Revision History

September 2017	Online Only	New for Version 1.0
March 2018	Online Only	Revised for Version 1.1 (Release 2018a)
September 2018	Online Only	Revised for Version 1.2 (Release 2018b)

Functions — Alphabetical List

1

Functions — Alphabetical List

abbreviations

Table of common abbreviations

Syntax

tbl = abbreviations

Description

tbl = abbreviations returns a table of common English abbreviations.

Examples

Table of Abbreviations

View a table of abbreviations. You can use this table to detect abbreviations and sentences when using addSentenceDetails.

```
tbl = abbreviations;
head(tbl)
```

ans=8×2 table Abbreviation	Usage
"aba"	regular
"abc"	regular
"abf"	regular
"abh"	regular
"abohm"	regular
"abs"	regular
"abt"	regular
"abv"	regular

Output Arguments

tbl — Table of abbreviations

table

Table of abbreviations. The addSentenceDetails and splitSentences functions, by default, use this table to detect sentence boundaries.

The table has two variables:

- Abbreviation Abbreviation, specified as a string
- Usage Type of abbreviation, specified as a categorical scalar

The following table describes the possible values of Usage and the behavior of addSentenceDetails and splitSentences when observing abbreviations of these types.

Usage	Behavior	Example Abbreviation	Example Text	Detected Sentences
regular	If the next word is a capitalized sentence starter, then break at the trailing	appt	"Book an appt. We'll meet then."	"Book an appt." "We'll meet then."
	period. Otherwise, do not break at the trailing period.		"Book an appt. today."	"Book an appt. today."
inner	Do not break after trailing period.	Dr	"Dr. Smith."	"Dr. Smith."
reference	If the next token is not a number, then break at a trailing period. If the next token is a number, then do not	fig	"See fig. 3."	"See fig. 3."

Usage	Behavior	Example Abbreviation	Example Text	Detected Sentences
	break at the trailing period.		"Try a fig. They are nice."	"Try a fig." "They are nice."
unit	If the previous word is a number and the following word is a capitalized sentence starter, then break at a trailing period.	in	"The height is 30 in. The width is 10 in."	"The height is 30 in." "The width is 10 in."
	If the previous word is a number and the following word is not capitalized, then do not break at a trailing period.	•	"The item is 10 in. wide."	"The item is 10 in. wide."
	If the previous word is not a number, then break at a trailing period.		"Come in. Sit down."	"Come in." "Sit down."

addPartOfSpeechDetails

Add part-of-speech tags to documents

Syntax

```
newDocuments = addPartOfSpeechDetails(documents)
newDocuments = addPartOfSpeechDetails(documents,'RetokenizeMethod',
method)
```

Description

newDocuments = addPartOfSpeechDetails(documents) detects parts of speech in documents and updates the token details. The function, by default, retokenizes the text for part-of-speech tagging. For example, the function splits the word "you're" into the tokens "you" and "'re". To get the part-of-speech details from newDocuments, use tokenDetails.

newDocuments = addPartOfSpeechDetails(documents, 'RetokenizeMethod', method) also specifies the method to use for retokenizing the documents.

Examples

Add Part-of-Speech Details to Documents

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

View the token details of the first few tokens.

ans=8×5 table Token	DocumentNumber	LineNumber	Туре	Language
"fairest"	1	1	letters	en
"creatures"	1	1	letters	en
"desire"	1	1	letters	en
"increase"	1	1	letters	en
"thereby"	1	1	letters	en
"beautys"	1	1	letters	en
"rose"	1	1	letters	en
"might"	1	1	letters	en

tdetails = tokenDetails(documents); head(tdetails)

Add part-of-speech details to the documents using the addPartOfSpeechDetails function. This function first adds sentence information to the documents, and then adds the part-of-speech tags to the table returned by tokenDetails. View the updated token details of the first few tokens.

```
documents = addPartOfSpeechDetails(documents);
tdetails = tokenDetails(documents);
head(tdetails)
```

ans=8×7 table Token	DocumentNumber	SentenceNumber	LineNumber	Туре	Langua
"fairest"	1	1	1	letters	en
"creatures"	1	1	1	letters	en
"desire"	1	1	1	letters	en
"increase"	1	1	1	letters	en
"thereby"	1	1	1	letters	en
"beautys"	1	1	1	letters	en
"rose"	1	1	1	letters	en
"might"	1	1	1	letters	en

Get Part of Speech Details of Japanese Text

Tokenize Japanese text using tokenizedDocument.

```
str = [
    "恋に悩み、苦しむ。"
    "恋の悩みで 苦しむ。"
    "空に星が輝き、瞬いている。"
    "空の星が輝きを増している。"
    "駅までは遠くて、歩けない。"
    "遠くの駅まで歩けない。"
    "すももももももものうち。"];
documents = tokenizedDocument(str);
```

For Japanese text, you can get the part-of-speech details using tokenDetails. For English text, you must first use addPartOfSpeechDetails.

```
tdetails = tokenDetails(documents);
head(tdetails)
```

```
ans=8×7 table
```

Token	DocumentNumber	LineNumber	Туре	Language	Part0fSpeech
"恋" "に"	1	1	letters	ja ja	noun adposition
"悩み" "、" "苦」お:"	1 1 1	1 1 1	letters punctuation letters	ja ja ia	verb punctuation verb
ロじり "。" "恋" "の"	1 2 2	1 1 1	punctuation letters letters	ja ja ja	punctuation noun adposition
				-	

Input Arguments

documents - Input documents

tokenizedDocument array

Input documents, specified as a tokenizedDocument array.

method — Method to retokenize documents

'part-of-speech' (default) | 'none'

Method to retokenize documents, specified as one of the following:

- 'part-of-speech' Transform the tokens for part-of-speech tagging. The function performs these tasks:
 - Split compound words. For example, split the compound word "wanna" into the tokens "want" and "to". This includes compound words containing apostrophes. For example, the function splits the word "don't" into the tokens "do" and "n't".
 - Merge periods with preceding abbreviations. For example, merge the tokens "Mr" and "." into the token "Mr.".
 - Merge runs of periods into ellipses. For example, merge three instances of "." into the single token "...".
- 'none' Do not retokenize the documents.

Output Arguments

newDocuments — Updated documents

tokenizedDocument array

Updated documents, returned as a tokenizedDocument array. To get the sentence details from newDocuments, use tokenDetails.

Algorithms

If the input documents do not contain sentence details, then the function first runs addSentenceDetails.

Introduced in R2018b

addDocument

Add documents to bag-of-words or bag-of-n-grams model

Syntax

```
newBag = addDocument(bag,documents)
```

Description

newBag = addDocument(bag,documents) adds documents to the bag-of-words or bag-of-n-grams model bag.

Examples

Add Documents to Bag-of-Words Model

Create a bag-of-words model from an array of tokenized documents.

```
documents = tokenizedDocument([
    "an example of a short sentence"
    "a second short sentence"]);
bag = bagOfWords(documents)
bag =
    bagOfWords with properties:
        Counts: [2x7 double]
        Vocabulary: [1x7 string]
        NumWords: 7
        NumDocuments: 2
```

Create another array of tokenized documents and add it to the same bag-of-words model.

```
documents = tokenizedDocument([
    "a third example of a short sentence"
```

```
"another short sentence"]);
newBag = addDocument(bag,documents)
newBag =
    bagOfWords with properties:
        Counts: [4x9 double]
        Vocabulary: [1x9 string]
        NumWords: 9
        NumDocuments: 4
```

Import Text from Multiple Files Using a File Datastore

If your text data is contained in multiple files in a folder, then you can import the text data into MATLAB using a file datastore.

Create a file datastore for the example sonnet text files. The examples sonnets have file names "exampleSonnetN.txt", where N is the number of the sonnet. Specify the read function to be extractFileText.

Create an empty bag-of-words model.

bag = bag0fWords

Loop over the files in the datastore and read each file. Tokenize the text in each file and add the document to bag.

```
while hasdata(fds)
    str = read(fds);
    document = tokenizedDocument(str);
    bag = addDocument(bag,document);
end
```

View the updated bag-of-words model.

```
bag
```

Input Arguments

bag — Input bag-of-words or bag-of-n-grams model

bagOfWords object | bagOfNgrams object

Input bag-of-words or bag-of-n-grams model, specified as a bagOfWords object or a bagOfNgrams object.

documents — Input documents

tokenizedDocument array | string array of words | cell array of character vectors

Input documents, specified as a tokenizedDocument array, a string array of words, or a cell array of character vectors. If documents is a string array or a cell array of character vectors, then it must be a row vector representing a single document, where each element is a word.

Output Arguments

newBag — Output model

bagOfWords object | bagOfNgrams object

Output model, returned as a bagOfWords object or a bagOfNgrams object. The type of newBag is the same as the type of bag.

See Also

bagOfNgrams | bagOfWords | removeDocument | removeEmptyDocuments |
tokenizedDocument

Introduced in R2017b

addLanguageDetails

Add language identifiers to documents

Syntax

```
newDocuments = addLanguageDetails(documents)
newDocuments = addLanguageDetails(documents,'Language',language)
```

Description

newDocuments = addLanguageDetails(documents) detects the language of documents and updates the token details. The function adds details to the tokens with missing language details only. To get the language details from newDocuments, use tokenDetails.

newDocuments = addLanguageDetails(documents, 'Language', language)
specifies the language to update with.

Examples

Add Language Details to Documents

Manually tokenize some text by splitting it into an array of words. Convert the manually tokenized text into a tokenizedDocument object by setting the 'TokenizeMethod' option to 'none'.

```
str = split("an example of a short sentence")';
documents = tokenizedDocument(str,'TokenizeMethod','none');
```

View the token details using tokenDetails.

```
tdetails = tokenDetails(documents)
```

```
tdetails=6×2 table
Token DocumentNumber
```

```
"an" 1
"example" 1
"of" 1
"a" 1
"short" 1
"sentence" 1
```

When you specify 'TokenizeMethod', 'none', the function does not automatically detect the language details of the documents. To add the language details, use the addLanguageDetails function. This function, by default, automatically detects the language.

documents = addLanguageDetails(documents);

View the updated token details using tokenDetails.

```
tdetails = tokenDetails(documents)
```

```
tdetails=6×4 table
```

Token	DocumentNumber	Туре	Language
"an"	1	letters	en
"example"	1	letters	en
"of"	1	letters	en
"a"	1	letters	en
"short"	1	letters	en
"sentence"	1	letters	en

Input Arguments

documents — Input documents

tokenizedDocument array

Input documents, specified as a tokenizedDocument array.

language — Language

'en'|'ja'

Language, specified as one of the following:

- 'en' English
- 'ja' Japanese

If you do not specify a value, then the function detects the language from the input text using the corpusLanguage function.

This option specifies the language details of the tokens. To view the language details of the tokens, use tokenDetails. These language details determine the behavior of the removeStopWords, addPartOfSpeechDetails, normalizeWords, and addSentenceDetails functions on the tokens.

For more information about language support in Text Analytics Toolbox $^{\rm TM}$, see "Language Support".

Output Arguments

newDocuments — Output documents

tokenizedDocument array

Output documents, returned as a tokenizedDocument array.

addLemmaDetails

Add lemma forms of tokens to documents

Syntax

newDocuments = addLemmaDetails(documents)

Description

newDocuments = addLemmaDetails(documents) adds lemma details to documents and updates the token details. To get the lemma details from newDocuments, use tokenDetails.

Examples

Add Lemma Details to Documents

Create a tokenized document array.

```
str = [ ...
    "The dogs ran after the cat."
    "I am building a house."];
documents = tokenizedDocument(str);
```

Add lemma details to the documents using addLemmaDetails. This function lemmatizes the text and adds the lemma form of each token to the table returned by tokenDetails. View the updated token details of the first few tokens.

```
documents = addLemmaDetails(documents);
tdetails = tokenDetails(documents);
head(tdetails)
ans=8×6 table
Token DocumentNumber LineNumber Type Language Lemma
```

"The"	1	1	letters	en	"the"
"dogs"	1	1	letters	en	"dog"
"ran"	1	1	letters	en	"run"
"after"	1	1	letters	en	"after"
"the"	1	1	letters	en	"the"
"cat"	1	1	letters	en	"cat"
"."	1	1	punctuation	en	"."
"I"	2	1	letters	en	"i"

Input Arguments

documents — Input documents

tokenizedDocument array

Input documents, specified as a tokenizedDocument array.

Output Arguments

newDocuments — Output documents

tokenizedDocument array

Output documents, returned as a tokenizedDocument array.

addSentenceDetails

Add sentence numbers to documents

Syntax

```
newDocuments = addSentenceDetails(documents)
newDocuments = addSentenceDetails(documents,Name,Value)
```

Description

newDocuments = addSentenceDetails(documents) detects the sentence boundaries in documents and updates the token details. To get the sentence details from newDocuments, use tokenDetails.

newDocuments = addSentenceDetails(documents,Name,Value) specifies
additional options using one or more name-value pair arguments.

Examples

Add Sentence Details to Documents

Create a tokenized document array.

```
str = [ ...
    "This is an example document. It has two sentences."
    "This document has one sentence."
    "Here is another example document. It also has two sentences."];
documents = tokenizedDocument(str);
```

Add sentence details to the documents using addSentenceDetails. This function adds the sentence numbers to the table returned by tokenDetails. View the updated token details of the first few tokens.

documents = addSentenceDetails(documents); tdetails = tokenDetails(documents); head(tdetails)

ans=8×6 table

```

```
ans=6×6 table
```

 Token	DocumentNumber	SentenceNumber	LineNumber	Туре	Lai
"It"	3	2	1	letters	
"also"	3	2	1	letters	
"has"	3	2	1	letters	
"two"	3	2	1	letters	
"sentences"	3	2	1	letters	
"."	3	2	1	punctuation	

Input Arguments

documents - Input documents

tokenizedDocument array

Input documents, specified as a tokenizedDocument array.

Name-Value Pair Arguments

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1, Value1, ..., NameN, ValueN.

Example: 'Abbreviations', ["cm" "mm" "in"] species to detect sentences boundaries where these abbreviations are followed by a period and a capitalized sentence starter.

Abbreviations — List of abbreviations

string array | character vector | cell array of character vectors | table

List of abbreviations, specified as a string array, character vector, cell array of character vectors, or a table.

If Abbreviations is a string array, character vector, or cell array of character vectors, then the function treats these as regular abbreviations. If the next word is a capitalized sentence starter, then the function breaks at the trailing period. The function ignores any differences in the letter case of the abbreviations. Specify the sentence starters using the Starters name-value pair.

To specify different behaviors when splitting sentences at abbreviations, specify Abbreviations as a table. The table must have variables named Abbreviation and Usage, where Abbreviation contains the abbreviations, and Usage contains the type of each abbreviation. The following table describes the possible values of Usage, and the behavior of the function when passed abbreviations of these types.

Usage	Behavior	Example Abbreviation	Example Text	Detected Sentences
regular	If the next word is a capitalized sentence starter, then break at the trailing	appt	"Book an appt. We'll meet then."	"Book an appt." "We'll meet then."
	period. Otherwise, do not break at the trailing period.		"Book an appt. today."	"Book an appt. today."

Usage	Behavior	Example Abbreviation	Example Text	Detected Sentences
inner	Do not break after trailing period.	Dr	"Dr. Smith."	"Dr. Smith."
reference	If the next token is not a number, then break at a trailing period. If the next token is a number, then do not break at the trailing period.	fig	"See fig. 3." "Try a fig. They are nice."	"See fig. 3." "Try a fig." "They are nice."
unit	If the previous word is a number and the following word is a capitalized sentence starter, then break at a trailing period.	in	"The height is 30 in. The width is 10 in."	"The height is 30 in." "The width is 10 in."
	If the previous word is a number and the following word is not capitalized, then do not break at a trailing period.		"The item is 10 in. wide."	"The item is 10 in. wide."
	If the previous word is not a number, then break at a trailing period.		"Come in. Sit down."	"Come in." "Sit down."

The default value is the output of the abbreviations function.

Tip By default, the function treats single letter abbreviations, such as "V.", or tokens with mixed single letters and periods, such as "U.S.A." as regular abbreviations. You do not need to include these abbreviations in Abbreviations.

Example: ["cm" "mm" "in"]
Data Types: char | string | table | cell

Starters — Words that start a sentence

string array | character vector | cell array of character vectors

Words that start a sentence, specified as a string array, character vector, or a cell array of character vectors. If a sentence starter appears capitalized after a regular abbreviation, then the function detects a sentence boundary at the trailing period. The function ignores any differences in the letter case of the sentence starters.

The default value is the output of the **stopWords** function.

Data Types: char | string | cell

Output Arguments

newDocuments — Updated documents

tokenizedDocument array

Updated documents, returned as a tokenizedDocument array. To get the sentence details from newDocuments, use tokenDetails.

Definitions

Language Considerations

The addSentenceDetails function detects sentence boundaries based on punctuation characters and line number information. For English text, the function also uses a list of abbreviations passed to the function.

For other languages, you might need to specify your own list of abbreviations for sentence detection. To do this, use the 'Abbreviations' option of addSentenceDetails.

Algorithms

If emoticons or emoji characters appear after a terminating punctuation character, then the function splits the sentence after the emoticons and emoji.

Introduced in R2018a

addTypeDetails

Add token type details to documents

Syntax

```
newDocuments = addTypeDetails(documents)
newDocuments = addTypeDetails(documents, 'TopLevelDomains', domains)
```

Description

newDocuments = addTypeDetails(documents) detects the token types in documents and updates the token details. The function adds type details to the tokens with unknown type only. To get the token types from newDocuments, use tokenDetails.

newDocuments = addTypeDetails(documents, 'TopLevelDomains', domains)
also specifies the top-level domains to use for web address detection.

Examples

Add Token Type Details to Documents

Convert manually tokenized text into a tokenizedDocument object, setting the 'TokenizeMethod' option to 'none'.

```
str = ["For" "more" "information" "," "see" "https://www.mathworks.com" "."];
documents = tokenizedDocument(str, 'TokenizeMethod', 'none')
documents =
   tokenizedDocument:
    7 tokens: For more information , see https://www.mathworks.com .
```

View the token details using the tokenDetails function.

tdetails=7×2 table DocumentNumber Token "For" 1 "more" 1 1 "information" "," 1 "see" 1 "https://www.mathworks.com" 1 " . " 1

If you set 'TokenizeMethod' to 'none' in the call to the tokenizedDocument function, then it does not detect the types of the tokens. To add the token type details, use the addTypeDetails function.

documents = addTypeDetails(documents);

View the updated token details.

tdetails = tokenDetails(documents)

tdetails = tokenDetails(documents)

tdetails=7× <i>3 table</i> Token	DocumentNumber	Туре
"For"	1	letters
"more"	1	letters
"information"	1	letters
н н ,	1	punctuation
"see"	1	letters
"https://www.mathworks.com"	1	web-address
" " · · · · · · · · · · · · · · · · · ·	1	punctuation

Input Arguments

documents — Input documents
tokenizedDocument array

Input documents, specified as a tokenizedDocument array.

domains — Top-level domains

character vector | string array | cell array of character vectors

Top-level domains to use for web address detection, specified as a character vector, string array, or cell array of character vectors.

If you do not specify domains, then the function uses the output of topLevelDomains.

Example: ["com" "net" "org"] Data Types: char | string | cell

Output Arguments

newDocuments — Output documents

tokenizedDocument array

Output documents, returned as a tokenizedDocument array.

bagOfNgrams

Bag-of-n-grams model

Description

A bag-of-n-grams model records the number of times that each n-gram appears in each document of a collection. An n-gram is a collection of n successive words.

bagOfNgrams does not split text into words. To create an array of tokenized documents, see tokenizedDocument.

Creation

Syntax

- bag = bagOfNgrams
- bag = bagOfNgrams(documents)
- bag = bagOfNgrams(____, 'NgramLengths', lengths)
- bag = bagOfNgrams(uniqueNgrams,counts)

Description

bag = bag0fNgrams creates an empty bag-of-n-grams model.

bag = bagOfNgrams(documents) creates a bag-of-n-grams model and counts the bigrams (pairs of words) in documents.

bag = bagOfNgrams(____, 'NgramLengths', lengths) counts n-grams of the specified lengths using any of the previous syntaxes.

bag = bagOfNgrams(uniqueNgrams, counts) creates a bag-of-n-grams model using the n-grams in uniqueNgrams and the corresponding frequency counts in counts. If uniqueNgrams contains <missing> values, then the corresponding values in counts are ignored.

Input Arguments

documents — Input documents

tokenizedDocument array | string array of words | cell array of character vectors

Input documents, specified as a tokenizedDocument array, a string array of words, or a cell array of character vectors. If documents is a string array or a cell array of character vectors, then it must be a row vector representing a single document, where each element is a word.

uniqueNgrams — Unique n-gram list

string array | cell array of character vectors

Unique n-gram list, specified as a NumNgrams-by-maxN string array or cell array of character vectors, where NumNgrams is the number of unique n-grams, and maxN is the length of the largest n-gram.

The value of uniqueNgrams(i,j) is the jth word of the ith n-gram. If the number of words in the ith n-gram is less than maxN, then the remaining entries of the ith row of uniqueNgrams are empty.

If uniqueNgrams contains <missing>, then the function ignores the corresponding values in counts.

Each n-gram must have at least one word.

```
Example: ["An" ""; "An" "example"; "example" ""]
Data Types: string | cell
```

counts — Frequency counts of n-grams

matrix of nonnegative integers

Frequency counts of n-grams corresponding to the rows of uniqueNgrams, specified as a matrix of nonnegative integers. The value counts(i,j) corresponds to the number of times the n-gram uniqueNgrams(j,:) appears in the *i*th document.

counts must have as many columns as uniqueNgrams has rows.

lengths — Lengths of n-grams

2 (default) | positive integer | vector of positive integers

Lengths of n-grams, specified as a positive integer or a vector of positive integers.
Properties

Counts — N-gram counts per document

sparse matrix

N-gram counts per document, specified as a sparse matrix.

Ngrams — Unique n-grams in model

string array

Unique n-grams in the model, specified as a string array. Ngrams(i,j) is the jth word of the ith n-gram. If the number of columns of Ngrams is greater than the number of words in the n-gram, then the remaining entries are empty.

NgramLengths — Lengths of n-grams

2 (default) | positive integer | vector of positive integers

Lengths of n-grams, specified as a positive integer or a vector of positive integers.

Vocabulary — Unique words in model

string vector

Unique words in the model, specified as a string vector.

Data Types: string

NumNgrams — Number of n-grams seen

nonnegative integer

Number of n-grams seen, specified as a nonnegative integer.

NumDocuments — Number of documents seen

nonnegative integer

Number of documents seen, specified as a nonnegative integer.

Object Functions

encode tfidf topkngrams Encode documents as matrix of word or n-gram counts Term Frequency-Inverse Document Frequency (tf-idf) matrix Most frequent n-grams

addDocument	Add documents to bag-of-words or bag-of-n-grams model
removeDocument	Remove documents from bag-of-words or bag-of-n-grams model
removeEmptyDocuments	Remove empty documents from tokenized document array, bag-of-words model, or bag-of-n-grams model
removeNgrams	Remove n-grams from bag-of-n-grams model
removeInfrequentNgrams	Remove infrequently seen n-grams from bag-of-n-grams model
join	Combine multiple bag-of-words or bag-of-n-grams models
wordcloud	Create word cloud chart from text, bag-of-words model, bag- of-n-grams model, or LDA model

Examples

Create Bag-of-N-Grams Model

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
documents(1:10)
```

ans =
 10x1 tokenizedDocument:

70 tokens: fairest creatures desire increase thereby beautys rose might never die of 71 tokens: forty winters shall besiege thy brow dig deep trenches thy beautys field 65 tokens: look thy glass tell face thou viewest time face form another whose fresh 71 tokens: unthrifty loveliness why dost thou spend upon thy self thy beautys legat 61 tokens: hours gentle work frame lovely gaze every eye doth dwell play tyrants sa 68 tokens: let winters ragged hand deface thee thy summer ere thou distilld make sw 64 tokens: lo orient gracious light lifts up burning head eye doth homage newappear 70 tokens: music hear why hearst thou music sadly sweets sweets war joy delights jo 70 tokens: fear wet widows eye thou consumst thy self single life ah thou issueless 69 tokens: shame deny thou bearst love thy self art unprovident grant thou wilt the

```
Create a bag-of-n-grams model.
```

```
bag = bagOfNgrams(documents)
bag =
    bagOfNgrams with properties:
        Counts: [154x8799 double]
        Vocabulary: [1x3092 string]
        Ngrams: [8799x2 string]
        NgramLengths: 2
        NumNgrams: 8799
        NumDocuments: 154
```

Visualize the model using a word cloud.

figure
wordcloud(bag);

Count N-Grams of Different Lengths

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

Create a bag-of-n-grams model. To count n-grams of length 2 and 3 (bigrams and trigrams), specify 'NgramLengths' to be the vector [2 3].

```
bag = bagOfNgrams(documents, 'NgramLengths', [2 3])
bag =
  bagOfNgrams with properties:
          Counts: [154×18022 double]
      Vocabulary: [1×3092 string]
          Ngrams: [18022×3 string]
    NgramLengths: [2 3]
       NumNgrams: 18022
    NumDocuments: 154
```

View the 10 most common n-grams of length 2 (bigrams).

ans=10×3 table Count NgramLength Ngram "thou" "art" н н 34 2 "eve" ш 2 "mine" 15 "thy" "self" ш 14 2 "thou" "dost" ш 2 13 шп 2 "mine" "own" 13 "thv" 11.11 2 "sweet" 12 "thy" "love" пп 11 2 "dost" "thou" ш 10 2 "thou" 2 "wilt" нп 10 "thee" "love" шп 9 2

topkngrams(bag,10,'NGramLengths',2)

View the 10 most common n-grams of length 3 (trigrams).

Create Bag-of-N-Grams Model from Unique N-Grams and Counts

Create a bag-of-n-grams model using a string array of unique n-grams and a matrix of counts.

Load the example n-grams and counts from sonnetsBigramCounts.mat. This file contains a string array uniqueNgrams, which contains the unique n-grams, and the matrix counts, which contains the n-gram frequency counts.

```
load sonnetsBigramCounts.mat
```

View the first few n-grams in uniqueNgrams.

```
uniqueNgrams(1:10,:)
```

```
ans = 10x2 string array
    "fairest"    "creatures"
    "desire"
    "desire"    "increase"
    "increase"    "thereby"
    "thereby"    "beautys"

bagOfWords

Bag-of-words model

Description

A bag-of-words model (also known as a term-frequency counter) records the number of times that words appear in each document of a collection.

bagOfWords does not split text into words. To create an array of tokenized documents, see tokenizedDocument.

Creation

Syntax

- bag = bagOfWords
- bag = bagOfWords(documents)
- bag = bagOfWords(uniqueWords,counts)

Description

bag = bagOfWords creates an empty bag-of-words model.

bag = bagOfWords(documents) counts the words appearing in documents and returns a bag-of-words model.

bag = bagOfWords(uniqueWords,counts) creates a bag-of-words model using the words in uniqueWords and the corresponding frequency counts in counts.

Input Arguments

documents — Input documents

tokenizedDocument array | string array of words | cell array of character vectors

Input documents, specified as a tokenizedDocument array, a string array of words, or a cell array of character vectors. If documents is a string array or a cell array of character vectors, then it must be a row vector representing a single document, where each element is a word.

uniqueWords — Unique word list

string vector | cell array of character vectors

Unique word list, specified as a string vector or a cell array of character vectors. If uniqueWords contains <missing>, then the function ignores the missing values. The size of uniqueWords must be 1-by-V where V is the number of columns of counts.

```
Example: ["an" "example" "list"]
Data Types: string | cell
```

counts — Frequency counts of words

matrix of nonnegative integers

Frequency counts of words corresponding to uniqueWords, specified as a matrix of nonnegative integers. The value counts(i,j) corresponds to the number of times the word uniqueWords(j) appears in the *i*th document.

counts must have numel(uniqueWords) columns.

Properties

Counts - Word counts per document

sparse matrix

Word counts per document, specified as a sparse matrix.

NumDocuments — Number of documents seen

nonnegative integer

Number of documents seen, specified as a nonnegative integer.

NumWords — Number of words in model nonnegative integer

Number of words in the model, specified as a nonnegative integer.

Vocabulary - Unique words in model

string vector

Unique words in the model, specified as a string vector.

Data Types: string

Object Functions

encode	Encode documents as matrix of word or n-gram counts
tfidf	Term Frequency-Inverse Document Frequency (tf-idf) matrix
topkwords	Most important words in bag-of-words model or LDA topic
addDocument	Add documents to bag-of-words or bag-of-n-grams model
removeDocument	Remove documents from bag-of-words or bag-of-n-grams model
removeEmptyDocuments	Remove empty documents from tokenized document array, bag-of-words model, or bag-of-n-grams model
removeWords	Remove selected words from documents or bag-of-words model
removeInfrequentWords	Remove words with low counts from bag-of-words model
join	Combine multiple bag-of-words or bag-of-n-grams models
wordcloud	Create word cloud chart from text, bag-of-words model, bag-of-n-grams model, or LDA model

Examples

Create Bag-of-Words Model

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

Create a bag-of-words model using bag0fWords.

```
bag = bagOfWords(documents)
bag =
    bagOfWords with properties:
        Counts: [154x3092 double]
        Vocabulary: [1x3092 string]
        NumWords: 3092
        NumDocuments: 154
```

View the top 10 words and their total counts.

tbl = topkwords(bag,10)

```
tbl=10×2 table
    Word
               Count
    "thy"
                281
    "thou"
                234
    "love"
                162
    "thee"
                161
    "doth"
                 88
    "mine"
                 63
    "shall"
                59
    "eves"
                56
    "sweet"
                 55
    "time"
                 53
```

Create Bag-of-Words Model from Unique Words and Counts

Create a bag-of-words model using a string array of unique words and a matrix of word counts.

```
uniqueWords = ["a" "an" "another" "example" "final" "sentence" "third"];
counts = [ ...
    1 2 0 1 0 1 0;
    0 0 3 1 0 4 0;
    1 0 0 5 0 3 1;
    1 0 0 1 7 0 0];
bag = bagOfWords(uniqueWords,counts)
```

```
bag =
  bagOfWords with properties:
            Counts: [4x7 double]
            Vocabulary: [1x7 string]
            NumWords: 7
            NumDocuments: 4
```

Import Text from Multiple Files Using a File Datastore

If your text data is contained in multiple files in a folder, then you can import the text data into MATLAB using a file datastore.

Create a file datastore for the example sonnet text files. The examples sonnets have file names "exampleSonnetN.txt", where N is the number of the sonnet. Specify the read function to be extractFileText.

```
Create an empty bag-of-words model.
```

```
bag = bagOfWords
bag =
bagOfWords with properties:
```

```
Counts: []
Vocabulary: [1x0 string]
NumWords: 0
NumDocuments: 0
```

Loop over the files in the datastore and read each file. Tokenize the text in each file and add the document to bag.

```
while hasdata(fds)
    str = read(fds);
    document = tokenizedDocument(str);
    bag = addDocument(bag,document);
end
```

View the updated bag-of-words model.

bag

Remove Stop Words from Bag-of-Words Model

Remove the stop words from a bag-of-words model by inputting a list of stop words to removeWords. Stop words are words such as "a", "the", and "in" which are commonly removed from text before analysis.

```
documents = tokenizedDocument([
    "an example of a short sentence"
    "a second short sentence"]);
bag = bagOfWords(documents);
newBag = removeWords(bag,stopWords)
newBag =
    bagOfWords with properties:
```

```
Counts: [2x4 double]
Vocabulary: ["example" "short" "sentence" "second"]
NumWords: 4
NumDocuments: 2
```

Most Frequent Words of Bag-of-Words Model

Create a table of the most frequent words of a bag-of-words model.

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

Create a bag-of-words model using bagOfWords.

```
bag = bagOfWords(documents)
bag =
    bagOfWords with properties:
        Counts: [154x3092 double]
        Vocabulary: [1x3092 string]
        NumWords: 3092
    NumDocuments: 154
```

Find the top five words.

T = topkwords(bag);

Find the top 20 words in the model.

```
k = 20;
T = topkwords(bag,k)
```

T=20×2 table Word	Count
"thy"	281
"thou"	234
"love"	162
"thee"	161
"doth"	88
"mine"	63
"shall"	59
"eyes"	56
"sweet"	55
"time"	53
"beauty"	52
"nor"	52
"art"	51
"yet"	51
"0"	50
"heart"	50

Create Tf-idf Matrix

Create a Term Frequency-Inverse Document Frequency (tf-idf) matrix from a bag-of-words model.

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

Create a bag-of-words model using bag0fWords.

```
bag = bagOfWords(documents)
```

```
bag =
  bagOfWords with properties:
        Counts: [154x3092 double]
        Vacabularuu [1u2002 string]
```

```
Vocabulary: [1x3092 string]
NumWords: 3092
NumDocuments: 154
```

Create a tf-idf matrix. View the first 10 rows and columns.

M = tfidf(bag); full(M(1:10,1:10))

ans = 10×10

3.6507	4.3438	2.7344	3.6507	4.3438	2.2644	3.2452	3.8918	2
Θ	Θ	Θ	Θ	Θ	4.5287	Θ	Θ	
Θ	Θ	Θ	Θ	Θ	Θ	Θ	Θ	
Θ	Θ	Θ	Θ	Θ	2.2644	Θ	\odot	
Θ	Θ	Θ	Θ	Θ	2.2644	Θ	\odot	
Θ	Θ	Θ	Θ	Θ	2.2644	Θ	\odot	
Θ	Θ	Θ	Θ	Θ	\odot	Θ	\odot	
Θ	Θ	Θ	Θ	Θ	\odot	Θ	\odot	
Θ	Θ	Θ	Θ	Θ	2.2644	Θ	\odot	
Θ	Θ	2.7344	Θ	Θ	Θ	Θ	\odot	

Create Word Cloud from Bag-of-Words Model

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

Create a bag-of-words model using bag0fWords.

bag = bagOfWords(documents)

Visualize the bag-of-words model using a word cloud.

figure wordcloud(bag);

Create Bag-of-Words Model in Parallel

If your text data is contained in multiple files in a folder, then you can import the text data and create a bag-of-words model in parallel using parfor. If you have Parallel Computing Toolbox^m installed, then the parfor loop runs in parallel, otherwise, it runs in serial. Use join to combine an array of bag-of-words models into one model.

Create a bag-of-words model from a collection of files. The examples sonnets have file names "exampleSonnetN.txt", where N is the number of the sonnet. Get a list of the files and their locations using dir.

```
fileLocation = fullfile(matlabroot,'examples','textanalytics','exampleSonnet*.txt');
fileInfo = dir(fileLocation)
```

```
fileInfo = 5x1 struct array with fields:
    name
    folder
    date
    bytes
    isdir
    datenum
```

Initialize an empty bag-of-words model and then loop over the files and create an array of bag-of-words models.

```
bag = bagOfWords;
numFiles = numel(fileInfo);
parfor i = 1:numFiles
    f = fileInfo(i);
    filename = fullfile(f.folder,f.name);
    textData = extractFileText(filename);
    document = tokenizedDocument(textData);
    bag(i) = bagOfWords(document);
end
Starting parallel pool (parpool) using the 'local' profile ...
connected to 12 workers.
```

Combine the bag-of-words models using join.

bag = join(bag)

Tips

• If you intend to use a held out test set for your work, then partition your text data before using bagOfWords. Otherwise, the bag-of-words model may bias your analysis.

context

Search documents for word occurrences in context

Syntax

- T = context(documents,word)
- T = context(documents,word,contextLength)
- T = context(____, 'Source', source)

Description

T = context(documents,word) searches for occurrences of word in documents and returns a table showing word in context and its locations.

T = context(documents,word,contextLength) specifies the length of the context to return.

T = context(____, 'Source', source) displays the context in the original source string source if the word is found.

Examples

Search Documents for Word Occurrences

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

Word

Document

Search for the word "life".

tbl = context(documents,"life"); head(tbl)

```
", When others would give life, and bring a tomb. There" 83 108
"a tomb. There lives more life in one of your fair eyes" 83 118
"hyself away, For term of life thou art assured mine; A" 92 13
...
```

Input Arguments

documents - Input documents

tokenizedDocument array

Input documents, specified as a tokenizedDocument array.

word — Word to find

string scalar | character vector | scalar cell array

Word to find in context, specified as a string scalar, character vector, or scalar cell array containing a character vector.

Data Types: char | string | cell

contextLength — Context length

25 (default) | positive integer

Context length, specified as a positive integer.

source - Source text

string array | cell array of character vectors

Source text, specified as the comma-separated pair consisting of 'Source' and a string array or a cell array of character vectors. If the input documents are preprocessed, and you have the source text, then you can use this option to make the output more readable.

The source text must be the same size as documents.

Output Arguments

T — Table of contexts table

Table of contexts with these columns:

Context	String containing the queried word in context	
Document	Numeric index of the document containing the word	
Word	Numeric index of the word in the document	

See Also

doc2cell|doclength|joinWords|string|tokenizedDocument

Topics

"Prepare Text Data for Analysis" "Create Simple Text Model for Classification"

Introduced in R2017b

corpusLanguage

Detect language of text

Syntax

language = corpusLanguage(str)

Description

language = corpusLanguage(str) detects the language of the text in str. The function detects English and Japanese text only.

Examples

Detect Language of Text

Detect the language of a string array of text.

```
str = [
"恋の悩みで 苦しむ。"
"空の星が輝きを増している。"];
language = corpusLanguage(str)
language =
'ja'
```

Input Arguments

str — Input text string array | character vector | cell array of character vectors

Input text, specified as a string array, character vector, or cell array of character vectors.

Example: ["An example of a short sentence."; "A second short sentence."]

Data Types: string | char | cell

Output Arguments

language — Detected language

'en'|'ja'

Detected language, returned as one of the following:

- 'en' Detected English text
- 'ja' Detected Japanese text

Introduced in R2018b

decodeHTMLEntities

Convert HTML and XML entities into characters

Syntax

newStr = decodeHTMLEntities(str)

Description

newStr = decodeHTMLEntities(str) replaces HTML and XML character entities and numeric character references in the elements of str with their Unicode equivalent.

Examples

Replace HTML Entities with Unicode

Replace HTML character entities with their Unicode equivalent.

```
str = ["<&gt;" "R&amp;D"];
newStr = decodeHTMLEntities(str)
newStr = 1x2 string array
    "<>" "R&D"
```

Replace HTML numeric character references with their Unicode equivalent. Unicode character with hex code # x20 is a space.

```
str = "R D";
newStr = decodeHTMLEntities(str)
newStr =
"R D"
```

Input Arguments

str – Input text

string array | character vector | cell array of character vectors

Input text, specified as a string array, character vector, or cell array of character vectors.

```
Example: ["An example of a short sentence."; "A second short
sentence."]
```

Data Types: string | char | cell

Output Arguments

newStr — Output text

string array | character vector | cell array of character vectors

Output text, returned as a string array, a character vector, or cell array of character vectors. str and newStr have the same data type.

See Also

erasePunctuation | eraseTags | eraseURLs | lower | tokenizedDocument | upper

Topics

"Prepare Text Data for Analysis" "Create Simple Text Model for Classification"

Introduced in R2017b

doclength

Length of documents in document array

Syntax

N = doclength(documents)

Description

N = doclength(documents) returns the number of tokens in each document in documents.

Examples

Find Number of Words in Documents

Find the number of words in an array of tokenized documents. Erase the punctuation characters so they do not get counted as words.

```
str = [ ...
    "An example of a short sentence."
    "A second short sentence."];
documents = tokenizedDocument(str)

documents =
    2x1 tokenizedDocument:
    7 tokens: An example of a short sentence .
    5 tokens: A second short sentence .
```

documents = erasePunctuation(documents)

```
documents =
    2x1 tokenizedDocument:
```

6 tokens: An example of a short sentence 4 tokens: A second short sentence N = doclength(documents) N = 2×1 6 4

Input Arguments

documents — Input documents

tokenizedDocument array

Input documents, specified as a tokenizedDocument array.

Output Arguments

N — Document lengths

vector of nonnegative integers

Document lengths, returned as a vector of nonnegative integers. The size of N is the same as the size of <code>documents</code>.

See Also

context|doc2cell|joinWords|string|tokenizedDocument

Topics

"Prepare Text Data for Analysis" "Create Simple Text Model for Classification"

Introduced in R2017b

doc2cell

Convert documents to cell array of string vectors

Syntax

C = doc2cell(documents)

Description

C = doc2cell(documents) converts a tokenizedDocument array to a cell array. The entries of C are string arrays containing the corresponding words in each document.

Examples

Convert Document Array to Cell Array

Convert a tokenizedDocument array to a cell array of string vectors.

