The software described in this document is furnished under a license agreement. The software may be used or copied only under the terms of the license agreement. No part of this manual may be photocopied or reproduced in any form without prior written consent from The MathWorks, Inc.

FEDERAL ACQUISITION: This provision applies to all acquisitions of the Program and Documentation by, for, or through the federal government of the United States. By accepting delivery of the Program or Documentation, the government hereby agrees that this software or documentation qualifies as commercial computer software or commercial computer software documentation as such terms are used or defined in FAR 12.212, DFARS Part 227.72, and DFARS 252.227-7014. Accordingly, the terms and conditions of this Agreement and only those rights specified in this Agreement, shall pertain to and govern the use, modification, reproduction, release, performance, display, and disclosure of the Program and Documentation by the federal government (or other entity acquiring for or through the federal government) and shall supersede any conflicting contractual terms or conditions. If this License fails to meet the government's needs or is inconsistent in any respect with federal procurement law, the government agrees to return the Program and Documentation, unused, to The MathWorks, Inc.

Trademarks

MATLAB and Simulink are registered trademarks of The MathWorks, Inc. See www.mathworks.com/trademarks for a list of additional trademarks. Other product or brand names may be trademarks or registered trademarks of their respective holders.

Patents

MathWorks products are protected by one or more U.S. patents. Please see www.mathworks.com/patents for more information.

Revision History

September 2013	Online only	New for Version 1.0 (Release 2013b)
March 2014	Online Only	Revised for Version 1.1 (Release 2014a)
October 2014	Online Only	Revised for Version 1.2 (Release 2014b)
March 2015	Online Only	Revised for Version 1.3 (Release 2015a)
September 2015	Online Only	Revised for Version 2.0 (Release 2015b)
October 2015	Online Only	Rereleased for Version 1.3.1 (Release
		2015aSP1)
March 2016	Online Only	Revised for Version 2.1 (Release 2016a)
September 2016	Online Only	Revised for Version 2.2 (Release 2016b)
March 2017	Online Only	Revised for Version 2.3 (Release 2017a)
September 2017	Online Only	Revised for Version 2.4 (Release 2017b)
March 2018	Online Only	Revised for Version 2.5 (Release 2018a)
September 2018	Online Only	Revised for Version 2.6 (Release 2018b)
March 2019	Online Only	Revised for Version 3.0 (Release 2019a)

- "Customize Polyspace User Interface" on page 1-32
- "Upload Results to Polyspace Access" on page 1-36

Add Source Files for Analysis in Polyspace User Interface

To begin a Polyspace analysis, you must specify the path to your source files and headers.

You can specify your source paths explicitly or extract them from a build command (makefile). If you use a build command for building your source code or build your source code in an IDE (using an underlying build command), try extracting from the build command first. If Polyspace cannot trace your build command, manually add the paths to your source and include folders. You specify the target and compiler options later. See "Target and Compiler".

Provide the source paths in a Polyspace project. The source files are displayed on the **Project Browser** pane.

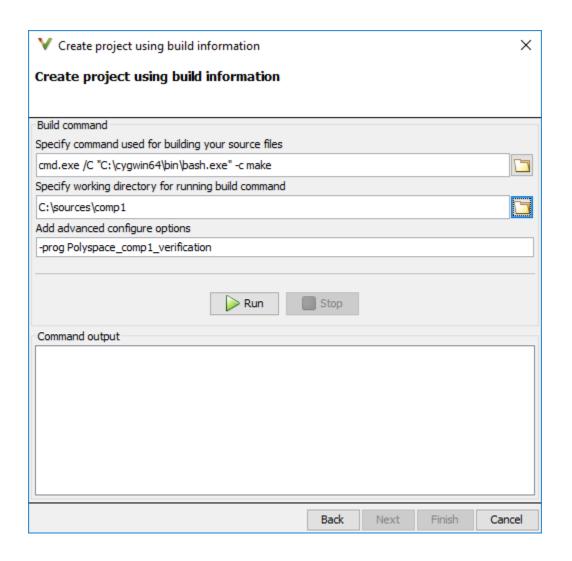

A corresponding .psprj file is created in the location where you saved the project. When you create a project, choose the default location for saving it or enter a new location. To change the default location, select **Tools** > **Preferences** and use the options on the **Project and Results Folder** tab.

Add Sources from Build Command

Select File > New Project. Select Create from build command.

After providing a project name and location, on the next window, enter this information:

- The build command, exactly as you run it on your code.
- The folder from which you run your build command.

When you click **Run**, Polyspace runs the build command and extracts the information for creating a Polyspace project, specifically, source paths and compiler information.

If you build your source code within an IDE such as Visual Studio[®], in the field for specifying the build command, enter the path to your executable, for instance, C:\Program Files (x86)\Microsoft Visual Studio 10.0\Common7\IDE

\VCExpress.exe. When you click **Run**, Polyspace opens your IDE. In your IDE, perform a complete build of your code. When you close your IDE, Polyspace extracts your source paths and compiler information. See also "Create Project Using Visual Studio Information" on page 1-16.

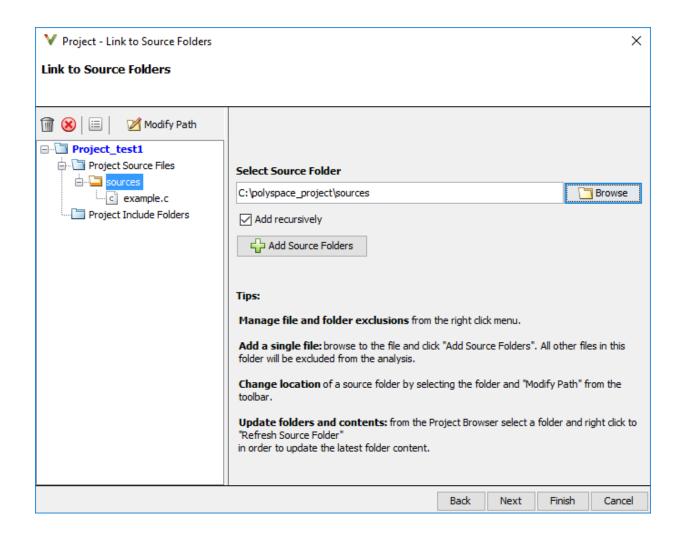

When you create a project from your build command, the **Project Browser** pane displays your source folders but not the include folders. In case you want to verify that your include folders were extracted, open the project file (with extension .psprj) in a text editor.

You can use additional options to modify the default project creation from build command. For instance, to create a Polyspace project despite build errors, in the **Add advanced configure options** field, enter the option -allow-build-error. To look up allowed options, see polyspace-configure.

Add Sources Manually

Select **File > New Project**.

After providing a project name and location, on the next window, enter or navigate to the root folder containing your source files. After selecting the **Add recursively** box, click **Add Source Folders**. All files in the folder and subfolders are added to your project. To exclude specific files or folders from analysis, right-click the files or folders and select **Exclude Files**.

On the next window, add include folders. The analysis looks for include files relative to the include folder paths that you specify. For instance, if your code contains the preprocessor directive #include<../mylib.h> and you include the folder:

C:\My_Project\MySourceFiles\Includes

the folder $C:My_Project\MySourceFiles$ must contain a file mylib.h.

For Standard Library headers such as stdio.h, if you know the path to the headers from your compiler, specify them explicitly. Otherwise, the analysis uses Polyspace implementation of the Standard Library headers, which in some special cases, might not match your compiler implementation. See also "Provide Standard Library Headers for Polyspace Analysis" on page 8-19.

Your project file with source and include folders are displayed in the **Project Browser** pane. Later, if you add files to one of these folders, you can update your project. Right-click the folder that you want to update, or the entire **Project Source Files** folder, and select **Refresh Source Folder**.

You can also right-click to exclude files or add more folders to the project. The files that you add the first time are copied to the first module in your project. If you add new files later, you must explicitly right-click them and add them to a module.

- "Run Polyspace Analysis on Desktop" on page 1-8
- "Create Project Using Visual Studio Information" on page 1-16
- "Provide Standard Library Headers for Polyspace Analysis" on page 8-19

Run Polyspace Analysis on Desktop

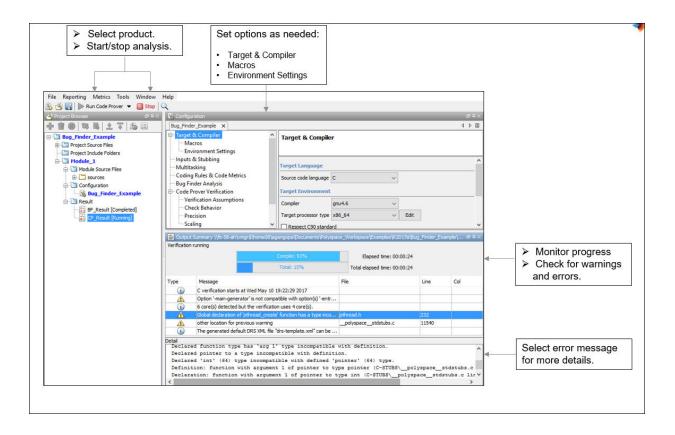

This topic describes how to run an analysis in the Polyspace user interface, monitor progress, fix compilation issues, and open analysis results as available.

After you specify your source files and compiler on page 1-2, start the Polyspace analysis. During analysis, Polyspace first compiles your code, and then checks for bugs (Bug Finder) or proves code correctness (Code Prover). If you encounter compilation errors, read the error message and diagnose the root cause of the error. To resolve the errors, you often have to set some Polyspace configuration options and rerun the analysis.

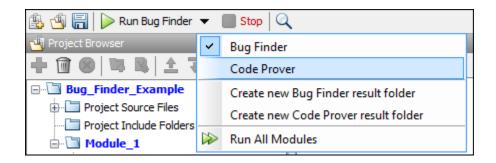

Arrange Layout of Windows for Project Setup

To set up a convenient distribution of windows, in the Polyspace user interface, select **Window** > **Reset Layout** > **Project Setup**.

Set Product and Result Location

To switch products or create a separate folder for each run, select options from the dropdown list beside the **Run** button. For instance, to avoid overwriting previous results each time that you run Bug Finder, select **Create new Bug Finder result folder**.

The results are stored in subfolders Module_1, Module_2, and so on in the project folder. To find the physical location of the project folder, right-click a project on the **Project Browser** pane and select **Open Folder with File Manager**.

To use a different folder naming convention or a different storage location for results, select **Tools > Preferences** and use the options on the **Project and Results Folder** tab.

Start and Monitor Analysis

If your project has multiple modules, select the module that you want to analyze. To start the analysis, select **Run Bug Finder** or **Run Code Prover**. Monitor progress on the **Output Summary** pane.

Bug Finder: You can see some results after partial analysis because certain defect
checkers do not need cross-functional information and can show results as soon as a
function is analyzed. If results are available while the analysis is still running, you see
this icon beside the Run Bug Finder button:

The icon indicates the number of results available. To open the results, click the icon. Once the analysis is over, the **Running** label in the icon changes to **Completed**. To reload the full set of results, click the icon again.

 Code Prover: You can see results only after the analysis is complete. Code Prover is more likely to report compilation errors because it does a more rigorous analysis and must follow stricter rules for compilation. The progress bar distinguishes between the various phases of analysis starting from compilation.

Fix Compilation Errors

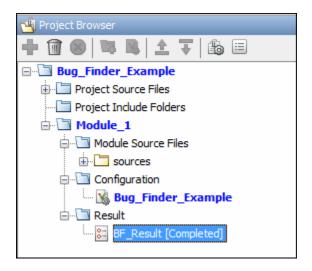

If compilation errors occur, the analysis continues on the remaining files that do compile. The **Dashboard** pane shows that some files did not compile and links to the **Output Summary** pane for details. The **Output Summary** pane shows compilation errors with a con.

For further diagnosis, select the error message for more details. Identify the line in your code responsible for the compilation error. You can use the error message details to understand why the line compiled with your compiler and what additional information Polyspace requires to emulate your compiler. See if you can work around the error by using a Polyspace option. For more information, see "Troubleshoot Compilation Errors".

For more precise run-time error checking in Code Prover, it is recommended that you fix all compilation errors. Use the option Stop analysis if a file does not compile (-stop-if-compile-error).

Open Results

After analysis, the results open automatically. To open results that you have closed, double-click the result node on the **Project Browser** pane.

The Bug Finder (Code Prover) results are stored in a .psbf (.pscp) file in the results folder. For instance, if you save your project in C:\Projects\, a .psbf file for the Bug Finder analysis results on the first module Module_1 is stored in C:\Projects\Module_1\BF_Result. See also "Project and Results Folder Contents" on page 1-13.

- "Filter and Group Results" on page 17-2

Project and Results Folder Contents

When you run an analysis in the Polyspace user interface, Polyspace generates files that contain information about configuration options and analysis results.

The organization of Polyspace files in the physical folder location follows the hierarchy displayed in the Polyspace user interface. The project folder contains a subfolder for each module. In each module folder, there is one or more result subfolder, named Result_#. The number of result folders depends on whether you overwrite or retain previous results for each new run. To use a different folder naming convention or different storage location for results, select **Tools** > **Preferences** and use the options on the **Project and Results Folder** tab.

The project folder has the project file with extension .psprj. If you open a project from a previous release in the user interface, the project is upgraded for the new release. A backup of the old project file is saved with the extension .bak.psprj.

Files in the Results Folder

Some of the files and folders in the results folder are described below:

- Polyspace_release_project_name_date-time.log A log file associated with each analysis.
- ps_results.psbf An encrypted file containing your Polyspace results. Open this file in the Polyspace environment to view your results.
- \bullet ps_sources.db A non-encrypted database file listing source files and macros.
- drs-template.xml A template generated when you use constraint specification.
- ps_comments.db An encrypted database file containing your comments and justifications.
- comments_bak A subfolder used to import comments between results.
- .status and .settings Two folders that store files required to relaunch the analysis.
- Polyspace-Doc When you generate a report, by default, your report is saved in this folder with the name *ProjectName_ReportType*. For example, a developer report in PDF format would be, myProject_Developer.pdf.

-results-dir

Storage of Temporary Files

Polyspace produces some temporary files when performing an analysis. If your analysis runs slow or you encounter errors such as running out of disk space, check your temporary file location. For more information on possible errors, see:

- "Errors with Temporary Files" on page 20-70
- "Reduce Memory Usage and Time Taken by Polyspace Analysis" (Polyspace Code Prover)

To determine where to store temporary files, Polyspace looks for these environment variables in the following order:

• RTE_TMP_DIR: Define this environment variable only if you want to store Polyspace temporary files in a folder different from the standard temporary folders (defined by TMPDIR and such). You can see the current standard temporary folder by using the MATLAB® function tempdir.

Note This path must be an absolute path to an existing folder on which the current user has access rights (for reading and writing).

- TMPDIR
- TMP
- TEMP

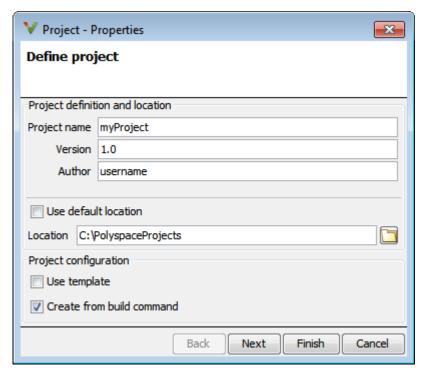

If one of these variables is defined, Polyspace uses that path for storing temporary files. If these environment variables are not defined, Polyspace stores temporary files in:

- /tmp on Linux® and Mac
- Folder specified with the USERPROFILE environment variable, folder returned from GetWindowsDirectoryW Windows® API, or Temp directory on Windows

Create Project Using Visual Studio Information

To create a Polyspace project, you can trace your Visual Studio build.

- 1 In the Polyspace interface, select **File > New Project**.
- 2 In the Project Properties window, under **Project Configuration**, select **Create** from build command and click **Next**.

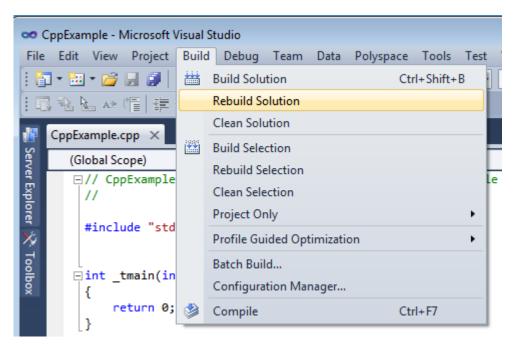

- In the field **Specify command used for building your source files**, enter the full path to the Visual Studio executable. For instance, "C:\Program Files (x86)\Microsoft Visual Studio 10.0\Common7\IDE\devenv.exe".
- 4 In the field **Specify working directory for running build command**, enter a folder to which you have write access, for instance, C:\temp\Polyspace. Click

This action opens the Visual Studio environment.

5 In the Visual Studio environment, create and build a Visual Studio project.

If you already have a Visual Studio project, open the existing project and build a clean solution. For instance, to build a clean solution in Visual Studio 2012, select **BUILD > Rebuild Solution**.

6 After the project builds, close Visual Studio.

Polyspace traces your Visual Studio build and creates a Polyspace project.

The Polyspace project contains the source files from your Visual Studio build and the relevant **Target & Compiler** options.

7 If you update your Visual Studio project, to update the corresponding Polyspace project, on the **Project Browser**, right-click the project name and select **Update Project**.

• "Troubleshooting Project Creation from Visual Studio Build" on page 20-25

Create Project Using Configuration Template

A configuration template is a predefined set of analysis options for a specific compilation environment.

Why Use Templates

Use templates to simplify your project setup. For instance, after you configure a project for a specific compilation environment, you can create a template out of the configuration. Using the template, you can reuse the configuration for projects that have the same compilation environment.

When creating a new project, you can do one of the following:

- Use an existing template to automatically set analysis options for your compiler.
 - Polyspace software provides predefined templates for common compilers such as IAR, Kiel, Visual and VxWorks. For additional templates, see Polyspace Compiler Templates.
- Set analysis options manually. You can then save your options as a template and reuse them later. You can also share the template with other users and enforce consistent usage of Polyspace Bug Finder in your organization.

Use Predefined Template

- 1 Select **File > New Project**.
- On the Project Properties dialog box, after specifying the project name and location, under **Project configuration**, select **Use template**.
- 3 On the next screen, select the template that corresponds to your compiler. For further details on a template, select the template and view the **Description** column on the right.
 - If your compiler does not appear in the list of predefined templates, select **Baseline C** or **Baseline C++**.
- 4 On the next screen, add your source files and include folders.

Create Your Own Template

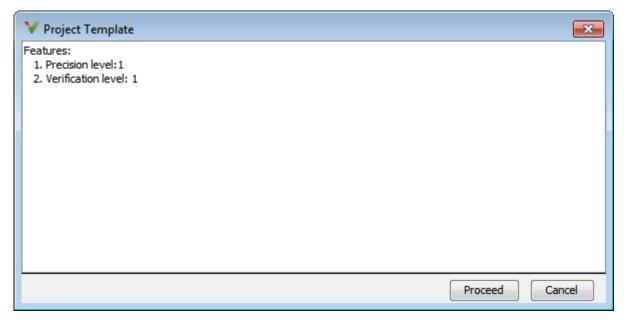

This example shows how to save a configuration from an existing project and create a new project using the saved configuration.

- To create a template from a project that is open on the **Project Browser** pane:
 - Right-click the project configuration that you want to use, and then select **Save As Template**.
 - 2 Enter a description for the template, then click **Proceed**. Save your template file.

Suppose you create a Code Prover configuration template that runs Code Prover analysis to a precision level of 1 and a verification level of 1. See:

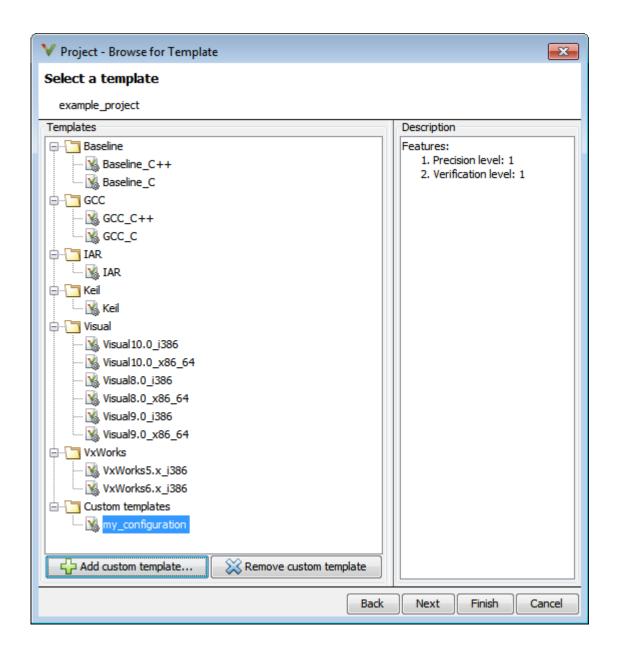

- Precision level (-0)
- Verification level (-to)

You can enter this description for the template.

When you create a new project, to use a saved template:

- Select Add custom template...
- Navigate to the template that you saved earlier, and then click **Open**. The new template appears in the **Custom templates** folder on the **Templates** browser. Select the template for use.

More About

- "Specify Polyspace Analysis Options" on page 7-2
- "Analysis Options"

Update Polyspace Project

To analyze your C/C++ source files with Bug Finder or Code Prover in the Polyspace user interface, you create a Polyspace project. During development, you can simply update this project and rerun the analysis for updated results. This topic describes the updates that you can make.

To begin updates, right-click your project on the **Project Browser** pane. You see a different set of options depending on the node that you right-click.

Change Folder Path

If you have moved the source folder that you added to your project, modify the path in your Polyspace project. You can also modify the folder path to point to a different version of the code in your version control system.

In the **Project Browser**, right-click the top sources folder and select **Modify Path**.Change the path to the new location.

To resync the files under this source folder, right-click your source folder and select **Refresh Source Folder**.

Refresh Source List

If you made changes to files in a folder already added to the project, you do not need to re-add the folder to your project. Refreshing your source file list looks for new files, removed files, and moved files.

Right-click your source folder and select **Refresh Source Folder**. The files in your Polyspace project refresh to match your file system.

Refresh Project Created from Build Command

If you created your project automatically from your build system, to update the project later by rerunning your build command, right-click the project folder and select **Update Project**.

You see the information that you entered when creating the original project. Click **Run** to retrace your build command and recreate the Polyspace project.

Add Source and Include Folders

If you want to change which files or folders are active in your project without removing them from your project tree, right-click the file or folder and select **Exclude Files**. The

file appears with an symbol in your project indicating it is not considered for analysis. You can reinclude the files for analysis by right-clicking and selecting **Include Files**.

If you want to add additional source folders or include folders, right-click your project or the **Source** or **Include** folder in your project. Select **Add Source Folder** or **Add Include Folder**.

Before running an analysis, you must copy the source files to a module. Select the source files that you want to copy. To select multiple files together, press the **Ctrl** key while selecting the files. Right-click your selection. Select **Copy to > Module_n**. *n* is the module number.

Manage Include File Sequence

You can change the order of include folders to manage the sequence in which include files are compiled.

When multiple include files by the same name exist in different folders, you might want to change the order of include folders instead of reorganizing the contents of your folders. For a particular include file name, the software includes the file in the first include folder under **Project Name** > **Include**.

In the following figure, Folder_1 and Folder_2 contain the same include file include.h. If your source code includes this header file, during compilation, Folder_2/include.h is included in preference to Folder_1/include.h.

To change the order of include folders, in your project, expand the **Include** folder. Select the include folder or folders that you want to move. To move the folder, click either or or

• "Add Source Files for Analysis in Polyspace User Interface" on page 1-2

Organize Layout of Polyspace User Interface

The Polyspace user interface has two default layouts of panes.

The default layout for project setup has the following arrangement of panes:

Project Browser	Configuration
	Output Summary

The default layout for results review has the following arrangement of panes:

Results List	Result Details
	Dashboard

You can create and save your own layout of panes. If the current layout of the user interface does not meet your requirements, you can use a saved layout.

You can also change to one of the default layouts of the Polyspace user interface. Select **Window > Reset Layout > Project Setup** or **Window > Reset Layout > Results Review**.

Create Your Own Layout

To create your own layout, you can close some of the panes, open some panes that are not visible by default, and move existing panes to new locations.

To open a closed pane, select **Window > Show/Hide View > pane_name**.

To move a pane to another location:

- **1** Float the pane in one of three ways:
 - Click and drag the blue bar on the top of the pane to float all tabs in that pane.

For instance, if **Project Browser** and **Results List** are tabbed on the same pane, this action floats the pane together with its tabs.

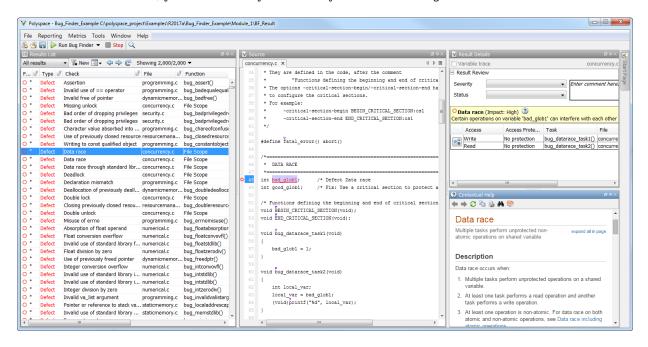

• Click and drag the tab at the bottom of the pane to float only that tab.

For instance, if **Project Browser** and **Results List** are tabbed on the same pane, dragging out **Project Browser** creates a pane with only **Project Browser** on it and floats this new pane.

- Click on the top right of the pane to float all tabs in that pane.
- **2** Drag the pane to another location until it snaps into a new position.

If you want to place the pane in its original location, click in the upper-right corner of the floating pane.

For instance, you can create your own layout for reviewing results.

Save and Reset Layout

After you have created your own layout, you can save it. You can change from another layout to this saved layout.

To save your layout, select Window > Save Current Layout As. Enter a name for this layout.

- To use a saved layout, select **Window > Reset Layout > layout_name**.
- To remove a saved layout from the Reset Layout list, select Window > Remove Custom Layout > layout_name.

More About

- "Customize Polyspace User Interface" on page 1-32
- "Organize Layout of Polyspace User Interface" on page 1-29

Customize Polyspace User Interface

In this section... "Possible Customizations" on page 1-33 "Storage of Polyspace User Interface Customizations" on page 1-34

You can customize various aspects of the Polyspace user interface, for instance, default project storage locations or default font size of source code. Select **Tools** > **Preferences**.

Possible Customizations

Change Default Font Size

To change the default font size in the Polyspace user interface, select the **Miscellaneous** tab.

 To increase the font size of labels on the user interface, select a value for GUI font size.

For example, to increase the default size by 1 point, select +1.

 To increase the font size of the code on the Source pane and the Code Editor pane, select a value for Source code font size.

When you restart Polyspace, you see the increased font size.

Specify External Text Editor

You can change the default text editor for opening source files from the Polyspace interface. By default, if you open your source file from the user interface, it opens on a **Code Editor** tab. If you prefer editing your source files in an external editor, you can change this default behavior.

To change the text editor, select the **Editors** tab. From the **Text editor** drop-down list, select **External**. In the **Text editor** field, specify the path to your text editor. For example:

C:\Program Files\Windows NT\Accessories\wordpad.exe

To make sure that your source code opens at the correct line and column in your text editor, specify command-line arguments for the editor using Polyspace macros, \$FILE, \$LINE and \$COLUMN. Once you specify the arguments, when you right-click a check on the **Results List** pane and select **Open Editor**, your source code opens at the location of the check.

Polyspace has already specified the command-line arguments for these editors: Emacs, Notepad++ (Windows only), UltraEdit, VisualStudio, WordPad (Windows only) or gVim. If you are using one of these editors, select it from the **Arguments** drop-down list.

If you are using another text editor, select Custom from the drop-down list, and enter the command-line options in the field provided.

For console-based text editors, you must create a terminal. For example, to specify vi:

- 1 In the **Text Editor** field, enter /usr/bin/xterm.
- **2** From the **Arguments** drop-down list, select Custom.
- 3 In the field to the right, enter -e /usr/bin/vi \$FILE.

To revert back to the built-in editor, on the **Editors** tab, from the **Text editor** drop-down list, select **Built In**.

Create Custom Review Status

When reviewing Polyspace results, you can assign a status such as To fix or Justified. See "Address Polyspace Results Through Bug Fixes or Comments" on page 16-2.

You can create your own statuses to assign. To create a new status, select the **Review Statuses** tab.

Storage of Polyspace User Interface Customizations

The software stores the settings that you specify through the Polyspace Preferences in the following file:

- Windows: \$Drive\Users\\$User\AppData\Roaming\MathWorks \MATLAB\\$Release\Polyspace\polyspace.prf
- Linux: /home/\$User/.matlab/\$Release/Polyspace/polyspace.prf

Here, \$Drive is the drive where the operating system files are located such as C:, \$User is the username and \$Release is the release number.

The following file stores the location of all installed Polyspace products across various releases:

 Windows: \$Drive\Users\\$User\AppData\Roaming\MathWorks\MATLAB \polyspace_shared\polyspace_products.prf • Linux:/home/\$User/.matlab/polyspace_shared/polyspace_products.prf

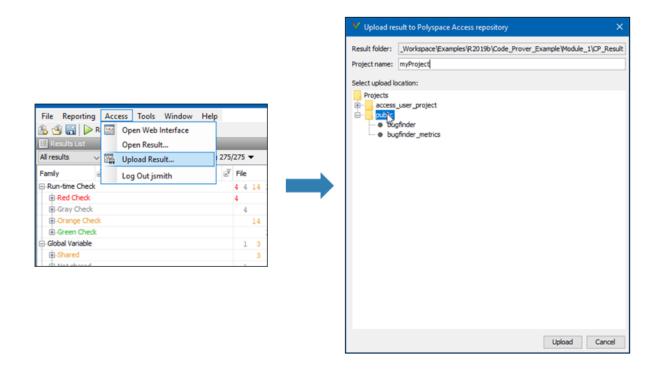

Upload Results to Polyspace Access

Polyspace Access offers a centralized database where you can store Polyspace analysis results for sharing and collaborative reviews. After you upload results, open the Polyspace Access web interface to view statistics about the quality of your code and to triage and review individual results.

Upload Results from Polyspace Desktop Client

Before you upload results, you must configure the Polyspace desktop client to communicate with Polyspace Access. See "Register Polyspace Desktop User Interface" (Polyspace Bug Finder Access).

To upload analysis results to the Polyspace Access database from the Polyspace desktop client, select a set of results in the **Project Browser** pane or open the results in the **Results List** pane. Go to **Access > Upload Results** and follow the prompts. If you get a login request, use your Polyspace Access login credentials.

You can also upload results to Polyspace Access by selecting a result in the **Project Browser** pane and using the context menu.

After you upload results to Polyspace Access, if you open a local copy of the results in the desktop interface, you cannot make changes to the **Status**, **Severity**, or comment fields. To make changes to the **Status**, **Severity**, or comment fields, open the results from Polyspace Access by going to **Access > Open Results**.

Once you save the changes you make to these fields in the desktop interface, the changes are reflected in the Polyspace Access web interface.

Upload Results at Command Line

You can upload results from the from the command line only if they are generated with Polyspace Bug Finder Server^{TM} or Polyspace Code Prover^{TM} Server.

To upload analysis results to Polyspace Access from the DOS or UNIX command line, use the polyspace-access binary. In the command, specify the path of the folder under which the .psbf, .pscp, or .rte results file is stored. For instance, to upload Polyspace Bug Finder results stored in the file BF_results\ps_results.psbf, use this command:

```
polyspace-access -host hostName ^
-port port -upload BF_results
```

The command prompts you for your Polyspace Access login credentials, then uploads the results to the public folder of the Polyspace Access database. *hostName*is the fully qualified host name of the machine where you run the **Gateway** service. *port* is the **Port number** value specified for the **Gateway** service in the settings of the cluster operator. Depending on your configuration, you might also have to specify the -protocol option in the command. See "Configure Polyspace Access Services" (Polyspace Bug Finder Access).

For additional information on polyspace-access, see the documentation for Polyspace Bug Finder or Polyspace Bug Finder Server.

Run Polyspace Analysis with Windows or Linux Scripts

- "Run Polyspace Analysis from Command Line" on page 2-2
- "Modularize Polyspace Analysis by Using Build Command" on page 2-5
- "polyspace-configure Source Files Selection Syntax" on page 2-12
- "Configure Polyspace Analysis Options in User Interface and Generate Scripts" on page 2-15

Run Polyspace Analysis from Command Line

To run an analysis from a DOS or UNIX® command window, use the command polyspace-bug-finder or polyspace-code-prover followed by other options you wish to use. See also:

- polyspace-bug-finder
- polyspace-code-prover

Specify Sources and Analysis Options Directly

At the Windows, Linux or Mac OS X command-line, append sources and analysis options to the polyspace-bug-finder or polyspace-code-prover command.

For instance:

 To specify sources, use the -sources option followed by a comma-separated list of sources.

If your current folder contains a sources subfolder with the source files, you can omit the -sources flag. The analysis considers files in sources and all subfolders under sources.

• To specify the target processor, use the -target option. For instance, to specify the m68k processor for your source file file.c, use the command:

```
polyspace-bug-finder -sources "file.c" -lang c -target m68k
```

• To check for violation of MISRA C® rules, use the -misra2 option. For instance, to check for only the required MISRA C rules on your source file file.c, use the command:

```
polyspace-bug-finder -sources "file.c" -misra2 required-rules
```

For the full list of analysis options, see:

- "Analysis Options"
- "Analysis Options" (Polyspace Code Prover)

For the full list of options, enter the following at the command line:

```
polyspace-bug-finder -help
```

Specify Sources and Analysis Options in Text File

Instead of specifying the options directly, you can save the options in a text file and use the text file each time you run the analysis.

1 Create an options file called listofoptions.txt with your options. For example:

```
#These are the options for MyCodeProverProject
-lang c
-prog MyCodeProverProject
-author jsmith
-sources "mymain.c,funAlgebra.c,funGeometry.c"
-target x86_64
-compiler generic
-dos
-misra2 required-rules
-do-not-generate-results-for all-headers
-main-generator
-results-dir C:\Polyspace\MyCodeProverProject
```

2 Run Polyspace using options in the file listofoptions.txt.

```
polyspace-code-prover -options-file listofoptions.txt
```

See also -options-file.

Create Options File from Build System

If you use a build command (makefile) to build your source code, you can collect the sources and compiler options from your build command. Trace your build command to generate a text file with the required Polyspace options.

1 Create a list of Polyspace options using the configuration tool.

where <code>buildCommand</code> is the command you use to build your source code, for instance <code>make -B</code>.

See also polyspace-configure.

2 Run Polyspace using the options read from your build.

In addition to the options collected from your build command, you might want to add further options, for instance, to specify the defect checkers. You can append these options to the options file, add them directly at the command line or add them through a second options file (using another -options-file flag).

3 Open the results in the Polyspace user interface.

```
polyspace-bug-finder myResults
```

Modularize Polyspace Analysis by Using Build Command

To configure the Polyspace analysis, you can reuse the compilation options in your build command such as make. First, you trace your build command with polyspace-configure (or polyspaceConfigure in MATLAB) and create a Polyspace options file. You later specify this options file for the subsequent Polyspace analysis.

If your build command creates several binaries, by default polyspace-configure groups the source files for all binaries into one Polyspace options file. If binaries that use the same source files or functions are compiled with different options, you lose this distinction in the subsequent Polyspace analysis. The presence of the same function multiple times can lead to link errors during the Polyspace analysis and sometimes to incorrect results.

This topic shows how to create a separate Polyspace options file for each binary created in your makefile. Suppose that a makefile creates four binaries: two executable (target cmd1 and cmd2) and two shared libraries (target liba and libb). You can create a separate Polyspace options file for each of these binaries.

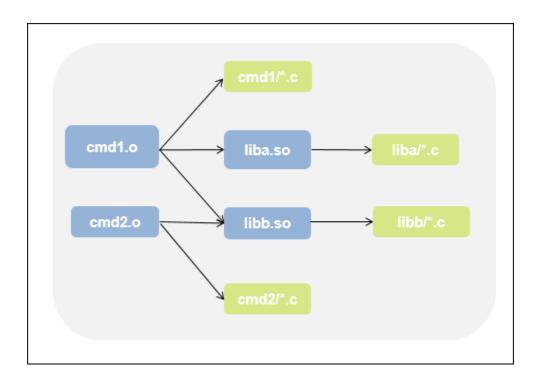

To try this example, use the files in *polyspaceroot*\help\toolbox\bugfinder\examples\multiple_modules. Here, *polyspaceroot* is the Polyspace installation folder, for instance, C:\Program Files\Polyspace\R2019a or C:\Program Files\Polyspace Server\R2019a.

Build Source Code

Inspect the makefile. The makefile creates four binaries:

```
CC := qcc
LD := ld
LIBA SOURCES := $(wildcard src/liba/*.c)
LIBB SOURCES := $(wildcard src/libb/*.c)
CMD1 SOURCES := $(wildcard src/cmd1/*.c)
CMD2 SOURCES := $(wildcard src/cmd2/*.c)
LIBA_OBJ := $(notdir $(LIBA_SOURCES:.c=.o))
LIBB OBJ := $(notdir $(LIBB_SOURCES:.c=.o))
CMD1_OBJ := $(notdir $(CMD1_SOURCES:.c=.o))
CMD2 OBJ := $(notdir $(CMD2 SOURCES:.c=.o))
LIBB SOBJ := libb.so
LIBA_SOBJ := liba.so
all: cmd1 cmd2
cmd1: liba libb
    $(CC) -o $@ $(CMD1_SOURCES) $(LIBA_SOBJ) $(LIBB_SOBJ)
cmd2: libb
    $(CC) -c $(CMD2 SOURCES)
    $(LD) -o $@ $(CMD2 OBJ) $(LIBB SOBJ)
liba: libb
    $(CC) -fPIC -c $(LIBA_SOURCES)
    $(CC) -shared -o $(LIBA SOBJ) $(LIBA OBJ)
libb:
    $(CC) -fPIC -c $(LIBB SOURCES)
    $(CC) -shared -o $(LIBB_SOBJ) $(LIBB_OBJ)
.PHONY: clean
clean:
    rm *.o
```

The binaries created have the dependencies shown in this figure. For instance, creation of the object cmdl.o depends on all.c files in the folder cmdl and the shared objects liba.so and libb.so.

Build your source code by using the makefile. Use the -B flag to ensure full build.

Make sure that the build runs to completion.

Create One Polyspace Options File for Full Build

Trace the build command by using polyspace-configure. Use the option -output-options-file to create a Polyspace options file psoptions from the build command.

```
polyspace-configure -output-options-file psoptions make -B
```

Run Bug Finder or Code Prover by using the previously created options file: Save the analysis results in a results subfolder.

```
polyspace-bug-finder -options-file psoptions -results-dir results
```

You see this link error (warning in Bug Finder):

```
Procedure 'main' multiply defined.
```

The error occurs because the files cmd1/cmd1_main.c and cmd2/cmd2_main.c both have a main function. When you run your build command, the two files are used in separate targets in the makefile. However, polyspace-configure by default creates one options file for the full build. The Polyspace options file contains both source files resulting in conflicting definitions of the main function.

To verify the cause of the error, open the Polyspace options file psoptions. You see these lines that include the files with conflicting definitions of the main function.

```
-sources src/cmd1/cmd1_main.c
-sources src/cmd2/cmd2_main.c
```

Create Options File for Specific Binary in Build Command

To avoid the link error, build the source code for a specific binary when tracing your build command by using polyspace-configure.

For instance, build your source code for the binary cmd1.o. Specify the makefile target cmd1 for make, which creates this binary.

```
polyspace-configure -output-options-file psoptions make -B cmd1
```

Run Bug Finder or Code Prover by using the previously created options file.

```
polyspace-bug-finder -options-file psoptions -results-dir results
```

The link error does not occur and the analysis runs to completion. You can open the Polyspace options file psoptions and see that only the source files in the cmd1 subfolder and the files involved in creating the shared objects are included with the -sources

option. The source files in the cmd2 subfolder, which are not involved in creating the binary cmd1.o, are not included in the Polyspace options file.

Special Considerations for Libraries (Code Prover only)

If you trace the creation of a shared object from libraries, the source files extracted do not contain a main function. In the subsequent Code Prover analysis, you can see an error because of the missing main.

Use the Polyspace option Verify module or library (-main-generator) to generate a main function. Specify the option in the options file that was created or directly at the command line. See "Verify C Application Without main Function" (Polyspace Code Prover).

In C++, use these additional options for classes:

- Class (-class-analyzer)
- Functions to call within the specified classes (-class-analyzercalls)

Create One Options File Per Binary Created in Build Command

To create an options file for a specific binary created in the build command, you must know the details of your build command. If you are not familiar with the internal details of the build command, you can create a separate Polyspace options file for *every* binary created in the build command. The approach works for binaries that are executables, shared (dynamic) libraries and static libraries.

This approach works only if you use these compilers:

- GNU C or GNU C++
- Microsoft Visual C++

Trace the build command by using polyspace-configure. To create a separate options file for each binary, use the option -module with polyspace-configure.

polyspace-configure -module -output-options-path optionsFilesFolder make -B

The command creates options files in the folder optionsFilesFolder. In the preceding example, the command creates four options files for the four binaries:

- cmd1.psopts
- cmd2.psopts
- liba_so.psopts
- libb so.psopts

You can run Polyspace on the code implementation of a specific binary by using the corresponding options file. For instance, you can run Code Prover on the code implementation of the binary created from the makefile target cmd1 by using this command:

polyspace-bug-finder -options-file cmdl.psopts -results-dir results

For this approach, you do not need to know the details of your build command. However, when you create a separate options file for each binary in this way, each options file contains source files directly involved in the binary and not through shared objects. For instance, the options file cmdl.psopts in this example specifies only the source files in the cmdl subfolder and not the source files involved in creating the shared objects liba.so and libb.so. The subsequent analysis by using this options file cannot access functions from the shared objects and uses function stubs instead. In the Code Prover analysis, if you see too many orange checks due to the stubbing, use the approach stated in the section "Create Options File for Specific Binary in Build Command" on page 2-8.

Special Considerations for Libraries (Code Prover only)

If you trace the creation of a shared object from libraries, the source files extracted do not contain a main function. In the subsequent Code Prover analysis, you can see an error because of the missing main.

Use the Polyspace option Verify module or library (-main-generator) to generate a main function. Specify the option in the options file that was created or directly at the command line. See "Verify C Application Without main Function" (Polyspace Code Prover).

In C++, use these additional options for classes:

- Class (-class-analyzer)
- Functions to call within the specified classes (-class-analyzer-calls)

More About

• "Run Polyspace Analysis from Command Line" on page 2-2

polyspace-configure Source Files Selection Syntax

When you create projects by using polyspace-configure, you can include or exclude source files whose paths match the pattern that you pass to the options -include-sources or -exclude-sources. You can specify these two options multiple times and combine them at the command line.

This folder structure applies to these examples.

To try these examples, use the demo files in *polyspaceroot*\help\toolbox \bugfinder\examples\sources-select. *polyspaceroot* is the Polyspace installation folder.

Run this command:

```
polyspace-configure -allow-overwrite -include-sources "glob_pattern" \
-print-excluded-sources -print-included-sources make -B
```

<code>glob_pattern</code> is the glob pattern that you use to match the paths of the files you want to include or exclude from your project. To ensure the shell does not expand the glob patterns you pass to <code>polyspace-configure</code>, enclose them in double quotes.

In the table, the examples assume that sources is a top-level folder.

Glob Pattern Syntax	Example
No special characters, slashes ('/'), or backslashes ('\'). Pattern matches corresponding files, but	-include-sources "main.c" matches: /sources/app/main.c
not folders.	
Pattern contains '*' or '?' special characters.	<pre>-include-sources "b?.c" matches: /sources/lib/b/b1.c</pre>
'*' matches zero or more characters in file or folder name.	/sources/lib/b/b2.c
'?' matches one character in file or folder name.	-include-sources "app/*.c" matches:
The matches do not include path separators.	/sources/app/main.c
Pattern starts with slash '/' (UNIX) or drive letter (Windows).	-include-sources "/a" does not match anything.
Pattern matches absolute path only.	-include-sources "/sources/app" matches:
	/sources/app/main.c
Pattern ends with a slash (UNIX), backslash (Windows), or '**'.	-include-sources "a/" matches
	/sources/lib/a/al.c
Pattern matches all files under specified folder.	/sources/lib/a/a2.c
'**' is ignored if it is at the start of the pattern.	
Pattern contains '/**/' (UNIX) or '**\' (Windows). Pattern matches zero or more	-include-sources "lib/**/?1.c" matches:
folders in the specified path.	/sources/lib/a/al.c
	/sources/lib/b/b1.c

Glob Pattern Syntax	Example	
Pattern starts with '.' or ''.	If you start polyspace-configure from / sources/lib/a,	
Pattern matches paths relative to the path where you run the command.	-include-sources "/lib/**/b?.c" matches:	
	/sources/lib/b/b1.c	
	/sources/lib/b/b2.c	
Pattern is a UNC path on Windows .	If your files are on server myServer:	
	\\myServer\sources\lib\b** matches:	
	\\myServer\sources\lib\b\b1.c	
	\\myServer\sources\lib\b\b2.c	

polyspace-configure does not support these glob patterns:

• Absolute paths relative to the current drive on Windows.

For instance, \foo\bar.

• Relative paths to the current folder.

For instance, $C:foo\bar.$

• Extended length paths in Windows.

For instance, foo.

 \bullet Paths that contain '.' or '..' except at the start of the pattern.

For instance, /foo/bar/../a?.c.

• The '*' character by itself.

Configure Polyspace Analysis Options in User Interface and Generate Scripts

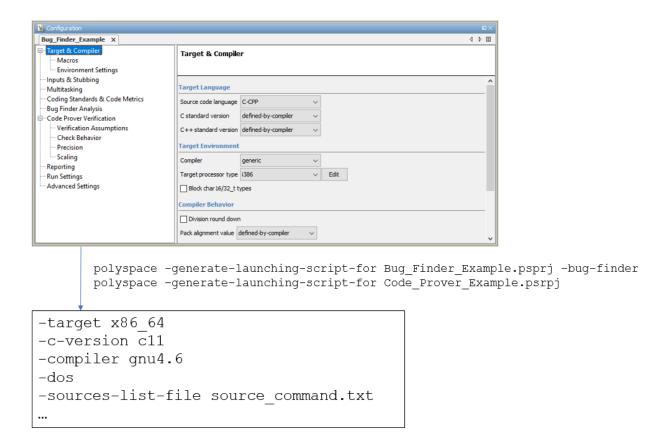

In this section...

"Prerequisites" on page 2-17

"Generate Scripts from Configuration" on page 2-17

"Run Analysis with Generated Scripts" on page 2-18

If you have an installation of the desktop products, Polyspace Bug Finder and/or Polyspace Code Prover, you can configure your project in the user interface of the desktop products. You can then generate a script or an options file from the configuration defined in the user interface and use the script or options file for automated runs with the desktop or server products.

Unless you create a Polyspace project from existing specifications such as a build command, when setting up the project, you might have to perform a few trial runs first. In these trial runs, if you run into compilation errors or unchecked code, you might have to modify your analysis configuration. It is easier performing this initial setup in the user interface of the desktop products. The user interface provides various features such as:

- Compilation assistant that suggests workarounds for some compilation errors,
- · Auto-generation of XML file for constraint specification,
- Context-sensitive help for options.

Prerequisites

You must have at least one license of Polyspace Bug Finder and/or Polyspace Code Prover to open the Polyspace user interface and configure the options.

After generating the scripts, you can run the analysis using either the desktop products (Polyspace Bug Finder and Polyspace Code Prover) or the server products (Polyspace Bug Finder Server and/or Polyspace Code Prover Server).

Generate Scripts from Configuration

This example shows how to generate a script from a Bug Finder configuration. The same steps apply to a Code Prover configuration.

- **1** Add source files to a new project in the Polyspace user interface.
 - Navigate to polyspaceroot\polyspace\bin, where polyspaceroot is the Polyspace installation folder, for instance, C:\Program Files\Polyspace \R2019a. Open the Polyspace user interface using the polyspace executable and create a new project.
 - See "Add Source Files for Analysis in Polyspace User Interface" on page 1-2.
- Specify the analysis options on the **Configuration** pane in the Polyspace project. To open this pane, in the project browser, click the configuration node in your Polyspace project.
 - See "Specify Polyspace Analysis Options" on page 7-2.
- **3** Run the analysis. Based on compilation errors and analysis results, modify options as needed.
 - See "Run Polyspace Analysis on Desktop" on page 1-8.
- 4 Once your analysis options are set, generate a script from the project (.psprj file).

To generate a script from the demo project, <code>Bug_Finder_Example</code>:

Load the project. Select Help > Examples > Bug_Finder_Example.psprj. A copy of this project is loaded in the Examples folder in your default workspace.
 To find the project location, place your cursor on the project name in the Project Browser pane.

b Navigate to the project location and enter:

```
polyspace -generate-launching-script-for Bug_Finder_Example.psprj -bug-finder To generate Code Prover scripts, use the same command without the -bug-finder option.
```

These files are generated for scripting the analysis:

- source_command.txt: Lists source files. This file can be provided as argument to the -sources-list-file option.
- options_command.txt: Lists analysis options. This file can be provided as argument to the -options-file option.
- launchingCommand.bat or launchingCommand.sh, depending on your operating system. The file uses the polyspace-bug-finder or polyspace-code-prover executable to run the analysis. The analysis runs on the source files listed in source_command.txt and uses the options listed in options_command.txt.

Run Analysis with Generated Scripts

After configuring your analysis and generating scripts, you can use the generated files to automate the subsequent analysis. You can automate the subsequent analysis using either the desktop or server products.

To automate a Bug Finder analysis with the desktop product, Polyspace Bug Finder:

- **1** Generate scripts as mentioned in the previous section.
- 2 Execute the script launchingCommand.bat or launchingCommand.sh at periodic intervals or based on predefined triggers.

To automate a Bug Finder analysis with the server product, Polyspace Bug Finder Server:

- After specifying options in the user interface and before generating scripts, move the Polyspace project (.psprj file) to the server where the server product is running.
- **2** Generate scripts as mentioned in the previous section.
 - The scripts refer to the server product executable instead of the desktop products.
- **3** Execute the script launchingCommand.bat or launchingCommand.sh at periodic intervals or based on predefined triggers.

Alternatively, you can modify the script generated for the desktop product so that the server product is executed. The script refers to the path to a desktop product executable, for instance:

"C:\Program Files\Polyspace\R2019a\polyspace\bin\polyspace-code-prover.exe"

Replace this with the path to a server product executable, for instance:

"C:\Program Files\Polyspace Server\R2019a\polyspace\bin\
 polyspace-code-prover-server.exe"

Sometimes, you might want to override some of the options in the options file. For instance, the option to specify a results folder is hardcoded in the script. You can remove this option or override it when launching the scripts:

launchingCommand -results-dir newResultsFolder

where *newResultsFolder* is the new results folder. This folder can even be dynamically generated for each run.

If you override multiple options in options_command.txt, you can save the overrides in a second options file. Modify the script launchingCommand.bat or launchingCommand.sh so that both options files are used. The script uses the option - options - file to use an options file, for instance:

```
-options-file options command.txt
```

If you place your option overrides in a second options file overrides.txt, modify the script to append a second -options-file option:

```
-options-file options_command.txt -options-file overrides.txt
```

Run Polyspace Analysis with MATLAB Scripts

- "Integrate Polyspace with MATLAB and Simulink" on page 3-2
- "Run Polyspace Analysis by Using MATLAB Scripts" on page 3-5
- "Generate MATLAB Scripts from Polyspace User Interface" on page 3-9
- "Troubleshoot Polyspace Analysis from MATLAB" on page 3-12

Integrate Polyspace with MATLAB and Simulink

Starting from R2019a, you can install Polyspace Bug Finder and Polyspace Code Prover as standalone products and analyze C/C++ code. However, you can interact with other MathWorks® products in these ways:

- Use MATLAB scripts to run Polyspace.
 - See "Polyspace Analysis with MATLAB Scripts".
- Run Polyspace after C/C++ code generation from models in the Simulink Editor.
 - See "Polyspace Analysis in Simulink".
- Run Polyspace after C/C++ code generation from MATLAB code in the MATLAB Coder™ App (if you have an Embedded Coder® license).

See "Polyspace Analysis in MATLAB Coder".

If you install Polyspace products and other MathWorks products such as MATLAB, Simulink or Embedded Coder, you have to run the MATLAB installer twice and install Polyspace in a different root folder from the other products. For instance, in Windows:

- Your default MATLAB root folder is C:\Program Files\MATLAB\R2019a.
- Your default Polyspace root folder is C:\Program Files\Polyspace\R2019a.

To run Polyspace from within MATLAB, Simulink or MATLAB Coder, you have to perform a post-installation step to link your MATLAB and Polyspace installations.

Integrate Polyspace with MATLAB Installation from Same Release

If your Polyspace and MATLAB installations belong to the same release, you can use all MATLAB functions and classes available for running Polyspace. You can also run Polyspace on generated code in the Simulink editor or MATLAB Coder App (with an Embedded Coder license).

To link your MATLAB and Polyspace installations:

1 Open MATLAB with administrator privileges.

- Navigate to polyspaceroot\toolbox\polyspace\pscore\. Here, polyspaceroot is the Polyspace installation folder, for instance, C:\Program Files\Polyspace\R2019a.
- **3** At the MATLAB command prompt, enter:

```
polyspacesetup('install')
```

You see a prompt stating that the workspace will be cleared and all open models closed. Click **Yes** to continue the linking. The process might take a few minutes to complete.

4 Restart MATLAB. You can now use all functions and classes available for running Polyspace.

A MATLAB installation can be linked with only one Polyspace installation. To link to a new Polyspace installation, any previous links must be removed. To remove a link between a Polyspace and MATLAB installation, repeat the same steps as before with one difference: At the MATLAB command prompt, enter:

```
polyspacesetup('uninstall')
```

Integrate Polyspace with MATLAB Installation from Different Release

If you upgrade your Polyspace installation but not your MATLAB (Simulink) installation, you can link your MATLAB installation with the later release of Polyspace.

Remove the existing link between your Polyspace and MATLAB installation as described in the previous section. Then, in your post-installation step, navigate to *polyspaceroot* \toolbox\polyspace\pscore\pscore\, where *polyspaceroot* is the installation folder for the later release of Polyspace. At the MATLAB command prompt, enter:

```
polyspacesetup('install')
```

If you integrate MATLAB with a later release of Polyspace, you cannot use all functions and classes available to run the analysis. In particular, you cannot use the polyspace.Project, polyspace.Options and polyspace.ModelLinkOptions classes.

• Use the polyspaceCodeProver function to run Code Prover and the polyspaceBugFinder function to run Bug Finder on handwritten code.

• Use the functions pslinkoptions, pslinkrun and pslinkfun to run Polyspace on generated code.

You can also run Polyspace on C/C++ code generated from models in the Simulink editor. However, you cannot run Polyspace on C/C++ code generated from MATLAB code in the MATLAB Coder App.

Check Integration Between MATLAB and Polyspace

To check if a MATLAB installation is already linked to a Polyspace installation, open MATLAB and enter a Polyspace-specific command, for instance:

```
obj = polyspace.Project
```

The command will display an error if the MATLAB installation is not linked to a Polyspace installation.

More About

- "Polyspace Analysis with MATLAB Scripts"
- "Polyspace Analysis in Simulink"
- "Polyspace Analysis in MATLAB Coder"

Run Polyspace Analysis by Using MATLAB Scripts

You can automate the analysis of your C/C++ code by using MATLAB scripts. In your script, you specify your source files and analysis options such as compiler, run an analysis, and read the analysis results to MATLAB tables.

For instance, use this script to run a Polyspace Bug Finder analysis on a sample file:

```
proj = polyspace.Project
% Specify sources and includes
sourceFile = fullfile(polyspaceroot, 'polyspace', ...
    examples', 'cxx', 'Bug_Finder_Example', 'sources', 'numerical.c');
includeFolder = fullfile(polyspaceroot, 'polyspace', ...
    'examples', 'cxx', 'Bug_Finder_Example', 'sources');
% Configure analysis
proj.Configuration.Sources = {sourceFile};
proj.Configuration.TargetCompiler.Compiler = 'qnu4.9';
proj.Configuration.EnvironmentSettings.IncludeFolders = {includeFolder};
proj.Configuration.ResultsDir = fullfile(pwd, 'results');
% Run analysis
bfStatus = proj.run('bugFinder');
% Read results
bfSummary = proj.Results.getSummary('defects');
See also polyspace. Project.
```

Prerequisites

Before you run Polyspace from MATLAB, you must link your Polyspace and MATLAB installations. See "Integrate Polyspace with MATLAB and Simulink" on page 3-2.

Specify Multiple Source Files

You can specify a folder containing all your source files. For instance:

```
sourceFolder = fullfile(polyspaceroot, 'polyspace', ...
    'examples', 'cxx', 'Bug_Finder_Example', 'sources');
proj.Configuration.Sources = {fullfile(sourceFolder,'*')};
```

You can also specify multiple source folders in the cell array.

You can specify a folder that contains all your source files directly *or in subfolders*. For instance:

If you do not want to analyze all files in a folder, you can explicitly specify which files to analyze. For instance:

```
sourceFolder = fullfile(polyspaceroot, 'polyspace', ...
    'examples', 'cxx', 'Bug_Finder_Example', 'sources');
file1 = fullfile(sourceFolder, 'numerical.c');
file2 = fullfile(sourceFolder, 'staticmemory.c');
proj.Configuration.Sources = {file1, file2};
```

You can explicitly exclude files from analysis. For instance:

```
% Specify source folder.
sourceFolder = fullfile(polyspaceroot, 'polyspace', ...
    'examples', 'cxx', 'Bug_Finder_Example', 'sources');
proj.Configuration.Sources = {fullfile(sourceFolder,'**')};

% Specify files to exclude.
file1 = fullfile(sourceFolder,'security.c');
file2 = fullfile(sourceFolder,'tainteddata.c');
proj.Configuration.InputsStubbing.DoNotGenerateResultsFor = ['custom=' file1 ...
    ',' file2];
```

However, this method of exclusion does not apply to Code Prover run-time error checking.

Check for MISRA C:2012 Violations

You can customize the Polyspace analysis to check for MISRA C:2012 rule violations.

Set options for checking MISRA C:2012 rules. Disable the regular Bug Finder analysis, which looks for defects.

```
% Enable MISRA C checking
proj.Configuration.CodingStandards.EnableMisraC3 = true;
proj.Configuration.CodingStandards.MisraC3Subset = 'mandatory';
```

```
% Disable defect checking
proj.Configuration.BugFinderAnalysis.EnableCheckers = false;
% Run analysis
bfStatus = proj.run('bugFinder');
% Read summary of results
misraSummary = proj.Results.getSummary('misraC2012');
```

Check for Specific Defects or Coding Rule Violations

Instead of the default set of defect or coding rule checkers, you can specify your own set.

To disable MISRA C:2012 rules 8.1 to 8.4:

```
% Disable rules
misraRules = polyspace.CodingRulesOptions('misraC2012');
misraRules.rule_8_1 = false;
misraRules.rule_8_2 = false;
misraRules.rule_8_3 = false;
misraRules.rule_8_4 = false;
% Configure analysis
proj.Configuration.CodingStandards.EnableMisraC3 = true;
proj.Configuration.CodingStandards.MisraC3Subset = misraRules;
See also polyspace.CodingRulesOptions.
```

To enable Bug Finder defects, use the class polyspace.DefectsOptions. One difference between coding rules and defects class is that coding rule checkers are enabled by default. You disable the ones that you do not want. All defect checkers are disabled by default. You enable the ones that you want.

Find Files That Do Not Compile

If one or more of your files contain a compilation error, the analysis continues with the remaining files. You can choose to stop analysis on compilation errors.

```
proj.Configuration.EnvironmentSettings.StopWithCompileError = true;
```

However, it is more convenient to let the analysis complete and capture all compilation errors from the analysis log file. For more information, see "Troubleshoot Polyspace Analysis from MATLAB" on page 3-12.

Run Analysis on Server

You can run an analysis on a remote server instead of your local desktop. Once you have set up connection to a server, you can run the analysis in batch mode. For setup information, see "Install Products for Submitting Polyspace Analysis from Desktops to Remote Server".

Specify that the analysis must run on a server. Specify a folder on your desktop where results are downloaded after analysis.

```
proj.Configuration.MergedComputingSettings.BatchBugFinder = true;
proj.Configuration.ResultsDir = fullfile(pwd,'results');
Run analysis as usual.
```

```
proj.run('bugFinder');
```

Open the results from the results folder location.

```
pslinkfun('openresults', '-resultsfolder', proj.Configuration.ResultsDir);
```

If the analysis is complete and the results have been downloaded, they open in the Polyspace user interface.

- "Visualize Bug Finder Analysis Results in MATLAB" on page 18-12
- "Troubleshoot Polyspace Analysis from MATLAB" on page 3-12

Generate MATLAB Scripts from Polyspace User Interface

You can specify analysis options in the Polyspace user interface and later generate a MATLAB script for easier reuse of those options.

In the user interface, to determine which options to specify, you have tooltips, autocompletion of function names, compilation assistant, context-sensitive help and so on. After you specify the options, you can generate a MATLAB script. For subsequent analyses, you can modify and run the script without opening the Polyspace user interface.

Prerequisites

Before you run Polyspace from MATLAB, you must link your Polyspace and MATLAB installations. See "Integrate Polyspace with MATLAB and Simulink" on page 3-2.

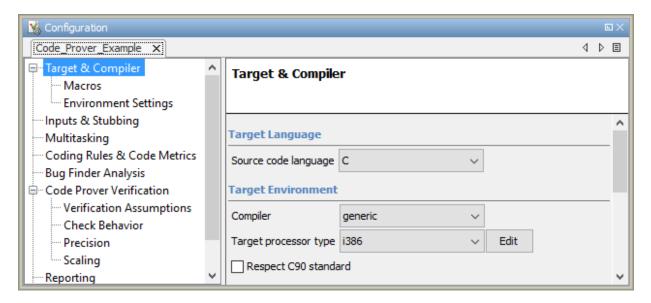

Create Scripts from Polyspace Projects

To start an analysis in the Polyspace user interface, create a project. In the project:

- You specify source and include folders during project creation.
- You specify analysis options such as compiler or multitasking in your project configuration. You also enable or disable checkers.

From this project, you can generate a script that contains your sources, includes and other analysis options. To begin, select **File > New Project**. For details, see "Add Source Files for Analysis in Polyspace User Interface" on page 1-2.

This example uses a sample project. To open the project, select **Help > Examples > Code_Prover_Example.psprj**. You see the options in the project configuration. For instance, on the **Target & Compiler** node, you see a **generic** compiler and an **i386** processor.

- **1** Open MATLAB.
- 2 Create a polyspace.Options object from the sample Polyspace project.

3 Append the object to a MATLAB script.

```
filePath = opts.toScript('runPolyspace.m', 'append');
```

Open the script runPolyspace.m. You see the options that you specified from the user interface. For instance, you see the compiler and target processor.

```
opts.TargetCompiler.Compiler = 'generic';
opts.TargetCompiler.Target = 'i386';
```

Later, you can run the script to create a polyspace.Options object.

```
run(filePath);
```

The preceding example converts the sample project Code_Prover_Example directly to a script. When you open the sample project in the user interface, a copy is loaded into your Polyspace workspace. If you make changes to the sample project, the changes are made

to the copied version. To see the changes in your MATLAB script, provide the copied project path to the loadProject method. To see the location of your workspace, select **Tools > Preferences** and view the **Project and Results Folder** tab.

Related Examples

"Run Polyspace Analysis by Using MATLAB Scripts" on page 3-5

Troubleshoot Polyspace Analysis from MATLAB

When you run a Polyspace analysis on your C/C++ code, if one or more of your files fail to compile, the analysis continues with the remaining files. You can choose to stop the analysis on compilation errors.

```
proj = polyspace.Project;
proj.Configuration.EnvironmentSettings.StopWithCompileError = true;
```

However, it is more convenient to let the analysis complete and capture all compilation errors.

The compilation errors are displayed in the analysis log that appears on the MATLAB command window. The analysis log also contains the options used and the various stages of analysis. The lines that indicate errors begin with the Error: string. Find these lines and extract them to a log file for easier scanning. Produce a warning to indicate that compilation errors occurred.

Prerequisites

Before you run Polyspace from MATLAB, you must link your Polyspace and MATLAB installations. See "Integrate Polyspace with MATLAB and Simulink" on page 3-2.

Capture Polyspace Analysis Errors in Error Log

The function runPolyspace defined later captures the output from the command window using the evalc function and stores lines starting with Error: in a file error.log. You can call runPolyspace with paths to your source and include folders.

For instance, you can call the function with paths to demo source files in the subfolder polyspace/examples/cxx/Bug_Finder_Example/sources of the MATLAB installation folder.

```
sourcePath = fullfile(polyspaceroot, 'polyspace', ...
    'examples', 'cxx', 'Bug_Finder_Example', 'sources');
includePath = fullfile(polyspaceroot, 'polyspace', ...
    'examples', 'cxx', 'Bug_Finder_Example', 'sources');
[status, resultsSummary] = runPolyspace(sourcePath, includePath);
```

The function is defined as follows.

```
function [status, resultsSummary] = runPolyspace(sourcePath, libPath)
% runPolyspace takes two string arguments: source and include folder.
% The files in the source folder are analyzed for defects.
% If one or more files fail to compile, the errors are saved in a log.
% A warning on the screen indicates that compilation errors occurred.
    proj = polyspace.Project;
    % Specify sources
    proj.Configuration.Sources = {fullfile(sourcePath,'*')};
    % Specify compiler and paths to libraries
    proj.Configuration.TargetCompiler.Compiler = 'qnu4.9';
    proj.Configuration.EnvironmentSettings.IncludeFolders = {fullfile(libPath,'*')};
    % Run analysis
    runMode = 'bugFinder';
    [logFileContent,status] = evalc('proj.run(runMode)');
    % Open file for writing errors
    errorFile = fopen('error.log','wt+');
    % Check log file for compilation errors
    numErrors = 0;
    log = strsplit(logFileContent,'\n');
    errorLines = find(contains(log, {'Error:'}, 'IgnoreCase', true));
    for ii=1:numel(errorLines)
          fprintf(errorFile, '%s\n', log{errorLines(ii)});
          numErrors = numErrors + 1;
    end
    if numErrors
        warning('%d compilation error(s). See error.log for details.', numErrors);
    end
    fclose(errorFile):
    % Read results
    resultsSummary = proj.Results.getSummary('defects');
```

The analysis log is also captured in a file Polyspace_R20##n_ProjectName_date-time.log. Instead of capturing the output from the command window, you can search this file.

You can adapt this script for other purposes. For instance, you can capture warnings in addition to errors. The lines with warnings begin with warning:. The warnings indicate situations where the analysis proceeds despite an issue. The analysis makes an assumption to work around the issue. If the assumption is incorrect, you can see errors later or in rare cases, incorrect analysis results.

Send Polyspace Analysis from Desktop to Remote Servers

In this section...

"Client-Server Workflow for Running Analysis" on page 4-2

"Prerequisites" on page 4-4

"Offload Analysis in Polyspace User Interface" on page 4-4

You can perform a Polyspace analysis locally on your desktop or offload the analysis to one or more dedicated servers. You offload a Polyspace analysis from a Polyspace desktop product such as Polyspace Bug Finder but the analysis runs on the server using a Polyspace server product such as Polyspace Bug Finder Server.

This topic shows how to send a Polyspace analysis from the user interface of the Polyspace desktop products.

- To offload an analysis with scripts, see "Send Polyspace Analysis from Desktop to Remote Servers Using Scripts" on page 4-7.
- For a simple tutorial that walks through all the steps for offloading a Polyspace analysis, see "Send Bug Finder Analysis from Desktop to Locally Hosted Server". In the tutorial, the same computer acts as the client and the server.

Client-Server Workflow for Running Analysis

After the initial setup, you can submit a Polyspace analysis from a client desktop to a server. The client-server workflow happens in three steps. All three steps can be performed on the same computer or three different computers.

1 Client node: You specify Polyspace analysis options and start the analysis on the client desktop. The initial phase of analysis upto compilation runs on the desktop. After compilation, the analysis job is submitted to the server.

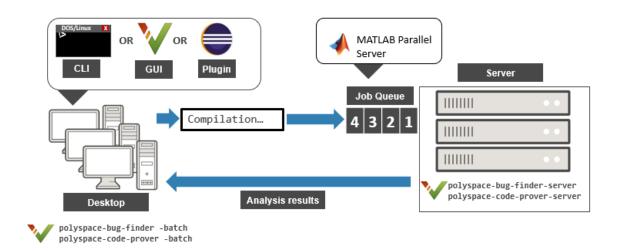

You require the Polyspace desktop product, Polyspace Bug Finder on the computer that acts as the client node.

Head node: The server consists of a head node and several worker nodes. The head node uses a job scheduler to manage submissions from multiple client desktops. The jobs are then distributed to the worker nodes as they become available.

You require the product MATLAB Parallel Server $^{\text{\tiny TM}}$ on the computer that acts as the head node.

3 Worker nodes: When a worker becomes available, the job scheduler assigns the analysis to the worker. The Polyspace analysis runs on the worker and the results are downloaded back to the client desktop for review.

You require the product MATLAB Parallel Server on the computers that act as worker nodes. You also require the Polyspace server products, Polyspace Bug Finder Server and/or Polyspace Code Prover Server, to run the analysis.

Prerequisites

Before offloading an analysis from the user interface of the Polyspace desktop products, you must set up your project's source files, analysis options, and remote analysis settings. If you have not done so, for more information on:

- How to add source files, see "Add Source Files for Analysis in Polyspace User Interface" on page 1-2.
- How to set up communication between client and server, see "Install Products for Submitting Polyspace Analysis from Desktops to Remote Server".

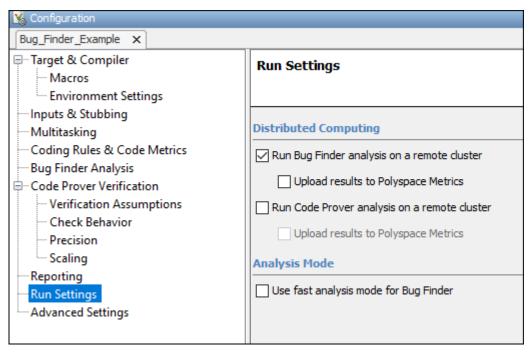

Once you have set up a Polyspace project and established communicated between a desktop and a remote server, you are ready to offload a Polyspace analysis.

Offload Analysis in Polyspace User Interface

To start a remote analysis:

- **1** Select a project to analyze.
- 2 On the Configuration pane, select Run Settings.

Select Run Bug Finder analysis on a remote cluster and/or Run Code Prover analysis on a remote cluster.

If you want to store your results in the Polyspace Metrics repository, select **Upload** results to Polyspace Metrics.

Otherwise, clear this check box. After analysis, the results are downloaded to the desktop for review.

4 Start the analysis. For instance, to start a Bug Finder analysis, click the **Run Bug Finder** button.

The compilation part of the analysis takes place on the desktop product. After compilation, the analysis is offloaded to the server.

5 To monitor the analysis, select **Tools > Open Job Monitor**. In the Polyspace Job Monitor, follow your queued job to monitor progress.

Once the analysis is complete, the results are downloaded back to the user interface of the Polyspacedesktop products. You can open the results directly in the user interface. If you uploaded the results to Polyspace Metrics, you have to explicitly download them from the Polyspace Metrics interface.

If the analysis stops after compilation and you have to restart the analysis, to avoid restarting from the compilation phase, use the option <code>-submit-job-from-previous-compilation-results</code>.

Note If you choose to upload results to Polyspace Metrics, your results are not downloaded automatically after verification. Use the Polyspace Metrics web dashboard to view the results and download them to your desktop. For more information, see "View Projects in Polyspace Metrics" on page 19-5.

Send Polyspace Analysis from Desktop to Remote Servers Using Scripts

Instead of running a Polyspace analysis on your local desktop, you can send the analysis to a remote cluster. You can use a dedicated cluster for running Polyspace to free up memory on your local desktop.

This topic shows how to use Windows or Linux scripts to send the analysis to a remote cluster and download the results to your desktop after analysis.

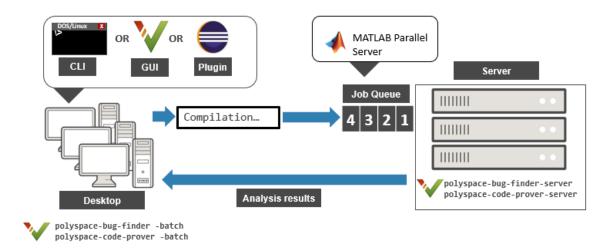

- To offload an analysis from the Polyspace user interface, see "Send Polyspace Analysis from Desktop to Remote Servers" on page 4-2.
- For a simple tutorial that walks through all the steps for offloading a Polyspace analysis, see "Send Bug Finder Analysis from Desktop to Locally Hosted Server". In the tutorial, the same computer acts as the client and the server.

Client-Server Workflow for Running Analysis

After the initial setup, you can submit a Polyspace analysis from a client desktop to a server. The client-server workflow happens in three steps. All three steps can be performed on the same computer or three different computers.

- 1 Client node: You specify Polyspace analysis options and start the analysis on the client desktop. The initial phase of analysis upto compilation runs on the desktop. After compilation, the analysis job is submitted to the server.
 - You require the Polyspace desktop product, Polyspace Bug Finder on the computer that acts as the client node.
- **Head node**: The server consists of a head node and several worker nodes. The head node uses a job scheduler to manage submissions from multiple client desktops. The jobs are then distributed to the worker nodes as they become available.
 - You require the product MATLAB Parallel Server on the computer that acts as the head node.
- **Worker nodes**: When a worker becomes available, the job scheduler assigns the analysis to the worker. The Polyspace analysis runs on the worker and the results are downloaded back to the client desktop for review.

You require the product MATLAB Parallel Server on the computers that act as worker nodes. You also require the Polyspace server products, Polyspace Bug Finder Server and/or Polyspace Code Prover Server to run the analysis.

Prerequisites

Before you run a remote analysis by using scripts, you must set up communication between a desktop and a remote server. See "Install Products for Submitting Polyspace Analysis from Desktops to Remote Server".

Run Remote Analysis

To run a remote analysis, use this command:

polyspaceroot\polyspace\bin\polyspace-bug-finder
-batch -scheduler NodeHost | MJSName@NodeHost [options]

where:

- *polyspaceroot* is the installation folder of Polyspace desktop products, for instance, C:\Program Files\Polyspace\R2019a.
- NodeHost is the name of the computer that hosts the head node of the MATLAB Parallel Server cluster.

MJSName is the name of the MATLAB Job Scheduler on the head node host.

If you set up communications with a cluster from the Polyspace user interface, you can determine <code>NodeHost</code> and <code>MJSName</code> from the user interface. Select <code>Metrics</code> > <code>Metrics</code> and <code>Remote Server Settings</code>. Open the MATLAB Parallel Server Admin Center. Under <code>MATLAB Job Scheduler</code>, see the <code>Name</code> and <code>Hostname</code> columns for <code>MJSName</code> and <code>NodeHost</code>.

If you use the startjobmanager command to start the MATLAB Job Scheduler, *MJSName* is the argument of the option -name. For details, see "Configure Advanced Options for MATLAB Job Scheduler Integration" (MATLAB Parallel Server).

- *options* are the analysis options. These options are the same as that of a local analysis. For instance, you can use these options:
 - -sources-list-file: Specify a text file with one source file name per line.
 - -options-file: Specify a text file with one option per line.
 - -results-dir: Specify a download folder for storing results after analysis.

For the full list of options, see "Analysis Options". Alternatively, you can:

- Start an analysis in the user interface and stop after compilation. You can obtain the text files and scripts for running the analysis at the command line. See "Configure Polyspace Analysis Options in User Interface and Generate Scripts" on page 2-15.
- Enter polyspace-bug-finder -h. The list of available options with a brief description are displayed.
- Place your cursor over each option on the **Configuration** pane in the Polyspace user interface. Click the **More Help** button for information on the option syntax and when the option is required.

The analysis executes locally on your desktop up to the end of the compilation phase. After compilation, the software submits the analysis job to the cluster and provides a job ID. You can also read the ID from the file ID.txt in the results folder. To monitor your analysis, use the polyspace-jobs-manager command with the job ID.

If the analysis stops after compilation and you have to restart the analysis, to avoid rerunning the compilation phase, use the option -submit-job-from-previous-compilation-results.

Manage Remote Analysis

To manage multiple remote analyses, use the option -batch. For instance:

See also Run Bug Finder or Code Prover analysis on a remote cluster (-batch). Here:

- polyspaceroot is your MATLAB installation folder.
- *schedulerName* is one of the following:
 - Name of the computer that hosts the head node of your MATLAB Parallel Server cluster (NodeHost).
 - Name of the MATLAB Job Scheduler on the head node host (MJSName@NodeHost).
 - Name of a MATLAB cluster profile (ClusterProfile).

For more information about clusters, see "Discover Clusters and Use Cluster Profiles" (Parallel Computing Toolbox)

If you do not specify a job scheduler, polyspace-job-manager uses the scheduler specified in the Polyspace preferences. To see the scheduler name, select **Tools** > **Preferences**. On the **Server Configuration** tab, see the **Job scheduler host name**.

- action refers to the possible action commands to manage jobs on the scheduler:
 - listjobs:

Generate a list of Polyspace jobs on the scheduler. For each job, the software produces this information:

- ID Verification or analysis identifier.
- AUTHOR Name of user that submitted job.
- APPLICATION Name of Polyspace product, for example, Polyspace Code Prover or Polyspace Bug Finder.
- LOCAL_RESULTS_DIR Results folder on local computer, specified through the Tools > Preferences > Server Configuration tab.
- WORKER Local computer from which job was submitted.
- STATUS Status of job, for example, running and completed.
- DATE Date on which job was submitted.
- LANG Language of submitted source code.
- download -job ID -results-folder FolderPath:

Download results of analysis with specified ID to folder specified by *FolderPath*.

When the analysis job is queued on the server, the command polyspace-bug-finder returns a job id. In addition, a file ID.txt in the results folder contains the job ID in this format:

```
job_id;server_name:project_name version_number
```

For instance, 92; localhost: Demo 1.0.

If you do not use the -results-folder option, the software downloads the result to the folder that you specified when starting analysis, using the -results-dir option.

After downloading results, use the Polyspace user interface to view the results.

• getlog -job *ID*:

Open log for job with specified ID.

• remove -job ID:

Remove job with specified ID.

• promote -job *ID*:

Promote job with specified ID in the queue.

• demote -job ID

Demote job with specified ID in the queue.

Sample Scripts for Remote Analysis

In Windows, to avoid typing the commands each time, you can save the commands in a batch file. In Linux, you can relaunch the analysis by using a shell script. To create a batch file for running analysis:

- 1 Save your analysis options in a file listofoptions.txt. See -options-file.
- 2 Create a file launcher.bat in a text editor like Notepad.

In the file, enter these commands:

polyspaceroot is the Polyspace installation folder. *localhost* is the name of the computer that hosts the head node of your MATLAB Parallel Server cluster.

- **3** Replace the definitions of these variables in the file:
 - POLYSPACE_PATH: Enter the actual location of the .exe file.
 - RESULTS_PATH: Enter the path to a folder. The files generated during compilation are saved in the folder.
 - OPTIONS_FILE: Enter the path to the file listofoptions.txt.
- 4 Double-click launcher.bat to run the analysis.

Tip If you run a Polyspace analysis, a Windows .bat or Linux .sh file is generated. The file is in the .settings subfolder in your results folder. Instead of writing a script from scratch, you can relaunch the analysis using this file.

Run Polyspace Analysis on Generated Code

Run Polyspace Analysis on Code Generated with Embedded Coder

If you generate code from a Simulink model by using Embedded Coder or TargetLink®, you can analyze the generated code for bugs or run-time errors with Polyspace from within the Simulink environment. You do not have to manually set up a Polyspace project.

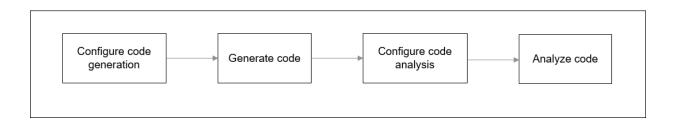

This topic uses Embedded Coder for code generation. For analysis of TargetLink-generated code, see "Run Polyspace Analysis on Code Generated with TargetLink" on page 5-34.

For a tutorial with a specific model, see "Analyze Code Generated from Simulink Subsystem" on page 5-8.

Prerequisites

Before you run Polyspace from Simulink, you must link your Polyspace and MATLAB installations. See "Integrate Polyspace with MATLAB and Simulink" on page 3-2.

Generate and Analyze Code

Configure Code Generation and Generate Code

To configure code generation and generate code from a model or subsystem, do one of the following:

- Select Code > C/C++ > Embedded Coder Quick Start. Follow the on-screen instructions.
- Configure code generation through Simulink configuration parameters. The chief parameters to set are:
 - Type (Simulink): Select **Fixed-step**.
 - Solver (Simulink): Select auto (Automatic solver selection) or Discrete (no continuous states).
 - System target file (Simulink Coder): Enter ert.tlc or autosar.tlc. If you derive target files from ert.tlc, you can also specify them.
 - "Code-to-model" (Simulink Coder): Select this option to enable links from code to model.

For the full list of parameters to set, see "Recommended Model Configuration Parameters for Polyspace Analysis" on page 5-19.

Alternatively, run the Code Generation Advisor with the objective **Polyspace** and see if the required parameters are already set. See "Configure Model for Code Generation Objectives by Using Code Generation Advisor" (Embedded Coder).

To generate code, select Code > C/C++ > Build Model. There is an equivalent option to generate code from a subsystem.

Configure Code Analysis

Select **Code** > **Polyspace** > **Options**. If needed, change default values of these options.

- "Product mode": Choose Code Prover or Bug Finder.
- Settings from: Enable checking of MISRA® coding rules in addition to the default checks specified in the project configuration. The default Bug Finder checks look for bugs. The default Code Prover checks look for run-time errors.
- "Input", "Tunable parameters" and "Output": Constrain inputs, tunable parameters, or outputs for a more precise Code Prover analysis.

- "Output folder": Specify a dedicated folder for results. The default analysis saves the results in a folder results_modelName in the current working folder.
- · "Open results automatically after verification"

Analyze Code

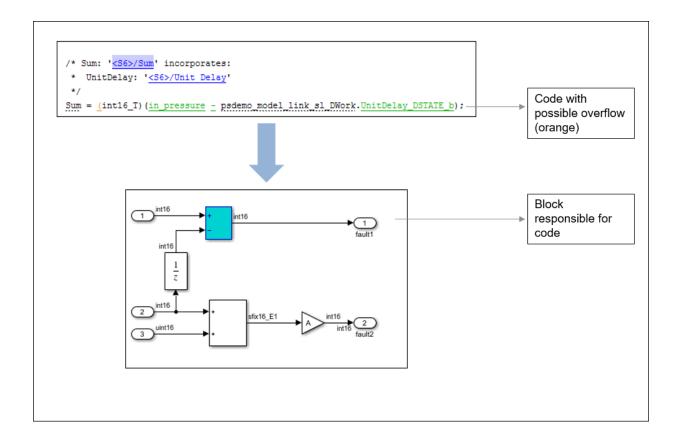

To analyze the code, select **Code > Polyspace > Verify Code Generated for > Model**. There is an equivalent option for a subsystem.

You can follow the progress of the analysis in the MATLAB Command Window.

The results open automatically unless explicitly disabled. By default, the results are saved in a folder results_ModelName in the current folder. Each new run overwrites previous results. You can change the default folders or save the results to a Simulink project. To make these changes, select **Code** > **Polyspace** > **Options**.

If you have closed the results and want to open them later, select **Code > Polyspace > Open Results > For Generated Code**.

Review Analysis Results

Review Results in Code

The results appear in the Polyspace user interface on the **Results List** pane. Click each result to see the source code on the **Source** pane and details on the **Result Details** pane. See also:

- "Interpret Polyspace Bug Finder Results" on page 15-2
- •
- •
- "Address Polyspace Results Through Bug Fixes or Comments" on page 16-2
- "Filter and Group Results" on page 17-2

Navigate from Code to Model

Links in code comments show blocks that generate the subsequent lines of code. To see the blocks in the model, click the block names in the links. If you encounter issues, see "Troubleshoot Navigation from Code to Model" on page 5-39.

Alternatively, you can right-click a variable name and select **Go to Model**. This option is not available for all variables.

Fix Issue

Investigate whether the issues in your code are related to design flaws in the model.

Design flaws in the model can lead to issues in the generated code. For instance:

- The generated code might be free of specific run-time errors only for a certain range
 of a block parameter. To fix this issue, you can change the storage class of that block
 parameter or use calibration data for the analysis by using the configuration
 parameter "Tunable parameters".
- The generated code might be free of specific run-time errors only for a certain range
 of inputs. To determine this error-free range, you can specify a minimum and
 maximum value for the Inport block signals. The Polyspace analysis uses this
 constrained range. See "Specify Ranges for Signals" (Simulink).
- Certain transitions in Stateflow[®] charts can be unreachable.

If you include handwritten C/C++ code in S-Function blocks, the Polyspace analysis can reveal possible integration issues between the handwritten and generated code. You can also analyze the handwritten code in isolation. See "Analyze S-Function Code" on page 5-16.

Annotate Blocks to Justify Issues

If you do not want to make changes in response to a Polyspace result, annotate the relevant blocks. After you annotate a block, code operations generated from the block show results prepopulated with your comments. To annotate a block, right-click the block and select **Polyspace > Annotate Selected Block > Edit**. Enter the following:

 Comma-separated list of result acronyms. To justify only the type of result, select Only 1 check.

See:

- "Short Names of Bug Finder Defect Checkers" on page 13-4
- "Short Names of Code Prover Run-Time Checks" (Polyspace Code Prover)
- Status, severity, and comment to be assigned to the results.

Sometimes operations in the generated code are known to cause orange checks in Code Prover. Suppose an operation is known to possibly overflow. The generated code protects against the overflow by following the operation with a saturation. Polyspace still flags the possible overflow as an orange check. To automatically justify these checks through code comments, specify the configuration parameter "Operator annotations" (Simulink Coder).

More About

• "Configure Advanced Polyspace Options in Simulink" on page 5-22

Analyze Code Generated from Simulink Subsystem

You can run Polyspace on the code generated from a Simulink model or subsystem.

