MBC Model Fitting

Create experimental designs and statistical models for model-based calibration

Description

The **MBC Model Fitting** app enables you to create experimental designs, fit statistical models to engine data, and export the models to generate optimal calibrations in MBC Optimization app. You can also export models to MATLAB® and Simulink® to reuse statistical models for control design, hardware-in-the-loop testing, or powertrain simulation.

Open the MBC Model Fitting App

- MATLAB Toolstrip: On the **Apps** tab, under **Automotive**, click the app icon.
- MATLAB command prompt: Enter mbcmodel.

Examples

- "Model Set Up"
- "Multi-Injection Diesel Calibration"
- "Gasoline Engine Calibration"
- "Model Export to MATLAB, Simulink, and CAGE"

Programmatic Use

mbcmodel opens the Model Browser or brings an existing Model Browser to the front of the screen.

mbcmodel fileName.mat opens the Model Browser and loads the file specified by fileName.mat.

- "Gasoline Engine Calibration"
- "Model Export to MATLAB, Simulink, and CAGE"

MBC Optimization

Generate optimal lookup tables for model-based calibration

Description

The **MBC Optimization** app lets you use statistical models created in MBC Model Fitting app to generate optimal calibrations for lookup tables that control engine functions. You can generate calibrations and lookup tables for complex, high-degree-of-freedom engines to identify the optimal balance of engine performance, emissions, and fuel economy.

Open the MBC Optimization App

- MATLAB Toolstrip: On the **Apps** tab, under **Automotive**, click the app icon.
- MATLAB command prompt: Enter cage.

Examples

- "Calibration Setup"
- "Optimization"
- "Feature Calibration"
- "Tradeoff Calibration"

Programmatic Use

cage opens the CAGE Browser or brings an existing CAGE Browser to the front of the screen. CAGE stands for Calibration Generation.

cage fileName.cag opens the CAGE Browser and loads the file specified by fileName.

- "Tradeoff Calibration"

ActiveInputs

Active boundary model inputs

Syntax

B.ActiveInputs = [X]

Description

ActiveInputs is a property of mbcboundary. Model.

B.ActiveInputs = [X] sets the active inputs for the boundary model. X is a logical row vector indicating which inputs to use to fit a boundary. You can build boundary models using subsets of input factors and then combine them for the most accurate boundary. This approach can provide more effective results than including all inputs.

Examples

To make a boundary model using only the first two inputs:

B.ActiveInputs = [true true false false];

Introduced in R2009b

Add

Add boundary model to tree and fit to test plan data

Syntax

```
B = Add(Tree,B)
B = Add(Tree,B,InBest)
```

Description

This is a method of mbcboundary. Tree.

B = Add(Tree, B) adds the boundary model to the tree and fits the boundary model to the test plan data. Tree is an mbcboundary. Tree object, B is a new boundary model object. The boundary model must have the same inputs as the boundary tree. The boundary model is always fitted when you add it to the boundary tree. This fitting ensures that the fitting data is compatible with the test plan data. The method returns the fitted boundary model.

B = Add(Tree,B,InBest) adds and fits the boundary model, and InBest specifies whether to include the boundary model in the best boundary model for the boundary tree. By default, the best model includes the new boundary model.

See Also

Update | Remove | CreateBoundary

Introduced in R2009b

AddConstraint

Add design constraint

Syntax

D = AddConstraint(D,c)

Description

AddConstraint is a method of mbcdoe.design.

D = AddConstraint(D,c) adds constraint c to the design. You must call AddConstraint to apply the constraint and remove points outside the constraint.

If c is a boundary model, AddConstraint also converts the boundary model object to a mbcdoe.designconstraint object.

See Also

CreateConstraint

Introduced in R2008a

AddDesign

Add design to test plan

Syntax

```
D = AddDesign(T,D)
D = AddDesign(T,Level,D)
D = AddDesign(T,Level,D,Parent)
```

Description

AddDesign is a method of mbcmodel.testplan.

```
D = AddDesign(T, D) adds a design to test plan T.
```

D = AddDesign(T, Level, D) adds a design and specifies the level.

D = AddDesign(T, Level, D, Parent) adds a child design.

D is the array of designs to be added to the test plan, T.

Level is the test plan level. By default the level is the outer level (i.e., Level 1 for One-stage, Level 2 (global) for Two-stage).

Parent is the parent design in the design tree. By default designs are added to the top level of the design tree. See Designs for more information on the design tree.

In order to ensure that the design names are unique in the test plan, the design name will be changed when adding a design to a test plan if a design of the same name already exists. The array of designs with modified names is an output.

Examples

To add three designs to the test plan global (2) level:

```
D = AddDesign(TP, [sfDesign, parkedCamsDesign, mainDesign])
```

See Also

UpdateDesign | RemoveDesign | FindDesign

Introduced in R2008a

AddFilter

Add user-defined filter to dataset

Syntax

```
D = AddFilter(D, expr)
```

Description

This is a method of mbcmodel.data.

A filter is a constraint on the dataset used to exclude some records. You define the filter using logical operators or a logical function on the existing variables.

D is the mbcmodel.data object you want to filter.

expr is an input character vector holding the expression that defines the filter.

Examples

```
AddFilter(D, 'AFR < AFR_CALC + 10');
```

The effect of this filter is to keep all records where AFR < AFR CALC +10.

```
AddFilter(D, 'MyFilterFunction(AFR, RPM, TQ, SPK)');
```

The effect of this filter is to apply the function MyFilterFunction using the variables AFR, RPM, TQ, SPK.

All filter functions receive an nx1 vector for each variable and must return an nx1 logical array out. In that array, true (or 1) indicates a record to keep, and false (or 0) indicates a record to discard.

See Also

ModifyFilter | RemoveFilter | Filters | AddTestFilter | ModifyTestFilter

AddTestFilter

Add user-defined test filter to dataset

Syntax

```
D = AddTestFilter(D, expr)
```

Description

This is a method of mbcmodel.data.

A test filter is a constraint on the dataset used to exclude some entire tests. You define the test filter using logical operators or functions on the existing variables.

D is your data object.

expr is the input character vector holding the definition of the new test filter.

Examples

```
AddTestFilter(d1, 'any(n>1000)');
```

The effect of this filter is to include all tests in which all records have speed (n) greater than 1000.

Similar to filters, test filter functions are iteratively evaluated on each test, receiving an $n \times 1$ vector for each variable input in a test, and must return an 1×1 logical array out. In that array, true (or 1) indicates a record to keep, and false (or 0) indicates a test to discard.

```
AddTestFilter(data, 'length(LOGNO) > 6');
```

The effect of this filter is to include all tests with more than 6 records.

See Also

ModifyTestFilter | RemoveTestFilter | TestFilters | AddFilter

AddVariable

Add user-defined variable to dataset

Syntax

```
D = AddVariable(D, expr, units)
```

Description

This is a method of mbcmodel.data.

You can define new variables in terms of existing variables. Note that variable names are case sensitive.

D is your data object.

expr is the input character vector holding the definition of the new variable.

units is an optional input character vector holding the units of the variable.

Examples

```
AddVariable(D, 'MY_NEW_VARIABLE = TQ*AFR/2');
AddVariable(D, 'funcVar = MyVariableFunction(TQ, AFR, RPM)',
'lb');
AddVariable(D, 'TQ=tq');
```

The last example could be useful if the signal names in the data do not match the model input factor names in the test plan template file.

See Also

ModifyVariable | RemoveVariable | UserVariables

AliasMatrix

Alias matrix for linear model parameters

Syntax

A = M.AliasMatrix

Description

This is a method of mbcmodel.linearmodel.

A = M.AliasMatrix calculates the alias matrix for the linear model parameters (where M is a linear model).

Examples

A = AliasMatrix(knot_model)

See Also

ParameterStatistics

Introduced in R2007a

AlternativeModelStatistics

Summary statistics for alternative models

Syntax

S = AlternativeModelStatistics(R)

S = AlternativeModelStatistics(R, Name)

Description

This is a method of all model objects: mbcmodel.hierarchicalresponse, mbcmodel.localresponse and mbcmodel.response.

This returns an array (S) of summary statistics of all the alternative model fits, to be used to select the best model. These are the summary statistics seen in the list view at the bottom of the Model Browser GUI in any model view.

You must use CreateAlternativeModels before you can compare the alternative responses using AlternativeModelStatistics. Then use ChooseAsBest.

R is the model object whose alternative response models you want to compare. R could be a local (L), response feature (R) or hierarchical response (HR) model.

S is a structure containing Statistics and Names fields.

- S.Statistics is a matrix of size (number alternative responses x number of statistics).
- S.Names is a cell array containing the names of all the statistics.

The available statistics vary according to what kind of parent model (two-stage, local, response feature or response) produced the alternative models, and include PRESS RMSE, RMSE, and Two-Stage RMSE.

All the available statistics are calculated unless you specify which you want. You can specify only the statistics you require using the following form:

S = AlternativeModelStatistics(R, Name)

This returns a double matrix containing only the statistics specified in Name.

Note that you use SummaryStatistics to examine the fit of the current model, and AlternativeModelStatistics to examine the fit of several alternative child models.

Examples

S = AlternativeModelStatistics(R);

See Also

CreateAlternativeModels | SummaryStatistics | ChooseAsBest

Alternative Responses

Array of alternative responses for this response

Syntax

altR = R.AlternativeResponses

Description

This is a property of the response model object, mbcmodel.response (R).

It returns a list of alternative responses used for one-stage or response feature models.

Examples

```
R = testplan.Responses;
TQ = R(1);
AR = TQ.AlternativeResponses;
```

See Also

LocalResponses | ResponseFeatures(Local Response)

Append

Append data to dataset

Syntax

```
D = Append(D, otherData)
```

Description

This is a method of mbcmodel.data.

You can use this to add new data to your existing dataset, D.

otherData is the input argument holding the extra data to add below the existing data. This argument can either be an mbcmodel.data object or a double array. The behavior is different depending on the type.

If otherData is an mbcmodel.data object then Append will look for common SignalNames between the two sets of data. If no common SignalNames are found then a error will be thrown. Any common signals will be Appended to the existing data and other signals will be filled with NaN.

If otherData is a double array then it must have exactly the same number of columns as there are SignalNames in the data, and a simple vertcat (vertical concatenation) is applied between the existing data and otherData.

Examples

```
Append(D, CreateData('aDataFile.xls'));
Append(D, rand(10,100));
```

See Also

CreateData

AttachData

Attach data from project to test plan

Syntax

newD = AttachData(T, D, Property1, Value, Property2, Value...)

Description

This is a method of mbcmodel.testplan. Use it to attach the data you want to model to the test plan.

T is the test plan object, D is the data object.

The following table shows the valid properties and their corresponding possible values. The first five are optional property/value pairs to control how the data is matched to a design. These are the settings shown in the last page of the Data Wizard (if there is a design) in the Model Browser. For more information on the meaning of these settings, refer to the Data Wizard section (under Data) in the *Model Browser User's Guide*.

The usedatarange property changes the test plan input ranges to the range of the data.

Note If the testplan has responses set up the models are fitted when you attach data.

Property	Value	Default
unmatcheddata	{'all', 'none'}	'all'
moredata	{'all', 'closest'}	'all'
moredesign	{'none', 'closest'}	'none'
tolerances	[1xNumInputs double]	ModelRange/20
usedatarange	logical	false

When you attach data to a test plan the Name property of the test plan inputs is used to select data channels. If the Name is empty then the Symbol is used as the Name. If the Name does not exist in the dataset, an error is generated.

When a test plan has data attached, it is only possible to change the symbols, ranges or nonlinear transforms of the test plan inputs.

Examples

To use all the data in DATA in the test plan TESTPLAN and set the input ranges to the data range:

```
newD = AttachData(TESTPLAN, DATA, 'usedatarange', true);
```

To match data DATA to the best design in testplan TESTPLAN within specified tolerances:

```
tol = [0.075, 100, 1, 2];
unmatch = 'all';
moredata = 'all';
moredes = 'none';
AttachData(testplan, data ,...
    'tolerances', tol,...
    'unmatcheddata', unmatch,...
    'moredata', moredata,...
    'moredesign', moredes);

You can use AttachData to use data from one project in another project, as follows:
p1 = mbcmodel.LoadProject( filename );
p2 = mbcmodel.LoadProject( filename2 );
p1.Testplan.AttachData( p2.Data );
```

See Also

Data | CreateData | DetachData

Augment

Add design points

Syntax

```
D = Augment(D, Numpoints)
D = Augment(D, 'Prop1', value1,...)
```

Description

Augment is a method of mbcdoe.design. Use it to add points to a design using a specified design generator. After augmenting a design, the design Style is set to Custom unless an optimal design is used for augmentation, as in the Design Editor.

D = Augment(D, Numpoints) augments the design with the number of points specified by Numpoints using the current generator settings.

D = Augment(D, 'Prop1', value1,...) augments the design with the generator specified by the generator property value pairs.

You can use the Augment method to add points to an existing type using a different design type.

```
OptDesign = Augment(OptDesign,...
    'Type','V-optimal',...
    'MaxIterations',200,...
    'NoImprovement', 50,...
    'NumberOfPoints',20);
```

To set all designs points to fixed and then augment an existing design optimally, use the FixPoints method to fix all the points as follows:

```
OptDesign = FixPoints(OptDesign);
OptDesign = Augment(OptDesign,...
    'Type','V-optimal',...
    'MaxIterations',200,...
    'NoImprovement', 50,...
    'NumberOfPoints',20);
```

When augmenting with an optimal design generator existing points which are not fixed may be changed. To add points optimally and keep only fixed points, use RemovePoints before augmenting, e.g.,

```
OptDesign = RemovePoints(OptDesign, 'free');
OptDesign = Augment(OptDesign,...
    'Type', 'V-optimal',...
    'MaxIterations',200,...
    'NoImprovement', 50,...
    'NumberOfPoints',20);
```

To get a candidate set object for use with an optimal design:

You see an error if you try to call Augment when the design Style is User-defined or Experimental data.

Examples

To create a candidate set and then optimally augment a design with 10 points:

```
CandidateSet = augmentedDesign.CreateCandidateSet...
( 'Type', 'Grid' );
CandidateSet.NumberOfLevels = [21 21 21 21];
augmentedDesign = Augment( augmentedDesign,...
    'Type', 'V-optimal',...
    'NumberOfPoints', 10,...
    'CandidateSet', CandidateSet,...
    'MaxIterations', 200,...
    'NoImprovement', 50 );
```

See Also

Generate | CreateCandidateSet

Introduced in R2008a

BeginEdit

Begin editing session on data object

Syntax

D = BeginEdit(D)

Description

This is a method of mbcmodel.data.

You must call this method before you can make any changes to a data object.

There are no input arguments. You must call BeginEdit before attempting to modify your data object (D in the example below) in any way. An error will be thrown if this condition is not satisfied. Data which cannot be edited (see IsEditable) will throw an error if BeginEdit is called.

Examples

BeginEdit(D);

See Also

CommitEdit | RollbackEdit | IsEditable | IsBeingEdited

BestDesign

Best design in test plan

Syntax

T.BestDesign{Level} = d;

Description

BestDesign is a property of mbcdmodel.testplan.

 $T.BestDesign\{Level\} = d$; sets d as the best design, where Level is the test plan level. There can be one best design for each level, but the best global (2) level design is used for matching to data when you call AttachData.

BestDesign is a cell array with a cell per level. TP.BestDesign{1} is the best design for the first level and TP.BestDesign{2} is best design for the second level.

Examples

To set the design globalDesign as the best design at the global (2) level:

T.BestDesign{2} = globalDesign

See Also

CreateDesign

Introduced in R2008a

BestModel

Combined best boundary models

Syntax

mbcboundary.Tree.BestModel

Description

This is a property of mbcboundary. Tree and mbcboundary. TwoStageTree.

mbcboundary.Tree.BestModel returns the combined boundary model containing all best boundary models in the tree (read only).

BestModel is the boundary model combining the models selected as best. You can select which boundary models to include in the best model with InBest. If the best boundary model includes more than one boundary model, that boundary model is an mbcboundary.Boolean object.

For TwoStageTree objects, the BestModel property contains the best boundary model (local, global, and response) (read only). In this case, BestModel is the boundary model combining the best local, global and response boundary models. You can select which boundary models to include in the best model with InBest. If the best boundary model includes more than one boundary model, that boundary model is an mbcboundary.Boolean object.

See Also

InBest

Boundary

Get boundary model tree from test plan

Syntax

BoundaryTree = mbcmodel.testplan.Boundary

Description

Boundary is a property of mbcmodel.testplan.

BoundaryTree = mbcmodel.testplan.Boundary returns the boundary tree for the test plan. The BoundaryTree is a container for all the boundary models you create. BoundaryTree is an mbcboundary.Tree object.

Examples

To get the boundary tree from the test plan Boundary property:

BoundaryTree = mbcmodel.testplan.Boundary

See Also

CreateBoundary | mbcboundary.Tree | mbcboundary.Model

Boundary Model

Get boundary model from test plan

Syntax

```
Best = BoundaryModel (T)
Best = BoundaryModel (T, Type)
```

Description

BoundaryModel is a method of mbcmodel.testplan.

Best = BoundaryModel (T) returns the best boundary model for T, the test plan. Best is a boundary model subclass of mbcboundary. AbstractBoundary: mbcboundary. Model, mbcboundary. Boolean, mbcboundary. PointByPoint, or mbcboundary. TwoStage.

Note Before Release 2009b, BoundaryModel returned an mbcdoe.designconstraint object. Use designconstraint to convert a boundary to a design constraint.

Best = BoundaryModel (T, Type) is the best boundary model for the specified type associated with the test plan. Type can be any of the following values:

- 'all': Best boundary model for all inputs (default)
- 'local': Best local boundary model
- 'global': Best global boundary model

Examples

To load boundary constraints from another project file and add to design:

```
otherProject = mbcmodel.LoadProject( [matlabroot, '\toolbox\...
mbc\mbctraining\Gasoline_project.mat']);
boundaryConstraints = otherProject.Testplans(1).Boundary.Global.BestModel
Design.Constraints = boundaryConstraints;
```

When you add the constraints to the design, the boundary model object converts automatically to an mbcdoe.designconstraint.

See Also

Boundary | CreateBoundary

Introduced in R2008a

BoxCoxSSE

SSE and confidence interval for Box-Cox transformations

Syntax

```
[sse, ci, lambda] = BoxCoxSSE(Model, lambda)
[sse, ci, lambda] = BoxCoxSSE(Model)
BoxCoxSSE(Model, ...)
```

Description

This is a method of mbcmodel.linearmodel.

[sse, ci, lambda] = BoxCoxSSE(Model, lambda) computes the sum of squares error (sse) and confidence interval (ci) for values of the model under different Box-Cox transforms (as given by the parameter lambda). The data used is that which was used to fit the model. sse is a vector the same size as lambda and ci is a scalar. There is no statistical difference between the Box-Cox transforms where sse less than ci.

[sse, ci, lambda] = BoxCoxSSE(Model) If lambda is not specified, then default values for are used and these are returned in third output argument.

BoxCoxSSE (Model, ...) If no output arguments are requested then a plot of SSE versus lambda is displayed. The confidence intervals are also displayed on this plot.

Examples

To try several different values, of the Box-Cox parameter and plot the results:

```
lambda = -3:0.5:3;
[sse, ci] = BoxCoxSSE( M, lambda);
semilogy( lambda, sse, 'bo-', lambda([1,end]), [ci, ci], 'r--' );
xlabel( 'Box-Cox parameter, \lambda' );
ylabel( 'SSE' );
```

Note that BoxCoxSSE does not set a Box-Cox transform in the model. To do this use:

```
M.Properties.BoxCox = 0;
[S,M] = M.Fit;
```

See Also

ParameterStatistics

Introduced in R2007a

Centers

Centers of RBF model

Syntax

centers = params.Centers

Description

This is a property of mbcmodel.rbfmodelparameters, for Radial Basis Function (RBF) models only. This returns an array of size $number_of_centers$ by $number_of_variables$.

Examples

centers = params.Centers;

See Also

Widths

cgoptimoptions

Create custom optimization options object

Syntax

Description

Use the cgoptimoptions object to define custom optimization settings for use in CAGE.

For a list of cgoptimoptions methods, see "Optimization Function Reference" in the CAGE documentation.

For instructions, see "User-Defined Optimizations" in the CAGE documentation.

Introduced in R2010b

cgoptimstore

Construct optimization interface

Syntax

Description

When running a user-defined optimization, you use the cgoptimstore object in the Evaluation section of your script. Use the cgoptimstore object to define the interface to CAGE for your custom optimization routine. CAGE interacts with your routine (obtaining inputs and sending outputs) via the cgoptimstore object. The cgoptimstore object provides methods for accessing information about and evaluating the objectives and constraints that have been defined in the CAGE GUI. The cgoptimstore object also provides the interface for sending the optimization results back to CAGE when an optimization is completed.

For a list of cgoptimstore methods, see "Optimization Function Reference" in the CAGE documentation.

For instructions, see "User-Defined Optimizations" in the CAGE documentation.

Introduced in R2010b

ChooseAsBest

Choose best model from alternative responses

Syntax

ChooseAsBest(R, Index)

Description

This is a method of the response model object, mbcmodel.response. This is the same function as selecting the best model in the Model Selection window of the Model Browser GUI. For a local model MakeHierarchicalResponse performs a similar function.

R is the object containing the response model.

Index is the number of the response model you want to choose as best. Use AlternativeResponses to find the index for each response model, and use AlternativeModelStatistics to choose the best fit.

Examples

```
ChooseAsBest(R, AlternativeModel)
RMSE = AlternativeModelStatistics(R, 'RMSE');
[mr, Best] = min(RMSE);
ChooseAsBest(R, Best);
```

See Also

AlternativeResponses | AlternativeModelStatistics | DiagnosticStatistics | MakeHierarchicalResponse

CommitEdit

Update temporary changes in data

Syntax

```
D = CommitEdit(D)
```

Description

This is a method of mbcmodel.data.

Use this to apply changes you have made to the data, such as creating new variables and applying filters to remove unwanted records.

There are no input arguments. Once you have finished editing your data object D you must commit your changes back to the project. Data can only be committed if both IsEditable and IsBeingEdited are true. CommitEdit will throw an error if these conditions are not met.

Examples

```
D = P.Data;
BeginEdit(D);
AddVariable(D, 'TQ = tq', 'lbft');
AddFilter(D, 'TQ < 200');
DefineTestGroups(D, {'RPM' 'AFR'}, [50 10], 'MyLogNo');
CommitEdit(D);

For an example situation which results in CommitEdit failing:
D = p.Data;
D1 = p.Data;
BeginEdit(D1);
tp = p.Testplan;
Attach(tp, D);</pre>
```

Where p is an mbcmodel.project object, and D and D1 are mbcmodel.data objects.

At this point IsEditable(D1) becomes false because it is now Attached to the test plan and hence can only be modified from the test plan. If you now enter:

```
OK = D1.IsEditable
the answer is false.
If you now enter:
CommitEdit(D1);
```

An error is thrown because the data is no longer editable. The error message informs you that the data may have been attached to a test plan and can only be edited from there.

ConstrainedGenerate

Generate constrained space-filling design of specified size

Syntax

```
design = ConstrainedGenerate( design, NumPoints, 'UnconstrainedSize', Size,
'MaxIter', NumIterations )
design = ConstrainedGenerate( design, NumPoints, OPTIONS )
```

Description

ConstrainedGenerate is a method of mbcdoe.design. Use it to generate a space-filling design of specified size within the constrained region. This method only works for space-filling designs. It may not be possible to achieve a specified number of points, depending on the generator settings and constraints.

design = ConstrainedGenerate(design, NumPoints, 'UnconstrainedSize', Size,
'MaxIter', NumIterations) tries to generate a design with the number of constrained points
specified by NumPoints. You can supply parameter value pairs for the options or you can use a
structure:design = ConstrainedGenerate(design, NumPoints, OPTIONS).

- MaxIter Maximum iterations, Default: 10
- UnconstrainedSize Total number of points in unconstrained design. Default: NumPoints

The algorithm ConstrainedGenerate produces a sequence of calls to Generate, and updates the UnconstrainedSize using the following formula:

```
UnconstrainedSize = ceil(UnconstrainedSize * NumPoints/D.NumberOfPoints);
```

Examples

With ConstrainedGenerate, make a 200 point design, using an existing space-filling design sfDesign, and inspect the constrained and total number of points:

```
sfDesign = ConstrainedGenerate( sfDesign, 200, 'UnconstrainedSize', 800, 'MaxIter',10 );
% How did we do?
finalNumberOfPoints = sfDesign.NumberOfPoints
% How many points did we need in total?
totalNumberOfPoints = sfDesign.Generator.NumberOfPoints
finalNumberOfPoints = 200
totalNumberOfPoints = 330
```

Constraints

Constraints in design

Syntax

Constraints = D.Constraints

Description

Constraints is a property of mbcdoe.design.

