',...
          'Text','An alternative class description');
   end
end
```

The resulting output appears as follows. In this case, **Source code** appears because the `ShowSourceLink` property was set to `true`.



Function Block Parameters: MATLAB System

AlternativeTitle

An alternative class description

Source code

Parameters

matlab.system.display.Section class

Package: matlab.system.display

Property group section for System objects

Syntax

```
matlab.system.display.Section(N1,V1,...Nn,Vn)
matlab.system.display.Section(Obj,...)
```

Description

`matlab.system.display.Section(N1,V1,...Nn,Vn)` creates a property group section for displaying System object properties, which you define using property Name-Value pairs (N,V). You use `matlab.system.display.Section` to define property groups using the `getPropertyGroupsImpl` method. The available Section properties are

- `Title` — Section title. The default value is an empty character vector.
- `TitleSource` — Source of section title. Valid values are `'Property'` and `'Auto'`. The default value is `'Property'`, which uses the character vector from the `Title` property. If the `Obj` name is given, the default value is `Auto`, which uses the `Obj` name.
- `Description` — Section description. The default value is an empty character vector.
- `PropertyList` — Section property list as a cell array of property names. The default value is an empty array. If the `Obj` name is given, the default value is all eligible display properties.

Note Certain properties are not eligible for display either in a dialog box or in the System object summary on the command-line. Property types that cannot be displayed are: hidden, abstract, private or protected access, discrete state, and continuous state. Dependent properties do not display in a dialog box, but do display in the command-line summary.

matlab.system.display.Section(Obj,...) creates a property group section for the specified System object (Obj) and sets the following property values:

- TitleSource — Set to 'Auto', which uses the Obj name.
- PropertyList — Set to all publicly-available properties in the Obj.

You can use mfilename('class') from within this method to get the name of the System object. If you set any Name-Value pairs, those property values override the default settings.

Methods

Examples

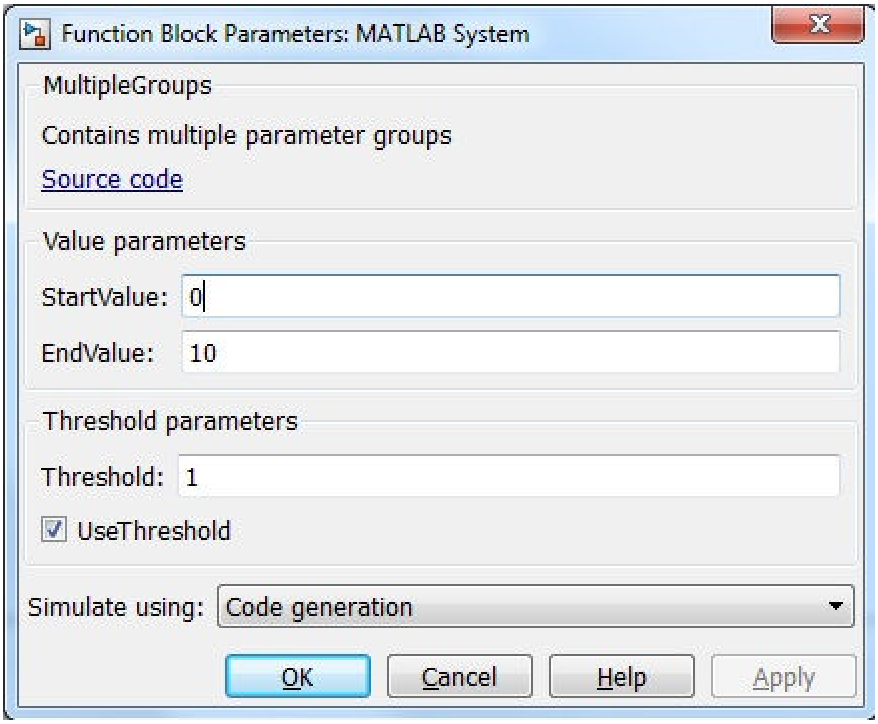
Define Property Groups

Define two property groups in your class definition file by specifying their titles and property lists.

```
methods (Static, Access = protected)
   function groups = getPropertyGroupsImpl
      valueGroup = matlab.system.display.Section(...
           'Title','Value parameters',...
           'PropertyList',{'StartValue','EndValue'});

      thresholdGroup = matlab.system.display.Section(...
           'Title','Threshold parameters',...
           'PropertyList',{'Threshold','UseThreshold'});
      groups = [valueGroup,thresholdGroup];
   end
end
```

When you specify the System object in the MATLAB System block, the resulting dialog box appears as follows.



Function Block Parameters: MATLAB System

MultipleGroups

Contains multiple parameter groups

Source code

Topics

"Add Property Groups to System Object and MATLAB System Block"

matlab.system.display.Action class

Package: matlab.system.display

Custom button

Syntax

```
matlab.system.display.Action(action)
matlab.system.display.Action(action,Name,Value)
```

Description

`matlab.system.display.Action(action)` specifies a button to display on the MATLAB System block. This button executes a function by launching a System object method or invoking any MATLAB function or code.

A typical button function launches a figure. The launched figure is decoupled from the block dialog box. Changes to the block are not synced to the displayed figure.

You define `matlab.system.display.Action` within the `getPropertyGroupsImpl` method in your class definition file. You can define multiple buttons using separate instances of `matlab.system.display.Action` in your class definition file.

`matlab.system.display.Action(action,Name,Value)` includes `Name,Value` pair arguments, which you can use to specify any properties.

Input Arguments

`action`

Action taken when the user presses the specified button on the MATLAB System block dialog. The action is defined as a function handle or as a MATLAB command. If you define the action as a function handle, the function definition must define two inputs. These inputs are a `matlab.system.display.ActionData` object and a System object instance, which can be used to invoke a method.

A matlab.system.display.ActionData object is the callback object for a display action. You use the UserData property of matlab.system.display.ActionData to store persistent data, such as a figure handle.

Name-Value Pair Arguments

Specify optional comma-separated pairs of Name,Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1,Value1,...,NameN,ValueN.

Properties

You specify these properties as part of the input using Name,Value pair arguments. Optionally, you can define them using object.property syntax.

- ActionCalledFcn — Action to take when the button is pressed. You cannot specify this property using a Name-Value pair argument.
- Label — Text to display on the button. The default value is an empty character vector.
- Description — Text for the button tooltip. The default value is an empty character vector.
- Placement — Character vector indicating where on a separate row in the property group to place the button. Valid values are 'first', 'last', or a property name. If you specify a property name, the button is placed above that property. The default value is 'last'.
- Alignment — Character vector indicating how to align the button. Valid values are 'left' and 'right'. The default value is 'left'.

Examples

Define Button on MATLAB System Block

Define a **Visualize** button and its associated function to open a figure that plots a ramp using the parameter values in the block dialog.

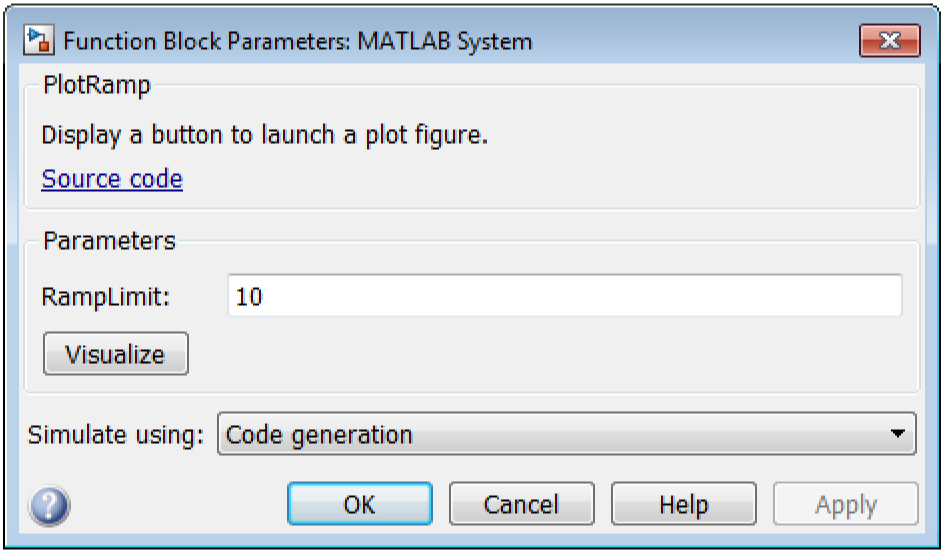
```
methods(Static,Access = protected)
  function group = getPropertyGroupsImpl
```

```
    group = matlab.system.display.Section(mfilename('class'));
    group.Actions = matlab.system.display.Action(@(~,obj)...
        visualize(obj),'Label','Visualize');
    end
  end

  methods
    function obj = PlotRamp(varargin)
      setProperties(obj,nargin,varargin{:});
    end

    function visualize(obj)
      figure;
      d = 1:obj.RampLimit;
      plot(d);
    end
  end
```

When you specify the System object in the MATLAB System block, the resulting block dialog box appears as follows.



Function Block Parameters: MATLAB System

PlotRamp

Display a button to launch a plot figure.

Source code

Parameters

RampLimit: 10

Simulate using: Code generation

To open the same figure, rather than multiple figures, when the button is pressed more than once, use this code instead.

```
methods(Static,Access = protected)
  function group = getPropertyGroupsImpl
    group = matlab.system.display.Section(mfilename('class'));
    group.Actions = matlab.system.display.Action(@(actionData,obj)...
       visualize(obj,actionData),'Label','Visualize');
  end
end

methods
  function obj = ActionDemo(varargin)
    setProperties(obj,nargin,varargin{:});
  end

  function visualize(obj,actionData)
    f = actionData.UserData;
    if isempty(f) || ~ishandle(f)
      f = figure;
      actionData.UserData = f;
    else
        figure(f); % Make figure current
    end

    d = 1:obj.RampLimit;
    plot(d);
  end
end
```

matlab.system.display.SectionGroup class

Package: matlab.system.display

Section group for System objects

Syntax

```
matlab.system.display.SectionGroup(N1,V1,...Nn,Vn)
matlab.system.display.SectionGroup(Obj,...)
```

Description

`matlab.system.display.SectionGroup(N1,V1,...Nn,Vn)` creates a group for displaying System object properties and display sections created with `matlab.system.display.Section`. You define such sections or properties using property Name-Value pairs (`N`,`V`). A section group can contain both properties and sections. You use `matlab.system.display.SectionGroup` to define section groups using the `getPropertyGroupsImpl` method. Section groups display as separate tabs in the MATLAB System block. The available Section properties are

- `Title` — Group title. The default value is an empty character vector.
- `TitleSource` — Source of group title. Valid values are `'Property'` and `'Auto'`. The default value is `'Property'`, which uses the character vector from the `Title` property. If the `Obj` name is given, the default value is `Auto`, which uses the `Obj` name. In the System object property display at the MATLAB command line, you can omit the default "Main" title for the first group of properties by setting `TitleSource` to `'Auto'`.
- `Description` — Group or tab description that appears above any properties or panels. The default value is an empty character vector.
- `PropertyList` — Group or tab property list as a cell array of property names. The default value is an empty array. If the `Obj` name is given, the default value is all eligible display properties.
- `Sections` — Group sections as an array of section objects. If the `Obj` name is given, the default value is the default section for the `Obj`.

matlab.system.display.SectionGroup(Obj,...) creates a section group for the specified System object (Obj) and sets the following property values:

- TitleSource — Set to 'Auto'.
- Sections — Set to matlab.system.display.Section object for Obj.

You can use mfilename('class') from within this method to get the name of the System object. If you set any Name-Value pairs, those property values override the default settings.

Examples

Define Block Dialog Tabs

Define in your class definition file two tabs, each containing specific properties. For this example, you use the matlab.system.display.SectionGroup, matlab.system.display.Section, and getPropertyGroupsImpl methods.

```
methods (Static, Access = protected)
   function groups = getPropertyGroupsImpl
      valueGroup = matlab.system.display.Section(...
           'Title','Value parameters',...
           'PropertyList',{'StartValue','EndValue'});

      thresholdGroup = matlab.system.display.Section(...
           'Title','Threshold parameters',...
           'PropertyList',{'Threshold','UseThreshold'});

      mainGroup = matlab.system.display.SectionGroup(...
           'Title','Main', ...
           'Sections',[valueGroup,thresholdGroup]);

      initGroup = matlab.system.display.SectionGroup(...
           'Title','Initial conditions', ...
           'PropertyList',{'IC1','IC2','IC3'});

      groups = [mainGroup,initGroup];
   end
end
```

The resulting dialog appears as follows when you add the object to Simulink with the MATLAB System block.

matlab.system.display.Icon class

Package: matlab.system.display

Custom icon image

Syntax

```
icon = matlab.system.display.Icon(imageFile)
```

Description

`icon = matlab.system.display.Icon(imageFile)` sets the `imageFile` image as the MATLAB System block icon. To set the icon image, use the `icon` output argument from `getIconImpl`.

Input Arguments

`imageFile` — Image file
character array

Image file to display on the block icon, specified as a character array. If the image is not on the path, use the full path to your image file.

The image file must be in a file format supported for block masks. See “Draw Static Icon”.

Example: `"image.png"`

Examples

Add Image to MATLAB System Block

Define an image in your class definition file.

```
    methods(Access = protected)
        function icon = getIconImpl(~)
            % Define icon for MATLAB System block
            icon = matlab.system.display.Icon("my_icon.png");
        end
    end
```

The image now appears on the MATLAB System block icon.

matlab.system.mixin.Propagates class

Package: matlab.system.mixin

Signal characteristics propagation mixin class

Description

`matlab.system.mixin.Propagates` specifies the output size, data type, and complexity of a System object. Use this mixin class and its methods when you will include your System object in Simulink via the MATLAB System block. This mixin is called by the MATLAB System block during Simulink model compilation.

Implement the methods of this class when Simulink cannot infer the output specifications directly from the inputs or when you want bus support. If you do not include this mixin, Simulink cannot propagate the output or bus data type, an error occurs.

To use this mixin, subclass from this `matlab.system.mixin.Propagates` in addition to subclassing from the `matlab.System` base class. Type the following syntax as the first line of your class definition file. `ObjectName` is the name of your System object.

```
classdef ObjectName < matlab.System &...
    matlab.system.mixin.Propagates
```

Methods

getDiscreteStateSpecificationImpl	Discrete state size, data type, and complexity
getOutputDataTypeImpl	Data types of output ports
getOutputSizeImpl	Sizes of output ports
isOutputComplexImpl	Complexity of output ports
isOutputFixedSizeImpl	Fixed- or variable-size output ports
propagatedInputComplexity	Complexity of input during Simulink propagation
propagatedInputDataType	Data type of input during Simulink propagation
propagatedInputFixedSize	Fixed-size status of input during Simulink propagation
propagatedInputSize	Size of input during Simulink propagation

Note If your System object has exactly one input and one output and no discrete property states, or if you do not need bus support, you do not have to implement any of these methods. The `matlab.system.mixin.Propagates` provides default values in these cases.

getDiscreteStateSpecificationImpl

Class: matlab.system.mixin.Propagates
Package: matlab.system.mixin

Discrete state size, data type, and complexity

Syntax

```
[sz,dt,cp] = getDiscreteStateSpecificationImpl(obj,propertyname)
```

Description

`[sz,dt,cp] = getDiscreteStateSpecificationImpl(obj,propertyname)` returns the size, data type, and complexity of the discrete state property. This property must be a discrete state property. You must define this method if your System object has discrete state properties and is used in the MATLAB System block.

You always set the `getDiscreteStateSpecificationImpl` method access to `protected` because it is an internal method that users do not directly call or run.

`getDiscreteStateSpecificationImpl` is called by the MATLAB System block during Simulink model compilation.

Note You must set `Access = protected` for this method.

You cannot modify any properties in this method.

Input Arguments

`obj`

System object handle

`propertyname`

Name of discrete state property of the System object

Output Arguments

`sz`

Vector containing the length of each dimension of the property.

Default: `[1 1]`

`dt`

Data type of the property. For built-in data types, `dt` is a character vector. For fixed-point data types, `dt` is a numerictype object.

Default: `double`

`cp`

Complexity of the property as a scalar, logical value:

- `true` = complex
- `false` = real

Default: `false`

Examples

Specify Discrete State Property Size, Data Type, and Complexity

Specify in your class definition file the size, data type, and complexity of a discrete state property.