- Polyspace Bug Finder checks the code for bugs or coding rule violations (for instance, MISRA C: 2012 rules).
- Polyspace Code Prover exhaustively checks the code for run-time errors.

If you use Embedded Coder for code generation, this tutorial shows how to run Polyspace on the generated code from within Simulink.

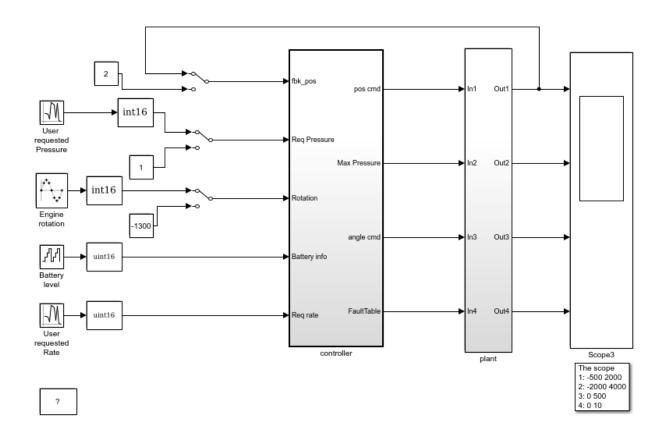

Prerequisites

Before you run Polyspace from Simulink, you must link your Polyspace and MATLAB installations. See "Integrate Polyspace with MATLAB and Simulink" on page 3-2.

Open Model

Open the example model.

```
modelName = 'psdemo_model_link_sl';
open_system(modelName)
```

Copyright 2010-2015 The MathWorks, Inc.

Generate Code

Generate code for the controller subsystem in your model.

- 1 Right-click the controller subsystem and select C/C++ Code > Build This Subsystem.
- 2 In the dialog box, select **Build**.

Equivalent MATLAB Code:

```
subsysPath = 'psdemo_model_link_sl/controller';
rtwbuild(subsysPath);
```

Analyze Code

Analyze the code generated for the controller subsystem.

1 Choose a product, Bug Finder or Code Prover, to analyze the code.

Right-click the controller subsystem and select **Polyspace > Options**. For **Product mode**, choose Code Prover or Bug Finder.

2 Analyze the generated code.

Right-click the controller subsystem and select **Polyspace** > **Verify Generated Code for** > **Selected Subsystem**. Follow the progress of analysis in the MATLAB Command Window.

Equivalent MATLAB Code:

```
opts = polyspace.ModelLinkOptions('C');
mlopts = pslinkoptions(subsysPath);
mlopts.VerificationMode = 'CodeProver';
mlopts.PrjConfigFile = generateProject(opts, 'polyspaceProject');
pslinkrun(subsysPath, mlopts);
```

To analyze with Bug Finder, replace CodeProver with BugFinder. For more information on the code, see polyspace. ModelLinkOptions, pslinkoptions and pslinkrun.

Review Analysis Results

After analysis, the results are displayed in the Polyspace user interface.

If you run Bug Finder, the results consist of bugs detected in the generated code. If you run Code Prover, the results consist of checks that are color-coded as follows:

- **Green (proven code)**: The check does not fail for the data constraints provided. For instance, a division operation does not cause a **Division by Zero** error.
- **Red (verified error)**: The check always fails for the set of data constraints provided. For instance, a division operation always causes a **Division by Zero** error.

- **Orange (possible error)**: The check indicates unproven code and can fail for certain values of the data constraints provided. For instance, a division operation sometimes causes a **Division by Zero** error.
- **Gray (unreachable code)**: The check indicates a code operation that cannot be reached for the data constraints provided.

Review each analysis result in detail. For instance, in your Code Prover results:

- 1 On the **Results List** pane, select the red **Out of bounds array index** check.
- 2 On the **Source** pane, place your cursor on the red check to view additional information. For instance, the tooltip on the red [operator states the array size and possible values of the array index. The **Result Details** pane also provides this information.

The error occurs in a handwritten C file Command_strategy_file.c. The C file is inside an S-Function block Command Strategy in the controller subsystem.

Trace Errors Back to Model and Fix Them

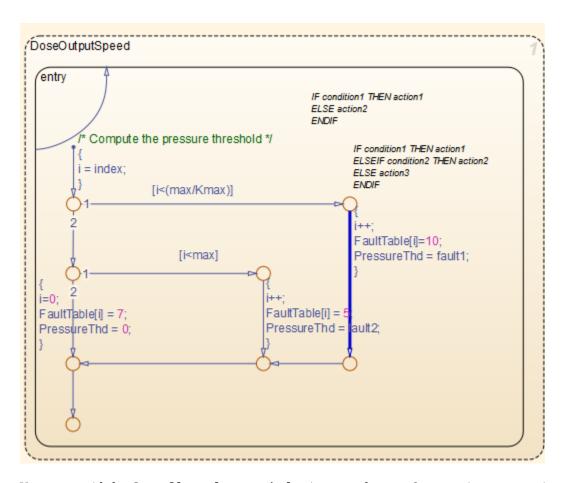

For code generated from the model, you can trace an error back to your model. These sections show how to trace specific Code Prover results back to the model.

Error 1: Out of bounds array index

- 1 On the **Results List** pane, select the orange **Out of bounds array index** error that occurs in the file controller.c.
- 2 On the **Source** pane, click the link **S5:76** in comments above the orange error.

```
/* Transition: '<S5>:75' */
/* Transition: '<S5>:76' */
(*i)++;
/* Outport: '<Root>/FaultTable' */
controller Y.FaultTable[*i] = 10;
```

You see that the error occurs due to a transition in the Stateflow chart synch_and_asynch_monitoring. You can trace the error to the input variable index of the Stateflow chart.

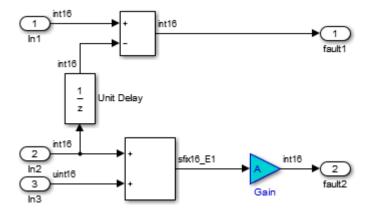

You can avoid the **Out of bounds array index** in several ways. One way is to constrain the input variable index using a Saturation block before the Stateflow chart.

Error 2: Overflow

- 1 On the **Results List** pane, select the orange **Overflow** error shown below. The error appears in the file controller.c.
- 2 On the **Source** pane, review the error. To trace the error back to the model, click the link **S2/Gain** in comments above the orange error.

```
/* Gain: '<S2>/Gain' incorporates:
* Inport: '<Root>/Battery Info'
```

You see that the error occurs in the Fault Management subsystem inside a Gain block following a Sum block.

You can avoid the **Overflow** in several ways. One way is to constrain the value of the signal in_battery_info that is fed to the Sum block. To constrain the signal:

- 1 Double-click the Inport block Battery info that provides the input signal in battery info to the controller subsystem.
- 2 On the **Signal Attributes** tab, change the **Maximum** value of the signal.

The errors in this model occur due to one of the following:

- Faulty scaling, unknown calibrations and untested data ranges coming out of a subsystem into an arithmetic block.
- Array manipulation in Stateflow event-based modelling and handwritten lookup table functions.
- Saturations leading to unexpected data flow inside the generated code.
- Faulty Stateflow programming.

Once you identify the root cause of the error, you can modify the model appropriately to fix the issue.

Check for Coding Rule Violations

To check for coding rule violations, before starting code analysis:

- 1 Right-click the controller subsystem and select **Polyspace > Options**.
- In the Configuration Parameters dialog box, select an appropriate option in the Settings from list. For instance, select Project configuration and MISRA C 2012 AGC Checking.

It is recommended that you run Bug Finder for checking MISRA C:2012 rules. For **Product mode**, choose Bug Finder.

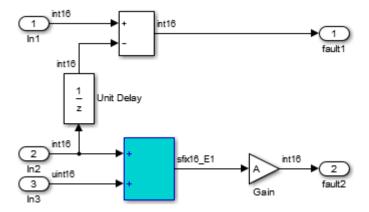

3 Click **Apply** or **OK** and rerun the analysis.

Annotate Blocks to Justify Results

You can justify your results by adding annotations to your blocks. During code analysis, Polyspace Code Prover reads your annotations and populates the result with your justification. Once you justify a result, you do not have to review it again.

- 1 On the **Results List** pane, from the drop-down list in the upper left corner, select **File**.
- In the file controller.c, in the function controller_step(), select the violation of MISRA C:2012 rule 10.4. The **Source** pane shows that an addition operation violates the rule.
- 3 On the **Source** pane, click the link **S2/Sum1** in comments above the addition operation.

You see that the rule violation occurs in a Sum block.

To annotate this block and justify the rule violation:

- a Right-click the block and select Polyspace > Annotate Selected Block > Edit.
- **b** Select MISRA-C-2012 for **Annotation type** and enter information about the rule violation. Set the **Status** to **No action planned** and the **Severity** to **Unset**.
- c Click **Apply** or **OK**. The words **Polyspace annotation** appear below the block, indicating that the block contains a code annotation.
- **d** Regenerate code and rerun the analysis. The **Severity** and **Status** columns on the **Results List** pane are prepopulated with your annotations.

More About

• "Run Polyspace Analysis on Code Generated with Embedded Coder" on page 5-2

Analyze S-Function Code

If you want to check your S-Function code for bugs or errors, you can run Polyspace directly from your S-Function block in Simulink.

Prerequisites

Before you run Polyspace from MATLAB, you must link your Polyspace and MATLAB installations. See "Integrate Polyspace with MATLAB and Simulink" on page 3-2.

S-Function Analysis Workflow

To verify an S-Function with Polyspace, follow this recommended workflow:

- **1** Compile your S-Function to be compatible with Polyspace.
- **2** Select your Polyspace options.
- **3** Run a Polyspace Bug Finder analysis using one of the two analysis modes:
 - **This Occurrence** Analyzes the specified occurrence of the S-Function with the input for that block.
 - **All Occurrences** Analyzes the S-Function code with input values from every occurrence of the S-Function.
- **4** Review results in the Polyspace interface.
 - For information about navigating through your results, see "Filter and Group Results" on page 17-2.
 - For help reviewing and understanding the results, see "Polyspace Bug Finder Results".

Compile S-Functions to Be Compatible with Polyspace

Before you analyze your S-Function with Polyspace Bug Finder , you must compile your S-Function with one of following tools:

 The Legacy Code Tool with the def.Options.supportCoverageAndDesignVerifier set to true. See legacy_code.

- The SFunctionBuilder block, with **Enable support for Design Verifier** selected on the **Build Info** tab of the SFunctionBuilder dialog box.
- The Simulink Coverage[™] function slcovmex, with the option -sldv.

Example S-Function Analysis

This example shows the workflow for analyzing S-Functions with Polyspace. You use the model psdemo_model_link_sl and the S-Function Command_Strategy.

1 Open the model and use the Legacy Code Tool to compile the S-Function Command Strategy.

```
% Open Model
psdemo_model_link_sl

% Compile S-Function Command_Strategy
def = legacy_code('initialize');
def.SourceFiles = { 'command_strategy_file.c' };
def.HeaderFiles = { 'command_strategy_file.h' };
def.SFunctionName = 'Command_Strategy';
def.OutputFcnSpec = 'int16 y1 = command_strategy(uint16 u1, uint16 u2)';
def.IncPaths = { fullfile(polyspaceroot, ...
   'toolbox', 'polyspace', 'pslink', 'pslinkdemos', 'psdemo_model_link_sl') };
def.SrcPaths = def.IncPaths;
def.Options.supportCoverageAndDesignVerifier = true;
legacy_code('compile',def);
```

- 2 Open the subsystem psdemo_model_link_sl/controller.
- 3 Right-click the S-Function block Command_Strategy and select Polyspace > Options.
- 4 In the Configuration Parameters dialog box, make sure that the following parameters are set:
 - **Product mode** Bug Finder
 - Settings from Project configuration and MISRA C 2012 checking
 - Open results automatically after verification <a> □ On
- **5** Apply your settings and close the Configuration Parameters.
- 6 Right-click the Command_Strategy block and select **Polyspace** > **Verify S-Function** > **This Occurrence**.

Follow the analysis in the MATLAB Command Window. When the analysis is finished, your results open in the Polyspace interface.

Recommended Model Configuration Parameters for Polyspace Analysis

For Polyspace analyses, set the following parameter configurations before generating code. If you do not use the recommended value for SystemTargetFile, you get an error. For other parameters, if you do not use the recommended value, you get a warning.

Grouping	Command-Line	Name and Location in Configuration
Code Generation	Name: SystemTargetFile (Simulink Coder) Value: An Embedded Coder Target Language Compiler (TLC) file. For example ert.tlc or autosar.tlc. Name: MatFileLogging (Simulink Coder) Value: 'off' Name: GenerateReport (Simulink Coder) Value: 'on' Name: IncludeHyperlinksInReport (Simulink Coder) Value: 'on'	Location: Code Generation Name: System target file Value: Embedded Coder target file Location: Code Generation > Interface Name: MAT-file logging Value: Not selected Location: Code Generation > Report Name: Create code-generation report Value: Selected Location: Code Generation > Report Name: Code-to-model Value: Selected

Grouping	Command-Line	Name and Location in Configuration
	Name: GenerateSampleERTMain (Embedded Coder)	Location: Code Generation > Templates
	Value: 'off'	Name: Generate an example main program
		Value: Not selected
	Name: GenerateComments (Simulink Coder)	Location: Code Generation > Comments
	Value: 'on'	Name: Include comments
		Value: ☑ Selected
	Name: DefaultParameterBehavior (Simulink Coder)	Location: Optimization
	Value: 'Inlined'	Name: Default parameter behavior
		Value: Inlined
	Name: InitFltsAndDblsToZero (Simulink Coder)	Location: Optimization
Optimization	Value: 'on'	Name: Use memset to initialize floats and doubles to 0.0
		Value: Not selected
	Name: ZeroExternalMemoryAtStartup (Simulink Coder)	Location: Optimization
	Value: 'on'	Name: Remove root level I/O zero initialization
		Value: Not selected
	Name: SolverType (Simulink)	Location: Solver
Solver	Value: 'Fixed-Step'	Name: Type
		Value: Fixed-step

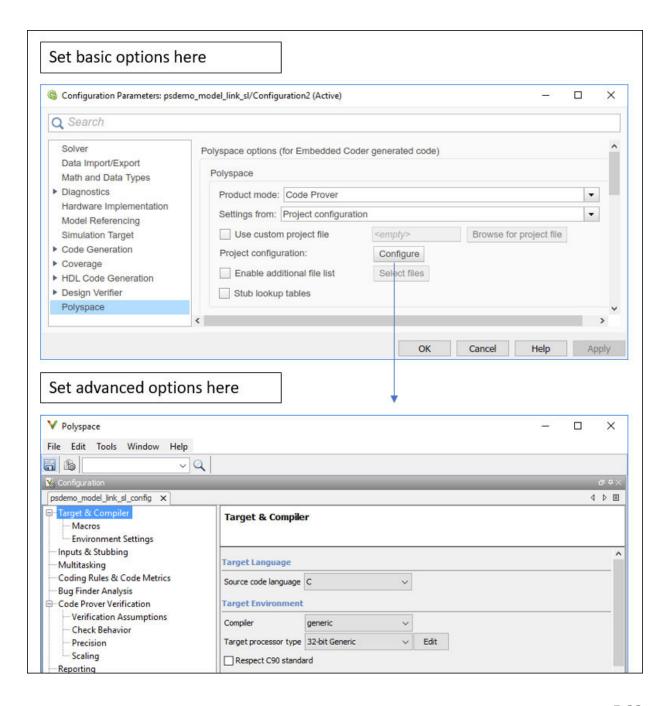

Grouping	Command-Line	Name and Location in Configuration
	Name: Solver (Simulink)	Location: Solver
	Value: 'FixedStepDiscrete'	Name: Solver
		Value: discrete (no continuous states)

Configure Advanced Polyspace Options in Simulink

Before analyzing generated code in Simulink, you can change some of the default options. This topic shows how to configure the options and save this configuration.

For getting started with Polyspace analysis in Simulink, see "Run Polyspace Analysis on Code Generated with Embedded Coder" on page 5-2.

Configure Options

Set basic options

The commonly used options appear in Simulink Configuration Parameters. Select **Code** > **Polyspace** > **Options**.

Set advanced options

Select **Code** > **Polyspace** > **Options**. From the Configuration Parameters window, you can access a wider set of options for configuring the analysis. Click the **Configure** button beside **Project configuration**.

For instance, you can:

 Run the code analysis on a remote cluster. Use the option Run Bug Finder or Code Prover analysis on a remote cluster.

If you use this option, after starting the analysis, you can follow the progress of the analysis on the remote cluster through the Job Monitor window. Select **Code** > **Polyspace** > **Open Job Monitor**.

Stub certain functions for the analysis and then constrain the function output. Use the
options Functions to stub (-functions-to-stub) and Constraint setup
(-data-range-specifications).

If a basic option in the Configuration Parameters window directly conflicts with an advanced option in the Polyspace window, the former prevails. For instance, in this situation, Polyspace checks for MISRA C: 2012 rules:

- "Settings from (C)": You select this basic option Project configuration and MISRA C 2012 checking for generated code.
- Check MISRA C:2012 (-misra3): You disable this advanced option.

By default, the advanced options are saved in a project file (modelname_config.psprj) in the pslink_config subfolder of the results folder. You can reuse the options associated with this project.

Share and Reuse Configuration

You can share the basic or advanced options across multiple models.

- Basic options: You can share and reuse the options set in the Configuration Parameters window. See "Share a Configuration for Multiple Models" (Simulink).
- Advanced options: The advanced options are saved in a separate Polyspace project associated with your analysis. Share this project across multiple models.

The next sections show how to reuse the advanced options. You can specify the advanced options just once. You can reuse these advanced options across multiple models and set only the basic options individually in each model.

Set options from model

Set the advanced options as needed. To see where the associated project file is stored or change the name of the file, on the Polyspace window toolbar, click the icon.

Reuse options in another model

To reuse the advanced options in another model, open the Configuration Parameters window from the model. Select **Code** > **Polyspace** > **Options**.

- Select **Use custom project file**. Provide the path to the project file previously created (extension .psprj).
- For Settings from, select Project configuration so that the settings in your project are used.

If you want to check for additional issues, for instance MISRA C: 2012 violations, select Project configuration and MISRA C 2012 checking for generated code.

If you run an analysis from the command line, you can set these options with the pslinkoptions function. See also pslinkoptions Properties.

More About

- "Run Polyspace Analysis on Code Generated with Embedded Coder" on page 5-2
- "Run Polyspace Analysis on Code Generated with TargetLink" on page 5-34
- "Default Polyspace Options for Code Generated with Embedded Coder" on page 5-28
- "Default Polyspace Options for Code Generated with TargetLink" on page 5-36

How Polyspace Analysis of Generated Code Works

When you run Polyspace on generated code, the software automatically reads the following information from the generated code:

- initialize() functions
- terminate() functions
- step() functions
- List of parameter variables
- List of input variables

If you run Code Prover, the software uses this information to generate a main function that:

- Initializes parameters using the Polyspace option Parameters (-variables-written-before-loop).
- 2 Calls initialization functions using the option Initialization functions (functions-called-before-loop).
- 3 Initializes inputs using the option Inputs (-variables-written-in-loop).
- 4 Calls the step function using the option Step functions (-functions-called-in-loop).
- 5 Calls the terminate function using the option Termination functions (-functions-called-after-loop).

The main function conceptually looks like this:

Code Prover uses this generated main function to perform the subsequent analysis.

For C++ code that is generated with Embedded Coder, the initialize(), step(), and terminate() functions and associated variables are either class members or have global scope.

Default Polyspace Options for Code Generated with Embedded Coder

In this section...

"Default Options" on page 5-28

"Constraint Specification" on page 5-28

"Recommended Polyspace options for Verifying Generated Code" on page 5-29

"Hardware Mapping Between Simulink and Polyspace" on page 5-30

Default Options

For Embedded Coder code, the software sets the following verification options by default:

- -sources path_to_source_code
- -D PST_ERRNO
- -D main=main rtwec
- -I matlabroot\polyspace\include
- -I matlabroot\extern\include
- -I matlabroot\rtw\c\libsrc
- -I matlabroot\simulink\include
- -I matlabroot\sys\lcc\include
- -functions-to-stub=[rtIsNaN,rtIsInf,rtIsNaNF,rtIsInfF]
- -results-dir results

Note *matlabroot* is the MATLAB installation folder.

Constraint Specification

You can constrain inputs, parameters, and outputs to lie within specified ranges. Use these configuration parameters:

- "Input"
- "Tunable parameters"

"Output"

The software automatically creates a Polyspace constraints file using information from the MATLAB workspace and block parameters.

You can also manually define a constraints file in the Polyspace user interface. See "Specify External Constraints" on page 9-2. If you define a constraints file, the software appends the automatically generated information to the constraints file you create. Manually defined constraint information overrides automatically generated information for all variables.

The software supports the automatic generation of constraint specifications for the following kinds of generated code:

- Code from standalone models
- Code from configured function prototypes
- Reusable code
- Code generated from referenced models and submodels

Additional Information

See also "External Constraints on Polyspace Analysis of Generated Code" on page 5-31.

Recommended Polyspace options for Verifying Generated Code

For Embedded Coder code, the software automatically specifies values for the following verification options:

- -main-generator
- -functions-called-in-loop
- -functions-called-before-loop
- -functions-called-after-loop
- -variables-written-in-loop
- -variables-written-before-loop

In addition, for the option -server, the software uses the value specified in the **Send to Polyspace** server check box on the **Polyspace** pane. These values override the corresponding option values in the **Configuration** pane of the Polyspace user interface.

You can specify other verification options for your Polyspace Project through the Polyspace **Configuration** pane. See "Configure Advanced Polyspace Options in Simulink" on page 5-22.

Hardware Mapping Between Simulink and Polyspace

The software automatically imports target word lengths and byte ordering (endianness) from Simulink model hardware configuration settings. The software maps **Device vendor** and **Device type** settings on the Simulink **Configuration Parameters > Hardware Implementation** pane to **Target processor type** settings on the Polyspace **Configuration** pane.

The software creates a generic target for the verification.

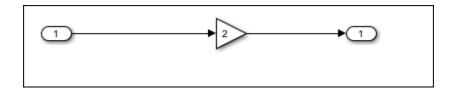

External Constraints on Polyspace Analysis of Generated Code

When you check generated code for bugs or run-time errors, you can choose whether to perform the check for all values of an input or a specific range of values. You can extract the input range from the Simulink model.

Likewise, you can use a fixed value for tunable parameters or a range of values. You can also check whether output values fall within a specific range.

Extract External Constraints from Model

Consider this simple model with an Inport block, a Gain block, and an Outport block. Suppose the signal in the Inport and Outport blocks and the gain parameter of the Gain block have a minimum and maximum value.

You can analyze the code generated from this model with these minimum and maximum values. Select **Code** > **Polyspace** > **Options**. Specify these configuration parameters:

• "Input": Select Use specified minimum and maximum values. The Code Prover analysis checks the generated code within the specified range of values from the Inport block. The Bug Finder analysis uses this information to exclude false positives.

Default: This option is selected.

• "Tunable parameters": Select Use specified minimum and maximum values.

Default: This option is not selected. The analysis uses the fixed gain value of the Gain block (the value 2 in the example).

For the analysis to consider a range instead of a fixed value, the parameters must be tunable and not inlined. See Default parameter behavior.

• "Output": Select Verify outputs are within minimum and maximum values. The Code Prover analysis creates a red check if the outputs exceed the range specified on the Outport block. See also Correctness condition.

Default: This option is not selected. The Code Prover analysis does not check output values.

After analysis, to check if a constrained range value is used, see one of these files:

- Constraint specification XML file modelname_drs.xml in the folder results modelname\modelname.
- Polyspace project file modelname.prpsj in the folder results modelname.

Open this file in the Polyspace user interface. In the project configuration, see the extracted constraints specified for the option Constraint setup (-data-range-specifications).

Storage Classes Supported for Constraint Extraction

To allow constraint extraction from the Simulink model, the signals and parameters must have data types in specific storage classes. For details on storage classes, see "Choose Storage Class for Controlling Data Representation in Generated Code" (Embedded Coder).

Common Storage Classes

Storage Class	Signal Constraint Supported	Parameter Constraint Supported
Auto	Yes	Yes
ExportedGlobal	Yes	Yes
ImportedExtern	Yes	Yes
ImportedExternPointer	Yes	Yes

Storage Class		Parameter Constraint Supported
Model default	Yes	Yes

Other Storage Classes

Storage Class	Signal Constraint Supported	Parameter Constraint Supported
BitField	Yes	Yes
CompilerFlag	No	No
Const	No	Yes
ConstVolatile	No	Yes
Define	No	No
ExportToFile	Yes	Yes
FileScope	Yes	No
GetSet	No	No
ImportedDefine	No	No
ImportFromFile	No	No
Struct	No	No
Volatile	Yes	Yes

Run Polyspace Analysis on Code Generated with TargetLink

You can analyze code generated from Simulink models with TargetLink.

You have fewer capabilities for code generated with TargetLink compared to code generated with Embedded Coder. For instance, you cannot add annotations to your blocks that carry over to the generated code and justify known issues.

Configure and Run Analysis

Configure code analysis

Select **Code** > **Polyspace** > **Options**. Change default values of these options if needed.

- "Product mode": Choose Bug Finder or Code Prover.
- "Settings from (C)": Enable checking of MISRA or JSF® coding rules in addition to the default checks.
- "Output folder": Specify a dedicated folder for results. The default analysis runs Code Prover on generated code and saves the results in a folder results_modelName in the current working folder.
- "Enable additional file list": Add C files that are not part of the generated code.
- "Open results automatically after verification"

Analyze code

To analyze the code, select **Code > Polyspace > Verify Code Generated for > Selected Target Link Subsystem**. You cannot analyze code generated from the entire model.

You can follow the progress of the analysis in the MATLAB command window.

The results open automatically unless explicitly disabled. By default, the results are saved in a folder results_ModelName in the current folder. Each new run overwrites previous results. You can change these behaviors or save the results to a Simulink project using appropriate configuration parameters.

Review Analysis Results

Review result in code

The results appear on the **Results List** pane. Click each result to see the source code and details on the **Result Details** pane.

Navigate from code to model

Links in code comments show blocks that generate the subsequent lines of code. To see the blocks in the model, click the block names.

Fix issue

Investigate whether the issues in your code are related to design flaws in the model.

For instance, you might need to constrain the range of signal from Inport blocks. See "Specify Ranges for Signals" (Simulink).

Default Polyspace Options for Code Generated with TargetLink

In this section...

"TargetLink Support" on page 5-36

"Default Options" on page 5-36

"Lookup Tables" on page 5-37

"Data Range Specification" on page 5-37

"Code Generation Options" on page 5-38

TargetLink Support

The Windows version of Polyspace Bug Finder is supported for versions 3.5 and 4.0 of the dSPACE® Data Dictionary and TargetLink Code Generator.

Polyspace Bug Finder does support CTO generated code. However, for better results, MathWorks recommends that you disable the CTO option in TargetLink before generating code. For more information, see the dSPACE documentation.

Because Polyspace Bug Finder extracts information from the dSPACE Data Dictionary, you must regenerate the code before performing an analysis.

Default Options

Polyspace sets the following options by default:

- -sources path_to_source_code
- -results-dir results_folder_name
- -I path to source code
- -D PST ERRNO
- -I dspaceroot\matlab\TL\SimFiles\Generic
- -I dspaceroot\matlab\TL\srcfiles\Generic
- -I dspaceroot\matlab\TL\srcfiles\i86\LCC
- -I matlabroot\polyspace\include
- -I matlabroot\extern\include
- -I matlabroot\rtw\c\libsrc
- -I matlabroot\simulink\include
- -I matlabroot\sys\lcc\include

- -functions-to-stub=[rtIsNaN,rtIsInf,rtIsNaNF,rtIsInfF]
- -scalar-overflows-behavior wrap-around
- -boolean-types Bool

Note *dspaceroot* and *matlabroot* are the dSPACE and MATLAB tool installation directories respectively.

Lookup Tables

By default, Polyspace provides stubs for the lookup table functions. The dSPACE data dictionary is used to define the range of their return values. A lookup table that uses extrapolation returns full range for the type of variable that it returns. You can disable this behavior from the Polyspace configuration menu.

Data Range Specification

You can constrain inputs, parameters, and outputs to lie within specified data ranges. See "Specify Ranges for Signals" (Simulink).

The software automatically creates a Polyspace constraints file using the dSPACE Data Dictionary for each global variable. The constraint information is used to initialize each global variable to the range of valid values as defined by the min..max information in the data dictionary. This information allows Polyspace software to model real values for the system during analysis. Carefully defining the min-max information in the model allows the analysis to be more precise, because only the range of real values is analyzed.

Note Boolean types are modeled having a minimum value of 0 and a maximum of 1.

You can also manually define a constraint file in the Polyspace user interface. See "Specify External Constraints" on page 9-2. If you define a constraint file, the software appends the automatically generated information to the constraint file you create. Manually defined constraint information overrides automatically generated information for all variables.

Constraints cannot be applied to static variables. Therefore, the compilation flags -D static= is set automatically. It has the effect of removing the static keyword from the code. If you have a problem with name clashes in the global name space, either rename the variables or disable this option in Polyspace configuration.

Code Generation Options

From the TargetLink Main Dialog, it is recommended to:

- Set the option Clean code
- Unset the option Enable sections/pragmas/inline/ISR/user attributes
- Turn off the compute to overflow (CTO) generation. Polyspace can analyze code generated with CTO, but the results may not be as precise.

When you install Polyspace, the tlcgOptions variable is updated with 'PolyspaceSupport', 'on' (see variable in 'C:\dSPACE\Matlab\Tl\config \codegen\tl_pre_codegen_hook.m' file).

Troubleshoot Navigation from Code to Model

When you run Polyspace on generated code, in the analysis results, you see links in code comments. The links show names of blocks that generate the subsequent lines of code. To see the blocks in the model, you click the block names in the links.

This topic shows the issues that can happen in navigation from code to model.

Links from Code to Model Do Not Appear

See if you are looking at source files (.c or .cpp) or header files. Header files are not directly associated with blocks in the model and do not have links back to the model.

Links from Code to Model Do Not Work

You may encounter issues with the back-to-model feature if:

- Your operating system is Windows Vista[™] or Windows 7; and User Account Control (UAC) is enabled or you do not have administrator privileges.
- You have multiple versions of MATLAB installed.

To reconnect MATLAB and Polyspace:

- 1 Close Polyspace.
- 2 At the MATLAB command-line, enter pslinkfun('enablebacktomodel').

When you open your Polyspace results, the hyper-links will highlight the relevant blocks in your model.

Your Model Already Uses Highlighting

If your model extensively uses block coloring, the coloring from this feature may interfere with the colors already in your model. You can change the color of blocks when they are linked to Polyspace results. For instance, to change the color to magenta, use this command:

The color can be one of the following:

- 'cyan'
- 'magenta'
- 'orange'
- 'lightBlue'

- 'red'
- 'green'
- 'blue'
- 'darkGreen'

Run Polyspace on C/C++ Code Generated from MATLAB Code

After generating C/C++ code from MATLAB code, you can independently check the generated code for:

- Bugs or defects and coding rule violations: Use Polyspace Bug Finder.
- Run-time errors: Use Polyspace Code Prover.

Whether you generate code in the MATLAB Coder app or use codegen, you can follow the same workflow for checking the generated code.

This tutorial uses the MATLAB Coder example averaging_filter in polyspaceroot \help\toolbox\codeprover\examples\matlab_coder. Here, polyspacroot is the Polyspace installation folder, for instance, C:\Program Files\Polyspace\R2019a. The example shows a Code Prover analysis. You can follow a similar workflow for Bug Finder.

Prerequisites

To run this tutorial:

- You must have an Embedded Coder license. The MATLAB Coder app does not show options for running Polyspace unless you have an Embedded Coder license.
- You must be familiar with how to open and use the MATLAB Coder app or the codegen command. Otherwise, see the MATLAB Coder Getting Started.
- You must link your Polyspace and MATLAB installations. See "Integrate Polyspace with MATLAB and Simulink" on page 3-2.

Run Polyspace Analysis

In the MATLAB Coder app, generate code from the file averaging_filter.m and analyze the generated code.

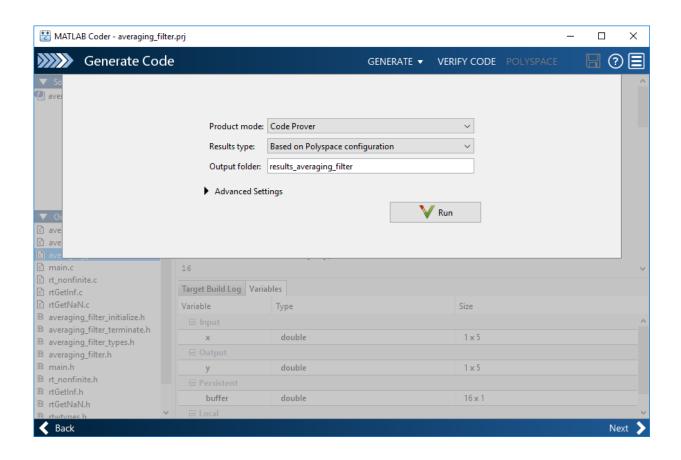

Generate code.

From the entry-point function in the file, generate standalone C/C++ code (a static library, dynamically linked library, or executable program) in the MATLAB Coder app.

The function has one input. Explicitly specify a data type for the input, for instance, a 1 X 100 vector of type double, or provide a file for deriving data types.

2 Analyze the generated code.

After code generation, open the **Polyspace** pane and click **Run**.

If the analysis is completed without errors, the Polyspace results open automatically. If you close the results, you can reopen them from the final page in the app, under the section **Generated Output**. The results are stored in a subfolder results_averaging_filter in the folder containing the MATLAB file.

To script the preceding workflow, run:

```
% Generate code
matlabFileName = fullfile(polyspaceroot, 'help',...
    'toolbox','codeprover','examples','matlab_coder','averaging_filter.m');
codegenFolder = fullfile(pwd, 'codegenFolder');
codegen(matlabFileName, '-config:lib', '-c', '-args', ...
    {zeros(1,100,'double')}, '-d', codegenFolder);
% Configure Polyspace analysis
opts = pslinkoptions('ec');
opts.ResultDir = ['results_',codeName];
opts.OpenProjectManager = 1;
% Run Polyspace
[polyspaceFolder, resultsFolder] = pslinkrun('-codegenFolder', codegenFolder, opts);
```

Review Analysis Results

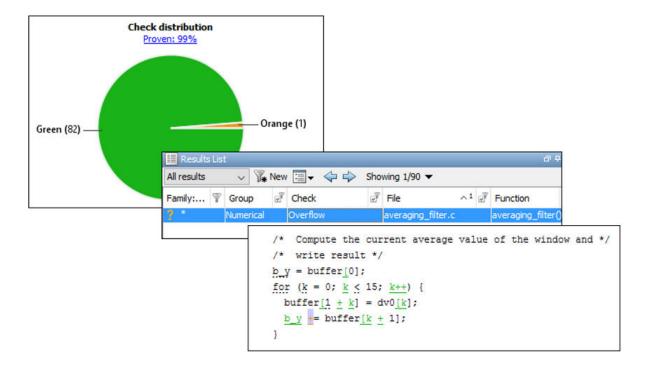

After analysis, the **Results List** pane shows a list of run-time checks. For an explanation of the result colors, see "Code Prover Result and Source Code Colors" (Polyspace Code Prover).

Review the results and determine whether to fix the issues.

1 Filter out results that you do not want to review. For instance, you might not want to see the green checks.

See an overview of the results on the **Dashboard** pane. Click the orange section of the pie chart to filter the list of results on the **Results List** pane to the one orange check. Click this orange **Overflow** check and see the source code for the operation that can overflow.

If results are grouped by family, to see a flat list, on the **Results List** pane, from the dropdown, select **None**.

2 Find the root cause of each run-time error.

On the **Source** pane, use right-click navigation tools and tooltips to identify the root cause of the check. In this case, you see that the + operation overflows because Polyspace makes an assumption about the input array to the function. The assumption is that the array elements can have any value allowed by their double data type. The tooltip on the line buffer[0] = x[i] shows the assumed range.

```
/* Add a new sample value to the buffer */
buffer[0] = x[i];

/* Com
    Assignment to element of static array (float 64): [-1.7977E<sup>+308</sup> .. 1.7977E<sup>+308</sup>]

/* wri
b y = b
for (k
buffe
buffer
buffer[k + 1];
}
Press 'F2' for focus
```

With an Embedded Coder license, you can easily trace back from the generated C code to the original MATLAB code. See "Interactively Trace Between MATLAB Code and Generated C/C++ Code" (Embedded Coder).

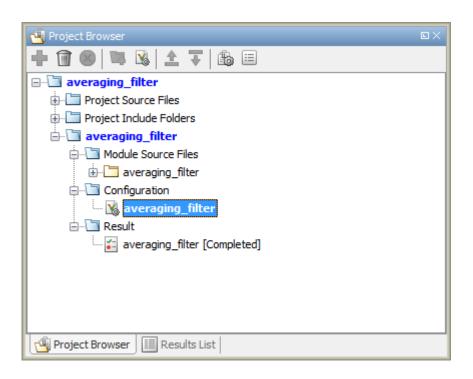

Run Analysis for Specific Design Range

You can check the generated code for a specific range of inputs. Range specification helps narrow down the default assumption that inputs are full-range.

To specify a range for inputs:

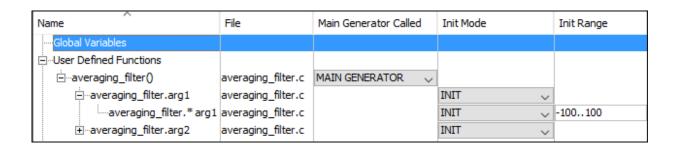

1 Open the analysis configuration.

In the Polyspace user interface, switch to the Polyspace project created for the analysis. Select **Window > Reset Layout > Project Setup**. On the **Project Browser** pane, click the project configuration.

2 Specify a design range for the inputs.

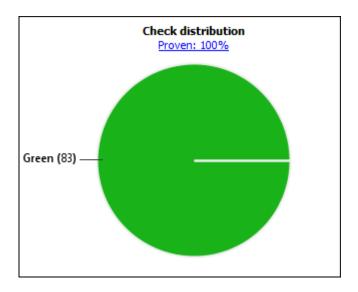

In the **Configuration** pane, on the **Inputs & Stubbing** node, set up your constraints. Click **Edit** beside **Constraint setup**. Constrain the range of the first input to [-100..100].

You can overwrite the default constraint template or save the constraints elsewhere. For information on the columns in this window, see "External Constraints for Polyspace Analysis" on page 9-8.

3 Rerun the analysis from the Coder app (or at the MATLAB command line) and see the results.

On the **Dashboard** pane, you do not see the previous orange overflow anymore.

• "Configure Advanced Polyspace Options in MATLAB Coder App" on page 5-49

Configure Advanced Polyspace Options in MATLAB Coder App

Before analyzing generated code with Polyspace in the MATLAB Coder App, you can change some of the default options. This topic shows how to configure the options and save this configuration.

For getting started with Polyspace analysis in the MATLAB Coder App, see "Run Polyspace on C/C++ Code Generated from MATLAB Code" on page 5-42.

Configure Options

The default analysis runs Code Prover based on a default project configuration. The results are stored in a folder result_project_name in the current working folder.

You can change these options in the MATLAB Coder App itself:

- **Product mode**: Select Code Prover or Bug Finder.
- **Results type**: Check for MISRA C:2004 (MISRA AC AGC) or MISRA C:2012 rule violations, in addition to or instead of the default checkers.

- Output folder: Choose an output folder name. To save the results of each run in a
 new folder, under Advanced Settings, select Make output folder name unique by
 adding a suffix.
- **Check code generation options**: Choose to see warnings or errors if the code generation uses options that can result in imprecise Code Prover analysis.

For instance, if the code generation setting **Use memset to initialize floats and doubles to 0.0** is disabled, Code Prover can show imprecise orange checks because of approximations. See "Orange Checks in Code Prover" (Polyspace Code Prover).

To see the other default options or update them, under **Advanced Settings**, click the **Configure** button. You see the options on a **Configuration** pane.

For more information on the options, see Bug Finder Analysis Options or Code Prover Analysis Options (Polyspace Code Prover).

Share and Reuse Configuration

If you change some of the default options in the **Configuration** pane, your updated configuration is saved as a <code>.psprj</code> file in the results folder. Using this file, you can reuse your configuration across multiple MATLAB Coder projects.

Reuse Configuration in Coder App

To reuse a previous configuration in the current project opened in the MATLAB Coder App, under **Advanced Settings**, select **Reuse existing configuration**. For **Template configuration file**, provide the .psprj file that stores the previous configuration.

The **Results type** option in the MATLAB Coder app still shows **Based on Polyspace configuration** but the configuration used is the one that you provided.

Reuse Configuration on Command Line

At the MATLAB command line, you create an options object with the pslinkoptions function. You modify the analysis options by using the properties of this object and then run analysis with the pslinkrun function.

```
opts = pslinkoptions('ec');
...
pslinkrun('-codegenfolder', codegenFolder, opts);

You can associate advanced analysis options set in a .psprj file with the options object.
Use the properties EnablePrjConfigFile and PrjConfigFile.

opts.EnablePrjConfigFile = true;
opts.PrjConfigFile = 'C:\Polyspace\config.psprj';
```

For more information, see pslinkoptions Properties.

• "Run Polyspace on C/C++ Code Generated from MATLAB Code" on page 5-42

Run Polyspace Analysis in IDE Plugins

Run Polyspace Analysis in Eclipse

If you develop code in Eclipse or an Eclipse-based IDE, you can install the Polyspace plugin and run a Polyspace analysis on the source files in an Eclipse project. You can check for bugs each time you save your code, or explicitly run an analysis.

This topic describes how to set up a Polyspace analysis in Eclipse and review analysis results.

After you install the Polyspace plugin, you see a **Polyspace** menu and right-click options in the **Project Explorer** to run a Polyspace analysis.

The analysis progress bar, quick run buttons and analysis results appear on specific panes. To avoid cluttering your window, you can confine these panes to the Polyspace

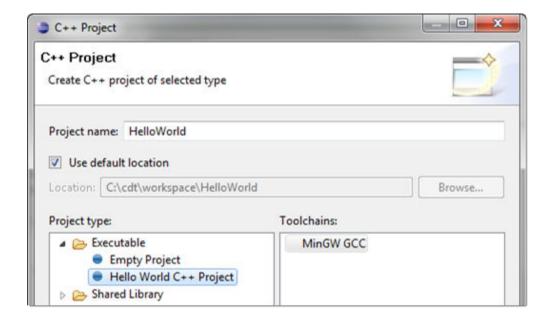

perspective. Select **Window** > **Open Perspective** > **Other**. In the Open Perspective dialog box, select **Polyspace**. You can switch back to other perspectives using tabs on the upper right.

Configure and Run Analysis

Configure analysis

Polyspace analyzes the source files in your Eclipse project. In addition to sources, the analysis uses the following information:

• Compiler: The compiler toolchain can be extracted from your Eclipse project. If the project directly refers to a compilation toolchain such as MinGW GCC, the Polyspace analysis can use the information.

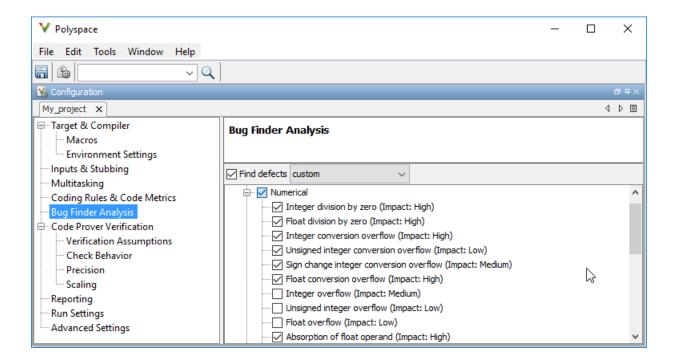

If your Eclipse project uses a build command (makefile) that has the compiler information, you must perform some additional steps to extract this information for the Polyspace analysis.

If Polyspace cannot extract the compiler information from your build command, you can also explicitly specify your compiler options explicitly like other analysis options.

See "Specify Polyspace Compiler Options Through Eclipse Project" on page 6-9.

 Other analysis options: You can retain the default analysis options or adjust them to your requirements. Select Polyspace > Configure Project.

The key options are:

- **Target & Compiler**: If you have not specified your compiler information through your Eclipse project, use these options.
- **Bug Finder Analysis**: Specify which defects to check for in a Bug Finder analysis.
- Code Prover Verification, Check Behavior, Precision: Modify the behavior of checkers in a Code Prover verification.

Note that you cannot run a remote analysis using the Polyspace plugin for Eclipse. To send the analysis job to a remote cluster, start the analysis from the Polyspace user interface or using scripts. See "Polyspace Analysis on Clusters".

Run analysis

After configuration, you can start and stop a Polyspace analysis explicitly from the **Polyspace** menu, right-click options on your Eclipse project or quick run buttons in the Polyspace panes. You can switch between Bug Finder and Code Prover using the **W** icon on the **Polyspace Run** pane.

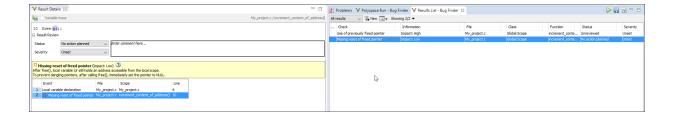

Run analysis when saving code

In the Polyspace perspective, you can set up a Bug Finder analysis that runs each time you save your code. To enable this analysis, select **Polyspace** > **Run Fast Analysis on Save**. The analysis runs quickly but looks for a reduced set of defects. You get the same results as if you had specified the analysis option Use fast analysis mode for Bug Finder (-fast-analysis).

Review Analysis Results

View results after analysis

After analysis, the results appear on the **Results List** pane. Click each result to see the source code and details on the **Result Details** pane.

View results as available

Some results of a Bug Finder analysis are often available before the analysis is complete.

If so, the con in the **Polyspace Run - Bug Finder** pane turns to . To load available results, click this icon. The icon shows up again when more results are available.

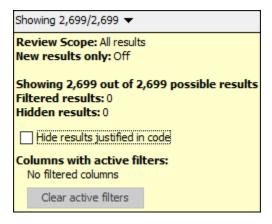

Address results

Based on the result details, fix your code or justify the result. To justify a result, set its **Status** to Justified, No Action Planned or Not a Defect. To hide a justified result in the next run, add the status as annotation to your source code. See "Annotate Code and Hide Known or Acceptable Results" on page 16-6.

For quick annotation, right-click the result and select **Annotate Code and Hide Result**. The option adds annotations in this format and hides the result from the results list:

line of code; /* polyspace Family:Result_name */

For details of the format, see "Annotate Code and Hide Known or Acceptable Results" on page 16-6. To unhide the hidden results, from the **Showing** menu, clear the box **Hide** results justified in code.

Specify Polyspace Compiler Options Through Eclipse Project

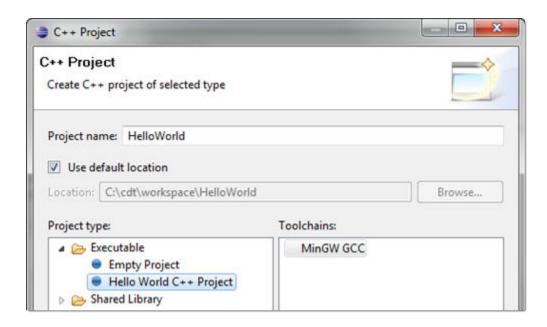

Polyspace analysis in Eclipse uses a set of default analysis options preconfigured for your coding language and operating system. For each project, you can customize the analysis options further.

- Compiler options: You specify the compiler that you use, the libraries that you include and the macros that are defined for your compilation.
 - If your Eclipse project directly refers to a compilation toolchain, the analysis extracts the compiler options from the project.
 - See "Eclipse Refers Directly to Your Compilation Toolchain" on page 6-9.
 - If the project refers to your compilation toolchain through a build command, the
 analysis cannot extract the compiler options. Trace the build command to extract
 the options.
 - See "Eclipse Uses Your Compilation Toolchain Through Build Command" on page 6-10.
- Other options: Through the other options, you specify which analysis results you want
 and how precise you want them to be. To specify these options in Eclipse, select
 Polyspace > Configure Project.

For information on how to run Polyspace from Eclipse, see "Run Polyspace Analysis in Eclipse" on page 6-2.

Eclipse Refers Directly to Your Compilation Toolchain

When setting up your Eclipse project, you might be directly referring to your compilation toolchain without using a build command. For instance, you might refer to the MinGW GCC toolchain in the project setup wizard as below.

The compiler options from your Eclipse project, such as include paths and preprocessor macros, are reused for the analysis.

You cannot view the options directly in the Polyspace configuration but you can view them in your Eclipse editor. In your project properties (**Project > Properties**), in the **Paths** and **Symbols** node:

- See the include paths under the **Includes** tab.
 - During analysis, the paths are implicitly used with the analysis option -I.
- See the preprocessor macros under the **Symbols** tab.

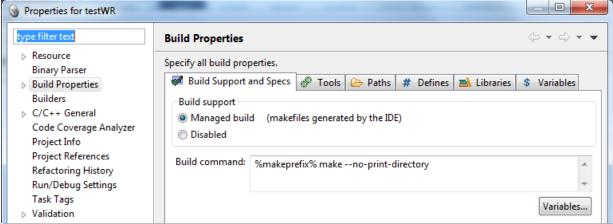

During analysis, the macros are implicitly used with the analysis option Preprocessor definitions (-D).

Eclipse Uses Your Compilation Toolchain Through Build Command

When setting up your Eclipse project, instead of specifying your compilation toolchain directly, you might be specifying it through a build command. For instance, in the Wind

shown in the following figure. **Build Properties** Specify all build properties.

River Workbench IDE (an Eclipse-based IDE), you might specify your build command as

If you use a build command for compilation, the analysis cannot automatically extract the compiler options. You must trace your build command.

Replace your build command with: 1

> polyspaceroot\polyspace\bin\polyspace-configure.exe -no-sources -output-project PolyspaceWorkspace\Projects\EclipseProjects\Name\Name.psprj buildCommand

Here:

- *polyspaceroot* is the Polyspace installation folder.
- polyspaceWorkspace is the folder where your Polyspace files are stored. You specify this location on the **Project and Results Folder** tab in your Polyspace preferences (**Tools** > **Preferences** in the Polyspace user interface).
- *Name* is the name of your Eclipse project.
- buildCommand is the original build command that you want to trace.

For instance, in the preceding example, buildCommand is the following:

%makeprefix% make --no-print-directory

For information on the options -output-project and -no-sources, see polyspace-configure.

2 Build your Eclipse project. Perform a clean build so that files are recompiled.

For instance, select the option **Project > Clean**. Normally, the option runs your build command. With your replacement in the previous step, the option also traces the build to extract the compiler options.

3 Restore the original build command and restart Eclipse.

You can now run analysis on your Eclipse project. The analysis uses the compiler options that it has extracted.

Configure Polyspace Analysis

Specify Polyspace Analysis Options

You can change the default options associated with a Polyspace analysis. For instance, you can:

• Change the set of defects that Bug Finder looks for.

See Find defects (-checkers).

• Change the default behavior of run-time checkers in Code Prover.

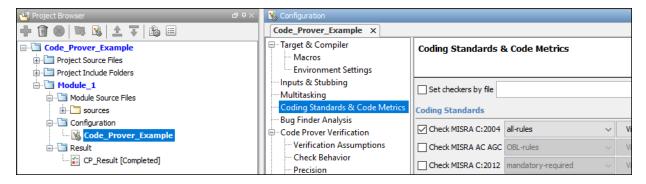

See, for instance, Overflow mode for unsigned integer (-unsigned-integer-overflows).

For the full list of analysis options, see "Analysis Options".

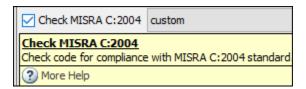

Depending on how you run Polyspace, you can configure the analysis options accordingly.

Polyspace User Interface

In the Polyspace user interface, you create a project for the analysis. The project can have one or more modules. Click the **Configuration** node in a module. On the **Configuration** pane, change options as needed.

For more information, see the tooltip on each option. Click the **More help** link for context-sensitive help on the options.

For more information, see "Run Polyspace Analysis on Desktop" on page 1-8.

Windows or Linux Scripts

Provide the options to the polyspace-bug-finder-nodesktop or polyspace-code-prover-nodesktop command. See also:

- polyspace-bug-finder-nodesktop
- polyspace-code-prover-nodesktop

For instance:

You can also provide the options in a text file. See "Run Polyspace Analysis from Command Line" on page 2-2.

MATLAB Scripts

Create a polyspace.Project object and set the options through the Configuration property of the object. See also:

- polyspace.Project
- polyspace.Project.Configuration Properties

For instance:

```
proj = polyspace.Project;
proj.Configuration.CodingStandards.EnableMisraC3 = true;
proj.Configuration.BugFinderAnalysis.EnableCheckers = false;
```

See also "Run Polyspace Analysis by Using MATLAB Scripts" on page 3-5.

Eclipse and Eclipse-based IDEs

Select **Polyspace** > **Configure Project**. Set the options in the Configuration window.

Some Target & Compiler options are automatically extracted from your Eclipse project. See "Run Polyspace Analysis in Eclipse" on page 6-2.

Simulink

In your Simulink model, specify the basic options through Simulink Configuration Parameters. Select **Code** > **Polyspace** > **Options**.

From this window, you can navigate to the full set of Polyspace analysis options.

See:

- "Run Polyspace Analysis on Code Generated with Embedded Coder" on page 5-2
- "Configure Advanced Polyspace Options in Simulink" on page 5-22

MATLAB Coder App

In the MATLAB Coder app, after code generation, specify the basic options through the **Polyspace** pane. From this window, you can navigate to the full set of Polyspace analysis options.

See:

- "Run Polyspace on C/C++ Code Generated from MATLAB Code" on page 5-42
- "Configure Advanced Polyspace Options in MATLAB Coder App" on page 5-49

Configure Target and Compiler Options

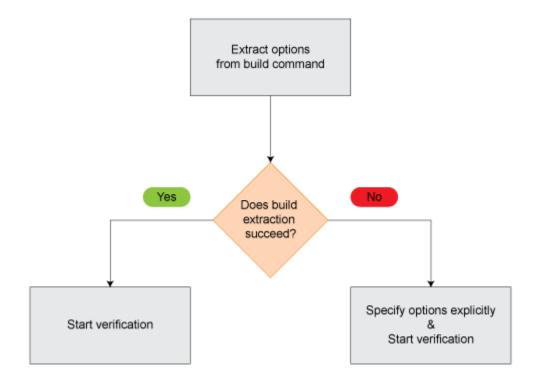

Specify Target Environment and Compiler Behavior

Before verification, specify your source code language (C or C++), target processor, and the compiler that you use for building your code. In certain cases, to emulate your compiler behavior, you might have to specify additional options.

Using your specification, the verification determines the sizes of fundamental types, considers certain macros as defined, and interprets compiler-specific extensions of the Standard. If the options do not correspond to your run-time environment, you can encounter:

- Compilation errors
- Verification results that might not apply to your target

If you use a build command such as gmake to build your code and the build command meets certain restrictions, you can extract the options from the build command. Otherwise, specify the options explicitly.

Extract Options from Build Command

If you use build automation scripts to build your source code, you can set up a Polyspace project from your scripts. The options associated with your compiler are specified in that project.

In the Polyspace desktop products, for information on how to trace your build command from the:

- Polyspace user interface, see "Add Source Files for Analysis in Polyspace User Interface" on page 1-2.
- DOS or UNIX command line, see polyspace-configure.
- MATLAB command line, see polyspaceConfigure.

In the Polyspace server products, for information on how to trace your build command, see "Create Polyspace Analysis Configuration from Build Command" (Polyspace Bug Finder Server).

For Polyspace project creation, your build automation script (makefile) must meet certain requirements. See "Requirements for Project Creation from Build Systems" on page 8-21.

Specify Options Explicitly

If you cannot trace your build command and therefore manually create a project, you have to specify the options explicitly.

- In the user interface of the Polyspace desktop products, select a project configuration.
 On the Configuration pane, select Target & Compiler. Specify the options.
- At the DOS or UNIX command line, specify flags with the polyspace-bug-finder, polyspace-code-prover, polyspace-bug-finder-server or polyspacecode-prover-server command.
- At the MATLAB command line, specify arguments with the polyspaceBugFinder, polyspaceCodeProver, polyspaceBugFinderServer or polyspaceCodeProverServer function.

Specify the options in this order.

- · Required options:
 - Source code language (-lang): If all files have the same extension .c
 or .cpp, the verification uses the extension to determine the source code language.
 Otherwise, explicitly specify the option.
 - Compiler (-compiler): Select the compiler that you use for building your source code. If you cannot find your compiler, use an option that closely matches your compiler.
 - Target processor type (-target): Specify the target processor on which you intend to execute your code. For some processors, you can change the default specifications. For instance, for the processor hc08, you can change the size of types double and long double from 32 to 64 bits.

If you cannot find your target processor, you can create your own target and specify the sizes of fundamental types, default signedness of char, and endianness of the target machine. See Generic target options.

Language-specific options:

- C standard version (-c-version): The default C language standard depends on your compiler specification. If you do not specify a compiler explicitly, the default analysis uses the C99 standard. Specify an earlier standard such as C90 or a later standard such as C11.
- C++ standard version (-cpp-version): The default C++ language standard depends on your compiler specification. If you do not specify a compiler explicitly, the default analysis uses the C++03 standard. Specify later standards such as C++11 or C++14.
- Compiler-specific options:

Whether these options are available or not depends on your specification for Compiler (-compiler). For instance, if you select a visual compiler, the option Pack alignment value (-pack-alignment-value) is available. Using the option, you emulate the compiler option /Zp that you use in Visual Studio.

For all compiler-specific options, see "Target and Compiler".

Advanced options:

Using these options, you can modify the verification results. For instance, if you use the option Division round down (-div-round-down), the verification considers that quotients from division or modulus of negative numbers are rounded down. Use these options only if you use similar options when compiling your code.

For all advanced options, see "Target and Compiler".

• Compiler header files:

If you specify the diab, tasking or greenhills compiler, you must specify the path to your compiler header files. See "Provide Standard Library Headers for Polyspace Analysis" on page 8-19.

If you still see compilation errors after running analysis, you might have to specify other options:

- Define macros: Sometimes, a compilation error occurs because the analysis considers a macro as undefined. Explicitly define these macros. See Preprocessor definitions (-D).
- Specify include files: Sometimes, a compilation error occurs because your compiler defines standard library functions differently from Polyspace and you do not provide

your compiler include files. Explicitly specify the path to your compiler include files. See "Provide Standard Library Headers for Polyspace Analysis" on page 8-19.

C/C++ Language Standard Used in Polyspace Analysis

The Polyspace analysis adheres to a specific language standard for code compilation. The language standard, along with your compiler specification, defines the language elements that you can use in your code. For instance, if the Polyspace analysis uses the C99 standard, C11 features such as use of the thread support library from threads.h causes compilation errors.

Supported Language Standards

The Polyspace analysis supports these standards:

• **C**: C90, C99, C11

The default standard depends on your compiler specification. If you do not specify a compiler explicitly, the default analysis uses the C99 standard. To change the language standard, use the option C standard version (-c-version).

• **C++**: C++03, C++11, C++14

The default standard depends on your compiler specification. If you do not specify a compiler explicitly, the default analysis uses the C++03 standard. To change the language standard, use the option C++ standard version (-cpp-version).

Default Language Standard

The default language standard depends on your specification for the option Compiler (-compiler).

Compiler	C Standard	C++ Standard
generic	C99	C++03
gnu3.4, gnu4.6, gnu4.7, gnu4.8, gnu4.9	C99	C++03
gnu5.x	C11	C++03
gnu6.x	C11	C++14
gnu7.x	C11	C++14

Compiler	C Standard	C++ Standard
clang3.x	C99	C++03
		The analysis accepts some C ++11 extensions.
clang4.x	C99	C++03
		The analysis accepts C++14 extensions.
clang5.x	C99	C++03
		The analysis accepts C++14 extensions.
visual9.0, visual10.0, visual11.0, visual12.0	C99	C++03
visual14.0	C99	C++14
visual15.x	C99	C++14
iar	C99	C++03
armcc	C99	C++03
armclang	C11	C++03
keil	C99	C++03
diab	C99	C++03
tasking	C99	C++03
greenhills	C99	C++03
codewarrior	C99	C++03
ti	C99	C++03
iar-ew	C99	C++03
renesas	C99	C++03

C11 Language Elements Supported in Polyspace

This table provides a partial list of C language elements that have been introduced since C11 and the corresponding Polyspace support. If your code contains non-supported constructions, Polyspace reports a compilation error.

C11 Language Element	Supported
alignas and alignof convenience macros	Yes
aligned_alloc function	Yes
noreturn convenience macros	Yes
Generic selection	Yes
Thread support library (threads.h)	Yes
Atomic operations library (stdatomic.h)	Yes
Atomic types with _Atomic	Yes. If you use the Clang compiler, see limitations book for limitations on atomic data types. See "Limitations of Polyspace Verification" (Polyspace Code Prover).
UTF-16 and UTF-32 character utilities	Yes
Bound-checking interfaces or alternative versions of standard library functions that check for buffer overflows (Annex K of C11) For instance, strcpy_s is an alternative to strcpy that checks for certain errors in the string copy.	No. Polyspace checks for certain run-time errors in use of standard library functions. The checking does not extend to these alternatives.
Anonymous structures and unions	Yes
Static assert declaration	Yes

C11 Language Element	Supported
Features related to error handling such as errno_t and rsize_t typedef-s	No. If you see compilation errors from use of these typedef-s, explicitly specify the path to your compiler headers. See "Provide Standard Library Headers for Polyspace Analysis" on page 8-19.
<pre>quick_exit and at_quick_exit</pre>	Yes. In Bug Finder, functions registered with at_quick_exit appear as uncalled.
CMPLX, CMPLXF and CMPLXL macros	Yes

C++11 Language Elements Supported in Polyspace

This table provides a partial list of C++ language elements that have been introduced since C++11 and the corresponding Polyspace support. If your code contains non-supported constructions, Polyspace reports a compilation error.

C++11 Std Ref	Description	Supported
C++2011-DR226	Default template arguments for function templates	Yes
C++2011-DR339	Solving the SFINAE problem for expressions	Yes
C++2011-N1610	Initialization of class objects by rvalues	Yes
C++2011-N1653	C99 preprocessor	Yes
C++2011-N1720	Static assertions	Yes
C++2011-N1737	Multi-declarator auto	Yes
C++2011-N1757	Right angle brackets	Yes
C++2011-N1791	Extended friend declarations	No
C++2011-N1811	long long	Yes
C++2011-N1984	auto-typed variables	Yes
C++2011-N1986	Delegating constructors	Yes
C++2011-N1987	Extern templates	Yes
C++2011-N1988	Extended integral types	Yes
C++2011-N2118	Rvalue references	Yes
C++2011-N2170	Universal character name literals	Yes
C++2011-N2179	Concurrency: Propagating exceptions	No
C++2011-N2235	Generalized constant expressions	Yes
C++2011-N2239	Concurrency: Sequence points	No new syntax/keywor not affect Polyspace su
C++2011-N2242	Variadic templates	Yes
C++2011-N2249	New character types	Yes
C++2011-N2253	Extending sizeof	Yes
C++2011-N2258	Template aliases	Yes
C++2011-N2340	_func_ predefined identifier	Yes

C++11 Std Ref	Description	Supported
C++2011-N2341	Alignment support	Yes
C++2011-N2342	Standard Layout Types	Yes
C++2011-N2343	Declared type of an expression	Yes
C++2011-N2346	Defaulted and deleted functions	Yes
C++2011-N2347	Strongly typed enums	Yes
C++2011-N2427	Concurrency: Atomic operations	No
C++2011-N2429	Concurrency: Memory model	No new syntax/keywor not affect Polyspace su
C++2011-N2431	Null pointer constant	Yes
C++2011-N2437	Explicit conversion operators	Yes
C++2011-N2439	Rvalue references for *this	Yes
C++2011-N2440	Concurrency: Abandoning a process and at_quick_exit	Yes
C++2011-N2442	Unicode string literals	Yes
C++2011-N2442	Raw string literals	Yes
C++2011-N2535	Inline namespaces	Yes
C++2011-N2540	Inheriting constructors	Yes
C++2011-N2541	New function declarator syntax	Yes
C++2011-N2544	Unrestricted unions	Yes
C++2011-N2546	Removal of auto as a storage-class specifier	Yes
C++2011-N2547	Concurrency: Allow atomics use in signal handlers	No
C++2011-N2555	Extending variadic template template parameters	Yes
C++2011-N2657	Local and unnamed types as template arguments	Yes
C++2011-N2659	Concurrency: Thread-local storage	No
C++2011-N2660	Concurrency: Dynamic initialization and destruction with concurrency	Yes
C++2011-N2664	Concurrency: Data-dependency ordering: atomics and memory model	No
C++2011-N2672	Initializer lists	Yes
C++2011-N2748	Concurrency: Strong Compare and Exchange	No

C++11 Std Ref	Description	Supported
C++2011-N2752	Concurrency: Bidirectional Fences	No
C++2011-N2756	Nonstatic data member initializers	Yes
C++2011-N2761	Generalized attributes	Yes
C++2011-N2764	Forward declarations for enums	Yes
C++2011-N2765	User-defined literals	Yes
C++2011-N2927	New wording for C++0x lambdas	Yes
C++2011-N2928	Explicit virtual overrides	Yes
C++2011-N2930	Range-based for	Yes
C++2011-N3050	Allowing move constructors to throw [noexcept]	Yes
C++2011-N3053	Defining move special member functions	Yes
C++2011-N3276	decltype and call expressions	Yes

C++14 Language Elements Supported in Polyspace

This table provides a partial list of C++ language elements that have been introduced since C++14 and the corresponding Polyspace support. If your code contains non-supported constructions, Polyspace reports a compilation error.

C++14 Std Ref	++14 Std Ref Description	
C++2014-N3323	Implicit conversion from class type in certain contexts such as delete or switch statement.	This C++14 feature allows implicit conversion from class type in certain contexts. No new syntax/ keyword is introduced and therefore does not affect Polyspace support for C++14.
C++2014-N3462	More SFINAE-friendly std::result_of	Yes
C++2014-N3472	Binary literals, for instance, 0b100.	Yes
C++2014-N3545	<pre>operator() in integral_constant template of constexpr type</pre>	Yes
C++2014-N3637	Relation between std::async and destructor of std::future	No new syntax/keyword is introduced and therefore does not affect Polyspace support for C++14.
		Yes.
C++2014-N3638	Automatic deduction of return type for functions where an explicit return type is not specified	In some cases, Code Prove
C++2014-N3642	Suffixes for user-defined literals indicating time (h, min, s, ms, us, ns) and strings (s)	Yes
		Yes.
C++2014-N3648	Initialization of captured members in lambda functions	In some cases, during initialization, Code Prover can call the corresponding constructors more number of times than necessary.

C++14 Std Ref	Description	Supported	
	Generic (polymorphic) lambda expressions:		
	Using auto type-specifier for parameter and return type		
C++2014-N3649	Conversion of generic capture-less lambda expressions to pointer-to-function.	Yes	
C++2014-N3651	Variable templates	Yes	
C++2014-N3652	Declarations, conditions and loops in constexpr functions.	Yes	
	Initialization of aggregate classes with fewer initializers than members		
	For instance, this initialization has fewer initializers than members. The member c is initialized with the value 0 and d is initialized with the value s.		
	<pre>struct S { int a; const char* b; int c;</pre>		
C++2014-N3653	int d = b[a];}; S ss = { 1, "asdf" };	Yes	
C++2014-N3654	std::quoted	Yes	
C++2014-N3656	std::make_unique	Yes	
C++2014-N3658	std::integer_sequence	Yes	
		No.	
		The use of std::shared_lock does not cause compilation erro but the construct is not	
C++2014-N3658	std::shared_lock	semantically supported.	

C++14 Std Ref	C++14 Std Ref Description	
C++2014-N3664	Calling new and delete operators in batches.	This C++14 feature clarification how successive calls to the new operator are implemented. No new syntax/keyword is introduced and therefore does not affect Polyspace support for C++14.
C++2014-N3668	std::exchange	Partially supported.
C++2014-N3670	Using std::get with a data type to get one element in an std::tuple (provided there is only one element of the type in the tuple)	Yes
C++2014-N3671	Overloads for std::equal, std::mismatch and std::is_permutation function templates that accept two separate ranges	Yes
C++2014-N3733	Removal of std::gets from <cstdio></cstdio>	Yes
C++2014-N3776	Wording change for destructor of std::future	No new syntax/keyword is introduced and therefore does not affect Polyspace support for C++14.
C++2014-N3779	<pre>std::complex literals representing pure imaginary numbers with suffix i, if or il</pre>	Yes
C++2014-N3781	Use of single quotation mark as digit separator, for instance, 1'000.	Yes
C++2014-N3786	Prohibiting "out of thin air' results in C++14	No new syntax/keyword is introduced and therefore does not affect Polyspace support for C++14.
C++2014-N3910	Synchronizing behavior of signal handlers	No new syntax/keyword is introduced and therefore does not affect Polyspace support for C++14.

C++14 Std Ref	Description	Supported
C++2014-N3924		No new syntax/keyword is introduced and therefore does not affect Polyspace support for C++14.
C++2014-N3927		No new syntax/keyword is introduced and therefore does not affect Polyspace support for C++14.

• "C/C++ Language Standard Used in Polyspace Analysis" on page 8-7

Provide Standard Library Headers for Polyspace Analysis

Before Polyspace analyzes the code for bugs and run-time errors, it compiles your code. Even if the code compiles with your compiler, you can see compilation errors with Polyspace. If the error comes from a standard library function, it usually indicates that Polyspace is not using your compiler headers. To work around the errors, provide the path to your compiler headers.

This topic shows how to locate the standard library headers from your compiler. The code examples cause a compilation error that shows the location of the headers.

• To locate the folder containing your C compiler system headers, compile this C code by using your compilation toolchain:

```
float fopen(float f);
#include <stdio.h>
```

The code does not compile because the fopen declaration conflicts with the declaration inside stdio.h. The compilation error shows the location of your compiler implementation of stdio.h. Your C standard library headers are all likely to be in that folder.

• To locate the folder containing your C++ compiler system headers, compile this C++ code by using your compilation toolchain:

```
namespace std {
    float cin;
}
#include <iostream>
```

The code does not compile because the cin declaration conflicts with the declaration inside iostream.h. The compilation error shows the location of your compiler implementation of iostream.h. Your C++ standard library headers are all likely to be in that folder.

After you locate the path to your compiler's header files, specify the path for the Polyspace analysis. For C++ code, specify the paths to both your C and C++ headers.

• In the user interface (Polyspace desktop products), add the folder to your project.

For more information, see "Add Source Files for Analysis in Polyspace User Interface" on page 1-2.

At the command line, use the flag -I with the polyspace-bug-finder, polyspace-code-prover, polyspace-bug-finder-server or polyspace-code-prover-server command..

For more information, see -I.

Requirements for Project Creation from Build Systems

For automatic project creation from build systems, your build commands or makefiles must meet certain requirements.

Compiler Requirements

Your compiler must be called locally.

If you use a compiler cache such as ccache or a distributed build system such as distmake, the software cannot trace your build. You must deactivate them.

· Your compiler must perform a clean build.

If your compiler performs only an incremental build, use appropriate options to build all your source files. For example, if you use gmake, append the -B or -W makefileName option to force a clean build. For the list of options allowed with the GNU^{\circledast} make, see make options.

- Your compiler configuration must be available to Polyspace. The compilers currently supported include the following:
 - arm Keil
 - Clang
 - Wind River[®] Diab
 - GNU C/C++
 - · IAR Embedded Workbench
 - Green Hills®
 - NXP CodeWarrior®
 - Renesas[®]
 - Altium[®] Tasking
 - Texas Instruments[™]
 - · tcc Tiny C Compiler
 - Microsoft[®] Visual C++[®]

If your compiler configuration is not available to Polyspace:

- Write a compiler configuration file for your compiler in a specific format. For more information, see "Compiler Not Supported for Project Creation from Build Systems" on page 20-11.
- Contact MathWorks Technical Support. For more information, see "Contact Technical Support" on page 20-8.
- With the TASKING compiler, if you use an alternative sfr file with extension .asfr, Polyspace might not be able to locate your file. If you encounter an error, explicitly #include your .asfr file in the preprocessed code using the option Include (-include).

Typically, you use the statement #include __SFRFILE__(__CPU__) along with the compiler option --alternative-sfr-file to specify an alternative sfr file. The path to the file is typically $Tasking_C166_INSTALL_DIR \in Sfr$ \regCPUNAME.asfr. For instance, if your TASKING compiler is installed in C:\Program Files\Tasking\C166-VX_v4.0r1\ and you use the CPU-related flag -Cxc2287m_104f or --cpu=xc2287m_104f, the path is C:\Program Files \Tasking\C166-VX_v4.0r1\include\sfr\regxc2287m.asfr.

Build Command Requirements

- Your build command must run to completion without any user interaction.
- In Linux, only UNIX shell (sh) commands must be used. If your build uses advanced commands such as commands supported only by bash, tcsh or zsh, Polyspace cannot trace your build.
 - In Windows, only DOS commands must be used. If your build uses advanced commands such as commands supported only by PowerShell or Cygwin $^{\text{\tiny TM}}$, Polyspace cannot trace your build. To see if Polyspace supports your build command, run the command from cmd.exe in Windows. For more information, see "Check if Polyspace Supports Build Scripts" on page 20-22.
- If you use statically linked libraries, Polyspace cannot trace your build. In Linux, you can install the full Linux Standard Base (LSB) package to allow dynamic linking. For example, on Debian® systems, install LSB with the command apt-get install lsb.
- Your build command must not use aliases.
 - The alias command is used in Linux to create an alternate name for commands. If your build command uses those alternate names, Polyspace cannot recognize them.
- Your build process must not use the LD_PRELOAD mechanism.

- Your build command must be executable completely on the current machine and must not require privileges of another user.
 - If your build uses sudo to change user privileges or ssh to remotely log in to another machine, Polyspace cannot trace your build.
- If your build command uses redirection with the > or | character, the redirection occurs after Polyspace traces the command. Therefore, Polyspace does not handle the redirection.

For example, if your command occurs as

command1 | command2

And you enter

polyspace-configure command1 | command2

When tracing the build, Polyspace traces the first command only.

- If the System Integrity Protection (SIP) feature is active on the operating system macOS El Capitan (10.11) or a later macOS version, Polyspace cannot trace your build command. Before tracing your build command, disable the SIP feature. You can reenable this feature after tracing the build command.
- If your computer hibernates during the build process, Polyspace might not be able to trace your build.

Note Your environment variables are preserved when Polyspace traces your build command.

Supported Keil or IAR Language Extensions

Polyspace analysis can interpret a subset of common C/C++ language constructs and extended keywords by default. For compiler-specific keywords, you must specify your choice of compiler. If you specify keil or iar for Compiler (-compiler), the Polyspace verification allows language extensions specific to the Keil or IAR compilers.

Special Function Register Data Type

Embedded control applications frequently read and write port data, set timer registers, and read input captures. To deal with these requirements without using assembly language, some microprocessor compilers define special data types such as sfr and sbit. Typical declarations are:

```
sfr A0 = 0x80;
sfr A1 = 0x81;
sfr ADCUP = 0xDE;
sbit EI = 0x80;
```

The declarations reside in header files such as regxx.h for the basic 80Cxxx micro processor. The declarations customize the compiler to the target processor.

You access a register or a port by using the sfr and sbit data as follows. However, these data types are not part of the C99 Standard.

```
int status,P0;

void main (void) {
  ADCUP = 0x08; /* Write data to register */
  A1 = 0xFF; /* Write data to Port */
  status = P0; /* Read data from Port */
  EI = 1; /* Set a bit (enable all interrupts) */
}
```

To analyze this type of code, use these options:

- Compiler (-compiler): Specify keil or iar.
- Sfr type support (-sfr-types): Specify the data type and size in bits.

The analysis then supports the Keil or IAR language extensions even if some structures, keywords, and syntax are not part of the C99 standard.

Keywords Removed During Preprocessing

Once you specify the Keil or IAR compiler, the analysis recognizes compiler-specific keywords in your code. If a keyword is not relevant for the analysis, it is removed from the source code during preprocessing.

If you disable the keyword and use it as an identifier instead, you can encounter a compilation error when you compile your code with Polyspace. See "Errors Related to Keil or IAR Compiler" on page 20-44.

These keywords are removed during preprocessing:

- Keil: bdata, far, idata, huge, sdata
- IAR: saddr, reentrant, reentrant_idata, non_banked, plm, bdata, idata, pdata, code, xdata, xhuge, interrupt, __interrupt, __intrinsic

The data keyword is not removed.

Remove or Replace Keywords Before Compilation

The Polyspace compiler strictly follows the ANSI® C99 Standard (ISO/IEC 9899:1999). If your compiler allows deviation from the Standard, the Polyspace compilation using default options cannot emulate your compiler. For instance, your compiler can allow certain non-ANSI keyword, which Polyspace does not recognize by default.

To emulate your compiler closely, you specify the Target & Compiler options. If you still get compilation errors from unrecognized keywords, you can remove or replace them only for the purposes of verification. The option Preprocessor definitions (-D) allows you to make simple substitutions. For complex substitutions, for instance to remove a group of space-separated keywords such as a function attribute, use the option Command/script to apply to preprocessed files (-post-preprocessing-command).

Remove Unrecognized Keywords

You can remove unsupported keywords from your code for the purposes of analysis. For instance, follow these steps to remove the far and 0x keyword from your code (0x) precedes an absolute address).

Save the following template as C:\Polyspace\myTpl.pl.

Content of myTpl.pl

```
while (<$INFILE>)
{

    # Remove far keyword
    s/far//;

    # Remove "@ 0xFE1" address constructs
    s/\@\s0x[A-F0-9]*//g;

    # Remove "@0xFE1" address constructs
    s/\@0x[A-F0-9]*//g;

# Remove "@ ((unsigned)&LATD*8)+2" type constructs
    s/\@\s\(\(unsigned\)\&[A-Z0-9]+\*8\)\+\d//g;

# DON'T DELETE LINE BELOW: Print the current processed line
    print $OUTFILE $_;
}
```

For reference, see a summary of Perl regular expressions.

Perl Regular Expressions

```
# Metacharacter What it matches
# Single Characters
# . Any character except newline
# [a-z0-9] Any single character in the set
# [^a-z0-9] Any character not in set
# \d A digit same as
# \D A non digit same as [^0-9]
# \w An Alphanumeric (word) character
# \W Non Alphanumeric (non-word) character
# Whitespace Characters
# \s Whitespace character
# \S Non-whitespace character
# \n newline
# \r return
# \t tab
# \f formfeed
# \b backspace
#
```

```
# Anchored Characters
# \B word boundary when no inside []
# \B non-word boundary
# ^ Matches to beginning of line
# $ Matches to end of line
# Repeated Characters
# x? 0 or 1 occurrence of x
# x* 0 or more x's
# x+ 1 or more x's
# x{m,n} Matches at least m x's and no more than n x's
# abc All of abc respectively
# to|be|great One of "to", "be" or "great"
# Remembered Characters
# (string) Used for back referencing see below
# \1 or $1 First set of parentheses
# \2 or $2 First second of parentheses
# \3 or $3 First third of parentheses
# Back referencing
# e.g. swap first two words around on a line
# red cat -> cat red
\# s/(\w+) (\w+)/$2 $1/;
```

2 On the **Configuration** pane, select **Environment Settings**.

To the right of **Command/script to apply to preprocessed files**, click .

- **4** Use the Open File dialog box to navigate to C:\Polyspace.
- 5 In the **File name** field, enter myTpl.pl.
- 6 Click Open. You see C:\Polyspace\myTpl.pl in the Command/script to apply to preprocessed files field.

Remove Unrecognized Function Attributes

You can remove unsupported function attributes from your code for the purposes of analysis.

If you run verification on this code specifying a generic compiler, you can see compilation errors from the noreturn attribute. The code compiles using a GNU compiler.

```
void fatal () __attribute__ ((noreturn));

void fatal (/* ... */)
{
    /* ... */ /* Print error message. */ /* ... */
    exit (1);
}
```

If the software does not recognize an attribute and the attribute does not affect the code analysis, you can remove it from your code for the purposes of verification. For instance, you can use this Perl script to remove the noreturn attribute.

```
while ($line = <STDIN>)
{

# __attribute__ ((noreturn))

# Remove far keyword

$line =~ s/__attribute__\ \(\(noreturn\)\)//g;

# Print the current processed line to STDOUT print $line;
}
```

Specify the script using the option Command/script to apply to preprocessed files (-post-preprocessing-command).

• "Troubleshoot Compilation Errors"

Gather Compilation Options Efficiently

Polyspace verification can sometimes stop in the compilation or linking phase due to the following reasons:

- The Polyspace compiler strictly follows a C or C++ Standard (depending on your choice of compiler). See "C/C++ Language Standard Used in Polyspace Analysis" on page 8-7. If your compiler allows deviation from the Standard, the Polyspace compilation using default options cannot emulate your compiler.
- Your compiler declares standard library functions with argument or return types different from the standard types. Unless you also provide the function definition, for efficient verification, Polyspace uses its own definitions of standard library functions, which have the usual prototype. The mismatch in types causes a linking error.

You can easily work around the compilation and standard library function errors. To work around the errors, you typically specify certain analysis options. In some cases, you might have to add a few lines to your code. For instance:

- To emulate your compiler behavior more closely, you specify the Target & Compiler options. If you still face compilation errors, you might have to remove or replace certain unrecognized keywords using the option Preprocessor definitions (-D). However, the option allows only simple substitution of a string with another string. For more complex replacements, you might have to add #define statements to your code.
- To avoid errors from stubbing standard library functions, you might have to #define certain Polyspace-specific macros so that Polyspace does not use its own definition of standard library functions.

Instead of adding these modifications to your original code, create a single polyspace.h file that contains all modifications. Use the option Include (-include) to force inclusion of the polyspace.h file in all source files under verification.

Benefits of this approach include:

- The error detection is much faster since it will be detected during compilation rather than in the link or subsequent phases.
- There will be no need to modify original source files.
- \bullet $\,$ The file is automatically included as the very first file in the original .c files.
- The file is reusable for other projects developed under the same environment.

Example 8.1. Example

This is an example of a file that can be used with the option Include (-include).

Configure Inputs and Stubbing Options

Specify External Constraints

This example shows how to specify constraints (also known as data range specifications or DRS) on variables in your code. Polyspace uses the code that you provide to make assumptions about items such as variable ranges and allowed buffer size for pointers. Sometimes the assumptions are broader than what you expect because:

- You have not provided the complete code. For example, you did not provide some of the function definitions.
- Some of the information about variables is available only at run time. For example, some variables in your code obtain values from the user at run time.

Because of these broad assumptions:

- Code Prover can consider more execution paths than those paths that occur at run
 time. If an operation fails along one of the execution paths, Polyspace places an orange
 check on the operation. If that execution path comes from an assumption that is too
 broad, the orange check might indicate a false positive.
- Bug Finder can sometimes produce false positives.

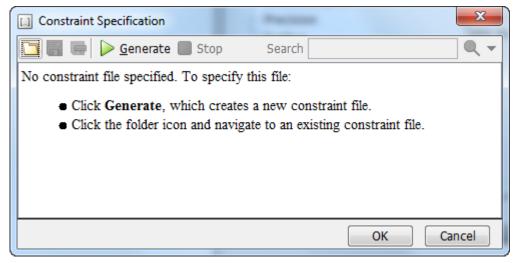

To reduce the number of such false positives, you can specify additional constraints on global variables, function inputs, and return values and modifiable arguments of stubbed functions. You save the constraints as an XML file to use them for subsequent analyses. If your source code changes, you can update the previous constraints. You do not have to create a new constraint template.

Note In Bug Finder, you can only constrain global variables. You cannot constrain function inputs or return values of stubbed functions.

Create Constraint Template

User Interface (Desktop Products Only)

- Open the project configuration. On the Configuration pane, select Inputs & Stubbing.
- 2 To the right of **Constraint setup**, click the **Edit** button to open the **Constraint Specification** window.

- In the Constraint Specification dialog box, create a blank constraint template. The template contains a list of all variables on which you can provide constraints. To
 - create a new template, click Generate. The software compiles your project and creates a template. The new template is stored in a file Module number Project name drs template.xml in your project folder.
- 4 Specify your constraints and save the template as an XML file. For more information, see "External Constraints for Polyspace Analysis" on page 9-8.
- 5 Click OK.

You see the full path to the template XML file in the **Constraint setup** field. If you run an analysis, Polyspace uses this template for extracting variable constraints.

Command Line

Use the option Constraint setup (-data-range-specifications) to specify the constraints XML file.

To specify constraints in the XML file:

1 First, create a blank XML template. The template lists all global variables, function inputs and modifiable arguments and return values of stubbed functions without specifying any constraints on them.

To create a blank template, run an analysis only upto the compilation phase. In Bug Finder, disable checking of defects. Use the option Find defects (-checkers). In Code Prover, check for source compliance only. Use the argument compile for the option Verification level (-to). After the analysis, a blank template XML drs-template.xml is created in the results folder.

For C++ projects, to create a blank constraints template, you have to use the argument cpp-normalize for the option Verification level (-to).

2 Edit the XML file to specify your constraints.

For examples, see:

- "Constrain Global Variable Range" (Polyspace Code Prover)
- "Constrain Function Inputs" (Polyspace Code Prover)

Create Constraint Template from Code Prover Analysis Results

You can constrain variable ranges based on their expected range in real-world applications. For instance, if a variable represents vehicle speed, you can set a maximum possible value. You can also constrain variable ranges only if they cause too many orange checks from overapproximation.

A Code Prover analysis shows all global variables, function inputs and stubbed functions that lead to orange checks from possible overapproximation. You can constrain only these variables for a more precise analysis.

- 1 Open Code Prover results in the Polyspace user interface or Polyspace Access web interface.
- **2** Open the **Orange Sources** pane. Do one of the following:
 - Select an orange check. If the software can trace an orange check to a root cause,
 a icon appears on the Result Details pane. Click this icon to open the Orange Sources pane.
 - In the Polyspace user interface, select Window > Show/Hide View > Orange Sources. In the Polyspace Access web interface, select Layout > Show/Hide View > Orange Sources.

You see the full list of variables (function inputs or return values of stubbed functions) that can cause orange checks. Constrain the ranges of these variables.

