You can use the Simulation Data Inspector programmatic interface to access the logged data from the simulations. When you access data using the Simulation Data Inspector programmatic interface, you can use functions to create plots in the Simulation Data Inspector.

To start, access the run IDs for the most recent two runs and then get the corresponding `Simulink.sdi.Run` object. The Run objects allow you to access the logged data for the simulations.

```
runIDs = Simulink.sdi.getAllRunIDs;
sineRunID = runIDs(end-1);
squareRunID = runIDs(end);

sineRun = Simulink.sdi.getRun(sineRunID);
squareRun = Simulink.sdi.getRun(squareRunID);
```

Suppose you want to analyze the relationship between the input and output for the model. Get the `Simulink.sdi.Signal` objects for the input and output signals from the two simulation runs.

```
sineOut = getSignalByIndex(sineRun,1);
sineIn = getSignalByIndex(sineRun,3);

squareOut = getSignalByIndex(squareRun,1);
squareIn = getSignalByIndex(squareRun,3);
```

Change the subplot layout in the Simulation Data Inspector to 2-by-1 and plot the signals from the first simulation run on the top plot and the signals from the second run on the bottom plot.

```
Simulink.sdi.setSubPlotLayout(2,1)

plotOnSubPlot(sineIn,1,1,true)
plotOnSubPlot(sineOut,1,1,true)

plotOnSubPlot(squareIn,2,1,true)
plotOnSubPlot(squareOut,2,1,true)
```

Save the Simulation Data Inspector Session

To view the plotted data in the Simulation Data Inspector, enter `Simulink.sdi.view` in the command window.

Then, save the Simulation Data Inspector session as an MLDATX file.

```
Simulink.sdi.save('myData.mldatx')
```

Load the Simulation Data Inspector Session

To mimic a scenario where you want to return to looking at the same data at a later point, clear the data from the Simulation Data Inspector and reset the subplot layout to 1-by-1.

```
Simulink.sdi.clear
Simulink.sdi.setSubPlotLayout(1,1)
```

Load the session file and resume working with the data. You can open the Simulation Data Inspector and view the results using the `Simulink.sdi.view` function.

```
Simulink.sdi.load('myData.mldatx');
```

Input Arguments

fileName — File name

character vector

Name for the session file.

Example: 'myData.mldatx'

See Also

Topics

“Inspect and Compare Data Programmatically”

“Save and Share Simulation Data Inspector Data and Views”

Introduced in R2011b

Simulink.sdi.saveView

Save visualization settings to apply to other data

Syntax

```
Simulink.sdi.saveView(filename)
```

Description

`Simulink.sdi.saveView(filename)` saves the current view in the Simulation Data Inspector to the file, `filename`.

A view contains information about the layout and plots in the graphical viewing area as well as properties of plotted signals. When you load a view, the Simulation Data Inspector uses the properties and preferences in the file to display data currently in the Simulation Data Inspector. Signals in the Simulation Data Inspector that align with the signals in the view are plotted in the graphical viewing area. Use a view to apply a consistent set of visualization settings to multiple sets of similar data.

The view file saves the following information:

- Subplot layout and visualization type
- Settings for each visualization type in the layout
- Signal selection mode
- Replay controls visibility
- Metadata displayed in the work area
- Settings for signal grouping in the work area
- Plotted signals and the line style and color for each plotted signal

A view file does not contain data. To save run data, export the data or save a session using the `Simulink.sdi.save` function.

Examples

Save and Use a View

This example visualizes the output from the `ex_vdp` model, saves the configuration as a view, and then uses the view to visualize the output from another simulation of the same model.

To generate data to plot in the Simulation Data Inspector, simulate the model.

```
open_system('ex_vdp')
set_param('ex_vdp/Mu', 'Gain', '1')
sim('ex_vdp');
```

Programmatically Configure and Save a View

The `ex_vdp` model is configured to log two signals, `x1` and `x2`. Plot each signal on a subplot in a 2-by-1 layout.

```
Simulink.sdi.setSubPlotLayout(2,1)
```

To plot one signal on each subplot, first access the `Simulink.sdi.Run` object for the simulation.

```
runIDs = Simulink.sdi.getAllRunIDs;
ex_vdpRunID = runIDs(end);
ex_vdpRun = Simulink.sdi.getRun(ex_vdpRunID);
```

Then, you can access the data for each signal in a `Simulink.sdi.Signal` object and use the `plotOnSubPlot` function to specify where to plot each signal.

```
x1 = getSignalByIndex(ex_vdpRun,1);
x2 = getSignalByIndex(ex_vdpRun,2);
```

```
plotOnSubPlot(x1,1,1,true)
plotOnSubPlot(x2,2,1,true)
```

To view the result in the Simulation Data Inspector, enter `Simulink.sdi.view` in the command window.

Then, save the view.

```
Simulink.sdi.saveView('ex_vdpView.mldatx')
```

Use the View

To mimic a situation where the Simulation Data Inspector is configured differently and contains data from another simulation, this example clears data from the Simulation Data Inspector, loads a view that represents the default visualization configuration, and runs another simulation of the `ex_vdp` model.

```
Simulink.sdi.clear
Simulink.sdi.loadView('default.mldatx');
set_param('ex_vdp/Mu', 'Gain', '2')
sim('ex_vdp');
```

Use the `Simulink.sdi.loadView` function to apply the saved view from the previous simulation.

```
Simulink.sdi.loadView('ex_vdpView.mldatx')
```

You can open the Simulation Data Inspector to view the results using the `Simulink.sdi.view` function. The saved view includes information regarding the axes limits. When you use a view to apply visualization settings, you may need to adjust axes limits or zoom levels to fit data from a modified simulation.

Input Arguments

filename — Name of view file

string | character array

Name of the view file, specified as a string or character array.

Example: 'myView.mldatx'

Data Types: char | string

Topics

“Save and Share Simulation Data Inspector Data and Views”

Introduced in R2020a

Simulink.sdi.sendWorkerRunToClient

Package: Simulink.sdi

Send run created on parallel workers to the Simulation Data Inspector

Syntax

```
Simulink.sdi.sendWorkerRunToClient  
Simulink.sdi.sendWorkerRunToClient(run)
```

Description

`Simulink.sdi.sendWorkerRunToClient` sends the run most recently generated by the worker to the client MATLAB and imports the run to the Simulation Data Inspector.

`Simulink.sdi.sendWorkerRunToClient(run)` sends the run corresponding to `run` to the client MATLAB and imports the run to the Simulation Data Inspector.

Examples

Manually Send Runs from Parallel Workers to the Simulation Data Inspector

This example shows how to use `Simulink.sdi.sendWorkerRunToClient` to send runs created using parallel workers manually to the Simulation Data Inspector.

Setup

This example runs several simulations of the `vdp` model, varying the value of the gain, `Mu`. To set up for the parallel simulation, define a vector of `Mu` values and configure the Simulation Data Inspector for manual Parallel Computing Toolbox support.

```
% Enable manual Parallel Computing Toolbox support  
Simulink.sdi.enablePCTSupport('manual');
```

```
% Choose several Mu values  
MuVals = [1 2 3 4];
```

Initialize Parallel Workers

Use `parpool` to start a pool of four parallel workers. This example calls `parpool` inside an `if` statement so you only create a parallel pool if you don't already have one. You can use `spmd` to run initialization code common to all workers. For example, load the `vdp` model and select signals to log to runs that we can send to the Simulation Data Inspector on the client MATLAB. To avoid data concurrency issues when simulating with `sim` in `parfor`, create a temporary directory on each worker. After the simulations complete, another `spmd` block deletes the temporary directories.

```
p = gcp('ncreate');  
  
if isempty(p)
```

```

    parpool(4);

end

Starting parallel pool (parpool) using the 'local' profile ...
connected to 4 workers.

spsmd

```

```

    % Load system and select signals to log
    load_system('vdp')
    Simulink.sdi.markSignalForStreaming('vdp/x1',1,'on')
    Simulink.sdi.markSignalForStreaming('vdp/x2',1,'on')

    % Create temporary directory for simulation on worker
    workDir = pwd;
    addpath(workDir)
    tempDir = tempname;
    mkdir(tempDir)
    cd(tempDir)

```

```
end
```

Run Parallel Simulations with parfor

To stream data from parallel workers to the Simulation Data Inspector, you have to run parallel simulations using `parfor`. Each worker runs a `vdp` simulation with a different value of `Mu`. Simulink cannot access the contents of the `parfor` loop, so the variable `MuVal` is defined in the worker's workspace, where the `vdp` model can see it, using `assignin`.

```

parfor (index = 1:4)

    % Set value of Mu in the worker's base workspace
    assignin('base','MuVal',MuVals(index));

    % Modify the value of Mu in the model and simulate
    set_param('vdp/Mu','Gain','MuVal')
    sim('vdp')

```

Access Data and Send Run to Client MATLAB

You can use the Simulation Data Inspector programmatic interface on the worker the same way you would in the client MATLAB. This example creates a `Simulink.sdi.Run` object and attaches the value of `Mu` used in the simulation with the `Tag` property.

```

    % Attach metadata to the run
    IDs = Simulink.sdi.getAllRunIDs;
    lastIndex = length(IDs);
    runID = Simulink.sdi.getRunIDByIndex(lastIndex);
    parRun = Simulink.sdi.getRun(runID);
    parRun.Tag = strcat('Mu = ',num2str(MuVals(index)));

    % Send the run to the Simulation Data Inspector on the client MATLAB
    Simulink.sdi.sendWorkerRunToClient

end

```

Close Temporary Directories and View Runs in the Simulation Data Inspector

Use another `spmd` section to delete the temporary directories created on the workers once the simulations complete. In each simulation, `Simulink.sdi.sendWorkerRunToClient` imported runs from all the workers into the Simulation Data Inspector. You can view the data and check the run properties to see the value of `Mu` used during simulation.

```
spmd
```

```
    % Remove temporary directories
    cd(workDir)
    rmdir(tempDir, 's')
    rmpath(workDir)
```

```
end
```

```
Simulink.sdi.view
```

Input Arguments

run — Run ID or `Simulink.sdi.Run` object

runID | `Simulink.sdi.Run` object

Run ID or `Simulink.sdi.Run` object corresponding to the run you want to import into the Simulation Data Inspector.

Simulink.sdi.setArchiveRunLimit

Package: Simulink.sdi

Specify a limit for the number of runs stored in the Simulation Data Inspector archive

Syntax

```
Simulink.sdi.setArchiveRunLimit(limit)
```

Description

`Simulink.sdi.setArchiveRunLimit(limit)` sets the Simulation Data Inspector archive limit as specified by `limit`. When the number of runs in the archive reaches the limit, the Simulation Data Inspector starts to delete runs from the archive on a first-in, first-out basis. When another run enters the archive, the Simulation Data Inspector deletes the run that has been in the archive the longest. A `limit` of `-1` indicates that the archive has no limit for the number of runs it stores. A `limit` of `0` means that the archive cannot contain any runs.

Tip To retain data for only the current run, configure the Simulation Data Inspector to automatically archive runs and set the archive run limit to `0`.

Examples

Configure the Simulation Data Inspector to Retain Only the Current Run

You can configure the Simulation Data Inspector to retain only the logged data for your current simulation. In iterative design and debugging workflows, this configuration helps prevent accumulation of unwanted logged data on disk. First, check the configuration of the Simulation Data Inspector archive. You can save the parameters to restore your preferences after you finish designing or debugging.

```
limit = Simulink.sdi.getArchiveRunLimit;  
mode = Simulink.sdi.getAutoArchiveMode;
```

Set the archive limit to `0` and configure the Simulation Data Inspector to automatically archive simulation runs.

```
setArchiveRunLimit(0)  
setAutoArchiveMode(true)
```

When you simulate your model, the Simulation Data Inspector deletes the previous run and updates the view to show signals in the current simulation.

When you finish designing or debugging your model, you can restore the Simulation Data Inspector archive back to its previous configuration.

```
Simulink.sdi.setArchiveRunLimit(limit)  
Simulink.sdi.setAutoArchiveMode(mode)
```

Input Arguments

limit — Maximum number of runs to store in the Simulation Data Inspector archive

scalar

Limit for the number of runs stored in the Simulation Data Inspector archive. When the number of runs in the archive reaches the limit, the Simulation Data Inspector starts to delete runs from the archive, on a first-in, first-out basis. A `limit` of -1 indicates that there is no limit on the runs stored in the archive. A `limit` of 0 indicates that the archive cannot contain any runs.

Example: -1

Example: 10

Topics

“Iterate Model Design Using the Simulation Data Inspector”

Introduced in R2018b

Simulink.sdi.setAutoArchiveMode

Package: Simulink.sdi

Specify whether the Simulation Data Inspector automatically archives simulation runs

Syntax

```
Simulink.sdi.setAutoArchiveMode(mode)
```

Description

`Simulink.sdi.setAutoArchiveMode(mode)` configures the automatic archive behavior of the Simulation Data Inspector, according to `mode`. The Simulation Data Inspector automatically archives simulation runs when you specify `mode` as `true`. When you specify `mode` as `false`, the Simulation Data Inspector does not automatically archive.

Examples

Configure the Simulation Data Inspector Archive

You can configure the Simulation Data Inspector to retain only the logged data for your current simulation. In iterative design and debugging workflows, this configuration helps prevent accumulation of unwanted logged data on disk. First, check the configuration of the Simulation Data Inspector archive. You can save the parameters to restore your preferences after you finish designing or debugging.

```
limit = Simulink.sdi.getArchiveRunLimit;  
mode = Simulink.sdi.getAutoArchiveMode;
```

Set the archive limit to 0 and configure the Simulation Data Inspector to automatically archive simulation runs.

```
Simulink.sdi.setArchiveRunLimit(0)  
Simulink.sdi.setAutoArchiveMode(true)
```

When you simulate your model, the Simulation Data Inspector deletes the previous run and updates the view to show signals in the current simulation.

When you finish designing or debugging your model, you can restore the Simulation Data Inspector archive back to its previous configuration.

```
Simulink.sdi.setArchiveRunLimit(limit)  
Simulink.sdi.setAutoArchiveMode(mode)
```

Input Arguments

mode — Logical specification of Simulation Data Inspector automatic archive behavior

`true` (default) | `false`

Logical value that specifies whether the Simulation Data Inspector automatically archives simulation runs.

- `true` — The Simulation Data Inspector automatically archives simulation runs.
- `false` — The Simulation Data Inspector does not automatically archive simulation runs.

Example: `false`

Data Types: `logical`

Simulink.sdi.setBorderOn

Display or hide border on time plots

Syntax

```
Simulink.sdi.setBorderOn(border)
```

Description

`Simulink.sdi.setBorderOn(border)` displays or hides the border on time plots in the Simulation Data Inspector according to the logical input, `border`. The function sets the value of the **Show border** setting in the Simulation Data Inspector **Time Plot Settings**. The setting applies to all time plots in the layout. By default, the Simulation Data Inspector shows the border on time plots.

Examples

Configure Time Plot Border Display

You can use the `Simulink.sdi.setBorderOn` function to show or hide the border on time plots in the Simulation Data Inspector. By default, the Simulation Data Inspector shows the border on time plots.

This example starts by showing how to use the `Simulink.sdi.getBorderOn` function to determine whether the border is currently displayed. Subsequent sections show the code to hide and show the border. To show the result, the example generates an image using the `Simulink.sdi.snapshot` function with settings specified by a `Simulink.sdi.CustomSnapshot` object.

```
snapSettings = Simulink.sdi.CustomSnapshot;  
snapSettings.Width = 300;  
snapSettings.Height = 300;
```

Get Current Border Display Setting

Before modifying the border display setting for time plots, you can save the current setting to a variable in the workspace in case you want to restore the preference later.

```
border = Simulink.sdi.getBorderOn;
```

Hide the Border on Time Plots

```
Simulink.sdi.setBorderOn(false)  
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

Show the Border on Time Plots

```
Simulink.sdi.setBorderOn(true)  
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

Input Arguments

border — Display or hide time plot border

true or 1 (default) | false or 0

Specify whether time plot borders are shown or hidden in the Simulation Data Inspector.

- true or 1 — Display border for time plots.
- false or 0 — Hide border for time plots.

See Also

`Simulink.sdi.setTicksPosition`

Topics

“Create Plots Using the Simulation Data Inspector”

Introduced in R2019b

Simulink.sdi.setGridOn

Package: Simulink.sdi

Configure grid lines for time plots

Syntax

```
Simulink.sdi.setGridOn(grid)
```

Description

`Simulink.sdi.setGridOn(grid)` configures the grid lines for time plots in the Simulation Data Inspector according to the input, `grid`. The function configures the **Horizontal** and **Vertical** options for the **Time Plot Settings** in the Simulation Data Inspector. The settings apply to the session and configure the grids for all time plots. By default, the Simulation Data Inspector shows horizontal and vertical grid lines.

Examples

Configure Grid for Time Plots in the Simulation Data Inspector

You can use `Simulink.sdi.setGridOn` to configure the appearance of the grid for time plots in the Simulation Data Inspector. By default, the Simulation Data Inspector shows horizontal and vertical grid lines.

This example starts by showing how to use `Simulink.sdi.getGridOn` to access the current grid configuration. The subsequent sections show the code for each configuration option for time plot grid in the Simulation Data Inspector. To see the result, the example uses a `Simulink.sdi.CustomSnapshot` object to specify settings for the output of the `Simulink.sdi.snapshot` function.

```
snapSettings = Simulink.sdi.CustomSnapshot;  
snapSettings.Width = 300;  
snapSettings.Height = 300;
```

Get Initial Grid Setting

Before modifying the grid display preferences, you can save the current configuration to a variable in the workspace in case you want to restore the preferences later.

```
gridInit = Simulink.sdi.getGridOn;
```

Configure Horizontal Grid Lines

Show only horizontal grid lines in the Simulation Data Inspector.

```
Simulink.sdi.setGridOn('horizontal')  
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

Configure Vertical Grid Lines

Show only vertical grid lines in the Simulation Data Inspector.

```
Simulink.sdi.setGridOn('vertical')  
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
```

Configure No Grid Lines

Show no grid lines in the Simulation Data Inspector.

```
Simulink.sdi.setGridOn('off')  
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
```

Configure Horizontal and Vertical Grid Lines

Show horizontal and vertical grid lines in the Simulation Data Inspector.

```
Simulink.sdi.setGridOn('on')  
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

Input Arguments

grid — Specify visible grid lines

'on' (default) | 'horizontal' | 'vertical' | 'off'

Specify grid appearance for time plots in the Simulation Data Inspector.

- 'on' shows horizontal and vertical grid lines on time plots in the Simulation Data Inspector.
- 'horizontal' shows only horizontal grid lines on time plots in the Simulation Data Inspector.
- 'vertical' shows only vertical grid lines on time plots in the Simulation Data Inspector.
- 'off' shows no grid lines on time plots in the Simulation Data Inspector.

Compatibility Considerations

Specifying the input as a logical value is not recommended

Starting in R2019b, the `Simulink.sdi.setGridOn` input values changed to:

- 'on'
- 'horizontal'
- 'vertical'
- 'off'

In R2019a, the `Simulink.sdi.setGridOn` accepted a logical input to show or hide the grid on time plots in the Simulation Data Inspector:

- `true` or `1` shows horizontal and vertical grid lines on time plots in the Simulation Data Inspector.
- `false` or `0` hides horizontal and vertical grid lines on time plots in the Simulation Data Inspector.

Starting in R2019b, use the `'on'` input value for the same behavior as the `true` or `1` input, and use the `'off'` input value for the same behavior as the `false` or `0` input.

Introduced in R2019a

Simulink.sdi.setMarkersOn

Package: Simulink.sdi

Show or hide markers for plotted signals

Syntax

```
Simulink.sdi.setMarkersOn(value)
```

Description

`Simulink.sdi.setMarkersOn(value)` shows or hides markers on signals plotted in the Simulation Data Inspector according to the logical input, `value`. The function configures the **Show markers** setting in the Simulation Data Inspector. The setting applies to the session and shows or hides markers for all signals plotted in the Simulation Data Inspector. By default, markers are hidden in the Simulation Data Inspector.

Examples

Display Markers in the Simulation Data Inspector

```
Simulink.sdi.setMarkersOn(true);
```

Input Arguments

`value` — Logical input

false or 0 (default) | true or 1

Logical specification of whether markers are shown on plots in the Simulation Data Inspector.

- true or 1 shows markers on plots in the Simulation Data Inspector.
- false or 0 does not show markers on plots in the Simulation Data Inspector.

Data Types: logical

Simulink.sdi.setRunNamingRule

Package: Simulink.sdi

Specify the Simulation Data Inspector run naming rule

Syntax

```
Simulink.sdi.setRunNamingRule('rule')
```

Description

`Simulink.sdi.setRunNamingRule('rule')` sets the Simulation Data Inspector rule for naming runs created by simulating a Simulink model.

Examples

Modify Run Naming Rule Then Restore Default

This example shows how to use the Simulation Data Inspector API to modify the Simulation Data Inspector run naming rule, check a run's name, restore default preferences, and check the run naming rule.

```
% Load model
load_system('sldemo_fuelsys')

% Modify run naming rule
Simulink.sdi.setRunNamingRule('<model_name> Run <run_index>')

% Simulate system
sim('sldemo_fuelsys')

% Check run name
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
fuelRun = Simulink.sdi.getRun(runID);
fuelRun.name

ans =
'sldemo_fuelsys Run 1'

% Clear preferences to reset the run naming rule
Simulink.sdi.clearPreferences

% Check run naming rule
Simulink.sdi.getRunNamingRule

ans =
'Run <run_index>: <model_name>'
```

Input Arguments

'rule' — Simulation Data Inspector run naming rule

Run <run_index>: <model_name> (default) | character vector

Simulation Data Inspector run naming rule for runs created by simulating a Simulink model. The character vector specifying the run naming rule can include plain text and any of the following tokens that represent data pulled from each run:

- <run_index> - Run's index in the Simulation Data Inspector repository.
- <model_name> - Name of the model simulated to create the run.
- <time_stamp> - Start time for the simulation that created the run.
- <sim_mode> - Simulation mode used for the simulation that created the run.

Example: '<time_stamp> Simulation <run_index>: <model_name>'

Example: '<model_name> - <run_index>'

Alternatives

You can modify the run naming rule using the Simulation Data Inspector UI in the **Preferences** menu. You can rename a run by modifying the Name property of its `Simulink.sdi.Run` object.

“Organize Your Simulation Data Inspector Workspace”

Introduced in R2011b

Simulink.sdi.setRunOverwrite

Package: Simulink.sdi

(Removed) Enable and disable run overwrite mode for a Simulation Data Inspector run

Note The `Simulink.sdi.setRunOverwrite` function has been removed. You can configure the Overwrite Run mode behavior using the `Simulink.sdi.setAutoArchiveMode` and `Simulink.sdi.setArchiveRunLimit` functions. For further details, see “Compatibility Considerations”.

Syntax

```
Simulink.sdi.setRunOverwrite(runID, overwrite)
```

Description

`Simulink.sdi.setRunOverwrite(runID, overwrite)` configures run overwrite mode for the run corresponding to `runID`, according to the value specified for `overwrite`.

Examples

Configure the Simulation Data Inspector Archive

You can configure the Simulation Data Inspector to retain only the logged data for your current simulation. In iterative design and debugging workflows, this configuration helps prevent accumulation of unwanted logged data on disk. First, check the configuration of the Simulation Data Inspector archive. You can save the parameters to restore your preferences after you finish designing or debugging.

```
limit = Simulink.sdi.getArchiveRunLimit;  
mode = Simulink.sdi.getAutoArchiveMode;
```

Set the archive limit to 0 and configure the Simulation Data Inspector to automatically archive simulation runs.

```
Simulink.sdi.setArchiveRunLimit(0)  
Simulink.sdi.setAutoArchiveMode(true)
```

When you simulate your model, the Simulation Data Inspector deletes the previous run and updates the view to show signals in the current simulation.

When you finish designing or debugging your model, you can restore the Simulation Data Inspector archive back to its previous configuration.

```
Simulink.sdi.setArchiveRunLimit(limit)  
Simulink.sdi.setAutoArchiveMode(mode)
```

Input Arguments

runID — Numeric run identifier

scalar

Run ID for the run you want to set run overwrite for. The Simulation Data Inspector assigns run IDs when it creates runs. You can get the run ID for a run using `Simulink.sdi.getAllRunIDs` or `Simulink.sdi.getRunIDByIndex`.

overwrite — Run overwrite enable/disable

true | false

Logical value for run overwrite mode. Specify `overwrite` as `true` to enable run overwrite mode for a run, and set `overwrite` to `false` to disable run overwrite mode for a run.

Compatibility Considerations

Simulink.sdi.setRunOverwrite function has been removed

Errors starting in R2018b

The `Simulink.sdi.setRunOverwrite` function is removed in R2018b with the introduction of the Simulation Data Inspector archive. You can configure the Overwrite Run mode behavior using the new `Simulink.sdi.setAutoArchiveMode` and `Simulink.sdi.setArchiveRunLimit` functions. Enable the Simulation Data Inspector to automatically archive simulation runs, and set the archive limit to 0.

```
Simulink.sdi.setAutoArchiveMode(true);  
Simulink.sdi.setArchiveRunLimit(0);
```

With these settings, the Simulation Data Inspector retains the data for the current simulation run and discards the data for the previous simulation run. The view in the Simulation Data Inspector also updates to show signals in the current run, with consistent line styles and colors.

You can disable each aspect of the behavior separately. To retain prior run data, set the archive limit to a nonzero value. If you want no limit on the number of runs stored in the archive, you can specify -1 as the archive limit. When you disable the **Automatically archive** setting, the Simulation Data Inspector does not move the prior run to the archive or update the view to show signals from the current run.

Simulink.sdi.setSignalInputProcessingMode

Specify value for Input Processing signal property

Syntax

```
Simulink.sdi.setSignalInputProcessingMode(blkPath,port,mode)  
Simulink.sdi.setInputProcessingMode(h,mode)
```

Description

`Simulink.sdi.setSignalInputProcessingMode(blkPath,port,mode)` specifies `mode` as the value of the **Input Processing** property for the signal at the specified block path and port. You can only specify the **Input Processing** property for logged signals.

The **Input Processing** setting affects the format of the logged data and how the Simulation Data Inspector and dashboard blocks display the signal. You can configure a signal for frame-based or sample-based input processing.

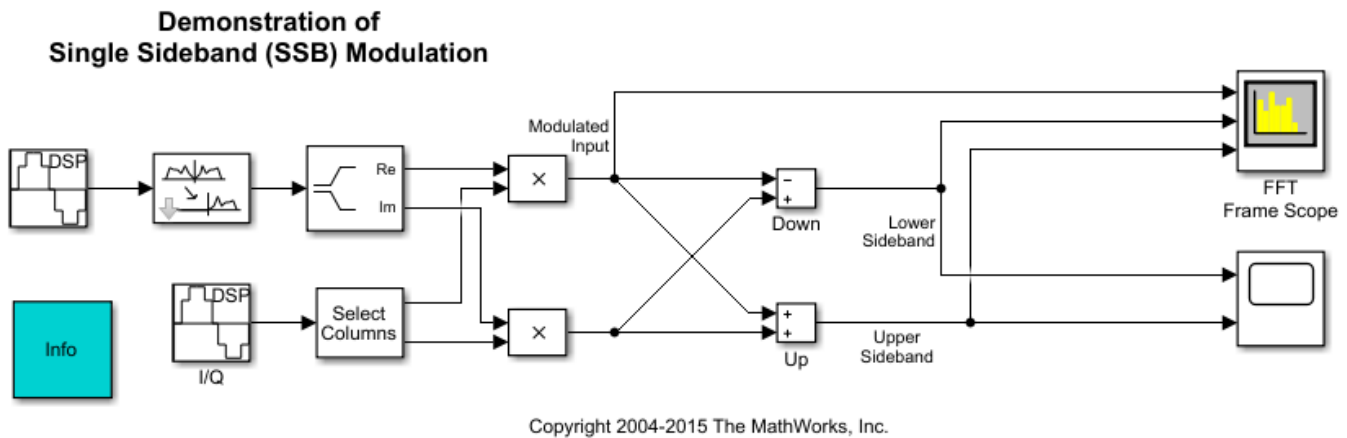

`Simulink.sdi.setInputProcessingMode(h,mode)` specifies `mode` as the value of the **Input Processing** property for the signal that corresponds to the line handle, `h`.

Examples

Programmatically Specify Input Processing Setting to Log a Frame-Based Signal

Many signal processing applications process data using frames, rather than individual signal values. A frame consists of signal values for several sample times. To process signals as frame-based in your model, specify frame-based processing in the blocks. To log and visualize frame-based signals, set the **Input Processing** setting to `Columns as channels (frame based)` in the Instrumentation Properties for the signal.

This example uses a model from the DSP System Toolbox™ to show how to programmatically specify the **Input Processing** setting for signals in a model using the `Simulink.sdi.setSignalInputProcessingMode` function. The model uses frame-based signals and demonstrates single sideband (SSB) modulation.

Configure Signal Logging

Open or load the model `ssbdemo_frame`. This example illustrates a scripting workflow and only loads the model.

```
load_system('ssbdemo_frame');
```

The model includes visualization blocks and does not use signal logging. Mark the signals that represent the upper sideband and lower sideband for logging.

```
upperSB_block = 'ssbdemo_frame/Up';
lowerSB_block = 'ssbdemo_frame/Down';
```

```
Simulink.sdi.markSignalForStreaming(upperSB_block,1,'on')
Simulink.sdi.markSignalForStreaming(lowerSB_block,1,'on')
```

If you simulate the model as-is, the signals would be logged as though they were sample-based, so each element in a sample would be treated as a separate channel. To log the signals as frame-based, specify the **Input Processing** setting for the signal as frame using the `Simulink.sdi.setSignalInputProcessingMode` function.

```
Simulink.sdi.setSignalInputProcessingMode(upperSB_block,1,'frame');
Simulink.sdi.setSignalInputProcessingMode(lowerSB_block,1,'frame');
```

After configuring the upper and lower sideband signals for logging and as frame-based, the data logs to the workspace and the Simulation Data Inspector in a frame-based format, so each column in a sample is treated as a channel in the signal. You can view and analyze the data in the Simulation Data Inspector or using its programmatic interface.

Input Arguments

blkPath — Block path for block that produces signal

string | character array

Block path for the block that produces the signal, specified as a string or character array.

Example: "vdp/Mu"

port — Number of block output port connected to signal

scalar

Block output port number for the port that produces the signal, specified as a scalar.

Example: 1

mode — Signal input processing setting

"sample" (default) | "frame"

Input Processing property value for the signal, returned as "signal" or "frame".

- **sample** — Sample-based input processing, where each element in a sample is treated as a channel.
- **frame** — Frame-based input processing, where each column in a sample is treated as a channel.

h — Signal line handle

line handle

Line handle for the signal. You can get the line handle for a signal using the `get_param` function with the 'LineHandles' option. For example, to access the line handle for the output of the Mu block in the model vdp:

```
MuLineHandles = get_param('vdp/Mu','LineHandles');  
MuOutputLineHandle = MuLineHandles.Outputport;
```

Example: MuOutputLineHandle

Introduced in R2020a

Simulink.sdi.setSubPlotLayout

Package: Simulink.sdi

Set subplot layout in the Simulation Data Inspector

Syntax

```
Simulink.sdi.setSubPlotLayout(r,c)
```

Description

`Simulink.sdi.setSubPlotLayout(r,c)` sets the grid layout of plots in the Simulation Data Inspector using the specified number of rows, *r*, and columns, *c*.

Examples

Change Subplot Layout

```
% Change subplot layout to 4 rows and 2 columns  
Simulink.sdi.setSubPlotLayout(4,2);
```

Create a Run and View the Data

This example shows how to create a run, add data to it, and then view the data in the Simulation Data Inspector.

Create Data for the Run

Create `timeseries` objects to contain data for a sine signal and a cosine signal. Give each `timeseries` object a descriptive name.

```
time = linspace(0,20,100);  
  
sine_vals = sin(2*pi/5*time);  
sine_ts = timeseries(sine_vals,time);  
sine_ts.Name = 'Sine, T=5';  
  
cos_vals = cos(2*pi/8*time);  
cos_ts = timeseries(cos_vals,time);  
cos_ts.Name = 'Cosine, T=8';
```

Create a Run and Add Data

Use the `Simulink.sdi.view` function to open the Simulation Data Inspector.

```
Simulink.sdi.view
```

To import data into the Simulation Data Inspector from the workspace, create a `Simulink.sdi.Run` object using the `Simulink.sdi.Run.create` function. Add information about the run to its metadata using the `Name` and `Description` properties of the Run object.

```
sinusoidsRun = Simulink.sdi.Run.create;
sinusoidsRun.Name = 'Sinusoids';
sinusoidsRun.Description = 'Sine and cosine signals with different frequencies';
```

Use the `add` function to add the data you created in the workspace to the empty run.

```
add(sinusoidsRun, 'vars', sine_ts, cos_ts);
```

Plot the Data in the Simulation Data Inspector

Use the `getSignalByIndex` function to access `Simulink.sdi.Signal` objects that contain the signal data. You can use the `Simulink.sdi.Signal` object properties to specify the line style and color for the signal and plot it in the Simulation Data Inspector. Specify the `LineColor` and `LineDashed` properties for each signal.

```
sine_sig = getSignalByIndex(sinusoidsRun,1);
sine_sig.LineColor = [0 0 1];
sine_sig.LineDashed = '-.';

cos_sig = sinusoidsRun.getSignalByIndex(2);
cos_sig.LineColor = [0 1 0];
cos_sig.LineDashed = '--';
```

Use the `Simulink.sdi.setSubPlotLayout` function to configure a 2-by-1 subplot layout in the Simulation Data Inspector plotting area. Then use the `plotOnSubplot` function to plot the sine signal on the top subplot and the cosine signal on the lower subplot.

```
Simulink.sdi.setSubPlotLayout(2,1);

plotOnSubPlot(sine_sig,1,1,true);
plotOnSubPlot(cos_sig,2,1,true);
```

Close the Simulation Data Inspector and Save Your Data

When you have finished inspecting the plotted signal data, you can close the Simulation Data Inspector and save the session to an MLDATX file.

```
Simulink.sdi.close('sinusoids.mldatx')
```

Input Arguments

r — Number of rows

integer

Number of rows in the subplot grid layout, specified as a whole number between 1 and 8, inclusive.

Example: 2

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | char

c — Number of columns

integer

Number of columns in the subplot grid layout, specified as a whole number between 1 and 8, inclusive.

Example: 2

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `char`

Simulink.sdi.setTableGrouping

Package: Simulink.sdi

Change signal grouping hierarchy in Inspect pane

Syntax

```
Simulink.sdi.setTableGrouping
Simulink.sdi.setTableGrouping('group1')
Simulink.sdi.setTableGrouping('group1', 'group2')
Simulink.sdi.setTableGrouping('group1', 'group2', 'group3')
```

Description

`Simulink.sdi.setTableGrouping` groups signals in the **Inspect** pane of the Simulation Data Inspector as a flat list.

`Simulink.sdi.setTableGrouping('group1')` groups signals in the **Inspect** pane by the parameter specified by `group1`.

`Simulink.sdi.setTableGrouping('group1', 'group2')` groups signals in the **Inspect** pane first by the parameter specified by `group1` and then by the parameter specified by `group2`.

`Simulink.sdi.setTableGrouping('group1', 'group2', 'group3')` groups signals in the **Inspect** pane first by the parameter specified by `group1`, then by the parameter specified by `group2`, and finally by the parameter specified by `group3`. If you have a Simscape license, you have three options for table grouping.

Examples

Group Data by Model and Then Data Hierarchy

You can group your data in the navigation pane to visualize subsystem and data hierarchy relationships among signals clearly.

```
Simulink.sdi.setTableGrouping('Subsystems', 'DataHierarchy');
```

Input Arguments

'group1' — Signal grouping parameter

character vector

Parameter used to group signals in the **Inspect** pane of the Simulation Data Inspector. You can specify two grouping parameters, or three if you have a Simscape license.

- `DataHierarchy` groups signals according to any data hierarchy in the model, for example grouping signals in a bus together.
- `SubSystems` groups signals according to the model's subsystem hierarchy.

- `PhysmodHierarchy` groups signals according to the Simscape block structure. This parameter is only available with a Simscape license.

Example: 'SubSystems'

Example: 'DataHierarchy'

Data Types: char

Introduced in R2016a

Simulink.sdi.setTickLabelsDisplay

Configure tick label visibility for time plot axes

Syntax

```
Simulink.sdi.setTickLabelsDisplay(label)
```

Description

`Simulink.sdi.setTickLabelsDisplay(label)` displays labels for the tick marks on axes of time plots in the Simulation Data Inspector according to the input, `label`. The function sets the value of the **Tick labels** setting in the Simulation Data Inspector **Time Plot Settings**. The setting applies to all time plots in the layout. By default, the Simulation Data Inspector displays tick mark labels for both time plot axes.

Examples

Configure Tick Mark Label Visibility for Time Plots

You can use the `Simulink.sdi.setTickLabelsDisplay` function to configure the visibility of tick mark labels for the *t*- and *y*-axes on time plots in the Simulation Data Inspector. By default, the Simulation Data Inspector displays tick marks for both axes.

This example starts by showing how to use the `Simulink.sdi.getTickLabelsDisplay` function to access the current tick mark label visibility. Subsequent sections show the code to specify each available option for tick mark label visibility on time plots in the Simulation Data Inspector. To see the result of each configuration, the example generates an image using the `Simulink.sdi.snapshot` function with settings specified by a `Simulink.sdi.CustomSnapshot` object.

```
snapSettings = Simulink.sdi.CustomSnapshot;  
snapSettings.Width = 300;  
snapSettings.Height = 300;
```

Get Current Tick Mark Label Visibility

Before modifying the visibility of the tick mark labels on time plots, you can save the current configuration to a variable in the workspace in case you want to restore the preference later.

```
initTickLabels = Simulink.sdi.getTickLabelsDisplay;
```

Show Only *t*-Axis Tick Mark Labels

Show the tick mark labels for the *t*-Axis.

```
Simulink.sdi.setTickLabelsDisplay('t-axis')  
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
```

Show Only y-Axis Tick Mark Labels

Show the tick mark labels for the y-axis.

```
Simulink.sdi.setTickLabelsDisplay('y-axis')  
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

Hide Tick Mark Labels

You can hide the tick mark labels for both axes.

```
Simulink.sdi.setTickLabelsDisplay('none')  
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

Show All Tick Mark Labels

By default, the Simulation Data Inspector shows tick mark labels for both axes on time plots.

```
Simulink.sdi.setTickLabelsDisplay('all')  
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

Input Arguments

label — Tick mark labels to display

'all' (default) | 't-axis' | 'y-axis' | 'none'

Specify tick mark labels to display on time plots in the Simulation Data Inspector.

- 'all' — Display tick mark labels for both time plot axes.
- 't-axis' — Display tick mark labels only on the *t*-axis for time plots.
- 'y-axis' — Display tick mark labels only on the *y*-axis for time plots.
- 'none' — Do not display tick mark labels.

Topics

“Create Plots Using the Simulation Data Inspector”

Introduced in R2019b

Simulink.sdi.setTicksPosition

Configure position for tick marks on time plots

Syntax

```
Simulink.sdi.setTicksPosition(position)
```

Description

`Simulink.sdi.setTicksPosition(position)` sets the location of tick marks on time plots in the Simulation Data Inspector according to the input, `position`. The function configures the **Ticks** setting in the Simulation Data Inspector **Time Plot Settings**. The setting applies to all time plots in the layout. By default, the Simulation Data Inspector displays tick marks on the outside of the plot area.

Examples

Configure Position for Tick Marks on Time Plots

You can use `Simulink.sdi.setTicksPosition` function to specify the position for tick marks on time plots in the Simulation Data Inspector. By default, the Simulation Data Inspector displays tick marks outside of the plot area for time plots.

This example starts by showing how to use the `Simulink.sdi.getTicksPosition` function to access the current position of tick marks. Subsequent sections show the code to specify each configuration option for the position of tick marks on time plots in the Simulation Data Inspector. To see the result, the example generates an image using `Simulink.sdi.snapshot` with settings specified by a `Simulink.sdi.CustomSnapshot` object.

```
snapSettings = Simulink.sdi.CustomSnapshot;  
snapSettings.Width = 300;  
snapSettings.Height = 300;
```

Get Current Tick Mark Position

Before modifying the position of tick marks on time plots, you can save the current configuration to a variable in the workspace in case you want to restore the preference later.

```
initTickPos = Simulink.sdi.getTicksPosition;
```

Position Tick Marks Inside Plot Area

Position the tick marks inside the plot area to increase the amount of space used by the plot area.

```
Simulink.sdi.setTicksPosition('inside')  
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

Hide Tick Marks on Time Plots

You can hide the tick marks for time plots in the Simulation Data Inspector. Hiding the tick marks expands the plot area.

```
Simulink.sdi.setTicksPosition('none')  
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

**Position Tick Marks Outside Plot Area**

By default, the Simulation Data Inspector displays tick marks outside of the plot area for time plots.

```
Simulink.sdi.setTicksPosition('outside')  
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

Input Arguments

position — Position for tick marks on time plots

'outside' (default) | 'inside' | 'none'

Specify the position for tick marks on time plots in the Simulation Data Inspector.

Tip Move tick marks to the inside of time plots to increase the area available to the plot area.

Example: 'inside'

convertUnits

Package: Simulink.sdi

Convert units of Simulink.sdi.Signal object

Syntax

```
convertUnits(sig,units)
```

Description

`convertUnits(sig,units)` converts the units of the Simulink.sdi.Signal object `sig` to the units specified by `units`. For a list of accepted units, see [Allowed Units](#). You can use the `convertUnits` function to convert the units of Simulink.sdi.Signal objects that contain data of all built-in and fixed-point types.

Examples

Programmatically Convert Signal Units

This example shows how to use the `convertUnits` function to convert the units of a Simulink.sdi.Signal object, using the model `sldemo_autotrans`. When you convert the units of the Signal object, the Simulation Data Inspector performs a conversion on the data and updates any plots that display the signal. Changing the units of a Signal object does not affect the model that created the signal.

Generate Simulation Data

Simulate the `sldemo_autotrans` model to create a run in the Simulation Data Inspector. Then, use the `Simulink.sdi.Run.getLatest` function to access the Run object that corresponds to the simulation.

```
out = sim('sldemo_autotrans');  
autoRun = Simulink.sdi.Run.getLatest;
```

Inspect the Signal Properties

Get the Simulink.sdi.Signal object for the EngineRPM signal and check the Units property.

```
engine_sig = getSignalsByName(autoRun, 'EngineRPM');  
engine_sig.Units  
  
ans =  
'rpm'
```

Convert Signal Units

Use the `convertUnits` function to convert the EngineRPM signal units to rad/s. Then, change the signal name to reflect the new units.

```
convertUnits(engine_sig, 'rad/s')  
engine_sig.Name = 'EngineFreq, rad/s';
```

Check the modified signal properties.

```
engine_sig.Units
```

```
ans =  
'rad/s'
```

```
engine_sig.Name
```

```
ans =  
'EngineFreq, rad/s'
```

Input Arguments

sig — Signal with units to convert

Simulink.sdi.Signal object

Signal with units to convert, specified as a Simulink.sdi.Signal object.

units — Desired signal units

string | character vector

Desired units for the signal, specified as a string or character vector. For a list of accepted units, see Allowed Units.

Example: 'm'

Example: "ft/s"

Data Types: char | string

export

Package: Simulink.sdi

Export Simulink.sdi.Signal object to workspace or file

Syntax

```
ts = export(sig)
ts = export(sig,startTime,endTime)
export( ___,Name,Value)
```

Description

`ts = export(sig)` exports the Simulink.sdi.Signal object `sig` to the timeseries object, `ts`, in the MATLAB workspace.

`ts = export(sig,startTime,endTime)` exports the portion of the Simulink.sdi.Signal object defined by `startTime` and `endTime` to the timeseries object, `ts`, in the MATLAB workspace.

`export(___,Name,Value)` exports the Simulink.sdi.Signal object to the base workspace or a file according to the options specified by one or more name-value pair arguments.

Examples

Export Signal Data to the Workspace

This example shows how to create a run in the Simulation Data Inspector, access the data, and export the signal data to a `timeseries` object in the workspace.

Simulate the model `sldemo_fuelsys` to create a run in the Simulation Data Inspector that contains the logged data.

```
sim('sldemo_fuelsys');
```

Use the `Simulink.sdi.getCurrentSimulationRun` function to access the run.

```
fuelRun = Simulink.sdi.getCurrentSimulationRun('sldemo_fuelsys');
```

Use the `getSignalByIndex` function to get the second signal in the `Simulink.sdi.Run` object.

```
sig = getSignalByIndex(fuelRun,2);
```

Export the signal data to the workspace using the `export` function.

```
ts = export(sig);
```

Input Arguments

sig — Signal to export

Simulink.sdi.Signal object

Signal to export, specified as a Simulink.sdi.Signal object.

startTime — Export start time

integer

Start time for the signal portion to export, specified as an integer.

Example: 0

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64

endTime — Export end time

integer

End time for the signal portion to export, specified as an integer.

Example: 10

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64

Name-Value Pair Arguments

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1, Value1, ..., NameN, ValueN.

Example: 'to', 'file'

to — Where to export data

'variable' (default) | 'file'

Where to export data, specified as the comma-separated pair consisting of 'to' and 'variable' or 'file'.

When you export data to a file, you must also specify a file name using the 'filename' name-value pair argument. You can specify a file name with a .mat or .xlsx extension.

When you export a signal to a MAT-file, the data is saved in the MAT-file as a timeseries object.

Data exported to a Microsoft Excel file is saved using the format described in “Simulation Data Inspector Import and Export File Format”.

When you export data to a Microsoft Excel file, you can specify additional options using the 'overwrite', 'metadata', and 'sharetimecolumn' name-value pairs.

Example: 'to', 'file'

filename — Name of file to contain exported data

string | character array

Name of the file to contain the exported data, specified as the comma-separated pair consisting of 'filename' and a string or character array. Include a .mat or .xlsx extension in the file name to

specify whether to export to a MAT-file or a Microsoft Excel file. When you do not specify an extension with the file name, the data exports to a MAT-file.

Use the 'filename' name-value pair argument when you specify the 'to' name-value pair argument with the value 'file'.

When you export data to a Microsoft Excel file, you can specify additional options using the 'overwrite', 'metadata', and 'sharetimecolumn' name-value pair arguments.

Example: 'filename', "mySpreadsheet.xlsx"

overwrite — Data to overwrite in existing Microsoft Excel file

'file' (default) | 'sheetonly'

Data to overwrite in existing Microsoft Excel file, specified as the comma-separated pair consisting of 'overwrite' and 'file' or 'sheetonly'.

- 'file' — Overwrite the entire file with the exported data.
- 'sheetonly' — Only overwrite sheets of the Microsoft Excel file with data that corresponds to the exported data.

When you export data to an existing MAT-file, the exported data overwrites the entire file.

Example: 'overwrite', 'sheetonly'

metadata — Metadata to include in exported Microsoft Excel file

[] (default) | string array

Metadata to include in the exported Microsoft Excel file, specified as the comma-separated pair consisting of 'metadata' and a string array. By default, the export operation does not include any metadata. You can export this metadata to the Microsoft Excel file:

- `dataType` — Signal data type
- `units` — Signal units
- `blockPath` — Path to the source block for logged signals
- `interp` — Signal interpolation method
- `portIndex` — Index of the port on the source block for logged signals

You can specify the desired metadata in any order you choose in the string array. The order of the metadata does not affect the format in the exported file, which always matches the description in "Simulation Data Inspector Import and Export File Format".

Example: 'metadata', ["units", "dataType"]

sharetimecolumn — Whether signals share time columns in exported Microsoft Excel file

'on' (default) | 'off'

Whether signals that have identical time data share time columns in the exported Microsoft Excel file, specified as the comma-separated pair consisting of 'sharetimecolumn' and 'on' or 'off'. By default, signals with the same time data share a time column in the exported file. When you specify the value as 'off', each signal in the exported file has its own time column.

Example: 'sharetimecolumn', 'off'

Output Arguments

ts — Exported signal data

timeseries object

Exported signal data, returned as a `timeseries` object.

Alternatives

You can export data to the workspace or a file from the Simulation Data Inspector UI. For more information, see “Save and Share Simulation Data Inspector Data and Views”.

getAsTall

Package: Simulink.sdi

Create tall timetable from Simulink.sdi.Signal object

Syntax

```
tt = getAsTall(sig)
```

Description

`tt = getAsTall(sig)` returns a tall timetable containing the time and data values in the Simulink.sdi.Signal object `sig`. For more information on working with tall arrays, see “Tall Arrays for Out-of-Memory Data” (MATLAB).

Examples

Get Tall Timetable of Signal Data

This example shows how to generate a tall timetable from the signal data in a Simulink.sdi.Signal object.

Create a run containing logged data in the Simulation Data Inspector by simulating the model `sldemo_fuelsys`.

```
sim('sldemo_fuelsys');
```

Use the `Simulink.sdi.getAllRunIDs` function to get the run ID for the run that corresponds to the simulation. Then use the `Simulink.sdi.getRun` function to get the `Simulink.sdi.Run` object that corresponds to the run ID.

```
runIDs = Simulink.sdi.getAllRunIDs;  
runID = runIDs(end);
```

```
fuelRun = Simulink.sdi.getRun(runID);
```

Use the `getSignalByIndex` function to get the `Simulink.sdi.Signal` object that corresponds to the second signal in the run.

```
sig = getSignalByIndex(fuelRun,2);
```

Get a tall timetable containing the signal data by using the `getAsTall` function.

```
tt = getAsTall(sig)
```

```
tt =
```

```
    Mx1 tall timetable
```

```
      Time
```

```
      Data
```

```
_____
```

```
0 sec          0.068493
0.00056199 sec 0.092452
0.0033719 sec  0.21101
0.01 sec        0.48273
0.02 sec        0.88522
0.03 sec        1.2763
0.04 sec        1.6563
0.05 sec        2.0255
:               :
:               :
```

Input Arguments

sig — Signal to return as a tall timetable

`Simulink.sdi.Signal` object

Signal to return as a tall timetable, specified as a `Simulink.sdi.Signal` object.

Output Arguments

tt — Tall timetable

tall timetable

Data from the `Simulink.sdi.Signal`, returned as a tall timetable.

See Also

`Simulink.sdi.Signal` | `Simulink.sdi.exportRun` | `export` | `tall`

plotOnSubPlot

Package: Simulink.sdi

Plot Simulink.sdi.Signal object on Simulation Data Inspector subplot

Syntax

```
plotOnSubplot(sig,r,c,checked)
```

Description

`plotOnSubplot(sig,r,c,checked)` plots or clears the signal that corresponds to the Simulink.sdi.Signal object `sig` on the subplot specified by `r` and `c`.

Examples

Plot Signals from Simulation Run

This example demonstrates how to access the Simulink.sdi.Run object for a Simulation Data Inspector run created by logging signals. From the Simulink.sdi.Run object you can get Simulink.sdi.Signal objects that contain the logged signal data and metadata. You can use the Signal objects and the plotOnSubPlot function to plot the data in the Simulation Data Inspector.

Create a Simulation Run and Access the Run Object

The `ex_vdp` model logs two signals. To create a simulation run containing the logged data, simulate the model.

```
sim('ex_vdp');
```

The Simulation Data Inspector keeps track of runs by assigning a unique numeric run ID to each run created by simulation, importing data, or opening a session. To access the run object for the simulation you just performed, use the Simulink.sdi.getAllRunIDs function and take the last run ID in the returned vector.

```
runIDs = Simulink.sdi.getAllRunIDs;  
runID = runIDs(end);
```

Once you have the run ID for the run, you can use the Simulink.sdi.getRun function to get the Simulink.sdi.Run object that corresponds to the run. You can use the Run object to check the metadata associated with the run, including the number of signals in the run.

```
vdpRun = Simulink.sdi.getRun(runID);
```

```
vdpRun.SignalCount
```

```
ans = int32  
     2
```

Plot Data Using Signal Objects

Use the `getSignalByIndex` function to access signals from the Run object, `fuelRun`.

```
signal1 = getSignalByIndex(vdpRun,1);  
signal2 = getSignalByIndex(vdpRun,2);
```

Use the `Simulink.sdi.setSubPlotLayout` function to specify a 3-by-1 layout.

```
Simulink.sdi.setSubPlotLayout(2,1)
```

Before plotting the data, use the `Simulink.sdi.clearAllSubPlots` function to clear any data that is already plotted.

```
Simulink.sdi.clearAllSubPlots
```

Plot one signal on each subplot. To plot signals on the first subplot, you can set the checked property for the signal. To plot signals on subplots other than the first subplot, use the `plotOnSubPlot` function.

```
signal1.Checked = true;  
plotOnSubPlot(signal2,2,1,true);
```

View the Plotted Data

To view the plots you just created, open the Simulation Data Inspector using the `Simulink.sdi.view` function.

Input Arguments

sig – Signal to plot

`Simulink.sdi.Signal` object

Signal to plot, specified as a `Simulink.sdi.Signal` object.

r – Row index

integer

Row index for the subplot, specified as an integer between 1 and 8, inclusive.

Example: 1

c – Column index

integer

Column index for the subplot, specified as an integer between 1 and 8, inclusive.

Example: 2

checked – Plot or clear signal

`true` | `false`

Plot or clear the signal on the subplot, specified as one of these values:

- `true` plots the signal on the subplot.
- `false` clears the signal from the subplot.

Data Types: `logical`

Alternatives

You can use the Simulation Data Inspector UI to modify the plot layout and plotted signals. For more information, see “Inspect Simulation Data”.

“Create Plots Using the Simulation Data Inspector”

Introduced in R2017b

Simulink.sdi.snapshot

Package: Simulink.sdi

Capture contents of Simulation Data Inspector plots

Syntax

```
fig = Simulink.sdi.snapshot
[fig,image] = Simulink.sdi.snapshot
Simulink.sdi.snapshot(Name,Value)
Simulink.sdi.snapshot(Name,Value)
Simulink.sdi.snapshot(Name,Value)
```

Description

`fig = Simulink.sdi.snapshot` creates a figure of the plotting area in the open Simulation Data Inspector session with the figure handle `fig`.

`[fig,image] = Simulink.sdi.snapshot` creates a figure of the plotting area in the open Simulation Data Inspector session with the figure handle `fig` and returns the image data in the array, `image`.

`Simulink.sdi.snapshot(Name,Value)` captures an image of the Simulation Data Inspector plots according to the options specified by name-value pairs.

`fig = Simulink.sdi.snapshot(Name,Value)` captures an image of the Simulation Data Inspector plots according to the options specified by name-value pairs. This syntax returns the figure handle, `fig`, if a figure is created.

`[fig, image] = Simulink.sdi.snapshot(Name,Value)` captures an image of the Simulation Data Inspector plots according to the options specified by name-value pairs. This syntax returns the figure handle, `fig`, and an array of image data, `image`, when appropriate for the specified options.

Examples

Copy View Settings to a Run

This example shows how to copy view settings from one run to another and how to create figures using the `Simulink.sdi.CustomSnapshot` object.

Simulate Your Model and Get a Run Object

Configure the `vdp` model to save output data, and run a simulation to create data.

```
load_system('vdp')
set_param('vdp','SaveFormat','Dataset','SaveOutput','on')
set_param('vdp/Mu','Gain','1');
sim('vdp');
```

Use the Simulation Data Inspector programmatic interface to access the run data.

```
runIndex = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(runIndex);
vdpRun = Simulink.sdi.getRun(runID);
```

Modify Signal View Settings

Use the `Simulink.sdi.Run` object to access signals in the run. Then, modify the signal view settings. This example specifies the line color and style for each signal. The view settings for the run comprise the view settings for each signal and view settings specified for the plot area.

```
sig1 = vdpRun.getSignalByIndex(1);
sig2 = vdpRun.getSignalByIndex(2);

sig1.LineColor = [0 0 1];
sig1.LineDashed = '-.';

sig2.LineColor = [1 0 0];
sig2.LineDashed = ':';
```

Capture a Snapshot from the Simulation Data Inspector

Create a `Simulink.sdi.CustomSnapshot` object and use the `Simulink.sdi.snapshot` function to programmatically capture a snapshot of the contents of the Simulation Data Inspector.

```
snap = Simulink.sdi.CustomSnapshot;
```

You can use properties of the `Simulink.sdi.CustomSnapshot` object to configure the plot settings, like the subplot layout and axis limits, and to plot signals. When you use a `Simulink.sdi.CustomSnapshot` object to create your figure, these plot settings do not affect the Simulation Data Inspector.

```
snap.Rows = 2;
snap.YRange = {[ -2.25 2.25], [ -3 3]};
snap.plotOnSubPlot(1,1,sig1,true)
snap.plotOnSubPlot(2,1,sig2,true)
```

Use `Simulink.sdi.snapshot` to generate the figure you specified in the properties of the `Simulink.sdi.CustomSnapshot` object.

```
fig = Simulink.sdi.snapshot("from", "custom", "to", "figure", "settings", snap);
```

Copy the View Settings to a New Simulation Run

Simulate the model again, with a different Mu value. Use the Simulation Data Inspector programmatic interface to access the simulation data.

```
set_param('vdp/Mu', 'Gain', '5')
sim('vdp');
```

```
runIndex2 = Simulink.sdi.getRunCount;
runID2 = Simulink.sdi.getRunIDByIndex(runIndex2);
run2 = Simulink.sdi.getRun(runID2);
```

To create a plot of the new output data that looks like the one you created in the previous step, you can copy the view settings to the run in a single line of code using `Simulink.sdi.copyRunViewSettings`. The `Simulink.sdi.copyRunViewSettings` function does not automatically update plot settings in `Simulink.sdi.CustomSnapshot` objects, so specify the plot input as `false`.

```
sigIDs = Simulink.sdi.copyRunViewSettings(runID, runID2, false);
```

Capture a Snapshot of the New Simulation Run

Use the `Simulink.sdi.CustomSnapshot` object to capture a snapshot of the new simulation run. First, clear the signals from the subplots. Then, plot the signals from the new run and capture another snapshot.

```
snap.clearSignals
snap.YRange = {[-2.25 2.25], [-8 8]};
```

```

snap.plotOnSubPlot(1,1,sigIDs(1),true)
snap.plotOnSubPlot(2,1,sigIDs(2),true)

fig = snap.snapshot("to","figure");

```

Input Arguments

Name-Value Pair Arguments

Specify optional comma-separated pairs of **Name**, **Value** arguments. **Name** is the argument name and **Value** is the corresponding value. **Name** must appear inside quotes. You can specify several name and value pair arguments in any order as **Name1**, **Value1**, ..., **NameN**, **ValueN**.

Example: 'to', 'figure', 'props', {'Name', 'My Data'}

from — Content to include in the snapshot

'opened' (default) | 'active' | 'comparison' | 'custom'

Content to include in the snapshot.

- 'opened' — Include all subplots in the graphical viewing area of the open Simulation Data Inspector session.
- 'active' — Include only the active (selected) subplot in the open Simulation Data Inspector session.
- 'comparison' — Include the comparison plots for the selected comparison run or signal in the open Simulation Data Inspector session.

- `'custom'` — Include contents specified by the `settings` name-value pair `Simulink.sdi.CustomSnapshot` object. You can use the `'from', 'custom'` option to create a snapshot without opening the Simulation Data Inspector or affecting your open Simulation Data Inspector session. Include a `settings` name-value pair when you specify `'from', 'custom'`.

Example: `'from', 'comparison'`

Data Types: `char | string`

to — Type of snapshot to create

`'image'` (default) | `'figure'` | `'file'` | `'clipboard'`

Type of snapshot to create.

- `'image'` — Create a figure and return the figure handle and an array of image data. When you specify `'to', 'image'`, the `fig` and `image` outputs both have value.
- `'figure'` — Create a figure and return the figure handle. When you specify `'to', 'figure'` the `fig` output has value, and the `image` output is empty.
- `'file'` — Save to a PNG file with the name specified by the `filename` name-value pair. If you do not specify a `filename` name-value pair, the file is named `plots.png`. When you specify `'to', 'file'`, the `fig` and `image` outputs are both empty.
- `'clipboard'` — Copy the plots to your system clipboard. From the clipboard, you can paste the image into another program such as Microsoft Word. When you specify `'to', 'clipboard'`, the `fig` and `image` outputs are both empty.

Example: `'to', 'file'`

Data Types: `char | string`

filename — Name for image file

`'plots.png'` (default) | character array | string

Name of the image file to store the snapshot when you specify `'to', 'file'`.

Example: `'filename', 'MyImage.png'`

Data Types: `char | string`

props — Properties to customize the figure

cell array

Figure properties, specified as a cell array. You can include settings for the figure properties described in Figure Properties.

Example: `'props', {'Name', 'MyData', 'NumberTitle', 'off'}`

Data Types: `char | string`

settings — Custom snapshot settings

`Simulink.sdi.CustomSnapshot`

`Simulink.sdi.CustomSnapshot` object specifying custom snapshot settings. You can use the `settings` name-value pair to specify the dimensions of the image in pixels, subplot layout, and limits for the `x-` and `y-`axes.

Example: `'settings', customSnap`

Data Types: `char | string`

Output Arguments

fig — Figure handle

figure handle

Handle for the figure. When a figure is not created with your specified options, the `fig` output is empty.

image — Image data

array

Array of image data. The `image` output has value when you use `Simulink.sdi.snapshot` without any input arguments or without a `to` name-value pair and when you specify `'to','image'`.

Introduced in R2018a

Simulink.sdi.view

Package: Simulink.sdi

Open the Simulation Data Inspector

Syntax

```
Simulink.sdi.view
```

Description

`Simulink.sdi.view` opens the Simulation Data Inspector. You can write a script to plot your data and customize the Simulation Data Inspector properties and then use `Simulink.sdi.view` to see the results.

Examples

Open the Simulation Data Inspector from the Command Line

You can open the Simulation Data Inspector from the MATLAB command line to visualize, inspect, and analyze your data.

```
Simulink.sdi.view
```

Create a Run and View the Data

This example shows how to create a run, add data to it, and then view the data in the Simulation Data Inspector.

Create Data for the Run

Create `timeseries` objects to contain data for a sine signal and a cosine signal. Give each `timeseries` object a descriptive name.

```
time = linspace(0,20,100);  
  
sine_vals = sin(2*pi/5*time);  
sine_ts = timeseries(sine_vals,time);  
sine_ts.Name = 'Sine, T=5';  
  
cos_vals = cos(2*pi/8*time);  
cos_ts = timeseries(cos_vals,time);  
cos_ts.Name = 'Cosine, T=8';
```

Create a Run and Add Data

Use the `Simulink.sdi.view` function to open the Simulation Data Inspector.

```
Simulink.sdi.view
```

To import data into the Simulation Data Inspector from the workspace, create a `Simulink.sdi.Run` object using the `Simulink.sdi.Run.create` function. Add information about the run to its metadata using the `Name` and `Description` properties of the Run object.

```
sinusoidsRun = Simulink.sdi.Run.create;
sinusoidsRun.Name = 'Sinusoids';
sinusoidsRun.Description = 'Sine and cosine signals with different frequencies';
```

Use the `add` function to add the data you created in the workspace to the empty run.

```
add(sinusoidsRun, 'vars', sine_ts, cos_ts);
```

Plot the Data in the Simulation Data Inspector

Use the `getSignalByIndex` function to access `Simulink.sdi.Signal` objects that contain the signal data. You can use the `Simulink.sdi.Signal` object properties to specify the line style and color for the signal and plot it in the Simulation Data Inspector. Specify the `LineColor` and `LineDashed` properties for each signal.

```
sine_sig = getSignalByIndex(sinusoidsRun,1);
sine_sig.LineColor = [0 0 1];
sine_sig.LineDashed = '-.';

cos_sig = sinusoidsRun.getSignalByIndex(2);
cos_sig.LineColor = [0 1 0];
cos_sig.LineDashed = '--';
```

Use the `Simulink.sdi.setSubPlotLayout` function to configure a 2-by-1 subplot layout in the Simulation Data Inspector plotting area. Then use the `plotOnSubplot` function to plot the sine signal on the top subplot and the cosine signal on the lower subplot.

```
Simulink.sdi.setSubPlotLayout(2,1);

plotOnSubPlot(sine_sig,1,1,true);
plotOnSubPlot(cos_sig,2,1,true);
```

Close the Simulation Data Inspector and Save Your Data

When you have finished inspecting the plotted signal data, you can close the Simulation Data Inspector and save the session to an `MLDATX` file.

```
Simulink.sdi.close('sinusoids.mldatx')
```

Alternatives

You can open the Simulation Data Inspector from the Simulink Editor toolbar with the **Simulation**

Data Inspector button .

Introduced in R2011b

Simulink.SimulationData.createStructOfTimeseries

Create structure of timeseries data to load as simulation input for bus

Syntax

```
tsStruct = Simulink.SimulationData.createStructOfTimeseries(busObj,
tsStructIn)
tsStruct = Simulink.SimulationData.createStructOfTimeseries(busObj,
tsCellArray)
tsStructArray = Simulink.SimulationData.createStructOfTimeseries(busObj,
tsCellArray,dims)
tsStruct = Simulink.SimulationData.createStructOfTimeseries(tsArray)
```

Description

`tsStruct = Simulink.SimulationData.createStructOfTimeseries(busObj, tsStructIn)` creates a structure with attributes that match those specified by the `Simulink.Bus` object, `busObj`, and data specified by the structure of timeseries objects, `tsStructIn`.

When the names in the input structure do not match the names specified by the bus object, the function renames the fields in the output structure to match the bus object specification. When other attributes such as data type and complexity do not match, the function returns an error.

You can use this syntax to create a simulation input that fully or partially specifies the data for a bus. You can also use this syntax to rename the structure elements to match the names in the `Simulink.Bus` object.

`tsStruct = Simulink.SimulationData.createStructOfTimeseries(busObj, tsCellArray)` creates a structure of timeseries objects with attributes that match those specified by the `Simulink.Bus` object, `busObj`, and data specified by the cell array of timeseries objects, `tsCellArray`.

When the names in the input structure do not match the names specified by the bus object, the function renames the fields in the output structure to match the bus object specification. When other attributes such as data type and complexity do not match, the function returns an error.

You can use this syntax to create simulation input that fully or partially specifies the data for a bus using a flat list of timeseries objects. The function maps the timeseries objects to the hierarchy specified by the `Simulink.Bus` object using a depth-first search.

`tsStructArray = Simulink.SimulationData.createStructOfTimeseries(busObj, tsCellArray,dims)` creates an array of timeseries structures where the attributes of each structure match those defined by the `Simulink.Bus` object, `busObj` with the data specified by the cell array of timeseries objects, `tsCellArray`. The input `dims` specifies the dimensions of the array.

`tsStruct = Simulink.SimulationData.createStructOfTimeseries(tsArray)` creates a structure of timeseries objects from the bus data stored in the `Simulink.TsArray` object, `tsArray`. In versions before R2016a, signal logging creates `Simulink.TsArray` objects to store

logged bus data. Use this syntax when you want to use bus data logged in a release before R2016a using ModelDataLogs format as simulation input.

Examples

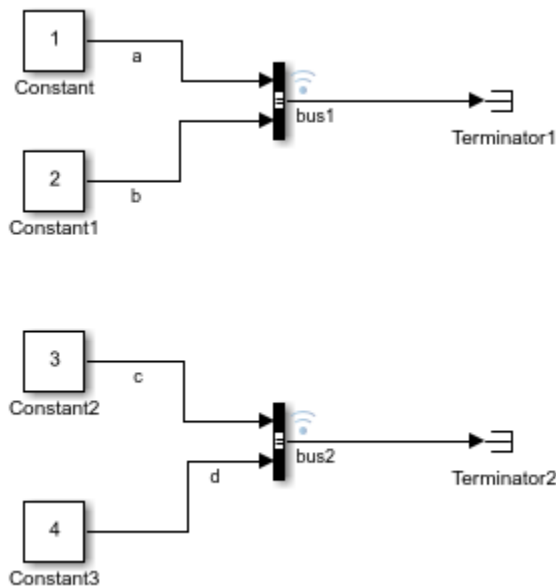

Use Logged Bus Data as Simulation Input

You can use the `Simulink.SimulationData.createStructOfTimeseries` function to create structures of `timeseries` objects to use as simulation input for bus signals. This example shows you how to create a structure of timeseries to load into a model using timeseries data logged from a different simulation.

Create a Structure of Timeseries

Open the `ex_log_structtimeseries` model.

```
open_system('ex_log_structtimeseries')
```

The model uses Constant blocks and Bus Creator blocks to build two buses, `bus1` and `bus2`, with signals `a`, `b`, `c`, and `d`. The model uses signal logging to log the bus data. Create bus data by simulating the model.

```
out = sim('ex_log_structtimeseries');
```

View the data in the logging variable `logout`. Signal logging creates a `Simulink.SimulationData.Dataset` object with `Simulink.SimulationData.Signal` objects as elements.

```
logout = out.logout
```

```
logout =
```

```
Simulink.SimulationData.Dataset 'logout' with 2 elements
```

	Name	BlockPath
1	[1x1 Signal]	bus1 ex_log_structtimeseries/Bus Creator
2	[1x1 Signal]	bus2 ex_log_structtimeseries/Bus Creator1

- Use braces { } to access, modify, or add elements using index.

You can use the `get` function to select the `Simulink.SimulationData.Signal` object for `bus2`. The bus data is in the `Values` property of the `Simulink.SimulationData.Signal` object. The data representing `bus2` is logged in a structure containing `timeseries` objects named `c` and `d`.

```
logout.get(2).Values
```

```
ans =
```

```
struct with fields:
    c: [1x1 timeseries]
    d: [1x1 timeseries]
```

Loading Model Configuration

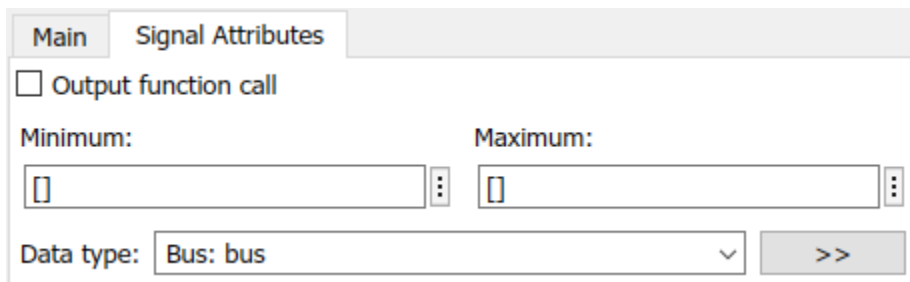

Open the `ex_load_structtimeseries` model, which uses the logged simulation data as input.

```
open_system('ex_load_structtimeseries')
```

The model uses the `InBus` Inport block to load input bus data. A `Bus Selector` block chooses signals from the bus to display on `Display` blocks.

Double-click the `InBus` block and check its **Data type** on the **Signal Attributes** tab of the dialog. The data type is specified by a `Simulink.Bus` object called `bus`.

Close the dialog and open the Model Explorer. On the **Callbacks** tab, you can see the model uses its `PreLoadFcn` to define the `Simulink.Bus` object that defines the data type for the Inport block.

Open the Configuration Parameters and view the specification for the **Input** parameter on the **Data Import/Export** pane. The model uses the variable `inputBus` for its **Input**.

Create Simulation Input from the Structure of timeseries Data

To load the data logged for `bus1`, you only need to assign the structure data to the Input variable for the model.

```
inputBus = logcout.get(1).Values
```

```
inputBus =
    struct with fields:
        a: [1x1 timeseries]
        b: [1x1 timeseries]
```

When you simulate the model, the Display blocks show the values 1 and 2 logged in `bus1` and loaded into the model.

To load the data logged for `bus2`, you need to use the `Simulink.Bus` object that defines the Inport block data type and `Simulink.SimulationData.createStructOfTimeseries` to create a structure of `timeseries` with names specified by the `Simulink.Bus` object.

```
inputBus = Simulink.SimulationData.createStructOfTimeseries('bus', ...
    logcout.get(2).Values)
```

```
inputBus =
    struct with fields:
        a: [1x1 timeseries]
        b: [1x1 timeseries]
```

When you simulate the model, the Display blocks show the values 3 and 4 logged in `bus2` and loaded into the model.

Partially Specify Simulation Input for a Bus

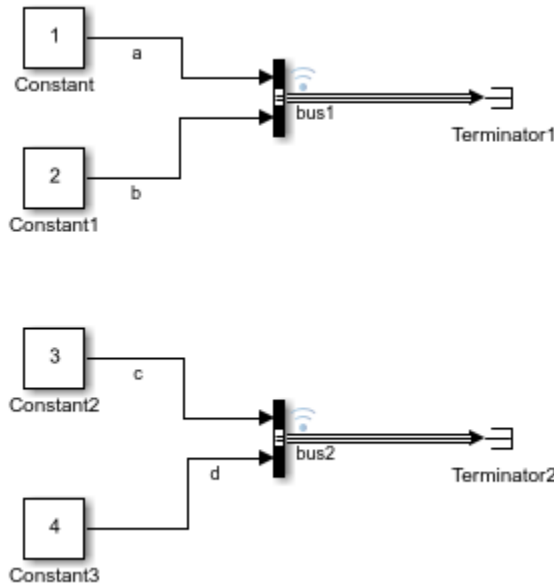

This example shows how to use the `Simulink.SimulationData.createStructOfTimeseries` function to create partially specified simulation input for a bus. This example logs data from `ex_log_structtimeseries` and then loads that data into `ex_load_structtimeseries`.

Create timeseries Data

First, open and simulate the `ex_log_structtimeseries` model. The model logs two bus signals, `bus1` and `bus2`, created using Constant blocks and Bus Creator blocks. Access the `logcout` Dataset in the `Simulink.SimulationOutput` object, `out`.

```
open_system('ex_log_structtimeseries')
out = sim('ex_log_structtimeseries');
```

```
logout = out.logout;
```

You can use a structure of timeseries data or a cell array of timeseries data to partially specify simulation input for a bus.

Partially Specify Bus Data with a Structure of timeseries Data

Open the model `ex_load_structtimeseries` that will load some of the data you logged in the previous section.

```
open_system('ex_load_structtimeseries')
```

Use the `get` function to access the structure of timeseries data logged for bus1.

```
bus1 = logout.get(1).Values;
```

Then, replace the b data with `[]`.

```
bus1.b = [];
```

The `ex_load_structtimeseries` model uses the variable `inputBus` as its **Input**. The `Simulink.Bus` object, `bus`, that defines the data type for the Inport block is defined in the `PreLoadFcn` callback for the `ex_load_structtimeseries` model. Because the signal names in `bus1` match the `Simulink.Bus` object specification for the Inport block in the `ex_load_structtimeseries` model, you can use the logged structure without modification. To load the data for `bus1`, assign `bus1` to the variable `inputBus`.

```
inputBus = bus1;
```

Simulate the model. The Display blocks show the logged value 1 for a and 0 for b. The simulation uses ground values when you do not specify data for the signal.

```
loadOut = sim('ex_load_structtimeseries');
```

Now, load the data logged for bus2. The signal names in bus2 do not match the `Simulink.Bus` object specification for the Inport block in the `ex_load_structtimeseries` model. Modify the data in the structure to partially specify input data for the bus. Then, use the `Simulink.SimulationData.createStructOfTimeseries` function to change the names in the structure to match the bus specification.

```
bus2 = logout.get(2).Values;
bus2.d = [];
inputBus = bus2;
inputBus = Simulink.SimulationData.createStructOfTimeseries('bus',inputBus);
```

Simulate the model. The Display blocks show the logged value 3 for a and 0 for b.

```
loadOut = sim('ex_load_structtimeseries');
```

Partially Specify Bus Data with a Cell Array of Timeseries Data

When you have `timeseries` data, you can use `Simulink.SimulationData.createStructOfTimeseries` to partially specify simulation input for a bus using a cell array of the `timeseries` data. Load the `timeseries` data for signal d in bus2 as part of a partial bus specification for the Inport block in the `ex_load_structtimeseries` model. The `PreLoadFcn` callback for the `ex_load_structtimeseries` model defines the `Simulink.Bus` object, `bus`, that defines the data type for the Inport block.

```
d = logout.get(2).Values.d;

inputBus = Simulink.SimulationData.createStructOfTimeseries('bus',...
    {d, []});
```

Simulate the model. The Display block for signal a in the `ex_load_structtimeseries` model shows the data logged in signal d from the `ex_log_structtimeseries` model. The Display block for signal b shows 0.

```
loadOut = sim('ex_load_structtimeseries');
```

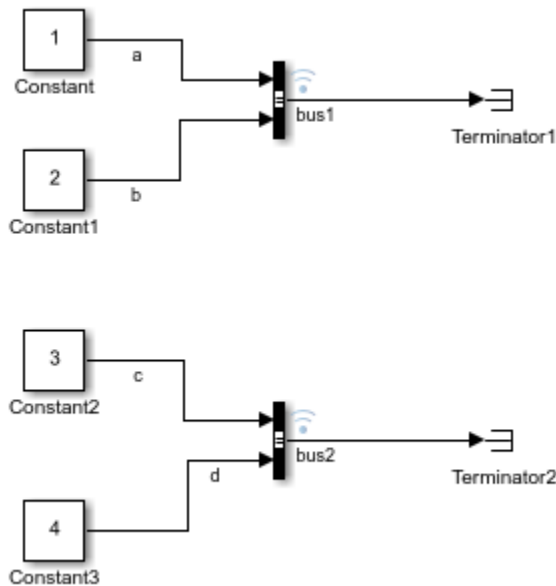

Load Simulation Input Data for an Array of Buses

This example shows how to use the `Simulink.SimulationData.createStructOfTimeseries` function to generate simulation input for an array of buses. You create `timeseries` data by simulating one model. Then, you create an input structure using the logged data to load into an array of buses in another model.

Create `timeseries` Data

To start, open the `ex_log_structtimeseries` model.

```
open_system('ex_log_structtimeseries')
```

The model creates two buses, bus1 and bus2, using Constant blocks and Bus Creator blocks. The signals are named a, b, c, and d. Create logged bus data by simulating the model.

```
out = sim('ex_log_structtimeseries');
```

The output out contains a Simulink.SimulationData.Dataset object, logouts, with the logged data. You can access the bus1 and bus2 signals using the get function. The data for each signal is in the Simulink.SimulationData.Signal object Values parameter. You can access the bus elements using a dot followed by the signal name. bus1 is the first signal in the Dataset object and contains signals a and b. bus2 contains signals c and d.

```
logouts = out.logouts;
```

```
a = logouts.get(1).Values.a;
b = logouts.get(1).Values.b;
c = logouts.get(2).Values.c;
d = logouts.get(2).Values.d;
```

Loading Model Configuration

Open the model ex_structtimeseries_aob, which uses an array of buses as input.

```
open_system('ex_load_structtimeseries_aob')
```

The model uses the InAoB Inport block to load simulation input. Selector blocks select a bus from the array of buses, and Bus Selector blocks select signals to show in the Display blocks.

Double-click the InAoB block and look at the **Signal Attributes** pane of the dialog. The **Data type** for the block is set to **Bus** with the type defined by the Simulink.Bus object, bus. The **Port dimensions** parameter is set to [2 1].

You can see the definition for the Simulink.Bus object, bus, in the **Callbacks** tab in the Model Explorer. This model uses the PreLoadFcn to define the bus object.

Open the Model Configuration Parameters and look at the **Input** parameter. The model uses the variable inputAoB as input.

Create Array of Buses Simulation Input

Use Simulink.SimulationData.createStructOfTimeseries and the data logged in the first section to create a structure to load as simulation input for the array of buses. Specify the dimensions as [2 1] to match the dimensions of the InAoB block.

```
inputAoB = Simulink.SimulationData.createStructOfTimeseries('bus', ...
    {a,b,c,d}, [2 1]);
```

When you simulate the model, the Display blocks show the data for signals a, b, c, and d logged from the ex_log_structtimeseries model. The array of buses contains two buses with signals a and b. Simulink.SimulationData.createStructOfTimeseries renamed signals c and d to match the Simulink.Bus specification used by the array of buses.

```
inputAoB(2)
```

```
ans =
```

```
struct with fields:
```

```
  a: [1x1 timeseries]
  b: [1x1 timeseries]
```

Simulate the model. The display blocks show the logged values.

```
aob_out = sim('ex_load_structtimeseries_aob');
```

Create a Structure of timeseries Objects from a Simulink.TsArray Object

In releases before R2016a, when you log simulation data using ModelDataLogs format, bus data is stored as a Simulink.TSArray object. You cannot log data using ModelDataLogs format using a release after R2016a. In this example, the logged data, log sout, was logged in ModelDataLogs format using a release before R2016a. The variable log sout contains data for a single bus, bus1.

```
log sout
```

```
log sout =
```

```
Simulink.ModelDataLogs (log_modeldatalogs):
  Name           Elements  Simulink Class
  bus1           2        TsArray
```

To load the logged data as simulation input for a bus, create a structure of timeseries objects from the data in bus1.

```
struct_of_ts = ...
Simulink.SimulationData.createStructOfTimeseries(logsout.bus1)

struct_of_ts =

    const1_sig: [1x1 timeseries]
    const2_sig: [1x1 timeseries]
```

Input Arguments

busObj — Name of Simulink.Bus object

character vector

Name of the Simulink.Bus object that specifies the attributes for the data in the output structure of timeseries objects. When you want to load the structure of timeseries objects as simulation input for a bus, the busObj is the bus that defines the data type for the root-level Inport block.

Simulink.SimulationData.createStructOfTimeseries validates the input timeseries attributes including data type and complexity against the Simulink.Bus object specification. When element names do not match between the Simulink.Bus specification and the input timeseries data, Simulink.SimulationData.createStructOfTimeseries renames the timeseries data to match the bus specification. When other attributes do not match, the function returns an error.

Example: 'MyInputBus'

tsStructIn — Structure of timeseries objects

structure of timeseries data

Structure of timeseries data for use in creating the output structure of timeseries objects according to the Simulink.Bus object. The structure must have the same hierarchy as the Simulink.Bus object.

To partially specify data for a bus, use [] in the place of the bus element you want to use ground values.

tsCellArray — Cell array of timeseries objectscell array of `timeseries` objects

Cell array of `timeseries` objects specifying the data for the output structure of `timeseries` objects.

To partially specify data for a bus, use `[]` in the place of the bus element you want to use ground values.

The `Simulink.SimulationData.createStructOfTimeseries` function maps the `timeseries` elements of the cell array to the hierarchy specified by the `Simulink.Bus` object using a depth-first search.

Example: `{ts1,ts2,ts3}`

Example: `{ts1,[],ts3}`

Dependencies

When you specify the `dims` argument, the number of cells in the cell array must match the number of individual signal elements in the `Simulink.Bus` object multiplied by the product of the specified dimensions.

dims — Dimensions for output array

vector

Dimensions for the array of `timeseries` structures, specified as a vector.

When you specify the dimensions as a scalar, `n`, the function creates a 1-by-`n` array.

Example: `[2,1]`

Dependencies

When you specify the `dims` argument, the number of cells in the cell array must match the number of individual signal elements in the `Simulink.Bus` object multiplied by the product of the specified dimensions.

Data Types: `double`

tsArray — Simulink.TsArray object`Simulink.TsArray`

`Simulink.TsArray` object.

In versions prior to R2016a, signal logging creates `Simulink.TsArray` objects to store logged bus data. Use this syntax when you want to use data logged using `ModelDataLogs` format in a version before R2016a to create simulation input for a bus.

Example: `myTsArrayObj`

Output Arguments**tsStruct — Structure of timeseries objects**

struct

Structure of `timeseries` objects with attributes specified by the `Simulink.TsArray` or `Simulink.Bus` input. You can load the structure of `timeseries` objects as simulation input for a bus.

tsStructArray – Array of timeseries structures

array

Array of structures of `timeseries` objects with dimensions specified by the `dims` input.

getAsDatastore

Class: Simulink.SimulationData.DatasetRef

Package: Simulink.SimulationData

Get matlab.io.datastore.SimulationDatastore representation of element from referenced Dataset object

Syntax

```
element =  
Simulink.SimulationData.DatasetRef.getAsDatastore(datasetref_elements)
```

Description

element =
Simulink.SimulationData.DatasetRef.getAsDatastore(datasetref_elements) returns a matlab.io.datastore.SimulationDatastore representation of an element or collection of elements from the referenced dataset, based on index, name, or block path of the element.

You can represent a Dataset element as a matlab.io.datastore.SimulationDatastore object if the element was placed into the MAT-file using either of these approaches:

- Log Dataset format data to persistent storage (MAT-file).
- Place the element into a Simulink.SimulationData.Dataset object and saved the Dataset object to a v7.3 MAT-file.

The SimulationDatastore representation for a Dataset element creates a SimulationDatastore object for the Values field of that element. The SimulationDatastore representation supports streaming of the data for the Values property of the element into other simulations or into MATLAB.

Note You cannot use create a SimulationDatastore for Dataset elements that contain these types of data:

- Array
-

You can use SimulationDatastore objects to:

- Refer to logged simulation data that is stored on disk in a MAT-file.
- Specify signals to stream incrementally from disk to a simulation.
- Provide a basis for big data analysis using MATLAB functions.

Input Arguments

datasetref_element — Element of referenced dataset in MAT-file
index of the element

Element of a referenced dataset in a MAT-file, specified as an index, name (as a character vector), or block path (as a character vector).

Output Arguments

element — Element accessed using SimulationDatastore object

matlab.io.datastore.SimulationDatastore object | Simulink.SimulationData.Signal, Simulink.SimulationData.State or similar object, whose Values data uses a matlab.io.datastore.SimulationDatastore object

Element accessed using SimulationDatastore object, returned as either a matlab.io.datastore.SimulationDatastore object or a Simulink.Signal, Simulink.State, or similar object, whose Values data uses a matlab.io.datastore.SimulationDatastore object.

Examples

Use a SimulationDatastore to Reference a Signal's Data in a DatasetRef

Log signal data to persistent storage (select the **Log Dataset data to file** configuration parameter) and simulate a model.

Create a DatasetRef for the signal logging Dataset data (logout) in the out.mat MAT-file.

```
sigLogRef = Simulink.SimulationData.DatasetRef('out.mat', 'logout');
firstSig = sigLogRef.getAsDatastore(1)
```

```
firstSig =
```

```
Simulink.SimulationData.Signal
Package: Simulink.SimulationData

Properties:
    Name: 'x1'
    PropagatedName: ''
    BlockPath: [1x1 Simulink.SimulationData.BlockPath]
    PortType: 'output'
    PortIndex: 1
    Values: [1x1 matlab.io.datastore.SimulationDatastore]
```

Load the data into another model. This approach streams the values of the signal x1 for another simulation.

```
ds = Simulink.SimulationData.Dataset;
ds{1} = sigLogRef{1};
sim('other_model', 'ExternalInput', 'ds');
```

Alternative

To streamline the use of indexing, you can use curly braces ({}) syntax to obtain a SimulationDatastore object for DatasetRef object signal values. The requirements and results are the same as using getAsDatastore. For example, if you log signal data to persistent storage (select the **Log Dataset data to file** configuration parameter) and simulate a model.

```
sigLogRef = Simulink.SimulationData.DatasetRef('out.mat','logout');  
firstSig = sigLogRef{1}
```

```
ans =
```

```
Simulink.SimulationData.Signal  
Package: Simulink.SimulationData
```

```
Properties:
```

```
    Name: 'x1'  
PropagatedName: ''  
    BlockPath: [1x1 Simulink.SimulationData.BlockPath]  
    PortType: 'outport'  
    PortIndex: 1  
    Values: [1x1 matlab.io.datastore.SimulationDatastore]
```

Topics

“Load Big Data for Simulations”

Introduced in R2017a

Simulink.SimulationData.DatasetRef.getDatasetVariableNames

List names of Dataset variables in MAT-file

Syntax

```
varNames = Simulink.SimulationData.DatasetRef.getDatasetVariableNames(  
matFile)
```

Description

`varNames = Simulink.SimulationData.DatasetRef.getDatasetVariableNames(matFile)` lists the names of variables for Dataset data in a MAT-file.

Examples

List Variable Names in MAT-File

Suppose that you simulate a model using the default variable names for signal logging data and states data. You enable the **Configuration Parameters > Data Import/Export > Log Dataset data to file** and use the default MAT-file name of `out.mat`.

List the variable names in the MAT-file.

```
varNames = Simulink.SimulationData.DatasetRef.getDatasetVariableNames('out.mat')  
  
varNames =  
    'xout' 'logout'
```

Tips

To get the names of Dataset variables in the MAT-file, using the `Simulink.SimulationData.DatasetRef.getDatasetVariableNames` function processes faster than using the `who`, or `whos` functions.

Input Arguments

matFile — MAT-file that contains Dataset variables

character vector

MAT-file that contains Dataset variables, specified as a character vector. The character vector specifies the path to the MAT-file.

Output Arguments

varNames — Names of Dataset variables in MAT-file

cell array

Names of Dataset variables in MAT-file, returned as a cell array.

Simulink.SimulationData.forEachTimeseries

Call function on each timeseries object

Syntax

```
dataResults = Simulink.SimulationData.forEachTimeseries(functionHandle,
inputData)
```

Description

`dataResults = Simulink.SimulationData.forEachTimeseries(functionHandle, inputData)` runs the specified function handle on all MATLAB timeseries objects contained in `inputData`.

Examples

Find Minimum for Logged Bus Signal Data

This example shows how to use the `forEachTimeseries` function to run the `min` function on each timeseries object in the logged data for the `COUNTERBUS` signal.

Open the model and simulate it.

```
open_system('sldemo_mdref_bus')
sim('sldemo_mdref_bus');
```

Access the signal logging data. For this model, that data is stored in the `topOut` variable.

```
topOut
```

```
Simulink.SimulationData.Dataset 'topOut' with 4 elements
```

	Name	BlockPath
1 [1x1 Signal]	COUNTERBUS	sldemo_mdref_bus/Concatenate
2 [1x1 Signal]	OUTERDATA	sldemo_mdref_bus/CounterA
3 [1x1 Signal]	INCREMENTBUS	sldemo_mdref_bus/IncrementBusCreator
4 [1x1 Signal]	INNERDATA	...erA sldemo_mdref_counter_bus/COUNTER

- Use braces `{ }` to access, modify, or add elements using index.

Find the values for the COUNTERBUS element.

```
counterbusData = topOut{1}.Values
```

```
counterbusData =
```

```
2x1 struct array with fields:
```

```
data
limits
```

Run the `min` function on the counterbus data.

```
ret = Simulink.SimulationData.forEachTimeseries(@min,counterbusData)
```

```
ret =
```

```
2x1 struct array with fields:
```

```
data
limits
```

Explore the returned data.

```
ret(1)
```

```
ans =
```

```
data: 0
limits: [1x1 struct]
```

```
ret(2).limits
```

```
ans =
```

```
upper_saturation_limit: 40
lower_saturation_limit: 0
```

Input Arguments

functionHandle — Function to run on MATLAB timeseries objects

function handle

Function to run on `timeseries` objects, specified as a function handle. For information about specifying function handles, see “Pass Function to Another Function” (MATLAB).

The function that you use with `forEachTimeseries`:

- Can be either a built-in function or a user-specified function
- Must return a scalar

If the function that you use with `forEachTimeseries` takes:

- One argument, specify the function handle and the input data. For example:

```
ret = Simulink.SimulationData.forEachTimeseries(@min,data);
```

- More than one argument, specify the function handle as `@(x)` and then specify the function, using `x` as the first argument. For remaining arguments, specify values. For example, this command runs the `resample` function on MATLAB timeseries objects in `data`, for the time vector `[2.5 3]`.

```
ret = Simulink.SimulationData.forEachTimeseries(@(x)...  
(resample(x,[2.5 3]),data);
```

inputData — Data to run specified function on

MATLAB timeseries object | array of timeseries | structure with timeseries at leaf nodes | array of structures with timeseries at leaf nodes

Data to run specified function on, specified as timeseries data.

Output Arguments

dataResults — Data resulting from running specified function

MATLAB timeseries object | array of timeseries | structure with timeseries at leaf nodes | array of structures with timeseries at leaf nodes

Data resulting from running specified function, returned using the format and hierarchy of the input data.

Simulink.SimulationData.signalLoggingSelector

Open Signal Logging Selector

Syntax

```
Simulink.SimulationData.signalLoggingSelector(modelName)
```

Description

`Simulink.SimulationData.signalLoggingSelector(modelName)` opens the Signal Logging Selector dialog box for the model that you specify with `modelName`.

Input Arguments

modelName

Character vector that specifies the name of the model for which you want to open the Signal Logging Selector dialog box.

Example

Open the Signal Logging Selector dialog box for the `sldemo_mdref_bus.mdl`.

```
Simulink.SimulationData.signalLoggingSelector('sldemo_mdref_bus')
```

setName

Class: Simulink.SimulationData.Unit

Package: Simulink.SimulationData

Specify name of logging data units

Syntax

```
unitObject = setName(unitObj,unitName)
```

Description

`unitObject = setName(unitObj,unitName)` sets the name for the `Simulink.SimulationData.Unit` object to the name specified in `unitName`.

Input Arguments

unitObj — Logging data unit object to name

`Simulink.SimulationData.Unit` object

Logging data unit object to name, specified as a `Simulink.SimulationData.Unit` object.

unitName — Name of logging data unit

character vector

Name of logging data unit, specified as a character vector.

Output Arguments

name — Name of logging data units

character vector

Name of logging data units, returned as a character vector.

