- To store the table data and evenly spaced breakpoints in the `Simulink.LookupTable` object, set **Specification** to `Even spacing`. Use the **First point** and **Spacing** parameters to generate a set of evenly spaced breakpoints.

Note When **Specification** is set to `Explicit values` or `Even spacing`, you can change the order of the tunable size, breakpoint, and table entries in a lookup table object-generated structure.

Support tunable size

Specification to enable tuning the effective size of the table in the generated code. In the code, the structure that corresponds to the object has an extra field for each breakpoint vector. Each extra field stores the length of the corresponding breakpoint vector. You can change the value of each field to adjust the effective size of the table.

This property appears only if you set **Specification** to `Explicit values` or `Even spacing`.

Note If you store breakpoint data in `Simulink.Breakpoint` objects by setting **Specification** to `Reference`, to enable tuning of the table size in the generated code, use the **Support tunable size** property of each `Simulink.Breakpoint` object.

Value

Data for the breakpoint set. Specify a numeric vector with at least two elements.

You can also use an expression with mathematical operators such as `sin(1:0.5:30)` as long as the expression returns a numeric vector. When you click **Apply** or **OK**, the object executes the expression and uses the result to set the value of this property.

When you set **Data type** to `auto`, to set **Value**, use a typed expression such as `single([1 2 3])` or use the `fi` constructor to embed an `fi` object.

You can edit this data by using a more intuitive interface in a lookup table block. See “Import Lookup Table Data from MATLAB”.

Data type

Data type of the breakpoint set. The default setting is `auto`, which means that the breakpoint set acquires a data type from the value that you specify in **Value**. If you use an untyped expression such as `[1 2 3]` to set **Value**, the breakpoint data use the data type `double`. If you specify a typed expression such as `single([1 2 3])` or an `fi` object, the breakpoint data use the data type specified by the expression or object.

You can explicitly specify an integer data type, a floating-point data type, a fixed-point data type, or a data type expression such as the name of a `Simulink.AliasType` object.

For more information about data types in Simulink, see “Data Types Supported by Simulink”. To decide how to control the data types of table and breakpoint data in `Simulink.LookupTable` and `Simulink.Breakpoint` objects, see “Control Data Types of Lookup Table Objects” (Simulink Coder).

Dimensions

Dimension lengths of the breakpoint set.

To use symbolic dimensions, specify a character vector. See “Implement Dimension Variants for Array Sizes in Generated Code” (Embedded Coder).

Min

Minimum value of the elements in the breakpoint set. The default value is empty, `[]`. You can specify a numeric, real value.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

Max

Maximum value of the elements in the breakpoint set. The default value is empty, `[]`. You can specify a numeric, real value.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

Unit

Physical unit of the elements in the breakpoint set. You can specify text such as `degF`. See “Unit Specification in Simulink Models”.

Field name

Name of a structure field in the generated code. This field stores the breakpoint set data. The default value is `BP1` for the first breakpoint set and `BP2` for the second set. To change the field name, specify text.

Tunable size name

Name of a structure field in the generated code. This field stores the length (number of elements) of the breakpoint set, which the generated code algorithm uses to determine the size of the table. To tune the effective size of the table during code execution, change the value of this structure field in memory. The default name is `N1` for the first breakpoint set and `N2` for the second set. To change the field name, specify text.

This column appears only if you select **Support tunable size**.

Description

Description of the breakpoint set. You can specify text such as `This breakpoint set represents the pressure input`.

First point

First point in evenly spaced breakpoint data. This parameter is available when **Specification** is set to `Even spacing`.

Spacing

Spacing between points in evenly spaced breakpoint data. This parameter is available when **Specification** is set to `Even spacing`.

Name

Name of the `Simulink.Breakpoint` object that stores the information for this breakpoint set.

This column appears only if you set **Specification** to `Reference`.

First point name

Name of the `Simulink.Breakpoint` object that stores the information for the first point. This parameter is available when **Specification** is set to `Even spacing`.

Spacing name

Name of the `Simulink.Breakpoint` object that stores the information for the spacing. This parameter is available when **Specification** is set to `Even spacing`.

Data definition: Storage class

Storage class of the structure variable (if you set **Specification** to `Explicit values` or `Even spacing`) or array variable (`Reference`) in the generated code. The variable stores the table data and, if the variable is a structure, the breakpoint set data. The default setting is `Auto`.

For more information about storage classes, see “Apply Storage Classes to Individual Signal, State, and Parameter Data Elements” (Simulink Coder).

If you have Embedded Coder, you can choose a custom storage class. For information about custom storage classes, see “Apply Custom Storage Classes to Individual Signal, State, and Parameter Data Elements” (Embedded Coder).

Data definition: Alias

Alternative name for the structure variable (if you set **Specification** to `Explicit values` or `Even spacing`) or array variable (`Reference`) in the generated code. The default value is empty, in which case the generated code uses the name of the `Simulink.LookupTable` object as the name of the structure or array variable. To set the alias, specify text.

To enable this property, set **Data definition: Storage class** to a setting other than `Auto`.

Data definition: Alignment

Data alignment boundary in the generated code. The starting memory address for the data allocated for the structure or array variable is a multiple of the value that you specify. The default value is `-1`, which allows the code generator to determine an optimal alignment based on usage.

Specify a positive integer that is a power of 2, not exceeding 128. For more information about using data alignment for code replacement, see “Data Alignment for Code Replacement” (Embedded Coder).

Struct Type definition: Name

Name of the structure type that the structure variable uses in the generated code. The default value is empty. Specify text.

This property appears only if you set **Specification** to `Explicit values` or `Even spacing`.

Struct Type definition: Data scope

Scope of the structure type definition (imported from your custom code or exported from the generated code). The default value is `Auto`. When you select `Auto`:

- If you do not specify a value in the **Struct Type definition: Header file** box, the generated code exports the structure type definition to the file *`model`*`_types.h`. *`model`* is the name of the model.
- If you specify a value in the **Struct Type definition: Header file** box, such as `myHdr.h`, the generated code imports the structure type definition from `myHdr.h`.

To explicitly specify the data scope:

- To import the structure type definition into the generated code from your custom code, select `Imported`.
- To export the structure type definition from the generated code, select `Exported`.

If you do not specify a value in the **Struct Type definition: Header file** box, the generated code imports or exports the type definition from or to *`StructName`*`.h`. *`StructName`* is the name that you specify by using the property **Struct Type definition: Name**.

This property appears only if you set **Specification** to `Explicit values` or `Even spacing`.

Struct Type definition: Header file

Name of the header file that contains the structure type definition. You can import the definition from a header file that you create, or export the definition into a generated header file. To control the scope of the structure type, adjust the setting for the **Struct Type definition: Data scope** property.

This property appears only if you set **Specification** to `Explicit values` or `Even spacing`.

Properties

`Breakpoints` — Breakpoint set information

vector of `Simulink.lookuptable.Breakpoint` objects | cell array of character vectors

Breakpoint set information, specified as a vector of `Simulink.lookuptable.Breakpoint` objects, a cell array of character vectors, or a vector of `Simulink.lookuptable.Evenspacing` objects.

If you use a vector of `Simulink.lookuptable.Breakpoint` objects, each object represents a breakpoint set. Using a vector of `Simulink.lookuptable.Breakpoint` objects sets the property `BreakpointsSpecification` to `'Explicit values'`.

If you use a cell array of character vectors, each character vector represents the name of a `Simulink.Breakpoint` object. Using a cell array of character vectors sets the property `BreakpointsSpecification` to `'Reference'`.

If you use a vector of `Simulink.lookuptable.Evenspacing` objects, each object represents a breakpoint set. Using a vector of `Simulink.lookuptable.Evenspacing` objects sets the property `BreakpointsSpecification` to `'Even Spacing'`.

BreakpointsSpecification — Source of breakpoint set information
`'Explicit values'` (default) | `'Reference'` | `'Even spacing'`

Source of the breakpoint set information, specified as `'Explicit values'` (default), `'Even spacing'`, or `'Reference'`. See the **Breakpoints** > **Specification** parameter.

Data Types: `char`

CoderInfo — Code generation settings for structure or array variable
`Simulink.CoderInfo` object

Code generation settings for the structure variable (if you set `BreakpointsSpecification` to `'Explicit values'` or `'Even spacing'`) or array variable (`'Reference'`) that stores the lookup table and breakpoint sets, specified as a `Simulink.CoderInfo` object. You can specify a storage class or custom storage class by using this embedded object. See `Simulink.CoderInfo`.

StructTypeInfo — Settings for structure type in the generated code
`Simulink.lookuptable.StructTypeInfo` object

Settings for the structure type that the structure variable uses in the generated code, specified as a `Simulink.lookuptable.StructTypeInfo` object.

If you set `BreakpointsSpecification` to `'Reference'`, the `Simulink.LookupTable` object does not appear in the generated code as a structure. The code generator ignores this property.

SupportTunableSize — Option to generate code that enables tunability of table size
false (default) | true

Option to generate code that enables tunability of the effective size of the table, specified as true or false. See the **Support Tunable Size** parameter.

Data Types: logical

Table — Information for table data
Simulink.lookuptable.Table object

Information for the table data, specified as a Simulink.lookuptable.Table object.

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Represent a One-Dimensional Lookup Table

1. Create a Simulink.LookupTable object named LUTObj.

   ```
   LUTObj = Simulink.LookupTable;
   ```
2. Specify the table data.

   ```
   LUTObj.Table.Value = [1.1 2.2 3.3 4.4 5.5];
   ```
3. Specify the breakpoint set data.

   ```
   LUTObj.Breakpoints(1).Value = [-2 -1 0 1 2];
   ```
4. Specify a name for the structure type in the generated code.

   ```
   LUTObj.StructTypeInfo.Name = 'myLUTStruct';
   ```

You can use LUTObj in a 1-D Lookup Table block dialog box. In the block, set **Data specification** to Lookup table object and **Name** to LUTObj.

Represent a Two-Dimensional Lookup Table

1 Create a `Simulink.LookupTable` object named `LUTObj`.

```
LUTObj = Simulink.LookupTable;
```

2 Specify the table data.

```
LUTObj.Table.Value = [1.1 2.2 3.3 4.4 5.5; ...
                      6.6 7.7 8.8 9.9 10.1];
```

3 Specify the breakpoint set data. In the `Breakpoints` property, use the vector index `2` to set the values in the second breakpoint set.

```
LUTObj.Breakpoints(1).Value = [-1 1];
```

```
LUTObj.Breakpoints(2).Value = [-2 -1 0 1 2];
```

`LUTObj` creates a `Simulink.lookuptable.Breakpoint` object as the second vector element in the value of the `Breakpoints` property. Except for the `Value` property, the new object has default property values.

4 Specify a name for the structure type in the generated code.

```
LUTObj.StructTypeInfo.Name = 'myLUTStruct';
```

You can use `LUTObj` in a 2-D Lookup Table block dialog box.

Evenly Space Every Second Value Starting from 1

To evenly space every second value starting from 1, use the Breakpoint object.

1 Create a `Simulink.LookupTable` object named `LUTObj`.

```
LUTObj=Simulink.LookupTable
```

```
LUTObj = 

  LookupTable with properties:

                     Table: [1×1 Simulink.lookuptable.Table]
    BreakpointsSpecification: 'Explicit values'
                 Breakpoints: [1×1 Simulink.lookuptable.Breakpoint]
          SupportTunableSize: 0
```

```
                   CoderInfo: [1×1 Simulink.CoderInfo]
              StructTypeInfo: [1×1 Simulink.lookuptable.StructTypeInfo]
```

2 Set up the breakpoint property to even spacing.

```
LUTObj.BreakpointsSpecification='Even spacing'
```

```
LUTObj = 

  LookupTable with properties:

                       Table: [1×1 Simulink.lookuptable.Table]
    BreakpointsSpecification: 'Even spacing'
                 Breakpoints: [1×1 Simulink.lookuptable.Evenspacing]
          SupportTunableSize: 0
                   CoderInfo: [1×1 Simulink.CoderInfo]
              StructTypeInfo: [1×1 Simulink.lookuptable.StructTypeInfo]
```

3 Get the properties of the breakpoint.

```
LUTObj.Breakpoints(1)
```

```
ans = 

  Evenspacing with properties:

         FirstPoint: 0
            Spacing: 1
           DataType: 'auto'
                Min: []
                Max: []
               Unit: ''
     FirstPointName: 'BPFirstPoint1'
        SpacingName: 'BPSpacing1'
    TunableSizeName: 'N1'
        Description: ''
```

4 To set the first point property, use the Breakpoint object `FirstPoint` property.

```
LUTObj.Breakpoints(1).FirstPoint=1
```

5 To set the spacing property, use the Breakpoint object.

```
LUTObj.Breakpoints(1).Spacing=2
```

6 Get the properties of the breakpoint.

```
    LUTObj.Breakpoints(1)

    ans = 

      Evenspacing with properties:

             FirstPoint: 1
                Spacing: 2
               DataType: 'auto'
                    Min: []
                    Max: []
                   Unit: ''
         FirstPointName: 'BPFirstPoint1'
            SpacingName: 'BPSpacing1'
        TunableSizeName: 'N1'
            Description: ''
```

Control Code Generation for Lookup Table and Breakpoint Sets

Create a `Simulink.LookupTable` object named `LUTObj`.

```
LUTObj = Simulink.LookupTable;
```

Specify the table data.

```
LUTObj.Table.Value = [1.00 2.25 3.50 4.75 6.00; ...
                      7.25 8.50 9.75 11.00 12.25];
```

Specify the breakpoint set data. In the `Breakpoints` property, use the array index `2` to create an additional `Simulink.lookuptable.BreakpointInfo` object, which represents the second breakpoint set.

```
LUTObj.Breakpoints(1).Value = [-1 1];
```

```
LUTObj.Breakpoints(2).Value = [-2 -1 0 1 2];
```

Specify data types for the lookup table and each breakpoint set.

```
LUTObj.Table.DataType = 'fixdt(1,16,2)';
```

```
LUTObj.Breakpoints(1).DataType = 'int16';
LUTObj.Breakpoints(2).DataType = 'int16';
```

Specify unique names for the structure fields that store the table data and breakpoint sets in the generated code.

```
LUTObj.Table.FieldName = 'myTable';
```

```
LUTObj.Breakpoints(1).FieldName = 'myBPSet1';
```

```
LUTObj.Breakpoints(2).FieldName = 'myBPSet2';
```

Export the structure variable definition from the generated code by using the storage class `ExportedGlobal`.

```
LUTObj.CoderInfo.StorageClass = 'ExportedGlobal';
```

Name the structure type in the generated code `LUTStructType`. Export the structure type definition to a generated header file named `myLUTHdr.h`.

```
LUTObj.StructTypeInfo.Name = 'LUTStructType';
LUTObj.StructTypeInfo.DataScope = 'Exported';
LUTObj.StructTypeInfo.HeaderFileName = 'myLUTHdr.h';
```

In an n-D Lookup Table block in a model, set **Data specification** to `Lookup table object` and **Name** to `LUTObj`.

```
load_system('myModel_LUTObj')
set_param('myModel_LUTObj/Lookup Table','DataSpecification','Lookup table object',...
    'LookupTableObject','LUTObj')
```

Generate code from the model.

```
rtwbuild('myModel_LUTObj')
```

```
### Starting build procedure for model: myModel_LUTObj
### Successful completion of code generation for model: myModel_LUTObj
```

The generated code defines the structure type `LUTStructType` in the generated header file `myLUTHdr.h`.

```
file = fullfile('myModel_LUTObj_ert_rtw','myLUTHdr.h');
rtwdemodbtype(file,'typedef struct {','} LUTStructType;',1,1)
```

```
typedef struct {
  int16_T myBPSet1[2];
  int16_T myBPSet2[5];
  int16_T myTable[10];
} LUTStructType;
```

The code uses the global structure variable `LUTObj` to store the table and breakpoint set data. The table data is scaled based on the specified fixed-point data type.

```
file = fullfile('myModel_LUTObj_ert_rtw','myModel_LUTObj.c');
rtwdemodbtype(file,'LUTStructType LUTObj = {','/* Variable: LUTObj',1,1)
```

```
LUTStructType LUTObj = {
  { -1, 1 },

  { -2, -1, 0, 1, 2 },

  { 4, 29, 9, 34, 14, 39, 19, 44, 24, 49 }
} ;                                    /* Variable: LUTObj
```

Generate Code That Uses Conditionally Compiled Dimension Lengths

Suppose your handwritten code conditionally allocates memory and initializes a lookup table based on dimension lengths that you specify as `#define` macros. This example shows how to generate code that uses your external table and breakpoint data.

Symbolic dimensions require that you use an ERT-based system target file, which requires Embedded Coder®.

Explore External Code

In your current folder, copy these macro definitions into a header file named `ex_myHdr_LUT.h`.

```
#include "rtwtypes.h"

#ifndef _HEADER_MYHDR_H_
#define _HEADER_MYHDR_H_

#define bp1Len 2
#define bp2Len 2
```

```
typedef struct {
  real_T BP1[bp1Len];
  real_T BP2[bp2Len];
  real_T Table[bp1Len * bp2Len];
} LUTObj_Type;

extern LUTObj_Type LUTObj;

#endif
```

Copy this static initialization code into a source file named `ex_mySrc_LUT.c`.

```
#include "ex_myHdr_LUT.h"

#if bp1Len == 2 && bp1Len == 2
LUTObj_Type LUTObj = {
  { 1.0, 2.0 },

  { 3.0, 4.0 },

  { 3.0, 2.0, 4.0, 1.0 }
} ;
#endif

#if bp1Len == 3 && bp1Len == 3
LUTObj_Type LUTObj = {
  { 1.0, 2.0, 3.0 },

  { 4.0, 5.0, 6.0 },

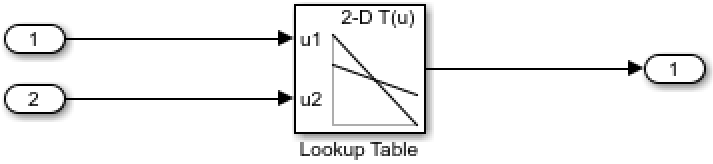
  { 1.0, 6.0, 2.0, 3.0, 8.0, 9.0, 5.0, 4.0, 7.0 }
} ;
#endif
```

To generate code that imports this data, create `bp1Len` and `bp2Len` as `Simulink.Parameter` objects in MATLAB. Create `LUTObj` as a `Simulink.LookupTable` object. Use the parameter objects to specify the dimension lengths for the table and breakpoint set data in the `Simulink.LookupTable` object.

Create Example Model

Create the example model `ex_LUTObj` by using an n-D Lookup Table block. In the Lookup Table block dialog box, on the **Table and Breakpoints** tab, set **Number of table dimensions** to 2.

```
open_system('ex_LUTObj')
```



Create `Simulink.LookupTable` Object

In the Model Explorer **Model Hierarchy** pane, select **Base Workspace**.

On the toolbar, click the **Add Simulink LookupTable** button. A `Simulink.LookupTable` object named `Object` appears in the base workspace.

In the **Contents** pane (the middle pane), rename the object as `LUTObj`.

Alternatively, create the object at the command prompt:

```
LUTObj = Simulink.LookupTable;
```

Configure `Simulink.LookupTable` Object

In the **Contents** pane, select the new object `LUTObj`. The property dialog box appears in the **Dialog** pane (the right pane).

Set **Number of table dimensions** to 2.

Under **Table**, set **Value** to `[3 4; 2 1]`.

In the first row under **Breakpoints**, set **Value** to `[1 2]`.

In the second row under **Breakpoints**, set **Value** to `[3 4]`. Click **Apply**.

Under **Struct Type definition**, set **Data scope** to `Imported`. Set **Header file** to `ex_myHdr_LUT.h`. Set **Name** to `LUTObj_Type`.

In the Lookup Table block dialog box, set **Data specification** to `Lookup table object`. Set **Name** to `LUTObj`. Click **Apply**.

Alternatively, to configure the object and the blocks, use these commands:

```
LUTObj.Breakpoints(1).Value = [1 2];
LUTObj.Breakpoints(2).Value = [3 4];
LUTObj.Table.Value = [3 4; 2 1];
LUTObj.StructTypeInfo.DataScope = 'Imported';
LUTObj.StructTypeInfo.HeaderFileName = 'ex_myHdr_LUT.h';
LUTObj.StructTypeInfo.Name = 'LUTObj_Type';
set_param('ex_LUTObj/Lookup Table','LookupTableObject','LUTObj')
set_param('ex_LUTObj/Lookup Table',...
    'DataSpecification','Lookup table object')
```

Enable the code generator to use `Simulink.Parameter` objects as macros that specify dimension lengths. Select the configuration parameter **Allow symbolic dimension specification**.

```
set_param('ex_LUTObj','AllowSymbolicDim','on')
```

Create the `Simulink.Parameter` objects that represent the macros `bp1Len` and `bp2Len`. To generate code that imports the macros from your header file `ex_myHdr_LUT.h`, apply the custom storage class `ImportedDefine`.

```
bp1Len = Simulink.Parameter(2);
bp1Len.Min = 2;
bp1Len.Max = 3;
bp1Len.DataType = 'int32';
bp1Len.CoderInfo.StorageClass = 'Custom';
bp1Len.CoderInfo.CustomStorageClass = 'ImportedDefine';
bp1Len.CoderInfo.CustomAttributes.HeaderFile = 'ex_myHdr_LUT.h';

bp2Len = Simulink.Parameter(2);
bp2Len.Min = 2;
bp2Len.Max = 3;
bp2Len.DataType = 'int32';
bp2Len.CoderInfo.StorageClass = 'Custom';
bp2Len.CoderInfo.CustomStorageClass = 'ImportedDefine';
bp2Len.CoderInfo.CustomAttributes.HeaderFile = 'ex_myHdr_LUT.h';
```

Configure the existing `Simulink.LookupTable` object `LUTObj` to use the `Simulink.Parameter` objects. Set the dimension lengths of the breakpoint set data and the table data by using the names of the parameter objects.

```
LUTObj.Breakpoints(1).Dimensions = '[1 bp1Len]';
LUTObj.Breakpoints(2).Dimensions = '[1 bp2Len]';
LUTObj.Table.Dimensions = '[bp1Len bp2Len]';
```

Configure `LUTObj` as imported data by applying the custom storage class `ImportFromFile`. To import your definition of `LUTObj`, add the name of the file `ex_mySrc_LUT.c` to the model configuration parameter **Configuration Parameters > Code Generation > Custom Code > Additional Build Information > Source files**.

```
LUTObj.CoderInfo.StorageClass = 'Custom';
LUTObj.CoderInfo.CustomStorageClass = 'ImportFromFile';
LUTObj.CoderInfo.CustomAttributes.HeaderFile = 'ex_myHdr_LUT.h';

set_param('ex_LUTObj','CustomSource','ex_mySrc_LUT.c')
```

Generate and Inspect Code

Configure the model to compile an executable from the generated code.

```
set_param('ex_LUTObj','GenCodeOnly','off')
```

Generate code from the model.

```
rtwbuild('ex_LUTObj')
```

```
### Starting build procedure for model: ex_LUTObj
### Successful completion of build procedure for model: ex_LUTObj
```

In the code generation report, view the generated file `ex_LUTObj.h`. The file imports the macro definitions and the structure type definition by including your header file `ex_myHdr_LUT.h`.

```
file = fullfile('ex_LUTObj_ert_rtw','ex_LUTObj.h');
rtwdemodbtype(file,'#include "ex_myHdr_LUT.h"','#include "ex_myHdr_LUT.h"',1,1)
```

```
#include "ex_myHdr_LUT.h"
```

In the source file `ex_LUTObj.c`, the code algorithm in the model `step` function passes the breakpoint and table data to the function that performs the table lookup. The algorithm also passes `bp1Len` so the lookup function can traverse the rows and columns of the table data, which appear in the generated code as a serialized 1-D array.

```
file = fullfile('ex_LUTObj_ert_rtw','ex_LUTObj.c');
rtwdemodbtype(file,'/* Model step function */','/* Model initialize function */',1,0)
```

```
/* Model step function */
void ex_LUTObj_step(void)
```

```
{
  /* Outport: '<Root>/Out1' incorporates:
   *  Inport: '<Root>/In1'
   *  Inport: '<Root>/In2'
   *  Lookup_n-D: '<Root>/Lookup Table'
   */
  ex_LUTObj_Y.Out1 = look2_binlcapw(ex_LUTObj_U.In1, ex_LUTObj_U.In2,
    (&(LUTObj.BP1[0])), (&(LUTObj.BP2[0])), (&(LUTObj.Table[0])),
    ex_LUTObj_ConstP.LookupTable_maxIndex, (uint32_T)bp1Len);
}
```

Limitations

- You cannot subclass `Simulink.Breakpoint` or `Simulink.LookupTable`. For this reason, you cannot apply custom storage classes other than those in the built-in `Simulink` package.
- You cannot use `Simulink.Breakpoint` objects or `Simulink.LookupTable` objects that refer to `Simulink.Breakpoint` objects as instance-specific parameter data for reusable components. For example, you cannot use one of these objects as:

  - A model argument in a model workspace or a model argument value in a Model block.
  - The value of a mask parameter on a CodeReuse Subsystem block.
  - The value of a mask parameter on a subsystem that you reuse by creating a custom library.

  However, you can use standalone `Simulink.LookupTable` objects, which do not refer to `Simulink.Breakpoint` objects, in these ways.
- When blocks in a subsystem use `Simulink.LookupTable` or `Simulink.Breakpoint` objects, you cannot set data type override only on the subsystem. Instead, set data type override on the entire model.

Simulink.lookuptable.Breakpoint class

Package: Simulink.lookuptable

Configure breakpoint set data for lookup table object

Description

An object of the `Simulink.lookuptable.Breakpoint` class stores breakpoint set information for a lookup table. The object resides in the `Breakpoints` property of a `Simulink.LookupTable` object or `Simulink.Breakpoint` object.

You can use `Simulink.LookupTable` and `Simulink.Breakpoint` objects to store and configure a lookup table for ASAP2 and AUTOSAR code generation.

To represent multiple breakpoint sets for a multidimensional lookup table, store a vector of `Simulink.lookuptable.Breakpoint` objects in the `Breakpoints` property of a `Simulink.LookupTable` object.

To share a breakpoint set between multiple lookup tables, use a `Simulink.Breakpoint` object to store and configure the breakpoint set information. Use the object in a Prelookup block and create `Simulink.LookupTable` objects to use in Interpolation Using Prelookup blocks.

Construction

When you create a `Simulink.LookupTable` object or `Simulink.Breakpoint` object, a `Simulink.lookuptable.Breakpoint` object appears as the value of the `Breakpoints` property.

To create more `Simulink.lookuptable.Breakpoint` objects for a `Simulink.LookupTable` object, use this technique:

Access the `Breakpoints` property by specifying a vector index.

To create a `Simulink.lookuptable.Breakpoint` object, you can set the value of any of the object properties. The `Simulink.LookupTable` object creates the

Simulink.lookuptable.Breakpoint object with default property values, and sets the property that you specified.

The value of the Breakpoints property is an array of Simulink.lookuptable.Breakpoint objects. Each embedded object represents one breakpoint set.

For example, suppose that you create a Simulink.LookupTable object named LUTObj. To create more breakpoint sets, access the Breakpoints property by specifying vector indices:

```
LUTObj.Breakpoints(1).Value = [-1 1];
LUTObj.Breakpoints(2).Value = [-2 -1 0 1 2];
LUTObj.Breakpoints(3).Value = [-5 -3 0 3 5];
```

The object LUTObj creates additional Simulink.lookuptable.Breakpoint objects and sets the Value property of each object. LUTObj now stores information for three breakpoint sets.

Properties

DataType — Data type of breakpoint set elements

'auto' (default) | character vector

Data type of breakpoint set elements, specified as a character vector. You can explicitly specify an integer, a floating-point, a fixed-point data type, or a data type expression such as the name of a Simulink.AliasType object.

The default value, 'auto', means that the breakpoint set acquires a data type from the value that you specify in the Value property. If you use an untyped expression such as [1 2 3] to set Value, the breakpoint data use the data type double. If you specify a typed expression such as single([1 2 3]) or an fi object, the breakpoint data use the data type specified by the expression or object.

For more information about data types in Simulink, see “Data Types Supported by Simulink”. To decide how to control the data types of table and breakpoint data in Simulink.LookupTable and Simulink.Breakpoint objects, see “Control Data Types of Lookup Table Objects” (Simulink Coder).

Example: 'int16'

Example: 'myTypeAlias'

Data Types: `char`

`Description` — Description of breakpoint set

`''` (default) | character vector

Description of the breakpoint set, specified as a character vector.

Example: `'This breakpoint set represents the pressure input.'`

Data Types: `char`

`Dimensions` — Dimension lengths of breakpoint set

`[0 0]` (default) | numeric vector

Dimension lengths of the breakpoint set, returned as a numeric vector or specified as a character vector.

To use symbolic dimensions, specify a character vector.

`FieldName` — Name of structure field that stores breakpoint set data

`'BP'` (default) | character vector

Name of a structure field in the generated code, specified as a character vector. This field stores the breakpoint set data.

The code generator uses this property only under these circumstances, which cause the breakpoint data to appear in the generated code as a structure field:

- The `Simulink.lookuptable.Breakpoint` object exists in a `Simulink.LookupTable` object and in the `Simulink.LookupTable` object you set `BreakpointsSpecification` to `'Explicit values'`.
- The `Simulink.lookuptable.Breakpoint` object exists in a `Simulink.Breakpoint` object and in the `Simulink.Breakpoint` object you set `SupportTunableSize` to `true`.

Example: `'MyBkptSet1'`

Data Types: `char`

`Max` — Maximum value of breakpoint set elements

`[]` (default) | numeric `double` value

Maximum value of the elements of the breakpoint set, specified as a numeric, real value of the data type `double`.

Example: `17.23`

Data Types: `double`

`Min` — Minimum value of breakpoint set elements

`[]` (default) | numeric `double` value

Minimum value of the elements of the breakpoint set, specified as a numeric, real value of the data type `double`.

Example: `-52.6`

Data Types: `double`

`TunableSizeName` — Name of structure field that stores length of breakpoint set

`'N'` (default) | character vector

Name of a structure field in the generated code, specified as a character vector. This field stores the length of the breakpoint set, which the generated code algorithm uses to determine the size of the table. To tune the effective size of the table during code execution, change the value of this structure field in memory.

The code generator uses this property only under these circumstances, which enable a tunable table size in the generated code:

- The `Simulink.lookuptable.Breakpoint` object exists in a `Simulink.LookupTable` object and in the `Simulink.LookupTable` object you set:
  - `BreakpointsSpecification` to `'Explicit values'`.
  - `SupportTunableSize` to `true`.
- The `Simulink.lookuptable.Breakpoint` object exists in a `Simulink.Breakpoint` object and in the `Simulink.Breakpoint` object you set `SupportTunableSize` to `true`.

Example: `'LengthForDim1'`

Data Types: `char`

`Unit` — Physical unit of breakpoint set

`''` (default) | character vector

Physical unit of the elements of the breakpoint set, specified as a character vector.

Example: `'inches'`

Data Types: `char`

`Value` — Breakpoint set data
`[]` (default) | numeric vector

The breakpoint set data, specified as a numeric vector with at least two elements. To control the data type of the breakpoint set, use the `DataType` property of the `Simulink.lookuptable.Breakpoint` object.

When you set `DataType` to `'auto'`, to set the `Value` property, use a typed expression such as `single([1 2 3])` or use the `fi` constructor to embed an `fi` object.

Example: `[10 20 30]`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fi`

`Simulink.Breakpoint` | `Simulink.LookupTable`

Introduced in R2016b

Simulink.lookuptable.Evenspacing class

Package: Simulink.lookuptable

Configure even spacing set data for lookup table object

Description

An object of the `Simulink.lookuptable.Evenspacing` class stores event spacing set information for a lookup table. The object resides in the `Evenspacing` property of a `Simulink.LookupTable` object.

You can use `Simulink.LookupTable` objects to store and configure a lookup table for ASAP2 and AUTOSAR code generation.

To represent multiple breakpoint sets for a multidimensional lookup table, store a vector of `Simulink.lookuptable.Evenspacing` objects in the `Evenspacing` property of a `Simulink.LookupTable` object.

Construction

When you create a `Simulink.LookupTable` object and set `BreakpointSpecification` to `'Even spacing'`, a `Simulink.lookuptable.Evenspacing` object appears as the value of the `Breakpoints` property.

To create more `Simulink.lookuptable.Evenspacing` objects for a `Simulink.LookupTable` object, use this technique:

Access the `Breakpoints` property by specifying a vector index.

To create a `Simulink.lookuptable.Evenspacing` object, you can set the value of any of the object properties. The `Simulink.LookupTable` object creates the `Simulink.lookuptable.Evenspacing` object with default property values, and sets the property that you specified.

The value of the Breakpoints property is an array of Simulink.lookuptable.Evenspacing objects. Each embedded object represents one breakpoint set.

For example, suppose that you create a Simulink.LookupTable object named myLUTObj. To create more breakpoint sets, access the Breakpoints property by specifying scalar indices for FirstPoint and Spacing properties. To create more even spacing breakpoint sets, update the object with this pair of properties:

```
LUTObj.Breakpoints(1).FirstPoint=-1;
LUTObj.Breakpoints(1).Spacing=2;
LUTObj.Breakpoints(1).FirstPoint=-2;
LUTObj.Breakpoints(1).Spacing=1;
LUTObj.Breakpoints(1).FirstPoint=-5;
LUTObj.Breakpoints(1).Spacing=2;
```

The object myLUTObj creates additional Simulink.lookuptable.Evenspacing objects and sets the FirstPoint and Spacing properties of each object. LUTObj now stores information for three breakpoint sets.

Properties

FirstPoint — First point in evenly spaced breakpoint data

[ ] (default) | numeric scalar

First point in evenly spaced breakpoint data, specified as a numeric scalar. To control the data type of the breakpoint set, use the DataType property of the Simulink.lookuptable.Evenspacing object.

When you set DataType to 'auto', to set the FirstPoint property, use a typed expression such as single(1) or use the fi constructor to embed a fi object.

Example: -1

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | fi

Spacing — Spacing between points in evenly spaced breakpoint data

[ ] (default) | numeric, positive, monotonically increasing scalar

Spacing between points in evenly spaced breakpoint data, specified as a numeric scalar. To control the data type of the breakpoint set, use the DataType property of the Simulink.lookuptable.Evenspacing object.

When you set DataType to 'auto', to set the Spacing property, use a typed expression such as single(1) or use the fi constructor to embed an fi object.

Example: -1

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | fi

DataType — Data type of breakpoint set elements

'auto' (default) | character vector

Data type of breakpoint set elements, specified as a character vector. You can explicitly specify an integer, a floating-point, a fixed-point data type, or a data type expression such as the name of a Simulink.AliasType object.

The default value, 'auto', means that the breakpoint set acquires a data type from the value that you specify in the Value property. If you use an untyped expression such as [1 2 3] to set Value, the breakpoint data use the data type double. If you specify a typed expression such as single([1 2 3]) or an fi object, the breakpoint data use the data type specified by the expression or object.

For more information about data types in Simulink, see “Data Types Supported by Simulink”. To decide how to control the data types of table and breakpoint data in Simulink.LookupTable and Simulink.Breakpoint objects, see “Control Data Types of Lookup Table Objects” (Simulink Coder).

Example: 'int16'

Example: 'myTypeAlias'

Data Types: char

Min — Minimum value of breakpoint set elements

[] (default) | numeric double value

Minimum value of the elements of the breakpoint set, specified as a numeric, real value of the data type double.

Example: -52.6

Data Types: double

Max — Maximum value of breakpoint set elements

[] (default) | numeric double value

Maximum value of the elements of the breakpoint set, specified as a numeric, real value of the data type double.

Example: `17.23`

Data Types: `double`

`Unit` — Physical unit of breakpoint set

`''` (default) | character vector

Physical unit of the elements of the breakpoint set, specified as a character vector.

Example: `'inches'`

Data Types: `char`

`FirstPointName` — Name of the `Simulink.lookuptable.Evenspacing` object that stores the information for the first point

`'BPFirstPoint1'` (default) | character vector

Name of the `Simulink.Breakpoint` object that stores the information for the first point, specified as a character vector. Generated code uses this name to display the first point.

Example: `'myFirstPointName'`

Data Types: `char`

`SpacingName` — Name of the `Simulink.lookuptable.Evenspacing` object that stores the information for the spacing

`'auto'` (default) | character vector

Name of the `Simulink.Breakpoint` object that stores the information for the spacing, specified as a character vector. Generated code uses this name to display the spacing.

Example: `'mySpacing'`

Data Types: `char`

`TunableSizeName` — Name of structure field that stores length of breakpoint set

`'N'` (default) | character vector

Name of a structure field in the generated code, specified as a character vector. This field stores the length of the breakpoint set, which the generated code algorithm uses to determine the size of the table. To tune the effective size of the table during code execution, change the value of this structure field in memory.

The code generator uses the property only under these circumstances, which enable a tunable table size in the generated code:

- The `Simulink.lookuptable.Evenspacing` object exists in a `Simulink.LookupTable` object, in which you set `BreakpointsSpecification` to `'Even spacing'` and `SupportTunableSize` to `true`.

Example: `'LengthForDim1'`

Data Types: `char`

`Description` — Description of breakpoint set

`''` (default) | character vector

Description of the breakpoint set, specified as a character vector.

Example: `'This breakpoint set represents the pressure input.'`

Data Types: `char`

`Simulink.LookupTable` | `Simulink.lookuptable.Breakpoint`

Introduced in R2017b

Simulink.lookuptable.StructTypeInfo class

Package: Simulink.lookuptable

Configure settings for structure type that lookup table object uses in the generated code

Description

An object of the `Simulink.lookuptable.StructTypeInfo` class controls the structure type that the generated code creates to store data for lookup table objects. The `Simulink.lookuptable.StructTypeInfo` object resides in the `StructTypeInfo` property of a `Simulink.LookupTable` object or `Simulink.Breakpoint` object. Use these parent objects to store and configure a lookup table for ASAP2 and AUTOSAR code generation.

A `Simulink.LookupTable` object appears as a structure in the generated code when you set the `Specification` property to `'Explicit values'`. A `Simulink.Breakpoint` object appears as a structure in the generated code when you set the `SupportTunableSize` property to `true`.

Construction

When you create a `Simulink.LookupTable` or `Simulink.Breakpoint` object, a `Simulink.lookuptable.StructTypeInfo` object appears as the value of the `StructTypeInfo` property.

Properties

DataScope — Scope of structure type definition

`'Auto'` (default) | `'Exported'` | `'Imported'`

Scope of structure type definition, specified as a character vector.

Data Types: `char`

HeaderFileName — Name of header file that contains structure type definition
'' (default) | character vector

Name of the header file that contains the structure type definition, specified as a character vector.

Example: 'myHdr.h'

Data Types: char

Name — Name of structure type
'' (default) | character vector

Name of the structure type, specified as a character vector.

Data Types: char

Simulink.Breakpoint | Simulink.LookupTable

Introduced in R2016b

Simulink.lookuptable.Table class

Package: Simulink.lookuptable

Configure table data for lookup table object

Description

An object of the `Simulink.lookuptable.Table` class stores table information for a lookup table. The object resides in the `Table` property of a `Simulink.LookupTable` object. You can use the `Simulink.LookupTable` object to store and configure a lookup table for ASAP2 and AUTOSAR code generation.

Construction

When you create a `Simulink.LookupTable` object, a `Simulink.lookuptable.Table` object appears as the value of the `Table` property.

Properties

`DataType` — Data type of table data elements

`'auto'` (default) | character vector

Data type of the table data elements, specified as a character vector. You can explicitly specify an integer data type, a floating-point data type, a fixed-point data type, or a data type expression such as the name of a `Simulink.AliasType` object.

The default value, `'auto'`, means that the table data acquire a data type from the value that you specify in the `Value` property. If you use an untyped expression such as `[1 2 3]` to set `Value`, the table data use the data type `double`. If you specify a typed expression such as `single([1 2 3])` or an `fi` object, the table data use the data type specified by the expression or object.

For more information about data types in Simulink, see “Data Types Supported by Simulink”. To decide how to control the data types of table and breakpoint data in

Simulink.LookupTable and Simulink.Breakpoint objects, see “Control Data Types of Lookup Table Objects” (Simulink Coder).

Example: 'int16'

Example: 'myTypeAlias'

Data Types: char

Description — Description of table data

'' (default) | character vector

Description of the table data, specified as a character vector.

Example: 'This lookup table describes the action of a pump.'

Data Types: char

Dimensions — Dimension lengths of table data

[0 0] (default) | numeric vector

Dimension lengths of the table data, returned as a numeric vector or specified as a character vector.

To use symbolic dimensions, specify a character vector.

FieldName — Name of a structure field in the generated code

'Table' (default) | character vector

Name of a structure field in the generated code, specified as a character vector. This field stores the table data if you configure the Simulink.LookupTable object to appear in the generated code as a structure.

Example: 'MyPumpTable'

Data Types: char

Max — Maximum value of table data elements

[] (default) | numeric double value

Maximum value of the elements of the table data, specified as a numeric, real value of the data type double.

Example: 17.23

Data Types: double

`Min` — Minimum value of table data elements

`[]` (default) | numeric `double` value

Minimum value of the elements of the table data, specified as a numeric, real value of the data type `double`.

Example: `-52.6`

Data Types: `double`

`Unit` — Physical unit of table elements

`''` (default) | character vector

Physical unit of the elements of the table data, specified as a character vector.

Example: `'degC'`

Data Types: `char`

`Value` — Table data

`[]` (default) | numeric vector or multidimensional array

The table data, specified as a numeric vector or multidimensional array with at least two elements. To control the data type of the table data, use the `DataType` property of the `Simulink.lookuptable.Table` object.

When you set `DataType` to `'auto'`, to set the `Value` property, use a typed expression such as `single([1 2 3])` or use the `fi` constructor to embed an `fi` object.

Example: `[10 20 30; 40 50 60]`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fi`

Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects (MATLAB).

`Simulink.Breakpoint` | `Simulink.LookupTable`

Introduced in R2016b

Simulink.MDLInfo class

Package: Simulink

Extract model file information without loading block diagram into memory

Description

The class Simulink.MDLInfo extracts information from a model file without loading the block diagram into memory.

You can create an `MdlInfo` object containing all the model information properties, or you can use the static methods for convenient access to individual properties without creating the class first. For example, to get the description only:

```
description = Simulink.MDLInfo.getDescription('mymodel')
```

To get the metadata only:

```
metadata = Simulink.MDLInfo.getMetadata('mymodel')
```

All model information properties are read only.

Construction

`info = Simulink.MDLInfo('`*`mymodel`*`')` creates an instance of the `MdlInfo` class `info` and populates the properties with the information from the model file `'`*`mymodel`*`'`.

`mymodel` can be:

- A block diagram name (for example, `vdp`)
- The file name for a file on the MATLAB path (for example, `mymodel.slx`)
- A file name relative to the current folder (for example, `mydir/mymodel.slx`)
- A fully qualified file name (for example, `C:\mydir\mymodel.slx`)

`Simulink.MDLInfo` resolves the supplied name by looking at files on the MATLAB path, and ignores any block diagrams in memory. This may cause unexpected results if you supply the name of a loaded model, but its file is shadowed by another file on the MATLAB path. If a file is shadowed, you see a warning in the command window. To avoid any confusion, supply a fully-qualified file name to `Simulink.MDLInfo`.

Properties

`BlockDiagramName`

Name of block diagram.

`Description`

The Description parameter of the model. For details, see “Version Information Properties”.

`FileFormatMinorVersion`

Contains a value only for a Service Pack release of Simulink. Indicates that the file was saved by a Service Pack release, when the Service Pack included changes to the model file format.

`FileName`

The fully-qualified Name of the model file.

`Interface`

Names and attributes of the block diagram's root inports, outports, model references, etc., describing the graphical interface if you created a Model Reference block from this model.

Structure.

`IsLibrary`

Whether the block diagram is a library. Logical.

`LastModifiedBy`

Name of the user who last saved the model.

`LastSavedArchitecture`

Platform architecture when saved, for example, `'glnxa64'`.

`Metadata`

Names and values of arbitrary data associated with the model.

Structure. The structure fields can be character vectors, numeric matrices of type "double", or more structures. Use the method `getMetadata` to extract this metadata structure without loading the model.

`ModelVersion`

Model file version number.

`ReleaseName`

Name of release of Simulink that was used to save the model file, for example, `'R2016a'`.

`SavedCharacterEncoding`

Character encoding when saved, for example, `'UTF-8'`.

`SimulinkVersion`

Version number of Simulink software that was used to save the model file.

Methods

getDescription	Extract model file description without loading block diagram into memory
getMetadata	Extract model file metadata without loading block diagram into memory

Copy Semantics

Handle. To learn how this affects your use of the class, see Copying Objects (MATLAB) in the MATLAB Programming Fundamentals documentation.

Examples

Construct and view a model information object:

```
info = Simulink.MDLInfo('mymodel')
% Get the Version when the model was saved
simulink_version = info.SimulinkVersion;
% Get model metadata
metadata = info.metadata
```

To add metadata to a model, create a metadata structure containing the information you require and use `set_param` to attach it to the model. For example:

```
  metadata.TestStatus = 'untested';
  metadata.ExpectedCompletionDate
     = '01/01/2011';
  load_system(mymodelname);
  set_param(mymodelname,'Metadata',...
  metadata)  % must be a struct
  save_system(mymodelname);
  close_system(mymodelname);
```

Construct a model information object for a model named `mpowertrain`, in order to find the names of referenced models without loading the model into memory:

```
info = Simulink.MDLInfo('mpowertrain')
% Get the Interface property
info.Interface
```

Output:

```
ans =
                   Inports: [0x1 struct]
                  Outports: [0x1 struct]
                 Trigports: [0x1 struct]
                 Connports: [0x1 struct]
              ModelVersion: '1.122'
           ModelReferences: {2x1 cell}
    ParameterArgumentNames: ''
        TestPointedSignals: [0x1 struct]
```

Get the referenced models:

```
 info.Interface.ModelReferences
```

Output is in the form *`model name / block path | referenced model name`*:

```
ans =
    'mpowertrain/Model Variants|manual_transmission'
    'mpowertrain/engine model|menginemodel'
```

See Also

`Simulink.MDLInfo.getDescription`; `Simulink.MDLInfo.getMetadata`

Simulink.MDLInfo.getDescription

Class: Simulink.MDLInfo
Package: Simulink

Extract model file description without loading block diagram into memory

Syntax

```
description = Simulink.MDLInfo.getDescription('mymodel')
description = info.getDescription
```

Description

`description = Simulink.MDLInfo.getDescription('`*`mymodel`*`')` returns the `description` associated with the file *`mymodel`*, without loading the model.

`mymodel` can be:

- A block diagram name (for example, `vdp`)
- The file name for a file on the MATLAB path (for example, `mymodel.slx`)
- A file name relative to the current folder (for example, `mydir/mymodel.slx`)
- A fully qualified file name (for example, `C:\mydir\mymodel.slx`)

`description = info.getDescription` returns the `description` property of the `Simulink.MDLInfo` object `info`.

Examples

Get the description without loading the model or creating a `Simulink.MDLInfo` object:

```
description = Simulink.MDLInfo.getDescription('mymodel')
```

Create a `Simulink.MDLInfo` object containing all the model information properties, and get the description property:

```
info = Simulink.MDLInfo('mymodel')
description = info.getDescription
```

See Also

`Simulink.MDLInfo`; `Simulink.MDLInfo.getMetadata`

Simulink.MDLInfo.getMetadata

Class: Simulink.MDLInfo
Package: Simulink

Extract model file metadata without loading block diagram into memory

Syntax

```
metadata = Simulink.MDLInfo.getMetadata('mymodel')
metadata = info.getMetadata
```

Description

`metadata = Simulink.MDLInfo.getMetadata('`*`mymodel`*`')` extracts the structure `metadata` associated with the file *`mymodel`*, without loading the model.

`mymodel` can be:

- A block diagram name (for example, `vdp`)
- The file name for a file on the MATLAB path (for example, `mymodel.slx`)
- A file name relative to the current folder (for example, `mydir/mymodel.slx`)
- A fully qualified file name (for example, `C:\mydir\mymodel.slx`)

`metadata = info.getMetadata` returns the `metadata` property of the `Simulink.MDLInfo` object `info`.

`metadata` is a structure containing the names and attributes of arbitrary data associated with the model. The structure fields can be character vectors, numeric matrices of type "double", or more structures.

To add metadata to a model, create a metadata structure containing the information you require and use `set_param` to attach it to the model. If it is important to extract the information without loading the model, use metadata instead of adding custom user data with `add_param`.

Examples

Create a metadata structure and use `set_param` to attach it to the model:

```
  metadata.TestStatus = 'untested';
  metadata.ExpectedCompletionDate = '01/01/2011';
  load_system('mymodel');
  set_param('mymodel','Metadata',metadata) % must be a struct
  save_system('mymodel');
  close_system('mymodel');
```

Get the metadata without loading the model or creating a `Simulink.MDLInfo` object:

```
metadata = Simulink.MDLInfo.getMetadata('mymodel')
```

Create a `Simulink.MDLInfo` object containing all the model information properties, and get the metadata property:

```
info = Simulink.MDLInfo('mymodel')
metadata = info.getMetadata
```

See Also

`Simulink.MDLInfo`; `Simulink.MDLInfo.getDescription`

Simulink.ModelAdvisor

Run Model Advisor from MATLAB file

Description

Use instances of this class in MATLAB programs to run the Model Advisor, for example, to perform a standard set of checks. MATLAB software creates an instance of this object for each model that you open in the current MATLAB session. To get a handle to a model's Model Advisor object, execute the following command

```
ma = Simulink.ModelAdvisor.getModelAdvisor(model);
```

where `model` is the name of the model or subsystem that you want to check. Your program can then use the Model Advisor object's methods to initialize and run the Model Advisor's checks.

About IDs

Many `Simulink.ModelAdvisor` object methods require or return IDs. An *ID* is a unique identifier for a Model Advisor check, task, or group. ID must remain constant. A `Simulink.ModelAdvisor` object includes methods that enable you to retrieve the ID or IDs for all checks, tasks, and groups, checks belonging to groups and tasks, the active check, and selected checks, tasks and groups.

You find check IDs in the Model Advisor, using check context menus.

To Find	Do This
Check Title, ID, or location of the MATLAB source code	1 On the model window toolbar, select **Settings** > **Preferences**. 2 In the Model Advisor Preferences dialog box, select **Show Source Tab**. 3 In the right pane of the Model Advisor window, click the **Source** tab. The Model Advisor window displays the check Title, TitleId, and location of the MATLAB source code for the check.

To Find	Do This
Check ID	**1** In the left pane of the Model Advisor, select the check. **2** Right-click the check name and select **Send Check ID to Workspace**. The ID is displayed in the Command Window and sent to the base workspace.
Check IDs for selected checks in a folder	**1** In the left pane of the Model Advisor, select the checks for which you want IDs. Clear the other checks in the folder. **2** Right-click the folder and select **Send Check ID to Workspace**. An array of the selected check IDs are sent to the base workspace.

Syntax

`*ma* = Simulink.ModelAdvisor`

Arguments

`*ma*`

A variable representing the `Simulink.ModelAdvisor` object you create.

Properties

`EmitInputParametersToReport`

The `EmitInputParametersToReport` property specifies the display of check input parameters in the Model Advisor report.

Value	Description
`'true'` (default)	Display check input parameters in the Model Advisor report.
`'false'`	Do not display check input parameters in the Model Advisor report.

Method Summary

Name	Description
“closeReport” on page 5-314	Close Model Advisor report.
“deselectCheck” on page 5-314	Clear checks.
“deselectCheckAll” on page 5-315	Clear all checks.
“deselectCheckForGroup” on page 5-315	Clear a group of checks.
“deselectCheckForTask” on page 5-316	Clear checks that belong to a specified task or set of tasks.
“deselectTask” on page 5-316	Clear tasks.
“deselectTaskAll” on page 5-317	Clear all tasks.
“displayReport” on page 5-317	Display Model Advisor report.
“exportReport” on page 5-318	Copy report to a specified location.
“filterResultWithExclusion” on page 5-318	Filter objects that have been excluded by user-defined exclusions.
“getBaselineMode” on page 5-319	Get baseline mode setting for the Model Advisor.
“getCheckAll” on page 5-320	Get the IDs of the checks performed by the Model Advisor.
“getCheckForGroup” on page 5-320	Get checks belonging to a check group.
“getCheckForTask” on page 5-321	Get checks belonging to a task.
“getCheckResult” on page 5-321	Get check results.
“getCheckResultData” on page 5-322	Get check result data.
“getCheckResultStatus” on page 5-322	Get pass/fail status of a check or set of checks.
“getGroupAll” on page 5-323	Get the IDs of the groups of tasks performed by the Model Advisor.
“getInputParameters” on page 5-323	Get input parameters of a check.
“getListViewParameters” on page 5-324	Get list view parameters of a check.

Name	Description
“getModelAdvisor” on page 5-325	Get the Model Advisor for a model or subsystem.
“getSelectedCheck” on page 5-325	Get selected checks.
“getSelectedSystem” on page 5-326	Get path of system currently targeted by the Model Advisor.
“getSelectedTask” on page 5-326	Get selected tasks.
“getTaskAll” on page 5-327	Get the IDs of the tasks performed by the Model Advisor.
“Simulink.ModelAdvisor.openConfigUI” on page 5-327	Start the Model Advisor Configuration editor.
“Simulink.ModelAdvisor.reportExists” on page 5-328	Determine whether a report exists for a system or subsystem.
“runCheck” on page 5-328	Run selected checks.
“runTask” on page 5-329	Run checks for selected tasks.
“selectCheck” on page 5-329	Select checks.
“selectCheckAll” on page 5-330	Select all checks.
“selectCheckForGroup” on page 5-330	Select a group of checks.
“selectCheckForTask” on page 5-331	Select checks that belong to a specified task.
“selectTask” on page 5-331	Select tasks.
“selectTaskAll” on page 5-332	Select all tasks.
“setActionEnable” on page 5-332	Set enable/disable status for a check action.
“setBaselineMode” on page 5-333	Set baseline mode for the Model Advisor.
“setCheckErrorSeverity” on page 5-334	Set severity of a check failure.
“setCheckResult” on page 5-334	Set result for the currently running check.
“setCheckResultData” on page 5-335	Set result data for the currently running check.

Name	Description
"setCheckResultStatus" on page 5-336	Set pass/fail status for the currently running check.
"setListViewParameters" on page 5-336	Set list view parameters for a check.
"verifyCheckRan" on page 5-337	Verify that checks have run.
"verifyCheckResult" on page 5-338	Generate a baseline set of check results or compare the current set of results to the baseline results.
"verifyCheckResultStatus" on page 5-339	Verify that a model has passed or failed a set of checks.
"verifyHTML" on page 5-340	Generate a baseline report or compare the current report to a baseline report.

Methods

closeReport

Close Model Advisor report

```
closeReport
```

Closes the report associated with this Model Advisor object, which closes the Model Advisor window.

"displayReport" on page 5-317

deselectCheck

Clear check

```
success = deselectCheck(ID)
```

ID

Character vector or cell array that specifies the IDs of the checks to be cleared.

`success`

True (1) if the check is cleared.

This method clears the checks specified by `ID`.

Note This method cannot clear disabled checks.

“getCheckAll” on page 5-320, “deselectCheckForGroup” on page 5-315, “selectCheck” on page 5-329

deselectCheckAll

Clear all checks

```
success = deselectCheckAll
```

`success`

True (1) if all checks are cleared.

Clears all checks that are not disabled.

“selectCheckAll” on page 5-330

deselectCheckForGroup

Clear group of checks

```
success = deselectCheckForGroup(groupName)
```

groupName

Character vector or cell array that specifies the names of the groups to be cleared.

`success`

True (1) if the method succeeds in clearing the specified group.

Clears a specified group of checks.

“selectCheckForGroup” on page 5-330

deselectCheckForTask

Clear checks that belong to specified task or set of tasks

```
success = deselectCheckForTask(ID)
```

ID

Character vector or cell array of character vectors that specify the IDs of tasks whose checks are to be cleared.

`success`

True (1) if the specified tasks are cleared.

Clears checks belonging to the tasks specified by the *`ID`* argument.

“getTaskAll” on page 5-327, “selectCheckForTask” on page 5-331

deselectTask

Clear task

```
success = deselectTask(ID)
```

`ID`

Character vector or cell array that specifies the ID of tasks to be cleared

`success`

True (1) if the method succeeded in clearing the specified tasks.

Clears the tasks specified by *`ID`*.

“selectTask” on page 5-331, “getTaskAll” on page 5-327

deselectTaskAll

Clears all tasks

```
success = deselectTaskAll
```

`success`

True (1) if this method succeeds in clearing all tasks.

Clears all tasks.

“selectTaskAll” on page 5-332

displayReport

Display report in Model Advisor window

```
displayReport
```

Displays the report associated with this Model Advisor object in the Model Advisor window. The report includes the most recent results of running checks on the system associated with this Model Advisor object and the current selection status of checks, groups, and tasks for the system.

“Simulink.ModelAdvisor.reportExists” on page 5-328

exportReport

Create copy of report generated by Model Advisor

```
[success message] = exportReport(destination)
```

destination

Path name of copy to be made of the report file.

success

True (1) if this method succeeded in creating a copy of the report at the specified location.

message

Empty if the copy was successful; otherwise, the reason the copy did not succeed.

This method creates a copy of the last report generated by the Model Advisor and stores the copy at the specified location.

“Simulink.ModelAdvisor.reportExists” on page 5-328

filterResultWithExclusion

Filter objects that have been excluded by user-defined exclusions.

```
filteredResultHandles = obj.filterResultWithExclusion(ResultHandles)
```

`filteredResultHandles`

An array of objects causing exclusion enabled checks to warn or fail.

`obj`

A variable representing the `Simulink.ModelAdvisor.getModelAdvisor` object.

`ResultHandles`

An array of objects causing a check warning or failure.

This method filters objects that cause a check warning or failure with checks that have exclusions enabled.

Note This method is intended for excluding objects from custom checks created with the Model Advisor's customization API, a feature available with Simulink Check™.

“getModelAdvisor” on page 5-325

getBaselineMode

Determine whether Model Advisor is in baseline data generation mode

```
mode = getBaselineMode
```

`mode`

Boolean value indicating baseline mode.

The `mode` output variable returns true if the Model Advisor is in baseline data mode. Baseline data mode causes the verification methods of the Model Advisor, for example, “verifyHTML” on page 5-340, to generate baseline data.

“setBaselineMode” on page 5-333, “verifyHTML” on page 5-340, “verifyCheckResult” on page 5-338, “verifyCheckResultStatus” on page 5-339

getCheckAll

Get IDs of all checks

```
IDs = getCheckAll
```

`IDs`

Cell array of character vectors specifying the IDs of all checks performed by the Model Advisor.

Returns a cell array of character vectors specifying the IDs of all checks performed by the Model Advisor.

“getTaskAll” on page 5-327, “getGroupAll” on page 5-323

getCheckForGroup

Get checks that belong to check group

```
IDs = getCheckForGroup(groupName)
```

`groupName`

Character vector specifying the name of a group.

`IDs`

Cell array of IDs.

Returns a cell array of IDs of the tasks and checks belonging to the group specified by *`groupName`*.

“getCheckForTask” on page 5-321

getCheckForTask

Get checks that belong to task

```
checkIDs = getCheckForTask(taskID)
```

`taskID`

ID of a task.

`checkIDs`

Cell array of IDs of checks belonging to the specified task.

Returns a cell array of IDs of the checks belonging to the task specified by *`taskID`*.

“getCheckForGroup” on page 5-320

getCheckResult

Get results of running check or set of checks

```
result = getCheckResult(ID)
```

`ID`

ID of a check or cell array of check IDs.

`result`

A check result or cell array of check results.

Gets results for the specified checks. The format of the results depends on the checks that generated the data.

Note This method is intended for accessing results generated by custom checks created with the Model Advisor's customization API, an optional feature available with Simulink Check software. For more information, see “Define Custom Checks” (Simulink Check).

“getCheckResultData” on page 5-322, “getCheckResultStatus” on page 5-322

getCheckResultData

Get data resulting from running check or set of checks

```
result = getCheckResultData(ID)
```

`ID`

Check ID or cell array of check IDs.

`result`

Data from a check result or cell array of data from check results.

Gets the check result data for the specified checks. The format of the data depends on the checks that generated the data.

Note This method is intended for accessing check result data generated by custom checks created with the Model Advisor's customization API, an optional feature available with Simulink Check software. For more information, see “Define Custom Checks” (Simulink Check).

“getCheckResult” on page 5-321, “getCheckResultStatus” on page 5-322

getCheckResultStatus

Get status of check or set of checks

```
result = getCheckResultStatus(ID)
```

`ID`

Check ID or cell array of check IDs.

`result`

Boolean or a cell array of Boolean values indication the pass or fail status of a check or set of checks.

Invoke this method after running a set of checks to determine whether the checks passed or failed.

“getCheckResult” on page 5-321, “getCheckResultData” on page 5-322

getGroupAll

Get all groups of checks run by Model Advisor

```
IDs = getGroupAll
```

`IDs`

Cell array of IDs of all groups of checks run by the Model Advisor.

Returns a cell array of IDs of all groups of checks run by the Model Advisor.

“getCheckAll” on page 5-320, “getTaskAll” on page 5-327

getInputParameters

Get input parameters of check

```
params = obj.getInputParameters(check_ID)
```

`params`
: A cell array of `ModelAdvisor.InputParameter` objects.

`obj`
: A variable representing the `Simulink.ModelAdvisor` object.

`check_ID`
: A character vector that uniquely identifies the check.

  You can omit the *`check_ID`* if you use the method inside a check callback function.

Returns the input parameters associated with a check.

Note This method is intended for accessing custom checks created with the Model Advisor's customization API, an optional feature available with Simulink Check software. For more information, see “Define Custom Checks” (Simulink Check).

`ModelAdvisor.InputParameter`

getListViewParameters

Get list view parameters of check

```
params = obj.getListViewParameters(check_ID)
```

`params`
: A cell array of `ModelAdvisor.ListViewParameter` objects.

`obj`
: A variable representing the `Simulink.ModelAdvisor` object.

`check_ID`
: A character vector that uniquely identifies the check.

  You can omit the *`check_ID`* if you use the method inside a check callback function.

Returns the list view parameters associated with a check.

Note This method is intended for accessing custom checks created with the Model Advisor's customization API, an optional feature available with Simulink Check software. For more information, see “Define Custom Checks” (Simulink Check).

“setListViewParameters” on page 5-336, `ModelAdvisor.ListViewParameter`

getModelAdvisor

Get Model Advisor object for system or subsystem

```
obj = Simulink.ModelAdvisor.getModelAdvisor(system)
obj = Simulink.ModelAdvisor.getModelAdvisor(system, 'new')
```

`system`

Name of model or subsystem.

`'new'`

Required when changing Model Advisor working scope from one system to another without closing the previous session. Alternatively, you can close the previous session before invoking `getModelAdvisor`, in which case `'new'` can be omitted.

`obj`

Model Advisor object.

This static method (see “Static Methods”) creates and returns an instance of `Simulink.ModelAdvisor` class for the model or subsystem specified by `system`.

getSelectedCheck

Get currently selected checks

```
IDs = getSelectedCheck
```

`IDs`

Cell array of IDs of currently selected checks.

Returns the IDs of the currently selected checks in the Model Advisor.

“getSelectedTask” on page 5-326

getSelectedSystem

Get system currently targeted by Model Advisor

```
path = getSelectedSystem
```

`path`

Path of the selected system.

Gets the path of the system currently targeted by the Model Advisor. That is, the system or subsystem most recently selected for checking either interactively by the user or programmatically via `Simulink.ModelAdisor.getModelAdvisor`.

“getModelAdvisor” on page 5-325

getSelectedTask

Get selected tasks

```
IDs = getSelectedTask
```

`IDs`

Cell array of IDs of currently selected tasks.

Returns the IDs of the currently selected tasks in the Model Advisor.

“getSelectedCheck” on page 5-325

getTaskAll

Get tasks run by Model Advisor

```
IDs = getTaskAll
```

`IDs`

Cell array of IDs of tasks run by the Model Advisor.

Returns a cell array of IDs of tasks run by the Model Advisor.

“getCheckAll” on page 5-320, “getGroupAll” on page 5-323

Simulink.ModelAdvisor.openConfigUI

Starts Model Advisor Configuration editor

```
Simulink.ModelAdvisor.openConfigUI
```

This static method starts the Model Advisor Configuration editor. Use the Model Advisor Configuration editor to create customized configurations for the Model Advisor.

Note The Model Advisor Configuration editor is an optional feature available with Simulink Check software (see “Organize Checks and Folders Using the Model Advisor Configuration Editor” (Simulink Check) for more information).

- Before starting the Model Advisor Configuration editor, ensure that the current folder is writable. If the folder is not writable, you see an error message when you start the Model Advisor Configuration editor.
- The Model Advisor Configuration editor uses the `slprj` folder in the code generation folder to store reports and other information. If the `slprj` folder does not exist in the code generation folder, the Model Advisor Configuration editor creates it. For more information, see “Model Reference Simulation Targets”.

Simulink.ModelAdvisor.reportExists

Determine whether report exists for model or subsystem

```
exists = reportexists('system')
```

`system`

Character vector specifying path of a system or subsystem.

`exists`

True (1) if a report exists for *`system`*.

This method returns true (1) if a report file exists for the model (system) or subsystem specified by *`system`* in the `slprj/modeladvisor` subfolder of the MATLAB working folder.

“exportReport” on page 5-318

runCheck

Run currently selected checks

```
success = runCheck(ID)
```

`ID`

ID or cell array of IDs of checks to run.

`success`

True (1) if the checks were run.

Runs the checks currently selected in the Model Advisor. Invoking this method is equivalent to selecting the **Run Selected Checks** button on the Model Advisor window.

“selectCheck” on page 5-329

runTask

Run currently selected tasks

```
success = runTask
```

`success`

True (1) if the tasks were run.

Runs the tasks currently selected in the Model Advisor. Invoking this method is equivalent to selecting the **Run Selected Checks** button on the Model Advisor window.

“selectTask” on page 5-331

selectCheck

Select check

```
success = selectCheck(ID)
```

`ID`

ID or cell array of IDs of checks to be selected.

`success`

True (1) if this method succeeded in selecting the specified checks.

Select the check specified by *`ID`*. This method cannot select a check that is disabled.

“selectCheckAll” on page 5-330, “selectCheckForGroup” on page 5-330, “deselectCheck” on page 5-314

selectCheckAll

Select all checks

```
success = selectCheckAll
```

`success`

True (1) if this method succeeded in selecting all checks.

Selects all checks that are not disabled.

“selectCheck” on page 5-329, “selectCheckForGroup” on page 5-330, “deselectCheck” on page 5-314

selectCheckForGroup

Select group of checks

```
success = selectCheckForGroup(ID)
```

`ID`

ID or cell array of group IDs.

`success`

True (1) if this method succeeded in selecting the specified groups

Selects the groups specified by *`ID`*.

“deselectCheckForGroup” on page 5-315

selectCheckForTask

Select checks that belong to specified task or set of tasks

```
success = selectCheckForTask(ID)
```

`ID`

ID or cell array of IDs of tasks whose checks are to be selected.

`success`

True (1) if this method succeeded in selecting the checks for the specified tasks

Selects checks belonging to the tasks specified by the *`ID`* argument.

“deselectCheckForTask” on page 5-316

selectTask

Select task

```
success = selectTask(ID)
```

ID

ID or cell array of IDs of the task to be selected.

`success`

True (1) if this method succeeds in selecting the specified tasks.

Selects a task.

“deselectTask” on page 5-316

selectTaskAll

Select all tasks

```
success = selectTaskAll
```

`success`

True (1) if this method succeeds in selecting all tasks.

Selects all tasks.

“deselectTaskAll” on page 5-317

setActionEnable

Set status for check action

```
obj.setActionEnable(value)
```

obj

A variable representing the `Simulink.ModelAdvisor` object.

`value`

Boolean value indicating whether the Action box is enabled or disabled.

- `true` — enable the Action box.
- `false` — Disable the Action box.

The `setActionEnable` method specifies the enables or disables the Action box. Only a check callback function can invoke this method.

Note This method is intended for accessing custom checks created with the Model Advisor's customization API, an optional feature available with Simulink Check software. For more information, see “Define Custom Checks” (Simulink Check).

`ModelAdvisor.Action`

setBaselineMode

Set baseline data generation mode for Model Advisor

`setBaselineMode(`*`mode`*`)`

`mode`

Boolean value indicating setting of Model Advisor's baseline mode, either on (`true`) or off (`false`).

Sets the Model Advisor's baseline mode to *`mode`*. Baseline mode causes the Model Advisor's verify methods to generate baseline comparison data for verifying the results of a Model Advisor run.

“getBaselineMode” on page 5-319, “verifyCheckResult” on page 5-338, “verifyHTML” on page 5-340

setCheckErrorSeverity

Set severity of check failure

```
obj.setCheckErrorSeverity(value)
```

obj

A variable representing the `Simulink.ModelAdvisor` object.

value

Integer indicating severity of failure.

- `0` — Check Result = Warning
- `1` — Check Result = Failed

Sets result status for a currently running check that fails to *value*. Only a check callback function can invoke this method.

Note This method is intended for accessing custom checks created with the Model Advisor's customization API, an optional feature available with Simulink Check software. For more information, see “Define Custom Checks” (Simulink Check).

“setCheckResultStatus” on page 5-336

setCheckResult

Set result for currently running check

```
success = setCheckResult(result)
```

result

Character vector or cell array that specifies the result of the currently running task.

`success`

True (1) if this method succeeds in setting the check result.

Sets the check result for the currently running check. Only the callback function of a check can invoke this method.

Note This method is intended for use with custom checks created with the Model Advisor's customization API, an optional feature available with Simulink Check software. For more information, see “Define Custom Checks” (Simulink Check).

“getCheckResult” on page 5-321, “setCheckResultData” on page 5-335, “setCheckResultStatus” on page 5-336

setCheckResultData

Set result data for currently running check

```
success = setCheckResultData(data)
```

`data`

Result data to be set.

`success`

True (1) if this method succeeds in setting the result data for the current check

Sets the check result data for the currently running check. Only the callback function of a check can invoke this method.

Note This method is intended for use with custom checks created with the Model Advisor's customization API, an optional feature available with Simulink Check software. For more information, see “Define Custom Checks” (Simulink Check).

“getCheckResultData” on page 5-322, “setCheckResult” on page 5-334, “setCheckResultStatus” on page 5-336

setCheckResultStatus

Set status for currently running check

```
success = setCheckResultStatus(status)
```

status

Boolean value that indicates the status of the check that just ran, either pass (`true`) or fail (`false`)

`success`

True (1) if the status was set.

Sets the pass or fail status for the currently running check to `status`. Only the callback function of the check can invoke this method.

Note This method is intended for use with custom checks created with the Model Advisor's customization API, an optional feature available with Simulink Check software. For more information, see “Define Custom Checks” (Simulink Check).

“getCheckResultStatus” on page 5-322, “setCheckResult” on page 5-334, “setCheckResultData” on page 5-335, “setCheckErrorSeverity” on page 5-334

setListViewParameters

Specify list view parameters for check

```
obj.setListViewParameters(check_ID, params)
```

obj

A variable representing the `Simulink.ModelAdvisor` object.

check_ID

A character vector that uniquely identifies the check.

You can omit the *check_ID* if you use the method inside a check callback function.

params

A cell array of `ModelAdvisor.ListViewParameter` objects.

Set the list view parameters for the check.

Note This method is intended for accessing custom checks created with the Model Advisor's customization API, an optional feature available with Simulink Check software. For more information, see “Define Custom Checks” (Simulink Check).

“getListViewParameters” on page 5-324, `ModelAdvisor.ListViewParameter`

verifyCheckRan

Verify that Model Advisor has run set of checks

```
[success, missingChecks, additionalChecks] = verifyCheckRan(IDs)
```

IDs

Cell array of IDs of checks to verify.

`success`

Boolean value specifying whether the checks ran.

`missingChecks`

Cell array of IDs for specified checks that did not run.

`additionalChecks`

Cell array of IDs for unspecified checks that ran.

The output variable `success` returns `true` if both:

- All the checks specified by *`IDs`* ran.
- Only the checks specified by *`IDs`* ran.

The `missingChecks` argument provides the specified checks that did not run. The `additionalChecks` argument lists unspecified checks that ran.

“verifyCheckResultStatus” on page 5-339

verifyCheckResult

Generate baseline Model Advisor check results file or compare current check results to baseline check results

```
[success message] = verifyCheckResult(baseline, checkIDs)
```

`baseline`

Path of the baseline check results MAT-file.

`checkIDs`

Cell array of check IDs.

`success`

Boolean value specifying whether the method succeeded.

`message`

Character vector specifying an error message.

If the Model Advisor is in baseline mode (see “setBaselineMode” on page 5-333), this method stores the most recent results of running the checks specified by `checkIDs` in a MAT-file at the location specified by `baseline`. If the method is unable to store the check results at the specified location, it returns `false` in the output variable `success` and the reason for the failure in the output variable `message`. If the Model Advisor is not in baseline mode, this method compares the most recent results of running the checks specified by `checkIDs` with the report specified by `baseline`. If the current results match the baseline results, this method returns`true` as the value of the `success` output variable.

Note You must run the checks specified by `checkIDs` (see “runCheck” on page 5-328) before invoking `verifyCheckResult`.

This method enables you to compare the most recent check results generated by the Model Advisor with a baseline set of check results. You can use the method to generate the baseline report as well as perform current-to-baseline result comparisons. To generate a baseline report, put the Model Advisor in baseline mode, using “setBaselineMode” on page 5-333. Then invoke this method with the baseline argument set to the location where you want to store the baseline results. To perform a current-to-baseline report comparison, first ensure that the Model Advisor is not in baseline mode (see “getBaselineMode” on page 5-319). Then invoke this method with the path of the baseline report as the value of the `baseline` input argument.

“setBaselineMode” on page 5-333, “getBaselineMode” on page 5-319, “runCheck” on page 5-328, “verifyCheckResultStatus” on page 5-339

verifyCheckResultStatus

Verify that model has passed or failed set of checks

```
[success message] = verifyCheckResultStatus(baseline, checkIDs)
```

`baseline`

Array of Boolean variables.

`checkIDs`

Cell array of check IDs.

`success`

Boolean value specifying whether the method succeeded.

`message`

Character vector specifying an error message.

This method compares the passor fail (`true` or `false`) statuses from the most recent running of the checks specified by *`checkIDs`* with the Boolean values specified by *`baseline`*. If the statuses match the baseline, this method returns `true` as the value of the `success` output variable.

Note You must run the checks specified by *`checkIDs`* (see “runCheck” on page 5-328) before invoking `verifyCheckResultStatus`.

“runCheck” on page 5-328

verifyHTML

Generate baseline Model Advisor report or compare current report to baseline report

```
[success message] = verifyHTML(baseline)
```

`baseline`

Path of a Model Advisor report.

`success`

Boolean value specifying whether the method succeeded.

`message`

Character vector specifying an error message.

If the Model Advisor is in baseline mode (see “setBaselineMode” on page 5-333), this method stores the report most recently generated by the Model Advisor at the location specified by *`baseline`*. If the method is unable to store a copy of the report at the specified location, it returns `false` in the output variable `success` and the reason for the failure in the output variable `message`. If the Model Advisor is not in baseline mode, this method compares the report most recently generated by the Model Advisor with the report specified by *`baseline`*. If the current report has exactly the same content as the baseline report, this method returns `true` as the value of the `success` output variable.

This method enables you to compare a report generated by the Model Advisor with a baseline report to determine if they differ. You can use the method to generate the baseline report as well as perform current-to-baseline report comparisons. To generate a baseline report, put the Model Advisor in baseline mode. Then invoke this method with the baseline argument set to the location where you want to store the baseline report. To perform a current-to-baseline report comparison, first ensure that the Model Advisor is not in baseline mode (see “getBaselineMode” on page 5-319). The invoke this method with the path of the baseline report as the value of the *baseline* input argument.

“setBaselineMode” on page 5-333, “getBaselineMode” on page 5-319, “verifyCheckResult” on page 5-338

Introduced in R2006a

Simulink.ModelDataLogs

Container for signal data logs of a model

Description

Note The ModelDataLogs class is supported for backwards compatibility. Starting in R2016a, you cannot log data in the ModelDataLogs format. Signal logging uses the Dataset format. In R2016a or later, when you open a model from an earlier release that had used ModelDataLogs format, the model simulated in use Dataset format.

You can convert signal logging data from ModelDataLogs to Dataset format. Converting to Dataset format makes it easier to post-process with other logged data (for example, logged states), which can also use Dataset format. For more information, see "Convert Logged Data to Dataset Format".

If you have legacy code that uses the ModelDataLogs API, you can encounter situations that require updates to your code or model. See "Migrate Scripts That Use Legacy ModelDataLogs API".

In releases before R2016a, if you set **Configuration Parameters** > **Data Import/Export** > **Signal logging format** to ModelDataLogs, Simulink software created instances of the Simulink.ModelDataLogs class to contain signal logs while simulating a model. Logging created an instance of this class for a top model and for each model referenced by the top model that contains signals to be logged. Logging assigned the ModelDataLogs object for the top model to a variable in the base workspace. The name of the variable is the name specified in the **Configuration Parameters** > **Data Import/export** > **Signal logging name** parameter. The default value is logsout.

A ModelDataLogs object has a variable number of properties. The first property, named Name, specifies the name of the model whose signal data the object contains or, if the model is a referenced model, the name of the Model block that references the model. The remaining properties reference objects that contain signal data logged during simulation of the model. The objects may be instances of any of the following types of objects:

- Simulink.ModelDataLogs

Container for the data logs of a model

- `Simulink.SubsysDataLogs`

  Container for the data logs of a subsystem

- `Simulink.Timeseries`

  Data log for any signal except a mux or bus signal

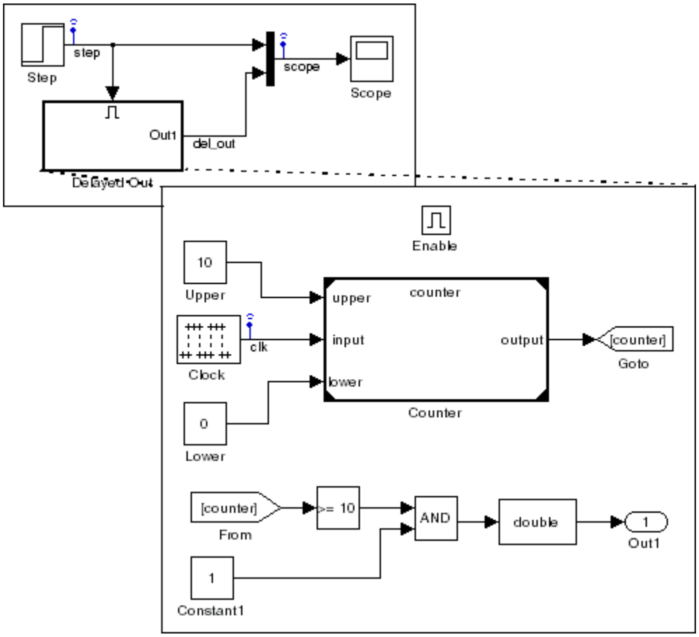
- `Simulink.TsArray`

  Data log for a mux or bus signal

The names of the properties identify the data being logged as follows:

- For signal data logs, the name of the signal
- For a subsystem or model log container, the name of the subsystem or model, respectively

Consider, for example, the following model.



As indicated by the testpoint icons, this model specifies that Simulink software should log the signals named `step` and `scope` in the root system and the signal named `clk` in the subsystem named Delayed Out. After you simulate this model in a release earlier than R2016a, the MATLAB workspace contains the following variable:

```
Simulink.ModelDataLogs (siglgex):
  Name                   elements  Simulink Class

  scope                     2      TsArray
  step                      1      Timeseries
  ('Delayed Out')           2      SubsysDataLogs
```

You can use fully qualified object names or the Simulink `unpack` command to access the signal data. For example, to access the amplitudes of the `clk` signal in the Delayed Out subsystem in a `logsout` object, enter

```
data = logsout.('Delayed Out').clk.Data;
```

or

```
>> logsout.unpack('all');
>> data = clk.Data;
```

Access Logged Signal Data Saved in ModelDataLogs Format

The `Simulink.ModelDataLogs` object contains signal data objects to capture signal logging information for specific model elements.

Model Element	**Signal Data Object**
Top-level or referenced model	`Simulink.ModelDataLogs`
Subsystem in a model	`Simulink.SubsysDataLogs`
Signal other than a bus or Mux signal	`Simulink.Timeseries`
Bus signal or Mux signal	`Simulink.TsArray`

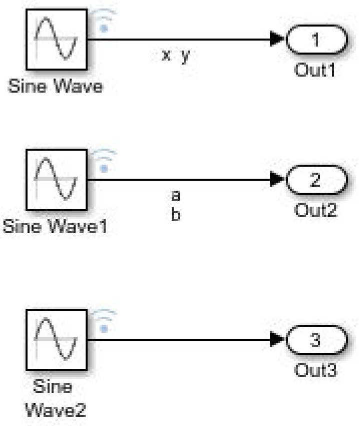
Handling Spaces and Newlines in Logged Names

Signal names in data logs can have spaces or newlines in their names when the signal:

- Is named and the name includes a space or newline character.

- Is unnamed and originates in a block whose name includes a space or newline character.
- Exists in a subsystem or referenced model, and the name of the subsystem, Model block, or of any superior block includes a space or newline character.

The following model shows a signal whose name contains a space, a signal whose name contains a newline, and an unnamed signal that originates in a block whose name contains a newline:



The following example shows how to handle spaces or new lines in logged names, if a model uses `ModelDataLogs` for the signal logging format.

```
logsout
```

```
logsout =

Simulink.ModelDataLogs (model_name):
  Name                   Elements  Simulink Class

  ('x y')                    1      Timeseries
  ('a
b')                    1      Timeseries
  ('SL_Sine
Wave1')          1      Timeseries
```

You cannot access any of the `Simulink.Timeseries` objects in this log using TAB name completion or by typing the name to MATLAB. This syntax is not recognized because the space or newline in each name appears to the MATLAB parser as a separator between identifiers. For example:

```
logsout.x y

??? logsout.x y
              |
Error: Unexpected MATLAB expression.
```

To reference a `Simulink.Timeseries` object whose name contains a space, enclose the element containing the space in single quotes:

```
logsout.('x y')

       Name: 'x y'
     BlockPath: 'model_name/Sine'
     PortIndex: 1
    SignalName: 'x y'
    ParentName: 'x y'
      TimeInfo: [1x1 Simulink.TimeInfo]
          Time: [51x1 double]
          Data: [51x1 double]
```

To reference a `Simulink.Timeseries` object whose name contains a newline, concatenate to construct the element containing the newline:

```
cr=sprintf('\n')
logsout.(['a' cr 'b'])
```

The same techniques work when a space or newline in a data log derives from the name of:

- An unnamed logged signal's originating block
- A subsystem or Model block that contains any logged signal
- Any block that is superior to such a block in the model hierarchy

This code can reference logged data for the signal:

```
logsout.(['SL_Sine' cr 'Wave1'])
```

For names with multiple spaces, newlines, or both, repeat and combine the two techniques as needed to specify the intended name to MATLAB.

Bus Signals

`ModelDataLogs` format stores each logged bus signal data in a separate `Simulink.TsArray` object.

The hierarchy of a bus signal is preserved in the logged signal data. The logged name of a signal in a virtual bus derives from the name of the source signal. The logged name of a signal in a nonvirtual bus derives from the applicable bus object, and can differ from the name of the source signal. See “Composite Signals” for information about those capabilities.

Introduced before R2006a

Simulink.SimState.ModelSimState class

Package: Simulink.SimState

Access SimState snapshot data

Description

The `Simulink.SimState.ModelSimState` class contains all of the information associated with a “snapshot” of a simulation, including the logged states, the time of the snapshot, and the start time of the simulation. To access these data for a block, use the `getBlockSimState` method or the `loggedStates` property.

Properties

`description`

Specify a description. By default, Simulink generates a character vector based on your model name.

`loggedStates`

The logged states are the continuous and discrete states of the blocks in a model. These states represent a subset of the complete simulation state (SimState) of the model.

If `loggedStates` is in `Dataset` format, you cannot assign a structure or a `Simulink.SimulationData.Dataset` object with a different number of elements than that of the `Dataset` object used for `loggedStates`.

If the `loggedStates` is in `Structure` format, you cannot assign a `Dataset` object.

Attributes:

`dependent`	`loggedStates` is obtained from the saved states of the block. `loggedStates` depends on the full state being saved in the SimState object, unlike, properties like `description`, which are independent of the save states.

`snapshotTime`

Time at which Simulink takes a “snapshot” of the complete simulation states. This data is read only.

`startTime`

Time at which the simulation starts. This data is read only.

Methods

getBlockSimState	Access SimState of individual Stateflow Chart, MATLAB Function, or S-function block
setBlockSimState	Set SimState of individual Stateflow Chart, MATLAB Function, or S-function block

Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects (MATLAB) in the MATLAB Programming Fundamentals documentation.

Simulink.ModelWorkspace

Interact with the model workspace of a model programmatically

Description

Use a `Simulink.ModelWorkspace` object to interact with a model workspace. For example, you can add and remove variables, set the data source of the workspace, and save changes to the workspace.

For more information, see “Model Workspaces”.

Creation

To create a `Simulink.ModelWorkspace`, use the `get_param` function to query the value of the model parameter `ModelWorkspace`. For example, to create an object named `mdlWks` that represents the model workspace of a model named `myModel.slx`:

```
mdlWks = get_param('myModel','ModelWorkspace')
```

Properties

`DataSource` — Source for initializing variables in model workspace

`'Model File'` (default) | `'MAT-File'` | `'MATLAB Code'` | `'MATLAB File'`

Source for initializing the variables in the model workspace, specified as one of these character vectors:

- `'Model File'` — The variables are stored in the model file. When you save the model, you also save the variables.
- `'MATLAB Code'` — The variables are created by MATLAB code that you write and store in the model file.
- `'MAT-File'` — The variables are stored in a MAT-file, which you can manage and manipulate separately from the model file.

- `'MATLAB File'` — The variables are created by MATLAB code in a script file, which you can manage and manipulate separately from the model file.

Data Types: `char`

`FileName` — Name of external file that stores or creates variables

`''` (empty character vector) (default) | character vector

Name of the external file that stores or creates variables, specified as a character vector. To enable this property, set `DataSource` to `'MAT-File'` or `'MATLAB File'`.

Example: `'myFile.mat'`

Example: `'myFile.m'`

Data Types: `char`

`MATLABCode` — MATLAB code for initializing variables

`''` (empty character vector) (default) | character vector

MATLAB code for initializing variables, specified as a character vector. To enable this property, set `DataSource` to `'MATLAB Code'`.

Example: `sprintf('%% Create variables that this model uses.\n\nK = 0.00983;\n\nP = Simulink.Parameter(5);')`

Data Types: `char`

Object Functions

getVariable	Return value of variable in the model workspace of a model
getVariablePart	Get value of variable property in model workspace
setVariablePart	Set property of variable in model workspace
hasVariable	Determine whether variable exists in the model workspace of a model
whos	Return list of variables in the model workspace of a model
saveToSource	Save model workspace changes to the external data source of the model workspace
save	Save contents of model workspace to a MAT-file
reload	Reinitialize variables from the data source of a model workspace
evalin	Evaluate expression in the model workspace of a model
clear	Clear variables from the model workspace of a model
assignin	Assign value to variable in the model workspace of a model

Examples

Interact With Model Workspace Programmatically

Create a variable in the model workspace of a model. Then, modify the variable and query the variable value to confirm the modification.

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object `mdlWks` that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp','ModelWorkspace');
```

Create a variable named `myVar` with value `5.12` in the model workspace.

```
assignin(mdlWks,'myVar',5.12)
```

Apply a new value, `7.22`. To do so, first create a temporary copy of the variable by using the `getVariable` function. Then, modify the copy and use it to overwrite the original variable in the model workspace.

```
temp = getVariable(mdlWks,'myVar');
temp = 7.22;
assignin(mdlWks,'myVar',temp)
```

Confirm the new value by querying the value of the variable.

```
getVariable(mdlWks,'myVar')
```

```
ans =

    7.2200
```

“Variables”

Introduced before R2006a

assignin

Package: Simulink

Assign value to variable in the model workspace of a model

Syntax

```
assignin(mdlWks,varName,varValue)
```

Description

`assignin(mdlWks,varName,varValue)` assigns the value `varValue` to the MATLAB variable `varName` in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`. If the variable does not exist, `assignin` creates it.

Examples

Assign Value to Variable in Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp','ModelWorkspace');
```

Create a variable named `myVar` with value `5.12` in the model workspace.

```
assignin(mdlWks,'myVar',5.12)
```

Input Arguments

`mdlWks` — Target model workspace

`Simulink.ModelWorkspace` object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

`varName` — Name of target variable

character vector

Name of the target variable, specified as a character vector.

Example: `'myVar'`

Data Types: `char`

`varValue` — Value to assign to target variable

valid value

Value to assign to the target value, specified as a valid value. For example, you can specify a literal number, a structure, or an expression that evaluates to a valid value.

If you specify the name of a handle object, such as a `Simulink.Parameter` object, use the `copy` function to create a separate copy of the object.

Example: `5.12`

Example: `struct('a',5.12,'b',7.22)`

Example: `Simulink.Parameter(5.12)`

Example: `copy(myExistingParameterObject)`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical` | `char` | `string` | `struct` | `table` | `cell` | `categorical` | `datetime` | `duration` | `calendarDuration` | `fi`
Complex Number Support: Yes

See Also

`Simulink.ModelWorkspace`

Introduced before R2006a

clear

Package: Simulink

Clear variables from the model workspace of a model

Syntax

```
clear(mdlWks)
```

Description

`clear(mdlWks)` removes all variables from the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`.

Examples

Clear Variables From Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp','ModelWorkspace');
```

Create a variable named `myVar` with value `5.12` in the model workspace.

```
assignin(mdlWks,'myVar',5.12)
```

Clear all variables from the model workspace, including `myVar`.

```
clear(mdlWks)
```

Input Arguments

`mdlWks` — Target model workspace
`Simulink.ModelWorkspace` object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

See Also

`Simulink.ModelWorkspace`

Introduced before R2006a

evalin

Package: Simulink

Evaluate expression in the model workspace of a model

Syntax

```
result = evalin(mdlWks,expression)
```

Description

`result = evalin(mdlWks,expression)` evaluates the expression `expression` in the model workspace represented by the `Simulink.ModelWorkspace` object represented by `mdlWks`. The function returns the result of the expression in `result`.

Note For setting and getting variable properties in the model workspace, consider using `setVariablePart` and `getVariablePart` instead of `evalin` because:

- The functions do not create new variables or cause unintended results.
- `getVariablePart` does not dirty the model.

For information on these alternatives, see `Simulink.ModelWorkspace`.

Examples

Evaluate Expression in Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp','ModelWorkspace');
```

Create some variables in the model workspace.

```
assignin(mdlWks,'myVar',5.12)
assignin(mdlWks,'myOtherVar',7.22)
```

Evaluate the expression `myLastVar = myVar + myOtherVar` in the model workspace. The expression creates another variable, `myLastVar`, whose value is the sum of the first two variables.

```
evalin(mdlWks,'myLastVar = myVar + myOtherVar');
```

Input Arguments

`mdlWks` — Target model workspace

`Simulink.ModelWorkspace` object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

`expression` — Expression to evaluate

character vector

Expression to evaluate, specified as a character vector.

Example: `'myLastVar = myVar + myOtherVar'`

Data Types: `char`

Output Arguments

`result` — Result of expression

number, structure, or other MATLAB value

Result of the evaluated expression, returned as a number, structure, or other MATLAB value.

See Also

`Simulink.ModelWorkspace`

Introduced before R2006a

reload

Package: Simulink

Reinitialize variables from the data source of a model workspace

Syntax

```
reload(mdlWks)
```

Description

`reload(mdlWks)` reinitializes the variables in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`. When you set the `DataSource` property of the model workspace to `'MAT-File'`, `'MATLAB File'`, or `'MATLAB Code'`, `reload` overwrites variables that exist in the model workspace by loading the associated MAT-file or by running the associated MATLAB code.

Examples

Reinitialize Variables in a Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp','ModelWorkspace');
```

Configure the model workspace to use some MATLAB code as a data source.

```
mdlWks.DataSource = 'MATLAB Code';
mdlWks.MATLABCode = sprintf('myVar = 5.12;\nmyOtherVar = 7.22;');
```

Create variables in the model workspace by executing the MATLAB code.

```
reload(mdlWks)
```

Assign new values to the variables in the model workspace.

```
assignin(mdlWks,'myVar',5.22)
assignin(mdlWks,'myOtherVar',7.33)
```

Overwrite the new values with the values specified by the MATLAB code.

```
reload(mdlWks)
```

Confirm that the variables have the values specified by the MATLAB code.

```
myVarValue = getVariable(mdlWks,'myVar')
myOtherVarValue = getVariable(mdlWks,'myOtherVar')
```

```
myVarValue =

    5.1200

myOtherVarValue =

    7.2200
```

Input Arguments

`mdlWks` — Target model workspace
`Simulink.ModelWorkspace` object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

See Also

`Simulink.ModelWorkspace`

Introduced before R2006a

save

Package: Simulink

Save contents of model workspace to a MAT-file

Syntax

```
save(mdlWks,fileName)
```

Description

`save(mdlWks,fileName)` saves the variables in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks` to the MAT-file specified by `fileName`.

When you set the `DataSource` property of the model workspace to `'MAT-File'` or `'MATLAB File'`, to save to the file that acts as the external data source of the model, use `saveToSource` instead of `save`.

Examples

Save Contents of Model Workspace to MAT-File

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp','ModelWorkspace');
```

Create some variables in the model workspace.

```
assignin(mdlWks,'myVar',5.12)
assignin(mdlWks,'myOtherVar',7.22)
```

Save the variables to a new MAT-file named `myVars.mat`.

```
save(mdlWks,'myVars.mat')
```

The MAT-file appears in your current folder.

Input Arguments

`mdlWks` — Target model workspace

`Simulink.ModelWorkspace` object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

`fileName` — Name of target MAT-file

character vector

Name of the target MAT-file, specified as a character vector.

Example: `'myFile.mat'`

Data Types: `char`

See Also

`Simulink.ModelWorkspace`

Introduced before R2006a

saveToSource

Package: Simulink

Save model workspace changes to the external data source of the model workspace

Syntax

```
saveToSource(mdlWks)
```

Description

`saveToSource(mdlWks)` saves the variables in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks` to the MAT-file or script file specified by the `FileName` property of the model workspace.

When you set the `DataSource` property of the model workspace to `'MAT-File'` or `'MATLAB File'`, the `FileName` property specifies the name of the file that acts as the external data source of the workspace. As you make changes to the variables in the model workspace, use `saveToSource` to permanently save the changes in the external data source.

Examples

Save Variables to External Data Source of Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp','ModelWorkspace');
```

Create some variables in the model workspace.

```
assignin(mdlWks,'myVar',5.12)
assignin(mdlWks,'myOtherVar',7.22)
```

Configure the model workspace to use a MAT-file named `myVars.mat` as the data source.

```
mdlWks.DataSource = 'MAT-File';
mdlWks.FileName = 'myVars.mat';
```

Save the variables to the external data source (the MAT-file).

```
saveToSource(mdlWks)
```

The file appears in your current folder.

Input Arguments

`mdlWks` — Target model workspace

`Simulink.ModelWorkspace` object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

See Also

`Simulink.ModelWorkspace`

Introduced before R2006a

whos

Package: Simulink

Return list of variables in the model workspace of a model

Syntax

```
varList = whos(mdlWks)
```

Description

`varList = whos(mdlWks)` returns a list of the variables in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`.

Examples

Return List of Variables in Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp','ModelWorkspace');
```

Create some variables in the model workspace.

```
assignin(mdlWks,'myVar',5.12)
assignin(mdlWks,'myOtherVar',7.22)
```

Display a list of the variables in the model workspace.

```
whos(mdlWks)
```

```
  Name            Size            Bytes  Class     Attributes

  myOtherVar      1x1                 8  double
  myVar           1x1                 8  double
```

Input Arguments

`mdlWks` — Target model workspace
`Simulink.ModelWorkspace` object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

Output Arguments

`varList` — List of variables
nested structure array

List of variables, returned as a nested structure array. For details about the information in the list, see `whos`.

See Also

`Simulink.ModelWorkspace`

Introduced before R2006a

getVariable

Package: Simulink

Return value of variable in the model workspace of a model

Syntax

```
varValue = getVariable(mdlWks,varName)
```

Description

`varValue = getVariable(mdlWks,varName)` returns the value of the variable whose name is `varName` that exists in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`.

If the value of the target variable is a handle to a handle object (such as `Simulink.Parameter`), `getVariable` returns a copy of the handle. Changes you make to the variable in the model workspace or to the returned variable (`variableValue`) affect both variables.

To return a deep copy of the handle object, use the `copy` method of the object. To modify a handle object that you store in a model workspace, it is a best practice to use both the `getVariable` and `assignin` methods (see “Modify Property Value of Handle Object” on page 5-371).

Examples

Return Value of Variable in Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a Simulink.ModelWorkspace object that represents the model workspace of vdp.

```
mdlWks = get_param('vdp','ModelWorkspace');
```

Create a variable named myVar in the model workspace.

```
assignin(mdlWks,'myVar',5.12)
```

Return the value of the new variable. Store the value in another variable named varValue.

```
varValue = getVariable(mdlWks,'myVar');
```

Modify Property Value of Handle Object

Modify a property of the Simulink.Parameter object K, which is defined in model mdl.slx. When you call getVariable, use the copy method because Simulink.Parameter is a handle class.

```
wksp = get_param(mdl,'ModelWorkspace');
value = copy(getVariable(wksp,'K'));
value.DataType = 'single';
assignin(wksp,'K',value);
```

Input Arguments

mdlWks — Target model workspace
Simulink.ModelWorkspace object

Target model workspace, specified as a Simulink.ModelWorkspace object.

varName — Name of target variable
character vector

Name of the target variable, specified as a character vector.

Example: 'myVariable'

Data Types: char

Output Arguments

`varValue` — Value of target variable
number, structure, or other MATLAB value

Value of the target variable, returned as a number, structure, or other MATLAB value.

See Also

`Simulink.ModelWorkspace` | `get_param`

Introduced in R2012a

getVariablePart

Package: Simulink

Get value of variable property in model workspace

Syntax

```
varValue = getVariablePart(mdlWks,varName.Property)
```

Description

`varValue = getVariablePart(mdlWks,varName.Property)` returns the value of the variable property named `varName.Property` that exists in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`.

If the value of the variable property is a handle to a handle object (such as `Simulink.Parameter`), `getVariablePart` returns a copy of the handle.

Using `getVariablePart` is preferable to using `evalin` for getting variable properties in the model workspace because:

- The function does not dirty the model.
- Use of the function does not result in the creation of a new variable or other unintended results.

Examples

Return Value of Variable Properties in Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp','ModelWorkspace');
```

Create a structure named `myStruct` with fields `a`, `b`, and `c`.

```
aStruct.a = 10;
aStruct.b = {1,2,3,4,5};
aStruct.c = Simulink.Parameter(7);
mdlWks.assignin('myStruct',aStruct);
```

Return the values of the structure fields. Store the values in `varValuea`, `varValueb`, and `varValuec`.

```
varValuea = getVariablePart(mdlWks,'myStruct.a');
varValueb = getVariablePart(mdlWks,'myStruct.b{1}');
varValueC = getVariablePart(mdlWks,'myStruct.c.Value');
```

Input Arguments

`mdlWks` — Target model workspace
`Simulink.ModelWorkspace` object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

`varName.Property` — Name of target variable property
character vector

Name of the target variable property, specified as a character vector.

Example: `'myVariable.Property'`

Data Types: `char`

Output Arguments

`varValue` — Value of variable property
number, structure, or other MATLAB value

Value of the variable property, returned as a number, structure, or other MATLAB value.

If the value of the variable property is a handle to a handle object (such as `Simulink.Parameter`), `getVariablePart` returns a copy of the handle.

See Also

`Simulink.ModelWorkspace`

Introduced in R2018b

setVariablePart

Package: Simulink

Set property of variable in model workspace

Syntax

```
varValue = setVariablePart(mdlWks,varName.Property, varValue)
```

Description

`varValue = setVariablePart(mdlWks,varName.Property, varValue)` assigns `varValue` to the MATLAB variable property `varName.Property` in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`.

Using `setVariablePart` is preferable to using `evalin` for assigning variable properties in the model workspace because the `setVariablePart` function does not create a new variable or cause unintended results.

Examples

Assign Value to Variable Properties in Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp','ModelWorkspace');
```

Create a structure named `myStruct` with fields `a`, `b`, and `c`.

```
aStruct.a = 10;
aStruct.b = {1,2,3,4,5};
aStruct.c = Simulink.Parameter(7);
mdlWks.assignin('myStruct',aStruct);
```

Assign new values to the structure fields.

```
setVariablePart(mdlWks,'myStruct.a', 2);
setVariablePart(mdlWks,'myStruct.b{1}', 2);
setVariablePart(mdlWks,'myStruct.c', Simulink.Parameter(2));
```

Return the new values of the structure fields. Store the values in `varValuea`, `varValueb`, and `varValuec`.

```
varValuea = getVariablePart(mdlWks,'myStruct.a')
varValueb = getVariablePart(mdlWks,'myStruct.b{1}')
varValueC = getVariablePart(mdlWks,'myStruct.c.Value')
```

Input Arguments

`mdlWks` — Target model workspace

`Simulink.ModelWorkspace` object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

`varName.Property` — Name of target variable property

character vector

Name of the target variable, property specified as a character vector.

Example: `'myVariable.Property'`

Data Types: `char` | `string`

`varValue` — Value to assign to variable property

valid value

Value to assign to the value property, specified as a valid value. For example, you can specify a literal number, a structure, or an expression that evaluates to a valid value.

If you specify the name of a handle object, such as a `Simulink.Parameter` object, use the `copy` function to create a separate copy of the object.

Example: `5.12`

Example: `struct('a',5.12,'b',7.22)`

Example: `Simulink.Parameter(5.12)`

Example: `copy(myExistingParameterObject)`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical` | `char` | `string` | `struct` | `table` | `cell` | `categorical` | `datetime` | `duration` | `calendarDuration` | `fi`
Complex Number Support: Yes

See Also

`Simulink.ModelWorkspace`

Introduced in R2018b

hasVariable

Package: Simulink

Determine whether variable exists in the model workspace of a model

Syntax

```
varExists = hasVariable(mdlWks,varName)
```

Description

`varExists = hasVariable(mdlWks,varName)` returns `1` if a variable whose name is `varName` exists in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`.

Examples

Determine Existence of Variable in Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp','ModelWorkspace');
```

Create a variable named `myVar` in the model workspace.

```
assignin(mdlWks,'myVar',5.12)
```

Determine whether a variable named `myVar` exists in the model workspace.

```
exists = hasVariable(mdlWks,'myVar')
exists =
   1
```

Input Arguments

`mdlWks` — Target model workspace
`Simulink.ModelWorkspace` object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

`varName` — Name of target variable
character vector

Name of the target variable, specified as a character vector.

Example: `'myVariable'`

Data Types: `char`

Output Arguments

`varExists` — Indication of existence
`1` | `0`

Indication of variable existence, returned as `1` (true) or `0`.

Introduced in R2012a

Simulink.MSFcnRunTimeBlock

Get run-time information about Level-2 MATLAB S-function block

Description

This class allows a Level-2 MATLAB S-function or other MATLAB program to obtain information from Simulink software and provide information to Simulink software about a Level-2 MATLAB S-Function block. Simulink software creates an instance of this class for each Level-2 MATLAB S-Function block in a model. Simulink software passes the object to the callback methods of Level-2 MATLAB S-functions when it updates or simulates a model, allowing the callback methods to get and provide block-related information to Simulink software. See “Write Level-2 MATLAB S-Functions” for more information.

You can also use instances of this class in MATLAB programs to obtain information about Level-2 MATLAB S-Function blocks during a simulation. See “Access Block Data During Simulation” for more information.

The Level-2 MATLAB S-function template `*matlabroot*/toolbox/simulink/blocks/msfuntmpl.m` shows how to use a number of the following methods.

Parent Class

`Simulink.RunTimeBlock`

Derived Classes

None

Property Summary

Name	Description
“AllowSignalsWithMoreThan2D” on page 5-384	enable Level-2 MATLAB S-function to use multidimensional signals.
“DialogPrmsTunable” on page 5-384	Specifies which of the S-function's dialog parameters are tunable.
“NextTimeHit” on page 5-384	Time of the next sample hit for variable sample time S-functions.

Method Summary

Name	Description
“AutoRegRuntimePrms” on page 5-385	Register this block's dialog parameters as run-time parameters.
“AutoUpdateRuntimePrms” on page 5-385	Update this block's run-time parameters.
“IsDoingConstantOutput” on page 5-385	Determine whether the current simulation stage is the constant sample time stage.
“IsMajorTimeStep” on page 5-386	Determine whether the current simulation time step is a major time step.
“IsSampleHit” on page 5-386	Determine whether the current simulation time is one at which a task handled by this block is active.
“IsSpecialSampleHit” on page 5-387	Determine whether the current simulation time is one at which multiple tasks handled by this block are active.
“RegBlockMethod” on page 5-388	Register a callback method for this block.

Name	Description
“RegisterDataTypeFxpBinaryPoint” on page 5-388	Register fixed-point data type with binary point-only scaling.
“RegisterDataTypeFxpFSlopeFixexpBias” on page 5-389	Register fixed-point data type with [Slope Bias] scaling specified in terms of fractional slope, fixed exponent, and bias.
“RegisterDataTypeFxpSlopeBias” on page 5-390	Register data type with [Slope Bias] scaling.
“SetAccelRunOnTLC” on page 5-392	Specify whether to use this block's TLC file to generate the simulation target for the model that uses it.
“SetPreCompInpPortInfoToDynamic” on page 5-392	Set precompiled attributes of this block's input ports to be inherited.
“SetPreCompOutPortInfoToDynamic” on page 5-393	Set precompiled attributes of this block's output ports to be inherited.
“SetPreCompPortInfoToDefaults” on page 5-393	Set precompiled attributes of this block's ports to the default values.
“SetSimViewingDevice” on page 5-393	Specify whether block is a viewer.
“SupportsMultipleExecInstances” on page 5-394	
“WriteRTWParam” on page 5-394	Write custom parameter information to Simulink Coder file.

Properties

AllowSignalsWithMoreThan2D

Allow Level-2 MATLAB S-functions to use multidimensional signals. You must set the `AllowSignalsWithMoreThan2D` property in the `setup` method.

Boolean

RW

DialogPrmsTunable

Specifies whether a dialog parameter of the S-function is tunable. Tunable parameters are registered as run-time parameters when you call the “AutoRegRuntimePrms” on page 5-385 method. Note that `SimOnlyTunable` parameters are not registered as run-time parameters. For example, the following lines initializes three dialog parameters where the first is tunable, the second in not tunable, and the third is tunable only during simulation.

```
block.NumDialogPrms     = 3;
block.DialogPrmsTunable = {'Tunable','Nontunable','SimOnlyTunable'};
```

array

RW

NextTimeHit

Time of the next sample hit for variable sample-time S-functions.

double

RW

Methods

AutoRegRuntimePrms

Register a block's tunable dialog parameters as run-time parameters.

```
AutoRegRuntimePrms;
```

Use in the `PostPropagationSetup` method to register this block's tunable dialog parameters as run-time parameters.

AutoUpdateRuntimePrms

Update a block's run-time parameters.

```
AutoUpdateRuntimePrms;
```

Automatically update the values of the run-time parameters during a call to `ProcessParameters`.

See the S-function *`matlabroot`*`/toolbox/simulink/simdemos/simfeatures/adapt_lms.m` in the Simulink model `sldemo_msfcn_lms` for an example.

IsDoingConstantOutput

Determine whether this is in the constant sample time stage of a simulation.

```
bVal = IsDoingConstantOutput;
```

Returns true if this is the constant sample time stage of a simulation, i.e., the stage at the beginning of a simulation where Simulink software computes the values of block outputs that cannot change during the simulation (see “Constant Sample Time”). Use this method in the Outputs method of an S-function with port-based sample times to avoid unnecessarily computing the outputs of ports that have constant sample time, i.e., [inf, 0].

```
function Outputs(block)
.
.
  if block.IsDoingConstantOutput
    ts = block.OutputPort(1).SampleTime;
    if ts(1) == Inf
    %% Compute port's output.
    end
  end
.
.
%% end of Outputs
```

See “Specifying Port-Based Sample Times” for more information.

IsMajorTimeStep

Determine whether current time step is a major or a minor time step.

```
bVal = IsMajorTimeStep;
```

Returns true if the current time step is a major time step; false, if it is a minor time step. This method can be called only from the Outputs or Update methods.

IsSampleHit

Determine whether the current simulation time is one at which a task handled by this block is active.

```
bVal = IsSampleHit(stIdx);
```

stIdx

Global index of the sample time to be queried.

Use in Outputs or Update block methods when the MATLAB S-function has multiple sample times to determine whether a sample hit has occurred at stIdx. The sample time index stIdx is a global index for the Simulink model. For example, consider a model that contains three sample rates of 0.1, 0.2, and 0.5, and a MATLAB S-function block that contains two rates of 0.2 and 0.5. In the MATLAB S-function, block.IsSampleHit(0) returns true for the rate 0.1, not the rate 0.2.

This block method is similar to ssIsSampleHit for C-MeX S-functions, however ssIsSampleHit returns values based on only the sample times contained in the S-function. For example, if the model described above contained a C-MeX S-function with sample rates of 0.2 and 0.5, ssIsSampleHit(S,0,tid) returns true for the rate of 0.2.

Use port-based sample times to avoid using the global sample time index for multi-rate systems (see Simulink.BlockPortData).

IsSpecialSampleHit

Determine whether the current simulation time is one at which multiple tasks implemented by this block are active.

```
bVal = IsSpecialSampleHit(stIdx1,stIdx1);
```

stIdx1

Index of sample time of first task to be queried.

stIdx2

Index of sample time of second task to be queried.

Use in Outputs or Update block methods to ensure the validity of data shared by multiple tasks running at different rates. Returns true if a sample hit has occurred at stIdx1 and a sample hit has also occurred at stIdx2 in the same time step (similar to ssIsSpecialSampleHit for C-Mex S-functions).

When using the IsSpecialSampleHit macro, the slower sample time must be an integer multiple of the faster sample time.

RegBlockMethod

Register a block callback method.

```
RegBlockMethod(methName, methHandle);
```

`methName`

Name of method to be registered.

`methHandle`

MATLAB function handle of the callback method to be registered.

Registers the block callback method specified by `methName` and `methHandle`. Use this method in the `setup` function of a Level-2 MATLAB S-function to specify the block callback methods that the S-function implements.

RegisterDataTypeFxpBinaryPoint

Register fixed-point data type with binary point-only scaling.

```
dtID = RegisterDataTypeFxpBinaryPoint(isSigned, wordLength,
fractionalLength, obeyDataTypeOverride);
```

`isSigned`

`true` if the data type is signed.

`false` if the data type is unsigned.

`wordLength`

Total number of bits in the data type, including any sign bit.

`fractionalLength`

Number of bits in the data type to the right of the binary point.

`obeyDataTypeOverride`

`true` indicates that the **Data Type Override** setting for the subsystem is to be obeyed. Depending on the value of **Data Type Override**, the resulting data type could be `Double`, `Single`, `ScaledDouble`, or the fixed-point data type specified by the other arguments of the function.

`false` indicates that the **Data Type Override** setting is to be ignored.

This method registers a fixed-point data type with Simulink software and returns a data type ID. The data type ID can be used to specify the data types of input and output ports, run-time parameters, and DWork states. It can also be used with all the standard data type access methods defined for instances of this class, such as “DatatypeSize” on page 5-437.

Use this function if you want to register a fixed-point data type with binary point-only scaling. Alternatively, you can use one of the other fixed-point registration functions:

- Use “RegisterDataTypeFxpFSlopeFixexpBias” on page 5-389 to register a data type with [Slope Bias] scaling by specifying the word length, fractional slope, fixed exponent, and bias.
- Use “RegisterDataTypeFxpSlopeBias” on page 5-390 to register a data type with [Slope Bias] scaling.

If the registered data type is not one of the Simulink built-in data types, a Fixed-Point Designer license is checked out.

RegisterDataTypeFxpFSlopeFixexpBias

Register fixed-point data type with [Slope Bias] scaling specified in terms of fractional slope, fixed exponent, and bias

```
dtID = RegisterDataTypeFxpFSlopeFixexpBias(isSigned, wordLength,
fractionalSlope, fixedexponent, bias, obeyDataTypeOverride);
```

`isSigned`

`true` if the data type is signed.

`false` if the data type is unsigned.

`wordLength`

Total number of bits in the data type, including any sign bit.

`fractionalSlope`

Fractional slope of the data type.

`fixedexponent`

exponent of the slope of the data type.

`bias`

Bias of the scaling of the data type.

`obeyDataTypeOverride`

`true` indicates that the **Data Type Override** setting for the subsystem is to be obeyed. Depending on the value of **Data Type Override**, the resulting data type could be `True Doubles`, `True Singles`, `ScaledDouble`, or the fixed-point data type specified by the other arguments of the function.

`false` indicates that the **Data Type Override** setting is to be ignored.

This method registers a fixed-point data type with Simulink software and returns a data type ID. The data type ID can be used to specify the data types of input and output ports, run-time parameters, and DWork states. It can also be used with all the standard data type access methods defined for instances of this class, such as “DatatypeSize” on page 5-437.

Use this function if you want to register a fixed-point data type by specifying the word length, fractional slope, fixed exponent, and bias. Alternatively, you can use one of the other fixed-point registration functions:

- Use “RegisterDataTypeFxpBinaryPoint” on page 5-388 to register a data type with binary point-only scaling.
- Use “RegisterDataTypeFxpSlopeBias” on page 5-390 to register a data type with [Slope Bias] scaling.

If the registered data type is not one of the Simulink built-in data types, a Fixed-Point Designer license is checked out.

RegisterDataTypeFxpSlopeBias

Register data type with [Slope Bias] scaling.

```
dtID = RegisterDataTypeFxpSlopeBias(isSigned, wordLength,
totalSlope, bias, obeyDataTypeOverride);
```

`isSigned`

`true` if the data type is signed.

`false` if the data type is unsigned.

`wordLength`

Total number of bits in the data type, including any sign bit.

`totalSlope`

Total slope of the scaling of the data type.

`bias`

Bias of the scaling of the data type.

`obeyDataTypeOverride`

`true` indicates that the **Data Type Override** setting for the subsystem is to be obeyed. Depending on the value of **Data Type Override**, the resulting data type could be `True Doubles`, `True Singles`, `ScaledDouble`, or the fixed-point data type specified by the other arguments of the function.

`false` indicates that the **Data Type Override** setting is to be ignored.

This method registers a fixed-point data type with Simulink software and returns a data type ID. The data type ID can be used to specify the data types of input and output ports, run-time parameters, and DWork states. It can also be used with all the standard data type access methods defined for instances of this class, such as “DatatypeSize” on page 5-437.

Use this function if you want to register a fixed-point data type with [Slope Bias] scaling. Alternatively, you can use one of the other fixed-point registration functions:

- Use “RegisterDataTypeFxpBinaryPoint” on page 5-388 to register a data type with binary point-only scaling.
- Use “RegisterDataTypeFxpFSlopeFixexpBias” on page 5-389 to register a data type by specifying the word length, fractional slope, fixed exponent, and bias

If the registered data type is not one of the Simulink built-in data types, a Fixed-Point Designer license is checked out.

SetAccelRunOnTLC

Specify whether to use block's TLC file to generate code for the Accelerator mode of Simulink software.

```
SetAccelRunOnTLC(bVal);
```

`bVal`

May be `'true'` (use TLC file) or `'false'` (run block in interpreted mode).

Specify if the block should use its TLC file to generate code that runs with the accelerator. If this option is `'false'`, the block runs in interpreted mode. See the S-function `msfcn_times_two.m` in the Simulink model `msfcndemo_timestwo` for an example.

Note The default JIT Accelerator mode does not support inlining of user-written TLC S-Functions. Please see “How Acceleration Modes Work” and “Control S-Function Execution” for more information.

SetPreCompInpPortInfoToDynamic

Set precompiled attributes of this block's input ports to be inherited.

```
SetPreCompInpPortInfoToDynamic;
```

Initialize the compiled information (dimensions, data type, complexity, and sampling mode) of this block's input ports to be inherited. See the S-function `*matlabroot*/toolbox/simulink/simdemos/simfeatures/adapt_lms.m` in the Simulink model `sldemo_msfcn_lms` for an example.

SetPreCompOutPortInfoToDynamic

Set precompiled attributes of this block's output ports to be inherited.

```
SetPreCompOutPortInfoToDynamic;
```

Initialize the compiled information (dimensions, data type, complexity, and sampling mode) of the block's output ports to be inherited. See the S-function `*matlabroot*/toolbox/simulink/simdemos/simfeatures/adapt_lms.m` in the Simulink model `sldemo_msfcn_lms` for an example.

SetPreCompPortInfoToDefaults

Set precompiled attributes of this block's ports to the default values.

```
SetPreCompPortInfoToDefaults;
```

Initialize the compiled information (dimensions, data type, complexity, and sampling mode) of the block's ports to the default values. By default, a port accepts a real scalar sampled signal with a data type of `double`.

SetSimViewingDevice

Specify whether this block is a viewer.

```
SetSimViewingDevice(bVal);
```

`bVal`

May be `'true'` (is a viewer) or `'false'` (is not a viewer).

Specify if the block is a viewer/scope. If this flag is specified, the block will be used only during simulation and automatically stubbed out in generated code.

SupportsMultipleExecInstances

Specify whether or not a For Each Subsystem supports an S-function inside of it.

```
SupportsMultipleExecInstances(bVal);
```

`bVal`

May be `'true'` (S-function is supported) or `'false'` (S-function is not supported).

Specify if an S-function can operate within a For Each Subsystem.

WriteRTWParam

Write a custom parameter to the Simulink Coder information file used for code generation.

```
WriteRTWParam(pType, pName, pVal)
```

`pType`

Type of the parameter to be written. Valid values are `'string'` and `'matrix'`.

`pName`

Name of the parameter to be written.

`pVal`

Value of the parameter to be written.

Use in the `WriteRTW` method of the MATLAB S-function to write out custom parameters. These parameters are generally settings used to determine how code should be generated in the TLC file for the S-function. See the S-function *`matlabroot`*`/toolbox/simulink/simdemos/simfeatures/adapt_lms.m` in the Simulink model `sldemo_msfcn_lms` for an example.

Introduced before R2006a

Simulink.NumericType

Specify floating-point, integer, or fixed-point data type

Description

Use a `Simulink.NumericType` object to set and share numeric data types for signal, state, and parameter data in a model.

1. Create an instance of this class in the MATLAB base workspace, a model workspace, or a data dictionary. To create a numeric type in a model workspace, you must clear the **Is alias** property.
2. Set the properties of the object to create a custom floating point, integer, or fixed point data type.
3. Assign the data type to all signals and parameters of your model that you want to conform to the data type.

Assigning a data type in this way allows you to change the data types of the signals and parameters in your model by changing the properties of the object that describe them. You do not have to change the model itself.

To rename a data type in a model and in the code that you generate from a model (by generating a `typedef` statement), you can use an object of the class `Simulink.AliasType`.

Creation

To create a `Simulink.NumericType` object interactively, use the Model Explorer:

1. On the Model Explorer **Model Hierarchy** pane, select a workspace, such as the base workspace, or a data dictionary.
2. From the Model Explorer **Add** menu, select **Simulink.NumericType**.

   The Model Explorer creates an instance of a `Simulink.NumericType` object and assigns it to a variable named `Numeric` in the target workspace.

3 Rename the variable to a more appropriate name, for example, a name that reflects its intended usage.

To change the name, edit the name displayed in the **Name** field on the Model Explorer **Contents** pane.

4 On the Model Explorer **Dialog** pane, use the **Data type mode** property to select a data type that the object represents.

To create a `Simulink.NumericType` object programmatically, use the `Simulink.NumericType` function described below.

Syntax

`typeObj = Simulink.NumericType`

Description

`typeObj = Simulink.NumericType` returns a `Simulink.NumericType` object with default property values.

Properties

`Bias` — Bias for slope and bias scaling

`0` (default) | real number

Bias for slope and bias scaling of a fixed-point data type (Fixed-Point Designer), specified as a real number.

If you use a number with a data type other than `double` to set the value, Simulink converts the value to `double`.

Corresponds to **Bias** in the property dialog box.

Example: 3

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical`

DataScope — Specification to generate or import type definition in the generated code

'Auto' (default) | 'Exported' | 'Imported'

Specification to generate or import the type definition (typedef) in the generated code (Simulink Coder), specified as 'Auto', 'Exported, or 'Imported'.

The table shows the effect of each option.

Value	Action
'Auto' (default)	If no value is specified for HeaderFile, export the type definition to *model*_types.h. *model* is the model name. If a value is specified for HeaderFile, import the data type definition from the specified header file.
'Exported'	Export the data type definition to a header file, which can be specified in the HeaderFile property. If no value is specified for HeaderFile, the header file name defaults to *type*.h. *type* is the data type name.
'Imported'	Import the data type definition from a header file, which can be specified in the HeaderFile property. If no value is specified for HeaderFile, the header file name defaults to *type*.h. *type* is the data type name.

For more information, see “Control File Placement of Custom Data Types” (Embedded Coder).

Corresponds to **Data scope** in the property dialog box.

DataTypeMode — Mode of numeric data type

'Double' (default) | 'Single' | 'Boolean' | 'Fixed-point: unspecified scaling' | 'Fixed-point: binary point scaling' | 'Fixed-point: slope and bias scaling'

Mode of the numeric data type, specified as one of these character vectors:

- 'Double' — Same as the MATLAB double type.
- 'Single' — Same as the MATLAB single type.
- 'Boolean' — Same as the MATLAB boolean type.
- 'Fixed-point: unspecified scaling' — A fixed-point data type with unspecified scaling.

- `'Fixed-point: binary point scaling'` — A fixed-point data type with binary-point scaling.
- `'Fixed-point: slope and bias scaling'` — A fixed-point data type with slope and bias scaling.

Selecting a fixed-point data type mode can, depending on the other dialog box options that you select, cause the model to run only on systems that have a Fixed-Point Designer option installed.

Corresponds to **Data type mode** in the property dialog box.

Data Types: `char`

`DataTypeOverride` — Data type override mode

`'Inherit'` (default) | `'Off'`

Data type override mode, specified as `'Inherit'` or `'Off'`.

- If you specify `'Inherit'`, the data type override setting for the context in which this numeric type is used (block, signal, Stateflow chart in Simulink) applies to this numeric type.
- If you specify `'Off'`, data type override does not apply to this numeric type.

For more information about data type override, see “Control Data Type Override”.

Corresponds to **Data type override** in the property dialog box.

Data Types: `char`

`Description` — Custom description of data type

`''` (empty character vector) (default) | character vector

Custom description of the data type, specified as a character vector.

Corresponds to **Description** in the property dialog box.

Example: `'This is a floating-point data type.'`

Data Types: `char`

`FixedExponent` — Exponent for binary point scaling

`0` (default) | real number

Exponent for binary point scaling, specified as a real number. Setting this property causes Simulink software to set the `FractionLength` and `Slope` properties accordingly, and vice versa. This property applies only if the `DataTypeMode` is `Fixed-point: binary point scaling` or `Fixed-point: slope and bias scaling`.

If you use a number with a data type other than `double` to set the value, Simulink converts the value to `double`.

This property does not appear in the property dialog box.

Example: `-8`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical`

`FractionLength` — Bit length of the fractional portion of a fixed-point number

`0` (default) | real integer

Bit length of the fractional portion of a fixed-point number (Fixed-Point Designer), specified as a real integer. This property equals `-FixedExponent`. Setting this property causes Simulink software to set the `FixedExponent` property accordingly, and vice versa.

If you use a number with a data type other than `double` to set the value, Simulink converts the value to `double`.

Corresponds to **Fraction length** in the property dialog box.

Example: 8

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical`

`HeaderFile` — Name of header file that contains type definition in the generated code

`''` (empty character vector) (default) | character vector

Name of the header file that contains the type definition (`typedef`) in the generated code, specified as a character vector.

If this property is specified, the specified name is used during code generation for importing or exporting. If this property is empty, the value defaults to *`type`*`.h` if `DataScope` equals `'Imported'` or `'Exported'`, or defaults to *`model`*`_types.h` if `DataScope` equals `'Auto'`.

By default, the generated `#include` directive uses the preprocessor delimiter `"` instead of `<` and `>`. To generate the directive `#include <myTypes.h>`, specify `HeaderFile` as `'<myTypes.h>'`.

For more information, see “Control File Placement of Custom Data Types” (Embedded Coder).

Corresponds to **Header file** in the property dialog box.

Example: `'myHdr.h'`

Example: `'myHdr'`

Example: `'myHdr.hpp'`

Data Types: `char`

`IsAlias` — Specification to create data type alias using object name

`false` (default) | `true`

Specification to create a data type alias by using the name of the object, specified as `true` (yes) or `false` (no).

If you specify `true`, the object acts as a data type alias in a similar manner to a `Simulink.AliasType` object. For more information, see “Control Data Type Names in Generated Code” (Embedded Coder).

Corresponds to **Is alias** in the property dialog box.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical`

`Signedness` — Signedness of fixed-point data type

`'Signed` (default) | `'Unsigned'` | `'Auto'`

Signedness of a fixed-point data type (Fixed-Point Designer), specified as `'Signed'` (signed), `'Unsigned'` (unsigned), or `'Auto'` (inherit signedness).

Corresponds to **Signedness** in the property dialog box.

Data Types: `char`

`Slope` — Slope for slope and bias scaling of fixed-point data type

`2^0` (default) | real number

Slope for slope and bias scaling of a fixed-point data type (Fixed-Point Designer), specified as a real number.

This property equals `SlopeAdjustmentFactor * 2^FixedExponent`. If `SlopeAdjustmentFactor` is 1.0, Simulink software displays the value of this field as `2^SlopeAdjustmentFactor`. Otherwise, it displays it as a numeric value. Setting this property causes Simulink software to set the `FixedExponent` and `SlopeAdjustmentFactor` properties accordingly, and vice versa.

If you use a number with a data type other than `double` to set the value, Simulink converts the value to `double`.

This property appears only if `DataTypeMode` is `Fixed-point: slope and bias scaling`.

Corresponds to **Slope** in the property dialog box.

Example: `5.2`

Example: `2^9`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical`

`SlopeAdjustmentFactor` — Slope for slope and bias scaling of fixed-point data type

`1` (default) | real number

Slope for slope and bias scaling of a fixed-point data type (Fixed-Point Designer), specified as a real number in the range [1, 2).

Setting this property causes Simulink software to adjust the `Slope` property accordingly, and vice versa. This property applies only if `DataTypeMode` is `Fixed-point: slope and bias scaling`.

If you use a number with a data type other than `double` to set the value, Simulink converts the value to `double`.

This property does not appear in the property dialog box.

Example: `1.7`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical`

`WordLength` — Word size of fixed-point or integer data type

16 (default) | integer

Word size of a fixed-point (Fixed-Point Designer) or integer data type, specified as an integer number of bits.

This property appears only if `DataTypeMode` is `Fixed-point`.

If you use a number with a data type other than `double` to set the value, Simulink converts the value to `double`.

Corresponds to **Word length** in the property dialog box.

Example: 8

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical`

Object Functions

isboolean	Determine whether numeric type represents the Boolean data type boolean
isdouble	Determine whether numeric type represents the double-precision, floating-point data type double
isfixed	Determine whether numeric type represents a fixed-point data type
isfloat	Determine whether numeric type represents a floating-point data type
isscalingbinarypoint	Determine whether fixed-point numeric type has binary-point scaling
isscalingslopebias	Determine whether numeric type represents a fixed-point data type with slope-and-bias scaling
isscalingunspecified	Determine whether numeric type represents a data type with unspecified scaling
issingle	Determine whether numeric type represents the single-precision, floating-point data type single

Examples

isboolean

Package: Simulink

Determine whether numeric type represents the Boolean data type `boolean`

Syntax

```
indication = isboolean(numericType)
```

Description

`indication = isboolean(numericType)` returns `1` (`true`) if the `Simulink.NumericType` object `numericType` represents the Boolean data type `boolean` and `0` (`false`) otherwise.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

Input Arguments

`numericType` — Target numeric type

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

Output Arguments

`indication` — Indication of whether target object represents boolean

`1` | `0`

Indication of whether the target object represents `boolean`, returned as `1` (`true`) or `0` (false).

See Also

isdouble

Package: Simulink

Determine whether numeric type represents the double-precision, floating-point data type `double`

Syntax

```
indication = isdouble(numericType)
```

Description

`indication = isdouble(numericType)` returns `1` (`true`) if the `Simulink.NumericType` object `numericType` represents the double-precision, floating-point data type `double` and `0` (`false`) otherwise.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

Input Arguments

`numericType` — Target numeric type

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

Output Arguments

`indication` — Indication of whether target object represents double

`1` | `0`

Indication of whether the target object represents `double`, returned as `1` (`true`) or `0` (`false`).

isfixed

Package: Simulink

Determine whether numeric type represents a fixed-point data type

Syntax

```
indication = isfixed(numericType)
```

Description

`indication = isfixed(numericType)` returns `1` (`true`) if the `Simulink.NumericType` object `numericType` represents a fixed-point data type and `0` (`false`) otherwise.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

Input Arguments

numericType — Target numeric type

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

Output Arguments

indication — Indication of whether target object represents a fixed-point type

`1` | `0`

Indication of whether the target object represents a fixed-point type, returned as `1` (`true`) or `0` (`false`).

isfloat

Package: Simulink

Determine whether numeric type represents a floating-point data type

Syntax

```
indication = isfloat(numericType)
```

Description

`indication = isfloat(numericType)` returns `1` (`true`) if the `Simulink.NumericType` object `numericType` represents a floating-point data type such as `double` or `single`, and `0` (`false`) otherwise.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

Input Arguments

`numericType` — Target numeric type

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

Output Arguments

`indication` — Indication of whether target object represents a floating-point type

`1` | `0`

Indication of whether the target object represents a floating-point type, returned as `1` (`true`) or `0` (false).

Introduced in R2010b

isscalingbinarypoint

Package: Simulink

Determine whether fixed-point numeric type has binary-point scaling

Syntax

```
indication = isscalingbinarypoint(numericType)
```

Description

`indication = isscalingbinarypoint(numericType)` returns `1` (`true`) if the `Simulink.NumericType` object `numericType` represents a fixed-point data type with binary-point scaling and `0` (`false`) otherwise. A numeric type object can use binary-point scaling if you explicitly specify it or if you specify trivial slope-and-bias scaling (the slope is an integer power of two and the bias is zero).

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

Input Arguments

`numericType` — Target numeric type
`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

Output Arguments

`indication` — Indication of whether target object represents fixed-point type with binary-point scaling
`1` | `0`

Indication of whether the target object represents a fixed-point type with binary-point scaling, returned as `1` (`true`) or `0` (`false`).

Introduced in R2010b

isscalingslopebias

Package: Simulink

Determine whether numeric type represents a fixed-point data type with slope-and-bias scaling

Syntax

```
indication = isscalingslopebias(numericType)
```

Description

`indication = isscalingslopebias(numericType)` returns `1` (`true`) if the `Simulink.NumericType` object `numericType` represents a fixed-point data type with nontrivial slope-and-bias scaling and `0` (`false`) otherwise. A slope-and-bias fixed-point type has trivial scaling if the slope is an integer power of two and the bias is zero.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

Input Arguments

`numericType` — Target numeric type
`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

Output Arguments

`indication` — Indication of whether target object represents fixed-point type with slope-and-bias scaling
`1` | `0`

Indication of whether the target object represents a fixed-point type with nontrivial slope-and-bias scaling, returned as `1` (`true`) or `0` (`false`).

Introduced in R2010b

isscalingunspecified

Package: Simulink

Determine whether numeric type represents a data type with unspecified scaling

Syntax

```
indication = isscalingunspecified(numericType)
```

Description

`indication = isscalingunspecified(numericType)` returns `1` (`true`) if the `Simulink.NumericType` object `numericType` represents a fixed-point or scaled double data type with unspecified scaling and `0` (`false`) otherwise.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

Input Arguments

`numericType` — Target numeric type
`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

Output Arguments

`indication` — Indication of whether target object represents a type with unspecified scaling
`1` | `0`

Indication of whether the target object represents a type with unspecified scaling, returned as `1` (`true`) or `0` (`false`).

Introduced in R2010b

issingle

Package: Simulink

Determine whether numeric type represents the single-precision, floating-point data type `single`

Syntax

```
indication = issingle(numericType)
```

Description

`indication = issingle(numericType)` returns `1` (`true`) if the `Simulink.NumericType` object `numericType` represents the single-precision, floating-point data type `single` and `0` (`false`) otherwise.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

Input Arguments

`numericType` — Target numeric type

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

Output Arguments

`indication` — Indication of whether target object represents `single`

`1` | `0`

Indication of whether the target object represents `single`, returned as `1` (`true`) or `0` (`false`).

Simulink.Parameter

Store, share, and configure block parameter values

Description

Create a `Simulink.Parameter` object to set the value of one or more block parameters in a model, such as the **Gain** parameter of a Gain block. You create the object in a workspace or in a data dictionary. Set the parameter value in the object, not in the block.

Use a `Simulink.Parameter` object to:

- Share a value among multiple block parameters.
- Represent an engineering constant or a tunable calibration parameter.
- Separate a parameter value from its data type.
- Configure parameter data for code generation.

The `Value` property of the object stores the parameter value. To use the object in a model, set the value of a block parameter to an expression that involves the name of the object. Omit the `Value` property from the expression. For more information, see “Use Parameter Objects”.

For more information about block parameters, see “Set Block Parameter Values” and “How Generated Code Stores Internal Signal, State, and Parameter Data” (Simulink Coder).

Creation

Create a `Simulink.Parameter` object:

- Directly from a block dialog box or the Property Inspector. See “Create, Edit, and Manage Workspace Variables”.
- By using the Model Data Editor. Inspect the **Parameters** tab.
- By using the Model Explorer. See “Create Data Objects from Built-In Data Class Package Simulink”.

- By using the `Simulink.Parameter` function, described below.

Syntax

```
paramObj = Simulink.Parameter
paramObj = Simulink.Parameter(paramValue)
```

Description

`paramObj = Simulink.Parameter` returns a `Simulink.Parameter` object with default property values.

`paramObj = Simulink.Parameter(paramValue)` returns a `Simulink.Parameter` object and initializes the value of the `Value` property by using `paramValue`.

Properties

For information about properties in the property dialog box of a `Simulink.Parameter` object, see “Simulink.Parameter Property Dialog Box”.

`CoderInfo` — Specifications for generating code for parameter object

`Simulink.CoderInfo` object

Specifications for generating code for the parameter object, returned as a `Simulink.CoderInfo` object.

This property is read only. Instead, modify the properties of the `Simulink.CoderInfo` object that this property contains.

For example, the `StorageClass` property of the `Simulink.CoderInfo` object determines how Simulink code generation toolboxes allocate memory for the parameter object in the generated code. For more information, see “Apply Storage Classes to Individual Signal, State, and Parameter Data Elements” (Simulink Coder) and “Choose Storage Class for Controlling Data Representation in Generated Code” (Embedded Coder).

`Complexity` — Numeric complexity of parameter value

`'real'` (default) | `'complex'`

Numeric complexity of the parameter value, returned as `'real'` (if the value is real) or `'complex'` (if the value is complex). Simulink determines the complexity from the parameter value that you specify in the `Value` property. This property is read only.

Data Types: `char`

DataType — Data type of parameter value

`'auto'` (default) | character vector

Data type of the parameter value that you specify in the `Value` property. When you simulate the model or generate code, Simulink casts the value to the specified data type.

If you specify `'auto'`, the default setting, the parameter object uses the same data type as the block parameters that use the object. See “Reduce Maintenance Effort with Data Type Inheritance”.

When you set the `Value` property by using something other than a `double` number, the object typically sets the `DataType` property based on the value of the `Value` property. For example, when you set the `Value` property to `int8(5)`, the object sets the value of the `DataType` property to `'int8'`.

To explicitly specify a built-in data type (see “Data Types Supported by Simulink”), specify one of these options:

- `'double'`
- `'single'`
- `'int8'`
- `'uint8'`
- `'int16'`
- `'uint16'`
- `'int32'`
- `'uint32'`
- `'boolean'`

To specify a fixed-point data type, use the `fixdt` function. For example, specify `'fixdt(1,16,5)'`.

If you use a `Simulink.AliasType` or `Simulink.NumericType` object to create and share custom data types in your model, specify the name of the object.

To specify an enumerated data type, use the name of the type preceded by `Enum:`. For example, specify `'Enum: myEnumType'`.

When you store a structure or array of structures in the `Value` property of the object, the object sets the `DataType` property to `'struct'`. To specify a `Simulink.Bus` object as the data type, use the name of the bus object preceded by `Bus:`. For example, specify `'Bus: myBusObject'`.

Example: `'auto'`

Example: `'int8'`

Example: `'fixdt(1,16,5)'`

Example: `'myAliasTypeObject'`

Example: `'Enum: myEnumType'`

Example: `'Bus: myBusObject'`

Data Types: `char`

`Description` — Custom description of parameter object

`''` (empty character vector) (default) | character vector

Custom description of the parameter object, specified as a character vector. Use this property to document the significance that the parameter object has in your algorithm.

If you have Embedded Coder, you can configure this description to appear in the generated code as a comment. See “Simulink data object descriptions” (Simulink Coder).

Example: `'This parameter represents the maximum rotation speed of the engine.'`

Data Types: `char`

`Dimensions` — Dimensions of parameter value

`[0 0]` (default) | row vector | character vector

Dimensions of the value stored in the `Value` property, returned as a row vector or specified as a character vector.

When you set the `Value` property of the object, the object sets the value of the `Dimensions` property to a `double` row vector. The vector is the same vector that the `size` function returns.

To use symbolic dimensions, specify a character vector. See “Implement Dimension Variants for Array Sizes in Generated Code” (Embedded Coder).

Example: `[1 3]`

Example: `'[1 myDimParam]'`

Data Types: `double` | `char`

`Max` — Maximum value of parameter

`[]` (empty) (default) | real `double` scalar

Maximum value that the `Value` property of the object can store, specified as a real `double` scalar.

The default value is `[]` (empty), which means the parameter value does not have a maximum.

If you store a complex number in the `Value` property, the `Max` property applies separately to the real and imaginary parts.

If you store a structure in the `Value` property, the object ignores the `Max` property. Instead, use a `Simulink.Bus` object as the data type of the parameter object, and specify a maximum value for each field by using the elements of the bus object. See “Control Field Data Types and Characteristics by Creating Parameter Object”.

If the parameter value is greater than the maximum value or if the maximum value is outside the range of the object data type, Simulink generates a warning. When updating the diagram or starting a simulation, Simulink generates an error.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

Example: `5.32`

Data Types: `double`

`Min` — Minimum value of parameter

`[]` (empty) (default) | real `double` scalar

Minimum value that the `Value` property of the object can store, specified as a real `double` scalar.

The default value is `[]` (empty), which means the parameter value does not have a minimum.

If you store a complex number in the Value property, the Min property applies separately to the real and imaginary parts.

If you store a structure in the Value property, the object ignores the Min property. Instead, use a Simulink.Bus object as the data type of the parameter object, and specify a minimum value for each field by using the elements of the bus object. See “Control Field Data Types and Characteristics by Creating Parameter Object”.

If the parameter value is less than the minimum value or if the minimum value is outside the range of the object data type, Simulink generates a warning. When updating the diagram or starting a simulation, Simulink generates an error.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”

Example: -0.92

Data Types: double

Unit — Physical unit of parameter value

empty (default) | valid unit

Physical unit of parameter value, specified as a character vector. For more information, see “Unit Specification in Simulink Models”.

Example: 'degC'

Data Types: char

Value — Value to use in target block parameters

[] (default) | valid value

Value to use in target block parameters, specified as any of these valid values:

- Numeric value
- Boolean value
- Instance of enumerated type
- Structure
- Scalar or array
- Mathematical expression (see “Set Variable Value by Using a Mathematical Expression”)

You can use MATLAB syntax to specify the value.

Example Expression	Description
`15.23`	Specifies a scalar value
`[3 4; 9 8]`	Specifies a matrix
`3+2i`	Specifies a complex value
`struct('A',20,'B',5)`	Specifies a structure with two fields, `A` and `B`, with double-precision values `20` and `5`. Organize block parameters into structures (see "Organize Related Block Parameter Definitions in Structures") or initialize the signal elements in a bus (see "Specify Initial Conditions for Bus Signals").
`slexpr('myVar + myOtherVar')`	Specifies the expression `myVar + myOtherVar` where `myVar` and `myOtherVar` are other MATLAB variables or parameter objects. Simulink preserves this mathematical relationship between the object and the variables.

To use a `Simulink.Parameter` object to store a value of a particular numeric data type, specify the ideal value with the `Value` property, and control the type with the `DataType` property.

If you set the `Value` property by using a typed expression such as `single(32.5)`, the `DataType` property changes to reflect the new type. A best practice is using an expression that is not typed. You can avoid accumulating numerical error through repeated quantizations or data type saturation, especially for fixed-point data types.

Example: `3.15`

Example: `single([3.15 1.23])`

Example: `1.2 + 3.2i`

Example: `true`

Example: `myEnumType.myEnumValue`

Example: `struct('field1',15,'field2',7.32)`

Example: `slexpr('myVar + myOtherVar')`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical` | `struct` | `fi`

Complex Number Support: Yes

Examples

Use Parameter Object to Set Value of Gain Parameter

1. At the command prompt, create a `Simulink.Parameter` object.

   ```
   myParam = Simulink.Parameter;
   ```
2. Assign a numeric value to the `Value` property.

   ```
   myParam.Value = 15.23;
   ```
3. Specify other characteristics for the block parameter by adjusting the object properties. For example, to specify the minimum and maximum values the parameter can take, use the `Min` and `Max` properties.

   ```
   myParam.Min = 10.11;
   myParam.Max = 25.27;
   ```
4. In a block dialog box, specify the value of a parameter as `myParam`. For example, in a Gain block dialog box, specify **Gain** as `myParam`.

   During simulation, the **Gain** parameter uses the value `15.23`.

Change Value Stored by Parameter Object

1. At the command prompt, create a `Simulink.Parameter` object that stores the value `2.52`.

   ```
   myParam = Simulink.Parameter(2.52);
   ```
2. Change the value by accessing the `Value` property of the object. This technique preserves the values of the other properties of the object.

   ```
   myParam.Value = 1.13;
   ```

Create Parameter Object with Specific Numeric Data Type

To reduce model maintenance, you can leave the DataType property at its default value, auto. The parameter object acquires a data type from the block parameter that uses the object.

To reduce the risk of the data type changing when you make changes to signal data types and other data types in your model, you can explicitly specify a data type for the parameter object. For example, when you generate code that exports parameter data to your custom code, explicitly specify a data type for the object.

1. At the command prompt, create a Simulink.Parameter object that stores the value 18.25.

   ```
   myParam = Simulink.Parameter(18.25);
   ```

   The expression 18.25 returns the number 18.25 with the double-precision, floating-point data type double. The Value property stores the number 18.25 with double precision.
2. Use the DataType property to specify the single-precision data type single.

   ```
   myParam.DataType = 'single';
   ```

   When you simulate or generate code, the parameter object casts the value of the Value property, 18.25, to the data type specified by the DataType property, single.

Set Parameter Value to a Mathematical Expression

This example shows how to set the value of a parameter object, myParam, to the sum of two other variables, myVar and myOtherVar. With this technique, when you change the values of the independent variables, Simulink immediately calculates the new value of the parameter object.

1. Create the two independent variables.

   ```
   myVar = 5.2;
   myOtherVar = 9.8;
   ```
2. Create the parameter object.

   ```
   myParam = Simulink.Parameter;
   ```

3 Set the value of the parameter object to the expression `myVar + myOtherVar`.

```
myParam.Value = slexpr('myVar + myOtherVar')
```

Simulink.RunTimeBlock

Allow Level-2 MATLAB S-function and other MATLAB programs to get information about block while simulation is running

Description

This class allows a Level-2 MATLAB S-function or other MATLAB program to obtain information about a block. Simulink software creates an instance of this class or a derived class for each block in a model. Simulink software passes the object to the callback methods of Level-2 MATLAB S-functions when it updates or simulates a model, allowing the callback methods to get block-related information from and provide such information to Simulink software. See "Write Level-2 MATLAB S-Functions" in Writing S-Functions for more information. You can also use instances of this class in MATLAB programs to obtain information about blocks during a simulation. See "Access Block Data During Simulation" for more information.

Note `Simulink.RunTimeBlock` objects do not support MATLAB sparse matrices. For example, the following line of code attempts to assign a sparse identity matrix to the run-time object's output port data. This line of code in a Level-2 MATLAB S-function produces an error:

```
block.Outport(1).Data = speye(10);
```

Parent Class

None

Derived Classes

`Simulink.MSFcnRunTimeBlock`

Property Summary

Name	Description
“BlockHandle” on page 5-433	Block's handle.

RW
```

```
ssGetNumOutputPorts
```

NumContStates

Number of continuous states.

```
RW
```

```
ssGetNumContStates
```

NumDworkDiscStates

Number of discrete states. In a MATLAB S-function, you need to use DWorks to set up discrete states.

```
RW
```

```
ssGetNumDiscStates
```

NumDialogPrms

Number of parameters declared on the block's dialog. In the case of the S-function, it returns the number of parameters listed as a comma-separated list in the **S-function parameters** dialog field.

`RW`

`ssGetNumSFcnParams`

NumInputPorts

Number of input ports.

`RW`

`ssGetNumInputPorts`

NumRuntimePrms

Number of run-time parameters used by this block. See “Create and Update S-Function Run-Time Parameters” for more information.

`RW`

`ssGetNumSFcnParams`

SampleTimes

Block's sample times.

`RW` for MATLAB S-functions, `RO` for all other blocks.

Methods

ContStates

Get a block's continuous states.

```
states = ContStates();
```

Get vector of continuous states.

```
ssGetContStates
```

DataTypeIsFixedPoint

Determine whether a data type is fixed point.

```
bVal = DataTypeIsFixedPoint(dtID);
```

`dtID`
: Integer value specifying the ID of a data type.

Returns `true` if the specified data type is a fixed-point data type.

DatatypeName

Get the name of a data type.

```
name = DatatypeName(dtID);
```

`dtID`

Integer value specifying ID of a data type.

Returns the name of the data type specified by `dtID`.

“DatatypeSize” on page 5-437

DatatypeSize

Get the size of a data type.

```
size = DatatypeSize(dtID);
```

`dtID`

Integer value specifying the ID of a data type.

Returns the size of the data type specified by `dtID`.

“DatatypeName” on page 5-436

Derivatives

Get derivatives of a block's continuous states.

```
derivs = Derivatives();
```

Get vector of state derivatives.

```
ssGetdX
```

DialogPrm

Get an S-function's dialog parameters.

```
param = DialogPrm(pIdx);
```

`pIdx`

Integer value specifying the index of the parameter to be returned.

Get the specified dialog parameter. In the case of the S-function, each `DialogPrm` corresponds to one of the elements in the comma-separated list of parameters in the **S-function parameters** dialog field.

`ssGetSFcnParam`, “RuntimePrm” on page 5-440

Dwork

Get one of a block's DWork vectors.

```
dworkObj = Dwork(dwIdx);
```

`dwIdx`

Integer value specifying the index of a work vector.

Get information about the DWork vector specified by `dwIdx` where `dwIdx` is the index number of the work vector. This method returns an object of type `Simulink.BlockCompDworkData`.

`ssGetDWork`

FixedPointNumericType

Get the properties of a fixed-point data type.

```
eno = FixedPointNumericType(dtID);
```

`dtID`

Integer value specifying the ID of a fixed-point data type.

Returns an object of `embedded.Numeric` class that contains the attributes of the specified fixed-point data type.

Note `embedded.Numeric` is also the class of the `numerictype` objects created by Fixed-Point Designer software. For information on the properties defined by `embedded.Numeric` class, see "numerictype Object Properties" (Fixed-Point Designer).

InputPort

Get an input port of a block.

```
port = InputPort(pIdx);
```

`pIdx`

Integer value specifying the index of an input port.

Get the input port specified by `pIdx`, where `pIdx` is the index number of the input port. For example,

```
port = rto.InputPort(1)
```

returns the first input port of the block represented by the run-time object `rto`.

This method returns an object of type `Simulink.BlockPreCompInputPortData` or `Simulink.BlockCompInputPortData`, depending on whether the model that contains the port is uncompiled or compiled. You can use this object to get and set the input port's uncompiled or compiled properties, respectively.

`ssGetInputPortSignalPtrs`, `Simulink.BlockPreCompInputPortData`, `Simulink.BlockCompInputPortData`, “OutputPort” on page 5-440

OutputPort

Get an output port of a block.

```
port = OutputPort(pIdx);
```

`pIdx`

Integer value specifying the index of an output port.

Get the output port specified by `pIdx`, where `pIdx` is the index number of the output port. For example,

```
port = rto.OutputPort(1)
```

returns the first output port of the block represented by the run-time object `rto`.

This method returns an object of type `Simulink.BlockPreCompOutputPortData` or `Simulink.BlockCompOutputPortData`, depending on whether the model that contains the port is uncompiled or compiled, respectively. You can use this object to get and set the output port's uncompiled or compiled properties, respectively.

`ssGetInputPortSignalPtrs`, `Simulink.BlockPreCompOutputPortData`, `Simulink.BlockCompOutputPortData`

RuntimePrm

Get an S-function's run-time parameters.

```
param = RuntimePrm(pIdx);
```

`pIdx`

Integer value specifying the index of a run-time parameter.

Get the run-time parameter whose index is `pIdx`. This run-time parameter is a Simulink.BlockData on page 5-198 object of type Simulink.BlockRunTimePrmData.

`ssGetRunTimeParamInfo`

Introduced before R2006a

Simulink.SampleTime class

Package: Simulink

Object containing sample time information

Description

The `SampleTime` class represents the sample time information associated with an individual sample time.

Use the methods `Simulink.Block.getSampleTimes` and `Simulink.BlockDiagram.getSampleTimes` to retrieve the values of the `SampleTime` properties for a block and for a block diagram, respectively.

Properties

`Value`

A two-element array of doubles that contains the period and offset of the sample time

`Description`

A 1x*n* character array that describes the sample time type

`ColorRGBValue`

A 1x3 array of doubles that contains the red, green and blue (RGB) values of the sample time color

`Annotation`

A 1x*n* character array that represents the annotation of a specific sample time (for example, 'D1')

OwnerBlock

For asynchronous and variable sample times, `OwnerBlock` is a character vector containing the full path to the block that controls the sample time. For all other types of sample times, it is an empty character vector.

ComponentSampleTimes

If the sample time is an async union or if the sample time is hybrid and the component sample times are available, then the array ComponentSampleTimes contains Simulink.SampleTime objects.

Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects (MATLAB) in the MATLAB Programming Fundamentals documentation.

Examples

Retrieve the sample time information for the 'vdp' model.

```
ts = Simulink.BlockDiagram.getSampleTimes('vdp')
```

Simulink returns:

```
ts =

  1x2 Simulink.SampleTime
  Package: Simulink

  Properties:
    Value
    Description
    ColorRGBValue
    Annotation
    OwnerBlock
    ComponentSampleTimes

  Methods
```

To examine the values of the properties:

```
ts(1), ts(2)

ans =

  Simulink.SampleTime
  Package: Simulink

  Properties:
                   Value: [0 0]
             Description: 'Continuous'
           ColorRGBValue: [0 0 0]
              Annotation: 'Cont'
              OwnerBlock: []
    ComponentSampleTimes: {}

  Methods

ans =

  Simulink.SampleTime
  Package: Simulink

  Properties:
                   Value: [Inf 0]
             Description: 'Constant'
           ColorRGBValue: [1 0.2600 0.8200]
              Annotation: 'Inf'
              OwnerBlock: []
    ComponentSampleTimes: {}

  Methods
```

Simulink.Block.getSampleTimes | Simulink.BlockDiagram.getSampleTimes

Simulink.sdi.CustomSnapshot class

Package: Simulink.sdi

Specify settings for a snapshot without opening or affecting the Simulation Data Inspector

Description

Use a `Simulink.sdi.CustomSnapshot` object to specify settings for a snapshot you want to create without opening the Simulation Data Inspector or affecting the open session. Creating a snapshot using a `Simulink.sdi.CustomSnapshot` object is the best option for fully scripted workflows. You can specify the snapshot dimensions in pixels, the subplot layout, and limits for the *x*- and *y*- axes. You can use the `clearSignals` and `plotOnSubplot` methods to plot signals you want to include in the snapshot. To capture the snapshot, you can pass the `Simulink.sdi.CustomSnapshot` object as the value for the `settings` name-value pair for the `Simulink.sdi.snapshot` function or use the `snapshot` method.

Construction

`snap = Simulink.sdi.CustomSnapshot` creates a `Simulink.sdi.CustomSnapshot` object.

Properties

`Width` — Image width
`600` (default) | scalar

Image width, in pixels.

Example: `750`

`Height` — Image height
`400` (default) | scalar

Image height, in pixels.

Example: `500`

Rows — Number of subplot rows

`1` (default) | scalar

Number of subplot rows, specified as a scalar between `1` and `8`, inclusive. Use `Rows` and `Columns` to set your desired subplot layout.

Example: `2`

`Columns` — Number of subplot columns

`1` (default) | scalar

Number of subplot columns, specified as a scalar between `1` and `8`, inclusive. Use `Rows` and `Columns` to set your desired subplot layout.

Example: `3`

`TimeSpan` — X-axis limits

`2x1` matrix

Limits for the time axis in the snapshot. The time axis limits are the same for all subplots. By default, the time axis adjusts to accommodate the largest time range of the plotted signals.

Example: `[0 20]`

YRange — Y-axis limits

cell array

Cell array of 1-by-2 matrices specifying the *y*-axis limits for all subplots in the custom snapshot. By default, `YRange` is `[-3 3]` for all subplots.

Example: `{[-10 10],[0 100]}`

Methods

clearSignals	Clear signals plotted on subplots of a `Simulink.sdi.CustomSnapshot` object
plotOnSubPlot	Plot signals on `Simulink.sdi.CustomSnapshot` object subplots
snapshot	Create a custom snapshot

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Copy View Settings to a Run

This example shows how to copy the view settings for aligned signals from one run to another.

Simulate Your Model and get Run Object

Simulate the `vdp` model to create a run of data to visualize.

```
load_system('vdp')
set_param('vdp','SaveFormat','Dataset','SaveOutput','on')
sim('vdp')

runIndex = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(runIndex);
vdpRun = Simulink.sdi.getRun(runID);
```

Modify View Settings for Signals

Use the `Simulink.sdi.Run` object to access the signals in the run. Then, modify the signals' view settings, and plot them in the Simulation Data Inspector. Open the Simulation Data Inspector and use `Simulink.sdi.snapshot` to view the results.

```
sig1 = vdpRun.getSignalByIndex(1);
sig2 = vdpRun.getSignalByIndex(2);

sig1.LineColor = [0 0 1];
sig1.LineDashed = '-.';

sig2.LineColor = [1 0 0];
sig2.LineDashed = ':';
```

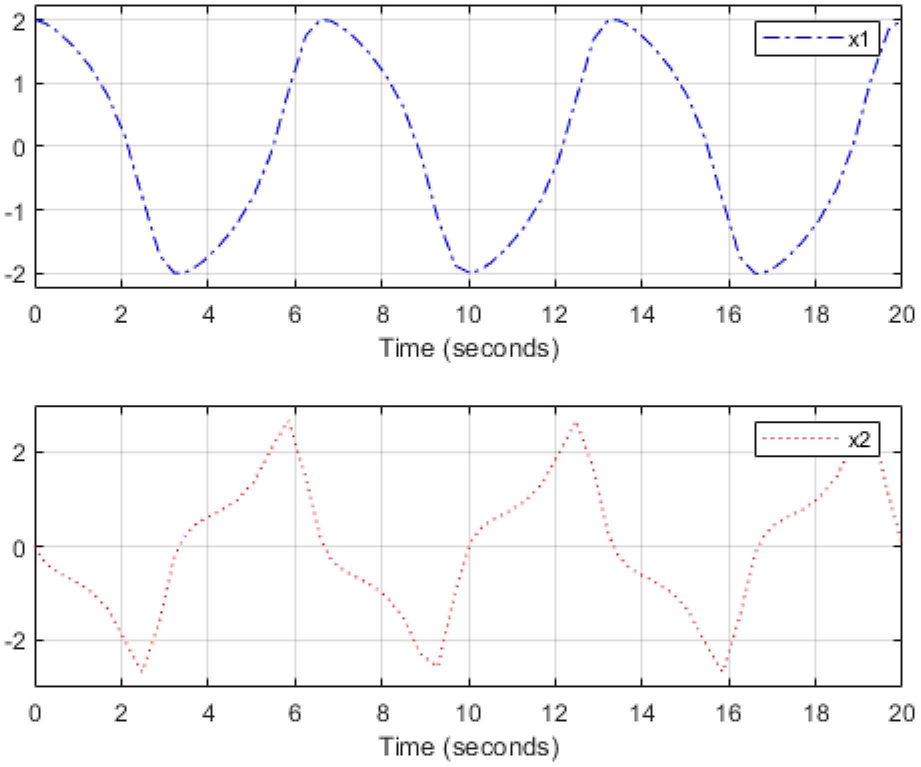
Capture a Snapshot from the Simulation Data Inspector

Create a `Simulink.sdi.CustomSnapshot` object and use the `Simulink.sdi.snapshot` function to programmatically capture a snapshot of the contents of the Simulation Data Inspector.

```
snap = Simulink.sdi.CustomSnapshot;

snap.Rows = 2;
snap.YRange = {[-2.25 2.25],[-3 3]};
snap.plotOnSubPlot(1,1,sig1,true)
snap.plotOnSubPlot(2,1,sig2,true)

fig = Simulink.sdi.snapshot("from","custom","to","figure","settings",snap);
```



Copy the View Settings to a New Simulation Run

Simulate the model again, with a different Mu value. Then, visualize the new run by copying the view settings from the first run. Specify the plot input as true to plot the signals from the new run.

```
set_param('vdp/Mu','Gain','5')
sim('vdp')

runIndex2 = Simulink.sdi.getRunCount;
runID2 = Simulink.sdi.getRunIDByIndex(runIndex2);
run2 = Simulink.sdi.getRun(runID2);

sigIDs = Simulink.sdi.copyRunViewSettings(runID,runID2,true);
```

Capture a Snapshot of the New Simulation Run

Use the Simulink.sdi.CustomSnapshot object to capture a snapshot of the new simulation run. First, clear the signals from the subplots. Then, plot the signals from the new run and capture another snapshot.

```
snap.clearSignals
snap.YRange = {[-2.25 2.25],[-8 8]};
snap.plotOnSubPlot(1,1,sigIDs(1),true)
snap.plotOnSubPlot(2,1,sigIDs(2),true)

fig = snap.snapshot("to","figure");
```

clearSignals

Class: Simulink.sdi.CustomSnapshot
Package: Simulink.sdi

Clear signals plotted on subplots of a `Simulink.sdi.CustomSnapshot` object

Syntax

```
snap.clearSignals
```

Description

`snap.clearSignals` clears plotted signals from all subplots in the `Simulink.sdi.CustomSnapshot` object, `snap`. Using the `clearSignals` method does not affect any subplots or signals in your open Simulation Data Inspector session.

Examples

Copy View Settings to a Run

This example shows how to copy the view settings for aligned signals from one run to another.

Simulate Your Model and get Run Object

Simulate the `vdp` model to create a run of data to visualize.

```
load_system('vdp')
set_param('vdp','SaveFormat','Dataset','SaveOutput','on')
sim('vdp')

runIndex = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(runIndex);
vdpRun = Simulink.sdi.getRun(runID);
```

Modify View Settings for Signals

Use the Simulink.sdi.Run object to access the signals in the run. Then, modify the signals' view settings, and plot them in the Simulation Data Inspector. Open the Simulation Data Inspector and use Simulink.sdi.snapshot to view the results.

```
sig1 = vdpRun.getSignalByIndex(1);
sig2 = vdpRun.getSignalByIndex(2);

sig1.LineColor = [0 0 1];
sig1.LineDashed = '-.';

sig2.LineColor = [1 0 0];
sig2.LineDashed = ':';
```

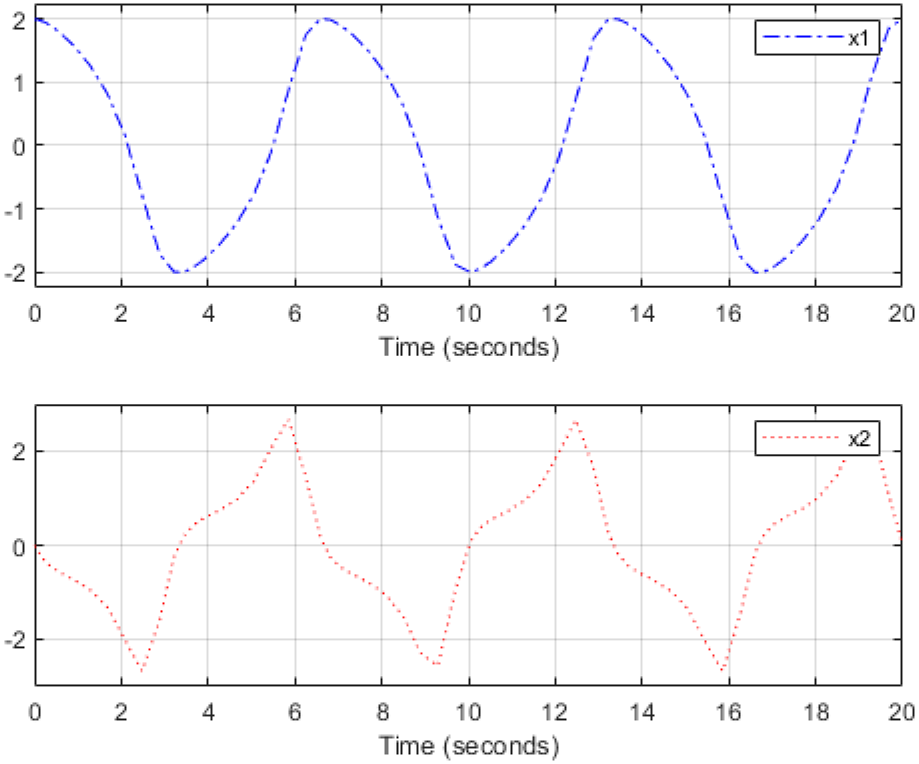
Capture a Snapshot from the Simulation Data Inspector

Create a Simulink.sdi.CustomSnapshot object and use the Simulink.sdi.snapshot function to programmatically capture a snapshot of the contents of the Simulation Data Inspector.

```
snap = Simulink.sdi.CustomSnapshot;

snap.Rows = 2;
snap.YRange = {[-2.25 2.25],[-3 3]};
snap.plotOnSubPlot(1,1,sig1,true)
snap.plotOnSubPlot(2,1,sig2,true)

fig = Simulink.sdi.snapshot("from","custom","to","figure","settings",snap);
```



Copy the View Settings to a New Simulation Run

Simulate the model again, with a different `Mu` value. Then, visualize the new run by copying the view settings from the first run. Specify the `plot` input as `true` to plot the signals from the new run.

```
set_param('vdp/Mu','Gain','5')
sim('vdp')

runIndex2 = Simulink.sdi.getRunCount;
runID2 = Simulink.sdi.getRunIDByIndex(runIndex2);
run2 = Simulink.sdi.getRun(runID2);

sigIDs = Simulink.sdi.copyRunViewSettings(runID,runID2,true);
```

Capture a Snapshot of the New Simulation Run

Use the `Simulink.sdi.CustomSnapshot` object to capture a snapshot of the new simulation run. First, clear the signals from the subplots. Then, plot the signals from the new run and capture another snapshot.

```
snap.clearSignals
snap.YRange = {[-2.25 2.25],[-8 8]};
snap.plotOnSubPlot(1,1,sigIDs(1),true)
snap.plotOnSubPlot(2,1,sigIDs(2),true)

fig = snap.snapshot("to","figure");
```

"Create Plots Using the Simulation Data Inspector"

Introduced in R2018a

plotOnSubPlot

Class: Simulink.sdi.CustomSnapshot
Package: Simulink.sdi

Plot signals on `Simulink.sdi.CustomSnapshot` object subplots

Syntax

```
snap.plotOnSubPlot(row,column,signal,plot)
```

Description

`snap.plotOnSubPlot(row,column,signal,plot)` plots the `signal` on the subplot in the `Simulink.sdi.CustomSnapshot` object, `snap`, specified by `row` and `column` when `plot` is `true`. When `plot` is `false`, `plotOnSubPlot` clears the `signal` from the subplot.

Input Arguments

`row` — Subplot row

scalar

Row for subplot on which you want to plot a signal. Specify `row` as a value from 1 through 8, inclusive.

Example: 2

`column` — Subplot column

scalar

Column for subplot on which you want to plot a signal. Specify `column` as a value from 1 through 8, inclusive.

Example: 3

signal — Signal to plot
Simulink.sdi.Signal | signal ID

Signal ID or Simulink.sdi.Signal object corresponding to the signal you want to plot.

Example: sigID

plot — Plot indicator
logical

Logical indicator of whether to plot or clear the signal from the subplot.

- true – Plot the signal.
- false – Clear the signal.

Example: true

Data Types: logical

Examples

Copy View Settings to a Run

This example shows how to copy the view settings for aligned signals from one run to another.

Simulate Your Model and get Run Object

Simulate the vdp model to create a run of data to visualize.

```
load_system('vdp')
set_param('vdp','SaveFormat','Dataset','SaveOutput','on')
sim('vdp')

runIndex = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(runIndex);
vdpRun = Simulink.sdi.getRun(runID);
```

Modify View Settings for Signals

Use the Simulink.sdi.Run object to access the signals in the run. Then, modify the signals' view settings, and plot them in the Simulation Data Inspector. Open the Simulation Data Inspector and use Simulink.sdi.snapshot to view the results.

```
sig1 = vdpRun.getSignalByIndex(1);
sig2 = vdpRun.getSignalByIndex(2);

sig1.LineColor = [0 0 1];
sig1.LineDashed = '-.';

sig2.LineColor = [1 0 0];
sig2.LineDashed = ':';
```

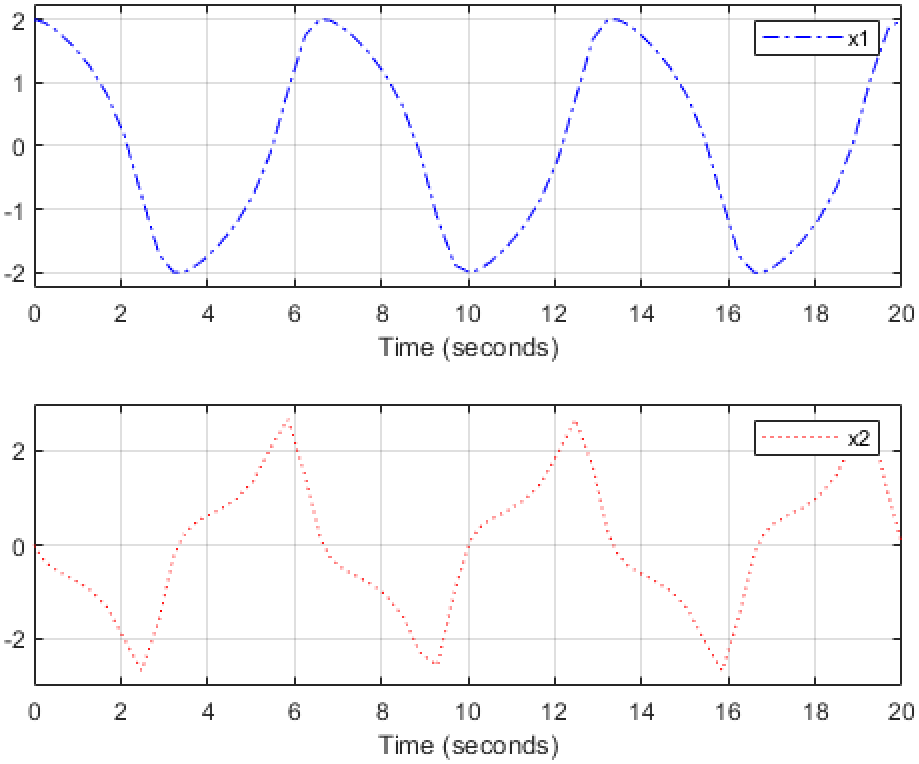
Capture a Snapshot from the Simulation Data Inspector

Create a `Simulink.sdi.CustomSnapshot` object and use the `Simulink.sdi.snapshot` function to programmatically capture a snapshot of the contents of the Simulation Data Inspector.

```
snap = Simulink.sdi.CustomSnapshot;

snap.Rows = 2;
snap.YRange = {[-2.25 2.25],[-3 3]};
snap.plotOnSubPlot(1,1,sig1,true)
snap.plotOnSubPlot(2,1,sig2,true)

fig = Simulink.sdi.snapshot("from","custom","to","figure","settings",snap);
```



Copy the View Settings to a New Simulation Run

Simulate the model again, with a different `Mu` value. Then, visualize the new run by copying the view settings from the first run. Specify the `plot` input as `true` to plot the signals from the new run.

```
set_param('vdp/Mu','Gain','5')
sim('vdp')

runIndex2 = Simulink.sdi.getRunCount;
runID2 = Simulink.sdi.getRunIDByIndex(runIndex2);
run2 = Simulink.sdi.getRun(runID2);

sigIDs = Simulink.sdi.copyRunViewSettings(runID,runID2,true);
```

Capture a Snapshot of the New Simulation Run

Use the `Simulink.sdi.CustomSnapshot` object to capture a snapshot of the new simulation run. First, clear the signals from the subplots. Then, plot the signals from the new run and capture another snapshot.

```
snap.clearSignals
snap.YRange = {[-2.25 2.25],[-8 8]};
snap.plotOnSubPlot(1,1,sigIDs(1),true)
snap.plotOnSubPlot(2,1,sigIDs(2),true)

fig = snap.snapshot("to","figure");
```

Introduced in R2018a

snapshot

Class: Simulink.sdi.CustomSnapshot
Package: Simulink.sdi

Create a custom snapshot

Syntax

```
fig = snap.snapshot
[fig,image] = snap.snapshot
fig = snap.snapshot(Name,Value)
[fig,image] = snap.snapshot
```

Description

`fig = snap.snapshot` creates a figure according to the properties of the `Simulink.sdi.CustomSnapshot` object, `snap`, and returns the handle for the figure, `fig`.