Update Existing Template

With new code submissions, you might have to specify additional constraints. You can update an existing template to add global variables, function inputs and stubbed functions that come from the new code submissions.

Additionally, if you remove some variables or functions from your code, constraints on them are not applicable any more. Instead of regenerating a constraint template and respecifying the constraints, you can update an existing template and remove the variables that are not present in your code.

User Interface (Desktop Products Only)

- 1 On the **Configuration** pane, select **Inputs & Stubbing**.
- **2** Open the existing template in one of the following ways:
 - In the Constraint setup field, enter the path to the template XML file. Click Edit.
 - Click **Edit**. In the Constraint Specification dialog box, click the icon to navigate to your template file.
- 3 Click Update.
 - Variables that are no longer present in your source code appear under the Non Applicable node. To remove an entry under the Non Applicable node or the node itself, right-click and select Remove This Node.
 - **b** Specify your new constraints for any of the other variables.

Command Line

In a continuous integration workflow, you can use the constraints XML file from the previous run. If new code submissions require additional constraints:

- Specify constraints on variables from new code submissions in a constraints XML file. See Create Constraint Template: Command Line on page 9-3.
- 2 Merge the constraints XML file with the new constraints and the constraints XML file from the previous run.

Specify Constraints in Code

Specifying constraints outside your code allows for more precise analysis. However, you must use the code within the specified constraints because the constraints are *outside* your code. Otherwise, the results might not apply. For example, if you use function inputs outside your specified range, a run-time error can occur on an operation even though checks on the operation are green.

To specify constraints *inside* your code, you can use:

- Appropriate error handling tests in your code.
 - Polyspace checks to determine if the errors can actually occur. If they do not occur, the test blocks appear as **Unreachable code**.
- The assert macro. For example, to constrain a variable var in the range [0,10], you can use assert(var >= 0 && var <=10);.

Polyspace checks your assert statements to see if the condition can be false. Following the assert statement, Polyspace considers that the assert condition is true. Using assert statements, you can constrain your variables for the remaining code in the same scope. For examples, see Assertion.

- "XML File Format for Constraints" on page 9-23

External Constraints for Polyspace Analysis

For a more precise analysis with Polyspace, you can specify external constraints on:

- Global Variables.
- User-defined Functions.

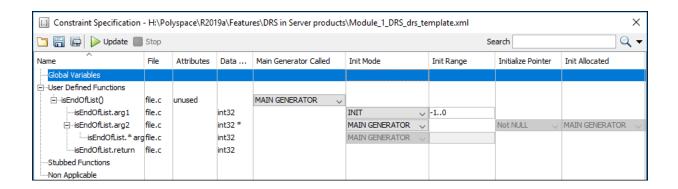

Constraints on user-defined functions do not apply to a Bug Finder analysis.

Stubbed Functions.

Constraints on stubbed functions do not apply to a Bug Finder analysis.

For more information, see "Specify External Constraints" on page 9-2. For a partial list of limitations, see "Constraint Specification Limitations" on page 9-15.

In the user interface of the Polyspace desktop products, you can specify the constraints through a **Constraint Specification** window. The constraints are saved in an XML file that you can reuse for other projects.

This table explains the various columns in the **Constraint Specification** window. If you directly edit the constraint XML file to specify a constraint (for instance, in the Polyspace Server products), this table also shows the correspondence between columns in the user interface and entries in the XML file. The XML entry highlighted in bold appears in the corresponding column of the **Constraint Specification** window.

Column	Settings
Name	Displays the list of variables and functions in your Project for which you can specify data ranges.
	This Column displays three expandable menu items:
	Globals - Displays global variables in the project.
	• User defined functions – Displays user-defined functions in the project. Expand a function name to see its inputs.
	Stubbed functions – Displays a list of stub functions in the project. Expand a function name to see the inputs and return values.
	XML File Entry:
	<function name="funcName"></function>
	<scalar name="arg1"></scalar>
	<pre><pointer name="arg2"></pointer></pre>
File	Displays the name of the source file containing the variable or function.
	XML File Entry:
	<file name="C:\Project1\Sources\file.c"></file>
Attributes	Displays information about the variable or function.
	For example, static variables display static. Uncalled functions display unused.
	XML File Entry:
	<pre><function attributes="unused" name="funcName"></function></pre>
Data Type	Displays the variable type.
	XML File Entry:
	<pre><scalar complete_type="int32" name="arg1"></scalar></pre>

Column	Settings	
Main Generator	Applicable only for user-defined functions.	
Called	Specifies whether the main generator calls the function:	
	• MAIN GENERATOR - Main generator may call this function, depending on the value of the -functions-called-in-loop (C) or -main-generator-calls (C++) parameter.	
	 NO - Main generator will not call this function. YES - Main generator will call this function. XML File Entry: 	
	<pre></pre>	

Column	Settings
Init Mode	Specifies how the software assigns a range to the variable:
	• MAIN GENERATOR - Variable range is assigned depending on the settings of the main generator options -main-generator-writes-variables and -no-def-init-glob.
	• IGNORE - Variable is not assigned to any range, even if a range is specified.
	• INIT - Variable is assigned to the specified range only at initialization, and keeps the range until first write.
	• PERMANENT - Variable is permanently assigned to the specified range. If the variable is assigned outside this range during the program, no warning is provided. Use the globalassert mode if you need a warning.
	User-defined functions support only INIT mode.
	Stub functions support only PERMANENT mode.
 IGNORE, or INIT mode. MAIN GENERATOR - Pointer fo generator. IGNORE - Pointer is not initiali INIT - Specify if the pointer is 	For C verifications, global pointers support MAIN GENERATOR, IGNORE, or INIT mode.
	MAIN GENERATOR - Pointer follows the options of the main generator.
	IGNORE - Pointer is not initialized
	• INIT - Specify if the pointer is NULL, and how the pointed object is allocated (Initialize Pointer and Init Allocated options).
	XML File Entry:
	<scalar init_mode="INIT" name="arg1"></scalar>

Column	Settings	
Init Range	Specifies the minimum and maximum values for the variable.	
	You can use the keywords min and max to denote the minimum and maximum values of the variable type. For example, for the type long, min and max correspond to -2^31 and 2^31-1 respectively.	
	You can also use hexadecimal values. For example: 0x120x100	
	For enum variables, you cannot specify ranges directly using the enumerator constants. Instead use the values represented by the constants.	
	For enum variables, you can also use the keywords enum_min and enum_max to denote the minimum and maximum values that the variable can take. For example, for an enum variable of the type defined below, enum_min is 0 and enum_max is 5:	
	<pre>enum week{ sunday, monday=0, tuesday, wednesday, thursday, friday, saturday};</pre>	
	XML File Entry:	
	<pre><scalar init_range="-10" name="arg1"></scalar></pre>	
Initialize Pointer	Applicable only to pointers. Enabled only when you specify Init Mode :INIT.	
	Specifies whether the pointer should be NULL:	
	May-be NULL - The pointer could potentially be a NULL pointer (or not).	
	Not Null - The pointer is never initialized as a null pointer.	
	Null - The pointer is initialized as NULL.	
	Note Not applicable for C++ projects. See "Constraint Specification Limitations" on page 9-15.	
	XML File Entry:	
	<pre><pointer initialize_pointer="Not NULL" name="arg1"></pointer></pre>	

Column	Settings
Init Allocated	Applicable only to pointers. Enabled only when you specify Init Mode :INIT.
	Specifies how the pointed object is allocated:
generator. • None - Pointed object is not written. • SINGLE - Write the pointed object or the first element o	The pointed object is anotated by the main
	None - Pointed object is not written.
	• SINGLE - Write the pointed object or the first element of an array. (This setting is useful for stubbed function parameters.)
	MULTI - All objects (or array elements) are initialized.
Note Not applicable for C++ projects. See "Constraint Special Limitations" on page 9-15.	Note Not applicable for C++ projects. See "Constraint Specification Limitations" on page 9-15.
	XML File Entry:
	<pre><pointer init_pointed="MAIN_GENERATOR" name="arg1"></pointer></pre>

Column	Settings
# Allocated	Applicable only to pointers.
Objects	Specifies how many objects are pointed to by the pointer (the pointed object is considered as an array).
	The Init Allocated parameter specifies how many allocated objects are actually initialized. For instance, consider this code:
	<pre>void func(int *ptr) { assert(ptr[0]==1); assert(ptr[1]==1); }</pre>
	If you specify these constraints:
	• ptr has Init Allocated set to MULTI and # Allocated Objects set to 2,
	*ptr has Init Range set to 11,
	both assertions are green. However, if you specify these constraints:
1	ptr has Init Allocated set to SINGLE
	*ptr has Init Range set to 11,
	the second assertion is orange. Only the first object that ptr points to initialized to 1. Objects beyond the first can be potentially full range.
	Note Not applicable for C++ projects. See "Constraint Specification Limitations" on page 9-15.
	XML File Entry:
	<pre><pointer name="arg1" number_allocated="10"></pointer></pre>
Global Assert	Specifies whether to perform an assert check on the variable at global initialization, and after each assignment.
	XML File Entry:
	<pre><scalar global_assert="YES" name="glob"></scalar></pre>

Column	Settings
Global Assert Range	Specifies the minimum and maximum values for the range you want to check.
	XML File Entry:
	<pre><scalar assert_range="0200" name="glob"></scalar></pre>
Comment	Remarks that you enter, for example, justification for your DRS values.
	XML File Entry:
	<pre><scalar comment="Speed Range" name="glob"></scalar></pre>

Constraint Specification Limitations

You cannot specify these constraints:

• *C++ Pointers cannot be constrained:*

In C++, you cannot constrain pointer arguments of functions. Functions that have pointer arguments only do not appear in the constraint specification interface.

Because of polymorphism, a C++ pointer can point to objects of multiple classes in a class hierarchy and can require invoking different constructors. The pre-analysis for constraint specification cannot determine which object type to constrain or which constructor to call.

Constraints cannot be relations:

You cannot specify a constraint that relates the return value of a function to its inputs. You can only specify a constant range for the constraints.

Multiple ranges not possible:

You cannot specify multiple ranges for a constraint. For instance, you cannot specify that a function argument has either the value -1 or a value in the range [1,100]. Instead, specify the range [-1,100] or perform two separate analyses, once with the value -1 and once with the range [1,100].

More About

• "Specify External Constraints" on page 9-2

Constrain Global Variable Range

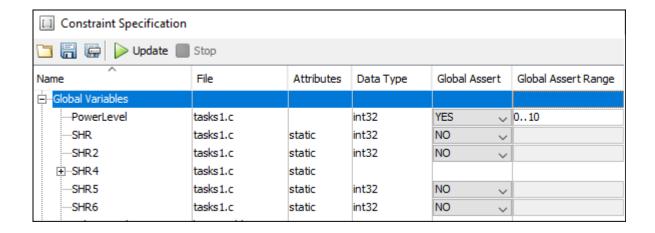

You can impose constraints (also known as data range specifications or DRS) on the range of a global variable and check with Code Prover whether write operations on the variable violate the constraint. For the general workflow, see "Specify External Constraints" on page 9-2.

User Interface (Desktop Products Only)

To constrain a global variable range and also check for violation of the constraint:

- In your project configuration, select **Inputs & Stubbing**. Click the button next to the **Constraint setup** field.
- In the Constraint Specification window, click

Under the **Global Variables** node, you see a list of global variables.

3 For the global variable that you want to constrain:

- From the drop-down list in the Global Assert column, select YES.
- In the **Global Assert Range** column, enter the range in the format *min*..*max*. *min* is the minimum value and *max* the maximum value for the global variable.
- To save your specifications, click the button.

In **Save a Constraint File** window, save your entries as an xml file.

5 Run a verification and open the results.

For every write operation on the global variable, you see a green, orange, or red **Correctness condition** check. If the check is:

- Green, the variable is within the range that you specified.
- Orange, the variable can be outside the range that you specified.
- Red, the variable is outside the range that you specified.

When two or more tasks write to the same global variable, the **Correctness condition** check can appear orange on all write operations to the variable even when only one write operation takes the variable outside the **Global Assert** range.

Command Line

Use the option Constraint setup (-data-range-specifications) with an XML file specifying your constraint.

For instance, for an analysis with Polyspace Code Prover Server, specify the option as follows:

Create a blank constraint XML template as described in "Specify External Constraints" on page 9-2. In the XML file, locate and constrain the global variables. XML tags for global variables appear directly within the file tag without an enclosing function tag. For instance, in this constraint XML, PowerLevel and SHR are global variables:

```
<function name="Tserver" line="73" .../>
    <function name="initregulate" line="47" .../>
    <function name="orderregulate" line="35" ...>
        <scalar name="return" ... global_assert="unsupported" assert_range="unsupported"
        </function>
        <function name="proc1" line="101" .../>
</file>
```

To specify a constraint on a global variable and check during a Code Prover analysis if the constraint is violated:

- **1** Set the global_assert attribute of the variable's scalar tag to YES.
- Set the assert_range attribute to a range in the form min..max, for instance, 0..10.

In the preceding example, the variable PowerLevel is constrained this way.

Correctness condition

More About

- "Specify External Constraints" on page 9-2
- "External Constraints for Polyspace Analysis" on page 9-8
- "Constrain Function Inputs" (Polyspace Code Prover)

Constrain Function Inputs

For a more precise Code Prover analysis, you can specify constraints (also known as data range specifications or DRS) on function inputs. Code Prover checks your function definition for run-time errors with respect to the constrained inputs. For the general workflow, see "Specify External Constraints" on page 9-2.

For instance, for a function defined as follows, you can specify that the argument val has values in the range [1..10]. You can also specify that the argument ptr points to a 3-element array where each element is initialized:

```
int func(int val, int* ptr) {
    .
.
}
```

User Interface (Desktop Products Only)

To specify constraints on function inputs:

- In your project configuration, select **Inputs & Stubbing**. Click the button for **Constraint setup**.
- In the Constraint Specification window, click

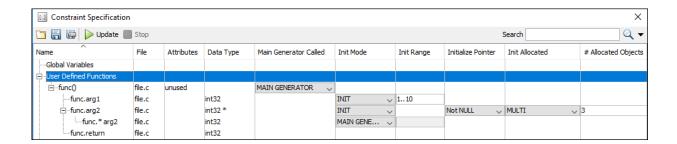

Under the **User Defined Functions** node, you see a list of functions whose inputs can be constrained.

- **3** Expand the node for each function.
 - You see each function input on a separate row. The inputs have the syntax function_name.argl, function_name.arg2, etc.
- 4 Specify your constraints on one or more of the function inputs. For more information, see "External Constraints for Polyspace Analysis" on page 9-8.

For example, in the preceding code:

• To constrain val to the range [1..10], select INIT for **Init Mode** and enter 1..10 for **Init Range**.

• To specify that ptr points to a 3-element array where each element is initialized, select MULTI for **Init Allocated** and enter 3 for **# Allocated Objects**.

5 Run verification and open the results. On the **Source** pane, place your cursor on the function inputs.

The tooltips display the constraints. For example, in the preceding code, the tooltip displays that val has values in 1..10.

Command Line

Use the option Constraint setup (-data-range-specifications) with an XML file specifying your constraint.

For instance, for an analysis with Polyspace Code Prover Server, specify the option as follows:

Create a blank constraint XML template as described in "Specify External Constraints" on page 9-2. In the XML file, locate and constrain the function inputs. The function inputs appear as a scalar or pointer tag in a function tag. The inputs are named as arg1, arg2 and so on. For instance, for the preceding code, the XML structure for the inputs of func appear as follows:

```
<function name="func" line="1" attributes="unused"
    main_generator_called="MAIN_GENERATOR" comment="">
```

To specify a constraint on a function input, set the attributes init_mode and init_range for scalar variables, and init_pointed and number_allocated for pointer variables.

- To constrain val to the range [1..10], set the init_mode attribute of the tag with name argl to INIT and init range to 1..10.
- To specify that ptr points to a 3-element array where each element is initialized, set the init_mode attribute of the tag with name arg2 to INIT, init_pointed to MULTI and number allocated to 3.

- "Constrain Global Variable Range" (Polyspace Code Prover)

XML File Format for Constraints

For a more precise Polyspace analysis, you can specify constraints on global variables, function inputs and stubbed functions. You can specify the constraints in the user interface of the Polyspace desktop products or at the command line as an XML file. For the general workflow, see "Specify External Constraints" on page 9-2.

This topic describes details of the constraint XML file schema. You typically require this information only if you create a constraint XML from scratch. If you run a verification once, the software automatically generates a template constraint file <code>drs-template.xml</code> in your results folder. Instead of creating a constraint XML file from scratch, it is easier to edit this template XML file to specify your constraints. For some examples, see:

- "Constrain Global Variable Range" (Polyspace Code Prover)
- "Constrain Function Inputs" (Polyspace Code Prover)

For another explanation of what the XML tags mean, see "External Constraints for Polyspace Analysis" on page 9-8.

You can also see the information in this topic and the underlying XML schema in *polyspaceroot*\polyspace\drs. Here, *polyspaceroot* is the Polyspace installation folder, for instance, C:\Program Files\Polyspace\R2019a.

Syntax Description — XML Elements

The constraints file contains the following XML elements:

- <global> element Declares the global scope, and is the root element of the XML file.
- <file> element Declares a file scope. Must be enclosed in the <global> element.
 May enclose any variable or function declaration. Static variables must be enclosed in a file element to avoid conflicts.
- <scalar> element— Declares an integer or a floating point variable. May be enclosed
 in any recognized element, but cannot enclose any element. Sets init/permanent/global
 asserts on variables.

- <array> element Declares an array variable. May enclose any other variable
 definition (including itself), to define the members of the array.
- <struct> element Declares a structure variable or object (instance of class). May
 enclose any other variable definition (including itself), to define the fields of the
 structure.
- <function> element Declares a function or class method scope. May enclose any variable definition, to define the arguments and the return value of the function.
 Arguments should be named arg1, arg2, ...argn and the return value should be called return.

The following notes apply to specific fields in each XML element:

- (*) Fields used only by the GUI. These fields are not mandatory for verification to
 accept the ranges. The field line contains the line number where the variable is
 declared in the source code, complete_type contains a string with the complete
 variable type, and base_type is used by the GUI to compute the min and max values.
 The field comment is used to add information about any node.
- (**) The field name is mandatory for scope elements <file> and <function> (except for function pointers). For other elements, the name must be specified when declaring a root symbol or a struct field.
- (***) If more than one attribute applies to the variable, the attributes must be separated by a space. Only the static attribute is mandatory, to avoid conflicts between static variables having the same name. An attribute can be defined multiple times without impact.
- (****) This element is used only by the GUI, to determine which init modes are allowed for the current element (according to its type). The value works as a mask, where the following values are added to specify which modes are allowed:
 - 1: The mode "N0" is allowed.
 - 2 : The mode "INIT" is allowed.
 - **4**: The mode "PERMANENT" is allowed.
 - **8**: The mode "MAIN_GENERATOR" is allowed.

For example, the value "10" means that modes "INIT" and "MAIN_GENERATOR" are allowed. To see how this value is computed, refer to "Valid Modes and Default Values" on page 9-28.

(*****) — A sub-element of a pointer (i.e. a pointed object) will be taken into account
only if init_pointed is equal to SINGLE, MULTI, SINGLE_CERTAIN_WRITE or
MULTI CERTAIN WRITE.

• (*****) — SINGLE_CERTAIN_WRITE or MULTI_CERTAIN_WRITE are available for parameters and return values of stubbed functions only if they are pointers. If the parameter or return value is a structure and the structure has a pointer field, they are also available for the pointer field.

Configure Multitasking Analysis

Analyze Multitasking Programs in Polyspace

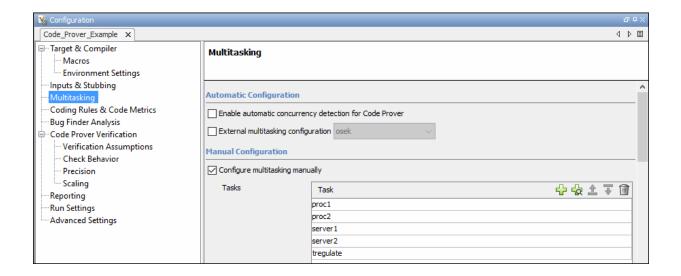

With Polyspace, you can analyze programs where multiple threads (tasks) run concurrently.

In addition to regular run-time checks, the analysis looks for issues specific to concurrent execution:

- Data races, deadlocks, consecutive or missing locks and unlocks (Bug Finder)
- Unprotected shared variables (Code Prover)

Configure Analysis

If your code uses multitasking primitives from certain families, for instance, pthread create for thread creation:

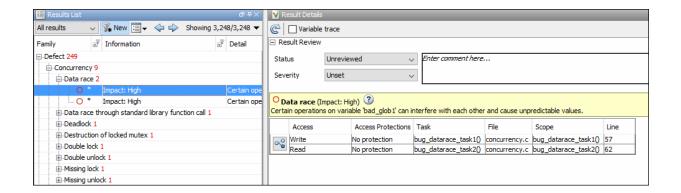

- In Bug Finder, the analysis detects them and extracts your multitasking model from the code.
- In Code Prover, you must enable this automatic detection explicitly.

See "Auto-Detection of Thread Creation and Critical Section in Polyspace" on page 10-6.

Alternatively, define your multitasking model through the analysis options. In the user interface, the options are on the **Multitasking** node in the **Configuration** pane. For more information, see "Configuring Polyspace Multitasking Analysis Manually" on page 10-19.

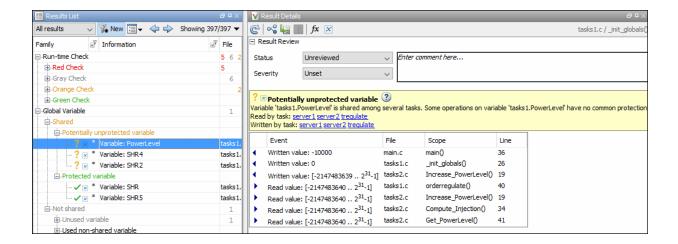

Review Analysis Results

Bug Finder

The Bug Finder analysis shows concurrency defects such as data races and deadlocks. See "Concurrency Defects".

Code Prover

The Code Prover analysis exhaustively checks if shared global variables are protected from concurrent access. See "Global Variables" (Polyspace Code Prover).

Review the results using the message on the **Result Details** pane. See a visual representation of conflicting operations using the (graph) icon.

Auto-Detection of Thread Creation and Critical Section in Polyspace

With Polyspace, you can analyze programs where multiple threads run concurrently. Polyspace can analyze your multitasking code for data races, deadlocks and other concurrency defects, if the analysis is aware of the concurrency model in your code. In some situations, Polyspace can detect thread creation and critical sections in your code automatically. Bug Finder detects them by default. In Code Prover, you enable automatic detection using the option Enable automatic concurrency detection for Code Prover (-enable-concurrency-detection).

For the multitasking code analysis workflow, see "Analyze Multitasking Programs in Polyspace" on page 10-2.

If your thread creation function is not detected automatically:

- You can also map the function to a thread-creation function that Polyspace can detect automatically. Use the option -function-behavior-specifications.
- Otherwise, you must manually model your multitasking threads by using configuration options. See "Configuring Polyspace Multitasking Analysis Manually" on page 10-19.

Multitasking Routines that Polyspace Can Detect

Polyspace can detect thread creation and critical sections if you use primitives from these groups. Polyspace recognizes calls to these routines as the creation of a new thread or as the beginning or end of a critical section.

POSIX

Thread creation: pthread create

Critical section begins: pthread_mutex lock

Critical section ends: pthread mutex unlock

VxWorks

Thread creation: taskSpawn

Critical section begins: semTake

Critical section ends: semGive

To activate automatic detection of concurrency primitives for VxWorks[®], in the user interface of the Polyspace desktop products, use the VxWorks template. For more information on templates, see "Create Project Using Configuration Template" on page 1-19. At the command-line, use these options:

```
-D1=CPU=I80386
```

- -D2= GNUC =2
- -D3= OS VXWORKS

Concurrency detection is possible only if the multitasking functions are created from an entry point named main. If the entry point has a different name, such as vxworks entry point, do one of the following:

- Provide a main function.
- Preprocessor definitions (-D): In preprocessor definitions, set vxworks entry point=main.

Windows

Thread creation: CreateThread

Critical section begins: EnterCriticalSection

Critical section ends: LeaveCriticalSection

μC/OS II

Thread creation: OSTaskCreate

Critical section begins: OSMutexPend

Critical section ends: OSMutexPost

C + +11

Thread creation: std::thread::thread

Critical section begins: std::mutex::lock

Critical section ends: std::mutex::unlock

For autodetection of C++11 threads, explicitly specify paths to your compiler header files or use polyspace-configure.

For instance, if you use std::thread for thread creation, explicitly specify the path to the folder containing thread.h.

See also "Limitations of Automatic Thread Detection" on page 10-13.

C11

Thread creation: thrd create

Critical section begins: mtx lock

Critical section ends: mtx unlock

Example of Automatic Thread Detection

The following multitasking code models five philosophers sharing five forks. The example uses POSIX® thread creation routines and illustrates a classic example of a deadlock. Run Bug Finder on this code to see the deadlock.

```
#include "pthread.h"
#include <stdio.h>
#include <unistd.h>
pthread_mutex_t forks[5];
void* philo1(void* args)
    while (1) {
        printf("Philosopher 1 is thinking\n");
        sleep(1);
        pthread mutex lock(&forks[0]);
        printf("Philosopher 1 takes left fork\n");
        pthread mutex lock(&forks[1]);
        printf("Philosopher 1 takes right fork\n");
        printf("Philosopher 1 is eating\n");
        sleep(1);
        pthread mutex unlock(&forks[1]);
        printf("Philosopher 1 puts down right fork\n");
        pthread mutex unlock(&forks[0]);
        printf("Philosopher 1 puts down left fork\n");
    return NULL;
void* philo2(void* args)
{
    while (1) {
        printf("Philosopher 2 is thinking\n");
        sleep(1);
        pthread mutex lock(&forks[1]);
        printf("Philosopher 2 takes left fork\n");
        pthread mutex lock(&forks[2]);
        printf("Philosopher 2 takes right fork\n");
        printf("Philosopher 2 is eating\n");
        sleep(1):
        pthread mutex unlock(&forks[2]);
        printf("Philosopher 2 puts down right fork\n");
        pthread mutex unlock(&forks[1]);
        printf("Philosopher 2 puts down left fork\n");
    return NULL;
}
```

```
void* philo3(void* args)
{
    while (1) {
        printf("Philosopher 3 is thinking\n");
        sleep(1);
        pthread mutex lock(&forks[2]);
        printf("Philosopher 3 takes left fork\n");
        pthread mutex lock(&forks[3]);
        printf("Philosopher 3 takes right fork\n");
        printf("Philosopher 3 is eating\n");
        sleep(1);
        pthread mutex unlock(&forks[3]);
        printf("Philosopher 3 puts down right fork\n");
        pthread mutex unlock(&forks[2]);
        printf("Philosopher 3 puts down left fork\n");
    }
    return NULL;
}
void* philo4(void* args)
    while (1) {
        printf("Philosopher 4 is thinking\n");
        sleep(1);
        pthread mutex lock(&forks[3]);
        printf("Philosopher 4 takes left fork\n");
        pthread mutex lock(&forks[4]);
        printf("Philosopher 4 takes right fork\n");
        printf("Philosopher 4 is eating\n");
        sleep(1):
        pthread mutex unlock(&forks[4]);
        printf("Philosopher 4 puts down right fork\n");
        pthread mutex unlock(&forks[3]);
        printf("Philosopher 4 puts down left fork\n");
    return NULL;
}
void* philo5(void* args)
{
    while (1) {
        printf("Philosopher 5 is thinking\n");
        sleep(1);
        pthread mutex lock(&forks[4]);
```

```
printf("Philosopher 5 takes left fork\n");
        pthread mutex lock(&forks[0]);
        printf("Philosopher 5 takes right fork\n");
        printf("Philosopher 5 is eating\n");
        sleep(1):
        pthread mutex unlock(&forks[0]);
        printf("Philosopher 5 puts down right fork\n");
        pthread mutex unlock(&forks[4]);
        printf("Philosopher 5 puts down left fork\n");
    return NULL;
}
int main(void)
   pthread t ph[5];
   pthread create(&ph[0], NULL, philo1, NULL);
   pthread create(&ph[1], NULL, philo2, NULL);
   pthread create(&ph[2], NULL, philo3, NULL);
   pthread create(&ph[3], NULL, philo4, NULL);
   pthread create(&ph[4], NULL, philo5, NULL);
   pthread join(ph[0], NULL);
   pthread join(ph[1], NULL);
   pthread join(ph[2], NULL);
   pthread join(ph[3], NULL);
   pthread join(ph[4], NULL);
    return 1:
}
```

Each philosopher needs two forks to eat, a right and a left fork. The functions philo1, philo2, philo3, philo4, and philo5 represent the philosophers. Each function requires two pthread_mutex_t resources, representing the two forks required to eat. All five functions run at the same time in five concurrent threads.

However, a deadlock occurs in this example. When each philosopher picks up their first fork (each thread locks one pthread_mutex_t resource), all the forks are being used. So, the philosophers (threads) wait for their second fork (second pthread_mutex_t resource) to become available. However, all the forks (resources) are being held by the waiting philosophers (threads), causing a deadlock.

Naming Convention for Automatically Detected Threads

If you use a function such as pthread_create() to create new threads (tasks), each thread is associated with an unique identifier. For instance, in this example, two threads are created with identifiers idl and idl.

```
pthread_t* id1, id2;

void main()
{
    pthread_create(id1, NULL, start_routine, NULL);
    pthread_create(id2, NULL, start_routine, NULL);
}
```

If a data race occurs between the threads, the analysis can detect it. When displaying the results, the threads are indicated as task_id, where id is the identifier associated with the thread. In the preceding example, the threads are identified as task_id1 and task id2.

If a thread identifiers is:

Local to a function, the thread name shows the function.

```
For instance, the thread created below appears as task_f:id
void f(void)
{
    pthread_t* id;
    pthread_create(id, NULL, start_routine, NULL);
}
```

A field of a structure, the thread name shows the structure.

For instance, the thread created below appears as task_a#id struct {pthread_t* id; int x;} a; pthread_create(a.id,NULL,start_routine,NULL);

• An array member, the thread name shows the array.

For instance, the thread created below appears as $task_tab[1]$.

```
pthread_t* tab[10];
pthread create(tab[1],NULL,start routine,NULL);
```

Limitations of Automatic Thread Detection

The multitasking model extracted by Polyspace does not include some features. Polyspace cannot model:

- Thread priorities and attributes Ignored by Polyspace.
- Recursive semaphores.
- Unbounded thread identifiers, such as extern pthread_t ids[] Warning.
- Calls to concurrency primitive through high-order calls Warning.
- Aliases on thread identifiers Polyspace over-approximates when the alias is used.
- Termination of threads Polyspace ignores pthread_join and thrd_join. Polyspace replaces pthread_exit and thrd_exit by a standard exit.
- (Polyspace Bug Finder only) Creation of multiple threads through multiple calls to the same function with different pointer arguments.

Example

In this example, Polyspace considers that only one thread is created.

```
pthread_t id1, id2;
void start(pthread_t* id)
{
    pthread_create(id, NULL, start_routine, NULL);
}
void main()
{
    start(&id1);
    start(&id2);
}
```

• (Polyspace Code Prover only) Shared local variables — Only global variables are considered shared. If a local variable is accessed by multiple threads, the analysis does not take into account the shared nature of the variable.

Example

In this example, the analysis does not take into account that the local variable x can be accessed by both task1 and task2 (after the new thread is created).

```
#include <pthread.h>
#include <stdlib.h>
void* task2(void* args)
    int* x = (int*) args;
    *x = 1:
    return (void*)x;
}
void task1()
    int x;
    x = 2;
    pthread t id;
    (void)pthread_create(&id, NULL, task2, (void*) &x);
    /* x (local var) passed to task2 */
    x = 3;
    /* Unknown thread priority means x = 1 OR x = 3.*/
    /* However, the analysis considers x = 3 */
    /* Assertion below is green */
    assert(x == 3);
}
int main(void)
    task1();
    return 0;
}
```

(Polyspace Code Prover only) Shared dynamic memory — Only global variables are considered shared. If a dynamically allocated memory region is accessed by multiple threads, the analysis does not take into account its shared nature.

Example

In this example, the analysis does not take into account that lx points to a shared memory region. The region can be accessed by both task1 and task2 (after the new thread is created). The Code Prover analysis also reports lx as a non-shared variable.

```
#include <pthread.h>
#include <stdlib.h>
static int* lx;
void* task2(void* args)
{
    int* x = (int*) args;
    *x = 1;
    return (void*)x;
}
void task1()
    pthread t id;
    lx = (int*)malloc(sizeof(int));
    if (lx == NULL) exit(1);
    (void)pthread_create(&id, NULL, task2, (void*) lx);
    *lx = 3;
   /* Unknown thread priority means *lx = 1 OR *lx = 3.*/
    /* However, the analysis considers *lx = 3 */
    /* Assertion below is green */
    assert(*lx == 3);
}
int main(void)
    task1();
    return 0;
```

Number of tasks created with CreateThread when threadId is set to NULL— When
you create multiple threads that execute the same function, if the last argument of
CreateThread is NULL, Polyspace only detects one instance of this function, or task.

Example

In this example, Polyspace detects only one instance of thread_function1(), but 10 instances of thread_function2().

```
#include <windows.h>
#define MAX_LOOP_THREADS 10

DWORD WINAPI thread_function1(LPVOID data) {}
DWORD WINAPI thread_function2(LPVOID data) {}

HANDLE hds1[MAX_LOOP_THREADS];
HANDLE hds2[MAX_LOOP_THREADS];
DWORD threadId[MAX_LOOP_THREADS];

int main(void)
{
    for (int i = 0; i < MAX_LOOP_THREADS; i++) {
        hds1[i] = CreateThread(NULL, 0, thread_function1, NULL, 0, NULL);
        hds2[i] = CreateThread(NULL, 0, thread_function2, NULL, 0, &threadId[i]);
    }

    return 0;
}</pre>
```

(C++11 only) If you use lambda expressions as start functions during thread creation,
 Polyspace does not detect shared variables in the lambda expressions.

Example

In this example, Polyspace does not detect that the variable y used in the lambda expressions is shared between two threads. As a result, Bug Finder, for instance, does not show a **Data race** defect.

```
#include <thread>
int y;
int main() {
    std::thread t1([] {y++;});
    std::thread t2([] {y++;});
    t1.join();
    t2.join();
    return 0;
}
```

 (C++11 threads with Polyspace Code Prover only) String literals as thread function argument — Code Prover shows a red Illegally dereferenced pointer error if the thread function has an std::string& parameter and you pass a string literal argument.

Example

In this example, the thread function foo has an std::string& parameter. When starting a thread, a string literal is passed as argument to this function, which undergoes an implicit conversion to std::string type. Code Prover loses track of the original string literal in this conversion. Therefore, a dashed red underline appears on operator<< in the body of foo and a red Illegally dereferenced pointer check in the body of operator<<.

```
#include <iostream>
#include <thread>

using namespace std;

void foo(const std::string& f) {
    std::cout << f;
}

void main() {
    std::thread tl(foo, "foo_arg");
}</pre>
```

To work around this issue, assign the string literal to a temporary variable and pass the variable as argument to the thread function.

```
#include <iostream>
#include <thread>

using namespace std;

void foo(const std::string& f) {
    std::cout << f;
}

void main() {
    std::string str = "foo_arg";
    std::thread tl(foo, str);
}</pre>
```

- "Configuring Polyspace Multitasking Analysis Manually" on page 10-19

Configuring Polyspace Multitasking Analysis Manually

With Polyspace, you can analyze programs where multiple threads run concurrently. In some situations, Polyspace can detect thread creation and critical sections in your code automatically. See "Auto-Detection of Thread Creation and Critical Section in Polyspace" on page 10-6.

If your code has functions that are intended for concurrent execution, but that cannot be detected automatically, you must specify them before analysis. If these functions operate on a common variable, you must also specify protection mechanisms for those operations.

For the multitasking code analysis workflow, see "Analyze Multitasking Programs in Polyspace" on page 10-2.

Specify Options for Multitasking Analysis

Use these options to specify cyclic tasks, interrupts and protections for shared variables. In the Polyspace user interface, the options are on the **Multitasking** node in the **Configuration** pane.

- Entry points (-entry-points): Specify noncyclic entry point functions.
 - Do not specify main. Polyspace implicitly considers main as an entry point function.
- Cyclic tasks (-cyclic-tasks): Specify functions that are scheduled at periodic intervals.
- Interrupts (-interrupts): Specify functions that can run asynchronously.
- Disabling all interrupts (-routine-disable-interrupts -routine-enable-interrupts): Specify functions that disable and reenable interrupts (Bug Finder only).
- Critical section details (-critical-section-begin -critical-section-end): Specify functions that begin and end critical sections.
- Temporally exclusive tasks (-temporal-exclusions-file): Specify groups of functions that are temporally exclusive.
- -preemptable-interrupts: Specify functions that have lower priority than interrupts, but higher priority than tasks (preemptable or non-preemptable).

Only the Bug Finder analysis considers priorities.

-non-preemptable-tasks: Specify functions that have higher priority than tasks, but lower priority than interrupts (preemptable or non-preemptable).

Only the Bug Finder analysis considers priorities.

Adapt Code for Code Prover Multitasking Analysis

The multitasking analysis in Code Prover is more exhaustive about finding potentially unprotected shared variables and therefore follows a strict model.

Tasks and interrupts must be void-void functions.

Functions that you specify as tasks and interrupts must have the prototype:

```
void func(void);
```

Suppose you want to specify a function func that takes int arguments:

```
void func(int);
```

Define a wrapper void-void function that calls func with a volatile value. Specify this wrapper function as a task or interrupt.

```
void func wrapper() {
  volatile int arg:
  func(arg);
}
```

The main function must end.

Code Prover assumes that the main function ends before all tasks and interrupts begin. If the main function contains an infinite loop or run-time error, the tasks and interrupts are not analyzed. If you see that there are no checks in your tasks and interrupts, look for a token underlined in dashed red to identify the issue in the main function. See "Reasons for Unchecked Code" (Polyspace Code Prover).

Suppose you want to specify the main function as a cyclic task.

```
void performTask1Cycle(void);
void performTask2Cycle(void);
```

```
void main() {
while(1) {
    performTask1Cycle();
}
void task2() {
while(1) {
    performTask2Cycle();
  }
}
Replace the definition of main with:
#ifdef POLYSPACE
void main() {
void task1() {
 while(1) {
    performTask1Cycle();
}
#else
void main() {
while(1) {
    performTask1Cycle();
  }
}
#endif
```

The replacement defines an empty main and places the content of main into another function task1 if a macro POLYSPACE is defined. Define the macro POLYSPACE using the option Preprocessor definitions (-D) and specify task1 for the option Tasks (-entry-points).

This assumption does not apply to automatically detected threads. For instance, a main function can create threads using pthread_create.

All tasks and interrupts can interrupt each other.

The Bug Finder analysis considers priorities of tasks. A function that you specify as a task cannot interrupt a function that you specify as an interrupt because an interrupt has higher priority.

The Code Prover analysis considers that all tasks and interrupts can interrupt each other.

All tasks and interrupts can run any number of times in any sequence.

The Code Prover analysis considers that all tasks and interrupts can run any number of times in any sequence.

Suppose in this example, you specify reset and inc as cyclic tasks. The analysis shows an overflow on the operation var+=2.

```
void reset(void) {
  var=0;
}

void inc(void) {
  var+=2;
}
```

Suppose you want to model a scheduling of tasks such that reset executes after inc has executed five times. Write a wrapper function that implements this sequence. Specify this new function as a cyclic task instead of reset and inc.

```
void task() {
 volatile int randomValue = 0;
 while(randomValue) {
  inc();
  inc();
  inc();
  inc();
  reset();
  }
}
```

Suppose you want to model a scheduling of tasks such that reset executes after inc has executed zero to five times. Write a wrapper function that implements this sequence. Specify this new function as a cyclic task instead of reset and inc.

```
void task() {
 volatile int randomValue = 0;
 while(randomValue) {
   if(randomValue)
     inc();
   if(randomValue)
     inc();
   if(randomValue)
     inc();
   if(randomValue)
     inc();
   if(randomValue)
     inc();
   if(randomValue)
     inc();
   if(randomValue)
   inc();
   reset();
   }
}
```

Protections for Shared Variables in Multitasking Code

If your code is intended for multitasking, tasks in your code can access a common shared variable. To prevent data races, you can protect read and write operations on the variable. This topic shows the various protection mechanisms that Polyspace can recognize.

Detect Unprotected Access

You can detect an unprotected access using either Bug Finder or Code Prover. Code Prover is more exhaustive and proves if a shared variable is protected from concurrent access.

- Bug Finder detects an unprotected access using the result **Data race**. See Data race.
- Code Prover detects an unprotected access using the result **Shared unprotected global variable**. See Potentially unprotected variable.

Suppose you analyze this code, specifying signal_handler_1 and signal_handler_2 as cyclic tasks. Use the analysis option Cyclic tasks (-cyclic-tasks).

```
#include <limits.h>
int shared_var;
```

```
void inc() {
  shared_var+=2;
}

void reset() {
  shared_var = 0;
}

void signal_handler_1(void) {
    reset();
    inc();
    inc();
}

void signal_handler_2(void) {
  shared_var = INT_MAX;
}

void main() {
}
```

Bug Finder shows a data race on shared_var. Code Prover shows that shared_var is a potentially unprotected shared variable. Code Prover also shows that the operation shared_var += 2 can overflow. The overflow occurs if the call to inc in signal_handler_1 immediately follows the operation shared_var = INT_MAX in signal_handler_2.

Protect Using Critical Sections

One possible solution is to protect operations on shared variables using critical sections.

In the preceding example, modify your code so that operations on shared_var are in the same critical section. Use the functions take_semaphore and give_semaphore to begin and end the critical sections. To specify these functions that begin and end critical sections, use the analysis options Critical section details (-critical-section-begin -critical-section-end).

```
#include <limits.h>
int shared_var;

void inc() {
```

```
shared var+=2;
void reset() {
 shared_var = 0;
/* Declare lock and unlock functions */
void take semaphore(void);
void give_semaphore(void);
void signal handler 1() {
    /* Begin critical section */
    take semaphore();
    reset();
    inc();
    inc();
    /* End critical section */
    give semaphore();
}
void signal handler 2() {
   /* Begin critical section */
   take semaphore();
   shared var = INT MAX;
   /* End critical section */
   give_semaphore();
}
void main() {
```

You do not see the data race in Bug Finder. Code Prover proves that the shared variable is protected. You also do not see the overflow because the call to reset() in signal handler 1 always precedes calls to inc().

You can also use primitives such as the POSIX functions pthread mutex lock and pthread mutex unlock to begin and end critical sections. For a list of primitives that Polyspace can detect automatically, see "Auto-Detection of Thread Creation and Critical Section in Polyspace" on page 10-6.

Protect Using Temporally Exclusive Tasks

Another possible solution is to specify a group of tasks as temporally exclusive. Temporally exclusive tasks cannot interrupt each other.

In the preceding example, specify that signal_handler_1 and signal_handler_2 are temporally exclusive. Use the option Temporally exclusive tasks (-temporal-exclusions-file).

You do not see the data race in Bug Finder. Code Prover proves that the shared variable is protected. You also do not see the overflow because the call to reset() in signal handler 1 always precedes calls to inc().

Protect Using Priorities

Another possible solution is to specify that one task has higher priority over another.

In the preceding example, specify that signal_handler_1 is an interrupt. Retain signal_handler_2 as a cyclic task. Use the options Cyclic tasks (-cyclic-tasks) and Interrupts (-interrupts).

Bug Finder does not show the data race defect anymore. The reason is this:

- The operation shared_var = INT_MAX in signal_handler_2 is atomic. Therefore, the operations in signal handler 1 cannot interrupt it.
- The operations in signal_handler_1 cannot be interrupted by the operation in signal handler 2 because signal handler 1 has higher priority.

You can specify up to four different priorities with these options (with highest priority listed first):

- Interrupts (-interrupts)
- -preemptable-interrupts
- -non-preemptable-tasks
- Cyclic tasks (-cyclic-tasks)

A task with higher priority is atomic with respect to a task with lower priority. Note that the checker Data race including atomic operations ignores the difference in

priorities and continues to show the data race. See also "Define Preemptable Interrupts and Nonpreemptable Tasks" on page 10-33.

Code Prover does not consider priorities of tasks. Therefore, Code Prover still shows shared_var as a potentially unprotected global variable.

Protect By Disabling Interrupts

In a Bug Finder analysis, you can protect a group of operations by disabling all interrupts. Use the option Disabling all interrupts (-routine-disable-interrupts -routine-enable-interrupts).

After you call a routine to disable interrupts, all subsequent operations are atomic until you call another routine to reenable interrupts. The operations are atomic with respect to operations in all other tasks.

More About

- "Analyze Multitasking Programs in Polyspace" on page 10-2
- "Define Atomic Operations in Multitasking Code" on page 10-29

Define Atomic Operations in Multitasking Code

In code with multiple threads, you can use Polyspace Bug Finder to detect data races or Polyspace Code Prover to list potentially unprotected shared variables.

To determine if a variable shared between multiple threads is protected against concurrent access, Polyspace checks if the operations on the variable are atomic.

Nonatomic Operations

If an operation is nonatomic, Polyspace considers that the operation involves multiple steps. These steps do not need to occur together and can be interrupted by operations in other threads.

For instance, consider these two operations in two different threads:

Thread 1: var++;

This operation is nonatomic because it takes place in three steps: reading var, incrementing var, and writing back var.

• Thread 2: var = 0:

This operation is atomic if the size of var is less than the word size on the target. See details below for how Polyspace determines the word size.

If the two operations are not protected (by using, for instance, critical sections), the operation in the second thread can interrupt the operation in the first thread. If the interruption happens after var is incremented in the first thread but before the incremented value is written back, you can see unexpected results.

What Polyspace Considers as Nonatomic

Code Prover considers all operations as nonatomic unless you protect them, for instance, by using critical sections. See "Define Specific Operations as Atomic" on page 10-30.

Bug Finder considers an operation as nonatomic if it can translate into more than one machine instruction. For instance:

- The operation can involve both a read and write operation. For example, var++ involves reading the value of var, increasing the value by one and writing the increased value back to var.
- The operation can involve a 64-bit variable on a 32-bit target. For example, the operation

```
long long var1, var2;
var1=var2;
```

involves two steps in copying the content of var2 to var1 on certain targets.

Polyspace uses the **Pointer** size for your **Target processor type** as the threshold to compute atomicity. For instance, if you use i386 as your Target processor type, the **Pointer** size is 32 bits and **Long long** and **Double** sizes are both 64 bits. Therefore, Polyspace considers copying one long long or double variable to another as nonatomic.

See also Target processor type (-target).

 The operation can involve writing the return value of a function call to a shared variable. For example, the operation x=func() involves calling func and writing the return value of func to x.

To detect data races where at least one of the two interrupting operations is nonatomic, enable the Bug Finder checker Data race. To remove this constraint on the checker, enable Data race including atomic operations.

Define Specific Operations as Atomic

You might want to define a group of operations as atomic. This group of operations cannot be interrupted by operations in another thread or task.

Use one of these techniques:

Critical sections

Protect a group of operations with critical sections.

A critical section begins and ends with calls to specific functions. You can use a predefined set of primitives to begin or end critical sections, or use your own functions.

A group of operations in a critical section are atomic with respect to another group of operations that are in the same critical section (that is, having the same beginning and ending function).

Specify critical sections using the option Critical section details (-critical-section-begin -critical-section-end).

Temporally exclusive tasks

Protect a group of operations by specifying certain tasks as temporally exclusive.

If a group of tasks are temporally exclusive, all operations in one task are atomic with respect to operations in the other tasks.

Specify temporal exclusion using the option Temporally exclusive tasks (-temporal-exclusions-file).

• **Task priorities** (Bug Finder only)

Protect a group of operations by specifying that certain tasks have higher priorities. For instance, interrupts have higher priorities over cyclic tasks.

You can specify up to four different priorities with these options (with highest priority listed first):

- Interrupts (-interrupts)
- -preemptable-interrupts
- -non-preemptable-tasks
- Cyclic tasks (-cyclic-tasks)

All operations in a task with higher priority are atomic with respect to operations in tasks with lower priorities. See also "Define Preemptable Interrupts and Nonpreemptable Tasks" on page 10-33.

Routine disabling interrupts (Bug Finder only)

Protect a group of operations by disabling all interrupts. Use the option Disabling all interrupts (-routine-disable-interrupts -routine-enable-interrupts).

After you call a routine to disable interrupts, all subsequent operations are atomic until you call another routine to reenable interrupts. The operations are atomic with respect to operations in all other tasks.

For a tutorial, see "Protections for Shared Variables in Multitasking Code" on page 10-24.

Critical section details (-critical-section-begin -critical-sectionend) | Cyclic tasks (-cyclic-tasks) | Interrupts (-interrupts) | Temporally exclusive tasks (-temporal-exclusions-file)

More About

- "Analyze Multitasking Programs in Polyspace" on page 10-2
- "Protections for Shared Variables in Multitasking Code" on page 10-24

Define Preemptable Interrupts and Nonpreemptable Tasks

Bug Finder detects data races between concurrent tasks. Using Bug Finder analysis options, you can fix data race detection by specifying that certain tasks have higher priorities over others. A task with higher priority is atomic with respect to tasks with lower priority and cannot be interrupted by those tasks.

Emulating Task Priorities

You can specify up to four different priorities with these options (with highest priority listed first):

- Interrupts (nonpreemptable): Use option Interrupts (-interrupts).
- Interrupts (preemptable): Use options Interrupts (-interrupts) and preemptable-interrupts.
- Cyclic tasks (nonpreemptable): Use options Cyclic tasks (-cyclic-tasks) and non-preemptable-tasks.
 - You can also define preemptable noncyclic tasks with the option Entry points (-entry-points) and -non-preemptable-tasks.
- Cyclic tasks (preemptable): Use option Cyclic tasks (-cyclic-tasks).

You can also define noncyclic tasks with the option Entry points (-entry-points).

For instance, interrupts have the highest priority and cannot be preempted by other tasks. To define a class of interrupts that can be preempted, lower their priority by making them preemptable.

Examples of Task Priorities

Consider this example with three tasks. A variable var is shared between the two tasks task1 and task2 without any protection such as a critical section. Depending on the priorities of task1 and task2, Bug Finder shows a data race. The third task is not

relevant for the example (and is added only to include a critical section, otherwise data race detection is disabled).

```
int var;

void begin_critical_section(void);
void end_critical_section(void);

void task1(void) {
    var++;
}

void task2(void) {
    var=0;
}

void task3(void){
    begin_critical_section();
    /* Some atomic operation */
    end_critical_section();
}
```

Adjust the priorities of task1 and task2 and see whether a data race is detected. For instance:

- **1** Configure these mulitasking options:
 - Interrupts (-interrupts): Specify task1 and task2 as interrupts.
 - Cyclic tasks (-cyclic-tasks): Specify task3 as a cyclic task.
 - Critical section details (-critical-section-begin -critical-section-end): Specify begin_critical_section as a function beginning a critical section and end_critical_section as a function ending a critical section.
- 2 Run Bug Finder.

You do not see a data race. Since task1 and task2 are nonpreemptable interrupts, the shared variable cannot be accessed concurrently.

- 3 Change task1 to a preemptable interrupt by using the option -preemptable-interrupts.
- 4 Run Bug Finder again. You now see a data race on the shared variable var.

Further Explorations

Modify this example in the following ways and see the effect of the modification:

Change the priorities of task1 and task2.

For instance, you can leave task1 as a nonpreemptable interrupt but change task2 to a preemptable interrupt by using the option -preemptable-interrupts.

The data race disappears. The reason is:

- task1 has higher priority and cannot be interrupted by task2.
- The operation in task2 is atomic and cannot be interrupted by task1.
- Enable the checker Data race including atomic operations (not enabled by default). Use the option Find defects (-checkers).

You see the data race again. The checker considers all operations as potentially nonatomic and the operation in task2 can now be interrupted by the higher priority operation in task1.

Try other modifications to the analysis options and see the result of the checkers.

Polyspace Results

Data race | Data race including atomic operations

More About

- "Analyze Multitasking Programs in Polyspace" on page 10-2
- "Protections for Shared Variables in Multitasking Code" on page 10-24
- "Define Atomic Operations in Multitasking Code" on page 10-29

Define Critical Sections with Functions That Take **Arguments**

When verifying multitasking code, Polyspace considers that a critical section lies between calls to a lock and unlock function.

```
lock():
/* Critical section code */
unlock():
```

A group of operations in a critical section are atomic with respect to another group of operations that are in the same critical section (that is, having the same lock and unlock function). See also "Define Atomic Operations in Multitasking Code" on page 10-29.

Polyspace Assumption on Functions Defining Critical Sections

Polyspace ignores arguments to functions that begin and end critical sections.

For instance, Polyspace treats the two code sections below as the same critical section if you specify my task 1 and my task 2 as entry points, my lock as the lock function and my unlock as the unlock function.

```
int shared_var;
void my_lock(int);
void my unlock(int);
void my_task_1() {
   my lock(1);
   /* Critical section code */
   shared var=0;
   my unlock(1);
}
void my_task_2() {
   my lock(2);
   /* Critical section code */
   shared var++;
   my unlock(2);
}
```

As a result, the analysis considers that these two sections are protected from interrupting each other even though they might not be protected. For instance, Bug Finder does not detect the data race on shared var.

Often, the function arguments can be determined only at run time. Since Polyspace models the critical sections prior to the static analysis and run-time error checking phase, the analysis cannot determine if the function arguments are different and ignores the arguments.

Adapt Polyspace Analysis to Lock and Unlock Functions with Arguments

When the arguments to the functions defining critical sections are compile-time constants, you can adapt the analysis to work around the Polyspace assumption.

For instance, you can use Polyspace analysis options so that the code in the preceding example appears to Polyspace as shown here.

```
int shared var;
void my_lock 1(void);
void my lock 2(void);
void my unlock 1(void);
void my unlock 2(void);
void my_task_1() {
   my lock 1();
   /* Critical section code */
   shared var=0;
   my unlock 1();
}
void my task 2() {
   my_lock_2();
   /* Critical section code */
   shared var++;
   my unlock 2();
}
```

If you then specify my_lock_1 and my_lock_2 as the lock functions and my_unlock_1 and my_unlock_2 as the unlock functions, the analysis recognizes the two sections of code as part of different critical sections. For instance, Bug Finder detects a data race on shared_var.

To adapt the analysis for lock and unlock functions that take compile-time constants as arguments:

In a header file common polyspace include.h, convert the function arguments into extensions of the function name with #define-s. In addition, provide a declaration for the new functions.

For instance, for the preceding example, use these #define-s and declarations:

```
#define my lock(X) my lock ##X()
#define my_unlock(X) my_unlock_##X()
void my lock 1(void);
void my_lock_2(void);
void my unlock 1(void);
void my_unlock_2(void);
```

2 Specify the file name common polyspace include.h as argument for the option Include (-include).

The analysis considers this header file as #include-d in all source files that are analyzed.

3 Specify the new function names as functions beginning and ending critical sections. Use the options Critical section details (-critical-section-begin critical-section-end).

Critical section details (-critical-section-begin -critical-sectionend)

More About

"Protections for Shared Variables in Multitasking Code" on page 10-24

Configure Coding Rules Checking and Code Metrics Computation

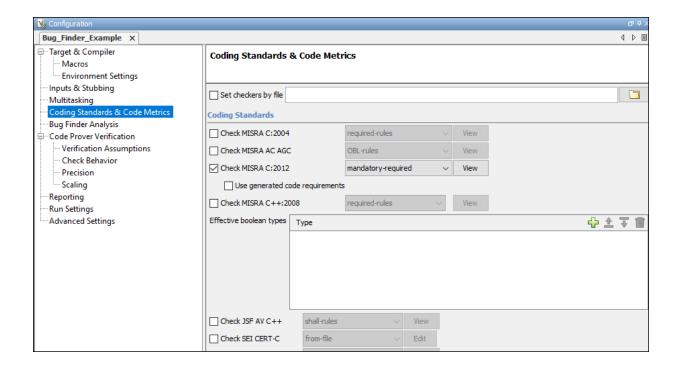

Check for Coding Standard Violations

With Polyspace, you can check your C/C++ code for violations of coding rules such as MISRA C:2012 rules. Adhering to coding rules can reduce the number of defects and improve the quality of your code.

Polyspace can detect the violations of these rules:

- MISRA C: 2004
- MISRA C: 2012
- MISRA C++
- JSF AV C++
- AUTOSAR C++14 (Bug Finder only)
- CERT C (Bug Finder only)
- CERT C++ (Bug Finder only)
- ISO®/IEC TS 17961 (Bug Finder only)

Configure Coding Rules Checking

Specify Standard and Predefined Checker Subsets

Specify the coding rules through Polyspace analysis options. When you run Bug Finder or Code Prover, the analysis looks for coding rule violations in addition to other checks. You can disable the other checks and look for coding rule violations only.

In the Polyspace user interface (desktop products), the options are on the **Configuration** pane under the **Coding Standards & Code Metrics** node.

For C code, use one of these options:

Check MISRA C:2004 (-misra2)

For generated code, enable the option specific to generated code.

Check MISRA C:2012 (-misra3)

For generated code, enable the option specific to generated code.

- Check SEI CERT-C (-cert-c)
- Check ISO/IEC TS 17961 (-iso-17961)

For C++ code, use one of these options:

- Check MISRA C++ rules (-misra-cpp)
- Check JSF++ rules (-jsf-coding-rules)
- Check AUTOSAR C++ 14 (-autosar-cpp14)
- Check SEI CERT-C++ (-cert-cpp)

You can specify a predefined subset of rules, for instance, mandatory for MISRA C: 2012. These subsets are typically defined by the standard.

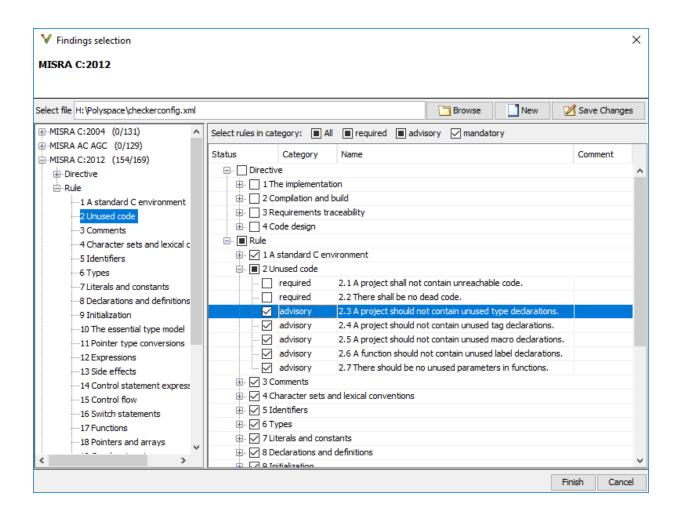

You can also define naming conventions for identifiers using regular expressions. See "Create Custom Coding Rules" on page 11-64.

Customize Checker Subsets

Instead of the predefined subsets, you can specify your own subset of rules from a coding standard.

User Interface (Desktop Products Only)

- Select the coding standard. From the drop-down list for the subset of rules, select from-file. Click Edit.
- 2 In the **Findings selection** window, the coding standard is highlighted on the left pane. On the right pane, select the rules that you want to include in your analysis.

When you save the rule selections, the configuration is saved in an XML file that you can reuse for multiple analyses. The same file contains rules selected for all coding standards. You can reuse this file across multiple projects to enforce common coding standards in a team or organization. To reuse this file in another project in the Polyspace user interface:

• Choose a coding standard in the project configuration. From the drop-down list for the subset of rules, select from-file.

 Click Edit and browse to the file location. Alternatively, enter the file name as argument for the option Set checkers by file (-checkers-selection-file).

Command Line

With the Polyspace desktop products, you can create a coding standard XML file in the user interface and then use this file for command-line analysis.

With the Polyspace server products, you have to create a coding standard XML from scratch. Use the file StandardsConfiguration.xml in polyspaceserverroot \polyspace\examples\cxx\Bug Finder Example\sources as a template and turn on rules using entries in the XML file. Here, polyspaceserverroot is the root installation folder for the Polyspace Server products, for instance, C:\Program Files \Polyspace Server\R2019a.

For instance, to turn on MISRA C: 2012 rule 8.1, use this entry:

```
<standard name="MISRA C:2012">
 <section name="8 Declarations and definitions">
      <check id="8.1" state="on">
     </check>
 </section>
</standard>
```

For full list of rule id-s and section names, see:

- "AUTOSAR C++14 Rules"
- "CERT C Rules and Recommendations"
- "CERT C++ Rules"
- "ISO/IEC TS 17961 Rules"
- "Custom Coding Rules"
- "JSF C++ Rules"
- "MISRA C:2004 Rules"
- "MISRA C:2012 Directives and Rules"

"MISRA C++:2008 Rules"

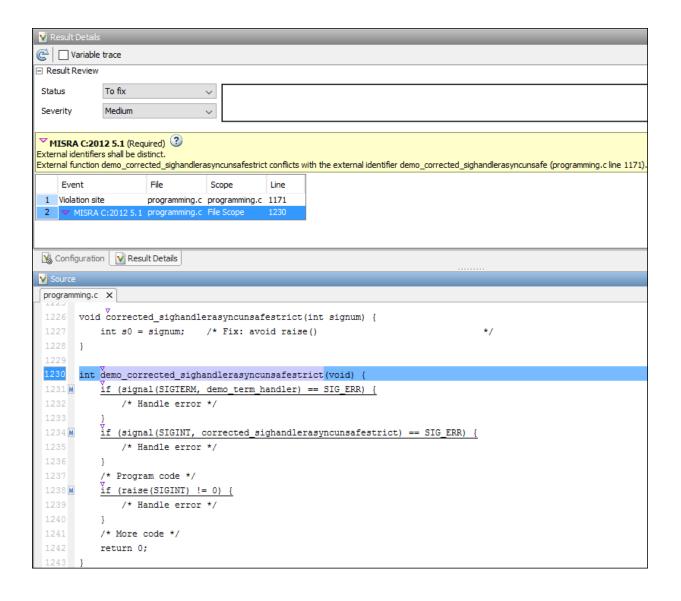

Check for Coding Standards Only

To check for coding standards only:

- In Bug Finder, disable checking of defects. Use the option Find defects (-checkers).
- In Code Prover, check for source compliance only. Use the option Verification level (-to).

These rules are checked in the later stages of a Code Prover analysis: MISRA C:2004 rules 9.1, 13.7, and 21.1, and MISRA C:2012 rules 2.2, 9.1, 14.3, and 18.1. If you stop Code Prover at source compliance checking, the analysis might not find all violations of these rules. You can also see a difference in results based on your choice for the option Verification level (-to). For example, it is possible that Code Prover suspects in the first pass that a variable may be uninitialized but proves in the second pass that the variable is initialized. In that case, you see a violation of MISRA C:2012 Rule 9.1 in the first pass but not in the second pass.

Review Coding Rule Violations

After analysis, you see the coding standard violations on the **Results List** pane. Select a violation to see further details on the **Result Details** pane and the source code on the **Source** pane.

Violations of coding standards are indicated in the source code with the ∇ icon.

For further steps, see "Review Analysis Results".

Generate Reports

You can generate reports using templates that are explicitly defined for coding standards. Use the CodingStandards template. This template:

- Reports only coding standard violations in your analysis results, and omits other types of results such as defects, run-time errors or code metrics.
- Creates a separate chapter in the report for each coding standard. the chapter provides an overview of all violations of the standard and then lists each violation.

To specify a report template, use the option Bug Finder and Code Prover report (-report-template).

Changes in Coding Standard Checking in R2019a

Starting in R2019a, checking for coding standards involves a workflow that is simpler than in previous releases. For instance:

- You can explicitly check for security standards such as CERT C and ISO/IEC TS 17961.
- You can create a single reusable file describing your checker configuration for coding standards. You can enforce common standards across a project, team or organization by specifying a common checker configuration.

You can create a reusable checker configuration for all supported coding standards except CWE. See also "Check for Coding Standard Violations" on page 11-2.

This topic shows how to migrate workflows for checking coding standard violations from releases prior to R2019a.

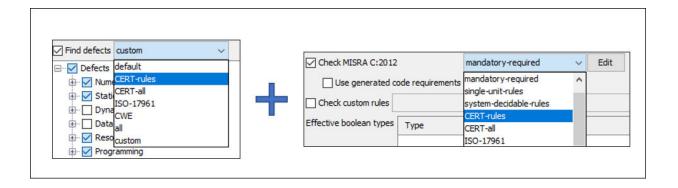

Checking of CERT C, CERT C++ and ISO 17961 Rules

Configuration

Prior to R2019a, to check for a security standard such as CERT C, CERT C++ or ISO/IEC TS 17961, you enabled defect checkers and MISRA C: 2012 checkers that corresponded to rules from the standard.

For instance, to check for CERT C rules only (and exclude CERT C recommendations):

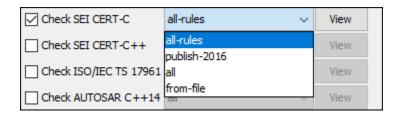

- You enabled the options Find defects (-checkers) and Check MISRA C:2012 (-misra3).
- 2 For each option, you selected the subset CERT-rules.

In R2019a, you can explicitly check for a security standard and specify a subset of rules from the standard.

For instance, to check for CERT C rules only (and exclude CERT C recommendations):

- 1 Enable the option Check SEI CERT-C (-cert-c).
- 2 Specify the subset all-rules.

Review

Prior to R2019a, to review violations of a security standard, you used defects and MISRA C: 2012 violations that are mapped to the standard.

For instance, to review CERT C violations:

1 You enabled the **CERT ID** column in the results list.

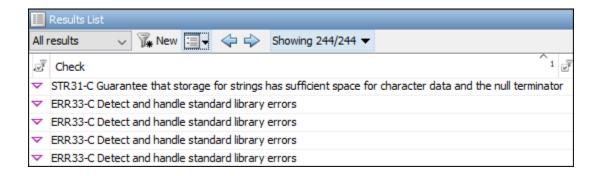

For each defect or MISRA C:2012 violation, the column shows the CERT C rules that are mapped to the defect or MISRA C: 2012 violation. Multiple CERT C rules can be mapped to a single defect, and multiple defects can be mapped to a CERT C rule.

2 You used custom filters on the column to display only specific CERT C rules.

In R2019a, if you explicitly check for a security standard, the results list shows violations of the standard as results.

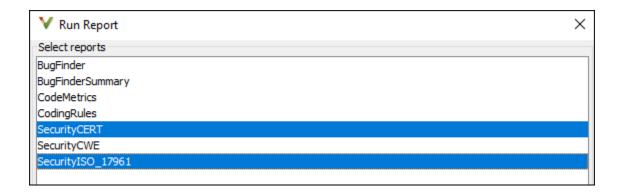

For instance, CERT C rule violations appear explicitly as results (instead of a column mapping to defects or MISRA C: 2012 violations).

Reporting

Priort to R2019a, to create reports tailored for:

- The CERT C standard, you used the template SecurityCERT.
- The ISO/IEC TS 17961 standard, you used the template SecurityISO_17961.

In R2019a, use the ${\tt CodingStandards}$ template for all coding standards.

To use this template, you must rerun the analysis once with the coding standard enabled. If you do not want to rerun the analysis but generate reports for the coding standard, you can continue to use the old templates. To use old templates:

- 1 In the **Run Report** window, select **Browse**.
- 2 Navigate to the **deprecated** folder and select one of these templates: SecurityCERT before R2019a.rpt and SecurityISO 17961 before R2019a.rpt.

The full path to the folder is *polyspaceroot*\toolbox\polyspace\psrptgen \templates\bug finder\deprecated. Here, polyspaceroot is the Polyspace installation folder, for instance, C:\Program Files\Polyspace\R2019a.

See also Bug Finder and Code Prover report (-report-template).

Checking of MISRA and JSF Rules

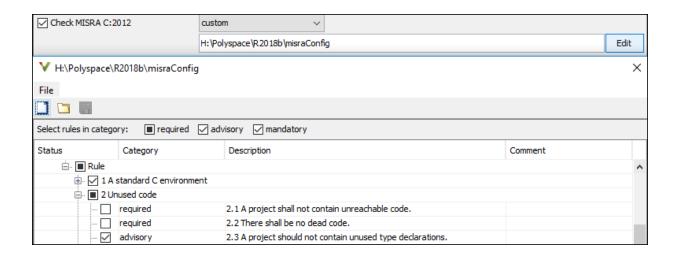

Configuration

The options to check for MISRA and JSF rules and the predefined rule subsets are the same as in previous releases. However, if you check for custom subsets of rules, the workflow is significantly different.

Prior to R2019a, to check for a custom subset of MISRA C:2012 rules:

- 1 You selected the subset custom for the option Check MISRA C:2012 (-misra3).
- 2 You clicked **Edit** to specify which rules to check and saved the file.

You repeated this step for each coding standard that you want to check. For instance, if you checked for both MISRA C:2012 and custom rules (naming conventions for identifiers) and selected a custom subset of rules for each, you created two files with your rule specifications.

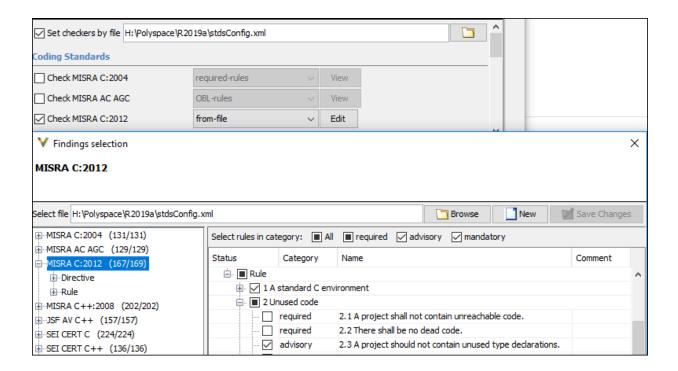

In R2019a, you specify a common file for all coding standards. The file is in XML format and contains rule specifications for all standards that you can check for.

For instance, to check for both MISRA C: 2012 and custom rules and specify a custom subset of rules for each:

- Select the subset from-file for the options Check MISRA C:2012 (-misra3) and Check custom rules (-custom-rules).
- Click **Edit** beside one of the options. On the **Findings selection** window, specify all rules that you want to enable. When you save the resulting XML file, the file appears for the option Set checkers by file (-checkers-selection-file).

To reuse the same rules across multiple projects, specify this XML file for the option Set checkers by file (-checkers-selection-file) in all the projects.

You can import rule configuration files from releases prior to R2019a and save them as XML files that can be used in R2019a and beyond. For instance, to import a MISRA C: 2012 rule configuration file:

- Select the subset from-file for the options Check MISRA C:2012 (-misra3) and click Edit.
- 2 On the **Findings selection** window, browse to the pre-R2019a rule configuration file and open the file.

When you save the file, the file automatically gets saved to the new XML format.

You can also import multiple rule configuration files and create a common configuration. For instance, if the files MISRAConfiguration and CustomRuleConfiguration contains rule configurations for MISRA C:2012 and custom rules respectively, to create a single XML file combining these two configurations:

- **1** Move both files to one folder.
- 2 On the **Findings selection** window, browse to the folder containing the rule configuration files.
- **3** Select both files and click **Open**.

You see your selections for MISRA C:2012 and custom rules in the **Findings selection** window. When you save the file, the selections are saved in a common XML file. In case both rule configurations contain a specification for the same rule, the last specification is considered.

Reporting

Prior to R2019a, you used the CodingRules template to report MISRA and JSF rule violations.

In R2019a, use the CodingStandards template to report these violations. Reports generated using the CodingStandards template contain the same chapters as reports generated with the CodingRules template in previous releases.

In addition to the MISRA and JSF standards, if you also check for security standards such as CERT C, the reports contain additional chapters for the security standards.

Avoid Violations of MISRA C 2012 Rules 8.x

MISRA C:2012 rules 8.1-8.14 enforce good coding practices surrounding declarations and definitions. If you follow these practices, you are less likely to have conflicting declarations or to unintentionally modify variables.

If you do not follow these practices during coding, your code might require major changes later to be MISRA C-compliant. You might have too many MISRA C violations. Sometimes, in fixing a violation, you might violate another rule. Instead, keep these rules in mind when coding. Use the MISRA C:2012 checker to spot any issues that you might have missed.

Explicitly specify all data types in declarations.

Avoid implicit data types like this declaration of k:

```
extern void foo (char c, const k);
Instead use:
extern void foo (char c, const int k);
That way, you do not violate MISRA C:2012 Rule 8.1.
```

When declaring functions, provide names and data types for all parameters.

Avoid declarations without parameter names like these declarations:

```
extern int func(int);
extern int func2():
Instead use:
extern int func(int arg);
extern int func2(void);
```

That way, you do not violate MISRA C:2012 Rule 8.2.

If you want to use an object or function in multiple files, declare the object or function once in only one header file.

To use an object in multiple source files, declare it as extern in a header file. Include the header file in all the source files where you need the object. In one of those source files, define the object. For instance:

```
/* header.h */
extern int var;
/* file1.c */
#include "header.h"
/* Some usage of var */
/* file2.c */
#include "header.h"
int var=1;
```

To use a function in multiple source files, declare it in a header file. Include the header file in all the source files where you need the function. In one of those source files, define the function.

That way, you do not violate MISRA C:2012 Rule 8.3, MISRA C:2012 Rule 8.4, MISRA C:2012 Rule 8.5, or MISRA C:2012 Rule 8.6.

 If you want to use an object or function in one file only, declare and define the object or function with the static specifier.

Make sure that you use the static specifier in all declarations and the definition. For instance, this function func is meant to be used only in the current file:

```
static int func(void);
static int func(void){
}
```

That way, you do not violateMISRA C:2012 Rule 8.7 and MISRA C:2012 Rule 8.8.

 If you want to use an object in one function only, declare the object in the function body.

Avoid declaring the object outside the function.

For instance, if you use var in func only, do declare it outside the body of func:

```
int var;
void func(void) {
   var=1;
}
```

Instead use:

```
void func(void) {
   int var;
   var=1:
}
```

That way, you do not violate MISRA C:2012 Rule 8.7 and MISRA C:2012 Rule 8.9.

 If you want to inline a function, declare and define the function with the static specifier.

Every time you add inline to a function definition, add static too:

```
static inline double func(int val);
static inline double func(int val) {
```

That way, you do not violate MISRA C:2012 Rule 8.10.

When declaring arrays, explicitly specify their size.

Avoid implicit size specifications like this:

```
extern int32_t array[];
Instead use:
#define MAXSIZE 10
extern int32 t array[MAXSIZE];
```

That way, you do not violate MISRA C:2012 Rule 8.11.

· When declaring enumerations, try to avoid mixing implicit and explicit specifications.

Avoid mixing implicit and explicit specifications. You can specify the first enumeration constant explicitly, but after that, use either implicit or explicit specifications. For instance, avoid this type of mix:

```
enum color {red = 2, blue, green = 3, yellow};
Instead use:
enum color {red = 2, blue, green, yellow};
That way, you do not violate MISRA C:2012 Rule 8.12.
```

 When declaring pointers, point to a const-qualified type unless you want to use the pointer to modify an object.

Point to a const-qualified type by default unless you intend to use the pointer for modifying the pointed object. For instance, in this example, ptr is not used to modify the pointed object:

```
char last_char(const char * const ptr){
}
```

That way, you do not violate MISRA C:2012 Rule 8.13.

Software Quality Objective Subsets (C:2004)

In this section	
"Rules in SQO-Subset1" on page 11-22	
"Rules in SQO-Subset2" on page 11-23	

Rules in SQO-Subset1

In Polyspace Code Prover, the following set of coding rules will typically reduce the number of unproven results.

Rule number	Description
5.2	Identifiers in an inner scope shall not use the same name as an identifier in an outer scope, and therefore hide that identifier.
8.11	The <i>static</i> storage class specifier shall be used in definitions and declarations of objects and functions that have internal linkage.
8.12	When an array is declared with external linkage, its size shall be stated explicitly or defined implicitly by initialization.
11.2	Conversion shall not be performed between a pointer to an object and any type other than an integral type, another pointer to a object type or a pointer to void.
11.3	A cast should not be performed between a pointer type and an integral type.
12.12	The underlying bit representations of floating-point values shall not be used.
13.3	Floating-point expressions shall not be tested for equality or inequality.
13.4	The controlling expression of a <i>for</i> statement shall not contain any objects of floating type.
13.5	The three expressions of a <i>for</i> statement shall be concerned only with loop control.
14.4	The goto statement shall not be used.
14.7	A function shall have a single point of exit at the end of the function.
16.1	Functions shall not be defined with variable numbers of arguments.

Rule number	Description
16.2	Functions shall not call themselves, either directly or indirectly.
16.7	A pointer parameter in a function prototype should be declared as pointer to const if the pointer is not used to modify the addressed object.
17.3	>, >=, <, <= shall not be applied to pointer types except where they point to the same array.
17.4	Array indexing shall be the only allowed form of pointer arithmetic.
17.5	The declaration of objects should contain no more than 2 levels of pointer indirection.
17.6	The address of an object with automatic storage shall not be assigned to an object that may persist after the object has ceased to exist.
18.3	An area of memory shall not be reused for unrelated purposes.
18.4	Unions shall not be used.
20.4	Dynamic heap memory allocation shall not be used.

Note Polyspace software does not check MISRA rule 18.3.

Rules in SQO-Subset2

Good design practices generally lead to less code complexity, which can reduce the number of unproven results in Polyspace Code Prover. The following set of coding rules enforce good design practices. The SQO-subset2 option checks the rules in SQO-subset1 and some additional rules.

Rule number	Description
5.2	Identifiers in an inner scope shall not use the same name as an identifier in an outer scope, and therefore hide that identifier.
6.3	typedefs that indicate size and signedness should be used in place of the basic types
8.7	Objects shall be defined at block scope if they are only accessed from within a single function

Rule number	Description
8.11	The <i>static</i> storage class specifier shall be used in definitions and declarations of objects and functions that have internal linkage.
8.12	When an array is declared with external linkage, its size shall be stated explicitly or defined implicitly by initialization.
9.2	Braces shall be used to indicate and match the structure in the nonzero initialization of arrays and structures
9.3	In an enumerator list, the = construct shall not be used to explicitly initialize members other than the first, unless all items are explicitly initialized
10.3	The value of a complex expression of integer type may only be cast to a type that is narrower and of the same signedness as the underlying type of the expression
10.5	Bitwise operations shall not be performed on signed integer types
11.1	Conversion shall not be performed between a pointer to a function and any type other than an integral type
11.2	Conversion shall not be performed between a pointer to an object and any type other than an integral type, another pointer to a object type or a pointer to void.
11.3	A cast should not be performed between a pointer type and an integral type.
11.5	Type casting from any type to or from pointers shall not be used
12.1	Limited dependence should be placed on C's operator precedence rules in expressions
12.2	The value of an expression shall be the same under any order of evaluation that the standard permits
12.5	The operands of a logical && or shall be primary-expressions
12.6	Operands of logical operators (&&, and !) should be effectively Boolean. Expression that are effectively Boolean should not be used as operands to operators other than (&&, or !)
12.9	The unary minus operator shall not be applied to an expression whose underlying type is unsigned
12.10	The comma operator shall not be used

Rule number	Description
12.12	The underlying bit representations of floating-point values shall not be used.
13.1	Assignment operators shall not be used in expressions that yield Boolean values
13.2	Tests of a value against zero should be made explicit, unless the operand is effectively Boolean
13.3	Floating-point expressions shall not be tested for equality or inequality.
13.4	The controlling expression of a <i>for</i> statement shall not contain any objects of floating type.
13.5	The three expressions of a <i>for</i> statement shall be concerned only with loop control.
13.6	Numeric variables being used within a "for" loop for iteration counting should not be modified in the body of the loop
14.4	The goto statement shall not be used.
14.7	A function shall have a single point of exit at the end of the function.
14.8	The statement forming the body of a <i>switch, while, do while</i> or <i>for</i> statement shall be a compound statement
14.10	All if else if constructs should contain a final else clause
15.3	The final clause of a <i>switch</i> statement shall be the <i>default</i> clause
16.1	Functions shall not be defined with variable numbers of arguments.
16.2	Functions shall not call themselves, either directly or indirectly.
16.3	Identifiers shall be given for all of the parameters in a function prototype declaration
16.7	A pointer parameter in a function prototype should be declared as pointer to const if the pointer is not used to modify the addressed object.
16.8	All exit paths from a function with non-void return type shall have an explicit return statement with an expression
16.9	A function identifier shall only be used with either a preceding &, or with a parenthesized parameter list, which may be empty

Rule number	Description
17.3	>, >=, <, <= shall not be applied to pointer types except where they point to the same array.
17.4	Array indexing shall be the only allowed form of pointer arithmetic.
17.5	The declaration of objects should contain no more than 2 levels of pointer indirection.
17.6	The address of an object with automatic storage shall not be assigned to an object that may persist after the object has ceased to exist.
18.3	An area of memory shall not be reused for unrelated purposes.
18.4	Unions shall not be used.
19.4	C macros shall only expand to a braced initializer, a constant, a parenthesized expression, a type qualifier, a storage class specifier, or a do-while-zero construct
19.9	Arguments to a function-like macro shall not contain tokens that look like preprocessing directives
19.10	In the definition of a function-like macro each instance of a parameter shall be enclosed in parentheses unless it is used as the operand of # or ##
19.11	All macro identifiers in preprocessor directives shall be defined before use, except in #ifdef and #ifndef preprocessor directives and the defined() operator
19.12	There shall be at most one occurrence of the # or ## preprocessor operators in a single macro definition.
20.3	The validity of values passed to library functions shall be checked.
20.4	Dynamic heap memory allocation shall not be used.

Note Polyspace software does not check MISRA rule **20.3** directly.

However, you can check this rule by writing manual stubs that check the validity of values. For example, the following code checks the validity of an input being greater than 1:

```
int my_system_library_call(int in) {assert (in>1); if random \
return -1 else return 0; }
```

"Rules in SQO-Subset2" on page 11-29	

Rules in SQO-Subset1

In Polyspace Code Prover, the following set of coding rules will typically reduce the number of unproven results.

Rule number	Description
5.2	Identifiers in an inner scope shall not use the same name as an identifier in an outer scope, and therefore hide that identifier.
8.11	The <i>static</i> storage class specifier shall be used in definitions and declarations of objects and functions that have internal linkage.
8.12	When an array is declared with external linkage, its size shall be stated explicitly or defined implicitly by initialization.
11.2	Conversion shall not be performed between a pointer to an object and any type other than an integral type, another pointer to a object type or a pointer to void.
11.3	A cast should not be performed between a pointer type and an integral type.
12.12	The underlying bit representations of floating-point values shall not be used.
14.7	A function shall have a single point of exit at the end of the function.
16.1	Functions shall not be defined with variable numbers of arguments.
16.2	Functions shall not call themselves, either directly or indirectly.
17.3	>, >=, <, <= shall not be applied to pointer types except where they point to the same array.
17.6	The address of an object with automatic storage shall not be assigned to an object that may persist after the object has ceased to exist.
18.4	Unions shall not be used.

For more information about these rules, see MISRA AC AGC Guidelines for the Application of MISRA-C:2004 in the Context of Automatic Code Generation.

Rules in SQO-Subset2

Good design practices generally lead to less code complexity, which can reduce the number of unproven results in Polyspace Code Prover. The following set of coding rules enforce good design practices. The SQO-subset2 option checks the rules in SQO-subset1 and some additional rules.

Rule number	Description
5.2	Identifiers in an inner scope shall not use the same name as an identifier in an outer scope, and therefore hide that identifier.
6.3	typedefs that indicate size and signedness should be used in place of the basic types
8.7	Objects shall be defined at block scope if they are only accessed from within a single function
8.11	The <i>static</i> storage class specifier shall be used in definitions and declarations of objects and functions that have internal linkage.
8.12	When an array is declared with external linkage, its size shall be stated explicitly or defined implicitly by initialization.
9.3	In an enumerator list, the = construct shall not be used to explicitly initialize members other than the first, unless all items are explicitly initialized
11.1	Conversion shall not be performed between a pointer to a function and any type other than an integral type
11.2	Conversion shall not be performed between a pointer to an object and any type other than an integral type, another pointer to a object type or a pointer to void.
11.3	A cast should not be performed between a pointer type and an integral type.
11.5	Type casting from any type to or from pointers shall not be used
12.2	The value of an expression shall be the same under any order of evaluation that the standard permits

Rule number	Description
12.9	The unary minus operator shall not be applied to an expression whose underlying type is unsigned
12.10	The comma operator shall not be used
12.12	The underlying bit representations of floating-point values shall not be used.
14.7	A function shall have a single point of exit at the end of the function.
16.1	Functions shall not be defined with variable numbers of arguments.
16.2	Functions shall not call themselves, either directly or indirectly.
16.3	Identifiers shall be given for all of the parameters in a function prototype declaration
16.8	All exit paths from a function with non-void return type shall have an explicit return statement with an expression
16.9	A function identifier shall only be used with either a preceding &, or with a parenthesized parameter list, which may be empty
17.3	>, >=, <, <= shall not be applied to pointer types except where they point to the same array.
17.6	The address of an object with automatic storage shall not be assigned to an object that may persist after the object has ceased to exist.
18.4	Unions shall not be used.
19.9	Arguments to a function-like macro shall not contain tokens that look like preprocessing directives
19.10	In the definition of a function-like macro each instance of a parameter shall be enclosed in parentheses unless it is used as the operand of # or ##
19.11	All macro identifiers in preprocessor directives shall be defined before use, except in #ifdef and #ifndef preprocessor directives and the defined() operator
19.12	There shall be at most one occurrence of the # or ## preprocessor operators in a single macro definition.
20.3	The validity of values passed to library functions shall be checked.

Note Polyspace software does not check MISRA rule **20.3** directly.

However, you can check this rule by writing manual stubs that check the validity of values. For example, the following code checks the validity of an input being greater than 1:

```
int my_system_library_call(int in) {assert (in>1); if random \
return -1 else return 0; }
```

For more information about these rules, see MISRA AC AGC Guidelines for the Application of MISRA-C:2004 in the Context of Automatic Code Generation.

• "Check for Coding Rule Violations" on page 5-14

Software Quality Objective Subsets (C:2012)

In this section	
"Guidelines in SQO-Subset1" on page 11-32	
"Guidelines in SQO-Subset2" on page 11-33	

These subsets of MISRA C:2012 guidelines can have a direct or indirect impact on the precision of your Polyspace results. When you set up coding rules checking, you can select these subsets.