```
documents = tokenizedDocument([ ...
    "an example of a short sentence" ...
    "a second short sentence"])
documents =
    1x2 tokenizedDocument:
    6 tokens: an example of a short sentence
    4 tokens: a second short sentence
    C = doc2cell(documents)
```

```
C = 1x2 cell array
```

```
{1x6 string} {1x4 string}
```

View the first element of the cell array.

C{1}

```
ans = 1x6 string array
"an" "example" "of" "a" "short" "sentence"
```

Input Arguments

documents - Input documents

tokenizedDocument array

Input documents, specified as a tokenizedDocument array.

Output Arguments

C — Output cell array

cell array of string vectors

Output cell array of string vectors. Each element of ${\sf C}$ is a string vector containing the words of the corresponding document.

See Also

context|doclength|joinWords|string|tokenizedDocument

Topics

"Prepare Text Data for Analysis" "Create Simple Text Model for Classification"

Introduced in R2017b

doc2sequence

Convert documents to sequences for deep learning

Syntax

```
sequences = doc2sequence(enc,documents)
sequences = doc2sequence(emb,documents)
sequences = doc2sequence(____,Name,Value)
```

Description

sequences = doc2sequence(enc,documents) returns a cell array of the numeric indices of the words in documents given by the word encoding enc. Each element of sequences is a vector of the indices of the words in the corresponding document.

sequences = doc2sequence(emb,documents) returns a cell array of the embedding
vectors of the words in documents given by the word embedding emb. Each element of
sequences is a matrix of the embedding vectors of the words in the corresponding
document.

sequences = doc2sequence(_____, Name, Value) specifies additional options using
one or more name-value pair arguments.

Examples

Convert Documents to Sequences of Word Indices

Load the weather reports data and create a tokenizedDocument array.

```
filename = "weatherReports.csv";
data = readtable(filename, 'TextType', 'string');
textData = data.event_narrative;
documents = tokenizedDocument(textData);
```

Create a word encoding.

enc = wordEncoding(documents);

Convert the documents to sequences of word indices.

```
sequences = doc2sequence(enc,documents);
```

View the sizes of the first 10 sequences. Each sequence is a 1-by-S vector, where S is the number of word indices in the sequence. Because the sequences are padded, S is constant.

sequences(1:10)

```
ans = 10x1 cell array
{1x930 double}
```

Convert Documents to Sequences of Word Vectors

Convert an array of tokenized documents to sequences of word vectors using a pretrained word embedding.

Load a pretrained word embedding using the fastTextWordEmbedding function. This function requires Text Analytics Toolbox[™] Model for fastText English 16 Billion Token Word Embedding support package. If this support package is not installed, then the function provides a download link.

emb = fastTextWordEmbedding;

Load the weather reports data and create a tokenizedDocument array.

```
filename = "weatherReports.csv";
data = readtable(filename, 'TextType', 'string');
```
```
textData = data.event_narrative;
documents = tokenizedDocument(textData);
```

Convert the documents to sequences of word vectors using doc2sequence. The doc2sequence function, by default, left-pads the sequences to have the same length. When converting large collections of documents using a high-dimensional word embedding, padding can require large amounts of memory. To prevent the function from padding the data, set the 'PaddingDirection' option to 'none'. Alternatively, you can control the amount of padding using the 'Length' option.

```
sequences = doc2sequence(emb,documents,'PaddingDirection','none');
```

View the sizes of the first 10 sequences. Each sequence is D-by-S matrix, where D is the embedding dimension, and S is the number of word vectors in the sequence.

sequences(1:10)

```
ans = 10×1 cell array
{300×8 single}
{300×39 single}
{300×14 single}
{300×14 single}
{300×15 single}
{300×20 single}
{300×20 single}
{300×6 single}
{300×21 single}
{300×10 single}
```

Pad or Truncate Sequences to Specified Length

Convert a collection of documents to sequences of word vectors using a pretrained word embedding, and pad or truncate the sequences to a specified length.

Load a pretrained word embedding using fastTextWordEmbedding. This function requires Text Analytics Toolbox[™] Model for fastText English 16 Billion Token Word Embedding support package. If this support package is not installed, then the function provides a download link.

```
emb = fastTextWordEmbedding;
```

Load the weather reports data and create a tokenizedDocument array.

```
filename = "weatherReports.csv";
data = readtable(filename, 'TextType', 'string');
textData = data.event_narrative;
documents = tokenizedDocument(textData);
```

Convert the documents to sequences of word vectors. Specify to left-pad or truncate the sequences to have length 100.

```
sequences = doc2sequence(emb,documents,'Length',100);
```

View the sizes of the first 10 sequences. Each sequence is D-by-S matrix, where D is the embedding dimension, and S is the number of word vectors in the sequence (the sequence length). Because the sequence length is specified, S is constant.

sequences(1:10)

```
ans = 10×1 cell array
{300×100 single}
```

Input Arguments

emb — Input word embedding

wordEmbedding object

Input word embedding, specified as a wordEmbedding object.

enc - Input word encoding

wordEncoding object

Input word encoding, specified as a wordEncoding object.

documents - Input documents

tokenizedDocument array

Input documents, specified as a tokenizedDocument array.

Name-Value Pair Arguments

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1, Value1, ..., NameN, ValueN.

Example: 'Length', 'shortest' truncates the sequences to have the same length as the shortest sequence.

UnknownWord — Unknown word behavior

'discard' (default) | 'nan'

Unknown word behavior, specified as the comma-separated pair consisting of 'UnknownWord' and one of the following:

- 'discard' If a word is not in the input map, then discard it.
- 'nan' If a word is not in the input map, then return a NaN value.

Tip If you are creating sequences for training a deep learning network with a word embedding, use 'discard'. Do not use sequences with NaN values, because doing so can propagate errors through the network.

PaddingDirection — Padding direction

'left' (default) | 'right' | 'none'

Padding direction, specified as the comma-separated pair consisting of 'PaddingDirection' and one of the following:

- 'left' Pad sequences on the left.
- 'right' Pad sequences on the right.
- 'none' Do not pad sequences.

Tip When converting large collections of data using a high-dimensional word embedding, padding can require large amounts of memory. To prevent the function from adding too much padding, set the 'PaddingDirection' option to 'none' or set 'Length' to a smaller value.

PaddingValue — Padding value

0 (default) | numeric scalar

Padding value, specified as the comma-separated pair consisting of 'PaddingValue' and a numeric scalar. Do not pad sequences with NaN, because doing so can propagate errors through the network.

```
Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64
```

Length — Sequence length

'longest' (default) | 'shortest' | positive integer

Sequence length, specified as the comma-separated pair consisting of 'Length' and one of the following:

- 'longest' Pad sequences to have the same length as the longest sequence.
- 'shortest' Truncate sequences to have the same length as the shortest sequence.
- Positive integer Pad or truncate sequences to have the specified length. The function truncates the sequences on the right.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | char | string

Output Arguments

sequences — Output sequences

cell array

Output sequences, returned as a cell array.

For word embedding input, the *i*th element of **sequences** is a matrix of the word vectors corresponding to the *i*th input document.

For word encoding input, the *i*th element of sequences is a vector of the word encoding indices corresponding to the *i*th input document.

Tips

• When converting large collections of data using a high-dimensional word embedding, padding can require large amounts of memory. To prevent the function from adding too much padding, set the 'PaddingDirection' option to 'none' or set 'Length' to a smaller value.

Introduced in R2018b

docfun

Apply function to words in documents

Syntax

```
newDocuments = docfun(func,documents)
newDocuments = docfun(func,documents1,...,documentsN)
```

Description

newDocuments = docfun(func,documents) calls the function specified by the function handle func and passes elements of documents as a string vector of words.

- If func accepts exactly one input argument, then the words of newDocuments(i) are the output of func(string(documents(i))).
- If func accepts two input arguments, then the words of newDocuments(i) are the output of func(string(documents(i)), details), where details contains the corresponding token details output by tokenDetails.
- If func changes the number of words in the document, then docfun removes the token details from that document.

docfun does not perform the calls to function func in a specific order.

newDocuments = docfun(func,documents1,...,documentsN) calls the function specified by the function handle func and passes elements of documents1, ...,documentsN as string vectors of words, where N is the number of inputs to the function func. The words of newDocuments(i) are the output of func(string(documents1(i)),...,string(documentsN(i))).

Each of documents1,..., documentsN must be the same size.

Examples

Reverse Words in Documents

Apply reverse to each word in a document array.

```
documents = tokenizedDocument([ ...
    "an example of a short sentence"
    "a second short sentence"])

documents =
    2x1 tokenizedDocument:
    6 tokens: an example of a short sentence
    4 tokens: a second short sentence

func = @reverse;
newDocuments = docfun(func,documents)

newDocuments =
    2x1 tokenizedDocument;
```

```
6 tokens: na elpmaxe fo a trohs ecnetnes
4 tokens: a dnoces trohs ecnetnes
```

Specify Document Function with Multiple Inputs

Tag words by combining the words from one document array with another, using the string function plus.

Create the first tokenizedDocument array. Erase the punctuation and convert the text to lowercase.

```
str = [ ...
    "An example of a short sentence."
    "A second short sentence."];
str = erasePunctuation(str);
str = lower(str);
documents1 = tokenizedDocument(str)
documents1 =
```

```
6 tokens: an example of a short sentence
4 tokens: a second short sentence
```

Create the second tokenizedDocument array. The documents have the same number of words as the corresponding documents in documents1. The words of documents2 are POS tags for the corresponding words.

```
documents2 = tokenizedDocument([ ...
    "_det _noun _prep _det _adj _noun"
    "_det _adj _adj _noun"])
documents2 =
    2x1 tokenizedDocument:
    6 tokens: _det _noun _prep _det _adj _noun
    4 tokens: _det _adj _adj _noun
func = @plus;
newDocuments = docfun(func,documents1,documents2)
newDocuments =
    2x1 tokenizedDocument:
```

6 tokens: an_det example_noun of_prep a_det short_adj sentence_noun 4 tokens: a_det second_adj short_adj sentence_noun

The output is not the same as calling plus on the documents directly.

plus(documents1,documents2)

```
ans =
2x1 tokenizedDocument:
12 tokens: an example of a short sentence _det _noun _prep _det _adj _noun
8 tokens: a second short sentence _det _adj _noun
```

Input Arguments

func — Function handle

function handle

Function handle that accepts N string arrays as inputs and outputs a string array. func must accept string(documents1(i)),...,string(documentsN(i)) as input.

Function handle to apply to words in documents. The function must have one of the following syntaxes:

- newWords = func(words), where words is a string array of the words of a single document.
- newWords = func(words,details), where words is a string array of the words of a single document, and details is the corresponding table of token details given by tokenDetails.
- newWords = func(words1,...,wordsN), where words1,...,wordsN are string arrays of words.

Example: @reverse

Data Types: function_handle

documents — Input documents

tokenizedDocument array

Input documents, specified as a tokenizedDocument array.

Output Arguments

newDocuments — Output documents

tokenizedDocument array

Output documents, returned as a tokenizedDocument array.

Introduced in R2017b

encode

Encode documents as matrix of word or n-gram counts

Use encode to encode an array of tokenized documents as a matrix of word or n-gram counts according to a bag-of-words or bag-of-n-grams model. To encode documents as vectors or word indices, use a wordEncoding object.

Syntax

```
counts = encode(bag,documents)
counts = encode(bag,words)
counts = encode(____,Name,Value)
```

Description

counts = encode(bag,documents) returns a matrix of frequency counts for documents based on the bag-of-words or bag-of-n-grams model bag.

counts = encode(bag,words) returns a matrix of frequency counts for a list of words.

counts = encode(_____, Name, Value) specifies additional options using one or more
name-value pair arguments.

Examples

Encode Documents as Word Count Matrix

Encode an array of documents as a matrix of word counts.

```
documents = tokenizedDocument([
    "an example of a short sentence"
    "a second short sentence"]);
bag = bagOfWords(documents)
```

```
bag =
  bagOfWords with properties:
        Counts: [2x7 double]
      Vocabulary: [1x7 string]
      NumWords: 7
    NumDocuments: 2

documents = tokenizedDocument([
    "a new sentence"
    "a second new sentence"])

documents =
    2x1 tokenizedDocument:
    3 tokens: a new sentence
    4 tokens: a second new sentence
```

View the documents encoded as a matrix of word counts. The word "new" does not appear in **bag**, so it is not counted.

```
counts = encode(bag,documents);
full(counts)
ans = 2×7
0 0 0 1 0 1 0
0 0 0 1 0 1 1
```

The columns correspond to the vocabulary of the bag-of-words model.

```
bag.Vocabulary
```

ans = 1x7 string array
"an" "example" "of" "a" "short" "sentence" "second"

Encode Words as Word Count Vector

Encode an array of words as a vector of word counts.

```
documents = tokenizedDocument([
    "an example of a short sentence"
    "a second short sentence"]);
bag = bagOfWords(documents)
bag =
  bagOfWords with properties:
          Counts: [2x7 double]
      Vocabulary: [1x7 string]
        NumWords: 7
    NumDocuments: 2
words = ["another" "example" "of" "a" "short" "example" "sentence"];
counts = encode(bag,words)
counts =
                2
   (1,2)
   (1,3)
                1
                1
   (1, 4)
   (1,5)
                1
                1
   (1, 6)
```

Output Document Word Counts in Columns

Encode an array of documents as a matrix of word counts with documents in columns.

```
documents = tokenizedDocument([
    "an example of a short sentence"
    "a second short sentence"]);
bag = bagOfWords(documents)
bag =
    bagOfWords with properties:
        Counts: [2x7 double]
        Vocabulary: [1x7 string]
        NumWords: 7
        NumDocuments: 2
```

```
documents = tokenizedDocument([
    "a new sentence"
    "a second new sentence"])
documents =
    2x1 tokenizedDocument:
    3 tokens: a new sentence
    4 tokens: a second new sentence
```

View the documents encoded as a matrix of word counts with documents in columns. The word "new" does not appear in **bag**, so it is not counted.

```
counts = encode(bag,documents,'DocumentsIn','columns');
full(counts)
```

```
ans = 7×2

0 0

0 0

0 0

1 1

0 0

1 1

0 1
```

Input Arguments

bag — Input bag-of-words or bag-of-n-grams model

bagOfWords object | bagOfNgrams object

Input bag-of-words or bag-of-n-grams model, specified as a bagOfWords object or a bagOfNgrams object.

documents — Input documents

tokenizedDocument array | string array of words | cell array of character vectors

Input documents, specified as a tokenizedDocument array, a string array of words, or a cell array of character vectors. If documents is a string array or a cell array of character

vectors, then it must be a row vector representing a single document, where each element is a word.

Tip To ensure that the documents are encoded correctly, you must preprocess the input documents using the same steps as the documents used to create the input model. For an example showing how to create a function to preprocess text data, see "Prepare Text Data for Analysis".

words - Input words

string vector | character vector | cell array of character vectors

Input words, specified as a string vector, character vector, or cell array of character vectors. If you specify words as a character vector, then the function treats the argument as a single word.

Data Types: string | char | cell

Name-Value Pair Arguments

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1, Value1, ..., NameN, ValueN.

Example: 'DocumentsIn', 'rows' specifies the orientation of the output documents as rows.

DocumentsIn — Orientation of output documents

'rows' (default) | 'columns'

Orientation of output documents in the frequency count matrix, specified as the commaseparated pair consisting of 'DocumentsIn' and one of the following:

- 'rows' Return a matrix of frequency counts with rows corresponding to documents.
- 'columns' Return a transposed matrix of frequency counts with columns corresponding to documents.

Data Types: char

ForceCellOutput — **Indicator for forcing output to be returned as cell array** false (default) | true

Indicator for forcing output to be returned as cell array, specified as the comma separated pair consisting of 'ForceCellOutput' and true or false.

Data Types: logical

Output Arguments

counts — Word or n-gram counts

sparse matrix | cell array of sparse matrices

Word or n-gram counts, returned as a sparse matrix of nonnegative integers or a cell array of sparse matrices.

If bag is a non-scalar array or 'ForceCellOutput' is true, then the function returns the outputs as a cell array of sparse matrices. Each element in the cell array is matrix of word or n-gram counts of the corresponding element of bag.

Introduced in R2017b

erasePunctuation

Erase punctuation from text and documents

Syntax

```
newStr = erasePunctuation(str)
newDocuments = erasePunctuation(documents)
newDocuments = erasePunctuation(documents, 'TokenTypes', types)
```

Description

newStr = erasePunctuation(str) erases punctuation and symbols from the elements of str. The function removes characters that belong to the Unicode punctuation or symbol classes.

newDocuments = erasePunctuation(documents) erases punctuation and symbols from documents. If a word is empty after removing punctuation and symbol characters, then the function removes it. For tokenized document input, the function erases punctuation from tokens with type 'punctuation' and 'other'. For example, the function does not erase punctuation and symbol characters from URLs and email addresses.

newDocuments = erasePunctuation(documents, 'TokenTypes',types) erases
punctuation and symbols from only the specified token types.

Examples

Erase Punctuation from Text

Erase the punctuation from the text in str.

str = "it's one and/or two.";
newStr = erasePunctuation(str)

newStr =
"its one andor two"

To insert a space where the "/" symbol is, first use the replace function.

```
newStr = replace(str, "/", " ")
```

newStr =
"it's one and or two."

newStr = erasePunctuation(newStr)

```
newStr =
"its one and or two"
```

Erase Punctuation from Documents

Erase the punctuation from an array of documents.

```
documents = tokenizedDocument([ ...
    "An example of a short sentence."
    "Another example... with a URL: https://www.mathworks.com"])
documents =
    2x1 tokenizedDocument:
    7 tokens: An example of a short sentence .
    10 tokens: Another example . . . with a URL : https://www.mathworks.com
```

newDocuments = erasePunctuation(documents)

```
newDocuments =
2x1 tokenizedDocument:
6 tokens: An example of a short sentence
6 tokens: Another example with a URL https://www.mathworks.com
```

Here, the function does not erase the punctuation symbols from the URL.

Input Arguments

str – Input text

string array | character vector | cell array of character vectors

Input text, specified as a string array, character vector, or cell array of character vectors.

```
Example: ["An example of a short sentence."; "A second short
sentence."]
```

```
Data Types: string | char | cell
```

documents — Input documents

tokenizedDocument array

Input documents, specified as a tokenizedDocument array.

types — Token types to erase punctuation from

```
{ 'punctuation', 'other' } (default) | string array | character vector | cell array of character vectors
```

Token types to erase punctuation from, specified as a character vector, string array, or a cell array of character vectors containing one or more of the following token types:

- 'letters' string of letter characters only
- 'digits' string of digits only
- 'punctuation' string of punctuation and symbol characters only
- 'email-address' detected email address
- 'web-address' detected web address
- 'hashtag' detected hashtag (starts with "#" character followed by a letter)
- 'at-mention' detected at-mention (starts with "@" character)
- 'emoticon' detected emoticon
- 'emoji' detected emoji
- 'other' does not belong to previous types

Data Types: string | char | cell

Output Arguments

newStr — Output text

string array | character vector | cell array of character vectors

Output text, returned as a string array, a character vector, or cell array of character vectors. str and newStr have the same data type.

newDocuments — Output documents

tokenizedDocument array

Output documents, returned as a tokenizedDocument array.

Definitions

Unicode Character Categories

Each Unicode character is assigned a category. The following table summarizes the Unicode punctuation and symbol categories and provides an example character from each category:

Category	Category Code	Number of Characters	Example Character
Punctuation, Connector	[Pc]	10	-
Punctuation, Dash	[Pd]	24	-
Punctuation, Close	[Pe]	73)
Punctuation, Final quote	[Pf]	10	"
Punctuation, Initial quote	[Pi]	12	u
Punctuation, Other	[Po]	566	!
Punctuation, Open	[Ps]	75	(
Symbol, Currency	[Sc]	54	\$

Category	Category Code	Number of Characters	Example Character
Symbol, Modifier	[Sk]	121	^
Symbol, Math	[Sm]	948	+
Symbol, Other	[So]	5855	1

For more information, see [1].

Tips

• For string input, erasePunctuation removes punctuation characters from URLs and HTML tags. This behavior can prevent the functions eraseTags, eraseURLs, and decodeHTMLEntities from working as expected. If you want to use these functions to preprocess your text, then use these functions before using erasePunctuation.

Compatibility Considerations

erasePunctuation skips complex tokens

Behavior changed in R2018b

Starting in R2018b, for tokenizedDocument input, erasePunctuation, by default, erases punctuation and symbol characters from tokens with type 'punctuation' or 'other' only. This behavior prevents the function from affecting complex tokens such as URLs and email-addresses.

In previous versions, erasePunctuation erases punctuation characters from all tokens. To reproduce the behavior, use the 'TokenTypes' name-value pair.

upper

Topics

"Prepare Text Data for Analysis" "Create Simple Text Model for Classification" "Language Support"

Introduced in R2017b

eraseTags

Erase HTML and XML tags from text

Syntax

```
newStr = eraseTags(str)
```

Description

newStr = eraseTags(str) erases HTML and XML comments and tags from the
elements of str.

The function erases comments and tags with tag name a, abbr, acronym, b, bdi, bdo, big, code, del, dfn, em, font, i, ins, kbd, mark, rp, rt, ruby, s, small, span, strike, strong sub, sup, tt, u, var and wbr, and replaces all other tags with a space.

The function does not remove HTML and XML elements (the tags as well anything between start and end tags). For example, <code>eraseTags("x<a>y")</code> returns the string "xy". It only removes the tags <a> and , and does not remove the element <a>y.

Examples

Erase HTML and XML Tags and Comments

Erase the tags from some HTML code. The function replaces the *
* tag with a space.

```
htmlCode = "one.<br>two";
newStr = eraseTags(htmlCode)
newStr =
"one. two"
```

Erase the tags from some XML code. The function removes the <sub> tags and does not replace them with a space.

```
xmlCode = "H<sub>2</sub>0";
newStr = eraseTags(xmlCode)
newStr =
"H20"
```

Input Arguments

```
str — Input text
string array | character vector | cell array of character vectors
```

Input text, specified as a string array, character vector, or cell array of character vectors.

```
Example: ["An example of a short sentence."; "A second short
sentence."]
```

Data Types: string | char | cell

Output Arguments

newStr - Output text

string array | character vector | cell array of character vectors

Output text, returned as a string array, a character vector, or cell array of character vectors. str and newStr have the same data type.

See Also

Topics

"Prepare Text Data for Analysis" "Create Simple Text Model for Classification"

Introduced in R2017b

eraseURLs

Erase HTTP and HTTPS URLs from text

Syntax

```
newStr = eraseURLs(str)
```

Description

newStr = eraseURLs(str) erases HTTP and HTTPS URLs from the elements of str.

Examples

Erase URL from Text

Erase the URL from the text in str.

```
str = "For more information, see https://www.mathworks.com";
newStr = eraseURLs(str)
```

```
newStr =
"For more information, see "
```

Input Arguments

str — Input text
string array | character vector | cell array of character vectors

Input text, specified as a string array, character vector, or cell array of character vectors.

```
Example: ["An example of a short sentence."; "A second short
sentence."]
```

```
Data Types: string | char | cell
```

Output Arguments

newStr - Output text

string array | character vector | cell array of character vectors

Output text, returned as a string array, a character vector, or cell array of character vectors. str and newStr have the same data type.

Introduced in R2017b

extractFileText

Read text from PDF, Microsoft Word, HTML, and plain text files

Syntax

```
str = extractFileText(filename)
str = extractFileText(filename,Name,Value)
```

Description

str = extractFileText(filename) reads the text data from a file as a string.

str = extractFileText(filename,Name,Value) specifies additional options using
one or more name-value pair arguments.

Examples

Extract Text Data from Text File

Extract the text from sonnets.txt using extractFileText. The file sonnets.txt contains Shakespeare's sonnets in plain text.

```
str = extractFileText("sonnets.txt");
```

View the first sonnet.

```
i = strfind(str,"I");
ii = strfind(str,"II");
start = i(1);
fin = ii(1);
extractBetween(str,start,fin-1)
ans =
    "I
```

```
From fairest creatures we desire increase,
That thereby beauty's rose might never die,
But as the riper should by time decease,
His tender heir might bear his memory:
But thou, contracted to thine own bright eyes,
Feed'st thy light's flame with self-substantial fuel,
Making a famine where abundance lies,
Thy self thy foe, to thy sweet self too cruel:
Thou that art now the world's fresh ornament,
And only herald to the gaudy spring,
Within thine own bud buriest thy content,
And tender churl mak'st waste in niggarding:
Pity the world, or else this glutton be,
To eat the world's due, by the grave and thee.
```

Extract Text Data from PDF

п

Extract the text from exampleSonnets.pdf using extractFileText. The file exampleSonnets.pdf contains Shakespeare's sonnets in a PDF file.

```
str = extractFileText("exampleSonnets.pdf");
```

View the second sonnet.

```
ii = strfind(str,"II");
iii = strfind(str,"III");
start = ii(1);
fin = iii(1);
extractBetween(str,start,fin-1)
ans =
    "II
    When forty winters shall besiege thy brow,
    And dig deep trenches in thy beauty's field,
    Thy youth's proud livery so gazed on now,
    Will be a tatter'd weed of small worth held:
    Then being asked, where all thy beauty lies,
    Where all the treasure of thy lusty days;
```

```
To say, within thine own deep sunken eyes,
Were an all-eating shame, and thriftless praise.
How much more praise deserv'd thy beauty's use,
If thou couldst answer 'This fair child of mine
Shall sum my count, and make my old excuse,'
Proving his beauty by succession thine!
This were to be new made when thou art old,
And see thy blood warm when thou feel'st it cold.
```

Extract the text from pages 3, 5, and 7 of the PDF file.

```
pages = [3 5 7];
str = extractFileText("exampleSonnets.pdf", ...
'Pages',pages);
```

View the 10th sonnet.

ш

```
x = strfind(str, "X");
xi = strfind(str,"XI");
start = x(1);
fin = xi(1);
extractBetween(str,start,fin-1)
ans =
    "Х
       Is it for fear to wet a widow's eye,
       That thou consum'st thy self in single life?
       Ah! if thou issueless shalt hap to die.
       The world will wail thee like a makeless wife:
       The world will be thy widow and still weep
       That thou no form of thee hast left behind,
       When every private widow well may keep
       By children's eyes, her husband's shape in mind:
       Look! what an unthrift in the world doth spend
       Shifts but his place, for still the world enjoys it;
       But beauty's waste hath in the world an end,
       And kept unused the user so destroys it.
         No love toward others in that bosom sits
         That on himself such murd'rous shame commits.
```

п

```
For shame! deny that thou bear'st love to any,
Who for thy self art so unprovident.
Grant, if thou wilt, thou art belov'd of many,
But that thou none lov'st is most evident:
For thou art so possess'd with murderous hate,
That 'gainst thy self thou stick'st not to conspire,
Seeking that beauteous roof to ruinate
Which to repair should be thy chief desire.
```

Import Text from Multiple Files Using a File Datastore

If your text data is contained in multiple files in a folder, then you can import the text data into MATLAB using a file datastore.

Create a file datastore for the example sonnet text files. The examples sonnets have file names "exampleSonnetN.txt", where N is the number of the sonnet. Specify the read function to be extractFileText.

Create an empty bag-of-words model.

bag = bag0fWords

Loop over the files in the datastore and read each file. Tokenize the text in each file and add the document to bag.

```
while hasdata(fds)
    str = read(fds);
    document = tokenizedDocument(str);
    bag = addDocument(bag,document);
end
```

View the updated bag-of-words model.

bag

Extract Text from HTML

To extract text data directly from HTML code, use extractHTMLText and specify the HTML code as a string.

```
code = "<html><body><h1>THE SONNETS</h1>by William Shakespeare</body></html>";
str = extractHTMLText(code)
str =
    "THE SONNETS
    by William Shakespeare"
```

Input Arguments

filename — Name of file

string scalar | character vector

Name of the file, specified as a string scalar or character vector.

Data Types: string | char

Name-Value Pair Arguments

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1, Value1, ..., NameN, ValueN.

Example: 'Pages', [1 3 5] specifies to read pages 1, 3, and 5 from a PDF file.

Encoding — Character encoding

'auto' (default) | 'UTF-8' | 'ISO-8859-1' | 'windows-1251' | 'windows-1252' | ...

Character encoding to use, specified as the comma-separated pair consisting of 'Encoding' and a character vector or a string scalar. The character vector or string scalar must contain a standard character encoding scheme name such as the following.

'Big5'	'ISO-8859-1'	'windows-847'
'Big5-HKSCS'	'ISO-8859-2'	'windows-949'
'CP949'	'ISO-8859-3'	'windows-1250'
'EUC-KR'	'ISO-8859-4'	'windows-1251'
'EUC-JP'	'ISO-8859-5'	'windows-1252'
' EUC - TW '	'ISO-8859-6'	'windows-1253'
'GB18030'	'ISO-8859-7'	'windows-1254'
'GB2312'	'ISO-8859-8'	'windows-1255'
'GBK'	'ISO-8859-9'	'windows-1256'
'IBM866'	'ISO-8859-11'	'windows-1257'

'K018-R'	'ISO-8859-13'	'windows-1258'
'K0I8-U'	'ISO-8859-15'	'US-ASCII'
	'Macintosh'	'UTF-8'
	'Shift_JIS'	

If you do not specify an encoding scheme, then the function performs heuristic autodetection for the encoding to use. If these heuristics fail, then you must specify one explicitly.

This option only applies when the input is a plain text file.

```
Data Types: char | string
```

ExtractionMethod — Extraction method

'tree' (default) | 'article' | 'all-text'

Extraction method, specified as the comma-separated pair consisting of 'ExtractionMethod' and one of the following:

Option	Description
'tree'	Analyze the DOM tree and text contents, then extract a block of paragraphs.
'article'	Detect article text and extract a block of paragraphs.
'all-text'	Extract all text in the HTML body, except for scripts and CSS styles.

Password — Password to open PDF file

character vector | string scalar

Password to open PDF file, specified as the comma-separated pair consisting of 'Password' and a character vector or a string scalar. This option only applies if the input file is a PDF.

Example: 'Password','skroWhtaM'

Data Types: char | string

Pages — Pages to read from PDF file

vector of positive integers

Pages to read from PDF file, specified as the comma-separated pair consisting of 'Pages' and a vector of positive integers. This option only applies if the input file is a PDF file. The function, by default, reads all pages from the PDF file.

```
Example: 'Pages',[1 3 5]
Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 |
uint32 | uint64
```

Tips

• To read text directly from HTML code, use extractHTMLText.

Introduced in R2017b

extractHTMLText

Extract text from HTML

Syntax

```
str = extractHTMLText(code)
str = extractHTMLText(tree)
str = extractHTMLText(____,'ExtractionMethod',ex)
```

Description

str = extractHTMLText(code) parses the HTML code in code and extracts the text.

```
str = extractHTMLText(tree) extracts the text from an HTML tree.
```

```
str = extractHTMLText( ____, 'ExtractionMethod', ex) also specifies the
extraction method to use.
```

Examples

Extract Text from HTML

To extract text data directly from HTML code, use <code>extractHTMLText</code> and specify the HTML code as a string.

```
code = "<html><body><h1>THE SONNETS</h1>by William Shakespeare</body></html>";
str = extractHTMLText(code)
```

```
str =
    "THE SONNETS
    by William Shakespeare"
```

Extract Text from Website

To extract the text data from a web page, first use the webread function to read the HTML code. Then use the extractHTMLText function on the returned code.

```
url = "https://www.mathworks.com/help/textanalytics";
code = webread(url);
str = extractHTMLText(code)
str =
    'Text Analytics Toolbox™ provides algorithms and visualizations for preprocessing,
    Text Analytics Toolbox includes tools for processing raw text from sources such as
    Using machine learning techniques such as LSA, LDA, and word embeddings, you can
```

Find Elements in HTML Tree

Read HTML code from the URL https://www.mathworks.com/help/textanalytics using the webread function.

```
url = "https://www.mathworks.com/help/textanalytics";
code = webread(url);
```

Parse the HTML code using htmlTree.

```
tree = htmlTree(code);
```

Find all the hyperlinks in the HTML tree using findElement. The hyperlinks are nodes with element name "A".

```
selector = "A";
subtrees = findElement(tree,selector);
```

View the first few subtrees.

subtrees(1:10)

```
ans =
   10×1 htmlTree:
```
(1,1) <A class="svg_link navbar-brand" href="https://www.mathworks.com?s_ti... (2,1) <A class="mwa-nav_login" href="https://www.mathworks.com/login?uri=ht... (3,1) Product... (4,1) Solut... (5,1) Acade... (6,1) Acade... (6,1) Suppor... (7,1) Commu... (8,1) E... (9,1) <A href="https://www.mathworks.com/company/aboutus/contact_us.html?s_... (10,1) <A href="https://www.mathworks.com/store?s_cid=store_top_nav&s_ti...</p>

Extract the text from the subtrees using extractHTMLText. The result contains the link text from each link on the page.

```
str = extractHTMLText(subtrees);
str(1:10)
ans = 10×1 string array
    ""
    "Sign In"
    "Products"
    "Solutions"
    "Academia"
    "Support"
    "Community"
    "Events"
    "Contact Us"
    "How to Buy"
```

Input Arguments

code — HTML code

string scalar | character vector | scalar cell array containing a character vector

HTML code, specified as a string scalar, a character vector, or a scalar cell array containing a character vector.

- To read HTML code from a web page, use webread.
- To extract text from an HTML file, use extractFileText.

```
Example: "<a href='https://www.mathworks.com'>MathWorks</a>"
Data Types: char | string | cell
```

tree – HTML tree

htmlTree array

HTML tree, specified as an htmlTree array.

```
ex — Extraction method
```

```
'tree'(default)|'article'|'all-text'
```

Extraction method, specified as one of the following:

Option	Description
'tree'	Analyze the DOM tree and text contents, then extract a block of paragraphs.
'article'	Detect article text and extract a block of paragraphs.
'all-text'	Extract all text in the HTML body, except for scripts and CSS styles.

fastTextWordEmbedding

Pretrained fastText word embedding

Syntax

emb = fastTextWordEmbedding

Description

emb = fastTextWordEmbedding returns a 300-dimensional pretrained word
embedding for 1 million English words.

This function requires the Text Analytics Toolbox Model *for fastText English 16 Billion Token Word Embedding* support package. If this support package is not installed, the function provides a download link.

Examples

Download fastText Support Package

Download and install the Text Analytics Toolbox Model for fastText English 16 Billion Token Word Embedding support package.

Type fastTextWordEmbedding at the command line.

fastTextWordEmbedding

If the Text Analytics Toolbox Model *for fastText English 16 Billion Token Word Embedding* support package is not installed, then the function provides a link to the required support package in the Add-On Explorer. To install the support package, click the link, and then click **Install**. Check that the installation is successful by typing emb = fastTextWordEmbedding at the command line.

emb = fastTextWordEmbedding

```
emb =
  wordEmbedding with properties:
    Dimension: 300
    Vocabulary: [1×1000000 string]
```

If the required support package is installed, then the function returns a wordEmbedding object.

Map Words to Vectors and Back

Load a pretrained word embedding using fastTextWordEmbedding. This function requires Text Analytics Toolbox[™] Model for fastText English 16 Billion Token Word Embedding support package. If this support package is not installed, then the function provides a download link.

```
emb = fastTextWordEmbedding
```

```
emb =
wordEmbedding with properties:
   Dimension: 300
Vocabulary: [1×1000000 string]
```

Map the words "Italy", "Rome", and "Paris" to vectors using word2vec.

```
italy = word2vec(emb, "Italy");
rome = word2vec(emb, "Rome");
paris = word2vec(emb, "Paris");
Map the vector italy - rome + paris to a word using vec2word.
word = vec2word(emb,italy - rome + paris)
word =
"France"
```

Convert Documents to Sequences of Word Vectors

Convert an array of tokenized documents to sequences of word vectors using a pretrained word embedding.

Load a pretrained word embedding using the fastTextWordEmbedding function. This function requires Text Analytics Toolbox[™] Model for fastText English 16 Billion Token Word Embedding support package. If this support package is not installed, then the function provides a download link.

```
emb = fastTextWordEmbedding;
```

Load the weather reports data and create a tokenizedDocument array.

```
filename = "weatherReports.csv";
data = readtable(filename, 'TextType', 'string');
textData = data.event_narrative;
documents = tokenizedDocument(textData);
```

Convert the documents to sequences of word vectors using doc2sequence. The doc2sequence function, by default, left-pads the sequences to have the same length. When converting large collections of documents using a high-dimensional word embedding, padding can require large amounts of memory. To prevent the function from padding the data, set the 'PaddingDirection' option to 'none'. Alternatively, you can control the amount of padding using the 'Length' option.

```
sequences = doc2sequence(emb,documents,'PaddingDirection','none');
```

View the sizes of the first 10 sequences. Each sequence is D-by-S matrix, where D is the embedding dimension, and S is the number of word vectors in the sequence.

sequences(1:10)

```
ans = 10×1 cell array

{300×8 single}

{300×39 single}

{300×14 single}

{300×14 single}

{300×0 single}

{300×15 single}

{300×20 single}

{300×6 single}

{300×21 single}

{300×10 single}
```

Output Arguments

emb — Pretrained word embedding

wordEmbedding object

Pretrained word embedding, returned as a wordEmbedding object.

findElement

Find elements in HTML tree

Syntax

```
subtrees = findElement(tree,selector)
```

Description

subtrees = findElement(tree,selector) returns the elements in tree matching
the CSS selector.

Examples

Find Elements in HTML Tree

Read HTML code from the URL https://www.mathworks.com/help/textanalytics using the webread function.

```
url = "https://www.mathworks.com/help/textanalytics";
code = webread(url);
```

Parse the HTML code using htmlTree.

```
tree = htmlTree(code);
```

Find all the hyperlinks in the HTML tree using findElement. The hyperlinks are nodes with element name "A".

```
selector = "A";
subtrees = findElement(tree,selector);
```

View the first few subtrees.

subtrees(1:10)

```
ans =
10×1 htmlTree:
(1,1) <A class="svg_link navbar-brand" href="https://www.mathworks.com?s_ti...
(2,1) <A class="mwa-nav_login" href="https://www.mathworks.com/login?uri=ht...

(10,1) <A href="https://www.mathworks.com/store?s_cid=store_top_nav&amp;s_ti...
</pre>
```

Extract the text from the subtrees using extractHTMLText. The result contains the link text from each link on the page.

```
str = extractHTMLText(subtrees);
str(1:10)
ans = 10×1 string array
    ""
    "Sign In"
    "Products"
    "Solutions"
    "Academia"
    "Support"
    "Community"
    "Events"
    "Contact Us"
    "How to Buy"
```

Input Arguments

tree — HTML tree scalar htmlTree object

HTML tree, specified as a scalar htmlTree object.

selector - CSS selector

string scalar | character vector

CSS selector, specified as a string scalar or a character vector. For more information, see "CSS Selectors" on page 1-115.

Output Arguments

subtrees — Matching HTML subtrees

htmlTree array

Matching HTML subtrees, returned as an htmlTree array.

Definitions

HTML Elements

A typical HTML element contains the following components:

- Element name Name of the HTML tag. The element name corresponds to the Name property of the HTML tree.
- Attributes Additional information about the tag. HTML attributes have the form name="value", where name and value denote the attribute name and value respectively. The attributes appear inside the opening HTML tag. To get the attribute values from an HTML tree, use getAttribute.
- Content Element content. The content appears between opening and closing HTML tags. The content can be text data or nested HTML elements. To extract the text from an htmlTree object, use extractHTMLText. To get the nested HTML elements of an htmlTree object, use the Children property.

For example, the HTML element <a href="https://
www.mathworks.com">Home comprises the following components:

Component	Value	Description	
Element name	a	Element is a hyperlink	

Component		Value	Description	
Attribute	Attribute name	href	Hyperlink reference	
	Attribute value	"https:// www.mathworks.co m"	Hyperlink reference value	
Content		Home	Text to display	

CSS Selectors

CSS selectors specify patterns to match elements in a tree.

This table shows some examples showing how to extract different HTML elements from an HTML tree:

Task	CSS Selector	Example
Find all paragraph () elements.	"p"	<pre>findElement(tree,"p")</pre>
Find all paragraph () and list item () elements.	"p,li"	<pre>findElement(tree,"p,l i")</pre>
Find all paragraph () elements that are inside table () elements.	"table p"	<pre>findElement(tree,"tab le p")</pre>
Find all hyperlink (<a>) elements with hyperlink reference attribute (href) values ending with ".pdf".	"a[href\$="".pdf""]"	<pre>findElement(tree,"a[h ref\$="".pdf""]")</pre>
Find all paragraph () elements that are the first child of their parent.	"p:first-child"	<pre>findElement(tr,"p:fir st-child")</pre>
Find all paragraph () elements that are the first paragraph element of their parent.	"p:first-of-type"	<pre>findElement(tr,"p:fir st-of-type")</pre>

Task	CSS Selector	Example
Find all emphasis () elements where the parent is a paragraph () element.	"p > em"	<pre>findElement(tr,"p > em")</pre>
Find all paragraph () elements appearing immediately after a heading 1 (<h1>) element</h1>	"h1 + p"	<pre>findElement(tr,"h1 + p")</pre>
Find all empty elements.	":empty"	<pre>findElement(tr,":empt y")</pre>
Find all nonempty label (<label>) elements.</label>	"label:not(:empty)"	<pre>findElement(tr,"label :not(:empty)")</pre>

The findElement function supports all of CSS level 3, except for the selectors ":lang", ":checked", ":link", ":active", ":hover", ":focus", ":target", ":enabled", and ":disabled".

For more information about CSS selectors, see [1].

Introduced in R2018b

fitlda

Fit latent Dirichlet allocation (LDA) model

A latent Dirichlet allocation (LDA) model is a topic model which discovers underlying topics in a collection of documents and infers word probabilities in topics. If the model was fit using a bag-of-n-grams model, then the software treats the n-grams as individual words.

Syntax

```
mdl = fitlda(bag,numTopics)
mdl = fitlda(counts,numTopics)
mdl = fitlda(____,Name,Value)
```

Description

mdl = fitlda(bag,numTopics) fits an LDA model with numTopics topics to the bagof-words or bag-of-n-grams model bag.

mdl = fitlda(counts,numTopics) fits an LDA model to the documents represented
by a matrix of frequency counts.

mdl = fitlda(____, Name, Value) specifies additional options using one or more
name-value pair arguments.

Examples

Fit LDA Model

To reproduce the results in this example, set rng to 'default'.