`[fig,image] = snap.snapshot` creates a figure according to the properties of the `Simulink.sdi.CustomSnapshot` object, `snap`, and returns the handle for the figure, `fig`, and an array of image data, `image`.

`fig = snap.snapshot(Name,Value)` creates a figure according to the properties of the `Simulink.sdi.CustomSnapshot` object, `snap`, with additional options specified by one or more `Name,Value` pair arguments. This syntax returns the figure handle, `fig`.

`[fig,image] = snap.snapshot` creates a figure according to the properties of the `Simulink.sdi.CustomSnapshot` object, `snap`, with additional options specified by one or more `Name,Value` pair arguments. This syntax returns the figure handle, `fig`, and an array of image data, `image`.

Input Arguments

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: `'to','figure','props',{'Name','My Data'}`

`to` — Type of snapshot to create

`'image'` (default) | `'figure'` | `'file'` | `'clipboard'`

Type of snapshot to create.

- `'image'` — Create a figure and return the figure handle and an array of image data. When you specify `'to','image'`, the `fig` and `image` outputs both have value.
- `'figure'` — Create a figure and return the figure handle. When you specify `'to','figure'` the `fig` output has value, and the `image` output is empty.
- `'file'` — Save to a PNG file with the name specified by the `filename` name-value pair. If you do not specify a `filename` name-value pair, the file is named `plots.png`. When you specify `'to','file'`, the `fig` and `image` outputs are both empty.
- `'clipboard'` — Copy the plots to your system clipboard. From the clipboard, you can paste the image into another program such as Microsoft Word. When you specify `'to','clipboard'`, the `fig` and `image` outputs are both empty.

Example: `'to','file'`

Data Types: `char` | `string`

`filename` — Name for image file

`'plots.png'` (default) | character array | string

Name of the image file to store the snapshot when you specify `'to','file'`.

Example: `'filename','MyImage.png'`

Data Types: `char` | `string`

`props` — Properties to customize the figure

cell array

Figure properties, specified as a cell array. You can include settings for the figure properties described in Figure Properties.

Example: `'props',{'Name','MyData','NumberTitle','off'}`

Data Types: `char` | `string`

Output Arguments

`fig` — Figure handle

figure handle

Handle for the figure. When a figure is not created with your specified options, the `fig` output is empty.

`image` — Image data

array

Array of image data. The `image` output has value when you use `Simulink.sdi.snapshot` without any input arguments or without a `to` name-value pair and when you specify `'to','image'`.

Examples

Copy View Settings to a Run

This example shows how to copy the view settings for aligned signals from one run to another.

Simulate Your Model and get Run Object

Simulate the `vdp` model to create a run of data to visualize.

```
load_system('vdp')
set_param('vdp','SaveFormat','Dataset','SaveOutput','on')
sim('vdp')

runIndex = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(runIndex);
vdpRun = Simulink.sdi.getRun(runID);
```

Modify View Settings for Signals

Use the `Simulink.sdi.Run` object to access the signals in the run. Then, modify the signals' view settings, and plot them in the Simulation Data Inspector. Open the Simulation Data Inspector and use `Simulink.sdi.snapshot` to view the results.

```
sig1 = vdpRun.getSignalByIndex(1);
sig2 = vdpRun.getSignalByIndex(2);

sig1.LineColor = [0 0 1];
sig1.LineDashed = '-.';

sig2.LineColor = [1 0 0];
sig2.LineDashed = ':';
```

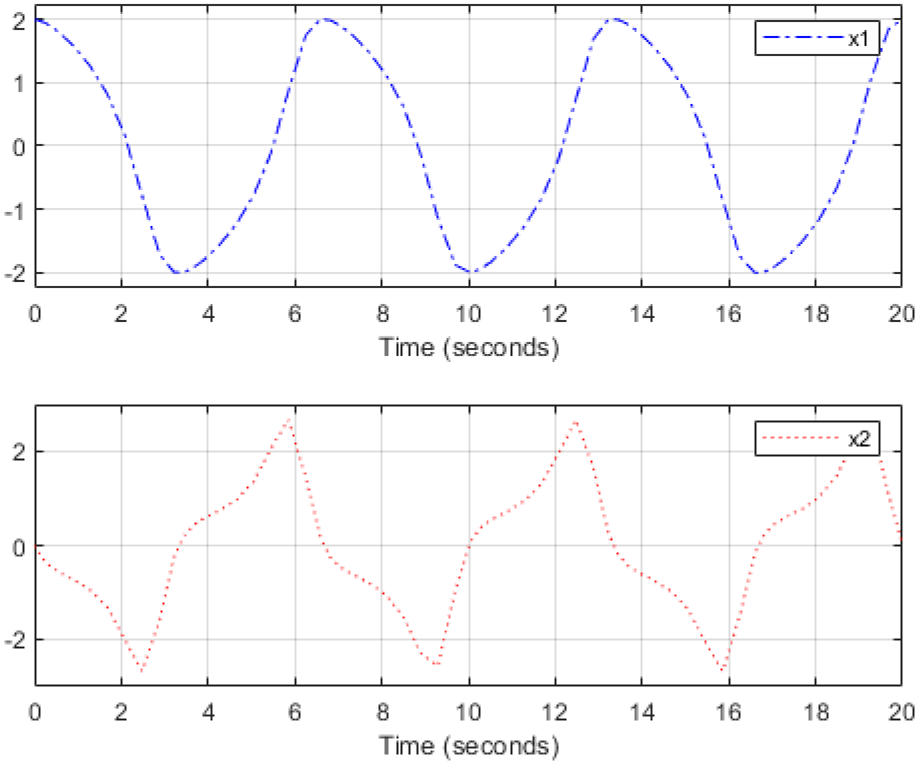
Capture a Snapshot from the Simulation Data Inspector

Create a `Simulink.sdi.CustomSnapshot` object and use the `Simulink.sdi.snapshot` function to programmatically capture a snapshot of the contents of the Simulation Data Inspector.

```
snap = Simulink.sdi.CustomSnapshot;

snap.Rows = 2;
snap.YRange = {[-2.25 2.25],[-3 3]};
snap.plotOnSubPlot(1,1,sig1,true)
snap.plotOnSubPlot(2,1,sig2,true)

fig = Simulink.sdi.snapshot("from","custom","to","figure","settings",snap);
```



Copy the View Settings to a New Simulation Run

Simulate the model again, with a different `Mu` value. Then, visualize the new run by copying the view settings from the first run. Specify the `plot` input as `true` to plot the signals from the new run.

```
set_param('vdp/Mu','Gain','5')
sim('vdp')

runIndex2 = Simulink.sdi.getRunCount;
runID2 = Simulink.sdi.getRunIDByIndex(runIndex2);
run2 = Simulink.sdi.getRun(runID2);

sigIDs = Simulink.sdi.copyRunViewSettings(runID,runID2,true);
```

Capture a Snapshot of the New Simulation Run

Use the `Simulink.sdi.CustomSnapshot` object to capture a snapshot of the new simulation run. First, clear the signals from the subplots. Then, plot the signals from the new run and capture another snapshot.

```
snap.clearSignals
snap.YRange = {[-2.25 2.25],[-8 8]};
snap.plotOnSubPlot(1,1,sigIDs(1),true)
snap.plotOnSubPlot(2,1,sigIDs(2),true)

fig = snap.snapshot("to","figure");
```

Simulink.sdi.DatasetRef class

Package: Simulink.sdi

Access data in Simulation Data Inspector repository

Description

The `Simulink.sdi.DatasetRef` class provides access to data in the Simulation Data Inspector repository without loading the entire set of data into memory. The class is compatible with the `Simulink.SimulationData.DatasetRef` class.

Construction

`dsr_array = Simulink.sdi.DatasetRef` constructs an array containing a `Simulink.sdi.DatasetRef` object for each run in the Simulation Data Inspector.

`dsr_array = Simulink.sdi.DatasetRef(domain)` creates an array containing a `Simulink.sdi.DatasetRef` object for each run, with the contents of each run limited to the selected `domain`.

`dsr = Simulink.sdi.DatasetRef(runID)` creates a `Simulink.sdi.DatasetRef` object of the run corresponding to the run identifier, `runID`.

`dsr = Simulink.sdi.DatasetRef(runID, domain)` creates a `Simulink.sdi.DatasetRef` object of the run corresponding to `runID` with the contents specified by `domain`.

`dsr = Simulink.sdi.DatasetRef(runID, domain, repositoryPath)` creates a `Simulink.sdi.DatsetRef` object of the run corresponding to `runID` including the contents specified by `domain` from a repository path specified by `repositoryPath`.

Input Arguments

domain — Specify contents of Simulink.sdi.DatasetRef objects
'signals' | 'outports' | []

Limits the contents included in the `Simulink.sdi.DatasetRef` object.

- `'signals'` includes only logged signals.
- `'outports'` includes only logged outports.
- `[]` includes all run data.

`runID` — Run identifier
integer

Specifies the run containing the data for the `Simulink.sdi.DatasetRef` object.

`repositoryPath` — Path containing the run
string | character vector

Specifies the location of the run containing the data for the `Simulink.sdi.DatasetRef` object.

Properties

Name — Run name
character vector

The name of the run that corresponds with the `Simulink.sdi.DatasetRef` object.

Example: `'Run 1'`

Run — Simulink.sdi.Run object
Simulink.sdi.Run object

`Simulink.sdi.Run` object associated with the `Simulink.sdi.DatasetRef` object.

`numElements` — Number of top-level elements in run
Simulink.sdi.Run object

Number of top-level elements in the `Simulink.sdi.Run` object associated with the `Simulink.sdi.DatasetRef` object.

Methods

compare	Compare runs with DatasetRef objects
getAsDatastore	Retrieve element as sdidatastore object
getElement	Retrieve DatasetRef element by index
getElementNames	Get character vectors of element names
getSignal	Return Signal object
plot	Open the Simulation Data Inspector to view and compare data

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Compare Runs with the Simulink.sdi.DatasetRef Object

This example shows how to work with the `Simulink.sdi.DatasetRef` object by comparing two runs of the `ex_sldemo_absbrake` system with different desired slip ratios.

```
% Simulate model ex_sldemo_absbrake to create a run of logged signals
load_system('ex_sldemo_absbrake')
sim('ex_sldemo_absbrake')

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
brakeRun = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = brakeRun.getDatasetRef;
```

```
% Get the names of the elements in the object
names = run_DSRef.getElementNames

names = 2x1 cell array
    {'yout'}
    {'slp' }

% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);

% View signals in outputs
outputs = yout.Values

outputs = struct with fields:
    Ww: [1x1 timeseries]
    Vs: [1x1 timeseries]
    Sd: [1x1 timeseries]

% Get slp signal
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

% Create another run for a different Desired relative slip
set_param('ex_sldemo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_sldemo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));

% Open the Simulation Data Inspector to view signals
run_DSRef.plot
```

compare

Class: Simulink.sdi.DatasetRef
Package: Simulink.sdi

Compare runs with DatasetRef objects

Syntax

```
[matches, mismatches, results] = dsrObj.compare(other)
```

Description

`[matches, mismatches, results] = dsrObj.compare(other)` returns the number of matches, number of mismatches, and comparison results for a comparison of data in a `Simulink.sdi.DatasetRef` object. The comparison results are returned as a `Simulink.sdi.DiffRunResult` object.

Input Arguments

`other` — Comparison data

MAT-file | variable

Comparison data, which can come from another `Simulink.sdi.DatasetRef` object, a `Dataset` in the workspace, or a MAT-file.

Example: `'data.mat'`

Example: `var`

Output Arguments

`matches` — Number of matching signals

integer

Number of signals that matched within tolerance in the comparison.

mismatches — Number of mismatched signals

integer

Number of signals that did not match within tolerance in the comparison.

results — Simulink.sdi.DiffRunResult object with comparison results

Simulink.sdi.DiffRunResult object

Results of the comparison, returned in a `Simulink.sdi.DiffRunResult` object.

Examples

Compare Runs with the Simulink.sdi.DatasetRef Object

This example shows how to work with the `Simulink.sdi.DatasetRef` object by comparing two runs of the `ex_sldemo_absbrake` system with different desired slip ratios.

```
% Simulate model ex_sldemo_absbrake to create a run of logged signals
load_system('ex_sldemo_absbrake')
sim('ex_sldemo_absbrake')

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
brakeRun = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = brakeRun.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames
```

```
names = 2x1 cell array
    {'yout'}
    {'slp' }
```

```
% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);
```

```
% View signals in outputs
outputs = yout.Values
```

```
outputs = struct with fields:
    Ww: [1x1 timeseries]
    Vs: [1x1 timeseries]
    Sd: [1x1 timeseries]
```

```
% Get slp signal
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

% Create another run for a different Desired relative slip
set_param('ex_sldemo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_sldemo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));

% Open the Simulation Data Inspector to view signals
run_DSRef.plot
```

Alternatives

Using the Simulation Data Inspector API, you could create runs for the data you want to compare and use `Simulink.sdi.compareRuns` for the comparison. You can also view runs created from simulation, import data to runs, and compare runs with the Simulation Data Inspector UI.

getAsDatastore

Class: Simulink.sdi.DatasetRef
Package: Simulink.sdi

Retrieve element as sdidatastore object

Syntax

```
[elementDatastore, name, index] = SDIDatasetRef.getAsDatastore(arg)
```

Description

`[elementDatastore, name, index] = SDIDatasetRef.getAsDatastore(arg)` returns the requested element as a `matlab.io.datastore.sdidatastore`object, along with the element name and index.

Input Arguments

`arg` — Element selection criterion
integer | character vector

Search criterion used to retrieve the element from the `Simulink.sdi.DatasetRef`object. For name-based searches, specify `arg` as a character vector. For index-based searches, `arg` is an integer, representing the index of the desired element.

Example: `'MySignal'`

Example: `3`

Output Arguments

`elementDatastore` — Element as sdidatastore
sdidatastore object

Element as `matlab.io.datastore.sdidatastore` object.

name — Element name

character vector

The name of the element.

index — Element index in DatasetRef object

integer

The index of the element in the `Simulink.sdi.DatasetRef` object.

Examples

Create an sdidatastore Object for a Signal

This example shows how to create a `sdidatastore` object for a signal in a `Simulink.sdi.DatasetRef` object.

```
% Simulate model sldemo_fuelsys to create a run of logged signals
sim('sldemo_fuelsys')

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
fuelRun = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = fuelRun.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames
```

```
names =

  15x1 cell array

    {'EGO Fault Switch:1'           }
    {'air_fuel_ratio'               }
    {'Engine Speed Fault Switch:1'  }
    {'speed'                        }
    {'MAP Fault Switch:1'           }
    {'map'                          }
    {'ego'                          }
    {'Throttle Angle Fault Switch:1'}
    {'throttle'                     }
    {'fuel'                         }
    {'ego_sw'                       }
    {'engine_speed'                 }
    {'speed_sw'                     }
    {'map_sw'                       }
    {'throttle_sw'                  }

% Get sdidatastore object for fuel signal
fuel_ds = run_DSRef.getAsDatastore(10);
```

Alternatives

You can construct a `sdidatastore` object for a specified signal using `matlab.io.datastore.sdidatastore`.

getElement

Class: Simulink.sdi.DatasetRef
Package: Simulink.sdi

Retrieve DatasetRef element by index

Syntax

```
[element, name, index] = SDIdatasetRef.getElement(index)
```

Description

`[element, name, index] = SDIdatasetRef.getElement(index)` returns the element within the Run in the `Simulink.sdi.DatasetRef` object at the specified `index`.

Input Arguments

`index` — Index of element

integer

Location of the element in the `Simulink.sdi.DatasetRef` object.

Output Arguments

`element` — Run element in the DatasetRef object

signal

Element from the run in the `Simulink.sdi.DatasetRef` object.

`name` — Element name

character vector

Name of the element retrieved from the `Simulink.sdi.DatasetRef` object.

index — Location of element
integer

Location of the element within the `Simulink.sdi.DatasetRef` object.

Examples

Compare Runs with the Simulink.sdi.DatasetRef Object

This example shows how to work with the `Simulink.sdi.DatasetRef` object by comparing two runs of the `ex_sldemo_absbrake` system with different desired slip ratios.

```
% Simulate model ex_sldemo_absbrake to create a run of logged signals
load_system('ex_sldemo_absbrake')
sim('ex_sldemo_absbrake')

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
brakeRun = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = brakeRun.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames
```

```
names = 2x1 cell array
    {'yout'}
    {'slp' }
```

```
% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);

% View signals in outputs
outputs = yout.Values
```

```
outputs = struct with fields:
    Ww: [1x1 timeseries]
    Vs: [1x1 timeseries]
    Sd: [1x1 timeseries]

% Get slp signal
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

% Create another run for a different Desired relative slip
set_param('ex_sldemo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_sldemo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));

% Open the Simulation Data Inspector to view signals
run_DSRef.plot
```

getElementNames

Class: Simulink.sdi.DatasetRef
Package: Simulink.sdi

Get character vectors of element names

Syntax

```
names = dsrObj.getElementNames
```

Description

`names = dsrObj.getElementNames` returns a cell array of character vectors containing the names of the elements in `dsrObj`.

Output Arguments

names — Element names
cell array

Names of the top level elements in the `Simulink.sdi.DatasetRef` object in a cell array.

Examples

Compare Runs with the Simulink.sdi.DatasetRef Object

This example shows how to work with the `Simulink.sdi.DatasetRef` object by comparing two runs of the `ex_sldemo_absbrake` system with different desired slip ratios.

```
% Simulate model ex_sldemo_absbrake to create a run of logged signals
load_system('ex_sldemo_absbrake')
```

```
sim('ex_sldemo_absbrake')

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
brakeRun = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = brakeRun.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames
```

```
names = 2x1 cell array
    {'yout'}
    {'slp' }
```

```
% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);

% View signals in outputs
outputs = yout.Values
```

```
outputs = struct with fields:
    Ww: [1x1 timeseries]
    Vs: [1x1 timeseries]
    Sd: [1x1 timeseries]
```

```
% Get slp signal
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

% Create another run for a different Desired relative slip
set_param('ex_sldemo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_sldemo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));
```

```
% Open the Simulation Data Inspector to view signals
run_DSRef.plot
```

getSignal

Class: Simulink.sdi.DatasetRef
Package: Simulink.sdi

Return Signal object

Syntax

```
sigObj = SDIDatasetRef.getSignal(searchArg)
```

Description

`sigObj = SDIDatasetRef.getSignal(searchArg)` returns the `Simulink.sdi.Signal` object corresponding to the search argument, `searchArg`.

Input Arguments

`searchArg` — Search parameter

character vector | integer

The search parameters to select the `Simulink.sdi.Signal` object. The `searchArg` can be a character vector or string targeting a signal name or an integer for an index-based search.

Example: `'throttle'`

Example: 2

Output Arguments

`sigObj` — Simulink.sdi.Signal object

Simulink.sdi.Signal object

The `Simulink.sdi.Signal` object corresponding to the search query.

Examples

Compare Runs with the Simulink.sdi.DatasetRef Object

This example shows how to work with the `Simulink.sdi.DatasetRef` object by comparing two runs of the `ex_sldemo_absbrake` system with different desired slip ratios.

```
% Simulate model ex_sldemo_absbrake to create a run of logged signals
load_system('ex_sldemo_absbrake')
sim('ex_sldemo_absbrake')

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
brakeRun = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = brakeRun.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames
```

```
names = 2x1 cell array
    {'yout'}
    {'slp' }
```

```
% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);

% View signals in outputs
outputs = yout.Values
```

```
outputs = struct with fields:
    Ww: [1x1 timeseries]
    Vs: [1x1 timeseries]
    Sd: [1x1 timeseries]
```

```
% Get slp signal
```

```
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

% Create another run for a different Desired relative slip
set_param('ex_sldemo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_sldemo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));

% Open the Simulation Data Inspector to view signals
run_DSRef.plot
```

Alternatives

If the signal is a top-level element in the `Simulink.sdi.DatasetRef` object, you can use the `Simulink.sdi.DatasetRef.getElement` method to get the `Simulink.sdi.Signal` object by index.

Simulink.sdi.DiffRunResult class

Package: Simulink.sdi

Access run comparison metadata

Description

The `Simulink.sdi.DiffRunResult` class provides access to the run comparison metadata. You can use the `getSignalByIndex` method to access the data and comparison results for each signal in the run comparison.

Construction

`DiffRunResultObj = Simulink.sdi.compareRuns(runID1, runID2)` returns a `Simulink.sdi.DiffRunResult` object to provide access to the comparison results from comparing the runs corresponding to `runID1` and `runID2`.

Input Arguments

`runID1` — Baseline run identifier
integer

Numeric run identifier for the **Baseline** run in the comparison.

`runID2` — Compare to run identifier
integer

Numeric identifier for the **Compare to** run in the comparison.

Properties

`RunID1` — Baseline signal run ID
integer

Run identifier for the **Baseline** signal of the comparison.

`RunID2` — Compare to signal run ID

integer

Run identifier for the **Compare to** signal of the comparison.

`MatlabVersion` — Version used

character vector

Version of MATLAB used.

`DateCreated` — Object creation date

datetime

Date and time the `Simulink.sdi.DiffRunResult` object was created.

Data Types: `datetime`

`Count` — Number of signals compared

integer

Number of signals aligned between the two runs in the comparison. For more information on how signals are aligned for comparisons, see “How the Simulation Data Inspector Compares Data”.

Methods

getResultByIndex	Return signal comparison result

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Analyze Simulation Data with Signal Tolerances

You can change tolerance values on a signal-by-signal basis to evaluate the effect of a model parameter change. This example uses the `slexAircraftExample` model and the

Simulation Data Inspector to evaluate the effect of changing the time constant for the low-pass filter following the control input.

Setup

Load the model, and mark the `q, rad/sec` and `alpha, rad` signals for logging. Then, simulate the model to create the baseline run.

```
% Load example model
load_system('slexAircraftExample')

% Mark the q, rad/sec and alpha, rad signals for logging
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',3,'on
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on

% Simulate system
sim('slexAircraftExample')
```

Modify Model Parameter

Modify the model parameter `Ts` in the model workspace to change the time constant of the input low-pass filter.

```
% Change input filter time constant
modelWorkspace = get_param('slexAircraftExample','modelworkspace');
modelWorkspace.assignin('Ts',1)

% Simulate again
sim('slexAircraftExample')
```

Compare Runs and Inspect Results

Use the `Simulink.sdi.compareRuns` function to compare the data from the simulations. Then, inspect the `match` property of the signal result to see whether the signals fell within the default tolerance of 0.

```
% Get run data
runIDs = Simulink.sdi.getAllRunIDs;
runID1 = runIDs(end - 1);
runID2 = runIDs(end);

% Compare runs
diffRun1 = Simulink.sdi.compareRuns(runID1,runID2);

% Get signal result
```

```
sig1Result1 = diffRun1.getResultByIndex(1);
sig2Result1 = diffRun1.getResultByIndex(2);

% Check whether signals matched
sig1Result1.Match

ans = logical
   0

sig2Result1.Match

ans = logical
   0
```

Compare Runs with Signal Tolerances

The signals did not match within the default tolerance of 0. To further analyze the effect of the time constant change, add signal tolerances to the comparison with the baseline signal properties to determine the tolerance required for a pass. This example uses a combination of time and absolute tolerances.

```
% Get signal object for sigID1
run1 = Simulink.sdi.getRun(runID1);
sigID1 = run1.getSignalIDByIndex(1);
sigID2 = run1.getSignalIDByIndex(2);

sig1 = Simulink.sdi.getSignal(sigID1);
sig2 = Simulink.sdi.getSignal(sigID2);

% Set tolerances for q, rad/sec
sig1.AbsTol = 0.1;
sig1.TimeTol = 0.6;

% Set tolerances for alpha, rad
sig2.AbsTol = 0.2;
sig2.TimeTol = 0.8;

% Run the comparison again
diffRun2 = Simulink.sdi.compareRuns(runID1,runID2);
sig1Result2 = diffRun2.getResultByIndex(1);
sig2Result2 = diffRun2.getResultByIndex(2);
```

```
% Check the result
sig1Result2.Match

ans = logical
   1

sig2Result2.Match

ans = logical
   1
```

Alternatives

You can view and inspect comparison results using the Simulation Data Inspector UI. For more information, see “Compare Simulation Data”.

getResultByIndex

Class: Simulink.sdi.DiffRunResult
Package: Simulink.sdi

Return signal comparison result

Syntax

```
diffSigObj = diffRunObj.getResultByIndex(index)
```

Description

`diffSigObj = diffRunObj.getResultByIndex(index)` returns the `Simulink.sdi.DiffSignalResult` object `diffSigObj` corresponding to the `index` in the `Simulink.sdi.DiffRunResult` object, `diffRunObj`.

Input Arguments

`index` — Index of signal in run
integer

Index of the signal in the `Simulink.sdi.DiffRunResult` object.

Output Arguments

`diffSigObj` — Simulink.sdi.DiffSignalResult object corresponding to the index
Simulink.sdi.DiffSignalResult object

`Simulink.sdi.DiffSignalResult` object for the signal at the specified index.

Examples

Analyze Simulation Data with Signal Tolerances

You can change tolerance values on a signal-by-signal basis to evaluate the effect of a model parameter change. This example uses the `slexAircraftExample` model and the Simulation Data Inspector to evaluate the effect of changing the time constant for the low-pass filter following the control input.

Setup

Load the model, and mark the `q, rad/sec` and `alpha, rad` signals for logging. Then, simulate the model to create the baseline run.

```
% Load example model
load_system('slexAircraftExample')

% Mark the q, rad/sec and alpha, rad signals for logging
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',3,'on
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on

% Simulate system
sim('slexAircraftExample')
```

Modify Model Parameter

Modify the model parameter `Ts` in the model workspace to change the time constant of the input low-pass filter.

```
% Change input filter time constant
modelWorkspace = get_param('slexAircraftExample','modelworkspace');
modelWorkspace.assignin('Ts',1)

% Simulate again
sim('slexAircraftExample')
```

Compare Runs and Inspect Results

Use the `Simulink.sdi.compareRuns` function to compare the data from the simulations. Then, inspect the `match` property of the signal result to see whether the signals fell within the default tolerance of 0.

```
% Get run data
runIDs = Simulink.sdi.getAllRunIDs;
```

```
runID1 = runIDs(end - 1);
runID2 = runIDs(end);

% Compare runs
diffRun1 = Simulink.sdi.compareRuns(runID1,runID2);

% Get signal result
sig1Result1 = diffRun1.getResultByIndex(1);
sig2Result1 = diffRun1.getResultByIndex(2);

% Check whether signals matched
sig1Result1.Match

ans = logical
   0

sig2Result1.Match

ans = logical
   0
```

Compare Runs with Signal Tolerances

The signals did not match within the default tolerance of 0. To further analyze the effect of the time constant change, add signal tolerances to the comparison with the baseline signal properties to determine the tolerance required for a pass. This example uses a combination of time and absolute tolerances.

```
% Get signal object for sigID1
run1 = Simulink.sdi.getRun(runID1);
sigID1 = run1.getSignalIDByIndex(1);
sigID2 = run1.getSignalIDByIndex(2);

sig1 = Simulink.sdi.getSignal(sigID1);
sig2 = Simulink.sdi.getSignal(sigID2);

% Set tolerances for q, rad/sec
sig1.AbsTol = 0.1;
sig1.TimeTol = 0.6;

% Set tolerances for alpha, rad
sig2.AbsTol = 0.2;
sig2.TimeTol = 0.8;
```

```
% Run the comparison again
diffRun2 = Simulink.sdi.compareRuns(runID1,runID2);
sig1Result2 = diffRun2.getResultByIndex(1);
sig2Result2 = diffRun2.getResultByIndex(2);

% Check the result
sig1Result2.Match

ans = logical
   1

sig2Result2.Match

ans = logical
   1
```

Alternatives

You can inspect comparison results using the Simulation Data Inspector UI. For more information, see “Compare Simulation Data”.

Topics

“Inspect and Compare Data Programmatically”

Introduced in R2012b

Simulink.sdi.DiffSignalResult class

Package: Simulink.sdi

Access signal comparison results

Description

The `Simulink.sdi.DiffSignalResult` object provides access to the data and metadata created by a signal comparison. A `Simulink.sdi.DiffSignalResult` object gives access the difference signal, tolerance data, and the synchronized signal data.

Construction

`DiffSignalObj = Simulink.sdi.compareSignals(signalID1, signalID2)`creates a `Simulink.sdi.DiffSignalResult` object to provide access to the results of the comparison of the signals corresponding to `sigID1` and `sigID2`.

`DiffSignalObj = DiffRunObj.getResultByIndex(index)` returns a `Simulink.sdi.DiffSignalResult` object for the signal comparison corresponding to the `index` within a `Simulink.sdi.DiffRunResult` object.

Input Arguments

`signalID1` — Signal identifier for Baseline signal
integer

Numeric signal identifier for the **Baseline** signal in comparison.

`signalID2` — Signal identifier for Compare to signal
integer

Numeric signal identifier for the **Compare to** signal in comparison

`index` — Index of signal in run
integer

Index of the signal within the run.

Properties

`Diff` — Difference signal

timeseries

Difference signal resulting from the comparison as a `timeseries` object.

`Match` — Logical indicator of signal match

logical

Logical indicator of whether comparison signals match within the tolerances.

- `0` indicates that the difference between the signals is not within tolerance.
- `1` indicates that the difference between the signals is within tolerance.

`UnitsMatch` — Logical indicator of unit match

logical

Logical indicator of whether comparison signals' units match. Comparisons of signals with units that do not match are always marked out of tolerance, and no difference signal is computed.

- `0` indicates that the signals' units do not match.
- `1` indicates that the signals' units match.

`MaxDifference` — Maximum difference

double

Maximum difference between the two comparison signals.

`SignalID1` — Baseline signal identifier

integer

Unique signal identifier for the **Baseline** comparison signal.

`SignalID2` — Compare to signal identifier

integer

Unique signal identifier for the **Compare to** comparison signal.

Sync1 — Synchronized Baseline signal

timeseries

Synchronized **Baseline** signal. For more information about synchronization, see "How the Simulation Data Inspector Compares Data".

Sync2 — Synchronized Compare to signal

timeseries

Synchronized **Compare to** signal. For more information about synchronization, see "How the Simulation Data Inspector Compares Data".

Tol — Tolerance signal

timeseries

Tolerance data for every data point of the comparison. For more information on how the tolerance signal is computed, see "How the Simulation Data Inspector Compares Data".

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Compare Signals Within a Simulation Run

This example uses the `slexAircraftExample` model to demonstrate the comparison of the input and output signals for a control system. The example marks the signals for streaming then gets the run object for a simulation run. Signal IDs from the run object specify the signals to be compared.

```
% Load model slexAircraftExample and mark signals for streaming
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot',1,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on

% Simulate model slexAircraftExample
sim('slexAircraftExample')
```

```
% Get run IDs for most recent run
allIDs = Simulink.sdi.getAllRunIDs;
runID = allIDs(end);

% Get Run object
aircraftRun = Simulink.sdi.getRun(runID);

% Get signal IDs
signalID1 = aircraftRun.getSignalIDByIndex(1);
signalID2 = aircraftRun.getSignalIDByIndex(2);

if (aircraftRun.isValidSignalID(signalID1))
    % Change signal tolerance
    signal1 = Simulink.sdi.getSignal(signalID1);
    signal1.AbsTol = 0.1;
end

if (aircraftRun.isValidSignalID(signalID1) && aircraftRun.isValidSignalID(signalID2))
    % Compare signals
    sigDiff = Simulink.sdi.compareSignals(signalID1,signalID2);

    % Check whether signals match within tolerance
    match = sigDiff.match
end

match = logical
   0
```

Alternatives

You can view and inspect comparison results using the Simulation Data Inspector UI. For more information, see “Compare Simulation Data”.

"How the Simulation Data Inspector Compares Data"

Introduced in R2012b

Simulink.sdi.Run class

Package: Simulink.sdi

Access run signals and metadata

Description

The `Simulink.sdi.Run` object manages a run's metadata and the signals that comprise the run. You can use several methods to retrieve `Simulink.sdi.Signal` objects to access the signal data and metadata.

Construction

`runObj = Simulink.sdi.Run.create` creates an empty `Simulink.sdi.Run` object.

`runObj = Simulink.sdi.getRun(runID)` creates a `Simulink.sdi.Run`object, `runObj`, for the run corresponding to `runID`.

You can also use the `Simulink.sdi.createRun` and `Simulink.sdi.createRunOrAddToStreamedRun` functions to create `Run` objects.

Input Arguments

`runID` — Run identifier
integer

Unique number identifying the run.

Properties

id — Run identifier
integer

Unique numerical identification for the run.

`Name` — Run name

[] (default) | character vector

Name of the run. By default, `name` is empty.

Example: `'Run 1'`

`Description` — Run description

[] (default) | character vector

Description of the run. By default, `Description` is empty.

Example: `'Initial simulation'`

`Tag` — Information tag

[] (default) | character vector

Tag for additional run information. By default, `Tag` is empty. You can use the `Tag` parameter to categorize your simulation data or attach extra information to simulation runs.

Example: `'Gain = 2'`

`DateCreated` — Run creation time

datetime object

Date and time the run was created.

Data Types: `datetime`

`SignalCount` — Number of signals in run

integer

Number of signals contained in the run.

`Model` — Model that created the run

character vector

Name of the model that created the run.

`SimMode` — Simulation mode

character vector

Simulation mode used to create the run, for runs created by simulation.

`StartTime` — Run start time
integer

First time point shared by all signals in the run.

`StopTime` — Run stop time
integer

Last time point shared by all signals in the run.

`SLVersion` — Simulink version used to create run
character vector

Version of Simulink used for the simulation that created the run.

`ModelVersion` — Model version used to create run
character vector

Version of the model simulated to create the run, taken from the **Model Properties**.

`UserID` — System account
character vector

System account used for the simulation that created the run. `UserID` only has a value for runs produced with Simulink simulations.

`MachineName` — Name of machine used for simulation
character vector

Name of the machine used for the simulation that created the run. `MachineName` only has a value for runs produced with Simulink simulations.

`TaskName` — Task name
[] (default) | character vector

Name of the simulation task that created the run for runs created with Parallel Computing Toolbox workers.

`SolverType` — Type of solver used to create run
'Variable-Step' | 'Fixed-Step'

The type of solver used for the simulation that created the run. `SolverType` only has a value for runs produced with Simulink simulations.

`SolverName` — Name of solver used to create run

character vector

Name of the solver used for the simulation that created the run. `SolverName` only has a value for runs produced with Simulink simulations.

Example: `ode45`

`ModelInitializationTime` — Time to initialize model

double

Amount of time to initialize the model for the simulation that created the run. `ModelInitializationTime` only has a value for runs produced with Simulink simulations.

`ModelExecutionTime` — Time to execute model

double

Execution time of the model simulation that created the run. `ModelExecutionTime` only has a value for runs produced with Simulink simulations.

`ModelTerminationTime` — Time to terminate simulation

double

Time to terminate the simulation that created the run. `ModelTerminationTime` only has a value for runs produced with Simulink simulations.

`ModelTotalElapsedTime` — Total simulation time

double

Total time to run model simulation that created the run. `ModelTotalElapsedTime` only has a value for runs produced with Simulink simulations.

Methods

add	Add signals to run
create	Create a Simulink.sdi.Run object
export	Export run to Simulink.SimulationData.Dataset object
getDatasetRef	Create a Simulink.sdi.DatasetRef object for a run
getSignalByIndex	Get `Simulink.sdi.Signal` object by index
getSignalIDByIndex	Return signal ID for signal at index
isValidSignalID	Determine whether signal ID is valid within a run

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Plot Signals from a Simulation Run

This example demonstrates how to access the `Simulink.sdi.Run` object for a run created by logging signals to the Simulation Data Inspector. From the `Simulink.sdi.Run` object you can get `Simulink.sdi.Signal` objects that you can use to view data.

```
% Simulate model to create a run
sim('sldemo_fuelsys')

% Get runID for the run
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get run object for the run
fuelRun = Simulink.sdi.getRun(runID);

% Check signal count of the run
fuelRun.signalCount
```

```
ans = int32
    15

% Get signal objects for the signals in the run
signal1 = fuelRun.getSignalByIndex(4);
signal2 = fuelRun.getSignalByIndex(9);
signal3 = fuelRun.getSignalByIndex(10);

% Create subplot layout to display signals
Simulink.sdi.setSubPlotLayout(3, 1)

% Plot signals
signal1.checked = true;
signal2.plotOnSubPlot(2, 1, true);
signal3.plotOnSubPlot(3, 1, true);

% View plots in the Simulation Data Inspector
Simulink.sdi.view
```

Create a Run and View the Data

This example shows how to create a run, add data to it, and then view the data in the Simulation Data Inspector.

Create Data for the Run

This example creates `timeseries` objects for a sine and a cosine. To visualize your data, the Simulation Data Inspector requires at least a time vector that corresponds with your data.

```
% Generate timeseries data
time = linspace(0, 20, 100);

sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals, time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals, time);
cos_ts.Name = 'Cosine, T=8';
```

Create a Simulation Data Inspector Run and Add Your Data

To give the Simulation Data Inspector access to your data, use the `create` method and create a run. This example modifies some of the run's properties to help identify the data. You can easily view run and signal properties with the Simulation Data Inspector.

```
% Create a run
sinusoidsRun = Simulink.sdi.Run.create;
sinusoidsRun.Name = 'Sinusoids';
sinusoidsRun.Description = 'Sine and cosine signals with different frequencies';

% Add timeseries data to run
sinusoidsRun.add('vars', sine_ts, cos_ts);
```

Plot Your Data Using the `Simulink.sdi.Signal` Object

The `getSignalByIndex` method returns a `Simulink.sdi.Signal` object that can be used to plot the signal in the Simulation Data Inspector. You can also programmatically control aspects of the plot's appearance, such as the color and style of the line representing the signal. This example customizes the subplot layout and signal characteristics.

```
% Get signal, modify its properties, and change Checked property to true
sine_sig = sinusoidsRun.getSignalByIndex(1);
sine_sig.LineColor = [0 0 1];
sine_sig.LineDashed = '-.';
sine_sig.Checked = true;

% Add another subplot for the cosine signal
Simulink.sdi.setSubPlotLayout(2, 1);

% Plot the cosine signal and customize its appearance
cos_sig = sinusoidsRun.getSignalByIndex(2);
cos_sig.LineColor = [0 1 0];
cos_sig.plotOnSubPlot(2, 1, true);

% View the signal in the Simulation Data Inspector
Simulink.sdi.view
```

Close the Simulation Data Inspector and Save Your Data

```
Simulink.sdi.close('sinusoids.mat')
```

Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport('local')

% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];
```

Initialize Parallel Workers

Use gcp to create a pool of local workers to run parallel simulations if you don't already have one. In an `spmd` code block, load the `slexAircraftExample` model and select signals to log. To avoid data concurrency issues using `sim` in `parfor`, create a temporary directory for each worker to use during simulations.

```
p = gcp;
```

```
Starting parallel pool (parpool) using the 'local' profile ...
connected to 4 workers.
```

```
spmd

    % Load system and select signals to log
    load_system('slexAircraftExample')
    Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
    Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',

    % Create temporary directory on each worker
    workDir = pwd;
    addpath(workDir)
    tempDir = tempname;
    mkdir(tempDir)
    cd(tempDir)

end
```

Run Parallel Simulations

Use `parfor` to run the seven simulations in parallel. Select the value for `Ts` for each simulation, and modify the value of `Ts` in the model workspace. Then, run the simulation and build an array of `Simulink.sdi.WorkerRun` objects to access the data with the Simulation Data Inspector. After the `parfor` loop, use another `spmd` segment to remove the temporary directories from the workers.

```
parfor index = 1:7

    % Select value for Ts
    Ts_val = Ts_vals(index);

    % Change the filter time constant and simulate
    modelWorkspace = get_param('slexAircraftExample','modelworkspace');
    modelWorkspace.assignin('Ts',Ts_val)
    sim('slexAircraftExample')

    % Create a worker run for each simulation
    workerRun(index) = Simulink.sdi.WorkerRun.getLatest

end

spmd

    % Remove temporary directories
    cd(workDir)
    rmdir(tempDir, 's')
    rmpath(workDir)

end
```

Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

```
ds(7) = Simulink.SimulationData.Dataset;

for a = 1:7
    ds(a) = workerRun(a).getDataset;
end
ds(1)

ans = 
Simulink.SimulationData.Dataset '' with 2 elements

                         Name        BlockPath                               
                         __________  ________________________________________

    1  [1x1 Signal]      alpha, rad  ...rcraftExample/Aircraft Dynamics Model
    2  [1x1 Signal]      Stick       slexAircraftExample/Pilot               

  - Use braces { } to access, modify, or add elements using index.
```

Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```
for b = 1:7
    datasetRef(b) = workerRun(b).getDatasetRef;
end

datasetRef(1)

ans = 
  DatasetRef with properties:

           Name: 'Run 3: slexAircraftExample'
            Run: [1×1 Simulink.sdi.Run]
    numElements: 2
```

Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local `Run` objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```
for c = 1:7
```

```
    Runs(c) = workerRun(c).getLocalRun;
    Ts_val_str = num2str(Ts_vals(c));
    desc = strcat('Ts = ', Ts_val_str);
    Runs(c).Description = desc;
    Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);

end
```

Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

```
Simulink.sdi.cleanupWorkerResources
```

Alternatives

You can view runs and their properties in the Simulation Data Inspector UI. You can also import data to create runs in the Simulation Data Inspector GUI. For more information, see “View Data with the Simulation Data Inspector”.

add

Class: Simulink.sdi.Run
Package: Simulink.sdi

Add signals to run

Syntax

```
run.add(sig)
run.add(source, filename)
run.add(source, ts1, ts2)
```

Description

`run.add(sig)` adds the data `sig` to the `Simulink.sdi.Run` object `run` from the base workspace.

`run.add(source, filename)` adds the data in the file `filename` to the `Simulink.sdi.Run` object, `run`.

`run.add(source, ts1, ts2)` allows you to add multiple signals to the run from the base workspace.

Input Arguments

`sig` — Data to add

Signals to add to the run. Data types that you can add to a run include:

- `timeseries`
- `Simulink.SimulationData.Dataset`
- `Simulink.SimulationOutput`
- `timetable`

- Data logged with `Structure with time` format
- Simscape variables

`source` — Data source selector

'file' | 'vars'

Source of the data to add to the run, specified as a character vector.

- `'file'` indicates that the data comes from a file.
- `'vars'` indicates that the data comes from one or more variables in the workspace.

`filename` — File containing data

character vector

File with data to add to the run.

Example: `'data.mat'`

`ts1, ts2` — Workspace variables to add to run

timeseries

Data to add to the run in one or more `timeseries` objects.

Examples

Create a Run and View the Data

This example shows how to create a run, add data to it, and then view the data in the Simulation Data Inspector.

Create Data for the Run

This example creates `timeseries` objects for a sine and a cosine. To visualize your data, the Simulation Data Inspector requires at least a time vector that corresponds with your data.

```
% Generate timeseries data
time = linspace(0, 20, 100);

sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals, time);
```

```
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals, time);
cos_ts.Name = 'Cosine, T=8';
```

Create a Simulation Data Inspector Run and Add Your Data

To give the Simulation Data Inspector access to your data, use the `create` method and create a run. This example modifies some of the run's properties to help identify the data. You can easily view run and signal properties with the Simulation Data Inspector.

```
% Create a run
sinusoidsRun = Simulink.sdi.Run.create;
sinusoidsRun.Name = 'Sinusoids';
sinusoidsRun.Description = 'Sine and cosine signals with different frequencies';

% Add timeseries data to run
sinusoidsRun.add('vars', sine_ts, cos_ts);
```

Plot Your Data Using the Simulink.sdi.Signal Object

The `getSignalByIndex` method returns a `Simulink.sdi.Signal` object that can be used to plot the signal in the Simulation Data Inspector. You can also programmatically control aspects of the plot's appearance, such as the color and style of the line representing the signal. This example customizes the subplot layout and signal characteristics.

```
% Get signal, modify its properties, and change Checked property to true
sine_sig = sinusoidsRun.getSignalByIndex(1);
sine_sig.LineColor = [0 0 1];
sine_sig.LineDashed = '-.';
sine_sig.Checked = true;

% Add another subplot for the cosine signal
Simulink.sdi.setSubPlotLayout(2, 1);

% Plot the cosine signal and customize its appearance
cos_sig = sinusoidsRun.getSignalByIndex(2);
cos_sig.LineColor = [0 1 0];
cos_sig.plotOnSubPlot(2, 1, true);

% View the signal in the Simulation Data Inspector
Simulink.sdi.view
```

Close the Simulation Data Inspector and Save Your Data

```
Simulink.sdi.close('sinusoids.mat')
```

Simulink.sdi.Run.create

Class: Simulink.sdi.Run
Package: Simulink.sdi

Create a Simulink.sdi.Run object

Syntax

```
runObj = Simulink.sdi.Run.create
```

Description

`runObj = Simulink.sdi.Run.create` creates the empty run object, `runObj`. You can add signals to the Run object with the `Simulink.sdi.Run.add` method or the `Simulink.sdi.addToRun` function. For more information on the `Simulink.sdi.Run` object and its properties, see `Simulink.sdi.Run`.

Output Arguments

`runObj` — Simulink.sdi.Run object
Simulink.sdi.Run object

Empty `Simulink.sdi.Run` object.

Examples

Create a Run and View the Data

This example shows how to create a run, add data to it, and then view the data in the Simulation Data Inspector.

Create Data for the Run

This example creates timeseries objects for a sine and a cosine. To visualize your data, the Simulation Data Inspector requires at least a time vector that corresponds with your data.

```
% Generate timeseries data
time = linspace(0, 20, 100);

sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals, time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals, time);
cos_ts.Name = 'Cosine, T=8';
```

Create a Simulation Data Inspector Run and Add Your Data

To give the Simulation Data Inspector access to your data, use the create method and create a run. This example modifies some of the run's properties to help identify the data. You can easily view run and signal properties with the Simulation Data Inspector.

```
% Create a run
sinusoidsRun = Simulink.sdi.Run.create;
sinusoidsRun.Name = 'Sinusoids';
sinusoidsRun.Description = 'Sine and cosine signals with different frequencies';

% Add timeseries data to run
sinusoidsRun.add('vars', sine_ts, cos_ts);
```

Plot Your Data Using the Simulink.sdi.Signal Object

The getSignalByIndex method returns a Simulink.sdi.Signal object that can be used to plot the signal in the Simulation Data Inspector. You can also programmatically control aspects of the plot's appearance, such as the color and style of the line representing the signal. This example customizes the subplot layout and signal characteristics.

```
% Get signal, modify its properties, and change Checked property to true
sine_sig = sinusoidsRun.getSignalByIndex(1);
sine_sig.LineColor = [0 0 1];
sine_sig.LineDashed = '-.';
sine_sig.Checked = true;
```

```
% Add another subplot for the cosine signal
Simulink.sdi.setSubPlotLayout(2, 1);

% Plot the cosine signal and customize its appearance
cos_sig = sinusoidsRun.getSignalByIndex(2);
cos_sig.LineColor = [0 1 0];
cos_sig.plotOnSubPlot(2, 1, true);

% View the signal in the Simulation Data Inspector
Simulink.sdi.view
```

Close the Simulation Data Inspector and Save Your Data

```
Simulink.sdi.close('sinusoids.mat')
```

export

Class: Simulink.sdi.Run
Package: Simulink.sdi

Export run to Simulink.SimulationData.Dataset object

Syntax

```
ds = runObj.export
```

Description

`ds = runObj.export` exports the `Simulink.sdi.Run` object `runObj` to the `Simulink.SimulationData.Dataset`, `ds`.

Output Arguments

ds — Simulink.SimulationData.Dataset object containing run data
Simulink.SimulationData.Dataset object

Simulink.SimulationData.Dataset object containing the run data.

Examples

Export Run Data

This example shows how to export data from a run in the Simulation Data Inspector to a `Simulink.SimulationData.Dataset` object in the base workspace you can use to further process your data. The method you choose to export your run depends on the processing you do in your script. If you have a run object for the run, you can use the `export` method to create a `Simulink.SimulationData.Dataset` object with the run's data in the base workspace. If you do not have a run object, use the `Simulink.sdi.exportRun` function to export the run to the workspace.

Export Run Using Simulink.sdi.exportRun

Use the `Simulink.sdi.export` function when your workflow does not include creating a run object.

```
% Load vdp model
load_system('vdp')

% Get handles for signal lines in model
SignalHandles = get_param('vdp', 'Lines');

% Mark signals for streaming
Simulink.sdi.markSignalForStreaming(SignalHandles(5).Handle, 'on')
Simulink.sdi.markSignalForStreaming(SignalHandles(6).Handle, 'on')

% Simulate vdp model
sim('vdp')

% Get run ID for simulation run
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Export run
simDataset = Simulink.sdi.exportRun(runID);
```

Export Run Using export Method

When you already have a `Simulink.sdi.Run` object for your run, you can use the `export` method to create a `Simulink.SimulationData.Dataset` object in the base workspace for further processing of the data.

```
% Load vdp model
load_system('vdp')

% Get handles for signal lines in model
SignalHandles = get_param('vdp', 'Lines');

% Mark signals for streaming
Simulink.sdi.markSignalForStreaming(SignalHandles(5).Handle, 'on')
Simulink.sdi.markSignalForStreaming(SignalHandles(6).Handle, 'on')

% Simulate model vdp and get run object
sim('vdp')

% Get run object for simulation run
```

```
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
vdpRun = Simulink.sdi.getRun(runID);

% Get signal ids for signals
sigID1 = vdpRun.getSignalIDByIndex(1);
sigID2 = vdpRun.getSignalIDByIndex(2);

% Compare signals
diffResult = Simulink.sdi.compareSignals(sigID1,sigID2);
diffResult.match
```

```
ans = logical
   0
```

```
% Export run
simDataset = vdpRun.export;
```

Alternatives

You can export run data programmatically using the `Simulink.sdi.exportRun` function, or you can use the Simulation Data Inspector UI. For more information, see “Save and Share Simulation Data Inspector Data and Views”.

getDatasetRef

Class: Simulink.sdi.Run
Package: Simulink.sdi

Create a Simulink.sdi.DatasetRef object for a run

Syntax

```
DatasetRef = runObj.getDatasetRef
```

Description

`DatasetRef = runObj.getDatasetRef` creates a `Simulink.sdi.DatasetRef` object with the data in the `Simulink.sdi.Run` object, `runObj`.

Output Arguments

DatasetRef — Simulink.sdi.DatasetRef object

Simulink.sdi.DatasetRef object

`Simulink.sdi.DatasetRef` object that provides access to the run data.

Examples

Compare Runs with the Simulink.sdi.DatasetRef Object

This example shows how to work with the `Simulink.sdi.DatasetRef` object by comparing two runs of the `ex_sldemo_absbrake` system with different desired slip ratios.

```
% Simulate model ex_sldemo_absbrake to create a run of logged signals
load_system('ex_sldemo_absbrake')
sim('ex_sldemo_absbrake')
```

```
% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
brakeRun = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = brakeRun.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames

names = 2x1 cell array
    {'yout'}
    {'slp' }

% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);

% View signals in outputs
outputs = yout.Values

outputs = struct with fields:
    Ww: [1x1 timeseries]
    Vs: [1x1 timeseries]
    Sd: [1x1 timeseries]

% Get slp signal
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

% Create another run for a different Desired relative slip
set_param('ex_sldemo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_sldemo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));
```

```
% Open the Simulation Data Inspector to view signals
run_DSRef.plot
```

Alternatives

You can also create a `Simulink.sdi.DatasetRef` object using the `Simulink.sdi.DatasetRef` constructor.

getSignalByIndex

Class: Simulink.sdi.Run
Package: Simulink.sdi

Get `Simulink.sdi.Signal` object by index

Syntax

```
signal = runObj.getSignalByIndex(index)
```

Description

`signal = runObj.getSignalByIndex(index)` returns a signal object for the signal at the specified `index` within the `Simulink.sdi.Run` object, `runObj`.

Input Arguments

`index` — Signal index

integer

Index of the signal within the run.

Output Arguments

`signal` — Simulink.sdi.Signal object

Simulink.sdi.Signal object

`Simulink.sdi.Signal` object for the signal at the specified index in the run.

Examples

Plot Signals from a Simulation Run

This example demonstrates how to access the `Simulink.sdi.Run` object for a run created by logging signals to the Simulation Data Inspector. From the `Simulink.sdi.Run` object you can get `Simulink.sdi.Signal` objects that you can use to view data.

```
% Simulate model to create a run
sim('sldemo_fuelsys')

% Get runID for the run
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get run object for the run
fuelRun = Simulink.sdi.getRun(runID);

% Check signal count of the run
fuelRun.signalCount

ans = int32
    15

% Get signal objects for the signals in the run
signal1 = fuelRun.getSignalByIndex(4);
signal2 = fuelRun.getSignalByIndex(9);
signal3 = fuelRun.getSignalByIndex(10);

% Create subplot layout to display signals
Simulink.sdi.setSubPlotLayout(3, 1)

% Plot signals
signal1.checked = true;
signal2.plotOnSubPlot(2, 1, true);
signal3.plotOnSubPlot(3, 1, true);

% View plots in the Simulation Data Inspector
Simulink.sdi.view
```

Alternatives

You can access signal properties, view signals, and export data to the workspace using the Simulation Data Inspector UI. For more information, see “Organize Your Simulation Data Inspector Workspace”.

getSignalIDByIndex

Class: Simulink.sdi.Run
Package: Simulink.sdi

Return signal ID for signal at index

Syntax

```
signalID = runObj.getSignalIDByIndex(index)
```

Description

`signalID = runObj.getSignalIDByIndex(index)` returns the signal ID for the signal at the specified `index` in the `Simulink.sdi.Run` object. You can use the signal ID to create a `Simulink.sdi.Signal` object or to perform a signal comparison with `Simulink.sdi.compareSignals`.

Input Arguments

`index` — Signal index

integer

Index of the signal within the run.

Output Arguments

`signalID` — Signal identifier

integer

Unique numeric signal identifier.

Examples

Compare Signals Within a Simulation Run

This example uses the `slexAircraftExample` model to demonstrate the comparison of the input and output signals for a control system. The example marks the signals for streaming then gets the run object for a simulation run. Signal IDs from the run object specify the signals to be compared.

```
% Load model slexAircraftExample and mark signals for streaming
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot',1,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on

% Simulate model slexAircraftExample
sim('slexAircraftExample')

% Get run IDs for most recent run
allIDs = Simulink.sdi.getAllRunIDs;
runID = allIDs(end);

% Get Run object
aircraftRun = Simulink.sdi.getRun(runID);

% Get signal IDs
signalID1 = aircraftRun.getSignalIDByIndex(1);
signalID2 = aircraftRun.getSignalIDByIndex(2);

if (aircraftRun.isValidSignalID(signalID1))
    % Change signal tolerance
    signal1 = Simulink.sdi.getSignal(signalID1);
    signal1.AbsTol = 0.1;
end

if (aircraftRun.isValidSignalID(signalID1) && aircraftRun.isValidSignalID(signalID2))
    % Compare signals
    sigDiff = Simulink.sdi.compareSignals(signalID1,signalID2);

    % Check whether signals match within tolerance
    match = sigDiff.match
end
```

```
match = logical
   0
```

Alternatives

You can access signal properties, view signals, and export data to the workspace using the Simulation Data Inspector UI. For more information, see “Organize Your Simulation Data Inspector Workspace”.

isValidSignalID

Class: Simulink.sdi.Run
Package: Simulink.sdi

Determine whether signal ID is valid within a run

Syntax

```
isValid = runObj.isValidSignalID(signalID)
```

Description

`isValid = runObj.isValidSignalID(signalID)` returns a logical indication of whether the `signalID` corresponds to a signal in the `Simulink.sdi.Run` object `runObj`.

Input Arguments

`signalID` — Signal identifier

integer

Unique numeric signal identifier.

Output Arguments

`isValid` — Logical indicator

logical

Logical indicator of signal ID validity.

- `true` when the `signalID` corresponds to a signal in the run object.
- `false` when the `signalID` does not correspond to a signal in the run object.

Examples

Compare Signals Within a Simulation Run

This example uses the `slexAircraftExample` model to demonstrate the comparison of the input and output signals for a control system. The example marks the signals for streaming then gets the run object for a simulation run. Signal IDs from the run object specify the signals to be compared.

```
% Load model slexAircraftExample and mark signals for streaming
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot',1,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'o

% Simulate model slexAircraftExample
sim('slexAircraftExample')

% Get run IDs for most recent run
allIDs = Simulink.sdi.getAllRunIDs;
runID = allIDs(end);

% Get Run object
aircraftRun = Simulink.sdi.getRun(runID);

% Get signal IDs
signalID1 = aircraftRun.getSignalIDByIndex(1);
signalID2 = aircraftRun.getSignalIDByIndex(2);

if (aircraftRun.isValidSignalID(signalID1))
    % Change signal tolerance
    signal1 = Simulink.sdi.getSignal(signalID1);
    signal1.AbsTol = 0.1;
end

if (aircraftRun.isValidSignalID(signalID1) && aircraftRun.isValidSignalID(signalID2))
    % Compare signals
    sigDiff = Simulink.sdi.compareSignals(signalID1,signalID2);

    % Check whether signals match within tolerance
    match = sigDiff.match
end
```

```
match = logical
   0
```

Simulink.sdi.Signal class

Package: Simulink.sdi

Access signal data and metadata

Description

A `Simulink.sdi.Signal` object provides access to signal data and metadata. The metadata includes properties for visualizing and comparing signals.

Construction

`signal = Simulink.sdi.getSignal(signalID)` returns a `Simulink.sdi.Signal` object corresponding to the `signalID`.

`signal = runObj.getSignal(signalID)` returns a `Simulink.sdi.Signal` object corresponding to the `signalID`.

`signal = runObj.getSignalByIndex(index)` returns a `Simulink.sdi.Signal` object corresponding to the `signalID` at the index specified by `index` in the `Run` object `runObj`.

Input Arguments

`signalID` — Signal identifier
integer

Numeric signal identifier for the signal generated by the Simulation Data Inspector. You can get the signal ID for a signal using methods of the `Simulink.sdi.Run` object or using the `Simulink.sdi.getSignal` function.

`index` — Signal index within run
integer

Index of the signal within the run.

Example: `1`

Properties

Signal Properties (read only)

`ID` — Signal identifier
integer

Unique number identifying the signal.

Example: `1330`

`RunID` — Run identifier
integer

Run identifier for the run that contains the signal.

Example: `1402`

`Name` — Signal name
character vector

Name of the signal.

Example: `'fuel'`

`Units` — Signal measurement units
character vector

Signal units of measure.

Example: `'g/s'`

`Data Type` — Data type for signal data
character vector

Data type of signal data.

Example: `'double'`

`Complexity` — Complexity of signal data
character vector

Specifies whether signal data is real or complex.

Example: `'real'`

`SampleTime` — Signal sample time

character vector

Signal sample time. A value of `'Continuous'` indicates a variable-step simulation.

Example: `'Continuous'`

Example: `0.1`

`Model` — Name of model that produced signal

character vector

Name of the model that produced the signal.

Example: `'sldemo_fuelsys'`

`BlockPath` — Path of block that defines signal

character vector

The path to the block that produced the signal.

Example: `'sldemo_fuelsys/Engine Gas Dynamics'`

`FullBlockPath` — Path of the block that defines the signal

character vector

Path to the block that generates the signal including the full model hierarchy. For signals within reference models, `FullBlockPath` is a cell array containing the full path. For other signals, `FullBlockPath` is identical to `BlockPath`.

Example: `'sldemo_fuelsys/Engine Gas Dynamics/Mixing & Combustion/MinMax'`

`PortIndex` — Block port index

integer

Index of the output port that defines the signal.

Example: 1

`Dimensions` — Dimensions of matrix containing signal

integer array

Dimensions of the matrix that contains the signal.

Example: `[1]`

`Channel` — Index of signal within matrix

integer array

Indices of the signal for signals that are part of a vector or matrix.

`Values` — Signal values

timeseries

Time and data values for the signal. For buses, `Values` is a struct.

`RootSource` — High-level logging structure containing signal imported from workspace

character vector

Name of the high-level logging structure containing the signal, for signals imported from the MATLAB workspace.

`TimeSource` — Source of signal time data imported from workspace

character vector

Name of the variable containing the signal time data for signals imported from the MATLAB workspace.

`DataSource` — Source of data imported from workspace

character vector

Name of the array containing the signal data for signals imported from the MATLAB workspace.

Visualization Properties

`ComplexFormat` — Display format for complex signals

`"real-imaginary"` | `"magnitude"` | `"magnitude-phase"` | `"phase"`

Complex format specifying how to display complex signal data in the Simulation Data Inspector.

- `"real-imaginary"` — The real and imaginary components of the signal display together when you plot the signal. The imaginary component of the signal is plotted with a different shade of the **Line Color**.

- `"magnitude"` — The magnitude of the signal displays when you plot the signal.
- `"magnitude-phase"` — The magnitude and phase of the signal display together when you plot the signal.
- `"phase"` — The phase of the signal displays when you plot the signal. The phase is plotted with a different shade of the **Line Color**.

Data Types: `char` | `string`

`Checked` — Plotting indicator

false (default) | true

Logical value indicating whether the signal is plotted on any subplot. Setting `Checked` to `false` clears the signal from all subplots. Setting `Checked` to `true` plots the signal on the active subplot.

Data Types: `logical`

`LineColor` — Signal line color

`1-by-3` vector

Color of signal in plots, specified as a 1-by-3 RGB vector.

Example: [0 114 189]

Data Types: `double`

`LineDashed` — Signal line style

'-' | '--' | ':' | '-.'

Signal line style.

- `'-'` specifies a solid line style.
- `'--'` specifies a dashed line style.
- `':'` specifies a dotted line style.
- `'-.'` specifies a dash-dot line style.

`InterpMethod` — Interpolation method

'linear' (default) | 'zoh'

Interpolation method used in data visualization and synchronization. `'zoh'` specifies zero-order hold, and `'linear'` specifies linear interpolation. For more information about the interpolation options, see “How the Simulation Data Inspector Compares Data”.

Comparison Properties

`AbsTol` — Absolute tolerance

0 (default) | double

Positive-valued absolute tolerance of the signal used for signal comparisons. The Simulation Data Inspector uses tolerances specified in the signal properties of the baseline signal when **Override Global Tol** is set to `yes`. For more information about tolerances in the Simulation Data Inspector, see “How the Simulation Data Inspector Compares Data”.

Example: `0.1`

Data Types: `double`

`RelTol` — Relative tolerance

0 (default) | double

Positive-valued relative tolerance for the signal used for signal comparisons. The Simulation Data Inspector uses tolerances specified in the signal properties of the baseline signal when **Override Global Tol** is set to `yes`. The relative tolerance is expressed as a fractional multiplier. For example, `0.1` specifies a 10 percent tolerance. For more information about tolerances in the Simulation Data Inspector, see “How the Simulation Data Inspector Compares Data”.

Example: `0.05`

Data Types: `double`

`TimeTol` — Time tolerance

0 (default) | double

Positive-valued time tolerance for the signal used in signal comparisons. The Simulation Data Inspector uses tolerances specified in the signal properties of the baseline signal when **Override Global Tol** is set to `yes`. Specify the time tolerance in seconds. For more information about tolerances in the Simulation Data Inspector, see “How the Simulation Data Inspector Compares Data”.

Example: `0.1`

Data Types: `double`

`SyncMethod` — Synchronization method

'union' (default) | 'intersection'

Method used to synchronize signal time data for comparison. For more information about the synchronization options, see “How the Simulation Data Inspector Compares Data”.

Methods

convertUnits	Convert signal units
export	Export signal object to MATLAB timeseries
getAsTall	Return tall timetable with time and data values
plotOnSubPlot	Plot signal on specified sub-plot

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Analyze Simulation Data with Signal Tolerances

You can change tolerance values on a signal-by-signal basis to evaluate the effect of a model parameter change. This example uses the `slexAircraftExample` model and the Simulation Data Inspector to evaluate the effect of changing the time constant for the low-pass filter following the control input.

Setup

Load the model, and mark the `q, rad/sec` and `alpha, rad` signals for logging. Then, simulate the model to create the baseline run.

```
% Load example model
load_system('slexAircraftExample')

% Mark the q, rad/sec and alpha, rad signals for logging
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',3,'on
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on
% Simulate system
sim('slexAircraftExample')
```

Modify Model Parameter

Modify the model parameter `Ts` in the model workspace to change the time constant of the input low-pass filter.

```
% Change input filter time constant
modelWorkspace = get_param('slexAircraftExample','modelworkspace');
modelWorkspace.assignin('Ts',1)

% Simulate again
sim('slexAircraftExample')
```

Compare Runs and Inspect Results

Use the `Simulink.sdi.compareRuns` function to compare the data from the simulations. Then, inspect the `match` property of the signal result to see whether the signals fell within the default tolerance of 0.

```
% Get run data
runIDs = Simulink.sdi.getAllRunIDs;
runID1 = runIDs(end - 1);
runID2 = runIDs(end);

% Compare runs
diffRun1 = Simulink.sdi.compareRuns(runID1,runID2);

% Get signal result
sig1Result1 = diffRun1.getResultByIndex(1);
sig2Result1 = diffRun1.getResultByIndex(2);

% Check whether signals matched
sig1Result1.Match
```

```
ans = logical
   0
```

```
sig2Result1.Match
```

```
ans = logical
   0
```

Compare Runs with Signal Tolerances

The signals did not match within the default tolerance of 0. To further analyze the effect of the time constant change, add signal tolerances to the comparison with the baseline signal properties to determine the tolerance required for a pass. This example uses a combination of time and absolute tolerances.

```
% Get signal object for sigID1
run1 = Simulink.sdi.getRun(runID1);
sigID1 = run1.getSignalIDByIndex(1);
sigID2 = run1.getSignalIDByIndex(2);

sig1 = Simulink.sdi.getSignal(sigID1);
sig2 = Simulink.sdi.getSignal(sigID2);

% Set tolerances for q, rad/sec
sig1.AbsTol = 0.1;
sig1.TimeTol = 0.6;

% Set tolerances for alpha, rad
sig2.AbsTol = 0.2;
sig2.TimeTol = 0.8;

% Run the comparison again
diffRun2 = Simulink.sdi.compareRuns(runID1,runID2);
sig1Result2 = diffRun2.getResultByIndex(1);
sig2Result2 = diffRun2.getResultByIndex(2);

% Check the result
sig1Result2.Match
```

```
ans = logical
   1
```

```
sig2Result2.Match
```

```
ans = logical
   1
```

Define Comparison and Visualization Properties for a Signal

This example shows how to obtain a `Simulink.sdi.Signal` object and modify its properties using the Simulation Data Inspector programmatic interface.

Acquire a `Simulink.sdi.Signal` Object

First, run a simulation to create a run. This example uses example model `slexAircraftExample`. Then, use the Simulation Data Inspector programmatic interface to get the `Simulink.sdi.Signal` object for your signal of interest.

```
% Configure model "slexAircraftExample" for logging and simulate
simOut = sim('slexAircraftExample','SaveOutput','on',...
                   'SaveFormat','StructureWithTime');

% Use Simulink.sdi.createRun to create a run and return the list of signal IDs for sign
% contained in the run
[~,~,signalIDs] = Simulink.sdi.createRun('My Run','base',{'simOut'});

% Get the signal object corresponding to the first signal ID
signalObj = Simulink.sdi.getSignal(signalIDs(1));
```

Modify the Signal Properties

The `Simulink.sdi.Signal` object has several comparison and visualization properties that you can modify.

```
% Define comparison and visualization properties for this signal
signalObj.syncMethod = 'intersection';
signalObj.lineColor = [1,0.4,0.6];
signalObj.lineDashed = '-';
signalObj.checked = true;
```

View the Signal Properties

You can view the signal properties in the command window and in the Simulation Data Inspector to verify that the signal has its properties defined how you want them.

```
signalObj
```

```
signalObj = 
  Signal with properties:

               ID: 45696
            RunID: 45685
             Name: 'Integrate:CSTATE'
            Units: ''
         DataType: 'double'
       Complexity: "real"
    ComplexFormat: "real-imaginary"
```

```
         SampleTime: ''
              Model: 'slexAircraftExample'
          BlockPath: 'slexAircraftExample/Aircraft↵Dynamics↵Model/Vertical Channel/Integ
      FullBlockPath: 'slexAircraftExample/Aircraft Dynamics Model/Vertical Channel/Integ
          PortIndex: 0
         Dimensions: 1
            Channel: [1×0 int32]
            Checked: 1
          LineColor: [1 0.4000 0.6000]
         LineDashed: '-'
       InterpMethod: 'linear'
             AbsTol: 0
             RelTol: 0
            TimeTol: 0
         SyncMethod: 'intersection'
             Values: [1×1 timeseries]
         RootSource: 'simOut.get('xout')'
         TimeSource: 'simOut.get('xout').time'
         DataSource: 'simOut.get('xout').signals(1).values'
```

```
Simulink.sdi.view
```

Compare Signals Within a Simulation Run

This example uses the `slexAircraftExample` model to demonstrate the comparison of the input and output signals for a control system. The example marks the signals for streaming then gets the run object for a simulation run. Signal IDs from the run object specify the signals to be compared.

```
% Load model slexAircraftExample and mark signals for streaming
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot',1,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on

% Simulate model slexAircraftExample
sim('slexAircraftExample')

% Get run IDs for most recent run
allIDs = Simulink.sdi.getAllRunIDs;
runID = allIDs(end);

% Get Run object
aircraftRun = Simulink.sdi.getRun(runID);
```

```
% Get signal IDs
signalID1 = aircraftRun.getSignalIDByIndex(1);
signalID2 = aircraftRun.getSignalIDByIndex(2);

if (aircraftRun.isValidSignalID(signalID1))
    % Change signal tolerance
    signal1 = Simulink.sdi.getSignal(signalID1);
    signal1.AbsTol = 0.1;
end

if (aircraftRun.isValidSignalID(signalID1) && aircraftRun.isValidSignalID(signalID2))
    % Compare signals
    sigDiff = Simulink.sdi.compareSignals(signalID1,signalID2);

    % Check whether signals match within tolerance
    match = sigDiff.match
end
```

```
match = logical
   0
```

Plot Signals from a Simulation Run

This example demonstrates how to access the `Simulink.sdi.Run` object for a run created by logging signals to the Simulation Data Inspector. From the `Simulink.sdi.Run` object you can get `Simulink.sdi.Signal` objects that you can use to view data.

```
% Simulate model to create a run
sim('sldemo_fuelsys')

% Get runID for the run
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get run object for the run
fuelRun = Simulink.sdi.getRun(runID);

% Check signal count of the run
fuelRun.signalCount
```

```
ans = int32
    15
```

```
% Get signal objects for the signals in the run
signal1 = fuelRun.getSignalByIndex(4);
signal2 = fuelRun.getSignalByIndex(9);
signal3 = fuelRun.getSignalByIndex(10);

% Create subplot layout to display signals
Simulink.sdi.setSubPlotLayout(3, 1)

% Plot signals
signal1.checked = true;
signal2.plotOnSubPlot(2, 1, true);
signal3.plotOnSubPlot(3, 1, true);

% View plots in the Simulation Data Inspector
Simulink.sdi.view
```

Alternatives

Use the Simulation Data Inspector UI to view and modify signals and signal properties.

convertUnits

Class: Simulink.sdi.Signal
Package: Simulink.sdi

Convert signal units

Syntax

```
signal.convertUnits(units)
```

Description

`signal.convertUnits(units)` converts the units of `signal` to the units specified by `units`. For a list of acceptable units, see Allowed Units. You can use `Simulink.sdi.Signal.convertUnits` to convert the units on `Simulink.sdi.Signal` objects with data of all built-in and fixed-point types.

Input Arguments

`units` — Desired signal units

string | character vector

Desired units for the signal.

Example: `'m'`

Example: `"ft/s"`

Data Types: `char` | `string`

Examples

Programmatically Convert Signal Units

This example shows how to use the `convertUnits` method to convert the units of a `Simulink.sdi.Signal` object, using the model `sldemo_autotrans`.

Generate Simulation Data

Simulate the model to create a run of data. Then, use the Simulation Data Inspector programmatic interface to get the run data.

```
% Simulate the model
sim('sldemo_autotrans')

% Get a Simulink.sdi.Run object for the most recently created run
ids = Simulink.sdi.getAllRunIDs;
id = ids(end);
transRun = Simulink.sdi.getRun(id);
```

Inspect the Signal Properties

Get a `Simulink.sdi.Signal` object for the `EngineRPM` signal and inspect its properties to determine the units.

```
% Get Simulink.sdi.Signal object
signal = transRun.getSignalByIndex(1)
```

```
signal = 
  Signal with properties:

               ID: 22254
            RunID: 22291
             Name: 'EngineRPM'
            Units: 'rpm'
         DataType: 'double'
       Complexity: "real"
    ComplexFormat: "real-imaginary"
       SampleTime: '0.04'
            Model: 'sldemo_autotrans'
        BlockPath: 'sldemo_autotrans/Engine'
    FullBlockPath: 'sldemo_autotrans/Engine'
        PortIndex: 1
       Dimensions: 1
```

```
          Channel: [1x0 int32]
          Checked: 0
        LineColor: [0.9290 0.6940 0.1250]
       LineDashed: '-'
      InterpMethod: 'linear'
           AbsTol: 0
           RelTol: 0
          TimeTol: 0
       SyncMethod: 'union'
           Values: [1x1 timeseries]
       RootSource: ''
       TimeSource: ''
       DataSource: ''
```

Convert Signal Units

Use the `convertUnits` method to convert the `EngineRPM` signal units to rad/s. Then, change the signal name to reflect the new units.

```
% Convert units
signal.convertUnits('rad/s')

signal.Name = 'Engine,rad/s';
```

export

Class: Simulink.sdi.Signal
Package: Simulink.sdi

Export signal object to MATLAB timeseries

Syntax

```
ts = sigObj.export
ts = sigObj.export(startTime, endTime)
```

Description

`ts = sigObj.export` exports the `Simulink.sdi.Signal` object `sigObj` to the timeseries `ts` in the MATLAB workspace.

`ts = sigObj.export(startTime, endTime)` exports the portion of the `Simulink.sdi.Signal` object defined by `startTime` and `endTime` to the timeseries `ts` in the MATLAB workspace.

Input Arguments

`startTime` — Export start time

integer

Start time for the signal portion to export.

Example: `0`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64`

`endTime` — Export end time

integer

End time for the signal portion to export.

Example: 10

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64

Output Arguments

ts — Exported timeseries
timeseries

Timeseries exported from Simulink.sdi.Signal object.

Examples

Export Signal Data to Timeseries

This example shows how to generate a signal and export the signal data to a timeseries.

```
% Simulate model sldemo_fuelsys to create a run of logged signals
sim('sldemo_fuelsys');

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
fuelRun = Simulink.sdi.getRun(runID);

% Get a signal
signal = fuelRun.getSignalByIndex(2);

% Export signal data to timeseries
ts = signal.export;
```

Alternatives

You can export data to MATLAB or a MAT-file from the Simulation Data Inspector UI. For more information, see “Save and Share Simulation Data Inspector Data and Views”.

getAsTall

Class: Simulink.sdi.Signal
Package: Simulink.sdi

Return tall timetable with time and data values

Syntax

```
tt = sigObj.getAsTall
```

Description

`tt = sigObj.getAsTall` returns a tall timetable of the time and data values in the Simulink.sdi.Signal object `sigObj`. For more information on working with tall arrays, see “Tall Arrays” (MATLAB).

Output Arguments

`tt` — Tall timetable

tall timetable

Tall timetable containing the data from the Simulink.sdi.Signal object.

Examples

Get Tall Timetable of Signal Data

This example shows how to generate a tall timetable from signal data in a `Simulink.sdi.Signal` object.

```
% Simulate the model sldemo_fuelsys to create a run of logged signals
sim('sldemo_fuelsys');
```

```
% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
fuelRun = Simulink.sdi.getRun(runID);

% Get a signal
signal = fuelRun.getSignalByIndex(2);

% Get tall timetable of signal
tt = signal.getAsTall
```

```
tt =

  Mx1 tall timetable

          Time             Data   
    ______________       ________

plotOnSubPlot

Class: Simulink.sdi.Signal
Package: Simulink.sdi

Plot signal on specified sub-plot

Syntax

```
signalObj.plotOnSubplot(r, c, checked)
```

Description

`signalObj.plotOnSubplot(r, c, checked)` plots or clears the signal corresponding to the `Simulink.sdi.Signal` object, `sigObj`, on the sub-plot specified by `r` and `c`.

Input Arguments

r — Row index

scalar

Row index for the sub-plot.

Example: 1

c — Column index

scalar

Column index for the sub-plot.

Example: 2

checked — Signal checked parameter state

true | false

Desired state for signal on sub-plot.

- `true` plots the signal on the sub-plot.
- `false` clears the signal from the sub-plot.

Data Types: `logical`

Examples

Plot Signals from a Simulation Run

This example demonstrates how to access the `Simulink.sdi.Run` object for a run created by logging signals to the Simulation Data Inspector. From the `Simulink.sdi.Run` object you can get `Simulink.sdi.Signal` objects that you can use to view data.

```
% Simulate model to create a run
sim('sldemo_fuelsys')

% Get runID for the run
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get run object for the run
fuelRun = Simulink.sdi.getRun(runID);

% Check signal count of the run
fuelRun.signalCount

ans = int32
    15

% Get signal objects for the signals in the run
signal1 = fuelRun.getSignalByIndex(4);
signal2 = fuelRun.getSignalByIndex(9);
signal3 = fuelRun.getSignalByIndex(10);

% Create subplot layout to display signals
Simulink.sdi.setSubPlotLayout(3, 1)

% Plot signals
signal1.checked = true;
signal2.plotOnSubPlot(2, 1, true);
signal3.plotOnSubPlot(3, 1, true);
```

```
% View plots in the Simulation Data Inspector
Simulink.sdi.view
```

Alternatives

You can use the Simulation Data Inspector GUI to modify your plot layout and where you plot signals. For more information, see “Inspect Simulation Data”.

Simulink.sdi.WorkerRun class

Package: Simulink.sdi

Access simulation data from parallel workers

Description

The `Simulink.sdi.WorkerRun` class provides access to run data generated on Parallel Computing Toolbox parallel workers. Create a `Simulink.sdi.WorkerRun` object on the worker, and then use the object to access data in your local MATLAB session.

Construction

`workerRun = Simulink.sdi.WorkerRun(runID)` creates a `Simulink.sdi.WorkerRun` object with the run identifier specified by `runID`.

`workerRun = Simulink.sdi.WorkerRun.getLatest` creates a `Simulink.sdi.WorkerRun` object of the most recent run.

Input Arguments

`runID` — Run identifier
integer

Run identifier

Methods

getDataset	Create Dataset of worker run data
getDatasetRef	Create DatasetRef for worker run
getLatest	Create worker run for latest run
getLocalRun	Create local run from worker run

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport('local')

% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];
```

Initialize Parallel Workers

Use gcp to create a pool of local workers to run parallel simulations if you don't already have one. In an `spmd` code block, load the `slexAircraftExample` model and select signals to log. To avoid data concurrency issues using `sim` in `parfor`, create a temporary directory for each worker to use during simulations.

```
p = gcp;
```

```
Starting parallel pool (parpool) using the 'local' profile ...
connected to 4 workers.
```

```
spmd

    % Load system and select signals to log
    load_system('slexAircraftExample')
    Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
    Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',

    % Create temporary directory on each worker
    workDir = pwd;
    addpath(workDir)
    tempDir = tempname;
    mkdir(tempDir)
    cd(tempDir)

end
```

Run Parallel Simulations

Use `parfor` to run the seven simulations in parallel. Select the value for `Ts` for each simulation, and modify the value of `Ts` in the model workspace. Then, run the simulation and build an array of `Simulink.sdi.WorkerRun` objects to access the data with the Simulation Data Inspector. After the `parfor` loop, use another `spmd` segment to remove the temporary directories from the workers.

```
parfor index = 1:7

    % Select value for Ts
    Ts_val = Ts_vals(index);

    % Change the filter time constant and simulate
    modelWorkspace = get_param('slexAircraftExample','modelworkspace');
    modelWorkspace.assignin('Ts',Ts_val)
    sim('slexAircraftExample')

    % Create a worker run for each simulation
    workerRun(index) = Simulink.sdi.WorkerRun.getLatest

end

spmd

    % Remove temporary directories
    cd(workDir)
    rmdir(tempDir, 's')
    rmpath(workDir)

end
```

Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

```
ds(7) = Simulink.SimulationData.Dataset;

for a = 1:7
    ds(a) = workerRun(a).getDataset;
end
ds(1)
```

```
ans = 
Simulink.SimulationData.Dataset '' with 2 elements

                         Name        BlockPath
                         __________  ________________________________________

    1  [1x1 Signal]      alpha, rad  ...rcraftExample/Aircraft Dynamics Model
    2  [1x1 Signal]      Stick       slexAircraftExample/Pilot

  - Use braces { } to access, modify, or add elements using index.
```

Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```
for b = 1:7
    datasetRef(b) = workerRun(b).getDatasetRef;
end

datasetRef(1)
```

```
ans = 
  DatasetRef with properties:

           Name: 'Run 3: slexAircraftExample'
            Run: [1×1 Simulink.sdi.Run]
    numElements: 2
```

Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local Run objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```
for c = 1:7

    Runs(c) = workerRun(c).getLocalRun;
    Ts_val_str = num2str(Ts_vals(c));
    desc = strcat('Ts = ', Ts_val_str);
    Runs(c).Description = desc;
    Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);

end
```

Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

```
Simulink.sdi.cleanupWorkerResources
```

Alternatives

You can also access, view, and analyze simulation data from Parallel Computing Toolbox workers using the Simulation Data Inspector UI.

getDataset

Class: Simulink.sdi.WorkerRun
Package: Simulink.sdi

Create Dataset of worker run data

Syntax

```
dataset = workerRun.getDataset
dataset = workerRun.getDataset(domain)
```

Description

`dataset = workerRun.getDataset` returns a `Simulink.SimulationData.Dataset` object of the data corresponding to the `Simulink.sdi.WorkerRun` object.

`dataset = workerRun.getDataset(domain)` returns a `Simulink.SimulationData.Dataset` object of the data corresponding to the `Simulink.sdi.WorkerRun` object limited to the scope specified by `domain`.

Input Arguments

domain — Scope specifier

'signals' | 'outports'

Scope limiting argument that selects the data to return in the `Simulink.SimulationData.Dataset` object.

- `'signals'` limits the data returned in the `Dataset` to signals in the `WorkerRun`.
- `'outports'` limits the data returned in the `Dataset` to outport data in the `WorkerRun`.

Output Arguments

dataset — Simulink.SimulationData.Dataset object
Simulink.SimulationData.Dataset object

Simulink.SimulationData.Dataset object containing the data from the Simulink.sdi.WorkerRun object.

Examples

Access Data from a Parallel Simulation

This example executes parallel simulations of the model slexAircraftExample with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

getDatasetRef

Class: Simulink.sdi.WorkerRun
Package: Simulink.sdi

Create DatasetRef for worker run

Syntax

```
datasetRef = workerRun.getDatasetRef
datasetRef = workerRun.getDatasetRef(domain)
```

Description

`datasetRef = workerRun.getDatasetRef` returns a `Simulink.SimulationData.DatasetRef` object referencing the data in the `Simulink.sdi.WorkerRun` object, `workerRun`.

`datasetRef = workerRun.getDatasetRef(domain)` returns a `Simulink.SimulationData.DatasetRef` object referencing the data in the `Simulink.sdi.WorkerRun` object, `workerRun`, limited to the scope specified by `domain`.

Input Arguments

domain — Scope limiting input

'signals' | 'outports'

Scope limiting argument that selects the data to reference in the `Simulink.SimulationData.DatasetRef` object.

- `'signals'` limits the data referenced in the `DatasetRef` to signals in the `WorkerRun`.
- `'outports'` limits the data referenced in the `DatasetRef` to outport data in the `WorkerRun`.

Output Arguments

datasetRef — Simulink.SimulationData.DatasetRef object
Simulink.sdi.DatasetRef object

`Simulink.sdi.DatasetRef` object referencing the data in the Parallel Computing Toolbox worker run.

Examples

Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport('local')

    1  [1x1 Signal]      alpha, rad  ...rcraftExample/Aircraft Dynamics Model
    2  [1x1 Signal]      Stick       slexAircraftExample/Pilot

  - Use braces { } to access, modify, or add elements using index.
```

Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```
for b = 1:7
    datasetRef(b) = workerRun(b).getDatasetRef;
end

datasetRef(1)

ans =
  DatasetRef with properties:

           Name: 'Run 3: slexAircraftExample'
            Run: [1×1 Simulink.sdi.Run]
    numElements: 2
```

Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local Run objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```
for c = 1:7

    Runs(c) = workerRun(c).getLocalRun;
    Ts_val_str = num2str(Ts_vals(c));
    desc = strcat('Ts = ', Ts_val_str);
    Runs(c).Description = desc;
    Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);

end
```

Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

```
Simulink.sdi.cleanupWorkerResources
```

Topics

“Inspect and Compare Data Programmatically”

Introduced in R2017b

Simulink.sdi.WorkerRun.getLatest

Class: Simulink.sdi.WorkerRun
Package: Simulink.sdi

Create worker run for latest run

Syntax

```
runObj = Simulink.sdi.WorkerRun.getLatest
```

Description

`runObj = Simulink.sdi.WorkerRun.getLatest` creates a `Simulink.sdi.WorkerRun` object for the latest run on a Parallel Computing Toolbox worker.

Output Arguments

`runObj` — Local Simulink.sdi.Run object
Simulink.sdi.WorkerRun object

`Simulink.sdi.WorkerRun` object to access the data from the latest Parallel Computing Toolbox worker run.

Examples

Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport('local')

% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];
```

Initialize Parallel Workers

Use gcp to create a pool of local workers to run parallel simulations if you don't already have one. In an `spmd` code block, load the `slexAircraftExample` model and select signals to log. To avoid data concurrency issues using `sim` in `parfor`, create a temporary directory for each worker to use during simulations.

```
p = gcp;
```

```
Starting parallel pool (parpool) using the 'local' profile ...
connected to 4 workers.
```

```
spmd

    % Load system and select signals to log
    load_system('slexAircraftExample')
    Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
    Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',

    % Create temporary directory on each worker
    workDir = pwd;
    addpath(workDir)
    tempDir = tempname;
    mkdir(tempDir)
    cd(tempDir)

end
```

Run Parallel Simulations

Use parfor to run the seven simulations in parallel. Select the value for Ts for each simulation, and modify the value of Ts in the model workspace. Then, run the simulation and build an array of Simulink.sdi.WorkerRun objects to access the data with the Simulation Data Inspector. After the parfor loop, use another spmd segment to remove the temporary directories from the workers.

```
parfor index = 1:7

    % Select value for Ts
    Ts_val = Ts_vals(index);

    % Change the filter time constant and simulate
    modelWorkspace = get_param('slexAircraftExample','modelworkspace');
    modelWorkspace.assignin('Ts',Ts_val)
    sim('slexAircraftExample')

    % Create a worker run for each simulation
    workerRun(index) = Simulink.sdi.WorkerRun.getLatest

end

spmd

    % Remove temporary directories
    cd(workDir)
    rmdir(tempDir, 's')
    rmpath(workDir)

end
```

Get Dataset Objects from Parallel Simulation Output

The getDataset method puts the data from a WorkerRun into a Dataset object so you can easily post-process.

```
ds(7) = Simulink.SimulationData.Dataset;

for a = 1:7
    ds(a) = workerRun(a).getDataset;
end
ds(1)
```

```
ans = 
Simulink.SimulationData.Dataset '' with 2 elements

                         Name        BlockPath                               
                         __________  ________________________________________

    1  [1x1 Signal]      alpha, rad  ...rcraftExample/Aircraft Dynamics Model
    2  [1x1 Signal]      Stick       slexAircraftExample/Pilot               

  - Use braces { } to access, modify, or add elements using index.
```

Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```
for b = 1:7
    datasetRef(b) = workerRun(b).getDatasetRef;
end

datasetRef(1)
```

```
ans = 
  DatasetRef with properties:

           Name: 'Run 3: slexAircraftExample'
            Run: [1×1 Simulink.sdi.Run]
    numElements: 2
```

Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local `Run` objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```
for c = 1:7

    Runs(c) = workerRun(c).getLocalRun;
    Ts_val_str = num2str(Ts_vals(c));
    desc = strcat('Ts = ', Ts_val_str);
    Runs(c).Description = desc;
    Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);

end
```

Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

```
Simulink.sdi.cleanupWorkerResources
```

Introduced in R2017b

getLocalRun

Class: Simulink.sdi.WorkerRun
Package: Simulink.sdi

Create local run from worker run

Syntax

```
runObj = workerRun.getLocalRun
```

Description

`runObj = workerRun.getLocalRun` creates the local `Simulink.sdi.Run` object `runObj` for the `Simulink.sdi.WorkerRun` object `workerRun`. Use `getLocalRun` in the client MATLAB to access the `Simulink.sdi.WorkerRun` data.

Output Arguments

`runObj` — Local Simulink.sdi.Run object
Simulink.sdi.Run object

Local `Simulink.sdi.Run` object.

Examples

Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport('local')

% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];
```

Initialize Parallel Workers

Use gcp to create a pool of local workers to run parallel simulations if you don't already have one. In an `spmd` code block, load the `slexAircraftExample` model and select signals to log. To avoid data concurrency issues using `sim` in `parfor`, create a temporary directory for each worker to use during simulations.

```
p = gcp;
```

```
Starting parallel pool (parpool) using the 'local' profile ...
connected to 4 workers.
```

```
spmd

    % Load system and select signals to log
    load_system('slexAircraftExample')
    Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
    Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',

    % Create temporary directory on each worker
    workDir = pwd;
    addpath(workDir)
    tempDir = tempname;
    mkdir(tempDir)
    cd(tempDir)

end
```

Run Parallel Simulations

Use parfor to run the seven simulations in parallel. Select the value for Ts for each simulation, and modify the value of Ts in the model workspace. Then, run the simulation and build an array of Simulink.sdi.WorkerRun objects to access the data with the Simulation Data Inspector. After the parfor loop, use another spmd segment to remove the temporary directories from the workers.

```
parfor index = 1:7

    % Select value for Ts
    Ts_val = Ts_vals(index);

    % Change the filter time constant and simulate
    modelWorkspace = get_param('slexAircraftExample','modelworkspace');
    modelWorkspace.assignin('Ts',Ts_val)
    sim('slexAircraftExample')

    % Create a worker run for each simulation
    workerRun(index) = Simulink.sdi.WorkerRun.getLatest

end

spmd

    % Remove temporary directories
    cd(workDir)
    rmdir(tempDir, 's')
    rmpath(workDir)

end
```

Get Dataset Objects from Parallel Simulation Output

The getDataset method puts the data from a WorkerRun into a Dataset object so you can easily post-process.

```
ds(7) = Simulink.SimulationData.Dataset;

for a = 1:7
    ds(a) = workerRun(a).getDataset;
end
ds(1)
```

```
ans = 
Simulink.SimulationData.Dataset '' with 2 elements

                         Name        BlockPath                              
                         __________  _______________________________________

    1  [1x1 Signal]      alpha, rad  ...rcraftExample/Aircraft Dynamics Model
    2  [1x1 Signal]      Stick       slexAircraftExample/Pilot               

  - Use braces { } to access, modify, or add elements using index.
```

Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```
for b = 1:7
    datasetRef(b) = workerRun(b).getDatasetRef;
end

datasetRef(1)
```

```
ans = 
  DatasetRef with properties:

           Name: 'Run 3: slexAircraftExample'
            Run: [1×1 Simulink.sdi.Run]
    numElements: 2
```

Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local `Run` objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```
for c = 1:7

    Runs(c) = workerRun(c).getLocalRun;
    Ts_val_str = num2str(Ts_vals(c));
    desc = strcat('Ts = ', Ts_val_str);
    Runs(c).Description = desc;
    Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);

end
```

Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

```
Simulink.sdi.cleanupWorkerResources
```

Simulink.Signal

Specify attributes of signal

Description

This class enables you to create workspace objects that you can use to assign or validate the attributes of a signal or discrete state, such as its data type, numeric type, dimensions, and so on.

You can use a signal object to:

- Assign values to signal attributes that are left unassigned (have a value of `-1` or `auto`) by the signal source.
- Validate signal attributes whose values are explicitly assigned by the signal source. Such attributes have values other than `-1` or `auto`. Successful validation guarantees that the signal has the attributes that you intended it to have.

You can create a `Simulink.Signal` object in the MATLAB workspace or in a model workspace.

Use signal objects to assign or validate signal or discrete state attributes by giving the signal or discrete state the same name as the workspace variable that references the `Simulink.Signal` object.

For more information about using signal objects, see “Use Simulink.Signal Objects to Specify and Control Signal Attributes” and “Data Objects”.

Creation

Create a `Simulink.Signal` object:

- By using the Model Data Editor. See “For Signals”.
- By using the Model Explorer. See “Create Data Objects from Built-In Data Class Package Simulink”.

- Directly from a signal properties dialog box or the Property Inspector in a model. See “Create Signal Object from Signal Properties Dialog Box”.
- By using the `Simulink.Signal` function, described below.

Syntax

```
signalObj = Simulink.Signal
```

Description

`signalObj = Simulink.Signal` returns a `Simulink.Signal` object with default property values.

Properties

For information about properties in the property dialog box of a `Simulink.Signal` object, see “Property Dialog Box”.

`CoderInfo` — Specifications for generating code for signal

`Simulink.CoderInfo` object

Information used by Simulink Coder for generating code for this signal. The value of this property is an object of `Simulink.CoderInfo` class.

For more information, see “Apply Storage Classes to Individual Signal, State, and Parameter Data Elements” (Simulink Coder) and “Choose Storage Class for Controlling Data Representation in Generated Code” (Embedded Coder).

`Complexity` — Numeric complexity of signal

`'auto'` (default) | `'real'` | `'complex'`

Character vector specifying the numeric type of this signal. Valid values are `'auto'` (determined by Simulink), `'real'`, or `'complex'`.

Data Types: `char`

`DataType` — Data type of signal

`'auto'` (default) | character vector

Character vector specifying the data type of this signal.

The default value, `'auto'`, specifies that Simulink should determine the data type. You can specify a built-in data type (for example, `'uint8'` or `'single'`) or a custom data type. To specify a custom data type, use a MATLAB expression that specifies the type, (for example, the name of a `Simulink.NumericType` object that you create in the base workspace).

To specify a bus object as the data type for the signal object, use the `'Bus: <object_name>'` syntax. See “Bus Support” for details about what you need to do if you specify a bus object as the data type.

Example: `'auto'`

Example: `'int8'`

Example: `'fixdt(1,16,5)'`

Example: `'myAliasTypeObject'`

Example: `'Enum: myEnumType'`

Example: `'Bus: myBusObject'`

Data Types: `char`

Description — Custom description of signal

`''` (empty character vector) (default) | character vector

Description of this signal. This field is intended for use in documenting this signal.

This property is used by the Simulink Report Generator and for code generation.

If you have an Embedded Coder license, you can add the signal description as a comment for the variable declaration in generated code:

- Specify a storage class for the signal object other than `Auto`.
- On the **Code Generation > Comments** pane of the model Configuration Parameters dialog box, select the model configuration parameter **Simulink data object descriptions**. For more information, see “Simulink data object descriptions” (Simulink Coder).

Example: `'This signal represents the rotation speed of the engine.'`

Data Types: `char`

`Dimensions` — Dimensions of signal

`-1` (default) | row vector | character vector

Scalar or vector specifying the dimensions of this signal.

Valid values are `-1` (the default) specifying any dimensions, `N` specifying a vector signal of size `N`, or `[M N]` specifying an `MxN` matrix signal.

To use symbolic dimensions, specify a character vector.

Example: `[1 3]`

Example: `'[1 myDimParam]'`

Data Types: `double` | `char`

`DimensionsMode` — Dimension mode of signal

`'auto'` (default) | `'Fixed'` | `'Variable'`

Dimensions mode of the signal. Valid values are:

- `'auto'`— Allows variable-size and fixed-size signals.
- `'Fixed'`—Allows only fixed-size signals. Does not allow variable-size signals.
- `'Variable'`—Allows only variable-size signals.

For information about variable-size signals, see “Variable-Size Signal Basics”.

`Max` — Maximum value of signal

`[]` (empty) (default) | real `double` scalar

Maximum value that this signal can have.

The default value is `[]` (unspecified). Specify a finite, real, double, scalar value.

Note If you specify a bus object as the data type for a signal, do not set the maximum value for bus data on the signal property dialog box. Simulink ignores this setting. Instead, set the maximum values for bus elements of the bus object specified as the data type. For information on the Maximum property of a bus element, see `Simulink.BusElement`.

Simulink uses this value in the following ways:

- When updating the diagram or starting a simulation, Simulink generates an error if the initial value of the signal is greater than the maximum value or if the maximum value is outside the range of the data type of the signal.
- When you enable the **Simulation range checking** diagnostic, Simulink alerts you during simulation if the signal value is greater than the maximum value (see “Simulation range checking”).

Example: `5.32`

Data Types: `double`

`Min` — Minimum value of signal

`[]` (empty) (default) | real `double` scalar

Minimum value that this signal can have.

The default value is `[]` (unspecified). Specify a finite, real, double, scalar value.

Note If you specify a bus object as the data type for a signal, do not set the minimum value for bus data on the signal property dialog box. Simulink ignores this setting. Instead, set the minimum values for bus elements of the bus object specified as the data type. For information on the Minimum property of a bus element, see `Simulink.BusElement`.

Simulink uses this value in the following ways:

- When updating the diagram or starting a simulation, Simulink generates an error if the signal's initial value is less than the minimum value or if the minimum value is outside the range for the data type of the signal.
- When you enable the **Simulation range checking** diagnostic, Simulink alerts you during simulation if the signal value is less than the minimum value (see “Simulation range checking”).

Example: `-0.92`

Data Types: `double`

`InitialValue` — Initial value of signal or state

`''` (empty character vector) (default) | character vector

Signal or state value before a simulation takes its first time step.

You can specify any MATLAB expression, including the name of a workspace variable, that evaluates to a numeric scalar value or array.

At the command prompt or in a script, even if you use a number, specify the initial value as a character vector.

```
mySigObject.InitialValue='5.3';
```

```
mySigObject.InitialValue = 'myNumericVariable';
```

To specify an initial value for a signal that uses a numeric data type other than `double`, cast the initial value to the signal data type. For example, you can specify `'single(73.3)'` to use `73.3` as the initial value for a signal of data type `single`.

If you use a bus object as the data type for the signal object, set `InitialValue` to a character vector containing either `0` or a MATLAB structure that matches the bus object. See “Bus Support” for details.

If the initial value evaluates to a MATLAB structure, then in the **Configuration Parameters** dialog box, set “Underspecified initialization detection” to `Simplified`.

If necessary, Simulink converts the initial value to ensure type, complexity, and dimension consistency with the corresponding block parameter value. If you specify an invalid value or expression, an error message appears when you update the model. Also, Simulink performs range checking of the initial value. The software alerts you when the initial value of the signal lies outside a range that corresponds to its specified minimum and maximum values and data type.

Classic initialization mode: In this mode, initial value settings for signal objects that represent the following signals and states override the corresponding block parameter initial values if undefined (specified as `[]`):

- Output signals of conditionally executed subsystems and Merge blocks
- Block states

Simplified initialization mode: In this mode, initial values of signal objects associated with the following blocks are ignored. The initial values of the corresponding blocks are used instead.

- Outport blocks of conditionally executed subsystems
- Merge blocks

Example: `'15.23'`

Example: `'myInitParam'`

Data Types: `char`

`SampleTime` — Sample time of signal
`-1` (default) | `double` scalar or array

Rate at which this signal should be updated.

See “Specify Sample Time” for details.

Example: `0.001`

Example: `2`

Data Types: `double`

`Unit` — Physical unit of signal value
`''` (default) | valid unit

Physical unit used for expressing this signal value (for example, inches).

For more information, see “Unit Specification in Simulink Models”.

Example: `'degC'`

Data Types: `char`

Simulink.SimulationData.BlockPath

Fully specified Simulink block path

Description

Simulink creates block path objects when creating dataset objects for signal logging and data store logging. `Simulink.SimulationData.Signal` and `Simulink.SimulationData.DataStoreMemory` objects include block path objects.

You can create a block path that you can use with the `Simulink.SimulationData.Dataset.getElement` method to access a specific dataset element. If you want to create a dataset in MATLAB to use as a baseline to compare against a signal logging or data store logging dataset, then you need to create the block paths as part of that dataset.

The `Simulink.SimulationData.BlockPath` class is very similar to the `Simulink.BlockPath` class.

You do not have to have Simulink installed to use the `Simulink.SimulationData.BlockPath` class. However, you must have Simulink installed to use the `Simulink.BlockPath` class. If you have Simulink installed, consider using `Simulink.BlockPath` instead of `Simulink.SimulationData.BlockPath`, because the `Simulink.BlockPath` class includes a method for checking the validity of block path objects without you having to update the model diagram.

Property Summary

Name	Description
`SubPath` on page 5-205	Individual component within the block specified by the block path

Method Summary

Name	Description
`BlockPath` on page 5-205	Create a block path.
`convertToCell` on page 5-208	Convert a block path to a cell array of character vectors.
`getBlock` on page 5-209	Get a single block path in the model reference hierarchy.
`getLength` on page 5-210	Get the length of the block path.

Properties

SubPath

Represents an individual component within the block specified by the block path.

For example, if the block path refers to a Stateflow chart, you can use `SubPath` to indicate the chart signals. For example:

```
Block Path:
      'sf_car/shift_logic'

    SubPath:
      'gear_state.first'
```

character vector

`RW`

Methods

BlockPath

Create block path

```
blockpath_object = Simulink.SimulationData.BlockPath()
blockpath_object = Simulink.SimulationData.BlockPath(blockpath)
blockpath_object = Simulink.SimulationData.BlockPath(paths)
blockpath_object = Simulink.SimulationData.BlockPath(paths, subpath)
```

`blockpath`

The block path object that you want to copy.

`paths`

A character vector or cell array of character vectors that Simulink uses to build the block path.

Specify each character vector in order, from the top model to the specific block for which you are creating a block path.

Each character vector must be a path to a block within the Simulink model. The block must be:

- A block in a single model
- A Model block (except for the last character vector, which may be a block other than a Model block)
- A block that is in a model that is referenced by a Model block that is specified in the previous character vector

`subpath`

A character vector that represents an individual component within a block.

`blockpath_object`

The block path that you create.

`blockpath_object = Simulink.SimulationData.BlockPath()` creates an empty block path.

`blockpath_object = Simulink.SimulationData.BlockPath(blockpath)` creates a copy of the block path of the block path object that you specify with the `source_blockpath` argument.

`blockpath = Simulink.SimulationData.BlockPath(paths)` creates a block path from the character vector or cell array of character vectors that you specify with the `paths` argument. Each character vector represents a path at a level of model hierarchy.

`blockpath = Simulink.SimulationData.BlockPath(paths, subpath)` creates a block path from the character vector or cell array of character vectors that you specify with the `paths` argument and creates a path for the individual component (for example, a signal) of the block.

Create a block path object called `bp1`, using a cell array of character vectors representing elements of the block path.

```
bp1 = Simulink.SimulationData.BlockPath(...
{'sldemo_mdlref_depgraph/thermostat', ...
'sldemo_mdlref_heater/Fahrenheit to Celsius', ...
'sldemo_mdlref_F2C/Gain1'})
```

The resulting block path reflects the model reference hierarchy for the block path.

```
bp1 =

  Simulink.BlockPath
  Package: Simulink

  Block Path:
    'sldemo_mdlref_depgraph/thermostat'
      'sldemo_mdlref_heater/Fahrenheit to Celsius'
        'sldemo_mdlref_F2C/Gain1
```

convertToCell

Convert block path to cell array of character vectors

```
cellarray = Simulink.SimulationData.BlockPath.convertToCell()
```

`cellarray`

The cell array of character vectors representing the elements of the block path.

`cellarray = Simulink.SimulationData.BlockPath.convertToCell()` converts a block path to a cell array of character vectors.

```
bp1 = Simulink.SimulationData.BlockPath(...
{'sldemo_mdlref_depgraph/thermostat', ...
'sldemo_mdlref_heater/Fahrenheit to Celsius', ...
'sldemo_mdlref_F2C/Gain1'})
cellarray_for_bp1 = bp1.convertToCell()
```

The result is a cell array representing the elements of the block path.

```
cellarray_for_bp1 =

    'sldemo_mdlref_depgraph/thermostat'
    'sldemo_mdlref_heater/Fahrenheit to Celsius'
    'sldemo_mdlref_F2C/Gain1'
```

getBlock

Get single block path in model reference hierarchy

```
block = Simulink.SimulationData.BlockPath.getBlock(index)
```

`index`

The index of the block for which you want to get the block path. The index reflects the level in the model reference hierarchy. An index of 1 represents a block in the top-level model, an index of 2 represents a block in a model referenced by the block of index 1, and an index of `n` represents a block that the block with index `n-1` references.

`block`

The block representing the level in the model reference hierarchy specified by the `index` argument.

`blockpath = Simulink.SimulationData.BlockPath.getBlock(index)` returns the block path of the block specified by the `index` argument.

Get the block for the second level in the model reference hierarchy.

```
bp1 = Simulink.SimulationData.BlockPath(...
{'sldemo_mdlref_depgraph/thermostat', ...
'sldemo_mdlref_heater/Fahrenheit to Celsius', ...
'sldemo_mdlref_F2C/Gain1'})
blockpath = bp1.getBlock(2)
```

The result is the `thermostat` block, which is at the second level in the block path hierarchy.

```
blockpath =

sldemo_mdlref_heater/Fahrenheit to Celsius
```

getLength

Get length of block path

```
length = Simulink.SimulationData.BlockPath.getLength()
```

`length`

The length of the block path. The length is the number of levels in the model reference hierarchy.

`length = Simulink.SimulationData.BlockPath.getLength()` returns a numeric value that corresponds to the number of levels in the model reference hierarchy for the block path.

Get the length of block path `bp1`.

```
bp1 = Simulink.SimulationData.BlockPath(...
{'sldemo_mdlref_depgraph/thermostat', ...
'sldemo_mdlref_heater/Fahrenheit to Celsius', ...
 'sldemo_mdlref_F2C/Gain1'})
length_bp1 = bp1.getLength()
```

The result reflects that the block path has three elements.

```
length_bp1 =

     3
```

Simulink.BlockPath | Simulink.SimulationData.Dataset

Introduced in R2012b

Simulink.SimulationData.Dataset class

Package: Simulink.SimulationData

Create Simulink.SimulationData.Dataset object

Description

Simulink creates `Simulink.SimulationData.Dataset` objects to store data elements when:

- Performing signal logging, which use the `Dataset` format
- Logging states or outputs, if you use the default format of `Dataset`.
- Logging a data store

Using the `Dataset` format for state and output logging offers several advantages compared to `Array`, `Structure`, or `Structure with time`. For details, see “Format for State Information Saved Without SimState”.

To generate a `Simulink.SimulationData.Dataset` object from the root-level Inport blocks in a model, you can use the `createInputDataset` function. Signals in the generated dataset have the properties of the Inport blocks and the corresponding ground values at model start and stop times. You can create `timeseries` and `timetable` objects for the time and values for signals for which you want to load data for simulation. The other signals use ground values.

You can use curly braces (`{}`) to streamline indexing syntax to access, set, and add elements in a dataset, instead of using `get`, `getElement`, `setElement`, or `addElement` methods. To get or set an element using curly braces, the index must be a scalar that is not greater than the number of elements in the dataset variable. To add an element, the index must be a scalar that is greater than the total number of elements in the dataset by one. The `get`, `getElement`, `setElement`, or `addElement` methods support specifying an element by name or block path, as well as by index.

For individual non-bus signal data, you can specify these types of data for `Dataset` elements:

- `timeseries`
- `timetable`
- `matlab.io.datastore.SimulationDatastore`
- `double` vectors or structure of `double` data
- `timeseries`
- a `Simulink.SimulationData.Signal`, `Simulink.SimulationData.State`, or `Simulink.SimulationData.DataStoreMemory` object

For bus signals, use a structure with a data element for each leaf signal, using one of these formats:

- A MATLAB `timeseries` object
- A MATLAB `timetable` object
- A `matlab.io.datastore.SimulationDatastore` object
- An empty matrix
- An array that meets one of these requirements:
  - An array with time in the first column and the remaining columns each corresponding to an input port. See “Loading Data Arrays to Root-Level Inputs”.
  - An `nx1` array for a root inport that drives a function-call subsystem.
- Another structure, with data elements for each signal that are consistent with these requirements for a structure for bus data

Variable-size signals are not supported for `Dataset` data values.

Construction

`convertedDataset = Simulink.SimulationData.Dataset( loggedDataToConvert)` converts the `loggedDataToConvert` to a `Simulink.SimulationData.Dataset` object. You can then use the `Simulink.SimulationData.Dataset.concat` method to combine elements of two `Dataset` objects.

`constructedDataset = Simulink.SimulationData.Dataset( variableName,'DatasetName','dsname')` constructs a `Simulink.SimulationData.Dataset` object, adds variable `variableName`, and names the data set `dsname`.

Input Arguments

`loggedDataToConvert` — Data element to convert

character vector

Data element to convert to a data set, specified as a character vector. You can convert elements such as:

- Array
- Structure

  Note Structure inputs cannot be arrays or matrices.
- Structure with time
- MATLAB time series
- Structure of MATLAB time-series elements
- `ModelDataLogs`

`variableName` — Variable to add to data set

character vector

Variable to add to data set, specified as a character vector.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: `'DatasetName','dsname'`

`DatasetName` — Data set name

character vector

Data set name, specified as a character vector.

Output Arguments

`convertedDataset` — Converted data set

`Simulink.SimulationData.Dataset` object

Converted data set, returned as a `Simulink.SimulationData.Dataset` object.

`constructedDataset` — Constructed data set

`Simulink.SimulationData.Dataset` object

Constructed data set, returned as a `Simulink.SimulationData.Dataset` object.

Properties

Name — Name of the data set

same as the logging variable (default) | character vector

Name of the data set, specified as a character vector or logging variable (for example, `logsout` for signal logging). Specify a name when you want to distinguish easily one data set from another. For example, you could reset the name when comparing multiple simulations. This property is read/write.

```
ds = Simulink.SimulationData.Dataset
ds.Name = 'Dataset1'
```

`Total Elements` — Total number of elements

double

Total number of elements in data set, specified as a double. This property is read only. To get this value, use the `Simulink.SimulationData.Dataset.numElements` method.

Methods

addElement	Add element to end of data set
concat	Concatenate dataset to another dataset
get	Get element or collection of elements from dataset
getElementNames	Return names of all elements in dataset
find	Get element or collection of elements from dataset
numElements	Get number of elements in data set
plot	Plot dataset elements in Signal Preview window or Simulation Data Inspector
setElement	Change element stored at specified index

Tip To get the names of `Dataset` variables in the MAT-file, using the `Simulink.SimulationData.DatasetRef.getDatasetVariableNames` function processes faster than using the `who` or `whos` functions.

Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects (MATLAB).

Examples

Concatenate Dataset ds1 to Dataset ds

Convert data from two To Workspace blocks, convert to `Dataset` format, and concatenate them. `myvdp` is the `vdp` model with two To Workspace blocks with variables named `simout` and `simout1`. These blocks log data in time-series format.

```
mdl = 'myvdp';
open_system(mdl);
sim(mdl)
ds = Simulink.SimulationData.Dataset(simout);
```

```
ds1 = Simulink.SimulationData.Dataset(simout1);
dsfinal = concat(ds,ds1)
```

Access, Change, and Add Dataset Elements

Use curly brace indexing syntax to work with a `logsout` signal logging dataset that has three elements.

Get the second element of the `logsout` dataset.

```
logsout{2}
```

Change the name of the third element.

```
logsout{3}.Name = 'thirdSignal'
```

Add a fourth element.

```
time = 0.1*(0:100)';
element4 = Simulink.SimulationData.Signal;
element4.Name = 'C';
element4.Values = timeseries(3*sin(time),time);
logsout{4} = element4
```

Introduced in R2011a

Simulink.SimulationData.DatasetRef class

Package: Simulink.SimulationData

Create `Simulink.SimulationData.DatasetRef` object

Description

To use a reference for accessing a `Simulink.SimulationData.Dataset` object stored in a MAT-file, create a `Simulink.SimulationData.DatasetRef` object. You can use this reference to avoid running out of memory, by retrieving data signal by signal, for data that you log to persistent storage. You can stream a `DatasetRef` object into a root-level input port or you can use it to create a `SimulationDatastore` object to use for streaming. For details, see “Load Big Data for Simulations”.

For parallel simulations, for which you specify an array of `Simulink.SimulationInput` objects, if you are logging to file, Simulink:

- Creates `Simulink.SimulationData.DatasetRef` objects to access output data in the MAT-file and includes those objects in the `SimulationOutput` object data
- Enables the `CaptureErrors` argument for simulation

Construction

`datasetRefObj = Simulink.SimulationData.DatasetRef(location, identifier)` creates a reference to the contents of a `Simulink.SimulationData.Dataset` variable stored in a MAT-file.

Input Arguments

`location` — MAT-file containing `Simulink.SimulationData.Dataset` object to reference
character vector

MAT-file containing Simulink.SimulationData.Dataset object to reference, specified as a character vector. The character vector is a path to the MAT-file. Do not use a file name from one locale in a different locale.

identifier — Name of variable in MAT-file
character vector

Name of a Simulink.SimulationData.Dataset variable in MAT-file, specified as a character vector. When you log to persistent storage, Simulink uses the variable names specified for each kind of logging.

Suppose that you use the default variable name for signal logging (logsout) and default MAT-file name for persistent storage logging (mat.out), After you simulate the model, then to create a reference to the Dataset object for signal logging, at the MATLAB command line, enter:

```
sigLogRef = Simulink.SimulationData.DatasetRef('out.mat','logsout');
```

Output Arguments

datasetRefObj — Reference to Dataset object
Simulink.SimulationData.DatasetRef object

Reference to logging dataset, returned as a Simulink.SimulationData.DatasetRef object.

Properties

Location — MAT-file containing Simulink.SimulationData.Dataset object to reference
character vector

MAT-file containing Simulink.SimulationData.Dataset object to reference, specified as a character vector. The character vector is a path to the MAT-file. Include the .mat extension in the file name. Do not use a file name from one locale in a different locale.

Identifier — Name of variable in MAT-file
character vector

Name of a `Simulink.SimulationData.Dataset` variable in MAT-file, specified as a character vector. When you log to persistent storage, Simulink uses the variable names specified for each kind of logging (for example, `'logsout'` for signal logging data).

Methods

Use the `numElements`, `getElement`, and `getElementNames` methods for a `Simulink.SimulationData.DatasetRef` object the same way that you use those methods for a `Simulink.SimulationData.Dataset` object.

Method	Purpose
`numElements`	Get number of elements from dataset
`getElementNames`	Return names of all elements in dataset
`get` The `get` method is an alias for the `getElement` method. **Note** You can use curly braces to streamline indexing syntax to access elements in a dataset reference, instead of using `get` or `getElement` methods. To get an element using curly braces, the index must be a scalar that is not greater than the number of elements in the variable. The `get` and `getElement` methods support specifying an element by name or block path, as well as by index.	Get element from dataset
`getAsDatastore`	Get `matlab.io.datastore.SimulationDatastore` representation of element from a `DatasetRef` object
getDatasetVariableNames on page 2-889	List names of `Dataset` variables in MAT-file

Method	Purpose
`plot`	Plot elements from dataset in Signal Preview window

Tip To get the names of `Dataset` variables in the MAT-file, using the `Simulink.SimulationData.DatasetRef.getDatasetVariableNames` function processes faster than using the `who` or `whos` functions.

Copy Semantics

You can copy `DatasetRef` object properties by value. However, copying the `DatasetRef` object produces a handle object. Copying the `DatasetRef` object does not copy the data in the MAT-file that the object references. For details about copy operations, see Copying Objects (MATLAB) in the MATLAB documentation.

Examples

Create References to Persistent Storage Dataset Objects

This example shows how to construct and use `Simulink.SimulationData.DatasetRef` objects to access data for a model that logs to persistent storage. This simple example shows the basic steps for logging to persistent storage. This example does not represent a realistic situation for logging to persistent storage, because it shows a short simulation with small memory requirements.

Open the vdp model.

In the **Configuration Parameters > Data Import/Export** pane, select these parameters:

- **States**
- **Log Dataset data to file**

Set the **Format** parameter to `Dataset`.

Leave the other parameter settings as they are and click **Apply**.

In the model, click a signal and from the action bar, select **Enable Data Logging**.

Simulate the model.

Get a list of `Dataset` variable names in the `out.mat` file.

```
varNames = Simulink.SimulationData.DatasetRef.getDatasetVariableNames('out.mat')
```

```
varNames =

  1x2 cell array

  'logsout'   'xout'
```

Create a reference to the logged states data that is stored in `out.mat`. The variable for the logged states data is `xout`.

```
statesLogRef = Simulink.SimulationData.DatasetRef('out.mat','xout')
```

```
statesLogRef =

  Simulink.SimulationData.DatasetRef
  Characteristics:
          Location: out.mat (/my_files/out.mat)
        Identifier: xout

  Resolved Dataset: 'xout' with 2 elements

       Name  BlockPath
       ____  _________
    1  ''    vdp/x1
    2  ''    vdp/x2
```

Create a reference to the signal logging data that is stored in `out.mat`. The variable for the signal logging data is `logsout`.

```
sigLogRef = Simulink.SimulationData.DatasetRef('out.mat.','logsout')
```

```
sigLogRef =

  Simulink.SimulationData.DatasetRef
  Characteristics:
          Location: out.mat (/my_files/out.mat)
        Identifier: logsout
  Resolved Dataset: 'logsout' with 1 element

       Name  BlockPath
       ____  _________
    1  x1    vdp/x1
```

Use the `numElements` to access the number of elements in the logged states dataset.

```
statesLogRef.numElements
```

```
ans =

     2
```

Use the `DatasetRef` to access the first element of the signal logging dataset.

```
sigLogRef{1}
```

```
ans = 

  Simulink.SimulationData.Signal
  Package: Simulink.SimulationData

  Properties:
              Name: 'x1'
    PropagatedName: ''
         BlockPath: [1x1 Simulink.SimulationData.BlockPath]
          PortType: 'outport'
         PortIndex: 1
            Values: [1x1 timeseries]

  Methods, Superclasses
```

Delete the persistent storage MAT-file and try to use one of the `DatasetRef` objects.

```
delete('out.mat');
statesLogRef.get(1)
```

```
File does not exist.
```

The `statesLogRef` still exists, but it is a reference to a `Dataset` object that is in a file that no longer exists.

Simulink.SimulationData.DataStoreMemory

Container for data store logging information

Description

Simulink uses `Simulink.SimulationData.DataStoreMemory` objects to store logging information from Data Store Memory blocks during simulation. The objects contain information about the blocks that write to the data store.

Property Summary

Name	Description
`BlockPath` on page 5-618	Location of Data Store Memory block for the logged data store
`DSMWriterBlockPaths` on page 5-619	Location of Data Store Write blocks that write to the data store
`DSMWriters` on page 5-619	Data Store Write blocks for each signal value
`Name` on page 5-619	Name of the data store dataset
`Scope` on page 5-620	Scope of the data store: `'local'` or `'global'`
`Values` on page 5-620	Time and data that were logged

Properties

BlockPath

Location of Data Store Memory block for the logged data store.

character vector

`RW`

DSMWriterBlockPaths

Location of blocks that write to the data store. Each element of the array contains the full block path of one writer block.

Vector of `Simulink.SimulationData.BlockPath` objects

`RO`

DSMWriters

The number of writes in the data store.

The `n`th element of `DSMWriters` contains the index of the element in `DSMWriterBLockPaths` that contains the block path of the writer that performed the `n`th write to `Values`.

Integer vector

`RO`

Name

Name of the data store dataset

character vector

`RO`

Scope

Scope of the data store: `'local'` or `'global'`

character vector

`RW`

Values

Time and data that were logged

MATLAB `timeseries`

`RW`

Simulink.SimulationData.LoggingInfo

Signal logging override settings

Description

This object specifies a set of signal logging override settings.

Use a `Simulink.SimulationData.LoggingInfo` object to specify the signal logging override settings for a signal. You can use this object for the `LoggingInfo` property of a `Simulink.SimulationData.SignalLoggingInfo` object.

Property Summary

Name	Description
`DataLogging` on page 5-622	Signal logging mode.
`NameMode` on page 5-622	Source of signal logging name.
`LoggingName` on page 5-622	Custom signal logging name.
`DecimateData` on page 5-623	Use subset of sample points.
`Decimation` on page 5-623	Decimation value (`n`): Simulink logs every `n`th data point.
`LimitDataPoints` on page 5-623	Limit number of data points to log.
`MaxPoints` on page 5-624	Maximum number of data points to log (`N`). The set of logged data points is the last `N` data points generated by the simulation.

Method Summary

Name	Description
`LoggingInfo` on page 5-624	Create a set of signal logging override settings for a signal.

Properties

DataLogging

Signal logging mode.

Indicates whether logging is enabled for this signal.

logical value — `{true} | false`

`RW`

NameMode

Source of signal logging name.

Indicates whether the signal logging name is a custom name (`'true'`) or whether the signal logging name is the same as the signal name (`'false'`).

logical value — `true | {false}`

`RW`

LoggingName

Custom signal logging name

The custom signal logging name to use for this signal, if the `NameMode` property is `true`.

character vector

`RW`

DecimateData

Log a subset of sample points, selecting data points at a specified interval. The first sample point is always logged.

logical value — `true | {false}`

`RW`

Decimation

Decimation value (`n`). If the `DecimateData` property is `true`, then Simulink logs every `n`th data point.

positive integer

`RW`

LimitDataPoints

Limit the number of data points to log.

logical value — `true | {false}`

`RW`

MaxPoints

Maximum number of data points to log (N). If the LimitDataPoints property is true, then the set of logged data points includes the last N data points generated by the simulation.

positive integer

RW

Methods

LoggingInfo

Create a Simulink.SimulationData.LoggingInfo object.

```
logging_info_object = Simulink.SimulationData.LoggingInfo()
logging_info_object = Simulink.SimulationData.LoggingInfo(object)
```

object

A signal logging override settings object whose property values the constructor uses for the new Simulink.SimulationData.LoggingInfo object. The signal logging override object that you specify must be one of the following types of objects:

- Simulink.SimulationData.LoggingInfo object
- Simulink.LoggingInfo object

logging_info_object

A Simulink.SimulationData.LoggingInfo object.

logging_info_object = Simulink.SimulationData.LoggingInfo() creates a Simulink.SimulationData.LoggingInfo object that has default property values.

`logging_info_object = Simulink.SimulationData.LoggingInfo(object)` creates a `Simulink.SimulationData.LoggingInfo` object that copies the property values from the signal logging override object that you specify with the `object` argument.

The following example creates a `Simulink.SimulationData.LoggingInfo` object with default settings, changes the `DecimateData` and `Decimation` properties, and uses the object for the `LoggingInfo` property of a `Simulink.SimulationData.SignalLoggingInfo` object `mi`.

```
open_system(docpath(fullfile(docroot, 'toolbox', 'simulink', 'examples', 'ex_mdlref_cou
open_system(docpath(fullfile(docroot, 'toolbox', 'simulink', 'examples', 'ex_bus_loggin
log_info = Simulink.SimulationData.LoggingInfo();
log_info.DecimateData = true;
log_info.Decimation = 2;
mi = Simulink.SimulationData.SignalLoggingInfo('ex_bus_logging');
mi.LoggingInfo = log_info
```

```
Simulink.SimulationData.SignalLoggingInfo
  Package: Simulink.SimulationData

  BlockPath:
    'ex_bus_logging'

  OutputPortIndex: 1

  LoggingInfo:
        DataLogging: 1
           NameMode: 0
        LoggingName: ''
       DecimateData: 1
         Decimation: 2
    LimitDataPoints: 0
          MaxPoints: 5000
```

Simulink.SimulationData.ModelLoggingInfo

Signal logging override settings for a model

Description

This class is a collection of `Simulink.SimulationData.SignalLoggingInfo` objects that specify all signal logging override settings for a model.

Use methods and properties of this class to:

- Turn off logging for a signal or a Model block.
- Change logging settings for any signals that are marked for logging within a model.

You can control whether a top-level model and referenced models override signal logging settings or use the signal logging settings specified by the model. Use the `LoggingMode` and `LogAsSpecifiedByModels` properties to control which logging settings to apply.

Logging Mode for Models	Property Settings
For top-level model and all referenced models, use logging settings specified in the model.	Set `LoggingMode` to `LogAllAsSpecifiedInModel`.
For top-level model and all referenced models, use override signal logging settings.	Set `LoggingMode` to `OverrideSignals`.
For top-level model and referenced models, use a mix of override signal logging settings and the signal logging settings specified in the model.	Set `LoggingMode` to `OverrideSignals`. Include models you want to ignore override signal logging settings in the `LogAsSpecifiedByModels` cell array.

For more information and examples, see “Override Signal Logging Settings from MATLAB”.

Property Summary

Name	Description
`LoggingMode` on page 5-628	Signal logging override status
`LogAsSpecifiedByModels` on page 5-629	Source of signal logging settings for the top-level model or a top-level Model block
`Signals` on page 5-630	All signals that have signal override settings

Method Summary

Name	Description
`findSignal` on page 5-634	Find signals within the `Signals` vector, using block path and output port index.
`verifySignalAndModelPaths` on page 5-638	Verify signal and model paths for the model signal logging override object.
`getLogAsSpecifiedInModel` on page 5-636	Determine whether the model logs signals as specified in the model or uses override settings.
`setLogAsSpecifiedInModel` on page 5-637	Set the logging mode for the top-level model or a top-level Model block.
`createFromModel` on page 5-630	Create and populate a model signal logging override object with all logged signals in the model reference hierarchy.
`ModelLoggingInfo` on page 5-633	Set signals to log or override logging settings.

Properties

LoggingMode

Signal logging override status. Values are:

- `OverrideSignals` — (Default) Uses the logging settings for signals, as specified in the `Signals` property. For models where `getLogAsSpecifiedInModel` is:

  - `true` — Logs all signals, as specified in the model.
  - `false` — Logs only the signals specified in the `Signals` property.
- `LogAllAsSpecifiedInModel` — Logs signals in the top-level model and all referenced models, as specified in the model. Simulink honors the signal logging indicators (blue antennae) and ignores the `Signals` property.

To change the logging mode for the top-level model or for a given reference model, use the `setLogAsSpecifiedInModel` method.

character array

`RW`

LogAsSpecifiedByModels

When `LoggingMode` is set to `'OverrideSignals'`, the `LogAsSpecifiedByModels` cell array specifies the top-level models and top-level Model blocks that ignore the `'OverrideSignals'` setting and log signals as specified in the models or Model blocks.

- For the top-level model and top-level Model blocks that the cell array includes, Simulink ignores the `Signals` property overrides.
- For a model or Model block that the cell array does *not* include, Simulink uses the `Signals` property to determine which signals to log.

When `LoggingMode` is set to `'LogAllAsSpecifiedInModel'`, Simulink ignores the `LogAsSpecifiedByModels` property.

Use the `getLogAsSpecifiedInModel` method to determine whether the top-level model or top-level Model block logs signals as specified in the model (default logging), and use `setLogAsSpecifiedInModel` to turn default logging on and off.

cell array — For the top-level model, specify the model name. For Model blocks, specify the block path.

`RW`

Signals

Vector of `Simulink.SimulationData.SignalLoggingInfo` objects for all signals with signal logging override settings.

vector of `Simulink.SimulationData.SignalLoggingInfo` objects

`RW`

Methods

createFromModel

Create a `Simulink.SimulationData.ModelLoggingInfo` object for a top-level model, with override settings for each logged signal in the model.

```
model_logging_info_object = ...
Simulink.SimulationData.ModelLoggingInfo.createFromModel(...
model,options)
```

`model`

Name of the top-level model for which to create a `Simulink.SimulationData.ModelLoggingInfo` object.

`options`

You can use any combination of the following option name and value pairs to control the kinds of systems from which to include logged signals.

- `FollowLinks`
  - `on` — (Default) Include logged signals from inside of libraries.
  - `off` — Skip all libraries.
- `LookUnderMasks`

  - `all` — (Default) Include logged signals from all masked subsystems.
  - `none` — Skip all masked subsystems.
  - `graphical` — Include logged signals from masked subsystems that do not have a workspace or dialog box.
  - `functional` — Include logged signals from masked subsystems that do not have a dialog box.
- `Variants`
  - `ActiveVariants` — (Default) Include logged signals from only active subsystem and model reference variants.
  - `AllVariants` — Include logged signals from all subsystem and model reference variants.
- `RefModels`
  - `on` — (Default) Include logged signals from referenced models.
  - `off` — Skip all referenced models.

If you select more than one option, then the created `Simulink.SimulationData.ModelLoggingInfo` object includes signals that fit the combinations (the "AND") of the specified options. For example, if you set `FollowLinks` to `on` and set `RefModels` to `off`, then the model signal logging override object does not include signals from library links that exist inside of referenced models.

`model_logging_override_object`

`Simulink.SimulationData.ModelLoggingInfo` object for the top-level model.

`model_logging_info_object = Simulink.SimulationData.ModelLoggingInfo.createFromModel(model)` creates a `Simulink.SimulationData.ModelLoggingInfo` object for the model that includes logged signals for the following kinds of systems:

- Libraries
- Masked subsystems
- Referenced models

- Active variants

`model_logging_override_object = Simulink.SimulationData.ModelLoggingInfo.createFromModel(model, options)` creates a `Simulink.SimulationData.ModelLoggingInfo` object for the model. The included logged signals reflect the options settings for the following kinds of systems:

- Libraries
- Masked subsystems
- Referenced models
- Variants

The following example creates a model logging override object for the `sldemo_mdlref_bus` model and automatically adds each logged signal in the model to that object:

```
mi = Simulink.SimulationData.ModelLoggingInfo.createFromModel(...
'sldemo_mdlref_bus')
```

```
mi = 

  ModelLoggingInfo with properties:

                   Model: 'sldemo_mdlref_bus'
             LoggingMode: 'OverrideSignals'
    LogAsSpecifiedByModels: {}
                 Signals: [1x3 Simulink.SimulationData.SignalLoggingInfo]
```

To apply the model override object settings, use:

```
set_param(sldemo_mdlref_bus,'DataLoggingOverride',mi);
```

You can use the options for the `createFromModel` method to specify how the method should handle model components like variants and model references. For example, use the `Variants` option to create a `model_logging_override` object that includes logged signals in all variants of the `sldemo_variant_subsystems` model.

By default, the `sldemo_variant_subsystems` model does not log any signals. Start by configuring the output signals from the `Linear Controller` and `Nonlinear Controller` subsystems for logging.

```
% Open the sldemo_variant_subsystems model
sldemo_variant_subsystems;
```

```
% Mark the output of the Linear Controller subsystem for logging
ph = get_param('sldemo_variant_subsystems/Controller/Linear Controller',...
    'PortHandles');
set_param(ph.Outport(1),'DataLogging','on');

% Mark the output of the Nonlinear Controller subsystem for logging
ph1 = get_param('sldemo_variant_subsystems/Controller/Nonlinear Controller',...
    'PortHandles');
set_param(ph1.Outport(1),'DataLogging','on');
```

Then, use the `createFromModel` method to create a `model_logging_override` object that includes signals logged in all variant subsystems of the `sldemo_variant_subsystems` model.

```
% Create a model_logging_override object for the model including all variants
mi = Simulink.SimulationData.ModelLoggingInfo.createFromModel(...
'sldemo_variant_subsystems', 'Variants', 'AllVariants')
```

```
mi = 

  ModelLoggingInfo with properties:

                     Model: 'sldemo_variant_subsystems'
               LoggingMode: 'OverrideSignals'
    LogAsSpecifiedByModels: {}
                   Signals: [1×2 Simulink.SimulationData.SignalLoggingInfo]
```

ModelLoggingInfo

Specify signals to log or override logging settings.

```
model_logging_override_object = ....
Simulink.SimulationData.ModelLoggingInfo(model)
```

`model`

Name of the top-level model for which to create a `Simulink.SimulationData.ModelLoggingInfo` object

`model_logging_override_object`

`Simulink.SimulationData.ModelLoggingInfo` object created for the specified top-level model.

model_logging_override_object= Simulink.SimulationData.ModelLoggingInfo(model) creates a Simulink.SimulationData.ModelLoggingInfo object for the specified top-level model.

If you use the Simulink.SimulationData.ModelLoggingInfo constructor, specify a Simulink.SimulationData.SignalLoggingInfo object for each logged signal for which you want to override logging settings.

To check that you have specified valid signal logging override settings for a model, use the verifySignalAndModelPaths method with the Simulink.SimulationData.ModelLoggingInfo object for the model.

The following example shows how to log all signals as specified in the top-level model and all referenced models.

```
mi = Simulink.SimulationData.ModelLoggingInfo('sldemo_mdlref_bus');
mi.LoggingMode = 'LogAllAsSpecifiedInModel'
```

```
mi =

  ModelLoggingInfo with properties:

                   Model: 'sldemo_mdlref_bus'
             LoggingMode: 'LogAllAsSpecifiedInModel'
    LogAsSpecifiedByModels: {}
                 Signals: []
```

To apply the model override object settings, use:

```
set_param(sldemo_mdlref_bus, 'DataLoggingOverride', mi);
```

The following example shows how to log only signals in the top-level model:

```
mi = ...
Simulink.SimulationData.ModelLoggingInfo('sldemo_mdlref_bus');
mi.LoggingMode = 'OverrideSignals';
mi = mi.setLogAsSpecifiedInModel('sldemo_mdlref_bus', true);
set_param('sldemo_mdlref_bus', 'DataLoggingOverride', mi);
```

findSignal

Find signals within the Signals vector, using a block path and optionally an output port index.

```
signal_indices = ...
      model_logging_override_object.findSignal(block_path)
signal_indices = ...
      model_logging_override_object.findSignal(...
      block_path, port_index)
```

`block_path`

Source block to search. The `block_path` must be one of the following:

- Character vector
- Cell array of character vectors
- `Simulink.BlockPath` object

`port_index`

Index of the output port to search. Specify a scalar greater than, or equal to, `1`.

`signal_indices`

Vector of numeric indices into the signals vector of the `Simulink.SimulationData.ModelLoggingInfo` object.

`signal_indices = model_logging_override_object.findSignal( block_path)` finds the indices of the signals for the block path that you specify.

To find a *single* instance of a signal within a referenced model, use a `Simulink.BlockPath` object or a cell array with a *full path*.

To find *all* instances of a signal within a referenced model, use a character vector with the *relative* path of the signal within the referenced model.

To find a logged chart signal within a Stateflow chart, use a `Simulink.BlockPath` object and set the `SubPath` property to the name of the Stateflow chart signal.

`signal_indices = model_logging_override_object.findSignal( block_path, port_index)` finds the indices of the output signal for the port that you specify, for the block path that you specify.

Do not use the `port_index` argument for Stateflow chart signals.

To find a signal that is *not* in a Stateflow chart and that does *not* appear in multiple instances of a referenced model:

```
open_system(docpath(fullfile(docroot,'toolbox','simulink','examples','ex_bus_logging')))
% Open the referenced model
ex_mdlref_counter_bus
mi = Simulink.SimulationData.ModelLoggingInfo.createFromModel(...
     'ex_bus_logging');
% Click the COUNTERBUSCreator block that is the source of
% the logged COUNTERBUS signal
signal_index = mi.findSignal(gcb)
```

```
signal_index =

     1
```

To find a signal in a specific instance of a referenced model that is not in a Stateflow chart, use the following approach:

```
signal_index = mi.findSignal({'ex_bus_logging/CounterA', ...
'ex_mdlref_counter_bus/Bus Creator'})
```

```
signal_index =

     4
```

For an example that uses the `findSignal` method with a Stateflow chart, see “Override Logging Properties with the Command-Line API” (Stateflow).

getLogAsSpecifiedInModel

Determine whether the model logs as specified in the model or uses override settings.

```
logging_mode = ...
getLogAsSpecifiedInModel(model_logging_override_object, path)
```

`model_logging_override_object`

A `Simulink.SimulationData.ModelLoggingInfo` object.

`path`

The `path` is a character vector that specifies one of the following:

- Name of the top-level model
- Block path of a Model block in the top-level model

`logging_mode`

The `logging_mode` is:

- `true`, if the model specified by `path` is logged as specified in the model.
- `false`, if the model specified by `path` is logged using the override settings specified in the `Signals` property.

`logging_mode = model_logging_override_object.getLogAsSpecifiedInModel(path)` returns:

- `true`, if the model specified by `path` is logged as specified in the model.
- `false`, if the model specified by `path` is logged using the override settings specified in the `Signals` property.

In the following example, the `Simulink.SimulationData.ModelLoggingInfo` object `mi` uses the override settings specified in its `Signals` property.

```
mi = Simulink.SimulationData.ModelLoggingInfo('sldemo_mdlref_bus');
logging_mode = getLogAsSpecifiedInModel(mi, 'sldemo_mdlref_bus')
```

```
logging_mode =

     0
```

setLogAsSpecifiedInModel

Set logging mode for top-level model or top-level Model block

```
setLogAsSpecifiedInModel(override_object, path)
```

`override_object`

`Simulink.SimulationData.ModelLoggingInfo` object.

`path`

Character vector that specifies one of the following:

- Name of the top-level model
- Block path of a Model block in the top-level model

`value`

Logging mode:

- `true`, if the model specified by `path` is logged as specified in the model
- `false`, if the model specified by `path` is logged using the override settings specified in the `Signals` property.

`setLogAsSpecifiedInModel(override_object, path, value)` sets the LoggingMode property for a top-level model or a Model block in the top-level model.

The following example shows how to log only signals in the top-level model, using the logging settings specified in that model:

```
sldemo_mdlref_bus;
mi = Simulink.SimulationData.ModelLoggingInfo('sldemo_mdlref_bus');
mi.LoggingMode = 'OverrideSignals';
mi = setLogAsSpecifiedInModel(mi, 'sldemo_mdlref_bus', true);
set_param('sldemo_mdlref_bus', 'DataLoggingOverride', mi);
```

verifySignalAndModelPaths

Verify paths in `Simulink.SimulationData.ModelLoggingInfo` object.

```
verified_object = verifySignalAndModelPaths...
     (model_logging_override_object, action)
```

`model_logging_override_object`

The `Simulink.SimulationData.ModelLoggingInfo` object to verify. This argument is required.

action

The action that the function performs if verification fails. This argument is optional. Specify one of the following values:

- `error` — (default) Throw an error when verification fails
- `warnAndRemove` — Issue a warning when verification fails and update the `Simulink.SimulationData.ModelLoggingInfo` object.
- `remove` — Silently update the `Simulink.SimulationData.ModelLoggingInfo` object.

verified_object

If the method detects no invalid paths, it returns the validated object. For example:

```
verified_object =

  Simulink.SimulationData.ModelLoggingInfo
  Package: Simulink.SimulationData

  Properties:
                     Model: 'logging_top'
               LoggingMode: 'OverrideSignals'
    LogAsSpecifiedByModels: {}
                   Signals: [1x11 Simulink.SimulationData.SignalLoggingInfo]
```

If the method detects an invalid path, it performs the action specified by the `action` argument. By default, it issues an error message.

verified_object = verifySignalAndModelPaths(model_logging_override_object, action)

For a `Simulink.SimulationData.ModelLoggingInfo` object, verify that:

- All character vectors in the `LogAsSpecifiedByModels` property are either the name of the top-level model or the block path of a Model block in the top-level model.
- The block paths for signals in the `Signals` property refer to valid blocks within the hierarchy of the top-level model.
- The `OutputPortIndex` property for all signals in the `Signals` property are valid for the given block.
- All signals in the `Signals` property refer to *logged* signals.

The action argument specifies what action the method performs. By default, the method returns an error if it detects an invalid path.

If you use the Simulink.SimulationData.ModelLoggingInfo constructor and specify a Simulink.SimulationData.SignalLoggingInfo object for each signal, then consider using the verifySignalAndModelPaths method to verify that your object definitions are valid.

The following example shows how to validate the signal and block paths in a Simulink.SimulationData.ModelLoggingInfo object. Because the action argument is warnAndRemove, if the validation fails, the verifySignalAndModelPaths method issues a warning and updates the Simulink.SimulationData.ModelLoggingInfo object.

```
mi = Simulink.SimulationData.ModelLoggingInfo('sldemo_mdlref_bus');
verified_object = verifySignalAndModelPaths...
     (mi, 'warnAndRemove')
```

“Export Signal Data Using Signal Logging”
“Log Data Stores”

Introduced in R2012b

Simulink.SimulationData.Parameter class

Stores logged parameter data and metadata

Description

The `Simulink.SimulationData.Parameter` object stores data and metadata for logged block parameters. Tunable parameters connected to Dashboard blocks are logged to the Simulation Data Inspector during simulation. To access logged parameter data, you can export the simulation run from the Simulation Data Inspector using the UI or the `Simulink.sdi.exportRun` function. For more information about exporting simulation runs with the Simulation Data Inspector UI, see “Export Data from the Simulation Data Inspector”.

Construction

`dataset = Simulink.sdi.exportRun(runID)` returns a `Simulink.SimulationData.Parameter` object as an element in `dataset` when the run corresponding to `runID` contains logged parameter data.

Input Arguments

`runID` — Run ID for a run with logged parameter data
integer

Run ID for the run containing logged parameter data. Run IDs are assigned by the Simulation Data Inspector. You can get the run ID for a simulation run using the `Simulink.sdi.getAllRunIDs` or `Simulink.sdi.getRunIDByIndex` function.

Output Arguments

`dataset` — Dataset containing the run data
`Simulink.SimulationData.Dataset`

`Simulink.SimulationData.Dataset` object containing the run data and metadata. When the run contains logged parameter data, the dataset contains a

Simulink.SimulationData.Parameter object as an element for each logged parameter. The Simulink.SimulationData.Parameter element takes the name of the logged parameter. You can access a Simulink.SimulationData.Parameter object using get.

Properties

Name — Parameter name in Dashboard label
character vector

Parameter name as it appears in the label for the Dashboard block.

Example: 'Mu:Gain'

BlockPath — Path of the block associated with the parameter
Simulink.SimulationData.BlockPath

Path to the block the parameter or variable corresponds to, returned as a Simulink.SimulationData.BlockPath object.

Example: vdp/Mu

ParameterName — Parameter name
character vector

Name of the logged parameter as it appears in the block dialog box. For variables, the ParameterName property is empty.

Example: 'Gain'

VariableName — Variable name
character vector

Name of the logged variable. For parameters, the VariableName property is empty.

Example: 'Zw'

Values — Timeseries of parameter values
timeseries

timeseries of parameter values. For logged variables, the timeseries name is the variable name. For logged parameters, the timeseries name is empty.

Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects (MATLAB).

Examples

Access Logged Parameter Data

This example shows how to access logged parameter data. Parameter data automatically logs to the Simulation Data Inspector when you connect a Dashboard block to a block parameter. Parameter data does not export to the workspace with other simulation data at the end of simulation. You can access the logged parameter data by exporting the run containing it from the Simulation Data Inspector.

Log Parameter Data

Run a simulation of the model `ex_vdp_param`, a modified version of the `vdp` model with an Edit block connected to the gain parameter of the Mu block. The parameter data logs with the signal data for signals marked for logging.

```
sim('ex_vdp_param')
```

Export Run

Use the Simulation Data Inspector programmatic interface to get the run ID for the `ex_vdp_param` simulation, and export the run.

```
index = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(index);

dataset = Simulink.sdi.exportRun(runID);
```

Access Parameter Data

Use the `get` method to access the `Simulink.SimulationData.Parameter` object for the logged parameter data. The `Values` property contains the timeseries data for the parameter.

```
muGain = dataset.get('Mu:Gain')
```

```
muGain = 
  Simulink.SimulationData.Parameter
  Package: Simulink.SimulationData

  Properties:
         Name: 'Mu:Gain'
    BlockPath: [1x1 Simulink.SimulationData.BlockPath]
       Values: [1x1 timeseries]

  Methods, Superclasses

Simulink.SimulationData.SignalLoggingInfo

Signal logging override settings for signal

Description

This object contains the signal override signal logging settings for a single logged signal.

Property Summary

Name	Description
`BlockPath` on page 5-645	`Simulink.BlockPath` of source block of a signal to log.
`OutputPortIndex` on page 5-646	Index of an output port to log.
`LoggingInfo` on page 5-646	`Simulink.SimulationData.LoggingInfo` object containing all logging override settings for a signal.

Method Summary

Name	Description
`SignalLoggingInfo` on page 5-647	Create a signal logging override object for a signal.

Properties

BlockPath

`Simulink.BlockPath` of source block of signal to log. The block path represents the full model reference hierarchy.

To specify a specific instance of a signal, use an absolute path, reflecting the model reference hierarchy, starting at the top model. For example:

```
sig_log_info = Simulink.SimulationData.SignalLoggingInfo(...
{'sldemo_mdlref_bus/CounterA', ...
'sldemo_mdlref_counter_bus/Bus Creator'})
```

`Simulink.BlockPath`

`RW`

OutputPortIndex

Index of the output port to log. The index is a 1-based numeric value.

nonzero integer

`RW`

LoggingInfo

`Simulink.SimulationData.LoggingInfo` object containing logging override settings for a signal. The logging settings specify whether signal logging is overridden for this signal. The logging settings also can specify a logging name, a decimation factor, and a maximum number of data points.

`Simulink.SimulationData.LoggingInfo` object

`RW`

Methods

SignalLoggingInfo

Construct a `Simulink.SimulationData.SignalLoggingInfo` object.

```
signal_logging_info_object = ...
   Simulink.SimulationData.SignalLoggingInfo()
signal_loggingInfo_object = ...
   Simulink.SimulationData.SignalLoggingInfo(path)
signalLoggingInfo_object = ...
   Simulink.SimulationData.SignalLoggingInfo(path,index)
```

`path`

The block path of the source block for which the signal logging override settings apply. If you use this argument without also using the `port` argument, then Simulink sets the output port index to `1`.

`index`

Output port index to which the signal logging override settings apply.

`signal_logging_object`

`Simulink.SimulationData.SignalLoggingInfo` object that represents the override settings of a signal.

`signal_logging_override_object = Simulink.SimulationData.SignalLoggingInfo()` creates a `Simulink.SimulationData.LoggingInfo` object that contains default logging settings for a signal.

`signal_logging_override_object = Simulink.SimulationData.SignalLoggingInfo(path)` creates a `Simulink.SimulationData.LoggingInfo` object, using the specified block path, and sets the output port index to `1`.

`signal_logging_override_object = Simulink.SimulationData.SignalLoggingInfo(path, port)` creates a

Simulink.SimulationData.LoggingInfo object that contains default logging settings for the specified block path and output port index.

The following example creates a Simulink.SimulationData.SignalLoggingInfo object for the first output port of the Bus Creator block in the sldemo_mdlref_bus model.

```
sldemo_mdlref_bus;
mi = Simulink.SimulationData.ModelLoggingInfo(...
'sldemo_mdlref_bus');
mi.LoggingMode = 'OverrideSignals';
mi.Signals = ...
   Simulink.SimulationData.SignalLoggingInfo(...
   {'sldemo_mdlref_bus/CounterA', ...
'sldemo_mdlref_counter_bus/Bus Creator'}, 1)
```

The output is:

```
mi =

  Data.ModelLoggingInfo with properties:

                     Model: 'sldemo_mdlref_bus'
               LoggingMode: 'OverrideSignals'
    LogAsSpecifiedByModels: {}
                   Signals: [1x1 Simulink.SimulationData.SignalLoggingInfo]

  Methods
```

Simulink.SimulationData.Signal

Container for signal logging information

Description

Simulink uses `Simulink.SimulationData.Signal` objects to store signal logging information during simulation. The objects contain information about the source block for the signal, including the port type and index.

Property Summary

Name	Description
`BlockPath` on page 5-649	Block path for the source block for the signal
`Name` on page 5-650	Name of signal element to use for name-based access
`PropagatedName` on page 5-650	Propagated signal name, if any
`PortIndex` on page 5-650	Numeric index of port that was logged
`PortType` on page 5-651	Type of port that was logged: for signal logging, the port type is `'outport'`
`Values` on page 5-651	Time and data that were logged

Properties

BlockPath

Block path for the source block for the signal

`Simulink.SimulationData.BlockPath`

RW

Name

Name of signal element to use for name-based access

character vector

RW

PropagatedName

Propagated name of signal element

Signal logging and root Outport block logging data for a signal captures the propagated signal name if the logging format is `Dataset` and:

- For signal logging, you:
  - Mark the signal for signal logging and in the Signal Properties dialog box select **Show Propagated Signals**.
  - Enable **Configuration Parameters > Data Import/Export > Signal logging**.
- For root Outport block logging, you select **Configuration Parameters > Data Import/Export > Output**.

The propagated signal name does not include angle brackets (<>).

character vector

RO

PortIndex

Numeric index of port that was logged

scalar real integer

`RW`

PortType

Type of port that was logged: for signal logging, the port type is `'outport'`

character vector

`RW`

Values

Time and data that were logged.

For an example of how to use the `Values` property and plot logged signal data, in the `sldemo_mdlref_bus` example, see “Logging Signal Data.”

- MATLAB `timeseries` object
- Structure of MATLAB `timeseries` objects (for bus signals)
- Array of structures of MATLAB `timeseries` objects (for array of buses signals)
- Array of MATLAB `timeseries` objects (for nonbus signals in a For Each subsystem)
- MATLAB `timetable` object
- Structure of MATLAB `timetable` objects (for bus signals)
- Array of structures of MATLAB `timetable` objects (for array of buses signals)
- Cell array of MATLAB `timetable` objects (for nonbus signals in a For Each subsystem)

Simulink.SimulationData.State class

Package: Simulink.SimulationData

State logging element

Description

Simulink uses `Simulink.SimulationData.State` objects to store state logging information during simulation. The objects contain state information about which block the state data is coming from and the type of state.

Properties

`Name` — Name of state element to use for name-based access
character vector

Name of state element to use for name-based access, specified as a character vector. If you do not specify a name, `'CSTATE'` or `'DSTATE'` is used, depending on whether it a continuous or discrete state.

`BlockPath` — Block path for state source block
a `Simulink.SimulationData.BlockPath` object

Block path for state source block, specified as a `Simulink.SimulationData.BlockPath` object

`Label` — Type of state
`'CSTATE'` | `'DSTATE'`

Type of state, returned as `'CSTATE'` or `'DSTATE'`. Read-only property.

- `'CSTATE'` – Continuous state
- `'DSTATE'` – Discrete state

`Values` — State element information
single MATLAB `timeseries` object | a structure of MATLAB `timeseries` objects

State element information, specified as a single MATLAB `timeseries` object or as a structure of MATLAB `timeseries` objects.

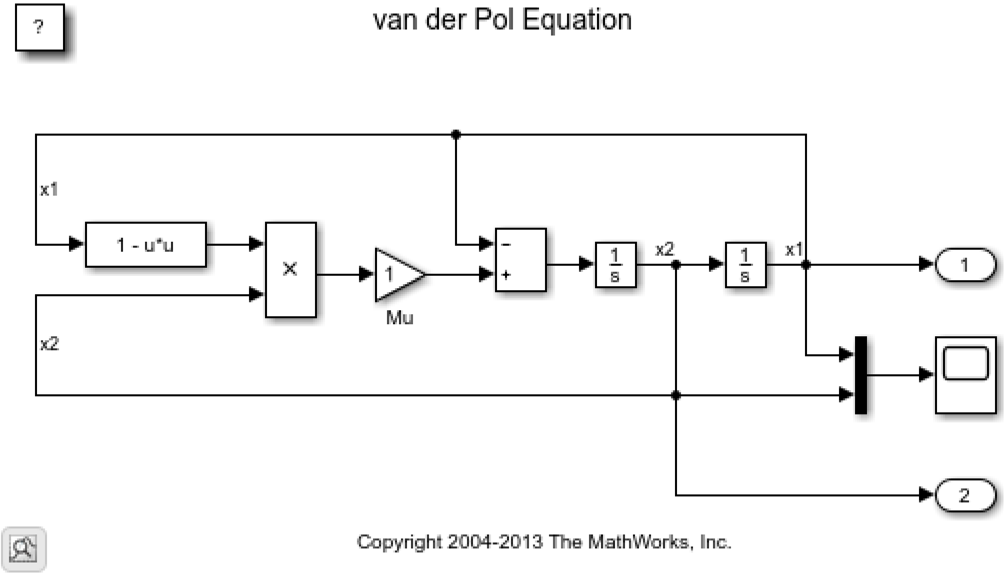
Examples

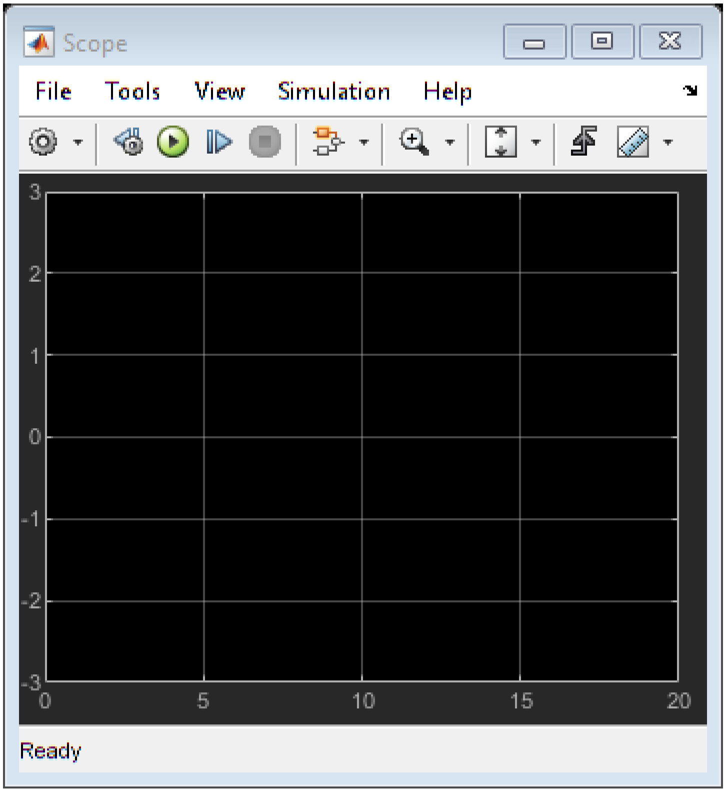
Final State Information in Structure with Dataset Format

Saved final state information in `Dataset` format and access the state data after simulation.

Open the `vdp` model and specify to log final states in `Dataset` format. Use the default logged state variable, `xFinal`.

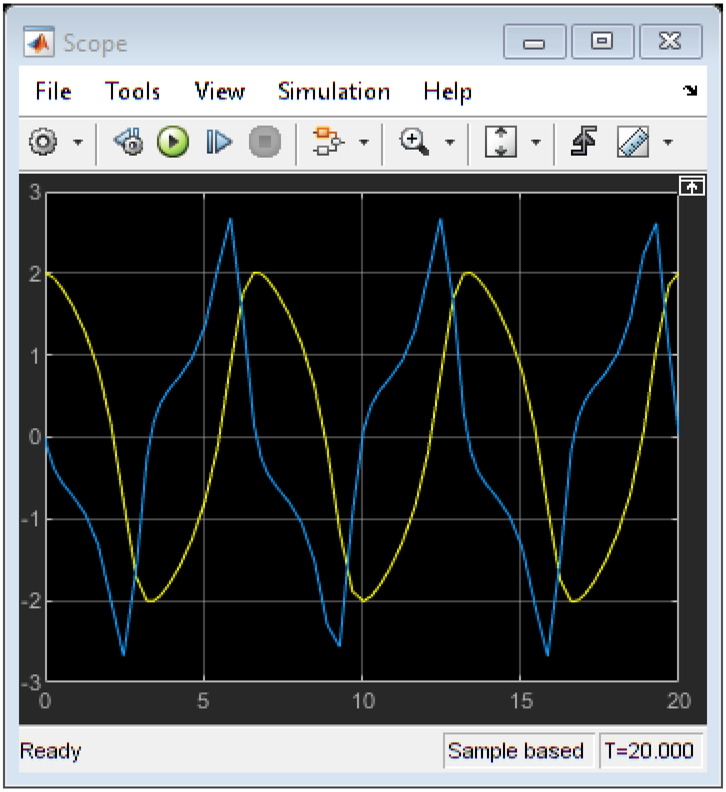
```
open_system('vdp');
set_param(gcs,'SaveFinalState','on','SaveFormat','Dataset');
```





Simulate the `vdp` model.

```
sim('vdp');
```



View the state logging information in `xFinal`.

```
xFinal
```

```
xFinal =

Simulink.SimulationData.Dataset 'xFinal' with 2 elements

                        Name  BlockPath
                        ____  _________

    1  [1x1 State]      ''    vdp/x1
    2  [1x1 State]      ''    vdp/x2

  - Use braces { } to access, modify, or add elements using index.
```

Examine the first element of the state dataset.

```
xFinal.get(1)
```

```
ans = 

  Simulink.SimulationData.State
  Package: Simulink.SimulationData

  Properties:
         Name: ''
    BlockPath: [1×1 Simulink.SimulationData.BlockPath]
        Label: CSTATE
       Values: [1×1 timeseries]
```

“State Information”

Introduced in R2015a

Simulink.SimulationData.Unit class

Package: Simulink.SimulationData

Store units for simulation data

Description

Simulink creates `Simulink.SimulationData.Unit` objects to store unit information for signals when:

- Performing signal logging, which uses the `Dataset` format
- Logging root Outport blocks, if in **Configurations Parameters** you select the **Output** parameter and set **Format** to `Dataset`
- Logging to a To Workspace block or To File block, if you set the **Save format** block parameter to the default of `Timeseries`

Construction

`unitsObj = Simulink.SimulationData.Unit(unitName)` creates a `Simulink.SimulationData.Unit` object with the unit that you specify.

Input Arguments

`unitName` — Name of logging data units

character vector

Name of logging data units, specified as a character vector.

Output Arguments

`unitObj` — Logging data units

`Simulink.SimulationData.Unit` object

Logging data units, returned as a `Simulink.SimulationData.Unit` object.

Properties

Name — Name of the units
character vector

Name of the units, specified as a character vector.

Methods

Method	Purpose
`Simulink.SimulationData.Unit.setName`	Specify name of logging data unit

Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects (MATLAB).

Examples

Create and Use Inches Logging Units

Create a `Simulink.SimulationData.Unit` object representing inches.

```
inchesUnit = Simulink.SimulationData.Unit('inches');
```

Create a MATLAB `timeseries` object and set its `Units` field to the `Simulink.SimulationData.Unit` object.

```
ts = timeseries(1:10);
ts.DataInfo.Units = inchesUnit;
ts.DataInfo.Units
```

```
ans = 

  Units with properties:
    Name: 'inches'
```

Introduced in R2016a

Simulink.SimulationInput class

Package: Simulink

Creates `SimulationInput` objects to make changes to a model for multiple or individual simulations

Description

The `Simulink.SimulationInput` object allows you to make changes to a model and run simulations with those changes. These changes are temporarily applied to the model. Through `Simulink.SimulationInput` object, you can change:

- Initial state
- Model parameters
- Block parameters
- External inputs
- Variables

Through the `Simulink.SimulationInput` object, you can also specify MATLAB functions to run at the start and the end of each simulation by using `in.PreSimFcn` and `in.PostSimFcn`, respectively.`Simulink.SimulationInput` does not support the ability to allow model references to have their own data dictionary.

Construction

`in = Simulink.SimulationInput('modelName')` creates a `SimulationInput` object for a model.

Input Arguments

`modelName` — Name of the model
character vector

Create a `Simulink.SimulationInput` object by passing the name of the model as an argument.

Example: `in = Simulink.SimulationInput('cstr')`

Properties

`ModelName` — Name of the model
character vector

Name of the model for which the `SimulationInput` object is created.

`InitialState` — Initial state
`Simulink.SimState.ModelSimState` object

Initial state of the model for a simulation specified as a `Simulink.SimState.ModelSimState` object.

`ExternalInput` — External Input
numerical array, dataset object, timeseries, character array

External inputs added to the model for a simulation.

`BlockParameters` — Block parameters
array of `Simulink.Simulation.BlockParameter`

Block parameters of the model that are modified.

`Variables` — Variables
array of `Simulink.Simulation.Variable`

Variables of the model that are modified.

`ModelParameters` — Model parameters
array of `Simulink.Simulation.ModelParameter`

Model parameters of the model that are modified.

`PreSimFcn` — Function
MATLAB function

MATLAB function to run before the start of the simulation.

PostSimFcn — Function

MATLAB function

MATLAB function to run after the simulations.

UserString — User string

character array

Brief description of the simulation specified as a character array.

Methods

Method	Purpose
setModelParameter	Set model parameters to be used for a specific simulation through SimulationInput object.
setBlockParameter	Set block parameters to be used for a specific simulation through SimulationInput object.
setInitialState	Set initial state to be used for a specific simulation through SimulationInput object.
setExternalInput	Set external inputs for a simulation through SimulationInput object.
setVariable	Set variables for a simulation through SimulationInput object.
setPreSimFcn	Specify a MATLAB function to run before start of each simulation through SimulationInput object.
setPostSimFcn	Specify a MATLAB function to run after each simulation is complete through SimulationInput object.
applyToModel	Apply changes to the model specified through a SimulationInput object.
validate	Validate the contents of the SimulationInput object.

Examples

Create a Simulink.SimulationInput Object

This example shows you how to create a SimulationInput object.

Create a single SimulationInput object for a model.

```
model = 'sldemo_househeat';
in = Simulink.SimulationInput(model);
```

Create an Array of Simulink.SimulationInput Objects

This example shows you how to create an array of SimulationInput objects.

Create an array of SimulationInput objects by using the for loop.

```
model = 'vdp';
for i = 10:-1:1
   in(i) = Simulink.SimulationInput(model);
end
```

Set Block Parameters using an Array of Simulink.SimulationInput Objects

This example modifies the block parameters of a model through the SimulationInput object.

Open the model

```
mdl = 'sldemo_househeat';
open_system(mdl);
```

Create a SimulationInput object for this model.

```
in = Simulink.SimulationInput(mdl);
```

Modify block parameter.

```
in = in.setBlockParameter('sldemo_househeat/Set Point','Value','300');
```

Simulate the model.

```
out = sim(in)
```

applyToModel

Apply changes to the model specified through a `SimulationInput` object, `in`

Syntax

`in.applyToModel`

Description

`in.applyToModel` applies the changes specified through the `SimulationInput` object to the model. You can use it to debug a model or to interactively analyze a simulation.

Examples

Apply Changes Made Through the Simulink.SimulationInput Object to the Model

This example shows how to modify a model through a `SimulationInput` object and save those modifications.

Open the model and create a `SimulationInput` object.

```
open_system('sldemo_househeat');
in = Simulink.SimulationInput('sldemo_househeat');
```

Modify block parameter, model parameters and a variable through `SimulationInput` object.

```
in = in.setBlockParameter('sldemo_househeat/Set Point','Value','75');
in = in.setVariable('cost',50,'Workspace','sldemo_househeat');
in = in.setModelParameter('StartTime','1','StopTime','5');
```

Apply the modifications made in the above step to the model.

```
in.applyToModel
```

setExternalInput

Set external inputs for a simulation through `SimulationInput` object, `in`

Syntax

```
in = in.setExternalInput([t, u1,..uN])
in = in.setExternalInput(ds)
in = in.setExternalInput(ts)
```

Description

`in = in.setExternalInput([t, u1,..uN])` allows you to directly specify numerical arrays as inputs to a model if a model has root inports.

`in = in.setExternalInput(ds)` allows you to directly specify dataset objects as external inputs to a model if a model has root inports..

`in = in.setExternalInput(ts)` allows you to directly specify timeseries object as external input if a model has a single root inport.

Examples

Set Numerical Arrays as External Inputs Through a `Simulink.SimulationInput` Object

This example shows how to set numerical arrays as external inputs.

Open the model

```
open_system('sldemo_mdlref_counter');
```

Create a `SimulationInput` object for this model.

```
in = Simulink.SimulationInput('sldemo_mdlref_counter');
```

Prepare external inputs.

```
t = (0:0.01:10)';
u1 = 5*ones(size(t));
u2 = 10*sin(t);
u3 = -5*ones(size(t));
```

Set external inputs to the model.

```
in = in.setExternalInput([t, u1, u2, u3]);
```

Simulate the model.

```
out = sim(in);
```

Input Arguments

`[t, u1,..uN]` — Numerical array

numerical array

Numerical array to be used as an external input.

`ds` — Dataset object

`Simulink.SimulationData.Dataset` object

Dataset object to be used as an external input

`ts` — Time series

time object handle

Time series to be used as an external input

“Run Parallel Simulations Using parsim”

Introduced in R2017a

setPostSimFcn

Specify a MATLAB function to run after each simulation is complete through SimulationInput object, in

Syntax

```
in = in.setPostSimFcn(@(y) myfunction(arg1, arg2...))
```

Description

in = in.setPostSimFcn(@(y) myfunction(arg1, arg2...)) runs after each simulation is complete. The Simulink.SimulationOutput object is passed as the argument y to this function. myfunction is any MATLAB function and can be used to do the post processing on the output. To return post processed data, you must return it as values in a struct. These values are then packed into the Simulink.SimulationOutput output to replace the usual logged data or add new data to the Simulink.SimulationOutput object.

Examples

Specify a MATLAB function for Postprocessing of the Output

This example specifies a MATLAB Function through SimulationInput object to run after each simulation is complete.

Create a PostSimFcn to get the mean of the output.

```
function newout = postsim(out);
newout.mean = mean(out.yout);
end
```

Create a SimulationInput object for a model.

```
in = Simulink.SimulationInput('vdp');
in = in.setPostSimFcn(@(x) postsim(x));
in = in.setModelParameter('SaveOutput','on');
```

Simulate the model.

```
out = sim(in)
```

View your result

```
out.mean
```

It is best practice to avoid using `'ErrorMessage'` and `'SimulationMetadata'` as field names in the function.

Input Arguments

y — Copy of Simulink.SimulationOutput object for postprocessing
`Simulink.SimulationOutput` object

This is a `Simulink.SimulationOutput` object which is an input to `myfunction`.

setPreSimFcn

Specify a MATLAB function to run before start of each simulation through `SimulationInput` object, in

Syntax

```
in = in.setPreSimFcn(@(x) myfunction(arg1, arg2...))
```

Description

`in = in.setPreSimFcn(@(x) myfunction(arg1, arg2...))` runs before each simulation starts. The `Simulink.SimulationInput` object is passed as an argument `x` to this function. `myfunction` is any MATLAB function and can be used to modify the `Simulink.SimulationInput` object. If you use `myfunction` to modify the `Simulink.SimulationInput` object, you must return `Simulink.SimulationInput` object as the only output argument.

Examples

Specify a MATLAB Function to Run Before Each Simulation

This example shows how to specify a MATLAB function through `SimulationInput` object to run at before start of each simulation.

Create a `PreSimFcn` function.

```
function presim(in)
signalbuilder('sf_car/User Inputs', 'ActiveGroup', in.Variables.Value)
end
```

Open the model.

```
model = 'sf_car';
open_system(model);
```

Create an array of `SimulationInput` objects for this model. Use `in.PreSimFcn` to run `presim` before simulation.

```
 n = 4;
   for idx = n:-1:1
      in(idx) = Simulink.SimulationInput(model);
      in(idx) = in(idx).setVariable('SigIndex', idx);
      in(idx) = in(idx).setPreSimFcn(@(x) presim(x));
   end
```

Simulate the model.