Constraints = D.Constraints Designs have a Constraints property, initially this is empty:

constraints = design.Constraints

constraints =
0x0 array of mbcdoe.designconstraint

Use CreateConstraint to form constraints.

Topics

CreateConstraint AddConstraint

CopyData

Create data object from copy of existing object

Syntax

```
newD = CopyData(P, D)
newD = CopyData(P, Index)
```

Description

This is a method of mbcmodel.project.

Use this to duplicate data, for example if you want to make changes for further modeling but want to retain the existing dataset. You can refer to the data object either by name or index.

P is the project object.

D is the data object you want to copy.

Index is the index of the data object you want to copy.

Examples

```
D2 = CopyData(P1, D1);
```

Correlation

Correlation matrix for linear model parameters

Syntax

STATS = Correlation(LINEARMODEL)

Description

This is a method of mbcmodel.linearmodel.

 ${\sf STATS} = {\sf Correlation}$ (LINEARMODEL) calculates the correlation matrix for the linear model parameters.

Examples

Stats = Correlation(knot_model)

See Also

ParameterStatistics

Introduced in R2007a

Covariance

Covariance matrix for linear model parameters

Syntax

STATS = Covariance(LINEARMODEL)

Description

This is a method of mbcmodel.linearmodel.

 $\mathsf{STATS} = \mathsf{Covariance}(\mathsf{LINEARMODEL})$ calculates the covariance matrix for the linear model parameters.

Examples

Stats = Covariance(knot_model)

See Also

ParameterStatistics

Introduced in R2007a

CreateAlgorithm

Create algorithm

Syntax

```
newalg = alg.CreateAlgorithm( AlgorithmName)
```

Description

This is a method of mbcmodel.fitalgorithm.

newalg = alg.CreateAlgorithm(AlgorithmName) creates an algorithm of the specified type. alg is a mbcmodel.fitalgorithm object. AlgorithmName must be in the list of alternative algorithms given by alg.getAlternativeNames.

To change the fit algorithm for a model:

```
>> model = mbcmodel.CreateModel('Polynomial', 2);
>> minpress = model.FitAlgorithm.CreateAlgorithm('Minimize PRESS');
>> model.FitAlgorithm = minpress;
```

The AlgorithmName determines what properties you can set. You can display the properties for an algorithm as follows:

```
>> model.FitAlgorithm.properties
Algorithm: Minimize PRESS
```

```
Alternatives: 'Least Squares','Forward Selection','Backward Selection','Prune'

MaxIter: Maximum Iterations (int: [1,1000])
```

As a simpler alternative to using CreateAlgorithm, you can assign the algorithm name directly to the algorithm. For example:

```
B.FitAlgorithm.BoundaryPointOptions = 'Boundary Only';
```

Or:

```
m.FitAlgorithm = 'Minimize PRESS';
```

Case and spaces are ignored. See FitAlgorithm.

The following sections list the properties available for each algorithm type.

Linear Model Algorithm Properties

Linear Models Algorithms

Used by polynomials, hybrid splines and as the StepAlgorithm for RBF algorithms.

Algorithm: Least Squares

Alternatives: 'Minimize PRESS', 'Forward Selection', 'Backward Selection', 'Prune'

Algorithm: Minimize PRESS

Alternatives: 'Least Squares', 'Forward Selection', 'Backward Selection', 'Prune'

• MaxIter: Maximum Iterations (int: [1,1000])

Algorithm: Forward Selection

Alternatives: 'Least Squares', 'Minimize PRESS', 'Backward Selection', 'Prune'

- ConfidenceLevel: Confidence level (%) (numeric: [70,100])
- MaxIter: Maximum Iterations (int: [1,1000])
- RemoveAll: Remove all terms first (Boolean)

Algorithm: Backward Selection

Alternatives: 'Least Squares', 'Minimize PRESS', 'Forward Selection', 'Prune'

- ConfidenceLevel: Alpha (%) (numeric: [70,100])
- MaxIter: Maximum Iterations (int: [1,1000])
- Include All: Include all terms first (Boolean)

Algorithm: Prune

Alternatives: 'Least Squares', 'Minimize PRESS', 'Forward Selection', 'Backward Selection'

- Criteria (PRESS RMSE|RMSE|GCV|Weighted PRESS|-2logL|AIC|AICc|BIC|R^2|R^2 adj|PRESS R^2|DW|Cp|cond(J))
- MinTerms: Minimum number of terms (int: [0,Inf])
- Tolerance (numeric: [0,1000])
- Include All: Include all terms before prune (Boolean)
- Display (Boolean)

RBF Algorithm Properties

For information about any of the RBF and Hybrid RBF algorithm properties, see "Radial Basis Functions for Model Building", and especially "Fitting Routines" in the Model Browser User's Guide.

Algorithm: RBF Fit

- WidthAlgorithm: Width selection algorithm (mbcmodel.fitalgorithm)
- StepAlgorithm: Stepwise (mbcmodel.fitalgorithm)

Width Selection Algorithms

Alternatives: 'WidPerDim', 'Tree Regression'

Algorithm: TrialWidths

- NestedFitAlgorithm: Lambda selection algorithm (mbcmodel.fitalgorithm)
- Trials: Number of trial widths in each zoom (int: [2,100])

- Zooms: Number of zooms (int: [1,100])
- MinWidth: Initial lower bound on width (numeric: [2.22045e-016,1000])
- MaxWidth: Initial upper bound on width (numeric: [2.22045e-016,100])
- PlotFlag: Display plots (Boolean)
- PlotProgress: Display fit progress (Boolean)

Algorithm: WidPerDim

Alternatives: 'TrialWidths', 'Tree Regression'

- NestedFitAlgorithm: Lambda selection algorithm (mbcmodel.fitalgorithm)
- DisplayFlag: Display (Boolean)
- MaxFunEvals: Maximum number of test widths (int: [1,1e+006])
- PlotProgress: Display fit progress (Boolean)

Algorithm: Tree Regression

Alternatives: 'TrialWidths', 'WidPerDim'

- MaxNumRectangles: Maximum number of panels (int: [1,Inf])
- MinPerRectangle: Minimum data points per panel (int: [2,Inf])
- RectangleSize: Shrink panel to data (Boolean)
- AlphaSelectAlg: Alpha selection algorithm (mbcmodel.fitalgorithm)

Lambda Selection Algorithms

Algorithm: IterateRidge

Alternatives: 'IterateRols', 'StepItRols'

- CenterSelectionAlg: Center selection algorithm (mbcmodel.fitalgorithm)
- MaxNumIter: Maximum number of updates (int: [1,100])
- Tolerance: Minimum change in log10(GCV) (numeric: [2.22045e-016,1])
- NumberOfLambdaValues: Number of initial test values for lambda (int: [0,100])
- CheapMode: Do not reselect centers for new width (Boolean)
- PlotFlag: Display (Boolean)

Algorithm: IterateRols

Alternatives: 'IterateRidge', 'StepItRols'

- CenterSelectionAlg: Center selection algorithm (mbcmodel.fitalgorithm)
- MaxNumIter: Maximum number of iterations (int: [1,100])
- Tolerance: Minimum change in log10(GCV) (numeric: [2.22045e-016,1])
- NumberOfLambdaValues: Number of initial test values for lambda (int: [0,100])
- CheapMode: Do not reselect centers for new width (Boolean)
- PlotFlag: Display (Boolean)

Algorithm: StepItRols

Alternatives: 'IterateRidge', 'IterateRols'

- MaxCenters: Maximum number of centers (evalstr)
- PercentCandidates: Percentage of data to be candidate centers (evalstr)
- StartLambdaUpdate: Number of centers to add before updating (int: [1,Inf])
- Tolerance: Minimum change in log10(GCV) (numeric: [2.22045e-016,1])
- MaxRep: Maximum number of times log10(GCV) change is minimal (int: [1,100])

Center Selection Algorithms

Algorithm: Rols

Alternatives: 'RedErr', 'WiggleCenters', 'CenterExchange'

- MaxCenters: Maximum number of centers (evalstr)
- PercentCandidates: Percentage of data to be candidate centers (evalstr)
- Tolerance: Regularized error tolerance (numeric: [2.22045e-016,1])

Algorithm: RedErr

Alternatives: 'Rols', 'WiggleCenters', 'CenterExchange'

• MaxCenters: Number of centers (evalstr)

Algorithm: WiggleCenters

Alternatives: 'Rols', 'RedErr', 'CenterExchange'

- MaxCenters: Number of centers (evalstr)
- PercentCandidates: Percentage of data to be candidate centers (evalstr)

Algorithm: CenterExchange

Alternatives: 'Rols', 'RedErr', 'WiggleCenters'

- MaxCenters: Number of centers (evalstr)
- NumLoops: Number of augment/reduce cycles (int: [1,Inf])
- NumAugment: Number of centers to augment by (int: [1,Inf])

Tree Regression Algorithms

Algorithm: Trial Alpha

Alternatives: 'Specify Alpha'

- AlphaLowerBound: Initial lower bound on alpha (numeric: [2.22045e-016,Inf])
- AlphaUpperBound: Initial upper bound on alpha (numeric: [2.22045e-016,Inf])
- Zooms: Number of zooms (int: [1,Inf])
- Trials: Trial alphas per zoom (int: [2,Inf])
- Spacing: Spacing (LinearLogarithmic)
- CenterSelectAlg: Center selection algorithm (mbcmodel.fitalgorithm)

Algorithm: Specify Alpha

Alternatives: 'Trial Alpha'

- Alpha: Width scale parameter, alpha (numeric: [2.22045e-016,Inf])
- NestedFitAlgorithm: Center selection algorithm (mbcmodel.fitalgorithm)

Algorithm: Tree-based Center Selection

Alternatives: 'Generic Center Selection'

- ModelSelectionCriteria: Model selection criteria (BIC|GCV)
- MaxNumberCenters: Maximum number of centers (evalstr)

Algorithm: Generic Center Selection

Alternatives: 'Tree-based Center Selection'

• CenterSelectAlg: Center selection algorithm (mbcmodel.fitalgorithm)

Hybrid RBF Algorithms

Algorithm: RBF Fit

- WidthAlgorithm: Width selection algorithm (mbcmodel.fitalgorithm)
- StepAlgorithm: Stepwise (mbcmodel.fitalgorithm)

Width Selection Algorithms

Algorithm: TrialWidths

- NestedFitAlgorithm: Lambda and term selection algorithm (mbcmodel.fitalgorithm)
- Trials: Number of trial widths in each zoom (int: [2,100])
- Zooms: Number of zooms (int: [1,100])
- MinWidth: Initial lower bound on width (numeric: [2.22045e-016,1000])
- MaxWidth: Initial upper bound on width (numeric: [2.22045e-016,100])
- PlotFlag: Display plots (Boolean)
- PlotProgress: Display fit progress (Boolean)

Nested Fit Algorithms

Algorithm: Twostep

Alternatives: 'Interlace'

- MaxCenters: Maximum number of centers (evalstr)
- PercentCandidates: Percentage of data to be candidate centers (evalstr)
- StartLambdaUpdate: Number of terms to add before updating (int: [1,Inf])
- Tolerance: Minimum change in log10(GCV) (numeric: [2.22045e-016,1])
- MaxRep: Maximum number of times log10(GCV) change is minimal (int: [1,100])
- PlotFlag: Display (Boolean)

Algorithm: Interlace

Alternatives: 'Twostep'

- MaxParameters: Maximum number of terms (evalstr)
- MaxCenters: Maximum number of centers (evalstr)
- PercentCandidates: Percentage of data to be candidate centers (evalstr)
- StartLambdaUpdate: Number of terms to add before updating (int: [1,Inf])
- Tolerance: Minimum change in log10(GCV) (numeric: [2.22045e-016,1])
- MaxRep: Maximum number of times log10(GCV) change is minimal (int: [1,100])

Boundary Model Fit Algorithm Parameters

The following sections list the available fit algorithm parameters for command-line boundary models. The boundary model fit algorithm parameters have the same fit options as the Boundary Editor GUI. For instructions on using these fit options, see "Editing Boundary Model Fit Options" in the Model Browser documentation.

Convex Hull

KeepAllFacets: Boolean to indicate whether to keep all facets (default is false, do not keep all facets).

Tolerance: Tolerance for maximum 1-norm distance allowed for removing facets (numeric: [0,Inf], default 0.02). To remove more facets, increase the tolerance.

For more information, see "Convex Hull Setting" in the Model Browser documentation.

Ellipsoid

Algorithm: Constraint Fitting

Boundary PointOptions: Boundary Points (mbcmodel.fitalgorithm)

The boundary points algorithm uses optimization to find the best ellipse. These options are from fmincon.

Algorithm: Boundary Points

- Display: Display (none|iter|final)
- MaxFunEvals: Maximum function evaluations (int: [1,Inf])
- MaxIter: Maximum iterations (int: [1,Inf])
- TolFun: Function tolerance (numeric: [1e-012,Inf])
- TolX: Variable tolerance (numeric: [1e-012,Inf])
- TolCon: Constraint tolerance (numeric: [1e-012,Inf])

Star-shaped

Algorithm: Constraint Fitting

SpecialPointOptions: Special Points (mbcmodel.fitalgorithm)

Boundary Point Options: Boundary Points (mbcmodel.fitalgorithm)

ConstraintFitOptions: Constraint Fit (mbcmodel.fitalgorithm)

Star-shaped—Special Points

Algorithm: Star-shaped Points

CenterAlg: Center (mbcmodel.fitalgorithm)

Algorithm alternatives: 'Mean', 'Median', 'Mid Range', 'Min Ellipse', 'User Defined'

For User Defined only: CenterPoint: User-defined center [X1,X2] (vector: NumberOfActiveInputs)

Star-shaped—Boundary Points

You can choose to find boundary points (use Interior) or to assume that all points are on the boundary (use Boundary Only). The interior algorithm then has manual and auto options for the dilation radius and ray casting algorithms.

- Algorithm: Boundary Only (no further options)
- Algorithm: Interior. Further options:
 - DilationRadius (mbcmodel.fitalgorithm)
 - Algorithm: Auto
 - Algorithm: Manual
 - radius: Radius (numeric: [0,Inf])
 - RayCasting (mbcmodel.fitalgorithm)
 - Algorithm: From data
 - Algorithm: Manual
 - nrays: Number of Rays (int: [1,Inf])

Star-shaped—Constraint Fit

Algorithm: Star-shaped RBF Fit

Further options:

- Transform (None|Log|McCallum)
- KernelOpts: RBF Kernel (mbcmodel.fitalgorithm)

Kernel algorithms can be: wendland, multiquadric, recmultiquadric, gaussian, thinplate, logisticrbf. linearrbf, cubicrbf.

You can specify widths and continuity as sub-properties of particular RBF kernels.

• You can set widths for wendland, multiquadric, recmultiquadric, gaussian, logisticrbf. Width: RBF Width (numeric: [1.49012e-008,Inf])

You can set Continuity for wendland. Cont: RBF Continuity (0|2|4|6)

RbfOpts: RBF Algorithm (mbcmodel.fitalgorithm)

Algorithm: Interpolation. The following are additional settings for interpolating RBF.

- CoincidentStrategy: Coincident Node Strategy (Maximum|Minimum|Mean)
- Algorithm: Algorithm (Direct|GMRES|BICG|CGS|QMR)
- Tolerance: Tolerance (numeric: [0,Inf])
- MaxIt: Maximum number of iterations (int: [1,Inf])

Examples

```
First get a fitalgorithm object, F, from a model:
M = mbcmodel.CreateModel('Polynomial', 4);
F = M.FitAlgorithm
F =
Algorithm: Least Squares
Alternatives: 'Minimize PRESS', 'Forward Selection', 'Backward
Selection', 'Prune'
1x1 struct array with no fields.
Then, to create a new algorithm type:
Alg = CreateAlgorithm(F, 'Minimize PRESS')
Ala =
Algorithm: Minimize PRESS
Alternatives: 'Least Squares', 'Forward Selection', 'Backward
Selection', 'Prune'
    MaxIter: 50
The AlgorithmName determines what properties you can set. You can display the properties for an
algorithm as follows:
>> model.FitAlgorithm.properties
Algorithm: Minimize PRESS
Alternatives: 'Least Squares', 'Forward Selection', 'Backward
Selection', 'Prune'
     MaxIter: Maximum Iterations (int: [1,1000])
As a simpler alternative to using CreateAlgorithm, you can assign the algorithm name directly to
the algorithm. For example:
B.FitAlgorithm.BoundaryPointOptions = 'Boundary Only';
Or:
m.FitAlgorithm = 'Minimize PRESS';
Case and spaces are ignored.
```

getAlternativeNames | SetupDialog | FitAlgorithm

Introduced in R2007a

CreateAlternativeModels

Create alternative models from model template

Syntax

```
R = CreateAlternativeModels(R, modeltemplate, criteria)
R = CreateAlternativeModels(R, modellist, criteria)
R = CreateAlternativeModels(R, LocalModels, LocalCriteria, GlobalModels, GlobalCriteria)
```

Description

This is a method of all model objects: mbcmodel.hierarchicalresponse, mbcmodel.localresponse and mbcmodel.response.

This is the same as the Build Models function in the Model Browser GUI. A selection of child node models are built. The results depend on where you call this method from. Note that the hierarchical model is automatically constructed when CreateAlternativeModels is called for a local model.

• This option makes alternative response feature models for each response feature.

```
R = CreateAlternativeModels(R, models, criteria)
```

- Models is the list of models. You can use a model template file (.mbm) created in the Model Browser, or a cell array of mbcmodel.model objects.
- Criteria is the selection criteria for best model (from the statistics available from AlternativeModelStatistics).
- This option makes alternative local models as well as alternative response feature models.

```
R = CreateAlternativeModels(R,
LocalModels,LocalCriteria,GlobalModels,GlobalCriteria)
```

- LocalModels is the list of local models you must pass in an empty matrix).
- LocalCriteria is 'Two-Stage RMSE'.
- GlobalModels is the list of global models (from the model template).
- GlobalCriteria is the selection criteria for best model.

You construct a model template file (such as 'mymodels.mbm') in the Model Browser. From any response (global or one-stage model) with alternative responses (child nodes), select **Model > Make Template**. You can save the child node model types of your currently selected modeling node as a model template. Alternatively from any response click **Build Models** in the toolbar and create a series of alternative response models in the dialog.

Examples

```
mymodels = 'mymodels.mbm';
mlist = {};
```

```
load('-mat', mymodels);
criteria = 'PRESS RMSE';
CreateAlternativeModels(R, [], 'Two-Stage RMSE', mlist,
criteria);
Note that the model template contains the variable mlist.
CreateAlternativeModels( RESPONSE, 'alternative_models.mbm', 'Weighted PRESS' )
```

creates alternative response feature models based upon the model template file alternative_models.mbt, and chooses the best model based upon each model's Weighted PRESS statistic.

AlternativeModelStatistics

CreateBoundary

Create boundary model

Syntax

```
B = mbcboundary.CreateBoundary(Type,Inputs)
B = mbcboundary.CreateBoundary(Type,Inputs,Property,Value,...)
B = CreateBoundary(Tree)
B = CreateBoundary(Tree,Type)
B = CreateBoundary(Tree,Type,Property,Value,...)
newboundary = CreateBoundary(B,Type)
newboundary = CreateBoundary(B,Type,Property,Value,...)
```

Description

B = mbcboundary.CreateBoundary(Type,Inputs) This syntax is a static package function that creates an mbcboundary.Model object (B) of the specified Type, where Inputs is an mbcmodel.modelinput object. Use this function to create a new boundary model object independent of any project. See fit for an alternative.

B = mbcboundary.CreateBoundary(Type,Inputs,Property,Value,...) creates a boundary with the specified properties. Properties depend on the boundary model type.

You can use getAlternativeTypes to get a list of valid model types, or see Type (for boundary models). Spaces and case in Type are ignored.

CreateBoundary is also a method of mbcboundary. Tree. Use the method to create a new boundary model within a project.

- B = CreateBoundary(Tree) creates a new boundary model, B, from the mbcboundary. Tree object, Tree. The method uses the test plan inputs to define the boundary model inputs. You must call Addto add the new model to the tree.
- B = CreateBoundary (Tree, Type) creates a new boundary model, B of the specified Type.
- B = CreateBoundary (Tree, Type, Property, Value, ...) creates a boundary with the specified properties.

CreateBoundary is also a method of mbcboundary. AbstractBoundary and all its subclasses. Use the method to create a new boundary model from an existing boundary model.

newboundary = CreateBoundary(B,Type) creates a new boundary model, newboundary, with the same inputs as the current boundary model B. You can get a list of valid types with getAlternativeTypes.

newboundary = CreateBoundary(B, Type, Property, Value, ...) creates a new boundary model with specified properties.

Examples

You can create a boundary model outside of a project in either of the following ways:

```
B = mbcboundary.Fit(Data,Type);
B = mbcboundary.CreateBoundary(Type,Inputs)
```

To create a new boundary model within a project:

```
Tree = testplan.Boundary
B = CreateBoundary(Tree)
```

This creates a new boundary model, B, from the mbcboundary. Tree object, Tree. The method uses the test plan inputs to define the boundary model inputs.

To create a star-shaped global boundary model for a testplan:

```
B = CreateBoundary(testplan.Boundary.Global, 'Star-shaped');
```

Call Add to add the boundary model to the tree. .

To add the boundary model to the test plan, and fit the boundary model:

```
B = Add(testplan.Boundary.Global,B);
```

The best boundary model for the tree includes this boundary model.

To create boundary models for a point-by-point test plan:

```
B = TP.Boundary.Local.CreateBoundary('Point-by-point');
% Use convex hull type for the local boundaries
B.LocalModel = CreateBoundary(B.LocalModel,'Convex hull');
% Add point-by-point boundary model to project.
TP.Boundary.Local.Add(B);
```

Introduced in R2009b

CreateCandidateSet

Create candidate set for optimal designs

Syntax

```
D = CreateCandidateSet(D)
D = CreateCandidateSet(D,prop1,value1,...)
```

Description

CreateCandidateSet is a method of mbcdoe.design. Candidate sets are very similar to design generators. They are not used directly in specifying a design but are used to specify the set of all possible points to be considered as part of an optimal design. You obtain the candidate set from an optimal design generator or by using mbcdoe.design.CreateCandidateSet.

D = CreateCandidateSet(D) creates a candidate set (mbcdoe.candidateset object) for the design.

D = CreateCandidateSet(D,prop1,value1,...) creates a candidate set with the specified properties for the design. To see the properties you can set, see the table of candidate set properties, Candidate Set Properties (for Optimal Designs).

Examples

```
CandidateSet = augmentedDesign.CreateCandidateSet( 'Type',...
'Grid' );
CandidateSet.NumberOfLevels = [21 21 21 21];
```

See Also

Properties (for candidate sets) | Augment

Introduced in R2008a

CreateConstraint

Create design constraint

Syntax

```
c = CreateConstraint(D)
c = CreateConstraint(D,prop1,val1,...)
```

Description

CreateConstraint is a method of mbcdoe.design.

Designs have a Constraints property, initially this is empty:

```
constraints = design.Constraints
constraints =
0x0 array of mbcdoe.designconstraint
```

Use CreateConstraint to form constraints.

c = CreateConstraint(D) creates a default constraint for the design.

c = CreateConstraint(D,prop1,val1,...) creates a constraint with the specified properties.
See Constraint Properties.

By default a 1D table constraint is created for designs with two or more inputs.

For a design with one input a linear constraint is created by default.

You can specify the constraint type during creation by using the Type property, e.g.,

```
c = CreateConstraint(D,'Type','Linear')
```

Other available properties depend on the design type. See the table Constraint Properties.

This method does not add the constraint to the design. You must explicitly add the constraint to the design using the Constraints property of the design e.g.,

```
D = AddConstraint(D,c)
or
D.Constraints(end+1) = c;
```

You must call AddConstraint to apply the constraint and remove design points outside the constraint.