```
rng('default')
```

Load the example data. The file **sonnetsPreprocessed.txt** contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words

separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

Create a bag-of-words model using bag0fWords.

```
bag = bagOfWords(documents)
bag =
    bagOfWords with properties:
        Counts: [154x3092 double]
        Vocabulary: [1x3092 string]
        NumWords: 3092
        NumDocuments: 154
```

Fit an LDA model with four topics.

```
numTopics = 4;
mdl = fitlda(bag,numTopics)
```

Initial topic assignments sampled in 0.0812113 seconds.

Iteration 	Time per iteration (seconds)	Relative change in log(L)	Training perplexity 	Topic concentration	Topic concentration iterations
0 1 2 3 4 5 6	0.01 0.03 0.03 0.02 0.02 0.02 0.02 0.02 0.03	1.0482e-02 1.7190e-03 4.3796e-04 9.4193e-04 3.7079e-04 9.5777e-05	1.215e+03 1.128e+03 1.115e+03 1.118e+03 1.111e+03 1.108e+03 1.107e+03	1.000 1.000 1.000 1.000 1.000 1.000 1.000 1.000	0 0 0 0 0 0 0

mdl =

ldaModel with properties:

NumTopics: 4

```

```

Visualize the topics using word clouds.

```
figure
for topicIdx = 1:4
    subplot(2,2,topicIdx)
    wordcloud(mdl,topicIdx);
    title("Topic: " + topicIdx)
end
```

Topic: 3

Fit LDA Model to Word Count Matrix

Fit an LDA model to a collection of documents represented by a word count matrix.

To reproduce the results of this example, set rng to 'default'.

rng('default')

Load the example data. sonnetsCounts.mat contains a matrix of word counts and a corresponding vocabulary of preprocessed versions of Shakespeare's sonnets. The value counts(i,j) corresponds to the number of times the jth word of the vocabulary appears in the ith document.

```
load sonnetsCounts.mat
size(counts)
ans = 1×2
154 3092
```

Fit an LDA model with 7 topics. To suppress the verbose output, set 'Verbose' to 0.

```
numTopics = 7;
mdl = fitlda(counts,numTopics,'Verbose',0);
```

Visualize multiple topic mixtures using stacked bar charts. Visualize the topic mixtures of the first three input documents.

```
topicMixtures = transform(mdl,counts(1:3,:));
figure
barh(topicMixtures,'stacked')
xlim([0 1])
title("Topic Mixtures")
xlabel("Topic Probability")
ylabel("Document")
legend("Topic "+ string(1:numTopics),'Location','northeastoutside')
```

Predict Top LDA Topics of Documents

To reproduce the results in this example, set rng to 'default'.

```
rng('default')
```

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
```

```
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

Create a bag-of-words model using bag0fWords.

```
bag = bagOfWords(documents)
```

Fit an LDA model with 20 topics.

```
numTopics = 20;
mdl = fitlda(bag,numTopics)
```

Initial topic assignments sampled in 0.0591059 seconds.

Iteration	Time per	Relative	Training	Topic	Topic
	iteration	change in	perplexity	concentration	concentration
	(seconds)	log(L)			iterations

```
Vocabulary: [1x3092 string]
TopicOrder: 'initial-fit-probability'
FitInfo: [1x1 struct]
```

Predict the top topics for an array of new documents.

```
newDocuments = tokenizedDocument([
    "what's in a name? a rose by any other name would smell as sweet."
    "if music be the food of love, play on."]);
topicIdx = predict(mdl,newDocuments)
topicIdx = 2×1
    19
    8
```

Visualize the predicted topics using word clouds.

```
figure
subplot(1,2,1)
wordcloud(mdl,topicIdx(1));
title("Topic " + topicIdx(1))
subplot(1,2,2)
wordcloud(mdl,topicIdx(2));
title("Topic " + topicIdx(2))
```

Topic 8

Input Arguments

bag – Input model

bagOfWords object | bagOfNgrams object

Input bag-of-words or bag-of-n-grams model, specified as a bagOfWords object or a bagOfNgrams object. If bag is a bagOfNgrams object, then the function treats the n-grams as individual words.

numTopics — Number of topics

positive integer

Number of topics, specified as a positive integer. For an example showing how to choose the number of topics, see "Choose Number of Topics for LDA Model".

Example: 200

counts — Frequency counts of words

matrix of nonnegative integers

Frequency counts of words, specified as a matrix of nonnegative integers. If you specify 'DocumentsIn' to be 'rows', then the value counts(i,j) corresponds to the number of times the *j*th word of the vocabulary appears in the *i*th document. Otherwise, the value counts(i,j) corresponds to the number of times the *i*th word of the vocabulary appears in the *i*th document.

Name-Value Pair Arguments

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1, Value1, ..., NameN, ValueN.

Example: 'Solver', 'avb' specifies to use approximate variational Bayes as the solver.

Solver Options

Solver — Solver for optimization

'cgs' (default) | 'savb' | 'avb' | 'cvb0'

Solver for optimization, specified as the comma-separated pair consisting of 'Solver' and one of the following:

Stochastic Solver

• 'savb' - Use stochastic approximate variational Bayes [1] [2]. This solver is best suited for large datasets and can fit a good model in fewer passes of the data.

Batch Solvers

• 'cgs' - Use collapsed Gibbs sampling [3]. This solver can be more accurate at the cost of taking longer to run. The resume function does not support models fitted with CGS.

- 'avb' Use approximate variational Bayes [4]. This solver typically runs more quickly than collapsed Gibbs sampling and collapsed variational Bayes, but can be less accurate.
- 'cvb0' Use collapsed variational Bayes, zeroth order [4] [5]. This solver can be more accurate than approximate variational Bayes at the cost of taking longer to run.

For an example showing how to compare solvers, see "Compare LDA Solvers".

Example: 'Solver', 'savb'

LogLikelihoodTolerance — Relative tolerance on log-likelihood

0.0001 (default) | positive scalar

Relative tolerance on log-likelihood, specified as the comma-separated pair consisting of 'LogLikelihoodTolerance' and a positive scalar. The optimization terminates when this tolerance is reached.

Example: 'LogLikelihoodTolerance',0.001

FitTopicProbabilities — Option for fitting corpus topic probabilities true (default) | false

Option for fitting topic concentration, specified as the comma-separated pair consisting of 'FitTopicConcentration' and either true or false.

The function fits the Dirichlet prior $\alpha = \alpha_0 (p_1 \quad p_2 \quad \cdots \quad p_K)$ on the topic mixtures,

where α_0 is the topic concentration and p_1, \ldots, p_K are the corpus topic probabilities which sum to 1.

Example: 'FitTopicProbabilities',false

Data Types: logical

FitTopicConcentration — Option for fitting topic concentration

true | false

Option for fitting topic concentration, specified as the comma-separated pair consisting of 'FitTopicConcentration' and either true or false.

For batch the solvers 'cgs', 'avb', and 'cvb0', the default for FitTopicConcentration is true. For the stochastic solver 'savb', the default is false.

The function fits the Dirichlet prior $\alpha = \alpha_0 (p_1 \quad p_2 \quad \cdots \quad p_K)$ on the topic mixtures,

where α_0 is the topic concentration and p_1, \ldots, p_K are the corpus topic probabilities which sum to 1.

```
Example: 'FitTopicConcentration', false
```

Data Types: logical

InitialTopicConcentration — **Initial estimate of the topic concentration** numTopics/4 (default) | nonnegative scalar

Initial estimate of the topic concentration, specified as the comma-separated pair consisting of 'InitialTopicConcentration' and a nonnegative scalar. The function sets the concentration per topic to TopicConcentration/NumTopics. For more information, see "Latent Dirichlet Allocation" on page 1-131.

```
Example: 'InitialTopicConcentration',25
```

TopicOrder — Topic Order

'initial-fit-probability' (default) | 'unordered'

Topic order, specified as one of the following:

- 'initial-fit-probability' Sort the topics by the corpus topic probabilities of input document set (the CorpusTopicProbabilities property).
- 'unordered' Do not sort the topics.

WordConcentration — Word concentration

1 (default) | nonnegative scalar

Word concentration, specified as the comma-separated pair consisting of 'WordConcentration' and a nonnegative scalar. The software sets the Dirichlet prior on the topics (the word probabilities per topic) to be the symmetric Dirichlet distribution parameter with the value WordConcentration/numWords, where numWords is the vocabulary size of the input documents. For more information, see "Latent Dirichlet Allocation" on page 1-131.

DocumentsIn — Orientation of documents

'rows' (default) | 'columns'

Orientation of documents in the word count matrix, specified as the comma-separated pair consisting of 'DocumentsIn' and one of the following:

- 'rows' Input is a matrix of word counts with rows corresponding to documents.
- 'columns' Input is a transposed matrix of word counts with columns corresponding to documents.

This option only applies if you specify the input documents as a matrix of word counts.

Note If you orient your word count matrix so that documents correspond to columns and specify 'DocumentsIn', 'columns', then you might experience a significant reduction in optimization-execution time.

Batch Solver Options

IterationLimit — Maximum number of iterations

100 (default) | positive integer

Maximum number of iterations, specified as the comma-separated pair consisting of 'IterationLimit' and a positive integer.

This option supports batch solvers only ('cgs', 'avb', or 'cvb0').

Example: 'IterationLimit',200

Stochastic Solver Options

DataPassLimit — Maximum number of passes through data

1 (default) | positive integer

Maximum number of passes through the data, specified as the comma-separated pair consisting of 'DataPassLimit' and a positive integer.

If you specify 'DataPassLimit' but not 'MiniBatchLimit', then the default value of 'MiniBatchLimit' is ignored. If you specify both 'DataPassLimit' and 'MiniBatchLimit', then fitlda uses the argument that results in processing the fewest observations.

This option supports only the stochastic ('savb') solver.

Example: 'DataPassLimit',2

MiniBatchLimit — Maximum number of mini-batch passes positive integer

Maximum number of mini-batch passes, specified as the comma-separated pair consisting of 'MiniBatchLimit' and a positive integer.

If you specify 'MiniBatchLimit' but not 'DataPassLimit', then fitlda ignores the default value of 'DataPassLimit'. If you specify both 'MiniBatchLimit' and 'DataPassLimit', then fitlda uses the argument that results in processing the fewest observations. The default value is ceil(numDocuments/MiniBatchSize), where numDocuments is the number of input documents.

This option supports only the stochastic ('savb') solver.

```
Example: 'MiniBatchLimit',200
```

MiniBatchSize — Mini-batch size

1000 (default) | positive integer

Mini-batch size, specified as the comma-separated pair consisting of 'MiniBatchLimit' and a positive integer. The function processes MiniBatchSize documents in each iteration.

This option supports only the stochastic ('savb') solver.

Example: 'MiniBatchSize',512

LearnRateDecay — Learning rate decay

0.5 (default) | positive scalar less than or equal to 1

Learning rate decay, specified as the comma-separated pair 'LearnRateDecay' and a positive scalar less than or equal to 1.

For mini-batch *t*, the function sets the learning rate to $\eta(t) = 1/(1+t)^{\kappa}$, where κ is the learning rate decay.

If LearnRateDecay is close to 1, then the learning rate decays faster and the model learns mostly from the earlier mini-batches. If LearnRateDecay is close to 0, then the learning rate decays slower and the model continues to learn from more mini-batches. For more information, see "Stochastic Solver" on page 1-134.

This option supports the stochastic solver only ('savb').

```
Example: 'LearnRateDecay', 0.75
```

Display Options

ValidationData — Validation data

[] (default) | bagOfWords object | bagOfNgrams object | sparse matrix of word counts

Validation data to monitor optimization convergence, specified as the comma-separated pair consisting of 'ValidationData' and a bagOfWords object, a bagOfNgrams object, or a sparse matrix of word counts. If the validation data is a matrix, then the data must have the same orientation and the same number of words as the input documents.

Verbose — Verbosity level

1 (default) | 0

Verbosity level, specified as the comma-separated pair consisting of <code>'Verbose'</code> and one of the following:

- 0 Do not display verbose output.
- 1 Display progress information.

Example: 'Verbose',0

Output Arguments

mdl — Output LDA model

ldaModel object

Output LDA model, returned as an ldaModel object.

Definitions

Latent Dirichlet Allocation

A *latent Dirichlet allocation* (LDA) model is a document topic model which discovers underlying topics in a collection of documents and infers word probabilities in topics. LDA models a collection of *D* documents as topic mixtures $\theta_1, \ldots, \theta_D$, over *K* topics characterized by vectors of word probabilities $\varphi_1, \ldots, \varphi_K$. The model assumes that the

topic mixtures $\theta_1, \ldots, \theta_D$, and the topics $\varphi_1, \ldots, \varphi_K$ follow a Dirichlet distribution with concentration parameters α and β respectively.

The topic mixtures $\theta_1, \ldots, \theta_D$ are probability vectors of length *K*, where *K* is the number of topics. The entry θ_{di} is the probability of topic *i* appearing in the *d*th document. The topic mixtures correspond to the rows of the DocumentTopicProbabilities property of the ldaModel object.

The topics $\varphi_1, \ldots, \varphi_K$ are probability vectors of length V, where V is the number of words in the vocabulary. The entry φ_{iv} corresponds to the probability of the vth word of the vocabulary appearing in the *i*th topic. The topics $\varphi_1, \ldots, \varphi_K$ correspond to the columns of the TopicWordProbabilities property of the ldaModel object.

Given the topics $\varphi_1, \ldots, \varphi_K$ and Dirichlet prior α on the topic mixtures, LDA assumes the following generative process for a document:

- ¹ Sample a topic mixture $\theta \sim \text{Dirichlet}(\alpha)$. The random variable θ is a probability vector of length *K*, where *K* is the number of topics.
- **2** For each word in the document:

а

b

Sample a topic index $z \sim \text{Categorical}(\theta)$. The random variable z is an integer from 1 through K, where K is the number of topics.

Sample a word $w \sim \text{Categorical}(\varphi_z)$. The random variable w is an integer from 1 through V, where V is the number of words in the vocabulary, and represents the corresponding word in the vocabulary.

Under this generative process, the joint distribution of a document with words W_1, \ldots, W_N , with topic mixture θ , and with topic indices z_1, \ldots, z_N is given by

$$p(\theta, z, w | \alpha, \varphi) = p(\theta | \alpha) \prod_{n=1}^{N} p(z_n | \theta) p(w_n | z_n, \varphi),$$

where N is the number of words in the document. Summing the joint distribution over z and then integrating over θ yields the marginal distribution of a document w:

$$p(w \mid \boldsymbol{\alpha}, \boldsymbol{\varphi}) = \int_{\boldsymbol{\theta}} p(\boldsymbol{\theta} \mid \boldsymbol{\alpha}) \prod_{n=1}^{N} \sum_{z_n} p(z_n \mid \boldsymbol{\theta}) p(w_n \mid z_n, \boldsymbol{\varphi}) d\boldsymbol{\theta}.$$

The following diagram illustrates the LDA model as a probabilistic graphical model. Shaded nodes are observed variables, unshaded nodes are latent variables, nodes without outlines are the model parameters. The arrows highlight dependencies between random variables and the plates indicate repeated nodes.

Dirichlet Distribution

The Dirichlet distribution is a continuous generalization of the multinomial distribution. Given the number of categories $K \ge 2$, and concentration parameter α , where α is a

vector of positive reals of length K, the probability density function of the Dirichlet distribution is given by

$$p(\theta \# \alpha) = \frac{1}{B(\alpha)} \prod_{i=1}^{K} \theta_i^{\alpha_i - 1},$$

where B denotes the multivariate Beta function given by

$$B(\alpha) = \frac{\prod_{i=1}^{K} \Gamma(\alpha_i)}{\Gamma\left(\sum_{i=1}^{K} \alpha_i\right)}.$$

A special case of the Dirichlet distribution is the symmetric Dirichlet distribution. The symmetric Dirichlet distribution is characterized by the concentration parameter α , where all the elements of α are the same.

Stochastic Solver

The stochastic solver processes documents in mini-batches. It updates the per-topic word probabilities using a weighted sum of the probabilities calculated from each mini-batch, and the probabilities from all previous mini-batches.

For mini-batch *t*, the solver sets the learning rate to $\eta(t) = 1/(1+t)^{\kappa}$, where κ is the learning rate decay.

The function uses the learning rate decay to update Φ , the matrix of word probabilities per topic, by setting

$$\Phi^{(t)} = (1 - \eta(t))\Phi^{(t-1)} + \eta(t)\Phi^{(t^*)},$$

where $\Phi^{(t^*)}$ is the matrix learned from mini-batch t, and $\Phi^{(t-1)}$ is the matrix learned from mini-batches 1 through t-1.

Before learning begins (when t = 0), the function initializes the initial word probabilities per topic $\Phi^{(0)}$ with random values.

Compatibility Considerations

fitlda sorts topics

Behavior changed in R2018b

Starting in R2018b, fitlda, by default, sorts the topics in descending order of the topic probabilities of the input document set. This behavior makes it easier to find the topics with the highest probabilities.

In previous versions, fitlda does not change the topic order. To reproduce the behavior, set the 'TopicOrder' option to 'unordered'.

Introduced in R2017b

fitlsa

Fit LSA model

A latent semantic analysis (LSA) model discovers relationships between documents and the words that they contain. An LSA model is a dimensionality reduction tool useful for running low-dimensional statistical models on high-dimensional word counts. If the model was fit using a bag-of-n-grams model, then the software treats the n-grams as individual words.

Syntax

```
mdl = fitlsa(bag,numComponents)
mdl = fitlsa(counts,numComponents)
mdl = fitlsa(____,Name,Value)
```

Description

mdl = fitlsa(bag,numComponents) fits an LSA model with numComponents
components to the bag-of-words or bag-of-n-grams model bag.

mdl = fitlsa(counts,numComponents) fits an LSA model to the documents
represented by the matrix of word counts counts.

mdl = fitlsa(_____, Name, Value) specifies additional options using one or more
name-value pair arguments.

Examples

Fit LSA Model

Fit a Latent Semantic Analysis model to a collection of documents.

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words

separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

Create a bag-of-words model using bag0fWords.

```
bag = bagOfWords(documents)
bag =
    bagOfWords with properties:
        Counts: [154x3092 double]
        Vocabulary: [1x3092 string]
        NumWords: 3092
        NumDocuments: 154
```

Fit an LSA model with 20 components.

Transform new documents into lower dimensional space using the LSA model.

```
newDocuments = tokenizedDocument([
    "what's in a name? a rose by any other name would smell as sweet."
    "if music be the food of love, play on."]);
dscores = transform(mdl,newDocuments)
```

dscores = 2×20

0.1338	0.1623	0.1680	-0.0541	-0.2464	-0.0134	0.2604	-0.0205	Θ.
0.2547	0.5576	-0.0095	0.5660	-0.0643	-0.1236	-0.0082	0.0522	-0.

Fit LSA Model to Word Count Matrix

Load the example data. sonnetsCounts.mat contains a matrix of word counts corresponding to preprocessed versions of Shakespeare's sonnets.

```
load sonnetsCounts.mat
size(counts)
ans = 1×2
154 3092
```

Fit LSA model with 20 components. Set the feature strength exponent to 4.

Input Arguments

bag — Input model bagOfWords object | bagOfNgrams object

Input bag-of-words or bag-of-n-grams model, specified as a bagOfWords object or a bagOfNgrams object. If bag is a bagOfNgrams object, then the function treats the n-grams as individual words.

numComponents — Number of components

positive integer

Number of components, specified as a positive integer. This value must be less than the number of the input documents, and the vocabulary size of the input documents.

Example: 200

counts — Frequency counts of words

matrix of nonnegative integers

Frequency counts of words, specified as a matrix of nonnegative integers. If you specify 'DocumentsIn' to be 'rows', then the value counts(i,j) corresponds to the number of times the *j*th word of the vocabulary appears in the *i*th document. Otherwise, the value counts(i,j) corresponds to the number of times the *i*th word of the vocabulary appears in the *j*th document.

Name-Value Pair Arguments

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1, Value1, ..., NameN, ValueN.

Example: 'FeatureStrengthExponent', 4 sets the feature strength exponent to 4.

DocumentsIn — Orientation of documents

'rows' (default) | 'columns'

Orientation of documents in the word count matrix, specified as the comma-separated pair consisting of 'DocumentsIn' and one of the following:

- 'rows' Input is a matrix of word counts with rows corresponding to documents.
- 'columns' Input is a transposed matrix of word counts with columns corresponding to documents.

This option only applies if you specify the input documents as a matrix of word counts.
Note If you orient your word count matrix so that documents correspond to columns and specify 'DocumentsIn', 'columns', then you might experience a significant reduction in optimization-execution time.

FeatureStrengthExponent — Initial feature strength exponent

2 (default) | nonnegative scalar

Initial feature strength exponent, specified as a nonnegative scalar. This value scales the feature component strengths for the documentScores, wordScores, and transform functions.

```
Example: 'FeatureStrengthExponent',4
```

```
Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64
```

Output Arguments

mdl — Output LSA model

lsaModel object

Output LSA model, returned as an lsaModel object.

getAttribute

Read HTML attribute of root node of HTML tree

Syntax

```
str = getAttribute(tree,attr)
```

Description

str = getAttribute(tree,attr) returns the attribute attr of the root node of tree. If that attribute is not set, then the function returns a missing value.

Examples

Get Attribute of HTML Tag

Read HTML code from the URL https://www.mathworks.com/help/textanalytics using webread.

```
url = "https://www.mathworks.com/help/textanalytics";
code = webread(url);
```

Parse the HTML code using htmlTree.

```
tree = htmlTree(code);
```

Find all the hyperlinks in the HTML tree using findElement. The hyperlinks are the nodes with element name "A".

```
selector = "A";
subtrees = findElement(tree,selector);
subtrees(1:10)
ans =
10×1 htmlTree:
```

```

```

Input Arguments

```
tree — HTML tree
htmlTree array
```

HTML tree, specified as an htmlTree array.

attr — Attribute name

string scalar | character vector | scalar cell array containing a character vector

Attribute name, specified as a string scalar, character vector, or a scalar cell array containing a character vector.

Output Arguments

str – HTML attribute

string array

HTML attribute, returned as a string array

Definitions

HTML Elements

A typical HTML element contains the following components:

- Element name Name of the HTML tag. The element name corresponds to the Name property of the HTML tree.
- Attributes Additional information about the tag. HTML attributes have the form name="value", where name and value denote the attribute name and value respectively. The attributes appear inside the opening HTML tag. To get the attribute values from an HTML tree, use getAttribute.
- Content Element content. The content appears between opening and closing HTML tags. The content can be text data or nested HTML elements. To extract the text from an htmlTree object, use extractHTMLText. To get the nested HTML elements of an htmlTree object, use the Children property.

For example, the HTML element <a href="https://
www.mathworks.com">Home comprises the following components:

Component		Value	Description	
Element name		a	Element is a hyperlink	
Attribute	Attribute name	href	Hyperlink reference	

Component		Value	Description	
	Attribute value	"https:// www.mathworks.co m"	Hyperlink reference value	
Content		Home	Text to display

htmlTree

Parsed HTML tree

Description

An htmlTree object represents a parsed HTML element or node. Extract parts of interest using the findElement function or the Children property, and extract text using the extractHTMLText function.

Creation

Syntax

tree = htmlTree(code)

Description

tree = htmlTree(code) parses the HTML code in the string code and returns the
resulting tree structure.

Input Arguments

code — HTML code

string scalar | character vector | scalar cell array containing a character vector

HTML code, specified as a string scalar, a character vector, or a scalar cell array containing a character vector.

Тір

- To read HTML code from a web page, use webread.
- To extract text from an HTML file, use extractFileText.

Example: "MathWorks"
Data Types: char | string | cell

Properties

Children — Direct descendants of element

htmlTree array

Direct descendants of the element, specified as an htmlTree array.

Parent — Parent node htmlTree object

Parent node in the tree, specified as an htmlTree object.

If the HTML tree is a root node, then the value of Parent is missing.

Name — HTML element name string scalar

HTML element name, specified as a string scalar.

For more information, see "HTML Elements" on page 1-151.

Object Functions

Definitions

HTML Elements

A typical HTML element contains the following components:

- Element name Name of the HTML tag. The element name corresponds to the Name property of the HTML tree.
- Attributes Additional information about the tag. HTML attributes have the form name="value", where name and value denote the attribute name and value respectively. The attributes appear inside the opening HTML tag. To get the attribute values from an HTML tree, use getAttribute.
- Content Element content. The content appears between opening and closing HTML tags. The content can be text data or nested HTML elements. To extract the text from an htmlTree object, use extractHTMLText. To get the nested HTML elements of an htmlTree object, use the Children property.

For example, the HTML element <a href="https://
www.mathworks.com">Home comprises the following components:

Component		Value	Description
Element name		а	Element is a hyperlink
Attribute	Attribute name	href	Hyperlink reference
	Attribute value	"https:// www.mathworks.co m"	Hyperlink reference value
Content		Home	Text to display

ind2word

Map encoding index to word

Syntax

words = ind2word(enc,M)

Description

words = ind2word(enc,M) returns the words corresponding to the encoding indices in M according to the word encoding enc.

Examples

Map Encoding Indices to Words

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
documents(1:10)
ans =
```

10x1 tokenizedDocument:

70 tokens: fairest creatures desire increase thereby beautys rose might never die 71 tokens: forty winters shall besiege thy brow dig deep trenches thy beautys field 65 tokens: look thy glass tell face thou viewest time face form another whose fresh 71 tokens: unthrifty loveliness why dost thou spend upon thy self thy beautys lega 61 tokens: hours gentle work frame lovely gaze every eye doth dwell play tyrants sa 68 tokens: let winters ragged hand deface thee thy summer ere thou distilld make sw 64 tokens: lo orient gracious light lifts up burning head eye doth homage newappear 70 tokens: music hear why hearst thou music sadly sweets sweets war joy delights jo 70 tokens: fear wet widows eye thou consumst thy self single life ah thou issueless 69 tokens: shame deny thou bearst love thy self art unprovident grant thou wilt the

Create a word encoding.

enc = wordEncoding(documents)

enc =
wordEncoding with properties:
 NumWords: 3092
Vocabulary: [1x3092 string]

View the words corresponding to indices 1, 3, and 5 using the ind2word function.

```
idx = [1 3 5];
words = ind2word(enc,idx)
words = 1x3 string array
    "fairest" "desire" "thereby"
```

Input Arguments

```
enc — Input word encoding
```

wordEncoding object

Input word encoding, specified as a wordEncoding object.

M — Word encoding indices

vector of positive integers

Word encoding indices, specified as a vector of positive integers.

Output Arguments

words — Output words

string vector

Output words, returned as a string vector.

Introduced in R2018b

ismember

(To be removed) Test if word is member of word embedding

Note ismember will be removed in a future release. Use isVocabularyWord instead. For more information, see "Compatibility Considerations".

Syntax

tf = ismember(emb,words)

Description

tf = ismember(emb,words) returns an array containing logical 1 (true) where the word in words is a member of the word embedding emb. Elsewhere, the array contains logical 0 (false).

Examples

Test If Word Is Member of Embedding

Test to determine if words are members of a word embedding.

Load a pretrained word embedding using fastTextWordEmbedding. This function requires Text Analytics Toolbox Model *for fastText English 16 Billion Token Word Embedding* support package. If this support package is not installed, then the function provides a download link.

```
emb = fastTextWordEmbedding
```

emb =

wordEmbedding with properties:

```
Dimension: 300
Vocabulary: [1×1000000 string]
```

Test if the words "I", "love", and "fastTextWordEmbedding" are in the word embedding.

```
words = ["I" "love" "fastTextWordEmbedding"];
tf = ismember(emb,words)
tf =
 1×3 logical array
 1 1 0
```

Input Arguments

emb — Input word embedding

wordEmbedding object

Input word embedding, specified as a wordEmbedding object.

words – Input words

string vector | character vector | cell array of character vectors

Input words, specified as a string vector, character vector, or cell array of character vectors. If you specify words as a character vector, then the function treats the argument as a single word.

Data Types: string | char | cell

Compatibility Considerations

ismember will be removed

Warns starting in R2018b

To update your code, for wordEmbedding object input, change the function name from ismember to isVocabularyWord. You do not need to change the arguments. The syntaxes are equivalent.

ismissing

Find HTML trees without values

Syntax

tf = ismissing(tree)

Description

tf = ismissing(tree) returns a logical array that indicates which elements of tree do not reference HTML trees. For example, if tree is given by the Parent property of a root node, then the function returns 1 (true).

Examples

Test If HTML Tree Is Root Node

To test if an HTML tree object represents a root node, test that the Parent property is missing.

Read HTML code from the URL https://www.mathworks.com/help/textanalytics using webread.

```
url = "https://www.mathworks.com/help/textanalytics";
code = webread(url);
```

Parse the HTML code using htmlTree.

tree = htmlTree(code);

Test if the parent of tree references an HTML tree.

tf = ismissing(tree.Parent)

```
tf = logical
1
```

Since tree represents the root node of the HTML tree, the value of tree.Parent is missing and the ismissing function returns 1 (true).

Input Arguments

tree — HTML tree htmlTree array

HTML tree, specified as an htmlTree array.

See Also

readPDFFormData | tokenizedDocument

Topics

"Parse HTML and Extract Text Content" "Extract Text Data from Files" "Prepare Text Data for Analysis" "Create Simple Text Model for Classification"

Introduced in R2018b

isVocabularyWord

Test if word is member of word embedding or encoding

Syntax

- tf = isVocabularyWord(emb,words)
- tf = isVocabularyWord(enc,words)

Description

tf = isVocabularyWord(emb,words) tests if the elements of words are members of the word embedding emb. The function returns a logical array containing 1 (true) where the words are members of the word embedding. Elsewhere, the array contains 0 (false).

tf = isVocabularyWord(enc,words) tests if the elements of words are members of the word encoding enc.

Examples

Test If Word Is Member of Embedding

Test to determine if words are members of a word embedding.

Load a pretrained word embedding using the fastTextWordEmbedding function. This function requires Text Analytics Toolbox[™] Model for fastText English 16 Billion Token Word Embedding support package. If this support package is not installed, then the function provides a download link.

emb = fastTextWordEmbedding

```
emb =
wordEmbedding with properties:
Dimension: 300
```

```
Vocabulary: [1×999994 string]
```

Test if the words "I", "love", and "fastTextWordEmbedding" are in the word embedding.

```
words = ["I" "love" "fastTextWordEmbedding"];
tf = isVocabularyWord(emb,words)
tf = 1×3 logical array
1 1 0
```

Input Arguments

emb — Input word embedding

wordEmbedding object

Input word embedding, specified as a wordEmbedding object.

enc - Input word encoding

wordEncoding object

Input word encoding, specified as a wordEncoding object.

words — Input words string vector | character vector | cell array of character vectors

Input words, specified as a string vector, character vector, or cell array of character vectors. If you specify words as a character vector, then the function treats the argument as a single word.

Data Types: string | char | cell

join

Combine multiple bag-of-words or bag-of-n-grams models

Syntax

newBag = join(bag)
newBag = join(bag,dim)

Description

newBag = join(bag) combines the elements in the array bag by merging the frequency counts. The function combines the elements along the first dimension not equal to 1.

newBag = join(bag,dim) combines the elements in the array bag along the dimension
dim.

Examples

Combine Bag-of-Words Models

Create an array of two bags-of-words models from tokenized documents.

```
str = [ ...
    "an example of a short sentence"
    "a second short sentence"];
documents = tokenizedDocument(str);
bag(1) = bagOfWords(documents(1));
bag(2) = bagOfWords(documents(2))
bag =
    1x2 bagOfWords array with properties:
    Counts
    Vocabulary
```

NumWords NumDocuments

Combine the bag-of-words models using join.

```
bag = join(bag)
bag =
   bag0fWords with properties:
        Counts: [2x7 double]
        Vocabulary: [1x7 string]
        NumWords: 7
   NumDocuments: 2
```

Create Bag-of-Words Model in Parallel

If your text data is contained in multiple files in a folder, then you can import the text data and create a bag-of-words model in parallel using parfor. If you have Parallel Computing Toolbox^m installed, then the parfor loop runs in parallel, otherwise, it runs in serial. Use join to combine an array of bag-of-words models into one model.

Create a bag-of-words model from a collection of files. The examples sonnets have file names "exampleSonnetN.txt", where N is the number of the sonnet. Get a list of the files and their locations using dir.

```
fileLocation = fullfile(matlabroot,'examples','textanalytics','exampleSonnet*.txt');
fileInfo = dir(fileLocation)
```

```
fileInfo = 5x1 struct array with fields:
    name
    folder
    date
    bytes
    isdir
    datenum
```

Initialize an empty bag-of-words model and then loop over the files and create an array of bag-of-words models.

```
bag = bagOfWords;
numFiles = numel(fileInfo);
parfor i = 1:numFiles
    f = fileInfo(i);
    filename = fullfile(f.folder,f.name);
    textData = extractFileText(filename);
    document = tokenizedDocument(textData);
    bag(i) = bagOfWords(document);
end
Starting parallel pool (parpool) using the 'local' profile ...
connected to 12 workers.
```

Combine the bag-of-words models using join.

Input Arguments

bag — Array of bag-of-words or bag-of-n-grams models

bagOfWords array | bagOfNgrams array

Array of bag-of-words or bag-of-n-grams models, specified as a bagOfWords array or a bagOfNgrams array. If bag is a bagOfNgrams array, then each element to be joined must have the same value for the NgramLengths property.

dim — Dimension along which to join models

positive integer

Dimension along which to join models, specified as a positive integer. If dim is not specified, then the default is the first dimension with a size that does not equal 1.

Output Arguments

newBag — Output model

bagOfWords array | bagOfNgrams array

Output model, returned as a bagOfWords object or a bagOfNgrams object. The type of newBag is the same as the type of bag. newBag has the same data type as the input model and has a size of 1 along the dimension being joined.

joinWords

Convert documents to string by joining words

Syntax

```
newStr = joinWords(documents)
newStr = joinWords(documents,delim)
```

Description

newStr = joinWords(documents) converts a tokenizedDocument array to a string array by joining the words in each document with a space.

newStr = joinWords(documents,delim) joins the words with delimiter delim
instead of a space.

Examples

Convert Documents to String by Joining Words

Convert a tokenizedDocument array to a string array by joining the words with a space.

```
documents = tokenizedDocument([
    "an example of a short sentence"
    "a second short sentence"])
documents =
    2x1 tokenizedDocument:
    6 tokens: an example of a short sentence
    4 tokens: a second short sentence
    str = joinWords(documents)
```

```
str = 2x1 string array
"an example of a short sentence"
"a second short sentence"
```

Convert a tokenizedDocument array to a string array by joining the words with an underscore.

```
str = joinWords(documents,"_")
```

```
str = 2x1 string array
"an_example_of_a_short_sentence"
"a_second_short_sentence"
```

Input Arguments

```
documents — Input documents
```

tokenizedDocument array

Input documents, specified as a tokenizedDocument array.

delim — Delimiter to join words

string scalar | character vector | scalar cell array

Delimiter to join words, specified as a string scalar, character vector, or scalar cell array containing a character vector.

Example: "_"
Example: '_'
Example: { '_' }
Data Types: char | string | cell

Output Arguments

newStr — Output text

string array | character vector | cell array of character vectors

Output text, returned as a string array, a character vector, or cell array of character vectors. str and newStr have the same data type.

ldaModel

Latent Dirichlet allocation (LDA) model

Description

A latent Dirichlet allocation (LDA) model is a topic model which discovers underlying topics in a collection of documents and infers word probabilities in topics. If the model was fit using a bag-of-n-grams model, then the software treats the n-grams as individual words.

Creation

Create an LDA model using the fitlda function.

Properties

NumTopics — Number of topics

positive integer

Number of topics in the LDA model, specified as a positive integer.

TopicConcentration — Topic concentration

positive scalar

Topic concentration, specified as a positive scalar. The function sets the concentration per topic to TopicConcentration/NumTopics. For more information, see "Latent Dirichlet Allocation" on page 1-184.

WordConcentration — Word concentration

1 (default) | nonnegative scalar

Word concentration, specified as a nonnegative scalar. The software sets the concentration per word to WordConcentration/numWords, where numWords is the vocabulary size of the input documents. For more information, see "Latent Dirichlet Allocation" on page 1-184.

CorpusTopicProbabilities — Topic probabilities of input document set vector

Topic probabilities of input document set, specified as a vector. The corpus topic probabilities of an LDA model are the probabilities of observing each topic in the entire data set used to fit the LDA model. CorpusTopicProbabilities is a 1-by-K vector where K is the number of topics. The kth entry of CorpusTopicProbabilities corresponds to the probability of observing topic k.

DocumentTopicProbabilities — Topic probabilities per input document matrix

Topic probabilities per input document, specified as a matrix. The document topic probabilities of an LDA model are the probabilities of observing each topic in each document used to fit the LDA model. DocumentTopicProbabilities is a D-by-K matrix where D is the number of documents used to fit the LDA model, and K is the number of topics. The (d,k)th entry of DocumentTopicProbabilities corresponds to the probability of observing topic k in document d.

If any the topics have zero probability (CorpusTopicProbabilities contains zeros), then the corresponding columns of DocumentTopicProbabilities and TopicWordProbabilities are zeros.

The order of the rows in **DocumentTopicProbabilities** corresponds to the order of the documents in the training data.

TopicWordProbabilities — Word probabilities per topic

matrix

Word probabilities per topic, specified as a matrix. The topic word probabilities of an LDA model are the probabilities of observing each word in each topic of the LDA model. TopicWordProbabilities is a *V*-by-*K* matrix, where *V* is the number of words in Vocabulary and *K* is the number of topics. The (v,k)th entry of TopicWordProbabilities corresponds to the probability of observing word *v* in topic *k*.

If any the topics have zero probability (CorpusTopicProbabilities contains zeros), then the corresponding columns of DocumentTopicProbabilities and TopicWordProbabilities are zeros.

The order of the rows in TopicWordProbabilities corresponds to the order of the words in Vocabulary.

TopicOrder — Topic Order

'initial-fit-probability' (default) | 'unordered'

Topic order, specified as one of the following:

- 'initial-fit-probability' Sort the topics by the corpus topic probabilities of the initial model fit. These probabilities are the CorpusTopicProbabilities property of the initial ldaModel object returned by fitlda. The resume function does not reorder the topics of the resulting ldaModel objects.
- 'unordered' Do not order topics.

FitInfo — Information recorded when fitting LDA model

struct

Information recorded when fitting LDA model, specified as a struct with the following fields:

- TerminationCode Status of optimization upon exit
 - 0 Iteration limit reached.
 - 1 Tolerance on log-likelihood satisfied.
- TerminationStatus Explanation of the returned termination code
- NumIterations Number of iterations performed
- NegativeLogLikelihood Negative log-likelihood for the data passed to fitlda
- Perplexity Perplexity for the data passed to fitlda
- Solver Name of the solver used
- History Struct holding the optimization history
- StochasticInfo Struct holding information for stochastic solvers

Data Types: struct

Vocabulary — List of words in the model

string vector

List of words in the model, specified as a string vector.

Data Types: string

Object Functions

logp	Document log-probabilities and goodness of fit of LDA model
predict	Predict top LDA topics of documents
resume	Resume fitting LDA model
topkwords	Most important words in bag-of-words model or LDA topic
transform	Transform documents into lower-dimensional space
wordcloud	Create word cloud chart from text, bag-of-words model, bag-of-n-grams
	model, or LDA model

Examples

Fit LDA Model

To reproduce the results in this example, set rng to 'default'.

```
rng('default')
```

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

Create a bag-of-words model using bag0fWords.

```
bag = bagOfWords(documents)
bag =
    bagOfWords with properties:
        Counts: [154x3092 double]
        Vocabulary: [1x3092 string]
        NumWords: 3092
        NumDocuments: 154
```

Fit an LDA model with four topics.

numTopics = 4; mdl = fitlda(bag,numTopics)

Initial topic assignments sampled in 0.0812113 seconds.