```
out = sim(in)
```

Input Arguments

x — A Simulink.SimulationInput object as input to the myfunction
`Simulink.SimulationInput` object

This is an input to `myfunction` in which you can modify the `Simulink.SimulationInput` object.

setBlockParameter

Set block parameters to be used for a specific simulation through SimulationInput object, in

Syntax

```
in = in.setBlockParameter('BlockPath','ParameterName','Value',...
'ParameterNameN','ValueN')
```

Description

in = in.setBlockParameter('BlockPath','ParameterName','Value',... 'ParameterNameN','ValueN') sets the parameter on the block specified at BlockPath with the properties ParameterName and Value. You can set multiple block parameters in a model using the same SimulationInput object. For more information on block parameter, see “Block-Specific Parameters” on page 6-128.

You can use getBlockParameter('BlockPath','ParameterName') method to get the value of block parameter and the removeBlockParameter('BlockPath','ParameterName') method to remove block parameter from the Simulink.SimulationInput object.

Examples

Modify a Block Parameter for a Simulation

This example modifies the block parameters of a model through the SimulationInput object.

Open the model

```
mdl = 'sldemo_househeat';
open_system(mdl);
```

Create a `SimulationInput` object for this model.

```
in = Simulink.SimulationInput(mdl);
```

Modify block parameter.

```
in = in.setBlockParameter('sldemo_househeat/Set Point','Value','300');
```

Simulate the model.

```
out = sim(in)
```

Input Arguments

'BlockPath' — Path of the block

character vector

BlockPath is the path of the block for which the parameter is changed

Example: `'sldemo_househeat/Set Point'`

'ParameterName' — Block parameter name

character vector

Specify optional comma-separated pairs of `ParameterName,Value` arguments. `ParameterName` is the parameter name and `Value` is the corresponding value. `ParameterName` must appear inside single quotes (`' '`). Block parameter values are typically specified as character vectors. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`. `ParameterNameN`,`ValueN` pairs follow the same syntax as `set_param`.

Example: `'Value'`, `'350'`

Introduced in R2017a

setInitialState

Set initial state to be used for a specific simulation through `SimulationInput` object, `in`

Syntax

```
in.setInitialState = xInitial
```

Description

`in.setInitialState = xInitial` sets the initial state of a model to `xInitial`, a `Simulink.SimState.ModelSimState` object.

Input Arguments

`xInitial` — Simulink.SimState.ModelSimState object
Simulink.SimState.ModelSimState

You can change the `Initial State` of a model by assigning it to a `Simulink.SimState.ModelSimState` object.

setModelParameter

Set model parameters to be used for a specific simulation through `SimulationInput` object, `in`

Syntax

`in = in.setModelParameter('ParameterName',Value,...'ParameterNameN', ValueN)`

Description

`in = in.setModelParameter('ParameterName',Value,...'ParameterNameN', ValueN)` sets a model parameter `Name` with a `Value`. You can add multiple model parameters to the model using the same `SimulationInput` object. For more information on model parameters, see “Model Parameters” on page 6-2.

You can use `getModelParameter('ParameterName')` method to get the value of model parameter and the `removeModelParameter('ParameterName')` method to remove model parameter from the `Simulink.SimulationInput` object

Examples

Modify a Model Parameter for a Simulation

This example modifies the model parameters of through the `SimulationInput` object

Open the model.

```
mdl = 'sldemo_househeat';
open_system(mdl);
```

Create a `SimulationInput` object for this model.

```
in = Simulink.SimulationInput(mdl);
```

Specify a timeout of 5 seconds and modify model parameters, `StartTime` and `StopTime`

```
in = in.setModelParameter('Timeout',5);
in = in.setModelParameter('StartTime','1','StopTime','4');
```

Simulate the model.

```
out = sim(in)
```

Input Arguments

`'ParameterName'` — Block parameter name

character vector

Specify optional comma-separated pairs of `ParameterName,Value` arguments. `ParameterName` is the parameter name and `Value` is the corresponding value. `ParameterName` must appear inside single quotes (`' '`). Model parameter values are typically specified as character vectors. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`. `ParameterNameN`,`ValueN` pairs follow the same syntax as `set_param`.

Example: `'StartTime','1'`

Introduced in R2017a

setVariable

Set variables for a simulation through SimulationInput object, in

Syntax

```
in = in.setVariable(Name,Value)
in = in.setVariable(Name,Value,'Workspace', 'ModelName')
```

Description

in = in.setVariable(Name,Value) assigns a Value to variable Name. You can add multiple variables to the model using the same SimulationInput object.

in = in.setVariable(Name,Value,'Workspace', 'ModelName') assigns the Value to variable Name. Variables that are defined through the SimulationInput object are placed in the global workspace scope by default. The term global workspace is specific to the Simulink.SimulationInput object and its methods. Variables in the global workspace scope take precedence if a variable with the same name exists in the base workspace or the data dictionary. The variables in the model workspace take precedence over the global workspace scope. To change the value of a model workspace variable, set the scope by specifying the model name when you add the variable to the SimulationInput object.

You can use getVariable('VariableName') method to get the value of variable and the removeVariable('VariableName') method to remove variable from the Simulink.SimulationInput object

For information on using nonscalar variables, structure variables and parameter objects, see “Sweep Nonscalars, Structures, and Parameter Objects”.

Examples

Modify a Variable for a Simulation

This example modifies the model parameters of through the `SimulationInput` object.

Open the model.

```
mdl = 'sldemo_househeat';
open_system(mdl);
```

Create a `SimulationInput` object for this model

```
in = Simulink.SimulationInput(mdl);
```

Set the variable value to 50.

```
in = in.setVariable('cost',50);
```

By default, this variable is placed in the global workspace scope.

Simulate the model.

```
out = sim(in)
```

Modify a Variable for a Simulation in the Model Workspace

This example modifies the model parameters of `sldemo_househeat` through the `SimulationInput` object.

Set path and open the model.

```
mdl = 'sldemo_househeat';
open_system(mdl);
```

Create a `SimulationInput` object for this model

```
in = Simulink.SimulationInput(mdl);
```

Set the variable to 50 and set the scope to model workspace.

```
in = in.setVariable('cost',50,'Workspace','sldemo_househeat');
```

Simulate the model.

```
out = sim(in)
```

Input Arguments

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the literal value of the variable. `Name` must appear inside single quotes (`' '`). You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: `'cost',65`

`Workspace` — Workspace for the variable

character vector

Set the scope of the defined variable by specifying the model name

Example: `'Workspace'`, `'sldemo_househeat'`

Introduced in R2017a

validate

Validate the contents of the `SimulationInput` object, `in`

Syntax

```
in.validate
```

Description

`in.validate` validates the changes made to the model through the `SimulationInput` object. This method validates all the changes made to the model through the `SimulationInput` object.

Examples

Validate Changes Made Through the SimulationInput Object

This example modifies and validates the variable of the model through the `SimulationInput` object.

Open the model.

```
mdl = 'sldemo_househeat';
open_system(mdl);
```

Create a `SimulationInput` object for this model

```
in = Simulink.SimulationInput(mdl);
```

Modify a model parameter

```
in = in.setModelParameter('InvalidParamName','5');
```

Validate this change

```
in.validate
```

Topics

"Run Multiple Simulations"
"Run Parallel Simulations Using parsim"

Introduced in R2017a

Simulink.Simulation.Future class

Package: Simulink

Create `Future` object for simulation

Description

Create a `Simulink.Simulation.Future` when you execute `parsim` with the `'RunInBackground'` argument set to `'on'`. The `parsim` command runs multiple simulations in parallel using the inputs specified with an array of `Simulink.SimulationInput` objects. You can use this object to monitor the status of ongoing simulations, fetch outputs of completed simulations, or cancel ongoing simulations.

The `parsim` command uses the Parallel Computing Toolbox license to run the simulations in parallel. `parsim` runs the simulations in serial if a parallel pool cannot be created or if Parallel Computing Toolbox is not used.

Construction

`future = parsim(in,'RunInBackground','on')` creates a `Simulink.Simulation.Future` object, `future`, while running multiple simulations in parallel the using the inputs specified in the `Simulink.SimulationInput` object, `in`.

Input Arguments

in — `Simulink.SimulationInput` object array
object (default) | array

A `Simulink.SimulationInput` object or an array of `Simulink.SimulationInput` objects is used to run multiple simulations. Specify parameters and values of a model to run multiple simulations without making it dirty.

Example: `in = Simulink.SimulationInput('vdp')`, `in(1:10) = Simulink.SimulationInput('vdp')`

'RunInBackground' — parsim argument to enable RunInbackground

'off' (default) | 'on'

Set to 'on', to run simulations asynchronously, keeping the MATLAB command prompt available.

Properties

Diary — Log of outputs from the simulation

text file

Text log of outputs from the simulation.

This property is read-only.

ID — Numeric identifier of the future object

scalar integer

ID of the future object, specified as a scalar integer.

This property is read-only.

Read — Whether the outputs have been read

1 | 0

Whether a call to fetchNext or fetchOutputs has read the outputs in the Simulink.Simulation.Future object array, specified as 1 if true and 0 if false.

This property is read-only.

State — Current state of future object array

'pending' | 'queued' | 'running' | 'finished' | 'failed' | 'unavailable'

Current state of future object array, specified as 'pending', 'queued', 'running', 'finished','failed', or 'unavailable'.

This property is read-only.

Methods

Method	Purpose
cancel	Cancel a pending, queued, or running Simulink.Simulation.Future object
fetchNext	Fetch next available unread output from Simulink.Simulation.Future object array
fetchOutputs	Retrieve Simulink.SimulationOutput from Simulink.Simulation.Future
wait	Wait for Simulink.Simulation.Future objects to complete simulation

Examples

Create a Simulink.Simulation.Future Object

This example shows how to create a Simulink.Simulation.Future object array and use it to retrieve outputs and see the status of simulations.

This example runs several simulations of the vdp model, varying the value of the gain Mu.

Open the model and define a vector of Mu values.

```
open_system('vdp');
Mu_Values = [0.5:0.25:5];
MuVal_length = length(Mu_Values);
```

Using Mu_Values, initialize an array of Simulink.SimulationInput objects. To preallocate the array, a loop index is made to start from the largest value.

```
for i = MuVal_length:-1:1
    in(i) = Simulink.SimulationInput('vdp');
    in(i) = in(i).setBlockParameter('vdp/Mu',...
        'Gain',num2str(Mu_Values(i)));
end
```

Simulate the model using parsim. Set it to 'RunInBackground', to be able to use the command prompt, while simulations are running.

```
Future = parsim(in,'RunInBackground','on');
```

Use the `fetchNext` method on `Future` simulations.

```
for i = 1:MuVal_length
    [completedIdx,simOut] = fetchNext(Future)
end
```

`batchsim` | `cancel` | `fetchNext` | `fetchOutputs` | `parsim` | `wait`

Classes
`Simulink.Simulation.Job` | `Simulink.SimulationInput`

Topics

"Multiple Simulation Workflows"

Introduced in R2018a

cancel

Cancel a pending, queued, or running `Simulink.Simulation.Future` object

Syntax

```
cancel(Future)
```

Description

`cancel(Future)` stops the objects of the `Simulink.Simulation.Futures` array, `Future`, that are currently in `'pending'`, `'queued'`, or `'running'` state. For elements of the `Futures` in the `'finished'` state, no action is taken.

Examples

Cancel Simulations of Future Objects

This example shows how to use the `cancel` method on an array of `future` objects to stop the simulations.

This example runs several simulations of the `vdp` model, varying the value of the gain Mu.

Open the model and define a vector of Mu values.

```
open_system('vdp');
Mu_Values = [0.5:0.25:1000];
MuVal_length = length(Mu_Values)
```

Using `Mu_Values`, initialize an array of `Simulink.SimulationInput` objects. To preallocate the array, a loop index is made to start from the largest value.

```
for i = MuVal_length:-1:1
    in(i) = Simulink.SimulationInput('vdp');
    in(i) = in(i).setBlockParameter('vdp/Mu',...
        'Gain',num2str(Mu_Values(i)));
end
```

Simulate the model using `parsim`. Set to '`RunInBackground`' to enable the use the command prompt, while simulations are running.

```
Future = parsim(in,'RunInBackground','on');
```

Now, assume that you want to run simulations with different values of Mu and cancel the ongoing simulations.

```
cancel(Future)
```

Input Arguments

`Future` — `Simulation.Simulink.Future` object
array

Array of `Simulation.Simulink.Future` objects. To create `Future`, run `parsim` with `'RunInBackground'` option set to `'on'`.

Example: `Future = parsim(in,'RunInBackground','on')`

See Also

Functions
`batch` | `batchsim` | `fetchNext` | `fetchOutputs` | `parsim` | `wait`

Classes
`Simulink.Simulation.Future` | `Simulink.SimulationInput`

Introduced in R2018a

fetchNext

Fetch next available unread output from Simulink.Simulation.Future object array

Syntax

```
[idx,simOut] = fetchNext(Future)
[idx,simOut] = fetchNext(Future, Timeout)
```

Description

[idx,simOut] = fetchNext(Future) waits for the unread element of Simulink.Simulation.Future array, Future, to reach a 'finished' state. It returns the index of the simulation that finished, and the corresponding Simulink.SimulationOutput object.

[idx,simOut] = fetchNext(Future, Timeout) waits for a maximum of Timeout seconds for a result to become available. If the timeout expires before any result is available, simOut is returned as an empty array.

An error is reported if there are no elements in Future with property Read as false. You can check for are any unread futures using anyUnread = ~all([F.Read]).

fetchNext displays an error if any element of Future with a 'finished' state encounters an error during execution. The Read property of that element becomes true allowing any subsequent call to fetchNext to proceed.

Examples

Create a Simulink.Simulation.Future Object

This example shows how to create a Simulink.Simulation.Future object array and use it to retrieve outputs and see the status of simulations.

This example runs several simulations of the vdp model, varying the value of the gain Mu.

Open the model and define a vector of Mu values.

```
open_system('vdp');
Mu_Values = [0.5:0.25:5];
MuVal_length = length(Mu_Values);
```

Using `Mu_Values`, initialize an array of `Simulink.SimulationInput` objects. To preallocate the array, a loop index is made to start from the largest value.

```
for i = MuVal_length:-1:1
    in(i) = Simulink.SimulationInput('vdp');
    in(i) = in(i).setBlockParameter('vdp/Mu',...
        'Gain',num2str(Mu_Values(i)));
end
```

Simulate the model using `parsim`. Set it to '`RunInBackground`' to be able to use the command prompt, while simulations are running.

```
Future = parsim(in,'RunInBackground','on');
```

Use the `fetchNext` method on `Future`.

```
for i = 1:MuVal_length
    [completedIdx,simOut] = fetchNext(Future)
end
```

Input Arguments

Future — Simulation.Simulink.Future object

array

Array of `Simulation.Simulink.Future` objects. To create `Future`, run `parsim` with `'RunInBackground'` option set to `'on'`.

Example: `Future = parsim(in,'RunInBackground','on')`

Timeout — Number of seconds specified for fetchNext to time out

scalar

Specify a `Timeout` for `fetchNext` to retrieve the results from the `Simulation.Simulink.Future` array, `Future`.

Example: `[idx, simOut] = fetchNext(Future, 45)`

Output Arguments

`idx` — Index of the simulation

integer

When `fetchNext` method is used on an array of `Simulink.Simulation.Future` objects, it returns the index of the simulation whose output is being retrieved.

`simOut` — Simulation object containing logged simulation results

object | array

Array of `Simulink.SimulationOutput` objects that contain all of the logged simulation results. The size of the array is equal to the size of the array of `Simulink.SimulationInput` objects.

All simulation outputs (logged time, states, and signals) are returned in a single `Simulink.SimulationOutput` object. You define the model time, states, and output that are logged using the **Data Import/Export** pane of the Model Configuration Parameters dialog box. You can log signals using blocks such as the To Workspace and Scope blocks. The **Signal & Scope Manager** tool can directly log signals.

```

Description

simOut = fetchOutputs(Future) fetches the output from an array of Simulink.Simulation.Future objects, Future, after each element of Future is in a 'finished' state. fetchOutputs returns an array of Simulink.SimulationOutput objects.

Examples

Create a Future and Retrieve Outputs Using fetchOutputs

This example shows how to use the fetchOutputs method on an array of future objects to retrieve a Simulink.SimulationOutput array.

This example runs several simulations of the vdp model, varying the value of the gain Mu.

Open the model and define a vector of Mu values.

```
open_system('vdp');
Mu_Values = [0.5,0.75,1,1.25];
MuVal_length = length(Mu_Values);
```

Using Mu_Values, initialize an array of Simulink.SimulationInput objects. To preallocate the array, a loop index is made to start from the largest value.

```
for i = MuVal_length:-1:1
    in(i) = Simulink.SimulationInput('vdp');
    in(i) = in(i).setBlockParameter('vdp/Mu',...
        'Gain',num2str(Mu_Values(i)));
end
```

Simulate the model using `parsim`. Set to '`RunInBackground`' to enable the use of command prompt, while simulations are running.

```
Future = parsim(in,'RunInBackground','on');
```

Use the `fetchOutputs` method on `Future`

```
simOut = fetchOutputs(Future)
```

```
simOut =

1x4 Simulink.SimulationOutput array
```

Input Arguments

`Future` — `Simulation.Simulink.Future` object

array

Array of `Simulation.Simulink.Future` objects. To create, `Future`, run `parsim` with `'RunInBackground'` option set to `'on'`.

Example: `Future = parsim(in,'RunInBackground','on')`

Output Arguments

`simOut` — Simulation object containing logged simulation results

object

Array of `Simulink.SimulationOutput` objects that contain all of the logged simulation results. The size of the array is equal to the size of the array of `Simulink.SimulationInput` objects.

All simulation outputs (logged time, states, and signals) are returned in a single `Simulink.SimulationOutput` object. You define the model time, states, and output that are logged using the **Data Import/Export** pane of the Model Configuration Parameters dialog box. You can log signals using blocks such as the To Workspace and Scope blocks. The **Signal & Scope Manager** tool can directly log signals.

Classes
`Simulink.Simulation.Future` | `Simulink.SimulationInput`

Introduced in R2018a

wait

Wait for `Simulink.Simulation.Future` objects to complete simulation

Syntax

```
Ok = wait(Future)
```

Description

`Ok = wait(Future)` blocks the command prompt until each element of the `Simulink.Simulation.Future` array, `Future` is in a `'finished'` state.

Examples

Wait for the `Future` Array to Complete Simulations

This example shows how to use the `wait` method on an array of `future` objects.

This example runs several simulations of the `vdp` model, varying the value of the gain Mu.

Open the model and define a vector of Mu values.

```
open_system('vdp');
Mu_Values = [0.5:0.25:5];
MuVal_length = length(Mu_Values);
```

Using `Mu_Values`, initialize an array of `Simulink.SimulationInput` objects. To preallocate the array, a loop index is made to start from the largest value.

```
for i = MuVal_length:-1:1
    in(i) = Simulink.SimulationInput('vdp');
    in(i) = in(i).setBlockParameter('vdp/Mu',...
        'Gain',num2str(Mu_Values(i)));
end
```

Simulate the model using `parsim`. Set to '`RunInBackground`' to enable the use of command prompt while the simulations are running and to create an array of `Simulink.Simulation.Future` objects.

```
Future = parsim(in,'RunInBackground','on');
```

Use the `wait` method on `Future` to block the execution.

```
Ok = wait(Future)
```

Input Arguments

`Future` — `Simulation.Simulink.Future` object

array

Array of `Simulation.Simulink.Future` objects. To create `Future`, run `parsim` with `'RunInBackground'` option set to `'on'`.

Example: `Future = parsim(in,'RunInBackground','on')`

Output Arguments

`Ok` — Whether the wait is completed successfully

1 | 0

`Ok` is `true` if the wait completes successfully, `false` if any of the `Future` objects failed execution or were canceled. Specified as 1 if true, 0 if false.

Simulink.SimulationMetadata class

Package: Simulink

Access metadata of simulation runs

Description

The SimulationMetadata class contains information about a simulation run including:

- Model information
- Timing information
- Execution and diagnostic information
- Custom character vector to tag the simulation
- Custom data to describe the simulation

SimulationMetadata packages this information with the SimulationOutput object. To use SimulationMetadata, use one of these approaches:

- In **Configuration Parameters** > **Data Import/Export**, under **Save options**, select **Single simulation output**.
- Use set_param to set ReturnWorkspaceOutputs to on.

```
set_param(model_name,'ReturnWorkspaceOutputs','on');
```

To retrieve the SimulationMetadata object, use the getSimulationMetadata method on a SimulationOutput object.

Properties

ModelInfo — Information about the model and simulation operating environment

structure

The ModelInfo structure has these fields.

Field Name	Type	Description
ModelName	char	Name of the model
ModelVersion	char	Version of the model
ModelFilePath	char	Absolute location of the .mdl/.slx file
UserID	char	System user ID of the machine used for the simulation
MachineName	char	Hostname of the machine used for the simulation
Platform	char	Operating system of the machine used for the simulation
ModelStructuralChecksum	4–by–1 uint32	Structural checksum of the model calculated after an update diagram
SimulationMode	char	Simulation mode
StartTime	double	Simulation start time
StopTime	double	Time at which the simulation was terminated
SolverInfo	structure	Solver information: • Fixed-step solvers – Solver type, name, and fixed step size • Variable solvers – Solver type, name, and max step size (initial setting)
SimulinkVersion	structure	Version of Simulink
LoggingInfo	structure	Metadata about logging to persistent storage: • LoggingToFile field — Indicates whether logging to persistent storage is enabled ('on' or 'off') • LoggingFileName field — Specifies the resolved file name for the persistent storage MAT-file (if LoggingToFile is 'on').

`ExecutionInfo` — Structure to store information about a simulation run

structure

Structure to store information about a simulation run, including the reason a simulation stopped and any diagnostics reported during the simulation. The structure has these fields.

Field Name	Type	Description
`StopEvent`	Nontranslated character vector	Reason the simulation stopped, represented by one of the following: - `ReachedStopTime` – Simulation stopped upon reaching stop time and no errors were reported during execution. `StopEvent` has value `ReachedStopTime`, even if errors are reported in the stop callbacks, which are executed after the simulation ends. - `ModelStop` – Simulation stopped by a block or by solver before reaching stop time. - `StopCommand` – Simulation stopped manually by clicking the **Stop** button or using the `set_param` command. - `DiagnosticError` – Simulation stopped because an error was reported during simulation. - `KeyboardControlC` – Simulation stopped using keystroke `Ctrl+C`. - `PauseCommand` – Simulation paused manually by clicking the **Pause** button or using the `set_param` command. - `ConditionalPause` – Simulation paused using a conditional breakpoint. - `PauseTime` – Simulation paused at or after specified pause time. - `StepForward` – Simulation paused after clicking step forward. - `StepBackward` – Simulation paused after clicking step backward.

Field Name	Type	Description
		• TimeOut – Simulation stopped because execution time exceeded timeout specified by TimeOut.
StopEventSource	Simulink.SimulationData.BlockPath	Source of stop event, if it is a valid Simulink object.
StopEventDescription	Translated character vector	Superset of information stored in StopEvent and StopEventSource.
ErrorDiagnostic	struct	Error reported during simulation, represented by the following fields: • Diagnostic – MSLDiagnostic object that includes object paths, ID, message, cause, and stack. • SimulationPhase – Represented by one of these: Initialization, Execution, or Termination. • SimulationTime – Simulation time represented as a double, if reported during Execution; else, represented as []. By passing the name–value pair 'CaptureErrors', 'on' to the sim command, errors generated during simulation are reported in ExecutionInfo.ErrorDiagnostic. The sim command does not capture generated errors.

Field Name	Type	Description
WarningDiagnostics	Array of struct	Array of all warnings reported during the simulation. Each array item is represented by the following fields: • Diagnostic – MSLDiagnostic object that includes object paths, ID, message, cause, and stack. • SimulationPhase – Represented as: Initialization, Execution, or Termination. • SimulationTime – Simulation time represented as a double, if reported during Execution; else, represented as [].

TimingInfo — Structure to store profiling information about the simulation
structure

Structure to store profiling information about the simulation, including the time stamps for the start and end of the simulation. The structure has these fields.

Field Name	Type	Description
WallClockTimestampStart	character vector	Wall clock time when the simulation started, in YYYY-MM-DD HH:MI:SS format with microsecond resolution
WallClockTimestampStop	character vector	Wall clock time when the simulation stopped, in YYYY-MM-DD HH:MI:SS format with microsecond resolution
InitializationElapsedWallTime	double	Time spent before execution, in seconds
ExecutionElapsedWallTime	double	Time spent during execution, in seconds
TerminationElapsedWallTime	double	Time spent after execution, in seconds

Field Name	Type	Description
TotalElapsedWallTime	double	Total time spent in initialization, execution, and termination, in seconds

The ExecutionElapsedWallTime includes the time that Simulink spent to roll back or step back in a simulation. The ExecutionElapsedWallTime does not include the time spent between steps. For example, if you use Stepper to step through a simulation, the ExecutionElapsedWallTime time does not include the time when the simulation is in a paused state. For more information about using Stepper, see "How Simulation Stepper Helps With Model Analysis".

UserString — Custom character vector to describe the simulation
character vector

Use Simulink.SimulationOutput.setUserString to directly store a character vector in the SimulationMetadata object that is contained in the SimulationOutput object.

UserData — Custom data to store in SimulationMetadata object that is contained in the SimulationOutput object
character vector

Use Simulink.SimulationOutput.setUserData to store custom data in the SimulationMetadata object that is contained in the SimulationOutput object.

Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects (MATLAB).

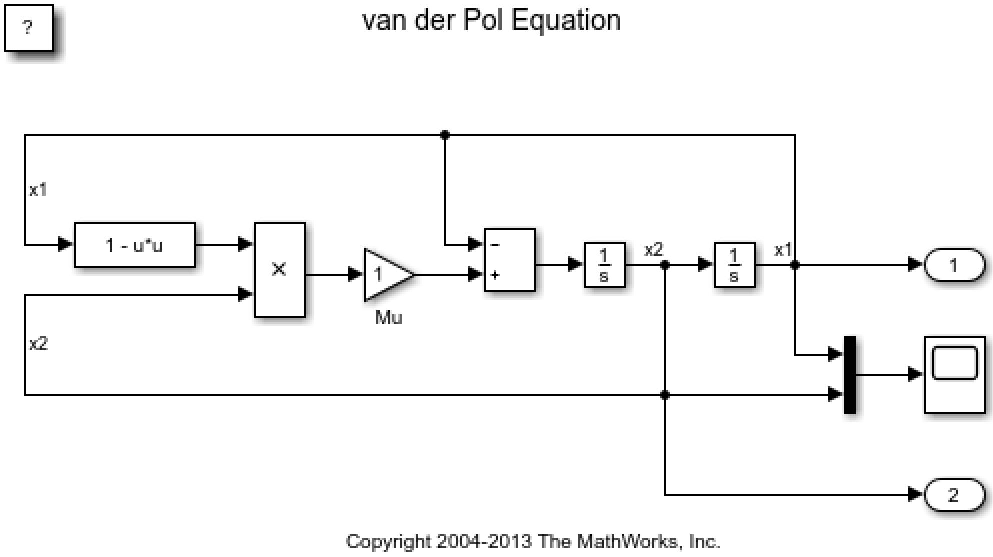
Examples

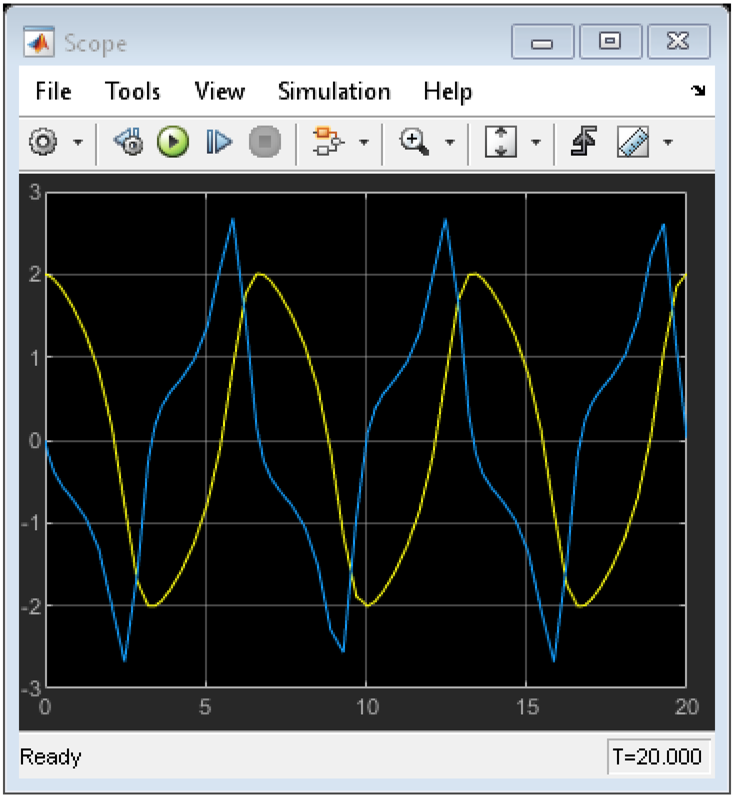
Get a SimulationMetadata Object for vdp Simulation

Simulate the vdp model. Retrieve metadata from a SimulationMetadata object of the simulation.

Simulate the vdp model. Save the results of the Simulink.SimulationOutput object in simout.

```
open_system('vdp');
simout = sim(bdroot,'ReturnWorkspaceOutputs','on');
```





Retrieve metadata information about this simulation using `mData`. This is the `SimulationMetadata` object that `simout` contains.

```
mData=simout.getSimulationMetadata()
```

```
mData = 

  SimulationMetadata with properties:

        ModelInfo: [1x1 struct]
       TimingInfo: [1x1 struct]
    ExecutionInfo: [1x1 struct]
       UserString: ''
         UserData: []
```

Store custom data or string in `simout`.

```
simout=simout.setUserData(struct('param1','value1','param2','value2','param3','value3
simout=simout.setUserString('Store first simulation results');
```

Retrieve the custom data you stored from `mData`.

```
mData=simout.getSimulationMetadata()
disp(mData.UserData)
```

```
mData =

  SimulationMetadata with properties:

        ModelInfo: [1x1 struct]
       TimingInfo: [1x1 struct]
    ExecutionInfo: [1x1 struct]
       UserString: 'Store first simulation results'
         UserData: [1x1 struct]

    param1: 'value1'
    param2: 'value2'
    param3: 'value3'
```

Retrieve the custom string you stored from `mData`.

```
mData=simout.getSimulationMetadata()
disp(mData.UserString)
```

```
mData =

  SimulationMetadata with properties:

        ModelInfo: [1x1 struct]
       TimingInfo: [1x1 struct]
    ExecutionInfo: [1x1 struct]
       UserString: 'Store first simulation results'
         UserData: [1x1 struct]
```

```
Store first simulation results
```

`Simulink.SimulationOutput.getSimulationMetadata` | `Simulink.SimulationOutput.setUserData` | `Simulink.SimulationOutput.setUserString`

Introduced in R2015a

Simulink.SimulationOutput class

Package: Simulink

Access object values of simulation results

Description

The `SimulationOutput` class contains all simulation outputs, including workspace variables.

You can use dot notation to access the data for simulation outputs. For example, to return data for the xout variable for a simOut `SimulationOutput` object, use a `simOut.tout` command.

Alternatively, you can use `Simulink.SimulationOutput.who` and either `Simulink.SimulationOutput.get` or `Simulink.SimulationOutput.find` methods to access the output variable names and their respective values.

Properties

`SimulationMetadata` — Metadata for simulation runs

`Simulink.SimulationMetadata` object

Metadata for simulation runs, returned as a `Simulink.SimulationMetadata` object. Fields other than the `UserData` and `UserString` fields are read only.

`ErrorMessage` — Simulation logging error messages

char vector

Simulation logging error message, returned as a char vector. (read only)

Methods

find	Access and display values of simulation results
get	Access and display values of simulation results
getSimulationMetadata	Return `SimulationMetadata` object for simulation
setUserData	Store custom data in `SimulationMetadata` object that `SimulationOutput` object contains
setUserString	Store custom character vector in `SimulationMetadata` object that `SimulationOutput` object contains
who	Access and display output variable names of simulation

Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects (MATLAB) in the MATLAB Programming Fundamentals documentation.

Examples

View Simulation Output and Metadata

Simulate a model and place the results of the `Simulink.SimulationOutput` object in `simOut` and view the simulation metadata.

Simulate the `vdp` model.

```
simOut = sim('vdp','SimulationMode','normal','AbsTol','1e-5',...
                     'SaveState','on','StateSaveName','xoutNew',...
                     'SaveOutput','on','OutputSaveName','youtNew')
```

```
 Simulink.SimulationOutput:

                xoutNew: [65x2 double]
                youtNew: [65x2 double]

     SimulationMetadata: [1x1 Simulink.SimulationMetadata]
           ErrorMessage: [0x0 char]
```

Get the values of the variable *youtNew*.

```
simOut.youtNew
```

Simulink returns and displays the values.

Get the timing information for the simulation.

```
myMetadata = simOut.SimulationMetadata
```

```
myMetadata = 

  SimulationMetadata with properties:

        ModelInfo: [1×1 struct]
       TimingInfo: [1×1 struct]
    ExecutionInfo: [1×1 struct]
       UserString: ''
         UserData: []
```

```
myMetadata.TimingInfo
```

```
ans = 

  struct with fields:

          WallClockTimestampStart: '2016-12-30 08:47:51.739935'
           WallClockTimestampStop: '2016-12-30 08:47:58.185579'
    InitializationElapsedWallTime: 5.9166
         ExecutionElapsedWallTime: 0.1910
       TerminationElapsedWallTime: 0.3380
             TotalElapsedWallTime: 6.4456
```

Simulink.SubsysDataLogs

Container for subsystem signal data logs

Description

Note Before R2016a, the `Simulink.SubsysDataLogs` class was used in conjunction with the `ModelDataLogs` logging data format. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format.

However, you can use data that was logged in a previous release using `ModelDataLogs` format.

In releases before R2016a, Simulink created instances of this class to contain logs for signals in a subsystem models were logged in `ModelDataLogs` format. Objects of this class have a variable number of properties. The first property, named `Name`, is the name of the subsystem whose log data this object contains. The remaining properties are signal log or signal log container objects containing the data logged for the subsystem specified by this object's `Name` property.

For example, suppose you have this logged data from a model run in a release earlier than R2016a:

```
Simulink.SubsysDataLogs (Gain):
  Name                  elements  Simulink Class

  a                        1      Timeseries
  m                        2      TsArray
```

You can use either fully qualified log names or the `unpack` command to access the signal logs contained by a `SubsysDataLogs` object. For example, to access the amplitudes logged for signal `a` in the preceding example, you could enter the following at the MATLAB command line:

```
data = logsout.Gain.a.Data;
```

or

```
>> logsout.unpack('all');
data = a.Data;
```

Introduced before R2006a

Simulink.SuppressedDiagnostic class

Package: Simulink

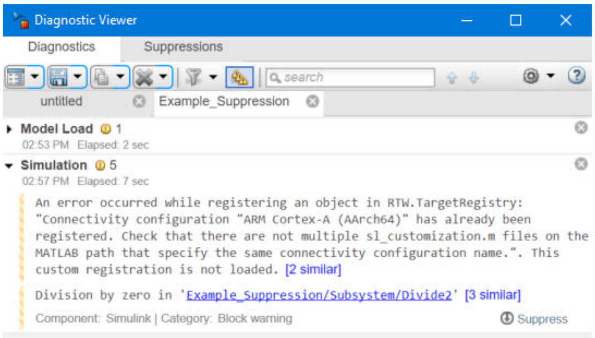
Suppress diagnostic messages from a specified block

Description

A `Simulink.SuppressedDiagnostic` object contains information related to diagnostic warnings or errors that are suppressed from being thrown during simulation.

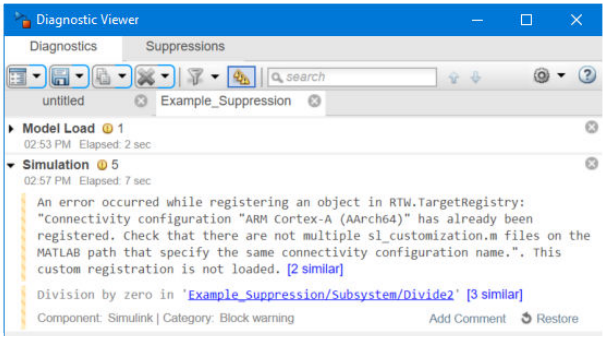
Construction

The Diagnostic Viewer in Simulink includes an option to suppress certain diagnostics. This feature enables you to suppress warnings or errors for specific objects in your model. Click the **Suppress** button next to the warning in the Diagnostic Viewer to suppress the warning from the specified source. This action creates a `Simulink.SuppressedDiagnostic` object. You can access this object at the MATLAB command line using the `Simulink.getSuppressedDiagnostics` function. You can add a comment for the suppressed diagnostic. You can restore the diagnostic by clicking **Restore**.



```
An error occurred while registering an object in RTW.TargetRegistry:
"Connectivity configuration "ARM Cortex-A (AArch64)" has already been
registered. Check that there are not multiple sl_customization.m files on the
MATLAB path that specify the same connectivity configuration name.". This
custom registration is not loaded. [2 similar]

Division by zero in 'Example_Suppression/Subsystem/Divide2' [3 similar]
```



```
An error occurred while registering an object in RTW.TargetRegistry:
"Connectivity configuration "ARM Cortex-A (AArch64)" has already been
registered. Check that there are not multiple sl_customization.m files on the
MATLAB path that specify the same connectivity configuration name.". This
custom registration is not loaded. [2 similar]

Division by zero in 'Example_Suppression/Subsystem/Divide2' [3 similar]
```

`DiagnosticObject = Simulink.SuppressedDiagnostic(source, message_id)` creates a suppressed diagnostic object. The object suppresses all instances of diagnostics represented by `message_id` thrown by the blocks specified by `source`.

Input Arguments

`source` — System, block, or model object throwing diagnostic

model | subsystem | block path | block handle

The source of the diagnostic, specified as a model, subsystem, block path, block handle, cell array of block paths, or cell array of block handles.

To get the block path, use the `gcb` function.

To get the block handle, use the `getSimulinkBlockHandle` function.

Data Types: `char` | `cell` | `string`

`message_id` — message identifier of diagnostic

message identifier

The message identifier of the diagnostic, specified as a character vector or string. You can find the message identifier of diagnostics thrown during simulation by accessing the `ExecutionInfo` property of the `Simulink.SimulationMetadata` object associated with a simulation. You can also use the `lastwarn` function.

Data Types: `char` | `string`

Properties

`Comments` — Comments associated with the suppression object

character vector

Comments associated with the suppression object, specified as a character vector. This property is optional.

Data Types: `char`

`ID` — Message identifier of the diagnostic that was suppressed

character vector

The message identifier of the diagnostic that was suppressed, specified as a character vector.

Data Types: `char`

`LastModified` — Date and time the suppression object was last modified

character vector

Date and time the suppression object was last modified, specified as a character vector. This property is read-only.

Data Types: `char`

`LastModifiedBy` — Name of the user who was last to add or edit the suppression object

character vector

Name of the user who last added or edited the suppression object, specified as a character vector. This property is optional.

Data Types: `char`

`Source` — block path of the source of the diagnostic

character vector

The block path of the model object that has a suppressed diagnostic, specified as a character vector.

Data Types: `char`

Methods

restore	Remove specified diagnostic suppressions
suppress	Suppress diagnostic specified by `Simulink.SuppressedDiagnostic` object

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Create a Simulink.SuppressedDiagnostic Object

Using the model from “Suppress Diagnostic Messages Programmatically”, create and then restore a diagnostic suppression.

Create a `Simulink.SuppressedDiagnostic` object, `suppression` to suppress the parameter precision loss warning thrown by the Constant block, `one`.

```
suppression = Simulink.SuppressedDiagnostic('Suppressor_CLI_Demo/one',...
'SimulinkFixedPoint:util:fxpParameterPrecisionLoss');
```

The parameter precision loss warning is no longer thrown in future simulations of this model.

Add accountability information to the object by editing the `LastModifiedBy` and `Comments` properties of the object.

```
suppression.LastModifiedBy = 'John Doe';
suppression.Comments = 'Reviewed: Joe Schmoe'
```

```
suppression = 

  SuppressedDiagnostic with properties:

            Source: 'Suppressor_CLI_Demo/one'
                Id: 'SimulinkFixedPoint:util:fxpParameterPrecisionLoss'
    LastModifiedBy: 'John Doe'
          Comments: 'Reviewed: Joe Schmoe'
      LastModified: '2016-Jun-01 17:25:21'
```

You can restore the diagnostic using the `restore` method.

```
restore(suppression);
```

Topics

“Suppress Diagnostic Messages Programmatically”

Class Attributes (MATLAB)
Property Attributes (MATLAB)

Introduced in R2016b

restore

Class: Simulink.SuppressedDiagnostic
Package: Simulink

Remove specified diagnostic suppressions

Syntax

`restore(SuppressedDiagnostic)`

Description

`restore(SuppressedDiagnostic)` removes the specified suppressed diagnostic object.

Input Arguments

`SuppressedDiagnostic` — Suppressed diagnostic object to restore
`Simulink.SuppressedDiagnostic` object

`Simulink.SuppressedDiagnostic` object

Examples

Restore a Suppressed Diagnostic

Using the model from “Suppress Diagnostic Messages Programmatically”, create and then restore a diagnostic suppression.

Create a `Simulink.SuppressedDiagnostic` object, `suppression` to suppress the parameter precision loss warning from the Constant block, `one`.

```
suppression = Simulink.SuppressedDiagnostic('Suppressor_CLI_Demo/one',...
'SimulinkFixedPoint:util:fxpParameterPrecisionLoss');
```

You can restore the diagnostic using the `restore` method.

```
restore(suppression);
```

Restore All Suppressed Diagnostics

Using the model from “Suppress Diagnostic Messages Programmatically”, restore all diagnostic suppressions associated with a model.

Use the `Simulink.suppressDiagnostic` function to suppress the parameter precision loss and parameter underflow warnings from the Constant block, `one`.

```
diags = {'SimulinkFixedPoint:util:fxpParameterPrecisionLoss', 'SimulinkFixedPoint:util
Simulink.suppressDiagnostic('Suppressor_CLI_Demo/one',diags);
```

Use the `Simulink.getSuppressedDiagnostics` function to get all suppressions associated with the model, returned as an array of `Simulink.SuppressedDiagnostic` objects.

```
suppressed_diagnostics = Simulink.getSuppressedDiagnostics('Suppressor_CLI_Demo')
```

```
suppressed_diagnostics = 

  1×2 SuppressedDiagnostic array with properties:

    Source
    Id
    LastModifiedBy
    Comments
    LastModified
```

Restore all diagnostics using the `restore` method and iterating through the `suppressed_diagnostics` array.

```
for iter = 1:numel(suppressed_diagnostics)
    restore(suppressed_diagnostics(iter));
end
```

Simulink.TimeInfo

Provide information about time data in `Simulink.Timeseries` object

Description

Simulink software creates instances of these objects to describe the time data that it includes in `Simulink.Timeseries` objects.

Note The `Simulink.Timeseries` class is supported for backwards compatibility. The `ModelDataLogs` format created `Simulink.Timeseries` objects for signal logging data. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format. In R2016a or later, when you open a model from an earlier release that had used `ModelDataLogs` format, the model simulated in use `Dataset` format.

You can convert signal logging data from `ModelDataLogs` to `Dataset` format. Converting to `Dataset` format makes it easier to post-process with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see “Convert Logged Data to Dataset Format”.

If you have legacy code that uses the `ModelDataLogs` API, you can encounter situations that require updates to your code or model. See “Migrate Scripts That Use Legacy ModelDataLogs API”.

Properties

Name	Access	Description
`Units`	RW	The units, e.g., `'seconds'`, in which the time series data are expressed in the associated `Simulink.Timeseries` object.

Name	Access	Description
Start	RW	If the associated signal is not in a conditionally executed subsystem, this field contains the simulation time of the first signal value recorded in the associated Simulink.Timeseries object. If the signal is in a conditionally executed subsystem, this field contains an array of times when the system became active.
end	RW	If the associated signal is not in a conditionally executed subsystem, this field contains the simulation time of the last signal value recorded in the associated Simulink.Timeseries object. If the signal is in a conditionally executed subsystem, this field contains an array of times when the system became inactive.
Increment	RW	The interval between simulation times at which signal data is logged in the associated Simulink.Timeseries object. If the signal is aperiodic (continuous signal with variable-step solver), this property has a value of NaN. A signal is periodic if it has a discrete sample time (not continuous or constant) or is continuous with a fixed-step solver.
Length	W	The number of signal samples recorded in the associated Simulink.Timeseries object, i.e., the length of the arrays referenced by the object's Time and Data properties.

Simulink.Timeseries

Store data for any signal except mux or bus signal

Description

Note The Simulink.Timeseries class is supported for backwards compatibility. The ModelDataLogs format created Simulink.Timeseries objects for signal logging data. Starting in R2016a, you cannot log data in the ModelDataLogs format. Signal logging uses the Dataset format. In R2016a or later, when you open a model from an earlier release that had used ModelDataLogs format, the model simulated in use Dataset format.

You can convert signal logging data from ModelDataLogs to Dataset format. Converting to Dataset format makes it easier to post-process with other logged data (for example, logged states), which can also use Dataset format. For more information, see “Convert Logged Data to Dataset Format”.

If you have legacy code that uses the ModelDataLogs API, you can encounter situations that require updates to your code or model. See “Migrate Scripts That Use Legacy ModelDataLogs API”.

Simulink software creates instances of this class to store signal data that it logs for any signal except a mux or bus signal, which are stored in a Simulink.TsArray. See “Export Signal Data Using Signal Logging” for more information.

Properties

Name	Access	Description
Name	RW	Name of this signal log.
BlockPath	RW	Path of the block that output the signal logged in this signal log.

Name	Access	Description
PortIndex	RW	Index of the output port that emitted the signal logged in this signal log.
SignalName	RW	Name of the signal logged in this signal log.
ParentName	RW	Name of the parent of the signal recorded in this log, if the signal is an element of a mux or a virtual bus; otherwise, the same as SignalName.
TimeInfo	RW	An object of Simulink.TimeInfo class that describes the time data in this log.
Time	RW	An array containing the simulation times at which signal data was logged.
Data	RW	An array containing the signal data.

Simulink.TsArray

Store data for mux or bus signal

Description

Note Before R2016a, the `Simulink.TsArray` class was used in conjunction with the `ModelDataLogs` logging data format. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format.

However, you can use data that was logged in a previous release using `ModelDataLogs` format.

In releases earlier than R2016a, Simulink software created instances of this class to contain the data that it logs for a mux or bus signal. Other types of signals were stored in a `Simulink.Timeseries`.

Objects of the `Simulink.TsArray` class have a variable number of properties. The first property, called `Name`, specifies the log name of the logged signal. The remaining properties reference logs for the elements of the logged signal: `Simulink.Timeseries` objects for elementary signals and `Simulink.TSArray` objects for mux or bus signals. The name of each property is the log name of the corresponding signal.

For example, suppose you have this logged data from a model run in a release earlier than R2016a that was configured to log in `ModelDataLogs` format.

```
logsout.b2

Simulink.TsArray (untitled/Bus Creator1):
  Name                   elements   Simulink Class

  x1                        1       Timeseries
  b1                        2       TsArray
```

The `Simulink.ModelDataLogs` object, named `logsout`, contains a `Simulink.TsArray` object, named `b2`, that contains the logs for the elements of `b2` (that is, the elementary signal `x1` and the bus signal `b1`). Entering the fully qualified name of the Simulink.TsArray object, (logsout.b2) at the MATLAB command line reveals the structure of the signal log for this model.

You can use either fully qualified log names or the unpack command to access the signal logs contained by a Simulink.TsArray object. For example, to access the amplitudes logged for signal x1 in the preceding example, you can enter the following at the MATLAB command line:

```
data = logsout.b2.x1.Data;
```

or

```
logsout.unpack('all');
data = x1.Data;
```

Simulink.Variant class

Package: Simulink

Specify conditions that control variant selection

Description

An object of the `Simulink.Variant` class represents a conditional expression called a variant control. The object allows you to specify a Boolean expression that activates a specific variant choice when it evaluates to `true`.

A variant control comprises one or more variant control variables, specified using MATLAB variables or `Simulink.Parameter` objects.

You specify variant controls for each variant choice represented in a Variant Subsystem or Model Variant block. For a given Variant Subsystem or Model Variant block, only one variant control can evaluate to `true` at a time. When a variant control evaluates to `true`, Simulink activates the variant choice that corresponds to that variant control.

Construction

`variantControl = Simulink.Variant(conditionExpression)` creates a variant control.

Properties

`conditionExpression` — Variant condition expression

`'(default)'` | character vector

Variant condition expression, specified as a character vector containing one or more of these operands and operators.

Operands

- Variable names that resolve to MATLAB variables or `Simulink.Parameter` objects with integer or enumerated data type and scalar literal values
- Variable names that resolve to `Simulink.Variant` objects
- Scalar literal values that represent integer or enumerated values

Operators

- Parentheses for grouping
- Arithmetic, relational, logical, or bit-wise operators

The variant condition expression evaluates to a Boolean value. This property has read and write access.

Example: `'(Fuel==2 || Emission==1) && Ratio==2'`

Examples

Create Variant Controls Using MATLAB Variables

Use MATLAB variables when you want to simulate the model but are not considering code generation.

Create MATLAB variables with scalar literal values.

```
Fuel = 3;
Emission = 1;
Ratio = 3;
```

Develop conditional expressions using the variables.

```
Variant1 = Simulink.Variant('Fuel==1 && Emission==2');
Variant2 = Simulink.Variant('(Fuel==2 || Emission==1) && Ratio==2');
Variant3 = Simulink.Variant('Fuel==3 || Ratio==4');
```

Create Variant Controls Using `Simulink.Parameter` Objects

If you want to generate preprocessor conditionals for code generation, use `Simulink.Parameter` objects .

Create variant `Simulink.Parameter` objects with scalar literal values.

```
Fuel = Simulink.Parameter(3);
Emission = Simulink.Parameter(1);
Ratio = Simulink.Parameter(3);
```

Specify the custom storage class for these objects as `ImportedDefine` so that the values are specified by an external header file.

Other valid values for the custom storage class are `Define` and `CompilerFlag`.

```
Fuel.CoderInfo.StorageClass = 'Custom';
Fuel.CoderInfo.CustomStorageClass = 'ImportedDefine';

Emission.CoderInfo.StorageClass = 'Custom';
Emission.CoderInfo.CustomStorageClass = 'ImportedDefine';

Ratio.CoderInfo.StorageClass = 'Custom';
Ratio.CoderInfo.CustomStorageClass = 'ImportedDefine';
```

Develop conditional expressions using the variables and create variant controls.

```
Variant1 = Simulink.Variant('Fuel==1 && Emission==2');
Variant2 = Simulink.Variant('(Fuel==2 || Emission==1) && Ratio==2');
Variant3 = Simulink.Variant('Fuel==3 || Ratio==4');
```

Simulink.VariantConfigurationData class

Package: Simulink

Class representing a variant configurations data object

Description

The variant configuration data object, stores a collection of variant configurations, constraints, and the name of the default active configuration. The `Simulink.VariantConfigurationData` class has properties that enable you to add, modify, or remove variant configurations, constraints, and control variables. Use an instance of `Simulink.VariantConfigurationData` class to do the following:

- Define and edit variant configurations.
- Add control variables to variant configurations.
- Add copy of variant configuration.
- Delete existing variant configurations, constraints, and sub model configurations.
- Set a specific configuration as default active.
- Validate model using default or a specific variant configuration.
- Query or create variant configurations data object for a given model.

Properties

`VariantConfigurations`

Set of variant configurations. The names of the configurations must be unique and valid MATLAB variable names.

`Constraints`

Set of constraints that must always be satisfied by the model for all variant configurations. The name of the constraints must be unique and valid MATLAB variable names.

`DefaultConfigurationName`

Name of the variant configuration to be used by default for validation.

Methods

addConfiguration	Add a new variant configuration to the variant configuration data object
addConstraint	Add a constraint to the variant configuration data object
addControlVariables	Add control variables to an existing variant configuration
addCopyOfConfiguration	Add a copy of an existing variant configuration to the variant configuration data object
addSubModelConfigurations	Add to a variant configuration the names of the configurations to be used for submodels
existsFor	Check if variant configuration data object exists for a model
getConfiguration	Returns the variant configuration with a given name from a variant configuration data object
getDefaultConfiguration	Returns default variant configuration, if any, for a variant configuration data object
getFor	Get existing variant configuration data object for a model
getOrCreateFor	Get existing or create a new variant configuration data object for a model
removeConfiguration	Remove a variant configuration with a given name from the variant configuration data object
removeConstraint	Remove a constraint from the variant configuration data object
removeControlVariable	Remove a control variable from a variant configuration
removeSubModelConfiguration	Remove from a variant configuration, the configuration to be used for a sub model.
setDefaultConfigurationName	Set name of the default variant configuration for a variant configuration data object
validateModel	Validate all variant blocks in the model and submodels in the hierarchy during simulation
VariantConfigurationData	Object constructor with optional arguments for variant configurations, constraints, and default configuration name

Examples

```
load_system(model);
% Create variant config and associate it with model
variantConfig = Simulink.VariantConfigurationData;
set_param(model, 'VariantConfigurationObject', 'variantConfig');
```

“Variant Manager Overview”

addConfiguration

Class: Simulink.VariantConfigurationData
Package: Simulink

Add a new variant configuration to the variant configuration data object

Syntax

```
vcdataObj.addConfiguration(name)
vcdataObj.addConfiguration(name,description)
vcdataObj.addConfiguration(name,description,controlVars)
vcdataObj.addConfiguration(name,description,controlVars,
subModelConfigurations)
```

Description

`vcdataObj.addConfiguration(name)` adds a new variant configuration with a given name to the variant configuration data object.

`vcdataObj.addConfiguration(name,description)` adds a new variant configuration with a given name and optional description to the variant configuration data object.

`vcdataObj.addConfiguration(name,description,controlVars)` adds a new variant configuration with a given name, optional description, and control variables to the variant configuration data object.

`vcdataObj.addConfiguration(name,description,controlVars, subModelConfigurations)` adds a new variant configuration with a given name, optional description, control variables, and submodel configurations to the variant configuration data object.

Input Arguments

name

Name of variant configuration being added.

description

Description text for the variant configuration being added.

controlVars

Control variables for the variant configuration being added. This argument must be a vector of structures with required fields: `Name` and `Value`. The values assigned to the `Name` field must be unique and valid MATLAB variable names. The `Value` field can contain either character vectors or `Simulink.Parameter` objects. The values of control variables are checked during validation of the variant configuration.

subModelConfigurations

Vector of structures containing fields: `ModelName`, `ConfigurationName`. The names of submodels must be unique and valid MATLAB variable names and configuration names must be valid MATLAB variables.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add a variant configuration LinInterExp
vcdataObj.addConfiguration('LinInterExp')
```

See Also

`Simulink.VariantConfigurationData` | `Simulink.VariantConfigurationData.addControlVariables` | `Simulink.VariantConfigurationData.addSubModelConfigurations`

addConstraint

Class: Simulink.VariantConfigurationData
Package: Simulink

Add a constraint to the variant configuration data object

Syntax

```
vcdataObj.addConstraint(nameOfConstraint)
vcdataObj.addConstraint(nameOfConstraint,condition)
vcdataObj.addConstraint(nameOfConstraint,condition,description)
```

Description

`vcdataObj.addConstraint(nameOfConstraint)` adds a new constraint with a given name to `vcdataObj`.

`vcdataObj.addConstraint(nameOfConstraint,condition)` adds a new constraint with a given name and condition expression to `vcdataObj`.

`vcdataObj.addConstraint(nameOfConstraint,condition,description)`adds a new constraint with a given name, condition expression, and description to `vcdataObj`.

Input Arguments

nameOfConstraint

Name of constraint being added. Must be unique and valid MATLAB variable name.

condition

Boolean expression that must evaluate to true. When the expression evaluates to true, it means the constraint is satisfied.

`description`

Text that describes the constraint.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add a constraint named LinNotExtern
vcdataObj.addConstraint('LinNotExtern','((Ctrl~=1)...
  || (PlantLocation ~=1))','Description of the constraint')
```

addControlVariables

Class: Simulink.VariantConfigurationData
Package: Simulink

Add control variables to an existing variant configuration

Syntax

```
vcdataObj.addControlVariables(nameOfConfiguration,controlVars)
```

Description

`vcdataObj.addControlVariables(nameOfConfiguration,controlVars)`, adds control variables to a variant configuration.

Input Arguments

`nameOfConfiguration`

Specifies the name of an existing configuration.

`controlVars`

Control variables being added. This argument must be a vector of structures with required fields: `Name` and `Value`. The values assigned to the `Name` field must be unique and valid MATLAB variable names. The `Value` field can contain either character vectors or `Simulink.Parameter` objects. The values of control variables are checked during validation of the variant configuration.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;
```

```
% Add a variant configuration named LinInterExp
vcdataObj.addConfiguration('LinInterExp',...
'Linear Internal Experimental Plant Controller');

% Add control variables SmartSensor1Mod and PlanLocation
vcdataObj.addControlVariables('LinInterExp',...
  cell2struct({'SmartSensor1Mod', '2';...
               'PlantLocation', '1'},...
              {'Name', 'Value'}, 2))
```

Simulink.VariantConfigurationData | Simulink.VariantConfigurationData.addSubModelConfigurations | Simulink.VariantConfigurationData.removeControlVariable | Simulink.VariantConfigurationData.removeSubModelConfiguration

addCopyOfConfiguration

Class: Simulink.VariantConfigurationData
Package: Simulink

Add a copy of an existing variant configuration to the variant configuration data object

Syntax

```
vcdataObj.addCopyOfConfiguration(nameOfExistingConfiguration)
vcdataObj.addCopyOfConfiguration(nameOfExistingConfiguration,
nameOfTobeAddedConfiguration)
```

Description

`vcdataObj.addCopyOfConfiguration(nameOfExistingConfiguration)`, adds a new configuration with a default name (default name is based on existing configuration name being copied) as a copy of the existing configuration to the variant configuration data object.

`vcdataObj.addCopyOfConfiguration(nameOfExistingConfiguration, nameOfTobeAddedConfiguration)`, adds a new configuration with a specified name, as a copy of the existing configuration, to the variant configuration data object.

Input Arguments

`nameOfExistingConfiguration`

Name of existing configuration.

Default:

`nameOfTobeAddedConfiguration`

Name of new configuration to be added as a copy of the configuration.

Default:

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add the variant configuration LinInterExp
vcdataObj.addConfiguration('LinInterExp',...
  'Linear Internal Experimental Plant Controller');

% Add a copy of variant configuration LinInterExp
% and name the copy as LinExtExp
vcdataObj.addCopyOfConfiguration('LinInterExp','LinExtExp')
```

See Also

Simulink.VariantConfigurationData | Simulink.VariantConfigurationData.addConfiguration | Simulink.VariantConfigurationData.removeConfiguration | Simulink.VariantConfigurationData.setDefaultConfiguration

addSubModelConfigurations

Class: Simulink.VariantConfigurationData
Package: Simulink

Add to a variant configuration the names of the configurations to be used for submodels

Syntax

```
vcdataObj.addSubModelConfigurations(nameOfConfiguration,
subModelConfigurations)
```

Description

`vcdataObj.addSubModelConfigurations(nameOfConfiguration, subModelConfigurations)`, specifies names of the configurations to be used for submodels.

Input Arguments

`nameOfConfiguration`

Name for the configuration of submodels that are model references.

`subModelConfigurations`

Vector of structures containing fields: `ModelName`, `ConfigurationName`. The names of submodels must be unique and valid MATLAB variable names and configuration names must be valid MATLAB variables.

Examples

```
% Add the path to the model file
addpath(fullfile(docroot,'toolbox','simulink','examples'));
```

```
% Load the model
load_system('slexVariantManagementExample');

% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add the variant configuration LinInterExp
vcdataObj.addConfiguration('LinInterExp',...
  'Linear Internal Experimental Plant Controller');

% Add a new submodel configuration to LinInterExp
vcdataObj.addSubModelConfigurations('LinInterExp',...
  [struct('ModelName', 'slexVariantManagementExternalPlantMdlRef',...
          'ConfigurationName', 'LowFid')])
```

Simulink.VariantConfigurationData | Simulink.VariantConfigurationData.addControlVariables | Simulink.VariantConfigurationData.removeControlVariable | Simulink.VariantConfigurationData.removeSubModelConfiguration

existsFor

Class: Simulink.VariantConfigurationData
Package: Simulink

Check if variant configuration data object exists for a model

Syntax

```
Simulink.VariantConfigurationData.existsFor(modelNameOrHandle)
```

Description

`Simulink.VariantConfigurationData.existsFor(modelNameOrHandle)` returns true if the variant configuration data object exists for the model.

Input Arguments

`modelNameOrHandle`

Name or handle to the model.

Examples

```
% Add the path to the model file
addpath(fullfile(docroot,'toolbox','simulink','examples'));

% Load the model
load_system('slexVariantManagementExample');

% Checks whether a variant configuration
% data object exists for model
[exists] = Simulink.VariantConfigurationData.existsFor...
  ('slexVariantManagementExample')
```

See Also

`Simulink.VariantConfigurationData` | `Simulink.VariantConfigurationData.getFor`

getConfiguration

Class: Simulink.VariantConfigurationData
Package: Simulink

Returns the variant configuration with a given name from a variant configuration data object

Syntax

```
vcdataObj.getConfiguration(nameOfConfiguration)
```

Description

`vcdataObj.getConfiguration(nameOfConfiguration)` returns a specific variant configuration that is associated with the variant configuration data object.

Input Arguments

`nameOfConfiguration`

Name of the variant configuration to be returned.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add the variant configuration LinInterExp
vcdataObj.addConfiguration('LinInterExp',...
  'Linear Internal Experimental Plant Controller');

% Add a control variable SmartSensor1Mod
vcdataObj.addControlVariables('LinInterExp',...
  [struct('Name','SmartSensor1Mod','Value','2')]);
```

```
% Obtain information on the variant configuration..
% LinInterExp from the variant configuration data object
vc = vcdataObj.getConfiguration('LinInterExp')
```

See Also

Simulink.VariantConfigurationData | Simulink.VariantConfigurationData.addConfiguration | Simulink.VariantConfigurationData.getDefaultConfiguration | Simulink.VariantConfigurationData.removeConfiguration

getDefaultConfiguration

Class: Simulink.VariantConfigurationData
Package: Simulink

Returns default variant configuration, if any, for a variant configuration data object

Syntax

```
vcdataObj.getDefaultConfiguration
```

Description

`vcdataObj.getDefaultConfiguration` returns the default variant configuration. If no default variant configuration is defined, then `[]` is returned.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add the variant configuration named LinInterExp
vcdataObj.addConfiguration('LinInterExp',...
  'Linear Internal Experimental Plant Controller');

% Add the variant configuration LinInterStd
vcdataObj.addConfiguration('LinInterStd',...
  'Linear Internal Standard Plant Controller');

% Set LinExtExp as the default variant configuration
vcdataObj.setDefaultConfigurationName('LinExtExp');

% Obtain the default variant configuration
defvc = vcdataObj.getDefaultConfiguration
```

See Also

`Simulink.VariantConfigurationData` | `Simulink.VariantConfigurationData.getConfiguration` | `Simulink.VariantConfigurationData.setDefaultConfigurationName`

getFor

Class: Simulink.VariantConfigurationData
Package: Simulink

Get existing variant configuration data object for a model

Syntax

`Simulink.VariantConfigurationData.getFor(modelNameOrHandle)`

Description

`Simulink.VariantConfigurationData.getFor(modelNameOrHandle)`, returns the variant configuration object for the model. If no default variant configuration is defined, then `[]` is returned.

Input Arguments

`modelNameOrHandle`

Model name or handle.

Examples

```
% Add the path to the model file
addpath(fullfile(docroot,'toolbox','simulink','examples'));

% Load the model
load_system('slexVariantManagementExample');

% Obtain variant configuration data object for the model
% slexVariantManagementExample
vcdataObj = Simulink.VariantConfigurationData.getFor...
  ('slexVariantManagementExample')
```

See Also

`Simulink.VariantConfigurationData` | `Simulink.VariantConfigurationData.existsFor` | `Simulink.VariantConfigurationData.getOrCreateFor`

getOrCreateFor

Class: Simulink.VariantConfigurationData
Package: Simulink

Get existing or create a new variant configuration data object for a model

Syntax

`Simulink.VariantConfigurationData.getOrCreateFor(modelNameOrHandle)`

Description

`Simulink.VariantConfigurationData.getOrCreateFor(modelNameOrHandle)`, returns the object if the variant configuration data objects exists otherwise, creates an empty object.

Input Arguments

`modelNameOrHandle`

Model name or handle to the model.

Examples

```
% Add the path to the model file
addpath(fullfile(docroot,'toolbox','simulink','examples'));

% Load the model
load_system('slexVariantManagementExample');

% Obtain existing or create an empty variant configuration
% data object for the slexVariantManagementExample model
vcdataObj = Simulink.VariantConfigurationData.getOrCreateFor...
  ('slexVariantManagementExample')
```

removeConfiguration

Class: Simulink.VariantConfigurationData
Package: Simulink

Remove a variant configuration with a given name from the variant configuration data object

Syntax

`vcdataObj.removeConfiguration(nameOfConfiguration)`

Description

`vcdataObj.removeConfiguration(nameOfConfiguration)` removes the configuration from the variant configuration data object.

Input Arguments

`nameOfConfiguration`

Name of the configuration to be removed.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add the LinInterExp variant configuration
% to the variant configuration data object
vcdataObj.addConfiguration('LinInterExp',...
  'Linear Internal Experimental Plant Controller');

% Remove the LinInterExp configuration
% from the variant configuration data object
vcdataObj.removeConfiguration('LinInterExp')
```

See Also

Simulink.VariantConfigurationData | Simulink.VariantConfigurationData.addConfiguration | Simulink.VariantConfigurationData.getConfiguration

removeConstraint

Class: Simulink.VariantConfigurationData
Package: Simulink

Remove a constraint from the variant configuration data object

Syntax

```
vcdataObj.removeConstraint(nameOfConstraint)
```

Description

`vcdataObj.removeConstraint(nameOfConstraint)`, removes the constraint from the variant configuration data object.

Input Arguments

nameOfConstraint

Name of the constraint to be removed.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add a constraint named LinNotExtern
vcdataObj.addConstraint('LinNotExtern','((Ctrl~=1)...
  || (PlantLocation ~=1))',..
  'Description of the constraint');

% Remove the constraint LinNotExtern
% from the variant configuration
vcdataObj.removeConstraint('LinNotExtern')
```

See Also

`Simulink.VariantConfigurationData` | `Simulink.VariantConfigurationData.addConstraint`

removeControlVariable

Class: Simulink.VariantConfigurationData
Package: Simulink

Remove a control variable from a variant configuration

Syntax

```
vcdataObj.removeControlVariable(nameOfConfiguration,
nameOfControlVariable)
```

Description

`vcdataObj.removeControlVariable(nameOfConfiguration, nameOfControlVariable)` removes a control variable from a variant configuration.

Input Arguments

`nameOfConfiguration`

Name of the variant configuration.

`nameOfControlVariable`

Name of the control variable to be deleted.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add a variant configuration named LinInterExp
vcdataObj.addConfiguration('LinInterExp',...
  'Linear Internal Experimental Plant Controller');
```

```
% Add control variables SmartSensor1Mod and PlanLocation
vcdataObj.addControlVariables('LinInterExp',...
  [struct('Name','SmartSensor1Mod','Value','2')]);

% Remove the control variable SmartSensor1Mod
% from the configuration LinInterExp
vcdataObj.removeControlVariable('LinInterExp',...
  'SmartSensor1Mod')
```

See Also

Simulink.VariantConfigurationData | Simulink.VariantConfigurationData.addControlVariables

removeSubModelConfiguration

Class: Simulink.VariantConfigurationData
Package: Simulink

Remove from a variant configuration, the configuration to be used for a sub model.

Syntax

```
vcdataObj.removeSubModelConfiguration(nameOfConfiguration,
nameOfSubModel)
```

Description

`vcdataObj.removeSubModelConfiguration(nameOfConfiguration, nameOfSubModel)`, removes the configuration specified for a submodel.

Input Arguments

`nameOfConfiguration`

Name of the submodel configuration to be removed.

`nameOfSubModel`

Name of the submodel from which the configuration must be removed.

Examples

```
% Load the model
load_system('slexVariantManagementExample');

% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;
```

```
% Add the variant configuration named LinInterExp
vcdataObj.addConfiguration('LinInterExp',...
  'Linear Internal Experimental Plant Controller',controlvars);

% Add a new submodel configuration to LinInterExp
vcdataObj.addSubModelConfigurations('LinInterExp',...
  [struct('ModelName','slexVariantManagementExternalPlantMdlRef',...
  'ConfigurationName', 'LowFid')]);

% Remove the submodel configuration LinInterExp
% from the submodel slexVariantManagementExternalPlantMdlRef
vcdataObj.removeSubModelConfiguration('LinInterExp',..
  'slexVariantManagementExternalPlantMdlRef')
```

See Also

Simulink.VariantConfigurationData | Simulink.VariantConfigurationData.addSubModelConfigurations

setDefaultConfigurationName

Class: Simulink.VariantConfigurationData
Package: Simulink

Set name of the default variant configuration for a variant configuration data object

Syntax

```
vcdataObj.setDefaultConfigurationName(nameOfConfiguration)
```

Description

`vcdataObj.setDefaultConfigurationName(nameOfConfiguration)` sets the default configuration name. A variant configuration must exist with the same name. If an empty value is passed, then the default configuration name is cleared.

Input Arguments

`nameOfConfiguration`

Name of the configuration to be set as the default.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add the LinInterExp variant configuration
vcdataObj.addConfiguration('LinInterExp',...
  'Linear Internal Experimental Plant Controller');

% Set the configuration LinInterExp as default
vcdataObj.setDefaultConfigurationName('LinInterExp');
```

```
% Obtain the default variant configuration
dconfig = vcdataObj.getDefaultConfiguration
```

See Also

Simulink.VariantConfigurationData | Simulink.VariantConfigurationData.getDefaultConfiguration

validateModel

Class: Simulink.VariantConfigurationData
Package: Simulink

Validate all variant blocks in the model and submodels in the hierarchy during simulation

Syntax

```
Simulink.VariantConfigurationData.validateModel(modelName)
Simulink.VariantConfigurationData.validateModel(modelName,
configName)
```

Description

`Simulink.VariantConfigurationData.validateModel(modelName)`, validates the model and referenced models during simulation.

`Simulink.VariantConfigurationData.validateModel(modelName, configName)`, validates the model and referenced models during simulation optionally using a variant configuration.

Input Arguments

`modelName`

Name of the model

`configName`

Name of the configuration to be validated

Examples

```
% Add the path to the model file
addpath(fullfile(docroot,'toolbox','simulink','examples'));
```

```
% Load the model
load_system('slexVariantManagementExample');

% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add a variant configuration LinInterExp
vcdataObj.addConfiguration('LinInterExp');

% Add control variables to LinInterExp
vcdataObj.addControlVariables('LinInterExp',...
  cell2struct({'Ctrl', '1';...
               'PlantLocation', '2';...
               'SimType', '2'},...
              {'Name', 'Value'}, 2));

% Associate this object with the model
set_param('slexVariantManagementExample',...
  'VariantConfigurationObject', 'vcdataObj');

% Validate the model slexVariantManagementExample using
% the configuration LinInterExp
[valid, errors] = Simulink.VariantConfigurationData.validateModel...
  ('slexVariantManagementExample','LinInterExp')
```

VariantConfigurationData

Class: Simulink.VariantConfigurationData
Package: Simulink

Object constructor with optional arguments for variant configurations, constraints, and default configuration name

Syntax

```
vardataObj = Simulink.VariantConfigurationData(
variantConfigurations)
```

Description

`vardataObj = Simulink.VariantConfigurationData(variantConfigurations)`, constructor that creates an empty variant configuration data object. Optionally, can also accept constraints and a default configuration name as inputs.

Input Arguments

`variantConfigurations`

Configurations that are part of the variant configuration data object.

`constraints`

Constraints to be satisfied by the model.

`defaultConfigurationName`

Name of the default configuration

Examples

```
% Create an empty variant configuration data object
vcdataObj = Simulink.VariantConfigurationData
```

Simulink.VariantManager class

Package: Simulink

Class representing a set of Variant Manager functionality

Description

The variant manager class provides a set of methods to access Variant Manager functionality from the MATLAB command-line. Use an instance of `Simulink.VariantManager` class to:

- Convert the Subsystems or Model block to a Variant Subsystem.
- Find variables used in Variant control expressions.
- Generate a reduced model for specified variant configurations.
- Display or control behavior of a variant condition legend.

Method

variantLegend	Display or control behavior of variant condition legend
reduceModel	Generate reduced model for specified variant configurations
convertToVariant	Convert Subsystem, or Model block, or Variant Model block to a Variant Subsystem block

"Variant Manager Overview"
`Simulink.VariantManager.variantLegend`
`Simulink.VariantManager.convertToVariant`

variantLegend

Class: Simulink.VariantManager
Package: Simulink

Display or control behavior of variant condition legend

Syntax

```
Simulink.VariantManager.variantLegend(modelName, action)
```

Description

`Simulink.VariantManager.variantLegend(modelName, action)` displays or performs a specified `action` on the variant condition legend.

Input Arguments

`modelName` — Model for which the variant legend is displayed

character vector

Model for which the variant legend is displayed, specified as a character vector.

`action` — Task to be performed on the variant legend

`'open'` | `'print'` | `'showCodeConditions'` | `'close'`

Task to be performed on the variant condition legend for the model. You can specify the task as:

- `'open'` — Displays the variant condition legend for a model. The model must be open. If the legend is opened for the first time, the model is updated.
- `'print'` — Prints the data in the variant condition legend. The legend must be open. There is no preview before printing the legend.

- 'showCodeConditions' — Displays code generation conditions column in the variant condition legend. The legend must be open. showCodeConditions is used as a name-value pair and accepts 'on' or 'off' as its values.
- 'close' — Closes the variant condition legend belonging to the specified model.

Examples

```
model = 'sldemo_variant_subsystems';
        open_system(model);
        % Open the variant condition legend
        Simulink.VariantManager.variantLegend(model,'open');
        % Display the code generation conditions
        Simulink.VariantManager.variantLegend(model,'showCodeConditions','on');
```

Introduced in R2017b

reduceModel

Class: Simulink.VariantManager
Package: Simulink

Generate reduced model for specified variant configurations

Syntax

```
Simulink.VariantManager.reduceModel(Model)
Simulink.VariantManager.reduceModel(Model, Name, Value)
```

Description

`Simulink.VariantManager.reduceModel(Model)` creates a reduced model for the specified configuration. The referenced models and library blocks are also reduced. By default, the name of the reduced model and any reduced child referenced model name is the original model name suffixed with `_r`.

`Simulink.VariantManager.reduceModel(Model, Name, Value)` specifies the reduction parameters in the Name and Value arguments form.

Input Arguments

`Model` — Model to be reduced
character vector

Required field. Model to be reduced, specified as a character vector.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (`' '`) and is caseinsensitive whereas, the value string is casesensitive. You can specify several name and value pair arguments in any order as Name1,Value1,...,NameN,ValueN.

NamedConfigurations — Variant configuration name

{''} | character vector | 'cell array'

Specifies the names of variant configurations. By default, current values of variant control variables are used for reduction.

VariableGroups — Variant control variable value

{''} | 'cell array'

Specifies the variant control variable values to be used for reduction. By default, the current values of variant control variables are used.

The specified values must be a cell array with variant control variable names and their corresponding values.

Note 'VariableGroups' and 'NamedConfigurations' are mutually exclusive.

Consider this example:

```
Simulink.VariantManager.reduceModel('iv_model', ...
                                              'VariableGroups',...
                                              {{'V',1,'W',1},{'V',2,'W',2}})
```

FullRangeVariables — Variant control variable value

{''} | 'cell array'

Specifies the full-range variant control variable values to be used for reduction. This allows you to reduce a model for all valid values of the specified variant control variable. Provide a reference value for variant control variable that results in a successful model compilation.

Consider this example:

```
Simulink.VariantManager.reduceModel('slexVariantReducer',...
                      'VariableGroups',{'V',1},...
                      'FullRangeVariables',{'W',1});
```

You can specify a variant control variable, 'W', as a full-range variant control variable. This allows you to reduce the model for all valid values of variable 'W'. In the example, full-range variant control variable W uses a reference value of 1.

`OutputFolder` — Folder to store the reduced model

character vector

Specifies the folder to place the reduced models and related artifacts. By default, the reduced models are generated in `./reducedModel` subfolder in the original model folder.

`PreserveSignalAttributes` — Preserve the signal attributes in the reduced model

{true} | false

When the value is `true`, the Variant Reducer preserves the compiled signal attributes between the original and reduced models by adding signal specification blocks at appropriate block ports in the reduced model. Compiled signal attributes include signal data types, signal dimensions, compiled sample times, etc.

`Verbose` — Displays step details

true | {false}

When the value is `true`, the Variant Reducer displays details of the steps performed during model reduction.

`ModelSuffix` — Reduced model name suffix

{_r}

Specifies the suffix to append to the reduced models and the related artifacts.

`GenerateSummary` — Generates a summary html file

true | {false}

When the value is `true`, the Variant Reducer generates a html file with details about the reduced model and any modifications that may be required for masks and callbacks.

Note To generate summary, you must have **Simulink Report Generator** license.

Examples

```
% Reduce model based on its variant control variable values in the base workspace.
Simulink.VariantManager.reduceModel('sldemo_variant_subsystems');

% Reduce the model associated with a variant configuration data object and configurations to be retained in
Simulink.VariantManager.reduceModel('slexVariantManagementExample', ...
                                          'NamedConfigurations', {'LinInterStd',
                                          'NonLinExterHighFid'})

% Reduce the model by specifying variant control variable values. Here, two groups are specified correspondi
% {V==1, W==1}, and {V==2, W==2} respectively.
Simulink.VariantManager.reduceModel('iv_model', ...
                                          'VariableGroups',...
                                          {{'V',1,'W',1},{'V',2,'W',2}});

% Reduce the model by specifying variant control variable values where 'W' is a full-range variant control v
% automatically maps the specification to correspond to the following four explicit groups: {V==1, W==1}, {V
Simulink.VariantManager.reduceModel('slexVariantReducer',...
                                          'VariableGroups',...
                                          {'V',1},...
                                          'FullRangeVariables',{'W',1});
```

Variant Subsystem

Topics

“Create a Simple Variant Model”
“What Are Variants and When to Use Them”
`Simulink.VariantManager`
`Simulink.VariantManager.variantLegend`

Introduced in R2016a

convertToVariant

Class: Simulink.VariantManager
Package: Simulink

Convert Subsystem, or Model block, or Variant Model block to a Variant Subsystem block

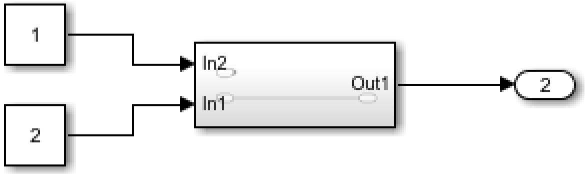
Syntax

```
variant_subsystem = Simulink.VariantManager.convertToVariant(block)
variant_subsystem = Simulink.VariantManager.convertToVariant(
blockHandle)
```

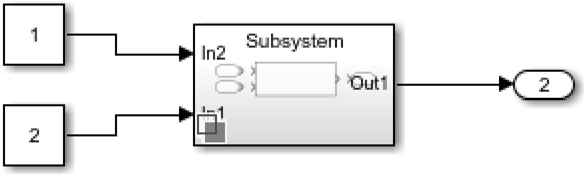
Description

`variant_subsystem = Simulink.VariantManager.convertToVariant(block)` or `variant_subsystem = Simulink.VariantManager.convertToVariant(blockHandle)` converts a Subsystem, or Model block, or Variant Model block to a Variant Subsystem block. A Variant Subsystem can contain Subsystems, Model blocks, or both as choices.

Consider this model with Subsystem block.



You can convert this Subsystem block to a Variant Subsystem block using the `convertToVariant` method.

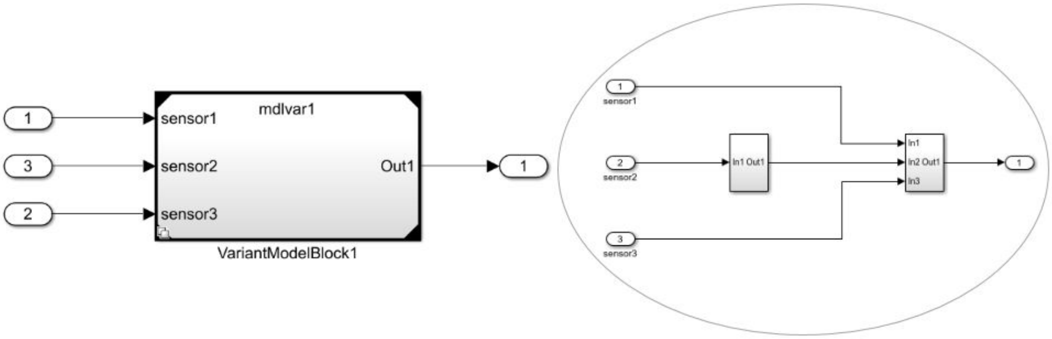


Similarly you can convert a Variant Model block to a Variant Subsystem block.

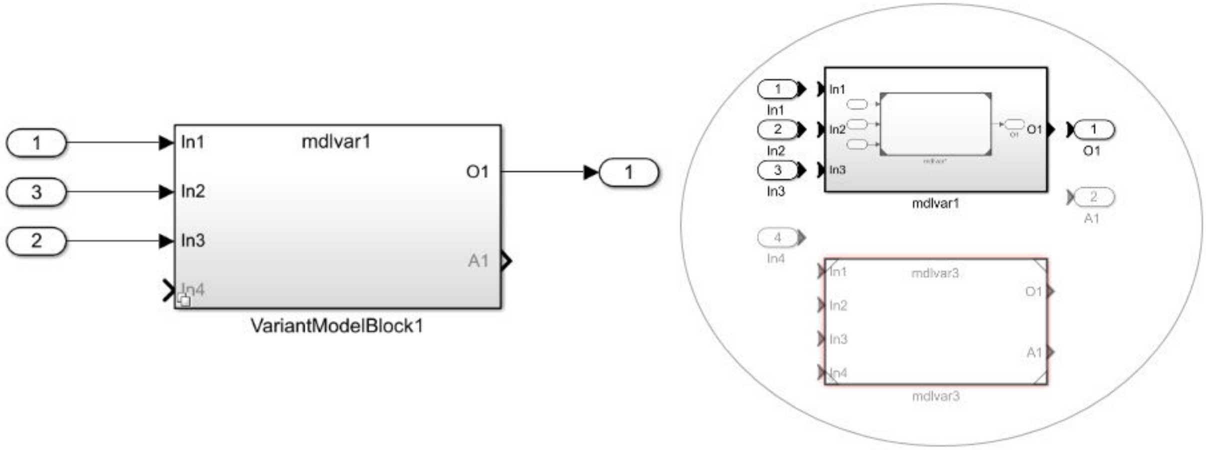
To convert a Variant Model block to a Variant Subsystem block, you can also use the Upgrade Advisor check, **Identify Variant Model blocks and convert those to Variant Subsystem containing Model block choices**. This check provides a **Fix** button to convert Variant Model blocks to Variant Subsystem blocks. For more information on using Upgrade Advisor check to convert a Variant Model block to a Variant Subsystem block, see “Upgrade Advisor Checks”

If there are inconsistencies in the port name or port number in models referenced by Variant Model block, Simulink corrects these inconsistencies while converting the Variant Model block to Variant Subsystem block.

Consider this model with Variant Model block having different port names.



When you convert this Variant Model block to a Variant Subsystem block, the inconsistencies are corrected automatically.



Note Future releases will no longer support using a Model block to contain model variants. You can use the `convertToVariant` method to convert model variants so that Model blocks are contained in a Variant Subsystem. Use of a Variant Subsystem block provides these advantages:

- Allows you to mix Model and Subsystem blocks as variant choices
- Supports flexible I/O, so that all variants do not need to have the same number of input and output ports

For an example of a model that uses a Variant Subsystem block as a container for variant models, see “Model Reference Variants”.

Limitations

You cannot convert a Subsystem block that meets the following condition:

- The Subsystem block is in a Simscape model that has Editing Mode set to **Restricted**.
- The Variant Model block has a mix of control ports or there is a name mismatch in control port types.
- The Variant Model block has control ports with different port numbers and name mapping.

Input Arguments

`block` — Subsystem or Model block to convert
block path | block handle

The path or block handle of the Subsystem or Model block to convert to a Variant Subsystem block. Specify a block path as a character vector and a block handle as a scalar.

Output Arguments

`variant_subsystem` — Handle of Variant Subsystem block
scalar returned by Simulink

If you specify an output argument, the method returns the block handle of the Variant Subsystem block created by the conversion.

Examples

```
open_system('sldemo_mdlref_conversion');
   Simulink.VariantManager.convertToVariant('sldemo_mdlref_conversion/Bus Counter');
```

Alternative Functionality

Simulink Editor

In the Simulink Editor, right-click the Model block and select **Subsystems & Model Reference > Convert to > Variant Subsystem**.

Topics

“Create a Simple Variant Model”

“What Are Variants and When to Use Them”

Introduced in R2017b

Simulink.WorkspaceVar

Store information about workspace variables and blocks that use them

Note `Simulink.WorkspaceVar` is not recommended. Use `Simulink.VariableUsage` instead.

Description

A `Simulink.WorkspaceVar` object describes attributes of a workspace variable and lists the blocks that use the variable.

Creation

The `Simulink.findVars` function returns one or more `Simulink.WorkspaceVar` objects that embody the results of searching for variables.

Only the `Simulink.WorkspaceVar` function can set any field value in a `Simulink.WorkspaceVar` object. The fields are otherwise read-only.

Syntax

```
varObj = Simulink.WorkspaceVar(varNames,wkspName)
```

Description

`varObj = Simulink.WorkspaceVar(varNames,wkspName)` creates an array of `Simulink.WorkspaceVar` objects to describe the variables `varNames`. The constructor sets the `Name` property of each object to one of the variable names specified by `varNames`, and sets the `Workspace` property of all the objects to the workspace specified by `wkspName`. You can specify `varNames` with variables that are not used in any loaded models.

Input Arguments

`varNames` — Names of target variables

character vector | cell array of character vectors

Names of target variables, specified as a character vector or a cell array of character vectors. The constructor creates a `Simulink.WorkspaceVar` object for each variable name. You can specify `varNames` with variables that are not used in any loaded models.

Example: `'k'`

Example: `{'k','asdf','fuelFlow'}`

Data Types: `char` | `cell`

`wkspName` — Name of containing workspace

character vector

Name of the workspace that defines the target variables, specified as a character vector. For example, you can specify the MATLAB base workspace. The constructor also determines and sets the `WorkspaceType` property of each of the returned `Simulink.WorkspaceVar` objects.

Example: `'base workspace'`

Example: `'myModel'`

Example: `'myDictionary.sldd'`

Data Types: `char`

Properties

`Name` — Name of variable

`''` (empty character vector) (default) | character vector

This property is read-only.

Name of the variable described by the object, returned as a character vector.

`Workspace` — Name of workspace that contains variable

`''` (empty character vector (default) | character vector

This property is read-only.

Name of the workspace that contains the variable, returned as a character vector. For example:

Workspace value	Meaning
`'base workspace'`	The MATLAB base workspace
`'MyModel'`	The model workspace for the model `MyModel`.
`'MyModel/Mask1'`	The mask workspace for the masked block `Mask1` in the model `MyModel`.

`WorkspaceType` — Type of workspace containing variable

`'unknown'` (default) | `'base'` | `'model'` | `'mask'`

This property is read-only.

Type of workspace that contains the variable, returned as a character vector. The possible values are:

- `'base'` — The base workspace
- `'model'` — A model workspace
- `'mask'` — A mask workspace

`UsedByBlocks` — Users of variable

`{}` (empty cell array) (default) | cell array of character vectors

This property is read-only.

Users of the variable, returned as a cell array of character vectors. Each character vector identifies a block that uses the variable. The `Simulink.findVars` function populates this property.

Object Functions

`intersect`	Return intersection of two arrays of Simulink.VariableUsage objects
`setdiff`	Return difference between two arrays of Simulink.VariableUsage objects

Examples

Create Object That Represents Variable in Base Workspace

Return a `Simulink.WorkspaceVar` object for a variable `k` in the base workspace.

```
var = Simulink.WorkspaceVar('k', 'base workspace');
```

Represent All Variables in the Base Workspace

Return an array of `Simulink.WorkspaceVar` objects containing one object for each variable returned by the `whos` command in the base workspace.

```
vars = Simulink.WorkspaceVar(who,WkspName)
```

Represent All Variables in a Model Workspace

Return an array of `Simulink.WorkspaceVar` objects that describes all the variables in a model workspace.

```
hws = get_param('mymodel', 'ModelWorkspace');
vars=Simulink.WorkspaceVar(hws.whos, 'MyModel')
```

Represent All Variables in a Mask Workspace

Return an array of `Simulink.WorkspaceVar` objects that describes all the variables in a mask workspace.

```
maskVars = get_param('mymodel/maskblock', 'MaskWSVariables');
vars = Simulink.WorkspaceVar(maskVars, 'mymodel/maskblock');
```

See Also

`Simulink.findVars` | `intersect` | `setdiff`

Introduced in R2010a

Simulink.VariableUsage

Store information about the relationship between variables and blocks in models

Description

A `Simulink.VariableUsage` object describes where a variable is used in models.

Use this information to:

- Prepare to permanently store the variables in files and workspaces. For more information about storing variables for a model, see “Determine Where to Store Variables and Objects for Simulink Models”.
- Reduce the number of variables that you need to store by eliminating unused variables.
- Prepare to partition variables and establish variable ownership when you work in a team.

To analyze variable usage in models, use `Simulink.VariableUsage` objects together with the `Simulink.findVars` function. The function returns and accepts `Simulink.VariableUsage` objects as arguments. For more information, see `Simulink.findVars`.

A `Simulink.VariableUsage` object can also describe the usage of an enumerated data type.

Only a `Simulink.VariableUsage` constructor or the `Simulink.findVars` function can set property values in a `Simulink.VariableUsage` object. The properties are otherwise read only.

Creation

The `Simulink.findVars` function returns `Simulink.VariableUsage` objects.

To create variable usage objects for use as a filter when using `Simulink.findVars`, use the `Simulink.VariableUsage` function described below.

Syntax

```
variableUsageObj = Simulink.VariableUsage(varNames,sourceName)
```

Description

`variableUsageObj = Simulink.VariableUsage(varNames,sourceName)` creates an array of `Simulink.VariableUsage` objects to describe the variables `varNames`. The constructor sets the `Name` property of each object to one of the variable names specified by `varNames`, and sets the `Source` property of all the objects to the source specified by `sourceName`. You can specify `varNames` with variables that are not used in any loaded models.

Input Arguments

`varNames` — Names of target variables
character vector | cell array of character vectors

Names of target variables, specified as a character vector or a cell array of character vectors. The constructor creates a `Simulink.VariableUsage` object for each variable name.

Example: `'k'`

Example: `{'k','asdf','fuelFlow'}`

Data Types: `char` | `cell`

`sourceName` — Name of variable source
character vector

Name of the source that defines the target variables, specified as a character vector. For example, you can specify the MATLAB base workspace or a data dictionary as a source. The constructor also determines and sets the `SourceType` property of each of the returned `Simulink.VariableUsage` objects.

Example: `'base workspace'`

Example: `'myModel'`

Example: `'myDictionary.sldd'`

Data Types: `char`

Properties

Name — Name of variable or enumerated type

'' (empty character vector) (default) | character vector

This property is read-only.

The name of the variable or enumerated data type the object describes, returned as a character vector.

Source — Name of defining workspace

'' (empty character vector) (default) | character vector

This property is read-only.

The name of the workspace or data dictionary that defines the described variable, returned as a character vector. The table shows some examples.

Source Value	Meaning
'base workspace'	MATLAB base workspace
'MyModel'	Model workspace for the model MyModel
'MyModel/Mask1'	Mask workspace for the masked block Mask1 in the model MyModel
'sldemo_fuelsys_dd_controller.sldd'	The data dictionary named 'sldemo_fuelsys_dd_controller.sldd'

The table shows some examples if you created the Simulink.VariableUsage object by using the Simulink.findVars function to find enumerated data types.

Source Value	Meaning
'BasicColors.m'	The enumerated type is defined in the MATLAB file 'BasicColors.m'.
''	The enumerated type is defined dynamically and has no source.
'sldemo_fuelsys_dd_controller.sldd'	The enumerated type is defined in the data dictionary named 'sldemo_fuelsys_dd_controller.sldd'.

SourceType — Type of defining workspace

'unknown source' (default) | 'base workspace' | 'model workspace' | 'mask workspace' | 'data dictionary'

This property is read-only.

The type of the workspace that defines the variable, returned as a character vector. The possible values are:

- 'base workspace'
- 'model workspace'
- 'mask workspace'
- 'data dictionary'

If you created the Simulink.VariableUsage object by using the Simulink.findVars function to find enumerated data types, the possible values are:

- 'MATLAB file'
- 'dynamic class'
- 'data dictionary'

Users — Blocks that use the variable or models that use the enumerated type

{} (empty cell array) (default) | cell array of character vectors

This property is read-only.

Blocks that use the variable or models that use the enumerated type, returned as a cell array of character vectors. Each character vector names a block or model that uses the variable or enumerated type. The Simulink.findVars function populates this property.

Object Functions

intersect	Return intersection of two arrays of Simulink.VariableUsage objects
setdiff	Return difference between two arrays of Simulink.VariableUsage objects

Examples

Create Object That Represents Variable in Base Workspace

Return a `Simulink.VariableUsage` object for a variable `k` in the base workspace.

```
var = Simulink.VariableUsage('k','base workspace');
```

You can use `var` as a filter for the `Simulink.findVars` function.

Represent All Variables in the Base Workspace

Return an array of `Simulink.VariableUsage` objects containing one object for each variable returned by the `whos` command in the base workspace.

```
vars = Simulink.VariableUsage(whos,'base workspace')
```

Represent All Variables in a Model Workspace

Return an array of `Simulink.VariableUsage` objects that describes all the variables in a model workspace.

```
hws = get_param('mymodel','ModelWorkspace');
vars = Simulink.VariableUsage(hws.whos,'MyModel')
```

Represent All Variables in a Mask Workspace

Return an array of `Simulink.VariableUsage` objects that describes all the variables in a mask workspace.

```
maskVars = get_param('mymodel/maskblock','MaskWSVariables');
vars = Simulink.VariableUsage(maskVars,'mymodel/maskblock');
```

`Simulink.data.existsInGlobal` | `Simulink.findVars`

Topics

“Model Exploration”

“Variables”

Introduced in R2012b

intersect

Package: Simulink

Return intersection of two arrays of `Simulink.VariableUsage` objects

Syntax

```
VarsOut = intersect(VarsIn1,VarsIn2)
```

Description

`VarsOut = intersect(VarsIn1,VarsIn2)` returns an array that identifies the variables described in `VarsIn1` and in `VarsIn2`, which are arrays of `Simulink.VariableUsage` objects. If a variable is described by a `Simulink.VariableUsage` object in `VarsIn1` and in `VarsIn2`, the function returns a `Simulink.VariableUsage` object that stores the variable usage information from both objects in the `Users` property.

`intersect` compares the `Name`, `Source`, and `SourceType` properties of the `Simulink.VariableUsage` objects in `VarsIn1` with the same properties of the objects in `VarsIn2`. If `VarsIn1` and `VarsIn2` each contain `Simulink.VariableUsage` objects that have the same values for these three properties, they both describe the same variable.

To create `Simulink.VariableUsage` objects that describe the usage of variables in a model, use the `Simulink.findVars` function.

Examples

Compare Variables Used by Models

Given two models, discover the variables needed by both models.

```
model1Vars = Simulink.findVars('model1');
model2Vars = Simulink.findVars('model2');
commonVars = intersect(model1Vars,model2Vars);
```

Input Arguments

VarsIn1 — First array of variables for comparison

array of Simulink.VariableUsage objects

First array of variables for comparison, specified as an array of Simulink.VariableUsage objects.

VarsIn2 — Second array of variables for comparison

array of Simulink.VariableUsage objects

Second array of variables for comparison, specified as an array of Simulink.VariableUsage objects.

Output Arguments

VarsOut — Variables described in both input arrays

array of Simulink.VariableUsage objects

Variables that are described in both input arrays, returned as an array of Simulink.VariableUsage objects. The function returns an object for each variable that is described in VarsIn1 and in VarsIn2.

See Also

Simulink.VariableUsage | Simulink.findVars | setdiff

Topics

“Model Exploration”
“Variables”

Introduced in R2012b

setdiff

Package: Simulink

Return difference between two arrays of Simulink.VariableUsage objects

Syntax

VarsOut = setdiff(VarsIn1,VarsIn2)

Description

VarsOut = setdiff(VarsIn1,VarsIn2) returns an array that identifies the variables described in VarsIn1 but not in VarsIn2, which are arrays of Simulink.VariableUsage objects. If a variable is described by a Simulink.VariableUsage object in VarsIn1 but not in VarsIn2, the function returns a copy of the object.

setdiff compares the Name, Source, and SourceType properties of the Simulink.VariableUsage objects in VarsIn1 with the same properties of the objects in VarsIn2. If VarsIn1 and VarsIn2 each contain a Simulink.VariableUsage object with the same values for these three properties, the objects describe the same variable, and setdiff does not return an object to describe it.

To create Simulink.VariableUsage objects that describe the usage of variables in a model, use the Simulink.findVars function.

Examples

Determine Variable Usage Difference Between Models

Given two models, discover the variables that are needed by the first model but not the second model.

```
model1Vars = Simulink.findVars('model1');
model2Vars = Simulink.findVars('model2');
differentVars = setdiff(model1Vars,model2Vars);
```

Find Variables Not Used by Model

Locate all variables in the base workspace that are not used by a loaded model that has been recently compiled.

```
models = find_system('type','block_diagram','LibraryType','None');
base_vars = Simulink.VariableUsage(who,'base workspace');
used_vars = Simulink.findVars(models,'WorkspaceType','base');
unusedVars = setdiff(base_vars,used_vars);
```

Input Arguments

VarsIn1 — First array of variables for comparison
array of Simulink.VariableUsage objects

First array of variables for comparison, specified as an array of Simulink.VariableUsage objects.

VarsIn2 — Second array of variables for comparison
array of Simulink.VariableUsage objects

Second array of variables for comparison, specified as an array of Simulink.VariableUsage objects.

Output Arguments

VarsOut — Variables described in first array but not second array
array of Simulink.VariableUsage objects

Variables that are described in the first input array but not in the second input array, returned as an array of Simulink.VariableUsage objects. The function returns an object for each variable that is described in VarsIn1 but not in VarsIn2.

Introduced in R2012b

Simulink.data.Dictionary class

Package: Simulink.data

Configure data dictionary

Description

An object of the `Simulink.data.Dictionary` class represents a data dictionary. The object allows you to perform operations on the data dictionary such as save or discard changes, import data from the base workspace, and add other data dictionaries as references.

Construction

The functions `Simulink.data.dictionary.create` and `Simulink.data.dictionary.open` create a `Simulink.data.Dictionary` object.

Properties

`DataSources` — Referenced data dictionaries
cell array of character vectors

This property is read-only.

Referenced data dictionaries by file name, returned as a cell array of character vectors. This property only lists directly referenced dictionaries whose parent is the `Simulink.data.Dictionary` object.

`EnableAccessToBaseWorkspace` — Specify whether models can use design data in the base workspace
`false` (default) | `true`

Whether linked models can use design data in the base workspace, specified as `true` or `false`.

To determine whether a dictionary provides access to the base workspace (including through referenced dictionaries), query the `HasAccessToBaseWorkspace` property.

For more information about this property, including restrictions that limit your ability to interact with base workspace data through the dictionary, see “Continue to Use Shared Data in the Base Workspace”.

Data Types: `logical`

`HasAccessToBaseWorkspace` — Query whether models can use design data in the base workspace

`0` (default) | `1`

This property is read-only.

Query whether models can use design data in the base workspace, returned as `1` (true) or `0` (false). If the dictionary or a referenced dictionary has the `EnableAccessToBaseWorkspace` property set to `true`, this property returns `1`.

Use this property to determine whether models that link to the dictionary can use design data in the base workspace. You do not need to query each referenced dictionary to determine whether it has the `EnableAccessToBaseWorkspace` property set to `true`.

Data Types: `logical`

`HasUnsavedChanges` — Indicator of unsaved changes

0 | 1

This property is read-only.

Indicator of unsaved changes to the data dictionary, returned as `0` or `1`. The value is `1` if changes have been made since last data dictionary save and `0` if not.

`NumberOfEntries` — Total number of entries in data dictionary

integer

This property is read-only.

Total number of entries in data dictionary, including those in referenced dictionaries, returned as an integer.

Methods

addDataSource	Add reference data dictionary to parent data dictionary
close	Close connection between data dictionary and `Simulink.data.Dictionary` object
discardChanges	Discard changes to data dictionary
filepath	Full path and file name of data dictionary
getSection	Return `Simulink.data.dictionary.Section` object to represent data dictionary section
hide	Remove data dictionary from Model Explorer
importEnumTypes	Import enumerated type definitions to data dictionary
importFromBaseWorkspace	Import base workspace variables to data dictionary
listEntry	List data dictionary entries
removeDataSource	Remove reference data dictionary from parent data dictionary
saveChanges	Save changes to data dictionary
show	Show data dictionary in Model Explorer

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Create New Data Dictionary and Data Dictionary Object

Create a data dictionary file `myNewDictionary.sldd` and a `Simulink.data.Dictionary` object representing the new data dictionary. Assign the object to variable `dd1`.

```
dd1 = Simulink.data.dictionary.create('myNewDictionary.sldd')
```

```
dd1 =

  data dictionary with properties:

          DataSources: {0x1 cell}
    HasUnsavedChanges: 0
      NumberOfEntries: 0
```

Open Existing Data Dictionary

Create a `Simulink.data.Dictionary` object representing the existing data dictionary `myDictionary_ex_API.sldd`. Assign the object to variable `dd2`.

```
dd2 = Simulink.data.dictionary.open('myDictionary_ex_API.sldd')
```

```
dd2 =

  Dictionary with properties:

          DataSources: {'myRefDictionary_ex_API.sldd'}
    HasUnsavedChanges: 0
      NumberOfEntries: 4
```

addDataSource

Class: Simulink.data.Dictionary
Package: Simulink.data

Add reference data dictionary to parent data dictionary

Syntax

```
addDataSource(dictionaryObj,refDictionaryFile)
```

Description

`addDataSource(dictionaryObj,refDictionaryFile)` adds a data dictionary, `refDictionaryFile`, as a reference dictionary to a parent dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object.

The parent dictionary contains all the entries that are defined in the referenced dictionary until the referenced dictionary is removed from the parent dictionary. The `DataSource` property of an entry indicates the dictionary that defines the entry.

Input Arguments

`dictionaryObj` — Parent data dictionary

`Simulink.data.Dictionary` object

Parent data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

`refDictionaryFile` — File name of data dictionary to reference

character vector

File name of data dictionary to reference, specified as a character vector that includes the `.sldd` extension. The data dictionary file must be on your MATLAB path.

Example: 'mySubDictionary_ex_API.sldd'

Data Types: char

Examples

Add a Reference Data Dictionary to a Parent Data Dictionary

Open the data dictionary myDictionary_ex_API.sldd and represent it with a Simulink.data.Dictionary object named myDictionaryObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Add the data dictionary mySubDictionary_ex_API.sldd as a reference dictionary to myDictionary_ex_API.sldd.

```
addDataSource(myDictionaryObj,'mySubDictionary_ex_API.sldd');
```

Confirm the addition by viewing the DataSources property of variable myDictionaryObj. The property returns the name of the newly referenced dictionary.

```
myDictionaryObj.DataSources
```

```
ans = 

    'myRefDictionary_ex_API.sldd'
    'mySubDictionary_ex_API.sldd'
```

Alternatives

You can use the Model Explorer window to manage reference dictionaries. See “Partition Dictionary Data Using Referenced Dictionaries” for more information.

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

close

Class: Simulink.data.Dictionary
Package: Simulink.data

Close connection between data dictionary and `Simulink.data.Dictionary` object

Syntax

`close(dictionaryObj)`

Description

`close(dictionaryObj)` closes the connection between the `Simulink.data.Dictionary` object `dictionaryObj` and the data dictionary it represents. `dictionaryObj` remains as a `Simulink.data.Dictionary` object but no longer represents any data dictionary.

Input Arguments

`dictionaryObj` — Target `Simulink.data.Dictionary` object
handle to `Simulink.data.Dictionary` object

Target `Simulink.data.Dictionary` object, specified as a handle to the object.

Tips

- Use the `close` function in a custom MATLAB function to disassociate a `Simulink.data.Dictionary` object from a data dictionary. Custom MATLAB functions can create and store variables and objects in function workspaces but cannot delete those variables and objects.
- The `close` function does not affect the content or the state of the represented data dictionary. The function does not discard unsaved changes to the represented dictionary or entries. You can save or discard them later.

`Simulink.data.Dictionary`

Topics

"Store Data in Dictionary Programmatically"

Introduced in R2015a

discardChanges

Class: Simulink.data.Dictionary
Package: Simulink.data

Discard changes to data dictionary

Syntax

```
discardChanges(dictionaryObj)
```

Description

`discardChanges(dictionaryObj)` discards all changes made to the specified data dictionary since the last time changes to the dictionary were saved using the `saveChanges` function. `discardChanges` also discards changes made to referenced data dictionaries. The changes to the target dictionary and its referenced dictionaries are permanently lost.

Input Arguments

`dictionaryObj` — Target data dictionary

`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

Examples

Discard Changes to Data Dictionary

Create a `Simulink.data.Dictionary` object representing the data dictionary `myDictionary_ex_API.sldd` and assign the object to variable `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd')
```

```
myDictionaryObj = 

  Dictionary with properties:

          DataSources: {'myRefDictionary_ex_API.sldd'}
    HasUnsavedChanges: 0
      NumberOfEntries: 4
```

Make a change to `myDictionary_ex_API.sldd` by adding an entry named `myNewEntry` with value `237`. View the `HasUnsavedChanges` property of `myDictionaryObj` to confirm a change was made.

```
addEntry(dDataSectObj,'myNewEntry',237);
myDictionaryObj
```

```
myDictionaryObj = 

  Dictionary with properties:

          DataSources: {'myRefDictionary_ex_API.sldd'}
    HasUnsavedChanges: 1
      NumberOfEntries: 5
```

Discard all changes to `myDictionary_ex_API.sldd`. The `HasUnsavedChanges` property of `myDictionaryObj` indicates changes were discarded.

```
discardChanges(myDictionaryObj)
myDictionaryObj
```

```
myDictionaryObj = 

  Dictionary with properties:

          DataSources: {'myRefDictionary_ex_API.sldd'}
```

```
    HasUnsavedChanges: 0
          NumberOfEntries: 4
```

Alternatives

You can use the Model Explorer window to discard changes to data dictionaries. See “View and Revert Changes to Dictionary Entries” for more information.

filepath

Class: Simulink.data.Dictionary
Package: Simulink.data

Full path and file name of data dictionary

Syntax

```
dictionaryFilePath = filepath(dictionaryObj)
```

Description

`dictionaryFilePath = filepath(dictionaryObj)` returns the full path and file name of the data dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object.

Input Arguments

`dictionaryObj` — Target data dictionary
`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

Examples

Return Path of Data Dictionary File

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Return the full path of `myDictionary_ex_API.sldd` and assign it to variable `myDictionaryFilePath`.

```
myDictionaryFilePath = filepath(myDictionaryObj)
```

```
myDictionaryFilePath =

C:\Users\jsmith\myDictionary_ex_API.sldd
```

See Also

`Simulink.data.Dictionary`

Topics

"Store Data in Dictionary Programmatically"

Introduced in R2015a

getSection

Class: Simulink.data.Dictionary
Package: Simulink.data

Return `Simulink.data.dictionary.Section` object to represent data dictionary section

Syntax

```
sectionObj = getSection(dictionaryObj,sectionName)
```

Description

`sectionObj = getSection(dictionaryObj,sectionName)` returns a `Simulink.data.dictionary.Section` object representing one section, `sectionName`, of a data dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object.

You cannot use the data dictionary programmatic interface (see “Store Data in Dictionary Programmatically”) to access the **Embedded Coder** section of a data dictionary. Instead, see Embedded Coder Dictionary.

Input Arguments

`dictionaryObj` — Data dictionary containing target section

`Simulink.data.Dictionary` object

Data dictionary containing target section, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

`sectionName` — Name of target data dictionary section

character vector

Name of target data dictionary section, specified as a character vector.

Example: `'Design Data'`

Example: `'Configurations'`

Data Types: `char`

Examples

Create New Data Dictionary Section Object

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
dDataSectObj = getSection(myDictionaryObj,'Design Data')
```

```
dDataSectObj = 

  Section with properties:

    Name: 'Design Data'
```

See Also

`Simulink.data.Dictionary` | `Simulink.data.dictionary.Section`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

hide

Class: Simulink.data.Dictionary
Package: Simulink.data

Remove data dictionary from Model Explorer

Syntax

```
hide(dictionaryObj)
```

Description

`hide(dictionaryObj)` removes the data dictionary `dictionaryObj` from the **Model Hierarchy** pane of Model Explorer. The target dictionary no longer appears as a node in the model hierarchy tree. Use this function when you are finished working with a data dictionary and want to reduce clutter in the Model Explorer.

Input Arguments

`dictionaryObj` — Target data dictionary
`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

Examples

Hide Data Dictionary from Model Explorer

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Open Model Explorer and display the new data dictionary as the selected tree node in the **Model Hierarchy** pane.

```
show(myDictionaryObj)
```

With Model Explorer open, at the MATLAB command prompt, call the `hide` function to observe the removal of `myDictionary_ex_API.sldd` from the model hierarchy tree.

```
hide(myDictionaryObj)
```

Tips

- To add a data dictionary as a node in the model hierarchy tree in Model Explorer, use the `show` function or use the interface to open and view the dictionary in Model Explorer.
- The `hide` function does not affect the content of the target dictionary.

Alternatives

You can remove a data dictionary from the **Model Hierarchy** pane of Model Explorer by right-clicking the dictionary tree node and selecting **Close**.

See Also

`Simulink.data.Dictionary` | `show`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

importEnumTypes

Class: Simulink.data.Dictionary
Package: Simulink.data

Import enumerated type definitions to data dictionary

Syntax

```
importedTypes = importEnumTypes(dictionaryObj,targetTypes)
[importedTypes,importFailures] = importEnumTypes(dictionaryObj,
targetTypes)
```

Description

`importedTypes = importEnumTypes(dictionaryObj,targetTypes)` imports to the data dictionary `dictionaryObj` the definitions of one or more enumerated types `targetTypes`. `importEnumTypes` does not import MATLAB variables created using enumerated types but instead, in support of those variables, imports the definitions of the types. The target data dictionary stores the definition of a successfully imported type as an entry. This syntax returns a list of the names of successfully imported types. `importEnumTypes` saves changes made to the target dictionary, so before you use `importEnumTypes`, confirm that unsaved changes are acceptable.

`[importedTypes,importFailures] = importEnumTypes(dictionaryObj, targetTypes)` additionally returns a list of any target types that were not successfully imported. You can inspect the list to determine the reason for each failure.

Input Arguments

`dictionaryObj` — Target data dictionary

`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

`targetTypes` — Enumerated type definitions to import

cell array of character vectors | string array

Enumerated type definitions to import, specified as a cell array of character vectors or a string array. If any target types are defined using `classdef` blocks in MATLAB files or P-files, the files must be available on your MATLAB path so that `importEnumTypes` can disable them.

Example: `{'myEnumType'}`

Example: `{'myFirstEnumType','mySecondEnumType','myThirdEnumType'}`

Data Types: `cell`

Output Arguments

`importedTypes` — Target types successfully imported

array of structures

Target enumerated type definitions successfully imported, returned as an array of structures. Each structure in the array represents one imported type. The `className` field of each structure identifies a type by name and the `renamedFiles` field identifies any renamed MATLAB files or P-files.

`importFailures` — Target types not imported

array of structures

Enumerated type definitions targeted but not imported, returned as an array of structures. Each structure in the array represents one type not imported. The `className` field of each structure identifies a type by name and the `reason` field explains the failure.

Examples

Import Enumerated Data to Data Dictionary

Create a data dictionary myNewDictionary.sldd in your current working folder and a Simulink.data.Dictionary object representing the new data dictionary. Assign the object to the variable myDictionaryObj.

```
myDictionaryObj = Simulink.data.dictionary.create('myNewDictionary.sldd');
```

Run the script in the MATLAB file myDataEnum_ex_API.m. The file defines an enumerated type named InstrumentTypes using the Simulink.defineIntEnumType function and creates three variables based on the new type. Then, import the new variables from the base workspace to myDictionary_ex_API.sldd.

```
myDataEnum_ex_API
importFromBaseWorkspace(myDictionaryObj,'varList',...
{'firstEnumVariable','secondEnumVariable','thirdEnumVariable'});
```

Clear the imported variables from the base workspace. Before you can import an enumerated data type definition to the target data dictionary, you must clear the base workspace of any variables created using the target type.

```
clear firstEnumVariable
clear secondEnumVariable
clear thirdEnumVariable
```

Import the data type definition to myDictionary_ex_API.sldd.

```
importEnumTypes(myDictionaryObj,{'InstrumentTypes'})
```

```
ans = 

       className: 'InstrumentTypes'
    renamedFiles: {}
```

Tips

- Before you can import an enumerated data type definition to a data dictionary, you must clear the base workspace of any variables created using the target type.
- You can define an enumerated type using a classdef block in a MATLAB file or a P-file. importEnumTypes imports type definitions directly from these files if you specify the names of the types to import using the input argument targetTypes and if the files defining the types are on your MATLAB path.

- To avoid conflicting definitions for imported types, `importEnumTypes` renders MATLAB files or P-files ineffective by appending `.save` to their names. The `.save` extensions cause variables to rely on the definitions in the target data dictionary and not on the definitions in the files. You can remove the `.save` extensions to restore the files to their original state.
- You can use `importEnumTypes` to import enumerated types defined using the `Simulink.defineIntEnumType` function. Because such types are not defined using MATLAB files or P-files, `importEnumTypes` does not rename any files.
- Use the function `Simulink.findVars` to generate a list of the enumerated types that are used by a model. Then, use the list with `importEnumTypes` to import the definitions of the types to a data dictionary. See “Enumerations in Data Dictionary” for more information.

`Simulink.data.Dictionary` | `importFromBaseWorkspace`

Topics

“Enumerations in Data Dictionary”
“Store Data in Dictionary Programmatically”

Introduced in R2015a

importFromBaseWorkspace

Class: Simulink.data.Dictionary
Package: Simulink.data

Import base workspace variables to data dictionary

Syntax

```
importedVars = importFromBaseWorkspace(dictionaryObj)
importedVars = importFromBaseWorkspace(dictionaryObj,Name,Value)
[importedVars,existingVars] = importFromBaseWorkspace(___)
```

Description

`importedVars = importFromBaseWorkspace(dictionaryObj)` imports all variables from the MATLAB base workspace to the data dictionary `dictionaryObj` without overwriting existing entries in the dictionary. If any base workspace variables are already in the dictionary, the function present a warning and a list.

This syntax returns a list of names of the successfully imported variables. A variable is considered successfully imported only if `importFromBaseWorkspace` assigns the value of the variable to the corresponding entry in the target data dictionary.

`importedVars = importFromBaseWorkspace(dictionaryObj,Name,Value)` imports base workspace variables to a data dictionary, with additional options specified by one or more `Name,Value` pair arguments.

`[importedVars,existingVars] = importFromBaseWorkspace(___)` additionally returns a list of variables that were not overwritten. Use this syntax if `existingVarsAction` is set to `'none'`, the default value, which prevents existing dictionary entries from being overwritten.

Input Arguments

dictionaryObj — Target data dictionary
Simulink.data.Dictionary object

Target data dictionary, specified as a Simulink.data.Dictionary object. Before you use this function, represent the target dictionary with a Simulink.data.Dictionary object by using, for example, the Simulink.data.dictionary.create or Simulink.data.dictionary.open function.

Name-Value Pair Arguments

Specify optional comma-separated pairs of Name,Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1,Value1,...,NameN,ValueN.

clearWorkspaceVars — Flag to clear base workspace of imported variables
false (default) | true

Flag to clear the base workspace of any successfully imported variables, specified as the comma-separated pair consisting of 'clearWorkspaceVars' and true or false.

Example: 'clearWorkspaceVars',true

Data Types: logical

existingVarsAction — Action to take for existing dictionary variables
'none' (default) | 'error' | 'overwrite'

Action to take for existing dictionary variables, specified as the comma-separated pair consisting of 'existingVarsAction' and 'none', 'error', or 'overwrite'.

If you specify 'none', importFromBaseWorkspace attempts to import target variables but does not import or make any changes to variables that are already in the data dictionary.

If you specify 'error', importFromBaseWorkspace returns an error, without importing any variables, if any target variables are already in the data dictionary.

If you specify 'overwrite', importFromBaseWorkspace imports all target variables and overwrites any variables that are already in the data dictionary.

Example: `'existingVarsAction','error'`

Data Types: `char`

`varList` — Variables to import

cell array of character vectors | string array

Names of specific base workspace variables to import, specified as the comma-separated pair consisting of `'varList'` and a cell array of character vectors or a string array. If you want to import only one variable, specify the name inside a cell array. If you do not specify `'varList'`, `importFromBaseWorkspace` imports all variables from the MATLAB base workspace.

Example: `'varList',{'a','myVariable','fuelFlow'}`

Example: `'varList',{'fuelFlow'}`

Data Types: `cell`

Output Arguments

`importedVars` — Successfully imported variables

cell array of character vectors

Names of successfully imported variables, returned as a cell array of character vectors. A variable is considered successfully imported only if `importFromBaseWorkspace` assigns the value of the variable to the corresponding entry in the target data dictionary.

`existingVars` — Variables that were not imported

cell array of character vectors

Names of target variables that were not imported due to their existence in the target data dictionary, returned as a cell array of character vectors. `existingVars` has content only if `'existingVarsAction'` is set to `'none'` which is also the default. In that case `importFromBaseWorkspace` imports only variables that are not already in the target data dictionary.

Examples

Import All Base Workspace Variables to Data Dictionary

In the MATLAB base workspace, create variables to import.

```
a = 'Char Variable';
myVariable = true;
fuelFlow = 324;
```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import all base workspace variables to the data dictionary and return a list of successfully imported variables. If any base workspace variables are already in `myDictionary_ex_API.sldd`, `importFromBaseWorkspace` presents a warning and a list of the affected variables.

```
importFromBaseWorkspace(myDictionaryObj);
```

```
Warning: The following variables were not imported because
they already exist in the dictionary:
   fuelFlow
```

Specify Variables to Import to Data Dictionary from Base Workspace

In the MATLAB base workspace, create variables to import.

```
b = 'Char Variable';
mySecondVariable = true;
airFlow = 324;
```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import only the new base workspace variables to the data dictionary.

```
importFromBaseWorkspace(myDictionaryObj,'varList',...
{'b','mySecondVariable','airFlow'});
```

Import Variables from Base Workspace and Overwrite Conflicts

In the MATLAB base workspace, create a variable to import.

```
fuelFlow = 324;
```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`. `myDictionary_ex_API.sldd` already contains an entry called `fuelFlow`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import the variable `fuelFlow` and overwrite the corresponding entry in `myDictionary_ex_API.sldd`.

```
importFromBaseWorkspace(myDictionaryObj,'varList',{'fuelFlow'},...
'existingVarsAction','overwrite');
```

`importFromBaseWorkspace` assigns the value of the base workspace variable `fuelFlow` to the value of the corresponding entry in `myDictionary_ex_API.sldd`.

Return Variables Not Imported to Data Dictionary from Base Workspace

Return a list of variables that are not imported from the MATLAB base workspace because they are already in the target data dictionary.

In the MATLAB base workspace, create variables to import.

```
fuelFlow = 324;
myNewVariable = 'This is a character vector.'
```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`. `myDictionary_ex_API.sldd` already contains an entry called `fuelFlow`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import the variables `fuelFlow` and `myNewVariable` to the data dictionary. Specify names for the output arguments of `importFromBaseWorkspace` to return the names of successfully and unsuccessfully imported variables.

```
[importedVars,existingVars] = importFromBaseWorkspace(myDictionaryObj,...
'varList',{'fuelFlow','myNewVariable'})
```

```
importedVars = 

    'myNewVariable'

existingVars = 

    'fuelFlow'
```

importFromBaseWorkspace does not import the variable fuelflow because it is already in the target data dictionary.

Tips

- importFromBaseWorkspace can import MATLAB variables created from enumerated data types but cannot import the definitions of the enumerated types. Use the importEnumTypes function to import enumerated data type definitions to a data dictionary. If you import variables of enumerated data types to a data dictionary but do not import the enumerated type definitions, the dictionary is less portable and might not function properly if used by someone else.

Alternatives

- When you use the Simulink Editor to link a model to a data dictionary, you can choose to import model variables from the base workspace. See “Migrate Single Model to Use Dictionary” for more information.
- You can also use the Model Explorer window to drag-and-drop variables from the base workspace into a data dictionary.

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

listEntry

Class: Simulink.data.Dictionary
Package: Simulink.data

List data dictionary entries

Syntax

```
listEntry(dictionaryObj)
listEntry(dictionaryObj,Name,Value)
```

Description

`listEntry(dictionaryObj)` displays in the MATLAB Command Window a table of information about all the entries in the data dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object. The displayed information includes the name of each entry, the name of the section containing each entry, the status of each entry, the date and time each entry was last modified, the last user name to modify each entry, and the class of the value each entry contains. By default, the function sorts the list of entries alphabetically by entry name.

`listEntry(dictionaryObj,Name,Value)` displays the entries in a data dictionary with additional options specified by one or more `Name,Value` pair arguments.

To return the value of a data dictionary entry at the command prompt, use the `getValue` method of a `Simulink.data.dictionary.Entry` object. See “Store Data in Dictionary Programmatically”.

Input Arguments

`dictionaryObj` — Target data dictionary

`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

`Ascending` — Sort order of list

`true` (default) | `false`

Sort order of the list of data dictionary entries, specified as the comma-separated pair consisting of `'Ascending'` and `true` or `false`. If you specify `false`, `listEntry` sorts the list in descending order.

Example: `'Ascending',false`

Data Types: `logical`

`Class` — Criteria to filter list by class

character vector

Criteria to filter the list of data dictionary entries by class, specified as the comma-separated pair consisting of `'Class'` and a character vector identifying a valid class. The function lists only entries whose values are of the specified class.

Example: `'Class','Simulink.Parameter'`

Data Types: `char`

`LastModifiedBy` — Criteria to filter list by user name of last modifier

character vector

Criteria to filter the list of data dictionary entries by the user name of the last user to modify each entry, specified as the comma-separated pair consisting of `'LastModifiedBy'` and a character vector identifying the specified user name. The function lists only entries that were last modified by the specified user name.

Example: `'LastModifiedBy','jsmith'`

Data Types: `char`

`Limit` — Maximum number of entries to list

integer

Maximum number of entries to list, specified as the comma-separated pair consisting of `'Limit'` and an integer. The function lists up to the specified number of entries starting from the top of the sorted and filtered list.

Example: `'Limit',9`

Data Types: `double`

`Name` — Criteria to filter list by entry name

character vector

Criteria to filter the list of data dictionary entries by entry name, specified as the comma-separated pair consisting of `'Name'` and a character vector defining the filter criteria. You can use an asterisk character, `*`, as a wildcard to represent any number of characters. The function lists only entries whose names match the filter criteria.

Example: `'Name','fuelFlow'`

Example: `'Name','fuel*'`

Data Types: `char`

`Section` — Criteria to filter list by data dictionary section

character vector

Criteria to filter the list of data dictionary entries by section, specified as the comma-separated pair consisting of `'Section'` and a character vector identifying the target section. The function lists only entries that are contained in the target section.

Example: `'Section','Design Data'`

`SortBy` — Flag to sort list by specific property

`'Name'` (default) | `'Section'` | `'LastModified'` | `'LastModifiedBy'`

Flag to sort the list of data dictionary entries by a specific property, specified as the comma-separated pair consisting of `'SortBy'` and a character vector identifying a property in the list of entries. Valid properties include `'Name'`, `'Section'`, `'LastModified'`, and `'LastModifiedBy'`.

Example: `'SortBy','LastModifiedBy'`

Examples

List All Entries in Data Dictionary

Represent the data dictionary `sldemo_fuelsys_dd_controller.sldd` with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd_controller.sldd');
```

List all the entries in the data dictionary.

```
listEntry(myDictionaryObj)
```

Sort List of Data Dictionary Entries in Descending Order

Represent the data dictionary `sldemo_fuelsys_dd_controller.sldd` with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd_controller.sldd');
```

List all the entries in the data dictionary and sort the list in descending order by entry name.

```
listEntry(myDictionaryObj,'Ascending',false)
```

Filter List of Data Dictionary Entries by Name

Represent the data dictionary `sldemo_fuelsys_dd_controller.sldd` with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd_controller.sldd');
```

List only the entries in the data dictionary whose names begin with `max`.

```
listEntry(myDictionaryObj,'Name','max*')
```

Sort List of Data Dictionary Entries by Time of Modification

Represent the data dictionary `sldemo_fuelsys_dd_controller.sldd` with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd_controller.sldd');
```

List all the entries in the dictionary and sort the list by the date and time each entry was last modified.

```
listEntry(myDictionaryObj,'SortBy','LastModified')
```

Introduced in R2015a

removeDataSource

Class: Simulink.data.Dictionary
Package: Simulink.data

Remove reference data dictionary from parent data dictionary

Syntax

```
removeDataSource(dictionaryObj,refDictionaryFile)
```

Description

`removeDataSource(dictionaryObj,refDictionaryFile)` removes a referenced data dictionary, `refDictionaryFile`, from a parent dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object.

The parent dictionary no longer contains the entries that are defined in the referenced dictionary.

Input Arguments

`dictionaryObj` — Parent data dictionary

`Simulink.data.Dictionary` object

Parent data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

`refDictionaryFile` — File name of referenced data dictionary

character vector

File name of referenced data dictionary, specified as a character vector that includes the `.sldd` extension. The data dictionary file must be on your MATLAB path.

Example: `'myRefDictionary_ex_API.sldd'`

Data Types: `char`

Examples

Remove Referenced Data Dictionary from Parent Data Dictionary

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`. The `DataSources` property of `myDictionaryObj` indicates `myDictionary_ex_API.sldd` references `myRefDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd')
```

```
myDictionaryObj = 

  Dictionary with properties:

          DataSources: {'myRefDictionary_ex_API.sldd'}
    HasUnsavedChanges: 0
           NumberOfEntries: 4
```

Remove `myRefDictionary_ex_API.sldd` from `myDictionary_ex_API.sldd`.

```
removeDataSource(myDictionaryObj,'myRefDictionary_ex_API.sldd');
```

View the properties of the `Simulink.data.Dictionary` object `myDictionaryObj`, which represents the parent data dictionary. The `DataSources` property confirms the removal of `myRefDictionary_ex_API.sldd`.

```
myDictionaryObj
```

```
myDictionaryObj = 

  Dictionary with properties:

          DataSources: {0x1 cell}
```

```
    HasUnsavedChanges: 1
          NumberOfEntries: 3
```

Alternatives

You can use Model Explorer to manage reference dictionaries. See “Partition Dictionary Data Using Referenced Dictionaries” for more information.

See Also

`Simulink.data.Dictionary` | `addDataSource`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

saveChanges

Class: Simulink.data.Dictionary
Package: Simulink.data

Save changes to data dictionary

Syntax

`saveChanges(dictionaryObj)`

Description

`saveChanges(dictionaryObj)` saves all changes made to a data dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object. `saveChanges` also saves changes made to referenced data dictionaries. The previous states of the target dictionary and its referenced dictionaries are permanently lost.

Input Arguments

`dictionaryObj` — Target data dictionary

`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

Examples

Save Changes to Data Dictionary

Create a new data dictionary myNewDictionary.sldd and represent the Design Data section with a Simulink.data.dictionary.Section object named dDataSectObj.

```
myDictionaryObj = Simulink.data.dictionary.create('myNewDictionary.sldd')
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

```
myDictionaryObj = 

  data dictionary with properties:

          DataSources: {0x1 cell}
    HasUnsavedChanges: 0
        NumberOfEntries: 0
```

Change myNewDictionary.sldd by adding an entry named myNewEntry with value 237. View the HasUnsavedChanges property of myDictionaryObj to confirm a change was made.

```
addEntry(dDataSectObj,'myNewEntry',237);
myDictionaryObj
```

```
myDictionaryObj = 

  Dictionary with properties:

          DataSources: {0x1 cell}
    HasUnsavedChanges: 1
        NumberOfEntries: 1
```

Save all changes to myNewDictionary.sldd. The HasUnsavedChanges property of myDictionaryObj indicates changes were saved.

```
saveChanges(myDictionaryObj)
myDictionaryObj
```

```
myDictionaryObj = 

  Dictionary with properties:

          DataSources: {0x1 cell}
```

```
HasUnsavedChanges: 0
      NumberOfEntries: 1
```

Alternatives

You can use Model Explorer to save changes to a data dictionary by right-clicking on the dictionary tree node in the **Model Hierarchy** pane and selecting **Save Changes**.

See Also

`Simulink.data.Dictionary` | `discardChanges`

Topics

"Store Data in Dictionary Programmatically"

Introduced in R2015a

show

Class: Simulink.data.Dictionary
Package: Simulink.data

Show data dictionary in Model Explorer

Syntax

```
show(dictionaryObj)
show(dictionaryObj,openModelExplorer)
```

Description

`show(dictionaryObj)` opens Model Explorer and displays the data dictionary `dictionaryObj` as the selected tree node in the **Model Hierarchy** pane.

`show(dictionaryObj,openModelExplorer)` enables you to add the target dictionary to the **Model Hierarchy** pane without opening Model Explorer.

Input Arguments

`dictionaryObj` — Target data dictionary

`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

`openModelExplorer` — Flag to open Model Explorer

`true` (default) | `false`

Flag to open Model Explorer, specified as `true` or `false`.

Data Types: `logical`

Examples

Show Data Dictionary in Model Explorer

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Open Model Explorer and display `myDictionary_ex_API` as the selected node of the model hierarchy tree in the **Model Hierarchy** pane.

```
show(myDictionaryObj)
```

Add Data Dictionary to Model Hierarchy Tree

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Add `myDictionary_ex_API.sldd` to the model hierarchy tree without opening Model Explorer.

```
show(myDictionaryObj,false)
```

You can confirm the addition of `myDictionary_ex_API` to the model hierarchy tree by manually opening Model Explorer.

Tips

- Use the `hide` function to remove a data dictionary from the tree in the **Model Hierarchy** pane of Model Explorer. The dictionary does not appear in the hierarchy again until you use the `show` function or you open and view the dictionary in the Model Explorer using the interface.

See Also

`Simulink.data.Dictionary` | `hide`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

Simulink.data.dictionary.Entry class

Package: Simulink.data.dictionary

Configure data dictionary entry

Description

An object of the `Simulink.data.dictionary.Entry` class represents one entry of a data dictionary. The object allows you to perform operations such as assign the entry a value or change the name of the entry.

Before you can create a new `Simulink.data.dictionary.Entry` object, you must create a `Simulink.data.dictionary.Section` object representing the data dictionary section that contains the target entry. However, once created, the `Simulink.data.dictionary.Entry` object exists independently of the `Simulink.data.dictionary.Section` object. Use the function `getSection` to create a `Simulink.data.dictionary.Section` object.

Construction

The functions `addEntry`, `getEntry`, and `find` create `Simulink.data.dictionary.Entry` objects.

Properties

`DataSource` — File name of containing data dictionary

character vector

File name of containing data dictionary, specified as a character vector. Changes you make to this property affect the represented data dictionary entry.

Example: `'myDictionary.sldd'`

Data Types: `char`

`LastModified` — Date and time of last modification

character vector

Date and time of last modification to entry, returned in Coordinated Universal Time (UTC) as a character vector. This property is read only.

`LastModifiedBy` — Name of last user to modify entry

character vector

Name of last user to modify entry, returned as a character vector. This property is read only.

`Name` — Name of entry

character vector

Name of entry, specified as a character vector. Changes you make to this property affect the represented data dictionary entry.

Data Types: `char`

`Status` — State of entry

`'New'` | `'Modified'` | `'Unchanged'` | `'Deleted'`

State of entry, returned as `'New'`, `'Modified'`, `'Unchanged'`, or `'Deleted'`. The state is valid since the last data dictionary save. If the state is `'Deleted'`, the represented entry was deleted from its data dictionary. This property is read only.

Methods

deleteEntry	Delete data dictionary entry
discardChanges	Discard changes to data dictionary entry
find	Search in array of data dictionary entries
getValue	Return value of data dictionary entry
setValue	Set value of data dictionary entry
showChanges	Display changes made to data dictionary entry

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Add Entry to Data Dictionary and Modify its Value

Represent the Design Data section of the data dictionary myDictionary_ex_API.sldd with a Simulink.data.dictionary.Section object named dDataSectObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Add an entry myEntry with value 27 to the Design Data section of myDictionary_ex_API.sldd. Assign the returned Simulink.data.dictionary.Entry object to variable e.

```
e = addEntry(dDataSectObj,'myEntry',27)
```

```
e = 

  Entry with properties:

            Name: 'myEntry'
           Value: 27
      DataSource: 'myDictionary_ex_API.sldd'
    LastModified: '2014-Aug-26 18:42:08.439709'
  LastModifiedBy: 'jsmith'
          Status: 'New'
```

Change the value of myEntry from 27 to the character vector 'My New Value'.

```
setValue(e,'My New Value')
e
```

```
e = 

  Entry with properties:
```

```
            Name: 'myEntry'
           Value: 'My New Value'
      DataSource: 'myDictionary_ex_API.sldd'
    LastModified: '2014-Aug-26 18:45:58.336598'
  LastModifiedBy: 'jsmith'
          Status: 'New'
```

Return Value of Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
fuelFlowObj = getEntry(dDataSectObj,'fuelFlow');
```

Return the value of the entry `fuelFlow` and assign the value to the variable `fuelFlowValue`.

```
fuelFlowValue = getValue(fuelFlowObj)
```

```
fuelFlowValue =

   237
```

Move Entry Within Data Dictionary Hierarchy

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`. `myDictionary_ex_API.sldd` references the data dictionary `myRefDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Create a `Simulink.data.dictionary.Entry` object representing the entry `fuelFlow`, which resides in `myDictionary_ex_API.sldd`. Assign the object to variable `e`.

```
e = getEntry(dDataSectObj,'fuelFlow')
```

```
e = 

  Entry with properties:

              Name: 'fuelFlow'
             Value: 237
        DataSource: 'myDictionary_ex_API.sldd'
      LastModified: '2014-Sep-05 13:12:06.099278'
    LastModifiedBy: 'jsmith'
            Status: 'Unchanged'
```

Migrate the entry `fuelFlow` to the reference data dictionary `myRefDictionary_ex_API.sldd` by modifying the `DataSource` property of `e`.

```
e.DataSource = 'myRefDictionary_ex_API.sldd'
```

```
e = 

  Entry with properties:

              Name: 'fuelFlow'
             Value: 237
        DataSource: 'myRefDictionary_ex_API.sldd'
      LastModified: '2014-Sep-05 13:12:06.099278'
    LastModifiedBy: 'jsmith'
            Status: 'Modified'
```

Because `myDictionary_ex_API.sldd` references `myRefDictionary_ex_API.sldd`, both dictionaries belong to the same dictionary hierarchy, allowing you to migrate the entry `fuelFlow` between them.

Topics

“Store Data in Dictionary Programmatically”
“What Is a Data Dictionary?”

Introduced in R2015a

deleteEntry

Class: Simulink.data.dictionary.Entry
Package: Simulink.data.dictionary

Delete data dictionary entry

Syntax

`deleteEntry(entryObj)`

Description

`deleteEntry(entryObj)` deletes the data dictionary entry represented by `entryObj`, a `Simulink.data.dictionary.Entry` object. The represented entry no longer exists in the data dictionary that defined it.

The function sets the `Status` properties of any `Simulink.data.dictionary.Entry` objects representing the deleted entry to `'Deleted'`. You can access only the `Status` properties of the objects.

Input Arguments

`entryObj` — Target data dictionary entry

`Simulink.data.dictionary.Entry` object

Target data dictionary entry, specified as a `Simulink.data.dictionary.Entry` object. Before you use this function, represent the target entry with a `Simulink.data.dictionary.Entry` object by using, for example, the `getEntry` function.

Examples

Delete Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
fuelFlowObj = getEntry(dDataSectObj,'fuelFlow');
```

Delete the entry `fuelFlow` from the data dictionary `myDictionary_ex_API.sldd`. `myDictionary_ex_API.sldd` no longer contains the `fuelFlow` entry.

```
deleteEntry(fuelFlowObj)
```

Alternatives

You can use the Model Explorer window to view the contents of a data dictionary and delete entries.

See Also

`Simulink.data.dictionary.Entry` | `addEntry`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

discardChanges

Class: Simulink.data.dictionary.Entry
Package: Simulink.data.dictionary

Discard changes to data dictionary entry

Syntax

```
discardChanges(entryObj)
```

Description

`discardChanges(entryObj)` discards all changes made to the data dictionary entry `entryObj`, a `Simulink.data.dictionary.Entry` object, since the last time the containing data dictionary was saved using the `saveChanges` function. The changes to the entry are permanently lost.

Input Arguments

`entryObj` — Target data dictionary entry
`Simulink.data.dictionary.Entry` object

Target data dictionary entry, specified as a `Simulink.data.dictionary.Entry` object. Before you use this function, represent the target entry with a `Simulink.data.dictionary.Entry` object by using, for example, the `getEntry` function.

Examples

Discard Changes to Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
fuelFlowObj = getEntry(dDataSectObj,'fuelFlow');
```

Change the entry `fuelFlow` by assigning it the new value `493`. Confirm a change was made by viewing the `Status` property of `fuelFlowObj`.

```
setValue(fuelFlowObj,493);
fuelFlowObj
```

```
fuelFlowObj = 

  Entry with properties:

              Name: 'fuelFlow'
             Value: 493
        DataSource: 'myDictionary_ex_API.sldd'
      LastModified: '2014-Sep-05 13:14:30.661978'
    LastModifiedBy: 'jsmith'
            Status: 'Modified'
```

Discard all changes to the entry `fuelFlow`. The `Status` property of `fuelFlowObj` shows that changes were discarded.

```
discardChanges(fuelFlowObj)
fuelFlowObj
```

```
fuelFlowObj = 

  Entry with properties:

              Name: 'fuelFlow'
             Value: 237
        DataSource: 'myDictionary_ex_API.sldd'
      LastModified: '2014-Sep-05 13:12:06.099278'
```

```
    LastModifiedBy: 'jsmith'
            Status: 'Unchanged'
```

Tips

- You can use the `discardChanges` function or the `saveChanges` function with an entire data dictionary, discarding or saving changes to all entries in the dictionary at once. However, only the `discardChanges` function can additionally operate on individual entries. You cannot use the `saveChanges` function to save changes to individual entries.

Alternatives

You can use Model Explorer and the Comparison Tool to discard changes to data dictionary entries. See “View and Revert Changes to Dictionary Entries” for more information.

`Simulink.data.dictionary.Entry` | `saveChanges`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

find

Class: Simulink.data.dictionary.Entry
Package: Simulink.data.dictionary

Search in array of data dictionary entries

Syntax

```
foundEntries = find(targetEntries,PName1,PValue1,...,PNameN,PValueN)
foundEntries = find(targetEntries,PName1,PValue1,...,PNameN,PValueN,
options)
```

Description

`foundEntries = find(targetEntries,PName1,PValue1,...,PNameN,PValueN)` searches the array of data dictionary entries `targetEntries` using search criteria `PName1,PValue1,...,PNameN,PValueN`, and returns an array of entries matching the criteria. This syntax matches the search criteria with the properties of the target entries, which are `Simulink.data.dictionary.Entry` objects, but not with the properties of their values. See `Simulink.data.dictionary.Entry` for a list of data dictionary entry properties.

`foundEntries = find(targetEntries,PName1,PValue1,...,PNameN,PValueN, options)` searches for data dictionary entries using additional search options. For example, you can match the search criteria with the values of the target entries.

Input Arguments

`targetEntries` — Data dictionary entries to search

array of `Simulink.data.dictionary.Entry` objects

Data dictionary entries to search, specified as an array `Simulink.data.dictionary.Entry` objects. Before you use this function, represent the target entries with `Simulink.data.dictionary.Entry` objects by using, for example, the `getEntry` function.

Example: [myEntryObj1,myEntryObj2,myEntryObj3]

PName1,PValue1,...,PNameN,PValueN — Search criteria
name-value pairs representing properties

Search criteria, specified as one or more name-value pairs representing names and values of properties of the target data dictionary entries. For a list of the properties of a data dictionary entry, see `Simulink.data.dictionary.Entry`. If you specify more than one name-value pair, the returned entries meet all of the criteria.

If you include the `'-value'` option to search in the values of the target entries, the search criteria apply to the values of the entries rather than to the entries themselves.

Example: 'LastModifiedBy','jsmith'

Example: 'DataSource','myRefDictionary_ex_API.sldd'

options — Additional search options
supported option codes

Additional search options, specified as one or more of the following supported option codes.

`'-value'`	This option causes `find` to search only in the values of the target data dictionary entries. Specify this option before any other search criteria or `options` arguments.
`'-and'`, `'-or'`, `'-xor'`, or `'-not'` logical operators	These options modify or combine multiple search criteria or other option codes.
`'-property',propertyName`	This name-value pair causes `find` to search for entries or values that have the property `propertyName` regardless of the value of the property. Specify `propertyName` as a character vector.
`'-class',className`	This name-value pair causes `find` to search for entries or values that are objects of the class `className`. Specify `className` as a character vector.

`'-isa',className`	This name-value pair causes `find` to search for entries or values that are objects of the class or of any subclass derived from the class `className`. Specify `className` as a character vector.
`'-regexp'`	This option allows you to use regular expressions in your search criteria. This option affects only search criteria that follow `'-regexp'`.

Example: `'-value'`

Example: `'-value','-property','CoderInfo'`

Example: `'-value','-class','Simulink.Parameter'`

Output Arguments

`foundEntries` — Data dictionary entries matching search criteria
array of `Simulink.data.dictionary.Entry` objects

Data dictionary entries matching the specified search criteria, returned as an array of `Simulink.data.dictionary.Entry` objects.

Examples

Search Data Dictionary Entry Values for Specific Class

Search in an array of data dictionary entries `myEntryObjs` for entries whose values are objects of the class `Simulink.Parameter`.

```
foundEntries = find(myEntryObjs,'-value','-class','Simulink.Parameter')
```

Search Data Dictionary Entries for Modifying User

Search in an array of data dictionary entries `myEntryObjs` for entries that were last modified by the user `jsmith`.

```
foundEntries = find(myEntryObjs,'LastModifiedBy','jsmith')
```

Search Data Dictionary Entries Using Multiple Criteria

Search in an array of data dictionary entries `myEntryObjs` for entries that were last modified by the user `jsmith` or whose names begin with `fuel`.

```
foundEntries = find(myEntryObjs,'LastModifiedBy','jsmith','-or',...
'-regexp','Name','fuel*')
```

Search Data Dictionary Entries Using Regular Expressions

Search in an array of data dictionary entries `myEntryObjs` for entries whose names begin with `Press`.

```
foundEntries = find(myEntryObjs,'-regexp','Name','Press*')
```

Search Data Dictionary Entries for Specific Value

Search in an array of data dictionary entries `myEntryObjs` for entries whose values are `273`. If you find more than one entry, store the entries in an array called `foundEntries`.

```
foundEntries = [];
for i = 1:length(myEntryObjs)
    if getValue(myEntryObjs(i)) == 237
        foundEntries = [foundEntries myEntryObjs(i)];
    end
end
```

Search Data Dictionary Entry Values for Specific Property

Search in an array of data dictionary entries `myEntryObjs` for entries whose values have a property `DataType`.

```
foundEntries = find(myEntryObjs,'-value','-property','DataType')
```

See Also

Simulink.data.dictionary.Entry | find

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

getValue

Class: Simulink.data.dictionary.Entry
Package: Simulink.data.dictionary

Return value of data dictionary entry

Syntax

```
entryValue = getValue(entryObj)
```

Description

`entryValue = getValue(entryObj)` returns the value of the data dictionary entry `entryObj`, a `Simulink.data.dictionary.Entry` object.

To programmatically access variables for the purpose of sweeping block parameter values, consider using `Simulink.SimulationInput` objects instead of modifying the variables through the programmatic interface of the data dictionary. See “Optimize, Estimate, and Sweep Block Parameter Values”.

Input Arguments

`entryObj` — Target data dictionary entry

`Simulink.data.dictionary.Entry` object

Target data dictionary entry, specified as a `Simulink.data.dictionary.Entry` object. Before you use this function, represent the target entry with a `Simulink.data.dictionary.Entry` object by using, for example, the `getEntry` function.

Examples

Return Value of Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
fuelFlowObj = getEntry(dDataSectObj,'fuelFlow');
```

Return the value of the entry `fuelFlow` and assign the value to variable `fuelFlowValue`.

```
fuelFlowValue = getValue(fuelFlowObj)
```

```
fuelFlowValue =

   237
```

See Also

`Simulink.data.dictionary.Entry` | `setValue`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

setValue

Class: Simulink.data.dictionary.Entry
Package: Simulink.data.dictionary

Set value of data dictionary entry

Syntax

```
setValue(entryObj,newValue)
```

Description

`setValue(entryObj,newValue)` assigns the value `newValue` to the data dictionary entry `entryObj`, a `Simulink.data.dictionary.Entry` object.

To programmatically access variables for the purpose of sweeping block parameter values, consider using `Simulink.SimulationInput` objects instead of modifying the variables through the programmatic interface of the data dictionary. See “Optimize, Estimate, and Sweep Block Parameter Values”.

Input Arguments

`entryObj` — Target data dictionary entry
`Simulink.data.dictionary.Entry` object

Target data dictionary entry, specified as a `Simulink.data.dictionary.Entry` object. Before you use this function, represent the target entry with a `Simulink.data.dictionary.Entry` object by using, for example, the `getEntry` function.

`newValue` — Value to assign to data dictionary entry
MATLAB expression

Value to assign to data dictionary entry, specified as a MATLAB expression. The expression must return a value that is supported by the data dictionary section that contains the entry.

Example: 27.5

Example: myBaseWorkspaceVariable

Example: Simulink.Parameter

Examples

Set Value of Data Dictionary Entry

Represent the data dictionary entry fuelFlow with a Simulink.data.dictionary.Entry object named fuelFlowObj. fuelFlow is defined in the data dictionary myDictionary_ex_API.sldd.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
fuelFlowObj = getEntry(dDataSectObj,'fuelFlow');
```

Set the value of the entry fuelFlow to 493. Then, view the Value property of fuelFlowObj to observe the change.

```
setValue(fuelFlowObj,493)
fuelFlowObj
```

```
fuelFlowObj = 

  Entry with properties:

            Name: 'fuelFlow'
           Value: 493
      DataSource: 'myDictionary_ex_API.sldd'
    LastModified: '2014-Sep-05 13:37:22.161124'
    LastModifiedBy: 'jsmith'
            Status: 'Modified'
```

Alternatives

You can use the Model Explorer window to view and change the values of data dictionary entries.

`Simulink.data.dictionary.Entry` | `getValue`

Topics

"Store Data in Dictionary Programmatically"

Introduced in R2015a

showChanges

Class: Simulink.data.dictionary.Entry
Package: Simulink.data.dictionary

Display changes made to data dictionary entry

Syntax

```
showChanges(entryObj)
```

Description

`showChanges(entryObj)` opens the Comparison Tool to show changes made to the data dictionary entry `entryObj`, a `Simulink.data.dictionary.Entry` object. The Comparison Tool displays the properties of `entryObj` as they were when the data dictionary was last saved and as they were when the `showChanges` function was called.

Input Arguments

`entryObj` — Target data dictionary entry
`Simulink.data.dictionary.Entry` object

Target data dictionary entry, specified as a `Simulink.data.dictionary.Entry` object. Before you use this function, represent the target entry with a `Simulink.data.dictionary.Entry` object by using, for example, the `getEntry` function.

Examples

View Unsaved Changes to Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
fuelFlowObj = getEntry(dDataSectObj,'fuelFlow');
```

Make a change to the entry `fuelFlow` by assigning it the new value `494`.

```
setValue(fuelFlowObj,494);
```

Observe the unsaved change to the entry `fuelFlow`. The Comparison Tool opens and compares side by side the current state of the entry with its most recently saved state.

```
showChanges(fuelFlowObj)
```

Alternatives

You can use Model Explorer and the Comparison Tool to view changes to data dictionary entries. See “View and Revert Changes to Dictionary Entries” for more information.

`Simulink.data.dictionary.Entry` | `discardChanges`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

Simulink.data.dictionary.EnumTypeDefinition class

Package: Simulink.data.dictionary

Store enumerated type definition in data dictionary

Description

An object of the `Simulink.data.dictionary.EnumTypeDefinition` class defines an enumerated data type in a data dictionary. You store the object in a data dictionary entry so models linked to the dictionary can use the enumerated type definition.

In the MATLAB base workspace, objects of this class retain information about an enumerated type but do not define the type for use by other variables or by models.

Construction

When you use the function `importEnumTypes` to import the definitions of enumerated types to a data dictionary, Simulink creates a `Simulink.data.dictionary.EnumTypeDefinition` object in the dictionary for each imported definition. The dictionary stores each object in an individual entry.

The constructor `Simulink.data.dictionary.EnumTypeDefinition` creates an instance of this class with default property values and a single enumeration member that has underlying integer value `0`.

Properties

`AddClassNameToEnumNames` — Flag to control enumeration identifiers in generated code

`false` (default) | `true`

Flag to prefix enumerations with the class name in generated code, specified as `true` or `false`.

If you specify `true`, when you generate code the identifier of each enumeration member begins with the name of the enumeration class. For example, an enumeration class `LEDcolor` with enumeration members `GREEN` and `RED` defines the enumeration members in generated code as `LEDcolor_GREEN` and `LEDcolor_RED`.

Data Types: `logical`

`DataScope` — Flag to control data type definition in generated code

`'Auto'` (default) | `'Imported'` | `'Exported'`

Flag to control data type definition in generated code, specified as `'Auto'`, `'Imported'`, or `'Exported'`. The table describes the behavior of generated code for each value.

Value	Action
`Auto` (default)	If you do not specify the property `Headerfile`, export the data type definition to *`model`*`_types.h`, where *`model`* is the model name. If you specify `Headerfile`, import the data type definition from the specified header file.
`Exported`	Export the data type definition to a separate header file. If you do not specify the property `Headerfile`, the header file name defaults to *`type`*`.h`, where *`type`* is the data type name.
`Imported`	Import the data type definition from a separate header file. If you do not specify the property `Headerfile`, the header file name defaults to *`type`*`.h`, where *`type`* is the data type name.

`DefaultValue` — Default enumeration member

`''` (default) | character vector

Default enumeration member, specified as a character vector. Specify `DefaultValue` as the name of an enumeration member you have already defined.

When you create a `Simulink.data.dictionary.EnumTypeDefinition` object, `DefaultValue` is an empty character vector, `''`, and Simulink uses the first enumeration member as the default member.

Example: `'enumMember1'`

`Description` — Description of enumerated data type in generated code

`''` (default) | character vector

Description of the enumerated data type, specified as a character vector. Use this property to explain the purpose of the type in generated code.

Example: `'Two possible colors of LED indicator: GREEN and RED.'`

Data Types: `char`

`HeaderFile` — Name of header file defining enumerated data type in generated code

`''` (default) | character vector

Name of the header file that defines the enumerated data type in generated code, specified as a character vector. Use a `.h` extension to specify the file name.

If you do not specify `HeaderFile`, generated code uses a default header file name that depends on the value of the `DataScope` property .

Example: `'myTypeIncludeFile.h'`

Data Types: `char`

`StorageType` — Data type of underlying integer values

`''` (default) | character vector

Data type of the integer values underlying the enumeration members, specified as a character vector. Generated code stores the underlying integer values using the data type you specify.

You can specify one of these supported integer types:

- `'int8'`
- `'int16'`

- `'int32'`
- `'uint8'`
- `'uint16'`

To store the underlying integer values in generated code using the native integer type of the target hardware, specify `StorageType` as an empty character vector, `''`, which is the default value.

Example: `'int16'`

`''`

Methods

appendEnumeral	Add enumeration member to enumerated data type definition in data dictionary
removeEnumeral	Remove enumeration member from enumerated data type definition in data dictionary

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Programmatically Create Enumerated Type Definition in Data Dictionary

Create an object that can store the definition of an enumerated type. By default, the new type defines a single enumeration member `enum1` with underlying integer value `0`.

```
myColors = Simulink.data.dictionary.EnumTypeDefinition
```

```
myColors =
   Simulink.data.dictionary.EnumTypeDefinition
      enum1
```

Add some enumeration members to the definition of the type.

```
appendEnumeral(myColors,'Orange',1,'')
appendEnumeral(myColors,'Black',2,'')
appendEnumeral(myColors,'Cyan',3,'')
myColors
```

```
myColors =

   Simulink.data.dictionary.EnumTypeDefinition
      enum1
      Orange
      Black
      Cyan
```

Remove the default enumeration member enum1. Since enum1 is the first enumeration member in the list, identify it with index 1.

```
removeEnumeral(myColors,1)
myColors
```

```
myColors =

   Simulink.data.dictionary.EnumTypeDefinition
      Orange
      Black
      Cyan
```

Customize the enumerated type by configuring the properties of the object representing it.

```
myColors.Description = 'These are my favorite colors.';
myColors.DefaultValue = 'Cyan';
myColors.HeaderFile = 'colorsType.h';
```

Open the data dictionary myDictionary_ex_API.sldd and represent it with a Simulink.data.Dictionary object named myDictionaryObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import the object that defines the enumerated type myColors to the dictionary.

```
importFromBaseWorkspace(myDictionaryObj,'varList',{'myColors'});
```

Alternatives

You can use Model Explorer to add and modify enumerated data types stored in a data dictionary.

Topics

“Store Data in Dictionary Programmatically”
“Use Enumerated Data in Simulink Models”

Introduced in R2015a

appendEnumeral

Class: Simulink.data.dictionary.EnumTypeDefinition
Package: Simulink.data.dictionary

Add enumeration member to enumerated data type definition in data dictionary

Syntax

```
appendEnumeral(typeObj,memberName,memberValue,memberDesc)
```

Description

`appendEnumeral(typeObj,memberName,memberValue,memberDesc)` adds an enumeration member to the enumerated type definition stored by `typeObj`, a `Simulink.data.dictionary.EnumTypeDefinition` object.

Input Arguments

`typeObj` — Target enumerated type definition

`Simulink.data.dictionary.EnumTypeDefinition` object

Target enumerated type definition, specified as a `Simulink.data.dictionary.EnumTypeDefinition` object.

`memberName` — Name of new enumeration member

character vector

Name of the new enumeration member, specified as a character vector.

Example: `'myNewEnumMember'`

Data Types: `char`

`memberValue` — Integer value underlying new enumeration member

integer

Integer value underlying the new enumeration member, specified as an integer.

The definition of the enumeration class determines the integer data type used in generated code to store the underlying values of enumeration members.

Example: 3

Data Types: single | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | double

memberDesc — Description of new enumeration member
character vector

Description of the new enumeration member, specified as a character vector.

If you do not want to supply a description for the enumeration member, use an empty character vector.

Example: 'Enumeration member number 1.'

Example: ''

Data Types: char

Examples

Programmatically Create Enumerated Type Definition in Data Dictionary

Create an object that can store the definition of an enumerated type. By default, the new type defines a single enumeration member enum1 with underlying integer value 0.

```
myColors = Simulink.data.dictionary.EnumTypeDefinition
```

```
myColors =

   Simulink.data.dictionary.EnumTypeDefinition
      enum1
```

Add some enumeration members to the definition of the type.

```
appendEnumeral(myColors,'Orange',1,'')
appendEnumeral(myColors,'Black',2,'')
appendEnumeral(myColors,'Cyan',3,'')
myColors
```

```
myColors = 

   Simulink.data.dictionary.EnumTypeDefinition
      enum1
      Orange
      Black
      Cyan
```

Remove the default enumeration member `enum1`. Since `enum1` is the first enumeration member in the list, identify it with index `1`.

```
removeEnumeral(myColors,1)
myColors
```

```
myColors = 

   Simulink.data.dictionary.EnumTypeDefinition
      Orange
      Black
      Cyan
```

Customize the enumerated type by configuring the properties of the object representing it.

```
myColors.Description = 'These are my favorite colors.';
myColors.DefaultValue = 'Cyan';
myColors.HeaderFile = 'colorsType.h';
```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import the object that defines the enumerated type `myColors` to the dictionary.

```
importFromBaseWorkspace(myDictionaryObj,'varList',{'myColors'});
```

Alternatives

You can use Model Explorer to add enumeration members to the enumerated data type represented by a `Simulink.data.dictionary.EnumTypeDefinition` object.

See Also

`Simulink.data.dictionary.EnumTypeDefinition` | `Simulink.data.dictionary.EnumTypeDefinition.removeEnumeral`

Topics

“Store Data in Dictionary Programmatically”
“Use Enumerated Data in Simulink Models”

Introduced in R2015a

removeEnumeral

Class: Simulink.data.dictionary.EnumTypeDefinition
Package: Simulink.data.dictionary

Remove enumeration member from enumerated data type definition in data dictionary

Syntax

`removeEnumeral(typeObj,memberNum)`

Description

`removeEnumeral(typeObj,memberNum)` removes an enumeration member from the enumerated type definition stored by `typeObj`, a `Simulink.data.dictionary.EnumTypeDefinition` object.

Input Arguments

`typeObj` — Target enumerated type definition

`Simulink.data.dictionary.EnumTypeDefinition` object

Target enumerated type definition, specified as a `Simulink.data.dictionary.EnumTypeDefinition` object.

`memberNum` — Index of target enumeration member

integer

Index of target enumeration member, specified as an integer.

The first enumeration member in an enumerated type definition has index `1`. For example, suppose an enumerated type `BasicColors` has this definition:

```
myColors =

   Simulink.data.dictionary.EnumTypeDefinition
```

```
        Orange
        Black
        Cyan
```

To remove the enumeration member `Black`, specify `memberNum` as `2`. To remove the enumeration member `Cyan`, specify `3`.

Do not specify `memberNum` using the integer value underlying an enumeration member. The integer value underlying the member is not equivalent to the index of the member.

Example: 3

Data Types: `single` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `double`

Examples

Programmatically Create Enumerated Type Definition in Data Dictionary

Create an object that can store the definition of an enumerated type. By default, the new type defines a single enumeration member `enum1` with underlying integer value `0`.

```
myColors = Simulink.data.dictionary.EnumTypeDefinition
```

```
myColors = 

   Simulink.data.dictionary.EnumTypeDefinition
      enum1
```

Add some enumeration members to the definition of the type.

```
appendEnumeral(myColors,'Orange',1,'')
appendEnumeral(myColors,'Black',2,'')
appendEnumeral(myColors,'Cyan',3,'')
myColors
```

```
myColors = 

   Simulink.data.dictionary.EnumTypeDefinition
      enum1
      Orange
      Black
      Cyan
```

Remove the default enumeration member `enum1`. Since `enum1` is the first enumeration member in the list, identify it with index `1`.

```
removeEnumeral(myColors,1)
myColors
```

```
myColors =

   Simulink.data.dictionary.EnumTypeDefinition
      Orange
      Black
      Cyan
```

Customize the enumerated type by configuring the properties of the object representing it.

```
myColors.Description = 'These are my favorite colors.';
myColors.DefaultValue = 'Cyan';
myColors.HeaderFile = 'colorsType.h';
```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import the object that defines the enumerated type `myColors` to the dictionary.

```
importFromBaseWorkspace(myDictionaryObj,'varList',{'myColors'});
```

Alternatives

You can use Model Explorer to remove enumeration members from the enumerated data type represented by a `Simulink.data.dictionary.EnumTypeDefinition` object.

Topics

“Store Data in Dictionary Programmatically”

“Use Enumerated Data in Simulink Models”

Introduced in R2015a

Simulink.data.dictionary.Section class

Package: Simulink.data.dictionary

Configure data dictionary section

Description

An object of the `Simulink.data.dictionary.Section` class represents one section of a data dictionary, such as Design Data or Configurations. The object allows you to perform operations on the section such as add or delete entries and import data from files.

Before you can create a `Simulink.data.dictionary.Section` object, you must create a `Simulink.data.Dictionary` object representing the target data dictionary. Once created, the `Simulink.data.dictionary.Section` object exists independently of the `Simulink.data.Dictionary` object.

You cannot use the data dictionary programmatic interface (see “Store Data in Dictionary Programmatically”) to access the **Embedded Coder** section of a data dictionary. Instead, see Embedded Coder Dictionary.

Construction

The function `getSection` creates a `Simulink.data.dictionary.Section` object.

Properties

Name — Name of data dictionary section

character vector

Name of data dictionary section, returned as a character vector. This property is read only.

Methods

addEntry	Add new entry to data dictionary section
assignin	Assign value to data dictionary entry
deleteEntry	Delete data dictionary entry
evalin	Evaluate MATLAB expression in data dictionary section
exist	Check existence of data dictionary entry
exportToFile	Export data dictionary entries from section to MAT-file or MATLAB file
find	Search in data dictionary section
getEntry	Create `Simulink.data.dictionary.Entry` object to represent data dictionary entry
importFromFile	Import variables from MAT-file or MATLAB file to data dictionary section

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Create New Data Dictionary Section Object

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
dDataSectObj = getSection(myDictionaryObj,'Design Data')
```

```
dDataSectObj = 

  Section with properties:
    Name: 'Design Data'
```

See Also

`Simulink.data.Dictionary` | `getSection`

Topics

“Store Data in Dictionary Programmatically”
“What Is a Data Dictionary?”

Introduced in R2015a

addEntry

Class: Simulink.data.dictionary.Section
Package: Simulink.data.dictionary

Add new entry to data dictionary section

Syntax

```
addEntry(sectionObj,entryName,entryValue)
entryObj = addEntry(sectionObj,entryName,entryValue)
```

Description

`addEntry(sectionObj,entryName,entryValue)` adds an entry, with name `entryName` and value `entryValue`, to the data dictionary section `sectionObj`, a `Simulink.data.dictionary.Section` object.

`entryObj = addEntry(sectionObj,entryName,entryValue)` returns a `Simulink.data.dictionary.Entry` object representing the newly added data dictionary entry.

Input Arguments

`sectionObj` — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

`entryName` — Name of new data dictionary entry

character vector

Name of new data dictionary entry, specified as a character vector.

Example: 'myNewEntry'

Data Types: char

entryValue — Value of new data dictionary entry
MATLAB expression

Value of new data dictionary entry, specified as a MATLAB expression that returns any valid data dictionary content.

Example: 27.5

Example: myBaseWorkspaceVariable

Example: Simulink.Parameter

Examples

Add Entry to Design Data Section of Data Dictionary

Represent the Design Data section of the data dictionary myDictionary_ex_API.sldd with a Simulink.data.dictionary.Section object named dDataSectObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Add an entry to the Design Data section of myDictionary_ex_API.sldd an entry myNewEntry with value 237.

```
addEntry(dDataSectObj,'myNewEntry',237)
```

Add New Simulink.Parameter Object to Data Dictionary

Represent the Design Data section of the data dictionary myDictionary_ex_API.sldd with a Simulink.data.dictionary.Section object named dDataSectObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Add an entry to the Design Data section of myDictionary_ex_API.sldd. Name the new entry myNewParam and assign a Simulink.Parameter object to the value.

```
addEntry(dDataSectObj,'myNewParam',Simulink.Parameter)
```

The expression `Simulink.Parameter` constructs a new `Simulink.Parameter` object, and the `addEntry` function assigns the object to the value of the new data dictionary entry `myNewParam`.

Tips

- `addEntry` returns an error if the entry name you specify with `entryName` is already the name of an entry in the target data dictionary section or in the same section of any referenced dictionaries.

Alternatives

You can use Model Explorer to add entries to a data dictionary in the same way you can use it to add variables to a model workspace or the base workspace.

See Also

`Simulink.data.dictionary.Entry` | `Simulink.data.dictionary.Section` | `assignin`

Topics

"Store Data in Dictionary Programmatically"

Introduced in R2015a

assignin

Class: Simulink.data.dictionary.Section
Package: Simulink.data.dictionary

Assign value to data dictionary entry

Syntax

```
assignin(sectionObj,entryName,entryValue)
```

Description

`assignin(sectionObj,entryName,entryValue)` assigns the value `entryValue` to the data dictionary entry `entryName` in the data dictionary section `sectionObj`, a `Simulink.data.dictionary.Section` object. If an entry with the specified name is not in the target section, `assignin` creates the entry with the specified name and value.

If an entry with the name specified by input argument `entryName` is not defined in the target data dictionary section but is defined in a referenced dictionary, `assignin` does not create a new entry in the target section but operates on the entry in the referenced dictionary.

To programmatically access variables for the purpose of sweeping block parameter values, consider using `Simulink.SimulationInput` objects instead of modifying the variables through the programmatic interface of the data dictionary. See “Optimize, Estimate, and Sweep Block Parameter Values”.

Input Arguments

`sectionObj` — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a

Simulink.data.dictionary.Section object by using, for example, the getSection function.

entryName — Name of target data dictionary entry
character vector

Name of target data dictionary entry, specified as a character vector. If a matching entry does not already exist, the functions creates a new entry using the specified name.

Example: 'myEntry'

Data Types: char

entryValue — Value to assign to data dictionary entry
MATLAB expression

Value to assign to data dictionary entry, specified as a MATLAB expression that returns any valid data dictionary content.

Example: 27.5

Example: myBaseWorkspaceVariable

Example: Simulink.Parameter

Examples

Assign Value to Data Dictionary Entry

Assign a value to a data dictionary entry by operating on a Simulink.data.dictionary.Section object.

Represent the Design Data section of the data dictionary myDictionary_ex_API.sldd with a Simulink.data.dictionary.Section object named dDataSectObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Assign the value 237 to an entry myAssignedEntry in the data dictionary myDictionary_ex_API.sldd. If an entry named myAssignedEntry is not in myDictionary_ex_API.sldd, create it.

```
assignin(dDataSectObj,'myAssignedEntry',237)
```

Alternatives

You can use the Model Explorer window to view and change the values of data dictionary entries.

See Also

`Simulink.data.dictionary.Section` | `setValue`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

deleteEntry

Class: Simulink.data.dictionary.Section
Package: Simulink.data.dictionary

Delete data dictionary entry

Syntax

```
deleteEntry(sectionObj,entryName)
deleteEntry(sectionObj,entryName,'DataSource',dictionaryName)
```

Description

`deleteEntry(sectionObj,entryName)` deletes a data dictionary entry `entryName` from the data dictionary section `sectionObj`, a `Simulink.data.dictionary.Section` object. If there are multiple entries with the specified name in a hierarchy of reference dictionaries, the function deletes all the entries. If you represent a data dictionary entry with one or more `Simulink.data.dictionary.Entry` objects and later delete the entry using the `deleteEntry` function, the objects remain with their `Status` property set to `'Deleted'`.

`deleteEntry(sectionObj,entryName,'DataSource',dictionaryName)` deletes an entry that is defined in the data dictionary `DictionaryName`. Use this syntax to uniquely identify an entry that is defined more than once in a hierarchy of referenced data dictionaries.

Input Arguments

`sectionObj` — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a

Simulink.data.dictionary.Section object by using, for example, the getSection function.

entryName — Name of target data dictionary entry

character vector

Name of target data dictionary entry, specified as a character vector.

Example: 'myEntry'

Data Types: char

dictionaryName — Name of data dictionary that defines target entry

character vector

File name of data dictionary that defines the target entry, specified as a character vector including the .sldd extension.

Example: 'mySubDictionary_ex_API.sldd'

Data Types: char

Examples

Delete Entry from Data Dictionary Section

Represent the Design Data section of the data dictionary myDictionary_ex_API.sldd with a Simulink.data.dictionary.Section object named dDataSectObj. The Design Data section of myDictionary_ex_API.sldd already contains an entry named fuelFlow.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Delete the entry fuelFlow from the data dictionary myDictionary_ex_API.sldd. myDictionary_ex_API.sldd no longer contains the fuelFlow entry.

```
deleteEntry(dDataSectObj,'fuelFlow')
```

Delete Entry from Reference Data Dictionary

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Delete the entry `myRefEntry` from the data dictionary `myRefDictionary_ex_API.sldd`. `myDictionary_ex_API.sldd` references `myRefDictionary_ex_API.sldd`, and `myRefDictionary_ex_API.sldd` defines an entry`myRefEntry`.