Examples

Name a Logging Data Unit Object

```
inchesUnit = Simulink.SimulationData.Unit('in');  
inchesUnit = setName(inchesUnit,'inches')
```

```
inchesUnit =
```

```
    Units with properties:

Introduced in R2011a

Simulink.SimulationData.updateDatasetFormatLogging

Convert model and its referenced models to use `Dataset` format for signal logging

Syntax

```
Simulink.SimulationData.updateDatasetFormatLogging(top_model)
Simulink.SimulationData.updateDatasetFormatLogging(top_model, variants)
```

Description

Note The `ModelDataLogs` class is supported for backwards compatibility. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format. In R2016a or later, when you open a model from an earlier release that had used `ModelDataLogs` format, the model simulated in use `Dataset` format. You do not need to use this command to update the signal logging format for a model that uses model referencing. Opening the model in R2016a or later uses `Dataset` format for all signal logging.

You can convert signal logging data from `ModelDataLogs` to `Dataset` format. Converting to `Dataset` format makes it easier to post-process with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see “Convert Logged Data to Dataset Format”.

If you have legacy code that uses the `ModelDataLogs` API, you can encounter situations that require updates to your code or model. See “Migrate Scripts That Use Legacy ModelDataLogs API”.

`Simulink.SimulationData.updateDatasetFormatLogging(top_model)` converts the top-level model and all of its referenced models to use the `Dataset` format for signal logging instead of the `ModelDataLogs` format. You can convert signal logging data from `ModelDataLogs` to `Dataset` format. Converting to `Dataset` format makes it easier to post-process with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see “Convert Logged Data to Dataset Format”.

If a Model block has the **Generate preprocessor conditionals** option selected, the function converts all the variants; otherwise, the function converts only the active variant.

`Simulink.SimulationData.updateDatasetFormatLogging(top_model, variants)` specifies which variant models to convert to use the `Dataset` signal logging format. For details about the `variants` argument, see “Input Arguments” on page 2-907

Input Arguments

`top_model`

Character vector that specifies the name of the top-level model.

variants

Character vector that specifies which variant models to update:

- 'ActivePlusCodeVariants' — (Default) Search all variants if any generate preprocessor conditionals. Otherwise, search only the active variant.
- 'ActiveVariants' — Convert only the active variant.
- 'AllVariants' — Convert all variants.

More About

Dataset

The *Dataset* format causes Simulink to use a `Simulink.SimulationData.Dataset` object to store the logged signal data. The *Dataset* format use MATLAB timeseries objects to formatting the data.

ModelDataLogs

The *ModelDataLogs* format causes Simulink to use a `Simulink.ModelDataLogs` object to store the logged signal data. `Simulink.Timeseries` and `Simulink.TsArray` objects provide the format for the data.

Tips

- The conversion function sets the `SignalLoggingSaveFormat` parameter value to `Dataset` for all the updated models.
- If you want to save the format updates that the conversion function makes, then ensure that the top-level model, referenced models, and variant models are accessible and writable.
- If a model has no other unsaved changes, the conversion function saves the format updates to the model. If the model has unsaved changes, the function updates the format, but does not save those changes.
- If you use this function for a model that does not include any referenced models, the function converts the top-level model use the `Dataset` format.

find

Class: Simulink.SimulationOutput

Package: Simulink

Access and display values of simulation results

Syntax

```
output = simOut.find('VarName')
```

Description

`output = simOut.find('VarName')` accepts one variable name. Specify *VarName* inside single quotes.

Input Arguments

VarName

Name of logged variable for which you seek values.

Default:

Output Arguments

Value

Value of the logged variable name specified in input.

Examples

Simulate `vdp` and store the values of the variable `youtNew` in `yout`.

```
simOut = sim('vdp','SimulationMode','rapid','AbsTol','1e-5',...  
            'SaveState','on','StateSaveName','xoutNew',...  
            'SaveOutput','on','OutputSaveName','youtNew');  
yout = simOut.find('youtNew')
```

Alternatives

A simpler alternative is to use dot notation. For example, to access data for the `xoutNew` output variable, you can use this command:

```
simOut.xoutNew
```

Another alternative is to use `Simulink.SimulationOutput.who` and then `Simulink.SimulationOutput.get`.

See Also

`get` | `who`

get

Class: Simulink.SimulationOutput

Package: Simulink

Access and display values of simulation results

Syntax

```
output = simOut.get('VarName')
```

Description

`output = simOut.get('VarName')` accepts one variable name. Specify *VarName* inside single quotes.

Tip A simpler alternative to using the `get` function is to use dot notation. For example, to access data for the `xout` output variable, you can use this command:

```
simOut.xout
```

Input Arguments

VarName

Name of logged variable for which you seek values.

Default:

Output Arguments

Value

Value of the logged variable name specified in input.

Examples

Simulate `vdp` and store the values of the variable `youtNew` in `yout`.

```
simOut = sim('vdp','SimulationMode','rapid','AbsTol','1e-5',...  
            'SaveState','on','StateSaveName','xoutNew',...  
            'SaveOutput','on','OutputSaveName','youtNew');  
yout = simOut.get('youtNew')
```

Alternatives

A simpler alternative is to use dot notation. For example, to access data for the `xout` output variable, you can use this command:

```
simOut.xout
```

Another alternative is to use `Simulink.SimulationOutput.who` and then `Simulink.SimulationOutput.find`.

See Also

[find](#) | [who](#)

getSimulationMetadata

Class: Simulink.SimulationOutput

Package: Simulink

Return SimulationMetadata object for simulation

Syntax

```
mData = simout.getSimulationMetadata()
```

Description

`mData = simout.getSimulationMetadata()` retrieves metadata information in a SimulationMetadata object from the `simout` SimulationOutput object.

Input Arguments

simout — Simulation object to get metadata from
object

Simulation object to get metadata from, specified as a SimulationOutput object.

Output Arguments

mData — SimulationMetadata object stored in the `simout` SimulationOutput object
object

SimulationMetadata object stored in the `simout` SimulationOutput object, returned as an object.

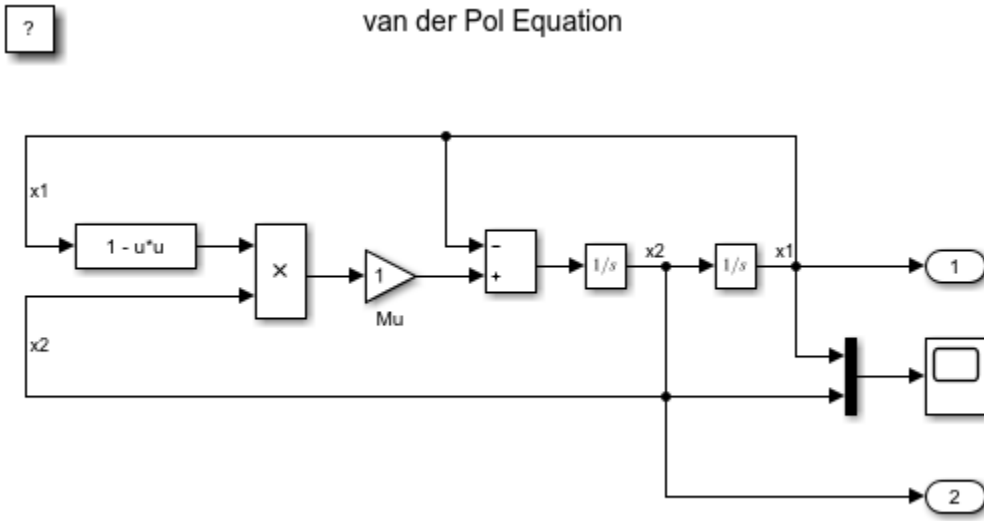

Examples

Retrieve Metadata From vdp Simulation

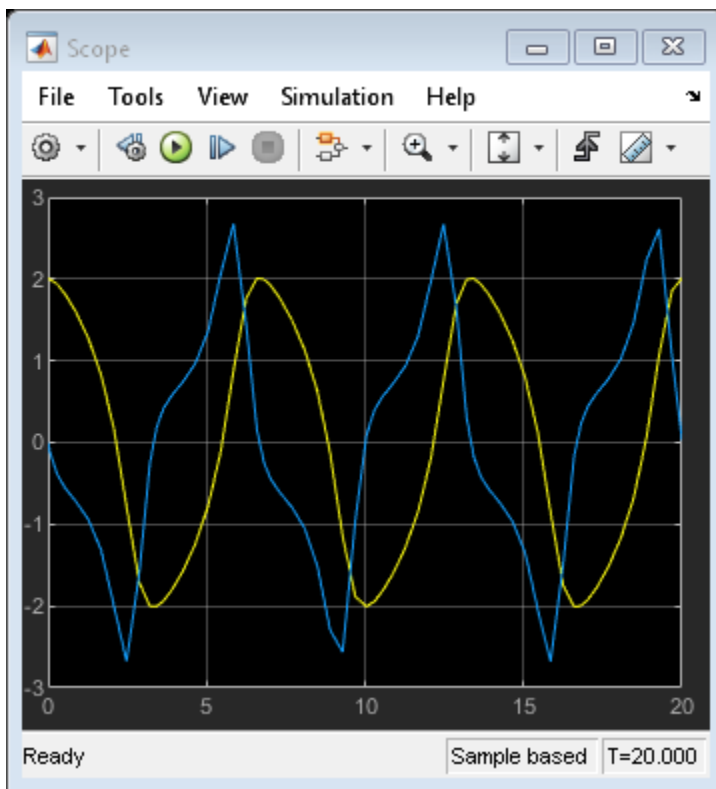

Simulate the vdp model and retrieve metadata information from the simulation.

Simulate the vdp model. Save the results of the Simulink.SimulationOutput object in `simout`

```
open_system('vdp')  
simout = sim(bdroot, 'ReturnWorkspaceOutputs', 'on');
```

Copyright 2004-2013 The MathWorks, Inc.

Retrieve metadata information about this simulation using `mData`.

```
mData=simout.getSimulationMetadata()
```

```
mData =
```

```
SimulationMetadata with properties:
```

```
ModelInfo: [1x1 struct]
TimingInfo: [1x1 struct]
ExecutionInfo: [1x1 struct]
UserString: ''
UserData: []
```

Alternatives

A simpler alternative to use dot notation with the `SimulationMetadata` property. For example:

```
simOut.SimulationMetadata.ModelInfo
```

Another alternative is to display simulation metadata in the Variable Editor using one of these approaches:

- Select the **Show Simulation Metadata** check box (which displays the data in a tree structure).
- Double-click the **SimulationMetadata** row.
- View the `SimulationMetadata` object.

setUserData

Class: Simulink.SimulationOutput

Package: Simulink

Store custom data in SimulationMetadata object that SimulationOutput object contains

Syntax

```
simoutNew = simout.setUserData(CustomData)
```

Description

`simoutNew = simout.setUserData(CustomData)` assigns a copy of the `simout` SimulationOutput object to `simoutNew`. The copy contains CustomData in its SimulationMetadata object.

Input Arguments

simout — Simulation object to get metadata from
object

Simulation object to get metadata from, specified as a SimulationOutput object.

CustomData — Data to store in a metadata object
data

Any custom data you want to store in the metadata object.

Output Arguments

simoutNew — Simulation object that stores metadata object with custom data
object

A copy of the `simout` SimulationOutput object that contains CustomData in its SimulationMetadata object, returned as an object.

Examples

Store Data in SimulationMetadata Object of vdp Simulation

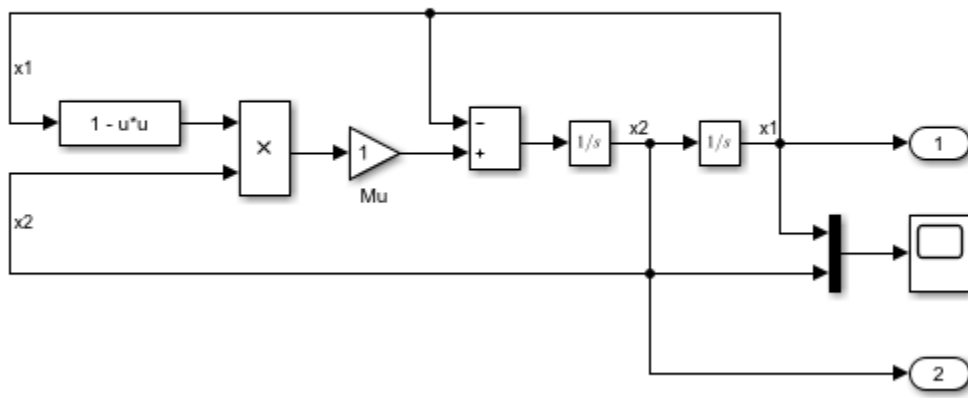

Simulate the vdp model. Store custom data in the SimulationMetadata object that the SimulationOutput object contains.

Simulate the vdp model. Save the results of the Simulink.SimulationOutput object in `simout`.

```
open_system('vdp')  
simout=sim(bdroot,'ReturnWorkspaceOutputs','on');
```

van der Pol Equation

Copyright 2004-2013 The MathWorks, Inc.

Store custom data about the simulation in the SimulationMetadata object that simout contains.

```
simout=simout.setUserData(struct('param1','value1','param2','value2','param3','value3'));
```

Use SimulationOutput.getSimulationMetadata to retrieve the information you stored.

```
mData=simout.getSimulationMetadata();
disp(mData.UserData)
```

```
param1: 'value1'  
param2: 'value2'  
param3: 'value3'
```

`Simulink.SimulationMetadata` | `getSimulationMetadata` | `setUserString`

setUserString

Class: Simulink.SimulationOutput

Package: Simulink

Store custom character vector in SimulationMetadata object that SimulationOutput object contains

Syntax

```
simoutNew = simout.setUserString(CustomString)
```

Description

`simoutNew = simout.setUserString(CustomString)` assigns a copy of the `simout` SimulationOutput object to `simoutNew`. The copy contains CustomString in its SimulationMetadata object.

Input Arguments

simout — Simulation object to get metadata from
object

Simulation object to get metadata from, specified as a SimulationOutput object.

CustomString — Character vector to store in a metadata object
character vector

Any custom character vector you want to store in the metadata object.

Output Arguments

simoutNew — Simulation object that stores metadata object with custom character vector
object

A copy of the `simout` SimulationOutput object that contains CustomString in its SimulationMetadata object, returned as an object.

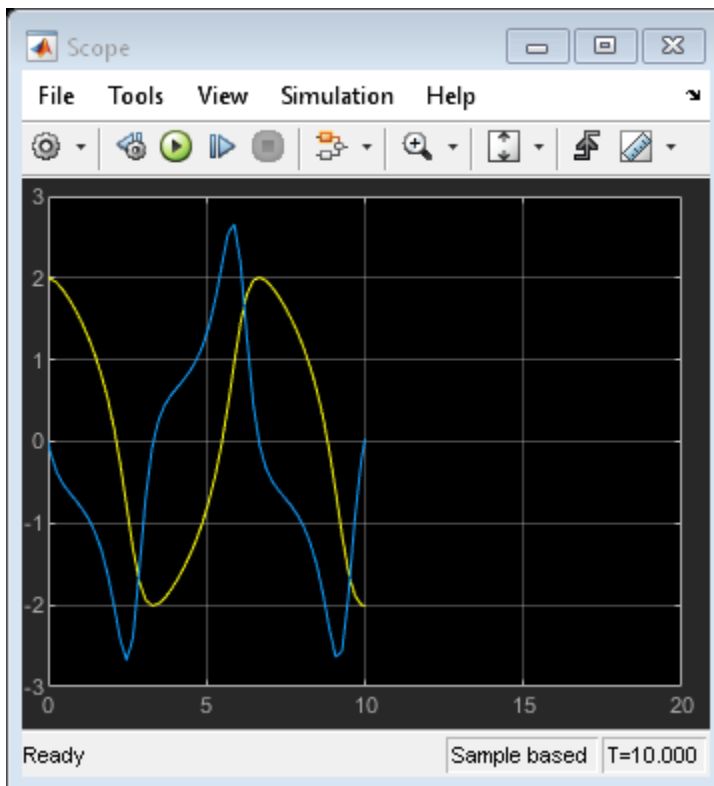

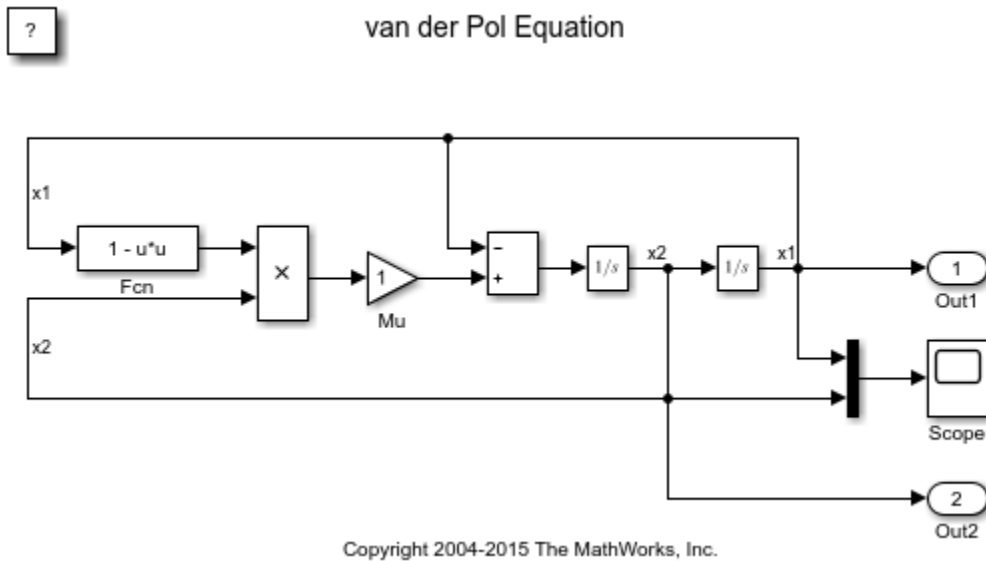

Examples

Store a Character Vector in SimulationMetadata Object of vdp Simulation

Simulate the vdp model. Store a custom character vector in the SimulationMetadata object that the SimulationOutput object contains.

Simulate the vdp model. Save the results of the Simulink.SimulationOutput object in `simout`.

```
open_system('vdp')  
simout=sim(bdroot,'ReturnWorkspaceOutputs','on');
```

Store a character vector to describe the simulation.

```
simout=simout.setUserString('First Simulation');
```

Use `SimulationOutput.getSimulationMetadata` to retrieve the information you stored.

```
mData=simout.getSimulationMetadata();
disp(mData.UserString)
```

First Simulation

who

Class: Simulink.SimulationOutput

Package: Simulink

Access and display output variable names of simulation

Syntax

```
simOutVar = simOut.who
```

Description

simOutVar = simOut.who returns the names of all simulation output variables, including workspace variables.

Output Arguments

simOutVar

Character vector array of output variable names of simulation.

Examples

Simulate vdp and store the character vector values of the output variable names.

```
simOut = sim('vdp','SimulationMode','rapid','AbsTol','1e-5',...  
            'SaveState','on','StateSaveName','xoutNew',...  
            'SaveOutput','on','OutputSaveName','youtNew');  
simOutVar = simOut.who
```

Alternatives

A simpler alternative is to use dot notation. For example, to access data for the xoutNew output variable, you can use this command:

```
simOut.xoutNew
```

Simulink.SubSystem.convertToModelReference

Convert subsystem to model reference

Syntax

```
Simulink.SubSystem.convertToModelReference(gcf,'UseConversionAdvisor',true)
```

```
[success,mdlRefBlkHs] = Simulink.SubSystem.convertToModelReference(subsys,mdlRefs)
```

```
[success,mdlRefBlkHs] = Simulink.SubSystem.convertToModelReference(subsys,mdlRefs,Name,Value)
```

Description

`Simulink.SubSystem.convertToModelReference(gcf,'UseConversionAdvisor',true)` opens the Model Reference Conversion Advisor for the currently selected subsystem block.

`[success,mdlRefBlkHs] = Simulink.SubSystem.convertToModelReference(subsys,mdlRefs)` converts the specified subsystems to referenced models using the `mdlRefs` value.

For each subsystem that the function converts, it:

- Creates a model
- Copies the contents of the subsystem into the new model
- Updates any root-level Inport, Outport, Trigger, and Enable blocks and the configuration parameters of the model to match the compiled attributes of the original subsystem
- Copies the contents of the model workspace of the original model to the new model

Before you use the function, load the model containing the subsystem.

`[success,mdlRefBlkHs] = Simulink.SubSystem.convertToModelReference(subsys,mdlRefs,Name,Value)` uses additional options specified by one or more `Name,Value` pair arguments.

Examples

Open the Model Reference Conversion Advisor

Open the f14 model.

```
open_system('f14');
```

In the f14 model, select the Controller subsystem output signal and click **Log Signals**.

In the Simulink Editor, select the Controller subsystem. Then open the Model Reference Conversion Advisor from the command line.

```
Simulink.SubSystem.convertToModelReference(gcf,'UseConversionAdvisor',true);
```

Perform the conversion using the advisor.

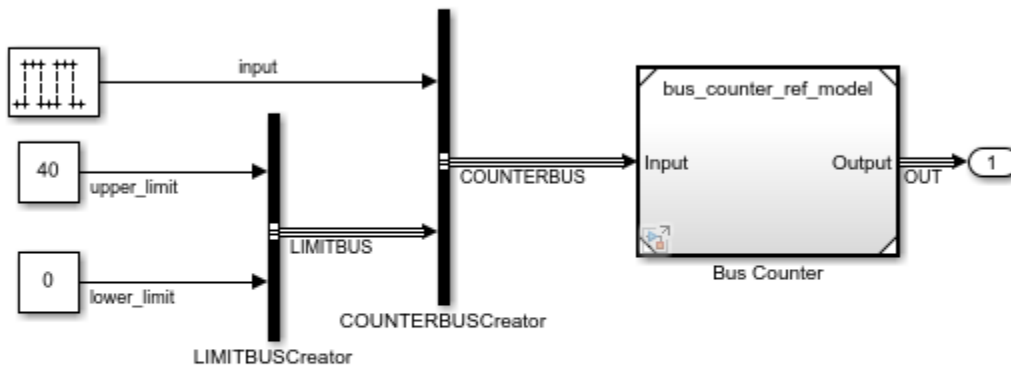

Convert Subsystem to Referenced Model

Convert the Bus Counter subsystem to a referenced model named bus_counter_ref_model.

```
open_system('sldemo_mdref_conversion');
Simulink.SubSystem.convertToModelReference(...
    'sldemo_mdref_conversion/Bus Counter', ...
    'bus_counter_ref_model', ...
    'AutoFix',true,...
    'ReplaceSubsystem',true,...
    'CheckSimulationResults',true);
```

Successfully converted Subsystem block to Model block.

Conversion to Model Reference Example

Double click here to convert 'Bus Counter' Subsystem to Referenced Model

Copyright 1990-2014 The MathWorks, Inc.

Convert Multiple Subsystems to Referenced Models

Convert the two subsystems with one command.

```
open_system('f14');
set_param(gcs, 'SaveOutput', 'on', 'SaveFormat', 'Dataset');
set_param(gcs, 'SignalResolutionControl', 'UseLocalSettings');
Simulink.SubSystem.convertToModelReference(...
    {'f14/Controller', 'f14/Aircraft Dynamics Model'}, ...
    {'controller_ref_model', 'aircraft_dynamics_ref_model'}, ...
```

```
'ReplaceSubsystem',true,...
'AutoFix',true,...
'CheckSimulationResults',true)
```

Input Arguments

subsys — Subsystems to convert

character vector | subsystem handle | cell array of character vectors | array of subsystem handles

Subsystems to convert, specified as a character vector, subsystem handle, or cell array of strings or array of subsystem handles.

For information on which subsystems you can convert, see “Modify Referenced Models for Conditional Execution”.

Data Types: double

mdlRefs — Referenced model names

character vector | cell array of character vectors

Referenced model names, specified as a character vector or cell array of character vectors. Each model name must be 59 characters or less.

If you specify a cell array of subsystems to convert, specify a cell array of referenced model names. Each model name corresponds to the specified subsystem, in the same order.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Example: `Simulink.SubSystem.convertToModelReference...
(engineSubsys,engineModelRef,'ReplaceSubsystem',true)`

AutoFix — Fix all conversion issues that can be fixed automatically

false (default) | true

If you set `AutoFix` to `true`, the function fixes all conversion issues that it can fix.

For issues that the function cannot fix, the conversion process generates error messages that you address by modifying the model.

Note If you set `'Force'` to `true`, then the function does not automatically fix conversion issues.

Data Types: logical

Force — Complete conversion even with errors

false (default) | true

If you set `'Force'` to `true`, the function returns conversion errors as warnings and continues with the conversion without fixing the errors. This option allows you to use the function to do the initial steps of conversion and then complete the conversion process yourself.

If you set `Force` to `true`, then the function does not fix conversion issues, even if you set `'AutoFix'` to `true`. However, the `success` output argument is `true`, regardless of whether any conversion errors occurred.

CheckSimulationResults — Compare simulation results before and after conversion

`false` (default) | `true`

Compare simulation results before and after conversion, specified as `true` or `false`.

Before performing the conversion, enable signal logging for the subsystem output signals of interest in the model.

For the `Simulink.SubSystem.convertToModelReference` command, set:

- `'CheckSimulationResults'` to `true`
- `'AbsoluteTolerance'`
- `'RelativeTolerance'`
- `'SimulationModes'` to the same as the simulation mode as in the original model

If the difference between simulation results exceeds the tolerance level, the function displays a message.

AbsoluteTolerance — Absolute signal tolerance for comparison

`'1e-06'` (default) | `double`

Absolute signal tolerance for comparison, specified as a `double`. Use the option only if you set `CheckSimulationResults` to `true`.

Data Types: `double`

RelativeTolerance — Relative signal tolerance for comparison

`'1e-06'` (default) | `double`

Relative signal tolerance for comparison, specified as a `double`. Use the option only if you set `CheckSimulationResults` to `true`.

Data Types: `double`

DataFileName — Name of file for storing conversion data

`character vector`

Name of file for storing conversion data, specified as a `character vector`. You can specify an absolute or relative path.

You can save the conversion data in a `MAT`-file (default) or a `MATLAB` file. If you use a `.m` file extension, the function serializes all variables to a `MATLAB` file.

By default, the function uses a file name consisting of the model name plus `_conversion_data.mat`.

ReplaceSubsystem — Replace content of each subsystem with Model blocks

`false` (default) | `true`

Replace subsystem blocks with `Model` blocks, specified as `true` or `false`. The `Model` block references the referenced model.

By default, the function displays the referenced models in separate Simulink Editor windows.

If you set the value to `true`, consider making a backup of the original model before you convert the subsystems. If you want to undo the conversion, having a backup makes it easier to restore the model.

If you set `ReplaceSubsystem` to `true`, the conversion action depends on whether you use the automatic fix options.

- If you use the automatic fixes, then the conversion replaces the Subsystem block with a Model block unless the automatic fixes change the input or output ports. If the ports change, then the conversion includes the contents of the subsystem in a Model block that is inserted in the Subsystem block.
- If you do not use the automatic fixes, then the conversion replaces the Subsystem block with a Model block.

Data Types: `logical`

CreateWrapperSubsystem — Insert wrapper subsystem to preserve model layout

`false` (default) | `true`

Insert wrapper subsystem to preserve model layout, specified as `true` or `false`. When you convert a subsystem to a referenced model, you can have the conversion process insert a wrapper subsystem to preserve the layout of a model. The subsystem wrapper contains the Model block from the conversion.

The conversion creates a wrapper subsystem automatically if the conversion modifies the Model block interface by adding ports.

Data Types: `logical`

SimulationModes — Simulation mode for Model blocks

'Normal' (default) | 'Accelerator'

Simulation mode for Model blocks, specified as a 'Normal' or 'Accelerator'. The simulation mode setting applies to the Model blocks that reference the models that the conversion creates.

BuildTarget — Model reference targets to generate

'Sim' | 'Coder'

Model reference targets to generate.

- 'Sim' — Model reference simulation target
- 'Coder' — Code generation target

Output Arguments

success — Conversion status

1 | 0

Conversion status. A value of 1 indicates a successful conversion.

If you set 'Force' to `true`, the function returns a value of 1 if the conversion completes. However, the simulation results can differ from the simulation results for the model before conversion.

mdlRefBlkHs — Handles of created Model blocks

handle of Model block | array of handles of Model blocks

Handles of created Model blocks, returned as a double or cell array.

Data Types: double

Tips

- You cannot convert a parent subsystem and a child of that subsystem at the same time.
- Specifying multiple subsystems to convert with one command can save time, compared to converting each subsystem separately. The multiple subsystem conversion process compiles the model once.
- If you specify multiple subsystems to convert, the conversion process attempts to convert each subsystem. Successfully converted subsystems produce referenced models, even if the conversions of other subsystems fail.
- If you specify multiple subsystems, consider:
 - In the input arguments, setting 'Autofix', 'ReplaceSubsystem', and 'CheckSimulationResults' to true.
 - In the model, setting a short simulation time.
- A data dictionary saves bus objects that it creates as part of the conversion process when both of these conditions exist:
 - The top model uses a data dictionary.
 - All changes to the top model are saved.
- To maintain the behavior of a masked subsystem, perform these additional tasks:
 - For masked callbacks, icons, ports, and documentation, create a backup copy of the masked subsystem before converting it to a referenced model. After conversion, copy the content from the Mask Editor of the backup masked subsystem to the Mask Editor of the new Model block.
 - Replace mask parameters with model arguments (see “Parameterize Instances of a Reusable Referenced Model”).

Note Referenced models do not support the functionality that you can achieve with mask initialization code to create masked parameters.

Compatibility Considerations**'BuildTarget' argument value 'RTW' is not recommended***Not recommended starting in R2019a*

In R2019a, an argument value used with the `Simulink.SubSystem.convertToModelReference` function was updated. The legacy argument value is supported for backward compatibility.

To take advantage of the updated 'BuildTarget' argument value, use 'Coder' instead of 'RTW'.

Simulink.SubSystem.copyContentsToBlockDiagram

Copy contents of subsystem to empty block diagram

Syntax

```
Simulink.SubSystem.copyContentsToBlockDiagram(subsys, bdiag)
```

Description

`Simulink.SubSystem.copyContentsToBlockDiagram(subsys, bdiag)` copies the contents of the subsystem *subsys* to the block diagram *bdiag*. The subsystem and block diagram must have already been loaded. The subsystem cannot be part of the block diagram. The function affects only blocks, lines, and annotations; it does not affect nongraphical information such as configuration sets.

This function cannot be used if the destination block diagram contains any blocks or signals. Other types of information can exist in the destination block diagram and are unaffected by the function. Use `Simulink.BlockDiagram.deleteContents` if necessary to empty the block diagram before using `Simulink.SubSystem.copyContentsToBlockDiagram`.

Tip To flatten a model hierarchy by expanding the contents of a subsystem to the system that contains that subsystem, do not use the `Simulink.SubSystem.copyContentsToBlockDiagram` function. Instead, expand the subsystem, as described in “Expand Subsystem Contents”.

Input Arguments

subsys

Subsystem name or handle

bdiag

Block diagram name or handle

Examples

Copy the graphical contents of `f14/Controller`, including all nested subsystems, to a new block diagram:

```
% open f14
open_system('f14');

% create a new model
newbd = new_system;
open_system(newbd);

% copy the subsystem
Simulink.SubSystem.copyContentsToBlockDiagram('f14/Controller', newbd);

% close f14 and the new model
close_system('f14', 0);
close_system(newbd, 0);
```

Simulink.SubSystem.deleteContents

Delete contents of subsystem

Syntax

```
Simulink.SubSystem.deleteContents(subsys)
```

Description

`Simulink.SubSystem.deleteContents(subsys)` deletes the contents of the subsystem *subsys*. The function affects only blocks, lines, and annotations. The subsystem must have already been loaded.

Note This function does not delete library blocks in a subsystem.

Input Arguments

subsys

Subsystem name or handle

Examples

Delete the graphical contents of `Controller`, including all nested subsystems:

```
load_system('f14');  
Simulink.SubSystem.deleteContents('f14/Controller');
```

Simulink.SubSystem.getChecksum

Return checksum of nonvirtual subsystem

Syntax

```
[checksum,details] = Simulink.SubSystem.getChecksum(subsys)
```

Description

`[checksum,details] = Simulink.SubSystem.getChecksum(subsys)` returns the checksum of the specified nonvirtual subsystem. Simulink computes the checksum based on the subsystem parameter settings and the blocks the subsystem contains. Virtual subsystems do not have checksums.

One use of this command is to determine why code generated for a subsystem is not being reused.

Note `Simulink.SubSystem.getChecksum` compiles the model that contains the specified subsystem, if the model is not already in a compiled state. If you need to get the checksum for multiple subsystems and want to avoid multiple compiles, use the command `,model([], [], [], 'compile')` to place the model in a compiled state before using `Simulink.SubSystem.getChecksum`.

This command accepts the argument `subsys`, which is the full name or handle of the nonvirtual subsystem block for which you are returning checksum data.

Examples

Run getChecksum on Model

Run the function `Simulink.SubSystem.getChecksum` on the model `rtwdemo_ssreuse`. In the MATLAB editor window, both output structures are displayed. In the workspace pane, double-click on either of the structures to view its contents.

Load the model `rtwdemo_ssreuse`.

```
rtwdemo_ssreuse
```

Select subsystem `SS1` and execute the follow line of code in the MATLAB editor to get the full name and path to the subsystem `SS1`:

```
path_ss1 = gcb
```

Run the function `getChecksum` on the subsystem with the following command:

```
[chksum1, chksum1_details] = Simulink.SubSystem.getChecksum(path_ss1)
```

The output structures `chksum1` and `chksum1_details` will store the output of the `getChecksum` function call.

```
chksum1 =  
    struct with fields:  
        Value: [4×1 uint32]  
        MarkedUnique: 0  
  
chksum1_details =  
    struct with fields:  
        ContentsChecksum: [1×1 struct]  
        InterfaceChecksum: [1×1 struct]  
        ContentsChecksumItems: [359×1 struct]  
        InterfaceChecksumItems: [60×1 struct]
```

Input Arguments

subsys — Name or handle of nonvirtual subsystem

character vector

Input the full name of the nonvirtual subsystem for which you want to calculate the checksum.

Data Types: char

Output Arguments

checksum — A structure that stores the value of the checksum and indicates whether **subsys** contains unique block or subsystem properties which prevent generated code reuse

structure

Checksum information, returned as a structure with the fields:

Value — Array of four 32-bit integers that represents the subsystem's 128-bit checksum

4×1 uint32

MarkedUnique — True if the subsystem or the blocks it contains have properties that would prevent the code generated for the subsystem from being reused; otherwise, false

bool

details — A structure that stores checksum data on model contents and the interface

structure

Checksum information, returned as a structure with the fields:

ContentsChecksum — A structure of the same form as **checksum**, representing a checksum that provides information about all blocks in the system

structure

InterfaceChecksum — A structure of the same form as **checksum**, representing a checksum that provides information about the subsystem's block parameters and connections

structure

ContentsChecksumItems — Structure array that Simulink uses to compute the checksum for ContentsChecksum

structure

Structure array returned with the following fields:

Handle — Object for which Simulink added an item to the checksum. For a block, the handle is a full block path. For a block port, the handle is the full block path and a character vector that identifies the port

char array

Identifier — Descriptor of the item Simulink added to the checksum. If the item is a documented parameter, the identifier is the parameter name

char array

Value — Value of the item Simulink added to the checksum. If the item is a parameter, Value is the value returned by `get_param(handle, identifier)`

type

InterfaceChecksumItems — Structure array that Simulink uses to compute the checksum for InterfaceChecksum

structure

Structure array returned with the following fields:

Handle — Object for which Simulink added an item to the checksum. For a block, the handle is a full block path. For a block port, the handle is the full block path and a character vector that identifies the port

char array

Identifier — Descriptor of the item Simulink added to the checksum. If the item is a documented parameter, the identifier is the parameter name

char array

Value — Value of the item Simulink added to the checksum. If the item is a parameter, Value is the value returned by `get_param(handle, identifier)`

type

Introduced in R2006b

Simulink.suppressDiagnostic

Suppress a diagnostic from a specific block

Syntax

```
Simulink.suppressDiagnostic(source, message_id)  
Simulink.suppressDiagnostic(diagnostic)
```

Description

`Simulink.suppressDiagnostic(source, message_id)` suppresses all instances of diagnostics represented by `message_id` thrown by the blocks specified by `source`.

`Simulink.suppressDiagnostic(diagnostic)` suppresses the diagnostics associated with MSLDiagnostic object `diagnostic`.

Examples

Suppress a Warning Thrown By a Block

Using the model from “Suppress Diagnostic Messages Programmatically”, use the `Simulink.suppressDiagnostic` function to suppress the parameter precision loss warning thrown by the Constant block, `one`.

```
Simulink.suppressDiagnostic('Suppressor_CLI_Demo/one', ...  
    'SimulinkFixedPoint:util:fxpParameterPrecisionLoss');
```

Input Arguments

source — Block or model object throwing the diagnostic

block path | block handle

The source of the diagnostic, specified as a block path, block handle, cell array of block paths, or cell array of block handles.

To get the block path, use the `gcb` function.

To get the block handle, use the `getSimulinkBlockHandle` function.

Data Types: char | cell

message_id — message identifier of diagnostic

message identifier | cell array of message identifiers

Message identifier of the diagnostic, specified as a character vector or a cell array of character vectors. You can find the message identifier of diagnostics thrown during simulation by accessing the `ExecutionInfo` property of the `Simulink.SimulationMetadata` object associated with a simulation. You can also use the `lastwarn` function.

Data Types: char | cell

diagnostic – Diagnostic object

MSLDiagnostic object

Diagnostic specified as an MSLDiagnostic object. Access the MSLDiagnostic object through the ExecutionInfo property of the Simulink.SimulationMetadata object.

Data Types: struct

sint

Create `Simulink.NumericType` object describing signed integer data type

Syntax

```
a = sint(WordLength)
```

Description

`sint(WordLength)` returns a `Simulink.NumericType` object that describes the data type of a signed integer with a word size given by *WordLength*.

Note `sint` is a legacy function. In new code, use `fixdt` instead. In existing code, replace `sint(WordLength)` with `fixdt(1,WordLength,0)`.

Examples

Define a 16-bit signed integer data type.

```
a = sint(16)
```

```
a =
```

```
    NumericType with properties:
```

```
        DataTypeMode: 'Fixed-point: binary point scaling'
        Signedness: 'Signed'
        WordLength: 16
        FractionLength: 0
        IsAlias: 0
        DataScope: 'Auto'
        HeaderFile: ''
        Description: ''
```

Introduced before R2006a

slblocksearchdb.trainfrommodel

Train suggestion engine to improve quick insert results based on one model

Syntax

```
slblocksearchdb.trainfrommodel(model)
```

Description

`slblocksearchdb.trainfrommodel(model)` improves quick insert search results based on a single model.

Examples

Use a Single Model for Training

Train the suggestion engine to use a model to improve results. Assume 'MyModels' is in the current folder. This code uses a relative path.

```
slblocksearchdb.trainfrommodel('MyModels/model.slx')
```

Input Arguments

model — Model for training the suggestion engine

model path

Model to train the suggestion engine, specified as a character vector or string scalar of the full model path or relative path. Include the `.slx` or `.mdl` extension

Example: 'H:/MyModels/model.slx' 'mymodel.slx'

See Also

`slblocksearchdb.trainfrommodelsindir` | `slblocksearchdb.untrainall` | `slblocksearchdb.untrainmodel` | `slblocksearchdb.untrainmodelsindir`

Topics

"Improve Quick Block Insert Results"

Introduced in R2018a

slblocksearchdb.trainfrommodelsindir

Train suggestion engine to improve quick insert results based on models in a folder

Syntax

```
slblocksearchdb.trainfrommodelsindir(folder)
slblocksearchdb.trainfrommodelsindir(folder,'exclude',exclusions)
```

Description

`slblocksearchdb.trainfrommodelsindir(folder)` improves search results based on the models in `folder`, recursively.

`slblocksearchdb.trainfrommodelsindir(folder,'exclude',exclusions)` excludes the specified models from updating the suggestion engine.

Examples

Train Suggestion Engine and Exclude Folders and Models

Create the cell array `exPath` for a folder you want to exclude and a model you want to exclude. To train the suggestion engine, use the cell array in the `slblocksearchdb.trainfrommodelsindir` command.

```
exPath = {'MyModels/testmodels' 'MyModels/myvdp.slx'}
slblocksearchdb.trainfrommodelsindir('MyModels','exclude',exPath)
```

The command uses the models in the folder 'MyModels' with the exclusions you specified.

Input Arguments

folder — Folder whose models to use for training

folder path

Folder whose models to use for training the suggestion engine, specified as an absolute or relative path character vector or string scalar.

Example: 'H:/MyModels/trainingmodels' 'MyModels'

exclusions — Models to exclude from training models

cell array of character vectors | string array

Models to exclude from training the suggestion engine, specified as a cell array of character vectors or a string array. Specify folders or models to exclude as a full or relative path. Model names must include the file extension `.slx` or `.mdl`.

```
Example: {'H:/MyModels/trainingmodels' 'MyModels/trainingmodels2' 'MyModels/
myvdp.slx'}
```

“Improve Quick Block Insert Results”

Introduced in R2018a

slblocksearchdb.untrainall

Remove the effects of all added models from the suggestion engine

Syntax

```
slblocksearchdb.untrainall
```

Description

`slblocksearchdb.untrainall` removes the models added to the suggestion engine to improve quick insert results. Use this function when you want to return the database to the default state.

Examples

Add Models and Remove All

Add some models to the suggestion engine.

```
slblocksearchdb.trainfrommodelsindir('MyModels')  
slblocksearchdb.trainfrommodel('C:/users/TrainingModels/mymodel.slx')
```

Remove all added models from the suggestion engine.

```
slblocksearchdb.untrainall
```

Topics

“Improve Quick Block Insert Results”

Introduced in R2018a

slblocksearchdb.untrainmodel

Remove the effect of a model from the suggestion engine

Syntax

```
slblocksearchdb.untrainmodel('model')
```

Description

`slblocksearchdb.untrainmodel('model')` removes the effects of a single model from the suggestion engine.

Examples

Remove a Model from the Suggestion Engine

Train the suggestion engine to use a model to improve results.

```
slblocksearchdb.trainfrommodel('MyModels/model.slx')
```

Remove the model from the suggestion engine.

```
slblocksearchdb.untrainmodel('MyModels/model.slx')
```

Input Arguments

model — Model to remove from the suggestion engine

model path

Model whose effects to remove from the suggestion engine, specified as the full or relative path character vector or string scalar. Include the `.slx` or `.mdl` extension.

Example: `'H:/MyModels/model.slx'`

Topics

“Improve Quick Block Insert Results”

Introduced in R2018a

slblocksearchdb.untrainmodelsindir

Remove the effects of models from the suggestion engine

Syntax

```
slblocksearchdb.untrainmodelsindir(folder)
slblocksearchdb.untrainmodelsindir(folder,'exclude',exclusions)
```

Description

`slblocksearchdb.untrainmodelsindir(folder)` removes models in `folder` from the suggestion engine, recursively.

`slblocksearchdb.untrainmodelsindir(folder,'exclude',exclusions)` excludes the specified models from updating the suggestion engine.

Examples

Remove the Effects of Models from Suggestion Engine

Create the cell array `exPath` for a folder and a model whose effects you do not want to remove from the suggestion engine. Then use the cell array in the `slblocksearchdb.untrainmodelsindir` command.

```
exPath = {'MyModels/subfolder' 'MyModels/myvdp.slx'}
slblocksearchdb.untrainmodelsindir('MyModels','exclude',exPath)
```

The command removes the models in the folder 'MyModels' with the exclusions you specified.

Input Arguments

folder — Folder whose models to remove from the suggestion engine

folder path

Folder whose models to remove from the suggestion engine, specified as an absolute or relative path character vector or string scalar.

Example: 'H:/MyModels/trainingmodels' 'MyModels'

exclusions — Folders and models to exclude from removing

cell array of character vectors | string array

Folders or models to exclude from removing from the suggestion engine, specified as a cell array of character vectors or a string array. Specify the folders or models to exclude as a full or relative path. For models, include the `.slx` or `.mdl` extension.

Example: {'H:/MyModels/trainingmodels' 'MyModels/trainingmodels2' 'MyModels/myvdp.slx'}

“Improve Quick Block Insert Results”

Introduced in R2018a

slbuild

Build standalone executable or model reference target for model

Syntax

```
slbuild(model)
slbuild(model,buildSpec)
slbuild(model,buildSpec,Name,Value)
```

Description

`slbuild(model)` builds a standalone Simulink Coder binary executable file from *model*, using the current model configuration settings. If the *model* has not been loaded, `slbuild` loads it before initiating the build process.

You cannot use `slbuild` to build subsystems.

`slbuild(model,buildSpec)` builds a standalone Simulink Coder binary executable file from *model* according to the specified code generation action.

`slbuild(model,buildSpec,Name,Value)` builds a standalone Simulink Coder binary executable file from *model* as specified by one or more *Name,Value* pairs.

Examples

Generate Code and Build Executable Image for Model

Generate C code for model `rtwdemo_rtwintr`.

```
slbuild('rtwdemo_rtwintr')
% Same operation as ...
% slbuild('rtwdemo_rtwintr','StandaloneCoderTarget')
```

For the generic real-time (GRT) target, the coder generates these code files and places them in folders `rtwdemo_rtwintr_grt_rtw` and `slprj/grt/_sharedutils`.

Model Files	Shared Files	Interface Files	Other Files
<code>rtwdemo_rtwintr.c</code>	<code>rtwtypes.h</code>	<code>rtmodel.h</code>	none
<code>rtwdemo_rtwintr.h</code>	<code>multiword_types.h</code>		
<code>rtwdemo_rtwintr_private.h</code>	<code>builtin_typeid_types.h</code>		
<code>rtwdemo_rtwintr_types.h</code>			

If the following model configuration parameters settings apply, the coder generates additional results.

Parameter Setting	Results
Code Generation > Generate code only pane is cleared	Executable image <code>rtwdemo_rtwintr.exe</code>
Code Generation > Report > Create code generation report is selected	Report appears, providing information and links to generated code files, subsystem and code interface reports, entry-point functions, inports, outputs, interface parameters, and data stores

Clean Top Model Build

Clean the model build area enough to trigger regeneration of the top model code at the next build.

```
slbuild('rtwdemo_rtwintr', 'CleanTopModel')
```

Force Top Model Build

Generate code and build an executable image for `rtwdemo_mdltreftop`, which refers to model `rtwdemo_mdltreftop`, regardless of model checksums and parameter settings.

```
slbuild('rtwdemo_mdltreftop', 'StandaloneCoderTarget', ...
        'ForceTopModelBuild', true)
```

Input Arguments

model — Specifies model for the build process

handle | character vector

Model for which to build a standalone executable or model reference target, specified as a handle or a character vector representing the model name.

Example: `gcs`

buildSpec — Specifies the code generation action for the build process

'StandaloneCoderTarget' (default) | 'ModelReferenceSimTarget' |
'ModelReferenceCoderTarget' | 'ModelReferenceCoderTargetOnly' | 'CleanTopModel'

`buildSpec` directs the code generator to perform the selected build action for the model and build process:

- Honors the setting of the **Rebuild** parameter on the **Model Referencing** pane of the Configuration Parameters dialog box.
- Requires a Simulink Coder license only if you build a model reference Simulink Coder target, not if you build a model reference simulation target only.

The `buildSpec` argument must be one of the following.

buildSpec	Build Action
'StandaloneCoderTarget'	Builds a standalone Simulink Coder binary executable file from <i>model</i> , using the current model configuration settings. If <i>model</i> has not been loaded, <code>slbuild</code> loads it before initiating the build process.
'ModelReferenceSimTarget'	Builds a model reference simulation target (does not require a Simulink Coder license).
'ModelReferenceCoderTarget'	Builds a model reference Simulink Coder target and the corresponding model reference simulation target.
'ModelReferenceCoderTargetOnly'	Builds only a model reference Simulink Coder target.
'CleanTopModel'	Cleans the model build area enough to trigger regeneration of the top model code at the next build.

Example: 'ModelReferenceSimTarget'

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1, Value1, . . . , NameN, ValueN`.

Example: 'UpdateThisModelReferenceTarget', 'Force'

UpdateThisModelReferenceTarget — Specifies a conditional rebuild option for the model reference build

'Force' | 'IfOutOfDateOrStructuralChange' | 'IfOutOfDate'

The 'UpdateThisModelReferenceTarget' value specifies a conditional rebuild option for the model reference target build. This option applies only to *model*, not to any models referenced by *model*.

'UpdateThisModelReferenceTarget' Value	Equivalent Rebuild Option	Rebuild Action
'Force'	Always	Unconditionally rebuilds the model.
'IfOutOfDateOrStructuralChange'	If any changes detected	Rebuilds the model if the build process detects any changes.
'IfOutOfDate'	If any changes in known dependencies detected	Rebuilds the model if the build process detects any changes in known dependencies of this model.

For more information on the different rebuild options, see **Rebuild**.

Example: 'UpdateThisModelReferenceTarget', 'Force'

Dependencies

To use this option, set `buildSpec` to 'ModelReferenceSimTarget', 'ModelReferenceCoderTarget', or 'ModelReferenceCoderTargetOnly'.

ForceTopModelBuild — Specifies whether to force the top model of the model hierarchy to build

false (default) | true

Setting the 'ForceTopModelBuild' value to `true` directs the code generator to generate code and build an executable image for the top model of the model hierarchy, regardless of model checksums and parameter settings.

Example: `'ForceTopModelBuild', true`

Dependencies

To use this option, set `buildSpec` to `'StandaloneCoderTarget'`.

OpenBuildStatusAutomatically — Display build information

`false` (default) | `true`

To display build information in the Build Status window, specify `true`. The default is `false`. For more information about using the status window, see “Monitor Parallel Building of Referenced Models” (Simulink Coder).

The Build Status window supports parallel builds of referenced model hierarchies. Do not use the Build Status window for serial builds.

Dependencies

To use this option, set `buildSpec` to `'StandaloneCoderTarget'`.

Compatibility Considerations

'StandaloneRTWTarget', 'ModelReferenceRTWTarget', and 'ModelReferenceRTWTargetOnly' arguments are not recommended

Not recommended starting in R2019a

In R2019a, some arguments used with the `slbuild` function were updated. Legacy arguments are supported for backward compatibility.

To take advantage of the updated arguments:

- Use `'StandaloneCoderTarget'` instead of `'StandaloneRTWTarget'`
- Use `'ModelReferenceCoderTarget'` instead of `'ModelReferenceRTWTarget'`
- Use `'ModelReferenceCoderTargetOnly'` instead of `'ModelReferenceRTWTargetOnly'`

Extended Capabilities

Automatic Parallel Support

Accelerate code by automatically running computation in parallel using Parallel Computing Toolbox™.

To build referenced models in parallel, in the top model, select the configuration parameter check box **Enable parallel model reference builds**. For more information, see “Reduce Build Time for Referenced Models by Using Parallel Builds” (Simulink Coder).

In Parallel Computing Toolbox commands, for example, a `parfor` or `spmd` loop, do not invoke `rtwbuild`, `rtwrebuild`, or `slbuild` commands that build models that are configured for parallel builds.

slCharacterEncoding

Change MATLAB character set encoding

Syntax

```
slCharacterEncoding(encoding)
current = slCharacterEncoding()
```

Description

`slCharacterEncoding(encoding)` changes the MATLAB character set encoding to the one you specify. Use this syntax to change the current MATLAB character set encoding to be compatible with the character encoding of a model that you want to open. Close all open models or libraries before changing the MATLAB character set encoding except when changing from US-ASCII to another encoding.

Use this syntax to specify these encodings:

- 'US-ASCII'
- 'Windows-1252'
- 'ISO-8859-1'
- 'Shift_JIS'
- 'UTF-8'

If you want to use a different character encoding, start MATLAB with the appropriate locale settings for your operating system. Consult your operating system manual to change the locale setting. Simulink can support any character encoding that uses single-byte or double-byte characters.

`current = slCharacterEncoding()` returns the current MATLAB character set encoding.

Examples

Change Encoding for Simulink Session

Suppose that you create a model in a MATLAB session configured for 'Shift_JIS' and open it in a session configured for 'US-ASCII'. The warning message shows the encoding of the current session and the encoding used to create the model. If you encounter any problems with corrupted characters, for example when using MATLAB files associated with the model, then use the `slCharacterEncoding` function to change the character encoding.

Close all open models.

Find out the current encoding.

```
slCharacterEncoding()
```

```
ans =  
    'windows-1252'
```

Use `slCharacterEncoding` to change the character encoding of the current MATLAB session to match the model character encoding, for example to ASCII.

```
slCharacterEncoding('US-ASCII')
```

Reopen the model.

Input Arguments

encoding — Character encoding to set

'US-ASCII' | 'Windows-1252' | 'ISO-8859-1' | 'Shift_JIS' | 'UTF-8'

Character encoding to set, specified as one of these values:

- 'US-ASCII'
- 'Windows-1252'
- 'ISO-8859-1'
- 'Shift_JIS'
- 'UTF-8'

Introduced before R2006a

sldebug

Start simulation in debug mode

Syntax

```
sldebug('sys')
```

Description

`sldebug('sys')` starts a simulation in debug mode. See “Debugger Command-Line Interface” for information about using the debugger.

Examples

The following command:

```
sldebug('vdp')
```

loads the Simulink example model `vdp` into memory and starts the simulation in debug mode. Alternatively, you can achieve the same result by using the `sim` command:

```
sim('vdp', 'debug', 'on')
```

See Also

`sim`

Introduced in R2006a

sldiagnostics

Display diagnostic information about Simulink system

Syntax

```
sldiagnostics('sys')
[txtRpt, sRpt] = sldiagnostics('sys')
[txtRpt, sRpt] = sldiagnostics('sys', options)
[txtRpt, sRpt] = sldiagnostics('sys', 'CompileStats')
[txtRpt, sRpt] = sldiagnostics('sys', 'RTWBuildStats')
```

Description

`sldiagnostics('sys')` displays the following diagnostic information associated with the model or subsystem specified by `sys`:

- Number of each type of block
- Number of each type of Stateflow object
- Number of states, outputs, inputs, and sample times of the root model.
- Names of libraries referenced and instances of the referenced blocks
- Time and additional memory used for each compilation phase of the root model

If the model specified by `sys` is not loaded, then `sldiagnostics` loads the model before performing the analysis.

The command `sldiagnostics('sys', options)` displays only the diagnostic information associated with the specific operations listed as `options` character vectors. The table below summarizes the options available and their corresponding valid input and output.

With `sldiagnostics`, you can input the name of a model or the path to a subsystem. For some analysis options, `sldiagnostics` can analyze only a root model. If you provide an incompatible input for one of these analyses, then `sldiagnostics` issues a warning. Finally, if you input a Simulink Library, then `sldiagnostics` cannot perform options that require a model compilation (**Update Diagram**). Instead, `sldiagnostics` issues a warning.

During the analysis, `sldiagnostics` will follow library links but will not follow or analyze Model References. See `find_mdhrefs` for more information on finding all Model blocks and referenced models in a specified model.

Option	Valid Inputs	Output
CountBlocks	root model, library, or subsystem	Lists all unique blocks in the system and the number of occurrences of each. This includes blocks that are nested in masked subsystems or hidden blocks.
CountSF	root model, library, or subsystem	Lists all unique Stateflow objects in the system and the number of occurrences of each.

Option	Valid Inputs	Output
Sizes	root model	Lists the number of states, outputs, inputs, and sample times, as well as a flag indicating direct feedthrough, used in the root model.
Libs	root model, library, or subsystem	Lists all unique libraries referenced in the root model, as well as the names and numbers of the library blocks.
CompileStats	root model	Lists the time and additional memory used for each compilation phase of the root model. This information helps users troubleshoot model compilation speed and memory issues.
RTWBuildStats	root model	Lists the same information as the <code>CompileStats</code> diagnostic. When issued with the second output argument <code>sRpt</code> , it captures the same statistics included in <code>CompileStats</code> and also the Simulink Coder build statistics. You must explicitly specify this option, because it is not part of the default analysis.
All	not applicable	Performs all diagnostics.

Note Running the `CompileStats` diagnostic before simulating a model for the first time will show greater memory usage. However, subsequent runs of the `CompileStats` diagnostic on the model will require less memory usage.

`[txtRpt, sRpt] = sldiagnostics('sys')` returns the diagnostic information as a textual report `txtRpt` and a structure array `sRpt`, which contains the following fields that correspond to the diagnostic options:

- `blocks`
- `stateflow`
- `sizes`
- `links`
- `compilestats`

`[txtRpt, sRpt] = sldiagnostics('sys', options)` returns only the specified options. If your chosen options specify just one type of analysis, then `sRpt` contains the results of only that analysis.

`[txtRpt, sRpt] = sldiagnostics('sys', 'CompileStats')` returns information on time and memory usage in `txtRpt` and `sRpt`.

`[txtRpt, sRpt] = sldiagnostics('sys', 'RTWBuildStats')` includes Simulink Coder build statistics in addition to the information reported for `CompileStats` in the `sRpt` output.

- `txtRpt` contains the formatted textual output of time spent in each of the phases in Simulink and Simulink Coder (if you specified `RTWBuildStats`), for example:

```

Compile Statistics For: rtwdemo_counter
  Cstat1: 0.00 seconds Model compilation pre-start
  Cstat2: 0.00 seconds Stateflow compile pre-start notification
  Cstat3: 0.10 seconds Post pre-comp-start engine event
  Cstat4: 10.00 seconds Stateflow compile start notification
  Cstat5: 0.00 seconds Model compilation startup completed

```

- `sRpt` is a MATLAB structure containing time and memory usage for each of the phases, for example:

```

sRpt =
Model:      'myModel1'
Statistics:  [1x134 struct]

```

The size of the `sRpt.Statistics` array indicates the number of compile and build phases executed during the operation. Examine the Statistics fields:

```

sRpt.Statistics(1) =
Description:      'Phase1'
CPUTime:         7.2490
WallClockTime    4.0092
ProcessMemUsage: 26.2148
ProcessMemUsagePeak: 28.6680
ProcessVMSize:   15.9531

```

`CPUTime` and `WallClockTime` show the elapsed time for the phase in seconds. `ProcessMemUsage`, `ProcessMemUsagePeak` and `ProcessVMSize` show the memory consumption during execution of the phase in MB.

Examine these key metrics to understand the performance:

- `WallClockTime`—The real-time elapsed in each phase in seconds. Sum the `WallClockTime` in each phase to get the total time taken to perform the operation:

```
ElapsedTime = sum([statRpt.Statistics(:).WallClockTime]);
```

- `ProcessMemUsage`—The amount of memory consumed in each phase. Sum the `ProcessMemUsage` across all the phases to get the memory consumption during the entire operation:

```
TotalMemory = sum([statRpt.Statistics(:).ProcessMemUsage]);
```

- `ProcessMemUsagePeak`—The maximum amount of allocated memory in each phase. Get the maximum of this metric across all the phases to find the peak memory allocation during the operation:

```
PeakMemory = max([statRpt.Statistics(:).ProcessMemUsagePeak]);
```

Note Memory statistics are available only on the Microsoft Windows platform.

Examples

The following command counts and lists each type of block used in the `sldemo_bounce` model that comes with Simulink software.

```
sldiagnostics('sldemo_bounce', 'CountBlocks')
```

The following command counts and lists both the unique blocks and Stateflow objects used in the `sf_boiler` model that comes with Stateflow software; the textual report returned is captured as `myReport`.

```
myReport = sldiagnostics('sf_boiler', 'CountBlocks', 'CountSF')
```

The following commands open the `f14` model that comes with Simulink software, and counts the number of blocks used in the `Controller` subsystem.

```
sldiagnostics('f14/Controller', 'CountBlocks')
```

The following command runs the `Sizes` and `CompileStats` diagnostics on the `f14` model, capturing the results as both a textual report and structure array.

```
[txtRpt, sRpt] = sldiagnostics('f14', 'Sizes', 'CompileStats')
```

Introduced in R2006a

sldiagviewer.createStage

Create a stage to display diagnostic messages

Syntax

```
myStage = sldiagviewer.createStage(StageName, 'Name', 'Value')
```

Description

`myStage = sldiagviewer.createStage(StageName, 'Name', 'Value')` creates a stage with the given stage name.

Examples

Create Stage and Display Diagnostic Messages

Use the `createStage` function to create a stage to display diagnostic messages in the Diagnostic Viewer.

```
% Create a Stage to display all the messages
```

```
myStage = sldiagviewer.createStage('Analysis', 'modelName', 'vdp');
```

```
myStage =  
    Stage with no properties.
```

Input Arguments

StageName — Name of stage

character vector

Name of the stage, specified as a character vector.

Example: 'Analysis'

Data Types: `string`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Example: 'modelName', 'vdp'

modelName — Name of model

character vector | `string`

Name of model, specified as the comma-separated pair consisting of 'modelName' and a character vector or `string`.

Output Arguments

myStage — Handle to created stage

stage object

Handle to the created stage, returned as a stage object.

sldiagviewer.diary

Log simulation warnings and errors and build information to file

Syntax

```
sldiagviewer.diary
sldiagviewer.diary(filename)
sldiagviewer.diary(toggle)
sldiagviewer.diary(filename, 'UTF-8')
```

Description

`sldiagviewer.diary` intercepts build information, warnings, and errors transmitted to the Command Window or the Diagnostic Viewer and logs them to a text file `diary.txt` in the current folder.

`sldiagviewer.diary(filename)` toggles the logging state of the text file specified by `filename`.

`sldiagviewer.diary(toggle)` turns logging to the log file on or off. The setting applies to the last file name you specified for logging or to `diary.txt` if you did not specify a file name.

`sldiagviewer.diary(filename, 'UTF-8')` specifies the character encoding for the log file `filename`.

Examples

Log Build Information and Simulation Warnings and Errors

Start logging build information and simulation warnings and errors to `diary.txt`.

```
sldiagviewer.diary
open_system('vdp')
rtwbuild('vdp')
```

Open `diary.txt` to view logs.

```
### Starting build procedure for model: vdp
### Build procedure for model: 'vdp' aborted due to an error.
...
```

Log to Specific File

Set up logging to a file.

```
sldiagviewer.diary('C:\MyLogs\log1.txt')
```

Toggle File Logging State

Switch the logging state of a file.

```
sdiagviewer.diary('C:\MyLogs\log1.txt') % Start logging
open_system('vdp')
rtwbuild('vdp')

sdiagviewer.diary('off') % Switch off logging
open_system('sldemo_fuelsys')
rtwbuild('sldemo_fuelsys')

sdiagviewer.diary('on') % Resume logging
```

Specify Log File Name and Character Encoding

Set the file name to log to and the character encoding to use.

```
sdiagviewer.diary('C:\MyLogs\log1.txt', 'UTF-8')
```

Input Arguments

toggle — Logging state

'off' | 'on'

Logging state, specified as 'on' or 'off'.

Example: `sdiagviewer.diary('on')`

filename — Name of file to log data to

character vector

Name of file to log data to, specified as a character vector.

Example: `sdiagviewer.diary('C:\Simulations\mySimulationDiary.txt')`

sldiagviewer.reportError

Report error messages in Diagnostic Viewer

Syntax

```
output = sldiagviewer.reportError(Message)
```

Description

`output = sldiagviewer.reportError(Message)` reports the message as an error.

Examples

Report an Error Message

Create a stage and use the `reportError` function to report an error message in the Diagnostic Viewer for the specified model.

```
% Create a Stage to display all the messages
my_stage = sldiagviewer.createStage('Analysis', 'ModelName', 'vdp');
% Report a custom error message to Diagnostic Viewer
sldiagviewer.reportError('This is a custom error message.');
```

```
output =
    logical
         1
```

Input Arguments

Message — Message to be displayed

MSLException object | MException object | string

This message is displayed as an error in the Diagnostic Viewer.

Example: 'This is a custom error message.'

Output Arguments

output — shows the success or failure of the operation

logical

Shows whether the message was displayed successfully.

sldiagviewer.reportInfo

Report information messages in Diagnostic Viewer

Syntax

```
output = sldiagviewer.reportInfo(Message)
```

Description

`output = sldiagviewer.reportInfo(Message)` reports the message as information.

Examples

Report an Information Message

Create a stage and use the `reportInfo` function to report a message as information in the Diagnostic Viewer for the specified model.

```
% Create a Stage to display all the messages
my_stage = sldiagviewer.createStage('Analysis', 'ModelName', 'vdp');
% Report a custom info message to Diagnostic Viewer
sldiagviewer.reportInfo('This is a custom information message.');
```

```
output =
    logical
         1
```

Input Arguments

Message — Message to be displayed

MSLException object | MException object | string

This message is displayed in the Diagnostic Viewer as an information.

Example: 'This is a custom information message.'

Output Arguments

output — shows the success or failure of the operation

logical

Shows whether the message was displayed successfully.

sldiagviewer.reportWarning

Report warning messages in Diagnostic Viewer

Syntax

```
output = sldiagviewer.reportWarning(Message)
```

Description

`output = sldiagviewer.reportWarning(Message)` reports a message as warning in the diagnostic Viewer.

Examples

Report a Warning in Diagnostic Viewer

Create a stage and use the `reportWarning` function to report a warning message in the Diagnostic Viewer for the specified model.

```
% Create a Stage to display all the messages
my_stage = sldiagviewer.createStage('Analysis', 'ModelName', 'vdp');
% Report a custom warning message to Diagnostic Viewer
sldiagviewer.reportWarning('This is a custom warning message.');
```

```
output =
    logical
         1
```

Input Arguments

Message — Message to display

MSLException object | MException object | string

This message is displayed as a warning in the Diagnostic Viewer.

Example: 'This is a custom warning message.'

Output Arguments

output — shows the success or failure of the operation

logical

Shows whether the message was displayed successfully.

sldiscmdl

Discretize model that contains continuous blocks

Syntax

```
sldiscmdl('model_name',sample_time)
sldiscmdl('model_name',sample_time,method)
sldiscmdl('model_name',sample_time,options)
sldiscmdl('model_name',sample_time,method,freq)
sldiscmdl('model_name',sample_time,method,options)
sldiscmdl('model_name',sample_time,method,freq,options)
[old_blks,new_blks] = sldiscmdl('model_name',sample_time,method,freq,options)
```

Description

`sldiscmdl('model_name',sample_time)` discretizes the model named '*model_name*' using the specified *sample_time*. The model does not need to be open, and the units for *sample_time* are simulation seconds.

`sldiscmdl('model_name',sample_time,method)` discretizes the model using *sample_time* and the transform method specified by *method*.

`sldiscmdl('model_name',sample_time,options)` discretizes the model using *sample_time* and criteria specified by the *options* cell array. This array consists of four elements: {*target*, *replace_with*, *put_into*, *prompt*}.

`sldiscmdl('model_name',sample_time,method,freq)` discretizes the model using *sample_time*, *method*, and the critical frequency specified by *freq*. The units for *freq* are Hz. When you specify *freq*, *method* must be 'prewarp'.

`sldiscmdl('model_name',sample_time,method,options)` discretizes the model using *sample_time*, *method*, and *options*.

`sldiscmdl('model_name',sample_time,method,freq,options)` discretizes the model using *sample_time*, *method*, *freq*, and *options*. When you specify *freq*, *method* must be 'prewarp'.

`[old_blks,new_blks] = sldiscmdl('model_name',sample_time,method,freq,options)` discretizes the model using *sample_time*, *method*, *freq*, and *options*. When you specify *freq*, *method* must be 'prewarp'. The function also returns two cell arrays that contain full path names of the original, continuous blocks and the new, discretized blocks.

Input Arguments

model_name

Name of the model to discretize.

sample_time

Sample-time specification for the model:

Scalar value	Sample time with zero offset, such as 1
Two-element vector	Sample time with nonzero offset, such as [1 0.1]

method

Method of converting blocks from continuous to discrete mode:

'zoh' (default)	Zero-order hold on the inputs
'foh'	First-order hold on the inputs
'tustin'	Bilinear (Tustin) approximation
'prewarp'	Tustin approximation with frequency prewarping
'matched'	Matched pole-zero method

For single-input, single-output (SISO) systems only

freq

Critical frequency in Hz. This input applies only when the *method* input is 'prewarp'.

options

Cell array {*target*, *replace_with*, *put_into*, *prompt*}, where each element can take the following values:

<i>target</i>	'all' (default)	Discretize all continuous blocks
	'selected'	Discretize only selected blocks in the model
	'full_blk_path'	Discretize specified block
<i>replace_with</i>	'parammask' (default)	Create discrete blocks whose parameters derive from the corresponding continuous blocks
	'hardcoded'	Create discrete blocks with hard-coded parameters placed directly into each block dialog box
<i>put_into</i>	'copy' (default)	Create discretization in a copy of the original model
	'configurable'	Create discretization candidate in a configurable subsystem
	'current'	Apply discretization to the current model
	'untitled'	Create discretization in a new untitled window
<i>prompt</i>	'on' (default)	Show discretization information at the command prompt
	'off'	Do not show discretization information at the command prompt

Examples

Discretize all continuous blocks in the `slexAircraftExample` model using a 1-second sample time:

```
sldiscmdl('slexAircraftExample',1);
```

Discretize the `Aircraft Dynamics Model` subsystem in the `slexAircraftExample` model using a 1-second sample time, a 0.1-second offset, and a first-order hold transform method:

```
sldiscmdl('slexAircraftExample',[1 0.1],'foh',...  
{'slexAircraftExample/Aircraft Dynamics Model',...  
'parammask','copy','on'});
```

Discretize the `Aircraft Dynamics Model` subsystem in the `slexAircraftExample` model and retrieve the full path name of the second discretized block:

```
[old_blks,new_blks] = sldiscmdl('slexAircraftExample',[1 0.1],...  
'foh',{'slexAircraftExample/Aircraft Dynamics Model','parammask',...  
'copy','on'});  
% Get full path name of the second discretized block  
new_blks{2}
```

`slmdliscui`

Topics

“Discretize a Model with the `sldiscmdl` Function”

Introduced before R2006a

slexpr

Generate expression to use in value of parameter object

Syntax

```
expressionOut = slexpr(expressionIn)
```

Description

`expressionOut = slexpr(expressionIn)` converts the MATLAB-syntax expression `expressionIn` to an object, `expressionOut`, that you can use to set the `Value` property of a parameter object (such as `Simulink.Parameter`). When you use multiple parameter objects to set block parameter values, you can use the expression to model mathematical relationships between the objects. For more information, see “Set Variable Value by Using a Mathematical Expression”.

Examples

Model Relationship Between Mass, Length, and Moment of Inertia of Metronome

In the base workspace, create three `Simulink.Parameter` objects that represent the mass, length, and moment of inertia of a pointlike metronome.

```
m = Simulink.Parameter;
r = Simulink.Parameter;
J = Simulink.Parameter;
```

Set the mass to 0.1 kg and the length to 1.0 m.

```
m.Value = 0.1;
r.Value = 1.0;
```

Set the value of the moment of inertia to the mass times the square of the length.

```
J.Value = slexpr('m*r^2');
```

Simulink preserves the expression, $m*r^2$. If you change the value of the mass or the length, Simulink recalculates the value of the moment of inertia.

Input Arguments

expressionIn — Target expression

string | character vector

Target expression, specified as a string or character vector.

Example: "myParam + myOtherParam"

Data Types: char | string

Output Arguments

expressionOut — Simulink representation of expression

`Simulink.data.Expression` object

Simulink representation of the target expression, returned as a `Simulink.data.Expression` object. A `Simulink.data.Expression` object has no use outside the `Value` property of a parameter object.

See Also

`Simulink.Parameter`

Introduced in R2018a

slIsFileChangedOnDisk

Determine whether model has changed since it was loaded

Syntax

```
Changed = slIsFileChangedOnDisk('sys')
```

Description

Changed = slIsFileChangedOnDisk('sys') Returns true if the file which contains block diagram *sys* was changed on disk since the block diagram was loaded.

Examples

To ensure that code is not generated for a model whose file has changed on disk since it was loaded, include the following in the 'entry' section of the *STF_make_rtw_hook.m* file:

```
if (slIsFileChangedOnDisk(sys))  
    error('File has changed on disk since it was loaded. Aborting code generation.');
```

```
end
```

Topics

“Customize Build Process with STF_make_rtw_hook File” (Simulink Coder)

“Model File Change Notification”

Introduced in R2007b

sLibraryBrowser

Open Simulink Library Browser

Syntax

```
sLibraryBrowser  
sLibraryBrowser('open')  
sLibraryBrowser('noshow')  
libraryhandle = sLibraryBrowser  
sLibraryBrowser('close')
```

Description

sLibraryBrowser opens the Simulink Library Browser.

If you want to load the Simulink block library, use `load_system simulink` instead.

If you want to start Simulink without opening any windows, use the faster `start_simulink` instead.

sLibraryBrowser('open') opens the Library Browser.

sLibraryBrowser('noshow') loads the Library Browser in memory without making it visible. Use this to make future calls to sLibraryBrowser('open') faster.

libraryhandle = sLibraryBrowser returns the handle of the Library Browser object.

sLibraryBrowser('close') closes the Library Browser.

Examples

Open and Close the Library Browser

```
sLibraryBrowser  
sLibraryBrowser('close')
```

Load the Library Browser and Get a Handle

```
libraryhandle = sLibraryBrowser('noshow')
```

Topics

“Build and Edit a Model Interactively”

Introduced in R2016a

slmdliscui

Open Model Discretizer GUI

Syntax

```
slmdliscui  
slmdliscui('model')
```

Description

`slmdliscui` opens the Model Discretizer. A model does not need to be open.

`slmdliscui('model')` opens the Model Discretizer for the model or library called '*name*'.

To use the Model Discretizer, you must have a Control System Toolbox license, version 5.2 or later.

Examples

Open the Model Discretizer for the `slexAircraftExample` model:

```
slmdliscui('slexAircraftExample')
```

Open the Model Discretizer for the `discretizing` library:

```
slmdliscui('discretizing')
```

`sldiscmdl`

Topics

“Discretize a Model with the Model Discretizer”

Introduced before R2006a

slprofreport

(Not recommended) Regenerate profiler report from data, ProfileData, saved from previous run

Syntax

```
slprofreport(model_nameProfileData)
```

Description

When you run a model with the profiler enabled, the simulation generates the data and saves it in the variable, `model_nameProfileData`. `slprofreport(model_nameProfileData)` generates a profiler report based on the data in `model_nameProfileData`, saved from the model run.

Input Arguments

ProfileData

Variable that contains profiler data from a model run. The variable name consists of the model name and ProfileData, for example, `vdpProfileData`.

Default: None

Examples

Regenerate Simulink Profiler Results

Regenerate the Profiler report for model `vdp`

In the MATLAB Command Window, start the `vdp` model.

In the Simulink editor window, run `vdp` model with Simulink Profiler enabled.

Simulink stores the data to the variable `vdpProfileData`.

To review the report, in the MATLAB Command Window

```
slprofreport(vdpProfileData)
```

The Simulink Profiler Report window is displayed.

Compatibility Considerations

slprofreport is not recommended

Not recommended starting in R2020a

Starting in R2020a, the `slprofreport` function is no longer recommended to load saved **Simulink Profiler** reports. The reports are saved to a MAT file and can be directly loaded into the current workspace.

For profiling reports saved before R2019b, you can use the `siprofreport` function to load the report.

“How Profiler Captures Performance Data”

Introduced in R2012a

slproject.create

(Not recommended) Create blank project

Note `slproject.create` is not recommended. Use `matlab.project.createProject` instead. For more information, see “Compatibility Considerations”.

Syntax

```
proj = slproject.create
proj = slproject.create(path)
proj = slproject.create(name)
```

Description

`proj = slproject.create` creates and opens a project using the blank project template from the Simulink start page, and returns a project object. Use the project object to manipulate the currently open project at the command line. The new project is created in the default project folder. To change the default folder for new projects, on the MATLAB Home tab, click **Preferences**. In the Preferences dialog box, on the MATLAB Project pane, set the **Default folder**.

`proj = slproject.create(path)` creates the project at the location specified by `path`.

`proj = slproject.create(name)` creates the project in the default folder, with the name specified by `name`.

Examples

Create a Blank Project in the Default Folder

```
slproject.create
```

You can control the default folder for new projects using the project preferences.

Create a Blank Project in a Specified Folder

```
proj = slproject.create('C:\work\myprojectname');
```

Create a Named Blank Project in the Default Folder

```
proj = slproject.create('myprojectname');
```

Input Arguments

path — Path for the new project location

character vector

Path for the new project location, specified as a character vector. If you do not specify the path, `slproject.create` creates the project in the default location. You can change the default location in the project preferences.

Example: `C:\work\projectname`

Data Types: `char`

name — Name for the new project

character vector

Name for the new project, specified as a character vector.

Example: `myproject`

Data Types: `char`

Output Arguments

proj — Project

project object

Project, returned as a project object. Use the project object to manipulate the currently open project at the command line.

Properties of `proj` output argument.

Project Property	Description
Name	Project name
Information	Information about the project such as the description, source control integration, repository location, and whether it is a top-level project.
Dependencies	Dependencies between project files in a MATLAB digraph object.
Shortcuts	Shortcut files in the project.
ProjectPath	Folders that the project puts on the MATLAB path.
ProjectReferences	Folders that contain referenced projects. Contains read-only project objects for referenced projects.
Categories	Categories of project labels.
Files	Paths and names of project files.
RootFolder	Full path to project root folder.

Compatibility Considerations

Simulink project API is not recommended

Not recommended starting in R2019a

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but,

after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

addPath

(Not recommended) Add folder to path of project

Note `simulinkproject` is not recommended. Use `currentProject` or `openProject` instead. For more information, see “Compatibility Considerations”.

Syntax

```
folderpath = addPath(project, folder)
```

Description

`folderpath = addPath(project, folder)` adds a folder in a project to the current project path. The folder must be in the project. The project puts the folders on the MATLAB search path when it loads and removes them from the path when it closes. To learn more, see “Specify Project Path”.

Examples

Add a Folder to the Project Path

```
sldemo_slproject_airframe;  
project = simulinkproject;
```

Create a new folder.

```
folderpath = fullfile(project.RootFolder, 'folder');  
mkdir(folderpath);
```

Add this new folder to the project.

```
projectFile = addFile(project, folderpath);
```

Add this new folder to the project path.

```
folderpath = addPath(project, folderpath);
```

Input Arguments

project — Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a project at the command line.

folder — Path of folder

character vector | string

Path of the folder to add relative to the project root folder, specified as a character vector or string. The folder must be within the root folder.

Example: models/myfolder

Output Arguments

folderpath — Path folder

path folder object

Path folder object containing the specified folder path. The project puts the folders on the MATLAB search path when it loads and removes them from the path when it closes.

Compatibility Considerations

Simulink project API is not recommended

Not recommended starting in R2019a

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

Topics

“Specify Project Path”

Introduced in R2017a

removePath

(Not recommended) Remove folder from project path

Note `simulinkproject` is not recommended. Use `currentProject` or `openProject` instead. For more information, see “Compatibility Considerations”.

Syntax

```
removePath(project, folder)
```

Description

`removePath(project, folder)` removes a folder in a project from the current project path. The folder must be in the project.

Examples

Remove a Folder from the Project Path

```
sldemo_slproject_airframe;  
project = simulinkproject;
```

Create a new folder.

```
folderpath = fullfile(project.RootFolder, 'folder');  
mkdir(folderpath);
```

Add this new folder to the project.

```
projectFile = addFile(project, folderpath);
```

Add the new folder to the project path.

```
folderpath = addPath(project, folderpath);
```

Remove the new folder from the project path.

```
removePath(project, folderpath)
```

Input Arguments

project – Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a project at the command line.

folder – Path of folder

character vector

Path of the folder to remove relative to the project root folder, specified as a character vector. The folder must be within the root folder.

Example: `models/myfolder`

Compatibility Considerations

Simulink project API is not recommended

Not recommended starting in R2019a

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

Introduced in R2017a

addReference

(Not recommended) Add referenced project to project

Note `simulinkproject` is not recommended. Use `currentProject` or `openProject` instead. For more information, see “Compatibility Considerations”.

Syntax

```
projreference = addReference(project, folder)
projreference = addReference(project, folder, type)
```

Description

`projreference = addReference(project, folder)` adds a reference to the project specified by `folder`. The reference is added to the current project, `project`.

`projreference = addReference(project, folder, type)` specifies the type of reference to create. Specify relative or absolute reference.

Examples

Add a Referenced Project

Create a project and get a project object.

```
sldemo_slproject_airframe;
project = simulinkproject;
```

Create a new blank project.

```
projectToReference = slproject.create();
```

Reload the first project and add a reference to the new blank project.

```
reload(project);
addReference(project, projectToReference, 'absolute');
```

Find out if a project is a top-level project. 1 indicates a top-level project.

```
project.Information.TopLevel
```

```
ans =
```

```
    logical
```

1

Input Arguments

project — Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a project at the command line.

folder — Path of folder

character vector

Path of the folder to add the reference, relative to the project root folder, specified as a character vector. The folder must be within the root folder.

Example: `models/myfolder`

type — Type of reference

relative | absolute

Type of reference, relative to the project root folder, specified as a character vector.

Output Arguments

projreference — Project reference

project reference object

Project reference object containing information about the referenced project.

Compatibility Considerations

Simulink project API is not recommended

Not recommended starting in R2019a

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

`removeReference` | `simulinkproject`

Introduced in R2017a

removeReference

(Not recommended) Add folder to project path

Note `simulinkproject` is not recommended. Use `currentProject` or `openProject` instead. For more information, see “Compatibility Considerations”.

Syntax

```
removeReference(project, folder)
```

Description

`removeReference(project, folder)` removes the reference to the project `project` from the current project.

Examples

Remove a Referenced Project

Create a project and get a project object.

```
sldemo_slproject_airframe;  
project = simulinkproject;
```

Create a new blank project.

```
projectToReference = slproject.create();
```

Reload the first project and add a reference to the new blank project.

```
project.reload();  
addReference(project, projectToReference, 'absolute');
```

Remove the reference to the blank project.

```
removeReference(project, projectToReference);
```

Input Arguments

project – Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a project at the command line.

folder – Path of folder

character vector

Path of the folder to the reference to be removed, relative to the project root folder, specified as a character vector. The folder must be within the root folder.

Example: `models/myfolder`

Compatibility Considerations

Simulink project API is not recommended

Not recommended starting in R2019a

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. addShortcut

(Not recommended) Add shortcut to project

Note `simulinkproject` is not recommended. Use `currentProject` or `openProject` instead. For more information, see “Compatibility Considerations”.

Syntax

```
shortcut = addShortcut(project, file)
```

Description

`shortcut = addShortcut(project, file)` adds a shortcut to the specified file in the project.

To set the shortcut to run at startup or shutdown, use `Project`. See “Automate Startup Tasks”.

Examples

Add a Shortcut

Create a project and get a project object.

```
sldemo_slproject_airframe;
project = simulinkproject;
```

Create a new file.

```
filepath = fullfile(project.RootFolder, 'new_model.slx')
    new_system('new_model');
    save_system('new_model', filepath)
```

Add this new model to the project.

```
projectFile = addFile(project, filepath)
```

Add a new shortcut to the new model.

```
shortcut = addShortcut(project, filepath);
```

Input Arguments

project – Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a project at the command line.

file – Path of file

character vector

Path of the file to add a shortcut to, relative to the project root folder, including the file extension, specified as a character vector. The file must be within the root folder.

Example: 'models/myModelName.slx'

Output Arguments

shortcut — Shortcut

shortcut object

Shortcut object containing information about the shortcut.

Compatibility Considerations

Simulink project API is not recommended

Not recommended starting in R2019a

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

Topics

"Automate Startup Tasks"

Introduced in R2017a

removeShortcut

(Not recommended) Remove shortcut from project

Note `simulinkproject` is not recommended. Use `currentProject` or `openProject` instead. For more information, see “Compatibility Considerations”.

Syntax

```
removeShortcut(project, file)
```

Description

`removeShortcut(project, file)` removes the shortcut to the specified file in the project.

Examples

Remove a Shortcut

Create a project and get a project object.

```
sldemo_slproject_airframe;  
project = simulinkproject;
```

Create a new file.

```
filepath = fullfile(project.RootFolder, 'new_model.slx')  
    new_system('new_model');  
    save_system('new_model', filepath)
```

Add this new model to the project.

```
projectFile = addFile(project, filepath)
```

Add a new shortcut to the new model.

```
shortcut = addShortcut(project, filepath);
```

Remove the shortcut.

```
removeShortcut(project, shortcut);
```

Input Arguments

project – Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a project at the command line.

file — Path of file

character vector

Path of the shortcut file, relative to the project root folder, including the file extension, specified as a character vector. The file must be within the root folder.

Example: 'models/myModelName.slx'

Compatibility Considerations**Simulink project API is not recommended**

Not recommended starting in R2019a

`addShortcut` | `simulinkproject`

Introduced in R2017a

slproject.getCurrentProject

(To be removed) Manipulate current project at command line

Note `slproject.getCurrentProject` will be removed in a future release. Use `currentProject` instead.

Syntax

```
proj = slproject.getCurrentProject
```

Description

`proj = slproject.getCurrentProject` gets the current project open in the Project Tool and returns a project object `proj` that you can use to manipulate the project programmatically. If no project is open, then you see an error.

Note `slproject.getCurrentProject` is replaced by `slproject.getCurrentProjects`.

Examples

Get Airframe Example Project

Open the Airframe project and use `slproject.getCurrentProject` to get a project object to manipulate the project at the command line.

```
sldemo_slproject_airframe
proj = slproject.getCurrentProject
```

```
proj =
```

```
    ProjectManager with properties:
```

```
        Name: 'Simulink Project Airframe Example'
        Categories: [1x1 slproject.Category]
        Shortcuts: [1x8 slproject.Shortcut]
        ProjectPath: [1x7 slproject.PathFolder]
        ProjectReferences: [1x0 slproject.ProjectReference]
        Files: [1x30 slproject.ProjectFile]
        RootFolder: 'C:\Work\Simulink\Projects\slexamples\airframe'
```

Output Arguments

proj – Project

project object

Project, returned as a project object. Use the project object to manipulate the currently open project at the command line.

See Also

Functions

`currentProject` | `simulinkproject` | `slproject.getCurrentProjects` | `slproject.loadProject`

Introduced in R2013a

slproject.getCurrentProjects

(Not recommended) List all top-level projects

Note `slproject.getCurrentProjects` is not recommended. Use `matlab.project.rootProject` instead. For more information, see “Compatibility Considerations”.

Syntax

```
projects = slproject.getCurrentProjects
```

Description

`projects = slproject.getCurrentProjects` returns a list of all open top-level projects. Currently only one or zero top-level projects can be loaded. Returns an object array of 1 or 0 `ProjectManager` objects `projects` that you can use to manipulate the project programmatically. Use `slproject.getCurrentProjects` for project automation scripts.

If you execute `slproject.getCurrentProjects` inside a project shortcut, it returns only the project that the shortcut belongs to. If the shortcut belongs to a referenced project, it returns the referenced project.

Examples

Get Airframe Example Project

Open the Airframe project and use `slproject.getCurrentProjects` to get a project object to manipulate the project at the command line.

```
sldemo_slproject_airframe
proj = slproject.getCurrentProjects
```

```
proj =
```

```
ProjectManager with properties:
```

```
    Name: 'Simulink Project Airframe Example'
    Categories: [1x1 slproject.Category]
    Shortcuts: [1x8 slproject.Shortcut]
    ProjectPath: [1x7 slproject.PathFolder]
    ProjectReferences: [1x0 slproject.ProjectReference]
    Files: [1x30 slproject.ProjectFile]
    RootFolder: 'C:\Work\Simulink\Projects\airframe'
```

Find Project Commands

Open the airframe project and create a project object.

```
sldemo_slproject_airframe
proj = slproject.getCurrentProject

proj =

  ProjectManager with properties:

    Name: 'Simulink Project Airframe Example'
    Categories: [1x1 slproject.Category]
    Shortcuts: [1x8 slproject.Shortcut]
    ProjectPath: [1x7 slproject.PathFolder]
    ProjectReferences: [1x0 slproject.ProjectReference]
    Files: [1x30 slproject.ProjectFile]
    RootFolder: 'C:\Work\Simulink\Projects\airframe'
```

Find out what you can do with your project.

```
methods(proj)
```

```
Methods for class slproject.ProjectManager:
```

```
addFile                findCategory
addFolderIncludingChildFiles findFile
close                  isLoaded
createCategory         listModifiedFiles
export                 refreshSourceControl
```

```
reload
removeCategory
removeFile
```

Examine Project Properties

After you get a project object, you can examine project properties.

Open the airframe project and create a project object.

```
sldemo_slproject_airframe
proj = slproject.getCurrentProjects;
```

Examine the project files.

```
files = proj.Files
```

```
files =
```

```
1x30 ProjectFile array with properties:
```

```
Path
Labels
Revision
SourceControlStatus
```

Examine the labels of the eighth file.

```
proj.Files(8).Labels
```

```
ans =

    Label with properties:
    File: 'C:\Work\airframe\data\system_model.sldd'
         Data: []
         DataType: 'none'
         Name: 'Design'
         CategoryName: 'Classification'
```

Get a particular file.

```
myfile = findFile(proj, 'models/AnalogControl.slx')
```

```
myfile =
```

```
    ProjectFile with properties:
         Path: 'C:\Temp\airframe\models\AnalogControl.slx'
         Labels: [1x1 slproject.Label]
         Revision: '2'
    SourceControlStatus: Unmodified
```

Find out what you can do with the file.

```
methods(myfile)
```

```
Methods for class slproject.ProjectFile:
```

```
addLabel
removeLabel
findLabel
```

Output Arguments

projects – Projects

object array of 1 or 0 ProjectManager objects

Projects, returned as an object array of 1 or 0 ProjectManager objects. Use the project object to manipulate the currently open project at the command line.

Properties of ProjectManager objects in output argument.

Project Property	Description
Name	Project name
Categories	Categories of project labels
Shortcuts	Shortcut files in project
ProjectPath	Folders that the project puts on the MATLAB path
ProjectReferences	Folders that contain referenced projects
Files	Paths and names of project files
RootFolder	Full path to project root folder

Tips

Alternatively, you can use `simulinkproject` to get a project object, but `simulinkproject` also opens and gives focus to the Project Tool. Use `simulinkproject` to open projects and explore projects interactively. Use `slproject.getCurrentProjects` for project automation scripts.

Compatibility Considerations

Simulink project API is not recommended

Not recommended starting in R2019a

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

Functions

`matlab.project.rootProject` | `simulinkproject` | `slproject.getCurrentProject` | `slproject.loadProject`

Introduced in R2016a

slproject.loadProject

(Not recommended) Load project

Note `simulinkproject` is not recommended. Use `currentProject` or `openProject` instead. For more information, see “Compatibility Considerations”.

Syntax

```
slproject.loadProject(projectPath);
proj = slproject.loadProject(projectPath)
```

Description

`slproject.loadProject(projectPath)`; loads the project specified by the `.prj` file or folder `projectPath` in the Project Tool, and closes any currently open project.

`proj = slproject.loadProject(projectPath)` loads the project and returns a project object `proj` for manipulating the project. Use `slproject.loadProject` for project automation scripts.

Examples

Load Project

Load a project from a folder called 'C:/projects/project1/'. Replace this path with the location of your project.

```
proj = slproject.loadProject('C:/projects/project1/')
```

Get Airframe Example Project

Open the Airframe project and use `slproject.getCurrentProjects` to get a project object to manipulate the project at the command line.

```
sldemo_slproject_airframe
proj = slproject.getCurrentProjects
```

```
proj =
```

```
  ProjectManager with properties:
```

```
      Name: 'Simulink Project Airframe Example'
      Categories: [1x1 slproject.Category]
      Shortcuts: [1x8 slproject.Shortcut]
      ProjectPath: [1x7 slproject.PathFolder]
      ProjectReferences: [1x0 slproject.ProjectReference]
```

```
Files: [1x30 slproject.ProjectFile]
RootFolder: 'C:\Work\Simulink\Projects\airframe'
```

Find Project Commands

Get the Airframe project.

```
sldemo_slproject_airframe
proj = slproject.getCurrentProjects;
```

Find project commands.

```
methods(proj)
```

Methods for class slproject.ProjectManager:

```
addFile                findCategory
addFolderIncludingChildFiles  findFile
close                  isLoading
createCategory         listModifiedFiles
export                 refreshSourceControl
```

```
reload
removeCategory
removeFile
```

Examine Project Properties

After you get a project object, you can examine project properties.

Get the airframe project.

```
sldemo_slproject_airframe
proj = slproject.getCurrentProjects;
```

Examine the project files.

```
files = proj.Files
```

```
files =
```

```
1x30 ProjectFile array with properties:
```

```
Path
Labels
Revision
SourceControlStatus
```

Examine the labels of the 13th file.

```
proj.Files(13).Labels
```

```
ans =
```

Label with properties:

```
File: 'C:\Temp\airframe\models\AnalogControl.slx'
      Data: []
      DataType: 'none'
      Name: 'Design'
      CategoryName: 'Classification'
```

Get a particular file by name.

```
myfile = findFile(proj, 'models/AnalogControl.slx')
```

```
myfile =
```

ProjectFile with properties:

```
      Path: 'C:\Temp\airframe\models\AnalogControl.slx'
      Labels: [1x1 slproject.Label]
      Revision: '2'
      SourceControlStatus: Unmodified
```

Find out what you can do with the file.

```
methods(myfile)
```

Methods for class slproject.ProjectFile:

```
addLabel
removeLabel
findLabel
```

Input Arguments

projectPath — Full path to project file or folder

character vector

Full path to project .prj file or the path to the project root folder, specified as a character vector.

Example: 'C:/projects/project1/myProject.prj'

Example: 'C:/projects/project1/'

Output Arguments

proj — Project

project object

Project, returned as a project object. Use the project object to manipulate and explore the project at the command line.

Properties of proj output argument.

Project Property	Description
Name	Project name
Categories	Categories of project labels

Project Property	Description
Shortcuts	Shortcut files in project
ProjectPath	Folders that the project puts on the MATLAB path
ProjectReferences	Folders that contain referenced projects
Files	Paths and names of project files
RootFolder	Full path to project root folder

Compatibility Considerations

Simulink project API is not recommended

Not recommended starting in R2019a

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

See Also

Functions

`simulinkproject` | `slproject.getCurrentProjects`

Topics

“What Are Projects?”

Introduced in R2013a

listModifiedFiles

(Not recommended) List modified files in project

Note `simulinkproject` is not recommended. Use `currentProject` or `openProject` instead. For more information, see “Compatibility Considerations”.

Syntax

```
modifiedfiles = listModifiedFiles(proj)
```

Description

`modifiedfiles = listModifiedFiles(proj)` returns the list of modified project files in the project object `proj`. `listModifiedFiles` refreshes the source control statuses in the project and then returns an array of the project files which are listed in the Modified Files view of the project.

Examples

Get a List of Modified Files in the Project

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;  
proj = simulinkproject;
```

Modify a project model file by adding an arbitrary block.

```
open_system('AnalogControl')  
add_block('built-in/SubSystem', 'AnalogControl/test')  
save_system('AnalogControl')
```

Get all the modified files in the project.

```
modifiedfiles = listModifiedFiles(proj)
```

```
modifiedfiles =
```

```
    1x2 ProjectFile array with properties:
```

```
    Path  
    Labels  
    Revision  
    SourceControlStatus
```

Observe two modified files. Compare with the Modified Files view in Project, where you can see a modified model file, and the corresponding `.SimulinkProject` definition file.