Examples

To create a Linear constraint, add it to a design, and regenerate the design points:

```
cLinear = CreateConstraint(design, 'Type', 'Linear');
cLinear.A = [-2.5e-4, 1];
cLinear.b = 0.25;
cLinear
design.Constraints = cLinear;
design = Generate(design);
To create and apply a 1D Table constraint:
cTable1d = CreateConstraint(design, 'Type', '1D Table');
cTable1d.Table = [0.9 \ 0.5];
cTable1d.Breakpoints = [500 6000];
cTable1d
design.Constraints = cTable1d;
design = Generate(design);
To combine constraints, use an array of the constraints you want to apply:
design.Constraints = [cLinear, cTable1d];
constraints = design.Constraints
design = Generate(design);
constraints =
1x2 array of mbcdoe.designconstraint
Linear design constraint: -0.00025*N + 1*L \le 0.25
1D Table design constraint: L(N) <= Lmax
To load boundary constraints from another project file and add to design:
otherProject = mbcmodel.LoadProject( [matlabroot,'\toolbox\',...
'mbc\mbctraining\Gasoline_project.mat']);
mytestplan = otherProject.Testplans(1);
boundaryConstraints = BoundaryModel(mytestplan, 'global');
Design.Constraints = boundaryConstraints;
```

See Also

Properties (for design constraints) | AddConstraint

Introduced in R2008a

CreateData

Create data object

Syntax

```
D = CreateData(P)
D = CreateData(P,filename)
D = CreateData(P,table)
D = CreateData(P,mbcdatastructure)
D = CreateData(P,filename,filetype)
```

Description

The first syntax is a method of mbcmodel.project. Use this to create a new data object in an existing project. P is the project object.

filename is a character vector specifying the full path to the file.

table is the table object.

mbcdatastructure is the MBC data structure.

filetype is a character vector specifying the file type. See DataFileTypes for the specification of allowed file types (and mbccheckindataloadingfcn to specify your own data loading function). If filetype is not provided, then MBC will attempt to infer the file type from the file extension, i.e. if the file extension is .xls then MBC will try the Excel File Loader.

If filename is not provided then no data will be loaded into the new data object. Data can be loaded subsequently using ImportFromFile, provided that editing of the data object has been enabled via a call to BeginEdit. Call CommitEdit to apply edits.

If you create the data object specifying a filename, then the Name property is set to the filename. However, if you use ImportFromFile after creation to load data from a file, the name of the data object does not change.

The second syntax is a function. Use this to create a new data object independent of any project. You can use AttachData to use the data object in another test plan, e.g.,

```
d = mbcmodel.CreateData(filename);
testplan.AttachData(d);
```

Examples

```
data = CreateData(P, 'D:\MBCWork\data1.xls');
D = mbcmodel.CreateData;
D = mbcmodel.CreateData('D:\MBCWork\data.xls');
```

Where P is an mbcmodel.project object.

See Also

DataFileTypes | BeginEdit | CopyData | RemoveData | Data | ImportFromFile | CommitEdit | AttachData

CreateDesign

Create design object for test plan or model

Syntax

```
D = CreateDesign(Testplan)
D = CreateDesign(Testplan, Level)
D = CreateDesign(Testplan, Level, prop1, value1,...)
D = CreateDesign(Model)
D = CreateDesign(Model, prop1, value1,...)
D = CreateDesign(Inputs)
D = CreateDesign(Inputs, prop1, value1,...)
D = CreateDesign(Design)
```

Description

CreateDesign is a method of mbcmodel.testplan, mbcmodel.model, and mbcmodel.modelinput. Property value pairs can be specified at creation time. The property value pairs are properties of mbcdoe.design.

Properties of mbcdoe.design

mbcdoe.design Property	Description
Constraints on page 1-33	Constraints in design.
Generator on page 1-88	Design generation options.
Inputs on page 1-104	Inputs for design.
Model on page 1-142	Model for design.
Points on page 1-174	Matrix of design points.
PointTypes on page 1-175	Fixed and free point status.
Style on page 1-230	Style of design type.
NumInputs on page 1-157	Read-only — Number of model inputs.
NumberOfPoints on page 1-159	Read-only — Number of design points.
Type on page 1-239	Design type. The design property Type can <i>only</i> be specified with CreateDesign and is subsequently readonly for design objects.

D = CreateDesign(Testplan) creates a design for the test plan, where Testplan is an mbcmodel.testplan object.

D = CreateDesign(Testplan, Level) creates a design for the specified level of the test plan. By default the level is the outer level (i.e., Level 1 for one-stage, Level 2 (global) for two-stage).

If you do not specify any properties, the method creates a default design type. The default design types are a Sobol Sequence for two or more inputs, and a Full Factorial for a single input.

- D = CreateDesign(Testplan, Level, prop1, value1,...) creates a design with the specified properties.
- D = CreateDesign(Model) creates a design based on the inputs of the mbcmodel.model object, Model.
- D = CreateDesign(Model,prop1,value1,...) creates a design with the specified properties based on the inputs of the model.
- D = CreateDesign(Inputs) creates a design based on the inputs of the mbcmodel.modelinput object, Inputs.
- D = CreateDesign(Inputs,prop1,value1,...) creates a design with the specified properties based on the inputs.
- D = CreateDesign(Design) creates a copy of an existing design.

Examples

```
To create a space-filling design for a test plan TP:
sfDesign = CreateDesign(TP, ...
    'Type', 'Latin Hypercube Sampling',...
'Name', 'Space Filling');
Create an optimal design based on the inputs of a model:
optimalDesign = CreateDesign( model,...
    'Type', 'V-optimal',...
'Name', 'Optimal Design');
Create a classical full factorial design based on the inputs defined by a mbcmodel.modelinput
object:
design = CreateDesign( inputs, 'Type', 'Full Factorial' );
Create a new design based on an existing design (ActualDesign) in order to augment it:
augmentedDesign = ActualDesign.CreateDesign('Name',...
 'Augmented Design');
Create a local level design for the two-stage test plan TP:
localDesign = TP.CreateDesign(1, 'Type',...
'Latin Hypercube Sampling');
Create a global level design for the two-stage test plan TP:
globalDesign = TP.CreateDesign(2, 'Type',...
 'Latin Hypercube Sampling');
```

Generate | modelinput

Introduced in R2008a

CreateModel

Create new model

Syntax

```
M = mbcmodel.CreateModel(Type, INPUTS)
NewModel = CreateModel(model,Type)
```

Description

M = mbcmodel.CreateModel(Type, INPUTS) This syntax is a function that creates an mbcmodel.model object of the specified Type.

mbcmodel.linearmodel and mbcmodel.localmodel are subclasses of mbcmodel.model. Model types that begin with the word "local" specify an mbcmodel.localmodel object.

NewModel = CreateModel(model, Type) This syntax is a function that creates a new model (of the specified Type) with the same inputs as an existing model. model is an mbcmodel.model object. You can use getAlternativeTypes to generate a list of valid model types. See Type (for models) for a list of valid model types. Spaces and case in Type are ignored.

INPUTS can be a mbcmodel.modelinput object, or any valid input to the mbcmodel.modelinput constructor. See modelinput.

Examples

To create a hybrid spline with four input factors, enter:

```
M = mbcmodel.CreateModel('Hybrid Spline', 4)
```

To create an RBF with four input factors, enter:

```
Inputs = mbcmodel.modelinput('Symbol',{'N','L','EXH','INT'}',...
    'Name',{'ENGSPEED','LOAD','EXHCAM','INTCAM'}',...
    'Range',{[800 5000],[0.1 1],[-5 50],[-5 50]}');
RBFModel = mbcmodel.CreateModel( 'RBF', Inputs);
```

To create a polynomial with the same input factors as the previously created RBF, enter:

```
PolyModel = CreateModel(RBFModel, 'Polynomial')
```

See Also

```
getAlternativeTypes | modelinput | CreateProject | CreateData | Type (for models)
```

Introduced in R2007a

CreateProject

Create project object

Syntax

P = mbcmodel.CreateProject

Description

This is a function that creates an mbcmodel.project object.

P is the project object.

P = mbcmodel.CreateProject creates an mbcmodel.project called Untitled. P = mbcmodel.CreateProject(NAME) creates an mbcmodel.project called NAME.

Examples

```
P = mbcmodel.CreateProject;
Create a project called MBT_Project:
P = mbcmodel.CreateProject( 'MBT_Project' );
```

CreateResponse

Create new response model for test plan

Syntax

```
R = CreateResponse(T, Varname)
R = CreateResponse(T, Varname, Model)
R = CreateResponse(T, Varname, LocalModel, GlobalModel)
R = CreateResponse(T, Varname, LocalModel, GlobalModel, DatumType)
```

Description

This is a method of mbcmodel.testplan.

R = CreateResponse(T, Varname) creates a model of the variable Varname using the test plan's one- or two-stage default models. T is the test plan object, R is the new response object.

R = CreateResponse(T, Varname, Model) creates a one-stage model of Varname, where T must be a one-stage test plan object.

R = CreateResponse(T, Varname, LocalModel, GlobalModel) or R = CreateResponse(T, Varname, LocalModel, GlobalModel, DatumType) creates a two-stage model of Varname. T must be a two-stage test plan object. DatumType can only be specified if the local model type permits a datum model. Only the model types "Polynomial Spline" and "Polynomial with Datum" permit datum models.

Varname is the variable name for the new response.

Model is the One-stage model object (if you leave this field empty, the default is used).

Local Model is the Local Model object (if you leave this field empty, the default is used).

GlobalModel is the Response Feature model object (if you leave this field empty, the default is used).

DatumType can be 'None' 'Maximum' 'Minimum' or 'Linked'.

Examples

To create a response using the default models, enter:

```
R = CreateResponse(T, 'torque');
TQ_response = CreateResponse(testplan, 'TQ');
```

To create a response and specify the local and global model types, enter:

```
models = T.DefaultModels
LocalModel = CreateModel(models{1}, 'Local Polynomial Spline');
GlobalModel = CreateModel(models{2}, 'RBF');
R = CreateResponse(T, 'TQ', LocalModel, GlobalModel, 'Maximum')
```

See Also

Responses

CreateResponseFeature

Create new response feature for local model

Syntax

```
RF = CreateResponseFeature(RF,RFType)
RF = CreateResponseFeature(RF,RFType,EvaluationPoint)
```

Description

This is a method of mbcmodel.localresponse.

RF = CreateResponseFeature(RF,RFType) creates a response feature for RFType.

RF = CreateResponseFeature(RF,RFType,EvaluationPoint) creates a response feature for RFType at EvaluationPoint.

RFType is a description character vector belonging to the set of alternative response features for the current local model.

EvaluationPoint is a row vector with an element for each model input and is used for response features that require an input value to evaluate the response feature (e.g., function evaluation, derivatives). It is an error to specify an evaluation point for a response feature type that does not require an evaluation point.

You should use this method to add response features without refitting all local and global models.

Examples

```
RF = CreateResponseFeature(RF, 'Beta 1')
```

See Also

ResponseFeatures(Local Model)

Introduced in R2007b

CreateTestplan

Create new test plan

Syntax

```
T = CreateTestplan(P,TestPlanTemplate)
T = CreateTestplan(P,TestPlanTemplate,newtestplanname)
T = CreateTestplan(P,InputsPerLevel)
T = CreateTestplan(P,InputsPerLevel,newtestplanname)
T = CreateTestplan(P,Inputs)
T = CreateTestplan(P,Inputs, newtestplanname)
```

Description

This is a method of the mbcmodel.project object.

You can use this method with a test plan template or input information.

You set templates up in the Model Browser GUI. This setup includes number of stages, inputs, base models, and designs. If the test plan is used as part of a previous project it is also possible to save response models in the test plan. It is not possible to change the number of stages after creation of the test plan.

After you create a new test plan, you can add data to model, and new responses. Note that the model input signal names specified in the template *must* match the signal names in the data.

Use CreateTestplan in the following ways:

T = CreateTestplan(P,TestPlanTemplate) creates a test plan.

T = CreateTestplan(P, TestPlanTemplate, newtestplanname) creates a test plan with a name.

P is the project object.

TestPlanTemplate is the full name and path to the test plan template file created in the Model Browser.

newtestplanname is the optional name for the new test plan object.

T = CreateTestplan(P,InputsPerLevel) creates a test plan with the number of inputs per level.

T = CreateTestplan(P,InputsPerLevel,newtestplanname) creates a test plan with the inputs per level and a name.

InputsPerLevel is a row vector with number of inputs for each stage.

T = CreateTestplan(P, Inputs) creates a test plan with the number of inputs.

T = CreateTestplan(P, Inputs, newtestplanname) creates a test plan with the number of inputs and a name.

Inputs is a cell array with input information for each level. The input information can be specified as a cell array of mbcmodel.modelinput objects (one for each level), or as a cell array of cell arrays (one for each level).

Examples

```
To create a test plan using a test plan template, enter:
T = CreateTestplan(P1, 'd:\MBCwork\TQtemplate1', 'newtestplan')
testplan = CreateTestplan(P, 'example testplan')
To create a test plan using inputs per level, enter:
T = P.CreateTestplan([1,2])
To specify the input information in a cell array of mbcmodel.modelinput objects, enter:
% Define Inputs for test plan
LocalInputs = mbcmodel.modelinput('Symbol','S',...
    'Name','SPARK',...
'Range',[0 50]);
GlobalInputs = mbcmodel.modelinput('Symbol',{'N','L','ICP',...
'ECP'},'Name',{'SPEED','LOAD','INT_ADV','EXH_RET'},...
     Range', {[500 6000], [0.0679]
                                      0.9502],[-5 50],[-5 50]});
% create test plan
testplan = CreateTestplan( project, {LocalInputs,...
GlobalInputs} );
Or
T = P.CreateTestplan({LocalInputs,GlobalInputs})
To specify the input information in a cell array, enter:
localInputs = {'S',0,50,'','SPARK'};
globalInputs = {'N', 800, 5000, '', 'ENGSPEED'
                          1, '', 'LOAD'
50, '', 'EXHCAM'
50, '', 'INTCAM'};
            'L', 0.1,
            'EXH', -5,
            'INT', -5,
T = CreateTestplan(P, {localInputs, globalInputs});
```

AttachData | CreateResponse | Responses | Data | Levels | InputSignalNames | InputsPerLevel | Inputs | modelinput

Data

Array of data objects in project, boundary tree, or test plan

Syntax

```
allD = project.Data
allD = testplan.Data
```

Description

This is a property of mbcmodel.project, mbcmodel.testplan, and mbcboundary.Tree.

For projects and test plans, it returns an array of mbcmodel.data objects. A project can have many data objects, but a test plan can only have one or none.

Tree.B.Data returns a double matrix for one-stage, response, and global boundary models. For local boundary models, Data is a cell array of double matrices with one cell per test. For boundary models, Data is read-only.

Examples

```
allD = P.Data;
```

For a project object P, this example returns an nx1 array of all the data objects.

```
allD = T.Data;
```

For the test plan object T, this example returns a 1x1 array if the test plan has a data object attached, and 0x1 otherwise.

See Also

CreateData | RemoveData | CopyData

DataFileTypes

Data file types

Syntax

```
f = mbcmodel.DataFileTypes
```

Description

This is a function to return a list of data file types for mbcmodel.

Examples

```
f = mbcmodel.DataFileTypes

f =

Columns 1 through 4
   'Excel file' 'FT/DB data files' 'Delimited Text File'
[1x25 char]
Column 5
   'MATLAB Data File'
```

See Also

ImportFromFile | CreateData

Introduced in R2007a

DefaultModels

Default models for test plan

Syntax

testplan.DefaultModels

Description

This is a read-only property of mbcmodel.testplan. It returns a cell array of mbcmodel.model objects (one array for each stage).

Examples

To get the default model objects for use in creating a response, enter:

```
models = T.DefaultModels
LocalModel = CreateModel(models{1}, 'Local Polynomial Spline');
GlobalModel = CreateModel(models{2}, 'RBF');
R = CreateResponse(T, 'TQ', LocalModel, GlobalModel, 'Maximum')
```

See Also

CreateResponse | modelinput

DefineNumberOfRecordsPerTest

Define exact number of records per test

Syntax

```
D = DefineNumberOfRecordsPerTest(D, number, testnumAlias)
```

Description

This is a method of mbcmodel.data.

You can use this to set one test per record for one-stage modeling.

number is the input specifying the number of records to include in each test. Most usually this will be used to specify one test per record.

testnumAlias is an optional character vector input to define the SignalName that should be used as the testnumber within MBC. Defaults to the index of the test.

Note testnumaAias uses the first record in the test as the testnumber, and testnumbers *are* unique so any duplicates will be modified.

Examples

```
DefineNumberOfRecordsPerTest(D, 1);
DefineNumberOfRecordsPerTest(D, 10, 'MYLOGNO');
```

See Also

DefineTestGroups

DefineTestGroups

Define rule-based test groupings

Syntax

D = DefineTestGroups(D, variables, tolerances, testnumAlias, reorder)

Description

This is a method of mbcmodel.data.

You can impose rules to collect records of the current dataset (D) into groups; these groups are referred to as **tests**. Test groupings are used to define hierarchical structure in the data for two-stage modeling.

Select a variable or variables to group by and set tolerances. The tolerance is used to define groups: on reading through the data, when the value of any specified variable changes by more than the tolerance, a new group is defined.

variables is the input cell array of character vectors holding the SignalNames on which to define the test groupings.

tolerances is the input double array of the same length as variables holding the required tolerances for the test grouping definition.

testnumAlias is an optional character vector input to define the SignalName that should be used as the testnumber within MBC. Defaults to the index of the test.

Note testnumAlias uses the first record in the test as the testnumber, and testnumbers *are* unique so any duplicates will be modified.

reorder is an optional Boolean indicating that the data should be reordered within the dataset. Defaults to false.

See the section on Test Groupings (under Data) in the Model Browser User's Guide for more information on these inputs.

Examples

```
DefineTestGroups(D, {'AFR' 'RPM'}, [0.1 30], 'MYLOGNO', false);
```

See Also

DefineNumberOfRecordsPerTest | NumberOfTests

designconstraint

Convert boundary model to design constraint

Syntax

C = designconstraint(C)

Description

This is a method of mbcboundary. AbstractBoundary and all its subclasses (e.g., mbcboundary. Model).

C = designconstraint(C) converts the boundary model C to an mbcdoe.designconstraint object. Convert boundary models to use them as a design constraint. You cannot convert the boundary model to a design constraint until it is fitted (Fitted=true).

You can also call mbcdoe.design.AddConstraint directly and the method converts the boundary model object to a mbcdoe.designconstraint object.

See Also

AddConstraint

Introduced in R2009b

Designs

Designs in test plan

Syntax

D = T.Designs

Description

Designs is a property of mbcmodel.testplan.

D = T.Designs returns a cell array of designs in the test plan, T, one element for each level.

When using designs at the command line, designs are treated as an array. In the Design Editor you can build a design tree, where child designs inherit characteristics such as constraints from the parent design. At the command line you can copy and modify designs. By default, designs are added to the top level of the design tree. To build tree structures at the command line, you can use the Parent argument of the AddDesign method to specify the parent design in the design tree. The tree structure cannot be used at the command line any further, but you can use the design tree in the Design Editor after you load the project into the Model Browser.

Examples

```
To get local designs only:
```

LocalDesigns = T.Designs{1}

To get global designs only:

GlobalDesigns = T.Designs{2}

To get the fifth global design:

 $D = T.Design \{2\}(5)$

After modifying the design, you must call <code>UpdateDesign</code>, or reassign to the test plan as follows:

T.Design $\{2\}(5) = D$

See Also

UpdateDesign

DetachData

Detach data from test plan

Syntax

T = DetachData(T)

Description

This is a method of mbcmodel.testplan.

T is the test plan object. A test plan can only use a single dataset, so you do not need to specify the data object.

Examples

DetachData(T1);

See Also

AttachData

DiagnosticStatistics

Diagnostic statistics for response

Syntax

```
S = DiagnosticStatistics(R)
S = DiagnosticStatistics(R, Stats)
S = DiagnosticStatistics(LocalR, TestNumbers)
S = DiagnosticStatistics(LocalR, TestNumbers, Stats)
```

Description

This is a method of the local and response model objects, mbcmodel.localresponse and mbcmodel.response.

The options available are model-specific and are the same options shown in the drop-down menus of the scatter plots (the top plots) in the local and global (response feature) model views of the toolbox GUI.

- S = DiagnosticStatistics(R) returns S, a structural array containing Statistics and Names fields. R is the response or local response model object.
- S = DiagnosticStatistics(R, Stats) allows you to specify Stats, an optional input that defines which diagnostic statistics you want from the available list. If you don't specify Stats, you get all available statistics.
- S = DiagnosticStatistics(LocalR, TestNumbers) returns S for LocalR, a local response object, and Testnumbers specifies the index into tests for local or hierarchical models.

Use S = DiagnosticStatistics(LocalR, TestNumbers, Stats) to specify which diagnostic statistics you want from the available list.

A row is set to NaN if that point is removed.

Examples

```
studentRes = DiagnosticStatistics(local, tn, 'Studentized
residuals');
```

See Also

SummaryStatistics | AlternativeModelStatistics

Discrepancy

Discrepancy value

Syntax

s = Discrepancy(D)

Description

Discrepancy is a method of mbcdoe.design.

s = Discrepancy(D) returns the discrepancy, which is a measure of the deviation from the average point density. Discrepancy is defined over the unconstrained design and is only available for space-filling designs.

See Also

Maximin | Minimax

Introduced in R2008a

DoubleInputData

Data being used as input to model

Syntax

```
X = DoubleInputData(R, TestNumber)
```

Description

This is a method of all model objects: mbcmodel.hierarchicalresponse, mbcmodel.localresponse and mbcmodel.response. It returns an array (X) containing the input data used for fitting the model.

R is the response model object.

TestNumber is an optional input to specify the tests you want.

Examples

```
X = DoubleInputData(R);
x = DoubleInputData(local, tn);
```

See Also

DoubleResponseData

DoubleResponseData

Data being used as output to model for fitting

Syntax

Y = DoubleResponseData(R, TestNumber)

Description

This is a method of all model objects: mbcmodel.hierarchicalresponse, mbcmodel.localresponse and mbcmodel.response. It returns an array (Y) containing the response data used for fitting the model.

R is the response model object.

TestNumber is an optional input to specify the tests you want.

Examples

```
Y = DoubleResponseData(R);
y = DoubleResponseData(local, tn);
```

See Also

DoubleInputData

Evaluate

Evaluate model, boundary model, or design constraint

Syntax

```
Y = Evaluate(M, X)
Y = Evaluate(C, X)
Y = Evaluate(B, X)
```

Description

This is a method of mbcmodel.model,mbcdoe.designconstraint, and boundary model object mbcboundary.AbstractBoundary and all its subclasses.

```
Y = Evaluate(M, X) evaluates the model M at X.
```

Y = Evaluate(C, X) evaluates the design constraint C at X (negative results are within the constraint).

Y = Evaluate(B, X) evaluates the boundary model B at X. X is a matrix with B. NumInputs columns. All boundaries use the form g(x)=0. A positive value indicates that the point is outside the boundary. The method cannot evaluate a boundary model until it is fitted.

X is a (numpoints-by-nfactors) array.

Y is a (numpoints-by-1) array.

See Also

PredictedValue | PEV

Introduced in R2007a

Export

Make command-line or Simulink export model

Syntax

```
ExportedModel = Export(MODEL)
ExportedModel = Export(MODEL, Format)
```

Description

This is a method of these model objects: mbcmodel.hierarchicalresponse, mbcmodel.localresponse, mbcmodel.response and mbcmodel.model.

ExportedModel = Export(MODEL) exports the model to MATLAB software. ExportedModel is an xregstatsmodel object, that you can use to evaluate the model and calculate the prediction error variance. If you convert an mbcmodel.localresponse object and you have not created a two-stage model (hierarchical response object), then the output is an mbcPointByPointModel object that you can use to evaluate the model and calculate the prediction error variance.

ExportedModel = Export(MODEL, Format) exports the model in the specified format, which can be 'MATLAB' or 'Simulink'.

Format must be 'MATLAB' or 'Simulink'; an error will be thrown if this is incorrect.

You can evaluate models exported to the MATLAB workspace in the same way as when you export them from the Model Browser. You can save these models as a *.mat file and load them into CAGE.

Model is the object containing the response models from the node you are exporting from.

Examples

```
M = Export(R2, 'MATLAB');
mbt_model = Export(maxTQ, 'MATLAB');
```

See Also

xregstatsmodel

ExportToMBCDataStructure

Export data to MBC data structure

Syntax

mbcStruct = ExportToMBCDataStructure(D)

Description

This is a method of mbcmodel.data.

It converts the specified data object (D) to the MBC Data Structure format.