```
deleteEntry(dDataSectObj,'myRefEntry','DataSource',...
'myRefDictionary_ex_API.sldd')
```

Alternatives

You can use the Model Explorer window to delete entries from a data dictionary in the same way you can delete variables from a model workspace or the base workspace.

`Simulink.data.dictionary.Entry` | `Simulink.data.dictionary.Section` | `addEntry`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

evalin

Class: Simulink.data.dictionary.Section
Package: Simulink.data.dictionary

Evaluate MATLAB expression in data dictionary section

Syntax

```
returnValue = evalin(sectionObj,expression)
```

Description

`returnValue = evalin(sectionObj,expression)` evaluates a MATLAB expression in the data dictionary section `sectionObj` and returns the values returned by `expression`.

To programmatically access variables for the purpose of sweeping block parameter values, consider using `Simulink.SimulationInput` objects instead of modifying the variables through the programmatic interface of the data dictionary. See “Optimize, Estimate, and Sweep Block Parameter Values”.

Input Arguments

sectionObj — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

expression — MATLAB expression to evaluate

character vector

MATLAB expression to evaluate, specified as a character vector.

Example: 'a = 5.3'

Example: 'whos'

Example: 'CurrentSpeed.Value = 290.73'

Data Types: char

Examples

List All Entries in Data Dictionary Section

Represent the Design Data section of the data dictionary myDictionary_ex_API.sldd with a Simulink.data.dictionary.Section object named dDataSectObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Execute the whos command in the Design Data section of myDictionary_ex_API.sldd.

```
evalin(dDataSectObj,'whos')
```

```
   Name                    Size               Bytes  Class                 Attributes

  fuelFlow               1x1                    8  double
  myRefEntry             1x1                    1  logical
  parameterGain37        1x1                  112  Simulink.Parameter
```

Tips

- evalin allows you to treat a data dictionary section as a MATLAB workspace. You can think of entries contained in the section as workspace variables you can manipulate with MATLAB expressions.

Simulink.data.dictionary.Section | Simulink.data.evalinGlobal

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

exist

Class: Simulink.data.dictionary.Section
Package: Simulink.data.dictionary

Check existence of data dictionary entry

Syntax

```
doesExist = exist(sectionObj,entryName)
```

Description

`doesExist = exist(sectionObj,entryName)` determines if the data dictionary section `sectionObj` contains an entry by the name of `entryName` and returns an indication.

Input Arguments

`sectionObj` — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

`entryName` — Name of target entry

character vector

Name of target entry, specified as a character vector.

Example: `'myEntry'`

Data Types: `char`

Output Arguments

doesExist — Indication of entry existence

0 | 1

Indication of entry existence, returned as 0 if false and 1 if true.

Examples

Determine if Data Dictionary Entry Exists

Determine if an entry exists in a data dictionary by searching for the name of the entry

Represent the Design Data section of the data dictionary myDictionary_ex_API.sldd with a Simulink.data.dictionary.Section object named dDataSectObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Determine if an entry fuelFlow exists in the Design Data section of myDictionary_ex_API.sldd.

```
exist(dDataSectObj,'fuelFlow')
```

```
ans =

     1
```

Determine if an entry myEntry exists in the Design Data section of myDictionary_ex_API.sldd.

```
exist(dDataSectObj,'myEntry')
```

```
ans =

     0
```

Tips

- `exist` also determines if a matching entry exists in the same section of any referenced data dictionaries. For example, if `sectionObj` represents the Design Data section of a data dictionary `myDictionary_ex_API.sldd`, `exist` searches the Design Data section of `myDictionary_ex_API.sldd` and the Design Data sections of any dictionaries referenced by `myDictionary_ex_API.sldd`.

Alternatives

You can use Model Explorer to search a data dictionary for an entry.

Topics

"Store Data in Dictionary Programmatically"

Introduced in R2015a

exportToFile

Class: Simulink.data.dictionary.Section
Package: Simulink.data.dictionary

Export data dictionary entries from section to MAT-file or MATLAB file

Syntax

```
exportToFile(sectionObj,fileName)
```

Description

`exportToFile(sectionObj,fileName)` exports to a MAT or MATLAB file all the values of the entries contained in the data dictionary section `sectionObj`, a `Simulink.data.dictionary.Section` object. `exportToFile` exports the values of all entries, including those defined in referenced dictionaries.

Input Arguments

`sectionObj` — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

`fileName` — Name of MAT or MATLAB file

character vector

Name of target MAT or MATLAB file, specified as a character vector. `exportToFile` supplies a file extension `.mat` if you do not specify an extension.

Example: `'myNewFile.mat'`

Example: `'myNewFile.m'`

Data Types: char

Examples

Export Data Dictionary Entries to MAT or MATLAB Files

Represent the Design Data section of the data dictionary myDictionary_ex_API.sldd with a Simulink.data.dictionary.Section object named dDataSectObj. Represent the Configurations section of myDictionary_ex_API.sldd with an object named configSectObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
configSectObj = getSection(myDictionaryObj,'Configurations');
```

Export the entries from the Design Data section of myDictionary_ex_API.sldd to a MATLAB file in your current working folder.

```
exportToFile(dDataSectObj,'myDictionaryDesignData.m')
```

Export the entries from the Configurations section of myDictionary_ex_API.sldd to a MAT-file in your current working folder.

```
exportToFile(configSectObj,'myDictionaryConfigurations.mat')
```

```
Exported 1 entries from scope 'Configurations'
to MAT-file myDictionaryConfigurations.mat.
```

Limitation

The exportToFile method does not export enumerated data types (which are stored as Simulink.data.dictionary.EnumTypeDefinition objects). To transfer or copy an enumerated type from one dictionary to another, use the getEntry and addEntry methods of Simulink.data.dictionary.Section objects.

Alternatives

You can use Model Explorer to export data dictionary entries to a file. See “Export Design Data from Dictionary” for more information.

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

find

Class: Simulink.data.dictionary.Section
Package: Simulink.data.dictionary

Search in data dictionary section

Syntax

```
foundEntries = find(sectionObj,PName1,PValue1,...,PNameN,PValueN)
foundEntries = find(sectionObj,PName1,PValue1,...,PNameN,PValueN,
options)
```

Description

`foundEntries = find(sectionObj,PName1,PValue1,...,PNameN,PValueN)` searches the data dictionary section `sectionObj` using search criteria `PName1,PValue1,...,PNameN,PValueN`, and returns an array of matching entries that were found in the target section. This syntax matches the search criteria with the properties of the entries in the target section but not with the properties of their values. See `Simulink.data.dictionary.Entry` for a list of data dictionary entry properties.

`foundEntries = find(sectionObj,PName1,PValue1,...,PNameN,PValueN, options)` searches for data dictionary entries using additional search options. For example, you can match the search criteria with the values of the entries in the target section.

Input Arguments

`sectionObj` — Data dictionary section to search
`Simulink.data.dictionary.Section` object

Data dictionary section to search, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

PName1,PValue1,...,PNameN,PValueN — Search criteria

name-value pairs representing properties

Search criteria, specified as one or more name-value pairs representing names and values of properties of the entries in the target data dictionary section. For a list of the properties of a data dictionary entry, see `Simulink.data.dictionary.Entry`. If you specify more than one name-value pair, the returned entries meet all of the criteria.

If you include the `'-value'` option to search in the values of the entries, the search criteria apply to the values of the entries rather than to the entries themselves.

Example: `'LastModifiedBy','jsmith'`

Example: `'DataSource','myRefDictionary_ex_API.sldd'`

options — Additional search options

supported option codes

Additional search options, specified as one or more of the following supported option codes.

`'-value'`	This option causes `find` to search only in the values of the entries in the target data dictionary section. Specify this option before any other search criteria or `options` arguments.
`'-and'`, `'-or'`, `'-xor'`, `'-not'` logical operators	These options modify or combine multiple search criteria or other option codes.
`'-property',propertyName`	This name-value pair causes `find` to search for entries or values that have the property `propertyName` regardless of the value of the property. Specify `propertyName` as a character vector.
`'-class',className`	This name-value pair causes `find` to search for entries or values that are objects of the class `className`. Specify `className` as a character vector.
`'-isa',className`	This name-value pair causes `find` to search for entries or values that are objects of the class or of any subclass derived from the class `className`. Specify `className` as a character vector.

'-regexp'	This option allows you to use regular expressions in your search criteria. This option affects only search criteria that follow '-regexp'.

Example: '-value'

Example: '-value','-property','CoderInfo'

Example: '-value','-class','Simulink.Parameter'

Output Arguments

foundEntries — Data dictionary entries matching search criteria
array of Simulink.data.dictionary.Entry objects

Data dictionary entries matching the specified search criteria, returned as an array of Simulink.data.dictionary.Entry objects.

Examples

Return Array of All Entries in Data Dictionary Section

Represent the Design Data section of the data dictionary myDictionary_ex_API.sldd with a Simulink.data.dictionary.Section object named dDataSectObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Return all of the entries stored in the Design Data section of the data dictionary myDictionary_ex_API.sldd.

```
allEntries = find(dDataSectObj)
```

Search Data Dictionary Section for Specific Class

Represent the Design Data section of the data dictionary myDictionary_ex_API.sldd with a Simulink.data.dictionary.Section object named dDataSectObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Search in the Design Data section of `myDictionary_ex_API.sldd` for entries whose values are objects of the `Simulink.Parameter` class.

```
foundEntries = find(dDataSectObj,'-value','-class','Simulink.Parameter')
```

Search Data Dictionary Section for Modifying User

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Search in the Design Data section of `myDictionary_ex_API.sldd` for entries that were last modified by the user `jsmith`.

```
foundEntries = find(dDataSectObj,'LastModifiedBy','jsmith')
```

Search Data Dictionary Section Using Multiple Criteria

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Search in the Design Data section of `myDictionary_ex_API.sldd` for entries that were last modified by the user `jsmith` or whose names begin with `fuel`.

```
foundEntries = find(dDataSectObj,'LastModifiedBy','jsmith','-or',...
'-regexp','Name','fuel*')
```

Search Data Dictionary Section Using Regular Expressions

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Search in the Design Data section of `myDictionary_ex_API.sldd` for entries whose names begin with `fuel`.

```
foundEntries = find(dDataSectObj,'-regexp','Name','fuel*')
```

Search Data Dictionary Section for Specific Value

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Return all of the entries stored in the Design Data section of the data dictionary `myDictionary_ex_API.sldd`.

```
allEntries = find(dDataSectObj);
```

Find the entries with value `237`. If you find more than one entry, store the entries in an array called `foundEntries`.

```
foundEntries = [];
for i = 1:length(allEntries)
    if getValue(allEntries(i)) == 237
        foundEntries = [foundEntries allEntries(i)];
    end
end
```

Search Data Dictionary Section for Specific Property

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Search in the Design Data section of `myDictionary_ex_API.sldd` for entries whose values have a property `DataType`.

```
foundEntries = find(dDataSectObj,'-value','-property','DataType')
```

Alternatives

You can use Model Explorer to search a data dictionary for entries using arbitrary criteria.

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

getEntry

Class: Simulink.data.dictionary.Section
Package: Simulink.data.dictionary

Create `Simulink.data.dictionary.Entry` object to represent data dictionary entry

Syntax

```
entryObj = getEntry(sectionObj,entryName)
entryObj = getEntry(sectionObj,
entryName,'DataSource',dictionaryName)
```

Description

`entryObj = getEntry(sectionObj,entryName)` returns an array of `Simulink.data.dictionary.Entry` objects representing data dictionary entries `entryName` found in the data dictionary section `sectionObj`, a `Simulinkdata.dictionary.Section` object. `getEntry` returns multiple objects if multiple entries have the specified name in a reference hierarchy of data dictionaries.

`entryObj = getEntry(sectionObj, entryName,'DataSource',dictionaryName)` returns an object representing a data dictionary entry that is defined in the data dictionary `dictionaryName`. Use this syntax to uniquely identify an entry that is defined more than once in a hierarchy of referenced data dictionaries.

Input Arguments

`sectionObj` — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

entryName — Name of target data dictionary entry
character vector

Name of target data dictionary entry, specified as a character vector.

Example: 'myEntry'

Data Types: char

dictionaryName — Name of data dictionary containing target entry
character vector

File name of data dictionary containing the target entry, specified as a character vector including the .sldd extension.

Example: 'mySubDictionary_ex_API.sldd'

Data Types: char

Output Arguments

entryObj — Target data dictionary entry
Simulink.data.dictionary.Entry object

Target data dictionary entry, returned as one or more Simulink.data.dictionary.Entry objects.

Examples

Set Value of Data Dictionary Entry

Represent the Design Data section of the data dictionary myDictionary_ex_API.sldd with a Simulink.data.dictionary.Section object named dDataSectObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Represent the data dictionary entry fuelFlow with a Simulink.data.dictionary.Entry object named fuelFlowObj. fuelFlow is defined in the data dictionary myDictionary_ex_API.sldd.

```
fuelFlowObj = getEntry(dDataSectObj,'fuelFlow');
```

Set the value of the entry `fuelFlow` to 493.

```
setValue(fuelFlowObj,493)
```

Set Value of Entry in Reference Dictionary

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Represent the data dictionary entry `myRefEntry` with a `Simulink.data.dictionary.Entry` object named `refEntryObj`. `myDictionary_ex_API.sldd` references `myRefDictionary_ex_API.sldd`, and `myRefDictionary_ex_API.sldd` defines an entry `myRefEntry`.

```
refEntryObj = getEntry(dDataSectObj,'myRefEntry','DataSource',...
'myRefDictionary_ex_API.sldd');
```

Set the value of the entry `myRefEntry` to 493.

```
setValue(refEntryObj,493)
```

Topics

"Store Data in Dictionary Programmatically"

Introduced in R2015a

importFromFile

Class: Simulink.data.dictionary.Section
Package: Simulink.data.dictionary

Import variables from MAT-file or MATLAB file to data dictionary section

Syntax

```
importedVars = importFromFile(sectionObj,fileName)
importedVars = importFromFile(sectionObj,
fileName,'existingVarsAction',existAction)
[importedVars,existingVars] = importFromFile( ___ )
```

Description

`importedVars = importFromFile(sectionObj,fileName)` imports variables defined in the MAT-file or MATLAB file `fileName` to the data dictionary section `sectionObj` without overwriting any variables that are already in the target section. If any variables are already in the target section, the function displays a warning and a list in the MATLAB Command Window. This syntax returns a list of variables that were successfully imported. A variable is considered successfully imported only if `importFromFile` assigns the value of the variable to the corresponding entry in the target data dictionary.

`importedVars = importFromFile(sectionObj, fileName,'existingVarsAction',existAction)` imports variables that are already in the target section by taking a specified action `existAction`. For example, you can choose to use the variable values in the target file to overwrite the corresponding values in the target section.

`[importedVars,existingVars] = importFromFile( ___ )` returns a list of variables in the target section that were not overwritten. Use this syntax if `existingVarsAction` is set to `'none'`, the default value, which prevents existing dictionary entries from being overwritten.

Input Arguments

`sectionObj` — Target data dictionary section
`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

`fileName` — Name of MAT or MATLAB file
character vector

Name of target MAT or MATLAB file, specified as a character vector. `importFromFile` automatically supplies a file extension `.mat` if you do not specify an extension.

Example: `'myFile.mat'`

Example: `'myFile.m'`

Data Types: `char`

`existAction` — Action to take for existing dictionary variables
`'none'` (default) | `'overwrite'` | `'error'`

Action to take for existing dictionary variables, specified as `'none'`, `'overwrite'`, or `'error'`.

If you specify `'none'`, `importFromFile` attempts to import target variables but does not import or make any changes to variables that are already in the data dictionary section.

If you specify `'overwrite'`, `importFromFile` imports all target variables and overwrites any variables that are already in the data dictionary section.

If you specify `'error'`, `importFromFile` returns an error, without importing any variables, if any target variables are already in the data dictionary section.

Example: `'overwrite'`

Data Types: `char`

Output Arguments

importedVars — Successfully imported variables
cell array of character vectors

Names of successfully imported variables, returned as a cell array of character vectors. A variable is considered successfully imported only if importFromFile assigns its value to the corresponding entry in the target data dictionary.

existingVars — Variables that were not imported
cell array of character vectors

Names of target variables that were not imported due to their existence in the target data dictionary, returned as a cell array of character vectors. existingVars has content only if existAction is set to 'none', which is also the default. In that case importFromFile imports only variables that are not already in the target data dictionary.

Examples

Import to Data Dictionary from File

Represent the Design Data section of the data dictionary myDictionary_ex_API.sldd with a Simulink.data.dictionary.Section object named dDataSectObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Import all variables contained in the file myData_ex_API.m to the data dictionary and return a list of successfully imported variables. If any variables are already in myDictionary_ex_API.sldd, importFromFile returns a warning and a list of the affected variables.

```
importFromFile(dDataSectObj,'myData_ex_API.m')
```

```
Warning: The following variables were not imported because
they already exist in the dictionary:
   fuelFlow

ans =
    'myFirstEntry'
    'mySecondEntry'
    'myThirdEntry'
```

Import Variables from File and Overwrite Conflicts

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Import all variables contained in the file `myData_ex_API.m` to the data dictionary, overwrite any variables that are already in the dictionary, and return a list of successfully imported variables.

```
importFromFile(dDataSectObj,'myData_ex_API.m','existingVarsAction','overwrite')
```

```
ans =

    'fuelFlow'
    'myFirstEntry'
    'mySecondEntry'
    'myThirdEntry'
```

Return Variables Not Imported to Data Dictionary from File

Return a list of variables that are not imported from a file because they are already in the target data dictionary

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Import all variables contained in the file `myData_ex_API.m` to the data dictionary. Specify names for the output arguments of `importFromFile` to return the names of successfully and unsuccessfully imported variables.

```
[importedVars,existingVars] = importFromFile(dDataSectObj,'myData_ex_API.m')

importedVars =

    'myFirstEntry'
    'mySecondEntry'
    'myThirdEntry'

existingVars =

    'fuelFlow'
```

`importFromFile` does not import the variable `fuelflow` because it is already in the target data dictionary.

Tips

- `importFromFile` can import MATLAB variables created from enumerated data types but cannot import the definitions of the enumerated types. Use the `importEnumTypes` function to import enumerated data type definitions to a data dictionary. If you import variables of enumerated data types to a data dictionary but do not import the enumerated type definitions, the dictionary is less portable and might not function properly if used by someone else.

Alternatives

You can use the Model Explorer to import variables to a data dictionary from a file. See “Import Data to Dictionary from File” for more information.

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

Simulink.DualScaledParameter

Specify name, value, units, and other properties of Simulink dual-scaled parameter

Description

Use `Simulink.DualScaledParameter` so that you can define an object that stores two scaled values of the same physical value.

For example, for temperature measurement, you can store a Fahrenheit scale and a Celsius scale with conversion defined by a computation method that you provide. Given one scaled value, the `Simulink.DualScaledParameter` computes the other scaled value using the computation method.

A dual-scaled parameter inherits some properties from the `Simulink.Parameter` class. A dual-scaled parameter has:

- A calibration value. The value that you prefer to use.
- A main value. The real-world value that Simulink uses.
- An internal stored integer value. The value that is used in the embedded code.

You can use `Simulink.DualScaledParameter` objects in your model for both simulation and code generation. The parameter computes the internal value before code generation via the computation method. This offline computation results in leaner generated code.

If you provide the calibration value, the parameter computes the main value using the computation method. This method can be a first-order rational function.

$$y = \frac{ax + b}{cx + d}$$

- `x` is the calibration value.
- `y` is the main value.
- `a` and `b` are the coefficients of the CalToMain compute numerator.
- `c` and `d` are the coefficients of the CalToMain compute denominator.

If you provide the calibration minimum and maximum values, the parameter computes minimum and maximum values of the main value. Simulink performs range checking of parameter values. The software alerts you when the parameter object value lies outside a range that corresponds to its specified minimum and maximum values and data type.

Creation

Create a `Simulink.DualScaledParameter` object:

- By using the Model Data Editor. Instead of creating a `Simulink.Parameter` object, create a `Simulink.DualScaledParameter` object. See “Interact with a Model That Uses Workspace Variables”.
- By using the Model Explorer:

  1. In the **Model Hierarchy** pane, select a workspace or data dictionary.
  2. On the toolbar, select **Add** > **Add Custom**.
  3. In the Model Explorer — Select Object dialog box, set **Object class** to `Simulink.DualScaledParameter`.
- By using the `Simulink.DualScaledParameter` function, described below.

Syntax

```
DSParam = Simulink.DualScaledParameter
```

Description

`DSParam = Simulink.DualScaledParameter` returns a `Simulink.DualScaledParameter` object with default property values.

Properties

For information about properties in the property dialog box of a `Simulink.DualScaledParameter` object, see “Simulink.DualScaledParameter Property Dialog Box”.

CalibrationValue — Calibration value of this parameter

[ ] (default) | finite, real, double number

Calibration value of this parameter, specified as a finite, real, double number. This value represents the value that you prefer to use.

Before specifying CalibrationValue, you must specify CalToMainCompuNumerator and CalToMainCompuDenominator to define the computation method. The parameter uses the computation method and the calibration value to calculate the main value that Simulink uses.

Corresponds to **Calibration value** in the property dialog box.

Example: 5.34

Data Types: double

CalibrationMin — Calibration minimum value of this parameter

[ ] (default) | finite, real, double, scalar number

Calibration minimum value of this parameter, specified as a finite, real, double, scalar number. The default value, [], means the minimum is unspecified.

Before specifying CalibrationMin, you must specify CalToMainCompuNumerator and CalToMainCompuDenominator to define the computation method. The parameter uses the computation method and the calibration minimum value to calculate the minimum or maximum value that Simulink uses. A first order rational function is strictly monotonic, either increasing or decreasing. If it is increasing, setting the calibration minimum sets the main minimum value. If it is decreasing, setting the calibration minimum sets the main maximum.

If the parameter value is less than the minimum value or if the minimum value is outside the range of the parameter data type, Simulink generates a warning. In these cases, when updating the diagram or starting a simulation, Simulink generates an error.

Corresponds to **Calibration minimum** in the property dialog box.

Example: 10.51

Data Types: double

CalibrationMax — Calibration maximum value of this parameter

[ ] (default) | finite, real, double, scalar number

Calibration maximum value of this parameter, specified as a finite, real, double, scalar number. The default value, `[]`, means the maximum is unspecified.

Before specifying `CalibrationMax`, you must specify `CalToMainCompuNumerator` and `CalToMainCompuDenominator` to define the computation method. The parameter uses the computation method and the calibration maximum value to calculate the corresponding maximum or minimum value that Simulink uses. A first order rational function is strictly monotonic, either increasing or decreasing. If it is increasing, setting the calibration maximum sets the main maximum value. If it is decreasing, setting the calibration maximum sets the main minimum.

If the parameter value is less than the minimum value or if the minimum value is outside the range of the parameter data type, Simulink generates a warning. In these cases, when updating the diagram or starting a simulation, Simulink generates an error.

Corresponds to **Calibration maximum** in the property dialog box.

Example: `-10.51`

Data Types: `double`

`CalToMainCompuNumerator` — Numerator coefficients of the computation method

`[]` (default) | finite, real, double scalar | finite, real, double vector

Numerator coefficients of the computation method, specified as a scalar number or vector of values for the numerator coefficients `a` and `b` of the first-order linear equation:

$$y = \frac{ax + b}{cx + d}$$

The default value is `[]` (unspecified). Specify finite, real, double scalar values for `a` and `b`. For example, `[1 1]` or, for reciprocal scaling, `1`.

Once you have applied `CalToMainCompuNumerator`, you cannot change it.

Corresponds to **CalToMain compute numerator** in the property dialog box.

Example: `[1 1]`

Example: `1`

Data Types: `double`

`CalToMainCompuDenominator` — Denominator coefficients of the computation method

`[]` (default) | finite, real, double scalar | finite, real, double vector

Denominator coefficients of the computation method, specified as a scalar number or vector of values for the denominator coefficients `c` and `d` of the first-order linear equation:

$$y = \frac{ax + b}{cx + d}$$

The default value is `[]` (unspecified). Specify finite, real, double scalar values for `c` and `d`. For example, `[1 1]`.

Once you have applied `CalToMainCompuDenominator`, you cannot change it.

Corresponds to **CalToMain compute denominator** in the property dialog box.

Example: `[1 1]`

Data Types: `double`

`CalibrationName` — Name of the calibration parameter

`''` (empty character vector) (default) | character vector

Name of the calibration parameter, specified as a character vector.

Corresponds to **Calibration name** in the property dialog box.

Example: `'This is a calibration parameter.'`

Data Types: `char`

`CalibrationDocUnits` — Measurement units for this calibration parameter's value

`''` (empty character vector) (default) | character vector

Measurement units for this calibration parameter's value, specified as a character vector.

Corresponds to **Calibration units** in the property dialog box.

Example: `'Fahrenheit'`

Data Types: `char`

`IsConfigurationValid` — Information about validity of configuration

`true` (default) | `false`

This property is read-only.

Information about the validity of the object configuration, returned as `true` (valid) or `false` (invalid). If Simulink detects an issue with the configuration, it sets this field to `false` and provides information in the `DiagnosticMessage` property.

Corresponds to **Is configuration valid** in the property dialog box.

Data Types: `logical`

`DiagnosticMessage` — Diagnostic information about invalid configuration

`''` (empty character vector) (default) | character vector

This property is read-only.

Diagnostic information about an invalid object configuration, returned as a character vector. If you specify invalid property settings, Simulink displays a message in this field. Use the diagnostic information to help you fix an invalid configuration issue.

Corresponds to **Diagnostic message** in the property dialog box.

Data Types: `char`

Examples

Create and Update a Dual-Scaled Parameter

Create a `Simulink.DualScaledParameter` object that stores a temperature as both Fahrenheit and Celsius.

Create a `Simulink.DualScaledParameter` object.

```
Temp = Simulink.DualScaledParameter;
```

Set the computation method that converts between Fahrenheit and Celsius.

```
Temp.CalToMainCompuNumerator = [1 -32];
Temp.CalToMainCompuDenominator = [1.8];
```

Set the value of the temperature that you want to see in Fahrenheit.

```
Temp.CalibrationValue = 212
```

```
Temp =

  DualScaledParameter with properties:

             CalibrationValue: 212
               CalibrationMin: []
               CalibrationMax: []
      CalToMainCompuNumerator: [1 -32]
    CalToMainCompuDenominator: 1.8000
              CalibrationName: ''
          CalibrationDocUnits: ''
         IsConfigurationValid: 1
            DiagnosticMessage: ''
                        Value: 100
                    CoderInfo: [1x1 Simulink.CoderInfo]
                  Description: ''
                     DataType: 'auto'
                          Min: []
                          Max: []
                         Unit: ''
                   Complexity: 'real'
                   Dimensions: [1 1]
```

The `Simulink.DualScaledParameter` calculates `Temp.Value` which is the value that Simulink uses. `Temp.CalibrationValue` is `212` (degrees Fahrenheit), so `Temp.Value` is `100` (degrees Celsius).

Name the value and specify the units.

```
Temp.CalibrationName = 'TempF';
Temp.CalibrationDocUnits = 'Fahrenheit';
```

Set calibration minimum and maximum values.

```
Temp.CalibrationMin = 0;
Temp.CalibrationMax = 300;
```

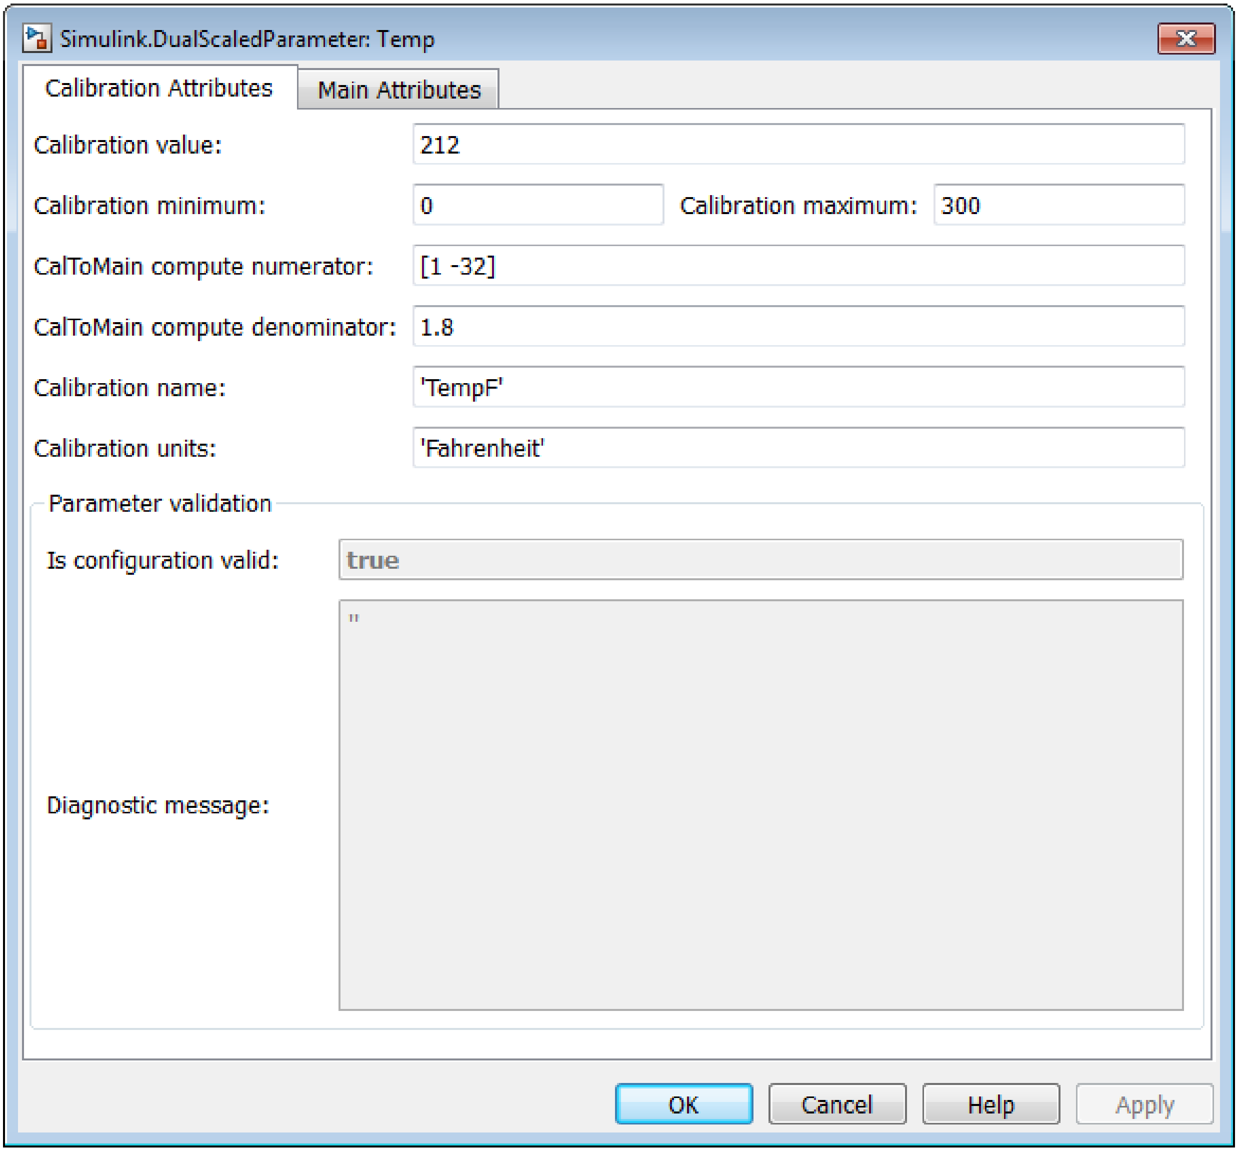
If you specify a calibration value outside this allowable range, Simulink generates a warning.

Specify the units that Simulink uses.

```
Temp.Unit = 'degC';
```

Open the Simulink.DualScaledParameter dialog box.

```
open Temp
```



Simulink.DualScaledParameter: Temp

Calibration value: 212

Calibration minimum: 0 Calibration maximum: 300

CalToMain compute numerator: [1 -32]

CalToMain compute denominator: 1.8

Calibration name: 'TempF'

Calibration units: 'Fahrenheit'

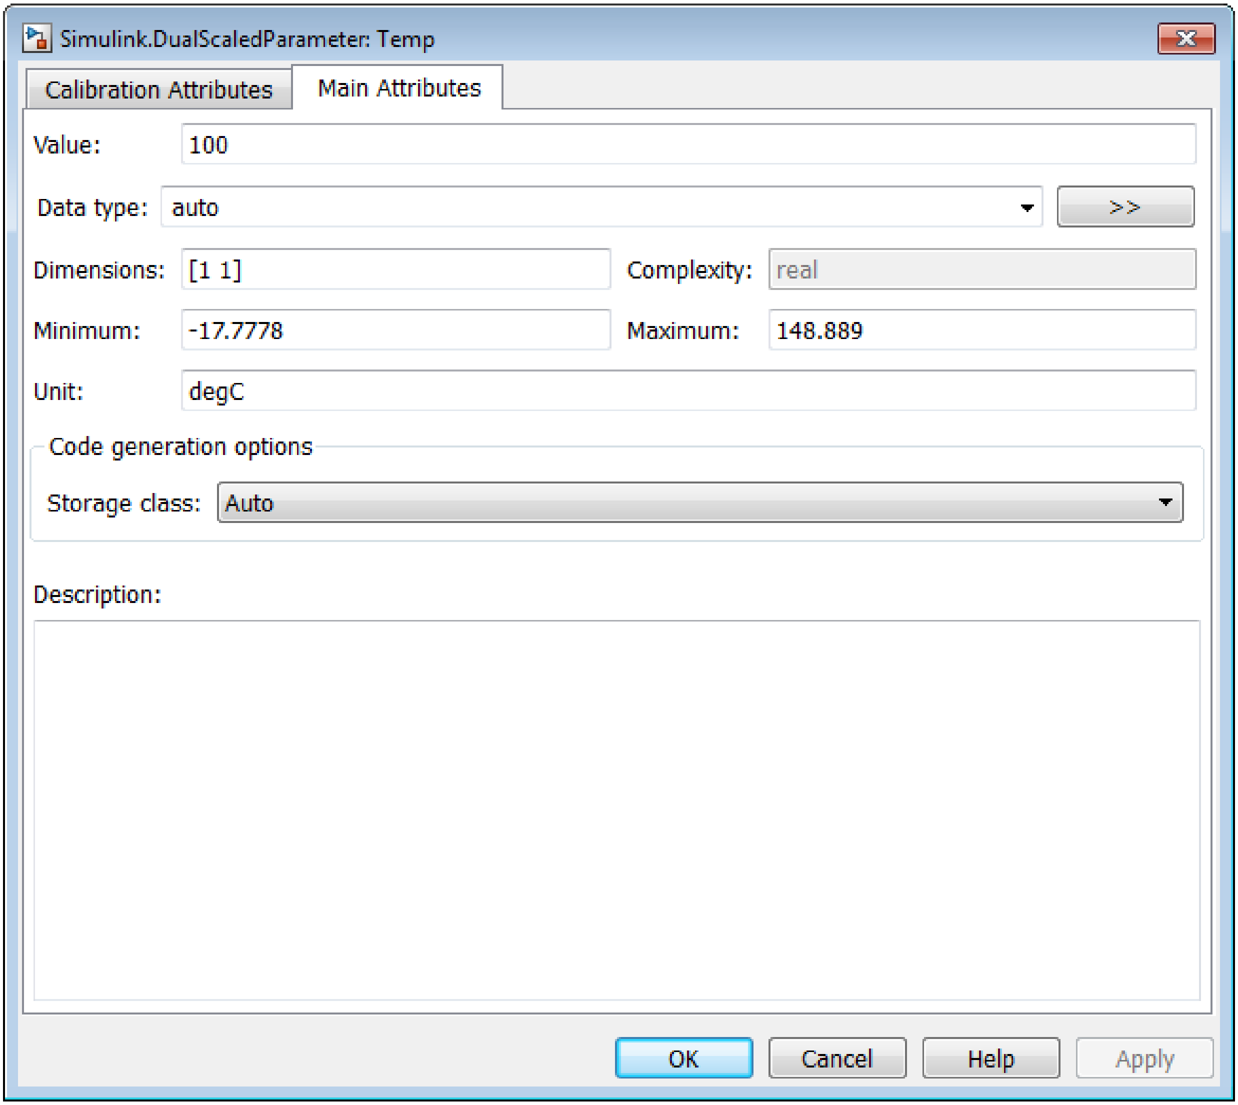
Parameter validation

Is configuration valid: true

Diagnostic message: ''

The **Calibration Attributes** tab displays the calibration value and the computation method that you specified.

In the dialog box, click the **Main Attributes** tab.



Simulink.DualScaledParameter: Temp

Value: 100

Data type: auto

Dimensions: [1 1]

Complexity: real

Minimum: -17.7778

Maximum: 148.889

Unit: degC

Code generation options

Storage class: Auto

Description:

This tab displays information about the value used by Simulink.

Introduced in R2013b

Simulink.Mask class

Package: Simulink

Control masks programmatically

Description

Use an instance of `Simulink.Mask` class to perform the following operations:

- Create, copy, and delete masks.
- Create, edit, and delete mask parameters.
- Determine the block that owns the mask.
- Obtain workspace variables defined for a mask.

Properties

`Type`

Specifies the mask type of the associated block.

Type: `character vector | string scalar`

Default: `Empty character vector`

`Description`

Specifies the block description of the associated block.

Type: `character vector | string scalar`

Default: `Empty character vector`

`Help`

Specifies the help text that is displayed for the mask.

Type: `character vector|string scalar`

Default: `Empty character vector`

`Initialization`

Specifies the initialization commands for the associated block.

Type: `character vector|string scalar`

Default: `Empty character vector`

`SelfModifiable`

Indicates that the block can modify itself and its content.

Type: `boolean`

Values: `'on'|'off'`

Default: `'off'`

`Display`

Specifies MATLAB code for drawing the block icon.

Type: `character vector|string scalar`

Default: `Empty character vector`

`IconFrame`

Sets the visibility of the block frame. (Visible is on, Invisible is off).

Type: `boolean`

Values: `'on'|'off'`

Default: `'on'`

`IconOpaque`

Sets the transparency of the icon (Opaque is on, Transparent is off).

Type: `boolean`

Values: `'on'|'off'`

Default: `'on'`

`RunInitForIconRedraw`

Specifies whether Simulink must run mask initialization before executing the mask icon commands.

Type: `enum`

Values: `'auto'|'on'|'off'`

Default: `'auto'`

`IconRotate`

Sets icon to rotate with the block.

Type: `enum`

Values: `'none'|'port'`

Default: `'none'`

`PortRotate`

Specifies the port rotation policy for the masked block.

Type: `enum`

Values: `'default'|'physical'`

Default: `'default'`

`IconUnits`

Specifies the units for the drawing commands.

Type: `enum`

Values: `'pixel'|'autoscale'|'normalized'`

Default: `'autoscale'`

Methods

addParameter	Add a parameter to a mask
copy	Copy a mask from one block to another
create	Create a mask on a Simulink block
delete	Unmask a block and delete the mask from memory
get	Get a block mask as a mask object
addDialogControl	Add dialog control elements to mask dialog box
getDialogControl	Search for a specific dialog control on the mask
getOwner	Determine the block that owns a mask
getParameter	Get a mask parameter using its name
getWorkspaceVariables	Get all the variables defined in the mask workspace for a masked block
numParameters	Determine the number of parameters in a mask
removeDialogControl	Remove dialog control element from mask dialog box
removeParameter	Remove parameter from mask dialog box
removeAllParameters	Remove all existing parameters from a mask
set	Set the properties of an existing mask
addParameterConstraint	Add parameter constraint to a mask
removeParameterConstraint	Delete a mask parameter constraint
removeCrossParameterConstraint	Delete a cross-parameter constraint
removeAllParameterConstraints	Delete all mask parameter constraints
removeAllCrossParameterConstraints	Delete all cross-parameter constraints from a mask
getParameterConstraint	Get mask parameter constraint properties
getCrossParameterConstraint	Get cross-parameter constraint
getAssociatedParametersOfConstraint	Get mask parameters associated with a constraint
addCrossParameterConstraint	Add cross-parameter constraint

addParameter

Class: Simulink.Mask
Package: Simulink

Add a parameter to a mask

Syntax

```
p = Simulink.Mask.get(blockName)
p.addParameter(Name,Value)
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`p.addParameter(Name,Value)` appends a parameter to the mask. If you do not specify name–value pairs as arguments with this command, Simulink generates name for the mask parameter with control type set to `edit`.

Input Arguments

`blockName`

The handle to the block or the path to the block inside the model.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

`Type`

Type of control that is used to specify the value of this parameter.

Default: edit

`TypeOptions`

The options that are displayed within a popup control or in a promoted parameter. This field is a cell array.

Default: empty

`Name`

The name of the mask parameter. This name is assigned to the mask workspace variable created for this parameter.

Default: generated name

`Prompt`

Text that identifies the parameter on the Mask Parameters dialog box.

Default: empty

`Value`

The default value of the mask parameter in the Mask Parameters dialog box.

Default: Type specific; depends on the `Type` of the parameter

`Evaluate`

Option to specify whether parameter must be evaluated.

Default: `'on'`

`Tunable`

Option to specify whether parameter is tunable.

Default: `'on'`

`Enabled`

Option to specify whether user can set parameter value.

Default: `'on'`

`Visible`

Option to set whether mask parameter is hidden or visible to the user.

Default: `'on'`

`Callback`

Container for MATLAB code that executes when user makes a change in the Mask Parameters dialog box and clicks **Apply**.

Default: empty

`Container`

Option to specifies a container for the child dialog control. The permitted values are `'panel'`, `'group'`, and `'tab'`.

Examples

1. Get mask as an object using a masked block’s path.

   ```
   p = Simulink.Mask.get('myModel/Subsystem');
   ```
2. Add a parameter to the mask without specifying name–value pairs for parameter attributes.

   ```
   p.addParameter;
   ```
3. Add a mask parameter of type popup that cannot be evaluated.

   ```
   p.addParameter('Type','popup','TypeOptions',...
   {'Red' 'Blue' 'Green'},'Evaluate','off');
   ```

“Create Block Masks” | `Simulink.Mask`

Simulink.Mask.copy

Class: Simulink.Mask
Package: Simulink

Copy a mask from one block to another

Syntax

```
pSource = Simulink.Mask.get(srcBlockName)
pDest = Simulink.Mask.create(destBlockName)
pDest.copy(pSource)
```

Description

`pSource = Simulink.Mask.get(srcBlockName)` gets the mask on the source block specified by `blockName` as a mask object.

`pDest = Simulink.Mask.create(destBlockName)` creates an empty mask on the destination block specified by `destBlockName`.

`pDest.copy(pSource)` overwrites the destination mask with the source mask.

Input Arguments

`srcBlockName`

The handle to the source block or the path to the source block inside the model.

Note The source block should be masked.

`destBlockName`

The handle to the destination block or the path to the destination block inside the model.

Note The destination block should have an empty mask. Otherwise, the copied mask will overwrite the non-empty mask.

Examples

1. Create an empty mask on the destination block using the block’s path.

   ```
   pDest = Simulink.Mask.create('myModel/Subsystem');
   ```
2. Get source mask as an object using the source block’s path.

   ```
   pSource = Simulink.Mask.get('myModel/Abs');
   ```
3. Make the destination mask a copy of the source mask.

   ```
   pDest.copy(pSource);
   ```

“Create Block Masks” | `Simulink.Mask`

Simulink.Mask.create

Class: Simulink.Mask
Package: Simulink

Create a mask on a Simulink block

Syntax

```
p = Simulink.Mask.create(blockName)
```

Description

`p = Simulink.Mask.create(blockName)` creates an empty mask on the block specified by `blockName`. If the specified block is already masked, an error message appears.

Input Arguments

`blockName`

The handle to the block or the path to the block inside the model.

Examples

1. Create a mask using a block's handle.

   Note In the model, select the block to be masked.

   ```
   p = Simulink.Mask.create(gcbh);
   ```
2. Create a mask using the block's path.

   ```
   p = Simulink.Mask.create('myModel/Subsystem');
   ```

See Also

"Create Block Masks" | `Simulink.Mask`

delete

Class: Simulink.Mask
Package: Simulink

Unmask a block and delete the mask from memory

Syntax

```
p = Simulink.Mask.get(blockName)
p.delete
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`p.delete` unmasks the block and deletes the mask from memory.

Input Arguments

`blockName`

The handle to the block or the path to the block inside the model.

Examples

1. Get mask as an object using a masked block’s path.

   ```
   p = Simulink.Mask.get('myModel/Subsystem');
   ```

2. Unmask the block using the mask object and delete the mask from memory.

   ```
   p.delete;
   ```

See Also

“Create Block Masks” | `Simulink.Mask`

Simulink.Mask.get

Class: Simulink.Mask
Package: Simulink

Get a block mask as a mask object

Syntax

```
p = Simulink.Mask.get(blockName)
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object. If the specified block is not masked, a null value returns.

Input Arguments

`blockName`

The handle to the block or the path to the block inside the model.

Examples

1 Get mask as an object using a masked block's handle.

   Note In the model, select the masked block.

   ```
   p = Simulink.Mask.get(gcbh);
   ```

2 Get mask as an object using a masked block's path.

   ```
   p = Simulink.Mask.get('myModel/Subsystem');
   ```

“Create Block Masks” | `Simulink.Mask`

addDialogControl

Class: Simulink.Mask
Package: Simulink

Add dialog control elements to mask dialog box

Syntax

```
successIndicator = maskObj.addDialogControl(controlType,
controlIdentifier)
successIndicator = maskObj.addDialogControl(Name,Value)
```

Description

`successIndicator = maskObj.addDialogControl(controlType, controlIdentifier)` adds dialog control elements like text, hyperlinks, or tabs to mask dialog box. First get the mask object and assign it to the variable `maskObj`

`successIndicator = maskObj.addDialogControl(Name,Value)` specifies the Name and Value arguments for an element on the mask dialog box. You can specify multiple Name-Value pairs.

Input Arguments

`controlType` — Value type of dialog control element

character vector | string scalar

Type of dialog control element, specified

- `'panel'`
- `'group'`
- `'tabcontainer'`
- `'tab'`

- `'collapsiblepanel'`
- `'text'`
- `'image'`
- `'hyperlink'`
- `'pushbutton'`

`controlIdentifer` — Unique identifier for the element
character vector | string scalar

Specifies the programmatic identifier for the element of mask dialog box. Use a name that is unique and does not have space between words. For more information, see “Variable Names” (MATLAB).

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (`' '`) and is case-sensitive. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

`Type`

Type of control that is used to specify the value of this dialog control element. Type is a required argument. The permitted values are `'panel'`, `'group'`, `'tabcontainer'`, `'tab'`, `'collapsiblepanel'`, `'text'`, `'image'`, `'hyperlink'`, and `'pushbutton'`.

Default: empty

`Name`

The identifier of the dialog control element. Name is a required argument. This field is available for all dialog control types.

Default: empty

`Prompt`

Text that is displayed in the dialog control element on the Mask dialog box. This field is available for all except for panel and image dialog control types.

Default: empty

`Tooltip`

Tooltip for the dialog control element.

Default: empty

`Enabled`

Option to specify whether you can set value for the dialog control element. This field is available for all dialog control types.

Default: `'on'`

`Visible`

Option to set whether the dialog control element is hidden or visible to the user. This field is available for all dialog control types.

Default: `'on'`

`Callback`

Container for MATLAB code that executes when you edit the dialog control element and click **Apply**. This field is available only for the hyperlink and pushbutton dialog control types.

Default: empty

`Row`

Option to set whether the dialog control is placed in the new row or the same row. This field is available for all dialog control types.

Default: empty

`Filepath`

Contains the path to an image file. This field is available for image, and pushbutton dialog control types.

Default: empty

Container

Option to specifies a container for the child dialog control. The permitted values are the names of `'panel'`, `'group'`, and `'tab'` dialog controls.

Examples

Add Dialog Control Elements to Mask Dialog Box

Get mask object and add dialog control element to it.

```
% Get mask object on model Engine

maskObj = Simulink.Mask.get('Engine/Gain');

% Add hyperlink to mask dialog box

maskLink = maskObj.addDialogControl('hyperlink','link');
maskLink.Prompt = 'Mathworks Home Page';
maskLink.Callback = 'web(''www.mathworks.com'')'

% Alternative method to add hyperlink

maskLink = maskObj.addDialogControl('hyperlink','link');
maskLink.Prompt = 'www.mathworks.com';

% Add text to mask dialog box

maskText = maskObj.addDialogControl('text','text_tag');
maskText.Prompt = 'Enable range checking';

% Add button to mask dialog box

maskButton = maskObj.addDialogControl('pushbutton','button_tag');
maskButton.Prompt = 'Compute';
```

Add Dialog Control Elements to Mask Dialog Box Tabs

Create tabs on the mask dialog box and add elements to these tabs.

```
% Get mask object on a block named 'GainBlock'

maskObj = Simulink.Mask.get('GainBlock/Gain');

% Create a tab container

maskObj.addDialogControl('tabcontainer','allTabs');
tabs = maskObj.getDialogControl('allTabs');

% Create tabs and name them

maskTab1 = tabs.addDialogControl('tab','First');
maskTab1.Prompt = 'First tab';

maskTab2 = tabs.addDialogControl('tab','Second');
maskTab2.Prompt = 'Second tab';

% Add elements to one of the tabs

firstTab = tabs.getDialogControl('First');
firstTab.addDialogControl('text','textOnFirst');
firstTab.getDialogControl('textOnFirst').Prompt = 'Tab one';
```

Add Dialog Control Element Using Name-Value Pair

Add dialog control element and specify values for it

```
% Get mask object on model Engine

maskObj = Simulink.Mask.get('Engine/Gain');

% Add a dialog box and specify values for it

maskDialog = maskObj.addDialogControl('Type','text',...
'Prompt','hello','Visible','off');
```

“Create Block Masks” | Control Masks Programmatically | `Simulink.Mask`

Introduced in R2014a

getDialogControl

Class: Simulink.Mask
Package: Simulink

Search for a specific dialog control on the mask

Syntax

```
[control, phandle] = handle.getDialogControl(cname)
```

Description

`[control, phandle] = handle.getDialogControl(cname)` , search for a specific child dialog control recursively on the mask dialog.

Input Arguments

`cname`

Name of the dialog control being searched on the mask dialog.

Default:

Output Arguments

`control`

Target dialog control being searched on the mask dialog.

`phandle`

Parent of the dialog control being searched mask dialog.

Examples

Find a dialog control

Find a text dialog control on the mask dialog box. `maskObj` is the handle to the mask object. The `getDialogControl` method returns the handle to the dialog control (`hdlgctrl`) and handle to the parent dialog control (`phandle`).

```
[hdlgctrl, phandle] = maskObj.getDialogControl('txt_var')
```

See Also

“Create Block Masks” | `Simulink.Mask`

getOwner

Class: Simulink.Mask
Package: Simulink

Determine the block that owns a mask

Syntax

```
p = Simulink.Mask.get(blockName)
p.getOwner
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`p.getOwner` returns the interface to the block that owns the mask.

Input Arguments

blockName

The handle to the block or the path to the block inside the model.

Examples

1. Get mask as an object using a masked block’s path.

   ```
   p = Simulink.Mask.get('myModel/Subsystem');
   ```

2. Get the interface to the block that owns the mask.

   ```
   p.getOwner;
   ```

See Also

"Create Block Masks" | `Simulink.Mask`

getParameter

Class: Simulink.Mask
Package: Simulink

Get a mask parameter using its name

Syntax

```
p = Simulink.Mask.get(blockName)
param = p.getParameter(paramName)
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`param = p.getParameter(paramName)` returns an array of mask parameters.

Input Arguments

`blockName`

The handle to the block or the path to the block inside the model.

`paramName`

The name of the parameter you want to get.

Examples

1. Get mask as an object using a masked block’s path.

   ```
   p = Simulink.Mask.get('myModel/Subsystem');
   ```

2 Get a mask parameter by using its name.

```
param = p.getParameter('intercept');
```

See Also

“Create Block Masks” | `Simulink.Mask`

getWorkspaceVariables

Class: Simulink.Mask
Package: Simulink

Get all the variables defined in the mask workspace for a masked block

Syntax

```
p = Simulink.Mask.get(blockName)
vars = p.getWorkspaceVariables
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`vars = p.getWorkspaceVariables` returns as a structure all the variables defined in the mask workspace for the masked block.

Input Arguments

`blockName`

The handle to the block or the path to the block inside the model.

Examples

1 Get mask as an object using a masked block’s path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```

2 Get all the variables defined in the mask workspace for the masked block.

```
vars = p.getWorkspaceVariables;
```

See Also

“Create Block Masks” | `Simulink.Mask`

numParameters

Class: Simulink.Mask
Package: Simulink

Determine the number of parameters in a mask

Syntax

```
p = Simulink.Mask.get(blockName)
p.numParameters
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`p.numParameters` returns the number of parameters in the mask.

Input Arguments

`blockName`

The handle to the block or the path to the block inside the model.

Examples

1. Get mask as an object using a masked block’s path.

   ```
   p = Simulink.Mask.get('myModel/Subsystem');
   ```

2. Get the number of parameters in the mask.

   ```
   p.numParameters;
   ```

See Also

“Create Block Masks” | `Simulink.Mask`

removeDialogControl

Class: Simulink.Mask
Package: Simulink

Remove dialog control element from mask dialog box

Syntax

```
successIndicator = maskVariable.removeDialogControl(
controlIdentifier)
```

Description

`successIndicator = maskVariable.removeDialogControl( controlIdentifier)` removes dialog control element, specified by `controlIndentifier`, like text, hyperlinks, or tabs from a mask dialog box. First get the mask object and assign it to the variable `maskVariable`.

Successful removal of a dialog control element returns a Boolean value of `1`.

Input Arguments

`controlIdentifer` — Unique identifier for the element
character vector | string scalar

Programmatic identifier for the dialog control element of mask dialog box.

Examples

Remove Dialog Control Element from Mask Dialog Box

```
% Get mask object on the Gain block in the model Engine.
```

```
maskObj = Simulink.Mask.get('Engine/Gain');

% Remove element named AllTab from mask dialog box.

p = maskObj.removeDialogControl('AllTab');
```

See Also

"Create Block Masks" | `Simulink.Mask`

Introduced in R2013b

removeParameter

Class: Simulink.Mask
Package: Simulink

Remove parameter from mask dialog box

Syntax

```
successIndicator = maskVariable.removeParameter(controlIdentifier)
```

Description

`successIndicator = maskVariable.removeParameter(controlIdentifier)` removes parameter, specified by `controlIdentifier`, like edit, check box, popup from an existing mask dialog box. First get the mask object and assign it to the variable `maskVariable`.

Successful removal of a parameter returns a Boolean value of `1`.

Input Arguments

`controlIdentifer` — Unique identifier for the parameter
character vector | string scalar

Programmatic identifier for the parameter of mask dialog box, specified as a character vector.

Examples

Remove Parameter from Mask Dialog Box

```
% Get mask object on the Gain block in the model Engine.
```

```
maskObj = Simulink.Mask.get('Engine/Gain');

% Remove parameter named checkbox1 from mask dialog box.

p = maskObj.removeParameter('checkbox1');
```

Note You can also use the index number as the `controlIdentifier`.

See Also

“Create Block Masks” | `Simulink.Mask`

Introduced in R2012b

removeAllParameters

Class: Simulink.Mask
Package: Simulink

Remove all existing parameters from a mask

Syntax

```
p = Simulink.Mask.get(blockName)
p.removeAllParameters
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`p.removeAllParameters` deletes all existing parameters from the mask.

Input Arguments

`blockName`

The handle to the block or the path to the block inside the model.

Examples

1. Get mask as an object using a masked block’s path.

   ```
   p = Simulink.Mask.get('myModel/Subsystem');
   ```
2. Delete all existing parameters from the mask.

   ```
   p.removeAllParameters;
   ```

See Also

“Create Block Masks” | `Simulink.Mask`

set

Class: Simulink.Mask
Package: Simulink

Set the properties of an existing mask

Syntax

```
p = Simulink.Mask.get(blockName)
p.set(Name,Value)
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`p.set(Name,Value)` sets mask properties that you specify using name–value pairs as arguments.

Input Arguments

`blockName`

The handle to the block or the path to the block inside the model.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

`Type`

Text used as title for mask documentation that user sees on clicking **Help** in the Mask Parameters dialog box.

Default: empty

`Description`

Text used as summary for mask documentation that user sees on clicking **Help** in the Mask Parameters dialog box.

Default: empty

`Help`

Text used as body text for mask documentation that user sees on clicking **Help** in the Mask Parameters dialog box.

Default: empty

`Initialization`

MATLAB code that initializes the mask.

Default: empty

`SelfModifiable`

Option to set whether the mask can modify itself during simulation.

Default: `'off'`

`Display`

MATLAB code that draws the mask icon.

Default: empty

`IconFrame`

Option to specify whether the mask icon appears inside a visible block frame.

Default: `'on'`

MaskIconOpaque

Option to set the mask icon as opaque or transparent.

Default: `'opaque'`

RunInitForIconRedraw

Option to specify whether Simulink should run mask initialization before executing the mask icon commands.

Default: `'off'`

IconRotate

Option to specify icon rotation.

Default: `'none'`

PortRotate

Option to specify port rotation.

Default: `'default'`

IconUnits

Option to specify whether mask icon is autoscaled, normalized, or scaled in pixels.

Default: `'autoscale'`

Examples

1. Get mask as an object using a masked block’s path.

   ```
   p = Simulink.Mask.get('myModel/Subsystem');
   ```

2. Modify the mask so that its mask icon is transparent and its documentation summarizes what it does.

   ```
   p.set('IconOpaque','off','Type','Random number generator','Description',...
   'This block generates random numbers.');
   ```

See Also

“Create Block Masks” | `Simulink.Mask`

addParameterConstraint

Class: Simulink.Mask
Package: Simulink

Add parameter constraint to a mask

Syntax

```
paramConstraint = maskObj.addParameterConstraint(Name,Value)
```

Description

`paramConstraint = maskObj.addParameterConstraint(Name,Value)` adds a constraint to the specified mask. Constraints can only be associated to the Edit type mask parameters.

Input Arguments

`maskObj` — Block mask handle

mask object

Block mask handle, specified as a mask object. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information, see `Simulink.Mask.get`

Data Types: `char` | `cell`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Name — Mask constraint name

character vector | string

Required field. Must be a valid MATLAB name. Specifies a name for the mask parameter constraint.

`Parameters` — Mask parameter name

cell array of character vector | string

Optional field. Specifies the **Edit** mask parameter name to which you want to associate the constraint.

`Rules` — Rule for mask parameter constraint

DataType | Dimension | Complexity | Sign | Finiteness | Minimum | Maximum | CustomConstraint

Required field. Rules are defined within curly braces. A constraint can have single or multiple rules.

Name-Value Pairs for Rules

Name	Value
`DataType`	`double`, `single`, `numeric`, `integer`, `int8`, `uint8`, `int16`, `uint16`, `int32`, `uint32`, `boolean`, `enum`, `fixdt`
`Dimension`	`scalar`, `rowvectar`, `columnvectar`, `2dmatrix`, `ndmatrix`
`Complexity`	`real`, `complex`
`Sign`	`positive`, `negative`, `zero`
`Finiteness`	`finite`, `inf`, `-inf`, `NaN`
`Minimum`	character vector
`Maximum`	character vector
`CustomConstraint`	Valid MATLAB expression returning logical true or false.

Output Arguments

`paramConstraint` — Mask parameter constraint

character vector | string

Handle to the mask parameter constraint, returned as a character vector. You can associate a constraint to the mask parameter either during or after creating the constraint.

Examples

Create Mask Constraint with Single Rule

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Create mask constraint with single rule.
paramConstraint = maskObj.addParameterConstraint('Name','const2',...
'Parameters',{'Parameter2'}, 'Rules', {'DataType', 'uint8'})
```

```
ans = 

  Constraints with properties:

               Name: 'const2'
    ConstraintRules: [1×1 Simulink.Mask.ParameterConstraintRules]
```

Create Mask Constraint with Multiple Rules

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Create mask constraint with multiple rules.
paramConstraint = maskObj.addParameterConstraint('Name','const3',...
'Parameters',{'Parameter3'}, 'Rules', {{'DataType', 'uint8'},{'DataType', {'fixdt(1,8,4
```

```
ans = 

  Constraints with properties:

               Name: 'const3'
    ConstraintRules: [1×2 Simulink.Mask.ParameterConstraintRules]
```

Introduced in R2018a

removeParameterConstraint

Class: Simulink.Mask
Package: Simulink

Delete a mask parameter constraint

Syntax

```
maskObj.removeParameterConstraint(paramConstraint)
```

Description

`maskObj.removeParameterConstraint(paramConstraint)` deletes the specified mask parameter constraint.

Input Arguments

`maskObj` — Block mask handle

mask object

Handle to the block mask, specified as mask object. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information, see `Simulink.Mask.get`.

Data Types: `char` | `cell`

`paramConstraint` — Mask constraint name

character vector | string

Name of the mask parameter constraint to be deleted, specified as character vector.

Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);
```

```
% Remove mask constraint with name 'const1'.
maskObj.removeParameterConstraint('const1')
```

See Also

“Create Block Masks” | `Simulink.Mask`

removeCrossParameterConstraint

Class: Simulink.Mask
Package: Simulink

Delete a cross-parameter constraint

Syntax

```
maskObj.removeCrossParameterConstraint(CrossConstraint)
```

Description

`maskObj.removeCrossParameterConstraint(CrossConstraint)` deletes the specified cross-constraint.

Input Arguments

`maskObj` — Block mask handle

mask object

Handle to the block mask, specified as mask object. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information, see `Simulink.Mask.get`.

Data Types: `char` | `cell`

`CrossConstraint` — Cross constraint name

character vector | string

Name of the cross-constraint to be removed, specified as character vector.

Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);
```

```
% Remove cross-constraint of name 'const1'.
maskObj.removeCrossParameterConstraint('const1')
```

removeAllParameterConstraints

Class: Simulink.Mask
Package: Simulink

Delete all mask parameter constraints

Syntax

`maskObj.removeAllParameterConstraints()`

Description

`maskObj.removeAllParameterConstraints()` deletes all the parameter constraints from a mask.

Input Arguments

`maskObj` — Block mask handle
mask object

Handle to the block mask. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information see, `Simulink.Mask.get`

Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Remove all constraints from the mask.
maskObj.removeAllParameterConstraints()
```

See Also

“Create Block Masks” | `Simulink.Mask`

removeAllCrossParameterConstraints

Class: Simulink.Mask
Package: Simulink

Delete all cross-parameter constraints from a mask

Syntax

```
maskObj.removeAllCrossParameterConstraints()
```

Description

`maskObj.removeAllCrossParameterConstraints()` deletes all cross-constraints from a mask.

Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Remove all cross constraints from the mask.
maskObj.removeAllCrossParameterConstraints()
```

getParameterConstraint

Class: Simulink.Mask
Package: Simulink

Get mask parameter constraint properties

Syntax

```
paramConstraint = maskObj.getParameterConstraint(
paramConstraintName)
```

Description

`paramConstraint = maskObj.getParameterConstraint(paramConstraintName)` gets the properties of a mask parameter constraint.

Input Arguments

`maskObj` — Block mask handle
mask object

Handle to the block mask, specified as mask object. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information, see `Simulink.Mask.get`.

Data Types: `char` | `cell`

`paramConstraintName` — Mask constraint name
character vector | string

Name of the constraint of which you want get the properties, specified as character vector.

Output Arguments

paramConstraint — Mask constraint property
cell array of character vector

Constraint properties, returned as a cell array.

Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Find parameters associated with the constraint.
paramConstraint = maskObj.getParameterConstraint('const3')

ans =

  Constraints with properties:

             Name: 'const3'
  ConstraintRules: [1×2 Simulink.Mask.ParameterConstraintRules]
```

See Also

Introduced in R2018a

getCrossParameterConstraint

Class: Simulink.Mask
Package: Simulink

Get cross-parameter constraint

Syntax

```
CrossConstraint = maskObj.getCrossParameterConstraint(
CrossConstraintName)
```

Description

`CrossConstraint = maskObj.getCrossParameterConstraint( CrossConstraintName)` gets the properties of a cross parameter constraint on a mask. Apply a cross-parameter constraint to specify rules between mask parameter values.

Input Arguments

`maskObj` — Block mask handle

mask object

Handle to the block mask, specified as mask object. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information, see `Simulink.Mask.get`.

Data Types: `char` | `cell`

`CrossConstraintName` — Cross-constraint name

character vector | string

Name of the cross-parameter constraint for which you get the constraint properties, specified as the mask object.

Output Arguments

CrossConstraint — Cross-constraint property

cell array

Cross-parameter constraint properties, returned as a cell array.

Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get cross constraint.
CrossConstraint = maskObj.getCrossParameterConstraint('crossparam1')
```

```
ans =

  CrossParameterConstraints with properties:
            Name: 'crossparam1'
            Rule: 'Parameter2 > Parameter3'
    ErrorMessage: ''
```

getAssociatedParametersOfConstraint

Class: Simulink.Mask
Package: Simulink

Get mask parameters associated with a constraint

Syntax

```
maskParam = maskObj.getAssociatedParametersOfConstraint(
paramConstraintName)
```

Description

`maskParam = maskObj.getAssociatedParametersOfConstraint( paramConstraintName)` gets the parameters that are associated with a mask constraint.

Input Arguments

`maskObj` — Block mask handle

mask object

Handle to the block mask, specified as mask object. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information, see `Simulink.Mask.get`.

Data Types: `char` | `cell`

`paramConstraintName` — Mask constraint name

character vector | string

Name of the constraint for which you want to find the associated mask parameters, specified as character vector.

Output Arguments

`maskParam` — Mask parameter name
cell array of character vector

Mask parameter, specified as a cell array.

Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Find parameters associated with the constraint.
maskParam = maskObj.getAssociatedParametersOfConstraint('const3')
```

```
ans =

  1×1 cell array

    {'Parameter1'}
```

"Create Block Masks" | `Simulink.Mask`

Introduced in R2018a

addCrossParameterConstraint

Class: Simulink.Mask
Package: Simulink

Add cross-parameter constraint

Syntax

```
CrossConstraint = maskObj.addCrossParameterConstraint(Name,Value)
```

Description

`CrossConstraint = maskObj.addCrossParameterConstraint(Name,Value)` adds a constraint among parameters of a mask.

Input Arguments

`maskObj` — Block mask handle
mask object

Block mask handle, specified as a mask object. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information, see `Simulink.Mask.get`.

Data Types: `char` | `cell`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Name — Cross-parameter constraint name
character vector | string

Cross-parameter constraint name, specified as a character vector. Must be a valid MATLAB value.

`Rule` — Cross-parameter constraint rule

MATLAB expression | string

Cross-parameter constraint rule, specified as a valid MATLAB expression that returns logical true or false. You can specify multiple rules by separating them with a logical operators like &&. For example, `parameter1 > parameter2 && parameter2 > parameter3`. Here, `parameter1`, `parameter2` and `parameter3` are parameters of a mask.

`ErrorMessage` — Error message

character vector | string

Optional field. Specifies the error message to be displayed when the cross parameter constraint rule is not satisfied. You can specify the error message as character vector or as a message catalog ID. If you use the message catalog ID to specify an error, the error message must not have any holes in it. Simulink displays a default error message if no user-defined error message is found.

Output Arguments

`CrossConstraint` — Cross parameter constraint

cell array

Handle to the cross-parameter constraint, returned as a cell array.

Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Add cross parameter constraint.
CrossConstraint = maskObj.addCrossParameterConstraint('Name','crossconstraint1',...
'Rule','upperbound > lowerbound','ErrorMessage','Incorrect value specified.')
```

```
ans =
  CrossParameterConstraints with properties:

            Name: 'crossconstraint1'
            Rule: 'upperbound > lowerbound'
    ErrorMessage: 'Incorrect value specified.'
```

“Create Block Masks” | `Simulink.Mask`

Introduced in R2018a

Simulink.Mask.Constraints class

Package: Simulink.Mask

Create Mask Constraint

Description

Use an instance of the `Simulink.Mask.Constraint` to add or remove a parameter constraint rule.

Properties

`DataType`

Specifies the data type associated with the constraint rule.

Type: `double, single, numeric, integer, int8, uint8, int16, uint16, int32, uint32, boolean, enum, fixdt`

Default: `Empty`

`Dimension`

Specifies the dimension associated with the constraint rule.

Type: `scalar, rowvector, columnvector, 2dmatrix, ndmatrix`

Default: `Empty`

`Complexity`

Specifies the complexity associated with the constraint rule.

Type: `real, complex`

Default: `Empty`

`Sign`

Specifies the sign associated with the constraint rule.

Type: `positive, negative, zero`

Default: `Empty`

`Finiteness`

Specifies the finiteness associated with the constraint rule.

Type: `finite, inf, -inf, NaN`

Default: `Empty`

`Range`

Specifies the range associated with the constraint rule.

Type: `Minimum, Maximum`

Default: `Empty`

`CustomConstraint`

Specifies the error message associated with the constraint rule.

Type: `Valid MATLAB expression`

Default: `Empty`

Methods

addParameterConstraintRule	Add rules to a parameter constraint
removeParameterConstraintRule	Delete a mask parameter constraint rule

See Also

Introduced in R2018a

addParameterConstraintRule

Class: Simulink.Mask.Constraints
Package: Simulink.Mask

Add rules to a parameter constraint

Syntax

```
paramConstRule = paramConstraint.addParameterConstraintRule(
Name,Value)
```

Description

`paramConstRule = paramConstraint.addParameterConstraintRule(
Name,Value)` adds rule to a parameter constraint.

Input Arguments

`paramConstraint` — Handle to mask constraint
constraint object

Handle to the mask parameter constraint for which you want to add constraint rules, specified as constraint object.

Data Types: `char` | `cell`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Name-Value Pair for Rules

Name	Value
`DataType`	`double`, `single`, `numeric`, `integer`, `int8`, `uint8`, `int16`, `uint16`, `int32`, `uint32`, `boolean`, `enum`, `fixdt`
`Dimension`	`scalar`, `rowvectar`, `columnvectar`, `2dmatrix`, `ndmatrix`
`Complexity`	`real`, `complex`
`Sign`	`positive`, `negative`, `zero`
`Finiteness`	`finite`, `inf`, `-inf`, `NaN`
`Minimum`	`string`
`Maximum`	`string`
`CustomConstraint`	Valid MATLAB expression

Output Arguments

`paramConstRule` — Mask constraint rule
cell array

Mask constraint rule, specified as as a cell array.

Examples

```
% Get mask constraint handle
paramConstraint = maskObj.getParameterConstraint('const3');

% Add rules to the constraint.
paramConstRule = paramConstraint.addParameterConstraintRule('DataType','int8')
```

```
ans =

  ParameterConstraintRules with properties:

            DataType: 'int8'
```

```
           Dimension: {0×1 cell}
          Complexity: {0×1 cell}
                Sign: {0×1 cell}
          Finiteness: {0×1 cell}
             Minimum: ''
             Maximum: ''
    CustomConstraint: ''
```

“Create Block Masks” | `Simulink.Mask`

Introduced in R2018a

removeParameterConstraintRule

Class: Simulink.Mask.Constraints
Package: Simulink.Mask

Delete a mask parameter constraint rule

Syntax

```
paramConstraint.removeParameterConstraintRule(RuleIndex)
```

Description

`paramConstraint.removeParameterConstraintRule(RuleIndex)` deletes the specified constraint rule from a mask parameter constraint.

Input Arguments

`paramConstraint` — Handle to constraint

constraint object

Handle to mask parameter constraint of which you want to remove constraint rule, specified as an object.

Data Types: `char` | `cell`

`RuleIndex` — Constraint rule index

integer

Index number of the mask constraint rule, specified as an integer.

Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);
```

```
% Get mask constraint handle.
paramConstraint = maskObj.getParameterConstraint('const3');

% Remove mask constraint rule.
paramConstraint.removeParameterConstraintRule(1)
```

See Also

“Create Block Masks” | `Simulink.Mask`

Introduced in R2018a

Simulink.MaskParameter class

Package: Simulink

Control mask parameters programmatically

Description

Use an instance of `Simulink.MaskParameter` to set the properties of mask parameters.

Properties

`Type`

Specifies the mask parameter type.

Type: `character vector`

Values:
`'edit'|'checkbox'|'popup'|'min'|'max'|'promote'|'combobox'|'radiobutton'|'unidt'|'slider'|'dial'|'spinbox'`

Default: `'edit'`

`TypeOptions`

Specifies the option for the parameter if it exists, otherwise, it is empty. Applicable for parameters of type `popup`, `radio`, `Datatypestr`, and `promote` .

Type: `cell array of character vectors`

Default: `{''}`

`Name`

Specifies the name of the mask parameter. This name is assigned to the mask workspace variable created for the mask parameter. The mask parameter name must not match the built-in parameter name.

Type: `character vector`

Default: `Auto generated`

`Prompt`

Specifies a character vector that appears as the label associated with the parameter on the mask dialog.

Type: `character vector`

Default: `Empty character vector`

`Value`

Specifies the value of the mask parameter.

Default: Depends on the type of the parameter.

`Evaluate`

Indicates if the parameter value is to be evaluated in MATLAB or treated as a character vector when the block is evaluated.

Type: `boolean`

Values: `'on'|'off'`

Default: `'on'`

`Tunable`

Indicates if the parameter value can be changed during simulation.

Type: `boolean`

Values: `'on'|'off'`

Default: `'on'`

`NeverSave`

Indicates if the parameter value gets saved in the model file.

Type: `boolean`

Values: `'on'|'off'`

Default: `'off'`

`Hidden`

Indicates if the parameter should never show on the mask dialog box.

Type: `boolean`

Values: `'on'|'off'`

Default: `'off'`

`ReadOnly`

Indicates if the parameter on the mask dialog box is editable or is read-only.

Type: `boolean`

Values: `'on'|'off'`

Default: `'off'`

`Enabled`

Indicates if the parameter is enabled in the mask dialog box.

Type: `boolean`

Values: `'on'|'off'`

Default: `'on'`

`Visible`

Indicates if the parameter is visible in the mask dialog box.

Type: `boolean`

Values: `'on'|'off'`

Default: `'on'`

`ShowTooltip`

Indicates if tool tip is enabled for the mask parameter.

Type: `boolean`

Values: `'on'|'off'`

Default: `'on'`

`Callback`

Specifies the MATLAB code that executes when a user changes the parameter value from the mask dialog box.

Type: `character vector`

Default: `Empty character vector`

`TabName`

Specifies the tab name of the mask dialog box where the parameter is displayed.

Type: `character vector`

Default: `Empty character vector`

`Alias`

Specifies the alternate name for mask parameter.

Type: `character vector`

Default: `Empty character vector`

`DialogControl`

Specifies the layout options of mask dialog.

Type: `Class of type Simulink.dialog.parameter.<Typeofparameter>`

Values:
`'edit'|'checkbox'|'popup'|'min'|'max'|'promote'|'combobox'|'radiobutton'|'unidt'|'slider'|'dial'|'spinbox'`

Default: `Edit`

`ConstraintName`

Indicates the constraint associated with a parameter. To associate a constraint programmatically the constraint must be already available. To associate a constraint from a mat file use the format `<matfilename>:<constraintname>`.

Type: `character vector`

Default: `Empty character vector`

Methods

set	Set properties of mask parameters

See Also

Topics

"Control Masks Programmatically"
"Create Block Masks"

set

Class: Simulink.MaskParameter
Package: Simulink

Set properties of mask parameters

Syntax

`Simulink.MaskParameter.set(Name,Value)`

Description

`Simulink.MaskParameter.set(Name,Value)` sets the properties of a mask parameter.

Input Arguments

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

`Type`

Type of control that is used to specify the value of this parameter.

Default: edit

`TypeOptions`

The options that are displayed within a popup control or in a promoted parameter. This field is a cell array.

Default: empty

`Name`

The name of the mask parameter. This name is assigned to the mask workspace variable created for this parameter.

Default: empty

`Prompt`

Text that identifies the parameter on the Mask Parameters dialog.

Default: empty

`Value`

The default value of the mask parameter in the Mask Parameters dialog.

Default: Type specific; depends on the `Type` of the parameter

`Evaluate`

Option to specify whether parameter must be evaluated.

Default: `'on'`

`Tunable`

Option to specify whether parameter is tunable.

Default: `'on'`

`Enabled`

Option to specify whether user can set parameter value.

Default: `'on'`

`Visible`

Option to set whether mask parameter is hidden or visible to the user.

Default: `'on'`

Callback

Container for MATLAB code that executes when user makes a change in the Mask Parameters dialog and clicks **Apply**.

Default: empty

Examples

1. Get mask as an object using a masked block's path.

   ```
   p = Simulink.Mask.get('myModel/Subsystem');
   ```

2. Get a mask parameter.

   ```
   a = p.Parameters(1);
   ```

3. Edit mask parameter so it is of type popup, cannot be evaluated.

   ```
   a.set('Type','popup','TypeOptions',{'Red' 'Blue' 'Green'},...
   'Evaluate','off');
   ```

Simulink.dialog.Control class

Package: Simulink.dialog

Create instances of dialog control

Description

Use an instance of `Simulink.dialog.Control` class to create, delete, or search dialog controls.

Properties

`Name`

Uniquely identifies the dialog control element and is a required field.

Type: `character vector`

See Also

`Simulink.dialog.Button` | `Simulink.dialog.Hyperlink` | `Simulink.dialog.Image` | `Simulink.dialog.Text` | `Simulink.dialog.parameter.Control` | `Simulink.dialog.Container` | “Create Block Masks”

Simulink.dialog.Container class

Package: Simulink.dialog

Create instances of a container dialog control

Description

Use an instance of `Simulink.dialog.Container` class to add container type dialog control.

Properties

`Name`

Uniquely identifies the container dialog control and is a required filed.

Type: `character vector`

`Enabled`

Indicates whether container is active on the mask dialog box.

Type: `boolean`

Value: `'on'|'off'`

Default: `'on'`

`Visible`

Indicates whether container is displayed on the mask dialog box.

Type: `boolean`

Value: `'on'|'off'`

Default: `'on'`

AlignPrompts

Allows you to align the parameters vertically on the mask dialog box.

Type: `boolean`

Value: `'on'|'off'`

Default: `'off'`

DialogControls

Specifies the child dialog controls contained in the container.

Type: `Simulink.dialog.Control`

Default: `Empty array`

Methods

addDialogControl	Add dialog control elements to mask dialog box
removeDialogControl	Remove dialog control element from mask dialog box
getDialogControl	Search for a specific dialog control on the mask

See Also

`Simulink.dialog.Group` | `Simulink.dialog.Panel` | `Simulink.dialog.Tab` | `Simulink.dialog.TabContainer` | `Simulink.dialog.Control` | “Create Block Masks”

addDialogControl

Class: Simulink.dialog.Container
Package: Simulink.dialog

Add dialog control elements to mask dialog box

Syntax

```
successIndicator = maskObj.addDialogControl(controlType,
controlIdentifier)
successIndicator = maskObj.addDialogControl(Name,Value)
```

Description

`successIndicator = maskObj.addDialogControl(controlType, controlIdentifier)` adds dialog control elements like text, hyperlinks, or tabs to mask dialog box. First get the mask object and assign it to the variable `maskObj`

`successIndicator = maskObj.addDialogControl(Name,Value)` specifies the Name and Value arguments for an element on the mask dialog box. You can specify multiple Name-Value pairs.

Input Arguments

`controlType` — Value type of dialog control element

character vector

Type of dialog control element, specified

- `'panel'`
- `'group'`
- `'tabcontainer'`
- `'tab'`

- `'collapsiblepanel'`
- `'text'`
- `'image'`
- `'hyperlink'`
- `'pushbutton'`

`controlIdentifer` — Unique identifier for the element
character vector

Specifies the programmatic identifier for the element of mask dialog box. Use a name that is unique and does not have space between words. For more information, see “Variable Names” (MATLAB).

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (`' '`) and is case-sensitive. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

`Type`

Type of control that is used to specify the value of this dialog control element. Type is a required argument. The permitted values are `'panel'`, `'group'`, `'tabcontainer'`, `'tab'`, `'collapsiblepanel'`, `'text'`, `'image'`, `'hyperlink'`, and `'pushbutton'`. If the parent dialog control type is `'tabcontainer'`, the child dialog control must be `'tab'`.

`Name`

The identifier of the dialog control element. Name is a required argument. This field is available for all dialog control types.

`Prompt`

Text that is displayed in the dialog control element on the Mask dialog box. This field is available for all except for panel and image dialog control types.

Default: empty

`Enabled`

Option to specify whether you can set value for the dialog control element. This field is available for all dialog control types.

Default: `'on'`

`Visible`

Option to set whether the dialog control element is hidden or visible to the user. This field is available for all dialog control types.

Default: `'on'`

`Callback`

Container for MATLAB code that executes when you edit the dialog control element and click **Apply**. This field is available only for the hyperlink and pushbutton dialog control types.

Default: empty

`Row`

Option to set whether the dialog control is placed in the new row or the same row. This field is available for all dialog control types.

Default: empty

`FilePath`

Contains the path to an image file. This field is available for image, and pushbutton dialog control types.

Default: empty

`Container`

Option to specifies a container for the child dialog control. The permitted values are the names of `'panel'`, `'group'`, and `'tab'` dialog controls.

Examples

Add Dialog Control Elements to Mask Dialog Box

Get mask object and add dialog control element to it.

```
% Get mask object on model Engine

maskObj = Simulink.Mask.get('Engine/Gain');

% Add hyperlink to mask dialog box

maskLink = maskObj.addDialogControl('hyperlink','link');
maskLink.Prompt = 'Mathworks Home Page';
maskLink.Callback = 'web(''www.mathworks.com'')'

% Alternative method to add hyperlink

maskLink = maskObj.addDialogControl('hyperlink','link');
maskLink.Prompt = 'www.mathworks.com';

% Add text to mask dialog box

maskText = maskObj.addDialogControl('text','text_tag');
maskText.Prompt = 'Enable range checking';

% Add button to mask dialog box

maskButton = maskObj.addDialogControl('pushbutton','button_tag');
maskButton.Prompt = 'Compute';
```

Add Dialog Control Elements to Mask Dialog Box Tabs

Create tabs on the mask dialog box and add elements to these tabs.

```
% Get mask object on a block named 'GainBlock'

maskObj = Simulink.Mask.get('GainBlock/Gain');

% Create a tab container
```

```
maskObj.addDialogControl('tabcontainer','allTabs');
tabs = maskObj.getDialogControl('allTabs');

% Create tabs and name them

maskTab1 = tabs.addDialogControl('tab','First');
maskTab1.Prompt = 'First tab';

maskTab2 = tabs.addDialogControl('tab','Second');
maskTab2.Prompt = 'Second tab';

% Add elements to one of the tabs

firstTab = tabs.getDialogControl('First');
firstTab.addDialogControl('text','textOnFirst');
firstTab.getDialogControl('textOnFirst').Prompt = 'Tab one';
```

Add Dialog Control Element Using Name-Value Pair

Add dialog control element and specify values for it

```
% Get mask object on model Engine

maskObj = Simulink.Mask.get('Engine/Gain');

% Add a dialog box and specify values for it

maskDialog = maskObj.addDialogControl('Type','text',...
'Prompt','hello','Visible','off');
```

Simulink.dialog.Container | “Create Block Masks”

Introduced in R2014a

removeDialogControl

Class: Simulink.dialog.Container
Package: Simulink.dialog

Remove dialog control element from mask dialog box

Syntax

```
successIndicator = maskVariable.removeDialogControl(
controlIdentifier)
```

Description

`successIndicator = maskVariable.removeDialogControl( controlIdentifier)` removes dialog control element, specified by `controlIndentifier`, like text, hyperlinks, or tabs from a mask dialog box. First get the mask object and assign it to the variable `maskVariable`.

Successful removal of a dialog control element returns a Boolean value of `1`.

Input Arguments

`controlIdentifer` — Unique identifier for the element
character vector

Programmatic identifier for the dialog control element of mask dialog box, specified as a character vector.

Examples

Remove Dialog Control Element from Mask Dialog Box

```
% Get mask object on the Gain block in the model Engine.
```

```
maskObj = Simulink.Mask.get('Engine/Gain');

% Remove element named AllTab from mask dialog box.

maskTab = maskObj.removeDialogControl('AllTab');
```

`Simulink.dialog.Container` | "Create Block Masks"

Introduced in R2013b

getDialogControl

Class: Simulink.dialog.Container
Package: Simulink.dialog

Search for a specific dialog control on the mask

Syntax

```
[control, phandle] = handle.getDialogControl(controlIdentifier)
```

Description

`[control, phandle] = handle.getDialogControl(controlIdentifier)`, search for a specific child dialog control recursively on the mask dialog box.

Input Arguments

`controlIdentifier`

Name of the dialog control being searched on the mask dialog box.

Default:

Output Arguments

`control`

Target dialog control being searched on the mask dialog box.

`phandle`

Parent of the dialog control being searched mask dialog box.

Examples

Find a dialog control

Find a text dialog control on the mask dialog box. `maskObj` is the handle to the mask object. The `getDialogControl` method returns the handle to the dialog control (`hdlgctrl`) and handle to the parent dialog control (`phandle`).

```
[hdlgctrl, phandle] = maskObj.getDialogControl('txt_var')
```

Simulink.dialog.Panel class

Package: Simulink.dialog

Create an instance of a panel dialog control

Description

Use an instance of `Simulink.dialog.Panel` class to create an instance of panel dialog control.

Properties

`Name`

Uniquely identifies the panel dialog control and is a required field.

Type: `character vector`

`Row`

Specifies whether panel is placed on the current row or on a new row.

Type: `character vector`

Values: `'current'|'new'`

Default: `'new'`

`Enabled`

Specifies whether panel is active on the mask dialog box.

Type: `boolean`

Values: `'on'|'off'`

Default: `'on'`

`Visible`

Specifies whether panel is displayed on the mask dialog box.

Type: `boolean`

Values: `'on'` | `'off'`

Default: `'on'`

`DialogControls`

Specifies the child dialog controls contained in the panel.

Type: `Simulink.dialog.Control`

Default: `Empty array`

Methods

addDialogControl	Add dialog control elements to mask dialog box
removeDialogControl	Remove dialog control element from mask dialog box
getDialogControl	Search for a specific dialog control on the mask

Simulink.dialog.Group class

Package: Simulink.dialog

Create an instance of a group dialog control

Description

Use an instance of `Simulink.dialog.Group` class to create an instance of group dialog control.

Properties

`Name`

Uniquely identifies the group dialog control and is a required field.

Type: `character vector`

`Prompt`

Specifies the text displayed on the group.

Type: `character vector`

Default: `Empty character vector`

`Row`

Specifies whether group is placed on the current row or on a new row.

Type: `character vector`

Values: `'current'|'new'`

Default: `'new'`

`Enabled`

Specifies whether group is active on the mask dialog box.

Type: `boolean`

Values: `'on'`|`'off'`

Default: `'on'`

`Visible`

Specifies whether group is displayed on the mask dialog box.

Type: `boolean`

Values: `'on'`|`'off'`

Default: `'on'`

`DialogControls`

Specifies the child dialog controls contained in the group.

Type: `Simulink.dialog.Control`

Default: `Empty array`

Methods

addDialogControl	Add dialog control elements to mask dialog box
removeDialogControl	Remove dialog control element from mask dialog box
getDialogControl	Search for a specific dialog control on the mask

Simulink.dialog.Tab class

Package: Simulink.dialog

Create an instance of a tab dialog control

Description

Use an instance of `Simulink.dialog.Tab` class to create an instance of tab dialog control.

Properties

`Name`

Uniquely identifies the tab dialog control and is a required field.

Type: `character vector`

`Prompt`

Specifies the text displayed on the tab.

Type: `character vector`

Default: `Empty character vector`

`Enabled`

Specifies whether tab is active on the mask dialog box.

Type: `boolean`

Values: `'on'|'off'`

Default: `'on'`

`Visible`

Specifies whether tab is displayed on the mask dialog box.

Type: `boolean`

Values: `'on'` | `'off'`

Default: `'on'`

`DialogControls`

Specifies the child dialog controls contained in the tab dialog control.

Type: `Simulink.dialog.Control`

Default: `Empty array`

Methods

addDialogControl	Add dialog control elements to mask dialog box
removeDialogControl	Remove dialog control element from mask dialog box
getDialogControl	Search for a specific dialog control on the mask

Simulink.dialog.TabContainer class

Package: Simulink.dialog

Create an instance of a tab container dialog control

Description

Use an instance of `Simulink.dialog.TabContainer` class to create an instance of tab container dialog control. Tab container dialog box be used to group the tab dialog controls.

Properties

`Name`

Uniquely identifies the tab container dialog control and is a required field.

Type: `character vector`

`Row`

Specifies whether tab container is placed on the current row or on a new row.

Type: `enumerated string`

Values: `'current'|'new'`

Default: `'new'`

`Enabled`

Specifies whether tab container is active on the mask dialog box.

Type: `boolean`

Values: `'on'|'off'`

Default: `'on'`

`Visible`

Specifies whether tab container is displayed on the mask dialog box.

Type: `boolean`

Values: `'on'`|`'off'`

Default: `'on'`

`DialogControls`

Specifies the child dialog controls contained in the group. `Simulink.dialog.TabContainer` class can only contain `Simulink.dialog.Tab` dialog control.

Type: `Simulink.dialog.Tab`

Default: `Empty array`

Methods

addDialogControl	Add dialog control elements to mask dialog box
removeDialogControl	Remove dialog control element from mask dialog box
getDialogControl	Search for a specific dialog control on the mask

Simulink.dialog.Button class

Package: Simulink.dialog

Create a button dialog control

Description

Use an instance of `Simulink.dialog.Button` class to add a button dialog control.

Properties

`Name`

Uniquely identifies the dialog control and is a required field.

Type: `character vector`

`Prompt`

Specifies the text displayed on the button dialog control.

Type: `character vector`

Default: `empty`

`FilePath`

Specifies the path to the image file to be shown on the button dialog control.

Type: `character vector`

Default: `empty`

`Callback`

Specifies the MATLAB command (s) to be executed when the dialog control is invoked.

Type: `character vector`

Default: `empty`

`Row`

Specifies whether dialog control is placed on the current row or on a new row.

Type: `character vector`

Value: `'current'|'new'`

Default: `'current'`

`Enabled`

Indicates whether container is active on the mask dialog box.

Type: `boolean`

Value: `'on'|'off'`

Default: `'on'`

`Visible`

Indicates whether container is displayed on the mask dialog box.

Type: `boolean`

Value: `'on'|'off'`

Default: `'on'`

Simulink.dialog.Hyperlink class

Package: Simulink.dialog

Create a hyperlink dialog control

Description

Use an instance of `Simulink.dialog.Hyperlink` class to add a hyperlink dialog control.

Properties

`Name`

Uniquely identifies the dialog control and is a required field.

Type: `character vector`

`Prompt`

Specifies the text displayed on the hyperlink.

Type: `character vector`

Default: `empty`

`Callback`

Specifies the MATLAB command (s) to be executed when the dialog control is invoked.

Type: `character vector`

Default: `empty`

`Row`

Specifies whether hyperlink is placed on the current row or on a new row.

Type: `character vector`

Value: `'current'|'new'`

Default: `'new'`

`Enabled`

Indicates whether hyperlink is active on the mask dialog box.

Type: `boolean`

Value: `'on'|'off'`

Default: `'on'`

`Visible`

Indicates whether hyperlink is displayed on the mask dialog box.

Type: `boolean`

Value: `'on'|'off'`

Default: `'on'`

Simulink.dialog.Image class

Package: Simulink.dialog

Create an image dialog control

Description

Use an instance of `Simulink.dialog.Image` class to add an image dialog control.

Properties

`Name`

Uniquely identifies the dialog control and is a required field.

Type: `character vector`

`FilePath`

Specifies the path to the image file to be displayed on the dialog box.

Type: `character vector`

Default: `empty`

`Row`

Specifies whether dialog control is placed on the current row or on a new row.

Type: `character vector`

Value: `'current'|'new'`

Default: `'new'`

`Enabled`

Indicates whether image is active on the mask dialog box.

Type: `boolean`

Value: `'on'`|`'off'`

Default: `'on'`

`Visible`

Indicates whether image is displayed on the mask dialog box.

Type: `boolean`

Value: `'on'`|`'off'`

Default: `'on'`

Simulink.dialog.Text class

Package: Simulink.dialog

Create a text dialog control

Description

Use an instance of `Simulink.dialog.Text` class to add a text dialog control.

Properties

`Name`

Uniquely identifies the dialog control element and is a required field.

Type: `character vector`

`Prompt`

Specifies the text displayed on the mask dialog box.

Type: `character vector`

Default: `empty`

`WordWrap`

Specifies whether to wrap long text to the next line on the mask dialog box.

Type: `boolean`

Value: `'on'|'off'`

Default: `'on'`

`Row`

Specifies whether dialog control is placed on the current row or on a new row.

Type: `character vector`

Value: `'current'|'new'`

Default: `'new'`

`Enabled`

Indicates whether dialog control is active on the mask dialog box.

Type: `boolean`

Value: `'on'|'off'`

Default: `'on'`

`Visible`

Indicates whether dialog control is displayed on the mask dialog box.

Type: `boolean`

Value: `'on'|'off'`

Default: `'on'`

`Simulink.dialog.Control` | “Create Block Masks”

Simulink.sfunction.Analyzer class

Package: Simulink.sfunction

Create a Simulink S-function analyzer object

Description

This class enables you to perform checks on S-functions within a model or a library. These checks include MEX compiler setup check, source code check, MEX-file check, parameter robustness check for S-functions. The check result can be accessed either from a MATLAB structure or an HTML report.

The S-function analyzer checks the source code of the S-functions based on the S-function names. The S-function source code can be automatically included in the analysis if the source file is a single .c or .cpp file in the MATLAB path that has the same name as the S-function. Otherwise, the build information can be specified through the S-function Analyzer APIs. If no source code is available on the specified path, the analysis is skipped.

Construction

`sfunAnalyzer = Simulink.sfunction.Analyzer(model)` creates a `Simulink.sfunction.Analyzer` object with the model you specify. In this case, the source code for the S-function can be automatically included in the analysis if the source code file is a single .c or .cpp file in the MATLAB path that has the same name as the S-function. For example, if the specified model contains an S-function called `mysfun`, and the source file for `mysfun` is a single file `mysfun.c` in the MATLAB path, a `Simulink.sfunction.analyzer.BuildInfo` object is automatically created and included in the analysis.

`sfunAnalyzer = Simulink.sfunction.Analyzer(model,'BuildInfo',{bdInfo})` creates a `Simulink.sfunction.Analyzer` object with the model and a `Simulink.sfunction.analyzer.BuildInfo` object named `bdInfo`.

`sfunAnalyzer = Simulink.sfunction.Analyzer(model,'Options',{opts})` creates an `Simulink.sfunction.Analyzer` object with the model and a `Simulink.sfunction.analyzer.Options` object named `opts`.

Input Arguments

`model` — Specify a model in the path

character vector | string

Names of the model in the path, specified as a string or character vector.

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: `'BuildInfo', {buildInfo}`

`BuildInfo` — Specify the `buildinfo` object

cell array

A cell array of `buildinfo` objects. See `Simulink.sfunction.analyzer.BuildInfo` for more information.

`Options` — Specify the S-function analyzer running options

object

An object to specify S-function analyzer running options. These checks include Polyspace® Code Prover™ and parameter robustness checks. See `Simulink.sfunction.analyzer.Options` for more information.

Methods

run	Perform checks on S-functions
generateReport	Generate an HTML report of S-function checks

See Also

`Simulink.sfunction.Analyzer.generateReport` | `Simulink.sfunction.Analyzer.run` | `Simulink.sfunction.analyzer.BuildInfo` | `Simulink.sfunction.analyzer.Options` | `Simulink.sfunction.analyzer.findSfunctions`

Introduced in R2017b

run

Class: Simulink.sfunction.Analyzer
Package: Simulink.sfunction

Perform checks on S-functions

Syntax

`result = run()`

Description

`result = run()` returns a struct containing the result from the analyzer checks. An example result struct has the following fields:

```
       TimeGenerated: '19-Jul-2017 19:25:32'
            Platform: 'win64'
             Release: '(R2017b)'
     SimulinkVersion: '9.0'
      ExemptedBlocks: {}
    MexConfiguration: [1×1 mex.CompilerConfiguration]
                Data: [4×4 struct]
```

Output Arguments

`result` — Sfunction.Analyzer structure
MATLAB structure

MATLAB structure containing the result of S-function analyzer.

`Simulink.sfunction.Analyzer` | `Simulink.sfunction.Analyzer.run` | `Simulink.sfunction.analyzer.BuildInfo` | `Simulink.sfunction.analyzer.Options` | `Simulink.sfunction.analyzer.findSfunctions`

Introduced in R2017b

Simulink.sfunction.analyzer.BuildInfo class

Package: Simulink.sfunction.analyzer

Create an object to represent build information

Description

`Simulink.sfunction.analyzer.BuildInfo` object captures the build information for S-functions, such as source files, header files, and linking libraries, for use with the `Simulink.sfunction.Analyzer` class.

Construction

`bdInfo= Simulink.sfunction.analyzer.BuildInfo(SfcnFile)` creates a `Simulink.sfunction.analyzer.BuildInfo` object.

`bdInfo = Simulink.sfunction.analyzer.BuildInfo(SfcnFile, 'SrcPath', {srcpaths}, 'ExtraSrcFileList', {srcfilelist})` creates a `Simulink.sfunction.analyzer.BuildInfo` object for a C-MEX S-function source file, a list of extra source files located in the specified path.

`bdInfo = Simulink.sfunction.analyzer.BuildInfo(SfcnFile, ' ObjFileList',{objfilelist})` creates a `Simulink.sfunction.analyzer.BuildInfo` object for C-MEX S-function source file and list of extra objective code files.

`bdInfo = Simulink.sfunction.analyzer.BuildInfo(SfcnFile, 'IncPaths', {incpathslist})` creates a `Simulink.sfunction.analyzer.BuildInfo` object for C-MEX S-function source file and paths to the folders including header files.

`bdInfo = Simulink.sfunction.analyzer.BuildInfo(SfcnFile, ' LibFileList',{libfilelist}, 'LibPaths',{libpaths})` creates a `Simulink.sfunction.analyzer.BuildInfo` object for C-MEX S-function source file and library files and library file paths used for building.

`bdInfo = Simulink.sfunction.analyzer.BuildInfo(SfcnFile, ' PreProcDefList',{preprocdir})` creates a

`Simulink.sfunction.analyzer.BuildInfo` object for C-MEX S-function source file and `pre-processor` directives list.

Input Arguments

`SfcnFile` — S-function source file

character vector | string

S-function source file having the same name as the S-function.

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: `'SrcPath'`, `{srcpath}`

`SrcPath` — Source file path

cell array of character vectors | string

Search paths to extra S-function source files that are referenced by `SfcnFile`, specified as a cell array or a string.

`ExtraSrcFileList` — Extra source file list

cell array of character vectors | string

List of extra S-function source files, specified as a cell array or string.

`ObjFileList` — Extra objective code

cell array

List of objective files used for building, specified as a cell array.

`IncPaths` — Search paths for header files

cell array of character vectors | string

Specify paths to include folders for header files, specified as a cell array or a string.

`LibFileList` — External libraries list

cell array of character vectors | string

List of external library files used for building, specified as a cell array or string.

`LibPaths` — Search paths for external libraries

cell array of character vectors | string

Search paths for external library files used for building, specified as a cell array or a string.

`PreProcDefList` — Preprocessor directives

cell array of character vectors | string

List of the preprocessor directives, specified as a cell array or a string.

Output Arguments

`bdInfo` — BuildInfo object

object

Build information for the S-functions supplied to the S-function analyzer. Returns a `simulink.sfunction.analyzer.BuildInfo` object.

Examples

Create a `bdInfo` object for an S-function `mysfun` that includes a source file `mysfun.c`:

Basic Use

```
bdInfo = Simulink.sfunction.analyzer.BuildInfo('mysfun.c');
```

The output `bdInfo` has the following fields:

```
bdInfo = 

  BuildInfo with properties:

            SfcnFile: 'mysfun.c'
            SfcnName: 'mysfun'
             SrcType: 'C'
            SrcPaths: {}
    ExtraSrcFileList: {}
         ObjFileList: {}
```

```
            IncPaths: {}
         LibFileList: {}
            LibPaths: {}
      PreProcDefList: {}
```

Advanced Use

Create a `bdInfo` object for an S-function `mysfun` that includes a source file `mysfun.c` and also includes:

- List of extra source files, `extra1.c` and `extra2.c`
- Paths to source file folders, `/path1` and `/path2`.
- List of objective files, `o1.obj` and `o2.obj`.
- List of library files, `l1.lib` and `l2.lib`.
- Library paths, `/libpath1`.
- Pre-processor running directives, `-DDEBUG`.

```
Simulink.sfunction.analyzer.BuildInfo('mysfun.c',...
                                      'ExtraSrcFileList',{extra1.c,extra2.c},... %speci
                                      'SrcPaths',{/path1,/path2},...             %speci
                                      'ObjFileList',{o1.obj,o2.obj},...          %speci
                                      'LibFileList',{l1.lib,l2.lib},...          %speci
                                      'LibPaths',{/libpath1},...                 %speci
                                      'PreProcDefList',{DEBUG});                 %speci
```

`Simulink.sfunction.Analyzer` | `Simulink.sfunction.Analyzer.generateReport` | `Simulink.sfunction.Analyzer.run` | `Simulink.sfunction.analyzer.Options` | `Simulink.sfunction.analyzer.findSfunctions`

Introduced in R2017b

Simulink.sfunction.analyzer.Options class

Package: Simulink.sfunction.analyzer

Create an object to specify options for running S-function checks

Description

`Simulink.sfunction.analyzer.Options` object is created through the constructor `Simulink.sfunction.analyzer.Options()`. `Simulink.sfunction.analyzer.Options` object captures the options for running S-function checks. These checks include whether to enable Polyspace and Parameter Robustness checks, maximum model simulation time and output path for result report.

Construction

`opts= Simulink.sfunction.analyzer.Options()` returns a options object with these property values:

```
  EnablePolyspace: 0
 EnableRobustness: 0
       ReportPath: ''
  ModelSimTimeOut: 10
```

Properties

EnablePolyspace — Polyspace Code Prover check
`False` (default) | `True`

Boolean type check to determine whether to include Polyspace Code Prover check.

Note These checks usually take some time to run.

`EnableRobustness` — Parameter robustness check

`False` (default) | `True`

Boolean type check to indicate whether to include Robutness checks.

Note These checks usually take some time to run.

`ReportPath` — Generated report directory

current working directory (default) | character array

Path to the generated report directory.

`ModelSimTimeOut` — Maximum model simulation time

`10` (default) | scalar

Maximum model simulation time in seconds.

`EnableUsePublishedOnly` — Use of documented APIs

`False` (default) | `True`

Check to indicate if any undocumented S-function APIs are used in the code.

findSfunctions

Find and return all eligible S-functions in a model

Syntax

```
sfuns = Simulink.sfunction.analyzer.findSfunctions(model)
```

Description

`sfuns = Simulink.sfunction.analyzer.findSfunctions(model)` returns all eligible S-functions in a model for the S-function checks. Rules are applied to filter out all ineligible S-functions.

Input Arguments

`model` — A Simulink model or library in path
character vector | string vector

A Simulink model or library in path specified as a string or a character vector.

Output Arguments

`sfuns` — A list of all eligible S-functions
cell array of character vectors

Eligible S-functions in the model, specified as a cell array of character vectors.

addElement

Class: Simulink.SimulationData.Dataset
Package: Simulink.SimulationData

Add element to end of data set

Syntax

```
dataset = addElement(dataset,element)
dataset = addElement(dataset,element,name)
```

Description

`dataset = addElement(dataset,element)` adds an element to the `Simulink.SimulationData.Dataset` dataset.

`dataset = addElement(dataset,element,name)` adds an element to the `Simulink.SimulationData.Dataset` data set and gives the element the name that you specify with the `name` argument. If the object already has a name, the element instead uses the name you specify by using the `name` argument.

Input Arguments

dataset — Data set

`SimulationData.Dataset` object

The data set to which to add the element.

element — Element to add

`Simulink.SimulationData.Signal` object | `Simulink.SimulationData.State` object | `Simulink.SimulationData.DataStoreMemory` object | `timeseries` object | `matlab.io.datastore.SimulationDatastore` object

Element to add to the data set, specified as a `Simulink.SimulationData.Signal`, `Simulink.SimulationData.DataStoreMemory`, or `matlab.io.datastore.SimulationDatastore` object.

name — Name for element

character vector

Name for element, specified as a character vector.

Output Arguments

`dataset` — Data set

character vector

The data set to which you add the element, returned as a character vector. The new element is added to the end of the data set.

Examples

Create a Data Set

Create a data set and add three elements to it.

```
time = 0.1*(0:100)';
ds = Simulink.SimulationData.Dataset;
element1 = Simulink.SimulationData.Signal;
element1.Name = 'A';
element1.Values = timeseries(sin(time),time);
ds = addElement(ds,element1);
element2 = Simulink.SimulationData.Signal;
element2.Name = 'B';
element2.Values = timeseries(2*sin(time),time);
ds = addElement(ds,element2);
element3 = Simulink.SimulationData.Signal;
element3.Name = 'C';
element3.Values = timeseries(3*sin(time),time);
ds = addElement(ds,element3);
ds
```

```
ds = 

Simulink.SimulationData.Dataset '' with 3 elements

                         Name  BlockPath 
                         ____  _________ 

    1  [1x1 Signal]      A     ''       
    2  [1x1 Signal]      B     ''       
    3  [1x1 Signal]      C     ''       

  - Use braces { } to access, modify, or add elements using index.
```

Alternative

To streamline indexing syntax, you can use curly braces ({}) to add an element to a dataset, instead of using addElement. For the index, use a scalar that is greater than the number of elements by one. The new element becomes the last element of the dataset.

```
time = 0.1*(0:100)';
ds = Simulink.SimulationData.Dataset;
element1 = Simulink.SimulationData.Signal;
element1.Name = 'A';
element1.Values = timeseries(sin(time),time);
ds{1} = element1;
element2 = Simulink.SimulationData.Signal;
element2.Name = 'B';
element2.Values = timeseries(2*sin(time),time);
ds{2} = element2;
element3 = Simulink.SimulationData.Signal;
element3.Name = 'C';
element3.Values = timeseries(3*sin(time),time);
ds{3} = element3;
```

concat

Class: Simulink.SimulationData.Dataset
Package: Simulink.SimulationData

Concatenate dataset to another dataset

Syntax

```
dataset1 = concat(dataset1,dataset2)
```

Description

`dataset1 = concat(dataset1,dataset2)` concatenates the elements of `dataset2` to `dataset1`.

Input Arguments

`dataset1` — Dataset to concatenate to

data set

Dataset to concatenate to with `dataset2`, returned as a cell array.

`dataset2` — Dataset to concatenate

data set

Data set to concatenate to `dataset1`, specified as a cell array.

Output Arguments

`dataset1` — Concatenated dataset

data set

Concatenated dataset from `dataset1` and `dataset2`.

Examples

Concatenate ds1 to ds

Convert output from two To Workspace blocks to `Dataset` format and concatenate them.

```
mdl = 'myvdp';
open_system(mdl);
sim(mdl)
ds = Simulink.SimulationData.Dataset(simout);
ds1 = Simulink.SimulationData.Dataset(simout1);
dsfinal = concat(ds,ds1);
```

get

Class: Simulink.SimulationData.Dataset
Package: Simulink.SimulationData

Get element or collection of elements from dataset

Syntax

```
element = get(dataset,index)
element = get(dataset,name)
element = get(dataset,{name})
```

Description

`element = get(dataset,index)` returns the element corresponding to the `index`. The `getElement` method uses the same syntax and behavior as the `get` method.

`element = get(dataset,name)` returns the element whose name matches `name`. When `name` is in a cell array, return the index of the element whose name matches `name`.

`element = get(dataset,{name})` returns a single element if only one element name matches, a `SimulationData.Dataset` if multiple elements with this name exist.

If you use **Log Dataset data to file** to create the MAT-file, use `getAsDatastore` for fast access to the data.

Input Arguments

dataset — Dataset
`SimulationData.Dataset` object

The data set from which to get the element.

index — Index value of element to get
scalar numeric

Index value of element to get. The index reflects the index value of a data set element.

name — Name for data set element
character array | cell array

Name for a data set element, specified as:

- A character array reflecting the name of the data set element
- A cell array containing one character vector. To return a `SimulationData.Dataset object` that can contain one element, use this format. Consider this form when writing scripts.

Output Arguments

`element` — Element
element | `SimulationData.Dataset` object | empty object

The element that the `get` method finds.

- If `index` is the first argument after the data set, the method returns the element at the `index`.
- If `name` is the first argument after the data set:
  - If the method finds one element, it returns the element.
  - If the method finds more than one element, return a Dataset that contains the elements.
  - If the method does not find an element, it returns an empty object.

Examples

Access Dataset Elements

Access `Simulink.SimulationData.Dataset` elements in the top model of the `ex_bus_logging` model. The signal logging dataset is `topOut`.

```
open_system(docpath(fullfile(docroot,'toolbox','simulink',...
'examples','ex_bus_logging')));
```

```
open_system(docpath(fullfile(docroot,'toolbox','simulink',...
'examples','ex_mdlref_counter_bus')));
sim('ex_bus_logging')
topOut

topOut = 

  Simulink.SimulationData.Dataset
  Package: Simulink.SimulationData

  Characteristics:
              Name: 'topOut'
    Total Elements: 4

  Elements:
    1: 'COUNTERBUS'
    2: 'OUTPUTBUS'
    3: 'INCREMENTBUS'
    4: 'inner_bus'

  -Use get or getElement to access elements by index, name or
   block path.
  -Use addElement or setElement to add or modify elements.

  Methods, Superclasses
```

Access Dataset Elements with Index

Access the element at index if the first argument is a numeric value.

```
el = logsout.get(1);
```

Access Dataset Elements with Characters

Access the element whose name matches `name`.

```
el = logsout.get('name');
```

Access Dataset Elements with Cell Array

Return a dataset if the first argument is a cell array with a character vector as the first element.

```
ds = logsout.get({'my_name'});
```

Alternatives

You can use curly braces to streamline indexing syntax to get an element in a dataset, instead of using `get` or `getElement`. The index must be a scalar that is not greater than the number of elements in the variable. For example, get the second element of the `logsout` dataset.

```
logsout{2}
```

Also, you can use the `find` method to get an element or collection of elements from a dataset.

getElementNames

Class: Simulink.SimulationData.Dataset
Package: Simulink.SimulationData

Return names of all elements in dataset

Syntax

```
element_list = getElementNames(dataset)
```

Description

`element_list = getElementNames(dataset)` returns the names of all of the elements in the `Simulink.SimulationData.Dataset` object.

Input Arguments

`dataset` — Data set

`SimulationData.Dataset` object

The data set from which to the element name.

Output Arguments

`element_list` — Data set

cell array

Data set, returned as a cell array of the character vectors containing names of all of the elements of the dataset.

Examples

Return Names of Elements

Return the names of the elements for the `topOut` data set (the signal logging data).

```
open_system(docpath(fullfile(docroot,'toolbox','simulink',...
'examples','ex_bus_logging')));
open_system(docpath(fullfile(docroot,'toolbox','simulink',...
'examples','ex_mdlref_counter_bus')));
sim('ex_bus_logging')
el_names = topOut.getElementNames
```

```
el_names = 

    'COUNTERBUS'
    'OUTPUTBUS'
    'INCREMENTBUS'
    'inner_bus'
```

find

Class: Simulink.SimulationData.Dataset
Package: Simulink.SimulationData

Get element or collection of elements from dataset

Syntax

```
[datasetOut,retIndex]=find(datasetIn,Name,Value,…)
```

```
[datasetOut,retIndex]=find(datasetIn,Name,Value,'-logicaloperator',…
Name,Value,…)
```

```
[datasetOut,retIndex]=find(datasetIn,'-regexp',Name,Value,…)
```

Description

`[datasetOut,retIndex]=find(datasetIn,Name,Value,…)` returns a `Simulink.SimulationData.Dataset` object and indices of the elements whose property values match the specified property names and values. Specify optional comma-separated pairs of `Name,Value` properties. `Name` is the property name and `Value` is the corresponding value. `Name` must appear inside single quotes (`' '`). You can specify several name-value pair properties in any order as `Name1,Value1,...,NameN,ValueN`.

`[datasetOut,retIndex]=find(datasetIn,Name,Value,'-logicaloperator',… Name,Value,…)` applies the logical operator to the matching property value. You can combine multiple logical operators. Logical operator can be one of:

- `-or`
- `-and`

If you do not specify an operation, the method assumes `-and`.

`[datasetOut,retIndex]=find(datasetIn,'-regexp',Name,Value,…)` matches elements using regular expressions as if the value of the property is passed to the `regexp` function as:

```
regexp(element.Name,Value)
```

The method applies regular expression matching to the name-value pairs that appear after `-regexp`. If there is no `-regexp`, the method matches elements as if the value of the property is passed as:

```
isequal(element.Name,Value)
```

For more information on `-regexp`, see “-regexp With Multiple Block Paths” on page 5-1060.

`-regexp` With Multiple Block Paths

`-regexp` works with properties of type char. To specify multiple block paths, you can use `Simulink.SimulationData.BlockPath` and `Simulink.BlockPath`. For example, when a signal is logged in a referenced model, you can use `Simulink.SimulationData.BlockPath` to specify multiple block paths.

The method returns elements that contain a **BlockPath** property where one or more of the individual block paths match the specified `Value` path when you use:

- `-regexp` with the **BlockPath** `Name` property.
- `Value` as a character vector or scalar object of type `Simulink.SimulationData.BlockPath` with one block path

Input Arguments

`datasetIn` — `SimulationData.Dataset`
`SimulationData.Dataset` object

`SimulationData.Dataset` object in which to search for matching elements.

Name — Name of property
character vector

Name of property to find in the element.

Value — Value of property
character vector | double | `Simulink.SimulationData.BlockPath`

Value of property to find in the element.

Output Arguments

datasetOut — SimulationData.Dataset data set
SimulationData.Dataset

SimulationData.Dataset object that contains the elements that match the specified criteria. If there is no matching SimulationData.Dataset object, the returned SimulationData.Dataset object contains no elements.

retIndex — Indices
vector

Indices of the elements datasetIn that match the specified criteria.

Examples

Find Block Path

Find a specific block path (specified by character vector) and port index.

```
dsOut = find(dsIn, 'BlockPath', 'vdp/x1', 'PortIndex', 1)
```

Find Elements

Find elements that have either name or propagated name as InValve.

```
dsOut = find(dsIn, 'Name', 'InValve', '-or', 'PropagatedName', 'InValve')
dsOut = find(dsIn, '-regex','Name', 'In*', '-or', …
                   '-regex','PropagatedName', 'In*')
```

Find and Change Element

Find and replace all elements containing specified_name with a new_name.

```
[dsOut,idxInDs] = find(ds, 'specified_name');
for idx=1: length(idxInDs)
  % process each element
```

```
   elm = get(dsOut, idx);
   elm.Name= 'New_Name'
   dsIn = setElement(dsIn, idxInDs(idx), elm);
end
```

Find Signals in subSys Using -regexp

Find all signals logged in a `subSys` using `-regexp`.

```
dsOut = find(dsIn, '-regexp', 'BlockPath', 'mdl/subSys/.*')
```

Find Signals in Referenced Model

Find all signals logged in the Model block.

```
dsOut = find(dsIn, '-regexp', 'BlockPath', 'refmdl/ModelBlk')
```

Alternative

You can use curly braces to streamline indexing syntax to get an element in a dataset, instead of using `find`. The index must be a scalar that is not greater than the number of elements in the variable. For example, get the second element of the `logsout` dataset.

```
logsout{2}
```

Also, you can use the `get` method to get an element or collection of elements from a dataset.

numElements

Class: Simulink.SimulationData.Dataset
Package: Simulink.SimulationData

Get number of elements in data set

Syntax

```
length = numElements(dataset)
```

Description

`length = numElements(dataset)` gets the number of elements in the top-level dataset. To get the number of elements of a nested data set, use `numElements` with the nested data set.

Input Arguments

`dataset` — Data set
`SimulationData.Dataset` object

The data set from which to get the number of elements.

Output Arguments

`length` — Number of elements
double

Number of elements, returned as a double.

Examples

Get Number of Elements

Get the number of elements in the signal logging data set for the `ex_bus_logging`.

```
length = topOut.numElements()
```

plot

Class: Simulink.SimulationData.Dataset
Package: Simulink.SimulationData

Plot dataset elements in Signal Preview window or Simulation Data Inspector

Syntax

```
plot(ds)
plot(ds,viewer)
```

Description

`plot(ds)` plots the `Simulink.SimulationData.Dataset` elements against time and interpolates values between samples by using either zero-order-hold or linear interpolation. The plot displays as a read-only plot in the Signal Preview window.

`plot(ds,viewer)` displays the plot in the Signal Preview window or Simulation Data Inspector, depending on the `viewer` value.

Input Arguments

ds — Data set
`SimulationData.Dataset` object

The data set that contains the elements to plot.

viewer — Viewer to display plot
preview (default) | sdi

Viewer to display the plot, specified as `preview` (Signal Preview window) or `sdi` (Simulation Data Inspector).

Examples

Plot a Data Set

Create a timeseries object `ts` and add elements to plot in Simulation Data Inspector.

```
% Create a timeseries object
ts = timeseries([0;20],[0;10]);
% Create a SimulationData.Dataset
ds = Simulink.SimulationData.Dataset();
% Place timeseries object in dataset
ds = ds.addElement(ts,'ts');
% Plot the element
plot(ds,'sdi');
```

Introduced in R2016b

setElement

Class: Simulink.SimulationData.Dataset
Package: Simulink.SimulationData

Change element stored at specified index

Syntax

```
dataset = setElement(dataset,index,... element)
dataset = setElement(index,element, name)
```

Description

`dataset = setElement(dataset,index,... element)` changes the element stored at the specified index, for an existing index. If `index` is one greater than the number of elements in the data set, the function adds the element at the end of the data set.

`dataset = setElement(index,element, name)` changes the element stored at the specified index and gives it the name that you specify. You can use `name` to identify an element that does not have a name. If the signal already has a name, the element instead uses the name you specify by using the `name` argument.

Input Arguments

`dataset` — Data set
`SimulationData.Dataset` object

The data set for which to set the element.

`index` — Index
scalar

Index for the added element, specified as a scalar numeric value. The value must be between 1 and the number of elements plus 1.

element — Element to replace existing element
Simulink.SimulationData.Signal object | Simulink.SimulationData.DataStoreMemory object

Element to replace existing element or to add to the data set, specified as a Simulink.SimulationData.Signal object or Simulink.SimulationData.DataStoreMemory object.

name — Element name
character vector

Element name, returned as a character vector.

Output Arguments

dataset — Data set
character vector

Data set in which you change or add an element, specified as a character vector.

Examples

Set Element Name

Set element name.

```
ds = Simulink.SimulationData.Dataset
element1 = Simulink.SimulationData.Signal
element1.Name = 'A'
ds = ds.addElement(element1)
element2 = Simulink.SimulationData.Signal
element2.Name = 'B'
elementNew = Simulink.SimulationData.Signal
ds = ds.setElement(2,elementNew,'B1')
ds
```

```
ds =

  Simulink.SimulationData.Dataset
  Package: Simulink.SimulationData

  Characteristics:
              Name: 'topOut'
    Total Elements: 2

  Elements:
    1: 'A'
    2: 'B1'

  Use getElement to access elements by index, name or
  block path.

  Methods, Superclasses
```

Alternative

You can use curly braces to streamline indexing syntax to change an element in a dataset, instead of using `setElement`. The index must be a scalar that is not greater than the number of elements in the variable. For example, change the name of second element of the `logsout` dataset.

```
logsout{2}.Name = 'secondSignal'
```

coder.BuildConfig class

Package: coder

Build context during code generation

Description

The code generator creates an object of this class to facilitate access to the build context. The build context encapsulates the settings used by the code generator including:

- Target language
- Code generation target
- Target hardware
- Build toolchain

Use `coder.BuildConfig` methods in the methods that you write for the `coder.ExternalDependency` class.

Construction

The code generator creates objects of this class.

Methods

getHardwareImplementation	Get handle of copy of hardware implementation object
getStdLibInfo	Get standard library information
getTargetLang	Get target code generation language
getToolchainInfo	Returns handle of copy of toolchain information object
isCodeGenTarget	Determine if build configuration represents specified target
isMatlabHostTarget	Determine if hardware implementation object target is MATLAB host computer

Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects (MATLAB).

Examples

Use `coder.BuildConfig` methods to access the build context in `coder.ExternalDependency` methods

This example shows how to use `coder.BuildConfig` methods to access the build context in `coder.ExternalDependency` methods. In this example, you use:

- `coder.BuildConfig.isMatlabHostTarget` to verify that the code generation target is the MATLAB host. If the host is not MATLAB report an error.
- `coder.BuildConfig.getStdLibInfo` to get the link-time and run-time library file extensions. Use this information to update the build information.

Write a class definition file for an external library that contains the function `adder`.

```
%================================================================
% This class abstracts the API to an external Adder library.
% It implements static methods for updating the build information
% at compile time and build time.
%================================================================
classdef AdderAPI < coder.ExternalDependency
    %#codegen

    methods (Static)

        function bName = getDescriptiveName(~)
            bName = 'AdderAPI';
        end

        function tf = isSupportedContext(buildContext)
            if  buildContext.isMatlabHostTarget()
                tf = true;
            else
                error('adder library not available for this target');
            end
        end

        function updateBuildInfo(buildInfo, buildContext)
            % Get file extensions for the current platform
            [~, linkLibExt, execLibExt, ~] = buildContext.getStdLibInfo();

            % Add file paths
            hdrFilePath = fullfile(pwd, 'codegen', 'dll', 'adder');
            buildInfo.addIncludePaths(hdrFilePath);

            % Link files
            linkFiles = strcat('adder', linkLibExt);
            linkPath = hdrFilePath;
            linkPriority = '';
            linkPrecompiled = true;
            linkLinkOnly = true;
            group = '';
            buildInfo.addLinkObjects(linkFiles, linkPath, ...
                linkPriority, linkPrecompiled, linkLinkOnly, group);

            % Non-build files for packaging
            nbFiles = 'adder';
            nbFiles = strcat(nbFiles, execLibExt);
            buildInfo.addNonBuildFiles(nbFiles,'','');
        end

        %API for library function 'adder'
        function c = adder(a, b)
```

```
            if coder.target('MATLAB')
                % running in MATLAB, use built-in addition
                c = a + b;
            else
                % Add the required include statements to the generated function code
                coder.cinclude('adder.h');
                coder.cinclude('adder_initialize.h');
                coder.cinclude('adder_terminate.h');
                c = 0;

                % Because MATLAB Coder generated adder, use the
                % housekeeping functions before and after calling
                % adder with coder.ceval.

                coder.ceval('adder_initialize');
                c = coder.ceval('adder', a, b);
                coder.ceval('adder_terminate');
            end
        end
    end
end
```

"Develop Interface for External C/C++ Code" (MATLAB Coder)
"Build Process Customization" (MATLAB Coder)

Introduced in R2013b

coder.ExternalDependency class

Package: coder

Interface to external code

Description

`coder.ExternalDependency` is an abstract class for developing an interface between external code and MATLAB code intended for code generation. You can define classes that derive from `coder.ExternalDependency` to encapsulate the interface to external libraries, object files, and C/C++ source code. This encapsulation allows you to separate the details of the interface from your MATLAB code.

To define a class derived from `coder.ExternalDependency`, create a subclass. For example:

```
classdef myClass < coder.ExternalDependency
```

You must define all of the methods listed in “Methods” on page 5-1077. These methods are static and are not compiled. The code generator invokes these methods in MATLAB after code generation is complete to configure the build for the generated code. The `RTW.BuildInfo` and `coder.BuildConfig` objects that describe the build information and build context are automatically created during the build process. The `updateBuildInfo` method provides access to these objects. For more information on build information customization, see “Build Process Customization” (MATLAB Coder).

You also define methods that call the external code. These methods are compiled. For each external function that you want to call, write a method to define the programming interface to the function. In the method, use `coder.ceval` to call the external function.

Methods

getDescriptiveName	Return descriptive name for external dependency
isSupportedContext	Determine if build context supports external dependency
updateBuildInfo	Update build information

Examples

Encapsulate the Interface to an External C Dynamic Library

This example shows how to encapsulate the interface to an external C dynamic linked library using `coder.ExternalDependency`.

Write a function `adder` that returns the sum of its inputs.

```
function c = adder(a,b)
%#codegen
c = a + b;
end
```

Generate a library that contains `adder`.

```
codegen('adder','-args',{-2,5},'-config:dll','-report')
```

Write the class definition file `AdderAPI.m` to encapsulate the library interface.

```
%================================================================
% This class abstracts the API to an external Adder library.
% It implements static methods for updating the build information
% at compile time and build time.
%================================================================

classdef AdderAPI < coder.ExternalDependency
    %#codegen

    methods (Static)

        function bName = getDescriptiveName(~)
            bName = 'AdderAPI';
        end
```

```
function tf = isSupportedContext(buildContext)
    if  buildContext.isMatlabHostTarget()
        tf = true;
    else
        error('adder library not available for this target');
    end
end

function updateBuildInfo(buildInfo, buildContext)
    % Get file extensions for the current platform
    [~, linkLibExt, execLibExt, ~] = buildContext.getStdLibInfo();

    % Add file paths
    hdrFilePath = fullfile(pwd, 'codegen', 'dll', 'adder');
    buildInfo.addIncludePaths(hdrFilePath);

    % Link files
    linkFiles = strcat('adder', linkLibExt);
    linkPath = hdrFilePath;
    linkPriority = '';
    linkPrecompiled = true;
    linkLinkOnly = true;
    group = '';
    buildInfo.addLinkObjects(linkFiles, linkPath, ...
        linkPriority, linkPrecompiled, linkLinkOnly, group);

    % Non-build files for packaging
    nbFiles = 'adder';
    nbFiles = strcat(nbFiles, execLibExt);
    buildInfo.addNonBuildFiles(nbFiles,'','');
end

%API for library function 'adder'
function c = adder(a, b)
    if coder.target('MATLAB')
        % running in MATLAB, use built-in addition
        c = a + b;
    else
        % Add the required include statements to the generated function code
        coder.cinclude('adder.h');
        coder.cinclude('adder_initialize.h');
        coder.cinclude('adder_terminate.h');
        c = 0;
```

```
                % Because MATLAB Coder generated adder, use the
                % housekeeping functions before and after calling
                % adder with coder.ceval.

                coder.ceval('adder_initialize');
                c = coder.ceval('adder', a, b);
                coder.ceval('adder_terminate');
            end
        end
    end
end
```

Write a function `adder_main` that calls the external library function `adder`.

```
function y = adder_main(x1, x2)
    %#codegen
    y = AdderAPI.adder(x1, x2);
end
```

Generate a MEX function for `adder_main`. The MEX Function exercises the `coder.ExternalDependency` methods.

```
codegen('adder_main', '-args', {7,9}, '-report')
```

Copy the library to the current folder using the file extension for your platform.

For Windows, use:

```
copyfile(fullfile(pwd, 'codegen', 'dll', 'adder', 'adder.dll'));
```

For Linux, use:

```
copyfile(fullfile(pwd, 'codegen', 'dll', 'adder', 'adder.so'));
```

Run the MEX function and verify the result.

```
adder_main_mex(2,3)
```

Introduced in R2013b

TimeScopeConfiguration

Control Scope block appearance and behavior

Description

Scope configuration properties control the appearance and behavior of a scope block. Create a scope configuration object with `get_param`, and then change property values using the object with dot notation.

Creation

`myScopeConfiguration = get_param(gcbh,'ScopeConfiguration')` creates a scope configuration object for the selected scope block.

Properties

Name — Title on a scope window

block name (default) | character vector

Title on a scope window, specified as a character vector.

`NumInputPorts` — Number of input ports

`'1'` (default) | character vector

Number of input ports on a scope block, specified as a character vector. The maximum number of input ports is 96.

UI Use

Select **File** > **Number of Input Ports**.

`ActiveDisplay` — Display for setting display-specific properties

`'1'` (default) | character vector

Display for setting display-specific properties, specified as a character vector. The number of a display corresponds to its column-wise placement index. For multi-column layouts, the displays are numbered down and then across.

Dependency

Setting this property selects the display for setting the properties `ShowGrid`, `ShowLegend`, `Title`, `PlotAsMagnitudePhase`, `YLabel`, and `YLimits`.

UI Use

Open the **Configuration Properties**. On the **Display** tab, set **Active display**.

`AxesScaling` — How to scale y-axes

`'Manual'` (default) | `'Auto'` | `'Updates'`

How to scale *y*-axes, specified as one of these values:

- `'Manual'` — Manually scale *y*-axes with the **Scale Y-axis Limits** button.
- `'Auto'` — Scale *y*-axes during and after simulation.
- `'Updates'` — Scale *y*-axes after specified number of block updates (time intervals).

Dependency

If this property is set to `'Updates'`, also specify the property `AxesScalingNumUpdates`

UI Use

Open the **Configuration Properties**. On the **Main** tab, set **Axes scaling**.

`AxesScalingNumUpdates` — Number of updates before scaling y-axes

`'10'` (default) | character vector

Number of updates before scaling *y*-axes, specified as a character vector.

Dependency

Activate this property by setting AxesScaling to `'Updates'`.

UI Use

Open the **Configuration Properties**. On the **Main** tab, set **Number of updates**.

`DataLogging` — Save scope data

`false` (default) | `true`

Set this property to `true` to save scope data to a variable in the MATLAB workspace.

This property does not apply to floating scopes and scope viewers.

Dependency

If this property is set to `true`, you must also specify the properties `DataLoggingVariableName` and `DataLoggingSaveFormat`.

UI Use

Open the **Configuration Properties**. On the **Logging** tab, set **Log data to workspace**.

`DataLoggingVariableName` — Variable name for saving scope data

`'ScopeData'` (default) | character vector

Variable name for saving scope data in the MATLAB workspace, specified as a character vector. This property does not apply to floating scopes and scope viewers.

Dependency

Activate this property by setting `DataLogging` to `true`.

UI Use

Open the **Configuration Properties**. On the **Logging** tab, set **Variable name**.

`DataLoggingSaveFormat` — Variable format for saving scope data

`'Dataset'` (default) | `'Structure With Time'` | `'Structure'` | `'Array'`

Variable format for saving scope data to the MATLAB workspace, specified as one of these values:

- `'Dataset'` — Save data as a dataset object. This format does not support variable-size data, MAT-file logging, or external mode archiving. See `Simulink.SimulationData.Dataset`.
- `'StructureWithTime'` — Save data as a structure with associated time information. This format does not support single- or multiport frame-based data, or multirate data.
- `'Structure'` — Save data as a structure. This format does not support multirate data.
- `'Array'` — Save data as an array with associated time information. This format does not support multiport sample-based data, single- or multiport frame-based data, variable-size data, or multirate data.

This property does not apply to floating scopes and scope viewers.

Dependency

Activate this property by setting `DataLogging` to `true`.

UI Use

Open the **Configuration Properties**. On the **Logging** tab, set **Save format**.

`DataLoggingLimitDataPoints` — Limit buffered data

`false` (default) | `true`

Set to `true` to limit buffered data before plotting and saving data.

For simulations with **Stop time** set to `inf`, always set this parameter to `true`.

Dependency

If this property is set to `true`, also specify the number of data values to plot and save with the property `DataLoggingMaxPoints`.

UI Use

Open the **Configuration Properties**. On the **Logging** tab, set **Limit data points to last**.

`DataLoggingMaxPoints` — Maximum number of data values

`'5000'` (default) | character vector

Maximum number of data values to plot and save, specified as a character vector. The data values that are plotted and saved are from the end of a simulation. For example, setting this property to 100 saves the last 100 data points.

Dependency

Activate this property by setting `DataLoggingLimitDataPoints` to `true`. Specifying this property limits the data values a scope plots and the data values saved in the MATLAB variable specified in `DataLoggingVariableName`.

UI Use

Open the **Configuration Properties**. On the **Logging** tab, set the text box to the right of **Limit data points to last**.

`DataLoggingDecimateData` — Reduce scope data

`false` (default) | `true`

Set this property to `true` to reduce scope data before plotting and saving.

Dependency

If this property is set to `true`, you must also specify the `DataLoggingDecimation` property.

UI Use

Open the **Configuration Properties**. On the **Logging** tab, set **Decimation**.

`DataLoggingDecimation` — Decimation factor

`'1'` (default) | character vector

Decimation factor applied to the signal data before plotting and saving, specified as a character vector. The scope buffers every N^{th} data point, where N is the decimation factor you specify. A value of `1` buffers all data values.

Dependency

Activate this property by setting `DataLoggingDecimateData` to `true`.

UI Use

Open the **Configuration Properties**. On the **Logging** tab, set the text box to the right of **Decimation**.

`FrameBasedProcessing` — Frame-based processing of signals

`false` (default for Time Scope block) | `true` (default for Scope block)

Set this property to `true` to process signals as frame-based.

- `false` — Process signal values in a channel at each time interval (sample based).
- `true` — Process signal values in a channel as a group of values from multiple time intervals (frame based). Frame-based processing is available only with discrete input signals.

UI Use

Open the **Configuration Properties**. On the **Main** tab, set **Input processing**.

`LayoutDimensions` — Number of display rows and columns

`[1 1]` (default) | `[numberOfRows numberOfColumns]`

Number of display rows and columns, specified with as a two-element vector. The maximum layout dimension is 16-by-16.

- If the number of displays is equal to the number of ports, signals from each port appear on separate displays.
- If the number of displays is less than the number of ports, signals from additional ports appear on the last *y*-axis.

UI Use

Open the **Configuration Properties**. On the **Main** tab, select the **Layout** button.

`MaximizeAxes` — Maximize size of signal plots

`'Auto'` (default) | `'On'` | `'Off'`

Specify whether or not to maximize the size of signal plots:

- `'Auto'` — If `Title` and `YLabel` are not specified, maximize all plots.
- `'On'` — Maximize all plots. Values in `Title` and `YLabel` are hidden.
- `'Off'` — Do not maximize plots.

Each of the plots expands to fit the full display. Maximizing the size of signal plots removes the background area around the plots.

UI Use

Open the **Configuration Properties**. On the **Main** tab, set **Maximize axes**.

`MinimizeControls` — Hide menu and toolbar

`false` (default) | `true`

Set this property to `true` to hide the menu and toolbar.

If you dock the scope, this property is inactive.

`OpenAtSimulationStart` — Open scope when starting simulation

`true` (default for Time Scope) | `false` (default for Scope)

Set this property to `true` to open the scope when the simulation starts.

UI Use

Select **File** > **Open at Start of Simulation**

`PlotAsMagnitudePhase` — Magnitude and phase plots

`false` (default) | `true`

Specify whether or not to display the magnitude and phase plots:

- `false` — Display signal plot.

  If the signal is complex, plot the real and imaginary parts on the same *y*-axis (display).
- `true` — Display magnitude and phase plots.

  If the signal is real, plot the absolute value of the signal for the magnitude. The phase is 0 degrees for positive values and 180 degrees for negative values.

Dependency

Set the `ActiveDisplay` property before setting this property.

UI Use

Open the **Configuration Properties**. On the **Display** tab, set **Plot signals as magnitude and phase**.

`Position` — Size and location of the scope

`[left bottom width height]`

Size and location of scope window, specified as a four-element vector consisting of the left, bottom, width, and height positions, in pixels.

By default, a scope window appears in the center of your screen with a width of `560` pixels and height of `420` pixels.

`ShowGrid` — Vertical and horizontal grid lines

`true` (default) | `false`

Set this property to true to display vertical and horizontal grid lines.

Dependency

Set the `ActiveDisplay` property before setting this property.

UI Use

Open the **Configuration Properties**. On the **Display** tab, set **Show grid**.

`SampleTime` — Time interval

`'-1'` (default) | character vector

Time interval between Scope block updates during a simulation, specified as a character vector. This property does not apply to floating scopes and scope viewers.

UI Use

Open the **Configuration Properties**. On the **Main** tab, set **Sample Time**.

`ShowLegend` — Signal legend

`false` (default) | `true`

Set this property to `true` to display the legend.

Names listed in the legend are the signal names from the model. For signals with multiple channels, a channel index is appended after the signal name. See the Scope block reference for an example.

Dependency

Set the `ActiveDisplay` property before setting this property.

UI Use

Open the **Configuration Properties**. On the **Display** tab, set **Show legend**.

`ShowTimeAxisLabel` — Display or hide x-axis labels

`true` (default for Time Scope block) | `false` (default for Scope block)

Set this property to `true` to display the *x*-axis labels.

Dependency

Set the `ActiveDisplay` property before setting this property.

If this property is set to `true`, also set `TimeAxisLabels`. If `TimeAxisLabels` is set to `'None'`, this property is inactive.

UI Use

Open the **Configuration Properties**. On the **Time** tab, set **Show time-axis label**.

`TimeAxisLabels` — How x-axis labels display

`'All'` (default for Time Scope block) | `'Bottom'` (default for Scope block) | `'None'`

How *x*-axis labels display, specified as one of these values:

- `'All'` — Display *x*-axis labels on all displays.
- `'Bottom'` — Display *x*-axis labels only on the bottom display.
- `'None'` — Do not display labels and deactivate `ShowTimeAxisLabel` property.

Dependency

Set the `ActiveDisplay` property before specifying this property.

Set `ShowTimeAxisLabel` to `true` and set `Maximize axes` to `'Off'`.

UI Use

Open the **Configuration Properties**. On the **Time** tab, set **Time-axis labels**.

`TimeDisplayOffset` — x-axis range offset

`'0'` (default) | character vector

x-axis range offset number, specified as a character vector. For input signals with multiple channels, enter a scalar or vector of offsets.

- Scalar — Offset all channels of an input signal by the same value.
- Vector — Independently offset the channels.

UI Use

Open the **Configuration Properties**. On the **Time** tab, set **Time display offset**.

`TimeSpan` — Length of x-axis range to display

`'0'` (default) | character vector | `'Auto'`

Length of *x*-axis range to display, specified as one of these values:

- Positive real number — Any value less than the total simulation time specified as a character vector.
- `'Auto'` — Difference between the simulation start and stop times.

The block calculates the beginning and end times of the *x*-axis range using the `TimeDisplayOffset` and `TimeSpan` properties. For example, if you set `TimeDisplay` to `10` and the `TimeSpan` to `20`, the scope sets the *x*-axis range from `10` to `30`.

UI Use

Open the **Configuration Properties**. On the **Time** tab, set **Time span**.

`TimeSpanOverrunAction` — How to display data

`'Wrap'` (default) | `'Scroll'`

How to display data beyond the visible *x*-axis range, specified as one of these values:

- `'Wrap'` — Draw a full screen of data from left to right, clear the screen, and then restart drawing of data.
- `'Scroll'` — Move data to the left as new data is drawn on the right. This mode is graphically intensive and can affect run-time performance.

You can see the effects of this option only when plotting is slow with large models or small step sizes.

UI Use

Open the **Configuration Properties**. On the **Time** tab, set **Time span overrun action**.

`TimeUnits` — Units to display on the x-axis

`'Metric'` (default for Time Scope block) | `'None'` (default for Scope block) | `'Seconds'`

Units to display on the *x*-axis, specified as one of these values:

- `'Metric'` — Display time units based on the length of the `TimeSpan` property.
- `'None'` — Display `Time` on the *x*-axis.
- `'Seconds'` — Display `Time (seconds)` on the *x*-axis.

UI Use

Open the **Configuration Properties**. On the **Time** tab, set **Time units**.

`Title` — Title for display

`'%<SignalLabel>'` (default) | character vector

Title for a display, specified as a character vector. The default value `%<SignalLabel>` uses the input signal name for the title.

Dependency

Set the `ActiveDisplay` property before setting this property.

UI Use

Open the **Configuration Properties**. On the **Display** tab, set **Title**.

`Visible` — Visibility of scope window

`true (default)` | `false`

Set this property to true to make the scope window visible.

`YLabel` — Y-axis label

`''` (default) | character vector

y-axis label for active display, specified as a character vector.

Dependency

Set the `ActiveDisplay` property before setting this property.

If `PlotAsMagnitudePhase` is `true`, the value of `YLabel` is hidden and plots are labeled `Magnitude` and `Phase`.

UI Use

Open the **Configuration Properties**. On the **Display** tab, set **Y-label**.

`YLimits` — Minimum and maximum values of y-axis

`[-10 10]` (default) | `[ymin ymax]`

Minimum and maximum values of *y*-axis, specified as a two-element numeric vector.

Dependency

Set the `ActiveDisplay` property before setting this property.

When `PlotAsMagnitudePhase` is `true`, this property specifies the *y*-axis limits for the magnitude plot. The *y*-axis limits of the phase plot are always `[-180 180]`.

UI Use

Open the **Configuration Properties**. On the **Display** tab, set **Y-limits (Minimum)** and **Y-limits (Maximum)**.

Examples

Create Scope Configuration Object

This example creates a scope configuration object using the `'vdp'` model which models the van der Pol equation.

```
open_system('vdp')
myScopeConfiguration = get_param('vdp/Scope','ScopeConfiguration');
myScopeConfiguration.NumInputPorts = '2';
```

Simulink.Simulation.Job class

Package: Simulink

Execute batchsim to create a Simulink.Simulation.Job object, simJob

Description

Execute batchsim command with a parallel pool to create a Simulink.Simulation.Job object. The batchsim command offloads multiple simulations to run in batche using the inputs specified with an array of Simulink.SimulationInput objects. You can use this object to monitor the status of a batch job, fetch outputs of a completed batch job, or cancel one or more jobs.

The batchsim command uses the Parallel Computing Toolbox™ license to run the simulations on compute cluster. If a parallel pool cannot be created, batchsim runs the simulations in serial . In the absence ofParallel Computing Toolbox license, batchsim errors out.

Construction

simJob = batchsim(in) creates a Simulink.Simulation.Job object, simJob, while running multiple simulations in batches on a compute cluster using the inputs specified in the Simulink.SimulationInput object, in.

createSimulationJob(batchJob) creates a Simulink.Simulation.Job object from a parallel.job object, batchJob. Use the createSimulationJob command to retrieve the job object returned by the batchsim command.

Input Arguments

in — Simulink.SimulationInput object array
object (default) | array

A Simulink.SimulationInput object or an array of Simulink.SimulationInput objects used to run multiple simulations. Specify parameters and values of a model to run multiple simulations without making it dirty.

Example: `in = Simulink.SimulationInput('vdp')`, `in(1:10) = Simulink.SimulationInput('vdp')`

Properties

`AdditionalPaths` — Folders to add to MATLAB search path of workers

character vector | string | string array | array of character vectors

Specified folders to add to MATLAB search path of parallel workers.

This property is read-only.

`AttachedFiles` — Files and folders sent to the workers

character vector | string | string array | array of character vectors

Files and folders to send to the parallel workers.

This property is read-only.

`AutoAddClientPath` — Whether user-added entries on client path are added to each worker path

true (default) | false

Whether user-added entries on the client path are added to each parallel worker path at the start of the batch job, specified as true or false.

`CreateDateTime` — Date and time of `simJob` creation

datetime object

Date and time at which the batch job was created, specified as a datetime object.

This property is read-only.

`EnvironmentVariables` — Environment variables sent to the workers

character vector | string | string array | array of character vectors

Defines the names of environment variables that are copied from a client session to the parallel workers.

This property is read-only after job submission.

`FinishDateTime` — Date and time of `simJob` completion

datetime object

Date and time at when the batch job completes execution, specified as a datetime object.

This property is read-only.

`ID` — Numeric identifier of the `simJob` object

scalar integer

ID of the `future` object, specified as a scalar integer.

This property is read-only.

`Name` — `simJob` name

string | character vector

Name of the `job` object, specified as a string.

`Parent` — Cluster object containing `simJob`

`parallel.cluster` object

Cluster object that contains the `Simulink.Simulation.Job` object, `simJob`.

`StartDateTime` — Date and time when `simJob` starts running

datetime object

Date and time when the `Simulink.Simulation.Job` starts running, specified as a datetime object.

This property is read-only.

`State` — Current state of `future` object array

`'pending'` | `'queued'` | `'running'` | `'finished'` | `'failed'`

Current state of `future` object array, specified as `'pending'`, `'queued'`, `'running'`, `'finished'`, or `'failed'`.

This property is read-only.

`SubmitDateTime` — Date and time of `simJob` submission

datetime object

Date and time when the `Simulink.Simulation.Job` is submitted, specified as a datetime object.

This property is read-only.

Tag — Label associated with `simJob`
string

Label associated with `Simulink.Simulation.Job` object.

Type — Job Type
`independent` | `pool`

Type of the `Simulink.Simulation.Job` object, specified as `independent` or `pool`.

`UserData` — Data associated with `simJob`
string

Stores any data associated with a job object. The data is stored in a client MATLAB session, and is not available on the workers.

`UserName` — Name of the user who creates the `simJob` object
string | character vector

Name of the user who creates the `Simulink.Simulation.Job` object.

Methods

Method	Purpose
`cancel`	Cancel a pending, queued, or running `Simulink.Simulation.Job` object
`diary`	Display or save Command Window text of batch job
`fetchOutputs`	Retrieve an array of `Simulink.SimulationOutput` objects from all simulations in `Simulink.Simulation.Job`
`listAutoAttachedFiles`	List of files automatically attached to job, task, or parallel pool

Method	Purpose
wait	Wait for Simulink.Simulation.Job object to change state

Examples

Run Parallel Simulations With batchsim to Create Simulink.Simulation.Job

This example shows how to run parallel simulations in batch using the sldemo_househeat model. batchsim offloads simulations to the compute cluster, enabling you to carry out other tasks while the batch job is processing, or close the client MATLAB and access the batch job later.

Observe the model behavior for different temperature set points.

1. Open the model.

```
open_system('sldemo_househeat');
```

2. Define a set of values for different temperatures.

```
setPointValues = 65:2:85;
spv_Length = length(setPointValues);
```

3. Using the setPointValues, initialize an array of Simulink.SimulationInput objects.

```
in(1:spv_Length) = Simulink.SimulationInput('sldemo_househeat');
for i = 1:1:spv_Length
    in(i) = in(i).setBlockParameter('sldemo_househeat/Set Point',...
        'Value',num2str(setPointValues(i)));
end
```

4. Specify the pool size of the number of workers to use. In addition to the number of workers used to run simulations in parallel, a head worker is required. In this case, assume that three workers are available to run a batch job for the parallel simulations. The job object returns useful metadata as shown. You can use the job ID to access the job object later from any machine. NumWorkers displays how many workers are running the simulations – the number of workers specified in the 'Pool' argument plus an additional head worker.

```
simJob = batchsim(in,'Pool',3)

                  ID: 1
                Type: pool
          NumWorkers: 4
            Username: #####
               State: running
      SubmitDateTime: ##-###-#### ##:##:##
       StartDateTime: 
    Running Duration: 0 days 0h 0m 0s
```

cancel

Package: Simulink

Cancel a pending, queued, or running `Simulink.Simulation.Job` object

Syntax

```
cancel(simJob)
cancel(simJob,'Message')
```

Description

`cancel(simJob)` stops the `Simulink.Simulation.Job` object, `simJob`, that is currently in `'pending'`, `'queued'`, or `'running'` state.

`cancel(simJob,'Message')` stops the `Simulink.Simulation.Job` object, `simJob`, that is in `'pending'`, `'queued'`, or `'running'` state and displays a user-specified message.

The `State` property of `Simulink.Simulation.Job` object is set to finished, and other pending simulations are canceled. Canceling a job object disables you to fetch results from it. A canceled job object cannot be started again.

Note On canceling the job, the results of the completed simulations in the job are also lost.

Examples

Cancel a Batch Job

This example shows how to use the `cancel` method on a `simJob` object to stop simulations. The example runs several simulations of the `vdp` model, varying the value of the gain Mu.

1. Open the model and define a vector of Mu values.

```
open_system('vdp');
mu_Values = [0.5:0.25:1000];
muVal_Length = length(mu_Values);
```

2. Using mu_Values, initialize an array of Simulink.SimulationInput objects.

```
in(1:muVal_Length) = Simulink.SimulationInput('vdp');
for i = 1:1:muVal_Length
    in(i) = in(i).setBlockParameter('vdp/Mu',...
        'Gain',num2str(mu_Values(i)));
end
```

3. Specify the pool size of the number of workers to use. In addition to the number of workers used to run simulations in parallel, a head worker is required. In this case, assume that three workers are available to run a batch job for the parallel simulations. The simulations are offloaded onto the default cluster profile.

```
simJob = batchsim(in,'Pool',3);
```

4. Now, assume that you want to run simulations with different values of Mu and cancel the ongoing simulations.

```
cancel(simJob)
```

Input Arguments

simJob — Simulink.Simulation.Job object

object

A Simulink.Simulation.Job object. To create a simJob, run batchsim.

Example: simJob = batchsim(in,'Pool',6)

diary

Package: Simulink

Display or save Command Window text of `Simulink.Simulation.Job` object

Syntax

```
diary(simJob)
diary(simJob,'filename')
```

Description

`diary(simJob)` displays the Command Window output from the `Simulink.Simulation.Job` object, `simJob`, in the MATLAB Command Window. The Command Window output is captured only if the `batchsim` command includes the `'CaptureDiary'` argument with a value of `true`.

`diary(simJob,'filename')` causes the Command Window output from the batch job to be appended to the specified file. Open the file, `filename`, with any text editor.

Examples

Display the Diary of simJob

This example uses `sldemo_househeat` model to show how to display the diary of the `Simulink.Simulation.Job` object, `simJob`. To create a `simJob`, you run parallel simulations using the `batchsim` command.

1. Open the model.

```
open_system('sldemo_househeat');
```

2. Define a set of values for different temperatures.

```
setPointValues = 65:2:85;
spv_Length = length(setPointValues);
```

3. Using `setPointValues`, initialize an array of `Simulink.SimulationInput` objects.

```
in(1:spv_Length) = Simulink.SimulationInput('sldemo_househeat');
for i = 1:1:spv_Length
    in(i) = in(i).setBlockParameter('sldemo_househeat/Set Point',...
        'Value',num2str(setPointValues(i)));
end
```

4. Specify the pool size of the number of workers to use. In addition to the number of workers used to run simulations in parallel, a head worker is required. In this case, assume that three workers are available to run a batch job for the parallel simulations. The job object returns useful metadata as shown. You can use the job `ID` to access the job object later from any machine. `NumWorkers` displays how many workers are running the simulations – the number of workers specified in the `'Pool'` argument plus an additional head worker.

```
simJob = batchsim(in,'Pool',3)
```

```
                 ID: 1
               Type: pool
         NumWorkers: 4
           Username: #####
              State: running
     SubmitDateTime: ##-###-#### ##:##:##
      StartDateTime: 
   Running Duration: 0 days 0h 0m 0s
```

5. Use the `diary` method of the `Simulink.Simulation.Job` object to display the output of the batch job in the MATLAB command window.

Note that the diary is not displayed here because this is an example model.

```
diary(simJob)
```

Input Arguments

`simJob` — `Simulink.Simulation.Job` object

object

A `Simulink.Simulation.Job` object. To create a `simJob`, run `batchsim`.

Example: `simJob = batchsim(in,'Pool',4)`

`'filename'` — File to append with Command Window output text
string

Specify a file to append with Command Window output text from the `Simulink.Simulation.Job` object.

Example: `diary(simJob,'abc.txt')`

fetchOutputs

Package: Simulink

Retrieve an array of `Simulink.SimulationOutput` objects from all simulations in `Simulink.Simulation.Job`

Syntax

```
out = fetchOutputs(simJob)
```

Description

`out = fetchOutputs(simJob)` returns an array of `Simulink.SimulationOutput` objects containing the results of the simulations in a batch job, `simJob`.

`fetchOutputs` reports an error if the job is not in the `'finished'` state, or if one of its simulations encounters an error during execution. Use the `wait` method to wait for the job to complete before fetching outputs.

Examples

Fetch Outputs of the Batch Simulations

This example shows how to run parallel simulations in batch and fetch the resulting `Simulink.SimulationOutput` objects from the `Simulink.Simulation.Job` object. `batchsim` command offloads simulations to the compute cluster, enabling you to carry out other tasks while the batch job is processing, or close the client MATLAB and access the batch job later.

1. Open the model.

```
open_system('sldemo_househeat');
```

2. Define a set of values for different temperatures.

```
setPointValues = 65:2:85;
spv_Length = length(setPointValues);
```

3. Using `setPointValues`, initialize an array of `Simulink.SimulationInput` objects.

```
in(1:spv_Length) = Simulink.SimulationInput('sldemo_househeat');
for i = 1:1:spv_Length
    in(i) = in(i).setBlockParameter('sldemo_househeat/Set Point',...
        'Value',num2str(setPointValues(i)));
end
```

4. Specify the pool size of the number of workers to use. In addition to the number of workers used to run simulations in parallel, a head worker is required. In this case, assume that three workers are available to run a batch job for the parallel simulations. The job object returns useful metadata as shown. You can use the job `ID` to access the job object later from any machine. `NumWorkers` displays how many workers are running the simulations – the number of workers specified in the `'Pool'` argument plus an additional head worker.

```
simJob = batchsim(in,'Pool',3)
```

```
                 ID: 1
               Type: pool
         NumWorkers: 4
           Username: #####
              State: running
     SubmitDateTime: ##-###-#### ##:##:##
      StartDateTime: 
   Running Duration: 0 days 0h 0m 0s
```

5. Access the results of the batch job using the `fetchOutputs` method. `fetchOutputs` returns an array of `Simulink.SimulationOuput` objects. You can fetch outputs only once `simJob` is in `finished` state.

```
out = fetchOutputs(simJob)
```

```
1x11 Simulink.SimulationOutput array
```

Input Arguments

`simJob` — `Simulink.Simulation.Job` object
object

A `Simulink.Simulation.Job` object. To create `simJob`, run `batchsim`.

Example: `simJob = batchsim(in,'Pool',4)`

Output Arguments

out — Simulation object containing logged simulation results
object

Array of `Simulink.SimulationOutput` objects that contain all of the logged simulation results. The size of the array is equal to the size of the array of `Simulink.SimulationInput` objects passed to `batchsim`.

All simulation outputs (logged time, states, and signals) are returned in a single `Simulink.SimulationOutput` object. You define the model time, states, and output that are logged using the **Data Import/Export** pane of the Model Configuration Parameters dialog box. You can log signals using blocks such as the To Workspace and Scope blocks. The **Signal & Scope Manager** tool can directly log signals.

listAutoAttachedFiles

Package: Simulink

List of files automatically attached to the `Simulink.Simulation.Job` object or parallel pool

Syntax

```
listAutoAttachedFiles(simJob)
```

Description

`listAutoAttachedFiles(simJob)` performs a dependency analysis on the `Simulink.Simulation.Job` job object, `simJob`. Then it displays a list of the code files that are already attached or are going to be automatically attached to the job object, `simJob`.

Examples

Run Parallel Simulations with `batchsim` and List Attached Files

This example shows how to run parallel simulations in batch and list any attached files. `batchsim` offloads simulations to the compute cluster, enabling you to carry out other tasks while the batch job is processing, or close the client MATLAB and access the batch job later.

1. Open the model.

```
open_system('sldemo_househeat');
```

2. Define a set of values for different temperatures.

```
setPointValues = 65:2:85;
spv_Length = length(setPointValues);
```

3. Using the `setPointValues`, initialize an array of `Simulink.SimulationInput` objects.

```
in(1:spv_Length) = Simulink.SimulationInput('sldemo_househeat');
for i = 1:1:spv_Length
    in(i) = in(i).setBlockParameter('sldemo_househeat/Set Point',...
        'Value',num2str(setPointValues(i)));
end
```

4. Specify the pool size of the number of workers to use. In addition to the number of workers used to run simulations in parallel, a head worker is required. In this case, assume that three workers are available to run a batch job for the parallel simulations. The job object returns useful metadata as shown. You can use the job `ID` to access the job object later from any machine. `NumWorkers` displays how many workers are running the simulations – the number of workers specified in the `'Pool'` argument plus an additional head worker.

```
simJob = batchsim(in,'Pool',3)
```

```
                  ID: 1
                Type: pool
          NumWorkers: 4
            Username: #####
               State: running
      SubmitDateTime: ##-###-#### ##:##:##
       StartDateTime: 
    Running Duration: 0 days 0h 0m 0s
```

If `AutoAttachFiles` property of `Simulink.Simulation.Job` is set to true in the cluster profile, then the job running on the cluster has the necessary code files automatically attached to it. Use the `listAutoAttachedFiles` method to view the attached files.

Note that the list of attached files is not displayed here because this is an example model.

```
listAutoAttachedFiles(simJob)
```

Input Arguments

`simJob` — `Simulink.Simulation.Job` object

object

A `Simulink.Simulation.Job` object. To create a `simJob`, run `batchsim`.

Example: `simJob = batchsim(in,'Pool',4)`

wait

Package: Simulink

Wait for Simulink.Simulation.Job object to change state

Syntax

```
wait(simJob)
wait(simJob,'stateOfJob')
wait(simJob,'stateOfJob',timeout)
```

Description

wait(simJob) blocks execution in a client session until the job identified by the object simJob reaches the 'finished' state or fails. This occurs when all the simulations finish execution on the workers.

wait(simJob,'stateOfJob') blocks execution in the client session until the specified job object changes state to the value of 'state'. The valid states to wait for are 'queued', 'running', and 'finished'. If the object is currently or has already been in the specified state, wait is not performed and execution returns immediately. For example, if you execute wait(simJob,'queued') for a job already in the 'finished' state, the call returns immediately.

wait(simJob,'stateOfJob',timeout) blocks execution until either the job reaches the specified 'state', or timeout seconds elapse, whichever happens first.

Examples

Wait for Simulations in simJob to Finish

This example shows uses the sldemo_househeat model to show how to wait for the batch simulations to finish.

1. Open the model.

```
open_system('sldemo_househeat');
```

2. Define a set of values for different temperatures.

```
setPointValues = 65:2:85;
spv_Length = length(setPointValues);
```

3. Using the `setPointValues`, initialize an array of `Simulink.SimulationInput` objects.

```
in(1:spv_Length) = Simulink.SimulationInput('sldemo_househeat');
for i = 1:1:spv_Length
    in(i) = in(i).setBlockParameter('sldemo_househeat/Set Point',...
        'Value',num2str(setPointValues(i)));
end
```

4. Specify the pool size of the number of workers to use. In addition to the number of workers used to run simulations in parallel, a head worker is required. In this case, assume that three workers are available to run a batch job for the parallel simulations. The job object returns useful metadata as shown. You can use the job `ID` to access the job object later from any machine. `NumWorkers` displays how many workers are running the simulations – the number of workers specified in the `'Pool'` argument plus an additional head worker.

```
simJob = batchsim(in,'Pool',3)
```

```
                 ID: 1
               Type: pool
         NumWorkers: 4
           Username: #####
              State: running
     SubmitDateTime: ##-###-#### ##:##:##
      StartDateTime: 
   Running Duration: 0 days 0h 0m 0s
```

5. Now, wait for the job to finish before retrieving the outputs.

```
wait(simJob)
```

Input Arguments

`simJob` — `Simulink.Simulation.Job` object

object

A `Simulink.Simulation.Job` object. To create a `simJob`, run `batchsim`.

Example: `simJob = batchsim(in,'Pool','5')`

`'stateOfJob'` — Value of the simulation job object `State` property to wait for

'pending' | 'queued' | 'running' | 'finished' | 'failed' | 'unavailable'

Value of the `State` property of `Simulink.Simulation.Job` object to wait for.

Example: `wait(simJob,'queued')`

`timeout` — Maximum time to wait, in seconds

object

Specify a timeout for `wait` to block execution in seconds.

Example: `wait(simJob, 5)`

getSimulationJobs

Get all `Simulink.Simulation.Job` objects from cluster

Syntax

```
jobs = getSimulationJobs(myCluster)
```

Description

`jobs = getSimulationJobs(myCluster)` returns an array of `Simulink.Simulation.Job` objects that correspond to the jobs created by executing of `batchsim` on cluster, `myCluster`.

Examples

Get a `Simulink.Simulation.Job` Object from the Cluster

This example shows how to access a `batchsim` job that was submitted to a cluster. Assume that `myCluster` is a `parallel.Cluster` object on which the `Simulink.Simulation.Job` object is running.

```
jobs = getSimulationJobs(myCluster)
```

```
 1×2 Job array:

        ID           Type        State              FinishDateTime  Username
     -----------------------------------------------------------------------
   1     3           pool       queued                              #######
   2     4           pool       queued                              #######
```

The output displays all the `Simulink.Simulation.Job` objects on cluster, `myCluster`.

Input Arguments

`myCluster` — `parallel.Cluster` object
object

Cluster object representing parallel cluster compute resources.

Output Arguments

`jobs` — Array of `Simulink.Simulation.Job` objects
array

Array of `Simulink.Simulation.Job` objects submitted by executing `batchsim` command.

Model and Block Parameters

Model Parameters

In this section...

About Model Parameters

You can query and/or modify the properties (parameters) of a Simulink model from the command line. Parameters that describe a model are model parameters, and parameters that describe a Simulink block are block parameters. Block parameters that are common to Simulink blocks are called common block parameters. There are also block-specific parameters. Masks also have parameters, that is, parameters that describe a masked block.

The model and block properties can also include callbacks, which are commands that execute when certain model or block events occur. These events include opening a model, simulating a model, copying a block, opening a block, and so on.

This table lists, in alphabetical order, parameters that describe a model. You can set these parameters using the `set_param` command. The **Description** column indicates where you can set the value on a dialog box.

For examples, see "Examples of Setting Model Parameters" on page 6-108. The **Values** column shows the type of value required, the possible values (separated with a vertical line), and the default value enclosed in braces.

The table also includes model callback parameters (see "Callbacks for Customized Model Behavior"). Do not use model parameters in a `PreLoadFcn` callback. Instead, use them in a `PostLoadFcn` callback.