Guidelines in SQO-Subset1

The following set of MISRA C:2012 coding guidelines typically reduces the number of unproven results in Polyspace Code Prover.

Rule	Description
8.8	The static storage class specifier shall be used in all declarations of objects and functions that have internal linkage
8.11	When an array with external linkage is declared, its size should be explicitly specified
8.13	A pointer should point to a const-qualified type whenever possible
11.1	Conversions shall not be performed between a pointer to a function and any other type
11.2	Conversions shall not be performed between a pointer to an incomplete type and any other type
11.4	A conversion should not be performed between a pointer to object and an integer type
11.5	A conversion should not be performed from pointer to void into pointer to object
11.6	A cast shall not be performed between pointer to void and an arithmetic type
11.7	A cast shall not be performed between pointer to object and a non-integer arithmetic type
14.1	A loop counter shall not have essentially floating type

Rule	Description
14.2	A for loop shall be well-formed
15.1	The goto statement should not be used
15.2	The goto statement shall jump to a label declared later in the same function
15.3	Any label referenced by a goto statement shall be declared in the same block, or in any block enclosing the goto statement
15.5	A function should have a single point of exit at the end
17.1	The features of <starg.h> shall not be used</starg.h>
17.2	Functions shall not call themselves, either directly or indirectly
18.3	The relational operators >, >=, < and <= shall not be applied to objects of pointer type except where they point into the same object
18.4	The +, -, += and -= operators should not be applied to an expression of pointer type
18.5	Declarations should contain no more than two levels of pointer nesting
18.6	The address of an object with automatic storage shall not be copied to another object that persists after the first object has ceased to exist
19.2	The union keyword should not be used
21.3	The memory allocation and deallocation functions of <stdlib.h> shall not be used</stdlib.h>

Guidelines in SQO-Subset2

Good design practices generally lead to less code complexity, which can reduce the number of unproven results in Polyspace Code Prover. The following set of coding rules enforce good design practices. The SQO-subset2 option checks the rules in SQO-subset1 and some additional rules.

Rule	Description
8.8	The static storage class specifier shall be used in all declarations of objects and functions that have internal linkage
8.11	When an array with external linkage is declared, its size should be explicitly specified

Rule	Description
8.13	A pointer should point to a const-qualified type whenever possible
11.1	Conversions shall not be performed between a pointer to a function and any other type
11.2	Conversions shall not be performed between a pointer to an incomplete type and any other type
11.4	A conversion should not be performed between a pointer to object and an integer type
11.5	A conversion should not be performed from pointer to void into pointer to object
11.6	A cast shall not be performed between pointer to void and an arithmetic type
11.7	A cast shall not be performed between pointer to object and a non-integer arithmetic type
11.8	A cast shall not remove any const or volatile qualification from the type pointed to by a pointer
12.1	The precedence of operators within expressions should be made explicit
12.3	The comma operator should not be used
13.2	The value of an expression and its persistent side effects shall be the same under all permitted evaluation orders
13.4	The result of an assignment operator should not be used
14.1	A loop counter shall not have essentially floating type
14.2	A for loop shall be well-formed
14.4	The controlling expression of an if statement and the controlling expression of an iteration-statement shall have essentially Boolean type
15.1	The goto statement should not be used
15.2	The goto statement shall jump to a label declared later in the same function
15.3	Any label referenced by a goto statement shall be declared in the same block, or in any block enclosing the goto statement
15.5	A function should have a single point of exit at the end

Rule	Description
15.6	The body of an iteration- statement or a selection- statement shall be a compound- statement
15.7	All if else if constructs shall be terminated with an else statement
16.4	Every switch statement shall have a default label
16.5	A default label shall appear as either the first or the last switch label of a switch statement
17.1	The features of <starg.h> shall not be used</starg.h>
17.2	Functions shall not call themselves, either directly or indirectly
17.4	All exit paths from a function with non-void return type shall have an explicit return statement with an expression
18.3	The relational operators >, >=, < and <= shall not be applied to objects of pointer type except where they point into the same object
18.4	The $+$, $-$, $+=$ and $-=$ operators should not be applied to an expression of pointer type
18.5	Declarations should contain no more than two levels of pointer nesting
18.6	The address of an object with automatic storage shall not be copied to another object that persists after the first object has ceased to exist
19.2	The union keyword should not be used
20.4	A macro shall not be defined with the same name as a keyword
20.6	Tokens that look like a preprocessing directive shall not occur within a macro argument
20.7	Expressions resulting from the expansion of macro parameters shall be enclosed in parentheses
20.9	All identifiers used in the controlling expression of #if or #elif preprocessing directives shall be #define'd before evaluation
20.11	A macro parameter immediately following a # operator shall not immediately be followed by a ## operator
21.3	The memory allocation and deallocation functions of <stdlib.h> shall not be used</stdlib.h>

SQO Subset 1 - Direct Impact on Selectivity

The following set of MISRA C++ coding rules will typically improve the number of unproven results in Polyspace Code Prover.

MISRA C++ Rule	Description
2-10-2	Identifiers declared in an inner scope shall not hide an identifier declared in an outer scope.
3-1-3	When an array is declared, its size shall either be stated explicitly or defined implicitly by initialization.
3-3-2	The One Definition Rule shall not be violated.
3-9-3	The underlying bit representations of floating-point values shall not be used.
5-0-15	Array indexing shall be the only form of pointer arithmetic.
5-0-18	>, >=, <, <= shall not be applied to objects of pointer type, except where they point to the same array.
5-0-19	The declaration of objects shall contain no more than two levels of pointer indirection.
5-2-8	An object with integer type or pointer to void type shall not be converted to an object with pointer type.
5-2-9	A cast should not convert a pointer type to an integral type.
6-2-2	Floating-point expressions shall not be directly or indirectly tested for equality or inequality.
6-5-1	A for loop shall contain a single loop-counter which shall not have floating type.
6-5-2	If loop-counter is not modified by or ++, then, within condition, the loop-counter shall only be used as an operand to $<=$, $<$, $>$ or $>=$.
6-5-3	The loop-counter shall not be modified within condition or statement.

MISRA C++ Rule	Description
6-5-4	The loop-counter shall be modified by one of:, $++$, $-=n$, or $+=n$; where n remains constant for the duration of the loop.
6-6-1	Any label referenced by a goto statement shall be declared in the same block, or in a block enclosing the goto statement.
6-6-2	The goto statement shall jump to a label declared later in the same function body.
6-6-4	For any iteration statement there shall be no more than one break or goto statement used for loop termination.
6-6-5	A function shall have a single point of exit at the end of the function.
7-5-1	A function shall not return a reference or a pointer to an automatic variable (including parameters), defined within the function.
7-5-2	The address of an object with automatic storage shall not be assigned to another object that may persist after the first object has ceased to exist.
7-5-4	Functions should not call themselves, either directly or indirectly.
8-4-1	Functions shall not be defined using the ellipsis notation.
9-5-1	Unions shall not be used.
10-1-2	A base class shall only be declared virtual if it is used in a diamond hierarchy.
10-1-3	An accessible base class shall not be both virtual and nonvirtual in the same hierarchy.
10-3-1	There shall be no more than one definition of each virtual function on each path through the inheritance hierarchy.
10-3-2	Each overriding virtual function shall be declared with the virtual keyword.
10-3-3	A virtual function shall only be overridden by a pure virtual function if it is itself declared as pure virtual.
15-0-3	Control shall not be transferred into a try or catch block using a goto or a switch statement.
15-1-3	An empty throw (throw;) shall only be used in the compound- statement of a catch handler.
15-3-3	Handlers of a function-try-block implementation of a class constructor or destructor shall not reference non-static members from this class or its bases.
15-3-5	A class type exception shall always be caught by reference.

MISRA C++ Rule	Description
15-3-6	Where multiple handlers are provided in a single try-catch statement or function-try-block for a derived class and some or all of its bases, the handlers shall be ordered most-derived to base class.
15-3-7	Where multiple handlers are provided in a single try-catch statement or function-try-block, any ellipsis (catch-all) handler shall occur last.
15-4-1	If a function is declared with an exception-specification, then all declarations of the same function (in other translation units) shall be declared with the same set of type-ids.
15-5-1	A class destructor shall not exit with an exception.
15-5-2	Where a function's declaration includes an exception-specification, the function shall only be capable of throwing exceptions of the indicated type(s).
18-4-1	Dynamic heap memory allocation shall not be used.

SQO Subset 2 - Indirect Impact on Selectivity

Good design practices generally lead to less code complexity, which can improve the number of unproven results in Polyspace Code Prover. The following set of coding rules may help to address design issues in your code. The SQO-subset2 option checks the rules in SQO-subset1 and SQO-subset2.

MISRA C++ Rule	Description
2-10-2	Identifiers declared in an inner scope shall not hide an identifier declared in an outer scope.
3-1-3	When an array is declared, its size shall either be stated explicitly or defined implicitly by initialization.
3-3-2	If a function has internal linkage then all re-declarations shall include the static storage class specifier.
3-4-1	An identifier declared to be an object or type shall be defined in a block that minimizes its visibility.
3-9-2	typedefs that indicate size and signedness should be used in place of the basic numerical types.
3-9-3	The underlying bit representations of floating-point values shall not be used.

MISRA C++ Rule	Description
4-5-1	Expressions with type bool shall not be used as operands to built-in operators other than the assignment operator =, the logical operators &&, , !, the equality operators == and !=, the unary & operator, and the conditional operator.
5-0-1	The value of an expression shall be the same under any order of evaluation that the standard permits.
5-0-2	Limited dependence should be placed on C++ operator precedence rules in expressions.
5-0-7	There shall be no explicit floating-integral conversions of a cvalue expression.
5-0-8	An explicit integral or floating-point conversion shall not increase the size of the underlying type of a cvalue expression.
5-0-9	An explicit integral conversion shall not change the signedness of the underlying type of a cvalue expression.
5-0-10	If the bitwise operators ~ and << are applied to an operand with an underlying type of unsigned char or unsigned short, the result shall be immediately cast to the underlying type of the operand.
5-0-13	The condition of an if-statement and the condition of an iteration- statement shall have type bool
5-0-15	Array indexing shall be the only form of pointer arithmetic.
5-0-18	>, >=, <, <= shall not be applied to objects of pointer type, except where they point to the same array.
5-0-19	The declaration of objects shall contain no more than two levels of pointer indirection.
5-2-1	Each operand of a logical && or shall be a postfix - expression.
5-2-2	A pointer to a virtual base class shall only be cast to a pointer to a derived class by means of dynamic_cast.
5-2-5	A cast shall not remove any const or volatile qualification from the type of a pointer or reference.
5-2-6	A cast shall not convert a pointer to a function to any other pointer type, including a pointer to function type.
5-2-7	An object with pointer type shall not be converted to an unrelated pointer type, either directly or indirectly.

MISRA C++ Rule	Description
5-2-8	An object with integer type or pointer to void type shall not be converted to an object with pointer type.
5-2-9	A cast should not convert a pointer type to an integral type.
5-2-11	The comma operator, && operator and the operator shall not be overloaded.
5-3-2	The unary minus operator shall not be applied to an expression whose underlying type is unsigned.
5-3-3	The unary & operator shall not be overloaded.
5-18-1	The comma operator shall not be used.
6-2-1	Assignment operators shall not be used in sub-expressions.
6-2-2	Floating-point expressions shall not be directly or indirectly tested for equality or inequality.
6-3-1	The statement forming the body of a switch, while, do while or for statement shall be a compound statement.
6-4-2	All if else if constructs shall be terminated with an else clause.
6-4-6	The final clause of a switch statement shall be the default-clause.
6-5-1	A for loop shall contain a single loop-counter which shall not have floating type.
6-5-2	If loop-counter is not modified by or ++, then, within condition, the loop-counter shall only be used as an operand to $<=$, $<$, $>$ or $>=$.
6-5-3	The loop-counter shall not be modified within condition or statement.
6-5-4	The loop-counter shall be modified by one of:, $++$, $-=n$, or $+=n$; where n remains constant for the duration of the loop.
6-6-1	Any label referenced by a goto statement shall be declared in the same block, or in a block enclosing the goto statement.
6-6-2	The goto statement shall jump to a label declared later in the same function body.
6-6-4	For any iteration statement there shall be no more than one break or goto statement used for loop termination.
6-6-5	A function shall have a single point of exit at the end of the function.
7-5-1	A function shall not return a reference or a pointer to an automatic variable (including parameters), defined within the function.

MISRA C++ Rule	Description
7-5-2	The address of an object with automatic storage shall not be assigned to another object that may persist after the first object has ceased to exist.
7-5-4	Functions should not call themselves, either directly or indirectly.
8-4-1	Functions shall not be defined using the ellipsis notation.
8-4-3	All exit paths from a function with non-void return type shall have an explicit return statement with an expression.
8-4-4	A function identifier shall either be used to call the function or it shall be preceded by &.
8-5-2	Braces shall be used to indicate and match the structure in the non-zero initialization of arrays and structures.
8-5-3	In an enumerator list, the = construct shall not be used to explicitly initialize members other than the first, unless all items are explicitly initialized.
9-5-1	Unions shall not be used.
10-1-2	A base class shall only be declared virtual if it is used in a diamond hierarchy.
10-1-3	An accessible base class shall not be both virtual and nonvirtual in the same hierarchy.
10-3-1	There shall be no more than one definition of each virtual function on each path through the inheritance hierarchy.
10-3-2	Each overriding virtual function shall be declared with the virtual keyword.
10-3-3	A virtual function shall only be overridden by a pure virtual function if it is itself declared as pure virtual.
11-0-1	Member data in non- POD class types shall be private.
12-1-1	An object's dynamic type shall not be used from the body of its constructor or destructor.
12-8-2	The copy assignment operator shall be declared protected or private in an abstract class.
15-0-3	Control shall not be transferred into a try or catch block using a goto or a switch statement.
15-1-3	An empty throw (throw;) shall only be used in the compound- statement of a catch handler.

MISRA C++ Rule	Description
15-3-3	Handlers of a function-try-block implementation of a class constructor or destructor shall not reference non-static members from this class or its bases.
15-3-5	A class type exception shall always be caught by reference.
15-3-6	Where multiple handlers are provided in a single try-catch statement or function-try-block for a derived class and some or all of its bases, the handlers shall be ordered most-derived to base class.
15-3-7	Where multiple handlers are provided in a single try-catch statement or function-try-block, any ellipsis (catch-all) handler shall occur last.
15-4-1	If a function is declared with an exception-specification, then all declarations of the same function (in other translation units) shall be declared with the same set of type-ids.
15-5-1	A class destructor shall not exit with an exception.
15-5-2	Where a function's declaration includes an exception-specification, the function shall only be capable of throwing exceptions of the indicated type(s).
16-0-5	Arguments to a function-like macro shall not contain tokens that look like preprocessing directives.
16-0-6	In the definition of a function-like macro, each instance of a parameter shall be enclosed in parentheses, unless it is used as the operand of # or ##.
16-0-7	Undefined macro identifiers shall not be used in #if or #elif preprocessor directives, except as operands to the defined operator.
16-2-2	C++ macros shall only be used for: include guards, type qualifiers, or storage class specifiers.
16-3-1	There shall be at most one occurrence of the # or ## operators in a single macro definition.
18-4-1	Dynamic heap memory allocation shall not be used.

More About

• "Check for Coding Rule Violations" on page 5-14

Coding Rule Subsets Checked Early in Analysis

In the initial compilation phase of the analysis, Polyspace checks those coding rules that do not require the run-time error detection part of the analysis. If you want only those rules checked, you can perform a much quicker analysis.

The software provides two predefined subsets of rules that it checks earlier in the analysis. The subsets are available with the options Check MISRA C:2004 (-misra2), Check MISRA AC AGC (-misra-ac-agc), and Check MISRA C:2012 (-misra3).

Argument	Purpose
single-unit- rules	Check rules that apply only to single translation units. If you detect only coding rule violations and select this subset, a
	Bug Finder analysis stops after the compilation phase.
system- decidable-rules	Check rules in the single-unit-rules subset and some rules that apply to the collective set of program files. The additional rules are the less complex rules that apply at the integration level. These rules can be checked only at the integration level because the rules involve more than one translation unit.
	If you detect only coding rule violations and select this subset, a Bug Finder analysis stops after the linking phase.

See also "Check for Coding Rule Violations" on page 5-14.

MISRA C: 2004 and MISRA AC AGC Rules

The software checks the following rules early in the analysis. The rules that are checked at a system level and appear only in the system-decidable-rules subset are indicated by an asterisk.

Environment

Rule	Description
	All code shall conform to ISO 9899:1990 "Programming languages - C", amended and corrected by ISO/IEC 9899/COR1:1995, ISO/IEC 9899/COR2:1996.

Language Extensions

Rule	Description
2.1	Assembly language shall be encapsulated and isolated.
2.2	Source code shall only use /* */ style comments.
2.3	The character sequence /* shall not be used within a comment.

Documentation

Rule	Description
3.4	All uses of the #pragma directive shall be documented and explained.

Character Sets

Rule	Description
4.1	Only those escape sequences which are defined in the ISO C standard shall be used.
4.2	Trigraphs shall not be used.

Identifiers

Rule	Description
5.1*	Identifiers (internal and external) shall not rely on the significance of more than 31 characters.
5.2	Identifiers in an inner scope shall not use the same name as an identifier in an outer scope, and therefore hide that identifier.
5.3*	A typedef name shall be a unique identifier.
5.4*	A tag name shall be a unique identifier.
5.5*	No object or function identifier with a static storage duration should be reused.
5.6*	No identifier in one name space should have the same spelling as an identifier in another name space, with the exception of structure and union member names.
5.7*	No identifier name should be reused.

Types

Rule	Description
6.1	The plain char type shall be used only for the storage and use of character values.
6.2	Signed and unsigned char type shall be used only for the storage and use of numeric values.
6.3	typedefs that indicate size and signedness should be used in place of the basic types.
6.4	Bit fields shall only be defined to be of type unsigned int or signed int.
6.5	Bit fields of type signed int shall be at least 2 bits long.

Constants

Rule	Description
7.1	Octal constants (other than zero) and octal escape sequences shall not be used.

Declarations and Definitions

Rule	Description
8.1	Functions shall have prototype declarations and the prototype shall be visible at both the function definition and call.
8.2	Whenever an object or function is declared or defined, its type shall be explicitly stated.
8.3	For each function parameter the type given in the declaration and definition shall be identical, and the return types shall also be identical.
8.4*	If objects or functions are declared more than once their types shall be compatible.
8.5	There shall be no definitions of objects or functions in a header file.
8.6	Functions shall always be declared at file scope.
8.7	Objects shall be defined at block scope if they are only accessed from within a single function.
8.8*	An external object or function shall be declared in one file and only one file.
8.9*	An identifier with external linkage shall have exactly one external definition.
8.10*	All declarations and definitions of objects or functions at file scope shall have internal linkage unless external linkage is required.
8.11	The static storage class specifier shall be used in definitions and declarations of objects and functions that have internal linkage
8.12	When an array is declared with external linkage, its size shall be stated explicitly or defined implicitly by initialization.

Initialization

Rule	Description
9.2	Braces shall be used to indicate and match the structure in the nonzero initialization of arrays and structures.
9.3	In an enumerator list, the = construct shall not be used to explicitly initialize members other than the first, unless all items are explicitly initialized.

Arithmetic Type Conversion

Rule	Description
10.1	The value of an expression of integer type shall not be implicitly converted to a different underlying type if:
	It is not a conversion to a wider integer type of the same signedness, or
	The expression is complex, or
	The expression is not constant and is a function argument, or
	The expression is not constant and is a return expression
10.2	The value of an expression of floating type shall not be implicitly converted to a different type if
	It is not a conversion to a wider floating type, or
	The expression is complex, or
	The expression is a function argument, or
	The expression is a return expression
10.3	The value of a complex expression of integer type may only be cast to a type that is narrower and of the same signedness as the underlying type of the expression.
10.4	The value of a complex expression of float type may only be cast to narrower floating type.
10.5	If the bitwise operator ~ and << are applied to an operand of underlying type unsigned char or unsigned short, the result shall be immediately cast to the underlying type of the operand
10.6	The "U" suffix shall be applied to all constants of unsigned types.

Pointer Type Conversion

Rule	Description
11.1	Conversion shall not be performed between a pointer to a function and any type other than an integral type.
11.2	Conversion shall not be performed between a pointer to an object and any type other than an integral type, another pointer to a object type or a pointer to void.
11.3	A cast should not be performed between a pointer type and an integral type.
11.4	A cast should not be performed between a pointer to object type and a different pointer to object type.
11.5	A cast shall not be performed that removes any const or volatile qualification from the type addressed by a pointer

Expressions

Rule	Description
12.1	Limited dependence should be placed on C's operator precedence rules in expressions.
12.3	The sizeof operator should not be used on expressions that contain side effects.
12.5	The operands of a logical && or shall be primary-expressions.
12.6	Operands of logical operators (&&, and !) should be effectively Boolean. Expression that are effectively Boolean should not be used as operands to operators other than (&&, or !).
12.7	Bitwise operators shall not be applied to operands whose underlying type is signed.
12.9	The unary minus operator shall not be applied to an expression whose underlying type is unsigned.
12.10	The comma operator shall not be used.
12.11	Evaluation of constant unsigned expression should not lead to wraparound.
12.12	The underlying bit representations of floating-point values shall not be used.
12.13	The increment (++) and decrement () operators should not be mixed with other operators in an expression

Control Statement Expressions

Rule	Description
13.1	Assignment operators shall not be used in expressions that yield Boolean values.
13.2	Tests of a value against zero should be made explicit, unless the operand is effectively Boolean.
13.3	Floating-point expressions shall not be tested for equality or inequality.
13.4	The controlling expression of a for statement shall not contain any objects of floating type.
13.5	The three expressions of a for statement shall be concerned only with loop control.
13.6	Numeric variables being used within a for loop for iteration counting should not be modified in the body of the loop.

Control Flow

Rule	Description
14.3	All non-null statements shall either
	have at least one side effect however executed, or
	cause control flow to change.
14.4	The goto statement shall not be used.
14.5	The continue statement shall not be used.
14.6	For any iteration statement, there shall be at most one break statement used for loop termination.
14.7	A function shall have a single point of exit at the end of the function.
14.8	The statement forming the body of a switch, while, do while or for statement shall be a compound statement.
14.9	An if (expression) construct shall be followed by a compound statement. The else keyword shall be followed by either a compound statement, or another if statement.
14.10	All if else if constructs should contain a final else clause.

Switch Statements

Rule	Description
15.0	Unreachable code is detected between switch statement and first case.
15.1	A switch label shall only be used when the most closely-enclosing compound statement is the body of a switch statement
15.2	An unconditional break statement shall terminate every non-empty switch clause.
15.3	The final clause of a switch statement shall be the default clause.
15.4	A switch expression should not represent a value that is effectively Boolean.
15.5	Every switch statement shall have at least one case clause.

Functions

Rule	Description
16.1	Functions shall not be defined with variable numbers of arguments.
16.3	Identifiers shall be given for all of the parameters in a function prototype declaration.
16.4*	The identifiers used in the declaration and definition of a function shall be identical.
16.5	Functions with no parameters shall be declared with parameter type void.
16.6	The number of arguments passed to a function shall match the number of parameters.
16.8	All exit paths from a function with non-void return type shall have an explicit return statement with an expression.
16.9	A function identifier shall only be used with either a preceding &, or with a parenthesized parameter list, which may be empty.

Pointers and Arrays

Rule	Description
17.4	Array indexing shall be the only allowed form of pointer arithmetic.
17.5	A type should not contain more than 2 levels of pointer indirection.

Structures and Unions

Rule	Description
18.1	All structure or union types shall be complete at the end of a translation unit.
18.4	Unions shall not be used.

Preprocessing Directives

Rule	Description
19.1	#include statements in a file shall only be preceded by other preprocessors directives or comments.
19.2	Nonstandard characters should not occur in header file names in #include directives.
19.3	The #include directive shall be followed by either a <filename> or "filename" sequence.</filename>
19.4	C macros shall only expand to a braced initializer, a constant, a parenthesized expression, a type qualifier, a storage class specifier, or a do-while-zero construct.
19.5	Macros shall not be #defined and #undefd within a block.
19.6	#undef shall not be used.
19.7	A function should be used in preference to a function like-macro.
19.8	A function-like macro shall not be invoked without all of its arguments.
19.9	Arguments to a function-like macro shall not contain tokens that look like preprocessing directives.
19.10	In the definition of a function-like macro, each instance of a parameter shall be enclosed in parentheses unless it is used as the operand of # or ##.
19.11	All macro identifiers in preprocessor directives shall be defined before use, except in #ifdef and #ifndef preprocessor directives and the defined() operator.
19.12	There shall be at most one occurrence of the # or ## preprocessor operators in a single macro definition.
19.13	The # and ## preprocessor operators should not be used.
19.14	The defined preprocessor operator shall only be used in one of the two standard forms.
19.15	Precautions shall be taken in order to prevent the contents of a header file being included twice.
19.16	Preprocessing directives shall be syntactically meaningful even when excluded by the preprocessor.

Rule	Description
19.17	All #else, #elif and #endif preprocessor directives shall reside in the same file as the #if or #ifdef directive to which they are related.

Standard Libraries

Rule	Description
20.1	Reserved identifiers, macros and functions in the standard library, shall not be defined, redefined or undefined.
20.2	The names of standard library macros, objects and functions shall not be reused.
20.4	Dynamic heap memory allocation shall not be used.
20.5	The error indicator errno shall not be used.
20.6	The macro offsetof, in library <stddef.h>, shall not be used.</stddef.h>
20.7	The setjmp macro and the longjmp function shall not be used.
20.8	The signal handling facilities of <signal.h> shall not be used.</signal.h>
20.9	The input/output library <stdio.h> shall not be used in production code.</stdio.h>
20.10	The library functions atof, atoi and atoll from library <stdlib.h> shall not be used.</stdlib.h>
20.11	The library functions abort, exit, getenv and system from library <pre><stdlib.h> shall not be used.</stdlib.h></pre>
20.12	The time handling functions of library <time.h> shall not be used.</time.h>

The rules that are checked at a system level and appear only in the system-decidablerules subset are indicated by an asterisk.

MISRA C: 2012 Rules

The software checks the following rules early in the analysis. The rules that are checked at a system level and appear only in the system-decidable-rules subset are indicated by an asterisk.

Standard C Environment

Rule	Description
1.1	The program shall contain no violations of the standard C syntax and constraints, and shall not exceed the implementation's translation limits.
1.2	Language extensions should not be used.

Unused Code

Rule	Description
2.3*	A project should not contain unused type declarations.
2.4*	A project should not contain unused tag declarations.
2.5*	A project should not contain unused macro declarations.
2.6	A function should not contain unused label declarations.
2.7	There should be no unused parameters in functions.

Comments

Rule	Description
3.1	The character sequences /* and // shall not be used within a comment.
3.2	Line-splicing shall not be used in // comments.

Character Sets and Lexical Conventions

Rule	Description
4.1	Octal and hexadecimal escape sequences shall be terminated.
4.2	Trigraphs should not be used.

Identifiers

Rule	Description
5.1*	External identifiers shall be distinct.
5.2	Identifiers declared in the same scope and name space shall be distinct.
5.3	An identifier declared in an inner scope shall not hide an identifier declared in an outer scope.
5.4	Macro identifiers shall be distinct.
5.5	Identifiers shall be distinct from macro names.
5.6*	A typedef name shall be a unique identifier.
5.7*	A tag name shall be a unique identifier.
5.8*	Identifiers that define objects or functions with external linkage shall be unique.
5.9*	Identifiers that define objects or functions with internal linkage should be unique.

Types

Rule	Description
6.1	Bit-fields shall only be declared with an appropriate type.
6.2	Single-bit named bit fields shall not be of a signed type.

Literals and Constants

Rule	Description
7.1	Octal constants shall not be used.
7.2	A "u" or "U" suffix shall be applied to all integer constants that are represented in an unsigned type.
7.3	The lowercase character "l" shall not be used in a literal suffix.
7.4	A string literal shall not be assigned to an object unless the object's type is "pointer to const-qualified char".

Declarations and Definitions

Rule	Description
8.1	Types shall be explicitly specified.
8.2	Function types shall be in prototype form with named parameters.
8.3*	All declarations of an object or function shall use the same names and type qualifiers.
8.4	A compatible declaration shall be visible when an object or function with external linkage is defined.
8.5*	An external object or function shall be declared once in one and only one file.
8.6*	An identifier with external linkage shall have exactly one external definition.
8.7*	Functions and objects should not be defined with external linkage if they are referenced in only one translation unit.
8.8	The static storage class specifier shall be used in all declarations of objects and functions that have internal linkage.
8.9*	An object should be defined at block scope if its identifier only appears in a single function.
8.10	An inline function shall be declared with the static storage class.
8.11	When an array with external linkage is declared, its size should be explicitly specified.
8.12	Within an enumerator list, the value of an implicitly-specified enumeration constant shall be unique.
8.14	The restrict type qualifier shall not be used.

Initialization

Rule	Description
9.2	The initializer for an aggregate or union shall be enclosed in braces.
9.3	Arrays shall not be partially initialized.
9.4	An element of an object shall not be initialized more than once.
9.5	Where designated initializers are used to initialize an array object the size of the array shall be specified explicitly.

The Essential Type Model

Rule	Description
10.1	Operands shall not be of an inappropriate essential type.
10.2	Expressions of essentially character type shall not be used inappropriately in addition and subtraction operations.
10.3	The value of an expression shall not be assigned to an object with a narrower essential type or of a different essential type category.
10.4	Both operands of an operator in which the usual arithmetic conversions are performed shall have the same essential type category.
10.5	The value of an expression should not be cast to an inappropriate essential type.
10.6	The value of a composite expression shall not be assigned to an object with wider essential type.
10.7	If a composite expression is used as one operand of an operator in which the usual arithmetic conversions are performed then the other operand shall not have wider essential type.
10.8	The value of a composite expression shall not be cast to a different essential type category or a wider essential type.

Pointer Type Conversion

Rule	Description
11.1	Conversions shall not be performed between a pointer to a function and any other type.
11.2	Conversions shall not be performed between a pointer to an incomplete type and any other type.
11.3	A cast shall not be performed between a pointer to object type and a pointer to a different object type.
11.4	A conversion should not be performed between a pointer to object and an integer type.
11.5	A conversion should not be performed from pointer to void into pointer to object.
11.6	A cast shall not be performed between pointer to void and an arithmetic type.
11.7	A cast shall not be performed between pointer to object and a non-integer arithmetic type.
11.8	A cast shall not remove any const or volatile qualification from the type pointed to by a pointer.
11.9	The macro NULL shall be the only permitted form of integer null pointer constant.

Expressions

Rule	Description
12.1	The precedence of operators within expressions should be made explicit.
12.3	The comma operator should not be used.
12.4	Evaluation of constant expressions should not lead to unsigned integer wraparound.

Side Effects

Rule	Description
13.3	A full expression containing an increment (++) or decrement () operator should have no other potential side effects other than that caused by the increment or decrement operator.
13.4	The result of an assignment operator should not be used.
13.6	The operand of the sizeof operator shall not contain any expression which has potential side effects.

Control Statement Expressions

Rule	Description
14.4	The controlling expression of an if statement and the controlling expression of an iteration-statement shall have essentially Boolean type.

Control Flow

Rule	Description
15.1	The goto statement should not be used.
15.2	The goto statement shall jump to a label declared later in the same function.
15.3	Any label referenced by a goto statement shall be declared in the same block, or in any block enclosing the goto statement.
15.4	There should be no more than one break or goto statement used to terminate any iteration statement.
15.5	A function should have a single point of exit at the end
15.6	The body of an iteration-statement or a selection-statement shall be a compound statement.
15.7	All if else if constructs shall be terminated with an else statement.

Switch Statements

Rule	Description
16.1	All switch statements shall be well-formed.
16.2	A switch label shall only be used when the most closely-enclosing compound statement is the body of a switch statement.
16.3	An unconditional break statement shall terminate every switch-clause.
16.4	Every switch statement shall have a default label.
16.5	A default label shall appear as either the first or the last switch label of a switch statement.
16.6	Every switch statement shall have at least two switch-clauses.
16.7	A switch-expression shall not have essentially Boolean type.

Functions

Rule	Description
17.1	The features of <starg.h> shall not be used.</starg.h>
17.3	A function shall not be declared implicitly.
17.4	All exit paths from a function with non-void return type shall have an explicit return statement with an expression.
17.6	The declaration of an array parameter shall not contain the static keyword between the [].
17.7	The value returned by a function having non-void return type shall be used.

Pointers and Arrays

Rule	Description
18.4	The $+$, $-$, $+=$ and $-=$ operators should not be applied to an expression of pointer type.
18.5	Declarations should contain no more than two levels of pointer nesting.
18.7	Flexible array members shall not be declared.
18.8	Variable-length array types shall not be used.

Overlapping Storage

Rule	Description	
19.2	The union keyword should not be used.	

Preprocessing Directives

Rule	Description	
20.1	#include directives should only be preceded by preprocessor directives or comments.	
20.2	The ', ", or $\$ characters and the $/*$ or $//$ character sequences shall not occur in a header file name.	
20.3	The #include directive shall be followed by either a <filename> or \"filename \" sequence.</filename>	
20.4	A macro shall not be defined with the same name as a keyword.	
20.5	#undef should not be used.	
20.6	Tokens that look like a preprocessing directive shall not occur within a macro argument.	
20.7	Expressions resulting from the expansion of macro parameters shall be enclosed in parentheses.	
20.8	The controlling expression of a #if or #elif preprocessing directive shall evaluate to 0 or 1.	
20.9	All identifiers used in the controlling expression of #if or #elif preprocessing directives shall be #define'd before evaluation.	
20.10	The # and ## preprocessor operators should not be used.	
20.11	A macro parameter immediately following a # operator shall not immediately be followed by a ## operator.	
20.12	A macro parameter used as an operand to the # or ## operators, which is itself subject to further macro replacement, shall only be used as an operand to these operators.	
20.13	A line whose first token is # shall be a valid preprocessing directive.	
20.14	All #else, #elif and #endif preprocessor directives shall reside in the same file as the #if, #ifdef or #ifndef directive to which they are related.	

Standard Libraries

Rule	Description	
21.1	#define and #undef shall not be used on a reserved identifier or reserved	
	macro name.	
21.2	A reserved identifier or macro name shall not be declared.	
21.3	The memory allocation and deallocation functions of <stdlib.h> shall not be used.</stdlib.h>	
21.4	The standard header file <setjmp.h> shall not be used.</setjmp.h>	
21.5	The standard header file <signal.h> shall not be used.</signal.h>	
21.6	The Standard Library input/output functions shall not be used.	
21.7	The atof, atoi, atol, and atoll functions of <stdlib.h> shall not be used.</stdlib.h>	
21.8	The library functions abort, exit, getenv and system of <stdlib.h> shall not be used.</stdlib.h>	
21.9	The library functions bsearch and qsort of <stdlib.h> shall not be used.</stdlib.h>	
21.10	The Standard Library time and date functions shall not be used.	
21.11	The standard header file <tgmath.h> shall not be used.</tgmath.h>	
21.12	The exception handling features of <fenv.h> should not be used.</fenv.h>	

The rules that are checked at a system level and appear only in the system-decidable-rules subset are indicated by an asterisk.

More About

• "Check for Coding Rule Violations" on page 5-14

Create Custom Coding Rules

This example shows how to create a custom coding rules file. You can use this file to check names or text patterns in your source code against custom rules that you specify. For each rule, you specify a pattern in the form of a regular expression. The software compares the pattern against identifiers in the source code and determines whether the custom rule is violated.

The tutorial uses the following code stored in a file printInitialValue.c:

```
#include <stdio.h>
typedef struct {
    int a;
    int b;
} collection:
void main()
    collection myCollection= {0,0};
    printf("Initial values in the collection are %d and %d.",
           myCollection.a,myCollection.b);
}
```

User Interface (Desktop Products Only)

- Create a Polyspace project. Add printInitialValue.c to the project.
- 2 On the Configuration pane, select Coding Standards & Code Metrics. Select the Check custom rules box.
- 3 Edit Click

The **Findings selection** window opens, displaying in the left pane all the coding standards Polyspace supports, and with the **Custom** node highlighted.

Specify the rules to check for in the right pane.

Expand the 4 Structs node. For the option 4.3 All struct fields must follow the specified pattern:

Column Title	Action	
Status	Select ☑.	
Convention	Enter All struct fields must begin with s_ and have capital letters or digits	
Pattern	Enter s_[A-Z0-9_]+	
Comment	Leave blank. This column is for comments that appear in the coding rules file alone.	

- 5 Save the file and run the analysis. On the **Results List** pane, you see two violations of rule 4.3. Select the first violation.
 - a On the **Source** pane, the line int a; is marked.
 - On the Result Details pane, you see the error message that you had entered, All struct fields must begin with s_ and have capital letters
- 6 Right-click the **Source** pane and select **Open Editor**. The file printInitialValue.c opens in the **Code Editor** pane or an external text editor depending on your **Preferences**.
- 7 In the file, replace all instances of a with s_A and b with s_B. Rerun the analysis.

The custom rule violations no longer appear on the **Results List** pane.

Command Line

Create a coding standard configuration file. You can begin from the template file StandardsConfiguration.xml provided in polyspaceroot\polyspace\examples \cxx\Bug_Finder_Example\sources or polyspaceroot\polyspace\examples \cxx\Code_Prover_Example\sources. Here, polyspaceroot is the installation folder of the Polyspace desktop or server products. For instance, for the desktop products, the installation folder can be C:\Program Files\Polyspace\R2019a.

To enable the custom rule 4.3, enter the following in the configuration file:

```
<standard name="CUSTOM RULES">
    ...
<section name="4 Structures">
```

```
<check id="4.3" state="on">
        <convention>All struct fields must begin with s_
                    and have capital letters or digits</convention>
        <pattern>s [A-Z0-9 ]+</pattern>
        <comment># Issue when structure field name does not begin with c_</comment>
      </check>
 </section>
</standard>
```

Provide this file as argument for the option Check custom rules (-custom-rules) during analysis. For instance, if the text file is named codingStandard.xml, for an analysis with Polyspace Code Prover Server, enter:

polyspace-code-prover-server -sources file -custom-rules codingStandard.xml

Check custom rules (-custom-rules)

Compute Code Complexity Metrics

This example shows how to review the code complexity metrics that Polyspace computes. For information on the individual metrics, see "Code Metrics".

Polyspace does not compute code complexity metrics by default. To compute them during analysis, use the option Calculate code metrics (-code-metrics).

After analysis, the software displays project, file and function metrics on the **Results List** pane. You can compare the computed metric values against predefined limits. If a metric value exceeds limits, you can redesign your code to lower the metric value. For instance, if the number of called functions is high and several of those functions are always called together, you can write one function that fuses the bodies of those functions. Call that one function instead of the group of functions that are called together.

Impose Limits on Metrics (Desktop Products Only)

In the user interface of the Polyspace desktop products, open some results with metrics computations. Then impose limits on the metric values and update results on the **Results List** pane to show only metric values that exceed the limits.

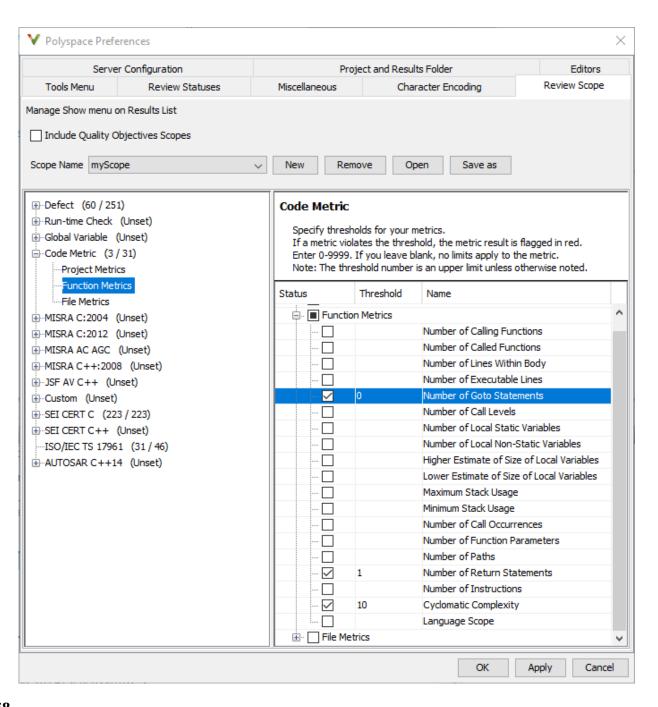

- 1 Select **Tools** > **Preferences**.
- 2 On the **Review Scope** tab, do one of the following:
 - To use a predefined limit, select **Include Quality Objectives Scopes**.

The **Scope Name** list shows the additional option HIS. The option HIS displays the HIS code metrics on page 11-70 only. Select the option to see the limit values.

- To define your own limits, select ${\bf New}.$ Save your limits file.

On the left pane, select **Code Metric**. On the right, select a metric and specify a limit value for the metric. Other than **Comment Density**, limit values are upper limits.

To select all metrics in a category such as **Function Metrics**, select the box next to the category name. For more information on the metrics categories, see "Code Metrics". If only a some metrics in a category are selected, the check box next to the category name displays a symbol.

3 Select **Apply** or **OK**.

The drop-down list in the left of the **Results List** pane toolbar displays additional options.

- If you use predefined limits, the option HIS appears. This option displays code metrics only.
- If you define your own limits, the option corresponding to your limits file name appears.
- 4 Select the option corresponding to the limits that you want. Only metric values that violate your limits appear on the **Results List** pane.
- 5 Review each violation and decide how to rework your code to avoid the violation.

Note To enforce coding standards across your organization, share your limits file that you saved in XML format.

People in your organization can use the **Open** button on the **Review Scope** tab and navigate to the location of the XML file.

Impose Limits on Metrics (Server and Access products)

In the Polyspace Access web interface, limits on code complexity metrics are predefined. In the **Dashboard** perspective, if you select **Code Metric**, a **Code Metrics** window shows the metric values and limits.

To find the limits used, see "HIS Code Complexity Metrics" on page 11-70.

HIS Code Complexity Metrics

The following list shows the Hersteller Initiative Software (HIS) standard metrics that Polyspace evaluates. These metrics and the recommended limits for their values are part of a standard defined by a major group of Original Equipment Manufacturers or OEMs. For more information on how to focus your review to this subset of code metrics, see "Compute Code Complexity Metrics" on page 11-67.

Project

Polyspace evaluates the following HIS metrics at the project level.

Metric	Recommended Upper Limit	
Number of direct recursions	0	
Number of recursions	0	

File

Polyspace evaluates the HIS metric, comment density, at the file level. The recommended lower limit is 20.

Function

Polyspace evaluates the following HIS metrics at the function level.

Metric	Recommended Upper Limit
Cyclomatic complexity	10
Language scope	4
Number of call levels	4
Number of calling functions	5
Number of called functions	7
Number of function parameters	5
Number of goto statements	0
Number of instructions	50

Metric	Recommended Upper Limit	
Number of paths	80	
Number of return statements	1

Polyspace MISRA C 2004 and MISRA AC AGC Checkers

The Polyspace MISRA C:2004 checker helps you comply with the MISRA C 2004 coding standard.¹

When MISRA C rules are violated, the MISRA C checker enables Polyspace software to provide messages with information about the rule violations. Most messages are reported during the compile phase of an analysis.

The MISRA C checker can check nearly all of the 142 MISRA C:2004 rules.

The MISRA AC AGC checker checks rules from the OBL (obligatory) and REC (recommended) categories specified by MISRA AC AGC Guidelines for the Application of MISRA-C:2004 in the Context of Automatic Code Generation.

There are subsets of MISRA coding rules that can have a direct or indirect impact on the selectivity (reliability percentage) of your results. When you set up rule checking, you can select these subsets directly. These subsets are defined in:

- "Software Quality Objective Subsets (C:2004)" on page 11-22
- "Software Quality Objective Subsets (AC AGC)" on page 11-28

Note The Polyspace MISRA checker is based on MISRA C:2004, which also incorporates MISRA C Technical Corrigendum.

"Unsupported MISRA C:2004 and MISRA AC AGC Rules" on page 12-46

Supported MISRA C:2004 and MISRA AC AGC Rules

The following tables list MISRA C:2004 coding rules that the Polyspace coding rules checker supports. Details regarding how the software checks individual rules and any limitations on the scope of checking are described in the "Polyspace Specification" column.

Note The Polyspace coding rules checker:

- Supports MISRA-C:2004 Technical Corrigendum 1 for rules 4.1, 5.1, 5.3, 6.1, 6.3, 7.1, 9.2, 10.5, 12.6, 13.5, and 15.0.
- Checks rules specified by MISRA AC AGC Guidelines for the Application of MISRA-C:2004 in the Context of Automatic Code Generation.

The software reports most violations during the compile phase of an analysis. However, the software detects violations of rules 9.1 (Non-initialized variable), 12.11 (one of the overflow checks) using -scalar-overflows-checks signed-and-unsigned), 13.7 (dead code), 14.1 (dead code), 16.2 and 21.1 during code analysis, and reports these violations as run-time errors.

Note Some violations of rules 13.7 and 14.1 are reported during the compile phase of analysis.

Troubleshooting

If you expect a rule violation but do not see it, check out "Coding Standard Violations Not Displayed" on page 20-63.

Environment

N.	MISRA Definition	Messages in report file	Polyspace Specification
1.1	All code shall conform to ISO 9899:1990 "Programming languages - C", amended and corrected by ISO/IEC 9899/COR1:1995, ISO/IEC 9899/AMD1:1995, and ISO/IEC 9899/COR2:1996.	The text All code shall conform to ISO 9899:1990 Programming languages C, amended and corrected by ISO/IEC 9899/COR1:1995, ISO/IEC 9899/AMD1:1995, and ISO/IEC 9899/COR2:1996 precedes each of the following messages: • ANSI C does not allow '#include_next' • ANSI C does not allow macros with variable arguments list • ANSI C does not allow '#assert' • ANSI C does not allow '#unassert' • ANSI C does not allow testing assertions • ANSI C does not allow '#ident' • ANSI C does not allow '#ident' • ANSI C does not allow '#sccs' • text following '#else' violates ANSI standard. • text following '#else' or '#endif' violates ANSI standard. • text following '#else' or '#endif' violates ANSI standard.	All the supported extensions lead to a violation of this MISRA rule. Standard compilation error messages do not lead to a violation of this MISRA rule and remain unchanged.

N.	MISRA Definition	Messages in report file	Polyspace Specification
1.1 (cont.)		The text All code shall conform to ISO 9899:1990 Programming languages C, amended and corrected by ISO/IEC 9899/COR1:1995, ISO/IEC 9899/AMD1:1995, and ISO/IEC 9899/COR2:1996 precedes each of the following messages:	
		 ANSI C90 forbids 'long long int' type. ANSI C90 forbids 'long double' type. 	
		double' type.ANSI C90 forbids long long integer constants.	
		• Keyword 'inline' should not be used.	
		Array of zero size should not be used.	
		Integer constant does not fit within unsigned long int.	
		• Integer constant does not fit within long int.	
		• Too many nesting levels of #includes: N_1 . The limit is N_0 .	
		• Too many macro definitions: N_1 . The limit is N_0 .	
		• Too many nesting levels for control flow: N_1 . The limit is N_0 .	

N.	MISRA Definition	Messages in report file	Polyspace Specification
		• Too many enumeration constants: N_1 . The limit is N_0 .	

Language Extensions

N.	MISRA Definition	Messages in report file	Polyspace Specification
2.1	Assembly language shall be encapsulated and isolated.	Assembly language shall be encapsulated and isolated.	No warnings if code is encapsulated in the following: • asm functions or asm pragma • Macros
2.2	Source code shall only use /* */ style comments	C++ comments shall not be used.	C++ comments are handled as comments but lead to a violation of this MISRA rule Note: This rule cannot be annotated in the source code.
2.3	The character sequence /* shall not be used within a comment	The character sequence /* shall not appear within a comment.	This rule violation is also raised when the character sequence /* inside a C++ comment. Note: This rule cannot be annotated in the source code.

Documentation

Rule	MISRA Definition	Messages in report file	Polyspace Specification
3.4	All uses of the #pragma directive shall be documented and explained.	All uses of the #pragma directive shall be documented and explained.	To check this rule, you must list the pragmas that are allowed in source files by using the option Allowed pragmas (-allowed-pragmas). If Polyspace finds a pragma not in the allowed pragma list, a violation is raised.

Character Sets

N.	MISRA Definition	Messages in report file	Polyspace Specification
4.1	Only those escape sequences which are defined in the ISO C standard shall be used.	\ <character> is not an ISO C escape sequence Only those escape sequences which are defined in the ISO C standard shall be used.</character>	
4.2	Trigraphs shall not be used.	Trigraphs shall not be used.	Trigraphs are handled and converted to the equivalent character but lead to a violation of the MISRA rule

Identifiers

N.	MISRA Definition	Messages in report file	Polyspace Specification
5.1	Identifiers (internal and external) shall not rely on the significance of more than 31 characters	Identifier 'XX' should not rely on the significance of more than 31 characters.	All identifiers (global, static and local) are checked. For easier review, the rule checker shows all identifiers
			that have the same first 31 characters as one rule violation. You can see all instances of conflicting identifier names in the event history of that rule violation.
5.2	Identifiers in an inner scope shall not use the same name as an identifier in an outer	Local declaration of XX is hiding another identifier.	Assumes that rule 8.1 is not violated.
	scope, and therefore hide that identifier.	Declaration of parameter XX is hiding another identifier.	
5.3	A typedef name shall be a unique identifier	{typedef name}'%s' should not be reused. (already used as {typedef name} at %s:%d)	Warning when a typedef name is reused as another identifier name.
5.4	A tag name shall be a unique identifier	{tag name}'%s' should not be reused. (already used as {tag name} at %s:%d)	Warning when a tag name is reused as another identifier name
5.5	No object or function identifier with a static storage duration should be reused.	{static identifier/parameter name}'%s' should not be reused. (already used as {static identifier/parameter	Warning when a static name is reused as another identifier name
		name} with static storage duration at %s:%d)	Bug Finder and Code Prover check this coding rule differently. The analyses can produce different results.

N.	MISRA Definition	Messages in report file	Polyspace Specification
5.6	No identifier in one name space should have the same spelling as an identifier in another name space, with the exception of structure and union member names.	{member name}'%s' should not be reused. (already used as {member name} at %s:%d)	Warning when an idf in a namespace is reused in another namespace
5.7	No identifier name should be reused.	{identifier}'%s' should not be reused. (already used as {identifier} at %s:%d)	 No violation reported when: Different functions have parameters with the same name Different functions have local variables with the same name A function has a local variable that has the same name as a parameter of another function

Types

N.	MISRA Definition	Messages in report file	Polyspace Specification
6.1	The plain char type shall be used only for the storage and use of character values	on plain chars are '=', '==' or '!=' operators, explicit casts to integral types and '?' (for the 2nd and 3rd	Warning when a plain char is used with an operator other than =, ==, !=, explicit casts to integral types, or as the second or third operands of the ? operator.

N.	MISRA Definition	Messages in report file	Polyspace Specification
6.2	Signed and unsigned char type shall be used only for the storage and use of numeric values.	 Value of type plain char is implicitly converted to signed char. Value of type plain char is implicitly converted to unsigned char. Value of type signed char is implicitly converted to plain char. Value of type unsigned char is implicitly converted to plain char. 	Warning if value of type plain char is implicitly converted to value of type signed char or unsigned char.
6.3	typedefs that indicate size and signedness should be used in place of the basic types	typedefs that indicate size and signedness should be used in place of the basic types.	No warning is given in typedef definition.
6.4	Bit fields shall only be defined to be of type <i>unsigned int</i> or <i>signed int</i> .	Bit fields shall only be defined to be of type unsigned int or signed int.	
6.5	Bit fields of type <i>signed int</i> shall be at least 2 bits long.	Bit fields of type signed int shall be at least 2 bits long.	No warning on anonymous signed int bitfields of width 0 - Extended to all signed bitfields of size <= 1 (if Rule 6.4 is violated).

Constants

N.	MISRA Definition	Messages in report file	Polyspace Specification
7.1	Octal constants (other than zero) and octal escape sequences shall not be used.	Octal constants other than zero and octal escape sequences shall not be used.	
		Octal constants (other than zero) should not be used.	
		Octal escape sequences should not be used.	

Declarations and Definitions

N.	MISRA Definition	Messages in report file	Polyspace Specification
8.1	Functions shall have prototype declarations and the prototype shall be visible at both the function definition and call.	 Function XX has no complete prototype visible at call. Function XX has no prototype visible at definition. 	Prototype visible at call must be complete.
8.2	Whenever an object or function is declared or defined, its type shall be explicitly stated	Whenever an object or function is declared or defined, its type shall be explicitly stated.	
8.3	For each function parameter the type given in the declaration and definition shall be identical, and the return types shall also be identical.	Definition of function 'XX' incompatible with its declaration.	Assumes that rule 8.1 is not violated. The rule is restricted to compatible types. Can be turned to Off

N.	MISRA Definition	Messages in report file	Polyspace Specification
8.4	If objects or functions are declared more than once their types shall be compatible.	 If objects or functions are declared more than once their types shall be compatible. Global declaration of 'XX' function has incompatible type with its definition. Global declaration of 'XX' variable has incompatible type with its definition. 	Violations of this rule might be generated during the link phase. Bug Finder and Code Prover check this coding rule differently. The analyses can produce different results.
8.5	There shall be no definitions of objects or functions in a header file	 Object 'XX' should not be defined in a header file. Function 'XX' should not be defined in a header file. Fragment of function should not be defined in a header file. 	Tentative definitions are considered as definitions. For objects with file scope, tentative definitions are declarations that: • Do not have initializers. • Do not have storage class specifiers, or have the static specifier
8.6	Functions shall always be declared at file scope.	Function 'XX' should be declared at file scope.	This rule maps to ISO/IEC TS 17961 ID addrescape.
8.7	Objects shall be defined at block scope if they are only accessed from within a single function	Object 'XX' should be declared at block scope.	Restricted to static objects.

N.	MISRA Definition	Messages in report file	Polyspace Specification
8.8	An external object or function shall be declared in one file and only one file	Function/Object 'XX' has external declarations in multiple files.	Restricted to explicit extern declarations (tentative definitions are ignored). Polyspace considers that variables or functions declared extern in a non-header file violate this rule. Bug Finder and Code Prover check this coding rule differently. The analyses can
8.9	Definition: An identifier with external linkage shall have exactly one external definition.	 Procedure/Global variable XX multiply defined. Forbidden multiple tentative definitions for object XX Global variable has multiple tentative definitions Undefined global variable XX 	produce different results. The checker flags multiple definitions only if the definitions occur in different files. No warnings appear on predefined symbols. Bug Finder and Code Prover check this coding rule differently. The analyses can produce different results.
8.10	All declarations and definitions of objects or functions at file scope shall have internal linkage unless external linkage is required	Function/Variable XX should have internal linkage.	Assumes that 8.1 is not violated. No warning if 0 uses. Bug Finder and Code Prover check this coding rule differently. The analyses can produce different results.
8.11	The <i>static</i> storage class specifier shall be used in definitions and declarations of objects and functions that have internal linkage	static storage class specifier should be used on internal linkage symbol XX.	

N.	MISRA Definition	Messages in report file	Polyspace Specification
8.12	When an array is declared with external linkage, its size shall be stated explicitly or defined implicitly by initialization	Size of array 'XX' should be explicitly stated.	

Initialization

N.	MISRA Definition	Messages in report file	Polyspace Specification
9.1	All automatic variables shall have been assigned a value before being used.		Checked during code analysis. Violations displayed as Non-initialized variable results. Bug Finder and Code Prover check this coding rule differently. The analyses can produce different results. In Code Prover, you can also see a difference in results based on your choice for the option Verification level (-to). See "Check for Coding Standard"
9.2	Braces shall be used to indicate and match the structure in the nonzero initialization of arrays and structures.	Braces shall be used to indicate and match the structure in the nonzero initialization of arrays and structures.	Violations" on page 11-2.
9.3	In an enumerator list, the = construct shall not be used to explicitly initialize members other than the first, unless all items are explicitly initialized.	In an enumerator list, the = construct shall not be used to explicitly initialize members other than the first, unless all items are explicitly initialized.	

Arithmetic Type Conversion

N.	MISRA Definition	Messages in report file	Polyspace Specification
10.1	The value of an expression of integer type shall not be implicitly converted to a different underlying type if: • it is not a conversion to a wider integer type of the same signedness, or • the expression is complex, or • the expression is not constant and is a function argument, or • the expression is not expression is not expression	expression of underlying type XX to the type XX that is not a wider integer type of the same signedness. Implicit conversion of one of the binary operands whose underlying types are XX and XX Implicit conversion of the binary right hand operand of underlying type XX to XX that is not an integer type. Implicit conversion of the binary left hand operand of underlying type XX to XX that is not ax integer type. Implicit conversion of the binary right hand operand of underlying type XX to XX that is not a wider integer type of the same signedness or Implicit conversion of the binary? left hand operand of underlying type XX to XX, but it is a complex expression.	ANSI C base types order (signed char, short, int, long) defines that T2 is wider than T1 if T2 is on the right hand of T1 or T2 = T1. The same interpretation is applied on the unsigned version of base types. An expression of bool or enum types has int as underlying type. Plain char may have signed or unsigned underlying type (depending on Polyspace target configuration or option setting). The underlying type of a simple expression of struct.bitfield is the base type used in the bitfield definition, the bitfield width is not token into account and it assumes that only signed unsigned int are used for bitfield (Rule 6.4). This rule violation is not produced on operations involving pointers. No violation reported when: • The implicit conversion is a type widening, without

N. MISRA Definition	Messages in report file	Polyspace Specification
N. MISRA Definition	 Messages in report file Implicit conversion of non-constant integer expression of underlying type XX in function return whose expected type is XX. Implicit conversion of non-constant integer expression of underlying type XX as argument of function whose corresponding parameter type is XX. 	change of signedness of integer The expression is an

N.	MISRA Definition	Messages in report file	Polyspace Specification
10.2	The value of an expression of floating type shall not be implicitly converted to a different type if • it is not a conversion to a wider floating type, or • the expression is complex, or • the expression is a function argument, or • the expression is a return expression	 Implicit conversion of the expression from XX to XX that is not a wider floating type. Implicit conversion of the binary? right hand operand from XX to XX, but it is a complex expression. Implicit conversion of the binary? right hand operand from XX to XX that is not a wider floating type or Implicit conversion of the binary? left hand operand from XX to XX, but it is a complex expression. Implicit conversion of complex floating expression from XX to XX. Implicit conversion of floating expression of XX type in function return whose expected type is XX. Implicit conversion of floating expression of XX type as argument of function whose corresponding parameter type is XX. 	ANSI C base types order (float, double) defines that T2 is wider than T1 if T2 is on the right hand of T1 or T2 = T1. No violation reported when: • The implicit conversion is a type widening • The expression is an argument expression or a return expression.

N.	MISRA Definition	Messages in report file	Polyspace Specification
10.3	The value of a complex expression of integer type may only be cast to a type that is narrower and of the same signedness as the underlying type of the expression	Complex expression of underlying type XX may only be cast to narrower integer type of same signedness, however the destination type is XX.	The rule checker raises a defect only if the result of a composite expression is cast to a different or wider essential type. For instance, in this example, a violation is shown in the first assignment to i but not the second. In the first assignment, a composite expression i+1 is directly cast from a signed to an unsigned type. In the second assignment, the
			composite expression is first cast to the same type and then the result is cast to a different type. typedef int int32_T; typedef unsigned char ui int32_T i; i = (uint8_T)(i+1); /* Noncompliant */ i = (uint8_T)((int32_T)(/* Compliant */
			• ANSI C base types order (signed char, short, int, long) defines that T1 is narrower than T2 if T2 is on the right hand of T1 or T1 = T2. The same methodology is applied on the unsigned version of base types.

N.	MISRA Definition	Messages in report file	Polyspace Specification
			An expression of bool or enum types has int as underlying type.
			Plain char may have signed or unsigned underlying type (depending on target configuration or option setting).
			• The underlying type of a simple expression of struct.bitfield is the base type used in the bitfield definition, the bitfield width is not token into account and it assumes that only signed, unsigned int are used for bitfield (Rule 6.4).
10.4	The value of a complex expression of float type may only be cast to narrower floating type	Complex expression of XX type may only be cast to narrower floating type, however the destination type is XX.	ANSI C base types order (float, double) defines that T1 is narrower than T2 if T2 is on the right hand of T1 or $T2 = T1$.
10.5	If the bitwise operator ~ and << are applied to an operand of underlying type unsigned char or unsigned short, the result shall be immediately cast to the underlying type of the operand	Bitwise [<< ~] is applied to the operand of underlying type [unsigned char unsigned short], the result shall be immediately cast to the underlying type.	

N.	MISRA Definition	Messages in report file	Polyspace Specification
10.6	The "U" suffix shall be applied to all constants of unsigned types	No explicit 'U suffix on constants of an unsigned type.	Warning when the type determined from the value and the base (octal, decimal or hexadecimal) is unsigned and there is no suffix u or U. For example, when the size of the int and long int data types is 32 bits, the coding rule checker will report a violation of rule 10.6 for the following line: int a = 2147483648; There is a difference between decimal and hexadecimal constants when int and long int are not the same size.

Pointer Type Conversion

N.	MISRA Definition	Messages in report file	Polyspace Specification
11.1	Conversion shall not be performed between a pointer to a function and any type other than an integral type	Conversion shall not be performed between a pointer to a function and any type other than an integral type.	Casts and implicit conversions involving a function pointer. Casts or implicit conversions from NULL or (void*)0 do not give any warning.
11.2	Conversion shall not be performed between a pointer to an object and any type other than an integral type, another pointer to a object type or a pointer to void	Conversion shall not be performed between a pointer to an object and any type other than an integral type, another pointer to a object type or a pointer to void.	There is also a warning on qualifier loss This rule maps to ISO/IEC TS 17961 ID alignconv.

N.	MISRA Definition	Messages in report file	Polyspace Specification
11.3	A cast should not be performed between a pointer type and an integral type	A cast should not be performed between a pointer type and an integral type.	Exception on zero constant. Extended to all conversions This rule maps to ISO/IEC TS 17961 ID alignconv.
11.4	A cast should not be performed between a pointer to object type and a different pointer to object type.	A cast should not be performed between a pointer to object type and a different pointer to object type.	
11.5	A cast shall not be performed that removes any <i>const</i> or <i>volatile</i> qualification from the type addressed by a pointer	A cast shall not be performed that removes any <i>const</i> or <i>volatile</i> qualification from the type addressed by a pointer	

Expressions

N.	MISRA Definition	Messages in report file	Polyspace Specification
12.1	Limited dependence should be placed on C's operator precedence rules in expressions	Limited dependence should be placed on C's operator precedence rules in expressions	
12.2	The value of an expression shall be the same under any order of evaluation that the standard permits.	 The value of 'sym' depends on the order of evaluation. The value of volatile 'sym' depends on the order of evaluation because of multiple accesses. 	Rule 12.2 check assumes that no assignment in expressions that yield a Boolean values (rule 13.1). The expression is a simple expression of symbols. i = i ++; is a violation, but tab[2] = tab[2]++; is not a violation.
12.3	The sizeof operator should not be used on expressions that contain side effects.	The sizeof operator should not be used on expressions that contain side effects.	No warning on volatile accesses

N.	MISRA Definition	Messages in report file	Polyspace Specification
12.4	The right hand operand of a logical && or operator shall not contain side effects.	The right hand operand of a logical && or operator shall not contain side effects.	No warning on volatile accesses
12.5	The operands of a logical && or shall be primary-expressions.	i • operano or iodical il is noi	During preprocessing, violations of this rule are detected on the expressions in #if directives.
		The operands of a logical && or shall be primary-expressions.	Allowed exception on associatively (a && b && c), (a b c).

N.	MISRA Definition	Messages in report file	Polyspace Specification
(6 1 1	Operands of logical operators (&&, and !) should be effectively Boolean. Expression that are effectively Boolean should not be used as operands to operators other than (&&, or !).	 Operand of '!' logical operator should be effectively Boolean. Left operand of '%s' logical operator should be effectively Boolean. Right operand of '%s' logical operator should be effectively Boolean. %s operand of '%s' is effectively Boolean. Boolean should not be used as operands to operators other than '&&', ' ', '!', '=', '==', '!=' and '?:'. 	The operand of a logical operator should be a Boolean data type. Although the C standard does not explicitly define the Boolean data type, the standard implicitly assumes the use of the Boolean data type. Some operators may return Boolean-like expressions, for example, (var == 0). Consider the following code: unsigned char flag; if (!flag) The rule checker reports a violation of rule 12.6: Operand of '!' logical operator should be effectively Boolean. The operand flag is not a Boolean but an unsigned char. To be compliant with rule 12.6, the code must be rewritten either as if (!(flag != 0)) or if (flag == 0) The use of the option - boolean-types may increase or decrease the

N.	MISRA Definition	Messages in report file	Polyspace Specification
			number of warnings generated.
12.7	Bitwise operators shall not be applied to operands whose underlying type is signed	 [~/Left Shift/Right shift/&] operator applied on an expression whose underlying type is signed. Bitwise ~ on operand of signed underlying type XX. Bitwise [<< >>] on left hand operand of signed underlying type XX. Bitwise [& ^] on two operands of s 	The underlying type for an integer is signed when: it does not have a u or U suffix it is small enough to fit into a 64 bits signed number
12.8	The right hand operand of a shift operator shall lie between zero and one less than the width in bits of the underlying type of the left hand operand.	 shift amount is negative shift amount is bigger than 64 Bitwise [<< >>] count out of range [0X] (width of the underlying type XX of the left hand operand - 1) 	The numbers that are manipulated in preprocessing directives are 64 bits wide so that valid shift range is between 0 and 63 Check is also extended onto bitfields with the field width or the width of the base type when it is within a complex expression
12.9	The unary minus operator shall not be applied to an expression whose underlying type is unsigned.	 Unary - on operand of unsigned underlying type XX. Minus operator applied to an expression whose underlying type is unsigned 	 The underlying type for an integer is signed when: it does not have a u or U suffix it is small enough to fit into a 64 bits signed number
12.10	The comma operator shall not be used.	The comma operator shall not be used.	

N.	MISRA Definition	Messages in report file	Polyspace Specification
12.11	Evaluation of constant unsigned expression should not lead to wraparound.	Evaluation of constant unsigned integer expressions should not lead to wraparound.	
12.12	The underlying bit representations of floating-point values shall not be used.	The underlying bit representations of floating-point values shall not be used.	 Warning when: A float pointer is cast as a pointer to another data type. Casting a float pointer as a pointer to void does not generate a warning. A float is packed with another data type. For example: union { float f; int i; }
12.13	The increment (++) and decrement () operators should not be mixed with other operators in an expression	The increment (++) and decrement () operators should not be mixed with other operators in an expression	Warning when ++ or operators are not used alone.

Control Statement Expressions

N.	MISRA Definition	Messages in report file	Polyspace Specification
13.1	not be used in expressions	Assignment operators shall not be used in expressions that yield Boolean values.	

N.	MISRA Definition	Messages in report file	Polyspace Specification
13.2	Tests of a value against zero should be made explicit, unless the operand is effectively Boolean	Tests of a value against zero should be made explicit, unless the operand is effectively Boolean	No warning is given on integer constants. Example: if (2) The use of the option - boolean-types may increase or decrease the number of warnings generated.
13.3	Floating-point expressions shall not be tested for equality or inequality.	Floating-point expressions shall not be tested for equality or inequality.	Warning on directs tests only.
13.4	The controlling expression of a <i>for</i> statement shall not contain any objects of floating type	The controlling expression of a for statement shall not contain any objects of floating type	If for index is a variable symbol, checked that it is not a float.

N.	MISRA Definition	Messages in report file	Polyspace Specification
N. 13.5	MISRA Definition The three expressions of a for statement shall be concerned only with loop control	 1st expression should be an assignment. Bad type for loop counter (XX). 2nd expression should be a comparison. 2nd expression should be a comparison with loop counter (XX). 3rd expression should be an assignment of loop counter (XX). 3rd expression: assigned variable should be the loop counter (XX). The following kinds of for loops are allowed: (a) all three expressions shall be present; (b) the 2nd and 3rd expressions shall be present with prior initialization of the loop counter; (c) all three expressions shall be empty for a 	Checked if the for loop index (V) is a variable symbol; checked if V is the last assigned variable in the first expression (if present). Checked if, in first expression, if present, is assignment of V; checked if in 2nd expression, if present, must be a comparison of V; Checked if in 3rd expression, if present, must be an assignment of V.
13.6	Numeric variables being used within a <i>for</i> loop for iteration counting should not be modified in the body of the loop.	deliberate infinite loop. Numeric variables being used within a for loop for iteration counting should not be modified in the body of the loop.	Detect only direct assignments if the for loop index is known and if it is a variable symbol.

N.	MISRA Definition	Messages in report file	Polyspace Specification
13.7	Boolean operations whose results are invariant shall not be permitted	 Boolean operations whose results are invariant shall not be permitted. Expression is always true. Boolean operations whose results are invariant shall not be permitted. Expression is always false. Boolean operations whose results are invariant shall not be permitted. 	During compilation, check comparisons with at least one constant operand. Bug Finder and Code Prover check this coding rule differently. The analyses can produce different results. • Bug Finder flags some violations of this rule through the Dead code and Useless if checkers. • Code Prover does not use gray code to flag violations of this rule. In Code Prover, you can also see a difference in results based on your choice for the option Verification level (-to). See "Check for Coding Standard Violations" on page 11-2 The rule violation appears when you check whether an enum variable value lies between its lower and upper bound. The violation appears even if you increment or decrement the variable outside its bounds, for instance, in this for loop condition:

N.	MISRA Definition	Messages in report file	Polyspace Specification
			<pre>enum ec {RED, BLUE, GREEN} for(col=RED; col<=GREEN; col++) {}</pre>
			An enum variable can potentially wrap around when incremented outside its range and the loop condition can be always true. To avoid the rule violation, you can cast the enum to an integer before the comparison, for instance:
			<pre>enum ec {RED, BLUE, GREEN} col; for(col=RED; (int)col<=GREEN; col- {}</pre>

Control Flow

N.	MISRA Definition	Messages in report file	Polyspace Specification
14.1	There shall be no unreachable code.	There shall be no unreachable code.	Bug Finder and Code Prover check this coding rule differently. The analyses can produce different results.
14.2	All non-null statements shall either have at least one side effect however executed, or cause control flow to change	All non-null statements shall either: • have at least one side effect however executed, or • cause control flow to change	

N.	MISRA Definition	Messages in report file	Polyspace Specification
14.3	Before preprocessing, a null statement shall occur on a line by itself; it may be followed by a comment provided that the first character following the null statement is a white-space character.	A null statement shall appear on a line by itself	We assume that a ';' is a null statement when it is the first character on a line (excluding comments). The rule is violated when: • there are some comments before it on the same line. • there is a comment immediately after it • there is something else than a comment after the ';' on the same line.
14.4	The <i>goto</i> statement shall not be used.	The goto statement shall not be used.	
14.5	The <i>continue</i> statement shall not be used.	The continue statement shall not be used.	
14.6	For any iteration statement there shall be at most one break statement used for loop termination	For any iteration statement there shall be at most one break statement used for loop termination	
14.7	A function shall have a single point of exit at the end of the function	A function shall have a single point of exit at the end of the function	
14.8	The statement forming the body of a <i>switch</i> , <i>while</i> , <i>do while</i> or <i>for</i> statement shall be a compound statement	 The body of a do while statement shall be a compound statement. The body of a for statement shall be a compound statement. The body of a switch statement shall be a compound statement 	

N.	MISRA Definition	Messages in report file	Polyspace Specification
14.9	An if (expression) construct shall be followed by a compound statement. The else keyword shall be followed by either a compound statement, or another if statement	 An if (expression) construct shall be followed by a compound statement. The else keyword shall be followed by either a compound statement, or another if statement 	
14.10	All <i>if else if</i> constructs should contain a final <i>else</i> clause.	All if else if constructs should contain a final else clause.	

Switch Statements

N.	MISRA Definition	Messages in report file	Polyspace Specification
15.0	The MISRA C switch syntax shall be used.	switch statements syntax normative restrictions.	Warning on declarations or any statements before the first switch case.
			Warning on label or jump statements in the body of switch cases.
			On the following example, the rule is displayed in the log file at line 3:
			<pre>1 2 switch(index) { 3 var = var + 1; // RULE 15.0 // violated 4case 1:</pre>
			The code between switch statement and first case is checked as dead code by Polyspace. It follows ANSI standard behavior.
			This rule is not considered as a required rule in the MISRA C:2004 rules for generated code. In generated code, if you find a violation of rule 15.0 that does not simultaneously violate a later rule in this group, justify the violation with appropriate comments.

N.	MISRA Definition	Messages in report file	Polyspace Specification
15.1	A switch label shall only be used when the most closely-enclosing compound statement is the body of a switch statement	A switch label shall only be used when the most closely-enclosing compound statement is the body of a switch statement	
15.2	An unconditional <i>break</i> statement shall terminate every non-empty switch clause	An unconditional break statement shall terminate every non-empty switch clause	Warning for each non- compliant case clause.
15.3	The final clause of a <i>switch</i> statement shall be the <i>default</i> clause	The final clause of a switch statement shall be the default clause	
15.4	A <i>switch</i> expression should not represent a value that is effectively Boolean	A switch expression should not represent a value that is effectively Boolean	The use of the option - boolean-types may increase the number of warnings generated.
15.5	Every <i>switch</i> statement shall have at least one <i>case</i> clause	Every switch statement shall have at least one case clause	

Functions

N.	MISRA Definition	Messages in report file	Polyspace Specification
16.1	Functions shall not be defined with variable numbers of arguments.	Function XX should not be defined as varargs.	
16.2	Functions shall not call themselves, either directly or indirectly.	Function %s should not call itself.	Done by Polyspace software (Use the call graph in Polyspace Code Prover). Polyspace also partially checks this rule during the compilation phase.
16.3	Identifiers shall be given for all of the parameters in a function prototype declaration.	Identifiers shall be given for all of the parameters in a function prototype declaration.	Assumes Rule 8.6 is not violated.

N.	MISRA Definition	Messages in report file	Polyspace Specification
16.4	The identifiers used in the declaration and definition of a function shall be identical.	The identifiers used in the declaration and definition of a function shall be identical.	Assumes that rules 8.8 , 8.1 and 16.3 are not violated. All occurrences are detected.
16.5	Functions with no parameters shall be declared with parameter type <i>void</i> .	Functions with no parameters shall be declared with parameter type void.	Definitions are also checked.
16.6	The number of arguments passed to a function shall match the number of parameters.	 Too many arguments to XX. Insufficient number of arguments to XX. 	Assumes that rule 8.1 is not violated. This rule maps to ISO/IEC TS 17961 ID argcomp.
16.7	A pointer parameter in a function prototype should be declared as pointer to const if the pointer is not used to modify the addressed object.	Pointer parameter in a function prototype should be declared as pointer to const if the pointer is not used to modify the addressed object.	Warning if a non-const pointer parameter is either not used to modify the addressed object or is passed to a call of a function that is declared with a const pointer parameter.
16.8	All exit paths from a function with non-void return type shall have an explicit return statement with an expression.	Missing return value for non-void function XX.	Warning when a non-void function is not terminated with an unconditional return with an expression.
16.9	A function identifier shall only be used with either a preceding &, or with a parenthesized parameter list, which may be empty.	Function identifier XX should be preceded by a & or followed by a parameter list.	

N.	MISRA Definition	Messages in report file	Polyspace Specification
16.10	If a function returns error information, then that error information shall be tested.	If a function returns error information, then that error information shall be tested.	Warning if a non-void function is called and the returned value is ignored. No warning if the result of the call is cast to void. No check performed for calls of memcpy, memmove, memset, strcpy, strncpy, strcat, or strncat.

Pointers and Arrays

N.	MISRA Definition	Messages in report file	Polyspace Specification
17.1	Pointer arithmetic shall only be applied to pointers that address an array or array element.	Pointer arithmetic shall only be applied to pointers that address an array or array element.	
17.2	Pointer subtraction shall only be applied to pointers that address elements of the same array	Pointer subtraction shall only be applied to pointers that address elements of the same array.	
17.3	>, >=, <, <= shall not be applied to pointer types except where they point to the same array.	>, >=, <, <= shall not be applied to pointer types except where they point to the same array.	
17.4	Array indexing shall be the only allowed form of pointer arithmetic.	Array indexing shall be the only allowed form of pointer arithmetic.	 Warning on: Operations on pointers. (p +I, I+p, and p-I, where p is a pointer and I an integer). Array indexing on nonarray pointers.

N.	MISRA Definition	Messages in report file	Polyspace Specification
17.5	A type should not contain more than 2 levels of pointer indirection	A type should not contain more than 2 levels of pointer indirection	
17.6	The address of an object with automatic storage shall not be assigned to an object that may persist after the object has ceased to exist.	Pointer to a parameter is an illegal return value. Pointer to a local is an illegal return value.	Warning when assigning address to a global variable, returning a local variable address, or returning a parameter address. This rule maps to ISO/IEC TS 17961 ID accfree.

Structures and Unions

N.	MISRA Definition	Messages in report file	Polyspace Specification
18.1	All structure or union types shall be complete at the end of a translation unit.	All structure or union types shall be complete at the end of a translation unit.	Warning for all incomplete declarations of structs or unions.
18.2	An object shall not be assigned to an overlapping object.	An object shall not be assigned to an overlapping object.	
		Destination and source of XX overlap, the behavior is undefined.	
18.4	Unions shall not be used	Unions shall not be used.	

Preprocessing Directives

N.	MISRA Definition	Messages in report file	Polyspace Specification
19.1	#include statements in a file shall only be preceded by other preprocessors directives or comments	#include statements in a file shall only be preceded by other preprocessors directives or comments	A message is displayed when a #include directive is preceded by other things than preprocessor directives, comments, spaces or "new lines".

N.	MISRA Definition	Messages in report file	Polyspace Specification
19.2	Nonstandard characters should not occur in header file names in #include directives	A message is displayed on characters ', " or /* between < and > in #include <filename></filename>	
		A message is displayed on characters ', or /* between " and " in #include "filename"	
19.3	The #include directive shall be followed by either a <filename> or "filename"</filename>	• '#include' expects "FILENAME" or <filename></filename>	
	sequence.	• '#include_next' expects "FILENAME" or <filename></filename>	

N.	MISRA Definition	Messages in report file	Polyspace Specification
19.4		Macro ' <name>' does not expand to a compliant construct.</name>	We assume that a macro definition does not violate this rule when it expands to: • a braced construct (not necessarily an initializer) • a parenthesized construct (not necessarily an expression) • a number • a character constant • a string constant (can be the result of the concatenation of string field arguments and literal strings)
			the following keywords: typedef, extern, static, auto, register, const, volatile,asm andinline a do-while-zero construct
19.5	Macros shall not be #defined and #undefd within a block.	Macros shall not be #define'd within a block.	
	and a made mann a growth	Macros shall not be #undef'd within a block.	
19.6	#undef shall not be used.	#undef shall not be used.	
19.7	A function should be used in preference to a function likemacro.	A function should be used in preference to a function likemacro	Message on all function-like macro definitions.

N.	MISRA Definition	Messages in report file	Polyspace Specification
19.8	A function-like macro shall not be invoked without all of its arguments	 arguments given to macro '<name>'</name> macro '<name>' used without args.</name> macro '<name>' used with just one arg.</name> macro '<name>' used with too many (<number>) args.</number></name> 	
19.9	Arguments to a function-like macro shall not contain tokens that look like preprocessing directives.	Macro argument shall not look like a preprocessing directive.	This rule is detected as violated when the '#' character appears in a macro argument (outside a string or character constant)
19.10	In the definition of a function- like macro each instance of a parameter shall be enclosed in parentheses unless it is used as the operand of # or ##.	Parameter instance shall be enclosed in parentheses.	If x is a macro parameter, the following instances of x as an operand of the # and ## operators do not generate a warning: #x, ##x, and x##. Otherwise, parentheses are required around x. The software does not generate a warning if a parameter is reused as an argument of a function or function-like macro. For example, consider a parameter x. The software does not generate a warning if x appears as (x) or (x, or ,x) or ,x,.

N.	MISRA Definition	Messages in report file	Polyspace Specification
19.11	All macro identifiers in preprocessor directives shall be defined before use, except in #ifdef and #ifndef preprocessor directives and the defined() operator.	' <name>' is not defined.</name>	
19.12	There shall be at most one occurrence of the # or ## preprocessor operators in a single macro definition.	More than one occurrence of the # or ## preprocessor operators.	
19.13	The # and ## preprocessor operators should not be used	Message on definitions of macros using # or ## operators	
19.14	The defined preprocessor operator shall only be used in one of the two standard forms.	'defined' without an identifier.	
19.15	Precautions shall be taken in order to prevent the contents of a header file being included twice.	Precautions shall be taken in order to prevent multiple inclusions.	When a header file is formatted as, #ifndef <control macro=""> #define <control macro=""> <contents> #endif or, #ifndef <control macro=""> #error #else #define <control macro=""> <contents> #endif it is assumed that precautions have been taken to prevent multiple inclusions. Otherwise, a violation of this MISRA rule is detected.</contents></control></control></contents></control></control>

N.	MISRA Definition	Messages in report file	Polyspace Specification
19.16	Preprocessing directives shall be syntactically meaningful even when excluded by the preprocessor.	directive is not syntactically meaningful.	
19.17	All #else, #elif and #endif preprocessor directives shall reside in the same file as the #if or #ifdef directive to which they are related.	 '#elif' not within a conditional. '#else' not within a conditional. '#elif' not within a conditional. '#endif' not within a conditional. unbalanced '#endif'. unterminated '#if' conditional. unterminated '#ifdef' conditional. unterminated '#ifndef' conditional. 	

Standard Libraries

N.	MISRA Definition	Messages in report file	Polyspace Specification
20.1	Reserved identifiers, macros and functions in the standard library, shall not be defined, redefined or undefined.	 The macro '<name> shall not be redefined.</name> The macro '<name> shall not be undefined.</name> 	

N.	MISRA Definition	Messages in report file	Polyspace Specification
20.2	The names of standard library macros, objects and functions shall not be reused.		In case a macro whose name corresponds to a standard library macro, object or function is defined, the rule that is detected as violated is 20.1 .
			Tentative definitions are considered as definitions. For objects with file scope, tentative definitions are declarations that:
			Do not have initializers.
			Do not have storage class specifiers, or have the static specifier

N.	MISRA Definition	Messages in report file	Polyspace Specification
20.3	The validity of values passed to library functions shall be checked.	Validity of values passed to library functions shall be checked	Warning for argument in library function call if the following are all true:
			Argument is a local variable
			Local variable is not tested between last assignment and call to the library function
			Library function is a common mathematical function
			Corresponding parameter of the library function has a restricted input domain.
			The library function can be one of the following: sqrt, tan, pow, log, log10, fmod, acos, asin, acosh, atanh, or atan2.
			Bug Finder and Code Prover check this rule differently. The analysis can produce different results.
20.4	Dynamic heap memory allocation shall not be used.	• The macro ' <name> shall not be used.</name>	In case the dynamic heap memory allocation functions
		Identifier XX should not be used.	macro is expanded in the code, this rule is detected as violated. Assumes rule 20.2 is not violated.
20.5	The error indicator errno shall not be used	The error indicator errno shall not be used	Assumes that rule 20.2 is not violated

N.	MISRA Definition	Messages in report file	Polyspace Specification
20.6	The macro <i>offsetof</i> , in library <stddef.h>, shall not be used.</stddef.h>	 The macro '<name> shall not be used.</name> Identifier XX should not be used. 	Assumes that rule 20.2 is not violated
20.7	The setjmp macro and the longjmp function shall not be used.	 The macro '<name> shall not be used.</name> Identifier XX should not be used. 	In case the longjmp function is actually a macro and the macro is expanded in the code, this rule is detected as violated. Assumes that rule 20.2 is not violated
20.8	The signal handling facilities of <signal.h> shall not be used.</signal.h>	 The macro '<name> shall not be used.</name> Identifier XX should not be used. 	In case some of the signal functions are actually macros and are expanded in the code, this rule is detected as violated. Assumes that rule 20.2 is not violated
20.9	The input/output library <stdio.h> shall not be used in production code.</stdio.h>	 The macro '<name> shall not be used.</name> Identifier XX should not be used. 	In case the input/output library functions are actually macros and are expanded in the code, this rule is detected as violated. Assumes that rule 20.2 is not violated
20.10	The library functions atof, atoi and atoll from library <stdlib.h> shall not be used.</stdlib.h>	 The macro '<name> shall not be used.</name> Identifier XX should not be used. 	In case the atof, atoi and atoll functions are actually macros and are expanded, this rule is detected as violated. Assumes that rule 20.2 is not violated
20.11	The library functions abort, exit, getenv and system from library <stdlib.h> shall not be used.</stdlib.h>	 The macro '<name> shall not be used.</name> Identifier XX should not be used. 	In case the abort, exit, getenv and system functions are actually macros and are expanded, this rule is detected as violated. Assumes that rule 20.2 is not violated

N.	MISRA Definition	Me	essages in report file	Polyspace Specification
20.12	The time handling functions of library <time.h> shall not be used.</time.h>		not be used. Identifier XX should not be used.	In case the time handling functions are actually macros and are expanded, this rule is detected as violated. Assumes that rule 20.2 is not violated

Runtime Failures

N.	MISRA Definition	Messages in report file	Polyspace Specification
21.1	Minimization of runtime failures shall be ensured by the use of at least one of: • static verification tools/ techniques; • dynamic verification tools/ techniques; • explicit coding of checks to handle runtime faults.		Done by Polyspace. Bug Finder and Code Prover check this coding rule differently. The analyses can produce different results. In Code Prover, you can also see a difference in results based on your choice for the option Verification level (-to). See "Check for Coding Standard Violations" on page 11-2

Unsupported MISRA C:2004 and MISRA AC AGC Rules

The Polyspace coding rules checker does not check the following MISRA C:2004 coding rules. These rules cannot be enforced because they are outside the scope of Polyspace software. They may concern documentation, dynamic aspects, or functional aspects of MISRA rules. The "**Polyspace Specification**" column describes the reason each rule is not checked.