An MBC Data Structure is a structure array that contains the following fields:

- varNames is a cell array of character vectors that hold the names of the variables in the data (1xn or nx1).
- varUnits is a cell array of character vectors that hold the units associated with the variables in varNames (1xn or nx1). This array can be empty, in which case no units are defined.
- data is an array that holds the values of the variables (m x n).
- comment is an optional character vector holding comment information about the data.

Examples

X = ExportToMBCDataStructure(D1);

See Also

 ${\tt ImportFromMBCDataStructure}$

ExportToTable

Export data to table

Syntax

table = ExportToTable(D)

Description

This is a method of mbcmodel.data.

Converts the data object (D) to a table object.

Examples

table = ExportToTable(D);

See Also

CreateData | ImportFromTable

Introduced in R2019a

Filename

Full path to project file

Syntax

Name = P.Filename

Description

This is a property of mbcmodel.project.

Examples

Name = P.Filename;

Filters

Structure array holding user-defined filters

Syntax

filt = D.Filters

Description

This is a property of mbcmodel.data.

It returns a structure array holding information about the currently defined filters. The array will be the same length as the number of currently defined filters, with the following fields for each filter:

- Expression The character vector expression as defined in AddFilter or ModifyFilter
- AppliedOK Boolean indicating that the filter was successfully applied
- RemovedRecords Boolean vector indicating which records the filter removed. Note that many filters could remove the same record
- Message Character vector holding information on the success or otherwise of the filter

Examples

filt = D.Filters;

See Also

AddFilter | ModifyFilter | RemoveFilter

FindDesign

Find design by name

Syntax

```
D = FindDesign(T,Name)
D = FindDesign(T,Level,Name)
```

Description

FindDesign is a method of mbcmodel.testplan.

D = FindDesign(T, Name) finds a design with a matching name from the test plan T.

Name is a character vector or a cell array of character vectors specifying a design name.

Level is the test plan level. By default the level is the outer level (i.e., Level 1 for one-stage, Level 2 (global) for two-stage).

D = FindDesign(T, Level, Name) finds a design with a matching name from the specified level of the test plan.

Introduced in R2008a

FitAlgorithm

Fit algorithm for model or boundary model

Syntax

F = M.FitAlgorithm

Description

This is a property of mbcmodel.model, and boundary model objects mbcboundary.AbstractBoundary and all subclasses.

An mbcmodel.model.FitAlgorithm object is contained within the FitAlgorithm property of an mbcmodel.model object or mbcboundary object. This object has a Name property, and the following methods: CreateAlgorithm, getAlternativeNames, IsAlternative, SetupDialog, properties.

As a simpler alternative to using CreateAlgorithm, you can assign the algorithm name directly to the algorithm. For example:

```
B.FitAlgorithm.BoundaryPointOptions = 'Boundary Only';
m.FitAlgorithm = 'Minimize PRESS';
```

Case and spaces are ignored.

For properties, see CreateAlgorithm.

Examples

```
To get a fitalgorithm object, F, from a model:
```

```
M = mbcmodel.CreateModel('Polynomial', 4);
F = M.FitAlgorithm

F =
Algorithm: Least Squares
Alternatives: 'Minimize PRESS','Forward Selection','Backward
Selection','Prune'
1x1 struct array with no fields.
```

See Also

CreateAlgorithm | getAlternativeNames | IsAlternative | SetupDialog

fit

Fit model or boundary model to new or existing data, and provide summary statistics

Syntax

```
[model,statistics] = fit(model,X,Y)
[model,statistics] = fit(model)
```

Description

This is a method of mbcmodel.model and mbcboundary.Model.

[model, statistics] = fit(model, X, Y) This fits the model to the specified data. After you have
called fit specifying the data to use, then you can refit the model by calling [model, statistics]
= fit(model).

Examples

```
statistics = fit(knot)
statistics =
    27.0000    7.0000    1.0000    3.0184    2.6584
```

See Also

SummaryStatistics | UpdateResponse

Fitted

Indicate whether boundary model has been fitted

Syntax

Fitted(B)

Description

This is a property of mbcboundary. AbstractBoundary and all its subclasses.

Fitted(B) indicates whether boundary model B has been fitted (read only). You cannot evaluate the boundary model unless fitted equals true.

Introduced in R2009b

FixPoints

Fix design points

Syntax

```
D = FixPoints(D)
D = FixPoints(D,indices)
```

Description

FixPoints is a method of mbcdoe.design.

D = FixPoints(D) fixes all points in the design.

D = FixPoints(D, indices) fixes all points specified by indices.

See Also

PointTypes | RemovePoints

Introduced in R2008a

Generate

Generate new design points

Syntax

```
D = Generate(D)
D = Generate(D, NumPoints)
D = Generate(D, 'Prop1', value1,...)
```

Description

Generate is a method of mbcdoe.design. The Generate method always generates a new design and replaces the existing points (fixed or free).

- D = Generate(D) regenerates the design with the current generator settings (the current design properties and current number of points). It is possible that a different design will result (e.g., for Latin Hypercube Sampling designs).
- D = Generate(D, NumPoints) generates the number of points specified by NumPoints using the current generator settings. You cannot specify the number of points for all design types (e.g., Central Composite, Box Behnken) and therefore the NumPoints second input is not supported for all design types.
- D = Generate(D, 'Prop1', value1,...) generates a new design with the generator specified by the generator property value pairs.

You can use the property value pairs to specify design generator properties (such as the design Type) as part of the Generate command, e.g.,

This is equivalent to the following code setting the properties individually and then assigning the updated generator object to the design:

```
P = OptDesign.Generator;
P.Type = 'V-optimal';
P.CandidateSet.NumberOfLevels(:)=21;
P.MaxIterations = 200;
P.NumberOfPoints = 200;
P.NoImprovement = 50;
OptDesign.Generator = P;
```

You see an error if you try to call Generate when the design Style is User-defined or Experimental data.

For space-filling designs, see also ConstrainedGenerate. Using Generate with constrained space-filling is not guaranteed to produce a design with the specified number of points. Use ConstrainedGenerate instead.

Examples

```
To generate a design with 10 points:
```

```
d = Generate( d, 10 );
```

Note The design Type must have a writable property 'NumberOfPoints' to use this syntax D = Generate(D,NumPoints). See Type (for designs and generators).

To create and generate a 15 point latin hypercube sampling design:

```
globalDesign = TP.CreateDesign(2, 'Type',...
    'Latin Hypercube Sampling');
globalDesign = Generate(globalDesign, 15)
```

To regenerate the design and get a different 15 point latin hypercube sampling design:

```
globalDesign = Generate(globalDesign);
```

To create and generate a halton design with 50 points:

```
haltonDesign = CreateDesign( inputs, 'Type',...
  'Halton Sequence', 'Name', 'Halton' );
haltonDesign = Generate( haltonDesign, 'NumberOfPoints', 50 );
```

To create and generate a halton design with specified scrambling and other properties:

```
haltonDesignWithScrambling = haltonDesign.CreateDesign...
( 'Name', 'Scrambled Halton' );
haltonDesignWithScrambling = Generate...
(haltonDesignWithScrambling,
   'Scramble', 'RR2', 'PrimeLeap', true );
```

To create a full factorial design and specify the number of levels when generating the design:

```
design = CreateDesign( inputs, 'Type', 'Full Factorial' );
design = Generate( design, 'NumberOfLevels', [50 50] );
```

See Also

Augment | CreateDesign | ConstrainedGenerate

Introduced in R2008a

Generator

Design generation options

Syntax

- D.Generator
- D.Generator = NewGenerator

Description

Generator is a property of mbcdoe.design.

- D. Generator returns an mbcdoe.generator object.
- D.Generator = NewGenerator generates a new design based on the new design generator. Design generators provide the properties for all the design types.

The properties you can set depend on the design Type. To view the properties for generating designs, see Properties (for design generators).

Use getAlternativeTypes to get a list of alternative generators.

See Also

Generate | Properties (for design generators) | Type (for designs and generators) | getAlternativeTypes

GetAllTerms

List all model terms

Syntax

Terms = M.Properties.GetAllTerms

Description

This is a method of mbcmodel.linearmodelproperties.

Terms = M.Properties.GetAllTerms returns a list of all terms in this model. M is an mbcmodel.linearmodel object.

Terms is a (*numterms*-by-*nfactors*) array. The (m,n)th element is the power of the nth factor in the mth term.

Examples

The following example creates a model, and finds which terms are quadratic in the first input factor (X1):

See Also

GetIncludedTerms

Introduced in R2007a

getAlternativeNames

List alternative algorithm names

Syntax

```
F.getAlternativeNames
AltList = getAlternativeNames(F)
```

Description

This is a method of mbcmodel.fitalgorithm.

F.getAlternativeNames or AltList = getAlternativeNames(F) return a cell array of alternative algorithm names. F is a mbcmodel.fitalgorithm object.

Examples

```
model = mbcmodel.CreateModel('Polynomial', 2);
F = model.FitAlgorithm;
altAlgs = F.getAlternativeNames

altAlgs =
    'Least Squares' 'Minimize PRESS' 'Forward Selection'
'Backward Selection' 'Prune'
```

See Also

CreateAlgorithm | IsAlternative

Introduced in R2007a

getAlternativeTypes

Alternative model or design types

Syntax

```
list = getAlternativeTypes(Model)
list = getAlternativeTypes(Boundary)
list = getAlternativeTypes(Design)
list = getAlternativeTypes(Design,Style)
list = getAlternativeTypes(DesignGenerator)
list = getAlternativeTypes(DesignGenerator,Style)
list = getAlternativeTypes(CandidateSet)
list = getAlternativeTypes(DesignConstraint)
```

Description

This is a method of

- mbcmodel.model
- All the boundary model objects: mbcboundary.AbstractBoundary and all its subclasses.
- All the design objects: mbcdoe.design, mbcdoe.generator, mbcdoe.candidateset, and mbcdoe.designconstraint.

Models

list = getAlternativeTypes(Model) returns a cell array of alternative model types with the same number of inputs as Model.

Boundary Models

list = getAlternativeTypes(Boundary) returns a list of boundary model types that you can
use as alternative boundary model types for the current boundary model.

Designs

list = getAlternativeTypes(Design) returns a list of design types, which you can use as
alternative designs for current design.

list = getAlternativeTypes(Design,Style) returns a list of design types of the specified style. The design style requires a type of 'Space-Filling', 'Classical' or 'Optimal'.

Design Generators

list = getAlternativeTypes(DesignGenerator) returns a list of design generator types that
you can use as alternative designs for current design generator.

list = getAlternativeTypes(DesignGenerator,Style) returns a list of design generator
types of the specified style. The design generator style requires a type of 'Candidate
Set','Space-Filling', 'Classical' or 'Optimal'.

Design Candidate Sets

list = getAlternativeTypes(CandidateSet) is a list of candidate set types that you can use as alternative candidate sets for the current candidate set. You can obtain the candidate set from an optimal design generator or by using mbcdoe.design.CreateCandidateSet.

Design Constraints

list = getAlternativeTypes(DesignConstraint) returns a list of design constraint types.

Examples

```
model = mbcmodel.CreateModel('RBF', 2);
altmodels = getAlternativeTypes(model)

This produces the output:
altmodels =
   Columns 1 through 6
   'Polynomial' 'Hybrid Spline' 'RBF' 'Polynomial-RBF'
   'Hybrid Spline-RBF' 'Multiple Linear'

Columns 7 through 8
   'Neural Network' 'Transient'
```

See Also

Type (for models) | CreateModel

Introduced in R2007a

GetIncludedTerms

List included model terms

Syntax

Terms = M.Properties.GetIncludedTerms

Description

This is a method of mbcmodel.linearmodelproperties.

Terms = M.Properties.GetIncludedTerms returns a list of those terms that will be used to fit the model. M is an mbcmodel.linearmodel object.

Terms is a (numincludedterms-by-nfactors) array. The (m,n)th element is the power of the nth factor in the mth included term.

Examples

```
>>model = mbcmodel.CreateModel('Polynomial', 2);
>>includedterms = model.Properties.GetIncludedTerms;
>>xlquadraticterms = find(includedterms(:,1)==2)
xlquadraticterms =
4
8
```

See Also

GetAllTerms | SetTermStatus

Introduced in R2007a

getLocalBoundary

Local boundary model for operating point

Syntax

getLocalBoundary(B)

Description

This is a method of mbcboundary. TwoStage.

getLocalBoundary(B) returns the definition of the local boundary model.

Introduced in R2009b

GetTermLabel

List labels for model terms

Syntax

```
Labels = M.Properties.GetTermLabel
Labels = M.Properties.GetTermLabel( Terms )
Labels = M.Properties.GetTermLabel( Terms, 'Format',OutputFormat )
```

Description

This is a method of mbcmodel.linearmodelproperties, which returns a user-friendly label for one or more specified terms.

```
Labels = M.Properties.GetTermLabel lists the labels.
```

```
Labels = M.Properties.GetTermLabel( Terms ) lists the labels with the specified terms.
```

Labels = M.Properties.GetTermLabel(Terms, 'Format',OutputFormat) lists the labels with the specified terms and format.

M is an mbcmodel.linearmodel object.

The specified terms form a row where each value gives the power of that parameter. OutputFormat can be 'List' or 'Formula'.

Examples

```
model = mbcmodel.CreateModel('Polynomial', 2);
model.Properties.GetTermLabel([1 2; 1 0] )
produces {'X1*X2^2';'X1'} and
model.Properties.GetTermLabel([1 2; 1 0], 'Format', 'Formula' )
produces 'X1*X2^2 + X1'.
```

See Also

GetAllTerms | GetIncludedTerms

Introduced in R2007a

GetTermStatus

List status of some or all model terms

Syntax

```
Status = M.Properties.GetTermStatus
Status = M.Properties.GetTermStatus(Terms)
```

Description

This is a method of mbcmodel.linearmodelproperties.

Status = M.Properties.GetTermStatus returns the status of all of the terms in this model. Status is a cell array of status character vectors. M is an mbcmodel.linearmodel object.

Status = M.Properties.GetTermStatus(Terms) returns the status of the specified terms in this model.

The stepwise status for each term can be 'Always', 'Never' or 'Step'. The status determines whether you can use the StepwiseRegression function to throw away terms in order to try to improve the predictive power of the model.

Examples

```
model = mbcmodel.CreateModel('Polynomial', 2);
Get status of X2³ term:
status = model.Properties.GetTermStatus([0 3])
status =
    'Step'
Get status of all terms linear in X1:
status = model.Properties.GetTermStatus([1 0; 1 1; 1 2])
status =
    'Step'
    'Step'
    'Step'
    'Step'
    'Step'
    'Step'
```

See Also

SetTermStatus | StepwiseStatus

Introduced in R2007a

Global

Global boundary model tree

Syntax

Global(B)

Description

This is a property of mbcboundary. TwoStageTree.

Global (B) The Global property contains a global boundary model tree (read only).

The toolbox fits boundary models in the global model boundary tree with one point per test (the average value of the global variables for that test).

Introduced in R2009b

GlobalModel

Interpolating global boundary model definition

Syntax

B.GlobalModel

Description

This is a property of mbcboundary. TwoStage.

 $\hbox{{\tt B.GlobalModel}\ returns\ the\ definition\ of\ global\ boundary\ model.\ Global{\tt Model}\ requires\ the\ type\ Interpolating\ RBF.}$

ImportFromFile

Load data from file

Syntax

```
D = ImportFromFile(D, filename, filetype)
D = ImportFromFile(D, filename, 'Excel file', SHEETNAME)
```

Description

This is a method of the mbcmodel.data object.

First you must use CreateData, than BeginEdit before you can call ImportFromFile to bring data into your new data object, D, as follows:D = ImportFromFile(D, filename, filetype) loads data from the file.

Note that you can specify filename and filetype when you call CreateData as a shortcut for loading data from a file. You still need to call BeginEdit before you can make changes to the data.

filename is a character vector holding the full path to the file to load.

filetype is an optional file type to load. See DataFileTypes for the specification of the allowed file types (and mbccheckindataloadingfcn to specify your own data loading function).

Filetype defaults to 'auto' which will attempt to guess the filetype based on the extension of the file being loaded. i.e. if the file extension is .xls then MBC will try the Excel File Loader.

D = ImportFromFile(D, filename, 'Excel file', SHEETNAME) specifies a sheet name for an Excel file.

Examples

ImportFromFile(D, 'D:\MBCData\Raw Data\testdata.xls');

See Also

CreateData | DataFileTypes | BeginEdit | ImportFromMBCDataStructure | RemoveData |
Append

ImportFromMBCDataStructure

Load data from MBC data structure

Syntax

D = ImportFromMBCDataStructure(D,mbcStruct)

Description

This is a method of mbcmodel.data.

First you must use CreateData, than BeginEdit before you can bring data into your new data object.

An MBC data structure is a structure array that contains the following fields:

- varNames is a cell array of character vectors that hold the names of the variables in the data (1xn or nx1).
- varUnits is a cell array of character vectors that hold the units associated with the variables in varNames (1xn or nx1). This array can be empty, in which case no units are defined.
- data is an array that holds the values of the variables (m x n).
- comment is an optional character vector holding comment information about the data.

Examples

ImportFromMBCDataStructure(D, mbcStruct);

See Also

ImportFromFile | CreateData | BeginEdit | RemoveData | Append |
ExportToMBCDataStructure

ImportFrom Table

Load data from a table object

Syntax

D = ImportFromTable(D,tableobject)

Description

This is a method of mbcmodel.data.

tableobject is a table object.

Examples

ImportFromTable(D,tableobject);

See Also

CreateData | ExportToTable

Introduced in R2019a

InBest

Boundary models selected as best

Syntax

mbcboundary.Tree.InBest

Description

This is a property of mbcboundary. Tree and mbcboundary. TwoStageTree.

mbcboundary.Tree.InBest Specify a logical array indicating which boundary models to select as best.

You can combine models into a single boundary model for the boundary tree. The logical array specifies which models to include in the best boundary model. The BestModel property gives the best boundary model for the boundary tree.

Including boundary models InBest corresponds to combining boundary models in best in the Boundary Editor. For further information, see "Combining Best Boundary Models" in the Model Browser documentation.

See Also

BestModel

InputData

Input data for model

Syntax

D = M.InputData

Description

This is a property of mbcmodel.model. It returns an array of the input variable data currently in the model.

Examples

D = knot.InputData;

See Also

OutputData

Inputs

Inputs for test plan, model, boundary model, design, or constraint

Syntax

testplan.Inputs
model.Inputs
design.Inputs
boundary.Inputs

Description

This is a property of mbcmodel.testplan, mbcmodel.model, mbcdoe.design, mbcdoe.designconstraint, and boundary model object mbcboundary.AbstractBoundary and all its subclasses.

For mbcmodel.testplan, this property returns a cell array of mbcmodel.modelinput objects (one array for each stage). You cannot change the number of stages after creation of the test plan.

For mbcmodel.model and mbcboundary objects, this property returns an mbcmodel.modelinput object. You cannot edit this object when it is attached to a response. You cannot change number of inputs after creation.

In both cases, verification of valid variable names and symbols occurs before assigning inputs to model at the command line. Names and Symbols must be unique.

Boundary model inputs use an array of mbcmodel.modelinput objects. You set the number of boundary model inputs when you create the boundary model. You can change the name, symbol, and range of the inputs.

For mbcdoe.design, D.Inputs = NewInputs updates the inputs. You cannot change the number of design inputs. Many designs have Limits properties in addition to model input ranges. These properties allow you to restrict the range of the design without changing the model or losing points via a constraint.

See Also

CreateTestplan | modelinput

InputSetupDialog

Open Input Setup dialog box to edit inputs

Syntax

[NEWMODEL, OK] = InputSetupDialog(OLDMODEL)
[NEWTESTPLAN, OK] = InputSetupDialog(OLDTESTPLAN)

Description

This is a method of mbcmodel.model and mbcmodel.testplan.

[NEWMODEL, OK] = InputSetupDialog(OLDMODEL) opens the Input Setup dialog box, where you can edit the model inputs (names, symbols, and ranges).

[NEWTESTPLAN, OK] = InputSetupDialog(OLDTESTPLAN) opens the Input Setup dialog box, where you can edit the test plan inputs (names, symbols, and ranges).

If you click Cancel to dismiss the dialog box, OK = false and NEWMODEL = OLDMODEL. If you click OK to close the dialog box, then OK = true and NEWMODEL is your new chosen model setup. The new model is refitted when you click OK.

Introduced in R2007a

InputSignalNames

Names of signals in data that are being modeled

Syntax

inputs = A.InputSignalNames

Description

This is a property of mbcmodel.testplan and the modeling objects mbcmodel.hierarchicalresponse, mbcmodel.localresponse and mbcmodel.response.

A can be a test plan (T) or model (L, R, HR) object.

Examples

```
inputs = T.'InputSignalNames;
InputFactors = thisRF.InputSignalNames';
```

See Also

SignalNames

InputsPerLevel

Number of inputs at each level in model

Syntax

L = T.InputsPerLevel

Description

This is a property of mbcmodel.testplan.

This is a vector of length Levels. Each element defines the number of inputs at that level. See "Understanding Model Structure for Scripting" for an explanation of the levels in a test plan.

Examples

```
L = T.InputsPerLevel
L = 2 4
```

This answer means the test plan T has 2 local inputs and 4 global inputs.

See Also

Levels | Level

IsAlternative

Test alternative fit algorithm

Syntax

OK = IsAlternative(F1, F2)

Description

This is a method of mbcmodel.fitalgorithm.

OK = IsAlternative(F1, F2) tests whether F is an alternative mbcmodel.fitalgorithm for

See Also

CreateAlgorithm | getAlternativeNames

Introduced in R2007a

IsBeingEdited

Boolean signaling if data or model is being edited

Syntax

OK = D.IsBeingEdited

Description

This is a property of mbcmodel.data and mbcmodel.model.

This Boolean property indicates that the data or model is currently being edited.

For data, it also indicates that previously there was a successful call to <code>BeginEdit</code> and hence that whatever changes have been applied can be undone by calling <code>RollbackEdit</code>. It does not indicate that a call to <code>CommitEdit</code> will necessarily succeed. See <code>CommitEdit</code> for an example of this case.

Examples

```
OK = D.IsBeingEdited;
OK = knot.IsBeingEdited;
```

See Also

BeginEdit | IsEditable | CommitEdit | RollbackEdit

IsEditable

Boolean signaling whether data is editable

Syntax

OK = D.IsEditable

Description

This is a property of mbcmodel.data.

This Boolean property indicates if a particular piece of data is editable. The following rules apply:

- If the data was created using mbcmodel.CreateData and was not Attached to a test plan it is editable.
- If the data was created or retrieved from the project and was not Attached to a test plan it is editable.
- If the data was Attached to a test plan and was subsequently retrieved from that test plan it is editable.

Examples

```
D = p.Data;
D1 = p.Data;
BeginEdit(D1);
tp = p.Testplan;
Attach(tp, D);
```

Where p is an mbcmodel.project object, and D and D1 are mbcmodel.data objects.

At this point D1. IsEditable becomes false because D1 is now Attached to the test plan and hence can only be modified from the test plan. If you now enter:

```
OK = D1.IsEditable
```

the answer is false.

See Also

BeginEdit | IsBeingEdited | CommitEdit | RollbackEdit

Jacobian

Calculate Jacobian matrix for model at existing or new X points

Syntax

J = Jacobian(model, optional X)

Description

This is a method of mbcmodel.model.

This calculates the Jacobian matrix for the model at existing or new X points. If X is not specified then the existing data is used. The Jacobian is the regression matrix for linear models and RBF models.

The Jacobian matrix (for linear and RBF models) is the same as the Regression Matrix in the Design Evaluation Tool GUI. These matrices only include the terms currently selected in the model.

If all terms are included (none removed by Stepwise) then the Jacobian (for linear and RBF models) is the same as the Full FX matrix found in the Design Evaluation Tool GUI. The Jacobian matrix only includes the currently selected model terms.

To determine the condition number, use the MATLAB command cond(J).

Examples

J = Jacobian(knot)

Introduced before R2006a

Level

Level in test plan of response

Syntax

level = R.Level

Description

This is a property for all model objects: mbcmodel.hierarchicalresponse, mbcmodel.localresponse and mbcmodel.response.

R is the response for which you want the level.

The level is usually 0 for hierarchical models, usually 1 for local models, and usually 2 or 1 for response models. See "Understanding Model Structure for Scripting" for an explanation of what Level indicates about a response.

Examples

level = R.Level;

See Also

Levels

Levels

Number of levels in hierarchical model

Syntax

levels = T.Levels

Description

This is a property of mbcmodel.testplan.

See "Understanding Model Structure for Scripting" for an explanation of what Levels mean.