Model Parameters in Alphabetical Order

Parameter	Description	Values
`AbsTol`	Specify the largest acceptable solver error, as the value of the measured state approaches zero. Set by **Absolute tolerance** on the **Solver** pane of the Configuration Parameters dialog box.	`{'auto'}`
`AccelVerboseBuild`	Controls the verbosity level during code generation for Simulink Accelerator mode, model reference Accelerator mode, and Rapid Accelerator mode. Set by **Verbose accelerator builds** on the Configuration Parameters dialog box.	`{'off'} | 'on'`
`AlgebraicLoopMsg`	Specifies diagnostic action to take when there is an algebraic loop. Set by **Algebraic loop** on the **Solver** section of the **Diagnostics** pane of the Configuration Parameters dialog box.	`'none' | {'warning'} | 'error'`

Parameter	Description	Values
`ArrayBoundsChecking`	Select the diagnostic action to take when blocks write data to locations outside the memory allocated to them. Set by **Array bounds exceeded** on the Configuration Parameters dialog box.	`{'none'} | 'warning' | 'error'`
`ArtificialAlgebraic-LoopMsg`	Specifies diagnostic action to take if algebraic loop minimization cannot be performed for a subsystem because an input port of that subsystem has direct feedthrough. Set by **Minimize algebraic loop** on the **Solver** section of the **Diagnostics** pane in the Configuration Parameters dialog box.	`'none' | {'warning'} | 'error'`
`AssertControl`	Enable model verification blocks in the current model either globally or locally. Set by **Model Verification block enabling** on the Configuration Parameters dialog box.	`{'UseLocalSettings'} | 'EnableAll' | 'DisableAll'`

Parameter	Description	Values
`AutoInsertRateTranBlk`	Specify whether Simulink software inserts hidden Rate Transition blocks between blocks that have different sample rates. Set by **Automatically handle rate transition for data transfer** on the **Solver** pane of the Configuration Parameters dialog box.	`'on' | {'off'}`
`BlockDescription-StringDataTip`	Specifies whether to display the user description for a block as a data tip. In the Simulink Editor, set by **Description** on the **Display > Blocks > Block Tool Tip Options** menu.	`'on' | {'off'}`
`BlockNameDataTip`	Specifies whether to display the block name as a data tip. In the Simulink Editor, set by **Block Name** on the **Display > Blocks > Block Tool Tip Options** menu.	`'on' | {'off'}`
`BlockParametersDataTip`	Specifies whether to display a block parameter in a data tip. In the Simulink Editor, set by **Parameter Names & Values** on the **Display > Blocks > Block Tool Tip Options** menu.	`'on' | {'off'}`

Parameter	Description	Values
`BlockPriority-ViolationMsg`	Select the diagnostic action to take if Simulink software detects a block priority specification error. Set by **Block priority violation** on the **Solver** section of the **Diagnostics** pane of the Configuration Parameters dialog box.	`{'warning'} | 'error'`
`BlockReduction`	Enables block reduction optimization. Set by **Block reduction** on the Configuration Parameters dialog box.	`{'on'} | 'off'`
`BlockReductionOpt`	See `BlockReduction` parameter for more information.	
`BooleanDataType`	Enable Boolean mode. Set by **Implement logic signals as Boolean data (vs. double)** on the Configuration Parameters dialog box.	`{'on'} | 'off'`
`BrowserLookUnderMasks`	Show masked subsystems in the Model Browser. In the Simulink Editor, set by **Include Systems with Mask Parameters** on the **View > Model Browser** menu.	`'on' | {'off'}`

Parameter	Description	Values
`BrowserShowLibraryLinks`	Show library links in the Model Browser. In the Simulink Editor, set by **Include Library Links** on the **View > Model Browser** menu.	`'on' | {'off'}`
`BufferReusableBoundary`	Insert buffers at reusable subsystem boundaries if needed.	`'on' | {'off'}`
`BufferReuse`	Enable reuse of block I/O buffers. Set by **“Reuse local block outputs” (Simulink Coder)** on the **Optimization** pane of the Configuration Parameters dialog box.	`{'on'} | 'off'`

`BusNameAdapt`	Repair broken selections in the Bus Selector and Bus Assignment block parameters dialog boxes that are due to upstream bus hierarchy changes.
	Set by **“Repair bus selections”** on the **Diagnostics > Connectivity** pane of the Configuration Parameters dialog box.
		`{'WarnAndRepair'} |`
		`'ErrorWithoutRepair'`

Parameter	Description	Values
BusObjectLabelMismatch	Select the diagnostic action to take if the name of a bus element does not match the name specified by the corresponding bus object. Set by **Element name mismatch** on the **Diagnostics > Connectivity** pane of the Configuration Parameters dialog box.	'none' | {'warning'} | 'error'
CheckExecutionContext-RuntimeOutputMsg	Specify whether to display a warning if Simulink software detects potential output differences from previous releases. Set by **Check runtime output of execution context** on the Configuration Parameters dialog box.	'on' | {'off'}
CheckForMatrix-Singularity	See CheckMatrixSingularityMsg parameter for more information.	
CheckMatrix-SingularityMsg	Select the diagnostic action to take if the Product block detects a singular matrix while inverting one of its inputs in matrix multiplication mode. Set by **Division by singular matrix** on the **Data Validity Diagnostics** pane of the Configuration Parameters dialog box.	{'none'} | 'warning' | 'error'

Parameter	Description	Values
`CheckModelReference-TargetMessage`	Select the diagnostic action to take if Simulink software detects a target that needs to be rebuilt. Set by **“Never rebuild diagnostic”** on the **Model Referencing** pane of the Configuration Parameters dialog box.	`'none' | 'warning' | {'error'}`
`CheckSSInitialOutputMsg`	Enable checking for undefined initial subsystem output. Set by **Check undefined subsystem initial output** on the Configuration Parameters dialog box.	`{'on'} | 'off'`
`CloseFcn`	Set the close callback function, which can be a command or a variable. Set by **Model close function** on the **Callbacks** pane of the Model Properties dialog box. See “Create Model Callbacks” for more information.	`{''}`
`CompiledBusType`	Return information about whether the signal connected to a port is not a bus, or whether it is a virtual or nonvirtual bus. (Read-only) Get with the `get_param` command. Specify a port or line handle. See “Display Information About Buses”.	Return values are `'NOT_BUS'`, `'VIRTUAL_BUS'`, and `'NON_VIRTUAL_BUS'`

Parameter	Description	Values
`CompiledModelBlockNormalModeVisibility`	For a top model that is being simulated or that is in a compiled state, return information about which Model blocks have normal mode visibility enabled.	Return values indicate which Model blocks have normal mode visibility enabled.
`ConditionallyExecute-Inputs`	Enable conditional input branch execution optimization. Set by **Conditional input branch execution** on the Configuration Parameters dialog box.	`{'on'} | 'off'`
`ConsecutiveZCsStepRelTol`	Relative tolerance associated with the time difference between zero-crossing events. Set by **Time tolerance** on the **Solver** pane of the Configuration Parameters dialog box.	`{'10*128*eps'}`
`ConsistencyChecking`	Select the diagnostic action to take if S-functions have continuous sample times, but do not produce consistent results when executed multiple times. Set by **Solver data inconsistency** on the **Solver** section of the **Diagnostics** pane of the Configuration Parameters dialog box.	`{'none'} | 'warning' | 'error'`

Parameter	Description	Values
`ContinueFcn`	Continue simulation callback. Set by **Simulation continue function** on the **Callbacks** pane of the Model Properties dialog box.	`{''}`
`CovCompData`	If `CovHtmlReporting` is set to `on` and `CovCumulativeReport` is set to `on`, this parameter specifies `cvdata` objects containing additional model coverage data to include in the model coverage report. Set by the **Additional data to include in report** field in the **Advanced parameters** section of the **Coverage > Results** pane of the Configuration Parameters dialog box.	`{''}`

Parameter	Description	Values
CovCumulativeReport	If CovHtmlReporting is set to on, this parameter allows the CovCumulativeReport and CovCompData parameters to specify the number of coverage results displayed in the model coverage report. If set to on, the Simulink Coverage™ software displays the coverage results from successive simulations in the report. If set to off, the software displays the coverage results for the last simulation in the report. Set by the **Include cumulative data in coverage report** option in the **Advanced parameters** section of the **Coverage > Results** pane of the Configuration Parameters dialog box.	'on' | {'off'}
CovDataFileName	If CovEnable is set to on, specifies the name of the file to which Simulink Coverage saves the coverage data results.	{''}

Parameter	Description	Values
`CovCumulativeVarName`	If `CovSaveCumulativeToWorkspaceVar` is set to `on`, the Simulink Coverage software saves the results of successive simulations in the workspace variable specified by this property.	`{'covCumulativeData'}`
`CovEnable`	Enables coverage analysis for Simulink Coverage. Set by **Enable coverage analysis** on the **Coverage** pane of the Configuration Parameters dialog box.	`'on' | {'off'}`
`CovEnableCumulative`	Accumulates model coverage results for Simulink Coverage from successive simulations. Set this and `CovSaveCumulativeToWorkspaceVar` to `on` to collect model coverage results for multiple simulations in one `cvdata` object.	`'on' | {'off'}`
`CovExternalEMLEnable`	Enables coverage for any external MATLAB functions that MATLAB functions for code generation call in your model. The functions can be defined in a MATLAB Function block or in a Stateflow chart. Enable this feature by checking **MATLAB Files** on the **Coverage** pane of the Configuration Parameters dialog box.	`{'on'} | 'off'`

Parameter	Description	Values
`CovForceBlockReductionOff`	If `CovForceBlockReductionOff` is set to `on`, the Simulink Coverage software ignores the value of the Simulink **Block reduction** parameter. The software provides coverage data for every block in the model that collects coverage.	`{'on'} | 'off'`
`CovHighlightResults`	Enable model coloring for coverage results. Enabled by selecting **Display coverage results using model coloring** on the **Coverage** > **Results** pane of the Configuration Parameters dialog box.	`'on' | {'off'}`

Parameter	Description	Values
CovHTMLOptions	If CovHtmlReporting is set to on, use this parameter to select from a set of display options for the resulting model coverage report. Select these options in the **Results Explorer** settings after you record coverage for a model.	Character vector of appended character sets separated by a space. HTML options are enabled or disabled through a value of 1 or 0, respectively, in the following character sets (default values shown): • '-sRT=1' — Show report • '-sVT=0' — Web view mode • '-aTS=1' — Include each test in the model summary • '-bRG=1' — Produce bar graphs in the model summary • '-bTC=0' — Use two color bar graphs (red, blue) • '-hTR=0' — Display hit/count ratio in the model summary • '-xEM=0' — Exclude execution metric details from report • '-nFC=0' — Exclude fully covered model objects from report • '-nFD=1' — Exclude fully covered model object details from report • '-scm=1' — Include cyclomatic complexity numbers in summary • '-bcm=1' — Include cyclomatic complexity numbers in block details • '-xEv=0' — Filter Stateflow events from report

Parameter	Description	Values
		- '-xEM=0' — Filter Execution metric from report
CovIncludeTopModel	Option to include the top-level model in the coverage analysis.	{'on'} | 'off'
CovHtmlReporting	Set to on to tell the Simulink Coverage software to create an HTML report containing the coverage data at the end of simulation. Set by **Generate report automatically after analysis** on the **Coverage** > **Results** pane of the Configuration Parameters dialog box.	'on' | {'off'}
CovLogicBlockShortCircuit	Enables the option to treat Simulink logic blocks as short-circuited for coverage analysis. Enabled by selecting **Treat Simulink logic blocks as short-circuited** on the **Coverage** pane of the Configuration Parameters dialog box.	'on' | {'off'}

Parameter	Description	Values
`CovMcdcMode`	Determines the definition of Modified Condition Decision Coverage (MCDC) to use during coverage analysis. To record model coverage using the masking MCDC definition, set `CovMcdcMode` to `'Masking'`. To record model coverage using the unique-cause MCDC definition, set `CovMcdcMode` to `'UniqueCause'`.	`{'Masking'} | 'UniqueCause'`

Parameter	Description	Values
`CovMetricSettings`	Selects coverage metrics for a coverage report. Coverage metrics are enabled by selecting the check boxes for individual coverages in the **Coverage metrics** section of the **Coverage** pane of the Configuration Parameters dialog box. Enable options `'s'` and `'w'` by selecting **Treat Simulink Logic blocks as short-circuited** and **Warn when unsupported blocks exist in model**, respectively, on the **Coverage** pane of the Configuration Parameters dialog box. Disable option `'e'` by selecting **Display coverage results using model coloring** in the **Results Explorer** settings after you record coverage for a model. **Note** The metrics and options set by this parameter can also be set by the following parameters: • CovHighlightResults • CovLogicBlockShortCircuit • CovMetricStructuralLevel • CovMetricLookupTable	`{'dwe'}` Each order-independent value enables a coverage metric or option as follows: • `'d'` — Enable decision coverage • `'c'` — Enable condition coverage and decision coverage • `'m'` — Enable MCDC coverage, condition coverage, and decision coverage • `'t'` — Enable lookup table coverage • `'r'` — Enable signal range coverage • `'z'` — Enable signal size coverage • `'o'` — Enable coverage for Simulink Design Verifier blocks • `'i'` — Enable saturation on integer overflow coverage • `'b'` — Enable relational boundary coverage • `'s'` — Treat Simulink logic blocks as short-circuited • `'w'` — Warn when unsupported blocks exist in model • `'e'` — Eliminate model coloring for coverage results

Parameter	Description	Values
	• CovMetricSignalRange • CovMetricSignalSize • CovMetricObjectiveConstraint • CovMetricSaturateOnIntegerOverflow • CovMetricRelationalBoundary • CovUnsupportedBlockWarning	
`CovMetricLookupTable`	Enable lookup table coverage. Enabled by selecting **Lookup Table** in the **Coverage metrics** section of the **Coverage** pane of the Configuration Parameters dialog box.	`'on' | {'off'}`
`CovMetricObjectiveConstraint`	Enable Simulink Design Verifier objectives and constraints coverage. Enabled by selecting **Objectives and Constraints** in the **Coverage metrics** section of the **Coverage** pane of the Configuration Parameters dialog box.	`'on' | {'off'}`
`CovMetricRelationalBoundary`	Enable relational boundary coverage. Enabled by selecting **Relational Boundary** in the **Coverage metrics** section of the **Coverage** pane of the Configuration Parameters dialog box.	`'on' | {'off'}`

Parameter	Description	Values
`CovMetricSaturateOnIntegerOverflow`	Enable saturate on integer overflow coverage. Enabled by selecting **Saturate on Integer Overflow** in the **Coverage metrics** section of the **Coverage** pane of the Configuration Parameters dialog box.	`'on' | {'off'}`
`CovMetricSignalRange`	Enable signal range coverage. Enabled by selecting **Signal Range** in the **Coverage metrics** section of the **Coverage** pane of the Configuration Parameters dialog box.	`'on' | {'off'}`
`CovMetricSignalSize`	Enable signal size coverage. Enabled by selecting **Signal Size** in the **Coverage metrics** section of the **Coverage** pane of the Configuration Parameters dialog box.	`'on' | {'off'}`
`CovMetricStructuralLevel`	Define the level of structural coverage. Set by **Structural coverage level** on the **Coverage** pane of the Configuration Parameters dialog box.	`'BlockExecution' | {'Decision'} | 'ConditionDecision' | 'MCDC'`

Parameter	Description	Values
`CovModelRefEnable`	If `CovModelRefEnable` is set to `on` or `all`, the Simulink Coverage software generates coverage data for all referenced models. If `CovModelRefEnable` is set to `filtered`, coverage data is collected for all referenced models except those specified by the parameter `CovModelRefExcluded`. Set by **Coverage for referenced models** on the **Coverage** pane of the Configuration Parameters dialog box.	`'on' | {'off'} | 'all' | 'filtered'`
`CovModelRefExcluded`	If `CovModelRefEnable` is set to `filtered`, this parameter stores a comma-separated list of referenced models for which coverage is disabled. Set by selecting **Coverage for referenced models** on the **Coverage** pane of the Configuration Parameters dialog box and then clicking **Select Models**.	`{''}`

Parameter	Description	Values
`CovNameIncrementing`	If `CovSaveSingleToWorkspaceVar` is set to `on`, setting `CovNameIncrementing` to `on` causes the Simulink Coverage software to append numerals to the workspace variable names for results so that earlier results are not overwritten (for example, `covdata1`, `covdata2`, etc.) Set by **Increment variable name with each simulation** below the selected **Save last run in workspace variable** check box on the **Coverage > Results** pane of the Configuration Parameters dialog box.	`'on' | {'off'}`
`CovOutputDir`	If `CovEnable` is set to `on`, specifies the directory in which Simulink Coverage saves the coverage output files.	`{''}`
`CovPath`	Model path of the subsystem for which the Simulink Coverage software gathers and reports coverage data. Set by selecting **Subsystem** on the **Coverage** pane of the Configuration Parameters dialog box and then clicking **Select Subsystem**.	`{'/'}`

Parameter	Description	Values
CovReportOnPause	Specifies that when you pause during simulation, the model coverage report appears in updated form, with coverage results up to the current pause or stop time.	{'on'} | 'off'
CovSaveCumulativeTo-WorkspaceVar	If set to on, the Simulink Coverage software accumulates and saves the results of successive simulations in the workspace variable specified by CovCumulativeVarName.	'on' | {'off'}
CovSaveName	If CovSaveSingleToWorkspaceVar is set to on, the Simulink Coverage software saves the results of the last simulation run in the workspace variable specified by this property. Set by **cvdata object name** below the selected **Save last run in workspace variable** check box on the **Coverage > Results** pane of the Configuration Parameters dialog box.	{'covdata'}

Parameter	Description	Values
CovSaveSingleTo-WorkspaceVar	If set to on, the Simulink Coverage software saves the results of the last simulation run in the workspace variable specified by CovSaveName. Set by **Save last run in workspace variable** on the **Coverage > Results** pane of the Configuration Parameters dialog box.	'on' | {'off'}
CovScope	Sets the scope of analysis for coverage recording. Set by the **Scope of analysis section** of the **Coverage** pane in the Configuration Parameters dialog box.	{'EntireSystem'} | 'ReferencedModels' | 'Subsystem'
CovSFcnEnable	Enables coverage for C/C++ S-Function blocks in your model. Enable this feature by checking **C/C++ S-Functions** on the **Coverage** pane of the Configuration Parameters dialog box. For more information, see “Coverage for Custom C/C++ Code in Simulink Models” (Simulink Coverage).	'on' | {'off'}
CovShowResultsExplorer	Option to shows the results explorer after simulation. Enabled by selecting **Show Results Explorer** on the **Coverage > Results** pane of the Configuration Parameters dialog box.	{'on'} | 'off'

Parameter	Description	Values
CovUnsupportedBlockWarning	Warn when unsupported blocks exist in model. Enabled by selecting **Warn when unsupported blocks exist in model** on the **Coverage** pane of the Configuration Parameters dialog box.	'on' | {'off'}
Created	Date and time model was created. Set by **Created on** on the **History** pane of the Model Properties dialog box. See “Model Information and History” for more information.	character vector
Creator	Name of model creator. Set by **Created by** on the **History** pane of the Model Properties dialog box. See “Model Information and History” for more information.	character vector
CurrentBlock	For internal use.	
CurrentOutputPort	For internal use.	
CurrentSimState	Save the SimState snapshot of the simulation if the simulation is in a paused state.	Simulink.SimState.ModelSimState object | {[]}

Parameter	Description	Values
DataDictionary	Simulink data dictionary to which this model is linked. Set by **Data Dictionary** and **Base Workspace** on the **Data** pane of the Model Properties dialog box. For basic information about data dictionaries, see “What Is a Data Dictionary?”. To use this parameter programmatically, see “Store Data in Dictionary Programmatically”.	{''}
DataLoggingOverride	A Simulink.SimulationData.ModelLoggingInfo object that specifies the signal logging override settings for a model. See “Override Signal Logging Settings”.	Simulink.SimulationData.ModelLoggingInfo — {'OverrideSignals'} | 'LogAllAsSpecifiedInModel'
DatasetSignalFormat	Format for logged Dataset leaf elements. For details, see “Dataset signal format”.	'timetable' | {'timeseries'}
DataTransfer	A Simulink.GlobalDataTransfer object that configures data transfers for models configured for concurrent execution.	'on' | {'off'}

Parameter	Description	Values
`DataTypeOverride`	Specifies data type used to override fixed-point data types. Set by **Data type override** on the Fixed-Point Tool.	`{'UseLocalSettings'} | 'ScaledDouble' | 'Double' | 'Single' | 'Off'`
`Decimation`	Specify that Simulink software output only every `N` points, where `N` is the specified decimation factor. Set by **“Decimation”** on the **Data Import/Export** pane of the Configuration Parameters dialog box.	`{'1'}`
`DefaultParameterBehavior`	Enable inlining of block parameters in generated code. Set by **Default parameter behavior**, see “Default parameter behavior” (Simulink Coder).	`'Inlined' | {'Tunable'}`

`DefaultAnnotationFontName`
`DefaultBlockFontName`
`DefaultLineFontName`
	Name of font to use for new annotation text, block text, or signal line labels and on existing annotations, block names, or signal lines whose `FontName` property is set to `'auto'`.
	Set with **Diagram > Format > Font Styles for Model** dialog box.
		character vector

Parameter	Description	Values
DefaultAnnotationFontSize DefaultBlockFontSize DefaultLineFontSize	Size of font to use for new annotation text, block text, or signal line labels and on existing annotations, blocks, or signal lines whose FontSize property is set to -1. Set with **Diagram** > **Format** > **Font Styles for Model** dialog box.	positive integer
DefaultAnnotationFontAngle DefaultBlockFontAngle DefaultLineFontAngle	Angle of font for new annotation text, block text, or signal line labels and on existing annotations, blocks, or signal lines whose FontAngle property is set to 'auto'. Set with **Diagram** > **Format** > **Font Styles for Model** dialog box.	{'normal'} | 'italic'
DefaultAnnotationFontWeight DefaultBlockFontWeight DefaultLineFontWeight	Weight of font for new annotation text, block text, or signal line labels and on existing annotations, blocks, or signal lines whose FontWeight property is set to 'auto'. Set with **Diagram** > **Format** > **Font Styles for Model** dialog box.	{'normal'} | 'bold'

Parameter	Description	Values
DefaultUnderspecifiedDataType	Specify data type to use if Simulink cannot infer the type of a signal during data type propagation. Set by **“Default for underspecified data type”** on the **Math and Data Types** pane of the Configuration Parameters dialog box.	{'double'} | 'single'
DeleteChildFcn	Delete child callback function. Created on the **Callbacks** pane of the Block Properties dialog box. See “Specify Block Callbacks” for more information.	{''}
Description	Description of this model. Set by **Model description** on the **Description** pane of the Model Properties dialog box.	{''}
Dirty	If the parameter is on, the model has unsaved changes.	'on' | {'off'}
DiscreteInherit-ContinuousMsg	For internal use.	
DisplayBdSearchResults	For internal use.	
DisplayBlockIO	For internal use.	
DisplayCallgraph-Dominators	For internal use	
DisplayCompileStats	For internal use.	
DisplayCondInputTree	For internal use.	
DisplayCondStIdTree	For internal use.	

Parameter	Description	Values
`DisplayErrorDirections`	For internal use.	
`DisplayInvisibleSources`	For internal use.	
`DisplaySortedLists`	For internal use.	
`DisplayVectorAndFunctionCounts`	For internal use.	
`DisplayVectPropagationResults`	For internal use.	
`ExecutionContextIcon`	Show execution context bars on conditional subsystems that do not propagate execution context across the subsystem boundaries. In the Simulink Editor, set by **Execution Context Indicator** on the **Display** > **Signals & Ports** menu.	`'on' | {'off'}`
`ExplicitPartitioning`	Specifies whether or not to manually map tasks (explicit mapping) or use the rate-based tasks.	`'on' | {'off'}`
`ExpressionFolding`	Enables expression folding. Set by **“Eliminate superfluous local variables (Expression folding)” (Simulink Coder)** on the Configuration Parameters dialog box.	`{'on'} | 'off'`

Parameter	Description	Values
`ExternalInput`	Names of MATLAB workspace variables used to designate data and times to be loaded from the workspace. Set by the **Input** field on the **Data Import/Export** pane of the Configuration Parameters dialog box.	`{'[t, u]'}`
`ExtMode...`	Parameters whose names start with `ExtMode` apply to Simulink external mode simulations. For more information, see “Host-Target Communication with External Mode Simulation” (Simulink Coder).	
`ExtrapolationOrder`	Extrapolation order of the `ode14x` implicit fixed-step solver. Set by **Extrapolation order** on the **Solver** pane of the Configuration Parameters dialog box.	integer — `1 | 2 | 3 | {4}`
`FastRestart`	Enable or disable fast restart mode. In the Simulink Editor toolbar, click the **Fast restart** button on or off.	`{'on'} | 'off'`

Parameter	Description	Values
`FcnCallInpInside-ContextMsg`	Specifies diagnostic action to take when Simulink software must compute any function-call subsystem inputs directly or indirectly during execution of a call to a function-call subsystem. Set by **Context-dependent inputs** on the **Connectivity Diagnostics** pane of the Configuration Parameters dialog box.	`{'Error'} | 'Warning'`
`FileName`	For internal use.	
`FinalStateName`	Names of final states to save to the workspace after a simulation ends. Set by the **Final states** field on the **Data Import/Export** pane of the Configuration Parameters dialog box.	`{'xFinal'}`
`FixedStep`	Fixed-step size. Set by **Fixed-step size (fundamental sample time)** on the **Solver** pane of the Configuration Parameters dialog box.	`{'auto'}`

Parameter	Description	Values
FixptConstOverflowMsg	Specifies diagnostic action to take when a fixed-point constant overflow occurs during simulation. Set by **Detect overflow** on the **Type Conversion Diagnostics** pane of the Configuration Parameters dialog box.	{'none'} | 'warning' | 'error'
FixptConstPrecisionLossMsg	Specifies diagnostic action to take when a fixed-point constant precision loss occurs during simulation. Set by **Detect precision loss** on the **Type Conversion Diagnostics** pane of the Configuration Parameters dialog box.	{'none'} | 'warning' | 'error'
FixptConstUnderflowMsg	Specifies diagnostic action to take when a fixed-point constant underflow occurs during simulation. Set by **Detect underflow** on the **Type Conversion Diagnostics** pane of the Configuration Parameters dialog box.	{'none'} | 'warning' | 'error'
FixPtInfo	For internal use.	
FollowLinksWhen-OpeningFromGotoBlocks	Specifies whether to search for Goto tags in libraries referenced by the model when opening the From block dialog box.	'on' | {'off'}
ForceArrayBoundsChecking	For internal use.	

Parameter	Description	Values
ForceConsistencyChecking	For internal use.	
ForceModelCoverage	For internal use.	
ForwardingTable	Specifies the forwarding table for this library. See “Create Forwarding Table” for more information.	{{'old_path_1', 'new_path_1'} ... {'old_path_n', 'new_path_n'}}
ForwardingTableString	For internal use.	
GeneratePreprocessorConditionals	When generating code for an ERT target, this parameter determines whether variant choices are enclosed within C preprocessor conditional statements (#if). When you select this option, Simulink analyzes all variant choices during an update diagram or simulation. This analysis provides early validation of the code generation readiness of all variant choices.	{'off'} | 'on'
GridSpacing	Has no effect in Simulink Editor. This parameter will be removed in a future release.	integer — {20}
Handle	Handle of the block diagram for this model.	double
HardwareBoard	Select the type of hardware on which to run your model. Set by **“Hardware board”** on the **Hardware Implementation** pane of the Configuration Parameters dialog box.	{'none'}

Parameter	Description	Values
`HideAutomaticNames`	Hides block names given automatically by the Simulink Editor. See "Hide or Display Block Names".	`{'on'} | 'off'`
`HiliteAncestors`	For internal use.	
`IgnoreBidirectionalLines`	For internal use.	
`IgnoredZcDiagnostic`	Control diagnostic messages related to zero-crossings that are being ignored.	`'none' | {'warning'} | 'error'`
`InheritedTsInSrcMsg`	Message behavior when the sample time is inherited. Set by **Source block specifies -1 sample time** on the **Sample Time Diagnostics** pane of the Configuration Parameters dialog box.	`'none' | {'warning'} | 'error'`
`InitFcn`	Function that is called when this model is first compiled for simulation. Set by **Model initialization function** on the **Callbacks** pane of the Model Properties dialog box. See "Create Model Callbacks" for more information.	`{''}`
`InitialState`	Initial state name or values. Set by the **Initial state** field on the **Data Import/Export** pane of the Configuration Parameters dialog box.	variable or vector — `{'xInitial'}`

Parameter	Description	Values
`InitialStep`	Initial step size. Set by **Initial step size** on the **Solver** pane of the Configuration Parameters dialog box.	`{'auto'}`
`InitInArrayFormatMsg`	Message behavior when the initial state is an array. You set with the initial state with the **Initial state** configuration parameter. Avoid using an array for the initial state. If the order of the elements in the array does not match the order in which blocks initialize, the simulation can produce unexpected results. To promote deterministic simulation results, use the default setting or set the diagnostic to `error`. Alternatively, you can set the message behavior using the **“InitInArrayFormatMsg”** on the Configuration Parameters dialog box.	`'none' | {'warning'} | 'error'`

Parameter	Description	Values
`InsertRTBMode`	Control whether the Rate Transition block parameter **Ensure deterministic data transfer (maximum delay)** is set for auto-inserted Rate Transition blocks. Set by **Deterministic data transfer** on the **Solver** pane of the Configuration Parameters dialog box.	`'Always' | {'Whenever possible'} | 'Never (minimum delay)'`
`InspectSignalLogs`	Enable Simulink software to display logged signals in the Simulation Data Inspector tool at the end of a simulation or whenever you pause the simulation. Set by **“Record logged workspace data in Simulation Data Inspector”** on the **Data Import/Export** pane of the Configuration Parameters dialog box.	`'on' | {'off'}`
`InstrumentedSignals`	Returns a `Simulink.HMI.InstrumentedSignals` object with the properties of model name and the number of signals that are marked for streaming. From this object, you can control signal streaming using the block path and output port index.	object — `Simulink.HMI.InstrumentedSignals`

Parameter	Description	Values
`Int32ToFloatConvMsg`	Specify message behavior when a 32-bit integer is converted to a single-precision float. Set by **32-bit integer to single precision float conversion** on the **Type Conversion Diagnostics** pane of the Configuration Parameters dialog box.	`'none' | {'warning'}`
`IntegerOverflowMsg`	Specify message behavior when an integer overflow occurs. Set by **“Wrap on overflow”** in the **Signals** section on the **Data Validity Diagnostics** pane of the Configuration Parameters dialog box.	`'none' | {'warning'} | 'error'`
`IntegerSaturationMsg`	Specify message behavior when an integer saturation occurs. Set by **“Saturate on overflow”** in the **Signals** section on the **Data Validity Diagnostics** pane of the Configuration Parameters dialog box.	`'none' | {'warning'} | 'error'`

Parameter	Description	Values
`InvalidFcnCallConnMsg`	Specify message behavior when an invalid function-call connection exists. Set by **Invalid function-call connection** on the **Connectivity Diagnostics** pane of the Configuration Parameters dialog box.	`'warning' | {'error'}`
`Jacobian`	For internal use.	
`LastModifiedBy`	User name of the person who last modified this model.	character vector
`LastModifiedDate`	Date when the model was last saved.	character vector
`LibraryLinkDisplay`	Displays the blocks in the model that are linked or have disabled or modified links. In the Simulink Editor, set by **Library Links** on the **Display** menu.	`'none'| {'disabled'} |'user' | 'all'` Set to `none`, does not display the link badge on the block. Set to `disabled`, displays the disabled link badge on the block. Set to `user`, displays only links to the user libraries. Set to `all`, displays all links.
`LibraryType`	For internal use.	

Parameter	Description	Values
`LifeSpan`	Specify how long (in days) an application that contains blocks depending on elapsed or absolute time should be able to execute before timer overflow. Set by **Application lifespan (days)** on the **Math and Data Types** pane of the Configuration Parameters dialog box.	`{'auto'} |` any positive, nonzero scalar value
`LimitDataPoints`	Specify that the number of data points exported to the MATLAB workspace be limited to the number specified. Set by the **Limit data points** configuration parameter	`{'on'} | 'off'`
`LinearizationMsg`	For internal use.	
`Lines`	For internal use.	
`LoadExternalInput`	Load input from workspace. Set by the **Input** check box on the **Data Import/Export** pane of the Configuration Parameters dialog box.	`'on' | {'off'}`
`LoadInitialState`	Load initial state from workspace. Set by the **Initial state** check box on the **Data Import/Export** pane of the Configuration Parameters dialog box.	`'on' | {'off'}`
`Location`	For internal use.	

Parameter	Description	Values
Lock	Lock or unlock a block library. Setting this parameter to on prevents a user from inadvertently changing a library.	'on' | {'off'}
LockLinksToLibrary	Lock or unlock links to a library. Setting this parameter to on prevents a user from inadvertently changing linked blocks from the Simulink Editor.	'on' | {'off'}
LoggingFileName	Use when you enable LoggingToFile parameter for logging to persistent storage. Specify the destination MAT-file for data logging.	{'out.mat'}
LoggingToFile	Store logging data that uses Dataset format to persistent storage (MAT-file). Using a Simulink.SimulationData.DatasetRef object to access signal logging and states logging data loads data into the model workspace incrementally. Accessing data for other kinds of logging loads all of the data at once. Use this feature when logging large amounts of data that can cause memory issues. For more information about logging large data sets, see "Log Data to Persistent Storage".	'on' | {'off'}

Parameter	Description	Values
`MAModelExclusionFile`	Specifies the location of the Model Advisor exclusion file. Set by the **File Name** field on the Model Advisor Exclusion Editor dialog box.	`{' '}`
`MaskedZcDiagnostic`	Control diagnostic messages related to zero-crossings that are being masked.	`'none' | {'warning'} | 'error'`
`MaxConsecutiveMinStep`	Maximum number of minimum step size violations allowed during simulation. This option appears when the solver type is `Variable-step` and the solver is an ode one. Set by **Number of consecutive min steps** on the **Solver** pane of the Configuration Parameters dialog box.	`{'1'}`
`MaxConsecutiveZCs`	Maximum number of consecutive zero crossings allowed during simulation. This option appears when the solver type is `Variable-step` and the solver is an ode one. Set by **Number of consecutive zero crossings** on the **Solver** pane of the Configuration Parameters dialog box.	`{'1000'}`

Parameter	Description	Values
MaxConsecutiveZCsMsg	Specifies diagnostic action to take when Simulink software detects the maximum number of consecutive zero crossings allowed. This option appears when the solver type is Variable-step and the solver is an ode one. Set by **Consecutive zero crossings violation** on the **Solver** section of the **Diagnostics** pane of the Configuration Parameters dialog box.	'none' | 'warning' | {'error'}
MaxDataPoints	Maximum number of output data points to save. Set by the **Limit data points to last** field on the **Data Import/Export** pane of the Configuration Parameters dialog box.	{'1000'}
MaxMDLFileLineLength	Controls the line lengths in the model file. Use this to avoid line-wrapping, which can be important for source control tools. Specifies the maximum length in bytes, which may different from the number of characters in Japanese, and is different from the number of columns when tabs are present.	integer — -1 (unlimited) or >= 80. Default is 120.

Parameter	Description	Values
`MaxNumMinSteps`	Maximum number of times the solver uses the minimum step size.	`{'-1'}`
`MaxOrder`	Maximum order for `ode15s`. Set by **Maximum order** on the **Solver** pane of the Configuration Parameters dialog box.	`'1' | '2' | '3' | '4' | {'5'}`
`MaxStep`	Maximum step size. Set by **Max step size** on the **Solver** pane of the Configuration Parameters dialog box.	`{'auto'}`
`MdlSubVersion`	For internal use	
`MergeDetectMultiDriving-BlocksExec`	Select the diagnostic action to take when the software detects a Merge block with more than one driving block executing at the same time step. Set by **Detect multiple driving blocks executing at the same time step** on the Configuration Parameters dialog box.	`{'none'} | 'warning' | 'error'`
`Metadata`	Names and attributes of arbitrary data associated with the model. To extract this metadata structure without needing to load the model, use the method `Simulink.MDLInfo.getMetadata`.	Structure. Fields can be character vectors, numeric matrices of type "double", or more structures.

Parameter	Description	Values
MinMaxOverflow-ArchiveData	For internal use	
MinMaxOverflow-ArchiveMode	Logging type for fixed-point logging. Set by **Overwrite or merge model simulation results** in the Fixed-Point Tool.	{'Overwrite'} | 'Merge'
MinMaxOverflowLogging	Setting for fixed-point logging. Set by **Fixed-point instrumentation mode** in the Fixed-Point Tool.	{'UseLocalSettings'} | 'MinMaxAndOverflow' | 'OverflowOnly' | 'ForceOff'
MinStep	Minimum step size for the solver. Set by **Min step size** on the **Solver** pane of the Configuration Parameters dialog box.	{'auto'}
MinStepSizeMsg	Message shown when minimum step size is violated. Set by **Min step size violation** on the **Solver** section of the **Diagnostics** pane of the Configuration Parameters dialog box.	{'warning'} | 'error'

Parameter	Description	Values
`ModelBlockNormalModeVisibility`	Use with `set_param` to set normal mode visibility on for the specified Model blocks. You can set this parameter with the Model Block Normal Mode Visibility dialog box. For details, see “Specify the Instance Having Normal Mode Visibility”.	With `set_param`, use an array of `Simulink.BlockPath` objects or cell array of cell arrays of character vectors of paths to blocks or models. With `set_param`, an empty array specifies to use the Simulink default selection for the instance to have normal mode visibility enabled.
`ModelBlockNormaModeVisibilityBlockPath`	Return information about which Model blocks have normal mode visibility enabled. Use with a model that you are editing.	Return values indicate which Model blocks have normal mode visibility enabled. See “Simulate Multiple Referenced Model Instances in Normal Mode”.
`ModelBrowserVisibility`	Show the Model Browser. In the Simulink Editor, set by **Model Browser** on the **View** menu.	`'on' | {'off'}`
`ModelBrowserWidth`	Width of the Model Browser pane in the model window. To display the Model Browser pane, see the `ModelBrowserVisibility` parameter.	integer — `{200}`
`ModelDataFile`	For internal use.	`{''}`
`ModelDependencies`	List of model dependencies. Set by **Model dependencies** on the **Model Referencing** pane of the Configuration Parameters dialog box.	`{''}`

Parameter	Description	Values
`ModelReferenceCS-MismatchMessage`	This parameter is maintained for compatibility purposes only. Do not use this parameter. You can use the Model Advisor to identify models referenced in Accelerator mode for which Simulink ignores certain configuration parameters. **1** In the Simulink Editor, select **Analysis > Model Advisor**. **2** Select **By Task**. **3** Run the **Check diagnostic settings ignored during accelerated model reference simulation** check. For more information, see "Diagnostic Configuration Parameters Ignored in Accelerator Mode".	`{'none'} | 'warning' | 'error'` Simulink ignores this parameter if you set it to `warning` or `error`.
`ModelReferenceData-LoggingMessage`	Message shown when there is unsupported data logging. Set by **Unsupported data logging** on the **Model Referencing Diagnostics** pane of the Configuration Parameters dialog box.	`'none' | {'warning'} | 'error'`

Parameter	Description	Values
`ModelReferenceExtra-NoncontSigs`	Specifies diagnostic action to take when a discrete signal appears to pass through a Model block to the input of a block with continuous states. Set by **Extraneous discrete derivative signals** on the **Solver** section of the **Diagnostics** pane of the Configuration Parameters dialog box.	`'none' | 'warning' | {'error'}`
`ModelReferenceIO-MismatchMessage`	Message shown when there is a port and parameter mismatch. Set by **Port and parameter mismatch** on the **Model Referencing Diagnostics** pane of the Configuration Parameters dialog box.	`{'none'} | 'warning' | 'error'`
`ModelReferenceIOMsg`	Message shown when there is an invalid root Inport or Outport block connection. Set by **Invalid root Inport/ Outport block connection** on the **Model Referencing Diagnostics** pane of the Configuration Parameters dialog box.	`{'none'} | 'warning' | 'error'`

Parameter	Description	Values
`ModelReferenceMin-AlgLoopOccurrences`	Toggles the minimization of algebraic loop occurrences. Set by **Minimize algebraic loop occurrences** on the **Model Referencing** pane of the Configuration Parameters dialog box.	`'on' | {'off'}`
`ModelReferenceNum-InstancesAllowed`	Total number of model reference instances allowed per top model. Set by **Total number of instances allowed per top model** on the **Model Referencing** pane of the Configuration Parameters dialog box.	`'Zero' | 'Single' | {'Multi'}`
`ModelReferencePass-RootInputsByReference`	Toggles the passing of scalar root inputs by value. Set by “Pass fixed-size scalar root inputs by value for code generation”on the **Model Referencing** pane of the Configuration Parameters dialog box.	`{'on'} | 'off'`
`ModelReferenceSim-TargetVerbose`	This parameter is deprecated and has no effect. Use `AccelVerboseBuild` instead.	
`ModelReferenceSymbol-NameMessage`	For referenced models, specifies diagnostic action to take when the **Maximum identifier length** does not provide enough space to make global identifiers unique across models.	`'none' | {'warning'} | 'error'`

Parameter	Description	Values
`ModelReferenceTargetType`	For internal use.	
`ModelReferenceVersion-MismatchMessage`	Message shown when there is a model block version mismatch. Set by **Model block version mismatch** on the **Model Referencing Diagnostics** pane of the Configuration Parameters dialog box.	`{'none'} | 'warning' | 'error'`
`ModelVersion`	Version number of model.	`{'1.1'}`
`ModelVersionFormat`	Format of model's version number. Set by **Model version** on the **History** pane of the Model Properties dialog box. See “Model Information and History” for more information.	`{'1.%<AutoIncrement: 0>'}`
`ModelWorkspace`	References this model's model workspace object.	an instance of the `Simulink.ModelWorkspace` class
`ModifiedByFormat`	Format for the display of last modifier. Set by **Last saved by** on the **History** pane of the Model Properties dialog box. See “Model Information and History” for more information. Can also be set by **Last saved by** on the **Model history** field on the **History** pane of the Model Explorer.	`{'%<Auto>'}`

Parameter	Description	Values
ModifiedComment	Field for user comments.	{''}
ModifiedDateFormat	Format used to generate the value of the LastModifiedDate parameter. Set by **Last saved on** on the **History** pane of the Model Properties dialog box. See "Model Information and History" for more information.	{'%<Auto>'}
ModifiedHistory	Area for keeping notes about the history of the model. Set by the **Model history** field on the **History** pane of the Model Properties dialog box. See "Model Information and History" for more information. Can also be set by the **Model history** field on the **History** pane of the Model Explorer.	{''}
MultiTaskCondExecSysMsg	Select the diagnostic action to take if Simulink software detects a subsystem that might cause data corruption or nondeterministic behavior. Set by **Multitask conditionally executed subsystem** on the **Sample Time Diagnostics** pane of the Configuration Parameters dialog box.	'none' | 'warning' | {'error'}

Parameter	Description	Values
`MultiTaskDSMMsg`	Specifies diagnostic action to take when one task reads data from a Data Store Memory block to which another task writes data. Set by **Multitask data store** on the **Data Validity Diagnostics** pane of the Configuration Parameters dialog box.	`'none' | 'warning' | {'error'}`
`MultiTaskRateTransMsg`	Specifies diagnostic action to take when an invalid rate transition takes place between two blocks operating in multitasking mode. Set by **Multitask rate transition** on the **Sample Time Diagnostics** pane of the Configuration Parameters dialog box.	`'warning' | {'error'}`
`Name`	Model name.	character vector
`NonBusSignalsTreatedAsBus`	Detect when Simulink implicitly converts a non-bus signal to a bus signal to support connecting the signal to a block expecting a bus signal. **“Non-bus signals treated as bus signals”** on the **Diagnostics > Connectivity** pane of the Configuration Parameters dialog box.	`{'none'} | 'warning' | 'error'`

Parameter	Description	Values
`NumberNewtonIterations`	Number of Newton's method iterations performed by the `ode14x` implicit fixed-step solver. Set by **Number Newton's iterations** on the **Solver** pane of the Configuration Parameters dialog box.	integer — `{1}`
`NumStatesForStiffnessChecking`	Threshold value of number of continuous states in model for stiffness calculation. If the number of continuous states in the model exceeds the `NumStatesForStiffnessChecking` value, auto solver uses `ode15s`. For more information, see “Use Auto Solver to Select a Solver”.	`{''}`
`ObjectParameters`	Names and attributes of model parameters.	structure
`Open`	For internal use.	
`OptimizeBlockIOStorage`	Enables signal storage reuse optimization. Set by **Signal storage reuse** on the Configuration Parameters dialog box.	`{'on'} | 'off'`

Parameter	Description	Values
`OutputOption`	Time step output options for variable-step solvers. Set by **Output options** parameter under **Configuration Parameters** > **Data Import/Export** > **Additional parameters**.	`'AdditionalOutputTimes' | {'RefineOutputTimes'} | 'SpecifiedOutputTimes'`
`OutputSaveName`	Workspace variable to store the model outputs. Set by the **Output** field on the **Data Import/Export** pane of the Configuration Parameters dialog box.	`{'yout'}`
`OutputTimes`	Output times set when Set by **Output options** parameter under **Configuration Parameters** > **Data Import/Export** > **Additional parameters** is set to `Produce additional output`. Set using the **Output times** parameter.	`{'[]'}` **Note** If the value of **Output options** is `Produce additional output` or `Produce specified output only`, set to a value other than the default value of `'[]'`.
`PaperOrientation`	Printing paper orientation.	`'portrait' | {'landscape'}`
`PaperPosition`	When `PaperPositionMode` is set to `manual`, this parameter determines the position and size of a diagram on paper and the size of the diagram exported as a graphic file in the units specified by `PaperUnits`.	vector — `[left, bottom, width, height]`

Parameter	Description	Values
PaperPositionMode	Paper position mode. • auto When printing, Simulink software sizes the diagram to fit the printed page. When exporting a diagram as a graphic image, Simulink software sizes the exported image to be the same size as the diagram's normal size on screen. • manual When printing, Simulink software positions and sizes the diagram on the page as indicated by PaperPosition. When exporting a diagram as a graphic image, Simulink software sizes the exported graphic to have the height and width specified by PaperPosition. • tiled Enables tiled printing. See “Tiled Printing” for more information.	{'auto'} | 'manual' | 'tiled'
PaperSize	Size of PaperType in PaperUnits.	vector — [width height] (read only)

Parameter	Description	Values
PaperType	Printing paper type.	'usletter' | 'uslegal' | 'a0' | 'a1' | 'a2' | 'a3' | 'a4' | 'a5' | 'b0' | 'b1' | 'b2' | 'b3' | 'b4' | 'b5' | 'arch-A' | 'arch-B' | 'arch-C' | 'arch-D' | 'arch-E' | 'A' | 'B' | 'C' | 'D' | 'E' | 'tabloid'
PaperUnits	Printing paper size units.	'normalized' | {'inches'} | 'centimeters' | 'points'

Parameter	Description	Values
`ParallelModelReferenceErrorOnInvalidPool`	Specify if you want the Simulink software to perform a consistency check on the parallel pool before starting a parallel build. If you set the parameter to `on`, the client and the remote workers must meet the following criteria for the parallel build to initiate: • The parallel pool is open. • The pool is `spmd` compatible. • The platform is consistent between workers and client. • The workers have a Simulink Real-Time license. • A common compiler exists across workers and client. If you set the parameter to `off`, the software displays a warning for the first condition that fails and then performs a sequential build.	`{'on'} | 'off'`

Parameter	Description	Values
`ParameterArgumentNames`	List of parameters used as arguments when this model is called as a reference. Set by checking the **Argument** column for variables in the model workspace of the referenced model. See “Parameterize Instances of a Reusable Referenced Model”.	`{''}`
`ParameterDowncastMsg`	Specifies diagnostic action to take when a parameter downcast occurs during simulation. Set by **Detect downcast** on the **Data Validity Diagnostics** pane of the Configuration Parameters dialog box.	`'none' | 'warning' | {'error'}`
`ParameterOverflowMsg`	Specifies diagnostic action to take when a parameter overflow occurs during simulation. Set by **Detect overflow** on the **Data Validity Diagnostics** pane of the Configuration Parameters dialog box.	`'none' | 'warning' | {'error'}`

Parameter	Description	Values
`ParameterPrecisionLossMsg`	Specifies diagnostic action to take when parameter precision loss occurs during simulation. Set by **Detect precision loss** on the **Data Validity Diagnostics** pane of the Configuration Parameters dialog box.	`'none' | {'warning'} | 'error'`
`ParameterTunabilityLossMsg`	Specifies diagnostic action to take when a parameter cannot be tuned because it uses unsupported functions or operators. Set by **Detect loss of tunability** on the **Data Validity Diagnostics** pane of the Configuration Parameters dialog box.	`'none' | {'warning'} | 'error'`
`ParameterUnderflowMsg`	Specifies diagnostic action to take when a parameter underflow occurs during simulation. Set by **Detect underflow** on the **Data Validity Diagnostics** pane of the Configuration Parameters dialog box.	`{'none'} | 'warning' | 'error'`
`ParamWorkspaceSource`	For internal use.	
`Parent`	Name of the model or subsystem that owns this object. The value of this parameter for a model is an empty character vector.	`{''}`

Parameter	Description	Values
`Pause`	Pause simulation callback. Set by **Simulation pause function** on the **Callbacks** pane of the Model Properties dialog box.	`{''}`
`PortDataTypeDisplayFormat`	When you display port data types in a model by selecting **Display** > **Signals and Ports** > **Port Data Types**, choose whether to display data type aliases, base data types, or both. In the Simulink Editor, set by **Display** > **Signals and Ports** > **Port Data Type Display Format**.	`{'AliasTypeOnly'} | 'BaseTypeOnly' | 'BaseAndAliasTypes'`
`PositivePriorityOrder`	Choose the appropriate priority ordering for the real-time system targeted by this model. The Simulink Coder software uses this information to implement asynchronous data transfers. Set by **Higher priority value indicates higher task priority** on the **Solver** pane of the Configuration Parameters dialog box.	`'on' | {'off'}`

Parameter	Description	Values
`PostLoadFcn`	Function invoked just after this model is loaded. Set by **Model post-load function** on the **Callbacks** pane of the Model Properties dialog box. See “Create Model Callbacks” for more information.	`{''}`
`PostSaveFcn`	Function invoked just after this model is saved to disk. Not executed for blocks inside library links. Set by **Model post-save function** on the **Callbacks** pane of the Model Properties dialog box. See “Create Model Callbacks” for more information.	`{''}`
`PreLoadFcn`	Preload callback. Set by **Model pre-load function** on the **Callbacks** pane of the Model Properties dialog box. See “Create Model Callbacks” for more information.	`{''}`

Parameter	Description	Values
PreSaveFcn	Function invoked just before this model is saved to disk. Not executed for blocks inside library links, except when you are breaking the link, e.g., with save_system(A, B, 'BreakUserLinks', 'on'). Set by **Model pre-save function** on the **Callbacks** pane of the Model Properties dialog box. See "Create Model Callbacks" for more information.	{''}
ProdBitPerChar	Describes the length in bits of the C char data type supported by the hardware board to be used by this model. Set by **Number of bits: char** on the **Hardware Implementation** pane of the Configuration Parameters dialog box.	integer — {8}
ProdBitPerInt	Describes the length in bits of the C int data type supported by the hardware board to be used by this model. Set by **Number of bits: int** on the **Hardware Implementation** pane of the Configuration Parameters dialog box.	integer — {32}

Parameter	Description	Values
ProdBitPerLong	Describes the length in bits of the C long data type supported by the hardware board to be used by this model. Set by **Number of bits: long** on the **Hardware Implementation** pane of the Configuration Parameters dialog box.	integer — {32}
ProdBitPerLongLong	Describes the length in bits of the C long data type supported by the hardware board to be used by this model. Set by **Number of bits: long long** on the **Hardware Implementation** pane of the Configuration Parameters dialog box. The value of this parameter must be greater than or equal to the value of ProdBitPerLong.	integer — {64}
ProdBitPerShort	Describes the length in bits of the C short data type supported by the hardware board to be used by this model. Set by **Number of bits: short** on the **Hardware Implementation** pane of the Configuration Parameters dialog box.	integer — {16}

Parameter	Description	Values
`ProdEndianess`	Describes the significance of the first byte of a data word of the hardware board to be used by this model. Set by **Byte ordering** on the **Hardware Implementation** pane of the Configuration Parameters dialog box.	`{'Unspecified'} | 'LittleEndian' | 'BigEndian'`
`ProdEqTarget`	Specifies that the hardware used to test the code generated from this model is the same as the production hardware or has the same characteristics.	`{'on'} | 'off'`
`ProdHWDeviceType`	Predefined hardware device to specify the C language constraints for your microprocessor. Set by **Device vendor** and **Device type** on the **Hardware Implementation** pane of the Configuration Parameters dialog box.	`{'Generic->Unspecified (assume 32-bit Generic)'}`
`ProdIntDivRoundTo`	Describes how the C compiler that creates production code for this model rounds the result of dividing one signed integer by another to produce a signed integer quotient. Set by **Signed integer division rounds to** on the **Hardware Implementation** pane of the Configuration Parameters dialog box.	`'Floor' | 'Zero' | {'Undefined'}`

Parameter	Description	Values
ProdLargestAtomicFloat	Specify the largest floating-point data type that can be atomically loaded and stored on the hardware board. Set by **Largest atomic size: floating-point** on the **Hardware Implementation** pane of the Configuration Parameters dialog box.	'Float' | 'Double' | {'None'}
ProdLargestAtomicInteger	Specify the largest integer data type that can be atomically loaded and stored on the hardware board. Set this parameter to 'LongLong' only if the production hardware supports the C long long data type and you have set ProdLongLongMode to 'on'. Set by **Largest atomic size: integer** on the **Hardware Implementation** pane of the Configuration Parameters dialog box.	{'Char'} | 'Short' | 'Int' | 'Long' | 'LongLong'
ProdLongLongMode	Specify that your C compiler supports the C long long data type. Most C99 compilers support long long. Set by **Support long long** on the **Hardware Implementation** pane of the Configuration Parameters dialog box.	'on' | {'off'}

Parameter	Description	Values
`ProdShiftRightIntArith`	Describes whether the C compiler that creates production code for this model implements a signed integer right shift as an arithmetic right shift. Set by **Shift right on a signed integer as arithmetic shift** on the **Hardware Implementation** pane of the Configuration Parameters dialog box.	`{'on'} | 'off'`
`ProdWordSize`	Describes the word length in bits of the hardware board to be used by this model. Set by **Number of bits: native** on the **Hardware Implementation** pane of the Configuration Parameters dialog box.	integer — `{32}`
`Profile`	Enables the simulation profiler for this model. In the Simulink Editor, set by **Show Profiler Report** on the **Analysis** menu.	`'on' | {'off'}`

Parameter	Description	Values
PropagateSignalLabelsOutOfModel	Pass propagated signal names to output signals of Model block. Set by **Propagate all signal labels out of the model** on the **Model Referencing** pane of the Configuration Parameters dialog box. See "Propagate all signal labels out of the model" for more information.	{'on'} | 'off'
PropagateVarSize	Select how variable-size signals propagate through referenced models. Set by **Propagate sizes of variable-size signals** on the **Model Referencing** pane of the Configuration Parameters dialog box. See **"Model Configuration Parameters: Model Referencing"** for more information.	| 'Infer from blocks in model' | 'Only when enabling' | 'During execution'
ReadBeforeWriteMsg	Specifies diagnostic action to take when the model attempts to read data from a data store before it has stored data at the current time step. Set by **Detect read before write** on the **Data Validity Diagnostics** pane of the Configuration Parameters dialog box.	{'UseLocalSettings'} | 'DisableAll' | 'EnableAllAsWarning' | 'EnableAllAsError'

Parameter	Description	Values
RecordCoverage	If RecordCoverage is set to on, Simulink collects and reports model coverage data during simulation. The format of this report is controlled by the values of the following parameters: CovCompData CovCumulativeReport CovCumulativeVarName CovHTMLOptions CovHtmlReporting CovMetricSettings CovModelRefEnable CovModelRefExcluded CovNameIncrementing CovPath CovReportOnPause CovSaveCumulativeToWork-SpaceVar CovSaveName CovSaveSingleToWorkspac eVar If set to off, no model coverage data is collected or reported.	'on' | {'off'}

Parameter	Description	Values
	Set by **Entire System** on the **Coverage** pane of the Configuration Parameters dialog box.	
`Refine`	Refine factor. Set by **Refine factor** parameter under parameter under **Configuration Parameters > Data Import/ Export > Additional parameters**.	`{'1'}`
`RelTol`	Relative error tolerance. Set by **Relative tolerance** on the **Solver** pane of the Configuration Parameters dialog box.	`{'1e-3'}`
`RemoveDisableFunc`	For model referencing contexts for ERT targets, remove the generated disable functions that cannot be reached from anywhere in the generated code. Set by the **“Remove disable function” (Embedded Coder)** configuration parameter.	`'on' | {'off'}`

Parameter	Description	Values
`RemoveResetFunc`	For model referencing contexts for ERT targets, remove the generated reset functions that cannot be reached from anywhere in the generated code. Set by the **“Remove reset function” (Embedded Coder)** configuration parameter.	`{'on'} | 'off'`
`ReportName`	Name of the associated file for the Report Generator.	`{'simulink-default.rpt'}`
`ReqHilite`	Highlights all the blocks in the Simulink diagram that have requirements associated with them. In the Simulink Editor, set by **Highlight Model** on the **Analysis > Requirements** menu.	`'on' | {'off'}`
`RequirementInfo`	For internal use.	
`RootOutportRequire-BusObject`	Specifies diagnostic action to take when a bus enters a root model Outport block for which a bus object has not been specified. Set by **Unspecified bus object at root Outport block** on the **Connectivity Diagnostics** pane of the Configuration Parameters dialog box.	`'none' | {'warning'} | 'error'`

Parameter	Description	Values
RTPrefix	Specifies diagnostic action to take when Simulink software encounters an object name that begins with rt. Set by **"rt" prefix for identifiers** on the **Data Validity Diagnostics** pane of the Configuration Parameters dialog box.	'none' | 'warning' | {'error'}
RTW...	For information about model parameters beginning with RTW, see Configuration Parameters for Simulink Models and Parameter Reference in the Simulink Coder documentation.	
SampleTimeAnnotations	In the Simulink Editor, set by **Annotations** on the **Display** > **Sample Time** menu.	'on' | {'off'}
SampleTimeColors	In the Simulink Editor, set by **Colors** on the **Display** > **Sample Time Display** menu.	'on' | {'off'}
SampleTimeConstraint	This option appears when the solver type is Fixed-step. Set by **Periodic sample time constraint** on the **Solver** pane of the Configuration Parameters dialog box.	{'Unconstrained'} | 'STIndependent' | 'Specified'

Parameter	Description	Values
`SampleTimeProperty`	Specifies and assigns priorities to the sample times implemented by the model. This option appears when **Periodic sample time constraint** is set to `Specified`. Set by **Sample time properties** on the **Solver** pane of the Configuration Parameters dialog box.	Structure containing the fields `SampleTime`, `Offset`, and `Priority`
`SavedCharacterEncoding`	Specifies the character set used to encode this model. See the `slCharacterEncoding` command for more information.	character vector
`SaveDefaultBlockParams`	For internal use.	
`SavedSinceLoaded`	Indicates whether the model has been saved since it was loaded. `'on'` indicates the model has been saved.	`'on' | 'off'`
`SaveFinalState`	Save final states to workspace. Set by the **Final states** check box on the **Data Import/Export** pane of the Configuration Parameters dialog box.	`'on' | {'off'}`
`SaveFormat`	Format used to save data to the MATLAB workspace. Set by **Format** on the **Data Import/Export** pane of the Configuration Parameters dialog box.	`{'Dataset'} | 'Structure' | 'StructureWithTime'| 'Array'`

Parameter	Description	Values
`SaveOutput`	Save simulation output to workspace. Set by the **Output** check box on the **Data Import/Export** pane of the Configuration Parameters dialog box. Do not use a variable name that is the same as a `Simulink.SimulationOutput` object function name or property name.	`{'on'} | 'off'`
`SaveState`	Save states to workspace. Set by the **States** check box on the **Data Import/Export** pane of the Configuration Parameters dialog box.	`'on' | {'off'}`
`SaveTime`	Save simulation time to workspace. Set by the **Time** check box on the **Data Import/Export** pane of the Configuration Parameters dialog box. Do not use a variable name that is the same as a `Simulink.SimulationOutput` object function name or property name.	`{'on'} | 'off'`

Parameter	Description	Values
`SaveWithDisabledLinksMsg`	Specifies diagnostic action to take when saving a block diagram having disabled library links. Set by **Block diagram contains disabled library links** on the **Saving Diagnostics** pane of the Configuration Parameters dialog box.	`'none' | {'warning'} | 'error'`
`SaveWithParameterized-LinksMsg`	Specifies diagnostic action to take when saving a block diagram having parameterized library links. Set by **Block diagram contains parameterized library links** on the **Saving Diagnostics** pane of the Configuration Parameters dialog box.	`'none' | {'warning'} | 'error'`
`ScreenColor`	Background color of the model window. In the Simulink Editor, set by **Canvas Color** on the **Diagram > Format** menu.	`'black' | {'white'} | 'red' | 'green' | 'blue' | 'cyan' | 'magenta' | 'yellow' | 'gray' | 'lightBlue' | 'orange' | 'darkGreen' | [r,g,b,a]` where `r, g, b`, and `a` are the red, green, blue, and alpha values of the color normalized to the range 0.0 to 1.0. The alpha value is ignored.
`ScrollbarOffset`	For internal use.	

Parameter	Description	Values
SFcnCompatibilityMsg	Specifies diagnostic action to take when S-function upgrades are needed. Set by **S-function upgrades needed** on the **Compatibility Diagnostics** pane of the Configuration Parameters dialog box.	{'none'} | 'warning' | 'error'
SFExecutionAtInitializationDiag	Select the diagnostic action to take when Stateflow detects triggered or enabled charts that are not running at initialization. Set by **“Execute-at-Initialization disabled in presence of input events”** on the **Compatibility Diagnostics** pane of the Configuration Parameters dialog box.	

Parameter	Description	Values
SFInvalidInputDataAccess-InChartInitDiag	Select the diagnostic action to take when a chart: - Has the ExecuteAtInitialization property set to true - Accesses input data on a default transition or associated state entry actions, which execute at chart initialization Set by **Invalid input data access in chart initialization** on the **Diagnostics > Stateflow** pane of the Configuration Parameters dialog box.	'none' | {'warning'} | 'error'
SFMachineParented-DataDiag	Select the diagnostic action to take when Stateflow detects machine-parented data that you can replace with chart-parented data of scope Data Store Memory. Set by **“Use of machine-parented data instead of Data Store Memory”** on the **Diagnostics > Stateflow** pane of the Configuration Parameters dialog box.	'none'|{'warning'}|'error'

Parameter	Description	Values
SFNoUnconditionalDefault-TransitionDiag	Select the diagnostic action to take when a chart does not have an unconditional default transition to a state or a junction. Set by **No unconditional default transitions** on the **Diagnostics > Stateflow** pane of the Configuration Parameters dialog box.	'none' | {'warning'} | 'error'
SFSelfTransitionDiag	Select the diagnostic action to take when you can remove a self-transition on a leaf state. Set by **“Self transition on leaf state”** on the **Diagnostics > Stateflow** pane of the Configuration Parameters dialog box.	'none'|{'warning'}|'error'
SFSimEcho	Enables output to appear in the MATLAB Command Window during simulation of a model that contains MATLAB Function blocks, Stateflow charts, or Truth Table blocks. Set by **Echo expressions without semicolons** on the **Simulation Target** pane of the Configuration Parameters dialog box.	{'on'} | 'off'

Parameter	Description	Values
SFTemporalDelaySmallerThanSampleTimeDiag	Select the diagnostic action to take when a state or transition absolute time operator uses a time value that is shorter than the sample time for the Stateflow block. Set by **“Absolute time temporal value shorter than sampling period”** on the **Simulation Target** pane of the Configuration Parameters dialog box.	'none'|{'warning'}|'error'
SFTransitionActionBeforeConditionDiag	Select the diagnostic action to take when a transition action is specified before a condition action in a transition path containing multiple segmented transitions. Set by **“Transition action specified before condition action”** on the **Diagnostics** > **Stateflow** pane of the Configuration Parameters dialog box.	'none' | {'warning'} | 'error'
SFTransitionOutsideNaturalParentDiag	Select the diagnostic action to take when a chart contains a transition that loops outside the parent state or junction. Set by **Transition outside natural parent** on the **Diagnostics** > **Stateflow** pane of the Configuration Parameters dialog box.	'none' | {'warning'} | 'error'

Parameter	Description	Values
SFUndirectedBroadcastEventsDiag	Select the diagnostic action to take when a chart contains undirected local event broadcasts. Set by **Undirected event broadcasts** on the **Diagnostics** > **Stateflow** pane of the Configuration Parameters dialog box.	'none' | {'warning'} | 'error'
SFUnexpectedBacktrackingDiag	Select the diagnostic action to take when a chart junction: • Does not have an unconditional transition path to a state or a terminal junction • Has multiple transition paths leading to it Set by **Unexpected backtracking** on the **Diagnostics** > **Stateflow** pane of the Configuration Parameters dialog box.	'none' | {'warning'} | 'error'
SFUnreachableExecutionPathDiag	Select the diagnostic action to take when there are chart constructs not on a valid execution path. Set by **“Unreachable execution path”** on the **Diagnostics** > **Stateflow** pane of the Configuration Parameters dialog box.	'none' | {'warning'} | 'error'

Parameter	Description	Values
`SFUnusedDataAndEventsDiag`	Select the diagnostic action to take for detection of unused data and events in a chart. Set by **Unused data and events** on the **Diagnostics > Stateflow** pane of the Configuration Parameters dialog box.	`'none' | {'warning'} | 'error'`
`ShapePreserveControl`	At each time step, use derivative information to improve integration accuracy. Set by **Shape preservation** on the **Solver** pane of the Configuration Parameters dialog box.	`'EnableAll' | {'DisableAll'}`
`ShowGrid`	Has no effect in Simulink Editor. This parameter will be removed in a future release.	`'on' | {'off'}`
`ShowLinearization-Annotations`	Toggles linearization icons in the model.	`{'on'} | 'off'`
`ShowLineDimensions`	Show signal dimensions on this model's block diagram. In the Simulink Editor, set by **Signal Dimensions** on the **Display > Signal & Ports** menu.	`'on' | {'off'}`
`ShowLineDimensions-OnError`	For internal use.	
`ShowLineWidths`	Deprecated. Use `ShowLineDimensions` instead.	
`ShowLoopsOnError`	Highlight invalid loops graphically.	`{'on'} | 'off'`

Parameter	Description	Values
`ShowModelReference-BlockIO`	Toggles display of I/O mismatch on block. In the Simulink Editor, set by **Block I/O Mismatch for Referenced Model** on the **Display** > **Blocks** menu.	`'on' | {'off'}`
`ShowModelReference-BlockVersion`	Toggles display of version on block. In the Simulink Editor, set by **Block Version for Referenced Models** on the **Display** > **Blocks** menu.	`'on' | {'off'}`
`Shown`	For internal use.	
`ShowPageBoundaries`	Toggles display of page boundaries on the Simulink Editor canvas. In the Simulink Editor, set by **Show Page Boundaries** on the **File** > **Print** menu.	`'on' | {'off'}`
`ShowPortDataTypes`	Show data types of ports on this model's block diagram. In the Simulink Editor, set by **Port Data Types** on the **Display** > **Signals & Ports** menu.	`'on' | {'off'}`
`ShowPortDataTypesOnError`	For internal use.	

Parameter	Description	Values
`ShowPortUnits`	Show units of ports, subsystem, and model block icons on the model block diagram. In the Simulink Editor, set **Port Units** on the **Display** > **Signals & Ports** menu.	`'on' | {'off'}`
`ShowStorageClass`	Show storage classes of signals on this model's block diagram. In the Simulink Editor, set by **Storage Class** on the **Format** > **Signals & Ports** menu.	`'on' | {'off'}`
`ShowTestPointIcons`	Show test point icons on this model's block diagram. In the Simulink Editor, set by **Testpoint & Logging Indicators** on the **Display** > **Signals & Ports** menu.	`{'on'} | 'off'`
`ShowViewerIcons`	Show viewer icons on this model's block diagram. In the Simulink Editor, set by **Viewer Indicator** on the **Display** > **Signals & Ports** menu.	`{'on'} | 'off'`

Parameter	Description	Values
`SignalHierarchy`	If the signal is a bus, returns the name and hierarchy of the signals in the bus. (Read-only) Get with the `get_param` command. Specify a port or line handle. See "Display Information About Buses".	Return values reflect the structure of the signal that you specify.
`SignalInfNanChecking`	Specifies diagnostic action to take when the value of a block output is `Inf` or `NaN` at the current time step. Set by **Inf or NaN block output** on the **Data Validity Diagnostics** pane of the Configuration Parameters dialog box.	`{'none'} | 'warning' | 'error'`
`SignalLabelMismatchMsg`	Specifies diagnostic action to take when a signal label mismatch occurs. Set by **Signal label mismatch** on the **Connectivity Diagnostics** pane of the Configuration Parameters dialog box.	`{'none'} | 'warning' | 'error'`
`SignalLogging`	Globally enable signal logging for this model. Set by the **Signal logging** check box on the **Data Import/Export** pane of the Configuration Parameters dialog box.	`{'on'} | 'off'`

Parameter	Description	Values
`SignalLoggingName`	Name for saving signal logging data to a workspace. Set by the **Signal logging** field on the **Data Import/Export** pane of the Configuration Parameters dialog box. Do not use a variable name that is the same as a `Simulink.SimulationOutput` object function name or property name.	`{'logsout'}`
`SignalLoggingSaveFormat`	Format for saving signal logging data.	`{'Dataset'}` `'ModelDataLogs'` is supported for backward compatibility. However, when you open a model in R2016a or later, signal logging uses `Dataset` format, regardless of the setting of this parameter.
`SignalNameFromLabel`	Propagate signal names for Bus Creator block input signals whenever you change the name of an input signal programmatically. Set with the `set_param` command, using either a port or line handle and a character vector specifying the signal name to propagate.	`{''}`

Parameter	Description	Values
SignalRangeChecking	Select the diagnostic action to take when signals exceed specified minimum or maximum values. Set by **Simulation range checking** on the **Data Validity Diagnostics** pane of the Configuration Parameters dialog box.	{'none'} | 'warning' | 'error'
SignalResolutionControl	Control which named states and signals get resolved to Simulink signal objects. Set by **Signal resolution** on the **Data Validity Diagnostics** pane of the Configuration Parameters dialog box.	'None' | {'UseLocalSettings'} | 'TryResolveAll' | 'TryResolveAllWithWarning'
SigSpecEnsureSample-TimeMsg	Specifies diagnostic action to take when the sample time of the source port of a signal specified by a Signal Specification block differs from the signal's destination port. Set by **Enforce sample times specified by Signal Specification blocks** on the **Sample Time Diagnostics** pane of the Configuration Parameters dialog box.	'none' | {'warning'} | 'error'

Parameter	Description	Values
SimBuildMode	Specifies how you build the simulation target for a model that contains MATLAB Function blocks, Stateflow charts, or Truth Table blocks. Set by **Simulation target build mode** on the **Simulation Target** pane of the Configuration Parameters dialog box.	{'sf_incremental_build'} | 'sf_nonincremental_build' | 'sf_make' | 'sf_make_clean' | 'sf_make_clean_objects'
SimCompilerOptimization	Specifies the compiler optimization level during acceleration code generation. Set by **Compiler optimization level** on the Configuration Parameters dialog box.	'on' | {'off'}
SimCtrlC	Enables responsiveness checks in code generated for MATLAB Function blocks. Set by **“Ensure responsiveness”** on the **Simulation Target** pane of the Configuration Parameters dialog box.	{'on'} | 'off'

Parameter	Description	Values
`SimCustomHeaderCode`	Enter code lines to appear near the top of a generated header file for a model that contains MATLAB Function blocks, Stateflow charts, or Truth Table blocks. Set by **Header file** on the **Simulation Target > Custom Code** pane of the Configuration Parameters dialog box.	`{''}`
`SimCustomInitializer`	Enter code statements that execute once at the start of simulation for a model that contains MATLAB Function blocks, Stateflow charts, or Truth Table blocks. Set by **Initialize function** on the **Simulation Target > Custom Code** pane of the Configuration Parameters dialog box.	`{''}`
`SimCustomSourceCode`	Enter code lines to appear near the top of a generated source code file for a model that contains MATLAB Function blocks, Stateflow charts, or Truth Table blocks. Set by **Source file** on the **Simulation Target > Custom Code** pane of the Configuration Parameters dialog box.	`{''}`

Parameter	Description	Values
`SimCustomTerminator`	Enter code statements that execute at the end of simulation for a model that contains MATLAB Function blocks, Stateflow charts, or Truth Table blocks. Set by **Terminate function** on the **Simulation Target > Custom Code** pane of the Configuration Parameters dialog box.	`{''}`
`SimIntegrity`	Detects violations of memory integrity while building MATLAB Function blocks and stops simulation with a diagnostic. Set by **"Ensure memory integrity"** on the **Simulation Target** pane of the Configuration Parameters dialog box.	`{'on'} | 'off'`
`SimParseCustomCode`	Specify whether or not to parse the custom code and report unresolved symbols in the model. Set by **Parse custom code symbols** on the **Simulation Target > Custom Code** pane of the Configuration Parameters dialog box.	`{'on'} | 'off'`

Parameter	Description	Values
`SimReservedNameArray`	Enter the names of variables or functions in the generated code that match the names of variables or functions specified in custom code. This action prevents naming conflicts between identifiers in the generated code and in custom code for a model that contains MATLAB Function blocks, Stateflow charts, or Truth Table blocks. Set by **Reserved names** on the **Simulation Target > Symbols** pane of the Configuration Parameters dialog box.	character vector array — `{{}}`
`SimulationCommand`	Executes a simulation command. **Note** You cannot use `set_param` to run a simulation in a MATLAB session that does not have a display, i.e., if you used `matlab -nodisplay` to start the session.	`'start' | 'stop' | 'pause' | 'continue' | 'step' | 'update' | 'WriteDataLogs' | 'SimParamDialog' | 'connect' | 'disconnect' | 'WriteExtModeParamVect' | 'AccelBuild'`
`SimulationMode`	Indicates whether Simulink software should run in Normal, Accelerator, Rapid Accelerator, SIL, PIL, or External mode. In the Simulink Editor, set by the **Simulation > Mode** menu.	`{'normal'} | 'accelerator' | 'rapid-accelerator' | 'external' | 'Software-in-the-loop (SIL)' | 'Processor-in-the-loop (PIL)'`

Parameter	Description	Values
`SimulationStatus`	Indicates simulation status.	`{'stopped'} | 'updating' | 'initializing' | 'running' | 'compiled' | 'paused' | 'terminating' | 'external'`
`SimulationTime`	Current time value for the simulation.	double — `{0}`
`SimStateInterfaceChecksumMismatchMsg`	Check to ensure that the interface checksum is identical to the model checksum before loading the SimState.	`'none'|'warning'|error'`
`SimStateOlderReleaseMsg`	Check to report that the SimState was generated by an earlier version of Simulink. In the **Diagnostics** pane of the Configuration Parameters dialog box, configure the diagnostic to allow Simulink to report the message as error or warning.	`'error'|'warning'`
`SimUserDefines`	Enter a space-separated list of preprocessor macro definitions to be added to the generated code for a model that contains MATLAB Function blocks, Stateflow charts, or Truth Table blocks. Set by **Defines** on the **Simulation Target > Custom Code** pane of the Configuration Parameters dialog box.	`{''}`

Parameter	Description	Values

`SimUserIncludeDirs`	Enter a space-separated list of directory paths that contain files you include in the compiled target for a model that contains MATLAB Function blocks, Stateflow charts, or Truth Table blocks.
	Set by **Include directories** on the **Simulation Target > Custom Code** pane of the Configuration Parameters dialog box.
		`{''}`
		Note If your list includes any Windows path names that contain spaces, each instance must be enclosed in double quotes within the argument, for example,
		`'C:\Project "C:\Custom Files"'`

`SimUserLibraries`	Enter a space-separated list of static libraries that contain custom object code to link into the target for a model that contains MATLAB Function blocks, Stateflow charts, or Truth Table blocks. Set by **Libraries** on the **Simulation Target > Custom Code** pane of the Configuration Parameters dialog box.	`{''}`
`SimUserSources`	Enter a space-separated list of source files to compile and link into the target for a model that contains MATLAB Function blocks, Stateflow charts, or Truth Table blocks. Set by **Source files** on the **Simulation Target > Custom Code** pane of the Configuration Parameters dialog box.	`{''}`

Parameter	Description	Values
`SingleTaskRateTransMsg`	Specifies diagnostic action to take when a rate transition takes place between two blocks operating in single-tasking mode. Set by **Single task rate transition** on the **Sample Time Diagnostics** pane of the Configuration Parameters dialog box.	`{'none'} | 'warning' | 'error'`
`Solver`	Solver used for the simulation. Set by the **Solver** drop-down list on the **Solver** pane of the Configuration Parameters dialog box.	`'VariableStepDiscrete' | {'ode45'} | 'ode23' | 'ode113' | 'ode15s' | 'ode23s' | 'ode23t' | 'ode23tb' | 'FixedStepDiscrete' |'ode8'| 'ode5' | 'ode4' | 'ode3' | 'ode2' | 'ode1' | 'ode14x'`
`EnableMultiTasking`	Solver mode for this model. This option appears when the solver type is `Fixed-step`. Set by **“Treat each discrete rate as a separate task”** on the **Solver** pane of the Configuration Parameters dialog box.	`'On' | {'Off'}`
`SolverName`	Solver used for the simulation. See `Solver` parameter for more information.	

Parameter	Description	Values
`SolverPrmCheckMsg`	Enables diagnostics to control when Simulink software automatically selects solver parameters. This option notifies you if: • Simulink software changes a user-modified parameter to make it consistent with other model settings • Simulink software automatically selects solver parameters for the model, such as **FixedStepSize** Set by **Automatic solver parameter selection** on the **Solver** section of the **Diagnostics** pane of the Configuration Parameters dialog box.	`'none' | {'warning'} | 'error'`
`SolverResetMethod`	This option appears when the solver type is `Variable-step` and the solver is `ode15s (stiff/NDF)`, `ode23t (Mod. stiff/Trapezoidal)`, or `ode23tb (stiff/TR-BDF2)`. Set by **Solver reset method** on the **Solver** pane of the Configuration Parameters dialog box.	`{'Fast'} | 'Robust'`

Parameter	Description	Values
`SolverType`	Solver type used for the simulation. Set by **Type** on the **Solver** pane of the Configuration Parameters dialog box.	`{'Variable-step'} | 'Fixed-step'`
`SortedOrder`	Show the sorted order of this model's blocks on the block diagram. In the Simulink Editor, set by **Sorted Execution Order** on the **Display** > **Blocks** menu.	`'on' | {'off'}`
`StartFcn`	Start simulation callback. Set by **Simulation start function** on the **Callbacks** pane of the Model Properties dialog box. See “Create Model Callbacks” for more information.	`{''}`
`StartTime`	Simulation start time. Set by **Start time** on the **Solver** pane of the Configuration Parameters dialog box.	`{'0.0'}`

Parameter	Description	Values
`StateNameClashWarn`	Select the diagnostic action to take when a name is used for more than one state in the model. Set by **State name clash** on the **Solver** section of the **Diagnostics** pane of the Configuration Parameters dialog box.	`'none' | {'warning'}`
`StateSaveName`	State output name to be saved to workspace. Set by the **States** field on the **Data Import/Export** pane of the Configuration Parameters dialog box.	`{'xout'}`
`StatusBar`	Has no effect in Simulink Editor. This parameter will be removed in a future release. In the Simulink Editor, set by **Status Bar** on the **View** menu.	`{'on'} | 'off'`
`StiffnessThreshold`	Threshold value to determine if the model is stiff. A model is stiff if the stiffness exceeds the `StiffnessThreshold` value. The default value for this parameter is 1000. For more information, see “Use Auto Solver to Select a Solver”.	`{''}`

Parameter	Description	Values
`StopFcn`	Stop simulation callback. Set by **Simulation stop function** on the **Callbacks** pane of the Model Properties dialog box. See “Create Model Callbacks” for more information.	`{''}`
`StopTime`	Simulation stop time. Set by **Stop time** on the **Solver** pane of the Configuration Parameters dialog box.	`{'10.0'}`

`StrictBusMsg`	Specifies diagnostic action to take when Simulink software detects a signal that some blocks treat as a mux or vector, while other blocks treat the signal as a bus.
	To be enabled, several options in MathWorks products require this parameter be set to `'ErrorLevel1'` or `'ErrorOnBusTreatedAsVector'`.
	Set by **Bus signal treated as vector** on the **Diagnostics Connectivity** pane of the Configuration Parameters dialog box.
		`{'ErrorLevel1'}`
		`'WarnOnBusTreatedAsVector'` |
		`'ErrorOnBusTreatedAsVector'`

Parameter	Description	Values
`SupportModelReferenceSimTargetCustomCode`	Use custom C code with Stateflow or with MATLAB Function blocks during referenced model simulation (SIM) target build for accelerator mode **Caution** Using custom C code for referenced models in accelerator mode can produce different results than if you simulate the model without using the custom code. If the custom code includes declarations of structures for buses or enumerations, the SIM target generation fails if the build results in duplicate declarations of those structures. Also, if the custom code uses a structure representing a bus or enumeration, you could get unexpected simulation results.	`'on' | {'off'}`
`Tag`	User-specified text that is assigned to the model's `Tag` parameter and saved with the model.	`{''}`
`TargetBitPerChar`	Describes the length in bits of the C `char` data type supported by the hardware used to test generated code.	integer — `{8}`
`TargetBitPerInt`	Describes the length in bits of the C `int` data type supported by the hardware used to test generated code.	integer — `{32}`

Parameter	Description	Values
`TargetBitPerLong`	Describes the length in bits of the C `long` data type supported by the hardware used to test generated code.	integer — `{32}`
`TargetBitPerLongLong`	Describes the length in bits of the C `long long` data type supported by the hardware used to test generated code. The value of this parameter must be greater than or equal to the value of `TargetBitPerLong`.	integer — `{64}`
`TargetBitPerShort`	Describes the length in bits of the C `short` data type supported by the hardware used to test generated code.	integer — `{16}`
`TargetEndianess`	Describes the significance of the first byte of a data word of the hardware used to test generated code.	`{'Unspecified'} | 'LittleEndian' | 'BigEndian'`
`TargetHWDeviceType`	Describes the characteristics of the hardware used to test generated code.	`{'Generic->Unspecified (assume 32-bit Generic)'}`
`TargetIntDivRoundTo`	Describes how the C compiler that creates test code for this model rounds the result of dividing one signed integer by another to produce a signed integer quotient.	`'Floor' | 'Zero' | {'Undefined'}`
`TargetLargestAtomicFloat`	Specify the largest floating-point data type that can be atomically loaded and stored on the hardware used to test code.	`'Float' | 'Double' | {'None'}`

Parameter	Description	Values
TargetLargestAtomicInteger	Specify the largest integer data type that can be atomically loaded and stored on the hardware used to test code. Set this parameter to 'LongLong' only if the test hardware supports the C long long data type and you have set TargetLongLongMode to 'on'.	{'Char'} | 'Short' | 'Int' | 'Long' | 'LongLong'
TargetLongLongMode	Specify that your C compiler supports the C long long data type. Most C99 compilers support long long.	'on' | {'off'}
TargetShiftRightIntArith	Describes whether the C compiler that creates test code for this model implements a signed integer right shift as an arithmetic right shift.	{'on'} | 'off'
TargetTypeEmulation WarnSuppressLevel	Specifies whether Simulink Coder software displays or suppresses warning messages when emulating integer sizes in rapid prototyping environments.	integer — {0}
TargetWordSize	Describes the word length in bits of the hardware used to test generated code.	integer — {32}

Parameter	Description	Values
`TasksWithSamePriorityMsg`	Specifies diagnostic action to take when tasks have equal priority. Set by **Tasks with equal priority** on the **Sample Time Diagnostics** pane of the Configuration Parameters dialog box.	`'none' | {'warning'} | 'error'`
`TiledPageScale`	Scales the size of the tiled page relative to the model.	`{'1'}`
`TiledPaperMargins`	Controls the size of the margins associated with each tiled page. Each element in the vector represents a margin at the particular edge.	vector — `[left, top, right, bottom]`
`TimeAdjustmentMsg`	Specifies diagnostic action to take if Simulink software makes a minor adjustment to a sample hit time while running the model. Set by **Sample hit time adjusting** on the Configuration Parameters dialog box.	`{'none'} | 'warning'`
`TimeSaveName`	Simulation time name. Set by the **Time** field on the **Data Import/Export** pane of the Configuration Parameters dialog box.	variable — `{'tout'}`
`TLC...`	Parameters whose names begin with TLC are used for code generation. See the Simulink Coder documentation for more information.	

Parameter	Description	Values
`ToolBar`	Has no effect in Simulink Editor. This parameter will be removed in a future release. In the Simulink Editor, hide or display all toolbars with **Toolbars** on the **View** menu or, hide or display specific toolbars using **File** > **Simulink Preferences** > **Editor Default** toolbar options.	`{'on'} | 'off'`
`TryForcingSFcnDF`	This flag is used for backward compatibility with user S-functions that were written prior to R12.	`'on' | {'off'}`
`TunableVars`	List of global (tunable) parameters. Set in the Model Parameter Configuration dialog box.	`{''}`
`TunableVarsStorageClass`	List of storage classes for their respective tunable parameters. Set in the Model Parameter Configuration dialog box.	`{''}`
`TunableVarsTypeQualifier`	List of storage type qualifiers for their respective tunable parameters. Set in the Model Parameter Configuration dialog box.	`{''}`
`Type`	Simulink object type (read only).	`{'block_diagram'}`

Parameter	Description	Values
UnconnectedInputMsg	Unconnected input ports diagnostic. Set by **Unconnected block input ports** on the **Connectivity Diagnostics** pane of the Configuration Parameters dialog box.	'none' | {'warning'} | 'error'
UnconnectedLineMsg	Unconnected lines diagnostic. Set by **Unconnected line** on the **Connectivity Diagnostics** pane of the Configuration Parameters dialog box.	'none' | {'warning'} | 'error'
UnconnectedOutputMsg	Unconnected block output ports diagnostic. Set by **Unconnected block output ports** on the **Connectivity Diagnostics** pane of the Configuration Parameters dialog box.	'none' | {'warning'} | 'error'
UnderSpecifiedDataTypeMsg	Detect usage of heuristics to assign signal data types. Set by **Underspecified data types** on the **Data Validity Diagnostics** pane of the Configuration Parameters dialog box.	{'none'} | 'warning' | 'error'

Parameter	Description	Values
`UnderspecifiedInitializationDetection`	Select how Simulink software handles initialization of initial conditions for conditionally executed subsystems, Merge blocks, subsystem elapsed time, and Discrete-Time Integrator blocks. Set by **Underspecified initialization detection** on the Configuration Parameters dialog box.	`{'classic'} | 'simplified'`
`UniqueDataStoreMsg`	Specifies diagnostic action to take when the model contains multiple Data Store Memory blocks that specify the same data store name. Set by **Duplicate data store names** on the **Data Validity Diagnostics** pane of the Configuration Parameters dialog box.	`{'none'} | 'warning' | 'error'`
`UnknownTsInhSupMsg`	Detect blocks that have not set whether they allow the model containing them to inherit a sample time. Set by **Unspecified inheritability of sample time** on the **Diagnostics > Sample Time** pane of the Configuration Parameters dialog box.	`'none' | {'warning'} | 'error'`

Parameter	Description	Values
`UnnecessaryDatatypeConvMsg`	Detect unnecessary data type conversion blocks. Set by **Unnecessary type conversions** on the **Type Conversion Diagnostics** pane of the Configuration Parameters dialog box.	`{'none'} | 'warning'`
`UpdateHistory`	Specifies when to prompt the user about updating the model history. Set by **Prompt to update model history** on the **History** pane of the Model Properties dialog box or **Prompt to update model history** on the **History** pane of the Model Explorer. See "Model Information and History" for more information.	`{'UpdateHistoryNever'} | 'UpdateHistoryWhenSave'`
`UpdateModelReferenceTargets`	Specify whether to rebuild simulation and Simulink Coder targets for referenced models before updating, simulating, or generating code for this model. Set by **Rebuild** on the **Model Referencing** pane of the Configuration Parameters dialog box.	`'IfOutOfDate' | 'Force' | 'AssumeUpToDate' | {'IfOutOfDateOrStructuralChange'}`
`UseAnalysisPorts`	For internal use.	

Parameter	Description	Values
`UseDivisionForNetSlopeComputation`	Use division to handle net slope computations when simplicity and accuracy conditions are met.	`{'off'} | 'on' | 'UseDivisionForReciprocalsOfIntegersOnly'`
`VectorMatrix-ConversionMsg`	Detect vector-to-matrix or matrix-to-vector conversions. Set by **Vector/matrix block input conversion** on the **Type Conversion Diagnostics** pane of the Configuration Parameters dialog box.	`{'none'} | 'warning' | 'error'`
`Version`	Simulink version you are currently running, e.g., `'7.6'`. If you are using a service pack, the `ver` function returns an additional digit, e.g., 7.4.1 (R2009bSP1). To get version information without loading the block diagram into memory, see `Simulink.MDLInfo`.	double (read only)
`VersionLoaded`	Simulink version that last saved the model, e.g., `'7.6'`. If you are using a service pack, the `ver` function returns an additional digit, e.g., 7.4.1 (R2009bSP1). See also `SavedSinceLoaded`. To get version information without loading the block diagram into memory, see `Simulink.MDLInfo`.	double (read only)

Parameter	Description	Values
`WideLines`	Draws lines that carry vector or matrix signals wider than lines that carry scalar signals. In the Simulink Editor, set by **Wide Nonscalar Lines** on the **Display** > **Signals & Ports** menu.	`'on' | {'off'}`
`WideVectorLines`	Deprecated. Use `WideLines` instead.	
`WriteAfterReadMsg`	Specifies diagnostic action to take when the model attempts to store data in a data store after previously reading data from it in the current time step. Set by **Detect write after read** on the **Data Validity Diagnostics** pane of the Configuration Parameters dialog box.	`{'UseLocalSettings'} | 'DisableAll' | 'EnableAllAsWarning' | 'EnableAllAsError'`
`WriteAfterWriteMsg`	Specifies diagnostic action to take when the model attempts to store data in a data store twice in succession in the current time step. Set by **Detect write after write** on the **Data Validity Diagnostics** pane of the Configuration Parameters dialog box.	`{'UseLocalSettings'} | 'DisableAll' | 'EnableAllAsWarning' | 'EnableAllAsError'`

Parameter	Description	Values
`ZCThreshold`	Specifies the deadband region used during the detection of zero crossings. Signals falling within this region are defined as having crossed through zero. Set by **Signal threshold** on the **Solver** pane of the Configuration Parameters dialog box.	`{'auto'} |` any real number greater than or equal to zero
`ZeroCross`	For internal use.	
`ZeroCrossAlgorithm`	Specifies the algorithm to detect zero crossings when you select a variable-step solver. Set by **Algorithm** on the **Solver** pane of the Configuration Parameters dialog box.	`{'Nonadaptive'} | 'Adaptive'`
`ZeroCrossControl`	Enable zero-crossing detection. Set by **Zero-crossing control** on the **Solver** pane of the Configuration Parameters dialog box.	`{'UseLocalSettings'} | 'EnableAll' | 'DisableAll'`

Parameter	Description	Values
ZoomFactor	Zoom factor of the Simulink Editor window expressed as a percentage of normal (100%) or by the keywords FitSystem or FitSelection. In the Simulink Editor, set by the zoom commands on the **View** menu.	{'100'} | 'FitSystem' | 'FitSelection'

Examples of Setting Model Parameters

These examples show how to set model parameters for the mymodel system.

This command sets the simulation start and stop times.

```
set_param('mymodel','StartTime','5','StopTime','100')
```

This command sets the solver to ode15s and changes the maximum order.

```
set_param('mymodel','Solver','ode15s','MaxOrder','3')
```

This command associates a PostSaveFcn callback.

```
set_param('mymodel','PostSaveFcn','my_save_cb')
```

Common Block Properties

In this section...

About Common Block Properties

This table lists the properties common to all Simulink blocks, including block callback properties (see “Callbacks for Customized Model Behavior”). Examples of commands that change these properties follow this table (see “Examples of Setting Block Properties” on page 6-126).

Common Block Properties

Property	Description	Values
`AncestorBlock`	Name of the library block that the block is linked to (for blocks with a disabled link).	character vector
`AttributesFormatString`	Block annotation text (corresponds to block properties).	character vector
`BackgroundColor`	Block background color.	color value |`'[r,g,b]'` | `'[r,g,b,a]'` `r`, `g`, and `b`, are the red, green, blue values of the color in the range 0.0 to 1.0. If specified, the alpha value (`a`) is ignored. Possible color values are `'black'`, `'white'`, `'red'`, `'green'`, `'blue'`, `'cyan'`, `'magenta'`, `'yellow'`, `'gray'`, `'lightBlue'`, `'orange'`, `'darkGreen'`.
`BlockDescription`	Block description shown in the Block Properties dialog box.	character array
`BlockDiagramType`	Returns `model` if it is in an open Simulink block diagram. Returns `library` if it is a Simulink library.	`'model'` | `'library'`
`BlockType`	Block type (read only).	character array
`ClipboardFcn`	Function called when block is copied to the clipboard (**Ctrl+C**) or when the menu item **Copy** is selected.	function | character vector
`CloseFcn`	Function called when `close_system` is run on block.	function | character vector

Property	Description	Values
`Commented`	Exclude block from simulation.	`{'off'} | 'on' | 'through'`

`CompiledPort-ComplexSignals`	Complexity of port signals after updating diagram. You must compile the model before querying this property. For example:
	`vdp([],[],[],'compile');`
	`d = get_param(gcb,'CompiledPortComplexSignals');`
	`vdp([],[],[],'term');`
		structure array

`CompiledIsActive`	Specifies whether the block status is active or not at compile time. `CompiledIsActive` returns `off` if any one of these conditions is true at compile time: • Block is inactive path of Inline Variant. • Block is inactive choice of Variant Subsystem. • Block is commented out is within a Subsystem block that is commented out. • Block is inactive due to condition propagated from Variant Subsystem block. `CompiledisActive` returns `off` for inactive choices and returns `on` for active choices of Variant Subsystem.	`'off' | 'on'`

Property	Description	Values
`CompiledPortDataTypes`	Data types of port signals after updating diagram. You must compile the model before querying this property. See `CompiledPortComplexSignals` .	structure array

`CompiledPortDesignMin`	Design minimum of port signals after updating diagram. You must compile the model before querying this property. For example:
	`feval(gcs, [],[],[],'compile');`
	`ports = get_param(gcb,'PortHandles');`
	`min = get_param(ports.Outport, 'CompiledPortDesignMin')`
	`feval(model, [],[],[],'term');`
		structure array

`CompiledPortDesignMax`	Design maximum of port signals at compile time. You must compile the model before querying this property. For example:
	`feval(gcs, [],[],[],'compile');`
	`ports = get_param(gcb,'PortHandles');`
	`max = get_param(ports.Outport, 'CompiledPortDesignMax')`
	`feval(model, [],[],[],'term');`
		structure array

`CompiledPortDimensions`	Dimensions of port signals after updating diagram. You must compile the model before querying this property. For details, see “Get Compiled Port Dimensions”.	numeric array

Property	Description	Values
CompiledPortDimensionsMode	Indication whether the port signal has a variable size (after updating diagram). You must compile the model before querying this property. See "Programmatically Determine Whether Signal Line Has Variable Size".	double number. 0 indicates the signal does not have a variable size. 1 indicates the signal has a variable size.
CompiledPortFrameData	Frame mode of port signals after updating diagram. You must compile the model before querying this property.	structure array
CompiledPortWidths	Structure of port widths after updating diagram. You must compile the model before querying this property.	structure array
CompiledSampleTime	Block sample time after updating diagram. You must compile the model before querying this property.	vector [sample time, offset time] or cell {[sample time 1, offset time 1]; [sample time 2, offset time 2];.....[sample time n, offset time n]}
ContinueFcn	Function called at the restart of a simulation (after a pause).	function | character vector
CopyFcn	Function called when block is copied. See "Block Callback Parameters" for details.	function | character vector
DataTypeOverrideCompiled	For internal use.	
DeleteFcn	Function called when block is deleted. See "Block Callback Parameters" for details.	MATLAB expression

Property	Description	Values
`DestroyFcn`	Function called when block is destroyed. See “Block Callback Parameters” for details.	MATLAB expression
`Description`	Description of block. Set by the **Description** field in the **General** pane of the Block Properties dialog box.	text and tokens
`Diagnostics`	For internal use.	
`DialogParameters`	List of names/attributes of block-specific parameters for an unmasked block, or mask parameters for a masked block.	structure
`DropShadow`	Display drop shadow.	`{'off'} | 'on'`
`ExtModeLoggingSupported`	Enable a block to support uploading of signal data in external mode (for example, with a scope block).	`{'off'} | 'on'`
`ExtModeLoggingTrig`	Enable a block to act as the trigger block for external mode signal uploading.	`{'off'} | 'on'`
`ExtModeUploadOption`	Enable a block to upload signal data in external mode when the **Select all** check box on the External Signal & Triggering dialog box is not selected. A value of `log` indicates the block uploads signals. A value of `none` indicates the block does not upload signals. The value `monitor` is currently not in use. If the **Select all** check box on the External Signal & Triggering dialog box is selected, it overrides this parameter setting.	`{'none'} | 'log' | 'monitor'`

Property	Description	Values
FontAngle	Font angle.	'normal' | 'italic' | 'oblique' | {'auto'}
FontName	Font name.	character array
FontSize	Font size. A value of -1 specifies that this block inherits the font size specified by the DefaultBlockFontSize model parameter.	real {'-1'}
FontWeight	Font weight.	'light' | 'normal' | 'demi' | 'bold' | {'auto'}
ForegroundColor	Foreground color of block icon.	color value |'[r,g,b]' | '[r,g,b,a]' r, g, and b, are the red, green, blue values of the color in the range 0.0 to 1.0. The value changes if it is too similar to the canvas color (ScreenColor parameter). Use get_param to return the actual value. If specified, the alpha value (a) is ignored. Possible color values are 'black', 'white', 'red', 'green', 'blue', 'cyan', 'magenta', 'yellow', 'gray', 'lightBlue', 'orange', 'darkGreen'.
Handle	Block handle.	real

Property	Description	Values
`HideAutomaticName`	Specify whether the block name given automatically by the Simulink Editor displays in the model. To hide automatic names, use the default setting of `'on'`. (The `HideAutomaticNames` parameter for the model must also be set to `'on'`.) Set to `'off'` to display the name, and also set the block `ShowName` parameter to `'on'`. Blocks whose `ShowName` parameter is `'off'` are hidden regardless of this setting. For more information on how the parameters interact, see “Hide or Display Block Names”.	`{'on'} | 'off'`
`HiliteAncestors`	For internal use.	
`InitFcn`	Initialization function for a block. Created on the **Callbacks** pane of the Model Properties dialog box. For more information, see “Create Model Callbacks”. On non-masked blocks, updating the diagram or running the simulation call this function.	MATLAB expression
`InputSignalNames`	Names of input signals.	cell array

Property	Description	Values
`IntrinsicDialogParameters`	List of names/attributes of block-specific parameters (regardless of whether the block is masked or unmasked). Use instead of `DialogParameters` if you want block-specific parameters for masked or unmasked blocks.	structure
`IOSignalStrings`	Block paths to objects that are connected to the Signal & Scope Manager. Simulink software saves these paths when the model is saved.	list
`IOType`	Signal & Scope Manager type. For internal use.	
`LibraryVersion`	For a linked block, the initial value of this property is the `ModelVersion` of the library at the time the link was created. The value updates with increments in the model version of the library.	character vector — `{'1.1'}`
`LineHandles`	Handles of lines connected to block.	structure
`LinkData`	Array of details about changes to the blocks inside the link that differ between a parameterized link and its library, listing the block names and parameter values. Use `[]` to reset to deparameterized, e.g., `set_param(gcb,'linkData',[])`. See “Restore Disabled or Parameterized Links”.	cell array

Property	Description	Values
LinkStatus	Link status of block. Updates out-of-date linked blocks when queried using get_param. See “Control Linked Block Programmatically”.	'none' | 'resolved' | 'unresolved' | 'implicit' | 'inactive' | 'restore' | 'propagate' | 'propagateHierarchy' | 'restoreHierarchy'
LoadFcn	Function called when block is loaded.	MATLAB expression
MinMaxOverflow-Logging_Compiled	For internal use.	
ModelCloseFcn	Function called when model is closed. The ModelCloseFcn is called prior to the block's DeleteFcn and DestroyFcn callbacks, if either are set.	MATLAB expression
ModelParamTableInfo	For internal use.	
MoveFcn	Function called when block is moved.	MATLAB expression
Name	Block name.	character vector
NameChangeFcn	Function called when block name is changed.	MATLAB expression
NamePlacement	Position of block name.	{'normal'} | 'alternate'
ObjectParameters	Names/attributes of block's parameters.	structure
OpenFcn	Function called when this Block Parameters dialog box opens.	MATLAB expression
Orientation	Where block faces.	{'right'} | 'left' | 'up' | 'down'
OutputSignalNames	Names of output signals.	cell array
Parent	Name of the system that owns the block.	character vector {'untitled'}

Property	Description	Values
`ParentCloseFcn`	Function called when parent subsystem is closed. The `ParentCloseFcn` of blocks at the root model level is not called when the model is closed.	MATLAB expression
`PauseFcn`	Function called at the pause of a simulation.	function | character vector

Property	Description	Values
`PortConnectivity`	The value of this property is an array of structures, each of which describes one of the block's input or output ports. Each port structure has the following fields: • `Type` Specifies the port's type and/or number. The value of this field can be: • *n*, where *n* is the number of the port for data ports • `'enable'` if the port is an enable port • `'trigger'` if the port is a trigger port • `'state'` for state ports • `'ifaction'` for action ports • `'LConn#'` for a left connection port where # is the port's number • `'RConn#'` for a right connection port where # is the port's number • `Position` The value of this field is a two-element vector, [*x y*], that specifies the port's position. • `SrcBlock` Handle of the block connected to this port. This	structure array

Property	Description	Values
	field is null for output ports and `-1` for unconnected input ports. `SrcBlock` property is a valid source handle for Variant Subsystem blocks. • `SrcPort` Number of the port connected to this port, starting at zero. This field is null for both output ports and unconnected input ports. • `DstBlock` Handle of the block to which this port is connected. This field is null for input ports and contains a 1-by-0 empty matrix for unconnected output ports. • `DstPort` Number of the port to which this port is connected, starting at zero. This field is null for input ports and contains a 1-by-0 empty matrix for unconnected output ports.	

Property	Description	Values
`PortHandles`	The value of this property is a structure that specifies the handles of the block's ports. The structure has the following fields: • `Inport` Handles of the block's input ports. • `Outport` Handles of the block's output ports. • `Enable` Handle of the block's enable port. • `Trigger` Handle of the block's trigger port. • `State` Handle of the block's state port. • `LConn` Handles of the block's left connection ports (for blocks that support Physical Modeling tools). • `RConn` Handles of the block's right connection ports (for blocks that support Physical Modeling tools).	structure array

Property	Description	Values
	- `Ifaction` Handle of the block's action port. - `Reset` Handle of the block’s reset port.	
`PortRotationType`	Type of port rotation used by this block. This is a read-only property.	`'default' | 'physical'`
`Ports`	A vector that specifies the number of each kind of port this block has. The order of the vector's elements corresponds to the following port types: - `Inport` - `Outport` - `Enable` - `Trigger` - `State` - `LConn` - `RConn` - `Ifaction` - `Reset`	vector

Property	Description	Values
`Position`	Position of block in model window. To help with block alignment, the position you set can differ from the actual block position by a few pixels. Use `get_param` to return the actual position.	vector of coordinates, in pixels: `[left top right bottom]` The origin is the upper-left corner of the Simulink Editor canvas before any canvas resizing. The maximum absolute value for a coordinate is 32767. Positive values are to the right of and down from the origin. Negative values are to the left of and up from the origin.
`PostSaveFcn`	Function called after the block is saved.	MATLAB expression
`PreCopyFcn`	Function called before the block is copied. See “Block Callback Parameters” for details.	MATLAB expression
`PreDeleteFcn`	Function called before the block is deleted. See “Block Callback Parameters” for details.	MATLAB expression
`PreSaveFcn`	Function called before the block is saved. See “Block Callback Parameters” for details.	MATLAB expression
`Priority`	Specifies the block's order of execution relative to other blocks in the same model. Set by the **Priority** field on the **General** pane of the Block Properties dialog box.	character vector `{''}`
`ReferenceBlock`	Name of the library block to which this block links.	character vector `{''}`
`RequirementInfo`	For internal use.	

Property	Description	Values
`RTWData`	User specified data, used by Simulink Coder software. Intended only for use with user written S-functions. See the section “S-Function RTWdata” (Simulink Coder) for details.	
`SampleTime`	Value of the sample time parameter. See “Specify Sample Time” for more details.	character vector
`Selected`	Status of whether or not block is selected.	`{'on'} | 'off'`
`ShowName`	Display or hide block name. To display a block name given by the Simulink Editor (automatic names), set the block `'HideAutomaticName'` parameter to `'off'` and `ShowName` to `'on'`. To hide an automatic block name given by the Editor, set `ShowName` to `'on'`, `HideAutomaticName` to `'on'`, and `HideAutomaticNames` on the model to `'on'`. For more information on how the parameters interact, see “Hide or Display Block Names”.	`{'on'} | 'off'`
`StartFcn`	Function called at the start of a simulation.	MATLAB expression
`StatePerturbation-ForJacobian`	State perturbation size to use during linearization. See “Change Perturbation Level of Blocks Perturbed During Linearization” (Simulink Control Design) for details.	character vector

Property	Description	Values
StaticLinkStatus	Link status of block. Does not update out-of-date linked blocks when queried using get_param. See also LinkStatus.	'none' | 'resolved' | 'unresolved' | 'implicit' | 'inactive' | 'restore' | 'propagate' | 'propagateHierarchy' | 'restoreHierarchy'
StopFcn	Function called at the termination of a simulation.	MATLAB expression
Tag	Text that appears in the block label that Simulink software generates. Set by the **Tag** field on the **General** pane of the Block Properties dialog box.	character vector {''}
Type	Simulink object type (read only).	'block'
UndoDeleteFcn	Function called when block deletion is undone.	MATLAB expression
UserData	User-specified data that can have any MATLAB data type.	{'[]'}
UserDataPersistent	Status of whether or not UserData will be saved in the model file.	'on' | {'off'}

Examples of Setting Block Properties

These examples illustrate how to change common block properties.

This command changes the orientation of the Gain block in the mymodel system so it faces the opposite direction (right to left).

```
set_param('mymodel/Gain','Orientation','left')
```

This command associates an OpenFcn callback with the Gain block in the mymodel system.

```
set_param('mymodel/Gain','OpenFcn','my_open_cb')
```

This command sets the Position property of the Gain block in the mymodel system. The block is 75 pixels wide by 25 pixels high.

```
set_param('mymodel/Gain','Position',[50 250 125 275])
```

Block-Specific Parameters

To write scripts that create and modify models, you can use the `get_param` and `set_param` functions to query and modify the properties and parameters of a block or diagram. Use the tables to determine the programmatic name of a parameter or property in a block dialog box.

Programmatic Parameters of Blocks and Models

Programmatic parameters that describe a model are model parameters (see “Model Parameters” on page 6-2). Parameters that describe a block are block parameters. Parameters that are common to all Simulink blocks are common block parameters (see “Common Block Properties” on page 6-109). Many blocks also have unique block-specific parameters. A masked block can have mask parameters (see “Mask Parameters” on page 6-276).

The model and block properties also include callbacks, which are commands that execute when a certain model or block event occurs. These events include opening a model, simulating a model, copying a block, opening a block, etc. See “Model, Block, and Port Callbacks”.

Tip For block parameters that accept array values, the number of elements in the array cannot exceed what `int_T` can represent. This limitation applies to both simulation and Simulink Coder code generation.

The maximum number of characters that a parameter edit field can contain is 49,000.

Block-Specific Parameters and Programmatic Equivalents

The tables list block-specific parameters for Simulink blocks. The type of the block appears in parentheses after the block name. Some Simulink blocks work as masked subsystems. The tables indicate masked blocks by adding the designation "masked subsystem" after the block type.

The type listed for nonmasked blocks is the value of the `BlockType` parameter (see “Common Block Properties” on page 6-109). The type listed for masked blocks is the value of the `MaskType` parameter (see “Mask Parameters” on page 6-276).

The **Dialog Box Prompt** column indicates the text of the prompt for the parameter in the block dialog box. The **Values** column shows the type of value required (scalar, vector, variable), the possible values (separated with a vertical line), and the default value (enclosed in braces).

Continuous Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Derivative (Derivative)		
CoefficientInTFapproximation	Coefficient c in the transfer function approximation s/(c*s+1) used for linearization	{'inf'}
Integrator (Integrator)		
ExternalReset	External reset	{'none'} | 'rising' | 'falling' | 'either' | 'level' | 'level hold'
InitialConditionSource	Initial condition source	{'internal'} | 'external'
InitialCondition	Initial condition	scalar or vector — {'0'}
LimitOutput	Limit output	{'off'} | 'on'
UpperSaturationLimit	Upper saturation limit	scalar or vector — {'inf'}
LowerSaturationLimit	Lower saturation limit	scalar or vector — {'-inf'}
ShowSaturationPort	Show saturation port	{'off'} | 'on'
ShowStatePort	Show state port	{'off'} | 'on'
AbsoluteTolerance	Absolute tolerance	character vector, scalar, or vector — {'auto'} | {'–1'} | any real scalar or vector
IgnoreLimit	Ignore limit and reset when linearizing	{'off'} | 'on'
ZeroCross	Enable zero-crossing detection	'off' | {'on'}
ContinuousStateAttributes	State Name	{''} | user-defined
WrapState	Wrap state	{'off'} | 'on'
WrappedStateUpperValue	Upper value of wrapped state	scalar or vector — {'pi'}
WrappedStateLowerValue	Lower value of wrapped state	scalar or vector — {'-pi'}
Second-Order Integrator (SecondOrderIntegrator)		
ICSourceX	Initial condition source x	{'internal'}| 'external'

Block (Type)/Parameter	Dialog Box Prompt	Values
ICX	Initial condition x	scalar or vector — {'0'}
LimitX	Limit x	{'off'} | 'on'
UpperLimitX	Upper limit x	scalar or vector — {'inf'}
LowerLimitX	Lower limit x	scalar or vector — {'-inf'}
WrapStateX	Enable wrapping of *x*	{'off'} | 'on'
WrappedUpperValueX	Upper value for wrapping *x*	scalar or vector — {'pi'}
WrappedLowerValueX	Lower value for wrapping *x*	scalar or vector — {'-pi'}
AbsoluteToleranceX	Absolute tolerance x	character vector, scalar, or vector — {'auto'} | {'–1'} | any real scalar or vector
StateNameX	State name x	{} | user-defined
ICSourceDXDT	Initial condition source dx/dt	{'internal'} | 'external'
ICDXDT	Initial condition dx/dt	scalar or vector — {'0'}
LimitDXDT	Limit dx/dt	{'off'} | 'on'
UpperLimitDXDT	Upper limit dx/dt	scalar or vector — {'inf'}
LowerLimitDXDT	Lower limit dx/dt	scalar or vector — {'-inf'}
AbsoluteToleranceDXDT	Absolute tolerance dx/dt	character vector, scalar, or vector — {'auto'} | {'–1'} | any real scalar or vector
StateNameDXDT	State name dx/dt	{} | user-defined
ExternalReset	External reset	{'none'} | 'rising' | 'falling' | 'either'
ZeroCross	Enable zero-crossing detection	{'on'} | 'off'
ReinitDXDTwhenXreachesSaturation	Reinitialize dx/dt when x reaches saturation	{'off'} | 'on'
IgnoreStateLimitsAndResetForLinearization	Ignore state limits and the reset for linearization	{'off'} | 'on'
ShowOutput	Show output	{'both'} | 'x' | 'dxdt'
State-Space (StateSpace)		
A	A	matrix — {'1'}

Block (Type)/Parameter	Dialog Box Prompt	Values
B	B	matrix — {'1'}
C	C	matrix — {'1'}
D	D	matrix — {'1'}
InitialCondition	Initial conditions	vector — {'0'}
AbsoluteTolerance	Absolute tolerance	character vector, scalar, or vector — {'auto'} | {'–1'} | any real scalar or vector
ContinuousStateAttributes	State Name	{''} | user-defined
Transfer Fcn (TransferFcn)		
Numerator	Numerator coefficients	vector or matrix — {'[1]'}
Denominator	Denominator coefficients	vector — {'[1 1]'}
AbsoluteTolerance	Absolute tolerance	character vector, scalar, or vector — {'auto'} | {'–1'} | any real scalar or vector
ContinuousStateAttributes	State Name	{''} | user-defined
Transport Delay (TransportDelay)		
DelayTime	Time delay	scalar or vector — {'1'}
InitialOutput	Initial output	scalar or vector — {'0'}
BufferSize	Initial buffer size	scalar — {'1024'}
FixedBuffer	Use fixed buffer size	{'off'} | 'on'
TransDelayFeedthrough	Direct feedthrough of input during linearization	{'off'} | 'on'
PadeOrder	Pade order (for linearization)	{'0'}
Variable Time Delay (VariableTimeDelay)		
VariableDelayType	Select delay type	'Variable transport delay' | {'Variable time delay'}
MaximumDelay	Maximum delay	scalar or vector — {'10'}

Block (Type)/Parameter	Dialog Box Prompt	Values
InitialOutput	Initial output	scalar or vector — {'0'}
MaximumPoints	Initial buffer size	scalar — {'1024'}
FixedBuffer	Use fixed buffer size	{'off'} | 'on'
ZeroDelay	Handle zero delay	{'off'} | 'on'
TransDelayFeedthrough	Direct feedthrough of input during linearization	{'off'} | 'on'
PadeOrder	Pade order (for linearization)	{'0'}
ContinuousStateAttributes	State Name	{''} | user-defined
Variable Transport Delay (VariableTransportDelay)		
VariableDelayType	Select delay type	{'Variable transport delay'} | 'Variable time delay'
MaximumDelay	Maximum delay	scalar or vector — {'10'}
InitialOutput	Initial output	scalar or vector — {'0'}
MaximumPoints	Initial buffer size	scalar — {'1024'}
FixedBuffer	Use fixed buffer size	{'off'} | 'on'
TransDelayFeedthrough	Direct feedthrough of input during linearization	{'off'} | 'on'
PadeOrder	Pade order (for linearization)	{'0'}
AbsoluteTolerance	Absolute tolerance	character vector, scalar, or vector — {'auto'} | {'–1'} | any positive real scalar or vector
ContinuousStateAttributes	State Name	{''} | user-defined
Zero-Pole (ZeroPole)		
Zeros	Zeros	vector — {'[1]'}
Poles	Poles	vector — {'[0 -1]'}
Gain	Gain	vector — {'[1]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
AbsoluteTolerance	Absolute tolerance	character vector, scalar, or vector — {'auto'} | {'–1'} | any positive real scalar or vector
ContinuousStateAttributes	State Name	{''} | user-defined

Discontinuities Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Backlash (Backlash)		
BacklashWidth	Deadband width	scalar or vector — {'1'}
InitialOutput	Initial output	scalar or vector — {'0'}
ZeroCross	Enable zero-crossing detection	'off' | {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Coulomb & Viscous Friction (Coulombic and Viscous Friction) (masked subsystem)		
offset	Coulomb friction value (Offset)	{'[1 3 2 0]'}
gain	Coefficient of viscous friction (Gain)	{'1'}
Dead Zone (DeadZone)		
LowerValue	Start of dead zone	scalar or vector — {'-0.5'}
UpperValue	End of dead zone	scalar or vector — {'0.5'}
SaturateOnIntegerOverflow	Saturate on integer overflow	'off' | {'on'}
LinearizeAsGain	Treat as gain when linearizing	'off' | {'on'}
ZeroCross	Enable zero-crossing detection	'off' | {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Dead Zone Dynamic (Dead Zone Dynamic) (masked subsystem)		
Hit Crossing (HitCross)		
HitCrossingOffset	Hit crossing offset	scalar or vector — {'0'}
HitCrossingDirection	Hit crossing direction	'rising' | 'falling' | {'either'}
ShowOutputPort	Show output port	'off' | {'on'}
ZeroCross	Enable zero-crossing detection	'off' | {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Quantizer (Quantizer)		
QuantizationInterval	Quantization interval	scalar or vector — {'0.5'}

Block (Type)/Parameter	Dialog Box Prompt	Values
LinearizeAsGain	Treat as gain when linearizing	'off' | {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Rate Limiter (RateLimiter)		
RisingSlewLimit	Rising slew rate	{'1'}
FallingSlewLimit	Falling slew rate	{'-1'}
SampleTimeMode	Sample time mode	'continuous' | {'inherited'}
InitialCondition	Initial condition	{'0'}
LinearizeAsGain	Treat as gain when linearizing	'off' | {'on'}
Rate Limiter Dynamic (Rate Limiter Dynamic) (masked subsystem)		
Relay (Relay)		
OnSwitchValue	Switch on point	{'eps'}
OffSwitchValue	Switch off point	{'eps'}
OnOutputValue	Output when on	{'1'}
OffOutputValue	Output when off	{'0'}
ZeroCross	Enable zero-crossing detection	'off' | {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	'Inherit: Inherit via back propagation' | {'Inherit: All ports same datatype'} | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16)' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)' | 'Enum: <class name>'

Block (Type)/Parameter	Dialog Box Prompt	Values
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
Saturation (Saturate)		
UpperLimit	Upper limit	scalar or vector — {'0.5'}
LowerLimit	Lower limit	scalar or vector — {'-0.5'}
LinearizeAsGain	Treat as gain when linearizing	'off' | {'on'}
ZeroCross	Enable zero-crossing detection	'off' | {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	'Inherit: Inherit via back propagation' | {'Inherit: Same as input'} | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
Saturation Dynamic (Saturation Dynamic) (masked subsystem)		
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output data type	{'Inherit: Same as second input'} | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
OutputDataTypeScalingMode	Deprecated in R2007b	
OutDataType	Deprecated in R2007b	
OutScaling	Deprecated in R2007b	
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
DoSatur	Saturate on integer overflow	{'off'} | 'on'
Wrap To Zero (Wrap To Zero) (masked subsystem)		
Threshold	Threshold	{'255'}

Discrete Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Delay (Delay)		
DelayLengthSource	Delay length > Source	{'Dialog'} | 'Input port'
DelayLength	Delay length > Value	{'2'}
DelayLengthUpperLimit	Delay length > Upper limit	{'100'}
InitialConditionSource	Initial condition > Source	{'Dialog'} | 'Input port'
InitialCondition	Initial condition > Value	{'0.0'}
ExternalReset	External reset	{'None'} | 'Rising' | 'Falling' | 'Either' | 'Level' | 'Level hold'
InputProcessing	Input processing	'Columns as channels (frame based)' | {'Elements as channels (sample based)'} | 'Inherited'
UseCircularBuffer	Use circular buffer for state	{'off'} | 'on'
PreventDirectFeedthrough	Prevent direct feedthrough	{'off'} | 'on'
RemoveDelayLengthCheckInGeneratedCode	Remove delay length check in generated code	{'off'} | 'on'
DiagnosticForDelayLength	Diagnostic for delay length	{'None'} | 'Warning' | 'Error'
SampleTime	Sample time (–1 for inherited)	{'-1'}
StateName	State name	{''}
StateMustResolveToSignalObject	State name must resolve to Simulink signal object	{'off'} | 'on'
StateSignalObject	Signal object class Code generation storage class	Simulink.Signal object Object of a class that is derived from Simulink.Signal

Block (Type)/Parameter	Dialog Box Prompt	Values
`StateStorageClass`	Code generation storage class	`{'Auto'} | 'Model default' | 'ExportedGlobal' | 'ImportedExtern' | 'ImportedExternPointer' | 'Custom'`
`CodeGenStateStorageTypeQualifier`	Code generation storage type qualifier	`{''}`
Difference (`Difference`) (masked subsystem)		
`ICPrevInput`	Initial condition for previous input	`{'0.0'}`
`OutMin`	Output minimum	`{'[]'}`
`OutMax`	Output maximum	`{'[]'}`
`OutDataTypeStr`	Output data type	`{'Inherit: Inherit via internal rule'} | 'Inherit: Inherit via back propagation' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'`
`OutputDataTypeScalingMode`	Deprecated in R2007b	
`OutDataType`	Deprecated in R2007b	
`OutScaling`	Deprecated in R2007b	
`LockScale`	Lock output data type setting against changes by the fixed-point tools	`{'off'} | 'on'`
`RndMeth`	Integer rounding mode	`'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'`

Block (Type)/Parameter	Dialog Box Prompt	Values
DoSatur	Saturate to max or min when overflows occur	{'off'} | 'on'
Discrete Derivative (Discrete Derivative) (masked subsystem)		
gainval	Gain value	{'1.0'}
ICPrevScaledInput	Initial condition for previous weighted input K*u/Ts	{'0.0'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Inherit via back propagation' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
OutputDataTypeScalingMode	Deprecated in R2007b	
OutDataType	Deprecated in R2007b	
OutScaling	Deprecated in R2007b	
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'} | 'on'
Discrete FIR Filter (Discrete FIR Filter)		

Block (Type)/Parameter	Dialog Box Prompt	Values
CoefSource	Coefficient source	{'Dialog parameters'} | 'Input port'
FilterStructure	Filter structure	{'Direct form'} | 'Direct form symmetric' | 'Direct form antisymmetric' | 'Direct form transposed' | 'Lattice MA' **Note** You must have a DSP System Toolbox license to use a filter structure other than Direct form.
Coefficients	Coefficients	vector — {'[0.5 0.5]'}
InputProcessing	Input processing	'Columns as channels (frame based)' | {'Elements as channels (sample based)'}
InitialStates	Initial states	scalar or vector — {'0'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
CoefMin	Coefficients minimum	{'[]'}
CoefMax	Coefficients maximum	{'[]'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
TapSumDataTypeStr	Tap sum data type	{'Inherit: Same as input'} | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
CoefDataTypeStr	Coefficients data type	{'Inherit: Same word length as input'} | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16)' | 'fixdt(1,16,0)'
ProductDataTypeStr	Product output data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Same as input' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)'
AccumDataTypeStr	Accumulator data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Same as input' | 'Inherit: Same as product output' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)'
StateDataTypeStr	State data type	'Inherit: Same as input' | {'Inherit: Same as accumulator'} | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output data type	'Inherit: Same as input' | {'Inherit: Same as accumulator'} | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16)' | 'fixdt(1,16,0)'
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
SaturateOnIntegerOverflow	Saturate on integer overflow	{'off'} | 'on'
Discrete Filter (DiscreteFilter)		
Numerator	Numerator coefficients	vector — {'[1]'}
Denominator	Denominator coefficients	vector — {'[1 0.5]'}
IC	Initial states	{'0'}
SampleTime	Sample time (-1 for inherited)	{'1'}
a0EqualsOne	Optimize by skipping divide by leading denominator coefficient (a0)	{'off'} | 'on'
NumCoefMin	Numerator coefficient minimum	{'[]'}
NumCoefMax	Numerator coefficient maximum	{'[]'}
DenCoefMin	Denominator coefficient minimum	{'[]'}
DenCoefMax	Denominator coefficient maximum	{'[]'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
`StateDataTypeStr`	State data type	`{'Inherit: Same as input'} | 'int8' | 'int16' | 'int32' | 'fixdt(1,16,0)'`
`NumCoefDataTypeStr`	Numerator coefficient data type	`{'Inherit: Inherit via internal rule'} | 'int8' | 'int16' | 'int32' | 'fixdt(1,16)' | 'fixdt(1,16,0)'`
`DenCoefDataTypeStr`	Denominator coefficient data type	`{'Inherit: Inherit via internal rule'} | 'int8' | 'int16' | 'int32' | 'fixdt(1,16)' | 'fixdt(1,16,0)'`
`NumProductDataTypeStr`	Numerator product output data type	`{'Inherit: Inherit via internal rule'} | 'Inherit: Same as input' | 'int8' | 'int16' | 'int32' | 'fixdt(1,16,0)'`
`DenProductDataTypeStr`	Denominator product output data type	`{'Inherit: Inherit via internal rule'} | 'Inherit: Same as input' | 'int8' | 'int16' | 'int32' | 'fixdt(1,16,0)'`
`NumAccumDataTypeStr`	Numerator accumulator data type	`{'Inherit: Inherit via internal rule'} | 'Inherit: Same as input' | 'Inherit: Same as product output' | 'int8' | 'int16' | 'int32' | 'fixdt(1,16,0)'`

Block (Type)/Parameter	Dialog Box Prompt	Values
DenAccumDataTypeStr	Denominator accumulator data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Same as input' | 'Inherit: Same as product output' | 'int8' | 'int16' | 'int32' | 'fixdt(1,16,0)'
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Same as input' | 'int8' | 'int16' | 'int32' | 'fixdt(1,16,0)'
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
SaturateOnIntegerOverflow	Saturate on integer overflow	{'off'} | 'on'
StateName	State name	{''}
StateMustResolveToSignalObject	State name must resolve to Simulink signal object	{'off'} | 'on'
StateSignalObject	Signal object class Code generation storage class	Simulink.Signal object Object of a class that is derived from Simulink.Signal
StateStorageClass	Code generation storage class	{'Auto'} | 'Model default' | 'ExportedGlobal' | 'ImportedExtern' | 'ImportedExternPointer' | 'Custom'

Block (Type)/Parameter	Dialog Box Prompt	Values
RTWStateStorageTypeQualifier	Code generation storage type qualifier	{''}
Discrete State-Space (DiscreteStateSpace)		
A	A	matrix — {'1'}
B	B	matrix — {'1'}
C	C	matrix — {'1'}
D	D	matrix — {'1'}

Block (Type)/Parameter	Dialog Box Prompt	Values
a0EqualsOne	Optimize by skipping divide by leading denominator coefficient (a0)	{'off'} | 'on'
NumCoefMin	Numerator coefficient minimum	{'[]'}
NumCoefMax	Numerator coefficient maximum	{'[]'}
DenCoefMin	Denominator coefficient minimum	{'[]'}
DenCoefMax	Denominator coefficient maximum	{'[]'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
StateDataTypeStr	State data type	{'Inherit: Same as input'} | 'int8' | 'int16' | 'int32' | 'fixdt(1,16,0)'
NumCoefDataTypeStr	Numerator coefficient data type	{'Inherit: Inherit via internal rule'} | 'int8' | 'int16' | 'int32' | 'fixdt(1,16,0)'
DenCoefDataTypeStr	Denominator coefficient data type	{'Inherit: Inherit via internal rule'} | 'int8' | 'int16' | 'int32' | 'fixdt(1,16,0)'
NumProductDataTypeStr	Numerator product output data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Same as input' | 'int8' | 'int16' | 'int32' | 'fixdt(1,16,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
DenProductDataTypeStr	Denominator product output data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Same as input' | 'int8' | 'int16' | 'int32' | 'fixdt(1,16,0)'
NumAccumDataTypeStr	Numerator accumulator data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Same as input' | 'Inherit: Same as product output' | 'int8' | 'int16' | 'int32' | 'fixdt(1,16,0)'
DenAccumDataTypeStr	Denominator accumulator data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Same as input' | 'Inherit: Same as product output' | 'int8' | 'int16' | 'int32' | 'fixdt(1,16,0)'
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Same as input' | 'int8' | 'int16' | 'int32' | 'fixdt(1,16,0)'
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
SaturateOnIntegerOverflow	Saturate on integer overflow	{'off'} | 'on'
StateName	State name	{''}

Block (Type)/Parameter	Dialog Box Prompt	Values
`StateMustResolveToSignalObject`	State name must resolve to Simulink signal object	`{'off'} | 'on'`
`StateSignalObject`	Signal object class Code generation storage class	`Simulink.Signal` object Object of a class that is derived from `Simulink.Signal`
`StateStorageClass`	Code generation storage class	`{'Auto'} | 'Model default' | 'ExportedGlobal' | 'ImportedExtern' | 'ImportedExternPointer' | 'Custom'`
`RTWStateStorageTypeQualifier`	Code generation storage type qualifier	`{''}`
Discrete Zero-Pole (`DiscreteZeroPole`)		
`Zeros`	Zeros	vector — `{'[1]'}`
`Poles`	Poles	vector — `{'[0 0.5]'}`
`Gain`	Gain	`{'1'}`
`SampleTime`	Sample time (-1 for inherited)	`{'1'}`
`StateName`	State name	`{''}`
`StateMustResolveToSignalObject`	State name must resolve to Simulink signal object	`{'off'} | 'on'`
`StateSignalObject`	Signal object class Code generation storage class	`Simulink.Signal` object Object of a class that is derived from `Simulink.Signal`
`StateStorageClass`	Code generation storage class	`{'Auto'} | 'Model default' | 'ExportedGlobal' | 'ImportedExtern' | 'ImportedExternPointer' | 'Custom'`

Block (Type)/Parameter	Dialog Box Prompt	Values
RTWStateStorageType Qualifier	Code generation storage type qualifier	{''}
Discrete-Time Integrator (DiscreteIntegrator)		
IntegratorMethod	Integrator method	{'Integration: Forward Euler'} | 'Integration: Backward Euler' | 'Integration: Trapezoidal' | 'Accumulation: Forward Euler' | 'Accumulation: Backward Euler' | 'Accumulation: Trapezoidal'
gainval	Gain value	{'1.0'}
ExternalReset	External reset	{'none'} | 'rising' | 'falling' | 'either' | 'level' | 'sampled level'
InitialConditionSource	Initial condition source	{'internal'} | 'external'
InitialCondition	Initial condition	scalar or vector — {'0'}
InitialConditionSetting	Initial condition setting	{'State (most efficient)'} | 'Output' | 'Compatibility'
SampleTime	Sample time (-1 for inherited)	{'1'}
LimitOutput	Limit output	{'off'} | 'on'
UpperSaturationLimit	Upper saturation limit	scalar or vector — {'inf'}
LowerSaturationLimit	Lower saturation limit	scalar or vector — {'-inf'}
ShowSaturationPort	Show saturation port	{'off'} | 'on'
ShowStatePort	Show state port	{'off'} | 'on'
IgnoreLimit	Ignore limit and reset when linearizing	{'off'} | 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Inherit via back propagation' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
SaturateOnIntegerOverflow	Saturate on integer overflow	{'off'} | 'on'
StateName	State name	{''}
StateMustResolveToSignalObject	State name must resolve to Simulink signal object	{'off'} | 'on'
StateSignalObject	Signal object class Code generation storage class	Simulink.Signal object Object of a class that is derived from Simulink.Signal
StateStorageClass	Code generation storage class	{'Auto'} | 'Model default' | 'ExportedGlobal' | 'ImportedExtern' | 'ImportedExternPointer' | 'Custom'

Block (Type)/Parameter	**Dialog Box Prompt**	**Values**
RTWStateStorageType Qualifier	Code generation storage type qualifier	{''}
First-Order Hold (First-Order Hold) (masked subsystem)		
Ts	Sample time	{'1'}
Memory (Memory)		
InitialCondition	Initial condition	scalar or vector — {'0'}
InheritSampleTime	Inherit sample time	{'off'} | 'on'
LinearizeMemory	Direct feedthrough of input during linearization	{'off'} | 'on'
LinearizeAsDelay	Treat as a unit delay when linearizing with discrete sample time	{'off'} | 'on'
StateName	State name	{''}
StateMustResolveTo SignalObject	State name must resolve to Simulink signal object	{'off'} | 'on'
StateSignalObject	Signal object class Code generation storage class	Simulink.Signal object Object of a class that is derived from Simulink.Signal
StateStorageClass	Code generation storage class	{'Auto'} | 'Model default' | 'ExportedGlobal' | 'ImportedExtern' | 'ImportedExternPointer' | 'Custom'
RTWStateStorageType Qualifier	Code generation storage type qualifier	{''}
Tapped Delay (S-Function) (Tapped Delay Line) (masked subsystem)		
vinit	Initial condition	{'0.0'}
samptime	Sample time	{'-1'}
NumDelays	Number of delays	{'4'}

Block (Type)/Parameter	Dialog Box Prompt	Values
`DelayOrder`	Order output vector starting with	`{'Oldest'} | 'Newest'`
`includeCurrent`	Include current input in output vector	`{'off'} | 'on'`
Transfer Fcn First Order (`First Order Transfer Fcn`) (masked subsystem)		
`PoleZ`	Pole (in Z plane)	`{'0.95'}`
`ICPrevOutput`	Initial condition for previous output	`{'0.0'}`
`RndMeth`	Integer rounding mode	`'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'`
`DoSatur`	Saturate to max or min when overflows occur	`{'off'} | 'on'`
Transfer Fcn Lead or Lag (`Lead or Lag Compensator`) (masked subsystem)		
`PoleZ`	Pole of compensator (in Z plane)	`{'0.95'}`
`ZeroZ`	Zero of compensator (in Z plane)	`{'0.75'}`
`ICPrevOutput`	Initial condition for previous output	`{'0.0'}`
`ICPrevInput`	Initial condition for previous input	`{'0.0'}`
`RndMeth`	Integer rounding mode	`'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'`
`DoSatur`	Saturate to max or min when overflows occur	`{'off'} | 'on'`
Transfer Fcn Real Zero (`Transfer Fcn Real Zero`) (masked subsystem)		
`ZeroZ`	Zero (in Z plane)	`{'0.75'}`
`ICPrevInput`	Initial condition for previous input	`{'0.0'}`

Block (Type)/Parameter	Dialog Box Prompt	Values
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'} | 'on'
Unit Delay (UnitDelay)		
InitialCondition	Initial condition	scalar or vector — {'0'}
InputProcessing	Input processing	'Columns as channels (frame based)' | {'Elements as channels (sample based)'} | 'Inherited'
SampleTime	Sample time (-1 for inherited)	{'-1'}
StateName	State name	{''}
StateMustResolveTo SignalObject	State name must resolve to Simulink signal object	{'off'} | 'on'
StateSignalObject	Signal object class Code generation storage class	Simulink.Signal object Object of a class that is derived from Simulink.Signal
StateStorageClass	Code generation storage class	{'Auto'} | 'Model default' | 'ExportedGlobal' | 'ImportedExtern' | 'ImportedExternPointer' | 'Custom'
CodeGenStateStorageType Qualifier	Code generation storage type qualifier	{''}
Zero-Order Hold (ZeroOrderHold)		
SampleTime	Sample time (-1 for inherited)	{'1'}

Logic and Bit Operations Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Bit Clear (`Bit Clear`) (masked subsystem)		
`iBit`	Index of bit (0 is least significant)	`{'0'}`
Bit Set (`Bit Set`) (masked subsystem)		
`iBit`	Index of bit (0 is least significant)	`{'0'}`
Bitwise Operator (S-Function) (`Bitwise Operator`) (masked subsystem)		
`logicop`	Operator	`{'AND'} | 'OR' | 'NAND' | 'NOR' | 'XOR' | 'NOT'`
`UseBitMask`	Use bit mask ...	`'off' | {'on'}`
`NumInputPorts`	Number of input ports	`{'1'}`
`BitMask`	Bit Mask	`{'bin2dec('11011001')'}`
`BitMaskRealWorld`	Treat mask as	`'Real World Value' | {'Stored Integer'}`
Combinatorial Logic (`CombinatorialLogic`)		
`TruthTable`	Truth table	`{'[0 0;0 1;0 1;1 0;0 1;1 0;1 0;1 1]'}`
`SampleTime`	Sample time (-1 for inherited)	`{'-1'}`
Compare To Constant (`Compare To Constant`) (masked subsystem)		
`relop`	Operator	`'==' | '~=' | '<' | {'<='} | '>=' | '>'`
`const`	Constant value	`{'3.0'}`
`OutDataTypeStr`	Output data type	`{'boolean'} | 'uint8'`
`ZeroCross`	Enable zero-crossing detection	`'off' | {'on'}`
Compare To Zero (`Compare To Zero`) (masked subsystem)		
`relop`	Operator	`'==' | '~=' | '<' | {'<='} | '>=' | '>'`
`OutDataTypeStr`	Output data type	`{'boolean'} | 'uint8'`
`ZeroCross`	Enable zero-crossing detection	`'off' | {'on'}`

Block (Type)/Parameter	Dialog Box Prompt	Values
Detect Change (`Detect Change`) (masked subsystem)		
`vinit`	Initial condition	`{'0'}`
`OutDataTypeStr`	Output data type	`{'boolean'} | 'uint8'`
Detect Decrease (`Detect Decrease`) (masked subsystem)		
`vinit`	Initial condition	`{'0.0'}`
`OutDataTypeStr`	Output data type	`{'boolean'} | 'uint8'`
Detect Fall Negative (`Detect Fall Negative`) (masked subsystem)		
`vinit`	Initial condition	`{'0'}`
`OutDataTypeStr`	Output data type	`{'boolean'} | 'uint8'`
Detect Fall Nonpositive (`Detect Fall Nonpositive`) (masked subsystem)		
`vinit`	Initial condition	`{'0'}`
`OutDataTypeStr`	Output data type	`{'boolean'} | 'uint8'`
Detect Increase (`Detect Increase`) (masked subsystem)		
`vinit`	Initial condition	`{'0.0'}`
`OutDataTypeStr`	Output data type	`{'boolean'} | 'uint8'`
Detect Rise Nonnegative (`Detect Rise Nonnegative`) (masked subsystem)		
`vinit`	Initial condition	`{'0'}`
`OutDataTypeStr`	Output data type	`{'boolean'} | 'uint8'`
Detect Rise Positive (`Detect Rise Positive`) (masked subsystem)		
`vinit`	Initial condition	`{'0'}`
`OutDataTypeStr`	Output data type	`{'boolean'} | 'uint8'`
Extract Bits (`Extract Bits`) (masked subsystem)		
`bitsToExtract`	Bits to extract	`{'Upper half'} | 'Lower half' | 'Range starting with most significant bit' | 'Range ending with least significant bit' | 'Range of bits'`
`numBits`	Number of bits	`{'8'}`

Block (Type)/Parameter	Dialog Box Prompt	Values
bitIdxRange	Bit indices ([start end], 0-based relative to LSB)	{'[0 7]'}
outScalingMode	Output scaling mode	{'Preserve fixed-point scaling'} | 'Treat bit field as an integer'
Interval Test (Interval Test) (masked subsystem)		
IntervalClosedRight	Interval closed on right	'off' | {'on'}
uplimit	Upper limit	{'0.5'}
IntervalClosedLeft	Interval closed on left	'off' | {'on'}
lowlimit	Lower limit	{'-0.5'}
OutDataTypeStr	Output data type	{'boolean'} | 'uint8'
Interval Test Dynamic (Interval Test Dynamic) (masked subsystem)		
IntervalClosedRight	Interval closed on right	'off' | {'on'}
IntervalClosedLeft	Interval closed on left	'off' | {'on'}
OutDataTypeStr	Output data type	{'boolean'} | 'uint8'
Logical Operator (Logic)		
Operator	Operator	{'AND'} | 'OR' | 'NAND' | 'NOR' | 'XOR' | 'NXOR' | 'NOT'
Inputs	Number of input ports	{'2'}
IconShape	Icon shape	{'rectangular'} | 'distinctive'
SampleTime	Sample time (-1 for inherited)	{'-1'}
AllPortsSameDT	Require all inputs and output to have the same data type	{'off'} | 'on'
OutDataTypeStr	Output data type	'Inherit: Logical (see Configuration Parameters: Optimization)' | {'boolean'} | 'fixdt(1,16)'

Block (Type)/Parameter	Dialog Box Prompt	Values
Relational Operator (`RelationalOperator`)		
`Operator`	Relational operator	`'==' | '~=' | '<' | {'<='} | '>=' | '>' | 'isInf' | 'isNaN' | 'isFinite'`
`ZeroCross`	Enable zero-crossing detection	`'off' | {'on'}`
`SampleTime`	Sample time (-1 for inherited)	`{'-1'}`
`InputSameDT`	Require all inputs to have the same data type	`{'off'} | 'on'`
`OutDataTypeStr`	Output data type	`'Inherit: Logical (see Configuration Parameters: Optimization)' | {'boolean'} | 'fixdt(1,16)'`
Shift Arithmetic (`ArithShift`)		
`BitShiftNumberSource`	Bits to shift > Source	`{'Dialog'} | 'Input port'`
`BitShiftDirection`	Bits to shift > Direction	`'Left' | 'Right' | {'Bidirectional'}`
`BitShiftNumber`	Bits to shift > Number	`{'8'}`
`BinPtShiftNumber`	Binary points to shift > Number	`{'0'}`
`DiagnosticForOORShift`	Diagnostic for out-of-range shift value	`{'None'} | 'Warning' | 'Error'`
`CheckOORBitShift`	Check for out-of-range 'Bits to shift' in generated code	`{'off'} | 'on'`
`nBitShiftRight`	Deprecated in R2011a	
`nBinPtShiftRight`	Deprecated in R2011a	

Lookup Table Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Cosine (`Cosine`) (masked subsystem)		
`Formula`	Output formula	`'sin(2*pi*u)' | {'cos(2*pi*u)'} | 'exp(j*2*pi*u)' | 'sin(2*pi*u) and cos(2*pi*u)'`
`NumDataPoints`	Number of data points for lookup table	`{'(2^5)+1'}`
`OutputWordLength`	Output word length	`{'16'}`
`InternalRulePriority`	Internal rule priority for lookup table	`{'Speed'} | 'Precision'`
Direct Lookup Table (n-D) (`LookupNDDirect`)		
`NumberOfTableDimensions`	Number of table dimensions	`'1' | {'2'} | '3' | '4'`
`InputsSelectThisObjectFromTable`	Inputs select this object from table	`{'Element'} | 'Vector' | '2-D Matrix'`
`TableIsInput`	Make table an input	`{'off'} | 'on'`
`Table`	Table data	`{'[4 5 6;16 19 20;10 18 23]'}`
`DiagnosticForOutOfRangeInput`	Diagnostic for out-of-range input	`'None' | {'Warning'} | 'Error'`
`SampleTime`	Sample time (-1 for inherited)	`{'-1'}`
`TableMin`	Table minimum	`{'[]'}`
`TableMax`	Table maximum	`{'[]'}`
`TableDataTypeStr`	Table data type	`{'Inherit: Inherit from 'Table data''} | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'boolean' | 'fixdt(1,16)' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'`

Block (Type)/Parameter	Dialog Box Prompt	Values
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'} | 'on'
maskTabDims	Deprecated in R2009b	
explicitNumDims	Deprecated in R2009b	
outDims	Deprecated in R2009b	
tabIsInput	Deprecated in R2009b	
mxTable	Deprecated in R2009b	
clipFlag	Deprecated in R2009b	
samptime	Deprecated in R2009b	
Interpolation Using Prelookup (Interpolation_n-D)		
NumberOfTableDimensions	Number of table dimensions	'1' | {'2'} | '3' | '4'
Table	Table data > Value	{'sqrt([1:11]' * [1:11])'}
TableSource	Table data > Source	{'Dialog'} | 'Input port'

TableSpecification	Specification	{'Explicit values'} | | 'Lookup table object'
		To set this parameter from 'Explicit values' to 'Lookup table object', use the same call to set_param to set the parameter LookupTableObject. For example:
		`set_param('myModel/myInterpBlock',...`
		`'TableSpecification',...`
		`'Lookup table object',...`
		`'LookupTableObject','myLUTObject')`

LookupTableObject	Name of lookup table object	{''}
InterpMethod	Interpolation method	'Flat' | {'Linear point-slope'} | 'Nearest' | 'Linear Lagrange'
ExtrapMethod	Extrapolation method	'Clip' | {'Linear'}

Block (Type)/Parameter	Dialog Box Prompt	Values
ValidIndexMayReachLast	Valid index input may reach last index	{'off'} | 'on'
DiagnosticForOutOfRange Input	Diagnostic for out-of-range input	{'None'} | 'Warning' | 'Error'
RemoveProtectionIndex	Remove protection against out-of-range index in generated code	{'off'} | 'on'
NumSelectionDims	Number of sub-table selection dimensions	{'0'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
TableDataTypeStr	Table data > Data Type	'Inherit: Inherit from 'Table data'' | {'Inherit: Same as output'} | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16)' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
TableMin	Table data > Minimum	{'[]'}
TableMax	Table data > Maximum	{'[]'}
IntermediateResultsDataTypeStr	Intermediate results > Data Type	{'Inherit: Inherit via internal rule'} | 'Inherit: Same as output' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output > Data Type	'Inherit: Inherit via back propagation' | {'Inherit: Inherit from table data'} | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
OutMin	Output > Minimum	{'[]'}
OutMax	Output > Maximum	{'[]'}
InternalRulePriority	Internal rule priority	{'Speed'} | 'Precision'
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
SaturateOnIntegerOverflow	Saturate on integer overflow	{'off'} | 'on'
CheckIndexInCode	Deprecated in R2011a	
n-D Lookup Table, 1-D Lookup Table, 2-D Lookup Table (Lookup_n-D)		
NumberOfTable-Dimensions	Number of table dimensions	'1' | '2' | '3' | '4'. Default is ‘1’ for 1-D Lookup Table, ‘2’ for 2-D Lookup Table, ‘3’ for n-D Lookup Table.

Block (Type)/Parameter	Dialog Box Prompt	Values

DataSpecification	(n-D Lookup Table) Data specification	{'Table and breakpoints'} | 'Lookup table object'
		To set this parameter from 'Table and breakpoints' to 'Lookup table object', use the same call to set_param to set the parameter LookupTableObject. For example:
		`set_param('myModel/myLookupBlock',...`
		`'DataSpecification','Lookup table...`
		`object',...`
		`'LookupTableObject','myLUTObject')`

LookupTableObject	Name of lookup table object.	{''}
Table	Table data	{'reshape(repmat([4 5 6;16 19 20;10 18 23],1,2),[3,3,2])'}
BreakpointsSpecification	Breakpoints specification	{'Explicit values'} | 'Even spacing'
BreakpointsForDimension1FirstPoint	First point	{'1'}
BreakpointsForDimension2FirstPoint	First point	{'1'}
BreakpointsForDimension3FirstPoint	First point	{'1'}
...	...	...
BreakpointsForDimension30FirstPoint	First point	{'1'}
BreakpointsForDimension1Spacing	Spacing	{'1'}
BreakpointsForDimension2Spacing	Spacing	{'1'}
BreakpointsForDimension3Spacing	Spacing	{'1'}

Block (Type)/Parameter	Dialog Box Prompt	Values
...	...	...
BreakpointsFor-Dimension30Spacing	Spacing	{'1'}
BreakpointsFor-Dimension1	Breakpoints 1	{'[10,22,31]'}
BreakpointsForDimension2	Breakpoints 2	{'[10,22,31]'}
BreakpointsFor-Dimension3	Breakpoints 3	{'[5, 7]'}
...	...	...
BreakpointsFor-Dimension30	Breakpoints 30	{'[1:3]'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InterpMethod	Interpolation method	'Flat' | 'Nearest' | {'Linear point-slope'} | 'Linear Lagrange' | 'Cubic spline'
ExtrapMethod	Extrapolation method	'Clip' | {'Linear'} | 'Cubic spline'
UseLastTableValue	Use last table value for inputs at or above last breakpoint	{'off'} | 'on'
DiagnosticForOutOfRange Input	Diagnostic for out-of-range input	{'None'} | 'Warning' | 'Error'
RemoveProtectionInput	Remove protection against out-of-range input in generated code	{'off'} | 'on'
IndexSearchMethod	Index search method	'Evenly spaced points' | 'Linear search' | {'Binary search'}
BeginIndexSearchUsing PreviousIndexResult	Begin index search using previous index result	{'off'} | 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
UseOneInputPortForAllInputData	Use one input port for all input data	{'off'} | 'on'
SupportTunableTableSize	Support tunable table size in code generation	{'off'} | 'on'
MaximumIndicesForEachDimension	Maximum indices for each dimension	{'[]'}
TableDataTypeStr	Table data > Data Type	'Inherit: Inherit from 'Table data'' | {'Inherit: Same as output'} | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16)' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
TableMin	Table data > Minimum	{'[]'}
TableMax	Table data > Maximum	{'[]'}
BreakpointsForDimension1DataTypeStr	Breakpoints 1 > Data Type	{'Inherit: Same as corresponding input'} | 'Inherit: Inherit from 'Breakpoint data'' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16)' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
BreakpointsForDimension1Min	Breakpoints 1 > Minimum	{'[]'}
BreakpointsForDimension1Max	Breakpoints 1 > Maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
BreakpointsForDimension2 DataTypeStr	Breakpoints 2 > Data Type	{'Inherit: Same as corresponding input'} | 'Inherit: Inherit from 'Breakpoint data'' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16)' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
BreakpointsForDimension2 Min	Breakpoints 2 > Minimum	{'[]'}
BreakpointsForDimension2 Max	Breakpoints 2 > Maximum	{'[]'}
...	...	...
BreakpointsForDimension30 DataTypeStr	Breakpoints 30 > Data Type	{'Inherit: Same as corresponding input'} | 'Inherit: Inherit from 'Breakpoint data'' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16)' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
BreakpointsForDimension30 Min	Breakpoints 30 > Minimum	{'[]'}
BreakpointsForDimension30 Max	Breakpoints 30 > Maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
FractionDataTypeStr	Fraction > Data Type	{'Inherit: Inherit via internal rule'} | 'double' | 'single' | 'fixdt(1,16,0)'
IntermediateResults DataTypeStr	Intermediate results > Data Type	'Inherit: Inherit via internal rule' | {'Inherit: Same as output'} | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
OutDataTypeStr	Output > Data Type	'Inherit: Inherit via back propagation' | 'Inherit: Inherit from table data' | {'Inherit: Same as first input'} | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
OutMin	Output > Minimum	{'[]'}
OutMax	Output > Maximum	{'[]'}
InternalRulePriority	Internal rule priority	{'Speed'} | 'Precision'
InputSameDT	Require all inputs to have the same data type	'off' | {'on'}
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | 'Floor' | 'Nearest' | 'Round' | {'Simplest'} | 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} | 'on'
ProcessOutOfRangeInput	Deprecated in R2009b	
Lookup Table Dynamic (Lookup Table Dynamic) (masked subsystem)		

Block (Type)/Parameter	Dialog Box Prompt	Values
LookUpMeth	Lookup Method	'Interpolation-Extrapolation' | {'Interpolation-Use End Values'} | 'Use Input Nearest' | 'Use Input Below' | 'Use Input Above'
OutDataTypeStr	Output data type	{'fixdt('double')'} | 'Inherit: Inherit via back propagation' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'boolean' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
OutputDataTypeScaling Mode	Deprecated in R2007b	
OutDataType	Deprecated in R2007b	
OutScaling	Deprecated in R2007b	
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round'| 'Simplest' | 'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'} | 'on'
Prelookup (PreLookup)		

Block (Type)/Parameter	Dialog Box Prompt	Values
BreakpointsSpecification	Specification	{'Explicit values'} | 'Even spacing' | 'Breakpoint object' To set this parameter from 'Explicit values' or 'Even spacing' to 'Breakpoint object', use the same call to set_param to set the parameter BreakpointObject. For example: set_param('myModel/myPrelookupBlock',... 'BreakpointsSpecification',... 'Breakpoint object',... 'BreakpointObject','myBPObject')
BreakpointObject	Name of breakpoint object	{''}
BreakpointsFirstPoint	First point	{'10'}
BreakpointsSpacing	Spacing	{'10'}
BreakpointsNumPoints	Number of points	{'11'}
BreakpointsData	Value	{'[10:10:110]'}
BreakpointsDataSource	Source	{'Dialog'} | 'Input port'
IndexSearchMethod	Index search method	'Evenly spaced points' | 'Linear search' | {'Binary search'}
BeginIndexSearchUsingPreviousIndexResult	Begin index search using previous index result	{'off'} | 'on'
OutputOnlyTheIndex	Output only the index	{'off'} | 'on'
ExtrapMethod	Extrapolation method	'Clip' | {'Linear'}
UseLastBreakpoint	Use last breakpoint for input at or above upper limit	{'off'} | 'on'
DiagnosticForOutOfRangeInput	Diagnostic for out-of-range input	{'None'} | 'Warning' | 'Error'

Block (Type)/Parameter	Dialog Box Prompt	Values
RemoveProtectionInput	Remove protection against out-of-range input in generated code	{'off'} | 'on'
SampleTime	Sample time (-1 for inherited)	{'-1'}
BreakpointDataTypeStr	Breakpoint > Data Type	{'Inherit: Same as input'} | 'Inherit: Inherit from 'Breakpoint data'' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16)' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
BreakpointMin	Breakpoint > Minimum	{'[]'}
BreakpointMax	Breakpoint > Maximum	{'[]'}
IndexDataTypeStr	Index > Data Type	'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | {'uint32'} | 'fixdt(1,16)'
FractionDataTypeStr	Fraction > Data Type	{'Inherit: Inherit via internal rule'} | 'double' | 'single' | 'fixdt(1,16,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
ProcessOutOfRangeInput	Deprecated in R2011a	
Sine (Sine) (masked subsystem)		
Formula	Output formula	{'sin(2*pi*u)'} | 'cos(2*pi*u)' | 'exp(j*2*pi*u)' | 'sin(2*pi*u) and cos(2*pi*u)'

Block (Type)/Parameter	Dialog Box Prompt	Values
NumDataPoints	Number of data points for lookup table	{'(2^5)+1'}
OutputWordLength	Output word length	{'16'}
InternalRulePriority	Internal rule priority for lookup table	{'Speed'} | 'Precision'

Math Operations Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Abs (Abs)		
ZeroCross	Enable zero-crossing detection	'off' | {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	'Inherit: Inherit via internal rule' | 'Inherit: Inherit via back propagation' | {'Inherit: Same as input'} | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} | 'on'
Add (Sum)		
IconShape	Icon shape	{'rectangular'} | 'round'
Inputs	List of signs	{'++'}
CollapseMode	Sum over	{'All dimensions'} | 'Specified dimension'

Block (Type)/Parameter	Dialog Box Prompt	Values
CollapseDim	Dimension	{'1'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all inputs to have the same data type	{'off'} | 'on'
AccumDataTypeStr	Accumulator data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Same as first input' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Inherit via back propagation' | 'Inherit: Same as first input' | 'Inherit: Same as accumulator' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'

Block (Type)/Parameter	Dialog Box Prompt	Values
`SaturateOnInteger Overflow`	Saturate on integer overflow	`{'off'} | 'on'`
Algebraic Constraint (`Algebraic Constraint`)		
`Constraint`	Constraint on input signal	`{'f(z) = 0'} | 'f(z) = z'`
`Solver`	Algebraic Loop Solver	`{'auto'} | 'Trust Region' | 'Line Search'`
`Tolerance`	Solver Tolerance	`{'auto'}`
`InitialGuess`	Initial guess	`{'0'}`
Assignment (`Assignment`)		
`NumberOfDimensions`	Number of output dimensions	`{'1'}`
`IndexMode`	Index mode	`'Zero-based' | {'One-based'}`
`OutputInitialize`	Initialize output (Y)	`{'Initialize using input port <Y0>'} | 'Specify size for each dimension in table'`
`IndexOptionArray`	Index Option	`'Assign all' | {'Index vector (dialog)'} | 'Index vector (port)' | 'Starting index (dialog)' | 'Starting index (port)'`
`IndexParamArray`	Index	cell array
`OutputSizeArray`	Output Size	cell array
`DiagnosticForDimensions`	Action if any output element is not assigned	`'Error' | 'Warning' | {'None'}`
`SampleTime`	Sample time (-1 for inherited)	`{'-1'}`
`IndexOptions`	See the **IndexOptionArray** parameter for more information.	
`Indices`	See the **IndexParamArray** parameter for more information.	