Get the second modified file.

```
modifiedfiles(2)
```

```
ans =  
  
ProjectFile with properties:  
  
Path: 'C:\Work\temp\slexamples\airframe2\models\AnalogControl.slx'  
Labels: [1x1 slproject.Label]  
Revision: '2'  
SourceControlStatus: Modified
```

Observe the file `SourceControlStatus` property is `Modified`. Similarly, `listModifiedFiles` returns any files that are added, conflicted, deleted, etc., that show up in the Modified Files view in Project.

Get all the project files with a particular source control status. For example, get the files that are `Unmodified`.

```
proj.Files(ismember([proj.Files.SourceControlStatus], matlab.sourcecontrol.Status.Unmodified))  
  
ans =  
  
1x29 ProjectFile array with properties:  
  
Path  
Labels  
Revision  
SourceControlStatus
```

Input Arguments

proj – Project

project

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a project at the command line.

Output Arguments

modifiedfiles – Modified files

file object | array

Modified files, returned as an array of file objects.

Compatibility Considerations

Simulink project API is not recommended

Not recommended starting in R2019a

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

`refreshSourceControl` | `simulinkproject`

Introduced in R2016a

listRequiredFiles

(Not recommended) Get project file dependencies

Note `simulinkproject` is not recommended. Use `currentProject` or `openProject` instead. For more information, see “Compatibility Considerations”.

Syntax

```
files = listRequiredFiles(proj, file)
```

Description

`files = listRequiredFiles(proj, file)` returns the files that the specified file requires to run.

Examples

Get Required Files

Open the airframe project, create a project object and get a file.

```
sldemo_slproject_airframe;  
proj = simulinkproject;  
file = 'models/slproject_f14.slx'
```

Get the files required by the specified file.

```
files = listRequiredFiles(proj, file);
```

Input Arguments

proj – Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a project at the command line.

file – Path of file

character vector | project file object

Path of the file relative to the project root folder, including the file extension, specified as a character vector, an absolute file path or an instance of a project file object. The file must be within the root folder.

Example: 'models/myModelName.slx'

Output Arguments

file — Project file

cell array of character vectors

Required files, returned as a cell array of character vectors.

Compatibility Considerations

Simulink project API is not recommended

Not recommended starting in R2019a

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. refreshSourceControl

(Not recommended) Update source control status of project files

Note `simulinkproject` is not recommended. Use `currentProject` or `openProject` instead. For more information, see “Compatibility Considerations”.

Syntax

```
refreshSourceControl(proj)
```

Description

`refreshSourceControl(proj)` updates the source control status for all files in the project `proj`. Use this to get the latest source control information before querying the `SourceControlStatus` property on individual files.

If you use `listModifiedFiles` to find all modified files in the project, you do not need to call `refreshSourceControl` first.

Examples

Refresh Source Control Information on Files in the Project

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;  
proj = simulinkproject;
```

Refresh source control status before querying individual files.

```
refreshSourceControl(proj)
```

Input Arguments

proj — Project

project

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a project at the command line.

Compatibility Considerations

Simulink project API is not recommended

Not recommended starting in R2019a

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but,

solverprofiler.profileModel

Examine model for performance analysis

Syntax

```
res = solverprofiler.profileModel(model)
res = solverprofiler.profileModel(model, Name, Value)
```

Description

`res = solverprofiler.profileModel(model)` runs the Solver Profiler on the specified model and stores the results in `res`

`res = solverprofiler.profileModel(model, Name, Value)` specifies the Solver Profiler parameters using one or more `Name, Value` pair arguments.

Examples

Examine a Model with Default Settings

Examine the model `f14` using the default commandline settings.

```
model = 'f14';
res = solverprofiler.profileModel(model);
```

You can see a summary of the results by calling `res.summary`.

```
res.summary
struct with fields:
    solver: 'ode45'
    tStart: 0
    tStop: 60
    absTol: 1.0000e-06
    relTol: 1.0000e-04
    hMax: 0.1000
    hAverage: 0.0444
    steps: 1352
    profileTime: 0.9974
    zcNumber: 0
    resetNumber: 600
    jacobianNumber: 0
    exceptionNumber: 195
```

Open the results in the Solver Profiler dialog to visualize them. This step is equivalent to enabling `OpenSP` when calling the function.

```
solverprofiler.exploreResult(res)
```

Configure Solver Profiler and Examine a Model

Examine the model `ssc_actuator_custom_pneumatic` with a fully specified configuration.

```
model = 'ssc_actuator_custom_pneumatic';
res = solverprofiler.profileModel(model, ...
    'SaveStates' , 'on' , ...
    'SaveSimscapeStates' , 'On' , ...
    'SaveJacobian' , 'On' , ...
    'StartTime' , 5 , ...
    'StopTime' , 50 , ...
    'BufferSize' , 10000 , ...
    'TimeOut' , 5 , ...
    'OpenSP' , 'On' , ...
    'DataFullFile' , fullfile(pwd, 'ssc_profiling_result.mat'));
```

Input Arguments

model — Model to examine

character vector (default)

Name of model to be profiled, specified as a character vector.

Example: `h = solverprofiler.profileModel('vdp')`

Name-Value Pair Arguments

Specify optional comma-separated pairs of **Name**, **Value** arguments. **Name** is the argument name and **Value** is the corresponding value. **Name** must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Example: `'StartTime', 0, 'StopTime', 10, 'SaveStates', 'On'`

SaveStates — Save model states to file

off (default) | on

By default, the profiler does not save the states of the model. Enabling this parameter configures the profiler to save the states to a MAT-file.

Example: `'SaveStates', 'On'`

SaveSimscapeStates — Save Simscape states to file

off (default) | on

Enable this parameter to save Simscape states to a MAT-file.

Example: `'SaveSimscapeStates', 'On'`

SaveJacobian — Save model Jacobian

off (default) | on

Option to log the solver Jacobian matrices to memory. This option is useful for simulations that use implicit solvers. For a comparison of solvers, see “Compare Solvers”.

Example: `'SaveJacobian', 'On'`

StartTime — Profiler start time

model start time (default) | scalar

Time, in seconds, of the simulation that the profiler starts analyzing the model. This is not the same as the start time of the simulation.

Example: 'StartTime',5

StopTime – Profiler stop time

model stop time (default) | scalar

Time, in seconds, of the simulation to which the profiler should profile the model. By default, the analysis continues until the end of the simulation. Changing this parameter does not change the stop time of the model which you specify in the Model Configuration Parameters.

A value less than the configured stop time of the model stops the profiling and simulation at **StopTime**.

Example: 'StopTime',30

BufferSize – Memory impact of logging

50000 (default) | positive scalar

Maximum number of events that are logged. If the number of logged events reaches this value and memory is available, increase **BufferSize**. If memory is limited, consider lowering the value.

Example: 'BufferSize',60000

TimeOut – Maximum time to wait for solver to resume

positive scalar

Time, in seconds, to wait before the profiler stops running. This option is useful in situations where the simulation is unable to proceed. The profiler waits for the specified time and quits if no progress has been made.

Example: 'TimeOut', 10

OpenSP – Open the Solver Profiler dialog box

off (default) | on

Option to open the Solver Profiler dialog box after profiling has completed.

Example: 'OpenSP', 'On'

DataFullFile – Path and name of saved results

character vector of full file path

By default, the profiling results are saved in a MAT-file named `model_@_dd_Month_yyyy_hh_mm_ss.mat` in the current working folder. You can specify a different file name by which to save the results in the current working folder. To save the file in a different location, specify the full path of the file, including the file name.

Example: 'DataFullFile','C:\Users\myusername\Documents\profiled\vdp_results.mat'

Output Arguments**res – High-level summary of profiling results**

structure

Profiling results, returned as a structure with the fields:

file — Full path and name of saved results

character vector

Path and name of the MAT-file where the results of the profiling operation are stored as MAT file. By default, they are stored in the current working folder with a file name having the pattern: `model_@_dd_Month_yyyy_hh_mm_ss.mat`. To store them in a different location or by a different name, specify `DataFullFile` when calling `solverprofiler.profileModel`.

summary — Summary of profiling results

structure

A high-level summary of the results of the profiling operation, returned as a structure. The summary provides an overview of the performance of the simulation and health of the model.

The summary structure contains these fields.

Field	Purpose	Values	Description
<code>solver</code>	Solver used by simulation	any of the solvers supported by Solver Profiler	Solver used by the simulation as configured in the Configuration Parameters for the model. For a list of all the solvers, see "Solver". The Solver Profiler does not support models without any continuous states.
<code>tStart</code>	Start time of simulation	scalar	Start time, in seconds, for the simulation of the model during the profiling operation.
<code>tStop</code>	Stop time of simulation	scalar	Stop time, in seconds, of the simulation during the profiling operation. If <code>StopTime</code> is set to be earlier than the configured <code>StopTime</code> of the model, the simulation stops at <code>StopTime</code> .
<code>absTol</code>	Absolute tolerance of the solver	positive scalar	Absolute tolerance of the solver as specified in the configuration settings for the model. For more information, see "Absolute tolerance"
<code>relTol</code>	Relative tolerance of the solver	positive scalar	Relative tolerance of the solver as specified in the configuration settings of the model. For more information, see "Relative tolerance"
<code>hMax</code>	Maximum step size	positive scalar	Largest time step that the solver can take. See "Max step size".
<code>hAverage</code>	Average step size	positive scalar	Average size of the time step taken by the solver.
<code>steps</code>	Total steps taken	positive scalar	Total number of time steps taken by the solver.
<code>profileTime</code>	Time to profile	positive scalar	Time, in seconds, taken by the Solver Profiler to examine the model.

Field	Purpose	Values	Description
zcNumber	Total number of zero crossings	nonnegative scalar	Number of times zero crossings occur during the simulation of the model. The detection of these zero crossings incurs computational cost and can slow down the simulation. For information on zero-crossing detection, see “Zero-Crossing Detection”.
resetNumber	Number of solver resets	nonnegative scalar	Number of times the solver has to reset its parameters.
jacobianNumber	Number of Jacobian updates	nonnegative scalar	Number of times the solver Jacobian matrix is updated during a simulation. For more information, see “Explicit Versus Implicit Continuous Solvers”.
exceptionNumber	Number of solver exceptions	nonnegative scalar	Total number of solver exceptions encountered during a simulation. These exceptions are events where the solver is unable to solve the model states to the specified accuracy. As a result, the solver runs adjusted trials which increase computational cost.

Data Types: struct

“Choose a Solver”

Introduced in R2017b

start_simulink

Start Simulink without opening any windows

Syntax

```
start_simulink
```

Description

`start_simulink` starts Simulink without opening any models, the Start Page, or the Simulink Library Browser. Use this in startup scripts to start Simulink without any other window taking the focus away from the MATLAB Desktop. For example, use `start_simulink` in the MATLAB `startup.m` file, when starting MATLAB with the `-r` command line option, or in project startup scripts. Opening a model for the first time in a MATLAB session is much quicker after running `start_simulink`.

If you want to open the Simulink Start Page to create or open models, use the `simulink` function instead.

If you want to open the Library Browser, use `sLibraryBrowser`.

Examples

Start Simulink When Starting MATLAB

Use the `-r` command line option to start Simulink when starting MATLAB, without opening any windows.

On Windows, create a desktop shortcut with the following target:

```
matlabroot\bin\win64\matlab.exe -r start_simulink
```

On Linux® and Mac, enter:

```
matlab -r start_simulink
```

“Automate Startup Tasks”

Introduced in R2015b

slupdate

Replace blocks from previous releases with latest versions

Compatibility

Note `slupdate` will be removed in a future release. The `slupdate` command can only upgrade some parts of your model. Use the Upgrade Advisor instead. See “Model Upgrades”.

Syntax

```
slupdate('sys')
slupdate('sys', prompt)
AnalysisResult = slupdate('sys', 'OperatingMode', 'Analyze')
```

Description

`slupdate('sys')` replaces blocks in model `sys` from a previous release of Simulink software with the latest versions. The `slupdate` function alone cannot perform all upgrade checks on your model. Use the Upgrade Advisor to access the `slupdate` checks and also advice and fixes for all other upgrade checks. See “Model Upgrades”.

Note Best practice is to first open the model, and press CTRL+D to update the model, before you call `slupdate`.

`slupdate('sys', prompt)` specifies whether to prompt you before replacing a block. If *prompt* equals 1, the command prompts you before replacing the block. The prompt asks whether you want to replace the block. Valid responses are

- `y`
Replace the block (the default).
- `n`
Do not replace the block.
- `a`
Replace this and all subsequent obsolete blocks without further prompting.

If *prompt* equals 0, the command replaces all obsolete blocks without prompting you.

In addition to replacing obsolete blocks, `slupdate`

- Reconnects broken links to masked blocks in libraries provided by MathWorks to ensure that the model reflects changes made to the blocks in this release. This will overwrite any custom changes you made to the masks of these blocks.

- Updates obsolete configuration settings for the model.

`AnalysisResult = slupdate('sys', 'OperatingMode', 'Analyze')` performs only the analysis portion without updating or changing the model. This command analyzes referenced models, linked libraries, and S-functions, and then returns a data structure with the following fields:

- `Message` — character vector containing a message summarizing the results
- `blockList` — cell array listing blocks that need to be updated
- `blockReasons` — cell array listing reasons for updating the corresponding blocks
- `modelList` — cell array listing referenced models and the parent model
- `libraryList` — cell array listing non-MathWorks libraries referenced
- `configSetList` — for internal use
- `sfunList` — cell array listing S-functions referenced
- `sfunOK` — logical array representing S-function status, where `false` indicates that an S-function needs updating and `true` indicates otherwise
- `sfunType` — cell array listing apparent S-function type (e.g., `.mex`)

stringtype

Create string data type

Syntax

```
string = stringtype(maximum_length)
stringtype(maximum_length)
```

Description

`string = stringtype(maximum_length)` creates a Simulink string data type with a maximum length. Alternatively, you can also create string data types using the String Constant, String Concatenate, and Compose String blocks.

`stringtype(maximum_length)` creates a Simulink string data type with a maximum length that you can type directly on the MATLAB command line or in the **Output data type** parameter of the String Constant, String Concatenate, or Compose String block.

Tip Specifying `stringtype(0)` creates a string data type with no maximum length. This syntax is the same as specifying `string` for Simulink block data types.

Examples

Create a String Data Type of Maximum Length 10

Create a string data type of maximum length 10.

```
h=stringtype(10)
```

h =

StringType with properties:

```
MaximumLength: 10
Description: ''
DataScope: 'Auto'
HeaderFile: ''
```

Input Arguments

maximum_length — Maximum length

scalar

Maximum length of string data type, specified as a scalar, from 1 to 32766. This value can be an integer, MATLAB variable, or MATLAB expression.

Data Types: double

Output Arguments

string — String data type object

scalar

String object, specified as a scalar.

trim

Find trim point of dynamic system

Syntax

```
[x,u,y,dx] = trim('sys')
[x,u,y,dx] = trim('sys',x0,u0,y0)
[x,u,y,dx] = trim('sys',x0,u0,y0,ix,iu,iy)
[x,u,y,dx] = trim('sys',x0,u0,y0,ix,iu,iy,dx0,idx)
[x,u,y,dx,options] = trim('sys',x0,u0,y0,ix,iu,iy,dx0,idx,options)
[x,u,y,dx,options] = trim('sys',x0,u0,y0,ix,iu,iy,dx0,idx,options,t)
```

Description

A trim point, also known as an equilibrium point, is a point in the parameter space of a dynamic system at which the system is in a steady state. For example, a trim point of an aircraft is a setting of its controls that causes the aircraft to fly straight and level. Mathematically, a trim point is a point where the system's state derivatives equal zero. `trim` starts from an initial point and searches, using a sequential quadratic programming algorithm, until it finds the nearest trim point. You must supply the initial point implicitly or explicitly. If `trim` cannot find a trim point, it returns the point encountered in its search where the state derivatives are closest to zero in a min-max sense; that is, it returns the point that minimizes the maximum deviation from zero of the derivatives. `trim` can find trim points that meet specific input, output, or state conditions, and it can find points where a system is changing in a specified manner, that is, points where the system's state derivatives equal specific nonzero values.

`[x,u,y,dx] = trim('sys')` finds the equilibrium point of the model 'sys', nearest to the system's initial state, `x0`. Specifically, `trim` finds the equilibrium point that minimizes the maximum absolute value of $[x-x_0, u, y]$. If `trim` cannot find an equilibrium point near the system's initial state, it returns the point at which the system is nearest to equilibrium. Specifically, it returns the point that minimizes $\text{abs}(dx)$ where `dx` represents the derivative of the system. You can obtain `x0` using this command.

```
[sizes,x0,xstr] = sys([],[],[],0)
```

`[x,u,y,dx] = trim('sys',x0,u0,y0)` finds the trim point nearest to `x0`, `u0`, `y0`, that is, the point that minimizes the maximum value of

```
abs([x-x0; u-u0; y-y0])
```

`[x,u,y,dx] = trim('sys',x0,u0,y0,ix,iu,iy)` finds the trim point closest to `x0`, `u0`, `y0` that satisfies a specified set of state, input, and/or output conditions. The integer vectors `ix`, `iu`, and `iy` select the values in `x0`, `u0`, and `y0` that must be satisfied. If `trim` cannot find an equilibrium point that satisfies the specified set of conditions exactly, it returns the nearest point that satisfies the conditions, namely,

```
abs([x(ix)-x0(ix); u(iu)-u0(iu); y(iy)-y0(iy)])
```

`[x,u,y,dx] = trim('sys',x0,u0,y0,ix,iu,iy,dx0,idx)` finds specific nonequilibrium points, that is, points at which the system's state derivatives have some specified nonzero value.

Here, `dx0` specifies the state derivative values at the search's starting point and `idx` selects the values in `dx0` that the search must satisfy exactly.

`[x,u,y,dx,options] = trim('sys',x0,u0,y0,ix,iu,iy,dx0,idx,options)` specifies an array of optimization parameters that `trim` passes to the optimization function that it uses to find trim points. The optimization function, in turn, uses this array to control the optimization process and to return information about the process. `trim` returns the `options` array at the end of the search process. By exposing the underlying optimization process in this way, `trim` allows you to monitor and fine-tune the search for trim points.

The following table describes how each element affects the search for a trim point. Array elements 1, 2, 3, 4, and 10 are particularly useful for finding trim points.

No.	Default	Description
1	0	Specifies display options. 0 specifies no display; 1 specifies tabular output; -1 suppresses warning messages.
2	10^{-4}	Precision the computed trim point must attain to terminate the search.
3	10^{-4}	Precision the trim search goal function must attain to terminate the search.
4	10^{-6}	Precision the state derivatives must attain to terminate the search.
5	N/A	Not used.
6	N/A	Not used.
7	N/A	Used internally.
8	N/A	Returns the value of the trim search goal function (λ in goal attainment).
9	N/A	Not used.
10	N/A	Returns the number of iterations used to find a trim point.
11	N/A	Returns the number of function gradient evaluations.
12	0	Not used.
13	0	Number of equality constraints.
14	100*(Number of variables)	Maximum number of function evaluations to use to find a trim point.
15	N/A	Not used.
16	10^{-8}	Used internally.
17	0.1	Used internally.
18	N/A	Returns the step length.

`[x,u,y,dx,options] = trim('sys',x0,u0,y0,ix,iu,iy,dx0,idx,options,t)` sets the time to `t` if the system is dependent on time.

Note If you fix any of the state, input or output values, `trim` uses the unspecified free variables to derive the solution that satisfies these constraints.

Examples

Consider a linear state-space system modeled using a State-Space block

$$\begin{aligned}\dot{x} &= Ax + Bu \\ y &= Cx + Du\end{aligned}$$

The A , B , C , and D matrices to enter at the command line or in the block parameters dialog are:.

```
A = [-0.09 -0.01; 1 0];
B = [ 0 -7; 0 -2];
C = [ 0 2; 1 -5];
D = [-3 0; 1 0];
```

Example 1

To find an equilibrium point in this model called `sys`, use:

```
[x,u,y,dx,options] = trim('sys')
x =
    0
    0
u =
    0
    0
y =
    0
    0
dx =
    0
    0
```

The number of iterations taken is:

```
options(10)
ans =
    7
```

Example 2

To find an equilibrium point near $x = [1;1]$, $u = [1;1]$, enter

```
x0 = [1;1];
u0 = [1;1];
[x,u,y,dx,options] = trim('sys', x0, u0);
x =
    1.0e-13 *
    -0.5160
    -0.5169
u =
    0.3333
    0.0000
y =
    -1.0000
    0.3333
dx =
    1.0e-12 *
```

```

0.1979
0.0035

```

The number of iterations taken is

```

options(10)
ans =
    25

```

Example 3

To find an equilibrium point with the outputs fixed to 1, use:

```

y = [1;1];
iy = [1;2];
[x,u,y,dx] = trim('sys', [], [], y, [], [], iy)
x =
    0.0009
   -0.3075
u =
   -0.5383
    0.0004
y =
    1.0000
    1.0000
dx =
    1.0e-15 *
   -0.0170
    0.1483

```

Example 4

To find an equilibrium point with the outputs fixed to 1 and the derivatives set to 0 and 1, use

```

y = [1;1];
iy = [1;2];
dx = [0;1];
idx = [1;2];
[x,u,y,dx,options] = trim('sys',[],[],y,[],[],iy,dx,idx)
x =
    0.9752
   -0.0827
u =
   -0.3884
   -0.0124
y =
    1.0000
    1.0000
dx =
    0.0000
    1.0000

```

The number of iterations taken is

```

options(10)
ans =
    13

```

Limitations

The trim point found by `trim` starting from any given initial point is only a local value. Other, more suitable trim points may exist. Thus, if you want to find the most suitable trim point for a particular application, it is important to try a number of initial guesses for x , u , and y .

Algorithms

`trim` uses a sequential quadratic programming algorithm to find trim points. See “Sequential Quadratic Programming (SQP)” (Optimization Toolbox) for a description of this algorithm.

Introduced before R2006a

tunablevars2parameterobjects

Create Simulink parameter objects from tunable parameters

Syntax

```
tunablevars2parameterobjects ('modelName')  
tunablevars2parameterobjects ('modelName', class)
```

Description

`tunablevars2parameterobjects ('modelName')` creates `Simulink.Parameter` objects in the base workspace for the variables listed in the specified model's Tunable Parameters dialog, then deletes the source information from the dialog. To preserve the information, save the resulting Simulink parameter objects into a MAT-file.

If a tunable variable is already defined as a numeric variable in the base workspace, the variable will be replaced by a parameter object and the original variable will be copied to the object's Value property.

If a tunable variable is already defined as a Simulink parameter object, the object will not be modified but the information for the variable will still be deleted from the Tunable Parameters dialog.

If a tunable variable is defined as any other class of variable, the variable will not be modified and the information for the variable will not be deleted from the Tunable Parameters dialog.

`tunablevars2parameterobjects ('modelName', class)` creates objects of the specified class rather than `Simulink.Parameter` objects.

Input Arguments

modelName

Model name or handle

class

Parameter class to use for creating objects

Default: `Simulink.Parameter`

See Also

`Simulink.Parameter`

Topics

"Tunable Parameters"

Introduced in R2007b

ufix

Create `Simulink.NumericType` object describing unsigned fixed-point data type

Syntax

```
a = ufix(WordLength)
```

Description

`ufix(WordLength)` returns a `Simulink.NumericType` object that describes an unsigned fixed-point data type with the specified word length and unspecified scaling.

Note `ufix` is a legacy function. In new code, use `fixdt` instead. In existing code, replace `ufix(WordLength)` with `fixdt(0,WordLength)`.

Examples

Define a 16-bit unsigned fixed-point data type.

```
a = ufix(16)
```

```
a =
```

```
    NumericType with properties:
```

```
    DataTypeMode: 'Fixed-point: unspecified scaling'  
    Signedness: 'Unsigned'  
    WordLength: 16  
    IsAlias: 0  
    DataScope: 'Auto'  
    HeaderFile: ''  
    Description: ''
```

See Also

`Simulink.NumericType` | `fixdt` | `float` | `sfix` | `sfrac` | `sint` | `ufrac` | `uint`

Introduced before R2006a

ufrac

Create `Simulink.NumericType` object describing unsigned fractional data type

Syntax

```
a = ufrac(WordLength)
a = ufrac(WordLength, GuardBits)
```

Description

`ufrac(WordLength)` returns a `Simulink.NumericType` object that describes the data type of an unsigned fractional data type with a word size given by `WordLength`.

`ufrac(WordLength, GuardBits)` returns a `Simulink.NumericType` object that describes the data type of an unsigned fractional data type. The total word size is given by `WordLength` with `GuardBits` bits located to the left of the binary point.

Note `ufrac` is a legacy function. In new code, use `fixdt` instead. In existing code, replace `ufrac(WordLength)` with `fixdt(0,WordLength,WordLength)` and `ufrac(WordLength,GuardBits)` with `fixdt(0,WordLength,(WordLength-GuardBits))`.

Examples

Define an 8-bit unsigned fractional data type with 4 guard bits. Note that the range of this data type is from 0 to $(1 - 2^{-8}) \cdot 2^4 = 15.9375$.

```
a = ufrac(8,4)
```

```
a =
```

```

NumericType with properties:
    DataTypeMode: 'Fixed-point: binary point scaling'
    Signedness: 'Unsigned'
    WordLength: 8
    FractionLength: 4
    IsAlias: 0
    DataScope: 'Auto'
    HeaderFile: ''
    Description: ''

```

See Also

`Simulink.NumericType` | `fixdt` | `float` | `sfix` | `sfrac` | `sint` | `ufix` | `uint`

Introduced before R2006a

uint

Create `Simulink.NumericType` object describing unsigned integer data type

Syntax

```
a = uint(WordLength)
```

Description

`uint(WordLength)` returns a `Simulink.NumericType` object that describes the data type of an unsigned integer with a word size given by `WordLength`.

Note `uint` is a legacy function. In new code, use `fixdt` instead. In existing code, replace `uint(WordLength)` with `fixdt(0,WordLength,0)`.

Examples

Define a 16-bit unsigned integer.

```
a = uint(16)
```

```
a =
```

```
    NumericType with properties:
```

```
        DataTypeMode: 'Fixed-point: binary point scaling'
        Signedness: 'Unsigned'
        WordLength: 16
        FractionLength: 0
        IsAlias: 0
        DataScope: 'Auto'
        HeaderFile: ''
        Description: ''
```

`Simulink.NumericType` | `fixdt` | `float` | `sfix` | `sfrac` | `sint` | `ufix` | `ufrac`

Introduced before R2006a

unpack

Extract signal logging objects from signal logs and write them into MATLAB workspace

Syntax

```
log.unpack  
tsarray.unpack  
log.unpack('systems')  
log.unpack('all')
```

Description

Note The `ModelDataLogs` class is supported for backwards compatibility. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format. In R2016a or later, when you open a model from an earlier release that had used `ModelDataLogs` format, the model simulated in use `Dataset` format.

You can convert signal logging data from `ModelDataLogs` to `Dataset` format. Converting to `Dataset` format makes it easier to post-process with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see “Convert Logged Data to Dataset Format”.

If you have legacy code that uses the `ModelDataLogs` API, you can encounter situations that require updates to your code or model. See “Migrate Scripts That Use Legacy `ModelDataLogs` API”.

`log.unpack` or `unpack(log)` extracts the top level elements of the `Simulink.ModelDataLogs` or `Simulink.SubsysDataLogs` object named **log** (e.g., `logout`).

`log.unpack('systems')` or `unpack(log, 'systems')` extracts `Simulink.Timeseries` and `Simulink.TsArray` objects from the `Simulink.ModelDataLogs` or `Simulink.SubsysDataLogs` object named `log`. This command does not extract `Simulink.Timeseries` objects from `Simulink.TsArray` objects nor does it write intermediate `Simulink.ModelDataLogs` or `Simulink.SubsysDataLogs` objects to the MATLAB workspace.

`log.unpack('all')` or `unpack(log, 'all')` extracts all the `Simulink.Timeseries` objects contained by the `Simulink.ModelDataLogs`, `Simulink.TsArray`, or `Simulink.SubsysDataLogs` object named `log`.

`tsarray.unpack` extracts the time-series objects of class `Simulink.Timeseries` from the `Simulink.TsArray` object named `tsarray`.

Topics

“Export Signal Data Using Signal Logging”

Introduced before R2006a

upgradeadvisor

Open Upgrade Advisor

Syntax

```
upgradeadvisor('modelname')  
upgrader = upgradeadvisor('modelname')
```

Description

`upgradeadvisor('modelname')` opens the Upgrade Advisor for the model specified by `modelname`. This command loads the model if necessary, but does not open it in the Simulink Editor. Use the Upgrade Advisor to help you upgrade and improve models with the current release.

`upgrader = upgradeadvisor('modelname')` returns an object that you can use to analyze and upgrade a hierarchy of models programmatically. If you specify an output, then the Upgrade Advisor does not open. You can use the methods `analyze` and `upgrade` with the `upgrader` object output of the `upgradeadvisor` function.

- To programmatically analyze a model for recommended upgrades, create an `upgrader` object and use the method `analyze`.
- To programmatically analyze and upgrade a model, create an `upgrader` object and use the method `upgrade`.
- To configure options before running `analyze` or `upgrade`, see “Examples” on page 2-1031.

Tip For an example showing how to programmatically upgrade a whole project, see “Upgrade Simulink Models Using a Project” on page 14-528.

Input Arguments

modelname

Name or handle to the model, specified as a character vector.

Output Arguments

upgrader

Object for analyzing and upgrading the hierarchy of models programmatically.

Examples

Open Upgrade Advisor on a Model

To open the Upgrade Advisor on the `vdp` example model:

```
upgradeadvisor('vdp')
```

To open the Upgrade Advisor on the currently selected model:

```
upgradeadvisor(bdroot)
```

Programmatically Analyze and Upgrade a Model

- 1 Get an upgrader object. This example uses a writable copy of the vdp model.

```
load_system('vdp'); save_system('vdp',fullfile(tempdir, 'myvdp'))
upgrader = upgradeadvisor('myvdp')
```

```
upgrader =
```

```
Upgrader with properties:
```

```
ChecksToSkip: {}
SkipLibraries: 0
SkipBlocksets: 1
OneLevelOnly: 0
ShowReport: 1
RootModel: 'myvdp'
ReportFile: ''
```

- 2 To analyze the model for recommended upgrades, following library links and model references, run:

```
analyze(upgrader);
```

You see a report of issues found.

- 3 To analyze the model and automatically fix all issues (where automated fixes are available), run:

```
upgrade(upgrader);
```

This command follows library links and model references, and saves any fixes to the model files.

You see a report of issues found and actions taken.

- 4 To find the location of the report:

```
reportLocation = upgrader.ReportFile
```

- 5 You can configure options before running analyze or upgrade.

- Specify checks to skip before running analyze or upgrade. Find the ID for a check in the Upgrade Advisor by right-clicking the check and selecting **Send Check ID to Workspace**. Then set the `upgrader.ChecksToSkip` property. For example:

```
upgrader.ChecksToSkip = {'mathworks.design.CSStoVSSConvert'};
upgrade(upgrader);
```

- Specify running the Upgrade Advisor on only the current model without following library links or model references:

```
upgrader.OneLevelOnly = true; % default false
```

- Specify running the Upgrade Advisor on the current model, following model references but not library links:

```
upgrader.SkipLibraries = true; % default false
```

- Specify running the Upgrade Advisor on the current model, including upgrading files in blocksets or toolboxes:

```
upgrader.SkipBlocksets = false; % default true
```

By default, the Upgrade Advisor does not upgrade files in blocksets or toolboxes. The Upgrade Advisor detects blocksets from the output of `ver` and the existence of a `Contents.m` file.

- To turn off showing the report after analyze or upgrade, set:

```
upgrader.ShowReport = false; % default true
```

Tip For an example showing how to programmatically upgrade a whole project, see “Upgrade Simulink Models Using a Project” on page 14-528.

Tips

- The Upgrade Advisor can identify cases where you can benefit by changing your model to use new features and settings in Simulink. The Advisor provides advice for transitioning to new technologies, and upgrading a model hierarchy.

The Upgrade Advisor can also identify cases where a model will not work because changes and improvements in Simulink require changes to a model.

The Upgrade Advisor offers options to perform recommended actions automatically or instructions for manual fixes.

Alternatives

You can also open the Upgrade Advisor from the Simulink Editor. In the **Modeling** tab, select **Model Advisor > Upgrade Advisor**.

Alternatively, you can open the Upgrade Advisor from the Model Advisor. In the Model Advisor, under **By Task checks**, expand the folder **Upgrading to the Current Simulink Version** and select the check **Open the Upgrade Advisor**.

Introduced in R2012b

view_mdhrefs

Analyze and visualize model referencing dependencies without library dependencies

Syntax

```
view_mdhrefs(sys)
```

Description

`view_mdhrefs` opens the Dependency Analyzer with library dependencies omitted. To open a specific configuration of the Dependency Analyzer, use `depview` with programmatic options. The Dependency Analyzer provides the same options regardless of how you open it.

`view_mdhrefs(sys)` opens the Dependency Analyzer. It displays a graph of model referencing dependencies for the specified model. The nodes in the graph represent Simulink models. The directed lines indicate model dependencies.

Examples

Open Dependency Analyzer without Library Dependencies

Open the Dependency Analyzer for the `sldemo_mdhref_depgraph` model.

```
view_mdhrefs('sldemo_mdhref_depgraph');
```

Input Arguments

sys — Model name or path

character vector

The full name or path of a model, specified as a character vector.

Data Types: char

See Also

who

List names of top-level data logging objects in Simulink ModelDataLogs data log

Syntax

```
log.who  
tsarray.who  
log.who('systems')  
log.who('all')
```

Description

Note To list names of top-level data logging objects in Dataset format, use `find`.

The `ModelDataLogs` class is supported for backwards compatibility. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format. In R2016a or later, when you open a model from an earlier release that had used `ModelDataLogs` format, the model simulated in use `Dataset` format.

You can convert signal logging data from `ModelDataLogs` to `Dataset` format. Converting to `Dataset` format makes it easier to post-process with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see “Convert Logged Data to Dataset Format”.

If you have legacy code that uses the `ModelDataLogs` API, you can encounter situations that require updates to your code or model. See “Migrate Scripts That Use Legacy ModelDataLogs API”.

`log.who` or `who(log)` lists the names of the top-level signal logging objects contained by `log`, where `log` is the handle of a `Simulink.ModelDataLogs` object name.

`tsarray.who` or `who(tsarray)` lists the names of `Simulink.TimeSeries` objects contained by the `Simulink.TsArray` object named `tsarray`.

`log.who('systems')` or `who(log, 'systems')` lists the names of all signal logging objects contained by `log` except for `Simulink.Timeseries` objects stored in `Simulink.TsArray` objects contained by `log`.

`log.who('all')` or `who(log, 'all')` lists the names of all the `Simulink.Timeseries` objects contained by the `Simulink.ModelDataLogs`, `Simulink.TsArray`, or `Simulink.SubsysDataLogs` object named `log`.

For information about other uses of `who`, execute `help who` in the MATLAB Command Window.

Tip To get the names of `Dataset` variables in the MAT-file, using the `Simulink.SimulationData.DatasetRef.getDatasetVariableNames` function processes faster than using the `who` or `whos` functions.

whos

List names and types of top-level data logging objects in Simulink ModelDataLogs data log

Syntax

```
log.whos
```

```
tsarray.whos
```

```
log.whos('systems')
```

```
log.whos('all')
```

Description

Note To list names of top-level data logging objects in Dataset format, use `find`.

The `ModelDataLogs` class is supported for backwards compatibility. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format. In R2016a or later, when you open a model from an earlier release that had used `ModelDataLogs` format, the model simulated in use `Dataset` format.

You can convert signal logging data from `ModelDataLogs` to `Dataset` format. Converting to `Dataset` format makes it easier to post-process with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see “Convert Logged Data to Dataset Format”.

If you have legacy code that uses the `ModelDataLogs` API, you can encounter situations that require updates to your code or model. See “Migrate Scripts That Use Legacy ModelDataLogs API”.

`log.whos` or `whos(log)` lists the names and types of the top-level signal logging objects contained by `log`, where `log` is the handle of a `Simulink.ModelDataLogs` object name.

`tsarray.whos` or `whos(tsarray)` lists the names and types of `Simulink.TimeSeries` objects contained by the `Simulink.TsArray` object named `tsarray`.

`log.whos('systems')` or `whos(log, 'systems')` lists the names and types of all signal logging objects contained by `log` except for `Simulink.Timeseries` objects stored in `Simulink.TsArray` objects contained by `log`.

`log.whos('all')` or `whos(log, 'all')` lists the names and types of all the `Simulink.Timeseries` objects contained by the `Simulink.ModelDataLogs`, `Simulink.TsArray` or `Simulink.SubsysDataLogs` object named `log`.

For information about other uses of `whos`, execute `help whos` in the MATLAB Command Window.

Tip To get the names of `Dataset` variables in the MAT-file, using the `Simulink.SimulationData.DatasetRef.getDatasetVariableNames` function processes faster than using the `who` or `whos` functions.

Introduced before R2006a

Mask Icon Drawing Commands

color	Change drawing color of subsequent mask icon drawing commands
disp	Display text on masked subsystem icon
dpoly	Display transfer function on masked subsystem icon
droots	Display transfer function on masked subsystem icon
fprintf	Display variable text centered on masked subsystem icon
image	Display RGB image on masked subsystem icon
patch	Draw color patch of specified shape on masked subsystem icon
plot	Draw graph connecting series of points on masked subsystem icon
port_label	Draw port label on masked subsystem icon
text	Display text at specific location on masked subsystem icon
block_icon	Promote a block icon image to the masked Subsystem

color

Change drawing color of subsequent mask icon drawing commands

Syntax

```
color(colorstr)
```

Here, *colorstr* must be a character vector.

Description

`color(colorstr)` sets the drawing color of all subsequent mask drawing commands to the color specified by the string *colorstr*.

colorstr must be one of the following supported color strings.

```
blue  
green  
red  
cyan  
magenta  
yellow  
black
```

Entering any other string or specifying the color using RGB values results in a warning at the MATLAB command prompt; Simulink ignores the color change. The specified drawing color does not influence the color used by the `patch` or `image` drawing commands.

Examples

The following commands

```
color('cyan');  
roots([-1], [-2 -3], 4)  
color('magenta')  
port_label('input',1,'in')  
port_label('output',1,'out')
```

draw the following mask icon.

See Also

`roots` | `port_label`

Introduced in R2006b

disp

Display text on masked subsystem icon

Syntax

```
disp(text)
disp(text, 'texmode', 'on')
```

Description

`disp(text)` displays *text* centered on the block icon. *text* is any MATLAB expression that evaluates to a string.

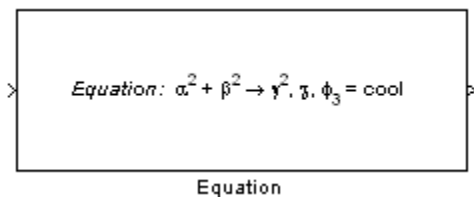

`disp(text, 'texmode', 'on')` allows you to use TeX formatting commands in *text*. The TeX formatting commands in turn allow you to include symbols and Greek letters in icon text. See “Interpreter” (MATLAB) for information on the TeX formatting commands supported by Simulink software.

Examples

The following command

```
disp('\itEquation: \alpha^2 + \beta^2 \rightarrow \gamma^2, \chi, \phi_3 = \bfcool', 'texmode','on')
```

draws the equation that appears on this masked block icon.

Equation

See Also

`fprintf` | `port_label` | `text`

Introduced in R2007a

dpoly

Display transfer function on masked subsystem icon

Syntax

```
dpoly(num, den)
```

```
dpoly(num, den, 'character')
```

Description

`dpoly(num, den)` displays the transfer function whose numerator is *num* and denominator is *den*.

`dpoly(num, den, 'character')` specifies the name of the transfer function independent variable. The default is *s*.

When Simulink draws the block icon, the initialization commands execute and the resulting equation appears on the block icon, as in the following examples:

- To display a continuous transfer function in descending powers of *s*, enter

```
dpoly(num, den)
```

For example, for `num = [0 0 1]`; and `den = [1 2 1]` the icon looks like:

$$\frac{1}{s^2+2s+1}$$

- To display a discrete transfer function in descending powers of *z*, enter

```
dpoly(num, den, 'z')
```

For example, for `num = [0 0 1]`; and `den = [1 2 1]`; the icon looks like:

$$\frac{1}{z^2+2z+1}$$

- To display a discrete transfer function in ascending powers of $1/z$, enter

```
dpoly(num, den, 'z-')
```

For example, for *num* and *den* as defined previously, the icon looks like:

$$\frac{z^{-2}}{1+2z^{-1}+z^{-2}}$$

If the parameters are not defined or have no values when you create the icon, Simulink software displays three question marks (? ? ?) in the icon. When you define parameter values in the Mask

Settings dialog box, Simulink software evaluates the transfer function and displays the resulting equation in the icon.

See Also

`disp` | `droots` | `port_label` | `text`

droots

Display transfer function on masked subsystem icon

Syntax

```
droots(zero, pole, gain)
droots(zero, pole, gain, 'z')
droots(zero, pole, gain, 'z-')
```

Description

`droots(zero, pole, gain)` displays the transfer function whose *zero* is *zero*, *pole* is *pole*, and *gain* is *gain*.

`droots(zero, pole, gain, 'z')` and `droots(zero, pole, gain, 'z-')` expresses the transfer function in terms of *z* or $1/z$.

When Simulink draws the block icon, the initialization commands execute and the resulting equation appears on the block icon, as in the following examples:

- To display a zero-pole gain transfer function, enter

```
droots(z, p, k)
```

For example, the preceding command creates this icon for these values:

```
z = []; p = [-1 -1]; k = 1;
```

If the parameters are not defined or have no values when you create the icon, Simulink software displays three question marks (? ? ?) in the icon. When you define parameter values in the Mask Settings dialog box, Simulink software evaluates the transfer function and displays the resulting equation in the icon.

See Also

`disp` | `dpoly` | `port_label` | `text`

Introduced in R2007a

fprintf

Display variable text centered on masked subsystem icon

Syntax

```
fprintf(text)
fprintf(formatSpec, var)
```

Description

The `fprintf` command displays formatted text centered on the icon and can display *formatSpec* along with the contents of *var*.

Note While this `fprintf` function is identical in name to its corresponding MATLAB function, it provides only the functionality described on this page.

`formatSpec` can be a character vector in single quotes, or a string scalar.

Formatting Operator

A formatting operator starts with a percent sign, %, and ends with a conversion character. The conversion character is required. Optionally, you can specify identifier, flags, field width, precision, and subtype operators between % and the conversion character. (Spaces are invalid between operators and are shown here only for readability).

Conversion Character

This table shows conversion characters to format numeric and character data as text.

Value Type	Conversion	Details
Integer, signed	<code>%d</code> or <code>%i</code>	Base 10
Integer, unsigned	<code>%u</code>	Base 10
	<code>%o</code>	Base 8 (octal)
	<code>%x</code>	Base 16 (hexadecimal), lowercase letters a-f
	<code>%X</code>	Same as <code>%x</code> , uppercase letters A-F
Floating-point number	<code>%f</code>	Fixed-point notation (Use a precision operator to specify the number of digits after the decimal point.)

Value Type	Conversion	Details
	<code>%e</code>	Exponential notation, such as <code>3.141593e+00</code> (Use a precision operator to specify the number of digits after the decimal point.)
	<code>%E</code>	Same as <code>%e</code> , but uppercase, such as <code>3.141593E+00</code> (Use a precision operator to specify the number of digits after the decimal point.)
	<code>%g</code>	The more compact of <code>%e</code> or <code>%f</code> , with no trailing zeros (Use a precision operator to specify the number of significant digits.)
	<code>%G</code>	The more compact of <code>%E</code> or <code>%f</code> , with no trailing zeros (Use a precision operator to specify the number of significant digits.)
Characters or strings	<code>%c</code>	Single character
	<code>%s</code>	Character vector or string array. The type of the output text is the same as the type of <code>formatSpec</code> .

Examples

The command

```
fprintf('Hello');
```

displays the text 'Hello' on the icon.

The command

```
fprintf('Hello = %d',17);
```

uses the decimal notation format (`%d`) to display the variable 17.

See Also

`disp` | `port_label` | `text`

Introduced before R2006a

image

Display RGB image on masked subsystem icon

Syntax

```
image(a)
image(a, position)
image(a, position, rotation)
```

Description

`image(a)` displays the image *a*, where *a* is an *m*-by-*n*-by-3 array of RGB values. If necessary, use the MATLAB commands `imread` and `ind2rgb` to read and convert bitmap files (such as GIF) to the necessary matrix format.

`image(a, position)` creates the image at the specified position as follows.

Position	Description
<code>[x, y, w, h]</code>	Position (<i>x</i> , <i>y</i>) and size (<i>w</i> , <i>h</i>) of the image where the position is relative to the lower-left corner of the mask. The image scales to fit the specified size.
<code>'center'</code>	Center of the mask
<code>'top-left'</code>	Top left corner of the mask, unscaled
<code>'bottom-left'</code>	Bottom left corner of the mask, unscaled
<code>'top-right'</code>	Top right corner of the mask, unscaled
<code>'bottom-right'</code>	Bottom right corner of the mask, unscaled

`image(a, position, rotation)` allows you to specify whether the image rotates (`'on'`) or remains stationary (`'off'`) as the icon rotates. The default is `'off'`.

Note Images in formats `.cur`, `.hdf4`, `.ico`, `.pcx`, `.ras`, `.xwd`, `.svg` (full version) cannot be used as block mask images.

Examples

You can use different commands depending on your requirement to add an image. These commands can be added in the **Icon & Ports** pane of the Mask Editor dialog box.

Syntax	Description
<code>image('icon.jpg')</code>	Reads the icon image from a JPEG file named <code>icon.jpg</code> in the MATLAB path.
<code>[data, map]=image('label.gif');</code> <code>pic=ind2rgb(data,map);</code>	Reads and converts a GIF file, <code>label.gif</code> , to the appropriate matrix format.
<code>image(pic)</code>	Reads the converted label image.

See Also

patch | plot

Introduced before R2006a

patch

Draw color patch of specified shape on masked subsystem icon

Syntax

```
patch(x, y)
patch(x, y, [r g b])
```

Description

`patch(x, y)` creates a solid patch having the shape specified by the coordinate vectors `x` and `y`. The patch's color is the current foreground color.

`patch(x, y, [r g b])` creates a solid patch of the color specified by the vector `[r g b]`, where `r` is the red component, `g` the green, and `b` the blue. For example,

```
patch([0 .5 1], [0 1 0], [1 0 0])
```

creates a red triangle on the mask's icon.

Examples

The command

```
patch([0 .5 1], [0 1 0], [1 0 0])
```

creates a red triangle on the mask's icon.

Pyramid

See Also

`image` | `plot`

Introduced before R2006a

plot

Draw graph connecting series of points on masked subsystem icon

Syntax

```
plot(Y)  
plot(X1,Y1,X2,Y2,...)
```

Description

`plot(Y)` plots, for a vector Y , each element against its index. If Y is a matrix, it plots each column of the matrix as though it were a vector.

`plot(X1,Y1,X2,Y2,...)` plots the vectors $Y1$ against $X1$, $Y2$ against $X2$, and so on. Vector pairs must be the same length and the list must consist of an even number of vectors.

Plot commands can include `NaN` and `inf` values. When Simulink software encounters `NaNs` or `infs`, it stops drawing, and then begins redrawing at the next numbers that are not `NaN` or `inf`. The appearance of the plot on the icon depends on the units defined by the **Icon units** option in the Mask Editor.

Simulink software displays three question marks (? ? ?) in the block icon and issues warnings in these situations:

- When you have not defined values for the parameters used in the drawing commands (for example, when you first create the mask, but have not yet entered values in the Mask Settings dialog box)
- When you enter a masked block parameter or drawing command incorrectly

Note The `plot` command supports all numeric data types.

Examples

The command

```
plot([0 1 5], [0 0 4])
```

generates the plot that appears on the icon for the Ramp block, in the Sources library.

See Also

`image`

Introduced before R2006a

port_label

Draw port label on masked subsystem icon

Syntax

```
port_label('port_type', port_number, 'label')  
port_label('port_type', port_number, 'label', 'texmode', 'on')
```

Description

`port_label('port_type', port_number, 'label')` draws a label on a port. Valid values for `port_type` include the following.

Value	Description
input	Simulink input port
output	Simulink output port
lconn	Physical Modeling connection port on the left side of a masked subsystem
rconn	Physical Modeling connection port on the right side of a masked subsystem
Enable	Label for the enable port in a masked Triggered or Enabled and Triggered subsystem.
trigger	Label for the trigger port in a masked Triggered or Enabled and Triggered subsystem.
action	Label for the action port in a masked Switch Case Action Subsystem.

The input argument `port_number` is an integer, and `label` is text specifying the port's label.

Note Physical Modeling port labels are assigned based on the nominal port location. If the masked subsystem has been rotated or flipped, for example, a port labeled using 'lconn' as the `port_type` may not appear on the left side of the block.

`port_label('port_type', port_number, 'label', 'texmode', 'on')` lets you use TeX formatting commands in `label`. The TeX formatting commands allow you to include symbols and Greek letters in the port label. See "Interpreter" (MATLAB) for information on the TeX formatting commands that the Simulink software supports.

Note Simulink does not support LaTeX formatting commands.

Examples

The command

```
port_label('input', 1, 'a')
```

defines a as the label of input port 1.

The command

```
port_label('Enable','En')
```

defines En as the label of Enable port.

The command

```
port_label('trigger','Tr')
```

defines Tr as the label of trigger port.

The command

```
port_label('action','Switch():')
```

defines Switch(): as the label of action port.

The command

```
port_label('trigger','\surd m','interpreter','tex')
```

defines the label of trigger port with TeX interpretation.

The commands

```
disp('Card\nSwapper');
port_label('input',1,'\spadesuit','texmode','on');
port_label('output',1,'\heartsuit','texmode','on');
```

draw playing card symbols as the labels of the ports on a masked subsystem.

See Also

disp | fprintf | text

Introduced before R2006a

text

Display text at specific location on masked subsystem icon

Syntax

```
text(x, y, 'text')  
text(x, y, 'text', 'horizontalAlignment', 'halign',  
     'verticalAlignment', 'valign')  
text(x, y, 'text', 'texmode', 'on')
```

Description

The `text` command places a character vector at a location specified by the point (x, y) whose units are defined by the **Icon units** option in the Mask Editor.

`text(x,y, text, 'texmode', 'on')` allows you to use TeX formatting commands in `text`. The TeX formatting commands in turn allow you to include symbols and Greek letters in icon text. See “Interpreter” (MATLAB) for information on the TeX formatting commands supported by Simulink software.

You can optionally specify the horizontal and/or vertical alignment of the text relative to the point (x, y) in the `text` command.

The `text` command offers the following horizontal alignment options.

Option	Aligns
'left'	The left end of the text at the specified point
'right'	The right end of the text at the specified point
'center'	The center of the text at the specified point

The `text` command offers the following vertical alignment options.

Option	Aligns
'base'	The baseline of the text at the specified point
'bottom'	The bottom line of the text at the specified point
'middle'	The midline of the text at the specified point
'cap'	The capitals line of the text at the specified point
'top'	The top of the text at the specified point

Note While this `text` function is identical in name to its corresponding MATLAB function, it provides only the functionality described on this page.

Examples

Text Alignment

Center the mask icon text foobar.

```
text(0.5, 0.5, 'foobar', 'horizontalAlignment', 'center')
```

Equation in Mask Icon

Draw a left-aligned equation as the mask icon.

In the Icons & Ports dialog of the Mask Editor, set **Icon units** to Normalized.

In the **Icon drawing commands** text box, enter the following command.

```
text(.05,.5,'\itEquation:} \Sigma \alpha^2 +
\beta^2 \rightarrow \infty, \Pi, \phi_3 = {\bfcool}',
'hor','left','texmode','on')
```

Equation

`disp` | `fprintf` | `port_label`

Introduced before R2006a

block_icon

Promote a block icon image to the masked Subsystem

Syntax

```
block_icon(BlockName)
```

Description

`block_icon(BlockName)` displays the underneath block icon image on the masked Subsystem icon. For more information, see `slexblockicon`.

Input Arguments

BlockName — Name of the underneath block

`string`

The name of the underneath block whose icon image you want to display on the Subsystem block that encapsulates the specified block. For more information, see `slexblockicon`

Data Types: `string`

See Also

`Simulink.Mask` | `slexblockicon`

Introduced in R2006b

Simulink Debugger Commands

ashow	Show algebraic loop
atrace	Set algebraic loop trace level
bafter	Insert breakpoint after specified method
break	Insert breakpoint before specified method
bshow	Show specified block
clear	Clear breakpoints from model
continue	Continue simulation
disp	Display block's I/O when simulation stops
ebreak	Enable (or disable) breakpoint on solver errors
elist	List simulation methods in order in which they are executed during simulation
emode	Toggle model execution between accelerated and normal mode
etrace	Enable or disable method tracing
help	Display help for debugger commands
nanbreak	Set or clear nonfinite value break mode
next	Advance simulation to start of next method at current level in model's execution list
probe	I/O and state data for blocks
quit	Stop simulation debugger
rbreak	Break simulation before solver reset
run	Run simulation to completion
slist	Sorted list of model blocks
states	Current state values
status	Debugging options in effect
step	Advance simulation by one or more methods
stimes	Model sample times
stop	Stop simulation
strace	Set solver trace level
systems	List nonvirtual systems of model
tbreak	Set or clear time breakpoint
trace	Display block's I/O each time block executes
undisp	Remove block from debugger's list of display points
untrace	Remove block from debugger's list of trace points
where	Display current location of simulation in simulation loop
xbreak	Break when debugger encounters step-size-limiting state
zcbreak	Toggle breaking at nonsampled zero-crossing events
zclist	List blocks containing nonsampled zero crossings

ashow

Show algebraic loop

Syntax

```
ashow  
ashow gcb  
ashow s:b  
ashow s#n  
ashow clear
```

Description

ashow returns a list of algebraic loops in the current model.

Note Simulink Debugger must be active (started) for all the debugger commands to run.

ashow gcb returns the algebraic loop containing the currently selected block.

ashow s:b returns the algebraic loop containing block b in system s

ashow s#n returns the nth algebraic loop in the system s

ashow clear removes algebraic loop highlighting in the current model

Examples

Highlight algebraic loops during debugging

This example shows you how to find algebraic loops and step through a simulation

Open the `sldemo_hydcyl` model

Start the Simulink debugger. Select **Simulation > Debug > Debug Model**.

Run the debugger.

In the MATLAB command prompt, enter:

```
ashow
```

```
Found 1 Algebraic loop(s):  
System#Algebraic loop id, number of blocks in loop  
- 0#1, 9 blocks in loop
```

The command returns the algebraic loops in the model as well as the number of blocks contained within.

Find algebraic loops containing selected block

Open the `sldemo_hydcyl` model and start the Simulink debugger.

Select any nonvirtual block in the model. For more information, see “Nonvirtual and Virtual Blocks”.

For example, select the PlotResults block, which is a Scope block.

In the MATLAB command prompt, enter

```
ashow gcb
```

```
Block sldemo_hydcyl/PlotResults isn't in an algebraic loop.
```

The PlotResults block does not belong in any algebraic loop.

Look under the mask of the Valve/Cylinder/Piston/Spring Assembly subsystem. To look under the mask, right click on the subsystem and open the context menu. Select **Mask > Look Under Mask**. Alternately, select the subsystem and press **Ctrl+U**.

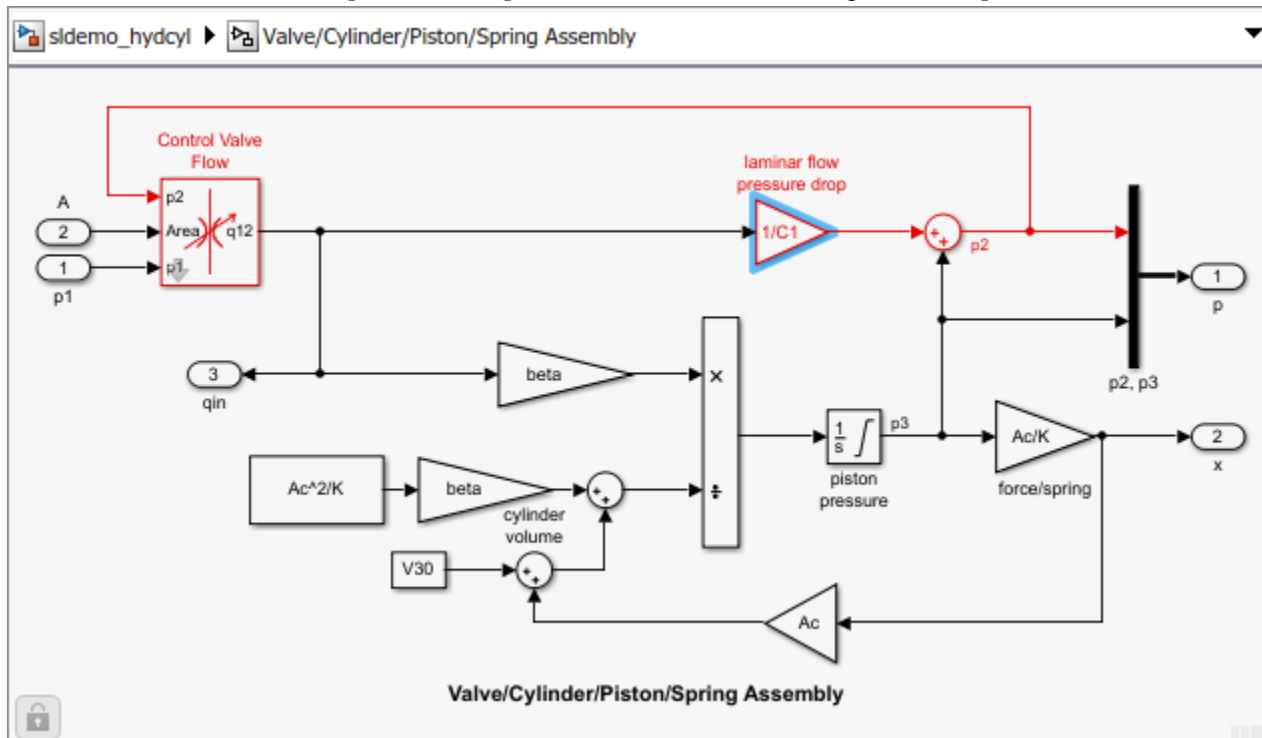

Select the laminar flow pressure drop block.

In the MATLAB command prompt, enter

```
ashow gcb
```

```
- sldemo_hydcyl/Valve//Cylinder//Piston//Spring Assembly/Control Valve Flow/IC
- sldemo_hydcyl/Valve//Cylinder//Piston//Spring Assembly/Control Valve Flow/signed sqrt
- sldemo_hydcyl/Valve//Cylinder//Piston//Spring Assembly/Control Valve Flow/Product
- sldemo_hydcyl/Valve//Cylinder//Piston//Spring Assembly/laminar flow pressure drop
- sldemo_hydcyl/Valve//Cylinder//Piston//Spring Assembly/Sum7
- sldemo_hydcyl/Pump/IC
- sldemo_hydcyl/Valve//Cylinder//Piston//Spring Assembly/Control Valve Flow/Sum1 (algebraic vari
- sldemo_hydcyl/Pump/Sum1
- sldemo_hydcyl/Pump/leakage (algebraic variable)
```

The laminar flow pressure drop block is contained in an algebraic loop with 8 other blocks.

Input Arguments

gcb – Currently selected block

gcb

Currently selected block, specified as gcb.

Example: `ashow gcb`

s:b – Block in model

system index:block index

Block index in the model, specified as system index:block index.

Example: `ashow 1:1`

Data Types: double

s#n – Algebraic loop index

system index#loop index

Algebraic loop index, specified as system index#loop index

Example: `ashow 0#1`

Data Types: double

clear – Remove highlighting

clear

Remove algebraic loop highlighting from model.

atrace

Topics

“Identify Algebraic Loops in Your Model”

Introduced before R2006a

atrace

Set algebraic loop trace level

Syntax

```
atrace level
```

```
at level
```

Arguments

level Trace level (0 = none, 4 = everything).

Description

The `atrace` command sets the algebraic loop trace level for a simulation.

Command	Displays for Each Algebraic Loop
<code>atrace 0</code>	No information
<code>atrace 1</code>	The loop variable solution, the number of iterations required to solve the loop, and the estimated solution error
<code>atrace 2</code>	Same as level 1
<code>atrace 3</code>	Level 2 plus Jacobian matrix used to solve loop
<code>atrace 4</code>	Level 3 plus intermediate solutions of the loop variable

`states` | `systems`

Introduced before R2006a

bafter

Insert breakpoint after specified method

Syntax

```
bafter
```

```
ba
```

```
bafter m:mid
```

```
bafter <sysIdx:blkIdx | gcb> [mth] [tid:TID]
```

```
bafter <s:sysIdx | gcs> [mth] [tid:TID]
```

```
bafter model [mth] [tid:TID]
```

```
bafter modelName <sysIdx:blkIdx | gcb> [mth] [tid:TID]
```

Arguments

<i>mid</i>	Method ID
<i>sysIdx:blkIdx</i>	Block ID
gcb	Currently selected block
<i>sysIdx</i>	System ID
gcs	Currently selected system
model	Currently selected model
<i>mth</i>	A method name, e.g., <code>Outputs.Major</code>
TID	Task ID
<i>modelName</i>	The name of the referenced model within the hierarchy of the top model, which is under debugging.

Description

bafter inserts a breakpoint after the current method.

Instead of **bafter**, you can use the short form of **ba** with any of the syntaxes.

bafter m:mid inserts a breakpoint after the method specified by *mid* (see “Method ID”).

bafter sysIdx:blkIdx inserts a breakpoint after each invocation of the method of the block specified by *sysIdx:blkIdx* (see “Block ID”) in major time steps. **bafter gcb** inserts a breakpoint after each invocation of a method of the currently selected block (see **gcb**) in major time steps.

bafter s:sysIdx inserts a breakpoint after each method of the root system or nonvirtual subsystem specified by the system ID: *sysIdx*.

Note The `systems` command displays the system IDs for all nonvirtual systems in the currently selected model.

`bafter gcs` inserts a breakpoint after each method of the currently selected nonvirtual system.

`bafter model` inserts a breakpoint after each method of the currently selected model.

The optional `meth` parameter allow you to set a breakpoint after a particular block, system, or model method and task. For example, `bafter gcb Outputs` sets a breakpoint after the Outputs method of the currently selected block.

The optional TID parameter allows you to set a breakpoint after invocation of a method by a particular task. For example, suppose that the currently selected nonvirtual subsystem operates on task 2 and 3. Then `bafter gcs Outputs tid:2` sets a breakpoint after the invocation of the subsystem's Outputs method that occurs when task 2 is active.

See Also

`break` | `clear` | `ebreak` | `nanbreak` | `rbreak` | `slist` | `systems` | `tbreak` | `where` | `xbreak` | `zcbreak`

Introduced before R2006a

break

Insert breakpoint before specified method

Syntax

break

b

break **m:mid**

break mdl

break mdl [mth] [**tid:TID**]

break <sysIdx:blkIdx | **gcb**> [mth] [**tid:TID**]

break <(taskIdx)sysIdx:blkIdx | **gcb**>

break <s:sysIdx | **gcs**> [mth] [**tid:TID**]

break **modelName** [mth] [**tid:TID**]

break **modelName** < (taskIdx)sysIdx:blkIdx> [mth] [**tid:TID**]

Arguments

<i>mid</i>	Method ID
<i>sysIdx:blkIdx</i>	Block ID
gcb	Currently selected block
<i>sysIdx</i>	System ID
<i>gcs</i>	Currently selected system
modelName	Currently selected model
<i>mth</i>	A method name, e.g., <code>Outputs.Major</code>
<i>TID</i>	task ID
<i>mdl</i>	Given model

Description

break inserts a breakpoint before the current method.

Instead of break, you can use the short form of b with any of the syntaxes.

break mdl breaks at each method of model (mdl). mdl refers to the top model.

break mdl [mth] [**tid:TID**] breaks at the method [mth] at tid (TID) of model (mdl).

break **m:mid** inserts a breakpoint before the method specified by *mid* (see “Method ID”).

`break sysIdx:blkIdx` inserts a breakpoint before each invocation of the method of the block specified by `sysIdx:blkIdx` (see “Block ID”) in major time steps. `break gcb` inserts a breakpoint before each invocation of a method of the currently selected block (see `gcb`) in major time steps.

`break s:sysIdx` inserts a breakpoint at each method of the root system or nonvirtual subsystem specified by the system ID: `sysIdx`.

Note The `systems` command displays the system IDs for all nonvirtual systems in the currently selected model.

`break gcs` inserts a breakpoint at each method of the currently selected nonvirtual system.

`break model` inserts a breakpoint at each method of the currently selected model.

Note Do not use a model name instead of identifier `model` in the `break model` command.

The optional `meth` parameter allow you to set a breakpoint at a particular block, system, or model method. For example, `break gcb Outputs` sets a breakpoint at the `Outputs` method of the currently selected block.

The optional TID parameter allows you to set a breakpoint at the invocation of a method by a particular task. For example, suppose that the currently selected nonvirtual subsystem operates on task 2 and 3. Then `break gcs Outputs tid:2` sets a breakpoint at the invocation of the subsystem's `Outputs` method that occurs when task 2 is active.

`break <(taskIdx)sysIdx:blkIdx | gcb>` breaks at each method of block `((taskIdx)sysIdx:blkIdx)`.

`break modelName < (taskIdx)sysIdx:blkIdx> [meth] [tid:TID]` breaks at the method `[meth]` at `tid` (TID) of block `((taskIdx)sysIdx:blkIdx)` in the model (`modelName`).

See Also

Introduced before R2006a

bshow

Show specified block

Syntax

```
bshow s:b
```

```
bshow [modelName] sysIdx:blkIdx
```

```
bs s:b
```

Arguments

s:b	The block whose system index is s and block index is b.
modelName s:b	The name of the model that is referenced followed by the block whose system index is s and block index is b.

Description

The bshow command opens the model window containing the specified block and selects the block.

bshow [modelName] (taskIdx)sysIdx:blkIdx shows block in system, sysIdx, with sorted list index, blkIdx, in the given task, taskIdx. The system and block are picked from the top model, unless referenced model is specified through modelName.

See Also

slist

Introduced before R2006a

clear

Clear breakpoints from model

Syntax

```
clear
```

```
cl
```

```
clear m:mid
```

```
clear id
```

```
clear <sysIdx:blkIdx | gcb>
```

Arguments

<i>mid</i>	Method ID
<i>id</i>	Breakpoint ID
<i>sysIdx:blkI</i> <i>dx</i>	Block ID
gcb	Currently selected block

Description

`clear` clears a breakpoint from the current method.

Instead of `clear`, you can use the short form of `cl` with any of the syntaxes.

`clear m:mid` clears a breakpoint from the method specified by *mid*.

`clear id` clears the breakpoint specified by the breakpoint ID *id*.

`clear sysIdx:blkIdx` clears any breakpoints set on the methods of the block specified by *sysIdx:blkIdx*.

`clear gcb` clears any breakpoints set on the methods of the currently selected block.

See Also

`bafter` | `break` | `slist`

Introduced before R2006a

continue

Continue simulation

Syntax

```
continue
```

```
c
```

Description

The `continue` command continues the simulation from the current breakpoint. If animation mode is not enabled, the simulation continues until it reaches another breakpoint or its final time step. If animation mode is enabled, the simulation continues in animation mode to the first method of the next major time step, ignoring breakpoints.

See Also

`quit` | `run` | `stop`

Introduced before R2006a

disp

Display block's I/O when simulation stops

Syntax

```
disp
```

```
d
```

```
disp gcb
```

```
disp s:b
```

```
disp modelName s:b
```

Arguments

Syntax and Description

Syntax	Description
s:b	The block whose system index is <i>s</i> and block index is <i>b</i> .
modelName s:b	The name of the referenced model within the hierarchy of the top model, which is under debugging followed by the block whose system index is <i>s</i> and block index is <i>b</i> .
gcb	Current block.

Description

The `disp` command registers a block as a display point. The debugger displays the inputs and outputs of all display points in the MATLAB Command Window whenever the simulation halts. Invoking `disp` without arguments shows a list of display points. Use `undisp` to unregister a block.

Instead of `disp`, you can use the short form of `d` with any of the syntaxes.

See Also

`probe` | `slist` | `trace` | `undisp`

Introduced before R2006a

ebreak

Enable (or disable) breakpoint on solver errors

Syntax

ebreak

eb

Description

This command causes the simulation to stop if the solver detects a recoverable error in the model. If you do not set or disable this breakpoint, the solver recovers from the error and proceeds with the simulation without notifying you.

See Also

bafter | break | clear | nanbreak | rbreak | slist | systems | tbreak | where | xbreak | zcbreak

Introduced before R2006a

elist

List simulation methods in order in which they are executed during simulation

Syntax

```
elist
```

```
el
```

```
elist m:mid [tid:TID]
```

```
elist <gcs | s:sysIdx> [mth] [tid:TID]
```

```
elist <gcb | (taskIdx)sysIdx:blkIdx> [mth] [tid:TID]
```

```
elist [modelName] <(taskIdx)sysIdx:blkIdx >
```

Description

Instead of `elist`, you can use the short form of `el` with any of the syntaxes.

`elist m:mid` lists the methods invoked by the system or nonvirtual subsystem method corresponding to the method id `mid` (see the `where` command for information on method IDs), e.g.,

```
(sldebug @19): elist m:19

RootSystem.Outputs 'vdp' [tid=0] : ← Calling method
  0:0 Integrator.Outputs 'vdp/x1' [tid=0]
  0:1 Outport.Outputs 'vdp/Out1' [tid=0]
  0:2 Integrator.Outputs 'vdp/x2' [tid=0]
  ...
  ↑      ↑      ↑      ↑
Blockid Method Block Taskid
```

The method list specifies the calling method followed by the methods that it calls in the order in which they are invoked. The entry for the calling method includes

- The name of the method

The name of the method is prefixed by the type of system that defines the method, e.g., `RootSystem`.

- The name of the model or subsystem instance on which the method is invoked
- The ID of the task that invokes the method

The entry for each called method includes

- The ID (`sysIdx:blkIdx`) of the block instance on which the method is invoked

The block ID is prefixed by a number specifying the system that contains the block (the *sysIdx*). This allows Simulink software to assign the same block ID to blocks residing in different subsystems.

- The name of the method

The method name is prefixed with the type of block that defines the method, e.g., Integrator.

- The name of the block instance on which the method is invoked
- The task that invokes the method

The optional task ID parameter (**tid:TID**) allows you to restrict the displayed lists to methods invoked for a specified task. You can specify this option only for system or atomic subsystem methods that invoke Outputs or Update methods.

`elist <gcs | s:sysIdx>` lists the methods executed for the currently selected system (specified by the `gcs` command) or the system or nonvirtual subsystem specified by the system ID *sysIdx*, e.g.,

```
(sdebug @19): elist gcs

RootSystem.Start 'vdp':
  0:0 Integrator.Start 'vdp/x1'
  0:2 Integrator.Start 'vdp/x2'
  0:4 Scope.Start 'vdp/Scope'
  0:5 Fcn.Start 'vdp/Fcn'
  0:6 Product.Start 'vdp/Product'
  0:7 Gain.Start 'vdp/Mu'
  0:8 Sum.Start 'vdp/Sum'

RootSystem.Initialize 'vdp':
  0:0 Integrator.Initialize 'vdp/x1'
  ...
```

The system ID of a model's root system is 0. You can use the debugger's `systems` command to determine the system IDs of a model's subsystems.

Note The `elist` and `where` commands use block IDs to identify subsystems in their output. The block ID for a subsystem is not the same as the system ID displayed by the `systems` command. Use the `elist sysIdx:blkIdx` form of the `elist` command to display the methods of a subsystem whose block ID appears in the output of a previous invocation of the `elist` or `where` command.

`elist m:mid [tid:TID]` displays the system execution list(s) identified by the system method, `mid` and `tid`.

`elist <gcs | s:sysIdx> mth` lists methods of type *mth* to be executed for the system specified by the `gcs` command or the system ID *sysIdx*, e.g.,

```
(sldebug @19): elist gcs Start

RootSystem.Start 'vdp':
  0:0 Integrator.Start 'vdp/x1'
  0:2 Integrator.Start 'vdp/x2'
  0:4 Scope.Start 'vdp/Scope'
  0:5 Fcn.Start 'vdp/Fcn'
  0:6 Product.Start 'vdp/Product'
  0:7 Gain.Start 'vdp/Mu'
  0:8 Sum.Start 'vdp/Sum'
  ...
```

Use `elist gcb` to list the methods invoked by the nonvirtual subsystem currently selected in the model.

`elist m:mid [tid:TID]` displays the system execution list(s) identified by the system method, `mid` and `tid`.

`elist [modelName] < (taskIdx)sysIdx:blkIdx >` displays the system execution list(s) identified by the subsystem block ((`taskIdx`)`sysIdx:blkIdx`), method, `mth`, and `tid` in the referenced model identified by `modelName`.

`elist <gcb | (taskIdx)sysIdx:blkIdx> [mth] [tid:TID]` displays the system execution list(s) identified by the subsystem block ((`taskIdx`)`sysIdx:blkIdx`), method, `mth`, and `tid`.

See Also

`slist` | `systems` | `where`

Introduced before R2006a

emode

Toggle model execution between accelerated and normal mode

Syntax

emode

em

Description

Toggles the simulation between accelerated and normal mode when using the Accelerator mode in Simulink software. For more information, see “Run Accelerator Mode with the Simulink Debugger”.

Introduced before R2006a

etrace

Enable or disable method tracing

Syntax

```
etrace level level-number
```

```
et level level-number
```

Description

This command enables or disables method tracing, depending on the value of `level`:

Level	Description
0	Turn tracing off.
1	Trace model methods.
2	Trace model and system methods.
3	Trace model, system, and block methods.

When method tracing is on, the debugger prints a message at the command line every time a method of the specified level is entered or exited. The message specifies the current simulation time, whether the simulation is entering or exiting the method, the method id and name, and the name of the model, system, or block to which the method belongs.

Introduced before R2006a

help

Display help for debugger commands

Syntax

help

?

h

Description

The help command displays a list of debugger commands in the command window. The list includes the syntax and a brief description of each command.

Introduced before R2006a

nanbreak

Set or clear nonfinite value break mode

Syntax

nanbreak

na

Description

The `nanbreak` command causes the debugger to break whenever the simulation encounters a nonfinite (NaN or Inf) value. If nonfinite break mode is set, `nanbreak` clears it.

See Also

`bafter` | `break` | `rbreak` | `tbreak` | `xbreak` | `zcbreak`

Topics

`ebreak`

Introduced before R2006a

next

Advance simulation to start of next method at current level in model's execution list

Syntax

next

n

Description

The `next` command advances the simulation to the start of the next method at the current level in the model's method execution list.

Note The `next` command has the same effect as the `step over` command. See `step` for more information.

See Also

`step`

Introduced before R2006a

probe

I/O and state data for blocks

Syntax

```
probe
probe s:b
probe modelName s:b
probe gcb
probe level level-type
p
```

Description

`probe` sets the Simulink debugger to interactive probe mode. In this mode, the debugger displays the I/O of a selected block. To exit interactive probe mode, enter a debugger command or press the **Enter** key.

`probe s:b` displays the I/O of the block whose system index is *s* and block index is *b*.

`probe modelName s:b` displays the I/O of the block system index is *s* and block index is *b* in the *modelName* model.

`probe gcb` displays the I/O of the currently selected block.

`probe level level-type` sets the verbosity level for `probe`, `trace`, and `dis`. If *level-type* is `io`, the debugger displays block I/O. If *level-type* is `all` (default), the debugger displays all information for the current state of a block, including inputs and outputs, states, and zero crossings.

`p` is the short form of the command.

Examples

Display I/O for the currently selected block `Out2` in the model `vdp` using the Simulink debugger.

- 1 In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt `>>` changes to the Simulink debugger prompt (`sldebug @0`): `>>`.

- 2 Enter:

```
probe gcb
```

The MATLAB Command Window displays:

```
probe: Data of 0:3 Output block 'vdp/Out2':
U1      = [0]
```

See Also

disp | trace

Introduced in R2007a

quit

Stop simulation debugger

Syntax

```
quit  
q
```

Description

`quit` stops the Simulink debugger and returns to the MATLAB command prompt.

`q` is the short form of the command.

Examples

Start the Simulink debugger for the model `vdp` and then stop it.

- 1 In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt `>>` changes to the Simulink debugger prompt (`sldebug @0`): `>>`.

- 2 Enter:

```
quit
```

See Also

`stop`

Introduced before R2006a

rbreak

Break simulation before solver reset

Syntax

```
rbreak  
rb
```

Description

`rbreak` enables (or disables) a solver reset breakpoint if the breakpoint is disabled (or enabled). The breakpoint causes the debugger to halt the simulation whenever an event requires a solver reset. The halt occurs before the solver resets.

`rb` is the short form of the command.

Examples

Start Simulink debugger for the model `vdp` and a set breakpoint before a solver reset.

- 1 In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt `>>` is replaced with the Simulink debugger prompt (`sldebug @0`): `>>`.

- 2 Enter:

```
rbreak
```

The MATLAB Command Window displays:

```
Break on solver reset request           : enabled
```

See Also

`bafter` | `break` | `ebreak` | `nanbreak` | `tbreak` | `xbreak` | `zcbreak`

Introduced before R2006a

run

Run simulation to completion

Syntax

```
run  
r
```

Description

`run` starts the simulation from the current breakpoint to its final time step. It ignores breakpoints and display points.

`r` is the short form of the command

Examples

Continue the simulation for the model `vdp` using the Simulink debugger.

- 1 In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt `>>` changes to the Simulink debugger prompt `(sldebug @0): >>`.

- 2 Enter:

```
run
```

See Also

`continue` | `quit` | `stop`

Introduced before R2006a

slist

Sorted list of model blocks

Syntax

```
slist
sli
```

Description

`slist` displays a list of blocks for the root system and each nonvirtual subsystem sorted according to data dependencies and other criteria.

For each system (root or nonvirtual), `slist` displays:

- Title line specifying the name of the system, the number of nonvirtual blocks that the system contains, and the number of blocks in the system that have direct feedthrough ports.
- Entry for each block in the order in which the blocks appear in the sorted list.

For each block entry, `slist` displays the block ID and the name and type of the block. The block ID consists of a system index and a block index separated by a colon (`sysIdx:blkIdx`).

- Block index is the position of the block in the sorted list.
- System index is the order in which the Simulink software generated the system sorted list. The system index has no special significance. It simply allows blocks that appear in the same position in different sorted lists to have unique identifiers.

Simulink software uses sorted lists to create block method execution lists (see `elist`) for root system and nonvirtual subsystem methods. In general, root system and nonvirtual subsystem methods invoke the block methods in the same order as the blocks appear in the sorted list.

Exceptions occur in the execution order of block methods. For example, execution lists for multicast models group together all blocks operating at the same rate and in the same task. Slower groups appear later than faster groups. The grouping of methods by task can result in a block method execution order that is different from the block sorted order. However, within groups, methods execute in the same order as the corresponding blocks appear in the sorted list.

`sli` is the short form of the command.

Examples

Display a sorted list of the root system in the `vdp` model using the Simulink debugger.

- 1 In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt `>>` changes to the Simulink debugger prompt (`sldebug @0`): `>>`.

- 2 Enter:

slist

The MATLAB Command Window displays:

```
---- Sorted list for 'vdp' [9 nonvirtual blocks, directFeed=0]
0:0   'vdp/x1' (Integrator)
0:1   'vdp/Out1' (Outport)
0:2   'vdp/x2' (Integrator)
0:3   'vdp/Out2' (Outport)
0:4   'vdp/Scope' (Scope)
0:5   'vdp/Fcn' (Fcn)
0:6   'vdp/Product' (Product)
0:7   'vdp/Mu' (Gain)
0:8   'vdp/Sum' (Sum)
```

elist | systems

Introduced before R2006a

states

Current state values

Syntax

states

Description

states displays a list of the current states of the model. The list includes the index, current value, system:block:element ID, state vector name, and block name for each state.

Examples

Display information about the states for the vdp model.

- 1 In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt >> changes to the Simulink debugger prompt (sldebug @0): >>.

- 2 Enter:

```
states
```

The MATLAB Command Window displays:

```
Continuous States:
Idx  Value                                     (system:block:element Name  'BlockName')
  0   0                                     (0:0:0  CSTATE  'vdp/x1')
  1   0                                     (0:2:0  CSTATE  'vdp/x2')
```

Introduced before R2006a

status

Debugging options in effect

Syntax

Description

Display a list of the debugging options in effect.

Examples

View Debugger Status for vdp

Start the debugger with vdp. The command prompt changes to the Simulink debugger prompt (sldebug @0): >>.

```
sldebug 'vdp'
```

Display the debugging status.

```
status

%------%

```

Introduced before R2006a

step

Advance simulation by one or more methods

Syntax

```
step
step in
step over
step out
step top
step blockmth
s
```

Description

`step` or `step in` advances the simulation to the next method in the current time step.

`step over` advances the simulation over the next method.

`step out` advances the simulation the end of the current simulation point hierarchy.

`step top` advances the simulation to the first method executed in the next time step.

`step blockmth` advances the simulation to the next method that operates on a block.

`s` is the short form of the command.

If `step` advances the simulation to the start of a block method, the debugger points at the block on which the method operates.

.

Examples

The following diagram illustrates the effect of various forms of the `step` command for the model `vdp`.

See Also

elist | next | where

Introduced in R2007a

stimes

Model sample times

Syntax

```
stimes  
sti
```

Description

`stimes` displays information about the model sample times, including the sample time period, offset, and task ID.

`sti` is the short form of the command.

Examples

Display sample times for the model `vdp` using the Simulink debugger.

- 1 In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt `>>` changes to the Simulink debugger prompt (`sldebug @0`): `>>`.

- 2 Enter:

```
stimes
```

The MATLAB Command Window displays:

```
--- Sample times for 'vdp' [Number of sample times = 1]  
1. [0      , 0      ] tid=0 (continuous sample time)
```

Introduced before R2006a

stop

Stop simulation

Syntax

```
stop
```

Description

`stop` stops the simulation of the model you are debugging.

Examples

Start and stop a simulation for the model `vdp` using the Simulink debugger.

- 1 Start a debugger session. In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt `>>` changes to the Simulink debugger prompt (`sldebug @0`): `>>`.

- 2 Start a simulation of the model. Enter:

```
run
```

- 3 Stop the simulation. Enter:

```
stop
```

See Also

`continue` | `quit` | `run`

Introduced before R2006a

strace

Set solver trace level

Syntax

```
strace level
i
```

Description

`strace level` causes the solver to display diagnostic information in the MATLAB Command Window, depending on the value of `level`. Values are 0 (no information) or 1 (maximum information about time steps, integration steps, zero crossings, and solver resets).

`i` is the short form of the command.

Examples

Display maximum information about a simulation for the model `vdp` using the Simulink debugger.

- 1 In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt `>>` changes to the Simulink debugger prompt (`sldebug @0`): `>>`.

- 2 Get information about the notation. Enter:

```
help time
```

The MATLAB Command Window displays:

```
Time is displayed as:
TM = <time while in MajorTimeStep>
Tm = <time while in MinorTimeStep>
Tr = <time while in solver reset>
Tz = <time at or just after zero crossing>
TzL = <time while in major step just before (at left post of) zero crossing>
TzR = <time while in major step at or just after (at right post of) zero crossing>
Ts = <time of successful integration step>
Tf = <time of failed integration step>
Tn = <time while in Newton iteration> (when using implicit solvers)
Tj = <time during Jacobian evaluation> (when using implicit solvers)

Step size is displayed as:
Hm = <step size at the start of solver phase>
Hs = <successful integration step size>
Hf = <failed integration step size>
Hn = <step size during Newton iteration> (when using implicit solvers)
Hz = <value of 'TM - TzL' during zero crossing search>
Iz = <value of 'Tz - TzL' during zero crossing search>
```

- 3 Set trace to display all information. Enter:

```
strace 1
```

When diagnostic tracing is on, the debugger displays the start of major and minor time steps.

```
[TM = 13.21072088374186 ] Start of Major Time Step
[Tm = 13.21072088374186 ] Start of Minor Time Step
```

The debugger displays integration information. This information includes the time step of the integration method, step size of the integration method, outcome of the integration step, normalized error, and index of the state.

```
[Tm = 13.21072088374186 ] [H = 0.2751116230148764 ] Begin Integration Step
[Tf = 13.48583250675674 ] [Hf = 0.2751116230148764 ] Fail [Er = 1.0404e+000]
  [Ix = 1]
[Tm = 13.21072088374186 ] [H = 0.2183536061326544 ] Retry
[Ts = 13.42907448987452 ] [Hs = 0.2183536061326539 ] Pass [Er = 2.8856e-001]
  [Ix = 1]
```

For zero crossings, the debugger displays information about the iterative search algorithm when the zero crossing occurred. This information includes the time step of the zero crossing, step size of the zero crossing detection algorithm, length of the time interval bracketing the zero crossing, and a flag denoting the rising or falling direction of the zero crossing.

```
[Tz = 3.615333333333301 ] Detected 1 Zero Crossing Event 0[F]
  Begin iterative search to bracket zero crossing event
[Tz = 3.621111157580072 ] [Hz = 0.005777824246771424 ] [Iz = 4.2222e-003] 0[F]
[Tz = 3.621116982080098 ] [Hz = 0.005783648746797265 ] [Iz = 4.2164e-003] 0[F]
[Tz = 3.621116987943544 ] [Hz = 0.005783654610242994 ] [Iz = 4.2163e-003] 0[F]
[Tz = 3.621116987943544 ] [Hz = 0.005783654610242994 ] [Iz = 1.1804e-011] 0[F]
[Tz = 3.621116987949452 ] [Hz = 0.005783654616151157 ] [Iz = 5.8962e-012] 0[F]
[Tz = 3.621116987949452 ] [Hz = 0.005783654616151157 ] [Iz = 5.1514e-014] 0[F]
  End iterative search to bracket zero crossing event
```

When solver resets occur, the debugger displays the time at which the solver was reset.

```
[Tr = 6.246905153573676 ] Process Solver Reset
[Tr = 6.246905153573676 ] Reset Zero Crossing Cache
[Tr = 6.246905153573676 ] Reset Derivative Cache
```

Introduced before R2006a

systems

List nonvirtual systems of model

Syntax

```
systems  
sys
```

Description

systems displays the nonvirtual subsystems for a model in the MATLAB Command Window.

sys is the short form of the command.

Examples

Display the nonvirtual systems for the model `sldemo_enginewc` using the Simulink debugger.

- 1 In the MATLAB Command Window, enter:

```
sldebug 'sldemo_enginewc'
```

The MATLAB command prompt `>>` changes to the Simulink debugger prompt (`sldebug @0`): `>>`.

- 2 Enter:

```
systems
```

The MATLAB Command Window displays the nonvirtual subsystems.

```
0 'sldemo_enginewc'  
2 'sldemo_enginewc/Compression'  
3 'sldemo_enginewc/Controller'  
4 'sldemo_enginewc/Throttle & Manifold/Throttle/TmpAtomicSubsysAtSwitchInport1'  
5 'sldemo_enginewc/valve timing/positive edge to dual edge conversion'
```

See Also

slist

Introduced before R2006a

tbreak

Set or clear time breakpoint

Syntax

tbreak

tb

tbreak t

Description

The `tbreak` command sets a breakpoint at the specified time step. If a breakpoint already exists at the specified time, `tbreak` clears the breakpoint. If you do not specify a time, `tbreak` toggles a breakpoint at the current time step.

Instead of `tbreak`, you can use the short form of `tb`, with or without `t`.

Topics

`ebreak`

Introduced before R2006a

trace

Display block's I/O each time block executes

Syntax

```
trace gcb  
trace s:b
```

```
tr gcb  
trace s:b
```

Arguments

s:b The block whose system index is s and block index is b.
gcb Current block.

Description

The trace command registers a block as a trace point. The debugger displays the I/O of each registered block each time the block executes.

See Also

disp | probe | slist | strace | untrace

Introduced before R2006a

undisp

Remove block from debugger's list of display points

Syntax

```
undisp gcb
```

```
und gcb
```

```
undisp s:b
```

```
und s:b
```

Arguments

s:b The block whose system index is s and block index is b.

gcb Current block.

Description

The undisp command removes the specified block from the debugger's list of display points.

See Also

disp | slist

Introduced before R2006a

untrace

Remove block from debugger's list of trace points

Syntax

```
untrace gcb
```

```
unt gcb
```

```
untrace s:b
```

```
unt s:b
```

Arguments

`s:b` The block whose system index is `s` and block index is `b`.

`gcb` Current block.

Description

The `untrace` command removes the specified block from the debugger's list of trace points.

See Also

`slist` | `trace`

Introduced before R2006a

where

Display current location of simulation in simulation loop

Syntax

where [detail]

w [detail]

Description

The where command displays the current location of the simulation in the simulation loop, for example,

```
sldebug 07): where
0 >> vdp.Simulate
1 >> vdp.Start
2 >> RootSystem.Start 'vdp'
7 >| 0:8 Sum.Start 'Sum'
```

The display consists of a list of simulation nodes with the last entry being the node that is about to be entered or exited. Each entry contains the following information:

- Method ID
 - The method ID identifies a specific invocation of a method.
- A symbol specifying its state:
 - >> (active)
 - >| (about to be entered)
 - <| (about to be exited)
- Name of the method invoked (e.g., RootSystem.Start)
- Name of the block or system on which the method is invoked (e.g., Sum)
- System and block ID (sysIdx:blkIdx) of the block on which the method is invoked

For example, 0:8 indicates that the specified method operates on block 8 of system 0.

where detail, where detail is any nonnegative integer, includes inactive nodes in the display.

```
0 >> vdp.Simulate
  1   >> vdp.Start
  2     >> RootSystem.Start 'vdp'
  3       0:4 Scope.Start 'Scope'
  4         0:5 Fcn.Start 'Fcn'
  5         0:6 Product.Start
'Product'
  6         0:7 Gain.Start 'Mu'
  7         >| 0:8 Sum.Start 'Sum'
```

See Also

step

Introduced before R2006a

xbreak

Break when debugger encounters step-size-limiting state

Syntax

```
xbreak
```

```
x
```

Description

The `xbreak` command pauses execution of the model when the debugger encounters a state that limits the size of the steps that the solver takes. If `xbreak` mode is already on, `xbreak` turns the mode off.

Classes

eventData	Provide information about block method execution events
Simulink.Annotation	Specify properties of model annotation
Simulink.BlockCompDworkData	Provide postcompilation information about block's DWork vector
Simulink.BlockCompInputPortData	Provide postcompilation information about block input port
Simulink.BlockCompOutputPortData	Provide postcompilation information about block output port
Simulink.BlockData	Provide run-time information about block-related data, such as block parameters
Simulink.BlockPortData	Describe block input or output port
Simulink.BlockPreCompInputPortData	Provide precompilation information about block input port
Simulink.BlockPreCompOutputPortData	Provide precompilation information about block output port
Simulink.GlobalDataTransfer	Configure concurrent execution data transfers
Simulink.MDLInfo	Extract model file information without loading block diagram into memory
getDescription	Extract model file description without loading block diagram into memory
getMetadata	Extract model file metadata without loading block diagram into memory
Simulink.ModelDataLogs	Container for signal data logs of a model
Simulink.SimState.ModelSimState	(Not recommended) Access SimState snapshot data
Simulink.MSFcnRunTimeBlock	Get run-time information about Level-2 MATLAB S-function block
Simulink.RunTimeBlock	Allow Level-2 MATLAB S-function and other MATLAB programs to get information about block while simulation is running
Simulink.SampleTime	Object containing sample time information
Simulink.SimulationData.BlockPath	Fully specified Simulink block path
Simulink.SimulationData.DataStoreMemory	Container for data store logging information
Simulink.SimulationData.LoggingInfo	Signal logging override settings
Simulink.SimulationData.ModelLoggingInfo	Signal logging override settings for a model
Simulink.SimulationData.SignalLoggingInfo	Signal logging override settings for signal
Simulink.SimulationData.Signal	Container for signal logging information
Simulink.SimulationData.State	State logging element
Simulink.SimulationMetadata	Access metadata of simulation runs
Simulink.SimulationOutput	Access object values of simulation results

matlab.io.datastore.sd datastore class

Package: matlab.io.datastore

Datastore for Simulation Data Inspector signals

Description

A `matlab.io.datastore.sd datastore` object provides access to signals logged to the Simulation Data Inspector that are too large to fit into memory. An `sd datastore` object references the data for a single signal. The `read` method loads the signal data referenced by an `sd datastore` object in a chunk-wise manner such that each chunk always fits into memory. You can use an `sd datastore` object to create a tall timetable for your signal data. For more information about working with tall arrays, see “Tall Arrays” (MATLAB).

Note `matlab.io.datastore.sd datastore` does not support parallel computations. If you have a Parallel Computing Toolbox license, use `mapreducer(0)` to set the execution environment to the local MATLAB client before creating a tall timetable from the `matlab.io.datastore.sd datastore`.

Construction

`ds = dsrObj.getAsDatastore(arg)` creates the `sd datastore`, `ds`, for the signal in the `Simulink.sdi.DatasetRef` object selected by the search criterion `arg`. You can specify `arg` as an integer representing the index of the desired signal within the `Simulink.sdi.DatasetRef` object, or as a character vector containing the name of the signal.

`ds = matlab.io.datastore.sd datastore(signalID)` creates the `sd datastore`, `ds`, for the signal corresponding to the specified `signalID`.

Input Arguments

arg — Element selection criterion

character vector | integer

Search criterion used to retrieve the element from the `Simulink.sdi.DatasetRef` object. For name-based searches, specify `arg` as a character vector. For index-based searches, `arg` is an integer, representing the index of the desired element.

Example: 'MySignal'

Example: 3

signalID — Numeric signal identifier

integer

Numeric signal identifier generated for the signal by the Simulation Data Inspector. You can get the signal ID for a signal using methods of the `Simulink.sdi.Run` object containing the signal or as a return from the `Simulink.sdi.createRun` function.

Properties

Name — Signal name

character vector

Name of the signal specified as a character vector.

Example: 'My Signal'

Signal — Simulink.sdi.Signal object

Simulink.sdi.Signal object

Simulink.sdi.Signal object associated with the sddatastore. The Signal property provides access to the signal data and metadata.

Methods

hasdata	Determine if data is available to read
preview	Return preview of data in sddatstore
read	Read a chunk of data from an sddatastore
readall	Read all data from an sddatastore
reset	Reset the read position

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Create a Tall Timetable for a Simulation Data Inspector Signal

This example shows how to create a tall timetable for a signal in the Simulation Data Inspector repository. You can create the tall timetable using a Simulink.sdi.Signal object or by first creating a matlab.io.datastore.sddatastore for the signal. You can use a matlab.io.datastore.sddatastore to incrementally read and process signal data for signals that do not fit into memory. A tall timetable handles the data chunking and processing in the background. In general, you can work with tall timetables very similarly to how you work with in-memory data.

Create Data and Access Signal ID

Whether you create your tall timetable using a Simulink.sdi.Signal object or a matlab.io.datastore.sddatastore, start by creating data and accessing the signal ID for a signal of interest. The sldemo_fuelsys model is configured to log signals which stream to the Simulation Data Inspector repository when you simulate the model.