Iteration 	Time per iteration (seconds)	Relative change in log(L)	Training perplexity 	Topic concentration	Topic concentration iterations
0 1 2 3 4 5 6	0.01 0.03 0.03 0.02 0.02 0.02 0.02 0.02 0.03	1.0482e-02 1.7190e-03 4.3796e-04 9.4193e-04 3.7079e-04 9.5777e-05	1.215e+03 1.128e+03 1.115e+03 1.118e+03 1.111e+03 1.108e+03 1.107e+03	$\begin{array}{c} 1.000\\ 1.000\\ 1.000\\ 1.000\\ 1.000\\ 1.000\\ 1.000\\ 1.000\\ 1.000\\ 1.000\\ 1.000\end{array}$	0 0 0 0 0 0 0

mdl =

ldaModel with properties:

```
NumTopics: 4
WordConcentration: 1
TopicConcentration: 1
CorpusTopicProbabilities: [0.2500 0.2500 0.2500]
DocumentTopicProbabilities: [154x4 double]
TopicWordProbabilities: [3092x4 double]
Vocabulary: [1x3092 string]
TopicOrder: 'initial-fit-probability'
FitInfo: [1x1 struct]
```

Visualize the topics using word clouds.

```
figure
for topicIdx = 1:4
    subplot(2,2,topicIdx)
    wordcloud(mdl,topicIdx);
    title("Topic: " + topicIdx)
end
```

Topic: 3

Highest Probability Words of LDA Topic

Create a table of the words with highest probability of an LDA topic.

To reproduce the results, set rng to 'default'.

```
rng('default')
```

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.
```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

Create a bag-of-words model using bagOfWords.

bag = bagOfWords(documents);

Fit an LDA model with 20 topics. To suppress verbose output, set 'Verbose' to 0.

```
numTopics = 20;
mdl = fitlda(bag,numTopics,'Verbose',0);
```

Find the top 20 words of the first topic.

```
k = 20;
topicIdx = 1;
tbl = topkwords(mdl,k,topicIdx)
```

tbl=20×2 table

Word	Score

wordcloud(tbl.Word,tbl.Score);

Document Topic Probabilities of LDA Model

Get the document topic probabilities (also known as topic mixtures) of the documents used to fit an LDA model.

To reproduce the results, set rng to 'default'.

```
rng('default')
```

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

Create a bag-of-words model using bag0fWords.

```
bag = bagOfWords(documents);
```

Fit an LDA model with 20 topics. To suppress verbose output, set 'Verbose' to 0.

View the topic probabilities of the first document in the training data.

```
topicMixtures = mdl.DocumentTopicProbabilities;
figure
bar(topicMixtures(1,:))
title("Document 1 Topic Probabilities")
xlabel("Topic Index")
ylabel("Probability")
```

Predict Top LDA Topics of Documents

To reproduce the results in this example, set rng to 'default'.

```
rng('default')
```

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
```

```
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

Create a bag-of-words model using bag0fWords.

```
bag = bagOfWords(documents)
```

Fit an LDA model with 20 topics.

```
numTopics = 20;
mdl = fitlda(bag,numTopics)
```

Initial topic assignments sampled in 0.0591059 seconds.

Definitions

Latent Dirichlet Allocation

A *latent Dirichlet allocation* (LDA) model is a document topic model which discovers underlying topics in a collection of documents and infers word probabilities in topics. LDA models a collection of *D* documents as topic mixtures $\theta_1, \ldots, \theta_D$, over *K* topics characterized by vectors of word probabilities $\varphi_1, \ldots, \varphi_K$. The model assumes that the

topic mixtures $\theta_1, \ldots, \theta_D$, and the topics $\varphi_1, \ldots, \varphi_K$ follow a Dirichlet distribution with concentration parameters α and β respectively.

The topic mixtures $\theta_1, \ldots, \theta_D$ are probability vectors of length *K*, where *K* is the number of topics. The entry θ_{di} is the probability of topic *i* appearing in the *d*th document. The topic mixtures correspond to the rows of the DocumentTopicProbabilities property of the ldaModel object.

The topics $\varphi_1, \ldots, \varphi_K$ are probability vectors of length *V*, where *V* is the number of words in the vocabulary. The entry φ_{iv} corresponds to the probability of the *v*th word of the vocabulary appearing in the *i*th topic. The topics $\varphi_1, \ldots, \varphi_K$ correspond to the columns of the TopicWordProbabilities property of the ldaModel object.

Given the topics $\varphi_1, \ldots, \varphi_K$ and Dirichlet prior α on the topic mixtures, LDA assumes the following generative process for a document:

- ¹ Sample a topic mixture $\theta \sim \text{Dirichlet}(\alpha)$. The random variable θ is a probability vector of length *K*, where *K* is the number of topics.
- 2 For each word in the document:

а

b

Sample a topic index $z \sim \text{Categorical}(\theta)$. The random variable z is an integer from 1 through K, where K is the number of topics.

Sample a word $w \sim \text{Categorical}(\varphi_z)$. The random variable w is an integer from 1 through V, where V is the number of words in the vocabulary, and represents the corresponding word in the vocabulary.

Under this generative process, the joint distribution of a document with words W_1, \ldots, W_N , with topic mixture θ , and with topic indices z_1, \ldots, z_N is given by

$$p(\boldsymbol{\theta}, \boldsymbol{z}, \boldsymbol{w} \,|\, \boldsymbol{\alpha}, \boldsymbol{\varphi}) = p(\boldsymbol{\theta} \,|\, \boldsymbol{\alpha}) \prod_{n=1}^{N} p(\boldsymbol{z}_n \,|\, \boldsymbol{\theta}) \, p(\boldsymbol{w}_n \,|\, \boldsymbol{z}_n, \boldsymbol{\varphi}),$$

where N is the number of words in the document. Summing the joint distribution over z and then integrating over θ yields the marginal distribution of a document w:

$$p(w \mid \alpha, \varphi) = \int_{\theta} p(\theta \mid \alpha) \prod_{n=1}^{N} \sum_{z_n} p(z_n \mid \theta) p(w_n \mid z_n, \varphi) d\theta.$$

The following diagram illustrates the LDA model as a probabilistic graphical model. Shaded nodes are observed variables, unshaded nodes are latent variables, nodes without outlines are the model parameters. The arrows highlight dependencies between random variables and the plates indicate repeated nodes.

Dirichlet Distribution

The Dirichlet distribution is a continuous generalization of the multinomial distribution. Given the number of categories $K \ge 2$, and concentration parameter α , where α is a

vector of positive reals of length K, the probability density function of the Dirichlet distribution is given by

$$p(\theta \# \alpha) = \frac{1}{B(\alpha)} \prod_{i=1}^{K} \theta_i^{\alpha_i - 1},$$

where B denotes the multivariate Beta function given by

$$B(\alpha) = \frac{\prod_{i=1}^{K} \Gamma(\alpha_i)}{\Gamma\left(\sum_{i=1}^{K} \alpha_i\right)}.$$

A special case of the Dirichlet distribution is the symmetric Dirichlet distribution. The symmetric Dirichlet distribution is characterized by the concentration parameter α , where all the elements of α are the same.

Introduced in R2017b

lsaModel

Latent semantic analysis (LSA) model

Description

A latent semantic analysis (LSA) model discovers relationships between documents and the words that they contain. An LSA model is a dimensionality reduction tool useful for running low-dimensional statistical models on high-dimensional word counts. If the model was fit using a bag-of-n-grams model, then the software treats the n-grams as individual words.

Creation

Create an LSA model using the fitlsa function.

Properties

NumComponents — Number of components

nonnegative integer

Number of components, specified as a nonnegative integer. The number of components is the dimensionality of the result vectors. Changing the value of NumComponents changes the length of the resulting vectors, without influencing the initial values. You can only set NumComponents to be less than or equal to the number of components used to fit the LSA model.

Example: 100

FeatureStrengthExponent — Exponent scaling feature component strengths nonnegative scalar

Exponent scaling feature component strengths for the DocumentScores and WordScores properties, and the transform function, specified as a nonnegative scalar. The LSA model scales the properties by their singular values (feature strengths), with an exponent of FeatureStrengthExponent/2.

Example: 2.5

ComponentWeights — Component weights

numeric vector

Component weights, specified as a numeric vector. The component weights of an LSA model are the singular values, squared. ComponentWeights is a 1-by-NumComponents vector where the *j*th entry corresponds to the weight of component *j*. The components are ordered by decreasing weights. You can use the weights to estimate the importance of components.

DocumentScores — Score vectors per input document

matrix

Score vectors per input document, specified as a matrix. The document scores of an LSA model are the score vectors in lower dimensional space of each document used to fit the LSA model. DocumentScores is a *D*-by-NumComponents matrix where *D* is the number of documents used to fit the LSA model. The (i_j) th entry of DocumentScores corresponds to the score of component j in document i.

WordScores — Word scores per component

matrix

Word scores per component, specified as a matrix. The word scores of an LSA model are the scores of each word in each component of the LSA model. WordScores is a V-by-NumComponents matrix where V is the number of words in Vocabulary. The (v,j)th entry of WordScores corresponds to the score of word v in component j.

Vocabulary — Unique words in model

string vector

Unique words in the model, specified as a string vector.

Data Types: string

Object Functions

transform Transform documents into lower-dimensional space

Examples

Fit LSA Model

Fit a Latent Semantic Analysis model to a collection of documents.

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

Create a bag-of-words model using bag0fWords.

```
bag = bagOfWords(documents)
bag =
    bagOfWords with properties:
        Counts: [154x3092 double]
        Vocabulary: [1x3092 string]
        NumWords: 3092
        NumDocuments: 154
```

Fit an LSA model with 20 components.

Transform new documents into lower dimensional space using the LSA model.

```
newDocuments = tokenizedDocument([
    "what's in a name? a rose by any other name would smell as sweet."
    "if music be the food of love, play on."]);
dscores = transform(mdl,newDocuments)
dscores = 2 \times 20
    0.1338
             0.1623
                      0.1680
                                 -0.0541 -0.2464
                                                     -0.0134
                                                                0.2604
                                                                         -0.0205
                                                                                    0.
    0.2547
              0.5576
                       -0.0095
                                  0.5660 -0.0643
                                                     -0.1236
                                                               -0.0082
                                                                          0.0522
                                                                                   -0.0
```

Calculate Document Similarity

Create a bag-of-words model from some text data.

```
str = [
    "I enjoy ham, eggs and bacon for breakfast."
    "I sometimes skip breakfast."
    "I eat eggs and ham for dinner."
    ];
documents = tokenizedDocument(str);
bag = bagOfWords(documents);
```

Fit an LSA model with two components. Set the feature strength exponent to 0.5.

Calculate the cosine distance between the documents score vectors using pdist. View the distances in a matrix D using squareform. D(i,j) denotes the distance between document i and j.

```
dscores = mdl.DocumentScores;
distances = pdist(dscores, 'cosine');
D = squareform(distances)
D = 3×3
0 0.6244 0.1489
0.6244 0 1.1670
0.1489 1.1670 0
```

Visualize the similarity between documents by plotting the document score vectors in a compass plot.

```
figure
compass(dscores(1,1),dscores(1,2),'red')
hold on
compass(dscores(2,1),dscores(2,2),'green')
compass(dscores(3,1),dscores(3,2),'blue')
hold off
title("Document Scores")
legend(["Document 1" "Document 2" "Document 3"],'Location','bestoutside')
```

logp

Document log-probabilities and goodness of fit of LDA model

Syntax

```
logProb = logp(ldaMdl,documents)
logProb = logp(ldaMdl,counts)
logProb = logp(ldaMdl,bag)
[logProb,ppl] = logp(___)
___ = logp(___,Name,Value)
```

Description

logProb = logp(ldaMdl,documents) returns the log-probabilities of documents
under the LDA model ldaMdl.

logProb = logp(ldaMdl,counts) returns the log-probabilities of the documents
represented by the matrix of word counts counts.

logProb = logp(ldaMdl,bag) returns the log-probabilities of the documents
represented by a bag-of-words or bag-of-n-grams model.

[logProb,ppl] = logp(_____) returns the perplexity computed from the logprobabilities.

____ = logp(____, Name, Value) specifies additional options using one or more namevalue pair arguments.

Examples

Calculate Document Log-Probabilities

To reproduce the results in this example, set rng to 'default'.

rng('default')

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

Create a bag-of-words model using bag0fWords.

```
bag = bagOfWords(documents)
bag =
    bagOfWords with properties:
        Counts: [154x3092 double]
        Vocabulary: [1x3092 string]
        NumWords: 3092
        NumDocuments: 154
```

Fit an LDA model with 20 topics. To suppress verbose output, set 'Verbose' to 0.

```
numTopics = 20;
mdl = fitlda(bag,numTopics,'Verbose',0);
```

Compute the document log-probabilities of the training documents and show them in a histogram.

```
logProbabilities = logp(mdl,documents);
figure
histogram(logProbabilities)
xlabel("Log Probability")
ylabel("Frequency")
title("Document Log-Probabilities")
```

Identify the three documents with the lowest log-probability. A low log-probability may suggest that the document may be an outlier.

```
[~,idx] = sort(logProbabilities);
idx(1:3)
ans = 3×1
146
19
65
```

documents(idx(1:3))

```
ans =
3x1 tokenizedDocument:
76 tokens: poor soul centre sinful earth sinful earth rebel powers array why dost
76 tokens: devouring time blunt thou lions paws make earth devour own sweet brood
73 tokens: brass nor stone nor earth nor boundless sea sad mortality oersways powe
```

Calculate Document Log-Probabilities from Word Count Matrix

Load the example data. sonnetsCounts.mat contains a matrix of word counts and a corresponding vocabulary of preprocessed versions of Shakespeare's sonnets.

load sonnetsCounts.mat
size(counts)
ans = 1×2

154 3092

Fit an LDA model with 20 topics.

numTopics = 20; mdl = fitlda(counts,numTopics)

Initial topic assignments sampled in 0.0826479 seconds.

Iteration	Time per	Relative	Training	Topic	Topic
	iteration	change in	perplexity	concentration	concentration
	(seconds)	log(L)			iterations
0 1 2 3 4 5 6	0.02 0.07 0.07 0.07 0.09 0.08 0.08	5.4884e-02 4.7400e-03 3.4597e-03 3.4662e-03 2.9259e-03 6.4180e-05	1.159e+03 8.028e+02 7.778e+02 7.602e+02 7.430e+02 7.288e+02 7.291e+02	5.000 5.000 5.000 5.000 5.000 5.000 5.000 5.000	0 0 0 0 0 0 0

mdl =

ldaModel with properties:

```
NumTopics: 20
WordConcentration: 1
TopicConcentration: 5
CorpusTopicProbabilities: [1x20 double]
DocumentTopicProbabilities: [154x20 double]
TopicWordProbabilities: [3092x20 double]
Vocabulary: [1x3092 string]
TopicOrder: 'initial-fit-probability'
FitInfo: [1x1 struct]
```

Compute the document log-probabilities of the training documents. Specify to draw 500 samples for each document.

```
numSamples = 500;
logProbabilities = logp(mdl,counts, ...
'NumSamples',numSamples);
```

Show the document log-probabilities in a histogram.

```
figure
histogram(logProbabilities)
xlabel("Log Probability")
ylabel("Frequency")
title("Document Log-Probabilities")
```

Identify the indices of the three documents with the lowest log-probability.

Compare Goodness of Fit

Compare the goodness of fit for two LDA models by calculating the perplexity of a heldout test set of documents.

To reproduce the results, set rng to 'default'.

```
rng('default')
```

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

Set aside 10% of the documents at random for testing.

```
numDocuments = numel(documents);
cvp = cvpartition(numDocuments, 'HoldOut',0.1);
documentsTrain = documents(cvp.training);
documentsTest = documents(cvp.test);
```

Create a bag-of-words model from the training documents.

```
bag = bagOfWords(documentsTrain)
bag =
    bagOfWords with properties:
        Counts: [139x2909 double]
        Vocabulary: [1x2909 string]
        NumWords: 2909
        NumDocuments: 139
```

Fit an LDA model with 20 topics to the bag-of-words model. To suppress verbose output, set 'Verbose' to 0.

```
numTopics = 20;
mdl1 = fitlda(bag,numTopics,'Verbose',0);
```

View information about the model fit.

mdl1.FitInfo

```
ans = struct with fields:
	TerminationCode: 1
	TerminationStatus: "Relative tolerance on log-likelihood satisfied."
	NumIterations: 26
	NegativeLogLikelihood: 5.6915e+04
	Perplexity: 742.7118
		Solver: "cgs"
		History: [1x1 struct]
```

Compute the perplexity of the held-out test set.

[~,ppl1] = logp(mdl1,documentsTest)

ppl1 = 781.6078

Fit an LDA model with 40 topics to the bag-of-words model.

numTopics = 40; mdl2 = fitlda(bag,numTopics,'Verbose',0);

View information about the model fit.

mdl2.FitInfo

Compute the perplexity of the held-out test set.

```
[~,ppl2] = logp(mdl2,documentsTest)
```

ppl2 = 808.6602

A lower perplexity suggests that the model may be better fit to the held-out test data.

Input Arguments

ldaMdl — Input LDA model

ldaModel object

Input LDA model, specified as an ldaModel object.

documents — Input documents

tokenizedDocument array | string array of words | cell array of character vectors

Input documents, specified as a tokenizedDocument array, a string array of words, or a cell array of character vectors. If documents is a string array or a cell array of character vectors, then it must be a row vector representing a single document, where each element is a word.

bag — Input model

bagOfWords object | bagOfNgrams object

Input bag-of-words or bag-of-n-grams model, specified as a bagOfWords object or a bagOfNgrams object. If bag is a bagOfNgrams object, then the function treats the n-grams as individual words.

counts — Frequency counts of words

matrix of nonnegative integers

Frequency counts of words, specified as a matrix of nonnegative integers. If you specify 'DocumentsIn' to be 'rows', then the value counts(i,j) corresponds to the number of times the *j*th word of the vocabulary appears in the *i*th document. Otherwise, the value counts(i,j) corresponds to the number of times the *i*th word of the vocabulary appears in the *j*th document.

Name-Value Pair Arguments

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1, Value1, ..., NameN, ValueN.

Example: 'NumSamples', 500 specifies to draw 500 samples for each document

DocumentsIn — Orientation of documents

'rows' (default) | 'columns'

Orientation of documents in the word count matrix, specified as the comma-separated pair consisting of 'DocumentsIn' and one of the following:

- 'rows' Input is a matrix of word counts with rows corresponding to documents.
- 'columns' Input is a transposed matrix of word counts with columns corresponding to documents.

This option only applies if you specify the input documents as a matrix of word counts.

Note If you orient your word count matrix so that documents correspond to columns and specify 'DocumentsIn', 'columns', then you might experience a significant reduction in optimization-execution time.

NumSamples — Number of samples to draw

1000 (default) | positive integer

Number of samples to draw for each document, specified as the comma-separated pair consisting of 'NumSamples' and a positive integer.

Example: 'NumSamples', 500

Output Arguments

logProb — Log-probabilities

numeric vector

Log-probabilities of the documents under the LDA model, returned as a numeric vector.

ppl — Perplexity positive scalar

Perplexity of the documents calculated from the log-probabilities, returned as a positive scalar.

Algorithms

The logp uses the *iterated pseudo-count* method described in

lower

Convert documents to lowercase

Syntax

```
newDocuments = lower(documents)
```

Description

newDocuments = lower(documents) converts each uppercase character in the input documents to the corresponding lowercase character, and leaves all other characters unchanged.

Examples

Convert Documents to Lowercase

Convert all uppercase characters in an array of documents to lowercase.

```
documents = tokenizedDocument([
    "An Example of a Short Sentence"
    "A Second Short Sentence"])
documents =
  2x1 tokenizedDocument:
    6 tokens: An Example of a Short Sentence
    4 tokens: A Second Short Sentence
newDocuments = lower(documents)
```

```
newDocuments =
  2x1 tokenizedDocument:
```

6 tokens: an example of a short sentence 4 tokens: a second short sentence

Input Arguments

documents - Input documents
tokenizedDocument array

Input documents, specified as a tokenizedDocument array.

Output Arguments

newDocuments — Output documents

tokenizedDocument array

Output documents, returned as a tokenizedDocument array.

Topics

"Prepare Text Data for Analysis" "Create Simple Text Model for Classification"

Introduced in R2017b

normalizeWords

Stem or lemmatize words

Use normalizeWords to reduce words to a root form. To *lemmatize* English words, or reduce them to their dictionary forms, set the 'Style' option to 'lemma'.

Syntax

```
newDocuments = normalizeWords(documents)
newWords = normalizeWords(words)
____ = normalizeWords(____,'Style',style)
```

Description

newDocuments = normalizeWords(documents) reduces the words in documents to a root form. For English text, the function, by default, stems the words using the Porter stemmer. For Japanese text, the function, by default, lemmatizes the words using the MeCab tokenizer.

newWords = normalizeWords(words) reduces each word in words to a root form.

```
= normalizeWords(____, 'Style', style) also specifies normalization style.
For example, normalizeWords(documents, 'Style', 'lemma') lemmatizes the words
in the input documents.
```

Examples

Stem Words in Documents

Stem the words in a document array using the Porter stemmer.

```
documents = tokenizedDocument([
    "a strongly worded collection of words"
```

```
"another collection of words"]);
newDocuments = normalizeWords(documents)
newDocuments =
    2x1 tokenizedDocument:
    6 tokens: a strongli word collect of word
    4 tokens: anoth collect of word
```

Stem Words in String Array

Stem the words in a string array using the Porter stemmer. Each element of the string array must be a single word.

```
words = ["a" "strongly" "worded" "collection" "of" "words"];
newWords = normalizeWords(words)
newWords = 1x6 string array
"a" "strongli" "word" "collect" "of" "word"
```

Lemmatize Words in Documents

Lemmatize the words in a document array.

```
documents = tokenizedDocument([
    "I am building a house."
    "The building has two floors."]);
newDocuments = normalizeWords(documents,'Style','lemma')
newDocuments =
    2x1 tokenizedDocument:
    6 tokens: i be build a house .
    6 tokens: the build have two floor .
```

To improve the lemmatization, first add part-of-speech details to the documents using the addPartOfSpeechDetails function. For example, if the documents contain part-of-

speech details, then normalizeWords reduces the only verb "building" and not the noun "building".

```
documents = addPartOfSpeechDetails(documents);
newDocuments = normalizeWords(documents,'Style','lemma')
newDocuments =
  2x1 tokenizedDocument:
  6 tokens: i be build a house .
  6 tokens: the building have two floor .
```

Lemmatize Japanese Text

Tokenize Japanese text using the tokenizedDocument function. The function automatically detects Japanese text.

```
str = [
    "空に星が輝き、瞬いている。"
    "空の星が輝きを増している。"
    "駅までは遠くて、歩けない。"
    "遠くの駅まで歩けない。"];
documents = tokenizedDocument(str);
```

Lemmatize the tokens using normalizeWords.

```
documents = normalizeWords(documents)
```

```
documents =
4x1 tokenizedDocument:
10 tokens: 空 に 星 が 輝く 、 瞬く て いる 。
10 tokens: 空 の 星 が 輝き を 増す て いる 。
9 tokens: 駅 まで は 遠い て 、 歩ける ない 。
7 tokens: 遠く の 駅 まで 歩ける ない 。
```

Input Arguments

documents — Input documents

tokenizedDocument array

Input documents, specified as a tokenizedDocument array.

words — Input words

string vector | character vector | cell array of character vectors

Input words, specified as a string vector, character vector, or cell array of character vectors. If you specify words as a character vector, then the function treats the argument as a single word.

Data Types: string | char | cell

style — Normalization style

'stem'|'lemma'

Normalization style, specified as one of the following:

- 'stem' Stem words using the Porter stemmer. This option supports English text only. For English text, this value is the default.
- 'lemma' Extract the dictionary form of each word. If a word is not in the internal dictionary, then the function outputs the word unchanged. For English text, the output is lowercase. For Japanese text, this value is the default.

The function only normalizes tokens with type 'letters' and 'other'. For more information on token types, see tokenDetails.

Tip For English text, to improve lemmatization of words in documents, first add part-of-speech details using the addPartOfSpeechDetails function.

Output Arguments

newDocuments — Output documents

tokenizedDocument array

Output documents, returned as a tokenizedDocument array.

newWords — Output words

string array | character vector | cell array of character vectors

Output words, returned as a string array, character vector, or cell array of character vectors. words and newWords have the same data type.

Algorithms

Language Details

tokenizedDocument objects contain details about the tokens including language details. The language details of the input documents determine the behavior of normalizeWords. The tokenizedDocument function, by default, automatically detects the language of the input text. To specify the language details manually, use the 'Language' name-value pair argument of tokenizedDocument. To view the token details, use the tokenDetails function.

Compatibility Considerations

normalizeWords skips complex tokens

Behavior changed in R2018b

Starting in R2018b, for tokenizedDocument input, normalizeWords normalizes tokens with type 'letters' or 'other' only. This behavior prevents the function from affecting complex tokens such as URLs and email-addresses.

In previous versions, normalizeWords normalizes all tokens. To reproduce this behavior, use the command newDocuments = docfun(@(str) normalizeWords(str),documents).

plus+

Append documents

Syntax

newDocuments = documents1 + documents2
newDocuments = plus(documents1,documents2)

Description

newDocuments = documents1 + documents2 appends the documents in documents2 to the documents in documents1.

newDocuments = plus(documents1, documents2) is equivalent to newDocuments = documents1 + documents2.

Examples

Append Documents

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

Create arrays containing the first 5 and second 5 sonnets.

```
documents1 = documents(1:5)
```

```
documents1 =
5x1 tokenizedDocument:
70 tokens: fairest creatures desire increase thereby beautys rose might never die
71 tokens: forty winters shall besiege thy brow dig deep trenches thy beautys field
65 tokens: look thy glass tell face thou viewest time face form another whose fresh
71 tokens: unthrifty loveliness why dost thou spend upon thy self thy beautys legad
61 tokens: hours gentle work frame lovely gaze every eye doth dwell play tyrants sa
```

documents2 = documents(6:10)

```
documents2 =
    5x1 tokenizedDocument:
```

68 tokens: let winters ragged hand deface thee thy summer ere thou distilld make su 64 tokens: lo orient gracious light lifts up burning head eye doth homage newappear 70 tokens: music hear why hearst thou music sadly sweets sweets war joy delights jo 70 tokens: fear wet widows eye thou consumst thy self single life ah thou issueless 69 tokens: shame deny thou bearst love thy self art unprovident grant thou wilt the

Append the second 5 sonnets to the first 5 sonnets.

```
newDocuments = documents1 + documents2
```

```
newDocuments =
    5x1 tokenizedDocument:
```

138 tokens: fairest creatures desire increase thereby beautys rose might never die 135 tokens: forty winters shall besiege thy brow dig deep trenches thy beautys fie 135 tokens: look thy glass tell face thou viewest time face form another whose free 141 tokens: unthrifty loveliness why dost thou spend upon thy self thy beautys lege 130 tokens: hours gentle work frame lovely gaze every eye doth dwell play tyrants

Input Arguments

documents1 — Input documents

array of tokenized documents

Input documents, specified as a tokenizedDocument array. documents1 and documents2 must be the same size.

documents2 — Input documents

array of tokenized documents

Input documents, specified as a tokenizedDocument array. documents1 and documents2 must be the same size.

Output Arguments

newDocuments — Output documents

tokenizedDocument array

Output documents, returned as a tokenizedDocument array.

predict

Predict top LDA topics of documents

Syntax

```
topicIdx = predict(ldaMdl,documents)
topicIdx = predict(ldaMdl,bag)
topicIdx = predict(ldaMdl,counts)
[topicIdx,score] = predict(___)
___ = predict(___,Name,Value)
```

Description

topicIdx = predict(ldaMdl,documents) returns the LDA topic indices with the largest probabilities for documents based on the LDA model ldaMdl.

topicIdx = predict(ldaMdl,bag) returns the LDA topic indices with the largest
probabilities for the documents represented by a bag-of-words or bag-of-n-grams model.

topicIdx = predict(ldaMdl,counts) returns the LDA topic indices with the largest
probabilities for the documents represented by a matrix of word counts.

```
[topicIdx,score] = predict(____) also returns a matrix of posterior probabilities
score.
```

____ = predict(____, Name, Value) specifies additional options using one or more
name-value pair arguments.

Examples

Predict Top LDA Topics of Documents

To reproduce the results in this example, set rng to 'default'.

rng('default')

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

Create a bag-of-words model using bagOfWords.

```
bag = bagOfWords(documents)
bag =
  bagOfWords with properties:
          Counts: [154x3092 double]
      Vocabulary: [1x3092 string]
```

Input Arguments

ldaMdl — Input LDA model

ldaModel object

Input LDA model, specified as an ldaModel object.

documents — Input documents

tokenizedDocument array | string array of words | cell array of character vectors

Input documents, specified as a tokenizedDocument array, a string array of words, or a cell array of character vectors. If documents is a tokenizedDocument, then it must be

a column vector. If **documents** is a string array or a cell array of character vectors, then it must be a row of the words of a single document.

Tip To ensure that the function does not discard useful information, you must first preprocess the input documents using the same steps used to preprocess the documents used to train the model.

bag — Input model

bagOfWords object | bagOfNgrams object

Input bag-of-words or bag-of-n-grams model, specified as a bagOfWords object or a bagOfNgrams object. If bag is a bagOfNgrams object, then the function treats the n-grams as individual words.

counts — Frequency counts of words

matrix of nonnegative integers

Frequency counts of words, specified as a matrix of nonnegative integers. If you specify 'DocumentsIn' to be 'rows', then the value counts(i,j) corresponds to the number of times the *j*th word of the vocabulary appears in the *i*th document. Otherwise, the value counts(i,j) corresponds to the number of times the *i*th word of the vocabulary appears in the *j*th document.

Name-Value Pair Arguments

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1, Value1, ..., NameN, ValueN.

Example: 'IterationLimit', 200 specifies the iteration limit to be 200.

DocumentsIn — Orientation of documents

'rows' (default) | 'columns'

Orientation of documents in the word count matrix, specified as the comma-separated pair consisting of 'DocumentsIn' and one of the following:

• 'rows' - Input is a matrix of word counts with rows corresponding to documents.

 'columns' - Input is a transposed matrix of word counts with columns corresponding to documents.

This option only applies if you specify the input documents as a matrix of word counts.

Note If you orient your word count matrix so that documents correspond to columns and specify 'DocumentsIn', 'columns', then you might experience a significant reduction in optimization-execution time.

IterationLimit — Maximum number of iterations

100 (default) | positive integer

Maximum number of iterations, specified as the comma-separated pair consisting of 'IterationLimit' and a positive integer.

Example: 'IterationLimit',200

LogLikelihoodTolerance — Relative tolerance on log-likelihood

0.0001 (default) | positive scalar

Relative tolerance on log-likelihood, specified as the comma-separated pair consisting of 'LogLikelihoodTolerance' and a positive scalar. The optimization terminates when this tolerance is reached.

Example: 'LogLikelihoodTolerance', 0.001

Output Arguments

topicIdx — Predicted topic indices

vector of numeric indices

Predicted topic indices, returned as a vector of numeric indices.

score - Predicted topic probabilities

matrix

Predicted topic probabilities, returned as a D-by-K matrix, where D is the number of input documents and K is the number of topics in the LDA model. score(i,j) is the probability that topic j appears in document i. Each row of score sums to one.

readPDFFormData

Read data from PDF forms

Syntax

```
data = readPDFFormData(filename)
data = readPDFFormData(filename, 'Password', password)
```

Description

data = readPDFFormData(filename) reads the data from a PDF form into a struct.

```
data = readPDFFormData(filename, 'Password', password) specifies the
password for opening the PDF form.
```

Examples

Read Data from PDF Form

Read the data from the form fields in weatherReportForm1.pdf using readPDFFormData. The function returns a struct containing the data from the PDF form fields.

Read Data From Multiple Forms

Read the data from the form fields in multiple files using a file datastore.

Create a file datastore for the weather reports forms. The forms are named "weatherReportFormN.pdf", where N is the number of the form. Specify the file name using the wildcard "*" to find all file names of this structure. To specify the read function to be readPDFFormData, input this function to fileDatastore using a function handle.

```
fds = fileDatastore("weatherReportForm*.pdf", 'ReadFcn',@readPDFFormData)
```

Loop over the files in the datastore and read each PDF form.

```
data = [];
while hasdata(fds)
    textData = read(fds);
    data = [data; textData];
end
data
data
data = 4x1 struct array with fields:
    event_type
    event_narrative
```

Input Arguments

filename — Name of file

string scalar | character vector

Name of the file, specified as a string scalar or character vector.

readPDFFormData supports AcroForm PDF files (interactive forms) only.

Data Types: string | char

password — Password to open PDF file

string scalar | character vector

Password to open PDF file, specified as a character vector or a string scalar.

Example: 'skroWhtaM'

Data Types: string | char

Output Arguments

data — Output struct

struct

Output struct. The fields of data correspond to the names of the form fields in the PDF. If the form field names are not valid struct field names, then the function automatically edits them to construct valid names.

readWordEmbedding

Read word embedding from file

Syntax

emb = readWordEmbedding(filename)

Description

emb = readWordEmbedding(filename) reads the pretrained word embedding stored in text file or zip file filename. The input file must be a text file with UTF-8 encoding in either the word2vec or GloVe text embedding format, or a zip file containing a text file of this format.

Examples

Read Word Embedding from Text File

Read the example word embedding. This model was derived by analyzing text from Wikipedia.

```
filename = "exampleWordEmbedding.vec";
emb = readWordEmbedding(filename)
```

```
emb =
wordEmbedding with properties:
   Dimension: 50
   Vocabulary: [1x9999 string]
```

Explore the word embedding using word2vec and vec2word.

```
king = word2vec(emb, "king");
man = word2vec(emb, "man");
```

```
woman = word2vec(emb,"woman");
word = vec2word(emb,king - man + woman)
word =
"queen"
```

Input Arguments

```
filename — Name of file
```

string scalar | character vector

Name of the file, specified as a string scalar or character vector.

Data Types: string | char

Output Arguments

emb — Output word embedding

word embedding

Output word embedding, returned as a wordEmbedding object.

regexprep

Replace text in words of documents using regular expression

Text Analytics Toolbox provides functions for common text preprocessing steps. For example, to remove punctuation and symbol characters, use erasePunctuation or to remove stem words using the Porter stemmer, use normalizeWords. For more information, see "Text Data Preparation".

Syntax

newDocuments = regexprep(documents,expression,replace)

Description

newDocuments = regexprep(documents,expression,replace) replaces all occurrences of the regular expression expression in the words of documents with the text in replace.

The function matches each word independently. The match does not have to span the whole word.

Examples

Update Text in Words

Replace words that begin with "s", end "e", and have at least one character between them. To match whole words, use "^" to match the start of a word and "\$" to match the end of the word.

```
documents = tokenizedDocument([ ...
    "an example of a short sentence"
    "a second short sentence"])
documents =
    2x1 tokenizedDocument;
```

```
6 tokens: an example of a short sentence
4 tokens: a second short sentence
expression = "^s(\w+)e$";
replace = "thing";
newDocuments = regexprep(documents,expression,replace)
newDocuments =
2x1 tokenizedDocument:
6 tokens: an example of a short thing
```

4 tokens: a second short thing

If you do not use "^" and "", then you can match substrings of the words. Replace all vowels with " ".

```
expression = "[aeiou]";
replace = "\_";
newDocuments = regexprep(documents,expression,replace)
```

```
newDocuments =
2x1 tokenizedDocument:
6 tokens: _n _x_mpl_ _f _ sh_rt s_nt_nc_
4 tokens: _ s_c_nd sh_rt s_nt_nc_
```

Include Captured Tokens in Word Replacement

Replace variations of the word "walk" by capturing the letters that follow "walk".