Block (Type)/Parameter	Dialog Box Prompt	Values
`OutputSizes`	See the **OutputSizeArray** parameter for more information.	
Bias (`Bias`)		
`Bias`	Bias	`{'0.0'}`
`SaturateOnInteger Overflow`	Saturate on integer overflow	`{'off'} | 'on'`
Complex to Magnitude-Angle (`ComplexToMagnitudeAngle`)		
`Output`	Output	`'Magnitude' | 'Angle' | {'Magnitude and angle'}`
`SampleTime`	Sample time (-1 for inherited)	`{'-1'}`
Complex to Real-Imag (`ComplexToRealImag`)		
`Output`	Output	`'Real' | 'Imag' | {'Real and imag'}`
`SampleTime`	Sample time (-1 for inherited)	`{'-1'}`
Divide (`Product`)		
`Inputs`	Number of inputs	`{'*/'}`
`Multiplication`	Multiplication	`{'Element-wise(.*)'} | 'Matrix(*)'`
`SampleTime`	Sample time (-1 for inherited)	`{'-1'}`
`InputSameDT`	Require all inputs to have same data type	`{'off'} | 'on'`
`OutMin`	Output minimum	`{'[]'}`
`OutMax`	Output maximum	`{'[]'}`

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Inherit via back propagation' | 'Inherit: Same as first input' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} | 'on'
Dot Product (DotProduct)		
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all inputs to have same data type	'off' | {'on'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Inherit via back propagation' | 'Inherit: Same as first input' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
OutputDataTypeScaling Mode	Deprecated in R2007b	
OutDataType	Deprecated in R2007b	
OutScaling	Deprecated in R2007b	
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} | 'on'
Find (Find)		
IndexOutputFormat	Index output format	{'Linear indices'} | 'Subscripts'
NumberOfInputDimensions	Number of input dimensions	integer — {'1'}
IndexMode	Index mode	{'Zero-based'} | 'One-based'
ShowOutputForNonzero InputValues	Show output port for nonzero input values	{'off'} | 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
SampleTime	Sample time (–1 for inherited)	{'-1'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16)'
Gain (Gain)		
Gain	Gain	{'1'}
Multiplication	Multiplication	{'Element-wise(K.*u)'} | 'Matrix(K*u)' | 'Matrix(u*K)' | 'Matrix(K*u) (u vector)'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Inherit via back propagation' | 'Inherit: Same as input' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'

Block (Type)/Parameter	Dialog Box Prompt	Values
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} | 'on'
ParamMin	Parameter minimum	{'[]'}
ParamMax	Parameter maximum	{'[]'}
ParamDataTypeStr	Parameter data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Same as input' | 'Inherit: Inherit from 'Gain'' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16)' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
Magnitude-Angle to Complex (MagnitudeAngleToComplex)		
Input	Input	'Magnitude' | 'Angle' | {'Magnitude and angle'}
ConstantPart	Magnitude or Angle	{'0'}
ApproximationMethod	Approximation method	{'None'} | 'CORDIC'
NumberOfIterations	Number of iterations	{'11'}
ScaleReciprocalGainFactor	Scale output by reciprocal of gain factor	'off' | {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Math Function (Math)		
Operator	Function	{'exp'} | 'log' | '10^u' | 'log10' | 'magnitude^2' | 'square' | 'pow' | 'conj' | 'reciprocal' | 'hypot' | 'rem' | 'mod' | 'transpose' | 'hermitian'

Block (Type)/Parameter	Dialog Box Prompt	Values
OutputSignalType	Output signal type	{'auto'} | 'real' | 'complex'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	'Inherit: Inherit via internal rule' | 'Inherit: Inherit via back propagation' | {'Inherit: Same as first input'} | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
SaturateOnIntegerOverflow	Saturate on integer overflow	'off' | {'on'}
Matrix Concatenate (Concatenate)		
NumInputs	Number of inputs	{'2'}
Mode	Mode	'Vector' | {'Multidimensional array'}
ConcatenateDimension	Concatenate dimension	{'2'}
MinMax (MinMax)		

Block (Type)/Parameter	Dialog Box Prompt	Values
Function	Function	{'min'} | 'max'
Inputs	Number of input ports	{'1'}
ZeroCross	Enable zero-crossing detection	'off' | {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all inputs to have the same data type	{'off'} | 'on'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Inherit via back propagation' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
SaturateOnIntegerOverflow	Saturate on integer overflow	{'off'} | 'on'
MinMax Running Resettable (MinMax Running Resettable) (masked subsystem)		
Function	Function	{'min'} | 'max'
vinit	Initial condition	{'0.0'}
Permute Dimensions (PermuteDimensions)		
Order	Order	{'[2,1]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
Polynomial (Polyval)		
coefs	Polynomial Coefficients	{'[+2.081618890e-019, -1.441693666e-014, +4.719686976e-010, -8.536869453e-006, +1.621573104e-001, -8.087801117e+001]'}
Product (Product)		
Inputs	Number of inputs	{'2'}
Multiplication	Multiplication	{'Element-wise(.*)'} | 'Matrix(*)'
CollapseMode	Multiply over	{'All dimensions'} | 'Specified dimension'
CollapseDim	Dimension	{'1'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all inputs to have same data type	{'off'} | 'on'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Inherit via back propagation' | 'Inherit: Same as first input' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | 'Floor' | 'Nearest' | 'Round' | 'Simplest' | {'Zero'}
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} | 'on'
Product of Elements (Product)		
Inputs	Number of inputs	{'*'}
Multiplication	Multiplication	{'Element-wise(.*)'} | 'Matrix(*)'
CollapseMode	Multiply over	{'All dimensions'} | 'Specified dimension'
CollapseDim	Dimension	{'1'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all inputs to have same data type	{'off'} | 'on'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Inherit via back propagation' | 'Inherit: Same as first input' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} | 'on'
Real-Imag to Complex (RealImagToComplex)		
Input	Input	'Real' | 'Imag' | {'Real and imag'}
ConstantPart	Real part or Imag part	{'0'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Reciprocal Sqrt (Sqrt)		
Operator	Function	'sqrt' | 'signedSqrt' | {'rSqrt'}
OutputSignalType	Output signal type	{'auto'} | 'real' | 'complex'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output data type	'Inherit: Inherit via internal rule' | 'Inherit: Inherit via back propagation' | {'Inherit: Same as first input'} | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
SaturateOnIntegerOverflow	Saturate on integer overflow	'off' | {'on'}
IntermediateResultsDataTypeStr	Intermediate results data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Inherit from input' | 'Inherit: Inherit from output' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
AlgorithmType	Method	'Exact' | {'Newton-Raphson'}
Iterations	Number of iterations	{'3'}

Block (Type)/Parameter	Dialog Box Prompt	Values
Reshape (`Reshape`)		
`OutputDimensionality`	Output dimensionality	`{'1-D array'} | 'Column vector (2-D)' | 'Row vector (2-D)' | 'Customize' | 'Derive from reference input port'`
`OutputDimensions`	Output dimensions	`{'[1,1]'}`
Rounding Function (`Rounding`)		
`Operator`	Function	`{'floor'} | 'ceil' | 'round' | 'fix'`
`SampleTime`	Sample time (-1 for inherited)	`{'-1'}`
Sign (`Signum`)		
`ZeroCross`	Enable zero-crossing detection	`'off' | {'on'}`
`SampleTime`	Sample time (-1 for inherited)	`{'-1'}`
Signed Sqrt (`Sqrt`)		
`Operator`	Function	`'sqrt' | {'signedSqrt'} | 'rSqrt'`
`OutputSignalType`	Output signal type	`{'auto'} | 'real' | 'complex'`
`SampleTime`	Sample time (-1 for inherited)	`{'-1'}`
`OutMin`	Output minimum	`{'[]'}`
`OutMax`	Output maximum	`{'[]'}`

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output data type	'Inherit: Inherit via internal rule' | 'Inherit: Inherit via back propagation' | {'Inherit: Same as first input'} | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	'off' | {'on'}

`OutMin`	Output minimum	`{'[]'}`
`OutMax`	Output maximum	`{'[]'}`
`OutDataTypeStr`	Output data type	`{'Inherit: Inherit via internal rule'} | 'Inherit: Inherit via back propagation' | 'Inherit: Same as first input' | 'Inherit: Same as accumulator' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'`

Block (Type)/Parameter	Dialog Box Prompt	Values
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} | 'on'
Trigonometric Function (Trigonometry)		
Operator	Function	{'sin'} | 'cos' | 'tan' | 'asin' | 'acos' | 'atan' | 'atan2' | 'sinh' | 'cosh' | 'tanh' | 'asinh' | 'acosh' | 'atanh' | 'sincos' | 'cos + jsin'
ApproximationMethod	Approximation method	{'None'} | 'CORDIC'
NumberOfIterations	Number of iterations	{'11'}
OutputSignalType	Output signal type	{'auto'} | 'real' | 'complex'
SampleTime	Sample time (-1 for inherited)	{'-1'}
Unary Minus (UnaryMinus)		
SampleTime	Sample time (-1 for inherited)	{'-1'}
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} | 'on'
Vector Concatenate (Concatenate)		
NumInputs	Number of inputs	{'2'}
Mode	Mode	{'Vector'} | 'Multidimensional array'
Weighted Sample Time Math (SampleTimeMath)		

Block (Type)/Parameter	Dialog Box Prompt	Values
TsampMathOp	Operation	{'+'} | '-' | '*' | '/' | 'Ts Only' | '1/Ts Only'
weightValue	Weight value	{'1.0'}
TsampMathImp	Implement using	{'Online Calculations'} | 'Offline Scaling Adjustment'
OutDataTypeStr	Output data type	{'Inherit via internal rule'} | 'Inherit via back propagation'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
SaturateOnIntegerOverflow	Saturate on integer overflow	{'off'} | 'on'
OutputDataTypeScalingMode	Deprecated in R2009b	
DoSatur	Deprecated in R2009b	

Model Verification Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Assertion (Assertion)		
Enabled	Enable assertion	'off' | {'on'}
AssertionFailFcn	Simulation callback when assertion fails	{''}
StopWhenAssertionFail	Stop simulation when assertion fails	'off' | {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Check Dynamic Gap (Checks_DGap) (masked subsystem)		
enabled	Enable assertion	'off' | {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off' | {'on'}
export	Output assertion signal	{'off'} | 'on'
icon	Select icon type	{'graphic'} | 'text'
Check Dynamic Range (Checks_DRange) (masked subsystem)		
enabled	Enable assertion	'off' | {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off' | {'on'}
export	Output assertion signal	{'off'} | 'on'
icon	Select icon type	{'graphic'} | 'text'
Check Static Gap (Checks_SGap) (masked subsystem)		
max	Upper bound	{'100'}
max_included	Inclusive upper bound	'off' | {'on'}
min	Lower bound	{'0'}
min_included	Inclusive lower bound	'off' | {'on'}

Block (Type)/Parameter	Dialog Box Prompt	Values
enabled	Enable assertion	'off' | {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off' | {'on'}
export	Output assertion signal	{'off'} | 'on'
icon	Select icon type	{'graphic'} | 'text'
Check Static Range (Checks_SRange) (masked subsystem)		
max	Upper bound	{'100'}
max_included	Inclusive upper bound	'off' | {'on'}
min	Lower bound	{'0'}
min_included	Inclusive lower bound	'off' | {'on'}
enabled	Enable assertion	'off' | {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off' | {'on'}
export	Output assertion signal	{'off'} | 'on'
icon	Select icon type	{'graphic'} | 'text'
Check Discrete Gradient (Checks_Gradient) (masked subsystem)		
gradient	Maximum gradient	{'1'}
enabled	Enable assertion	'off' | {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off' | {'on'}
export	Output assertion signal	{'off'} | 'on'
icon	Select icon type	{'graphic'} | 'text'
Check Dynamic Lower Bound (Checks_DMin) (masked subsystem)		

Block (Type)/Parameter	Dialog Box Prompt	Values
Enabled	Enable assertion	'off' | {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off' | {'on'}
export	Output assertion signal	{'off'} | 'on'
icon	Select icon type	{'graphic'} | 'text'
Check Dynamic Upper Bound (Checks_DMax) (masked subsystem)		
enabled	Enable assertion	'off' | {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off' | {'on'}
export	Output assertion signal	{'off'} | 'on'
icon	Select icon type	{'graphic'} | 'text'
Check Input Resolution (Checks_Resolution) (masked subsystem)		
resolution	Resolution	{'1'}
enabled	Enable assertion	'off' | {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off' | {'on'}
export	Output assertion signal	{'off'} | 'on'
Check Static Lower Bound (Checks_SMin) (masked subsystem)		
min	Lower bound	{'0'}
min_included	Inclusive boundary	'off' | {'on'}
enabled	Enable assertion	'off' | {'on'}
callback	Simulation callback when assertion fails (optional)	{''}

Block (Type)/Parameter	Dialog Box Prompt	Values
stopWhenAssertionFail	Stop simulation when assertion fails	'off' | {'on'}
export	Output assertion signal	{'off'} | 'on'
icon	Select icon type	{'graphic'} | 'text'
Check Static Upper Bound (Checks_SMax) (masked subsystem)		
max	Upper bound	{'0'}
max_included	Inclusive boundary	'off' | {'on'}
enabled	Enable assertion	'off' | {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off' | {'on'}
export	Output assertion signal	{'off'} | 'on'
icon	Select icon type	{'graphic'} | 'text'

Model-Wide Utilities Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Block Support Table (`Block Support Table`) (masked subsystem)		
DocBlock (`DocBlock`) (masked subsystem)		
`ECoderFlag`	Embedded Coder Flag	`{''}`
`DocumentType`	Document Type	`{'Text'} | 'RTF' | 'HTML'`
Model Info (`CMBlock`) (masked subsystem)		
`InitialSaveTempField`	InitialSaveTempField	`{''}`
`InitialBlockCM`	InitialBlockCM	`{'None'}`
`BlockCM`	BlockCM	`{'None'}`
`Frame`	Show block frame	`'off' | {'on'}`
`SaveTempField`	SaveTempField	`{''}`
`DisplayStringWithTags`	DisplayStringWithTags	`{'Model Info'}`
`MaskDisplayString`	MaskDisplayString	`{'Model Info'}`
`HorizontalTextAlignment`	Horizontal text alignment	`{'Center'}`
`LeftAlignmentValue`	LeftAlignmentValue	`{'0.5'}`
`SourceBlockDiagram`	SourceBlockDiagram	`{'untitled'}`
`TagMaxNumber`	TagMaxNumber	`{'20'}`
`CMTag1`	CMTag1	`{''}`
`CMTag2`	CMTag2	`{''}`
`CMTag3`	CMTag3	`{''}`
`CMTag4`	CMTag4	`{''}`
`CMTag5`	CMTag5	`{''}`
`CMTag6`	CMTag6	`{''}`
`CMTag7`	CMTag7	`{''}`
`CMTag8`	CMTag8	`{''}`
`CMTag9`	CMTag9	`{''}`
`CMTag10`	CMTag10	`{''}`

Block (Type)/Parameter	Dialog Box Prompt	Values
CMTag11	CMTag11	{''}
CMTag12	CMTag12	{''}
CMTag13	CMTag13	{''}
CMTag14	CMTag14	{''}
CMTag15	CMTag15	{''}
CMTag16	CMTag16	{''}
CMTag17	CMTag17	{''}
CMTag18	CMTag18	{''}
CMTag19	CMTag19	{''}
CMTag20	CMTag20	{''}
Timed-Based Linearization (Timed Linearization) (masked subsystem)		
LinearizationTime	Linearization time	{'1'}
SampleTime	Sample time (of linearized model)	{'0'}
Trigger-Based Linearization (Triggered Linearization) (masked subsystem)		
TriggerType	Trigger type	{'rising'} | 'falling' | 'either' | 'function-call'
SampleTime	Sample time (of linearized model)	{'0'}

Ports & Subsystems Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Action Port (`ActionPort`)		
`InitializeStates`	States when execution is resumed	`{'held'} | 'reset'`
`PropagateVarSize`	Propagate sizes of variable-size signals	`{'Only when execution is resumed'} | 'During execution'`
Atomic Subsystem (`SubSystem`)		
`ShowPortLabels`	Show port labels **Note** The values `'off'` and `'on'` are for backward compatibility only and should not be used in new models or when updating existing models.	`'none' | {'FromPortIcon'} | 'FromPortBlockName' | 'SignalName' | 'off' | 'on'`
`BlockChoice`	Block choice	`{''}`
`TemplateBlock`	Template block	`{''}`
`MemberBlocks`	Member blocks	`{''}`
`Permissions`	Read/Write permissions	`{'ReadWrite'} | 'ReadOnly' | 'NoReadOrWrite'`
`ErrorFcn`	Name of error callback function	`{''}`
`PermitHierarchical Resolution`	Permit hierarchical resolution	`{'All'} | 'ExplicitOnly' | 'None'`
`TreatAsAtomicUnit`	Treat as atomic unit	`'off' | {'on'}`
`TreatAsGroupedWhenPropagatingVariantConditions`	Treat as grouped when propagating variant conditions	`'off' | {'on'}`
`MinAlgLoopOccurrences`	Minimize algebraic loop occurrences	`{'off'} | 'on'`
`PropExecContext OutsideSubsystem`	Propagate execution context across subsystem boundary	`{'off'} | 'on'`

Block (Type)/Parameter	Dialog Box Prompt	Values
`CheckFcnCallInp InsideContextMsg`	Warn if function-call inputs are context-specific	`{'off'} | 'on'`
`SystemSampleTime`	Sample time (-1 for inherited)	`{'-1'}`
`RTWSystemCode`	Function packaging	`{'Auto'} | 'Inline' | 'Nonreusable function' | 'Reusable function'`
`RTWFcnNameOpts`	Function name options	`{'Auto'} | 'Use subsystem name' | 'User specified'`
`RTWFcnName`	Function name	`{''}`
`RTWFileNameOpts`	File name options	`{'Auto'} | 'Use subsystem name' | 'Use function name' | 'User specified'`
`RTWFileName`	File name (no extension)	`{''}`
`FunctionInterfaceSpec`	Function interface This parameter requires a license for Embedded Coder software and an ERT-based system target file.	`{'void_void'} | 'Allow arguments'`
`FunctionWithSeparateData`	"Function with separate data" on page 1-0 This parameter requires a license for Embedded Coder software and an ERT-based system target file.	`{'off'} | 'on'`

Block (Type)/Parameter	Dialog Box Prompt	Values
RTWMemSecFuncInitTerm	"Memory section for initialize/ terminate functions" on page 1-0 This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'Inherit from model'} | 'Default' | list of memory sections from model's package
RTWMemSecFuncExecute	"Memory section for execution functions" on page 1-0 This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'Inherit from model'} | 'Default' | list of memory sections from model's package
RTWMemSecDataConstants	"Memory section for constants" on page 1-0 This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'Inherit from model'} | 'Default' | list of memory sections from model's package
RTWMemSecDataInternal	"Memory section for internal data" on page 1-0 This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'Inherit from model'} | 'Default' | list of memory sections from model's package
RTWMemSecDataParameters	"Memory section for parameters" on page 1-0 This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'Inherit from model'} | 'Default' | list of memory sections from model's package

Block (Type)/Parameter	Dialog Box Prompt	Values
DataTypeOverride	No dialog box prompt Specifies data type used to override fixed-point data types. Set by **Data type override** on the Fixed-Point Tool.	{'UseLocalSettings'} | 'ScaledDouble' | 'Double' | 'Single' | 'Off'
MinMaxOverflowLogging	No dialog box prompt Setting for fixed-point instrumentation. Set by **Fixed-point instrumentation mode** on the Fixed-Point Tool.	{'UseLocalSettings'} | 'MinMaxAndOverflow' | 'OverflowOnly' | 'ForceOff'
SimViewingDevice	No dialog box prompt If set to 'on', designates the block as a Signal Viewing Subsystem — an atomic subsystem that encapsulates processing and viewing of signals received from the target system in External mode. For more information, see “Signal Viewing Subsystems” (Simulink Coder).	{'off'} | 'on'
IsSubsystemVirtual		boolean — {'off'} | 'on' Read-only
Code Reuse Subsystem (SubSystem)		
ShowPortLabels	Show port labels **Note** The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none' | {'FromPortIcon'} | 'FromPortBlockName' | 'SignalName' | 'off' | 'on'
BlockChoice	Block choice	{''}

Block (Type)/Parameter	Dialog Box Prompt	Values
TemplateBlock	Template block	{''}
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'} | 'ReadOnly' | 'NoReadOrWrite'
ErrorFcn	Name of error callback function	{''}
PermitHierarchicalResolution	Permit hierarchical resolution	{'All'} | 'ExplicitOnly' | 'None'
TreatAsAtomicUnit	Treat as atomic unit	'off' | {'on'}
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'} | 'on'
PropExecContextOutsideSubsystem	Propagate execution context across subsystem boundary	{'off'} | 'on'
CheckFcnCallInpInsideContextMsg	Warn if function-call inputs are context-specific	{'off'} | 'on'
SystemSampleTime	Sample time (-1 for inherited)	{'-1'}
RTWSystemCode	Function packaging	'Auto' | 'Inline' | 'Nonreusable function' | {'Reusable function'}
RTWFcnNameOpts	Function name options	'Auto' | {'Use subsystem name'} | 'User specified'
RTWFcnName	Function name	{''}
RTWFileNameOpts	File name options	'Auto' | {'Use subsystem name'} | 'Use function name' | 'User specified'
RTWFileName	File name (no extension)	{''}

Block (Type)/Parameter	Dialog Box Prompt	Values
`RTWMemSecFuncInitTerm`	“Memory section for initialize/terminate functions” on page 1-0 This parameter requires a license for Embedded Coder software and an ERT-based system target file.	`{'Inherit from model'}` | `'Default'` | list of memory sections from model's package
`RTWMemSecFuncExecute`	“Memory section for execution functions” on page 1-0 This parameter requires a license for Embedded Coder software and an ERT-based system target file.	`{'Inherit from model'}` | `'Default'` | list of memory sections from model's package
`RTWMemSecDataConstants`	“Memory section for constants” on page 1-0 This parameter requires a license for Embedded Coder software and an ERT-based system target file.	`{'Inherit from model'}` | `'Default'` | list of memory sections from model's package
`RTWMemSecDataInternal`	“Memory section for internal data” on page 1-0 This parameter requires a license for Embedded Coder software and an ERT-based system target file.	`{'Inherit from model'}` | `'Default'` | list of memory sections from model's package
`RTWMemSecDataParameters`	“Memory section for parameters” on page 1-0 This parameter requires a license for Embedded Coder software and an ERT-based system target file.	`{'Inherit from model'}` | `'Default'` | list of memory sections from model's package

Block (Type)/Parameter	Dialog Box Prompt	Values
DataTypeOverride	No dialog box prompt Specifies data type used to override fixed-point data types. Set by **Data type override** on the Fixed-Point Tool.	{'UseLocalSettings'} | 'ScaledDouble' | 'Double' | 'Single' | 'Off'
MinMaxOverflowLogging	No dialog box prompt Setting for fixed-point instrumentation. Set by **Fixed-point instrumentation mode** on the Fixed-Point Tool.	{'UseLocalSettings'} | 'MinMaxAndOverflow' | 'OverflowOnly' | 'ForceOff'
IsSubsystemVirtual		boolean — {'off'} | 'on' Read-only
Configurable Subsystem (SubSystem)		
ShowPortLabels	Show port labels **Note** The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none' | {'FromPortIcon'} | 'FromPortBlockName' | 'SignalName' | 'off' | 'on'
BlockChoice	Block choice	{''}
TemplateBlock	Template block	{'self'}
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'} | 'ReadOnly' | 'NoReadOrWrite'
ErrorFcn	Name of error callback function	{''}
PermitHierarchicalResolution	Permit hierarchical resolution	{'All'} | 'ExplicitOnly' | 'None'
TreatAsAtomicUnit	Treat as atomic unit	{'off'} | 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
`MinAlgLoopOccurrences`	Minimize algebraic loop occurrences	`{'off'} | 'on'`
`PropExecContext OutsideSubsystem`	Propagate execution context across subsystem boundary	`{'off'} | 'on'`
`CheckFcnCallInp InsideContextMsg`	Warn if function-call inputs are context-specific	`{'off'} | 'on'`
`SystemSampleTime`	Sample time (-1 for inherited)	`{'-1'}`
`RTWSystemCode`	Function packaging	`{'Auto'} | 'Inline' | 'Nonreusable function' | 'Reusable function'`
`RTWFcnNameOpts`	Function name options	`{'Auto'} | 'Use subsystem name' | 'User specified'`
`RTWFcnName`	Function name	`{''}`
`RTWFileNameOpts`	File name options	`{'Auto'} | 'Use subsystem name' | 'Use function name' | 'User specified'`
`RTWFileName`	File name (no extension)	`{''}`
`DataTypeOverride`	No dialog box prompt Specifies data type used to override fixed-point data types. Set by **Data type override** on the Fixed-Point Tool.	`{'UseLocalSettings'} | 'ScaledDouble' | 'Double' | 'Single' | 'Off'`
`MinMaxOverflowLogging`	No dialog box prompt Setting for fixed-point instrumentation. Set by **Fixed-point instrumentation mode** on the Fixed-Point Tool.	`{'UseLocalSettings'} | 'MinMaxAndOverflow' | 'OverflowOnly' | 'ForceOff'`

Block (Type)/Parameter	Dialog Box Prompt	Values
`SimViewingDevice`	No dialog box prompt If set to `'on'`, designates the block as a Signal Viewing Subsystem — an atomic subsystem that encapsulates processing and viewing of signals received from the target system in External mode. For more information, see "Signal Viewing Subsystems" (Simulink Coder).	`{'off'} | 'on'`
`DataTypeOverride`	No dialog box prompt Specifies data type used to override fixed-point data types. Set by **Data type override** on the Fixed-Point Tool.	`{'UseLocalSettings'} | 'ScaledDouble' | 'Double' | 'Single' | 'Off'`
`MinMaxOverflowLogging`	No dialog box prompt Setting for fixed-point instrumentation. Set by **Fixed-point instrumentation mode** on the Fixed-Point Tool.	`{'UseLocalSettings'} | 'MinMaxAndOverflow' | 'OverflowOnly' | 'ForceOff'`
`IsSubsystemVirtual`	No dialog box prompt	boolean — `{'on'} | 'off'` Read-only
Enable (`EnablePort`)		
`StatesWhenEnabling`	States when enabling	`{'held'} | 'reset'`
`PropagateVarSize`	Propagate sizes of variable-size signals	`{'Only when enabling'} | 'During execution'`
`ShowOutputPort`	Show output port	`{'off'} | 'on'`
`ZeroCross`	Enable zero-crossing detection	`'off' | {'on'}`
Enabled and Triggered Subsystem (`SubSystem`)		

Block (Type)/Parameter	Dialog Box Prompt	Values
ShowPortLabels	Show port labels **Note** The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none' | {'FromPortIcon'} | 'FromPortBlockName' | 'SignalName' | 'off' | 'on'
BlockChoice	Block choice	{''}
TemplateBlock	Template block	{''}
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'} | 'ReadOnly' | 'NoReadOrWrite'
ErrorFcn	Name of error callback function	{''}
PermitHierarchical Resolution	Permit hierarchical resolution	{'All'} | 'ExplicitOnly' | 'None'
TreatAsAtomicUnit	Treat as atomic unit	'off' | {'on'}
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'} | 'on'
PropExecContext OutsideSubsystem	Propagate execution context across subsystem boundary	{'off'} | 'on'
CheckFcnCallInp InsideContextMsg	Warn if function-call inputs are context-specific	{'off'} | 'on'
SystemSampleTime	Sample time (-1 for inherited)	{'-1'}
RTWSystemCode	Function packaging	{'Auto'} | 'Inline' | 'Nonreusable function' | 'Reusable function'
RTWFcnNameOpts	Function name options	{'Auto'} | 'Use subsystem name' | 'User specified'
RTWFcnName	Function name	{''}

Block (Type)/Parameter	Dialog Box Prompt	Values
RTWFileNameOpts	File name options	{'Auto'} | 'Use subsystem name' | 'Use function name' | 'User specified'
RTWFileName	File name (no extension)	{''}
DataTypeOverride	No dialog box prompt Specifies data type used to override fixed-point data types. Set by **Data type override** on the Fixed-Point Tool.	{'UseLocalSettings'} | 'ScaledDouble' | 'Double' | 'Single' | 'Off'
MinMaxOverflowLogging	No dialog box prompt Setting for fixed-point instrumentation. Set by **Fixed-point instrumentation mode** on the Fixed-Point Tool.	{'UseLocalSettings'} | 'MinMaxAndOverflow' | 'OverflowOnly' | 'ForceOff'
IsSubsystemVirtual		boolean — {'off'} | 'on' Read-only
Enabled Subsystem (SubSystem)		
ShowPortLabels	Show port labels **Note** The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none' | {'FromPortIcon'} | 'FromPortBlockName' | 'SignalName' | 'off' | 'on'
BlockChoice	Block choice	{''}
TemplateBlock	Template block	{''}
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'} | 'ReadOnly' | 'NoReadOrWrite'

Block (Type)/Parameter	Dialog Box Prompt	Values
`ErrorFcn`	Name of error callback function	`{''}`
`PermitHierarchicalResolution`	Permit hierarchical resolution	`{'All'} | 'ExplicitOnly' | 'None'`
`TreatAsAtomicUnit`	Treat as atomic unit	`'off' | {'on'}`
`MinAlgLoopOccurrences`	Minimize algebraic loop occurrences	`{'off'} | 'on'`
`PropExecContextOutsideSubsystem`	Propagate execution context across subsystem boundary	`{'off'} | 'on'`
`CheckFcnCallInpInsideContextMsg`	Warn if function-call inputs are context-specific	`{'off'} | 'on'`

`RTWFcnName`	Function name	`{''}`
`RTWFileNameOpts`	File name options	`{'Auto'} | 'Use subsystem name' | 'Use function name' | 'User specified'`
`RTWFileName`	File name (no extension)	`{''}`
`DataTypeOverride`	No dialog box prompt Specifies data type used to override fixed-point data types. Set by **Data type override** on the Fixed-Point Tool.	`{'UseLocalSettings'} | 'ScaledDouble' | 'Double' | 'Single' | 'Off'`

Block (Type)/Parameter	Dialog Box Prompt	Values
MinMaxOverflowLogging	No dialog box prompt Setting for fixed-point instrumentation. Set by **Fixed-point instrumentation mode** on the Fixed-Point Tool.	{'UseLocalSettings'} | 'MinMaxAndOverflow' | 'OverflowOnly' | 'ForceOff'
IsSubsystemVirtual		boolean — {'off'} | 'on' Read-only
For Each(ForEach)		
InputPartition	Partition	cell array of character vectors
InputPartitionDimension	Partition dimension for input signal	cell array of character vectors
InputPartitionWidth	Width of partition for input signal	cell array of character vectors
OutputConcatenationDimension	Concatenation dimension of output signal	cell array of character vectors
For Iterator (ForIterator)		
ResetStates	States when starting	{'held'} | 'reset'
IterationSource	Iteration limit source	{'internal'} | 'external'
IterationLimit	Iteration limit	{'5'}
ExternalIncrement	Set next i (iteration variable) externally	{'off'} | 'on'
ShowIterationPort	Show iteration variable	'off' | {'on'}
IndexMode	Index mode	'Zero-based' | {'One-based'}
IterationVariable DataType	Iteration variable data type	{'int32'} | 'int16' | 'int8' | 'double'
For Iterator Subsystem (SubSystem)		

Block (Type)/Parameter	Dialog Box Prompt	Values
ShowPortLabels	Show port labels **Note** The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none' | {'FromPortIcon'} | 'FromPortBlockName' | 'SignalName' | 'off' | 'on'
BlockChoice	Block choice	{''}
TemplateBlock	Template block	{''}
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'} | 'ReadOnly' | 'NoReadOrWrite'
ErrorFcn	Name of error callback function	{''}
PermitHierarchical Resolution	Permit hierarchical resolution	{'All'} | 'ExplicitOnly' | 'None'
TreatAsAtomicUnit	Treat as atomic unit	'off' | {'on'}
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'} | 'on'
PropExecContext OutsideSubsystem	Propagate execution context across subsystem boundary	{'off'} | 'on'
CheckFcnCallInp InsideContextMsg	Warn if function-call inputs are context-specific	{'off'} | 'on'
SystemSampleTime	Sample time (-1 for inherited)	{'-1'}
RTWSystemCode	Function packaging	{'Auto'} | 'Inline' | 'Nonreusable function' | 'Reusable function'
RTWFcnNameOpts	Function name options	{'Auto'} | 'Use subsystem name' | 'User specified'
RTWFcnName	Function name	{''}

Block (Type)/Parameter	Dialog Box Prompt	Values
RTWFileNameOpts	File name options	{'Auto'} | 'Use subsystem name' | 'Use function name' | 'User specified'
RTWFileName	File name (no extension)	{''}
DataTypeOverride	No dialog box prompt Specifies data type used to override fixed-point data types. Set by **Data type override** on the Fixed-Point Tool.	{'UseLocalSettings'} | 'ScaledDouble' | 'Double' | 'Single' | 'Off'
MinMaxOverflowLogging	No dialog box prompt Setting for fixed-point instrumentation . Set by **Fixed-point instrumentation mode** on the Fixed-Point Tool.	{'UseLocalSettings'} | 'MinMaxAndOverflow' | 'OverflowOnly' | 'ForceOff'
IsSubsystemVirtual		boolean — {'off'} | 'on' Read-only
Function-Call Generator (Function-Call Generator) (masked subsystem)		
sample_time	Sample time	{'1'}
numberOfIterations	Number of iterations	{'1'}
Function-Call Subsystem (SubSystem)		
ShowPortLabels	Show port labels **Note** The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none' | {'FromPortIcon'} | 'FromPortBlockName' | 'SignalName' | 'off' | 'on'
BlockChoice	Block choice	{''}
TemplateBlock	Template block	{''}

Block (Type)/Parameter	Dialog Box Prompt	Values
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'} | 'ReadOnly' | 'NoReadOrWrite'
ErrorFcn	Name of error callback function	{''}
PermitHierarchical Resolution	Permit hierarchical resolution	{'All'} | 'ExplicitOnly' | 'None'
TreatAsAtomicUnit	Treat as atomic unit	'off' | {'on'}
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'} | 'on'
PropExecContext OutsideSubsystem	Propagate execution context across subsystem boundary	{'off'} | 'on'
CheckFcnCallInp InsideContextMsg	Warn if function-call inputs are context-specific	{'off'} | 'on'
SystemSampleTime	Sample time (-1 for inherited)	{'-1'}
RTWSystemCode	Function packaging	{'Auto'} | 'Inline' | 'Nonreusable function' | 'Reusable function'
RTWFcnNameOpts	Function name options	{'Auto'} | 'Use subsystem name' | 'User specified'
RTWFcnName	Function name	{''}
RTWFileNameOpts	File name options	{'Auto'} | 'Use subsystem name' | 'Use function name' | 'User specified'
RTWFileName	File name (no extension)	{''}
DataTypeOverride	No dialog box prompt Specifies data type used to override fixed-point data types. Set by **Data type override** on the Fixed-Point Tool.	{'UseLocalSettings'} | 'ScaledDouble' | 'Double' | 'Single' | 'Off'

Block (Type)/Parameter	Dialog Box Prompt	Values
`MinMaxOverflowLogging`	No dialog box prompt Setting for fixed-point instrumentation. Set by **Fixed-point instrumentation mode** on the Fixed-Point Tool.	`{'UseLocalSettings'} | 'MinMaxAndOverflow' | 'OverflowOnly' | 'ForceOff'`
`IsSubsystemVirtual`		boolean — `{'off'} | 'on'` Read-only
If (`If`)		
`NumInputs`	Number of inputs	`{'1'}`
`IfExpression`	If expression (e.g., u1 ~= 0)	`{'u1 > 0'}`
`ElseIfExpressions`	Elseif expressions (comma-separated list, e.g., u2 ~= 0, u3(2) < u2)	`{''}`
`ShowElse`	Show else condition	`'off' | {'on'}`
`ZeroCross`	Enable zero-crossing detection	`'off' | {'on'}`
`SampleTime`	Sample time (-1 for inherited)	`{'-1'}`
If Action Subsystem (`SubSystem`)		
`ShowPortLabels`	Show port labels **Note** The values `'off'` and `'on'` are for backward compatibility only and should not be used in new models or when updating existing models.	`'none' | {'FromPortIcon'} | 'FromPortBlockName' | 'SignalName' | 'off' | 'on'`
`BlockChoice`	Block choice	`{''}`
`TemplateBlock`	Template block	`{''}`
`MemberBlocks`	Member blocks	`{''}`
`Permissions`	Read/Write permissions	`{'ReadWrite'} | 'ReadOnly' | 'NoReadOrWrite'`

Block (Type)/Parameter	Dialog Box Prompt	Values
`ErrorFcn`	Name of error callback function	`{''}`
`PermitHierarchical Resolution`	Permit hierarchical resolution	`{'All'} | 'ExplicitOnly' | 'None'`
`TreatAsAtomicUnit`	Treat as atomic unit	`'off' | {'on'}`
`MinAlgLoopOccurrences`	Minimize algebraic loop occurrences	`{'off'} | 'on'`
`PropExecContext OutsideSubsystem`	Propagate execution context across subsystem boundary	`{'off'} | 'on'`
`CheckFcnCallInp InsideContextMsg`	Warn if function-call inputs are context-specific	`{'off'} | 'on'`
`SystemSampleTime`	Sample time (-1 for inherited)	`{'-1'}`
`RTWSystemCode`	Function packaging	`{'Auto'} | 'Inline' | 'Nonreusable function' | 'Reusable function'`
`RTWFcnNameOpts`	Function name options	`{'Auto'} | 'Use subsystem name' | 'User specified'`
`RTWFcnName`	Function name	`{''}`
`RTWFileNameOpts`	File name options	`{'Auto'} | 'Use subsystem name' | 'Use function name' | 'User specified'`
`RTWFileName`	File name (no extension)	`{''}`
`DataTypeOverride`	No dialog box prompt Specifies data type used to override fixed-point data types. Set by **Data type override** on the Fixed-Point Tool.	`{'UseLocalSettings'} | 'ScaledDouble' | 'Double' | 'Single' | 'Off'`

Block (Type)/Parameter	Dialog Box Prompt	Values
MinMaxOverflowLogging	No dialog box prompt Setting for fixed-point instrumentation. Set by **Fixed-point instrumentation mode** on the Fixed-Point Tool.	{'UseLocalSettings'} | 'MinMaxAndOverflow' | 'OverflowOnly' | 'Off'
IsSubsystemVirtual		boolean — {'off'} | 'on' Read-only
In1 (Inport)		
Port	Port number	{'1'}
IconDisplay	Icon display	'Signal name' | {'Port number'} | 'Port number and signal name'
LatchByDelaying OutsideSignal	Latch input by delaying outside signal	{'off'} | 'on'
LatchInputFor FeedbackSignals	Latch input for feedback signals of function-call subsystem outputs	{'off'} | 'on'
Interpolate	Interpolate data	'off' | {'on'}
UseBusObject	Specify properties via bus object	{'off'} | 'on'
BusObject	Bus object for specifying bus properties	{'BusObject'}
BusOutputAsStruct	Output as nonvirtual bus	{'off'} | 'on'
PortDimensions	Port dimensions (-1 for inherited)	{'-1'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Data type	{'Inherit: auto'} | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'boolean' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)' | 'Enum: <class name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
Unit	Specify physical unit of the input signal to the block.	{'inherit'}| '<Enter unit>'
UnitNoProp	Specify physical unit of the input signal to the block without propagation. For a list of acceptable units, see Allowed Units.	'<Enter unit>'
SignalType	Signal type	{'auto'} | 'real' | 'complex'
Model (ModelReference)		
ModelNameDialog	The name of the referenced model exactly as you typed it in, with any surrounding whitespace removed. When you set ModelNameDialog programmatically or with the GUI, Simulink automatically sets the values of ModelName and ModelFile based on the value of ModelNameDialog.	{'<Enter Model Name>'}

Block (Type)/Parameter	Dialog Box Prompt	Values
ModelName	The value of ModelNameDialog stripped of any filename extension that you provided. For backward compatibility, setting ModelName programatically actually sets ModelNameDialog, which then sets ModelName as described. You cannot use get_param to obtain the ModelName of a protected model, because the name without a suffix would be ambiguous. Use get_param on ModelFile instead. You can test ProtectedModel to determine programmatically whether a referenced model is protected.	character vector — Set automatically when ModelNameDialog is set.
ModelFile	The value of ModelNameDialog with a filename extension. The suffix of the first match Simulink finds becomes the suffix of ModelFile. Setting ModelFile programmatically actually sets ModelNameDialog, which then sets ModelFile as described.	character vector — Set automatically when ModelNameDialog is set.
ProtectedModel	Read-only boolean indicating whether the model referenced by the block is protected (on) or unprotected (off).	boolean — 'off' | 'on' — Set automatically when ModelNameDialog is set.
ParameterArgumentNames	Names of model arguments that the referenced model defines. Corresponds to the **Name** column in the table under **Arguments** > **Model arguments**.	{''}

Block (Type)/Parameter	Dialog Box Prompt	Values
`ParameterArgumentValues`	Values for model arguments. Corresponds to the **Value** column in the table under **Arguments** > **Model arguments**.	structure with no fields
`SimulationMode`	Specifies whether to simulate the model by generating and executing code or by interpreting the model in Simulink software.	`{'Normal'} | 'Accelerator' | 'Software-in-the-loop (SIL)' | 'Processor-in-the-loop (PIL)'`
`Variant`	Specifies whether the Model block references variant models or Variant Subsystems.	`{'off'} | 'on'`
`VariantConfigurationObject`	Specifies the variant configuration object that is associated with the model.	`{''}` The value is an empty character vector if no configuration object is associated; otherwise, it is the name of a `Simulink.VariantConfigurationData` object.
`OverrideUsingVariant`	Whether to override the variant conditions and make a specified variant the active variant, and if so, the name of that variant.	`{''}` The value is the empty character vector if no overriding variant object is specified; or the name of the overriding object.
`ActiveVariant`	The variant that is currently active, either because its variant condition is `true` or `OverrideUsingVariant` has overridden the variant conditions and specified this variant.	`{''}` The value is the empty character vector if no variant is active; or the name of the active variant.

Block (Type)/Parameter	Dialog Box Prompt	Values
GeneratePreprocessor Conditionals	Locally controls whether generated code contains preprocessor conditionals. This parameter applies only to Simulink Coder code generation and has no effect on the behavior of a model in Simulink. The parameter is available only for ERT targets. For more information, see “Variant Systems” (Embedded Coder).	{'off'} | 'on'
DefaultDataLogging		{'off'} | 'on'
Out1 (Outport)		
Port	Port number	{'1'}
IconDisplay	Icon display	'Signal name' | {'Port number'} | 'Port number and signal name'
UseBusObject	Specify properties via bus object	{'off'} | 'on'
BusObject	Bus object for validating input bus	{'BusObject'}
BusOutputAsStruct	Output as nonvirtual bus in parent model	{'off'} | 'on'
PortDimensions	Port dimensions (-1 for inherited)	{'-1'}
VarSizeSig	Variable-size signal	{'Inherit'} | 'No' | 'Yes'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
`OutDataTypeStr`	Data type	`{'Inherit: auto'} | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'boolean' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)' | 'Enum: <class name>' | 'Bus: <object name>'`
`LockScale`	Lock output data type setting against changes by the fixed-point tools	`{'off'} | 'on'`
`Unit`	Specify physical unit of the input signal to the block. For a list of acceptable units, see Allowed Units.	`{'inherit'}| '<Enter unit>'`
`UnitNoProp`	Specify physical unit of the input signal to the block without propagation. For a list of acceptable units, see Allowed Units.	`'<Enter unit>'`
`SignalObject`	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See “Design Data Interface by Configuring Inport and Outport Blocks” (Simulink Coder).	`Simulink.Signal` object Object of a class that is derived from `Simulink.Signal`
`StorageClass`	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See “Design Data Interface by Configuring Inport and Outport Blocks” (Simulink Coder).	`{'Auto'} | 'Model default' | 'ExportedGlobal' | 'ImportedExtern' | 'ImportedExternPointer' | 'Custom'`
`SignalName`	Signal name	character vector

Block (Type)/Parameter	Dialog Box Prompt	Values
SignalType	Signal type	{'auto'} | 'real' | 'complex'
OutputWhenDisabled	Output when disabled	{'held'} | 'reset'
InitialOutput	Initial output	{'[]'}
MustResolveToSignalObject	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See “For Signals”.	{'off'} | 'on'
Subsystem (SubSystem)		
ShowPortLabels	Show port labels **Note** The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none' | {'FromPortIcon'} | 'FromPortBlockName' | 'SignalName' | 'off' | 'on'
BlockChoice	Block choice	{''}
TemplateBlock	Template block	{''}
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'} | 'ReadOnly' | 'NoReadOrWrite'
ErrorFcn	Name of error callback function	{''}
PermitHierarchical Resolution	Permit hierarchical resolution	{'All'} | 'ExplicitOnly' | 'None'
TreatAsAtomicUnit	Treat as atomic unit	{'off'} | 'on'
TreatAsGroupedWhenPropagatingVariantConditions	Treat as grouped when propagating variant conditions	'off' | {'on'}
VariantControl	Variant control	{'Variant'} | '(default)'
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'} | 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
PropExecContext OutsideSubsystem	Propagate execution context across subsystem boundary	{'off'} | 'on'
CheckFcnCallInp InsideContextMsg	Warn if function-call inputs are context-specific	{'off'} | 'on'
SystemSampleTime	Sample time (-1 for inherited)	{'-1'}
RTWSystemCode	Code generation function packaging	{'Auto'} | 'Inline' | 'Nonreusable function' | 'Reusable function'
RTWFcnNameOpts	Code generation function name options	{'Auto'} | 'Use subsystem name' | 'User specified'
RTWFcnName	Code generation function name	{''}
RTWFileNameOpts	Code generation file name options	{'Auto'} | 'Use subsystem name' | 'Use function name' | 'User specified'
RTWFileName	Code generation file name (no extension)	{''}
DataTypeOverride	Specifies data type used to override fixed-point data types. Set by **Data type override** on the Fixed-Point Tool.	{'UseLocalSettings'} | 'ScaledDouble' | 'Double' | 'Single' | 'Off'
MinMaxOverflowLogging	No dialog box prompt Setting for fixed-point instrumentation. Set by **Fixed-point instrumentation mode** on the Fixed-Point Tool.	{'UseLocalSettings'} | 'MinMaxAndOverflow' | 'OverflowOnly' | 'ForceOff'
IsSubsystemVirtual		boolean — {'on'} | 'off' Read-only
Virtual	For internal use	
Switch Case (SwitchCase)		

Block (Type)/Parameter	Dialog Box Prompt	Values
CaseConditions	Case conditions (e.g., {1,[2,3]})	{'{1}'}
ShowDefaultCase	Show default case	'off' | {'on'}
ZeroCross	Enable zero-crossing detection	'off' | {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
CaseShowDefault	Deprecated in R2009b	
Switch Case Action Subsystem (SubSystem)		
ShowPortLabels	Show port labels **Note** The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none' | {'FromPortIcon'} | 'FromPortBlockName' | 'SignalName' | 'off' | 'on'
BlockChoice	Block choice	{''}
TemplateBlock	Template block	{''}
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'} | 'ReadOnly' | 'NoReadOrWrite'
ErrorFcn	Name of error callback function	{''}
PermitHierarchical Resolution	Permit hierarchical resolution	{'All'} | 'ExplicitOnly' | 'None'
TreatAsAtomicUnit	Treat as atomic unit	'off' | {'on'}
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'} | 'on'
PropExecContext OutsideSubsystem	Propagate execution context across subsystem boundary	{'off'} | 'on'
CheckFcnCallInp InsideContextMsg	Warn if function-call inputs are context-specific	{'off'} | 'on'
SystemSampleTime	Sample time (-1 for inherited)	{'-1'}

Block (Type)/Parameter	Dialog Box Prompt	Values
RTWSystemCode	Code generation function packaging	{'Auto'} | 'Inline' | 'Nonreusable function' | 'Reusable function'
RTWFcnNameOpts	Code generation function name options	{'Auto'} | 'Use subsystem name' | 'User specified'
RTWFcnName	Code generation function name	{''}
RTWFileNameOpts	Code generation file name options	{'Auto'} | 'Use subsystem name' | 'Use function name' | 'User specified'
RTWFileName	Code generation file name (no extension)	{''}
DataTypeOverride	No dialog box prompt Specifies data type used to override fixed-point data types. Set by **Data type override** on the Fixed-Point Tool.	{'UseLocalSettings'} | 'ScaledDouble' | 'Double' | 'Single' | 'Off'
MinMaxOverflowLogging	No dialog box prompt Setting for fixed-point instrumentation. Set by **Fixed-point instrumentation mode** on the Fixed-Point Tool.	{'UseLocalSettings'} | 'MinMaxAndOverflow' | 'OverflowOnly' | 'ForceOff'
IsSubsystemVirtual		boolean — {'off'} | 'on' Read-only
Trigger (TriggerPort)		
TriggerType	Trigger type	{'rising'} | 'falling' | 'either' | 'function-call'
IsSimulinkFunction	Configure the Function-call subsystem to be a Simulink Function	{'off'} | 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
StatesWhenEnabling	States when enabling	{'held'} | 'reset' | 'inherit'
PropagateVarSize	Propagate sizes of variable-size signals	{'During execution'} | 'Only when enabling'
ShowOutputPort	Show output port	{'off'} | 'on'
OutputDataType	Output data type	{'auto'} | 'double' | 'int8'
SampleTimeType	Sample time type	{'triggered'} | 'periodic'
SampleTime	Sample time	{'1'}
ZeroCross	Enable zero-crossing detection	'off' | {'on'}
PortDimensions	Port dimensions (-1 for inherited)	{'-1'}
TriggerSignalSampleTime	Trigger signal sample time	{'-1'}
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}
OutDataTypeStr	Data type	{'Inherit: auto'} | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'boolean' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)' | 'Enum: <class name>'
Interpolate	Interpolate data	'off' | {'on'}
Triggered Subsystem (SubSystem)		

Block (Type)/Parameter	Dialog Box Prompt	Values
ShowPortLabels	Show port labels **Note** The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none' | {'FromPortIcon'} | 'FromPortBlockName' | 'SignalName' | 'off' | 'on'
BlockChoice	Block choice	{''}
TemplateBlock	Template block	{''}
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'} | 'ReadOnly' | 'NoReadOrWrite'
ErrorFcn	Name of error callback function	{''}
PermitHierarchical Resolution	Permit hierarchical resolution	{'All'} | 'ExplicitOnly' | 'None'
TreatAsAtomicUnit	Treat as atomic unit	'off' | {'on'}
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'} | 'on'
PropExecContext OutsideSubsystem	Propagate execution context across subsystem boundary	{'off'} | 'on'
CheckFcnCallInp InsideContextMsg	Warn if function-call inputs are context-specific	{'off'} | 'on'
SystemSampleTime	Sample time (-1 for inherited)	{'-1'}
RTWSystemCode	Code generation function packaging	{'Auto'} | 'Inline' | 'Nonreusable function' | 'Reusable function'
RTWFcnNameOpts	Code generation function name options	{'Auto'} | 'Use subsystem name' | 'User specified'
RTWFcnName	Code generation function name	{''}

Block (Type)/Parameter	Dialog Box Prompt	Values
`RTWFileNameOpts`	Code generation file name options	`{'Auto'} | 'Use subsystem name' | 'Use function name' | 'User specified'`
`RTWFileName`	Code generation file name (no extension)	`{''}`
`DataTypeOverride`	No dialog box prompt Specifies data type used to override fixed-point data types. Set by **Data type override** on the Fixed-Point Tool.	`{'UseLocalSettings'} | 'ScaledDouble' | 'Double' | 'Single' | 'Off'`
`MinMaxOverflowLogging`	No dialog box prompt Setting for fixed-point instrumentation. Set by **Fixed-point instrumentation mode** on the Fixed-Point Tool.	`{'UseLocalSettings'} | 'MinMaxAndOverflow' | 'OverflowOnly' | 'ForceOff'`
`IsSubsystemVirtual`		boolean — `{'off'} | 'on'` Read-only
Unit Conversion		
`OutDataTypeStr`	Output data type	`{'Inherit via internal rule'} | 'Inherit via back propagation'`
Unit System Configuration		
`AllowAllUnitSystems`	Allow or restrict unit systems.	boolean — `{'on'} | 'off'`
`UnitSystems`	Displays allowed unit system.	cell array of character vectors — `{'SI','English',SI (extended)','CGS'}`
While Iterator (`WhileIterator`)		
`MaxIters`	Maximum number of iterations (-1 for unlimited)	`{'5'}`
`WhileBlockType`	While loop type	`{'while'} | 'do-while'`

Block (Type)/Parameter	Dialog Box Prompt	Values
ResetStates	States when starting	{'held'} | 'reset'
ShowIterationPort	Show iteration number port	{'off'} | 'on'
OutputDataType	Output data type	{'int32'} | 'int16' | 'int8' | 'double'
While Iterator Subsystem (SubSystem)		
ShowPortLabels	Show port labels **Note** The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none' | {'FromPortIcon'} | 'FromPortBlockName' | 'SignalName' | 'off' | 'on'
BlockChoice	Block choice	{''}
TemplateBlock	Template block	{''}
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'} | 'ReadOnly' | 'NoReadOrWrite'
ErrorFcn	Name of error callback function	{''}
PermitHierarchical Resolution	Permit hierarchical resolution	{'All'} | 'ExplicitOnly' | 'None'
TreatAsAtomicUnit	Treat as atomic unit	'off' | {'on'}
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'} | 'on'
PropExecContext OutsideSubsystem	Propagate execution context across subsystem boundary	{'off'} | 'on'
CheckFcnCallInp InsideContextMsg	Warn if function-call inputs are context-specific	{'off'} | 'on'
SystemSampleTime	Sample time (-1 for inherited)	{'-1'}

Block (Type)/Parameter	Dialog Box Prompt	Values
RTWSystemCode	Code generation function packaging	{'Auto'} | 'Inline' | 'Nonreusable function' | 'Reusable function'
RTWFcnNameOpts	Code generation function name options	{'Auto'} | 'Use subsystem name' | 'User specified'
RTWFcnName	Code generation function name	{''}
RTWFileNameOpts	Code generation file name options	{'Auto'} | 'Use subsystem name' | 'Use function name' | 'User specified'
RTWFileName	Code generation file name (no extension)	{''}
DataTypeOverride	No dialog box prompt Specifies data type used to override fixed-point data types. Set by **Data type override** on the Fixed-Point Tool.	{'UseLocalSettings'} | 'ScaledDouble' | 'Double' | 'Single' | 'Off'
MinMaxOverflowLogging	No dialog box prompt Setting for fixed-point instrumentation. Set by **Fixed-point instrumentation mode** on the Fixed-Point Tool.	{'UseLocalSettings'} | 'MinMaxAndOverflow' | 'OverflowOnly' | 'ForceOff'
IsSubsystemVirtual		boolean — {'off'} | 'on' Read-only

Signal Attributes Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Bus to Vector (BusToVector)		
Data Type Conversion (DataTypeConversion)		
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via back propagation'} | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'boolean' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)' | 'Enum: <class name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
ConvertRealWorld	Input and output to have equal	{'Real World Value (RWV)'} | 'Stored Integer (SI)'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} | 'on'
SampleTime	Sample time (-1 for inherited)	{'-1'}
Data Type Conversion Inherited (Conversion Inherited) (masked subsystem)		
ConvertRealWorld	Input and Output to have equal	{'Real World Value'} | 'Stored Integer'

Block (Type)/Parameter	Dialog Box Prompt	Values
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'} | 'on'
Data Type Duplicate (DataTypeDuplicate)		
NumInputPorts	Number of input ports	{'2'}
Data Type Propagation (Data Type Propagation) (masked subsystem)		
PropDataTypeMode	1. Propagated data type	'Specify via dialog' | {'Inherit via propagation rule'}
PropDataType	1.1. Propagated data type (e.g., fixdt(1,16), fixdt('single'))	{'fixdt(1,16)'}
IfRefDouble	1.1. If any reference input is double, output is	{'double'} | 'single'
IfRefSingle	1.2. If any reference input is single, output is	'double' | {'single'}
IsSigned	1.3. Is-Signed	'IsSigned1' | 'IsSigned2' | {'IsSigned1 or IsSigned2'} | 'TRUE' | 'FALSE'
NumBitsBase	1.4.1. Number-of-Bits: Base	'NumBits1' | 'NumBits2' | {'max([NumBits1 NumBits2])'} | 'min([NumBits1 NumBits2])' | 'NumBits1+NumBits2'
NumBitsMult	1.4.2. Number-of-Bits: Multiplicative adjustment	{'1'}

Block (Type)/Parameter	Dialog Box Prompt	Values
NumBitsAdd	1.4.3. Number-of-Bits: Additive adjustment	{'0'}
NumBitsAllowFinal	1.4.4. Number-of-Bits: Allowable final values	{'1:128'}
PropScalingMode	2. Propagated scaling	'Specify via dialog' | {'Inherit via propagation rule'} | 'Obtain via best precision'
PropScaling	2.1. Propagated scaling: Slope or [Slope Bias] ex. 2^-9	{'2^-10'}
ValuesUsedBestPrec	2.1. Values used to determine best precision scaling	{'[5 -7]'}
SlopeBase	2.1.1. Slope: Base	'Slope1' | 'Slope2' | 'max([Slope1 Slope2])' | {'min([Slope1 Slope2])'} | 'Slope1*Slope2' | 'Slope1/Slope2' | 'PosRange1' | 'PosRange2' | 'max([PosRange1 PosRange2])' | 'min([PosRange1 PosRange2])' | 'PosRange1*PosRange2' | 'PosRange1/PosRange2'
SlopeMult	2.1.2. Slope: Multiplicative adjustment	{'1'}
SlopeAdd	2.1.3. Slope: Additive adjustment	{'0'}

Block (Type)/Parameter	Dialog Box Prompt	Values
BiasBase	2.2.1. Bias: Base	{'Bias1'} | 'Bias2' | 'max([Bias1 Bias2])' | 'min([Bias1 Bias2])' | 'Bias1*Bias2' | 'Bias1/Bias2' | 'Bias1+Bias2' | 'Bias1-Bias2'
BiasMult	2.2.2. Bias: Multiplicative adjustment	{'1'}
BiasAdd	2.2.3. Bias: Additive adjustment	{'0'}
Data Type Scaling Strip (Scaling Strip) (masked subsystem)		
IC (InitialCondition)		
Value	Initial value	{'1'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Probe (Probe)		
ProbeWidth	Probe width	'off' | {'on'}
ProbeSampleTime	Probe sample time	'off' | {'on'}
ProbeComplexSignal	Detect complex signal	'off' | {'on'}
ProbeSignalDimensions	Probe signal dimensions	'off' | {'on'}
ProbeFramedSignal	Detect framed signal	'off' | {'on'}
ProbeWidthDataType	Data type for width	{'double'} | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'Same as input'
ProbeSampleTimeDataType	Data type for sample time	{'double'} | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'Same as input'

Block (Type)/Parameter	Dialog Box Prompt	Values
ProbeComplexityDataType	Data type for signal complexity	{'double'} | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'boolean' | 'Same as input'
ProbeDimensionsDataType	Data type for signal dimensions	{'double'} | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'Same as input'
ProbeFrameDataType	Data type for signal frames	{'double'} | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'boolean' | 'Same as input'
Rate Transition (RateTransition)		
Integrity	Ensure data integrity during data transfer	'off' | {'on'}
Deterministic	Ensure deterministic data transfer (maximum delay)	'off' | {'on'}
InitialCondition	Initial conditions	{'0'}
OutPortSampleTimeOpt	Output port sample time options	{'Specify'} | 'Inherit' | 'Multiple of input port sample time'
OutPortSampleTimeMultiple	Sample time multiple (>0)	{'1'}
OutPortSampleTime	Output port sample time	{'-1'}
Signal Conversion (SignalConversion)		
ConversionOutput	Output	{'Signal copy'} | 'Virtual bus' | 'Nonvirtual bus'

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Data type	{'Inherit: auto'} | 'Bus: <object name>'
OverrideOpt	Exclude this block from 'Block reduction' optimization	{'off'} | 'on'
Signal Specification (SignalSpecification)		
Dimensions	Dimensions (-1 for inherited)	{'-1'}
VarSizeSig	Variable-size signal	{'Inherit'} | 'No' | 'Yes'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}
OutDataTypeStr	Data type	{'Inherit: auto'} | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'boolean' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)' | 'Enum: <class name>' | 'Bus: <object name>'
BusOutputAsStruct	Require nonvirtual bus	{'off'} | 'on'
Unit	Specify physical unit of the input signal to the block. For a list of acceptable units, see Allowed Units.	{'inherit'}| '<Enter unit>'
UnitNoProp	Specify physical unit of the input signal to the block without propagation. For a list of acceptable units, see Allowed Units.	'<Enter unit>'

Block (Type)/Parameter	Dialog Box Prompt	Values
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
SignalType	Signal type	{'auto'} | 'real' | 'complex'
Weighted Sample Time (SampleTimeMath)		
TsampMathOp	Operation	'+' | '-' | '*' | '/' | {'Ts Only'} | '1/Ts Only'
weightValue	Weight value	{'1.0'}
TsampMathImp	Implement using	{'Online Calculations'} | 'Offline Scaling Adjustment'
OutDataTypeStr	Output data type	{'Inherit via internal rule'} | 'Inherit via back propagation'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} | 'on'
OutputDataTypeScaling Mode	Deprecated in R2009b	
DoSatur	Deprecated in R2009b	
Width (Width)		
OutputDataTypeScaling Mode	Output data type mode	{'Choose intrinsic data type'} | 'Inherit via back propagation' | 'All ports same datatype'

Block (Type)/Parameter	Dialog Box Prompt	Values
DataType	Output data type	{'double'} | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32'

Signal Routing Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Bus Assignment (`BusAssignment`)		
`AssignedSignals`	Signals that are being assigned	`{''}`
`InputSignals`	Signals in the bus	matrix — `{'{}'}`
Bus Creator (`BusCreator`)		
`InheritFromInputs`	Override bus signal names from inputs	`{'on'} | 'off'` If set to `'on'`, overrides bus signal names from inputs. Otherwise, inherits bus signal names from a bus object.
`Inputs`	Number of inputs	`{'2'}`
`DisplayOption`		`'none' | 'signals' | {'bar'}`
`NonVirtualBus`	Output as nonvirtual bus	`{'off'} | 'on'`
`OutDataTypeStr`	Data type	`{'Inherit: auto'} | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'boolean' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)' | 'Enum: <class name>' | 'Bus: <object name>'`
Bus Selector (`BusSelector`)		
`OutputSignals`	Selected signals	character vector — in the form `'signal1,signal2'`
`OutputAsBus`	Output as bus	`{'off'} | 'on'`
`InputSignals`	Signals in bus	matrix — `{'{}'}`
Data Store Memory (`DataStoreMemory`)		
`DataStoreName`	Data store name	`{'A'}`

Block (Type)/Parameter	Dialog Box Prompt	Values
ReadBeforeWriteMsg	Detect read before write	'none' | {'warning'} | 'error'
WriteAfterWriteMsg	Detect write after write	'none' | {'warning'} | 'error'
WriteAfterReadMsg	Detect write after read	'none' | {'warning'} | 'error'
InitialValue	Initial value	{'0'}
StateMustResolveTo SignalObject	Data store name must resolve to Simulink signal object	{'off'} | 'on'
DataLogging	Log Signal Data	'off' | {'on'}
DataLoggingNameMode	Logging Name	{'SignalName'} | 'Custom'
DataLoggingName	Logging Name	{''}
DataLoggingLimit DataPoints	Limit data points to last	'off' | {'on'}
DataLoggingMaxPoints	Limit data points to last	non-zero integer {5000}
DataLoggingDecimateDat a	Decimation	'off' | {'on'}
DataLoggingLimit DataPoints	Decimation	non-zero integer {2}
StateStorageClass	Storage class	{'Auto'} | 'Model default' | 'ExportedGlobal' | 'ImportedExtern' | 'ImportedExternPointer' | 'Custom'
StateSignalObject	Signal object class Storage class	Simulink.Signal object Object of a class that is derived from Simulink.Signal
RTWStateStorageType Qualifier	Code generation type qualifier	{''}
VectorParams1D	Interpret vector parameters as 1-D	'off' | {'on'}

Block (Type)/Parameter	Dialog Box Prompt	Values
ShowAdditionalParam	Show additional parameters	{'off'} | 'on'
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}
OutDataTypeStr	Data type	{'Inherit: auto'} | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'boolean' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)' | 'Enum: <class name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
SignalType	Signal type	{'auto'} | 'real' | 'complex'
Data Store Read (DataStoreRead)		
DataStoreElements	Corresponds to the parameters on the **Element Selection** tab of the block dialog box. See “Specification using the command line”.	
DataStoreName	Data store name	{'A'}
SampleTime	Sample time	{'0'}
Data Store Write (DataStoreWrite)		
DataStoreElements	Corresponds to the parameters on the **Element Assignment** tab of the block dialog box. See “Specification using the command line”.	
DataStoreName	Data store name	{'A'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Demux (Demux)		

Block (Type)/Parameter	Dialog Box Prompt	Values
`Outputs`	Number of outputs	`{'2'}`
`DisplayOption`	Display option	`'none' | {'bar'}`
`BusSelectionMode`	Bus selection mode	`{'off'} | 'on'`
Environment Controller (`Environment Controller`) (masked subsystem)		
From (`From`)		
`GotoTag`	Goto tag	`{'A'}`
`IconDisplay`	Icon display	`'Signal name' | {'Tag'} | 'Tag and signal name'`
Goto (`Goto`)		
`GotoTag`	Tag	`{'A'}`
`IconDisplay`	Icon display	`'Signal name' | {'Tag'} | 'Tag and signal name'`
`TagVisibility`	Tag visibility	`{'local'} | 'scoped' | 'global'`
Goto Tag Visibility (`GotoTagVisibility`)		
`GotoTag`	Goto tag	`{'A'}`
Index Vector (`MultiPortSwitch`)		
`DataPortOrder`	Data port order	`{'Zero-based contiguous'} | 'One-based contiguous' | 'Specify indices'`
`Inputs`	Number of data ports	`{'1'}`
`zeroidx`	Deprecated in R2010a	
`SampleTime`	Sample time (-1 for inherited)	`{'-1'}`
`InputSameDT`	Require all data port inputs to have the same data type	`{'off'} | 'on'`
`OutMin`	Output minimum	`{'[]'}`
`OutMax`	Output maximum	`{'[]'}`

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Inherit via back propagation' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} | 'on'
AllowDiffInputSizes	Allow different data input sizes (Results in variable-size output signal)	{'off'} | 'on'
Manual Switch (Manual Switch) (masked subsystem)		
varsize	Allow different input sizes (Results in variable-size output signal)	{'off'} | 'on'
SampleTime	Sample time (-1 for inherited)	{'-1'}
Merge (Merge)		
Inputs	Number of inputs	{'2'}
InitialOutput	Initial output	{'[]'}
AllowUnequalInput PortWidths	Allow unequal port widths	{'off'} | 'on'
InputPortOffsets	Input port offsets	{'[]'}
Multiport Switch (MultiPortSwitch)		

Block (Type)/Parameter	Dialog Box Prompt	Values
DataPortOrder	Data port order	'Zero-based contiguous' | {'One-based contiguous'} | 'Specify indices'
Inputs	Number of data ports	{'3'}
zeroidx	Deprecated in R2010a	
DataPortIndices	Data port indices	{'{1,2,3}'}
DataPortForDefault	Data port for default case	{'Last data port'} | 'Additional data port'
DiagnosticForDefault	Diagnostic for default case	'None' | 'Warning' | {'Error'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all data port inputs to have the same data type	{'off'} | 'on'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Inherit via back propagation' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
SaturateOnIntegerOverflow	Saturate on integer overflow	{'off'} | 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
AllowDiffInputSizes	Allow different data input sizes (Results in variable-size output signal)	{'off'} | 'on'
Mux (Mux)		
Inputs	Number of inputs	{'2'}
DisplayOption	Display option	'none' | 'signals' | {'bar'}
UseBusObject	For internal use	
BusObject	For internal use	
NonVirtualBus	For internal use	
Selector (Selector)		
NumberOfDimensions	Number of input dimensions	{'1'}
IndexMode	Index mode	'Zero-based' | {'One-based'}
IndexOptionArray	Index Option	'Select all' | {'Index vector (dialog)'} | 'Index vector (port)' | 'Starting index (dialog)' | 'Starting index (port)'
IndexParamArray	Index	cell array
OutputSizeArray	Output Size	cell array
InputPortWidth	Input port size	{'1'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
IndexOptions	See the **IndexOptionArray** parameter for more information.	
Indices	See the **IndexParamArray** parameter for more information.	
OutputSizes	See the **IndexParamArray** parameter for more information.	

Block (Type)/Parameter	Dialog Box Prompt	Values
Switch (Switch)		
Criteria	Criteria for passing first input	{'u2 >= Threshold'} | 'u2 > Threshold' | 'u2 ~= 0'
Threshold	Threshold	{'0'}
ZeroCross	Enable zero-crossing detection	'off' | {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all data port inputs to have the same data type	{'off'} | 'on'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} | 'Inherit: Inherit via back propagation' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)' | 'Enum: <class name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
SaturateOnIntegerOverflow	Saturate on integer overflow	{'off'} | 'on'
AllowDiffInputSizes	Allow different input sizes (Results in variable-size output signal)	{'off'} | 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
Variant Source (tVariantSource)		
VariantControls	Variant control	{'Variant'} | '(default)'
OverrideUsingVariant	Override variant conditions and use the following variant	{''}
AllowZeroVariantControls	Allow zero active variant controls	{'off'} | 'on'
ShowConditionOnBlock	Show variant condition on block	{'off'} | 'on'
GeneratePreprocessorConditionals	Analyze all choices during update diagram and generate preprocessor conditionals	{'off'} | 'on'
CompiledActiveVariantControl		string — {''} The value is a empty string if no variant is active; or the name of the active variant. Compile the model before querying this property.
CompiledActiveVariantPort		string — {'-1'} The value is -1 if no variant is active; or the index of the active variant. Compile the model before querying this property.
Variant Sink (VariantSink)		
VariantControls	Variant control	{'Variant'} | '(default)'
OverrideUsingVariant	Override variant conditions and use the following variant	{''}
AllowZeroVariantControls	Allow zero active variant controls	{'off'} | 'on'
ShowConditionOnBlock	Show variant condition on block	{'off'} | 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
GeneratePreprocessorConditionals	Analyze all choices during update diagram and generate preprocessor conditionals	{'off'} | 'on'
CompiledActiveVariantControl		string — {''} The value is a empty string if no variant is active; or the name of the active variant. Compile the model before querying this property.
CompiledActiveVariantPort		string — {'-1'} The value is -1 if no variant is active; or the index of the active variant. Compile the model before querying this property.
Vector Concatenate (Concatenate)		
NumInputs	Number of inputs	{'2'}
Mode	Mode	{'Vector'} | 'Multidimensional array'

Sinks Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Display (Display)		
Format	Format	{'short'} | 'long' | 'short_e' | 'long_e' | 'bank' | 'hex (Stored Integer)' | 'binary (Stored Integer)' | 'decimal (Stored Integer)' | 'octal (Stored Integer)'
Decimation	Decimation	{'1'}
Floating	Floating display	{'off'} | 'on'
SampleTime	Sample time (-1 for inherited)	{'-1'}
Floating Scope (Scope)		
Floating		'off' | {'on'}
Location		vector — {'[376 294 700 533]'}
Open		{'off'} | 'on'
NumInputPorts		Do not change this parameter with the command-line. Instead, use the **Number of axes** parameter in the Scope parameters dialog.
TickLabels		'on' | 'off' | {'OneTimeTick'}
ZoomMode		{'on'} | 'xonly' | 'yonly'
AxesTitles		character vector
Grid		'off' | {'on'} | 'xonly' | 'yonly'
TimeRange		{'auto'}
YMin		{'-5'}

Block (Type)/Parameter	Dialog Box Prompt	Values
YMax		{'5'}
SaveToWorkspace		{'off'} | 'on'
SaveName		{'ScopeData'}
DataFormat		{'StructureWithTime'} | 'Structure' | 'Array'
LimitDataPoints		'off' | {'on'}
MaxDataPoints		{'5000'}
Decimation		{'1'}
SampleInput		{'off'} | 'on'
SampleTime		{'0'}
Out1 (Outport)		
Port	Port number	{'1'}
IconDisplay	Icon display	'Signal name' | {'Port number'} | 'Port number and signal name'
BusOutputAsStruct	Output as nonvirtual bus in parent model	{'off'} | 'on'
PortDimensions	Port dimensions (-1 for inherited)	{'-1'}
VarSizeSig	Variable-size signal	{'Inherit'} | 'No' | 'Yes'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Data type	{'Inherit: auto'} | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'boolean' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)' | 'Enum: <class name>' | 'Bus: <object name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} | 'on'
SignalObject	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See "Design Data Interface by Configuring Inport and Outport Blocks" (Simulink Coder).	Simulink.Signal object Object of a class that is derived from Simulink.Signal
StorageClass	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See "Design Data Interface by Configuring Inport and Outport Blocks" (Simulink Coder).	{'Auto'} | 'Model default' | 'ExportedGlobal' | 'ImportedExtern' | 'ImportedExternPointer' | 'Custom'
SignalName	Signal name	character vector
SignalType	Signal type	{'auto'} | 'real' | 'complex'
OutputWhenDisabled	Output when disabled	{'held'} | 'reset'
InitialOutput	Initial output	{'[]'}
MustResolveToSignalObject	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See "For Signals".	{'off'} | 'on'
Scope (Scope)		

Block (Type)/Parameter	Dialog Box Prompt	Values
`Floating`		`{'off'} | 'on'`
Location		vector — `{'[188 390 512 629]'}`
`Open`		`{'off'} | 'on'`
`NumInputPorts`		Do not change this parameter with the command-line. Instead, use the **Number of axes** parameter in the Scope parameters dialog.
`TickLabels`		`'on' | 'off' | {'OneTimeTick'}`
`ZoomMode`		`{'on'} | 'xonly' | 'yonly'`
`AxesTitles`		character vector
`Grid`		`'off' | {'on'} | 'xonly' | 'yonly'`
`TimeRange`		`{'auto'}`
`YMin`		`{'-5'}`
`YMax`		`{'5'}`
`SaveToWorkspace`		`{'off'} | 'on'`
`SaveName`		`{'ScopeData1'}`

Block (Type)/Parameter	Dialog Box Prompt	Values
Compose String (Compose String)		
Format	Format	scalar {""%d %f""}| ""%d"" | ""%i"" | ""%o"" | ""%x"" | ""%X"" | ""%f"" | ""%e"" | ""%E"" | ""%g"" | ""%G"" | ""%s"" | optional operators and text
OutDataTypeStr	Output data type	{"stringtype(255)"} | "stringtype(*N*)" | "string"
Scan String (Scan String)		
Format	Format	scalar {""%d %f""}| ""%d"" | ""%i"" | ""%o"" | ""%x"" | ""%X"" | ""%f"" | ""%e"" | ""%E"" | ""%g"" | ""%G"" | ""%s"" | optional operators and text
String Compare (String Compare)		
CaseSensitive	Case sensitivity for string compare	'off' | {'on'}
CompareOption	Amount of characters to compare	{"Entire string"} | "First N characters"
NumberOfCharacters	Number of characters to compare	{'1'} | scalar
String Concatenate (String Concatenate)		
Inputs	Number of inputs	{"2"}
OutDataTypeStr	Output data type	{"stringtype(128)"} | "stringtype(*N*)" | "string"
String Constant (String Constant)		
String	String	{"Hello!"} | scalar

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output data type	{"stringtype(128)"} | "stringtype(*N*)" | "string"
String to ASCII (String to ASCII)		
MaximumLength	Maximum length	{"31"} | scalar
String to Double (String to Double)		
Format	Format	scalar {""%d %f""}| ""%d"" | ""%i"" | ""%o"" | ""%x"" | ""%X"" | ""%f"" | ""%e"" | ""%E"" | ""%g"" | ""%G"" | ""%s"" | optional operators and text
String to Enum (String to Enum)		
OutDataTypeStr	Output data type	{"Enum: SlDemoSign"} | <data type expression>
String to Single (String to Single)		
Format	Format	scalar {""%f""}| ""%d"" | ""%i"" | ""%o"" | ""%x"" | ""%X"" | ""%f"" | ""%e"" | ""%E"" | ""%g"" | ""%G"" | ""%s"" | optional operators and text
Substring (Substring)		
InheritMaximumLength	Inherit maxiimum length from input	'off' | {'on'}
OutDataTypeStr	Output data type	{"stringtype(31)"} | "stringtype(*N*)" | "string"
StringFromIdxToEnd	Output string from 'idx' to end	{'off'} | 'on'

User-Defined Functions Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
MATLAB Function (`Stateflow`) (masked subsystem)		
MATLAB System (`MATLABSystem`)		
`System`	System object class name	`{''}`
Fcn (`Fcn`)		
`Expr`	Expression	`{'sin(u(1)*exp(2.3*(-u(2))))'}`
`SampleTime`	Sample time (-1 for inherited)	`{'-1'}`
Level-2 MATLAB S-Function (`M-S-Function`)		
`FunctionName`	S-function name	`{'mlfile'}`
`Parameters`	Arguments	`{''}`
Interpreted MATLAB Function (`MATLABFcn`)		
`MATLABFcn`	MATLAB function	`{'sin'}`
`OutputDimensions`	Output dimensions	`{'-1'}`
`OutputSignalType`	Output signal type	`{'auto'} | 'real' | 'complex'`
`Output1D`	Collapse 2-D results to 1-D	`'off' | {'on'}`
`SampleTime`	Sample time (-1 for inherited)	`{'-1'}`
S-Function (`S-Function`)		
`FunctionName`	S-function name	`{'system'}`
`Parameters`	S-function parameters	`{''}`
`SFunctionModules`	S-function modules	`{''}`
S-Function Builder (`S-Function Builder`) (masked subsystem)		
`FunctionName`	S-function name	`{'system'}`
`Parameters`	S-function parameters	`{''}`
`SFunctionModules`	S-function modules	`{''}`

Additional Discrete Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Fixed-Point State-Space (`Fixed-Point State-Space`) (masked subsystem)		
`A`	State Matrix A	`{'[2.6020 -2.2793 0.6708; 1 0 0; 0 1 0]'}`
`B`	Input Matrix B	`{'[ 1; 0; 0]'}`
`C`	Output Matrix C	`{'[0.0184 0.0024 0.0055]'}`
`D`	Direct Feedthrough Matrix D	`{'[0.0033]'}`
`InitialCondition`	Initial condition for state	`{'0.0'}`
`InternalDataType`	Data type for internal calculations	`{'fixdt('double')'}`
`StateEqScaling`	Scaling for State Equation AX +BU	`{'2^0'}`
`OutputEqScaling`	Scaling for Output Equation CX +DU	`{'2^0'}`
`LockScale`	Lock output data type setting against changes by the fixed-point tools	`{'off'} | 'on'`
`RndMeth`	Integer rounding mode	`'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'`
`DoSatur`	Saturate to max or min when overflows occur	`{'off'} | 'on'`
Transfer Fcn Direct Form II (`Transfer Fcn Direct Form II`) (masked subsystem)		
`NumCoefVec`	Numerator coefficients	`{'[0.2 0.3 0.2]'}`
`DenCoefVec`	Denominator coefficients excluding lead (which must be 1.0)	`{'[-0.9 0.6]'}`
`vinit`	Initial condition	`{'0.0'}`

Block (Type)/Parameter	Dialog Box Prompt	Values
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'} | 'on'
Transfer Fcn Direct Form II Time Varying (Transfer Fcn Direct Form II Time Varying) (masked subsystem)		
vinit	Initial condition	{'0.0'}
RndMeth	Integer rounding mode	'Ceiling' | 'Convergent' | {'Floor'} | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'} | 'on'
Unit Delay Enabled (Unit Delay Enabled) (masked subsystem)		
vinit	Initial condition	{'0.0'}
tsamp	Sample time	{'-1'}
Unit Delay Enabled External IC (Unit Delay Enabled External Initial Condition) (masked subsystem)		
tsamp	Sample time	{'-1'}
Unit Delay Enabled Resettable (Unit Delay Enabled Resettable) (masked subsystem)		
vinit	Initial condition	{'0.0'}
tsamp	Sample time	{'-1'}
Unit Delay Enabled Resettable External IC (Unit Delay Enabled Resettable External Initial Condition) (masked subsystem)		
tsamp	Sample time	{'-1'}
Unit Delay External IC (Unit Delay External Initial Condition) (masked subsystem)		
tsamp	Sample time	{'-1'}
Unit Delay Resettable (Unit Delay Resettable) (masked subsystem)		
vinit	Initial condition	{'0.0'}

Block (Type)/Parameter	Dialog Box Prompt	Values
`tsamp`	Sample time	`{'-1'}`
Unit Delay Resettable External IC (`Unit Delay Resettable External Initial Condition`) (masked subsystem)		
`tsamp`	Sample time	`{'-1'}`
Unit Delay With Preview Enabled (`Unit Delay With Preview Enabled`) (masked subsystem)		
`vinit`	Initial condition	`{'0.0'}`
`tsamp`	Sample time	`{'-1'}`
Unit Delay With Preview Enabled Resettable (`Unit Delay With Preview Enabled Resettable`) (masked subsystem)		
`vinit`	Initial condition	`{'0.0'}`
`tsamp`	Sample time	`{'-1'}`
Unit Delay With Preview Enabled Resettable External RV (`Unit Delay With Preview Enabled Resettable External RV`) (masked subsystem)		
`vinit`	Initial condition	`{'0.0'}`
`tsamp`	Sample time	`{'-1'}`
Unit Delay With Preview Resettable (`Unit Delay With Preview Resettable`) (masked subsystem)		
`vinit`	Initial condition	`{'0.0'}`
`tsamp`	Sample time	`{'-1'}`
Unit Delay With Preview Resettable External RV (`Unit Delay With Preview Resettable External RV`) (masked subsystem)		
`vinit`	Initial condition	`{'0.0'}`
`tsamp`	Sample time	`{'-1'}`

Additional Math: Increment - Decrement Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Decrement Real World (`Real World Value Decrement`) (masked subsystem)		
Decrement Stored Integer (`Stored Integer Value Decrement`) (masked subsystem)		
Decrement Time To Zero (`Decrement Time To Zero`) (masked subsystem)		
Decrement To Zero (`Decrement To Zero`) (masked subsystem)		
Increment Real World (`Real World Value Increment`) (masked subsystem)		
Increment Stored Integer (`Stored Integer Value Increment`) (masked subsystem)		

Mask Parameters

About Mask Parameters

This section lists parameters that describe masked blocks. You can use these descriptive parameters with `get_param` and `set_param` to obtain and specify the properties of a block mask.

The descriptive mask parameters listed in this section apply to all masks, and provide access to all mask properties. Be careful not to confuse these descriptive mask parameters with the mask-specific parameters defined for an individual mask in the Mask Editor **Parameters** pane.

See “Masking Fundamentals” and “Mask Editor Overview” for information about block masks and the Mask Editor.

Mask Parameters

Parameter	Description/Prompt	Values
`Mask`	Turns mask on or off.	`{'on'} | 'off'`
`MaskCallbackString`	Mask parameter callbacks that are executed when the respective parameter is changed on the dialog. Set by the **Dialog callback** field on the **Parameters** pane of the Mask Editor dialog box. For more information, see “Mask Callback Code”.	pipe-delimited character vector `{''}`
`MaskCallbacks`	Cell array version of `MaskCallbackString`.	cell array `{'[]'}`
`MaskDescription`	Block description. Set by the **Mask description** field on the **Documentation** pane of the Mask Editor dialog box.	character vector `{''}`
`MaskDisplay`	Drawing commands for the block icon. Set by the **Icon Drawing commands** field on the **Icon & Ports** pane of the Mask Editor dialog box.	character vector `{''}`
`MaskEditorHandle`	For internal use only.	
`MaskEnableString`	Option that determines whether a parameter is greyed out in the dialog. Set by the **Enable parameter** check box on the **Parameters** pane of the Mask Editor dialog box.	pipe-delimited character vector `{''}`
`MaskEnables`	Cell array version of `MaskEnableString`.	cell array of character vectors, each either `'on'` or`''off'` `{'[]'}`

Parameter	Description/Prompt	Values
MaskHelp	Block help. Set by the **Mask help** field on the **Documentation** pane of the Mask Editor dialog box.	character vector {''}
MaskIconFrame	Set the visibility of the icon frame (Visible is on, Invisible is off). Set by the **Block Frame** option on the **Icon & Ports** pane of the Mask Editor dialog box.	{'on'} | 'off'
MaskIconOpaque	Set the transparency of the icon. Set by the **Icon Transparency** option on the **Icon & Ports** pane of the Mask Editor dialog box.	{'opaque'} | 'transparent' | 'opaque-with-ports'
MaskIconRotate	Set the rotation of the icon (Rotates is on, Fixed is off). Set by the **Icon Rotation** option on the **Icon & Ports** pane of the Mask Editor dialog box.	'on' | {'off'}
MaskIconUnits	Set the units for the drawing commands. Set by the **Icon Units** option on the **Icon & Ports** pane of the Mask Editor dialog box.	'pixel' | {'autoscale'} | 'normalized'
MaskInitialization	Initialization commands. Set by the **Initialization commands** field on the **Initialization** pane of the Mask Editor dialog box.	MATLAB command {''}
MaskNames	Cell array of mask dialog parameter names. Set inside the **Variable** column in the **Parameters** pane of the Mask Editor dialog box.	matrix {'[]'}

Parameter	Description/Prompt	Values
MaskPortRotate	Specify the port rotation policy for the masked block. Set in the **Port Rotation** area on the **Icon & Ports** pane of the Mask Editor dialog box. For more information, see "Adjust Visual Presentation to Improve Model Readability".	{'default} | 'physical'
MaskPrompts	List of dialog parameter prompts (see below). Set inside the **Dialog parameters** area on the **Parameters** pane of the Mask Editor dialog box.	cell array of character vectors {'[]'}
MaskPromptString	List of dialog parameter prompts (see below). Set inside the **Dialog parameters** area on the **Parameters** pane of the Mask Editor dialog box.	character vector {''}
MaskPropertyName	Pipe-delimited version of MaskNames.	character vector {''}
MaskRunInitForIconRedraw	Specifies whether Simulink must run mask initialization before executing the mask icon commands.	{'auto'}|'on' |'off'
MaskSelfModifiable	Indicates that the block can modify itself. Set by the **Allow library block to modify its contents** check box on the **Initialization** pane of the Mask Editor dialog box.	'on' | {'off'}

Parameter	Description/Prompt	Values
`MaskStyles`	Determines whether the dialog parameter is a check box, edit field, or pop-up list. Set by the **Type** column in the **Parameters** pane of the Mask Editor dialog box.	cell array `{'[]'}`
`MaskStyleString`	Comma-separated version of `MaskStyles`.	character vector `{''}`
`MaskTabNameString`	For internal use only.	
`MaskTabNames`	For internal use only.	
`MaskToolTipsDisplay`	Determines which mask dialog parameters to display in the tooltip for this masked block. Specify as a cell array of `'on'` or `'off'` values, each of which indicates whether to display the parameter named at the corresponding position in the cell array returned by `MaskNames`.	cell array of `'on'` and `'off'` {''}
`MaskToolTipString`	Comma-delimited version of `MaskToolTipsDisplay`.	character vector `{''}`
`MaskTunableValues`	Allows the changing of mask dialog values during simulation. Set by the **Tunable** column in the **Parameters** pane of the Mask Editor dialog box.	cell array of character vectors `{'[]'}`
`MaskTunableValueString`	Comma-delimited character vector version of `MaskTunableValues`.	delimited character vector `{''}`
`MaskType`	Mask type. Set by the **Mask type** field on the **Documentation** pane of the Mask Editor dialog box.	character vector `{'Stateflow'}`
`MaskValues`	Dialog parameter values.	cell array `{'[]'}`

Parameter	Description/Prompt	Values
`MaskValueString`	Delimited character vector version of `MaskValues`.	delimited character vector `{''}`
`MaskVarAliases`	Specify aliases for a block's mask parameters. The aliases must appear in the same order as the parameters appear in the block's `MaskValues` parameter.	cell array `{'[]'}`
`MaskVarAliasString`	For internal use only.	
`MaskVariables`	List of the dialog parameters' variables (see below). Set inside the **Dialog parameters** area on the **Parameters** pane of the Mask Editor dialog box.	character vector `{''}`
`MaskVisibilities`	Specifies visibility of parameters. Set with the **Show parameter** check box in the **Options for selected parameter** area on the **Parameters** pane of the Mask Editor dialog box.	matrix `{'[]'}`
`MaskVisibilityString`	Delimited character vector version of `MaskVisibilities`.	character vector `{''}`
`MaskWSVariables`	List of the variables defined in the mask workspace (read only).	matrix `{'[]'}`

See Control Masks Programmatically, for more information on setting the mask parameters from the MATLAB command line.

Tools and Apps — Alphabetical List

Simulation Data Inspector

Inspect and compare data and simulation results to validate and iterate model designs

Description

The Simulation Data Inspector visualizes and compares multiple kinds of data.

Using the Simulation Data Inspector, you can inspect and compare time series data at multiple stages of your workflow. This example workflow shows how the Simulation Data Inspector supports all stages of the design cycle:

1. “View Data with the Simulation Data Inspector”.

   Run a simulation in a model configured to log data to the Simulation Data Inspector, or import data from the workspace or a MAT-file. You can view and verify model input data or inspect logged simulation data while iteratively modifying your model diagram, parameter values, or model configuration.
2. “Inspect Simulation Data”.

   Plot signals on multiple subplots, zoom in and out on specified plot axes, and use data cursors to understand and evaluate the data. “Create Plots Using the Simulation Data Inspector” to tell your story.
3. “Compare Simulation Data”

   Compare individual signals or simulation runs and analyze your comparison results with relative, absolute, and time tolerances. The compare tools in the Simulation Data Inspector facilitate iterative design and allow you to highlight signals that do not meet your tolerance requirements. For more information about the comparison operation, see “How the Simulation Data Inspector Compares Data”.
4. “Save and Share Simulation Data Inspector Data and Views”.

   Share your findings with others by saving Simulation Data Inspector data and views.

You can also harness the capabilities of the Simulation Data Inspector from the command line. For more information, see “Inspect and Compare Data Programmatically”.

Open the Simulation Data Inspector

- Simulink Editor toolbar: Click the Simulation Data Inspector icon.
- Click the streaming badge on a signal to open the Simulation Data Inspector and plot the signal.
- MATLAB command prompt: Enter `Simulink.sdi.view`.

Examples

Add Signals to a Run

This example shows how to use `Simulink.sdi.createRunOrAddToStreamedRun` to add data to an existing run for a model. In this example, you add logged states data to the run created through simulation.

Simulate the Model

Simulate the model to generate data. The model `slexAircraftExample` is configured to log outputs, so the Simulation Data Inspector automatically creates a run with the logged outport data. Using this simulation syntax, `out` contains the outport data (`yout`) and the states data (`xout`).

```
load_system('slexAircraftExample')
out = sim('slexAircraftExample','ReturnWorkspaceOutputs','on',...
             'SaveFormat','Dataset');
```

Add Logged States Data to Run

The Simulation Data Inspector automatically created a run for the logged outport data. Add the logged state data to the existing run using `Simulink.sdi.createRunOrAddToStreamedRun`.

```
Simulink.sdi.createRunOrAddToStreamedRun('slexAircraftExample','Run 1',...
               {'out'},{out});
```

Open the Simulation Data Inspector to View Results

Using `Simulink.sdi.createRunOrAddToStreamedRun` avoids redundancy in the data shown in the Simulation Data Inspector. Using `Simulink.sdi.createRun` to bring the states data into the Simulation Data Inspector creates a second run. `Simulink.sdi.addToRun` creates a duplicate signal from the outport data. Using `Simulink.sdi.createRunOrAddToStreamedRun`, you can include all simulation data in a single run without duplicating any signals.

```
Simulink.sdi.view
```

Modify Parameter for Several Runs

This example shows how to modify a parameter for all the runs in the Simulation Data Inspector programmatically.

Generate Runs

Load the `vdp` model and mark the `x1` and `x2` signals for logging. Then, run several simulations.

```
% Clear all data from the Simulation Data Inspector repository
Simulink.sdi.clear

% Load the model and mark signals of interest for streaming
load_system('vdp')
Simulink.sdi.markSignalForStreaming('vdp/x1',1,'on')
Simulink.sdi.markSignalForStreaming('vdp/x2',1,'on')

% Simulate the model with several Mu values
for gain = 1:5
    gainVal = num2str(gain);
    set_param('vdp/Mu','Gain',gainVal)
    sim('vdp')
end
```

Use `Simulink.sdi.getRunCount` to Assign Tolerance to x1 Signals

```
count = Simulink.sdi.getRunCount;

for a = 1:count
    runID = Simulink.sdi.getRunIDByIndex(a);
    vdpRun = Simulink.sdi.getRun(runID);
    sig = vdpRun.getSignalByIndex(1);
    sig.AbsTol = 0.1;
end
```

```
% Open the Simulation Data Inspector to view your data
Simulink.sdi.view
```

- “View Data with the Simulation Data Inspector”
- “Inspect Simulation Data”
- “Compare Simulation Data”
- “Iterate Model Design Using the Simulation Data Inspector”

Programmatic Use

`Simulink.sdi.view` opens the Simulation Data Inspector from the MATLAB command line.

Fixed-Point Tool

Fixed-Point Tool Parameters and Dialog Box

The Fixed-Point Tool includes the following components:

- **Main** toolbar
- **Model Hierarchy** pane
- **Contents** pane
- **Dialog** pane

Main Toolbar

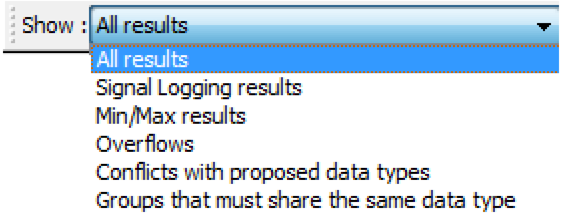
The Fixed-Point Tool's main toolbar appears near the top of the Fixed-Point Tool window under the Fixed-Point Tool's menu.

The toolbar contains the following buttons that execute commonly used Fixed-Point Tool commands:

Button	Usage
✓	Open the Fixed-Point Advisor to prepare the model for conversion to fixed point.
▶	Simulate a model and store the run results.
⏸	Pause a simulation.
■	Stop a simulation.
⊕	Analyze model and store derived minimum and maximum results.
DT	Propose data types. Propose fraction lengths for specified word lengths or propose word lengths for specified fraction lengths.
DT✓	Apply accepted data types.
∿	Compare selected runs.
∿	Create a difference plot for the selected signals.
∿	Plot the selected signal.

Button	Usage
📊	Create a histogram plot for the selected signal.

The toolbar also contains the **Show** option:



Show :
All results
All results
Signal Logging results
Min/Max results
Overflows
Conflicts with proposed data types
Groups that must share the same data type

The **Show** option specifies the type of results to display in the **Contents** pane. The **Contents** pane displays information only after you simulate a system or propose fraction lengths. If there are no results that satisfy a particular filter option, the list will be blank.

Show Option	Result
All results	Displays all results for the selected tree node.
Signal Logging results	For the selected tree node, displays blocks whose output ports have logged signal data. The Fixed-Point tool marks these blocks with the logged signal icon . **Note** You can plot simulation results associated with logged signal data using the Simulation Data Inspector.
Min/Max results	For the selected tree node, displays blocks that record design Min/Max, simulation Min/Max, and overflow data. **Prerequisites**: **Fixed-point instrumentation mode** should not be set to `Force Off`.
Overflows	For the selected tree node, displays blocks that have non-zero overflows recorded. If a block has its **Saturate on integer overflow** option selected, overflow information appears in the **Saturations** column, otherwise it appears in the **OverflowWraps** column.

Show Option	Result
Conflicts with proposed data types	For the selected tree node, displays results that have potential data typing or scaling issues. **Prerequisites**: This information is available only after you propose data types. The Fixed-Point Tool marks these results with a yellow or red icon, as shown here: ⚠ The proposed data type poses potential issues for this object. Open the Result Details tab to review these issues. ❌ The proposed data type will introduce errors if applied to this object. Open the Result Details tab for details about how to resolve these issues.
Groups that must share the same data type	For the selected tree node, displays blocks that must share the same data type because of data type propagation rules. **Prerequisites**: This information is available only after you propose fraction lengths. The Fixed-Point Tool allocates an identification tag to blocks that must share the same data type. This identification tag is displayed in the **DTGroup** column as follows: • If the selected tree node is the model root All results for the model are listed. The **DTGroup** column is sorted by default so that you can easily view all blocks in a group. • If the selected tree node is a subsystem The identification tags have a suffix that indicates the total number of results in each group. For example, `G2(2)` means group `G2` has 2 members. This information enables you to see how many members of a group belong to the selected subsystem and which groups share data types across subsystem boundaries.

Model Hierarchy Pane

The **Model Hierarchy** pane displays a tree-structured view of the Simulink model hierarchy. The first node in the pane represents a Simulink model. Expanding the root node displays subnodes that represent the model's subsystems, MATLAB Function blocks, Stateflow charts, and referenced models.

The Fixed-Point Tool's **Contents** pane displays elements that comprise the object selected in the **Model Hierarchy** pane. The **Dialog** pane provides parameters for specifying the selected object's data type override and fixed-point instrumentation mode. You can also specify an object’s data type override and fixed-point instrumentation mode by right-clicking on the object. The **Model Hierarchy** pane indicates the value of these parameters by displaying the following abbreviations next to the object name:

Abbreviation	Parameter Value
Fixed-point instrumentation mode	
`mmo`	`Minimums, maximums and overflows`
`o`	`Overflows only`
`fo`	`Force off`
Data type override	
`scl`	`Scaled double`
`dbl`	`Double`
`sgl`	`Single`
`off`	`Off`

Contents Pane

The **Contents** pane displays a tabular view of objects that log fixed-point data in the system or subsystem selected in the **Model Hierarchy** pane. The table rows correspond to model objects, such as blocks, block parameters, and Stateflow data. The table columns correspond to attributes of those objects, such as the data type, design minimum and maximum values, and simulation minimum and maximum values.

The **Contents** pane displays information only after you simulate a system, analyze the model to derive minimum and maximum values, or propose fraction lengths.

You can control which of the following columns the Fixed-Point Tool displays in this pane. For more information, see “Customizing the Contents Pane View” on page 8-8.

Column Label	Description
Accept	Check box that enables you to selectively accept the Fixed-Point Tool's data type proposal.
CompiledDesignMax	Compile-time information for **DesignMax**.
CompiledDesignMin	Compile-time information for **DesignMin**.
CompiledDT	Compile-time data type. This data type appears on the signal line in `sfix` format. See “Fixed-Point Data Type and Scaling Notation” (Fixed-Point Designer).
DerivedMax	Maximum value the Fixed-Point tool derives for this signal from design ranges specified for blocks.
DerivedMin	Minimum value the Fixed-Point tool derives for this signal from design ranges specified for blocks.
DesignMax	Maximum value the block specifies in its parameter dialog box, for example, the value of its **Output maximum** parameter.
DesignMin	Minimum value the block specifies in its parameter dialog box, for example, the value of its **Output minimum** parameter.
DivByZero	Number of divide-by-zero instances that occur during simulation.
DTGroup	Identification tag associated with objects that share data types.
InitValueMax	Maximum initial value for a signal or parameter. Some model objects provide parameters that allow you to specify the initial values of their signals. For example, the Constant block includes a **Constant value** that initializes the block output signal. **Note** The Fixed-Point Tool uses this parameter when it proposes data types.

Column Label	Description
InitValueMin	Minimum initial value for a signal or parameter. Some model objects provide parameters that allow you to specify the initial values of their signals. For example, the Constant block includes a **Constant value** that initializes the block output signal. **Note** The Fixed-Point Tool uses this parameter when it proposes data types.
LogSignal	Check box that allows you to enable or disable signal logging for an object.
ModelRequiredMin	Minimum value of a parameter used during simulation. For example, the n-D Lookup Table block uses the **Breakpoints** and **Table data** parameters to perform its lookup operation and generate output. In this example, the block uses more than one parameter so the Fixed-Point Tool sets **ModelRequiredMin** to the minimum of the minimum values of all these parameters. **Note** The Fixed-Point Tool uses this parameter when it proposes data types.
ModelRequiredMax	Maximum value of a parameter used during simulation. For example, the n-D Lookup Table block uses the **Breakpoints** and **Table data** parameters to perform its lookup operation and generate output. In this example, the block uses more than one parameter so the Fixed-Point Tool sets **ModelRequiredMax** to the maximum of the maximum values of all these parameters. **Note** The Fixed-Point Tool uses this parameter when it proposes data types.
Name	Identifies path and name of block.
OverflowWraps	Number of overflows that wrap during simulation.
ProposedDT	Data type that the Fixed-Point Tool proposes.

Column Label	Description
ProposedMax	Maximum value that results from the data type the Fixed-Point Tool proposes.
ProposedMin	Minimum value that results from the data type the Fixed-Point Tool proposes.
Run	Indicates the run name for these results.
Saturations	Number of overflows that saturate during simulation.
SimDT	Data type the block uses during simulation. This data type appears on the signal line in `sfix` format. See "Fixed-Point Data Type and Scaling Notation" (Fixed-Point Designer).
SimMax	Maximum value that occurs during simulation.
SimMin	Minimum value that occurs during simulation.
SpecifiedDT	Data type the block specifies in its parameter dialog box, for example, the value of its **Output data type** parameter.

Customizing the Contents Pane View

You can customize the **Contents** pane in the following ways:

- "Using Column Views" on page 8-8
- "Changing Column Order and Width" on page 8-10
- "Sorting by Columns" on page 8-10

Using Column Views

The Fixed-Point Tool provides the following standard Column Views:

View Name	Columns Provided	When Does the Fixed-Point Tool Display this View?
`Simulation View` (default)	**Name**, **Run**, **CompiledDT**, **SpecifiedDT**, **SimMin**, **SimMax**, **DesignMin**, **DesignMax**, **OverflowWraps**, **Saturations**	After a simulating minimum and maximum values.

View Name	Columns Provided	When Does the Fixed-Point Tool Display this View?
`Automatic Data Typing View`	**Name**, **Run**, **CompiledDT**, **CompiledDesignMax**, **CompiledDesignMin**,**Accept**, **ProposedDT**, **SpecifiedDT**, **DesignMin**, **DesignMax**, **DerivedMin**, **DerivedMax**, **SimMin**, **SimMax**, **OverflowWraps**, **Saturations**, **ProposedMin**, **ProposedMax**	After proposing data types if proposal is based on simulation, derived, and design min/max.
`Automatic Data Typing With Simulation Min/Max View`	**Name**, **Run**, **CompiledDT**, **Accept**, **ProposedDT**, **SpecifiedDT**, **SimMin**, **SimMax**, **DesignMin**, **DesignMax**, **OverflowWraps**, **Saturations**, **ProposedMin**, **ProposedMax**	After proposing data types if the proposal is based on simulation and design min/max.
`Automatic Data Typing With Derived Min/Max View`	**Name**, **Run**, **CompiledDesignMax**, **CompiledDesignMin**,**Accept**, **ProposedDT**, **SpecifiedDT**, **DerivedMin**, **DerivedMax**, **ProposedMin**, **ProposedMax**	After proposing data types if the proposal is based on design min/max and/or derived min/max.
`Data Collection View`	**Name**, **Run**, **CompiledDT**, **SpecifiedDT**, **DerivedMin**, **DerivedMax**, **SimMin**, **SimMax**, **OverflowWraps**, **Saturations**	After simulating or deriving minimum and maximum values if the results have simulation min/max, derived min/max, and design min/max.
`Derived Min/Max View`	**Name**, **Run**, **CompiledDesignMax**, **CompiledDesignMin**, **DerivedMin**, **DerivedMax**	After deriving minimum and maximum values.

By selecting **Show Details**, you can:

- Customize the standard column views
- Create your own column views

- Export and import column views saved in MAT-files, which you can share with other users
- Reset views to factory settings

  If you upgrade to a new release of Simulink, and the column views available in the Fixed-Point Tool do not match the views described in the documentation, reset your views to factory settings. When you reset all views, the Model Explorer removes all the custom views you have created. Before you reset views to factory settings, export any views that you will want to use in the future.

You can prevent the Fixed-Point Tool from automatically changing the column view of the contents pane by selecting **View > Lock Column View** in the Fixed-Point Tool menu. For more information on controlling views, see “Customize Model Explorer Views”.

Changing Column Order and Width

You can alter the order and width of columns that appear in the **Contents** pane as follows:

- To move a column, click and drag the head of a column to a new location among the column headers.
- To make a column wider or narrower, click and drag the right edge of a column header. If you double-click the right edge of a column header, the column width changes to fit its contents.

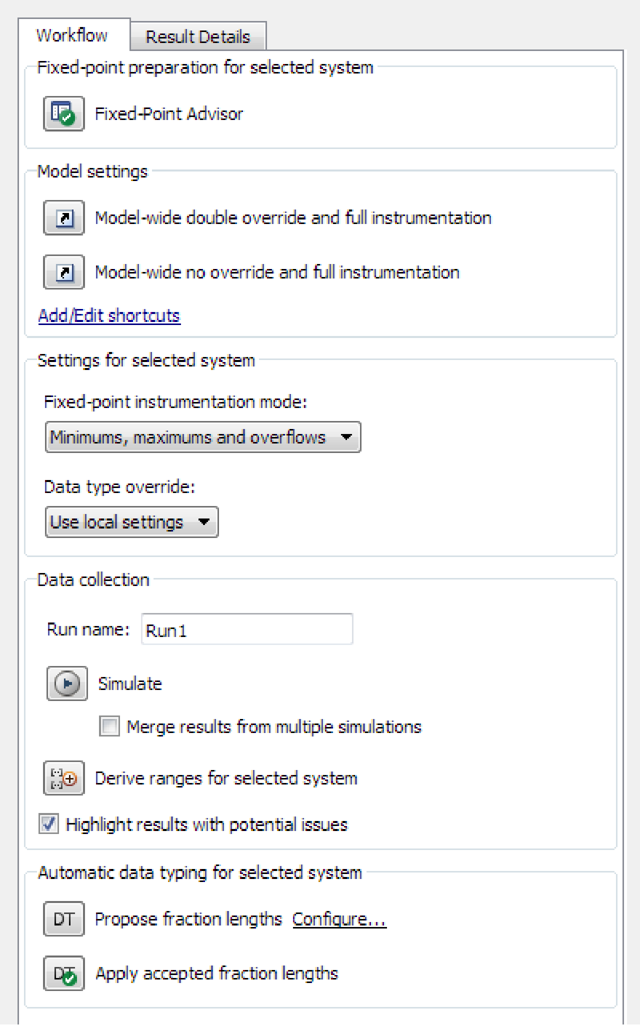
Sorting by Columns

By default, the **Contents** pane displays its contents in ascending order of the **Name** column. You can alter the order in which the **Contents** pane displays its rows as follows:

- To sort all the rows in ascending order of another column, click the head of that column.
- To change the order from ascending to descending, simply click again on the head of that column.

Dialog Pane

Use the Dialog pane to view and change properties associated with the system under design.



Workflow | Result Details

Fixed-Point Advisor

Model settings

Model-wide double override and full instrumentation

Model-wide no override and full instrumentation

Add/Edit shortcuts

Settings for selected system

Fixed-point instrumentation mode: Minimums, maximums and overflows

Data type override: Use local settings

Data collection

Run name: Run1

Simulate

□ Merge results from multiple simulations

Derive ranges for selected system

☑ Highlight results with potential issues

Automatic data typing for selected system

DT Propose fraction lengths Configure...

Apply accepted fraction lengths

The Dialog pane includes the following components:

Component	Description
System under design	Displays the system under design for conversion. You can change the selected system by clicking **Change**.

Component	Description
Fixed-point preparation	Contains the **Fixed-Point Advisor** button. Use this button to open the Fixed-Point Advisor to guide you through the tasks to prepare your floating-point model for conversion to fixed point. For more information, see “Fixed-Point Advisor” on page 8-12.
Configure model settings	Contains default configurations that set up run parameters, such as the run name and data type override settings, by clicking a button. For more information, see “Configure model settings” on page 8-13.
Range collection	Contains controls to collect simulation or derived minimum and maximum data for your model.
Automatic data typing	Contains controls to propose and, optionally, accept data type proposals.
Result Details tab	Use this tab to view data type information about the object selected in the **Contents** pane.

Tips

From the Fixed-Point Tool **View** menu, you can customize the layout of the **Dialog** pane. Select:

- **Show Fixed-Point Preparation** to show/hide the **Fixed-Point Advisor** button. By default, the Fixed-Point Tool displays this button.
- **Show Dialog View** to show/hide the **Dialog** pane. By default, the Fixed-Point Tool displays this pane.
- **Settings for selected system** to show/hide the **Settings for selected system** pane. By default, the Fixed-Point Tool displays this pane.

Fixed-Point Advisor

Open the Fixed-Point Advisor to guide you through the tasks to prepare a floating-point model for conversion to fixed point. Use the Fixed-Point Advisor if your model contains blocks that do not support fixed-point data types.

Configure model settings

Use the configurations to set up model-wide data type override and instrumentation settings prior to simulation. The Fixed-Point Tool provides:

- Frequently-used factory default configurations
- The ability to add and edit custom configurations

Note The factory default configurations apply to the whole model. You cannot use these shortcuts to configure subsystems.

Factory Defaults

Factory Default Configuration	Description
Range collection using double override	Use this configuration to observe ideal numeric behavior of the model and collect ranges for data type proposals. This configuration sets: • **Run name** to `DoubleOverride` • **Fixed-point instrumentation mode** to `Minimums, maximums and overflows` • **Data type override** to `Double` • **Data type override applies to** to `All numeric types` By default, a button for this configuration appears in the **Configure model settings** pane.

Factory Default Configuration	Description
Range collection with specified data types	Use this configuration to collect ranges of actual model and to validate current behavior. This configuration sets: • **Run name** to `NoOverride` • **Fixed-point instrumentation mode** to `Minimums, maximums and overflows` • **Data type override** to `Use local settings` By default, a button for this shortcut appears in the **Configure model settings** pane.
Remove overrides and disable range collection	Use this configuration to cleanup settings after finishing fixed-point conversion and to restore maximum simulation speed. This configuration sets: • **Fixed-point instrumentation mode** to `Off` • **Data type override** to `Use local settings` By default, a button for this shortcut appears in the **Configure model settings** pane.

Advanced settings

Use **Advanced settings** to add new configurations or edit existing user-defined configurations.

Run name

Specifies the run name

If you use a default configuration to set up a run, the Fixed-Point Tool uses the run name associated with this configuration. You can override the run name by entering a new name in this field.

Tips

- To store data for multiple runs, provide a different run name for each run. Running two simulations with the same run name overwrites the original run unless you select **Merge results from multiple simulations**.
- You can edit the run name in the Contents pane **Run** column.

For more information, see “Run Management” (Fixed-Point Designer).

Simulate

Simulates model and stores results.

Action

Simulates the model and stores the results with the run name specified in **Run name**. The Fixed-Point Tool displays the run name in the **Run** column of the **Contents** pane.

Merge instrumentation results from multiple simulations

Control how simulation results are stored

Settings

Default: Off

☑ On

Merges new simulation minimum and maximum results with existing simulation results in the run specified by the run name parameter. Allows you to collect complete range information from multiple test benches. Does not merge signal logging results.

□ Off

Clears all existing simulation results from the run specified by the run name parameter before displaying new simulation results.

Command-Line Alternative

Parameter: `'MinMaxOverflowArchiveMode'`
Type: string
Value: `'Overwrite'` | `'Merge'`

Default: `'Overwrite'`

Tip

Select this parameter to log simulation minimum and maximum values captured over multiple simulations. For more information, see “Propose Data Types For Merged Simulation Ranges” (Fixed-Point Designer).

Derive ranges for selected system

Derive minimum and maximum values for signals for the selected system.

The Fixed-Point Tool analyzes the selected system to compute derived minimum and maximum values based on design minimum and maximum values specified on blocks. For example, using the **Output minimum** and **Output maximum** for block outputs.

Action

Analyzes the selected system to compute derived minimum and maximum information based on the design minimum and maximum values specified on blocks.

By default, the Fixed-Point Tool displays the `Derived Min/Max View` with the following information in the **Contents** pane.

Command-Line Alternative

No command line alternative available.

Dependencies

Range analysis:

- Requires a Fixed-Point Designer license.

Propose

Signedness

Select whether you want The Fixed-Point Tool to propose signedness for results in your model. The Fixed-Point Tool proposes signedness based on collected range data and block constraints. By default, the **Signedness** check box is selected.

When the check box is selected, signals that are always strictly positive get an unsigned data type proposal. If you clear the check box, the Fixed-Point Tool proposes a signed data type for all results that currently specify a floating-point or an inherited output data type unless other constraints are present. If a result specifies a fixed-point output data type, the Fixed-Point Tool will propose a data type with the same signedness as the currently specified data type unless other constraints are present.

Word length or fraction length

Select whether you want the Fixed-Point Tool to propose word lengths or fraction lengths for the objects in your system.

- If you select **Word length**, the Fixed-Point Tool proposes a data type with the specified fraction length and the minimum word length to avoid overflows.
- If you select **Fraction length**, the Fixed-Point Tool proposes a data type with the specified word length and best-precision fraction length while avoiding overflows.

If a result currently specifies a fixed-point data type, that information will be used in the proposal. If a result specifies a floating-point or inherited output data type, and the **Inherited** and **Floating point** check boxes are selected, the Fixed-Point Tool uses the settings specified under **Automatic data typing** to make a data type proposal.

Propose for

Inherited

Propose data types for results that specify one of the inherited output data types.

Floating-point

Propose data types for results that specify floating-point output data types.

Default fraction length

Specify the default fraction length for objects in your model. The Fixed-Point Tool proposes a data type with the specified fraction length and the minimum word length that avoids overflows.

Command-Line Alternative

No command line alternative available.

Default word length

Specify the default word length for objects in your model. The Fixed-Point Tool will propose best-precision fraction lengths based on the specified default word length.

Command-Line Alternative

No command line alternative available.

When proposing types use

Specify the types of ranges to use for data type proposals.

Design and derived ranges

The Fixed-Point Tool uses the design ranges in conjunction with derived ranges to propose data types. Design ranges take precedence over derived ranges.

Design and simulation ranges

The Fixed-Point Tool uses the design ranges in conjunction with collected simulation ranges to propose data types. Design ranges take precedence over simulation ranges.

The **Safety margin for simulation min/max (%)** parameter specifies a range that differs from that defined by the simulation range. For more information, see “Safety margin for simulation min/max (%)” on page 8-18

All collected ranges

The Fixed-Point Tool uses design ranges in addition to derived and simulation ranges to propose data types.

Design minimum and maximum values take precedence over simulation and derived ranges.

Command-Line Alternative

No command line alternative available.

Safety margin for simulation min/max (%)

Specify safety factor for simulation minimum and maximum values.

Settings

Default: 0

The simulation minimum and maximum values are adjusted by the percentage designated by this parameter, allowing you to specify a range different from that obtained from the simulation run. The specified safety margin must be a real number greater than `-100`. For example, a value of 55 specifies that a range *at least* 55 percent larger is desired. A value of -15 specifies that a range *up to* 15 percent smaller is acceptable.

Dependencies

Before performing automatic data typing, you must specify design minimum and maximum values or run a simulation to collect simulation minimum and maximum data, or collect derived minimum and maximum values.

Command-Line Alternative

No command line alternative available.

Advanced Settings

In this section...

Advanced Settings Overview

Use the Advanced Settings dialog to control the fixed-point instrumentation mode, and data type override settings. You can also use the Advanced Settings dialog to add or edit user-defined configurations. You cannot modify the factory default configurations. If you add a new configuration and want it to appear as a button on the Fixed-Point Tool **Configure model settings** pane, use the controls in the **Shortcuts** tab.

Fixed-point instrumentation mode

Control which objects log minimum, maximum and overflow data during simulation.

Settings

Default: `Use local settings`

`Use local settings`

Logs data according to the value of this parameter set for each subsystem. Otherwise, settings for parent systems always override those of child systems.

`Minimums, maximums and overflows`

Logs minimum value, maximum value, and overflow data for all blocks in the current system or subsystem during simulation.

`Overflows only`

Logs only overflow data for all blocks in the current system or subsystem.

`Force off`

Does not log data for any block in the current system or subsystem. Use this selection to work with models containing fixed-point enabled blocks if you do not have a Fixed-Point Designer license.

Tips

- You cannot change the instrumentation mode for linked subsystems or referenced models.

Dependencies

The value of this parameter for parent systems controls min/max logging for all child subsystems, unless `Use local settings` is selected.

Command-Line Alternative

Parameter: `'MinMaxOverflowLogging'`
Type: string
Value: `'UseLocalSettings'` | `'MinMaxAndOverflow'` | `'OverflowOnly'` | `'ForceOff'`
Default: `'UseLocalSettings'`

Data type override

Control data type override of objects that allow you to specify data types in their dialog boxes.

Settings

Default: `Use local settings`

The value of this parameter for parent systems controls data type override for all child subsystems, unless `Use local settings` is selected.

`Use local settings`

Overrides data types according to the setting of this parameter for each subsystem.

`Scaled double`

Overrides the data type of all blocks in the current system and subsystem with doubles; however, the scaling and bias specified in the dialog box of each block is maintained.

`Double`

Overrides the output data type of all blocks in the current system or subsystem with doubles. The overridden values have no scaling or bias.

`Single`

Overrides the output data type of all blocks in the current system or subsystem with singles. The overridden values have no scaling or bias.

`Off`

No data type override is performed on any block in the current system or subsystem. The settings on the blocks are used.

Tips

- Set this parameter to `Double` or `Single` and the **Data type override applies to** parameter to `All numeric types` to work with models containing fixed-point enabled blocks if you do not have a Fixed-Point Designer license.
- You cannot change the **Data type override** setting on linked subsystems or referenced models.
- Data type override never applies to `boolean` data types.
- When you set the **Data type override** parameter of a parent system to `Double`, `Single`, `Scaled double` or `Off`, this setting also applies to all child subsystems and you cannot change the data type override setting for these child subsystems. When the **Data type override** parameter of a parent system is `Use local settings`, you can set the **Data type override** parameter for individual children.
- Use this parameter with the **Data type override applies to** parameter. The following table details how these two parameters affect the data types in your model.

Fixed-Point Tool Settings		Block Local Settings	
Data type override	**Data type override applies to**	**Floating-point types**	**Fixed-point types**
Use local settings/Off	N/A	Unchanged	Unchanged
Double	All numeric types	Double	Double
	Floating-point	Double	Unchanged
	Fixed-point	Unchanged	Double
Single	All numeric types	Single	Single
	Floating-point	Single	Unchanged
	Fixed-point	Unchanged	Single
Scaled double	All numeric types	Double	Scaled double equivalent of fixed-point type
	Floating-point	Double	Unchanged
	Fixed-point	Unchanged	Scaled double equivalent of fixed-point type

Dependencies

- The following Simulink blocks allow you to set data types in their block masks, but ignore the **Data type override** setting:
  - Probe
  - Trigger
  - Width

Command-Line Alternative

Parameter: `'DataTypeOverride'`
Type: string
Value: `'UseLocalSettings'` | `'ScaledDouble'` | `'Double'` | `'Single'` | `'Off'`
Default: `'UseLocalSettings'`

Data type override applies to

Specifies which data types the Fixed-Point Tool overrides

Settings

Default: `All numeric types`

`All numeric types`

Data type override applies to all numeric types, floating-point and fixed-point. It does not apply to `boolean` or enumerated data types.

`Floating-point`

Data type override applies only to floating-point data types, that is, `double` and `single`.

`Fixed-point`

Data type override applies only to fixed-point data types, for example, `uint8`, `fixdt`.

Tips

- Use this parameter with the **Data type override** parameter.
- Data type override never applies to `boolean` or enumerated data types or to buses.
- When you set the **Data type override** parameter of a parent system to `Double`, `Single`, `Scaled double` or `Off`, this setting also applies to all child subsystems and you cannot change the data type override setting for these child subsystems. When the **Data type override** parameter of a parent system is `Use local setting`, you can set the **Data type override** parameter for individual children.
- The following table details how these two parameters affect the data types in your model.

Fixed-Point Tool Settings		Block Local Settings	
Data type override	**Data type override applies to**	**Floating-point types**	**Fixed-point types**
Use local settings/Off	N/A	Unchanged	Unchanged
Double	All numeric types	Double	Double
	Floating-point	Double	Unchanged
	Fixed-point	Unchanged	Double
Single	All numeric types	Single	Single
	Floating-point	Single	Unchanged
	Fixed-point	Unchanged	Single

Fixed-Point Tool Settings		Block Local Settings	
Data type override	**Data type override applies to**	**Floating-point types**	**Fixed-point types**
Scaled double	All numeric types	Double	Scaled double equivalent of fixed-point type
	Floating-point	Double	Unchanged
	Fixed-point	Unchanged	Scaled double equivalent of fixed-point type

Dependencies

This parameter is enabled only when **Data type override** is set to `Scaled double`, `Double` or `Single`.

Command-Line Alternative

Parameter: `'DataTypeOverrideAppliesTo'`
Type: string
Value: `'AllNumericTypes'` | `'Floating-point'` | `'Fixed-point'`
Default: `'AllNumericTypes'`

Name of shortcut

Enter a unique name for your shortcut. By default, the Fixed-Point Tool uses this name as the **Run name** for this shortcut.

If the shortcut name already exists, the new settings overwrite the existing settings.

See Also

- “Run Management” (Fixed-Point Designer)

Allow modification of fixed-point instrumentation settings

Select whether to change the model fixed-point instrumentation settings when you apply this shortcut to the model.

Settings

Default: On

☑ On

When you apply this shortcut to the model, changes the fixed-point instrumentation settings of the model and its subsystems to the setting defined in this shortcut.

□ Off

Does not change the fixed-point instrumentation settings when you apply this shortcut to the model.

Tip

If you want to control data type override settings without altering the fixed-point instrumentation settings on your model, clear this option.

See Also

- “Run Management” (Fixed-Point Designer)

Allow modification of data type override settings

Select whether to change the model data type override settings when you apply this shortcut to the model

Settings

Default: On

☑ On

When you apply this shortcut to the model, changes the data type override settings of the model and its subsystems to the settings defined in this shortcut .

□ Off

Does not change the fixed-point instrumentation settings when you apply this shortcut to the model.

Allow modification of run name

Select whether to change the run name on the model when you apply this shortcut to the model

Settings

Default: On

☑ On

Changes the run name to the setting defined in this shortcut when you apply this shortcut to the model.

□ Off

Does not change the run name when you apply this shortcut to the model.

Run name

Specify the run name to use when you apply this shortcut.

By default, the run name uses the name of the shortcut. Run names are case sensitive.

Dependency

Allow modification of run name enables this parameter.

Capture system settings

Copy the model and subsystem fixed-point instrumentation mode and data type override settings into the Shortcut editor.

Fixed-point instrumentation mode

Control which objects in the shortcut editor log minimum, maximum and overflow data during simulation.

This information is stored in the shortcut. To use the current model setting, click **Capture system settings**.

Settings

Default: Same as model setting

`Use local settings`

Logs data according to the value of this parameter set for each subsystem. Otherwise, settings for parent systems always override those of child systems.

`Minimums, maximums and overflows`

Logs minimum value, maximum value, and overflow data for all blocks in the current system or subsystem during simulation.

`Overflows only`

Logs only overflow data for all blocks in the current system or subsystem.

`Force off`

Does not log data for any block in the current system or subsystem. Use this selection to work with models containing fixed-point enabled blocks if you do not have a Fixed-Point Designer license.

Dependency

Allow modification of fixed-point instrumentation settings enables this parameter.

Data type override

Control data type override of objects that allow you to specify data types in their dialog boxes.

This information is stored in the shortcut. To use the current model settings, click **Capture system settings**.

Settings

Default: Same as model

The value of this parameter for parent systems controls data type override for all child subsystems, unless `Use local settings` is selected.

`Use local settings`

Overrides data types according to the setting of this parameter for each subsystem.

`Scaled double`

Overrides the data type of all blocks in the current system and subsystem with doubles; however, the scaling and bias specified in the dialog box of each block is maintained.

`Double`

Overrides the output data type of all blocks in the current system or subsystem with doubles. The overridden values have no scaling or bias.

`Single`

Overrides the output data type of all blocks in the current system or subsystem with singles. The overridden values have no scaling or bias.

`Off`

No data type override is performed on any block in the current system or subsystem. The settings on the blocks are used.

Dependency

Allow modification of data type override settings enables this parameter.

Data type override applies to

Specifies which data types to override when you apply this shortcut.

This information is stored in the shortcut. To use the current model setting, click **Capture system settings**.

Settings

Default: `All numeric types`

`All numeric types`

Data type override applies to all numeric types, floating-point and fixed-point. It does not apply to `boolean` or enumerated data types.

`Floating-point`

Data type override applies only to floating-point data types, that is, `double` and `single`.

`Fixed-point`

Data type override applies only to fixed-point data types, for example, `uint8`, `fixdt`.

Dependency

Allow modification of data type override settings enables this parameter.

9

Model Advisor Checks

Simulink Checks

In this section...

In this section...

In this section...

Simulink Check Overview

Use the Simulink Model Advisor checks to configure your model for simulation.

See Also

- “Run Model Checks”
- “Simulink Coder Checks” (Simulink Coder)
- “Simulink Check Checks” (Simulink Check)

Migrating to Simplified Initialization Mode Overview

Simplified initialization mode was introduced in R2008b to improve the consistency of simulation results. This mode is especially important for models that do not specify initial conditions for conditionally executed subsystem output ports. For more information, see “Simplified Initialization Mode” and “Classic Initialization Mode”.

Use the Model Advisor checks in **Migrating to Simplified Initialization Mode** to help migrate your model to simplified initialization mode.

See Also

- “Simplified Initialization Mode”
- “Classic Initialization Mode”
- “Underspecified initialization detection”
- “Check usage of Merge blocks” on page 9-32
- “Check usage of Outport blocks” on page 9-35
- “Check usage of Discrete-Time Integrator blocks” on page 9-47
- “Check model settings for migration to simplified initialization mode” on page 9-48

Identify unconnected lines, input ports, and output ports

Check ID: `mathworks.design.UnconnectedLinesPorts`

Check for unconnected lines or ports.

Description

This check lists unconnected lines or ports. These can have difficulty propagating signal attributes such as data type, sample time, and dimensions.

Note Ports connected to ground/terminator blocks will pass this test.

Results and Recommended Actions

Condition	Recommended Action
Lines, input ports, or output ports are unconnected.	Connect the signals. Double-click the list of unconnected items to locate failure.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

Tips

Use the `PortConnectivity` command to obtain an array of structures describing block input or output ports.

See Also

“Common Block Properties” on page 6-109 for information on the `PortConnectivity` command.

“What Is a Model Advisor Exclusion?” (Simulink Check)

Check root model Inport block specifications

Check ID: `mathworks.design.RootInportSpec`

Check that root model Inport blocks fully define dimensions, sample time, and data type.

Description

Using root model Inport blocks that do not fully define dimensions, sample time, or data type can lead to undesired simulation results. Simulink software back-propagates dimensions, sample times and data types from downstream blocks unless you explicitly assign them values.

Results and Recommended Actions

Condition	Recommended Action
Root-level Inport blocks have undefined attributes.	Fully define the attributes of the root-level Inport blocks.

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

Tips

The following configurations pass this check:

- **Configuration Parameters > Solver > Periodic sample time constraint** is set to `Ensure sample time independent`
- For export-function models, *inherited sample time* is not flagged.

See Also

- “About Data Types in Simulink”.
- “Determine Output Signal Dimensions”.
- “Specify Sample Time”.
- “What Is a Model Advisor Exclusion?” (Simulink Check)

Check optimization settings

Check ID: `mathworks.design.OptimizationSettings`

Check for optimizations that can lead to non-optimal code generation and simulation.

Description

This check reviews the status of optimizations that can improve code efficiency and simulation time.

Results and Recommended Actions

Condition	Recommended Action
The specified optimizations are off.	Select the following optimization check boxes on the **Optimization** pane in the Configuration Parameters dialog box: • "Remove root level I/O zero initialization" (Simulink Coder) • "Remove internal data zero initialization" (Simulink Coder) Select the following optimization check boxes on the **Optimization** pane in the Configuration Parameters dialog box: • "Inline invariant signals" (Simulink Coder) (only if you have a Simulink Coder license) Select the following optimization check boxes in the Configuration Parameters dialog box: • "Block reduction" • "Conditional input branch execution" • "Implement logic signals as Boolean data (vs. double)" • "Use memset to initialize floats and doubles to 0.0" (Simulink Coder) • "Remove code from floating-point to integer conversions that wraps out-of-range values" (Simulink Coder) (only if you have a Simulink Coder license) • "Signal storage reuse" • "Enable local block outputs" (Simulink Coder) • "Reuse local block outputs" (Simulink Coder) • "Eliminate superfluous local variables (Expression folding)" (Simulink Coder) Select the following optimization check boxes on the **Optimization** pane in the Configuration Parameters dialog box: **Note** Model Advisor checks these parameters only if there is a Stateflow chart in the model.

Condition	Recommended Action
	• “Use bitsets for storing state configuration” (Simulink Coder) • “Use bitsets for storing Boolean data” (Simulink Coder)
“Application lifespan (days)” is set as infinite. This could lead to expensive 64-bit counter usage.	Choose a stop time if this is not intended.
The specified diagnostics, which can increase the time it takes to simulate your model, are set to `warning` or `error`.	Select `none` for: • **Solver data inconsistency** • **Array bounds exceeded** • **Diagnostics > Data Validity > Simulation range checking**
The specified Embedded Coder parameters are off.	If you have an Embedded Coder license and you are using an ERT-based system target file: • Select **Single output/update function**. For details, see “Single output/update function” (Simulink Coder). • Select **Ignore test point signals**. For details, see “Ignore test point signals” (Simulink Coder). • Set **Pass reusable subsystem outputs as** to `Individual arguments`. For details, see “Pass reusable subsystem outputs as” (Simulink Coder).

Tips

If the system contains Model blocks and the referenced model is in Accelerator mode, simulating the model requires generating and compiling code.

See Also

- “Model Configuration Parameters: Code Generation Optimization” (Simulink Coder)

Check diagnostic settings ignored during accelerated model reference simulation

Check ID: `mathworks.design.ModelRefSIMConfigCompliance`

Checks for referenced models for which Simulink changes configuration parameter settings during accelerated simulation.

Description

For models referenced in accelerator mode, Simulink ignores the settings of the following configuration parameters that you set to a value other than `None`.

- **Array bounds exceeded**
- **Diagnostics** > **Data Validity** > **Inf or NaN block output**
- **Diagnostics** > **Data Validity** > **Division by singular matrix**
- **Diagnostics** > **Data Validity** > **Wrap on overflow**

Also, for models referenced in accelerator mode, Simulink ignores the following **Configuration Parameters** > **Diagnostics** > **Data Validity** > **Data Store Memory block** parameters if you set them to a value other than `Disable all`. For details, see “Data Store Diagnostics”.

- **Detect read before write**
- **Detect write after read**
- **Detect write after write**

Results and Recommended Actions

Condition	Recommended Action
You want to see the results of running the identified diagnostics with settings to produce warnings or errors.	Simulate the model in Normal mode and resolve diagnostic warnings or errors.

Check for parameter tunability information ignored for referenced models

Check ID: `mathworks.design.ParamTunabilityIgnored`

Checks if parameter tunability information is included in the Model Parameter Configuration dialog box.

Description

Simulink software ignores tunability information specified in the Model Parameter Configuration dialog box. This check identifies those models containing parameter tunability information that Simulink software will ignore if the model is referenced by other models.

Results and Recommended Actions

Condition	Recommended Action
Model contains ignored parameter tunability information.	Click the links to convert to equivalent Simulink parameter objects in the MATLAB workspace.

See Also

“Create Tunable Calibration Parameter in the Generated Code” (Simulink Coder).

Check for implicit signal resolution

Check ID: `mathworks.design.ImplicitSignalResolution`

Identify models that attempt to resolve named signals and states to `Simulink.Signal` objects.

Description

Requiring Simulink software to resolve all named signals and states is inefficient and slows incremental code generation and model reference. This check identifies those signals and states for which you may turn off implicit signal resolution and enforce resolution.

Results and Recommended Actions

Condition	Recommended Action
Not all signals and states are resolved.	Turn off implicit signal resolution and enforce resolution for each signal and state that does resolve.

See Also

"Resolve Signal Objects for Output Data".

Check for optimal bus virtuality

Check ID: `mathworks.design.OptBusVirtuality`

Identify virtual buses that could be made nonvirtual. Making these buses nonvirtual improves generated code efficiency.

Description

This check identifies blocks incorporating virtual buses that cross a subsystem boundary. Changing these to nonvirtual improves generated code efficiency.

Results and Recommended Actions

Condition	Recommended Action
Blocks that specify a virtual bus crossing a subsystem boundary.	Change the highlighted bus to nonvirtual.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

- "Signal Basics".
- "Virtual and Nonvirtual Buses".
- "What Is a Model Advisor Exclusion?" (Simulink Check)

Check for Discrete-Time Integrator blocks with initial condition uncertainty

Check ID: `mathworks.design.DiscreteTimeIntegratorInitCondition`

Identify Discrete-Time Integrator blocks with state ports and initial condition ports that are fed by neither an Initial Condition nor a Constant block.

Description

Discrete-Time Integrator blocks with state port and initial condition ports might not be suitably initialized unless they are fed from an Initial Condition or Constant block. This is more likely to happen when Discrete-Time Integrator blocks are used to model second-order or higher-order dynamic systems.

Results and Recommended Actions

Condition	Recommended Action
Discrete-Time Integrator blocks are not initialized during the model initialization phase.	Add a Constant or Initial Condition block to feed the external Initial Condition port.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

Identify disabled library links

Check ID: `mathworks.design.DisabledLibLinks`

Search model for disabled library links.

Description

Disabled library links can cause unexpected simulation results. Resolve disabled links before saving a model.

Note This check may overlap with “Check model for block upgrade issues” on page 9-56.

Results and Recommended Actions

Condition	Recommended Action
Library links are disabled.	Click the **Library Link** > **Resolve link** option in the context menu.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

Tips

- Use the Model Browser to find library links.
- To enable a broken link, right-click a block in your model to display the context menu. Select **Library Link** > **Resolve link**.

Check for large number of function arguments from virtual bus across model reference boundary

Check ID: `mathworks.design.CheckVirtualBusAcrossModelReferenceArgs`

Checks virtual bus signals that cross model reference boundaries and flags cases where using virtual buses across a model reference boundary increases the number of function arguments significantly.

Description

To improve the speed of the code generation process, you can use this check to reduce the number of generated function arguments. If the check finds a model that where many arguments will be generated for a function, you can click **Update Model** to modify the model so that it generates fewer arguments.

Results and Recommended Action

Methods that generate many function arguments as the result of a virtual bus signal crossing model reference boundary slow down the code generation process.

Condition	Recommended Action
Methods are listed that generate a large number of arguments for the current the model configuration that this check can reduce by modifying the model.	Click **Update Model**.

Clicking **Update Model** resets Inport and Outport block parameters and inserts Signal Conversion blocks, as necessary, to reduce the number of generated function arguments for the model.

See Also

“Bus Data Crossing Model Reference Boundaries”

Identify parameterized library links

Check ID: `mathworks.design.ParameterizedLibLinks`

Search model for parameterized library links.

Description

Parameterized library links that are unintentional can result in unexpected parameter settings in your model. This can result in improper model operation.

Results and Recommended Actions

Condition	Recommended Action
Parameterized links are listed.	Verify that the links are intended to be parameterized.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

Tips

- Right-click a block in your model to display the context menu. Choose `Link Options` and click `Go To Library Block` to see the original block from the library.
- To parameterize a library link, choose `Look Under Mask`, from the context menu and select the parameter.

"Restore Disabled or Parameterized Links"

"What Is a Model Advisor Exclusion?" (Simulink Check)

Identify unresolved library links

Check ID: `mathworks.design.UnresolvedLibLinks`

Search the model for unresolved library links, where the specified library block cannot be found.

Description

Check for unresolved library links. Models do not simulate while there are unresolved library links.

Results and Recommended Actions

Condition	Recommended Action
Library links are unresolved.	Locate missing library block or an alternative.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

Identify configurable subsystem blocks for converting to variant subsystem blocks

Check ID: `mathworks.design.CSStoVSSConvert`

Search the model to identify configurable subsystem blocks at the model or subsystem level.

Results and Recommended Actions

Condition	Recommended Action
Configurable subsystem blocks are identified.	Convert these blocks to variant subsystem blocks to avoid compatibility issues. See Configurable Subsystem.

Capabilities and Limitations

You can run this check on your library models.

See Also

“Convert to Variant Subsystem” on page 1-216

Identify Variant Model blocks and convert those to Variant Subsystem containing Model block choices

Check ID: `mathworks.design.ConvertMdlrefVarToVSS`

Search the model to identify Variant Model blocks.

Results and Recommended Actions

Condition	Recommended Action
Variant Model blocks available in the model are listed.	Convert these blocks to Variant Subsystem blocks.

See Also

“Convert to Variants”

Check usage of function-call connections

Check ID: `mathworks.design.CheckForProperFcnCallUsage`

Check model diagnostic settings that apply to function-call connectivity and that might impact model execution.

Description

Check for connectivity diagnostic settings that might lead to non-deterministic model execution.

Results and Recommended Actions

Condition	Recommended Action
Diagnostics > Connectivity > Invalid function-call connection is set to `warning`. This might lead to non-deterministic model execution.	Set **Diagnostics > Connectivity > Invalid function-call connection** to `error`.
Diagnostic > Connectivity > Context-dependent inputs is set to `Disable All` or `Use local settings`. This might lead to non-deterministic model execution.	Set **Diagnostics > Connectivity > Context-dependent inputs** to `Enable all as errors`.

Function-Call Subsystem

Check Data Store Memory blocks for multitasking, strong typing, and shadowing issues

Check ID: `mathworks.design.DataStoreMemoryBlkIssue`

Look for modeling issues related to Data Store Memory blocks.

Description

Checks for multitasking data integrity, strong typing, and shadowing of data stores of higher scope.

Results and Recommended Actions

Condition	Recommended Action
The **Duplicate data store names** check is set to `none` or `warning`.	Consider setting the “Duplicate data store names” check to `error` in the Configuration Parameters dialog box, on the **Diagnostics > Data Validity** pane.

Condition	Recommended Action
The data store variable names are not strongly typed in one of the following: • **Signal Attributes** pane of the **Block Parameters** dialog for the Date Store Memory block • Global data store name	Specify a data type other than auto by taking one of the following actions: • Choose a data type other than `Inherit: auto` on the **Signal Attributes** pane of the **Block Parameters** dialog for the Date Store Memory block. • If you are using a global data store name, then specify its data type in the `Simulink.Signal` object.
The **Multitask data store** check is set to `none` or `warning`.	Consider setting the “Multitask data store” check to `error` in the Configuration Parameters dialog box, on the **Diagnostics > Data Validity** pane.

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

- “What Is a Model Advisor Exclusion?” (Simulink Check)

Check if read/write diagnostics are enabled for data store blocks

Check ID: `mathworks.design.DiagnosticDataStoreBlk`

For data store blocks in the model, enable the read-and-write diagnostics order checking to detect run-time issues.

Description

Check for the read-and-write diagnostics order checking. By enabling the read-and-write diagnostics, you detect potential run-time issues.

Results and Recommended Actions

Condition	Recommended Action
The **Detect read before write** check is disabled.	Consider enabling “Detect read before write” in the Configuration Parameter dialog box **Diagnostics> Data Validity** pane.
The **Detect write after read** check is disabled.	Consider enabling “Detect write after read” in the Configuration Parameter dialog box **Diagnostics> Data Validity** pane.
The **Detect write after write** check is disabled.	Consider enabling “Detect write after write” in the Configuration Parameter dialog box **Diagnostics> Data Validity** pane.

Capabilities and Limitations

Exclude blocks and charts from this check if you have a Simulink Check license.

Tips

.

- The run-time diagnostics can slow simulations down considerably. Once you have verified that Simulink does not generate warnings or errors during simulation, set them to `Disable all`.

Check data store block sample times for modeling errors

Check ID: `mathworks.design.DataStoreBlkSampleTime`

Identify modeling errors due to the sample times of data store blocks.

Description

Check data store blocks for continuous or fixed-in-minor-step sample times.

Results and Recommended Actions

Condition	Recommended Action
Data store blocks in your model have continuous or fixed-in-minor-step sample times.	Consider making the listed blocks discrete or replacing them with either Memory or Goto and From blocks.

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

See Also

- “Local and Global Data Stores”
- Data Store Memory
- Data Store Read
- Data Store Write
- “Fixed-in-Minor-Step”
- “What Is a Model Advisor Exclusion?” (Simulink Check)

Check for potential ordering issues involving data store access

Check ID: `mathworks.design.OrderingDataStoreAccess`

Look for read/write issues which may cause inaccuracies in the results.

Description

During an **Update Diagram**, identify potential issues relating to read-before-write, write-after-read, and write-after-write conditions for data store blocks.

Results and Recommended Actions

Condition	Recommended Action
Reading and writing (read-before-write or write-after-read condition) occur out of order.	Consider restructuring your model so that the Data Store Read block executes before the Data Store Write block.
Multiple writes occur within a single time step.	Change the model to write data only once per time step or refer to the following Tips section.

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

Tips

This check performs a static analysis which might not identify every instance of improper usage. Specifically, Function-Call Subsystems, Stateflow Charts, MATLAB for code generation, For Iterator Subsystems, and For Each Subsystems can cause both missed detections and false positives. For a more comprehensive check, consider enabling the following diagnostics on the **Diagnostics > Data Validity** pane in the Configuration Parameters dialog box: “Detect read before write”, “Detect write after read”, and “Detect write after write”.

Check structure parameter usage with bus signals

Check ID: `mathworks.design.MismatchedBusParams`

Identify blocks and `Simulink.Signal` objects that initialize bus signals by using mismatched structures.

Description

In a model, you can use a MATLAB structure to initialize a bus signal. For example, if you pass a bus signal through a Unit Delay block, you can set the **Initial condition** parameter to a structure. For basic information about initializing buses by using structures, see “Specify Initial Conditions for Bus Signals”.

Run this check to generate efficient and readable code by matching the shape and numeric data types of initial condition structures with those of bus signals. Matching these characteristics avoids unnecessary explicit typecasts and replaces field-by-field structure assignments with, for example, calls to `memcpy`.

Partial Structures

This check lists blocks and `Simulink.Signal` objects that initialize bus signals by using partial structures. During the iterative process of creating a model, you can use partial structures to focus on a subset of signal elements in a bus. For a mature model, use full structures to:

- Generate readable and efficient code.
- Support a modeling style that explicitly initializes unspecified signals. When you use partial structures, Simulink implicitly initializes unspecified signals.

For more information about full and partial structures, see “Create Full Structures for Initialization” and “Create Partial Structures for Initialization”.

Data Type Mismatches

This check lists blocks and `Simulink.Signal` objects whose initial condition structures introduce data type mismatches. The fields of these structures have numeric data types that do not match the data types of the corresponding bus signal elements.

When you configure an initial condition structure to appear as a tunable global structure in the generated code, avoid unnecessary explicit typecasts by matching the data types. See “Generate Tunable Initial Condition Structure for Bus Signal” (Simulink Coder).

Results and Recommended Actions

Condition	Recommended Action
Block or signal object uses partial structure	Consider using the function `Simulink.Bus.createMATLABStructure` to create a full initial condition structure.
Data types of structure fields do not match data types of corresponding signal elements	Consider defining the structure as a `Simulink.Parameter` object, and creating a `Simulink.Bus` object to use as the data type of the bus signal and of the parameter object. To control numeric data types, use the `Simulink.BusElement` objects in the bus object.

Check Delay, Unit Delay and Zero-Order Hold blocks for rate transition

Check ID: `mathworks.design.ReplaceZOHDelayByRTB`

Identify Delay, Unit Delay, or Zero-Order Hold blocks that are used for rate transition. Replace these blocks with actual Rate Transition blocks.

Description

If a model uses Delay, Unit Delay, or Zero-Order Hold blocks to provide rate transition between input and output signals, Simulink makes a hidden replacement of these blocks with built-in Rate Transition blocks. In the compiled block diagram, a yellow symbol and the letters “RT” appear in the upper-left corner of a replacement block. This replacement can affect the behavior of the model, as follows:

- These blocks lose their algorithmic design properties to delay a signal or implement zero-order hold. Instead, they acquire rate transition behavior.
- This modeling technique works only in specific transition configurations (slow-to-fast for Delay and Unit Delay blocks, and fast-to-slow for Zero-Order Hold block). Set the block sample time to be equal to the slower rate (source for the Delay and Unit Delay blocks and destination for the Zero-Order Hold block).
- When the block sample time of a downstream or upstream block changes, these Delay, Unit Delay and Zero-Order Hold blocks might not perform rate transition. For example, setting the source and destination sample times equal stops rate transition. The blocks then assume their original algorithmic design properties.
- The block sample time shows incomplete information about sample time rates. The block code runs at two different rates to handle data transfer. However, the block sample time and sample time color show it as a single-rate block. Tools and MATLAB scripts that use sample time information base their behavior on this information.

An alternative is to replace Delay, Unit Delay, or Zero-Order Hold blocks with actual Rate Transition blocks.

- The technique ensures unambiguous results in block behavior. Delay, Unit Delay, or Zero-Order Hold blocks act according to their algorithmic design to delay and hold signals respectively. Only Rate Transition blocks perform actual rate transition.
- Using an actual Rate Transition block for rate transition offers a configurable solution to handle data transfer if you want to specify deterministic behavior or the type of memory buffers to implement.

Use this check to identify instances in your model where Delay, Unit Delay or Zero-Order Hold blocks undergo hidden replacement to provide rate transition between signals. Click **Upgrade Model** to replace these blocks with actual Rate Transition blocks.

Results and Recommended Actions

Condition	Recommended Action
Model has no instances of Delay, Unit Delay, or Zero-Order Hold blocks used for rate transition.	No action required.
Model has instances of Delay, Unit Delay, or Zero-Order Hold blocks used for rate transition.	The check identifies these instances and allows you to upgrade the model. 1 Click **Upgrade Model** to replace with actual Rate Transition blocks. 2 Save changes to your model.

If you do not choose to replace the Delay, Unit Delay, and/or Zero-Order Hold blocks with actual Rate Transition blocks, Simulink continues to perform a hidden replacement of these blocks with built-in rate transition blocks.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

- “Run Model Checks”
- “Model Upgrades”
- Rate Transition
- “What Is a Model Advisor Exclusion?” (Simulink Check)

Check for calls to slDataTypeAndScale

Check ID: `mathworks.design.CallslDataTypeAndScale`

Identify calls to the internal function `slDataTypeAndScale`.

Description

In some previous versions of Simulink, opening a model that had been saved in an earlier version triggers an automatic upgrade to code for data type handling. The automatic upgrade inserts calls to the internal function `slDataTypeAndScale`. Although Simulink continues to support some uses of the function, if you eliminate calls to it, you get cleaner and faster code.

Simulink does not support calls to `slDataTypeAndScale` when:

- The first argument is a `Simulink.AliasType` object.
- The first argument is a `Simulink.NumericType` object with property `IsAlias` set to true.

Running **Check for calls to slDataTypeAndScale** identifies calls to `slDataTypeAndScale` that are required or recommended for replacement. In most cases, running the check and following the recommended action removes the calls. You can ignore calls that remain. Run the check unless you are sure there are not calls to `slDataTypeAndScale`.

Results and Recommended Actions

Condition	Recommended Action
Required Replacement Cases	Manually or automatically replace calls to `slDataTypeAndScale`. Cases listed require you to replace calls to `slDataTypeAndScale`.
Recommended Replacement Cases	For the listed cases, it is recommended that you manually or automatically replace calls to `slDataTypeAndScale`.
Manual Inspection Cases	Inspect each listed case to determine whether it should be manually upgraded.

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

Tips

- Do not manually insert a call to `slDataTypeAndScale` into a model. The function was for internal use only.

- Running **Check for calls to slDataTypeAndScale** calls the Simulink function `slRemoveDataTypeAndScale`. Calling this function directly provides a wider range of conversion options. However, you very rarely need more conversion options.

See Also

- For more information about upgrading data types and scales, in the MATLAB Command Window, execute the following:
  - `help slDataTypeAndScale`
  - `help slRemoveDataTypeAndScale`
- "What Is a Model Advisor Exclusion?" (Simulink Check)

Check bus signals treated as vectors

Check ID: `mathworks.design.BusTreatedAsVector`

Identify bus signals that Simulink treats as vectors.

Description

You cannot use bus signals that the Simulink software implicitly converts to vectors. Instead, either insert a Bus to Vector conversion block between the bus signal and the block input port that it feeds, or use the `Simulink.BlockDiagram.addBusToVector` command.

Results and Recommended Actions

Condition	Recommended Action
Bus signals are implicitly converted to vectors.	Use `Simulink.BlockDiagram.addBusToVector` or insert a Bus to Vector block.
Model is not configured to identify bus signals that Simulink treats as vectors.	In the Configuration Parameters dialog box, on the **Diagnostics > Connectivity** pane, set **Bus signal treated as vector** to `error`.

Action Results

Clicking **Modify** inserts a Bus to Vector block at the input ports of blocks that implicitly convert bus signals to vectors.

Tips

- Run this check before running **Check consistency of initialization parameters for Outport and Merge blocks**.
- For more information, see “Correct Buses Used as Vectors”.

See Also

- “Correct Buses Used as Vectors”
- Bus to Vector block
- “Bus signal treated as vector”
- “Migrating to Simplified Initialization Mode Overview” on page 9-5
- `Simulink.BlockDiagram.addBusToVector`

Check for potentially delayed function-call subsystem return values

Check ID: `mathworks.design.DelayedFcnCallSubsys`

Identify function-call return values that might be delayed because Simulink software inserted an implicit Signal Conversion block.

Description

So that signals reside in contiguous memory, Simulink software can automatically insert an implicit Signal Conversion block in front of function-call initiator block input ports. This can result in a one-step delay in returning signal values from calling function-call subsystems. The delay can be avoided by ensuring the signal originates from a signal block within the function-call system. Or, if the delay is acceptable, insert a Unit Delay block in front of the affected input ports.

Results and Recommended Actions

Condition	Recommended Action
The listed block input ports could have an implicit Signal Conversion block.	Decide if a one-step delay in returning signal values is acceptable for the listed signals. • If the delay is not acceptable, rework your model so that the input signal originates from within the calling subsystem. • If the delay is acceptable, insert a Unit Delay block in front of each listed input port.

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

See Also

Signal Conversion block

Unit Delay block

“What Is a Model Advisor Exclusion?” (Simulink Check)

Identify block output signals with continuous sample time and non-floating point data type

Check ID: `mathworks.design.OutputSignalSampleTime`

Find continuous sample time, non-floating-point output signals.

Description

Non-floating-point signals might not represent continuous variables without loss of information.

Results and Recommended Actions

Condition	Recommended Action
Signals with continuous sample times have a non-floating-point data type.	On the identified signals, either change the sample time to be discrete or fixed-in-minor-step ([0 1]).

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

See Also

“What Is Sample Time?”.

“What Is a Model Advisor Exclusion?” (Simulink Check)

Check usage of Merge blocks

Check ID: `mathworks.design.MergeBlkUsage`

Identify Merge blocks with parameter settings that can lead to unexpected behavior, and help migrate your model to simplified initialization mode.

Note Run this check along with the other checks in the “Migrating to Simplified Initialization Mode Overview” on page 9-5.

Description

Simplified initialization mode was introduced in R2008b to improve the consistency of simulation results. For more information, see “Simplified Initialization Mode” and “Classic Initialization Mode”.

This Model Advisor check identifies settings in the Merge blocks in your model that can cause problems if you use classic initialization mode. It also recommends settings for consistent behavior of Merge blocks. The results of the subchecks contain two types of statements: Failed and Warning. Failed statements identify issues that you must address manually before you can migrate the model to the simplified initialization mode. Warning statements identify issues or changes in behavior that can occur after migration.

Results and Recommended Actions

Condition	Recommended Action
Check the run-time diagnostic setting of the Merge block.	**1** In the Configuration Parameters dialog box, set “Detect multiple driving blocks executing at the same time step” to `error`. **2** Verify that the model simulates without errors before running this check again.
Check for Model blocks that are using the PIL simulation mode.	The simplified initialization mode does not support the Processor-in-the-loop (PIL) simulation for model references.
Check for library blocks with instances that cannot be migrated.	Examine the failed subcheck results for each block to determine the corrective actions.
Check for single-input Merge blocks.	Replace both the Mux block used to produce the input signal and the Merge block with one multi-input Merge block. Single-input Merge blocks are not supported in the simplified initialization mode.
Check for root Merge blocks that have an unspecified **Initial output** value.	If you do not specify an explicit value for the **Initial output** parameter of root Merge blocks, then Simulink uses the default initial value of the output data type. A root Merge block is a Merge block with an output port that does not connect to another Merge block. For information on the default initial value, see “Initializing Signal Values”.

Condition	Recommended Action
Check for Merge blocks with nonzero input port offsets.	Clear the **Allow unequal port widths** parameter of the Merge block. **Note** Consider using Merge blocks only for signal elements that require true merging. You can combine other elements with merged elements using the Concatenate block.
Check for Merge blocks that have unconnected inputs or that have inputs from non-conditionally executed subsystems.	Set the **Number of inputs** parameter of the Merge block to the number of Merge block inputs. You must connect each input to a signal. Verify that each Merge block input is driven by a conditionally executed subsystem. Merge blocks cannot be driven directly by an Iterator Subsystem or a block that is not a conditionally executed subsystem.
Check for Merge blocks with inputs that are combined or reordered outside of conditionally executed subsystems.	Verify that combinations or reordering of Merge block input signals takes place within a conditionally executed subsystem. Such designs may use Mux, Bus Creator, or Selector blocks.
Check for Merge blocks with inconsistent input sample times.	Verify that input signals to each Merge block have the same **Sample time**. Failure to do so could result in unpredictable behavior. Consequently, the simplified initialization mode does not allow inconsistent sample times.
Check for Merge blocks with multiple input ports that are driven by a single source.	Verify that the Merge block does not have multiple input signals that are driven by the same conditionally executed subsystem or conditionally executed Model block.

Condition	Recommended Action
Check for Merge blocks that use signal objects to specify the **Initial output** value.	Verify that the following behavior is acceptable. In the simplified initialization mode, signal objects cannot specify the **Initial output** parameter of the Merge block. While you can still initialize the output signal for a Merge block using a signal object, the initialization result may be overwritten by that of the Merge block. **Note** Simulink generates a warning that the initial value of the signal object has been ignored.

See Also

- "Migrating to Simplified Initialization Mode Overview" on page 9-5
- "What Is a Model Advisor Exclusion?" (Simulink Check)

Check usage of Outport blocks

Check ID: `mathworks.design.InitParamOutportMergeBlk`

Identify Outport blocks and conditional subsystems with parameter settings that can lead to unexpected behavior, and help migrate your model to simplified initialization mode.

Note Run this check along with the other checks in the "Migrating to Simplified Initialization Mode Overview" on page 9-5.

Description

Simplified initialization mode was introduced in R2008b to improve the consistency of simulation results. This mode is especially important for models that do not specify initial conditions for conditionally executed subsystem output ports. For more information, see "Simplified Initialization Mode" and "Classic Initialization Mode".

This Model Advisor check identifies Outport blocks and conditional subsystems in your model that can cause problems if you use the simplified initialization mode. It also recommends settings for consistent behavior of Outport blocks. The results of the subchecks contain two types of statements: Failed and Warning. Failed statements identify issues that you must address manually before you can migrate the model to the simplified initialization mode. Warning statements identify issues or changes in behavior can occur after migration.

Results and Recommended Actions

Condition	Recommended Action
Check for blocks inside of the Iterator Subsystem that require elapsed time.	Within an Iterator Subsystem hierarchy, do not use blocks that require a service that maintains the time that has elapsed between two consecutive executions. Since an Iterator Subsystem can execute multiple times at a given time step, the concept of elapsed time is not well-defined between two such executions. Using these blocks inside of an Iterator Subsystem can cause unexpected behavior.

Condition	Recommended Action
Check for Outport blocks that have conflicting signal buffer requirements.	The Outport block has a function-call trigger or function-call data dependency signal passing through it, along with standard data signals. Some of the standard data signals require an explicit signal buffer for the initialization of the output signal of the corresponding subsystem. However, buffering function-call related signals lead to a function-call data dependency violation. Consider modifying the model to pass function-call related signals through a separate Outport block. For examples of function-call data dependency violations, see the example model `sl_subsys_semantics`. A standard data signal may require an additional signal copy for one of the following reasons: • The Outport block is driven by a block with output that cannot be overwritten. The Ground block and the Constant block are examples of such blocks. • The Outport block shares the same signal source with another Outport block in the same subsystem or in one nested within the current subsystem but having a different initial output value. • The Outport block connects to the input of a Merge block • One of the input signals of the Outport block is specifying a `Simulink.Signal` object with an explicit initial value.

Condition	Recommended Action
Check for Outport blocks that are driven by a bus signal and whose **Initial output** value is not scalar.	For Outport blocks driven by bus signals, classic initialization mode does not support Initial Condition (IC) structures, while simplified initialization mode does. Hence, when migrating a model from classic to simplified mode, specify a scalar for the **Initial Output** parameter. After migration completes, to specify different initial values for different elements of the bus signal, use IC structures. For more information, see “Create Initial Condition Structures”.

Condition	Recommended Action
Check for Outport blocks that require an explicit signal copy.	An explicit copy of the bus signal driving the Outport block is required for the initialization of the output signal of the corresponding subsystem. Insert a Signal Conversion block before the Outport block, then set the Output parameter of the Signal Conversion block to `Bus copy`. A standard data signal may require an additional signal copy for one or more of the following reasons: • A block with output that cannot be overwritten is driving the Outport block. The Ground block and the Constant block are examples of such blocks. • The Outport block shares the same signal source with another Outport block in the same subsystem or in one nested within the current subsystem but having a different initial output value. • The Outport block connects to the input of a Merge block • One of the input signals of the Outport block is specifying a `Simulink.Signal` object with an explicit initial value.
Check for merged Outport blocks that inherit the **Initial Output** value from Outport blocks that have been configured to reset when the blocks become disabled.	When Outport blocks are driving a Merge block, do not set their **Output when disabled** parameters to `reset`.
Check for merged Outport blocks that are driven by nested conditionally executed subsystems.	Determine if the new behavior of the Outport blocks is acceptable. If it is not acceptable, modify the model to account for the new behavior before migrating to the simplified initialization mode.

Condition	Recommended Action
Check for merged Outport blocks that reset when the blocks are disabled.	Set the **Output when disabled** parameter of the Outport block to `held`. This setting is required because the Outport block connects to a Merge block. For more information, see Outport.
Check for Outport blocks that have an undefined **Initial output** value with invalid initial condition sources.	Verify that the following behavior is acceptable. When the **Initial output** parameter is unspecified (`[]`), it inherits the initial output from the source blocks. If at least one of the sources of the Outport block is not a valid source to inherit the initial value, the block uses the default initial value for that data type. For simplified initialization mode, valid sources an Outport blocks can inherit the **Initial output** value from are: Constant, Initial Condition, Merge (with initial output), Stateflow chart, function-call model reference, or conditionally executed subsystem blocks.
Check Outport blocks that have automatic rate transitions.	Simulink has inserted a Rate Transition block at the input of the Outport block. Specify the **Initial output** parameter for each Outport block. Otherwise, perform the following procedure: **1** In the Configuration Parameters dialog box, on the **Solver** pane, clear the option “Automatically handle rate transition for data transfer”. **2** Run this Model Advisor check again.

Condition	Recommended Action
Check Outport blocks that have a special signal storage requirement and have an undefined **Initial output** value.	Verify that the following behavior is acceptable. Specify the **Initial output** parameter for the Outport block. Set this value to `[]` (empty matrix) to use the default initial value of the output data type.
Check the **Initial output** setting of Outport blocks that reset when they are disabled.	Specify the **Initial output** parameter of the Outport block. You must specify the **Initial output** value for blocks that are configured to reset when they become disabled.
Check the **Initial output** setting for Outport blocks that pass through a function-call data dependency signal.	You cannot specify an **Initial output** value for the Outport block because function-call data dependency signals are passing through it. To set the **Initial output** value: **1** Set the **Initial output** parameter of the Outport block to `[]`. **2** Provide the initial value at the source of the data dependency signal rather than at the Outport block.

Condition	Recommended Action
Check for Outport blocks that use signal objects to specify the **Initial output** value.	Verify that the following behavior is acceptable. In the simplified initialization mode, signal objects cannot specify the **Initial output** parameter of an Outport block. You can still initialize the input or output signals for an Outport block using signal objects, but the initialization results may be overwritten by those of the Outport block. **Note** If you are working with a conditionally executed subsystem Outport block, Simulink generates a warning that the initial value of the signal object has been ignored.
Check for library blocks with instances that have warnings.	Examine the warning subcheck results for each block before migrating to the simplified initialization mode.
Check for merged Outport blocks that are either unconnected or connected to a Ground block.	Verify that the following behavior is acceptable. The Outport block is driving a Merge block, but its inputs are either unconnected or connected to Ground blocks. In the classic initialization mode, unconnected or grounded outports do not update the merge signal even when their parent conditionally executed subsystems are executing. In the simplified initialization mode, however, these outports will update the merge signal with a value of zero when their parent conditionally executed subsystems are executing.

Condition	Recommended Action
Check for Outport blocks that obtain the **Initial output** value from an input signal when they are migrated.	Verify that the following behavior is acceptable. The **Initial output** parameter of the Outport block is not specified. As a result, the simplified initialization mode will assume that the **Initial output** value for the Outport block is derived from the input signal. This assumption may result in different initialization behavior. If this behavior is not acceptable, modify your model before you migrate to the simplified initialization mode.
Check for outer Outport blocks that have an explicit **Initial output**.	Verify that the following behavior is acceptable. In classic initialization mode, the **Initial output** and **Output when disabled** parameters of the Outport block must match those of their source Outport blocks. In simplified initialization mode, Simulink sets the **Initial output** parameter of outer Outport blocks to `[]` (empty matrix) and **Output when disabled** parameter to `held`.
Check for conditionally executed subsystems that propagate execution context across the output boundary.	Verify that the following behavior is acceptable. The **Propagate execution context across subsystem boundary** parameter is selected for the subsystem. Execution context will still be propagated across input boundaries; however, the propagation will be disabled on the output side for the initialization in the simplified initialization mode.

Condition	Recommended Action
Check for blocks that read input from conditionally executed subsystems during initialization.	Verify that the following behavior is acceptable. Some blocks, such as the Discrete-Time Integrator block, read their inputs from conditionally executed subsystems during initialization in the classic initialization mode. Simulink performs this step as an optimization technique. This optimization is not allowed in the simplified initialization mode because the output of a conditionally executed subsystem at the first time step after initialization may be different than the initial value declared in the corresponding Outport block. In particular, this discrepancy occurs if the subsystem is active at the first time step.
Check for a migration conflict for Outport blocks that use a `Dialog` as the **Source of initial output value**.	Other instances of Outport blocks with the same library link either cannot be migrated or are being migrated in a different manner. Review the results from the **Check for library blocks with instances that cannot be migrated** to learn about the different migration paths for other instances of each Outport block. The Outport block will maintain its current settings and use its specified **Initial output** value.

Condition	Recommended Action
Check for a migration conflict for Outport blocks that use `Input signal` as the **Source of initial output** value.	Other instances of Outport blocks with the same library link either cannot be migrated or are being migrated in a different manner. Review the results from the **Check for library blocks with instances that cannot be migrated** to learn about the different migration paths for other instances of each Outport block. The Outport block currently specifies an **Initial output** of `[]` (empty matrix), and **the Output when disabled** as `held`. This means that each outport does not perform initialization, but implicitly relies on source blocks to initialize its input signal. After migration, the parameter **Source of initial output value** will be set to `Input signal` to reflect this behavior.
Check for a migration conflict for Outport blocks that have SimEvents semantics.	Other instances of Outport blocks with the same library link either cannot be migrated or are being migrated in a different manner. Review the results from the **Check for library blocks with instances that cannot be migrated** to learn about the different migration paths for other instances of each Outport block. The Outport blocks will continue to use an **Initial output** value of `[]` (empty matrix) and an **Output when disabled** setting of `held`. Simulink will maintain these settings because their parent conditionally executed subsystems are connected to SimEvents blocks.

Condition	Recommended Action
Check for a migration conflict for innermost Outport blocks with variable-size input and unspecified **Initial output**.	For these Outport blocks, the signal size varies only when the parent subsystem of the block is re-enabled. Therefore, Simulink implicitly assumes that the **Initial output** parameter is equal to 0, even though the parameter is unspecified, []. Consequently, unless you specify the parameter, the Model Advisor will explicitly set the parameter to 0 when the model is migrated to the simplified initialization mode. Other instances of Outport blocks with the same library link either cannot be migrated or are being migrated in a different manner. Review the results from the **Check for library blocks with instances that cannot be migrated** to learn about the different migration paths for other instances of each Outport block.
Check for a migration conflict for Outport blocks that use a default ground value as the Initial output.	The parameter **Initial output** is set to `[]` (empty matrix) and the source of the Outport is an invalid initial condition source. Thus, the block uses the default initial value as the initial output in the simplified initialization mode. Other instances of Outport blocks with the same library link either have errors or are being migrated differently.
Check for a migration conflict for merged Outport blocks without explicit specification of **Initial output**.	Review the results from the subcheck **Check for library blocks with instances that cannot be migrated** to learn about different migration paths for other instances of each Outport block. For the remaining Outport blocks, **Initial output** is set to `[]` (empty matrix) and **Output when disabled** is set to `held` respectively, in simplified initialization mode.

Check usage of Discrete-Time Integrator blocks

Check ID: `mathworks.design.DiscreteBlock`

Identify Discrete-Time Integrator blocks with parameter settings that can lead to unexpected behavior, and help migrate your model to simplified initialization mode.

Note Run this check along with the other checks in the “Migrating to Simplified Initialization Mode Overview” on page 9-5.

Description

Simplified initialization mode was introduced in R2008b to improve the consistency of simulation results. For more information, see “Simplified Initialization Mode” and “Classic Initialization Mode”.

This Model Advisor check identifies settings in Discrete-Time Integrator blocks in your model that can cause problems if you use the simplified initialization mode. It also recommends settings for consistent behavior of Discrete-Time Integrator blocks. The results of the subchecks contain two types of statements: Failed and Warning. Failed statements identify issues that you must address manually before you can migrate the model to the simplified initialization mode. Warning statements identify issues or changes in behavior that can occur after migration.

Results and Recommended Actions

Condition	Recommended Action
Check for Discrete-Time Integrator blocks whose parameter **Initial condition setting** is set to `Output`.	Determine if the new behavior of the Discrete-Time Integrator blocks is acceptable. If it is not acceptable, modify the model to account for the new behavior before migrating to the simplified initialization mode.

Condition	Recommended Action
Check for Discrete-Time Integrator blocks whose **Initial condition setting** parameter is set to `State (most efficient)` and are in a subsystem that uses triggered sample time.	Use periodic sample time for the block, or set **Initial Condition setting** to `Output`.
Check for blocks inside of the Iterator Subsystem that require elapsed time.	Within an Iterator Subsystem hierarchy, do not use blocks that require a service that maintains the time that has elapsed between two consecutive executions. Since an Iterator Subsystem can execute multiple times at a given time step, the concept of elapsed time is not well-defined between two such executions. Using these blocks inside of an Iterator Subsystem can cause unexpected behavior.

Check model settings for migration to simplified initialization mode

Note Do not run this check in isolation. Run this check along with the other checks in the "Migrating to Simplified Initialization Mode Overview" on page 9-5.

Check ID: `mathworks.design.ModelLevelMessages`

Identify settings in Model blocks and model configuration parameters that can lead to unexpected behavior, and help migrate your model to simplified initialization mode.

Description

Simplified initialization mode was introduced in R2008b to improve consistency of simulation results. For more information, see “Simplified Initialization Mode” and “Classic Initialization Mode”.

This Model Advisor check identifies issues in the model configuration parameters and Model blocks in your model that can cause problems when you migrate to simplified initialization mode. The results of the subchecks contain two types of statements: Failed and Warning. Failed statements identify issues that you must address manually before you can migrate the model to simplified initialization mode. Warning statements identify issues or changes in behavior that can occur after migration.

After running this Model Advisor consistency check, if you click **Explore Result** button, the messages pertain only to blocks that are not library-links.

Note Because it is difficult to undo these changes, select **File > Save Restore Point As** to back up your model before migrating to the simplified initialization mode.

For more information, see “Model Configuration Parameters: Connectivity Diagnostics”.

Results and Recommended Actions

Condition	Recommended Action
Verify that all Model blocks are using the simplified initialization mode.	Migrate the model referenced by the Model block to the simplified initialization mode, then migrate the top model.
Verify simplified initialization mode setting	Set **Configuration Parameters > Underspecified initialization detection** to `Simplified`.

Action Results

Clicking **Modify Settings** causes the following:

- The Model parameter is set to `simplified`
- If an Outport block has the **Initial output** parameter set to the empty character vector, `[]`, then the `SourceOfInitialOutputValue` parameter is set to **Input signal**.

- If an Outport has an empty **Initial output** and a variable-size signal, then the **Initial output** is set to zero.

See Also

- "Migrating to Simplified Initialization Mode Overview" on page 9-5

Check S-functions in the model

Check ID: `mathworks.design.SFuncAnalyzer`

Perform quality checks on S-functions in Simulink models or subsystems.

Description

The S-function analyzer performs quality checks on S-functions to identify improvements and potential problems in the specified model.

Results and Recommended Actions

Condition	Recommended Action
Continuous states are modified in `mdlOutputs` method.	Modify Continuous States at a major time step and use `ssSetSolverNeedsReset` function in S-function code.
Continuous states are modified in the `mdlUpdate` method.	Modify Continuous States only at a major time step and use `ssSetSolverNeedsReset` function in S-function code.
S-function discrete states are modified in the `mdlOutputs` at a minor step.	Modify the discrete states only at a major step guarded by `ssIsMajorTimeStep` function.
S-function mode vector is modified in the `mdlOutputs` method at a minor step.	Modify the mode vector only at a major step guarded by `sslsMajorTimeStep` function.
S-function is using static or global variables to declare internal states.	Declare the states explicitly using `ssSetNumDiscStates` function or "Model Global Data by Creating Data Stores".

Condition	Recommended Action
S-function has continuous states but sample time is not declared continuous.	Specify continuous sample time using `ssSetSampleTime` function.
S-function has discrete states but the `mdlOutputs` and `mdlUpdate` methods are combined.	Define the `mdlOutputs` and `mdlUpdate` methods separately and modify discrete states only in `mdlUpdate` method.
S-function sets the `SS_OPTION_CAN_BE_CALLED_CONDITIONALLY` option when having state-like data or multiple sample times.	Remove the options when the S-function has state-like data or multiple sample times.
`MEX` compilers do not exist on the machine.	Check for the presence or install `MEX` compilers on the machine.
S-function encounters errors while compiling the model.	Check the **Diagnostic Viewer** output and recompile the model.

Check for non-continuous signals driving derivative ports

Check ID: `mathworks.design.NonContSigDerivPort`

Identify noncontinuous signals that drive derivative ports.

Description

Noncontinuous signals that drive derivative ports cause the solver to reset every time the signal changes value, which slows down simulation.

Results and Recommended Actions

Condition	Recommended Action
There are noncontinuous signals in the model driving derivative ports.	• Make the specified signals continuous. • Replace the continuous blocks receiving these signals with discrete state versions of the blocks.

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

See Also

- "Modeling Dynamic Systems"
- "Simulation Phases in Dynamic Systems"
- "What Is a Model Advisor Exclusion?" (Simulink Check)

Runtime diagnostics for S-functions

Check ID: `mathworks.design.DiagnosticSFcn`

Check array bounds and solver consistency if S-Function blocks are in the model.

Description

Validates whether S-Function blocks adhere to the ODE solver consistency rules that Simulink applies to its built-in blocks.

Results and Recommended Actions

Condition	Recommended Action
Solver data inconsistency is set to `none`.	In the Configuration Parameters dialog box, set **Solver data inconsistency** to `warning` or `error`.
Array bounds exceeded is set to `none`.	In the Configuration Parameters dialog box, set **Array bounds exceeded** to `warning` or `error`

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

Check model for foreign characters

Check ID: `mathworks.design.characterEncoding`

Check for characters that are incompatible with the current encoding

Description

Check for characters in the model file that cannot be represented in the current encoding. These can cause errors during simulation, and may be corrupted when saving the model.

Results and Recommended Actions

Condition	Recommended Action
Incompatible characters found	Change the current encoding to the encoding specified in the model file, using `slCharacterEncoding`. To change the current encoding you need to close the models, and this closes the Model Advisor.

Tips

The Upgrade Advisor report shows the encoding you need, or you can retrieve the encoding from the model using the command:

```
get_param(modelname,'SavedCharacterEncoding')
```

Use `slCharacterEncoding` to change the encoding. This setting applies to the current MATLAB session, so if you restart MATLAB and want to open the same model, you will need to make the same change to the current encoding again.

For more information see:

- `slCharacterEncoding`
- “Open a Model with Different Character Encoding”
- “Save Models with Different Character Encodings”

Identify unit mismatches in the model

Check ID: `mathworks.design.UnitMismatches`

Identify instances of unit mismatches between ports in the model.

Description

Check for instances of unit mismatches between ports in the model.

Results and Recommended Actions

Condition	Recommended Action
Unit mismatches found	Change one of the mismatched unit settings to match the unit settings for the other port.

See Also

- “Unit Specification in Simulink Models”.

Identify automatic unit conversions in the model

Check ID: `mathworks.design.AutoUnitConversions`

Identify instances of automatic unit conversions in the model.

Description

Identify instances of automatic unit conversions in the model.

Results and Recommended Actions

Condition	Recommended Action
Automatic unit conversions found	Check that the converted units are expected for the model.

See Also

- “Unit Specification in Simulink Models”.

Identify disallowed unit systems in the model

Check ID: `mathworks.design.DisallowedUnitSystems`

Identify instances of disallowed unit systems in the model.

Description

Identify instances of disallowed unit systems in the model.

Results and Recommended Actions

Condition	Recommended Action
Disallowed unit systems found	Either choose a unit that conforms to the configured unit system, or select another unit system. For more information, see “Restricting Unit Systems”.

See Also

- “Unit Specification in Simulink Models”.

Identify undefined units in the model

Check ID: `mathworks.design.UndefinedUnits`

Identify instances of unit specifications, not defined in the unit database, in the model.

Description

Identify instances of unit specifications, not defined in the unit database, in the model.

Results and Recommended Actions

Condition	Recommended Action
Undefined units found	Change the unit to one that Simulink supports.

See Also

- “Unit Specification in Simulink Models”.
- Allowed Units

Check model for block upgrade issues

Check ID: `mathworks.design.Update`

Check for common block upgrade issues.

Description

Check blocks in the model for compatibility issues resulting from using a new version of Simulink software.

Results and Recommended Actions

Condition	Recommended Action
Blocks with compatibility issues found.	Click **Modify** to fix the detected block issues.
Check update status for the Level 2 API S-functions.	Consider replacing Level 1 S-functions with Level 2.

Action Results

Clicking **Modify** replaces blocks from a previous release of Simulink software with the latest versions.

See Also

- “Write Level-2 MATLAB S-Functions”.
- “Consult the Upgrade Advisor”.

- “Model Upgrades”

Check model for block upgrade issues requiring compile time information

Check ID: `mathworks.design.UpdateRequireCompile`

Check for common block upgrade issues.

Description

Check blocks for compatibility issues resulting from upgrading to a new version of Simulink software. Some block upgrades require the collection of information or data when the model is in the compile mode. For this check, the model is set to compiled mode and then checked for upgrades.

Results and Recommended Actions

Condition	Recommended Action
Model contains Lookup Table or Lookup Table (2-D) blocks and some of the blocks specify **Use Input Nearest** or **Use Input Above** for a lookup method.	Replace Lookup Table blocks and Lookup Table (2-D) blocks with n-D Lookup Table blocks. Do not apply **Use Input Nearest** or **Use Input Above** for lookup methods; select another option.
Model contains Lookup Table or Lookup Table (2-D) blocks and some blocks perform multiplication first during interpolation.	Replace Lookup Table blocks and Lookup Table (2-D) blocks with n-D Lookup Table blocks. However, because the n-D Lookup Table block performs division first, this replacement might cause a numerical difference in the result.
Model contains Lookup Table or Lookup Table (2-D) blocks. Some of these blocks specify **Interpolation-Extrapolation** as the **Lookup method** but their input and output are not the same floating-point type.	Replace Lookup Table blocks and Lookup Table (2-D) blocks with n-D Lookup Table blocks. Then change the extrapolation method or the port data types for block replacement.

Condition	Recommended Action
Model contains Unit Delay blocks with **Sample time** set to `-1` that inherit a continuous sample time.	Replace Unit Delay blocks with Memory blocks.

Check Data Store Memory blocks for multitasking

Action Results

Clicking **Modify** replaces blocks from a previous release of Simulink software with the latest versions.

See Also

- n-D Lookup Table
- Unit Delay

Check that the model is saved in SLX format

Check ID: `mathworks.design.UseSLXFile`

Check that the model is saved in SLX format.

Description

Check whether the model is saved in SLX format.

Results and Recommended Actions

Condition	Recommended Action
Model not saved in SLX format	Consider upgrading to the SLX file format to use the latest features in Simulink.

Capabilities and Limitations

You can run this check on your library models.

Tips

Simulink Projects can help you upgrade models to SLX format and preserve file revision history in source control. See “Upgrade Model Files to SLX and Preserve Revision History”.

See Also

- “Save Models in the SLX File Format”

Check model for SB2SL blocks

Check ID: `mathworks.simulink.SB2SL.Check`

Check that the model does not have outdated SB2SL blocks.

Description

Check if the model contains outdated SB2SL blocks.

Results and Recommended Actions

Condition	Recommended Action
Model contains outdated SB2SL blocks	Consider upgrading the model to current SB2SL blocks.

Action Results

Clicking **Update SB2SL Blocks** replaces blocks with the latest versions.

See Also

- “Consult the Upgrade Advisor”.

Check Model History properties

Check ID: `mathworks.design.SLXModelProperties`

Check for edited model history properties

Description

Check models for edited Model History property values that could be used with source control tool keyword substitution. This keyword substitution is incompatible with SLX file format.

In the MDL file format you can configure some model properties to make use of source control tool keyword substitution. If you save your model in SLX format, source control tools cannot perform keyword substitution. Information in the model file from such keyword substitution is cached when you first save the MDL file as SLX, and is not updated again. The Model Properties History pane and Model Info blocks in your model show stale information from then on.

Results and Recommended Actions

Condition	Recommended Action
Edited model history properties	Manually or automatically reset the properties to the default values. Click the button to reset, or to inspect and change these properties manually, open the Model Properties dialog and look in the History pane.

Capabilities and Limitations

You can run this check on your library models.

See Also

- “Consult the Upgrade Advisor”.
- “Model Upgrades”

Identify Model Info blocks that can interact with external source control tools

Check ID: `mathworks.design.ModelInfoKeywordSubstitution`

Use this check to find Model Info blocks that can be altered by external source control tools through keyword substitution.

Description

This check searches for character vectors in the Model Info block enclosed within dollar signs that can be overwritten by an external source control tool. Using third-party source control tool keyword expansion might corrupt your model files when you submit them. Keyword substitution is not available in SLX model file format.

For a more flexible interface to source control tools, use a Simulink project instead of the Model Info block. See “About Source Control with Projects”.

Results and Recommended Actions

Condition	Recommended Action
The Model Info block contains fields like this: `$`*`keyword`*`$`	Review the list of fields in the report, then remove the keyword character vectors from the Model Info block.

See Also

- “Consult the Upgrade Advisor”.
- “About Source Control with Projects”

Identify Model Info blocks that use the Configuration Manager

Check ID: `mathworks.design.ModelInfoConfigurationManager`

Use this check to find Model Info blocks that use the Configuration Manager.

Description

Model Info blocks using the Configuration Manager allow risky keyword substitution using external source control tools. Using third-party source control tool keyword expansion might corrupt your model files when you submit them. Keyword substitution is not available in SLX model file format. The Configuration Manager for the Model Info block will be removed in a future release.

For a more flexible interface to source control tools, use a Simulink project instead of the Model Info block. See “About Source Control with Projects”.

Results and Recommended Actions

Condition	Recommended Action
A Model Info block is using the Configuration Manager.	Click **Remove the Configuration Manager**.

See Also

- “Consult the Upgrade Advisor”.
- “About Source Control with Projects”

Check model for legacy 3DoF or 6DoF blocks

Check ID: `mathworks.design.Aeroblks.CheckDOF`

Lists 3DoF and 6DoF blocks are outdated.

Description

This check searches for 3DoF and 6DoF blocks from library versions prior to 3.13 (R2014a).

Results and Recommended Actions

Condition	Recommended Action
Blocks configured with old versions of 3DoF or 6DoF blocks found.	Click **Replace 3DoF and 6DoF Blocks** to replace the blocks with latest versions.

Action Results

Clicking **Replace 3DoF and 6DoF Blocks** replaces blocks with the latest versions.

See Also

- “Equations of Motion” (Aerospace Blockset)

Check model and local libraries for legacy Aerospace Blockset blocks

Check ID: `mathworks.design.Aeroblks.CheckFG`

Lists blocks configured to use FlightGear versions that are outdated or not supported.

Description

This check searches and lists blocks configured to use FlightGear versions that are outdated or not supported.

Results and Recommended Actions

Condition	Recommended Action
Blocks configured with old versions of FlightGear are found.	Click **Update FlightGear blocks** to change block settings to latest supported version of FlightGear. Then, download latest version of FlightGear that MATLAB supports.

Action Results

Clicking **Update FlightGear blocks** changes block settings to the latest supported version of FlightGear.

See Also

- “Flight Simulator Interfaces” (Aerospace Blockset)

Check model for Aerospace Blockset navigation blocks

Check ID: `mathworks.design.Aeroblks.CheckNAV`

Searches for Three-Axis Inertial Measurement Unit, Three-Axis Gyroscope, and Three-Axis Accelerometer blocks prior to 3.21 (R2018a).

Description

This check searches for Three-Axis Inertial Measurement Unit, Three-Axis Gyroscope, and Three-Axis Accelerometer blocks that have been updated in R2018a.

Results and Recommended Actions

Condition	Recommended Action
Three-Axis Inertial Measurement Unit, Three-Axis Gyroscope, and Three-Axis Accelerometer blocks prior to R2018a.	In R2018a or later, if you did not previously solve for steady state conditions, save the model now. If you previously solved for steady state conditions for the model, solve for these steady state conditions again, and then save the model.

See Also

- Three-Axis Accelerometer
- Three-Axis Gyroscope
- Three-Axis Inertial Measurement Unit

Check and update masked blocks in library to use promoted parameters

Check ID: `mathworks.design.CheckAndUpdateOldMaskedBuiltinBlocks`

Check for libraries that should be updated to use promoted parameters.

Description

This check searches libraries created before R2011b for masked blocks that should be updated to use promoted parameters. Since R2011b, if a block parameter is not promoted, its value in the linked block is locked to its value in the library block. This check excludes blocks of type Subsystem, Model reference, S-Function and M-S-Function.

Results and Recommended Actions

Condition	Recommended Action
Libraries that need to be updated are found	Click **Update**. Once the libraries have been updated, run the check again

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

- "Consult the Upgrade Advisor".
- "Model Upgrades"
- "What Is a Model Advisor Exclusion?" (Simulink Check)

Check and update mask image display commands with unnecessary imread() function calls

Check ID: `mathworks.design.CheckMaskDisplayImageFormat`

Check identifies masks using image display commands with unnecessary calls to the `imread()` function.

Description

This check searches for the mask display commands that make unnecessary calls to the `imread()` function, and updates them with mask display commands that do not call the `imread()` function. Since 2013a, a performance and memory optimization is available for mask images specified using the image path instead of the RGB triple matrix.

Results and Recommended Actions

Condition	Recommended Action
Mask display commands that make unnecessary calls to the `imread()` function are found.	Click **Update**. Once the blocks have been updated, run the check again.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

- “Consult the Upgrade Advisor”.
- “Model Upgrades”
- “What Is a Model Advisor Exclusion?” (Simulink Check)

Check and update mask to affirm icon drawing commands dependency on mask workspace

Check ID: `mathworks.design.CheckMaskRunInitFlag`

Check identifies if the mask icon drawing commands have dependency on the mask workspace.

Description

This check identifies if the mask icon drawing commands have dependency on the mask workspace and updates the `RunInitForIconRedraw` property accordingly. If there is no mask workspace dependency, the value of `RunInitForIconRedraw` is set to `off`, whereas, if there is mask workspace dependency the values is set to `on`.

Setting the values of `RunInitForIconRedraw` to `off` when there is no mask workspace dependency optimizes the performance by not executing the mask initialization code before drawing the block icon.

Results and Recommended Actions

Condition	Recommended Action
Mask drawing commands that are dependent or independent of the mask workspace are found.	Click **Update**. Once the blocks have been updated, run the check again.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

- “Consult the Upgrade Advisor”.
- “Model Upgrades”
- “What Is a Model Advisor Exclusion?” (Simulink Check)

Identify masked blocks that specify tabs in mask dialog using MaskTabNames parameter

Check ID: `mathworks.design.CheckAndUpdateOldMaskTabnames`

This check identifies masked blocks that specify tabs in mask dialog using the `MaskTabNames` parameter.

Description

This check identifies masked blocks that use the `MaskTabNames` parameter to programmatically create tabs in the mask dialog. Since R2013b, dialog controls are used to group parameters in a tab on the mask dialog.

Results and Recommended Actions

Condition	Recommended Action
Masked blocks that use the `MaskTabNames` parameter to create tabs programmatically in the mask dialog are found.	Click **Upgrade** available in the **Action** section. Once the blocks have been updated, run the check again.

Capabilities and Limitations

You can run this check on your library models.

See Also

- “Consult the Upgrade Advisor”.
- “Model Upgrades”

Identify questionable operations for strict single-precision design

Check ID: `mathworks.design.StowawayDoubles`

For a strict single-precision design, this check identifies the blocks that introduce double-precision operations, and non-optimal model settings.

Description

For a strict single-precision design, this check identifies the blocks that introduce double-precision operations, and non-optimal model settings.

Results and Recommended Actions

Condition	Recommended Action
Double-precision floating-point operations found in model.	Verify that: • Block input and output data types are set correctly. • In the Configuration Parameters dialog box, **Default for underspecified data type** is set to `single`.
Model uses a library standard that is not optimal for strict-single designs.	Verify that: • All target-specific math libraries used by the model support single-precision implementations. Set **Configuration Parameters > Standard math library** to `C99 (ISO)`.

Condition	Recommended Action
Logic signals are not implemented as Boolean data.	Verify that: • In the Configuration Parameters dialog box, **Implement logic signals as Boolean data** is selected.

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

See Also

- "Validate a Floating-Point Embedded Model"
- "Consult the Upgrade Advisor".

- "What Is a Model Advisor Exclusion?" (Simulink Check)

Check get_param calls for block CompiledSampleTime

Check ID: `mathworks.design.CallsGetParamCompiledSampleTime`

Use this check to identify MATLAB files in your working environment that contain `get_param` function calls to return the block `CompiledSampleTime` parameter.

Description

For multi-rate blocks (including subsystems), Simulink returns the block compiled sample time as a cell array of the sample rates in the block. The return value is a cell array of pairs of doubles. MATLAB code that accepts this return value only as pairs of doubles can return an error when called with a multi-rate block. Use this check to identify such code in your environment. Modify these instances of code to accept a cell array of pairs of doubles instead.

For example, consider a variable blkTs, which has been assigned the compiled sample time of a multi-rate block.

```
blkTs = get_param(block,'CompiledSampleTime');
```

Here are some examples in which the original code works only if blkTs is a pair of doubles and the block is a single-rate block:

- Example 1

  ```
  if isinf(blkTs(1))
      disp('found constant sample time')
  end
  ```

  Since blkTs is now a cell array, Simulink gives this error message:

  ```
  Undefined function 'isinf' for input arguments of type 'cell'
  ```

  Instead, use this code, for which blkTs can be a cell array or a pair of doubles.

  ```
  if isequal(blkTs, [inf,0])
      disp('found constant sample time')
  end
  ```
- Example 2

  ```
  if all(blkTs == [-1,-1])
      disp('found triggered sample time')
  end
  ```

  For the above example, since blkTs is now a cell array, Simulink gives this error:

  ```
  Undefined function 'eq' for input arguments of type 'cell'
  ```

  Instead, use this code, for which blkTs can be a cell array or a pair of doubles.

  ```
  if isequal(blkTs, [-1,-1])
      disp('found triggered sample time')
  end
  ```
- Example 3

  ```
  if (blkTs(1) == -1)
      disp('found a triggered context')
  end
  ```

  Again, since blkTs is now a cell array, Simulink gives this error:

  ```
  Undefined function 'eq' for input arguments of type 'cell'
  ```

  Instead, use this code.

```
if ~iscell(blkTs)
    blkTs = {blkTs};
end
for idx = 1:length(blkTs)
    thisTs = blkTs{idx};
    if (thisTs(1) == -1)
        disp('found a triggered context')
    end
end
```

The above code checks for a triggered type sample time (triggered or async). In cases in which a block has constant sample time ([inf,0]) in addition to triggered or async or when a block has multiple async rates, this alternative property detects the triggered type sample time.

This check scans MATLAB files in your environment. If the check finds instances of MATLAB code that contain `get_param` calls to output the block compiled sample time, Upgrade Advisor displays these results. It suggests that you modify code that accepts the block compiled sample time from multi-rate blocks.