```
methods (Access = protected)
   function [sz,dt,cp] = getDiscreteStateSpecificationImpl(~,name)
      sz = [1 1];
      dt = "double";
```

```
        cp = false;
    end
end
```

See Also

`matlab.system.mixin.Propagates`

Topics

“Set Discrete State Output Specification”

getOutputDataTypeImpl

Class: matlab.system.mixin.Propagates
Package: matlab.system.mixin

Data types of output ports

Syntax

```
[dt_1,dt_2,...,dt_n] = getOutputDataTypeImpl(obj)
```

Description

`[dt_1,dt_2,...,dt_n] = getOutputDataTypeImpl(obj)` returns the data type of each output port as a character vector for built-in data types or as a numeric object for fixed-point data types. The number of outputs must match the value returned from the `getNumOutputs` method or the number of output arguments listed in the `stepImpl` method.

For System objects with one input and one output and where you want the input and output data types to be the same, you do not need to implement this method. In this case, `getOutputDataTypeImpl` assumes the input and output data types are the same and returns the data type of the input.

If your System object has more than one input or output, and you subclass from `matlab.system.mixin.Propagates`, you must set the output data types in the `getOutputDataTypeImpl` method. For Simulink, if the input and output data types are different, you might have to cast the output value to the data type of the appropriate `dt_n` output argument. You specify this casting in the `stepImpl` method. For bus output, you must specify the name of the output bus in `getOutputDataTypeImpl`.

If needed to determine the output data type, you can use `propagatedInputDataType` within the `getOutputDataTypeImpl` method to obtain the input type.

Note You must set `Access = protected` for this method.

You cannot modify any properties in this method.

If you are debugging your code and examine the data types before Simulink completes propagation, you might see outputs with empty, [ ], data types. This occurs because Simulink has not completed setting the output data types.

Input Arguments

obj

System object

Output Arguments

dt_1,dt_2,...

Data type of the property. For built-in data types, `dt` is a character vector. For fixed-point data types, `dt` is a numerictype object.

Examples

Specify Output Data Type

Specify, in your class definition file how to control the output data type from a MATLAB System block. This example shows how to use the `getOutputDataTypeImpl` method to change the output data type from single to double, or propagate the input as a double. It also shows how to cast the data type to change the output data type in the `stepImpl` method.

```
classdef DataTypeChange < matlab.System & ...
  matlab.system.mixin.Propagates

   properties(Nontunable)
      Quantize = false
   end

   methods(Access = protected)
      function y = stepImpl(obj,u)
         if obj.Quantize == true
```

```
            % Cast for output data type to differ from input.
            y = single(u);
         else
            % Propagate output data type.
            y = u;
         end
      end

      function out = getOutputDataTypeImpl(obj)
         if obj.Quantize == true
            out = "single";
         else
            out = propagatedInputDataType(obj,1);
         end
      end
   end
end
```

Specify Bus Output

Specify, in your class definition file, that the System object data type is a bus. You must also include a property to specify the bus name.

```
properties(Nontunable)
   OutputBusName = "myBus";
end

methods (Access = protected)
   function out = getOutputDataTypeImpl(obj)
      out = obj.OutputBusName;
   end
end
```

Topics

"Set Output Data Type"

getOutputSizeImpl

Class: matlab.system.mixin.Propagates
Package: matlab.system.mixin

Sizes of output ports

Syntax

```
[sz_1,sz_2,...,sz_n] = getOutputSizeImpl(obj)
```

Description

`[sz_1,sz_2,...,sz_n] = getOutputSizeImpl(obj)` returns the size of each output port. The number of outputs must match the value returned from the `getNumOutputs` method or the number of output arguments listed in the `stepImpl` method.

If your System object has only one input and one output and you want the input and output sizes to be the same, you do not need to implement this method. In this case `getOutputSizeImpl` assumes that the input and output sizes are the same and returns the size of the input. For variable-size inputs in MATLAB, the size varies each time you run your object. For variable-size inputs in Simulink, the output size is the maximum input size.

You must implement the `getOutputSizeImpl` method to define the output size, if:

- Your System object has more than one input or output
- You need the output and input sizes to be different.

  If the output size differs from the input size, you must also use the `propagatedInputSize` method

During Simulink model compilation and propagation, the MATLAB System block calls the `getOutputSizeImpl` method to determine the output size.

All inputs default to variable-size inputs For these inputs, the output size is the maximum input size.

Note You must set `Access = protected` for this method.

In this method, you cannot modify any properties.

Input Arguments

obj

System object handle

Output Arguments

sz_1,sz_2,...

Vector containing the size of each output port.

Examples

Specify Output Size

Specify in your class definition file the size of a System object output.

```
methods (Access = protected)
   function sz_1 = getOutputSizeImpl(obj)
      sz_1 = [1 1];
   end
end
```

Specify Multiple Output Ports

Specify in your class definition file the sizes of multiple System object outputs.

```
methods (Access = protected)
   function [sz_1,sz_2] = getOutputSizeImpl(obj)
      sz_1 = propagatedInputSize(obj,1);
      sz_2 = [1 1];
   end
 end
```

Specify Output When Using Propagated Input Size

Specify in your class definition file the size of System object output when it depends on the propagated input size.

```
methods (Access = protected)
   function varargout = getOutputSizeImpl(obj)
      varargout{1} = propagatedInputSize(obj,1);
      if obj.HasSecondOutput
         varargout{2} = [1 1];
      end
   end
end
```

See Also

matlab.system.mixin.Propagates | propagatedInputSize

Topics

“Set Output Size”

isOutputComplexImpl

Class: matlab.system.mixin.Propagates
Package: matlab.system.mixin

Complexity of output ports

Syntax

```
[cp_1,cp_2,...,cp_n] = isOutputComplexImpl(obj)
```

Description

`[cp_1,cp_2,...,cp_n] = isOutputComplexImpl(obj)` returns whether each output port has complex data. The number of outputs must match the value returned from the `getNumOutputs` method or the number of output arguments listed in the `stepImpl` method.

For System objects with one input and one output and where you want the input and output complexities to be the same, you do not need to implement this method. In this case `isOutputComplexImpl` assumes the input and output complexities are the same and returns the complexity of the input.

If your System object has more than one input or output or you need the output and input complexities to be different, you must implement the `isOutputComplexImpl` method to define the output complexity. You also must use the `propagatedInputComplexity` method if the output complexity differs from the input complexity.

During Simulink model compilation and propagation, the MATLAB System block calls the `isOutputComplex` method, which then calls the `isOutputComplexImpl` method to determine the output complexity.

Note You must set `Access = protected` for this method.

You cannot modify any properties in this method.

Input Arguments

obj

System object handle

Output Arguments

cp_1,cp_2,...

Logical, scalar value indicating whether the specific output port is complex (`true`) or real (`false`).

Examples

Specify Output as Real-Valued

Specify in your class definition file that the output from a System object is a real value.

```
methods (Access = protected)
   function c1 = isOutputComplexImpl(obj)
       c1 = false;
   end
end
```

Topics

"Set Output Complexity"

isOutputFixedSizeImpl

Class: matlab.system.mixin.Propagates
Package: matlab.system.mixin

Fixed- or variable-size output ports

Syntax

```
[flag_1,flag_2,...flag_n] = isOutputFixedSizeImpl(obj)
```

Description

`[flag_1,flag_2,...flag_n] = isOutputFixedSizeImpl(obj)` returns whether each output port is fixed size. The number of outputs must match the value returned from the `getNumOutputs` method, which is the number of output arguments listed in the `stepImpl` method.

For System objects with one input and one output and where you want the input and output fixed sizes to be the same, you do not need to implement this method. In this case `isOutputFixedSizeImpl` assumes the input and output fixed sizes are the same and returns the fixed size of the input.

If your System object has more than one input or output or you need the output and input fixed sizes to be different, you must implement the `isOutputFixedSizeImpl` method to define the output fixed size. You also must use the `propagatedInputFixedSize` method if the output fixed size status differs from the input fixed size status.

During Simulink model compilation and propagation, the MATLAB System block calls the `isOutputFixedSize` method, which then calls the `isOutputFixedSizeImpl` method to determine the output fixed size.

All inputs default to variable-size inputs For these inputs, the output size is the maximum input size.

Note You must set `Access = protected` for this method.

You cannot modify any properties in this method.

Input Arguments

obj

System object handle

Output Arguments

flag_1,flag2,...

Logical, scalar value indicating whether the specific output port is fixed size (`true`) or variable size (`false`).

Examples

Specify Output as Fixed Size

Specify in your class definition file that the output from a System object is of fixed size.

```
methods (Access = protected)
   function c1 = isOutputFixedSizeImpl(obj)
      c1 = true;
   end
end
```

See Also

`matlab.system.mixin.Propagates` | `propagatedInputFixedSize`

Topics

"Set Fixed- or Variable-Size Output"

propagatedInputComplexity

Class: matlab.system.mixin.Propagates
Package: matlab.system.mixin

Complexity of input during Simulink propagation

Syntax

```
flag = propagatedInputComplexity(obj,index)
```

Description

`flag = propagatedInputComplexity(obj,index)` returns `true` or `false` to indicate whether the input argument for the indicated System object is complex. `index` specifies the input for which to return the complexity flag.

You can use `propagatedInputComplexity` only from within the `isOutputComplexImpl` method in your class definition file. Use `isOutputComplexImpl` when:

- Your System object has more than one input or output.
- The input complexity determines the output complexity.
- The output complexity must differ from the input complexity.

Input Arguments

`obj`

System object

`index`

Index of the specified input. Do not count the `obj` in the `index`. The first input is always `obj`.

Output Arguments

flag

Complexity of the specified input, returned as `true` or `false`

Examples

Match Input and Output Complexity

Get the complexity of the second input when you run the object and set the output to match it. Assume that the first input has no impact on the output complexity.

```
methods (Access = protected)
   function outcomplx = isOutputComplexImpl(obj)
      outcomplx = propagatedInputComplexity(obj,2);
   end
end
```

See Also

`isOutputComplexImpl` | `matlab.system.mixin.Propagates`

Topics

“Set Output Complexity”

propagatedInputDataType

Class: matlab.system.mixin.Propagates
Package: matlab.system.mixin

Data type of input during Simulink propagation

Syntax

```
dt = propagatedInputDataType(obj,index)
```

Description

`dt = propagatedInputDataType(obj,index)` returns the data type of an input argument for a System object. `index` specifies the input for which to return the data type.

You can use `propagatedInputDataType` only from within `getOutputDataTypeImpl`. Use `getOutputDataTypeImpl` when:

- Your System object has more than one input or output.
- The input data type status determines the output data type.
- The output data type must differ from the input data type.

Input Arguments

`obj`

System object

`index`

Index of the specified input. Do not count the `obj` in the `index`. The first input is always `obj`.

Output Arguments

dt

Data type of the specified input, returned as a character vector for floating-point input or as a numerictype for fixed-point input.

Examples

Match Input and Output Data Type

Get the data type of the second input. If the second input data type is `double`, then the output data type is `int32`. For all other cases, the output data type matches the second input data type. Assume that the first input has no impact on the output.

```
methods (Access = protected)
   function dt = getOutputDataTypeImpl(obj)
       if strcmpi(propagatedInputDataType(obj,2),'double')
           dt = 'int32';
       else
           dt = propagatedInputDataType(obj,2);
       end
   end
end
```

propagatedInputFixedSize

Class: matlab.system.mixin.Propagates
Package: matlab.system.mixin

Fixed-size status of input during Simulink propagation

Syntax

```
flag = propagatedInputFixedSize(obj,index)
```

Description

`flag = propagatedInputFixedSize(obj,index)` returns `true` or `false` to indicate whether an input argument of a System object is fixed size. `index` specifies the input for which to return the fixed-size flag.

You can use `propagatedInputFixedSize` only from within `isOutputFixedSizeImpl`. Use `isOutputFixedSizeImpl` when:

- Your System object has more than one input or output.
- The input fixed-size status determines the output fixed-size status.
- The output fixed-size status must differ from the input fixed-size status.

Input Arguments

`obj`

System object

`index`

Index of the specified input. Do not count the `obj` in the `index`. The first input is always `obj`.

Output Arguments

flag

Fixed-size status of the specified input, returned as `true` or `false`.

Examples

Match Fixed-Size Status of Input and Output

Get the fixed-size status of the third input and set the output to match it. Assume that the first and second inputs have no impact on the output.

```
methods (Access = protected)
   function outtype = isOutputFixedSizeImpl(obj)
      outtype = propagatedInputFixedSize(obj,3)
   end
end
```

See Also

`isOutputFixedSizeImpl` | `matlab.system.mixin.Propagates`

Topics

"Set Fixed- or Variable-Size Output"

propagatedInputSize

Class: matlab.system.mixin.Propagates
Package: matlab.system.mixin

Size of input during Simulink propagation

Syntax

```
sz = propagatedInputSize(obj,index)
```

Description

`sz = propagatedInputSize(obj,index)` returns, as a vector, the input size of the specified System object. The `index` specifies the input for which to return the size information. (Do not count the `obj` in the `index`. The first input is always `obj`.)

You can use `propagatedInputSize` only from within the `getOutputSizeImpl` method in your class definition file. Use `getOutputSizeImpl` when:

- Your System object has more than one input or output.
- The input size determines the output size.
- The output size must differ from the input size.

Note For variable-size inputs, the propagated input size from `propagatedInputSize` differs depending on the environment.

- MATLAB — `propagatedInputSize` returns the size of the inputs used when you run the object for the first time.
- Simulink — `propagatedInputSize` returns the upper bound of the input sizes.

Input Arguments

obj

System object

index

Index of the specified input

Output Arguments

sz

Size of the specified input, returned as a vector

Examples

Match Size of Input and Output

Get the size of the second input. If the first dimension of the second input has a size greater than 1, then set the output size to a 1 x 2 vector. For all other cases, the output is a 2 x 1 matrix. Assume that the first input has no impact on the output size.

```
methods (Access = protected)
   function outsz = getOutputSizeImpl(obj)
       sz = propagatedInputSize(obj,2);
       if sz(1) == 1
           outsz = [1,2];
       else
           outsz = [2,1];
       end
   end
end
```

matlab.system.mixin.Nondirect class

Package: matlab.system.mixin

Nondirect feedthrough mixin class

Description

`matlab.system.mixin.Nondirect` is a class that uses the `output` and `update` methods to process nondirect feedthrough data through a System object.

For System objects that use direct feedthrough, the object's input is needed to generate the output at that time. For these direct feedthrough objects, running the System object calculates the output and updates the state values. For nondirect feedthrough, however, the object's output depends only on the internal states at that time. The inputs are used to update the object states. For these objects, calculating the output with `outputImpl` is separated from updating the state values with `updateImpl`. If you use the `matlab.system.mixin.Nondirect` mixin and include the `stepImpl` method in your class definition file, an error occurs. In this case, you must include the `updateImpl` and `outputImpl` methods instead.

The following cases describe when System objects in Simulink use direct or nondirect feedthrough.

- System object supports code generation and does not inherit from the `Propagates` mixin — Simulink automatically infers the direct feedthrough settings from the System object code.
- System object supports code generation and inherits from the `Propagates` mixin — Simulink does not automatically infer the direct feedthrough settings. Instead, it uses the value returned by the `isInputDirectFeedthroughImpl` method.
- System object does not support code generation — Default `isInputDirectFeedthroughImpl` method returns false, indicating that direct feedthrough is not enabled. To override the default behavior, implement the `isInputDirectFeedthroughImpl` method in your class definition file.

Use the `Nondirect` mixin to allow a System object to be used in a Simulink feedback loop. A delay object is an example of a nondirect feedthrough object.

To use this mixin, you must subclass from this class in addition to subclassing from the `matlab.System` base class. Type the following syntax as the first line of your class definition file, where `ObjectName` is the name of your object:

```
classdef ObjectName < matlab.system & matlab.system.mixin.Nondirect
```

Methods

isInputDirectFeedthroughImpl	Direct feedthrough status of input
outputImpl	Output calculation from input or internal state of System object
updateImpl	Update object states based on inputs

See Also

`matlab.System`

Topics

"Use Update and Output for Nondirect Feedthrough"

isInputDirectFeedthroughImpl

Class: matlab.system.mixin.Nondirect
Package: matlab.system.mixin

Direct feedthrough status of input

Syntax

```
[flag1,...,flagN] = isInputDirectFeedthroughImpl(obj)
[flag1,...,flagN] = isInputDirectFeedthroughImpl(obj,
input,input2, ...)
```

Description

`[flag1,...,flagN] = isInputDirectFeedthroughImpl(obj)` specifies whether each input is a direct feedthrough input. If direct feedthrough is `true`, the output depends on the input at each time instant.

`[flag1,...,flagN] = isInputDirectFeedthroughImpl(obj, input,input2, ...)` uses one or more of the System object input specifications to determine whether inputs have direct feedthrough.

If you do not include the `isInputDirectFeedthroughImpl` method in your System object class definition file, all inputs are assumed to be direct feedthrough.

The following cases describe when System objects in Simulink code generation use direct or nondirect feedthrough.

- System object supports code generation and does not inherit from the `Propagates` mixin — Simulink automatically infers the direct feedthrough settings from the System object code.
- System object supports code generation and inherits from the `Propagates` mixin — Simulink does not automatically infer the direct feedthrough settings. Instead, it uses the value returned by the `isInputDirectFeedthroughImpl` method.
- System object does not support code generation — Default `isInputDirectFeedthroughImpl` method returns false, indicating that direct

feedthrough is not enabled. To override the default behavior, implement the `isInputDirectFeedthroughImpl` method in your class definition file.

Class Information

This method is part of the `matlab.system.mixin.Nondirect` class.

Run-Time Details

`isInputDirectFeedthroughImpl` is called by the MATLAB System block.

Method Authoring Tips

- You must set `Access = protected` for this method.
- You cannot modify, implement, or access tunable properties in this method.

Input Arguments

`obj` — System object
System object

System object handle used to access properties, states, and methods specific to the object.

`input1,input2,...` — Inputs to the System object
inputs to the System object algorithm

Inputs to the algorithm (`stepImpl`) of the System object. The inputs list must match the order of inputs in the `stepImpl` signature.

Output Arguments

`flag1,...,flagN` — Output flag for each input to the System object
logical

Logical value, either `true` or `false` indicating whether the input is direct feedthrough. The number of output flags must match the number of inputs to the System object (inputs to `stepImpl`, `outputImpl`, or `updateImpl`).

Examples

Specify Input as Nondirect Feedthrough

Use `isInputDirectFeedthroughImpl` in your class definition file for marking all inputs as nondirect feedthrough.