```
documents = tokenizedDocument([
    "I walk"
    "they walked"
    "we are walking"])
documents =
    3x1 tokenizedDocument:
    2 tokens: I walk
```

```
2 tokens: they walked
3 tokens: we are walking
expression = "walk(\w*)";
replace = "ascend$1";
newDocuments = regexprep(documents,expression,replace)
newDocuments =
3x1 tokenizedDocument:
2 tokens: I ascend
2 tokens: I ascend
3 tokens: we are ascending
```

Input Arguments

documents — Input documents

tokenizedDocument array

Input documents, specified as a tokenizedDocument array.

expression — Regular expression

character vector | cell array of character vectors | string array

Regular expression, specified as a character vector, a cell array of character vectors, or a string array. Each expression can contain characters, metacharacters, operators, tokens, and flags that specify patterns to match in str.

The following tables describe the elements of regular expressions.

Metacharacters

Metacharacters represent letters, letter ranges, digits, and space characters. Use them to construct a generalized pattern of characters.

Metacharacter	Description	Example
	Any single character, including white space	'ain' matches sequences of five consecutive characters that end with 'ain'.
[c ₁ c ₂ c ₃]	Any character contained within the square brackets. The following characters are treated literally: \$. * + ? and - when not used to indicate a range.	'[rp.]ain' matches 'rain' or 'pain' or '.ain'.
[^c ₁ c ₂ c ₃]	Any character not contained within the square brackets. The following characters are treated literally: \$. * + ? and - when not used to indicate a range.	<pre>'[^*rp]ain' matches all four-letter sequences that end in 'ain', except 'rain' and 'pain' and '*ain'. For example, it matches 'gain', 'lain', or 'vain'.</pre>
[c ₁ -c ₂]	Any character in the range of c_1 through c_2	'[A-G]' matches a single character in the range of A through G.
\w	Any alphabetic, numeric, or underscore character. For English character sets, w is equivalent to $[a-zA-Z_0-9]$	'\w*' identifies a word.
ΥW	Any character that is not alphabetic, numeric, or underscore. For English character sets, W is equivalent to $[^a-zA-Z_0-9]$	'\W*' identifies a term that is not a word.
\s	Any white-space character; equivalent to [\f\n\r\t\v]	'\w*n\s' matches words that end with the letter n, followed by a white-space character.
\S	Any non-white-space character; equivalent to [^ \f\n\r\t\v]	'\d\S' matches a numeric digit followed by any non-white-space character.
\d	Any numeric digit; equivalent to [0-9]	'\d*' matches any number of consecutive digits.
\D	Any nondigit character; equivalent to $[^0-9]$	'\w*\D\>' matches words that do not end with a numeric digit.
$ON or O{N}$	Character of octal value N	$\oldsymbol{0}$ 'matches the space character, defined by octal 40.

Metacharacter	Description	Example
$xN $ or $x{N}$	Character of hexadecimal value N	'\x2C' matches the comma character, defined by hex 2C.

Character Representation

Operator	Description
\a	Alarm (beep)
\b	Backspace
\f	Form feed
\n	New line
\r	Carriage return
\t	Horizontal tab
١v	Vertical tab
\char	Any character with special meaning in regular expressions that you want to match literally (for example, use \\ to match a single backslash)

Quantifiers

Quantifiers specify the number of times a pattern must occur in the matching text.

Quantifier	Matches the expression when it occurs	Example
expr*	0 or more times consecutively.	'\w*' matches a word of any length.
expr?	0 times or 1 time.	'\w*(\.m)?' matches words that optionally end with the extension .m.
expr+	1 or more times consecutively.	<pre>'' matches an HTML tag when the file name contains one or more characters.</pre>
expr{m,n}	At least m times, but no more than n times consecutively. {0,1} is equivalent to ?.	'\S{4,8}' matches between four and eight non-white-space characters.

Quantifier	Matches the expression when it occurs	Example
expr{m,}	At least m times consecutively. {0,} and {1,} are equivalent to * and +, respectively.	<pre>'' matches an <a> HTML tag when the file name contains one or more characters.</pre>
expr{n}	Exactly n times consecutively. Equivalent to {n,n}.	'\d{4}' matches four consecutive digits.

Quantifiers can appear in three modes, described in the following table. q represents any of the quantifiers in the previous table.

Mode	Description	Example
exprq	Greedy expression: match as many characters as possible.	<pre>Given the text 'text', the expression '<!--?t.*-->' matches all characters between : 'text'</pre>
exprq?	Lazy expression: match as few characters as necessary.	Given the text'text', the expression ' ?t.*? ' ends each match at the first occurrence of the closing angle bracket (>): '' '' '' ''
exprq+	Possessive expression: match as much as possible, but do not rescan any portions of the text.	Given the text'text', the expression ' ?t.*+ ' does not return any matches, because the closing angle bracket is captured using .*, and is not rescanned.

Grouping Operators

Grouping operators allow you to capture tokens, apply one operator to multiple elements, or disable backtracking in a specific group.

Grouping Operator	Description	Example
(expr)	Group elements of the expression and capture tokens.	'Joh?n\s(\w*)' captures a token that contains the last name of any person with the first name John or Jon.
(?:expr)	Group, but do not capture tokens.	<pre>'(?:[aeiou][^aeiou]){2}' matches two consecutive patterns of a vowel followed by a nonvowel, such as 'anon'. Without grouping, '[aeiou][^aeiou] {2}' matches a vowel followed by two nonvowels.</pre>
(?>expr)	Group atomically. Do not backtrack within the group to complete the match, and do not capture tokens.	'A(?>.*)Z' does not match 'AtoZ', although 'A(?:.*)Z' does. Using the atomic group, Z is captured using .* and is not rescanned.
(expr1 expr2)	Match expression exprl or expression expr2. If there is a match with expr1, then expr2 is ignored. You can include ?: or ?> after the	'(let tel)\w+' matches words that start with let or tel.
	opening parenthesis to suppress tokens or group atomically.	

Anchors

Anchors in the expression match the beginning or end of the input text or word.

Anchor	Matches the	Example
^expr	Beginning of the input text.	$^{\circ}M\w^{*}$ matches a word starting with M at the beginning of the text.
expr\$	End of the input text.	'\w*m\$' matches words ending with m at the end of the text.
\ <expr< td=""><td>Beginning of a word.</td><td>$^{\prime} < n \\ w^{\prime}$ matches any words starting with n.</td></expr<>	Beginning of a word.	$^{\prime} < n \\ w^{\prime}$ matches any words starting with n.

Anchor	Matches the	Example
expr\>	End of a word.	'\w*e\>' matches any words ending with e.

Lookaround Assertions

Lookaround assertions look for patterns that immediately precede or follow the intended match, but are not part of the match.

The pointer remains at the current location, and characters that correspond to the test expression are not captured or discarded. Therefore, lookahead assertions can match overlapping character groups.

Lookaround Assertion	Description	Example
expr(?=test)	Look ahead for characters that match test.	<pre>'\w*(?=ing)' matches terms that are followed by ing, such as 'Fly' and 'fall' in the input text 'Flying, not falling.'</pre>
expr(?!test)	Look ahead for characters that do not match test.	<pre>'i(?!ng)' matches instances of the letter i that are not followed by ng.</pre>
(?<=test)expr	Look behind for characters that match test.	<pre>'(?<=re)\w*' matches terms that follow 're', such as 'new', 'use', and 'cycle' in the input text 'renew, reuse, recycle'</pre>
(? test)expr</td <td>Look behind for characters that do not match test.</td> <td>'(?<!--\d)(\d)(?!\d)' matches<br-->single-digit numbers (digits that do not precede or follow other digits).</td>	Look behind for characters that do not match test.	'(? \d)(\d)(?!\d)' matches<br single-digit numbers (digits that do not precede or follow other digits).

If you specify a lookahead assertion *before* an expression, the operation is equivalent to a logical AND.

Operation	Description	Example
(?=test)expr	Match both test and expr.	<pre>'(?=[a-z])[^aeiou]' matches consonants.</pre>
(?!test)expr	Match expr and do not match test.	'(?![aeiou])[a-z]' matches consonants.

Logical and Conditional Operators

Logical and conditional operators allow you to test the state of a given condition, and then use the outcome to determine which pattern, if any, to match next. These operators support logical OR, and if or if/else conditions.

Conditions can be tokens, lookaround operators, or dynamic expressions of the form (? @cmd). Dynamic expressions must return a logical or numeric value.

Conditional Operator	Description	Example
expr1 expr2	Match expression expr1 or expression expr2. If there is a match with expr1, then expr2 is ignored.	'(let tel)\w+' matches words that start with let or tel.
(?(cond)expr)	If condition cond is true, then match expr.	'(?(?@ispc)[A-Z]:\\)' matches a drive name, such as C: when run on a Windows® system.
(?(cond)expr1 expr2)	If condition cond is true, then match expr1. Otherwise, match expr2.	<pre>'Mr(s?)*?(?(1)her his) \w*' matches text that includes her when the text begins with Mrs, or that includes his when the text begins with Mr.</pre>

Token Operators

Tokens are portions of the matched text that you define by enclosing part of the regular expression in parentheses. You can refer to a token by its sequence in the text (an ordinal token), or assign names to tokens for easier code maintenance and readable output.

Ordinal Token Operator	Description	Example
(expr)	Capture in a token the characters that match the enclosed expression.	'Joh?n\s(\w*)' captures a token that contains the last name of any person with the first name John or Jon.

Ordinal Token Operator	Description	Example
\N	Match the Nth token.	<pre>'<(\w+).*>.*<!--\1-->' captures tokens for HTML tags, such as 'title' from the text '<title>Some text</title>'.</pre>
(?(N)expr1 expr2)	If the Nth token is found, then match expr1. Otherwise, match expr2.	<pre>'Mr(s?)*?(?(1)her his) \w*' matches text that includes her when the text begins with Mrs, or that includes his when the text begins with Mr.</pre>

Named Token Operator	Description	Example
(? <name>expr)</name>	Capture in a named token the characters that match the enclosed expression.	<pre>'(?<month>\d+)-(?<day>\d+)- (?<yr>\d+)' creates named tokens for the month, day, and year in an input date of the form mm-dd- yy.</yr></day></month></pre>
\k <name></name>	Match the token referred to by name.	<pre>'<(?<tag>\w+).*>.*<!-- \k<tag-->>' captures tokens for HTML tags, such as 'title' from the text '<title>Some text</title>'.</tag></pre>
(?(name)expr1 expr2)	If the named token is found, then match expr1. Otherwise, match expr2.	<pre>'Mr(?<sex>s?)*?(? (sex)her his) \w*' matches text that includes her when the text begins with Mrs, or that includes his when the text begins with Mr.</sex></pre>

Note If an expression has nested parentheses, MATLAB[®] captures tokens that correspond to the outermost set of parentheses. For example, given the search pattern '(and(y|rew))', MATLAB creates a token for 'andrew' but not for 'y' or 'rew'.

Dynamic Regular Expressions

Dynamic expressions allow you to execute a MATLAB command or a regular expression to determine the text to match.

Operator	Description	Example
(??expr)	Parse expr and include the resulting term in the match expression. When parsed, expr must correspond to a complete, valid regular expression. Dynamic expressions that use the backslash escape character (\) require two backslashes: one for the initial parsing of expr, and one for the complete match.	<pre>'^(\d+)((??\\w{\$1}))' determines how many characters to match by reading a digit at the beginning of the match. The dynamic expression is enclosed in a second set of parentheses so that the resulting match is captured in a token. For instance, matching '5XXXXX' captures tokens for '5' and 'XXXXX'.</pre>
(??@cmd)	Execute the MATLAB command represented by cmd, and include the output returned by the command in the match expression.	<pre>'(.{2,}).?(??@fliplr(\$1))' finds palindromes that are at least four characters long, such as 'abba'.</pre>
(?@cmd)	Execute the MATLAB command represented by cmd, but discard any output the command returns. (Helpful for diagnosing regular expressions.)	<pre>'\w*?(\w)(?@disp(\$1))\1\w*' matches words that include double letters (such as pp), and displays intermediate results.</pre>

The parentheses that enclose dynamic expressions do *not* create a capturing group.

Within dynamic expressions, use the following operators to define replacement text.

Replacement Operator	Description
\$& or \$0	Portion of the input text that is currently a match
\$`	Portion of the input text that precedes the current match
\$ '	Portion of the input text that follows the current match (use $''$ to represent $''$)
\$N	Nth token
\$ <name></name>	Named token
\${cmd}	Output returned when MATLAB executes the command, cmd

Comments

Characters	Description	Example
(?#comment)	Insert a comment in the regular expression. The comment text is ignored when matching the input.	<pre>'(?# Initial digit)\<\d\w+' includes a comment, and matches words that begin with a number.</pre>

Search Flags

Search flags modify the behavior for matching expressions. An alternative to using a search flag within an expression is to pass an **option** input argument.

Flag	Description
(?-i)	Match letter case (default for regexp and regexprep).
(?i)	Do not match letter case (default for regexpi).
(?s)	Match dot (.) in the pattern with any character (default).
(?-s)	Match dot in the pattern with any character that is not a newline character.
(?-m)	Match the ^ and \$ metacharacters at the beginning and end of text (default).
(?m)	Match the ^ and \$ metacharacters at the beginning and end of a line.
(?-x)	Include space characters and comments when matching (default).
(?x)	Ignore space characters and comments when matching. Use '\ ' and '\#' to match space and # characters.

The expression that the flag modifies can appear either after the parentheses, such as

(?i)\w*

or inside the parentheses and separated from the flag with a colon (:), such as

(?i:\w*)

The latter syntax allows you to change the behavior for part of a larger expression.

Data Types: char | cell | string

replace — Replacement text

character vector | cell array of character vectors | string array

Replacement text, specified as a character vector, a cell array of character vectors, or a string array, as follows:

- If replace is a single character vector and expression is a cell array of character vectors, then regexprep uses the same replacement text for each expression.
- If replace is a cell array of N character vectors and expression is a single character vector, then regexprep attempts N matches and replacements.
- If both replace and expression are cell arrays of character vectors, then they must contain the same number of elements. regexprep pairs each replace element with its corresponding element in expression.

The replacement text can include regular characters, special characters (such as tabs or new lines), or replacement operators, as shown in the following tables.

Replacement Operator	Description
\$& or \$0	Portion of the input text that is currently a match
\$`	Portion of the input text that precedes the current match
\$ '	Portion of the input text that follows the current match (use $''$ to represent $''$)
\$N	Nth token
\$ <name></name>	Named token
\${cmd}	Output returned when MATLAB executes the command, cmd

Operator	Description
\a	Alarm (beep)
\b	Backspace
\f	Form feed
\n	New line
\r	Carriage return
\t	Horizontal tab
١v	Vertical tab
\char	Any character with special meaning in regular expressions that you want to match literally (for example, use $\ \ backslash$)

Data Types: char | cell | string

Output Arguments

newDocuments — Output documents

tokenizedDocument array

Output documents, returned as a tokenizedDocument array.

Tips

• Text Analytics Toolbox provides functions for common text preprocessing steps. For example, to remove punctuation and symbol characters, use erasePunctuation or to remove stem words using the Porter stemmer, use normalizeWords. For more information, see "Text Data Preparation".

Introduced in R2017b

removeDocument

Remove documents from bag-of-words or bag-of-n-grams model

Syntax

```
newBag = removeDocument(bag,idx)
```

Description

newBag = removeDocument(bag,idx) removes the documents with indices specified by idx from the bag-of-words or bag-of-n-grams model bag. If the removed documents contain words or n-grams that do not appear in the remaining documents, then the function also removes these words or n-grams from bag.

Examples

Remove Documents from Bag-of-Words Model

Remove selected documents from a bag-of-words model.

```
documents = tokenizedDocument([ ...
    "an example of a short sentence"
    "a second short sentence"
    "a third example"
    "a final sentence"]);
bag = bagOfWords(documents)
bag =
    bagOfWords with properties:
        Counts: [4x9 double]
    Vocabulary: [1x9 string]
        NumWords: 9
    NumDocuments: 4
```

Remove the first and third documents from bag.

Remove the same documents using logical indices.

Input Arguments

bag — Input bag-of-words or bag-of-n-grams model

bagOfWords object | bagOfNgrams object

Input bag-of-words or bag-of-n-grams model, specified as a bagOfWords object or a bagOfNgrams object.

idx — Indices of documents to remove

vector of numeric indices | vector of logical indices

Indices of documents to remove, specified as a vector of numeric indices or a vector of logical indices.

Example: [2 4 6]
Example: [0 1 0 1 0 1]

Output Arguments

newBag — Output model

bagOfWords object | bagOfNgrams object

Output model, returned as a bagOfWords object or a bagOfNgrams object. The type of newBag is the same as the type of bag.

Introduced in R2017b

removeEmptyDocuments

Remove empty documents from tokenized document array, bag-of-words model, or bag-of-n-grams model $% \mathcal{A}_{\mathrm{res}}$

Syntax

```
newDocuments = removeEmptyDocuments(documents)
newBag = removeEmptyDocuments(bag)
[____,idx] = removeEmptyDocuments(____)
```

Description

newDocuments = removeEmptyDocuments(documents) removes documents which have no words from documents.

newBag = removeEmptyDocuments(bag) removes documents which have no words or n-grams from the bag-of-words or bag-of-n-grams model bag.

[____,idx] = removeEmptyDocuments(____) also returns the indices of the removed documents.

Examples

Remove Empty Documents from Array

Remove documents containing no words from an array of tokenized documents.

Create an array of tokenized documents which includes empty documents.

```
documents = tokenizedDocument([
    "an example of a short sentence"
    ""
    "a second short sentence"
    ""1)
```

```
documents =
  4x1 tokenizedDocument:
  6 tokens: an example of a short sentence
  0 tokens:
  4 tokens: a second short sentence
  0 tokens:
```

Remove the empty documents.

```
newDocuments = removeEmptyDocuments(documents)
```

```
newDocuments =
2x1 tokenizedDocument:
6 tokens: an example of a short sentence
4 tokens: a second short sentence
```

Remove Empty Documents from Bag-of-Words Model

Remove documents containing no words from bag-of-words model.

Create a bag-of-words model from an array of tokenized documents.

```
documents = tokenizedDocument([
    "an example of a short sentence"
    ""
    "a second short sentence"
    ""]);
bag = bagOfWords(documents)
bag =
    bagOfWords with properties:
        Counts: [4x7 double]
    Vocabulary: [1x7 string]
        NumWords: 7
    NumDocuments: 4
```

Remove the empty documents from the bag-of-words model.

```
newBag = removeEmptyDocuments(bag)
```

Remove Documents and Corresponding Labels

Remove documents containing no words from an array and use the indices of removed documents to remove the corresponding labels also.

Create an array of tokenized documents which includes empty documents.

```
documents = tokenizedDocument([
    "an example of a short sentence"
    ""
    "a second short sentence"
    ""])
documents =
    4x1 tokenizedDocument:
    6 tokens: an example of a short sentence
    0 tokens:
    4 tokens: a second short sentence
    0 tokens:
```

Create a vector of labels.

```
labels = ["T"; "F"; "F"; "T"]
labels = 4x1 string array
    "T"
    "F"
    "F"
    "F"
    "T"
```

Remove the empty documents and get the indices of the removed documents.

```
[newDocuments, idx] = removeEmptyDocuments(documents)
```

```
newDocuments =
2x1 tokenizedDocument:
6 tokens: an example of a short sentence
4 tokens: a second short sentence
idx = 2×1
2
4
```

Remove the corresponding labels from labels.

```
labels(idx) = []
labels = 2x1 string array
"T"
"F"
```

Input Arguments

documents — Input documents

tokenizedDocument array

Input documents, specified as a tokenizedDocument array.

bag — Input bag-of-words or bag-of-n-grams model

bagOfWords object | bagOfNgrams object

Input bag-of-words or bag-of-n-grams model, specified as a bagOfWords object or a bagOfNgrams object.

Output Arguments

newDocuments — Output documents

tokenizedDocument array

Output documents, returned as a tokenizedDocument array.

newBag — Output model

bagOfWords object | bagOfNgrams object

Output model, returned as a bagOfWords object or a bagOfNgrams object. The type of newBag is the same as the type of bag.

idx — Indices of removed documents

vector of positive integers

Indices of removed documents, returned as a vector of positive integers.

Introduced in R2017b

removeInfrequentNgrams

Remove infrequently seen n-grams from bag-of-n-grams model

Syntax

```
newBag = removeInfrequentNgrams(bag,count)
newBag = removeInfrequentNgrams(bag,count,'NgramLengths',lengths)
```

Description

newBag = removeInfrequentNgrams(bag,count) removes the n-grams that appear at most count times in total from the bag-of-n-grams model bag.

newBag = removeInfrequentNgrams(bag,count,'NgramLengths',lengths) only removes n-grams with lengths specified by lengths.

Examples

Remove Infrequent N-Grams from Bag-of-N-Grams Model

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

Create a bag-of-n-grams model. Specify to count bigrams (pairs of words) and trigrams (triples of words).

```
bag = bagOfNgrams(documents, 'NgramLengths', [2 3])
```

Remove n-grams of any length that appear two or fewer times in total.

```
bag = removeInfrequentNgrams(bag,2)
```

Remove bigrams that appear four or fewer times in total.

```
bag = removeInfrequentNgrams(bag,4, 'NgramLengths',2)
bag =
    bagOfNgrams with properties:
        Counts: [154x41 double]
        Vocabulary: [1x30 string]
        Ngrams: [41x3 string]
        NgramLengths: [2 3]
        NumNgrams: 41
        NumDocuments: 154
```

Input Arguments

bag — Input bag-of-n-grams model

bagOfNgrams object

Input bag-of-n-grams model, specified as a bagOfNgrams object.

count — Count threshold

positive integer

Count threshold, specified as a positive integer. The function removes the n-grams that appear count times in total or fewer.

lengths — **N-gram lengths** positive integer | vector of positive integers

N-gram lengths, specified as a positive integer or a vector of positive integers.

If you specify lengths, the function removes infrequent n-grams of the specified lengths only. If you do not specify lengths, then the function removes infrequent n-grams regardless of length.

Example: [1 2 3]

Output Arguments

newBag — Output bag-of-n-grams model

bagOfNgrams object

Output bag-of-n-grams model, returned as a bagOfNgrams object.

removeInfrequentWords

Remove words with low counts from bag-of-words model

Syntax

newBag = removeInfrequentWords(bag,count)

Description

newBag = removeInfrequentWords(bag,count) removes the words that appear at
most count times in total from the bag-of-words model bag.

Examples

Remove Infrequent Words

Remove the words that appear two times or fewer from a bag-of-words model.

Create a bag-of-words model from an array of tokenized documents.

```
documents = tokenizedDocument([
    "an example of a short sentence"
    "a second short sentence"
    "another example"
    "a short example"]);
bag = bagOfWords(documents)
bag =
    bagOfWords with properties:
        Counts: [4x8 double]
        Vocabulary: [1x8 string]
        NumWords: 8
        NumDocuments: 4
```

Remove the words that appear two times or fewer from the bag-of-words model.

Input Arguments

bag — Input bag-of-words model

bagOfWords object

Input bag-of-words model, specified as a bagOfWords object.

count - Count threshold to remove words

positive integer

Count threshold to remove words, specified as a positive integer. The function removes the words that appear count times in total or fewer.

removeLongWords

Remove long words from documents or bag-of-words model

Syntax

```
newDocuments = removeLongWords(documents,len)
newBag = removeLongWords(bag,len)
```

Description

newDocuments = removeLongWords(documents,len) removes words of length len
or greater from documents.

newBag = removeLongWords(bag,len) removes words of length len or greater from the bagOfWords object bag.

Examples

Remove Long Words from Document

Remove the words with seven or greater characters from a document.

```
document = tokenizedDocument("An example of a short sentence");
newDocument = removeLongWords(document,7)
```

```
newDocument =
  tokenizedDocument:
  4 tokens: An of a short
```

Remove Long Words from Bag-of-Words Model

Remove the words with seven or greater characters from a bag-of-words model.

```
documents = tokenizedDocument([ ...
    "an example of a short sentence"
    "a second short sentence"]);
bag = bagOfWords(documents);
newBag = removeLongWords(bag,7)
newBag =
    bagOfWords with properties:
        Counts: [2x5 double]
        Vocabulary: ["an" "of" "a" "short" "second"]
        NumWords: 5
        NumDocuments: 2
```

Input Arguments

documents — Input documents

tokenizedDocument array

Input documents, specified as a tokenizedDocument array.

bag — Input bag-of-words model

bagOfWords object

Input bag-of-words model, specified as a bagOfWords object.

len — Minimum length of words to remove

positive integer

Minimum length of words to remove, specified as a positive integer. The function removes words with len or greater characters.

Output Arguments

newDocuments — Output documents

tokenizedDocument array

Output documents, returned as a tokenizedDocument array.

newBag — Output bag-of-words model

bagOfWords object

Output bag-of-words model, returned as a bagOfWords object.

removeNgrams

Remove n-grams from bag-of-n-grams model

Syntax

```
newBag = removeNgrams(bag,ngrams)
newBag = removeNgrams(bag,idx)
```

Description

newBag = removeNgrams(bag,ngrams) removes the specified n-grams from the bagof-n-grams model bag.

newBag = removeNgrams(bag,idx) specifies n-grams by numeric or logical indices in bag.Ngrams. This syntax is the same as newBag = removeNgrams(bag,bag.Ngrams(idx,:)).

Examples

Remove N-Grams from Bag-of-N-Grams Model

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

Create bag-of-n-grams model.

```
bag = bagOfNgrams(documents)
```

View the top five n-grams.

topkngrams(bag,5)

ans <i>=5×3 tabl</i> Ngr	s=5×3 table Ngram		NgramLength
"thou"	"art"	34	2
"mine"	"eye"	15	2
"thy"	"self"	14	2
"thou"	"dost"	13	2

Remove the n-grams ["thou" "art"] and ["thou" "dost"] from the model. View the new top 5 n-grams.

```
ngrams = [...
   "thou" "art"
   "thou" "dost"];
bag = removeNgrams(bag,ngrams);
topkngrams(bag,5)
ans=5×3 table
         Ngram
                      Count
                               NgramLength
            "eye"
   "mine"
                                    2
                       15
                                   2
2
            "self"
   "thy"
                       14
   "mine"
            "own"
                      13
   "thv" "sweet"
                      12
                                   2
   "thy"
            "love"
                      11
                                   2
```

Remove N-Grams from Bag-of-N-Grams Model by Index

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

Create bag-of-n-grams model.

```
bag = bagOfNgrams(documents)
bag =
    bagOfNgrams with properties:
        Counts: [154x8799 double]
        Vocabulary: [1x3092 string]
        Ngrams: [8799x2 string]
        NgramLengths: 2
        NumNgrams: 8799
        NumDocuments: 154
```

View the first ten n-grams in the model.

bag.Ngrams(1:10,:)

```
ans = 10x2 string array
    "fairest" "creatures"
    "creatures"
                  "desire"
    "desire"
                  "increase"
    "increase"
                  "thereby"
    "thereby"
                   "beautys"
    "beautvs"
                   "rose"
    "rose"
                  "might"
    "miaht"
                  "never"
    "never"
                   "die"
    "die"
                   "riper"
```

Remove the 9th and 10th n-grams from the model. View the new list of the first ten n-grams.

```
idx = [9 \ 10];
bag = removeNgrams(bag,idx);
bag.Ngrams(1:10,:)
ans = 10x2 string array
   "fairest" "creatures"
   "creatures" "desire"
"desire" "increase"
    "increase"
                 "thereby"
    "thereby" "beautys"
    "beautys"
                  "rose"
    "rose"
                   "might"
    "might"
                  "never"
    "riper"
                 "time"
    "time"
                  "decease"
```

Input Arguments

bag — Input bag-of-n-grams model

bagOfNgrams object

Input bag-of-n-grams model, specified as a bagOfNgrams object.

ngrams — N-grams to remove

string array | character vector | cell array of character vectors

N-grams to remove, specified as a string array, character vector, or a cell array of character vectors.

If ngrams is a string array or cell array, then it has size NumNgrams-by-maxN, where NumNgrams is the number of n-grams, and maxN is the length of the largest n-gram. If ngrams is a character vector, then it represents a single word (unigram).

The value of ngrams(i,j) is the jth word of the ith n-gram. If the number of words in the ith n-gram is less than $ma \times N$, then the remaining entries of the ith row of ngrams are empty.

```
Example: ["An" ""; "An example"; "example" ""]
```

Data Types: string | char | cell

idx — Indices of n-grams to remove

vector of numeric indices | vector of logical indices

Indices of n-grams to remove, specified as a vector of numeric indices or a vector of logical indices. The indices in idx correspond to the rows of the bag.Ngrams.

Example: [1 5 10]

removeShortWords

Remove short words from documents or bag-of-words model

Syntax

```
newDocuments = removeShortWords(documents,len)
newBag = removeShortWords(bag,len)
```

Description

newDocuments = removeShortWords(documents,len) removes words of length len
or less from documents.

newBag = removeShortWords(bag,len) removes words of length len or less from the bagOfWords object bag.

Examples

Remove Short Words from Document

Remove the words with two or fewer characters from a document.

```
document = tokenizedDocument("An example of a short sentence");
newDocument = removeShortWords(document,2)
```

```
newDocument =
  tokenizedDocument:
    3 tokens: example short sentence
```

Remove Short Words from Bag-of-Words Model

Remove the words with two or fewer characters from a bag-of-words model.

```
documents = tokenizedDocument([ ...
    "an example of a short sentence"
    "a second short sentence"]);
bag = bagOfWords(documents);
newBag = removeShortWords(bag,2)
newBag =
    bagOfWords with properties:
        Counts: [2x4 double]
        Vocabulary: ["example" "short" "sentence" "second"]
        NumWords: 4
        NumDocuments: 2
```

Input Arguments

documents — Input documents

tokenizedDocument array

Input documents, specified as a tokenizedDocument array.

bag — Input bag-of-words model

bagOfWords object

Input bag-of-words model, specified as a bagOfWords object.

len — Maximum length of words to remove

positive integer

Maximum length of words to remove, specified as a positive integer. The function removes words with len or fewer characters.

Output Arguments

newDocuments — Output documents

tokenizedDocument array

Output documents, returned as a tokenizedDocument array.

newBag — Output bag-of-words model

bagOfWords object

Output bag-of-words model, returned as a bagOfWords object.

See Also

bagOfNgrams | bagOfWords | normalizeWords | removeLongWords | removeWords |
stopWords | tokenizedDocument

Topics

"Prepare Text Data for Analysis" "Create Simple Text Model for Classification"

Introduced in R2017b

removeStopWords

Remove stop words from documents

Words like "a", "and", "to", and "the" (known as stop words) can add noise to data. Use this function to remove stop words before analysis.

Syntax

newDocuments = removeStopWords(documents)

Description

newDocuments = removeStopWords(documents) removes the stop words from the tokenizedDocument array documents.

The language of the removed stop words depend on the language details of the tokens. For more information, see "Language Details" on page 1-275.

Examples

Remove Stop Words from Documents

Remove the stop words from an array of documents using removeStopWords. The tokenizedDocument function detects that the documents are in English, so removeStopWords removes English stop words.

```
documents = tokenizedDocument([
    "an example of a short sentence"
    "a second short sentence"]);
newDocuments = removeStopWords(documents)
newDocuments =
```

```
2x1 tokenizedDocument:
```

```
3 tokens: example short sentence
3 tokens: second short sentence
```

Remove Japanese Stop Words

Tokenize Japanese text using tokenizedDocument. The function automatically detects Japanese text.

```
str = [
    "ここは静かなので、とても穏やかです"
    "企業内の顧客データを利用し、今年の売り上げを調べることが出来た。"
    "私は先生です。私は英語を教えています。"];
documents = tokenizedDocument(str);
```

Remove stop words using removeStopWords. The function uses the language details from documents to determine which language stop words to remove.

```
documents = removeStopWords(documents)
```

```
documents =
3x1 tokenizedDocument:
4 tokens: 静か 、 とても 穏やか
10 tokens: 企業 顧客 データ 利用 、 今年 売り上げ 調べる 出来 。
5 tokens: 先生 。 英語 教え 。
```

Input Arguments

documents - Input documents

tokenizedDocument array

Input documents, specified as a tokenizedDocument array.

Output Arguments

newDocuments — Output documents

tokenizedDocument array

Output documents, returned as a tokenizedDocument array.

Algorithms

Language Details

tokenizedDocument objects contain details about the tokens including language details. The language details of the input documents determine the behavior of removeStopWords. The tokenizedDocument function, by default, automatically detects the language of the input text. To specify the language details manually, use the 'Language' name-value pair argument of tokenizedDocument. To view the token details, use the tokenDetails function.

removeWords

Remove selected words from documents or bag-of-words model

Syntax

```
newDocuments = removeWords(documents,words)
newDocuments = removeWords(documents,idx)
```

```
newBag = removeWords(bag,words)
newBag = removeWords(bag,idx)
```

Description

newDocuments = removeWords(documents,words) removes the specified words
from documents.

```
newDocuments = removeWords(documents,idx) removes words by specifying the
numeric or logical indices idx of the words in documents.Vocabulary. This syntax is
the same as newDocuments =
removeWords(documents,documents.Vocabulary(idx)).
```

newBag = removeWords(bag,words) removes the specified words from the bag-ofwords model bag.

newBag = removeWords(bag,idx) removes words by specifying the numeric or logical indices idx of the words in bag.Vocabulary. This syntax is the same as newBag = removeWords(bag,bag.Vocabulary(idx)).

Examples

Remove Words from Documents

Remove words from an array of documents by inputting a string array of words to removeWords.

Create an array of tokenized documents.

```
documents = tokenizedDocument([
    "an example of a short sentence"
    "a second short sentence"]);
```

Remove the words "short" and "second".

```
words = ["short" "second"];
newDocuments = removeWords(documents,words)
newDocuments =
2x1 tokenizedDocument:
5 tokens: an example of a sentence
2 tokens: a sentence
```

Remove Words from Documents by Index

Remove words from documents by inputting a vector of numeric indices to removeWords.

Create an array of tokenized documents.

```
documents = tokenizedDocument([
    "I love MATLAB"
    "I love MathWorks"])

documents =
    2x1 tokenizedDocument:
    3 tokens: I love MATLAB
    3 tokens: I love MathWorks
```

View the vocabulary of documents.

```
documents.Vocabulary
```

```
ans = 1x4 string array
"I" "love" "MATLAB" "MathWorks"
```

Remove the first and third words of the vocabulary from the documents by specifying the numeric indices [1 3].

```
idx = [1 3];
newDocuments = removeWords(documents,idx)
newDocuments =
2x1 tokenizedDocument:
1 tokens: love
2 tokens: love MathWorks
```

Alternatively, you can specify logical indices.

```
idx = logical([1 0 1 0]);
newDocuments = removeWords(documents,idx)
```

```
newDocuments =
   2x1 tokenizedDocument:
   1 tokens: love
   2 tokens: love MathWorks
```

Remove Stop Words from Bag-of-Words Model

Remove the stop words from a bag-of-words model by inputting a list of stop words to removeWords. Stop words are words such as "a", "the", and "in" which are commonly removed from text before analysis.

```
documents = tokenizedDocument([
    "an example of a short sentence"
    "a second short sentence"]);
bag = bagOfWords(documents);
newBag = removeWords(bag,stopWords)
newBag =
    bagOfWords with properties:
        Counts: [2x4 double]
        Vocabulary: ["example" "short" "sentence" "second"]
```

NumWords: 4 NumDocuments: 2

Remove Words from Bag-of-Words Model by Index

Remove words from a bag-of-words model by inputting a vector of numeric indices to removeWords.

Create an array of tokenized documents.

```
documents = tokenizedDocument([
    "I love MATLAB"
    "I love MathWorks"]);
bag = bagOfWords(documents)
bag =
    bagOfWords with properties:
        Counts: [2x4 double]
        Vocabulary: ["I" "love" "MATLAB" "MathWorks"]
        NumWords: 4
        NumDocuments: 2
```

View the vocabulary of bag.

bag.Vocabulary

```
ans = 1x4 string array
"I" "love" "MATLAB" "MathWorks"
```

Remove the first and third words of the vocabulary from the bag-of-words model by specifying the numeric indices [1 3].

```
idx = [1 3];
newBag = removeWords(bag,idx)
newBag =
bagOfWords with properties:
```

```
Counts: [2x2 double]
Vocabulary: ["love" "MathWorks"]
NumWords: 2
NumDocuments: 2
```

Alternatively, you can specify logical indices.

Input Arguments

documents — Input documents

tokenizedDocument array

Input documents, specified as a tokenizedDocument array.

bag — Input bag-of-words model

bagOfWords object

Input bag-of-words model, specified as a bagOfWords object.

words - Words to remove

string vector | character vector | cell array of character vectors

Words to remove, specified as a string vector, character vector, or cell array of character vectors. If you specify words as a character vector, then the function treats it as a single word.

```
Data Types: string | char | cell
```

idx — Indices of words in vocabulary to remove

vector of numeric indices | vector of logical indices

Indices of words to remove, specified as a vector of numeric indices or a vector of logical indices. The indices in idx correspond to the locations of the words in the Vocabulary property of the input documents or bag-of-words model.

Example: [1 5 10]

Output Arguments

newDocuments — Output documents

tokenizedDocument array

Output documents, returned as a tokenizedDocument array.

newBag — Output bag-of-words model

bag0fWords object

Output bag-of-words model, returned as a bagOfWords object.

replace

Find and replace substrings in documents

Syntax

```
newDocuments = replace(documents,old,new)
```

Description

newDocuments = replace(documents,old,new) replaces all occurrences of old in documents with new.

Examples

Replace Substrings in Documents

Replace words in a document array.

```
documents = tokenizedDocument([
    "an extreme example"
    "another extreme example"])
```

documents =
 2x1 tokenizedDocument:
 3 tokens: an extreme example

3 tokens: another extreme example

newDocuments = replace(documents, "example", "sentence")

```
newDocuments =
2x1 tokenizedDocument:
3 tokens: an extreme sentence
```

3 tokens: another extreme sentence

Replace substrings of the words.

```
newDocuments = replace(documents,"ex","X-")
newDocuments =
    2x1 tokenizedDocument:
    3 tokens: an X-treme X-ample
    3 tokens: another X-treme X-ample
```

Input Arguments

documents — Input documents

tokenizedDocument array

Input documents, specified as a tokenizedDocument array.

old — Substring to replace

string array | character vector | cell array of character vectors

Substring to replace, specified as a string array, character vector, or cell array of character vectors.

Data Types: string | char | cell

new — New substring

string array | character vector | cell array of character vectors

New substring, specified as a string array, character vector, or cell array of character vectors.

Data Types: string | char | cell

Output Arguments

newDocuments — Output documents

tokenizedDocument array

Output documents, returned as a tokenizedDocument array.

Introduced in R2017b
resume

Resume fitting LDA model

Syntax

updatedMdl =	resume(ldaMdl,bag)
updatedMdl =	resume(ldaMdl,counts)
updatedMdl =	<pre>resume(, Name, Value)</pre>

Description

updatedMdl = resume(ldaMdl,bag) returns an updated LDA model by training for more iterations on the bag-of-words or bag-of-n-grams model bag. The input bag must be the same model used to fit ldaMdl.

updatedMdl = resume(ldaMdl,counts) returns an updated LDA model by training for more iterations on the documents represented by the matrix of word counts counts. The input counts must be the same matrix used to fit ldaMdl.

updatedMdl = resume(____, Name, Value) specifies additional options using one or more name-value pair arguments.

Examples

Resume Fitting of LDA Model

To reproduce the results in this example, set rng to 'default'.

```
rng('default')
```

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

Create a bag-of-words model using bag0fWords.

bag = bagOfWords(documents)

```
bag =
   bagOfWords with properties:
        Counts: [154x3092 double]
   Vocabulary: [1x3092 string]
        NumWords: 3092
```

NumDocuments: 154

Fit an LDA model with four topics. The resume function does not support the default solver for fitlda. Set the LDA solver to be collapsed variational Bayes, zeroth order.

```
numTopics = 4;
mdl = fitlda(bag,numTopics,'Solver','cvb0')
```

Iteration 	Time per iteration (seconds)	Relative change in log(L)	Training perplexity 	Topic concentration 	Topic concentration iterations

		History: [1x1 struct]
```

Input Arguments

ldaMdl — Input LDA model

ldaModel object

Input LDA model, specified as an ldaModel object. To resume fitting a model, you must fit ldaMdl with solver 'savb', 'avb', or 'cvb0'.

bag — Input model

bagOfWords object | bagOfNgrams object

Input bag-of-words or bag-of-n-grams model, specified as a bagOfWords object or a bagOfNgrams object. If bag is a bagOfNgrams object, then the function treats the n-grams as individual words.

counts — Frequency counts of words

matrix of nonnegative integers

Frequency counts of words, specified as a matrix of nonnegative integers. If you specify 'DocumentsIn' to be 'rows', then the value counts(i,j) corresponds to the number of times the *j*th word of the vocabulary appears in the *i*th document. Otherwise, the value

counts(i,j) corresponds to the number of times the *i*th word of the vocabulary appears in the *j*th document.

Note The arguments bag and counts must be the same used to fit ldaMdl.

Name-Value Pair Arguments

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1, Value1, ..., NameN, ValueN.

Example: 'LogLikelihoodTolerance', 0.001 specifies a log-likelihood tolerance of 0.001.

Solver Options

DocumentsIn — Orientation of documents

'rows' (default) | 'columns'

Orientation of documents in the word count matrix, specified as the comma-separated pair consisting of 'DocumentsIn' and one of the following:

- 'rows' Input is a matrix of word counts with rows corresponding to documents.
- 'columns' Input is a transposed matrix of word counts with columns corresponding to documents.

This option only applies if you specify the input documents as a matrix of word counts.

Note If you orient your word count matrix so that documents correspond to columns and specify 'DocumentsIn', 'columns', then you might experience a significant reduction in optimization-execution time.

FitTopicConcentration — Option for fitting topic concentration parameter true | false

Option for fitting topic concentration, specified as the comma-separated pair consisting of 'FitTopicConcentration' and either true or false.

The default value is the value used to fit ldaMdl.

Example: 'FitTopicConcentration',true Data Types: logical

FitTopicProbabilities — Option for fitting topic probabilities

true|false

Option for fitting topic concentration, specified as the comma-separated pair consisting of 'FitTopicConcentration' and either true or false.

The default value is the value used to fit ldaMdl.

The function fits the Dirichlet prior $\alpha = \alpha_0 (p_1 \quad p_2 \quad \cdots \quad p_K)$ on the topic mixtures,

where α_0 is the topic concentration and p_1, \ldots, p_K are the corpus topic probabilities which sum to 1.

Example: 'FitTopicProbabilities',true

Data Types: logical

LogLikelihoodTolerance — Relative tolerance on log-likelihood

0.0001 (default) | positive scalar

Relative tolerance on log-likelihood, specified as the comma-separated pair consisting of 'LogLikelihoodTolerance' and a positive scalar. The optimization terminates when this tolerance is reached.

Example: 'LogLikelihoodTolerance',0.001

Batch Solver Options

IterationLimit — Maximum number of iterations

100 (default) | positive integer

Maximum number of iterations, specified as the comma-separated pair consisting of 'IterationLimit' and a positive integer.

This option supports models fitted with batch solvers only ('cgs', 'avb', and 'cvb0').

```
Example: 'IterationLimit',200
```

Stochastic Solver Options

DataPassLimit — Maximum number of passes through data

1 (default) | positive integer

Maximum number of passes through the data, specified as the comma-separated pair consisting of 'DataPassLimit' and a positive integer.

If you specify 'DataPassLimit' but not 'MiniBatchLimit', then the default value of 'MiniBatchLimit' is ignored. If you specify both 'DataPassLimit' and 'MiniBatchLimit', then resume uses the argument that results in processing the fewest observations.

This option supports models fitted with stochastic solvers only ('savb').

Example: 'DataPassLimit',2

MiniBatchLimit — Maximum number of mini-batch passes

positive integer

Maximum number of mini-batch passes, specified as the comma-separated pair consisting of 'MiniBatchLimit' and a positive integer.

If you specify 'MiniBatchLimit' but not 'DataPassLimit', then resume ignores the default value of 'DataPassLimit'. If you specify both 'MiniBatchLimit' and 'DataPassLimit', then resume uses the argument that results in processing the fewest observations. The default value is ceil(numDocuments/MiniBatchSize), where numDocuments is the number of input documents.

This option supports models fitted with stochastic solvers only ('savb').

Example: 'MiniBatchLimit', 200

MiniBatchSize — Mini-batch size

1000 (default) | positive integer

Mini-batch size, specified as the comma-separated pair consisting of 'MiniBatchLimit' and a positive integer. The function processes MiniBatchSize documents in each iteration.

This option supports models fitted with stochastic solvers only ('savb').

```
Example: 'MiniBatchSize',512
```

Display Options

ValidationData — Validation data

[] (default) | bagOfWords object | bagOfNgrams object | sparse matrix of word counts

Validation data to monitor optimization convergence, specified as the comma-separated pair consisting of 'ValidationData' and a bagOfWords object, a bagOfNgrams object, or a sparse matrix of word counts. If the validation data is a matrix, then the data must have the same orientation and the same number of words as the input documents.

Verbose - Verbosity level

1 (default) | 0

Verbosity level, specified as the comma-separated pair consisting of 'Verbose' and one of the following:

- 0 Do not display verbose output.
- 1 Display progress information.

Example: 'Verbose',0

Output Arguments

updatedMdl — Updated LDA model

ldaModel object (default)

Updated LDA model, returned as an ldaModel object.

wordcloud

Topics

"Analyze Text Data Using Topic Models" "Choose Number of Topics for LDA Model" "Compare LDA Solvers" "Analyze Text Data Using Multiword Phrases" "Classify Text Data Using Deep Learning" Introduced in R2017b

splitSentences

Split text into sentences

Syntax

```
newStr = splitSentences(str)
```

Description

newStr = splitSentences(str) splits str into an array of sentences.

Examples

Split Text into Sentences

Read the text from the example file sonnets.txt and split it into sentences.

```
filename = "sonnets.txt";
str = extractFileText(filename);
sentences = splitSentences(str);
```

View the first few sentences.

```
sentences(1:10)
```

```
ans = 10x1 string array
"THE SONNETS"
"by William Shakespeare"
"I"
"From fairest creatures we desire increase,..."
"II"
"When forty winters shall besiege thy brow,..."
"How much more praise deserv'd thy beauty's use,..."
"This were to be new made when thou art old,..."
"III"
```

"Look in thy glass and tell the face thou viewest..."

Input Arguments

str – Input text

string scalar | character vector | scalar cell array containing a character vector

Input text, specified as a string scalar, a character vector, or a scalar cell array containing a character vector.