Results and Recommended Actions

Condition	Recommended Action
No MATLAB files call `get_param(block,CompiledSampleTime)`	None
Some MATLAB files call `get_param(block,CompiledSampleTime)`	If files use the block `CompiledSampleTime` parameter from multi-rate blocks, modify these files to accept the parameter as a cell array of pairs of doubles.

- “Sample Times in Subsystems”
- “Block Compiled Sample Time”

Check model for parameter initialization and tuning issues

Check ID: `mathworks.design.ParameterTuning`

Use this check to identify issues in the model that occur when you initialize parameters or tune them.

Description

This check scans your model for parameter initialization and tuning issues like:

- Rate mismatch between blocks
- Divide by zero issue in conditionally executed subsystems
- Invalid control port value in Index Vector blocks

Results and Recommended Actions

Condition	Recommended Action
The model has rate transition issues.	Select **Automatically handle rate transition for data transfer** in the **Solver** pane of the model configuration parameters.
The model has a divide by zero issue in a conditionally executed subsystem with a control port.	At the command prompt, run `set_param(control_port,'DisallowConstTsAndPrmTs'`
The model has an invalid control port value in a conditionally executed subsystem.	At the command prompt, run `set_param(control_port,'DisallowConstTsAndPrmTs'`

Action Results

Select **Upgrade model** to resolve issues in the model related to parameter initialization and tuning.

See Also

- "Automatic Rate Transition"

Check for virtual bus across model reference boundaries

Check ID: `mathworks.design.CheckVirtualBusAcrossModelReference`

Check virtual bus signals that cross model reference boundaries.

Description

This check identifies root-level Inport and Outport blocks in referenced models and Model blocks with virtual bus outputs that require updates to change to nonvirtual bus signals.

If the check identifies issues, click **Update Model** to convert root-level Inport and Outport blocks configured for virtual buses to use nonvirtual buses in these situations:

- For root-level Inport blocks — Enable the **Output as nonvirtual bus** parameter and insert a Signal Conversion block after the Inport block. The Signal Conversion block is configured to output a virtual bus.
- For root-level Outport blocks — Enable the **Output as nonvirtual bus in parent model** parameter.
- For Model blocks — For ports whose Outport blocks were updated to address issues, insert a Signal Conversion block after the corresponding ports of the Model block. The Signal Conversion block is configured to output a virtual bus.

Recommended Action and Results

To resolve issues, click **Upgrade Model**.

Note Run the **Analyze model hierarchy and continue upgrade sequence** check on the top-level model and then down through the model reference hierarchy.

Clicking **Upgrade Model** converts affected root-level Inport and Outport blocks configured for virtual buses to use nonvirtual buses in models where you:

- Use function prototype control
- Perform C++ code generation with the `I/O arguments step method` option.

  Alternatively, you can change the C++ code generation function specification setting to `Default step method`:

  1. In the **Configuration Parameters** > **Code Generation** > **Interface** pane, click **Configure C++ Class Interface**.
  2. In the dialog box, set the **Function specification** parameter to `Default step method`.
- Use buses that have variable-dimension signals

- Use an associated non-auto storage class for Outport block signals
  - The conversion for non-auto storage class occurs only if you have the target generation license that the model requires. For example, an ERT target requires an Embedded Coder license.
- Use Export-function models where an Outport block is driven by a nonvirtual bus
- Have Model blocks that reference models containing Outport blocks that have been fixed — Clicking **Upgrade Model** updates Model blocks referencing the models that had Outport blocks fixed by the **Analyze model hierarchy and continue upgrade sequence** check.

- “Bus Data Crossing Model Reference Boundaries”

Check model for custom library blocks that rely on frame status of the signal

Check ID: `mathworks.design.DSPFrameUpgrade`

This check identifies custom library blocks in the model that depend on the frame status of the signal.

Description

This check searches for the custom library blocks in a model that depend on the frame status of the signal. The check analyzes the blocks, recommends fixes, and gives reasons for the fixes. You must make the fixes manually.

Results and Recommended Actions

Condition	Recommended Action
The check finds custom library blocks that depend on the frame status of the signal.	Follow the recommendation given by the Upgrade Advisor.

Capabilities and Limitations

You can run this check only on custom library blocks in your model.

You must make the fixes manually.

This check appears only if you have the DSP System Toolbox installed.

See Also

"Frame-based processing" (DSP System Toolbox)

Check model for S-function upgrade issues

Check ID: `'mathworks.design.CheckForSFcnUpgradeIssues'`

Use this check on your model to identify your S-function's upgrade compatibility issues. These issues may include the use of 32-bit APIs, compilation with incompatible options, or use of deprecated separate complex APIs. Some common issues and information related to the fixes are described in results and recommendations section below.

Description

When upgrading your S-functions to use the features in the latest release, this check scans your model to warn against S-function upgrade incompatibility issues. If the result of this check gives a warning or error, fix your C MEX S-functions according to the description.

Results and Recommended Actions

Condition	Recommended Action
Custom-built S-functions are not supported.	Recompile your S-function with available compatible options. See "Custom-built MEX File Not Supported In Current Release" (MATLAB) for more information.
S-function is not compiled with the latest API (`mex -R2018a`).	Recompile using the latest flag (`mex -R2018a`). See "MEX File Is Compiled With Outdated Option" (MATLAB) for more information.
S-function uses 32-bit functions.	Modify your code according to the instructions in "MEX File Calls A 32-bit Function" (MATLAB).

Condition	Recommended Action
S-function is using deprecated separate complex APIs (mexGetPi, mexSetPi, mexGetImagData, mexSetImagData).	Use interleaved complex APIs and recompile your code with the latest flag (`mex -R2018a`). See “Upgrade MEX Files to Use Interleaved Complex API” (MATLAB) for more information.
S-function is using deprecated type-unsafe data API (mxGetData, mexSetData).	Use type-safe data APIs and recompile your code. See “MEX File Calls An Untyped Data Access Function” (MATLAB) for more information.
S-function is compiled with a future release and not supported in current release.	See “MEX File Built In MATLAB Release Not Supported In Current Release” (MATLAB) to recompile your files.

Check Rapid accelerator signal logging

Check ID: `mathworks.design.CheckRapidAcceleratorSignalLogging`

When simulating your model in rapid accelerator mode, use this check to find signals logged in your model that are globally disabled. Rapid accelerator mode supports signal logging. Use this check to enable signal logging globally.

Description

This check scans your model to see if a simulation is in rapid accelerator mode and whether the model contains signals with signal logging. If the check finds an instance and signal logging is globally disabled, an option to turn on signal logging globally appears.

Results and Recommended Actions

Condition	Recommended Action
Simulation mode is not rapid accelerator.	None. You can enable signal logging in rapid accelerator mode.

Condition	Recommended Action
Simulation mode is rapid accelerator. Upgrade Advisor did not find signals with signal logging enabled.	None. The model does not use signal logging. Enable signal logging for signals and globally if you want to log signals.
Simulation mode is rapid accelerator. Upgrade Advisor found signals with signal logging enabled. However, global setting for signal logging was disabled.	Enable signal logging globally if you want to log signals with signal logging enabled.
Signal logging was already globally enabled.	None.

Action Results

Selecting **Modify** enables signal logging globally in your model.

See Also

- “Signal Logging in Rapid Accelerator Mode”
- “Consult the Upgrade Advisor”.

Check virtual bus inputs to blocks

Check ID: `mathworks.design.VirtualBusUsage`

Check bus input signals for a set of blocks.

Description

Check bus input signals for a set of blocks.

Starting in R2015b, virtual bus signal inputs to blocks that require nonbus or nonvirtual bus input can cause an error. Examples of blocks that can specify a bus object as their output data type include a Bus Creator block and a root Inport block. The blocks that cause an error when they have a virtual bus input in this situation are:

- Assignment
- Delay

  The Delay block causes an error only if you use the Block Parameters dialog box to:

  - Set an initial condition that is a MATLAB structure or zero.
  - Specify a value for **State name**.
- Permute Dimension
- Reshape
- Selector
- Unit Delay

  The Unit Delay block causes an error only if you use the Block Parameters dialog box to:

  - Set an initial condition that is a MATLAB structure or zero.
  - Specify a value for **State name**.
- Vector Concatenate

Results and Recommended Actions

Condition	Recommended Action
Virtual bus signal input to these blocks: • Assignment • Delay (if you specify an initial condition from the dialog box that is a MATLAB structure or zero and the value for **State name** is not empty) • Permute Dimension • Reshape • Selector • Unit Delay (if you specify an initial condition that is a MATLAB structure or zero and the value for **State name** is not empty) • Vector Concatenate	In the Upgrade Advisor, click **Modify**. The check inserts a Bus to Vector block to attempt to convert virtual bus input signals to vector signals. For issues that the Upgrade Advisor identifies but cannot fix, modify the model manually. For details, see “Correct Buses Used as Vectors”.

Action Results

Clicking **Modify** inserts a Bus to Vector block at the input ports of blocks.

For many models, running the Upgrade Advisor modifies your model so that bus signals are not treated as vectors. However, for some models you can encounter compatibility issues even after running the check. Modify your model manually to address those issues.

After you compile the model using Upgrade Advisor, the Simulink Editor sometimes indicates that you need to save the model (the model is dirty), even though you did not make changes. To prevent this issue from reoccurring for this model, save the model.

Modeling Pattern	Issue	Solution
Data Store Memory block with **Data Type** set to `Inherit: auto`	A Data Store Memory block whose associated Data Store Read or Data Store Write blocks read or write bus signal data must use a bus object.	In the Data Store Memory block, set the **Data Type** signal attribute to `Bus: <BusObject>`.
Signal Conversion block **Output** parameter matches input bus type	A Signal Conversion block whose **Output** parameter is set to `Nonvirtual bus` requires a virtual bus input. A Signal Conversion block whose **Output** parameter is set to `Virtual bus` requires a nonvirtual bus input.	To create a copy of the input signal, set **Output** to `Signal copy`.
Merge, Switch, or Multiport Switch block with multiple bus inputs	Merge, Switch, or Multiport Switch blocks with multiple bus inputs require those inputs to have the same names and hierarchy.	Reconfigure the model so that the bus inputs have the same names and hierarchy.
Root Inport block outputting a virtual bus and specifying a value for **Port dimensions**	A root Inport block that outputs to a virtual bus must inherit the dimensions.	Set the Inport block **Port dimensions** signal attribute to `1` or `-1 (inherit)`.

Modeling Pattern	Issue	Solution
Mux block with nonvirtual bus inputs	A Mux block cannot accept nonvirtual bus signals.	To treat the output as an array, replace the Mux block with a Vector Concatenate block. If you want a virtual bus output, use a Bus Creator block to combine the signals.
Bus to Vector block without a virtual bus signal input	A nonbus signal does not need a Bus to Vector block.	Remove the Bus to Vector block.
Assignment block with virtual bus inputs	The Upgrade Advisor converts the Assignment block `Y0` port bus input to a vector.	Add a Bus to Vector block before the Assignment block.
S-function using a nonvirtual bus	An S-function that is not a Level-2 C S-function does not support nonvirtual bus signals.	Change the S-function to be a Level-2 C S-function. Consider using an S-Function Builder block to create a Level-2 C S-function.
Stateflow chart with parameterized data type	In a Stateflow chart, you cannot parameterize the data type of an input or output in terms of another input or output if the data type is a bus object.	For the parameterized port, set **Data Type** to `Bus: <object name>`.
Subsystem with bus operations in a Stateflow chart	An Inport block inside a subsystem in a Stateflow chart requires a bus object data type if its signal is a bus.	In the Inport block, set **Data type** to `Bus: <object name>`.
Ground block used as a bus source	The output signal of a Ground block cannot be a source for a bus.	Use a Constant block with **Constant value** set to 0 and the **Output data type** signal attribute set to `Bus: <object name>`.
Root Outport block with a single-element bus object data type	The input to the Outport block must be a bus if it specifies a bus object as its data type.	In the Outport block, set **Data type** to `Inherit: auto`.

Check for root outports with constant sample time

Check ID: `mathworks.design.CheckConstRootOutportWithInterfaceUpgrade`

Use this check to identify root outports with a constant sample time used with an AUTOSAR target, Function Prototype Control, or the model C++ class interface.

Description

Root outports with constant sample time are not supported when using an AUTOSAR target, Function Prototype Control, or the model C++ class interface. Use this check to identify root Outport blocks with this condition and modify the blocks as recommended.

Results and Recommended Actions

Condition	Recommended Action
Root outport with constant sample time used with an AUTOSAR target, Function Prototype Control or the model C++ class interface.	Consider one of the following: • Set the sample time of the block to the fundamental sample time. • Identify the source of the constant sample time and set its sample time to the fundamental sample time. • Place a Rate Transition block with inherited sample time (-1) before the block.

- “Consult the Upgrade Advisor”.

Analyze model hierarchy and continue upgrade sequence

Check ID: `com.mathworks.Simulink.UpgradeAdvisor.UpgradeModelHierarchy`

Check for child models and guide you through upgrade checks.

Description

This check identifies child models of this model, and guides you through upgrade checks to run both non-compile and compile checks. The Advisor provides tools to help with these tasks:

- If the check finds child models, it offers to run the Upgrade Advisor upon each child model in turn and continue the upgrade sequence. If you have a model hierarchy you need to check and update each child model in turn.
- If there are no child models, you still need to continue the check sequence until you have run both non-compile and compile checks.

You must run upgrade checks in this order: first the checks that do not require compile time information and do not trigger an Update Diagram, then the compile checks.

Click **Continue Upgrade Sequence** to run the next checks. If there are child models, this will open the next model. Keep clicking **Continue Upgrade Sequence** until the check passes.

Results and Recommended Actions

Condition	Recommended Action
Child models found	Click **Continue Upgrade Sequence** to run the next checks. If there are child models, this will close the current Upgrade Advisor session, and open Upgrade Advisor for the next model in the hierarchy.

Condition	Recommended Action
No child models, but more checks to run	If there are no child models, click **Continue Upgrade Sequence** to refresh the Upgrade Advisor with compilation checks selected. The compile checks trigger an Update Diagram (marked with ^). Run the next checks and take advised actions. When you return to this check, click **Continue Upgrade Sequence** until this check passes.

Tips

Best practice for upgrading a model hierarchy is to check and upgrade each model starting at the leaf end and working up to the root model.

When you click **Continue Upgrade Sequence**, the Upgrade Advisor opens the leaf model as far inside the hierarchy as it can find. Subsequent steps guide you through upgrading your hierarchy from leaf to root model.

When you open the Upgrade Advisor, the checks that are selected do not require compile time information and do not trigger an Update Diagram. Checks that trigger an Update Diagram are not selected to run by default, and are marked with ^. When you use the Upgrade Advisor on a hierarchy, keep clicking **Continue Upgrade Sequence** to move through this sequence of analysis:

1. The Upgrade Advisor opens each model and library in turn, from leaf to root, and selects the non-compile checks. Run the checks, take any advised actions, then click **Continue Upgrade Sequence** to open the next model and continue.
2. When you reach the root end of the hierarchy, the Upgrade Advisor then opens each model again in the same order (but not libraries) and selects only the checks that require a model compile. Run the checks, take any advised actions, then click **Continue Upgrade Sequence** to open the next model. Continue until you reach the end of the hierarchy and this check passes.

Check Access to Data Stores

Check ID: `mathworks.design.ConflictsForDataStoreReadWriters`

Identify potential execution order sensitivity when reading and writing to data stores.

Description

The execution order of blocks that read and write to the same data store can change the simulation result. When blocks in the same hierarchy access the same data store, the execution order is not deterministic.

Results and Recommended Actions

Condition	Recommended Action
Data Store Memory block accessed by multiple blocks in the same hierarchy.	To enforce execution order for the blocks, consider the following: • Add a data dependency between the blocks. • Set block priority. • Move blocks into separate Function-Call Subsystem blocks and schedule them.

Model Reference Conversion Advisor

Model Reference Conversion Advisor

Check Conversion Input Parameters

Use input parameters to configure the actions the advisor performs and the output it produces.

You can use the default parameters to run the advisor without changing any parameters.

Input Parameter	Description
New model name	The advisor provides a model name that is based on the Subsystem block name and is unique in the MATLAB path. The model name cannot exceed 59 characters. **Tip** If the advisor generates an error indicating that the target referenced model already exists, then use the **New model name** parameter to specify a new file name.
Conversion data file name	The advisor creates a file for storing data created during the conversion. By default, the advisor uses the model name at the beginning of the file name and appending `_conversion_data.mat`. For example, if the subsystem is in a model named `myModel`, the conversion file name is `myModel_conversion_data.mat`. You can save the conversion data in a MAT-file (default) or a MATLAB file. If you use a `.m` file extension, the advisor serializes all variables to a MATLAB file. **Note** If the top model uses a data dictionary, you cannot select this option.
Fix errors automatically	By default, if an advisor check finds any errors and the advisor can fix the error, the advisor provides a **Fix** button that you can click to have the advisor fix the issue. If you enable this parameter, the advisor fixes all conversion errors that it can, without displaying the **Fix** button.

Input Parameter	Description
Replace content of a subsystem with a Model block	By default, the advisor updates the original model by inserting a Model block in the model. The advisor action depends on whether you use the automatic fix options. • If you use the automatic fixes, then the advisor replaces the Subsystem block with a Model block unless the automatic fixes change the input or output ports. If the ports change, then the advisor includes the contents of the subsystem in a Model block that is inserted in the Subsystem block. • If you do not use the automatic fixes, then the advisor replaces the Subsystem block with a Model block. Clear this parameter to have the advisor open a new Simulink Editor window that contains only a Model block that references the newly created referenced model. The advisor does not update the original model in the other Simulink Editor window.

Input Parameter	Description
Check simulation results after conversion	Compare the results of simulating the top model for the referenced model to the results of simulating the baseline model that has the subsystem. To use this option, before performing the conversion, enable signal logging for the subsystem output signals of interest in the model. Set these advisor options: • **Model block simulation mode** — Use the same simulation mode as in the original model. • **Replace content of a subsystem with a Model block** — Enable this option. • **Stop time** — Specify when you want the simulations to end. The default is the stop time of the top model. If the top model stop time is set to `inf`, the advisor stops after 10 seconds. • **Absolute tolerance** — Specify a value if you do not want to use the default of `'1e-06'`. • **Relative tolerance** — Specify a value if you do not want to use the default of `'1e-03'`. To see the results after the conversion is complete, click **View comparison results**. The advisor displays the results of the comparison in the Simulation Data Inspector. For more information, see “Compare Simulation Results Before and After Conversion”.
Stop time	By default, the advisor uses the stop time of the top model, unless the stop time of the top model is `inf`. If the stop time of the top model is `inf`, the advisor uses a default stop time of `10`. You can specify a different stop time. For details, see “Specify Simulation Start and Stop Time”. To use this option, select **Check simulation results after conversion**.

Input Parameter	Description
Absolute tolerance	The absolute signal tolerance for the simulation run comparison. The default is `1e-06`. To use this option, select **Check simulation results after conversion**.
Relative tolerance	The relative signal tolerance for the simulation run comparison. The default is `1e-03`. To use this option, select **Check simulation results after conversion**.
Model block simulation mode	Simulation mode for the new Model block that references the referenced model. • `Normal` (default) • `Accelerator`

After you configure the advisor, to start the conversion checks, click **Run this task**.

11

Performance Advisor Checks

Simulink Performance Advisor Checks

In this section...

Simulink Performance Advisor Check Overview

Use Performance Advisor checks to improve model simulation time.

See Also

"Improve Simulation Performance Using Performance Advisor"

Baseline

Establish a measurement to compare the performance of a simulation after Performance Advisor implements improvements.

See Also

"Create a Performance Advisor Baseline Measurement"

Checks that Require Update Diagram

These checks require that **Update Diagram** occurs in order to run.

See Also

"Improve Simulation Performance Using Performance Advisor"

Checks that Require Simulation to Run

These checks require simulation to run in order to collect sufficient performance data. Performance Advisor reports the results after simulation completes.

See Also

"Improve Simulation Performance Using Performance Advisor"

Check Simulation Modes Settings

These checks evaluate simulation modes (Normal, Accelerator, Rapid Accelerator, Rapid Accelerator with up-to-date check off) and identify the optimal mode to achieve fastest simulation.

See Also

“What Is Acceleration?”

Check Compiler Optimization Settings

Use these checks to select compiler optimization settings for improved performance.

See Also

“Compiler optimization level”

Create baseline

Select this check to create a baseline when Performance Advisor runs. You can also create a baseline manually. A baseline is the measurement of simulation performance before you run checks in Performance Advisor. The baseline includes the time to run the simulation and the simulation results (signals logged). Before you create a baseline for a model, in the **Data Import/Export** pane of the Configuration Parameters dialog box:

- Select the **States** check box.
- Set the **Format** parameter to `Structure with time`.

See Also

“Create a Performance Advisor Baseline Measurement”

Identify resource-intensive diagnostic settings

To improve simulation speed, disable diagnostics where possible. For example, some diagnostics, such as **Solver data inconsistency** or **Array bounds exceeded**, incur run-time overheads during simulations.

See Also

- “Diagnostics”
- “Improve Simulation Performance Using Performance Advisor”

Check optimization settings

To improve simulation speed, enable optimizations where possible. For example, if some optimizations, such as Block Reduction, are disabled, enable these optimizations to improve simulation speed.

You can also trade off compile-time speed for simulation speed by setting the compiler optimization level. Compiler optimizations for accelerations are disabled by default. Enabling them accelerates simulation runs but results in longer build times. The speed and efficiency of the C compiler used for Accelerator and Rapid Accelerator modes also affects the time required in the compile step.

- “Improve Simulation Performance Using Performance Advisor”

Identify inefficient lookup table blocks

To improve simulation speed, use properly configured lookup table blocks.

See Also

- “Lookup Tables”
- “Optimize Generated Code for Lookup Table Blocks”
- “Optimize Breakpoint Spacing in Lookup Tables”
- “Improve Simulation Performance Using Performance Advisor”

Check MATLAB System block simulation mode

In general, to improve simulation speed, choose `Code generation` for the **Simulate using** parameter of the MATLAB System block. Because data exchange between MATLAB and Simulink passes through several software layers, `Interpreted execution` usually slows simulations, particularly if the model needs many data exchanges.

This check identifies which MATLAB System blocks can generate code and changes the **Simulate using** parameter value to `Code generation` where possible.

While `Code generation` does not support all MATLAB functions, the subset of the MATLAB language that it does support is extensive. By using this `Code generation`, you can improve performance.

See Also

- MATLAB System
- “Simulation Modes”
- “Improve Simulation Performance Using Performance Advisor”

Identify Interpreted MATLAB Function blocks

To improve simulation speed, replace Interpreted MATLAB Function blocks with MATLAB Function blocks where possible. Because data exchange between MATLAB and Simulink passes through several software layers, Interpreted MATLAB Function blocks usually slow simulations, particularly if the model needs many data exchanges.

Additionally, because you cannot compile an Interpreted MATLAB Function, an Interpreted MATLAB Function block impedes attempts to use an acceleration mode to speed up simulations.

While MATLAB Function blocks do not support all MATLAB functions, the subset of the MATLAB language that it does support is extensive. By replacing your interpreted MATLAB code with code that uses only this embeddable MATLAB subset, you can improve performance.

See Also

- MATLAB Function
- “Improve Simulation Performance Using Performance Advisor”

Identify simulation target settings

To improve simulation speed, disable simulation target settings where possible. For example, in the Configuration Parameters dialog box, clear the **Simulation Target > Echo expression without semicolons** check box to improve simulation speed.

See Also

- “Model Configuration Parameters: Simulation Target”
- “Improve Simulation Performance Using Performance Advisor”

Check model reference rebuild setting

To improve simulation speed, in the Configuration Parameters dialog box, verify that the **Model Referencing** > **Rebuild** parameter is set to `If any changes in known dependencies detected`.

See Also

- “Rebuild”
- “Improve Simulation Performance Using Performance Advisor”

Identify Scope blocks

Opened and uncommented Scope blocks can impact simulation performance. To improve simulation performance, close and comment out Scope blocks. Right-click a scope block, and then select **Comment Out**.

For opened Scopes, you can improve simulation speed by reducing updates. From the Scope **Simulation** menu, select **Reduce Updates to Improve Performance**.

See Also

- “Improve Simulation Performance Using Performance Advisor”

Identify active instrumentation settings on the model

Identify active instrumentation settings on the model. The fixed-point instrumentation mode controls which objects log minimum, maximum, and overflow data during simulation. Instrumentation is required to collect simulation ranges using the Fixed-Point Tool. These ranges are used to propose data types for the model (requires Fixed-Point Designer). When you are not actively converting your model to fixed point, disable the fixed-point instrumentation to restore the maximum simulation speed to your model.

From the model **Analysis** menu, select **Data Type Design > Fixed-Point Tool**. Under **System under design**, click **Continue**.

In the Model Hierarchy pane, the Fixed-Point Tool denotes systems that currently have instrumentation turned on with `(mmo)`, or `(o)`. Right-click the system in the model hierarchy and, under `Fixed-point instrumentation mode`, select `Use local settings` or `Force off`.

See Also

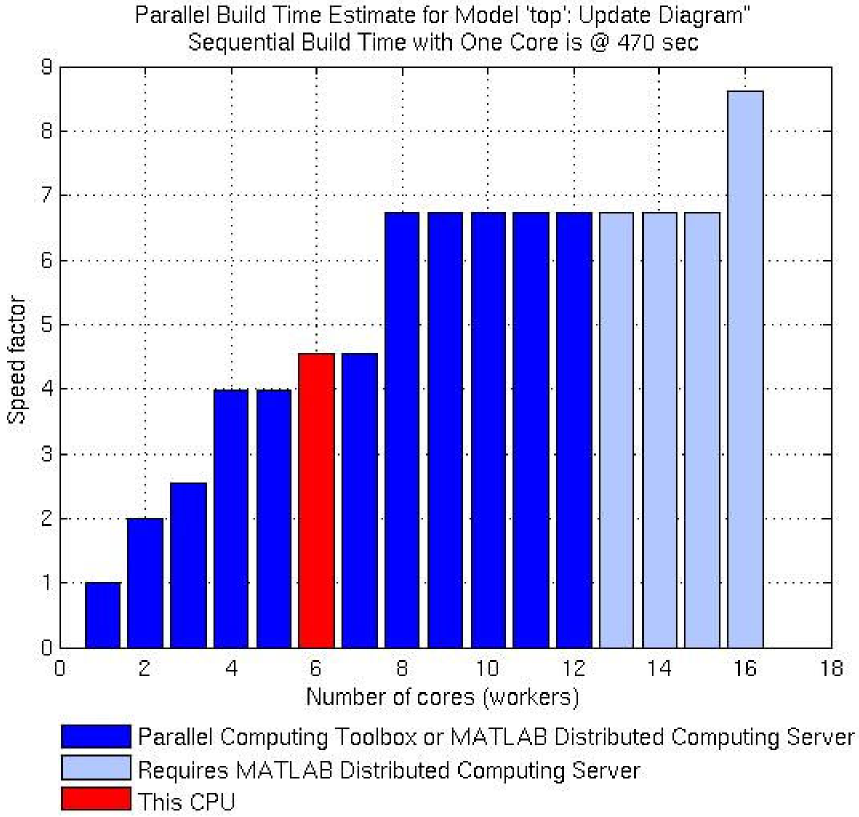
- Fixed-Point Instrumentation and Data Type Override (Fixed-Point Designer)

Check model reference parallel build

To improve simulation, verify the number of referenced models in the model. If there are two or more referenced models, build the model in parallel if possible.

Performance Advisor analyzes the model and estimates the build time on the current computer as if it were using several cores. It also estimates the parallel build time for the model in the same way an estimation would be performed if Parallel Computing Toolbox or MATLAB Distributed Computing Server software were installed on the computer. Performance Advisor performs this estimate as follows:

1. Search the model for referenced models that do not refer to other referenced models.
2. Calculate the average number of blocks in each of the referenced models that do not refer to other referenced models.
3. Of the list of referenced models that do not refer to others, select a referenced model whose number of blocks is closest to the calculated average.
4. Build this model to obtain the build time.
5. Based on the number of blocks and the build time for this referenced model, estimate the build time for all other referenced models.
6. Based on these build times, estimate the parallel build time for the top model.



To calculate the overhead time introduced by the parallel build mechanism, set the Parallel Build Overhead Time Estimation Factor. Performance Advisor calculates the estimated build time with overhead as:

(1 + Parallel Build Overhead Time Estimation Factor)*(Build time on a single machine)

See Also

- “Enable parallel model reference builds”
- “Improve Simulation Performance Using Performance Advisor”

Check Delay block circular buffer setting

To improve simulation, check that each Delay block in the model uses the appropriate buffer type. By default, the block uses an array buffer (the **Use circular buffer for state** option is not selected). However, when the delay length is large, a circular buffer can improve execution speed by keeping the number of copy operations constant.

If the Delay block is currently using an array buffer, and all of the following conditions are true, Performance Advisor selects a circular buffer:

- The Delay block is in sample-based mode, i.e,either the **Input processing** parameter is set to `Elements as channels (sample based)`, or the input signal type is set to `Sample based`.
- The value or upper limit of the delay length is 10 or greater.
- The size of the state—equal to the delay length multiplied by the total of all output signal widths—is 1000 or greater.

See Also

- Delay
- “Improve Simulation Performance Using Performance Advisor”

Check continuous and discrete rate coupling

If your model contains both discrete and continuous rates, the coupling between these rates can slow down simulation. Performance Advisor checks for these conditions in your model.

- The model is using a variable step solver.
- The model contains both continuous and discrete rates.
- The fastest discrete rate is relatively smaller than **Max step size** determined by the solver.

Setting the `DecoupledContinuousIntegration` parameter to `on` might speed up simulation.

See Also

- “Solver Types”

- “Speed Up Simulation”
- “Improve Simulation Performance Using Performance Advisor”

Check zero-crossing impact on continuous integration

If your model contains zero-crossings which do not impact the continuous integration, the simulation might slow down when all the following conditions are satisfied:

- The model uses a variable-step solver.
- The model contains blocks that have continuous states and zero-crossings.
- Some of the zero-crossings do not affect the integration of the continuous states.

Setting the `MinimalZcImpactIntegration` parameter to `On` might speed up simulation.

See Also

- “Speed Up Simulation”
- “Solver Types”
- “Improve Simulation Performance Using Performance Advisor”

Check discrete signals driving derivative port

Run this check if your simulation has many unnecessary resets. A discrete signal driving a block with continuous states triggers a reset at every sample time hit of the block. These resets are computationally expensive. Performance Advisor checks for these signals and blocks and provides a list of the same.

You can edit the model around the discovered discrete signals that drive these blocks to remove such cases. For example, inserting a Zero Order Hold block between the discrete signal and the corresponding block with continuous states might help resolve the issue.

See Also

- “Speed Up Simulation”
- “Modeling Techniques That Improve Performance”

Check solver type selection

To improve simulation, check that the model uses the appropriate solver type.

Explicit vs. Implicit Solvers

Selecting a solver depends on the approximation of the model stiffness at the beginning of the simulation. A stiff system has both slowly and quickly varying continuous dynamics. Implicit solvers are specifically designed for stiff problems, whereas explicit solvers are designed for non-stiff problems. Using non-stiff solvers to solve stiff systems is inefficient and can lead to incorrect results. If a non-stiff solver uses a very small step size to solve your model, check to see if you have a stiff system.

Model	Recommended Solver
Represents a stiff system	ode15s
Does not represent a stiff system	ode45

Performance Advisor uses the heuristic shown in the table to choose between explicit and implicit solvers.

Original Solver	Performance Advisor Action
Variable step solver	Calculates the system stiffness at 0 first. Then: • If the stiffness is greater than 1000, Performance Advisor chooses ode15s. • If the stiffness is less than 1000, Performance Advisor chooses ode45.
Fixed-step continuous solver	• If the stiffness is greater than 1000, Performance Advisor chooses ode14x. • If the stiffness is less than 1000, Performance Advisor chooses ode3.

This heuristic works best if the system stiffness does not vary during simulation. If the system stiffness varies with time, choose the most appropriate solver for that system rather than the one Performance Advisor suggests.

Select simulation mode

To achieve fastest simulation time, use this check to evaluate the following modes and identify the optimal selection:

- Normal
- Accelerator
- Rapid Accelerator
- Rapid Accelerator with up-to-date check off

In Normal mode,Simulink interprets your model during each simulation run. If you change the model frequently, this is generally the preferred mode to use because it requires no separate compilation step. It also offers the most flexibility to make changes to your model.

In Accelerator mode,Simulink compiles a model into a binary shared library or DLL where possible, eliminating the block-to-block overhead of an interpreted simulation in Normal mode. Accelerator mode supports the debugger and profiler, but not runtime diagnostics.

In Rapid Accelerator mode, simulation speeds are fastest but this mode only works with models where C-code is available for all blocks in the model. Also, this mode does not support the debugger or profiler.

When choosing Rapid Accelerator with up-to-date check off, Performance Advisor does not perform an up-to-date check during simulation. You can run the Rapid Accelerator executable repeatedly while tuning parameters without incurring the overhead of up-to-date checks. For instance, if you have a large model or a model that makes extensive use of model reference, this method of execution can increase efficiency.

For models with 3–D signals, Normal or Accelerator modes work best.

Select compiler optimizations on or off

Use this check to determine whether performing compiler optimization can help improve simulation speed. The optimization can only be performed in Accelerator or Rapid Accelerator modes.

Note This check will be skipped if MATLAB is not configured to use an optimizing compiler.

- "How Acceleration Modes Work"
- "Choosing a Simulation Mode"
- "Comparing Performance"
- "Improve Simulation Performance Using Performance Advisor"

Final Validation

This check validates the overall performance improvement of simulation time and accuracy in a model. If the performance is worse than the original model, Performance Advisor discards all changes to the model and loads the original model.

Global settings for validation do not apply to this check. If you have not validated the performance improvement from changes resulting from other checks, use this check to perform a final validation of all changes to a model.

Simulink Limits

Maximum Size Limits of Simulink Models

The following table documents some limits on the size and complexity of Simulink models.

Model Feature	Limit
Maximum number of levels in a block diagram	1024
Maximum number of branches in a line	1024
Maximum length of a parameter name	63
Maximum length of a parameter character vector value	32768
Maximum value of a model window coordinate	32768
Maximum number of bytes of logged simulation data	2^31-1 bytes on 32-bit systems, 2^48-1 bytes on 64-bit systems
Maximum number of bytes for the total block I/O buffer length in a model	2^31-1 bytes on 32-bit systems and on 64-bit systems
Maximum length of integer and fixed-point data types	128 bits
Maximum length of string data type	32,766 characters

Simulink Terminology

Simulink Terminology and Definitions

Systems and Models

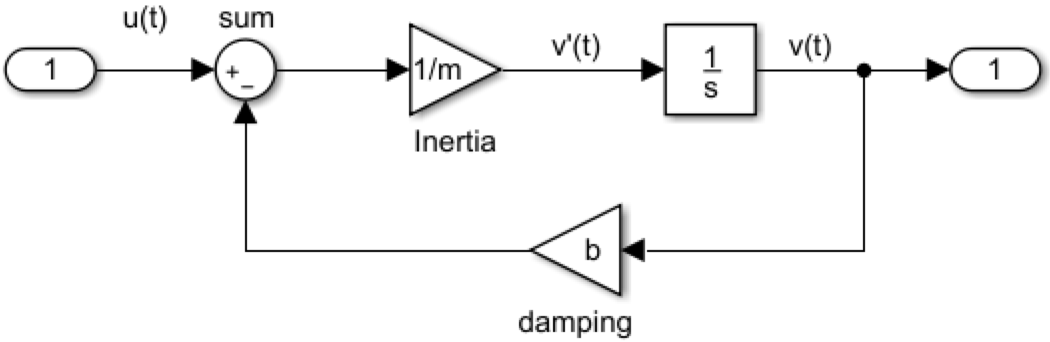
system, physical system – Physical object or process with observable and measurable characteristics that change over time. For example, a vehicle is a *system* with multiple *system components*

system component – Physical or functional part of a *system* that interacts with the other parts. The interactions define the structure and behavior of the *system*. For example, a cruise control module is a *system component* in a vehicle *system*.

Model, System Model, Dynamic System Model – Mathematical description of a *system* derived either from physical laws or experimental data. The description typically uses differential and difference equations.

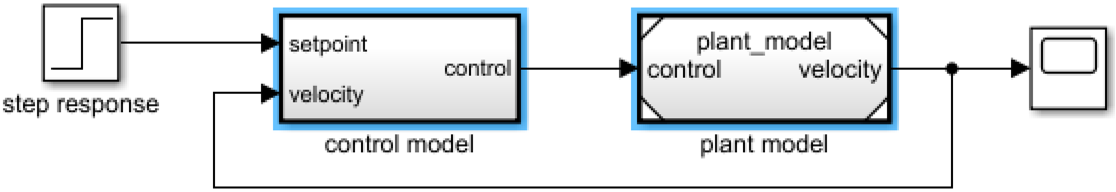
In the following example for a vehicle, u(t) is the force (N) moving the vehicle forward, v(t) is the velocity (m/s), b is a damping coefficient (N·s/m), and m the mass of the vehicle (kg).

Simulink uses block diagrams to visually implement the mathematics of a *model*.



model component – Part of a *model* that interacts with the other parts through an interface of inputs and outputs.

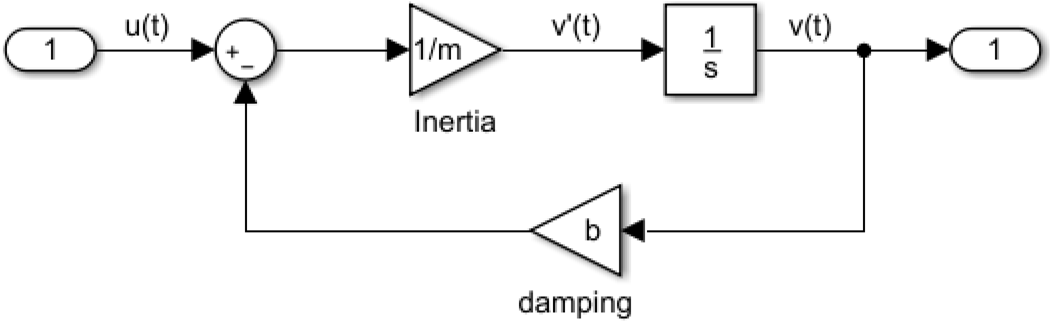
Simulink implements *model components* using Subsystem blocks and Model blocks that refer to other Simulink models. In the following example, **control model** is a Subsystem block and **plant model** is a Model block that references the file `plant_model.slx`.



differential equation (DE) – Mathematical equation containing derivatives of a variable. For continuous systems, differential equations describe the rate of change for variables with the equations defined for all values of time. For example, the velocity of a vehicle `v(t)` is defined with the following first order differential equation.

```
mv'(t) + bv(t) = u(t)
```

`u(t)` is the force moving the vehicle, `m` is mass, `b` is a damping coefficient, and the derivative `v'(t)` is acceleration. The following model implements the differential equation.

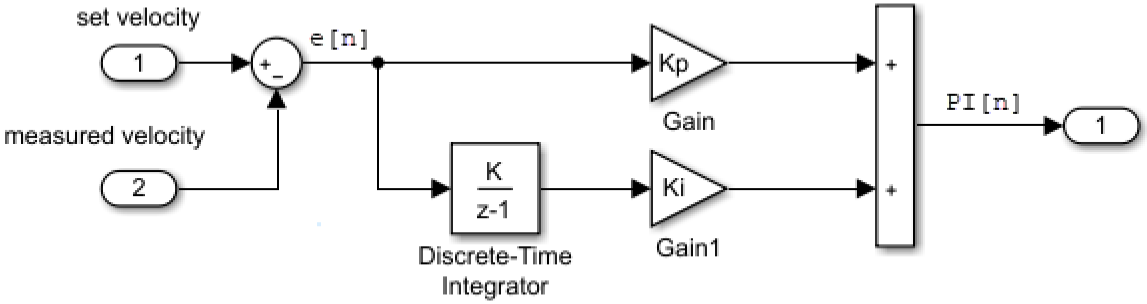


difference equation – Mathematical equation containing terms with present and past values. For discrete systems, difference equations describe the rate of change for variables defined only at specific times. For example, the control signal for a simple discrete PI (proportional–integral) controller is defined with the following difference equation.

```
PI[n] = e[n]Kp + (e[n]+e[n-1])Ki
```

`e[n]` is the error between the control signal and the set point value, `Kp` is the proportion constant while `Ki` is the integration constant, and `n` is the time step.

The following Simulink model implements the difference equation.



algebraic equation – Mathematical equation that is the sum of powers for one or more variables.

differential algebraic equations (DAE) – Set of differential and algebraic equations with a least one dependent variable that is not defined with a differential equation. Typically, an algebraic equation defines a variable constraint in the system model.

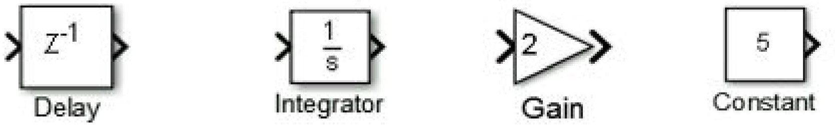
$$A' = -0.04A + 1 \cdot 10^4 BC$$

$$B' = 0.04A - 1 \cdot 10^4 BC - 3 \cdot 10^7 B^2$$

$$C = 1 - A - B$$

Simulink Models

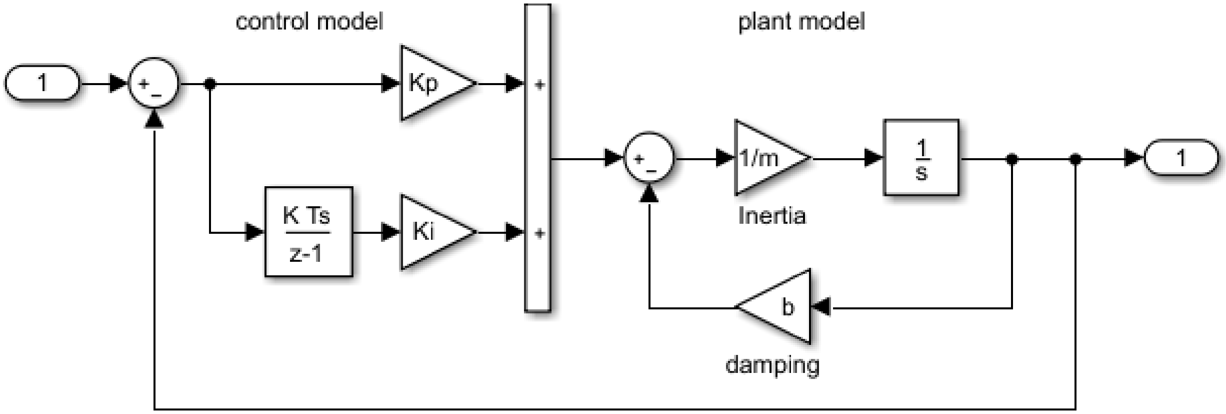
block, **model block**, **library block** – Basic modeling construct of Simulink. Some blocks have input signals, output signals, and state. Most blocks have parameters that specify block behavior. A library block is a block prototype while a model block is an instance of the library block.



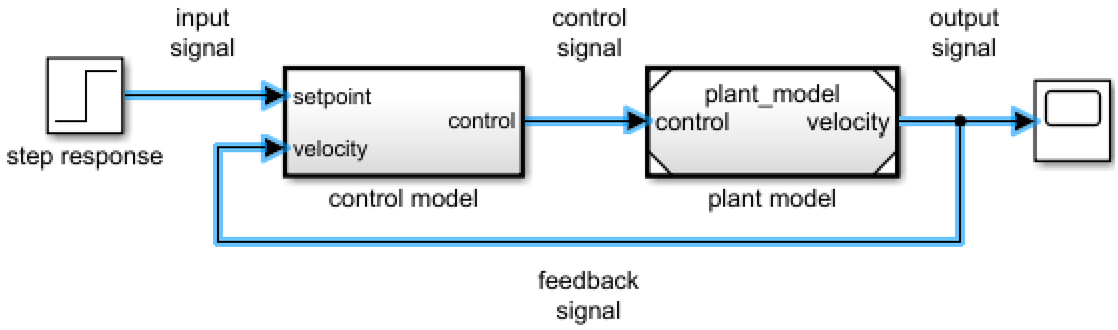
Each block represents a system of equations for the Simulink engine. The blocks show above have the following block equations.

$$\begin{cases} x[n+1] = u[n] \\ y[n] = x[n] \end{cases} \quad \begin{cases} \dfrac{dx}{dt} = u(t) \\ y(t) = x(t) \end{cases} \quad y(t) = 2 * x(t) \quad y(t) = 5$$

block diagram – Visual representation of a dynamic system model. Blocks are the variables and coefficients from the model equations while lines are the relationships between blocks.

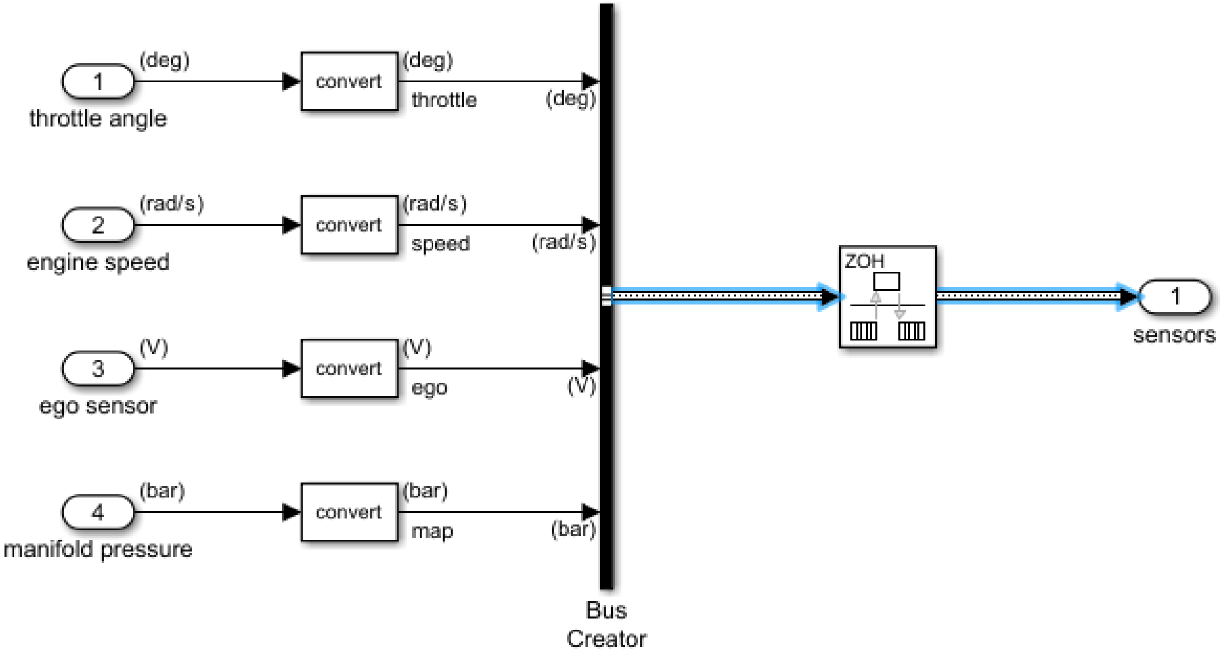


signal – Calculated output from a simulation that transfers data from one block to another block. Signals appear in a model as lines that connect the outputs of blocks to the inputs of other blocks. You can specify signal attributes, including signal name, data type, and dimension.



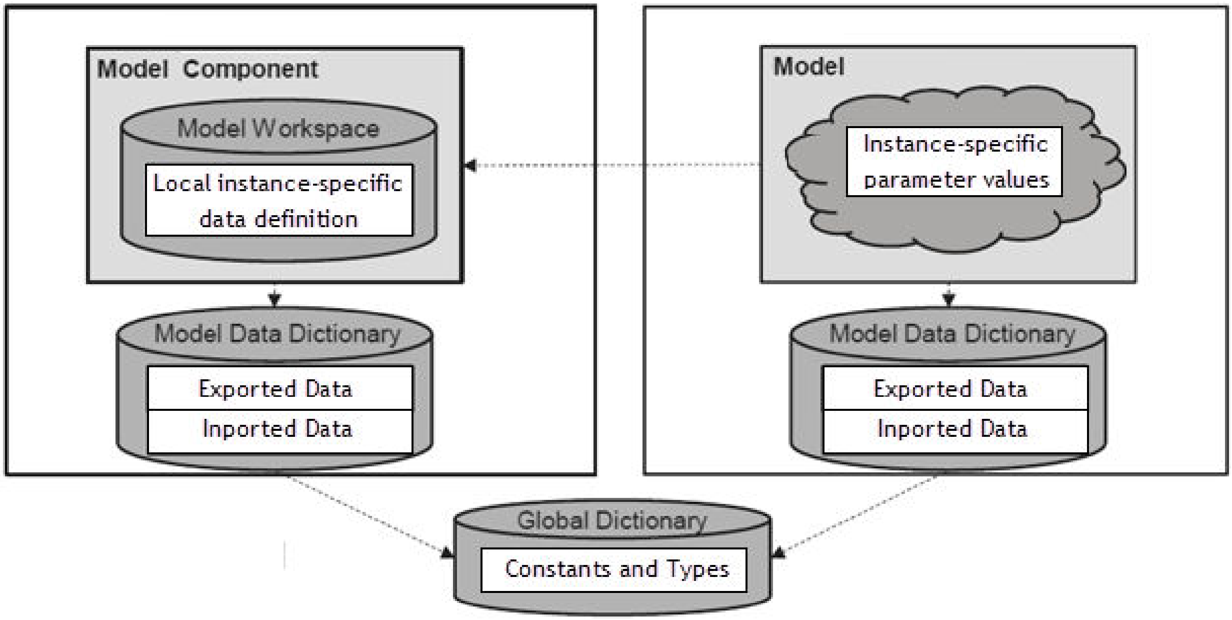
bus, **composit signal** – Group of signals used to manager and reduce visual complexity in a block diagram. Access the bus as a whole or select specific signals from the bus.

In the following model, individual sensor signals are combined into one bus signal.



data – Values for signals, block states, parameters, and other data a model needs to simulate and produce outputs from a simulation.

Simulink organizes model data into categories such as root-level I/O, global parameters, local parameters, and exported data.



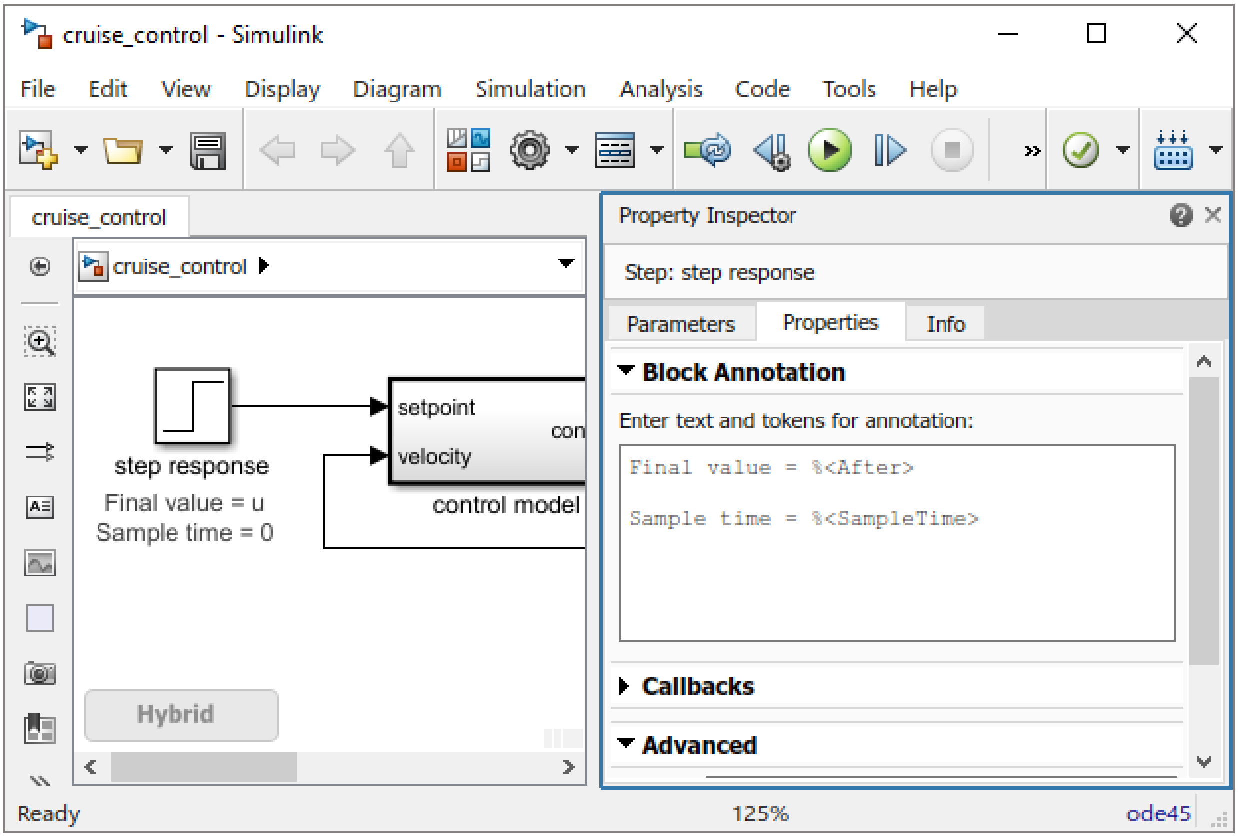
parameter – Name and value of a Simulink model characteristic:

- Model parameters – Control model behavior during compilation, simulation, and code generation. To set model parameters using the Configuration Parameters dialog box, select **Simulation > Model Configuration Parameters**.
- Block parameters – Define model dynamics and mathematics. Set block parameters using the Block Parameters dialog box or the Property Inspector.

property – Model and block characteristics that include:

- Block Annotation – Values of selected block parameters displayed below the block.
- Callbacks – Commands that execute when a specific model or block event occurs.
- Tags – Block identifiers that are programmatically searchable .

To set properties, select **View > Property Inspection**, and then select the **Properties** tab.



Step: step response

Enter text and tokens for annotation:

```
Final value = %<After>

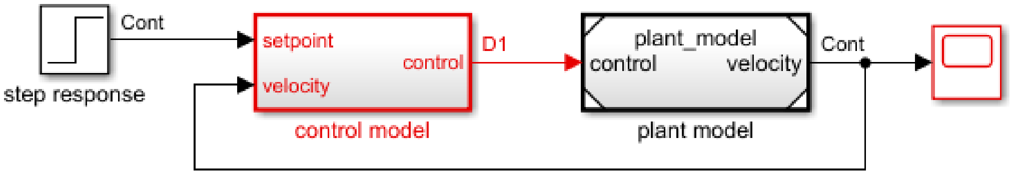
Sample time = %<SampleTime>
```

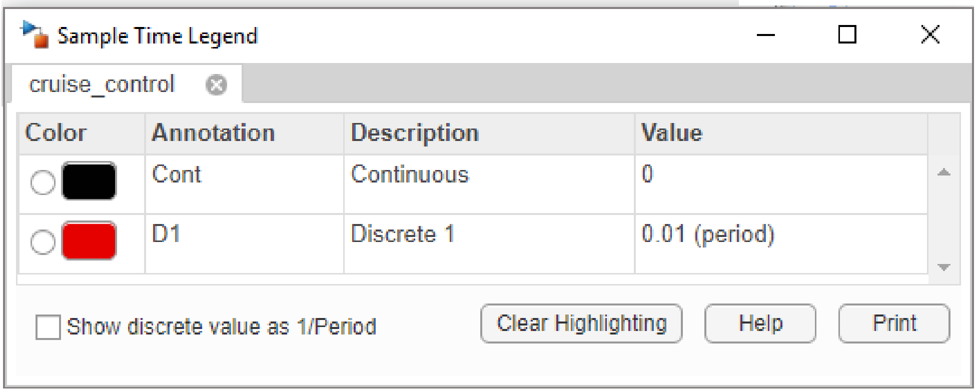
Final value = u
Sample time = 0

sample time – Time interval that defined the rate (1 / sample time) for calling the block methods to produce outputs and update internal state. Sample time is specified as:

- `-1` – Simulink determines the sample time.
- `0` – Continuous rate where blocks run at variable times based on solver settings. Blocks with continuous state, always have a sample time of `0`.
- Positive non-zero number – Discrete rate where blocks run at times that are multiples of their sample time.

In the following model, the controller runs at a discrete rate of `0.01` seconds while the plant was determined by Simulink to have a continuous sample time.



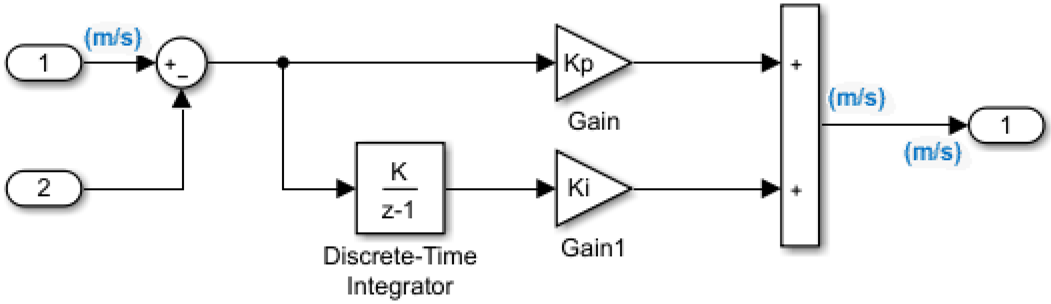


Color	Annotation	Description	Value
○ ⬛	Cont	Continuous	0
○ 🟥	D1	Discrete 1	0.01 (period)

□ Show discrete value as 1/Period

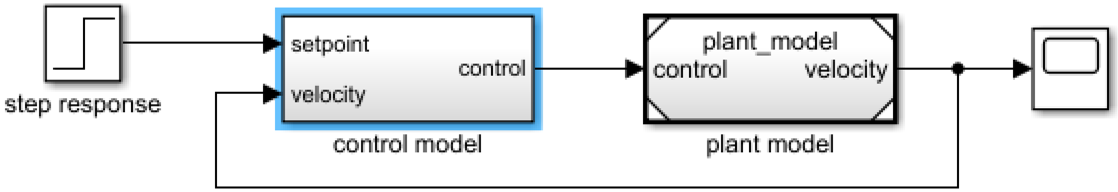
unit – Agreed upon amount of a quantity used to measure the total amount of a quantity.

Simulink *units* are specified as a Inport block or Outport block parameter at the boundaries of a Simulink *model component*. Simulink *model components* include Subsystem blocks, Model blocks, Stateflow charts, and Simulink to Simscape converter blocks. To display units on a model, select **Display** > **Signals & Ports** > **Port Units**.



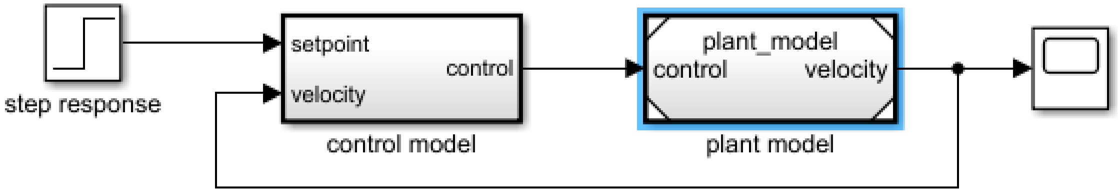
Subsystem block – Simulink block that groups together blocks that execute together as a unit (atomic subsystem) or execute separately within a *sorted order* (virtual subsystem).

In the following model, the control model is an atomic Subsystem block containing blocks that model a PI controller.



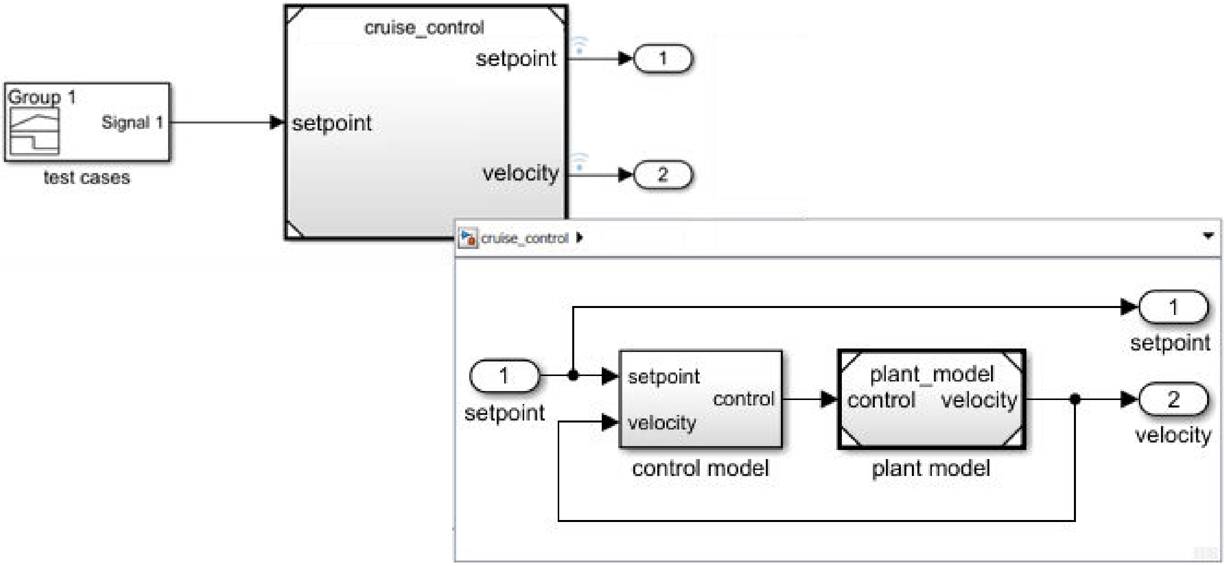
Model block, referenced model -- Child model included in a parent model using a Model block. For Simulation, blocks within a referenced model execute together as a unit.

In the following example, the plant model is saved in the file `plant_model.slx`, and then it is added to the `cruise_control` model using a Model block.



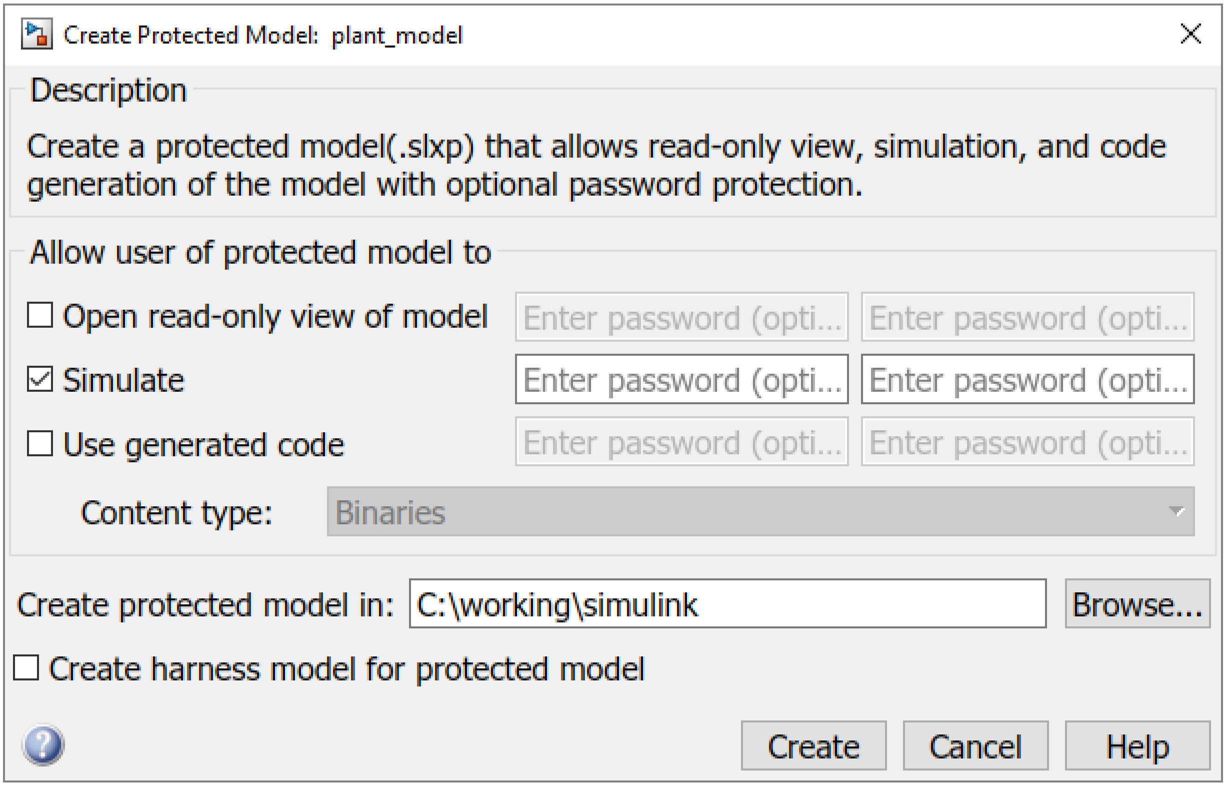
test-harness, test model – Simulink model that provides a framework for testing the simulation behavior and outputs of another model or model component. Objectives of the test-harness are to automate the testing process, execute a test suite with multiple test cases, and save results.

In the following model, a Signal Builder block provides test signals while outputs are logged for analysis in Simulation Data Inspector or MATLAB.



protected model - Simulink referenced model that cannot be edited and possibly hides the block diagram. A protected model provides the ability to deliver a model for simulation and code generation in a larger system model without revealing intellectual property.

To protect a referenced model, right-click a Model block, select **Subsystem & Model Reference > Create Protected Model for Selected Model Block**. Select the allowed model actions with optional passwords.



Create Protected Model: plant_model

Description

Create a protected model(.slxp) that allows read-only view, simulation, and code generation of the model with optional password protection.

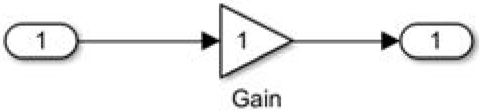
Create protected model in: C:\working\simulink

□ Create harness model for protected model

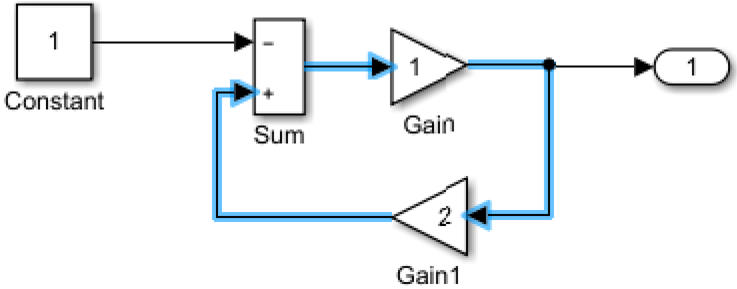
direct feedthrough – Simulink block characteristic where the output port signal of a block is computed from the values of its input port signals. The output signal value is a function of the input signal values.

Blocks with direct feedthrough include the Gain, Product, Sum, Transfer Fcn, State-Space, and Math Function blocks.

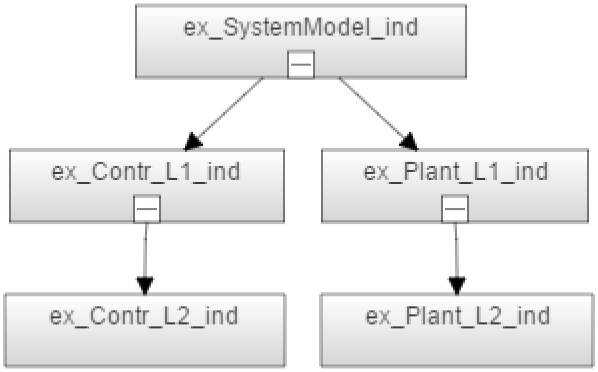


algebraic loop – *Signal* loop between blocks with *direct feedthrough*. An algebraic loop generally occurs when an input port of a block with *direct feedthrough* is driven directly by the output port of the same block or indirectly through other blocks with *direct feedthrough*.

In the following model, the two Gain blocks with *direct feedthrough* create an *algebraic loop*.



model dependencies – Files a Simulink model needs to run a simulation. Files include referenced models, data files, and S-function files. Use the *Model Dependency Viewer* to identify dependent model files.



Simulink Tools

Simulink Processes

compilation – Simulink process where the block diagram is translated to an internal representation that interacts with the Simulink engine. The model-level set of equations are composed from the block-level equations.

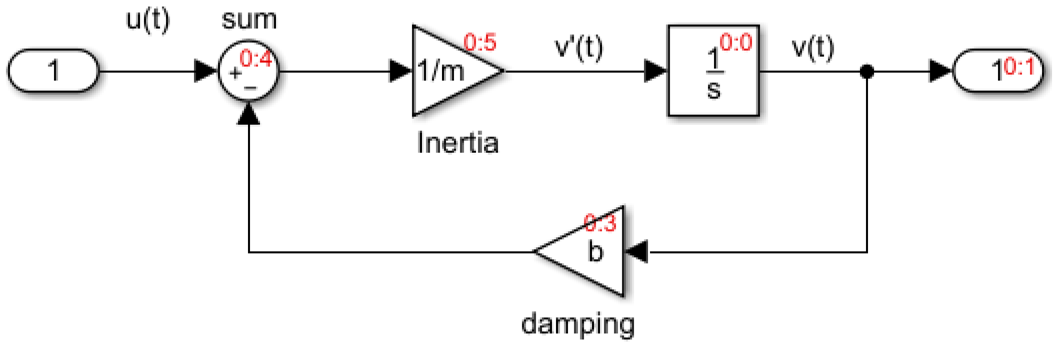
$$\begin{cases} X = [x_c, x_d] & \text{Model states} \\ \dot{x}_c = f_c(X, U, t) & \text{Derivative method} \\ x_d[n+1] = f_d(X, U, t) & \text{Update method} \\ Y = [y_1, y_2] & \\ Y = g(X, U, t) & \text{Output method} \end{cases}$$

$$X(t_0) = X_0 \qquad \text{Initial model states}$$

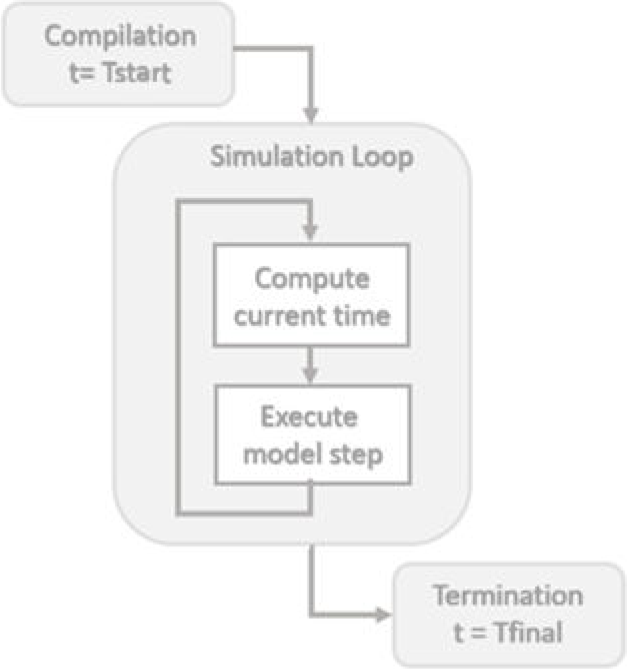
There are no model-level equations that contain terms for the blocks. Instead, model-level equations correspond to calling the methods on each block individually and in a specific order. This is equivalent to having a model-level system of equations.

sorted order – Order in which block output methods are called after evaluating direct feedthrough of each input port. To display sorted order, select **Display** > **Blocks** > **Sorted Execution Order**.

In the following model, the Integrator block output runs first, and then the loop of blocks connected to the Integrator block input.

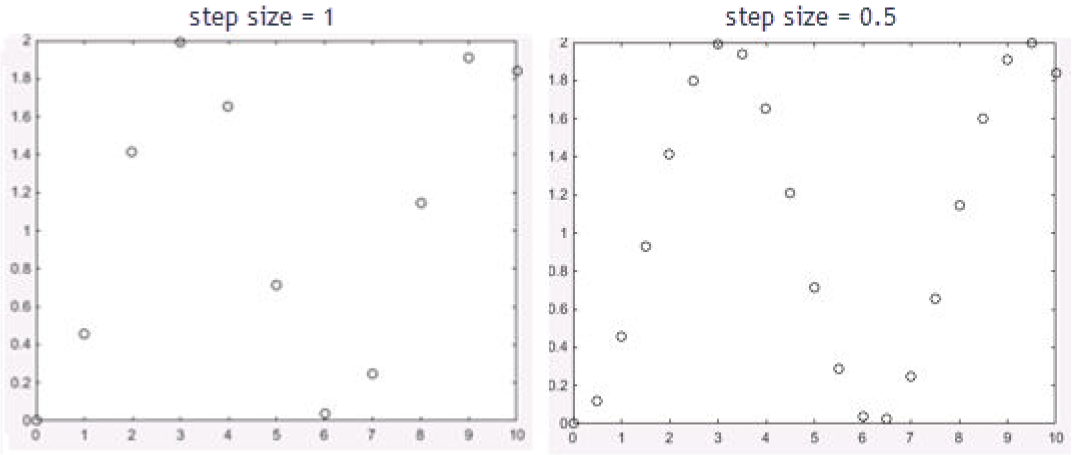


simulation – Simulink process after model *compilation* where block outputs and states are computed at successive time steps over a specified time range. During each simulation loop, Simulink calculates a `Δt` to determine the current time step `t(k+1) = t(k) + Δt`. At the end of a simulation, results are given as vectors `[t, X, Y]` for time, state and output at each time step.



solver, **numerical solver** – Algorithm that interprets the graphical model for a dynamic system to construct the underlying equations, and then solves the equations numerically. Types of solver:

- Fixed step – Time step `T(k+1) = T(k) + Δt` where `Δt` is constant. If step size is too large, simulation results can have a large error.



- Variable step – Time step `T(k+1) = T(k) + t`Δ_k were `t`Δ_k changes from one simulation step to the next. Variable step solvers iterate to reach a solution based on an error tolerance.

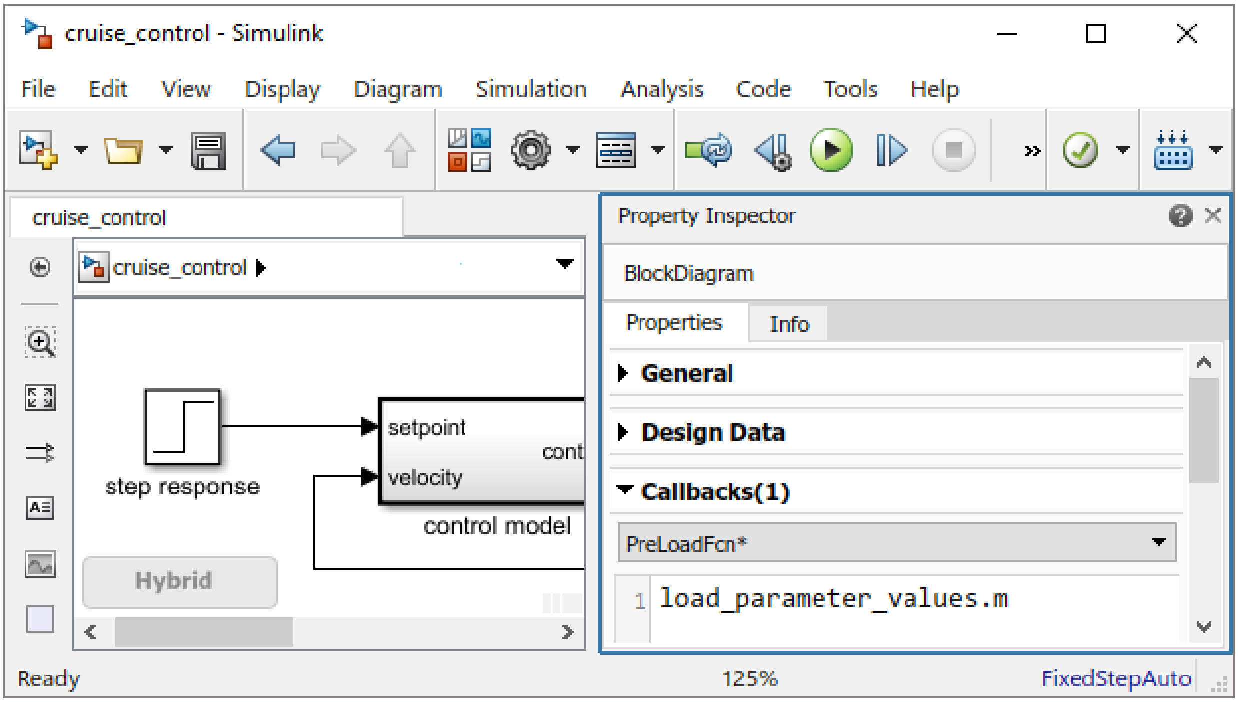
Programming Constructs in Simulink

Simulink command – MATLAB command that is specific to Simulinkmodeling or simulation. Enter Simulink commands in the MATLAB Command Window or use in MATLAB scripts for testing a model programmatically. The following commands set simulation parameters, run a simulation, and saves the simulation results. In the first statement, `sim` is a *Simulink command* for running a simulation.

```
simOut = sim('cruise_control','SimulationMode','normal',...
             'AbsTol','1e-5','SaveState','on',...
             'StateSaveName','xout','SaveOutput','on',...
             'OutputSaveName','yout','SaveFormat', 'Dataset');
outputs = simOut.get('yout')
```

callback, **model callback** – MATLAB® code that executes in response to a specific model or block action. To add a model callback, select **View** > **Property Inspector**, select the **Properties** tab, select a function from the **Callbacks** list, and then enter MATLAB code or the name of a MATALB script.

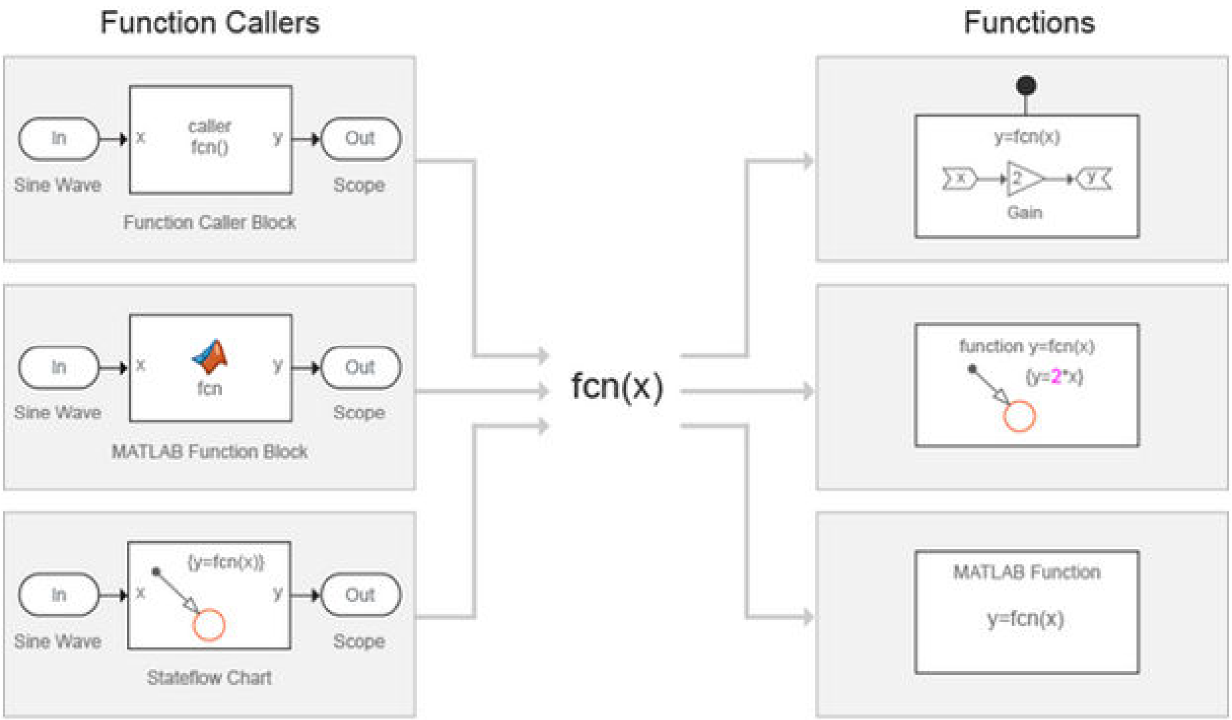
In the following example, when Simulink loads a model it also loads a file into the MATLAB workspace with parameters values for the model.



PreLoadFcn*

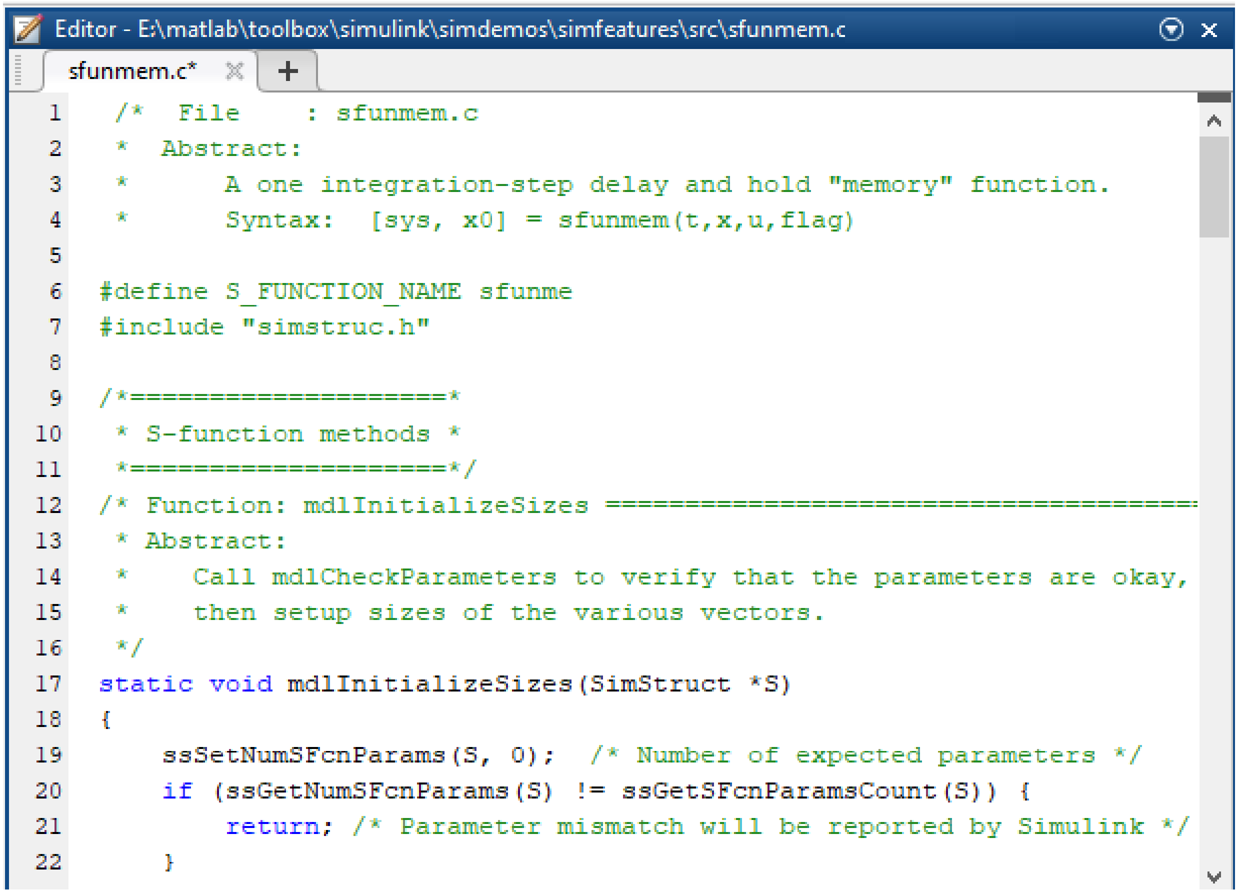
```
load_parameter_values.m
```

Simulink function – Computational unit that calculates a set of outputs when provided with a set of inputs. A common text interface between function caller and function definition allows various definition formats using a Simulink Function block, exported Stateflow graphical function, or exported Stateflow MATLAB function.



MATLAB Function –

S-function, **system-function** – Computer language description of a Simulink S-Function block written in MATLAB code, C, C++, or Fortran. C, C++, and Fortran S-functions are compiled as MEX files using the MATLAB `mex` utility.



Editor - E:\matlab\toolbox\simulink\simdemos\simfeatures\src\sfunmem.c
sfunmem.c*
+

```
 /*  File    : sfunmem.c

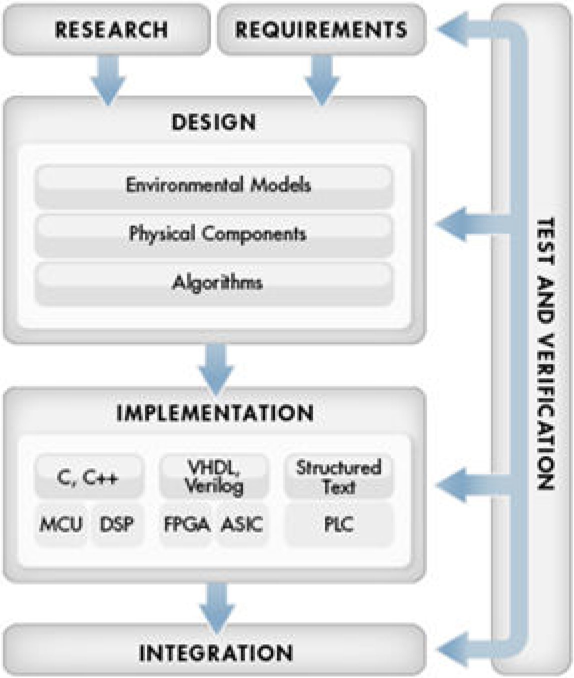
 *    Call mdlCheckParameters to verify that the parameters are okay,
 *    then setup sizes of the various vectors.
 */
static void mdlInitializeSizes(SimStruct *S)
{
    ssSetNumSFcnParams(S, 0);  /* Number of expected parameters */
    if (ssGetNumSFcnParams(S) != ssGetSFcnParamsCount(S)) {
        return; /* Parameter mismatch will be reported by Simulink */
    }
```

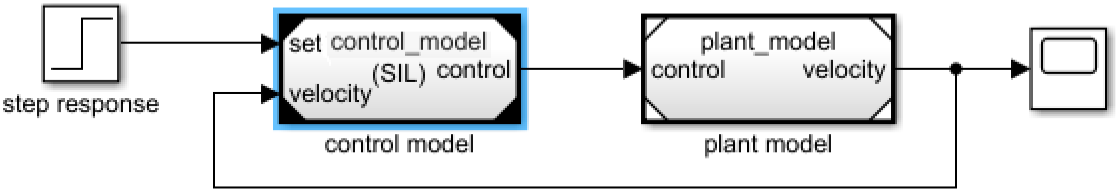
Model Development Processes

model-based design – Development process that uses a system model as an executable specification throughout development. The process supports model and model component design, model simulation of dynamic behavior, code generation from the model, and continuous test and verification.



software-in-the-loop (SIL) simulation – Development process where compiled source code on a development computer executes as a separate process from the rest of the Simulink model. Typical goals include initial source code testing and verification by comparing software-in-the-loop results with model simulation results or system requirements.

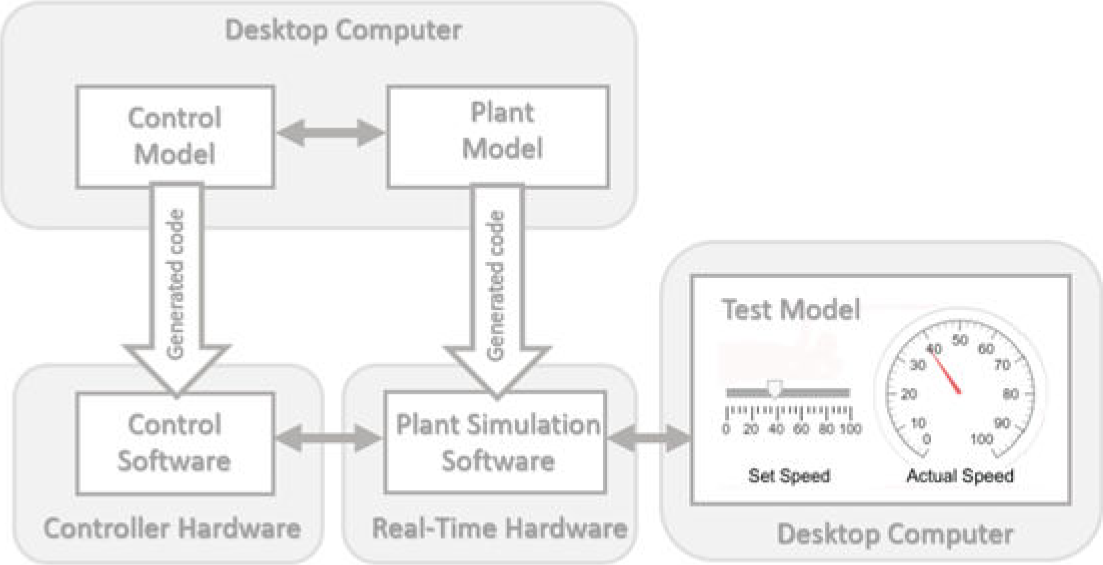
To run a software-in-the-loop simulation, right-click a Model block and select **Block parameters**. From the **Simulation mode** list, select `Software-in-the-loop (SIL)`.



processor-in-the-loop (PIL) simulation – Development process that cross-compiles source code and runs the resulting object code on a target processor using hardware-specific data attributes and sample time attributes. Typical goals include object code verification by comparing processor-in-the-loop results with model simulation or *software-in-the-loop (SIL)* results. Also, collect execution time profiling data.

hardware-in-the-loop (HIL) simulation – Simulation process that pairs physical components, such as the hardware and software for a controller, with a virtual real-time implementation of a physical component, such as a plant.

In the following example, code for the controller model is generated and downloaded to the production controller hardware. Code is generated for the plant model and downloaded to a real-time hardware computer (e.g. Simulink Realtime).



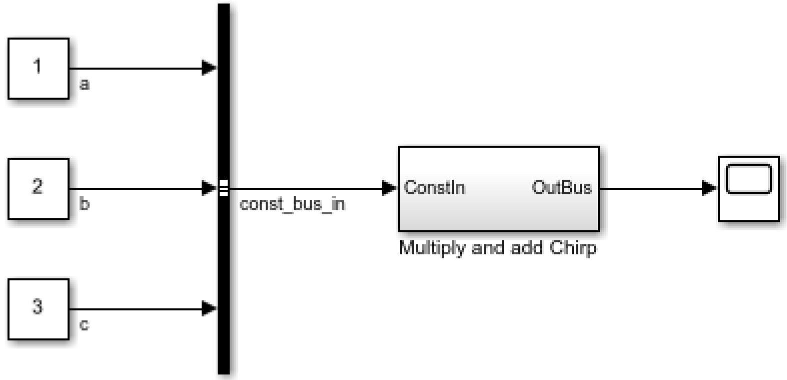
Block Reference Page Examples

Create Bus Ports in a Subsystem

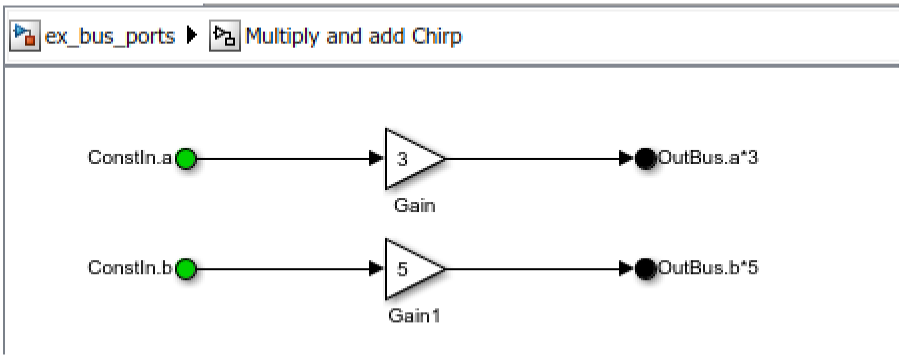
This example shows adding In Bus Element and Out Bus Element blocks to create bus element ports in a subsystem for selecting signals from an input bus and creating an output bus signal.

Model Structure

Open the model. The top model has three constant signals combined into a bus that feeds a subsystem input port and outputs a bus signal to a Scope block.

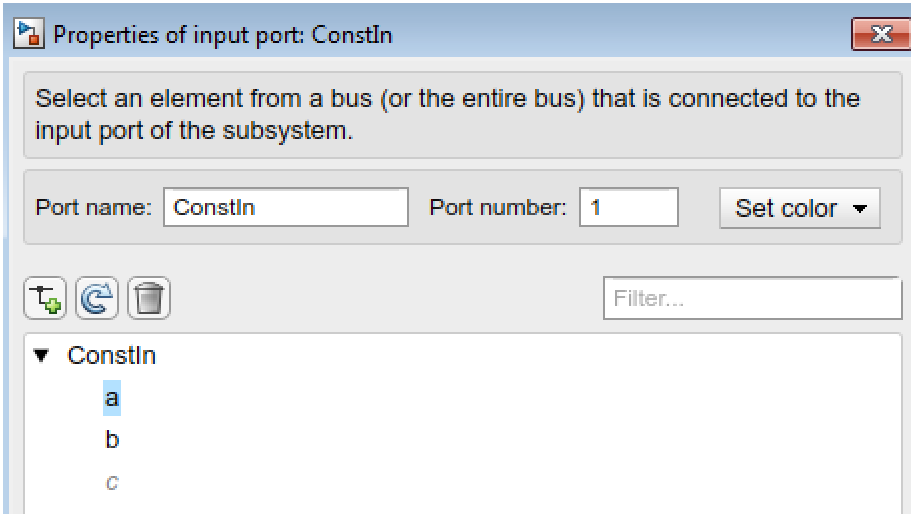


The subsystem includes two In Bus Element and Out Bus Element blocks.



Set the Port Name and Color for an In Bus Element Block

Open the Block Parameters dialog box for the ConstIn.a block. The Port name parameter is set to `ConstIn`, which changes the subsystem input port name from the default InBus. This block selects the `a` signal. The block color is set to green instead of the default black.



Properties of input port: ConstIn

Select an element from a bus (or the entire bus) that is connected to the input port of the subsystem.

Port name: ConstIn   Port number: 1   Set color ▾

Filter...

▼ ConstIn
- a
- b
- c

The In Bus Element block feeds a Gain block, and the Gain block connects to an Out Bus Element block that includes an `a*3` signal in the output bus signal.

Create an In Bus Element Block and an Out Bus Element Block

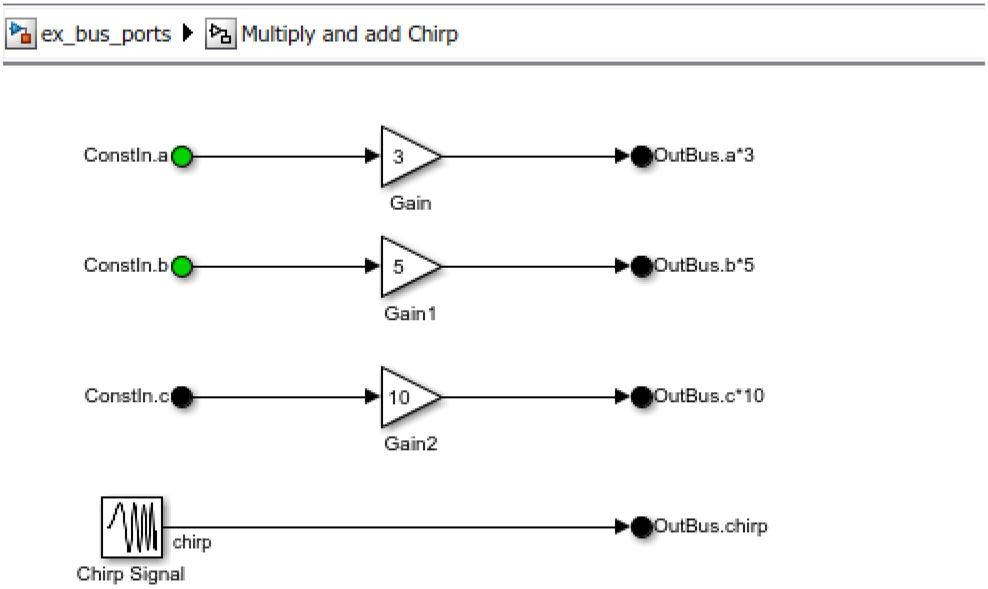
Create a third In Bus Element block for the `c` signal. In the Simulink Editor, right-click and drag the ConstIn.b block to make a copy of the block. Specify to use the existing port. Edit the block icon text to say `ConstIn.c`. Select the block and override the green block color by specifying black. Feed the output of the In Bus Element block to a third Gain block and set the gain to 10.

Copy the OutBus.b*5 block to create another Out Bus Element block, specifying to use the same port. Connect the Gain block to the Out Bus Element block that uses the same port. Connect the Gain block output signal to the Out Bus Element block and edit the icon text to say `OutBus.c*10`.

Add a Chirp Block and Include Its Output Signal in the Bus Output Signal

Add a Chirp Signal block and connect it to a new Out Bus Element block that uses the same port as the other Out Bus Element blocks (OutBus). Open the Out Bus Element dialog box, double-click the selected signal, and change the signal name to chirp.

The virtual bus signal that the subsystem outputs contains the output signals of the three Gain blocks and the Chirp block.

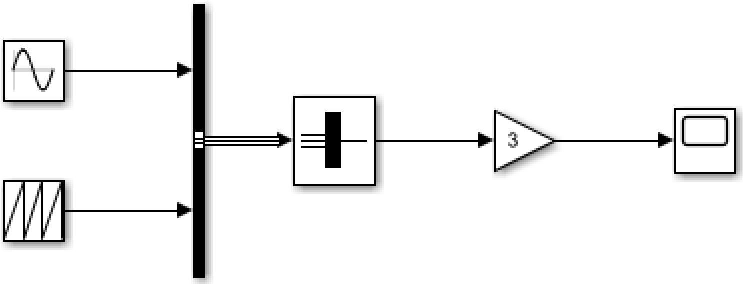


Convert Bus Signal to a Vector

This example shows how to use a Bus to Vector block to convert a bus signal to a vector, to provide a signal that the Gain block can accept.

Open a Simulink® model and simulate it.

```
model = fullfile(matlabroot,'examples','simulink','ex_bus_to_mux_ok');
open_system(model);
sim(model)
```

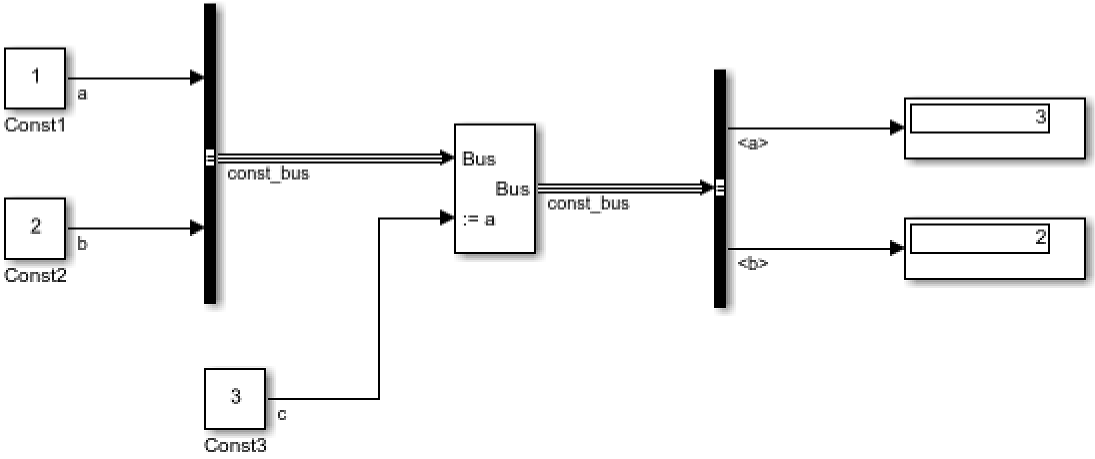


The Gain block cannot accept a bus signal. Inserting a Bus to Vector block provides the type of input signal (a vector) that the Gain block can accept. The Bus to Vector block has no user-accessible parameters.

Assign Signal Values to a Bus

This example shows how to use a Bus Assignment block to change a bus element value without adding Bus Selector and Bus Creator blocks to select bus elements and reassemble them into a bus.

Open the model and simulate it.



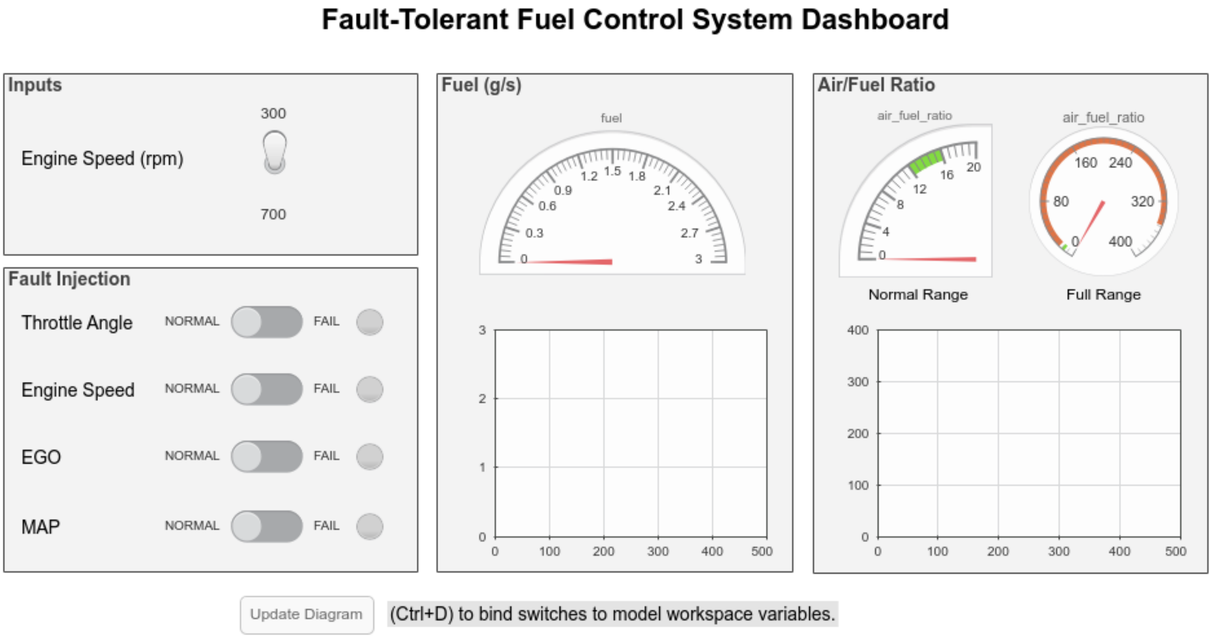
Initially, the value of signal a is 1. However, the Bus Assignment block replaces that initial value of signal a with the value of signal c, which is 3. The const_bus output signal has a value of 3 for signal a, as the Display block shows.

Initialize Your Model Using the Callback Button Block

This example shows how to use the Callback Button block to perform initialization routines on your model.

Explore the Model

The example model builds on the `sldemo_fuelsys` featured model. When you open the model, to bind the workspace variables to their Dashboard blocks, you have to update the model diagram. Here, the Callback Button block at the bottom of the Dashboard subsystem in the model has been configured to update the diagram on the release of the mouse button when you click the block.



You do not need to start a simulation for the Callback Button to react to your input. Just select and then click the Callback Button to run the initialization code. Double-click the Callback Button block to view and edit its parameters, including the press and click scripts.

Callback Button

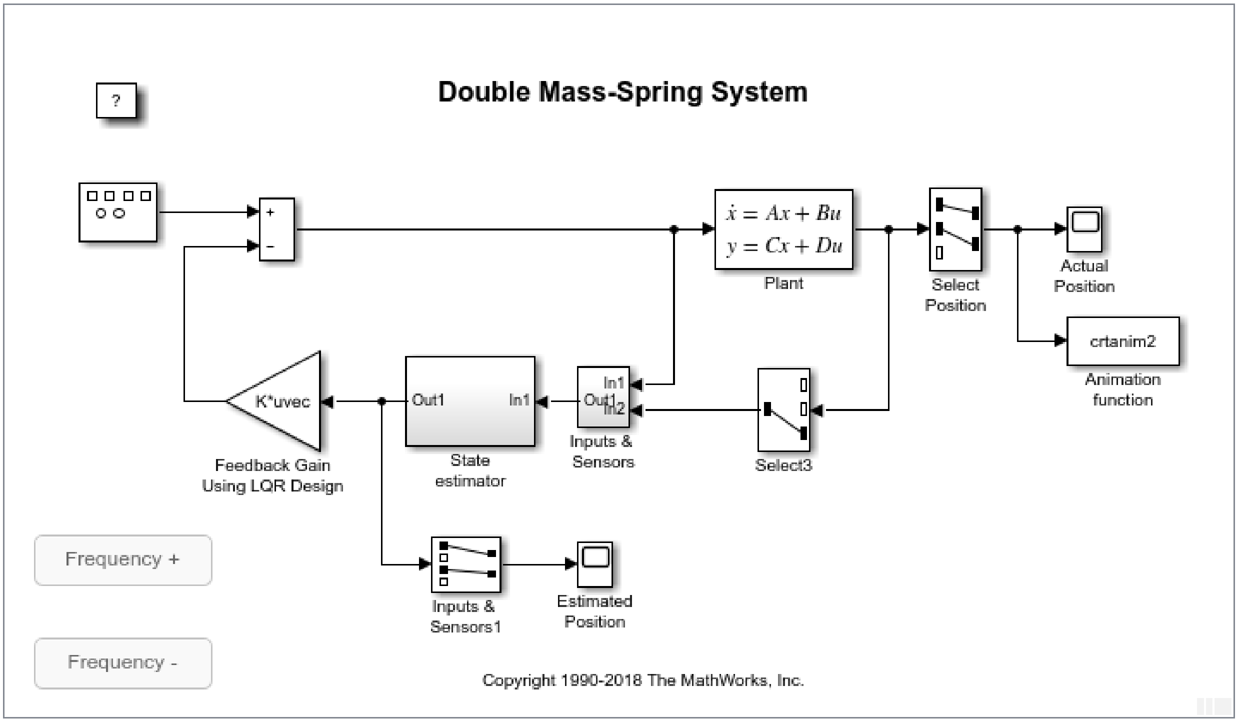
“Control a Parameter Value with Callback Button Blocks” on page 14-13

Control a Parameter Value with Callback Button Blocks

This example models control of a system that consists of two masses attached on either side of a spring. A control loop damps the oscillation of the spring that results when an external force acts on the system. The model uses Callback Button blocks to provide an interface for you to adjust the frequency of the external force before and during simulation.

Explore the Model

The model for this example adds two Callback Button blocks, labeled `Frequency +` and `Frequency -` to the Double Mass-Spring System model. When you simulate the model, an animation visualizes the system.



Click the button labeled `Frequency +` to increase the oscillation frequency. When you adjust the frequency of the external force, the Callback Button block displays a message in the command window indicating the new frequency value. You can adjust the parameter during a simulation and while the model is idle.

Both Callback Button blocks in this model are configured with a `ClickFcn` that responds to your clicks and a `PressFcn` that executes when you press the Callback Button block. Double-click the `Frequency +` Callback Button block to view its parameters.

When you click the `Frequency +` Callback Button block, the `ClickFcn` increases the frequency of the external force by `0.1`. If you press the Callback Button block for more than the `500` ms Press Delay, the `PressFcn` increases the frequency of the external force by `0.1` every second.

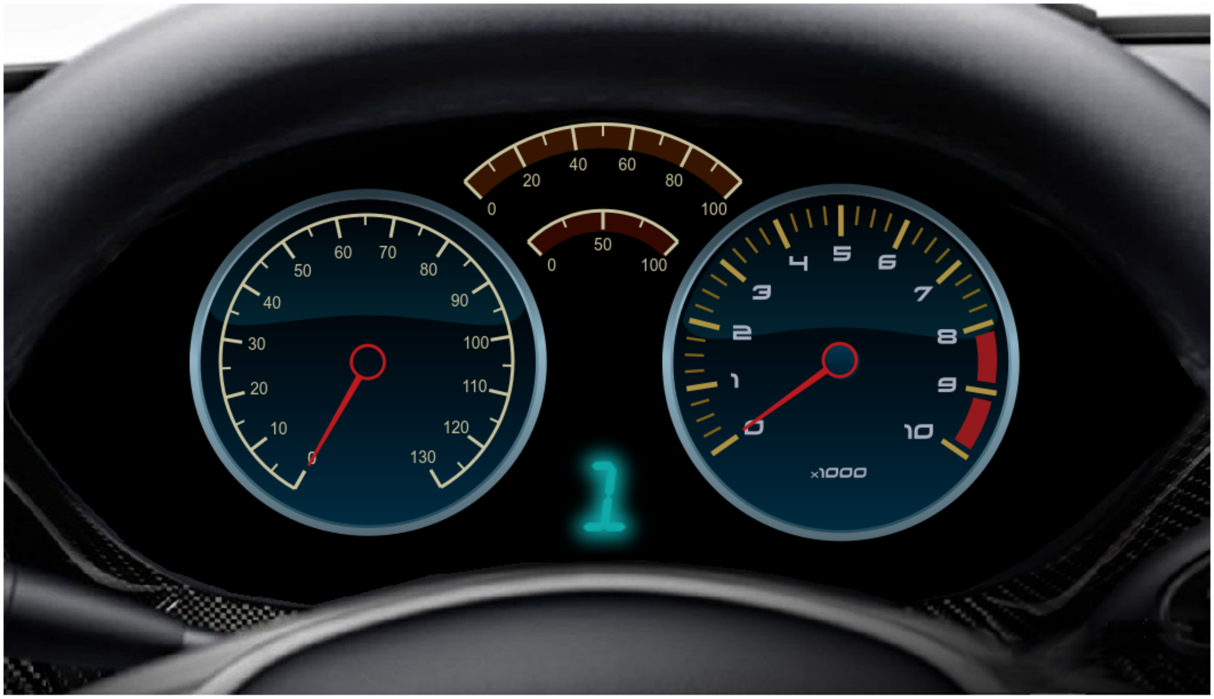
Create a Realistic Dashboard Using the Custom Gauge Block

You can use the Custom Gauge block to create a dashboard of controls and indicators for your model that looks how it would in a real system.

Model Overview

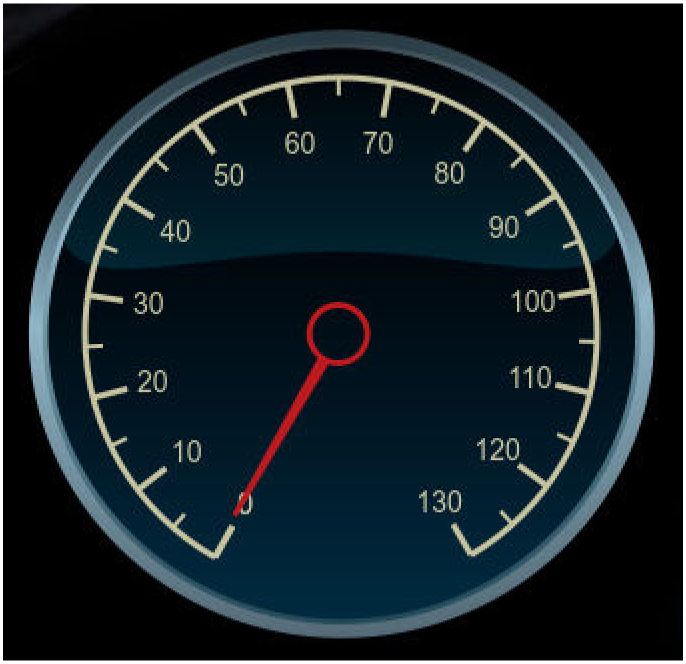
This example model uses four Custom Gauge blocks and a MultiStateImage block to create a dashboard for the `sf_car` model like one you might see in a real car.



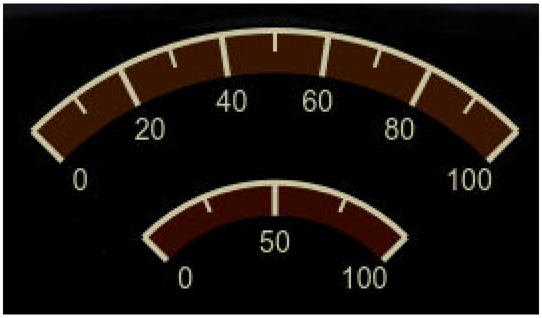
Explore the Model

To understand the connections between the Dashboard and model, you can select each block and jump to the signal it displays in the model. To jump to the connected signal, hover on the ellipsis that appears over the block when you select it. Then, click the arrow button.

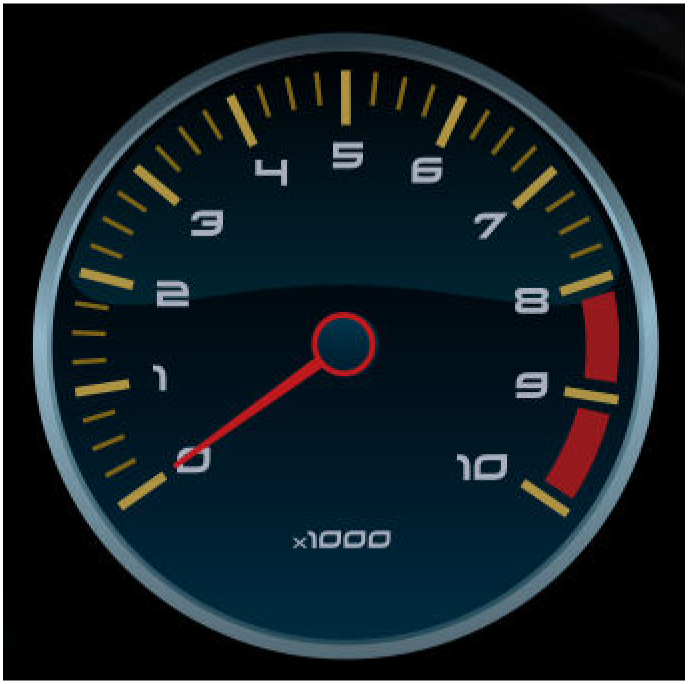
The Custom Gauge block on the left represents the `vehicle speed` signal, acting as a speedometer on the dashboard and using the default Custom Gauge appearance and a value arc you can see when you simulate the model.



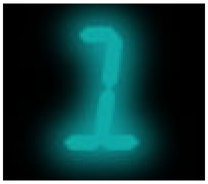
The Custom Gauge blocks at the top of the model display the `throttle` and `brake` signals. You can create this type of gauge by deleting the background image and needle image from the default Custom Gauge. Then, draw an arc and select colors for the tick marks, arc, and value arc.



The Custom Gauge block on the right displays the `engine RPM` signal on a custom gauge face. You can create a gauge like this by deleting the background image in the default Custom Gauge and uploading your own.



The MultiStateImage block on the bottom displays the `gear` signal using seven segment display style number images that correspond to the value of the `gear` signal.



Observe System During Simulation

You can use the dashboard to monitor the system response during simulation. The User Inputs subsystem includes several simulation inputs to model different vehicle maneuvers. To change the simulation input, navigate to the top level of the model and double-click the User Inputs subsystem. You can use the drop-down menu at the top of the gui to choose the vehicle action for the model to simulate. Choose between a passing maneuver, gradual acceleration, hard braking, and coasting. To monitor the system response during simulation, navigate back to the Dashboard subsystem and then press the play button to simulate the model.

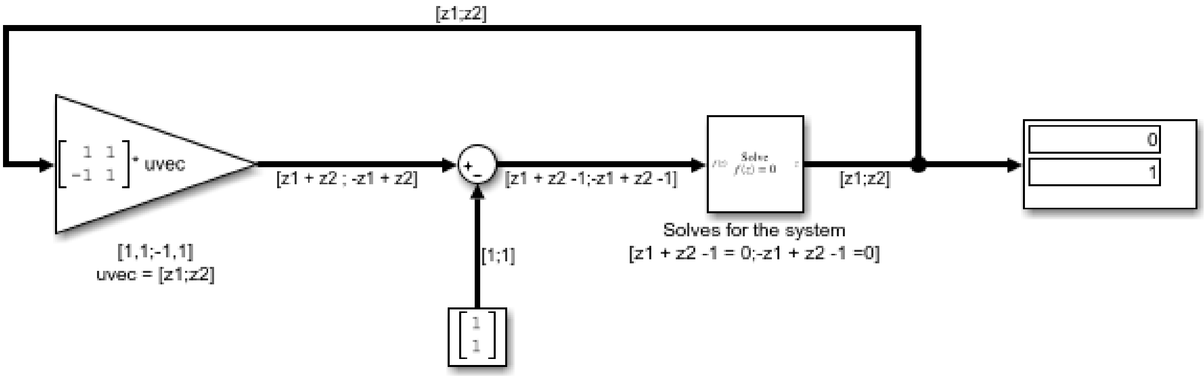
Solve a Linear System of Algebraic Equations

Use the Algebraic Constraint block to solve the system

$$z_1 + z_2 = 1$$
$$z_2 - z_1 = 1$$

The model represents the problem in a vectorized form as

$$\begin{bmatrix} 1 & 1 \\ -1 & 1 \end{bmatrix} \begin{bmatrix} z_1 \\ z_2 \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$



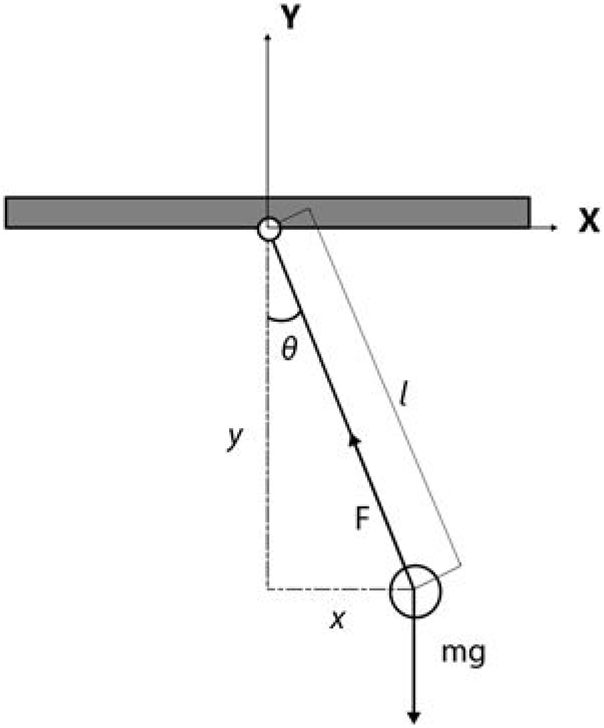
The signal fed to the Algebraic Constraint block $f(z)$ is a 2×1 vector of the form

$$\begin{bmatrix} z_1 + z_2 - 1 \\ -z - 1 + z_2 - 1 \end{bmatrix}$$

The block is configured to constrain $f(z)$ to 0. Thus solving for $f(z) = 0$ yields the solution $z_1 = 0,\ z_2 = 1$

Model a Planar Pendulum

Consider a point mass *m* suspended by a massless rod of length *l* under the influence of gravity. The position of the mass can be expressed in in Cartesian coordinates by *(x,y)*.



Modeling the System

A force balance of the mass gives the equations of motion in the *x* and *y* directions.

$$\begin{aligned} m\ddot{x} &= F\sin\theta \qquad (1) \\ m\ddot{y} + F\cos\theta &= -mg \qquad (2) \end{aligned}$$

Let *(u, v)* be the velocities in *(x, y)* respectively. The system can be rewritten as a system of first order ODEs

$$
\begin{aligned}
\dot{x} &= u && (3)\\
\dot{u} &= -F\tfrac{x}{ml} && (4)\\
\dot{y} &= v && (5)\\
\dot{v} &= -F\tfrac{y}{ml} - g && (6)
\end{aligned}
$$

where *F* is the tension in the rod. The system also possesses the geometric constraint

$$x^2 + y^2 \quad = \quad l^2 \qquad (7)$$

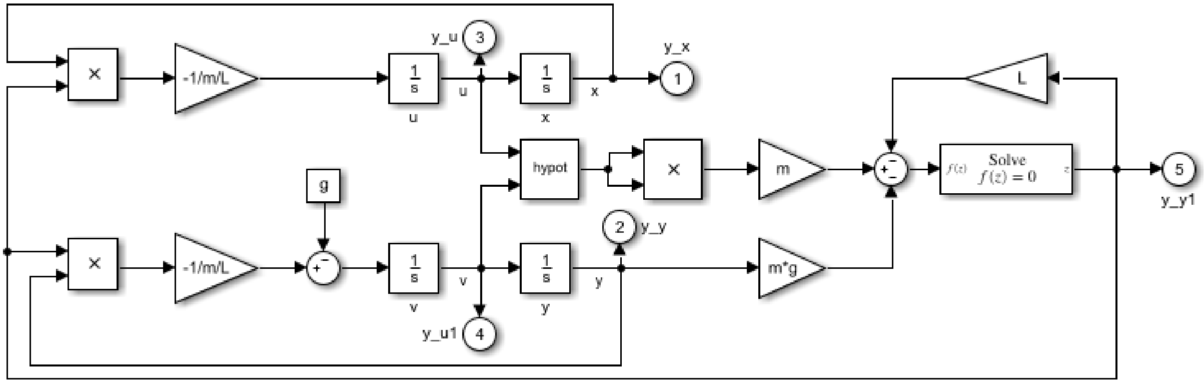
Differentiate (7) twice with respect to time *t* to arrive at

$$m(u^2 + v^2) - Fl - mgy \quad = \quad 0 \qquad (8)$$

This relationship is useful since it allows *F* to determined at every step for use in modeling the kinematics of the system.

Simulating the System

The system is simulated as shown in the figure below



Equation (8) contains one unknown *F* and is of the form *f(z) = 0* where $f(z) = m(u^2 + v^2) - Fl - mgy$. The Algebraic Constraint block constrains *f(z)* to 0 and solves for *F* in accordance with (8).

Improved Linearization with Transfer Fcn Blocks

The Laplace domain transfer function for the operation of differentiation is:

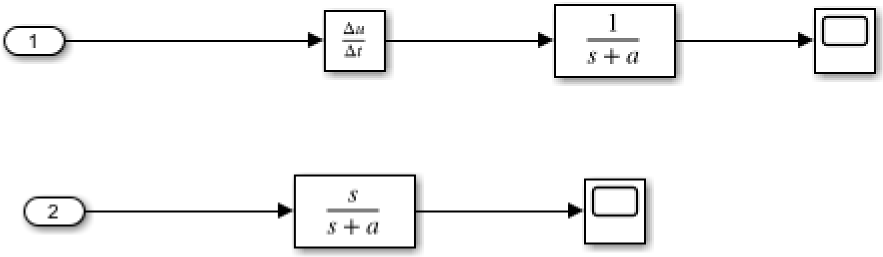
$$\frac{Y(s)}{X(s)} = s$$

This equation is not a proper transfer function, nor does it have a state-space representation. As such, the Simulink software linearizes this block as an effective gain of 0 unless you explicitly specify that a proper first-order transfer function should be used to approximate the linear behavior of this block.

To improve linearization, you can also try to incorporate the derivative term in other blocks. For example, if you have a Derivative block in series with a Transfer Fcn block, try using a single Transfer Fcn block of the form

$$\frac{s}{s+a}$$

For example, you can replace the first set of blocks in this figure with the blocks below them:



View Dead Zone Output on Sine Wave

This example shows the effect of the Dead Zone block on a sine wave. The model uses a dead zone lower limit of `-0.5` and an upper limit as `0.5`. Set these values through the parameters **Start of Dead Zone** and **End of Dead Zone** .

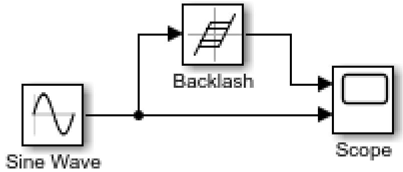
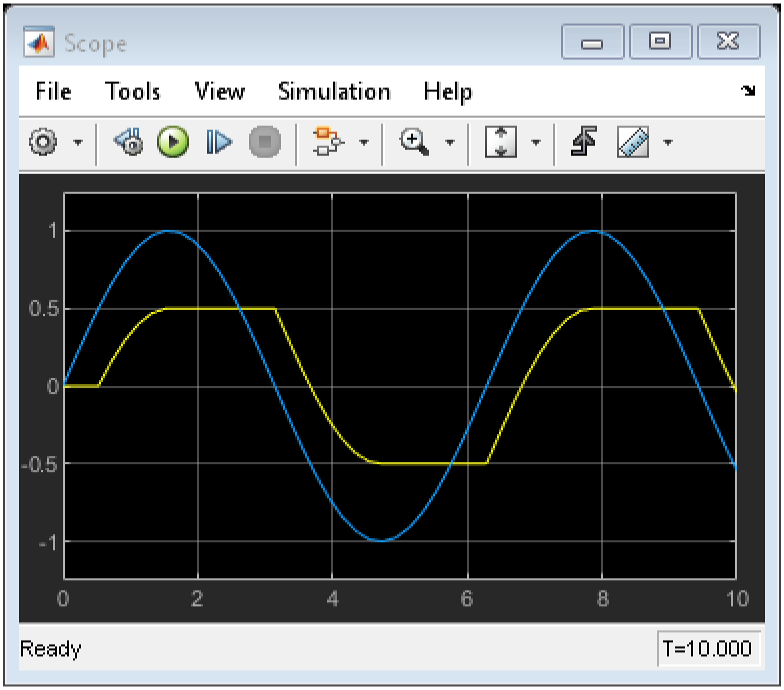
View Backlash Output on Sine Wave

This example shows the effect of the Backlash block on a sine wave using default parameters. The initial **Deadband width** is 1 and the **Initial output** is 0.

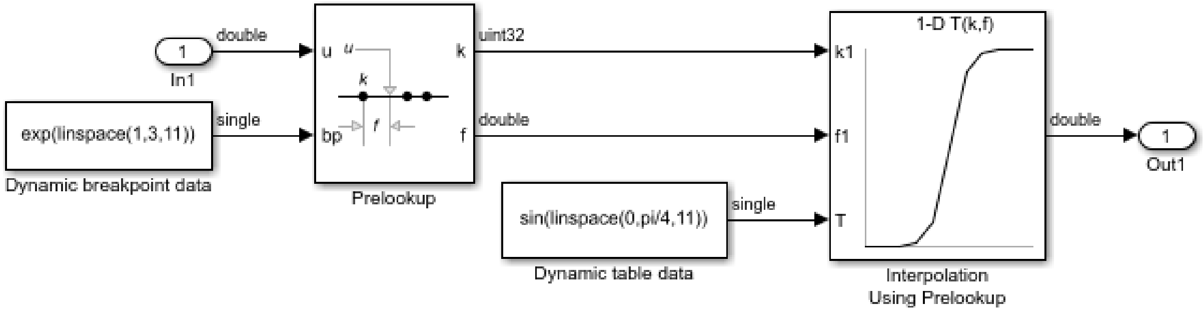




The initial deadband is centered around 0 and has a width of 1, which extends .5 in each direction. The output from the Backlash block begins at 0 and does not change until the input reaches the edge of the deadzone at .5. Then the output engages in a positive direction and changes an equal amount as the input. After the input reaches a value of 1, it starts moving in a negative direction. At this point the output disengages and stays flat until the input passes through the deadband width of 1. Once the input reaches the end of the deadband zone at 0, then the output engages and starts moving in a negative direction with the input.

Prelookup With External Breakpoint Specification

This example shows how to feed a breakpoint dataset from a Constant block to the bp input port of the Prelookup block.



The Prelookup block inherits the following breakpoint attributes from the bp input port:

- **Minimum**: `Inf`
- **Maximum**: `Inf`
- **Data type**: `single`

Similarly, a Constant block feeds the table data values to the T input port of the Interpolation Using Prelookup block, which inherits the following attributes:

- **Minimum**: `Inf`
- **Maximum**: `Inf`
- **Data type**: `single`

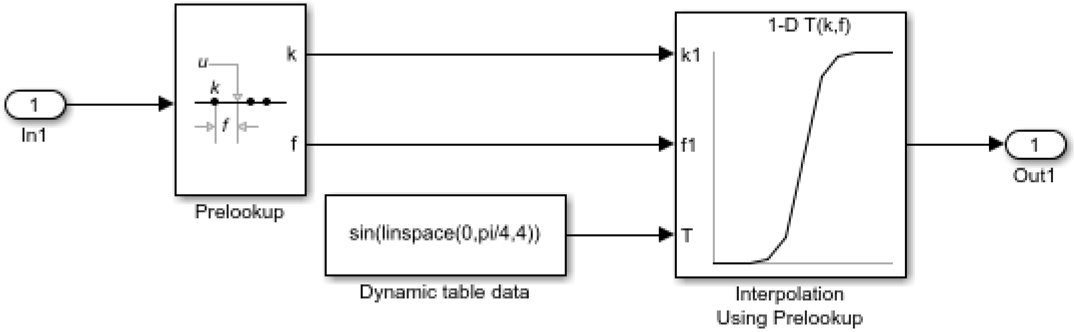
Simulink® uses double-precision, floating-point data to perform the computations in this model. However, the model stores the breakpoint and table data as single-precision, floating-point data. Using a lower-precision data type to store breakpoint and table data reduces the memory requirement.

Prelookup with Evenly Spaced Breakpoints

This example shows how to specify evenly spaced breakpoint data in the Prelookup block.

In the **Breakpoints data** section, the **Specification** parameter is set to `Even spacing`. The parameters **First point**, **Spacing**, and **Number of points** are set to 25, 12, and 4 respectively. Specifying these parameters creates four evenly spaced breakpoints: `[25, 37, 49, 61]`.

An alternative way to specify evenly spaced breakpoints is to set **Specification** to `Explicit values` and set **Value** to `[25:12:61]`.

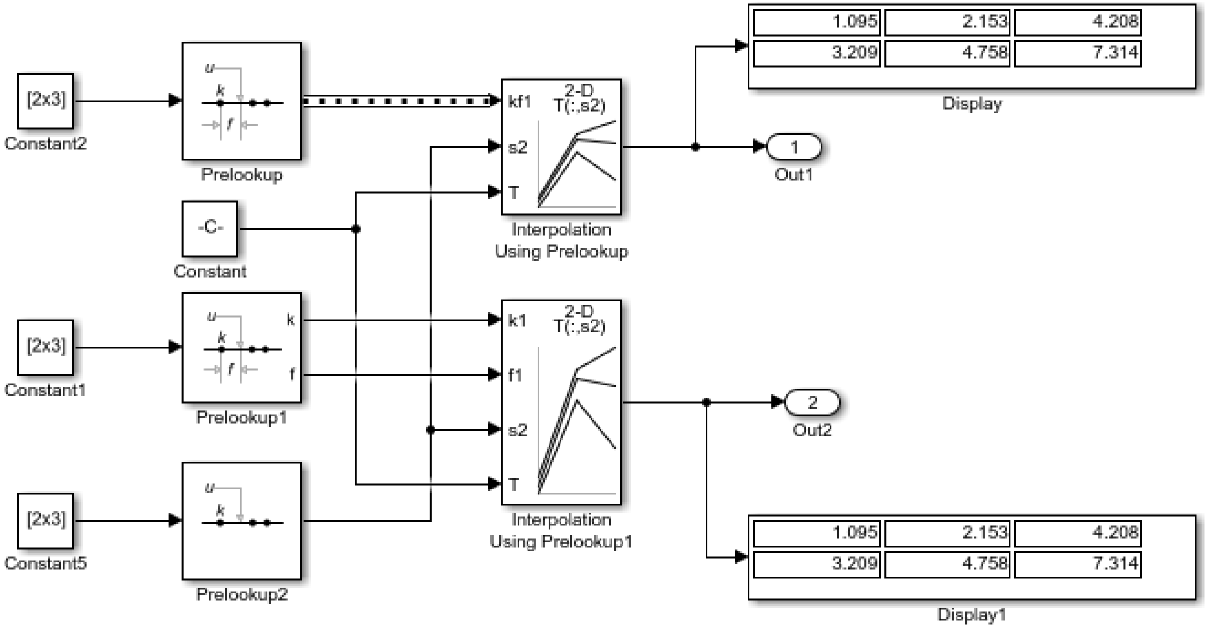


Simulink® uses double-precision, floating-point data to perform the computations in this model. However, the model stores the breakpoints and table data as double.

Configure the Prelookup Block to Output Index and Fraction as a Bus

This example shows how to output a bus containing the index (k) and fraction (f) from the Prelookup block. The bus object can then be used as an input to the Interpolation Using Prelookup block. The example also shows how to get the same results without using a bus object.

Open and simulate the model.



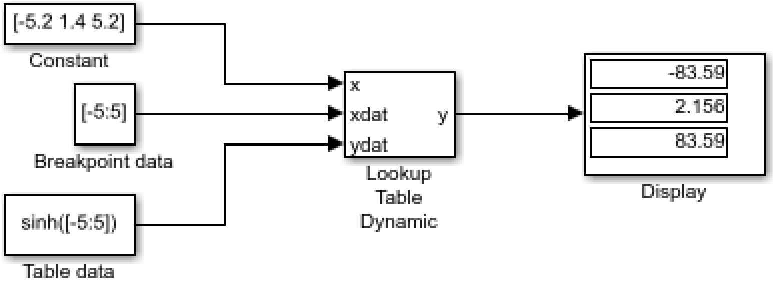
At the top of the model, open the dialog box for the Prelookup block. In the **Main** tab, note that **Output selection** is set to `Index and fraction as bus`. In the **Data Types** tab, note that **Output** is set to `Bus: myBus`. In the Simulink® Editor, select **File>Model Properties** and open the **Callbacks** tab. In the model's `PreLoadFcn`, the code defines the bus object `myBus`, which specifies the index as the first bus element and the fraction as the second element.

Open the dialog box for the Interpolation Using Prelookup block. In the **Main** tab, note that **Require index and fraction as bus** check box is selected. That option configures the block to use the bus output from the Prelookup block.

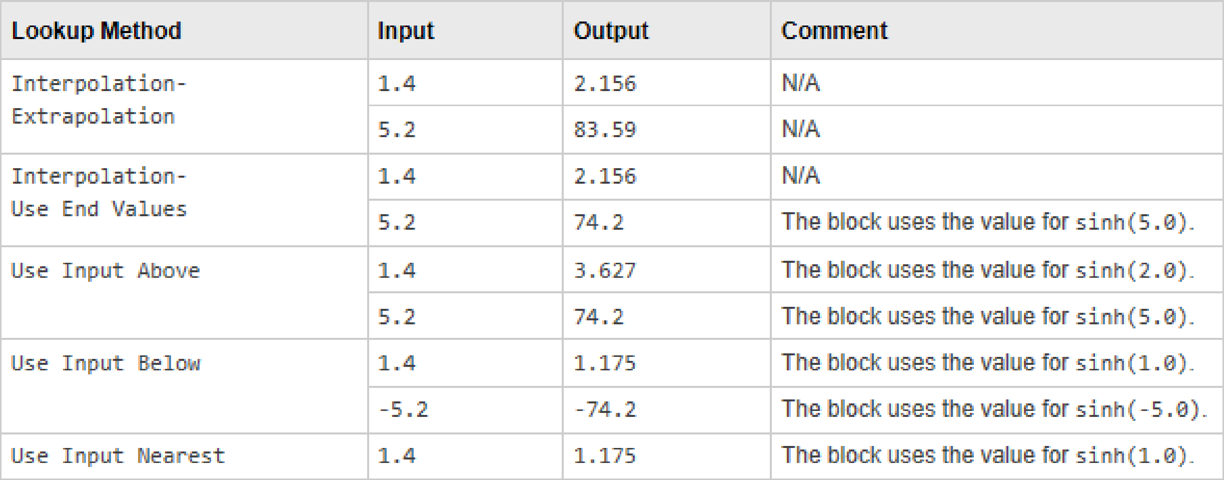
Approximating the sinh Function Using the Lookup Table Dynamic Block

This example shows how to use the Lookup Table Dynamic block to approximate the `sinh` function. The breakpoint data is given by the vector `[-5:5]` and the table data is given by the vector `sinh([-5:5])`. The input `x` is provided by the Constant block as a 1-by-3 vector containing values that are below, within, and above the breakpoint data values.

To see how each lookup method handles input values that are below, within, and above the breakpoint data values, change the value of the **Lookup Method** parameter on the Lookup Table Dynamic block.



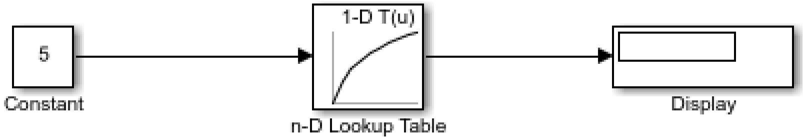
The Lookup Table Dynamic block outputs the following values when using the specified lookup methods and inputs.



Lookup Method	Input	Output	Comment
`Interpolation-Extrapolation`	`1.4`	`2.156`	N/A
	`5.2`	`83.59`	N/A
`Interpolation-Use End Values`	`1.4`	`2.156`	N/A
	`5.2`	`74.2`	The block uses the value for `sinh(5.0)`.
`Use Input Above`	`1.4`	`3.627`	The block uses the value for `sinh(2.0)`.
	`5.2`	`74.2`	The block uses the value for `sinh(5.0)`.
`Use Input Below`	`1.4`	`1.175`	The block uses the value for `sinh(1.0)`.
	`-5.2`	`-74.2`	The block uses the value for `sinh(-5.0)`.
`Use Input Nearest`	`1.4`	`1.175`	The block uses the value for `sinh(1.0)`.

Create a Logarithm Lookup Table

This example shows how to use the n-D Lookup Table block to create a logarithm lookup table. The lookup table allows you to approximate the common logarithm (base 10) over the input range [1,10] without performing an expensive computation.

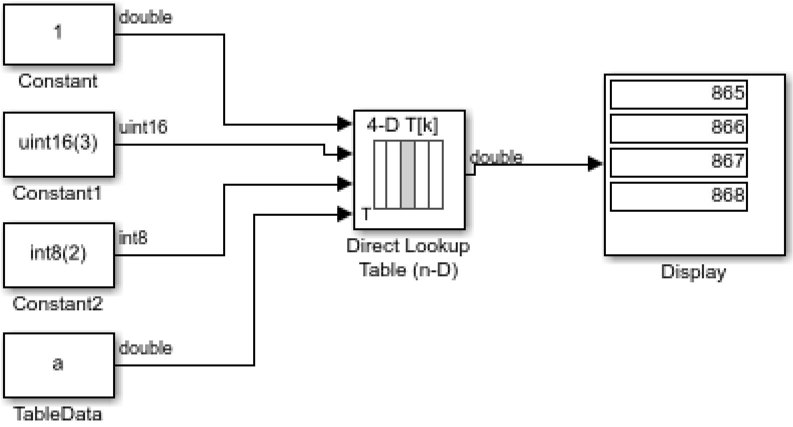


Providing Table Data as an Input to the Direct Lookup Table Block

This example shows how to provide table data as an input to the Direct Lookup Table block. In the following model, `a` is a 4-D array of linearly increasing values that you define with the following model preload function:

```
a = reshape(1:2800, [4 5 20 7]);
```

When you run the model, you get the following results:



The block labeled TableData feeds a 4-D array to the Direct Lookup Table (n-D) block, with a data type of double. Because the Direct Lookup Table (n-D) block uses zero-based indexing, the output is:

```
a(:,2,4,3)
```

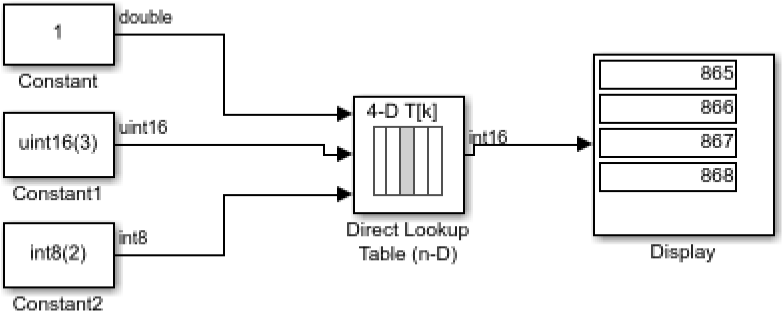
The output has the same data type as the table data input signal: double.

Specifying Table Data in the Direct Lookup Table Block Dialog Box

This example shows how to specify table data on the dialog box of the Direct Lookup Table (n-D) block. In the following model, the table data is a is a 4-D array of linearly increasing values that you define with the following model preload function:

```
a = reshape(1:2800, [4 5 20 7]);
```

When you run the model, you get the following results:



Because the Direct Lookup Table (n-D) block uses zero-based indexing, the output is:

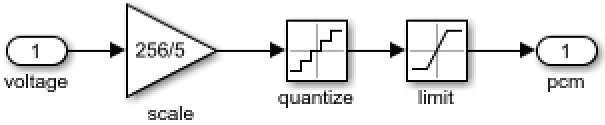
```
a(:,2,4,3)
```

The output data type matches the Direct Lookup Table block's **Table data type**, which is set to `int16`.

Using the Quantizer and Saturation blocks in sldemo_boiler

This example shows how the Quantizer and Saturation blocks are used in the model ex_sldemo_boiler. The ADC subsystem digitizes the input analog voltage by:

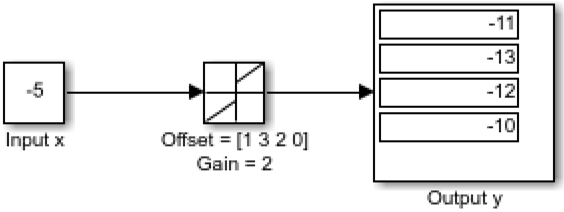
- Multiplying the analog voltage by 256/5 with the Gain block
- Rounding the value to integer floor with the Quantizer block
- Limiting the output to a maximum of 255 (the largest unsigned 8-bit integer value) with the Saturation block



This subsystem models a typical 8-bit analog-to-digital converter having an input range of 0-5 volts

Scalar Expansion with the Coulomb and Viscous Friction Block

This example shows a model with a scalar input to a Coulomb & Viscous Friction block that uses scalar expansion to output a vector.



Double click the friction block to see the parameters. **Coefficient of viscous friction (Gain)** is a scalar value `2`, but **Coulomb friction value (Offset)** is a vector value `[1 3 2 0]`. Therefore, the block uses element-wise scalar expansion to compute the output.

Each output is calculated using this formula.

$$y = sign(x).*(Gain.*abs(x)+Offset)$$

For example, the first offset 1 is calculated as follows.

$$y = - * ((2*5)+1)$$

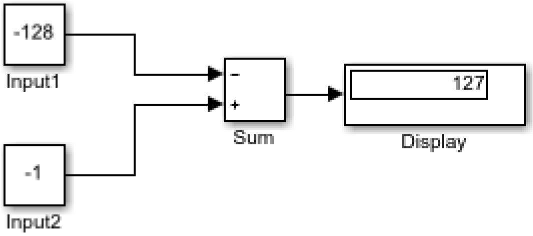
$$y = -11$$

If the dimensions for the input and `Offset` are the same, then no expansion is necessary.

Sum Block Reorders Inputs

This example shows how the Sum block reorders inputs. If you use a `-` sign as the first operation, the block reorders the inputs, if possible, to use a + operation. For example, in the expression `output = -a-b+c`, the Sum block reorders the input so that `output = c-a-b`. To initialize the accumulator, the Sum block uses the first + input port.

The block avoids performing a unary minus operation on the first operand `a` because doing so can change the value of `a` for fixed-point data types. In that case, the output value differs from the result of accumulating the values for `a` , `b` , and `c` .



Both the constant inputs use `int8` data types The Sum block also uses `int8` for the accumulator and output data types and has **Saturate on integer overflow** turned on. The Sum block reorders the inputs to give the ideal result of `127`.

1. Reorders inputs from `(-Input1 + Input2)` to `(Input2 - Input1)`.
2. Initializes the accumulator by using the first + input port. `Accumulator = int8(-1) = -1`
3. Continues to accumulate values. `Accumulator = Accumulator - int8(-12) = 127`
4. Caclulates the block output. `Output = int8(127) = 127`

If the Sum block does not reorder the inputs, then you get the nonideal result of `126`.

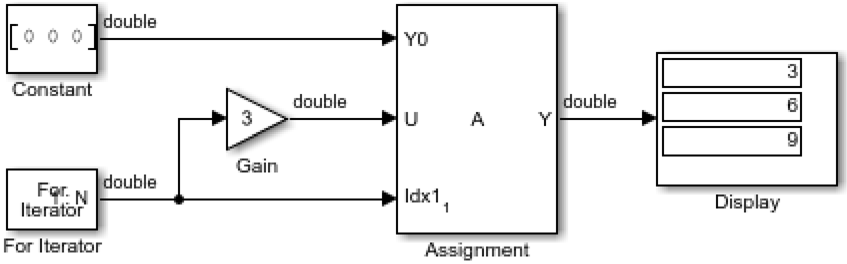
1. Initializes the accumulator by using the first input port. `Accumulator = int8(-(-128)) = 127`
2. Because saturation is on, the initial value of the accumulator saturates at `127` and does not wrap.
3. Continues to accumulate values. `Accumulator = Accumulator + int8(-1) = 126`

4 Calculates the block output. `Output = int8(126) = 126`

To explicitly specify a unary minus operation for `output = -a-b+c`, you can use the Unary Minus block in the Math Operations library.

Iterated Assignment with the Assignment Block

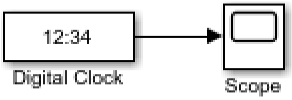
This example shows using the Assignment block to assign values computed in a For or While Iterator loop to successive elements. You can use vector, matrix or multidemensional signals and do the assignment in a single time step. In this model, the For Iterator block creates a vector signal each of whose elements equals $3 * i$ where i is the index of the element.

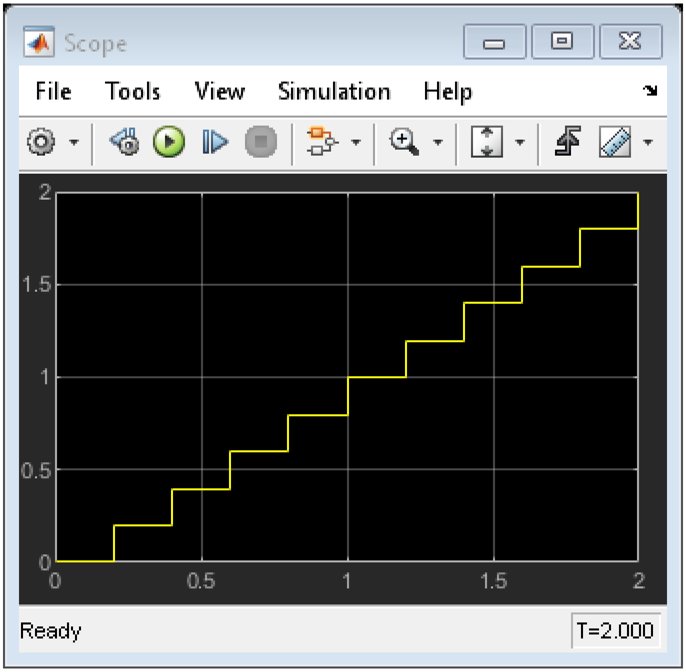


The iterator generates indices for the Assignment block. On the first iteration, the Assignment block copies the first input (Y0) to the output (Y) and assigns the second input (U) to the output Y(E1). On successive iterations, the Assignment block assigns the current value of U to Y(Ei), that is, without first copying Y0 to Y. These actions occur in a single time step.

View Sample Time Using the Digital Clock Block

This example shows how to view the simulation sample time at a specified sampling interval using the Digital Clock block. In this model, the Scope shows the output of a Digital Clock block with the **Sample time** set to `0.2`.

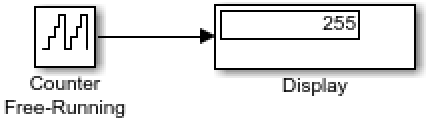




In this configuration, the Digital Clock block outputs the simulation time every 0.2 seconds. Otherwise, the block holds the output at the previous value.

Bit Specification Using a Positive Integer

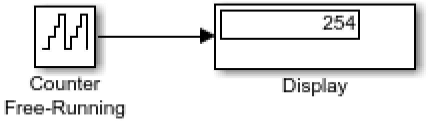
This example shows how to specify the **Number of bits** in the Counter Free-Running block as a positive integer.



At t = 255, the counter reaches the maximum value of `(2^8)-1`. If you increase the stop time of the simulation to 256, the counter wraps to zero.

Bit Specification Using an Unsigned Integer Expression

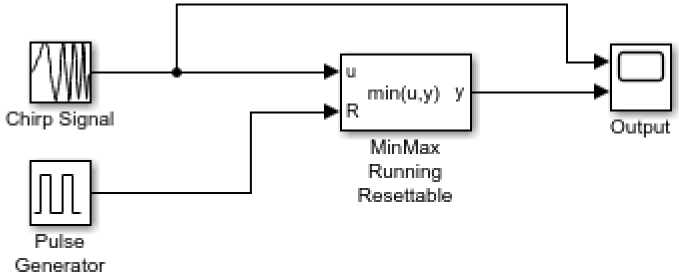
This example shows how to specify the **Number of bits** in the Counter Free-Running block as an unsigned integer expression.

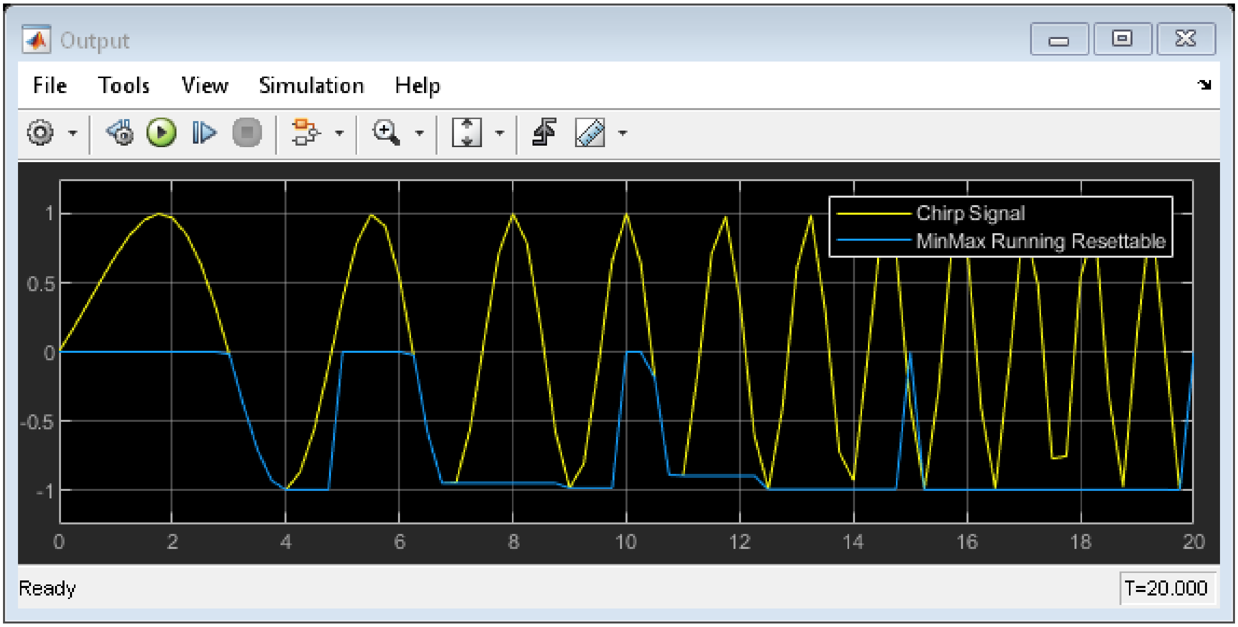


At t = 254, the counter reaches the maximum value of `uint8(2^(uint8(8))-1)`. If you increase the stop time of the simulation to 255, the counter wraps to zero.

Track Running Minimum Value of Chirp Signal

This example shows how to track the running minimum value of a signal generated by the Chirp Signal block.

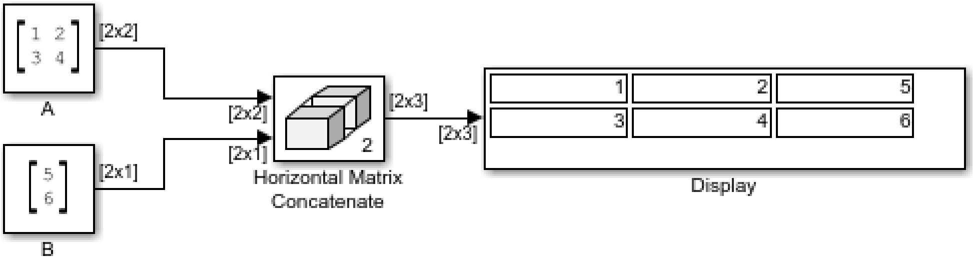




The Chirp Signal block generates a sine wave whose frequency increases at a linear rate with time. The MinMax Running Resettable block tracks the minimum value of that chirp signal over time. The running minimum value is reset every 5 seconds by the Pulse Generator block.

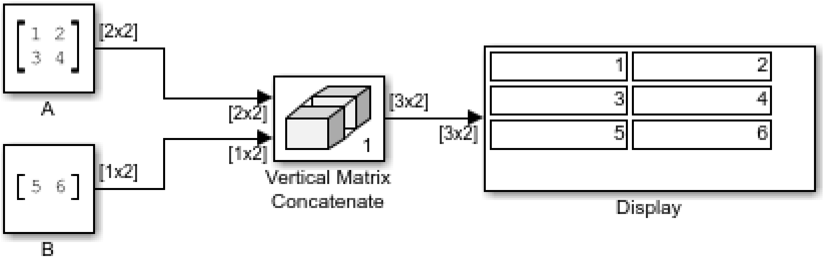
Horizontal Matrix Concatenation

This example shows how to perform a horizontal matrix concatenation with the Matrix Concatenate block. When you set the **Concatenate dimension** parameter to 2 and the inputs are 2-D matrices, the block performs horizontal matrix concatenation and places the input matrices side-by-side to create the output matrix.



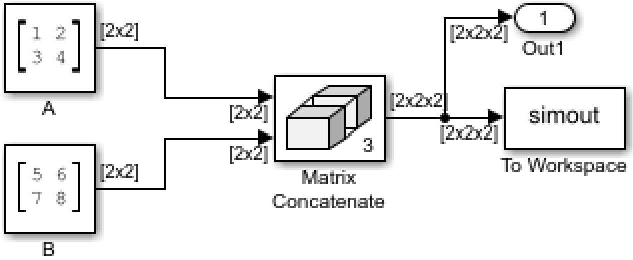
Vertical Matrix Concatenation

This example shows how to perform a vertical matrix concatenation with the Matrix Concatenate block. When you set the **Concatenate dimension** parameter to 1 and the inputs are 2-D matrices, the block performs vertical matrix concatenation and places the input matrices on top of each other to create the output matrix.



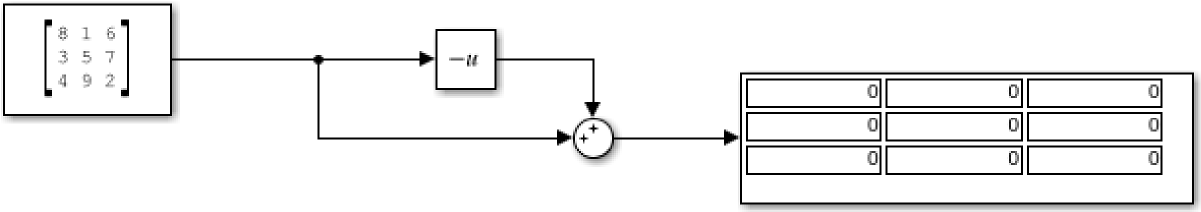
Multidimensional Matrix Concatenation

This example shows how to perform multidimensional matrix concatenation with the Matrix Concatenate block. When you set the **Concatenate dimension** parameter to 3 and the inputs are 2-D matrices, the block performs multidimensional matrix concatenation.



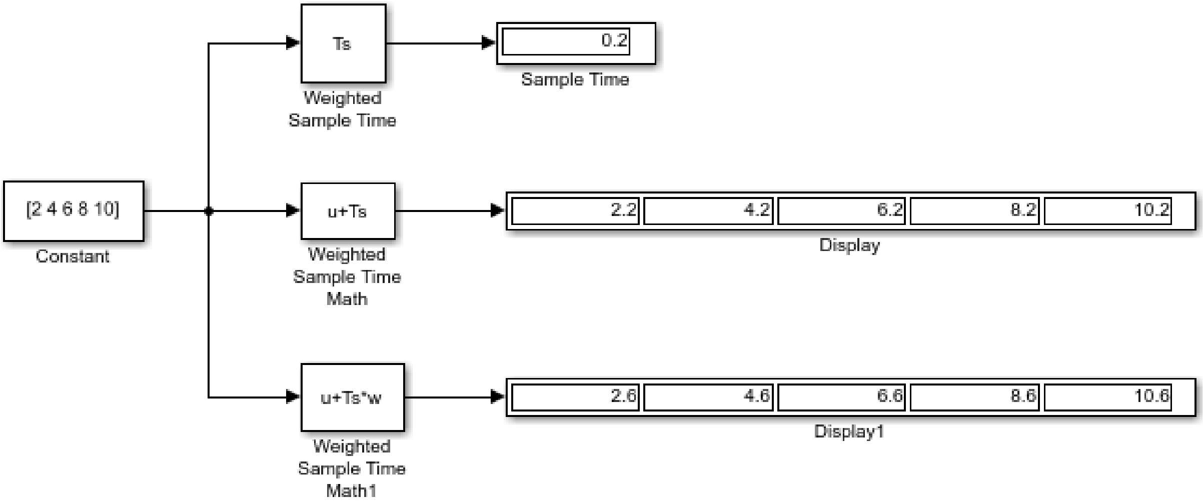
Unary Minus of Matrix Input

This example shows how to compute the unary minus of a matrix input.



Sample Time Math Operations Using the Weighted Sample Time Math Block

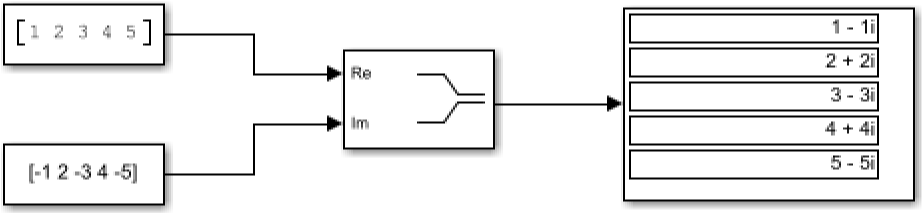
This example shows how to add the sample time value to a signal using the Weighted Sample Time Math block.

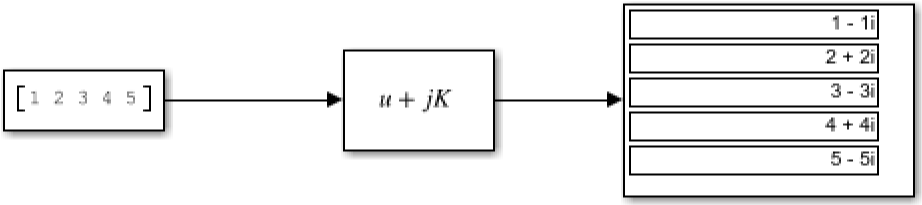


Using the Weighted Sample Time block, you can see the sample time of this model is `0.2`. When you set the **Operation** parameter to `+` and the **Weight value** to `1` on the Weighted Sample Time Math block, the block adds the sample time value of `0.2` to the input signal. When you set the **Weight value** to `3` in the Weighted Sample Time Math1 block, the block adds `Ts*3` to the input signal, thus increasing each value by `0.6`.

Construct Complex Signal from Real and Imaginary Parts

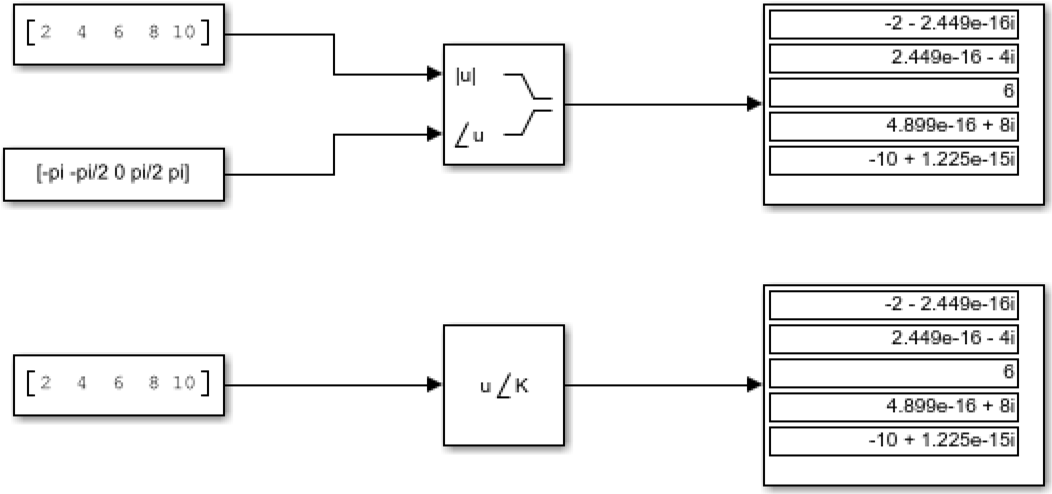
This example shows how to use the Real-Imag to Complex block to construct a complex-valued signal from real and imaginary parts. You can provide both the real and imaginary parts as block inputs, or provide one value as an input, and the other on the block dialog box.





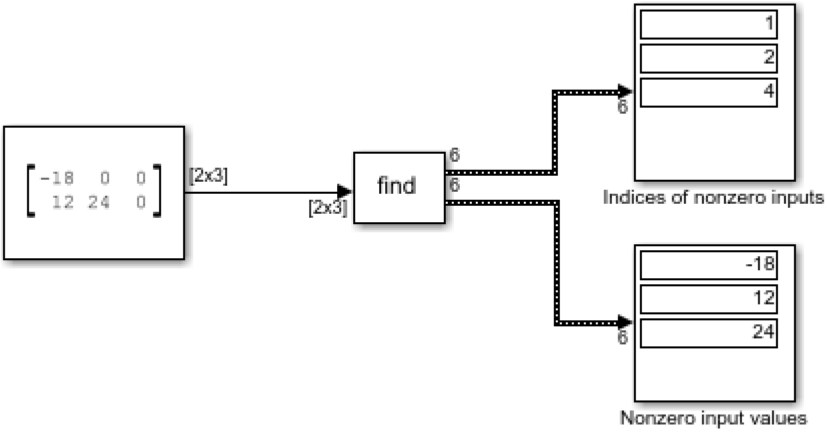
Construct Complex Signal from Magnitude and Phase Angle

This example shows how to use the Magnitude-Angle to Complex block to construct a complex-valued signal. You can provide both the magnitude and phase angle as block inputs, or provide one value as an input, and the other on the block dialog box.



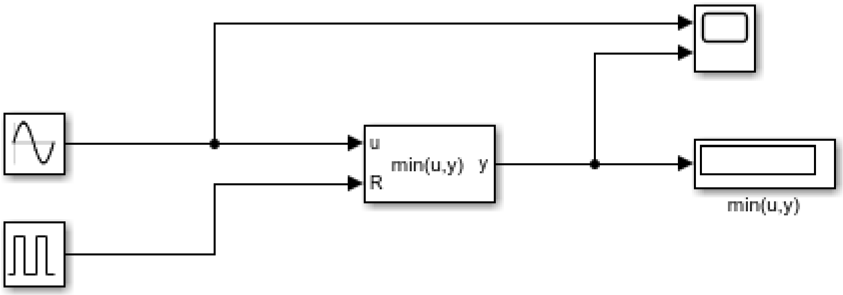
Find Nonzero Elements in an Array

This example shows how to use the Find block to find nonzero elements in an array. In the following model, the block is configured to output both the one-based linear index and the value of each nonzero element.



Calculate the Running Minimum Value with the MinMax Running Resettable Block

This example shows how to use the MinMax Running Resettable block to calculate the running minimum value. To watch how the running minimum value changes at each time step, you can use the Step Forward button to advance the simulation one step at a time.



After running the full simulation, you can view the results in the Scope. The initial value of the running minimum is `0`. It begins tracking the Sine Wave signal when the sine wave values turn negative. When the MinMax Running Resettable block receives a reset signal at T=8, the block resets the running minimum value to 0. The running minimum value tracks at `0` for a few time steps, until the sine wave values turn negative again.

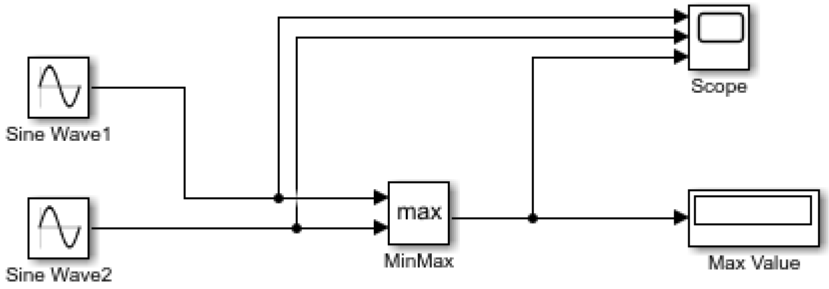
Find Maximum Value of Input

This example shows how to use the MinMax block to output the maximum value of two sine waves.



After running the full simulation, you can view the results in the Scope. Initially, the maximum value (orange line) tracks SineWave2. When the SineWave2 values turn negative, the maximum value begins tracking SineWave1. When the SineWave2 values become positive again, the maximum value resumes tracking SineWave2.

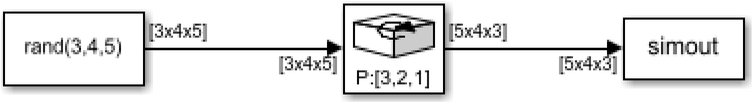
Permute Array Dimensions

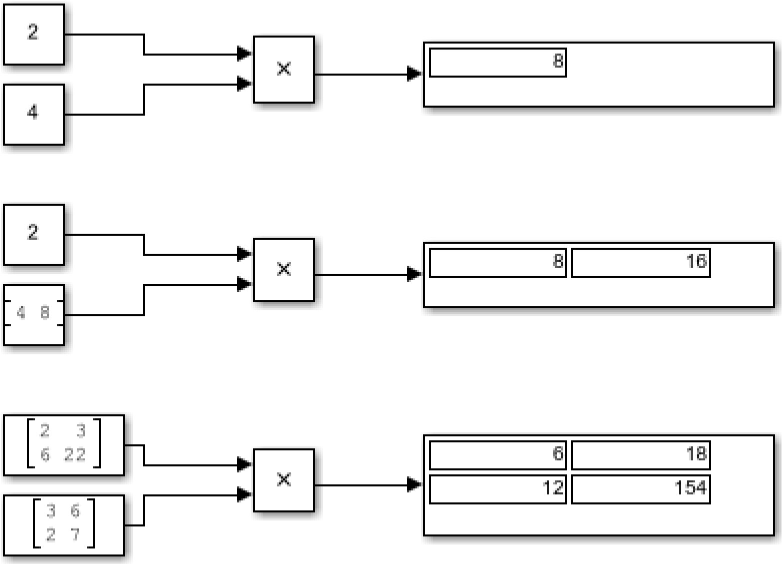
This example shows how to use the Permute Dimensions block to permute the first and third dimensions of a 3-by-4-by-5 input array.



When you set the **Order** parameter to `[3,2,1]`, the block permutes the first and third dimensions, and outputs a 5-by-4-by-3 array.