Examples

levels = T.Levels;

See Also

Level

Load

Load existing project file

Syntax

```
P = Load(P, Filename)
```

Description

This is a method of mbcmodel.project.

P is a project object, and Filename is the full path to the project you want to load.

Examples

```
P2 = Load(P2, 'D:/MBCwork/TQproject2.mat');
```

See Also

New

Introduced before R2006a

LoadProject

Load mbcmodel.project

Syntax

P = mbcmodel.LoadProject(filename)

Description

P = mbcmodel.LoadProject(filename) loads a mbcmodel.project from the file filename.

See Also

CreateProject | Load

Introduced in R2007a

Local

Local boundary model tree

Syntax

Description

This is a property of mbcboundary. TwoStageTree.

The Local property contains a local boundary model tree (read only).

Point-by-point and two-stage boundary models are fitted in the local boundary model tree. These boundary models fit local boundary models for each operating point and combine into a single boundary model that includes the global inputs.

LocalBoundaries

Array of local boundary models for each operating point

Syntax

LocalBoundaries(B)

Description

This is a property of mbcboundary.PointByPoint.

LocalBoundaries (B) returns a cell array of local boundary models for each operating point (read only).

LocalModel

Definition of local boundary model

Syntax

B.LocalModel

Description

This is a property of mbcboundary.PointByPoint and mbcboundary.TwoStage.

B.LocalModel returns the definition of the local boundary model for every operating point.

For mbcboundary. TwoStage, LocalModel requires a type of either Range or Ellipsoid.

For mbcboundary.PointByPoint, the LocalModel type can be any valid type for mbcboundary.Model (such as Range, Ellipsoid, Star-shaped, or Convex Hull).

LocalModel Properties

Edit local model properties

Syntax

Props = localmodel.Properties

Description

This is a property of the mbcmodel.localmodel object, which is a subclass of mbcmodel.model.

See "Understanding Model Structure for Scripting" for an explanation of the relationship between the different response types.

Every local model object has an mbcmodel.modelproperties object (within the Properties property). In this object, each local model type has specific properties, as described in the following tables.

Local Polynomial Properties

Property	Description	
Order	Polynomial order (vector int: {[0,Inf],2})	
InteractionOrder	Maximum order of interaction terms (int: [0,Inf])	
TransformInputRange	Transform inputs (Boolean)	
ParameterNames	List of parameter names (read-only)	
StepwiseStatus	<pre>Stepwise status {'Always', 'Never', 'Step'} (cell)</pre>	
Transform	Transform function (char) or empty ('')	
CovarianceModel	Covariance Model (enum: {'None','Power', 'Exponential','Mixed'})	
CorrelationModel	Correlation Model (enum: {'None','MA(1)','AR(1)', 'AR(2)'})	

Local Hybrid Spline Properties

Property	Description	
Order	Spline and polynomial order (vector int: {[0,3],2})	
SplineVariable	Spline variable	
SplineInteraction	Order of interaction between spline and polynomial (int: [0,3])	
Knots: Position of knots (vector real)	ParameterNames: List of parameter names (readonly)	
StepwiseStatus	Stepwise status {'Always','Never','Step'} (cell)	
Transform	Transform function (char) or empty ('')	
CovarianceModel	Covariance Model (enum: {'None','Power', 'Exponential','Mixed'})	
CorrelationModel	Correlation Model (enum: {'None','MA(1)','AR(1)', 'AR(2)'})	

Local Polynomial Spline Properties

Property	Description	
HighOrder	Polynomial order above knot (int: [2,Inf])	
LowOrder	Polynomial order below knot (int: [2,Inf])	
Transform	Transform function (char) or empty ('')	
CovarianceModel	Covariance Model (enum: {'None','Power', 'Exponential','Mixed'})	
CorrelationModel	Correlation Model (enum: {'None','MA(1)','AR(1)', 'AR(2)'})	
DatumType	Datum Type (enum: {'None','Maximum','Minimum', 'Linked'})	

Local Polynomial With Datum Properties

Property	Description
Order	Polynomial order (int: [0,Inf])
Transform	Transform function (char) or empty ('')
CovarianceModel	Covariance Model (enum: {'None', 'Power', 'Exponential', 'Mixed'})
CorrelationModel	Correlation Model (enum: {'None','MA(1)','AR(1)', 'AR(2)'})
DatumType	<pre>Datum Type (enum: {'None','Maximum','Minimum', 'Linked'})</pre>

Local Free Knot Spline Properties

Property	Description
Order	Spline Order (int: [0,Inf])
NumKnots	Number of knots (int: 'Positive')
Transform	Transform function (char) or empty ('')
CovarianceModel	Covariance Model (enum: {'None', 'Power',
	'Exponential','Mixed'})
CorrelationModel	Correlation Model (enum: {'None','MA(1)','AR(1)', 'AR(2)'})

Local Truncated Power Series Properties

Property	Description	
Order	Polynomial order (int: 'Positive')	
NumKnots	Number of knots (int: 'Positive')	
Transform	Transform function (char) or empty ('')	
CovarianceModel	Covariance Model (enum: {'None','Power', 'Exponential','Mixed'})	
CorrelationModel	Correlation Model (enum: {'None','MA(1)','AR(1)', 'AR(2)'})	

Local Growth Properties

Property	Description	
Model	<pre>Growth model (enum: {'expgrowth', 'gomp', 'logistic', 'logistic4', 'mmf', 'richards', 'weibul'})</pre>	
AlternativeModels	List of growth models (read-only)	
Transform	Transform function (char) or empty ('')	
TransformBothSides	Transform both sides (Boolean)	
CovarianceModel	Covariance Model (enum: {'None','Power', 'Exponential','Mixed'})	
CorrelationModel	Correlation Model (enum: {'None','MA(1)','AR(1)','AR(2)'})	

Local User-Defined Properties

Property	Description
Model	Name of user-defined model (enum: {'exponential'})
AlternativeModels	List of registered user-defined models (read-only)
Transform	Transform function (char) or empty ('')
TransformBothSides	Transform both sides (Boolean)
CovarianceModel	Covariance Model (enum: {'None','Power', 'Exponential','Mixed'})
CorrelationModel	Correlation Model (enum: {'None','MA(1)','AR(1)', 'AR(2)'})

Local Transient Properties

Property	Description	
Model	Name of transient model (enum: {'fuelPuddle'})	
AlternativeModels	List of registered transient models (read-only)	
Transform	Transform function (char) or empty ('')	
TransformBothSides	Transform both sides (Boolean)	
CovarianceModel	Covariance Model (enum: {'None','Power', 'Exponential','Mixed'})	
CorrelationModel	Correlation Model (enum: {'None','MA(1)','AR(1)', 'AR(2)'})	

Local Multiple Models Properties

Property	Description
ModelCandidates	List of candidate models (cell)
SelectionStatistic	Selection statistic for automatic model selection (char). See below for input names and descriptions. The list of valid statistics is the summary statistics in common with all model candidates (e.g., if an interpolating RBF is one of the candidates, only RMSE will be available).
AutomaticInputRanges	Use data range as model input ranges (Boolean)
Transform	Transform function (char) or empty ('')

Model Type	List of SelectionStatistic Inputs
Polynomial, Hybrid Spline, RBF, Hybrid RBF	'PRESS RMSE','RMSE','GCV','Weighted PRESS','-2logL','AIC','AICc', 'BIC','R^2','R^2 adj', 'PRESS R^2','DW','Cp','cond(J)'
Neural Network	'RMSE','R^2','R^2 adj','-2logL','AIC','AICc','BIC'
Free Knot Spline	'PRESS RMSE', 'RMSE', 'GCV', 'Weighted PRESS', '-2logL', 'AIC', 'AICc', 'BIC', 'R^2', 'R^2 adj', 'PRESS R^2', 'DW', 'Cp'
Interpolating RBF	'RMSE'

SelectionStatistic Input Argument	Description	
'PRESS RMSE'	Predicted Standard Error	'sqrt(PRESS/N)'
'RMSE'	Root Mean Square Error	'sqrt(SSE/(N-p))'

SelectionStatistic Input Argument	Description	
'GCV'	Generalized Cross-validation Variance	'N*SSE/(N-p)^2'
'Weighted PRESS'	Weighted Predicted Standard Error	'sqrt(PRESS/(N-p-1))'
'-2logL'	-2 * log likelihood	'N*log(SSE/N)'
'AIC'	Akaike Information Criteria	'-2logL + 2*(p+1)'
'AICc'	Small Sample Akaike Information Criteria	'-2logL + 2(p+1)*N/(N- p)'
'BIC'	Bayesian Information Criteria	'-2logL + 2*log(N)*(p +1)'
'R^2'	R^2	'1 - SSE/SST'
'R^2 adj'	Adjusted R^2	'1 - SSE/SST*(N-1)/(N- p)'
'PRESS R^2'	PRESS R^2	'1 - PRESS/SST'
'DW'	Durbin-Watson Statistic	'sum((e_i-e_{i+1})^2)/ sum(e_i^2) '
'Cp'	Mallow's Statistic	'SSE/(SSEmax/(N-pmax)) - N + 2*p'
'cond(J)'	Condition of Regression Matrix	'cond(J)'

Local Average Fit Properties

Property	Description	
Model	[1x1 mbcmodel.linearmodel]	
Transform	Transform function (char) or empty ('')	

Examples

To create a local model object, create a model specifying any model Type that begins with the word "local", e.g.,

```
L = mbcmodel.CreateModel('Local Polynomial',2);
```

To show properties, at the command line enter:

To set the Order property to a quadratic, enter:

To update the local model, the properties object must be reassigned to the model as follows:

```
>> L.Properties = P
L =

CreateModel|Type (for models)|ResponseFeatures(Local Model)

LocalResponses

Array of local responses for response

Syntax

local = response.LocalResponses

Description

This is a property of the mbcmodel.hierarchicalresponse object.

It returns the local model response objects that belong to the hierarchical response R.

See "Understanding Model Structure for Scripting" for an explanation of the relationship between the different response types.

Examples

local = response.LocalResponses;

MakeHierarchicalResponse

Build two-stage model from response feature models

Syntax

OK = MakeHierarchicalResponse(L,MLE)

Description

This method of mbcmodel.localresponse builds a two-stage model from the response feature models and optionally runs MLE (Maximum Likelihood Estimation). If there are more response features than the number of parameters in the local model, the subset of response features that leads to the best hierarchical response is chosen. The best hierarchical response is chosen using PRESS RMSE (root mean square prediction error — see "PRESS statistic") if all the response feature models are linear. Otherwise, the best hierarchical response is chosen using Two-stage RMSE.

This performs a similar function to ChooseAsBest for response models. You can call MakeHierarchicalResponse directly or indirectly by calling CreateAlternativeModels for a local model. If you call CreateAlternativeModels for a local model, MakeHierarchicalResponse is called automatically.

If the local and response models are not ready to calculate a two-stage model, an error is generated. This situation can occur if you have created alternative models and not chosen the best. A sufficient number of response features models to calculate the two-stage model must be selected.

L is the local model object.

MLE can be true or false. If true, MLE will be calculated.

Examples

OK = MakeHierarchicalResponse(L, true)

See Also

ChooseAsBest

Introduced before R2006a

MatchInputs

Match design constraint inputs

Syntax

```
C = MatchInputs(C,DesignInputs)
C = MatchInputs(C,DesignInputs,mapping)
```

Description

MatchInputs is a method of mbcdoe.designconstraint. Use it to match inputs for constraints from different sources.

```
C = MatchInputs(C, DesignInputs) matches DesignInputs and inputs in C.
```

C = MatchInputs(C,DesignInputs,mapping) matches inputs where mapping defines the relationship between the inputs in C, and DesignInputs.

Examples

A design constraint does not have required inputs EXH_RET and INT_ADV. Use MatchInputs to match the constraint inputs to the design inputs as follows:

```
c = BoundaryModel(p.Testplans, 'all')
Star(N-3.5e+003, L-0.54)
originalInputs=c.Inputs
originalInputs =
   SPEED (N) [rpm] [500,6000]
   LOAD (L) [%] [0.06,0.95]
designInputs = Design.Inputs
designInputs =
   SPEED (N) [rpm] [500,6000]
   LOAD (L) [%] [0.06,0.95]
   EXH_RET (ECP) [DegCrank] [-5,50]
   INT_ADV (ICP) [DegCrank] [-5,50]
c2=MatchInputs(c,designInputs,[1 2]);
newInputs=c2.Inputs
newInputs =
   SPEED (N) [rpm] [500,6000]
   LOAD (L) [%] [0.06,0.95]
   EXH RET (ECP) [DegCrank] [-5,50]
   INT_ADV (ICP) [DegCrank] [-5,50]
```

CreateConstraint

Introduced in R2008a

Maximin

Maximum of minimum of distance between design points

Syntax

s = Maximin(D)

Description

Maximin is a method of mbcdoe.design.

s = Maximin(D) returns the maximum of the minimum distance between design points. Maximin is defined over the unconstrained design and is only available for space-filling design types.

See Also

Minimax

Introduced in R2008a

mbcboundary.AbstractBoundary

Base boundary model class

Description

Do not use this class directly because the mbcboundary. AbstractBoundary class is the base class for all boundary model classes in the Model-Based Calibration Toolbox software.

The following subclasses inherit all the properties and methods of the mbcboundary. AbstractBoundary class:

- mbcboundary.Model
- mbcboundary.Boolean
- mbcboundary.PointByPoint
- mbcboundary.TwoStage

Properties of mbcboundary. AbstractBoundary

Fit algorithm for model or boundary model

Fitted Indicate whether boundary model has been fitted

Inputs Inputs for test plan, model, boundary model, design, or constraint

Name of object

NumInputs Number of model, boundary model, or design object inputs

Type (for boundary models) Boundary model type

Methods of mbcboundary. AbstractBoundary

Create Boundary Create boundary model

designconstraint Convert boundary model to design constraint

Evaluate Evaluate model, boundary model, or design constraint

getAlternativeTypes Alternative model or design types

mbcboundary.Boolean

Boolean boundary model class

Description

You can create Boolean boundary models, which are useful as design constraints, in two ways. You can either use logical operators $(&,|,\sim)$ on other boundary models, or you can include more than one boundary model in the best boundary model for a boundary tree. If you combine boundary models using logical operators you cannot add the resulting Boolean boundary model to a boundary tree.

When working in projects, you can combine boundary models by including them InBest. For example, you can use subsets of input factors to build boundary models (see ActiveFactors). You can then combine the subset boundary models for the most accurate boundary. This approach can provide more effective results than including all inputs. If the BestModel property of the boundary tree includes more than one boundary model, then the boundary model is an mbcboundary.Boolean object.

This class is a subclass of mbcboundary. AbstractBoundary.

Properties of mbcboundary.Boolean

Fit Algorithm Fit algorithm for model or boundary model

Fitted Indicate whether boundary model has been fitted

Inputs Inputs for test plan, model, boundary model, design, or constraint

Name of object

NumInputs Number of model, boundary model, or design object inputs

Type (for boundary models) Boundary model type

Methods of mbcboundary.Boolean

Create Boundary Create boundary model

designconstraint Convert boundary model to design constraint

Evaluate model, boundary model, or design constraint

getAlternativeTypes Alternative model or design types

mbcboundary.Model

Boundary model class

Description

The mbcboundary.Model class represents the basic boundary model types in the Model-Based Calibration Toolbox software.

You can fit boundary models in mbcmodel projects using the boundary tree class mbcboundary. Tree, or you can fit boundary models directly to data.

You can combine boundary models using the logical operators &, | and ~.

This class is a subclass of mbcboundary. AbstractBoundary.

Properties of mbcboundary. Model

Active Inputs Active boundary model inputs

Fit algorithm Fit algorithm for model or boundary model

Fitted Indicate whether boundary model has been fitted

Inputs Inputs for test plan, model, boundary model, design, or constraint

Name of object

NumInputs Number of model, boundary model, or design object inputs

Type (for boundary models) Boundary model type

Methods of mbcboundary. Model

CreateBoundary Create boundary model

designconstraint Convert boundary model to design constraint

Evaluate Evaluate model, boundary model, or design constraint

fit Fit model or boundary model to new or existing data, and provide summary

statistics

getAlternativeTypes Alternative model or design types

mbcboundary.PointByPoint

Point-by-point boundary model class

Description

You can only create and fit point-by-point boundary models in the local boundary tree in two ways. You can use either a two-stage test plan or an existing boundary of type, either 'Point-by-point' or 'Two-stage'. You cannot create or fit these types of boundary models outside a project. Fit them by adding to the boundary model to the boundary tree.

A separate boundary model is fitted to each operating point. Point-by-point boundary models are only valid at the observed operating points.

This class is a subclass of mbcboundary. AbstractBoundary.

Properties of mbcboundary.PointByPoint

Fit algorithm Fit algorithm for model or boundary model

Fitted Indicate whether boundary model has been fitted

Inputs Inputs for test plan, model, boundary model, design, or constraint

LocalBoundaries Array of local boundary models for each operating point

LocalModel Definition of local boundary model

Name of object

NumInputs Number of model, boundary model, or design object inputs

Operating Points Model operating point sites

Type (for boundary models) Boundary model type

Methods of mbcboundary.PointByPoint

Create Boundary Create boundary model

designconstraint Convert boundary model to design constraint

Evaluate Evaluate model, boundary model, or design constraint

getAlternativeTypes Alternative model or design types

mbcboundary.Tree

Boundary tree class

Description

The boundary Tree is a container for all the boundary models you create. You access the boundary tree from the Boundary property of mbcmodel.testplan. The root of the boundary tree for a one-stage test plan is an mbcboundary. Tree object. The root of the boundary tree for a two-stage test plan is a mbcboundary. TwoStageTree, and this object has mbcboundary. Tree objects in its Local, Global and Response properties.

Use the Models and BestModel properties of the boundary Tree to access your boundary models.

Properties of mbcboundary. Tree

BestModel Combined best boundary models

Data Array of data objects in project, boundary tree, or test plan

InBest Boundary models selected as best

Models Array of boundary models

TestPlan Test plan containing boundary tree

Methods of mbcboundary. Tree

Add boundary model to tree and fit to test plan data

Create Boundary Create boundary model

Remove Remove project, test plan, model, or boundary model
Update Update boundary model in tree and fit to test plan data

mbcboundary.TwoStage

Two-stage boundary model class

Description

You can only create and fit two-stage boundary models in the local boundary tree in two ways. You can use a two-stage test plan or an existing boundary of type, either 'Point-by-point' or 'Two-stage'. You cannot create or fit these types of boundary models outside a project. Fit them by adding the boundary model to the boundary tree.

Local boundary model parameters are fitted using interpolating RBFs for global inputs. Two-stage boundary models are valid at any operating point.

This class is a subclass of mbcboundary. AbstractBoundary.

Properties of mbcboundary. TwoStage

Fit Algorithm Fit algorithm for model or boundary model

Fitted Indicate whether boundary model has been fitted GlobalModel Interpolating global boundary model definition

Inputs Inputs for test plan, model, boundary model, design, or constraint

LocalModel Definition of local boundary model

Name of object

NumInputs Number of model, boundary model, or design object inputs

Type (for boundary models) Boundary model type

Methods of mbcboundary. TwoStage

Create Boundary Create boundary model

designconstraint Convert boundary model to design constraint

Evaluate Evaluate model, boundary model, or design constraint

getAlternativeTypes Alternative model or design types

getLocalBoundary Local boundary model for operating point

mbcboundary.TwoStageTree

Root boundary tree class in two-stage test plans

Description

You access the boundary tree from the Boundary property of mbcmodel.testplan. The root of the boundary tree for two-stage test plans contains boundary trees (mbcboundary.Tree objects) for local, global and response boundary models in the Local, Global and Response properties respectively.

Details of properties:

• Local — Local boundary model tree (read only).

Point-by-point and two-stage boundary models are fitted in the local boundary model tree. These boundary models fit local boundary models for each operating point and combine into a single boundary model that includes the global inputs.

• Global —Global boundary model tree (read only).

Boundary models in the global model boundary tree are fitted with one point per test (the average value of the global variables for that test).

• Response — Response boundary model tree (read only).

Boundary models in the response model boundary tree are fitted with all local and global input data for the test plan.

• BestModel — Best boundary model (local, global, and response) (read only).

BestModel is the boundary model combining the best local, global, and response boundary models. You can select which boundary models to include in the best model with InBest. If the best boundary model includes more than one boundary model, that boundary model is an mbcboundary.Boolean object.

InBest — Logical array indicating which boundary models you selected as best.

You can combine local, global, and response boundary models into a single boundary model for the test plan. The logical array specifies whether to include, in order, the best local, global, and response boundary models, in the best boundary model for the test plan. The BestModel property gives the best boundary model for the test plan.

• TestPlan — Test plan object that contains this boundary tree (read only).

$Properties \ of \ mbcboundary. Two Stage Tree$

BestModel Combined best boundary models
Global Global boundary model tree

InBest Boundary models selected as best

Local boundary model tree
Response Response for model object

TestPlan Test plan containing boundary tree

See Also

mbcPointByPointModel

Class for evaluating point-by-point models and calculating PEV

Description

If you convert an mbcmodel.localresponse object using Export and you have not created a two-stage model (hierarchical response object), then the output is an mbcPointByPointModel object. Point-by-point models are created from a collection of local models for different operating points. mbcPointByPointModel objects share all the same methods as xregstatsmodel except dferror. See xregstatsmodel.

Merge

Merge designs

Syntax

```
D = Merge(D1, D2, ...)
```

Description

Merge is a method of mbcdoe.design.

D = Merge(D1, D2, ...) merges the specified designs D1, D2, etc. into a single design D. The resulting design is a custom design Style.

See Also

Style | Augment

Minimax

Minimum of maximum distance between design points

Syntax

s = Minimax(D)

Description

Minimax is a method of mbcdoe.design.

s = Minimax(D) returns the minimum of the maximum distance between design points. Minimax is defined over the unconstrained design and is only available for space-filling designs.

See Also

Maximin

Model (for designs)

Model for design

Syntax

D.Model = NewModel

Description

Model is a property of mbcdoe.design.

D.Model = NewModel changes the model for the design to NewModel.

The number of inputs cannot be changed. Many designs have Limits properties in addition to model input ranges.

Setting this property changes optimal designs to ${\tt custom}$ if the new model does not support optimal designs.

See Also

Inputs

Model Object

Model object within response object

Syntax

M = response.Model

Description

This is a property of all mbcmodel.response objects.

Each response contains a model object (mbcmodel.model) that can be extracted and manipulated independently of the project.

Extract a model object from any response object (see Response), and then:

- Fit to new data (fit).
- Change model type, properties, and fit algorithm settings (ModelSetup, Type (for models); Properties (for models), CreateAlgorithm).
- Create a copy of the model with the same inputs (CreateModel).
- Include and exclude terms to improve the model (StepwiseRegression).
- Examine coefficient values, predicted values, and regression matrices (ParameterStatistics; PredictedValue; Jacobian).
- If you change the model you need to use UpdateResponse to replace the new model back into the response object in the project. When you use UpdateResponse the new model is fitted to the response data.

Examples

M = response.Model;

ModelForTest

Model for specified test

Syntax

```
model = ModelForTest(L,TestNo);
```

Description

This is a method of mbcmodel.localresponse.

```
model = ModelForTest(L,TestNo); gets the model for test TestNo.
```

Examples

```
To get the model for test 22, enter:
model = ModelForTest(L,22);
```

Introduced in R2007b

modelinput

Create modelinput object

Syntax

```
Inputs = mbcmodel.modelinput('Property1',value1,'Property2',value2,...);
Inputs = mbcmodel.modelinput(NUMINPUTS);
Inputs = mbcmodel.modelinput(INPUTCELLARRAY);
```

Description

This is the constructor for the mbcmodel.modelinput object.