Data Types: string | char | cell

Output Arguments

newStr — Output text

string array | character vector | cell array of character vectors

Output text, returned as a string array, a character vector, or cell array of character vectors. str and newStr have the same data type.

Algorithms

If emoticons or emoji characters appear after a terminating punctuation character, then the function splits the sentence after the emoticons and emoji.

stopWords

List of stop words

Syntax

```
words = stopWords
words = stopWords('Language', language)
```

Description

words = stopWords returns a string array of common English words which can be removed from documents before analysis.

```
words = stopWords('Language', language) specifies the stop word language.
```

Tip To remove stop words from tokenized documents, use removeStopWords.

Examples

Remove Stop Words from Bag-of-Words Model

Remove the stop words from a bag-of-words model by inputting a list of stop words to removeWords. Stop words are words such as "a", "the", and "in" which are commonly removed from text before analysis.

```
documents = tokenizedDocument([
    "an example of a short sentence"
    "a second short sentence"]);
bag = bagOfWords(documents);
newBag = removeWords(bag,stopWords)
newBag =
    bagOfWords with properties:
```

```
Counts: [2x4 double]
Vocabulary: ["example" "short" "sentence" "second"]
NumWords: 4
NumDocuments: 2
```

Input Arguments

language — Stop word language

'en' (default) | 'ja'

Stop word language, specified as one of the following:

- 'en' English
- 'ja' Japanese

For more information about language support in Text Analytics Toolbox, see "Language Support".

Definitions

Language Considerations

The removeStopWords function removes English and Japanese stop words only.

To remove stop words from other languages, use removeWords and specify your own stop words to remove.

string

Convert scalar document to string vector

Syntax

```
words = string(document)
```

Description

words = string(document) converts a scalar tokenizedDocument to a string array
of words.

Examples

Convert Document to String

Convert a scalar tokenized document to a string array of words.

document = tokenizedDocument("an example of a short sentence")

```
document =
  tokenizedDocument:
   6 tokens: an example of a short sentence
```

words = string(document)

```
words = 1x6 string array
"an" "example" "of" "a" "short" "sentence"
```

Input Arguments

document — Input document

scalar tokenizedDocument

Input document, specified as a scalar tokenizedDocument object.

Output Arguments

words — Output words string vector

Output words, returned as a string vector.

textscatter

2-D scatter plot of text

Syntax

```
ts = textscatter(x,y,str)
ts = textscatter(xy,str)
ts = textscatter(ax, ____)
ts = textscatter(____,Name,Value)
```

Description

ts = textscatter(x,y,str) creates a text scatter plot with elements of str at the locations specified by the vectors x and y, and returns the resulting TextScatter object.

ts = textscatter(xy,str) uses locations specified by the rows of xy. This syntax is
equivalent to textscatter(xy(:,1),xy(:,2),str).

ts = textscatter(ax, ____) plots into axes ax. You can use any input arguments
from previous syntaxes.

ts = textscatter(____, Name, Value) specifies additional TextScatter properties
using one or more name-value pair arguments.

Examples

Create Text Scatter Plot

Plot a string array of numbers at random points on a text scatter plot.

```
x = rand(50,1);
y = rand(50,1);
str = string(1:50);
```

figure
textscatter(x,y,str);

Alternatively, you can pass the coordinates x and y as a matrix xy, where x and y are the columns of xy.

xy = [x y]; figure textscatter(xy,str)

Specify Word Colors

Create text scatter plot of a word embedding and specify word colors.

Load a pretrained word embedding using fastTextWordEmbedding. This function requires Text Analytics Toolbox[™] Model for fastText English 16 Billion Token Word Embedding support package. If this support package is not installed, then the function provides a download link.

```
emb = fastTextWordEmbedding
```

```
emb =
    wordEmbedding with properties:
```

```
Dimension: 300
Vocabulary: [1×1000000 string]
```

Convert the first 500 words to vectors using word2vec. V is a matrix of word vectors of length 300.

```
words = emb.Vocabulary(1:500);
V = word2vec(emb,words);
size(V)
ans = 1×2
500 300
```

Embed the word vectors in two-dimensional space using tsne.

XY = tsne(V);

Plot the words at the coordinates specified by XY in a 2-D text scatter plot. Specify the word colors to be random.

```
numWords = numel(words);
colorData = rand(numWords,3);
figure
textscatter(XY,words,'ColorData',colorData)
title("Word Embedding t-SNE Plot")
```

Input Arguments

x — x values

vector

x values, specified as a vector. x, y, and str must be of equal length.

Example: [1 2 3]

y — y values vector y values, specified as a vector. x, y, and str must be of equal length.

Example: [1 2 3]

xy – x and y values

matrix

x and y values, specified as a matrix with two columns. xy(i,1) and xy(i,2) correspond to the x and y values of the *i*th element of str, respectively. xy must have the numel(str) rows.

textscatter(xy,str) is equivalent to textscatter(xy(:,1),xy(:,2),str).

Example: [1 2 3]

str — Input text

string vector | cell array of character vectors

Input text, specified as a string array or cell array of character vectors. x, y, and str must be of equal length.

Example: ["one" "two" "three"]

Data Types: string | cell

ax — Axes object

axes object

Axes object. If you do not specify an axes object, then the function uses the current axes.

Name-Value Pair Arguments

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1, Value1, ..., NameN, ValueN.

Example: 'Marker', '*' specifies the markers to be asterisks.

The TextScatter object properties listed here are only a subset. For a complete list, see TextScatter Properties.

TextDensityPercentage — Percentage of text data to show

60 (default) | scalar from 0 through 100

Percentage of text data to show, specified as a scalar from 0 through 100. To show all text, set TextDensityPercentage to 100. To show no text, set TextDensityPercentage to 0.

If you set TextDensityPercentage to 100, then the software does not plot markers.

Example: 70

MaxTextLength — Maximum length of text labels

40 (default) | positive integer

Maximum length of text labels, specified as a positive integer. The software truncates the text labels to this length and adds ellipses at the point of truncation.

Example: 10

MarkerColor — Marker colors

'auto' (default) | 'none' | RGB triplet

Marker colors, specified as one of these values:

- 'auto' For each marker, use the same color as the corresponding text labels.
- 'none' Do not show markers.
- RGB triplet Use the same color for all the markers in the plot. An RGB triplet is a three-element row vector whose elements specify the intensities of the red, green, and blue components of the color. The intensities must be in the range [0,1]; for example, [0.5 0.6 0.7].

Example: [1 0 0]

ColorData — Text colors

[] (default) | RGB triplet | matrix of RGB triplets | categorical vector

Text colors, specified as one of these values:

- RGB triplet Use the same color for all the text in the plot. An RGB triplet is a threeelement row vector whose elements specify the intensities of the red, green, and blue components of the color. The intensities must be in the range [0,1]; for example, [0.5 0.6 0.7].
- Three-column matrix of RGB triplets Use a different color for each text label in the plot. Each row of the matrix defines one color. The number of rows must equal the number of text labels.

Categorical vector — Use a different color for each category in the vector. Specify ColorData as a vector the same length as XData. Specify the colors for each category using the Colors property

Example: [1 0 0; 0 1 0; 0 0 1]

Colors — Category colors

matrix of RGB triplets

Category colors, specified as a matrix of RGB triplets. An RGB triplet is a three-element row vector whose elements specify the intensities of the red, green, and blue components of the color. The intensities must be in the range [0,1]; for example, $[0.5 \ 0.6 \ 0.7]$.

By default, Colors is equal to the ColorOrder property of the axes object.

Example: [1 0 0; 0 1 0; 0 0 1]

Output Arguments

ts — TextScatter object

TextScatter object

TextScatter object. Use ts to access and modify properties of the text scatter chart after it has been created. For more information, see TextScatter Properties.

Introduced in R2017b

textscatter3

3-D scatter plot of text

Syntax

```
ts = textscatter3(x,y,z,str)
ts = textscatter3(xyz,str)
ts = textscatter3(ax, ____)
ts = textscatter3(____,Name,Value)
```

Description

ts = textscatter3(x,y,z,str) creates a 3-D text scatter plot with elements of str at the locations specified by the vectors x, y, and z.

ts = textscatter3(xyz,str) creates a 3-D text scatter plot with elements of str at the locations specified by the rows of xyz. This syntax is equivalent to textscatter(xyz(:,1),xyz(:,2),xyz(:,3),str).

ts = textscatter3(ax, ____) plots into axes object ax. Use this syntax with any of the input arguments in previous syntaxes.

ts = textscatter3(____, Name, Value) specifies additional TextScatter properties
using one or more name-value pair arguments.

Examples

Create 3-D Text Scatter Plot

Plot a string array of numbers at random points on a 3-D text scatter plot.

```
x = rand(50,1);
y = rand(50,1);
z = rand(50,1);
```

```
str = string(1:50);
figure
textscatter3(x,y,z,str);
```

Alternatively, you can pass the coordinates x, y, and z as a matrix xyz, where x, y, and z are the columns of xyz.

xyz = [x y z]; figure textscatter3(xyz,str)

Specify Word Colors

Create text scatter plot of a word embedding and specify word colors.

Load a pretrained word embedding using fastTextWordEmbedding. This function requires Text Analytics Toolbox[™] Model for fastText English 16 Billion Token Word Embedding support package. If this support package is not installed, then the function provides a download link.

emb = fastTextWordEmbedding;

Convert the first 250 words to vectors using word2vec. V is a matrix of word vectors of length 300.

```
words = emb.Vocabulary(1:250);
V = word2vec(emb,words);
size(V)
ans = 1×2
250 300
```

Embed the word vectors in a 3-D space using tsne.

XYZ = tsne(V, 'NumDimensions',3);

Plot the words at the coordinates specified by XYZ in a 3-D text scatter plot. Specify the word colors to be random.

```
numWords = numel(words);
colorData = rand(numWords,3);
figure
textscatter3(XYZ,words,'ColorData',colorData)
title("Word Embedding t-SNE Plot")
```

Input Arguments

x — x values

vector

x values, specified as a vector. x, y, z, and str must be of equal length.

Example: [1 2 3]

y — y values vector y values, specified as a vector. x, y, z, and str must be of equal length.

Example: [1 2 3]

z – z values

vector

z values, specified as a vector. x, y, z, and str must be of equal length.

Example: [1 2 3]

str – Input text

string vector | cell array of character vectors

Input text, specified as a string array or cell array of character vectors. x, y, z, and str must be of equal length.

```
Example: ["one" "two" "three"]
```

Data Types: string | cell

ax — Axes object

axes object

Axes object. If you do not specify an axes object, then the function uses the current axes.

Name-Value Pair Arguments

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1, Value1, ..., NameN, ValueN.

Example: 'Marker', '*' specifies the markers to be asterisks.

The TextScatter object properties listed here are only a subset. For a complete list, see TextScatter Properties.

TextDensityPercentage - Percentage of text data to show

60 (default) | scalar from 0 through 100

Percentage of text data to show, specified as a scalar from 0 through 100. To show all text, set TextDensityPercentage to 100. To show no text, set TextDensityPercentage to 0.

If you set TextDensityPercentage to 100, then the software does not plot markers.

Example: 70

MaxTextLength — Maximum length of text labels

40 (default) | positive integer

Maximum length of text labels, specified as a positive integer. The software truncates the text labels to this length and adds ellipses at the point of truncation.

Example: 10

MarkerColor — Marker colors

'auto' (default) | 'none' | RGB triplet

Marker colors, specified as one of these values:

- 'auto' For each marker, use the same color as the corresponding text labels.
- 'none' Do not show markers.
- RGB triplet Use the same color for all the markers in the plot. An RGB triplet is a three-element row vector whose elements specify the intensities of the red, green, and blue components of the color. The intensities must be in the range [0,1]; for example, [0.5 0.6 0.7].

Example: [1 0 0]

ColorData — Text colors

[] (default) | RGB triplet | matrix of RGB triplets | categorical vector

Text colors, specified as one of these values:

- RGB triplet Use the same color for all the text in the plot. An RGB triplet is a threeelement row vector whose elements specify the intensities of the red, green, and blue components of the color. The intensities must be in the range [0,1]; for example, [0.5 0.6 0.7].
- Three-column matrix of RGB triplets Use a different color for each text label in the plot. Each row of the matrix defines one color. The number of rows must equal the number of text labels.
- Categorical vector Use a different color for each category in the vector. Specify ColorData as a vector the same length as XData. Specify the colors for each category using the Colors property

Example: [1 0 0; 0 1 0; 0 0 1]

Colors — Category colors

matrix of RGB triplets

Category colors, specified as a matrix of RGB triplets. An RGB triplet is a three-element row vector whose elements specify the intensities of the red, green, and blue components of the color. The intensities must be in the range [0,1]; for example, $[0.5 \ 0.6 \ 0.7]$.

By default, Colors is equal to the ColorOrder property of the axes object.

Example: [1 0 0; 0 1 0; 0 0 1]

Output Arguments

ts — TextScatter object

TextScatter object

TextScatter object. Use ts to access and modify properties of the text scatter chart after it has been created. For more information, see TextScatter Properties.

Introduced in R2017b

TextScatter Properties

Control text scatter chart appearance and behavior

Description

TextScatter properties control the appearance and behavior of TextScatter object. By changing property values, you can modify certain aspects of the text scatter chart.

Properties

Text

TextData — Text labels string array | cell array of character vectors

Text labels, specified as a string array, or a cell array of character vectors.

```
Example: ["word1" "word2" "word3"]
```

Data Types: string | cell

TextDensityPercentage — Percentage of text data to show

60 (default) | scalar from 0 through 100

Percentage of text data to show, specified as a scalar from 0 through 100. To show all text, set TextDensityPercentage to 100. To show no text, set TextDensityPercentage to 0.

If you set TextDensityPercentage to 100, then the software does not plot markers.

Example: 70

MaxTextLength — Maximum length of text labels

40 (default) | positive integer

Maximum length of text labels, specified as a positive integer. The software truncates the text labels to this length and adds ellipses at the point of truncation.

Example: 10

Font Style

FontName — Font name

system supported font name | 'FixedWidth'

Font name, specified as the name of the font to use or 'FixedWidth'. To display and print properly, the font name must be a font that your system supports. The default font depends on the specific operating system and locale.

To use a fixed-width font that looks good in any locale, use 'FixedWidth'. The 'FixedWidth' value relies on the root FixedWidthFontName property. Setting the root FixedWidthFontName property causes an immediate update of the display to use the new font.

Example: 'Cambria'

FontSize — Font size

10 (default) | scalar value greater than zero

Font size, specified as a scalar value greater than zero in point units. One point equals 1/72 inch. To change the font units, use the FontUnits property.

Example: 12

```
Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64
```

FontAngle — Character slant

'normal' (default) | 'italic'

Character slant, specified as 'normal' or 'italic'. Not all fonts have both font styles. Therefore, the italic font might look the same as the normal font.

FontWeight — Thickness of text characters

'normal' (default) | 'bold'

Thickness of the text characters, specified as one of these values:

- 'normal' Default weight as defined by the particular font
- 'bold' Thicker character outlines than normal

MATLAB uses the FontWeight property to select a font from those available on your system. Not all fonts have a bold font weight. Therefore, specifying a bold font weight still can result in the normal font weight.
FontSmoothing — Smooth font character appearance

'on' (default) | 'off'

Smooth font character appearance, specified as one of these values:

- 'on' Apply font smoothing. Reduce the appearance of jaggedness in the text characters to make the text easier to read.
- 'off' Do not apply font smoothing.

Text Box

EdgeColor — Color of box outline

'none' (default) | RGB triplet | character vector of color name

Color of box outline, specified as 'none', a three-element RGB triplet, or a character vector of a color name. The default edge color of 'none' makes the box outline invisible.

An RGB triplet is a three-element row vector whose elements specify the intensities of the red, green, and blue components of the color. The intensities must be in the range [0,1]; for example, $[0.4 \ 0.6 \ 0.7]$. Alternatively, you can specify some common colors by name. This table lists the long and short color name options and the equivalent RGB triplet values.

Option	Description	Equivalent RGB Triplet
'red'or'r'	Red	[1 0 0]
'green' or 'g'	Green	[0 1 0]
'blue' or 'b'	Blue	[0 0 1]
'yellow' or 'y'	Yellow	[1 1 0]
'magenta' or 'm'	Magenta	[1 0 1]
'cyan' or 'c'	Cyan	[0 1 1]
'white'or'w'	White	[1 1 1]
'black' or 'k'	Black	[0 0 0]

Example: 'blue'

Example: [0 0 1]

BackgroundColor — Color of text box background

'none' (default) | 'data' | RGB triplet

Color of text box background, specified as one of these values:

- 'none' Make the text box background transparent.
- 'data' Use background color specified by ColorData. The software automatically chooses a foreground to complement the background color.
- RGB triplet Use the same color for all the markers in the plot. An RGB triplet is a three-element row vector whose elements specify the intensities of the red, green, and blue components of the color. The intensities must be in the range [0,1]; for example, $[0.5 \ 0.6 \ 0.7]$.

Example: [1 0 0]

Margin — Space around text within text box

3 (default) | positive scalar

The space around the text within the text box, specified as a positive scalar in point units.

MATLAB uses the Extent property value plus the Margin property value to determine the size of the text box.

Example: 8

```
Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64
```

Markers

MarkerColor — Marker colors

'auto' (default) | 'none' | RGB triplet

Marker colors, specified as one of these values:

- 'auto' For each marker, use the same color as the corresponding text labels.
- 'none' Do not show markers.
- RGB triplet Use the same color for all the markers in the plot. An RGB triplet is a three-element row vector whose elements specify the intensities of the red, green, and blue components of the color. The intensities must be in the range [0,1]; for example, [0.5 0.6 0.7].

Example: [1 0 0]

MarkerSize — Marker size

6 (default) | positive scalar

Marker size, specified as a positive scalar.

Example: 10

Data

XData — x values

[] (default) | scalar | vector

x values, specified as a scalar or a vector. The text scatter plot displays an individual marker for each value in XData.

The input argument X to the textscatter and textscatter3 functions set the x values. XData and YData must have equal lengths.

```
Example: [1 2 4 2 6]
```

```
Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | categorical | datetime | duration
```

XDataSource — Variable linked to XData

' ' (default) | character vector containing MATLAB workspace variable name

Variable linked to XData, specified as a character vector containing a MATLAB workspace variable name. MATLAB evaluates the variable in the base workspace to generate the XData.

By default, there is no linked variable so the value is an empty character vector, ''. If you link a variable, then MATLAB does not update the XData values immediately. To force an update of the data values, use the refreshdata function.

Note If you change one data source property to a variable that contains data of a different dimension, you might cause the function to generate a warning and not render the graph until you have changed all data source properties to appropriate values.

Example: 'x'

YData — y values[] (default) | scalar | vector

y values, specified as a scalar or a vector. The text scatter plot displays an individual marker for each value in YData.

The input argument Y to the textscatter and textscatter3 functions set the y values. XData and YData must have equal lengths.

Example: [1 3 3 4 6]

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | categorical | datetime | duration

YDataSource — Variable linked to YData

' ' (default) | character vector containing MATLAB workspace variable name

Variable linked to YData, specified as a character vector containing a MATLAB workspace variable name. MATLAB evaluates the variable in the base workspace to generate the YData.

By default, there is no linked variable so the value is an empty character vector, ''. If you link a variable, then MATLAB does not update the YData values immediately. To force an update of the data values, use the refreshdata function.

Note If you change one data source property to a variable that contains data of a different dimension, you might cause the function to generate a warning and not render the graph until you have changed all data source properties to appropriate values.

Example: 'y'

ZData — z values

[] (default) | scalar | vector

z values, specified as a scalar or a vector.

- For 2-D scatter plots, ZData is empty by default.
- For 3-D scatter plots, the input argument Z to the scatter3 function sets the z values. XData, YData, and ZData must have equal lengths.

Example: [1 2 2 1 0]

```
Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | categorical | datetime | duration
```

ZDataSource — Variable linked to ZData

' ' (default) | character vector containing MATLAB workspace variable name

Variable linked to ZData, specified as a character vector containing a MATLAB workspace variable name. MATLAB evaluates the variable in the base workspace to generate the ZData.

By default, there is no linked variable so the value is an empty character vector, ''. If you link a variable, then MATLAB does not update the ZData values immediately. To force an update of the data values, use the refreshdata function.

Note If you change one data source property to a variable that contains data of a different dimension, you might cause the function to generate a warning and not render the graph until you have changed all data source properties to appropriate values.

Example: 'z'

ColorData — Text colors

[] (default) | RGB triplet | matrix of RGB triplets | categorical vector

Text colors, specified as one of these values:

- RGB triplet Use the same color for all the text in the plot. An RGB triplet is a threeelement row vector whose elements specify the intensities of the red, green, and blue components of the color. The intensities must be in the range [0,1]; for example, [0.5 0.6 0.7].
- Three-column matrix of RGB triplets Use a different color for each text label in the plot. Each row of the matrix defines one color. The number of rows must equal the number of text labels.
- Categorical vector Use a different color for each category in the vector. Specify ColorData as a vector the same length as XData. Specify the colors for each category using the Colors property

Example: [1 0 0; 0 1 0; 0 0 1]

Colors — Category colors

matrix of RGB triplets

Category colors, specified as a matrix of RGB triplets. An RGB triplet is a three-element row vector whose elements specify the intensities of the red, green, and blue components of the color. The intensities must be in the range [0,1]; for example, $[0.5 \ 0.6 \ 0.7]$.

By default, Colors is equal to the ColorOrder property of the axes object.

Example: [1 0 0; 0 1 0; 0 0 1]

Visibility

Visible — State of visibility

'on' (default) | 'off'

State of visibility, specified as one of these values:

- 'on' Display the object.
- 'off' Hide the object without deleting it. You still can access the properties of an invisible object.

Identifiers

Type — Type of graphics object

'textscatter'

This property is read-only.

Type of graphics object, returned as 'textscatter'. Use this property to find all objects of a given type within a plotting hierarchy; for example, searching for the type using findobj.

Tag — User-specified tag

' ' (default) | character vector

This property is read-only.

User-specified tag to associate with the object, specified as a character vector. Tags provide a way to identify graphics objects. Use this property to find all objects with a specific tag within a plotting hierarchy; for example, searching for the tag using findobj.

Example: 'January Data'

UserData — Data to associate with object

[] (default) | any MATLAB data

This property is read-only.

Data to associate with the object, specified as any MATLAB data; for example, a scalar, vector, matrix, cell array, character array, table, or structure. MATLAB does not use this data.

To associate multiple sets of data or to attach a field name to the data, use the getappdata and setappdata functions.

Example: 1:100

DisplayName — Text used for legend label

' ' (default) | character vector

This property is read-only.

Text used for the legend label, specified as a character vector. If you do not specify the text, then the legend uses a label of the form 'dataN'. The legend does not display until you call the legend command.

Example: 'Label Text'

Annotation — Control for including or excluding object from legend

Annotation object

Control for including or excluding the object from a legend, returned as an Annotation object. Set the underlying IconDisplayStyle property to one of these values:

- 'on' Include the object in the legend (default).
- 'off' Do not include the object in the legend.

For example, exclude a stem chart from the legend.

```
p = plot(1:10, 'DisplayName', 'Line Chart');
hold on
s = stem(1:10, 'DisplayName', 'Stem Chart');
hold off
s.Annotation.LegendInformation.IconDisplayStyle = 'off';
legend('show')
```

Alternatively, you can control the items in a legend using the **legend** function. Specify the first input argument as a vector of the graphics objects to include.

```
p = plot(1:10, 'DisplayName', 'Line Chart');
hold on
s = stem(1:10, 'DisplayName', 'Stem Chart');
hold off
legend(p)
```

Parent/Child

Parent — Parent

Axes object | PolarAxes object | Group object | Transform object

Parent, specified as an Axes, PolarAxes, Group, or Transform object.

Children — Children

empty GraphicsPlaceholder array

The object has no children. You cannot set this property.

HandleVisibility — Visibility of object handle

'on' (default) | 'off' | 'callback'

Visibility of the object handle in the Children property of the parent, specified as one of these values:

- 'on' Object handle is always visible.
- 'off' Object handle is invisible at all times. This option is useful for preventing unintended changes to the UI by another function. Set the HandleVisibility to 'off' to temporarily hide the handle during the execution of that function.
- 'callback' Object handle is visible from within callbacks or functions invoked by callbacks, but not from within functions invoked from the command line. This option blocks access to the object at the command-line, but allows callback functions to access it.

If the object is not listed in the Children property of the parent, then functions that obtain object handles by searching the object hierarchy or querying handle properties cannot return it. This includes get, findobj, gca, gcf, gco, newplot, cla, clf, and close.

Hidden object handles are still valid. Set the root ShowHiddenHandles property to 'on' to list all object handles regardless of their HandleVisibility property setting.

Interactive Control

ButtonDownFcn — Mouse-click callback

' ' (default) | function handle | cell array | character vector

Mouse-click callback, specified as one of these values:

- Function handle
- Cell array containing a function handle and additional arguments
- Character vector that is a valid MATLAB command or function, which is evaluated in the base workspace (not recommended)

Use this property to execute code when you click the object. If you specify this property using a function handle, then MATLAB passes two arguments to the callback function when executing the callback:

- Clicked object You can access properties of the clicked object from within the callback function.
- Event data This argument is empty for this property. Replace it with the tilde character (~) in the function definition to indicate that this argument is not used.

For more information on how to use function handles to define callback functions, see "Callback Definition" (MATLAB).

Note If the PickableParts property is set to 'none' or if the HitTest property is set to 'off', then this callback does not execute.

Example: @myCallback
Example: {@myCallback,arg3}

UIContextMenu — Context menu

uicontextmenu object

Context menu, specified as a uicontextmenu object. Use this property to display a context menu when you right-click the object. Create the context menu using the uicontextmenu function.

Note If the PickableParts property is set to 'none' or if the HitTest property is set to 'off', then the context menu does not appear.

Selected — Selection state

'off' (default) | 'on'

Selection state, specified as one of these values:

- 'on' Selected. If you click the object when in plot edit mode, then MATLAB sets its Selected property to 'on'. If the SelectionHighlight property also is set to 'on', then MATLAB displays selection handles around the object.
- 'off' Not selected.

SelectionHighlight — Display of selection handles when selected

'on' (default) | 'off'

Display of selection handles when selected, specified as one of these values:

- 'on' Display selection handles when the Selected property is set to 'on'.
- 'off' Never display selection handles, even when the Selected property is set to 'on'.

Callback Execution Control

PickableParts — Ability to capture mouse clicks

'visible' (default) | 'none'

Ability to capture mouse clicks, specified as one of these values:

- 'visible' Can capture mouse clicks when visible. The Visible property must be set to 'on' and you must click a part of the TextScatter object that has a defined color. You cannot click a part that has an associated color property set to 'none'. If the plot contains markers, then the entire marker is clickable if either the edge or the fill has a defined color. The HitTest property determines if the TextScatter object responds to the click or if an ancestor does.
- 'none' Cannot capture mouse clicks. Clicking the TextScatter object passes the click to the object below it in the current view of the figure window. The HitTest property of the TextScatter object has no effect.

HitTest — Response to captured mouse clicks

'on' (default) | 'off'

Response to captured mouse clicks, specified as one of these values:

- 'on' Trigger the ButtonDownFcn callback of the TextScatter object. If you have defined the UIContextMenu property, then invoke the context menu.
- 'off' Trigger the callbacks for the nearest ancestor of the TextScatter object that has a HitTest property set to 'on' and a PickableParts property value that enables the ancestor to capture mouse clicks.

Note The PickableParts property determines if the TextScatter object can capture mouse clicks. If it cannot, then the HitTest property has no effect.

Interruptible — Callback interruption

'on' (default) | 'off'

Callback interruption, specified as 'on' or 'off'. The Interruptible property determines if a running callback can be interrupted.

Note There are two callback states to consider:

- The running callback is the currently executing callback.
- The interrupting callback is a callback that tries to interrupt the running callback.

Whenever MATLAB invokes a callback, that callback attempts to interrupt a running callback. The Interruptible property of the object owning the running callback determines if interruption is allowed. If interruption is not allowed, then the BusyAction property of the object owning the interrupting callback determines if it is discarded or put in the queue.

If the ButtonDownFcn callback of the TextScatter object is the running callback, then the Interruptible property determines if it another callback can interrupt it:

- 'on' Interruptible. Interruption occurs at the next point where MATLAB processes the queue, such as when there is a drawnow, figure, getframe, waitfor, or pause command.
 - If the running callback contains one of these commands, then MATLAB stops the execution of the callback at this point and executes the interrupting callback. MATLAB resumes executing the running callback when the interrupting callback completes. For more information, see "Interrupt Callback Execution" (MATLAB).
 - If the running callback does not contain one of these commands, then MATLAB finishes executing the callback without interruption.
- 'off' Not interruptible. MATLAB finishes executing the running callback without any interruptions.

BusyAction — Callback queuing

'queue' (default) | 'cancel'

Callback queuing specified as 'queue' or 'cancel'. The BusyAction property determines how MATLAB handles the execution of interrupting callbacks.

Note There are two callback states to consider:

- The running callback is the currently executing callback.
- The interrupting callback is a callback that tries to interrupt the running callback.

Whenever MATLAB invokes a callback, that callback attempts to interrupt a running callback. The Interruptible property of the object owning the running callback determines if interruption is allowed. If interruption is not allowed, then the BusyAction property of the object owning the interrupting callback determines if it is discarded or put in the queue.

If the ButtonDownFcn callback of the TextScatter object tries to interrupt a running callback that cannot be interrupted, then the BusyAction property determines if it is discarded or put in the queue. Specify the BusyAction property as one of these values:

- 'queue' Put the interrupting callback in a queue to be processed after the running callback finishes execution. This is the default behavior.
- **'cancel'** Discard the interrupting callback.

Creation and Deletion Control

CreateFcn — Creation callback

' ' (default) | function handle | cell array | character vector

Creation callback, specified as one of these values:

- Function handle
- Cell array containing a function handle and additional arguments
- Character vector that is a valid MATLAB command or function, which is evaluated in the base workspace (not recommended)

Use this property to execute code when you create the object. Setting the CreateFcn property on an existing object has no effect. You must define a default value for this property, or define this property using a Name, Value pair during object creation. MATLAB executes the callback after creating the object and setting all of its properties.

If you specify this callback using a function handle, then MATLAB passes two arguments to the callback function when executing the callback:

- Created object You can access properties of the object from within the callback function. You also can access the object through the CallbackObject property of the root, which can be queried using the gcbo function.
- Event data This argument is empty for this property. Replace it with the tilde character (~) in the function definition to indicate that this argument is not used.

For more information on how to use function handles to define callback functions, see "Callback Definition" (MATLAB).

Example: @myCallback
Example: {@myCallback,arg3}

DeleteFcn — Deletion callback

' ' (default) | function handle | cell array | character vector

Deletion callback, specified as one of these values:

- Function handle
- Cell array containing a function handle and additional arguments
- Character vector that is a valid MATLAB command or function, which is evaluated in the base workspace (not recommended)

Use this property to execute code when you delete the object MATLAB executes the callback before destroying the object so that the callback can access its property values.

If you specify this callback using a function handle, then MATLAB passes two arguments to the callback function when executing the callback:

- Deleted object You can access properties of the object from within the callback function. You also can access the object through the CallbackObject property of the root, which can be queried using the gcbo function.
- Event data This argument is empty for this property. Replace it with the tilde character (~) in the function definition to indicate that this argument is not used.

For more information on how to use function handles to define callback functions, see "Callback Definition" (MATLAB).

Example: @myCallback

Example: {@myCallback,arg3}

BeingDeleted — **Deletion status**

'off' (default) | 'on'

Deletion status, returned as 'off' or 'on'. MATLAB sets the BeingDeleted property to 'on' when the delete function of the object begins execution (see the DeleteFcn property). The BeingDeleted property remains set to 'on' until the object no longer exists.

Check the value of the **BeingDeleted** property to verify that the object is not about to be deleted before querying or modifying it.

Introduced in R2017b

tfidf

Term Frequency-Inverse Document Frequency (tf-idf) matrix

Syntax

M = tfidf(bag) M = tfidf(bag,documents) M = tfidf(____,Name,Value)

Description

M = tfidf(bag) returns a Term Frequency-Inverse Document Frequency (tf-idf) matrix based on the bag-of-words or bag-of-n-grams model bag.

M = tfidf(bag, documents) returns a tf-idf matrix for the documents in documents by using the inverse document frequency (IDF) factor computed from bag.

M = tfidf(____, Name, Value) specifies additional options using one or more name-value pair arguments.

Examples

Create Tf-idf Matrix

Create a Term Frequency–Inverse Document Frequency (tf-idf) matrix from a bag-of-words model.

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
```

```
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

Create a bag-of-words model using bagOfWords.

```
bag = bagOfWords(documents)
```

Create a tf-idf matrix. View the first 10 rows and columns.

```
M = tfidf(bag);
full(M(1:10,1:10))
```

```
ans = 10 \times 10
```

3.6507	4.3438	2.7344	3.6507	4.3438	2.2644	3.2452	3.8918	2.
Θ	Θ	Θ	Θ	Θ	4.5287	Θ	Θ	
Θ	Θ	Θ	Θ	Θ	Θ	Θ	Θ	
Θ	Θ	Θ	Θ	Θ	2.2644	Θ	Θ	
Θ	Θ	Θ	Θ	Θ	2.2644	Θ	Θ	
Θ	Θ	Θ	Θ	Θ	2.2644	Θ	Θ	
Θ	Θ	Θ	Θ	Θ	Θ	Θ	Θ	
Θ	Θ	Θ	Θ	Θ	Θ	Θ	Θ	
Θ	Θ	Θ	Θ	Θ	2.2644	Θ	Θ	
Θ	Θ	2.7344	Θ	Θ	Θ	Θ	Θ	

Create tf-idf Matrix from New Documents

Create a Term Frequency-Inverse Document Frequency (tf-idf) matrix from a bag-of-words model and an array of new documents.

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words

separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

Create a bag-of-words model from the documents.

```
bag = bagOfWords(documents)
bag =
    bagOfWords with properties:
        Counts: [154x3092 double]
        Vocabulary: [1x3092 string]
        NumWords: 3092
        NumDocuments: 154
```

Create a tf-idf matrix for an array of new documents using the inverse document frequency (IDF) factor computed from bag.

```
newDocuments = tokenizedDocument([
    "what's in a name? a rose by any other name would smell as sweet."
    "if music be the food of love, play on."]);
M = tfidf(bag,newDocuments)
M =
   (1,7)
               3.2452
   (1, 36)
               1.2303
   (2, 197)
               3.4275
   (2, 313)
               3,6507
   (2, 387)
               0.6061
   (1, 1205)
               4.7958
   (1, 1835)
               3.6507
   (2, 1917)
               5.0370
```

Specify TF Weight Formulas

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

Create a bag-of-words model using bag0fWords.

```
bag = bagOfWords(documents)
bag =
    bagOfWords with properties:
        Counts: [154x3092 double]
        Vocabulary: [1x3092 string]
        NumWords: 3092
    NumDocuments: 154
```

Create a tf-idf matrix. View the first 10 rows and columns.

M = tfidf(bag); full(M(1:10,1:10))

```
ans = 10 \times 10
```

3.6507	4.3438	2.7344	3.6507	4.3438	2.2644	3.2452	3.8918	2.
Θ	Θ	Θ	Θ	Θ	4.5287	Θ	Θ	
Θ	Θ	Θ	Θ	Θ	Θ	Θ	Θ	
Θ	Θ	Θ	Θ	Θ	2.2644	Θ	Θ	
Θ	Θ	Θ	Θ	Θ	2.2644	Θ	Θ	
Θ	Θ	Θ	Θ	Θ	2.2644	Θ	Θ	
Θ	Θ	Θ	Θ	Θ	Θ	Θ	Θ	
Θ	Θ	Θ	Θ	Θ	Θ	Θ	Θ	
\odot	Θ	Θ	Θ	Θ	2.2644	Θ	Θ	
Θ	Θ	2.7344	Θ	Θ	Θ	Θ	Θ	

You can change the contributions made by the TF and IDF factors to the tf-idf matrix by specifying the TF and IDF weight formulas.

To ignore how many times a word appears in a document, use the binary option of 'TFWeight'. Create a tf-idf matrix and set 'TFWeight' to 'binary'. View the first 10 rows and columns.

```
M = tfidf(bag,'TFWeight','binary');
full(M(1:10,1:10))
```

```
ans = 10 \times 10
```

3.6507	4.3438	2.7344	3.6507	4.3438	2.2644	3.2452	1.9459	2
Θ	Θ	Θ	Θ	Θ	2.2644	Θ	Θ	
Θ	Θ	Θ	Θ	Θ	Θ	Θ	Θ	
Θ	Θ	Θ	Θ	Θ	2.2644	Θ	Θ	
Θ	Θ	Θ	Θ	Θ	2.2644	Θ	Θ	
Θ	Θ	Θ	Θ	Θ	2.2644	Θ	Θ	
Θ	Θ	Θ	Θ	Θ	Θ	Θ	Θ	
Θ	Θ	Θ	Θ	Θ	Θ	Θ	Θ	
Θ	Θ	Θ	Θ	Θ	2.2644	Θ	Θ	
Θ	Θ	2.7344	Θ	Θ	Θ	Θ	Θ	

Input Arguments

bag — Input bag-of-words or bag-of-n-grams model

bagOfWords object | bagOfNgrams object

Input bag-of-words or bag-of-n-grams model, specified as a bagOfWords object or a bagOfNgrams object.

documents - Input documents

tokenizedDocument array | string array of words | cell array of character vectors

Input documents, specified as a tokenizedDocument array, a string array of words, or a cell array of character vectors. If documents is a string array or a cell array of character vectors, then it must be a row vector representing a single document, where each element is a word.

Name-Value Pair Arguments

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1, Value1, ..., NameN, ValueN.

Example: 'Normalized', true specifies to normalize the frequency counts.

TFWeight — Method to set term frequency factor

```
'raw' (default) | 'binary' | 'log'
```

Method to set term frequency (TF) factor, specified as the comma-separated pair consisting of 'TFWeight' and one of the following:

- 'raw' Set the TF factor to the unchanged term counts.
- 'binary' Set the TF factor to the matrix of ones and zeros where the ones indicate whether a term is in a document.
- 'log' Set the TF factor to 1 + log(bag.Counts).

```
Example: 'TFWeight', 'binary'
```

Data Types: char

IDFWeight — Method to set inverse document frequency factor

```
'normal'(default)|'unary'|'smooth'|'max'|'probabilistic'
```

Method to set inverse document frequency (IDF) factor, specified as the comma-separated pair consisting of 'IDFWeight' and one of the following:

- 'normal' Set the IDF factor to log(N/NT).
- 'unary' Set the IDF factor to 1.
- 'smooth' Set the IDF factor to log(1+N/NT).
- 'max' Set the IDF factor to log(1+max(NT)/NT).
- 'probabilistic' Set the IDF factor to log((N-NT)/NT).

where N is the number of documents in the bag, and NT is the number of documents containing each term which is equivalent to sum(bag.Counts).

```
Example: 'IDFWeight', 'smooth'
Data Types: char
```

Normalized — Option to normalize term counts

false (default) | true

Option to normalize term counts, specified as the comma-separated pair consisting of 'Normalized' and true or false. If true, then the function normalizes each vector of term counts in the Euclidean norm.

Example: 'Normalized', true

Data Types: logical

DocumentsIn — Orientation of output documents

'rows' (default) | 'columns'

Orientation of output documents in the frequency count matrix, specified as the commaseparated pair consisting of 'DocumentsIn' and one of the following:

- 'rows' Return a matrix of frequency counts with rows corresponding to documents.
- 'columns' Return a transposed matrix of frequency counts with columns corresponding to documents.

Data Types: char

ForceCellOutput — **Indicator for forcing output to be returned as cell array** false (default) | true

Indicator for forcing output to be returned as cell array, specified as the comma separated pair consisting of 'ForceCellOutput' and true or false.

Data Types: logical

Output Arguments

M — Output Term Frequency-Inverse Document Frequency matrix

sparse matrix | cell array of sparse matrices

Output Term Frequency-Inverse Document Frequency matrix, specified as a sparse matrix or a cell array of sparse matrices.

If **bag** is a non-scalar array or 'ForceCellOutput' is true, then the function returns the outputs as a cell array of sparse matrices. Each element in the cell array is the tf-idf matrix calculated from the corresponding element of bag.

Introduced in R2017b

tokenizedDocument

Array of tokenized documents for text analysis

Description

A tokenized document is a document represented as a collection of words (also known as tokens) which is used for text analysis.

Use tokenized documents for the following tasks:

- Detect complex tokens in text such as web addresses, emoticons, emoji, and hashtags.
- Remove words such as stop words using removeWords or removeStopWords.
- Perform word-level preprocessing tasks such as stemming or lemmatization using normalizeWords.
- Analyze word and n-gram frequencies using bagOfWords and bagOfNgrams objects.
- Add sentence and part-of-speech details using addSentenceDetails and addPartOfSpeechDetails.
- View details about the tokens using tokenDetails.