Environment

Rule	Description	Polyspace Specification
` ± ′	1	Not statically checkable unless the data dynamic properties is taken into account

Rule	Description	Polyspace Specification
1.3 (Required)	Multiple compilers and/or languages shall only be used if there is a common defined interface standard for object code to which the language/compilers/assemblers conform.	It is a process rule method.
1.4 (Required)	The compiler/linker/Identifiers (internal and external) shall not rely on significance of more than 31 characters. Furthermore the compiler/linker shall be checked to ensure that 31 character significance and case sensitivity are supported for external identifiers.	compiler documentation.
1.5 (Advisory)	Floating point implementations should comply with a defined floating point standard.	To observe this rule, check your compiler documentation.

Language Extensions

Rule	Description	Polyspace Specification
2.4 (Advisory)	"commented out"	One way a tool can check this rule is to determine if the code compiles when commented out sections are uncommented. However, such checking can be expensive and inaccurate.

Documentation

Rule	Description	Polyspace Specification
3.1 (Required)	All usage of implementation-defined behavior shall be documented.	To observe this rule, check your compiler documentation. Error detection is based on undefined behavior, according to choices made for implementation- defined constructions.
3.2 (Required)	The character set and the corresponding encoding shall be documented.	To observe this rule, check your compiler documentation.

Rule	Description	Polyspace Specification
3.3 (Advisory)	The implementation of integer division in the chosen compiler should be determined, documented and taken into account.	To observe this rule, check your compiler documentation.
3.5 (Required)	The implementation-defined behavior and packing of bitfields shall be documented if being relied upon.	To observe this rule, check your compiler documentation.
3.6 (Required)	All libraries used in production code shall be written to comply with the provisions of this document, and shall have been subject to appropriate validation.	To observe this rule, check your compiler documentation.

Structures and Unions

Rule Description		Polyspace Specification
` - '	An area of memory shall not be reused for unrelated purposes.	"purpose" is functional design issue.

Polyspace MISRA C:2012 Checkers

The Polyspace MISRA C:2012 checker helps you to comply with the MISRA C 2012 coding standard.²

When MISRA C:2012 guidelines are violated, the Polyspace MISRA C:2012 checker provides messages with information about the violated rule or directive. Most violations are found during the compile phase of an analysis.

Polyspace Bug Finder can check all the MISRA C:2012 rules and most MISRA C:2012 directives. Polyspace Code Prover does not support checking of the following:

- MISRA C:2012 Dir 4.7, 4.13 and 4.14
- MISRA C:2012 Rule 21.13, 21.14, and 21.17 21.20
- MISRA C:2012 Rule 22.1 22.4 and 22.6 22.10

Each guideline is categorized into one of these three categories: mandatory, required, or advisory. When you set up rule checking, you can select subsets of these categories to check. For automatically generated code, some rules change categories, including to one additional category: readability. The Use generated code requirements (-misra3-agc-mode) option activates the categorization for automatically generated code.

There are additional subsets of MISRA C:2012 guidelines defined by Polyspace called Software Quality Objectives (SQO) that can have a direct or indirect impact on the precision of your results. When you set up checking, you can select these subsets. These subsets are defined in "Software Quality Objective Subsets (C:2012)" on page 11-32.

Essential Types in MISRA C: 2012 Rules 10.x

MISRA C: 2012 rules 10.x classify data types in categories. The rules treat data types in the same category as essentially similar.

For instance, the data types float, double and long double are considered as essentially floating. Rule 10.1 states that the % operation must not have essentially floating operands. This statement implies that the operands cannot have one of these three data types: float, double and long double.

Categories of Essential Types

The essential types fall in these categories:

Essential type category	Standard types	
Essentially Boolean	bool or _Bool (defined in stdbool.h)	
	If you define a boolean type through a typedef, you must specify this type name before coding rules checking. For more information, see Effective boolean types (-boolean-types).	
Essentially character	char	
Essentially enum	named enum	
Essentially signed	signed char, signed short, signed int, signed long, signed long	
Essentially unsigned	unsigned char, unsigned short, unsigned int, unsigned long, unsigned long	
Essentially floating	float, double, long double	

How MISRA C: 2012 Uses Essential Types

These rules use essential types in their statements:

• MISRA C: 2012 Rule 10.1: Operands shall not be of an inappropriate essential type.

For instance, the right operand of the << or >> operator must be essentially unsigned. Otherwise, negative values can cause undefined behavior.

MISRA C: 2012 Rule 10.2: Expressions of essentially character type shall not be used inappropriately in addition and subtraction operations.

For instance, the type char does not represent numeric values. Do not use a variable of this type in addition and subtraction operations.

• MISRA C: 2012 Rule 10.3: The value of an expression shall not be assigned to an object with a narrower essential type or of a different essential type category.

For instance, do not assign a variable of data type double to a variable with the narrower data type float.

MISRA C: 2012 Rule 10.4: Both operands of an operator in which the usual arithmetic conversions are performed shall have the same essential type category.

For instance, do not perform an addition operation with a signed int operand, which belongs to the essentially signed category, and an unsigned int operand, which belongs to the essentially unsigned category.

• MISRA C: 2012 Rule 10.5: The value of an expression should not be cast to an inappropriate essential type.

For instance, do not perform a cast between essentially floating types and essentially character types.

MISRA C: 2012 Rule 10.6: The value of a composite expression shall not be assigned to an object with wider essential type.

For instance, if a multiplication, binary addition or bitwise operation involves unsigned char operands, do not assign the result to a variable having the wider type unsigned int.

MISRA C: 2012 Rule 10.7: If a composite expression is used as one operand of an operator in which the usual arithmetic conversions are performed then the other operand shall not have wider essential type.

For instance, if one operand of an addition operation is a composite expression with two unsigned char operands, the other operand must not have the wider type unsigned int.

Unsupported MISRA C:2012 Guidelines

The Polyspace coding rules checker does not check the following MISRA C:2012 directives. These directives are not checked either in Bug Finder or Code Prover. These directives cannot be enforced because they are outside the scope of Polyspace software. These guidelines concern documentation, dynamic aspects, or functional aspects of MISRA rules.

For the list of supported rules and directives, see "MISRA C:2012 Directives and Rules".

Number	Category	AGC Category	Definition
Directive 3.1	Required	Required	All code shall be traceable to documented requirements
Directive 4.2	Advisory	Advisory	All usage of assembly language should be documented
Directive 4.4	Advisory	Advisory	Sections of code should not be "commented out"
Directive 4.12	Required	Required	Dynamic memory allocation shall not be used

Polyspace MISRA C++ Checkers

The Polyspace MISRA C++ checker helps you comply with the MISRA C++:2008 coding standard.³

When MISRA C++ rules are violated, the Polyspace software provides messages with information about why the code violates the rule. Most violations are found during the compile phase of an analysis. The MISRA C++ checker can check 202 of the 230 MISRA C++ coding rules.

There are subsets of MISRA C++ coding rules that can have a direct or indirect impact on the selectivity (reliability percentage) of your results. When you set up rule checking, you can select these subsets directly. These subsets are defined in "Software Quality Objective Subsets (C++)" on page 11-37.

Note The Polyspace MISRA C++ checker is based on MISRA C++:2008 - "Guidelines for the use of the C++ language in critical systems."

"Library Introduction" on page 12-60

Polyspace does not check the following MISRAC++ coding rules. These rules are not checked either in Bug Finder or Code Prover. Some of these rules cannot be enforced because they are outside the scope of Polyspace software. The rules concern documentation, dynamic aspects, or functional aspects of MISRA rules.

For the list of supported rules, see "MISRA C++:2008 Rules".

Language Independent Issues

N.	Category	MISRA Definition	Polyspace Specification
0-1-4	Required	A project shall not contain non-volatile POD variables having only one use.	
0-1-6	Required	A project shall not contain instances of non-volatile variables being given values that are never subsequently used.	
0-1-8	Required	All functions with void return type shall have external side effects.	

N.	Category	MISRA Definition	Polyspace Specification
0-3-1	Required	Minimization of run-time failures shall be ensured by the use of at least one of: (a) static analysis tools/techniques; (b) dynamic analysis tools/techniques; (c) explicit coding of checks to handle run-time faults.	
0-3-2	Required	If a function generates error information, then that error information shall be tested.	
0-4-1	Document	Use of scaled-integer or fixed-point arithmetic shall be documented.	To observe this rule, check your compiler documentation.
0-4-2	Document	Use of floating-point arithmetic shall be documented.	To observe this rule, check your compiler documentation.
0-4-3	Document	Floating-point implementations shall comply with a defined floating-point standard.	To observe this rule, check your compiler documentation.

General

N.	Category	MISRA Definition	Polyspace Specification
1-0-2		Multiple compilers shall only be used if they have a common, defined interface.	To observe this rule, check your compiler documentation.
1-0-3			To observe this rule, check your compiler documentation.

Lexical Conventions

N.	Category	MISRA Definition	Polyspace Specification
2-2-1			To observe this rule, check your compiler documentation.

N.	Category	MISRA Definition	Polyspace Specification
2-7-2	Required	Sections of code shall not be "commented out" using C-style comments.	One way a tool can check this rule is to determine if the code compiles when commented out sections are uncommented. However, such checking can be expensive and inaccurate.
2-7-3	Advisory	Sections of code should not be "commented out" using C++ comments.	One way a tool can check this rule is to determine if the code compiles when commented out sections are uncommented. However, such checking can be expensive and inaccurate.

Expressions

N.	Category	MISRA Definition	Polyspace Specification
5-0-16	Required	A pointer operand and any pointer resulting from pointer arithmetic using that operand shall both address elements of the same array.	
5-17-1	Required	The semantic equivalence between a binary operator and its assignment operator form shall be preserved.	

Declarations

N.		MISRA Definition	Polyspace Specification
7-2-1	-	An expression with enum underlying type shall only have values corresponding to the enumerators of the enumeration.	
7-4-1	Document	All usage of assembler shall be documented.	To observe this rule, check your compiler documentation.

Classes

N.	Category	MISRA Definition	Polyspace Specification
9-6-1		When the absolute positioning of bits representing a bit-field is required, then the behavior and packing of bit-fields shall be documented.	compiler documentation.

Templates

N.		MISRA Definition	Polyspace Specification
14-5-1	Required	A non-member generic function shall only be declared in a namespace that is not an associated namespace.	
14-7-1	Required	All class templates, function templates, class template member functions and class template static members shall be instantiated at least once.	
14-7-2	Required	For any given template specialization, an explicit instantiation of the template with the template-arguments used in the specialization shall not render the program ill-formed.	

Exception Handling

N.	Category	MISRA Definition	Polyspace Specification
15-0-1	Document	Exceptions shall only be used for error handling.	To observe this rule, check your compiler documentation.
15-1-1	Required	The assignment-expression of a throw statement shall not itself cause an exception to be thrown.	

N.	Category	MISRA Definition	Polyspace Specification
15-3-1	Required	Exceptions shall be raised only after start-up and before termination of the program.	
15-3-4	Required	Each exception explicitly thrown in the code shall have a handler of a compatible type in all call paths that could lead to that point.	

Library Introduction

N.	Category	MISRA Definition	Polyspace Specification
17-0-3	Required	The names of standard library functions shall not be overridden.	
17-0-4	Required		To observe this rule, check your compiler documentation.

Polyspace JSF C++ Checkers

The Polyspace JSF C++ checker helps you comply with the Joint Strike Fighter® Air Vehicle C++ coding standards (JSF++). These coding standards were developed by Lockheed Martin® for the Joint Strike Fighter program. They are designed to improve the robustness of C++ code, and improve maintainability.

4

When JSF++ rules are violated, the Polyspace JSF C++ checker enables Polyspace software to provide messages with information about the rule violations. Most messages are reported during the compile phase of an analysis.

Note The Polyspace JSF C++ checker is based on JSF++:2005.

^{4.} JSF and Joint Strike Fighter are Lockheed Martin.

JSF C++ Coding Rules

Supported JSF C++ Coding Rules

Code Size and Complexity

N.	JSF++ Definition	Polyspace Specification
1	Any one function (or method) will contain no more than 200 logical source lines of code (L-SLOCs).	Message in report file: <function name=""> has <num> logical source lines of code.</num></function>
3	All functions shall have a cyclomatic complexity number of 20 or less.	Message in report file: <function name=""> has cyclomatic complexity number equal to <num>.</num></function>

Environment

N.	JSF++ Definition	Polyspace Specification
8	All code shall conform to ISO/IEC 14882:2002(E) standard C++.	Reports the compilation error message
9	Only those characters specified in the C++ basic source character set will be used.	
11	Trigraphs will not be used.	
12	The following digraphs will not be used: <%, %>, <:, :>, %:, %:%:.	Message in report file: The following digraph will not be used: <digraph>. Reports the digraph. If the rule level is set to warning, the digraph will be allowed even if it is not supported in -compiler iso.</digraph>
13	Multi-byte characters and wide string literals will not be used.	Report L'c', L"string", and use of wchar_t.
14	Literal suffixes shall use uppercase rather than lowercase letters.	

N.	JSF++ Definition	Polyspace Specification
	Provision shall be made for run-time checking (defensive programming).	Done with checks in the software.

Libraries

N.	JSF++ Definition	Polyspace Specification
17	The error indicator errno shall not be used.	errno should not be used as a macro or a global with external "C" linkage.
18	The macro offsetof, in library <pre><stddef.h>, shall not be used.</stddef.h></pre>	offsetof should not be used as a macro or a global with external "C" linkage.
19	<pre><locale.h> and the setlocale function shall not be used.</locale.h></pre>	setlocale and localeconv should not be used as a macro or a global with external "C" linkage.
20	The setjmp macro and the longjmp function shall not be used.	setjmp and longjmp should not be used as a macro or a global with external "C" linkage.
21	The signal handling facilities of <signal.h> shall not be used.</signal.h>	signal and raise should not be used as a macro or a global with external "C" linkage.
22	The input/output library <stdio.h> shall not be used.</stdio.h>	all standard functions of <stdio.h> should not be used as a macro or a global with external "C" linkage.</stdio.h>
23	The library functions atof, atoi and atol from library <stdlib.h> shall not be used.</stdlib.h>	atof, atoi and atol should not be used as a macro or a global with external "C" linkage.
24	The library functions abort, exit, getenv and system from library <stdlib.h> shall not be used.</stdlib.h>	abort, exit, getenv and system should not be used as a macro or a global with external "C" linkage.
25	The time handling functions of library <pre><time.h> shall not be used.</time.h></pre>	clock, difftime, mktime, asctime, ctime, gmtime, localtime and strftime should not be used as a macro or a global with external "C" linkage.

Pre-Processing Directives

N.	JSF++ Definition	Polyspace Specification
26	Only the following preprocessor directives shall be used: #ifndef , #define , #endif , #include .	
27	#ifndef, #define and #endif will be used to prevent multiple inclusions of the same header file. Other techniques to prevent the multiple inclusions of header files will not be used.	Detects the patterns #if !defined, #pragma once, #ifdef, and missing #define.
28	The #ifndef and #endif preprocessor directives will only be used as defined in AV Rule 27 to prevent multiple inclusions of the same header file.	Detects any use that does not comply with AV Rule 27. Assuming 35/27 is not violated, reports only #ifndef.
29	The #define preprocessor directive shall not be used to create inline macros. Inline functions shall be used instead.	Rule is split into two parts: the definition of a macro function (29.def) and the call of a macrofunction (29.use). Messages in report file: 29.1: The #define preprocessor directive shall not be used to create inline macros. 29.2: Inline functions shall be used instead of inline macros.
30	The #define preprocessor directive shall not be used to define constant values. Instead, the const qualifier shall be applied to variable declarations to specify constant values.	Reports #define of simple constants.
31	The #define preprocessor directive will only be used as part of the technique to prevent multiple inclusions of the same header file.	Detects use of #define that are not used to guard for multiple inclusion, assuming that rules 35 and 27 are not violated.
32	The #include preprocessor directive will only be used to include header (*.h) files.	

Header Files

N.	JSF++ Definition	Polyspace Specification
33	The #include directive shall use the <filename.h> notation to include header files.</filename.h>	
35	A header file will contain a mechanism that prevents multiple inclusions of itself.	
39	Header files (*.h) will not contain non- const variable definitions or function definitions.	Reports definitions of global variables / function in header.

Style

N.	JSF++ Definition	Polyspace Specification
40	Every implementation file shall include the header files that uniquely define the inline functions, types, and templates used.	Reports when type, template, or inline function is defined in source file. Bug Finder and Code Prover check this coding rule differently. The analyses can produce different results.
41	Source lines will be kept to a length of 120 characters or less.	
42	Each expression-statement will be on a separate line.	Reports when two consecutive expression statements are on the same line.
43	Tabs should be avoided.	
44	All indentations will be at least two spaces and be consistent within the same source file.	Reports when a statement indentation is not at least two spaces more than the statement containing it. Does not report bad indentation between opening braces following if/else, do/while, for, and while statements. NB: in final release it will accept any indentation
46	User-specified identifiers (internal and external) will not rely on significance of more than 64 characters.	

N.	JSF++ Definition	Polyspace Specification
47	Identifiers will not begin with the underscore character '_'.	
48	 Identifiers will not differ by: Only a mixture of case The presence/absence of the underscore character The interchange of the letter 'O'; with the number '0' or the letter 'D' The interchange of the letter 'I'; with the number '1' or the letter 'I' The interchange of the letter 'S' with the number '5' The interchange of the letter 'Z' with the number 2 The interchange of the letter 'n' with the letter 'h' 	Checked regardless of scope. Not checked between macros and other identifiers. Messages in report file: Identifier Idf1 (file1.cpp line l1 column c1) and Idf2 (file2.cpp line l2 column c2) only differ by the presence/absence of the underscore character. Identifier Idf1 (file1.cpp line l1 column c1) and Idf2 (file2.cpp line l2 column c2) only differ by a mixture of case. Identifier Idf1 (file1.cpp line l1 column c1) and Idf2 (file2.cpp line l2 column c2) only differ by line l2 column c2) only differ by letter 0, with the number 0.
50	The first word of the name of a class, structure, namespace, enumeration, or type created with typedef will begin with an uppercase letter. All others letters will be lowercase.	 Messages in report file: The first word of the name of a class will begin with an uppercase letter. The first word of the namespace of a class will begin with an uppercase letter. Bug Finder and Code Prover check this coding rule differently. The analyses can produce different results.

N.	JSF++ Definition	Polyspace Specification
51	All letters contained in function and variables names will be composed entirely of lowercase letters.	 Messages in report file: All letters contained in variable names will be composed entirely of lowercase letters. All letters contained in function names will be composed entirely of lowercase letters.
52	Identifiers for constant and enumerator values shall be lowercase.	 Messages in report file: Identifier for enumerator value shall be lowercase. Identifier for template constant parameter shall be lowercase.
53	Header files will always have file name extension of ".h".	.H is allowed if you set the option -dos.
53.1	The following character sequences shall not appear in header file names: ', /*, //, or ".	
54	Implementation files will always have a file name extension of ".cpp".	Not case sensitive if you set the option -dos.
57	The public, protected, and private sections of a class will be declared in that order.	
58	When declaring and defining functions with more than two parameters, the leading parenthesis and the first argument will be written on the same line as the function name. Each additional argument will be written on a separate line (with the closing parenthesis directly after the last argument).	Detects that two parameters are not on the same line, The first parameter should be on the same line as function name. Does not check for the closing parenthesis.

N.	JSF++ Definition	Polyspace Specification
59	The statements forming the body of an if, else if, else, while, do while or for statement shall always be enclosed in braces, even if the braces form an empty block.	 Messages in report file: The statements forming the body of an if statement shall always be enclosed in braces. The statements forming the body of an else statement shall always be enclosed in braces. The statements forming the body of a while statement shall always be enclosed in braces. The statements forming the body of a do while statement shall always be enclosed in braces. The statements forming the body of a for statement shall always be enclosed in braces.
60	Braces ("{}") which enclose a block will be placed in the same column, on separate lines directly before and after the block.	Detects that statement-block braces should be in the same columns.
61	Braces ("{}") which enclose a block will have nothing else on the line except comments.	
62	The dereference operator '*' and the address-of operator '&' will be directly connected with the type-specifier.	Reports when there is a space between type and "*" "&" for variables, parameters and fields declaration.

N.	JSF++ Definition	Polyspace Specification
63	Spaces will not be used around '.' or '->', nor between unary operators and operands.	Reports when the following characters are not directly connected to a white space:
		• .
		• ->
		• !
		• ~
		• -
		• ++
		• _
		Note that a violation will be reported for "." used in float/double definition.

Classes

N.	JSF++ Definition	Polyspace Specification
67	Public and protected data should only be used in structs - not classes.	
68	Unneeded implicitly generated member functions shall be explicitly disallowed.	Reports when default constructor, assignment operator, copy constructor or destructor is not declared.
71.1	A class's virtual functions shall not be invoked from its destructor or any of its constructors.	Reports when a constructor or destructor directly calls a virtual function.
74	Initialization of nonstatic class members will be performed through the member initialization list rather than through assignment in the body of a constructor.	All data should be initialized in the initialization list except for array. Does not report that an assignment exists in ctor body.
		Message in report file: Initialization of nonstatic class members " <field>" will be performed through the member initialization list.</field>

N.	JSF++ Definition	Polyspace Specification
75	Members of the initialization list shall be listed in the order in which they are declared in the class.	
76	A copy constructor and an assignment operator shall be declared for classes that contain pointers to data items or nontrivial destructors.	Messages in report file: • no copy constructor and no copy assign • no copy constructor • no copy assign Bug Finder and Code Prover check this coding rule differently. The analyses can produce different results.
77.1	The definition of a member function shall not contain default arguments that produce a signature identical to that of the implicitly-declared copy constructor for the corresponding class/structure.	Does not report when an explicit copy constructor exists.
78	All base classes with a virtual function shall define a virtual destructor.	
79	All resources acquired by a class shall be released by the class's destructor.	Reports when the number of "new" called in a constructor is greater than the number of "delete" called in its destructor.
		Note A violation is raised even if "new" is done in a "if/else".

N.	JSF++ Definition	Polyspace Specification
81	The assignment operator shall handle self-assignment correctly	Reports when copy assignment body does not begin with "if (this != arg)"
		A violation is not raised if an empty else statement follows the if, or the body contains only a return statement.
		A violation is raised when the if statement is followed by a statement other than the return statement.
82	An assignment operator shall return a reference to *this.	The following operators should return *this on method, and *first_arg on plain function.
		operator=operator+=operator- =operator*=operator >>=operator <<=operator /=operator %=operator =operator &=operator ^=prefix operator++ prefix operator
		Does not report when no return exists.
		No special message if type does not match.
		Messages in report file:
		An assignment operator shall return a reference to *this.
		An assignment operator shall return a reference to its first arg.
83	An assignment operator shall assign all data members and bases that affect the class invariant (a data element representing a cache, for example, would not need to be copied).	Reports when a copy assignment does not assign all data members. In a derived class, it also reports when a copy assignment does not call inherited copy assignments.

N.	JSF++ Definition	Polyspace Specification
88	Multiple inheritance shall only be allowed in the following restricted form: n interfaces plus m private implementations, plus at most one protected implementation.	 Messages in report file: Multiple inheritance on public implementation shall not be allowed: <public_base_class> is not an interface.</public_base_class> Multiple inheritance on protected implementation shall not be allowed: <protected_base_class_1>.</protected_base_class_1> <protected_base_class_2> are not interfaces.</protected_base_class_2>
88.1	A stateful virtual base shall be explicitly declared in each derived class that accesses it.	
89	A base class shall not be both virtual and nonvirtual in the same hierarchy.	
94	An inherited nonvirtual function shall not be redefined in a derived class.	Does not report for destructor. Message in report file: Inherited nonvirtual function %s shall not be redefined in a derived class.
95	An inherited default parameter shall never be redefined.	
96	Arrays shall not be treated polymorphically.	Reports pointer arithmetic and array like access on expressions whose pointed type is used as a base class.
97	Arrays shall not be used in interface.	Only to prevent array-to-pointer-decay. Not checked on private methods
97.1	Neither operand of an equality operator (== or !=) shall be a pointer to a virtual member function.	Reports == and != on pointer to member function of polymorphic classes (cannot determine statically if it is virtual or not), except when one argument is the null constant.

Namespaces

N.	JSF++ Definition	Polyspace Specification
98	Every nonlocal name, except main(), should be placed in some namespace.	Bug Finder and Code Prover check this coding rule differently. The analyses can produce different results.
99	Namespaces will not be nested more than two levels deep.	

Templates

N.	JSF++ Definition	Polyspace Specification
104	A template specialization shall be declared before its use.	Reports the actual compilation error message.

Functions

N.	JSF++ Definition	Polyspace Specification
107	Functions shall always be declared at file scope.	
108	Functions with variable numbers of arguments shall not be used.	
109	A function definition should not be placed in a class specification unless the function is intended to be inlined.	Reports when "inline" is not in the definition of a member function inside the class definition.
110	Functions with more than 7 arguments will not be used.	
111	A function shall not return a pointer or reference to a non-static local object.	Simple cases without alias effect detected.
113	Functions will have a single exit point.	Reports first return, or once per function.
114	All exit points of value-returning functions shall be through return statements.	

N.	JSF++ Definition	Polyspace Specification
116	Small, concrete-type arguments (two or three words in size) should be passed by value if changes made to formal parameters should not be reflected in the calling function.	Report constant parameters references with sizeof <= 2 * sizeof(int). Does not report for copy-constructor.
119	Functions shall not call themselves, either directly or indirectly (i.e. recursion shall not be allowed).	Direct recursion is reported statically. Indirect recursion reported through the software. Message in report file: Function <f> shall not call directly itself.</f>
121	Only functions with 1 or 2 statements should be considered candidates for inline functions.	Reports inline functions with more than 2 statements.

Comments

N.	JSF++ Definition	Polyspace Specification
126	Only valid C++ style comments (//) shall be used.	
133	Every source file will be documented with an introductory comment that provides information on the file name, its contents,	Reports when a file does not begin with two comment lines.
	and any program-required information (e.g. legal statements, copyright information, etc).	Note : This rule cannot be annotated in the source code.

Declarations and Definitions

N.	JSF++ Definition	Polyspace Specification
	the same name as an identifier in an outer	Bug Finder and Code Prover check this coding rule differently. The analyses can produce different results.

N.	JSF++ Definition	Polyspace Specification
136	Declarations should be at the smallest feasible scope.	 Reports when: A global variable is used in only one function. A local variable is not used in a statement (expr, return, init) of the same level of its declaration (in the same block) or is not used in two substatements of its declaration.
		 Non-used variables are reported. Initializations at definition are ignored (not considered an access)
137	All declarations at file scope should be static where possible.	
138	Identifiers shall not simultaneously have both internal and external linkage in the same translation unit.	
139	External objects will not be declared in more than one file.	Reports all duplicate declarations inside a translation unit. Reports when the declaration localization is not the same in all translation units.
140	The register storage class specifier shall not be used.	
141	A class, structure, or enumeration will not be declared in the definition of its type.	

Initialization

N.	JSF++ Definition	Polyspace Specification
142		Done with Non-initialized variable checks in the software.

N.	JSF++ Definition	Polyspace Specification
144	Braces shall be used to indicate and match the structure in the non-zero initialization of arrays and structures.	This covers partial initialization.
145	In an enumerator list, the '=' construct shall not be used to explicitly initialize members other than the first, unless all items are explicitly initialized.	Generates one report for an enumerator list.

Types

N.	JSF++ Definition	Polyspace Specification
	The underlying bit representations of floating point numbers shall not be used in any way by the programmer.	Reports on casts with float pointers (except with void*).
148	Enumeration types shall be used instead of integer types (and constants) to select from a limited series of choices.	Reports when non enumeration types are used in switches.

Constants

N.	JSF++ Definition	Polyspace Specification
149	Octal constants (other than zero) shall not be used.	
150	Hexadecimal constants will be represented using all uppercase letters.	
151	Numeric values in code will not be used; symbolic values will be used instead.	Reports direct numeric constants (except integer/float value 1, 0) in expressions, non -const initializations. and switch cases. char constants are allowed. Does not report on templates non-type parameter. Bug Finder and Code Prover check this coding rule differently. The analyses can produce different results.

N.	JSF++ Definition	Polyspace Specification
151.1		Report when a char*, char[], or string type is used not as const.
		A violation is raised if a string literal (for example, " ") is cast as a non const.

Variables

N.	JSF++ Definition	Polyspace Specification
152	Multiple variable declarations shall not be allowed on the same line.	

Unions and Bit Fields

N.	JSF++ Definition	Polyspace Specification
153	Unions shall not be used.	
154	Bit-fields shall have explicitly unsigned integral or enumeration types only.	
156	All the members of a structure (or class) shall be named and shall only be accessed via their names.	Reports unnamed bit-fields (unnamed fields are not allowed).

Operators

N.	JSF++ Definition	Polyspace Specification
157	The right hand operand of a && or operator shall not contain side effects.	Assumes rule 159 is not violated.
		Messages in report file:
		• The right hand operand of a && operator shall not contain side effects.
		The right hand operand of a operator shall not contain side effects.

N.	JSF++ Definition	Polyspace Specification
158	The operands of a logical && or shall be parenthesized if the operands contain binary operators.	 Messages in report file: The operands of a logical && shall be parenthesized if the operands contain binary operators. The operands of a logical shall be parenthesized if the operands contain binary operators. Exception for: X Y Z , Z&&Y &&Z
159	Operators , &&, and unary & shall not be overloaded.	 Messages in report file: Unary operator & shall not be overloaded. Operator shall not be overloaded. Operator && shall not be overloaded.
160	An assignment expression shall be used only as the expression in an expression statement.	Only simple assignment, not +=, ++, etc.
162	Signed and unsigned values shall not be mixed in arithmetic or comparison operations.	
163	Unsigned arithmetic shall not be used.	
164	The right hand operand of a shift operator shall lie between zero and one less than the width in bits of the left-hand operand (inclusive).	
164.1	The left-hand operand of a right-shift operator shall not have a negative value.	Detects constant case +. Found by the software for dynamic cases.
165	The unary minus operator shall not be applied to an unsigned expression.	
166	The sizeof operator will not be used on expressions that contain side effects.	
168	The comma operator shall not be used.	

Pointers and References

N.	JSF++ Definition	Polyspace Specification
169	Pointers to pointers should be avoided when possible.	Reports second-level pointers, except for arguments of main.
170	More than 2 levels of pointer indirection shall not be used.	Only reports on variables/parameters.
171	Relational operators shall not be applied to pointer types except where both operands are of the same type and point to: • the same object,	Reports when relational operator are used on pointer types (casts ignored).
	• the same function,	
	members of the same object, or	
	• elements of the same array (including one past the end of the same array).	
173	The address of an object with automatic storage shall not be assigned to an object which persists after the object has ceased to exist.	
174	The null pointer shall not be de-referenced.	Done with checks in software.
175	A pointer shall not be compared to NULL or be assigned NULL; use plain 0 instead.	Reports usage of NULL macro in pointer contexts.
176	A typedef will be used to simplify program syntax when declaring function pointers.	Reports non-typedef function pointers, or pointers to member functions for types of variables, fields, parameters. Returns type of function, cast, and exception specification.

Type Conversions

N.	JSF++ Definition	Polyspace Specification
177	User-defined conversion functions should be avoided.	Reports user defined conversion function, non-explicit constructor with one parameter or default value for others (even undefined ones).
		Does not report copy-constructor.
		Additional message for constructor case:
		This constructor should be flagged as "explicit".
178	Down casting (casting from base to derived class) shall only be allowed through one of the following mechanism:	Reports explicit down casting, dynamic_cast included. (Visitor patter does not have a special case.)
	Virtual functions that act like dynamic casts (most likely useful in relatively simple cases).	
	• Use of the visitor (or similar) pattern (most likely useful in complicated cases).	
179	A pointer to a virtual base class shall not be converted to a pointer to a derived class.	Reports this specific down cast. Allows dynamic_cast.

N.	JSF++ Definition	Polyspace Specification
180	Implicit conversions that may result in a loss of information shall not be used.	Reports the following implicit casts: integer => smaller integer unsigned => smaller or eq signed signed => smaller or eq un-signed integer => float float => integer Does not report for cast to bool reports for implicit cast on constant done with the option -scalar-overflows-checks signed-and-unsigned Bug Finder and Code Prover check this coding rule differently. The analyses can produce different results.
181	Redundant explicit casts will not be used.	Reports useless cast: cast T to T. Casts to equivalent typedefs are also reported.
182	Type casting from any type to or from pointers shall not be used.	Does not report when Rule 181 applies.
184	Floating point numbers shall not be converted to integers unless such a conversion is a specified algorithmic requirement or is necessary for a hardware interface.	Reports float->int conversions. Does not report implicit ones.
185	C++ style casts (const_cast, reinterpret_cast, and static_cast) shall be used instead of the traditional C-style casts.	

Flow Control Standards

N.	JSF++ Definition	Polyspace Specification
186		Done with gray checks in the software. Bug Finder and Code Prover check this coding rule differently. The analyses can produce different results.

N.	JSF++ Definition	Polyspace Specification
187	All non-null statements shall potentially have a side-effect.	
188	Labels will not be used, except in switch statements.	
189	The goto statement shall not be used.	
190	The continue statement shall not be used.	
191	The break statement shall not be used (except to terminate the cases of a switch statement).	
192	All if, else if constructs will contain either a final else clause or a comment indicating why a final else clause is not necessary.	else if should contain an else clause.
193	Every non-empty case clause in a switch statement shall be terminated with a break statement.	
194	All switch statements that do not intend to test for every enumeration value shall contain a final default clause.	Reports only for missing default.
195	A switch expression will not represent a Boolean value.	
196	Every switch statement will have at least two cases and a potential default.	
197	Floating point variables shall not be used as loop counters.	Assumes 1 loop parameter.
198	The initialization expression in a for loop will perform no actions other than to initialize the value of a single for loop parameter.	Reports if loop parameter cannot be determined. Assumes Rule 200 is not violated. The loop variable parameter is assumed to be a variable.
199	The increment expression in a for loop will perform no action other than to change a single loop parameter to the next value for the loop.	Assumes 1 loop parameter (Rule 198), with non class type. Rule 200 must not be violated for this rule to be reported.

N.	JSF++ Definition	Polyspace Specification
200	Null initialize or increment expressions in for loops will not be used; a while loop will be used instead.	
201	Numeric variables being used within a for loop for iteration counting shall not be modified in the body of the loop.	Assumes 1 loop parameter (AV rule 198), and no alias writes.

Expressions

N.	JSF++ Definition	Polyspace Specification
202	Floating point variables shall not be tested for exact equality or inequality.	Reports only direct equality/inequality. Check done for all expressions.
203	Evaluation of expressions shall not lead to overflow/underflow.	Done with overflow checks in the software.
204	A single operation with side-effects shall only be used in the following contexts: • by itself • the right-hand side of an assignment • a condition • the only argument expression with a side-effect in a function call • condition of a loop • switch condition • single part of a chained operation	 A side effect is found in a return statement A side effect exists on a single value, and only one operand of the function call has a side effect.

N.	JSF++ Definition	Polyspace Specification
204.1	The value of an expression shall be the same under any order of evaluation that the standard permits.	Reports when: Variable is written more than once in an expression Variable is read and write in subexpressions Volatile variable is accessed more than once
		Note Read-write operations such as ++, are only considered as a write.
205	The volatile keyword shall not be used unless directly interfacing with hardware.	Reports if volatile keyword is used.

Memory Allocation

N.	JSF++ Definition	Polyspace Specification
206	(heap) shall not occur after initialization.	Reports calls to C library functions: malloc / calloc / realloc / free and all new/ delete operators in functions or methods.

Fault Handling

N.	JSF++ Definition	Polyspace Specification
208	C++ exceptions shall not be used.	Reports try, catch, throw spec, and throw.

Portable Code

N.	JSF++ Definition	Polyspace Specification
209	The basic types of int, short, long, float and double shall not be used, but specificlength equivalents should be typedef'd accordingly for each compiler, and these type names used in the code.	Only allows use of basic types through direct typedefs.

JSF++ Definition	Polyspace Specification
No dependence shall be placed on C++'s operator precedence rules, below arithmetic operators, in expressions.	Reports when a binary operation has one operand that is not parenthesized and is an operation with inferior precedence level. Reports bitwise and shifts operators that are used without parenthesis and binary operation arguments.
Pointer arithmetic will not be used.	Reports:p + Ip - Ip++pp+=p-= Allows p[i].
	No dependence shall be placed on C++'s operator precedence rules, below arithmetic operators, in expressions.

Code Size and Complexity

N.	JSF++ Definition
2	There shall not be any self-modifying code.

Rules

N.	JSF++ Definition
4	To break a "should" rule, the following approval must be received by the developer: • approval from the software engineering lead (obtained by the unit approval in the developmental CM tool)
5	To break a "will" or a "shall" rule, the following approvals must be received by the developer: • approval from the software engineering lead (obtained by the unit approval in the developmental CM tool) • approval from the software product manager (obtained by the unit approval in the developmental CM tool)
6	Each deviation from a "shall" rule shall be documented in the file that contains the deviation. Deviations from this rule shall not be allowed, AV Rule 5 notwithstanding.
7	Approval will not be required for a deviation from a "shall" or "will" rule that complies with an exception specified by that rule.

Environment

N.	JSF++ Definition
10	Values of character types will be restricted to a defined and documented subset of ISO 10646 1.

Libraries

N.	JSF++ Definition
	Only DO-178B level A [15] certifiable or SEAL 1 C/C++ libraries shall be used with safety-critical (i.e. SEAL 1) code.

Header Files

N.	JSF++ Definition
34	Header files should contain logically related declarations only.
36	Compilation dependencies should be minimized when possible.
37	Header (include) files should include only those header files that are required for them to successfully compile. Files that are only used by the associated .cpp file should be placed in the .cpp file — not the .h file.
38	Declarations of classes that are only accessed via pointers (*) or references (&) should be supplied by forward headers that contain only forward declarations.

Style

N.	JSF++ Definition
45	All words in an identifier will be separated by the '_' character.
49	All acronyms in an identifier will be composed of uppercase letters.
55	The name of a header file should reflect the logical entity for which it provides declarations.
56	The name of an implementation file should reflect the logical entity for which it provides definitions and have a ".cpp" extension (this name will normally be identical to the header file that provides the corresponding declarations.)
	At times, more than one .cpp file for a given logical entity will be required. In these cases, a suffix should be appended to reflect a logical differentiation.

Classes

N.	JSF++ Definition
64	A class interface should be complete and minimal.
65	A structure should be used to model an entity that does not require an invariant.

N.	JSF++ Definition
66	A class should be used to model an entity that maintains an invariant.
69	A member function that does not affect the state of an object (its instance variables) will be declared const. Member functions should be const by default. Only when there is a clear, explicit reason should the const modifier on member functions be omitted.
70	A class will have friends only when a function or object requires access to the private elements of the class, but is unable to be a member of the class for logical or efficiency reasons.
70.1	An object shall not be improperly used before its lifetime begins or after its lifetime ends.
71	Calls to an externally visible operation of an object, other than its constructors, shall not be allowed until the object has been fully initialized.
72	The invariant for a class should be:
	A part of the postcondition of every class constructor,
	A part of the precondition of the class destructor (if any),
	A part of the precondition and postcondition of every other publicly accessible operation.
73	Unnecessary default constructors shall not be defined.
77	A copy constructor shall copy all data members and bases that affect the class invariant (a data element representing a cache, for example, would not need to be copied).
80	The default copy and assignment operators will be used for classes when those operators offer reasonable semantics.
84	Operator overloading will be used sparingly and in a conventional manner.
85	When two operators are opposites (such as == and !=), both will be defined and one will be defined in terms of the other.
86	Concrete types should be used to represent simple independent concepts.
87	Hierarchies should be based on abstract classes.
90	Heavily used interfaces should be minimal, general and abstract.
91	Public inheritance will be used to implement "is-a" relationships.

N.	JSF++ Definition
92	A subtype (publicly derived classes) will conform to the following guidelines with respect to all classes involved in the polymorphic assignment of different subclass instances to the same variable or parameter during the execution of the system:
	Preconditions of derived methods must be at least as weak as the preconditions of the methods they override.
	Postconditions of derived methods must be at least as strong as the postconditions of the methods they override.
	In other words, subclass methods must expect less and deliver more than the base class methods they override. This rule implies that subtypes will conform to the Liskov Substitution Principle.
93	"has-a" or "is-implemented-in-terms-of" relationships will be modeled through membership or non-public inheritance.

Namespaces

N.	JSF++ Definition
100	Elements from a namespace should be selected as follows:
	using declaration or explicit qualification for few (approximately five) names,
	using directive for many names.

Templates

N.	JSF++ Definition
101	Templates shall be reviewed as follows:
	with respect to the template in isolation considering assumptions or requirements placed on its arguments.
	with respect to all functions instantiated by actual arguments.
102	Template tests shall be created to cover all actual template instantiations.
103	Constraint checks should be applied to template arguments.
105	A template definition's dependence on its instantiation contexts should be minimized.
106	Specializations for pointer types should be made where appropriate.

Functions

N.	JSF++ Definition
112	Function return values should not obscure resource ownership.
115	If a function returns error information, then that error information will be tested.
117	Arguments should be passed by reference if NULL values are not possible:
	• 117.1 - An object should be passed as const T& if the function should not change the value of the object.
	• 117.2 - An object should be passed as T& if the function may change the value of the object.
118	Arguments should be passed via pointers if NULL values are possible:
	• 118.1 - An object should be passed as const T* if its value should not be modified.
	• 118.2 - An object should be passed as T* if its value may be modified.
120	Overloaded operations or methods should form families that use the same semantics, share the same name, have the same purpose, and that are differentiated by formal parameters.
122	Trivial accessor and mutator functions should be inlined.
123	The number of accessor and mutator functions should be minimized.
124	Trivial forwarding functions should be inlined.
125	Unnecessary temporary objects should be avoided.

Comments

N.	JSF++ Definition
127	Code that is not used (commented out) shall be deleted.
	Note: This rule cannot be annotated in the source code.
128	Comments that document actions or sources (e.g. tables, figures, paragraphs, etc.) outside of the file being documented will not be allowed.
129	Comments in header files should describe the externally visible behavior of the functions or classes being documented.
130	The purpose of every line of executable code should be explained by a comment, although one comment may describe more than one line of code.

N.	JSF++ Definition
131	One should avoid stating in comments what is better stated in code (i.e. do not simply repeat what is in the code).
132	Each variable declaration, typedef, enumeration value, and structure member will be commented.
134	Assumptions (limitations) made by functions should be documented in the function's preamble.

Initialization

N.	JSF++ Definition
143	Variables will not be introduced until they can be initialized with meaningful values. (See also AV Rule 136, AV Rule 142, and AV Rule 73 concerning declaration scope, initialization before use, and default constructors respectively.)

Types

N.	JSF++ Definition				
146	Floating point implementations shall comply with a defined floating point standard.				
	The standard that will be used is the ANSI/IEEE® Std 754 [1].				

Unions and Bit Fields

N.	JSF++ Definition
155	Bit-fields will not be used to pack data into a word for the sole purpose of saving space.

Operators

N.	JSF++ Definition
167	The implementation of integer division in the chosen compiler shall be determined, documented and taken into account.

Type Conversions

N.	JSF++ Definition
183	Every possible measure should be taken to avoid type casting.

Expressions

N.	JSF++ Definition					
204	A single operation with side-effects shall only be used in the following contexts:					
	1 by itself					
	2 the right-hand side of an assignment					
	3 a condition					
	4 the only argument expression with a side-effect in a function call					
	5	condition of a loop				
	6	switch condition				
	7	single part of a chained operation				

Memory Allocation

N.	JSF++ Definition
207	Unencapsulated global data will be avoided.

Portable Code

N.	JSF++ Definition
210	Algorithms shall not make assumptions concerning how data is represented in memory (e.g. big endian vs. little endian, base class subobject ordering in derived classes, nonstatic data member ordering across access specifiers, etc.).
210.1	Algorithms shall not make assumptions concerning the order of allocation of nonstatic data members separated by an access specifier.
211	Algorithms shall not assume that shorts, ints, longs, floats, doubles or long doubles begin at particular addresses.
212	Underflow or overflow functioning shall not be depended on in any special way.
214	Assuming that non-local static objects, in separate translation units, are initialized in a special order shall not be done.

Efficiency Considerations

N.	JSF++ Definition
216	Programmers should not attempt to prematurely optimize code.

Miscellaneous

N.	JSF++ Definition
217	Compile-time and link-time errors should be preferred over run-time errors.
218	Compiler warning levels will be set in compliance with project policies.

Testing

N.	JSF++ Definition			
219	All tests applied to a base class interface shall be applied to all derived class interfaces as well. If the derived class poses stronger postconditions/invariants, then the new postconditions /invariants shall be substituted in the derived class tests.			
220	Structural coverage algorithms shall be applied against flattened classes.			
221	Structural coverage of a class within an inheritance hierarchy containing virtual functions shall include testing every possible resolution for each set of identical polymorphic references.			

Configure Bug Finder Checkers

- "Choose Specific Bug Finder Defect Checkers" on page 13-2
- "Short Names of Bug Finder Defect Checkers" on page 13-4
- "Bug Finder Defect Groups" on page 13-21
- "Polyspace Bug Finder Defects Checkers Enabled by Default" on page 13-27
- "Bug Finder Results Found in Fast Analysis Mode" on page 13-33
- "CWE Coding Standard and Polyspace Results" on page 13-66
- "Mapping Between CWE-658 or 659 and Polyspace Results" on page 13-100

Choose Specific Bug Finder Defect Checkers

You can check your C/C++ code using the predefined subsets of defect checkers in Bug Finder. However, you can also customize which defects to check for during the analysis.

You can use a spreadsheet to keep track of the defect checkers that you enable and add notes explaining why you do not enable the other checkers. A spreadsheet of checkers is provided in polyspaceroot\polyspace\resources. Here, polyspaceroot is the Polyspace installation folder, such as C:\Program Files\Polyspace\R2019a.

User Interface (Desktop Products Only)

- On the **Configuration** pane, select **Bug Finder Analysis**.
- 2 From the **Find defects** menu, select a set of defects. The options are:
 - default for the default list of defects. This list contains defects that are applicable to most coding projects.
 - See "Polyspace Bug Finder Defects Checkers Enabled by Default" on page 13-27.
 - all for all defects.
 - CWE for defects related to CWE coding standard.
 - For more information, see "CWE Coding Standard and Polyspace Results" on page 13-66.
 - custom to add defects to the default list or remove defects from it.

To standardize the bug finding across your organization, you can save your list of defect checkers as a configuration template and share with others. See "Create Project Using Configuration Template" on page 1-19.

Command Line

Use the option Find defects (-checkers). Specify a comma-separated list of checkers as arguments. For instance, to run a Bug Finder analysis on a server with only the data race checkers enabled, enter:

 $\verb|polyspace-bug-finder-server-sources| filename - \verb|checkers| DATA_RACE, DATA_RACE_STD_LIB| \\$

Use short names for the Bug Finder checkers instead of their full names. See "Short Names of Bug Finder Defect Checkers" on page 13-4.

Find defects (-checkers)

More About

- "Bug Finder Defect Groups" on page 13-21
- "Short Names of Bug Finder Defect Checkers" on page 13-4

Short Names of Bug Finder Defect Checkers

To justify defects through code annotations, use the command-line names, or short names, listed in the following table.

You can also enable the detection of a specific defect by using its short name as argument of the -checkers option. Instead of listing individual defects, you can also specify groups of defects by the group name, for instance, numerical, data flow, and so on. See Find defects (-checkers).

Defect	Command-line Name
*this not returned in copy assignment operator	RETURN_NOT_REF_TO_THIS
Abnormal termination of exit handler	EXIT_ABNORMAL_HANDLER
Absorption of float operand	FLOAT_ABSORPTION
Accessing object with temporary lifetime	TEMP_OBJECT_ACCESS
Alignment changed after memory reallocation	ALIGNMENT_CHANGE
Alternating input and output from a stream without flush or positioning call	IO_INTERLEAVING
Ambiguous declaration syntax	MOST_VEXING_PARSE
Arithmetic operation with NULL pointer	NULL_PTR_ARITH
Array access out of bounds	OUT_BOUND_ARRAY
Array access with tainted index	TAINTED_ARRAY_INDEX
Assertion	ASSERT

Defect	Command-line Name
Atomic load and store sequence not atomic	ATOMIC_VAR_SEQUENCE_NOT_ATOMIC
Atomic variable accessed twice in an expression	ATOMIC_VAR_ACCESS_TWICE
Bad file access mode or status	BAD_FILE_ACCESS_MODE_STATUS
Bad order of dropping privileges	BAD_PRIVILEGE_DROP_ORDER
Base class assignment operator not called	MISSING_BASE_ASSIGN_OP_CALL
Base class destructor not virtual	DTOR_NOT_VIRTUAL
Bitwise and arithmetic operation on the same data	BITWISE_ARITH_MIX
Bitwise operation on negative value	BITWISE_NEG
Blocking operation while holding lock	BLOCKING_WHILE_LOCKED
Buffer overflow from incorrect string format specifier	STR_FORMAT_BUFFER_OVERFLOW
C++ reference to const- qualified type with subsequent modification	WRITE_REFERENCE_TO_CONST_TYPE
C++ reference type qualified with const or volatile	CV_QUALIFIED_REFERENCE_TYPE
Call through non- prototyped function pointer	UNPROTOTYPED_FUNC_CALL
Call to memset with unintended value	MEMSET_INVALID_VALUE

Defect	Command-line Name
Character value absorbed into EOF	CHAR_E0F_CONFUSED
Closing a previously closed resource	DOUBLE_RESOURCE_CLOSE
Code deactivated by constant false condition	DEACTIVATED_CODE
Command executed from externally controlled path	TAINTED_PATH_CMD
Constant block cipher initialization vector	CRYPTO_CIPHER_CONSTANT_IV
Constant cipher key	CRYPTO_CIPHER_CONSTANT_KEY
Context initialized incorrectly for cryptographic operation	CRYPTO_PKEY_INCORRECT_INIT
Context initialized incorrectly for digest operation	CRYPTO_MD_BAD_FUNCTION
Conversion or deletion of incomplete class pointer	INCOMPLETE_CLASS_PTR
Copy constructor not called in initialization list	MISSING_COPY_CTOR_CALL
Copy of overlapping memory	OVERLAPPING_COPY
Copy operation modifying source operand	COPY_MODIFYING_SOURCE
Data race	DATA_RACE
Data race including atomic operations	DATA_RACE_ALL

Defect	Command-line Name
Data race through standard library function call	DATA_RACE_STD_LIB
Dead code	DEAD_CODE
Deadlock	DEADLOCK
Deallocation of previously deallocated pointer	DOUBLE_DEALLOCATION
Declaration mismatch	DECL_MISMATCH
Delete of void pointer	DELETE_OF_VOID_PTR
Destination buffer overflow in string manipulation	STRLIB_BUFFER_OVERFLOW
Destination buffer underflow in string manipulation	STRLIB_BUFFER_UNDERFLOW
Destruction of locked mutex	DESTROY_LOCKED
Deterministic random output from constant seed	RAND_SEED_CONSTANT
Double lock	DOUBLE_LOCK
Double unlock	DOUBLE_UNLOCK
Environment pointer invalidated by previous operation	INVALID_ENV_POINTER
Errno not checked	ERRNO_NOT_CHECKED
Errno not reset	MISSING_ERRNO_RESET
Exception caught by value	EXCP_CAUGHT_BY_VALUE
Exception handler hidden by previous handler	EXCP_HANDLER_HIDDEN

Defect	Command-line Name
Execution of a binary from a relative path can be controlled by an external actor	RELATIVE_PATH_CMD
Execution of externally controlled command	TAINTED_EXTERNAL_CMD
File access between time of check and use (TOCTOU)	ТОСТОИ
File descriptor exposure to child process	FILE_EXPOSURE_TO_CHILD
File manipulation after chroot without chdir	CHR00T_MISUSE
Float conversion overflow	FLOAT_CONV_OVFL
Float division by zero	FLOAT_ZERO_DIV
Floating point comparison with equality operators	BAD_FLOAT_OP
Float overflow	FLOAT_OVFL
Format string specifiers and arguments mismatch	STRING_FORMAT
Function called from signal handler not asynchronous-safe	SIG_HANDLER_ASYNC_UNSAFE
Function called from signal handler not asynchronous-safe (strict)	SIG_HANDLER_ASYNC_UNSAFE_STRICT
Function pointer assigned with absolute address	FUNC_PTR_ABSOLUTE_ADDR

Defect	Command-line Name
Function that can spuriously fail not wrapped in loop	SPURIOUS_FAILURE_NOT_WRAPPED_IN_LOOP
Function that can spuriously wake up not wrapped in loop	SPURIOUS_WAKEUP_NOT_WRAPPED_IN_LOOP
Hard-coded buffer size	HARD_CODED_BUFFER_SIZE
Hard-coded loop boundary	HARD_CODED_LOOP_BOUNDARY
Hard-coded object size used to manipulate memory	HARD_CODED_MEM_SIZE
Host change using externally controlled elements	TAINTED_HOSTID
Improper array initialization	IMPROPER_ARRAY_INIT
<pre>Inappropriate I/O operation on device files</pre>	INAPPROPRIATE_IO_ON_DEVICE
Incompatible padding for RSA algorithm operation	CRYPTO_RSA_BAD_PADDING
Incompatible types prevent overriding	VIRTUAL_FUNC_HIDING
Inconsistent cipher operations	CRYPTO_CIPHER_BAD_FUNCTION
Incorrect data type passed to va_arg	VA_ARG_INCORRECT_TYPE
Incorrect key for cryptographic algorithm	CRYPTO_PKEY_INCORRECT_KEY
Incorrect order of network connection operations	BAD_NETWORK_CONNECT_ORDER

Defect	Command-line Name
Incorrect pointer scaling	BAD_PTR_SCALING
Incorrect type data passed to va_start	VA_START_INCORRECT_TYPE
Incorrect use of offsetof in C++	OFFSETOF_MISUSE
Incorrect use of va_start	VA_START_MISUSE
Incorrect syntax of flexible array member size	FLEXIBLE_ARRAY_MEMBER_INCORRECT_SIZE
Information leak via structure padding	PADDING_INFO_LEAK
Inline constraint not respected	INLINE_CONSTRAINT_NOT_RESPECTED
Integer constant overflow	INT_CONSTANT_OVFL
Integer conversion overflow	INT_CONV_OVFL
Integer division by zero	INT_ZERO_DIV
Integer overflow	INT_0VFL
Integer precision exceeded	INT_PRECISION_EXCEEDED
Invalid assumptions about memory organization	INVALID_MEMORY_ASSUMPTION
Invalid deletion of pointer	BAD_DELETE
Invalid file position	INVALID_FILE_POS
Invalid free of pointer	BAD_FREE
<pre>Invalid use of = (assignment) operator</pre>	BAD_EQUAL_USE

Defect	Command-line Name
<pre>Invalid use of == (equality) operator</pre>	BAD_EQUAL_EQUAL_USE
Invalid use of standard library floating point routine	FLOAT_STD_LIB
Invalid use of standard library integer routine	INT_STD_LIB
Invalid use of standard library memory routine	MEM_STD_LIB
Invalid use of standard library routine	OTHER_STD_LIB
Invalid use of standard library string routine	STR_STD_LIB
Invalid va_list argument	INVALID_VA_LIST_ARG
Large pass-by-value argument	PASS_BY_VALUE
Library loaded from externally controlled path	TAINTED_PATH_LIB
Line with more than one statement	MORE_THAN_ONE_STATEMENT
Load of library from a relative path can be controlled by an external actor	RELATIVE_PATH_LIB
Loop bounded with tainted value	TAINTED_LOOP_BOUNDARY
Member not initialized in constructor	NON_INIT_MEMBER
Memory allocation with tainted size	TAINTED_MEMORY_ALLOC_SIZE
Memory comparison of float-point values	MEMCMP_FLOAT

Defect	Command-line Name
Memory comparison of padding data	MEMCMP_PADDING_DATA
Memory comparison of strings	MEMCMP_STRINGS
Memory leak	MEM_LEAK
Mismatch between data length and size	DATA_LENGTH_MISMATCH
Mismatched alloc/dealloc functions on Windows	WIN_MISMATCH_DEALLOC
Missing blinding for RSA algorithm	CRYPTO_RSA_NO_BLINDING
Missing block cipher initialization vector	CRYPTO_CIPHER_NO_IV
Missing break of switch case	MISSING_SWITCH_BREAK
Missing byte reordering when transferring data	MISSING_BYTESWAP
Missing case for switch condition	MISSING_SWITCH_CASE
Missing cipher algorithm	CRYPTO_CIPHER_NO_ALGORITHM
Missing cipher data to process	CRYPTO_CIPHER_NO_DATA
Missing cipher final step	CRYPTO_CIPHER_NO_FINAL
Missing cipher key	CRYPTO_CIPHER_NO_KEY
Missing data for encryption, decryption or signing operation	CRYPTO_PKEY_NO_DATA
Missing explicit keyword	MISSING_EXPLICIT_KEYWORD
Missing lock	BAD_UNLOCK
Missing null in string array	MISSING_NULL_CHAR

Defect	Command-line Name
Missing overload of allocation or deallocation function	MISSING_OVERLOAD_NEW_DELETE_PAIR
Missing padding for RSA algorithm	CRYPTO_RSA_NO_PADDING
Missing parameters for key generation	CRYPTO_PKEY_NO_PARAMS
Missing peer key	CRYPTO_PKEY_NO_PEER
Missing private key	CRYPTO_PKEY_NO_PRIVATE_KEY
Missing public key	CRYPTO_PKEY_NO_PUBLIC_KEY
Missing reset of a freed pointer	MISSING_FREED_PTR_RESET
Missing return statement	MISSING_RETURN
Missing unlock	BAD_LOCK
Missing virtual inheritance	MISSING_VIRTUAL_INHERITANCE
Misuse of a FILE object	FILE_OBJECT_MISUSE
Misuse of errno	ERRNO_MISUSE
Misuse of errno in a signal handler	SIG_HANDLER_ERRNO_MISUSE
Misuse of narrow or wide character string	NARROW_WIDE_STR_MISUSE
Misuse of readlink()	READLINK_MISUSE
Misuse of return value from nonreentrant standard function	NON_REENTRANT_STD_RETURN
Misuse of sign-extended character value	CHARACTER_MISUSE
Misuse of structure with flexible array member	FLEXIBLE_ARRAY_MEMBER_STRUCT_MISUSE

Defect	Command-line Name
Modification of internal buffer returned from nonreentrant standard function	WRITE_INTERNAL_BUFFER_RETURNED_FROM_STD_FUNC
Non-initialized pointer	NON_INIT_PTR
Non-initialized variable	NON_INIT_VAR
Nonsecure hash algorithm	CRYPTO_MD_WEAK_HASH
Nonsecure parameters for key generation	CRYPTO_PKEY_WEAK_PARAMS
Nonsecure RSA public exponent	CRYPTO_RSA_LOW_EXPONENT
Nonsecure SSL/TLS protocol	CRYPTO_SSL_WEAK_PROTOCOL
Null pointer	NULL_PTR
Object slicing	OBJECT_SLICING
Opening previously opened resource	DOUBLE_RESOURCE_OPEN
Overlapping assignment	OVERLAPPING_ASSIGN
Partially accessed array	PARTIALLY_ACCESSED_ARRAY
Partial override of overloaded virtual functions	PARTIAL_OVERRIDE
Pointer access out of bounds	OUT_BOUND_PTR
Pointer dereference with tainted offset	TAINTED_PTR_OFFSET
Pointer or reference to stack variable leaving scope	LOCAL_ADDR_ESCAPE

Defect	Command-line Name
Pointer to non- initialized value converted to const pointer	NON_INIT_PTR_CONV
Possible invalid operation on boolean operand	INVALID_OPERATION_ON_BOOLEAN
Possible misuse of sizeof	SIZEOF_MISUSE
Possibly unintended evaluation of expression because of operator precedence rules	OPERATOR_PRECEDENCE
Precision loss in integer to float conversion	INT_TO_FLOAT_PRECISION_LOSS
Predefined macro used as an object	MACRO_USED_AS_OBJECT
Predictable block cipher initialization vector	CRYPTO_CIPHER_PREDICTABLE_IV
Predictable cipher key	CRYPTO_CIPHER_PREDICTABLE_KEY
Predictable random output from predictable seed	RAND_SEED_PREDICTABLE
Preprocessor directive in macro argument	PRE_DIRECTIVE_MACRO_ARG
Privilege drop not verified	MISSING_PRIVILEGE_DROP_CHECK
Qualifier removed in conversion	QUALIFIER_MISMATCH
Resource leak	RESOURCE_LEAK

Defect	Command-line Name
Returned value of a sensitive function not checked	RETURN_NOT_CHECKED
Return from computational exception signal handler	SIG_HANDLER_COMP_EXCP_RETURN
Return of non const handle to encapsulated data member	BREAKING_DATA_ENCAPSULATION
Self assignment not tested in operator	MISSING_SELF_ASSIGN_TEST
Sensitive data printed out	SENSITIVE_DATA_PRINT
Sensitive heap memory not cleared before release	SENSITIVE_HEAP_NOT_CLEARED
Shared data access within signal handler	SIG_HANDLER_SHARED_OBJECT
Shift of a negative value	SHIFT_NEG
Shift operation overflow	SHIFT_0VFL
Side effect in arguments to unsafe macro	SIDE_EFFECT_IN_UNSAFE_MACRO_ARG
Side effect of expression ignored	SIDE_EFFECT_IGNORED
Signal call from within signal handler	SIG_HANDLER_CALLING_SIGNAL
Signal call in multithreaded program	SIGNAL_USE_IN_MULTITHREADED_PROGRAM
Sign change integer conversion overflow	SIGN_CHANGE
Standard function call with incorrect arguments	STD_FUNC_ARG_MISMATCH

Defect	Command-line Name
Static uncalled function	UNCALLED_FUNC
Stream argument with possibly unintended side effects	STREAM_WITH_SIDE_EFFECT
Subtraction or comparison between pointers to different arrays	PTR_T0_DIFF_ARRAY
Tainted division operand	TAINTED_INT_DIVISION
Tainted modulo operand	TAINTED_INT_MOD
Tainted NULL or non- null-terminated string	TAINTED_STRING
Tainted sign change conversion	TAINTED_SIGN_CHANGE
Tainted size of variable length array	TAINTED_VLA_SIZE
Tainted string format	TAINTED_STRING_FORMAT
Thread-specific memory leak	THREAD_MEM_LEAK
Too many va_arg calls for current argument list	T00_MANY_VA_ARG_CALLS
Typedef mismatch	TYPEDEF_MISMATCH
Umask used with chmod- style arguments	BAD_UMASK
Uncleared sensitive data in stack	SENSITIVE_STACK_NOT_CLEARED
Universal character name from token concatenation	PRE_UCNAME_JOIN_TOKENS
Unprotected dynamic memory allocation	UNPROTECTED_MEMORY_ALLOCATION
Unreachable code	UNREACHABLE

Defect	Command-line Name
Unreliable cast of function pointer	FUNC_CAST
Unreliable cast of pointer	PTR_CAST
Unsafe call to a system function	UNSAFE_SYSTEM_CALL
Unsafe conversion between pointer and integer	BAD_INT_PTR_CAST
Unsafe conversion from string to numerical value	UNSAFE_STR_TO_NUMERIC
Unsafe standard encryption function	UNSAFE_STD_CRYPT
Unsafe standard function	UNSAFE_STD_FUNC
Unsigned integer constant overflow	UINT_CONSTANT_OVFL
Unsigned integer conversion overflow	UINT_CONV_OVFL
Unsigned integer overflow	UINT_OVFL
Unused parameter	UNUSED_PARAMETER
Useless if	USELESS_IF
Use of automatic variable as putenv-family function argument	PUTENV_AUTO_VAR
Use of dangerous standard function	DANGEROUS_STD_FUNC
Use of externally controlled environment variable	TAINTED_ENV_VARIABLE

Defect	Command-line Name
Use of indeterminate string	INDETERMINATE_STRING
Use of memset with size argument zero	MEMSET_INVALID_SIZE
Use of non-secure temporary file	NON_SECURE_TEMP_FILE
Use of obsolete standard function	OBSOLETE_STD_FUNC
Use of path manipulation function without maximum sized buffer checking	PATH_BUFFER_OVERFLOW
Use of plain char type for numerical value	BAD_PLAIN_CHAR_USE
Use of previously closed resource	CLOSED_RESOURCE_USE
Use of previously freed pointer	FREED_PTR
Use of setjmp/longjmp	SETJMP_LONGJMP_USE
Use of signal to kill thread	THREAD_KILLED_WITH_SIGNAL
Use of tainted pointer	TAINTED_PTR
Variable length array with nonpositive size	NON_POSITIVE_VLA_SIZE
Variable shadowing	VAR_SHADOWING
Vulnerable path manipulation	PATH_TRAVERSAL
Vulnerable permission assignments	DANGEROUS_PERMISSIONS
Vulnerable pseudo-random number generator	VULNERABLE_PRNG
Weak cipher algorithm	CRYPTO_CIPHER_WEAK_CIPHER
Weak cipher mode	CRYPTO_CIPHER_WEAK_MODE

Defect	Command-line Name
Weak padding for RSA algorithm	CRYPTO_RSA_WEAK_PADDING
Write without a further read	USELESS_WRITE
Writing to const qualified object	CONSTANT_OBJECT_WRITE
Writing to read-only resource	READ_ONLY_RESOURCE_WRITE
Wrong allocated object size for cast	OBJECT_SIZE_MISMATCH
Wrong type used in sizeof	PTR_SIZEOF_MISMATCH

Bug Finder Defect Groups

In this section...

"Concurrency" on page 13-21

"Cryptography" on page 13-22

"Data flow" on page 13-22

"Dynamic Memory" on page 13-23

"Good Practice" on page 13-23

"Numerical" on page 13-23

"Object Oriented" on page 13-24

"Programming" on page 13-24

"Resource Management" on page 13-24

"Static Memory" on page 13-25

"Security" on page 13-25

"Tainted data" on page 13-25

For convenience, the defect checkers in Bug Finder are classified into various groups.

- In certain projects, you can choose to focus only on specific groups of defects. Specify the group name for the option Find defects (-checkers).
- When reviewing results, you can review all results of a certain group together. Filter out other results during review. See "Filter and Group Results" on page 17-2.

This topic gives an overview of the various groups.

Concurrency

These defects are related to multitasking code.

Data Race Defects

The data race defects occur when multiple tasks operate on a shared variable or call a nonreentrant standard library function without protection.

For the specific defects, see "Concurrency Defects".

Command-Line Parameter: concurrency

Locking Defects

The locking defects occur when the critical sections are not set up appropriately. For example:

- The critical sections are involved in a deadlock.
- A lock function does not have the corresponding unlock function.
- A lock function is called twice without an intermediate call to an unlock function.

Critical sections protect shared variables from concurrent access. Polyspace expects critical sections to follow a certain format. The critical section must lie between a call to a lock function and a call to an unlock function.

For the specific defects, see "Concurrency Defects".

Command-Line Parameter: concurrency

Cryptography

These defects are related to incorrect use of cryptography routines from the OpenSSL library. For instance:

- · Use of cryptographically weak algorithms
- Absence of essential elements such as cipher key or initialization vector
- Wrong order of cryptographic operations

For the specific defects, see "Cryptography Defects".

Command-Line Parameter: cryptography

Data flow

These defects are errors relating to how information moves throughout your code. The defects include:

- Dead or unreachable code
- · Unused code

Non-initialized information

For the specific defects, see "Data Flow Defects".

Command-Line Parameter: data_flow

Dynamic Memory

These defects are errors relating to memory usage when the memory is dynamically allocated. The defects include:

- Freeing dynamically allocated memory
- Unprotected memory allocations

For specific defects, see "Dynamic Memory Defects".

Command-Line Parameter: dynamic_memory

Good Practice

These defects allow you to observe good coding practices. The defects by themselves might not cause a crash, but they sometimes highlight more serious logic errors in your code. The defects also make your code vulnerable to attacks and hard to maintain.

The defects include:

- · Hard-coded constants such as buffer size and loop boundary
- Unused function parameters

For specific defects, see "Good Practice Defects".

Command-Line Parameter: good_practice

Numerical

These defects are errors relating to variables in your code; their values, data types, and usage. The defects include:

• Mathematical operations

- Conversion overflow
- Operational overflow

For specific defects, see "Numerical Defects".

Command-Line Parameter: numerical

Object Oriented

These defects are related to the object-oriented aspect of C++ programming. The defects highlight class design issues or issues in the inheritance hierarchy.

The defects include:

- Data member not initialized or incorrectly initialized in constructor
- Incorrect overriding of base class methods
- · Breaking of data encapsulation

For specific defects, see "Object Oriented Defects".

Command-Line Parameter: object_oriented

Programming

These defects are errors relating to programming syntax. These defects include:

- Assignment versus equality operators
- Mismatches between variable qualifiers or declarations
- · Badly formatted strings

For specific defects, see "Programming Defects".

Command-Line Parameter: programming

Resource Management

These defects are related to file handling. The defects include:

Unclosed file stream

Operations on a file stream after it is closed

For specific defects, see "Resource Management Defects".

Command-Line Parameter: resource_management

Static Memory

These defects are errors relating to memory usage when the memory is statically allocated. The defects include:

- Accessing arrays outside their bounds
- · Null pointers
- Casting of pointers

For specific defects, see "Static Memory Defects".

Command-Line Parameter: static_memory

Security

These defects highlight places in your code which are vulnerable to hacking or other security attacks. Many of these defects do not cause runtime errors, but instead point out risky areas in your code. The defects include:

- Managing sensitive data
- · Using dangerous or obsolete functions
- Generating random numbers
- Externally controlled paths and commands

For more details about specific defects, see "Security Defects".

Command-Line Parameter: security

Tainted data

These defects highlight elements in your code which are from unsecured sources. Malicious attackers can use input data or paths to attack your program and cause

failures. These defects highlight elements in your code that are vulnerable. Defects include:

- Use of tainted variables or pointers
- Externally controlled paths

For more details about specific defects, see "Tainted Data Defects".

Command-Line Parameter: tainted_data

Find defects (-checkers)

Polyspace Bug Finder Defects Checkers Enabled by Default

When you launch a Bug Finder analysis, the default setting for Find defects (-checkers) enables these defect checkers.

Defect	Command-line Name
Absorption of float operand	FLOAT_ABSORPTION
Accessing object with temporary lifetime	TEMP_OBJECT_ACCESS
Alignment changed after memory reallocation	ALIGNMENT_CHANGE
Alternating input and output from a stream without flush or positioning call	IO_INTERLEAVING
Array access out of bounds	OUT_BOUND_ARRAY
Assertion	ASSERT
Atomic load and store sequence not atomic	ATOMIC_VAR_SEQUENCE_NOT_ATOMIC
Atomic variable accessed twice in an expression	ATOMIC_VAR_ACCESS_TWICE
Base class assignment operator not called	MISSING_BASE_ASSIGN_OP_CALL
Base class destructor not virtual	DTOR_NOT_VIRTUAL
Buffer overflow from incorrect string format specifier	STR_FORMAT_BUFFER_OVERFLOW
Call through non-prototyped function pointer	UNPROTOTYPED_FUNC_CALL
Character value absorbed into EOF	CHAR_EOF_CONFUSED
Closing a previously closed resource	DOUBLE_RESOURCE_CLOSE
Conversion or deletion of incomplete class pointer	INCOMPLETE_CLASS_PTR

Defect	Command-line Name
Copy constructor not called in initialization list	MISSING_COPY_CTOR_CALL
Copy operation modifying source operand	COPY_MODIFYING_SOURCE
Data race	DATA_RACE
Data race through standard library function call	DATA_RACE_STD_LIB
Dead code	DEAD_CODE
Deadlock	DEADLOCK
Deallocation of previously deallocated pointer	DOUBLE_DEALLOCATION
Declaration mismatch	DECL_MISMATCH
Destination buffer overflow in string manipulation	STRLIB_BUFFER_OVERFLOW
Destination buffer underflow in string manipulation	STRLIB_BUFFER_UNDERFLOW
Double lock	DOUBLE_LOCK
Double unlock	DOUBLE_UNLOCK
Environment pointer invalidated by previous operation	INVALID_ENV_POINTER
Errno not reset	MISSING_ERRNO_RESET
Exception caught by value	EXCP_CAUGHT_BY_VALUE
Exception handler hidden by previous handler	EXCP_HANDLER_HIDDEN
Float conversion overflow	FLOAT_CONV_OVFL
Float division by zero	FLOAT_ZERO_DIV
Format string specifiers and arguments mismatch	STRING_FORMAT
Improper array initialization	IMPROPER_ARRAY_INIT

Defect	Command-line Name
Incompatible types prevent overriding	VIRTUAL_FUNC_HIDING
Incorrect data type passed to va_arg	VA_ARG_INCORRECT_TYPE
Incorrect pointer scaling	BAD_PTR_SCALING
Incorrect type data passed to va_start	VA_START_INCORRECT_TYPE
Incorrect use of offsetof in C++	OFFSETOF_MISUSE
Incorrect use of va_start	VA_START_MISUSE
Inline constraint not respected	INLINE_CONSTRAINT_NOT_RESPECTED
Integer conversion overflow	INT_CONV_OVFL
Integer division by zero	INT_ZERO_DIV
Invalid assumptions about memory organization	INVALID_MEMORY_ASSUMPTION
Invalid free of pointer	BAD_FREE
Invalid use of standard library floating point routine	FLOAT_STD_LIB
Invalid use of standard library integer routine	INT_STD_LIB
Invalid use of standard library memory routine	MEM_STD_LIB
Invalid use of standard library routine	OTHER_STD_LIB
Invalid use of standard library string routine	STR_STD_LIB
Invalid va_list argument	INVALID_VA_LIST_ARG
Memory comparison of padding data	MEMCMP_PADDING_DATA
Memory comparison of strings	MEMCMP_STRINGS
Missing lock	BAD_UNLOCK
Missing return statement	MISSING_RETURN

Defect	Command-line Name
Missing unlock	BAD_LOCK
Misuse of a FILE object	FILE_OBJECT_MISUSE
Misuse of errno	ERRNO_MISUSE
Misuse of errno in a signal handler	SIG_HANDLER_ERRNO_MISUSE
Misuse of sign-extended character value	CHARACTER_MISUSE
Misuse of structure with flexible array member	FLEXIBLE_ARRAY_MEMBER_STRUCT_MISU SE
Non-initialized pointer	NON_INIT_PTR
Non-initialized variable	NON_INIT_VAR
Null pointer	NULL_PTR
Object slicing	OBJECT_SLICING
Opening previously opened resource	DOUBLE_RESOURCE_OPEN
Partial override of overloaded virtual functions	PARTIAL_OVERRIDE
Pointer access out of bounds	OUT_BOUND_PTR
Pointer or reference to stack variable leaving scope	LOCAL_ADDR_ESCAPE
Possible misuse of sizeof	SIZEOF_MISUSE
Possibly unintended evaluation of expression because of operator precedence rules	OPERATOR_PRECEDENCE
Predefined macro used as an object	MACRO_USED_AS_OBJECT
Preprocessor directive in macro argument	PRE_DIRECTIVE_MACRO_ARG
Resource leak	RESOURCE_LEAK
Return from computational exception signal handler	SIG_HANDLER_COMP_EXCP_RETURN

Defect	Command-line Name
Shared data access within signal handler	SIG_HANDLER_SHARED_OBJECT
Side effect of expression ignored	SIDE_EFFECT_IGNORED
Sign change integer conversion overflow	SIGN_CHANGE
Signal call from within signal handler	SIG_HANDLER_CALLING_SIGNAL
Standard function call with incorrect arguments	STD_FUNC_ARG_MISMATCH
Stream argument with possibly unintended side effects	STREAM_WITH_SIDE_EFFECT
Subtraction or comparison between pointers to different arrays	PTR_TO_DIFF_ARRAY
Too many va_arg calls for current argument list	T00_MANY_VA_ARG_CALLS
Typedef mismatch	TYPEDEF_MISMATCH
Universal character name from token concatenation	PRE_UCNAME_JOIN_TOKENS
Unreachable code	UNREACHABLE
Unreliable cast of function pointer	FUNC_CAST
Unreliable cast of pointer	PTR_CAST
Unsigned integer conversion overflow	UINT_CONV_OVFL
Use of automatic variable as putenv-family function argument	PUTENV_AUTO_VAR
Use of previously closed resource	CLOSED_RESOURCE_USE
Use of previously freed pointer	FREED_PTR
Useless if	USELESS_IF
Variable length array with nonpositive size	NON_POSITIVE_VLA_SIZE

Defect	Command-line Name
Writing to const qualified object	CONSTANT_OBJECT_WRITE
Writing to read-only resource	READ_ONLY_RESOURCE_WRITE

Bug Finder Results Found in Fast Analysis Mode

In fast analysis mode, Bug Finder checks for a subset of defects and coding rules only. The tables below list the results that can be found in a fast analysis. See also Use fast analysis mode for Bug Finder (-fast-analysis).

Polyspace Bug Finder Defects

Static Memory

Name	Description
Buffer overflow from incorrect string format specifier (str_format_buffer_overflow)	String format specifier causes buffer argument of standard library functions to overflow
Unreliable cast of function pointer (func_cast)	Function pointer cast to another function pointer with different argument or return type
Unreliable cast of pointer (ptr_cast)	Pointer implicitly cast to different data type

Programming

Name	Description
Copy of overlapping memory (overlapping_copy)	Source and destination arguments of a copy function have overlapping memory
Exception caught by value (excp_caught_by_value)	catch statement accepts an object by value
Exception handler hidden by previous handler (excp_handler_hidden)	catch statement is not reached because of an earlier catch statement for the same exception
Format string specifiers and arguments mismatch (string_format)	String specifiers do not match corresponding arguments
Improper array initialization (improper_array_init)	Incorrect array initialization when using initializers
<pre>Invalid use of == (equality) operator (bad_equal_equal_use)</pre>	Equality operation in assignment statement
Invalid use of = (assignment) operator (bad_equal_use)	Assignment in conditional statement
Invalid use of floating point operation (bad_float_op)	Imprecise comparison of floating point variables
Missing null in string array (missing_null_char)	String does not terminate with null character
Overlapping assignment (overlapping_assign)	Memory overlap between left and right sides of an assignment
Possibly unintended evaluation of expression because of operator precedence rules (operator_precedence)	Operator precedence rules cause unexpected evaluation order in arithmetic expression
Unsafe conversion between pointer and integer (bad_int_ptr_cast)	Misaligned or invalid results from conversions between pointer and integer types
Wrong type used in sizeof (ptr_sizeof_mismatch)	sizeof argument does not match pointed type

Data Flow

Name	Description
Code deactivated by constant false condition (deactivated_code)	Code segment deactivated by #if 0 directive or if(0) condition
Missing return statement (missing_return)	Function does not return value though return type is not void
Static uncalled function (uncalled_func)	Function with static scope not called in file
Variable shadowing (var_shadowing)	Variable hides another variable of same name with nested scope

Object Oriented

Name	Description
*this not returned in copy assignment operator (return_not_ref_to_this)	operator= method does not return a pointer to the current object
Base class assignment operator not called (missing_base_assign_op_call)	Copy assignment operator does not call copy assignment operators of base subobjects
Base class destructor not virtual (dtor_not_virtual)	Class cannot behave polymorphically for deletion of derived class objects
Copy constructor not called in initialization list (missing_copy_ctor_call)	Copy constructor does not call copy constructors of some members or base classes
Incompatible types prevent overriding (virtual_func_hiding)	Derived class method hides a virtual base class method instead of overriding it
Member not initialized in constructor (non_init_member)	Constructor does not initialize some members of a class
Missing explicit keyword (missing_explicit_keyword)	Constructor missing the explicit specifier
Missing virtual inheritance (missing_virtual_inheritance)	A base class is inherited virtually and nonvirtually in the same hierarchy
Object slicing (object_slicing)	Derived class object passed by value to function with base class parameter
Partial override of overloaded virtual functions (partial_override)	Class overrides fraction of inherited virtual functions with a given name
Return of non const handle to encapsulated data member (breaking_data_encapsulation)	Method returns pointer or reference to internal member of object
Self assignment not tested in operator (missing_self_assign_test)	Copy assignment operator does not test for self-assignment

Security

Name	Description
Function pointer assigned with absolute address (func ptr absolute addr)	Constant expression is used as function address is vulnerable to code injection

Good Practice

Name	Description
Bitwise and arithmetic operation on the same data (bitwise_arith_mix)	Statement with mixed bitwise and arithmetic operations
Delete of void pointer (delete_of_void_ptr)	delete operates on a void* pointer pointing to an object
Hard-coded buffer size (hard_coded_buffer_size)	Size of memory buffer is a numerical value instead of symbolic constant
Hard-coded loop boundary (hard_coded_loop_boundary)	Loop boundary is a numerical value instead of symbolic constant
Large pass-by-value argument (pass_by_value)	Large argument passed by value between functions
Line with more than one statement (more_than_one_statement)	Multiple statements on a line
Missing break of switch case (missing_switch_break)	No comments at the end of switch case without a break statement
Missing reset of a freed pointer (missing_freed_ptr_reset)	Pointer free not followed by a reset statement to clear leftover data
Unused parameter (unused_parameter)	Function prototype has parameters not read or written in function body

MISRA C: 2004 and MISRA AC AGC Rules

The software checks the following rules early in the analysis.

Language Extensions

Rule	Description
2.1	Assembly language shall be encapsulated and isolated.
2.2	Source code shall only use /* */ style comments.
2.3	The character sequence /* shall not be used within a comment.

Documentation

Rule	Description
3.4	All uses of the #pragma directive shall be documented and explained.

Character Sets

Rule	Description
4.1	Only those escape sequences which are defined in the ISO C standard shall be used.
4.2	Trigraphs shall not be used.

Identifiers

Rule	Description
5.2	Identifiers in an inner scope shall not use the same name as an identifier in an outer scope, and therefore hide that identifier.

Types

Rule	Description
6.1	The plain char type shall be used only for the storage and use of character values.
6.2	Signed and unsigned char type shall be used only for the storage and use of numeric values.
6.3	typedefs that indicate size and signedness should be used in place of the basic types.
6.4	Bit fields shall only be defined to be of type unsigned int or signed int.
6.5	Bit fields of type signed int shall be at least 2 bits long.

Constants

Rule	Description
7.1	Octal constants (other than zero) and octal escape sequences shall not be used.

Declarations and Definitions

Rule	Description
8.1	Functions shall have prototype declarations and the prototype shall be visible at both the function definition and call.
8.2	Whenever an object or function is declared or defined, its type shall be explicitly stated.
8.3	For each function parameter the type given in the declaration and definition shall be identical, and the return types shall also be identical.
8.5	There shall be no definitions of objects or functions in a header file.
8.6	Functions shall always be declared at file scope.
8.7	Objects shall be defined at block scope if they are only accessed from within a single function.
8.8	An external object or function shall be declared in one file and only one file.
8.9	An identifier with external linkage shall have exactly one external definition.
8.11	The static storage class specifier shall be used in definitions and declarations of objects and functions that have internal linkage
8.12	When an array is declared with external linkage, its size shall be stated explicitly or defined implicitly by initialization.

Initialization

Rule	Description
9.2	Braces shall be used to indicate and match the structure in the nonzero initialization of arrays and structures.
9.3	In an enumerator list, the = construct shall not be used to explicitly initialize members other than the first, unless all items are explicitly initialized.

Arithmetic Type Conversion

Rule	Description
10.1	The value of an expression of integer type shall not be implicitly converted to a different underlying type if:
	It is not a conversion to a wider integer type of the same signedness, or
	The expression is complex, or
	The expression is not constant and is a function argument, or
	The expression is not constant and is a return expression
10.2	The value of an expression of floating type shall not be implicitly converted to a different type if
	It is not a conversion to a wider floating type, or
	The expression is complex, or
	The expression is a function argument, or
	The expression is a return expression
10.3	The value of a complex expression of integer type may only be cast to a type that is narrower and of the same signedness as the underlying type of the expression.
10.4	The value of a complex expression of float type may only be cast to narrower floating type.
10.5	If the bitwise operator ~ and << are applied to an operand of underlying type unsigned char or unsigned short, the result shall be immediately cast to the underlying type of the operand
10.6	The "U" suffix shall be applied to all constants of unsigned types.

Pointer Type Conversion

Rule	Description
11.1	Conversion shall not be performed between a pointer to a function and any type other than an integral type.
11.2	Conversion shall not be performed between a pointer to an object and any type other than an integral type, another pointer to a object type or a pointer to void.
11.3	A cast should not be performed between a pointer type and an integral type.
11.4	A cast should not be performed between a pointer to object type and a different pointer to object type.
11.5	A cast shall not be performed that removes any const or volatile qualification from the type addressed by a pointer

Expressions

Rule	Description
12.1	Limited dependence should be placed on C's operator precedence rules in expressions.
12.3	The sizeof operator should not be used on expressions that contain side effects.
12.5	The operands of a logical && or shall be primary-expressions.
12.6	Operands of logical operators (&&, $ $ and $!$) should be effectively Boolean. Expression that are effectively Boolean should not be used as operands to operators other than (&&, $ $ or $!$).
12.7	Bitwise operators shall not be applied to operands whose underlying type is signed.
12.9	The unary minus operator shall not be applied to an expression whose underlying type is unsigned.
12.10	The comma operator shall not be used.
12.11	Evaluation of constant unsigned expression should not lead to wraparound.
12.12	The underlying bit representations of floating-point values shall not be used.
12.13	The increment (++) and decrement () operators should not be mixed with other operators in an expression

Control Statement Expressions

Rule	Description
13.1	Assignment operators shall not be used in expressions that yield Boolean values.
13.2	Tests of a value against zero should be made explicit, unless the operand is effectively Boolean.
13.3	Floating-point expressions shall not be tested for equality or inequality.
13.4	The controlling expression of a for statement shall not contain any objects of floating type.
13.5	The three expressions of a for statement shall be concerned only with loop control.
13.6	Numeric variables being used within a for loop for iteration counting should not be modified in the body of the loop.

Control Flow

Rule	Description
14.3	All non-null statements shall either
	have at least one side effect however executed, or
	cause control flow to change.
14.4	The goto statement shall not be used.
14.5	The continue statement shall not be used.
14.6	For any iteration statement, there shall be at most one break statement used for loop termination.
14.7	A function shall have a single point of exit at the end of the function.
14.8	The statement forming the body of a switch, while, do while or for statement shall be a compound statement.
14.9	An if (expression) construct shall be followed by a compound statement. The else keyword shall be followed by either a compound statement, or another if statement.
14.10	All if else if constructs should contain a final else clause.

Switch Statements

Rule	Description
15.0	Unreachable code is detected between switch statement and first case.
15.1	A switch label shall only be used when the most closely-enclosing compound statement is the body of a switch statement
15.2	An unconditional break statement shall terminate every non-empty switch clause.
15.3	The final clause of a switch statement shall be the default clause.
15.4	A switch expression should not represent a value that is effectively Boolean.
15.5	Every switch statement shall have at least one case clause.