```
methods (Access = protected)
   function flag = isInputDirectFeedthroughImpl(~)
      flag = false;
   end
end
```

Complete Class Definition

```
classdef intDelaySysObj < matlab.System &...
     matlab.system.mixin.Nondirect
   % intDelaySysObj Delay input by specified number of samples.

   properties
      InitialOutput = 0;
   end
   properties (Nontunable)
      NumDelays = 1;
   end
   properties (DiscreteState)
      PreviousInput;
   end

   methods (Access = protected)
      function validatePropertiesImpl(obj)
         if ((numel(obj.NumDelays)>1) || (obj.NumDelays <= 0))
            error('Number of delays must be > 0 scalar value.');
         end
         if (numel(obj.InitialOutput)>1)
            error('Initial Output must be scalar value.');
         end
      end

      function setupImpl(obj)
         obj.PreviousInput = ones(1,obj.NumDelays)*obj.InitialOutput;
      end

      function resetImpl(obj)
         obj.PreviousInput = ones(1,obj.NumDelays)*obj.InitialOutput;
      end

      function [y] = outputImpl(obj,~)
         y = obj.PreviousInput(end);
      end
      function updateImpl(obj, u)
         obj.PreviousInput = [u obj.PreviousInput(1:end-1)];
      end
      function flag = isInputDirectFeedthroughImpl(~)
         flag = false;
      end
   end
end
```

Topics

“Use Update and Output for Nondirect Feedthrough”

outputImpl

Class: matlab.system.mixin.Nondirect
Package: matlab.system.mixin

Output calculation from input or internal state of System object

Syntax

```
[y1,y2,...,yN] = outputImpl(obj,u1,u2,...,uN)
```

Description

`[y1,y2,...,yN] = outputImpl(obj,u1,u2,...,uN)` specifies the algorithm to output the System object states. . The output values are calculated from the states and property values. Any inputs that you set to nondirect feedthrough are ignored during output calculation.

`outputImpl` is called by the `output` method. It is also called before the `updateImpl` method. For sink objects, calling `updateImpl` before `outputImpl` locks the object. For all other types of objects, calling `updateImpl` before `outputImpl` causes an error.

Note You must set `Access = protected` for this method.

You cannot modify any tunable properties in this method if its System object will be used in the Simulink MATLAB System block.

Input Arguments

`obj`

System object handle

u1,u2,...uN

Inputs from the algorithm. The number of inputs must match the number of inputs returned by the `getNumInputs` method. Nondirect feedthrough inputs are ignored during normal execution of the System object. However, for code generation, you must provide these inputs even if they are empty.

Output Arguments

y1,y2,...yN

Outputs calculated from the specified algorithm. The number of outputs must match the number of outputs returned by the `getNumOutputs` method.

Examples

Set Up Output that Does Not Depend on Input

Specify in your class definition file that the output does not directly depend on the current input with the `outputImpl` method. `PreviousInput` is a property of the `obj`.

```
methods (Access = protected)
   function [y] = outputImpl(obj, ~)
      y = obj.PreviousInput(end);
   end
end
```

Topics

“Use Update and Output for Nondirect Feedthrough”

updateImpl

Class: matlab.system.mixin.Nondirect
Package: matlab.system.mixin

Update object states based on inputs

Syntax

```
updateImpl(obj,input1,input2,...)
```

Description

`updateImpl(obj,input1,input2,...)` specifies the algorithm to update the System object states. You implement this method when your algorithm outputs depend only on the object's internal state and internal properties.

Run-Time Details

`updateImpl` is called by the `update` method and after the `outputImpl` method.

For sink objects, calling `updateImpl` before `outputImpl` locks the object. For all other types of objects, calling `updateImpl` before `outputImpl` causes an error.

Method Authoring Tips

- Do not use this method to update the outputs from the inputs.
- You must set `Access = protected` for this method.
- If the System object will be used in the Simulink MATLAB System block, you cannot modify any tunable properties in this method.

Input Arguments

obj — System object
System object

System object handle used to access properties, states, and methods specific to the object.

input1,input2,... — Inputs to the System object
inputs to the System object

List the inputs to the System object. The order of inputs must match the order of inputs defined in the stepImpl method.

Examples

Set Up Output that Does Not Depend on Current Input

Update the object with previous inputs. Use updateImpl in your class definition file. This example saves the u input and shifts the previous inputs.

```
methods (Access = protected)
   function updateImpl(obj,u)
      obj.PreviousInput = [u obj.PreviousInput(1:end-1)];
   end
end
```

matlab.system.mixin.SampleTime class

Control sample time for System objects in Simulink

Description

`matlab.system.mixin.SampleTime` specifies the sample time specifications for a System object when it is included in a MATLAB System block. Inherit from this mixin class and its methods to control the sample time of your System object in Simulink, via the MATLAB System block.

With this mixin, you can:

- Specify the sample time type
- Specify the sample time
- Customize the sample time with offsets and tick times
- Get the current simulation time

System objects that inherit from this mixin class must also inherit from `matlab.System`. For example:

```
classdef MySystemObject < matlab.System & matlab.system.mixin.SampleTime
```

Methods

getSampleTimeImpl	Specify sample time type, offset time, and sample time
getSampleTime	Query sample time
getCurrentTime	Current simulation time in MATLAB System block
createSampleTime	Create sample time specification object
setNumTicksUntilNextHit	Set the number of ticks in Simulink sample time

Topics

"Specify Sample Time for MATLAB System Block System Objects"

Introduced in R2017b

getSampleTimeImpl

Class: matlab.system.mixin.SampleTime

Specify sample time type, offset time, and sample time

Syntax

```
sts = getSampleTimeImpl(obj)
```

Description

`sts = getSampleTimeImpl(obj)` returns the sample time specification created within the method body, `sts`, for the System object `obj`. Specify the sample time specification within the body of `getSampleTimeImpl` by calling `createSampleTime`. The sample time specification affects the simulation time when the System object is included in a MATLAB System block.

This method is called during setup by `setupImpl`.

Input Arguments

`obj` — System object

system object

System object for which you want to specify the sample time.

Output Arguments

`sts` — Sample time specification object

sample time specification object

An object defining the sample time specification values. You create this object with the `createSampleTime` function.

Examples

Specify Inherited Sample Time

Specify that the MATLAB System block should inherit the sample from upstream blocks.

```
function sts = getSampleTimeImpl(obj)
    sts = createSampleTime(obj,'Type','Inherited');
end
```

Specify Discrete Sample Time

Specify a discrete sample time for the MATLAB System block.

```
function sts = getSampleTimeImpl(obj)
    sts = createSampleTime(obj,'Type','Discrete',...
      'SampleTime',10.2,'OffsetTime',0.5);
end
```

Topics

“Specify Sample Time for MATLAB System Block System Objects”

Introduced in R2017b

getSampleTime

Class: matlab.system.mixin.SampleTime

Query sample time

Syntax

```
sts = getSampleTime(obj)
```

Description

`sts = getSampleTime(obj)` returns the sample time specification for the System object `obj` when the System object is included in a MATLAB System block. You can call `getSampleTime` in the `stepImpl` method to change the algorithm based on the sample time.

Before sample time has propagated throughout the MATLAB System block model, `getSampleTime` returns the `getSampleTimeImpl` sample time specification. If your system object does not override `getSampleTimeImpl`, the default `Inherited` sample time specification is returned.

After sample time has propagated, `getSampleTime` returns the sample time specification populated with the actual MATLAB System block sample time type, sample time, and offset time.

Input Arguments

`obj` — System object
system object

System object included in a MATLAB System block that you want to query.

Output Arguments

sts — Sample time specification object
sample time specification object

The sample time specification for the System object. For more details about sample time specification objects, see createSampleTime.

Examples

Return Sample Time

This example of stepImpl returns a count value y, the current simulation time ct, and the sample time st. The sample time is obtained by calling getSampleTime.

```
function [y,ct,st] = stepImpl(obj,u)
      y = obj.Count + u;
      obj.Count = y;
      ct = getCurrentTime(obj);
      sts = getSampleTime(obj);
      st = sts.SampleTime;
    end
```

For a complete class definition, see “Specify Sample Time for MATLAB System Block System Objects”.

createSampleTime | getCurrentTime | getSampleTimeImpl | matlab.system.mixin.SampleTime

Topics

“Specify Sample Time for MATLAB System Block System Objects”

Introduced in R2017b

getCurrentTime

Class: matlab.system.mixin.SampleTime

Current simulation time in MATLAB System block

Syntax

```
t = getCurrentTime(obj)
```

Description

`t = getCurrentTime(obj)` returns the current simulation time in the MATLAB System block. Call this method in the `stepImpl` method of your System object.

Note If the MATLAB System block is operating in continuous sample time, `getCurrentTime` may return non-monotonic times due to solver operation.

Input Arguments

`obj` — System object
system object

System object included in a MATLAB System block that you want to query.

Output Arguments

`t` — Current simulation time
double

The current simulation time of the MATLAB System block that contains the System object.

Examples

Return Current Simulation Time

This example of `stepImpl` returns a count value `y` and the current simulation time `ct`. The simulation time is obtained by calling `getCurrentTime`.

```
function [y,ct] = stepImpl(obj,u)
    y = obj.Count + u;
    obj.Count = y;
    ct = getCurrentTime(obj);
end
```

For a complete class definition, see “Specify Sample Time for MATLAB System Block System Objects”.

See Also

`createSampleTime` | `getSampleTime` | `getSampleTimeImpl` | `matlab.system.mixin.SampleTime`

Topics

“Specify Sample Time for MATLAB System Block System Objects”

Introduced in R2017b

createSampleTime

Class: matlab.system.mixin.SampleTime

Create sample time specification object

Syntax

```
sts = createSampleTime(obj)
sts = createSampleTime(obj,'Type',Type)
sts = createSampleTime(obj,'Type',Type,Name,Value)
```

Description

`sts = createSampleTime(obj)` creates a sample time specification object for inherited sample time for the System object `obj`. Use this sample time specification object in the `getSampleTimeImpl` method of your System object. The sample time specification affects the simulation time when the System object is included in a MATLAB System block.

`sts = createSampleTime(obj,'Type',Type)` creates a sample time specification object with the specified sample time type.

`sts = createSampleTime(obj,'Type',Type,Name,Value)` creates a sample time specification object with additional options specified by one or more `Name,Value` pair arguments. `Name` is a property name and `Value` is the corresponding value. `Name` must appear inside single quotes (`''`). You can specify several name-value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Input Arguments

`obj` — System object

system object

System object that you want to specify the sample time.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: `'Type','Fixed In Minor Step'`

`Type` — Sample time type

`'Inherited'` (default) | `'Controllable'` | `'Discrete'` | `'Fixed In Minor Step'`

Type of sample time you want the System object to use in Simulink. For descriptions of the different types of sample times, see:

- `'Inherited'` - “Inherited Sample Time”
- `'Controllable'` - “Controllable Sample Time”
- `'Discrete'` - “Discrete Sample Time”
- `'Fixed In Minor Step'` - “Fixed-in-Minor-Step”

Example: `createSampleTime('Type','Fixed In Minor Step')`

`Disallow` — Disallow controllable sample time

`'Controllable'`

Optional for `Inherited` sample time only.

When the sample time type is set to `Inherited`, this option disallows inherited controllable sample time. Use this option if your System object depends on having constant time between each sample-time hit.

If controllable sample time is propagated to the System object, discrete sample time is used instead with the same tick time as the propagated controllable sample time.

Example:
`createSampleTime('Type','Inherited','Disallow','Controllable')`

`SampleTime` — Time between samples

`1` (default) | positive number

For `Discrete` sample time only.

Specify the time between sample hits in Simulink.

Data Types: `single` | `double`

Example: `createSampleTime('Type','Discrete','SampleTime',1)`

`OffsetTime` — Offset from sample time

`0` (default) | nonnegative number less than `SampleTime`

For `Discrete` sample time only.

Specify the offset time for the sample hit. The offset is a time interval indicating an update delay. The block is updated later in the sample interval than other blocks operating at the same sample rate.

The offset time must be nonnegative and less than `SampleTime`.

Data Types: `single` | `double`

Example: `createSampleTime('Type','Discrete','SampleTime',2,'OffsetTime',1)`

`TickTime` — Time between sample time hits

-1 (default) | positive scalar

Required for `Controllable` sample time only.

Specify the time between controllable sample time hits. The tick time must be a positive scalar.

Data Types: `single` | `double`

Example:
`createSampleTime('Type','Controllable','TickTime',obj.TickTime)`

Output Arguments

`sts` — Sample time specification object

sample time specification object

The sample time specification object. This object has the following properties:

- Type — Type of sample time

- SampleTime — Time between samples
- OffsetTime — Offset from sample time

Use this object as the return value of `getSampleTimeImpl`.

Examples

Create Inherited Sample Time Specification Objects

Specify that the MATLAB System block inherits the sample from upstream blocks. Inherited sample time is the default, so no additional arguments are needed.

```
function sts = getSampleTimeImpl(obj)
    sts = createSampleTime(obj);
end
```

Create Discrete Sample Time Object

Specify a discrete sample time specification for the MATLAB System block, including offset time and the sample time.

```
function sts = getSampleTimeImpl(obj)
    sts = createSampleTime(obj,'Type','Discrete',...
      'SampleTime',10.2,'OffsetTime',0.5);
end
```

See Also

`getCurrentTime` | `getSampleTime` | `getSampleTimeImpl` | `matlab.system.mixin.SampleTime` | `setNumTicksUntilNextHit`

Topics

“Specify Sample Time for MATLAB System Block System Objects”

Introduced in R2017b

setNumTicksUntilNextHit

Class: matlab.system.mixin.SampleTime

Set the number of ticks in Simulink sample time

Syntax

```
setNumTicksUntilNextHit(obj,ticks)
```

Description

`setNumTicksUntilNextHit(obj,ticks)` sets the number of ticks in Simulink sample time to wait until the next call to `stepImpl`, or `outputImpl`/`updateImpl`. To use this method, set your System object to controllable sample time with `createSampleTime('Type','Controllable')`. Otherwise, your System object gives a compilation error.

You can only call this method from `stepImpl`, `outputImpl`, `updateImpl`, or `resetImpl`.

Input Arguments

`obj` — System object
system object

System object that you want to specify the sample time.

`ticks` — Number of ticks in Simulink sample time
positive integer scalar

Number of ticks in Simulink sample time to wait until the next call to `stepImpl` or `outputImpl`/`updateImpl`. Specify this number as a positive integer scalar less than `intmax('uint64')`.

The number of sample time ticks to wait until the next hit is persistent. If you don’t update this number, Simulink uses the previously set value of number of ticks to wait.

ModelAdvisor.Preferences class

Package: ModelAdvisor

Set Model Advisor window preferences by specifying which folders and tabs to display

Description

Use instances of this class to set Model Advisor preferences.

Construction

The constructor `ModelAdvisor.Preferences` creates an instance of this class with default property values.

Create an instance `modelPreferences` of the `ModelAdvisor.Preferences` class.