```
open_system('sldemo_fuelsys')
sim('sldemo_fuelsys')
```

Then, use the Simulation Data Inspector programmatic interface to access the signal ID for a signal of interest. For example, access the ego signal.

```
runCount = Simulink.sdi.getRunCount;
latestRunID = Simulink.sdi.getRunIDByIndex(runCount);
latestRun = Simulink.sdi.getRun(latestRunID);

egoSigID = latestRun.getSignalIDByIndex(7);
```

Create a Tall Timetable Using a `matlab.io.datastore.sdidatastore`

In general, tall timetables are backed by datastores. Create a `matlab.io.datastore.sdidatastore` object to reference the signal data in the Simulation Data Inspector repository.

```
egoDs = matlab.io.datastore.sdidatastore(egoSigID);
```

Check the name of the datastore to verify you have the signal you expect.

```
egoDs.Name
```

```
ans =
'fuel'
```

Create a tall timetable from the `matlab.io.datastore.sdidatastore` to use for processing the signal data. When you have a Parallel Computing Toolbox™ license, you need to explicitly set the execution environment to the local MATLAB® session using `mapreducer` before creating the tall timetable. The `matlab.io.datastore.sdidatastore` object does not support parallel computations.

```
mapreducer(0);
```

```
egoTt = tall(egoDs)
```

```
egoTt =
```

```
Mx1 tall timetable
```

Time	Data

Create a Tall Timetable Using a `Simulink.sdi.Signal` Object

The `Simulink.sdi.Signal` class has a method to create a tall timetable directly, allowing you to skip the step of creating a datastore by creating it behind the scenes. Use the signal ID to access the `Simulink.sdi.Signal` object for the ego signal. Then, use the `getTable` method to create the tall timetable.

```
egoSig = Simulink.sdi.getSignal(egoSigID);
```

```
egoTt = egoSig.getAsTall
```

```
egoTt =
```

```
Mx1 tall timetable
```

Time	Data

0.00056199 sec	1.209
0.0033719 sec	1.209
0.01 sec	1.1729
0.02 sec	1.1409
0.03 sec	1.1124
0.04 sec	1.0873
0.05 sec	1.0652
:	:
:	:

Use the Tall Timetable to Process Your Signal Data

When you use the tall timetable `egoTt`, its underlying datastore reads chunks of data and passes them to the tall timetable to process. Neither the datastore nor the tall timetable retain any of the data in memory after processing. Also, the tall timetable defers processing for many operations. For example, calculate the mean value of the signal.

```
egoMean = mean(egoTt.Data)
```

```
egoMean =
```

```
tall double
```

```
?
```

You can use the `gather` function to evaluate a variable and write its value to the workspace, or you can use the `write` function to write the results to disc. When you use `gather`, be sure the results fit into memory.

```
egoMean = gather(egoMean)
```

```
Evaluating tall expression using the Local MATLAB Session:
```

```
- Pass 1 of 1: Completed in 5 min 28 sec
```

```
Evaluation completed in 5 min 29 sec
```

```
egoMean = 1.3292
```

When you perform multiple operations on a tall timetable, evaluation of the results for each step is deferred until you explicitly request the results with `write` or `gather`. During evaluation, MATLAB optimizes the number of passes it makes through the tall timetable, which can significantly speed up processing time for analyzing very large signals. For more information about working with tall arrays, see “Tall Arrays for Out-of-Memory Data” (MATLAB).

Process Signal Data Using a `matlab.io.datastore.sdidatastore`

A `matlab.io.datastore.sdidatastore` references signal data in the Simulation Data Inspector repository. When the signal is too large to fit into memory, you can use the

`matlab.io.datastore.sd datastore` to incrementally process the data manually or to create a tall timetable for the signal that handles the incremental processing for you. This example shows how to process data using a `matlab.io.datastore.sd datastore`.

Create a `matlab.io.datastore.sd datastore` for a Signal

Simulate the `sldemo_fuelsys` model, which is configured to log several signals, to create data in the Simulation Data Inspector repository.

```
sim('sldemo_fuelsys')
```

Use the Simulation Data Inspector programmatic interface to get the signal ID for the signal.

```
runCount = Simulink.sdi.getRunCount;
latestRunID = Simulink.sdi.getRunIDByIndex(runCount);
latestRun = Simulink.sdi.getRun(latestRunID);
speedSigID = latestRun.getSignalIDByIndex(4);
```

Use the signal ID to create a `matlab.io.datastore.sd datastore` for the speed signal.

```
speedSDIDs = matlab.io.datastore.sd datastore(speedSigID);
```

Verify the Contents of the Datastore

Check the `Name` property of the `matlab.io.datastore.sd datastore` to verify that it matches your expectations.

```
speedSDIDs.Name
```

```
ans =
'map'
```

You can also use the `preview` method to check that the first ten samples in the signal look correct.

```
speedSDIDs.preview
```

```
ans=10x1 timetable
      Time      Data
-----
0 sec          0.589
0.00056199 sec 0.58772
0.0033719 sec  0.58148
0.01 sec       0.56765
0.02 sec       0.54897
0.03 sec       0.53264
0.04 sec       0.51837
0.05 sec       0.50594
0.055328 sec   0.5
0.055328 sec   0.5
```

Process Signal Data with the `matlab.io.datastore.sd datastore`

When your signal is too large to fit into memory, you can use the `readData` method to read chunks of data from the Simulation Data Inspector repository to incrementally process your data. Use the

hasdata method as the condition for a while loop to incrementally process the whole signal. For example, find the maximum signal value.

```
latestMax = [];  
  
while speedSDIds.hasdata  
    speedChunk = speedSDIds.read;  
    speedChunkData = speedChunk.Data;  
    latestMax = max([speedChunkData; latestMax]);  
  
end
```

```
end
```

```
latestMax
```

```
latestMax = 0.8897
```

On each read operation, the read method updates the read position for the start of the next read operation. After reading some or all of the `matlab.io.datastore.sd datastore`, you can reset the read position to start again from the beginning of the signal.

```
speedSDIds.reset
```

Process Signal Data in Memory

When the signal referenced by your `matlab.io.datastore.sd datastore` fits into memory, you can use the `readall` method to read all the signal data into memory for processing, rather than reading and processing the data incrementally with the `read` method. The `readall` method returns a `timetable` with all the signal data.

```
speedTimetable = speedSDIds.readall;
```

```
speedMax = max(speedTimetable.Data)
```

```
speedMax = 0.8897
```

hasdata

Class: `matlab.io.datastore.sd datastore`

Package: `matlab.io.datastore`

Determine if data is available to read

Syntax

```
tf = sdi_ds.hasdata
```

Description

`tf = sdi_ds.hasdata` returns logical 1 if the `matlab.io.datastore.sd datastore`, `sdi_ds`, has data available to read. When `sdi_ds` does not have data available to read, `hasdata` returns 0.

Output Arguments

tf — Data availability indication

logical

Logical indication of whether the `matlab.io.datastore.sd datastore` has data available to read. When data is available, `tf` is 1. When data is not available, `tf` is 0.

Examples

Process Signal Data Using a `matlab.io.datastore.sd datastore`

A `matlab.io.datastore.sd datastore` references signal data in the Simulation Data Inspector repository. When the signal is too large to fit into memory, you can use the `matlab.io.datastore.sd datastore` to incrementally process the data manually or to create a tall timetable for the signal that handles the incremental processing for you. preview

Class: `matlab.io.datastore.sd datastore`

Package: `matlab.io.datastore`

Return preview of data in `sd datastore`

Syntax

```
dataPreview = sdi_ds.preview
```

Description

`dataPreview = sdi_ds.preview` returns the first 10 samples of signal data in the `matlab.io.datastore.sd datastore`, `sdi_ds`. The `preview` method does not change the read position. Use the `preview` method to verify that the data in your `matlab.io.datastore.sd datastore` appears as you expect.

Output Arguments

dataPreview — Preview of the data

`timetable`

First 10 samples of the signal referenced by the `matlab.io.datastore.sd datastore` in a `timetable`.

Examples

Process Signal Data Using a `matlab.io.datastore.sd datastore`

A `matlab.io.datastore.sd datastore` references signal data in the Simulation Data Inspector repository. read

Class: `matlab.io.datastore.sd datastore`

Package: `matlab.io.datastore`

Read a chunk of data from an `sd datastore`

Syntax

```
data = sdi_ds.read
```

Description

`data = sdi_ds.read` reads a chunk of samples from the `matlab.io.datastore.sd datastore`, `sdi_ds`, and updates the read position for `sdi_ds` to the point following the endpoint of the returned data. The samples are returned in the `timetable`, `data`. The number of samples read by the `read` method vary, and the returned `timetable` always fits into memory. Use the `read` method to incrementally process signals that are too large to fit into memory.

Output Arguments

data — Chunk of data read from `sd datastore`

`timetable`

Chunk of samples read from the `matlab.io.datastore.simulationdatastore`, returned as a `timetable`.

Examples

Process Signal Data Using a `matlab.io.datastore.sd datastore`

A `matlab.io.datastore.sd datastore` references signal data in the Simulation Data Inspector repository. When the signal is too large to fit into memory, you can use the `matlab.io.datastore.sd datastore` to incrementally process the data manually or to create a tall `timetable` for the signal that handles the incremental processing for you. This example shows how to process data using a `matlab.io.datastore.sd datastore`.

Process Signal Data with the `matlab.io.datastore.sd datastore`

When your signal is too large to fit into memory, you can use the `readData` method to read chunks of data from the Simulation Data Inspector repository to incrementally process your data. Use the `hasdata` method as the condition for a while loop to incrementally process the whole signal. For example, find the maximum signal value.

```
latestMax = [];

while speedSDIds.hasdata

    speedChunk = speedSDIds.read;
    speedChunkData = speedChunk.Data;
    latestMax = max([speedChunkData; latestMax]);

end

latestMax

latestMax = 0.8897
```

On each read operation, the `read` method updates the read position for the start of the next read operation. After reading some or all of the `matlab.io.datastore.sd datastore`, you can reset the read position to start again from the beginning of the signal.

```
speedSDIds.reset
```

Process Signal Data in Memory

When the signal referenced by your `matlab.io.datastore.sd datastore` fits into memory, you can use the `readall` method to read all the signal data into memory for processing, rather than reading and processing the data incrementally with the `read` method. The `readall` method returns a `timetable` with all the signal data.

```
speedTimetable = speedSDIds.readall;
```

```
speedMax = max(speedTimetable.Data)
```

```
speedMax = 0.8897
```

Alternatives

You can use your `matlab.io.datastore.sd datastore` to create a tall `timetable` to process signals too large to fit into memory. The tall `timetable` handles loading and processing the chunks of signal data for you. The `matlab.io.datastore.sd datastore` reference page includes an example that shows how to process your data using a tall `timetable`. For more information about working with tall `timetables`, see “Tall Arrays” (MATLAB).

```

Description

`sdi_ds.reset` resets the read position for the `matlab.io.datastore.sd datastore`, `sdi_ds`, to the beginning.

Examples

Process Signal Data Using a `matlab.io.datastore.sd datastore`

A `matlab.io.datastore.sd datastore` references signal data in the Simulation Data Inspector repository. When the signal is too large to fit into memory, you can use the `matlab.io.datastore.sd datastore` to incrementally process the data manually or to create a tall timetable for the signal that handles the incremental processing for you. This example shows how to process data using a `matlab.io.datastore.sd datastore`.

Create a `matlab.io.datastore.sd datastore` for a Signal

Simulate the `sldemo_fuelsys` model, which is configured to log several signals, to create data in the Simulation Data Inspector repository.

```
sim('sldemo_fuelsys')
```

Use the Simulation Data Inspector programmatic interface to get the signal ID for the signal.

```
runCount = Simulink.sdi.getRunCount;  
latestRunID = Simulink.sdi.getRunIDByIndex(runCount);  
latestRun = Simulink.sdi.getRun(latestRunID);  
speedSigID = latestRun.getSignalIDByIndex(4);
```

Use the signal ID to create a `matlab.io.datastore.sd datastore` for the speed signal.

```
speedSDIds = matlab.io.datastore.sd datastore(speedSigID);
```

Verify the Contents of the Datastore

Check the `Name` property of the `matlab.io.datastore.sd datastore` to verify that it matches your expectations.

```
speedSDIds.Name
```

```
ans =
'map'
```

You can also use the `preview` method to check that the first ten samples in the signal look correct.

```
speedSDIds.preview
```

```
ans=10x1 timetable
      Time      Data
-----
0 sec          0.589
0.00056199 sec 0.58772
0.0033719 sec  0.58148
0.01 sec       0.56765
0.02 sec       0.54897
0.03 sec       0.53264
0.04 sec       0.51837
0.05 sec       0.50594
0.055328 sec   0.5
0.055328 sec   0.5
```

Process Signal Data with the `matlab.io.datastore.sd datastore`

When your signal is too large to fit into memory, you can use the `readData` method to read chunks of data from the Simulation Data Inspector repository to incrementally process your data. Use the `hasdata` method as the condition for a while loop to incrementally process the whole signal. For example, find the maximum signal value.

```
latestMax = [];
while speedSDIds.hasdata
    speedChunk = speedSDIds.read;
    speedChunkData = speedChunk.Data;
    latestMax = max([speedChunkData; latestMax]);
end
latestMax
latestMax = 0.8897
```

On each read operation, the `read` method updates the read position for the start of the next read operation. After reading some or all of the `matlab.io.datastore.sd datastore`, you can reset the read position to start again from the beginning of the signal.

```
speedSDIds.reset
```

Process Signal Data in Memory

When the signal referenced by your `matlab.io.datastore.sd datastore` fits into memory, you can use the `readall` method to read all the signal data into memory for processing, rather than reading and processing the data incrementally with the `read` method. The `readall` method returns a `timetable` with all the signal data.

```
speedT timetable = speedSDIds.readall;  
speedMax = max(speedT timetable.Data)  
speedMax = 0.8897
```

Topics

“Datastore” (MATLAB)

Introduced in R2017b

matlab.io.datastore.SimulationDatastore class

Package: matlab.io.datastore

Datastore for inputs and outputs of Simulink models

Description

A `matlab.io.datastore.SimulationDatastore` object enables a Simulink model to interact with big data. You can load big data as simulation input and log big output data from a simulation. To simulate models with big data, you store the data in a MAT-file and refer to the data through a `SimulationDatastore` object. See “Work with Big Data for Simulations”.

A `SimulationDatastore` object refers to big simulation data (which a MAT-file stores) for one signal. If the MAT-file stores simulation data for a bus signal, a `SimulationDatastore` object refers to the data for one leaf signal element in the bus. You can use the datastore object to inspect and access the data and, through a parent object such as `Simulink.SimulationData.Signal`, simulate a Simulink model with the data.

To analyze the datastore data, you can use the methods and properties of the `SimulationDatastore` object as well as MATLAB tools such as the `tall` function. For more information about the MATLAB tools, see “Getting Started with Datastore” (MATLAB).

Construction

After you store big simulation data in a `Simulink.SimulationData.Dataset` object in a MAT-file, a signal element in the `Dataset` object points to the big data. To create a `matlab.io.datastore.SimulationDatastore` object that refers to the big data:

- 1 At the command prompt or in a script, create a `Simulink.SimulationData.DatasetRef` object that refers to the `Dataset` object in the MAT-file.
- 2 Use one of these techniques:
 - Use one-based, curly-brace indexing (for example, `{1}`) to return an object that represents the target signal element, such as `Simulink.SimulationData.Signal` or `Simulink.SimulationData.State`. For example, for a `DatasetRef` object named `logout_ref`, to create a `Signal` object that refers to the second signal element, use this code:

```
myLoggedSig = logout_ref{2}
```
 - Use the `getAsDatastore` method of the `DatasetRef` object to return an object that represents the target signal element. For more information, see `getAsDatastore`.

The `SimulationDatastore` object resides in the `Values` property of the returned object.

Properties

FileName — Name and path of file that contains big data

character vector

Name and path of the file that contains the big data, returned as a character vector. This property is read-only.

Data Types: char

NumSamples — Total number of samples (time steps) in the datastore

integer

Total number of samples (time steps) in the datastore, returned as an integer. The `readall` method extracts this many samples from the big data. This property is read-only.

Data Types: uint64

ReadSize — Amount of data to read at a time

100 (default) | scalar double

Amount of data to read at a time, in number of samples (time steps), specified as a scalar double. The `read` method extracts this many samples from the big data.

Data Types: double

Methods

<code>hasdata</code>	Determine if data is available to read
<code>isPartitionable</code>	Determine whether datastore is partitionable
<code>isShuffleable</code>	Determine whether datastore is shuffleable
<code>preview</code>	Return subset of data from datastore
<code>progress</code>	Return percentage of data that you have read from a datastore
<code>read</code>	Read data in datastore
<code>readall</code>	Read all data in datastore
<code>reset</code>	Reset datastore to initial state

Copy Semantics

Handle. To learn how handle classes affect copy operations, see [Copying Objects \(MATLAB\)](#).

Limitations

- `SimulationDatastore` does not support using a parallel pool with Parallel Computing Toolbox installed. To analyze data using tall arrays or run MapReduce algorithms, set the global execution environment to be the local MATLAB session using `mapreducer`. Enter this code:

```
mapreducer(0)
```

For information about controlling parallel resources, see “Run mapreduce on a Parallel Pool” (Parallel Computing Toolbox).

- You cannot use a MATLAB tall variable as simulation input data.

Examples

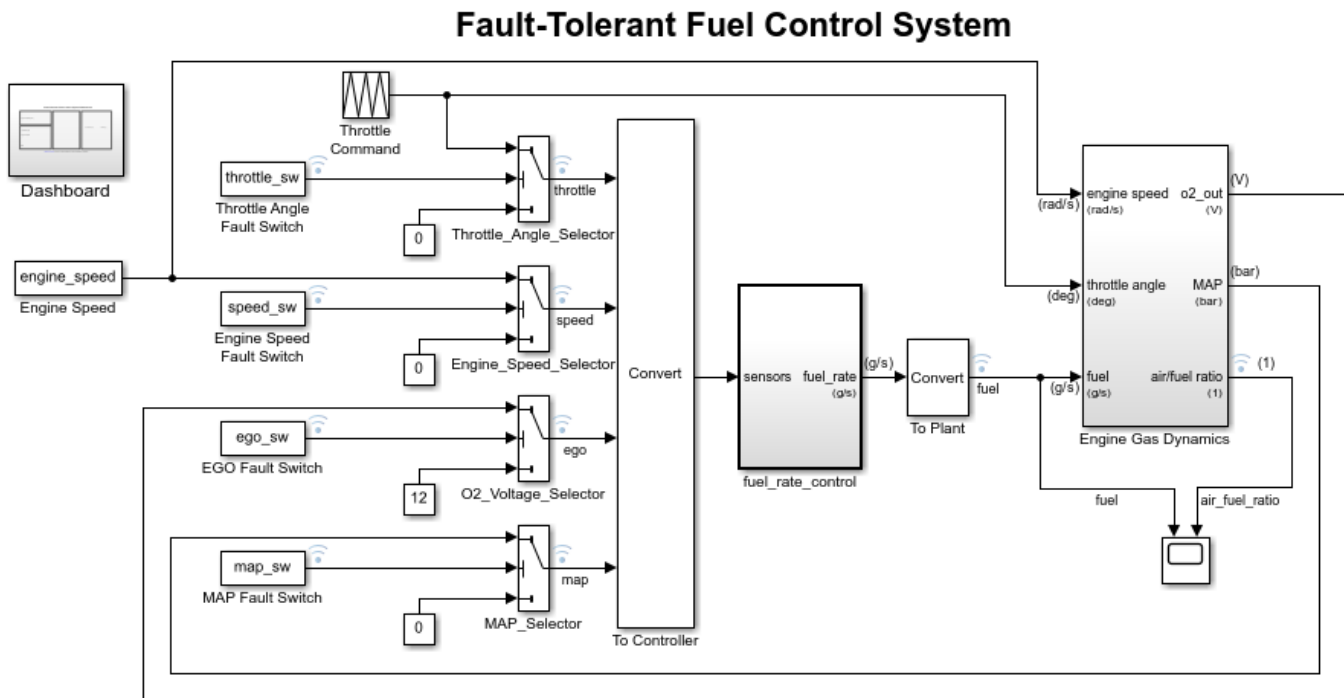

Inspect and Analyze Data in Simulation Datastore

This example shows how to log big data from a simulation and inspect and analyze portions of that data by interacting with a `matlab.io.datastore.SimulationDatastore` object.

Log Big Data from Model

Open the example model `sldemo_fuelsys`.

```
open_system('sldemo_fuelsys')
```

[Open the Dashboard](#) subsystem to simulate any combination of sensor failures.

Copyright 1990-2017 The MathWorks, Inc.

Select **Configuration Parameters > Data Import/Export > Log Dataset data to file.**

```
set_param('sldemo_fuelsys', 'LoggingToFile', 'on')
```

Simulate the model.

```
sim('sldemo_fuelsys')
```

The MAT-file `out.mat` appears in your current folder. The file contains data for logged signals such as `fuel` (which is at the root level of the model).

At the command prompt, create a `DatasetRef` object that refers to the logging variable by name, `sldemo_fuelsys_output`.

```
DSRef = Simulink.SimulationData.DatasetRef('out.mat', 'sldemo_fuelsys_output');
```

Preview Big Data

Use curly braces (`{` and `}`) to extract the signal element `fuel`, which is the tenth element in `DSRef`, as a `Simulink.SimulationData.Signal` object that contains a `SimulationDatastore` object.

```
SimDataSig = DSRef{10};
```

To more easily interact with the `SimulationDatastore` object that resides in the `Values` property of the `Signal` object, store a handle in a variable named `DStore`.

```
DStore = SimDataSig.Values;
```

Use the `preview` method to inspect the first five samples of logged data for the `fuel` signal.

```
preview(DStore)
```

```
ans =
```

```
10x1 timetable
```

Time	Data
0 sec	1.209
0.00056199 sec	1.209
0.0033719 sec	1.209
0.01 sec	1.1729
0.02 sec	1.1409
0.03 sec	1.1124
0.04 sec	1.0873
0.05 sec	1.0652
0.055328 sec	1.0652
0.055328 sec	1.0652

Inspect Specific Sample

Inspect the 603rd sample of logged `fuel` data.

Set the `ReadSize` property of `DStore` to a number that, considering memory resources, your computer can tolerate. For example, set `ReadSize` to 200.

```
DStore.ReadSize = 200;
```

Read from the datastore three times. Each read operation advances the reading position by 200 samples.

```
read(DStore);
read(DStore);
read(DStore);
```

Now that you are very close to the 603rd sample, set `ReadSize` to a smaller number. For example, set `ReadSize` to 5.

```
DStore.ReadSize = 5;
```

Read from the datastore again.

```
read(DStore)
```

```
ans =
```

```
5x1 timetable
```

Time	Data
5.79 sec	1.6097
5.8 sec	1.6136
5.81 sec	1.6003
5.82 sec	1.5904
5.83 sec	1.5832

The third sample of read data is the 603rd sample in the datastore.

Inspect Earlier Sample

Inspect the 403rd sample of logged `fuel` data. Due to previous read operations, the datastore now reads starting from the 606th sample, so you must reset the datastore. Then, you can read from the first sample up to the 403rd sample.

Use the `reset` method to reset `DStore`.

```
reset(DStore);
```

Set `ReadSize` to 200 again.

```
DStore.ReadSize = 200;
```

Read from the datastore twice to advance the read position to the 401st sample.

```
read(DStore);  
read(DStore);
```

Set `ReadSize` to 5 again.

```
DStore.ReadSize = 5;
```

Read from the datastore.

```
read(DStore)
```

```
ans =
```

```
5x1 timetable
```

Time	Data
3.85 sec	0.999
3.86 sec	0.99219
3.87 sec	0.98538
3.88 sec	0.97858

3.89 sec 0.97179

Extract Multiple Samples

Extract samples 1001 through 1020 (a total of 20 samples).

Reset the datastore.

```
reset(DStore)
```

Advance to sample 1001.

```
DStore.ReadSize = 200;
```

```
for i = 1:5
    read(DStore);
end
```

Prepare to extract 20 samples from the datastore.

```
DStore.ReadSize = 20;
```

Extract samples 1001 through 1020. Store the extracted data in a variable named `targetSamples`.

```
targetSamples = read(DStore)
```

```
targetSamples =
```

```
20x1 timetable
```

Time	Data
9.7 sec	1.5828
9.71 sec	1.5733
9.72 sec	1.5664
9.73 sec	1.5614
9.74 sec	1.5579
9.75 sec	1.5553
9.76 sec	1.5703
9.77 sec	1.582
9.78 sec	1.5913
9.79 sec	1.5988
9.8 sec	1.605
9.81 sec	1.6101
9.82 sec	1.6145
9.83 sec	1.6184
9.84 sec	1.6049
9.85 sec	1.595
9.86 sec	1.5877
9.87 sec	1.5824
9.88 sec	1.5785
9.89 sec	1.5757

Find Maximum Value of Data in Datastore

Reset the datastore.

```
reset(DStore)
```

Write a while loop, using the `hasdata` method, to incrementally analyze the data in chunks of 200 samples.

```
DStore.ReadSize = 200;
runningMax = [];
while hasdata(DStore)
    tt = read(DStore);
    rawChunk = tt.Data;
    runningMax = max([rawChunk; runningMax]);
end
```

Now, the variable `runningMax` stores the maximum value in the entire datastore.

```
runningMax
```

```
runningMax =
```

```
    1.6423
```

hasdata

Class: `matlab.io.datastore.SimulationDatastore`

Package: `matlab.io.datastore`

Determine if data is available to read

Syntax

```
tf = hasdata(dst)
```

Description

`tf = hasdata(dst)` returns logical 1 (true) if there is data available to read from the datastore (`matlab.io.datastore.SimulationDatastore` object) specified by `dst`. Otherwise, it returns logical 0 (false).

Input Arguments

dst — Input datastore

`matlab.io.datastore.SimulationDatastore` object

Input datastore, specified as a `matlab.io.datastore.SimulationDatastore` object. To create a `SimulationDatastore` object, see `matlab.io.datastore.SimulationDatastore`.

Examples

Inspect and Analyze Data in Simulation Datastore

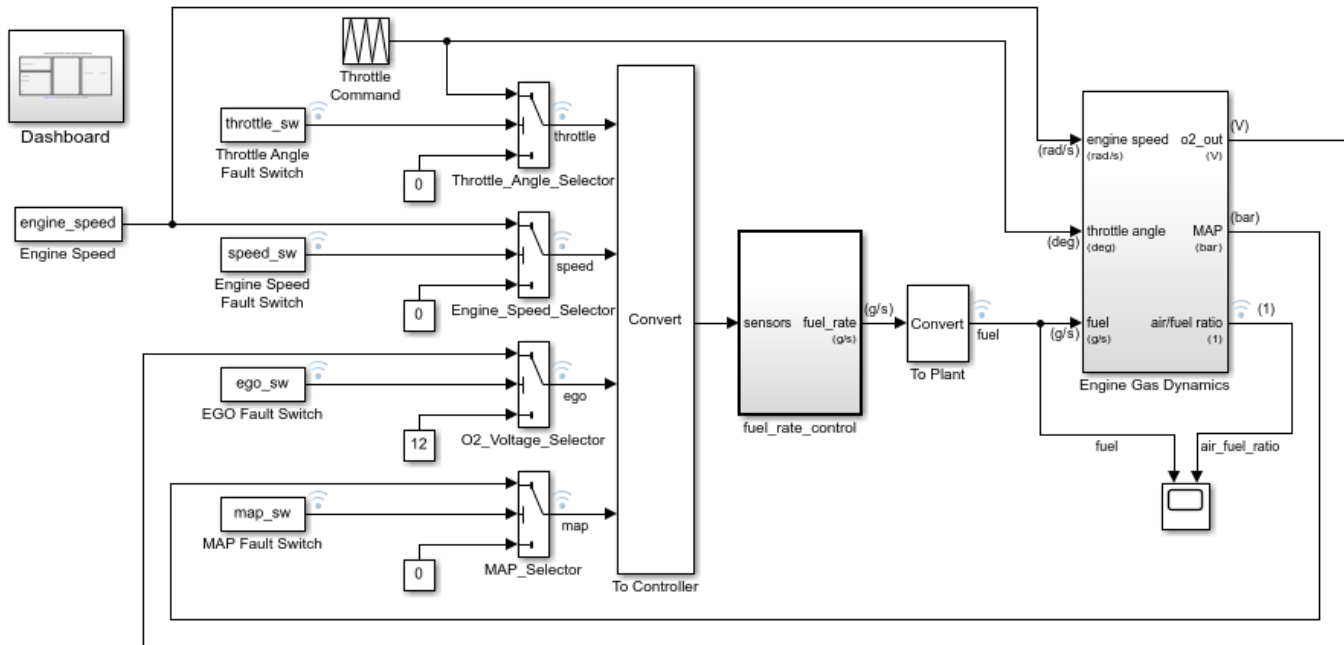

This example shows how to log big data from a simulation and inspect and analyze portions of that data by interacting with a `matlab.io.datastore.SimulationDatastore` object.

isPartitionable

Class: `matlab.io.datastore.SimulationDatastore`

Package: `matlab.io.datastore`

Determine whether datastore is partitionable

Syntax

```
tf = isPartitionable(ds)
```

Description

`tf = isPartitionable(ds)` returns logical 1 (true) if the datastore `ds` is partitionable. Otherwise, the result is logical 0 (false).

Input Arguments

ds — Input datastore

datastore

Input datastore. You can use these datastores as input:

- MATLAB datastores — Datastores created using MATLAB datastore functions. For a complete list of datastores, see “Select Datastore for File Format or Application” (MATLAB).
- Combined and transformed datastores — Datastores created using the `combine` and `transform` functions.
- Custom datastores — Datastores created using the custom datastore framework. Any datastore that subclasses from `matlab.io.Datastore` supports the `isPartitionable` function. See “Develop Custom Datastore” (MATLAB) for more information.

Examples

Test Partitionability of Simulation Datastore

This example shows how to determine the partitionability of a `matlab.io.datastore.SimulationDatastore` object that contains big data from a simulation.

Log Big Data from Model

Open the example model `sldemo_fuelsys`.

```
open_system('sldemo_fuelsys')
```

Fault-Tolerant Fuel Control System

[Open the Dashboard](#) subsystem to simulate any combination of sensor failures.

Copyright 1990-2017 The MathWorks, Inc.

Select **Configuration Parameters > Data Import/Export > Log Dataset data to file.**

```
set_param('sldemo_fuelsys', 'LoggingToFile', 'on')
```

Simulate the model.

```
sim('sldemo_fuelsys')
```

The MAT-file `out.mat` appears in your current folder. The file contains data for logged signals such as `fuel` (which is at the root level of the model).

At the command prompt, create a `DatasetRef` object that refers to the logging variable by name, `sldemo_fuelsys_output`.

```
DSRef = Simulink.SimulationData.DatasetRef('out.mat', 'sldemo_fuelsys_output');
```

Preview Big Data

Use curly braces (`{}` and `}`) to extract the signal element `fuel`, which is the tenth element in `DSRef`, as a `Simulink.SimulationData.Signal` object that contains a `SimulationDatastore` object.

```
SimDataSig = DSRef{10};
```

To more easily interact with the `SimulationDatastore` object that resides in the `Values` property of the `Signal` object, store a handle in a variable named `DStore`.

```
DStore = SimDataSig.Values;
```

Determine if the datastore is partitionable.

```
if isPartitionable(DStore)
    disp('Datastore is partitionable.')
else
    disp('Datastore is not partitionable.')
end
```

Datastore is not partitionable.

isShuffleable

Class: `matlab.io.datastore.SimulationDatastore`

Package: `matlab.io.datastore`

Determine whether datastore is shuffleable

Syntax

```
tf = isShuffleable(ds)
```

Description

`tf = isShuffleable(ds)` returns logical 1 (true) if the datastore `ds` is shuffleable. Otherwise, the result is logical 0 (false).

You can use the `shuffle` function on shuffleable datastores to randomize the ordering of files, while preserving the row associations of files in different datastores.

Input Arguments

ds — Input datastore

datastore

Input datastore. You can use these datastores as input:

- MATLAB datastores — Datastores created using MATLAB `datastore` functions. For a complete list of datastores, see “Select Datastore for File Format or Application” (MATLAB).
- Combined and transformed datastores — Datastores created using the `combine` and `transform` functions.
- Custom datastores — Datastores created using the custom datastore framework. Any datastore that subclasses from `matlab.io.Datastore` supports the `isShuffleable` function. See “Develop Custom Datastore” (MATLAB) for more information.

Examples

Test Shuffleability of Simulation Datastore

This example shows how to determine the shuffleability of a `matlab.io.datastore.SimulationDatastore` object that contains big data from a simulation.

Log Big Data from Model

Open the example model `sldemo_fuelsys`.

```
open_system('sldemo_fuelsys')
```

preview

Class: `matlab.io.datastore.SimulationDatastore`

Package: `matlab.io.datastore`

Return subset of data from datastore

Syntax

```
data = preview(dst)
```

Description

`data = preview(dst)` returns a subset of data from datastore (`matlab.io.datastore.SimulationDatastore` object) `dst` without changing its current read position. `preview` returns only the first ten samples (time steps) of data in the datastore. Use this method to quickly inspect and verify that the data appears as you expect.

Input Arguments

dst — Input datastore

`matlab.io.datastore.SimulationDatastore` object

Input datastore, specified as a `matlab.io.datastore.SimulationDatastore` object. To create a `SimulationDatastore` object, see `matlab.io.datastore.SimulationDatastore`.

Output Arguments

data — Subset of data

`timetable` object

Subset of data, returned as a `timetable` object. For information about `timetable`, see “Timetables” (MATLAB).

Examples

Inspect and Analyze Data in Simulation Datastore

This example shows how to log big data from a simulation and inspect and analyze portions of that data by interacting with a `matlab.io.datastore.SimulationDatastore` object.

Log Big Data from Model

Open the example model `sldemo_fuelsys`.

```
open_system('sldemo_fuelsys')
```

Fault-Tolerant Fuel Control System

[Open the Dashboard](#) subsystem to simulate any combination of sensor failures.

Copyright 1990-2017 The MathWorks, Inc.

Select **Configuration Parameters > Data Import/Export > Log Dataset data to file.**

```
set_param('sldemo_fuelsys', 'LoggingToFile', 'on')
```

Simulate the model.

```
sim('sldemo_fuelsys')
```

The MAT-file `out.mat` appears in your current folder. The file contains data for logged signals such as `fuel` (which is at the root level of the model).

At the command prompt, create a `DatasetRef` object that refers to the logging variable by name, `sldemo_fuelsys_output`.

```
DSRef = Simulink.SimulationData.DatasetRef('out.mat', 'sldemo_fuelsys_output');
```

Preview Big Data

Use curly braces (`{}` and `}`) to extract the signal element `fuel`, which is the tenth element in `DSRef`, as a `Simulink.SimulationData.Signal` object that contains a `SimulationDatastore` object.

```
SimDataSig = DSRef{10};
```

To more easily interact with the `SimulationDatastore` object that resides in the `Values` property of the `Signal` object, store a handle in a variable named `DStore`.

```
DStore = SimDataSig.Values;
```

Use the `preview` method to inspect the first five samples of logged data for the `fuel` signal.

```
preview(DStore)
```

```
ans =
```

```
10x1 timetable
```

Time	Data
0 sec	1.209
0.00056199 sec	1.209
0.0033719 sec	1.209
0.01 sec	1.1729
0.02 sec	1.1409
0.03 sec	1.1124
0.04 sec	1.0873
0.05 sec	1.0652
0.055328 sec	1.0652
0.055328 sec	1.0652

Inspect Specific Sample

Inspect the 603rd sample of logged fuel data.

Set the `ReadSize` property of `DStore` to a number that, considering memory resources, your computer can tolerate. For example, set `ReadSize` to 200.

```
DStore.ReadSize = 200;
```

Read from the datastore three times. Each read operation advances the reading position by 200 samples.

```
read(DStore);
read(DStore);
read(DStore);
```

Now that you are very close to the 603rd sample, set `ReadSize` to a smaller number. For example, set `ReadSize` to 5.

```
DStore.ReadSize = 5;
```

Read from the datastore again.

```
read(DStore)
```

```
ans =
```

```
5x1 timetable
```

Time	Data
5.79 sec	1.6097
5.8 sec	1.6136
5.81 sec	1.6003
5.82 sec	1.5904

```
5.83 sec    1.5832
```

The third sample of read data is the 603rd sample in the datastore.

Inspect Earlier Sample

Inspect the 403rd sample of logged fuel data. Due to previous read operations, the datastore now reads starting from the 606th sample, so you must reset the datastore. Then, you can read from the first sample up to the 403rd sample.

Use the `reset` method to reset `DStore`.

```
reset(DStore);
```

Set `ReadSize` to 200 again.

```
DStore.ReadSize = 200;
```

Read from the datastore twice to advance the read position to the 401st sample.

```
read(DStore);
read(DStore);
```

Set `ReadSize` to 5 again.

```
DStore.ReadSize = 5;
```

Read from the datastore.

```
read(DStore)
```

```
ans =
```

```
5x1 timetable
```

Time	Data
3.85 sec	0.999
3.86 sec	0.99219
3.87 sec	0.98538
3.88 sec	0.97858
3.89 sec	0.97179

Extract Multiple Samples

Extract samples 1001 through 1020 (a total of 20 samples).

Reset the datastore.

```
reset(DStore)
```

Advance to sample 1001.

```
DStore.ReadSize = 200;
```

```
for i = 1:5
    read(DStore);
end
```

Prepare to extract 20 samples from the datastore.

```
DStore.ReadSize = 20;
```

Extract samples 1001 through 1020. Store the extracted data in a variable named `targetSamples`.

```
targetSamples = read(DStore)
```

```
targetSamples =
```

```
20x1 timetable
```

Time	Data
9.7 sec	1.5828
9.71 sec	1.5733
9.72 sec	1.5664
9.73 sec	1.5614
9.74 sec	1.5579
9.75 sec	1.5553
9.76 sec	1.5703
9.77 sec	1.582
9.78 sec	1.5913
9.79 sec	1.5988
9.8 sec	1.605
9.81 sec	1.6101
9.82 sec	1.6145
9.83 sec	1.6184
9.84 sec	1.6049
9.85 sec	1.595
9.86 sec	1.5877
9.87 sec	1.5824
9.88 sec	1.5785
9.89 sec	1.5757

Find Maximum Value of Data in Datastore

Reset the datastore.

```
reset(DStore)
```

Write a `while` loop, using the `hasdata` method, to incrementally analyze the data in chunks of 200 samples.

```
DStore.ReadSize = 200;
runningMax = [];
while hasdata(DStore)
    tt = read(DStore);
    rawChunk = tt.Data;
    runningMax = max([rawChunk; runningMax]);
end
```

Now, the variable `runningMax` stores the maximum value in the entire datastore.

```
runningMax
```

```
runningMax =
```

```
    1.6423
```

progress

Class: `matlab.io.datastore.SimulationDatastore`

Package: `matlab.io.datastore`

Return percentage of data that you have read from a datastore

Syntax

```
p = progress(dst)
```

Description

`p = progress(dst)` returns the percentage, as a number between 0 and 1, of the data that you have read from a datastore (`matlab.io.datastore.SimulationDatastore` object). For example, a return value of 0.55 means you have read 55% of the data. Use the `progress` method and the `NumSamples` property to determine the current read position.

You read data from a `SimulationDatastore` object by using the `read` method.

Input Arguments

dst — Input datastore

`matlab.io.datastore.SimulationDatastore` object

Input datastore, specified as a `matlab.io.datastore.SimulationDatastore` object. To create a `SimulationDatastore` object, see `matlab.io.datastore.SimulationDatastore`.

Output Arguments

p — Percentage of data that you have read from the datastore

scalar double

Percentage of data that you have read from the datastore, returned as a scalar double.

Data Types: `double`

Topics

“Work with Big Data for Simulations”

Introduced in R2017a

read

Class: `matlab.io.datastore.SimulationDatastore`

Package: `matlab.io.datastore`

Read data in datastore

Syntax

```
data = read(dst)
[data,info] = read(dst)
```

Description

`data = read(dst)` returns data from a datastore (`matlab.io.datastore.SimulationDatastore` object). Subsequent calls to the `read` function continue reading from the endpoint of the previous call. Use the `ReadSize` property of the `SimulationDatastore` object to specify the amount of data, in samples (time steps), to read at a time. Use the `progress` method and the `NumSamples` property to determine the current read position.

`[data,info] = read(dst)` also returns information about the extracted data in `info`.

Input Arguments

dst — Input datastore

`matlab.io.datastore.SimulationDatastore` object

Input datastore, specified as a `matlab.io.datastore.SimulationDatastore` object. To create a `SimulationDatastore` object, see `matlab.io.datastore.SimulationDatastore`.

Output Arguments

data — Output data

`timetable` object

Output data, returned as a `timetable` object. For information about `timetable`, see “Timetables” (MATLAB).

info — Information about read data

structure array

Information about read data, returned as a structure. The structure has one field, `FileName`, which is a fully resolved path containing the path string, the name of the file, and the file extension.

Examples

Inspect and Analyze Data in Simulation Datastore

This example shows how to log big data from a simulation and inspect and analyze portions of that data by interacting with a `matlab.io.datastore.SimulationDatastore` object.

Log Big Data from Model

Open the example model `sldemo_fuelsys`.

```
open_system('sldemo_fuelsys')
```

[Open the Dashboard](#) subsystem to simulate any combination of sensor failures.

Copyright 1990-2017 The MathWorks, Inc.

Select **Configuration Parameters > Data Import/Export > Log Dataset data to file.**

```
set_param('sldemo_fuelsys', 'LoggingToFile', 'on')
```

Simulate the model.

```
sim('sldemo_fuelsys')
```

The MAT-file `out.mat` appears in your current folder. The file contains data for logged signals such as `fuel` (which is at the root level of the model).

At the command prompt, create a `DatasetRef` object that refers to the logging variable by name, `sldemo_fuelsys_output`.

```
DSRef = Simulink.SimulationData.DatasetRef('out.mat', 'sldemo_fuelsys_output');
```

Preview Big Data

Use curly braces (`{` and `}`) to extract the signal element `fuel`, which is the tenth element in `DSRef`, as a `Simulink.SimulationData.Signal` object that contains a `SimulationDatastore` object.

```
SimDataSig = DSRef{10};
```

To more easily interact with the `SimulationDatastore` object that resides in the `Values` property of the `Signal` object, store a handle in a variable named `DStore`.

```
DStore = SimDataSig.Values;
```

Use the `preview` method to inspect the first five samples of logged data for the `fuel` signal.

```
preview(DStore)
```

```
ans =
```

```

“Work with Big Data for Simulations”

Introduced in R2017a

readall

Class: `matlab.io.datastore.SimulationDatastore`

Package: `matlab.io.datastore`

Read all data in datastore

Syntax

```
data = readall(dst)
```

Description

`data = readall(dst)` returns all the data in the datastore (`matlab.io.datastore.SimulationDatastore` object) specified by `dst`.

If all the data in the datastore does not fit in memory, `readall` returns an error. To determine how many samples (time steps) a datastore holds, inspect the `NumSamples` property of the `SimulationDatastore` object.

Input Arguments

dst — Input datastore

`matlab.io.datastore.SimulationDatastore` object

Input datastore, specified as a `matlab.io.datastore.SimulationDatastore` object. To create a `SimulationDatastore` object, see `matlab.io.datastore.SimulationDatastore`.

Output Arguments

data — All data in the datastore

`timetable` object

All data in the datastore, returned as a `timetable` object. For information about `timetable`, see “Timetables” (MATLAB).

reset

Class: `matlab.io.datastore.SimulationDatastore`

Package: `matlab.io.datastore`

Reset datastore to initial state

Syntax

```
reset(dst)
```

Description

`reset(dst)` sets the read position of the datastore (`matlab.io.datastore.SimulationDatastore` object) specified by `dst` to the first sample in the datastore. Use `reset` to reread data from a datastore. You read from a datastore by using the `read` method.

Input Arguments

dst — Input datastore

`matlab.io.datastore.SimulationDatastore` object

Input datastore, specified as a `matlab.io.datastore.SimulationDatastore` object. To create a `SimulationDatastore` object, see `matlab.io.datastore.SimulationDatastore`.

eventData

Provide information about block method execution events

Description

Simulink software creates an instance of this class when a block method execution event occurs during simulation and passes it to any listeners registered for the event (see `add_exec_event_listener`). The instance specifies the type of event that occurred and the block whose method execution triggered the event. See “Access Block Data During Simulation” for more information.

Parent

LibraryBrowser.LibraryBrowser2 class

Package: LibraryBrowser

Simulink Library Browser

Description

Programmatically display, hide, size, and position the Simulink Library Browser.

Construction

```
lb = LibraryBrowser.LibraryBrowser2
```

Properties

IsOnTop — Always put library window on top

0 (default) | 1

Always put library window on top of other Simulink Editor windows, specified as 1 for always on top.

Example: `lb.IsOnTop = 1`

Methods

Method	Meaning	Example
refresh	Update the library browser display with changes that affect the library browser. Examples include adding a library to the library browser, removing a library from the library browser, and changes to your custom libraries, <code>slblocks</code> function, or <code>sl_customization.m</code> file. In general, refresh the library browser when you have made any changes that affect libraries on your MATLAB path that are registered in the library browser. .	<pre>lb = LibraryBrowser.LibraryBrowser2; refresh(lb)</pre>
show	Display the library browser.	<pre>lb = LibraryBrowser.LibraryBrowser2; show(lb)</pre>
hide	Hide the library browser.	<pre>lb = LibraryBrowser.LibraryBrowser2; hide(lb)</pre>
getPosition	Get the position of the library browser. Returned as four integers, in pixels: upper-left x coordinate, upper-left y coordinate, width, and depth.	<pre>lb = LibraryBrowser.LibraryBrowser2; getPosition(lb) ans = 50 279 600 600</pre>

Method	Meaning	Example
setPosition	Set the position of the library browser. Use an array of integers, in pixels: upper-left x coordinate, upper-left y coordinate, width, and depth.	<pre>lb = LibraryBrowser.LibraryBrowser2; setPosition(lb,[70 250 500 500])</pre>

Introduced in R2016b

allowModelReferenceDiscreteSampleTimeInheritanceImpl

Model reference sample time inheritance status for discrete sample times

Syntax

```
flag = allowModelReferenceDiscreteSampleTimeInheritanceImpl(obj)
```

Description

`flag = allowModelReferenceDiscreteSampleTimeInheritanceImpl(obj)` specifies whether a System object in a referenced model is allowed to inherit the sample time of the parent model. Use this method only for System objects that use discrete sample time and are intended for inclusion in Simulink via the MATLAB System block.

Run-Time Details

During model compilation, Simulink sets the referenced model sample time inheritance before the System object `setupImpl` method is called.

Method Authoring Tips

You must set `Access = protected` for this method.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `allowModelReferenceDiscreteSampleTimeInheritanceImpl` method does not use the object, you can replace this input with `~`.

Output Arguments

flag — discrete sample time inheritance flag

true | false

Flag indicating whether model reference discrete sample time inheritance is allowed for the MATLAB System block containing the System object, returned as a logical value.

The default value for this argument depends on the number of inputs to the System object. If you want to use the default value, you do not need to include this method in your System object class definition file.

Number of System object Inputs	Default Value and Override Effects
No inputs	<p>Default: <code>false</code> — Model reference discrete sample time inheritance is not allowed.</p> <p>If your System object uses discrete sample time in its algorithm, override the default by returning <code>true</code> from <code>allowModelReferenceDiscreteSampleTimeInheritanceImpl</code>.</p>
One or more inputs	<p>Default: <code>true</code> — If no other Simulink constraint prevents it, model reference sample time inheritance is allowed.</p>

Examples

Set Sample Time Inheritance for System Object

For a System object that has one or more inputs, to disallow model reference discrete sample time inheritance for that object, set the sample time inheritance to `false`. Include this code in your class definition file for the object.

```
methods (Access = protected)
    function flag = allowModelReferenceDiscreteSampleTimeInheritanceImpl(~)
        flag = false;
    end
end
```

getInputNamesImpl

Names of MATLAB System block input ports

Syntax

```
names = getInputNamesImpl(obj)
```

Description

`names = getInputNamesImpl(obj)` specifies the names of the input ports from System object, `obj` implemented in a MATLAB System block. The size of `names` matches the number of inputs returned by the `getNumInputs` method. If you change a property value that changes the number of inputs, the names of those inputs also change.

Class Information

This method is part of the `matlab.System` class.

Run-Time Details

`getInputNamesImpl` is called by the MATLAB System block.

Method Authoring Tips

You must set `Access = protected` for this method.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `getInputNamesImpl` method does not use the object, you can replace this input with `~`.

Output Arguments

names — Names of inputs

empty string array (default) | string array

Names of the inputs for the specified object, returned as a string array whose length equals the number of inputs.

Examples

“Customize MATLAB System Block Appearance”

See Also

`getNumInputsImpl` | `getOutputNamesImpl`

Topics

“Specify Input and Output Names”

“Customize MATLAB System Block Appearance”

Introduced in R2013b

getOutputNamesImpl

Names of MATLAB System block output ports

Syntax

```
names = getOutputNamesImpl(obj)
```

Description

`names = getOutputNamesImpl(obj)` specifies the names of the output ports from System object, `obj` implemented in a MATLAB System block. The size of `names` matches the number of outputs returned by the `getNumOutputs` method. If you change a property value that affects the number of outputs, the names of those outputs also change.

Class Information

This method is part of the `matlab.System` class.

Run-Time Details

`getOutputNamesImpl` is called by the MATLAB System block.

Method Authoring Tips

You must set `Access = protected` for this method.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `getOutputNamesImpl` method does not use the object, you can replace this input with `~`.

Output Arguments

names — Names of outputs

empty string array (default) | string array

Names of the outputs for the specified object, returned as a string array whose length equals the number of outputs.

Examples

“Customize MATLAB System Block Appearance”

See Also

`getInputNamesImpl` | `getNumOutputsImpl`

Topics

“Specify Input and Output Names”

Introduced in R2013b

getPropertyGroupsImpl

Property groups for System object display

Syntax

```
group = getPropertyGroupsImpl
```

Description

`group = getPropertyGroupsImpl` specifies how to display properties in the block dialog of a MATLAB System block. You can specify:

- Sections — Arrange properties into sections (panel on the MATLAB System block dialog) with `matlab.system.display.Section`.
- Section Groups — Arrange properties and sections into groups (tabs on the MATLAB System block dialog) with `matlab.system.display.SectionGroup`.
- Order of properties — Specify the order of properties within sections/groups
- Order of sections — Specify the order of sections within groups.

If you create a section, but that section is not in a section group, its properties appear above the block dialog tab panels.

Run-Time Details

In Simulink, `getPropertyGroupsImpl` modifies the MATLAB System block dialog.

In MATLAB, `getPropertyGroupsImpl` modifies how properties appear when the System object is displayed at the MATLAB command line. `getPropertyGroupsImpl` defines the order and groupings of properties. If your `getPropertyGroupsImpl` defines multiple section groups, only properties from the first section group are displayed at the command line. To display properties in other sections, a link is provided at the end of a System object property display. Group titles are also displayed at the command line.

Method Authoring Tips

- You must set `Access = protected` for this method.
- If you include a `getPropertyGroupsImpl` method but do not list all properties, the excluded properties do not appear in the dialog box.
- To omit the `Main` title for the first group of properties, in `matlab.system.display.SectionGroup`, set `TitleSource` to `'Auto'`.
- By default if you do not customize this method in your System object, the MATLAB System block dialog displays all public properties in the order specified in the System object class file.
- To customize property names, add comments above each property. For an example, see “System Object to Block Dialog Box Default Mapping”.

Output Arguments

group — Property sections and groups

array of `SectionGroup` or `Section` objects

Property groups and sections to pass to the MATLAB System block, specified as an array of `matlab.system.display.Section` and `matlab.system.display.SectionGroup` objects.

Examples

“Customize System Block Dialog Box”

getSimulateUsingImpl

Specify value for Simulate using parameter

Syntax

```
simmode = getSimulateUsingImpl
```

Description

`simmode = getSimulateUsingImpl` specifies the simulation mode of the System object implemented in a MATLAB System block. The simulation mode restricts your System object to simulation using either code generation or interpreted execution. The associated `showSimulateUsingImpl` method controls whether the **Simulate using** option is displayed on the dialog box.

Run-Time Details

`getSimulateUsingImpl` is called by the MATLAB System block.

Method Authoring Tips

You must set `Access = protected` and `Static` for this method.

Output Arguments

`simmode` — Simulation mode

"Code generation" | "Interpreted execution"

Simulation mode, returned as the string "Code generation" or "Interpreted execution". If you do not include the `getSimulateUsingImpl` method in your class definition file, the simulation mode is unrestricted. Depending on the value returned by the associated `showSimulateUsingImpl` method, the simulation mode is displayed on the dialog box as either a dropdown list or not at all.

Examples

Specify the Simulation Mode

In the class definition file of your System object, define the simulation mode to display in the MATLAB System block. To prevent **Simulate using** from displaying, see `showSimulateUsingImpl`.

```
methods (Static, Access = protected)
    function simMode = getSimulateUsingImpl
        simMode = "Interpreted execution";
    end
end
```

getSimulinkFunctionNamesImpl

Register Simulink function names used in your System object

Syntax

```
names = getSimulinkFunctionNamesImpl(obj)
```

Description

`names = getSimulinkFunctionNamesImpl(obj)` specifies the Simulink function names used in the System object `obj`.

If you use a Simulink function in your System object, you can only call a Simulink function from the `stepImpl`, `updateImpl`, or `outputImpl` method.

Run-Time Details

`getSimulinkFunctionNamesImpl` is invoked by the MATLAB System during model compilation to obtain the list of Simulink functions being called from the System object. Simulink uses this information to resolve the function names to a Simulink function declared in a Simulink Function block. If `getSimulinkFunctionNamesImpl` does not return the name of a function being called in the System object methods, Simulink attempts to resolve the function to a function on the MATLAB path.

Method Authoring Tips

You must set `Access = protected` for this method.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `getSimulinkFunctionNamesImpl` method does not use the object, you can replace this input with `~`.

Output Arguments

names — Simulink function names

{ ' ' } (default) | cell array of character vectors | string array

The names of the Simulink function you want to call from your System object.

Examples

“Call Simulink Functions from a MATLAB System Block”

showFiSettingsImpl

Fixed point data type tab visibility for System objects

Syntax

```
flag = showFiSettingsImpl
```

Description

`flag = showFiSettingsImpl` specifies whether the Data Types tab appears on the MATLAB System block dialog box. The Data Types tab includes parameters to control processing of fixed point data the MATLAB System block. You cannot specify which parameters appear on the tab. If you implement `showFiSettingsImpl`, the simulation mode is set to code generation.

The parameters that appear on the Data Types tab, which cannot be customized, are:

- **Saturate on integer overflow** — a check box to control the action to take on integer overflow for built-in integer types. The default is that the box is checked, which indicates to saturate. This is also the default for when **Same as MATLAB** is selected as the **MATLAB System fimath** option.
- **Treat these inherited Simulink signal types as fi objects** — a pull down that indicates which inherited data types to treat as fi data types. Valid options are:
 - Fixed point (default)
 - Fixed point & integer
- **MATLAB System fimath** has two radio button options:
 - **Same as MATLAB** (default) — uses the current MATLAB fixed-point math settings.
 - **Specify Other** — enables the edit box for specifying the desired fixed-point math settings.

For information on setting fixed-point math, see `fimath`.

Run-Time Details

`showFiSettingsImpl` is called by the MATLAB System block. For more information, see “Simulink Engine Phases Mapped to System Object Methods”.

Method Authoring Tips

- If you do not want to display the tab, you do not need to implement this method in your class definition file.
- You must set `Access = protected` for this method.

Output Arguments

flag — Display Data Types tab

false (default) | true

Flag indicating whether to display the Data Types tab on the MATLAB System block mask, returned as a logical scalar value. Returning a `true` value displays the tab. A `false` value does not display the tab.

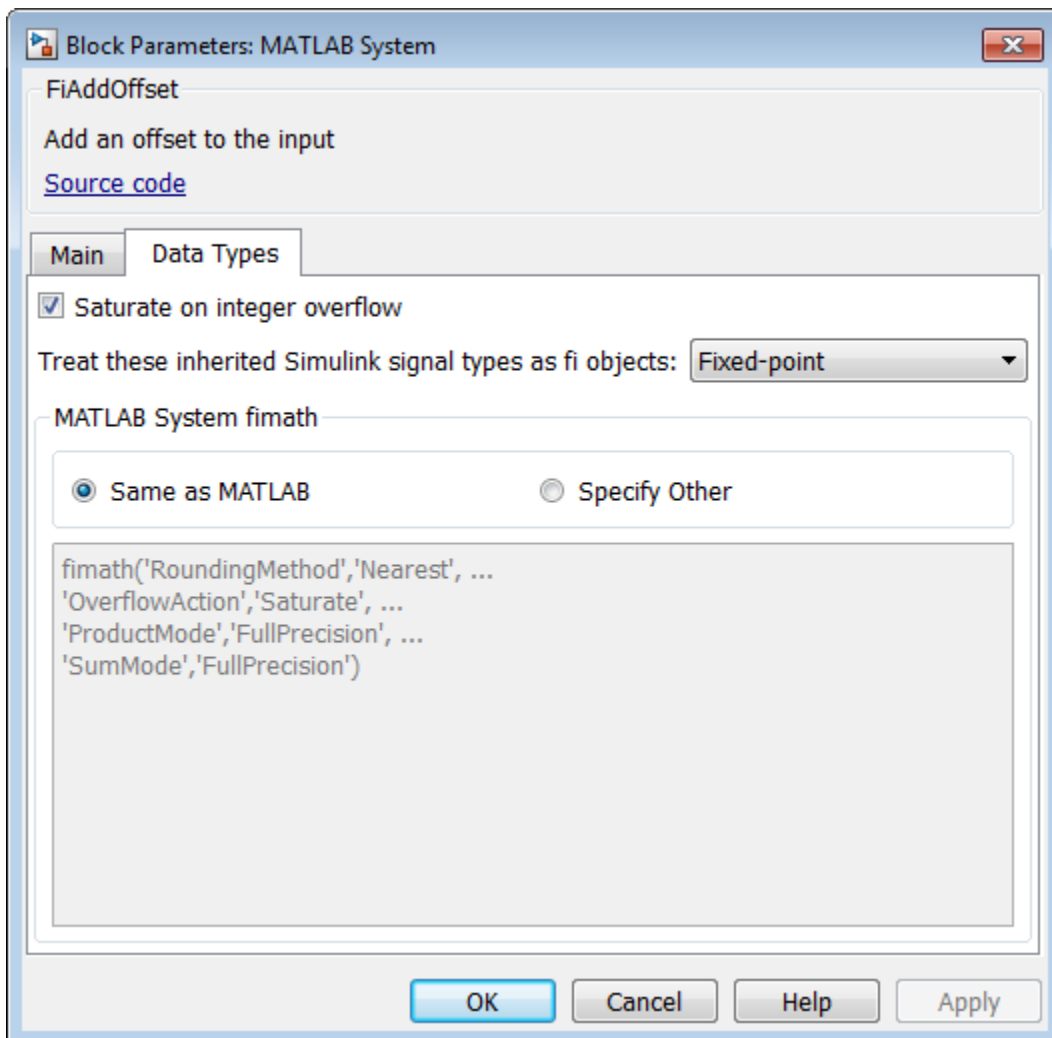

Examples

Show the Data Types Tab

Show the Data Types tab on the MATLAB System block dialog box.

```
methods (Static, Access = protected)
    function isVisible = showFiSettingsImpl
        isVisible = true;
    end
end
```

If you set the flag, `isVisible`, to `true`, the tab appears as follows when you add the object to Simulink with the MATLAB System block.

See Also

Topics

“Customize System Block Dialog Box”

Introduced in R2016a

showSimulateUsingImpl

Visibility of Simulate using parameter

Syntax

```
flag = showSimulateUsingImpl
```

Description

`flag = showSimulateUsingImpl` specifies whether **Simulate using** appears on the MATLAB System block dialog box.

Run-Time Details

`showSimulateUsingImpl` is called by the MATLAB System block.

Method Authoring Tips

You must set `Access = protected` and `Static` for this method.

Output Arguments

flag — Display parameter on block dialog box

`true` (default) | `false`

Flag indicating whether to display the **Simulate using** parameter and dropdown list on the MATLAB System block mask. `true` displays the parameter and dropdown list. `false` hides the parameter and dropdown list.

Examples

Hide the Simulate using Parameter

Hide the **Simulate using** parameter on the MATLAB System block dialog box.

```
methods (Static, Access = protected)
    function flag = showSimulateUsingImpl
        flag = false;
    end
end
```

If you set the `flag` to `true` or omit the `showSimulateUsingImpl` method, which defaults to `true`, the dialog appears as follows when you add the object to Simulink with the MATLAB System block.

If you also specify a single value for `getSimulateUsingImpl`, the dialog appears as follows when you add the object to Simulink with the MATLAB System block.

getGlobalNamesImpl

Global variable names for MATLAB System block

Syntax

```
name = getGlobalNamesImpl(obj)
```

Description

`name = getGlobalNamesImpl(obj)` specifies the names of global variables that are declared in a System object for use in a Simulink P-code file. For P-code files, in addition to declaring your global variables in `stepImpl`, `outputImpl`, or `updateImpl`, you must include the `getGlobalNamesImpl` method. You declare global variables in a cell array in the `getGlobalNamesImpl` method. System objects that contain these global variables are included in Simulink using a MATLAB System block. To enable a global variable in Simulink, your model also must include a Data Store Memory block with a **Data Store Name** that matches the global variable name.

Run-Time Details

`getGlobalNamesImpl` is called by the MATLAB System block.

Method Authoring Tips

You must set `Access = protected` for this method.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `getGlobalNamesImpl` method does not use the object, you can replace this input with `~`.

Output Arguments

name — Global variable names

cell array of character vectors

Cell array containing the global variable names. The elements of the cell array are character vectors.

Examples

Specify Global Names

Specify two global names in your class definition file.

```
methods(Access = protected)
    function glnames = getGlobalNamesImpl(obj)
```

```
    glnames = {'FEE','OTHERFEE'};
end

function y = stepImpl(obj,u)
    global FEE
    global OTHERFEE
    y = u - FEE * obj.lastData + OTHERFEE;
    obj.lastData = u;
end
end
```

getHeaderImpl

Header for System object display

Syntax

```
header = getHeaderImpl
```

Description

`header = getHeaderImpl` specifies the dialog header to display on the MATLAB System block dialog box. If you do not specify the `getHeaderImpl` method, no title or text appears for the header in the block dialog box.

Run-Time Details

`getHeaderImpl` is called by the MATLAB System block.

Method Authoring Tips

You must set `Access = protected` for this method.

Output Arguments

header — Header text

`matlab.system.display.Header` class

Header text specified as a `matlab.system.display.Header` class.

Examples

Define Header for System Block Dialog Box

Define a header in your class definition file for the `EnhancedCounter` System object.

```
methods (Static, Access = protected)
    function header = getHeaderImpl
        header = matlab.system.display.Header('EnhancedCounter', ...
            'Title', 'Enhanced Counter');
    end
end
```

See Also

`getPropertyGroupsImpl`

Topics

“Add Header Description”

Introduced in R2013b

getDiscreteStateImpl

Discrete state property values

Syntax

```
s = getDiscreteStateImpl(obj)
```

Description

`s = getDiscreteStateImpl(obj)` returns a struct `s` of internal state value properties, which have the `DiscreteState` attribute. The field names of the struct are the object's `DiscreteState` property names. To restrict or change the values returned by `getDiscreteState` method, you can override this `getDiscreteStateImpl` method.

Run-Time Details

`getDiscreteStateImpl` is called by the `setup` method. For details, see

“Detailed Call Sequence” (MATLAB).

Method Authoring Tips

- You must set `Access = protected` for this method.
- You cannot modify any properties in this method.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `getDiscreteStateImpl` method does not use the object, you can replace this input with `~`.

Output Arguments

s — State values

struct

State values, returned as a struct.

Examples

Get Discrete State Values

Use the `getDiscreteStateImpl` method in your class definition file to get the discrete states of the object.

```
methods (Access = protected)
    function s = getDiscreteStateImpl(obj)
```

```
end  
end
```

See Also

setupImpl

Topics

“Define Property Attributes” (MATLAB)

Introduced in R2012b

supportsMultipleInstanceImpl

Support System object in Simulink For Each subsystem

Syntax

```
flag = supportsMultipleInstanceImpl(obj)
```

Description

`flag = supportsMultipleInstanceImpl(obj)` specifies whether the System object can be used in a Simulink For Each subsystem via the MATLAB System block. To enable For Each support, you must include the `supportsMultipleInstanceImpl` in your class definition file and have it return `true`. Do not enable For Each support if your System object allocates exclusive resources that may conflict with other System objects, such as allocating file handles, memory by address, or hardware resources.

Run-Time Details

During Simulink model compilation and propagation, the MATLAB System block calls the `supportMultipleInstance` method, which then calls the `supportsMultipleInstanceImpl` method to determine For Each support.

Method Authoring Tips

- You must set `Access = protected` for this method.
- You cannot modify any properties in this method.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `supportsMultipleInstanceImpl` method does not use the object, you can replace this input with `~`.

Output Arguments

flag — Support for For Each subsystem flag

false (default) | true

Boolean value indicating whether the System object can be used in a For Each subsystem. The default value, if you do not include the `supportMultipleInstance` method, is `false`.

Examples

Enable For-Each Support for System Object

Specify in your class definition file that the System object can be used in a Simulink For Each subsystem.

```
methods (Access = protected)
    function flag = supportsMultipleInstanceImpl(obj)
        flag = true;
    end
end
```

See Also

matlab.System

Topics

“Enable For Each Subsystem Support”

Introduced in R2014b

processTunedPropertiesImpl

Action when tunable properties change

Syntax

```
processTunedPropertiesImpl(obj)
```

Description

`processTunedPropertiesImpl(obj)` specifies the algorithm to perform when one or more tunable property values change. This method is called as part of the next call to the System object after a tunable property value changes. A property is tunable only if its `Nontunable` attribute is `false`, which is the default.

Run-Time Details

`processTunedPropertiesImpl` is called when you run the System object.

In MATLAB when multiple tunable properties are changed before running the System object, `processTunedPropertiesImpl` is called only once for all the changes. `isChangedProperty` returns `true` for all the changed properties.

In Simulink, when a parameter is changed in a MATLAB System block dialog, the next simulation step calls `processTunedPropertiesImpl` before calling `stepImpl`. All tunable parameters are considered changed and `processTunedPropertiesImpl` method is called for each of them. `isChangedProperty` returns `true` for all the dialog properties.

For details, see “Detailed Call Sequence” (MATLAB).

Method Authoring Tips

- You must set `Access = protected` for this method.
- Use this method when a tunable property affects the value of a different property.
- If the System object will be used in the Simulink MATLAB System block, you cannot modify any tunable properties in this method.
- To check if a property has changed since `stepImpl` was last called, use `isChangedProperty` within `processTunedPropertiesImpl`. See “Specify Action When Tunable Property Changes” on page 5-92 for an example.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `processTunedPropertiesImpl` method does not use the object, you can replace this input with `~`.

Examples

Specify Action When Tunable Property Changes

Use `processTunedPropertiesImpl` to recalculate the lookup table if the value of either the `NumNotes` or `MiddleC` property changes before the next call to the System object. `propChange` indicates if either property has changed.

```
methods (Access = protected)
    function processTunedPropertiesImpl(obj)
        propChange = isChangedProperty(obj, 'NumNotes') || ...
            isChangedProperty(obj, 'MiddleC')
        if propChange
            obj.pLookupTable = obj.MiddleC * (1+log(1:obj.NumNotes)/log(12));
        end
    end
end
```

matlab.system.mixin.CustomIcon class

Package: matlab.system.mixin

Custom icon mixin class

Description

matlab.system.mixin.CustomIcon is a class that specifies the `getIcon` method. This method customizes the name of the icon used for the System object implemented through a MATLAB System block.

To use this method, you must subclass from this class in addition to the `matlab.System` base class. Type the following syntax as the first line of your class definition file, where `ObjectName` is the name of your object:

```
classdef ObjectName < matlab.system &...  
    matlab.system.mixin.CustomIcon
```

The `matlab.system.mixin.CustomIcon` class is a handle class.

See Also

`matlab.System` | `matlab.system.display.Icon`

Topics

"Add Text to Block Icon"

Introduced in R2017a

getIconImpl

Name to display as block icon

Syntax

```
icon = getIconImpl(obj)
```

Description

`icon = getIconImpl(obj)` specifies the text or image to display on the block icon of the MATLAB System block. If you do not specify the `getIconImpl` method, the block displays the class name of the System object as the block icon. For example, if you specify `pkg.MyObject` in the MATLAB System block, the default icon is labeled `MyObject`.

Run-Time Details

`getIconImpl` is called by the MATLAB System block during Simulink model compilation.

Method Authoring Tips

You must set `Access = protected` for this method.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `getIconImpl` method does not use the object, you can replace this input with `~`.

Output Arguments

icon — Block icon

character vector | cell array of character vectors | string | string array |
`matlab.system.display.Icon` object

The text or image to display as the block icon. Each cell is displayed as a separate line.

Examples

Add System Block Icon Name

Specify in your class definition file the name of the block icon as 'Enhanced Counter' using two lines.

```
methods (Access = protected)
    function icon = getIconImpl(~)
        icon = {'Enhanced', 'Counter'};
```

```
end  
end
```

Add Image to MATLAB System Block

Define an image in your class definition file.

```
methods(Access = protected)  
    function icon = getIconImpl(~)  
        % Define icon for System block  
        icon = matlab.system.display.Icon('my_icon.png');  
    end  
end
```

The image now appears on the System block icon.

“Customize System Block Appearance”

“Customize MATLAB System Block Appearance”

Introduced in R2017a

matlab.system.display.Header class

Package: matlab.system.display

Header for System objects properties

Syntax

```
matlab.system.display.Header(N1,V1,...Nn,Vn)
matlab.system.display.Header(Obj,...)
```

Description

`matlab.system.display.Header(N1,V1,...Nn,Vn)` specifies a header for the System object, with the header properties defined in Name-Value (N,V) pairs. You use `matlab.system.display.Header` within the `getHeaderImpl` method. The available header properties are

- **Title** — Header title. The default value is an empty character vector.
- **Text** — Header description. The default value is an empty character vector.
- **ShowSourceLink** — Show link to source code for the object.

`matlab.system.display.Header(Obj,...)` creates a header for the specified System object (`Obj`) and sets the following property values:

- **Title** — Set to the `Obj` class name.
- **Text** — Set to help summary for `Obj`.
- **ShowSourceLink** — Set to `true` if `Obj` is MATLAB code. In this case, the **Source Code** link is displayed. If `Obj` is P-coded and the source code is not available, set this property to `false`.

You can use `mfilename('class')` from within this method to get the name of the System object. If you set any Name-Value pairs, those property values override the default settings.

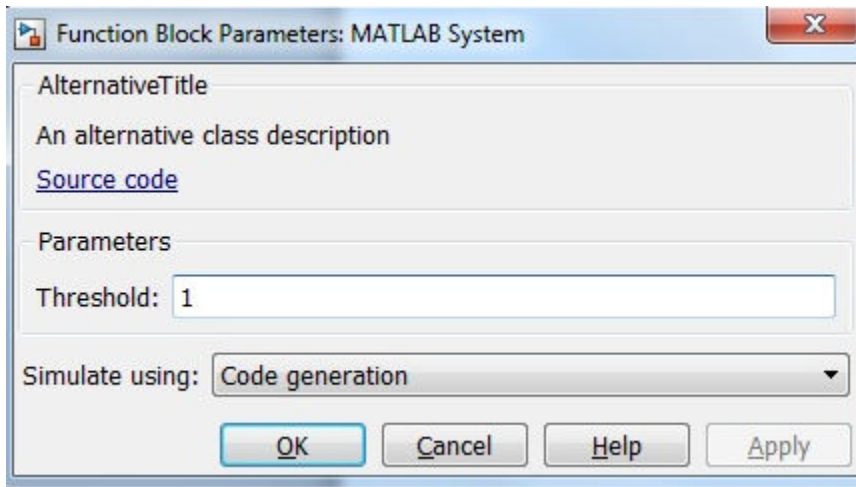

Examples

Define System Block Header

Define a header in your class definition file.

```
methods (Static, Access = protected)
    function header = getHeaderImpl
        header = matlab.system.display.Header(mfilename('class'), ...
            'Title','AlternativeTitle',...
            'Text','An alternative class description');
    end
end
```

The resulting output appears as follows. In this case, **Source code** appears because the `ShowSourceLink` property was set to `true`.

`getHeaderImpl` | `matlab.system.display.Section` |
`matlab.system.display.SectionGroup`

Topics

"Classes" (MATLAB)
"Add Header Description"

matlab.system.display.Section class

Package: matlab.system.display

Property group section for System objects

Syntax

```
matlab.system.display.Section(N1,V1,...Nn,Vn)
matlab.system.display.Section(Obj,...)
```

Description

`matlab.system.display.Section(N1,V1,...Nn,Vn)` creates a property group section for displaying System object properties, which you define using property Name-Value pairs (N,V). You use `matlab.system.display.Section` to define property groups using the `getPropertyGroupsImpl` method. The available Section properties are

- **Title** — Section title. The default value is an empty character vector.
- **TitleSource** — Source of section title. Valid values are 'Property' and 'Auto'. The default value is 'Property', which uses the character vector from the **Title** property. If the **Obj** name is given, the default value is **Auto**, which uses the **Obj** name.
- **Description** — Section description. The default value is an empty character vector.
- **PropertyList** — Section property list as a cell array of property names. The default value is an empty array. If the **Obj** name is given, the default value is all eligible display properties.

Note Certain properties are not eligible for display either in a dialog box or in the System object summary on the command-line. Property types that cannot be displayed are: hidden, abstract, private or protected access, discrete state, and continuous state. Dependent properties do not display in a dialog box, but do display in the command-line summary.

`matlab.system.display.Section(Obj,...)` creates a property group section for the specified System object (**Obj**) and sets the following property values:

- **TitleSource** — Set to 'Auto', which uses the **Obj** name.
- **PropertyList** — Set to all publicly-available properties in the **Obj**.

You can use `mfilename('class')` from within this method to get the name of the System object. If you set any Name-Value pairs, those property values override the default settings.

Examples

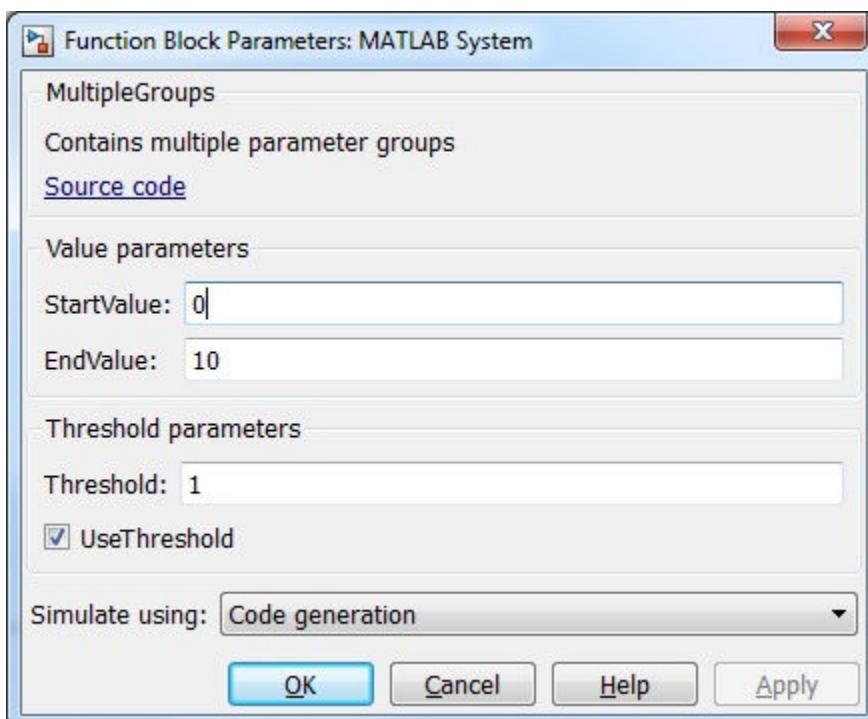

Define Property Groups

Define two property groups in your class definition file by specifying their titles and property lists.

```
methods (Static, Access = protected)
    function groups = getPropertyGroupsImpl
```

```
valueGroup = matlab.system.display.Section(...  
    'Title','Value parameters',...  
    'PropertyList',{'StartValue','EndValue'});  
  
thresholdGroup = matlab.system.display.SectionGroup(...  
    'Title','Threshold parameters',...  
    'PropertyList',{'Threshold','UseThreshold'});  
groups = [valueGroup,thresholdGroup];  
end  
end
```

When you specify the System object in the MATLAB System block, the resulting dialog box appears as follows.

Topics

“Customize System Block Dialog Box”

matlab.system.display.Action class

Package: matlab.system.display

Custom button

Syntax

```
matlab.system.display.Action(action)
matlab.system.display.Action(action,Name,Value)
```

Description

`matlab.system.display.Action(action)` specifies a button to display on the MATLAB System block. This button executes a function by launching a System object method or invoking any MATLAB function or code.

A typical button function launches a figure. The launched figure is decoupled from the block dialog box. Changes to the block are not synced to the displayed figure.

You define `matlab.system.display.Action` within the `getPropertyGroupsImpl` method in your class definition file. You can define multiple buttons using separate instances of `matlab.system.display.Action` in your class definition file.

`matlab.system.display.Action(action,Name,Value)` includes `Name,Value` pair arguments, which you can use to specify any properties.

Input Arguments

action

Action taken when the user presses the specified button on the MATLAB System block dialog. The action is defined as a function handle or as a MATLAB command. If you define the action as a function handle, the function definition must define two inputs. These inputs are a `matlab.system.display.ActionData` object and a System object instance, which can be used to invoke a method.

A `matlab.system.display.ActionData` object is the callback object for a display action. You use the `UserData` property of `matlab.system.display.ActionData` to store persistent data, such as a figure handle.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Properties

You specify these properties as part of the input using `Name,Value` pair arguments. Optionally, you can define them using `object.property` syntax.

- `ActionCalledFcn` — Action to take when the button is pressed. You cannot specify this property using a Name-Value pair argument.
- `Label` — Text to display on the button. The default value is an empty character vector.
- `Description` — Text for the button tooltip. The default value is an empty character vector.
- `Placement` — Character vector indicating where on a separate row in the property group to place the button. Valid values are 'first', 'last', or a property name. If you specify a property name, the button is placed above that property. The default value is 'last'.
- `Alignment` — Character vector indicating how to align the button. Valid values are 'left' and 'right'. The default value is 'left'.

Examples

Define Button on MATLAB System Block

Define a **Visualize** button and its associated function to open a figure that plots a ramp using the parameter values in the block dialog.

```
methods(Static,Access = protected)
    function group = getPropertyGroupsImpl
        group = matlab.system.display.Section(mfilename('class'));
        group.Actions = matlab.system.display.Action(@(~,obj)...
            visualize(obj),'Label','Visualize');
    end
end

methods
    function obj = PlotRamp(varargin)
        setProperties(obj,nargin,varargin{:});
    end

    function visualize(obj)
        figure;
        d = 1:obj.RampLimit;
        plot(d);
    end
end
```

When you specify the System object in the MATLAB System block, the resulting block dialog box appears as follows.

To open the same figure, rather than multiple figures, when the button is pressed more than once, use this code instead.

```

methods(Static,Access = protected)
    function group = getPropertyGroupsImpl
        group = matlab.system.display.Section(mfilename('class'));
        group.Actions = matlab.system.display.Action(@(actionData,obj)...
            visualize(obj,actionData),'Label','Visualize');
    end
end

methods
    function obj = ActionDemo(varargin)
        setProperties(obj,nargin,varargin{:});
    end

    function visualize(obj,actionData)
        f = actionData.UserData;
        if isempty(f) || ~ishandle(f)
            f = figure;
            actionData.UserData = f;
        else
            figure(f); % Make figure current
        end

        d = 1:obj.RampLimit;
        plot(d);
    end
end

```

matlab.system.display.SectionGroup class

Package: matlab.system.display

Section group for System objects

Syntax

```
matlab.system.display.SectionGroup(N1,V1,...Nn,Vn)
matlab.system.display.SectionGroup(Obj,...)
```

Description

`matlab.system.display.SectionGroup(N1,V1,...Nn,Vn)` creates a group for displaying System object properties and display sections created with `matlab.system.display.Section`. You define such sections or properties using property Name-Value pairs (N,V). A section group can contain both properties and sections. You use `matlab.system.display.SectionGroup` to define section groups using the `getPropertyGroupsImpl` method. Section groups display as separate tabs in the MATLAB System block. The available Section properties are

- **Title** — Group title. The default value is an empty character vector.
- **TitleSource** — Source of group title. Valid values are 'Property' and 'Auto'. The default value is 'Property', which uses the character vector from the Title property. If the **Obj** name is given, the default value is Auto, which uses the **Obj** name. In the System object property display at the MATLAB command line, you can omit the default "Main" title for the first group of properties by setting TitleSource to 'Auto'.
- **Description** — Group or tab description that appears above any properties or panels. The default value is an empty character vector.
- **PropertyList** — Group or tab property list as a cell array of property names. The default value is an empty array. If the **Obj** name is given, the default value is all eligible display properties.
- **Sections** — Group sections as an array of section objects. If the **Obj** name is given, the default value is the default section for the **Obj**.

`matlab.system.display.SectionGroup(Obj,...)` creates a section group for the specified System object (**Obj**) and sets the following property values:

- **TitleSource** — Set to 'Auto'.
- **Sections** — Set to `matlab.system.display.Section` object for **Obj**.

You can use `mfilename('class')` from within this method to get the name of the System object. If you set any Name-Value pairs, those property values override the default settings.

Examples

Define Block Dialog Tabs

Define in your class definition file two tabs, each containing specific properties. For this example, you use the `matlab.system.display.SectionGroup`, `matlab.system.display.Section`, and `getPropertyGroupsImpl` methods.

```
methods (Static, Access = protected)
    function groups = getPropertyGroupsImpl
        valueGroup = matlab.system.display.Section(...
            'Title','Value parameters',...
            'PropertyList',{'StartValue','EndValue'});

        thresholdGroup = matlab.system.display.Section(...
            'Title','Threshold parameters',...
            'PropertyList',{'Threshold','UseThreshold'});

        mainGroup = matlab.system.display.SectionGroup(...
            'Title','Main', ...
            'Sections',[valueGroup,thresholdGroup]);

        initGroup = matlab.system.display.SectionGroup(...
            'Title','Initial conditions', ...
            'PropertyList',{'IC1','IC2','IC3'});

        groups = [mainGroup,initGroup];
    end
end
```

The resulting dialog appears as follows when you add the object to Simulink with the MATLAB System block.

Topics

“Customize System Block Dialog Box”

matlab.system.display.Icon class

Package: matlab.system.display

Custom icon image

Syntax

```
icon = matlab.system.display.Icon(imageFile)
```

Description

`icon = matlab.system.display.Icon(imageFile)` sets the `imageFile` image as the MATLAB System block icon. To set the icon image, use the `icon` output argument from `getIconImpl`.

Input Arguments

imageFile — Image file

character array

Image file to display on the block icon, specified as a character array. If the image is not on the path, use the full path to your image file.

The image file must be in a file format supported for block masks. See “Draw Static Icon”.

Example: "image.png"

Examples

Add Image to MATLAB System Block

Define an image in your class definition file.

```
methods(Access = protected)
    function icon = getIconImpl(~)
        % Define icon for MATLAB System block
        icon = matlab.system.display.Icon("my_icon.png");
    end
end
```

The image now appears on the MATLAB System block icon.

matlab.system.mixin.Propagates class

Package: matlab.system.mixin

Signal characteristics propagation mixin class

Description

`matlab.system.mixin.Propagates` specifies the output size, data type, and complexity of a System object. Use this mixin class and its methods when you will include your System object in Simulink via the MATLAB System block. This mixin is called by the MATLAB System block during Simulink model compilation.

Note If your System object has exactly one input and one output and no discrete property states, or if you do not need bus support, you do not have to implement any of these methods. The `matlab.system.mixin.Propagates` provides default values in these cases.

Implement the methods of this class when Simulink cannot infer the output specifications directly from the inputs or when you want bus support. If you do not include this mixin, Simulink cannot propagate the output or bus data type, an error occurs.

To use this mixin, subclass from this `matlab.system.mixin.Propagates` in addition to subclassing from the `matlab.System` base class. Type the following syntax as the first line of your class definition file. `ObjectName` is the name of your System object.

```
classdef ObjectName < matlab.System &...  
    matlab.system.mixin.Propagates
```

The `matlab.system.mixin.Propagates` class is a handle class.

Introduced in R2014a

getDiscreteStateSpecificationImpl

Discrete state size, data type, and complexity

Syntax

```
[size,dataType,complexity] = getDiscreteStateSpecificationImpl(obj,propertyName)
```

Description

[size,dataType,complexity] = getDiscreteStateSpecificationImpl(obj,propertyName) returns the size, data type, and complexity of the discrete state property. This property must be a discrete state property. You must define this method if your System object has discrete state properties and is used in the MATLAB System block.

Run-Time Details

getDiscreteStateSpecificationImpl is called by the MATLAB System block during Simulink model compilation.

Method Authoring Tips

- You must set Access = protected for this method.
- You cannot modify any properties in this method.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your getDiscreteStateSpecificationImpl method does not use the object, you can replace this input with ~.

propertyName — Discrete state property name

property name

Name of discrete state property of the System object

Output Arguments

size — Property size

[1 1] (default) | numeric vector

Vector containing the length of each dimension of the property.

dataType — Property data type

double (default) | character vector

Data type of the property. For built-in data types, `dataType` is a character vector. For fixed-point data types, `dataType` is a numeric type object.

complexity — Complexity of the property

`false` (default) | `true`

Complexity of the property as a scalar, logical value:

- `true` — complex
- `false` — real

Examples

Specify Discrete State Property Size, Data Type, and Complexity

Specify in your class definition file the size, data type, and complexity of a discrete state property.

```
methods (Access = protected)
    function [sz,dt,cp] = getDiscreteStateSpecificationImpl(~,name)
        sz = [1 1];
        dt = "double";
        cp = false;
    end
end
```

“Set Discrete State Output Specification”

Introduced in R2013b

getOutputDataTypeImpl

Data types of output ports

Syntax

```
[dt_1,dt_2,...,dt_n] = getOutputDataTypeImpl(obj)
```

Description

`[dt_1,dt_2,...,dt_n] = getOutputDataTypeImpl(obj)` returns the data type of each output port as a character vector for built-in data types or as a numeric object for fixed-point data types. The number of outputs must match the value returned from the `getNumOutputsImpl` method or the number of output arguments listed in the `stepImpl` method.

For System objects with one input and one output and where you want the input and output data types to be the same, you do not need to implement this method. In this case, `getOutputDataTypeImpl` assumes the input and output data types are the same and returns the data type of the input.

If your System object has more than one input or output, and you use propagation, you must set the output data types in the `getOutputDataTypeImpl` method. For Simulink, if the input and output data types are different, you might have to cast the output value to the data type of the appropriate `dt_n` output argument. You specify this casting in the `stepImpl` method. For bus output, you must specify the name of the output bus in `getOutputDataTypeImpl`.

If needed to determine the output data type, you can use `propagatedInputDataType` within the `getOutputDataTypeImpl` method to obtain the input type.

Run-Time Details

`getOutputDataTypeImpl` is called by the MATLAB System block.

Method Authoring Tips

- You must set `Access = protected` for this method.
- You cannot modify any properties in this method.
- If you are debugging your code and examine the data types before Simulink completes propagation, you might see outputs with empty, `[]`, data types. This occurs because Simulink has not completed setting the output data types.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `getOutputDataTypeImpl` method does not use the object, you can replace this input with `~`.

Output Arguments

dt_1, dt_2, ... — Property data type

character vector | numeric type object

Data type of the property. For built-in data types, dt is a character vector. For fixed-point data types, dt is a numeric type object.

Examples

Specify Output Data Type

Specify, in your class definition file how to control the output data type from a MATLAB System block. This example shows how to use the `getOutputDataTypeImpl` method to change the output data type from single to double, or propagate the input as a double. It also shows how to cast the data type to change the output data type in the `stepImpl` method.

```
classdef DataTypeChange < matlab.System & ...
    matlab.system.mixin.Propagates

    properties(Nontunable)
        Quantize = false
    end

    methods(Access = protected)
        function y = stepImpl(obj,u)
            if obj.Quantize == true
                % Cast for output data type to differ from input.
                y = single(u);
            else
                % Propagate output data type.
                y = u;
            end
        end

        function out = getOutputDataTypeImpl(obj)
            if obj.Quantize == true
                out = "single";
            else
                out = propagatedInputDataType(obj,1);
            end
        end
    end
end
end
```

Specify Bus Output

Specify, in your class definition file, that the System object data type is a bus. You must also include a property to specify the bus name.

```
properties(Nontunable)
    OutputBusName = "myBus";
end
```

```
methods (Access = protected)
    function out = getOutputDataTypeImpl(obj)
        out = obj.OutputBusName;
    end
end
```

propagatedInputDataType

Topics

“Set Output Data Type”

Introduced in R2013b

getOutputSizeImpl

Sizes of output ports

Syntax

```
[sz_1,sz_2,...,sz_n] = getOutputSizeImpl(obj)
```

Description

[sz_1,sz_2,...,sz_n] = getOutputSizeImpl(obj) returns the size of each output port. The number of outputs must match the value returned from the getNumOutputs method or the number of output arguments listed in the stepImpl method.

If your System object has only one input and one output and you want the input and output sizes to be the same, you do not need to implement this method. In this case getOutputSizeImpl assumes that the input and output sizes are the same and returns the size of the input. For variable-size inputs in MATLAB, the size varies each time you run your object. For variable-size inputs in Simulink, the output size is the maximum input size.

You must implement the getOutputSizeImpl method to define the output size, if:

- Your System object has more than one input or output
- You need the output and input sizes to be different.

If the output size differs from the input size, you must also use the propagatedInputSize method

Run-Time Details

During Simulink model compilation and propagation, the MATLAB System block calls the getOutputSizeImpl method to determine the output size.

All inputs default to variable-size inputs For these inputs, the output size is the maximum input size.

Method Authoring Tips

- You must set Access = protected for this method.
- In this method, you cannot modify any properties.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your getOutputSizeImpl method does not use the object, you can replace this input with ~.

Output Arguments

sz_1, sz_2, ... — Output size

numeric vector

Vector containing the size of each output port.

Examples

Specify Output Size

Specify in your class definition file the size of a System object output.

```
methods (Access = protected)
    function sz_1 = getOutputSizeImpl(obj)
        sz_1 = [1 1];
    end
end
```

Specify Multiple Output Ports

Specify in your class definition file the sizes of multiple System object outputs.

```
methods (Access = protected)
    function [sz_1, sz_2] = getOutputSizeImpl(obj)
        sz_1 = propagatedInputSize(obj, 1);
        sz_2 = [1 1];
    end
end
```

Specify Output When Using Propagated Input Size

Specify in your class definition file the size of System object output when it depends on the propagated input size.