```
Inputs = mbcmodel.modelinput('Property1', value1, 'Property2', value2,...);
creates the mbcmodel.modelinput object.
```

You can set the properties shown in the following table.

Property	Description
Range	[min,max]
NonlinearTransform	{'','1./x','sqrt(x)', 'log10(x)','x.^2', 'log(x)'}
Name	Character vector. Signal name from dataset. Inputs for a test plan must be set before selecting data.
Symbol	Character vector. Short name for plot labels and for use in CAGE.
Units	Character vector. Units are overwritten from the dataset units when a data is selected.

Specify "property, value" pairs as follows:

```
Inputs = mbcmodel.modelinput('Symbol',{'A','B'},...
'Range',{[0 100],[-20 20]});
```

Scalar expansion of properties is supported, e.g.,

```
Inputs = mbcmodel.modelinput('Symbol',{'A','B'},...
'Range',[0 100]);
```

Inputs = mbcmodel.modelinput(NUMINPUTS); creates the mbcmodel.modelinput object with
the specified number inputs.

NUMINPUTS is the number of inputs. Symbols are automatically set to 'X1', 'X2',..., 'Xn'. The default range is [-1,1]. For example:

```
Inputs = mbcmodel.modelinput(2);
```

Inputs = mbcmodel.modelinput(INPUTCELLARRAY); creates the mbcmodel.modelinput
object with INPUTCELLARRAY inputs.

INPUTCELLARRAY is a cell array with one row per input and 5 columns to specify factor names, symbols, ranges and nonlinear transforms as follows.

The columns of INPUTCELLARRAY must be:

- **1** Factor symbol (character vector)
- 2 Minimum (double)
- 3 Maximum (double)
- **4** Transform (character vector) empty for none
- 5 Signal name

These columns are the same as the columns in the Model Factor Setup dialog box, which can be launched from the test plan in the model browser.

Examples

To create a modelinput object with 2 inputs, enter:

```
Inputs = mbcmodel.modelinput(2);
```

To create a modelinput object and define symbols and ranges, enter:

```
Inputs = mbcmodel.modelinput('Symbol',{'A','B'},...
'Range',{[0 100],[-20 20]});
Inputs = mbcmodel.modelinput('Symbol',{'A','B'},...
'Range',[0 100]);
```

To create a modelinput object and define inputs with a cell array, enter:

```
Inputs = mbcmodel.modelinput( {...
'N', 800, 5000, '', 'ENGSPEED'
'L', 0.1, 1, '', 'LOAD'
'EXH', -5, 50, '', 'EXHCAM'
'INT', -5, 50, '', 'INTCAM'} );
```

See Also

CreateModel | CreateTestplan

Introduced in R2007b

Models

Array of boundary models

Syntax

Models(T)

Description

This is a property of mbcboundary. Tree.

Models (T) returns a cell array of boundary models (read only).

Introduced in R2009b

ModelSetup

Open Model Setup dialog box where you can alter model type

Syntax

```
[newModel, OK] = ModelSetup(oldModel)
```

Description

This is a method of mbcmodel.model objects.

This method opens the **Model Setup** dialog box where you can choose new model types and settings. If you click **Cancel** to dismiss the dialog, OK = false and newModel = oldModel. If you click OK to close the dialog box, then OK = true and newModel is your new chosen model setup. Data and response remain the same as oldModel. The new model is refitted when you click OK.

Call UpdateResponse to put the new model type back into the response.

Examples

```
[RBF, OK] = ModelSetup(Cubic);
```

See Also

UpdateResponse | fit

Modified

Boolean signaling whether project has been modified

Syntax

Name = P.Modified

Description

This is a property of mbcmodel.project.

Examples

Name = Project.Modified;

ModifyFilter

Modify user-defined filter in dataset

Syntax

```
D = ModifyFilter(D, Index, expr)
```

Description

This is a method of mbcmodel.data.

You call this method to modify the expression that defines existing filters.

D is a data object.

Index is the input index to indicate which of the available filters you wish to modify. Use the property Filters to find the index for each filter.

expr is the input character vector holding the expression that defines the filter, as for AddFilter.

Examples

```
ModifyFilter(D, 3, 'AFR < AFR_CALC + 20');</pre>
```

The effect of this filter is to modify filter number 3 to keep all records where AFR < AFR CALC + 20.

```
ModifyFilter(D, 2, 'MyNewFilterFunction(AFR, RPM, TQ, SPK)');
```

This modifies filter number 2 to apply the function MyNewFilterFunction.

See Also

AddFilter | RemoveFilter | Filters

ModifyTestFilter

Modify user-defined test filter in dataset

Syntax

```
D = ModifyTestFilter(D, Index, expr)
```

Description

This is a method of mbcmodel.data.

You call this method to modify the expression that defines existing filters.

D is a data object.

Index is the input index to indicate which of the available test filters you wish to modify. Use the property TestFilters to find the index for each test filter.

expr is the input character vector holding the expression that defines the test filter, as for AddTestFilter.

Examples

```
ModifyTestFilter(d1, 2, 'any(n>2000)');
```

The effect of this is to modify test filter number 2 to include all tests in which any records have speed (n) greater than 1000.

See Also

AddTestFilter | RemoveTestFilter | TestFilters

ModifyVariable

Modify user-defined variable in dataset

Syntax

```
D = ModifyVariable(D, Index, expr, units)
```

Description

This is a method of mbcmodel.data.

You call this method to modify the expression that defines existing variables.

D is a data object.

Index is the input index to indicate which of the available variables you wish to modify. Use the property UserVariables to find the index for each variable.

expr is the input character vector holding the expression that defines the variable, as for AddVariable.

units is an optional input character vector holding the units of the variable.

Examples

```
ModifyVariable(D, 2, 'MY_NEW_VARIABLE = TQ*AFR/2');
```

See Also

AddVariable | RemoveVariable | UserVariables

MultipleVIF

Multiple VIF matrix for linear model parameters

Syntax

VIF = MultipleVIF(LINEARMODEL)

Description

This is a method of mbcmodel.linearmodel.

 ${\sf VIF} = {\sf MultipleVIF}({\sf LINEARMODEL})$ calculates the multiple Variance Inflation Factor (VIF) matrix for the linear model parameters.

Examples

VIF = MultipleVIF(knot_model)

See Also

ParameterStatistics

Name

Name of object

Syntax

name = A.Name

Description

This is a property of project, data, test plan, input, model, fitalgorithm, design, design constraint, and boundary model objects.

A can be any test plan (T), data (D), project (P) model (L, R, HR), fitalgorithm (F), design (D), design constraint (C) or boundary model (B) object.

You can change the names of these objects as follows:

A.Name = newName

For response (output or Y data) signal names, see ResponseSignalName.

For mbcmodel.Name, the Name property refers to the model output name. The toolbox sets this property to the data signal name when the response is created or if you assign a model to a response. You cannot set this property when a response is attached to the model.

For model parameter names, see Names.

For testplan and response object input names, see InputSignalNames, and for data objects, see SignalNames.

Names of boundary models are read only and provide a description of the boundary model type and active inputs.

Examples

ResponseFeatureName = thisRF.Name;

See Also

Names | InputSignalNames | SignalNames | ResponseSignalName

Names

Model parameter names

Syntax

N = params.Names

Description

This is a property of mbcmodel.modelparameters. It returns the names of all the parameters in the model. These are read-only.

Examples

```
N = paramsknot.Names
N =
'1'
'N'
'N^2'
'N*L'
'N*A'
'L'
'L^2'
'L*A'
'A'
'A';
```

See Also

NumberOfParameters | Values | Name

New

Create new project file

Syntax

P = New(P)

Description

This is a method of mbcmodel.project. Use this to modify a project object to make a new project from scratch. Note the current project gets removed from memory when you open a new one.

P is the new project object.

Examples

New(P);

See Also

Load

NumInputs

Number of model, boundary model, or design object inputs

Syntax

N = model.NumInputs

Description

This is a property of

- mbcmodel.model and mbcmodel.modelproperties
- The design objects mbcdoe.design, mbcdoe.generator, mbcdoe.candidateset, and mbcdoe.designconstraint
- The boundary model object mbcboundary. AbstractBoundary and all its subclasses: mbcboundary. Model, mbcboundary. Boolean, mbcboundary. PointByPoint and mbcboundary. TwoStage. You set the number of boundary model inputs when you create the boundary model.

It returns the number of inputs to the model, boundary model, or design object.

Examples

N = knot.NumInputs;

NumberOfParameters

Number of included model parameters

Syntax

N = knotparams.NumberOfParameters

Description

This is a read-only property of mbcmodel.linearmodelparameters, for linear models only.

The number returned is the number of parameters currently in the model (you can remove some parameters by using StepwiseRegression). To see which parameters are currently in the model, use StepwiseSelection. Only parameters listed as 'in' are currently included.

To see the total possible number of parameters in a linear model, use SizeOfParameterSet.

Use Names and Values to get the parameter names and values.

Examples

N = knotparams.NumberOfParameters;

See Also

SizeOfParameterSet | StepwiseSelection | StepwiseRegression | Names | Values

NumberOfPoints

Number of design points

Syntax

D.NumberOfPoints

Description

NumberOfPoints is a read only property of mbcdoe.design (constrained number of points).

D.NumberOfPoints is the number of points in the design after applying the constraints.

You specify the number of points for a design using the generator object. The NumberOfPoints property of mbcdoe.generator is the number of points before any constraints are applied. You cannot specify the number of points for all design types (e.g., it is not allowed for Central Composite, Box Behnken). To see which design types have an editable NumberOfPoints property, see the tables in Type (for designs and generators).

See Also

Type (for designs and generators)

NumberOfRecords

Total number of records in data object

Syntax

numRecords = D.NumberOfRecords

Description

This is a property of data objects: mbcmodel.data.

Examples

numRecords = Data.NumberOfRecords;

NumberOfTests

Total number of tests being used in model

Syntax

numtests = A.NumberOfTests

Description

This is a property of all model objects: mbcmodel.hierarchicalresponse, mbcmodel.localresponse and mbcmodel.response, and data objects mbcmodel.data. 'A' can be any model or data object.

Examples

numTests = TQ_response.NumberOfTests;

See Also

DefineTestGroups

OperatingPoints

Model operating point sites

Syntax

OperatingPoints(B)

Description

This is a property of mbcboundary.PointByPoint.

OperatingPoints(B) returns the operating point sites for models (read only).

Introduced in R2009b

OptimalCriteria

Optimal design criteria (V, D, A, G)

Syntax

```
s = OptimalCriteria(D)
s = OptimalCriteria(D,Criteria)
```

Description

OptimalCriteria is a method of mbcdoe.design. OptimalCriteria can only be used for optimal designs.

- s = OptimalCriteria(D) returns an array with the values of optimal criteria [V,D,A,G].
- s = OptimalCriteria(D,Criteria) returns the specified optimal criteria. Criteria must be one of V,D, A, or G.

OutlierIndices

Indices of DoubleInputData marked as outliers

Syntax

```
indices = OutlierIndices(R)
```

Description

This is a method of all model objects: mbcmodel.hierarchicalresponse, mbcmodel.localresponse and mbcmodel.response.

Examples

```
ind = OutlierIndices(R);
bad = OutlierIndices(thisRF);
```

See Also

DoubleInputData

OutlierIndicesForTest

Indices marked as outliers for test

Syntax

```
indices = OutlierIndicesForTest(R, TestNumber)
```

Description

This is a method of the local model object, mbcmodel.localresponse.

This shows the current records discarded as outliers.

You can use ':' to use all tests.

Examples

```
ind = OutlierIndicesForTest(R, ':');
bad = OutlierIndicesForTest(local, tn);
```

See Also

OutlierIndices

OutputData

Output (or response) data for model

Syntax

D = M.OutputData

Description

This is a property of mbcmodel.model.

It returns an array of the response data currently in the model.

Examples

D = knot.OutputData;

See Also

InputData

Owner

Object from which data was received

Syntax

0 = D1.0wner

Description

This property of mbcmodel.data is:

- Empty if the data was created using mbcmodel.CreateData
- An mbcmodel.project object if the data was extracted from a project
- An mbcmodel.testplan object if the data was extracted from a test plan

Examples

0 = D1.0wner;

Parameters

Model parameters

Syntax

P = model.Parameters

Description

This is a property of mbcmodel.model., that contains an object mbcmodel.modelparameters. This object contains a number of read-only parameters that describe the model.

All models have these properties:

- SizeOfParameterSet
- Names
- Values

Linear models also have these properties:

- StepwiseStatus
- NumberOfParameters
- StepwiseSelection

Radial Basis Function (RBF) models have all the above properties and these additional properties:

- Centers
- Widths

Examples

P = model.Parameters;

See Also

SizeOfParameterSet | Names | Values | StepwiseStatus | NumberOfParameters |
StepwiseSelection | Centers | Widths

ParameterStatistics

Calculate parameter statistics for linear model

Syntax

values = ParameterStatistics(linearmodel, optional statType)

Description

This is a method of mbcmodel.model, for linear models only. This calculates parameter statistics for the linear model. If you don't specify statType, then a structure with all valid types is output. statType may be a character vector specifying a particular statistic or a cell array of character vectors specifying a number of statistics to output. If statType is a character vector, then values is an array of doubles. If statType is a cell array of character vectors, then values is a cell array of array of doubles.

The valid types are:

'Alias'

'Covariance'

'Correlation'

'VIFsingle'

'VIFmultiple'

'VIFpartial'

'Stepwise'

These types (except Stepwise) appear in the Design Evaluation tool; see the documentation for this tool for details of these matrices.

The Stepwise field contains the values found in the Stepwise table. In this array (and in the Stepwise GUI) you can see for each parameter in the model: the value of the coefficient, the standard error of the coefficient, the t value and Next PRESS (the value of PRESS if the status of this term is changed at the next iteration). See the documentation for the Stepwise table. You can also see these Stepwise values when you use StepwiseRegression.

Examples

Stepwise: [10x4 double] values.Stepwise ans = 1.0e+003 * 0.0079 0.0210 0.0190 NaN0.0000 1.9801 0.0000 0.0210 0.0000 0.0000 0.0200 0.2984 0.0000 0.2768 -0.0000 0.0200 0.0000 0.0000 0.0200 0.2890 -0.0526 0.0367 0.0210 0.2679 0.0911 0.0279 0.0210 0.3837 -0.0041 0.0024 0.0210 0.2728 -0.0178 0.0095 0.0200 0.2460 0.0001 0.0000 0.0210 0.3246

StepwiseRegression

PartialVIF

Partial VIF matrix for linear model parameters

Syntax

STATS = PartialVIF(LINEARMODEL)

Description

This is a method of mbcmodel.linearmodel.

STATS = PartialVIF(LINEARMODEL) calculates the partial Variance Inflation Factor (VIF) matrix for the linear model parameters.

Examples

VIF = PartialVIF(knot_model)

See Also

ParameterStatistics

PEV

Predicted error variance of model at specified inputs

Syntax

```
pev = PEV(R, X)
```

Description

This is a method of the hierarchical, local response, response, and model objects: mbcmodel.hierarchicalresponse, mbcmodel.response, and mbcmodel.model.

R is the model object, and X is the array of input values where you want to evaluate the PEV of the model. For a local response, the predicted value uses the hierarchical model.

Note that for an mbcmodel.model.model.model.response objects only, the X is optional. That is, the syntax is:

```
PEV = PEV(model, optional X)
```

This calculates the Predicated Error Variance at X. If X is not specified, then X is the existing input values. An array is returned of PEV values evaluated at each data point.

Examples

```
pev = PEV(R, X);
```

See Also

PEVForTest

PEVForTest

Local model predicted error variance for test

Syntax

```
pev = PEVforTest(L, TestNumber, X)
```

Description

This is a method of the local model object, mbcmodel.localresponse.

L is the local model object.

TestNumber is the test for which you want to evaluate the model PEV.

X is the array of inputs where you want to evaluate the PEV of the model.

Examples

```
pev = PEVforTest(L, TestNumber, X);
```

See Also

PEV

Points

Matrix of design points

Syntax

designPoints = D.Points

Description

Points is a property of mbcdoe.design.

designPoints = D.Points returns the matrix of design points.

You can perform any valid MATLAB operation on this matrix. The number of columns of the points matrix must be the same as the number of inputs when setting Points. If you make an assignment to the Points, the design type changes to Custom. Points are only updated in the underlying design if they have changed.

See Also

FixPoints | PointTypes | RemovePoints | NumberOfPoints

PointTypes

Fixed and free point status

Syntax

D.PointTypes

Description

PointType is a property of mbcdoe.design. Each point has a type of free, fixed or data.

You can specify fixed points. free is the default. If a point has been matched to data then it is of type data.

D.PointTypes returns a cell array of PointTypes, one for each design point. You cannot change a PointType of data to something else as the data is set by the test plan when matching the design to data.

You can use the method FixPoints to fix all the points in a design.

See Also

FixPoints | Points | RemovePoints

PredictedValue

Predicted value of model at specified inputs

Syntax

```
y = PredictedValue(R,X)
y = PredictedValue(R)
```

Description

This is a method of the hierarchical, response, local response, and model objects: mbcmodel.hierarchicalresponse, mbcmodel.response, mbcmodel.localresponse, and mbcmodel.model.

y = PredictedValue(R,X) evaluates the model at the specified inputs, where R is the model object, and X is the array of inputs where you want to evaluate the output of the model.

Note that for an mbcmodel.model, mbcmodel.localresponse and mbcmodel.response objects, the X is optional. If X is not specified then the X is the existing input values. That is, the syntax is:

```
y = PredictedValue(model, optional X)
```

y = PredictedValue(R) calculates the predicted value at the fit data. An array is returned of predicted values evaluated at each data point. For local models, this is equivalent to y= PredictedValue(L, L.InputData).

Note that you cannot evaluate model output for a local response or hierarchical response until you have constructed it using MakeHierarchicalResponse (or CreateAlternativeModels). If you have created alternative response feature models then a best model must be selected. If you have made changes such as removing outliers since choosing a model as best, you may need to choose a new best model. For a local response, the predicted value uses the hierarchical model. If no data is specified then the data from all tests is used.

Examples

```
y = PredictedValue(R, X);
modelPred = PredictedValue(thisRF, x);
```

See Also

PredictedValueForTest | ChooseAsBest | PEV | Evaluate

PredictedValueForTest

Predicted local model response for test

Syntax

```
y = PredictedValueForTest(L, TestNumber, X)
```

Description

This is a method of the local model object, mbcmodel.localresponse.

L is a local model object.

TestNumber is the test for which you want to evaluate the model.

X is the array of inputs where you want to evaluate the output of the model.

Examples

```
y = PredictedValueForTest(L, TestNumber, X);
```

PredictedValue

Properties (for candidate sets)

View and edit candidate set properties

Syntax

properties(CS)
CS.PropertyName = NewValue

Description

 $\hbox{``Properties''} is a method of \verb"mbcdoe.candidateset", which returns a list of properties.$

properties(CS) lists the candidate set properties.

CS.PropertyName = NewValue sets the candidate set property.

The candidate set Type determines which properties you can set.

The following table lists the properties available for each candidate set type.

Candidate Set Properties (for Optimal Designs)

Candidate Set Type	Property	Description
All built-in: Grid/ Lattice, Grid, Lattice, Stratified Lattice, Sobol,	NumberOfPoints (read-only for Grid and Grid/Lattice)	Number of points (int: [0,Inf])
Halton	Limits	Design Limits
Grid	Levels	Selection criteria for best LHS design (cell)
	NumberPerLevel	Symmetric design (vector int: {[-Inf,Inf], NumInputs})
Lattice	Generators	Prime number generators for lattice (vector int: {[0,Inf], NumInputs})
Stratified Lattice	StratifyLevels	Number of levels for each factors (vector int: {[0,Inf], NumInputs})
Sobol Sequence	Scramble	Scramble method (enum: {'none', 'MatousekAffineOwen'}
	SkipMode	Skip mode options (enum: {'None','2^k','Custom'})
	Skip	Skip size (int: [0,Inf])
Halton Sequence	Scramble	Scrambling method for sequence (enum: {'None','RR2'})
	PrimeLeap	Leap sequence points using prime number (boolean)
	SkipZero	Skip zero point (boolean)
User-defined	NumberOfPoints	User-defined points (read-only)
	Points	User-defined points

Examples

You can use property value pairs to specify candidate set properties as part of the CreateCandidateSet command, or you can set properties individually.

To create a candidate set with type grid and specified grid levels:

```
CandidateSet = augmentedDesign.CreateCandidateSet...
( 'Type', 'Grid' );
CandidateSet.NumberOfLevels = [21 21 21 21];
```

See Also

CreateCandidateSet

Introduced in R2008a

Properties (for design constraints)

View and edit design constraint properties

Syntax

```
properties(C)
C.PropertyName = NewValue
```

Description

"Properties" is a method of mbcdoe.designconstraint, which returns a list of properties.

properties(C) lists the constraint properties.

C.PropertyName = NewValue sets the constraint property.

The constraint Type determines which properties you can set. For more information, see the following table or Type (for design constraints).

The following table lists the properties available for each constraint type.

Constraint Properties

Constraint Type	Property	Description
Linear design constraint: 1*Input1 + 1* Input2 + 1* Input3 <= 0	A	Matrix for linear constraint (matrix: [1,NumInputs])
	b	Bound for linear constraint (double)
Ellipsoid design constraint: Ellipsoid at (Input1=0, Input2=0, Input3=0)	CenterPoint	Center of ellipse (vector: NumInputs)
	Matrix	Ellipsoid form matrix (positive semi-definite) (matrix: [NumInputs, NumInputs])
1D Table design constraint:	Table	Table constraint (vector)
InputY(InputX) <= InputY max	Breakpoints	Breakpoints for rows (vector)
	Inequality	Relational Operator (enum: {'<=','>='})
	InputFactor	Column input symbol (enum: { 'InputX', 'InputY'})
	TableFactor	Table input symbol (enum: {'InputX','InputY'})
2D Table design constraint:	Table	: Table constraint (matrix))
InputZ(InputX,InputY) <=InputZmax	RowBreakpoints	Breakpoints for rows (vector)
~-mputzinax	ColumnBreakpoints	Breakpoints for columns (vector)
	Inequality	Relational operator (enum: {'<=','>='})
	RowFactor	Row input symbol (enum: {'InputX','InputY, 'InputZ'})
	ColumnFactor	Column input symbol (enum: {'InputX','InputY, 'InputZ'})
	TableFactor	Table input symbol (enum: {'InputX','InputY', 'InputZ'}

Examples

You can use property value pairs to specify constraint properties as part of the CreateConstraint command, or you can set properties individually.

For examples, see CreateConstraint.

See Also

CreateConstraint

Introduced in R2008a

Properties (for design generators)

View and edit design generator properties

Syntax

properties(Generator)
Generator.PropertyName = NewValue

Description

"properties" (lower case p) is a method of mbcdoe.generator, which returns a list of properties.

properties(Generator) lists the generator properties.

Generator.PropertyName = NewValue sets the generator property.

The design generator object Type determines which properties you can set. For more information, see Type (for designs and generators).

The settings are applied immediately, you do not need to call generate on the design object.

The following tables list the properties available for each design type.

Optimal Design Properties (D-, V- and A-Optimal)

Property	Description
NumberOfPoints	Number of points (int: [0,Inf])
InitialPoints	Initial design points (Matrix)
CandidateSet	Candidate set (mbcdoe.candidateset)
AllowReplicates	Allow replicate points (boolean)
AugmentMethod	Methods to add points (enum: {'random','optimal'})
Tolerance	Tolerance (numeric: 'positive')
MaxIterations	Maximum Iterations (int: 'positive')
NumberOfPointsToAlter	Number of points to alter per iteration using the random augment method (p) (int: 'positive')
NoImprovement	Number of iterations with no improvement using the random augment method (p) (int: 'positive')

Note Optimal designs have dependencies between NumberOfPoints, InitialPoints and CandidateSets. When you change NumberOfPoints, an initial point is drawn from the existing candidate set. Setting NumberOfPoints updates InitialPoints. Likewise setting InitialPoints updates NumberOfPoints. When changing the candidate set a new initial design is drawn from the new candidate set.

Space-Filling Design Properties

Design Type	Property	Description
All space-filling design types (Lattice, Latin Hypercube Sampling, Stratified Latin Hypercube, Sobol, Halton)	NumberOfPoints	Number of points (int: [0,Inf])
	Limits	Design Limits (matrix: [NumInputs,2])
Lattice	PrimeGenerators	Prime number generators for lattice for each input (vector int: [0,Inf])
Latin Hypercube Sampling and Stratified Latin Hypercube	SelectionCriteria	Selection criteria for best LHS design (enum: {'discrepancy', 'minimax', 'maximin', 'cdfvariance', 'cdfmaximum'})
	Symmetry	Symmetric design (boolean)
Stratified Latin Hypercube	StratifyLevels	Number of levels for each factors (vector int: {[0,Inf], NumInputs})
	StratifyValues	Stratify levels (cell)
Sobol Sequence	Scramble	Scramble method (enum: {'none', 'MatousekAffineOwen'}
	SkipMode	Skip mode options (enum: {'None','2^k', 'Custom'})
	Skip	Skip size (int: [0,Inf])
Halton Sequence	Scramble	Scrambling method for sequence (enum: {'None','RR2'})
	PrimeLeap	Leap sequence points using prime number (boolean)
	SkipZero	Skip zero point (boolean)

Classical Design Properties

Design Type	Property	Description
All (Box-Behnken, Central Composite, Full Factorial, Plackett-Burman, Regular Simplex)	NumberOfPoints (read-only)	Number of points (int: [0,Inf])
	Limits	Design limits
All except Plackett-Burman	NumberOfCenterPoints	Number of center points (int: [0,Inf])
Central Composite	StarPoints	<pre>Star point position (enum: {'FaceCenteredCube', 'Spherical', 'Rotatable', 'Custom'})</pre>
	Inscribe	Inscribe points (boolean)
	Alpha	<pre>Specify 'Custom' star point location: (vector: {'positive', NumInputs}) For 'FaceCenteredCube', alpha = 1 For 'Spherical', alpha = sqrt(nf) For 'Rotatable', alpha = 2^(nf/4)</pre>
Full Factorial	Levels	Cell array of levels for each input (cell)
	NumberOfLevels	Number of levels for each input (vector int: { 'positive', NumInputs })

Examples

You can use property value pairs to specify design generator properties as part of the Generate and Augment commands. You can also set properties individually. Some examples:

To create a full factorial design and specify the number of levels when generating the design:

```
design = CreateDesign( inputs, 'Type', 'Full Factorial' );
design = Generate( design, 'NumberOfLevels', [50 50] );

To create a latin hypercube sampling design:
globalDesign = TP.CreateDesign(2,...
'Type', 'Latin Hypercube Sampling');

To create and generate a halton design with 50 points:
haltonDesign = CreateDesign( inputs, 'Type',...
'Halton Sequence', 'Name', 'Halton' );
haltonDesign = Generate( haltonDesign, 50 );
```

To explicitly specify the NumberOfPoints property:

```
haltonDesign = Generate( haltonDesign, 'NumberOfPoints', 50 );
To create and generate a halton design with specified scrambling and other properties:
haltonDesignWithScrambling = haltonDesign.CreateDesign...
( 'Name', 'Scrambled Halton');
haltonDesignWithScrambling = Generate...
( haltonDesignWithScrambling,...
 'Scramble', 'RR2', 'PrimeLeap', true );
To generate an optimal design with specified properties:
OptDesign = Generate(OptDesign,...
    'Type','V-optimal',...
    'CandidateSet',C,...
    'MaxIterations',200,...
    'NoImprovement', 50,...'NumberOfPoints',200);
The previous code is equivalent to setting the properties individually and then calling Generate as
follows:
P = OptDesign.Generator;
P.Type = 'V-optimal';
P.CandidateSet.NumberOfLevels(:)=21;
P.MaxIterations = 200;
P.NumberOfPoints = 200;
P.NoImprovement = 50;
OptDesign.Generator = P;
To augment a design optimally with 20 points:
OptDesign = Augment(OptDesign,...
    'Type','V-optimal',...
    'MaxIterations',200,...
    'NoImprovement', 50,...
    'NumberOfPoints',20);
```

(for design constraints)

Introduced in R2008a

Properties (for models)

View and edit model properties

Syntax

```
modelprop=M.Properties
M.Properties.PropertyName = NewValue
properties(M.Properties)
f=M.Properties.properties
```

Description

"Properties" is a property of mbcmodel. model.

modelprop=M.Properties returns a mbcmodel.modelproperties object.

To edit a property, use the syntax M. Properties. PropertyName = NewValue.

"properties" is a method of mbcmodel.fitalgorithm and mbcmodel.modelproperties which returns a list of properties.

properties(M.Properties) lists the property names, types and allowed values.

f=M.Properties.properties returns the property names as a cell array.

The model Type determines which properties you can set. For more information, see Type (for models).

To get a mbcmodel.modelproperties object from a model:

A radial basis function network using a multiquadric kernel

```
with 0 centers
   and a global width of 2.
   The regularization parameter, lambda, is 0.0001.
   InputData: [0x2 double]
   OutputData: [0x1 double]
   Status: Not fitted
   Linked to Response: <not linked>
>> properties(M.Properties)
RBF Properties
     Kernel: RBF kernel (enum: {'multiquadric',...
'recmultiquadric','gaussian','thinplate','logisticrbf',...
'wendland', 'linearrbf','cubicrbf'})
     Continuity: Continuity for Wendland kernel...
 (0,2,4,6) (int: [0,6])
     ParameterNames: List of parameter names (read-only)
     StepwiseStatus: Stepwise status {'Always','Never',...
'Step'} (cell)
     BoxCox: Box-Cox transform (power) (numeric: [-3,3])
The following syntax returns the properties as a cell array:
>> f=M.Properties.properties
f =
    'Kernel'
    'Continuity'
    'ParameterNames'
    'StepwiseStatus'
     'BoxCox'
Change a property as follows:
>>M.Properties.Kernel = 'thinplate';
The model changes state to 'Being Edited'. The settings are not applied until you call Fit on the model
object.
The following sections list the properties available for each model type.
Gaussian Process Models — Properties
KernelFunction: Kernel function (enum:
{'Exponential','ARDExponential','SquaredExponential','ARDSquaredExponential','Matern32','ARDMat
ern32', 'Matern52', 'ARDMatern52', 'RationalQuadratic', 'ARDRationalQuadratic'})
BasisFunction: Explicit basis function (enum: {'None','Constant','Linear','PureQuadratic'})
Threshold: Threshold to switch to large data fitting algorithm (int: [1,Inf])
ActiveSetSize: Active set size (int: [1,Inf])
ActiveSetMethod: Large scale active set method (enum: {'SGMA', 'Entropy', 'Likelihood', 'Random'})
FitMethod: Large data fit method (enum: {'SD','FIC','SR'})
```

PredictMethod: Large data predict method (enum: {'Exact','BCD','SD','FIC','SR'})

InitializeMethod: Initialize hyperparameters method (enum: {'LOO-loss','logML','none'})

BoxCox: Box-Cox transform (power) (numeric: [-3,3])

Linear Models — Polynomial Properties

mbcmodel.linearmodel:Polynomial

Order: Polynomial order (vector int: {[0,Inf],NumInputs})

InteractionOrder: Maximum order of interaction terms (int: [0,Inf])

TransformInputRange: Transform inputs (Boolean)

ParameterNames: List of parameter names (read-only)

StepwiseStatus: Stepwise status {'Always','Never','Step'} (cell)

BoxCox: Box-Cox transform (power) (numeric: [-3,3])

Linear Models — Hybrid Spline Properties

mbcmodel.linearmodel:Hybrid Spline

Order: Spline and polynomial order (vector int: {[0,3],NumInputs})

SplineVariable: Spline variable

SplineInteraction: Order of interaction between spline and polynomial (int: [0,3])

Knots: Position of knots (vector real)

ParameterNames: List of parameter names (read-only)

StepwiseStatus: Stepwise status {'Always','Never','Step'} (cell)

BoxCox: Box-Cox transform (power) (numeric: [-3,3])

Linear Models — RBF Properties

mbcmodel.linearmodel:RBF

Kernel: RBF kernel (enum:

{'multiquadric','recmultiquadric','gaussian','thinplate','logisticrbf','wendland',

'linearrbf', 'cubicrbf' })

Continuity: Continuity for Wendland kernel (0,2,4,6) (int: [0,6])

Type (for models) | LocalModel Properties

RecordsPerTest

Number of records in each test

Syntax

numRecords = D.RecordsPerTest

Description

This is a property of data objects: mbcmodel.data. It returns an array, of length NumberOfTests, containing the number of records in each test.

Examples

numRecords = D.RecordsPerTest;

Remove

Remove project, test plan, model, or boundary model

Syntax

OK = Remove(A) removes project, test plan, or model object A.

Description

This is a method of all the nondata objects: projects, test plans, all models, and boundary trees.

A can be any project, test plan, or model object.

You cannot remove datum models if other models use them.

For boundary trees, specify which boundary model to remove: Remove(BoundaryTree,Index).

Examples

OK = Remove(R3);

RemoveData

Remove data from project

Syntax

```
P = RemoveData(P, D)
P = RemoveData(P, Index)
```

Description

This is a method of mbcmodel.project.

You can refer to the data object either by name or index.

P is the project object.

D is the data object you want to remove.

Index is the index of the data object you want to remove.

Examples

```
RemoveData(P, D);
```

See Also

CreateData | Data | CopyData

RemoveDesign

Remove design from test plan

Syntax

RemoveDesign(T,Name)
RemoveDesign(T,Level,Name)
RemoveDesign(T,D)
RemoveDesign(T,Level,D)

Description

RemoveDesign is a method of mbcmodel.testplan.

RemoveDesign(T, Name) removes a design with a matching name from the test plan T.

Name can be a character vector, or a cell array of character vectors.

RemoveDesign(T,Level,Name) removes a design with a matching name from the specified level of the test plan. By default the level is the outer level (i.e., Level 1 for one-stage, Level 2 (global) for two-stage).

RemoveDesign(T,D) removes D, an array of designs to be deleted. All designs with matching names are deleted.

RemoveDesign(T, Level, D) removes D from the specified level.

See Also

AddDesign | UpdateDesign | FindDesign

Introduced in R2008a

RemoveFilter

Remove user-defined filter from dataset

Syntax

```
D = RemoveFilter(D, Index)
```

Description

This is a method of the mbcmodel.data object.

Index is the input index indicating the filter to remove. Use the property Filters to find out which filters are present.

Examples

```
RemoveFilter(D1, 3);
```

See Also

AddFilter|Filters

RemoveOutliers

Remove outliers in input data by index or rule, and refit models

Syntax

```
R = RemoveOutliers(R, Selection);
R = RemoveOutliers(L, LocalSelection, GlobalSelection)
```

Description

This is a method of the local model object, mbcmodel.localresponse and the response feature model object mbcmodel.response.

All the response feature models are refitted after the local models are refitted. Outlier selection is applied to all tests.

For a response model:

- R is a response object.
- Selection specifies either a set of indices or the name of an outlier selection function, of the following form:

```
Indices = myMfile(model, data, factorName)
```

The factors are the same as defined in DiagnosticStatistics.

- data contains the factors as columns of a matrix.
- factorNames is a cell array of the names for each factor.

For a local model:

- LocalSelection is the local outlier selection indices or function.
- GlobalSelection is the global outlier selection indices or function.

Outlier selection functions must conform to this prototype:

```
Indices = myMfile(model, data, factorName)
```

The factors are the same as appear in the scatter plot in the Model Browser.

- data contains the factors as columns of a matrix.
- factorNames is a cell array of the names for each factor.

Examples

```
outlierind = [1 4 6 7];
RemoveOutliers(thisRF, outlierind);
```

See Also

RemoveOutliersForTest

RemoveOutliersForTest

Remove outliers on test by index or rule and refit models

Syntax

```
L = RemoveOutliersForTest(LOCALRESPONSE, TESTNUMBER, LOCALSELECTION)
L = RemoveOutliersForTest(LOCALRESPONSE, TESTNUMBER, LOCALSELECTION, doUpdate)
```

Description

This is a method of mbcmodel.localresponse.

L = RemoveOutliersForTest(LOCALRESPONSE, TESTNUMBER, LOCALSELECTION) removes outliers, refits the local model, and refits the response feature models.

L = RemoveOutliersForTest(LOCALRESPONSE, TESTNUMBER, LOCALSELECTION, doUpdate) removes outliers and if doUpdate is true, refits all response features after the local model is refitted.

TESTNUMBER is the single test number to refit.

LOCALSELECTION can either be a set of indices or a function name.

An outlier selection function must take the following form:

```
INDICES = MYMFILE(MODEL, DATA, FACTORNAME);
```

The factors are the same as defined in DiagnosticStatistics.

DATA contains the factors as columns of a matrix, and FACTORNAME is a cell array of the names for each factor.

Examples

For a local response LOCALRESPONSE, to remove first two data points and do not update response features:

```
RemoveOutliersForTest(LOCALRESPONSE,1,1:2,false);
```

To find list of indices of removed data points:

```
indices = OutliersForTest(LOCALRESPONSE,1);
```

To restore first data point:

```
RestoreDataForTest(LOCALRESPONSE,1,1,false);
```

To restore all data:

```
RestoreDataForTest(LOCALRESPONSE,1,':',false);
```

To update response features:

UpdateResponseFeatures(LOCALRESPONSE);

See Also

UpdateResponseFeatures | RestoreDataForTest | OutlierIndicesForTest | RemoveOutliers

RemovePoints

Remove all nonfixed design points

Syntax

```
D = RemovePoints(D)
D = RemovePoints(D,PointType)
D = RemovePoints(D,indices)
```

Description

RemovePoints is a method of mbcdoe.design.

D = RemovePoints(D) removes all nonfixed points from the design.

D = RemovePoints(D, PointType) removes the specified type of points, where PointType is one of 'free', 'fixed' or 'data'.

D = RemovePoints(D,indices) removes the points specified by indices.

Examples

To remove all free points:

```
Design = RemovePoints(Design, 'free');
```

See Also

FixPoints

Introduced in R2008a

RemoveTestFilter

Remove user-defined test filter from dataset

Syntax

```
D = RemoveTestFilter(D, Index)
```

Description

This is a method of mbcmodel.data.

D is the data object.

Index is the input index indicating the filter to remove.

Use the property TestFilters to find the index of the test filter you want to remove.

Examples

RemoveTestFilter(D1, 2);

See Also

AddTestFilter|TestFilters

RemoveVariable

Remove user-defined variable from dataset

Syntax

D = RemoveVariable(D, Index)

Description

This is a method of mbcmodel.data.

D is the data object.

Index is the input index indicating the variable to remove.

Use UserVariables to find the index of the variable you want to remove.

Examples

RemoveVariable(D1, 2);

See Also

AddVariable | UserVariables

Response

Response for model object

Syntax

R = model.Response

Description

Models. This is a property of mbcmodel.model. It returns the response the model object came from (e.g. a response object).

If you make changes to the model object (for example by changing the model type using ModelSetup, or using StepwiseRegression) you must use UpdateResponse to return the new model object to the response in the project.

Boundary models. This is a property of mbcboundary. TwoStageTree.

The Response property contains a response boundary model tree (read only). Boundary models in the response model boundary tree are fitted with all local and global input data for the test plan.

Examples

R = model.Response;

See Also

UpdateResponse | ModelSetup

ResponseFeatures(Local Model)

Set of response features for local model

Syntax

RFs = L.ResponseFeatures

Description

This is a property of the local model object, mbcmodel.localmodel.

RFs = L.ResponseFeatures returns a mbcmodel.responsefeatures object. L is the local model.

See "Understanding Model Structure for Scripting" in the Getting Started documentation for an explanation of the relationships between local models, local responses, and other responses.

Available properties and methods are described in the following tables.

Property	Description
EvaluationPoints	Cell array of evaluation points for the response feature set (read-only). An element of EvaluationPoints is empty if the response feature does not use the Evaluation point. This property is set up when the response feature is created (see the Add method).
Types	Cell array of types for response feature set (read-only). This property is set up when the response feature is created (see the Add method).
NumberOfResponseFeatures	Number of response features in set (read-only).
IsFitted	The local model has been fitted.

Method	Description
Add	Add new response feature to response feature set
	RF = Add(RF,RFtype)
	RFtype is a description character vector belonging to the set of alternative response features. See getAlternativeTypes.
	RF = Add(RF,RFtype,EvaluationPoint)
	EvaluationPoint is a row vector with an element for each model input and is used for response features that require an input value to evaluate the response feature (e.g., function evaluation, derivatives). It is an error to specify an evaluation point for a response feature type that does not require an evaluation point.

Method	Description
Remove	Remove a response feature from the response feature set
	RF = Remove(RF,index)
Select	Select a subset of response features from the response feature set
	RF = Select(RF,indices)
getDefaultSet	List of default response features
	RF = getDefaultSet(RF)
	Returns an mbcmodel.responsefeatures object with the default set of response features for the local model.
getAlternativeTypes	List of all alternative response feature types for local model
	RFtypes = getAlternativeTypes(RF)
	Returns a cell array of response feature type character vectors for the local model.
Evaluate	Evaluate response features
	rfvals = Evaluate(RF);
	Returns the values for the response features for the current local model.
	[rfvals,stderr] = Evaluate(RF)
	Also returns the standard errors for the response features for the current local model. The local model must be fitted before evaluating response features.
Jacobian	Jacobian matrix of response features with respect to parameters
	J = Jacobian(RF)
	The local model must be fitted before calculating the Jacobian matrix.
Covariance	Covariance matrix for response features
	rfvals = Covariance(RF);
	The local model must be fitted before calculating the covariance matrix.
Correlation	Correlation matrix for response features
	rfvals = Correlation(RF)
	Errors occur if model is not fitted.

Method	Description
	List of subsets of response features which can be used to reconstruct the local model
	RFlist = ReconstructSets(RF)
	RFlist is a cell array of mbcmodel.responsefeatures. Each element of RFlist can be used to reconstruct the local model from response feature values.

Examples

First, create a local model object:

```
L = mbcmodel.CreateModel('Local Polynomial',2)

L =
    1 + 2*X1 + 8*X2 + 3*X1^2 + 6*X1*X2 + 9*X2^2 + 4*X1^3...
+ 5*X1^2*X2 + 7*X1*X2^2 +
    10*X2^3
    InputData: [0x2 double]
    OutputData: [0x1 double]
    Status: Not fitted
    Linked to Response: not linked
```

The properties of the local model object are the same as the properties of an mbcmodel.model object with the additional property "ResponseFeatures". Look at the response features property as follows:

```
>> RFs = L.ResponseFeatures
RFs =
Response features for Polynomial
    'Beta 1'
    'Beta_X1'
    'Beta X1^2'
    'Beta_X1^3'
    'Beta X1^2*X2'
    'Beta_X1*X2'
    'Beta X1*X2^2'
    'Beta X2'
    'Beta X2^2'
    'Beta X2^3'
% Set up response features
RFtypes = getAlternativeTypes(RFs);
RF = Add(RF, RFtypes{end},-10);
% assign to local model
L.ResponseFeatures = RFs;
```

ResponseFeatures(Local Response)

Array of response features for local response

Syntax

RFs = L.ResponseFeatures

Description

This is a property of the local model object, mbcmodel.localresponse.

L is the local response.

See "Understanding Model Structure for Scripting" in the Getting Started documentation for an explanation of the relationships between local responses and other responses.

Examples

RFs = Local.ResponseFeatures;

ResponseSignalName

Name of signal or response feature being modeled

Syntax

ysignal = R.ResponseSignalName

Description

This is a property of all response objects: mbcmodel.hierarchicalresponse, mbcmodel.localresponse and mbcmodel.response.

R can be a hierarchical response, local response or response.

Examples

yName = local.ResponseSignalName;

See Also

InputSignalNames

Responses

Array of available responses for test plan

Syntax

R = T.Responses

Description

This is a property of mbcmodel.testplan.

T is the test plan object.

See "Understanding Model Structure for Scripting" for an explanation of the relationship between test plans and responses.

Examples

R = T.Responses;

RestoreData

Restore removed outliers

Syntax

R = RestoreData(RESPONSE)
R = RestoreData(RESPONSE, OUTLIERINDICES)

Description

This is a method of mbcmodel.localresponse and mbcmodel.response.

R = RestoreData(RESPONSE) restores all data previously removed as outliers.

R = RestoreData(RESPONSE, OUTLIERINDICES) restores all removed data specified in OutlierIndices. For a local response, the indices refer to record numbers for all tests.

Examples

RemoveOutliers(R, 1:5)
RestoreData(R, 1:2)

See Also

RemoveOutliersForTest | RemoveOutliers | OutlierIndices

Introduced in R2007a

RestoreDataForTest

Restore removed outliers for test

Syntax

```
L = RestoreDataForTest(LOCALRESPONSE, TESTNUMBER, Indices)
L = RestoreDataForTest(LOCALRESPONSE, TESTNUMBER, Indices, doUpdate)
```

Description

This is a method of mbcmodel.localresponse.

L = RestoreDataForTest(LOCALRESPONSE, TESTNUMBER, Indices) restores all removed data for TESTNUMBER specified in Indices.

L = RestoreDataForTest(LOCALRESPONSE, TESTNUMBER, Indices, doUpdate) restores all specified removed data and if doUpdate is true, refits all response features. By default, all response feature models will be updated. If a number of tests are being screened it is more efficient to set doUpdate to false and call UpdateResponseFeatures when all the tests have been screened.

Indices must be numbers and must belong to the set of outliers in OutliersForTest.

Examples

For a local response LOCALRESPONSE, to remove first two data points without updating response features:

```
RemoveOutliersForTest(LOCALRESPONSE,1,1:2,false);
```

To find list of indices of removed data points:

```
indices = OutliersForTest(LOCALRESPONSE,1);
```

To restore first data point:

RestoreDataForTest(LOCALRESPONSE,1,1,false);

To restore all data:

```
RestoreDataForTest(LOCALRESPONSE,1,':',false);
```

To update response features:

UpdateResponseFeatures(LOCALRESPONSE);

See Also

UpdateResponseFeatures | RemoveOutliersForTest | OutlierIndicesForTest

Introduced in R2007a

RollbackEdit

Undo most recent changes to data

Syntax

```
D = RollbackEdit(D)
```

Description

This is a method of mbcmodel.data. Use this if you change your mind about changes you have made to the data since you called BeginEdit, such as importing or appending data, applying filters or creating new user variables.

There are no input arguments. If for your data object D, IsBeingEdited is true, then RollbackEdit will return it to the same state as it was when BeginEdit was called. If IsEditable(D) is true then you can still modify it, if not it will revert to being read-only. See the example below.

Examples

```
D = P.Data;
BeginEdit(D);
AddVariable(D, 'TQ = tq', 'lbft');
AddFilter(D, 'TQ < 200');
DefineTestGroups(D, {'RPM' 'AFR'}, [50 10], 'MyLogNo');
RollbackEdit(D);</pre>
```

This returns the data object D to the same state as when BeginEdit was called. If the data object IsEditable then the returned object will still return true for IsBeingEdited, else it will not be editable.

For an example case where IsEditable is false and IsBeingEdited is true:

```
D = p.Data;
D1 = p.Data;
BeginEdit(D1);
tp = p.Testplan;
Attach(tp, D);
```

Where p is an mbcmodel.project object, and D and D1 are mbcmodel.data objects.

At this point IsEditable for D1 becomes false because it is now Attached to the test plan and hence can only be modified from the test plan. However

```
OK = D1.IsBeingEdited
```

will still be true at this point, and trying to call CommitEdit will fail.

See Also

```
BeginEdit | CommitEdit | IsBeingEdited
```

Save

Save project

Syntax

```
OK = Save(P)
OK = Save(P, filename)
```

Description

This is a method of mbcmodel.project.

OK = Save(P) saves the project P to the currently selected Filename. The project Name is used as the Filename if none has previously been specified. If neither has been specified then you see a warning that your project has been saved to Untitled.mat.

OK = Save(P, filename) saves the project P with the name specified by filename.

Examples

```
OK = Save(proj, 'Example.mat');
```

See Also

SaveAs

SaveAs

Save project to new file

Syntax

```
OK = SaveAs(P, Name)
```

Description

This is a method of ${\tt mbcmodel.project}.$

Examples

```
OK = SaveAs(proj, 'Example.mat');
```

See Also

Save

Scatter2D

Plot design points

Syntax

```
Scatter2D(D,Xindex,Yindex)
Scatter2D(D,xindex,yindex,plotArguments)
```

Description

Scatter2D is a method of mbcdoe.design.

Scatter2D(D, Xindex, Yindex) creates a scatter plot of the design points in design D, where X and Y are the indices or symbols for the input factors to plot on the X and Y axis.

Scatter2D(D,xindex,yindex,plotArguments) creates a scatter plot with additional arguments.plotArguments specifies additional arguments to the MATLAB plot command. The plot command used in Scatter2D is

```
plot(D.Points(:,v1),D.Points(:,v2),varargin{:})
The default for varargin is '.'.
```

Examples

```
Scatter2D( mainDesign, 1, 2 );
```

Introduced in R2008a

SetTermStatus

Set status of model terms

Syntax