Functions

Rule	Description
16.1	Functions shall not be defined with variable numbers of arguments.
16.3	Identifiers shall be given for all of the parameters in a function prototype declaration.
16.5	Functions with no parameters shall be declared with parameter type void.
16.6	The number of arguments passed to a function shall match the number of parameters.
16.8	All exit paths from a function with non-void return type shall have an explicit return statement with an expression.
16.9	A function identifier shall only be used with either a preceding &, or with a parenthesized parameter list, which may be empty.

Pointers and Arrays

Rule	Description
17.4	Array indexing shall be the only allowed form of pointer arithmetic.
17.5	A type should not contain more than 2 levels of pointer indirection.

Structures and Unions

Rule	Description
18.1	All structure or union types shall be complete at the end of a translation unit.
18.4	Unions shall not be used.

Preprocessing Directives

Rule	Description
19.1	<pre>#include statements in a file shall only be preceded by other preprocessors directives or comments.</pre>
19.2	Nonstandard characters should not occur in header file names in #include directives.
19.3	The #include directive shall be followed by either a <filename> or "filename" sequence.</filename>
19.4	C macros shall only expand to a braced initializer, a constant, a parenthesized expression, a type qualifier, a storage class specifier, or a do-while-zero construct.
19.5	Macros shall not be #define-d and #undef-d within a block.
19.6	#undef shall not be used.
19.7	A function should be used in preference to a function like-macro.
19.8	A function-like macro shall not be invoked without all of its arguments.
19.9	Arguments to a function-like macro shall not contain tokens that look like preprocessing directives.
19.10	In the definition of a function-like macro, each instance of a parameter shall be enclosed in parentheses unless it is used as the operand of # or ##.
19.11	All macro identifiers in preprocessor directives shall be defined before use, except in #ifdef and #ifndef preprocessor directives and the defined() operator.
19.12	There shall be at most one occurrence of the # or ## preprocessor operators in a single macro definition.
19.13	The # and ## preprocessor operators should not be used.
19.14	The defined preprocessor operator shall only be used in one of the two standard forms.
19.15	Precautions shall be taken in order to prevent the contents of a header file being included twice.
19.16	Preprocessing directives shall be syntactically meaningful even when excluded by the preprocessor.
19.17	All #else, #elif and #endif preprocessor directives shall reside in the same file as the #if or #ifdef directive to which they are related.

Standard Libraries

Rule	Description
20.1	Reserved identifiers, macros and functions in the standard library, shall not be defined, redefined or undefined.
20.2	The names of standard library macros, objects and functions shall not be reused.
20.4	Dynamic heap memory allocation shall not be used.
20.5	The error indicator errno shall not be used.
20.6	The macro offsetof, in library <stddef.h>, shall not be used.</stddef.h>
20.7	The setjmp macro and the longjmp function shall not be used.
20.8	The signal handling facilities of <signal.h> shall not be used.</signal.h>
20.9	The input/output library <stdio.h> shall not be used in production code.</stdio.h>
20.10	The library functions atof, atoi and atoll from library <stdlib.h> shall not be used.</stdlib.h>
20.11	The library functions abort, exit, getenv and system from library <stdlib.h> shall not be used.</stdlib.h>
20.12	The time handling functions of library <time.h> shall not be used.</time.h>

MISRA C: 2012 Rules

Standard C Environment

Rule	Description
1.1	The program shall contain no violations of the standard C syntax and constraints, and shall not exceed the implementation's translation limits.
1.2	Language extensions should not be used.

Unused Code

Rule	Description
2.6	A function should not contain unused label declarations.
2.7	There should be no unused parameters in functions.

Comments

Rule	Description
3.1	The character sequences /* and // shall not be used within a comment.
3.2	Line-splicing shall not be used in // comments.

Character Sets and Lexical Conventions

Rule	Description
4.1	Octal and hexadecimal escape sequences shall be terminated.
4.2	Trigraphs should not be used.

Identifiers

Rule	Description
5.2	Identifiers declared in the same scope and name space shall be distinct.
	An identifier declared in an inner scope shall not hide an identifier declared in an outer scope.
5.4	Macro identifiers shall be distinct.
5.5	Identifiers shall be distinct from macro names.

Types

Rule	Description
6.1	Bit-fields shall only be declared with an appropriate type.
6.2	Single-bit named bit fields shall not be of a signed type.

Literals and Constants

Rule	Description
7.1	Octal constants shall not be used.
7.2	A "u" or "U" suffix shall be applied to all integer constants that are represented in an unsigned type.
7.3	The lowercase character "l" shall not be used in a literal suffix.
7.4	A string literal shall not be assigned to an object unless the object's type is "pointer to const-qualified char".

Declarations and Definitions

Rule	Description
8.1	Types shall be explicitly specified.
8.2	Function types shall be in prototype form with named parameters.
8.4	A compatible declaration shall be visible when an object or function with external linkage is defined.
8.5	An external object or function shall be declared once in one and only one file.
8.6	An identifier with external linkage shall have exactly one external definition.
8.8	The static storage class specifier shall be used in all declarations of objects and functions that have internal linkage.
8.10	An inline function shall be declared with the static storage class.
8.11	When an array with external linkage is declared, its size should be explicitly specified.
8.12	Within an enumerator list, the value of an implicitly-specified enumeration constant shall be unique.
8.14	The restrict type qualifier shall not be used.

Initialization

Rule	Description
9.2	The initializer for an aggregate or union shall be enclosed in braces.
9.3	Arrays shall not be partially initialized.
9.4	An element of an object shall not be initialized more than once.
9.5	Where designated initializers are used to initialize an array object the size of the array shall be specified explicitly.

The Essential Type Model

Rule	Description
10.1	Operands shall not be of an inappropriate essential type.
10.2	Expressions of essentially character type shall not be used inappropriately in addition and subtraction operations.
10.3	The value of an expression shall not be assigned to an object with a narrower essential type or of a different essential type category.
10.4	Both operands of an operator in which the usual arithmetic conversions are performed shall have the same essential type category.
10.5	The value of an expression should not be cast to an inappropriate essential type.
10.6	The value of a composite expression shall not be assigned to an object with wider essential type.
10.7	If a composite expression is used as one operand of an operator in which the usual arithmetic conversions are performed then the other operand shall not have wider essential type.
10.8	The value of a composite expression shall not be cast to a different essential type category or a wider essential type.

Pointer Type Conversion

Rule	Description
11.1	Conversions shall not be performed between a pointer to a function and any other type.
11.2	Conversions shall not be performed between a pointer to an incomplete type and any other type.
11.3	A cast shall not be performed between a pointer to object type and a pointer to a different object type.
11.4	A conversion should not be performed between a pointer to object and an integer type.
11.5	A conversion should not be performed from pointer to void into pointer to object.
11.6	A cast shall not be performed between pointer to void and an arithmetic type.
11.7	A cast shall not be performed between pointer to object and a non-integer arithmetic type.
11.8	A cast shall not remove any const or volatile qualification from the type pointed to by a pointer.
11.9	The macro NULL shall be the only permitted form of integer null pointer constant.

Expressions

Rule	Description
12.1	The precedence of operators within expressions should be made explicit.
12.3	The comma operator should not be used.
12.4	Evaluation of constant expressions should not lead to unsigned integer wrap-around.

Side Effects

Rule	Description
13.3	A full expression containing an increment (++) or decrement () operator should have no other potential side effects other than that caused by the increment or decrement operator.
13.4	The result of an assignment operator should not be used.
13.6	The operand of the sizeof operator shall not contain any expression which has potential side effects.

Control Statement Expressions

Rule	Description
	The controlling expression of an if statement and the controlling expression of an iteration-statement shall have essentially Boolean type.

Control Flow

Rule	Description
15.1	The goto statement should not be used.
15.2	The goto statement shall jump to a label declared later in the same function.
15.3	Any label referenced by a goto statement shall be declared in the same block, or in any block enclosing the goto statement.
15.4	There should be no more than one break or goto statement used to terminate any iteration statement.
15.5	A function should have a single point of exit at the end
15.6	The body of an iteration-statement or a selection-statement shall be a compound statement.
15.7	All if else if constructs shall be terminated with an else statement.

Switch Statements

Rule	Description
16.1	All switch statements shall be well-formed.
16.2	A switch label shall only be used when the most closely-enclosing compound statement is the body of a switch statement.
16.3	An unconditional break statement shall terminate every switch-clause.
16.4	Every switch statement shall have a default label.
16.5	A default label shall appear as either the first or the last switch label of a switch statement.
16.6	Every switch statement shall have at least two switch-clauses.
16.7	A switch-expression shall not have essentially Boolean type.

Functions

Rule	Description
17.1	The features of <starg.h> shall not be used.</starg.h>
17.3	A function shall not be declared implicitly.
17.4	All exit paths from a function with non-void return type shall have an explicit return statement with an expression.
17.6	The declaration of an array parameter shall not contain the static keyword between the [].
17.7	The value returned by a function having non-void return type shall be used.

Pointers and Arrays

Rule	Description
18.4	The +, -, += and -= operators should not be applied to an expression of pointer type.
18.5	Declarations should contain no more than two levels of pointer nesting.
18.7	Flexible array members shall not be declared.
18.8	Variable-length array types shall not be used.

Overlapping Storage

Rule	Description
19.2	The union keyword should not be used.

Preprocessing Directives

Rule	Description
20.1	#include directives should only be preceded by preprocessor directives or comments.
20.2	The ', ", or \ characters and the /* or // character sequences shall not occur in a header file name.
20.3	The #include directive shall be followed by either a <filename> or \"filename\" sequence.</filename>
20.4	A macro shall not be defined with the same name as a keyword.
20.5	#undef should not be used.
20.6	Tokens that look like a preprocessing directive shall not occur within a macro argument.
20.7	Expressions resulting from the expansion of macro parameters shall be enclosed in parentheses.
20.8	The controlling expression of a #if or #elif preprocessing directive shall evaluate to 0 or 1.
20.9	All identifiers used in the controlling expression of #if or #elif preprocessing directives shall be #define'd before evaluation.
20.10	The # and ## preprocessor operators should not be used.
20.11	A macro parameter immediately following a # operator shall not immediately be followed by a ## operator.
20.12	A macro parameter used as an operand to the # or ## operators, which is itself subject to further macro replacement, shall only be used as an operand to these operators.
20.13	A line whose first token is # shall be a valid preprocessing directive.
20.14	All #else, #elif and #endif preprocessor directives shall reside in the same file as the #if, #ifdef or #ifndef directive to which they are related.

Standard Libraries

Rule	Description
21.1	#define and #undef shall not be used on a reserved identifier or reserved macro name.
21.2	A reserved identifier or macro name shall not be declared.
21.3	The memory allocation and deallocation functions of <stdlib.h> shall not be used.</stdlib.h>
21.4	The standard header file <setjmp.h> shall not be used.</setjmp.h>
21.5	The standard header file <signal.h> shall not be used.</signal.h>
21.6	The Standard Library input/output functions shall not be used.
21.7	The atof, atoi, atol, and atoll functions of <stdlib.h> shall not be used.</stdlib.h>
21.8	The library functions abort, exit, getenv and system of <stdlib.h> shall not be used.</stdlib.h>
21.9	The library functions bsearch and qsort of <stdlib.h> shall not be used.</stdlib.h>
21.10	The Standard Library time and date functions shall not be used.
21.11	The standard header file <tgmath.h> shall not be used.</tgmath.h>
21.12	The exception handling features of <fenv.h> should not be used.</fenv.h>

MISRA C++ 2008 Rules

Language Independent Issues

Rule	Description
0-1-7	The value returned by a function having a non-void return type that is not an overloaded operator shall always be used.
0-1-11	There shall be no unused parameters (named or unnamed) in non-virtual functions.
0-1-12	There shall be no unused parameters (named or unnamed) in the set of parameters for a virtual function and all the functions that override it.
0-2-1	An object shall not be assigned to an overlapping object.

General

Rule	Description
	All code shall conform to ISO/IEC 14882:2003 "The C++ Standard Incorporating Technical Corrigendum 1".

Lexical Conventions

Rule	Description
2-3-1	Trigraphs shall not be used.
2-5-1	Digraphs should not be used.
2-7-1	The character sequence /* shall not be used within a C-style comment.
2-10-1	Different identifiers shall be typographically unambiguous.
2-10-2	Identifiers declared in an inner scope shall not hide an identifier declared in an outer scope.
2-10-3	A typedef name (including qualification, if any) shall be a unique identifier.
2-10-4	A class, union or enum name (including qualification, if any) shall be a unique identifier.
2-10-6	If an identifier refers to a type, it shall not also refer to an object or a function in the same scope.
2-13-1	Only those escape sequences that are defined in ISO/IEC 14882:2003 shall be used.
2-13-2	Octal constants (other than zero) and octal escape sequences (other than "\0") shall not be used.
2-13-3	A "U" suffix shall be applied to all octal or hexadecimal integer literals of unsigned type.
2-13-4	Literal suffixes shall be upper case.
2-13-5	Narrow and wide string literals shall not be concatenated.

Basic Concepts

Rule	Description
3-1-1	It shall be possible to include any header file in multiple translation units without violating the One Definition Rule.
3-1-2	Functions shall not be declared at block scope.
3-1-3	When an array is declared, its size shall either be stated explicitly or defined implicitly by initialization.
3-3-1	Objects or functions with external linkage shall be declared in a header file.
3-3-2	If a function has internal linkage then all re-declarations shall include the static storage class specifier.
3-4-1	An identifier declared to be an object or type shall be defined in a block that minimizes its visibility.
3-9-1	The types used for an object, a function return type, or a function parameter shall be token-for-token identical in all declarations and re-declarations.
3-9-2	Typedefs that indicate size and signedness should be used in place of the basic numerical types.
3-9-3	The underlying bit representations of floating-point values shall not be used.

Standard Conversions

Rule	Description
4-5-1	Expressions with type bool shall not be used as operands to built-in operators other than the assignment operator =, the logical operators &&, $ $, $ $, the equality operators == and $ $ =, the unary & operator, and the conditional operator.
4-5-2	Expressions with type enum shall not be used as operands to built- in operators other than the subscript operator [], the assignment operator =, the equality operators == and !=, the unary & operator, and the relational operators <, <=, >, >=.
4-5-3	Expressions with type (plain) char and wchar_t shall not be used as operands to built-in operators other than the assignment operator =, the equality operators == and !=, and the unary & operator.

Expressions

Rule	Description
5-0-1	The value of an expression shall be the same under any order of evaluation that the standard permits.
5-0-2	Limited dependence should be placed on C++ operator precedence rules in expressions.
5-0-3	A cvalue expression shall not be implicitly converted to a different underlying type.
5-0-4	An implicit integral conversion shall not change the signedness of the underlying type.
5-0-5	There shall be no implicit floating-integral conversions.
5-0-6	An implicit integral or floating-point conversion shall not reduce the size of the underlying type.
5-0-7	There shall be no explicit floating-integral conversions of a cvalue expression.
5-0-8	An explicit integral or floating-point conversion shall not increase the size of the underlying type of a cvalue expression.
5-0-9	An explicit integral conversion shall not change the signedness of the underlying type of a cvalue expression.
5-0-10	If the bitwise operators ~ and << are applied to an operand with an underlying type of unsigned char or unsigned short, the result shall be immediately cast to the underlying type of the operand.
5-0-11	The plain char type shall only be used for the storage and use of character values.
5-0-12	signed char and unsigned char type shall only be used for the storage and use of numeric values.
5-0-13	The condition of an if-statement and the condition of an iteration-statement shall have type bool.
5-0-14	The first operand of a conditional-operator shall have type bool.
5-0-15	Array indexing shall be the only form of pointer arithmetic.
5-0-18	>, >=, <, <= shall not be applied to objects of pointer type, except where they point to the same array.
5-0-19	The declaration of objects shall contain no more than two levels of pointer indirection.
5-0-20	Non-constant operands to a binary bitwise operator shall have the same underlying type.
5-0-21	Bitwise operators shall only be applied to operands of unsigned underlying type.

Rule	Description
5-2-1	Each operand of a logical && or shall be a postfix - expression.
5-2-2	A pointer to a virtual base class shall only be cast to a pointer to a derived class by means of dynamic_cast.
5-2-3	Casts from a base class to a derived class should not be performed on polymorphic types.
5-2-4	C-style casts (other than void casts) and functional notation casts (other than explicit constructor calls) shall not be used.
5-2-5	A cast shall not remove any const or volatile qualification from the type of a pointer or reference.
5-2-6	A cast shall not convert a pointer to a function to any other pointer type, including a pointer to function type.
5-2-7	An object with pointer type shall not be converted to an unrelated pointer type, either directly or indirectly.
5-2-8	An object with integer type or pointer to void type shall not be converted to an object with pointer type.
5-2-9	A cast should not convert a pointer type to an integral type.
5-2-10	The increment (++) and decrement () operators should not be mixed with other operators in an expression.
5-2-11	The comma operator, && operator and the operator shall not be overloaded.
5-2-12	An identifier with array type passed as a function argument shall not decay to a pointer.
5-3-1	Each operand of the ! operator, the logical && or the logical operators shall have type bool.
5-3-2	The unary minus operator shall not be applied to an expression whose underlying type is unsigned.
5-3-3	The unary & operator shall not be overloaded.
5-3-4	Evaluation of the operand to the sizeof operator shall not contain side effects.
5-8-1	The right hand operand of a shift operator shall lie between zero and one less than the width in bits of the underlying type of the left hand operand.
5-14-1	The right hand operand of a logical && or operator shall not contain side effects.
5-18-1	The comma operator shall not be used.
5-19-1	Evaluation of constant unsigned integer expressions should not lead to wrap-around.

Statements

Rule	Description
6-2-1	Assignment operators shall not be used in sub-expressions.
6-2-2	Floating-point expressions shall not be directly or indirectly tested for equality or inequality.
6-2-3	Before preprocessing, a null statement shall only occur on a line by itself; it may be followed by a comment, provided that the first character following the null statement is a white - space character.
6-3-1	The statement forming the body of a switch, while, do while or for statement shall be a compound statement.
6-4-1	An if (condition) construct shall be followed by a compound statement. The else keyword shall be followed by either a compound statement, or another if statement.
6-4-2	All if else if constructs shall be terminated with an else clause.
6-4-3	A switch statement shall be a well-formed switch statement.
6-4-4	A switch-label shall only be used when the most closely-enclosing compound statement is the body of a switch statement.
6-4-5	An unconditional throw or break statement shall terminate every non - empty switch-clause.
6-4-6	The final clause of a switch statement shall be the default-clause.
6-4-7	The condition of a switch statement shall not have bool type.
6-4-8	Every switch statement shall have at least one case-clause.
6-5-1	A for loop shall contain a single loop-counter which shall not have floating type.
6-5-2	If loop-counter is not modified by or ++, then, within condition, the loop-counter shall only be used as an operand to $<=$, $<$, $>$ or $>=$.
6-5-3	The loop-counter shall not be modified within condition or statement.
6-5-4	The loop-counter shall be modified by one of:, $++$, $-=n$, or $+=n$; where n remains constant for the duration of the loop.
6-5-5	A loop-control-variable other than the loop-counter shall not be modified within condition or expression.
6-5-6	A loop-control-variable other than the loop-counter which is modified in statement shall have type bool.

Rule	Description
6-6-1	Any label referenced by a goto statement shall be declared in the same block, or in a block enclosing the goto statement.
6-6-2	The goto statement shall jump to a label declared later in the same function body.
6-6-3	The continue statement shall only be used within a well-formed for loop.
6-6-4	For any iteration statement there shall be no more than one break or goto statement used for loop termination.
6-6-5	A function shall have a single point of exit at the end of the function.

Declarations

Rule	Description
7-3-1	The global namespace shall only contain main, namespace declarations and extern "C" declarations.
7-3-2	The identifier main shall not be used for a function other than the global function main.
7-3-3	There shall be no unnamed namespaces in header files.
7-3-4	using-directives shall not be used.
7-3-5	Multiple declarations for an identifier in the same namespace shall not straddle a using-declaration for that identifier.
7-3-6	using-directives and using-declarations (excluding class scope or function scope using-declarations) shall not be used in header files.
7-4-2	Assembler instructions shall only be introduced using the asm declaration.
7-4-3	Assembly language shall be encapsulated and isolated.

Declarators

Rule	Description
8-0-1	An init-declarator-list or a member-declarator-list shall consist of a single init-declarator or member-declarator respectively.
8-3-1	Parameters in an overriding virtual function shall either use the same default arguments as the function they override, or else shall not specify any default arguments.
8-4-1	Functions shall not be defined using the ellipsis notation.
8-4-2	The identifiers used for the parameters in a re-declaration of a function shall be identical to those in the declaration.
8-4-3	All exit paths from a function with non-void return type shall have an explicit return statement with an expression.
8-4-4	A function identifier shall either be used to call the function or it shall be preceded by &.
8-5-2	Braces shall be used to indicate and match the structure in the non- zero initialization of arrays and structures.
8-5-3	In an enumerator list, the = construct shall not be used to explicitly initialize members other than the first, unless all items are explicitly initialized.

Classes

Rule	Description
9-3-1	const member functions shall not return non-const pointers or references to class-data.
9-3-2	Member functions shall not return non-const handles to class-data.
9-5-1	Unions shall not be used.
9-6-2	Bit-fields shall be either bool type or an explicitly unsigned or signed integral type.
9-6-3	Bit-fields shall not have enum type.
9-6-4	Named bit-fields with signed integer type shall have a length of more than one bit.

Derived Classes

Rule	Description
10-1-1	Classes should not be derived from virtual bases.
10-1-2	A base class shall only be declared virtual if it is used in a diamond hierarchy.
10-1-3	An accessible base class shall not be both virtual and non-virtual in the same hierarchy.
10-2-1	All accessible entity names within a multiple inheritance hierarchy should be unique.
10-3-1	There shall be no more than one definition of each virtual function on each path through the inheritance hierarchy.
10-3-2	Each overriding virtual function shall be declared with the virtual keyword.
10-3-3	A virtual function shall only be overridden by a pure virtual function if it is itself declared as pure virtual.

Member Access Control

Rule	Description
11-0-1	Member data in non- POD class types shall be private.

Special Member Functions

Rule	Description
12-1-1	An object's dynamic type shall not be used from the body of its constructor or destructor.
12-1-2	All constructors of a class should explicitly call a constructor for all of its immediate base classes and all virtual base classes.
12-1-3	All constructors that are callable with a single argument of fundamental type shall be declared explicit.
12-8-1	A copy constructor shall only initialize its base classes and the non- static members of the class of which it is a member.
12-8-2	The copy assignment operator shall be declared protected or private in an abstract class.

Templates

Rule	Description
14-5-2	A copy constructor shall be declared when there is a template constructor with a single parameter that is a generic parameter.
14-5-3	A copy assignment operator shall be declared when there is a template assignment operator with a parameter that is a generic parameter.
14-6-1	In a class template with a dependent base, any name that may be found in that dependent base shall be referred to using a qualified-id or this->.
14-6-2	The function chosen by overload resolution shall resolve to a function declared previously in the translation unit.
14-7-3	All partial and explicit specializations for a template shall be declared in the same file as the declaration of their primary template.
14-8-1	Overloaded function templates shall not be explicitly specialized.
14-8-2	The viable function set for a function call should either contain no function specializations, or only contain function specializations.

Exception Handling

Rule	Description
15-0-2	An exception object should not have pointer type.
15-0-3	Control shall not be transferred into a try or catch block using a goto or a switch statement.
15-1-2	NULL shall not be thrown explicitly.
15-1-3	An empty throw (throw;) shall only be used in the compound- statement of a catch handler.
15-3-2	There should be at least one exception handler to catch all otherwise unhandled exceptions
15-3-3	Handlers of a function-try-block implementation of a class constructor or destructor shall not reference non-static members from this class or its bases.
15-3-5	A class type exception shall always be caught by reference.
15-3-6	Where multiple handlers are provided in a single try-catch statement or function-try-block for a derived class and some or all of its bases, the handlers shall be ordered most-derived to base class.
15-3-7	Where multiple handlers are provided in a single try-catch statement or function-try-block, any ellipsis (catch-all) handler shall occur last.
15-5-1	A class destructor shall not exit with an exception.
15-5-2	Where a function's declaration includes an exception-specification, the function shall only be capable of throwing exceptions of the indicated type(s).

Preprocessing Directives

Rule	Description
16-0-1	#include directives in a file shall only be preceded by other preprocessor directives or comments.
16-0-2	Macros shall only be #define 'd or #undef 'd in the global namespace.
16-0-3	#undef shall not be used.
16-0-4	Function-like macros shall not be defined.
16-0-5	Arguments to a function-like macro shall not contain tokens that look like preprocessing directives.
16-0-6	In the definition of a function-like macro, each instance of a parameter shall be enclosed in parentheses, unless it is used as the operand of # or ##.
16-0-7	Undefined macro identifiers shall not be used in #if or #elif preprocessor directives, except as operands to the defined operator.
16-0-8	If the # token appears as the first token on a line, then it shall be immediately followed by a preprocessing token.
16-1-1	The defined preprocessor operator shall only be used in one of the two standard forms.
16-1-2	All #else, #elif and #endif preprocessor directives shall reside in the same file as the #if or #ifdef directive to which they are related.
16-2-1	The pre-processor shall only be used for file inclusion and include guards.
16-2-2	C++ macros shall only be used for: include guards, type qualifiers, or storage class specifiers.
16-2-3	Include guards shall be provided.
16-2-4	The ', ", /* or // characters shall not occur in a header file name.
16-2-5	The \ character should not occur in a header file name.
16-2-6	The #include directive shall be followed by either a <filename> or "filename" sequence.</filename>
16-3-1	There shall be at most one occurrence of the # or ## operators in a single macro definition.
16-3-2	The # and ## operators should not be used.
16-6-1	All uses of the #pragma directive shall be documented.
17-0-1	Reserved identifiers, macros and functions in the standard library shall not be defined, redefined or undefined.

Rule	Description
17-0-2	The names of standard library macros and objects shall not be reused.
17-0-5	The setjmp macro and the longjmp function shall not be used.

Language Support Library

Rule	Description
18-0-1	The C library shall not be used.
18-0-2	The library functions atof, atoi and atol from library <cstdlib> shall not be used.</cstdlib>
18-0-3	The library functions abort, exit, getenv and system from library <cstdlib> shall not be used.</cstdlib>
18-0-4	The time handling functions of library <ctime> shall not be used.</ctime>
18-0-5	The unbounded functions of library <cstring> shall not be used.</cstring>
18-2-1	The macro offsetof shall not be used.
18-4-1	Dynamic heap memory allocation shall not be used.
18-7-1	The signal handling facilities of <csignal> shall not be used.</csignal>

Diagnostic Library

Rule	Description
19-3-1	The error indicator errno shall not be used.

Input/Output Library

Rule	Description
27-0-1	The stream input/output library <cstdio> shall not be used.</cstdio>

CWE Coding Standard and Polyspace Results

Common Weakness Enumeration (CWE) is a dictionary of common software weakness types that can occur in software architecture, design, code, or implementation. These weaknesses can lead to security vulnerabilities.

CWE and Polyspace Bug Finder

The CWE dictionary assigns a unique identifier to each software weakness type. These identifiers serve as a common language for describing software security weaknesses and a standard for software security tools targeting these weaknesses. For more information, see Common Weakness Enumeration.

Polyspace Bug Finder results can be mapped to CWE identifiers. Using Bug Finder, you can check and document if your software has weaknesses listed in the CWE dictionary. Bug Finder supports the following aspects of the CWE Compatibility and Effectiveness Program:

- CWE Searchable: For each supported CWE identifier, you can see all instances in your code that have weaknesses corresponding to the identifier.
- CWE Output: For each Polyspace Bug Finder defect:
 - You can view the associated CWE identifier.
 - You can report the associated CWE identifier.

Bug Finder results are mapped to CWE identifiers (IDs). Using the Bug Finder results, you can evaluate your code against the CWE standard. For instance, CWE ID 119 (Improper restriction of operations within the bounds of a memory buffer) maps to the Bug Finder defects, Array access out of bounds and Pointer access out of bounds.

For more information on the CWE Compatibility and Effectiveness Program, see CWE Compatibility.

Find CWE IDs from Polyspace Results

Use the following workflow if you want to focus your Bug Finder analysis on the CWE standard.

 Analysis: Check your code only for those Bug Finder defects that correspond to the standard. Use the option Find defects (-checkers) with value CWE.

- *Results*: If you enable only the defect checkers corresponding to the CWE standard, you see only the defects that correspond to the standard. Fix or justify each defect.
 - Along with defects, you can see the CWE IDs mapped to each defect in the **CWE ID** column on the **Results List** pane. If the column is not enabled by default, right-click any column header and select **CWE ID**.
- Report: When you generate a report, choose the SecurityCWE template tailored for the CWE standard. The report shows the CWE ID-s corresponding to each result.

Mapping Between CWE Identifiers and Polyspace Results

The following table lists the CWE IDs (version 2.8) addressed by Polyspace Bug Finder with its corresponding defect checkers. Using Polyspace Bug Finder defect checkers, you can check for 133 CWE IDs.

There are three types of CWE identifiers: Class, Base and Variant. Identifiers of type Class define security weaknesses at an abstract level independent of a specific language or technology, while identifiers of type Base and Variant are more concrete. On the other hand, Polyspace Bug Finder results are designed to be specific so that users can have a precise diagnosis of the defect in their code and understand the defect quickly. Therefore:

- The Bug Finder results are mapped to the specific identifiers of type Base and Variant rather than the generic identifiers of type Class.
 - Only when a result covers more ground than a specific CWE identifier is the result mapped to its more general parent type. For instance, the defect checker **Array access out of bounds** covers many kinds of buffer overflows, while CWE-788 refers only to "Access of Memory Location After End of Buffer". Therefore, the defect checker is mapped to its parent, CWE-119, which refers to "Improper Restriction of Operations within the Bounds of a Memory Buffer". However, to keep the mapping precise, an attempt is made to map to specific CWE identifiers.
- Often, more than one Bug Finder result is mapped to a certain CWE identifier.

For instance, CWE-908 refers to "Use of Uninitialized Resource". To highlights specific kinds of uninitialized resources, Bug Finder has three different checkers: **Member not initialized in constructor**, **Non-initialized pointer**, and **Non-initialized variable**.

For mapping to the subsets CWE-658 and CWE-659, see "Mapping Between CWE-658 or 659 and Polyspace Results" on page 13-100.

CWE ID Description	Polyspace Bug Finder Defect Checker
External control of system or configuration setting	Host change using externally controlled elements Use of externally controlled environment variable
Improper input validation	Unsafe conversion from string to numerical value
Improper Limitation of a Pathname to a Restricted Directory ('Path Traversal')	Vulnerable path manipulation
Relative path traversal	Vulnerable path manipulation
Absolute path traversal	Vulnerable path manipulation
Improper Handling of Windows Device Names	Inappropriate I/O operation on device files
Improper neutralization of special elements used in a command	Execution of externally controlled command Unsafe call to a system function
Improper neutralization of special elements used in an OS command	Execution of externally controlled command Unsafe call to a system function
Argument injection or modification	Execution of externally controlled command Unsafe call to a system function
	External control of system or configuration setting Improper input validation Improper Limitation of a Pathname to a Restricted Directory ('Path Traversal') Relative path traversal Absolute path traversal Improper Handling of Windows Device Names Improper neutralization of special elements used in a command Improper neutralization of special elements used in an OS command Argument injection

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
114	Process control	Command executed from externally controlled path
		Execution of a binary from a relative path can be controlled by an external actor
		Execution of externally controlled command
		Library loaded from externally controlled path
		Load of library from a relative path can be controlled by an external actor
119	Improper restriction of operations within the bounds of a memory buffer	Array access out of bounds Pointer access out of bounds
120	Buffer copy without checking size of input ('Classic buffer	Invalid use of standard library memory routine
	overflow')	Invalid use of standard library string routine
		Tainted NULL or non-null-terminated string
121	Stack-based buffer overflow	Array access with tainted index
	Ovornow	Destination buffer overflow in string manipulation
122	Heap-based buffer overflow	Pointer dereference with tainted offset

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
124	Buffer underwrite ('Buffer underflow')	Array access with tainted index
		Buffer overflow from incorrect string format specifier
		Destination buffer underflow in string manipulation
		Pointer dereference with tainted offset
125	Out-of-bounds read	Array access with tainted index
		Buffer overflow from incorrect string format specifier
		Destination buffer overflow in string manipulation
126	Buffer over-read	Buffer overflow from incorrect string format specifier
127	Buffer under-read	Buffer overflow from incorrect string format specifier
128	Wrap-around error	Integer constant overflow
		Tainted sign change conversion
		Unsigned integer conversion overflow
		Memory allocation with tainted size
		Unsigned integer overflow
		Tainted size of variable length array
		Unsigned integer constant overflow
		Integer overflow
		Integer conversion overflow

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
129	Improper validation of array index	Array access with tainted index Pointer dereference with tainted offset
130	Improper handling of length parameter inconsistency	Mismatch between data length and size
131	Incorrect calculation of buffer size	Pointer access out of bounds Tainted sign change conversion Unsigned integer conversion overflow Memory allocation with tainted size Unsigned integer overflow Array access out of bounds Tainted size of variable length array
134	Uncontrolled format string	Tainted string format
135	Incorrect Calculation of Multi-Byte String Length	Destination buffer overflow in string manipulation Misuse of narrow or wide character string Unreliable cast of pointer
170	Improper null termination	Missing null in string array Misuse of readlink() Tainted NULL or non-null-terminated string

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
188	Reliance on data/ memory layout	Invalid assumptions about memory organization
		Memory comparison of padding data
		Memory comparison of strings
		Missing byte reordering when transferring data
		Pointer access out of bounds
189	Numeric Errors	Absorption of float operand
		Float conversion overflow
		Float division by zero
		Float overflow
		Integer constant overflow
		Integer conversion overflow
		Integer division by zero
		Integer overflow
		Precision loss in integer to float conversion
		Shift of a negative value
		Shift operation overflow
		Tainted division operand
		Unsigned integer constant overflow
		Unsigned integer conversion overflow
		Unsigned integer overflow

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
190	Integer overflow or wraparound	Integer constant overflow
		Integer conversion overflow
		Integer precision exceeded
		Integer overflow
		Possible invalid operation on boolean operand
		Shift operation overflow
		Tainted division operand
		Unsigned integer constant overflow
		Unsigned integer conversion overflow
		Unsigned integer overflow
191	Integer underflow (Wrap or	Integer constant overflow
1	wraparound)	Integer conversion overflow
		Integer overflow
		Unsigned integer constant overflow
		Unsigned integer conversion overflow
		Unsigned integer overflow

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
192	Integer coercion error	Tainted sign change conversion Unsigned integer conversion overflow
		Unsigned integer overflow
		Sign change integer conversion overflow
		Integer overflow
		Integer conversion overflow
194	Unexpected sign extension	Sign change integer conversion overflow
		Tainted sign change conversion
195	Signed to unsigned conversion error	Sign change integer conversion overflow
		Tainted sign change conversion
196	Unsigned to signed conversion error	Sign change integer conversion overflow
197	Numeric truncation error	Integer conversion overflow
	61101	Float conversion overflow
		Unsigned integer conversion overflow
198		Missing byte reordering when transferring data
226	Sensitive information uncleared before release	Uncleared sensitive data in stack

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
227	Improper fulfillment of API contract	Invalid use of standard library floating point routine
		Invalid use of standard library integer routine
		Invalid use of standard library memory routine
		Invalid use of standard library routine
		Invalid use of standard library string routine
		Writing to const qualified object
240	Improper handling of inconsistent structural elements	Mismatch between data length and size
242	Use of inherently dangerous function	Use of dangerous standard function
243	Creation of chroot jail without changing working directory	File manipulation after chroot without chdir
244	Improper clearing of heap memory before release	Sensitive heap memory not cleared before release
250	Execution with unnecessary privileges	Bad order of dropping privileges Privilege drop not verified
251	Often misused: string management	Destination buffer overflow in string manipulation
252	Unchecked return value	Returned value of a sensitive function not checked

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
253		Errno not checked
	Function Return Value	Errno not reset
		Returned value of a sensitive function not checked
		Unprotected dynamic memory allocation
		Unsafe conversion from string to numerical value
273	Improper check for dropped privileges	Privilege drop not verified

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
310	Cryptographic issues	Constant cipher key
		Weak cipher mode
		Context initialized incorrectly for cryptographic operation
		Nonsecure hash algorithm
		Constant block cipher initialization vector
		Context initialized incorrectly for digest operation
		Missing parameters for key generation
		Missing data for encryption, decryption or signing operation
		Nonsecure SSL/TLS protocol
		Missing peer key
		Missing cipher key
		Missing cipher algorithm
		Missing private key
		Missing public key
		Predictable block cipher initialization vector
		Nonsecure parameters for key generation
		Predictable cipher key
		Weak padding for RSA algorithm

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
		Nonsecure RSA public exponent
		Missing padding for RSA algorithm
		Missing blinding for RSA algorithm
		Incorrect key for cryptographic algorithm
		Missing block cipher initialization vector
		Weak cipher algorithm
		Incompatible padding for RSA algorithm operation
311	Missing encryption of sensitive data	Missing cipher final step
		Missing cipher data to process
312	Cleartext Storage of Sensitive Information	Sensitive heap memory not cleared before release
		Uncleared sensitive data in stack
316	Cleartext Storage of Sensitive Information in Memory	Sensitive heap memory not cleared before release
	III Memory	Uncleared sensitive data in stack
320	Key management errors	Constant cipher key
		Missing peer key
		Missing cipher key
		Missing private key
		Missing public key
321	Use of hard-coded cryptographic key	Constant cipher key

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
325	Missing required cryptographic step	Missing block cipher initialization vector
		Missing cipher algorithm
		Missing cipher data to process
		Missing cipher final step
		Missing cipher key
		Weak cipher algorithm
		Weak cipher mode
		Context initialized incorrectly for cryptographic operation
		Missing parameters for key generation
		Missing data for encryption, decryption or signing operation
		Incorrect key for cryptographic algorithm

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
326	Inadequate encryption strength	Weak cipher algorithm
		Constant cipher key
		Weak cipher mode
		Constant block cipher initialization vector
		Nonsecure parameters for key generation
		Predictable cipher key
		Weak padding for RSA algorithm
		Nonsecure RSA public exponent
		Missing padding for RSA algorithm
		Missing blinding for RSA algorithm
		Missing block cipher initialization vector
327	Use of a broken or	Unsafe standard encryption function
	risky cryptographic algorithm	Weak cipher algorithm
		Weak cipher mode
		Nonsecure hash algorithm
		Nonsecure SSL/TLS protocol
		Nonsecure parameters for key generation
		Weak padding for RSA algorithm
		Nonsecure RSA public exponent
		Missing padding for RSA algorithm

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
328	Reversible one-way hash	Nonsecure hash algorithm
329	Not using a random IV with CBC mode	Missing block cipher initialization vector
		Predictable block cipher initialization vector
		Constant block cipher initialization vector
330	Use of insufficiently random values	Deterministic random output from constant seed
		Predictable random output from predictable seed
		Vulnerable pseudo-random number generator
		Predictable block cipher initialization vector
		Predictable cipher key
336	Same seed in PRNG	Deterministic random output from constant seed
337	Predictable seed in PRNG	Predictable random output from predictable seed
338	Use of cryptographically	Vulnerable pseudo-random number generator
	weak pseudo-random number generator (PRNG)	Predictable block cipher initialization vector
		Predictable cipher key

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
353	Missing Support for Integrity Check	Context initialized incorrectly for digest operation
		Nonsecure hash algorithm
354	Improper Validation of Integrity Check Value	Context initialized incorrectly for digest operation
362	Concurrent execution using shared resource with improper synchronization ('Race Condition')	File descriptor exposure to child process Opening previously opened resource
364	Signal handler race condition	Shared data access within signal handler Function called from signal handler not asynchronous-safe (strict) Function called from signal handler not asynchronous-safe
366	Race condition within a thread	Data race Data race including atomic operations Data race through standard library function call
367	Time-of-check time- of-use (TOCTOU) race condition	File access between time of check and use (TOCTOU)

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
369	Divide by zero	Float division by zero
		Integer division by zero
		Invalid use of standard library floating point routine
		Invalid use of standard library integer routine
		Tainted division operand
		Tainted modulo operand
372	Incomplete internal state distinction	Context initialized incorrectly for cryptographic operation
		Context initialized incorrectly for digest operation
		Missing parameters for key generation
		Missing data for encryption, decryption or signing operation
		Inconsistent cipher operations
		Missing cipher data to process
		Incompatible padding for RSA algorithm operation
		Missing cipher final step
375	Returning a mutable object to an untrusted caller	Return of non const handle to encapsulated data member
377	Insecure temporary file	Use of non-secure temporary file

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
387	Signal errors	Return from computational exception signal handler
		Signal call from within signal handler
		Function called from signal handler not asynchronous-safe
		Function called from signal handler not asynchronous-safe (strict)
391	Unchecked error condition	Errno not checked
398	Indicator of poor code quality	Write without a further read
401	Improper release of memory before	Memory leak
	removing last reference	Thread-specific memory leak
404	Improper resource	Invalid deletion of pointer
	shutdown or release	Invalid free of pointer
		Memory leak
		Mismatched alloc/dealloc functions on Windows
		Thread-specific memory leak

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
413	Improper Resource Locking	Data race
	Locking	Data race including atomic operations
		Data race through standard library function call
		Function called from signal handler not asynchronous-safe
		Function called from signal handler not asynchronous-safe (strict)
		Opening previously opened resource
		Shared data access within signal handler
415	Double free	Deallocation of previously deallocated pointer
		Missing reset of a freed pointer
416	Use after free	Missing reset of a freed pointer
		Use of previously freed pointer
426	Untrusted search path	Command executed from externally controlled path
		Library loaded from externally controlled path

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
427	Uncontrolled search path element	Execution of a binary from a relative path can be controlled by an external actor
		Library loaded from externally controlled path
		Load of library from a relative path can be controlled by an external actor
		Use of externally controlled environment variable
456	Missing initialization	Errno not reset
	of a variable	Member not initialized in constructor
		Non-initialized pointer
		Non-initialized variable
457	Use of uninitialized	Member not initialized in constructor
	variable	Non-initialized pointer
		Non-initialized variable
465	Pointer Issues	Unsafe conversion between pointer and integer
466	Return of pointer	Array access out of bounds
	value outside of expected range	Pointer access out of bounds
		Unsafe conversion between pointer and integer
467	Use of sizeof() on a pointer type	Possible misuse of sizeof
		Wrong type used in sizeof
468	Incorrect pointer scaling	Incorrect pointer scaling

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
469	Use of pointer subtraction to determine size	Subtraction or comparison between pointers to different arrays
471	Modification of assumed-immutable data	Writing to const qualified object
474	Use of function with inconsistent implementations	Signal call from within signal handler Use of obsolete standard function
475	Undefined behavior for input to API	Copy of overlapping memory
476	NULL pointer dereference	Null pointer Tainted NULL or non-null-terminated string
477	Use of obsolete functions	Use of obsolete standard function
478	Missing default case in switch statement	Missing case for switch condition
479	Signal handler use of a non-reentrant function	Function called from signal handler not asynchronous-safe Function called from signal handler not asynchronous-safe (strict)
480	Use of incorrect operator	<pre>Invalid use of == (equality) operator Invalid use of = (assignment) operator</pre>
481	Assigning instead of comparing	<pre>Invalid use of = (assignment) operator</pre>
482	Comparing instead of assigning	<pre>Invalid use of == (equality) operator</pre>
484	Omitted break statement in switch	Missing break of switch case

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
522	Insufficiently	Constant cipher key
	Protected Credentials	Nonsecure hash algorithm
		Nonsecure parameters for key generation
		Nonsecure RSA public exponent
		Nonsecure SSL/TLS protocol
		Unsafe standard encryption function
532	Information exposure through log files	Sensitive data printed out
534	Information exposure through debug log files	Sensitive data printed out
535	Information exposure through shell error message	Sensitive data printed out
547	Use of hard-coded, security-relevant constants	Hard coded buffer size Hard coded loop boundary
558	Use of getlogin() in multithreaded application	Unsafe standard function
560	Use of umask() with chmod-style argument	Umask used with chmod-style arguments
561	Dead code	Dead code
		Static uncalled function
		Unreachable code

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
562	Return of stack variable address	Pointer or reference to stack variable leaving scope
		Use of automatic variable as putenv- family function argument
573	Improper following of specification by	Missing cipher algorithm
	caller	Missing cipher data to process
		Missing cipher final step
		Missing cipher key
		Modification of internal buffer returned from nonreentrant standard function
		Context initialized incorrectly for cryptographic operation
		Context initialized incorrectly for digest operation
		Missing parameters for key generation
		Missing data for encryption, decryption or signing operation
		Missing peer key
		Missing private key
		Missing public key
		Missing blinding for RSA algorithm
		Incorrect key for cryptographic algorithm
		Incompatible padding for RSA algorithm operation

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
587	Assignment of a fixed address to a pointer	Unsafe conversion between pointer and integer
		Function pointer assigned with absolute address
590	Free of memory not on the heap	Invalid free of pointer
606	Unchecked input for loop condition	Loop bounded with tainted value
628	Function call with incorrectly specified	Bad file access mode or status
	arguments	Copy of overlapping memory
		Invalid va_list argument
		Modification of internal buffer returned from nonreentrant standard function
		Standard function call with incorrect arguments
658	See "Mapping Between CWE-658 or 659 and Polyspace Results" on page 13-100.	
659	See "Mapping Between CWE-658 or 659 and Polyspace Results" on page 13-100.	
663	Use of a non- reentrant function in a concurrent context	Function called from signal handler not asynchronous-safe
		Function called from signal handler not asynchronous-safe (strict)
		Unsafe standard encryption function
		Unsafe standard function

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
664	Improper control of a resource through its lifetime	Context initialized incorrectly for cryptographic operation
		Context initialized incorrectly for digest operation
		Missing peer key
		Missing cipher key
		Missing private key
		Missing public key
		Inconsistent cipher operations
		Missing cipher data to process
		Incorrect key for cryptographic algorithm
		Incompatible padding for RSA algorithm operation
		Missing cipher final step
665	Improper initialization	Call to memset with unintended value
		Improper array initialization
		Overlapping assignment
		Use of memset with size argument zero
666	Operation on resource in wrong phase of lifetime	Incorrect order of network connection operations

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
667	Improper locking	Blocking operation while holding lock Missing unlock
		Destruction of locked mutex
672	Operation on a resource after expiration or release	Use of previously closed resource Closing a previously closed resource
675	Duplicate operations on resource	Opening previously opened resource
676	Use of potentially dangerous function	Unsafe conversion from string to numerical value
CO4	T	Use of dangerous standard function
681	Incorrect conversion between numeric types	Float conversion overflow Precision loss in integer to float conversion
682	Incorrect calculation	Absorption of float operand
		Float overflow
		Invalid use of standard library floating point routine
		Invalid use of standard library integer routine
		Tainted modulo operand
		Bitwise operation on negative value
		Use of plain char type for numerical value
683	Function Call With Incorrect Order of Arguments	Call to memset with unintended value
		Format string specifiers and arguments mismatch

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
685	Function call with incorrect number of arguments	Declaration mismatch
		Format string specifiers and arguments mismatch
		Standard function call with incorrect arguments
		Too many va_arg calls for current argument list
686	Function call with incorrect argument	Bad file access mode or status
	type	Declaration mismatch
		Format string specifiers and arguments mismatch
		Incorrect data type passed to va_arg
		Standard function call with incorrect arguments
		Use of automatic variable as putenv- family function argument
		Writing to const qualified object
687	Function call with incorrectly specified argument value	Copy of overlapping memory
		Standard function call with incorrect arguments
		Variable length array with nonpositive size

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
690	Unchecked return value to null pointer dereference	Invalid use of standard library memory routine
		Use of tainted pointer
		Null pointer
		Returned value of a sensitive function not checked
		Invalid use of standard library string routine
		Unprotected dynamic memory allocation
		Tainted NULL or non-null-terminated string
		Standard function call with incorrect arguments
		Invalid use of standard library routine
691	Insufficient control flow management	Use of setjmp/longjmp
693	Protection mechanism failure	Nonsecure SSL/TLS protocol
696	Incorrect behavior order	Bad order of dropping privileges
703	Improper check or handling of exceptional	Errno not reset Misuse of errno
	conditions	

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
704	Incorrect type conversion or cast	Character value absorbed into EOF
		Qualifier removed in conversion
		Precision loss in integer to float conversion
		Misuse of sign-extended character value
		Unreliable cast of pointer
		Wrong allocated object size for cast
705	Incorrect control flow scoping	Abnormal termination of exit handler
710	Coding standard violation	Bitwise and arithmetic operation on the same data
732	Incorrect permission assignment for critical resource	Vulnerable permission assignments
754	Improper check for unusual or exceptional conditions	Returned value of a sensitive function not checked
755	Improper handling of exceptional conditions	Exception handler hidden by previous handler
758	Reliance on undefined, unspecified, or	Unsafe conversion between pointer and integer
	implementation- defined behavior	Use of plain char type for numerical value
		Bitwise operation on negative value
762	Mismatched memory management routines	Invalid free of pointer
		Mismatched alloc/dealloc functions on Windows

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
764	Multiple locks of a critical resource	Double lock
765	Multiple unlocks of a critical resource	Double unlock
767	Access to critical private variable via public method	Return of non const handle to encapsulated data member
770	Allocation of resources without limits or throttling	Tainted size of variable length array
772	Missing release of resource after effective lifetime	Resource leak
780	Use of rsa algorithm without oaep	Weak padding for RSA algorithm Missing padding for RSA algorithm
783	Operator precedence logic error	Possibly unintended evaluation of expression because of operator precedence rules
785	Use of path manipulation function without maximum-sized buffer	Use of path manipulation function without maximum sized buffer checking
786	Access of memory location before start of buffer	Destination buffer underflow in string manipulation
787	Out-of-bounds write	Destination buffer overflow in string manipulation
		Destination buffer underflow in string manipulation

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
789	Uncontrolled memory allocation	Memory allocation with tainted size Tainted size of variable length array
		Unprotected dynamic memory allocation
805	Buffer access with incorrect length value	Hard-coded object size used to manipulate memory
822	Untrusted pointer dereference	Tainted NULL or non-null-terminated string
		Use of tainted pointer
823	Use of out-of-range pointer offset	Pointer access out of bounds
		Pointer dereference with tainted offset
824	Access of uninitialized pointer	Non-initialized pointer
825	Expired Pointer Dereference	Accessing object with temporary lifetime
		Deallocation of previously deallocated pointer
		Environment pointer invalidated by previous operation
		Missing reset of a freed pointer
		Pointer or reference to stack variable leaving scope
		Use of automatic variable as putenv- family function argument
		Use of previously freed pointer

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
826	Premature release of resource during expected lifetime	Closing a previously closed resource Destruction of locked mutex
		Use of previously closed resource
828	Signal handler with functionality that is not asynchronous-	Function called from signal handler not asynchronous-safe
	safe	Function called from signal handler not asynchronous-safe (strict)
832	Unlock of a resource that is not locked	Missing lock
833	Deadlock	Deadlock
843	Access of resource using incompatible type ('Type confusion')	Unreliable cast of pointer
872	CERT C++ Secure Coding Section 04 - Integers (INT)	Invalid use of standard library integer routine
873	CERT C++ Secure Coding Section 05 - Floating point arithmetic (FLP)	Absorption of float operand Floating point comparison with equality operators Invalid use of standard library floating point routine Float overflow
908	Use of uninitialized resource	Member not initialized in constructor Non-initialized pointer Non-initialized variable

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
910		Use of previously closed resource
	descriptor	Closing a previously closed resource
		Standard function call with incorrect arguments
922	Insecure Storage of Sensitive Information	File manipulation after chroot without chdir
		Umask used with chmod-style arguments
		Use of non-secure temporary file
		Vulnerable permission assignments

Mapping Between CWE-658 or 659 and Polyspace **Results**

CWE-658: Weaknesses in Software Written in C

CWE-658 is a subset of CWE IDs found in C programs that are not common to all languages. See CWE-658.

The following table lists the CWE IDs (version 2.8) from this subset that are addressed by Polyspace Bug Finder, with its corresponding defect checkers.

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
119	Improper restriction of operations within the bounds of a memory buffer	Array access out of bounds Pointer access out of bounds
120	Buffer copy without checking size of input ('Classic buffer overflow')	Invalid use of standard library memory routine Invalid use of standard library string routine Tainted NULL or non-null-terminated string
121	Stack-based buffer overflow	Array access with tainted index Destination buffer overflow in string manipulation
122	Heap-based buffer overflow	Pointer dereference with tainted offset

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
124	Buffer underwrite ('Buffer underflow')	Array access with tainted index
		Buffer overflow from incorrect string format specifier
		Destination buffer underflow in string manipulation
		Pointer dereference with tainted offset
125	Out-of-bounds read	Array access with tainted index
		Buffer overflow from incorrect string format specifier
		Destination buffer overflow in string manipulation
126	Buffer over-read	Buffer overflow from incorrect string format specifier
127	Buffer under-read	Buffer overflow from incorrect string format specifier
128	Wrap-around error	Integer constant overflow
		Tainted sign change conversion
		Unsigned integer conversion overflow
		Memory allocation with tainted size
		Unsigned integer overflow
		Tainted size of variable length array
		Unsigned integer constant overflow
		Integer overflow
		Integer conversion overflow

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
129	Improper validation of array index	Array access with tainted index
		Pointer dereference with tainted offset
130	Improper handling of length parameter inconsistency	Mismatch between data length and size
131	Incorrect calculation of buffer size	
		Tainted sign change conversion
		Unsigned integer conversion overflow
		Memory allocation with tainted size
		Unsigned integer overflow
		Array access out of bounds
		Tainted size of variable length array
134	Uncontrolled format string	Tainted string format
135	Incorrect Calculation of Multi-Byte String Length	Destination buffer overflow in string manipulation
	Longon	Misuse of narrow or wide character string
		Unreliable cast of pointer
170	Improper null termination	Missing null in string array
		Misuse of readlink()
		Tainted NULL or non-null-terminated string

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
188	Reliance on data/ memory layout	Invalid assumptions about memory organization
		Memory comparison of padding data
		Memory comparison of strings
		Missing byte reordering when transferring data
		Pointer access out of bounds
191	Integer underflow (Wrap or	Integer constant overflow
	wraparound)	Integer conversion overflow
		Integer overflow
		Unsigned integer constant overflow
		Unsigned integer conversion overflow
		Unsigned integer overflow
192	Integer coercion error	Tainted sign change conversion
	CITOI	Unsigned integer conversion overflow
		Unsigned integer overflow
		Sign change integer conversion overflow
		Integer overflow
		Integer conversion overflow
194	Unexpected sign	Sign change integer conversion overflow
	extension	Tainted sign change conversion
195	Signed to unsigned conversion error	Sign change integer conversion overflow
	conversion error	Tainted sign change conversion

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
196	Unsigned to signed conversion error	Sign change integer conversion overflow
197	Numeric truncation error	Integer conversion overflow Float conversion overflow Unsigned integer conversion overflow
242	Use of inherently dangerous function	Use of dangerous standard function
243	Creation of chroot jail without changing working directory	File manipulation after chroot without chdir
244	Improper clearing of heap memory before release	Sensitive heap memory not cleared before release
362	Concurrent execution using shared resource with improper synchronization ('Race Condition')	File descriptor exposure to child process Opening previously opened resource
364	Signal handler race condition	Shared data access within signal handler Function called from signal handler not asynchronous-safe (strict) Function called from signal handler not asynchronous-safe
366	Race condition within a thread	Data race Data race including atomic operations Data race through standard library function call

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
375	Returning a mutable object to an untrusted caller	Return of non const handle to encapsulated data member
401	Improper release of memory before removing last reference	Memory leak Thread-specific memory leak
415	Double free	Deallocation of previously deallocated pointer Missing reset of a freed pointer
416	Use after free	Missing reset of a freed pointer Use of previously freed pointer
457	Use of uninitialized variable	Member not initialized in constructor Non-initialized pointer Non-initialized variable
466	Return of pointer value outside of expected range	Array access out of bounds Pointer access out of bounds Unsafe conversion between pointer and integer
467	Use of sizeof() on a pointer type	Possible misuse of sizeof Wrong type used in sizeof
468	Incorrect pointer scaling	Incorrect pointer scaling
469	Use of pointer subtraction to determine size	Subtraction or comparison between pointers to different arrays
474	Use of function with inconsistent implementations	Signal call from within signal handler Use of obsolete standard function

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
476	NULL pointer dereference	Null pointer
		Tainted NULL or non-null-terminated string
478	Missing default case in switch statement	Missing case for switch condition
479	Signal handler use of a non-reentrant function	Function called from signal handler not asynchronous-safe
		Function called from signal handler not asynchronous-safe (strict)
480	Use of incorrect operator	<pre>Invalid use of == (equality) operator</pre>
		Invalid use of = (assignment) operator
481	Assigning instead of comparing	<pre>Invalid use of = (assignment) operator</pre>
482	Comparing instead of assigning	<pre>Invalid use of == (equality) operator</pre>
484	Omitted break statement in switch	Missing break of switch case
558	Use of getlogin() in multithreaded application	Unsafe standard function
560	Use of umask() with chmod-style argument	Umask used with chmod-style arguments
562	Return of stack variable address	Pointer or reference to stack variable leaving scope
		Use of automatic variable as putenv- family function argument

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
587	Assignment of a fixed address to a pointer	Unsafe conversion between pointer and integer
		Function pointer assigned with absolute address
676	Use of potentially dangerous function	Unsafe conversion from string to numerical value
		Use of dangerous standard function
incorrect number of arguments		Declaration mismatch
	Format string specifiers and arguments mismatch	
		Standard function call with incorrect arguments
		Too many va_arg calls for current argument list

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
690	Unchecked return value to null pointer dereference	Invalid use of standard library memory routine
	dereference	Use of tainted pointer
		Null pointer
		Returned value of a sensitive function not checked
		Invalid use of standard library string routine
		Unprotected dynamic memory allocation
		Tainted NULL or non-null-terminated string
		Standard function call with incorrect arguments
		Invalid use of standard library routine
704	conversion or cast	Character value absorbed into EOF
		Qualifier removed in conversion
		Precision loss in integer to float conversion
		Misuse of sign-extended character value
		Unreliable cast of pointer
		Wrong allocated object size for cast
762	Mismatched memory	Invalid free of pointer
	management routines	Mismatched alloc/dealloc functions on Windows

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
783	Operator precedence logic error	Possibly unintended evaluation of expression because of operator precedence rules
785	Use of path manipulation function without maximum-sized buffer	Use of path manipulation function without maximum sized buffer checking
789	Uncontrolled memory allocation	Memory allocation with tainted size Tainted size of variable length array Unprotected dynamic memory allocation
805	Buffer access with incorrect length value	Hard-coded object size used to manipulate memory
843	Access of resource using incompatible type ('Type confusion')	Unreliable cast of pointer
910	Use of expired file descriptor	Use of previously closed resource Closing a previously closed resource Standard function call with incorrect arguments

CWE-659: Weaknesses in Software Written in C++

CWE-659 is a subset of CWE IDs found in C++ programs that are not common to all languages. See CWE-659.

The following table lists the CWE IDs (version 2.8) from this subset that are addressed by Polyspace Bug Finder, with its corresponding defect checkers.

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
119	Improper restriction of operations within the bounds of a memory buffer	Array access out of bounds Pointer access out of bounds
120	Buffer copy without checking size of input ('Classic buffer overflow')	Invalid use of standard library memory routine Invalid use of standard library string routine Tainted NULL or non-null-terminated string
121	Stack-based buffer overflow	Array access with tainted index Destination buffer overflow in string manipulation
122	Heap-based buffer overflow	Pointer dereference with tainted offset
124	Buffer underwrite ('Buffer underflow')	Array access with tainted index Buffer overflow from incorrect string format specifier Destination buffer underflow in string manipulation Pointer dereference with tainted offset
125	Out-of-bounds read	Array access with tainted index Buffer overflow from incorrect string format specifier Destination buffer overflow in string manipulation
126	Buffer over-read	Buffer overflow from incorrect string format specifier

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
127	Buffer under-read	Buffer overflow from incorrect string format specifier
128	Wrap-around error	Integer constant overflow
		Tainted sign change conversion
		Unsigned integer conversion overflow
		Memory allocation with tainted size
		Unsigned integer overflow
		Tainted size of variable length array
		Unsigned integer constant overflow
		Integer overflow
		Integer conversion overflow
129	Improper validation of array index	Array access with tainted index
		Pointer dereference with tainted offset
130	Improper handling of length parameter inconsistency	Mismatch between data length and size
131	Incorrect calculation of buffer size	Pointer access out of bounds
	of buller size	Tainted sign change conversion
		Unsigned integer conversion overflow
		Memory allocation with tainted size
		Unsigned integer overflow
		Array access out of bounds
		Tainted size of variable length array

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
134	Uncontrolled format string	Tainted string format
135	Incorrect Calculation of Multi-Byte String Length	Destination buffer overflow in string manipulation Misuse of narrow or wide character string
		Unreliable cast of pointer
170	Improper null termination	Missing null in string array
	termination	Misuse of readlink()
		Tainted NULL or non-null-terminated string
188	Reliance on data/ memory layout	Invalid assumptions about memory organization
		Memory comparison of padding data
		Memory comparison of strings
		Missing byte reordering when transferring data
		Pointer access out of bounds
191	Integer underflow (Wrap or	Integer constant overflow
	wraparound)	Integer conversion overflow
		Integer overflow
		Unsigned integer constant overflow
		Unsigned integer conversion overflow
		Unsigned integer overflow

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
192	Integer coercion	Tainted sign change conversion
	error	Unsigned integer conversion overflow
		Unsigned integer overflow
		Sign change integer conversion overflow
		Integer overflow
		Integer conversion overflow
194	Unexpected sign extension	Sign change integer conversion overflow
	extension	Tainted sign change conversion
195	Signed to unsigned conversion error	Sign change integer conversion overflow
	conversion error	Tainted sign change conversion
196	Unsigned to signed conversion error	Sign change integer conversion overflow
197	Numeric truncation	Integer conversion overflow
	error	Float conversion overflow
		Unsigned integer conversion overflow
242	Use of inherently dangerous function	Use of dangerous standard function
243	Creation of chroot jail without changing working directory	File manipulation after chroot without chdir
244	Improper clearing of heap memory before release	Sensitive heap memory not cleared before release

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
362	Concurrent execution using shared resource with improper synchronization ('Race Condition')	File descriptor exposure to child process Opening previously opened resource
364	Signal handler race condition	Shared data access within signal handler Function called from signal handler not asynchronous-safe (strict) Function called from signal handler not asynchronous-safe
366	Race condition within a thread	Data race Data race including atomic operations Data race through standard library function call
375	Returning a mutable object to an untrusted caller	Return of non const handle to encapsulated data member
401	Improper release of memory before removing last reference	Memory leak Thread-specific memory leak
415	Double free	Deallocation of previously deallocated pointer Missing reset of a freed pointer
416	Use after free	Missing reset of a freed pointer Use of previously freed pointer

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
457	Use of uninitialized	Member not initialized in constructor
	variable	Non-initialized pointer
		Non-initialized variable
466	Return of pointer value outside of	Array access out of bounds
	expected range	Pointer access out of bounds
		Unsafe conversion between pointer and integer
467	Use of sizeof() on a	Possible misuse of sizeof
	pointer type	Wrong type used in sizeof
468	Incorrect pointer scaling	Incorrect pointer scaling
469	Use of pointer subtraction to determine size	Subtraction or comparison between pointers to different arrays
476	NULL pointer	Null pointer
	dereference	Tainted NULL or non-null-terminated string
478	Missing default case in switch statement	Missing case for switch condition
479	Signal handler use of a non-reentrant	Function called from signal handler not asynchronous-safe
	function	Function called from signal handler not asynchronous-safe (strict)
480	Use of incorrect	Invalid use of == (equality) operator
	operator	Invalid use of = (assignment) operator
481	Assigning instead of comparing	<pre>Invalid use of = (assignment) operator</pre>

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
482	Comparing instead of assigning	<pre>Invalid use of == (equality) operator</pre>
484	Omitted break statement in switch	Missing break of switch case
558	Use of getlogin() in multithreaded application	Unsafe standard function
562	Return of stack variable address	Pointer or reference to stack variable leaving scope Use of automatic variable as putenv-family function argument
587	Assignment of a fixed address to a pointer	Unsafe conversion between pointer and integer Function pointer assigned with absolute address
676	Use of potentially dangerous function	Unsafe conversion from string to numerical value Use of dangerous standard function

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
690	Unchecked return value to null pointer dereference	Invalid use of standard library memory routine
	dereference	Use of tainted pointer
		Null pointer
		Returned value of a sensitive function not checked
		Invalid use of standard library string routine
		Unprotected dynamic memory allocation
		Tainted NULL or non-null-terminated string
		Standard function call with incorrect arguments
		Invalid use of standard library routine
704	Incorrect type conversion or cast	Character value absorbed into EOF
		Qualifier removed in conversion
		Precision loss in integer to float conversion
		Misuse of sign-extended character value
		Unreliable cast of pointer
		Wrong allocated object size for cast
	Mismatched memory	Invalid free of pointer
	management routines	Mismatched alloc/dealloc functions on Windows

CWE ID	CWE ID Description	Polyspace Bug Finder Defect Checker
767	Access to critical private variable via public method	Return of non const handle to encapsulated data member
783	Operator precedence logic error	Possibly unintended evaluation of expression because of operator precedence rules
785	Use of path manipulation function without maximum-sized buffer	Use of path manipulation function without maximum sized buffer checking
789	Uncontrolled memory allocation	Memory allocation with tainted size Tainted size of variable length array Unprotected dynamic memory allocation
805	Buffer access with incorrect length value	Hard-coded object size used to manipulate memory
843	Access of resource using incompatible type ('Type confusion')	Unreliable cast of pointer
910	Use of expired file descriptor	Use of previously closed resource Closing a previously closed resource Standard function call with incorrect arguments

More About

"CWE Coding Standard and Polyspace Results" on page 13-66

Configure Comment Import from Previous Results

- "Import Comments from Previous Polyspace Analysis" on page 14-2
- "Import Existing MISRA C: 2004 Justifications to MISRA C: 2012 Results" on page 14-6

Import Comments from Previous Polyspace Analysis

After you have reviewed analysis results, you can reuse your review comments for subsequent analyses. If you add comments to your results file, they carry over to the next analysis on the same project. If you add comments to your code (annotate), they carry over to any subsequent analysis of the code, whether in the same project or not. You can also hide results using code annotations. For more information on commenting, see "Address Polyspace Results Through Bug Fixes or Comments" on page 16-2.

This topic shows how to import comments from one result file to another. Importing comments saves you from reviewing already justified results. For instance, after you import comments, on the Results List pane (user interface of desktop products), clicking

the 🔛 icon skips justified results. Using this icon, you can browse through unreviewed results. You can also filter the justified checks from display.

Automatic Comment Import from Last Analysis

By default, in the Polyspace user interface (desktop products only), comments are imported automatically from the most recent analysis on the project module. You can disable this default behavior.

- Select **Tools** > **Preferences**, which opens the Polyspace Preferences dialog box.
- 2 Select the **Project and Results Folder** tab.
- Under Import Comments, clear Automatically import comments from last verification.
- 4 Click OK.

If you upload results to the Polyspace Access web interface, comments from the last run of the same project are applied to the current run. You cannot disable the automatic comment import.

If you run analysis at the command line (and do not upload results to the Polyspace Access web interface), you have to explicitly import comments from another set of results. See "Command Line" on page 14-3.

Import Comments from Another Analysis Result

You can import comments directly from another Polyspace result to the current result.

If a result is found in both a Bug Finder and Code Prover analysis, you can comment on the Bug Finder result and import the comment to Code Prover. For instance, most coding rule checkers are common to Bug Finder and Code Prover. You can add comments to coding rule violations in Bug Finder and import the comments to the same violations in Code Prover.

User Interface (Desktop Products Only)

To import comments from another set of results:

- **1** Open the current analysis results.
- 2 Select Tools > Import Comments.
- 3 Navigate to the folder containing your previous results.
- 4 Select the other results file (with extension .psbf or .pscp) and then click **Open**.

The review comments from the previous results are imported into the current results.

Command Line

Use the option -import-comments during analysis to import comments from a previous verification.

To import comments from multiple results, use the polyspace-comments-import command.

Comment Import Algorithm

You can directly import review information from another set of results into the current results. However, it is possible that part of your review information is not imported to a subsequent analysis because:

You have changed your source code so that the line with a previous result is not
exactly identical to the line in the current run.

The comment import tool accounts for additional code that simply shifts an existing line. For instance, the tool recognizes that line 10 in Run 1 and line 12 in Run 2 have the same statement. If a division by zero occurs on line 10 in Run 1 and you have not fixed the issue in Run 2, the result along with associated review information are imported to line 12 in Run 2.

Run 1:
10 baseLine = min/numRecipients;
11
12
Run 2:

```
10 /* Calculate a baseline per recipient
11  based on minimum available resources */
12 baseLine = min/numRecipients;
```

However, if you change the line content itself, for instance, change numRecipient to numReceiver, the result and review information are not imported.

- You have changed your source code so that the Code Prover result color has changed.
- You entered new review information for the same result.

View Imported Comments That Do Not Apply

In the Polyspace user interface (desktop products only), the Import Checks and Comments Report highlights differences between two analysis results. When you import comments from a previous analysis, you can see this report. If you have closed the report after an import, to review the report again:

1 Select Window > Show/Hide View > Import Comments Report.

The Import Checks and Comments Report opens, highlighting differences in the two results.

2 Review the differences between the two results.

Your review information can differ between two results because of the following reasons:

• In Code Prover, if the check color changes, Polyspace imports the **Comment** field but not the **Status** field. In addition, Polyspace imports the **Severity** and **Justified** fields depending on the color change.

Color Change	Severity	Justified		
Orange or red to green	Not imported	Imported		
Gray to green	Not imported	Imported, if the Severity was set to High , Medium or Low .		
Red to orange or vice versa	Imported	Imported		
Green to red/orange/gray	Not imported	Not imported		

- If a result no longer appears in the code, Polyspace highlights only the change in the Import Checks and Comments Report. It does not import review comments from the previous result.
- If you have already entered different review comments for the same check, Polyspace highlights only the change in the Import Checks and Comments Report. It does not import review comments from the previous result.

Import Existing MISRA C: 2004 Justifications to MISRA C: 2012 Results

When you check your code for MISRA C: 2012 violations, Polyspace imports justifications of MISRA C: 2004 violations from previous analyses (if they exist). You can upgrade from checking of MISRA C: 2004 rules to MISRA C: 2012 rules while retaining your justifications. For general rules on comment import, see "Import Comments from Previous Polyspace Analysis" on page 14-2.

The software maps MISRA C: 2004 **Status**, **Severity**, and **Comment** values that you added through the user interface or code annotations to the corresponding MISRA C: 2012 results, if the results exist. For more information about mapping, consult addendum one of the MISRA C: 2012 publication.

If you are transitioning from MISRA C: 2004 to MISRA C: 2012, you do not have to review results that you have already justified.

III Results List □ ♥>											
All results New → Showing 8/14 New New											
Type 📝	Check	^1 ¥	Status	ď	Severity	ď	Comment: (7)	Y

Mapping Multiple MISRA C: 2004 Annotations to the Same MISRA C: 2012 Result

When you justify MISRA C: 2004 violations by using code block syntax or multiple line annotation syntax, and multiple violations map to the same MISRA C: 2012 rule, Polyspace does not import each result justification. Instead, the software imports only one set of **Status**, **Severity**, and **Comment** values and applies these values to all the instances of that particular MISRA C: 2012 rule violation.

For example, suppose that you analyze your code and find violations of MISRA C: 2004 rules 16.3 and 16.5. You can justify these results by using the annotation syntax where you enter a different status and explanatory comment for each rule.

```
//polyspace-begin misra2004:16.3 [Status 1] "Explanatory comment 1"
//polyspace-begin misra2004:16.5 [Status 2] "Explanatory comment 2"
code block start;
/* This block of code contains violations of
MISRA C:2004 rules 16.3 and 16.5 */
code block end;
//polyspace-end misra2004:16.3
//polyspace-end misra2004:16.5
```

The previous violations map to MISRA C: 2012 rule 8.2. When you check your annotated code against MISRA C: 2012 rules, Polyspace imports only the first line of annotations (for rule 16.3) and applies it to all rule 8.2 results. The second line of annotations for rule 16.5 is ignored. In the **Results List** pane, all violations of rule 8.2 have the **Status** column set to Status 1 and the Comment column set to "Explanatory comment 1".

Note The **Output Summary** pane displays a warning message for every result where the imported annotation conflicts with the original annotation. After you import your MISRA C: 2004 annotations, check that a justified status has not been assigned to results you intend to investigate or fix.

- "Source" on page 15-22
- "Call Hierarchy" on page 15-28
- "Result Details" on page 15-31

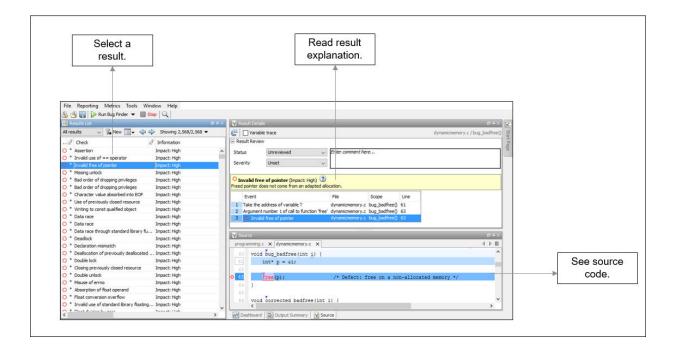

Interpret Polyspace Bug Finder Results

When you open the results of a Polyspace Bug Finder analysis, you see a list on the **Results List** pane. The results consist of defects, coding rule violations or code metrics.

You can first narrow down the focus of your review:

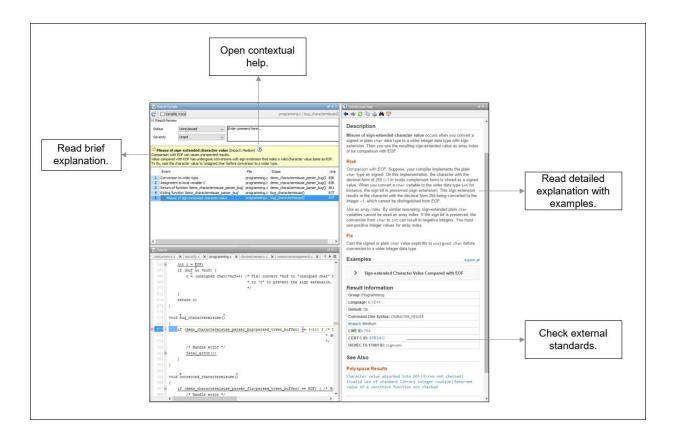

- Use filters on the results list columns to narrow down the list. For instance, you can
 focus on the high-impact defects.

Once you narrow down the list, you can begin reviewing individual results. This topic describes how to review a result.

To begin your review, select a result in the list.

Interpret Result Details Message

Interpret Message

The first step is to understand what is wrong. Read the message on the **Result Details** pane and the related line of code on the **Source** pane.

Seek Additional Resources for Help

Sometimes, you need additional help for certain results. Click the icon to open a help page for the selected result. See code examples illustrating the result. Check external standards such as CWE or CERT-C that provide additional rationale for fixing the issue.

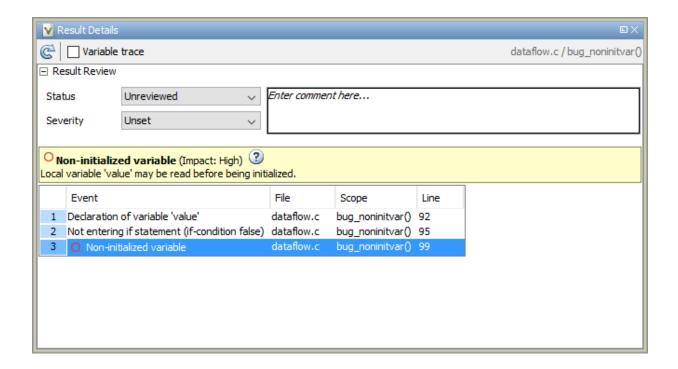

At this point, you might be ready to decide whether to fix the issue or not. Once you identify a fix, it might help to review all results of that type together.

Find Root Cause of Result

Sometimes, the root cause might be far from the actual location where the result is displayed. For instance, a variable that you read might be non-initialized because the initialization is not reachable. The defect is shown when you read the variable, but the root cause is perhaps a previous if or while condition that is always false.

Navigate to Related Events

Typically, the **Result Details** pane shows one sequence of events that leads to the result. The **Source** pane also highlights these events.

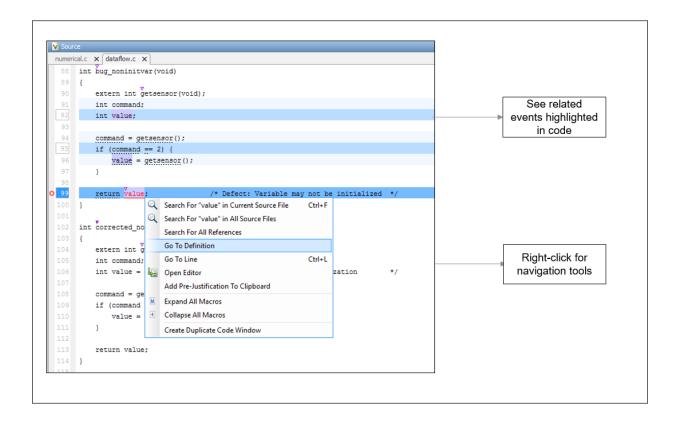

In the above event traceback, this sequence is shown:

- 1 A variable value is declared.
- 2 The execution path bypasses an if statement. This information might be relevant if the variable is initialized inside the if block.
- 3 Location of the current defect: **Non-initialized variable**

Typically, the traceback shows major points in the control flow: entering or bypassing conditional statements or loops, entering a function, and so on. For specific defects, the traceback shows other kinds of events relevant to the defect. For instance, for a **Declaration mismatch** defect, the traceback shows the two locations with conflicting declarations.

Create Your Own Navigation Path

If the event traceback is not available, use other navigation tools to trace your own path through the code.

Before you begin navigating through pathways in your code, ask the question: What am I looking for? Based on your answer, choose the appropriate navigation tool. For instance:

To investigate a Non-initialized variable defect, you might want to make sure that
the variable is not initialized at all. To look for previous instances of the variable, on
the Source pane, right-click the variable and select Search For All References.

Alternatively, double-click the variable. These options show only instances of a specific variable and not other variables with the same name in other scopes.

• To investigate a violation of MISRA C:2012 Rule 17.7:

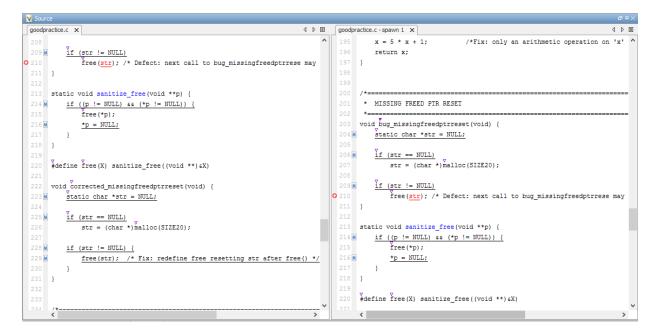

The value returned by a function having non-void return type shall be used. you might want to navigate from a function call to the function definition. Right-click the function and select **Go To Definition**.

After you navigate away from the current result, use the icon on the **Result Details** pane to come back.

If you click a source code token containing a result, the previous result selection on the **Results List** and the details on the **Result Details** pane do not change. You can keep the result in the results list and the result details pinned while navigating in the source code. Sometimes, you might want to see the result associated with a token. To update the result selection and the details, Ctrl-click the token or right-click and select **Select Results At This Location**.

Navigate in Separate Window

If reviewing a result requires deeper navigation in your source code, you can create a duplicate source code window that focuses on the result while you navigate in the original source code window.

Right-click on the **Source** pane and select **Create Duplicate Code Window**. Right-click on the tab showing the duplicate file name (ending with -spawn 1) and select **New Vertical Group**.

Perform the navigation steps in the duplicate file window while the defect still appears on the original file window. After the investigation is over, close the duplicate window.

Investigate the Cause of Empty Results List

When you run an analysis with Polyspace Bug Finder, the **Results List** pane can be empty or it can display this message:

Polyspace Bug Finder did not find any defects or coding rule violations in your code.

The message can indicate that your code has no defect or coding rule violation. However, before you reach this conclusion, check the following.

Possible Cause	Action to Take	
Did all your source files compile?	In the Output Summary pane, look for warning messages that start with:	
	Failed compilation.	
	If a file does not compile, Bug Finder can return some results, but only files with no compilation errors are fully analyzed.	
Did you include all your source files in your project?	In the Project Browser pane, make sure that all the files that you want to analyze are included in the Project Source Files folder.	
Did you configure	In the Configuration pane:	
your project correctly?	Under Coding Standards & Code Metrics, verify that you have selected the appropriate options if you want to check Coding Rules and compute Code Metrics.	
	Under Bug Finder Analysis , confirm that you have selected all the defects that you want to check during the analysis.	
	Under Run Settings, see if Use fast analysis mode for Bug Finder is selected. In this mode, Bug Finder checks for only a subset of defects and coding rules.	

Possible Cause	Action to Take	
Are you applying any filters to the results?	n the Results List pane header, make sure that there are no Hidden results in the Showing drop-down list. To clear all applied filters, click Clear active filters . Showing 0/168	
	Showing 0 out of 168 possible results Hidden results: 168 Review Scope: Defects & Rules New results only: Off Columns with active filters: Information File Clear active filters

Dashboard

The **Dashboard** pane provides statistics on the analysis results in a graphical format.

When you open a results file in Polyspace, this pane is displayed by default. You can view the following graphs:

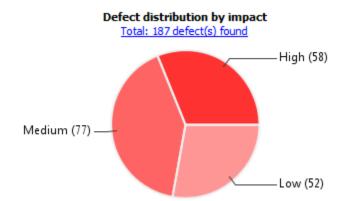

· Code covered by analysis

From this graph you can obtain the following information:

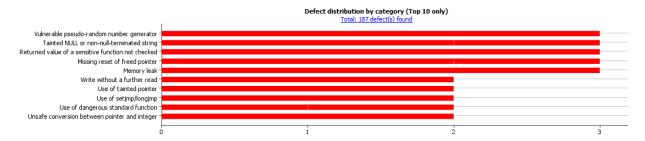

- **Files**: Ratio of analyzed files to total number of files. If a file contains a compilation error, Polyspace Bug Finder does not analyze the file.
 - If some of your files were only partially analyzed because of compilation errors, this pane contains a link stating that some files failed to compile. To see the compilation errors, click the link and navigate to the **Output Summary** pane.
- **Functions**: Ratio of analyzed functions to total number of functions *in the analyzed files*. If the analysis of a function takes longer than a certain threshold value, Polyspace Bug Finder does not analyze the function.

Defect distribution by impact

From this pie chart, you can obtain a graphical visualization of the defect distribution by impact. You can find at a glance whether the defects that Polyspace Bug Finder found in your code are low-impact defects. For more information on impact, see "Classification of Defects by Impact" on page 17-11.

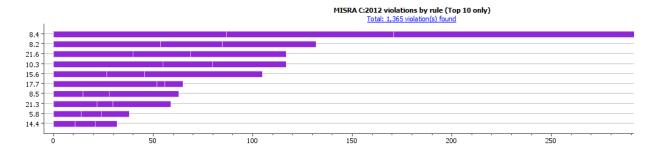

Defect distribution by category or file

From this graph you can obtain the following information.

	Category	File	
Top 10	The ten defect types with the highest number of individual defects.	The ten source files with the highest number of defects.	
	• Each column represents a defect type and is divided into the:	Each column represents a file and is divided into the:

	Use this view to organize your review starting at rules with fewer violations.	Use this view to organize your review starting at files with fewer rule violations.	

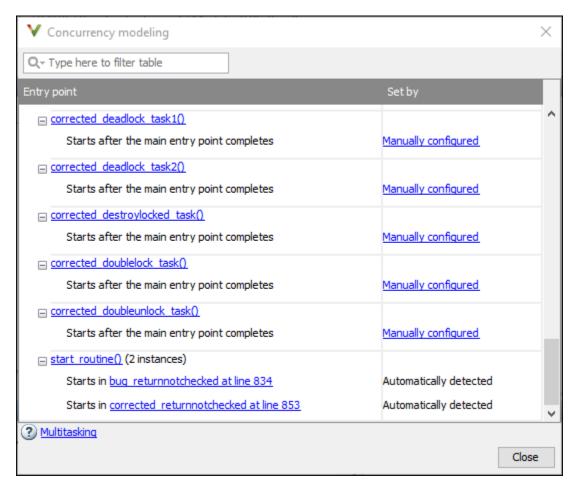

You can also perform the following actions on this pane:

- Select elements on the graphs to filter results from the **Results List** pane. See "Filter and Group Results" on page 17-2.
- View the configuration used to obtain the result. Select the link **Configuration**.

• View the modeling of the multitasking configuration of your code. Select the link Concurrency modeling on page 15-17.

Concurrency Modeling

The **Concurrency Modeling** view displays all the tasks and interrupts that the analysis extracts from your code and your Polyspace multitasking configuration.

in the table, the functions are listed in the first column by order of decreasing priority. The second column shows how Polyspace detects each task or interrupt: automatically, manually from the Polyspace configuration, or from an external file.

From this view, you can:

- Click a function name to go to its definition in the source code.
- Click an event to go to the corresponding call to the concurrency primitive in the source code, for instance pthread create.
- Click Manually configured, for functions that are manually configured, to go to the Multitasking node on the Configuration pane.

See Also

External multitasking configuration

More About

- "Analyze Multitasking Programs in Polyspace" on page 10-2
- "Auto-Detection of Thread Creation and Critical Section in Polyspace" on page 10-6

Results List

The **Results List** pane lists all results along with their attributes. To organize your results review, from the ☐▼ list on this pane, select one of the following options:

- **None**: Lists defects and coding rule violations without grouping. By default the results are listed in order of severity.
- **Family**: Lists results grouped by grouping. For more information on the defects covered by a group, see "Bug Finder Defect Groups" on page 13-21.
- **Class**: Lists results grouped by class. Within each class, the results are grouped by method. The first group, **Global Scope**, lists results not occurring in a class definition.