```
methods (Access = protected)
    function varargout = getOutputSizeImpl(obj)
        varargout{1} = propagatedInputSize(obj, 1);
        if obj.HasSecondOutput
            varargout{2} = [1 1];
        end
    end
end
```

Topics

“Set Output Size”

Introduced in R2013b

isOutputComplexImpl

Complexity of output ports

Syntax

```
[cp_1, cp_2, ..., cp_n] = isOutputComplexImpl(obj)
```

Description

[cp_1, cp_2, ..., cp_n] = isOutputComplexImpl(obj) returns whether each output port has complex data. The number of outputs must match the value returned from the `getNumOutputs` method or the number of output arguments listed in the `stepImpl` method.

For System objects with one input and one output and where you want the input and output complexities to be the same, you do not need to implement this method. In this case `isOutputComplexImpl` assumes the input and output complexities are the same and returns the complexity of the input.

If your System object has more than one input or output or you need the output and input complexities to be different, you must implement the `isOutputComplexImpl` method to define the output complexity. You also must use the `propagatedInputComplexity` method if the output complexity differs from the input complexity.

Run-Time Details

During Simulink model compilation and propagation, the MATLAB System block calls the `isOutputComplex` method, which then calls the `isOutputComplexImpl` method to determine the output complexity.

Method Authoring Tips

- You must set `Access = protected` for this method.
- You cannot modify any properties in this method.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `isOutputComplexImpl` method does not use the object, you can replace this input with `~`.

Output Arguments

cp_1, cp_2, ... — Complexity flag

true | false

Logical, scalar value indicating whether the specific output port is complex (`true`) or real (`false`).

Examples

Specify Output as Real-Valued

Specify in your class definition file that the output from a System object is a real value.

```
methods (Access = protected)
    function c1 = isOutputComplexImpl(obj)
        c1 = false;
    end
end
```

isOutputFixedSizeImpl

Fixed- or variable-size output ports

Syntax

```
[flag_1,flag_2,...flag_n] = isOutputFixedSizeImpl(obj)
```

Description

[flag_1,flag_2,...flag_n] = isOutputFixedSizeImpl(obj) returns whether each output port is fixed size. The number of outputs must match the value returned from the `getNumOutputs` method, which is the number of output arguments listed in the `stepImpl` method.

For System objects with one input and one output and where you want the input and output fixed sizes to be the same, you do not need to implement this method. In this case `isOutputFixedSizeImpl` assumes the input and output fixed sizes are the same and returns the fixed size of the input.

If your System object has more than one input or output or you need the output and input fixed sizes to be different, you must implement the `isOutputFixedSizeImpl` method to define the output fixed size. You also must use the `propagatedInputFixedSize` method if the output fixed size status differs from the input fixed size status.

Run-Time Details

During Simulink model compilation and propagation, the MATLAB System block calls the `isOutputFixedSize` method, which then calls the `isOutputFixedSizeImpl` method to determine the output fixed size.

All inputs default to variable-size inputs For these inputs, the output size is the maximum input size.

Method Authoring Tips

- You must set `Access = protected` for this method.
- You cannot modify any properties in this method.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `isOutputFixedSizeImpl` method does not use the object, you can replace this input with `~`.

Output Arguments

flag_1, flag2, ... — Fixed size flag

true | false

Logical, scalar value indicating whether the specific output port is fixed size (`true`) or variable size (`false`).

Examples

Specify Output as Fixed Size

Specify in your class definition file that the output from a System object is of fixed size.

```
methods (Access = protected)
    function c1 = isOutputFixedSizeImpl(obj)
        c1 = true;
    end
end
```

`propagatedInputFixedSize`

Topics

“Set Fixed- or Variable-Size Output”

Introduced in R2013b

propagatedInputComplexity

Complexity of input during Simulink propagation

Syntax

```
flag = propagatedInputComplexity(obj, index)
```

Description

`flag = propagatedInputComplexity(obj, index)` returns `true` or `false` to indicate whether the input argument for the indicated System object is complex. `index` specifies the input for which to return the complexity flag.

You can use `propagatedInputComplexity` only from within the `isOutputComplexImpl` method in your class definition file. Use `isOutputComplexImpl` when:

- Your System object has more than one input or output.
- The input complexity determines the output complexity.
- The output complexity must differ from the input complexity.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `propagatedInputComplexity` method does not use the object, you can replace this input with `~`.

index — Input index

positive integer

Index of the specified input. Do not count the `obj` in the `index`. The first input is always `obj`.

Output Arguments

flag — Complexity flag

`true` | `false`

Complexity of the specified input, returned as `true` or `false`

Examples

Match Input and Output Complexity

Get the complexity of the second input when you run the object and set the output to match it. Assume that the first input has no impact on the output complexity.

```
methods (Access = protected)
  function outcomplx = isOutputComplexImpl(obj)
    outcomplx = propagatedInputComplexity(obj,2);
  end
end
```

See Also

isOutputComplexImpl

Topics

“Set Output Complexity”

Introduced in R2014a

propagatedInputDataType

Data type of input during Simulink propagation

Syntax

```
dt = propagatedInputDataType(obj,index)
```

Description

`dt = propagatedInputDataType(obj,index)` returns the data type of an input argument for a System object. `index` specifies the input for which to return the data type.

You can use `propagatedInputDataType` only from within `getOutputDataTypeImpl`. Use `getOutputDataTypeImpl` when:

- Your System object has more than one input or output.
- The input data type status determines the output data type.
- The output data type must differ from the input data type.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `propagatedInputDataType` method does not use the object, you can replace this input with `~`.

index — Input index

positive integer

Index of the specified input. Do not count the `obj` in the `index`. The first input is always `obj`.

Output Arguments

dt — Input data type

character vector | numeric type object

Data type of the specified input, returned as a character vector for floating-point input or as a numeric type for fixed-point input.

Examples

Match Input and Output Data Type

Get the data type of the second input. If the second input data type is `double`, then the output data type is `int32`. For all other cases, the output data type matches the second input data type. Assume that the first input has no impact on the output.

```
methods (Access = protected)
    function dt = getOutputDataTypeImpl(obj)
        if strcmpi(propagatedInputDataType(obj,2), 'double')
            dt = 'int32';
        else
            dt = propagatedInputDataType(obj,2);
        end
    end
end
```

Topics

“Set Output Data Type”

“Data Type Propagation”

Introduced in R2014a

propagatedInputFixedSize

Fixed-size status of input during Simulink propagation

Syntax

```
flag = propagatedInputFixedSize(obj,index)
```

Description

`flag = propagatedInputFixedSize(obj,index)` returns `true` or `false` to indicate whether an input argument of a System object is fixed size. `index` specifies the input for which to return the fixed-size flag.

You can use `propagatedInputFixedSize` only from within `isOutputFixedSizeImpl`. Use `isOutputFixedSizeImpl` when:

- Your System object has more than one input or output.
- The input fixed-size status determines the output fixed-size status.
- The output fixed-size status must differ from the input fixed-size status.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `propagatedInputFixedSize` method does not use the object, you can replace this input with `~`.

index — Input index

positive integer

Index of the specified input. Do not count the `obj` in the `index`. The first input is always `obj`.

Output Arguments

flag — Fixed size flag

`true` | `false`

Fixed-size status of the specified input, returned as `true` or `false`.

Examples

Match Fixed-Size Status of Input and Output

Get the fixed-size status of the third input and set the output to match it. Assume that the first and second inputs have no impact on the output.

```
methods (Access = protected)

Topics

“Set Fixed- or Variable-Size Output”

Introduced in R2014a

propagatedInputSize

Size of input during Simulink propagation

Syntax

```
size = propagatedInputSize(obj,index)
```

Description

`size = propagatedInputSize(obj,index)` returns, as a vector, the input size of the specified System object. The `index` specifies the input for which to return the size information. (Do not count the `obj` in the `index`. The first input is always `obj`.)

You can use `propagatedInputSize` only from within the `getOutputSizeImpl` method in your class definition file. Use `getOutputSizeImpl` when:

- Your System object has more than one input or output.
- The input size determines the output size.
- The output size must differ from the input size.

Note For variable-size inputs, the propagated input size from `propagatedInputSize` differs depending on the environment.

- MATLAB — `propagatedInputSize` returns the size of the inputs used when you run the object for the first time.
 - Simulink — `propagatedInputSize` returns the upper bound of the input sizes.
-

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `propagatedInputSize` method does not use the object, you can replace this input with `~`.

index — Input index

integer

Index of the specified input

Output Arguments

size — Input size

numeric vector

Size of the specified input, returned as a vector

Examples

Match Size of Input and Output

Get the size of the second input. If the first dimension of the second input has a size greater than 1, then set the output size to a 1 x 2 vector. For all other cases, the output is a 2 x 1 matrix. Assume that the first input has no impact on the output size.

```
methods (Access = protected)
  function outsize = getOutputSizeImpl(obj)
    size = propagatedInputSize(obj,2);
    if size(1) == 1
      outsize = [1,2];
    else
      outsize = [2,1];
    end
  end
end
```

“Set Output Size”

Introduced in R2014a

matlab.system.mixin.Nondirect class

Package: matlab.system.mixin

Nondirect feedthrough mixin class

Description

`matlab.system.mixin.Nondirect` is a class that uses the `output` and `update` methods to process nondirect feedthrough data through a `System` object.

For `System` objects that use direct feedthrough, the object's input is needed to generate the output at that time. For these direct feedthrough objects, running the `System` object calculates the output and updates the state values. For nondirect feedthrough, however, the object's output depends only on the internal states at that time. The inputs are used to update the object states. For these objects, calculating the output with `outputImpl` is separated from updating the state values with `updateImpl`. If you use the `matlab.system.mixin.Nondirect` mixin and include the `stepImpl` method in your class definition file, an error occurs. In this case, you must include the `updateImpl` and `outputImpl` methods instead.

The following cases describe when `System` objects in Simulink use direct or nondirect feedthrough.

- `System` object supports code generation and does not inherit from the `Propagates` mixin — Simulink automatically infers the direct feedthrough settings from the `System` object code.
- `System` object supports code generation and inherits from the `Propagates` mixin — Simulink does not automatically infer the direct feedthrough settings. Instead, it uses the value returned by the `isInputDirectFeedthroughImpl` method.
- `System` object does not support code generation — Default `isInputDirectFeedthroughImpl` method returns `false`, indicating that direct feedthrough is not enabled. To override the default behavior, implement the `isInputDirectFeedthroughImpl` method in your class definition file.

Use the `Nondirect` mixin to allow a `System` object to be used in a Simulink feedback loop. A delay object is an example of a nondirect feedthrough object.

To use this mixin, you must subclass from this class in addition to subclassing from the `matlab.System` base class. Type the following syntax as the first line of your class definition file, where `ObjectName` is the name of your object:

```
classdef ObjectName < matlab.system & matlab.system.mixin.Nondirect
```

`matlab.System`

Topics

"Use Update and Output for Nondirect Feedthrough"

Introduced in R2013b

isInputDirectFeedthroughImpl

Direct feedthrough status of input

Syntax

```
[flag1,...,flagN] = isInputDirectFeedthroughImpl(obj)
[flag1,...,flagN] = isInputDirectFeedthroughImpl(obj,input,input2,...)
```

Description

[flag1,...,flagN] = isInputDirectFeedthroughImpl(obj) specifies whether each input is a direct feedthrough input. If direct feedthrough is true, the output depends on the input at each time instant.

[flag1,...,flagN] = isInputDirectFeedthroughImpl(obj,input,input2,...) uses one or more of the System object input specifications to determine whether inputs have direct feedthrough.

If you do not include the isInputDirectFeedthroughImpl method in your System object class definition file, all inputs are assumed to be direct feedthrough.

Code Generation

The following cases describe when System objects in Simulink code generation use direct or nondirect feedthrough.

System object's code generation support	Uses a propagation Impl method	SimulinkCode Generation Result
Y	N	Simulink automatically infers the direct feedthrough settings from the System object code.
Y	Y	Simulink does not automatically infer the direct feedthrough settings. Instead, it uses the value returned by the isInputDirectFeedthroughImpl method.
N	—	Default isInputDirectFeedthroughImpl method returns false, indicating that direct feedthrough is not enabled. To override the default behavior, implement the isInputDirectFeedthroughImpl method in your class definition file.

Run-Time Details

isInputDirectFeedthroughImpl is called by the MATLAB System block.

Method Authoring Tips

- You must set Access = protected for this method.
- You cannot modify, implement, or access tunable properties in this method.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `isInputDirectFeedthroughImpl` method does not use the object, you can replace this input with `~`.

input1, input2, ... — Inputs to the System object

inputs to the System object algorithm

Inputs to the algorithm (`stepImpl`) of the System object. The inputs list must match the order of inputs in the `stepImpl` signature.

Output Arguments

flag1, ..., flagN — Output flag for each input to the System object

logical

Logical value, either `true` or `false` indicating whether the input is direct feedthrough. The number of output flags must match the number of inputs to the System object (inputs to `stepImpl`, `outputImpl`, or `updateImpl`).

Examples

Specify Input as Nondirect Feedthrough

Use `isInputDirectFeedthroughImpl` in your class definition file for marking all inputs as nondirect feedthrough.

```
methods (Access = protected)
    function flag = isInputDirectFeedthroughImpl(~)
        flag = false;
    end
end
```

Complete Class Definition

```
classdef intDelaySysObj < matlab.System
    % intDelaySysObj Delay input by specified number of samples.

    properties
        InitialOutput = 0;
    end
    properties (Nontunable)
        NumDelays = 1;
    end
    properties (DiscreteState)
        PreviousInput;
    end

    methods (Access = protected)
        function validatePropertiesImpl(obj)
```

```
    if ((numel(obj.NumDelays)>1) || (obj.NumDelays <= 0))
        error('Number of delays must be > 0 scalar value.');
```

```
    end
    if (numel(obj.InitialOutput)>1)
        error('Initial Output must be scalar value.');
```

```
    end
end

function setupImpl(obj)
    obj.PreviousInput = ones(1,obj.NumDelays)*obj.InitialOutput;
end

function resetImpl(obj)
    obj.PreviousInput = ones(1,obj.NumDelays)*obj.InitialOutput;
end

function [y] = outputImpl(obj,~)
    y = obj.PreviousInput(end);
end
function updateImpl(obj, u)
    obj.PreviousInput = [u obj.PreviousInput(1:end-1)];
end
function flag = isInputDirectFeedthroughImpl(~)
    flag = false;
end
end
end
```

See Also

[outputImpl](#) | [updateImpl](#)

Topics

“Use Update and Output for Nondirect Feedthrough”

Introduced in R2013b

outputImpl

Output calculation from input or internal state of System object

Syntax

```
[y1,y2,...,yN] = outputImpl(obj,u1,u2,...,uN)
```

Description

`[y1,y2,...,yN] = outputImpl(obj,u1,u2,...,uN)` specifies the algorithm to output the System object states. The output values are calculated from the states and property values. Any inputs that you set to nondirect feedthrough are ignored during output calculation.

Run-Time Details

`outputImpl` is called by the internal `output` method. It is also called before the `updateImpl` method. For sink objects, calling `updateImpl` before `outputImpl` locks the object. For all other types of objects, calling `updateImpl` before `outputImpl` causes an error.

Method Authoring Tips

- You must set `Access = protected` for this method.
- If the System object will be used in the Simulink MATLAB System block, you cannot modify any tunable properties in this method.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `outputImpl` method does not use the object, you can replace this input with `~`.

u1,u2,...,uN — Inputs to the algorithm

inputs

Inputs from the algorithm. The number of inputs must match the number of inputs returned by the `getNumInputs` method. Nondirect feedthrough inputs are ignored during normal execution of the System object. However, for code generation, you must provide these inputs even if they are empty.

Output Arguments

y1,y2,...,yN — Outputs of the algorithm

outputs

Outputs calculated from the specified algorithm. The number of outputs must match the number of outputs returned by the `getNumOutputs` method.

Examples

Set Up Output that Does Not Depend on Input

Specify in your class definition file that the output does not directly depend on the current input with the `outputImpl` method. `PreviousInput` is a property of the `obj`.

```
methods (Access = protected)
    function [y] = outputImpl(obj, ~)
        y = obj.PreviousInput(end);
    end
end
```

See Also

`isInputDirectFeedthroughImpl` | `updateImpl`

Topics

“Use Update and Output for Nondirect Feedthrough”

Introduced in R2013b

updateImpl

Update object states based on inputs

Syntax

```
updateImpl(obj, input1, input2, ...)
```

Description

`updateImpl(obj, input1, input2, ...)` specifies the algorithm to update the System object states. You implement this method when your algorithm outputs depend only on the object's internal state and internal properties.

Run-Time Details

`updateImpl` is called by the `update` method and after the `outputImpl` method.

For sink objects, calling `updateImpl` before `outputImpl` locks the object. For all other types of objects, calling `updateImpl` before `outputImpl` causes an error.

Method Authoring Tips

- Do not use this method to update the outputs from the inputs.
- You must set `Access = protected` for this method.
- If the System object will be used in the Simulink MATLAB System block, you cannot modify any tunable properties in this method.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `updateImpl` method does not use the object, you can replace this input with `~`.

input1, input2, ... — Inputs to the System object

inputs to the System object

List the inputs to the System object. The order of inputs must match the order of inputs defined in the `stepImpl` method.

Examples

Set Up Output that Does Not Depend on Current Input

Update the object with previous inputs. Use `updateImpl` in your class definition file. This example saves the `u` input and shifts the previous inputs.

```
methods (Access = protected)
    function updateImpl(obj,u)
        obj.PreviousInput = [u obj.PreviousInput(1:end-1)];
    end
end
```

matlab.system.mixin.SampleTime class

Control sample time for System objects in Simulink

Description

`matlab.system.mixin.SampleTime` specifies the sample time specifications for a System object when it is included in a MATLAB System block. Inherit from this mixin class and use its methods to control the sample time of your System object in Simulink, via the MATLAB System block.

With this mixin, you can:

- Specify the sample time type
- Specify the sample time
- Customize the sample time with offsets and tick times
- Get the current simulation time

System objects that inherit from this mixin class must also inherit from `matlab.System`. For example:

```
classdef MySystemObject < matlab.System & matlab.system.mixin.SampleTime
```

The `matlab.system.mixin.SampleTime` class is a handle class.

Topics

“Specify Sample Time for MATLAB System Block System Objects”

Introduced in R2017b

getSampleTimeImpl

Specify sample time type, offset time, and sample time

Syntax

```
sts = getSampleTimeImpl(obj)
```

Description

`sts = getSampleTimeImpl(obj)` returns the sample time specification created within the method body, `sts`, for the System object `obj`. Specify the sample time specification within the body of `getSampleTimeImpl` by calling `createSampleTime`. The sample time specification affects the simulation time when the System object is included in a MATLAB System block.

Run-Time Details

`getSampleTimeImpl` is called during setup by `setupImpl`.

Method Authoring Tips

You must set `Access = protected` for this method.

Default Behavior

If you do not include this method in your System object definition, the sample time is inherited.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `getSampleTimeImpl` method does not use the object, you can replace this input with `~`.

Output Arguments

sts — Sample time specification object

sample time specification object

An object defining the sample time specification values. You create this object with the `createSampleTime` function.

Examples

Specify Inherited Sample Time

Specify that the MATLAB System block should inherit the sample from upstream blocks, except if the sample time type is controllable.

```
function sts = getSampleTimeImpl(obj)
    sts = createSampleTime(obj, 'ErrorOnPropagation', 'Controllable');
end
```

Specify Discrete Sample Time

Specify a discrete sample time for the MATLAB System block.

```
function sts = getSampleTimeImpl(obj)
    sts = createSampleTime(obj, 'Type', 'Discrete', ...
        'SampleTime', 10.2, 'OffsetTime', 0.5);
end
```

Topics

“Specify Sample Time for MATLAB System Block System Objects”

Introduced in R2017b

getSampleTime

Query sample time

Syntax

```
sts = getSampleTime(obj)
```

Description

`sts = getSampleTime(obj)` returns the sample time specification for the System object `obj` when the System object is included in a MATLAB System block. You can call `getSampleTime` in the `stepImpl` method to change the algorithm based on the sample time.

Before sample time has propagated throughout the MATLAB System block model, `getSampleTime` returns the `getSampleTimeImpl` sample time specification. If your system object does not override `getSampleTimeImpl`, the default Inherited sample time specification is returned.

After sample time has propagated, `getSampleTime` returns the sample time specification populated with the actual MATLAB System block sample time type, sample time, and offset time.

Input Arguments

obj — System object

System object

System object included in a MATLAB System block that you want to query.

Output Arguments

sts — Sample time specification object

sample time specification object

The sample time specification for the System object. For more details about sample time specification objects, see `createSampleTime`.

Examples

Return Sample Time

This example of `stepImpl` returns a count value `y`, the current simulation time `ct`, and the sample time `st`. The sample time is obtained by calling `getSampleTime`.

```
function [y,ct,st] = stepImpl(obj,u)
    y = obj.Count + u;
    obj.Count = y;
    ct = getCurrentTime(obj);
    sts = getSampleTime(obj);
    st = sts.SampleTime;
end
```

For a complete class definition, see “Specify Sample Time for MATLAB System Block System Objects”.

Topics

“Specify Sample Time for MATLAB System Block System Objects”

Introduced in R2017b

getCurrentTime

Current simulation time in MATLAB System block

Syntax

```
time = getCurrentTime(obj)
```

Description

`time = getCurrentTime(obj)` returns the current simulation time in the MATLAB System block. Call this method in the `stepImpl` method of your System object.

Dependencies

If the MATLAB System block is operating in continuous sample time, `getCurrentTime` may return non-monotonic times due to solver operation.

Input Arguments

obj – System object

system object

System object included in a MATLAB System block that you want to query.

Output Arguments

time – Current simulation time

double

The current simulation time of the MATLAB System block that contains the System object.

Examples

Return Current Simulation Time

This example of `stepImpl` returns a count value `y` and the current simulation time `ct`. The simulation time is obtained by calling `getCurrentTime`.

```
function [y,ct] = stepImpl(obj,u)
    y = obj.Count + u;
    obj.Count = y;
    ct = getCurrentTime(obj);
end
```

For a complete class definition, see “Specify Sample Time for MATLAB System Block System Objects”.

See Also

`createSampleTime` | `getSampleTime` | `getSampleTimeImpl`

Topics

“Specify Sample Time for MATLAB System Block System Objects”

Introduced in R2017b

createSampleTime

Create sample time specification object

Syntax

```
sts = createSampleTime(obj)
sts = createSampleTime(obj, 'Type', Type)
sts = createSampleTime(obj, 'Type', Type, Name, Value)
```

Description

`sts = createSampleTime(obj)` creates a sample time specification object for inherited sample time for the System object `obj`. Use this sample time specification object in the `getSampleTimeImpl` method of your System object. The sample time specification affects the simulation time when the System object is included in a MATLAB System block. If you do not include this method in your System object definition, the sample time is inherited.

`sts = createSampleTime(obj, 'Type', Type)` creates a sample time specification object with the specified sample time type.

`sts = createSampleTime(obj, 'Type', Type, Name, Value)` creates a sample time specification object with additional options specified by one or more `Name, Value` pair arguments. `Name` is a property name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name-value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Dependencies

You can only call `createSampleTime` from the `getSampleTimeImpl` method of your System object.

Input Arguments

obj — System object

System object

System object that you want to specify the sample time.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name, Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Example: `'Type', 'Fixed In Minor Step'`

Type — Sample time type

`'Inherited'` (default) | `'Controllable'` | `'Discrete'` | `'Fixed In Minor Step'`

Type of sample time you want the System object to use in Simulink. For descriptions of the different types of sample times, see:

- 'Inherited' - "Inherited Sample Time"
- 'Controllable' - "Controllable Sample Time"
- 'Discrete' - "Discrete Sample Time"
- 'Fixed In Minor Step' - "Fixed-in-Minor-Step"

Example: `createSampleTime('Type','Fixed In Minor Step')`

AllowPropagation — Allow the propagated sample time

'Controllable' | 'Constant' | 'Continuous' | cell array of character vectors | string array

For Inherited sample time only.

Specify one or more sample times you want to allow your object to use. When the sample time type is set to `Inherited` and the MATLAB System block receives the specified sample time, the block allows the sample time to propagate. You can specify multiple sample time types as a cell array or string array.

Example: `createSampleTime('Type','Inherited','AllowPropagation',{'Controllable','Continuous'})`

AlternatePropagation — Alter the propagated sample time

'Controllable' | 'Constant' | 'Continuous' | cell array of character vectors | string array

For Inherited sample time only.

Specify one or more sample times you do not want your object to use. When the sample time type is set to `Inherited` and you do not want the MATLAB System block to use the specified inherited sample time type, an alternative sample time is used by the block instead. You can specify multiple sample time types. For each sample time type, Simulink substitutes a different sample time type:

- 'Controllable' — The base rate of the controlled sample is propagated instead. Use this option if your System object depends on having constant time between each sample-time hit.
- 'Constant' — The base rate of the model is propagated instead, either the fastest discrete rate or fixed in minor step.
- 'Continuous' — The fastest discrete rate is propagated instead.

Example:

`createSampleTime('Type','Inherited','AlternatePropagation','Controllable')`

ErrorOnPropagation — Error on the propagated sample time

'Controllable' | 'Constant' | 'Continuous' | cell array of character vectors | string array

For Inherited sample time only.

Specify one or more sample times you do not want your object to use. When the sample time type is set to `Inherited` and the MATLAB System block receives the specified sample time, Simulink throws an error.

Example:

`createSampleTime('Type','Inherited','ErrorOnPropagation','Controllable')`

SampleTime — Time between samples

1 (default) | positive number

For Discrete sample time only.

Specify the time between sample hits in Simulink.

Example: `createSampleTime('Type','Discrete','SampleTime',1)`

Data Types: `single` | `double`

OffsetTime — Offset from sample time

0 (default) | nonnegative number less than `SampleTime`

For `Discrete` sample time only.

Specify the offset time for the sample hit. The offset is a time interval indicating an update delay. The block is updated later in the sample interval than other blocks operating at the same sample rate.

The offset time must be nonnegative and less than `SampleTime`.

Example: `createSampleTime('Type','Discrete','SampleTime',2,'OffsetTime',1)`

Data Types: `single` | `double`

TickTime — Time between sample time hits

-1 (default) | positive scalar

Required for `Controllable` sample time only.

Specify the time between controllable sample time hits. The tick time must be a positive scalar.

Example: `createSampleTime('Type','Controllable','TickTime',obj.TickTime)`

Data Types: `single` | `double`

Output Arguments

sts — Sample time specification object

sample time specification object

The sample time specification object. This object has the following properties:

- `Type` — Type of sample time
- `SampleTime` — Time between samples
- `OffsetTime` — Offset from sample time

Use this object as the return value of `getSampleTimeImpl`.

Examples

Create Inherited Sample Time Specification Object

Specify that the MATLAB System block inherits the sample from upstream blocks. Inherited sample time is the default, so no additional arguments are needed.

```
function sts = getSampleTimeImpl(obj)
    sts = createSampleTime(obj);
end
```

Create Discrete Sample Time Object

Specify a discrete sample time specification for the MATLAB System block, including offset time and the sample time.

```
function sts = getSampleTimeImpl(obj)
    sts = createSampleTime(obj, 'Type', 'Discrete', ...
        'SampleTime', 10.2, 'OffsetTime', 0.5);
end
```

[getCurrentTime](#) | [getSampleTime](#) | [getSampleTimeImpl](#) | [setNumTicksUntilNextHit](#)

Topics

“Specify Sample Time for MATLAB System Block System Objects”

Introduced in R2017b

setNumTicksUntilNextHit

Set the number of ticks in Simulink sample time

Syntax

```
setNumTicksUntilNextHit(obj,ticks)
```

Description

`setNumTicksUntilNextHit(obj,ticks)` sets the number of ticks in Simulink sample time to wait until the next call to `stepImpl`, or `outputImpl/updateImpl`.

Dependencies

To use this method, set your System object to controllable sample time with `createSampleTime('Type','Controllable')`. Otherwise, your System object gives a compilation error.

You can only call this method from `stepImpl`, `outputImpl`, `updateImpl`, or `resetImpl`.

Input Arguments

obj — System object

System object

System object that you want to specify the sample time.

ticks — Number of ticks in Simulink sample time

positive integer scalar

Number of ticks in Simulink sample time to wait until the next call to `stepImpl` or `outputImpl/updateImpl`. Specify this number as a positive integer scalar less than `intmax('uint64')`.

The number of sample time ticks to wait until the next hit is persistent. If you don't update this number, Simulink uses the previously set value of number of ticks to wait.

ModelAdvisor.Preferences class

Package: ModelAdvisor

Set Model Advisor window preferences by specifying which folders and tabs to display

Description

Use instances of this class to set Model Advisor preferences.

Construction

The constructor `ModelAdvisor.Preferences` creates an instance of this class with default property values.

Create an instance `modelPreferences` of the `ModelAdvisor.Preferences` class.

```
modelPreferences = ModelAdvisor.Preferences;
```

Properties

DeselectByProduct — Deselect the By Product folder

(default) | true

Selection of the **By Product** folder in the Model Advisor window. The default value is `true`.

Example: `true`

Data Types: `logical`

ShowAccordion — Display advisors

(default) | true

Display of the **Code Generation Advisor**, **Upgrade Advisor**, and **Performance Advisor** in the Model Advisor window. You can use these advisors to help configure your model for code generation, upgrade your model for the current release, or improve performance.

Example: `true`

Data Types: `logical`

ShowByProduct — Display the By Product folder

(default) | true

Display of the **By Product** folder in the Model Advisor window. The default value is `true`.

Example: `true`

Data Types: `logical`

ShowByTask — Display the By Task folder

(default) | true

Display of the **By Task** folder in the Model Advisor window. The default value is `true`.

Example: `true`

Data Types: `logical`

ShowExclusionsInRpt — Include exclusions in report

(default) | `true`

Include exclusions in the Model Advisor report. The default value is `true`.

Example: `true`

Data Types: `logical`

ShowExclusionTab — Display the Exclusions tab

(default) | `false`

Display of the **Exclusions** tab in the Model Advisor window. The default value is `false`. When you click the **Exclusions** tab, the Model Advisor window displays checks that are excluded from the Model Advisor analysis.

Example: `true`

Data Types: `logical`

ShowSourceTab — Display the Source tab

(default) | `false`

Display of the **Source** tab in the Model Advisor window. The default value is `false`. When you click the **Source** tab, the Model Advisor window displays the check Title, TitleID, and location of the MATLAB source code for the check.

Example: `true`

Data Types: `logical`

Examples

Turn Off Display Of By Product Folder

This example shows how to not display the **By Product** folder in the Model Advisor window:

```
mp = ModelAdvisor.Preferences;
mp.load;
mp.ShowByProduct = false;
mp.save
```

Alternatives

You can set the Model Advisor preferences by using the Model Advisor Preferences dialog box:

- On the Model Advisor menu, select **Settings > Preferences**.
- From the Model Editor, from the **Modeling** tab, select **Model Advisor > Preferences**.

“Run Model Advisor Checks”

Introduced in R2014b

Simulink.AliasType

Create alias for signal and parameter data type

Description

Use a `Simulink.AliasType` to create an alias of a built-in data type such as `int8`.

The name of the object is the alias. The data type to which an alias refers, such as `int8`, is the base type. Alias names cannot be:

- MATLAB built-in numeric types: `single`, `double`, `int8`, `uint8`, `int16`, `uint16`, `int32`, `uint32`, `int64`, or `uint64`.
- Fixed-Point Designer types beginning with `half`, `sfix`, `ufix`, or `flt`.

You create the object in the base workspace or a data dictionary. To use the alias, you use the name of the object to set data types for signals, states, and parameters in a model.

Using aliases to specify signal and parameter data types can greatly simplify global changes to the data types that a model specifies. In particular, changing the data type of all signals, states, and parameters whose data type is specified by an alias requires changing only the base type of the alias. By contrast, changing the data types of signals, states, and parameters whose data types are specified by an actual type name requires respecifying the data type of each signal and parameter individually.

You can use objects of this class to create an alias for Simulink built-in data types, fixed-point data types, enumerated data types, `Simulink.NumericType` objects, and other `Simulink.AliasType` objects. The code that you generate from a model (Simulink Coder) uses the alias only if you use an ERT-based system target file (Embedded Coder).

Alternatively, to define and name a numeric data type, you can use an object of the class `Simulink.NumericType`.

Creation

You can use either the Model Explorer or MATLAB commands to create a data type alias.

To use the Model Explorer to create an alias:

- 1 On the Model Explorer **Model Hierarchy** pane, select `Base Workspace`.

You must create data type aliases in the MATLAB workspace or in a data dictionary. If you attempt to create an alias in a model workspace, Simulink software displays an error.

- 2 From the Model Explorer **Add** menu, select **Simulink.AliasType**.

Simulink software creates an instance of a `Simulink.AliasType` object and assigns it to a variable named `Alias` in the MATLAB workspace.

- 3 Rename the variable to a more appropriate name, for example, a name that reflects its intended usage.

To change the name, edit the name displayed in the **Name** field on the Model Explorer **Contents** pane.

- 4 On the Model Explorer **Dialog** pane, in the **Base type** field, enter the name of the data type that this alias represents.

You can specify the name of any existing standard or user-defined data type in this field. Skip this step if the base type is `double` (the default).

To generate `Simulink.AliasType` objects that correspond to `typedef` statements in your external C code, consider using the `Simulink.importExternalCTypes` function.

To create a data type alias programmatically, use the `Simulink.AliasType` function described below.

Syntax

```
aliasObj = Simulink.AliasType
aliasObj = Simulink.AliasType(baseType)
```

Description

`aliasObj = Simulink.AliasType` returns a `Simulink.AliasType` object with default property values.

`aliasObj = Simulink.AliasType(baseType)` returns a `Simulink.AliasType` object and initializes the value of the `BaseType` property by using `baseType`.

Properties

For information about properties in the property dialog box of a `Simulink.AliasType` object, see “`Simulink.AliasType` Property Dialog Box”.

BaseType — Name of base data type

'double' (default) | character vector | string scalar

Name of the base data type that this alias renames, specified as a character vector or string scalar. You can specify the name of a standard data type, such as `int8`, or the name of a custom data type, such as the name of another `Simulink.AliasType` object or the name of an enumeration.

To specify a fixed-point data type, you can use a call to the `fixdt` function, such as `'fixdt(0,16,7)'`.

You can, with one exception, specify a nonstandard data type, e.g., a data type defined by a `Simulink.NumericType` object, by specifying the data type name. The exception is a `Simulink.NumericType` whose `DataTypeMode` is `Fixed-point: unspecified scaling`.

Note `Fixed-point: unspecified scaling` is a partially specified type whose definition is completed by the block that uses the `Simulink.NumericType`. Forbidding its use in alias types avoids creating aliases that have different base types depending on where they are used.

Corresponds to **Base type** in the property dialog box.

Example: 'int8'

Example: 'myOtherAlias'

Data Types: char | string

DataScope — Specification to generate or import type definition in the generated code

'Auto' (default) | 'Exported' | 'Imported'

Specification to generate or import the type definition (typedef) in the generated code (Simulink Coder), specified as 'Auto', 'Exported', or 'Imported'.

The table shows the effect of each option.

Value	Action
'Auto' (default)	If no value is specified for <code>HeaderFile</code> , export the type definition to <code>model_types.h</code> , where <code>model</code> is the model name. If you have an Embedded Coder license, and you have specified a data type replacement, then export the type definition to <code>rtwtypes.h</code> . If a value is specified for <code>HeaderFile</code> , import the data type definition from the specified header file.
'Exported'	Export the data type definition to a header file, which can be specified in the <code>HeaderFile</code> property. If no value is specified for <code>HeaderFile</code> , the header file name defaults to <code>type.h</code> . <code>type</code> is the data type name.
'Imported'	Import the data type definition from a header file, which can be specified in the <code>HeaderFile</code> property. If no value is specified for <code>HeaderFile</code> , the header file name defaults to <code>type.h</code> . <code>type</code> is the data type name.

For more information, see “Control File Placement of Custom Data Types” (Embedded Coder).

Corresponds to **Data scope** in the property dialog box.

Description — Custom description of data type alias

' ' (empty character vector) (default) | character vector

Custom description of the data type alias, specified as a character vector.

Corresponds to **Description** in the property dialog box.

Example: 'This type alias corresponds to a floating-point implementation.'

Data Types: char

HeaderFile — Name of header file that contains type definition in the generated code

' ' (empty character vector) (default) | character vector

Name of the header file that contains the type definition (typedef) in the generated code, specified as a character vector.

If this property is specified, the specified name is used during code generation for importing or exporting. If this property is empty, the value defaults to `type.h` if `DataScope` equals 'Imported' or 'Exported', or defaults to `model_types.h` if `DataScope` equals 'Auto'.

By default, the generated `#include` directive uses the preprocessor delimiter `"` instead of `<` and `>`. To generate the directive `#include <myTypes.h>`, specify `HeaderFile` as `'<myTypes.h>'`.

For more information, see “Control File Placement of Custom Data Types” (Embedded Coder).

Corresponds to **Header file** in the property dialog box.

Example: 'myHdr.h'

Example: 'myHdr'

Example: 'myHdr.hpp'

Data Types: char

Examples

Create Alias for Enumerated Data Type

To create an alias for an enumerated type called `SLDemoSign`:

```
myEnumAlias = Simulink.AliasType('Enum: SLDemoSign');
```

Create Alias for Fixed-Point Data Type

To create an alias for a fixed-point data type by using a `Simulink.AliasType` object, set the `BaseType` property of the object by using a call to the `fixdt` function. The value of `BaseType` must be specified as a character vector.

For example, this code creates an alias for an unsigned fixed-point data type with word length 16 and fraction length 7.

```
myFixptAlias = Simulink.AliasType;  
myFixptAlias.BaseType = 'fixdt(0,16,7)';
```

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using MATLAB® Coder™.

A `Simulink.AliasType` object appears in the generated code as a `typedef` statement. The generated code uses the named type to define and declare data (variables).

The `Simulink.AliasType` class does not support multiword base data types for code generation.

Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

Simulink.Annotation

Specify properties of model annotation

Description

Instances of this class specify the properties of annotations. You can use `getCallbackAnnotation` in an annotation callback function to get the `Simulink.Annotation` instance for the annotation associated with the callback function. You can use `find_system` and `get_param` to get the `Simulink.Annotation` instance associated with any annotation in a model. For example, this code gets the annotation object for the first annotation in the currently selected model and turns on its drop shadow

```
ah = find_system(gcs,'FindAll','on','type','annotation');
ao = get_param(ah(1),'Object');
ao.DropShadow = 'on';
```

Children

None.

Property Summary

Property	Description	Values
AnnotationType	Type of annotation—text (note), area, or image. This property is read only.	note_annotation area_annotation image_annotation
BackgroundColor	Background color of this annotation.	RGB value array [r,g,b,a] where r, g, b, and a are the red, green, blue, and alpha values of the color normalized to the range 0.0 to 1.0, delineated with commas. The alpha value is optional and ignored. Annotation background color can also be 'automatic' (transparent), 'black', 'white', 'red', 'green', 'blue', 'cyan', 'magenta', 'yellow', 'gray', 'lightBlue', 'orange', 'darkGreen'.
ClickFcn	Specifies MATLAB code to execute when you click this annotation. See “Associate a Click Function with an Annotation” for more information.	character vector
DeleteFcn	MATLAB code to execute before deleting this annotation. See “Annotation Callback Functions”.	character vector
Description	Description of this annotation.	character vector
DropShadow	Turn drop shadow display on or off.	'on' {'off'}

Property	Description	Values
FixedHeight	Specify whether the bottom border of the annotation resizes as you add content.	'on' {'off'}, where 'off' means that the bottom border resizes as you add content
FixedWidth	Specify whether to use word wrap or to have the width of the annotation expand to accommodate text.	'on' {'off'}, where 'off' means to use word wrap
FontAngle (plain text only)	Angle of the annotation font. The default value, 'auto', uses of the default font angle specified for lines in the Font Styles dialog box.	'normal' 'italic' 'oblique' {'auto'}
FontName (plain text only)	Name of annotation font. The default value, 'auto', uses the default font specified for lines in the Font Styles dialog box.	character vector
FontSize (plain text only)	Size of annotation font in points. The default value, -1, uses the default text size for lines specified in the Font Styles dialog box.	decimal number {'-1'}
FontWeight (plain text only)	Weight of the annotation font. The default value, 'auto', use of the default weight for lines specified in the Font Styles dialog box.	'light' 'normal' 'demi' 'bold' {'auto'}
ForegroundColor	Foreground color of this annotation.	RGB value array [r,g,b,a] where r, g, b, and a are the red, green, blue, and alpha values of the color normalized to the range 0.0 to 1.0, delineated with commas. The alpha value is optional and ignored. Annotation foreground color can also be 'black', 'white', 'red', 'green', 'blue', 'cyan', 'magenta', 'yellow', 'gray', 'lightBlue', 'orange', 'darkGreen'.
Handle	Annotation handle.	real
HiliteAncestors	For internal use.	
HorizontalAlignment	Horizontal alignment of this annotation.	'center' {'left'} 'right'
Interpreter	Specifies whether the annotation is interpreted as rich text or contains LaTeX commands. The default value, 'off', specifies a plain text annotation. When you format a plain text annotation using the formatting toolbar, the annotation becomes a rich text annotation.	'rich' 'tex' {'off'}

Property	Description	Values
IsImage	Specifies whether the annotation is an image-only annotation.	'on' {'off'}
InternalMargins	Space from the bounding box of text to the borders of the annotation.	1x4 array [left top right bottom]. The default is [1 1 1 1]. Supported coordinates are between -1073740824 and 1073740823, inclusive.
LoadFcn	MATLAB code to execute when the model containing this annotation is loaded. See "Annotation Callback Functions".	character vector
Name	Text of annotation. Same as Text.	character vector
Parent	Parent name of annotation object.	character vector
Path	Path to the annotation.	character vector
PlainText	Read-only display of the text in the annotation, without formatting.	vector
Position	Location of the annotation.	vector of coordinates, in pixels: [left top right bottom] The origin is the upper-left corner of the Simulink Editor canvas before any canvas resizing. Supported coordinates are between -1073740824 and 1073740823, inclusive. Positive values are to the right of and down from the origin. Negative values are to the left of and up from the origin.
RequirementInfo	For internal use.	character vector
Selected	Specifies whether this annotation is currently selected.	'on' 'off'
Tag	Text to assign to the annotation Tag parameter and save with the annotation.	character vector
TeXMode	Specifies whether to render TeX markup.	'on' {'off'}
Text	Text of annotation. Same as Name.	character vector
Type	Annotation type. This is always 'annotation'.	'annotation'

Property	Description	Values
UseDisplayText-AsClickCallback	<p>Specifies whether to use the contents of the Text property as the click function for this annotation.</p> <p>If set to 'on', the text of the annotation is interpreted as a valid MATLAB expression and run. If set to 'off', clicking the annotation runs the click function, if there is one. If there is no click function, clicking the annotation has no effect.</p> <p>See “Associate a Click Function with an Annotation” for more information.</p>	'on' {'off'}
UserData	Any data that you want to associate with this annotation.	vector
VerticalAlignment	Vertical alignment of this annotation.	'middle' {'top'} 'cap' 'baseline' 'bottom'

Method Summary

Method	Description
delete	Delete this annotation from the Simulink model.
dialog	Display the Annotation properties dialog box.
disp	Display the property names and their settings for this Annotation object.
fitToView	Zoom in on this annotation and highlight it in the model.
get	Return the specified property settings for this annotation.
help	Display a list of properties for this Annotation object with short descriptions.
methods	Display all nonglobal methods of this Annotation object.
set	Set the specified property of this Annotation object with the specified value.
setImage	Set the annotation contents to the specified image file. The resulting annotation is an image-only annotation.
struct	Return and display a MATLAB structure containing the property settings of this Annotation object.
view	Display this annotation in the Simulink Editor with this annotation highlighted.

Simulink.BlockCompDworkData

Provide postcompilation information about block's DWork vector

Description

Simulink software returns an instance of this class when a MATLAB program, e.g., a Level-2 MATLAB S-function, invokes the “Dwork” on page 5-370 method of a block's run-time object after the model containing the block has been compiled.

Parent

Simulink.BlockData

Children

None

Property Summary

Name	Description
“Usage” on page 5-164	Usage type of this DWork vector.
“UsedAsDiscState” on page 5-165	True if this DWork vector is being used to store the values of a block's discrete states.

Properties

Usage

Description

Returns a character vector indicating how this DWork vector is used. Permissible values are:

- DWork
- DState
- Scratch
- Mode

Data Type

character vector

Access

RW for MATLAB S-function blocks, RO for other blocks.

UsedAsDiscState**Description**

True if this DWork vector is being used to store the values of a block's discrete states.

Data Type

Boolean

Access

RW for MATLAB S-Function blocks, R0 for other blocks.

Introduced before R2006a

Simulink.BlockCompInputPortData

Provide postcompilation information about block input port

Description

Simulink software returns an instance of this class when a MATLAB program, e.g., a Level-2 MATLAB S-function, invokes the “InputPort” on page 5-371 method of a block's run-time object after the model containing the block has been compiled.

Parent

Simulink.BlockPortData

Children

None

Property Summary

Name	Description
“DirectFeedthrough” on page 5-166	True if this port has direct feedthrough.
“Overwritable” on page 5-166	True if this port is overwritable.

Properties

DirectFeedthrough

Description

True if this input port has direct feedthrough.

Data Type

Boolean

Access

RW for MATLAB S functions, RO for other blocks.

Overwritable

Description

True if this input port is overwritable.

Data Type

Boolean

Access

RW for MATLAB S functions, RO for other blocks.

Introduced before R2006a

Simulink.BlockCompOutputPortData

Provide postcompilation information about block output port

Description

Simulink software returns an instance of this class when a MATLAB program, e.g., a Level-2 MATLAB S-function, invokes the “OutputPort” on page 5-372 method of a block's run-time object after the model containing the block has been compiled.

Parent

Simulink.BlockPortData

Simulink.BlockData

Provide run-time information about block-related data, such as block parameters

Description

This class defines properties that are common to objects that provide run-time information about a block's ports and work vectors.

Parent

None

Children

Simulink.BlockPortData, Simulink.BlockCompDworkData

Property Summary

Name	Description
"AliasedThroughDataType" on page 5-169	Fundamental base data type.
"AliasedThroughDataTypeID" on page 5-170	Fundamental base data type ID.
"Complexity" on page 5-170	Numeric type (real or complex) of the block data.
"Data" on page 5-170	The block data.
"DataAsDouble" on page 5-171	The block data in double form.
"Datatype" on page 5-171	Data type of the block data.
"DatatypeID" on page 5-171	Index of the data type of the block data.
"Dimensions" on page 5-172	Dimensions of the block data.
"Name" on page 5-172	Name of the block data.
"Type" on page 5-172	Type of block data (e.g., a parameter).

Properties

AliasedThroughDataType

Description

Data type aliases allow a data type (B) to be recursively aliased to another alias type or `BaseType` (A). If alias type A is aliased to another alias type that is aliased to another alias type and so forth, this property allows the alias type to be iteratively searched (aliased through) until the type is no longer an alias type and that final result is the value of the property returned. For example, assume that you have created the Simulink Alias types A and B as follows:

```
A=Simulink.AliasType('double')
```

A =

```
Simulink.AliasType
    Description: ''
    HeaderFile: ''
    BaseType: 'double'
B=Simulink.AliasType('A')

B =
Simulink.AliasType
    Description: ''
    HeaderFile: ''
    BaseType: 'A'
```

If the data type of an item of block data is B, this property returns the base type A instead of B.

Data Type

character vector

Access

R0

AliasedThroughDataTypeId**Description**

Index of the data type alias returned by the `AliasedThroughDataType` property.

Data Type

integer

Access

R0

Complexity**Description**

Numeric type (real or complex) of the block data.

Data Type

character vector

The block data's in double form.

Data Type

double

Access

R0

Datatype**Description**

Data type of the values of the block-related object.

Data Type

character vector

Access

R0

DatatypeID**Description**

Index of the data type of the values of the block-related object. enter the numeric value for the desired data type, as follows:

Data Type	Value
'inherited'	-1
'double'	0
'single'	1
'int8'	2
'uint8'	3
'int16'	4
'uint16'	5
'int32'	6
'uint32'	7
'boolean' or fixed-point data types	8

Data Type

integer

Access

RW for MATLAB S functions, R0 for other blocks

Dimensions**Description**

Dimensions of the block-related object, e.g., parameter or DWork vector.

Data Type

array

Access

RW for MATLAB S functions, R0 for other blocks

Name**Description**

Name of block-related object, e.g., a block parameter or DWork vector.

Data Type

character vector

Access

RW for MATLAB S functions, R0 for other blocks

Type**Description**

Type of block data. Possible values are:

Type	Description
'BlockPreCompInputPortData '	This object contains data for an input port before the model is compiled.
'BlockPreCompOutputPortData '	This object contains data for an output port before the model is compiled.
'BlockCompInputPortData '	This object contains data for an input port after the model is compiled.
'BlockCompOutputPortData '	This object contains data for an output port after the model is compiled.
'BlockPreCompDworkData '	This object contains data for a DWork vector before the model is compiled.
'BlockCompDworkData '	This object contains data for a DWork vector after the model is compiled.
'BlockDialogPrmData '	This object describes a dialog box parameter of a Level-2 MATLAB S-function.

Type	Description
'BlockRuntimePrmData'	This object describes a run-time parameter of a Level-2 MATLAB S-function.
'BlockCompContStatesData'	This object describes the continuous states of the block at the current time step.
'BlockDerivativesData'	This object describes the derivatives of the block's continuous states at the current time step.

Introduced before R2006a

Simulink.Breakpoint class

Package: Simulink

Store and share data for a breakpoint set, configure the data for ASAP2 and AUTOSAR code generation

Description

An object of the `Simulink.Breakpoint` class stores breakpoint set data for a lookup table. You can use that data in one or more Prelookup blocks. With the object, you can specify a data type and code generation settings for the breakpoint set and share the set between multiple lookup tables. Use `Simulink.Breakpoint` objects and `Simulink.LookupTable` objects to configure COM_AXIS code generation for calibration.

The code generated for a `Simulink.Breakpoint` object is an array or a structure with two fields. If you configure the object to appear as a structure, one field stores the specified breakpoint set data and one scalar field stores the number of elements in the breakpoint set data. You can configure the structure type name, the field name, and other characteristics by using the properties of the object.

To package lookup table and breakpoint set data into a single structure in the generated code, for example, for STD_AXIS code generation, use a `Simulink.LookupTable` object to store all of the data. See “Package Shared Breakpoint and Table Data for Lookup Tables”.

Construction

`BpSet = Simulink.Breakpoint` returns a `Simulink.Breakpoint` object named `BpSet` with default property values.

To create a `Simulink.Breakpoint` object by using the Model Explorer, use the button  on the toolbar. The default name for the object is `Object`.

Property Dialog Box

Simulink.Breakpoint: myBreakpointSet

Name:

Data scope: Auto

Header file:

OK Cancel Help Apply

Breakpoints

The breakpoint set information. You can configure these characteristics:

Support tunable size

Specification to enable tuning the effective size of the table in the generated code. If you select this option, in the generated code, the `Simulink.Breakpoint` object appears as a structure variable. The structure has one field to store the breakpoint vector data and one field to store the number of elements in the breakpoint vector. You can change the value of the second field to adjust the effective size of the table.

If you clear this option, the `Simulink.Breakpoint` object appears in the generated code as a separate array variable instead of a structure.

Value

Breakpoint set data. Specify a vector with at least two elements.

You can also use an expression with mathematical operators such as `sin(1:0.5:30)` as long as the expression returns a numeric vector. When you click **Apply** or **OK**, the object executes the expression and uses the result to set the value of this property.

When you set **Data type** to `auto`, to set **Value**, use a typed expression such as `single([1 2 3])` or use the `fi` constructor to embed an `fi` object.

You can edit this data by using a more intuitive interface in a lookup table block. See “Import Lookup Table Data from MATLAB”.

Data type

Data type of the breakpoint set. The default setting is `auto`, which means that the breakpoint set acquires a data type from the value that you specify in **Value**. If you use an untyped expression such as `[1 2 3]` to set **Value**, the breakpoint data use the data type `double`. If you specify a typed expression such as `single([1 2 3])` or an `fi` object, the breakpoint

data use the data type specified by the expression or object. Enumerated data types are also supported.

You can explicitly specify an integer data type, a floating-point data type, a fixed-point data type, or a data type expression such as the name of a `Simulink.AliasType` object.

For more information about data types in Simulink, see “Data Types Supported by Simulink”. To decide how to control the data types of table and breakpoint data in `Simulink.LookupTable` and `Simulink.Breakpoint` objects, see “Control Data Types of Lookup Table Objects” (Simulink Coder).

Dimensions

Dimension lengths of the breakpoint set.

To use symbolic dimensions, specify a character vector. See “Implement Dimension Variants for Array Sizes in Generated Code” (Embedded Coder).

Min

Minimum value of the elements in the breakpoint set. The default value is empty, `[]`. You can specify a numeric, real value.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

Max

Maximum value of the elements in the breakpoint set. The default value is empty, `[]`. You can specify a numeric, real value.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

Stored Int Min

For `Simulink.Breakpoint` objects with a fixed-point data type, the minimum value of the elements in the breakpoint set, specified as a stored integer value. The value is derived from the real-world value **Min**. This property is available only in the property dialog box.

Stored Int Max

For `Simulink.Breakpoint` objects with a fixed-point data type, the maximum value of the elements in the breakpoint set, specified as a stored integer value. The value is derived from the real-world value **Max**. This property is available only in the property dialog box.

Unit

Physical unit of the elements in the breakpoint set. You can specify text such as `degC`. See “Unit Specification in Simulink Models”.

Field name

Name of a structure field in the generated code. This field stores the breakpoint set data. The default value is `BP`. To change the field name, specify text.

This column appears only if you select **Support tunable size**.

Tunable size name

Name of a structure field in the generated code. This scalar field stores the length of the breakpoint set (the number of elements), which the generated code algorithm uses to determine the size of the table. To tune the effective size of the table during code execution,

change the value of this structure field in memory. The default name is N. To change the field name, specify text.

This column appears only if you select **Support tunable size**.

Description

Description of the breakpoint set. You can specify text such as This breakpoint set represents the pressure input.

Data definition: Storage class

Storage class of the structure variable (if you select **Support tunable size**) or array variable in the generated code. The variable stores the breakpoint set data. The default setting is Auto.

For more information about storage classes, see “Apply Storage Classes to Individual Signal, State, and Parameter Data Elements” (Simulink Coder).

If you have Embedded Coder, you can choose a custom storage class. For information about custom storage classes, see “Apply Built-In and Customized Storage Classes to Data Elements” (Embedded Coder).

Data definition: Identifier

Alternative name for the variable in the generated code. The default value is empty, in which case the generated code uses the name of the `Simulink.Breakpoint` object as the name of the variable. To set the identifier, specify text.

To enable this property, set **Data definition: Storage class** to a setting other than Auto.

Data definition: Alignment

Data alignment boundary in the generated code. The starting memory address for the data allocated for the structure or array variable is a multiple of the value that you specify. The default value is -1, which allows the code generator to determine an optimal alignment based on usage.

Specify a positive integer that is a power of 2, not exceeding 128. For more information about using data alignment for code replacement, see “Data Alignment for Code Replacement” (Embedded Coder).

Struct Type definition: Name

Name of the structure type that the structure variable uses in the generated code. The default value is empty. Specify text.

This property appears only if you select **Support tunable size**.

Struct Type definition: Data scope

Scope of the structure type definition (imported from your handwritten code or exported from the generated code). The default value is Auto. When you select Auto:

- If you do not specify a value in the **Struct Type definition: Header file** box, the generated code exports the structure type definition to the file `model_types.h`. `model` is the name of the model.
- If you specify a value in the **Struct Type definition: Header file** box, such as `myHdr.h`, the generated code imports the structure type definition from `myHdr.h`.

To explicitly specify the data scope:

- To import the structure type definition into the generated code from your custom code, select **Imported**.

- To export the structure type definition from the generated code, select Exported.

If you do not specify a value in the **Struct Type definition: Header file** box, the generated code imports or exports the type definition from or to `StructName.h`. `StructName` is the name that you specify with the property **Struct Type definition: Name**.

This property appears only if you select **Support tunable size**.

Struct Type definition: Header file

Name of the header file that contains the structure type definition. You can import the definition from a header file that you create, or export the definition into a generated header file. To control the scope of the structure type, adjust the setting for the **Struct Type definition: Data scope** property.

This property appears only if you select **Support tunable size**.

Properties

Breakpoints — Breakpoint set data

`Simulink.lookuptable.Breakpoint` object

Breakpoint set data, specified as a `Simulink.lookuptable.Breakpoint` object. Use this embedded object to configure the structure field names and characteristics of the breakpoint set data such as breakpoint values, data type, and dimensions.

CoderInfo — Code generation settings for variable

`Simulink.CoderInfo` object

Code generation settings for the structure variable (if you set `SupportTunableSize` to `true`) or array variable (`false`) that stores the breakpoint set data, specified as a `Simulink.CoderInfo` object. You can specify a storage class or custom storage class by using this embedded object. For more information, see `Simulink.CoderInfo`.

StructTypeInfo — Settings for structure type in the generated code

`Simulink.lookuptable.StructTypeInfo` object

Settings for the structure type that the structure variable uses in the generated code, specified as a `Simulink.lookuptable.StructTypeInfo` object.

If you set `SupportTunableSize` to `false`, the `Simulink.Breakpoint` object does not appear in the generated code as a structure. The code generator ignores this property.

SupportTunableSize — Option to generate code that enables tunability of table size

`false` (default) | `true`

Option to generate code that enables tunability of the effective size of the table, specified as `true` or `false`. See the **Support Tunable Size** parameter.

Data Types: `logical`

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Share Breakpoint Data Between One-Dimensional Lookup Tables

- 1 Create a `Simulink.Breakpoint` object named `myBpSet`.

```
myBpSet = Simulink.Breakpoint
```

- 2 Specify the breakpoint data.

```
myBpSet.Breakpoints.Value = [-2 -1 0 1 2];
```

- 3 Create a `Simulink.LookupTable` object named `FirstLUTObj`.

```
FirstLUTObj = Simulink.LookupTable;
```

- 4 Specify the table data.

```
FirstLUTObj.Table.Value = [1.1 2.2 3.3 4.4 5.5];
```

- 5 Configure the lookup table object to refer to the breakpoint set object.

```
FirstLUTObj.Breakpoints = {'myBpSet'};
```

- 6 Create another `Simulink.LookupTable` object to store a different set of table data. Configure the lookup table object to refer to the same breakpoint set object.

```
SecondLUTObj = Simulink.LookupTable;
SecondLUTObj.Table.Value = [1.2 2.3 3.4 4.5 5.6];
SecondLUTObj.Breakpoints = {'myBpSet'};
```

You can use `FirstLUTObj` and `SecondLUTObj` to specify the table data in two different Interpolation Using Prelookup blocks. Use `myBpSet` to specify the breakpoint set data in one or two Prelookup blocks that provide the inputs for the Interpolation Using Prelookup blocks.

Limitations

- You cannot subclass `Simulink.Breakpoint` or `Simulink.LookupTable`. For this reason, you cannot apply custom storage classes other than those in the built-in `Simulink` package.
- You cannot use `Simulink.Breakpoint` objects or `Simulink.LookupTable` objects that refer to `Simulink.Breakpoint` objects as instance-specific parameter data for reusable components. For example, you cannot use one of these objects as:
 - A model argument in a model workspace or a model argument value in a Model block.
 - The value of a mask parameter on a CodeReuse Subsystem block.
 - The value of a mask parameter on a subsystem that you reuse by creating a custom library.

However, you can use standalone `Simulink.LookupTable` objects, which do not refer to `Simulink.Breakpoint` objects, in these ways.

- You cannot generate code according to the `FIX_AXIS` style.
- When blocks in a subsystem use `Simulink.LookupTable` or `Simulink.Breakpoint` objects, you cannot set data type override (see “Control Fixed-Point Instrumentation and Data Type Override”) only on the subsystem. Instead, set data type override on the entire model.

Simulink.CoderInfo

Specify information needed to generate code for signal, state, or parameter data

Description

Use a `Simulink.CoderInfo` object to specify code generation settings for signal, state, and parameter data in a model.

Simulink creates a `Simulink.CoderInfo` object for each data object that you create. Data objects represent signal, state, or parameter data. The `Simulink.CoderInfo` object exists in the `CoderInfo` property of each data object.

Data objects include objects of these classes:

- `Simulink.Parameter`
- `Simulink.Signal`
- `Simulink.LookupTable`
- `Simulink.Breakpoint`
- `Simulink.DualScaledParameter`

Use the properties of the `Simulink.CoderInfo` object to configure the representation of the parent data object in the generated code.

You can set the properties of a `Simulink.CoderInfo` object through the `CoderInfo` property or the property dialog box of the parent data object. For example, the following MATLAB expression sets the `StorageClass` property of a `Simulink.CoderInfo` object used by a signal object named `mysignal`.

```
mysignal.CoderInfo.StorageClass = 'ExportedGlobal';
```

Creation

When you create a data object, Simulink sets the value of the `CoderInfo` property by creating a `Simulink.CoderInfo` object. You do not need to create a `Simulink.CoderInfo` object explicitly.

Properties

Identifier — Alternative name for code generation

' ' (empty character vector) (default) | character vector

Alternative name for the data in the generated code, specified as a character vector.

Example: `'myOtherName'`

Data Types: `char`

Alignment — Data alignment boundary

-1 (default) | positive integer

Data alignment boundary for this data, specified as a positive integer that is a power of 2, not exceeding 128. Specify an integer number of double data type. See “Data Alignment for Code Replacement” (Embedded Coder) for more information.

Example: 8

Data Types: double

Complex Number Support: Yes

CustomAttributes — Custom storage class attributes of this data

SimulinkCSC.AttribClass_Simulink_Default object (default) | custom attributes object

Custom storage class attributes of this data, returned as a custom attributes object. You must set the property `StorageClass` to 'Custom' to enable this property.

Depending on the custom storage class that you apply by using the `CustomStorageClass` property of the `Simulink.CoderInfo` object, Simulink sets the value of this property by creating a custom attributes object. Then, you can set the values of the properties of the custom attributes object. See “Apply Built-In and Customized Storage Classes to Data Elements” (Embedded Coder) for more information.

CustomStorageClass — Custom storage class of this data

'Default' (default) | character vector

Custom storage class of this data, specified as a character vector. You must set the property `StorageClass` to 'Custom' to enable this property.

For a list of valid custom storage classes (Embedded Coder) when you create the data object from the `Simulink` package, see “Choose Storage Class for Controlling Data Representation in Generated Code” (Embedded Coder).

Example: 'ExportToFile'

Data Types: char

StorageClass — Storage class of this data

'Auto' (default) | character vector

Storage class of this data, specified as a character vector. For more information, see “Apply Storage Classes to Individual Signal, State, and Parameter Data Elements” (Simulink Coder).

Example: 'ExportedGlobal'

Data Types: char

Examples

Configure Code Generation Settings Programmatically

For examples that show how to configure code generation settings for a data item programmatically, see “Apply Storage Classes to Individual Signal, State, and Parameter Data Elements” (Simulink Coder) and “Apply Built-In and Customized Storage Classes to Data Elements” (Embedded Coder).

Simulink.FindOptions class

Package: Simulink

Options for finding blocks in models and subsystems

Description

Create an options object to use with `Simulink.findBlocks` and `Simulink.findBlocksOfType` to constrain the search.

Construction

`f = Simulink.FindOptions` creates a `FindOptions` object that uses the default search options.

`f = Simulink.FindOptions(Option1,Value1,...OptionN,ValueN)` creates the object using the specified search options.

Input Arguments

'CaseSensitive' — Option to specify whether to match case when searching

`true` (default) | `false`

Option to specify whether to match case when searching, specified as `true` for case-sensitive search or `false` for case-insensitive search.

'FollowLinks' — Option to follow library links

`false` (default) | `true`

Option to follow library links, specified as `true` or `false`. If `true`, search follows links into library blocks.

'IncludeCommented' — Option for the search to include commented blocks

`true` (default) | `false`

Option for the search to include commented blocks, specified as `true` or `false`.

'LookUnderMasks' — Options to search masked blocks

`'all'` (default) | `'none'` | `'functional'` | `'graphical'`

Options to search masked blocks, specified as:

- `'all'` — Search in all masked blocks.
- `'none'` — Prevent searching in masked systems.
- `'functional'` — Include masked subsystems that do not have dialogs.
- `'graphical'` — Include masked subsystems that do not have workspaces or dialogs.

'Variants' — Options to search Variant subsystems

`'AllVariants'` (default) | `'ActiveVariants'` | `'ActivePlusCodeVariants'`

Options to search Variant subsystems, specified as:

- 'AllVariants' — Search all variant choices.
- 'ActiveVariants' — Search only active variant choices.
- 'ActivePlusCodeVariants' — Search all variant choices with 'Generate_preprocessor_conditionals' active. Otherwise, search only the active variant choices.

The 'Variants' search constraint applies only to variant subsystems and model variants.

'RegExp' — Option to treat the search text as a regular expression

false (default) | true

Option to treat the search text as a regular expression, specified as true or false. To learn more about MATLAB regular expressions, see “Regular Expressions” (MATLAB).

'SearchDepth' — Levels in the model to search

positive integer

Levels in the model to search, specified as a positive integer. The default is to search all levels. Specify:

- 1 — Search in the top-level system.
- 2 — Search the top-level system and its children, 3 to search an additional level, and so on.

Examples

Specify Search Options to Use with Simulink.findBlocks

Search for all blocks in the Unlocked subsystem but not in any of its children.

```
f = Simulink.FindOptions('SearchDepth',1);
load_system('sldemo_clutch');
bl = Simulink.findBlocks('sldemo_clutch/Unlocked',f)
```

```
bl =
```

```
1.0e+03 *
1.1140
1.1150
1.1160
1.1170
1.1180
1.1190
1.1200
1.1210
1.1220
1.1230
1.1240
1.1250
1.1260
1.1270
1.1280
1.1290
1.1300
1.1310
1.1320
1.1330
```

To get the block name and path instead of the handle, use `getfullname`.

```
bl = getfullname (Simulink.findBlocks('sldemo_clutch/Unlocked',f))
```

```
bl =
```

```
20x1 cell array
```

```
{'sldemo_clutch/Unlocked/Tfmaxk' }
{'sldemo_clutch/Unlocked/Tin' }
{'sldemo_clutch/Unlocked/Enable' }
{'sldemo_clutch/Unlocked/E_Sum' }
{'sldemo_clutch/Unlocked/Engine←Damping' }
{'sldemo_clutch/Unlocked/Engine←Inertia' }
{'sldemo_clutch/Unlocked/Engine←Integrator' }
{'sldemo_clutch/Unlocked/Goto' }
{'sldemo_clutch/Unlocked/Goto1' }
{'sldemo_clutch/Unlocked/Max←Dynamic←Friction←Torque' }
{'sldemo_clutch/Unlocked/V_Sum' }
{'sldemo_clutch/Unlocked/Vehicle←Damping' }
{'sldemo_clutch/Unlocked/Vehicle←Inertia' }
{'sldemo_clutch/Unlocked/Vehicle←Integrator' }
{'sldemo_clutch/Unlocked/W_Slip' }
{'sldemo_clutch/Unlocked/slip direction' }
{'sldemo_clutch/Unlocked/w0' }
{'sldemo_clutch/Unlocked/w0 ' }
{'sldemo_clutch/Unlocked/we' }
{'sldemo_clutch/Unlocked/wv' }
```

Introduced in R2018a

Simulink.GlobalDataTransfer class

Package: Simulink

Configure concurrent execution data transfers

Description

The `Simulink.GlobalDataTransfer` object contains the data transfer information for the concurrent execution of a model. To access the properties of this class, use the `get_param` function to get the handle for this class, and then use dot notation to access the properties. For example:

```
dt=get_param(gcs,'DataTransfer');  
dt.DefaultTransitionBetweenContTasks
```

ans =

Ensure deterministic transfer (minimum delay)

Properties

DefaultTransitionBetweenSyncTasks

Global setting for data transfer handling option when the source and destination of a signal are in two different and periodic tasks.

Data Type: Enumeration. Can be one of:

- 'Ensure data integrity only'
- 'Ensure deterministic transfer (maximum delay)'
- 'Ensure deterministic transfer (minimum delay)'

Access: Read/write

DefaultTransitionBetweenContTasks

Global setting for the data transfer handling option for signals that have a continuous sample time.

Data Type: Enumeration. Can be one of:

- 'Ensure data integrity only'
- 'Ensure deterministic transfer (maximum delay)'
- 'Ensure deterministic transfer (minimum delay)'

Access: Read/write

DefaultExtrapolationMethodBetweenContTasks

Global setting for the data transfer extrapolation method for signals that have a continuous sample time.

Data Type: Enumeration. Can be one of:

- 'None'
- 'Zero Order Hold'
- 'Linear'
- 'Quadratic'

Access: Read/write

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Access the properties of this class.

```
dt=get_param(gcs,'DataTransfer');  
dt.DefaultTransitionBetweenContTasks
```

```
ans =
```

Ensure deterministic transfer (minimum delay)

“Configure Data Transfer Settings Between Concurrent Tasks”

Simulink.LookupTable class

Package: Simulink

Store and share lookup table and breakpoint data, configure the data for ASAP2 and AUTOSAR code generation

Description

An object of the `Simulink.LookupTable` class stores lookup table and breakpoint data. You can use that data in a lookup table block such as the n-D Lookup Table block. With the object, you can specify data types and code generation settings for the table and the breakpoint sets.

When you store all of the table and breakpoint set data in a single `Simulink.LookupTable` object, all of the data appears in a single structure in the generated code. To configure `STD_AXIS` code generation for calibration, use this technique.

To share a breakpoint set between multiple lookup tables, for example for `COM_AXIS` code generation, use a `Simulink.Breakpoint` object in one or more Prelookup blocks. Use `Simulink.LookupTable` objects in Interpolation Using Prelookup blocks. Then, configure the lookup table objects to refer to the breakpoint object. For more information, see “Package Shared Breakpoint and Table Data for Lookup Tables”.

Construction

`LUTObj = Simulink.LookupTable` returns a `Simulink.LookupTable` object `LUTObj` with default property values.

To create a `Simulink.LookupTable` object by using the Model Explorer, use the button  on the toolbar. The default name for the object is `Object`.

Property Dialog Box

Simulink.LookupTable: LUTObj

Number of table dimensions: 1

Table

Value	Data type	Dimensions	Min	Max	Unit	Field name	Description
[]	auto	[0 0]	[]	[]		Table	

Breakpoints

Specification: Explicit values Support tunable size

Value	Data type	Dimensions	Min	Max	Unit	Field name	Description
1 []	auto	[0 0]	[]	[]		BP1	

Code generation options

Data definition:

Storage class: Auto

Struct Type definition

Name:

Data scope: Auto

Header file:

OK Cancel Help Apply

Number of table dimensions

Number of dimensions of the lookup table. Specify an integer value up to 30 (inclusive). For example, to represent a three-dimensional lookup table, specify the integer 3.

Table

Information for the table data. You can configure these characteristics:

Value

Table data. Specify a numeric vector or multidimensional array with at least two elements.

You can also use an expression with mathematical operators such as `sin(1:0.5:30)` as long as the expression returns a numeric vector or multidimensional array. When you click **Apply** or **OK**, the object executes the expression and uses the result to set the value of this property.

When you set **Data type** to `auto`, to set **Value**, use a typed expression such as `single([1 2 3])` or use the `fi` constructor to embed an `fi` object.

When you specify table data with three or more dimensions, **Value** displays the data as an expression that contains a call to the `reshape` function. To edit the values in the data, modify the first argument of the `reshape` call, which contains all of the values in a serialized vector.

When you add or remove elements along a dimension, you must also correct the argument that represents the length of the modified dimension.

You can edit this data by using a more intuitive interface in a lookup table block. See “Import Lookup Table Data from MATLAB”.

Data type

Data type of the table data. The default setting is `auto`, which means that the table data acquire a data type from the value that you specify in **Value**. If you use an untyped expression such as `[1 2 3]` to set **Value**, the table data use the data type `double`. If you specify a typed expression such as `single([1 2 3])` or an `fi` object, the table data use the data type specified by the expression or object. Enumerated data types are also supported.

You can explicitly specify an integer data type, a floating-point data type, a fixed-point data type, or a data type expression such as the name of a `Simulink.AliasType` object.

For more information about data types in Simulink, see “Data Types Supported by Simulink”. To decide how to control the data types of table and breakpoint data in `Simulink.LookupTable` and `Simulink.Breakpoint` objects, see “Control Data Types of Lookup Table Objects” (Simulink Coder).

Dimensions

Dimension lengths of the lookup table data.

To use symbolic dimensions, specify a character vector. See “Implement Dimension Variants for Array Sizes in Generated Code” (Embedded Coder).

Min

Minimum value of the elements in the table data. The default value is empty, `[]`. You can specify a numeric, real value.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

Max

Maximum value of the elements in the table data. The default value is empty, `[]`. You can specify a numeric, real value.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

Stored Int Min

For `Simulink.LookupTable` objects with a fixed-point data type, the minimum value of the elements in the table data, specified as a stored integer value. The value is derived from the real-world value **Min**. This property is available only in the property dialog box.

Stored Int Max

For `Simulink.LookupTable` objects with a fixed-point data type, the maximum value of the elements in the table data, specified as a stored integer value. The value is derived from the real-world value **Max**. This property is available only in the property dialog box.

Unit

Physical units of the elements in the lookup table. You can specify text such as `degC`. See “Unit Specification in Simulink Models”.

Field name

Name of a structure field in the generated code. This field stores the table data if you configure the `Simulink.LookupTable` object to appear in the generated code as a structure. The default value is `Table`. To change the field name, specify text.

Description

Description of the lookup table. You can specify text such as `This lookup table describes the action of a pump.`

Breakpoints

Breakpoint set information. Each row is one breakpoint set. To configure additional breakpoint sets, specify an integer value in the **Number of table dimensions** box.

For the breakpoint sets, you can configure these characteristics:

Specification

Source for the information of the breakpoint sets, specified as `Explicit values` (default), `Reference`, or `Even spacing`.

- To store all of the table and breakpoint set data in the `Simulink.LookupTable` object, set **Specification** to `Explicit values`.

The `Simulink.LookupTable` object appears in the generated code as a single structure variable.

- To store the table data in the `Simulink.LookupTable` object and store the breakpoint set data in `Simulink.Breakpoint` objects, set **Specification** to `Reference`.

The `Simulink.LookupTable` object appears in the generated code as a separate array variable that contains the table data. Each `Simulink.Breakpoint` object appears as a separate array or structure variable that contains the breakpoint set data.

- To store the table data and evenly spaced breakpoints in the `Simulink.LookupTable` object, set **Specification** to `Even spacing`. Use the **First point** and **Spacing** parameters to generate a set of evenly spaced breakpoints.

Note When **Specification** is set to `Explicit values` or `Even spacing`, you can change the order of the tunable size, breakpoint, and table entries in a lookup table object-generated structure.

Support tunable size

Specification to enable tuning the effective size of the table in the generated code. In the code, the structure that corresponds to the object has an extra field for each breakpoint vector. Each extra field stores the length of the corresponding breakpoint vector. You can change the value of each field to adjust the effective size of the table.

This property appears only if you set **Specification** to `Explicit values` or `Even spacing`.

Note If you store breakpoint data in `Simulink.Breakpoint` objects by setting **Specification** to `Reference`, to enable tuning of the table size in the generated code, use the **Support tunable size** property of each `Simulink.Breakpoint` object.

Value

Data for the breakpoint set. Specify a numeric vector with at least two elements.

You can also use an expression with mathematical operators such as `sin(1:0.5:30)` as long as the expression returns a numeric vector. When you click **Apply** or **OK**, the object executes the expression and uses the result to set the value of this property.

When you set **Data type** to `auto`, to set **Value**, use a typed expression such as `single([1 2 3])` or use the `fi` constructor to embed an `fi` object.

You can edit this data by using a more intuitive interface in a lookup table block. See “Import Lookup Table Data from MATLAB”.

Data type

Data type of the breakpoint set. The default setting is `auto`, which means that the breakpoint set acquires a data type from the value that you specify in **Value**. If you use an untyped expression such as `[1 2 3]` to set **Value**, the breakpoint data use the data type `double`. If you specify a typed expression such as `single([1 2 3])` or an `fi` object, the breakpoint data use the data type specified by the expression or object.

You can explicitly specify an integer data type, a floating-point data type, a fixed-point data type, or a data type expression such as the name of a `Simulink.AliasType` object.

For more information about data types in Simulink, see “Data Types Supported by Simulink”. To decide how to control the data types of table and breakpoint data in `Simulink.LookupTable` and `Simulink.Breakpoint` objects, see “Control Data Types of Lookup Table Objects” (Simulink Coder).

Dimensions

Dimension lengths of the breakpoint set.

To use symbolic dimensions, specify a character vector. See “Implement Dimension Variants for Array Sizes in Generated Code” (Embedded Coder).

Min

Minimum value of the elements in the breakpoint set. The default value is empty, `[]`. You can specify a numeric, real value.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

Max

Maximum value of the elements in the breakpoint set. The default value is empty, `[]`. You can specify a numeric, real value.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

Unit

Physical unit of the elements in the breakpoint set. You can specify text such as `degF`. See “Unit Specification in Simulink Models”.

Field name

Name of a structure field in the generated code. This field stores the breakpoint set data. The default value is `BP1` for the first breakpoint set and `BP2` for the second set. To change the field name, specify text.

Tunable size name

Name of a structure field in the generated code. This field stores the length (number of elements) of the breakpoint set, which the generated code algorithm uses to determine the size of the table. To tune the effective size of the table during code execution, change the value of this structure field in memory. The default name is N1 for the first breakpoint set and N2 for the second set. To change the field name, specify text.

This column appears only if you select **Support tunable size**.

Description

Description of the breakpoint set. You can specify text such as This breakpoint set represents the pressure input.

First point

First point in evenly spaced breakpoint data. This parameter is available when **Specification** is set to Even spacing.

Spacing

Spacing between points in evenly spaced breakpoint data. This parameter is available when **Specification** is set to Even spacing.

Name

Name of the Simulink.Breakpoint object that stores the information for this breakpoint set.

This column appears only if you set **Specification** to Reference.

First point name

Name of the Simulink.Breakpoint object that stores the information for the first point. This parameter is available when **Specification** is set to Even spacing.

Spacing name

Name of the Simulink.Breakpoint object that stores the information for the spacing. This parameter is available when **Specification** is set to Even spacing.

Data definition: Storage class

Storage class of the structure variable (if you set **Specification** to Explicit values or Even spacing) or array variable (Reference) in the generated code. The variable stores the table data and, if the variable is a structure, the breakpoint set data. The default setting is Auto.

For more information about storage classes, see “Apply Storage Classes to Individual Signal, State, and Parameter Data Elements” (Simulink Coder).

If you have Embedded Coder, you can choose a custom storage class. For information about custom storage classes, see “Apply Built-In and Customized Storage Classes to Data Elements” (Embedded Coder).

Data definition: Identifier

Alternative name for the structure variable (if you set **Specification** to Explicit values or Even spacing) or array variable (Reference) in the generated code. The default value is empty, in which case the generated code uses the name of the Simulink.LookupTable object as the name of the structure or array variable. To set the identifier, specify text.

To enable this property, set **Data definition: Storage class** to a setting other than Auto.

Data definition: Alignment

Data alignment boundary in the generated code. The starting memory address for the data allocated for the structure or array variable is a multiple of the value that you specify. The default value is -1, which allows the code generator to determine an optimal alignment based on usage.

Specify a positive integer that is a power of 2, not exceeding 128. For more information about using data alignment for code replacement, see “Data Alignment for Code Replacement” (Embedded Coder).

Struct Type definition: Name

Name of the structure type that the structure variable uses in the generated code. The default value is empty. Specify text.

This property appears only if you set **Specification** to `Explicit` values or `Even spacing`.

Struct Type definition: Data scope

Scope of the structure type definition (imported from your custom code or exported from the generated code). The default value is `Auto`. When you select `Auto`:

- If you do not specify a value in the **Struct Type definition: Header file** box, the generated code exports the structure type definition to the file `model_types.h`. `model` is the name of the model.
- If you specify a value in the **Struct Type definition: Header file** box, such as `myHdr.h`, the generated code imports the structure type definition from `myHdr.h`.

To explicitly specify the data scope:

- To import the structure type definition into the generated code from your custom code, select `Imported`.
- To export the structure type definition from the generated code, select `Exported`.

If you do not specify a value in the **Struct Type definition: Header file** box, the generated code imports or exports the type definition from or to `StructName.h`. `StructName` is the name that you specify by using the property **Struct Type definition: Name**.

This property appears only if you set **Specification** to `Explicit` values or `Even spacing`.

Struct Type definition: Header file

Name of the header file that contains the structure type definition. You can import the definition from a header file that you create, or export the definition into a generated header file. To control the scope of the structure type, adjust the setting for the **Struct Type definition: Data scope** property.

This property appears only if you set **Specification** to `Explicit` values or `Even spacing`.

Properties**Breakpoints — Breakpoint set information**

vector of `Simulink.lookuptable.Breakpoint` objects | cell array of character vectors

Breakpoint set information, specified as a vector of `Simulink.lookuptable.Breakpoint` objects, a cell array of character vectors, or a vector of `Simulink.lookuptable.Evenspacing` objects.

If you use a vector of `Simulink.lookuptable.Breakpoint` objects, each object represents a breakpoint set. To use a vector of `Simulink.lookuptable.Breakpoint` objects, set the property `BreakpointsSpecification` to `'Explicit values'`.

If you use a cell array of character vectors, each character vector represents the name of a `Simulink.Breakpoint` object. To use a cell array of character vectors, set the property `BreakpointsSpecification` to `'Reference'`.

If you use a vector of `Simulink.lookuptable.Evenspacing` objects, each object represents a breakpoint set. To use a vector of `Simulink.lookuptable.Evenspacing` objects, set the property `BreakpointsSpecification` to `'Even Spacing'`.

BreakpointsSpecification — Source of breakpoint set information

`'Explicit values'` (default) | `'Reference'` | `'Even spacing'`

Source of the breakpoint set information, specified as `'Explicit values'` (default), `'Even spacing'`, or `'Reference'`. See the **Breakpoints > Specification** parameter.

Data Types: `char`

CoderInfo — Code generation settings for structure or array variable

`Simulink.CoderInfo` object

Code generation settings for the structure variable (if you set `BreakpointsSpecification` to `'Explicit values'` or `'Even spacing'`) or array variable (`'Reference'`) that stores the lookup table and breakpoint sets, specified as a `Simulink.CoderInfo` object. You can specify a storage class or custom storage class by using this embedded object. See `Simulink.CoderInfo`.

StructTypeInfo — Settings for structure type in the generated code

`Simulink.lookuptable.StructTypeInfo` object

Settings for the structure type that the structure variable uses in the generated code, specified as a `Simulink.lookuptable.StructTypeInfo` object.

If you set `BreakpointsSpecification` to `'Reference'`, the `Simulink.LookupTable` object does not appear in the generated code as a structure. The code generator ignores this property.

SupportTunableSize — Option to generate code that enables tunability of table size

`false` (default) | `true`

Option to generate code that enables tunability of the effective size of the table, specified as `true` or `false`. See the **Support Tunable Size** parameter.

Data Types: `logical`

Table — Information for table data

`Simulink.lookuptable.Table` object

Information for the table data, specified as a `Simulink.lookuptable.Table` object.

Copy Semantics

Handle. To learn how handle classes affect copy operations, see [Copying Objects \(MATLAB\)](#).

Examples

Represent a One-Dimensional Lookup Table

- 1 Create a `Simulink.LookupTable` object named `LUTObj`.

```
LUTObj = Simulink.LookupTable;
```

- 2 Specify the table data.

```
LUTObj.Table.Value = [1.1 2.2 3.3 4.4 5.5];
```

- 3 Specify the breakpoint set data.

```
LUTObj.Breakpoints(1).Value = [-2 -1 0 1 2];
```

- 4 Specify a name for the structure type in the generated code.

```
LUTObj.StructTypeInfo.Name = 'myLUTStruct';
```

You can use `LUTObj` in a 1-D Lookup Table block dialog box. In the block, set **Data specification** to `Lookup table object` and **Name** to `LUTObj`.

Represent a Two-Dimensional Lookup Table

- 1 Create a `Simulink.LookupTable` object named `LUTObj`.

```
LUTObj = Simulink.LookupTable;
```

- 2 Specify the table data.

```
LUTObj.Table.Value = [1.1 2.2 3.3 4.4 5.5; ...
                    6.6 7.7 8.8 9.9 10.1];
```

- 3 Specify the breakpoint set data. In the `Breakpoints` property, use the vector index 2 to set the values in the second breakpoint set.

```
LUTObj.Breakpoints(1).Value = [-1 1];
```

```
LUTObj.Breakpoints(2).Value = [-2 -1 0 1 2];
```

`LUTObj` creates a `Simulink.lookuptable.Breakpoint` object as the second vector element in the value of the `Breakpoints` property. Except for the `Value` property, the new object has default property values.

- 4 Specify a name for the structure type in the generated code.

```
LUTObj.StructTypeInfo.Name = 'myLUTStruct';
```

You can use `LUTObj` in a 2-D Lookup Table block dialog box.

Evenly Space Every Second Value Starting from 1

To evenly space every second value starting from 1, use the `Breakpoint` object.

- 1 Create a `Simulink.LookupTable` object named `LUTObj`.

```
LUTObj=Simulink.LookupTable
```

```
LUTObj =
```

LookupTable with properties:

```

        Table: [1x1 Simulink.lookuptable.Table]
BreakpointsSpecification: 'Explicit values'
        Breakpoints: [1x1 Simulink.lookuptable.Breakpoint]
SupportTunableSize: 0
        CoderInfo: [1x1 Simulink.CoderInfo]
        StructTypeInfo: [1x1 Simulink.lookuptable.StructTypeInfo]

```

- 2 Set up the breakpoint property to even spacing.

```
LUTObj.BreakpointsSpecification='Even spacing'
```

LUTObj =

LookupTable with properties:

```

        Table: [1x1 Simulink.lookuptable.Table]
BreakpointsSpecification: 'Even spacing'
        Breakpoints: [1x1 Simulink.lookuptable.Evenspacing]
SupportTunableSize: 0
        CoderInfo: [1x1 Simulink.CoderInfo]
        StructTypeInfo: [1x1 Simulink.lookuptable.StructTypeInfo]

```

- 3 Get the properties of the breakpoint.

```
LUTObj.Breakpoints(1)
```

ans =

Evenspacing with properties:

```

        FirstPoint: 0
        Spacing: 1
        DataType: 'auto'
        Min: []
        Max: []
        Unit: ''
        FirstPointName: 'BPFirstPoint1'
        SpacingName: 'BPSpacing1'
        TunableSizeName: 'N1'
        Description: ''

```

- 4 To set the first point property, use the Breakpoint object `FirstPoint` property.

```
LUTObj.Breakpoints(1).FirstPoint=1
```

- 5 To set the spacing property, use the Breakpoint object.

```
LUTObj.Breakpoints(1).Spacing=2
```

- 6 Get the properties of the breakpoint.

```
LUTObj.Breakpoints(1)
```

ans =

Evenspacing with properties:

```

    FirstPoint: 1
      Spacing: 2
      DataType: 'auto'
        Min: []
        Max: []
        Unit: ''
    FirstPointName: 'BPFirstPoint1'
    SpacingName: 'BPSpacing1'
    TunableSizeName: 'N1'
    Description: ''

```

Control Code Generation for Lookup Table and Breakpoint Sets

Create a `Simulink.LookupTable` object named `LUTObj`.

```
LUTObj = Simulink.LookupTable;
```

Specify the table data.

```
LUTObj.Table.Value = [1.00 2.25 3.50 4.75 6.00; ...
                    7.25 8.50 9.75 11.00 12.25];
```

Specify the breakpoint set data. In the `Breakpoints` property, use the array index 2 to create an additional `Simulink.lookuptable.BreakpointInfo` object, which represents the second breakpoint set.

```
LUTObj.Breakpoints(1).Value = [-1 1];
```

```
LUTObj.Breakpoints(2).Value = [-2 -1 0 1 2];
```

Specify data types for the lookup table and each breakpoint set.

```
LUTObj.Table.DataType = 'fixdt(1,16,2)';
```

```
LUTObj.Breakpoints(1).DataType = 'int16';
```

```
LUTObj.Breakpoints(2).DataType = 'int16';
```

Specify unique names for the structure fields that store the table data and breakpoint sets in the generated code.

```
LUTObj.Table.FieldName = 'myTable';
```

```
LUTObj.Breakpoints(1).FieldName = 'myBPSet1';
```

```
LUTObj.Breakpoints(2).FieldName = 'myBPSet2';
```

Export the structure variable definition from the generated code by using the storage class `ExportedGlobal`.

```
LUTObj.CoderInfo.StorageClass = 'ExportedGlobal';
```

Name the structure type in the generated code `LUTStructType`. Export the structure type definition to a generated header file named `myLUTHdr.h`.

```
LUTObj.StructTypeInfo.Name = 'LUTStructType';
LUTObj.StructTypeInfo.DataScope = 'Exported';
LUTObj.StructTypeInfo.HeaderFileName = 'myLUTHdr.h';
```

In an n-D Lookup Table block in a model, set **Data specification** to Lookup table object and **Name** to LUTObj.

```
load_system('myModel_LUTObj')
set_param('myModel_LUTObj/Lookup Table','DataSpecification','Lookup table object',...
         'LookupTableObject','LUTObj')
```

Generate code from the model.

```
rtwbuild('myModel_LUTObj')

### Starting build procedure for: myModel_LUTObj
### Generated code for 'myModel_LUTObj' is up to date because no structural, parameter or code re
### Successful completion of code generation for: myModel_LUTObj
```

The generated code defines the structure type LUTStructType in the generated header file myLUTHdr.h.

```
file = fullfile('myModel_LUTObj_ert_rtw','myLUTHdr.h');
rtwdemodbtype(file,'typedef struct {','} LUTStructType;',1,1)

typedef struct {
    int16_T myBPSet1[2];
    int16_T myBPSet2[5];
    int16_T myTable[10];
} LUTStructType;
```

The code uses the global structure variable LUTObj to store the table and breakpoint set data. The table data is scaled based on the specified fixed-point data type.

```
file = fullfile('myModel_LUTObj_ert_rtw','myModel_LUTObj.c');
rtwdemodbtype(file,'LUTStructType LUTObj = {','/* Variable: LUTObj',1,1)

LUTStructType LUTObj = {
    { -1, 1 },

    { -2, -1, 0, 1, 2 },

    { 4, 29, 9, 34, 14, 39, 19, 44, 24, 49 }
}; /* Variable: LUTObj
```

Generate Code That Uses Conditionally Compiled Dimension Lengths

Suppose your handwritten code conditionally allocates memory and initializes a lookup table based on dimension lengths that you specify as `#define` macros. This example shows how to generate code that uses your external table and breakpoint data.

Symbolic dimensions require that you use an ERT-based system target file, which requires Embedded Coder®.

Explore External Code

In your current folder, copy these macro definitions into a header file named `ex_myHdr_LUT.h`.

```
#include "rtwtypes.h"

#ifndef _HEADER_MYHDR_H_
```

```

#define _HEADER_MYHDR_H_

#define bp1Len 2
#define bp2Len 2

typedef struct {
    real_T BP1[bp1Len];
    real_T BP2[bp2Len];
    real_T Table[bp1Len * bp2Len];
} LUTObj_Type;

extern LUTObj_Type LUTObj;

#endif

```

Copy this static initialization code into a source file named `ex_mySrc_LUT.c`.

```

#include "ex_myHdr_LUT.h"

#if bp1Len == 2 && bp2Len == 2
LUTObj_Type LUTObj = {
    { 1.0, 2.0 },

    { 3.0, 4.0 },

    { 3.0, 2.0, 4.0, 1.0 }
};
#endif

#if bp1Len == 3 && bp2Len == 3
LUTObj_Type LUTObj = {
    { 1.0, 2.0, 3.0 },

    { 4.0, 5.0, 6.0 },

    { 1.0, 6.0, 2.0, 3.0, 8.0, 9.0, 5.0, 4.0, 7.0 }
};
#endif

```

To generate code that imports this data, create `bp1Len` and `bp2Len` as `Simulink.Parameter` objects in MATLAB. Create `LUTObj` as a `Simulink.LookupTable` object. Use the parameter objects to specify the dimension lengths for the table and breakpoint set data in the `Simulink.LookupTable` object.

Create Example Model

Create the example model `ex_LUTObj` by using an n-D Lookup Table block. In the Lookup Table block dialog box, on the **Table and Breakpoints** tab, set **Number of table dimensions** to 2.

```
open_system('ex_LUTObj')
```

Create Simulink.LookupTable Object

In the Model Explorer **Model Hierarchy** pane, select **Base Workspace**.

On the toolbar, click the **Add Simulink LookupTable** button. A Simulink.LookupTable object named Object appears in the base workspace.

In the **Contents** pane (the middle pane), rename the object as LUTObj.

Alternatively, create the object at the command prompt:

```
LUTObj = Simulink.LookupTable;
```

Configure Simulink.LookupTable Object

In the **Contents** pane, select the new object LUTObj. The property dialog box appears in the **Dialog** pane (the right pane).

Set **Number of table dimensions** to 2.

Under **Table**, set **Value** to [3 4; 2 1].

In the first row under **Breakpoints**, set **Value** to [1 2].

In the second row under **Breakpoints**, set **Value** to [3 4]. Click **Apply**.

Under **Struct Type definition**, set **Data scope** to Imported. Set **Header file** to ex_myHdr_LUT.h. Set **Name** to LUTObj_Type.

In the Lookup Table block dialog box, set **Data specification** to Lookup table object. Set **Name** to LUTObj. Click **Apply**.