Creation

Syntax

documents = tokenizedDocument
documents = tokenizedDocument(str)
documents = tokenizedDocument(str,Name,Value)

Description

documents = tokenizedDocument creates a scalar tokenized document with no tokens. documents = tokenizedDocument(str) tokenizes the elements of str and returns a
tokenized document array.

documents = tokenizedDocument(str,Name,Value) specifies additional options
using one or more name-value pair arguments.

Input Arguments

str – Input text

string array | character vector | cell array of character vectors | cell array of string arrays

Input text, specified as a string array, character vector, cell array of character vectors, or cell array of string arrays.

If the input text has not already been split into words, then str must be a string array, character vector, cell array of character vectors, or a cell array of string scalars.

Example: ["an example of a short document";"a second short document"]
Example: 'an example of a short document'
Example: {'an example of a short document'; 'a second short document'}

If the input text has already been tokenized, then specify 'TokenizeMethod' to be 'none'. If str contains a single document, then it must be a string vector of words, a row cell array of character vectors, or a cell array containing a single string vector of words. If str contains multiple documents, then it must be a cell array of string arrays.

```
Example: ["an" "example" "document"]
Example: {'an', 'example', 'document'}
Example: {["an" "example" "of" "a" "short" "document"]}
Example: {["an" "example" "of" "a" "short" "document"];["a" "second"
"short" "document"]}
Data Types: string | char | cell
```

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1, Value1, ..., NameN, ValueN.

Example: 'DetectPatterns', {'email-address', 'web-address'} detects email
addresses and web addresses

TokenizeMethod — Method to tokenize documents

'unicode'|'mecab'|'none'

Method to tokenize documents, specified as the comma-separated pair consisting of 'TokenizeMethod' and one of the following:

- 'unicode' Tokenize input text. If str is a cell array, then the elements of str must be string scalars or character vectors. If 'Language' is 'en', then 'unicode' is the default.
- 'mecab' Tokenize Japanese text using the MeCab tokenizer. If 'Language' is 'ja', then 'mecab' is the default.
- 'none' Do not tokenize the input text.

If the input text has already been tokenized, then specify 'TokenizeMethod' to be 'none'. If str contains a single document, then it must be a string vector of words, a row cell array of character vectors, or a cell array containing a single string vector of words. If str contains multiple documents, then it must be a cell array of string arrays.

If 'TokenizeMethod' is 'none', then the function tokenDetails returns an empty table. To add tokens with document and sentence numbers to the table, use addSentenceDetails.

Example: 'none'

DetectPatterns — Patterns of complex tokens to detect

'all' (default) | character vector | string array | cell array of character vectors

Patterns of complex tokens to detect, specified as the comma-separated pair consisting of 'DetectPatterns' and 'none', 'all', or a string or cell array containing one or more of the following:

- 'email-address' Detect email addresses. For example, treat user@domain.com as a single token.
- 'web-address' Detect web addresses. For example, treat www.mathworks.com as a single token.
- 'hashtag' Detect hashtags. For example, treat #MATLAB as a single token.
- 'at-mention' Detect at-mentions. For example, treat @MathWorks as a single token.

• 'emoticon' - Detect emoticons. For example, treat : - D as a single token.

If DetectPatterns is 'none', then the function does not detect any complex token patterns. If DetectPatterns is 'all', then the function detects all the listed complex token patterns.

```
Example: 'DetectPatterns', 'hashtag'
Example: 'DetectPatterns', { 'email-address', 'web-address' }
Data Types: char | string | cell
```

TopLevelDomains — Top-level domains to use for web address detection

character vector | string array | cell array of character vectors

Top-level domains to use for web address detection, specified as the comma-separated pair consisting of 'TopLevelDomains' and a character vector, string array, or cell array of character vectors. By default, the function uses the output of topLevelDomains.

This option only applies if 'DetectPatterns' is 'all' or contains 'web-address'.

```
Example: 'TopLevelDomains',["com" "net" "org"]
```

Data Types: char | string | cell

Language — Language

'en'|'ja'

Language, specified as the comma-separated pair consisting of 'Language' and one of the following:

- 'en' English. This option also sets the default value for 'TokenizeMethod' to 'unicode'.
- 'ja' Japanese. This option also sets the default value for 'TokenizeMethod' to 'mecab'.

If you do not specify a value, then the function detects the language from the input text using the corpusLanguage function.

This option specifies the language details of the tokens. To view the language details of the tokens, use tokenDetails. These language details determine the behavior of the removeStopWords, addPartOfSpeechDetails, normalizeWords, and addSentenceDetails functions on the tokens.

For more information about language support in Text Analytics Toolbox, see "Language Support".

Example: 'Language', 'ja'

Properties

Vocabulary — Unique words in the documents

string array

Unique words in the documents, specified as a string array. The words do not appear in any particular order.

Data Types: string

Object Functions

Preprocessing

Erase punctuation from text and documents
Remove stop words from documents
Remove selected words from documents or bag-of-words
model
Stem or lemmatize words
Remove empty documents from tokenized document array
bag-of-words model, or bag-of-n-grams model
Convert documents to lowercase
Convert documents to uppercase

Tokens, Sentences, and Parts of Speech

tokenDetails	Details of tokens in tokenized document array
addSentenceDetails	Add sentence numbers to documents
addPartOfSpeechDetails	Add part-of-speech tags to documents
addLanguageDetails	Add language identifiers to documents
addTypeDetails	Add token type details to documents
addLemmaDetails	Add lemma forms of tokens to documents

Export

writeTextDocument Write documents to text file

Manipulation and Conversion

doclength	Length of documents in document array
context	Search documents for word occurrences in context
joinwords	Convert documents to string by joining words
doc2cell	Convert documents to cell array of string vectors
string	Convert scalar document to string vector
plus	Append documents
replace	Find and replace substrings in documents
docfun	Apply function to words in documents
regexprep	Replace text in words of documents using regular expression

Display

wordcloud

 $\label{eq:create} Create \ word \ cloud \ chart \ from \ text, \ bag-of-words \ model, \ bag-of-n-grams \ model, \ or \ LDA \ model$

Examples

Tokenize Text

Create tokenized documents from a string array.

```
str = [
    "an example of a short sentence"
    "a second short sentence"]
str = 2x1 string array
    "an example of a short sentence"
    "a second short sentence"
```

documents = tokenizedDocument(str)

```
documents =
   2x1 tokenizedDocument:
   6 tokens: an example of a short sentence
```

4 tokens: a second short sentence

Detect Complex Tokens

Create a tokenized document from the string str. By default, the function treats the hashtag "#MATLAB", the emoticon ":-D", and the web address "https://www.mathworks.com/help" as single tokens.

```
str = "Learn how to analyze text in #MATLAB! :-D see https://www.mathworks.com/help/";
document = tokenizedDocument(str)
```

```
document =
   tokenizedDocument:
```

11 tokens: Learn how to analyze text in #MATLAB ! :-D see https://www.mathworks.com,

To detect only hashtags as complex tokens, specify the 'DetectPatterns' option to be 'hashtag' only. The function then tokenizes the emoticon ":-D" and the web address "https://www.mathworks.com/help" into multiple tokens.

```
document = tokenizedDocument(str, 'DetectPatterns', 'hashtag')
document =
   tokenizedDocument:
    24 tokens: Learn how to analyze text in #MATLAB ! : - D see https : / / www . mathway
```

Remove Stop Words from Documents

Remove the stop words from an array of documents using removeStopWords. The tokenizedDocument function detects that the documents are in English, so removeStopWords removes English stop words.

```
documents = tokenizedDocument([
    "an example of a short sentence"
    "a second short sentence"]);
newDocuments = removeStopWords(documents)
```

```
newDocuments =
2x1 tokenizedDocument:
3 tokens: example short sentence
3 tokens: second short sentence
```

Stem Words in Documents

Stem the words in a document array using the Porter stemmer.

```
documents = tokenizedDocument([
    "a strongly worded collection of words"
    "another collection of words"]);
newDocuments = normalizeWords(documents)
newDocuments =
    2x1 tokenizedDocument:
    6 tokens: a strongli word collect of word
    4 tokens: anoth collect of word
```

Search Documents for Word Occurrences

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
Search for the word "life".
```

```
tbl = context(documents,"life");
head(tbl)
```

ans=8×3 table

Context	Document	Word	
"consumst thy self single life ah thou issueless shalt "	9	10	
"ainted counterfeit lines life life repair times pencil"	16	35	
"d counterfeit lines life life repair times pencil pupi"	16	36	
" heaven knows tomb hides life shows half parts write b"	17	14	
"he eyes long lives gives life thee "	18	69	
"tender embassy love thee life made four two alone sink"	45	23	
"ves beauty though lovers life beauty shall black lines"	63	50	
"s shorn away live second life second head ere beautys "	68	27	

View the occurrences in a string array.

tbl.Context

```
ans = 23x1 string array
    "consumst thy self single life ah thou issueless shalt "
    "ainted counterfeit lines life life repair times pencil"
    "d counterfeit lines life life repair times pencil pupi"
    " heaven knows tomb hides life shows half parts write b"
    "he eyes long lives gives life thee
    "tender embassy love thee life made four two alone sink"
    "ves beauty though lovers life beauty shall black lines"
    "s shorn away live second life second head ere beautys "
    "e rehearse let love even life decay lest wise world lo"
    "st bail shall carry away life hath line interest memor"
    "art thou hast lost dregs life prey worms body dead cow"
               thoughts food life sweetseasond showers gro"
    "tten name hence immortal life shall though once gone w"
    " beauty mute others give life bring tomb lives life fa"
    "ve life bring tomb lives life fair eyes poets praise d"
    " steal thyself away term life thou art assured mine li"
    "fe thou art assured mine life longer thy love stay dep"
    " fear worst wrongs least life hath end better state be"
    "anst vex inconstant mind life thy revolt doth lie o ha"
    " fame faster time wastes life thou preventst scythe cr"
    "ess harmful deeds better life provide public means pub"
    "ate hate away threw savd life saying
    " many nymphs vowd chaste life keep came tripping maide"
```

Tokenize Japanese Text

Tokenize Japanese text using tokenizedDocument. The function automatically detects Japanese text.

```
str = [
    "恋に悩み、苦しむ。"
    "恋の悩みで苦しむ。"
    "空に星が輝き、瞬いている。"
    "空の星が輝きを増している。"];
documents = tokenizedDocument(str)

documents =
    4x1 tokenizedDocument:
    6 tokens: 恋 に 悩み 、 苦しむ 。
    6 tokens: 恋 の 悩み で 苦しむ 。
    10 tokens: 空 に 星 が 輝き 、 瞬い て いる 。
    10 tokens: 空 の 星 が 輝き を 増し て いる 。
```

Definitions

Language Considerations

The tokenizedDocument function has built-in rules for English and Japanese only. For English text, the 'unicode' tokenization method of tokenizedDocument detects tokens using rules based on Unicode[®] Standard Annex #29 [1] and the ICU tokenizer [2], modified to better detect complex tokens such as hashtags and URLs. For Japanese text, the 'mecab' tokenization method detects tokens using rules based on the MeCab tokenizer [3].

For other languages, you can still try using tokenizedDocument. If tokenizedDocument does not produce useful results, then try tokenizing the text manually. To create a tokenizedDocument array from manually tokenized text, set the 'TokenizeMethod' option to 'none'.

Compatibility Considerations

tokenizedDocument detects emoticons

Behavior changed in R2018b

Starting in R2018b, tokenizedDocument, by default, detects emoticon tokens. This behavior makes it easier to analyze text containing emoticons.

In R2017b and R2018a, tokenizedDocument splits emoticon tokens into multiple
tokens. To reproduce this behavior, in tokenizedDocument, specify the
'DetectPatterns' option to be {'email-address', 'webaddress', 'hashtag', 'at-mention'}.

tokenDetails returns token type emoji for emoji characters

Behavior changed in R2018b

Starting in R2018b, tokenizedDocument detects emoji characters and the tokenDetails function reports these tokens with type "emoji". This makes it easier to analyze text containing emoji characters.

In R2018a, tokenDetails reports emoji characters with type "other". To find the
indices of the tokens with type "emoji" or "other", use the indices idx =
tdetails.Type == "emoji" | tdetails.Type == "other", where tdetails is a
table of token details.

tokenizedDocument does not split at slash and colon characters between digits

Behavior changed in R2018b

Starting in R2018b, tokenizedDocument does not split at slash, backslash, or colon characters when they appear between two digits. This behavior produces better results when tokenizing text containing dates and times.

In previous versions, tokenizedDocument splits at these characters. To reproduce the behavior, tokenize the text manually or insert whitespace characters around slash, backslash, and colon characters before using tokenizedDocument.

tokenDetails

Details of tokens in tokenized document array

Syntax

tdetails = tokenDetails(documents)

Description

tdetails = tokenDetails(documents) returns a table of token details for the tokens in the tokenizedDocument array documents.

Examples

View Token Details of Documents

Create a tokenized document array.

```
str = [ ...
    "This is an example document. It has two sentences."
    "This document has one sentence and an emoticon. :)"
    "Here is another example document. :D"];
documents = tokenizedDocument(str);
```

View the token details of the first few tokens.

```
tdetails = tokenDetails(documents);
head(tdetails)
```

ans=8×5 table Token	DocumentNumber	LineNumber	Туре	Language
"This"	1	1	letters	en
"is"	1	1	letters	en

"an"	1	1	letters	en
"example"	1	1	letters	en
"document"	1	1	letters	en
	1	1	punctuation	en
"It"	1	1	letters	en
"has"	1	1	letters	en

The type variable contains the type of each token. View the emoticons in the documents.

```
idx = tdetails.Type == "emoticon";
tdetails(idx,:)
```

```
ans=2×5 table
```

Token	DocumentNumber	LineNumber	Туре	Language
":)"	2	1	emoticon	en
":D"	3	1	emoticon	en

Add Sentence Details to Documents

Create a tokenized document array.

```
str = [ ...
    "This is an example document. It has two sentences."
    "This document has one sentence."
    "Here is another example document. It also has two sentences."];
documents = tokenizedDocument(str);
```

Add sentence details to the documents using addSentenceDetails. This function adds the sentence numbers to the table returned by tokenDetails. View the updated token details of the first few tokens.

```
documents = addSentenceDetails(documents);
tdetails = tokenDetails(documents);
head(tdetails)
```

ans=8×6 table Token	DocumentNumber	SentenceNumber	LineNumber	Туре	Lang
"This"	1	1	1	letters	(
"is"	1	1	1	letters	
------------	---	---	---	-------------	
"an"	1	1	1	letters	
"example"	1	1	1	letters	
"document"	1	1	1	letters	
	1	1	1	punctuation	
"It"	1	2	1	letters	
"has"	1	2	1	letters	

View the token details of the second sentence of the third document.

```
idx = tdetails.DocumentNumber == 3 & ...
tdetails.SentenceNumber == 2;
tdetails(idx,:)
```

ans=6×6 table

Token	DocumentNumber	SentenceNumber	LineNumber	Туре	La
"T+"	3	2	1	letters	
"also"	3	2	1	letters	
"has"	3	2	1	letters	
"two"	3	2	1	letters	
"sentences"	3	2	1	letters	
" . "	3	2	1	punctuation	

Add Part-of-Speech Details to Documents

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

View the token details of the first few tokens.

```
tdetails = tokenDetails(documents);
head(tdetails)
```

ans=8×5 table Token	DocumentNumber	LineNumber	Туре	Language
"fairest"	1	1	letters	en
"creatures"	1	1	letters	en
"desire"	1	1	letters	en
"increase"	1	1	letters	en
"thereby"	1	1	letters	en
"beautys"	1	1	letters	en
"rose"	1	1	letters	en
"might"	1	1	letters	en

Add part-of-speech details to the documents using the addPartOfSpeechDetails function. This function first adds sentence information to the documents, and then adds the part-of-speech tags to the table returned by tokenDetails. View the updated token details of the first few tokens.

```
documents = addPartOfSpeechDetails(documents);
tdetails = tokenDetails(documents);
head(tdetails)
```

ans=8×7 <i>table</i> Token	DocumentNumber	SentenceNumber	LineNumber	Туре	Langua
"fairest"	1	1	1	letters	en
"creatures"	1	1	1	letters	en
"desire"	1	1	1	letters	en
"increase"	1	1	1	letters	en
"thereby"	1	1	1	letters	en
"beautys"	1	1	1	letters	en
"rose"	1	1	1	letters	en
"might"	1	1	1	letters	en

Input Arguments

documents — Input documents

tokenizedDocument array

Input documents, specified as a tokenizedDocument array.

Output Arguments

tdetails — Table of token details

table

Table of token details. tdetails has the following variables:

Name	Description
Token	Token text, returned as a string scalar.
DocumentNumber	Index of document that the token belongs to, returned as a positive integer.
SentenceNumber	Sentence number of token in document, returned as a positive integer. If these details are missing, then first add sentence details to documents using the addSentenceDetails function.
LineNumber	Line number of token in document, returned as a positive integer.

Name	Description
Туре	The type of token, returned as one of the following:
	 'letters' - string of letter characters only
	• 'digits' - string of digits only
	 'punctuation' - string of punctuation and symbol characters only
	 'email-address' - detected email address
	 'web-address' - detected web address
	 'hashtag' - detected hashtag (starts with "#" character followed by a letter)
	 'at-mention' - detected at-mention (starts with "@" character)
	• 'emoticon' - detected emoticon
	• 'emoji' - detected emoji
	 'other' - does not belong to previous types
	If these details are missing, then first add type details to documents using the addTypeDetails function.

Name	Description
Language	Language of the token, returned as one of the following:
	• 'en' – English
	• 'ja' – Japanese
	These language details determine the behavior of the removeStopWords, addPartOfSpeechDetails, normalizeWords, and addSentenceDetails functions on the tokens.
	If these details are missing, then first add language details to documents using the addLanguageDetails function.
	For more information about language support in Text Analytics Toolbox, see "Language Support".

Name	Description
PartOfSpeech	Part of speech tag, specified as one of the following:
	• 'adjective'
	• 'adposition'
	• 'adverb'
	 'auxiliary-verb'
	 'coord-conjunction'
	• 'determiner'
	 'interjection'
	• 'noun'
	• 'numeral'
	• 'particle'
	• 'pronoun'
	• 'proper-noun'
	• 'punctuation'
	 'subord-conjunction'
	• 'symbol'
	• 'verb'
	• 'other'
	If these details are missing, then first add part-of-speech details to documents using the addPartOfSpeechDetails function.
Lemma	Lemma form. If these details are missing, then first lemma details to documents using the addLemmaDetails function.

Compatibility Considerations

tokenDetails returns token type emoji for emoji characters

Behavior changed in R2018b

Starting in R2018b, tokenizedDocument detects emoji characters and the tokenDetails function reports these tokens with type "emoji". This makes it easier to analyze text containing emoji characters.

In R2018a, tokenDetails reports emoji characters with type "other". To find the
indices of the tokens with type "emoji" or "other", use the indices idx =
tdetails.Type == "emoji" | tdetails.Type == "other", where tdetails is a
table of token details.

Introduced in R2018a

topkwords

Most important words in bag-of-words model or LDA topic

Syntax

tbl = topkwords(bag)

tbl = topkwords(bag,k)

- tbl = topkwords(ldaMdl,k,topicIdx)
- tbl = topkwords(____, Name, Value)

Description

tbl = topkwords(bag) returns a table of the five words with the largest word counts
in bag-of-words model bag.

tbl = topkwords(bag,k) returns a table of the k words with the largest word counts.

tbl = topkwords(ldaMdl,k,topicIdx) returns a table of the k words with the highest probabilities in the latent Dirichlet allocation (LDA) topic topicIdx in the LDA modelldaMdl.

tbl = topkwords(_____, Name, Value) specifies additional options using one or more
name-value pair arguments.

Examples

Most Frequent Words of Bag-of-Words Model

Create a table of the most frequent words of a bag-of-words model.

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words

separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

Create a bag-of-words model using bag0fWords.

```
bag = bagOfWords(documents)
bag =
    bagOfWords with properties:
        Counts: [154x3092 double]
        Vocabulary: [1x3092 string]
        NumWords: 3092
        NumDocuments: 154
```

Find the top five words.

T = topkwords(bag);

Find the top 20 words in the model.

```
k = 20;
T = topkwords(bag,k)
T=20×2 table
      Word
                 Count
    "thv"
                  281
    "thou"
                  234
    "love"
                  162
    "thee"
                  161
    "doth"
                   88
    "mine"
                   63
    "shall"
                   59
    "eves"
                   56
    "sweet"
                   55
    "time"
                   53
    "beautv"
                   52
```

"nor"	52
"art"	51
"yet"	51
"0"	50
"heart"	50
:	

Highest Probability Words of LDA Topic

Create a table of the words with highest probability of an LDA topic.

To reproduce the results, set rng to 'default'.

```
rng('default')
```

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

Create a bag-of-words model using bag0fWords.

bag = bagOfWords(documents);

Fit an LDA model with 20 topics. To suppress verbose output, set 'Verbose' to 0.

```
numTopics = 20;
mdl = fitlda(bag,numTopics,'Verbose',0);
```

Find the top 20 words of the first topic.

"eyes"	0.11155
"beauty"	0.05777
"hath"	0.055778
"still"	0.049801
"true"	0.043825
"mine"	0.033865
"find"	0.031873
"black"	0.025897
"look"	0.023905
"tis"	0.023905
"kind"	0.021913
"seen"	0.021913
"found"	0.017929
"sin"	0.015937
"three"	0.013945
"golden"	0.0099608

Find the top 20 words of the first topic and use inverse mean scaling on the scores.

tbl = topkwords(mdl,k,topicIdx,'Scaling','inversemean')

tbl=20×2 table	
Word	Score
"eyes"	1.2718
"beauty"	0.59022
"hath"	0.5692
"still"	0.50269
"true"	0.43719
"mine"	0.32764
"find"	0.32544
"black"	0.25931
"tis"	0.23755
"look"	0.22519
"kind"	0.21594
"seen"	0.21594
"found"	0.17326
"sin"	0.15223
"three"	0.13143
"golden"	0.090698

Create a word cloud using the scaled scores as the size data.

figure
wordcloud(tbl.Word,tbl.Score);

Input Arguments

bag — Input bag-of-words model
bagOfWords object

Input bag-of-words model, specified as a bagOfWords object.

k — **Number of words** nonnegative integer

Number of words to return, specified as a positive integer.

Example: 20

ldaMdl — Input LDA model

ldaModel object

Input LDA model, specified as an ldaModel object.

topicIdx — Index of LDA topic

nonnegative integer

Index of LDA topic, specified as a nonnegative integer.

Name-Value Pair Arguments

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1, Value1, ..., NameN, ValueN.

Example: 'Scaling', 'inversemean' specifies to use inverse mean scaling on the topic word probabilities.

ForceCellOutput — **Indicator for forcing output to be returned as cell array** false (default) | true

Indicator for forcing output to be returned as cell array, specified as the comma separated pair consisting of 'ForceCellOutput' and true or false.

This option only applies if the input data is a bag-of-words model.

Data Types: logical

Scaling — Scaling to apply to topic word probabilities

'none' (default) | 'inversemean'

Scaling to apply to topic word probabilities, specified as the comma-separated pair consisting of 'Scaling' and one of the following:

- 'none' Return posterior word probabilities.
- 'inversemean' Normalize the posterior word probabilities per topic by the geometric mean of the posterior probabilities for this word across all topics. The function uses the formula Phi.*(log(Phi)-mean(log(Phi),1)), where Phi corresponds to ldaMdl.TopicWordProbabilities.

This option only applies if the input data is an LDA model.

Example: 'Scaling', 'inversemean' Data Types: char

Output Arguments

tbl — Table of top words

table | cell array of tables

Table of top words sorted in order of importance or a cell array of tables.

When the input is a bag-of-words model, the table has the following columns:

Word	Word specified as a string
Count	Number of times the word appears in the bag-of-words model

If bag is a non-scalar array or 'ForceCellOutput' is true, then the function returns the outputs as a cell array of tables. Each element in the cell array is a table containing the top words of the corresponding element of bag.

When the input is an LDA model, the table has the following columns:

Word	Word specified as a string
Score	Word probability for the given LDA topic

Tips

• To find the most frequently seen n-grams in a bag-of-n-grams model, use topkngrams.

Introduced in R2017b

topkngrams

Most frequent n-grams

Syntax

```
tbl = topkngrams(bag)
tbl = topkngrams(bag,k)
tbl = topkngrams(____,Name,Value)
```

Description

tbl = topkngrams(bag) returns a table listing the five most frequently seen n-grams in the bag-of-n-grams model bag.

tbl = topkngrams(bag,k) lists the k most frequently seen n-grams in the bag-of-ngrams model bag.

tbl = topkngrams(____, Name, Value) specifies additional options using one or more
name-value pair arguments.

Examples

Most Frequent Bigrams of Bag-of-N-Grams Model

Create a table of the most frequent bigrams of a bag-of-n-grams model.

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
```

```
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

Create a bag-of-n-grams model.

```
bag = bagOfNgrams(documents)
```

bag =

bagOfNgrams with properties:

```
Counts: [154×8799 double]
Vocabulary: [1×3092 string]
Ngrams: [8799×2 string]
NgramLengths: 2
NumNgrams: 8799
NumDocuments: 154
```

Find the top 5 bigrams.

tbl = topkngrams(bag)

tbl=5×3 tabl Ngr	bl=5×3 table Ngram		NgramLength
"thou"	"art"	34	2
"mine"	"eye"	15	2
"thy"	"self"	14	2
"thou"	"dost"	13	2
"mine"	"own"	13	2

Find the top 10 bigrams.

tbl = topkngrams(bag,10)

tbl= <i>10×3 tab</i> Ng	le ram	Count	NgramLength
"thou"	"art"	34	2
"mine"	"eye"	15	2
"thy"	"self"	14	2
"thou"	"dost"	13	2
"mine"	"own"	13	2

"thy"	"sweet"	12	2
"thy"	"love"	11	2
"dost"	"thou"	10	2
"thou"	"wilt"	10	2
"love"	"thee"	9	2

Count N-Grams of Different Lengths

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

Create a bag-of-n-grams model. To count n-grams of length 2 and 3 (bigrams and trigrams), specify 'NgramLengths' to be the vector [2 3].

```
bag = bagOfNgrams(documents,'NgramLengths',[2 3])
bag =
    bagOfNgrams with properties:
        Counts: [154×18022 double]
        Vocabulary: [1×3092 string]
        Ngrams: [18022×3 string]
        NgramLengths: [2 3]
        NumNgrams: 18022
        NumDocuments: 154
```

View the 10 most common n-grams of length 2 (bigrams).

```
topkngrams(bag,10,'NGramLengths',2)
ans=10×3 table
Ngram Count NgramLength
```

"thou"	"art"	11 11	34	2
"mine"	"eye"		15	2

"thou"	"dost"		13	2
"mine"	"own"		13	2
"thy"	"sweet"		12	2
"thy"	"love"		11	2
"dost"	"thou"		10	2
"thou"	"wilt"		10	2
"love"	"thee"	11.11	9	2

View the 10 most common n-grams of length 3 (trigrams).

topkngrams(bag,10,'NGramLengths',3)

ans=10×3 ta	b	le	
-------------	---	----	--

	Ngram		Count	NgramLength
"thy"	"sweet"	"self"	4	3
"why"	"dost"	"thou"	4	3
"thy"	"self"	"thy"	3	3
"thou"	"thy"	"self"	3	3
"mine"	"eye"	"heart"	3	3
"thou"	"shalt"	"find"	3	3
"fair"	"kind"	"true"	3	3
"thou"	"art"	"fair"	2	3
"love"	"thy"	"self"	2	3
"thy"	"self"	"thou"	2	3

Input Arguments

bag — Input bag-of-n-grams model

bagOfNgrams object

Input bag-of-n-grams model, specified as a bagOfNgrams object.

k — Number of n-grams

nonnegative integer

Number of n-grams to return, specified as a positive integer.

Example: 20

Name-Value Pair Arguments

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1, Value1, ..., NameN, ValueN.

Example: 'NgramLengths', [2 3] specifies to return the top bigrams and trigrams.

NgramLengths — N-gram lengths

positive integer | vector of positive integers

N-gram lengths, specified as the comma separated pair consisting of 'NgramLengths' and a positive integer or a vector of positive integers.

If you specify NgramLengths, then the function returns n-grams of these lengths only. If you do not specify NgramLengths, then the function returns the top n-grams regardless of length.

Example: [1 2 3]

ForceCellOutput — Indicator for forcing output to be returned as cell array

false (default) | true

Indicator for forcing output to be returned as cell array, specified as the comma separated pair consisting of 'ForceCellOutput' and true or false.

Data Types: logical

Output Arguments

tbl — Table of top n-grams

table | cell array of tables

Table of top n-grams sorted in order of frequency or a cell array of tables.

The table has the following columns:

Ngram	N-gram specified as a string vector
Count	Number of times the n-gram appears in the bag-of-n-grams model.
NgramLength	Length of the n-gram.

If bag is a non-scalar array or 'ForceCellOutput' is true, then the function returns the outputs as a cell array of tables. Each element in the cell array is a table containing the top n-grams of the corresponding element of bag.

topLevelDomains

List of top-level domains

Syntax

domains = topLevelDomains

Description

domains = **topLevelDomains** returns a string array of common top-level internet domain names which you can use to tokenize documents containing URLs.

Examples

List of Top-Level Domains

View list of top-level domains used to detect web addresses in strings. Reshape the output for readability.

```
domains = topLevelDomains;
reshape(domains, [], 5)
```

ans	= 51x5	string ar	ray

trainWordEmbedding

Train word embedding

Syntax

```
emb = trainWordEmbedding(filename)
emb = trainWordEmbedding(documents)
emb = trainWordEmbedding(____,Name,Value)
```

Description

emb = trainWordEmbedding(filename) trains a word embedding using the training
data stored in the text file filename. The file is a collection of documents stored in UTF-8
with one document per line and words separated by whitespace.

emb = trainWordEmbedding(documents) trains a word embedding using documents
by creating a temporary file with writeTextDocument, and then trains an embedding
using the temporary file.

emb = trainWordEmbedding(_____, Name, Value) specifies additional options using
one or more name-value pair arguments. For example, 'Dimension', 50 specifies the
word embedding dimension to be 50.

Examples

Train Word Embedding from File

Train a word embedding of dimension 20 using the example text file exampleSonnetsDocuments.txt. This file contains preprocessed versions of Shakespeare's sonnets, with one sonnet per line and words separated by a space.

```
filename = "exampleSonnetsDocuments.txt";
emb = trainWordEmbedding(filename)
```

```
Training: 100% Loss: 0 Remaining time: 0 hours 0 minutes.
emb =
  wordEmbedding with properties:
    Dimension: 100
    Vocabulary: [1x502 string]
```

View the word embedding in a text scatter plot using tsne.

```
words = emb.Vocabulary;
V = word2vec(emb,words);
XY = tsne(V);
textscatter(XY,words)
```

Train Word Embedding from Documents

Train a word embedding using the example data sonnetsPreprocessed.txt. This file contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

Train a word embedding using trainWordEmbedding.

```
emb = trainWordEmbedding(documents)
Training: 100% Loss: 2.7096 Remaining time: 0 hours 0 minutes.
emb =
   wordEmbedding with properties:
        Dimension: 100
        Vocabulary: [1x401 string]
```

Visualize the word embedding in a text scatter plot using tsne.

```
words = emb.Vocabulary;
V = word2vec(emb,words);
XY = tsne(V);
textscatter(XY,words)
```

Specify Word Embedding Options

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

Specify the word embedding dimension to be 50. To reduce the number of words discarded by the model, set 'MinCount' to 3. To train for longer, set the number of epochs to 10.

```
emb = trainWordEmbedding(documents, ...
    'Dimension',50, ...
    'MinCount',3, ...
    'NumEpochs',10)
Training: 100% Loss: 0 Remaining time: 0 hours 0 minutes.
emb =
    wordEmbedding with properties:
    Dimension: 50
    Vocabulary: [1x750 string]
```

View the word embedding in a text scatter plot using tsne.

```
words = emb.Vocabulary;
V = word2vec(emb, words);
XY = tsne(V);
textscatter(XY,words)
```

Input Arguments

filename — Name of file

string scalar | character vector

Name of the file, specified as a string scalar or character vector.

Data Types: string | char

documents — Input documents

tokenizedDocument array

Input documents, specified as a tokenizedDocument array.

Name-Value Pair Arguments

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1, Value1, ..., NameN, ValueN.

Example: 'Dimension', 50 specifies the word embedding dimension to be 50.

Dimension — Dimension of word embedding

100 (default) | positive integer

Dimension of the word embedding, specified as the comma-separated pair consisting of 'Dimension' and a nonnegative integer.

Example: 300

Window — Size of context window

5 (default) | nonnegative integer

Size of the context window, specified as the comma-separated pair consisting of 'Window' and a nonnegative integer.

Example: 10

Model — Model
'skipgram' (default) | 'cbow'

Model, specified as the comma-separated pair consisting of 'Model' and 'skipgram' (skip gram) or 'cbow' (continuous bag-of-words).

Example: 'cbow'

DiscardFactor — Factor to determine word discard rate

1e-4 (default) | positive scalar

Factor to determine the word discard rate, specified as the comma-separated pair consisting of 'DiscardFactor' and a positive scalar. The function discards a word from the input window with probability 1-sqrt(t/f) - t/f where f is the unigram probability of the word, and t is DiscardFactor. Usually, DiscardFactor is in the range of 1e-3 through 1e-5.

Example: 0.005

LossFunction — Loss function

'ns'(default)|'hs'|'softmax'

Loss function, specified as the comma-separated pair consisting of 'LossFunction' and 'ns' (negative sampling), 'hs' (hierarchical softmax), or 'softmax' (softmax).

Example: 'hs'

NumNegativeSamples — Number of negative samples

5 (default) | positive integer

Number of negative samples for the negative sampling loss function, specified as the comma-separated pair consisting of 'NumNegativeSamples' and a positive integer. This option is only valid when LossFunction is 'ns'.

Example: 10

NumEpochs — Number of epochs

5 (default) | positive integer

Number of epochs for training, specified as the comma-separated pair consisting of 'NumEpochs' and a positive integer.

Example: 10

MinCount — Minimum count of words

5 (default) | positive integer

Minimum count of words to include in the embedding, specified as the comma-separated pair consisting of 'MinCount' and a positive integer. The function discards words that appear fewer than MinCount times in the training data from the vocabulary.

Example: 10

NGramRange — Inclusive range for subword n-grams

[3 6] (default) | vector of two nonnegative integers

Inclusive range for subword n-grams, specified as the comma-separated pair consisting of 'NGramRange' and a vector of two nonnegative integers [min max]. If you do not want to use n-grams, then set 'NGramRange' to [0 0].

Example: [5 10]

InitialLearnRate — Initial learn rate

0.05 (default) | positive scalar

Initial learn rate, specified as the comma-separated pair consisting of 'InitialLearnRate' and a positive scalar.

Example: 0.01

UpdateRate — Rate for updating learn rate

100 (default) | positive integer

Rate for updating the learn rate, specified as the comma-separated pair consisting of 'UpdateRate' and a positive integer. The learn rate decreases to zero linearly in steps every N words where N is the UpdateRate.

Example: 50

Verbose - Verbosity level

1 (default) | 0

Verbosity level, specified as the comma-separated pair consisting of 'Verbose' and one of the following:

- 0 Do not display verbose output.
- 1 Display progress information.

Example: 'Verbose',0

Output Arguments

emb — Output word embedding

word embedding

Output word embedding, returned as a wordEmbedding object.

Definitions

Language Considerations

File input to the trainWordEmbedding function requires words separated by whitespace.

For files containing non-English text, you might need to input a tokenizedDocument array to trainWordEmbedding.

To create a tokenizedDocument array from pretokenized text, use the tokenizedDocument function and set the 'TokenizeMethod' option to 'none'.

Tips

The training algorithm uses the number of threads given by the function maxNumCompThreads. To learn how to change the number of threads used by MATLAB, see maxNumCompThreads.

Introduced in R2017b

transform

Transform documents into lower-dimensional space

Syntax

```
dscores = transform(lsaMdl,documents)
dscores = transform(lsaMdl,bag)
dscores = transform(lsaMdl,counts)
dscores = transform(ldaMdl,documents)
dscores = transform(ldaMdl,bag)
dscores = transform(ldaMdl,counts)
dscores = transform( ,Name,Value)
```

Description

dscores = transform(lsaMdl,documents) transforms documents into the semantic space of the latent semantic analysis (LSA) model lsaMdl.

dscores = transform(lsaMdl,bag) transforms documents represented by the bagof-words or bag-of-n-grams model bag into the semantic space of the LSA model lsaMdl.

dscores = transform(lsaMdl,counts) transforms documents represented by the matrix of word counts into the semantic space of the LSA model lsaMdl.

dscores = transform(ldaMdl,documents) transforms documents into the latent Dirichlet allocation (LDA) topic probability space of LDA model ldaMdl. The rows of dscores are the topic mixture representations of the documents.

dscores = transform(ldaMdl,bag) transforms documents represented by the bagof-words or bag-of-n-grams model bag into the LDA topic probability space of LDA model ldaMdl.

dscores = transform(ldaMdl,counts) transforms documents represented by the matrix of word counts into the LDA topic probability space of LDA model ldaMdl.

dscores = transform(_____, Name, Value) specifies additional options using one or more name-value pair arguments. These name-value pairs only apply if the input model is an ldaModel object.

Examples

Transform Documents into LSA Semantic Space

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

Create a bag-of-words model using bag0fWords.

```
bag = bagOfWords(documents)
bag =
    bagOfWords with properties:
        Counts: [154x3092 double]
        Vocabulary: [1x3092 string]
        NumWords: 3092
        NumDocuments: 154
```

Fit an LSA model with 20 components.

```
numCompnents = 20;
mdl = fitlsa(bag,numCompnents)
mdl =
    lsaModel with properties:
        NumComponents: 20
        ComponentWeights: [1x20 double]
        DocumentScores: [154x20 double]
```
WordScores: [3092x20 double] Vocabulary: [1x3092 string] FeatureStrengthExponent: 2

Use transform to transform the first 10 documents into the semantic space of the LSA model.

dscores = transform(mdl,documents(1:10))

dscores = 10×20

5.6059	-1.8559	0.9286	-0.7086	-0.4652	-0.8340	-0.6751	0.0611	0.2

Transform Documents into LDA Topic Mixtures

To reproduce the results in this example, set rng to 'default'.

```
rng('default')
```

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

Create a bag-of-words model using bag0fWords.

```
bag = bagOfWords(documents)
```

```
bag =
  bagOfWords with properties:
        Counts: [154x3092 double]
        Vocabulary: [1x3092 string]
        NumWords: 3092
        NumDocuments: 154
```

Fit an LDA model with five topics.

numTopics = 5; mdl = fitlda(bag,numTopics)

Initial topic assignments sampled in 0.0415024 seconds.

Iteration	Time per	Relative	Training	Topic	Topic
	iteration	change in	perplexity	concentration	concentration
	(seconds)	log(L)			iterations
0 1 2 3	0.01 0.03 0.02 0.02	 1.2300e-02 1.3254e-03 2.9402e-05	1.212e+03 1.112e+03 1.102e+03 1.102e+03	1.250 1.250 1.250 1.250 1.250	0 0 0 0

mdl =

ldaModel with properties:

```
NumTopics: 5

WordConcentration: 1

TopicConcentration: 1.2500

CorpusTopicProbabilities: [0.2000 0.2000 0.2000 0.2000]

DocumentTopicProbabilities: [154x5 double]

TopicWordProbabilities: [3092x5 double]

Vocabulary: [1x3092 string]

TopicOrder: 'initial-fit-probability'

FitInfo: [1x1 struct]
```

Use transform to transform the documents into a vector of topic probabilities. You can visualize these mixtures using stacked bar charts. View the topic mixtures of the first 10 documents.

```
topicMixtures = transform(mdl,documents(1:10));
figure
```

```
barh(topicMixtures,'stacked')
xlim([0 1])
title("Topic Mixtures")
xlabel("Topic Probability")
ylabel("Document")
legend("Topic " + string(1:numTopics),'Location','northeastoutside')
```

Transform Word Count Matrix into LDA Topic Mixtures

Load the example data. sonnetsCounts.mat contains a matrix of word counts and a corresponding vocabulary of preprocessed versions of Shakespeare's sonnets.

```
load sonnetsCounts.mat
size(counts)
ans = 1×2
154 3092
```

Fit an LDA model with 20 topics. To reproduce the results in this example, set rng to <code>'default'</code>.