This option is available for C++ code only.

• **File**: Lists results grouped by file. Within each file, the results are grouped by function.

For each result, the **Results List** pane contains the result attributes, listed in columns:

Attribute	Description	
Family	Group to which the result belongs.	
ID	Unique identification number of the result.	
Туре	Defect or coding rule violation.	
Group	 Category of the result, for instance: For defects: Groups such as static memory, numerical, control flow, concurrency, etc. For coding rule violations: Groups defined by the coding rule standard. For instance, MISRA C: 2012 defines groups related to code constructs such as functions, pointers and arrays, etc. 	

Attribute	Description
Check	Result name, for instance:
	For defects: Defect name
	For coding rule violations: Coding rule number
Detail	Additional information about a result. The column shows the first line of the Result Details pane.
	For an example of how to use this column, see the result MISRA C:2012 Dir 1.1.
File	File containing the instruction where the result occurs
Class	Class containing the instruction where the result occurs. If the result is not inside a class definition, then this column contains the entry, Global Scope .
Function	Function containing the instruction where the result occurs. If the function is a method of a class, it appears in the format class_name::function_name.
Folder	Path to the folder that contains the source file with the result
CWE ID	CWE IDs corresponding to the Bug Finder results.
	See "CWE Coding Standard and Polyspace Results" on page 13-66
Severity	Level of severity you have assigned to the result. The possible levels are:
	• Unset
	• High
	• Medium
	• Low

Attribute	Description
Status	Review status you have assigned to the result. The possible statuses are:
	Unreviewed (default status)
	• To investigate
	• To fix
	• Justified
	No action planned
	• Not a defect
	• Other
Comments	Comments you have entered about the result

To show or hide any of the columns, right-click anywhere on the column titles. From the context menu, select or clear the title of the column that you want to show or hide.

Using this pane, you can:

- Navigate through the results.
- Organize your result review using filters on the columns. For more information, see "Filter and Group Results" on page 17-2.

Source

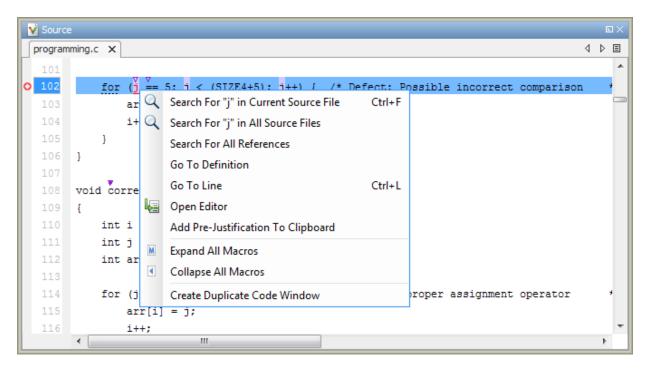

The **Source** pane shows the source code with the defects colored in red and the corresponding line number marked by •.

Tooltips

Placing your cursor over a result displays a tooltip that provides range information for variables, operands, function parameters, and return values.

Examine Source Code

On the **Source** pane, if you right-click a text string, the context menu provides options to examine your code:

For example, if you right-click the variable i, you can use the following options to examine and navigate through your code:

- **Search "j" in Current Source** List occurrences of the string within the current source file on the **Search** pane.
- **Search "j" in All Source Files** List occurrences of the string within the source files on the **Search** pane.
- **Search For All References** List all references in the **Search** pane. The software supports this feature for global and local variables, functions, types, and classes.
- **Go To Definition** Go to the line of code that contains the definition of i. The software supports this feature for global and local variables, functions, types, and classes. If a definition is not available to Polyspace, selecting the option takes you to the declaration.
- **Go To Line** Open the Go to line dialog box. If you specify a line number and click **Enter**, the software displays the specified line of code.
- **Expand All Macros** or **Collapse All Macros** Display or hide the content of macros in current source file.

Expand Macros

You can view the contents of source code macros in the source code view. A code information bar displays M icons that identify source code lines with macros.

```
| Numerical.c |
```

When you click a line with this icon, the software displays the contents of macros on that line in a box.

To display the normal source code again, click the line away from the box, for example, on the licon.

To display or hide the content of all macros:

- **1** Right-click anywhere on the source.
- 2 From the context menu, select either Expand All Macros or Collapse All Macros.

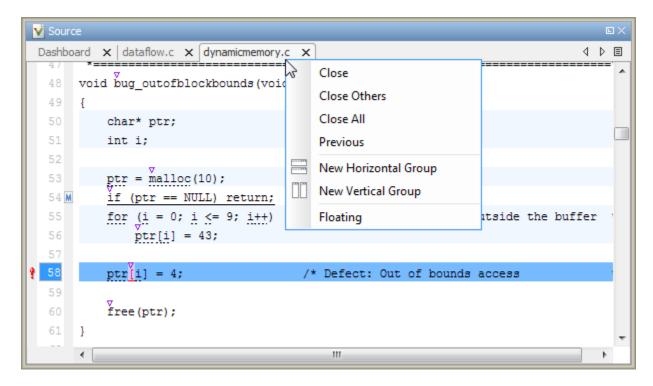

Note

- 1 The **Result Details** pane also allows you to view the contents of a macro if the check you select lies within a macro.
- 2 You cannot expand OSEK API macros in the **Source** pane.

Manage Multiple Files in Source Pane

You can view multiple source files in the **Source** pane.

Right-click on the ${\bf Source}$ pane toolbar.

From the **Source** pane context menu, you can:

- Close Close the currently selected source file. You can also use the χ button to close tabs.
- Close Others Close all source files except the currently selected file.
- Close All Close all source files.
- Next Display the next view.
- **Previous** Display the previous view.
- **New Horizontal Group** Split the Source window horizontally to display the selected source file below another file.
- **New Vertical Group** Split the Source window vertically to display the selected source file side-by-side with another file.
- **Floating** Display the current source file in a new window, outside the **Source** pane.

View Code Block

On the **Source** pane, to highlight a block of code, click either its opening or closing brace. If the brace itself is highlighted, click the brace twice.

```
V Source
                                                                                       ■×
 Dashboard X dataflow.c X
                                                                                    4 Þ 🗉
       int do anything (void);
 197
       int bug_deactivatedcode(int val)
           int retval;
           retval = do anything();
 203
           if (0 /*|| retval < 0*/)</pre>
204
                                             /* Defect: Deactivated (debug) code
               retval = do_anything()
 205
 206
 208
           return retval;
 209
 210
```

Call Hierarchy

The **Call Hierarchy** pane displays the call tree of functions in the source code.

For each function foo, the **Call Hierarchy** pane lists the functions and tasks that call foo (callers) and those called by foo (callees). The callers are indicated by (functions) or (tasks). The callees are indicated by (functions) or (tasks). The **Call Hierarchy** pane lists direct function calls and indirect calls through function pointers. The indirect calls are shown with the icon.

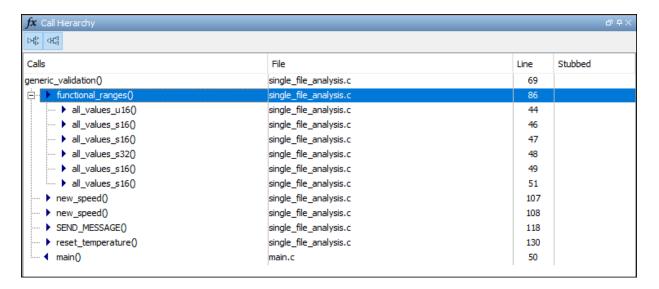

Note In Polyspace Bug Finder, you might not see all callers or callees of a function, especially for calls through function pointers and dead code.

For instance, Polyspace Bug Finder does not display the functions registered with at exit() and at quick exit(), and called by exit() and quick exit() respectively.

You open the **Call Hierarchy** pane by using the f^{x} icon in your result details. To update the pane:

- You can click a defect, either on the Results List or Source pane. You see the function containing the defect with its callers and callees.
- You can right-click the name of a function and select **Go To Definition**. You see the callers and callees of the function.

In this example, the **Call Hierarchy** pane displays the function generic validation, and with its callers and callees.

The line number in the **Call Hierarchy** pane refers to a different line in the source code:

- For the function name, the line number refers to the beginning of the function definition. The definition of generic validation begins on line 69.
- For a callee name, the number refers to the line where the callee is called. The callee functional_ranges is called by generic_validation on line 86.
- For a caller name, the number refers to the line where the caller calls the function. The caller main calls generic validation on line 50.

Tip To navigate to the call location in the source code, select a caller or callee name

In the **Call Hierarchy** pane, you can perform these actions:

Show/Hide Callers and Callees

Customize the view to display callers only or callees only. Show or hide callers and callees by clicking this button

Navigate Call Hierarchy

You can navigate the call hierarchy in your source code. For a function, double-click a caller or callee name to navigate to the caller or callee definition in the source code.

Determine If Function Is Stubbed

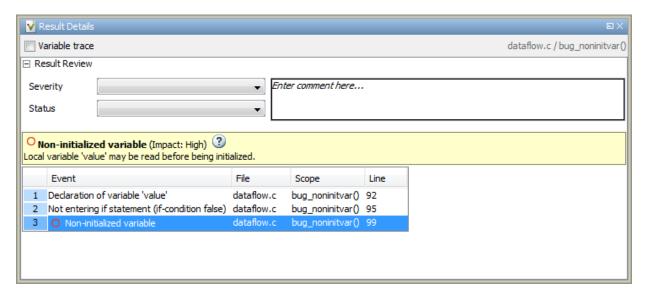

From the **Stubbed** column, you can determine if a function is stubbed. The entries in the column show why a function was stubbed.

- Automatic: Polyspace cannot find the function definition. For instance, you did not provide the file containing the definition.
- **Std library**: The function is a standard library function. You do not provide the function definition explicitly in your Polyspace project.
- **Mapped to std library**: You map the function to a standard library function by using the option -function-behavior-specifications.

Result Details

The **Result Details** pane contains comprehensive information about a specific defect. To see this information, on the **Results List** pane, select the defect.

On this pane, you can also assign a **Severity** and **Status** to each check. You can also enter comments to describe the results of your review. This action helps you track the progress of your review and avoid reviewing the same check twice.

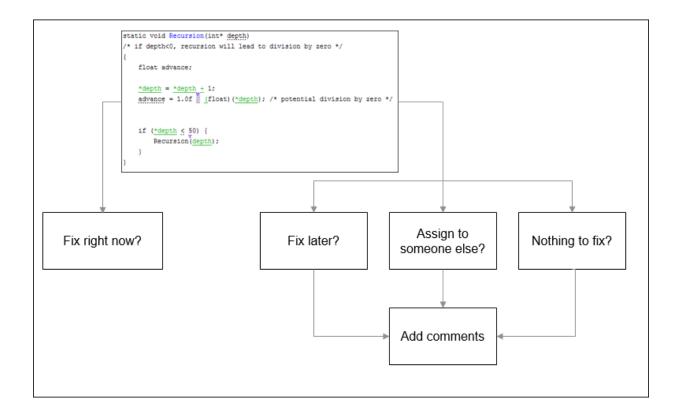

- The top right corner shows the file and function containing the defect, in the format file name/function name.
- The yellow box contains the name of the defect with an explanation of why the defect occurs.
- The **Event** column lists the sequence of code instructions causing the defect. The **Scope** column lists the function containing the instructions. If the instructions are not in a function, the column lists the file containing the instructions. The **Line** column lists the line number of the instructions.
- The Variable trace check box allows you to see an additional set of instructions that
 are related to the defect.
- The ② button allows you to access documentation for the defect.

Address Polyspace Results Through Bug Fixes or **Comments**

Once you understand the root cause of a Polyspace finding, you can fix your code. Otherwise, add comments to your Polyspace results to fix the code later or to justify the result. You can use the comments to keep track of your review progress.

If you add comments to your results file, they carry over to the next analysis on the same project. If you add comments to your code (annotate), they carry over to any subsequent analysis of the code, whether in the same project or not. You can also hide results using code annotations.

Comment in Results File

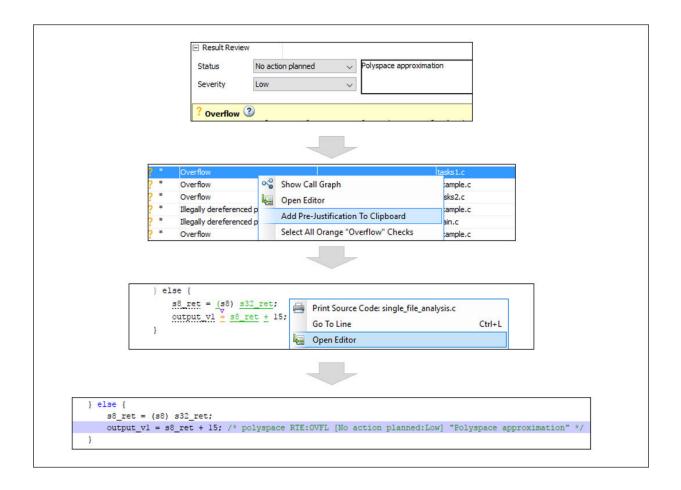

You can comment either on the **Results List** or **Result Details** pane. To comment, select a result, then set the **Severity** and **Status** fields, and optionally, enter notes with more explanations. The status indicates your response to the Polyspace result. If you do not plan to fix your code in response to a result, assign one of the following statuses:

- Justified
- No Action Planned
- Not a Defect

Based on the status, Polyspace considers that you have given due consideration and justified that result (retained the code despite the result).

Comment or Annotate in Code

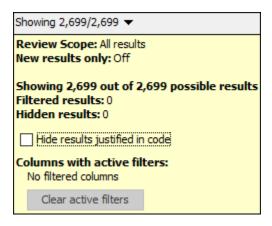

If you enter code comments or annotations in a specific syntax, the software can read them and populate the **Severity**, **Status**, and **Comment** fields in the next analysis of the code.

You can either type the annotation directly or copy it from the user interface. In the user interface, to copy annotations, right-click a result and select **Add Pre-Justification To**

Clipboard. Open your source code in an editor and paste *on the same line as* the result. If you follow this workflow, Polyspace assumes that you have set a status of No Action Planned. The software hides the result from all places (except reports needed for certification). The only exceptions are the safety-critical Code Prover run-time checks, which are hidden from the results list but not the source code.

To unhide the hidden results, from the **Showing** menu, clear the box **Hide results** justified in code.

If you want to explicitly set a status, first fill the **Status** field for a result and then copy to your code. Paste on the line containing the result.

If you want to directly type the annotation, see the annotation syntax in "Annotate Code and Hide Known or Acceptable Results" on page 16-6.

- "Import Comments from Previous Polyspace Analysis" on page 14-2

Annotate Code and Hide Known or Acceptable Results

If a Polyspace analysis of your code finds known or acceptable defects or coding rule violations, you can suppress the defects or violations in subsequent analyses. Add code annotations indicating that you have reviewed the issues and that you do not intend to fix them.

You can add annotations through the Polyspace user interface or by typing them directly in your code. For the general workflow, see "Address Polyspace Results Through Bug Fixes or Comments" on page 16-2. This topic shows the annotation syntax.

Code Annotation Syntax

To add comments directly to your source file, use the Polyspace annotation syntax. The syntax is not case sensitive, and has this format:

Annotation for current line of code:

```
line of code; /* polyspace Family:Result_name */
```

Annotation for current line of code and n following lines:

```
code; /* polyspace +n Family:Result name */
```

Annotation for block of code:

```
/* polyspace-begin Family:Result name */
code:
/* polyspace-end Family:Result name */
```

Annotations begin with the keyword polyspace and must include Family and Result name field values. You can optionally specify Status, Severity, and Comment field values.

```
polyspace Family:Result_name [Status:Severity] "Comment"
```

When you annotate a block of code, if subsequent annotations nested within that block of code apply to the same *Family* and *Result name*, they are ignored.

For example, in this code, the annotation on line 9 is ignored and the block annotation is applied instead.

```
1 /*polyspace-begin MISRA-C:14.9 [High:To fix] "Block annotation"*/
3 int main(void) /*polyspace MISRA-C:14.7 "Annotation applied"*/
4 {
5
      int x = 1;
6
      int y = x / 2;
7
8
      if (x > y) /*polyspace MISRA-C:14.9 "Annotation ignored"*/
9
1
          return x;
11
       return x;
12 }
13 /*polyspace-end MISRA-C:14.9 [High:To fix] "Block annotation"*/
```

If you do not specify a status, Polyspace considers the result justified, and assigns the status No action planned to the result.

To replace the different annotation fields with their allowed values, use the values in this table or see the examples on page 16-11.

Field	Allowed Value	
Family	Type of analysis result:	
	DEFECT (Polyspace Bug Finder) RTE, for run-time checks (Polyspace Code Prover)	
	CODE-METRICS, for function-level code complexity metrics	
	VARIABLE, for global variables (Polyspace Code Prover)	
	MISRA-C or MISRA2004 for MISRA C: 2004 rule violations	
	MISRA-AC-AGC for violations of MISRA C:2004 rules applicable to generated code	
	MISRA-C3 or MISRA2012 for MISRA C: 2012 rule violations. The annotation works even for the rules applicable to generated code.	
	CERT-C for CERT C coding standard violations	
	CERT-CPP for CERT C++ coding standard violations	
	ISO-17961 for ISO/IEC TS 17961 coding standard violations	
	MISRA-CPP for MISRA C++ rule violations	
	AUTOSAR-CPP14 for AUTOSAR C++14 rule violations	
	JSF for JSF++ rule violations	
	CUSTOM for violations of custom coding rules	
	To specify all analysis results, use the asterisk character *:*.	

Field	Allowed Value
Result_name	For DEFECT, use short names of checkers. See "Short Names of Bug Finder Defect Checkers" on page 13-4.
	For RTE, use short names of run-time checks. See "Short Names of Code Prover Run-Time Checks" (Polyspace Code Prover).
	For CODE-METRICS, use short names of code complexity metrics. See "Short Names of Code Complexity Metrics" on page 16-15.
	For VARIABLE, the only allowed value is the asterisk character " * ".
	For coding standard violations, specify the rule number or numbers.
	To specify all parts of a result name [MISRA2012:17.*] or all result names in a family [DEFECT:*], use the asterisk character.

Field	Allowed Value
Status	Text to indicate how you intend to address the error in your code. This value populates the Status column in the Results List pane as:
	• Unreviewed
	• To investigate
	• To fix
	• Justified
	No action planned
	• Not a defect
	• Other
	Polyspace suppresses results annotated with status Justified, No action planned, or Not a defect in subsequent analyses. If you specify a status that is not an allowed value, Polyspace stores it as a custom status.

Field	Allowed Value	
Severity	Text to indicate how critical you consider the error in your code. This value populates the Severity column in the Results List pane as:	
	UnsetHighMediumLow	
	If you specify a severity that is not an allowed value, Polyspace appends it to the status field and stores it as a custom status. For example, [To investigate:sporadic] is displayed in the Status column of the Results List pane as To investigate sporadic.	
Comment	Additional text, such as a keyword or an explanation for the status and severity. This value populates the Comment column in the Results List pane.	

Syntax Examples

Suppress a Single Defect

Enter an annotation on the same line as the defect and specify the Family (DEFECT) and the $Result_name$ (INT_OVFL). When you do not specify a status, Polyspace assigns the status No action planned, and then suppresses the result in subsequent analyses.

```
int var = INT_MAX;
var++;/* polyspace DEFECT:INT_OVFL */
```

Suppress a Single Coding Standard Violation

Justify a coding standard violation, for instance, a CERT-C violation.

Enter an annotation on the same line as the violation and specify the <code>Family</code> (CERT-C) and the <code>Result_name</code> (the rule number, for instance, STR31-C). Assign the status <code>Justified</code>, severity <code>Low</code> and a comment.

```
code; /* polyspace CERT-C:STR31-C [Justified:Low] "Overflow cannot happen" */
```

Suppress All MISRA C: 2012 Violations Over Multiple Lines

Enter an annotation with +n between polyspace and the Family:Result_name entries. The annotation applies to the same line and the n following lines.

This annotation applies to lines 4–7. The line count includes code, comments, and blank lines.

```
4. code ; // polyspace +3 MISRA2012:*
5. //comment
6.
7. code;
8. code;
```

Suppress All Code Metrics on Function

To annotate function-level code complexity metrics, in the function definition, enter an annotation on the same line as the function name.

This annotation suppresses all code complexity metrics for function func:

```
char func(char param) { //polyspace CODE-METRICS:*
    ...
}
```

Specify Multiple Families in the Same Annotation

Enter each family separated by a space. This annotation applies to all MISRA C:2012 rules 17 and to all run-time checks.

```
some code; /* polyspace MISRA2012:17.* RTE:* */
```

Specify Multiple Result Names in the Same Annotation

After you specify the <code>Family</code> (DEFECT), enter each <code>Result_name</code> separated by a comma.

Add Explanatory Comments to Annotation

After you specify a *Family* and a *Result_name*, you can add a *Comment* with additional information for your justification. You can provide a comment for all families and result names, or a comment for each family or result name.

```
//Single comment
code; /* polyspace DEFECT:BAD_FREE MISRA2004:* "OK Defect and MISRA" */
//Multiple comments incorrect syntax:
code; /* polyspace DEFECT:* "OK defect" MISRA2004:5.2 "OK MISRA" */
//Multiple comments correct syntax:
code; /* polyspace DEFECT:* "OK defect" polyspace MISRA2004:5.2 "OK MISRA" */
```

In annotations, Polyspace ignores all text following double quotes. To specify additional Family:Result_name, [Status:Severity] or Comment entries, you must reenter the keyword polyspace after text in double quotes.

Set Status and Severity

You can specify allowed values on page 16-6 or enter custom values for status and severity. A custom severity entry is appended to the status and stored as a custom **Status** in the user interface.

```
//Set Status only
code; /* polyspace DEFECT:* [To fix] "some comment" */

//Set Status 'To fix' and Severity 'High'
code; /* polyspace VARIABLE:* [To fix: High] "some comment"*/

//Set custom status 'Assigned' and Severity 'Medium'
code; /* polyspace MISRA2012:12.* [Assigned: Medium] */
```

- "Short Names of Bug Finder Defect Checkers" on page 13-4
- "Short Names of Code Complexity Metrics" on page 16-15

Short Names of Code Complexity Metrics

When annotating your code to justify metrics or creating custom software quality objectives, you use short names of code complexity metrics instead of the full names. The following table lists the short names for code complexity metrics.

Note that you can only annotate your code for function level code complexity metrics only.

Project Metrics

Code Metric	Acronym
Number of Direct Recursions	AP_CG_DIRECT_CYCLE
Number of Header Files	INCLUDES
Number of Files	FILES
Number of Protected Shared Variables (Code Prover only)	PSHV
Number of Recursions	AP_CG_CYCLE
Number of Potentially Unprotected Shared Variables (Code Prover only)	UNPSHV
Program Maximum Stack Usage (Code Prover only)	PROG_MAX_STACK
Program Minimum Stack Usage (Code Prover only)	PROG_MIN_STACK

File Metrics

Code Metric	Acronym
Comment Density	COMF
Estimated Function Coupling	FC0
Number of Lines	TOTAL_LINES
Number of Lines Without Comment	LINES_WITHOUT_CMT

Function Metrics

Code Metric	Acronym	
Cyclomatic Complexity	VG	
Higher Estimate of Local Variable Size	LOCAL_VARS_MAX	
Language Scope	VOCF	
Language Scope	LOCAL_VARS_MIN	
Minimum Stack Usage (Code Prover only)	MIN_STACK	
Maximum Stack Usage (Code Prover only)	MAX_STACK	
Number of Call Levels	LEVEL	
Number of Call Occurrences	NCALLS	
Number of Called Functions	CALLS	
Number of Calling Functions	CALLING	
Number of Executable Lines	FXLN	
Number of Function Parameters	PARAM	
Number of Goto Statements	GOTO	
Number of Instructions	STMT	
Number of Lines Within Body	FLIN	
Number of Local Non-Static Variables	LOCAL_VARS	
Number of Local Static Variables	LOCAL_STATIC_VARS	
Number of Paths	PATH	
Number of Return Statements	RETURN

More About

"Annotate Code and Hide Known or Acceptable Results" on page 16-6

Annotate Code for Known or Acceptable Results (Not Recommended)

Note Starting R2017b, Polyspace uses a simpler annotation format. See "Annotate Code and Hide Known or Acceptable Results" on page 16-6.

If Polyspace finds defects in your code that you cannot or will not fix, you can add annotations to your code. These annotations are code comments that indicate known or acceptable defects or coding rule violations. By using these annotations, you can:

- Avoid rereviewing defects or coding rule violations from previous analyses.
- Preserve review comments and classifications.

Note Source code annotations do not apply to code comments. You cannot annotate these rules:

- MISRA C:2004 Rules 2.2 and 2.3
- MISRA C:2012 Rules 3.1 and 3.2
- MISRA-C++ Rule 2-7-1
- JSF++ Rules 127 and 133

Add Annotations from the Polyspace Interface

This method shows you how to convert review comments and classifications in the Polyspace interface into code annotations.

- On the **Results List** or **Result Details** pane, assign a **Severity**, **Status**, and **Comment** to a result.
 - Click a result.
 - From the **Severity** and **Status** dropdown lists, select an option.
 - In the **Comment** field, enter a comment or keyword that helps you easily recognize the result.

- On the **Results List** pane, right-click the commented result and select **Add Pre-Justification to Clipboard**. The software copies the severity, status, and comment to the clipboard.
- **3** Right-click the result again and select **Open Editor**. The software opens the source file to the location of the defect.
- **4** Paste the contents of your clipboard on the line immediately before the line containing the defect or coding rule violation.
 - You can see your review comments as a code comment in the Polyspace annotation syntax, which Polyspace uses to repopulate review comments on your next analysis.
- **5** Save your source file and rerun the analysis.

On the **Results List** pane, the software populates the **Severity**, **Status**, and **Comment** columns for the defect or rule violation that you annotated. These fields are read only because they are populated from your code annotation. If you use a specific keyword or status for your annotations, you can filter your results to hide or show your annotated results. For more information on filtering, see "Filter and Group Results" on page 17-2.

Add Annotations Manually

This method shows you how to enter comments directly into your source files by using the Polyspace code annotation syntax. The syntax is not case-sensitive and applies to the first uncommented line of C/C++ code following the annotation.

- Open your source file in an editor and locate the line or section of code that you want to annotate.
- **2** Add one of the following annotations:
 - For a single line of code, add the following text directly before the line of code that you want to annotate.

```
/* polyspace<Type:Kind1[,Kind2] : [Severity] : [Status] > [Notes] */
```

• For a section of code, use the following syntax.

```
/* polyspace:begin<Type:Kind1[,Kind2] : [Severity] : [Status] > [Notes] */
... Code section ...
/* polyspace:end<Type:Kind1[,Kind2] : [Severity] : [Status] > */
```

If a macro expands to multiple lines, use the syntax for code sections even though the macro itself covers one line. The single-line syntax applies only to results that appear in the first line of the expanded macro.

Replace the words Type, Kind1, [Kind2], [Severity], [Status], and [Additional text] with allowed values, indicated in the following table. The text with square brackets [] is optional and you can delete it. See "Syntax Examples" on page 16-21.

Word	Allowed Values		
Туре	The type of results:		
	Defect (Polyspace Bug Finder)		
	RTE, for run-time checks (Polyspace Code Prover)		
	VARIABLE, for global variables (Polyspace Code Prover)		
	CODE-METRIC, for code complexity metrics.		
	MISRA-C, for MISRA C:2004		
	MISRA-AC-AGC		
	MISRA-C3, for MISRA C:2012		
	MISRA-CPP		
	• JSF		
	Custom, for custom coding rule violations.		
Kind1, [Kind2],	For defects, run-time checks and code metrics, use the short names of checkers. See:		
	"Short Names of Bug Finder Defect Checkers" on page 13-4		
	"Short Names of Code Prover Run-Time Checks" (Polyspace Code Prover)		
	For coding rule violations, specify the rule number or numbers.		
	For global variables, the only allowed value is ALL.		
	If you want the comment to apply to all possible defects or coding rules, specify ALL.		

Word	Allowed Values
Severity	Text that indicates how critical you consider the defect. Enter one of the following:
	• Unset
	• High
	Medium
	• Low
	This text populates the Severity column on the Results List pane.
Status	Text that indicates how you intend to correct the error in your code. Enter one of the following or any other text:
	• Unreviewed
	• To investigate
	• To fix
	• Justified
	No action planned
	Not a defect
	• Other
	This text populates the Status column on the Results List pane. The status is also used in Polyspace Metrics to determine whether a result is justified. To justify a result, use Justified, No action planned or Not a defect.
Notes	Additional comments, such as a keyword or an explanation for the status and severity.

Syntax Examples

• A single defect:

```
/*~polyspace < Defect: HARD\_CODED\_BUFFER\_SIZE: Medium: To~investigate >~Known~issue~*/int~table[100];
```

• A single run-time check:

```
/* polyspace<RTE: ZDV : High : To Fix > Denominator cannot be zero */ y=1/x;
```

• A MISRA C:2012 rule violation:

```
/* polyspace<MISRA-C3: 13.1 : Low : Justified> Known issue */
int arr[2] = \{x++,y\};
```

• Unused global variable:

```
/* polyspace<VARIABLE: ALL : Low : Justified> Variable to use later*/
int var unused;
```

• Multiple defects:

polyspace<Defect:USELESS_WRITE,DEAD_CODE:Low:No Action Planned> OK issue

• Multiple JSF rule violations:

polyspace<JSF:9,13:Low:Justified> Known issue

Define Custom Annotation Format

This example shows how to create and edit an XML file to define an annotation format and map it to the Polyspace annotation syntax.

To get started, copy the following code to a text editor and save it on your machine as annotations_description.xml.

```
<?xml version="1.0" encoding="UTF-8"?>
<Annotations xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"</pre>
              xsi:noNamespaceSchemaLocation="annotations xml schema.xsd"
              Group="example XML">
 <Expressions Search_For_Keywords="myKeyword"</pre>
               Separator Result Name="," >
    <!-- Define annotation format in this
    section by adding <Expression/> elements -->
   <Expression Mode="SAME LINE"</pre>
                Regex="myKeyword\s+(\w+(\s*,\s*\w+)*)"
                Rule Identifier Position="1"
                />
   <Expression Mode="GOTO INCREMENT"</pre>
                Regex="myKeyword\s+(\+\d+\s)(\w+(\s*,\s*\w+)*)"
                Increment Position="1"
           Rule Identifier Position="2"
                />
  <Expression Mode="BEGIN"
                Regex="myKeyword\s*(\w+(\s*,\s*\w+)*)\s*Block_on"
                Rule Identifier Position="1"
           Case Insensitive="true"
                />
   <Expression Mode="END"
                Regex="myKeyword\s^*(\w+(\s^*,\s^*\w+)^*)\s^*Block\_off"
                Rule Identifier Position="1"
                />
   <Expression Mode="END ALL"</pre>
                Regex="myKeyword\sBlock_off_all"
                />
   <Expression Mode="SAME LINE"</pre>
Regex="myKeywords\s+(\w+(\s*,\s*\w+)*)
(\s^*\[(\w+\s^*)^*([:]\s^*(\w+\s^*)^*)])^*(\s^*-*\s^*)^*([^-]^*)(\s^*-*)^*"
Rule_Identifier_Position="1"
```

```
Status Position="4"
Severity Position="6"
Comment Position="8"
<! -- Put the regular expression on a single line instead of two line
when you copy it to a text editor -->
   <!-- SAME LINE example with more complex regular expression.
        Matches the following annotations:
        //myKeywords 50 [my status:my severity] -Additional comment-
        //myKeywords 50 [my status]
        //myKeywords 50 [:my severity]
        //mvKevwords 50 -Additional comment-
            -->
</Expressions>
<Mapping>
   <!-- Map your annotation syntax to the Polyspace annotation
    syntax by adding <Result Name Mapping /> elements in this section -->
<Result Name Mapping Rule Identifier="100" Family="DEFECT"</pre>
   Result_Name="INT_ZERO_DIV"/>
<Result Name Mapping Rule Identifier="50" Family="MISRA-C3" Result Name="8.4"/>
<Result Name Mapping Rule Identifier="51" Family="MISRA-C3" Result Name="8.7"/>
<Result Name Mapping Rule Identifier="ALL MISRA" Family="MISRA-C3" Result Name="*"/>
</Mapping>
</Annotations>
```

The XML file consists of two parts:

- <Expressions>...</Expressions> where you define the format of your annotation syntax.
- <Mapping>...</Mapping> where you map your syntax to the Polyspace annotation syntax.

After you edit this file, Polyspace can interpret your custom code annotation when you invoke the option -xml-annotations-description.

Define Annotation Syntax Format

To define an annotation syntax in Polyspace, your syntax must follow a pattern that you can represent with a regular expression. See "Regular Expressions" (MATLAB). It is recommended that you include a keyword in the pattern of your annotation syntax to help identify it. In this example, the keyword is myKeyword. Set the attribute Search For Keywords equal to this keyword.

Once you know the pattern of your annotation, you can define it in the XML by adding an <Expression/> element and specifying at least the attributes Mode, Regex, and Rule Identifier Position. For instance, the first <Expression/> element in annotations description.xml defines an annotation with these attributes:

- Mode="SAME LINE". The annotation applies to code on the same line.
- Regex="myKeyword\s+(\w+(\s*,\s*\w+)*)". Polyspace uses the regular expression to search for a string that begins with myKeyword, followed by a space \s +. Polyspace then searches for a capturing group ($\w+(\s^*,\s^*\w+)^*$) that includes an alphanumeric rule identifier \w+ and, optionally, additional comma-separated rule identifiers $(\s^*,\s^*\w+)^*$.
- Rule_Identifier_Position="1". The integer value of this attribute corresponds to the number of opening parentheses preceding the relevant capturing group in the regular expression. In $myKeyword\s+(\w+(\s*,\s*\w+)*)$, one opening parenthesis precedes the capturing group of the rule identifier (\w+(\s*,\s*\w +)*). If you want to match rule identifiers captured by (\s*,\s*\w+), then you set Rule Identifier Position="2" because two opening parentheses precede this capturing group.

The list of attributes and their values are listed in this table. The example column refers to the format defined in annotations description.xml.

Attribute	Use	Value	Example
Mode	Required	SAME_LINE	Applies only on the same line as the annotation.
			code; //myKeyword 100

Attribute	Use	Value	Example
		GOTO_INCRE MENT	Applies on the same line as the annotation and the following n lines:
			3. code; // myKeyword +3 ALL_MISRA 4. /*comments */ 5. 6. code; 7. code;
			The preceding annotation applies to lines 3-6 only.
		BEGIN	Applies to the same line and all following lines until a corresponding expression with attribute Mode="END" or "END_ALL", or until the end of the file.
			//myKeyword 50, 51 Block_on Code block 1;
		END	Stops the application of a rule identifier declared by a corresponding expression with attribute Mode="BEGIN".
			//myKeyword 50, 51 Block_on Code block 1;
			More code; //myKeyword 50 Block_off
			Only rule identifier 50 is turned off. Rule identifier 51 still applies.

Attribute	Use	Value	Example
		END_ALL	Stops all rule identifiers declared by an expression with attribute Mode="BEGIN".
			//myKeyword 50, 51 Block_on Code block 1;
			More code; //myKeyword Block_off_all
			Rule identifiers 50 and 51 are turned off.
Regex	Required	Regular expression search string	See "Regular Expressions" (MATLAB). Regex="myKeyword\s+ (\w+(\s*,\s*\w+)*)" matches these expressions:
			// myKeyword 50, 51 /* myKeyword ALL_MISRA, 100 */

Attribute	Use	Value	Example
Rule_Identifi er_Position	Required, except when you set Mode="END_AL L"	Integer	The integer value of this attribute corresponds to the number of opening parentheses in the regular expression before the relevant search expression. <pre><expression increment_position="1" mode="GOTO_INCREMENT" regex="myKeyword\s+(\+\d+\s)</pre></td></tr><tr><td></td><td></td><td></td><td><pre>(\w+(\s*,\s*\w+)*)" rule_identifier_position="2"></expression></pre>
			Note Enter the regex expression on a single line when you edit your XML file.
			The search expression for the rule identifier \w+(\s*,\s*\w+)* is after the second opening parenthesis of the regular expression.

Attribute	Use	Value	Example
Increment_Position	Required only when you set Mode="GOTO_I NCREMENT"	Integer	The integer value of this attribute corresponds to the number of opening parentheses in the regular expression before the relevant search expression. <pre> <expression increment_position="1" mode="GOTO_INCREMENT" regex="myKeyword\s+(\+\d+\s) (\w+(\s*,\s*\w+)*)" rule_identifier_position="2"></expression> Note Enter the regex expression on a single line when you edit your XML file.</pre>
			The search expression for the increment \+\d+\s is after the first opening parenthesis of the regular expression.
Status_Positi on	Optional	Integer	See Increment_Position example. When you use this attribute, the entry in your annotation is displayed in the Status column on the Results List pane of the user interface.
Severity_Posi tion	Optional	Integer	See Increment_Position example. When you use this attribute, the entry in your annotation is displayed in the Severity column on the Results List pane of the user interface.

Attribute	Use	Value	Example
Comment_Posit	Optional	Integer	See Increment_Position example. When you use this attribute, the entry in your annotation is displayed in the Comment column on the Results List pane of the user interface. Your comment is appended to the string Justified by annotation in source:
Case_Insensitive	Optional	True or false	When you set this attribute to "true", the regular expression is case insensitive, otherwise it is case sensitive. If you do not declare this attribute in your expression, the regular expression is case sensitive. For Case_Insensitive="true", these annotations are equivalent: //MYKEYWORD ALL_MISRA BLOCK_ON //mykeyword all_misra block_on

Map Your Annotation to the Polyspace Annotation Syntax

After you define your annotation format, you can map the rule identifiers you are using to their corresponding Polyspace annotation syntax. You can do this mapping by adding an <Result_Name_Mapping/> element and specifying attributes Rule_Identifier, Family, and Result_Name. For instance, if rule identifier 50 corresponds to MISRA C: 2012 rule 8.4, map it to the Polyspace syntax MISRA-C3:8.4 by using this element:

<Result_Name_Mapping Rule_Identifier="50" Family="MISRA-C3" Result_Name="8.4"/>

The list of attributes and their values are listed in this table. The example column refers to the format defined in annotations description.xml.

Attribute	Use	Value	Example
Rule_Identifier	Required	User defined	See the mapping section of annotations_desc ription.xml
Family	Required	Corresponds to Polyspace results family. For a list of allowed values, see allowed values on page 16-6.	See the mapping section of annotations_desc ription.xml
Result_Name	Required	Corresponds to Polyspace result names. For a list of allowed values, see allowed values on page 16-6.	See the mapping section of annotations_desc ription.xml

More About

"Annotate Code and Hide Known or Acceptable Results" on page 16-6

Annotation Description Full XML Template

This table lists all the elements, attributes, and values of the XML that you can use to define an annotation format and map it to the Polyspace annotation syntax. For an example of how to edit an XML to define annotation syntax, see "Define Custom Annotation Format" on page 16-23.

Element	Attribute	Use	Value
Annotations	Group	Required	User defined string. For example, "Custom Annotations"
Expressions	Search_For_Keywords	Required	User defined string. This string is a keyword you include in the pattern of your annotation syntax to help identify it. For example, "myKeyword"
	Separator_Result _Name	Required	User defined string. This string is a separator when you list multiple Polyspace result names in the same annotation. For example ","
	Separator_Family _And_Result_Name	Optional	User defined string. This string is a separator when you list multiple Polyspace results families in the same annotation. For example, " "

Element	Attribute	Use	Value
	Separator_Family	Optional	User defined string. This string is a separator when you list a Polyspace results family and results name in the same annotation. For example, ":"
Expression	Mode	Required	SAME_LINE
			GOTO_INCREMENT
			BEGIN
			END
			END_ALL
			NEXT_CODE_LINE
			The annotation applies to the next line of code. Comments and blank lines are ignored.
			GOTO_LABEL
			LABEL
			XML_START
			XML_CONTENT
			The annotation for this expression must be on a single line.
			XML_END
	Regex	Required	Regular expression search string that matches the pattern of your annotation.

Element	Attribute	Use	Value
	Rule_Identifier_ Position	Required, except when you set Mode="END_ALL" or "LABEL"	Integer. The integer value of this attribute corresponds to the number of opening parentheses in the regular expression before the relevant search expression.
	Increment_Positi	Required only when you set Mode="GOTO_INCRE MENT"	Integer. The integer value of this attribute corresponds to the number of opening parentheses in the regular expression before the relevant search expression.
	Status_Position	Optional	Integer. The integer value of this attribute corresponds to the number of opening parentheses in the regular expression before the relevant search expression.
	Severity_Position	Optional	Integer. The integer value of this attribute corresponds to the number of opening parentheses in the regular expression before the relevant search expression.

Element	Attribute	Use	Value
	Comment_Position	Optional	Integer. The integer value of this attribute corresponds to the number of opening parentheses in the regular expression before the relevant search expression.
	Label_Position	Required only when you set Mode="GOTO_LABEL " or "LABEL"	Integer. The integer value of this attribute corresponds to the number of opening parentheses in the regular expression before the relevant search expression.
	Case_Insensitive	Optional	True or false. When you do not declare this attribute, the default value is false.
	Is_Pragma	Optional	True or false. When you do not declare this attribute, the default value is false.
			Set this attribute to true if you want to declare your annotation using a pragma instead of a comment.

Element	Attribute	Use	Value
	Applies_Also_On_ Same_Line	Optional	True or false. When you do not declare this attribute, the default value is true. Use this attribute to enable annotations with the old Polyspace syntax to apply on the same line of code.
Mapping	None	None	None
Result_Name_Mapp	Rule_Identifier	Required	User defined
ing	Family	Required	Corresponds to Polyspace results family. For a list of allowed values, see allowed values on page 16-6.
	Result_Name	Required	Corresponds to Polyspace result names. For a list of allowed values, see allowed values on page 16-6.

Example

This example code covers some of the less commonly used attributes for defining annotations in XML.

```
<?xml version="1.0" encoding="UTF-8"?>
<Annotations xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"</pre>
             xsi:noNamespaceSchemaLocation="annotations_xml schema.xsd"
             Group="XML Template">
 <Expressions Separator Result Name=","</pre>
               Search_For_Keywords="myKeyword">
   <Expression Mode="GOTO LABEL"
                Regex = (A|W)myKeyword\s+S\s+(d+(\s*,\s*\d+)*)\s+([a-zA-Z|-]\w+)"
                Rule Identifier Position="2"
                Label Position="4"
                />
    <Expression Mode="LABEL"
                Regex="(\A|\W)myKeyword\s+L:(\w+)"
                Label Position="2"
     <!-- Annotation applies starting current line until
        next declaration of label word "myLabel"
         Example:
         code; // myKeyword S 100 myLabel
        more code;
         // myKeyword L myLabel
    -->
   <Expression Mode="BEGIN"
                Regex="#\s*pragma\s+myKeyword MESSAGES ON\s+(\w+)"
                Rule Identifier Position="1"
                Is Pragma="true"
                />
   <!-- Annotation declared with pragma instead of comment
        Example: #pragma myKeyword MESSAGES ON 100 -->
   <!-- Comment declaration with XML format-->
   <!-- XML START must be declared before XML CONTENT -->
```

```
<Expression Mode="XML START"</pre>
                Regex="<\s*myKeyword COMMENT\s*>"
                />
   <!-- Example: <myKeyword_COMMENT> -->
   <Expression Mode="XML CONTENT"</pre>
                Regex="<\s*(\d*)\s*>(((?![*]/)(?!<).)*)</\s*(\d*)\s*>"
                Rule Identifier Position="1"
                Comment Position="2"
                />
   <!-- Example: <100>This is my comment</100>
      XML_CONTENT must be declare on a single line.
       <100>This is my comment
       </100>
       is incorrect.
       -->
   <Expression Mode="XML END"
                Regex="</\s*myKeyword COMMENT\s*>"
                />
            Example: </myKeyword COMMENT> -->
 </Expressions>
 <Mapping>
   <Result_Name_Mapping Rule_Identifier="100" Family="MISRA-C" Result_Name="4.1"/>
     </Mapping>
</Annotations>
```

More About

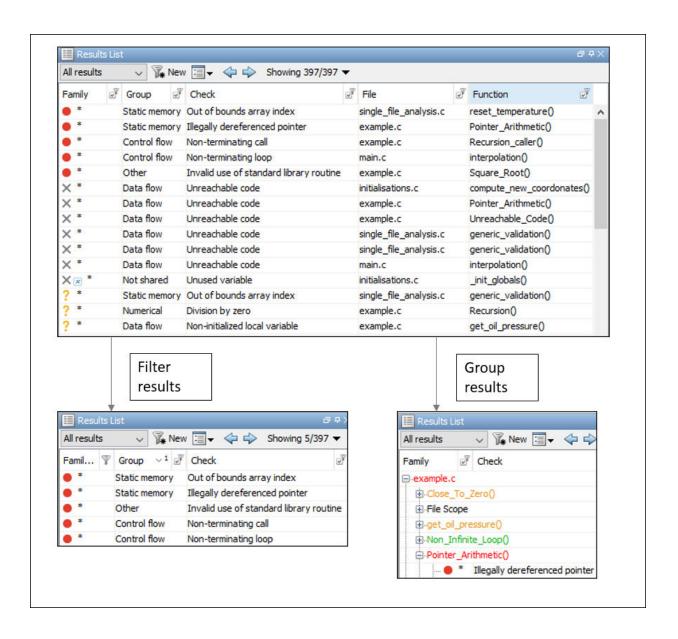

• "Annotate Code and Hide Known or Acceptable Results" on page 16-6

Manage Results

- "Filter and Group Results" on page 17-2
- "Classification of Defects by Impact" on page 17-11

Filter and Group Results

When you open the results of a Polyspace analysis, you see a flat list of defects (Bug Finder), run-time checks (Code Prover), coding rule violations or other results. To organize your review, you can narrow down the list or group results by file or result type.

Some of the ways you can use filtering are:

You can display certain types of defects or run-time checks only.

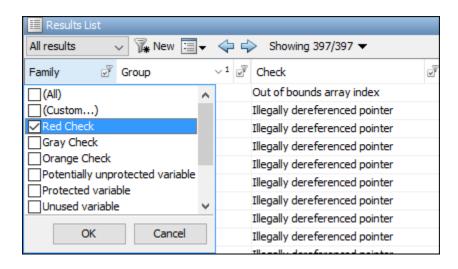

For instance, in Bug Finder, you can display only high-impact defects. See "Classification of Defects by Impact" on page 17-11.

- You can display only new results found since the last analysis.
- You can display only the results that have not justified.

For information on justification, see "Address Polyspace Results Through Bug Fixes or Comments" on page 16-2.

Filter Results

Filter Using Results List

You can filter using the columns on the **Results List** pane. Click the column headers to see the available filters. For information on the columns, see:

- "Results List" on page 15-19
- "Results List" (Polyspace Code Prover)

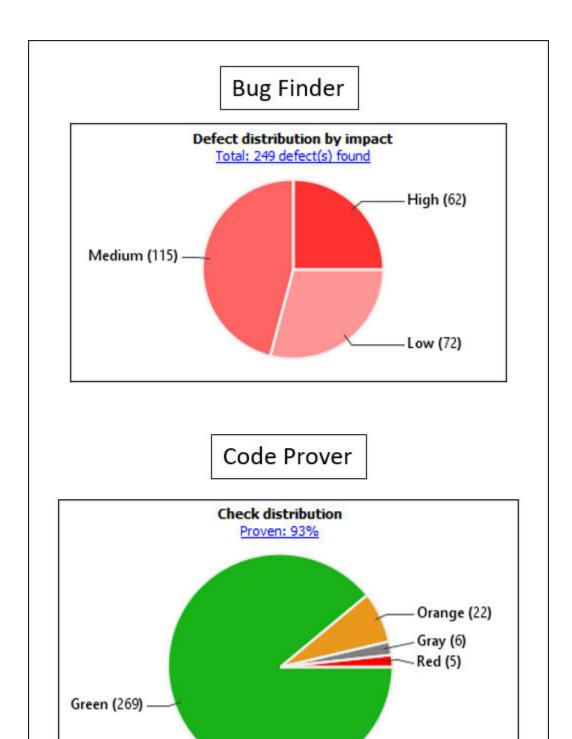

To see only results found since the last analysis, click the **New** button.

If you do not want to filter by the exact contents of a column, you can use a custom filter instead. For instance, you want to filter out subfolders of a specific folder. Instead of filtering out each subfolder in the **Folder** column, select **Custom** from the filter dropdown. Specify the root folder name for the doesn't contain filter.

You can use wildcard characters for the custom filter. The wildcard ? represents 0 or 1 character and * represents 0 or more characters.

If you apply filters in this way, they carry over to the next analysis. You can also name and save a subset of filters for use in multiple projects. To apply the named set of filters, pick this filter set from the **All results** list. To create a new entry in this list, select **Tools** > **Preferences** and create your own set of filters on the **Review Scope** tab.

Filter Using Dashboard

You can click graphs on the **Dashboard** pane to filter results. For instance:

- To see only high-impact defects in Bug Finder, click the corresponding section of the **Defect distribution by impact** chart.
- To see only red checks in Code Prover, click the corresponding section of the Check distribution chart.

To see all results again, click the link **View all results in this scope**.

Filter Using Orange Sources

An orange source can cause multiple orange checks in Code Prover. You can display all orange checks from the same source and review them together.

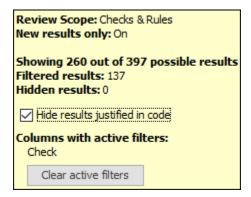

For instance, in this code, the unknown value input can cause an overflow and a division by zero. The variable input is an orange source that causes two orange checks.

```
void func (int input) {
int val1;
double val2;
val1 = input++;
val2 = 1.0/input;
}
```

To begin, select **Window > Show/Hide View > Orange Sources**. You see the list of orange sources. Select an orange source to see all orange checks coming from this source.

? Orange Sources				
Source Type	Name	File	Line	Max Oranges
stubbed function	get_bus_status()		-1	1
stubbed function	random_float()		-1	3
stubbed function	random_int()		-1	1
local volatile variable	get_oil_pressure.vol_i	example.c	27	2
local volatile variable	all_values_s32.tmps32	single_file_analysis.c	29	2

See Filters Used

On the **Results List** header, you see the number of results displayed in the format **Showing** x/y, for instance **Showing 100/250**. Click the dropdown beside this number to see the filters that are currently active. You can also clear the active filters from this dropdown (all except the named set of filters that you picked from the **All results** dropdown).

You see this information about the filters:

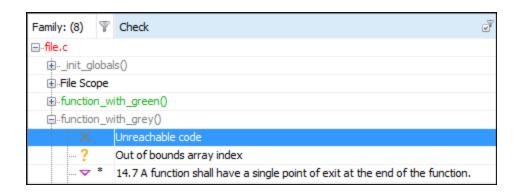

- Review Scope: If you pick a named set of filters from the All results dropdown, you see this filter set.
- New results only: If you use the New button to see only new results, you see this
 filter enabled.
- **Filtered results**: You see the number of results filtered in the Polyspace user interface (by any means: results list, dashboard or orange sources).
- **Hidden results**: You see the number of results hidden using code annotations. To unhide these results, clear **Hide results justified in code**.

For information on hiding results through code annotations, see "Address Polyspace Results Through Bug Fixes or Comments" on page 16-2.

 Columns with active filters: You see the columns in the Results List pane (or columns corresponding to graphs in the Dashboard pane) that you used to filter results.

Group Results

On the **Results List** pane, from the list, select an option, for instance, grouping by file. Alternatively, you can click a column header to sort the column contents alphabetically.

The available options for grouping are:

- None: Shows results without grouping.
- **Family**: Shows results grouped by result type.

The results are organized by type: checks (Code Prover), defects (Bug Finder), global variables (Code Prover), coding rule violations, code metrics. Within each type, they are grouped further.

• The defects (Bug Finder) are organized by the defect groups. For more information on the groups, see "Defects".

- The checks (Code Prover) are grouped by color. Within each color, the checks are
 organized by check group. For more information on the groups, see "Run-Time
 Checks" (Polyspace Code Prover).
- The global variables (Code Prover) are grouped by their usage. For more information, see "Global Variables" (Polyspace Code Prover).
- The coding rule violations are grouped by type of coding rule. For more information, see "Coding Standards".
- The code metrics are grouped by scope of metric. For more information, see "Code Metrics".
- File: Show results grouped by file.

Within each file, the results are grouped by function. The results that are not associated with a particular function are grouped under **File Scope**.

In Code Prover, the file or function name shows the worst check color in the file or function. The severity of a check color decreases in the order: red, gray, orange, green.

• **Class** (for C++ code only): Shows results grouped by class.

Within each class, the results are grouped by method. The results that are not associated with a particular class are grouped under **Global Scope**.

More About

"Classification of Defects by Impact" on page 17-11

Classification of Defects by Impact

To prioritize your review of Polyspace Bug Finder defects, you can use the **Impact** attribute assigned to the defect. This attribute appears on:

The Dashboard pane, in a Defect distribution by impact pie chart.

You can view at a glance whether you have many high impact defects. You can also select elements on the chart to filter out low or medium impact defects from the **Results List** pane. See "Filter and Group Results" on page 17-2.

• The **Results List** pane, in the **Information** column. When you select **None** from the ☐ ▼ list, the defects are sorted by impact.

You can filter out low and/or medium impact defects using this column or through the **Review Scope** tab in your preferences. See "Filter and Group Results" on page 17-2.

• The **Result Details** pane, beside the defect name.

The impact is assigned to a defect based on the following considerations:

Criticality, or whether the defect is likely to cause a code failure.

If a defect is likely to cause a code to fail, it is treated as a high impact defect. If the defect currently does not cause code failure but can cause problems with code maintenance in the future, it is a low impact defect.

• Certainty, or the rate of false positives.

For instance, the defect **Integer division by zero** is a high-impact defect because it is almost certain to cause a code crash. On the other hand, the defect **Dead code** has low impact because by itself, presence of dead code does not cause code failure. However, the dead code can hide other high-impact defects.

You cannot change the impact assigned to a defect.

High Impact Defects

The following list shows the high-impact defects.

Concurrency

- · Data race
- Data race through standard library function call
- Deadlock
- Double lock
- Double unlock
- Missing unlock

Data Flow

- Non-initialized pointer
- Non-initialized variable

Dynamic Memory

- Deallocation of previously deallocated pointer
- Invalid deletion of pointer
- Invalid free of pointer
- Use of previously freed pointer

Numerical

- Absorption of float operand
- Float conversion overflow
- Float division by zero
- Integer conversion overflow
- Integer division by zero
- Invalid use of standard library floating point routine
- Invalid use of standard library integer routine

Object Oriented

- Base class assignment operator not called
- Copy constructor not called in initialization list
- Object slicing

Programming

- Assertion
- Character value absorbed into EOF
- Declaration mismatch
- Errno not reset
- Invalid use of == (equality) operator
- Invalid use of standard library routine
- Invalid va list argument
- Misuse of errno
- Misuse of narrow or wide character string
- Misuse of return value from nonreentrant standard function
- · Possible misuse of sizeof
- Possibly unintended evaluation of expression because of operator precedence rules
- Typedef mismatch
- Variable length array with nonpositive size
- Writing to const qualified object
- Wrong type used in sizeof

Resource Management

- Closing a previously closed resource
- Resource leak
- Use of previously closed resource
- Writing to read-only resource

Security

- Bad order of dropping privileges
- Privilege drop not verified
- Returned value of a sensitive function not checked
- Unsafe call to a system function

• Use of non-secure temporary file

Static Memory

- Array access out of bounds
- Buffer overflow from incorrect string format specifier
- Destination buffer overflow in string manipulation
- Destination buffer underflow in string manipulation
- Invalid use of standard library memory routine
- Invalid use of standard library string routine
- Null pointer
- Pointer access out of bounds
- Pointer or reference to stack variable leaving scope
- Subtraction or comparison between pointers to different arrays
- Use of automatic variable as putenv-family function argument
- Use of path manipulation function without maximum sized buffer checking
- Wrong allocated object size for cast

Medium Impact Defects

The following list shows the medium-impact defects.

Concurrency

- Atomic load and store sequence not atomic
- Atomic variable accessed twice in an expression
- Data race including atomic operations
- Destruction of locked mutex
- Missing lock
- Thread-specific memory leak

Cryptography

• Constant block cipher initialization vector

- Constant cipher key
- Context initialized incorrectly for cryptographic operation
- Context initialized incorrectly for digest operation
- Incompatible padding for RSA algorithm operation
- Inconsistent cipher operations
- Incorrect key for cryptographic algorithm
- Missing blinding for RSA algorithm
- Missing block cipher initialization vector
- Missing cipher algorithm
- Missing cipher data to process
- Missing cipher final step
- Missing cipher key
- · Missing data for encryption, decryption or signing operation
- Missing padding for RSA algorithm
- Missing parameters for key generation
- Missing peer key
- Missing private key
- Missing public key
- Nonsecure hash algorithm
- Nonsecure parameters for key generation
- Nonsecure RSA public exponent
- Nonsecure SSL/TLS protocol
- Predictable block cipher initialization vector
- Predictable cipher key
- Weak cipher algorithm
- Weak cipher mode
- Weak padding for RSA algorithm

Data Flow

• Pointer to non-initialized value converted to const pointer

- Unreachable code
- Useless if

Dynamic Memory

Memory leak

Numerical

- Bitwise operation on negative value
- Integer constant overflow
- Integer overflow
- Sign change integer conversion overflow
- Use of plain char type for numerical value

Object Oriented

- Base class destructor not virtual
- Conversion or deletion of incomplete class pointer
- Copy operation modifying source operand
- Incompatible types prevent overriding
- Member not initialized in constructor
- Missing virtual inheritance
- Partial override of overloaded virtual functions
- Return of non const handle to encapsulated data member
- Self assignment not tested in operator

Programming

- Abnormal termination of exit handler
- Bad file access mode or status
- Call through non-prototyped function pointer
- Copy of overlapping memory
- Environment pointer invalidated by previous operation
- Exception caught by value

- Exception handler hidden by previous handler
- Floating point comparison with equality operators
- Function called from signal handler not asynchronous-safe
- Function called from signal handler not asynchronous-safe (strict)
- Improper array initialization
- Incorrect data type passed to va_arg
- Incorrect pointer scaling
- Incorrect type data passed to va_start
- Incorrect use of offsetof in C++
- · Incorrect use of va start
- Inline constraint not respected
- Invalid assumptions about memory organization
- Invalid file position
- Invalid use of = (assignment) operator
- Memory comparison of padding data
- Memory comparison of strings
- Missing byte reordering when transfering data
- Misuse of errno in a signal handler
- Misuse of sign-extended character value
- Shared data access within signal handler
- Side effect in arguments to unsafe macro
- Signal call from within signal handler
- Standard function call with incorrect arguments
- Too many va_arg calls for current argument list
- Unsafe conversion between pointer and integer
- Use of indeterminate string
- Use of memset with size argument zero

Resource Management

Opening previously opened resource

Security

- Deterministic random output from constant seed
- Errno not checked
- Execution of a binary from a relative path can be controlled by an external actor
- File access between time of check and use (TOCTOU)
- · File descriptor exposure to child process
- File manipulation after chroot without chdir
- Inappropriate I/O operation on device files
- Incorrect order of network connection operations
- Load of library from a relative path can be controlled by an external actor
- Mismatch between data length and size
- Misuse of readlink()
- Predictable random output from predictable seed
- Sensitive data printed out
- Sensitive heap memory not cleared before release
- Uncleared sensitive data in stack
- Unsafe standard encryption function
- Unsafe standard function
- Vulnerable permission assignments
- Vulnerable pseudo-random number generator

Static Memory

- Unreliable cast of function pointer
- Unreliable cast of pointer

Tainted Data

- Array access with tainted index
- Command executed from externally controlled path
- Execution of externally controlled command

- Host change using externally controlled elements
- Library loaded from externally controlled path
- Loop bounded with tainted value
- Memory allocation with tainted size
- Tainted sign change conversion
- Tainted size of variable length array
- Use of externally controlled environment variable

Low Impact Defects

The following list shows the low-impact defects.

Concurrency

- Blocking operation while holding lock
- Function that can spuriously fail not wrapped in loop
- Function that can spuriously wake up not wrapped in loop
- Signal call in multithreaded program
- Use of signal to kill thread

Data Flow

- Code deactivated by constant false condition
- Dead code
- Missing return statement
- Partially accessed array
- Static uncalled function
- Variable shadowing
- Write without a further read

Dynamic Memory

- Alignment changed after memory reallocation
- Mismatched alloc/dealloc functions on Windows
- Unprotected dynamic memory allocation

Good Practice

- Ambiguous declaration syntax
- Bitwise and arithmetic operation on a same data
- C++ reference to const-qualified type with subsequent modification
- C++ reference type qualified with const or volatile
- Delete of void pointer
- Hard coded buffer size
- Hard coded loop boundary
- Hard-coded object size used to manipulate memory
- Incorrect syntax of flexible array member size
- Large pass-by-value argument
- Line with more than one statement
- Missing break of switch case
- · Missing overload of allocation or deallocation function
- Missing reset of a freed pointer
- Unused parameter
- Use of setjmp/longjmp

Numerical

- Float overflow
- Integer precision exceeded
- · Possible invalid operation on boolean operand
- Precision loss from integer to float conversion
- Shift of a negative value
- Shift operation overflow
- Unsigned integer constant overflow
- Unsigned integer conversion overflow
- Unsigned integer overflow

Object Oriented

- *this not returned in copy assignment operator
- Missing explicit keyword

Programming

- Accessing object with temporary lifetime
- Alternating input and output from a stream without flush or positioning call
- Call to memset with unintended value
- Format string specifiers and arguments mismatch
- Memory comparison of float-point values
- Missing null in string array
- Misuse of a FILE object
- Misuse of structure with flexible array member
- Modification of internal buffer returned from nonreentrant standard function
- Overlapping assignment
- Predefined macro used as an object
- Preprocessor directive in macro argument
- Oualifier removed in conversion
- Return from computational exception signal handler
- Side effect of expression ignored
- Stream argument with possibly unintended side effects
- Universal character name from token concatenation
- Unsafe string to numeric value conversion

Security

- Function pointer assigned with absolute address
- Information leak via structure padding
- Missing case for switch condition
- Umask used with chmod-style arguments

- Use of dangerous standard function
- Use of obsolete standard function
- Vulnerable path manipulation

Static Memory

• Arithmetic operation with NULL pointer

Tainted Data

- Pointer dereference with tainted offset
- Tainted division operand
- Tainted modulo operand
- Tainted NULL or non-null-terminated string
- Tainted string format
- Use of tainted pointer

Generate Reports from Polyspace Results

- "Generate Reports" on page 18-2
- "Export Polyspace Analysis Results" on page 18-5
- "Export Polyspace Analysis Results to Excel by Using MATLAB Scripts" on page 18-9
- "Visualize Bug Finder Analysis Results in MATLAB" on page 18-12
- "Customize Existing Bug Finder Report Template" on page 18-17

Generate Reports

This example shows how to generate reports from Polyspace analysis results.

To generate reports, you can do one of the following:

- Run a Polyspace analysis and create a report from the analysis results. See the workflow described here.
- Specify that a report will be automatically generated after analysis. For more information on the options, see "Reporting".
- Export your results to a text file and generate graphs and statistics. See "Export Polyspace Analysis Results" on page 18-5.

Depending on the template you use, the report contains information about certain types of results from the **Results List** pane. You can see the following information about a result:

ID: Unique number for a result for the current analysis

To identify the result in your source code, you can use the ID in the **Results List** pane of the Polyspace user interface or in your IDE if you are using a Polyspace plugin.

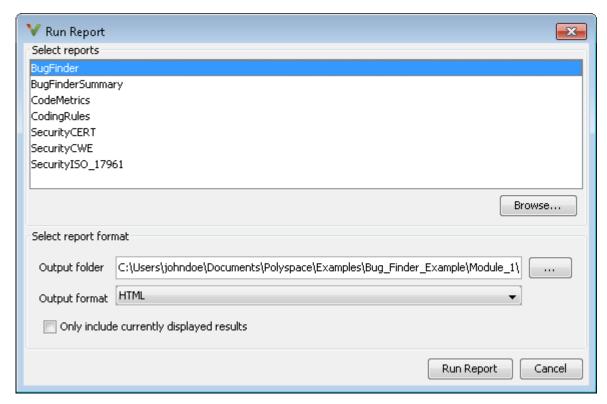

- Check: Defect names, MISRA C:2012 coding rule number, and so on.
- File and function
- Status, Severity, Comment: Information that you enter about a result.

In Bug Finder, the report does not contain the line or column number for a result. Use the report for archiving, gathering statistics and checking whether results have been reviewed and addressed (for certification purposes or otherwise). To review a result in your source code, use the Polyspace user interface or your IDE if you are using a Polyspace plugin.

Generate Reports from User Interface

You can generate a report from your analysis results. Using a customizable template, the report presents your results in a concise manner for managerial review or other purposes.

- 1 Open your results file.
- 2 Select **Reporting > Run Report**.

The Run Report dialog box opens.

- **3** Select the following options:
 - In the Select Reports section, select the types of reports that you want to generate. Press the Ctrl key to select multiple types. For example, you can select BugFinder and CodeMetrics.
 - Select the **Output folder** in which to save the report.
 - Select an **Output format** for the report.
 - If the display language (Windows) or locale (Linux) of your operating system is set to another language, you see an option to generate English reports. Select this option if you want an English report, otherwise the report is in another language.
 - If you want to filter results from your report, use filters on the **Results List** pane to display only the results that you want to report. Then, when generating reports,

select **Only include currently displayed results**. You cannot display filtered reports for results downloaded from Polyspace Metrics.

For more information on filtering, see "Filter and Group Results" on page 17-2.

4 Click Run Report.

The software creates the specified report and opens it.

Generate Reports from Command Line

You can script the generation of reports using the polyspace-report-generator command.

To generate **BugFinder** and **CodeMetrics** HTMLreports for results in C:\Users \johndoe\Documents\Polyspace\Examples\Bug_Finder_Example \Module 1\BF Result, use the following options with the command:

```
SET template_path=^
"C:\Program Files\MATLAB\R2018a\toolbox\polyspace\psrptgen\templates\bug_finder"
SET bf_templates=^
%template_path%\BugFinder.rpt,%template_path%\CodingMetrics.rpt
SET results_dir=^
"C:\Users\johndoe\Documents\Polyspace\Examples\Bug_Finder_Example\Module_1\BF_Result"
polyspace-report-generator ^
-results-dir %results_dir% ^
-template %bf_templates ^
-format html
```

| Output format (-report-output-format)

More About

- "Customize Existing Bug Finder Report Template" on page 18-17
- "Export Polyspace Analysis Results" on page 18-5

Export Polyspace Analysis Results

You can export your analysis results to a tab delimited text file or a MATLAB table (MATLAB). Using the text file or table, you can:

- Generate graphs or statistics about your results that you cannot readily obtain from the user interface by using MATLAB or Microsoft Excel®. For instance, for each Code Prover check type (**Division by zero**, **Overflow**), you can calculate how many checks are red, orange, or green.
- Integrate the analysis results with other checks you perform on your code.

Export Results to Text File

You can export results from the user interface or command line.

User Interface Command Line Open your analysis results. Use appropriate options with the polyspace-report-generator 2 Export all results or only a subset of command. the results. The available options are: To export all results, select **Reporting > Export > Export All** -generate-results-list-file: Results. Specifies that a text file must be If you want to filter results from generated. This option is required. your report, use filters on the -results-dir folder paths: Path **Results List** pane to display only to folder containing your analysis the results that you want to report. results. If you do not specify a folder Then, when exporting results, select path, the software uses analysis results **Reporting > Export > Export** from the current folder. **Currently Displayed Results.** To generate text files for multiple For more information on filtering, analyses, specify folder_paths as see "Filter and Group Results" on comma separated list with no spaces page 17-2. after the commas. For example: 3 Select a location to save the text file and click OK. C:\My project \Module 1\results,C:\My project \Module 2\Results To merge the text files, use the join function. -set-language-english: Use this option to generate English reports if the default report is in another language. The display language (Windows) or locale (Linux) of your operating system determines the default language in the report.

The exported text file uses the character encoding on your operating system. If special characters from your comments are not exported correctly in the text file, change the character encoding on your operating system before exporting.

Export Results to MATLAB Table

Instead of a text file, you can read your Polyspace analysis results into a MATLAB table. See:

- "Visualize Bug Finder Analysis Results in MATLAB" on page 18-12
- "Visualize Code Prover Analysis Results in MATLAB" (Polyspace Code Prover)

View Exported Results

The text file or the table contains the result information available on the **Results List** pane in the user interface (except for line and column information). See:

- "Results List" on page 15-19
- "Results List" (Polyspace Code Prover)

Some differences in presentation between the **Results List** pane and the text file are listed below.

- The text file has a **New** column that shows whether the result is new compared to the last analysis on the same code.
- The text file or the table also contains a Key column. The entry in this column is unique to a result across multiple analyses. When you merge multiple analysis results that might contain common files, use this entry to eliminate copies of a result. For instance, if you run coding-rule checking on multiple modules and merge the results, header files and coding rule violations in them appear in multiple module results. To eliminate copies of a coding rule violation, use the entry in the Key column.

You cannot identify the location of a Bug Finder result in your source code via the text file. However, you can still parse the file and generate graphs or statistics about your results.

Related Examples

"Visualize Bug Finder Analysis Results in MATLAB" on page 18-12

"Export Polyspace Analysis Results to Excel by Using MATLAB Scripts" on page 18- $\,9\,$

Export Polyspace Analysis Results to Excel by Using MATLAB Scripts

You can export the results of a Bug Finder or Code Prover analysis to an Excel report. See "Export Polyspace Analysis Results" on page 18-5. The report contains Polyspace results in a tab-delimited text file with predefined content and formatting.

You can also create Excel reports with your own content and formatting. Automate the creation of this report by using MATLAB scripts.

Report Result Summary and Details in One Worksheet

This example shows a sample script for generating Excel reports from Polyspace results.

The script adds two worksheets to an Excel workbook. The worksheets report content from the Polyspace results in *polyspaceroot*\polyspace\examples\cxx \Code_Prover_Example\Module_1\CP_result. Here, *polyspaceroot* is the Polyspace installation folder, such as C:\Program Files\Polyspace\R2019a.

Each worksheet contains the summary and details for a specific type of Polyspace result:

- MISRA C: 2012: This worksheet contains a summary of MISRA C: 2012 rule violations in the Polyspace results. The summary is followed by details of each MISRA C: 2012 violation.
- RTE: This worksheet contains a summary of run-time errors that Code Prover found. The summary is followed by details of each run-time error.

```
if isfile(filename)
    delete(filename)
end
% Disable warnings about adding new worksheets
warning('off','MATLAB:xlswrite:AddSheet')
% Write MISRA summary to the MISRA 2012 worksheet
misraSummaryTable = results.getSummary('misraC2012');
writetable(misraSummaryTable, filename, 'Sheet', 'MISRA 2012');
% Write MISRA results to the MISRA 2012 worksheet
misraDetailsTable = resultsTable(resultsTable.Family == 'MISRA C:2012',:);
detailsStartingCell = strcat('A',num2str(height(misraSummaryTable)+ 4));
writetable(misraDetailsTable, filename, 'Sheet', 'MISRA 2012', 'Range', ...
detailsStartingCell);
% Write runtime summary to the RTE worksheet
rteSummaryTable = results.getSummary('runtime');
writetable(rteSummaryTable, filename, 'Sheet', 'RTE');
% Write runtime results to the RTE worksheet
rteResultsTable = resultsTable(resultsTable.Family == 'Run-time Check',:);
detailsStartingCell = strcat('A',num2str(height(rteSummaryTable)+ 4));
writetable(rteResultsTable, filename, 'Sheet', 'RTE', 'Range', detailsStartingCell);
```

The key functions used in the example are:

- polyspace.CodeProverResults: Read Code Prover results into a table (MATLAB).
- writetable: Write a MATLAB table to a file. If the file name has the extension .xslx, the function writes to an Excel file.

To specify the content to write to the Excel sheet, use these name-value pairs:

- Use the name Sheet paired with a sheet name to specify a worksheet in the Excel workbook.
- Use the name Range paired with a cell name to specify the starting cell in the worksheet where the writing begins.

Control Formatting of Excel Report

Though you can control the content exported to the Excel report by using the preceding method, the method has limited formatting options for the report.

To format the Excel report on Windows systems, access the COM server directly by using actxserver. For example, Technical Solution 1-QLD4K uses actxserver to establish a connection between MATLAB® and Excel, write data to a worksheet, and specify the colors of the cells.

See also "Getting Started with COM" (MATLAB).

More About

• "Export Polyspace Analysis Results" on page 18-5

Visualize Bug Finder Analysis Results in MATLAB

After a Polyspace analysis, you can read your results to a MATLAB table (MATLAB). Using the table, you can generate graphs or statistics about your results. If you have MATLAB Report Generator, you can include these tables and graphs in a PDF or HTML report.

Export Results to MATLAB Table

To read existing Polyspace analysis results into a MATLAB table, use a polyspace. BugFinderResults object associated with the results.

For instance, to read the demo results in the read-only subfolder polyspace/ examples/cxx/Bug Finder Example/Module 1/BF Result of the MATLAB installation folder, copy the results to a writable folder and read them:

```
resPath = fullfile(polyspaceroot, 'polyspace', ...
    'examples', 'cxx', 'Bug_Finder_Example', 'Module_1','BF_Result');
userResPath = tempname;
copyfile(resPath,userResPath);
resObj = polyspace.BugFinderResults(userResPath);
resSummary = getSummary(res0bj);
resTable = getResults(res0bj);
```

resSummary and resTable are two MATLAB tables containing summary and details of the Polyspace results.

Alternatively, you can run a Polyspace analysis on C/C++ source files using a polyspace. Project object. After analysis, the Results property of the object contains the results. See "Run Polyspace Analysis by Using MATLAB Scripts" on page 3-5.

Generate Graphs from Results and Include in Report

After reading the results to a MATLAB table, you can visualize them in a convenient format. If you have MATLAB Report Generator, you can create a PDF or HTML report that contains your visualizations.

This example creates a pie chart showing the distribution of showing the distribution of defects by defect groups on page 13-21, and includes the chart in a report.

```
%% This example shows how to create a pie chart from your
% results and append it to a report.
%% Generate Pie Chart from Polyspace Results
% Copy a demo result set to a temporary folder.
resPath = fullfile(polyspaceroot, 'polyspace', 'examples', 'cxx', ...
  'Bug Finder Example', 'Module 1', 'BF Result');
userResPath = tempname;
copyfile(resPath, userResPath);
% Read results into a table.
resObj = polyspace.BugFinderResults(userResPath);
resTable = getResults(res0bj);
% Eliminate results that are not defects.
matches = (resTable.Family == 'Defect');
defectTable = resTable(matches ,:);
% Create a pie chart showing distribution of defects.
defectGroupList = removecats(defectTable.Group);
pieDefects = pie(defectGroupList);
labels = get(pieDefects(2:2:end), 'String');
set(pieDefects(2:2:end),'String','');
legend(labels, 'Location', 'bestoutside')
% Save the pie chart.
print('file','-dpng');
%% Append Pie Chart to Report
% Requires MATLAB Report Generator
% Create a report object.
import mlreportgen.dom.*;
report = Document('PolyspaceReport', 'html');
% Add a heading and paragraph to the report.
append(report, Heading(1, 'Bug Finder Defect Distribution Graph'));
paragraphText = ['The following graph shows the distribution of ' ...
               'defects in your code.'];
append(report, Paragraph(paragraphText));
```

```
% Add the image to the report.
chartObj = Image('file.png');
append(report, chartObj);
% Add another heading and paragraph to the report.
append(report, Heading(1, 'Defect Details'));
paragraphText = ['The following table shows the defects ' ...
               'in your code.'];
append(report, Paragraph(paragraphText));
% Add the table of defects to the report.
reducedInfoTable = defectTable(:,{'File','Function','Check',...
    'Status','Severity','Comment'});
reducedInfoTable = sortrows(reducedInfoTable,[1 2]);
tableObj = MATLABTable(reducedInfoTable);
tableObj.Style = {Border('solid','black'),ColSep('solid','black'),...
    RowSep('solid','black')};
append(report, tableObj);
% Close and view the report in a browser.
close(report);
rptview(report.OutputPath);
```

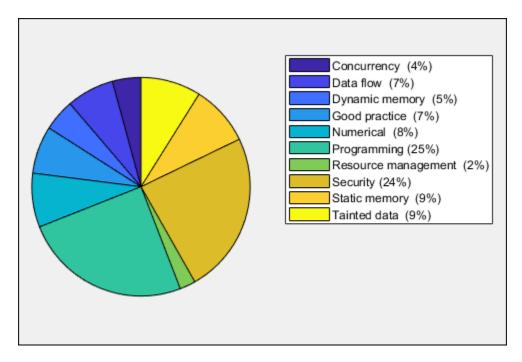

The key functions used in the example are:

- polyspace.BugFinderResults: Read Bug Finder results into a table (MATLAB).
- pie: Create pie chart from a categorical array (MATLAB). You can alternatively use the function histogram or heatmap.

To create histograms, replace pie with histogram in the script and remove the pie chart legends.

- mlreportgen.dom.Document: Create a report object that specifies the report format and where to store the report.
- mlreportgen.dom.Document.append: Append contents to the existing report.

When you execute the script, you see a distribution of defects by defect group. The script also creates an HTML report that contains the graph and table of Polyspace defects.

You can use any criteria to remove rows from the results table before reporting. The preceding example uses the criteria that the result must be from the defect family. See also Bug Finder result families.

```
matches = (resTable.Family == 'Defect');
defectTable = resTable(matches ,:);
```

Instead, you can use another criteria. For instance, you can remove results in header files and retain the results from source files only.

```
sourceExtensions = [".c",".cpp",".cxx"];
fileNameStrings = string(resTable.File);
matches = endsWith(fileNameStrings,sourceExtensions);
sourceTable = resTable(matches ,:);
```

Customize Existing Bug Finder Report Template

In this example, you learn how to customize an existing report template to suit your requirements. A report template allows you to generate a report from your analysis results in a specific format. If an existing report template does not suit your requirements, you can change certain aspects of the template.

For more information on the existing templates, see Bug Finder and Code Prover report (-report-template).

Prerequisites

Before you customize a report template:

 See whether an existing report template meets your requirements. Identify the template that produces reports in a format close to what you need. You can adapt this template.

To test a template, generate a report from sample results using the template. See "Generate Reports" on page 18-2.

• Make sure you have MATLAB Report Generator installed on your system.

In this example, you modify the **BugFinder** template that is available in Polyspace Bug Finder.

View Components of Template

A report template can be broken into components in MATLAB Report Generator. Each component represents some of the information that is included in a report generated using the template. For example, the component **Title Page** represents the information in the title page of the report.

In this example, you view the components of the **BugFinder** template.

1 Open the Report Explorer interface of Simulink Report Generator. At the MATLAB command prompt, enter:

report

2 Open the **BugFinder** template in the Report Explorer interface.

The **BugFinder** template is in *polyspaceroot*/toolbox/polyspace/psrptgen/templates/bug_finder where *polyspaceroot* is the Polyspace installation folder. Run polyspaceroot in MATLAB to find the installation folder location.

Your template opens in the Report Explorer. On the left pane, you can see the components of the template. You can click each component and view the component properties on the right pane.

Some components of the **BugFinder** template and their purpose are described below.

Component	Purpose	
Title Page	Inserts title page in the beginning of report	
Chapter/ Subsection	Groups portions of report into sections with titles	
Code Verification Summary	Inserts summary table of Polyspace analysis results	
Logical If	Executes child components only if a condition is satisfied	
Run-time Checks Summary Ordered by File	Inserts a table with Polyspace Bug Finder defects grouped by file	

To understand how the template works, compare the components in the template with a report generated using the template.

For more information on the components, see "Update Reports Created Interactively" (Simulink Report Generator). For information on Polyspace-specific components, see "Generate Reports".

Note Some of the component properties are set using internal expressions. Although you can view the expressions, do not change them. For instance, the conditions specified in the **Logical If** components in the **BugFinder** template are specified using internal expressions.

Change Components of Template

In the Report Explorer interface, you can:

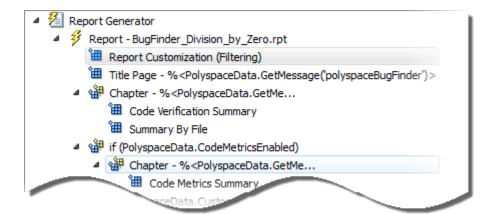

- Change properties of existing components of your template.
- Add new components to your template or remove existing components.

In this example, you add a component to the **BugFinder** template so that the template includes only **Integer division by zero** and **Float division by zero** defects in a report.

- Open the **BugFinder** template in the Report Explorer interface and save it elsewhere with a different name, for instance, **BugFinder Division by Zero**.
- 2 Add a new global component that filters every defect except division by zero from the **BugFinder_Division_by_Zero** template. The component is global because it applies to the full report and not one chapter of the report.

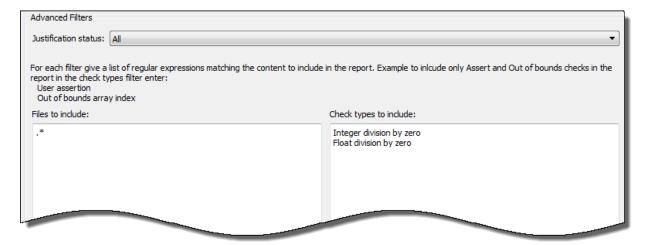

To perform this action:

a Drag the component Report Customization (Filtering) from the middle pane and drop it above the **Title Page** component. The positioning of the component ensures that the filters apply to the full report and not one chapter of the report.

b Select the **Report Customization (Filtering)** component. On the right pane, you can set the properties of this component. By default, the properties are set such that all results are included in the report.

To include only **Integer division by zero** and **Float division by zero** defects, under the **Advanced Filters** group, enter **Integer division** by zero and **Float division** by zero in the **Check types to include** field.

You can also use MATLAB regular expressions in this field to exclude results. For instance, to exclude the result **Dead code**, enter ^(?!Dead code).*. The

report generator applies the regular expressions against the Polyspace result names. For instance:

- The caret ^ indicates that the subsequent pattern must be at the beginning of the string.
- The characters (?!pattern).* indicates that the subsequent pattern must not appear in the string.

Together, the regular expression ^(?!Dead code).* indicates that Polyspace result names beginning with Dead code must be excluded from the report.See "Regular Expressions" (MATLAB).

You can toggle between activating and deactivating this component. Right-click the component and select **Activate/Deactivate Component**.

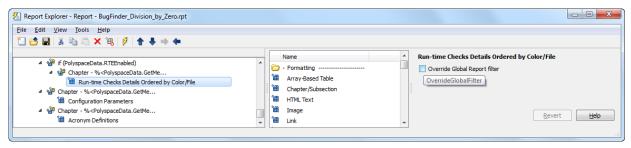

3 Change an existing chapter-specific component so that it does not override the global filter you applied in the previous step. If you prevent the overriding, the chapter-specific component follows the filtering specifications in the global component.

To perform this action:

On the left pane, select the Run-time Checks Details Ordered by Color/File component. This component produces tables in the report with details of run-time checks found in Polyspace Bug Finder.

The right pane shows the properties of this component.

b Clear the **Override Global Report** filter box.

In the Polyspace user interface, create a report using both the **BugFinder** and **BugFinder_Division_by_Zero** template from results containing division by zero defects. Compare the two reports.

For instance:

- a Open Help > Examples > Bug Finder Example.psprj.
 - The demo result contains **Integer division by zero** and **Float division by zero** defects.
- **b** Create a PDF report using the **BugFinder** template. See "Generate Reports" on page 18-2.
 - In the report, open **Chapter 4. Defects**. You can see all defects from the example result. Close the report.
- Create a PDF report using the BugFinder_Division_by_Zero template. In the Run Report window, use the Browse button to add the BugFinder Division_by_Zero template to the existing template list.

In the report, open **Chapter 5. Defects**. You see only **Integer division by zero** and **Float division by zero** defects.

Note After you add the template to the existing list of templates, before generating the report, make sure to select the newly added template.

Software Quality with Polyspace Metrics

- "Upload Results to Polyspace Metrics" on page 19-2
- "View Projects in Polyspace Metrics" on page 19-5
- "Compare Metrics Against Software Quality Objectives" on page 19-13
- "Web Browser Requirements for Polyspace Metrics" on page 19-24
- "View Results List in Polyspace Metrics" on page 19-26

Upload Results to Polyspace Metrics

Note For easier collaborative reviews, use Polyspace Bug Finder Access[™] . In addition to a more intuitive web dashboard, with Polyspace Access you can:

- Review and justify results directly from your web browser.
- Integrate a defect-tracking tool such as Jira with the web interface and create tickets to track Polyspace findings.
- Share analysis results using web links.

For more information, see the Polyspace Bug Finder Access documentation.

After analysis, you can upload results to the Polyspace Metrics web interface. The web interface displays a summary of your analysis results. You can share this summary with others even if they do not have Polyspace installed locally. You can also compare the results against previous analyses on the same project or measure them against predefined software quality objectives.

For more information, see "Polyspace Metrics Interface" on page 19-9.

Before you generate code quality metrics, set up Polyspace Metrics. See "Set Up Polyspace Metrics".

Manually Upload Results

To upload your results to the Polyspace Metrics web interface,

- 1 Select your results in the Project Browser pane.
- 2 Select Metrics > Upload to Metrics.
- When you upload results to Polyspace Metrics, you are prompted to enter a password. Leave the field blank if you do not want to specify one.

If you specify a password, you must enter it every time you open your project in Polyspace Metrics. The session lasts for 30 minutes even if you close and reopen your web browser. After 30 minutes, enter your password again.

You can also specify a password later. On the Polyspace Metrics web interface, right-click your project and select **Change/Set Password**.

Note The password for a Polyspace Metrics project is encrypted. The web data transfer is not encrypted. The password feature minimizes unintentional data corruption, but it does not provide data security. However, data transfers between a Polyspace local host and the remote analysis MATLAB Job Scheduler host are always encrypted. To use a secure web data transfer with HTTPS, see "Configure Web Server for HTTPS" (Polyspace Code Prover).

If you upload results from multiple modules in a project, the results have the same project name and version number but appear under separate modules in Polyspace Metrics. To see or change the project name and version number, right-click a project in the **Project Browser** pane and select **Project Properties**.