```
M.Properties = M.Properties.SetTermStatus(Terms, Status)
```

Description

This is a method of mbcmodel.linearmodelproperties.

M.Properties = M.Properties.SetTermStatus(Terms, Status) sets the status of the specified terms in this model. Status must be a cell array of status character vectors.

The stepwise status for each term can be Always, Never or Step. The status determines whether you can use the StepwiseRegression function to throw away terms in order to try to improve the predictive power of the model.

M is an mbcmodel.linearmodel object.

Examples

This example sets the status of the $X1*X2^2$ term to Never and the X1 term to Always.

See Also

GetTermStatus | StepwiseStatus

Introduced in R2007a

SetupDialog

Open fit algorithm setup dialog box

Syntax

[OPT,OK] = SetupDialog(F)

Description

This is a method of mbcmodel.fitalgorithm.

[OPT,OK] = SetupDialog(F) opens the fit algorithm setup dialog box, where you can edit the algorithm parameters. F is a mbcmodel.fitalgorithm object.

If you click **Cancel** to dismiss the dialog, OK = false and no changes are made. If you click OK to close the dialog box, then OK = true and your new chosen algorithm parameters are set up.

Examples

[OPT,OK]= SetupDialog(F)

See Also

CreateAlgorithm | getAlternativeNames

Introduced in R2007a

SignalNames

Names of signals held by data

Syntax

names = D.SignalNames

Description

This is a property of mbcmodel.data.

This is a cell array of character vectors that hold the names of the signals within the data. These names can be used to reference the appropriate signals in the Value method. The subset of these names that are being used for modeling may also be found in the test plan and responses InputSignalNames properties.

Examples

names = D.SignalNames;

See Also

SignalUnits | InputSignalNames | Value

SignalUnits

Names of units in data

Syntax

units = D.SignalUnits

Description

This is a property of mbcmodel.data.

D is the data object.

It returns a cell array of character vectors holding the units of the signals.

Examples

units = D.SignalUnits;

See Also

SignalNames

SingleVIF

Single VIF matrix for linear model parameters

Syntax

VIF = SingleVIF(LINEARMODEL)

Description

This is a method of mbcmodel.linearmodel.

 ${\sf VIF} = {\sf SingleVIF}({\sf LINEARMODEL})$ calculates the single Variance Inflation Factor (VIF) matrix for the linear model parameters.

Examples

VIF = SingleVIF(knot_model)

See Also

ParameterStatistics

Introduced in R2007a

SizeOfParameterSet

Number of model parameters

Syntax

N = params.SizeOfParameterSet

Description

This is a property of mbcmodel.linearmodelparameters, for linear models only. It returns the total possible number of parameters in the model. Note that not all of these terms are necessarily currently included in the model, as you may remove some using StepwiseRegression.

Call NumberOfParameters to see how many terms are currently included in the model. Call StepwiseSelection to see which terms are included and excluded.

Use Names and Values to get the parameter names and values.

Examples

N = knotparams.SizeOfParameterSet

See Also

NumberOfParameters | StepwiseSelection | Names | Values

StatisticsDialog

Open summary statistics dialog box

Syntax

[model,OK] = StatisticsDialog(model)

Description

This is a method of mbcmodel. model.

[model,OK] = StatisticsDialog(model) opens the Summary Statistics dialog box, where you can select the summary statistics you want to use.

If you click **Cancel** to dismiss the dialog, OK = false and no changes are made. If you click OK to close the dialog box, then OK = true and your new chosen summary statistics are set up.

See Also

SummaryStatistics

Introduced in R2007a

Status

Model status: fitted, not fitted or best

Syntax

S = model.Status

Description

This is a property of mbcmodel.model. It returns a character vector: `Fitted' if the model is fitted, `Not fitted' if the model is not fitted (for example there is not enough data to fit the model), or `Best' if the model has been selected as best from some alternative models. A model must be Fitted before it can be selected as Best.

Examples

```
S = knot.Status
S =
    `Fitted'
```

See Also

ChooseAsBest

StepwiseRegression

Change stepwise selection status for specified terms

Syntax

```
[S, model] = StepwiseRegression(model, optional toggleTerms)
```

Description

This is a method of mbcmodel.model, for linear models only. This method returns the Stepwise table (as in the Stepwise values for ParameterStatistics). Leave out toggleTerms to get the current Stepwise values. You can choose to remove or include parameters using StepwiseRegression, as long as their StepwiseStatus is Step.

The Stepwise values returned are the same as those found in the table in the Stepwise GUI. For each parameter, the columns are: the value of the coefficient, the standard error of the coefficient, the t value and Next PRESS (the value of PRESS if the status of this term is changed at the next iteration). Look for the lowest Next PRESS to indicate which terms to toggle in order to improve the predictive power of the model.

Call StepwiseRegression to toggle between in and out for particular parameters. toggleTerms can be either an index that specifies which parameters to toggle, or an array or logical where a true value indicates that a toggle should occur. The example shown toggles parameter 4, after inspection of the Next PRESS column indicates changing the status of this term will result in the lowest PRESS. StepwiseRegression returns the new Stepwise values after toggling a parameter.

After making changes to the model using StepwiseRegression you must call UpdateResponse.

Use StepwiseStatus (on the child modelparameters object) to see which parameters have a status of Step; these can be toggled between in and out using StepwiseRegression (on the parent model object).

Use StepwiseSelection (on the child modelparameters object) to view which terms are in and out, as shown in the example.

Examples

```
[S, knot] = StepwiseRegression(knot)
  1.0e+003 *
    0.1316
              0.0606

StepwiseSelection | StepwiseStatus | UpdateResponse

StepwiseSelection

Model parameters currently included and excluded

Syntax

N = paramsknot.StepwiseSelection

Description

This is a read-only property of mbcmodel.linearmodelparameters, for linear models only. It returns a status for each parameter in the model, in or out, depending on whether the term is included or excluded. You can choose to remove or include parameters using StepwiseRegression, as long as their StepwiseStatus is Step. Call StepwiseRegression (on the parent model object) to toggle between in and out for particular parameters. You must then call UpdateResponse before calling StepwiseSelection.

Examples

```
N = paramsknot.StepwiseSelection
N =
    'in'
    'in'
    'out'
    'out'
    'out'
    'in'

    'in'
    'in'
```

See Also

StepwiseRegression | StepwiseStatus | NumberOfParameters | UpdateResponse

StepwiseStatus

Stepwise status of parameters in model

Syntax

N = paramsknot.StepwiseStatus

Description

This is a method of mbcmodel.linearmodelparameters, for linear models only. It returns the stepwise status of each parameter in the model.

The stepwise status for each term can be Always, Never or Step. The status determines whether you can use the StepwiseRegression function to throw away terms in order to try to improve the predictive power of the model.

- Always Always included in the model.
- Never Never included in the model.
- Step You can choose whether to include or exclude this term. Do this by using StepwiseRegression to toggle between in and out for particular parameters.

Use StepwiseSelection to find out which terms are currently included and excluded.

Examples

StepwiseRegression | StepwiseSelection

Style

Style of design type

Syntax

D.Style

Description

Style is a read-only property of mbcdoe.design.

D.Style returns the style of the design.

The style of the design is one of:

- 'User-defined'
- 'Optimal'
- 'Space-filling'
- 'Classical'
- 'Experimental data'

The read-only Style property is derived from the design Type.

See Also

Type (for designs and generators)

SummaryStatistics

Summary statistics for response

Syntax

```
S = SummaryStatistics(M)
S = SummaryStatistics(M, Names)
```

Description

This is a method of all model objects (mbcmodel.model and mbcmodel.localmodel) and response objects (mbcmodel.hierarchicalresponse, mbcmodel.localresponse, and mbcmodel.response).

These statistics appear in the Summary Statistics pane of the Model Browser GUI.

- S = SummaryStatistics(M) returns summary statistics for the model or response in a structure array containing Statistics and Names fields.
- S = SummaryStatistics(M, Names) returns summary statistics specified by Names for the model or response in an array. Names can be a char array, or a cell array of character vectors.

Examples

```
S = SummaryStatistics(R2);
```

See Also

DiagnosticStatistics | AlternativeModelStatistics

ValidationRMSE

Calculates the validation RMSE for model data

Syntax

S = ValidationRMSE(model,X,Y)

Description

This is a method of mbcmodel.model

S = ValidationRMSE(model, X, Y) calculates the root-mean-square error (RMSE) of a validation set.

- rmse=sqrt(sum((Y-evaluate(model,X)).^2)/N)
- X and Y are table objects or numeric arrays. N is the number of data points.

Examples

S = ValidationRMSE(model, X, Y)

See Also

SummaryStatistics | UpdateResponse

Introduced in R2019a

SummaryStatisticsForTest

Statistics for specified test

Syntax

```
SS = SummaryStatisticsForTest( LocalResponse, TestNumber )
SS = SummaryStatisticsForTest(LocalResponse, TestNumber, Names)
```

Description

This is a method of mbcmodel.localresponse.

SS = SummaryStatisticsForTest(LocalResponse, TestNumber) returns a structure array containing Statistics and Names fields values for the local model for test TestNumber.

SS = SummaryStatisticsForTest(LocalResponse,TestNumber,Names) returns an array of the statistics specified by Names. Names can be a char array, or a cell array of character vectors.

Examples

SS = SummaryStatisticsForTest(L, 22)

See Also

SummaryStatistics

Introduced in R2007b

TestFilters

Structure array holding user-defined test filters

Syntax

testf = data.TestFilters

Description

This is a property of mbcmodel.data.

It returns a structure array holding information about the currently defined test filters for the data object D. The array will be the same length as the number of currently defined test filters, with the following fields for each filter:

- Expression The character vector expression as defined in AddTestFilter or ModifyTestFilter.
- AppliedOK Boolean indicating that the filter was successfully applied.
- RemovedTests Boolean vector indicating which tests the filter removed. Note that many filters could remove the same test.
- Message Character vector holding information on the success or otherwise of the filter.

Examples

testf = data.TestFilters;

See Also

AddTestFilter | ModifyTestFilter | RemoveTestFilter

TestPlan

Test plan containing boundary tree

Syntax

Tree.TestPlan

Description

This is a property of mbcboundary.Tree and mbcboundary.TwoStageTree.

Tree.TestPlan returns the test plan object that contains this boundary tree (read only).

Testplans

Array of test plan objects in project

Syntax

tps = project.Testplans

Description

This is a property of mbcmodel.project.

P is the project object.

Examples

tps = project.Testplans;

Type (for boundary models)

Boundary model type

Syntax

B.Type

Description

This is a property of mbcboundary. AbstractBoundary and all subclasses.

B. Type returns the boundary model type. You can only choose a type when you create the boundary. Use the Type input argument with CreateBoundary to specify what kind of boundary model you want to create, such as 'Star-shaped', 'Range', 'Ellipsoid', 'Convex Hull'.

Use getAlternativeTypes to find out what types are available for the specified boundary model.

Available types depend on the boundary model, for example:

- For mbcboundary.Model, type can be 'Star-shaped', 'Range', 'Ellipsoid', or 'Convex Hull'
- For mbcboundary. TwoStage, LocalModel requires a type of either Range or Ellipsoid, and GlobalModel requires a type of Interpolating RBFonly.
- For mbcboundary.PointByPoint, the LocalModel type can be any valid type for mbcboundary.Model.

You can only create boundaries of type 'Point-by-point' or 'Two-stage' from a Local boundary tree, or from an existing boundary of type 'Point-by-point' or 'Two-stage'. You cannot create or fit these types of boundary models outside a project. Fit them by adding the boundary model to the boundary tree.

Examples

The following example creates a point-by-point boundary model from the Local boundary tree:

```
B = CreateBoundary(T.Boundary.Local, 'Point-by-point');
```

Create a local boundary with type range:

```
B.LocalModel = CreateBoundary(B.LocalModel, 'Range');
```

See Also

CreateBoundary | getAlternativeTypes

Type (for candidate sets)

Candidate set type

Syntax

C.Type

Description

This is a property of mbcdoe.candidateset.

C.Type returns the candidate set type. You can only choose a type when you create the candidate set, when calling CreateCandidateset.

You can specify the candidate set type during creation by using the Type property, e.g.,

```
CandidateSet = augmentedDesign.CreateCandidateSet...
( 'Type', 'Grid' );
```

Other available properties depend on the candidate set type. To see the properties you can set, see the table of candidate set properties, Candidate Set Properties (for Optimal Designs).

See Also

CreateCandidateSet

Type (for designs and generators)

Design type

Syntax

D.Type

G.Type = NewType

Description

This is a read-only property of mbcdoe.design, and a settable property of mbcdoe.generator.

D. Type returns the design type. You can only choose a type when you create designs. After design creation, you can only set the Type of a mbcdoe.generator object, or when calling Generate or Augment.

G.Type = NewType changes the Type, where G is a mbcdoe.generator object.

The design Type determines which properties you can set. To set properties, see Properties (for design generators).

Get a list of types which could be used as alternative designs for current design, using getAlternativeTypes, by entering the following syntax:

Dlist = getAlternativeTypes(D)

where D is an mbcdoe.design object.

The design Type must be one shown in the following table. The read-only Style property is derived from the Type.

Style	Туре
Optimal	D-Optimal
	V-Optimal
	A-Optimal
Classical	Box-Behnken
	Central Composite
	Full Factorial
	Plackett-Burman
	Regular Simplex
Space-filling	Lattice
	Latin Hypercube Sampling
	Stratified Latin Hypercube
	Sobol Sequence
	Halton Sequence

Style	Туре
Experimental data	Design points replaced by data points
	Any design with a mix of Types (eg an optimally augmented space-filling design)

Examples

To specify the Type while creating and then generating a design of a given size:

```
D = CreateDesign(model,'Type','Sobol Sequence')
D = Generate(D,128);
```

See Also

Properties (for design generators) | Generate | Augment

Type (for design constraints)

Design constraint type

Syntax

C.Type

Description

This is a property of mbcdoe.constraint.

C.Type returns the design constraint type. You can only choose a type when you create the constraint, when calling CreateConstraint.

You can specify the constraint type during creation by using the Type property, e.g.,

c = D.CreateConstraint('Type','Linear')

Other available properties depend on the constraint type. See the table Constraint Properties.

The constraint Type must be one shown in the following table.

Constraint Type	Description
'Linear'	Linear design constraint: 1*Input1 + 1* Input2 + 1* Input3 <= 0
'Ellipsoid'	Ellipsoid design constraint: Ellipsoid at (Input1=0, Input2=0, Input3=0)
'1D Table'	1D Table design constraint: InputY(InputX) <= InputY max
'2D Table'	2D Table design constraint: InputZ(InputX,InputY) <=InputZmax

See Also

CreateConstraint | Constraint Properties

Type (for models)

Valid model types

Syntax

```
model.Type
M = mbcmodel.CreateModel(Type, NUMINPUTS)
M2 = CreateModel(M, Type)
```

Description

This is a property of mbcmodel. model.

model.Type returns the model type. This property is set at creation time. See CreateModel.

The model Type determines which properties you can set. To set properties, see Properties (for models), and LocalModel Properties.

Note Spaces and case in model Type are ignored.

The model type must be one shown in the following table.

Туре	Model Object
Polynomial	mbcmodel.linearmodel
Hybrid Spline	mbcmodel.linearmodel
RBF	mbcmodel.linearmodel
Hybrid RBF	mbcmodel.linearmodel
Polynomial-RBF	mbcmodel.linearmodel
Hybrid Spline-RBF	mbcmodel.linearmodel
Multiple Linear	mbcmodel.linearmodel
Free Knot Spline	mbcmodel.model
Transient	mbcmodel.model
User-Defined	mbcmodel.model
Neural Network	mbcmodel.model
Interpolating RBF	mbcmodel.model
Local Polynomial Spline	mbcmodel.localmodel
Local Polynomial with Datum	mbcmodel.localmodel
Local Polynomial	mbcmodel.localmodel
Local Hybrid Spline	mbcmodel.localmodel
Local Truncated Power Series	mbcmodel.localmodel

Туре	Model Object
Local Free Knot Spline	mbcmodel.localmodel
Local Multiple Models	mbcmodel.localmodel
Local Growth	mbcmodel.localmodel
Local User-Defined	mbcmodel.localmodel
Local Transient	mbcmodel.localmodel
Local Average Fit	mbcmodel.localmodel

Get a list of types, using getAlternativeTypes, by entering the following syntax:

Mlist = getAlternativeTypes(M)

where M is an mbcmodel.model object.

Create an alternative model as follows: M = mbcmodel.CreateModel(Type, NUMINPUTS) or M2 = CreateModel(M, Type).

See Also

Properties (for models) | getAlternativeTypes | CreateModel

Units

Model output units

Syntax

model.Units
modelinput.Units

Description

This is a property of mbcmodel.model and mbcmodel.modelinput objects.

model.Units or modelinput.Units return the units of the model or modelinput object.

This property is set to the data signal units when the response is created or if a model is assigned to a response. This property cannot be set when a response is attached to the model.

Update

Update boundary model in tree and fit to test plan data

Syntax

```
B = Update(Tree,Index,B)
B = Update(Tree,Index,B,InBest)
```

Description

This is a method of mbcboundary. Tree.

B = Update(Tree, Index, B) updates the boundary model B in the boundary tree Tree, and fits the boundary model to the test plan data. Tree is an mbcboundary. Tree object, Index is the index to boundary model in the tree, and B is a boundary model object. The boundary model must have the same inputs as the boundary tree. The boundary model is always fitted when you add it to the boundary tree. This fitting ensures that the fitting data is compatible with the test plan data. The method returns the fitted boundary model.

B = Update(Tree,Index,B,InBest) updates the boundary model in the tree and InBest specifies whether to include the boundary model in the best boundary model for the boundary tree. By default, the boundary model retains its previous InBest status after calling Update.

See Also

Add | Remove | CreateBoundary

Introduced in R2009b

UpdateDesign

Update design in test plan

Syntax

```
D = UpdateDesign(T,D)
D = UpdateDesign(T,Level,D)
```

Description

UpdateDesign is a method of mbcmodel.testplan. You must call UpdateDesign to replace an edited design in the test plan.

```
D = UpdateDesign(T,D) updates the design.
```

D = UpdateDesign(T, Level, D) updates the design at the specified devel.

D is the array of designs to be updated in the test plan, T.

Level is the test plan level. By default the level is the outer level (i.e., Level 1 for One-stage, Level 2 (global) for Two-stage).

The design Name is used to decide what to update. If no name match is found in the test plan, the design is added.

Design names must be unique so any repeated names will be changed. The array of designs is an output.

See Also

AddDesign | RemoveDesign | FindDesign

Introduced in R2008a

UpdateResponse

Replace model in response

Syntax

```
UpdateResponse(model)
M = UpdateResponse( M , R); updates the response specified by R
```

Description

This is a method of mbcmodel. model. This takes the model and places it back into the response it came from. Appropriate action is taken if a refit is necessary because you have modified either the model, response data or model data in the interim. For example, if you have changed the model type, the new model is fitted to the response data. If you have changed the response data (e.g. removed an outlier), the model is fitted to the new response data.

Note that when changing the model type or settings (using the ModelSetup command) the response is not refitted until you call UpdateResponse. If you have changed the model by using StepwiseRegression you must call UpdateResponse.

```
\label{eq:policy} $$\operatorname{UpdateResponse}(\ M\ )$$ updates the model in the response associated with the model. $$M = \operatorname{UpdateResponse}(\ M\ ,\ R)$; updates the response specified by $R$.
```

Examples

UpdateResponse(knot);

See Also

ModelSetup

UpdateResponseFeatures

Refit response feature models

Syntax

UpdateResponseFeatures(L)

Description

This is a method of mbcmodel.localresponse.

UpdateResponseFeatures (L) refits all response feature models. You need to call this if you used RemoveOutliersForTest without specifying refitting the response features (doUpdate set to false).

Examples

For a local response LOCALRESPONSE, to remove first two data points without updating response features:

RemoveOutliersForTest(LOCALRESPONSE,1,1:2,false);

To update response features:

UpdateResponseFeatures(LOCALRESPONSE);

See Also

RemoveOutliersForTest | RestoreDataForTest

Introduced in R2007a

UserVariables

Structure array holding user-defined variables

Syntax

userV = D.UserVariables

Description

This is a property of mbcmodel.data.

This returns a structure array holding information about the currently defined filters. The array will be the same length as the number of currently defined variables, with fields

- Variable variable name
 - Expression The character vector expression as defined in AddVariable or ModifyVariable
 - Units The character vector defining the units
 - AppliedOK Boolean indicating that the variable expression was successfully applied
 - Message Character vector holding information on the success or otherwise of the variable

Examples

```
myvars = D1.UserVariables
```

This returns the following information about the user-defined variable in the example data object D1:

```
Variable: 'BSFC'
Expression: 'BSFC = FUELFLO./(BTQ.*(ENGSPEED*2*pi/60))'
    Units: 'kg/Nm'
AppliedOK: 1
    Message: 'Variable successfully added'
```

Variable is the parsed name of the variable being added. Note that this might differ from the name used in AddVariable because the SignalName must be a valid MATLAB variable name, and hence MBC will parse and modify the input name appropriately.

See Also

AddVariable | ModifyVariable | RemoveVariable

Value

Double data from data object

Syntax

```
val = Value(D, varNames, testNumbers)
```

Description

This is a method of mbcmodel.data.

Use this to extract particular data values.

varNames is an optional input that specifies either the name of the signal that you want to extract (such as 'SPK') or an array of names ({'SPK' 'AFR' 'TQ'}) the indices of the signals ([1 4 5]). Defaults to ':' meaning all.

testNumbers is an optional input that specifies which test indices you want. Defaults to ':' meaning all.

val outputs the double values held in the data.

Examples

```
dblValues = Value(D, 'SPK', 1);
dblValues = Value(D, {'SPK' 'AFR'}, ':');
dblValues = Value(D, [1 3 4 5]);
dblValues = Value(D, ':', [1 4 6 8]);
```

See Also

SignalNames

Values

Values of model parameters

Syntax

vals = paramsknot.Values

Description

This is a read-only property of mbcmodel.modelparameters. It returns the value of each parameter in the model. Use Names to find out the names of these terms.

Examples

vals = paramsknot.Values;

See Also

Names

Widths

Width data from RBF model

Syntax

Width = params.Widths

Description

This is a property of mbcmodel.rbfmodelparameters, for Radial Basis Function (RBF) models only.

Width is usually a single value, but can also be of size 1 by number of variables in the case of the width per dimension algorithm, or number of centers by number of variables in the case of tree regression.

Examples

Width = params.Widths;

See Also

Centers

xregstatsmodel

Class for evaluating models and calculating PEV

Syntax

```
y = StatsModel(X)
Y = EvalModel(StatsModel, X)
[pev, Y] = pev(StatsModel, X)
C = ceval(StatsModel, X)
df = dferror(StatsModel)
Interval = predint(StatsModel, X, Level);
n = nfactors(StatsModel)
[n,symbols,units] = nfactors(StatsModel)
```

Description

Use the xregstatsmodel class to evaluate a model and calculate the prediction error variance.

You can create an xregstatsmodel object by either:

- Exporting a model from the Model Browser to the workspace.
- Converting any command line response or model object to an xregstatsmodel by using the Export method.

Use the Export method to convert mbcmodel.hierarchicalresponse, mbcmodel.localresponse, mbcmodel.response and mbcmodel.model objects to xregstatsmodel objects. Use the syntax ExportedModel = Export(MODEL). The default format is 'MATLAB' so you do not need to specify the format.

After you create an xregstatsmodel object, you can use the following methods to evaluate the model and calculate the prediction error variance:

EvalModel — evaluate model

```
pev — evaluate prediction error variance
ceval - evaluate boundary model
dferror — degrees of freedom for error
predint — calculate confidence intervals for model prediction
nfactors — get number of input factors
```

If you convert an mbcmodel.localresponse object using Export and you have not created a two-stage model (hierarchical response object), then the output is an mbcPointByPointModel object. Point-by-point models are created from a collection of local models for different operating points. mbcPointByPointModel objects share all the same methods as xregstatsmodel except dferror.

y = StatsModel(X) evaluates the xregstatsmodel model object StatsModel at input values X. X is a (N-by-NF) array, where NF is the number of inputs, and N the number of points to evaluate the model at.

Y = EvalModel(StatsModel, X) evaluates the model at input values X. You can also evaluate models using parentheses, e.g., y = StatsModel(X)

[pev, Y] = pev(StatsModel, X) calculates the prediction error variance of the model at X, pev, and also returns Y the evaluated model at X.

C = ceval(StatsModel, X) evaluates the boundary model constraints at X.

df = dferror(StatsModel) gets the degrees of freedom for the model.

Interval = predint(StatsModel, X, Level); calculates the confidence interval for model
prediction. A Level confidence interval of the predictions is calculated about the predicted value.
The default value for Level is 99. Interval is a Nx2 array where the first column is the lower
bound and the second column is the upper bound.

n = nfactors(StatsModel) gets the number of input factors of the model. [n,symbols,units]
= nfactors(StatsModel) returns the number, symbols and units of the input factors in the model.