```
modelPreferences = ModelAdvisor.Preferences;
```

Properties

`DeselectByProduct` — Deselect the By Product folder
(default) | `true`

Selection of the **By Product** folder in the Model Advisor window. The default value is `true`.

Example: `true`

Data Types: `logical`

`ShowAccordion` — Display advisors
(default) | `true`

Display of the **Code Generation Advisor**, **Upgrade Advisor**, and **Performance Advisor** in the Model Advisor window. You can use these advisors to help configure your model for code generation, upgrade your model for the current release, or improve performance.

Example: `true`

Data Types: `logical`

`ShowByProduct` — Display the By Product folder

(default) | `true`

Display of the **By Product** folder in the Model Advisor window. The default value is `true`.

Example: `true`

Data Types: `logical`

`ShowByTask` — Display the By Task folder

(default) | `true`

Display of the **By Task** folder in the Model Advisor window. The default value is `true`.

Example: `true`

Data Types: `logical`

`ShowExclusionsInRpt` — Include exclusions in report

(default) | `true`

Include exclusions in the Model Advisor report. The default value is `true`.

Example: `true`

Data Types: `logical`

`ShowExclusionTab` — Display the Exclusions tab

(default) | `false`

Display of the **Exclusions** tab in the Model Advisor window. The default value is `false`. When you click the **Exclusions** tab, the Model Advisor window displays checks that are excluded form the Model Advisor analysis.

Example: `true`

Data Types: `logical`

ShowSourceTab — Display the Source tab
(default) | false

Display of the **Source** tab in the Model Advisor window. The default value is `false`. When you click the **Source** tab, the Model Advisor window displays the check Title, TitleID, and location of the MATLAB source code for the check.

Example: `true`

Data Types: `logical`

Examples

Turn Off Display Of By Product Folder

This example shows how to not display the **By Product** folder in the Model Advisor window:

```
mp = ModelAdvisor.Preferences;
mp.load;
mp.ShowByProduct = false;
mp.save
```

Alternatives

You can set the Model Advisor preferences by using the Model Advisor Preferences dialog box:

- On the Model Advisor menu, select **Settings** > **Preferences**.
- From the Model Editor, select **Analysis** > **Model Advisor** > **Preferences**.

"Run Model Checks"

Introduced in R2014b

Simulink.AliasType

Create alias for signal and parameter data type

Description

Use a `Simulink.AliasType` to create an alias of a built-in data type such as `int8`.

The name of the object is the alias. The data type to which an alias refers, such as `int8`, is the base type.

You create the object in the base workspace or a data dictionary. To use the alias, you use the name of the object to set data types for signals, states, and parameters in a model.

Using aliases to specify signal and parameter data types can greatly simplify global changes to the data types that a model specifies. In particular, changing the data type of all signals, states, and parameters whose data type is specified by an alias requires changing only the base type of the alias. By contrast, changing the data types of signals, states, and parameters whose data types are specified by an actual type name requires respecifying the data type of each signal and parameter individually.

You can use objects of this class to create an alias for Simulink built-in data types, fixed-point data types, enumerated data types, `Simulink.NumericType` objects, and other `Simulink.AliasType` objects. The code that you generate from a model (Simulink Coder) uses the alias only if you use an ERT-based system target file (Embedded Coder).

Alternatively, to define and name a numeric data type, you can use an object of the class `Simulink.NumericType`.

Creation

You can use either the Model Explorer or MATLAB commands to create a data type alias.

To use the Model Explorer to create an alias:

1. On the Model Explorer **Model Hierarchy** pane, select `Base Workspace`.

You must create data type aliases in the MATLAB workspace or in a data dictionary. If you attempt to create an alias in a model workspace, Simulink software displays an error.

2 From the Model Explorer **Add** menu, select **Simulink.AliasType**.

   Simulink software creates an instance of a `Simulink.AliasType` object and assigns it to a variable named `Alias` in the MATLAB workspace.

3 Rename the variable to a more appropriate name, for example, a name that reflects its intended usage.

   To change the name, edit the name displayed in the **Name** field on the Model Explorer **Contents** pane.

4 On the Model Explorer **Dialog** pane, in the **Base type** field, enter the name of the data type that this alias represents.

   You can specify the name of any existing standard or user-defined data type in this field. Skip this step if the base type is `double` (the default).

To generate `Simulink.AliasType` objects that correspond to `typedef` statements in your external C code, consider using the `Simulink.importExternalCTypes` function.

To create a data type alias programmatically, use the `Simulink.AliasType` function described below.

Syntax

```
aliasObj = Simulink.AliasType
aliasObj = Simulink.AliasType(baseType)
```

Description

`aliasObj = Simulink.AliasType` returns a `Simulink.AliasType` object with default property values.

`aliasObj = Simulink.AliasType(baseType)` returns a `Simulink.AliasType` object and initializes the value of the `BaseType` property by using `baseType`.

Properties

For information about properties in the property dialog box of a `Simulink.AliasType` object, see “Simulink.AliasType Property Dialog Box”.

BaseType — Name of base data type

`'double'` (default) | character vector

Name of the base data type that this alias renames, specified as a character vector. You can specify the name of a standard data type, such as `int8`, or the name of a custom data type, such as the name of another `Simulink.AliasType` object or the name of an enumeration.

To specify a fixed-point data type, you can use a call to the `fixdt` function, such as `'fixdt(0,16,7)'`.

You can, with one exception, specify a nonstandard data type, e.g., a data type defined by a `Simulink.NumericType` object, by specifying the data type name. The exception is a `Simulink.NumericType` whose `DataTypeMode` is `Fixed-point: unspecified scaling`.

Note `Fixed-point: unspecified scaling` is a partially specified type whose definition is completed by the block that uses the `Simulink.NumericType`. Forbidding its use in alias types avoids creating aliases that have different base types depending on where they are used.

Corresponds to **Base type** in the property dialog box.

Example: `'int8'`

Example: `'myOtherAlias'`

Data Types: `char`

DataScope — Specification to generate or import type definition in the generated code

`'Auto'` (default) | `'Exported'` | `'Imported'`

Specification to generate or import the type definition (`typedef`) in the generated code (Simulink Coder), specified as `'Auto'`, `'Exported`, or `'Imported'`.

The table shows the effect of each option.

Value	Action
`'Auto'` (default)	If no value is specified for `HeaderFile`, export the type definition to *`model`*`_types.h`, where *`model`* is the model name. If you have an Embedded Coder license, and you have specified a data type replacement, then export the type definition to `rtwtypes.h`. If a value is specified for `HeaderFile`, import the data type definition from the specified header file.
`'Exported'`	Export the data type definition to a header file, which can be specified in the `HeaderFile` property. If no value is specified for `HeaderFile`, the header file name defaults to *`type`*`.h`. *`type`* is the data type name.
`'Imported'`	Import the data type definition from a header file, which can be specified in the `HeaderFile` property. If no value is specified for `HeaderFile`, the header file name defaults to *`type`*`.h`. *`type`* is the data type name.

For more information, see “Control File Placement of Custom Data Types” (Embedded Coder).

Corresponds to **Data scope** in the property dialog box.

`Description` — Custom description of data type alias

`''` (empty character vector) (default) | character vector

Custom description of the data type alias, specified as a character vector.

Corresponds to **Description** in the property dialog box.

Example: `'This type alias corresponds to a floating-point implementation.'`

Data Types: `char`

`HeaderFile` — Name of header file that contains type definition in the generated code

`''` (empty character vector) (default) | character vector

Name of the header file that contains the type definition (`typedef`) in the generated code, specified as a character vector.

If this property is specified, the specified name is used during code generation for importing or exporting. If this property is empty, the value defaults to *type*.h if DataScope equals 'Imported' or 'Exported', or defaults to *model*_types.h if DataScope equals 'Auto'.

By default, the generated #include directive uses the preprocessor delimiter " instead of < and >. To generate the directive #include <myTypes.h>, specify HeaderFile as '<myTypes.h>'.

For more information, see “Control File Placement of Custom Data Types” (Embedded Coder).

Corresponds to **Header file** in the property dialog box.

Example: 'myHdr.h'

Example: 'myHdr'

Example: 'myHdr.hpp'

Data Types: char

Examples

Create Alias for Enumerated Data Type

To create an alias for an enumerated type called SlDemoSign:

```
myEnumAlias = Simulink.AliasType('Enum: SlDemoSign');
```

Create Alias for Fixed-Point Data Type

To create an alias for a fixed-point data type by using a Simulink.AliasType object, set the BaseType property of the object by using a call to the fixdt function. The value of BaseType must be specified as a character vector.

For example, this code creates an alias for an unsigned fixed-point data type with word length 16 and fraction length 7.

```
myFixptAlias = Simulink.AliasType;
myFixptAlias.BaseType = 'fixdt(0,16,7)';
```

Simulink.Annotation

Specify properties of model annotation

Description

Instances of this class specify the properties of annotations. You can use `getCallbackAnnotation` in an annotation callback function to get the `Simulink.Annotation` instance for the annotation associated with the callback function. You can use `find_system` and `get_param` to get the `Simulink.Annotation` instance associated with any annotation in a model. For example, this code gets the annotation object for the first annotation in the currently selected model and turns on its drop shadow

```
ah = find_system(gcs,'FindAll','on','type','annotation');
ao = get_param(ah(1),'Object');
ao.DropShadow = 'on';
```

Children

None.

Property Summary

Property	Description	Values
`AnnotationType`	Type of annotation—text (note), area, or image. This property is read only.	`note_annotation` | `area_annotation` | `image_annotation`

Property	Description	Values
`BackgroundColor`	Background color of this annotation.	RGB value array | `[r,g,b,a]` where `r`, `g`, `b`, and `a` are the red, green, blue, and alpha values of the color normalized to the range 0.0 to 1.0, delineated with commas. The alpha value is optional and ignored. Annotation background color can also be `'black'`, `'white'`, `'red'`, `'green'`, `'blue'`, `'cyan'`, `'magenta'`, `'yellow'`, `'gray'`, `'lightBlue'`, `'orange'`, `'darkGreen'`.
`ClickFcn`	Specifies MATLAB code to execute when you click this annotation. See “Associate a Click Function with an Annotation” for more information.	character vector
`DeleteFcn`	MATLAB code to execute before deleting this annotation. See “Annotation Callback Functions”.	character vector
`Description`	Description of this annotation.	character vector
`DropShadow`	Turn drop shadow display on or off.	`'on' | {'off'}`
`FixedHeight`	Specify whether the bottom border of the annotation resizes as you add content	`'on' | {'off'}`, where `'off'` means that the bottom border resizes as you add content
`FixedWidth`	Specify whether to use word wrap or to have the width of the annotation expand to accommodate text	`'on' | {'off'}`, where `'off'` means to use word wrap

Property	Description	Values
FontAngle	Angle of the annotation font. The default value, 'auto', uses of the default font angle specified for lines in the Font Styles dialog box.	'normal' | 'italic' | 'oblique' | {'auto'}
FontName	Name of annotation font. The default value, 'auto', uses the default font specified for lines in the Font Styles dialog box.	character vector
FontSize	Size of annotation font in points. The default value, -1, uses the default text size for lines specified in the Font Styles dialog box.	decimal number | {'-1'}
FontWeight	Weight of the annotation font. The default value, 'auto', use of the default weight for lines specified in the Font Styles dialog box.	'light' | 'normal' | 'demi' | 'bold' | {'auto'}
ForegroundColor	Foreground color of this annotation.	RGB value array | [r,g,b,a] where r, g, b, and a are the red, green, blue, and alpha values of the color normalized to the range 0.0 to 1.0, delineated with commas. The alpha value is optional and ignored. Annotation background color can also be 'black', 'white', 'red', 'green', 'blue', 'cyan', 'magenta', 'yellow', 'gray', 'lightBlue', 'orange', 'darkGreen'.
Handle	Annotation handle.	real
HiliteAncestors	For internal use.	
Horizontal-Alignment	Horizontal alignment of this annotation.	'center' | {'left'}|'right'

Property	Description	Values
`Interpreter`	Specifies whether the annotation is interpreted as rich or contains LaTex commands	`'rich' | 'tex' | {'off'}`
`IsImage`	Specifies whether the annotation is an image-only annotation.	`'on' | {'off'}`
`InternalMargins`	Space from the bounding box of text to the borders of the annotation.	1x4 array `[left top right bottom]`. The default is `[1 1 1 1]`. The maximum value for a coordinate is 32767.
`LoadFcn`	MATLAB code to execute when the model containing this annotation is loaded. See “Annotation Callback Functions”.	character vector
`Name`	Text of annotation. Same as `Text`.	character vector
`Parent`	Parent name of annotation object.	character vector
`Path`	Path to the annotation.	character vector
`PlainText`	Read-only display of the text in the annotation, without formatting	vector
`Position`	Location of the annotation	1x4 array `[left top right bottom]`. The maximum value for a coordinate is 32767.
`RequirementInfo`	For internal use.	character vector
`Selected`	Specifies whether this annotation is currently selected.	`'on' | 'off'`
`Tag`	Text to assign to the annotation `Tag` parameter and save with the annotation.	character vector
`TeXMode`	Specifies whether to render TeX markup.	`'on' | {'off'}`

Property	Description	Values
Text	Text of annotation. Same as Name.	character vector
Type	Annotation type. This is always 'annotation'.	'annotation'
UseDisplayText-AsClickCallback	Specifies whether to use the contents of the Text property as the click function for this annotation. If set to 'on', the text of the annotation is interpreted as a valid MATLAB expression and run. If set to 'off', clicking the annotation runs the click function, if there is one. If there is no click function, clicking the annotation has no effect. See “Associate a Click Function with an Annotation” for more information.	'on' | {'off'}
UserData	Any data that you want to associate with this annotation.	vector
VerticalAlignment	Vertical alignment of this annotation.	'middle' | {'top'}|'cap'|'baseline'|'bottom'

Method Summary

Method	Description
delete	Delete this annotation from the Simulink model.
dialog	Display the Annotation properties dialog box.
disp	Display the property names and their settings for this Annotation object.
fitToView	Zoom in on this annotation and highlight it in the model.

Method	Description
`get`	Return the specified property settings for this annotation.
`help`	Display a list of properties for this Annotation object with short descriptions.
`methods`	Display all nonglobal methods of this Annotation object.
`set`	Set the specified property of this Annotation object with the specified value.
`setImage`	Set the annotation contents to the specified image file. The resulting annotation is an image-only annotation.
`struct`	Return and display a MATLAB structure containing the property settings of this Annotation object.
`view`	Display this annotation in the Simulink Editor with this annotation highlighted.

Introduced before R2006a

Simulink.BlockCompDworkData

Provide postcompilation information about block's DWork vector

Description

Simulink software returns an instance of this class when a MATLAB program, e.g., a Level-2 MATLAB S-function, invokes the “Dwork” on page 5-438 method of a block's run-time object after the model containing the block has been compiled.

Parent

`Simulink.BlockData`

Children

None

Property Summary

Name	Description
“Usage” on page 5-193	Usage type of this DWork vector.
“UsedAsDiscState” on page 5-193	True if this DWork vector is being used to store the values of a block's discrete states.

Properties

Usage

Returns a character vector indicating how this DWork vector is used. Permissible values are:

- DWork
- DState
- Scratch
- Mode

character vector

`RW` for MATLAB S-function blocks, `RO` for other blocks.

UsedAsDiscState

True if this DWork vector is being used to store the values of a block's discrete states.

Boolean

`RW` for MATLAB S-Function blocks, `RO` for other blocks.

Introduced before R2006a

Simulink.BlockCompInputPortData

Provide postcompilation information about block input port

Description

Simulink software returns an instance of this class when a MATLAB program, e.g., a Level-2 MATLAB S-function, invokes the “InputPort” on page 5-439 method of a block's run-time object after the model containing the block has been compiled.

Parent

`Simulink.BlockPortData`

Children

None

Property Summary

Name	Description
“DirectFeedthrough” on page 5-194	True if this port has direct feedthrough.
“Overwritable” on page 5-195	True if this port is overwritable.

Properties

DirectFeedthrough

True if this input port has direct feedthrough.

Boolean

`RW` for MATLAB S functions, `RO` for other blocks.

Overwritable

True if this input port is overwritable.

Boolean

`RW` for MATLAB S functions, `RO` for other blocks.

Introduced before R2006a

Simulink.BlockCompOutputPortData

Provide postcompilation information about block output port

Description

Simulink software returns an instance of this class when a MATLAB program, e.g., a Level-2 MATLAB S-function, invokes the “OutputPort” on page 5-440 method of a block's run-time object after the model containing the block has been compiled.

Parent

`Simulink.BlockPortData`

Children

None

Property Summary

Name	Description
“Reusable” on page 5-217	Specifies whether an output port's memory is reusable.

Properties

Reusable

Specifies whether an output port's memory is reusable. Options are: `NotReusableAndGlobal` and `ReusableAndLocal`.

character vector

`RW` for MATLAB S functions, `RO` for other blocks.

Introduced before R2006a

Simulink.BlockData

Provide run-time information about block-related data, such as block parameters

Description

This class defines properties that are common to objects that provide run-time information about a block's ports and work vectors.

Parent

None

Children

`Simulink.BlockPortData`, `Simulink.BlockCompDworkData`

Property Summary

Name	Description
"AliasedThroughDataType" on page 5-199	Fundamental base data type.
"AliasedThroughDataTypeID" on page 5-200	Fundamental base data type ID.
"Complexity" on page 5-200	Numeric type (real or complex) of the block data.
"Data" on page 5-200	The block data.
"DataAsDouble" on page 5-200	The block data in `double` form.
"Datatype" on page 5-201	Data type of the block data.
"DatatypeID" on page 5-201	Index of the data type of the block data.

Name	Description
“Dimensions” on page 5-202	Dimensions of the block data.
“Name” on page 5-202	Name of the block data.
“Type” on page 5-202	Type of block data (e.g., a parameter).

Properties

AliasedThroughDataType

Data type aliases allow a data type (B) to be recursively aliased to another alias type or `BaseType` (A). If alias type A is aliased to another alias type that is aliased to another alias type and so forth, this property allows the alias type to be iteratively searched (aliased through) until the type is no longer an alias type and that final result is the value of the property returned. For example, assume that you have created the Simulink Alias types A and B as follows:

```
A=Simulink.AliasType('double')

A =
Simulink.AliasType
    Description: ''
     HeaderFile: ''
       BaseType: 'double'
B=Simulink.AliasType('A')

B =
Simulink.AliasType
    Description: ''
     HeaderFile: ''
       BaseType: 'A'
```

If the data type of an item of block data is B, this property returns the base type A instead of B.

character vector

RO

AliasedThroughDataTypeID

Index of the data type alias returned by the `AliasedThroughDataType` property.

integer

`RO`

Complexity

Numeric type (real or complex) of the block data.

character vector

`RW` for MATLAB S functions, `RO` for other blocks.

Data

The block data.

The data type specified by the “Datatype” on page 5-201 or “DatatypeID” on page 5-201 properties of this object.

`RW`

DataAsDouble

The block data's in `double` form.

`double`

RO

Datatype

Data type of the values of the block-related object.

character vector

RO

DatatypeID

Index of the data type of the values of the block-related object. enter the numeric value for the desired data type, as follows:

Data Type	Value
'inherited'	-1
'double'	0
'single'	1
'int8'	2
'uint8'	3
'int16'	4
'uint16'	5
'int32'	6
'uint32'	7
'boolean' or fixed-point data types	8

integer

RW for MATLAB S functions, RO for other blocks

Dimensions

Dimensions of the block-related object, e.g., parameter or DWork vector.

array

`RW` for MATLAB S functions, `RO` for other blocks

Name

Name of block-related object, e.g., a block parameter or DWork vector.

character vector

`RW` for MATLAB S functions, `RO` for other blocks

Type

Type of block data. Possible values are:

Type	Description
`'BlockPreCompInputPortData'`	This object contains data for an input port before the model is compiled.
`'BlockPreCompOutputPortData'`	This object contains data for an output port before the model is compiled.
`'BlockCompInputPortData'`	This object contains data for an input port after the model is compiled.
`'BlockCompOutputPortData'`	This object contains data for an output port after the model is compiled.
`'BlockPreCompDworkData'`	This object contains data for a DWork vector before the model is compiled.

Type	Description
`'BlockCompDworkData'`	This object contains data for a DWork vector after the model is compiled.
`'BlockDialogPrmData'`	This object describes a dialog box parameter of a Level-2 MATLAB S-function.
`'BlockRuntimePrmData'`	This object describes a run-time parameter of a Level-2 MATLAB S-function.
`'BlockCompContStatesData'`	This object describes the continuous states of the block at the current time step.
`'BlockDerivativesData'`	This object describes the derivatives of the block's continuous states at the current time step.

character vector

RO

Introduced before R2006a

Simulink.BlockPath

Fully specified Simulink block path

Description

A Simulink.BlockPath object represents a fully specified block path that uniquely identifies a block within a model hierarchy, including model reference hierarchies that involve multiple instances of a referenced model. Simulink uses block path objects in a variety of contexts. For example, when you specify normal mode visibility, Simulink uses block path objects to identify the models with Normal mode visibility. For details, see "Normal Mode Visibility".

The Simulink.BlockPath class is very similar to the Simulink.SimulationData.BlockPath class.

You must have Simulink installed to use the Simulink.BlockPath class. However, you do not have to have Simulink installed to use the Simulink.SimulationData.BlockPath class. If you have Simulink installed, consider using Simulink.BlockPath instead of Simulink.SimulationData.BlockPath, because the Simulink.BlockPath class includes a method for checking the validity of block path objects without you having to update the model diagram.

Property Summary

Name	Description
SubPath on page 5-205	Individual component within the block specified by the block path

Method Summary

Name	Description
BlockPath on page 5-205	Create a block path.

Name	Description
`convertToCell` on page 5-208	Convert a block path to a cell array of character vectors.
`getBlock` on page 5-209	Get a single block path in the model reference hierarchy.
`getLength` on page 5-210	Get the length of the block path.
`validate` on page 5-210	Determine whether the block path represents a valid block hierarchy.

Properties

SubPath

Represents an individual component within the block specified by the block path.

For example, if the block path refers to a Stateflow chart, you can use `SubPath` to indicate the chart signals. For example:

```
Block Path:
      'sf_car/shift_logic'

    SubPath:
      'gear_state.first'
```

character vector

`RW`

Methods

BlockPath

Create block path

```
blockpath_object = Simulink.BlockPath()
blockpath_object = Simulink.BlockPath(blockpath)
blockpath_object = Simulink.BlockPath(paths)
blockpath_object = Simulink.BlockPath(paths, subpath)
```

`blockpath`

Block path object that you want to copy.

`paths`

A character vector or cell array of character vectors that Simulink uses to build the block path.

Specify each character vector in order, from the top model to the specific block for which you are creating a block path.

Each character vector must be a path to a block within the Simulink model. The block must be:

- A block in a single model
- A Model block (except for the last character vector, which may be a block other than a Model block)
- A block that is in a model that is referenced by a Model block that is specified in the previous character vector

When you create a block path for specifying Normal mode visibility:

- The first character vector must represent a block that is in the top model in the model reference hierarchy.
- Character vectors must represent Model blocks that are in Normal mode.
- Character vectors that represent variant models or variant subsystems must refer to an active variant.

You can use `gcb` in the cell array to specify the currently selected block.

`subpath`

Character vector that represents an individual component within a block.

`blockpath_object`

Block path that you create.

`blockpath_object = Simulink.BlockPath()` creates an empty block path.

`blockpath_object = Simulink.BlockPath(blockpath)` creates a copy of the block path of the block path object that you specify with the `source_blockpath` argument.

`blockpath = Simulink.BlockPath(paths)` creates a block path from the cell array of character vectors that you specify with the `paths` argument. Each character vector represents a path at a level of model hierarchy. Simulink builds the full block path based on the character vectors.

`blockpath = Simulink.BlockPath(paths, subpath)` creates a block path from the character vector or cell array of character vectors that you specify with the `paths` argument and creates a path for the individual component (for example, a signal) of the block.

Create a block path object called `bp1`, using `gcb` to get the current block.

```
sldemo_mdlref_depgraph
bp1 = Simulink.BlockPath(gcb)
```

The resulting block path is the top-level Model block called `thermostat` (the top-left Model block.

```
bp1 =

  Simulink.BlockPath
  Package: Simulink

  Block Path:
    'sldemo_mdlref_depgraph/thermostat'
```

Create a block path object called `bp2`, using a cell array of character vectors representing elements of the block path.

```
sldemo_mdlref_depgraph
bp2 = Simulink.BlockPath({'sldemo_mdlref_depgraph/thermostat', ...
'sldemo_mdlref_heater/Fahrenheit to Celsius', ...
'sldemo_mdlref_F2C/Gain1'})
```

The resulting block path reflects the model reference hierarchy for the block path

```
bp2 =

  Simulink.BlockPath
  Package: Simulink

  Block Path:
    'sldemo_mdlref_depgraph/thermostat'
      'sldemo_mdlref_heater/Fahrenheit to Celsius'
        'sldemo_mdlref_F2C/Gain1'
```

convertToCell

Convert block path to cell array of character vectors

```
cellarray = Simulink.BlockPath.convertToCell()
```

`cellarray`

Cell array of character vectors representing elements of block path.

`cellarray = Simulink.BlockPath.convertToCell()` converts a block path to a cell array of character vectors.

```
sldemo_mdlref_depgraph
bp2 = Simulink.BlockPath({'sldemo_mdlref_depgraph/thermostat', ...
'sldemo_mdlref_heater/Fahrenheit to Celsius', ...
'sldemo_mdlref_F2C/Gain1'})
cellarray_for_bp2 = bp2.convertToCell()
```

The result is a cell array representing the elements of the block path.

```
cellarray_for_bp2 =

    'sldemo_mdlref_depgraph/thermostat'
    'sldemo_mdlref_heater/Fahrenheit to Celsius'
    'sldemo_mdlref_F2C/Gain1'
```

getBlock

Get block path in model reference hierarchy

```
block = Simulink.BlockPath.getBlock(index)
```

`index`

The index of the block for which you want to get the block path. The index reflects the level in the model reference hierarchy. An index of 1 represents a block in the top-level model, an index of 2 represents a block in a model referenced by the block of index 1, and an index of `n` represents a block that the block with index `n-1` references.

`block`

The block representing the level in the model reference hierarchy specified by the `index` argument.

`blockpath = Simulink.BlockPath.getBlock(index)` returns the block path of the block specified by the `index` argument.

Get the block for the second level in the model reference hierarchy.

```
sldemo_mdlref_depgraph
bp2 = Simulink.BlockPath({'sldemo_mdlref_depgraph/thermostat', ...
'sldemo_mdlref_heater/Fahrenheit to Celsius', ...
'sldemo_mdlref_F2C/Gain1'})
blockpath = bp2.getBlock(2)
```

The result is the `thermostat` block, which is at the second level in the block path hierarchy.

```
blockpath =

sldemo_mdlref_heater/Fahrenheit to Celsius
```

getLength

Get length of block path

```
length = Simulink.BlockPath.getLength()
```

`length`

The length of the block path. The length is the number of levels in the model reference hierarchy.

`length = Simulink.BlockPath.getLength()` returns a numeric value that corresponds to the number of levels in the model reference hierarchy for the block path.

Get the length of block path `bp2`.

```
sldemo_mdlref_depgraph
bp2 = Simulink.BlockPath({'sldemo_mdlref_depgraph/thermostat', ...
'sldemo_mdlref_heater/Fahrenheit to Celsius', ...
'sldemo_mdlref_F2C/Gain1'})
length_bp2 = bp2.getLength()
```

The result reflects that the block path has three elements.