Command Line: Use the command polyspace-results-repository. For a quick review of the command options, use the -h flag. At the command line, enter:

polyspaceroot\polyspace\bin\polyspace-results-repository -h

Here, *polyspaceroot* is the Polyspace installation folder, for instance, C:\Program Files\Polyspace\R2019a.

Automatically Upload Results (Batch Analysis Only)

If you perform a remote analysis, you can specify for the results to be uploaded automatically to the web interface after analysis. Otherwise, upload the results after analysis manually.

- 1 On the **Configuration** pane, select **Run Settings**.
- 2 Along with Run Bug Finder analysis on a remote cluster, select Upload results to Polyspace Metrics.

After analysis, the results are automatically uploaded to the web interface.

When you upload results to Polyspace Metrics, you are prompted to enter a password. Leave the field blank if you do not want to specify one.

If you specify a password, you must enter it every time you open your project in Polyspace Metrics. The session lasts for 30 minutes even if you close and reopen your web browser. After 30 minutes, enter your password again.

You can also specify a password later. On the Polyspace Metrics web interface, right-click your project and select **Change/Set Password**.

Note The password for a Polyspace Metrics project is encrypted. The web data transfer is not encrypted. The password feature minimizes unintentional data corruption, but it does not provide data security. However, data transfers between a Polyspace local host and the remote analysis MATLAB Job Scheduler host are always encrypted. To use a secure web data transfer with HTTPS, see "Configure Web Server for HTTPS" (Polyspace Code Prover).

If you upload results from multiple modules in a project, the results have the same project name and version number but appear under separate modules in Polyspace Metrics. To see or change the project name and version number, right-click a project in the **Project Browser** pane and select **Project Properties**.

Command Line: Use the option Upload results to Polyspace metrics (-add-to-results-repository).

polyspace-results-repository

Related Examples

- "View Projects in Polyspace Metrics" on page 19-5
- "Compare Metrics Against Software Quality Objectives" on page 19-13

View Projects in Polyspace Metrics

Note For easier collaborative reviews, use Polyspace Bug Finder Access . In addition to a more intuitive web dashboard, with Polyspace Access you can:

- Review and justify results directly from your web browser.
- Integrate a defect-tracking tool such as Jira with the web interface and create tickets to track Polyspace findings.
- Share analysis results using web links.

For more information, see the Polyspace Bug Finder Access documentation.

Polyspace Metrics is a web dashboard that displays code quality metrics from your analysis results. Using this dashboard, you can:

- Track improvements or regression in code quality over time.
- · Provide managers a high-level overview of your code quality.
- · Compare your code against quality objectives.
- Narrow your analysis review to critical results.

Upload Results

Before you can review your project in Polyspace Metrics, you must "Upload Results to Polyspace Metrics" on page 19-2.

Open Metrics Interface

You can open the metrics interface in one of the following ways:

- If you have Polyspace installed, select **Metrics** > **Open Metrics**.
- If you do not have Polyspace installed, open a web browser and enter the following URL:

protocol:// ServerName: PortNumber

• protocol is either http (default) or https.

To use HTTPS, additional configuration is required. See "Configure Web Server for HTTPS" (Polyspace Code Prover).

- ServerName is the name or IP address of your Polyspace Metrics server.
- PortNumber is the web server port number (default 8080).

When the Polyspace Metrics web interface opens you are presented with a list of results in your repository. You can view these results by project or by run.

The **Projects** tab lists the uploaded results by projects. On this tab, you can:

- See the number of project runs and overall statistics about the project by hovering your cursor over the project name.
- See project-level metrics by right-clicking the column headers and adding additional columns: Bug Finder Checks, Coding Rules, Code Metrics, Run-Time Errors, or Review Progress.
- Create project groups by right-clicking a project and selecting Create Project Category. Drag projects to your new category.
- Filter projects using the column headers.
- Delete projects from the Metrics repository by right-clicking the project and selecting **Delete Project from Repository**.
- Assign or change the password for a project by right-clicking the project and selecting Change/Set Password.
- Review into code quality metrics for a project by clicking the project. For details, see "Polyspace Metrics Interface" on page 19-9.

The **Runs** tab lists the individual runs for all projects. On this tab, you can:

- Delete a run from the repository by right-clicking the run and selecting Delete Run from Repository.
- Assign password to run by right-clicking the run and selecting Change/Set Password.
- See runs between two specific dates by selecting the starting date in the **From** field and the end date in the **To** field.
- See only the last n runs by changing the value of the Maximum number of runs field.
- See code quality metrics for a run by right-clicking the run and selecting Go to Metrics Page.

• Download results of run to Polyspace user interface by clicking the run name.

Review Metrics

For each project or analysis, you can view the code quality metrics spread over four tabs, at project, file, and function level. Select a project and you see four tabs:

- The **Summary** tab on page 19-9 provides a high-level overview of the verification results.
- The **Code Metrics** tab on page 19-10 provides the details of the code complexity metrics in your results.
- The **Coding Rules** tab on page 19-11 provides the details of the coding rule violations in your results.
- The **Bug Finder** tab on page 19-11 provides details of code defects in your results.

If you want to "Compare Metrics Against Software Quality Objectives" on page 19-13, before reviewing your results, you can turn on quality objectives.

- 1 Click an entry on the **Summary** tab. Clicking on an entry brings you to the respective tab for more details.
- 2 On the **Code Metrics**, **Coding Rules** or **Run-Time Errors** tabs, select an entry to download the result to the Polyspace user interface.
 - The results appear on the **Results List** pane in the Polyspace user interface. The filter **Show** > **Web checks** on this pane indicate that you have downloaded the results from Polyspace Metrics.
- In the Polyspace user interface, review the particular result, investigate the root cause in your source code, and assign review comments and justifications.
- 4 To upload your comments and justifications to the Polyspace Metrics repository, select **Metrics** > **Upload to Metrics**.

Tip To upload automatically your comments and justifications to the Polyspace Metrics repository when you save them:

- a Select Tools > Preferences.
- b On the Server Configuration tab, select Save justifications in the Polyspace Metrics repository.

In the Polyspace Metrics interface, click to view your newly uploaded metrics.

Compare Metrics Between Results

Using the Polyspace Metrics interface, you can track improvements or regression in code quality metrics over various runs on the same source code.

To view trends in metrics, upload the various versions of your results to the Polyspace Metrics repository.

1 Open the Polyspace Metrics interface.

For more information, see "Open Metrics Interface" on page 19-5.

2 On the **Projects** tab, select the project for which you want to view trends.

The code quality metrics for all versions of the project appear on the **Summary**, **Code Metrics**, **Coding Rules**, and **Bug-Finder** tabs.

- **3** To compare two versions of the same project:
 - a In the **From** and **To** lists on the upper left of the web dashboard, select the two versions that you want to compare.
 - **b** Select the **Compare** box.

On each tab, new columns appear and existing columns display improvement or regression in a metric. For example, in the figure below, you see a new **All Metrics Trend** column that appears on the **Summary** tab. This column describes how the metrics in the **Bug-Finder** group compare over two versions of a project.

- A <u>M</u> means that the metrics is better.
- A ▼ means that the metric is worse.
- 4 To see only the new findings in a version compared to a previous version:
 - a In the **From** and **To** lists on the upper left of the web dashboard, select the two versions that you want to compare.
 - **b** Select the **New Findings Only** box.

The existing columns display only the new findings. In addition, you also see two new columns:

- The **Newly Confirmed** column shows those new findings to which you assign a **Severity** of High, Medium, or Low in the Polyspace user interface.
- The **Newly Fixed** column shows those findings to which you had assigned a **Severity** of **High**, **Medium**, or **Low** in the previous run. However, the assignment does not exist in the current run, either because a red or orange check turned green, or because you changed the **Severity** to **Unset**.

Polyspace Metrics Interface

- "Summary Tab" on page 19-9
- "Code Metrics Tab" on page 19-10
- "Coding Rules Tab" on page 19-11
- "Bug-Finder Tab" on page 19-11

If you turn on Software Quality Objectives, each tab also specifies how your project or run compares against those objectives. See "Compare Metrics Against Software Quality Objectives" on page 19-13.

Summary Tab

The **Summary** tab summarizes the analysis results for a project or run.

Column Name		Description	
Verification		Version number of the results and the source files.	
Verification Status		Analysis level completed.	
Code Metrics	Files	Number of files in project.	
	Lines of code	Number of lines of code, broken down by file.	
Coding Rules Confirmed Defects		Number of coding rule violations assigned a Severity of High, Medium, or Low in the Polyspace user interface.	
	Violations	Total number of coding rule violations.	
Bug-Finder Checks	Confirmed Defects	Number of defects assigned a Severity of High, Medium, or Low in the Polyspace user interface.	
	Checks	Total number of defects.	

Column Name		Description	
Verification		Version number of the results and the source files.	
Software Quality Objectives Overall Status		A status of PASS or FAIL based on whether your code satisfies the software quality objectives you specified.	
	Level	The software quality objectives that you specify. You can either use a predefined set of objectives or specify your own objectives.	
	Review Progress	Number or percent of justified results.	
		To justify a result, you must assign a Status in the Polyspace user interface.	
	Justified Code Metrics	Number or percent of code metric threshold violations that you have justified.	
		To justify a result, you must assign a Status in the Polyspace user interface.	
	Justified Coding Rules	Number or percent of coding rule violations that you have justified.	
		To justify a result, you must assign a Status in the Polyspace user interface.	
	Justified Bug-	Number or percent of defects that you have justified.	
	Finder Checks	To justify a result, you must assign a Status in the Polyspace user interface.	

Code Metrics Tab

The **Code Metrics** tab lists the code complexity metrics for your project or run.

Some metrics are calculated at the project level, while others are calculated at file or function level. For metrics calculated at the function level, the entry displayed for a file is either an aggregate or a maximum over the functions in the file.

For more information, see "Code Metrics".

Coding Rules Tab

The **Coding Rules** tab lists the coding rule violations in your project or run. For more information on the coding rules, see "Coding Standards".

You can group the information in the columns by Files or Coding Rules.

Column Name		Description
Coding Rules Confirmed Defects		Number of coding rule violations assigned a Severity of High, Medium, or Low in the Polyspace user interface.
	Justified	Number of coding rule violations that you have justified.
		To justify a result, you must assign a Status in the Polyspace user interface.
	Violations	Total number of coding rule violations.
		A status of PASS or FAIL based on whether your code satisfies the software quality objectives you specified.
	Level	The software quality objectives that you specify. You can either use a predefined set of objectives, or specify your own objectives.
	Review Progress	Number or percent of justified coding rule violations.
		To justify a result, you must assign a Status in the Polyspace user interface.

Bug-Finder Tab

The **Bug-Finder** tab lists the "Defects" in your project or run.

You can group the information in the columns by ${f Files}$ or ${f Bug-Finder\ Checkers}$.

Column Name	Description
Confirmed Defects	Number or percent of defects assigned a Severity of High , Medium , or Low in the Polyspace user interface.
	See "Address Polyspace Results Through Bug Fixes or Comments" on page 16-2.

Column Name		Description
Bug-Finder Checks	Justified	Number or percent of justified defects.
		To justify a result, you must assign a Status in the Polyspace user interface.
	Checks	Total number of checks.
	High	Total number of "High Impact Defects" on page 17-11.
	Medium	Total number of "Medium Impact Defects" on page 17-14.
	Low	Total number of "Low Impact Defects" on page 17-19.
Software Quality	Quality Status	A status of PASS or FAIL based on whether your code satisfies the software quality objectives you specified.
Objectives	Level	The software quality objectives that you specify. You can either use a predefined set of objectives or specify your own objectives.
	Review Progress	Number or percent of justified defects.
		To justify a result, you must assign a Status in the Polyspace user interface.

Related Examples

- "Address Polyspace Results Through Bug Fixes or Comments" on page 16-2
- "Upload Results to Polyspace Metrics" on page 19-2
- "Compare Metrics Against Software Quality Objectives" on page 19-13
- "Compare Metrics Between Results" on page 19-8

Compare Metrics Against Software Quality Objectives

After generating and viewing metrics from your analysis results, you can review the results in greater detail.

To focus your review, you can:

- **1** Define quality objectives that you or developers in your organization must meet.
- **2** Apply the quality objectives to your analysis results.
- **3** Review only those results that fail to meet those objectives.

Apply Predefined Objectives to Metrics

By default, the software quality objectives are turned off. To apply quality objectives:

- **1** In the Polyspace Metrics interface, open the metrics page for a project.
- 2 From the **Quality Objectives** list in the upper left, select **ON**.

A new group of **Software Quality Objectives** columns appears.

- The **Overall Status** column shows the last used quality objective level to generate a status of **PASS** or **FAIL** for your results.
- The \boldsymbol{Level} column shows the quality objective level.

To change your quality objective level, in this column, select a cell. From the drop-down list, select a quality level. For more information, see "Bug Finder Quality Objective Levels" on page 19-14.

- For files with an Overall Status of FAIL, to see what causes the failure, view the entries in the other Software Quality Objectives columns. The failing levels are marked red.
 - If the ▲ icon appears next to the status, it means that Polyspace does not have enough information to compute the status. For instance, if you specify BF-Q0-1, certain coding rules must be review. But, if you do not check coding rules during the analysis, Polyspace cannot determine whether your project satisfies the coding rule objectives specified in BF-Q0-1.
- 4 To investigate the failing quality objectives, select the entries marked red for more details.

- 5 On the Code Metrics, Coding Rules, or Bug-Finder tab,
 - a Select the red column entries to download the results.
 - **b** Review the violations and fix or justify the results.
 - See "Address Polyspace Results Through Bug Fixes or Comments" on page 16-2.
 - **c** Upload your new justifications to the Polyspace Metrics web dashboard.
- After your review, in the Polyspace Metrics interface, click to view the updated metrics.

If you change your code, to update the metrics, rerun your analysis and upload the results to the Polyspace Metrics repository. If you have justifications in your previous results, import them to the new results before uploading to the repository.

Bug Finder Quality Objective Levels

The Bug Finder Quality Objectives or BF-QOs are a set of thresholds against which you can compare your Bug Finder analysis results. These objectives are adapted from the Polyspace Code Prover "Software Quality Objectives" (Polyspace Code Prover). You can develop a review process based on the Quality Objectives.

You can use a predefined BF-QO level or define your own. Following are the predefined quality thresholds specified by each BF-QO.

BF-QO Level 1

Metric	Threshold Value
Comment density of a file	20
Number of paths through a function	80
Number of goto statements	0
Cyclomatic complexity	10
Number of calling functions	5
Number of calls	7
Number of parameters per function	5
Number of instructions per function	50

Metric	Threshold Value
Number of call levels in a function	4
Number of return statements in a function	1
Language scope, an indicator of the cost of maintaining or changing functions. Calculated as follows:	4
(N1+N2) / (n1+n2)	
• n1 — Number of different operators	
• N1 — Total number of operators	
• n2 — Number of different operands	
• N2 — Total number of operands	
Number of recursions	0
Number of direct recursions	0
Number of unjustified violations of the following MISRA C:2004 rules:	0
• 5.2	
• 8.11, 8.12	
• 11.2, 11.3	
• 12.12	
• 13.3, 13.4, 13.5	
• 14.4, 14.7	
• 16.1, 16.2, 16.7	
• 17.3, 17.4, 17.5, 17.6	
• 18.4	
• 20.4	

Metric	Threshold Value
Number of unjustified violations of the following MISRA C:2012 rules:	0
• 8.8, 8.11, and 8.13	
• 11.1, 11.2, 11.4, 11.5, 11.6, and 11.7	
• 14.1 and 14.2	
• 15.1, 15.2, 15.3, and 15.5	
• 17.1 and 17.2	
• 18.3, 18.4, 18.5, and 18.6	
• 19.2	
• 21.3	
Number of unjustified violations of the following MISRA C++ rules:	0
• 2-10-2	
• 3-1-3, 3-3-2, 3-9-3	
• 5-0-15, 5-0-18, 5-0-19, 5-2-8, 5-2-9	
• 6-2-2, 6-5-1, 6-5-2, 6-5-3, 6-5-4, 6-6-1, 6-6-2, 6-6-4, 6-6-5	
• 7-5-1, 7-5-2, 7-5-4	
• 8-4-1	
• 9-5-1	
• 10-1-2, 10-1-3, 10-3-1, 10-3-2, 10-3-3	
• 15-0-3, 15-1-3, 15-3-3, 15-3-5, 15-3-6, 15-3-7, 15-4-1, 15-5-1, 15-5-2	
• 18-4-1	

BF-QO Level 2 and 3

In addition to all the requirements of BF-QO Level 1, these levels includes the following thresholds:

Metric	Threshold Value
Number of "High Impact Defects" on page 17-11	0

BF-QO Level 4

In addition to all the requirements of BF-QO Level 2 and 3, this level includes the following thresholds:

Metric	Threshold Value
Number of "Medium Impact Defects" on page 17-14	0

BF-QO Level 5

In addition to all the requirements of BF-QO Level ${\bf 4}$, this level includes the following thresholds:

Metric	Threshold Value
Number of unjustified violations of the following MISRA C:2004 rules:	0
• 6.3	
• 8.7	
• 9.2, 9.3	
• 10.3, 10.5	
• 11.1, 11.5	
• 12.1, 12.2, 12.5, 12.6, 12.9, 12.10	
• 13.1, 13.2, 13.6	
• 14.8, 14.10	
• 15.3	
• 16.3, 16.8, 16.9	
• 19.4, 19.9, 19.10, 19.11, 19.12	
• 20.3	

Metric	Threshold Value
Number of unjustified violations of the following MISRA C:2012 rules:	0
• 11.8	
• 12.1 and 12.3	
• 13.2 and 13.4	
• 14.4	
• 15.6 and 15.7	
• 16.4 and 16.5	
• 17.4	
• 20.4, 20.6, 20.7, 20.9, and 20.11	
Number of unjustified violations of the following MISRA C++ rules:	0
• 3-4-1, 3-9-2	
• 4-5-1	
• 5-0-1, 5-0-2, 5-0-7, 5-0-8, 5-0-9, 5-0-10, 5-0-13, 5-2-1, 5-2-2, 5-2-7, 5-2-11, 5-3-3, 5-2-5, 5-2-6, 5-3-2, 5-18-1	
• 6-2-1, 6-3-1, 6-4-2, 6-4-6, 6-5-3	
• 8-4-3, 8-4-4, 8-5-2, 8-5-3	
• 11-0-1	
• 12-1-1, 12-8-2	
• 16-0-5, 16-0-6, 16-0-7, 16-2-2, 16-3-1	

BF-QO Level 6

In addition to all the requirements of BF-QO Level 5, this level includes the following thresholds:

Metric	Threshold Value
Number of "Low Impact Defects" on page 17-19	0

BF-QO Exhaustive

In addition to all the requirements of BF-QO Level 1, this level includes the following thresholds. The thresholds for coding rule violations apply only if you check for coding rule violations.

Metric	Threshold Value
Number of unjustified MISRA C and MISRA C++ coding rule violations	0
Number of unjustified defects	0

Customize Software Quality Objectives

Instead of using a predefined objective, you can define your own quality objectives and apply them to your project.

Save the following content in an XML file. Name the file Custom-SQ0-Definitions.xml.

```
<?xml version="1.0" encoding="UTF-8"?>
<MetricsDefinitions>
    <S00 ID="Custom-BF-00-Level" ApplicableProduct="Bug Finder"</pre>
                                  ApplicableProject="My Project">
        <comf>20</comf>
        <path>80</path>
        <goto>0</goto>
        < vq > 10 < /vq >
        <calling>5</calling>
        <calls>7</calls>
        <param>5</param>
        <stmt>50</stmt>
        <level>4</level>
        <return>1</return>
        <vocf>4</vocf>
        <ap cg cycle>0</ap cg cycle>
        <ap_cg_direct_cycle>0</ap_cg_direct_cycle>
        <Num Unjustified Violations>Custom MISRA Rules Set
                                    </Num Unjustified Violations>
        <Num Unjustified BF Checks>Custom BF Checks Set
                                     </Num Unjustified BF Checks>
    </S00>
```

</MetricsDefinitions>

You can use this file for both Bug Finder and Code Prover results. For information on the XML elements specific to Code Prover, see "Compare Metrics Against Software Quality Objectives" (Polyspace Code Prover).

Save this XML file in the folder where remote analysis data is stored, for example, C:\Users\JohnDoe\AppData\Roaming\Polyspace RLDatas.

If you want to change the folder location, select **Metrics > Metrics and Remote Server Settings**.

3 To make the quality level Custom-BF-QO-Level applicable to a certain project, replace the value of the ApplicableProject attribute with the project name.

If you want the quality objectives to apply to all projects, use ApplicableProject="".

4 Modify the file to specify your thresholds.

For specifying coding rules, begin the rule name with the appropriate string followed by the rule number. Use _ instead of a decimal point in the rule number.

Rule	String	Rule numbers
MISRA C: 2004	MISRA_C_	"MISRA C:2004 and MISRA AC AGC Coding Rules" on page 12-3
MISRA C: 2012	MISRA_C3_	"MISRA C:2012 Directives and Rules"
MISRA C++	MISRA_Cpp_	"MISRA C++:2008 Rules"
JSF C++	JSF_Cpp_	"JSF C++ Coding Rules" on page 12-62
Custom coding rules	Custom_	"Custom Coding Rules"

For specifying defects, use the defect acronym. See "Short Names of Bug Finder Defect Checkers" on page 13-4.

For specifying code metrics, use the code metric acronym. See "Short Names of Code Complexity Metrics" on page 16-15.

- After you have made your modifications, in the Polyspace Metrics interface, open the metrics for your project. From the **Quality Objectives** list in the upper left, select ON.
- On the **Summary** tab, select an entry in the **Level** column. For the project name that you specified, your new quality objective **Custom-BF-QO-Level** appears in the drop-down list.
- **7** Select your new quality objective.

The software compares the thresholds you had specified against your results and updates the **Overall Status** column with **PASS** or **FAIL**.

8 To define another set of custom quality objectives, add the following content to the Custom-BF-QO-Definitions.xml file:

• ID represents the name of the new set.

You cannot have the same values of ID and ApplicableProject for two different sets of quality objectives. For example, if you use ID="Custom-BF-QO-Level" for two different custom sets, and ApplicableProject is either My_Project or "" for both sets, you see the following error:

The SQO level 'Custom-BF-QO-Level' is multiply defined.

• ParentID specifies another level from which the current level inherits its quality objectives. In the preceding example, the level Custom-BF-QO-Level_2 inherits its quality objectives from the level Custom-BF-QO-Level.

If you do not want to inherit quality objectives from another level, omit this attribute.

• ... represents the additional quality thresholds that you specify for the level Custom-BF-QO-Level_2.

The quality thresholds that you specify override the thresholds that Custom-BF-Q0-Level_2 inherits from Custom-BF-Q0-Level. For instance, if you specify <goto>1</goto>, this objective overrides the threshold specification <goto>0</goto> of Custom-BF-Q0-Level.

Elements in Custom Quality Objective Files

- "HIS Metrics" on page 19-22
- "Non-HIS Metrics" on page 19-23

The following tables list the XML elements that can be added to the custom BF-QO file. The content of each element specifies a threshold against which the software compares analysis results. For each element, the table lists the metric to which the threshold applies. Here, HIS refers to the Hersteller Initiative Software.

HIS Metrics

Element	Metric
comf	Comment Density
path	Number of Paths
goto	Number of Goto Statements
vg	Cyclomatic Complexity
calling	Number of Calling Functions
calls	Number of Called Functions
param	Number of Function Parameters
stmt	Number of Instructions
level	Number of Call Levels
return	Number of Return Statements
vocf	Language Scope
ap_cg_cycle	Number of Recursions
ap_cg_direct_cycle	Number of Direct Recursions
Num_Unjustified_Violations	Number of unjustified violations of coding rules specified by entries under the element CodingRulesSet

Element	Metric
	Number of unjustified defects of types specified by entries under the element BugFinderChecksSet

Non-HIS Metrics

Element	Description of metric
fco	Estimated Function Coupling
flin	Number of Lines Within Body
fxln	Number of Executable Lines
ncalls	Number of Call Occurrences

Web Browser Requirements for Polyspace Metrics

To use Polyspace Metrics, install Java®, version 1.4 or later on your computer.

Polyspace Metrics supports these web browsers:

- Internet Explorer® version 7.0, or later
- Firefox® version 3.6, or later
- Google® Chrome version 12.0, or later
- Safari for Mac version 6.1.4 and 7.0.4

Additional Considerations

 With certain web browsers such as Google Chrome, you are prompted to download or open a file called psapplet.jsp. You must configure your system to open.jsp files using the Java Web Start Launcher (javaws) binary. You can find this binary in your Java installation folder.

For instance, if you download psapplet.jsp on a Windows system, to open and view your Polyspace results:

- 1 Right-click psapplet.jsp and select **Properties**.
- Next to **Opens With:** select the Java Web Start Launcher (javaws) binary. If the binary is not in the default list of options, browse to your Java installation folder, for example C:\Program Files\Java\jre1.8.0 161\bin.
- 3 After you apply your changes, double-click psapplet.jsp to open it.
- If your computer uses the Linux operating system, manually install the required Java plug-in for the Firefox web browser:
 - 1 Create a plugins folder under the .mozilla folder in your home directory:

```
mkdir ~/.mozilla/plugins
```

2 From this folder, create a symbolic link to the Java plug-in, which is available in the Java Runtime Environment folder.

For instance, to use the Java Runtime Environment of your MATLAB installation, enter these commands:

```
cd ~/.mozilla/plugins
ln -s MATLAB Install/sys/java/jre/glnxa64/jre/lib/amd64/libnpjp2.so
```

• If you download results using Internet Explorer 11, it may take a minute or two to open the Java plug-in and load the Polyspace interface.

View Results List in Polyspace Metrics

Note For easier collaborative reviews, use Polyspace Bug Finder Access . In addition to a more intuitive web dashboard, with Polyspace Access you can:

- Review and justify results directly from your web browser.
- Integrate a defect-tracking tool such as Jira with the web interface and create tickets to track Polyspace findings.
- · Share analysis results using web links.

For more information, see the Polyspace Bug Finder Access documentation.

This example shows how to use Polyspace Metrics to view the Results List in and download results. Your results appear in Polyspace Metrics if,

- Before analyzing your code in batch mode, you selected the Add to results repository analysis option.
- After analyzing your code, batch or local mode, you selected Metrics > Upload to Metrics.

Open Polyspace Metrics

1 From the Polyspace interface, select **Metrics** > **Open Metrics**.

You can also open the Polyspace Metrics Web UI using the URL:

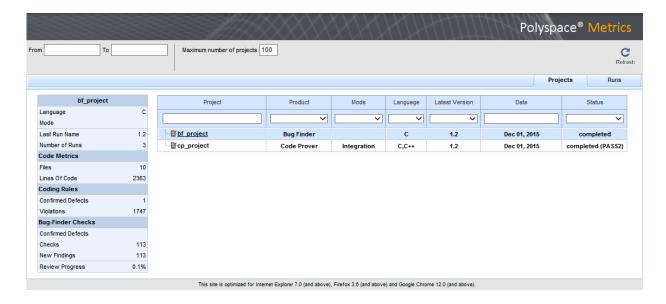

protocol://ServerName:PortNumber

protocol is either http (default) or https.

To use HTTPS, you must configure the web server for HTTPS.

- ServerName is the name or IP address of your Polyspace Metrics server.
- *PortNumber* is the web server port number (default 8080).

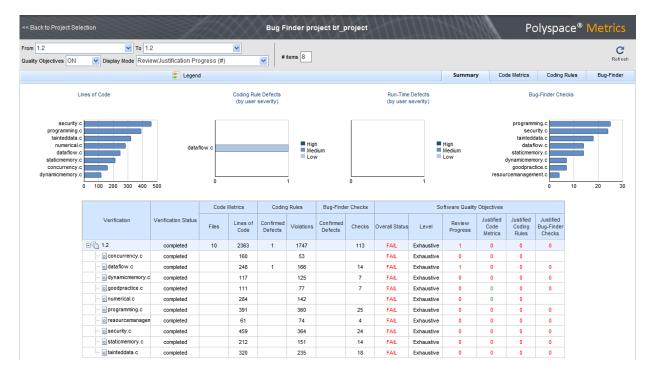

On the Metrics homepage, you can see all projects uploaded to your Polyspace Metrics repository.

View Results List

- $\textbf{1} \quad \text{Select the } \textbf{Projects} \text{ tab}.$
- 2 Hover over the project name to see a summary of the project results.
- **3** To see more details, select the project name.

The project opens to a Results List for the project.

Polyspace Metrics shows the summary graphically

Confirmed Defects column lists the number of coding rule violations or checks that you have reviewed and assigned a **Severity** of High, Medium, or Low in the Polyspace user interface.

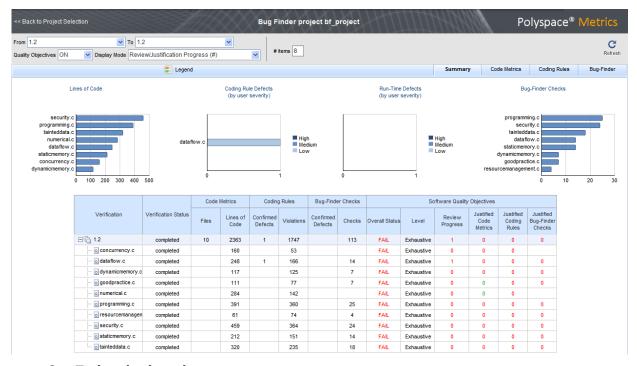

- **4** To view the results in more detail, select the tabs:
 - Code Metrics: Statistics about your project such as number of lines, header files, and function calls. To see code metrics, you must enable the analysis option Calculate code metrics (-code-metrics).
 - Coding Rules: Description of coding rule violations.
 - **Bug-Finder**: Description of defects detected by Polyspace Bug Finder.

Download Results

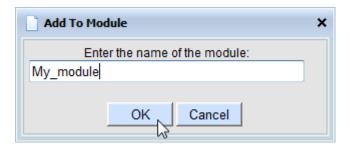

1 Select the **Projects** tab.

2 To view the Results List for your project, on the **Projects** column, select the project name.

The Results List for the project appears on the web page under the **Summary** tab.

- **3** To download results:
 - Individual file click a file name in the Verification column.
 - Whole project click a version number in the **Verification** column.
 - Group of files
 - a Right-click the row containing a file in the group. From the context menu, select **Add To Module**.
 - ${f b}$ Enter the name of your module in the dialog box. Click ${f OK}$.

The name of the module appears on the **Verification** column.

- **c** Drag and drop the other files in the group to the module.
- **d** Click the name of the module and follow any prompt from your web browser. If the results do not open automatically in the Polyspace interface, check the "Web Browser Requirements for Polyspace Metrics" on page 19-24.

The results open on the **Results List** pane in Polyspace Bug Finder. The filter **Show** > **Web checks** on this pane indicate that you have downloaded the results from Polyspace Metrics.

You can review the downloaded results or generate reports. If you generate a report, all results in the results file appear in the report (not just the downloaded results). To generate a filtered report, change the scope **Web checks** to another named filtered set, for instance, **All results**. Then, apply filters and generate the report. For more information, see "Generate Reports" on page 18-2.

License Error -4,0

Issue

When you try to run Polyspace, you get this error message:

License Error -4,0

Possible Cause: Another Polyspace Instance Running

You can open multiple instances of Polyspace, but you can only run one code analysis at a time.

If you try to run Polyspace processes from multiple windows, you will get a License Error -4.0 error.

Solution

Only run one analysis at a time, including any command-line or plugin analyses.

Possible Cause: Prior Polyspace Run in Simulink or MATLAB Coder

If you run Polyspace on generated code in the Simulink user interface or in the MATLAB Coder app, you can get a license error if you try to run a subsequent analysis in the Polyspace user interface. You get the error even if the previous run is over.

Solution

Run the subsequent analysis using the method that you used before, that is, in the Simulink user interface or MATLAB Coder app.

If you want to run the analysis in the Polyspace user interface, close Simulink or MATLAB Coder and then rerun the analysis.

View Error Information When Analysis Stops

If the analysis stops, you can view error information on the screen, either in the user interface or at the command-line terminal. Alternatively, you can view error information in a log file generated during analysis. Based on the error information, you can either fix your source code, add missing files or change analysis options to get past the error.

View Error Information in User Interface

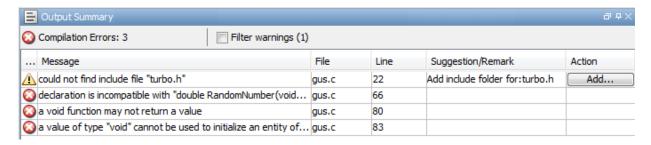

1 View the errors on the **Output Summary** tab.

The messages on this tab appear with the following icons.

Icon	Meaning
	Error that blocks analysis.
	For instance, the analysis cannot find a variable declaration or definition and therefore cannot determine the variable type.
A	Warning about an issue that does not block analysis by itself, but could be related to a blocking error.
	For instance, the analysis cannot find an include file that is #include-d in your code. The issue does not block the analysis by itself, but if the include file contains the definition of a variable that you use in your source code, you can face an error later.
(i)	Additional information about the analysis.

- 2 To diagnose and fix each error, you can do the following:
 - To see further details about the error, select the error message. The details appear
 in a **Detail** window below the **Output Summary** tab.
 - To open the source code at the line containing the error, double-click the message.
- **3** If you enable the Compilation Assistant, to fix an error, you can perform certain actions on the **Output Summary** tab.

The following figure shows an error due to a missing include file turbo.h. You can add the missing file by clicking the **Add** button on the **Output Summary** tab.

To turn on the Compilation Assistant, select **Tools > Preferences**. On the **Project and Results Folder** tab, select **Use Compilation Assistant**.

Note the following:

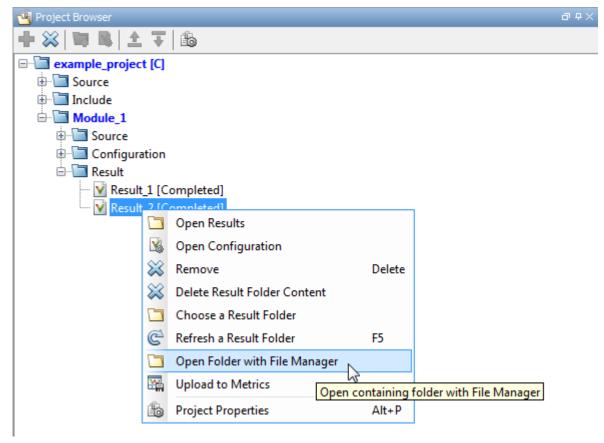

- By default, if some files do not compile, Bug Finder analyzes the remaining files. If you turn on Compilation Assistant, all files must compile. You do not get analysis results even if there is a single compilation error.
- The Compilation Assistant is disabled if you specify the option Command/script to apply to preprocessed files (-post-preprocessing-command)

Tip To search the error messages for a specific term, on the **Search** pane, enter your search term. From the drop down list on this pane, select **Output Summary** or **Run Log**. If the **Search** pane is not open by default, select **Windows** > **Show/Hide View** > **Search**.

View Error Information in Log File

You can view errors directly in the log file. The log file is in your results folder. To open the log file:

Right-click the result folder name on the **Project Browser** pane. From the context menu, select **Open Folder with File Manager**.

- 2 Open the log file, Polyspace R20##n ProjectName date-time.log
- **3** To view the errors, scroll through the log file, starting at the end and working backward.

The following example shows sample log file information. The error has occurred because a variable var used in the code is not defined earlier.

```
C:\missing_include.c, line 4: error: identifier "var" is undefined
    var = func();
    ^
```

1 error detected in the compilation of "missing_include.c".

C:\missing_include.c: warning: Failed compilation.
Global compilation phase...

Contact Technical Support

To contact MathWorks Technical Support, use this page. You need a MathWorks Account login and password. For faster turnaround with an issue in Polyspace, besides the required system information, provide appropriate code that reproduces the issue or the verification log file.

Provide System Information

When you enter a support request, provide the following system information:

- Hardware configuration
- Operating system
- Polyspace and MATLAB license numbers
- Specific version numbers for Polyspace products
- Installed Bug Report patches

To obtain your configuration information, do one of the following:

- In the Polyspace user interface, select **Help > About**.
- At the command line, run the following command, replacing polyspaceroot with your Polyspace installation folder:
 - UNIX polyspaceroot/polyspace/bin/polyspace-code-prover -ver
 - Windows polyspaceroot\polyspace\bin\polyspace-code-prover -ver

Provide Information About the Issue

Depending on the issue, provide appropriate artifacts to help Technical Support understand and reproduce the issue.

Compilation Errors

If you face compilation issues with your project, see "Troubleshoot Compilation Errors". If you are still having issues, contact technical support with the following information:

The analysis log.

The analysis log is a text file generated in your results folder and titled Polyspace_version_project_date_time.txt. It contains the error message, the options used for the analysis and other relevant information.

• The source files related to the compilation error, if possible.

If you cannot provide the source files:

- Try to provide a screenshot of the source code section that causes the compilation issue.
- Try to reproduce the issue with a different code. Provide that code to technical support.

Errors in Project Creation from Build Systems

If you face errors in creating a project from your build system, see "Troubleshoot Project Creation".

If you are still having issues, contact technical support with debug information. To provide the debug information:

Run polyspace-configure at the command line with the options -debug and build-trace. For instance:

```
polyspace-configure options -debug -build-trace build.txt buildCommand 2>&1 > out.log
```

Here:

- options is the list of polyspace-configure options that you typically use.
- buildCommand is the build command that you use, for instance, make.

Make sure that you do not use the option - verbose or -silent after -debug.

2 Provide the files build.txt and out.log.

Verification Result

If you are having trouble understanding a result, see "Polyspace Bug Finder Results".

If you are still having trouble understanding the result, contact technical support with the following information:

The analysis log.

The analysis log is a text file generated in your results folder and titled Polyspace_version_project_date_time.txt. It contains the options used for the analysis and other relevant information.

The source files related to the result if possible.

If you cannot provide the source files:

- Try provide a screenshot of the relevant source code from the **Source** pane on the Polyspace user interface.
- Try to reproduce the problem with a different code. Provide that code to technical support.

Compiler Not Supported for Project Creation from Build Systems

Issue

Your compiler is not supported for automatic project creation from build commands.

Cause

For automatic project creation from your build system, your compiler configuration must be available to Polyspace. Polyspace provides a compiler configuration file only for certain compilers.

For information on which compilers are supported, see "Requirements for Project Creation from Build Systems" on page 8-21.

Solution

To enable automatic project creation for an unsupported compiler, you can write your own compiler configuration file.

- 1 Copy one of the existing configuration files from *polyspaceroot*\polyspace \configure\compiler_configuration\. Select the configuration that most closely corresponds to your compiler using the mapping between the configuration files and compiler names on page 20-19.
- 2 Save the file as *my_compiler*.xml. *my_compiler* can be a name that helps you identify the file.
 - To edit the file, save it outside the installation folder. After you have finished editing, you must copy the file back to polyspaceroot\polyspace\configure \compiler_configuration\.
- **3** Edit the contents of the file to represent your compiler. Replace the entries between the XML elements with appropriate content.
- 4 After saving the edited XML file to *polyspaceroot*\polyspace\configure \compiler_configuration\, create a project automatically using your build command.

If you see errors, for instance, compilation errors, contact MathWorks Technical Support. After tracing your build command, the software compiles certain files using the compiler specifications detected from your configuration file and build command. Compilation errors might indicate issues in the configuration file.

Tip To quickly see if your compiler configuration file works, run the automatic project setup on a sample build that does not take much time to complete. After you have set up a project with your compiler configuration file, you can use this file for larger builds.

Elements of Compiler Configuration File

The following table lists the XML elements in the compiler configuration file file with a description of what the content within the element represents.

XML Element	Content Description	Content Example for GNU C Compiler
<pre><compiler_names><name> </name><compiler_names></compiler_names></compiler_names></pre>	Name of the compiler executable. This executable transforms your .c files into object files. You can add several binary names, each in a separate <name></name> element. The software checks for each of the provided names and uses the compiler name for which it finds a match. You must not specify the linker binary inside the <name></name> elements. If the name that you specify is present in an existing compiler configuration file, an error occurs. To avoid the error, use the additional option - compiler-config my_compiler.xml when tracing the build so that the software explicitly uses your compiler configuration file.	• gcc • gpp

XML Element	Content Description	Content Example for GNU C Compiler
<pre><include_options><opt> </opt></include_options></pre>	The option that you use with your compiler to specify include folders. To specify options where the argument immediately follows the option, use an isPrefix attribute for opt and set it to true.	-I
<pre><system_include_options> <opt> </opt> </system_include_options></pre>	The option that you use with your compiler to specify system headers. To specify options where the argument immediately follows the option, use an isPrefix attribute for opt and set it to true.	-isystem
<pre><preinclude_options><opt> </opt></preinclude_options></pre>	The option that you use with your compiler to force inclusion of a file in the compiled object. To specify options where the argument immediately follows the option, use an isPrefix attribute for opt and set it to true.	-include

XML Element	Content Description	Content Example for GNU C Compiler
<define_options><opt> </opt></define_options>	The option that you use with your compiler to predefine a macro. To specify options where the argument immediately follows the option, use an isPrefix attribute for opt and set it to true.	-D
<pre><undefine_options><opt> </opt></undefine_options></pre>	The option that you use with your compiler to undo any previous definition of a macro. To specify options where the argument immediately follows the option, use an isPrefix attribute for opt and set it to true.	-U

XML Element	Content Description	Content Example for GNU C Compiler
<pre><semantic_options><opt> </opt></semantic_options></pre>	The options that you use to modify the compiler behavior. These options specify the language settings to which the code must conform. You can use the isPrefix attribute to specify multiple options that have the same prefix and the numArgs attribute to specify options with multiple arguments. For instance: • Instead of <opt>-m32</opt> <opt>-m64</opt> You can write <opt isprefix="true">-m</opt> . • Instead of <opt>-std=c90</opt> <opt>-std=c99</opt> You can write <opt numargs="1">-std</opt> if your makefile uses -std c90 instead of -std=c90, this notation also supports that usage.	+11 • -fun signed - char

XML Element	Content Description	Content Example for GNU C Compiler
<dialect> </dialect>	The Polyspace dialect that corresponds to or closely matches your compiler dialect. The content of this element directly translates to the option Dialect in your Polyspace project or options file. For the complete list of compilers available, see Compiler (-compiler).	gnu4.7
<pre><preprocess_options_list> <opt> </opt> </preprocess_options_list></pre>	The options that specify how your compiler generates a preprocessed file. You can use the macro \$ (OUTPUT_FILE) if your compiler does not allow sending the preprocessed file to the standard output. Instead it defines the preprocessed file internally.	

XML Element	Content Description	Content Example for GNU C Compiler
<pre><preprocessed_output_file> <!-- preprocessed_output_file--></preprocessed_output_file></pre>	The name of file where the preprocessed output is stored. You can use the following macros when the name of the preprocessed output file is adapted from the source file: • \$(SOURCE_FILE): Source file name • \$(SOURCE_FILE_EXT): Source file extension • \$ (SOURCE_FILE_NO_EXT): Source file name without extension For instance, use \$ (SOURCE_FILE_NO_EXT).pre when the preprocessor file name has the same name as the source file, but with extension.pre.	For an example of this element, see the existing compiler configuration file xc8.xml.
<pre><src_extensions><ext> </ext></src_extensions></pre>	The file extensions for source files.	• C • cpp • c++
<pre><obj_extensions><ext> </ext></obj_extensions></pre>	The file extensions for object files.	
<pre><pre><pre><pre></pre></pre></pre></pre>	The file extensions for precompiled headers (if available).	

XML Element	Content Description	Content Example for GNU C Compiler
<pre><polyspace_extra_options_list> <opt> </opt> <pre><opt> </opt> </pre></polyspace_extra_options_list></pre>	Additional options that are used for the subsequent analysis. For instance, to avoid compilation errors in the subsequent analysis due to non-ANSI extension keywords, enter -D keyword=value, for example: <pre> <potypace_extra_options_li< td=""><td>pt></td></potypace_extra_options_li<></pre>	pt>

Mapping Between Existing Configuration Files and Compiler Names

Select the configuration file in *polyspaceroot*\polyspace\configure \compiler_configuration\ that most closely resembles the configuration of your compiler. Use the following table to map compilers to their configuration files.

Compiler Name	Vendor	XML File
ARM®	ARM Keil	armcc.xml
		armclang.xml
Visual C++	Microsoft	cl.xml
Clang	Not applicable	clang.xml
CodeWarrior	NXP	cw_ppc.xml
		cw_s12z.xml
cx6808	Cosmic	cx6808.xml

Compiler Name	Vendor	XML File
Diab	Wind River	diab.xml
gcc	Not applicable	gcc.xml
Green Hills	Green Hills Software	ghs_arm.xml
		ghs_arm64.xml
		ghs_i386.xml
		ghs_ppc.xml
		ghs_rh850.xml
		ghs_tricore.xml
IAR Embedded Workbench	IAR	iar.xml
		iar-arm.xml
		iar-avr.xml
		iar-msp430.xml
		iar-rh850.xml
		iar-rl78.xml
Renesas	Renesas	renesas-rh850.xml
		renesas-rl78.xml
		renesas-rx.xml
TASKING®	Altium	tasking.xml
		tasking-166.xml
		tasking-850.xml
		tasking-arm.xml
Tiny C	Not applicable	tcc.xml
TM320 and its derivatives	Texas Instruments	ti_arm.xml
		ti_c28x.xml
		ti_c6000.xml
		ti_msp430.xml
xc8 (PIC)	Microchip	xc8.xml

Slow Build Process When Polyspace Traces the Build

Issue

In some cases, your build process can run slower when Polyspace traces the build.

Cause

Polyspace caches information in files stored in the system temporary folder, such as C:\Users\User_Name\AppData\Local\Temp, in Windows. Your build can take a long time to perform read/write operations to this folder. Therefore, the overall build process is slow.

Solution

You can work around the slow build process by changing the location where Polyspace stores cache information. For instance, you can use a cache path local to the drive from which you run build tracing. To create and use a local folder ps_cache for storing cache information, use the advanced option -cache-path ./ps cache.

- If you trace your build from the Polyspace user interface, enter this flag in the field **Add advanced configure options**.
- If you trace your build from the DOS/ UNIX or MATLAB command line, use this flag with the polyspace-configure command.

For more information, see polyspace-configure.

Check if Polyspace Supports Build Scripts

Issue

This topic is relevant only if you are creating a Polyspace project in Windows from your build scripts.

When Polyspace traces your build script in a Windows console application other than cmd.exe, the command fails. However, the build command by itself executes to completion.

For instance, your build script executes to completion from the Cygwin shell. However, when Polyspace traces the build, the build script throws an error.

Possible Cause

When you launch a Windows console application, your environment variables are appropriately set. Alternate console applications such as the Cygwin shell can set your environment differently from cmd.exe.

Polyspace attempts to trace your build script with the assumption that the script runs to completion in cmd.exe. Therefore, even if your script runs to completion in the alternate console application, when Polyspace traces the build, the script can fail.

Solution

Make sure that your build script executes to completion in the cmd.exe interface. If the build executes successfully, create a wrapper .bat file around your script and trace this file.

For instance, before you trace a build command that executes to completion in the Cygwin shell, do one of the following:

 Launch the Cygwin shell from cmd.exe and then run your build script. For instance, if you use a script build.sh to build your code, enter the following command at the DOS command line:

```
cmd.exe /C "C:\cygwin64\bin\bash.exe" -c build.sh
```

Find the full path to your build script and then run this script from cmd.exe.

For instance, enter the following command at the DOS command line:

```
cmd.exe /C path to script
```

path_to_script is the full path to your build script. For instance, C:\my_scripts
\build.sh.

If the steps do not execute to completion, Polyspace cannot trace your build.

If the steps complete successfully, trace the build command after launching it from cmd.exe. For instance, on the command-line, do the following to create a Polyspace options file.

1 Enter your build commands in a .bat file.

```
rem @echo off
cmd.exe /C "C:\cygwin64\bin\bash.exe" -c build.sh
```

Name the file, for instance, launching.bat.

2 Trace the build commands in the .bat file and create a Polyspace options file.

"C:\Program Files\MATLAB\R2017b\polyspace\bin\polyspace-configure.exe"
-output-options-file myOptions.txt launching.bat

You can now run polyspace-bug-finder on the options file.

Troubleshooting Project Creation from MinGW Build

Issue

You create a project from a MinGW build, but get an error when running an analysis on the project. The error message comes from using one of these keywords: declspec, __cdecl, __fastcall, __thiscall or __stdcall.

Cause

When you create a project from a MinGW build, the project uses a GNU compiler. Polyspace does not recognize these keywords for the GNU compilers.

Solution

Replace these keywords with equivalent keywords just for the purposes of analysis.

Before analysis, for the option Preprocessor definitions (-D), enter:

 declspec(x)= attribute ((x)) cdecl= attribute ((cdecl)) __fastcall=__attribute__((__fastcall)) • __thiscall=__attribute__((__thiscall)) stdcall= attribute ((stdcall))

If you are running Polyspace on the command line in a UNIX shell, add double quotes around the -D option. For instance, use:

```
"-D cdecl= attribute (( cdecl ))"
```

Troubleshooting Project Creation from Visual Studio Build

In this section...

"Cannot Create Project from Visual Studio Build" on page 20-25

"Compilation Error After Creating Project from Visual Studio Build" on page 20-25

Cannot Create Project from Visual Studio Build

If you are trying to import a Visual Studio 2010 or Visual Studio 2012 project and polyspace-configure does not work properly, do the following:

- 1 Stop the MSBuild.exe process.
- 2 Set the environment variable MSBUILDDISABLENODEREUSE to 1.
- 3 Specify MSBuild.exe with the/nodereuse: false option.
- **4** Restart the Polyspace configuration tool:

polyspace-configure.exe -lang cpp <MSVS path>/msbuild sample.sln

Compilation Error After Creating Project from Visual Studio Build

Issue

After you automatically set up your project from a Visual Studio 2010 build, you face compilation errors.

Possible Cause

By default, Polyspace assigns the latest version of the compiler, visual12.0 to your project. This assignment can cause compilation errors. For more information on the option to specify compilers, see Compiler (-compiler).

Solution

To avoid the errors, do one of the following:

- After automatic project setup:
 - Open the project in the user interface. On the Configuration pane, select Target & Compiler.
 - 2 Check the setting for **Compiler**. If it is set to visual12.0, change it to visual10.

Note If you are creating an options file from your Visual Studio 2010 build, check the -compiler argument. If it is set to visual12.0, change it to visual10.

- Before automatic project setup:
 - Open the file cl.xml in *polyspaceroot*\polyspace\configure \compiler_configuration\ where *polyspaceroot* is your Polyspace installation folder such as C:\Program Files\Polyspace\R2019a.
 - 2 Change the line

```
<dialect>visual12.0</dialect>
```

to

<dialect>visual10</dialect>

3 Create your project or options file. The compiler is already assigned to visual10.

Error Processing Macro with Semicolon in Build System

Issue

You see this error when creating a Polyspace project or options file from your build system:

Could not process macro containing a semicolon

Cause

Some options in your build system use semicolons in the replacement list of a macro. Automatic project creation from build systems does not support this usage. For instance, a macro OK with this replacement list can cause issues:

```
{printf("OK");flush();}
```

The use of semicolons in replacement lists is not supported because a Polyspace project or options file created from your build system itself uses semicolon separators to separate macro definitions. For details on the Polyspace options that define macros, see:

- Preprocessor definitions (-D): This option defines macros.
- -options-for-sources: This option collects several macro definitions, separated by semicolon.

Solution

Define the macro in a header file instead of in the build system. For instance, define the macro OK like this in a header file:

```
#ifdef OK_DEFINED
#undef OK_DEFINED
#define OK {printf("OK");flush();}
#endif
```

Provide the header file only for the purposes of Polyspace analysis using the option Include (-include).

Polyspace Cannot Find the Server

Message

Error: Cannot instantiate Polyspace cluster Check the -scheduler option validity or your default cluster profile | Could not contact an MJS lookup service using the host computer name. The hostname, computer name, could not be resolved.

Possible Cause

Polyspace uses information provided in the preferences of a Polyspace desktop product to locate the server. If this information is incorrect, the software cannot locate the server.

Solution

Open the user interface of the Polyspace desktop product. Check if the server information provided is correct.

- Select **Tools** > **Preferences**.
- 2 Select the **Server Configuration** tab. Check your server information.

For instance, the entry in **Job scheduler host name** must match the host name of the computer that forms the head node of the MATLAB Parallel Server cluster. For more information, see "Install Products for Submitting Polyspace Analysis from Desktops to Remote Server".

Job Manager Cannot Write to Database

Message

Unable to write data to the job manager database

Possible Cause

If the computer that forms the head node of the MATLAB Parallel Server cluster cannot send data to the client computer, you see this error. The most likely reasons for the remote computer being unable to connect to the client computer are:

- Firewalls do not allow traffic from the MATLAB Job Scheduler to the client.
- The MATLAB Job Scheduler cannot resolve the short hostname of the client computer.

Workaround

Add localhost IP to configuration.

- 1 In the user interface of the Polyspace desktop products, select **Tools > Preferences**.
- 2 On the **Server Configuration** tab, in the **Localhost IP address** field, enter the IP address of your local computer.

To retrieve your IP address:

- Windows
 - 1 Open Control Panel > Network and Sharing Center.
 - 2 Select your active network.
 - In the Status window, click **Details**. Your IP address is listed under **IPv4 address**.
- Linux Run the ifconfig command and find the inet addr corresponding to your network connection.
- Mac Open System Preferences > Network.

Undefined Identifier Error

Issue

Polyspace verification fails during the compilation phase with a message about undefined identifiers.

The message indicates that Polyspace cannot find a variable definition. Therefore, it cannot identify the variable type.

Possible Cause: Missing Files

The source code you provided does not contain the variable definition. For instance, the variable is defined in an include file that Polyspace cannot find.

If you #include-d the include file in your source code but did not add it to your Polyspace project, you see a previous warning:

Warning: could not find include file "my_include.h"

Solution

If the variable definition occurs in an include file, add the folder that contains the include file.

- $\bullet\hspace{0.4cm}$ In the user interface of the Polyspace desktop products, add the folder to your project.
 - For more information, see "Add Source Files for Analysis in Polyspace User Interface" on page 1-2.
- At the command line, use the flag -I with the polyspace-bug-finder command.

For more information, see - I.

Possible Cause: Unrecognized Keyword

The variable represents a keyword that your compiler recognizes but is not part of the ANSI C standard. Therefore, Polyspace does not recognize it.

For instance, some compilers interpret $__SP$ as a reference to the stack pointer.

Solution

If the variable represents a keyword that Polyspace does not recognize, replace or remove the keyword from your source code or preprocessed code.

If you remove or replace the keyword from the preprocessed code, you can avoid the compilation error while keeping your source code intact. You can do one of the following:

Replace or remove each individual unknown keyword using an analysis option.
 Replace the compiler-specific keyword with an equivalent keyword from the ANSI C Standard.

For information on the analysis option, see Preprocessor definitions (-D).

• Declare the unknown keywords in a separate header file using #define directives. Specify that header file using an analysis option.

For information on the analysis option, see Include (-include). For a sample header file, see "Gather Compilation Options Efficiently" on page 8-30.

Possible Cause: Declaration Embedded in #ifdef Statements

The variable is declared in a branch of an **#ifdef** macro_name preprocessor directive. For instance, the declaration of a variable max power occurs as follows:

```
#ifdef _WIN32
   #define max_power 31
#endif
```

Your compilation toolchain might consider the macro <code>macro_name</code> as implicitly defined and execute the <code>#ifdef</code> branch. However, the Polyspace compilation might not consider the macro as defined. Therefore, the <code>#ifdef</code> branch is not executed and the variable <code>max_power</code> is not declared.

Solution

To work around the compilation error, do one of the following:

- Use **Target & Compiler** options to directly specify your compiler. For instance, to emulate a Visual C++ compiler, set the **Compiler** to visual12.0. See "Target and Compiler".
- Define the macro explicitly using the option Preprocessor definitions (-D).

Note If you create a Polyspace by tracing your build commands, most **Target & Compiler** options are automatically set.

Possible Cause: Project Created from Non-Debug Build

This can be a possible cause only if the undefined identifier occurs in an assert statement (or an equivalent Visual C++ macro such as ASSERT or VERIFY).

Typically, you come across this error in the following way. You create a Polyspace project from a build system in non-debug mode. When you run an analysis on the project, you face a compilation error from an undefined identifier in an assert statement. You find that the identifier my_identifier is defined in a #ifndef NDEBUG statement, for instance as follows:

```
#ifndef NDEBUG
int my_identifier;
#endif
```

The C standard states that when the NDEBUG macro is defined, all assert statements must be disabled.

Most IDEs define the NDEBUG macro in their build systems. When you build your source code in your IDE in non-debug mode, code in a #ifndef NDEBUG statement is removed during preprocessing. For instance, in the preceding example, my_identifier is not defined. If my_identifier occurs only in assert statements, it is not used either, because NDEBUG disables assert statements. You do not have compilation errors from undefined identifiers and your build system executes successfully.

Polyspace does not disable assert statements even if NDEBUG macro is defined because the software uses assert statements internally to enhance verification.

When you create a Polyspace project from your build system, if your build system defines the NDEBUG macro, it is also defined for your Polyspace project. Polyspace removes code in a #ifndef NDEBUG statement during preprocessing, but does not disable assert statements. If assert statements in your code rely on the code in a #ifndef NDEBUG statement, compilation errors can occur.

In the preceding example:

• The definition of my_identifier is removed during preprocessing.

• assert statements are not disabled. When my_identifier is used in an assert statement, you get an error because of undefined identifier my identifier.

Solution

To work around this issue, create a Polyspace project from your build system in debug mode. When you execute your build system in debug mode, NDEBUG is not defined. When you create a Polyspace project from this build, NDEBUG is not defined for your Polyspace project.

Depending on your project settings, use the option that enables building in debug mode. For instance, if your build system is gcc-based, you can define the DEBUG macro and undefine NDEBUG:

```
gcc -DDEBUG=1 -UNDEBUG *.c
```

Alternatively, you can disable the assert statements in your preprocessed code using the option Preprocessor definitions (-D). However, Polyspace will not be able to emulate the assert statements.

Unknown Function Prototype Error

Issue

During the compilation phase, the software displays a warning or error message about unknown function prototype.

the prototype for function 'myfunc' is unknown

The message indicates that Polyspace cannot find a function prototype. Therefore, it cannot identify the data types of the function argument and return value, and has to infer them from the calls to the function.

To determine the data types for such functions, Polyspace follows the C99 Standard (ISO/IEC 9899:1999, Chapter 6.5.2.2: Function calls).

- The return type is assumed to be int.
- The number and type of arguments are determined by the first call to the function. For
 instance, if the function takes one double argument in the first call, for subsequent
 calls, the software assumes that it takes one double argument. If you pass an int
 argument in a subsequent call, a conversion from int to double takes place.

During the linking phase, if a mismatch occurs between the number or type of arguments or the return type in different compilation units, the analysis follows an internal algorithm to resolve this mismatch and determine a common prototype.

Cause

The source code you provided does not contain the function prototype. For instance, the function is declared in an include file that Polyspace cannot find.

If you **#include**-d the include file in your source code but did not add it to your Polyspace project, you see a previous warning:

Warning: could not find include file "my include.h"

Solution

Search for the function declaration in your source repository.

If you find the function declaration in an include file, add the folder that contains the include file.

- In the user interface of the Polyspace desktop products, add the folder to your project.

 For more information, see "Add Source Files for Analysis in Polyspace User Interface" on page 1-2.
- At the command line, use the flag -I with the polyspace-bug-finder command.
 For more information, see -I.

Error Related to #error Directive

Issue

The analysis stops with a message containing a #error directive. For instance, the following message appears: #error directive: !Unsupported platform; stopping!.

Cause

You typically use the #error directive in your code to trigger a fatal error in case certain macros are not defined. Your compiler implicitly defines the macros, therefore the error is not triggered when you compile your code. However, the default Polyspace compilation does not consider the macros as defined, therefore, the error occurs.

For instance, in the following example, the #error directive is reached only if the macros __BORLANDC__, __VISUALC32__ or __GNUC__ are not defined. If you use a GNU C compiler, for instance, the compiler considers the macro __GNUC__ as defined and the error does not occur. However, if you use the default Polyspace compilation, it does not consider the macros as defined.

```
#if defined(__BORLANDC__) || defined(__VISUALC32__)
#define MYINT int
#elif defined(__GNUC__)
#define MYINT long
#else
#error !Unsupported platform; stopping!
#endif
```

Solution

For successful compilation, do one of the following:

• Specify a compiler such as visual12.0 or gnu4.9. Specifying a compiler defines some of the compilation flags for the analysis.

```
For more information, see Compiler (-compiler).
```

 If the available compiler options do not match your compiler, explicitly define one of the compilation flags __BORLANDC__, __VISUALC32__, or __GNUC__. For more information, see Preprocessor definitions (-D).

Large Object Error

Issue

The analysis stops during compilation with a message indicating that an object is too large.

Cause

The error happens when the software detects an object such as an array, union, structure, or class, that is too big for the pointer size of the selected target.

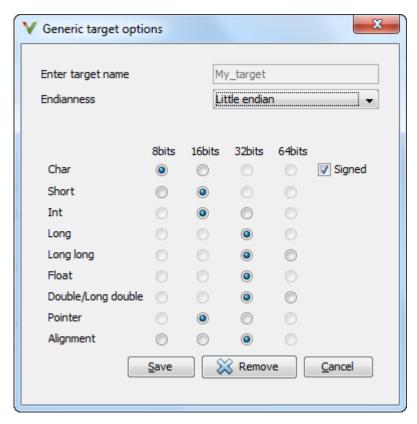

For instance, you get the message, Limitation: struct or union is too large in the following example. You specify a pointer size of 16 bits. The maximum object size allocated to a pointer, and therefore the maximum allowed size for an object, can be 2^{16} -1 bytes. However, you declare a structure as follows:

```
    struct S
        {
                char tab[65536];
        }s;
    struct S
        {
                char tab[65534];
                int val;
        }s;
```

Solution

1 Check the pointer size that you specified through your target processor type. For more information, see Target processor type (-target).

For instance, in the following, the pointer size for a custom target My_target is 16 bits.

2 Change your code or specify a different pointer size.

For instance, you can:

- Declare an array of smaller size in the structure.
 - If you are using a predefined target processor type, the pointer size is likely to be the same as the pointer size on your target architecture. Therefore, your declaration might cause errors on your target architecture.
- Change the pointer size of the target processor type that you specified, if possible.

Otherwise, specify another target processor type with larger pointer size or define your own target processor type. For more information on defining your own processor type, see Generic target options.

Note Polyspace imposes an internal limit of 128 MB on the size of data structures. Even if your target processor type specification allows data structures of larger size, this internal limit constrains the data structure sizes.

Errors Related to Generic Compiler

If you use a generic compiler, you can encounter this issue. For more information, see Compiler (-compiler).

Issue

The analysis stops with an error message related to a non-ANSI C keyword, for instance, data or attributes such as __attribute__((weak)).

Depending on the location of the keyword, the error message can vary. For instance, this line causes the error message: expected a ";".

```
data int tab[10];
```

Cause

The generic Polyspace compiler supports only ANSI C keywords. If you use a language extension, the generic compiler does not recognize it and treats the keyword as a regular identifier.

Solution

Specify your compiler by using the option Compiler (-compiler).

If your compiler is not directly supported or is not based on a supported compiler, you can use the generic compiler. To work around the compilation errors:

- If the keyword is related to memory modelling, remove it from the preprocessed code.
 For instance, to remove the data keyword, enter data= for the option Preprocessor definitions (-D).
- If the keyword is related to an attribute, remove attributes from the preprocessed code. Enter __attribute__(x) = for the option Preprocessor definitions (-D).

If your code has this line:

```
void __attribute__ ((weak)) func(void);
```

And you remove attributes, the analysis reads the line as:

void func(void);

When you use these workarounds, your source code is not altered.

Errors Related to Keil or IAR Compiler

If you use the compiler, Keil or IAR, you can encounter this issue. For more information, see Compiler (-compiler).

Missing Identifiers

Issue

The analysis stops with the error message, expected an identifier, as if an identifier is missing. However, in your source code, you can see the identifier.

Cause

If you select Keil or IAR as your compiler, the software removes certain keywords during preprocessing. If you use these keywords as identifiers such as variable names, a compilation error occurs.

For a list of keywords that are removed, see "Supported Keil or IAR Language Extensions" on page 8-24.

Solution

Specify that Polyspace must not remove the keywords during preprocessing. Define the macros __PST_KEIL_NO_KEYWORDS__ or __PST_IAR_NO_KEYWORDS__.

For more information, see Preprocessor definitions (-D).

Errors Related to Diab Compiler

If you choose diab for the option Compiler (-compiler), you can encounter this issue.

Issue

During Polyspace analysis, you see an error related to a keyword specific to the Diab compiler. For instance, you see an error related to the restrict keyword.

Cause

You typically use a compiler flag to enable the keyword. The Polyspace analysis does not enable these keywords by default. You have to make Polyspace aware of your compiler flags.

The Polyspace analysis does not enable these keywords by default to prevent compilation errors. Another user might not enable the keyword and instead use the keyword name as a regular identifier. If Polyspace treats the identifier as a keyword, a compilation error will occur.

Solution

Use the command-line option -compiler-parameter in your Polyspace analysis as follows. You use this command-line option to make Polyspace aware of your compiler flags. In the user interface of the Polyspace desktop products, you can enter the command-line option in the field Other. You can enter the option multiple times.

The argument of -compiler-parameter depends on the keyword that causes the error. Once you enable the keyword, do not use the keyword name as a regular identifier. For instance, once you enable the keyword pixel, do not use pixel as a variable name. The statement int pixel = 1 causes a compilation error.

• restrict keyword:

You typically use the compiler flag -Xlibc-new or -Xc-new. For your Polyspace analysis, use

-compiler-parameter -Xc-new

The following code will not compile with Polyspace unless you specify the compiler flag.

```
int sscanf(const char *restrict, const char *restrict, ...);
```

PowerPC AltiVec vector extensions such as the vector type qualifier:

```
You typically use the compiler flag -tPPCALLAV:. For your Polyspace analysis, use -compiler-parameter -tPPCALLAV:
```

The following code will not compile with Polyspace unless you specify the compiler flag.

```
vector unsigned char vbyte;
vector bool vbool;
vector pixel vpx;
int main(int argc, char** argv)
{
   return 0;
}
```

Extended keywords such as pascal, inline, packed, interrupt, extended, __X, __Y, vector, pixel, bool and others:

You typically use the compiler flag -Xkeywords=. For your Polyspace analysis, use -compiler-parameter -Xkeywords=0xFFFFFFF

The following code will not compile with Polyspace unless you specify the compiler flag.

```
packed(4) struct s2_t {
    char b;
    int i;
} s2;

packed(4,2) struct s3_t {
    char b;
} s3;

int pascal foo = 4;

int main(int argc, char** argv) {
    foo++;
```

```
return 0;
}
```

Errors Related to Green Hills Compiler

If you choose greenhills for the option Compiler (-compiler), you encounter this issue.

Issue

During Polyspace analysis, you see an error related to vector data types specific to Green Hills target rh850. For instance, you see an error related to identifier ev64 u16 .

Cause

When compiling code using the Green Hills compiler with target rh850, to enable single instruction multiple data (SIMD) vector instructions, you specify two flags:

- rh850 simd: You enable intrinsic functions that support SIMD vector instructions. The functions are defined in your compiler header files. These data types are available:
 - ev64 u16
 - _ev64_s16__
 - ev64 u32
 - _ev64_s32__
 - ev64 u64
 - ev64 s64
 - ev64_opaque___
 - ev128_opaque___
- -rh850 fpsimd: You enable intrinsic functions that support floating-point SIMD vector instructions. The functions are defined in your compiler header files. These data types are available:
 - ev128 f32
 - ev256_f32__

The Polyspace analysis does not enable SIMD support by default. You must identify your compiler flags to Polyspace.

Solution

In your Polyspace analysis, use the command-line option -compiler-parameter. In the user interface, you can enter the command-line option in the Other field, under the **Advanced Settings** in the **Configuration** pane.

- -rh850 simd: For your Polyspace analysis, use
 - -compiler-parameter -rh850 simd
- -rh850_fpsimd: For your Polyspace analysis, use
 - -compiler-parameter -rh850_fpsimd

Note

- __ev128_opaque__ is 16 bytes aligned in Polyspace.
- __ev256_f32__ is 32 bytes aligned in Polyspace.

Errors Related to TASKING Compiler

If you choose tasking for the option Compiler (-compiler), you can encounter this issue.

Issue

During Polyspace analysis, you see an error related to a Special Function Register data type.

Cause

When compiling with the TASKING compiler, you typically use the following compiler flags to specify where Special Function Register (SFR) data types are declared:

- --cpu=xxx: The compiler implicitly #includes the file sfr/regxxx.sfr in your source files. Once #include-ed, you can use Special Function Registers (SFR-s) declared in that .sfr file.
- --alternative-sfr-file: The compiler uses an alternative SFR file instead of the regular SFR file. You can use Special Function Registers (SFR-s) declared in that alternative SFR file.

If you specify the TASKING compiler for your Polyspace analysis, the analysis makes the following assumptions about these compiler flags:

--cpu=xxx: The analysis chooses a specific value of xxx. If you use a different value
with your TASKING compiler, you can encounter an error during Polyspace analysis.

The xxx value that the Polyspace analysis uses depends on your choice of Target processor type (-target):

• tricore: tc1793b

c166: xc167cirh850: r7f701603

arm: ARMv7M

• --alternative-sfr-file: The analysis assumes that you do not use an alternative SFR file. If you use one, you can encounter an error.

Solution

Use the command-line option -compiler-parameter in your Polyspace analysis as follows. You use this command-line option to make Polyspace aware of your compiler flags. In the user interface, you can enter the command-line option in the field Other. You can enter the option multiple times.

- -- cpu=xxx: For your Polyspace analysis, use
 - -compiler-parameter --cpu=xxx

Here, xxx is the value that you use when compiling with your compiler.

- --alternative-sfr-file: For your Polyspace analysis, use
 - -compiler-parameter --alternative-sfr-file

If you still encounter an error because Polyspace is not able to locate your .asfr file, explicitly #include your .asfr file in the preprocessed code using the option Include (-include).

Typically, the path to the file is Tasking_C166_INSTALL_DIR\include\sfr \regCPUNAME.asfr. For instance, if your TASKING compiler is installed in C:\Program Files\Tasking\C166-VX_v4.0rl\ and you use the CPU-related flag -Cxc2287m_104f or --cpu=xc2287m_104f, the path is C:\Program Files \Tasking\C166-VX v4.0rl\include\sfr\regxc2287m.asfr.

You can also encounter the same issue with alternative sfr files when you trace your build command. For more information, see "Requirements for Project Creation from Build Systems" on page 8-21.

Errors from Conflicts with Polyspace Header Files

Issue

You see compilation errors from header files included by Polyspace.

For instance, the error message refers to one of the subfolders of *polyspaceroot* \polyspace\verifier\cxx\include.

Typically, the error message is related to a standard library function.

Cause

If your compiler defines a standard library function or another construct and you do not provide the path to your compiler header files, Polyspace uses its own implementation of the function.

If your compiler definitions differ from the corresponding Polyspace definitions, the verification stops with an error.

Solution

Specify the folder containing your compiler header files.

- In the user interface, add the folder to your project.
 - For more information, see "Add Source Files for Analysis in Polyspace User Interface" on page 1-2.
- At the command line, use the flag -I with the polyspace-bug-finder command.

For more information, see - I.

For compilation with GNU C on UNIX-based platforms, use /usr/include. On embedded compilers, the header files are typically in a subfolder of the compiler installation folder. Examples of include folders are given for some compilers.

- Wind River Diab: For instance, /apps/WindRiver/Diab/5.9.4/diab/5.9.4.8/include/.
- IAR Embedded Workbench: For instance, C:\Program Files\IAR Systems \Embedded Workbench 7.5\arm\inc.

• Microsoft Visual Studio: For instance, C:\Program Files\Microsoft Visual Studio 14.0\VC\include.

Consult your compiler documentation for the path to your compiler header files. Alternatively, see "Provide Standard Library Headers for Polyspace Analysis" on page 8-19.

Errors from Assertion or Memory Allocation Functions

Issue

Polyspace uses its own implementation of standard library functions for more efficient analysis. If you redefine a standard library function and provide the function body to Polyspace, the analysis uses your definition.

However, for certain standard library functions, Polyspace continues to use its own implementations, even if you redefine the function and provide the function body. The functions include assert and memory allocation functions such as malloc, calloc and alloca.

You see a warning message like the following:

Body of routine "malloc" was discarded.

Cause

These functions have special meaning for the Polyspace analysis, so you are not allowed to redefine them. For instance:

- The Polyspace implementation of the malloc function allows the software to check if memory allocated using malloc is freed later.
- The Polyspace implementation of assert is used internally to enhance analysis.

Solution

Unless you particularly want your own redefinitions to be used, ignore the warning. The analysis results are based on Polyspace implementations of the standard library function, which follow the original function specifications.

If you want your own redefinitions to be used and you are sure that your redefined function behaves the same as the original function, rename the functions. You can rename the function only for the purposes of analysis using the option Preprocessor definitions (-D). For instance, to rename a function malloc to my malloc, use malloc=my malloc for the option argument.

Error from Special Characters

Issue

Your file or folder names contain extended ASCII characters, such as accented letters or Kanji characters. You face file access errors during analysis. Error messages you might see include:

- No source files to analyze
- Control character not valid
- Cannot create directory Folder_Name

Cause

Polyspace does not fully support these characters. If you use extended ASCII in your file or folder names, your Polyspace analysis may fail due to file access errors.

Workaround

Change the unsupported ASCII characters to standard US-ASCII characters.

Errors from In-Class Initialization (C++)

When a data member of a class is declared static in the class definition, it is a static member of the class. You must initialize static data members outside the class because they exist even when no instance of the class has been created.

```
class Test
public:
    static int m_number = 0;
};
Error message:
Error: a member with an in-class initializer must be const
Corrected code:
```

in file Test.h in file Test.cpp class Test int Test::m number = 0; public: static int m_number; };

Errors from Double Declarations of Standard Template Library Functions (C++)

Consider the following code.

```
#include <list>
void f(const std::list<int*>::const_iterator it) {}
void f(const std::list<int*>::iterator it) {}
void g(const std::list<int*>::const_reverse_iterator it) {}
void g(const std::list<int*>::reverse_iterator it) {}
```

The declared functions belong to list container classes with different iterators. However, the software generates the following compilation errors:

```
error: function "f" has already been defined error: function "g" has already been defined
```

You would also see the same error if, instead of list, the specified container was vector, set, map, or deque.

To avoid the double declaration errors, do one of the following:

- Deactivate automatic stubbing of standard template library functions. For more information, see No STL stubs (-no-stl-stubs).
- Define the following Polyspace preprocessing directives:
 - _PST_STL_LIST_CONST_ITERATOR_DIFFER_ITERATOR__
 - __PST_STL_VECTOR_CONST_ITERATOR_DIFFER_ITERATOR__
 - _PST_STL_SET_CONST_ITERATOR_DIFFER_ITERATOR__
 - PST STL MAP CONST ITERATOR DIFFER ITERATOR
 - __PST_STL_DEQUE_CONST_ITERATOR_DIFFER_ITERATOR__

For example, for the given code, run analysis at the command line with the following flag. The flag defines the appropriate directive for the list container.

```
-D __PST_STL_LIST_CONST_ITERATOR_DIFFER_ITERATOR__
```

For more information on defining preprocessor directives, see Preprocessor definitions (-D).

Errors Related to GNU Compiler

If you choose gnu for the option Compiler (-compiler), you can encounter this issue.

Issue

The Polyspace analysis stops with a compilation error.

Cause

You are using certain advanced compiler-specific extensions that Polyspace does not support. See "Limitations".

Solution

For easier portability of your code, avoid using the extensions.

If you want to use the extensions and still analyze your code, wrap the unsupported extensions in a preprocessor directive. For instance:

```
#ifdef POLYSPACE
    // Supported syntax
#else
    // Unsupported syntax
#endif
```

For regular compilation, do not define the macro POLYSPACE. For Polyspace analysis, enter POLYSPACE for the option Preprocessor definitions (-D).

If the compilation error is related to assembly language code, use the option <code>-asm-begin-asm-end</code>.

Errors Related to Visual Compilers

The following messages appear if the compiler is based on a Visual compiler. For more information, see Compiler (-compiler).

Import Folder

When a Visual application uses #import directives, the Visual C++ compiler generates a header file with extension .tlh that contains some definitions. To avoid compilation errors during Polyspace analysis, you must specify the folder containing those files.

Original code:

#include "stdafx.h"

```
#include <comdef.h>
#import <MsXml.tlb>
MSXML::_xml_error e ;
MSXML::DOMDocument* doc ;
int _tmain(int argc, _TCHAR* argv[])
{
    return 0;
}
Error message:
"../sources/ImportDir.cpp", line 7: catastrophic error: could not open source file "./MsXml.tlh"
```

The Visual C++ compiler generates these files in its "build-in" folder (usually Debug or Release). In order to provide those files:

• Build your Visual C++ application.

#import <MsXml.tlb>

• Specify your build folder for the Polyspace analysis.

pragma Pack

Using a different value with the compile flag (#pragma pack) can lead to a linking error message.

Original code:

test1.cpp	type.h	test2.cpp
<pre>#pragma pack(4)</pre>	struct A {	<pre>#pragma pack(2)</pre>
<pre>#include "type.h"</pre>	char c ; int i ; } ;	<pre>#include "type.h"</pre>

Error message:

To continue the analysis, use the option Ignore pragma pack directives (-ignore-pragma-pack).

C++/CLI

Polyspace does not support Microsoft C++/CLI, a set of language extensions for .NET programming.

You can get errors such as:

```
error: name must be a namespace name
using namespace System;
Or:
error: expected a declaration
public ref class Form1 : public System::Windows::Forms::Form
```

Eclipse Java Version Incompatible with Polyspace Plug-in

In this section...

"Issue" on page 20-61

"Cause" on page 20-61

"Solution" on page 20-61

Issue

After installing the Polyspace plug-in for Eclipse, when you open the Eclipse or Eclipse-based IDE, you see this error message:

Java 7 required, but the current java version is 1.6. You must install Java 7 before using Polyspace plug in.

You see this message even if you install Java 7 or higher.

Cause

Despite installing Java 7 or higher, the Eclipse or Eclipse-based IDE still uses an older version.

Solution

Make sure that the Eclipse or Eclipse-based IDE uses the compatible Java version.

Open the executable_name.ini file that occurs in the root of your Eclipse installation folder.

If you are running Eclipse, the file is eclipse.ini.

2 In the file, just before the line -vmargs, enter:

```
-vm
java_install\bin\javaw.exe
```

Here, <code>java_install</code> is the Java installation folder.

For instance, your product installation comes with the required Java version for certain platforms. You can force the Eclipse or Eclipse-based IDE to use this version. In your .ini file, enter the following just before the line -vmargs:

-vm
polyspaceroot\sys\java\jre\arch\jre\bin\javaw.exe

Here, polyspaceroot is your product installation folder, for instance, C:\Program Files\Polyspace\R2019a\ and arch is win32 or win64 depending on the product platform. Note that -vm and the path to javaw.exe must be on separate lines.

Coding Standard Violations Not Displayed

Issue

You expect a coding rule violation on a line of code but the Polyspace analysis does not show the violation.

Possible Cause: Rule Checker Not Enabled

You might be looking for a reduced subset of coding rules.

For instance, if you check for MISRA C: 2012 rules, by default, the analysis looks for the mandatory-required subset only.

Solution

Check the coding rules options that you use. See:

- Check MISRA C:2004 (-misra2)
- Check MISRA C:2012 (-misra3)
- Check MISRA C++:2008 (-misra-cpp)
- Check JSF AV C++ rules (-jsf-coding-rules)

Possible Cause: Rule Violations in Header Files

All coding rule violations in the file might be suppressed.

For instance, by default, coding rule violations are suppressed from header files that are not in the same location as the source files.

Solution

Check the files where you suppress coding rule violations. See Do not generate results for (-do-not-generate-results-for).

Possible Cause: Rule Violations in Macros

The rule violation occurs in a macro expansion. To save you from reviewing the same violation multiple times, the violation is shown on the macro definition instead of the

macro usage. If the definition occurs in a header file, it might be suppressed from the results.

On the **Source** pane, you can tell if a line contains a macro expansion. Look for the ${}^{{}_{\!\!{M}}}$ icon.

Solution

Find the macro definition and see if it occurs in a header file. Determine if you are suppressing coding rule violations from header files. See Do not generate results for (-do-not-generate-results-for).

Possible Cause: Compilation Errors

If any source file in the analysis does not compile, coding rules checking will be incomplete. The coding rules checker results:

- May not contain full results for files that did not compile
- May not contain full results for the files that did compile as some rules are checked only after compilation is complete

Check for compilation errors. See "View Error Information When Analysis Stops" on page 20-4.

Note When you enable the Compilation Assistant *and* coding rules checking, the software does not report coding rule violations if there are compilation errors.

Possible Cause: Code Prover Analysis with Lower Verification Level

If you run a Code Prover analysis to source compliance checking using the option Verification level (-to), you might not see violations of some rules. These rules are checked in the later stages of a Code Prover analysis.

This reasoning applies to specific rules and does not apply to a Bug Finder analysis. See "Check for Coding Standard Violations" on page 11-2.

Solution

If you do not see a violation of one of those rules, check if your Code Prover analysis runs up to source compliance checking only. Use a higher value for the option Verification level (-to).

Insufficient Memory During Report Generation

Message

```
Exporting views...
Initializing...
Polyspace Report Generator
Generating Report
.....
    Converting report
Opening log file: C:\Users\auser\AppData\Local\Temp\java.log.7512
Document conversion failed
.....
Java exception occurred:
java.lang.OutOfMemoryError: Java heap space
```

Possible Cause

During generation of very large reports, the software can sometimes indicate that there is insufficient memory.

Solution

If this error occurs, try increasing the Java heap size. The default heap size in a 64-bit architecture is 1024 MB.

To increase the size:

- 1 Navigate to *polyspaceroot*\polyspace\bin*architecture*. Where:
 - *polyspaceroot* is the installation folder.
 - architecture is your computer architecture, for instance, win32, win64, etc.
- 2 Change the default heap size that is specified in the file, java.opts. For example, to increase the heap size to 2 GB, replace 1024m with 2048m.
- If you do not have write permission for the file, copy the file to another location. After you have made your changes, copy the file back to polyspaceroot\polyspace\bin\architecture\.

Error or Slow Runs from Disk Defragmentation and Antivirus Software

Issue

In some cases, anti-virus software checks can noticeably slow down a Polyspace analysis. This reduction occurs because the software checks the temporary files produced by the Polyspace analysis.

You see noticeably slow analysis for a simple project or the analysis stops with an error message like the following:

```
Some stats on aliases use:
 Number of alias writes:
                           22968
 Number of must-alias writes: 3090
 Number of alias reads:
 Number of invisibles:
                           949
Stats about alias writes:
 biggest sets of alias writes: fool:a (733), foo2:x (728), foo1:b (728)
 procedures that write the biggest sets of aliases: fool (2679), foo2 (2266),
                                                      foo3 (1288)
**** C to intermediate language translation - 17 (P_PT) took 44real, 44u + 0s (1.4gc)
exception SysErr(0S.SysErr(name="Directory not empty", syserror=notempty)) raised.
unhandled exception: SysErr: No such file or directory [noent]
______
--- Verifier has encountered an internal error.
--- Please contact your technical support.
```

Possible Cause

A disk defragmentation tool or anti-virus software is running on your machine.

After starting an analysis, check the processes running and see if an anti-virus process is causing large amount of CPU usage (and possibly memory usage).

Solution

Try:

- Stopping the disk defragmentation tool.
- Deactivating the anti-virus software. Or, configuring exception rules for the anti-virus software to allow Polyspace to run without a failure.

For instance, you can try the following:

Configure the anti-virus software to whitelist the Polyspace executables.

For instance, in Windows, with the anti-virus software Windows Defender, you can add an exclusion for the Polyspace installation folder C:\Program Files \Polyspace\R2019a, in particular, the .exe files in the subfolder polyspace \bin and the .exe files starting with ps_ in the subfolder bin\win64.

Configure the anti-virus software to exclude your temporary folder, for example,
 C:\Temp, from the checking process.

See "Storage of Temporary Files" on page 1-15.

SQLite I/O Error

Issue

When you try to run Polyspace, you get this error message:

Cause

Polyspace uses an SQLite database for storing results. This error can appear when SQLite databases are saved on NFS (Network File System) folders.

Solution

Check the folder where you save Polyspace results. For instance, if you run Polyspace at the command line, check the option -results-dir.

If the folder is an NFS folder, use a local folder instead.

Errors with Temporary Files

Polyspace produces some temporary files during analysis. The following issues are related to storage of temporary files.

No Access Rights

When running verification, you get an error message that Polyspace could not create a folder for writing temporary files. For instance, the error message can be as follows:

Unable to create folder "C:\Temp\Polyspace\foldername

Cause

Polyspace produces some temporary files during analysis. If you do not have write permissions for the folder used to store the files, you can encounter the error.

Solution

There are two possible solutions to this error:

- Change the permissions of your temporary folder so you have full read and write privileges.
 - To learn how Polyspace determines the temporary folder location, see "Storage of Temporary Files" on page 1-15.
- Use the option -tmp-dir-in-results-dir. Instead of the standard temporary folder, Polyspace uses a subfolder of the results folder.

No Space Left on Device

When running verification, you get an error message that there is no space on a device.

Cause

If you do not have sufficient space on for the folder used to store the files, you can encounter the error.

Solution

There are two possible solutions to this error:

- Change the temporary folder to a drive that has enough disk space.
 - To learn how Polyspace determines the temporary folder location, see "Storage of Temporary Files" on page 1-15.
- Use the option -tmp-dir-in-results-dir. Instead of the standard temporary folder, Polyspace uses a subfolder of the results folder.

Cannot Open Temporary File

When running verification, you get an error message that Polyspace could not open a temporary file.

Cause

You defined the path for storing temporary files by using the environment variable RTE_TMP_DIR. You either used a relative path for the temporary folder, the folder does not exist or you do not have access rights to the folder.

Solution

There are two possible solutions to this error:

- Instead of defining a temporary folder specific to Polyspace through RTE_TMP_DIR, use a standard temporary folder.
 - To learn how Polyspace determines the temporary folder location, see "Storage of Temporary Files" on page 1-15.
- If you continue to use RTE_TMP_DIR, make sure you specify an absolute path to an existing folder and you have access rights to the folder.