Alternatively, to configure the object and the blocks, use these commands:

```
LUTObj.Breakpoints(1).Value = [1 2];
LUTObj.Breakpoints(2).Value = [3 4];
LUTObj.Table.Value = [3 4; 2 1];
LUTObj.StructTypeInfo.DataScope = 'Imported';
LUTObj.StructTypeInfo.HeaderFileName = 'ex_myHdr_LUT.h';
LUTObj.StructTypeInfo.Name = 'LUTObj_Type';
set_param('ex_LUTObj/Lookup Table', 'LookupTableObject', 'LUTObj')
set_param('ex_LUTObj/Lookup Table', ...
    'DataSpecification', 'Lookup table object')
```

Enable the code generator to use Simulink.Parameter objects as macros that specify dimension lengths. Select the configuration parameter **Allow symbolic dimension specification**.

```
set_param('ex_LUTObj', 'AllowSymbolicDim', 'on')
```

Create the `Simulink.Parameter` objects that represent the macros `bp1Len` and `bp2Len`. To generate code that imports the macros from your header file `ex_myHdr_LUT.h`, apply the storage class `ImportedDefine`.

```
bp1Len = Simulink.Parameter(2);
bp1Len.Min = 2;
bp1Len.Max = 3;
bp1Len.DataType = 'int32';
bp1Len.CoderInfo.StorageClass = 'Custom';
bp1Len.CoderInfo.CustomStorageClass = 'ImportedDefine';
bp1Len.CoderInfo.CustomAttributes.HeaderFile = 'ex_myHdr_LUT.h';

bp2Len = Simulink.Parameter(2);
bp2Len.Min = 2;
bp2Len.Max = 3;
bp2Len.DataType = 'int32';
bp2Len.CoderInfo.StorageClass = 'Custom';
bp2Len.CoderInfo.CustomStorageClass = 'ImportedDefine';
bp2Len.CoderInfo.CustomAttributes.HeaderFile = 'ex_myHdr_LUT.h';
```

Configure the existing `Simulink.LookupTable` object `LUTObj` to use the `Simulink.Parameter` objects. Set the dimension lengths of the breakpoint set data and the table data by using the names of the parameter objects.

```
LUTObj.Breakpoints(1).Dimensions = '[1 bp1Len]';
LUTObj.Breakpoints(2).Dimensions = '[1 bp2Len]';
LUTObj.Table.Dimensions = '[bp1Len bp2Len]';
```

Configure `LUTObj` as imported data by applying the storage class `ImportFromFile`. To import your definition of `LUTObj`, add the name of the file `ex_mySrc_LUT.c` to the model configuration parameter **Configuration Parameters > Code Generation > Custom Code > Additional Build Information > Source files**.

```
LUTObj.CoderInfo.StorageClass = 'Custom';
LUTObj.CoderInfo.CustomStorageClass = 'ImportFromFile';
LUTObj.CoderInfo.CustomAttributes.HeaderFile = 'ex_myHdr_LUT.h';

set_param('ex_LUTObj','CustomSource','ex_mySrc_LUT.c')
```

Generate and Inspect Code

Configure the model to compile an executable from the generated code.

```
set_param('ex_LUTObj','GenCodeOnly','off')
```

Generate code from the model.

```
rtwbuild('ex_LUTObj')

### Starting build procedure for: ex_LUTObj
### Successful completion of build procedure for: ex_LUTObj
```

In the code generation report, view the generated file `ex_LUTObj.h`. The file imports the macro definitions and the structure type definition by including your header file `ex_myHdr_LUT.h`.

```
file = fullfile('ex_LUTObj_ert_rtw','ex_LUTObj.h');
rtwdemodbtype(file,'#include "ex_myHdr_LUT.h"', '#include "ex_myHdr_LUT.h"',1,1)
```

```
#include "ex_myHdr_LUT.h"
```

In the source file `ex_LUTObj.c`, the code algorithm in the model `step` function passes the breakpoint and table data to the function that performs the table lookup. The algorithm also passes `bp1Len` so the lookup function can traverse the rows and columns of the table data, which appear in the generated code as a serialized 1-D array.

```
file = fullfile('ex_LUTObj_ert_rtw','ex_LUTObj.c');
rtwdemodbtype(file,'/* Model step function */','/* Model initialize function */',1,0)

/* Model step function */
void ex_LUTObj_step(void)
{
    /* Output: '<Root>/Out1' incorporates:
     * Inport: '<Root>/In1'
     * Inport: '<Root>/In2'
     * Lookup_n-D: '<Root>/Lookup Table'
     */
    ex_LUTObj_Y.Out1 = look2_binlcapw(ex_LUTObj_U.In1, ex_LUTObj_U.In2,
        (&(LUTObj.BP1[0])), (&(LUTObj.BP2[0])), (&(LUTObj.Table[0])),
        ex_LUTObj_ConstP.LookupTable_maxIndex, (uint32_T)bp1Len);
}
```

Limitations

- You cannot subclass `Simulink.Breakpoint` or `Simulink.LookupTable`. For this reason, you cannot apply custom storage classes other than those in the built-in Simulink package.
- You cannot use `Simulink.Breakpoint` objects or `Simulink.LookupTable` objects that refer to `Simulink.Breakpoint` objects as instance-specific parameter data for reusable components. For example, you cannot use one of these objects as:
 - A model argument in a model workspace or a model argument value in a Model block.
 - The value of a mask parameter on a CodeReuse Subsystem block.
 - The value of a mask parameter on a subsystem that you reuse by creating a custom library.

However, you can use standalone `Simulink.LookupTable` objects, which do not refer to `Simulink.Breakpoint` objects, in these ways.

- When blocks in a subsystem use `Simulink.LookupTable` or `Simulink.Breakpoint` objects, you cannot set data type override only on the subsystem. Instead, set data type override on the entire model.

Simulink.io.FileType class

Package: Simulink.io

Base class for file types

Description

Simulink.io.FileType is the base class for Simulink.io.FileType objects. In your class definition file, you must subclass your object from this base class. Simulink requires direct inheritance from FileType. Subclassing allows you to use the implementation methods and service methods provided by this class to build your object. Type this syntax as the first line of your class definition file to directly inherit from the Simulink.io.FileType base class, where ObjectName is the name of your object:

```
classdef ObjectName < Simulink.io.FileType
```

The Simulink.io.FileType class is a handle class.

Class Attributes

Abstract	true
HandleCompatible	true

For information on class attributes, see “Class Attributes” (MATLAB).

Properties

FileName — File name

character array

File name of file that contains custom signals for import to Signal Editor, specified as a character array.

Attributes:

GetAccess	public
SetAccess	public

Data Types:

Methods

Public Methods

exportImpl	Export signals to file
Simulink.io.FileType.getFileTypeDescription	Get custom file reader description
Simulink.io.FileType.isFileSupported	Check if file type is supported in Simulink
loadImpl	Load signal names from custom FileType object
loadAVariableImpl	Load specified variable from MAT-file
validateFileNameImpl	Validate contents of custom MAT-file

whosImpl

Determine contents of MAT-file associated with Simulink.io.FileType object

Specialized Operators and Functions

These methods specialize standard MATLAB operators and functions for objects in this class.

export	<p>This method calls the <code>exportImpl</code> method.</p> <p>From Signal Editor, write the structure of signals to a MAT-file. The structure must contain two cell arrays; one for signal names and one for signal values. Specify if the method appends to or overwrites the contents of the MAT-file. The method indicates if it succeeded in writing to the MAT-file and returns any error messages.</p>
import	<p><code>[importedData, warnStr] = import(reader)</code></p> <p>To import custom signals for a custom file type, identify the custom file type <code>reader</code> as a <code>Simulink.io.FileType</code> object. The method returns the found variable as a cell array of signal variables of supported types. For more information on supported types, see “Choose a Base Workspace and MAT-File Format”. The method returns a structure with two fields, <code>Data</code> and <code>Name</code>. <code>Data</code> is a cell array of signals and <code>Name</code> is a cell array of character vectors of the corresponding signal names.</p>
importAVariable	<p><code>varOut = importAVariable(reader,variableName)</code></p> <p>To import a specified variable for a custom file type, identify the custom file type reader as a <code>Simulink.io.FileType</code> object. Use <code>VariableName</code>, specified as a character array, to extract the desired signal from the file of custom format signals. The method returns the found variable, returned as a cell array of signal variables of supported types. For more information on supported types, see “Choose a Base Workspace and MAT-File Format”.</p>
load	<p>This method calls the <code>loadImpl</code> method.</p> <p>Load the signal listed in the custom file type.</p>
loadAVariable	<p>This method calls the <code>loadAVariableImpl</code> method.</p> <p>Validate the format of the signals in the custom MAT-file <code>fileName</code> with the associated <code>Simulink.io.FileType</code> reader.</p>

validateFileName	This method calls the validateFileNameImpl method. Validate the format of the signals in the custom MAT-file fileName with the associated Simulink.io.FileType reader.
whos	This method calls the whosImpl method. Return the contents of the custom file type MAT-file.

Examples

Subclass FileType

Define a Simulink.io.FileType class.

```
classdef MySignalMatFile < Simulink.io.FileType
end
```

Interact with FileType Using Specialized Functions

Interact with FileType using specialized functions. This example refers to the open('Simulink.io.CreateSignals') sample file.

Get contents of foo.mat.

```
fileName = 'foo.mat';
aReader = Simulink.io.CreateSignals(fileName);
resultOfWhos = whos(aReader);
```

Import custom signals from foo.mat.

```
aFileType = Simulink.io.CreateSignals('foo.mat');
out = import(aFileType);
```

Load the custom signals in foo.mat.

```
aFileType = Simulink.io.CreateSignals('foo.mat');
out = load(aFileType);
```

Load a variable from foo.mat.

```
aFileType = Simulink.io.CreateSignals('foo.mat');
out = loadAVariable( aFileType,'bar');
```

Export the signals from Signal Editor.

```
ds = Simulink.SimulationData.Dataset;
ds = ds.addElement(timeseries([1:10]',[1:10]'),'Siganl1');
ds = ds.addElement(timeseries([1:10]',[11:20]'),'Siganl2');
ds = ds.addElement(timeseries([1:10]',[21:30]'),'Siganl3');
```

```
aReader = Simulink.io.CreateSignals('myFileToExport.mat');  
didWrite = aReader.export(filePath,{'ds'},{ds},0);
```

Introduced in R2020a

exportImpl

Class: Simulink.io.FileType

Package: Simulink.io

Export signals to file

Syntax

```
[didWrite,errMsg] = exportImpl(exportFileName,varNames,varValues,isAppend)
```

Description

`[didWrite,errMsg] = exportImpl(exportFileName,varNames,varValues,isAppend)` exports signals from Signal Editor using the specified variables and returns `didWrite` and `errMsg` and saves them to `exportFileName`.

Input Arguments

exportFileName — File name for exported signals

character array

File name for exported signals, specified as a character array.

Data Types: `char`

varNames — Signal names

cell array of character vectors

Signal names, specified as a cell array of character vectors.

Data Types: `cell`

varValues — Signal values

cell array of signal variables

Signal values associated with the signals in `varNames`, specified as a cell array of signal variables of supported types. For more information on supported types, see “Choose a Base Workspace and MAT-File Format”.

Data Types: `cell`

isAppend — Append or overwrite signal file

false or 0 (default) | true or 1

Append or overwrite signal file, specified as true (1) or false (0).

Data Types: `logical`

Output Arguments

didWrite — Whether signals were successfully written

false or 0 | true or 1

Whether the signals were successfully written to `exportFileName`, returned as true (1) or false (0).

errMsg — Error message

character array

Error message, indicating errors with the reporting process, returned as a character array.

Examples

Subclass FileType Class and Implement exportImpl Method

Subclass `FileType` class and implement `exportImpl` method.

```
classdef MySignalMatFile < Simulink.io.FileType
```

Implement the static method `exportImpl`.

methods

```
function [didWrite,errMsg] = exportImpl(obj,fileName,cellOfVarNames, ...
    cellOfVarValues,isAppend)
    didWrite = false;
    errMsg = '';

    saveStruct = struct;

    for k = 1: length (cellOfVarNames)
        saveStruct.(cellOfVarNames{k}) = cellOfVarValues{k};
    end

    try
        if isAppend
            save(fileName,'-struct','saveStruct','-append');
        else
            save(fileName,'-struct','saveStruct');
        end
        didWrite = true;
    catch ME

        % Optional, return errMsg or throw hard error.
        % Returning an error message allows your automated
        % processes to carry on while allowing you to report the
        % error at a later time.
        errMsg = ME.message;
    end
end
end
end
```

Simulink.io.FileType.getFileTypeDescription

Class: Simulink.io.FileType

Package: Simulink.io

Get custom file reader description

Syntax

```
FileReaderDescription = getFileTypeDescription()
```

Description

FileReaderDescription = getFileTypeDescription() returns the file reader description.

Output Arguments

FileReaderDescription — FileType description

character array

FileType description, returned as a character array. When writing the file type description, consider describing the data layout of the file.

Examples

Subclass FileType Class and Implement getFileTypeDescription Method

Subclass FileType class and implement the getFileTypeDescription method.

```
classdef MySignalMatFile < Simulink.io.FileType
```

Implement the static method getFileTypeDescription.

```
methods ( Static )
    function aFileReaderDescription = getFileTypeDescription( )
        aFileReaderDescription = ['Return a char array describing your reader.'];
    end
end
```

Simulink.io.FileType.isFileSupported

Class: Simulink.io.FileType

Package: Simulink.io

Check if file type is supported in Simulink

Syntax

```
isSupported = isFileSupported(fullFile)
```

Description

`isSupported = isFileSupported(fullFile)` checks if the file located at `fullFile` is supported in Simulink.

Input Arguments

fullFile — Fully qualified file name

character array

Fully qualified file name, specified as a character array.

Example: `C:\mydir\mySignals.csv`

Data Types: `char`

Output Arguments

isSupported — File supported indicator

true (1) | false (0)

File support indicator, returned as true (1) or false (0).

Examples

Subclass FileType Class and Implement isFileSupported Method

Subclass `FileType` class and implement the `isFileSupported` method.

```
classdef MySignalMatFile < Simulink.io.FileType
```

Implement the static method `isFileSupported`.

```
methods ( Static )
```

```
    function isSupported = isFileSupported( fileLocation )
        isSupported = false;
        if exist( fileLocation, 'file' )
            isSupported = true;
        end
```

```
end  
end
```

loadImpl

Class: Simulink.io.FileType

Package: Simulink.io

Load signal names from custom FileType object

Syntax

```
matFileData = loadImpl(reader)
```

Description

`matFileData = loadImpl(reader)` loads the signal names listed in the custom FileType object.

Run-Time Details

`loadImpl` is called via `load` when you run the `Simulink.io.FileType` object. You can also run the application, which calls `load`. For details, see “Create Custom File Type for Import to Signal Editor”.

Input Arguments

reader — Signals to load

`Simulink.io.FileType`

Signals to load, specified as a `Simulink.io.FileType` object.

Data Types: `char`

Output Arguments

matFileData — Signals

cell array of signal variables

Variables of signals to load, returned as a cell array of signal variables of supported types. For more information on supported types, see “Choose a Base Workspace and MAT-File Format”.

Examples

Subclass FileType Class and Implement loadImpl Method

Subclass `FileType` class and implement the `loadImpl` method.

```
classdef MySignalMatFile < Simulink.io.FileType
```

Implement the static method `loadImpl`.

methods

```
function structOut = loadImpl(obj)
```

```
structOut = struct;

%assume mat-file
data = load(obj.FileName);
varsOnFile = fieldnames(data);

for k = 1: length(varsOnFile)

    if isSimulinkSignalFormat(data.(varsOnFile{k}))
        structOut.(varsOnFile{k}) = ...
            data.(varsOnFile{k});
    end
end
end
end
```

loadAVariableImpl

Class: Simulink.io.FileType

Package: Simulink.io

Load specified variable from MAT-file

Syntax

```
varOut = loadAVariableImpl(MATfile,varName)
```

Description

`varOut = loadAVariableImpl(MATfile,varName)` loads the specified variable from the MAT-file.

Input Arguments

MATfile — File name of MAT-file

character array

File name of the MAT-file that contains signals to load, specified as a character array.

Data Types: char

varName — Variable name

character array

Variable name to load, specified as a character array.

Data Types: char

Output Arguments

varOut — Found variable

cell array of signal variables

Found variables to load, returned as a cell array of signal variables of supported types. For more information on supported types, see “Choose a Base Workspace and MAT-File Format”.

Examples

Subclass FileType Class and Implement loadAVariableImpl Method

Subclass `FileType` class and implement `loadAVariableImpl` method.

```
classdef MySignalMatFile < Simulink.io.FileType
```

Implement the static method `loadAVariableImpl`.

```
methods
```

```
function structOut = loadAVariableImpl(obj,varName)

    % Assume loading a variable from a MAT-file.
    data = load(obj.FileName,varName);

    if isempty(fieldnames(data))
        error([varName ' was not found on the file.']);
    end

    if isSimulinkSignalFormat(data.(varName))
        structOut.(varName) = ...
            data.(varName);
    else
        error([varName ' is not a Simulink signal format.']);
    end
end
end
```

validateFileNameImpl

Class: Simulink.io.FileType

Package: Simulink.io

Validate contents of custom MAT-file

Syntax

```
validateFileNameImpl(reader, fileName)
```

Description

`validateFileNameImpl(reader, fileName)` validates the format of the signals in the custom MAT-file `fileName` with the associated `Simulink.io.FileType` reader.

Input Arguments

reader — Reader

`Simulink.io.FileType` object

Reader, specified as a `Simulink.io.FileType` object.

fileName — File name of MAT-file

character array

File name of a MAT-file that contains custom signals, specified as a character array.

Data Types: `char`

Examples

Subclass FileType Class and Implement validateFileNameImpl Method

Subclass `FileType` class and implement the `validateFileNameImpl` method.

```
classdef MySignalMatFile < Simulink.io.FileType
```

Implement static method `validateFileNameImpl`.

```
function validateFileNameImpl(aFile, filename) %#ok<INUSL>  
%validateFileNameImpl  
  
[-, ~, fileExt] = fileparts( filename );  
isSupported = strcmpi(fileExt, '.mat');  
  
if ~isSupported  
    error('This file format is not supported by application.');
```

```
end
```

whosImpl

Class: Simulink.io.FileType

Package: Simulink.io

Determine contents of MAT-file associated with Simulink.io.FileType object

Syntax

```
signals = whosImpl(reader)
```

Description

`signals = whosImpl(reader)` returns a structure containing the contents of the MAT-file associated with the `Simulink.io.FileType` object.

Run-Time Details

`whosImpl` is called via `whos` when you run the application. For details, see “Create Custom File Type for Import to Signal Editor”.

Input Arguments

reader — Reader

Simulink.io.FileType object

Reader, specified as a `Simulink.io.FileType` object.

Output Arguments

signals — Contents of MAT-file

array of structures

Contents of the MAT-file, returned as an array of structures. This structure has a signal name ['char array'] and an optional signal type of a supported type. For more information on supported types, see “Choose a Base Workspace and MAT-File Format”.

Examples

Subclass FileType Class and Implement whosImpl Method

Subclass `FileType` class and implement the `whosImpl` method.

```
classdef MySignalMatFile < Simulink.io.FileType
```

Implement the static method `whosImpl`.

methods

```
function outOnFile = whosImpl(obj)
    onFile = whos(obj.FileName);
```

```
numVars = length(onFile);  
outOnFile(1).name = [];  
outOnFile(1).type = [];  
  
for k = 1: length(numVars)

Simulink.io.SignalBuilderSpreadsheet class

Package: Simulink.io

Read spreadsheet in format used by Signal Builder

Description

Simulink.io.SignalBuilderSpreadsheet inherits from the Simulink.io.FileType base class. It reads spreadsheets formatted in a format used by Signal Builder. To import spreadsheets used in Signal Builder, use this class.

```
classdef SignalBuilderSpreadsheet < Simulink.io.FileType
```

The Simulink.io.SignalBuilderSpreadsheet class is a handle class.

Class Attributes

Abstract	false
HandleCompatible	true

For information on class attributes, see “Class Attributes” (MATLAB).

Properties

Public Properties

FileName — File name

character array

File name of file that contains signals to import to Signal Editor, specified as a character array.

Attributes:

Methods

Specialized Operators and Functions

These methods specialize standard MATLAB operators and functions for objects in this class.

export	<p>This method calls the <code>exportImpl</code> method.</p> <p>From Signal Editor, write the structure of signals to a MAT-file. The structure must contain two cell arrays; one for signal names and one for signal values. Specify if the method appends to or overwrites the contents of the MAT-file. The method indicates if it succeeded in writing to the MAT-file and returns any error messages.</p>
import	<p><code>[importedData, warnStr] = import(reader)</code></p> <p>To import custom signals for a custom file type, identify the custom file type <i>reader</i> as a <code>Simulink.io.FileType</code> object. The method returns the found variable as a cell array of signal variables of supported types. For more information on supported types, see "Choose a Base Workspace and MAT-File Format". The method returns a structure with two fields, <code>Data</code> and <code>.Name</code>. <code>Data</code> is a cell array of signals and <code>Name</code> is a cell array of character vectors of the corresponding signal names.</p>
importAVariable	<p><code>varOut = importAVariable(reader,variableName)</code></p> <p>To import a specified variable for a custom file type, identify the custom file type reader as a <code>Simulink.io.FileType</code> object. Use <i>VariableName</i>, specified as a character array, to extract the desired signal from the file of custom format signals. The method returns the found variable, returned as a cell array of signal variables of supported types. For more information on supported types, see "Choose a Base Workspace and MAT-File Format".</p>
load	<p>This method calls the <code>loadImpl</code> method.</p> <p>Load the signal listed in the custom file type.</p>
loadAVariable	<p>This method calls the <code>loadAVariableImpl</code> method.</p> <p>Validate the format of the signals in the custom MAT-file <code>fileName</code> with the associated <code>Simulink.io.FileType</code> reader.</p>
validateFileName	<p>This method calls the <code>validateFileNameImpl</code> method.</p> <p>Validate the format of the signals in the custom MAT-file <code>fileName</code> with the associated <code>Simulink.io.FileType</code> reader.</p>

whos	<p>This method calls the whosImpl method.</p> <p>Return the contents of the custom file type MAT-file.</p>
------	------------------------------------------------------------------------------------------------------------

Examples

Interact with SignalBuilderSpreadsheet Using Specialized Functions

Interact with FileType using specialized functions. This example refers to the open('Simulink.io.CreateSignals') sample file.

Get contents of Signal Builder format foo.xlsx spreadsheet.

```
fileName = 'foo.xlsx';
aReader = Simulink.io.SignalBuilderSpreadsheet(fileName);
resultOfWhos = whos( aReader );
```

Load the custom signals in foo.xlsx.

```
fileName = 'foo.xlsx';

aReader = Simulink.io.SignalBuilderSpreadsheet(fileName);
varsOnFileStruct = load(aReader,'myGroup1');
```

Load a variable from foo.xlsx.

```
fileName = 'foo.xlsx';

aReader = Simulink.io.SignalBuilderSpreadsheet(fileName);
var = loadAVariable(aReader,'myGroup1');
```

Import custom signals from foo.xlsx.

```
fileName = 'foo.xlsx';

aReader = Simulink.io.SignalBuilderSpreadsheet(fileName);
importedVars = import(aReader,'myGroup1');
```

Export the signals from Signal Editor.

```
ds = Simulink.SimulationData.Dataset;
ds = ds.addElement(timeseries([1:10]','[1:10]'),'Signal1'); %#ok<*NBRAK>
ds = ds.addElement(timeseries([1:10]','[11:20]'),'Signal2');
ds = ds.addElement(timeseries([1:10]','[21:30]'),'Signal3');

aReader = Simulink.io.SignalBuilderSpreadsheet('myFileToExport.xls');
didWrite = aReader.export(filePath,{'ds'},{ds},0);
```

Simulink.lookuptable.Breakpoint class

Package: Simulink.lookuptable

Configure breakpoint set data for lookup table object

Description

An object of the Simulink.lookuptable.Breakpoint class stores breakpoint set information for a lookup table. The object resides in the Breakpoints property of a Simulink.LookupTable object or Simulink.Breakpoint object.

You can use Simulink.LookupTable and Simulink.Breakpoint objects to store and configure a lookup table for ASAP2 and AUTOSAR code generation.

To represent multiple breakpoint sets for a multidimensional lookup table, store a vector of Simulink.lookuptable.Breakpoint objects in the Breakpoints property of a Simulink.LookupTable object.

To share a breakpoint set between multiple lookup tables, use a Simulink.Breakpoint object to store and configure the breakpoint set information. Use the object in a Prelookup block and create Simulink.LookupTable objects to use in Interpolation Using Prelookup blocks.

Construction

When you create a Simulink.LookupTable object or Simulink.Breakpoint object, a Simulink.lookuptable.Breakpoint object appears as the value of the Breakpoints property.

To create more Simulink.lookuptable.Breakpoint objects for a Simulink.LookupTable object, use this technique:

Access the Breakpoints property by specifying a vector index.

To create a Simulink.lookuptable.Breakpoint object, you can set the value of any of the object properties. The Simulink.LookupTable object creates the Simulink.lookuptable.Breakpoint object with default property values, and sets the property that you specified.

The value of the Breakpoints property is an array of Simulink.lookuptable.Breakpoint objects. Each embedded object represents one breakpoint set.

For example, suppose that you create a Simulink.LookupTable object named LUTObj. To create more breakpoint sets, access the Breakpoints property by specifying vector indices:

```
LUTObj.Breakpoints(1).Value = [-1 1];  
LUTObj.Breakpoints(2).Value = [-2 -1 0 1 2];  
LUTObj.Breakpoints(3).Value = [-5 -3 0 3 5];
```

The object LUTObj creates additional Simulink.lookuptable.Breakpoint objects and sets the Value property of each object. LUTObj now stores information for three breakpoint sets.

Properties

Data Type — Data type of breakpoint set elements

'auto' (default) | character vector

Data type of breakpoint set elements, specified as a character vector. You can explicitly specify an integer, a floating-point, a fixed-point data type, or a data type expression such as the name of a `Simulink.AliasType` object.

The default value, 'auto', means that the breakpoint set acquires a data type from the value that you specify in the `Value` property. If you use an untyped expression such as `[1 2 3]` to set `Value`, the breakpoint data use the data type `double`. If you specify a typed expression such as `single([1 2 3])` or an `fi` object, the breakpoint data use the data type specified by the expression or object.

For more information about data types in Simulink, see “Data Types Supported by Simulink”. To decide how to control the data types of table and breakpoint data in `Simulink.LookupTable` and `Simulink.Breakpoint` objects, see “Control Data Types of Lookup Table Objects” (Simulink Coder).

Example: 'int16'

Example: 'myTypeAlias'

Data Types: char

Description — Description of breakpoint set

' ' (default) | character vector

Description of the breakpoint set, specified as a character vector.

Example: 'This breakpoint set represents the pressure input.'

Data Types: char

Dimensions — Dimension lengths of breakpoint set

[0 0] (default) | numeric vector

Dimension lengths of the breakpoint set, returned as a numeric vector or specified as a character vector.

To use symbolic dimensions, specify a character vector.

FieldName — Name of structure field that stores breakpoint set data

'BP' (default) | character vector

Name of a structure field in the generated code, specified as a character vector. This field stores the breakpoint set data.

The code generator uses this property only under these circumstances, which cause the breakpoint data to appear in the generated code as a structure field:

- The `Simulink.lookupable.Breakpoint` object exists in a `Simulink.LookupTable` object and in the `Simulink.LookupTable` object you set `BreakpointsSpecification` to 'Explicit values'.
- The `Simulink.lookupable.Breakpoint` object exists in a `Simulink.Breakpoint` object and in the `Simulink.Breakpoint` object you set `SupportTunableSize` to true.

Example: 'MyBkptSet1'

Data Types: char

Max — Maximum value of breakpoint set elements

[] (default) | numeric double value

Maximum value of the elements of the breakpoint set, specified as a numeric, real value of the data type double.

Example: 17.23

Data Types: double

Min — Minimum value of breakpoint set elements

[] (default) | numeric double value

Minimum value of the elements of the breakpoint set, specified as a numeric, real value of the data type double.

Example: -52.6

Data Types: double

TunableSizeName — Name of structure field that stores length of breakpoint set

'N' (default) | character vector

Name of a structure field in the generated code, specified as a character vector. This field stores the length of the breakpoint set, which the generated code algorithm uses to determine the size of the table. To tune the effective size of the table during code execution, change the value of this structure field in memory.

The code generator uses this property only under these circumstances, which enable a tunable table size in the generated code:

- The `Simulink.lookuptable.Breakpoint` object exists in a `Simulink.LookupTable` object and in the `Simulink.LookupTable` object you set:
 - `BreakpointsSpecification` to 'Explicit values'.
 - `SupportTunableSize` to true.
- The `Simulink.lookuptable.Breakpoint` object exists in a `Simulink.Breakpoint` object and in the `Simulink.Breakpoint` object you set `SupportTunableSize` to true.

Example: 'LengthForDim1'

Data Types: char

Unit — Physical unit of breakpoint set

' ' (default) | character vector

Physical unit of the elements of the breakpoint set, specified as a character vector.

Example: 'inches'

Data Types: char

Value — Breakpoint set data

[] (default) | numeric vector

The breakpoint set data, specified as a numeric vector with at least two elements. To control the data type of the breakpoint set, use the `DataType` property of the `Simulink.lookupable.Breakpoint` object.

When you set `DataType` to `'auto'`, to set the `Value` property, use a typed expression such as `single([1 2 3])` or use the `fi` constructor to embed an `fi` object.

Example: `[10 20 30]`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fi`

Copy Semantics

Value. To learn how value classes affect copy operations, see [Copying Objects \(MATLAB\)](#).

`Simulink.Breakpoint` | `Simulink.LookupTable`

Introduced in R2016b

Simulink.lookupable.Evenspacing class

Package: Simulink.lookupable

Configure even spacing set data for lookup table object

Description

An object of the Simulink.lookupable.Evenspacing class stores event spacing set information for a lookup table. The object resides in the Evenspacing property of a Simulink.LookupTable object.

You can use Simulink.LookupTable objects to store and configure a lookup table for ASAP2 and AUTOSAR code generation.

To represent multiple breakpoint sets for a multidimensional lookup table, store a vector of Simulink.lookupable.Evenspacing objects in the Evenspacing property of a Simulink.LookupTable object.

Construction

When you create a Simulink.LookupTable object and set BreakpointSpecification to 'Even spacing', a Simulink.lookupable.Evenspacing object appears as the value of the Breakpoints property.

To create more Simulink.lookupable.Evenspacing objects for a Simulink.LookupTable object, use this technique:

Access the Breakpoints property by specifying a vector index.

To create a Simulink.lookupable.Evenspacing object, you can set the value of any of the object properties. The Simulink.LookupTable object creates the Simulink.lookupable.Evenspacing object with default property values, and sets the property that you specified.

The value of the Breakpoints property is an array of Simulink.lookupable.Evenspacing objects. Each embedded object represents one breakpoint set.

For example, suppose that you create a Simulink.LookupTable object named myLUTObj. To create more breakpoint sets, access the Breakpoints property by specifying scalar indices for FirstPoint and Spacing properties. To create more even spacing breakpoint sets, update the object with this pair of properties:

```
LUTObj.Breakpoints(1).FirstPoint=-1;
LUTObj.Breakpoints(1).Spacing=2;
LUTObj.Breakpoints(1).FirstPoint=-2;
LUTObj.Breakpoints(1).Spacing=1;
LUTObj.Breakpoints(1).FirstPoint=-5;
LUTObj.Breakpoints(1).Spacing=2;
```

The object `myLUTObj` creates additional `Simulink.lookupable.Evenspacing` objects and sets the `FirstPoint` and `Spacing` properties of each object. `LUTObj` now stores information for three breakpoint sets.

Properties

FirstPoint — First point in evenly spaced breakpoint data

[] (default) | numeric scalar

First point in evenly spaced breakpoint data, specified as a numeric scalar. To control the data type of the breakpoint set, use the `DataType` property of the `Simulink.lookupable.Evenspacing` object.

When you set `DataType` to 'auto', to set the `FirstPoint` property, use a typed expression such as `single(1)` or use the `fi` constructor to embed a `fi` object.

Example: -1

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fi`

Spacing — Spacing between points in evenly spaced breakpoint data

[] (default) | numeric, positive, monotonically increasing scalar

Spacing between points in evenly spaced breakpoint data, specified as a numeric scalar. To control the data type of the breakpoint set, use the `DataType` property of the `Simulink.lookupable.Evenspacing` object.

When you set `DataType` to 'auto', to set the `Spacing` property, use a typed expression such as `single(1)` or use the `fi` constructor to embed an `fi` object.

Example: -1

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fi`

DataType — Data type of breakpoint set elements

'auto' (default) | character vector

Data type of breakpoint set elements, specified as a character vector. You can explicitly specify an integer, a floating-point, a fixed-point data type, or a data type expression such as the name of a `Simulink.AliasType` object.

The default value, 'auto', means that the breakpoint set acquires a data type from the value that you specify in the `Value` property. If you use an untyped expression such as `[1 2 3]` to set `Value`, the breakpoint data use the data type `double`. If you specify a typed expression such as `single([1 2 3])` or an `fi` object, the breakpoint data use the data type specified by the expression or object.

For more information about data types in Simulink, see “Data Types Supported by Simulink”. To decide how to control the data types of table and breakpoint data in `Simulink.LookupTable` and `Simulink.Breakpoint` objects, see “Control Data Types of Lookup Table Objects” (Simulink Coder).

Example: 'int16'

Example: 'myTypeAlias'

Data Types: `char`

Min — Minimum value of breakpoint set elements

[] (default) | numeric double value

Minimum value of the elements of the breakpoint set, specified as a numeric, real value of the data type `double`.

Example: `-52.6`

Data Types: `double`

Max — Maximum value of breakpoint set elements

[] (default) | numeric double value

Maximum value of the elements of the breakpoint set, specified as a numeric, real value of the data type `double`.

Example: `17.23`

Data Types: `double`

Unit — Physical unit of breakpoint set

' ' (default) | character vector

Physical unit of the elements of the breakpoint set, specified as a character vector.

Example: `'inches'`

Data Types: `char`

FirstPointName — Name of the Simulink.LookupTable.Evenspacing object that stores the information for the first point

'BPFIRSTPOINT1' (default) | character vector

Name of the `Simulink.Breakpoint` object that stores the information for the first point, specified as a character vector. Generated code uses this name to display the first point.

Example: `'myFirstPointName'`

Data Types: `char`

SpacingName — Name of the Simulink.LookupTable.Evenspacing object that stores the information for the spacing

'auto' (default) | character vector

Name of the `Simulink.Breakpoint` object that stores the information for the spacing, specified as a character vector. Generated code uses this name to display the spacing.

Example: `'mySpacing'`

Data Types: `char`

TunableSizeName — Name of structure field that stores length of breakpoint set

'N' (default) | character vector

Name of a structure field in the generated code, specified as a character vector. This field stores the length of the breakpoint set, which the generated code algorithm uses to determine the size of the table. To tune the effective size of the table during code execution, change the value of this structure field in memory.

The code generator uses the property only under these circumstances, which enable a tunable table size in the generated code:

- The `Simulink.lookupable.Evenspacing` object exists in a `Simulink.LookupTable` object, in which you set `BreakpointsSpecification` to `'Even spacing'` and `SupportTunableSize` to `true`.

Example: `'LengthForDim1'`

Data Types: `char`

Description — Description of breakpoint set

`''` (default) | character vector

Description of the breakpoint set, specified as a character vector.

Example: `'This breakpoint set represents the pressure input.'`

Data Types: `char`

Copy Semantics

Value. To learn how value classes affect copy operations, see [Copying Objects \(MATLAB\)](#).

`Simulink.LookupTable` | `Simulink.lookupable.Breakpoint`

Introduced in R2017b

Simulink.lookupable.StructTypeInfo class

Package: Simulink.lookupable

Configure settings for structure type that lookup table object uses in the generated code

Description

An object of the `Simulink.lookupable.StructTypeInfo` class controls the structure type that the generated code creates to store data for lookup table objects. The `Simulink.lookupable.StructTypeInfo` object resides in the `StructTypeInfo` property of a `Simulink.LookupTable` object or `Simulink.Breakpoint` object. Use these parent objects to store and configure a lookup table for ASAP2 and AUTOSAR code generation.

A `Simulink.LookupTable` object appears as a structure in the generated code when you set the `Specification` property to 'Explicit values'. A `Simulink.Breakpoint` object appears as a structure in the generated code when you set the `SupportTunableSize` property to true.

Construction

When you create a `Simulink.LookupTable` or `Simulink.Breakpoint` object, a `Simulink.lookupable.StructTypeInfo` object appears as the value of the `StructTypeInfo` property.

Properties

DataScope — Scope of structure type definition

'Auto' (default) | 'Exported' | 'Imported'

Scope of structure type definition, specified as a character vector.

Data Types: char

HeaderFileName — Name of header file that contains structure type definition

' ' (default) | character vector

Name of the header file that contains the structure type definition, specified as a character vector.

Example: 'myHdr.h'

Data Types: char

Name — Name of structure type

' ' (default) | character vector

Name of the structure type, specified as a character vector.

Data Types: char

Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects (MATLAB).

See Also

[Simulink.Breakpoint](#) | [Simulink.LookupTable](#)

Introduced in R2016b

Simulink.lookupable.Table class

Package: Simulink.lookupable

Configure table data for lookup table object

Description

An object of the Simulink.lookupable.Table class stores table information for a lookup table. The object resides in the Table property of a Simulink.LookupTable object. You can use the Simulink.LookupTable object to store and configure a lookup table for ASAP2 and AUTOSAR code generation.

Construction

When you create a Simulink.LookupTable object, a Simulink.lookupable.Table object appears as the value of the Table property.

Properties

Data Type — Data type of table data elements

'auto' (default) | character vector

Data type of the table data elements, specified as a character vector. You can explicitly specify an integer data type, a floating-point data type, a fixed-point data type, or a data type expression such as the name of a Simulink.AliasType object.

The default value, 'auto', means that the table data acquire a data type from the value that you specify in the Value property. If you use an untyped expression such as [1 2 3] to set Value, the table data use the data type double. If you specify a typed expression such as single([1 2 3]) or an fi object, the table data use the data type specified by the expression or object.

For more information about data types in Simulink, see “Data Types Supported by Simulink”. To decide how to control the data types of table and breakpoint data in Simulink.LookupTable and Simulink.Breakpoint objects, see “Control Data Types of Lookup Table Objects” (Simulink Coder).

Example: 'int16'

Example: 'myTypeAlias'

Data Types: char

Description — Description of table data

' ' (default) | character vector

Description of the table data, specified as a character vector.

Example: 'This lookup table describes the action of a pump.'

Data Types: char

Dimensions — Dimension lengths of table data

[0 0] (default) | numeric vector

Dimension lengths of the table data, returned as a numeric vector or specified as a character vector.

To use symbolic dimensions, specify a character vector.

FieldName — Name of a structure field in the generated code

'Table' (default) | character vector

Name of a structure field in the generated code, specified as a character vector. This field stores the table data if you configure the `Simulink.LookupTable` object to appear in the generated code as a structure.

Example: 'MyPumpTable'

Data Types: char

Max — Maximum value of table data elements

[] (default) | numeric double value

Maximum value of the elements of the table data, specified as a numeric, real value of the data type `double`.

Example: 17.23

Data Types: double

Min — Minimum value of table data elements

[] (default) | numeric double value

Minimum value of the elements of the table data, specified as a numeric, real value of the data type `double`.

Example: -52.6

Data Types: double

Unit — Physical unit of table elements

' ' (default) | character vector

Physical unit of the elements of the table data, specified as a character vector.

Example: 'degC'

Data Types: char

Value — Table data

[] (default) | numeric vector or multidimensional array

The table data, specified as a numeric vector or multidimensional array with at least two elements. To control the data type of the table data, use the `DataType` property of the `Simulink.lookupTable.Table` object.

When you set `DataType` to 'auto', to set the `Value` property, use a typed expression such as `single([1 2 3])` or use the `fi` constructor to embed an `fi` object.

Example: [10 20 30; 40 50 60]

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | fi

Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects (MATLAB).

`Simulink.Breakpoint` | `Simulink.LookupTable`

Introduced in R2016b

Simulink.MDLInfo class

Package: Simulink

Extract model file information without loading block diagram into memory

Description

The class `Simulink.MDLInfo` extracts information from a model file without loading the block diagram into memory.

You can create an `MdlInfo` object containing all the model information properties, or you can use the static methods for convenient access to individual properties without creating the class first. For example, to get the description only:

```
description = Simulink.MDLInfo.getDescription('mymodel')
```

To get the metadata only:

```
metadata = Simulink.MDLInfo.getMetadata('mymodel')
```

All model information properties are read only.

Construction

`info = Simulink.MDLInfo('mymodel')` creates an instance of the `MdlInfo` class `info` and populates the properties with the information from the model file `'mymodel'`.

`mymodel` can be:

- A block diagram name (for example, `vdp`)
- The file name for a file on the MATLAB path (for example, `mymodel.slx`)
- A file name relative to the current folder (for example, `mydir/mymodel.slx`)
- A fully qualified file name (for example, `C:\mydir\mymodel.slx`)

`Simulink.MDLInfo` resolves the supplied name by looking at files on the MATLAB path, and ignores any block diagrams in memory. This may cause unexpected results if you supply the name of a loaded model, but its file is shadowed by another file on the MATLAB path. If a file is shadowed, you see a warning in the command window. To avoid any confusion, supply a fully-qualified file name to `Simulink.MDLInfo`.

Properties

BlockDiagramName

Name of block diagram.

BlockDiagramType

Type of block diagram. For example, 'Model', 'Subsystem', 'Library'.

Description

The Description parameter of the model. For details, see “Access Model Information Programmatically”.

ReleaseUpdateLevel

Contains the update release number that was used to save the SLX model. It is zero if the SLX model was saved in a general release, for example, 'R2020a'. It is a positive integer if the SLX model was saved in an update release, for example, 2 if the model was saved in 'R2020a Update 2'.

It is zero for MDL files and for SLX files saved in releases before R2020a.

FileName

The fully-qualified Name of the model file.

Interface

Names and attributes of the block diagram's root inports, outports, model references, etc., describing the graphical interface if you created a Model Reference block from this model.

Structure.

IsLibrary

Whether the block diagram is a library. Logical.

LastModifiedBy

Name of the user who last saved the model.

LastSavedArchitecture

Platform architecture when saved, for example, 'glnxa64'.

Metadata

Names and values of arbitrary data associated with the model.

Structure. The structure fields can be character vectors, numeric matrices of type "double", or more structures. Use the method `getMetadata` to extract this metadata structure without loading the model.

ModelVersion

Model file version number.

ReleaseName

Release name that was used to save the model file, for example, 'R2020a'.

SavedCharacterEncoding

Character encoding when saved, for example, 'UTF-8'.

SimulinkVersion

Version number of Simulink software that was used to save the model file.

Methods

getDescription Extract model file description without loading block diagram into memory
 getMetadata Extract model file metadata without loading block diagram into memory

Copy Semantics

Handle. To learn how this affects your use of the class, see Copying Objects (MATLAB) in the MATLAB Programming Fundamentals documentation.

Examples

Construct and view a model information object:

```
info = Simulink.MDLInfo('mymodel')
% Get the Version when the model was saved
simulink_version = info.SimulinkVersion;
% Get model metadata
metadata = info.metadata
```

To add metadata to a model, create a metadata structure containing the information you require and use `set_param` to attach it to the model. For example:

```
metadata.TestStatus = 'untested';
metadata.ExpectedCompletionDate
    = '01/01/2011';
load_system(mymodelName);
set_param(mymodelName, 'Metadata', ...
    metadata) % must be a struct
save_system(mymodelName);
close_system(mymodelName);
```

Construct a model information object for a model named `mpowertrain`, in order to find the names of referenced models without loading the model into memory:

```
info = Simulink.MDLInfo('mpowertrain')
% Get the Interface property
info.Interface
```

Output:

```
ans =
           Inports: [0x1 struct]
           Outports: [0x1 struct]
           Trigports: [0x1 struct]
           Connports: [0x1 struct]
           ModelVersion: '1.122'
           ModelReferences: {2x1 cell}
           ParameterArgumentNames: ''
           TestPointedSignals: [0x1 struct]
```

Get the referenced models:

```
info.Interface.ModelReferences
```

Output is in the form *model name / block path | referenced model name*:

```
ans =  
    'mpowertrain/Model Variants|manual_transmission'  
    'mpowertrain/engine model|menginemodel'
```

See Also

`Simulink.MDLInfo.getDescription`; `Simulink.MDLInfo.getMetadata`

Simulink.MDLInfo.getDescription

Class: Simulink.MDLInfo

Package: Simulink

Extract model file description without loading block diagram into memory

Syntax

```
description = Simulink.MDLInfo.getDescription('mymodel')  
description = info.getDescription
```

Description

`description = Simulink.MDLInfo.getDescription('mymodel')` returns the description associated with the file *mymodel*, without loading the model.

mymodel can be:

- A block diagram name (for example, vdp)
- The file name for a file on the MATLAB path (for example, mymodel.slx)
- A file name relative to the current folder (for example, mydir/mymodel.slx)
- A fully qualified file name (for example, C:\mydir\mymodel.slx)

`description = info.getDescription` returns the description property of the Simulink.MDLInfo object `info`.

Examples

Get the description without loading the model or creating a Simulink.MDLInfo object:

```
description = Simulink.MDLInfo.getDescription('mymodel')
```

Create a Simulink.MDLInfo object containing all the model information properties, and get the description property:

```
info = Simulink.MDLInfo('mymodel')  
description = info.getDescription
```

See Also

Simulink.MDLInfo; Simulink.MDLInfo.getMetadata

Simulink.MDLInfo.getMetadata

Class: Simulink.MDLInfo

Package: Simulink

Extract model file metadata without loading block diagram into memory

Syntax

```
metadata = Simulink.MDLInfo.getMetadata('mymodel')  
metadata = info.getMetadata
```

Description

`metadata = Simulink.MDLInfo.getMetadata('mymodel')` extracts the structure metadata associated with the file *mymodel*, without loading the model.

mymodel can be:

- A block diagram name (for example, vdp)
- The file name for a file on the MATLAB path (for example, mymodel.slx)
- A file name relative to the current folder (for example, mydir/mymodel.slx)
- A fully qualified file name (for example, C:\mydir\mymodel.slx)

`metadata = info.getMetadata` returns the metadata property of the Simulink.MDLInfo object `info`.

`metadata` is a structure containing the names and attributes of arbitrary data associated with the model. The structure fields can be character vectors, numeric matrices of type "double", or more structures.

To add metadata to a model, create a metadata structure containing the information you require and use `set_param` to attach it to the model. If it is important to extract the information without loading the model, use `metadata` instead of adding custom user data with `add_param`.

Examples

Create a metadata structure and use `set_param` to attach it to the model:

```
metadata.TestStatus = 'untested';  
metadata.ExpectedCompletionDate = '01/01/2011';  
load_system('mymodel');  
set_param('mymodel', 'Metadata', metadata) % must be a struct  
save_system('mymodel');  
close_system('mymodel');
```

Get the metadata without loading the model or creating a Simulink.MDLInfo object:

```
metadata = Simulink.MDLInfo.getMetadata('mymodel')
```

Create a `Simulink.MDLInfo` object containing all the model information properties, and get the metadata property:

```
info = Simulink.MDLInfo('mymodel')  
metadata = info.Metadata
```

`Simulink.MDLInfo`; `Simulink.MDLInfo.getDescription`

Simulink.ModelAdvisor

Run Model Advisor from MATLAB file

Description

To run the Model Advisor, use instances of this class in MATLAB programs. For example, you can perform a standard set of checks.

Many `Simulink.ModelAdvisor` object methods require or return IDs. An *ID* is a unique identifier for a Model Advisor check, task, or group. IDs must remain constant. A `Simulink.ModelAdvisor` object includes methods that enable you to retrieve the ID or IDs for:

- All checks, tasks, and groups
- Checks belonging to groups and tasks
- The active check
- Selected checks, tasks, and groups

To find check IDs in the Model Advisor, use the check context menu.

Find	Action
Check Title, ID, or location of the MATLAB source code	<ol style="list-style-type: none"> 1 On the model window toolbar, select Settings > Preferences. 2 In the Model Advisor Preferences dialog box, select Show Source Tab. 3 In the right pane of the Model Advisor window, click the Source tab. The Model Advisor window displays the check Title, TitleId, and location of the MATLAB source code for the check.
Check ID	<ol style="list-style-type: none"> 1 In the left pane of the Model Advisor, select the check. 2 Right-click the check name and select Send Check ID to Workspace. The ID is displayed in the Command Window and sent to the base workspace.
Check IDs for selected checks in a folder	<ol style="list-style-type: none"> 1 In the left pane of the Model Advisor, select the checks for which you want IDs. Clear the other checks in the folder. 2 Right-click the folder and select Send Check ID to Workspace. An array of the selected check IDs are sent to the base workspace.

Creation

Syntax

```
ma = Simulink.ModelAdvisor.getModelAdvisor(system)
```

Description

MATLAB creates an instance of this object for each model that you open in the current MATLAB session. To get a handle to a model's Model Advisor object, execute this command: `ma =`

`Simulink.ModelAdvisor.getModelAdvisor(system)` where `system` is the name of the model or subsystem that you want to check. Your program can then use the Model Advisor object methods to initialize and run the Model Advisor checks.

Input Arguments

system — Model or subsystem name

character vector

Model or subsystem that the Model Advisor checks.

Data Types: `char`

Properties

EmitInputParametersToReport — Display check input parameters in Model Advisor report

`true` (default) | `false`

A value of `true` displays input parameters in the Model Advisor report. A value of `false` does not display input parameters in the Model Advisor report.

Data Types: `char`

Object Functions

<code>closeReport</code>	Close Model Advisor report
<code>deselectCheck</code>	Clear Model Advisor check
<code>deselectCheckAll</code>	Clear Model Advisor checks
<code>deselectCheckForGroup</code>	Clear Model Advisor checks for groups
<code>deselectCheckForTask</code>	Clear Model Advisor checks that belong to a specified task or set of tasks
<code>deselectTask</code>	Clear Model Advisor checks that belong to a specified task or set of tasks
<code>deselectTaskAll</code>	Clear all Model Advisor tasks
<code>displayReport</code>	Display report in Model Advisor window
<code>exportReport</code>	Create copy of Model Advisor report
<code>filterResultWithExclusion</code>	Filter excluded objects
<code>getBaselineMode</code>	Determine whether Model Advisor is in baseline data generation mode
<code>getCheckAll</code>	Get check IDs of all Model Advisor checks
<code>getCheckForGroup</code>	Get checks belonging to Model Advisor check group
<code>getCheckForTask</code>	Get checks belonging to a task
<code>getCheckResult</code>	Get Model Advisor check results
<code>getCheckResultData</code>	Obtain Model Advisor check result data
<code>getCheckResultStatus</code>	Obtain Model Advisor check result status
<code>getGroupAll</code>	Get all groups of checks that Model Advisor runs
<code>getInputParameters</code>	Get Model Advisor check input parameters
<code>getListViewParameters</code>	Get Model Advisor checklist parameters displayed in checklist view
<code>Simulink.ModelAdvisor.getModelAdvisor</code>	Get Model Advisor object for system or subsystem
<code>getSelectedCheck</code>	Get currently selected Model Advisor checks
<code>getSelectedSystem</code>	Get system that Model Advisor targets
<code>getSelectedTask</code>	Get selected Model Advisor tasks

<code>getTaskAll</code>	Get tasks run by Model Advisor
<code>Simulink.ModelAdvisor.openConfigUI</code>	Starts Model Advisor Configuration Editor
<code>Simulink.ModelAdvisor.reportExists</code>	Determine whether Model Advisor report exists for model or subsystem
<code>runCheck</code>	Run currently selected checks
<code>runTask</code>	Run currently selected tasks
<code>selectCheck</code>	Select checks
<code>selectCheckAll</code>	Select all checks
<code>selectCheckForGroup</code>	Select check group
<code>selectCheckForTask</code>	Select checks for a specific task or tasks
<code>selectTask</code>	Select Model Advisor task
<code>selectTaskAll</code>	Select all Model Advisor tasks
<code>setActionEnable</code>	Set status for check action
<code>setBaselineMode</code>	Set Model Advisor baseline mode
<code>setCheckErrorSeverity</code>	Set severity of check failure
<code>setCheckResult</code>	Set result for currently running check
<code>setCheckResultData</code>	Set result data for currently running check
<code>setCheckResultStatus</code>	Set status for currently running check
<code>setListViewParameters</code>	Specify list-view parameters for check
<code>setInputParameters</code>	Specify input parameters
<code>verifyCheckRan</code>	Verify that Model Advisor ran a set of checks
<code>verifyCheckResult</code>	Generate baseline Model Advisor check results file or compare current check results to baseline check results
<code>verifyCheckResultStatus</code>	Verify that a model passed or failed a set of checks
<code>verifyHTML</code>	Generate baseline Model Advisor report or compare current report to baseline report

Topics

“Run Model Advisor Checks”

Introduced in R2006a

closeReport

Package: Simulink

Close Model Advisor report

Syntax

```
closeReport(ma)
```

Description

For a Model Advisor object, use the `closeReport(ma)` method to close a Model Advisor Report.

Input Arguments

ma — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to close the corresponding Model Advisor report.

See Also

`Simulink.ModelAdvisor`

Introduced in R2006a

deselectCheck

Package: Simulink

Clear Model Advisor check

Syntax

```
output = deselectCheck(ma,checkID)
```

Description

For a Model Advisor object, use the `output = deselectCheck(ma,checkID)` method to clear a Model Advisor check. This method cannot clear disabled checks.

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object that you want to clear Model Advisor check(s).

checkID — Check IDs associated with Model Advisor check(s)

character vector | cell array of character vectors

Model Advisor Check IDs for which you want to clear from the Model Advisor.

Example: 'mathworks.design.UnconnectedLinesPorts'

Output Arguments

output — Logical value

boolean

A logical value indicating whether Simulink cleared the specified check. A value of 1 indicates success. A value of 0 indicates that Simulink was not able to clear the specified check.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

deselectCheckAll

Package: Simulink

Clear Model Advisor checks

Syntax

```
output = deselectCheckAll(ma)
```

Description

For a Model Advisor object, use the `output = deselectCheckAll(ma)` method to clear all selected Model Advisor checks. This method cannot clear disabled checks.

Input Arguments

ma — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to clear all selected Model Advisor checks.

Output Arguments

output — Logical value

`boolean`

A logical value indicating whether Simulink cleared all selected checks. A value of 1 indicates success. A value of 0 indicates that Simulink did not clear all checks.

See Also

`Simulink.ModelAdvisor`

Introduced in R2006a

deselectCheckForGroup

Package: Simulink

Clear Model Advisor checks for groups

Syntax

```
output = deselectCheckForGroup(ma,groupName)
```

Description

For a Model Advisor object, use the `output = deselectCheckForGroup(ma,groupName)` method to clear all selected Model Advisor checks for one or more groups. To locate the group name, use the `getGroupAll` method.

Input Arguments

ma — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to clear all selected Model Advisor checks for one or more groups.

groupName — Check group names

character vector | cell array of character vectors

Name of group or groups that contain the selected Model Advisor checks that you want to clear.

Output Arguments

output — Logical value

boolean

A logical value indicating whether Simulink cleared the checks for the specified group. A value of 1 indicates success. A value of 0 indicates that Simulink did not clear the specified checks.

See Also

`Simulink.ModelAdvisor`

Introduced in R2006a

deselectCheckForTask

Package: Simulink

Clear Model Advisor checks that belong to a specified task or set of tasks

Syntax

```
output = deselectCheckForTask(ma,task)
```

Description

For a Model Advisor object, use the `output = deselectCheckForTask(ma,task)` method to clear all selected Model Advisor checks for one or more tasks. To locate the task name, use the `getTaskAll` method.

Input Arguments

ma — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to clear all selected Model Advisor checks for a task or tasks

task — Task name

character vector | cell array of character vectors

Name of task or tasks that contain selected Model Advisor checks that you want to clear.

Output Arguments

output — Logical value

boolean

A logical value indicating whether Simulink cleared the checks for the specified group. A value of 1 indicates success. A value of 0 indicates that Simulink did not clear the specified checks.

See Also

`Simulink.ModelAdvisor`

Introduced in R2006a

deselectTask

Package: Simulink

Clear Model Advisor checks that belong to a specified task or set of tasks

Syntax

```
output = deselectTask(ma,task)
```

Description

For a Model Advisor object, use the `output = deselectTask(ma,task)` method to clear all selected Model Advisor checks for one or more tasks. To locate the task name, use the `getTaskAll` method.

Input Arguments

ma — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to clear all selected Model Advisor checks for a task or tasks

task — Task name

character vector | cell array of character vectors

Name of task or tasks that contain selected Model Advisor checks that you want to clear.

Output Arguments

output — Logical value

boolean

A logical value indicating whether Simulink removed the checks for the specified task. A value of 1 indicates success. A value of 0 indicates that Simulink was not able to clear the checks for the specified task.

See Also

`Simulink.ModelAdvisor`

Introduced in R2006a

deselectTaskAll

Package: Simulink

Clear all Model Advisor tasks

Syntax

```
output = deselectTaskAll(ma)
```

Description

For a Model Advisor object, use the `output = deselectTaskAll(ma)` method to clear all selected Model Advisor checks for all tasks.

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to clear all selected Model Advisor checks for all tasks

Output Arguments

output — Logical value

boolean

A logical value indicating whether Simulink cleared the checks for all tasks. A value of 1 indicates success. A value of 0 indicates that Simulink did not clear the checks.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

displayReport

Package: Simulink

Display report in Model Advisor window

Syntax

```
displayReport(ma)
```

Description

For a Model Advisor object, use the `displayReport(ma)` method to display a Model Advisor report in the Model Advisor window. The report includes the most recent results of running checks on the system corresponding to the Model Advisor object and the current selection status of checks, groups, and tasks for the system.

Input Arguments

ma — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to open the corresponding Model Advisor report.

See Also

`Simulink.ModelAdvisor`

Introduced in R2006a

exportReport

Package: Simulink

Create copy of Model Advisor report

Syntax

```
[output, message] = exportReport(ma, destination)
```

Description

For a Model Advisor object, use the `[output, message] = exportReport(ma, destination)` method to create a copy of a Model Advisor report. The report includes the most recent results of running checks on the system corresponding to the Model Advisor object and the current selection status of checks, groups, and tasks for the system.

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to export the corresponding Model Advisor report.

destination — Path name

character vector

Path name to report file location.

Output Arguments

output — Logical value

boolean

A logical value indicating whether Simulink created a report in location that you specify by `destination` input argument. A value of 1 indicates success. A value of 0 indicates that Simulink did not create a copy of the report in the specified location.

message — Reason why report was not created

character vector

This output argument is empty if a report is created. If a report was not created, this argument contains the reason why.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

filterResultWithExclusion

Package: Simulink

Filter excluded objects

Syntax

```
filteredResultHandles = filterResultWithExclusion(ma,ResultHandles)
```

Description

Use the `filteredResultHandles = filterResultWithExclusion(ma,ResultHandles)` method to filter objects that have exclusions enabled and cause a check warning or failure.

This method is intended for excluding objects from custom checks that you create by using the Model Advisor customization API, available with Simulink Check™.

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to filter objects causing exclusion enabled checks to warn or fail.

ResultHandles — Array of model objects causing a check warning or failure

array of model objects

Array of objects causing a check warning or failure.

Output Arguments

filteredResultHandles — Array of objects causing a check warning or failure

array of objects

An array of objects causing exclusion enabled checks to warn or fail.

Simulink.ModelAdvisor

Topics

“Exclude Blocks From Custom Checks” (Simulink Check)

Introduced in R2006a

getBaselineMode

Package: Simulink

Determine whether Model Advisor is in baseline data generation mode

Syntax

```
mode = getBaselineMode(ma)
```

Description

`mode = getBaselineMode(ma)` returns true if the Model Advisor is in baseline data mode. Baseline data mode causes the verification methods of the Model Advisor, for example, `verifyHTML`, to generate baseline data.

Input Arguments

ma — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to determine if it is in baseline data mode.

Output Arguments

mode — Boolean value indicating baseline mode

0 (default)

A value of 1 indicates that the Model Advisor is in baseline data generation mode.

See Also

`Simulink.ModelAdvisor`

Introduced in R2006a

getCheckAll

Package: Simulink

Get check IDs of all Model Advisor checks

Syntax

```
CheckIDs = getCheckAll(ma)
```

Description

The `CheckIDs = getCheckAll(ma)` method returns a cell array of character vectors specifying the Check IDs of all checks that the Model Advisor performs.

Input Arguments

ma — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to get the Check IDs of all checks that the Model Advisor performs.

Output Arguments

CheckIDs — Model Advisor Check IDs

cell array of character vectors

Cell array of character vectors specifying the Check IDs of all Model Advisor checks.

See Also

`Simulink.ModelAdvisor`

Introduced in R2006a

getCheckForGroup

Package: Simulink

Get checks belonging to Model Advisor check group

Syntax

```
groupChecks = getCheckForGroup(ma,groupName)
```

Description

For a Model Advisor object, use the `groupChecks = getCheckForGroup(ma,groupName)` method to get all of the Model Advisor checks in a group. To locate the group name, use the `getGroupAll` method.

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to get all of the Model Advisor checks corresponding to a check group.

groupName — Check group name

character vector

Name of group that contains the Model Advisor checks.

Example: 'Simulink Coder'

Output Arguments

groupChecks — Model Advisor checks

cell array of character vectors

Checks that belong to a Model Advisor group.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

getCheckForTask

Package: Simulink

Get checks belonging to a task

Syntax

```
taskChecks = getCheckForTask(ma,taskID)
```

Description

For a Model Advisor object, use the `taskChecks = getCheckForTask(ma,taskID)` method to get all of the Model Advisor checks that are part of a task. To locate the task name, use the `getTaskAll` method.

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to get all of the Model Advisor checks that are part of a task.

taskID — Task name

character vector

Name of task that contains the Model Advisor checks.

Example: `'_SYSTEM_By Task_Modeling_Physical_Systems'`

Output Arguments

taskChecks — Model Advisor checks

cell array of character vectors

Checks that are part of a Model Advisor task

See Also

Simulink.ModelAdvisor

Introduced in R2006a

getCheckResult

Package: Simulink

Get Model Advisor check results

Syntax

```
results = getCheckResult(ma,checkID)
```

Description

For a Model Advisor object, use the `results = getCheckResult(ma,checkID)` method to get the results of running a check or set of checks.

This method enables you to access results generated by custom checks that you create using the Model Advisor customization API, an optional feature available with Simulink Check software. For more information, see “Defining Custom Model Advisor Checks Workflow” (Simulink Check).

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to obtain check results.

checkID — Check IDs associated with Model Advisor check

character vector|cell array of character vectors

Model Advisor Check IDs for which you want to obtain results.

Example: 'mathworks.design.UnconnectedLinesPorts'

Output Arguments

results — Check results

cell array

Cell array of check results. The result format depends on the check data.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

getCheckResultData

Package: Simulink

Obtain Model Advisor check result data

Syntax

```
results = getCheckResultData(ma,checkID)
```

Description

For a Model Advisor object, use the `results = getCheckResultData(ma,checkID)` method to get the check result data for a specified set of checks.

This method enables you to access results generated by custom checks that you create using the Model Advisor customization API, an optional feature available with Simulink Check software. For more information, see “Defining Custom Model Advisor Checks Workflow” (Simulink Check).

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to obtain check result data.

checkID — Check IDs associated with Model Advisor checks

character vector|cell array of character vectors

Model Advisor Check IDs that you want to obtain results

Example: 'mathworks.design.UnconnectedLinesPorts'

Output Arguments

results — Check results

cell array

Data from a check result or cell array of data from check results. The data format depends on the checks that generate the data.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

getCheckResultStatus

Package: Simulink

Obtain Model Advisor check result status

Syntax

```
status = getCheckResultStatus(ma,checkID)
```

Description

After running a set of checks, use the `status = getCheckResultStatus(ma,checkID)` method to determine whether these checks passed or failed.

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to determine whether a check or set of checks passed or failed.

checkID — Model Advisor Check IDs

character vector | cell array of character vectors

Model Advisor Check IDs for which you want to obtain results.

Example: 'mathworks.design.UnconnectedLinesPorts'

Output Arguments

status — Pass or fail

Boolean | cell array of Boolean values

Boolean value or cell array of Boolean values indicating the pass or fail status of a check or set of checks.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

getGroupAll

Package: Simulink

Get all groups of checks that Model Advisor runs

Syntax

```
groupChecks = getGroupAll(ma)
```

Description

For a Model Advisor object, use the `groupChecks = getGroupAll(ma)` method to get all groups of checks that the Model Advisor runs.

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to determine all Model Advisor check groups.

Output Arguments

groupChecks — Model Advisor check groups

cell array of character vectors

IDs of check groups that the Model Advisor runs.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

getInputParameters

Package: Simulink

Get Model Advisor check input parameters

Syntax

```
params = getInputParameters(ma,CheckID)
```

Description

Use the `params = getInputParameters(ma,CheckID)` method to get the input parameters for a Model Advisor check.

This method enables you to access custom checks that you create using Simulink Check. For more information, see “Defining Custom Model Advisor Checks Workflow” (Simulink Check).

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you determine the input parameters for specific Model Advisor check.

CheckID — Model Advisor check

character vector

Model Advisor check ID for which to obtain its input parameters. If you use the method inside a check callback function, you can omit this argument.

Example: 'mathworks.design.UnconnectedLinesPorts'

Output Arguments

params — Input parameters

cell array of ModelAdvisor.InputParameter objects

Cell array that contains the ModelAdvisor.InputParameter objects for a Model Advisor check.

See Also

Simulink.ModelAdvisor

Topics

“Run Model Advisor Checks”

Introduced in R2006a

getListViewParameters

Package: Simulink

Get Model Advisor checklist parameters displayed in checklist view

Syntax

```
params = getListViewParameters(ma,CheckID)
```

Description

Use the `params = getListViewParameters(ma,CheckID)` method to get the list view of parameters for a Model Advisor check.

This method enables you to access custom checks that you create by using Simulink Check. For more information, see “Defining Custom Model Advisor Checks Workflow” (Simulink Check).

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you determine the list view of parameters for a specific Model Advisor check.

CheckID — Model Advisor check

character vector

Name of Model Advisor check for which to obtain its parameters in list view. You can omit this argument if you use the method inside a check callback function.

Example: 'mathworks.design.UnconnectedLinesPorts'

Output Arguments

params — Input parameters

cell array of ModelAdvisor.ListViewParameter objects

Cell array that contains the ModelAdvisor.ListViewParameter objects for a Model Advisor check.

See Also

ModelAdvisor.ListViewParameter | Simulink.ModelAdvisor

Introduced in R2006a

Simulink.ModelAdvisor.getModelAdvisor

Package: Simulink

Get Model Advisor object for system or subsystem

Syntax

```
ma = Simulink.ModelAdvisor.getModelAdvisor(system,new)
```

Description

Use the `ma = Simulink.ModelAdvisor.getModelAdvisor(system,new)` method to return an instance of a `Simulink.ModelAdvisor` class for the model or subsystem that you specify by using the `system` input argument.

Input Arguments

system — Model or subsystem name

character vector

Name of model or subsystem for which you obtain the corresponding `Simulink.ModelAdvisor` object.

Example: 'sldemo_fuelsys_dd_controller'

Example: 'sldemo_fuelsys_dd_controller/airflow_calc'

Data Types: char

new — New Model Advisor object

character vector

This argument is optional except when changing the Model Advisor working scope from one system to another without closing the previous session. Alternatively, you can close the previous session before invoking the `getModelAdvisor` method.

Data Types: char

Output Arguments

ma — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for a model or subsystem that you specify by using a `system` input argument.

See Also

`Simulink.ModelAdvisor`

Introduced in R2006a

getSelectedCheck

Package: Simulink

Get currently selected Model Advisor checks

Syntax

```
CheckIDs = getSelectedCheck(ma)
```

Description

Use the `CheckIDs = getSelectedCheck(ma)` method to obtain the selected Model Advisor checks for a corresponding `Simulink.ModelAdvisor` object.

Input Arguments

ma — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to obtain the selected Model Advisor checks.

Output Arguments

CheckIDs — Model Advisor checks

cell array of character vectors

Check IDs of currently selected Model Advisor checks.

See Also

`Simulink.ModelAdvisor`

Introduced in R2006a

getSelectedSystem

Package: Simulink

Get system that Model Advisor targets

Syntax

```
system = getSelectedSystem(ma)
```

Description

Use the `system = getSelectedSystem(ma)` method to obtain the model or subsystem that is the target of the `Simulink.ModelAdvisor` object.

Input Arguments

ma — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to obtain the model or subsystem that the object targets.

Output Arguments

system — Model or subsystem

character vector

Name of the model or subsystem that the `ModelAdvisor` object `ma` targets.

See Also

`Simulink.ModelAdvisor`

Introduced in R2006a

getSelectedTask

Package: Simulink

Get selected Model Advisor tasks

Syntax

```
TaskIDs = getSelectedTask(ma)
```

Description

Use the `TaskIDs = getSelectedTask(ma)` method to obtain the tasks that are selected for the `Simulink.ModelAdvisor` object `ma`.

Input Arguments

ma — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to obtain the currently selected tasks.

Output Arguments

TaskIDs — Model Advisor Task IDs

cell array of character vectors

Cell array of selected Task IDs for the `Simulink.ModelAdvisor` object that you specify as an input.

See Also

`Simulink.ModelAdvisor`

Introduced in R2006a

getTaskAll

Package: Simulink

Get tasks run by Model Advisor

Syntax

```
TaskIDs = getTaskAll(ma)
```

Description

Use the `TaskIDs = getTaskAll(ma)` method to obtain the tasks that are run for the `Simulink.ModelAdvisor` object `ma`.

Input Arguments

ma — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to obtain the tasks that the Model Advisor ran.

Output Arguments

TaskIDs — Model Advisor Task IDs

cell array of character vectors

Cell array of Task IDs that are run for the `Simulink.ModelAdvisor` object that you specify as an input.

See Also

`Simulink.ModelAdvisor`

Introduced in R2006a

Simulink.ModelAdvisor.openConfigUI

Package: Simulink

Starts Model Advisor Configuration Editor

Syntax

```
Simulink.ModelAdvisor.openConfigUI(ma)
```

Description

Use the `Simulink.ModelAdvisor.openConfigUI(ma)` method to open the Model Advisor Configuration Editor. Use the Model Advisor Configuration Editor to create custom Model Advisor configurations.

The Model Advisor Configuration Editor is available with Simulink Check. For more information, see “Use the Model Advisor Configuration Editor to Customize the Model Advisor” (Simulink Check).

Before starting the Model Advisor Configuration Editor, make sure that the current folder is writable. If the folder is not writable, you see an error message when you start the Model Advisor Configuration Editor.

The Model Advisor Configuration Editor uses the `slprj` folder in the “Code generation folder” to store reports and other information. If the `slprj` folder does not exist in the code generation folder, the Model Advisor Configuration Editor creates it. For more information, see “Manage Simulation Targets for Referenced Models”.

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to open the Model Advisor Configuration Editor.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

Simulink.ModelAdvisor.reportExists

Package: Simulink

Determine whether Model Advisor report exists for model or subsystem

Syntax

```
exists = Simulink.ModelAdvisor.reportExists(system)
```

Description

Use the `exists = Simulink.ModelAdvisor.reportExists(system)` method to determine whether a Model Advisor report exists in the `slprj/modeladvisor` subfolder of the MATLAB working folder.

Input Arguments

system — Model or subsystem

character vector

Model or subsystem for which you want to determine whether a Model Advisor report exists.

Output Arguments

exists — Boolean value indicating whether Model Advisor report exists

Boolean

Boolean value that indicates whether Model Advisor report exists. A value of 1 indicates that the report exists. A value of 0 indicates that the report does not exist.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

runCheck

Package: Simulink

Run currently selected checks

Syntax

```
success = runCheck(ma,checkID)
```

Description

The `success = runCheck(ma,checkID)` method runs selected Model Advisor checks. Invoking this method is equivalent to selecting the **Run Selected Checks** button on the Model Advisor.

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to run Model Advisor.

checkID — Model Advisor check IDs

character vector | cell array of character vectors

If you want to run the Model Advisor on a subset of the currently selected Model Advisor checks, specify this optional input parameter.

Example: 'mathworks.design.UnconnectedLinesPorts'

Output Arguments

success — Boolean value indicating whether the Model Advisor ran on selected checks

Boolean

Boolean value that indicates whether the Model Advisor ran on the selected checks. A value of 1 indicates that the Model Advisor successfully ran on the selected checks. A value of 0 indicates that the Model Advisor did not run on the selected checks.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

runTask

Package: Simulink

Run currently selected tasks

Syntax

```
success = runTask(ma)
```

Description

The `success = runTask(ma)` method runs selected Model Advisor tasks. Invoking this method is equivalent to the **Run Selected Checks** button on the Model Advisor.

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to run the Model Advisor.

Output Arguments

success — Boolean value indicating whether the Model Advisor ran selected tasks

Boolean

Boolean value that indicates whether the Model Advisor ran on the selected tasks. A value of 1 indicates that the Model Advisor successfully ran on the selected tasks. A value of 0 indicates that the Model Advisor did not run on the selected tasks.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

selectCheck

Package: Simulink

Select checks

Syntax

```
success = selectCheck(ma,checkID)
```

Description

The `success = selectCheck(ma,checkID)` method selects Model Advisor checks.

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to select Model Advisor checks.

checkID — Model Advisor Check IDs

character vector | cell array of character vectors

Model Advisor checks for you to select.

Example: 'mathworks.design.UnconnectedLinesPorts'

Output Arguments

success — Boolean value indicating whether the Model Advisor selected the checks

Boolean

Boolean value that indicates whether the Model Advisor selected the checks. A value of 1 indicates that the Model Advisor successfully selected the specified checks. A value of 0 indicates that the Model Advisor did not select the specified checks.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

selectCheckAll

Package: Simulink

Select all checks

Syntax

```
success = selectCheckAll(ma)
```

Description

The `success = selectCheckAll(ma)` method selects all Model Advisor checks.

Input Arguments

ma — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to select all Model Advisor checks.

Output Arguments

success — Boolean value indicating whether all Model Advisor checks are selected

`Boolean`

`Boolean` value that indicates whether all Model Advisor checks are selected. A value of `1` indicates that the Model Advisor successfully selected all checks. A value of `0` indicates that the Model Advisor did not select all checks.

See Also

`Simulink.ModelAdvisor`

Introduced in R2006a

selectCheckForGroup

Package: Simulink

Select check group

Syntax

```
success = selectCheckForGroup(ma,groupName)
```

Description

The `success = selectCheckForGroup(ma,groupName)` method selects all Model Advisor checks in the group that you specify.

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to select the Model Advisor checks.

groupName — Check group name

character vector or cell array of character vectors

Name of groups that contain the Model Advisor checks that you want to select.

Output Arguments

success — Boolean value indicating whether the Model Advisor selected the checks

Boolean

Boolean value that indicates whether the Model Advisor selected the checks. A value of 1 indicates that the Model Advisor successfully selected the specified checks. A value of 0 indicates that the Model Advisor did not select the specified checks.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

selectCheckForTask

Package: Simulink

Select checks for a specific task or tasks

Syntax

```
success = selectCheckforTask(ma,taskIDs)
```

Description

Use the `success = selectCheckforTask(ma,taskIDs)` method to select the checks for a task or tasks.

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to select checks for a specific task or tasks.

taskIDs — Model Advisor Task IDs

cell array of character vectors | character vector

Cell array of Task IDs for the Simulink.ModelAdvisor object that you specify as an input.

Output Arguments

success — Boolean value indicating whether the checks are selected

Boolean

Boolean value that indicates whether the Model Advisor successfully selected the checks for the specified task or tasks. A value of 1 indicates that the Model Advisor successfully selected the checks. A value of 0 indicates that the Model Advisor did not select the checks.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

selectTask

Package: Simulink

Select Model Advisor task

Syntax

```
success = selectTask(ma, TaskIDs)
```

Description

The `success = selectTask(ma, TaskIDs)` method selects the Model Advisor tasks.

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to select Model Advisor tasks.

TaskIDs — Model Advisor Task IDs

cell array of character vectors

Cell array of Task IDs that you want to select for the Simulink.ModelAdvisor object, which you specify as an input.

Output Arguments

success — Boolean value indicating whether Model Advisor selected tasks

Boolean

Boolean value that indicates whether the Model Advisor selected tasks. A value of 1 indicates that the Model Advisor successfully selected the tasks. A value of 0 indicates that the Model Advisor did not select the tasks.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

selectTaskAll

Package: Simulink

Select all Model Advisor tasks

Syntax

```
success = selectTaskAll(ma)
```

Description

The `success = selectTaskAll(ma)` method selects all Model Advisor tasks.

Input Arguments

ma — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to select the Model Advisor tasks.

Output Arguments

success — Boolean value indicating whether Model Advisor selected tasks

`Boolean`

`Boolean` value that indicates whether the Model Advisor selected tasks. A value of 1 indicates that the Model Advisor successfully selected the tasks. A value of 0 indicates that the Model Advisor did not select the tasks.

See Also

`Simulink.ModelAdvisor`

Introduced in R2006a

setActionEnable

Package: Simulink

Set status for check action

Syntax

```
setActionEnable(ma, value)
```

Description

The `setActionEnable(ma, value)` method enables or disables the Action box. Only a check callback function can invoke this method.

This method enables you to access custom checks that you create by using the Model Advisor customization API, an optional feature that is available with Simulink Check software. For more information, see “Defining Custom Model Advisor Checks Workflow” (Simulink Check).

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to set check action status.

value — Boolean value indicating whether to enable or disable the Model Advisor Action box

Boolean

Boolean value that indicates whether to enable or disable Model Advisor **Action** box. To enable the box, specify a value of `true`. To disable the box, specify a value of `false`.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

setBaselineMode

Package: Simulink

Set Model Advisor baseline mode

Syntax

```
setBaselineMode(ma,mode)
```

Description

Use the `setBaselineMode(ma,mode)` method to set the Model Advisor baseline mode. Baseline mode causes the Model Advisor verify methods to generate baseline comparison data for verifying the results of a Model Advisor run.

Input Arguments

ma — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to set the baseline mode.

mode — Boolean value indicating the Model Advisor baseline mode

`Boolean`

Boolean value that indicates the Model Advisor baseline mode. A value of `true` indicates that baseline mode is on. A value of `false` indicates that baseline mode is off.

See Also

`Simulink.ModelAdvisor`

Introduced in R2006a

setCheckErrorSeverity

Package: Simulink

Set severity of check failure

Syntax

```
setCheckErrorSeverity(ma, value)
```

Description

Use the `setCheckErrorSeverity(ma, value)` method to set the check error severity for the currently running check. Only the callback function of a check can invoke this method.

This method enables you to access custom checks that you create by using the Model Advisor customization API, an optional feature that is available with Simulink Check software. For more information, see “Defining Custom Model Advisor Checks Workflow” (Simulink Check).

Input Arguments

***ma* — Model Advisor object**

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to set the check error severity for the currently running check.

***value* — Integer indicating severity of failure**

integer

A value of 0 indicates a warning check result. A value of 1 indicates a failed check result.

See Also

`Simulink.ModelAdvisor`

Introduced in R2006a

setCheckResult

Package: Simulink

Set result for currently running check

Syntax

```
success = setCheckResult(ma,result)
```

Description

Use the `success = setCheckResult(ma,result)` method to set the check result for the currently running check. Only the callback function of a check can invoke this method.

This method enables you to access custom checks that you create using the Model Advisor customization API, an optional feature that is available with Simulink Check software. For more information, see “Defining Custom Model Advisor Checks Workflow” (Simulink Check).

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to set the result for the currently running check.

result — Result to be set

character vector | cell array of character vectors

Character vector or cell array that specifies the result of the currently running check.

Output Arguments

success — Boolean value indicating whether the result is set

Boolean

Boolean value that indicates whether the Model Advisor successfully set the result for the currently running check. A value of 1 indicates that the Model Advisor successfully set the result. A value of 0 indicates that the Model Advisor did not set the result.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

setCheckResultData

Package: Simulink

Set result data for currently running check

Syntax

```
success = setCheckResultData(ma,data)
```

Description

Use the `success = setCheckResultData(ma,data)` method to set the check result data for the currently running check. Only the callback function of a check can invoke this method.

This method enables you to access custom checks that you create with the Model Advisor customization API, an optional feature that is available with Simulink Check software. For more information, see “Defining Custom Model Advisor Checks Workflow” (Simulink Check).

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to set result data for the currently running check.

data — Result data

cell array of character vectors

Result data that you specify for a custom check.

Output Arguments

success — Boolean value indicating whether result data is set

Boolean

Boolean value that indicates whether the Model Advisor successfully set result data for the currently running check. A value of 1 indicates that the Model Advisor successfully set the data. A value of 0 indicates that the Model Advisor did not set the data.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

setCheckResultStatus

Package: Simulink

Set status for currently running check

Syntax

```
success = setCheckResultStatus(ma, status)
```

Description

The `success = setCheckResultStatus(ma, status)` method sets the status for the currently running check. Only the callback function of a check can invoke this method.

This method enables you to access custom checks that you create with the Model Advisor customization API, an optional feature that is available with Simulink Check software. For more information, see “Defining Custom Model Advisor Checks Workflow” (Simulink Check).

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to set the status for the currently running check.

status — Status of currently running check

Boolean

Boolean value that indicates the status of the check that just ran. A value of `true` indicates that the check passed. A value of `false` indicates that the check failed.

Output Arguments

success — Boolean value indicating whether the Model Advisor successfully set the status

Boolean

Boolean value that indicates whether the Model Advisor successfully set the status of the currently running check. A value of `1` indicates that the Model Advisor successfully set the status. A value of `0` indicates that the Model Advisor did not set the status.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

setInputParameters

Package: Simulink

Specify input parameters

Syntax

```
success = setInputParameters(ma, checkID, InputParameters)
```

Description

Use the `success = setInputParameters(ma, checkID, InputParameters)` method to specify input parameters for a Model Advisor check.

This method enables you to access custom checks that you create using Simulink Check. For more information, see “Defining Custom Model Advisor Checks Workflow” (Simulink Check) .

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which to specify the input parameters for the specific Model Advisor check.

checkID — Model Advisor check

character vector

Model Advisor check ID to which the input parameters apply. If you use this method inside a current active check function, you can omit this argument.

Example: 'mathworks.design.UnconnectedLinesPorts'

InputParameters — Input parameters

cell array of ModelAdvisor.InputParameter objects

Cell array that contains the ModelAdvisor.InputParameter objects for a Model Advisor check.

Output Arguments

success — Boolean value indicating whether the input parameters were specified for check

Boolean

Boolean value that indicates whether the Model Advisor specified the input parameters. A value of 1 indicates that the Model Advisor successfully specified the input parameters for the check. A value of 0 indicates that the Model Advisor did not specify the input parameters.

See Also

ModelAdvisor.InputParameter | Simulink.ModelAdvisor

Topics

Introduced in R2006a

setListViewParameters

Package: Simulink

Specify list-view parameters for check

Syntax

```
setListViewParameters(ma,checkID, params)
```

Description

The `setListViewParameters(ma,checkID, params)` method sets the list-view parameters for a check. Only the callback function of a check can invoke this method.

This method enables you to access custom checks that you create with the Model Advisor customization API, an optional feature that is available with Simulink Check software. For more information, see “Defining Custom Model Advisor Checks Workflow” (Simulink Check).

Input Arguments

***ma* — Model Advisor object**

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to set list-view parameters.

***checkID* — Model Advisor Check ID**

character vector

Character vector specifying the identifier for a Model Advisor check.

***params* — Cell array of `ModelAdvisor.ListViewParameter` objects**

`ModelAdvisor.ListViewParameter` objects

Set the list-view parameters for the check.

See Also

`ModelAdvisor.ListViewParameter` | `Simulink.ModelAdvisor`

Introduced in R2006a

verifyCheckRan

Package: Simulink

Verify that Model Advisor ran a set of checks

Syntax

```
[success, missingChecks, additionalChecks]= verifyCheckRan(ma,CheckIDs)
```

Description

Use the `[success, missingChecks, additionalChecks]= verifyCheckRan(ma,CheckIDs)` method to verify that the Model Advisor ran a set of checks.

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to verify that a set of checks ran

CheckIDs — Model Advisor Check IDs

cell array of character vectors

Cell array of character vectors specifying the identifiers of Model Advisor checks that you want to verify have run.

Output Arguments

success — Boolean value indicating whether the Model Advisor ran checks

Boolean

Boolean value that indicates whether the Model Advisor successfully ran a set of checks. A value of 1 indicates that the Model Advisor successfully ran the checks. A value of 0 indicates that the Model Advisor did not run the checks.

missingChecks — Cell array of Check IDs

cell array of character vectors

Cell array of character vectors specifying the identifiers of specified Model Advisor checks that did not run.

additionalChecks — Model Advisor Check IDs

cell array of character vectors

Cell array of character vectors specifying the identifiers of unspecified Model Advisor checks that ran.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

verifyCheckResult

Package: Simulink

Generate baseline Model Advisor check results file or compare current check results to baseline check results

Syntax

```
[success, message]= verifyCheckResult(ma,baseline,CheckIDs)
```

Description

Use the `[success, message]= verifyCheckResult(ma,baseline,CheckIDs)` method to generate a baseline Model Advisor check results file or compare to current check results to baseline check results. If the Model Advisor is in baseline mode, this method stores the most recent results of running the checks that you specify by the `CheckIDs` argument in a MAT-file. For the MAT-file, use the location that you specify by using the `baseline` input argument.

To generate a baseline report, put the Model Advisor in baseline mode. Then invoke this method with the `baseline` argument set to the location where you want to store the baseline results. To perform a current-to-baseline report comparison, first check that the Model Advisor is not in baseline mode. Then, invoke this method with the path of the baseline report as the value of the `baseline` input argument.

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to verify that a set of checks ran.

baseline — Path of the baseline check results MAT-file

character vector

To perform a current-to-baseline report comparison, make sure that the Model Advisor is not in baseline mode and specify a path to the baseline report.

CheckIDs — Model Advisor Check IDs

cell array of character vectors

Cell array of character vectors specifying the identifiers of Model Advisor checks that you want to verify by using check results.

Output Arguments

success — Boolean value indicating whether the method succeeded

Boolean

Boolean value that indicates whether the method ran successfully. A value of 1 indicates that the method verified that the current check results match the baseline results. A value of 0 indicates that

the Model Advisor did not verify check results. If the method is unable to store the check results at the specified location, it returns false in the output variable success. The reason for the failure is in the message argument.

message — Error message

character vector

Error message indicating why Simulink did not verify check result.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

verifyCheckResultStatus

Package: Simulink

Verify that a model passed or failed a set of checks

Syntax

```
[success message]= verifyCheckResultStatus(ma, baseline, checkIDs)
```

Description

Use the `[success message]= verifyCheckResultStatus(ma, baseline, checkIDs)` method to verify that a model has passed or failed a set of checks.

Before invoking the `verifyCheckResultStatus` method, run the checks that you specify with `checkIDs`. Then use the `getCheckResultStatus` method to obtain the boolean values for the baseline argument.

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to verify that a set of checks passed.

baseline — Statuses from running most recent round of checks

Cell array of Boolean variables

Statuses from the most recent checks run that you specify by Check IDs.

checkIDs — Model Advisor Check IDs

cell array of character vectors

Cell array of character vectors specifying the identifiers of Model Advisor checks that you want to verify have run.

Output Arguments

success — Boolean value indicating whether the check statuses match the baseline

Boolean

Boolean value that indicates whether the statuses match the baseline. A value of 1 indicates that the statuses match. A value of 0 indicates that the statuses do not match the baseline.

message — Message indicating status

character vector

Message indicating whether the method successfully verified the check result statuses.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

verifyHTML

Package: Simulink

Generate baseline Model Advisor report or compare current report to baseline report

Syntax

```
[success message]= verifyHTML(ma,baseline)
```

Description

Use the `[success message]= verifyHTML(ma,baseline)` method to generate a Model Advisor report or to compare a current report to a baseline report.

This method enables you to compare a Model Advisor report with a baseline report to determine if they differ. You can use the method to generate the baseline report and perform current-to-baseline report comparisons. To generate a baseline report, use the `setBaselineMode` method to put the Model Advisor in baseline mode. Invoke this method with the baseline argument set to the location where you want to store the baseline report. To perform a current-to-baseline report comparison, first make sure that the Model Advisor is not in baseline mode. Then, invoke this method with the path of the baseline report as the value of the `baseline` input argument.

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to generate a baseline report or compare current report to baseline report

baseline — Path of Model Advisor report

character vector

Path to baseline Model Advisor report

Output Arguments

success — Boolean value indicating whether the method is successful

Boolean

Boolean value that indicates whether the method is successful. If the Model Advisor is in baseline mode, this method stores the most recently generated Model Advisor report at the location specified by the `baseline` input argument. If the method is unable to store a copy of the report at the specified location, it returns `false` in the output variable `success`. The reason for the failure is in the output variable `message`. If the Model Advisor is not in baseline mode, this method compares the report most recently generated by the Model Advisor with the report specified by `baseline`. If the current report has the same content as the baseline report, this method returns `true` as the value of the `success` output variable.

message — Message indicating status

character vector

Message indicating whether the Model Advisor is able to successfully store a report.

Simulink.ModelAdvisor

Introduced in R2006a

Simulink.ModelDataLogs

Container for signal data logs of a model

Description

Note The `ModelDataLogs` class is supported for backwards compatibility. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format. In R2016a or later, when you simulate a model from an earlier release that had used `ModelDataLogs` format, the model uses `Dataset` format to log data.

You can convert signal logging data from `ModelDataLogs` to `Dataset` format. Converting to `Dataset` format can facilitate post-processing with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see “Convert Logged Data to Dataset Format”.

If you have legacy code that uses `ModelDataLogs`, you can encounter situations that require updates to your code or model. For more information about updating scripts, see “Migrate Scripts That Use Legacy `ModelDataLogs` API”.

In releases before R2016a, when you set **Configuration Parameters > Data Import/Export > Signal logging format** to `ModelDataLogs`, logging data produces one or more `Simulink.ModelDataLogs` objects that contain logged data. Logging creates an instance of this class for the top model and for each model referenced by the top model that contains logged signals. The `ModelDataLogs` object for the top model is assigned to a variable in the base workspace. The name of the variable is specified by the **Configuration Parameters > Data Import/export > Signal logging name** parameter. The default value is `logout`.

A `ModelDataLogs` object has a variable number of properties. The first property, `Name`, specifies the name of the model whose signal data the object contains or, if the model is a referenced model, the name of the Model block that references the model. The remaining properties reference objects that contain signal data logged during simulation of the model. The objects may be instances of these types of objects:

- `Simulink.ModelDataLogs`
Container for the data logs of a model
- `Simulink.SubsysDataLogs`
Container for the data logs of a subsystem
- `Simulink.Timeseries`
Data log for any signal except a mux or bus signal
- `Simulink.TsArray`
Data log for a mux or bus signal

The names of the properties identify the data being logged as follows:

- For signal data logs, the name of the signal
- For a subsystem or model log container, the name of the subsystem or model, respectively

Consider, for example, the following model.

As indicated by the testpoint icons, this model specifies that Simulink software should log the signals named `step` and `scope` in the root system and the signal named `clk` in the subsystem named `Delayed Out`. After you simulate this model in a release earlier than R2016a, the MATLAB workspace contains the following variable:

```
Simulink.ModelDataLogs (siglgex):
  Name                elements  Simulink Class
  scope                2        TsArray
  step                 1        Timeseries
  ('Delayed Out')     2        SubsysDataLogs
```

You can use fully qualified object names or the Simulink `unpack` command to access the signal data. For example, to access the amplitudes of the `clk` signal in the `Delayed Out` subsystem in a `logout` object, enter

```
data = logout('Delayed Out').clk.Data;
```

or

```
>> logout.unpack('all');
>> data = clk.Data;
```

Access Logged Signal Data Saved in ModelDataLogs Format

The `Simulink.ModelDataLogs` object contains signal data objects to capture signal logging information for specific model elements.

Model Element	Signal Data Object
Top-level or referenced model	Simulink.ModelDataLogs
Subsystem in a model	Simulink.SubsysDataLogs
Signal other than a bus or Mux signal	Simulink.Timeseries
Bus signal or Mux signal	Simulink.TsArray

Handling Spaces and Newlines in Logged Names

Signal names in data logs can have spaces or newlines in their names when the signal:

- Is named and the name includes a space or newline character.
- Is unnamed and originates in a block whose name includes a space or newline character.
- Exists in a subsystem or referenced model, and the name of the subsystem, Model block, or of any superior block includes a space or newline character.

The following model shows a signal whose name contains a space, a signal whose name contains a newline, and an unnamed signal that originates in a block whose name contains a newline:

The following example shows how to handle spaces or new lines in logged names, if a model uses `ModelDataLogs` for the signal logging format.