```
length_bp2 =

     3
```

validate

Determine whether block path represents valid block hierarchy

```
Simulink.BlockPath.validate()
Simulink.BlockPath.validate(AllowInactiveVariant)
```

`Simulink.BlockPath.validate()` determines whether the block path represents a valid block hierarchy. If there are any validity issues, messages appear in the MATLAB command window. The method checks that:

- All elements in the block path represent valid blocks.
- Each element except for the last element:
  - Is a valid Model block
  - References the model of the next element

Simulink.BlockPortData

Describe block input or output port

Description

This class defines properties that are common to objects that provide run-time information about a block's ports.

Parent

`Simulink.BlockData`

Children

`Simulink.BlockPreCompInputPortData`, `Simulink.BlockPreCompOutputPortData`, `Simulink.BlockCompInputPortData`, `Simulink.BlockCompOutputPortData`

Property Summary

Name	Description
"IsBus" on page 5-213	True if this port is connected to a bus.
"IsSampleHit" on page 5-213	True if this port produces output or accepts input at the current simulation time step.
"SampleTime" on page 5-213	Sample time of this port.
"SampleTimeIndex" on page 5-213	Sample time index of this port.

Properties

IsBus

True if this port is connected to a bus.

Boolean

`RO`

IsSampleHit

True if this port produces output or accepts input at the current simulation time step.

Boolean

`RO`

SampleTime

Sample time of this port.

`[period offset]` where `period` and `offset` are values of type `double`. See “Specify Sample Time” for more information.

`RW` for MATLAB S functions, `RO` for other blocks

SampleTimeIndex

Sample time index of this port.

integer

R0

Introduced before R2006a

Simulink.BlockPreCompInputPortData

Provide precompilation information about block input port

Description

Simulink software returns an instance of this class when a MATLAB program, e.g., a Level-2 MATLAB S-function, invokes the “InputPort” on page 5-439 method of a block's run-time object before the model containing the block has been compiled.

Parent

`Simulink.BlockPortData`

Children

None

Property Summary

Name	Description
“DirectFeedthrough” on page 5-216	True if this port has direct feedthrough.
“Overwritable” on page 5-216	True if this port is overwritable.

Properties

DirectFeedthrough

True if this input port has direct feedthrough.

Boolean

`RW` for MATLAB S functions, `RO` for other blocks

Overwritable

True if this input port is overwritable.

Boolean

`RW` for MATLAB S functions, `RO` for other blocks

Introduced before R2006a

Simulink.BlockPreCompOutputPortData

Provide precompilation information about block output port

Description

Simulink software returns an instance of this class when a MATLAB program, e.g., a Level-2 MATLAB S-function, invokes the “OutputPort” on page 5-440 method of a block's run-time object before the model containing the block has been compiled.

Parent

`Simulink.BlockPortData`

Children

none

Property Summary

Name	Description
“Reusable” on page 5-217	Specifies whether an output port's memory is reusable.

Properties

Reusable

Specifies whether an output port's memory is reusable. Options are: `NotReusableAndGlobal` and `ReusableAndLocal`.

character vector

RW for MATLAB S functions, RO for other blocks

Introduced before R2006a

Simulink.Breakpoint class

Package: Simulink

Store and share data for a breakpoint set, configure the data for ASAP2 and AUTOSAR code generation

Description

An object of the `Simulink.Breakpoint` class stores breakpoint set data for a lookup table. You can use that data in one or more Prelookup blocks. With the object, you can specify a data type and code generation settings for the breakpoint set and share the set between multiple lookup tables. Use `Simulink.Breakpoint` objects and `Simulink.LookupTable` objects to configure COM_AXIS code generation for calibration.

The code generated for a `Simulink.Breakpoint` object is an array or a structure with two fields. If you configure the object to appear as a structure, one field stores the specified breakpoint set data and one scalar field stores the number of elements in the breakpoint set data. You can configure the structure type name, the field name, and other characteristics by using the properties of the object.

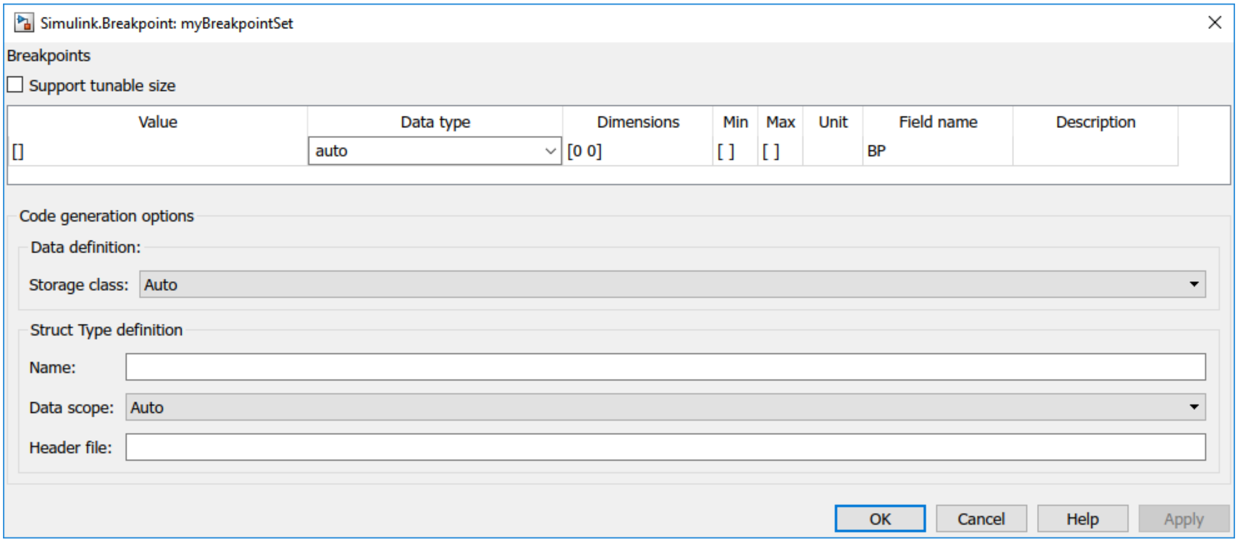
To package lookup table and breakpoint set data into a single structure in the generated code, for example, for STD_AXIS code generation, use a `Simulink.LookupTable` object to store all of the data. See “Package Shared Breakpoint and Table Data for Lookup Tables”.

Construction

`BpSet = Simulink.Breakpoint` returns a `Simulink.Breakpoint` object named `BpSet` with default property values.

To create a `Simulink.Breakpoint` object by using the Model Explorer, use the button on the toolbar. The default name for the object is `Object`.

Property Dialog Box



Simulink.Breakpoint: myBreakpointSet

Code generation options

Data definition:

Storage class: Auto

Struct Type definition

Name:

Data scope: Auto

Header file:

Breakpoints

The breakpoint set information. You can configure these characteristics:

Support tunable size

Specification to enable tuning the effective size of the table in the generated code. If you select this option, in the generated code, the `Simulink.Breakpoint` object appears as a structure variable. The structure has one field to store the breakpoint vector data and one field to store the number of elements in the breakpoint vector. You can change the value of the second field to adjust the effective size of the table.

If you clear this option, the `Simulink.Breakpoint` object appears in the generated code as a separate array variable instead of a structure.

Value

Breakpoint set data. Specify a vector with at least two elements.

You can also use an expression with mathematical operators such as `sin(1:0.5:30)` as long as the expression returns a numeric vector. When you click **Apply** or **OK**, the object executes the expression and uses the result to set the value of this property.

When you set **Data type** to `auto`, to set **Value**, use a typed expression such as `single([1 2 3])` or use the `fi` constructor to embed an `fi` object.

You can edit this data by using a more intuitive interface in a lookup table block. See “Import Lookup Table Data from MATLAB”.

Data type

Data type of the breakpoint set. The default setting is `auto`, which means that the breakpoint set acquires a data type from the value that you specify in **Value**. If you use an untyped expression such as `[1 2 3]` to set **Value**, the breakpoint data use the data type `double`. If you specify a typed expression such as `single([1 2 3])` or an `fi` object, the breakpoint data use the data type specified by the expression or object. Enumerated data types are also supported.

You can explicitly specify an integer data type, a floating-point data type, a fixed-point data type, or a data type expression such as the name of a `Simulink.AliasType` object.

For more information about data types in Simulink, see “Data Types Supported by Simulink”. To decide how to control the data types of table and breakpoint data in `Simulink.LookupTable` and `Simulink.Breakpoint` objects, see “Control Data Types of Lookup Table Objects” (Simulink Coder).

Dimensions

Dimension lengths of the breakpoint set.

To use symbolic dimensions, specify a character vector. See “Implement Dimension Variants for Array Sizes in Generated Code” (Embedded Coder).

Min

Minimum value of the elements in the breakpoint set. The default value is empty, `[]`. You can specify a numeric, real value.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

Max

Maximum value of the elements in the breakpoint set. The default value is empty, `[]`. You can specify a numeric, real value.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

Unit

Physical unit of the elements in the breakpoint set. You can specify text such as `degC`. See “Unit Specification in Simulink Models”.

Field name

Name of a structure field in the generated code. This field stores the breakpoint set data. The default value is `BP`. To change the field name, specify text.

This column appears only if you select **Support tunable size**.

Tunable size name

Name of a structure field in the generated code. This scalar field stores the length of the breakpoint set (the number of elements), which the generated code algorithm uses to determine the size of the table. To tune the effective size of the table during code execution, change the value of this structure field in memory. The default name is `N`. To change the field name, specify text.

This column appears only if you select **Support tunable size**.

Description

Description of the breakpoint set. You can specify text such as `This breakpoint set represents the pressure input`.

Data definition: Storage class

Storage class of the structure variable (if you select **Support tunable size**) or array variable in the generated code. The variable stores the breakpoint set data. The default setting is `Auto`.

For more information about storage classes, see “Apply Storage Classes to Individual Signal, State, and Parameter Data Elements” (Simulink Coder).

If you have Embedded Coder, you can choose a custom storage class. For information about custom storage classes, see “Apply Custom Storage Classes to Individual Signal, State, and Parameter Data Elements” (Embedded Coder).

Data definition: Alias

Alternative name for the variable in the generated code. The default value is empty, in which case the generated code uses the name of the `Simulink.Breakpoint` object as the name of the variable. To set the alias, specify text.

To enable this property, set **Data definition: Storage class** to a setting other than `Auto`.

Data definition: Alignment

Data alignment boundary in the generated code. The starting memory address for the data allocated for the structure or array variable is a multiple of the value that you specify. The default value is `-1`, which allows the code generator to determine an optimal alignment based on usage.

Specify a positive integer that is a power of 2, not exceeding 128. For more information about using data alignment for code replacement, see “Data Alignment for Code Replacement” (Embedded Coder).

Struct Type definition: Name

Name of the structure type that the structure variable uses in the generated code. The default value is empty. Specify text.

This property appears only if you select **Support tunable size**.

Struct Type definition: Data scope

Scope of the structure type definition (imported from your handwritten code or exported from the generated code). The default value is `Auto`. When you select `Auto`:

- If you do not specify a value in the **Struct Type definition: Header file** box, the generated code exports the structure type definition to the file *`model`*`_types.h`. *`model`* is the name of the model.
- If you specify a value in the **Struct Type definition: Header file** box, such as `myHdr.h`, the generated code imports the structure type definition from `myHdr.h`.

To explicitly specify the data scope:

- To import the structure type definition into the generated code from your custom code, select `Imported`.
- To export the structure type definition from the generated code, select `Exported`.

If you do not specify a value in the **Struct Type definition: Header file** box, the generated code imports or exports the type definition from or to *`StructName`*`.h`. *`StructName`* is the name that you specify with the property **Struct Type definition: Name**.

This property appears only if you select **Support tunable size**.

Struct Type definition: Header file

Name of the header file that contains the structure type definition. You can import the definition from a header file that you create, or export the definition into a generated header file. To control the scope of the structure type, adjust the setting for the **Struct Type definition: Data scope** property.

This property appears only if you select **Support tunable size**.

Properties

`Breakpoints` — Breakpoint set data

`Simulink.lookuptable.Breakpoint` object

Breakpoint set data, specified as a `Simulink.lookuptable.Breakpoint` object. Use this embedded object to configure the structure field names and characteristics of the breakpoint set data such as breakpoint values, data type, and dimensions.

`CoderInfo` — Code generation settings for variable

`Simulink.CoderInfo` object

Code generation settings for the structure variable (if you set `SupportTunableSize` to `true`) or array variable (`false`) that stores the breakpoint set data, specified as a `Simulink.CoderInfo` object. You can specify a storage class or custom storage class by using this embedded object. For more information, see `Simulink.CoderInfo`.

`StructTypeInfo` — Settings for structure type in the generated code

`Simulink.lookuptable.StructTypeInfo` object

Settings for the structure type that the structure variable uses in the generated code, specified as a `Simulink.lookuptable.StructTypeInfo` object.

If you set `SupportTunableSize` to `false`, the `Simulink.Breakpoint` object does not appear in the generated code as a structure. The code generator ignores this property.

`SupportTunableSize` — Option to generate code that enables tunability of table size

`false` (default) | `true`

Option to generate code that enables tunability of the effective size of the table, specified as `true` or `false`. See the **Support Tunable Size** parameter.

Data Types: `logical`

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Share Breakpoint Data Between One-Dimensional Lookup Tables

1. Create a `Simulink.Breakpoint` object named `myBpSet`.

   ```
   myBpSet = Simulink.Breakpoint
   ```
2. Specify the breakpoint data.

   ```
   myBpSet.Breakpoints.Value = [-2 -1 0 1 2];
   ```
3. Create a `Simulink.LookupTable` object named `FirstLUTObj`.

   ```
   FirstLUTObj = Simulink.LookupTable;
   ```
4. Specify the table data.

   ```
   FirstLUTObj.Table.Value = [1.1 2.2 3.3 4.4 5.5];
   ```
5. Configure the lookup table object to refer to the breakpoint set object.

   ```
   FirstLUTObj.Breakpoints = {'myBpSet'};
   ```
6. Create another `Simulink.LookupTable` object to store a different set of table data. Configure the lookup table object to refer to the same breakpoint set object.

   ```
   SecondLUTObj = Simulink.LookupTable;
   SecondLUTObj.Table.Value = [1.2 2.3 3.4 4.5 5.6];
   SecondLUTObj.Breakpoints = {'myBpSet'};
   ```

You can use `FirstLUTObj` and `SecondLUTObj` to specify the table data in two different Interpolation Using Prelookup blocks. Use `myBpSet` to specify the breakpoint set data in one or two Prelookup blocks that provide the inputs for the Interpolation Using Prelookup blocks.

Limitations

- You cannot subclass `Simulink.Breakpoint` or `Simulink.LookupTable`. For this reason, you cannot apply custom storage classes other than those in the built-in `Simulink` package.
- You cannot use `Simulink.Breakpoint` objects or `Simulink.LookupTable` objects that refer to `Simulink.Breakpoint` objects as instance-specific parameter data for reusable components. For example, you cannot use one of these objects as:

  - A model argument in a model workspace or a model argument value in a Model block.
  - The value of a mask parameter on a CodeReuse Subsystem block.
  - The value of a mask parameter on a subsystem that you reuse by creating a custom library.

  However, you can use standalone `Simulink.LookupTable` objects, which do not refer to `Simulink.Breakpoint` objects, in these ways.
- You cannot generate code according to the FIX_AXIS style.
- When blocks in a subsystem use `Simulink.LookupTable` or `Simulink.Breakpoint` objects, you cannot set data type override (see “Control Fixed-Point Instrumentation and Data Type Override”) only on the subsystem. Instead, set data type override on the entire model.

Introduced in R2016b

Simulink.Bus class

Package: Simulink

Specify properties of bus signal

Description

Objects of the `Simulink.Bus` class, used with objects of the `Simulink.BusElement` class, specify the properties of a bus signal. Bus objects validate the properties of bus signals. When you simulate a model or update diagram, Simulink checks whether the buses connected to the blocks have the properties specified by the bus objects. If not, Simulink halts and displays an error message. For a complete list of blocks that support using a bus object as a data type, see “When to Use Bus Objects”.

You can use the Simulink Bus editor or MATLAB commands to create and modify bus objects in the base MATLAB workspace. You cannot store a bus object in a model workspace.

When you use the Bus Editor, you create `Simulink.Bus` and `Simulink.BusElement` objects in the base workspace or the associated Simulink data dictionary.

Also, you can use a bus object to specify the attributes of a signal (for example, at the root level of a model or in a Data Store Memory block).

Construction

`busObj = Simulink.Bus` returns a bus object with these property values:

```
    Description: ''
      DataScope: 'Auto'
     HeaderFile: ''
      Alignment: -1
       Elements: [0×0 Simulink.BusElement]
```

The name of the bus object is the name of the MATLAB variable to which you assign the bus object. You can set individual properties after you construct the bus object.

Output Arguments

`busObject` — Bus object
`Simulink.Bus` object

Bus object, returned as a `Simulink.Bus` object.

Properties

`Description` — Bus object description
character vector

Bus object description, specified as a character vector. Use the description to document information about the bus object, such as the kind of signal it applies to or where the bus object is used. This information does not affect Simulink processing.

`Elements` — Bus elements
array of `Simulink.BusElement` objects

Bus elements, specified as an array of `Simulink.BusElement` objects. Each bus element object defines the name, data type, dimensions, and other properties of the signal within a bus.

`DataScope` — Data type definition mode in generated code
`'Auto'` (default) | `'Exported'` | `'Imported'`

Data type definition mode in generated code, specified as `'Auto'`, `'Exported'`, or `'Imported'`. This property specifies whether during code generation the data type definition is imported from, or exported to, the header file specified with the `HeaderFile` property.

Value	Action
`'Auto'` (default)	Import the data type definition from the specified header file. If you do not specify the header file, export the data type definition to the default header file.
`'Exported'`	Export the data type definition to the specified header file or default header file.

Value	Action
`'Imported'`	Import the data type definition from the specified header file or default header file.

`HeaderFile` — C header file used with data type definition
character vector

C header file used with data type definition, specified as a character vector. The header file is the file to import the data type definition from or export the data type definition to (based on the value of the `DataScope` property. The Simulink Coder software uses this property for code generation. Simulink software ignores this property.

By default, the generated `#include` directive uses the preprocessor delimiter `"` instead of `<` and `>`. To generate the directive `#include <myTypes.h>`, specify `HeaderFile` as `<myTypes.h>`.

`Alignment` — Data alignment boundary
-1 (default) | integer

Data alignment boundary, specified as an integer, in number of bytes. The Simulink Coder software uses this property for code generation. Simulink software ignores this property.

The starting memory address for the data allocated for the bus is a multiple of the `Alignment` setting. If the object occurs in a context that requires alignment, you must specify an `Alignment` value with a positive integer that is a power of 2, not exceeding 128.

Methods

Method	Purpose
`Simulink.Bus.cellToObject`	Convert cell array containing bus information to bus objects
`Simulink.Bus.createMATLABStruct`	Create MATLAB structures using same hierarchy and attributes as bus signals
`Simulink.Bus.createObject`	Create bus objects from blocks or MATLAB structures
`Simulink.Bus.objectToCell`	Use bus objects to create cell array containing bus information

Method	Purpose
Simulink.Bus.save	Save bus objects in MATLAB file

Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects (MATLAB).

Examples

Create Bus Objects and Bus Elements

Create the CONTROL bus object and its bus elements. The bus objects are stored in the base workspace.

```
clear elems;
elems(1) = Simulink.BusElement;
elems(1).Name = 'VALVE1';
elems(1).Dimensions = 1;
elems(1).DimensionsMode = 'Fixed';
elems(1).DataType = 'double';
elems(1).SampleTime = -1;
elems(1).Complexity = 'real';

elems(2) = Simulink.BusElement;
elems(2).Name = 'VALVE2';
elems(2).Dimensions = 1;
elems(2).DimensionsMode = 'Fixed';
elems(2).DataType = 'double';
elems(2).SampleTime = -1;
elems(2).Complexity = 'real';

CONTROL = Simulink.Bus;
CONTROL.Elements = elems;
```

This script is similar to the file that you get by saving a bus object to a MATLAB file and choosing the `Object` format.

Alternatives

You can use the Bus Editor to create interactively a bus object and its bus elements. For details, see “Create Bus Objects with the Bus Editor”.

Programmatically, you can create bus objects from:

- Blocks in a model
- MATLAB data
- External C code. See `Simulink.importExternalCTypes`.

Introduced before R2006a

Simulink.BusElement class

Package: Simulink

Describe element of bus signal

Description

An object of the `Simulink.BusElement` class specifies the properties of a signal in a bus. Bus element objects validate the properties of signals in a bus. A `Simulink.Bus` object contains bus elements. A bus element exists only within a bus object. You can specify a bus object, but not a bus element, as a block parameter value. When you simulate a model or update diagram, Simulink checks whether the signals in a bus connected to blocks have the properties specified by the bus elements. If not, Simulink halts and displays an error message.

You can use the Simulink Bus Editor (see “Create Bus Objects with the Bus Editor”), or MATLAB commands (see “Create Bus Objects Programmatically”) to create and modify bus objects and bus elements in the base MATLAB workspace.

Construction

`busElementName = Simulink.BusElement` returns a bus element with these property values:

```
              Name: 'a'
        Complexity: 'real'
        Dimensions: 1
          DataType: 'double'
               Min: []
               Max: []
    DimensionsMode: 'Fixed'
        SampleTime: -1
              Unit: ''
       Description: ''
```

Output Arguments

`busElement` — Bus element

`Simulink.BusElement` object

Bus element, returned as a `Simulink.BusElement` object.

Properties

`Name` — Name of bus element

character vector

Name of bus element, specified as a character vector.

`Complexity` — Numeric type of bus element

`'real'` (default) | `'complex'`

Numeric type of the bus element, specified as `'real'` or `'complex'`.

`Dimensions` — Dimensions of bus element

array

Dimensions of bus element, specified as an array.

`DataType` — Data type of bus element

built-in Simulink data type | a `Simulink.NumericType` object | a `Simulink.Bus` object

Data type of bus element, specified as a built-in Simulink data type or `Simulink.NumericType` object. Examples of built-in data types include `double` and `uint8`. You can specify a `Simulink.NumericType` object whose `DataTypeMode` property is set to a value other than `'Fixed-point: unspecified scaling'`. Specifying a bus object allows you to create bus objects that specify hierarchical buses (that is, buses that contain other buses).

`Min` — Minimum value of bus element

double | `[]`

Minimum value of the bus element, specified as a double. This value must be a finite real double scalar or, if the element is a bus, the value must be empty, `[]`.

`Max` — Maximum value of bus element

double | `[]`

Maximum value of the bus element, specified as a double. This value must be a finite real double scalar or, if the element is a bus, the value must be empty, `[]`.

`DimensionsMode` — Specify how to handle size of bus element

`'Fixed'` (default) | `'Variable'`

Specify how to handle size of bus element, specified as `'Fixed'` or `'Variable'`.

`SampleTime` — Sample time of bus element

-1 (default) | double

Sample time of bus element, specified as a double. The sample time is the size of the interval between times when this signal value must be recomputed. If these conditions apply, use the default value of `-1`:

- The bus element is a bus.
- The bus that includes this element passes through a block that changes the bus sample time, such as a Rate Transition block.

`Unit` — Physical unit for expressing bus element

character vector

Physical unit for expressing bus element, specified as a character vector (for example, `'inches'`).

Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects (MATLAB).

Examples

Create Bus Objects and Bus Elements

Create the `CONTROL` bus object and its bus elements. The bus objects are stored in the base workspace.