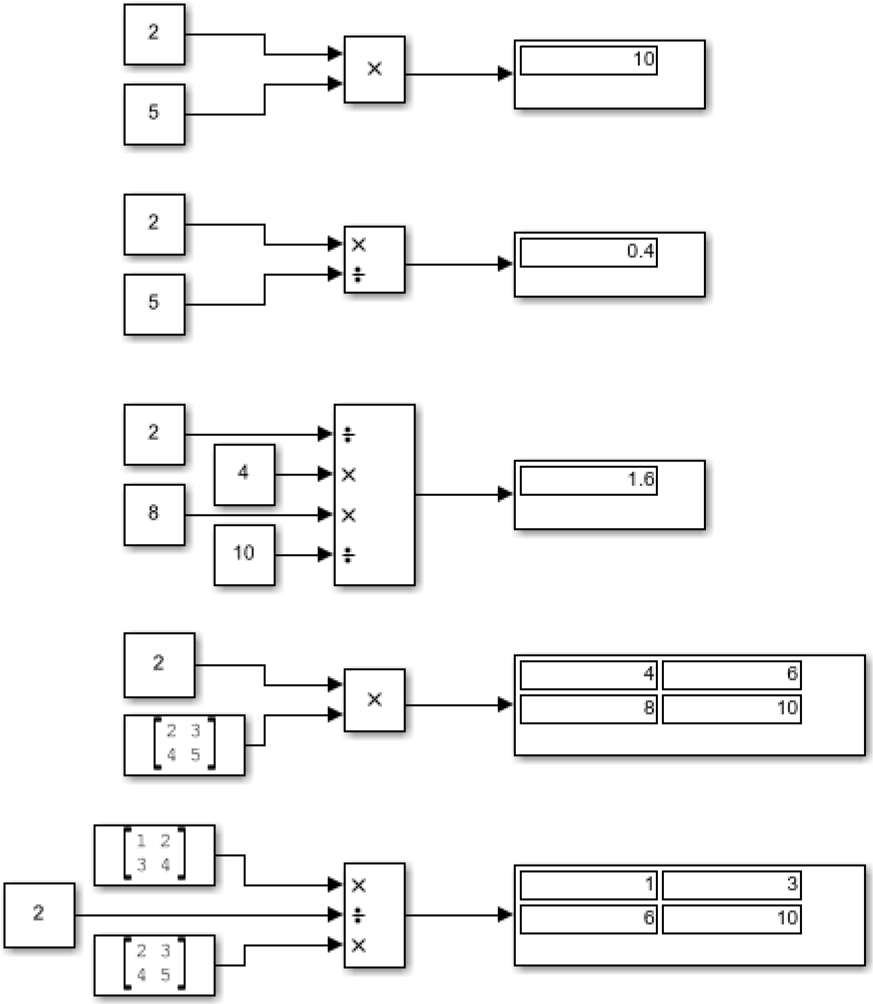
Multiply Inputs of Different Dimensions with the Product Block

This example shows how to perform element-wise `(.*)` multiplication of inputs using the Product block. In this example, the Product block multiplies two scalars, a scalar and a vector, and two 2x2 matrices.



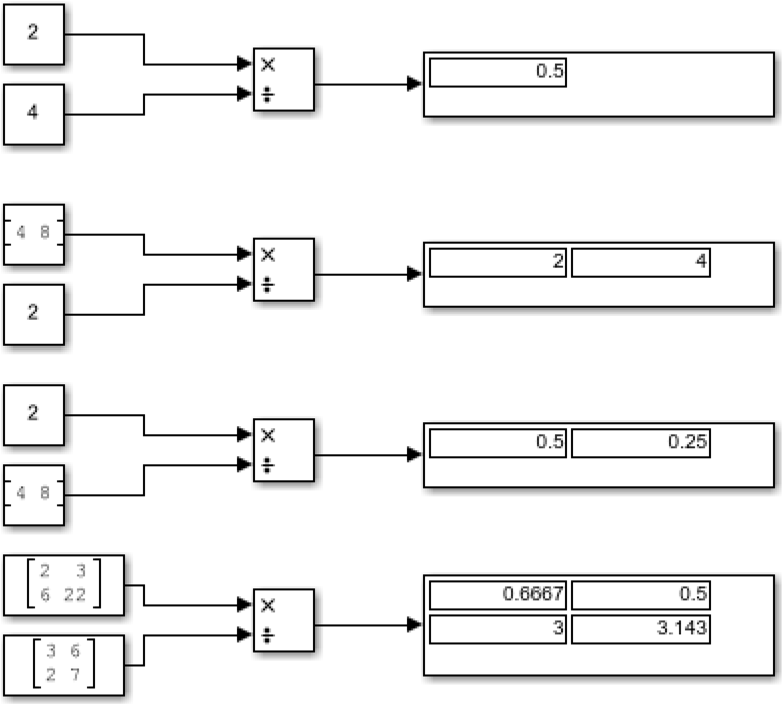
Multiply and Divide Inputs Using the Product Block

This example shows how to multiply and divide several input signals using the Product block.



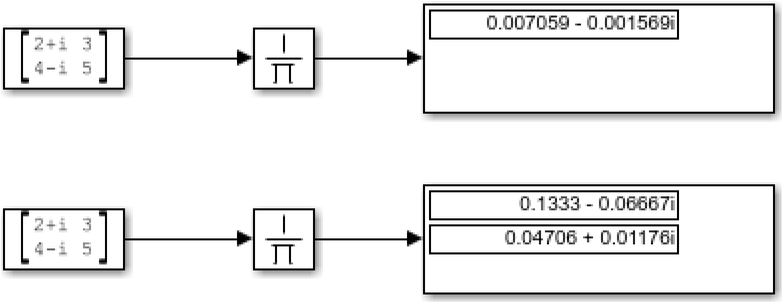
Divide Inputs of Different Dimensions Using the Divide Block

This example shows how to perform element-wise `(.*)` division of two inputs using the Divide block. In this example, the Divide block divides two scalars, a vector by a scalar, a scalar by a vector, and two matrices.



Complex Division Using the Product of Elements Block

This example shows how to perform element-wise complex division using the Product of Elements block.



The top Product of Elements block collapses the matrix input to a scalar by taking successive inverses of the four elements:

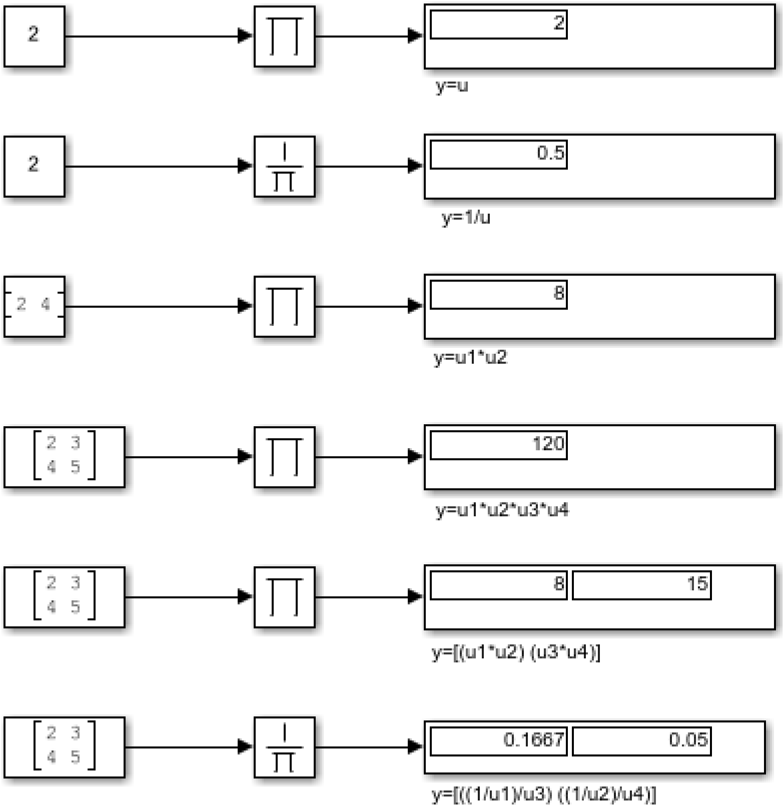
- `y = ((((1/2+i)/3)/4-i)/5)`

The bottom Product of Elements block collapses the matrix input to a vector by taking successive inverses along the second dimension:

- `y(1) = ((1/2+i)/3)`
- `y(2) = ((1/4-i)/5)`

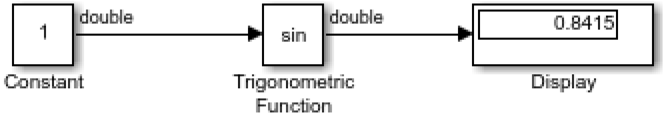
Element-Wise Multiplication and Division Using the Product of Elements Block

This example shows how to use the Product of Elements block to perform element-wise multiplication and division of inputs.



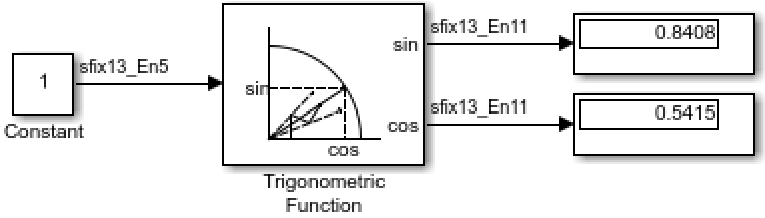
sin Function with Floating-Point Input

This example shows how to use the Trigonometric Function block to compute the sine of a floating-point input. The output of the Trigonometric Function block has the same data type as the input because the input data type is floating-point and the **Approximation method** is none.



sincos Function with Fixed-Point Input

This example shows how to use the Trigonometric Function block to compute the CORDIC approximation of `sincos` for a fixed-point input signal.



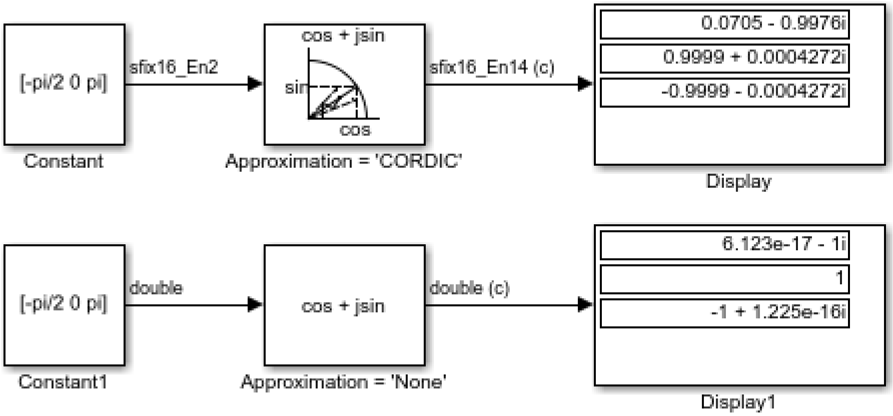
The Trigonometric Function block parameters are:

- **Function**: `sincos`
- **Approximation method**: `CORDIC`
- **Number of iterations**: `11`

When using the CORDIC approximation method, the input to the Trigonometric Function block must be in the range `[-2pi,2pi)`. The output type of the Trigonometric Function block is `fixdt(1,13,11)` because the input is a fixed-point signal and the **Approximation method** is set to `CORDIC`. The output fraction length equals the input word length minus two.

Trigonometric Function Block Behavior for Complex Exponential Output

This example compares the complex exponential output for two different configurations of the Trigonometric Function block.

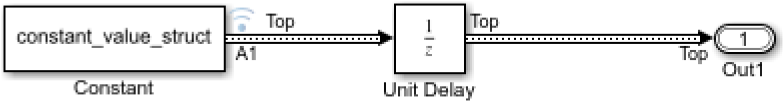


When the **Approximation method** is `CORDIC`, the input data type can be fixed point, in this case: `fixdt(1,16,2)`. The output data type is `fixdt(1,16,14)` because the output fraction length equals the input word length minus two.

When the **Approximation method** is `None`, the input data type must be floating point. The output data type is the same as the input data type.

Output a Bus Object from the Constant Block

This example shows how to output a bus object from the Constant block. The six Constant blocks used to create a bus object in the `ex_busic` example (see “Create Partial Structures for Initialization”) are replaced by a single constant block in this example.



To verify that the output from the Constant block reflects the values from the `constant_value_struct`, enter the following at the MATLAB command line:

```
constant_value_struct
```

```
constant_value_struct = 

  struct with fields:

    A: [1x1 struct]
    B: 5
    C: [1x1 struct]
```

Examine the logged data in the logsout variable, focusing on the A1 bus signal. The `constant_value_struct` structure sets the `B` element to `5`.

```
logsout.get('A1').Values.B.Data(1)
```

```
ans =

     5
```

Control Algorithm Execution Using Enumerated Signal

This example shows how to use a signal of an enumerated data type to control the execution of a block algorithm. For basic information about using enumerated data types in models, see “Use Enumerated Data in Simulink Models”.

Define Enumerated Type

Copy the enumerated type definition ex_SwitchCase_MyColors into a script file in your current folder.

```
classdef ex_SwitchCase_MyColors < Simulink.IntEnumType
  enumeration
    Red(0)
    Yellow(1)
    Blue(2)
    Mauve(3)
  end
end
```

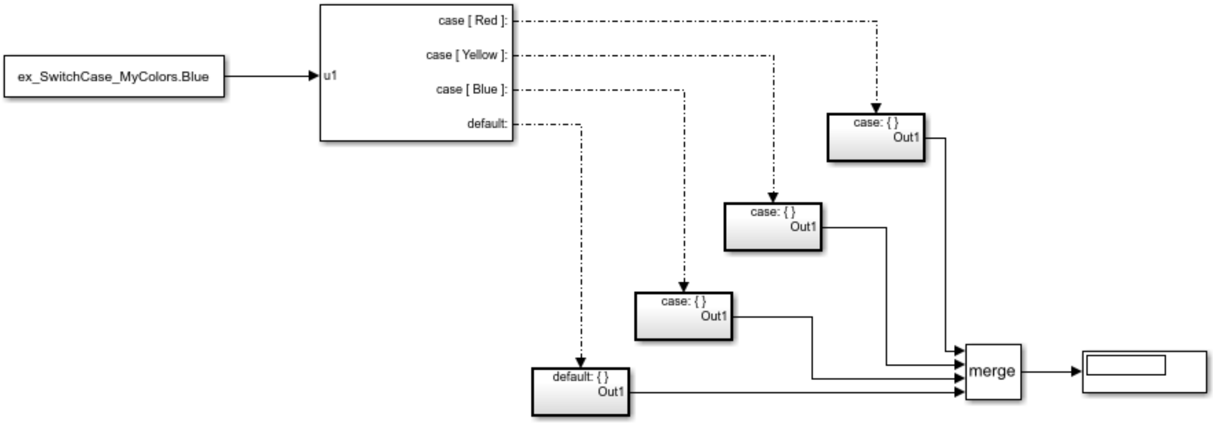
Alternatively, you can use the function Simulink.defineIntEnumType to define the type.

```
Simulink.defineIntEnumType('ex_SwitchCase_MyColors',...
{'Red','Yellow','Blue','Mauve'},[0;1;2;3])
```

Explore Example Model

Open the example model ex_enum_switch_case.

```
open_system('ex_enum_switch_case')
```



Open the Enumerated Constant block dialog box. The constant output value is `ex_SwitchCase_MyColors.Blue`.

Open the Switch Case block dialog box. The **Case conditions** box is specified as a cell array containing three of the four possible enumeration members. The block has four outputs corresponding to the three specified enumeration members and a default case.

Open the Switch Case Action Subsystem blocks. The subsystems each contain a Constant block that uses a different constant value.

Control Execution During Simulation

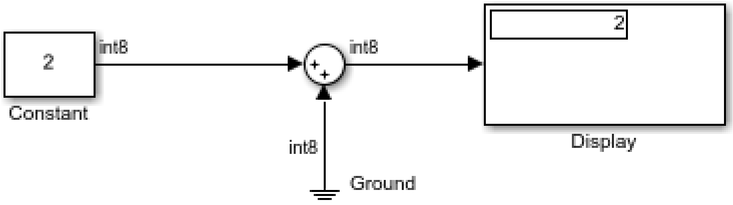
Simulate the model. The Display block shows the value `5`, which corresponds to the case `ex_SwitchCase_MyColors.Blue`.

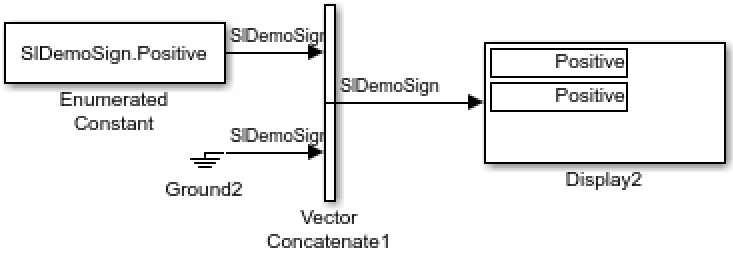
In the Enumerated Constant block dialog box, specify **Value** as `ex_SwitchCase_MyColors.Red` and click **Apply**. The Display block shows `19`.

Specify **Value** as `ex_SwitchCase_MyColors.Mauve` and click **Apply**. The Display block shows `3`, which corresponds to the default case.

Integer and Enumerated Data Type Support in the Ground Block

This example shows how to use the Ground block to ground block input ports that have integer and enumerated data types. In top row of this example, the output of the Constant block determines the data type (`int8`) of the port to which the Ground block is connected. That port determines the output data type of the Ground block, and the Ground block outputs a signal with zero value, and data type `int8`.





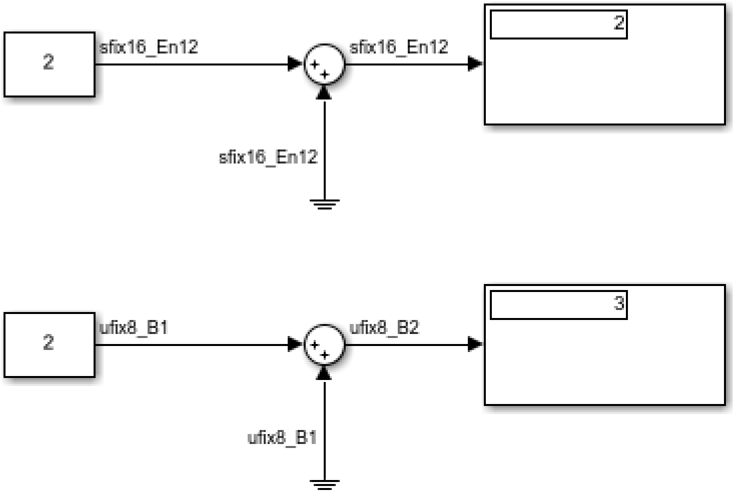
In the bottom row of this example, the Ground block is connected to a port with an enumerated data type. For enumerated data types, the Ground block outputs the default value of the enumeration. This behavior applies whether or not:

- The enumeration can represent zero
- The default value of the enumeration is zero

If the enumerated type does not have a default value, the Ground block outputs the first enumeration value in the type definition.

Fixed-Point Data Type Support in the Ground Block

This example shows how to use the Ground block to ground block input ports that have fixed-point data types. The top row of this example illustrates the Ground block behavior when the fixed-point data type can represent zero. In that case, the Ground block outputs a signal with zero value, and the same fixed-point data type as the port it is connected to.



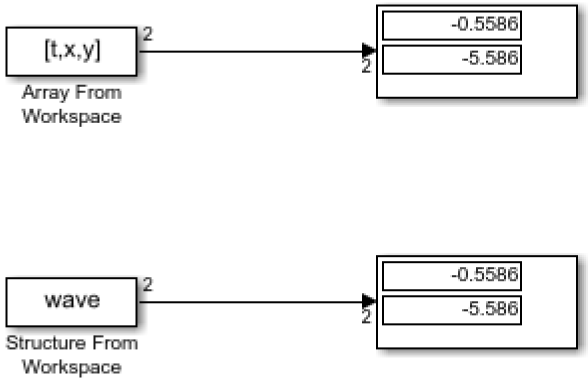
In the bottom row of this example, the output of the Constant block determines the data type of the port to which the Ground block is connected (`fixdt(0,8,1,1)`). Because zero cannot be represented exactly by the data type `fixdt(0,8,1,1)`, the Ground block outputs a nonzero value that is the closest possible value to zero (in this case, 1).

Read 1-D Array and Structure From Workspace

This example shows how to read 1-D signals from the MATLAB workspace. When you open the model, the following code is executed by a `PreLoadFcn` callback:

```
t = 0.2 * [0:49]';
x = sin(t);
y = 10*sin(t);
wave.time = t;
wave.signals.values = [x,y];
wave.signals.dimensions =2;
```

In the top row of the model, the From Workspace block reads the array `[t,x,y]` from the MATLAB workspace.



In the bottom row of the model, the From Workspace block reads the same values from the workspace, but this time they are read from a structure named `wave`.

Read Structure From Workspace Using Model Sample Time

This example shows how to read a structure from the MATLAB workspace using a sample time specified in the From Workspace block. When you open the model, the following code is executed by a `PreLoadFcn` callback:

```
t = 0.2 * [0:49]';
x = sin(t);
y = 10*sin(t);
wave.time = [];
wave.signals.values = [x,y];
wave.signals.dimensions =2;
```

The From Workspace block is configured as follows:

- **Sample time**: `0.2`
- **Interpolate data**: off
- **Form output after final value by**: `Setting to zero`

When you run the model, the From Workspace block reads the structure `wave` from the workspace. After the last time hit for which workspace data is available, the block outputs `0`.

Read 2-D Signals in Structure Format From Workspace

This example shows how to read a 2-D structure from the MATLAB workspace. When you open the model, the following code is executed by a `PreLoadFcn` callback:

```
t1 = 0.2 * [0:49]';
m = magic(10);
M = repmat(m,[1 1 length(t1)]);
data.time=t1;
data.signals.values = M;
data.signals.dimensions=[10 10];
```

This code creates 10-by-10 matrix (2-D signal) by using the `magic` function, and then creates a 3-D matrix by adding a time vector. The time vector must be a column vector. The `signals.values` field is a 3-D matrix where the third dimension corresponds to time. The `signals.dimensions` field is a two-element vector. The first element is the number of rows and the second element is the number of columns in the `signals.values` field.

When you run the model, the From Workspace block reads the structure `data` from the workspace.

From File Block Loading Timeseries Data

Create a MATLAB® `timeseries` object with time and signal values. Save the timeseries object to a MAT-file and load into a model using a From File block.

Create an array with the time and signal data, specifying signal data for 10 time steps.

```
t = .1*(1:10);
d = .2*(1:10);
x = [t;d];
```

Create a MATLAB `timeseries` object.

```
ts = timeseries(x(2:end,:),x(1,:))
```

```
  timeseries

  Common Properties:
            Name: 'unnamed'
            Time: [10x1 double]
        TimeInfo: tsdata.timemetadata
            Data: [1x1x10 double]
        DataInfo: tsdata.datametadata
```

Save the `timeseries` object in a Version 7.3 MAT-file.

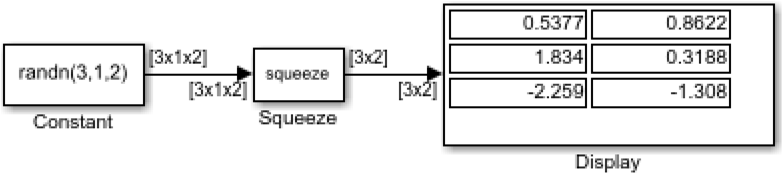
```
save('mySignals','ts','-v7.3')
```

Add a From File block and set the **File name** parameter of that block to `mySignals.mat`.

Simulate the model. The Scope block reflects the data loaded from the `mySignals.mat` file.

Eliminate Singleton Dimension with the Squeeze Block

This example shows a model using the Squeeze block to eliminate a dimension of size 1.



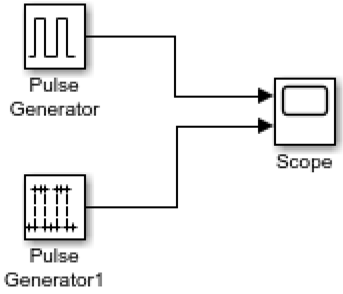
```
0.5377   0.8622
1.834    0.3188
-2.259   -1.308
```

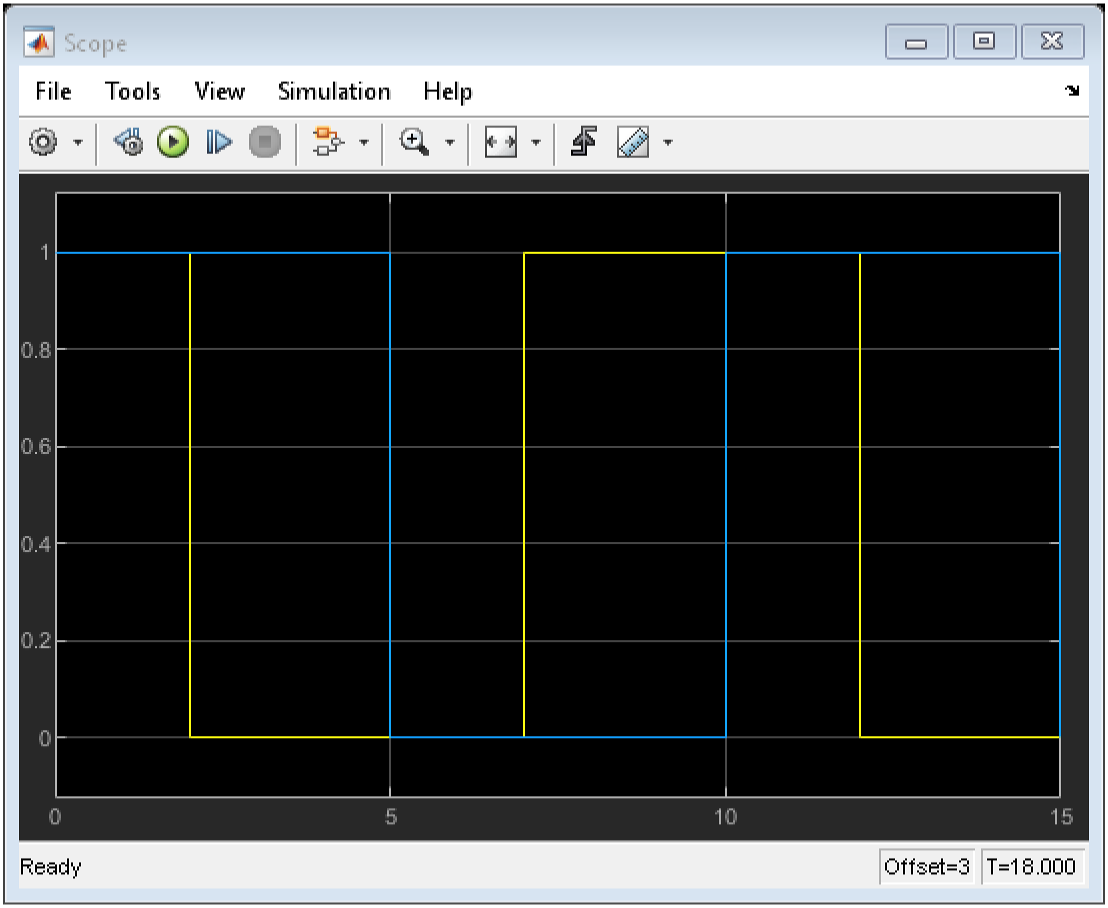
The Squeeze block converts a multidimensional array from the Constant block of size 3-by-1-by-2 into a 3-by-2 signal.

Difference Between Time- and Sample-Based Pulse Generation

This example shows the difference in behavior of the Pulse Generator block in time-based and sample-based modes.

Consider this model, with two Pulse Generator blocks. One block has the **Pulse type** parameter set to Time based, and the other to Sample based. Both blocks are configured to output a pulse with an amplitude of one that is `on` for five seconds, followed by `off` for five seconds. The simulation time runs from three seconds to a stop time of 18 seconds. Notice the time offset notice in the lower right corner.

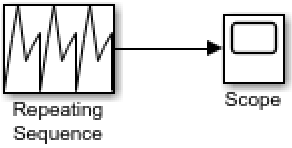


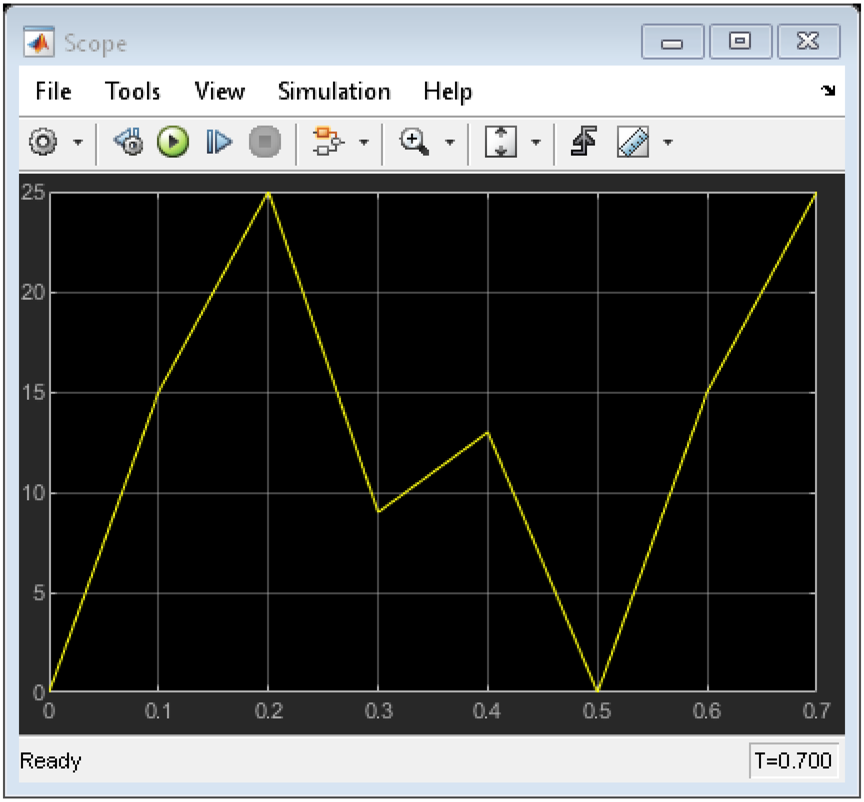


Notice that the time-based Pulse Generator produces an on signal for only two seconds and then switches to off. This is due to the block starting to compute the output from t=0 even though it does not output the simulation until t=3. The sample-based block outputs a pulse of five seconds on followed by five seconds off. In this case, the block output does not depend on simulation time and starts only when the simulation starts.

Specify a Waveform with the Repeating Sequence Block

This example shows how you specify a waveform with the Repeating Sequence block. In this model, the block defines the **Time values** parameter as `[0:0.1:0.5]` and the **Output values** parameter as `[0 15 25 09 13 17]`. The stop time of the simulation is `0.7` second.



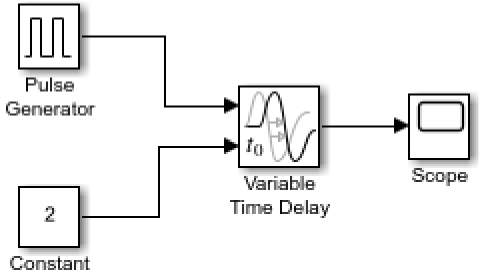


- Input period is `0.5`.
- Output at any time `t` is the output at time `t = t-0.5n`, where `n` = 0,1,2, and so on.
- Sequence repeats at `t = 0.5n`.

At `t = 0.5`, the expected output is equal to the output at `t = 0`, which is `0`. Therefore, the last value in the **Output values** parameter vector `[0 15 25 09 13 17]` does not appear.

Tune Phase Delay on Pulse Generator During Simulation

This example shows how to modify a model so that you can change a phase delay for a Pulse Generation block during simulation. You cannot tune the value of the **Phase delay** parameter during simulation. As a workaround, add a Constant block and a Variable Time Delay block.



In the Pulse Generator block, set the value of the **Phase delay** parameter to zero. Use the Constant block to specify the delay time in seconds. To tune the delay time during simulation, change the value stored in the Constant block.

Difference Sine Wave Signal

This example shows how to calculate the difference in a sine wave signal at each time step. The input is a 1-by-2 vector of sine waves, with amplitude 1 and 3. The difference block calculates the difference in each sine wave signal at every time step. The Scope block displays both the original sine waves and the output of the difference block.

Discrete-Time Derivative of Floating-Point Input

This example shows how to use the Discrete Derivative block to compute the discrete-time derivative of a floating-point input signal. The unfiltered discrete-time derivative is compared to a filtered discrete-time derivative that is computed by the Discrete Filter block.

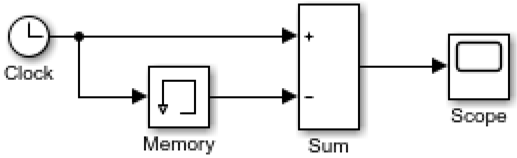
Calculate and Display Simulation Step Size using Memory and Clock Blocks

This example shows how to use the Memory and Clock blocks to calculate and display the step size in a simulation. The Sum block subtracts the time at the previous time step, which the Memory block generates, from the current time, which the Clock block generates.

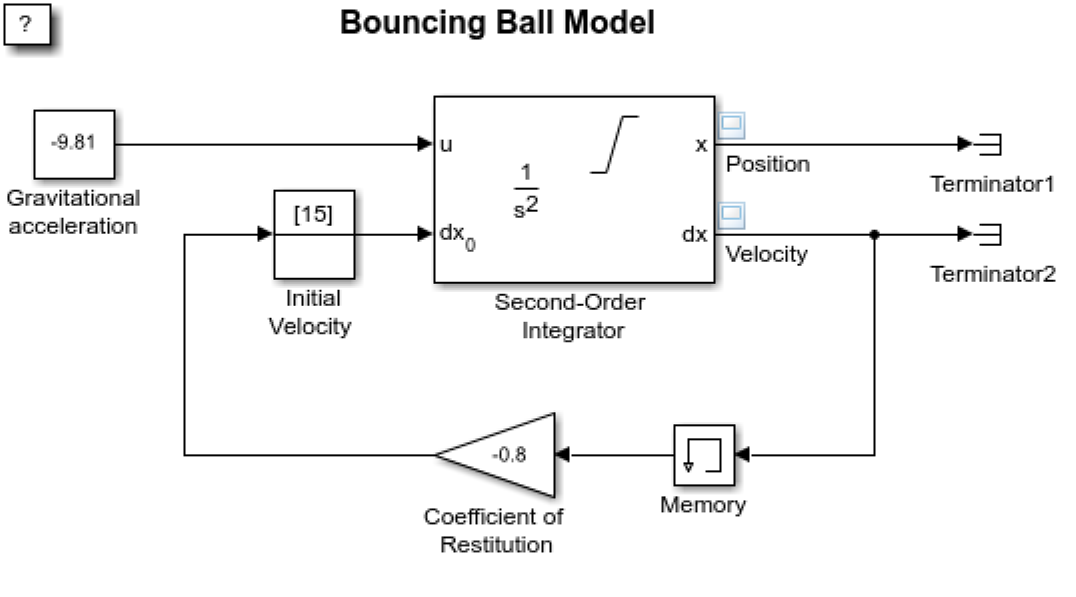


Because **Inherit sample time** is not selected for the Memory block, the block sample time depends on the type of solver for simulating the model. In this case, the model uses a fixed-step solver. Therefore, the sample time of the Memory block is the solver step size, or 1.

If you replace the Memory block with a Unit Delay block, you get the same results. The Unit Delay block inherits a discrete sample time of 1.

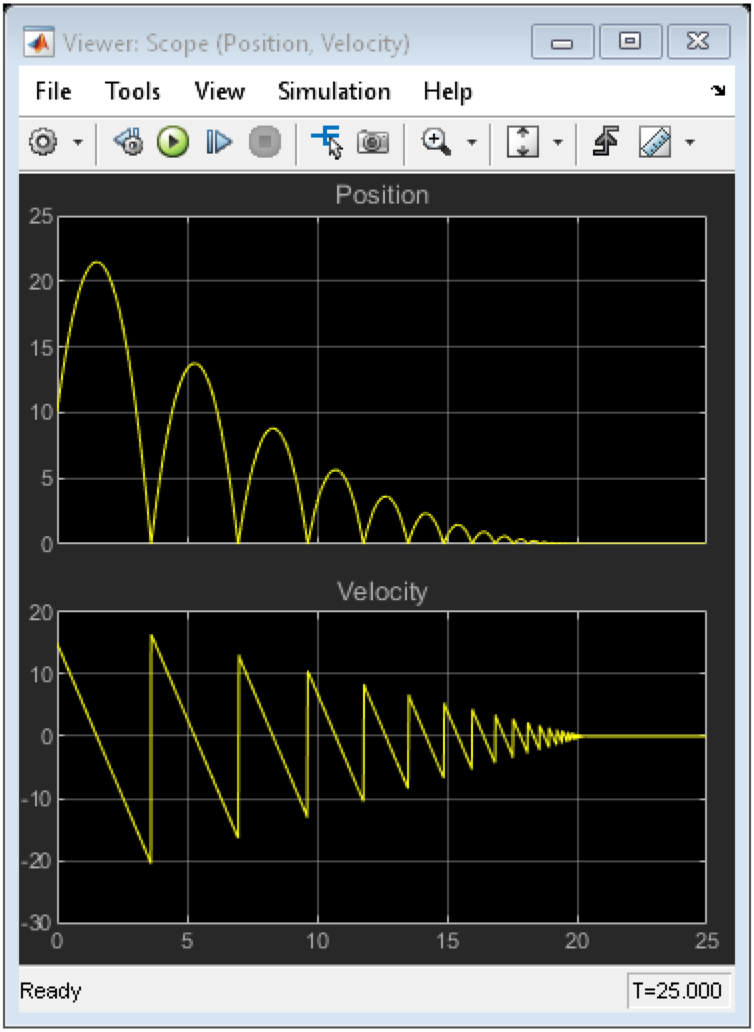
Capture the Velocity of a Bouncing Ball with the Memory Block

The `sldemo_bounce` example shows how to use the Second-Order Integrator and Memory blocks to capture the velocity of a bouncing ball just before it hits the ground.



Copyright 2004-2013 The MathWorks, Inc.

Because **Inherit sample time** is not selected for the Memory block, the block sample time depends on the type of solver for simulating the model. In this case, the model uses a variable-step (ode23) solver. Therefore, the sample time of the Memory block is continuous but fixed in minor time step: [0, 1]. When you run the model, you get the following results:

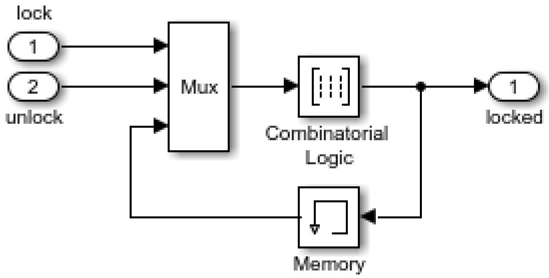


If you replace the Memory block with a Unit Delay block, you get the same results. However, a warning also appears due to the discrete Unit Delay block inheriting a continuous sample time.

For more information, see the model description.

Implement a Finite-State Machine with the Combinatorial Logic and Memory Blocks

The sldemo_clutch example shows how you can use the Memory block with the Combinatorial Logic block to implement a finite-state machine. This construct appears in the Friction Mode Logic/Lockup FSM subsystem:

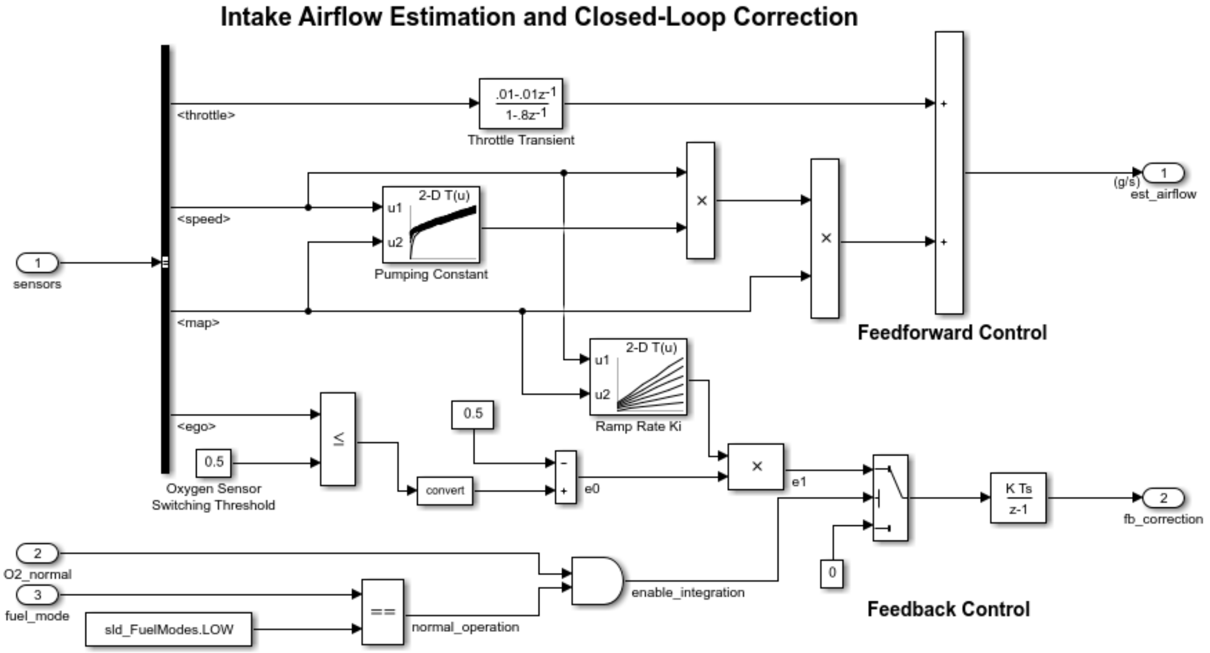


Because **Inherit sample time** is not selected for the Memory block, the block sample time depends on the type of solver for simulating the model. In this case, the model uses a variable-step (ode23) solver. Therefore, the sample time of the Memory block is continuous but fixed in minor time step: [0, 1].

For more information, see the model description.

Discrete-Time Integration Using the Forward Euler Integration Method

The sldemo_fuelsys model uses a Discrete-Time Integrator block in the `fuel_rate_control/airflow_calc` subsystem. This block uses the Forward Euler integration method.

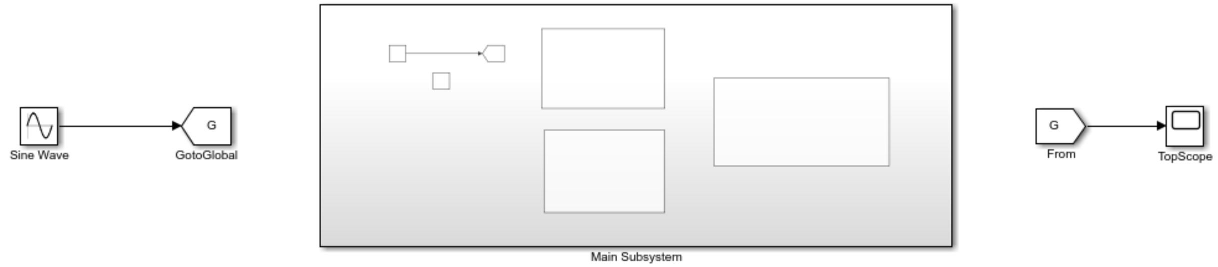


When the Switch block feeds a nonzero value into the Discrete-Time Integrator block, integration occurs. Otherwise, integration does not occur.

For more information, see the model description.

Signal Routing with the From, Goto, and Goto Tag Visibility Blocks

This example shows how to use the From, Goto, and Goto Tag Visibility blocks to route signals in your model. The GotoGlobal block at the top-level of the model has the **Goto tag** parameter set to `G` and the **Tag visibility** set to `global`. Thus, the `G` tag can be seen by From and Goto blocks at any level of the model hierarchy, except locations that span nonvirtual subsystem boundaries (like the Atomic Subsystem in this model). The From block at the top level of the model can see and connect to the global `G` tag, but cannot see or connect to the scoped `S` tag or `L` local tag that are specified on Goto blocks further down in the model hierarchy.



Inside of the Main Subsystem, the Goto block with **Goto tag** set to `S` has a **Tag visibility** of `scoped`. The Goto Tag Visibility block placed at the same level as that Goto block indicates the `S` tag can be seen by all From and Goto blocks at that level and below, except for locations that cross a nonvirtual subsystem boundary (i.e. the boundary with the Atomic Subsystem). Inside of Subsystem1 and Subsystem2, the From blocks can see and connect to the global Goto tag `G`, and the scoped Goto tag `S`.

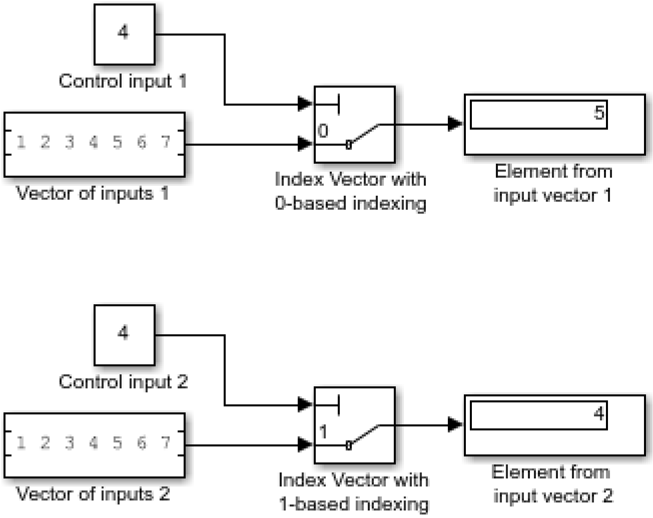
Zero-Based and One-Based Indexing with the Index Vector Block

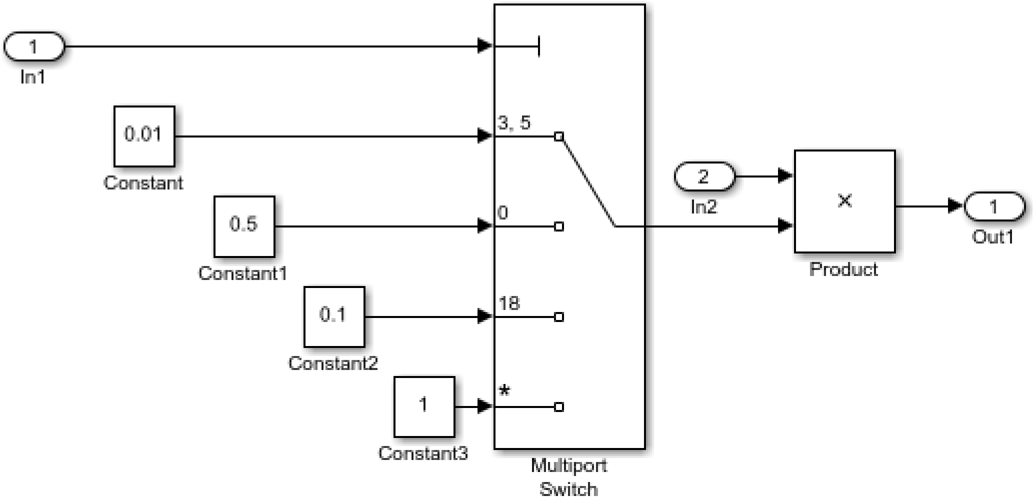
This example shows how the Index Vector block works with zero-based and one-based indexing.



The Index Vector block is from the Simulink Signal Routing library. It is a special configuration of the Multiport Switch block. To configure the Multiport Switch block as an Index Vector block, set the **Number of data ports** to `1` and **Data port order** to `Zero-based contiguous`.

Noncontiguous Values for Data Port Indices of Multiport Switch Block

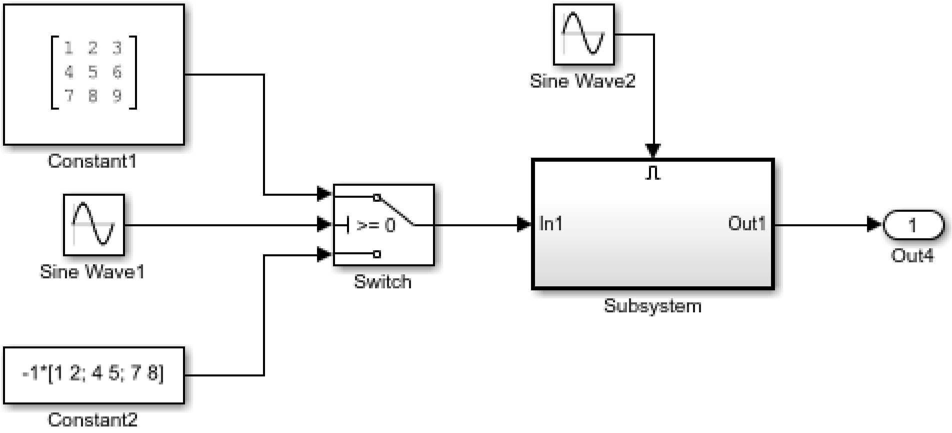
This example shows how to use a Multiport Switch block that specifies noncontiguous integer values for data ports. The values of the indices are visible on the data port labels. You do not have to open the block dialog box to determine which value maps to each data port.



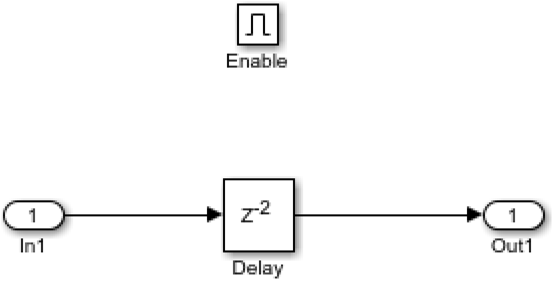
When you set **Data port for default case** to `Additional data port`, an extra port with a * label appears. This port corresponds to the default case, which applies when the control input does not match the data port indices 3, 5, 0, or 18. When that happens in this example, the Multiport Switch block outputs a value of `1`.

Using Variable-Size Signals on the Delay Block

This example shows how the Delay block supports vairable-size signals for sample-based processing. The Switch block controls whether the input signal to the enabled subsystem is a 3-by-3 or 3-by-2 matrix.



The Delay block appears inside the enabled subsystem.



The model follows these rules for variable-size signals while using sample-based processing.

- Signal dimensions change only during state reset when the block is enabled.

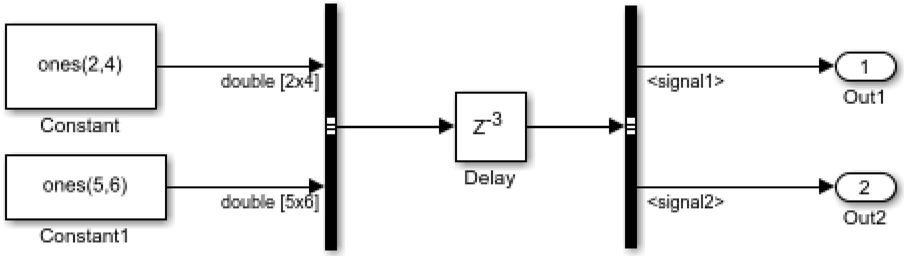
- Initial condition must be scalar.

The rules are implemented by these blocks.

- Enable block sets **Propagate sizes of variable-size signals** to `Only when enabling`.
- Delay block sets the **Initial condition** to the scalar value `0.0`.

Bus Signals with the Delay Block for Frame-Based Processing

This example shows how the Delay block supports bus signals for frame-based processing.



Each Constant block supplies an input signal to the Bus Creator block, which outputs a two-dimensional bus signal. After the Delay block delays the bus signal by three sample periods, the Bus Selector block separates the bus back into the two original signals.

The model follows these rules for bus signals.

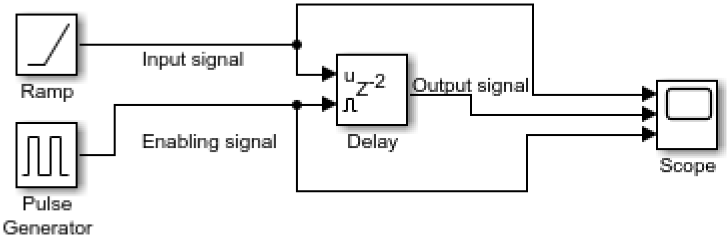
- For the initial condition, set the value on the dialog box.
- For frame-based processing, signal dimensions of the data input port `u` cannot be larger than two.

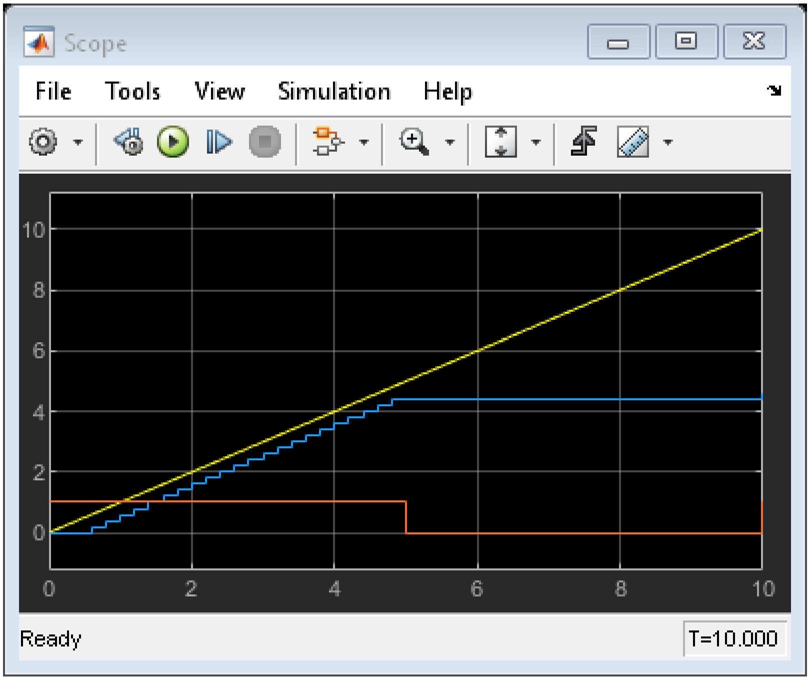
The model implements the rules by:

- Setting the **Initial condition** to a scalar value of `0`.
- Setting bus input to the Delay block as two dimensions.

Control Execution of Delay Block with Enable Port

This example shows how you can enable or disable the execution of the Delay block using an enable port. In this model, a ramp input signal feeds into a Delay block. The execution of the block is controlled by an enabling signal from the Pulse Generator block.

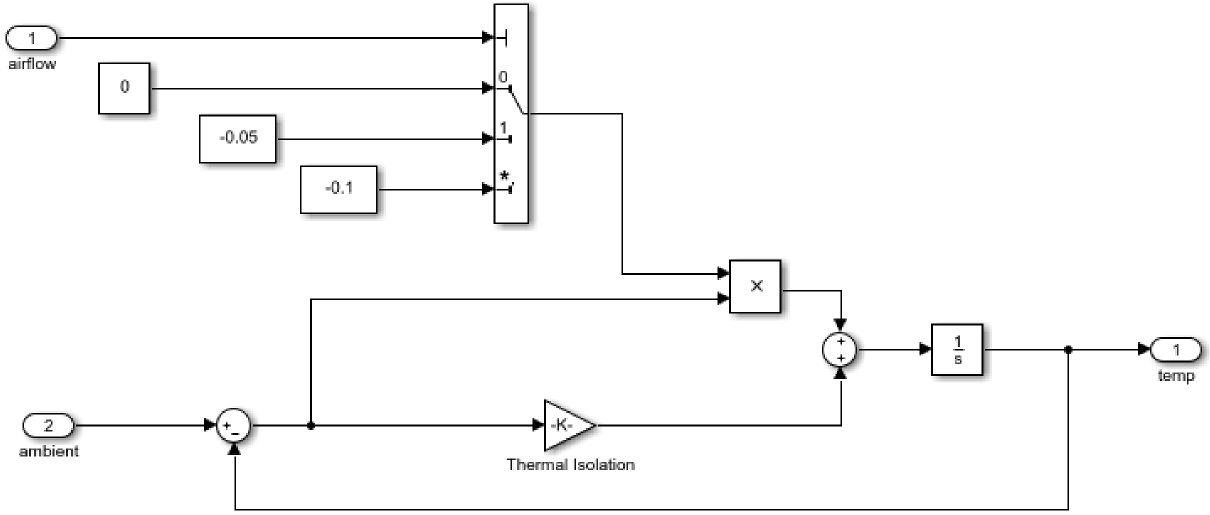




The blue line shows that the Delay block outputs the input signal value delayed by one time step while the enabling signal has a value of one. At `t=5` the enabling signal transitions to zero and the Delay block stops executing. The output is held at the last value until the block is enabled again.

Zero-Based Indexing for Multiport Switch Data Ports

The sf_aircontrol model uses a Multiport Switch block in the `Physical Plant` subsystem. This block uses zero-based indexing for contiguous ordering of three data ports.

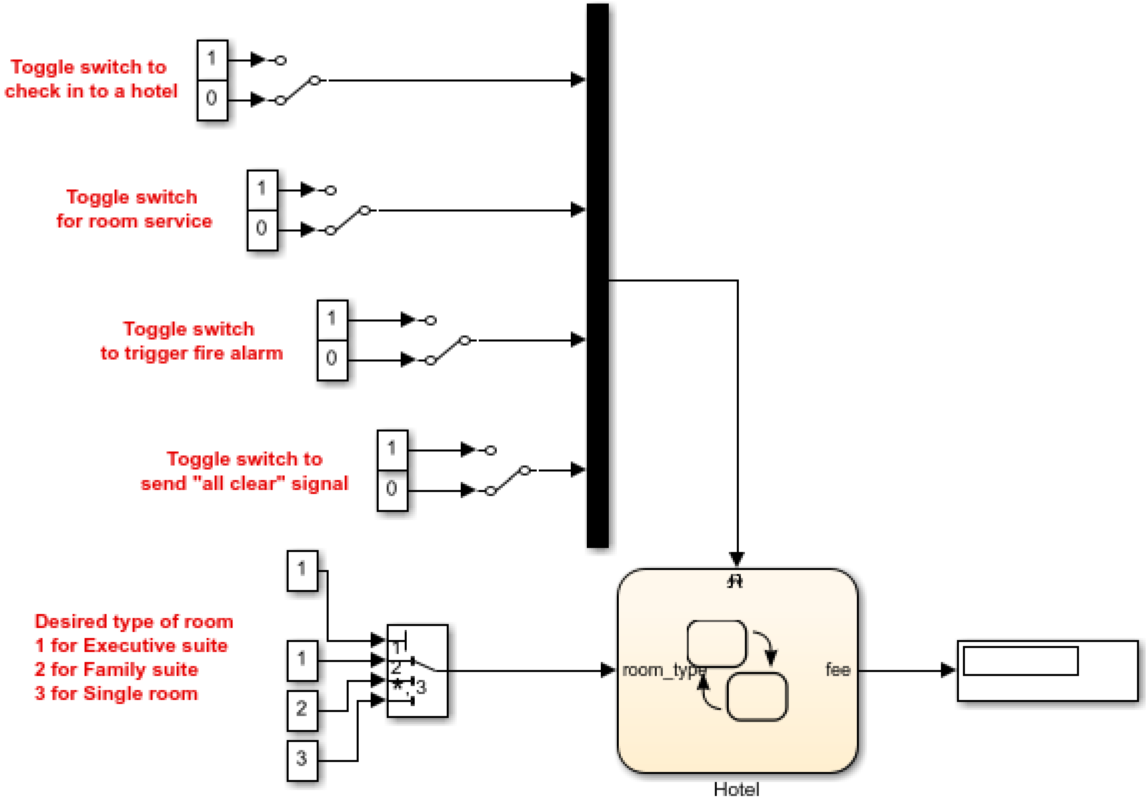


The indices are visible on the data port labels. You do not have to open the block dialog box to determine if the data ports use zero-based or one-based indexing.

When you set **Data port for default case** to `Last data port`, the last data port includes a `*` on the label (in this case, the label is `*,2`). The comma after the `*` indicates that the data port index has a value. This port corresponds to the default case, which applies when the control input does not match the data port indices. In this example, the Multiport Switch block outputs a value of `-0.1` when the control input does not match the data port indices of 0, 1, or 2.

One-Based Indexing for Multiport Switch Data Ports

The sf_semantics_hotel_checkin model uses a Multiport Switch block. This block uses one-based indexing for contiguous ordering of three data ports.

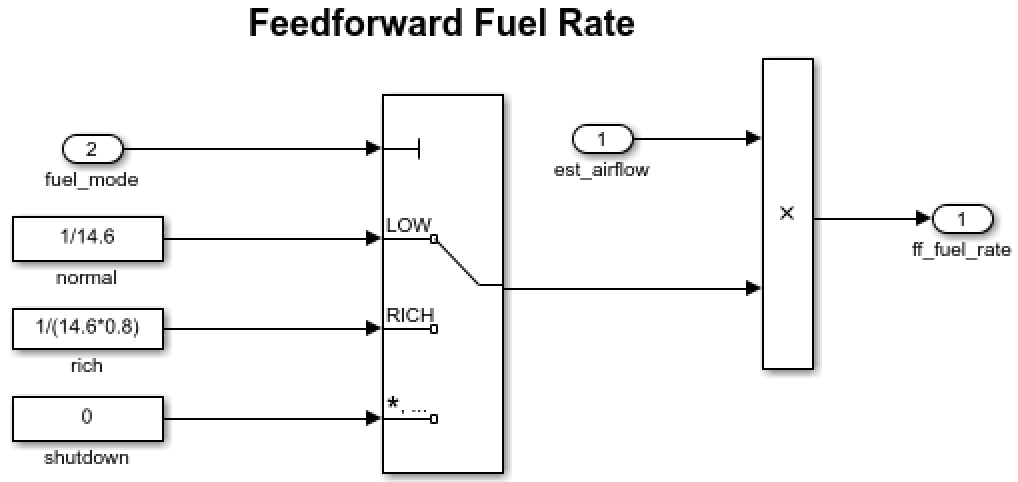


Copyright 2008-2013 The MathWorks, Inc.

When you increase the size of the block icon, the indices are visible on the data port labels. You do not have to open the block dialog box to determine whether the data ports use zero-based or one-based indexing.

Enumerated Names for Data Port Indices of the Multiport Switch Block

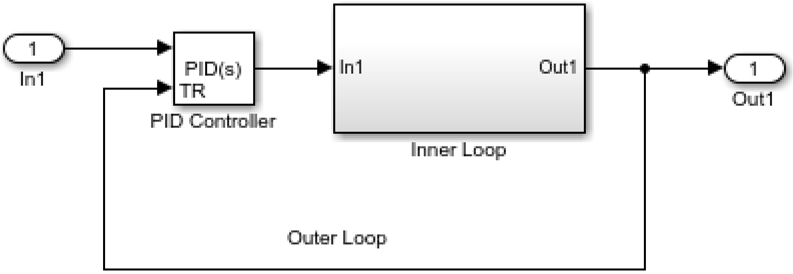
The sldemo_fuelsys model uses a Multiport Switch block in the `fuel_rate_control/fuel_calc/feedforward_fuel_rate` subsystem. This block uses the enumerated type `sld_FuelModes` to specify three data port indices: `LOW`, `RICH`, and `DISABLED`.



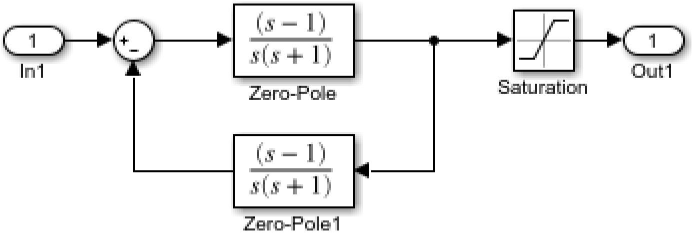
When you set **Data port for default case** to `Last data port`, the last data port includes a * on the label. The comma and ellipsis after the * indicate that the data port index has a value. This port corresponds to the default case, which applies when the control input does not match the data port indices `LOW`, `RICH`, or `DISABLED`. In this case, the Multiport Switch block outputs a value of `0`.

Prevent Block Windup in Multiloop Control

This example shows how to use signal tracking to prevent block windup in a two-loop control system.



The Inner Loop subsystem contains a saturation limit:

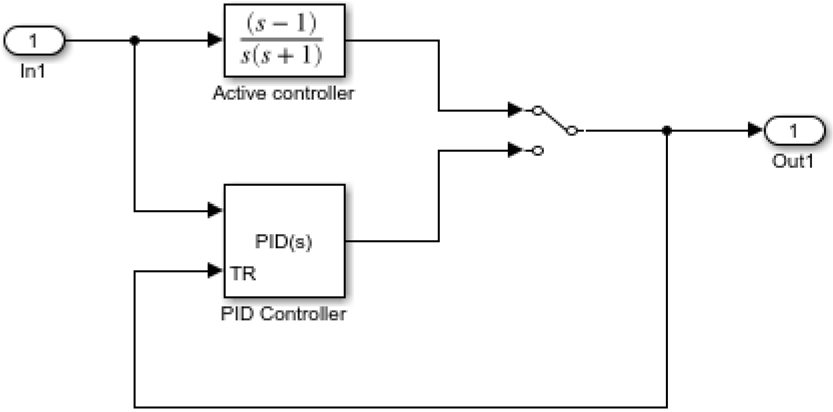


In this example, the inner loop has an effective gain of 1 when it does not saturate. When the inner loop does saturate, however, the integrator in the PID Controller can begin to wind up.

If the PID controller tracks the output of the inner loop, then its output never exceeds the saturated inner-loop output. To achieve this tracking, connect the Saturation block output to the tracking input of the PID Controller.

Bumpless Control Transfer

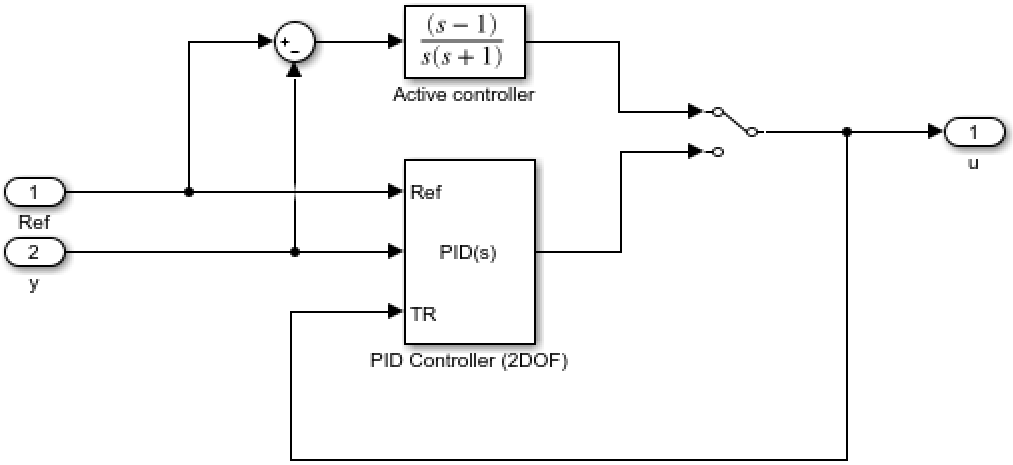
This example shows how to use signal tracking to achieve bumpless control transfer in a system that switches between a PID Controller block and another controller. You can make the PID controller track the output of the other controller by connecting the signal you want to track to the TR port of the PID Controller block. For example:



The input In1 takes a reference signal that feeds both controllers. The output Out1 drives a controlled system (not shown). A switch transfers control between the Active controller block (a Zero-Pole block) and the PID Controller block. When the Active controller is in the loop, the PID Controller block tracks its output. Thus, the two controllers have the same output when you switch to PID control, ensuring smooth operation.

Bumpless Control Transfer with a Two-Degree-of-Freedom PID Controller

This example shows how to use signal tracking to achieve bumpless control transfer in a system that switches between a PID Controller (2DOF) block and another controller. You can make the PID controller track the output of the other controller by connecting the signal you want to track to the TR port of the PID Controller block. For example:



The input Ref takes a reference signal, and the input y takes the measured feedback from the plant. These signals feed the 2DOF controller, and the difference between them feeds the Active controller block (a Zero-Pole block). The output u drives the plant. A switch transfers control between the active controller and the PID Controller (2DOF) block. When the Active controller is in the loop, the PID Controller (2DOF) block tracks its output. Thus, the two controllers have the same output when you switch to PID control, ensuring smooth operation.

Using a Bit Set block

If the Bit Set block is turned on for bit 2 bit 2 is set to 1.

A vector of constants 2.^[0 1 2 3 4] is represented in binary as [00001 00010 00100 01000 10000].

With bit 2 set to 1, the result is [00101 00110 00100 01100 10100], which is represented in decimal as [5 6 4 12 20].

Using a Bit Clear block

If the Bit Clear block is turned on for bit 2, bit 2 is set to 0.

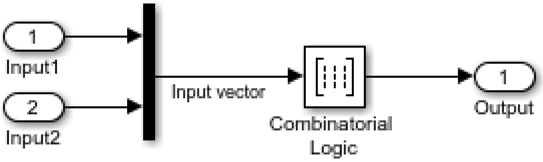
A vector of constants 2.^[0 1 2 3 4] is represented in binary as [00001 00010 00100 01000 10000].

With bit 2 set to 1, the result is [00101 00110 00100 01100 10100], which is represented in decimal as [5 6 4 12 20].

With bit 2 set to 0, the result is [00001 00010 00000 01000 10000], which is represented in decimal as [1 2 0 8 16]

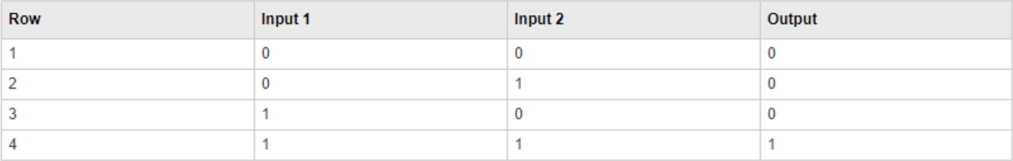
Two-Input AND Logic

This example builds a two-input AND function, which returns 1 when both input elements are 1, and 0 otherwise. To implement this function, specify the **Truth table** parameter value as [0; 0; 0; 1] The portion of the model that provides the inputs to and the output from the Combinatorial Logic block might look like this:



The following table indicates the combination of inputs that generate each output. The input signal labeled `Input` corresponds to the column in the table labeled Input 1. Similarly, the input signal `Input 2` corresponds to the column with the same name. The combination of these values determines the row of the Output column of the table that is passed as block output. For example, if the input vector is [1 0], the input references the third row:

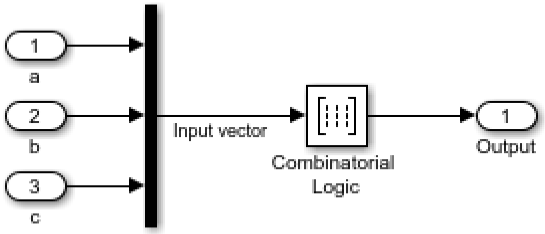
(2^1*1 + 1) The output value is 0.



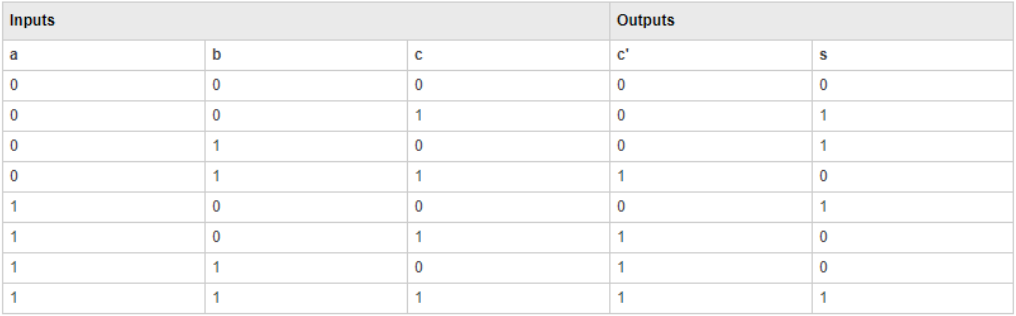
Row	Input 1	Input 2	Output
1	0	0	0
2	0	1	0
3	1	0	0
4	1	1	1

Circuit Logic

This sample circuit has three inputs: the two bits (**a** and **b**) to be summed and a carry-in bit (**c**). It has two outputs: the carry-out bit (**c'**) and the sum bit (**s**).



The truth table and corresponding outputs for each combination of input values for this circuit appear in the following table.

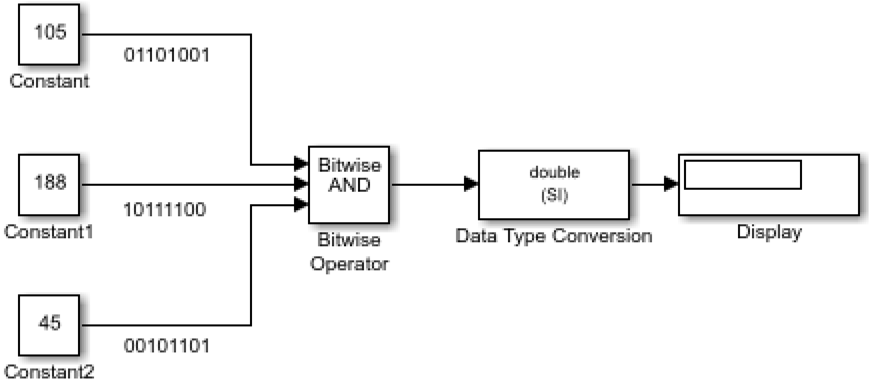


Inputs			Outputs	
a	b	c	c'	s
0	0	0	0	0
0	0	1	0	1
0	1	0	0	1
0	1	1	1	0
1	0	0	0	1
1	0	1	1	0
1	1	0	1	0
1	1	1	1	1

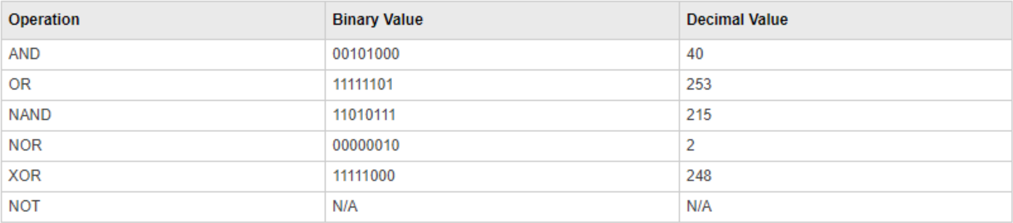
To implement this adder with the Combinatorial Logic block, you enter the 8-by-2 matrix formed by columns **c'** and **s** as the **Truth table** parameter. You can also implement sequential circuits (that is, circuits with states) with the Combinatorial Logic block by including an additional input for the state of the block and feeding the output of the block back into this state input.

Unsigned Inputs for the Bitwise Operator Block

The following model shows how the Bitwise Operator block works for unsigned inputs.



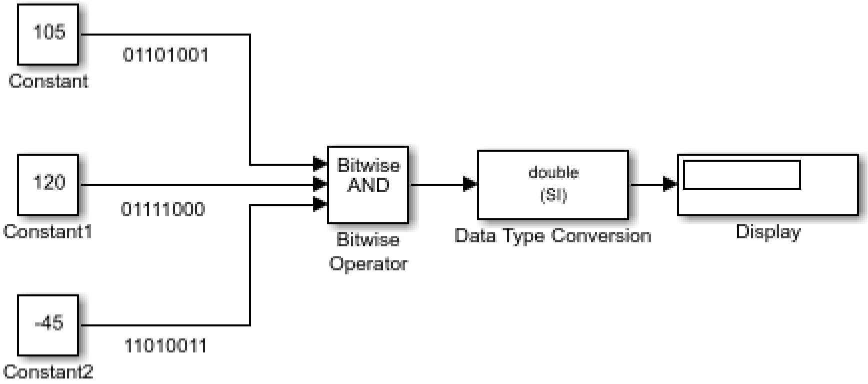
Each Constant block outputs an 8-bit unsigned integer (uint8). To determine the binary value of each Constant block output, use the dec2bin function. The results for all logic operations appear in the next table.



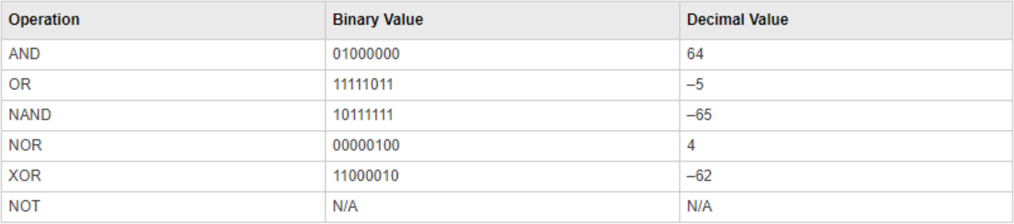
Operation	Binary Value	Decimal Value
AND	00101000	40
OR	11111101	253
NAND	11010111	215
NOR	00000010	2
XOR	11111000	248
NOT	N/A	N/A

Signed Inputs for the Bitwise Operator Block

The following model shows how the Bitwise Operator block works for signed inputs.



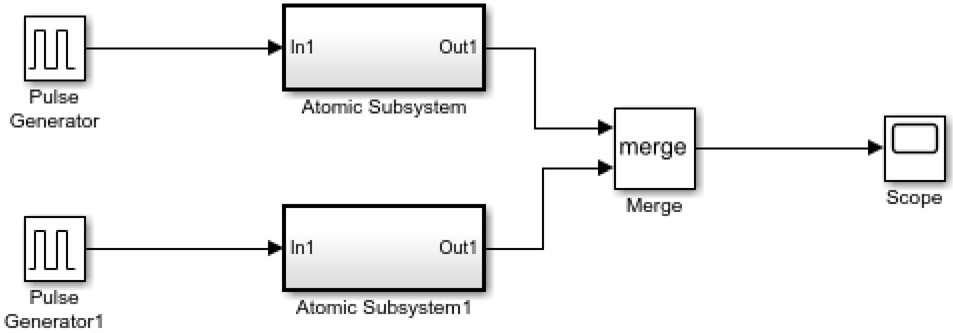
Each Constant block outputs an 8-bit signed integer (`int8`) . To determine the binary value of each Constant block output, use the dec2bin function. The results for all logic operations appear in the next table.



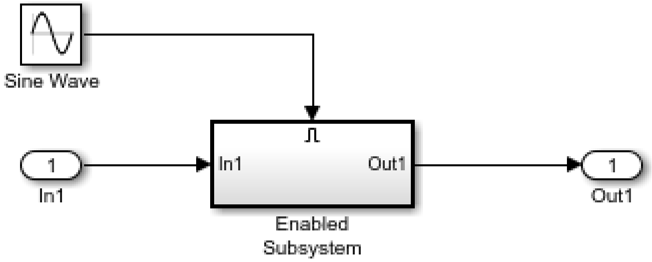
Operation	Binary Value	Decimal Value
AND	01000000	64
OR	11111011	–5
NAND	10111111	–65
NOR	00000100	4
XOR	11000010	–62
NOT	N/A	N/A

Merge Block with Input from Atomic Subsystems

This example shows a Merge block with inputs from two atomic subsystems.

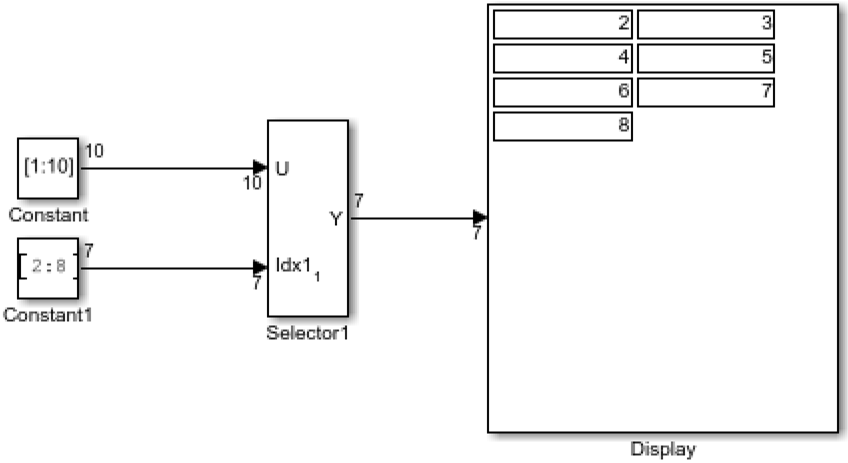


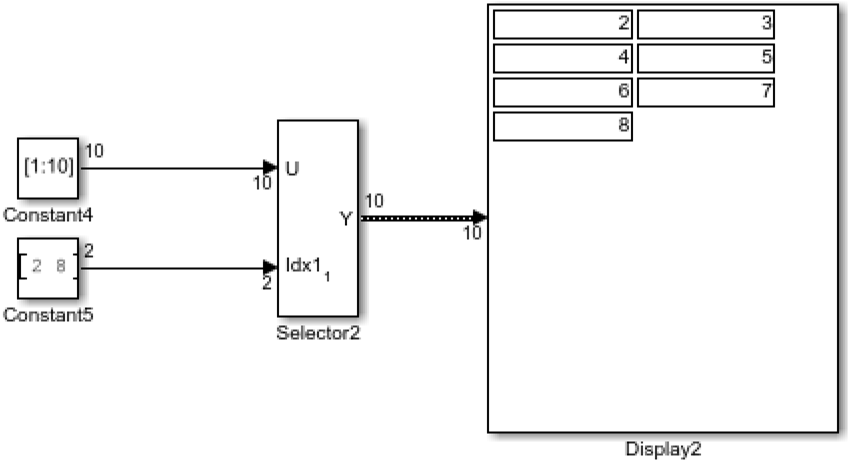
Each Atomic Subsystem block contains an enabled subsystem. This satisfies the requirement that inputs to a Merge block are from a conditionally executed subsystem.



Index Options with the Selector Block

This example shows two Selector blocks with the same kind of input signals, but two different **Index Option** settings.





Both Selector blocks select 7 values from the input signal that feeds the input port. The `Selector1` block outputs a fixed-size signal, whereas the `Selector2` block outputs a variable-size signal whose compiled signal dimension is 10 instead of 7.

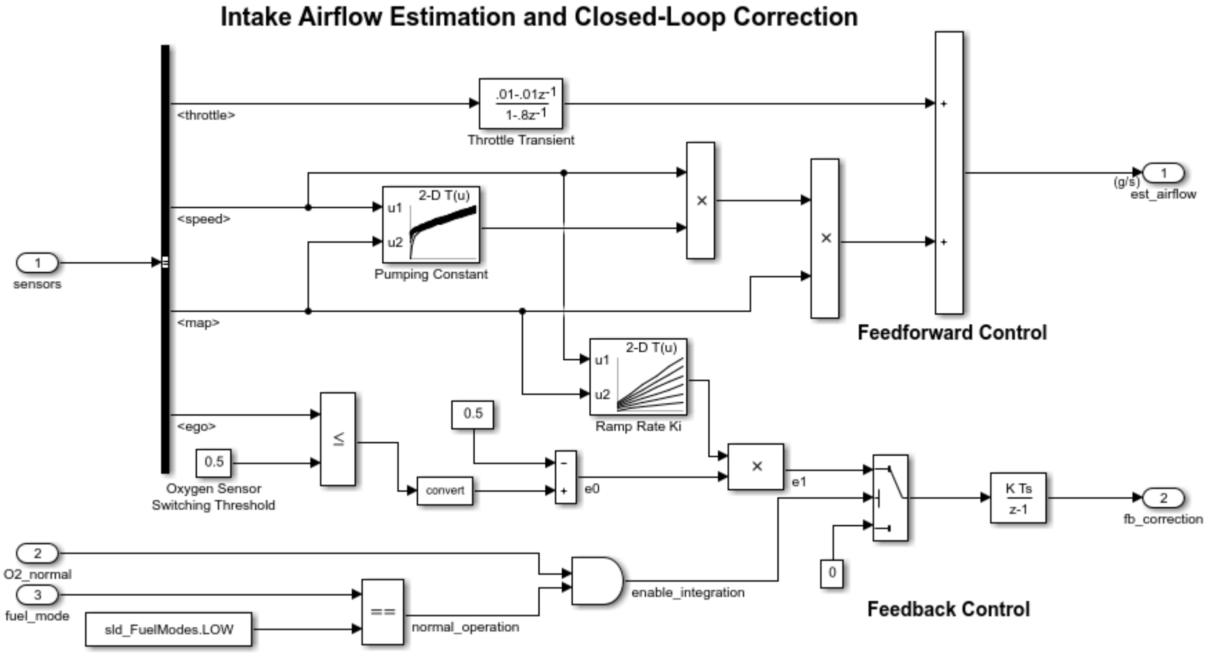
The `Selector1` block sets **Index Option** to `Index vector (port)`, which uses the input signal from `Constant1` as the index vector. The dimension of the input signal is 7, so the `Display` block shows the 7 values of the `Constant1` block. The `Selector2` block sets the **Input port size** parameter to 10, which is the size of the largest input signal to the `Selector2` block.

The `Selector2` block also sets the **Index Option** to `Starting and ending indices (port)`. The output is then set to the size of **Input port size** parameter (10), even though the size of the input signal is 7.

Switch Block with a Boolean Control Port Example

This example shows a Switch block with a Boolean input for the control port.

```
open_system('sldemo_fuelsys');
open_system('sldemo_fuelsys/fuel_rate_control/airflow_calc');
```



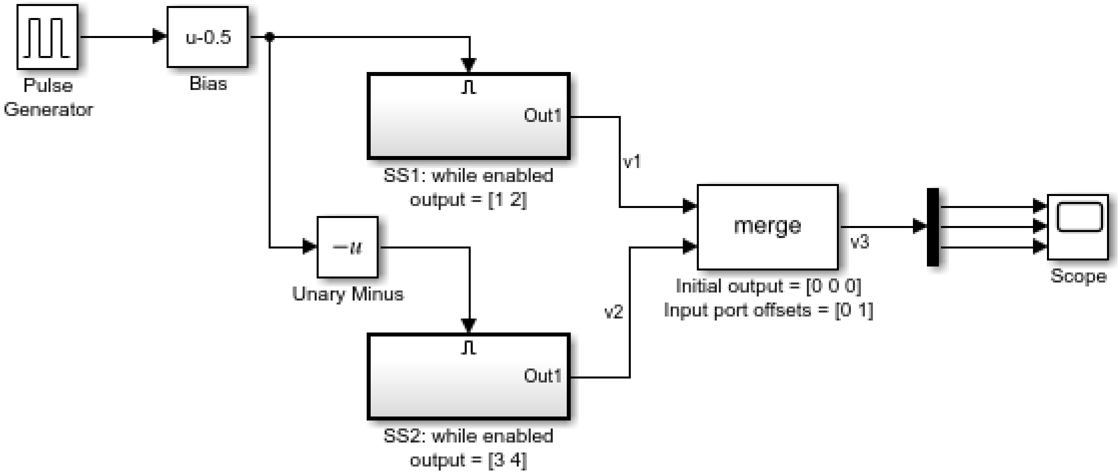
The value of the control port on the Switch block determines whether or not the feedback correction occurs. The control port value depends on the output of the Logical Operator block. When the Logical Operator block out is `true`, then the Switch block control port is 1 and the feedback control occurs. If the Logical Operator block output is `false` then the feedback control does not occur.

Merge Block with Unequal Input Widths Example

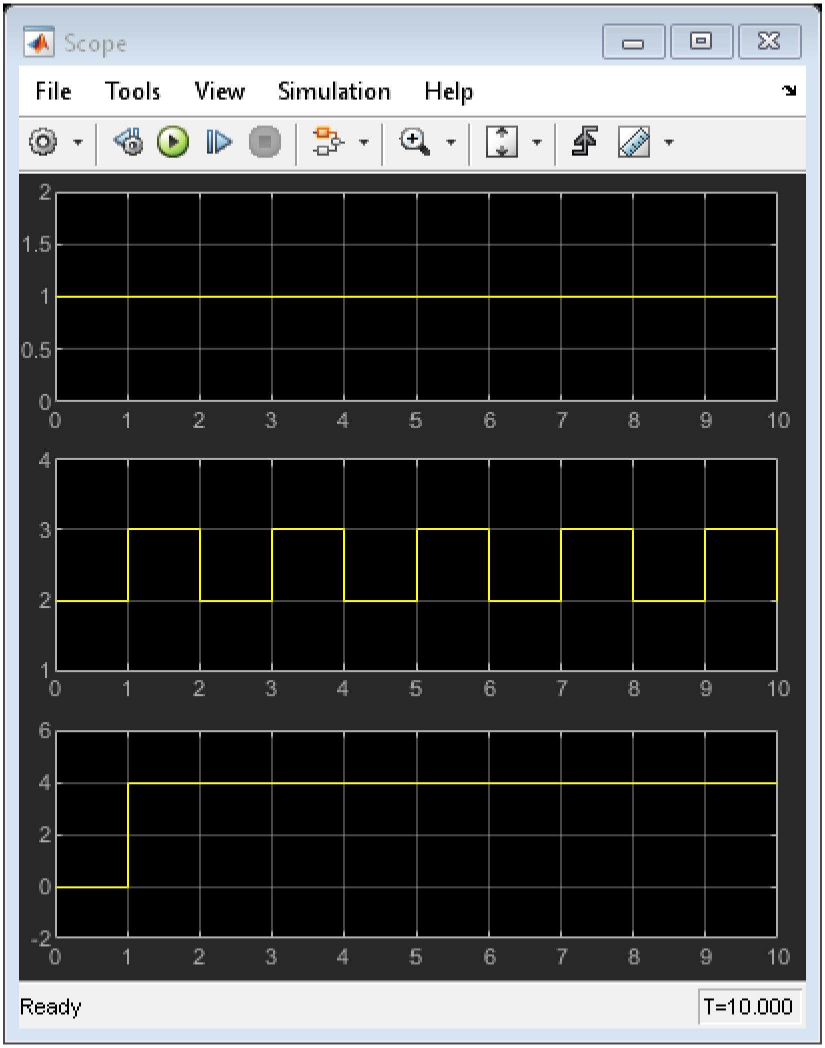
This example shows how to use the Merge block with inputs ports that have different widths. If you select `Allow unequal port widths`, the block accepts scalar and vector inputs having differing numbers of elements. You can specify an offset for each input signal relative to the beginning of the output signal. The width of the output signal is:

$$max(w1 + o1, w2 + o2, ...wn + on)$$

where wn are the widths of the input signals, and on are the offsets.



Pulse Generator
u-0.5
Bias
Out1
SS1: while enabled output = [1 2]
v1
−u
Unary Minus
merge
v3
Initial output = [0 0 0]
Input port offsets = [0 1]
Scope
v2
Out1
SS2: while enabled output = [3 4]



The Merge block has the following output width.

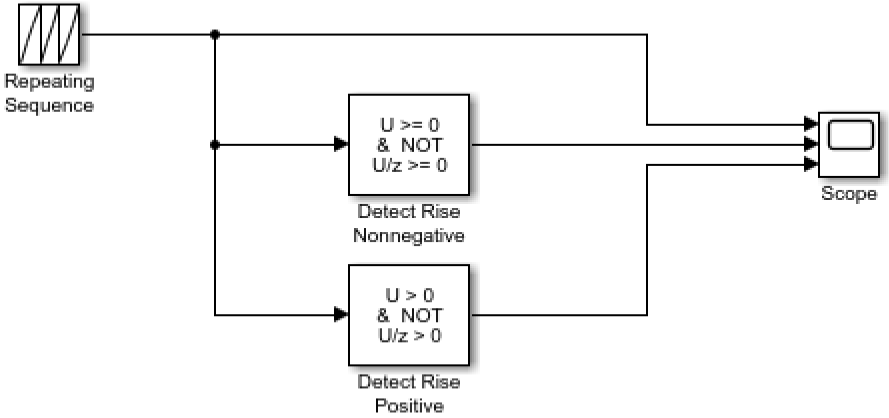
$$max(2+0,2+1)=3$$

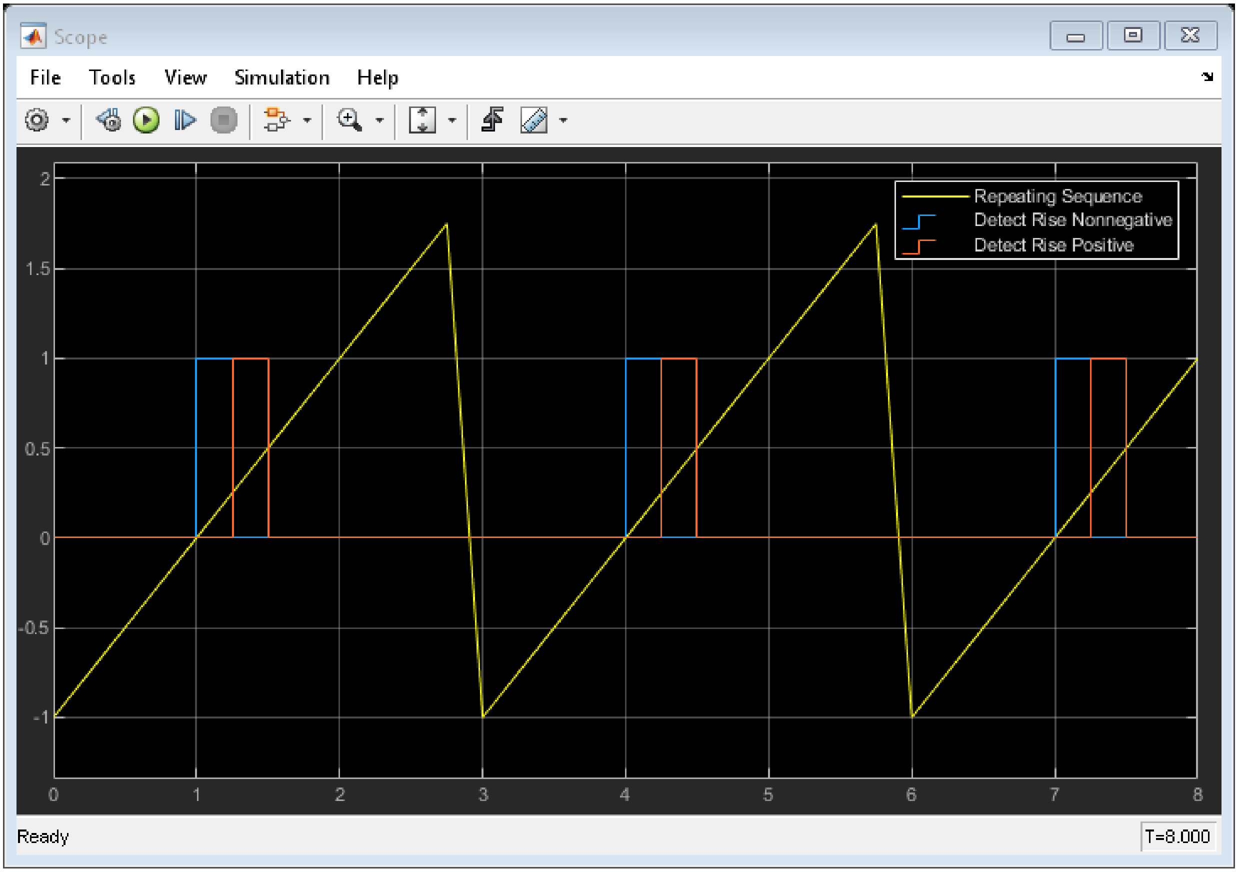
In this example, the offset of $v1$ is `0` and the offset of $v2$ is `1`. The Merge block maps the elements of $v1$ to the first two elements of $v3$ and the elements of $v2$ to the last two elements of $v3$. Only the second element of $v3$ is effectively merged, as show in the scope output.

If you use Simplified Initialization Mode, you must clear the `Allow unequal port widths` check box. The input port offsets for all signals must be zero.

Detect Rising Edge of Signals

This example shows how to detect the rising edge of a signal using the Detect Rise Nonnegative and Detect Rise Positive blocks.





With a fixed-step size of 0.25, this example illustrates the difference between the Detect Rise Nonnegative and Detect Rise Positive blocks. The Detect Rise Nonnegative block outputs true (`1`) at `t=1` because the input signal increased from a negative value to a nonnegative value (`0`). The Detect Rise Positive block outputs true (`1`) at `t=1.25` because the input signal increased from a nonpositive value (`0`) to a strictly positive value.

Detect Falling Edge Using the Detect Fall Nonpositive Block

This example shows how to use the Detect Fall Nonpositive block to detect a falling edge in the input signal. The block detects a falling edge when the signal value decreases from a strictly positive value to a nonpositive value. In this example, the **Initial condition** of the Detect Fall Nonpositive block is set to `1`. This means that the Boolean expression `U/z <= 0` evaluates to true and the block assumes the initial value of the input signal is nonpositive.

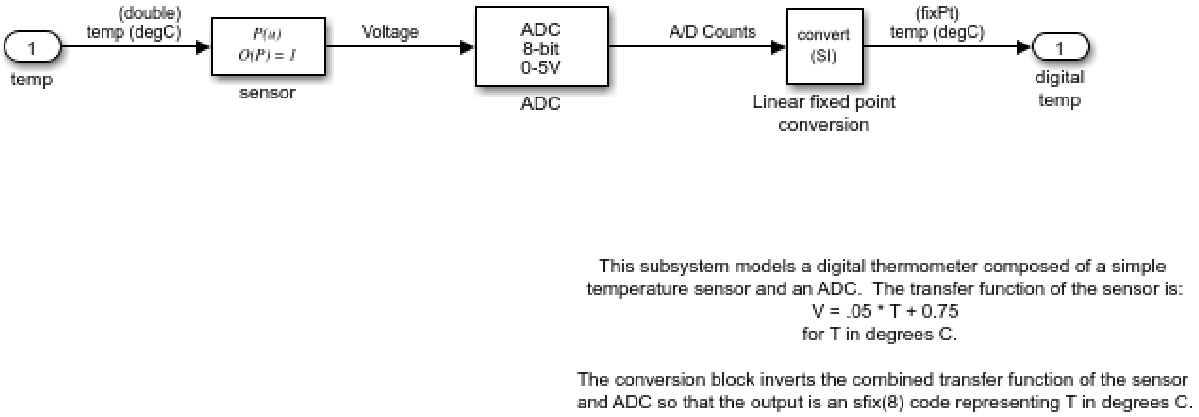
Model a Digital Thermometer Using the Polynomial Block

This example shows how the `ex_sldemo_boiler` model uses the Polynomial block.

In the `Boiler Plant model/digital thermometer` subsystem, the Polynomial Block models a first-order polynomial using the coefficients [0.05 0.75]

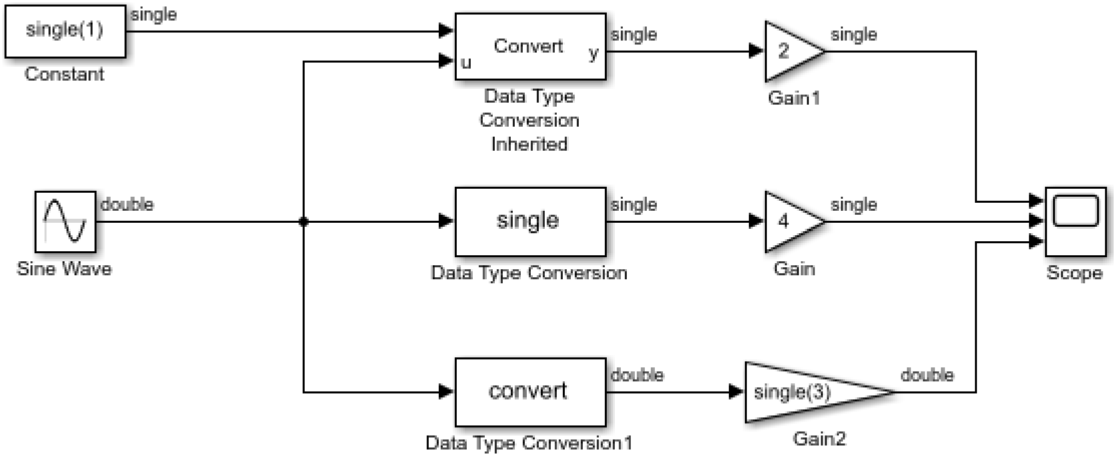


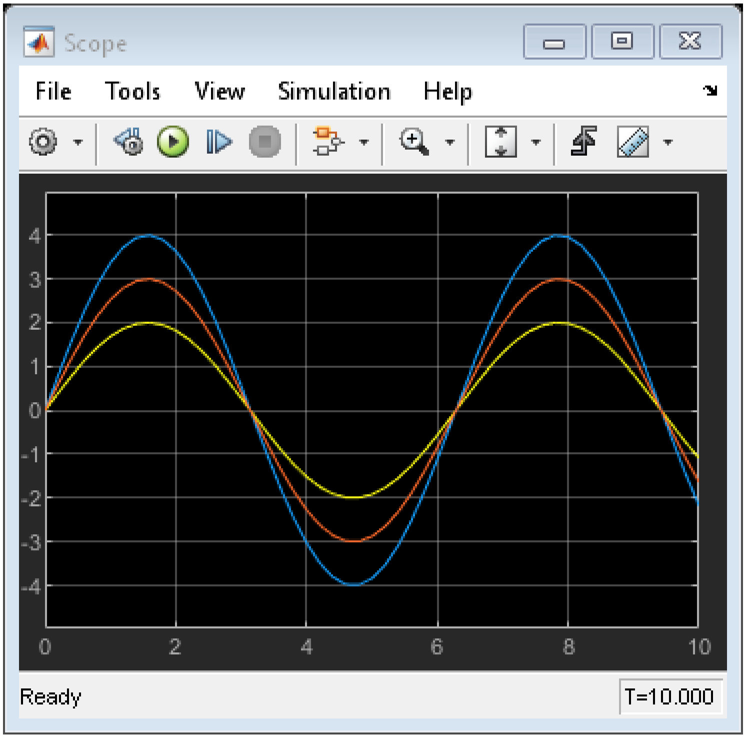
This subsystem models a digital thermometer composed of a simple temperature sensor and an ADC. The transfer function of the sensor is:
V = .05 * T + 0.75
for T in degrees C.

The conversion block inverts the combined transfer function of the sensor and ADC so that the output is an sfix(8) code representing T in degrees C.

Convert Data Types in Simulink Models

This example shows three different methods of converting data types in your model using the Data Type Conversion and Data Type Conversion Inherited blocks. In this model, a Sine Wave block generates the input signal. The Sine Wave block only outputs double-precision data types, so to generate a sine wave with a data type of single, you must perform a data type conversion.





In the first row, the Data Type Conversion Inherited block uses the data type coming from the Constant block (single) as the reference data type, and converts the sine wave to single.

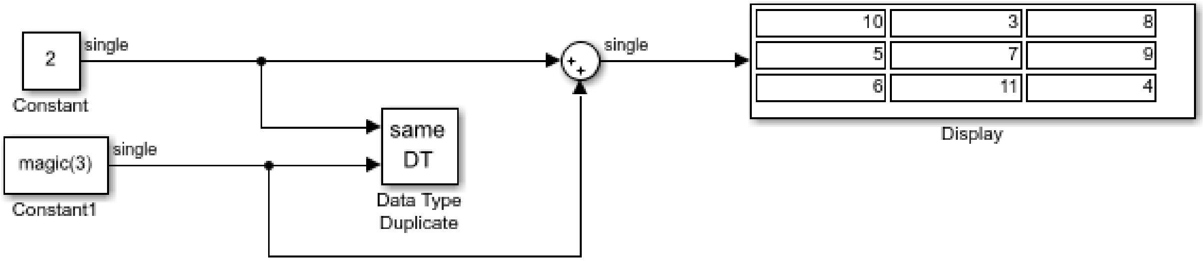
In the second row, the Data Type Conversion block has the **Output data type** set to `single`, and the sine wave is converted accordingly.

In the third row, the Data Type Conversion1 block has the **Output data type** set to `Inherit: Inherit via back propagation`. Because the downstream Gain2 block has a data type of single, the Data Type Conversion1 block converts the sine wave to a data type of single.

Control Data Types with the Data Type Duplicate Block

This example shows how to control data types in your model using the Data Type Duplicate block. In this model, the data type of the Constant block (currently `single`) drives the data types throughout the model.

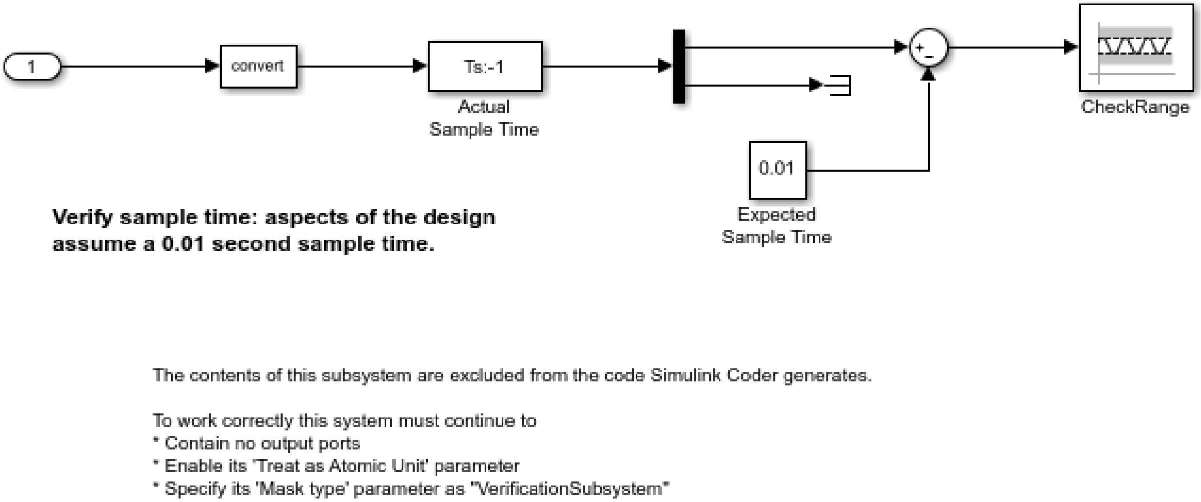
The Constant1 block has its **Output data type** parameter set to `Inherit: Inherit via back propagation`. Because the Constant1 and Constant blocks are both connected to the Data Type Duplicate block, the Constant1 block can inherit its data type from the Constant block. The Sum block has its **Output data type** set to `Inherit: Same as first input`, so it is also able to inherit its data type from the Constant block.



If you change the data type of the Constant block from `single` to `int32`, the `int32` data type propagates throughout the model.

Probe Sample Time of a Signal

The sldemo_fuelsys model shows how to check the sample time of a signal using the Probe block. This enables you to verify that the sample time matches the assumed value of the design.



Verify sample time: aspects of the design assume a 0.01 second sample time.

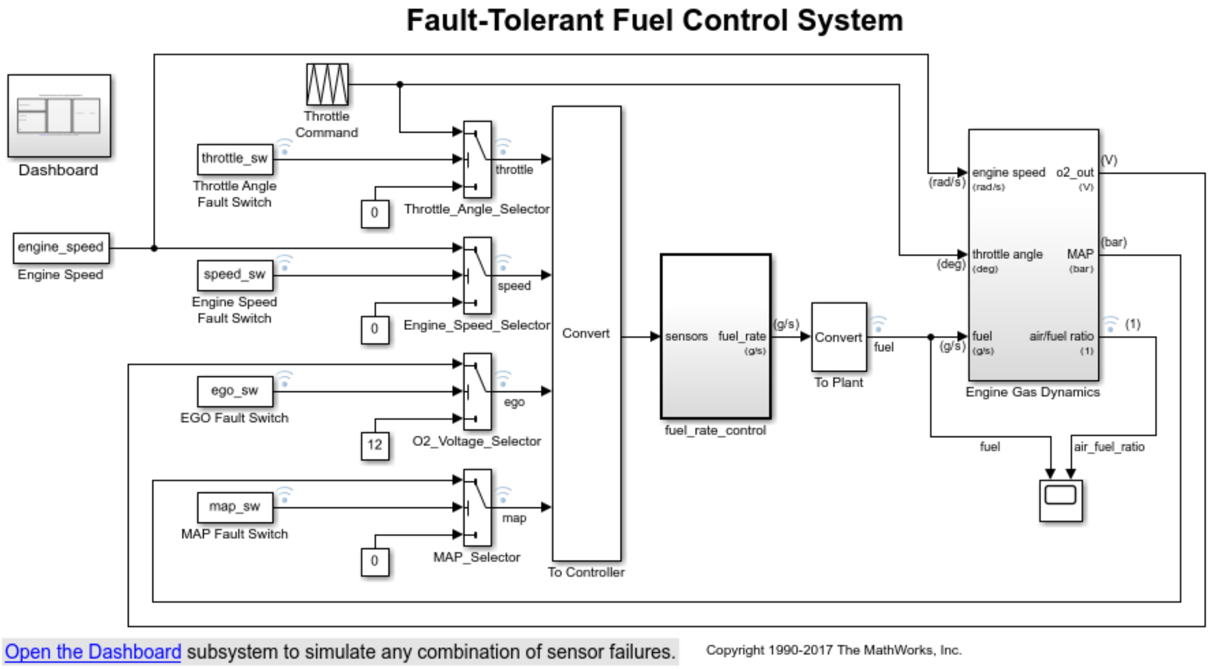
The contents of this subsystem are excluded from the code Simulink Coder generates.

To work correctly this system must continue to
* Contain no output ports
* Enable its 'Treat as Atomic Unit' parameter
* Specify its 'Mask type' parameter as "VerificationSubsystem"

For more information, see the model description.

Convert Signals Between Continuous Time and Discrete Time

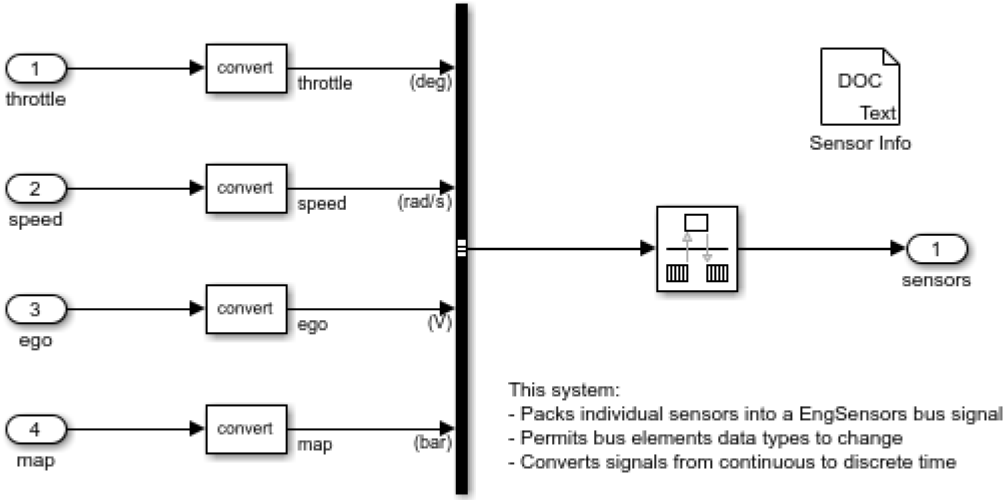
The sldemo_fuelsys model shows how to use the Rate Transition block to convert signals between continuous time and discrete time.



Open the Dashboard subsystem to simulate any combination of sensor failures.

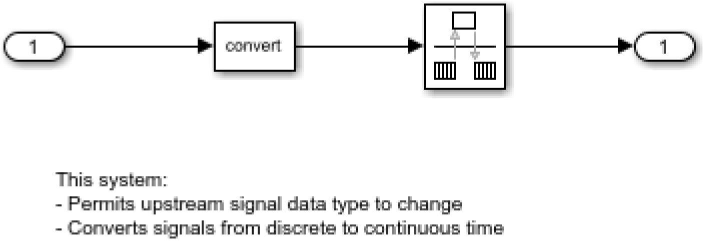
Copyright 1990-2017 The MathWorks, Inc.

In the `To Controller` subsystem, the Rate Transition block converts the signal from continuous time to discrete time. This discrete-time signal can then be processed by the `fuel_rate_control` subsystem.



This system:
- Packs individual sensors into a EngSensors bus signal
- Permits bus elements data types to change
- Converts signals from continuous to discrete time

The `To Plant` subsystem uses the Rate Transition block to convert the discrete-time output of the `fuel_rate_control` subsystem back to continuous time.

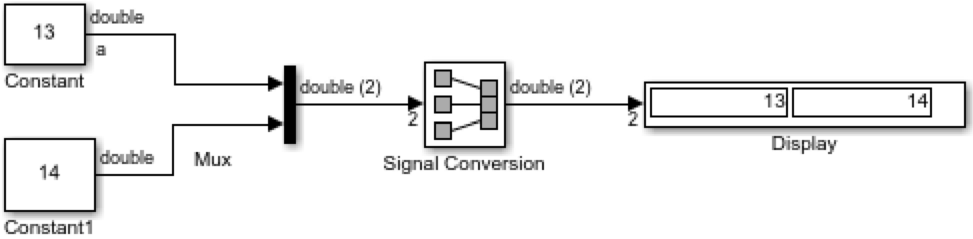


This system:
- Permits upstream signal data type to change
- Converts signals from discrete to continuous time

For more information, see the model description.

Convert Muxed Signal to a Vector

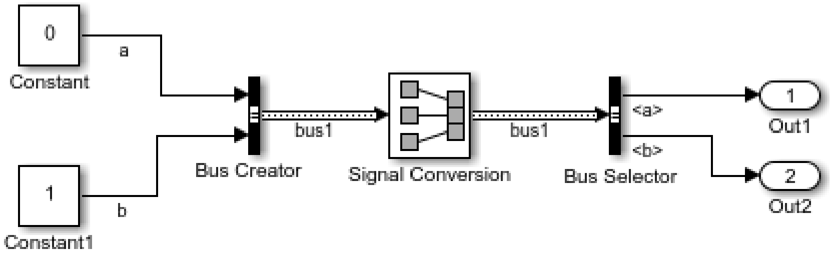
This example shows how to use the Signal Conversion block to convert a muxed input signal to a vector.



To convert the muxed signal to a vector, the **Output** parameter of the Signal Conversion block is set to `Signal copy`.

Create Contiguous Copy of a Bus Signal

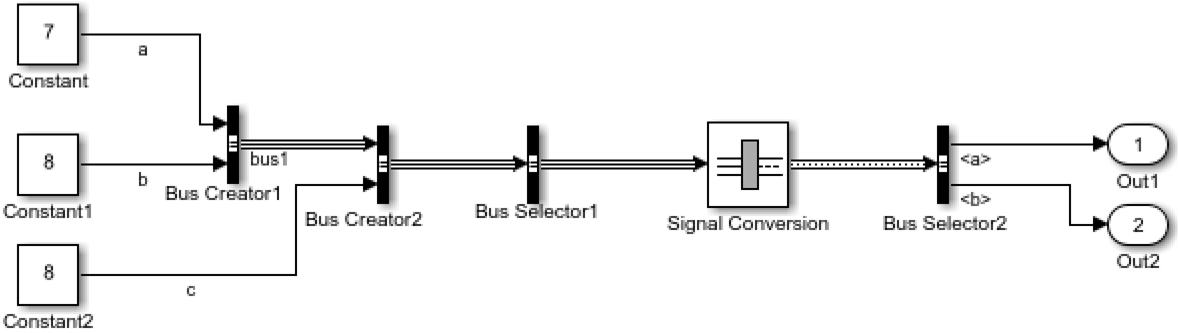
This example shows how to use the Signal Conversion block to create a contiguous copy of a bus signal.



The Bus Creator block creates a nonvirtual bus signal that is input to the Signal Conversion block. With the **Output** parameter set to `Signal copy`, the Signal Conversion block creates another contiguous copy of that input bus signal.

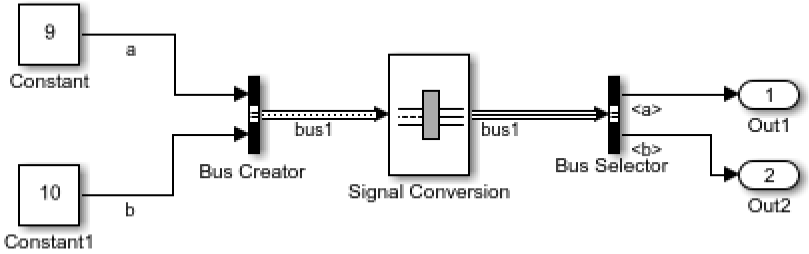
Convert Virtual Bus to a Nonvirtual Bus

In the following example, the Signal Conversion block converts a virtual bus signal from the first Bus Selector block to a nonvirtual bus signal that inputs to the second Bus Selector block. The Signal Conversion block has its **Output** parameter set to `Nonvirtual bus`, and specifies a bus object that matches the bus signal hierarchy of the bus that the first Bus Creator block outputs.



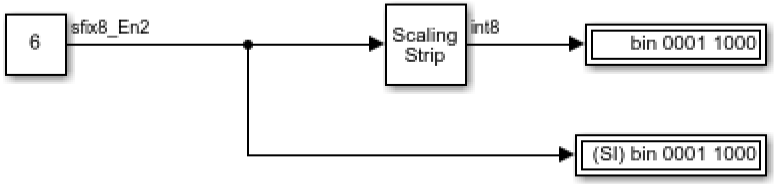
Convert Nonvirtual Bus to Virtual Bus

In the following example, the Signal Conversion block converts the nonvirtual bus signal from the Bus Creator block to a virtual bus signal that inputs to the Bus Selector block. The Signal Conversion block has its **Output** set to `Virtual bus`.



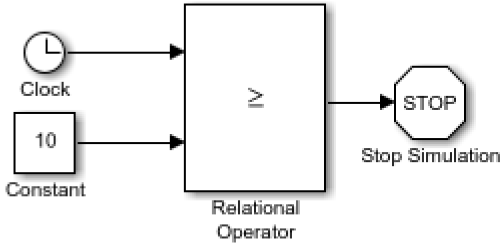
Remove Scaling from a Fixed-Point Signal

This example shows how to strip the scaling from a fixed-point input signal. To do so, the Data Type Scaling Strip block maps the input to the smallest built-in data type that has enough data bits to hold the input. The stored integer value of the input is the value of the output.



Stop Simulation Block with Relational Operator Block

This example shows how to control when a simulation stops by using a Stop Simulation block with a Relational Operator block. When you simulate the model, the model stops simulation when the simulation time reaches 10.

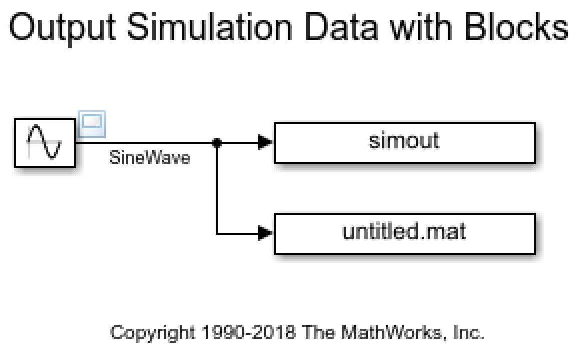


Output Simulation Data with Blocks

This example shows how To Workspace and To File blocks write data to the workspace and to a file respectively.

Open Example Model

```
open_system('ex_ToWorkspace_ToFile');
```



Output Simulation Data with Blocks

Simulate with Default Parameter Values

1. To name the output variables and file, modify the **Variable name** and **File name** block parameter values by using the Block Parameters dialog boxes or the command line.

```
set_param('ex_ToWorkspace_ToFile/To Workspace',...
    'VariableName','simoutToWorkspace')

set_param('ex_ToWorkspace_ToFile/To File',...
    'FileName','simoutToFile.mat',...
    'MatrixName','simoutToFileVariable')
```

2. Simulate the model.

```
sim('ex_ToWorkspace_ToFile');
```

3. To view the input signal for the To Workspace and To File blocks, open the scope viewer.

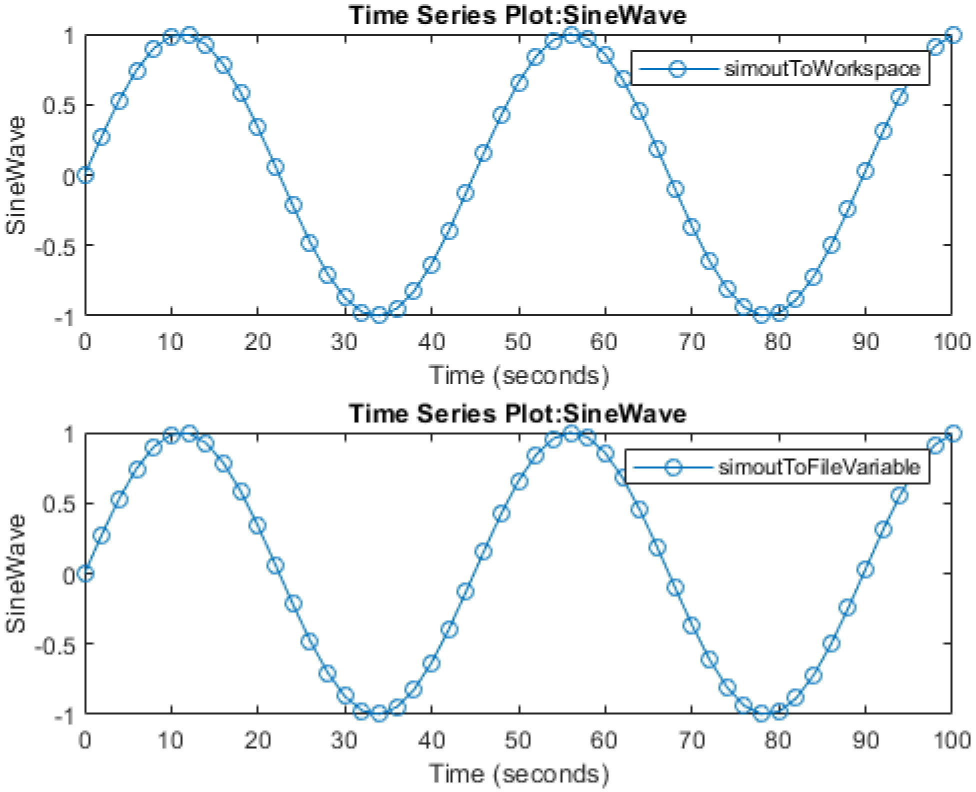
4. To access the data stored by the To File block, load the output file.

```
load('simoutToFile.mat')
```

5. Plot the data stored by the To Workspace and To File blocks.

```
subplot(2,1,1)
plot(simoutToWorkspace,'-o')
legend('simoutToWorkspace')

subplot(2,1,2)
plot(simoutToFileVariable,'-o')
legend('simoutToFileVariable')
```



As shown by the plots, the data stored by each block is the same given the default block parameter values.

Simulate with Custom Parameter Values

1. To keep the data from the previous simulation, specify new names for the output variables and file.

```
set_param('ex_ToWorkspace_ToFile/To Workspace',...
    'VariableName','simoutToWorkspace2')

set_param('ex_ToWorkspace_ToFile/To File',...
    'FileName','simoutToFile2.mat',...
    'MatrixName','simoutToFileVariable2')
```

2. To change the amount of data collected, modify the **Limit data points to last**, **Decimation**, and **Sample time** block parameter values.

```
set_param('ex_ToWorkspace_ToFile/To Workspace',...
    'MaxDataPoints','3',...
    'Decimation','20',...
    'SampleTime','0.5')

set_param('ex_ToWorkspace_ToFile/To File',...
    'Decimation','20',...
    'SampleTime','1')
```

The To File block does not provide the option to limit data points to the last data points collected.

3. Select **Single simulation output**, then modify the **Logging intervals** configuration parameter value.

```
set_param('ex_ToWorkspace_ToFile',...
    'ReturnWorkspaceOutputs','on',...
    'LoggingIntervals','[20,90]')
```

4. Simulate the model.

```
out = sim('ex_ToWorkspace_ToFile');
```

5. To access the data stored by the To File block, load the output file.

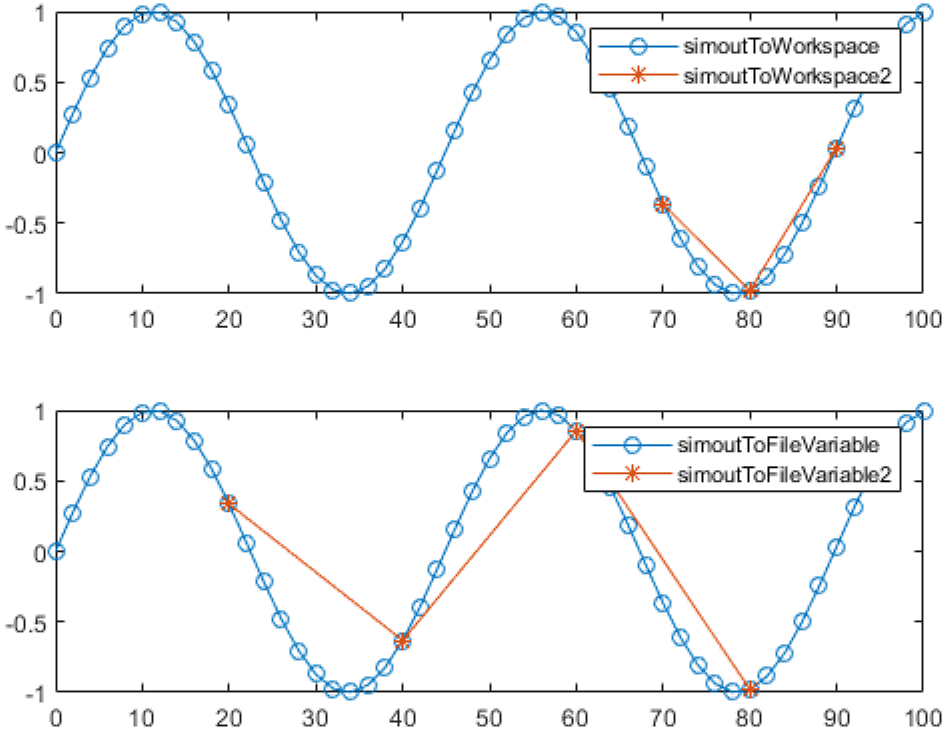
```
load('simoutToFile2.mat')
```

6. Plot the data stored by the To Workspace and To File blocks.

```
subplot(2,1,1)
hold on
```

```
plot(out.simoutToWorkspace2,'-*','DisplayName','simoutToWorkspace2')
hold off

subplot(2,1,2)
hold on
plot(simoutToFileVariable2,'-*','DisplayName','simoutToFileVariable2')
hold off
```



In this example, the To Workspace block collects data at 20, 30, 40, ..., 90 seconds. The data represents every 20th sample time within the logging intervals. When the simulation is completed or paused, the To Workspace block writes only the last three collected sample points to the workspace: 70, 80, and 90 seconds.

The To File block collects data at 20, 40, 60, and 80 seconds. The data similarly represents every 20th sample time within the logging intervals. However, the sample time for the To File block is double the sample time for the To Workspace block.

Increment and Decrement Real-World Values

This example shows how to increase and decrease the real-world value of a signal using the following blocks:

- Increment Real World
- Decrement Real World
- Decrement Time To Zero
- Decrement To Zero

The Scope block shows the output of a Sine Wave block with amplitude 5, as well as the real-world value of that signal incremented and decremented by one.

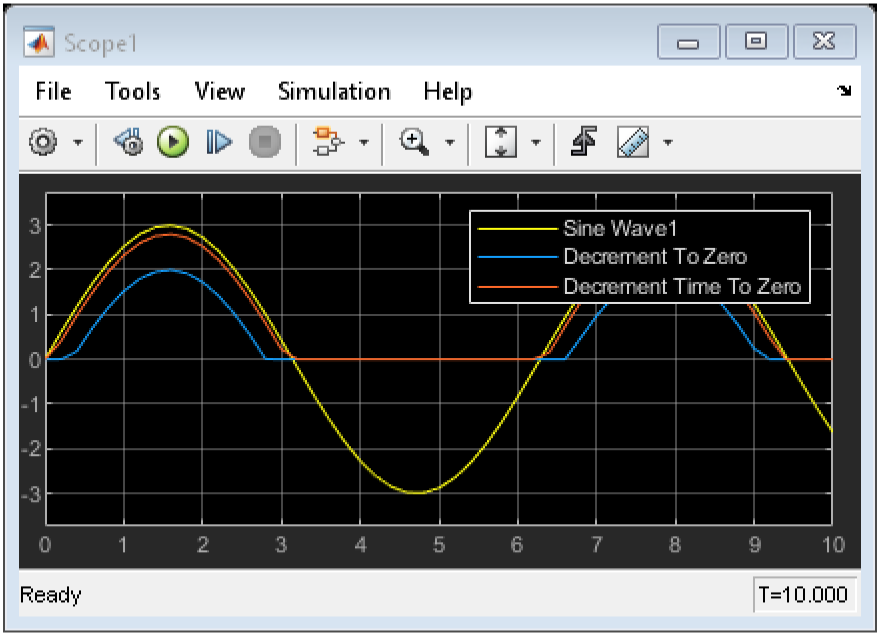
Decrement Real World
Increment Real World
Ready
T=10.000



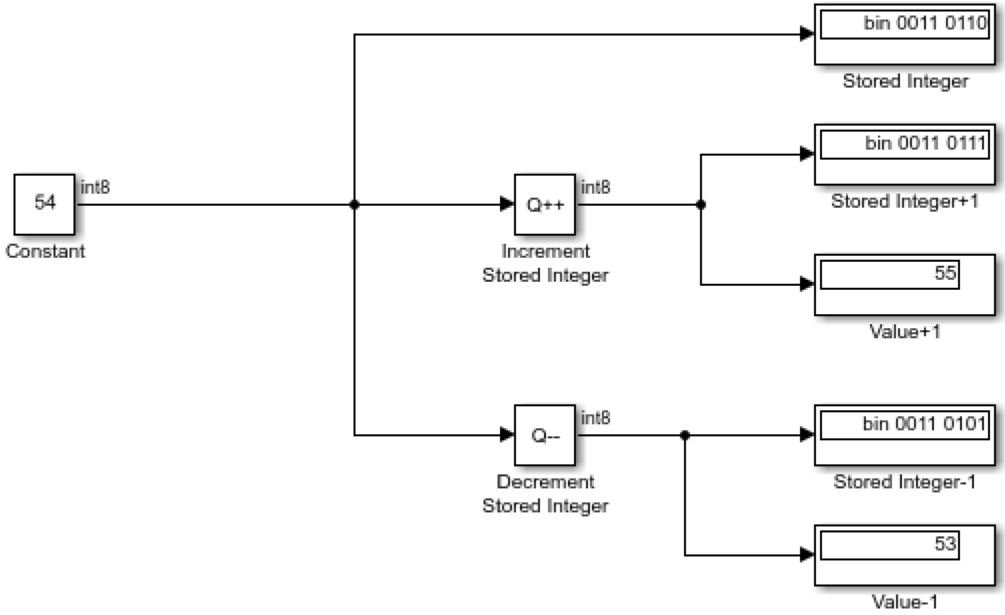
The Scope1 block shows the output of a Sine Wave block with amplitude 3, as well as the output of the Decrement To Zero and Decrement Time To Zero blocks:

- The Decrement To Zero block decreases the input sine wave signal by one, and ensures the value never goes below zero.
- The Decrement Time To Zero block decreases the input sine wave signal by the sample time, `Ts`, and ensures that the value never goes below zero.

Increment and Decrement Stored Integer Values

This example shows how to increase and decrease the stored integer value of a signal by one.

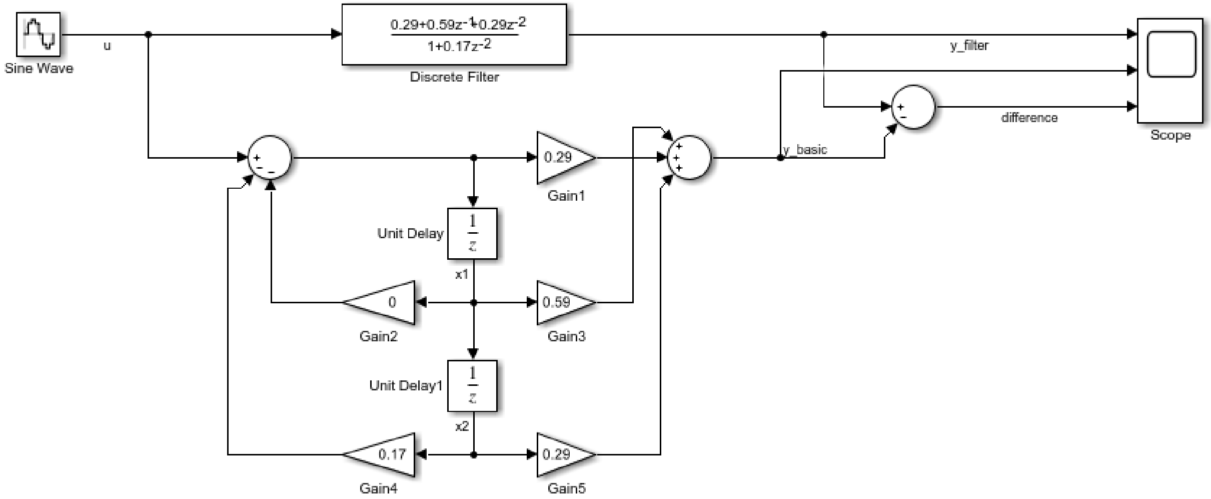
- The Increment Stored Integer block increases the stored integer value of the input signal by one.
- The Decrement Stored Integer block decreases the stored integer value of the input signal by one.

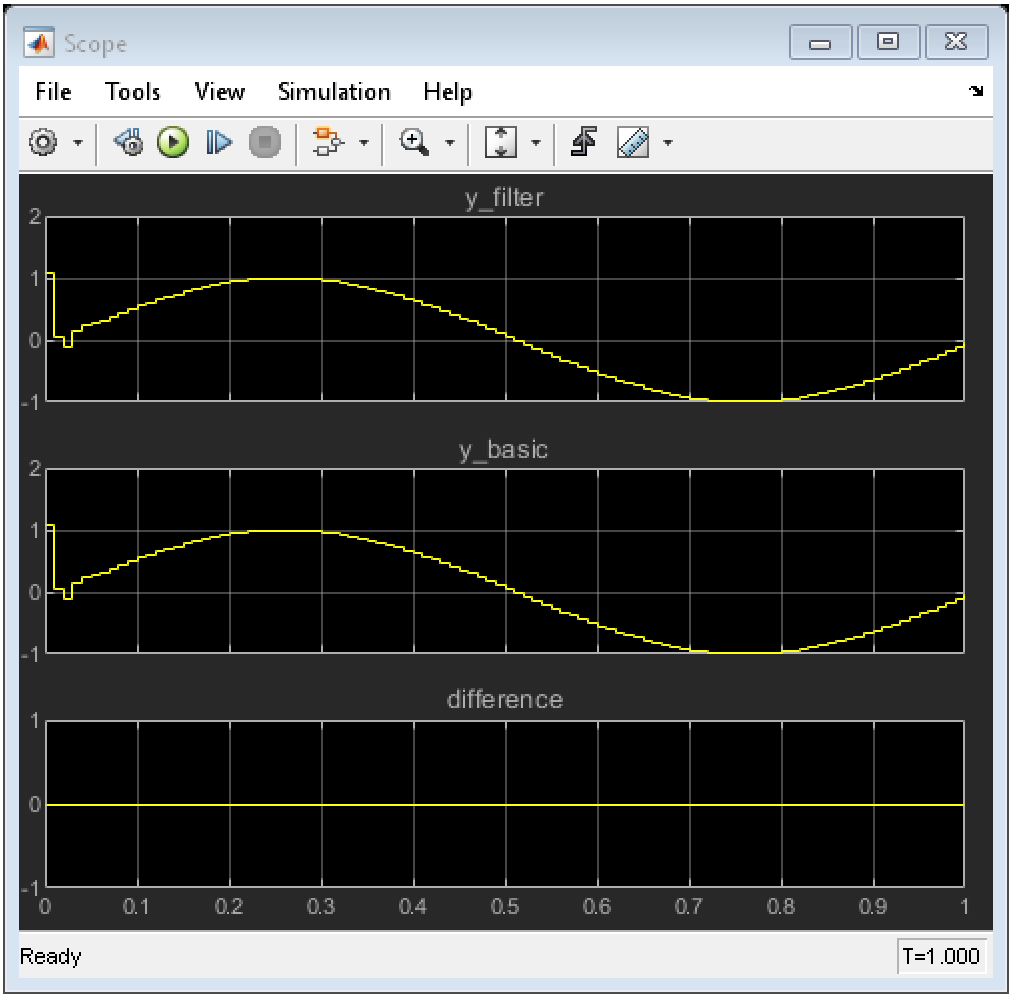


If you change the value of the input signal to 127 (the maximum value representable by an `int8` data type), incrementing the stored integer value by one causes an overflow. Because overflows in the Increment and Decrement Stored Integer blocks always wrap, the Increment Stored Integer block will output a value of -128.

Specify a Vector of Initial Conditions for a Discrete Filter Block

This example shows how to specify a vector of non-zero initial conditions for the Discrete Filter block.





The Scope shows that with the **Initial states** of the Discrete Filter block set to `[1 2]`, the difference between the signal filtered by the Discrete Filter block and the signal from the filter's building blocks is zero. This demonstrates that you can enter the initial conditions of the Discrete Filter block as a vector of `[1 2]`. As an alternative, you can set the initial condition of the Unit Delay Block to 2. The resulting output is the same.

Generate Linear Models for a Rising Edge Trigger Signal

You can use state and simulation time logging to extract the model states at operating points. In this example, the model is configured to get the states when the `x1` signal triggers the Trigger-Based Linearization block on a rising edge.

In this model, the **Trigger type** of the Trigger-Based Linearization block is set to `rising`. On the Data Import/Export pane of the Model Configuration Parameters dialog box, the `States` and `Time` check boxes are selected.

After simulating the model, the following variables appear in the MATLAB workspace:

- ex_vdp_triggered_linearization_Trigger_Based_Linearization
- tout
- xout

To get the index to the first operating point time, execute the following command:

```
ind1 = find(ex_vdp_triggered_linearization_Trigger_Based_Linearization(1).OperPoint.t==
```

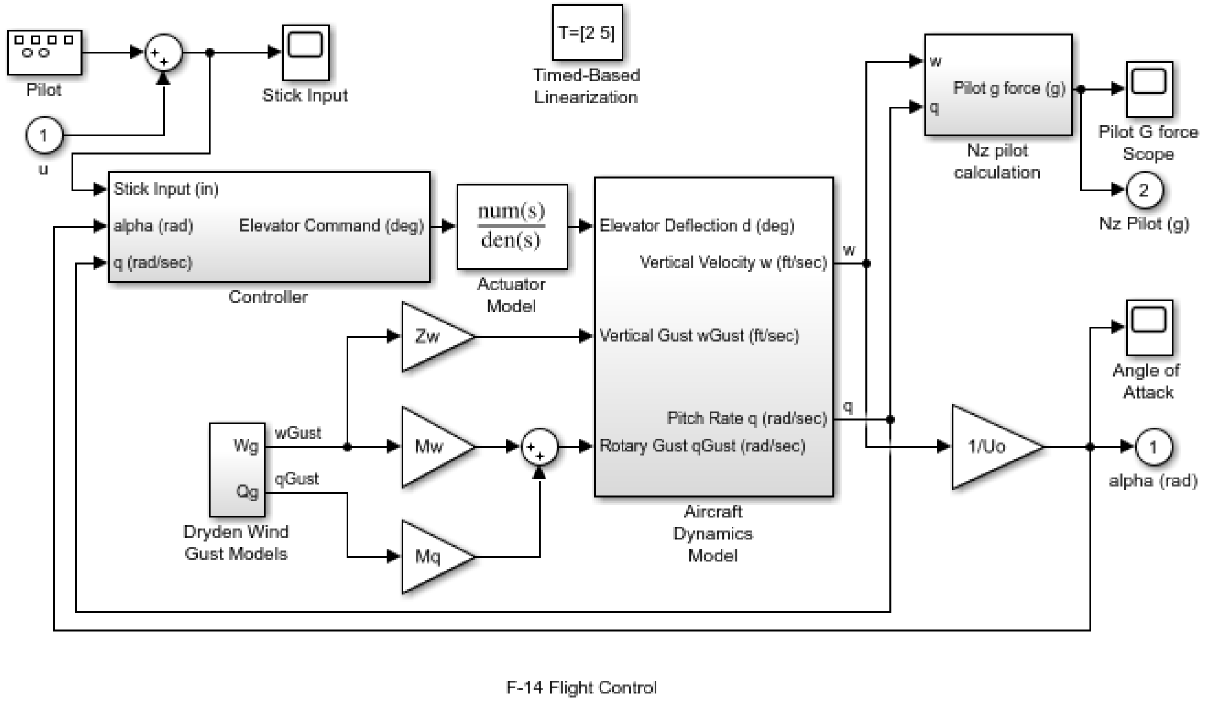
To get the state vector at this operating point, execute the following command:

```
x1 = xout(ind1,:);
```

Generate Linear Models at Predetermined Times

This example shows how to use the Timed-Based Linearization block to generate linear models at predetermined times.

In this model, the **Linearization time** of the Timed-Based Linearization block is set to [2 5]. On the Data Import/Export pane of the Model Configuration Parameters dialog box, the `States` and `Time` check boxes are selected. These settings enable you to get the states of the model at the simulation times of 2 and 5 seconds.



After simulating the model, the following variables appear in the MATLAB workspace:

- ex_f14_linearization_Timed_Based_Linearization

- tout
- xout

To get the indices to the operating point times, execute the following command:

```
ind1 = find(ex_f14_linearization_Timed_Based_Linearization(1).OperPoint.t==tout);
```

To get the state vectors at the operating points, execute the following command:

```
ind2 = find(ex_f14_linearization_Timed_Based_Linearization(1).OperPoint.t==tout);
```

Capture Measurement Descriptions in a DocBlock

This example shows how to use a DocBlock to capture information about a model. In the sldemo_fuelsys model, a DocBlock labeled `Sensor Info` is used to document measurement descriptions inside of the `To Controller` subsystem.

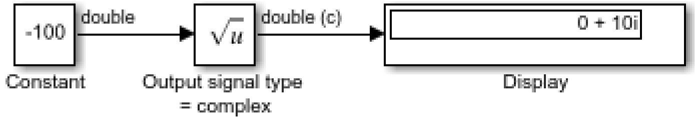
Square Root of Negative Values

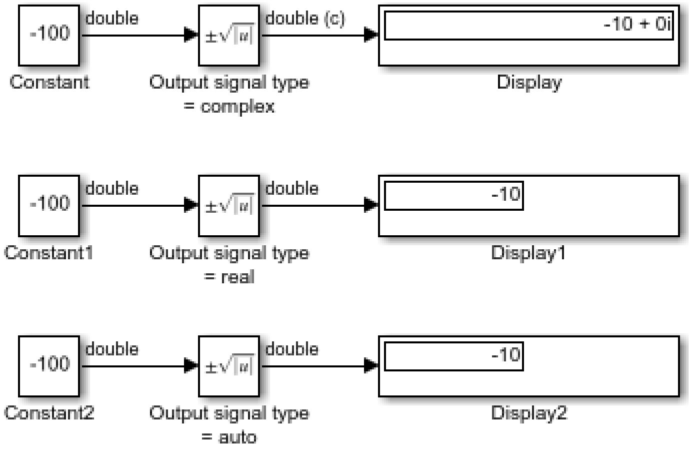
This example shows how to compute the square root of a negative-valued input signal as complex-valued output.



By setting the **Function** to `sqrt` and **Output signal type** to `complex`, the block produces the correct result of `0 + 10i` for an input of `-100`. If you change the **Output signal type** to `auto` or `real`, the block outputs `NaN`.

Signed Square Root of Negative Values

This example shows how to compute the signed square root of a negative-valued input signal.



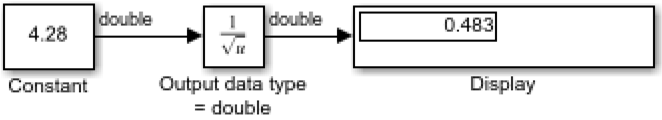
When the block input is negative and you set the **Function** to `signedSqrt`, the Sqrt block output is the same for any setting of the **Output signal type** parameter. By setting the **Format** of the first Display block to `decimal (Stored Integer)`, you can see the value of the imaginary part for the complex output.

rSqrt of Floating-Point Inputs

This example shows how to compute the rSqrt of a floating-point input signal. The Sqrt block has the following settings:

- **Method** = `Newton-Raphson`
- **Number of iterations** = `1`
- **Intermediate results data type** = `Inherit: Inherit from input`

After one iteration of the Newton-Raphson algorithm, the block output is within 0.0004 of the final value (0.4834).

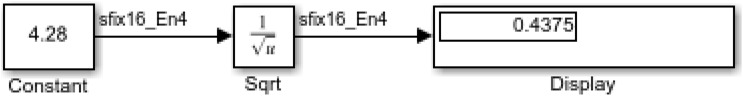


rSqrt of Fixed-Point Inputs

This example shows how to compute the rSqrt of a fixed-point input signal. The Sqrt block has the following settings:

- **Method** = `Newton-Raphson`
- **Number of iterations** = `1`
- **Intermediate results data type** = `Inherit: Inherit from input`

After one iteration of the Newton-Raphson algorithm, the block output is within 0.0459 of the final value (0.4834).



Model a Series RLC Circuit

Physical systems can be described as a series of differential equations in an implicit form, $F\left(t, x, \{\dot{x}\}\right) = 0$, or in the implicit state-space form $E\dot{x} = A\,x + B\,u$

If E is nonsingular, then the system can be easily converted to a system of ordinary differential equations (ODEs) and solved as such:

$$\dot{x} = \left(E^{-1}A\right)x + \left(E^{-1}B\right)u$$

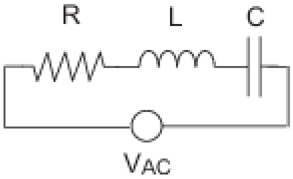
Many times, states of a system appear without a direct relation to their derivatives, usually representing physical conservation laws. For example:

$$\begin{aligned}\dot{x_1} &= x_2\\ 0 &= x_1 + x_2\end{aligned}$$

In this case, E is singular and cannot be inverted. This class of systems are commonly called *descriptor* systems and the equations are called differential-algebraic equations (DAEs).

Series RLC Circuit

Consider the simple series RLC circuit.



From Kirchoff's Voltage Law, the voltage drop across the circuit is equalt to the sum of the voltage drop across each of its elements:

$$V_{AC} = V_R + V_L + V_C$$

From Kirchoff's Current Law:

$$I_{AC} = I_R = I_L = I_C$$

where the subscripts R, L, and C denote the resistance, inductance, and capacitance respectively.

$$V_R = I\left(t\right)R$$

$V_L = L\dot{I}_L$ or $\dot{I}_L = \frac{1}{L}V_L$

$V_C = V_{AC}\left(0\right) + \int_0^t I_C\left(\tau\right)d\tau$ or $\dot{V}_c = \frac{1}{C}I_c$

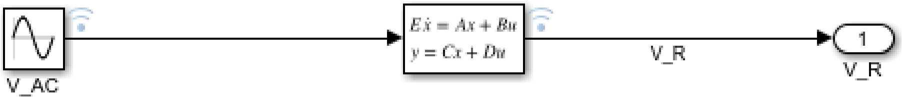
In Implicit State-Space Form

Model the system in Simulink with $R = 10\ \Omega$, $L = 1 \times 10^{-6}\ H$, $C = 1 \times 10^{-4}F$ to find the voltage across the resistor V_R. To use the Descriptor State-Space block, the system can be written in the implicit, or *descriptor*, state-space form $E\dot{x} = Ax + Bu$ as shown below.

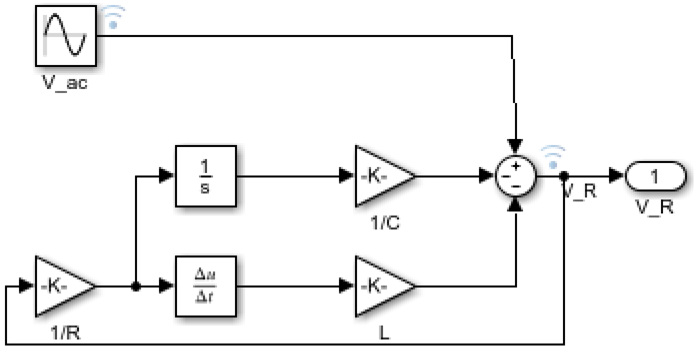
$$\begin{bmatrix} 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} \dot{V}_C \\ \dot{V}_L \\ \dot{V}_R \\ \dot{I}_L \\ \dot{I}_{AC} \end{bmatrix} = \begin{bmatrix} 0 & 0 & 0 & \frac{1}{C} & 0 \\ 1 & 1 & 1 & 0 & 0 \\ 0 & 0 & -1 & R & 0 \\ 0 & \frac{1}{L} & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & -1 \end{bmatrix} \begin{bmatrix} V_C \\ V_L \\ V_R \\ I_L \\ I_{AC} \end{bmatrix} + \begin{bmatrix} 0 \\ -1 \\ 0 \\ 0 \\ 0 \end{bmatrix} V_{AC}$$

where $x = \begin{bmatrix} V_C & V_L & V_R & I_L & I_{AC} \end{bmatrix}^T$ is the state vector.

Set $C = \begin{bmatrix} 0 & 0 & 1 & 0 & 0 \end{bmatrix}$ since the voltage across the resistor is being measured.



Compare this to modeling the system with an algebraic loop in order to find V_R.



The simulation of both models produces identical results. However, the Descriptor State-Space block allows you to make a simpler block diagram and avoid algebraic loops.

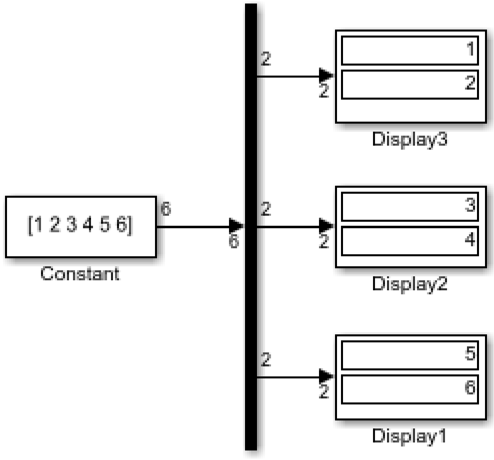
Extract Vector Elements and Distribute Evenly Across Outputs

This example shows how you can use the Demux block to distribute an input signal evenly over the desired number of outputs. For an input vector of length 6, when you set the **Number of outputs** parameter to 3, the Demux block creates three output signals, each of size 2.



See Also

Demux

Extract Vector Elements Using the Demux Block

When using the Demux block to extract and output elements from a vector input, you can use -1 in a vector expression to indicate that the block dynamically sizes the corresponding port. When a vector expression comprises both positive values and -1 values, the block assigns as many elements as needed to the ports with positive values. The block distributes the remaining elements as evenly as possible over the ports with -1 values.

In this example, the **Number of outputs** parameter of the Demux block is set to [-1, 3, -1]. Thus, the block outputs three signals where the second signal always has three elements. The sizes of the first and third signals depend on the size of the input signal. For an input vector with seven elements, the Demux block outputs two elements on the first port, three elements on the second port, and two elements on the third port.

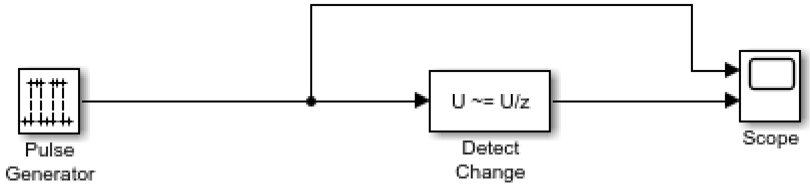
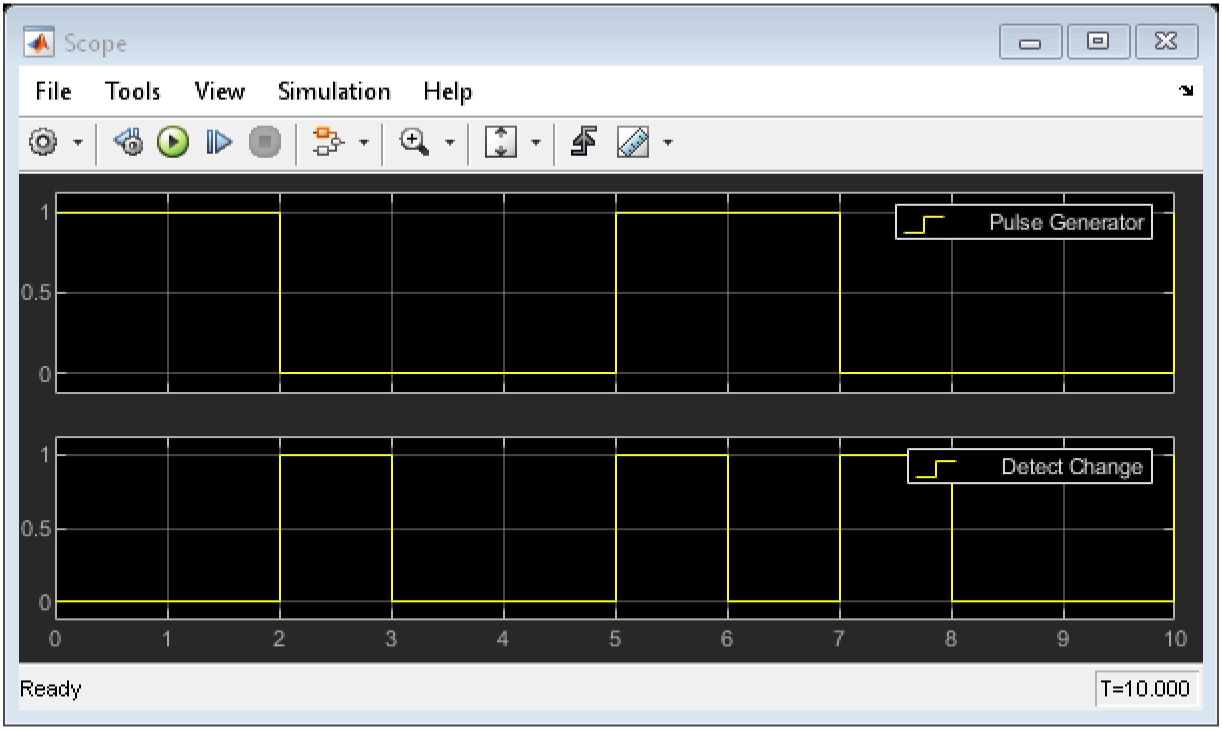
Demux

Detect Change in Signal Values

This example shows how to detect a change in signal values using the Detect Change block. When the input from the Pulse Generator block remains the same, the Detect Change block outputs zero (false), indicating that there was no change in signal values. When the value of the Pulse Generator block changes, the Detect Change block outputs one (true) indicating that the current signal value does not equal its previous value.



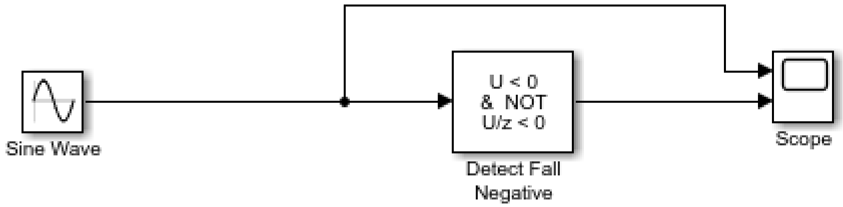


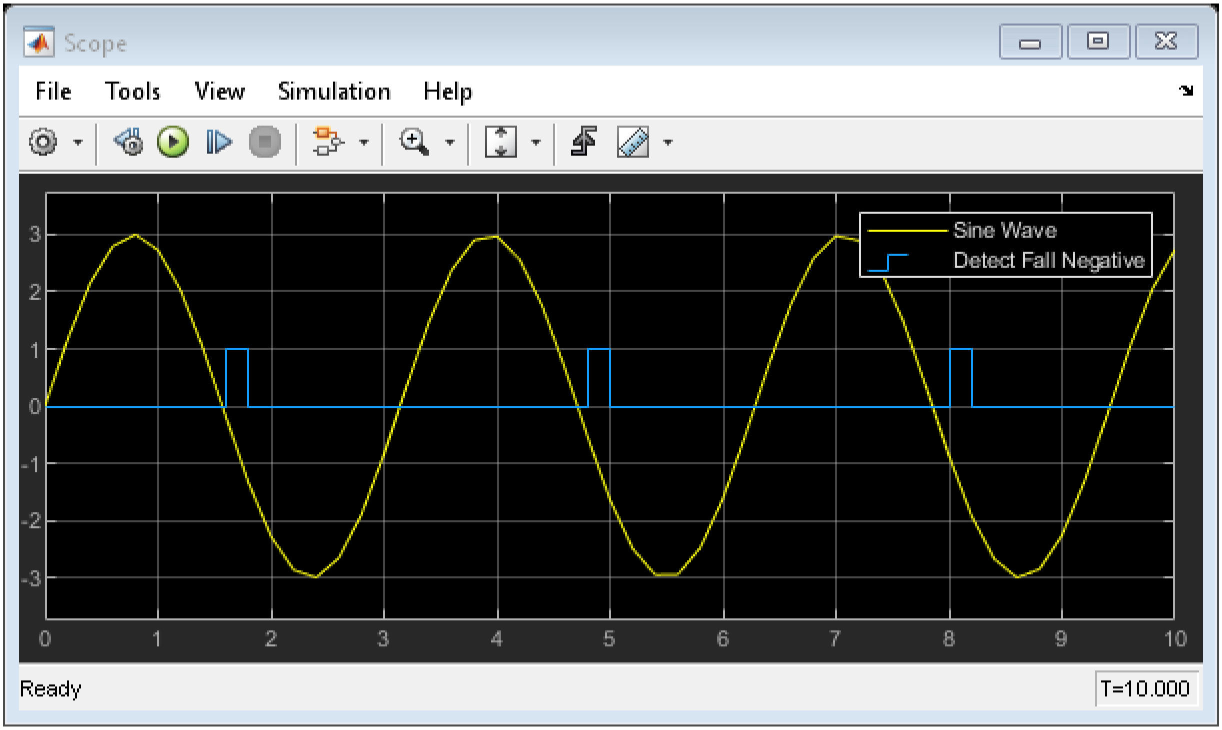
See Also

Detect Change | Pulse Generator | Scope

Detect Fall to Negative Signal Values

This example shows how to detect when a signal value decreases to a strictly negative value from a value that was greater than or equal to zero.





See Also

Detect Fall Negative | Scope | Sine Wave

Detect Decreasing Signal Values

This example shows how to determine if an input signal is strictly less than its previous value using the Detect Decrease block. When the current input to the Detect Decrease block is less than its previous value, the block outputs one (true). When the current input is greater than or equal to the previous signal value, the Detect Decrease block outputs zero (false).

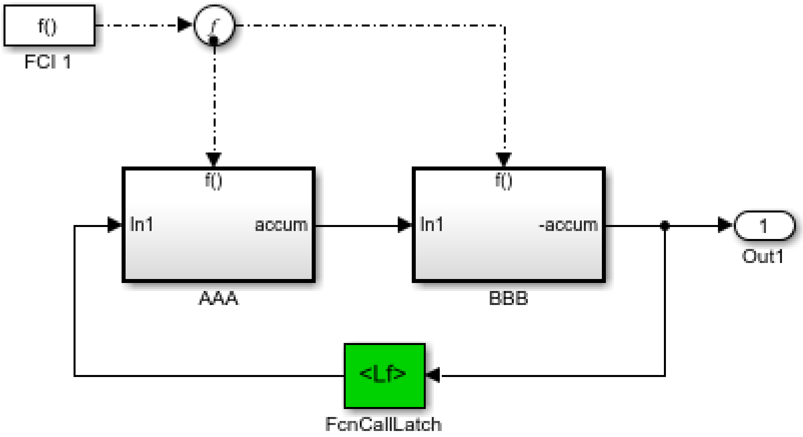
Detect Decrease | Scope | Sine Wave

Function-Call Blocks Connected to Branches of the Same Function-Call Signal

In this model, a Function-Call Feedback Latch block is on the feedback signal between the branched blocks. As a result, the latch block delays the signal at the input of the destination function-call block, and the destination function-call block executes prior to the source function-call block of the latch block.

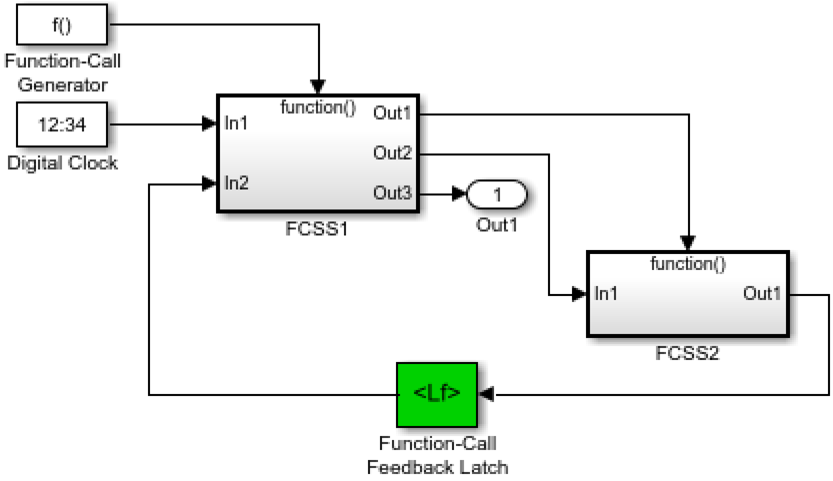


See Also

Function-Call Feedback Latch | Function-Call Generator | Function-Call Split | Function-Call Subsystem

Function-Call Feedback Latch on Feedback Signal Between Child and Parent

In this model, the Function-Call Feedback Latch block is on the feedback signal between the child and the parent. This arrangement prevents the signal value, read by the parent (FCSS1), from changing during execution of the child. In other words, the parent reads the value from the previous execution of the child (FCSS2).

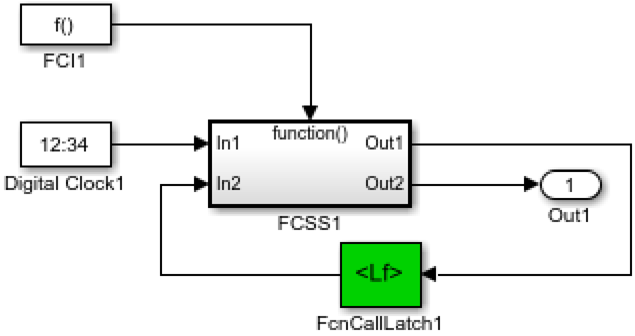


See Also

Digital Clock | Function-Call Feedback Latch | Function-Call Generator | Function-Call Subsystem

Single Function-Call Subsystem

In this example, a single function-call subsystem output serves as its own input.



See Also

Digital Clock | Function-Call Feedback Latch | Function-Call Generator | Function-Call Subsystem

Function-Call Subsystem with Merged Signal As Input

In this model a merged signal serves as the input to a function-call subsystem. Latching is necessary if one of the signals entering the Merge block forms a feedback loop with the function-call subsystem. In this example, one of the output signals from FCSS2 combines with the output of an Enabled Subsystem block and then feeds back into an inport of FCSS2.

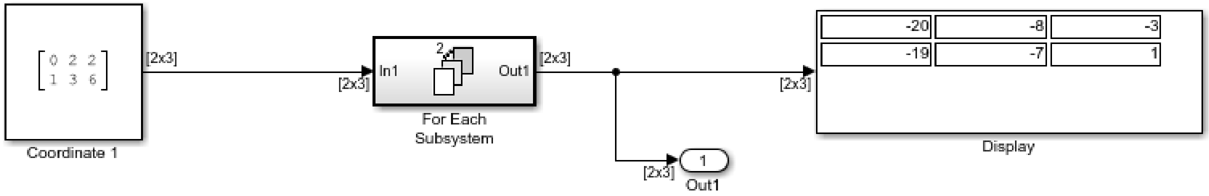
Partitioning an Input Signal with the For Each Block

The following model demonstrates the partitioning of an input signal by a For Each block. Each row of this 2-by-3 input array contains three integers that represent the (`x`, `y`, `z`)-coordinates of a point. The goal is to translate each of these points based on a new origin at `(-20, -10, -5)` and to display the results.



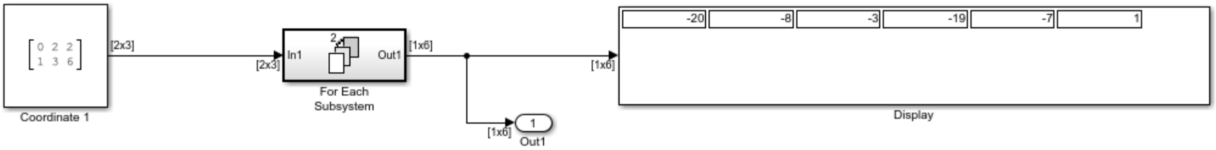
By placing the process of summing an input signal and the new origin inside of a For Each Subsystem block, you can operate on each set of coordinates by partitioning the input signal into two row vectors. To accomplish such partitioning, use the default settings of 1 for both the partition dimension and the partition width. If you also use the default concatenation dimension of 1, each new set of coordinates stacks in the d1 direction, making your display a 2-by-3 array.

See Also

For Each | For Each Subsystem

Specifying the Concatenation Dimension in the For Each Block

This example shows how to specify a concatenation dimension in the For Each block. When you specify a **Concatenation Dimension** of 2 on the **Output Concatenation** tab, each set of results stacks in the d2 direction, and the result is a single row vector.



To learn how the For Each block and subsystem handle a model with states, see the For Each Subsystem block reference page.

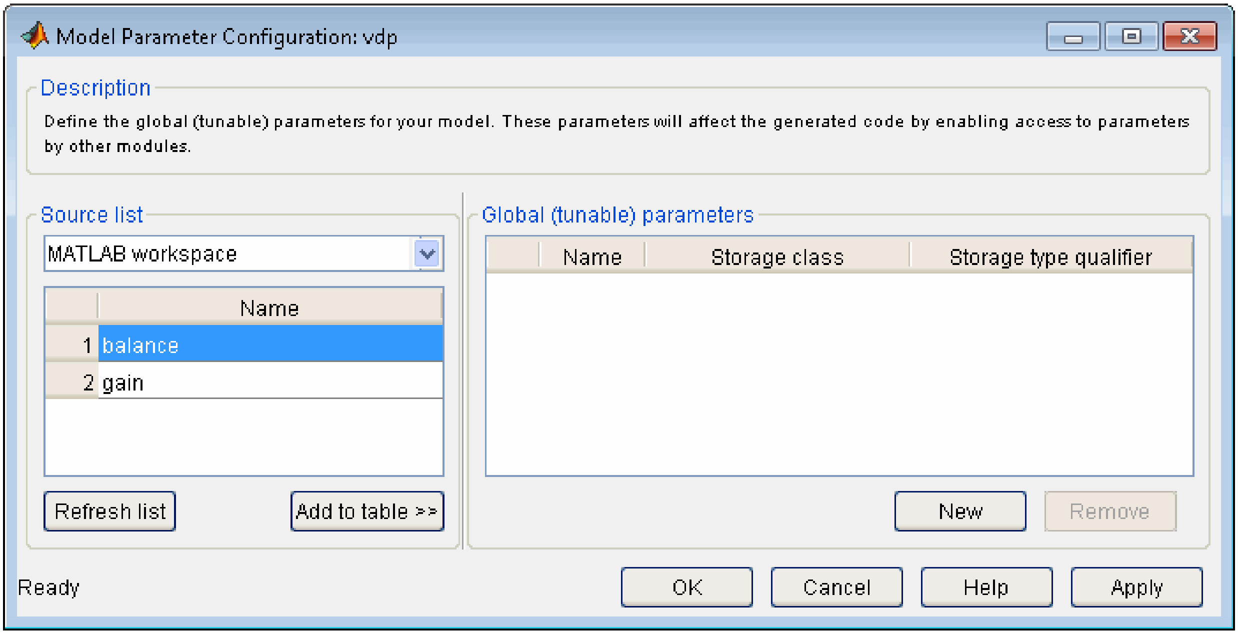
Model Parameter Configuration Dialog Box

Model Parameter Configuration Dialog Box

The **Model Parameter Configuration** dialog box allows you to declare specific tunable parameters when you set **Default parameter behavior** to `Inlined`. The parameters that you select appear in the generated code as tunable parameters. For more information about **Default parameter behavior**, see “Default parameter behavior” (Simulink Coder).

To declare tunable parameters, use `Simulink.Parameter` objects instead of the **Model Parameter Configuration** dialog box. See “Create Tunable Calibration Parameter in the Generated Code” (Simulink Coder).



Model Parameter Configuration: vdp

Description

Define the global (tunable) parameters for your model. These parameters will affect the generated code by enabling access to parameters by other modules.

Source list: MATLAB workspace

	Name
1	balance
2	gain

Global (tunable) parameters

	Name	Storage class	Storage type qualifier

Ready

Note Simulink Coder software ignores the settings of this dialog box if a model contains references to other models. However, you can still generate code that uses tunable parameters with model references, using `Simulink.Parameter` objects. See “Create Tunable Calibration Parameter in the Generated Code” (Simulink Coder).

The dialog box has the following controls.

Source list

Displays a list of workspace variables. The options are:

- MATLAB workspace — Lists all variables in the MATLAB workspace that have numeric values.
- Referenced workspace variables — Lists only those variables referenced by the model.

Refresh list

Updates the source list. Click this button if you have added a variable to the workspace since the last time the list was displayed.

Add to table

Adds the variables selected in the source list to the adjacent table of tunable parameters.

New

Defines a new parameter and adds it to the list of tunable parameters. Use this button to create tunable parameters that are not yet defined in the MATLAB workspace.

Note This option does not create the corresponding variable in the MATLAB workspace. You must create the variable yourself.

Storage class

Used for code generation. For more information, see “Storage class”.

Storage type qualifier

Used for code generation. For more information, see “Type qualifier”.

See Also