```
logstdout
```

```
logstdout =
```

```
Simulink.ModelDataLogs (model_name):
  Name                Elements  Simulink Class
  ('x y')              1        Timeseries
  ('a
b')                   1        Timeseries
  ('SL_Sine
Wave1')               1        Timeseries
```

You cannot access any of the `Simulink.Timeseries` objects in this log using TAB name completion or by typing the name to MATLAB. This syntax is not recognized because the space or newline in each name appears to the MATLAB parser as a separator between identifiers. For example:

```
logout.x y
```

```
??? logout.x y
```

```
|
Error: Unexpected MATLAB expression.
```

To reference a `Simulink.Timeseries` object whose name contains a space, enclose the element containing the space in single quotes:

```
logout.('x y')
```

```
    Name: 'x y'
  BlockPath: 'model_name/Sine'
   PortIndex: 1
  SignalName: 'x y'
  ParentName: 'x y'
   TimeInfo: [1x1 Simulink.TimeInfo]
         Time: [51x1 double]
         Data: [51x1 double]
```

To reference a `Simulink.Timeseries` object whose name contains a newline, concatenate to construct the element containing the newline:

```
cr=sprintf('\n')
logout.(['a' cr 'b'])
```

The same techniques work when a space or newline in a data log derives from the name of:

- An unnamed logged signal's originating block
- A subsystem or Model block that contains any logged signal
- Any block that is superior to such a block in the model hierarchy

This code can reference logged data for the signal:

```
logout.(['SL_Sine' cr 'Wave1'])
```

For names with multiple spaces, newlines, or both, repeat and combine the two techniques as needed to specify the intended name to MATLAB.

Bus Signals

`ModelDataLogs` format stores each logged bus signal data in a separate `Simulink.TsArray` object.

The hierarchy of a bus signal is preserved in the logged signal data. The logged name of a signal in a virtual bus derives from the name of the source signal. The logged name of a signal in a nonvirtual bus derives from the applicable bus object, and can differ from the name of the source signal. See “Composite Signals” for information about those capabilities.

Introduced before R2006a

Simulink.SimState.ModelSimState class

Package: Simulink.SimState

(Not recommended) Access SimState snapshot data

Note Simulink.SimState.ModelSimState is not recommended. Use Simulink.op.ModelOperatingPoint instead.

Description

The Simulink.SimState.ModelSimState class contains all of the information associated with a “snapshot” of a simulation, including the logged states, the time of the snapshot, and the start time of the simulation. To access these data for a block, use the `getBlockSimState` method or the `loggedStates` property.

Properties

description

Specify a description. By default, Simulink generates a character vector based on your model name.

loggedStates

The logged states are the continuous and discrete states of the blocks in a model. These states represent a subset of the complete simulation state (SimState) of the model.

If `loggedStates` is in Dataset format, you cannot assign a structure or a Simulink.SimulationData.Dataset object with a different number of elements than that of the Dataset object used for `loggedStates`.

If the `loggedStates` is in Structure format, you cannot assign a Dataset object.

Attributes:

dependent

`loggedStates` is obtained from the saved states of the block. `loggedStates` depends on the full state being saved in the SimState object, unlike, properties like `description`, which are independent of the save states.

snapshotTime

Time at which Simulink takes a “snapshot” of the complete simulation states. This data is read only.

startTime

Time at which the simulation starts. This data is read only.

Methods

`getBlockSimState` (Not recommended) Access SimState of individual Stateflow Chart, MATLAB Function, or S-function block

`setBlockSimState` (Not recommended) Set SimState of individual Stateflow Chart, MATLAB Function, or S-function block

Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects (MATLAB) in the MATLAB Programming Fundamentals documentation.

Simulink.ModelWorkspace

Interact with the model workspace of a model programmatically

Description

Use a `Simulink.ModelWorkspace` object to interact with a model workspace. For example, you can add and remove variables, set the data source of the workspace, and save changes to the workspace.

For more information, see “Model Workspaces”.

Creation

To create a `Simulink.ModelWorkspace`, use the `get_param` function to query the value of the model parameter `ModelWorkspace`. For example, to create an object named `mdlWks` that represents the model workspace of a model named `myModel.slx`:

```
mdlWks = get_param('myModel', 'ModelWorkspace')
```

Properties

DataSource — Source for initializing variables in model workspace

'Model File' (default) | 'MAT-File' | 'MATLAB Code' | 'MATLAB File'

Source for initializing the variables in the model workspace, specified as one of these character vectors:

- 'Model File' — The variables are stored in the model file. When you save the model, you also save the variables.
- 'MATLAB Code' — The variables are created by MATLAB code that you write and store in the model file.
- 'MAT-File' — The variables are stored in a MAT-file, which you can manage and manipulate separately from the model file.
- 'MATLAB File' — The variables are created by MATLAB code in a script file, which you can manage and manipulate separately from the model file.

Data Types: char

FileName — Name of external file that stores or creates variables

'' (empty character vector) (default) | character vector

Name of the external file that stores or creates variables, specified as a character vector. To enable this property, set `DataSource` to 'MAT-File' or 'MATLAB File'.

Example: 'myFile.mat'

Example: 'myFile.m'

Data Types: char

MATLABCode — MATLAB code for initializing variables

' ' (empty character vector) (default) | character vector

MATLAB code for initializing variables, specified as a character vector. To enable this property, set `DataSource` to 'MATLAB Code'.

Example: `sprintf('%s Create variables that this model uses.\n\nK = 0.00983;\n\nP = Simulink.Parameter(5);')`

Data Types: char

Object Functions

<code>getVariable</code>	Return value of variable in the model workspace of a model
<code>getVariablePart</code>	Get value of variable property in model workspace
<code>setVariablePart</code>	Set property of variable in model workspace
<code>hasVariable</code>	Determine whether variable exists in the model workspace of a model
<code>whos</code>	Return list of variables in the model workspace of a model
<code>saveToSource</code>	Save model workspace changes to the external data source of the model workspace
<code>save</code>	Save contents of model workspace to a MAT-file
<code>reload</code>	Reinitialize variables from the data source of a model workspace
<code>evalin</code>	Evaluate expression in the model workspace of a model
<code>clear</code>	Clear variables from the model workspace of a model
<code>assignin</code>	Assign value to variable in the model workspace of a model

Examples**Interact With Model Workspace Programmatically**

Create a variable in the model workspace of a model. Then, modify the variable and query the variable value to confirm the modification.

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object `mdlWks` that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create a variable named `myVar` with value 5.12 in the model workspace.

```
assignin(mdlWks, 'myVar', 5.12)
```

Apply a new value, 7.22. To do so, first create a temporary copy of the variable by using the `getVariable` function. Then, modify the copy and use it to overwrite the original variable in the model workspace.

```
temp = getVariable(mdlWks, 'myVar');
temp = 7.22;
assignin(mdlWks, 'myVar', temp)
```

Confirm the new value by querying the value of the variable.

```
getVariable(mdlWks, 'myVar')
```

ans =

7.2200

Introduced before R2006a

assignin

Package: Simulink

Assign value to variable in the model workspace of a model

Syntax

```
assignin mdlWks, varName, varValue)
```

Description

`assignin(mdlWks, varName, varValue)` assigns the value `varValue` to the MATLAB variable `varName` in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`. If the variable does not exist, `assignin` creates it.

Examples

Assign Value to Variable in Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create a variable named `myVar` with value `5.12` in the model workspace.

```
assignin(mdlWks, 'myVar', 5.12)
```

Input Arguments

mdlWks — Target model workspace

`Simulink.ModelWorkspace` object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

varName — Name of target variable

character vector

Name of the target variable, specified as a character vector.

Example: `'myVar'`

Data Types: `char`

varValue — Value to assign to target variable

valid value

Value to assign to the target value, specified as a valid value. For example, you can specify a literal number, a structure, or an expression that evaluates to a valid value.

If you specify the name of a handle object, such as a `Simulink.Parameter` object, use the `copy` function to create a separate copy of the object.

Example: `5.12`

Example: `struct('a',5.12,'b',7.22)`

Example: `Simulink.Parameter(5.12)`

Example: `copy(myExistingParameterObject)`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical` | `char` | `string` | `struct` | `table` | `cell` | `categorical` | `datetime` | `duration` | `calendarDuration` | `fi`

Complex Number Support: Yes

See Also

`Simulink.ModelWorkspace`

Introduced before R2006a

clear

Package: Simulink

Clear variables from the model workspace of a model

Syntax

```
clear mdlWks
```

Description

`clear(mdlWks)` removes all variables from the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`.

Examples

Clear Variables From Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create a variable named `myVar` with value `5.12` in the model workspace.

```
assignin(mdlWks, 'myVar', 5.12)
```

Clear all variables from the model workspace, including `myVar`.

```
clear(mdlWks)
```

Input Arguments

mdlWks — Target model workspace

`Simulink.ModelWorkspace` object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

See Also

`Simulink.ModelWorkspace`

Introduced before R2006a

evalin

Package: Simulink

Evaluate expression in the model workspace of a model

Syntax

```
result = evalin mdlWks, expression)
```

Description

`result = evalin(mdlWks, expression)` evaluates the expression `expression` in the model workspace represented by the `Simulink.ModelWorkspace` object represented by `mdlWks`. The function returns the result of the expression in `result`.

Note For setting and getting variable properties in the model workspace, consider using `setVariablePart` and `getVariablePart` instead of `evalin` because:

- The functions do not create new variables or cause unintended results.
- `getVariablePart` does not dirty the model.

For information on these alternatives, see `Simulink.ModelWorkspace`.

Examples

Evaluate Expression in Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create some variables in the model workspace.

```
assignin(mdlWks, 'myVar', 5.12)  
assignin(mdlWks, 'myOtherVar', 7.22)
```

Evaluate the expression `myLastVar = myVar + myOtherVar` in the model workspace. The expression creates another variable, `myLastVar`, whose value is the sum of the first two variables.

```
evalin(mdlWks, 'myLastVar = myVar + myOtherVar');
```

Input Arguments

mdlWks — Target model workspace

`Simulink.ModelWorkspace` object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

expression — Expression to evaluate

character vector

Expression to evaluate, specified as a character vector.

Example: `'myLastVar = myVar + myOtherVar'`

Data Types: `char`

Output Arguments

result — Result of expression

number, structure, or other MATLAB value

Result of the evaluated expression, returned as a number, structure, or other MATLAB value.

See Also

`Simulink.ModelWorkspace`

Introduced before R2006a

reload

Package: Simulink

Reinitialize variables from the data source of a model workspace

Syntax

```
reload mdlWks
```

Description

`reload(mdlWks)` reinitializes the variables in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`. When you set the `DataSource` property of the model workspace to `'MAT-File'`, `'MATLAB File'`, or `'MATLAB Code'`, `reload` overwrites variables that exist in the model workspace by loading the associated MAT-file or by running the associated MATLAB code.

Examples

Reinitialize Variables in a Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Configure the model workspace to use some MATLAB code as a data source.

```
mdlWks.DataSource = 'MATLAB Code';  
mdlWks.MATLABCode = sprintf('myVar = 5.12;\nmyOtherVar = 7.22;');
```

Create variables in the model workspace by executing the MATLAB code.

```
reload(mdlWks)
```

Assign new values to the variables in the model workspace.

```
assignin(mdlWks, 'myVar', 5.22)  
assignin(mdlWks, 'myOtherVar', 7.33)
```

Overwrite the new values with the values specified by the MATLAB code.

```
reload(mdlWks)
```

Confirm that the variables have the values specified by the MATLAB code.

```
myVarValue = getVariable(mdlWks, 'myVar')  
myOtherVarValue = getVariable(mdlWks, 'myOtherVar')
```

```
myVarValue =
```

```
    5.1200
```

```
myOtherVarValue =
```

```
    7.2200
```

Input Arguments

mdlWks — Target model workspace

Simulink.ModelWorkspace object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

See Also

`Simulink.ModelWorkspace`

Introduced before R2006a

save

Package: Simulink

Save contents of model workspace to a MAT-file

Syntax

```
save mdlWks, fileName)
```

Description

`save mdlWks, fileName)` saves the variables in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks` to the MAT-file specified by `fileName`.

When you set the `DataSource` property of the model workspace to 'MAT-File' or 'MATLAB File', to save to the file that acts as the external data source of the model, use `saveToSource` instead of `save`.

Examples

Save Contents of Model Workspace to MAT-File

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create some variables in the model workspace.

```
assignin mdlWks, 'myVar', 5.12  
assignin mdlWks, 'myOtherVar', 7.22)
```

Save the variables to a new MAT-file named `myVars.mat`.

```
save(mdlWks, 'myVars.mat')
```

The MAT-file appears in your current folder.

Input Arguments

mdlWks — Target model workspace

`Simulink.ModelWorkspace` object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

fileName — Name of target MAT-file

character vector

Name of the target MAT-file, specified as a character vector.

Example: 'myFile.mat'

Data Types: char

See Also

Simulink.ModelWorkspace

Introduced before R2006a

saveToSource

Package: Simulink

Save model workspace changes to the external data source of the model workspace

Syntax

```
saveToSource mdlWks
```

Description

`saveToSource mdlWks` saves the variables in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks` to the MAT-file or script file specified by the `FileName` property of the model workspace.

When you set the `DataSource` property of the model workspace to 'MAT-File' or 'MATLAB File', the `FileName` property specifies the name of the file that acts as the external data source of the workspace. As you make changes to the variables in the model workspace, use `saveToSource` to permanently save the changes in the external data source.

Examples

Save Variables to External Data Source of Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create some variables in the model workspace.

```
assignin(mdlWks, 'myVar', 5.12)  
assignin(mdlWks, 'myOtherVar', 7.22)
```

Configure the model workspace to use a MAT-file named `myVars.mat` as the data source.

```
mdlWks.DataSource = 'MAT-File';  
mdlWks.FileName = 'myVars.mat';
```

Save the variables to the external data source (the MAT-file).

```
saveToSource(mdlWks)
```

The file appears in your current folder.

Input Arguments

mdlWks — Target model workspace

Simulink.ModelWorkspace object

Target model workspace, specified as a Simulink.ModelWorkspace object.

See Also

Simulink.ModelWorkspace

Introduced before R2006a

whos

Package: Simulink

Return list of variables in the model workspace of a model

Syntax

```
varList = whos mdlWks)
```

Description

`varList = whos(mdlWks)` returns a list of the variables in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`.

Examples

Return List of Variables in Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create some variables in the model workspace.

```
assignin(mdlWks, 'myVar', 5.12)  
assignin(mdlWks, 'myOtherVar', 7.22)
```

Display a list of the variables in the model workspace.

```
whos(mdlWks)
```

Name	Size	Bytes	Class	Attributes
myOtherVar	1x1	8	double	
myVar	1x1	8	double	

Input Arguments

mdlWks — Target model workspace

`Simulink.ModelWorkspace` object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

Output Arguments

varList — List of variables

nested structure array

List of variables, returned as a nested structure array. For details about the information in the list, see `whos`.

See Also

`Simulink.ModelWorkspace`

Introduced before R2006a

getVariable

Package: Simulink

Return value of variable in the model workspace of a model

Syntax

```
varValue = getVariable mdlWks, varName)
```

Description

`varValue = getVariable(mdlWks, varName)` returns the value of the variable whose name is `varName` that exists in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`.

If the value of the target variable is a handle to a handle object (such as `Simulink.Parameter`), `getVariable` returns a copy of the handle. Changes you make to the variable in the model workspace or to the returned variable (`variableValue`) affect both variables.

To return a deep copy of the handle object, use the `copy` method of the object. To modify a handle object that you store in a model workspace, it is a best practice to use both the `getVariable` and `assignin` methods (see “Modify Property Value of Handle Object” on page 5-330).

Examples

Return Value of Variable in Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create a variable named `myVar` in the model workspace.

```
assignin(mdlWks, 'myVar', 5.12)
```

Return the value of the new variable. Store the value in another variable named `varValue`.

```
varValue = getVariable(mdlWks, 'myVar');
```

Modify Property Value of Handle Object

Modify a property of the `Simulink.Parameter` object `K`, which is defined in model `mdl.slx`. When you call `getVariable`, use the `copy` method because `Simulink.Parameter` is a handle class.

```
wksp = get_param mdl, 'ModelWorkspace';  
value = copy(getVariable(wksp, 'K'));
```

```
value.DataType = 'single';  
assignin(wksp, 'K', value);
```

Input Arguments

mdlWks — Target model workspace

Simulink.ModelWorkspace object

Target model workspace, specified as a Simulink.ModelWorkspace object.

varName — Name of target variable

character vector

Name of the target variable, specified as a character vector.

Example: 'myVariable'

Data Types: char

Output Arguments

varValue — Value of target variable

number, structure, or other MATLAB value

Value of the target variable, returned as a number, structure, or other MATLAB value.

See Also

Simulink.ModelWorkspace | get_param

Introduced in R2012a

getVariablePart

Package: Simulink

Get value of variable property in model workspace

Syntax

```
varValue = getVariablePart mdlWks, varName.Property)
```

Description

`varValue = getVariablePart(mdlWks, varName.Property)` returns the value of the variable property named `varName.Property` that exists in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`.

If the value of the variable property is a handle to a handle object (such as `Simulink.Parameter`), `getVariablePart` returns a copy of the handle.

Using `getVariablePart` is preferable to using `evalin` for getting variable properties in the model workspace because:

- The function does not dirty the model.
- Use of the function does not result in the creation of a new variable or other unintended results.

Examples

Return Value of Variable Properties in Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create a structure named `myStruct` with fields `a`, `b`, and `c`.

```
aStruct.a = 10;  
aStruct.b = {1,2,3,4,5};  
aStruct.c = Simulink.Parameter(7);  
mdlWks.assignin('myStruct', aStruct);
```

Return the values of the structure fields. Store the values in `varValuea`, `varValueb`, and `varValuec`.

```
varValuea = getVariablePart mdlWks, 'myStruct.a');  
varValueb = getVariablePart mdlWks, 'myStruct.b{1}';  
varValuec = getVariablePart mdlWks, 'myStruct.c.Value');
```

Input Arguments

mdlWks — Target model workspace

Simulink.ModelWorkspace object

Target model workspace, specified as a Simulink.ModelWorkspace object.

varName.Property — Name of target variable property

character vector

Name of the target variable property, specified as a character vector.

Example: 'myVariable.Property'

Data Types: char

Output Arguments

varValue — Value of variable property

number, structure, or other MATLAB value

Value of the variable property, returned as a number, structure, or other MATLAB value.

If the value of the variable property is a handle to a handle object (such as Simulink.Parameter), getVariablePart returns a copy of the handle.

See Also

Simulink.ModelWorkspace

Introduced in R2018b

setVariablePart

Package: Simulink

Set property of variable in model workspace

Syntax

```
varValue = setVariablePart mdlWks, varName.Property, varValue)
```

Description

`varValue = setVariablePart mdlWks, varName.Property, varValue)` assigns `varValue` to the MATLAB variable property `varName.Property` in the model workspace represented by the Simulink.ModelWorkspace object `mdlWks`.

Using `setVariablePart` is preferable to using `evalin` for assigning variable properties in the model workspace because the `setVariablePart` function does not create a new variable or cause unintended results.

Examples

Assign Value to Variable Properties in Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a Simulink.ModelWorkspace object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create a structure named `myStruct` with fields `a`, `b`, and `c`.

```
aStruct.a = 10;  
aStruct.b = {1,2,3,4,5};  
aStruct.c = Simulink.Parameter(7);  
mdlWks.assignin('myStruct', aStruct);
```

Assign new values to the structure fields.

```
setVariablePart(mdlWks, 'myStruct.a', 2);  
setVariablePart(mdlWks, 'myStruct.b{1}', 2);  
setVariablePart(mdlWks, 'myStruct.c', Simulink.Parameter(2));
```

Return the new values of the structure fields. Store the values in `varValuea`, `varValueb`, and `varValuec`.

```

varValuea = getVariablePart mdlWks, 'myStruct.a')
varValueb = getVariablePart mdlWks, 'myStruct.b{1}')
varValuec = getVariablePart mdlWks, 'myStruct.c.Value')

```

Input Arguments

mdlWks — Target model workspace

Simulink.ModelWorkspace object

Target model workspace, specified as a Simulink.ModelWorkspace object.

varName.Property — Name of target variable property

character vector

Name of the target variable property, specified as a character vector.

Example: 'myVariable.Property'

Data Types: char | string

varValue — Value to assign to variable property

valid value

Value to assign to the value property, specified as a valid value. For example, you can specify a literal number, a structure, or an expression that evaluates to a valid value.

If you specify the name of a handle object, such as a Simulink.Parameter object, use the copy function to create a separate copy of the object.

Example: 5.12

Example: struct('a',5.12,'b',7.22)

Example: Simulink.Parameter(5.12)

Example: copy(myExistingParameterObject)

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | logical | char | string | struct | table | cell | categorical | datetime | duration | calendarDuration | fi

Complex Number Support: Yes

See Also

Simulink.ModelWorkspace

Introduced in R2018b

hasVariable

Package: Simulink

Determine whether variable exists in the model workspace of a model

Syntax

```
varExists = hasVariable mdlWks, varName)
```

Description

`varExists = hasVariable(mdlWks, varName)` returns 1 if a variable whose name is `varName` exists in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`.

Examples

Determine Existence of Variable in Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create a variable named `myVar` in the model workspace.

```
assignin(mdlWks, 'myVar', 5.12)
```

Determine whether a variable named `myVar` exists in the model workspace.

```
exists = hasVariable(mdlWks, 'myVar')
```

```
exists =  
    1
```

Input Arguments

mdlWks — Target model workspace

`Simulink.ModelWorkspace` object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

varName — Name of target variable

character vector

Name of the target variable, specified as a character vector.

Example: `'myVariable'`

Data Types: char

Output Arguments

varExists — Indication of existence

1 | 0

Indication of variable existence, returned as 1 (true) or 0.

`Simulink.ModelWorkspace | get_param`

Introduced in R2012a

Simulink.MSFcnRunTimeBlock

Get run-time information about Level-2 MATLAB S-function block

Description

This class allows a Level-2 MATLAB S-function or other MATLAB program to obtain information from Simulink software and provide information to Simulink software about a Level-2 MATLAB S-Function block. Simulink software creates an instance of this class for each Level-2 MATLAB S-Function block in a model. Simulink software passes the object to the callback methods of Level-2 MATLAB S-functions when it updates or simulates a model, allowing the callback methods to get and provide block-related information to Simulink software. See “Write Level-2 MATLAB S-Functions” for more information.

You can also use instances of this class in MATLAB programs to obtain information about Level-2 MATLAB S-Function blocks during a simulation. See “Access Block Data During Simulation” for more information.

The Level-2 MATLAB S-function template *matlabroot/toolbox/simulink/blocks/msfuntmpl.m* shows how to use a number of the following methods.

Parent Class

Simulink.RunTimeBlock

Derived Classes

None

Property Summary

Name	Description
“AllowSignalsWithMoreThan2D” on page 5-340	enable Level-2 MATLAB S-function to use multidimensional signals.
“DialogPrmsTunable” on page 5-340	Specifies which of the S-function's dialog parameters are tunable.
“NextTimeHit” on page 5-340	Time of the next sample hit for variable sample time S-functions.

Method Summary

Name	Description
“AutoRegRuntimePrms” on page 5-340	Register this block's dialog parameters as run-time parameters.

Name	Description
"AutoUpdateRuntimePrms" on page 5-341	Update this block's run-time parameters.
"IsDoingConstantOutput" on page 5-341	Determine whether the current simulation stage is the constant sample time stage.
"IsMajorTimeStep" on page 5-342	Determine whether the current simulation time step is a major time step.
"IsSampleHit" on page 5-342	Determine whether the current simulation time is one at which a task handled by this block is active.
"IsSpecialSampleHit" on page 5-342	Determine whether the current simulation time is one at which multiple tasks handled by this block are active.
"RegBlockMethod" on page 5-343	Register a callback method for this block.
"RegisterDataTypeFxpBinaryPoint" on page 5-343	Register fixed-point data type with binary point-only scaling.
"RegisterDataTypeFxpFSlopeFixexpBias" on page 5-344	Register fixed-point data type with [Slope Bias] scaling specified in terms of fractional slope, fixed exponent, and bias.
"RegisterDataTypeFxpSlopeBias" on page 5-345	Register data type with [Slope Bias] scaling.
"SetAccelRunOnTLC" on page 5-346	Specify whether to use this block's TLC file to generate the simulation target for the model that uses it.
"SetPreCompInpPortInfoToDynamic" on page 5-347	Set precompiled attributes of this block's input ports to be inherited.
"SetPreCompOutPortInfoToDynamic" on page 5-347	Set precompiled attributes of this block's output ports to be inherited.
"SetPreCompPortInfoToDefaults" on page 5-347	Set precompiled attributes of this block's ports to the default values.
"SetSimViewingDevice" on page 5-347	Specify whether block is a viewer.
"SupportsMultipleExecInstances" on page 5-348	
"WriteRTWParam" on page 5-348	Write custom parameter information to Simulink Coder file.

Properties

AllowSignalsWithMoreThan2D

Description

Allow Level-2 MATLAB S-functions to use multidimensional signals. You must set the AllowSignalsWithMoreThan2D property in the setup method.

Data Type

Boolean

Access

RW

DialogPrmsTunable

Description

Specifies whether a dialog parameter of the S-function is tunable. Tunable parameters are registered as run-time parameters when you call the “AutoRegRuntimePrms” on page 5-340 method. Note that SimOnlyTunable parameters are not registered as run-time parameters. For example, the following lines initializes three dialog parameters where the first is tunable, the second in not tunable, and the third is tunable only during simulation.

```
block.NumDialogPrms = 3;  
block.DialogPrmsTunable = {'Tunable', 'Nontunable', 'SimOnlyTunable'};
```

Data Type

array

Access

RW

NextTimeHit

Description

Time of the next sample hit for variable sample-time S-functions.

Data Type

double

Access

RW

Methods

AutoRegRuntimePrms

Purpose

Register a block's tunable dialog parameters as run-time parameters.

Syntax

```
AutoRegRuntimePrms;
```

Description

Use in the `PostPropagationSetup` method to register this block's tunable dialog parameters as run-time parameters.

AutoUpdateRuntimePrms**Purpose**

Update a block's run-time parameters.

Syntax

```
AutoUpdateRuntimePrms;
```

Description

Automatically update the values of the run-time parameters during a call to `ProcessParameters`.

See the S-function `matlabroot/toolbox/simulink/simdemos/simfeatures/adapt_lms.m` in the Simulink model `sldemo_msfcn_lms` for an example.

IsDoingConstantOutput**Purpose**

Determine whether this is in the constant sample time stage of a simulation.

Syntax

```
bVal = IsDoingConstantOutput;
```

Description

Returns true if this is the constant sample time stage of a simulation, i.e., the stage at the beginning of a simulation where Simulink software computes the values of block outputs that cannot change during the simulation (see “Constant Sample Time”). Use this method in the `Outputs` method of an S-function with port-based sample times to avoid unnecessarily computing the outputs of ports that have constant sample time, i.e., `[inf, 0]`.

```
function Outputs(block)
.
.
    if block.IsDoingConstantOutput
        ts = block.OutputPort(1).SampleTime;
        if ts(1) == Inf
            %% Compute port's output.
            end
        end
    end
.
.
%% end of Outputs
```

See “Specifying Port-Based Sample Times” for more information.

IsMajorTimeStep**Purpose.**

Determine whether current time step is a major or a minor time step.

Syntax

```
bVal = IsMajorTimeStep;
```

Description

Returns true if the current time step is a major time step; false, if it is a minor time step. This method can be called only from the `Outputs` or `Update` methods.

IsSampleHit**Purpose**

Determine whether the current simulation time is one at which a task handled by this block is active.

Syntax

```
bVal = IsSampleHit(stIdx);
```

Arguments

`stIdx`

Global index of the sample time to be queried.

Description

Use in `Outputs` or `Update` block methods when the MATLAB S-function has multiple sample times to determine whether a sample hit has occurred at `stIdx`. The sample time index `stIdx` is a global index for the Simulink model. For example, consider a model that contains three sample rates of 0.1, 0.2, and 0.5, and a MATLAB S-function block that contains two rates of 0.2 and 0.5. In the MATLAB S-function, `block.IsSampleHit(0)` returns true for the rate 0.1, not the rate 0.2.

This block method is similar to `ssIsSampleHit` for C-MeX S-functions, however `ssIsSampleHit` returns values based on only the sample times contained in the S-function. For example, if the model described above contained a C-MeX S-function with sample rates of 0.2 and 0.5, `ssIsSampleHit(S,0,tid)` returns true for the rate of 0.2.

Use port-based sample times to avoid using the global sample time index for multi-rate systems (see `Simulink.BlockPortData`).

IsSpecialSampleHit**Purpose**

Determine whether the current simulation time is one at which multiple tasks implemented by this block are active.

Syntax

```
bVal = IsSpecialSampleHit(stIdx1,stIdx1);
```

Arguments`stIdx1`

Index of sample time of first task to be queried.

`stIdx2`

Index of sample time of second task to be queried.

Description

Use in `Outputs` or `Update` block methods to ensure the validity of data shared by multiple tasks running at different rates. Returns true if a sample hit has occurred at `stIdx1` and a sample hit has also occurred at `stIdx2` in the same time step (similar to `ssIsSpecialSampleHit` for C-Mex S-functions).

When using the `IsSpecialSampleHit` macro, the slower sample time must be an integer multiple of the faster sample time.

RegBlockMethod**Purpose**

Register a block callback method.

Syntax

```
RegBlockMethod(methName, methHandle);
```

Arguments`methName`

Name of method to be registered.

`methHandle`

MATLAB function handle of the callback method to be registered.

Description

Registers the block callback method specified by `methName` and `methHandle`. Use this method in the `setup` function of a Level-2 MATLAB S-function to specify the block callback methods that the S-function implements.

RegisterDataTypeFxpBinaryPoint**Purpose**

Register fixed-point data type with binary point-only scaling.

Syntax

```
dtID = RegisterDataTypeFxpBinaryPoint(isSigned, wordLength, fractionalLength, obeyDataTypeOverride);
```

Arguments`isSigned`

true if the data type is signed.

false if the data type is unsigned.

`wordLength`

Total number of bits in the data type, including any sign bit.

`fractionalLength`

Number of bits in the data type to the right of the binary point.

`obeyDataTypeOverride`

`true` indicates that the **Data Type Override** setting for the subsystem is to be obeyed. Depending on the value of **Data Type Override**, the resulting data type could be `Double`, `Single`, `ScaledDouble`, or the fixed-point data type specified by the other arguments of the function.

`false` indicates that the **Data Type Override** setting is to be ignored.

Description

This method registers a fixed-point data type with Simulink software and returns a data type ID. The data type ID can be used to specify the data types of input and output ports, run-time parameters, and DWork states. It can also be used with all the standard data type access methods defined for instances of this class, such as “DatatypeSize” on page 5-369.

Use this function if you want to register a fixed-point data type with binary point-only scaling. Alternatively, you can use one of the other fixed-point registration functions:

- Use “RegisterDataTypeFxpFSlopeFixexpBias” on page 5-344 to register a data type with [Slope Bias] scaling by specifying the word length, fractional slope, fixed exponent, and bias.
- Use “RegisterDataTypeFxpSlopeBias” on page 5-345 to register a data type with [Slope Bias] scaling.

If the registered data type is not one of the Simulink built-in data types, a Fixed-Point Designer license is checked out.

RegisterDataTypeFxpFSlopeFixexpBias

Purpose

Register fixed-point data type with [Slope Bias] scaling specified in terms of fractional slope, fixed exponent, and bias

Syntax

```
dtID = RegisterDataTypeFxpFSlopeFixexpBias(isSigned, wordLength,  
fractionalSlope, fixedexponent, bias, obeyDataTypeOverride);
```

Arguments

`isSigned`

`true` if the data type is signed.

`false` if the data type is unsigned.

`wordLength`

Total number of bits in the data type, including any sign bit.

`fractionalSlope`

Fractional slope of the data type.

fixedexponent

exponent of the slope of the data type.

bias

Bias of the scaling of the data type.

obeyDataTypeOverride

true indicates that the **Data Type Override** setting for the subsystem is to be obeyed. Depending on the value of **Data Type Override**, the resulting data type could be True Doubles, True Singles, ScaledDouble, or the fixed-point data type specified by the other arguments of the function.

false indicates that the **Data Type Override** setting is to be ignored.

Description

This method registers a fixed-point data type with Simulink software and returns a data type ID. The data type ID can be used to specify the data types of input and output ports, run-time parameters, and DWork states. It can also be used with all the standard data type access methods defined for instances of this class, such as "DatatypeSize" on page 5-369.

Use this function if you want to register a fixed-point data type by specifying the word length, fractional slope, fixed exponent, and bias. Alternatively, you can use one of the other fixed-point registration functions:

- Use "RegisterDataTypeFxpBinaryPoint" on page 5-343 to register a data type with binary point-only scaling.
- Use "RegisterDataTypeFxpSlopeBias" on page 5-345 to register a data type with [Slope Bias] scaling.

If the registered data type is not one of the Simulink built-in data types, a Fixed-Point Designer license is checked out.

RegisterDataTypeFxpSlopeBias**Purpose**

Register data type with [Slope Bias] scaling.

Syntax

```
dtID = RegisterDataTypeFxpSlopeBias(isSigned, wordLength, totalSlope, bias, obeyDataTypeOverride);
```

Arguments**isSigned**

true if the data type is signed.

false if the data type is unsigned.

wordLength

Total number of bits in the data type, including any sign bit.

totalSlope

Total slope of the scaling of the data type.

`bias`

Bias of the scaling of the data type.

`obeyDataTypeOverride`

`true` indicates that the **Data Type Override** setting for the subsystem is to be obeyed. Depending on the value of **Data Type Override**, the resulting data type could be `True Doubles`, `True Singles`, `ScaledDouble`, or the fixed-point data type specified by the other arguments of the function.

`false` indicates that the **Data Type Override** setting is to be ignored.

Description

This method registers a fixed-point data type with Simulink software and returns a data type ID. The data type ID can be used to specify the data types of input and output ports, run-time parameters, and DWork states. It can also be used with all the standard data type access methods defined for instances of this class, such as “DatatypeSize” on page 5-369.

Use this function if you want to register a fixed-point data type with [Slope Bias] scaling. Alternatively, you can use one of the other fixed-point registration functions:

- Use “RegisterDataTypeFxpBinaryPoint” on page 5-343 to register a data type with binary point-only scaling.
- Use “RegisterDataTypeFxpFSlopeFixexpBias” on page 5-344 to register a data type by specifying the word length, fractional slope, fixed exponent, and bias

If the registered data type is not one of the Simulink built-in data types, a Fixed-Point Designer license is checked out.

SetAccelRunOnTLC

Purpose

Specify whether to use block's TLC file to generate code for the Accelerator mode of Simulink software.

Syntax

```
SetAccelRunOnTLC(bVal);
```

Arguments

`bVal`

May be `'true'` (use TLC file) or `'false'` (run block in interpreted mode).

Description

Specify if the block should use its TLC file to generate code that runs with the accelerator. If this option is `'false'`, the block runs in interpreted mode. See the S-function `msfcn_times_two.m` in the Simulink model `msfcndemo_timestwo` for an example.

Note The default JIT Accelerator mode does not support inlining of user-written TLC S-Functions. Please see “How Acceleration Modes Work” and “Control S-Function Execution” for more information.

SetPreCompInPortInfoToDynamic

Purpose

Set precompiled attributes of this block's input ports to be inherited.

Syntax

```
SetPreCompInPortInfoToDynamic;
```

Description

Initialize the compiled information (dimensions, data type, complexity, and sampling mode) of this block's input ports to be inherited. See the S-function *matlabroot/toolbox/simulink/simdemos/simfeatures/adapt_lms.m* in the Simulink model *sldemo_msfcn_lms* for an example.

SetPreCompOutPortInfoToDynamic

Purpose

Set precompiled attributes of this block's output ports to be inherited.

Syntax

```
SetPreCompOutPortInfoToDynamic;
```

Description

Initialize the compiled information (dimensions, data type, complexity, and sampling mode) of the block's output ports to be inherited. See the S-function *matlabroot/toolbox/simulink/simdemos/simfeatures/adapt_lms.m* in the Simulink model *sldemo_msfcn_lms* for an example.

SetPreCompPortInfoToDefaults

Purpose

Set precompiled attributes of this block's ports to the default values.

Syntax

```
SetPreCompPortInfoToDefaults;
```

Description

Initialize the compiled information (dimensions, data type, complexity, and sampling mode) of the block's ports to the default values. By default, a port accepts a real scalar sampled signal with a data type of double.

SetSimViewingDevice

Purpose

Specify whether this block is a viewer.

Syntax

```
SetSimViewingDevice(bVal);
```

Arguments

bVal

May be 'true' (is a viewer) or 'false' (is not a viewer).

Description

Specify if the block is a viewer/scope. If this flag is specified, the block will be used only during simulation and automatically stubbed out in generated code.

SupportsMultipleExecInstances**Purpose**

Specify whether or not a For Each Subsystem supports an S-function inside of it.

Syntax

```
SupportsMultipleExecInstances(bVal);
```

Arguments

bVal

May be 'true' (S-function is supported) or 'false' (S-function is not supported).

Description

Specify if an S-function can operate within a For Each Subsystem.

WriteRTWParam**Purpose**

Write a custom parameter to the Simulink Coder information file used for code generation.

Syntax

```
WriteRTWParam(pType, pName, pVal)
```

Arguments

pType

Type of the parameter to be written. Valid values are 'string' and 'matrix'.

pName

Name of the parameter to be written.

pVal

Value of the parameter to be written.

Description

Use in the `WriteRTW` method of the MATLAB S-function to write out custom parameters. These parameters are generally settings used to determine how code should be generated in the TLC file for the S-function. See the S-function `matlabroot/toolbox/simulink/simdemos/simfeatures/adapt_lms.m` in the Simulink model `sldemo_msfcn_lms` for an example.

Introduced before R2006a

Simulink.NumericType

Specify floating-point, integer, or fixed-point data type

Description

Use a `Simulink.NumericType` object to set and share numeric data types for signal, state, and parameter data in a model.

- 1 Create an instance of this class in the MATLAB base workspace, a model workspace, or a data dictionary. To create a numeric type in a model workspace, you must clear the **Is alias** property.
- 2 Set the properties of the object to create a custom floating point, integer, or fixed point data type.
- 3 Assign the data type to all signals and parameters of your model that you want to conform to the data type.

Assigning a data type in this way allows you to change the data types of the signals and parameters in your model by changing the properties of the object that describe them. You do not have to change the model itself.

To rename a data type in a model and in the code that you generate from a model (by generating a typedef statement), you can use an object of the class `Simulink.AliasType`.

Creation

To create a `Simulink.NumericType` object interactively, use the Model Explorer:

- 1 On the Model Explorer **Model Hierarchy** pane, select a workspace, such as the base workspace, or a data dictionary.
- 2 From the Model Explorer **Add** menu, select **Simulink.NumericType**.

The Model Explorer creates an instance of a `Simulink.NumericType` object and assigns it to a variable named `Numeric` in the target workspace.

- 3 Rename the variable to a more appropriate name, for example, a name that reflects its intended usage.

To change the name, edit the name displayed in the **Name** field on the Model Explorer **Contents** pane.

- 4 On the Model Explorer **Dialog** pane, use the **Data type mode** property to select a data type that the object represents.

To create a `Simulink.NumericType` object programmatically, use the `Simulink.NumericType` function described below.

Syntax

```
typeObj = Simulink.NumericType
```

Description

`typeObj = Simulink.NumericType` returns a `Simulink.NumericType` object with default property values.

Properties

Bias — Bias for slope and bias scaling

0 (default) | real number

Bias for slope and bias scaling of a fixed-point data type (Fixed-Point Designer), specified as a real number.

If you use a number with a data type other than `double` to set the value, Simulink converts the value to `double`.

Corresponds to **Bias** in the property dialog box.

Example: 3

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical`

DataScope — Specification to generate or import type definition in the generated code

'Auto' (default) | 'Exported' | 'Imported'

Specification to generate or import the type definition (`typedef`) in the generated code (Simulink Coder), specified as 'Auto', 'Exported', or 'Imported'.

The table shows the effect of each option.

Value	Action
'Auto' (default)	If no value is specified for <code>HeaderFile</code> , export the type definition to <code>model_types.h.model</code> is the model name. If a value is specified for <code>HeaderFile</code> , import the data type definition from the specified header file.
'Exported'	Export the data type definition to a header file, which can be specified in the <code>HeaderFile</code> property. If no value is specified for <code>HeaderFile</code> , the header file name defaults to <code>type.h</code> . <code>type</code> is the data type name.
'Imported'	Import the data type definition from a header file, which can be specified in the <code>HeaderFile</code> property. If no value is specified for <code>HeaderFile</code> , the header file name defaults to <code>type.h</code> . <code>type</code> is the data type name.

For more information, see “Control File Placement of Custom Data Types” (Embedded Coder).

Corresponds to **Data scope** in the property dialog box.

DataTypeMode — Mode of numeric data type

'Double' (default) | 'Single' | 'Boolean' | 'Fixed-point: unspecified scaling' | 'Fixed-point: binary point scaling' | 'Fixed-point: slope and bias scaling'

Mode of the numeric data type, specified as one of these character vectors:

- 'Double' — Same as the MATLAB double type.
- 'Single' — Same as the MATLAB single type.
- 'Boolean' — Same as the MATLAB boolean type.
- 'Fixed-point: unspecified scaling' — A fixed-point data type with unspecified scaling.
- 'Fixed-point: binary point scaling' — A fixed-point data type with binary-point scaling.
- 'Fixed-point: slope and bias scaling' — A fixed-point data type with slope and bias scaling.

Selecting a fixed-point data type mode can, depending on the other dialog box options that you select, cause the model to run only on systems that have a Fixed-Point Designer option installed.

Corresponds to **Data type mode** in the property dialog box.

Data Types: char

DataTypeOverride — Data type override mode

'Inherit' (default) | 'Off'

Data type override mode, specified as 'Inherit' or 'Off'.

- If you specify 'Inherit', the data type override setting for the context in which this numeric type is used (block, signal, Stateflow chart in Simulink) applies to this numeric type.
- If you specify 'Off', data type override does not apply to this numeric type.

For more information about data type override, see “Control Data Type Override”.

Corresponds to **Data type override** in the property dialog box.

Data Types: char

Description — Custom description of data type

'' (empty character vector) (default) | character vector

Custom description of the data type, specified as a character vector.

Corresponds to **Description** in the property dialog box.

Example: 'This is a floating-point data type.'

Data Types: char

FixedExponent — Exponent for binary point scaling

0 (default) | real number

Exponent for binary point scaling, specified as a real number. Setting this property causes Simulink software to set the FractionLength and Slope properties accordingly, and vice versa. This property applies only if the DataTypeMode is Fixed-point: binary point scaling or Fixed-point: slope and bias scaling.

If you use a number with a data type other than double to set the value, Simulink converts the value to double.

This property does not appear in the property dialog box.

Example: -8

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical`

FractionLength — Bit length of the fractional portion of a fixed-point number

0 (default) | real integer

Bit length of the fractional portion of a fixed-point number (Fixed-Point Designer), specified as a real integer. This property equals `-FixedExponent`. Setting this property causes Simulink software to set the `FixedExponent` property accordingly, and vice versa.

If you use a number with a data type other than `double` to set the value, Simulink converts the value to `double`.

Corresponds to **Fraction length** in the property dialog box.

Example: 8

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical`

HeaderFile — Name of header file that contains type definition in the generated code

' ' (empty character vector) (default) | character vector

Name of the header file that contains the type definition (typedef) in the generated code, specified as a character vector.

If this property is specified, the specified name is used during code generation for importing or exporting. If this property is empty, the value defaults to `type.h` if `DataScope` equals `'Imported'` or `'Exported'`, or defaults to `model_types.h` if `DataScope` equals `'Auto'`.

By default, the generated `#include` directive uses the preprocessor delimiter `"` instead of `<` and `>`. To generate the directive `#include <myTypes.h>`, specify `HeaderFile` as `'<myTypes.h>'`.

For more information, see “Control File Placement of Custom Data Types” (Embedded Coder).

Corresponds to **Header file** in the property dialog box.

Example: `'myHdr.h'`

Example: `'myHdr'`

Example: `'myHdr.hpp'`

Data Types: `char`

IsAlias — Specification to create data type alias using object name

false (default) | true

Specification to create a data type alias by using the name of the object, specified as `true` (yes) or `false` (no).

If you specify `true`, the object acts as a data type alias in a similar manner to a `Simulink.AliasType` object. For more information, see “Control Data Type Names in Generated Code” (Embedded Coder).

Corresponds to **Is alias** in the property dialog box.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical`

Signedness — Signedness of fixed-point data type

'Signed (default) | 'Unsigned' | 'Auto'

Signedness of a fixed-point data type (Fixed-Point Designer), specified as 'Signed' (signed), 'Unsigned' (unsigned), or 'Auto' (inherit signedness).

Corresponds to **Signedness** in the property dialog box.

Data Types: char

SignednessBool — Signedness of fixed-point data type

false | true

Signedness of a fixed-point data type (Fixed-Point Designer), specified as a Boolean.

Corresponds to **Signedness** in the property dialog box.

Data Types: logical

Slope — Slope for slope and bias scaling of fixed-point data type2⁰ (default) | real number

Slope for slope and bias scaling of a fixed-point data type (Fixed-Point Designer), specified as a real number.

This property equals $\text{SlopeAdjustmentFactor} * 2^{\text{FixedExponent}}$. If **SlopeAdjustmentFactor** is 1.0, Simulink software displays the value of this field as $2^{\text{SlopeAdjustmentFactor}}$. Otherwise, it displays it as a numeric value. Setting this property causes Simulink software to set the **FixedExponent** and **SlopeAdjustmentFactor** properties accordingly, and vice versa.

If you use a number with a data type other than `double` to set the value, Simulink converts the value to `double`.

This property appears only if **DataTypeMode** is `Fixed-point: slope and bias scaling`.

Corresponds to **Slope** in the property dialog box.

Example: 5.2

Example: 2⁹

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | logical

SlopeAdjustmentFactor — Slope for slope and bias scaling of fixed-point data type

1 (default) | real number

Slope for slope and bias scaling of a fixed-point data type (Fixed-Point Designer), specified as a real number in the range [1, 2).

Setting this property causes Simulink software to adjust the **Slope** property accordingly, and vice versa. This property applies only if **DataTypeMode** is `Fixed-point: slope and bias scaling`.

If you use a number with a data type other than `double` to set the value, Simulink converts the value to `double`.

This property does not appear in the property dialog box.

Example: 1.7

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical`

WordLength — Word size of fixed-point or integer data type

16 (default) | integer

Word size of a fixed-point (Fixed-Point Designer) or integer data type, specified as an integer number of bits.

This property appears only if `DataTypeMode` is `Fixed-point`.

If you use a number with a data type other than `double` to set the value, Simulink converts the value to `double`.

Corresponds to **Word length** in the property dialog box.

Example: 8

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical`

Object Functions

<code>isboolean</code>	Determine whether numeric type represents the Boolean data type <code>boolean</code>
<code>isdouble</code>	Determine whether numeric type represents the double-precision, floating-point data type <code>double</code>
<code>isfixed</code>	Determine whether numeric type represents a fixed-point data type
<code>isfloat</code>	Determine whether numeric type represents a floating-point data type
<code>isscalingbinarypoint</code>	Determine whether fixed-point numeric type has binary-point scaling
<code>isscalinglopebias</code>	Determine whether numeric type represents a fixed-point data type with slope-and-bias scaling
<code>isscalingunspecified</code>	Determine whether numeric type represents a data type with unspecified scaling
<code>issingle</code>	Determine whether numeric type represents the single-precision, floating-point data type <code>single</code>

Examples

Share a Data Type Between Separate Algorithms, Data Paths, Models, and Bus Elements

See “Share a Data Type Between Separate Algorithms, Data Paths, Models, and Bus Elements”.

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using MATLAB® Coder™.

When you select the **Is alias** property, a `Simulink.NumericType` object appears in the generated code as a typedef statement. The generated code uses the named type to define and declare data (variables).

Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

isboolean

Package: Simulink

Determine whether numeric type represents the Boolean data type `boolean`

Syntax

```
indication = isboolean(numericType)
```

Description

`indication = isboolean(numericType)` returns 1 (true) if the `Simulink.NumericType` object `numericType` represents the Boolean data type `boolean` and 0 (false) otherwise.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

Input Arguments

numericType — Target numeric type

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

Output Arguments

indication — Indication of whether target object represents boolean

1 | 0

Indication of whether the target object represents boolean, returned as 1 (true) or 0 (false).

See Also

`Simulink.NumericType`

Topics

“Control Signal Data Types”

“Control Block Parameter Data Types”

“Control Data Type Names in Generated Code” (Embedded Coder)

Introduced in R2010b

isdouble

Package: Simulink

Determine whether numeric type represents the double-precision, floating-point data type `double`

Syntax

```
indication = isdouble(numericType)
```

Description

`indication = isdouble(numericType)` returns 1 (true) if the `Simulink.NumericType` object `numericType` represents the double-precision, floating-point data type `double` and 0 (false) otherwise.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

Input Arguments

numericType — Target numeric type

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

Output Arguments

indication — Indication of whether target object represents double

1 | 0

Indication of whether the target object represents double, returned as 1 (true) or 0 (false).

See Also

isfixed

Package: Simulink

Determine whether numeric type represents a fixed-point data type

Syntax

```
indication = isfixed(numericType)
```

Description

`indication = isfixed(numericType)` returns 1 (true) if the `Simulink.NumericType` object `numericType` represents a fixed-point data type and 0 (false) otherwise.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

Input Arguments

numericType — Target numeric type

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

Output Arguments

indication — Indication of whether target object represents a fixed-point type

1 | 0

Indication of whether the target object represents a fixed-point type, returned as 1 (true) or 0 (false).

isfloat

Package: Simulink

Determine whether numeric type represents a floating-point data type

Syntax

```
indication = isfloat(numericType)
```

Description

`indication = isfloat(numericType)` returns 1 (true) if the `Simulink.NumericType` object `numericType` represents a floating-point data type such as `double` or `single`, and 0 (false) otherwise.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

Input Arguments

numericType — Target numeric type

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

Output Arguments

indication — Indication of whether target object represents a floating-point type

1 | 0

Indication of whether the target object represents a floating-point type, returned as 1 (true) or 0 (false).

isscalingbinarypoint

Package: Simulink

Determine whether fixed-point numeric type has binary-point scaling

Syntax

```
indication = isscalingbinarypoint(numericType)
```

Description

`indication = isscalingbinarypoint(numericType)` returns 1 (true) if the `Simulink.NumericType` object `numericType` represents a fixed-point data type with binary-point scaling and 0 (false) otherwise. A numeric type object can use binary-point scaling if you explicitly specify it or if you specify trivial slope-and-bias scaling (the slope is an integer power of two and the bias is zero).

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

Input Arguments

numericType — Target numeric type

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

Output Arguments

indication — Indication of whether target object represents fixed-point type with binary-point scaling

1 | 0

Indication of whether the target object represents a fixed-point type with binary-point scaling, returned as 1 (true) or 0 (false).

See Also

Introduced in R2010b

isscalingslopebias

Package: Simulink

Determine whether numeric type represents a fixed-point data type with slope-and-bias scaling

Syntax

```
indication = isscalingslopebias(numericType)
```

Description

`indication = isscalingslopebias(numericType)` returns 1 (true) if the `Simulink.NumericType` object `numericType` represents a fixed-point data type with nontrivial slope-and-bias scaling and 0 (false) otherwise. A slope-and-bias fixed-point type has trivial scaling if the slope is an integer power of two and the bias is zero.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

Input Arguments

numericType — Target numeric type

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

Output Arguments

indication — Indication of whether target object represents fixed-point type with slope-and-bias scaling

1 | 0

Indication of whether the target object represents a fixed-point type with nontrivial slope-and-bias scaling, returned as 1 (true) or 0 (false).

isscalingunspecified

Package: Simulink

Determine whether numeric type represents a data type with unspecified scaling

Syntax

```
indication = isscalingunspecified(numericType)
```

Description

`indication = isscalingunspecified(numericType)` returns 1 (true) if the `Simulink.NumericType` object `numericType` represents a fixed-point or scaled double data type with unspecified scaling and 0 (false) otherwise.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

Input Arguments

numericType — Target numeric type

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

Output Arguments

indication — Indication of whether target object represents a type with unspecified scaling

1 | 0

Indication of whether the target object represents a type with unspecified scaling, returned as 1 (true) or 0 (false).

issingle

Package: Simulink

Determine whether numeric type represents the single-precision, floating-point data type `single`

Syntax

```
indication = issingle(numericType)
```

Description

`indication = issingle(numericType)` returns 1 (true) if the `Simulink.NumericType` object `numericType` represents the single-precision, floating-point data type `single` and 0 (false) otherwise.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

Input Arguments

numericType — Target numeric type

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

Output Arguments

indication — Indication of whether target object represents `single`

1 | 0

Indication of whether the target object represents `single`, returned as 1 (true) or 0 (false).

Simulink.RunTimeBlock

Allow Level-2 MATLAB S-function and other MATLAB programs to get information about block while simulation is running

Description

This class allows a Level-2 MATLAB S-function or other MATLAB program to obtain information about a block. Simulink software creates an instance of this class or a derived class for each block in a model. Simulink software passes the object to the callback methods of Level-2 MATLAB S-functions when it updates or simulates a model, allowing the callback methods to get block-related information from and provide such information to Simulink software. See “Write Level-2 MATLAB S-Functions” in Writing S-Functions for more information. You can also use instances of this class in MATLAB programs to obtain information about blocks during a simulation. See “Access Block Data During Simulation” for more information.

Note Simulink.RunTimeBlock objects do not support MATLAB sparse matrices. For example, the following line of code attempts to assign a sparse identity matrix to the run-time object's output port data. This line of code in a Level-2 MATLAB S-function produces an error:

```
block.Outputport(1).Data = speye(10);
```

Parent Class

None

Derived Classes

Simulink.MSFcnRunTimeBlock

Property Summary

Name	Description
“BlockHandle” on page 5-366	Block's handle.
“CurrentTime” on page 5-366	Current simulation time.
“NumDworks” on page 5-366	Number of discrete work vectors used by the block.
“NumOutputPorts” on page 5-367	Number of block output ports.
“NumContStates” on page 5-367	Number of block's continuous states.
“NumDworkDiscStates” on page 5-367	Number of block's discrete states
“NumDialogPrms” on page 5-367	Number of parameters that can be entered on S-function block's dialog box.
“NumInputPorts” on page 5-368	Number of block's input ports.

Name	Description
"NumRuntimePrms" on page 5-368	Number of run-time parameters used by block.
"SampleTimes" on page 5-368	Sample times at which block produces outputs.

Method Summary

Name	Description
"ContStates" on page 5-368	Get a block's continuous states.
"DataTypeIsFixedPoint" on page 5-369	Determine whether a data type is fixed point.
"DatatypeName" on page 5-369	Get name of a data type supported by this block.
"DatatypeSize" on page 5-369	Get size of a data type supported by this block.
"Derivatives" on page 5-370	Get a block's continuous state derivatives.
"DialogPrm" on page 5-370	Get a parameter entered on an S-function block's dialog box.
"Dwork" on page 5-370	Get one of a block's DWork vectors.
"FixedPointNumericType" on page 5-371	Determine the properties of a fixed-point data type.
"InputPort" on page 5-371	Get one of a block's input ports.
"OutputPort" on page 5-372	Get one of a block's output ports.
"RuntimePrm" on page 5-372	Get one of the run-time parameters used by a block.

Properties

BlockHandle

Description

Block's handle.

Access

R0

CurrentTime

Description

SampleTimes**Description**

Block's sample times.

Access

RW for MATLAB S-functions, RO for all other blocks.

Methods**ContStates****Purpose**

Get a block's continuous states.

Syntax

```
states = ContStates();
```

Description

Get vector of continuous states.

See Also

ssGetContStates

DataTypesFixedPoint**Purpose**

Determine whether a data type is fixed point.

Syntax

```
bVal = DataTypeIsFixedPoint(dtID);
```

Arguments

dtID

Integer value specifying the ID of a data type.

Description

Returns `true` if the specified data type is a fixed-point data type.

DatatypeName**Purpose**

Get the name of a data type.

Syntax

```
name = DatatypeName(dtID);
```

Arguments

dtID

Integer value specifying ID of a data type.

Description

Returns the name of the data type specified by `dtID`.

See Also

“DatatypeSize” on page 5-369

DatatypeSize**Purpose**

Get the size of a data type.

Syntax

```
size = DatatypeSize(dtID);
```

Arguments

dtID

Integer value specifying the ID of a data type.

Description

Returns the size of the data type specified by dtID.

See Also

“DatatypeName” on page 5-369

Derivatives**Purpose**

Get derivatives of a block's continuous states.

Syntax

```
derivs = Derivatives();
```

Description

Get vector of state derivatives.

See Also

ssGetdX

DialogPrm**Purpose**

Get an S-function's dialog parameters.

Syntax

```
param = DialogPrm(pIdx);
```

Arguments

pIdx

Integer value specifying the index of the parameter to be returned.

Description

Get the specified dialog parameter. In the case of the S-function, each DialogPrm corresponds to one of the elements in the comma-separated list of parameters in the **S-function parameters** dialog field.

See Also

ssGetSFcnParam, “RuntimePrm” on page 5-372

Dwork**Purpose**

Get one of a block's DWork vectors.

Syntax

```
dworkObj = Dwork(dwIdx);
```

Arguments

dwIdx

Integer value specifying the index of a work vector.

Description

Get information about the DWork vector specified by dwIdx where dwIdx is the index number of the work vector. This method returns an object of type `Simulink.BlockCompDworkData`.

See Also

ssGetDWork

FixedPointNumericType**Purpose**

Get the properties of a fixed-point data type.

Syntax

```
eno = FixedPointNumericType(dtID);
```

Arguments

dtID

Integer value specifying the ID of a fixed-point data type.

Description

Returns an object of `embedded.Numeric` class that contains the attributes of the specified fixed-point data type.

Note `embedded.Numeric` is also the class of the `numerictype` objects created by Fixed-Point Designer software. For information on the properties defined by `embedded.Numeric` class, see “`numerictype` Object Properties” (Fixed-Point Designer).

InputPort**Purpose**

Get an input port of a block.

Syntax

```
port = InputPort(pIdx);
```

Arguments

pIdx

Integer value specifying the index of an input port.

Description

Get the input port specified by pIdx, where pIdx is the index number of the input port. For example,

```
port = rto.InputPort(1)
```

returns the first input port of the block represented by the run-time object `rto`.

This method returns an object of type `Simulink.BlockPreCompInputPortData` or `Simulink.BlockCompInputPortData`, depending on whether the model that contains the port is uncompiled or compiled. You can use this object to get and set the input port's uncompiled or compiled properties, respectively.

See Also

`ssGetInputPortSignalPtrs`, `Simulink.BlockPreCompInputPortData`, `Simulink.BlockCompInputPortData`, “OutputPort” on page 5-372

OutputPort**Purpose**

Get an output port of a block.

Syntax

```
port = OutputPort(pIdx);
```

Arguments

`pIdx`

Integer value specifying the index of an output port.

Description

Get the output port specified by `pIdx`, where `pIdx` is the index number of the output port. For example,

```
port = rto.OutputPort(1)
```

returns the first output port of the block represented by the run-time object `rto`.

This method returns an object of type `Simulink.BlockPreCompOutputPortData` or `Simulink.BlockCompOutputPortData`, depending on whether the model that contains the port is uncompiled or compiled, respectively. You can use this object to get and set the output port's uncompiled or compiled properties, respectively.

See Also

`ssGetInputPortSignalPtrs`, `Simulink.BlockPreCompOutputPortData`, `Simulink.BlockCompOutputPortData`

RuntimePrm**Purpose**

Get an S-function's run-time parameters.

Syntax

```
param = RuntimePrm(pIdx);
```

Arguments

pIdx

Integer value specifying the index of a run-time parameter.

Description

Get the run-time parameter whose index is pIdx. This run-time parameter is a Simulink.BlockData on page 5-169 object of type Simulink.BlockRunTimePrmData.

See Also

ssGetRunTimeParamInfo

Introduced before R2006a

Simulink.SampleTime class

Package: Simulink

Object containing sample time information

Description

The `SampleTime` class represents the sample time information associated with an individual sample time.

Use the methods `Simulink.Block.getSampleTimes` and `Simulink.BlockDiagram.getSampleTimes` to retrieve the values of the `SampleTime` properties for a block and for a block diagram, respectively.

Properties

Value

A two-element array of doubles that contains the period and offset of the sample time

Description

A $1 \times n$ character array that describes the sample time type

ColorRGBValue

A 1×3 array of doubles that contains the red, green and blue (RGB) values of the sample time color

Annotation

A $1 \times n$ character array that represents the annotation of a specific sample time (for example, 'D1')

OwnerBlock

For asynchronous and variable sample times, `OwnerBlock` is a character vector containing the full path to the block that controls the sample time. For all other types of sample times, it is an empty character vector.

ComponentSampleTimes

If the sample time is an async union or if the sample time is hybrid and the component sample times are available, then the array `ComponentSampleTimes` contains `Simulink.SampleTime` objects.

Copy Semantics

Value. To learn how value classes affect copy operations, see [Copying Objects \(MATLAB\)](#) in the [MATLAB Programming Fundamentals](#) documentation.

Examples

Retrieve the sample time information for the 'vdp' model.

```
ts = Simulink.BlockDiagram.getSampleTimes('vdp')
```

Simulink returns:

```
ts =
```

```
1x2 Simulink.SampleTime
Package: Simulink
```

```
Properties:
```

```
Value
Description
ColorRGBValue
Annotation
OwnerBlock
ComponentSampleTimes
```

```
Methods
```

To examine the values of the properties:

```
ts(1), ts(2)
```

```
ans =
```

```
Simulink.SampleTime
Package: Simulink
```

```
Properties:
```

```
Value: [0 0]
Description: 'Continuous'
ColorRGBValue: [0 0 0]
Annotation: 'Cont'
OwnerBlock: []

Simulink.sdi.constraints.MatchesSignal class

Package: Simulink.sdi.constraints

Superclasses: matlab.unittest.constraints.Constraint

Constraint that compares time series data with tolerances using the Simulation Data Inspector

Description

Use the `Simulink.sdi.constraints.MatchesSignal` constraint to compare time series data against an expected value as part of a test. You can configure the constraint to use a combination of absolute, relative, and time tolerance values for the comparison. You can also specify additional options to configure the comparison behavior using a `Simulink.sdi.constraints.MatchesSignalOptions` object or using one or more name-value pair arguments on page 5-376. For more information about how tolerances and alignment options affect comparisons, see “How the Simulation Data Inspector Compares Data”.

Note The `MatchesSignal` constraint uses the Simulation Data Inspector to perform comparisons and requires a license for one of these products:

- Simulink
 - Signal Processing Toolbox™
 - MATLAB Coder
 - Fixed-Point Designer
-

Creation

Description

`MatchesSignal(expVal)` creates a constraint that determines whether time series data representing an actual value matches the data specified by the expected value, `expVal` on page 5-0 .

`MatchesSignal(expVal, Name, Value)` creates a constraint with additional properties on page 5-378 specified by one or more `Name, Value` pair arguments.

Input Arguments

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name, Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Example: `'IgnoringDataTypes', true`

IgnoringDataTypes — Constraint behavior when data types do not match

`false` (default) | `true`

Configure constraint sensitivity to the actual value having a different data type from the expected value.

- `false` — The constraint checks whether the expected value and actual value data types match.
- `true` — The constraint is insensitive to data type mismatches between the expected value and actual value.

Example: `'IgnoringDataTypes', true`

IgnoringSignalsNotAligned — Constraint behavior when signals do not align

`false` (default) | `true`

Configure constraint sensitivity to one or more signals not aligning between the expected value and actual value.

- `false` — The constraint checks for signals that do not align between the expected value and actual value.
- `true` — The constraint is insensitive to one or more signals not aligning between the expected value and actual value.

Example: `'IgnoringSignalsNotAligned', true`

IgnoringExtraData — Constraint behavior when the actual value covers a different time interval from the expected value

`false` (default) | `true`

Configure the constraint sensitivity to the actual value containing data outside of the time interval defined by the expected value.

- `false` — The constraint checks whether the actual value contains data outside the time interval defined by the expected value.
- `true` — The constraint is insensitive to the actual value containing data outside the time interval defined by the expected value.

Example: `'IgnoringExtraData', true`

AligningBy — Signal alignment criteria

string array

Alignment criteria for the comparison. When the expected value contains more than one signal, the Simulation Data Inspector comparison algorithm aligns signals for comparison between the expected and actual values. By default, the Simulation Data Inspector aligns by data source, then by block path, then by SID, and then by signal name. For details about the Simulation Data Inspector alignment algorithm, see “How the Simulation Data Inspector Compares Data”.

Specify alignment criteria as a string array with one or more of these options listed in the order in which you want them considered:

- `BlockPath` — The path to the source block for the signal.
- `SID` — Simulink identifier. For more information, see “Locate Diagram Components Using Simulink Identifiers”.
- `SignalName` — The name of the signal.
- `DataSource` — Path of the variable.

Example: 'AligningBy', ["SignalName", "BlockPath"] specifies signal alignment by signal name and then by block path.

Properties

Expected — Expected value to use as the baseline for the comparison

time series data | string scalar | character array

Expected value to use as the baseline for the comparison. The data for the expected value must pair data values with time. The data can be in any format supported by the Simulation Data Inspector. The Simulation Data Inspector requires data in a format that associates sample values with time. Supported formats include `timeseries`, `Structure with time`, and `Dataset`.

You can specify the expected value for the constraint using a variable in the workspace that contains the data or by specifying the full path or file name of a file that contains the data, as a string scalar or a character array.

Attributes:

GetAccess	public
SetAccess	immutable

MatchesSignalOptions — Constraint comparison configuration options

`Simulink.sdi.constraints.MatchesSignalOptions`

`Simulink.sdi.constraints.MatchesSignalOptions` object that specifies options to configure the comparison for the constraint. By default, the comparison uses the default alignment settings for the Simulation Data Inspector and has strict acceptance criteria, meaning that the comparison does not ignore any checks. You can use the `MatchesSignalOptions` property to configure how the constraint aligns signals in the expected and actual runs and whether tests using the constraint are sensitive to:

You can specify the `MatchesSignalOptions` property for the constraint using individual name-value pair arguments on page 5-376 or using the name-value pair 'WithOptions' with a `Simulink.sdi.constraints.MatchesSignalOptions` object as the value. When you specify the `MatchesSignalOptions` property using a `MatchesSignalOptions` object, you can use a single name-value pair to configure all the options for comparisons that use the constraint.

Attributes:

GetAccess	public
SetAccess	immutable

Data Types: `Simulink.sdi.constraints.MatchesSignalOptions`

AbsTol — Absolute tolerance for comparison

0 (default) | scalar

Absolute tolerance for comparisons using the constraint. For details about how the Simulation Data Inspector uses tolerance values in comparisons, see “How the Simulation Data Inspector Compares Data”.

Example: 0.1

Example: 2

Attributes:

GetAccess	public
SetAccess	immutable

Data Types: double

RelTol — Relative tolerance for comparison

0 (default) | scalar

Relative tolerance for comparisons using the constraint. For example, specify 0.1 to use a 10% tolerance for the comparison. For details about how the Simulation Data Inspector uses tolerance values in comparisons, see “How the Simulation Data Inspector Compares Data”.

Example: 0.05

Attributes:

GetAccess	public
SetAccess	immutable

Data Types: double

TimeTol — Time tolerance for comparison

0 (default) | scalar

Time tolerance for comparisons using the constraint, in seconds. For details about how the Simulation Data Inspector uses tolerance values in comparisons, see “How the Simulation Data Inspector Compares Data”.

Example: 0.001

Attributes:

GetAccess	public
SetAccess	immutable

Data Types: double

Examples**Create Tests for Time Series Comparisons**

This example shows how to use the `Simulink.sdi.constraints.MatchesSignal` constraint to compare time series data using data generated in the workspace. You can use the `MatchesSignal` constraint to compare data from many sources, including measured test data in a file and logged simulation outputs.

When you use the `MatchesSignal` constraint, you can specify absolute, relative, and time tolerances to use in the comparison. The `MatchesSignal` constraint uses the Simulation Data Inspector comparison algorithm, which includes steps for alignment and synchronization. For more information about the algorithm, see “How the Simulation Data Inspector Compares Data”.

The `MatchesSignal` constraint uses the Simulation Data Inspector for the time series comparison and requires one of these products:

- Simulink®
- Signal Processing Toolbox™
- MATLAB Coder™
- Fixed-Point Designer™

Create Time Series Data

This example generates workspace data in `timeseries` format for illustrative purposes only. You can use the `MatchesSignal` constraint to compare data from other sources, such as simulation outputs or a file containing test data, and the constraint can compare time series data in any format supported by the Simulation Data Inspector.

In this example, the first signal is a `timeseries` object containing data for a sine wave with the name `Wave Data`.

```
time = 0:0.1:20;
sig1vals = sin(2*pi/5*time);
sig1_ts = timeseries(sig1vals,time);
sig1_ts.Name = 'Wave Data';
```

The second signal is also a sine wave at the same frequency, with a slight attenuation and sampled at a different rate. Because the comparison algorithm for the `MatchesSignal` constraint includes a synchronization step, comparing these two signals with different time vectors does not always result in a test failure. The second signal is also named `Wave Data` so the alignment algorithm can pair the signals for comparison.

```
time2 = 0:0.05:20;
sig2vals = 0.98*sin(2*pi/5*time2);
sig2_ts = timeseries(sig2vals,time2);
sig2_ts.Name = 'Wave Data';
```

Create a Test Case and Compare the Signals

This example uses an interactive test for illustrative purposes. You can use the `MatchesSignal` constraint with other types of unit tests in the MATLAB testing framework. For example, to write class-based unit tests, see “Write Simple Test Case Using Classes” (MATLAB).

Create a `TestCase` instance for interactive use.

```
import matlab.unittest.TestCase

testCase = TestCase.forInteractiveUse;
```

Compare `sig1_ts` and `sig2_ts` using the `MatchesSignal` constraint. Use `sig1_ts` for the expected value in the instance of the `MatchesSignal` constraint.

```
import Simulink.sdi.constraints.MatchesSignal

testCase.verifyThat(sig2_ts,MatchesSignal(sig1_ts));
```

```
Verification failed.
-----
Framework Diagnostic:
-----
MatchesSignal(<Value>) failed.
--> The following aligned signals did not match:
```

ActualValue	ExpectedValue
{ '<Actual>.Data' }	{ '<Expected>.Data' }

Comparison results have been saved to:

--> C:\TEMP\Bdoc20a_1326390_10420\ibC22023\28\comparisonResults_e38b2575-172f-42fb-9875-1d9c

Stack Information:

In B:\matlab\tools\examples\exampletools\+mwtools\liveCodeToDocbook.m (liveCodeToDocbook) at

In B:\matlab\tools\build_using_matlab\BML.m (BML) at 13

The diagnostic information shows that the verification failed. When a test fails, the comparison results and original run data are saved in a Simulation Data Inspector session file. Click the link for the MLDATX file to open the session in the Simulation Data Inspector, where you can investigate the data compared by the test and the comparison results. When you inspect the results, you can see the attenuation creates the difference and causes the comparison to fail.

Specify an absolute tolerance of `0.02` for the instance of the `MatchesSignal` constraint to use in the comparison.

```
testCase.verifyThat(sig2_ts,MatchesSignal(sig1_ts,'AbsToL',0.02));
```

Verification passed.

Configure MatchesSignal Constraint Behavior

This example shows how to configure the comparison behavior of a `Simulink.sdi.constraints.MatchesSignal` constraint using a `Simulink.sdi.constraints.MatchesSignalOptions` object. You can use a `MatchesSignalOptions` object to configure multiple comparison properties with a single name-value pair input in the construction of the `MatchesSignal` instance.

Create Time Series Data

This example creates workspace data to use for illustrative purposes only. You can use the `MatchesSignal` constraint to compare data from other sources, such as simulation outputs or a file containing test data, and the constraint can compare time series data in any format supported by the Simulation Data Inspector.

In this example, the first signal is a `timeseries` object with the name `Wave Data` that contains data for a sine wave.

```
time = 0:0.1:20;
sig1vals = sin(2*pi/5*time);
sig1_ts = timeseries(sig1vals,time);
sig1_ts.Name = 'Wave Data';
```

The second signal is also a sine wave at the same frequency, with a slight attenuation and sampled at a different rate. Because the comparison algorithm for the `MatchesSignal` constraint includes a synchronization step, comparing these two signals with different time vectors does not necessarily result in a test failure. The second signal is cast to `single` data type and also named `Wave Data` so the alignment algorithm can pair the signals for comparison.

```
time2 = 0:0.1:22;
sig2vals = single(0.98*sin(2*pi/5*time2));
sig2_ts = timeseries(sig2vals,time2);
sig2_ts.Name = 'Wave Data';
```

Configure a MatchesSignal Instance and Compare the Data

You can use a `MatchesSignalOptions` object to specify how an instance of the `MatchesSignal` constraint handles conditions such as mismatched data types and how signals are aligned between the actual and expected data sets. You can specify the properties of the `MatchesSignalOptions` object to suit the test you want to write. For example, if you want your test to compare data of varying types and a data type match is not functionally relevant, you could set the `IgnoreDataTypes` property to `true`.

Create a `MatchesSignalOptions` object to create a `MatchesSignal` instance that ignores data type mismatches and data samples outside the time interval the actual and expected signals share.

```
import Simulink.sdi.constraints.MatchesSignalOptions
opts = MatchesSignalOptions('IgnoringDataTypes',true,'IgnoringExtraData',true);
```

Create a `TestCase` instance for interactive use and compare `sig1_ts` and `sig2_ts` using the `MatchesSignal` constraint, the `MatchesSignalOptions` object, and an absolute tolerance of `0.02`.

```
import matlab.unittest.TestCase
testCase = TestCase.forInteractiveUse;

import Simulink.sdi.constraints.MatchesSignal
testCase.verifyThat(sig2_ts,MatchesSignal(sig1_ts,'AbsTol',0.02,'WithOptions',opts))
```

Verification passed.

The test passes. When you run the same test again without the options defined by the `MatchesSignalOptions` object, the test fails due to the mismatched data types.

```
testCase.verifyThat(sig2_ts,MatchesSignal(sig1_ts,'AbsTol',0.02))
```

Verification failed.

```
-----
Framework Diagnostic:
-----
MatchesSignal(<Value>,'AbsTol',0.02) failed.
--> Data types do not match for the following aligned signals:
```

ActualValue	ActualDataType	ExpectedValue	ExpectedDataType
{'<Actual>.Data'}	{'single'}	{'<Expected>.Data'}	{'double'}

```
-----

Compatibility Considerations

Enhanced diagnostic information

Behavior changed in R2020a

Starting in R2020a, when a test that uses the `Simulink.sdi.constraints.MatchesSignal` constraint fails, the diagnostic information provides a path and link to a Simulation Data Inspector session file that includes the comparison results and the original data compared by the test. Open the session file to inspect the data and comparison results in the Simulation Data Inspector.

In previous releases, the diagnostic information included a path and link to a static image of the comparison results. The diagnostic information no longer includes the image.

Simulink.sdi.constraints.MatchesSignalOptions class

Package: `Simulink.sdi.constraints`

Specify comparison options for `Simulink.sdi.MatchesSignal` constraint

Description

Use a `Simulink.sdi.constraints.MatchesSignalOptions` object to configure the comparison behavior and acceptance criteria for an instance of the `Simulink.sdi.constraints.MatchesSignal` constraint.

Note The `MatchesSignal` constraint uses the Simulation Data Inspector to perform comparisons and requires a license for one of these products:

- Simulink
 - Signal Processing Toolbox
 - MATLAB Coder
 - Fixed-Point Designer
-

Creation

Description

`MatchesSignalOptions` creates an instance of the `Simulink.sdi.constraints.MatchesSignalOptions` class with properties that correspond to a constraint that does not ignore any checks and uses the default alignment settings for the Simulation Data Inspector.

`MatchesSignalOptions(Name, Value)` creates an instance of the `Simulink.sdi.constraints.MatchesSignalOptions` class with comparison behavior using properties on page 5-385 specified by one or more `Name, Value` pair arguments.

Properties

IgnoreDataTypes — Constraint behavior when data types do not match

`false` (default) | `true`

Constraint sensitivity to the actual value having a different data type from the expected value.

You can specify the `IgnoreDataTypes` property in the constructor using the `'IgnoringDataTypes'` name-value pair argument.

Attributes:

GetAccess	public
SetAccess	public

IgnoreSignalsNotAligned – Constraint behavior when signals do not align`false (default) | true`

Constraint sensitivity to one or more signals not aligning between the expected value and actual value.

You can specify the `IgnoreSignalsNotAligned` property in the constructor using the `'IgnoringSignalsNotAligned'` name-value pair argument.

Attributes:

GetAccess	public
SetAccess	public

IgnoreExtraData – Constraint behavior when the actual value covers a different time interval from the expected value`false (default) | true`

Constraint sensitivity to the actual value containing data outside of the time interval defined by the expected value.

You can specify the `IgnoreExtraData` property in the constructor using the `'IgnoringExtraData'` name-value pair argument.

Attributes:

GetAccess	public
SetAccess	public

Alignment – Signal alignment criteria`string array`

Alignment criteria for the comparison. When the expected value contains more than one signal, the Simulation Data Inspector comparison algorithm aligns signals for comparison between the expected and actual values. By default, the Simulation Data Inspector aligns by data source, then by block path, then by SID, and then by signal name. For details about the Simulation Data Inspector alignment algorithm, see “How the Simulation Data Inspector Compares Data”.

Specify alignment criteria as a string array with one or more of these options listed in the order in which you want them considered:

You can specify the `Alignment` property in the constructor using the `'AligningBy'` name-value pair argument.

Examples

Configure MatchesSignal Constraint Behavior

This example shows how to configure the comparison behavior of a `Simulink.sdi.constraints.MatchesSignal` constraint using a `Simulink.sdi.constraints.MatchesSignalOptions` object. You can use a `MatchesSignalOptions` object to configure multiple comparison properties with a single name-value pair input in the construction of the `MatchesSignal` instance.

Create Time Series Data

This example creates workspace data to use for illustrative purposes only. You can use the `MatchesSignal` constraint to compare data from other sources, such as simulation outputs or a file containing test data, and the constraint can compare time series data in any format supported by the Simulation Data Inspector.

In this example, the first signal is a `timeseries` object with the name `Wave Data` that contains data for a sine wave.

```
time = 0:0.1:20;
sig1vals = sin(2*pi/5*time);
sig1_ts = timeseries(sig1vals,time);
sig1_ts.Name = 'Wave Data';
```

The second signal is also a sine wave at the same frequency, with a slight attenuation and sampled at a different rate. Because the comparison algorithm for the `MatchesSignal` constraint includes a synchronization step, comparing these two signals with different time vectors does not necessarily result in a test failure. The second signal is cast to `single` data type and also named `Wave Data` so the alignment algorithm can pair the signals for comparison.

```
time2 = 0:0.1:22;
sig2vals = single(0.98*sin(2*pi/5*time2));
sig2_ts = timeseries(sig2vals,time2);
sig2_ts.Name = 'Wave Data';
```

Configure a MatchesSignal Instance and Compare the Data

You can use a `MatchesSignalOptions` object to specify how an instance of the `MatchesSignal` constraint handles conditions such as mismatched data types and how signals are aligned between the actual and expected data sets. You can specify the properties of the `MatchesSignalOptions` object to suit the test you want to write. For example, if you want your test to compare data of varying types and a data type match is not functionally relevant, you could set the `IgnoreDataTypes` property to `true`.

Create a `MatchesSignalOptions` object to create a `MatchesSignal` instance that ignores data type mismatches and data samples outside the time interval the actual and expected signals share.

```
import Simulink.sdi.constraints.MatchesSignalOptions
opts = MatchesSignalOptions('IgnoringDataTypes',true,'IgnoringExtraData',true);
```

Create a `TestCase` instance for interactive use and compare `sig1_ts` and `sig2_ts` using the `MatchesSignal` constraint, the `MatchesSignalOptions` object, and an absolute tolerance of `0.02`.

```
import matlab.unittest.TestCase
testCase = TestCase.forInteractiveUse;

import Simulink.sdi.constraints.MatchesSignal
testCase.verifyThat(sig2_ts,MatchesSignal(sig1_ts,'AbsTol',0.02,'WithOptions',opts))
```

Verification passed.

The test passes. When you run the same test again without the options defined by the `MatchesSignalOptions` object, the test fails due to the mismatched data types.

```
testCase.verifyThat(sig2_ts,MatchesSignal(sig1_ts,'AbsTol',0.02))
```

Verification failed.

```
-----
Framework Diagnostic:
-----
MatchesSignal(<Value>,'AbsTol',0.02) failed.
--> Data types do not match for the following aligned signals:
```

ActualValue	ActualDataType	ExpectedValue	ExpectedDataType
{'<Actual>.Data'}	{'single'}	{'<Expected>.Data'}	{'double'}

```
-----
Stack Information:
-----
```

Introduced in R2019a

Simulink.sdi.CustomSnapshot class

Package: Simulink.sdi

Specify settings for a snapshot without opening or affecting the Simulation Data Inspector

Description

Use a `Simulink.sdi.CustomSnapshot` object to specify settings for a snapshot you want to create without opening the Simulation Data Inspector or affecting the open session. Creating a snapshot using a `Simulink.sdi.CustomSnapshot` object is the best option for fully scripted workflows. You can specify the snapshot dimensions in pixels, the subplot layout, and limits for the x- and y- axes. You can use the `clearSignals` and `plotOnSubplot` methods to plot signals you want to include in the snapshot. To capture the snapshot, you can pass the `Simulink.sdi.CustomSnapshot` object as the value for the `settings` name-value pair for the `Simulink.sdi.snapshot` function or use the `snapshot` method.

Construction

`snap = Simulink.sdi.CustomSnapshot` creates a `Simulink.sdi.CustomSnapshot` object.

Properties

Width — Image width

600 (default) | scalar

Image width, in pixels.

Example: 750

Height — Image height

400 (default) | scalar

Image height, in pixels.

Example: 500

Rows — Number of subplot rows

1 (default) | scalar

Number of subplot rows, specified as a scalar between 1 and 8, inclusive. Use `Rows` and `Columns` to set your desired subplot layout.

Example: 2

Columns — Number of subplot columns

1 (default) | scalar

Number of subplot columns, specified as a scalar between 1 and 8, inclusive. Use `Rows` and `Columns` to set your desired subplot layout.

Example: 3

TimeSpan — X-axis limits

2x1 matrix

Limits for the time axis in the snapshot. The time axis limits are the same for all subplots. By default, the time axis adjusts to accommodate the largest time range of the plotted signals.

Example: [0 20]

YRange — Y-axis limits

cell array

Cell array of 1-by-2 matrices specifying the y-axis limits for all subplots in the custom snapshot. By default, YRange is [-3 3] for all subplots.

Example: {[-10 10],[0 100]}

Methods

`clearSignals` Clear signals plotted on subplots of a `Simulink.sdi.CustomSnapshot` object
`plotOnSubPlot` Plot signals on `Simulink.sdi.CustomSnapshot` object subplots
`snapshot` Create a custom snapshot

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples**Copy View Settings to a Run**

This example shows how to copy view settings from one run to another and how to create figures using the `Simulink.sdi.CustomSnapshot` object.

Simulate Your Model and Get a Run Object

Configure the `vdp` model to save output data, and run a simulation to create data.

```
load_system('vdp')
set_param('vdp','SaveFormat','Dataset','SaveOutput','on')
set_param('vdp/Mu','Gain','1');
sim('vdp');
```

Use the Simulation Data Inspector programmatic interface to access the run data.

```
runIndex = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(runIndex);
vdpRun = Simulink.sdi.getRun(runID);
```

Modify Signal View Settings

Use the `Simulink.sdi.Run` object to access signals in the run. Then, modify the signal view settings. This example specifies the line color and style for each signal. The view settings for the run comprise the view settings for each signal and view settings specified for the plot area.

```
sig1 = vdpRun.getSignalByIndex(1);
sig2 = vdpRun.getSignalByIndex(2);

sig1.LineColor = [0 0 1];
sig1.LineDashed = '-.';

sig2.LineColor = [1 0 0];
sig2.LineDashed = ':';
```

Capture a Snapshot from the Simulation Data Inspector

Create a `Simulink.sdi.CustomSnapshot` object and use the `Simulink.sdi.snapshot` function to programmatically capture a snapshot of the contents of the Simulation Data Inspector.

```
snap = Simulink.sdi.CustomSnapshot;
```

You can use properties of the `Simulink.sdi.CustomSnapshot` object to configure the plot settings, like the subplot layout and axis limits, and to plot signals. When you use a `Simulink.sdi.CustomSnapshot` object to create your figure, these plot settings do not affect the Simulation Data Inspector.

```
snap.Rows = 2;
snap.YRange = {[-2.25 2.25], [-3 3]};
snap.plotOnSubPlot(1,1,sig1,true)
snap.plotOnSubPlot(2,1,sig2,true)
```

Use `Simulink.sdi.snapshot` to generate the figure you specified in the properties of the `Simulink.sdi.CustomSnapshot` object.

```
fig = Simulink.sdi.snapshot("from", "custom", "to", "figure", "settings", snap);
```

Copy the View Settings to a New Simulation Run

Simulate the model again, with a different Mu value. Use the Simulation Data Inspector programmatic interface to access the simulation data.

```
set_param('vdp/Mu','Gain','5')
sim('vdp');
```

```
runIndex2 = Simulink.sdi.getRunCount;
runID2 = Simulink.sdi.getRunIDByIndex(runIndex2);
run2 = Simulink.sdi.getRun(runID2);
```

To create a plot of the new output data that looks like the one you created in the previous step, you can copy the view settings to the run in a single line of code using `Simulink.sdi.copyRunViewSettings`. The `Simulink.sdi.copyRunViewSettings` function does not automatically update plot settings in `Simulink.sdi.CustomSnapshot` objects, so specify the plot input as `false`.

```
sigIDs = Simulink.sdi.copyRunViewSettings(runID,runID2,false);
```

Capture a Snapshot of the New Simulation Run

Use the `Simulink.sdi.CustomSnapshot` object to capture a snapshot of the new simulation run. First, clear the signals from the subplots. Then, plot the signals from the new run and capture another snapshot.

```
snap.clearSignals
snap.YRange = {[-2.25 2.25],[-8 8]};
```

```
snap.plotOnSubPlot(1,1,sigIDs(1),true)
snap.plotOnSubPlot(2,1,sigIDs(2),true)

fig = snap.snapshot("to","figure");
```

clearSignals

Class: Simulink.sdi.CustomSnapshot

Package: Simulink.sdi

Clear signals plotted on subplots of a Simulink.sdi.CustomSnapshot object

Syntax

```
snap.clearSignals
```

Description

`snap.clearSignals` clears plotted signals from all subplots in the Simulink.sdi.CustomSnapshot object, `snap`. Using the `clearSignals` method does not affect any subplots or signals in your open Simulation Data Inspector session.

Examples

Copy View Settings to a Run

This example shows how to copy view settings from one run to another and how to create figures using the Simulink.sdi.CustomSnapshot object.

Simulate Your Model and Get a Run Object

Configure the vdp model to save output data, and run a simulation to create data.

```
load_system('vdp')
set_param('vdp', 'SaveFormat', 'Dataset', 'SaveOutput', 'on')
set_param('vdp/Mu', 'Gain', '1');
sim('vdp');
```

Use the Simulation Data Inspector programmatic interface to access the run data.

```
runIndex = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(runIndex);
vdpRun = Simulink.sdi.getRun(runID);
```

Modify Signal View Settings

Use the Simulink.sdi.Run object to access signals in the run. Then, modify the signal view settings. This example specifies the line color and style for each signal. The view settings for the run comprise the view settings for each signal and view settings specified for the plot area.

```
sig1 = vdpRun.getSignalByIndex(1);
sig2 = vdpRun.getSignalByIndex(2);

sig1.LineColor = [0 0 1];
sig1.LineDashed = '-.';

sig2.LineColor = [1 0 0];
sig2.LineDashed = ':';
```

Capture a Snapshot from the Simulation Data Inspector

Create a `Simulink.sdi.CustomSnapshot` object and use the `Simulink.sdi.snapshot` function to programmatically capture a snapshot of the contents of the Simulation Data Inspector.

```
snap = Simulink.sdi.CustomSnapshot;
```

You can use properties of the `Simulink.sdi.CustomSnapshot` object to configure the plot settings, like the subplot layout and axis limits, and to plot signals. When you use a `Simulink.sdi.CustomSnapshot` object to create your figure, these plot settings do not affect the Simulation Data Inspector.

```
snap.Rows = 2;
snap.YRange = {[-2.25 2.25],[-3 3]};
snap.plotOnSubPlot(1,1,sig1,true)
snap.plotOnSubPlot(2,1,sig2,true)
```

Use `Simulink.sdi.snapshot` to generate the figure you specified in the properties of the `Simulink.sdi.CustomSnapshot` object.

```
fig = Simulink.sdi.snapshot("from","custom","to","figure","settings",snap);
```

Copy the View Settings to a New Simulation Run

Simulate the model again, with a different `Mu` value. Use the Simulation Data Inspector programmatic interface to access the simulation data.

```
set_param('vdp/Mu', 'Gain', '5')
sim('vdp');
```

```
runIndex2 = Simulink.sdi.getRunCount;
runID2 = Simulink.sdi.getRunIDByIndex(runIndex2);
run2 = Simulink.sdi.getRun(runID2);
```

To create a plot of the new output data that looks like the one you created in the previous step, you can copy the view settings to the run in a single line of code using `Simulink.sdi.copyRunViewSettings`. The `Simulink.sdi.copyRunViewSettings` function does not automatically update plot settings in `Simulink.sdi.CustomSnapshot` objects, so specify the `plot` input as `false`.

```
sigIDs = Simulink.sdi.copyRunViewSettings(runID, runID2, false);
```

Capture a Snapshot of the New Simulation Run

Use the `Simulink.sdi.CustomSnapshot` object to capture a snapshot of the new simulation run. First, clear the signals from the subplots. Then, plot the signals from the new run and capture another snapshot.

```
snap.clearSignals
snap.YRange = {[-2.25 2.25], [-8 8]};
snap.plotOnSubPlot(1,1,sigIDs(1),true)
snap.plotOnSubPlot(2,1,sigIDs(2),true)
```

```
fig = snap.snapshot("to", "figure");
```

plotOnSubPlot

Class: Simulink.sdi.CustomSnapshot

Package: Simulink.sdi

Plot signals on Simulink.sdi.CustomSnapshot object subplots

Syntax

```
snap.plotOnSubPlot(row, column, signal, plot)
```

Description

`snap.plotOnSubPlot(row, column, signal, plot)` plots the signal on the subplot in the Simulink.sdi.CustomSnapshot object, `snap`, specified by `row` and `column` when `plot` is true. When `plot` is false, `plotOnSubPlot` clears the signal from the subplot.

Input Arguments

row — Subplot row

scalar

Row for subplot on which you want to plot a signal. Specify `row` as a value from 1 through 8, inclusive.

Example: 2

column — Subplot column

scalar

Column for subplot on which you want to plot a signal. Specify `column` as a value from 1 through 8, inclusive.

Example: 3

signal — Signal to plot

Simulink.sdi.Signal | signal ID

Signal ID or Simulink.sdi.Signal object corresponding to the signal you want to plot.

Example: sigID

plot — Plot indicator

logical

Logical indicator of whether to plot or clear the signal from the subplot.

- `true` - Plot the signal.
- `false` - Clear the signal.

Example: true

Data Types: logical

Examples

Copy View Settings to a Run

This example shows how to copy view settings from one run to another and how to create figures using the `Simulink.sdi.CustomSnapshot` object.

Simulate Your Model and Get a Run Object

Configure the vdp model to save output data, and run a simulation to create data.

```
load_system('vdp')
set_param('vdp','SaveFormat','Dataset','SaveOutput','on')
set_param('vdp/Mu','Gain','1');
sim('vdp');
```

Use the Simulation Data Inspector programmatic interface to access the run data.

```
runIndex = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(runIndex);
vdpRun = Simulink.sdi.getRun(runID);
```

Modify Signal View Settings

Use the `Simulink.sdi.Run` object to access signals in the run. Then, modify the signal view settings. This example specifies the line color and style for each signal. The view settings for the run comprise the view settings for each signal and view settings specified for the plot area.

```
sig1 = vdpRun.getSignalByIndex(1);
sig2 = vdpRun.getSignalByIndex(2);

sig1.LineColor = [0 0 1];
sig1.LineDashed = '-.';

sig2.LineColor = [1 0 0];
sig2.LineDashed = ':';
```

Capture a Snapshot from the Simulation Data Inspector

Create a `Simulink.sdi.CustomSnapshot` object and use the `Simulink.sdi.snapshot` function to programmatically capture a snapshot of the contents of the Simulation Data Inspector.

```
snap = Simulink.sdi.CustomSnapshot;
```

You can use properties of the `Simulink.sdi.CustomSnapshot` object to configure the plot settings, like the subplot layout and axis limits, and to plot signals. When you use a `Simulink.sdi.CustomSnapshot` object to create your figure, these plot settings do not affect the Simulation Data Inspector.

```
snap.Rows = 2;
snap.YRange = {[ -2.25 2.25], [ -3 3]};
snap.plotOnSubPlot(1,1,sig1,true)
snap.plotOnSubPlot(2,1,sig2,true)
```

Use `Simulink.sdi.snapshot` to generate the figure you specified in the properties of the `Simulink.sdi.CustomSnapshot` object.

```
fig = Simulink.sdi.snapshot("from","custom","to","figure","settings",snap);
```

Copy the View Settings to a New Simulation Run

Simulate the model again, with a different Mu value. Use the Simulation Data Inspector programmatic interface to access the simulation data.

```
set_param('vdp/Mu', 'Gain', '5')
sim('vdp');
```

```
runIndex2 = Simulink.sdi.getRunCount;
runID2 = Simulink.sdi.getRunIDByIndex(runIndex2);
run2 = Simulink.sdi.getRun(runID2);
```

To create a plot of the new output data that looks like the one you created in the previous step, you can copy the view settings to the run in a single line of code using `Simulink.sdi.copyRunViewSettings`. The `Simulink.sdi.copyRunViewSettings` function does not automatically update plot settings in `Simulink.sdi.CustomSnapshot` objects, so specify the plot input as `false`.

```
sigIDs = Simulink.sdi.copyRunViewSettings(runID, runID2, false);
```

Capture a Snapshot of the New Simulation Run

Use the `Simulink.sdi.CustomSnapshot` object to capture a snapshot of the new simulation run. First, clear the signals from the subplots. Then, plot the signals from the new run and capture another snapshot.