```
clear elems;
elems(1) = Simulink.BusElement;
elems(1).Name = 'VALVE1';
elems(1).Dimensions = 1;
elems(1).DimensionsMode = 'Fixed';
elems(1).DataType = 'double';
elems(1).SampleTime = -1;
elems(1).Complexity = 'real';

elems(2) = Simulink.BusElement;
elems(2).Name = 'VALVE2';
elems(2).Dimensions = 1;
elems(2).DimensionsMode = 'Fixed';
elems(2).DataType = 'double';
elems(2).SampleTime = -1;
elems(2).Complexity = 'real';

CONTROL = Simulink.Bus;
CONTROL.Elements = elems;
```

This script is similar to the file that you get by saving a bus object to a MATLAB file and choosing the `Object` format. For information about saving bus objects, see “Save and Import Bus Objects”.

Alternatives

You can use the Bus Editor to create interactively a bus object and its bus elements. For details, see “Create Bus Objects with the Bus Editor”.

Programmatically, you can create bus objects and elements from:

- Blocks in a model (see “Create Bus Objects from Blocks”)
- MATLAB data (see “Create Bus Objects from MATLAB Data”)

Compatibility Considerations

`Simulink.BusElement` objects will no longer support the `SamplingMode` property

Not recommended starting in R2016b

In R2016b, the `SamplingMode` property of `Simulink.BusElement` objects was removed. Scripts that use the `SamplingMode` property of `Simulink.BusElement` objects continue to work. `Simulink.Bus.cellToObject` continues to require the `SamplingMode` field and `Simulink.Bus.objectToCell` continues to include the sampling mode in the output cell arrays.

In a future release, support for `SamplingMode` will be removed.

To specify whether a signal is sample-based or frame-based, define the sampling mode of input signals at the block level instead of at the signal level.

Introduced before R2006a

Simulink.CoderInfo

Specify information needed to generate code for signal, state, or parameter data

Description

Use a `Simulink.CoderInfo` object to specify code generation settings for signal, state, and parameter data in a model.

Simulink creates a `Simulink.CoderInfo` object for each data object that you create. Data objects represent signal, state, or parameter data. The `Simulink.CoderInfo` object exists in the `CoderInfo` property of each data object.

Data objects include objects of these classes:

- `Simulink.Parameter`
- `Simulink.Signal`
- `Simulink.LookupTable`
- `Simulink.Breakpoint`
- `Simulink.DualScaledParameter`

Use the properties of the `Simulink.CoderInfo` object to configure the representation of the parent data object in the generated code.

You can set the properties of a `Simulink.CoderInfo` object through the `CoderInfo` property or the property dialog box of the parent data object. For example, the following MATLAB expression sets the `StorageClass` property of a `Simulink.CoderInfo` object used by a signal object named `mysignal`.

```
mysignal.CoderInfo.StorageClass = 'ExportedGlobal';
```

Creation

When you create a data object, Simulink sets the value of the `CoderInfo` property by creating a `Simulink.CoderInfo` object. You do not need to create a `Simulink.CoderInfo` object explicitly.

Properties

`Alias` — Alternative name for code generation

`''` (empty character vector) (default) | character vector

Alternative name for the data in the generated code, specified as a character vector.

Example: `'myOtherName'`

Data Types: `char`

`Alignment` — Data alignment boundary

`-1` (default) | positive integer

Data alignment boundary for this data, specified as a positive integer that is a power of 2, not exceeding 128. Specify an integer number of `double` data type. See "Data Alignment for Code Replacement" (Embedded Coder) for more information.

Example: 8

Data Types: `double`
Complex Number Support: Yes

`CustomAttributes` — Custom storage class attributes of this data

`SimulinkCSC.AttribClass_Simulink_Default` object (default) | custom attributes object

Custom storage class attributes of this data, returned as a custom attributes object. You must set the property `StorageClass` to `'Custom'` to enable this property.

Depending on the custom storage class that you apply by using the `CustomStorageClass` property of the `Simulink.CoderInfo` object, Simulink sets the value of this property by creating a custom attributes object. Then, you can set the values of the properties of the custom attributes object. See "Apply Custom Storage Classes to Individual Signal, State, and Parameter Data Elements" (Embedded Coder) for more information.

`CustomStorageClass` — Custom storage class of this data

`'Default'` (default) | character vector

Custom storage class of this data, specified as a character vector. You must set the property `StorageClass` to `'Custom'` to enable this property.

For a list of valid custom storage classes (Embedded Coder) when you create the data object from the `Simulink` package, see “Choose Storage Class for Controlling Data Representation in Generated Code” (Embedded Coder).

Example: `'ExportToFile'`

Data Types: `char`

`StorageClass` — Storage class of this data
`'Auto'` (default) | character vector

Storage class of this data, specified as a character vector. For more information, see “Apply Storage Classes to Individual Signal, State, and Parameter Data Elements” (Simulink Coder).

Example: `'ExportedGlobal'`

Data Types: `char`

Examples

Configure Code Generation Settings Programmatically

For examples that show how to configure code generation settings for a data item programmatically, see “Apply Storage Classes to Individual Signal, State, and Parameter Data Elements” (Simulink Coder) and “Apply Custom Storage Classes to Individual Signal, State, and Parameter Data Elements” (Embedded Coder).

Introduced in R2015a

ConfigSet

Model configuration set

Description

Use the `ConfigSet` object to access a model configuration set. Get information about your configuration set, manage configuration parameters, and manage components.

Creation

Use the getActiveConfigSet function to get the active configuration set for a model. Use the getConfigSet function to get a model configuration set by name.

Properties

`Components` — Components of the configuration set
cell array of `Simulink.ConfigComponent` objects

Components of the configuration set, specified by a cell array of `Simulink.ConfigComponent` objects.

`Description` — Description of the configuration set
character vector

Description of the configuration set, specified as a character vector. Use the description to provide additional information about a configuration set, such as its purpose.

`Name` — Name of the configuration set
character vector

Name of the configuration set, specified by a character vector. This name represents the configuration set in the Model Explorer.

Object Functions

attachComponent	Attach a component to a configuration set
copy	Copy a configuration set
getComponent	Get a configuration set component
getFullName	
getModel	
get_param	Get parameter names and values
isActive	
isValidParam	
saveAs	
setPropEnabled	
set_param	Set system and block parameter values

Examples

Get the Active Configuration Set for a Model

This example gets the active configuration set of the currently selected model.

```
hCs = getActiveConfigSet(gcs);
```

Introduced in R2006a

Simulink.ConfigSetRef

Link model to configuration set stored independently of any model

Description

Instances of this handle class allow a model to reference configuration sets that exist outside any model. See “Manage a Configuration Set”, “Overview”, and “Manage a Configuration Reference” for more information.

Property Summary

Name	Description
“Description” on page 5-243	Description of the configuration reference.
“Name” on page 5-243	Name of the configuration reference.
“SourceName” on page 5-244	Name of the variable in the workspace or the data dictionary that contains the referenced configuration set.

Note You can use the **Configuration Reference** dialog box to set the `Name`, `Description`, and `SourceName` properties of a configuration reference. See “Create and Attach a Configuration Reference” for details.

Method Summary

Name	Description
“copy” on page 5-244	Create a copy of a configuration reference.
“getFullName” on page 5-244	Get the full pathname of a configuration reference.
“getModel” on page 5-245	Get the handle of the model that owns a configuration reference.

Name	Description
"get_param" on page 5-245	Get the value of a configuration set parameter indirectly through a configuration reference.
"getRefConfigSet" on page 5-246	Get the configuration set specified by a configuration reference.
"isActive" on page 5-246	Determine whether a configuration reference is the active configuration object of the model.
"refresh" on page 5-246	Update configuration reference after any change to properties or configuration set availability.

Properties

Description

Description of the configuration reference. You can use this property to provide additional information about a configuration reference, such as its purpose. This field can remain blank.

```
character vector
```

```
RW
```

Name

Name of the configuration reference. This name represents the configuration reference in the GUI.

```
character vector
```

```
RW
```

SourceName

Name of the variable in the workspace or the data dictionary that contains the referenced configuration set.

`character vector`

`RW`

Methods

copy

Create a copy of this configuration reference.

```
copy
```

This method creates a copy of this configuration set.

Note You must use this method to create copies of configuration references. This is because `Simulink.ConfigSetRef` is a handle class. See “Handle Versus Value Classes” for more information.

getFullName

Get the full pathname of a configuration reference.

```
getFullName
```

This method returns a character vector specifying the full pathname of a configuration reference, e.g., `'vdp/Configuration'`.

getModel

Get the model that owns this configuration reference.

```
getModel
```

Returns a handle to the model that owns this configuration reference.

The following command opens the block diagram of the model that owns the configuration set referenced by the MATLAB workspace variable `hCr`.

```
open_system(hCr.getModel);
```

get_param

Get the value of a configuration set parameter indirectly through a configuration reference.

`get_param(`*`paramName`*`)`

`paramName`

Character vector specifying the name of the parameter whose value is to be returned.

This method returns the value of the specified parameter from the configuration set to which the configuration reference points. To obtain this value, the method uses the value of `SourceName` to retrieve the configuration set, then retrieves the value of *`paramName`* from that configuration set. Specifying *`paramName`* as `'ObjectParameters'` returns the names of all valid parameters in the configuration set. If a valid configuration set is not attached to the configuration reference, the method returns unreliable values.

The inverse method, `set_param`, is not defined for configuration references. To obtain a parameter value through a configuration reference, you must first use the `getRefConfigSet` method to retrieve the configuration set from the reference, then use `set_param` directly on the configuration set itself.

You can also use the get_param model construction command to get the values of parameters of a model's active configuration set, e.g., get_param(bdroot, 'SolverName') gets the solver name of the currently selected model.

The following command gets the name of the solver used by the selected model's active configuration.

```
hAcs = getActiveConfigSet(bdroot);
hAcs.get_param('SolverName');
```

getRefConfigSet

Get the configuration set specified by a configuration reference

```
getRefConfigSet
```

Returns a handle to the configuration set specified by the SourceName property of a configuration reference.

isActive

Determine whether this configuration set is its model's active configuration set.

```
isActive
```

Returns true if this configuration set is the active configuration set of the model that owns this configuration set.

refresh

Update configuration reference after any change to properties or configuration set availability

```
refresh
```

Updates a configuration reference after using the API to change any property of the reference, or after providing a configuration set that did not exist at the time the set was originally specified in `SourceName`. If you omit executing `refresh` after any such change, the configuration reference handle will be stale, and using it will give incorrect results.

Introduced in R2007a

Simulink.FindOptions class

Package: Simulink

Options for finding blocks in models and subsystems

Description

Create an options object to use with `Simulink.findBlocks` and `Simulink.findBlocksOfType` to constrain the search.

Construction

`f = Simulink.FindOptions` creates a `FindOptions` object that uses the default search options.

`f = Simulink.FindOptions(Option1,Value1,...OptionN,ValueN)` creates the object using the specified search options.

Input Arguments

`'CaseSensitive'` — Option to specify whether to match case when searching
`true` (default) | `false`

Option to specify whether to match case when searching, specified as `true` for case-sensitive search or `false` for case-insensitive search.

`'FollowLinks'` — Option to follow library links
`false` (default) | `true`

Option to follow library links, specified as `true` or `false`. If `true`, search follows links into library blocks.

`'IncludeCommented'` — Option for the search to include commented blocks
`true` (default) | `false`

Option for the search to include commented blocks, specified as `true` or `false`.

`'LookUnderMasks'` — Options to search masked blocks

`'all'` (default) | `'none'` | `'functional'` | `'graphical'`

Options to search masked blocks, specified as:

- `'all'` — Search in all masked blocks.
- `'none'` — Prevent searching in masked systems.
- `'functional'` — Include masked subsystems that do not have dialogs.
- `'graphical'` — Include masked subsystems that do not have workspaces or dialogs.

`'Variants'` — Options to search Variant subsystems

`'AllVariants'` (default) | `'ActiveVariants'` | `'ActivePlusCodeVariants'`

Options to search Variant subsystems, specified as:

- `'AllVariants'` — Search all variant choices.
- `'ActiveVariants'` — Search only active variant choices.
- `'ActivePlusCodeVariants'` — Search all variant choices with `'Generate preprocessor conditionals'` active. Otherwise, search only the active variant choices.

The `'Variants'` search constraint applies only to variant subsystems and model variants.

`'RegExp'` — Option to treat the search text as a regular expression

`false` (default) | `true`

Option to treat the search text as a regular expression, specified as `true` or `false`. To learn more about MATLAB regular expressions, see "Regular Expressions" (MATLAB).

`'SearchDepth'` — Levels in the model to search

positive integer

Levels in the model to search, specified as a positive integer. The default is to search all levels. Specify:

- `1` — Search in the top-level system.
- `2` — Search the top-level system and its children, `3` to search an additional level, and so on.

Examples

Specify Search Options to Use with Simulink.findBlocks

Search for all blocks in the Unlocked subsystem but not in any of its children.

```
f = Simulink.FindOptions('SearchDepth',1);
load_system('sldemo_clutch');
bl = Simulink.findBlocks('sldemo_clutch/Unlocked',f)
```

```
bl =

   1.0e+03 *

    1.1140
    1.1150
    1.1160
    1.1170
    1.1180
    1.1190
    1.1200
    1.1210
    1.1220
    1.1230
    1.1240
    1.1250
    1.1260
    1.1270
    1.1280
    1.1290
    1.1300
    1.1310
    1.1320
    1.1330
```

To get the block name and path instead of the handle, use `getfullname`.

```
bl = getfullname (Simulink.findBlocks('sldemo_clutch/Unlocked',f))
```

```
bl =

  20×1 cell array

    {'sldemo_clutch/Unlocked/Tfmaxk'                     }
    {'sldemo_clutch/Unlocked/Tin'                        }
    {'sldemo_clutch/Unlocked/Enable'                     }
    {'sldemo_clutch/Unlocked/E_Sum'                      }
    {'sldemo_clutch/Unlocked/Engine↵Damping'             }
    {'sldemo_clutch/Unlocked/Engine↵Inertia'             }
    {'sldemo_clutch/Unlocked/Engine↵Integrator'          }
    {'sldemo_clutch/Unlocked/Goto'                       }
    {'sldemo_clutch/Unlocked/Goto1'                      }
    {'sldemo_clutch/Unlocked/Max↵Dynamic↵Friction↵Torque'}
    {'sldemo_clutch/Unlocked/V_Sum'                      }
    {'sldemo_clutch/Unlocked/Vehicle↵Damping'            }
    {'sldemo_clutch/Unlocked/Vehicle↵Inertia'            }
    {'sldemo_clutch/Unlocked/Vehicle↵Integrator'         }
    {'sldemo_clutch/Unlocked/W_Slip'                     }
    {'sldemo_clutch/Unlocked/slip direction'             }
    {'sldemo_clutch/Unlocked/w0'                         }
    {'sldemo_clutch/Unlocked/w0 '                        }
    {'sldemo_clutch/Unlocked/we'                         }
    {'sldemo_clutch/Unlocked/wv'                         }
```

Simulink.GlobalDataTransfer class

Package: Simulink

Configure concurrent execution data transfers

Description

The `Simulink.GlobalDataTransfer` object contains the data transfer information for the concurrent execution of a model. To access the properties of this class, use the `get_param` function to get the handle for this class, and then use dot notation to access the properties. For example:

```
dt=get_param(gcs,'DataTransfer');
dt.DefaultTransitionBetweenContTasks

ans =

Ensure deterministic transfer (minimum delay)
```

Properties

`DefaultTransitionBetweenSyncTasks`

Global setting for data transfer handling option when the source and destination of a signal are in two different and periodic tasks.

Data Type: Enumeration. Can be one of:

- `'Ensure data integrity only'`
- `'Ensure deterministic transfer (maximum delay)'`
- `'Ensure deterministic transfer (minimum delay)'`

Access: Read/write

`DefaultTransitionBetweenContTasks`

Global setting for the data transfer handling option for signals that have a continuous sample time.

Data Type: Enumeration. Can be one of:

- `'Ensure data integrity only'`
- `'Ensure deterministic transfer (maximum delay)'`
- `'Ensure deterministic transfer (minimum delay)'`

Access: Read/write

`DefaultExtrapolationMethodBetweenContTasks`

Global setting for the data transfer extrapolation method for signals that have a continuous sample time.

Data Type: Enumeration. Can be one of:

- `'None'`
- `'Zero Order Hold'`
- `'Linear'`
- `'Quadratic'`

Access: Read/write

`AutoInsertRateTranBlk`

Setting for whether or not Simulink software automatically inserts hidden Rate Transition blocks between blocks that have different sample rates to ensure the integrity of data transfers between tasks; and optional determinism of data transfers for periodic tasks.

Data Type: Boolean. Can be one of:

- `0`
- `1`

Access: Read/write

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Access the properties of this class.