```
rng('default')
numTopics = 20;
mdl = fitlda(counts,numTopics)
```

Initial topic assignments sampled in 0.0597549 seconds.

Iteration	Time per	Relative	Training	Topic	Topic
	iteration	change in	perplexity	concentration	concentration
	(seconds)	log(L)			iterations
0 1 2 3 4 5 6	0.02 0.07 0.07 0.06 0.07 0.06 0.06	 5.4884e-02 4.7400e-03 3.4597e-03 3.4662e-03 2.9259e-03 6.4180e-05	1.159e+03 8.028e+02 7.778e+02 7.602e+02 7.430e+02 7.288e+02 7.291e+02	5.000 5.000 5.000 5.000 5.000 5.000 5.000 5.000	0 0 0 0 0 0 0

```
mdl =
```

ldaModel with properties:

```
NumTopics: 20
WordConcentration: 1
TopicConcentration: 5
CorpusTopicProbabilities: [1x20 double]
DocumentTopicProbabilities: [154x20 double]
TopicWordProbabilities: [3092x20 double]
Vocabulary: [1x3092 string]
TopicOrder: 'initial-fit-probability'
FitInfo: [1x1 struct]
```

Use transform to transform the documents into a vector of topic probabilities.

topicMixtures = transform(mdl,counts(1:10,:))

topicMixtures = 10×20

Input Arguments

lsaMdl — Input LSA model

lsaModel object

Input LSA model, specified as an lsaModel object.

ldaMdl — Input LDA model

ldaModel object

Input LDA model, specified as an ldaModel object.

documents — Input documents

tokenizedDocument array | string array of words | cell array of character vectors

Input documents, specified as a tokenizedDocument array, a string array of words, or a cell array of character vectors. If documents is a tokenizedDocument, then it must be a column vector. If documents is a string array or a cell array of character vectors, then it must be a row of the words of a single document.

Tip To ensure that the function does not discard useful information, you must first preprocess the input documents using the same steps used to preprocess the documents used to train the model.

bag — Input model

bagOfWords object | bagOfNgrams object

Input bag-of-words or bag-of-n-grams model, specified as a bagOfWords object or a bagOfNgrams object. If bag is a bagOfNgrams object, then the function treats the n-grams as individual words.

counts — Frequency counts of words

matrix of nonnegative integers

Frequency counts of words, specified as a matrix of nonnegative integers. If you specify 'DocumentsIn' to be 'rows', then the value counts(i,j) corresponds to the number of times the *j*th word of the vocabulary appears in the *i*th document. Otherwise, the value counts(i,j) corresponds to the number of times the *i*th word of the vocabulary appears in the *j*th document.

Name-Value Pair Arguments

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1, Value1, ..., NameN, ValueN.

Example: 'IterationLimit', 200 sets the iteration limit to 200.

Note These name-value pairs only apply if the input model is an ldaModel object.

DocumentsIn — Orientation of documents

'rows' (default) | 'columns'

Orientation of documents in the word count matrix, specified as the comma-separated pair consisting of 'DocumentsIn' and one of the following:

- 'rows' Input is a matrix of word counts with rows corresponding to documents.
- 'columns' Input is a transposed matrix of word counts with columns corresponding to documents.

This option only applies if you specify the input documents as a matrix of word counts.

Note If you orient your word count matrix so that documents correspond to columns and specify 'DocumentsIn', 'columns', then you might experience a significant reduction in optimization-execution time.

IterationLimit — Maximum number of iterations

100 (default) | positive integer

Maximum number of iterations, specified as the comma-separated pair consisting of 'IterationLimit' and a positive integer.

Example: 'IterationLimit',200

LogLikelihoodTolerance — Relative tolerance on log-likelihood 0.0001 (default) | positive scalar

Relative tolerance on log-likelihood, specified as the comma-separated pair consisting of 'LogLikelihoodTolerance' and a positive scalar. The optimization terminates when this tolerance is reached.

Example: 'LogLikelihoodTolerance',0.001

Output Arguments

dscores — Output document scores

matrix

Output document scores, returned as a matrix of score vectors.

Introduced in R2017b

upper

Convert documents to uppercase

Syntax

```
newDocuments = upper(documents)
```

Description

newDocuments = upper(documents) converts each lowercase character in the input documents to the corresponding uppercase character, and leaves all other characters unchanged.

Examples

Convert Documents to Uppercase

Convert all lowercase characters in an array of documents to uppercase.

```
documents = tokenizedDocument([
    "An Example of a Short Sentence"
    "A Second Short Sentence"])
documents =
    2x1 tokenizedDocument:
    6 tokens: An Example of a Short Sentence
    4 tokens: A Second Short Sentence
newDocuments = upper(documents)
```

```
newDocuments =
    2x1 tokenizedDocument:
```

6 tokens: AN EXAMPLE OF A SHORT SENTENCE 4 tokens: A SECOND SHORT SENTENCE

Input Arguments

documents - Input documents
tokenizedDocument array

Input documents, specified as a tokenizedDocument array.

Output Arguments

newDocuments — Output documents

tokenizedDocument array

Output documents, returned as a tokenizedDocument array.

Topics

"Prepare Text Data for Analysis" "Create Simple Text Model for Classification"

Introduced in R2017b

vec2word

Map embedding vector to word

Syntax

```
words = vec2word(emb,M)
[words,dist] = vec2word(emb,M)
____ = vec2word(emb,M,k)
____ = vec2word(____,'Distance',distance)
```

Description

words = vec2word(emb,M) returns the closest words to the embedding vectors in the rows of M.

[words,dist] = vec2word(emb,M) returns the closest words to the embedding vectors in M, and returns the distances dist of each to their source vectors.

= vec2word(emb,M,k) returns the top k closest words.

____ = vec2word(____, 'Distance', distance) specifies the distance metric.

Examples

Map Words to Vectors and Back

Load a pretrained word embedding using fastTextWordEmbedding. This function requires Text Analytics Toolbox[™] Model for fastText English 16 Billion Token Word Embedding support package. If this support package is not installed, then the function provides a download link.

```
emb = fastTextWordEmbedding
```

```
emb =
wordEmbedding with properties:
```

```
Dimension: 300
Vocabulary: [1×1000000 string]
```

Map the words "Italy", "Rome", and "Paris" to vectors using word2vec.

```
italy = word2vec(emb, "Italy");
rome = word2vec(emb, "Rome");
paris = word2vec(emb, "Paris");
Map the vector italy - rome + paris to a word using vec2word.
word = vec2word(emb,italy - rome + paris)
word =
"France"
```

Find Closest Words to Vector

Find the top five closest words to a word embedding vector and their distances.

Load a pretrained word embedding using fastTextWordEmbedding. This function requires Text Analytics Toolbox[™] Model for fastText English 16 Billion Token Word Embedding support package. If this support package is not installed, then the function provides a download link.

emb = fastTextWordEmbedding;

Map the words "Italy", "Rome", and "Paris" to vectors using word2vec.

```
italy = word2vec(emb,"Italy");
rome = word2vec(emb,"Rome");
paris = word2vec(emb,"Paris");
```

Map the vector italy - rome + paris to a word using vec2word. Find the top five closest words using the Euclidean distance metric.

```
k = 5;
M = italy - rome + paris;
[words,dist] = vec2word(emb,M,k,'Distance','euclidean');
```

Plot the words and distances in a bar chart.

```
figure;
bar(dist)
xticklabels(words)
xlabel("Word")
ylabel("Distance")
title("Distances to Vector")
```

Input Arguments

emb — Input word embedding

wordEmbedding object

Input word embedding, specified as a wordEmbedding object.

M — Word embedding vectors

matrix

Word embedding vectors, specified as a matrix. Each row of M is a word embedding vector. M must have emb.Dimension columns.

distance — Distance metric
'cosine'(default)|'euclidean'

Distance metric, specified as 'cosine' or 'euclidean'.

Output Arguments

words - Output words

string vector

Output words, returned as a string vector.

dist — Distance of words to source vectors

vector

Distance of words to their source vectors, returned as a vector.

word2ind

Map word to encoding index

Syntax

M = word2ind(enc,words)

Description

M = word2ind(enc,words) returns the indices of words in the encoding enc.

Examples

Map Words to Encoding Indices

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
documents(1:10)
ans =
10x1 tokenizedDocument:
70 tokens: fairest creatures desire increase thereby beautys rose might never die
71 tokens: forty winters shall besiege thy brow dig deep trenches thy beautys field
65 tokens: look thy glass tell face thou viewest time face form another whose fresh
71 tokens: unthrifty loveliness why dost thou spend upon thy self thy beautys legal
```

65 tokens: look thy glass tell face thou viewest time face form another whose fresh 71 tokens: unthrifty loveliness why dost thou spend upon thy self thy beautys legat 61 tokens: hours gentle work frame lovely gaze every eye doth dwell play tyrants sa 68 tokens: let winters ragged hand deface thee thy summer ere thou distilld make sw 64 tokens: lo orient gracious light lifts up burning head eye doth homage newappea 70 tokens: music hear why hearst thou music sadly sweets sweets war joy delights jo 70 tokens: fear wet widows eye thou consumst thy self single life ah thou issueles 69 tokens: shame deny thou bearst love thy self art unprovident grant thou wilt the

Create a word encoding.

```
enc = wordEncoding(documents)
enc =
wordEncoding with properties:
    NumWords: 3092
Vocabulary: [1x3092 string]
```

Map the words "rose", "love", and "beauty" to encoding indices using the word2ind function.

```
words = ["rose" "love" "beauty"];
idx = word2ind(enc,words)
idx = 1×3
7 387 79
```

Input Arguments

enc — Input word encoding

wordEncoding object

Input word encoding, specified as a wordEncoding object.

words — Input words

string vector | character vector | cell array of character vectors

Input words, specified as a string vector, character vector, or cell array of character vectors. If you specify words as a character vector, then the function treats the argument as a single word.

```
Data Types: string | char | cell
```

Output Arguments

M — Vector of word encoding indices

vector of positive integers

Vector of word encoding indices.

word2vec

Map word to embedding vector

Syntax

M = word2vec(emb,words)

Description

M = word2vec(emb,words) returns the embedding vectors of words in the embedding emb. If a word is not in the embedding vocabulary, then the function returns a row of NaNs.

Examples

Map Words to Vectors and Back

Load a pretrained word embedding using fastTextWordEmbedding. This function requires Text Analytics Toolbox[™] Model for fastText English 16 Billion Token Word Embedding support package. If this support package is not installed, then the function provides a download link.

```
emb = fastTextWordEmbedding
emb =
wordEmbedding with properties:
    Dimension: 300
Vocabulary: [1×1000000 string]
```

Map the words "Italy", "Rome", and "Paris" to vectors using word2vec.

```
italy = word2vec(emb, "Italy");
rome = word2vec(emb, "Rome");
paris = word2vec(emb, "Paris");
Map the vector italy - rome + paris to a word using vec2word.
word = vec2word(emb,italy - rome + paris)
word =
"France"
```

Input Arguments

emb — Input word embedding

wordEmbedding object

Input word embedding, specified as a wordEmbedding object.

words – Input words

string vector | character vector | cell array of character vectors

Input words, specified as a string vector, character vector, or cell array of character vectors. If you specify words as a character vector, then the function treats the argument as a single word.

```
Data Types: string | char | cell
```

Output Arguments

M — Matrix of word embedding vectors

matrix

Matrix of word embedding vectors.

wordcloud

Create word cloud chart from text, bag-of-words model, bag-of-n-grams model, or LDA model

Text Analytics Toolbox extends the functionality of the wordcloud (MATLAB) function. It adds support for creating word clouds directly from string arrays, and creating word clouds from bag-of-words models, bag-of-n-gram models, and LDA topics. If you do not have Text Analytics Toolbox installed, see wordcloud (MATLAB).

Syntax

```
wc = wordcloud(str)
wc = wordcloud(documents)
wc = wordcloud(bag)
wc = wordcloud(tbl,wordVar,sizeVar)
wc = wordcloud(words,sizeData)
wc = wordcloud(C)
wc = wordcloud(ldaMdl,topicIdx)
wc = wordcloud(parent, ____)
wc = wordcloud(____,Name,Value)
```

Description

wc = wordcloud(str) creates a word cloud chart by tokenizing and preprocessing the text in str, and then displaying the words with sizes corresponding to the word frequency counts.

wc = wordcloud(documents) creates a word cloud chart from the words appearing in documents.

wc = wordcloud(bag) creates a word cloud chart from the bag-of-words or bag-of-ngrams model bag. wc = wordcloud(tbl,wordVar,sizeVar) creates a word cloud chart from the table tbl. The variables wordVar and sizeVar in the table specify the words and word sizes respectively.

wc = wordcloud(words,sizeData) creates a word cloud chart from elements of words with word sizes specified by sizeData.

wc = wordcloud(C) creates a word cloud chart from the elements of categorical array C using frequency counts.

wc = wordcloud(ldaMdl,topicIdx) creates a word cloud chart from the topic with index topicIdx of the LDA model ldaMdl.

wc = wordcloud(parent, ____) creates the word cloud in the figure, panel, or tab specified by parent.

wc = wordcloud(_____, Name, Value) specifies additional WordCloudChart properties
using one or more name-value pair arguments.

Examples

Create Word Cloud from Text Data

Extract the text from sonnets.txt using extractFileText and display the text of the first sonnet.

```
str = extractFileText("sonnets.txt");
extractBefore(str,"II")
ans =
    "THE SONNETS
    by William Shakespeare
```

Ι

From fairest creatures we desire increase, That thereby beauty's rose might never die, But as the riper should by time decease, His tender heir might bear his memory: But thou, contracted to thine own bright eyes, Feed'st thy light's flame with self-substantial fuel, Making a famine where abundance lies, Thy self thy foe, to thy sweet self too cruel: Thou that art now the world's fresh ornament, And only herald to the gaudy spring, Within thine own bud buriest thy content, And tender churl mak'st waste in niggarding: Pity the world, or else this glutton be, To eat the world's due, by the grave and thee.

п

Display the words from the sonnets in a word cloud.

figure
wordcloud(str);

Create Word Cloud from Tokenized Documents

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

Visualize the documents using a word cloud.

Create Word Cloud from Bag-of-Words Model

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

Create a bag-of-words model using bagOfWords.

```
bag = bagOfWords(documents)
bag =
    bagOfWords with properties:
        Counts: [154x3092 double]
        Vocabulary: [1x3092 string]
        NumWords: 3092
        NumDocuments: 154
```

Visualize the bag-of-words model using a word cloud.

figure
wordcloud(bag);

Create Word Cloud from Table

Load the example data sonnetsTable. The table tbl contains a list of words in the variable Word, and the corresponding frequency counts in the variable Count.

```
load sonnetsTable
head(tbl)
ans=8×2 table
    Word Count
```

```
'''tis'
               1
''Amen''
               1
''Fair'
               2
''Gainst'
               1
''Since'
               1
''This'
               2
''Thou'
               1
''Thus'
               1
```

Plot the table data using wordcloud. Specify the words and corresponding word sizes to be the Word and Count variables respectively.

```
figure
wordcloud(tbl,'Word','Count');
title("Sonnets Word Cloud")
```

Create Word Cloud from LDA Topic

To reproduce the results in this example, set rng to 'default'.

rng('default')

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

Create a bag-of-words model using bagOfWords.

bag = bagOfWords(documents)

Fit an LDA model with 20 topics. To suppress verbose output, set 'Verbose' to 0.

Visualize the first four topics using word clouds.

```
figure
for topicIdx = 1:4
    subplot(2,2,topicIdx)
    wordcloud(mdl,topicIdx);
    title("Topic: " + topicIdx)
end
```

Topic: 3

Input Arguments

str – Input text

string array | character vector | cell array of character vectors

Input text, specified as a string array, character vector, or cell array of character vectors.

Example: ["An example of a short sentence."; "A second short sentence."]

Data Types: string | char | cell

documents - Input documents

tokenizedDocument array

Input documents, specified as a tokenizedDocument array.

tbl — Input table

table

Input table, with columns specifying the words and word sizes. Specify the words and the corresponding word sizes in the variables given by wordVar and sizeVar input arguments respectively.

Data Types: table

wordVar — Table variable for word data

string scalar | character vector | numeric index | logical vector

Table variable for word data, specified as a string scalar, character vector, numeric index, or a logical vector.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | logical | char | string

sizeVar — Table variable for size data

string scalar | character vector | numeric index | logical vector

Table variable for size data, specified as a string scalar, character vector, numeric index, or a logical vector.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | logical | char | string

words — Input words

string vector | cell array of character vectors

Input words, specified as a string vector or cell array of character vectors.

Data Types: string | cell

sizeData — Word size data

numeric vector

Word size data, specified as a numeric vector.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64

C — Input categorical data

categorical array

Input categorical data, specified as a categorical array. The function plots each unique element of C with size corresponding to histcounts(C).

Data Types: categorical

bag – Input model

bagOfWords object | bagOfNgrams object

Input bag-of-words or bag-of-n-grams model, specified as a bagOfWords object or a bagOfNgrams object. If bag is a bagOfNgrams object, then the function treats the n-grams as individual words.

ldaMdl — Input LDA model

ldaModel object

Input LDA model, specified as an ldaModel object.

topicIdx — Index of LDA topic

nonnegative integer

Index of LDA topic, specified as a nonnegative integer.

parent — Parent

figure | panel | tab

Parent specified as a figure, panel, or tab.

Name-Value Pair Arguments

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1, Value1, ..., NameN, ValueN.

Example: 'HighlightColor', 'blue' specifies the highlight color to be blue.

The WordCloudChart properties listed here are only a subset. For a complete list, see WordCloudChart Properties.

MaxDisplayWords — Maximum number of words to display

100 (default) | nonnegative integer

Maximum number of words to display, specified as a non-negative integer. The software displays the MaxDisplayWords largest words.

Color - Word color

[0.2510 0.2510 0.2510] (default) | RGB triplet | character vector containing a color name | matrix

Word color, specified as an RGB triplet, a character vector containing a color name, or an N-by-3 matrix where N is the length of WordData. If Color is a matrix, then each row corresponds to an RGB triplet for the corresponding word in WordData.

An RGB triplet is a three-element row vector whose elements specify the intensities of the red, green, and blue components of the color. The intensities must be in the range [0,1]; for example, $[0.4 \ 0.6 \ 0.7]$. Alternatively, you can specify some common colors by name. This table lists the long and short color name options and the equivalent RGB triplet values.

Option	Description	Equivalent RGB Triplet
'red'or'r'	Red	[1 0 0]
'green' or 'g'	Green	[0 1 0]
'blue' or 'b'	Blue	[0 0 1]
'yellow' or 'y'	Yellow	[1 1 0]
'magenta' or 'm'	Magenta	[1 0 1]
'cyan' or 'c'	Cyan	[0 1 1]
'white'or'w'	White	[1 1 1]
'black' or 'k'	Black	[0 0 0]

Example: 'blue'

Example: [0 0 1]

HighlightColor — Word highlight color

[0.8510 0.3255 0.0980] (default) | RGB triplet | character vector containing a color name

Word highlight color, specified as an RGB triplet, or a character vector containing a color name. The software highlights the largest words with this color.

An RGB triplet is a three-element row vector whose elements specify the intensities of the red, green, and blue components of the color. The intensities must be in the range [0,1]; for example, $[0.4 \ 0.6 \ 0.7]$. Alternatively, you can specify some common colors by name. This table lists the long and short color name options and the equivalent RGB triplet values.

Option	Description	Equivalent RGB Triplet
'red'or'r'	Red	[1 0 0]
'green' or 'g'	Green	[0 1 0]
'blue' or 'b'	Blue	[0 0 1]
'yellow' or 'y'	Yellow	[1 1 0]
'magenta' or 'm'	Magenta	[1 0 1]
'cyan' or 'c'	Cyan	[0 1 1]
'white'or'w'	White	[1 1 1]
'black' or 'k'	Black	[0 0 0]

Example: 'blue'

Example: [0 0 1]

Shape — Shape of word cloud

'oval' (default) | 'rectangle'

Shape of word cloud chart, specified as 'oval' or 'rectangle'.

Example: 'rectangle'

Output Arguments

wc — WordCloudChart object

WordCloudChart object

WordCloudChart object. You can modify the properties of a WordCloudChart after it is created. For more information, see WordCloudChart Properties.

Definitions

Language Considerations

For string input, the wordcloud function uses English and Japanese tokenization, stop word removal, and word normalization.

For other languages, you might need to manually preprocess your text data and specify unique words and corresponding sizes in wordcloud.

To specify word sizes in wordcloud, input your data as a table or arrays containing the unique words and corresponding sizes.

wordCloudCounts

Count words for word cloud creation

Syntax

T = wordCloudCounts(str)

Description

T = wordCloudCounts(str) tokenizes and preprocesses the text in str for word cloud creation and returns a table T of words and frequency counts.

Examples

Word Cloud Frequency Counts

Extract the text from sonnets.txt using extractFileText.

```
str = extractFileText("sonnets.txt");
```

View the first sonnet.

```
i = strfind(str,"I");
ii = strfind(str,"II");
start = i(1);
fin = ii(1);
extractBetween(str,start,fin-1)
ans =
    "I
    From fairest creatures we desire increase,
    That thereby beauty's rose might never die,
    But as the riper should by time decease,
    His tender heir might bear his memory:
```
```
But thou, contracted to thine own bright eyes,
Feed'st thy light's flame with self-substantial fuel,
Making a famine where abundance lies,
Thy self thy foe, to thy sweet self too cruel:
Thou that art now the world's fresh ornament,
And only herald to the gaudy spring,
Within thine own bud buriest thy content,
And tender churl mak'st waste in niggarding:
Pity the world, or else this glutton be,
To eat the world's due, by the grave and thee.
```

Tokenize and preprocess the sonnets text and create a table of word frequency counts.

```
T = wordCloudCounts(str);
head(T)
```

п

ans=8×2 table Word Count "thv" 281 "thou" 235 "love" 188 "thee" 162 "eyes" 90 "doth" 88 "make" 63 "mine" 63

Input Arguments

str – Input text

string array | character vector | cell array of character vectors

Input text, specified as a string array, character vector, or cell array of character vectors.

```
Example: ["An example of a short sentence."; "A second short
sentence."]
```

```
Data Types: string | char | cell
```

Output Arguments

T — Table of word counts

table

Table of words counts sorted in order of importance. The table has columns:

Word	String scalar of the word.
Count	The number of times the word appears in the documents. The function groups the counts of words that differ only by case or have a common stem according to normalizeWords. For example, the function groups the counts for "walk", "Walking", "walking", and "walks".

wordEmbedding

Word embedding model to map words to vectors and back

Description

A word embedding, popularized by the word2vec, GloVe, and fastText libraries, maps words in a vocabulary to real vectors.

The vectors attempt to capture the semantics of the words, so that similar words have similar vectors. Some embeddings also capture relationships between words, such as "king is to queen as man is to woman". In vector form, this relationship is king – man + woman = queen.

Creation

Create a word embedding by loading a pretrained embedding using fastTextWordEmbedding, reading an embedding from a file using readWordEmbedding, or by training an embedding using trainWordEmbedding.

Properties

Dimension — Dimension of word embedding

positive integer

Dimension of the word embedding, specified as a positive integer.

Example: 300

Vocabulary — Unique words in model

string vector

Unique words in the model, specified as a string vector.

Data Types: string

Object Functions

vec2word	Map embedding vector to word
word2vec	Map word to embedding vector
isVocabularyWord	Test if word is member of word embedding or encoding
writeWordEmbedding	Write word embedding file

Examples

Download fastText Support Package

Download and install the Text Analytics Toolbox Model for fastText English 16 Billion Token Word Embedding support package.

Type fastTextWordEmbedding at the command line.

fastTextWordEmbedding

If the Text Analytics Toolbox Model *for fastText English 16 Billion Token Word Embedding* support package is not installed, then the function provides a link to the required support package in the Add-On Explorer. To install the support package, click the link, and then click **Install**. Check that the installation is successful by typing emb = fastTextWordEmbedding at the command line.

```
emb = fastTextWordEmbedding
emb =
wordEmbedding with properties:
   Dimension: 300
   Vocabulary: [1×1000000 string]
```

If the required support package is installed, then the function returns a wordEmbedding object.

Map Words to Vectors and Back

Load a pretrained word embedding using fastTextWordEmbedding. This function requires Text Analytics Toolbox[™] Model for fastText English 16 Billion Token Word

Embedding support package. If this support package is not installed, then the function provides a download link.

```
emb = fastTextWordEmbedding
```

```
emb =
wordEmbedding with properties:
   Dimension: 300
Vocabulary: [1×1000000 string]
```

Map the words "Italy", "Rome", and "Paris" to vectors using word2vec.

```
italy = word2vec(emb, "Italy");
rome = word2vec(emb, "Rome");
paris = word2vec(emb, "Paris");
Map the vector italy - rome + paris to a word using vec2word.
word = vec2word(emb,italy - rome + paris)
word =
"France"
```

Convert Documents to Sequences of Word Vectors

Convert an array of tokenized documents to sequences of word vectors using a pretrained word embedding.

Load a pretrained word embedding using the fastTextWordEmbedding function. This function requires Text Analytics Toolbox[™] Model for fastText English 16 Billion Token Word Embedding support package. If this support package is not installed, then the function provides a download link.

emb = fastTextWordEmbedding;

Load the weather reports data and create a tokenizedDocument array.

```
filename = "weatherReports.csv";
data = readtable(filename, 'TextType', 'string');
textData = data.event_narrative;
documents = tokenizedDocument(textData);
```

Convert the documents to sequences of word vectors using doc2sequence. The doc2sequence function, by default, left-pads the sequences to have the same length. When converting large collections of documents using a high-dimensional word embedding, padding can require large amounts of memory. To prevent the function from padding the data, set the 'PaddingDirection' option to 'none'. Alternatively, you can control the amount of padding using the 'Length' option.

```
sequences = doc2sequence(emb,documents,'PaddingDirection','none');
```

View the sizes of the first 10 sequences. Each sequence is *D*-by-*S* matrix, where *D* is the embedding dimension, and *S* is the number of word vectors in the sequence.

sequences(1:10)

```
ans = 10×1 cell array
{300×8 single}
{300×39 single}
{300×14 single}
{300×14 single}
{300×15 single}
{300×15 single}
{300×20 single}
{300×6 single}
{300×21 single}
{300×10 single}
```

Read Word Embedding from Text File

Read the example word embedding. This model was derived by analyzing text from Wikipedia.

```
filename = "exampleWordEmbedding.vec";
emb = readWordEmbedding(filename)
emb =
  wordEmbedding with properties:
    Dimension: 50
    Vocabulary: [1x9999 string]
```

Explore the word embedding using word2vec and vec2word.

```
king = word2vec(emb,"king");
man = word2vec(emb,"man");
woman = word2vec(emb,"woman");
word = vec2word(emb,king - man + woman)
word =
"queen"
```

Write Word Embedding to File

Train a word embedding and write it to a text file.

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

Train a word embedding using trainWordEmbedding.

```
emb = trainWordEmbedding(documents)
Training: 100% Loss: 0 Remaining time: 0 hours 0 minutes.
emb =
   wordEmbedding with properties:
    Dimension: 100
   Vocabulary: [1x401 string]
```

Write the word embedding to a text file.

```
filename = "exampleSonnetsEmbedding.vec";
writeWordEmbedding(emb,filename)
```

Read the word embedding file using readWordEmbedding.

```
emb = readWordEmbedding(filename)
emb =
```

```
wordEmbedding with properties:
```

```
Dimension: 100
Vocabulary: [1x401 string]
```

wordEmbeddingLayer

Word embedding layer for deep learning networks

Description

A word embedding layer maps word indices to vectors.

Use a word embedding layer in a deep learning long short-term memory (LSTM) network. An LSTM network is a type of recurrent neural network (RNN) that can learn long-term dependencies between time steps of sequence data. A word embedding layer maps a sequence of word indices to embedding vectors and learns the word embedding during training.

Creation

Syntax

layer = wordEmbeddingLayer(dimension,numWords)
layer = wordEmbeddingLayer(dimension,numWords,Name,Value)

Description

layer = wordEmbeddingLayer(dimension,numWords) creates a word embedding
layer and specifies the embedding dimension and vocabulary size.

layer = wordEmbeddingLayer(dimension,numWords,Name,Value) sets optional
properties on page 1-437 using one or more name-value pairs. Enclose each property
name in single quotes.

Properties

Dimension — Dimension of word embedding positive integer

Dimension of the word embedding, specified as a positive integer.

Example: 300

NumWords — Number of words in model

positive integer

Number of words in the model, specified as a positive integer. If the number of unique words in the training data is greater than NumWords, then the layer maps the out-of-vocabulary words to the same vector.

Name — Layer name

' ' (default) | character vector

Layer name, specified as a character vector. If Name is set to '', then the software automatically assigns a name at training time.

Data Types: char

WeightLearnRateFactor — Learning rate factor for weights

1 (default) | nonnegative scalar

Learning rate factor for the weights, specified as a nonnegative scalar.

The software multiplies this factor by the global learning rate to determine the learning rate for the weights in this layer. For example, if WeightLearnRateFactor is 2, then the learning rate for the weights in this layer is twice the current global learning rate. The software determines the global learning rate based on the settings specified with the trainingOptions function.

Example: 2

WeightL2Factor — L2 regularization factor for weights

1 (default) | nonnegative scalar

L2 regularization factor for the weights, specified as a nonnegative scalar.

The software multiplies this factor by the global L2 regularization factor to determine the learning rate for the weights in this layer. For example, if WeightL2Factor is 2, then the L2 regularization for the weights in this layer is twice the global L2 regularization factor. You can specify the global L2 regularization factor using the trainingOptions function.

Example: 2

Examples

Create Word Embedding Layer

Create a word embedding layer with embedding dimension 300 and 5000 words.

```
layer = wordEmbeddingLayer(300,5000)
layer =
WordEmbeddingLayer with properties:
        Name: ''
Hyperparameters
Dimension: 300
NumWords: 5000
Learnable Parameters
Weights: []
Show all properties
```

Include a word embedding layer in an LSTM network.

```
inputSize = 1;
embeddingDimension = 300;
numWords = 5000;
numHiddenUnits = 200;
numClasses = 10;
layers = [
    sequenceInputLayer(inputSize)
    wordEmbeddingLayer(embeddingDimension,numWords)
    lstmLayer(numHiddenUnits, 'OutputMode', 'last')
    fullyConnectedLayer(numClasses)
    softmaxLayer
    classificationLayer]
layers =
    6x1 Layer array with layers:
    1 '' Sequence Input Sequence input with 1 dimensions
```

2	 Word Embedding Layer	Word embedding layer with 300 dimensions and 500
3	 LSTM	LSTM with 200 hidden units
4	 Fully Connected	10 fully connected layer
5	 Softmax	softmax
6	 Classification Output	crossentropyex

wordEncoding

Word encoding model to map words to indices and back

Description

A word encoding maps words in a vocabulary to numeric indices.

To encode documents as matrices of word or n-gram counts, use encode.

Creation

Syntax

enc = wordEncoding(documents)
enc = wordEncoding(documents,Name,Value)

Description

enc = wordEncoding(documents) creates a word encoding from the words in
documents.

enc = wordEncoding(documents,Name,Value) specifies additional options using
one or more name-value pair arguments. For example, 'Order', 'frequency' assigns
lower indices to more frequent words.

Input Arguments

documents — Input documents

tokenizedDocument array

Input documents, specified as a tokenizedDocument array.

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes.

You can specify several name and value pair arguments in any order as Name1, Value1, ..., NameN, ValueN.

Example: 'Order', 'frequency' sorts the indices by the total frequency in the documents in descending order.

Order — **Sorting of indices**

'first-seen' (default) | 'frequency'

Sorting of indices, specified as the comma-separated pair consisting of 'Order' and one of the following:

- 'first-seen' Assign indices to the words in the order in which they occur in the documents.
- 'frequency' Assign indices to the words sorted by total frequency in the documents in descending order.

If 'Order' is 'frequency' and multiple words have the same frequency, then the function does not assign indices in any particular order.

MaxNumWords — Maximum number of words to encode

inf (default) | positive integer

Maximum number of words to encode, specified as a positive integer or inf. The function first sorts the indices according to the 'Order' option and then encodes the top MaxNumWords words. If MaxNumWords is inf, then the function encodes all the words in the input documents.

Properties

NumWords - Number of words in model

nonnegative integer

Number of words in the model, specified as a nonnegative integer.

Vocabulary - Unique words in model

string vector

Unique words in the model, specified as a string vector.

Data Types: string

Object Functions

ind2wordMap encoding index to wordword2indMap word to encoding indexisVocabularyWordTest if word is member of word embedding or encoding

Examples

Create Word Encoding

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
documents(1:10)
```

ans =

```
10x1 tokenizedDocument:
```

70 tokens: fairest creatures desire increase thereby beautys rose might never die of 71 tokens: forty winters shall besiege thy brow dig deep trenches thy beautys field 65 tokens: look thy glass tell face thou viewest time face form another whose fresh 71 tokens: unthrifty loveliness why dost thou spend upon thy self thy beautys legat 61 tokens: hours gentle work frame lovely gaze every eye doth dwell play tyrants sa 68 tokens: let winters ragged hand deface thee thy summer ere thou distilld make sw 64 tokens: lo orient gracious light lifts up burning head eye doth homage newappear 70 tokens: music hear why hearst thou music sadly sweets sweets war joy delights jor 70 tokens: fear wet widows eye thou consumst thy self single life ah thou issueless 69 tokens: shame deny thou bearst love thy self art unprovident grant thou wilt the

Create a word encoding.

```
enc = wordEncoding(documents)
```

```
enc =
wordEncoding with properties:
```

```
NumWords: 3092
Vocabulary: [1x3092 string]
```

Create Word Encoding of Top Words in Documents

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
documents(1:10)
ans =
  10x1 tokenizedDocument:
    70 tokens: fairest creatures desire increase thereby beautys rose might never die
    71 tokens: forty winters shall besiege thy brow dig deep trenches thy beautys field
    65 tokens: look thy glass tell face thou viewest time face form another whose fres
    71 tokens: unthrifty loveliness why dost thou spend upon thy self thy beautys lega
    61 tokens: hours gentle work frame lovely gaze every eye doth dwell play tyrants sa
    68 tokens: let winters ragged hand deface thee thy summer ere thou distilld make su
    64 tokens: lo orient gracious light lifts up burning head eye doth homage newappea
    70 tokens: music hear why hearst thou music sadly sweets sweets war joy delights jo
    70 tokens: fear wet widows eye thou consumst thy self single life ah thou issueles:
    69 tokens: shame deny thou bearst love thy self art unprovident grant thou wilt the
```

Create a word encoding. Sort the indices by frequency and encode only the top 100 words.

```
enc = wordEncoding(documents, ...
    'Order','frequency', ...
    'MaxNumWords',100)
enc =
    wordEncoding with properties:
```

NumWords: 100 Vocabulary: [1x100 string]

View the words corresponding to indices 1, 2, and 3 using the ind2word function.

```
idx = [1 2 3];
words = ind2word(enc,idx)
words = 1x3 string array
"thy" "thou" "love"
```

Map Encoding Indices to Words

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
documents(1:10)
```

```
ans =
    10x1 tokenizedDocument:
```

70 tokens: fairest creatures desire increase thereby beautys rose might never die a 71 tokens: forty winters shall besiege thy brow dig deep trenches thy beautys field 65 tokens: look thy glass tell face thou viewest time face form another whose fresh 71 tokens: unthrifty loveliness why dost thou spend upon thy self thy beautys legac 61 tokens: hours gentle work frame lovely gaze every eye doth dwell play tyrants sa 68 tokens: let winters ragged hand deface thee thy summer ere thou distilld make sw 64 tokens: lo orient gracious light lifts up burning head eye doth homage newappear 70 tokens: music hear why hearst thou music sadly sweets sweets war joy delights jo 70 tokens: fear wet widows eye thou consumst thy self single life ah thou issueless 69 tokens: shame deny thou bearst love thy self art unprovident grant thou wilt the

Create a word encoding.

```
enc = wordEncoding(documents)
```

```
enc =
wordEncoding with properties:
    NumWords: 3092
Vocabulary: [1x3092 string]
```

View the words corresponding to indices 1, 3, and 5 using the ind2word function.

```
idx = [1 3 5];
words = ind2word(enc,idx)
words = 1x3 string array
    "fairest" "desire" "thereby"
```

Map Words to Encoding Indices

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
documents(1:10)
ans =
```

```
10x1 tokenizedDocument:
```

70 tokens: fairest creatures desire increase thereby beautys rose might never die of 71 tokens: forty winters shall besiege thy brow dig deep trenches thy beautys field 65 tokens: look thy glass tell face thou viewest time face form another whose fresh 71 tokens: unthrifty loveliness why dost thou spend upon thy self thy beautys legat 61 tokens: hours gentle work frame lovely gaze every eye doth dwell play tyrants sa 68 tokens: let winters ragged hand deface thee thy summer ere thou distilld make sw 64 tokens: lo orient gracious light lifts up burning head eye doth homage newappear 70 tokens: music hear why hearst thou music sadly sweets sweets war joy delights jo 70 tokens: fear wet widows eye thou consumst thy self single life ah thou issueless 69 tokens: shame deny thou bearst love thy self art unprovident grant thou wilt the

Create a word encoding.

```
enc = wordEncoding(documents)
enc =
wordEncoding with properties:
    NumWords: 3092
Vocabulary: [1x3092 string]
```

Map the words "rose", "love", and "beauty" to encoding indices using the word2ind function.

```
words = ["rose" "love" "beauty"];
idx = word2ind(enc,words)
idx = 1×3
7 387 79
```

Convert Documents to Sequences of Word Indices

Load the weather reports data and create a tokenizedDocument array.

```
filename = "weatherReports.csv";
data = readtable(filename, 'TextType', 'string');
textData = data.event_narrative;
documents = tokenizedDocument(textData);
```

Create a word encoding.

enc = wordEncoding(documents);

Convert the documents to sequences of word indices.

sequences = doc2sequence(enc,documents);

View the sizes of the first 10 sequences. Each sequence is a 1-by-S vector, where S is the number of word indices in the sequence. Because the sequences are padded, S is constant.

```
sequences(1:10)
```

ans = 10x1 cell array {1x930 double} {1x930 double}
{1x930 double}
{1x930 double}
{1x930 double}
{1x930 double}
{1x930 double}
{1x930 double}
{1x930 double}
{1x930 double}
{1x930 double}

writeTextDocument

Write documents to text file

Syntax

```
writeTextDocument(documents,filename)
writeTextDocument(documents,filename,'Append',true)
```

Description

writeTextDocument(documents,filename) writes documents to the specified text file. The function writes one document per line with a space between each word in UTF-8.

writeTextDocument(documents,filename,'Append',true) appends to the file
instead of overwriting.

Examples

Write Documents to Text File

Write an array of documents to a text file.

```
documents = tokenizedDocument([
    "an example of a short sentence"
    "a second short sentence"])
documents =
    2x1 tokenizedDocument:
    6 tokens: an example of a short sentence
    4 tokens: a second short sentence
filename = "documents.txt";
```

```
writeTextDocument(documents,filename)
```

Append Documents to Text File

Write an array of documents to a text file by appending the documents one at a time.

Create an array of tokenized documents.

```
documents = tokenizedDocument([
    "an example of a short sentence"
    "a second short sentence"])
documents =
    2x1 tokenizedDocument:
    6 tokens: an example of a short sentence
    4 tokens: a second short sentence
```

Write the first document to the file.

```
filename = "documents.txt";
writeTextDocument(documents(1),filename)
```

View the contents of the file using extractFileText.

```
str = extractFileText(filename)
```

```
str =
"an example of a short sentence"
```

Append the second document to the text file.

writeTextDocument(documents(2),filename,'Append',true)

View the contents of the file using extractFileText.

```
str = extractFileText(filename)
```

```
str =
    "an example of a short sentence
    a second short sentence"
```

Input Arguments

documents - Input documents
tokenizedDocument array

Input documents, specified as a tokenizedDocument array.

filename — Name of file

string scalar | character vector

Name of the file, specified as a string scalar or character vector.

Data Types: string | char

See Also

Introduced in R2017b

writeWordEmbedding

Write word embedding file

Syntax

writeWordEmbedding(emb,filename)

Description

writeWordEmbedding(emb,filename) writes the word embedding emb to the file filename. The function writes the vocabulary in UTF-8 in word2vec text format.

Examples

Write Word Embedding to File

Train a word embedding and write it to a text file.

Load the example data. The file sonnetsPreprocessed.txt contains preprocessed versions of Shakespeare's sonnets. The file contains one sonnet per line, with words separated by a space. Extract the text from sonnetsPreprocessed.txt, split the text into documents at newline characters, and then tokenize the documents.

```
filename = "sonnetsPreprocessed.txt";
str = extractFileText(filename);
textData = split(str,newline);
documents = tokenizedDocument(textData);
```

Train a word embedding using trainWordEmbedding.

```
emb = trainWordEmbedding(documents)
Training: 100% Loss: 0 Remaining time: 0 hours 0 minutes.
emb =
wordEmbedding with properties:
```

```
Dimension: 100
Vocabulary: [1x401 string]
```

Write the word embedding to a text file.

```
filename = "exampleSonnetsEmbedding.vec";
writeWordEmbedding(emb,filename)
```

Read the word embedding file using readWordEmbedding.

```
emb = readWordEmbedding(filename)
emb =
wordEmbedding with properties:
    Dimension: 100
    Vocabulary: [1x401 string]
```

Input Arguments

emb — Input word embedding

wordEmbedding object

Input word embedding, specified as a wordEmbedding object.

filename — Name of file

string scalar | character vector

Name of the file, specified as a string scalar or character vector.

Data Types: string | char