```
dt=get_param(gcs,'DataTransfer');
dt.DefaultTransitionBetweenContTasks

ans =

Ensure deterministic transfer (minimum delay)
```

"Configure Data Transfer Settings Between Concurrent Tasks"

Simulink.HMI.InstrumentedSignals class

Package: Simulink.HMI

Access logged signals in model

Description

`Simulink.HMI.InstrumentedSignals` objects contain a list of all logged signals in a model, including signals from all subsystems, library instances, and Stateflow charts. The list does not include signals inside reference models. You can access the list of logged signals in a reference model by creating a `Simulink.HMI.InstrumentedSignals` object for the reference model.

The `Simulink.HMI.InstrumentedSignals` object provides access to `Simulink.HMI.SignalSpecification` objects using the `get` method.

Construction

`instSigs = get_param(model, 'InstrumentedSignals')` returns `instSigs`, a `Simulink.HMI.InstrumentedSignals` object containing a list of all of the logged signals in the model, `model`.

Input Arguments

`model` — Model name
character vector

Model name or full path to model.

Example: `'sldemo_fuelsys'`

Example: `fullpath(matlabroot, 'examples', 'simulink', 'ex_sldemo_absbrake.slx')`

`'InstrumentedSignals'` — Parameter selection
'InstrumentedSignals'

Desired return from get_param, specified as a character vector. Using a value of 'InstrumentedSignals', get_param returns a Simulink.HMI.InstrumentedSignals object with a list of all the logged signals.

Example: 'InstrumentedSignals'

Properties

Model — Model name

character vector

Name of the model the aggregation of logged signals corresponds to.

Example: 'sldemo_fuelsys'

Count — Number of logged signals

integer

Number of logged signals in the model.

Example: 10

Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects (MATLAB).

Examples

Evaluate and Modify Logged Signals in Model

This example shows how to obtain the block paths for logged signals and remove the logging badge for a signal using Simulink.HMI.InstrumentedSignals and Simulink.HMI.SignalSpecification objects.

Get InstrumentedSignals Object

```
% Load the model sldemo_absbrake
load_system('sldemo_absbrake')
```

```
% Get logged signals with Simulink.HMI.InstrumentedSignals object
instSigs = get_param('sldemo_absbrake', 'InstrumentedSignals');

% Check logged signals count
instSigs.Count

ans = uint32
    2
```

Inspect Block Paths with SignalSpecifications Objects

Use the `get` method to get the `Simulink.HMI.SignalSpecification` objects for each of the signals in the `Simulink.HMI.InstrumentedSignals` object

```
% Get Simulink.HMI.SignalSpecification objects
sig1 = instSigs.get(1);
sig2 = instSigs.get(2);

% Inspect block paths for signals
blockPath1 = sig1.BlockPath

blockPath1 = 
  Simulink.BlockPath
  Package: Simulink

  Block Path:
    sldemo_absbrake/Bus Creator

  Use the getBlock method to access block path strings from this object.

  Methods

blockPath2 = sig2.BlockPath

blockPath2 = 
  Simulink.BlockPath
  Package: Simulink

  Block Path:
    sldemo_absbrake/Relative Slip

  Use the getBlock method to access block path strings from this object.

  Methods
```

Remove Logging Badge for Bus Signal

Remove the logging badge for the signal from the Bus Creator block.

```
% Get block path string and port index for the Bus Creator signal
blockPath_str = blockPath1.getBlock(1);
portIndex = sig1.OutputPortIndex;

% Clear the logging badge for the Bus Creator signal
Simulink.sdi.markSignalForStreaming(blockPath_str, portIndex, 'off')
```

Save and Restore a Set of Logged Signals

This example shows the capability of using the `Simulink.HMI.InstrumentedSignals` object to save a set of logged signals to restore after running a simulation with a different set of signals.

Load Model and Save Initial Configuration

Load the `sldemo_fuelsys` model, and save the initial set of logged signals.

```
% Load model
load_system sldemo_fuelsys

% Get Simulink.HMI.InstrumentedSignals object
initSigs = get_param('sldemo_fuelsys', 'InstrumentedSignals');

% Save logging configuration to file for future use
save initial_instSigs.mat initSigs
```

Remove All Logging Badges

Return to a baseline of no logged signals so you can easily select a different configuration of signals to log.

```
% Clear all logging signals
set_param('sldemo_fuelsys', 'InstrumentedSignals', [])
```

Restore Saved Logging Configuration

After working with a different set of logged signals, you can easily restore a saved configuration with the `Simulink.HMI.InstrumentedSignals` object.

```
% Load the saved configuration
load initial_instSigs.mat
```

```
% Restore logging configuration
set_param('sldemo_fuelsys', 'InstrumentedSignals', initSigs)
```

`Simulink.HMI.SignalSpecification` | `Simulink.sdi.markSignalForStreaming`

Topics

"View Data with the Simulation Data Inspector"
"Tune and Visualize Your Model with Dashboard Blocks"

Introduced in R2015b

Simulink.HMI.SignalSpecification class

Package: Simulink.HMI

Information for logging a signal

Description

The `Simulink.HMI.SignalSpecification` object contains the block path and port index required by `Simulink.sdi.markSignalForStreaming` to turn logging on or off for a signal.

Construction

`sigSpec = instSigs.get(index)` returns the `Simulink.HMI.SignalSpecification` object `sigSpec` for the signal at the specified `index` in the `Simulink.HMI.InstrumentedSignals` object `instSigs`.

Input Arguments

`index` — Index of signal
integer

Numeric index of the signal within the `Simulink.HMI.InstrumentedSignals` object.

Example: 1

Properties

`BlockPath` — Block path for signal
Simulink.BlockPath object

`Simulink.BlockPath` object with the block path for the signal.

`OutputPortIndex` — Signal index on block port
integer

Index of the signal on the output port of its block. For Stateflow signals, the OutputPortIndex is set to 1.

Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects (MATLAB).

Examples

Evaluate and Modify Logged Signals in Model

This example shows how to obtain the block paths for logged signals and remove the logging badge for a signal using `Simulink.HMI.InstrumentedSignals` and `Simulink.HMI.SignalSpecification` objects.

Get InstrumentedSignals Object

```
% Load the model sldemo_absbrake
load_system('sldemo_absbrake')

% Get logged signals with Simulink.HMI.InstrumentedSignals object
instSigs = get_param('sldemo_absbrake', 'InstrumentedSignals');

% Check logged signals count
instSigs.Count

ans = uint32
    2
```

Inspect Block Paths with SignalSpecifications Objects

Use the `get` method to get the `Simulink.HMI.SignalSpecification` objects for each of the signals in the `Simulink.HMI.InstrumentedSignals` object

```
% Get Simulink.HMI.SignalSpecification objects
sig1 = instSigs.get(1);
sig2 = instSigs.get(2);

% Inspect block paths for signals
blockPath1 = sig1.BlockPath
```

```
blockPath1 = 
  Simulink.BlockPath
  Package: Simulink

  Block Path:
    sldemo_absbrake/Bus Creator

  Use the getBlock method to access block path strings from this object.

  Methods

blockPath2 = sig2.BlockPath

blockPath2 = 
  Simulink.BlockPath
  Package: Simulink

  Block Path:
    sldemo_absbrake/Relative Slip

  Use the getBlock method to access block path strings from this object.

  Methods
```

Remove Logging Badge for Bus Signal

Remove the logging badge for the signal from the Bus Creator block.

```
% Get block path string and port index for the Bus Creator signal
blockPath_str = blockPath1.getBlock(1);
portIndex = sig1.OutputPortIndex;

% Clear the logging badge for the Bus Creator signal
Simulink.sdi.markSignalForStreaming(blockPath_str, portIndex, 'off')
```

Simulink.LookupTable class

Package: Simulink

Store and share lookup table and breakpoint data, configure the data for ASAP2 and AUTOSAR code generation

Description

An object of the `Simulink.LookupTable` class stores lookup table and breakpoint data. You can use that data in a lookup table block such as the n-D Lookup Table block. With the object, you can specify data types and code generation settings for the table and the breakpoint sets.

When you store all of the table and breakpoint set data in a single `Simulink.LookupTable` object, all of the data appears in a single structure in the generated code. To configure STD_AXIS code generation for calibration, use this technique.

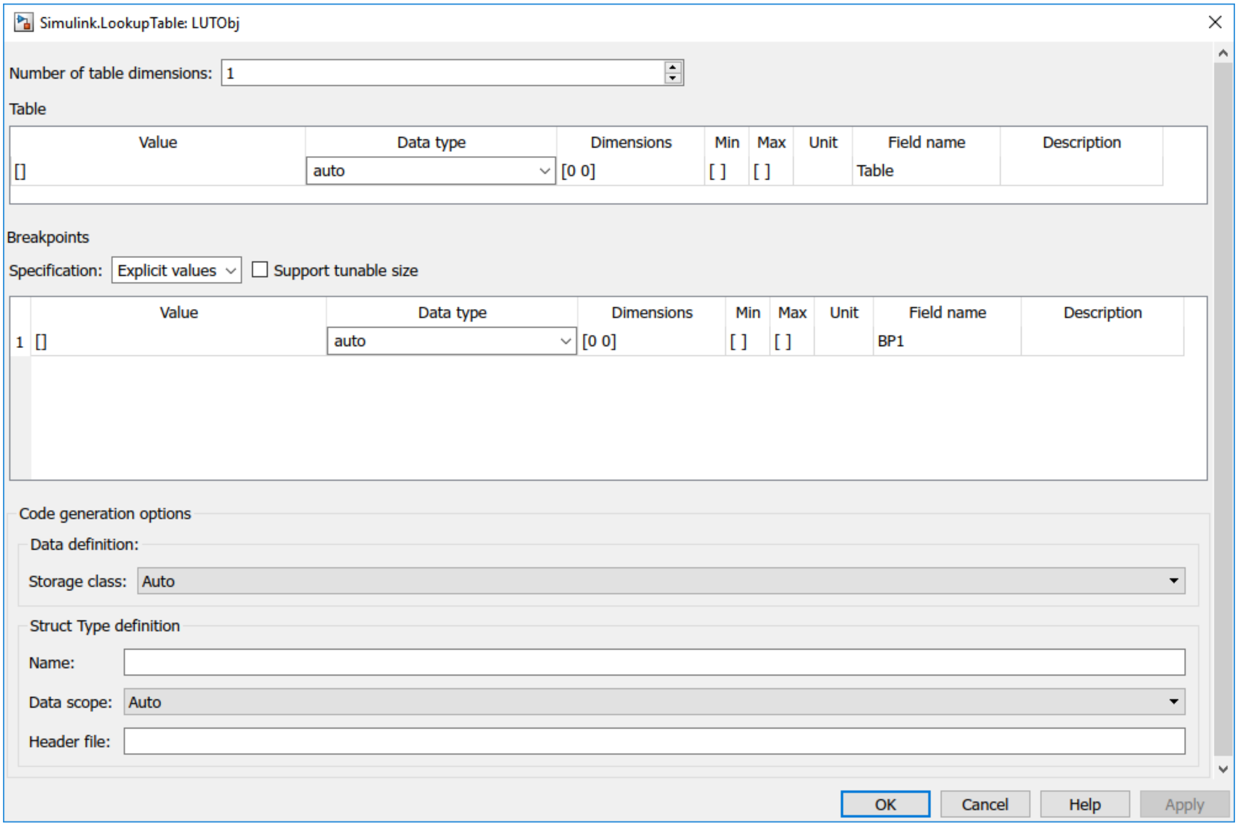
To share a breakpoint set between multiple lookup tables, for example for COM_AXIS code generation, use a `Simulink.Breakpoint` object in one or more Prelookup blocks. Use `Simulink.LookupTable` objects in Interpolation Using Prelookup blocks. Then, configure the lookup table objects to refer to the breakpoint object. For more information, see “Package Shared Breakpoint and Table Data for Lookup Tables”.

Construction

`LUTObj = Simulink.LookupTable` returns a `Simulink.LookupTable` object `LUTObj` with default property values.

To create a `Simulink.LookupTable` object by using the Model Explorer, use the button ▾ on the toolbar. The default name for the object is `Object`.

Property Dialog Box



Simulink.LookupTable: LUTObj

Number of table dimensions: 1

Table

Value	Data type	Dimensions	Min	Max	Unit	Field name	Description
[]	auto	[0 0]	[ ]	[ ]		Table	

Breakpoints

Specification: Explicit values □ Support tunable size

	Value	Data type	Dimensions	Min	Max	Unit	Field name	Description
1	[]	auto	[0 0]	[ ]	[ ]		BP1	

Code generation options

Data definition:

Storage class: Auto

Struct Type definition

Name:

Data scope: Auto

Header file:

Number of table dimensions

Number of dimensions of the lookup table. Specify an integer value up to 30 (inclusive). For example, to represent a three-dimensional lookup table, specify the integer 3.

Table

Information for the table data. You can configure these characteristics:

Value

Table data. Specify a numeric vector or multidimensional array with at least two elements.

You can also use an expression with mathematical operators such as `sin(1:0.5:30)` as long as the expression returns a numeric vector or multidimensional array. When you click **Apply** or **OK**, the object executes the expression and uses the result to set the value of this property.

When you set **Data type** to `auto`, to set **Value**, use a typed expression such as `single([1 2 3])` or use the `fi` constructor to embed an `fi` object.

When you specify table data with three or more dimensions, **Value** displays the data as an expression that contains a call to the `reshape` function. To edit the values in the data, modify the first argument of the `reshape` call, which contains all of the values in a serialized vector. When you add or remove elements along a dimension, you must also correct the argument that represents the length of the modified dimension.

You can edit this data by using a more intuitive interface in a lookup table block. See “Import Lookup Table Data from MATLAB”.

Data type

Data type of the table data. The default setting is `auto`, which means that the table data acquire a data type from the value that you specify in **Value**. If you use an untyped expression such as `[1 2 3]` to set **Value**, the table data use the data type `double`. If you specify a typed expression such as `single([1 2 3])` or an `fi` object, the table data use the data type specified by the expression or object. Enumerated data types are also supported.

You can explicitly specify an integer data type, a floating-point data type, a fixed-point data type, or a data type expression such as the name of a `Simulink.AliasType` object.

For more information about data types in Simulink, see “Data Types Supported by Simulink”. To decide how to control the data types of table and breakpoint data in `Simulink.LookupTable` and `Simulink.Breakpoint` objects, see “Control Data Types of Lookup Table Objects” (Simulink Coder).

Dimensions

Dimension lengths of the lookup table data.

To use symbolic dimensions, specify a character vector. See “Implement Dimension Variants for Array Sizes in Generated Code” (Embedded Coder).

Min

Minimum value of the elements in the table data. The default value is empty, `[]`. You can specify a numeric, real value.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

Max

Maximum value of the elements in the table data. The default value is empty, `[]`. You can specify a numeric, real value.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

Unit

Physical units of the elements in the lookup table. You can specify text such as `degC`. See “Unit Specification in Simulink Models”.

Field name

Name of a structure field in the generated code. This field stores the table data if you configure the `Simulink.LookupTable` object to appear in the generated code as a structure. The default value is `Table`. To change the field name, specify text.

Description

Description of the lookup table. You can specify text such as `This lookup table describes the action of a pump`.

Breakpoints

Breakpoint set information. Each row is one breakpoint set. To configure additional breakpoint sets, specify an integer value in the **Number of table dimensions** box.

For the breakpoint sets, you can configure these characteristics:

Specification

Source for the information of the breakpoint sets, specified as `Explicit values` (default), `Reference`, or `Even spacing`.

- To store all of the table and breakpoint set data in the `Simulink.LookupTable` object, set **Specification** to `Explicit values`.

  The `Simulink.LookupTable` object appears in the generated code as a single structure variable.

- To store the table data in the `Simulink.LookupTable` object and store the breakpoint set data in `Simulink.Breakpoint` objects, set **Specification** to `Reference`.

  The `Simulink.LookupTable` object appears in the generated code as a separate array variable that contains the table data. Each `Simulink.Breakpoint` object appears as a separate array or structure variable that contains the breakpoint set data.