```
snap.clearSignals
snap.YRange = {[-2.25 2.25], [-8 8]};
```

```
snap.plotOnSubPlot(1,1,sigIDs(1),true)
snap.plotOnSubPlot(2,1,sigIDs(2),true)

fig = snap.snapshot("to","figure");
```

snapshot

Class: Simulink.sdi.CustomSnapshot

Package: Simulink.sdi

Create a custom snapshot

Syntax

```
fig = snap.snapshot
[fig,image] = snap.snapshot
fig = snap.snapshot(Name,Value)
[fig,image] = snap.snapshot
```

Description

`fig = snap.snapshot` creates a figure according to the properties of the `Simulink.sdi.CustomSnapshot` object, `snap`, and returns the handle for the figure, `fig`.

`[fig,image] = snap.snapshot` creates a figure according to the properties of the `Simulink.sdi.CustomSnapshot` object, `snap`, and returns the handle for the figure, `fig`, and an array of image data, `image`.

`fig = snap.snapshot(Name,Value)` creates a figure according to the properties of the `Simulink.sdi.CustomSnapshot` object, `snap`, with additional options specified by one or more `Name,Value` pair arguments. This syntax returns the figure handle, `fig`.

`[fig,image] = snap.snapshot` creates a figure according to the properties of the `Simulink.sdi.CustomSnapshot` object, `snap`, with additional options specified by one or more `Name,Value` pair arguments. This syntax returns the figure handle, `fig`, and an array of image data, `image`.

Input Arguments

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: `'to','figure','props',{'Name','My Data'}`

to — Type of snapshot to create

`'image'` (default) | `'figure'` | `'file'` | `'clipboard'`

Type of snapshot to create.

- `'image'` — Create a figure and return the figure handle and an array of image data. When you specify `'to','image'`, the `fig` and `image` outputs both have value.
- `'figure'` — Create a figure and return the figure handle. When you specify `'to','figure'` the `fig` output has value, and the `image` output is empty.

- `'file'` — Save to a PNG file with the name specified by the `filename` name-value pair. If you do not specify a `filename` name-value pair, the file is named `plots.png`. When you specify `'to', 'file'`, the `fig` and `image` outputs are both empty.
- `'clipboard'` — Copy the plots to your system clipboard. From the clipboard, you can paste the image into another program such as Microsoft Word. When you specify `'to', 'clipboard'`, the `fig` and `image` outputs are both empty.

Example: `'to', 'file'`

Data Types: `char` | `string`

filename — Name for image file

`'plots.png'` (default) | character array | string

Name of the image file to store the snapshot when you specify `'to', 'file'`.

Example: `'filename', 'MyImage.png'`

Data Types: `char` | `string`

props — Properties to customize the figure

cell array

Figure properties, specified as a cell array. You can include settings for the figure properties described in Figure Properties.

Example: `'props', {'Name', 'MyData', 'NumberTitle', 'off'}`

Data Types: `char` | `string`

Output Arguments

fig — Figure handle

figure handle

Handle for the figure. When a figure is not created with your specified options, the `fig` output is empty.

image — Image data

array

Array of image data. The `image` output has value when you use `Simulink.sdi.snapshot` without any input arguments or without a `to` name-value pair and when you specify `'to', 'image'`.

Examples

Copy View Settings to a Run

This example shows how to copy view settings from one run to another and how to create figures using the `Simulink.sdi.CustomSnapshot` object.

Simulate Your Model and Get a Run Object

Configure the `vdp` model to save output data, and run a simulation to create data.

```
load_system('vdp')
set_param('vdp', 'SaveFormat', 'Dataset', 'SaveOutput', 'on')
```

```
set_param('vdp/Mu', 'Gain', '1');  
sim('vdp');
```

Use the Simulation Data Inspector programmatic interface to access the run data.

```
runIndex = Simulink.sdi.getRunCount;  
runID = Simulink.sdi.getRunIDByIndex(runIndex);  
vdpRun = Simulink.sdi.getRun(runID);
```

Modify Signal View Settings

Use the `Simulink.sdi.Run` object to access signals in the run. Then, modify the signal view settings. This example specifies the line color and style for each signal. The view settings for the run comprise the view settings for each signal and view settings specified for the plot area.

```
sig1 = vdpRun.getSignalByIndex(1);  
sig2 = vdpRun.getSignalByIndex(2);  
  
sig1.LineColor = [0 0 1];  
sig1.LineDashed = '-.';  
  
sig2.LineColor = [1 0 0];  
sig2.LineDashed = ':';
```

Capture a Snapshot from the Simulation Data Inspector

Create a `Simulink.sdi.CustomSnapshot` object and use the `Simulink.sdi.snapshot` function to programmatically capture a snapshot of the contents of the Simulation Data Inspector.

```
snap = Simulink.sdi.CustomSnapshot;
```

You can use properties of the `Simulink.sdi.CustomSnapshot` object to configure the plot settings, like the subplot layout and axis limits, and to plot signals. When you use a `Simulink.sdi.CustomSnapshot` object to create your figure, these plot settings do not affect the Simulation Data Inspector.

```
snap.Rows = 2;  
snap.YRange = {[ -2.25 2.25], [ -3 3]};  
snap.plotOnSubPlot(1,1,sig1,true)  
snap.plotOnSubPlot(2,1,sig2,true)
```

Use `Simulink.sdi.snapshot` to generate the figure you specified in the properties of the `Simulink.sdi.CustomSnapshot` object.

```
fig = Simulink.sdi.snapshot("from", "custom", "to", "figure", "settings", snap);
```

Copy the View Settings to a New Simulation Run

Simulate the model again, with a different Mu value. Use the Simulation Data Inspector programmatic interface to access the simulation data.

```
set_param('vdp/Mu','Gain','5')
sim('vdp');
```

```
runIndex2 = Simulink.sdi.getRunCount;
runID2 = Simulink.sdi.getRunIDByIndex(runIndex2);
run2 = Simulink.sdi.getRun(runID2);
```

To create a plot of the new output data that looks like the one you created in the previous step, you can copy the view settings to the run in a single line of code using `Simulink.sdi.copyRunViewSettings`. The `Simulink.sdi.copyRunViewSettings` function does not automatically update plot settings in `Simulink.sdi.CustomSnapshot` objects, so specify the plot input as `false`.

```
sigIDs = Simulink.sdi.copyRunViewSettings(runID,runID2,false);
```

Capture a Snapshot of the New Simulation Run

Use the `Simulink.sdi.CustomSnapshot` object to capture a snapshot of the new simulation run. First, clear the signals from the subplots. Then, plot the signals from the new run and capture another snapshot.

```
snap.clearSignals
snap.YRange = {[-2.25 2.25],[-8 8]};
```

```
snap.plotOnSubPlot(1,1,sigIDs(1),true)
snap.plotOnSubPlot(2,1,sigIDs(2),true)

fig = snap.snapshot("to","figure");
```

Simulink.sdi.DatasetRef class

Package: Simulink.sdi

Access data in Simulation Data Inspector repository

Description

The `Simulink.sdi.DatasetRef` class provides access to data in the Simulation Data Inspector repository without loading the entire set of data into memory. The class is compatible with the `Simulink.SimulationData.DatasetRef` class.

Construction

`dsr_array = Simulink.sdi.DatasetRef` constructs an array containing a `Simulink.sdi.DatasetRef` object for each run in the Simulation Data Inspector.

`dsr_array = Simulink.sdi.DatasetRef(domain)` creates an array containing a `Simulink.sdi.DatasetRef` object for each run, with the contents of each run limited to the selected domain.

`dsr = Simulink.sdi.DatasetRef(runID)` creates a `Simulink.sdi.DatasetRef` object of the run corresponding to the run identifier, `runID`.

`dsr = Simulink.sdi.DatasetRef(runID, domain)` creates a `Simulink.sdi.DatasetRef` object of the run corresponding to `runID` with the contents specified by `domain`.

`dsr = Simulink.sdi.DatasetRef(runID, domain, repositoryPath)` creates a `Simulink.sdi.DatasetRef` object of the run corresponding to `runID` including the contents specified by `domain` from a repository path specified by `repositoryPath`.

Input Arguments

domain — Specify contents of Simulink.sdi.DatasetRef objects

'signals' | 'outports' | []

Limits the contents included in the `Simulink.sdi.DatasetRef` object.

- 'signals' includes only logged signals.
- 'outports' includes only logged outports.
- [] includes all run data.

runID — Run identifier

integer

Specifies the run containing the data for the `Simulink.sdi.DatasetRef` object.

repositoryPath — Path containing the run

string | character vector

Specifies the location of the run containing the data for the `Simulink.sdi.DatasetRef` object.

Properties

Name — Run name

character vector

The name of the run that corresponds with the `Simulink.sdi.DatasetRef` object.

Example: 'Run 1'

Run — Simulink.sdi.Run object

`Simulink.sdi.Run` object

`Simulink.sdi.Run` object associated with the `Simulink.sdi.DatasetRef` object.

numElements — Number of top-level elements in run

`Simulink.sdi.Run` object

Number of top-level elements in the `Simulink.sdi.Run` object associated with the `Simulink.sdi.DatasetRef` object.

Methods

<code>compare</code>	Compare runs with <code>DatasetRef</code> objects
<code>getAsDatastore</code>	Retrieve element as <code>sdidatastore</code> object
<code>getElement</code>	Retrieve <code>DatasetRef</code> element by index
<code>getElementNames</code>	Get character vectors of element names
<code>getSignal</code>	Return <code>Signal</code> object
<code>plot</code>	Open the Simulation Data Inspector to view and compare data

Copy Semantics

Handle. To learn how handle classes affect copy operations, see [Copying Objects \(MATLAB\)](#).

Examples

Compare Runs with the Simulink.sdi.DatasetRef Object

This example shows how to work with the `Simulink.sdi.DatasetRef` object by comparing two runs of the `ex_sl_demo_absbrake` system with different desired slip ratios.

```
% Simulate model ex_sl_demo_absbrake to create a run of logged signals
load_system('ex_sl_demo_absbrake')
sim('ex_sl_demo_absbrake')

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
brakeRun = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
```

```
run_DSRef = brakeRun.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames

names = 2x1 cell
    {'yout'}
    {'slp' }

% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);

% View signals in outputs
outputs = yout.Values

outputs = struct with fields:
    Ww: [1x1 timeseries]
    Vs: [1x1 timeseries]
    Sd: [1x1 timeseries]

% Get slp signal
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

% Create another run for a different Desired relative slip
set_param('ex_slldemo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_slldemo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));

% Open the Simulation Data Inspector to view signals
run_DSRef.plot
```

Topics

“Inspect and Compare Data Programmatically”

Introduced in R2017b

compare

Class: Simulink.sdi.DatasetRef

Package: Simulink.sdi

Compare runs with DatasetRef objects

Syntax

```
[matches, mismatches, results] = dsrObj.compare(other)
```

Description

`[matches, mismatches, results] = dsrObj.compare(other)` returns the number of matches, number of mismatches, and comparison results for a comparison of data in a `Simulink.sdi.DatasetRef` object. The comparison results are returned as a `Simulink.sdi.DiffRunResult` object.

Input Arguments

other — Comparison data

MAT-file | variable

Comparison data, which can come from another `Simulink.sdi.DatasetRef` object, a Dataset in the workspace, or a MAT-file.

Example: 'data.mat'

Example: var

Output Arguments

matches — Number of matching signals

integer

Number of signals that matched within tolerance in the comparison.

mismatches — Number of mismatched signals

integer

Number of signals that did not match within tolerance in the comparison.

results — Simulink.sdi.DiffRunResult object with comparison results

`Simulink.sdi.DiffRunResult` object

Results of the comparison, returned in a `Simulink.sdi.DiffRunResult` object.

Examples

Compare Runs with the Simulink.sdi.DatasetRef Object

This example shows how to work with the `Simulink.sdi.DatasetRef` object by comparing two runs of the `ex_sl-demo_absbrake` system with different desired slip ratios.

```
% Simulate model ex_sl-demo_absbrake to create a run of logged signals
load_system('ex_sl-demo_absbrake')
sim('ex_sl-demo_absbrake')

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
brakeRun = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = brakeRun.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames

names = 2x1 cell
    {'yout'}
    {'slp' }

% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);

% View signals in outputs
outputs = yout.Values

outputs = struct with fields:
    Ww: [1x1 timeseries]
    Vs: [1x1 timeseries]
    Sd: [1x1 timeseries]

% Get slp signal
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

% Create another run for a different Desired relative slip
set_param('ex_sl-demo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_sl-demo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));

% Open the Simulation Data Inspector to view signals
run_DSRef.plot
```

Alternatives

Using the Simulation Data Inspector API, you could create runs for the data you want to compare and use `Simulink.sdi.compareRuns` for the comparison. You can also view runs created from simulation, import data to runs, and compare runs with the Simulation Data Inspector UI.

“How the Simulation Data Inspector Compares Data”

Introduced in R2017b

getAsDatastore

Class: Simulink.sdi.DatasetRef

Package: Simulink.sdi

Retrieve element as sdatastore object

Syntax

```
[elementDatastore, name, index] = SDIDatasetRef.getAsDatastore(arg)
```

Description

[elementDatastore, name, index] = SDIDatasetRef.getAsDatastore(arg) returns the requested element as a matlab.io.datastore.sdatastoreobject, along with the element name and index.

Input Arguments

arg — Element selection criterion

integer | character vector

Search criterion used to retrieve the element from the Simulink.sdi.DatasetRefobject. For name-based searches, specify arg as a character vector. For index-based searches, arg is an integer, representing the index of the desired element.

Example: 'MySignal'

Example: 3

Output Arguments

elementDatastore — Element as sdatastore

sdatastore object

Element as matlab.io.datastore.sdatastore object.

name — Element name

character vector

The name of the element.

index — Element index in DatasetRef object

integer

The index of the element in the Simulink.sdi.DatasetRef object.

Examples

Create an `sdidatastore` Object for a Signal

This example shows how to create a `sdidatastore` object for a signal in a `Simulink.sdi.DatasetRef` object.

```
% Simulate model sldemo_fuelsys to create a run of logged signals
sim('sldemo_fuelsys')

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
fuelRun = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = fuelRun.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames

names = 16x1 cell
    {'CheckRange'           }
    {'air_fuel_ratio'      }
    {'speed'               }
    {'map'                 }
    {'ego'                 }
    {'throttle'           }
    {'fuel'               }
    {'EGO Fault Switch:1' }
    {'Engine Speed Fault Switch:1' }
    {'MAP Fault Switch:1' }
    {'Throttle Angle Fault Switch:1'}
    {'ego_sw'             }
    {'engine_speed'       }
    {'speed_sw'           }
    {'map_sw'             }
    {'throttle_sw'        }
```

```
% Get sdidatastore object for fuel signal
fuel_ds = run_DSRef.getAsDatastore(10);
```

Alternatives

You can construct a `sdidatastore` object for a specified signal using `matlab.io.datastore.sdidatastore`.

getElement

Class: Simulink.sdi.DatasetRef

Package: Simulink.sdi

Retrieve DatasetRef element by index

Syntax

```
[element, name, index] = SDIdatasetRef.getElement(index)
```

Description

`[element, name, index] = SDIdatasetRef.getElement(index)` returns the element within the Run in the Simulink.sdi.DatasetRef object at the specified index.

Input Arguments

index — Index of element

integer

Location of the element in the Simulink.sdi.DatasetRef object.

Output Arguments

element — Run element in the DatasetRef object

signal

Element from the run in the Simulink.sdi.DatasetRef object.

name — Element name

character vector

Name of the element retrieved from the Simulink.sdi.DatasetRef object.

index — Location of element

integer

Location of the element within the Simulink.sdi.DatasetRef object.

Examples

Compare Runs with the Simulink.sdi.DatasetRef Object

This example shows how to work with the Simulink.sdi.DatasetRef object by comparing two runs of the `ex_sl-demo-absbrake` system with different desired slip ratios.

```
% Simulate model ex_sl-demo-absbrake to create a run of logged signals  
load_system('ex_sl-demo-absbrake')  
sim('ex_sl-demo-absbrake')
```

```

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
brakeRun = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = brakeRun.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames

names = 2x1 cell
    {'yout'}
    {'slp' }

% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);

% View signals in outputs
outputs = yout.Values

outputs = struct with fields:
    Ww: [1x1 timeseries]
    Vs: [1x1 timeseries]
    Sd: [1x1 timeseries]

% Get slp signal
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

% Create another run for a different Desired relative slip
set_param('ex_sldemo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_sldemo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));

% Open the Simulation Data Inspector to view signals
run_DSRef.plot

```

getElementNames

Class: Simulink.sdi.DatasetRef

Package: Simulink.sdi

Get character vectors of element names

Syntax

```
names = dsrObj.getElementNames
```

Description

`names = dsrObj.getElementNames` returns a cell array of character vectors containing the names of the elements in `dsrObj`.

Output Arguments

names — Element names

cell array

Names of the top level elements in the `Simulink.sdi.DatasetRef` object in a cell array.

Examples

Compare Runs with the Simulink.sdi.DatasetRef Object

This example shows how to work with the `Simulink.sdi.DatasetRef` object by comparing two runs of the `ex_sl_demo_absbrake` system with different desired slip ratios.

```
% Simulate model ex_sl_demo_absbrake to create a run of logged signals
load_system('ex_sl_demo_absbrake')
sim('ex_sl_demo_absbrake')

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
brakeRun = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = brakeRun.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames

names = 2x1 cell
    {'yout'}
    {'slp' }
```

```
% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);

% View signals in outputs
outputs = yout.Values

outputs = struct with fields:
    Ww: [1x1 timeseries]
    Vs: [1x1 timeseries]
    Sd: [1x1 timeseries]

% Get slp signal
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

% Create another run for a different Desired relative slip
set_param('ex_sldemo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_sldemo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));

% Open the Simulation Data Inspector to view signals
run_DSRef.plot
```

getSignal

Class: Simulink.sdi.DatasetRef

Package: Simulink.sdi

Return Signal object

Syntax

```
sigObj = SDIDatasetRef.getSignal(searchArg)
```

Description

`sigObj = SDIDatasetRef.getSignal(searchArg)` returns the `Simulink.sdi.Signal` object corresponding to the search argument, `searchArg`.

Input Arguments

searchArg — Search parameter

character vector | integer

The search parameters to select the `Simulink.sdi.Signal` object. The `searchArg` can be a character vector or string targeting a signal name or an integer for an index-based search.

Example: 'throttle'

Example: 2

Output Arguments

sigObj — Simulink.sdi.Signal object

`Simulink.sdi.Signal` object

The `Simulink.sdi.Signal` object corresponding to the search query.

Examples

Compare Runs with the Simulink.sdi.DatasetRef Object

This example shows how to work with the `Simulink.sdi.DatasetRef` object by comparing two runs of the `ex_sl-demo_absbrake` system with different desired slip ratios.

```
% Simulate model ex_sl-demo_absbrake to create a run of logged signals
load_system('ex_sl-demo_absbrake')
sim('ex_sl-demo_absbrake')

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
```

```

brakeRun = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = brakeRun.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames

names = 2x1 cell
    {'yout'}
    {'slp' }

% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);

% View signals in outputs
outputs = yout.Values

outputs = struct with fields:
    Ww: [1x1 timeseries]
    Vs: [1x1 timeseries]
    Sd: [1x1 timeseries]

% Get slp signal
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

% Create another run for a different Desired relative slip
set_param('ex_slldemo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_slldemo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));

% Open the Simulation Data Inspector to view signals
run_DSRef.plot

```

Alternatives

If the signal is a top-level element in the `Simulink.sdi.DatasetRef` object, you can use the `getElement` method to get the `Simulink.sdi.Signal` object by index.

plot

Class: Simulink.sdi.DatasetRef

Package: Simulink.sdi

Open the Simulation Data Inspector to view and compare data

Syntax

```
SDIDatasetRef.plot
```

Description

`SDIDatasetRef.plot` opens the Simulation Data Inspector, where you can view and compare runs and signals.

Examples

Compare Runs with the Simulink.sdi.DatasetRef Object

This example shows how to work with the `Simulink.sdi.DatasetRef` object by comparing two runs of the `ex_sl-demo-absbrake` system with different desired slip ratios.

```
% Simulate model ex_sl-demo-absbrake to create a run of logged signals
load_system('ex_sl-demo-absbrake')
sim('ex_sl-demo-absbrake')

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
brakeRun = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = brakeRun.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames

names = 2x1 cell
    {'yout'}
    {'slp' }

% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);

% View signals in outputs
outputs = yout.Values

outputs = struct with fields:
    Ww: [1x1 timeseries]
```

```
Vs: [1x1 timeseries]
Sd: [1x1 timeseries]

% Get slp signal
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

% Create another run for a different Desired relative slip
set_param('ex_slldemo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_slldemo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));

% Open the Simulation Data Inspector to view signals
run_DSRef.plot
```

Alternatives

You can use the `Simulink.sdi.view` function to open the Simulation Data Inspector. For information on using the UI to open the Simulation Data Inspector, see “View Data with the Simulation Data Inspector”.

Simulink.sdi.WorkerRun class

Package: Simulink.sdi

Access simulation data from parallel workers

Description

The `Simulink.sdi.WorkerRun` class provides access to run data generated on Parallel Computing Toolbox parallel workers. Create a `Simulink.sdi.WorkerRun` object on the worker, and then use the object to access data in your local MATLAB session.

Construction

`workerRun = Simulink.sdi.WorkerRun(runID)` creates a `Simulink.sdi.WorkerRun` object with the run identifier specified by `runID`.

`workerRun = Simulink.sdi.WorkerRun.getLatest` creates a `Simulink.sdi.WorkerRun` object of the most recent run.

Input Arguments

runID — Run identifier

integer

Run identifier

Methods

<code>getDataset</code>	Create Dataset of worker run data
<code>getDatasetRef</code>	Create DatasetRef for worker run
<code>getLatest</code>	Create worker run for latest run
<code>getLocalRun</code>	Create local run from worker run

Copy Semantics

Handle. To learn how handle classes affect copy operations, see [Copying Objects \(MATLAB\)](#).

Examples

Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport('local')
```

```
% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];
```

Initialize Parallel Workers

Use `gcp` to create a pool of local workers to run parallel simulations if you don't already have one. In an `spmd` code block, load the `slexAircraftExample` model and select signals to log. To avoid data concurrency issues using `sim` in `parfor`, create a temporary directory for each worker to use during simulations.

```
p = gcp;
```

```
Starting parallel pool (parpool) using the 'local' profile ...
connected to 4 workers.
```

```
spmd
```

```
% Load system and select signals to log
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model', 4, 'on')

% Create temporary directory on each worker
workDir = pwd;
addpath(workDir)
tempDir = tempname;
mkdir(tempDir)
cd(tempDir)
```

```
end
```

Run Parallel Simulations

Use `parfor` to run the seven simulations in parallel. Select the value for `Ts` for each simulation, and modify the value of `Ts` in the model workspace. Then, run the simulation and build an array of `Simulink.sdi.WorkerRun` objects to access the data with the Simulation Data Inspector. After the `parfor` loop, use another `spmd` segment to remove the temporary directories from the workers.

```
parfor index = 1:7
```

```
% Select value for Ts
Ts_val = Ts_vals(index);

% Change the filter time constant and simulate
modelWorkspace = get_param('slexAircraftExample', 'modelworkspace');
modelWorkspace.assignin('Ts', Ts_val)
sim('slexAircraftExample')
```

```

% Create a worker run for each simulation
workerRun(index) = Simulink.sdi.WorkerRun.getLatest

end

spmd

% Remove temporary directories
cd(workDir)
rmdir(tempDir, 's')
rmpath(workDir)

```

```
end
```

Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

```
ds(7) = Simulink.SimulationData.Dataset;
```

```
for a = 1:7
    ds(a) = workerRun(a).getDataset;
```

```
end
```

```
ds(1)
```

```
ans =
Simulink.SimulationData.Dataset '' with 2 elements
```

		Name	BlockPath
1	[1x1 Signal]	alpha, rad	...rcraftExample/Aircraft Dynamics Model
2	[1x1 Signal]	Stick	slexAircraftExample/Pilot

- Use braces { } to access, modify, or add elements using index.

Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```
for b = 1:7
    datasetRef(b) = workerRun(b).getDatasetRef;
```

```
end
```

```
datasetRef(1)
```

```
ans =
DatasetRef with properties:

    Name: 'Run 3: slexAircraftExample'
     Run: [1x1 Simulink.sdi.Run]
numElements: 2
```

Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local Run objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```
for c = 1:7

    Runs(c) = workerRun(c).getLocalRun;
    Ts_val_str = num2str(Ts_vals(c));
    desc = strcat('Ts = ', Ts_val_str);
    Runs(c).Description = desc;
    Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);

end
```

Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

```
Simulink.sdi.cleanupWorkerResources
```

Alternatives

You can also access, view, and analyze simulation data from Parallel Computing Toolbox workers using the Simulation Data Inspector UI.

getDataset

Class: Simulink.sdi.WorkerRun

Package: Simulink.sdi

Create Dataset of worker run data

Syntax

```
dataset = workerRun.getDataset  
dataset = workerRun.getDataset(domain)
```

Description

`dataset = workerRun.getDataset` returns a `Simulink.SimulationData.Dataset` object of the data corresponding to the `Simulink.sdi.WorkerRun` object.

`dataset = workerRun.getDataset(domain)` returns a `Simulink.SimulationData.Dataset` object of the data corresponding to the `Simulink.sdi.WorkerRun` object limited to the scope specified by `domain`.

Input Arguments

domain — Scope specifier

'signals' | 'outports'

Scope limiting argument that selects the data to return in the `Simulink.SimulationData.Dataset` object.

- 'signals' limits the data returned in the Dataset to signals in the WorkerRun.
- 'outports' limits the data returned in the Dataset to output data in the WorkerRun.

Output Arguments

dataset — `Simulink.SimulationData.Dataset` object

`Simulink.SimulationData.Dataset` object

`Simulink.SimulationData.Dataset` object containing the data from the `Simulink.sdi.WorkerRun` object.

Examples

Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport('local')
```

```
% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];
```

Initialize Parallel Workers

Use `gcp` to create a pool of local workers to run parallel simulations if you don't already have one. In an `spmd` code block, load the `slexAircraftExample` model and select signals to log. To avoid data concurrency issues using `sim` in `parfor`, create a temporary directory for each worker to use during simulations.

```
p = gcp;
```

```
Starting parallel pool (parpool) using the 'local' profile ...
connected to 4 workers.
```

```
spmd
```

```
% Load system and select signals to log
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model', 4, 'on')

% Create temporary directory on each worker
workDir = pwd;
addpath(workDir)
tempDir = tempname;
mkdir(tempDir)
cd(tempDir)
```

```
end
```

Run Parallel Simulations

Use `parfor` to run the seven simulations in parallel. Select the value for `Ts` for each simulation, and modify the value of `Ts` in the model workspace. Then, run the simulation and build an array of `Simulink.sdi.WorkerRun` objects to access the data with the Simulation Data Inspector. After the `parfor` loop, use another `spmd` segment to remove the temporary directories from the workers.

```
parfor index = 1:7
```

```
% Select value for Ts
Ts_val = Ts_vals(index);

% Change the filter time constant and simulate
modelWorkspace = get_param('slexAircraftExample', 'modelworkspace');
modelWorkspace.assignin('Ts', Ts_val)
sim('slexAircraftExample')
```

```

    % Create a worker run for each simulation
    workerRun(index) = Simulink.sdi.WorkerRun.getLatest

end

spmd

    % Remove temporary directories
    cd(workDir)
    rmdir(tempDir, 's')
    rmpath(workDir)

```

```
end
```

Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

```
ds(7) = Simulink.SimulationData.Dataset;
```

```
for a = 1:7
    ds(a) = workerRun(a).getDataset;
```

```
end
```

```
ds(1)
```

```
ans =
Simulink.SimulationData.Dataset '' with 2 elements
```

		Name	BlockPath
1	[1x1 Signal]	alpha, rad	...rcraftExample/Aircraft Dynamics Model
2	[1x1 Signal]	Stick	slexAircraftExample/Pilot

- Use braces { } to access, modify, or add elements using index.

Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```
for b = 1:7
    datasetRef(b) = workerRun(b).getDatasetRef;
```

```
end
```

```
datasetRef(1)
```

```
ans =
DatasetRef with properties:

    Name: 'Run 3: slexAircraftExample'
    Run: [1x1 Simulink.sdi.Run]
 numElements: 2
```

Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local Run objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```
for c = 1:7

    Runs(c) = workerRun(c).getLocalRun;
    Ts_val_str = num2str(Ts_vals(c));
    desc = strcat('Ts = ', Ts_val_str);
    Runs(c).Description = desc;
    Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);

end
```

Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

```
Simulink.sdi.cleanupWorkerResources
```

Topics

“Inspect and Compare Data Programmatically”

Introduced in R2017b

getDatasetRef

Class: Simulink.sdi.WorkerRun

Package: Simulink.sdi

Create DatasetRef for worker run

Syntax

```
datasetRef = workerRun.getDatasetRef  
datasetRef = workerRun.getDatasetRef(domain)
```

Description

`datasetRef = workerRun.getDatasetRef` returns a `Simulink.SimulationData.DatasetRef` object referencing the data in the `Simulink.sdi.WorkerRun` object, `workerRun`.

`datasetRef = workerRun.getDatasetRef(domain)` returns a `Simulink.SimulationData.DatasetRef` object referencing the data in the `Simulink.sdi.WorkerRun` object, `workerRun`, limited to the scope specified by `domain`.

Input Arguments

domain — Scope limiting input

'signals' | 'outports'

Scope limiting argument that selects the data to reference in the `Simulink.SimulationData.DatasetRef` object.

- 'signals' limits the data referenced in the `DatasetRef` to signals in the `WorkerRun`.
- 'outports' limits the data referenced in the `DatasetRef` to output data in the `WorkerRun`.

Output Arguments

datasetRef — Simulink.SimulationData.DatasetRef object

`Simulink.sdi.DatasetRef` object

`Simulink.sdi.DatasetRef` object referencing the data in the Parallel Computing Toolbox worker run.

Examples

Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport('local')
```

```
% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];
```

Initialize Parallel Workers

Use `gcp` to create a pool of local workers to run parallel simulations if you don't already have one. In an `spmd` code block, load the `slexAircraftExample` model and select signals to log. To avoid data concurrency issues using `sim` in `parfor`, create a temporary directory for each worker to use during simulations.

```
p = gcp;
```

```
Starting parallel pool (parpool) using the 'local' profile ...
connected to 4 workers.
```

```
spmd
```

```
% Load system and select signals to log
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model', 4, 'on')

% Create temporary directory on each worker
workDir = pwd;
addpath(workDir)
tempDir = tempname;
mkdir(tempDir)
cd(tempDir)
```

```
end
```

Run Parallel Simulations

Use `parfor` to run the seven simulations in parallel. Select the value for `Ts` for each simulation, and modify the value of `Ts` in the model workspace. Then, run the simulation and build an array of `Simulink.sdi.WorkerRun` objects to access the data with the Simulation Data Inspector. After the `parfor` loop, use another `spmd` segment to remove the temporary directories from the workers.

```
parfor index = 1:7
```

```
% Select value for Ts
Ts_val = Ts_vals(index);

% Change the filter time constant and simulate
modelWorkspace = get_param('slexAircraftExample', 'modelworkspace');
modelWorkspace.assignin('Ts', Ts_val)
sim('slexAircraftExample')
```

```

% Create a worker run for each simulation
workerRun(index) = Simulink.sdi.WorkerRun.getLatest

end

spmd

% Remove temporary directories
cd(workDir)
rmdir(tempDir, 's')
rmpath(workDir)

```

```
end
```

Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

```
ds(7) = Simulink.SimulationData.Dataset;
```

```
for a = 1:7
    ds(a) = workerRun(a).getDataset;
```

```
end
```

```
ds(1)
```

```
ans =
Simulink.SimulationData.Dataset '' with 2 elements
```

		Name	BlockPath
1	[1x1 Signal]	alpha, rad	...rcraftExample/Aircraft Dynamics Model
2	[1x1 Signal]	Stick	slexAircraftExample/Pilot

- Use braces { } to access, modify, or add elements using index.

Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```
for b = 1:7
    datasetRef(b) = workerRun(b).getDatasetRef;
```

```
end
```

```
datasetRef(1)
```

```
ans =
DatasetRef with properties:

    Name: 'Run 3: slexAircraftExample'
     Run: [1x1 Simulink.sdi.Run]
numElements: 2
```

Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local Run objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```
for c = 1:7

    Runs(c) = workerRun(c).getLocalRun;
    Ts_val_str = num2str(Ts_vals(c));
    desc = strcat('Ts = ', Ts_val_str);
    Runs(c).Description = desc;
    Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);

end
```

Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

```
Simulink.sdi.cleanupWorkerResources
```

Topics

“Inspect and Compare Data Programmatically”

Introduced in R2017b

Simulink.sdi.WorkerRun.getLatest

Class: Simulink.sdi.WorkerRun

Package: Simulink.sdi

Create worker run for latest run

Syntax

```
runObj = Simulink.sdi.WorkerRun.getLatest
```

Description

`runObj = Simulink.sdi.WorkerRun.getLatest` creates a `Simulink.sdi.WorkerRun` object for the latest run on a Parallel Computing Toolbox worker.

Output Arguments

runObj — Local Simulink.sdi.Run object

Simulink.sdi.WorkerRun object

Simulink.sdi.WorkerRun object to access the data from the latest Parallel Computing Toolbox worker run.

Examples

Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is  
% enabled.  
Simulink.sdi.clear  
Simulink.sdi.enablePCTSupport('local')
```

```
% Define Ts values  
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];
```

Initialize Parallel Workers

Use `gcp` to create a pool of local workers to run parallel simulations if you don't already have one. In an `spmd` code block, load the `slexAircraftExample` model and select signals to log. To avoid data concurrency issues using `sim` in `parfor`, create a temporary directory for each worker to use during simulations.

```
p = gcp;
```

```
Starting parallel pool (parpool) using the 'local' profile ...
connected to 4 workers.
```

```
spmd
```

```
% Load system and select signals to log
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model', 4, 'on')

% Create temporary directory on each worker
workDir = pwd;
addpath(workDir)
tempDir = tempname;
mkdir(tempDir)
cd(tempDir)
```

```
end
```

Run Parallel Simulations

Use `parfor` to run the seven simulations in parallel. Select the value for `Ts` for each simulation, and modify the value of `Ts` in the model workspace. Then, run the simulation and build an array of `Simulink.sdi.WorkerRun` objects to access the data with the Simulation Data Inspector. After the `parfor` loop, use another `spmd` segment to remove the temporary directories from the workers.

```
parfor index = 1:7
```

```
% Select value for Ts
Ts_val = Ts_vals(index);

% Change the filter time constant and simulate
modelWorkspace = get_param('slexAircraftExample','modelworkspace');
modelWorkspace.assignin('Ts',Ts_val)
sim('slexAircraftExample')

% Create a worker run for each simulation
workerRun(index) = Simulink.sdi.WorkerRun.getLatest
```

```
end
```

```
spmd
```

```
% Remove temporary directories
cd(workDir)
rmdir(tempDir, 's')
rmpath(workDir)
```

```
end
```

Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

```
ds(7) = Simulink.SimulationData.Dataset;
```

```

for a = 1:7
    ds(a) = workerRun(a).getDataset;
end
ds(1)

ans =
Simulink.SimulationData.Dataset '' with 2 elements

           Name      BlockPath
-----
1 [1x1 Signal]    alpha, rad    ...rcraftExample/Aircraft Dynamics Model
2 [1x1 Signal]    Stick        slexAircraftExample/Pilot

- Use braces { } to access, modify, or add elements using index.

```

Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```

for b = 1:7
    datasetRef(b) = workerRun(b).getDatasetRef;
end

datasetRef(1)

ans =
DatasetRef with properties:

    Name: 'Run 3: slexAircraftExample'
    Run: [1x1 Simulink.sdi.Run]
 numElements: 2

```

Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local `Run` objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```

for c = 1:7

    Runs(c) = workerRun(c).getLocalRun;
    Ts_val_str = num2str(Ts_vals(c));
    desc = strcat('Ts = ', Ts_val_str);
    Runs(c).Description = desc;
    Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);

end

```

Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

getLocalRun

Class: Simulink.sdi.WorkerRun

Package: Simulink.sdi

Create local run from worker run

Syntax

```
runObj = workerRun.getLocalRun
```

Description

`runObj = workerRun.getLocalRun` creates the local `Simulink.sdi.Run` object `runObj` for the `Simulink.sdi.WorkerRun` object `workerRun`. Use `getLocalRun` in the client MATLAB to access the `Simulink.sdi.WorkerRun` data.

Output Arguments

runObj — Local `Simulink.sdi.Run` object

`Simulink.sdi.Run` object

Local `Simulink.sdi.Run` object.

Examples

Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

Simulink.SimulationData.BlockPath

Fully specified Simulink block path

Description

Simulink creates block path objects when creating dataset objects for signal logging and data store logging. `Simulink.SimulationData.Signal` and `Simulink.SimulationData.DataStoreMemory` objects include block path objects.

You can create a block path that you can use with the `Simulink.SimulationData.Dataset.getElement` method to access a specific dataset element. If you want to create a dataset in MATLAB to use as a baseline to compare against a signal logging or data store logging dataset, then you need to create the block paths as part of that dataset.

The `Simulink.SimulationData.BlockPath` class is very similar to the `Simulink.BlockPath` class.

You do not have to have Simulink installed to use the `Simulink.SimulationData.BlockPath` class. However, you must have Simulink installed to use the `Simulink.BlockPath` class. If you have Simulink installed, consider using `Simulink.BlockPath` instead of `Simulink.SimulationData.BlockPath`, because the `Simulink.BlockPath` class includes a method for checking the validity of block path objects without you having to update the model diagram.

Property Summary

Name	Description
SubPath	Individual component within the block specified by the block path

Method Summary

Name	Description
BlockPath	Create a block path.
convertToCell	Convert a block path to a cell array of character vectors.
getBlock	Get a single block path in the model reference hierarchy.
getLength	Get the length of the block path.

Properties

SubPath

Description

Represents an individual component within the block specified by the block path.

For example, if the block path refers to a Stateflow chart, you can use SubPath to indicate the chart signals. For example:

```
Block Path:
    'sf_car/shift_logic'

    SubPath:
        'gear_state.first'
```

Data Type

character vector

Access

RW

Methods

BlockPath

Purpose

Create block path

Syntax

```
blockpath_object = Simulink.SimulationData.BlockPath()
blockpath_object = Simulink.SimulationData.BlockPath(blockpath)
blockpath_object = Simulink.SimulationData.BlockPath(paths)
blockpath_object = Simulink.SimulationData.BlockPath(paths, subpath)
```

Input Arguments

blockpath

The block path object that you want to copy.

paths

A character vector or cell array of character vectors that Simulink uses to build the block path.

Specify each character vector in order, from the top model to the specific block for which you are creating a block path.

Each character vector must be a path to a block within the Simulink model. The block must be:

- A block in a single model
- A Model block (except for the last character vector, which may be a block other than a Model block)
- A block that is in a model that is referenced by a Model block that is specified in the previous character vector

subpath

A character vector that represents an individual component within a block.

Output Arguments

`blockpath_object`

The block path that you create.

Description

`blockpath_object = Simulink.SimulationData.BlockPath()` creates an empty block path.

`blockpath_object = Simulink.SimulationData.BlockPath(blockpath)` creates a copy of the block path of the block path object that you specify with the `source_blockpath` argument.

`blockpath = Simulink.SimulationData.BlockPath(paths)` creates a block path from the character vector or cell array of character vectors that you specify with the `paths` argument. Each character vector represents a path at a level of model hierarchy.

`blockpath = Simulink.SimulationData.BlockPath(paths, subpath)` creates a block path from the character vector or cell array of character vectors that you specify with the `paths` argument and creates a path for the individual component (for example, a signal) of the block.

Example

Create a block path object called `bp1`, using a cell array of character vectors representing elements of the block path.

```
bp1 = Simulink.SimulationData.BlockPath(...
{'sldemo_mdref_depgraph/thermostat', ...
'sldemo_mdref_heater/Fahrenheit to Celsius', ...
'sldemo_mdref_F2C/Gain1'})
```

The resulting block path reflects the model reference hierarchy for the block path.

```
bp1 =
```

```
Simulink.BlockPath
Package: Simulink
```

```
Block Path:
'sldemo_mdref_depgraph/thermostat'
'sldemo_mdref_heater/Fahrenheit to Celsius'
'sldemo_mdref_F2C/Gain1'
```

convertToCell**Purpose**

Convert block path to cell array of character vectors

Syntax

```
cellarray = Simulink.SimulationData.BlockPath.convertToCell()
```

Output Arguments

`cellarray`

The cell array of character vectors representing the elements of the block path.

Description

`cellarray = Simulink.SimulationData.BlockPath.convertToCell()` converts a block path to a cell array of character vectors.

Examples

```
bp1 = Simulink.SimulationData.BlockPath(...
{'sldemo_mdref_depgraph/thermostat', ...
'sldemo_mdref_heater/Fahrenheit to Celsius', ...
'sldemo_mdref_F2C/Gain1'})
cellarray_for_bp1 = bp1.convertToCell()
```

The result is a cell array representing the elements of the block path.

```
cellarray_for_bp1 =
    'sldemo_mdref_depgraph/thermostat'
    'sldemo_mdref_heater/Fahrenheit to Celsius'
    'sldemo_mdref_F2C/Gain1'
```

getBlock**Purpose**

Get single block path in model reference hierarchy

Syntax

```
block = Simulink.SimulationData.BlockPath.getBlock(index)
```

Input Arguments

`index`

The index of the block for which you want to get the block path. The index reflects the level in the model reference hierarchy. An index of 1 represents a block in the top-level model, an index of 2 represents a block in a model referenced by the block of index 1, and an index of n represents a block that the block with index $n-1$ references.

Output Arguments

`block`

The block representing the level in the model reference hierarchy specified by the `index` argument.

Description

`blockpath = Simulink.SimulationData.BlockPath.getBlock(index)` returns the block path of the block specified by the `index` argument.

Example

Get the block for the second level in the model reference hierarchy.

```
bp1 = Simulink.SimulationData.BlockPath(...
{'sldemo_mdref_depgraph/thermostat', ...
'sldemo_mdref_heater/Fahrenheit to Celsius', ...
```

```
'sldemo_mdref_F2C/Gain1'})  
blockpath = bp1.getBlock(2)
```

The result is the thermostat block, which is at the second level in the block path hierarchy.

```
blockpath =  
  
sldemo_mdref_heater/Fahrenheit to Celsius
```

getLength

Purpose

Get length of block path

Syntax

```
length = Simulink.SimulationData.BlockPath.getLength()
```

Output Arguments

length

The length of the block path. The length is the number of levels in the model reference hierarchy.

Description

`length = Simulink.SimulationData.BlockPath.getLength()` returns a numeric value that corresponds to the number of levels in the model reference hierarchy for the block path.

Example

Get the length of block path `bp1`.

```
bp1 = Simulink.SimulationData.BlockPath(...  
{ 'sldemo_mdref_depgraph/thermostat', ...  
  'sldemo_mdref_heater/Fahrenheit to Celsius', ...  
  'sldemo_mdref_F2C/Gain1' })  
length_bp1 = bp1.getLength()
```

The result reflects that the block path has three elements.

```
length_bp1 =
```

```
    3
```

`Simulink.BlockPath` | `Simulink.SimulationData.Dataset`

Introduced in R2012b

Simulink.SimulationData.Dataset class

Package: Simulink.SimulationData

Create Simulink.SimulationData.Dataset object

Description

Simulink creates `Simulink.SimulationData.Dataset` objects to store data elements when:

- Performing signal logging, which use the `Dataset` format
- Logging states or outputs, if you use the default format of `Dataset`.
- Logging a data store

Using the `Dataset` format for state and output logging offers several advantages compared to `Array`, `Structure`, or `Structure with time`. For details, see “Format for State Information Saved Without Operating Point”.

To generate a `Simulink.SimulationData.Dataset` object from the root-level Inport blocks in a model, you can use the `createInputDataset` function. Signals in the generated dataset have the properties of the Inport blocks and the corresponding ground values at model start and stop times. You can create `timeseries` and `timetable` objects for the time and values for signals for which you want to load data for simulation. The other signals use ground values.

You can use curly braces (`{}`) to streamline indexing syntax to access, set, and add elements in a dataset, instead of using `get`, `getElement`, `setElement`, or `addElement` methods. To get or set an element using curly braces, the index must be a scalar that is not greater than the number of elements in the dataset variable. To add an element, the index must be a scalar that is greater than the total number of elements in the dataset by one. The `get`, `getElement`, `setElement`, or `addElement` methods support specifying an element by name or block path, as well as by index.

For individual non-bus signal data, you can specify these types of data for `Dataset` elements:

- `timeseries`
- `timetable`
- `matlab.io.datastore.SimulationDatastore`
- double vectors or structure of double data
- `timeseries`
- a `Simulink.SimulationData.Signal`, `Simulink.SimulationData.State`, or `Simulink.SimulationData.DataStoreMemory` object

For bus signals, use a structure with a data element for each leaf signal, using one of these formats:

- A MATLAB `timeseries` object
- A MATLAB `timetable` object
- A `matlab.io.datastore.SimulationDatastore` object
- An empty matrix
- An array that meets one of these requirements:

- An array with time in the first column and the remaining columns each corresponding to an input port. See “Loading Data Arrays to Root-Level Inputs”.
- An $n \times 1$ array for a root inport that drives a function-call subsystem.
- Another structure, with data elements for each signal that are consistent with these requirements for a structure for bus data

Variable-size signals are not supported for Dataset data values.

Construction

`convertedDataset = Simulink.SimulationData.Dataset(loggedDataToConvert)` converts the `loggedDataToConvert` to a `Simulink.SimulationData.Dataset` object. You can then use the `concat` method to combine elements of two `Dataset` objects.

`constructedDataset = Simulink.SimulationData.Dataset(variableName, 'DatasetName', 'dsname')` constructs a `Simulink.SimulationData.Dataset` object, adds variable `variableName`, and names the data set `dsname`.

Input Arguments

loggedDataToConvert — Data element to convert

character vector

Data element to convert to a data set, specified as a character vector. You can convert elements such as:

- Array
- Structure

Note Structure inputs cannot be arrays or matrices.

- Structure with time
- MATLAB time series
- Structure of MATLAB time-series elements
- `ModelDataLogs`

variableName — Variable to add to data set

character vector

Variable to add to data set, specified as a character vector.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1, Value1, . . . , NameN, ValueN`.

Example: `'DatasetName', 'dsname'`

DatasetName — Data set name

character vector

Data set name, specified as a character vector.

Output Arguments

convertedDataset — Converted data set

Simulink.SimulationData.Dataset object

Converted data set, returned as a Simulink.SimulationData.Dataset object.

constructedDataset — Constructed data set

Simulink.SimulationData.Dataset object

Constructed data set, returned as a Simulink.SimulationData.Dataset object.

Properties

Name — Name of the data set

same as the logging variable (default) | character vector

Name of the data set, specified as a character vector or logging variable (for example, `logout` for signal logging). Specify a name when you want to distinguish easily one data set from another. For example, you could reset the name when comparing multiple simulations. This property is read/write.

```
ds = Simulink.SimulationData.Dataset
ds.Name = 'Dataset1'
```

Total Elements — Total number of elements

double

Total number of elements in data set, specified as a double. This property is read only. To get this value, use the `numElements` method.

Methods

<code>addElement</code>	Add element to end of a Dataset object
<code>concat</code>	Concatenate dataset to another dataset
<code>exportToPreviousRelease</code>	Save a Dataset object to a MAT-file you can open in any release
<code>get</code>	Get element or collection of elements from dataset
<code>getElementNames</code>	Return names of all elements in dataset
<code>find</code>	Get element or collection of elements from dataset
<code>numElements</code>	Get number of elements in data set
<code>plot</code>	Plot data in the Simulation Data Inspector
<code>setElement</code>	Change element stored at specified index

Tip To get the names of Dataset variables in the MAT-file, using the `Simulink.SimulationData.DatasetRef.getDatasetVariableNames` function processes faster than using the `who` or `whos` functions.

Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects (MATLAB).

Examples

Concatenate Dataset ds1 to Dataset ds

Convert data from two To Workspace blocks, convert to Dataset format, and concatenate them. myvdp is the vdp model with two To Workspace blocks with variables named simout and simout1. These blocks log data in time-series format.

```
mdl = 'myvdp';
open_system(mdl);
sim(mdl)
ds = Simulink.SimulationData.Dataset(simout);
ds1 = Simulink.SimulationData.Dataset(simout1);
dsfinal = concat(ds,ds1)
```

Access, Change, and Add Dataset Elements

Use curly brace indexing syntax to work with a logouts signal logging dataset that has three elements.

Get the second element of the logouts dataset.

```
logouts{2}
```

Change the name of the third element.

```
logouts{3}.Name = 'thirdSignal'
```

Add a fourth element.

```
time = 0.1*(0:100)';
element4 = Simulink.SimulationData.Signal;
element4.Name = 'C';
element4.Values = timeseries(3*sin(time),time);
logouts{4} = element4
```

Introduced in R2011a

Simulink.SimulationData.DatasetRef class

Package: Simulink.SimulationData

Create Simulink.SimulationData.DatasetRef object

Description

To use a reference for accessing a Simulink.SimulationData.Dataset object stored in a MAT-file, create a Simulink.SimulationData.DatasetRef object. You can use this reference to avoid running out of memory, by retrieving data signal by signal, for data that you log to persistent storage. You can stream a DatasetRef object into a root-level input port or you can use it to create a SimulationDatastore object to use for streaming. For details, see “Load Big Data for Simulations”.

For parallel simulations, for which you specify an array of Simulink.SimulationInput objects, if you are logging to file, Simulink:

- Creates Simulink.SimulationData.DatasetRef objects to access output data in the MAT-file and includes those objects in the SimulationOutput object data
- Enables the CaptureErrors argument for simulation

Construction

`DSRefObj = Simulink.SimulationData.DatasetRef(location, identifier)` creates a reference to the contents of a Simulink.SimulationData.Dataset variable stored in a MAT-file.

Input Arguments

location — MAT-file containing Simulink.SimulationData.Dataset object to reference

character vector

MAT-file containing Simulink.SimulationData.Dataset object to reference, specified as a character vector. The character vector is a path to the MAT-file. Do not use a file name from one locale in a different locale.

identifier — Name of variable in MAT-file

character vector

Name of a Simulink.SimulationData.Dataset variable in MAT-file, specified as a character vector. When you log to persistent storage, Simulink uses the variable names specified for each kind of logging.

Suppose that you use the default variable name for signal logging (`logout`) and default MAT-file name for persistent storage logging (`mat.out`). After you simulate the model, then to create a reference to the Dataset object for signal logging, at the MATLAB command line, enter:

```
sigLogRef = Simulink.SimulationData.DatasetRef('out.mat', 'logout');
```

Output Arguments

DSRefObj — Reference to Dataset object

`Simulink.SimulationData.DatasetRef` object

Reference to logging dataset, returned as a `Simulink.SimulationData.DatasetRef` object.

Properties

Location — MAT-file containing `Simulink.SimulationData.Dataset` object to reference

character vector

MAT-file containing `Simulink.SimulationData.Dataset` object to reference, specified as a character vector. The character vector is a path to the MAT-file. Include the `.mat` extension in the file name. Do not use a file name from one locale in a different locale.

Identifier — Name of variable in MAT-file

character vector

Name of a `Simulink.SimulationData.Dataset` variable in MAT-file, specified as a character vector. When you log to persistent storage, Simulink uses the variable names specified for each kind of logging (for example, 'logout' for signal logging data).

Methods

Use the `numElements`, `getElement`, and `getElementNames` methods for a `Simulink.SimulationData.DatasetRef` object the same way that you use those methods for a `Simulink.SimulationData.Dataset` object.

Method	Purpose
<code>numElements</code>	Get number of elements from dataset
<code>getElementNames</code>	Return names of all elements in dataset
<code>get</code> The <code>get</code> method is an alias for the <code>getElement</code> method.	Get element from dataset
Note You can use curly braces to streamline indexing syntax to access elements in a dataset reference, instead of using <code>get</code> or <code>getElement</code> methods. To get an element using curly braces, the index must be a scalar that is not greater than the number of elements in the variable. The <code>get</code> and <code>getElement</code> methods support specifying an element by name or block path, as well as by index.	
<code>getAsDatastore</code>	Get <code>matlab.io.datastore.SimulationDatastore</code> representation of element from a <code>DatasetRef</code> object

Method	Purpose
getDatasetVariableNames on page 2-899	List names of Dataset variables in MAT-file
plot	Plot data in the Simulation Data Inspector

Tip To get the names of Dataset variables in the MAT-file, using the `Simulink.SimulationData.DatasetRef.getDatasetVariableNames` function processes faster than using the `who` or `whos` functions.

Copy Semantics

You can copy `DatasetRef` object properties by value. However, copying the `DatasetRef` object produces a handle object. Copying the `DatasetRef` object does not copy the data in the MAT-file that the object references. For details about copy operations, see [Copying Objects \(MATLAB\)](#) in the MATLAB documentation.

Examples

Create References to Persistent Storage Dataset Objects

This example shows how to construct and use `Simulink.SimulationData.DatasetRef` objects to access data for a model that logs to persistent storage. This simple example shows the basic steps for logging to persistent storage. This example does not represent a realistic situation for logging to persistent storage, because it shows a short simulation with small memory requirements.

Open the `vdp` model.

In the **Configuration Parameters** > **Data Import/Export** pane, select these parameters:

- **States**
- **Log Dataset data to file**

Set the **Format** parameter to **Dataset**.

Leave the other parameter settings as they are and click **Apply**.

In the model, click a signal and from the action bar, select **Enable Data Logging**.

Simulate the model.

Get a list of Dataset variable names in the `out.mat` file.

```
varNames = Simulink.SimulationData.DatasetRef.getDatasetVariableNames('out.mat')
varNames =
    1x2 cell array
    'logout'    'xout'
```

Create a reference to the logged states data that is stored in `out.mat`. The variable for the logged states data is `xout`.

```
statesLogRef = Simulink.SimulationData.DatasetRef('out.mat','xout')
```

```
statesLogRef =
```

```
Simulink.SimulationData.DatasetRef
Characteristics:
  Location: out.mat (/my_files/out.mat)
  Identifier: xout
```

```
Resolved Dataset: 'xout' with 2 elements
```

	Name	BlockPath
1	' '	vdp/x1
2	' '	vdp/x2

Create a reference to the signal logging data that is stored in `out.mat`. The variable for the signal logging data is `logout`.

```
sigLogRef = Simulink.SimulationData.DatasetRef('out.mat','logout')
```

```
sigLogRef =
```

```
Simulink.SimulationData.DatasetRef
Characteristics:
  Location: out.mat (/my_files/out.mat)
  Identifier: logout
```

```
Resolved Dataset: 'logout' with 1 element
```

	Name	BlockPath
1	x1	vdp/x1

Use the `numElements` to access the number of elements in the logged states dataset.

```
statesLogRef.numElements
```

```
ans =
```

```
2
```

Use the `DatasetRef` to access the first element of the signal logging dataset.

```
sigLogRef{1}
```

```
ans =
```

```
Simulink.SimulationData.Signal
Package: Simulink.SimulationData
```

```
Properties:
```

```
  Name: 'x1'
  PropagatedName: ''
  BlockPath: [1x1 Simulink.SimulationData.BlockPath]
  PortType: 'outport'
```

```
PortIndex: 1  
Values: [1x1 timeseries]
```

Methods, Superclasses

Delete the persistent storage MAT-file and try to use one of the DatasetRef objects.

```
delete('out.mat');  
statesLogRef.get(1)
```

```
File does not exist.
```

The statesLogRef still exists, but it is a reference to a Dataset object that is in a file that no longer exists.

Simulink.SimulationData.DataStoreMemory

Container for data store logging information

Description

Simulink uses `Simulink.SimulationData.DataStoreMemory` objects to store logging information from Data Store Memory blocks during simulation. The objects contain information about the blocks that write to the data store.

Property Summary

Name	Description
BlockPath on page 5-458	Location of Data Store Memory block for the logged data store
DSMWriterBlockPaths on page 5-458	Location of Data Store Write blocks that write to the data store
DSMWriters on page 5-459	Data Store Write blocks for each signal value
Name on page 5-459	Name of the data store dataset
Scope on page 5-459	Scope of the data store: 'local' or 'global'
Values on page 5-459	Time and data that were logged

Properties

BlockPath

Description

Location of Data Store Memory block for the logged data store.

Data Type

character vector

Access

RW

DSMWriterBlockPaths

Description

Location of blocks that write to the data store. Each element of the array contains the full block path of one writer block.

Data Type

Vector of `Simulink.SimulationData.BlockPath` objects

Access

R0

DSM Writers**Description**

The number of writes in the data store.

The *n*th element of `DSM Writers` contains the index of the element in `DSM Writer Block Paths` that contains the block path of the writer that performed the *n*th write to `Values`.

Data Type

Integer vector

Access

R0

Name**Description**

Name of the data store dataset

Data Type

character vector

Access

R0

Scope**Description**

Scope of the data store: 'local' or 'global'

Simulink.SimulationData.LoggingInfo

Signal logging override settings

Description

This object specifies a set of signal logging override settings.

Use a `Simulink.SimulationData.LoggingInfo` object to specify the signal logging override settings for a signal. You can use this object for the `LoggingInfo` property of a `Simulink.SimulationData.SignalLoggingInfo` object.

Property Summary

Name	Description
DataLogging on page 5-461	Signal logging mode.
NameMode on page 5-462	Source of signal logging name.
LoggingName on page 5-462	Custom signal logging name.
DecimateData on page 5-462	Use subset of sample points.
Decimation on page 5-462	Decimation value (n): Simulink logs every nth data point.
LimitDataPoints on page 5-463	Limit number of data points to log.
MaxPoints on page 5-463	Maximum number of data points to log (N). The set of logged data points is the last N data points generated by the simulation.

Method Summary

Name	Description
LoggingInfo on page 5-463	Create a set of signal logging override settings for a signal.

Properties

DataLogging

Description

Signal logging mode.

Indicates whether logging is enabled for this signal.

Data Type

logical value — {true} | false

Access

RW

NameMode**Description**

Source of signal logging name.

Indicates whether the signal logging name is a custom name ('true') or whether the signal logging name is the same as the signal name ('false').

Data Type

logical value — true | {false}

Access

RW

LoggingName**Description**

Custom signal logging name

The custom signal logging name to use for this signal, if the NameMode property is true.

Data Type

character vector

Access

RW

DecimateData**Description**

Log a subset of sample points, selecting data points at a specified interval. The first sample point is always logged.

Data Type

logical value — true | {false}

Access

RW

Decimation**Description**

Decimation value (n). If the DecimateData property is true, then Simulink logs every nth data point.

Data Type

positive integer

Access

RW

LimitDataPoints

Description

Limit the number of data points to log.

Data Type

logical value — true | {false}

Access

RW

MaxPoints

Description

Maximum number of data points to log (N). If the `LimitDataPoints` property is `true`, then the set of logged data points includes the last N data points generated by the simulation.

Data Type

positive integer

Access

RW

Methods

LoggingInfo

Purpose

Create a `Simulink.SimulationData.LoggingInfo` object.

Syntax

```
logging_info_object = Simulink.SimulationData.LoggingInfo()  
logging_info_object = Simulink.SimulationData.LoggingInfo(object)
```

Input Arguments

`object`

A signal logging override settings object whose property values the constructor uses for the new `Simulink.SimulationData.LoggingInfo` object. The signal logging override object that you specify must be one of the following types of objects:

- `Simulink.SimulationData.LoggingInfo` object
- `Simulink.LoggingInfo` object

Output Arguments

`logging_info_object`

A `Simulink.SimulationData.LoggingInfo` object.

Description

`logging_info_object = Simulink.SimulationData.LoggingInfo()` creates a `Simulink.SimulationData.LoggingInfo` object that has default property values.

`logging_info_object = Simulink.SimulationData.LoggingInfo(object)` creates a `Simulink.SimulationData.LoggingInfo` object that copies the property values from the signal logging override object that you specify with the `object` argument.

Examples

The following example creates a `Simulink.SimulationData.LoggingInfo` object with default settings, changes the `DecimateData` and `Decimation` properties, and uses the object for the `LoggingInfo` property of a `Simulink.SimulationData.SignalLoggingInfo` object `mi`.

```
open_system(docpath(fullfile(docroot, 'toolbox', 'simulink', 'examples', 'ex_mdref_counter_bus', 'ex_mdref_counter_bus.mat'), 'ex_mdref_counter_bus'));
open_system(docpath(fullfile(docroot, 'toolbox', 'simulink', 'examples', 'ex_bus_logging'), 'ex_bus_logging'));
log_info = Simulink.SimulationData.LoggingInfo();
log_info.DecimateData = true;
log_info.Decimation = 2;
mi = Simulink.SimulationData.SignalLoggingInfo('ex_bus_logging');
mi.LoggingInfo = log_info
```

```
Simulink.SimulationData.SignalLoggingInfo
  Package: Simulink.SimulationData
```

```
BlockPath:
  'ex_bus_logging'
```

```
OutputPortIndex: 1
```

```
LoggingInfo:
  DataLogging: 1
  NameMode: 0
  LoggingName: ''
  DecimateData: 1
  Decimation: 2
  LimitDataPoints: 0
  MaxPoints: 5000
```

Simulink.SimulationData.ModelLoggingInfo

Signal logging override settings for a model

Description

This class is a collection of `Simulink.SimulationData.SignalLoggingInfo` objects that specify all signal logging override settings for a model.

Use methods and properties of this class to:

- Turn off logging for a signal or a Model block.
- Change logging settings for any signals that are marked for logging within a model.

You can control whether a top model and referenced models override signal logging settings or use the signal logging settings specified by the model. Use the `LoggingMode` and `LogAsSpecifiedByModels` properties to control which logging settings to apply.

Logging Mode for Models	Property Settings
For top model and all referenced models, use logging settings specified in the model.	Set <code>LoggingMode</code> to <code>LogAllAsSpecifiedInModel</code> .
For top model and all referenced models, use override signal logging settings.	Set <code>LoggingMode</code> to <code>OverrideSignals</code> .
For top model and referenced models, use a mix of override signal logging settings and the signal logging settings specified in the model.	Set <code>LoggingMode</code> to <code>OverrideSignals</code> . Include models you want to ignore override signal logging settings in the <code>LogAsSpecifiedByModels</code> cell array.

For more information and examples, see “Override Signal Logging Settings from MATLAB”.

Property Summary

Name	Description
<code>LoggingMode</code> on page 5-466	Signal logging override status
<code>LogAsSpecifiedByModels</code> on page 5-466	Source of signal logging settings for the top model or a top-level Model block
<code>Signals</code> on page 5-467	All signals that have signal override settings

Method Summary

Name	Description
<code>findSignal</code> on page 5-471	Find signals within the <code>Signals</code> vector, using block path and output port index.

Name	Description
<code>verifySignalAndModelPaths</code> on page 5-474	Verify signal and model paths for the model signal logging override object.
<code>getLogAsSpecifiedInModel</code> on page 5-472	Determine whether the model logs signals as specified in the model or uses override settings.
<code>setLogAsSpecifiedInModel</code> on page 5-473	Set the logging mode for the top model or a top-level Model block.
<code>createFromModel</code> on page 5-467	Create and populate a model signal logging override object with all logged signals in the model hierarchy.
<code>ModelLoggingInfo</code> on page 5-470	Set signals to log or override logging settings.

Properties

LoggingMode

Description

Signal logging override status. Values are:

- `OverrideSignals` — (Default) Uses the logging settings for signals, as specified in the `Signals` property. For models where `getLogAsSpecifiedInModel` is:
 - `true` — Logs all signals, as specified in the model.
 - `false` — Logs only the signals specified in the `Signals` property.
- `LogAllAsSpecifiedInModel` — Logs signals in the top model and all referenced models, as specified in the model. Simulink honors the signal logging indicators (blue antennae) and ignores the `Signals` property.

To change the logging mode for the top model or for a given referenced model, use the `setLogAsSpecifiedInModel` method.

Data Type

character array

Access

RW

LogAsSpecifiedByModels

Description

When `LoggingMode` is set to `'OverrideSignals'`, the `LogAsSpecifiedByModels` cell array specifies the top models and top-level Model blocks that ignore the `'OverrideSignals'` setting and log signals as specified in the models or Model blocks.

- For the top model and top-level Model blocks that the cell array includes, Simulink ignores the `Signals` property overrides.
- For a model or Model block that the cell array does *not* include, Simulink uses the `Signals` property to determine which signals to log.

When `LoggingMode` is set to `'LogAllAsSpecifiedInModel'`, Simulink ignores the `LogAsSpecifiedByModels` property.

Use the `getLogAsSpecifiedInModel` method to determine whether the top model or top-level Model block logs signals as specified in the model (default logging), and use `setLogAsSpecifiedInModel` to turn default logging on and off.

Data Type

cell array — For the top model, specify the model name. For Model blocks, specify the block path.

Access

RW

Signals

Description

Vector of `Simulink.SimulationData.SignalLoggingInfo` objects for all signals with signal logging override settings.

Data Type

vector of `Simulink.SimulationData.SignalLoggingInfo` objects

Access

RW

Methods

createFromModel

Purpose

Create a `Simulink.SimulationData.ModelLoggingInfo` object for a top model, with override settings for each logged signal in the model.

Syntax

```
model_logging_info_object = ...
Simulink.SimulationData.ModelLoggingInfo.createFromModel(...
model,options)
```

Input Arguments

`model`

Name of the top model for which to create a `Simulink.SimulationData.ModelLoggingInfo` object.

`options`

You can use any combination of the following option name and value pairs to control the kinds of systems from which to include logged signals.

- `FollowLinks`
 - `on` — (Default) Include logged signals from inside of libraries.

- `off` — Skip all libraries.
- `LookUnderMasks`
 - `all` — (Default) Include logged signals from all masked subsystems.
 - `none` — Skip all masked subsystems.
 - `graphical` — Include logged signals from masked subsystems that do not have a workspace or dialog box.
 - `functional` — Include logged signals from masked subsystems that do not have a dialog box.
- `Variants`
 - `ActiveVariants` — (Default) Include logged signals from only active subsystem and model variants.
 - `AllVariants` — Include logged signals from all subsystem and model variants.
- `RefModels`
 - `on` — (Default) Include logged signals from referenced models.
 - `off` — Skip all referenced models.

If you select more than one option, then the created `Simulink.SimulationData.ModelLoggingInfo` object includes signals that fit the combinations (the “AND”) of the specified options. For example, if you set `FollowLinks` to `on` and set `RefModels` to `off`, then the model signal logging override object does not include signals from library links that exist inside of referenced models.

Output Arguments

`model_logging_override_object`

`Simulink.SimulationData.ModelLoggingInfo` object for the top model.

Description

`model_logging_info_object = Simulink.SimulationData.ModelLoggingInfo.createFromModel(model)` creates a `Simulink.SimulationData.ModelLoggingInfo` object for the model that includes logged signals for the following kinds of systems:

- Libraries
- Masked subsystems
- Referenced models
- Active variants

`model_logging_override_object = Simulink.SimulationData.ModelLoggingInfo.createFromModel(model, options)` creates a `Simulink.SimulationData.ModelLoggingInfo` object for the model. The included logged signals reflect the options settings for the following kinds of systems:

- Libraries
- Masked subsystems

- Referenced models
- Variants

Examples

The following example creates a model logging override object for the `sldemo_mdhref_bus` model and automatically adds each logged signal in the model to that object:

```
mi = Simulink.SimulationData.ModelLoggingInfo.createFromModel(...
'sldemo_mdhref_bus')

mi =

  ModelLoggingInfo with properties:
      Model: 'sldemo_mdhref_bus'
  LoggingMode: 'OverrideSignals'
LogAsSpecifiedByModels: {}
      Signals: [1x3 Simulink.SimulationData.SignalLoggingInfo]
```

To apply the model override object settings, use:

```
set_param(sldemo_mdhref_bus, 'DataLoggingOverride', mi);
```

You can use the options for the `createFromModel` method to specify how the method should handle model components like variants and model references. For example, use the `Variants` option to create a `model_logging_override` object that includes logged signals in all variants of the `sldemo_variant_subsystems` model.

By default, the `sldemo_variant_subsystems` model does not log any signals. Start by configuring the output signals from the `Linear Controller` and `Nonlinear Controller` subsystems for logging.

```
% Open the sldemo_variant_subsystems model
sldemo_variant_subsystems;

% Mark the output of the Linear Controller subsystem for logging
ph = get_param('sldemo_variant_subsystems/Controller/Linear Controller',...
'PortHandles');
set_param(ph.Outputport(1), 'DataLogging', 'on');

% Mark the output of the Nonlinear Controller subsystem for logging
ph1 = get_param('sldemo_variant_subsystems/Controller/Nonlinear Controller',...
'PortHandles');
set_param(ph1.Outputport(1), 'DataLogging', 'on');
```

Then, use the `createFromModel` method to create a `model_logging_override` object that includes signals logged in all variant subsystems of the `sldemo_variant_subsystems` model.

```
% Create a model_logging_override object for the model including all variants
mi = Simulink.SimulationData.ModelLoggingInfo.createFromModel(...
'sldemo_variant_subsystems', 'Variants', 'AllVariants')

mi =

  ModelLoggingInfo with properties:
      Model: 'sldemo_variant_subsystems'
  LoggingMode: 'OverrideSignals'
LogAsSpecifiedByModels: {}
      Signals: [1x2 Simulink.SimulationData.SignalLoggingInfo]
```

ModelLoggingInfo

Purpose

Specify signals to log or override logging settings.

Syntax

```
model_logging_override_object = ...
Simulink.SimulationData.ModelLoggingInfo(model)
```

Input Arguments

model

Name of the top model for which to create a `Simulink.SimulationData.ModelLoggingInfo` object

Output Arguments

model_logging_override_object

`Simulink.SimulationData.ModelLoggingInfo` object created for the specified top model.

Description

`model_logging_override_object= Simulink.SimulationData.ModelLoggingInfo(model)` creates a `Simulink.SimulationData.ModelLoggingInfo` object for the specified top model.

If you use the `Simulink.SimulationData.ModelLoggingInfo` constructor, specify a `Simulink.SimulationData.SignalLoggingInfo` object for each logged signal for which you want to override logging settings.

To check that you have specified valid signal logging override settings for a model, use the `verifySignalAndModelPaths` method with the `Simulink.SimulationData.ModelLoggingInfo` object for the model.

Examples

The following example shows how to log all signals as specified in the top model and all referenced models.

```
mi = Simulink.SimulationData.ModelLoggingInfo('sldemo_md1ref_bus');
mi.LoggingMode = 'LogAllAsSpecifiedInModel'

mi =

  ModelLoggingInfo with properties:

      Model: 'sldemo_md1ref_bus'
  LoggingMode: 'LogAllAsSpecifiedInModel'
LogAsSpecifiedByModels: {}
      Signals: []
```

To apply the model override object settings, use:

```
set_param(sldemo_md1ref_bus, 'DataLoggingOverride', mi);
```

The following example shows how to log only signals in the top model:

```
mi = ...
Simulink.SimulationData.ModelLoggingInfo('sldemo_md1ref_bus');
```

```
mi.LoggingMode = 'OverrideSignals';
mi = mi.setLogAsSpecifiedInModel('sldemo mdlref_bus', true);
set_param('sldemo mdlref_bus', 'DataLoggingOverride', mi);
```

findSignal

Purpose

Find signals within the Signals vector, using a block path and optionally an output port index.

Syntax

```
signal_indices = ...
    model_logging_override_object.findSignal(block_path)
signal_indices = ...
    model_logging_override_object.findSignal(...
    block_path, port_index)
```

Input Arguments

block_path

Source block to search. The `block_path` must be one of the following:

- Character vector
- Cell array of character vectors
- `Simulink.BlockPath` object

port_index

Index of the output port to search. Specify a scalar greater than, or equal to, 1.

Output Arguments

signal_indices

Vector of numeric indices into the signals vector of the `Simulink.SimulationData.ModelLoggingInfo` object.

Description

`signal_indices = model_logging_override_object.findSignal(block_path)` finds the indices of the signals for the block path that you specify.

To find a *single* instance of a signal within a referenced model, use a `Simulink.BlockPath` object or a cell array with a *full path*.

To find *all* instances of a signal within a referenced model, use a character vector with the *relative* path of the signal within the referenced model.

To find a logged chart signal within a Stateflow chart, use a `Simulink.BlockPath` object and set the `SubPath` property to the name of the Stateflow chart signal.

`signal_indices = model_logging_override_object.findSignal(block_path, port_index)` finds the indices of the output signal for the port that you specify, for the block path that you specify.

Do not use the `port_index` argument for Stateflow chart signals.

Examples

To find a signal that is *not* in a Stateflow chart and that does *not* appear in multiple instances of a referenced model:

```
open_system(docpath(fullfile(docroot, 'toolbox', 'simulink', 'examples', 'ex_bus_logging')))
% Open the referenced model
ex_mdhref_counter_bus
mi = Simulink.SimulationData.ModelLoggingInfo.createFromModel(...
    'ex_bus_logging');
% Click the COUNTERBUSCreator block that is the source of
% the logged COUNTERBUS signal
signal_index = mi.findSignal(gcb)
```

```
signal_index =
    1
```

To find a signal in a specific instance of a referenced model that is not in a Stateflow chart, use the following approach:

```
signal_index = mi.findSignal({'ex_bus_logging/CounterA', ...
    'ex_mdhref_counter_bus/Bus Creator'})
```

```
signal_index =
    4
```

For an example that uses the `findSignal` method with a Stateflow chart, see “Override Logging Properties with the Command-Line API” (Stateflow).

getLogAsSpecifiedInModel**Purpose**

Determine whether the model logs as specified in the model or uses override settings.

Syntax

```
logging_mode = ...
getLogAsSpecifiedInModel(model_logging_override_object, path)
```

Input Arguments

`model_logging_override_object`

A `Simulink.SimulationData.ModelLoggingInfo` object.

`path`

The path is a character vector that specifies one of the following:

- Name of the top model
- Block path of a Model block in the top model

Output Arguments

`logging_mode`

The `logging_mode` is:

- `true`, if the model specified by `path` is logged as specified in the model.

- `false`, if the model specified by `path` is logged using the override settings specified in the `Signals` property.

Description

`logging_mode = model_logging_override_object.getLogAsSpecifiedInModel(path)` returns:

- `true`, if the model specified by `path` is logged as specified in the model.
- `false`, if the model specified by `path` is logged using the override settings specified in the `Signals` property.

Examples

In the following example, the `Simulink.SimulationData.ModelLoggingInfo` object `mi` uses the override settings specified in its `Signals` property.

```
mi = Simulink.SimulationData.ModelLoggingInfo('sldemo_mdref_bus');
logging_mode = getLogAsSpecifiedInModel(mi, 'sldemo_mdref_bus')
```

```
logging_mode =
```

```
    0
```

setLogAsSpecifiedInModel

Purpose

Set logging mode for top model or top-level Model block

Syntax

```
setLogAsSpecifiedInModel(override_object, path)
```

Input Arguments

`override_object`

`Simulink.SimulationData.ModelLoggingInfo` object.

`path`

Character vector that specifies one of the following:

- Name of the top model
- Block path of a Model block in the top model

`value`

Logging mode:

- `true`, if the model specified by `path` is logged as specified in the model
- `false`, if the model specified by `path` is logged using the override settings specified in the `Signals` property.

Description

`setLogAsSpecifiedInModel(override_object, path, value)` sets the `LoggingMode` property for a top model or a Model block in the top model.

Example

The following example shows how to log only signals in the top model, using the logging settings specified in that model:

```
sldemo_mdref_bus;
mi = Simulink.SimulationData.ModelLoggingInfo('sldemo_mdref_bus');
mi.LoggingMode = 'OverrideSignals';
mi = setLogAsSpecifiedInModel(mi, 'sldemo_mdref_bus', true);
set_param('sldemo_mdref_bus', 'DataLoggingOverride', mi);
```

verifySignalAndModelPaths**Purpose**

Verify paths in `Simulink.SimulationData.ModelLoggingInfo` object.

Syntax

```
verified_object = verifySignalAndModelPaths...
(model_logging_override_object, action)
```

Input Arguments

`model_logging_override_object`

The `Simulink.SimulationData.ModelLoggingInfo` object to verify. This argument is required.

`action`

The action that the function performs if verification fails. This argument is optional. Specify one of the following values:

- `error` — (default) Throw an error when verification fails
- `warnAndRemove` — Issue a warning when verification fails and update the `Simulink.SimulationData.ModelLoggingInfo` object.
- `remove` — Silently update the `Simulink.SimulationData.ModelLoggingInfo` object.

Output Arguments

`verified_object`

If the method detects no invalid paths, it returns the validated object. For example:

```
verified_object =
    Simulink.SimulationData.ModelLoggingInfo
    Package: Simulink.SimulationData

    Properties:
        Model: 'logging_top'
        LoggingMode: 'OverrideSignals'
        LogAsSpecifiedByModels: {}
        Signals: [1x11 Simulink.SimulationData.SignalLoggingInfo]
```

If the method detects an invalid path, it performs the action specified by the `action` argument. By default, it issues an error message.

Description

```
verified_object = verifySignalAndModelPaths(model_logging_override_object,
action)
```

For a `Simulink.SimulationData.ModelLoggingInfo` object, verify that:

- All character vectors in the `LogAsSpecifiedByModels` property are either the name of the top model or the block path of a Model block in the top model.
- The block paths for signals in the `Signals` property refer to valid blocks within the hierarchy of the top model.
- The `OutputPortIndex` property for all signals in the `Signals` property are valid for the given block.
- All signals in the `Signals` property refer to *logged* signals.

The `action` argument specifies what action the method performs. By default, the method returns an error if it detects an invalid path.

If you use the `Simulink.SimulationData.ModelLoggingInfo` constructor and specify a `Simulink.SimulationData.SignalLoggingInfo` object for each signal, then consider using the `verifySignalAndModelPaths` method to verify that your object definitions are valid.

Example

The following example shows how to validate the signal and block paths in a `Simulink.SimulationData.ModelLoggingInfo` object. Because the `action` argument is `warnAndRemove`, if the validation fails, the `verifySignalAndModelPaths` method issues a warning and updates the `Simulink.SimulationData.ModelLoggingInfo` object.

```
mi = Simulink.SimulationData.ModelLoggingInfo('sldemo_mdlref_bus');
verified_object = verifySignalAndModelPaths...
    (mi, 'warnAndRemove')
```

Introduced in R2012b

Simulink.SimulationData.Parameter class

Package: Simulink.SimulationData

Stores logged parameter data and metadata

Description

The `Simulink.SimulationData.Parameter` object stores data and metadata for logged block parameters. Tunable parameters connected to Dashboard blocks are logged to the Simulation Data Inspector during simulation. To access logged parameter data, you can export the simulation run from the Simulation Data Inspector using the UI or the `Simulink.sdi.exportRun` function. For more information about exporting simulation runs with the Simulation Data Inspector UI, see “Export Data from the Simulation Data Inspector”.

Construction

`dataset = Simulink.sdi.exportRun(runID)` returns a `Simulink.SimulationData.Parameter` object as an element in `dataset` when the run corresponding to `runID` contains logged parameter data.

Input Arguments

runID — Run ID for a run with logged parameter data

integer

Run ID for the run containing logged parameter data. Run IDs are assigned by the Simulation Data Inspector. You can get the run ID for a simulation run using the `Simulink.sdi.getAllRunIDs` or `Simulink.sdi.getRunIDByIndex` function.

Output Arguments

dataset — Dataset containing the run data

`Simulink.SimulationData.Dataset`

`Simulink.SimulationData.Dataset` object containing the run data and metadata. When the run contains logged parameter data, the dataset contains a `Simulink.SimulationData.Parameter` object as an element for each logged parameter. The `Simulink.SimulationData.Parameter` element takes the name of the logged parameter. You can access a `Simulink.SimulationData.Parameter` object using `get`.

Properties

Name — Parameter name in Dashboard label

character vector

Parameter name as it appears in the label for the Dashboard block.

Example: 'Mu:Gain'

BlockPath — Path of the block associated with the parameter

`Simulink.SimulationData.BlockPath`

Path to the block the parameter or variable corresponds to, returned as a `Simulink.SimulationData.BlockPath` object.

Example: `vdp/Mu`

ParameterName — Parameter name

character vector

Name of the logged parameter as it appears in the block dialog box. For variables, the `ParameterName` property is empty.

Example: `'Gain'`

VariableName — Variable name

character vector

Name of the logged variable. For parameters, the `VariableName` property is empty.

Example: `'Zw'`

Values — Timeseries of parameter values

timeseries

timeseries of parameter values. For logged variables, the `timeseries` name is the variable name. For logged parameters, the `timeseries` name is empty.

Methods

`plot` Plot simulation output data in the Simulation Data Inspector

Copy Semantics

Value. To learn how value classes affect copy operations, see [Copying Objects \(MATLAB\)](#).

Examples

Access Logged Parameter Data

This example shows how to access logged parameter data. Parameter data automatically logs to the Simulation Data Inspector when you connect a Dashboard block to a block parameter. Parameter data does not export to the workspace with other simulation data at the end of simulation. You can access the logged parameter data by exporting the run containing it from the Simulation Data Inspector.

Log Parameter Data

Run a simulation of the model `ex_vdp_param`, a modified version of the `vdp` model with an Edit block connected to the gain parameter of the Mu block. The parameter data logs with the signal data for signals marked for logging.

```
sim('ex_vdp_param');
```

Export Run

Use the Simulation Data Inspector programmatic interface to get the run ID for the `ex_vdp_param` simulation, and export the run.

```
index = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(index);

dataset = Simulink.sdi.exportRun(runID);
```

Access Parameter Data

Use the `get` method to access the `Simulink.SimulationData.Parameter` object for the logged parameter data. The `Values` property contains the timeseries data for the parameter.

```
muGain = dataset.get('Mu:Gain')

muGain =
  Simulink.SimulationData.Parameter
  Package: Simulink.SimulationData

  Properties:
    Name: 'Mu:Gain'
    BlockPath: [1x1 Simulink.SimulationData.BlockPath]
    Values: [1x1 timeseries]
```

Simulink.SimulationData.SignalLoggingInfo

Signal logging override settings for signal

Description

This object contains the signal override signal logging settings for a single logged signal.

Property Summary

Name	Description
BlockPath on page 5-479	Simulink.BlockPath of source block of a signal to log.
OutputPortIndex on page 5-479	Index of an output port to log.
LoggingInfo on page 5-480	Simulink.SimulationData.LoggingInfo object containing all logging override settings for a signal.

Method Summary

Name	Description
SignalLoggingInfo on page 5-480	Create a signal logging override object for a signal.

Properties

BlockPath

Description

Simulink.BlockPath of source block of signal to log. The block path represents the full model reference hierarchy.

To specify a specific instance of a signal, use an absolute path, reflecting the model reference hierarchy, starting at the top model. For example:

```
sig_log_info = Simulink.SimulationData.SignalLoggingInfo(...
{'sldemo_mdref_bus/CounterA', ...
'sldemo_mdref_counter_bus/Bus Creator'})
```

Data Type

Simulink.BlockPath

Access

RW

OutputPortIndex

Description

Index of the output port to log. The index is a 1-based numeric value.

Data Type

nonzero integer

Access

RW

LoggingInfo**Description**

`Simulink.SimulationData.LoggingInfo` object containing logging override settings for a signal. The logging settings specify whether signal logging is overridden for this signal. The logging settings also can specify a logging name, a decimation factor, and a maximum number of data points.

Data Type

`Simulink.SimulationData.LoggingInfo` object

Access

RW

Methods**SignalLoggingInfo****Purpose**

Construct a `Simulink.SimulationData.SignalLoggingInfo` object.

Syntax

```
signal_logging_info_object = ...  
    Simulink.SimulationData.SignalLoggingInfo()  
signal_loggingInfo_object = ...  
    Simulink.SimulationData.SignalLoggingInfo(path)  
signalLoggingInfo_object = ...  
    Simulink.SimulationData.SignalLoggingInfo(path,index)
```

Input Arguments

path

The block path of the source block for which the signal logging override settings apply. If you use this argument without also using the `port` argument, then Simulink sets the output port index to 1.

index

Output port index to which the signal logging override settings apply.

Output Arguments

signal_logging_object

`Simulink.SimulationData.SignalLoggingInfo` object that represents the override settings of a signal.

Description

`signal_logging_override_object = Simulink.SimulationData.SignalLoggingInfo()` creates a `Simulink.SimulationData.LoggingInfo` object that contains default logging settings for a signal.

`signal_logging_override_object = Simulink.SimulationData.SignalLoggingInfo(path)` creates a `Simulink.SimulationData.LoggingInfo` object, using the specified block path, and sets the output port index to 1.

`signal_logging_override_object = Simulink.SimulationData.SignalLoggingInfo(path, port)` creates a `Simulink.SimulationData.LoggingInfo` object that contains default logging settings for the specified block path and output port index.

Examples

The following example creates a `Simulink.SimulationData.SignalLoggingInfo` object for the first output port of the Bus Creator block in the `sldemo_mdref_bus` model.

```
sldemo_mdref_bus;
mi = Simulink.SimulationData.ModelLoggingInfo(...
'sldemo_mdref_bus');
mi.LoggingMode = 'OverrideSignals';
mi.Signals = ...
    Simulink.SimulationData.SignalLoggingInfo(...
        {'sldemo_mdref_bus/CounterA', ...
'sldemo_mdref_counter_bus/Bus Creator'}, 1)
```

The output is:

```
mi =
    Data.ModelLoggingInfo with properties:
        Model: 'sldemo_mdref_bus'
        LoggingMode: 'OverrideSignals'
        LogAsSpecifiedByModels: {}
        Signals: [1x1 Simulink.SimulationData.SignalLoggingInfo]

    Methods
```

Simulink.SimulationData.Signal

Container for signal logging information

Description

Simulink uses `Simulink.SimulationData.Signal` objects to store signal logging information during simulation. The objects contain information about the source block for the signal, including the port type and index.

Property Summary

Name	Description
BlockPath on page 5-482	Block path for the source block for the signal
Name on page 5-482	Name of signal element to use for name-based access
PropagatedName on page 5-482	Propagated signal name, if any
PortIndex on page 5-483	Numeric index of port that was logged
PortType on page 5-483	Type of port that was logged: for signal logging, the port type is 'outport'
Values on page 5-483	Time and data that were logged

Properties

BlockPath

Description

Block path for the source block for the signal

Data Type

`Simulink.SimulationData.BlockPath`

Access

RW

Name

Description

Name of signal element to use for name-based access

Data Type

character vector

Access

RW

PropagatedName

Description

Propagated name of signal element

Signal logging and root Output block logging data for a signal captures the propagated signal name if the logging format is `Dataset` and:

- For signal logging, you:
 - Mark the signal for signal logging and in the Signal Properties dialog box select **Show Propagated Signals**.
 - Enable **Configuration Parameters > Data Import/Export > Signal logging**.
- For root Output block logging, you select **Configuration Parameters > Data Import/Export > Output**.

The propagated signal name does not include angle brackets (<>).

Data Type

character vector

Access

R0

PortIndex

Description

Numeric index of port that was logged

Data Type

scalar real integer

Access

RW

PortType

Description

Type of port that was logged: for signal logging, the port type is 'outport'

Data Type

character vector

Access

RW

Values

Description

Time and data that were logged.

For an example of how to use the `Values` property and plot logged signal data, in the `sldemo_md\lref_bus` example, see “Logging Signal Data.”

Data Type

- MATLAB `timeseries` object
- Structure of MATLAB `timeseries` objects (for bus signals)
- Array of structures of MATLAB `timeseries` objects (for array of buses signals)
- Array of MATLAB `timeseries` objects (for nonbus signals in a For Each subsystem)
- MATLAB `timetable` object
- Structure of MATLAB `timetable` objects (for bus signals)
- Array of structures of MATLAB `timetable` objects (for array of buses signals)
- Cell array of MATLAB `timetable` objects (for nonbus signals in a For Each subsystem)

Access

Simulink.SimulationData.State class

Package: Simulink.SimulationData

State logging element

Description

Simulink uses `Simulink.SimulationData.State` objects to store state logging information during simulation. The objects contain state information about which block the state data is coming from and the type of state.

Properties

Name — Name of state element to use for name-based access

character vector

Name of state element to use for name-based access, specified as a character vector. If you do not specify a name, 'CSTATE' or 'DSTATE' is used, depending on whether it is a continuous or discrete state.

BlockPath — Block path for state source block

a `Simulink.SimulationData.BlockPath` object

Block path for state source block, specified as a `Simulink.SimulationData.BlockPath` object

Label — Type of state

'CSTATE' | 'DSTATE'

Type of state, returned as 'CSTATE' or 'DSTATE'. Read-only property.

- 'CSTATE' - Continuous state
- 'DSTATE' - Discrete state

Values — State element information

single MATLAB timeseries object | a structure of MATLAB timeseries objects

State element information, specified as a single MATLAB timeseries object or as a structure of MATLAB timeseries objects.

Methods

`plot` Plot simulation output data in the Simulation Data Inspector

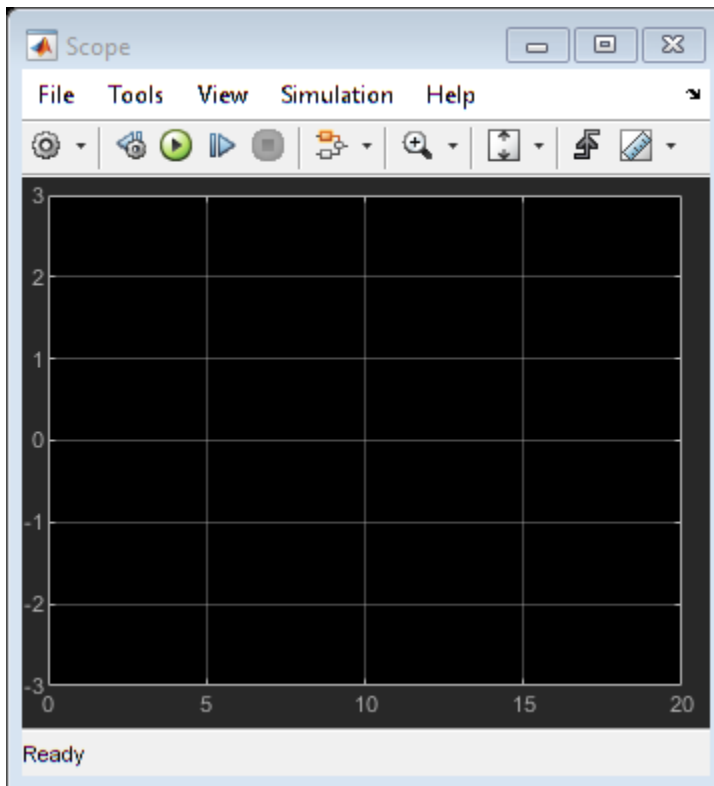

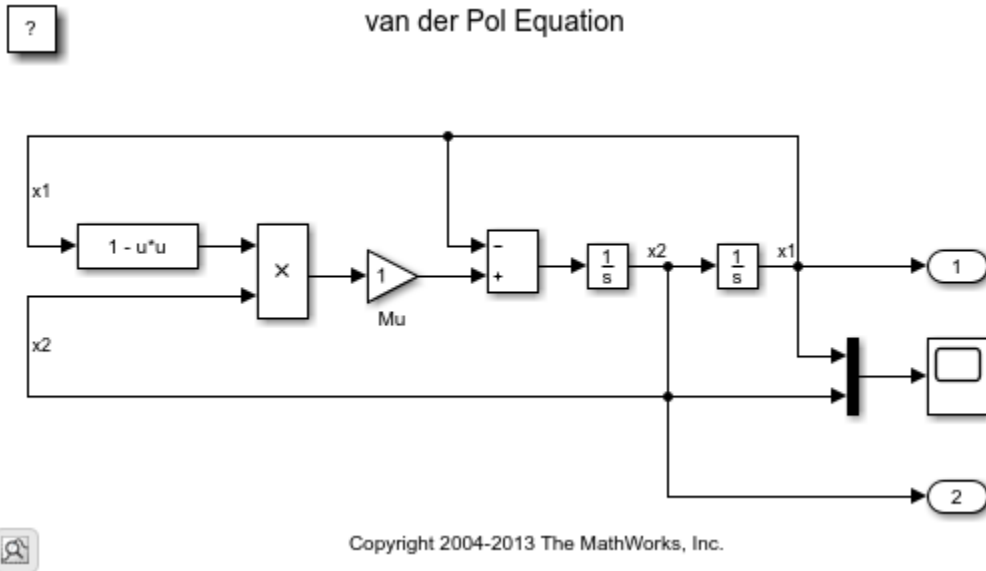

Examples

Final State Information in Structure with Dataset Format

Saved final state information in Dataset format and access the state data after simulation.

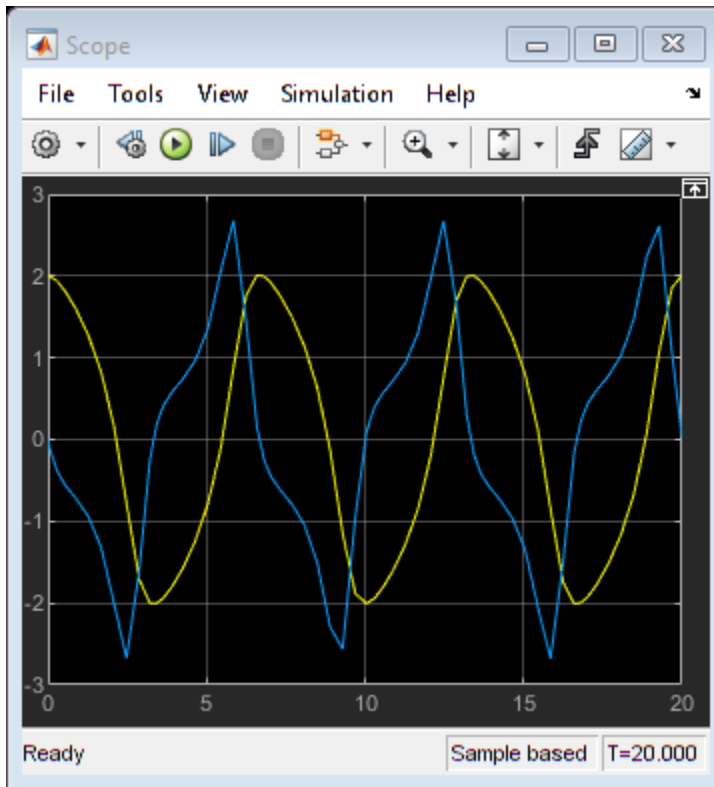

Open the vdp model and specify to log final states in Dataset format. Use the default logged state variable, xFinal.

```
open_system('vdp');  
set_param(gcs, 'SaveFinalState', 'on', 'SaveFormat', 'Dataset');
```

Simulate the vdp model.

```
sim('vdp');
```

View the state logging information in `xFinal`.

```
xFinal
```

```
xFinal =
```

```
Simulink.SimulationData.Dataset 'xFinal' with 2 elements
```

	Name	BlockPath
1	[1x1 State]	vdp/x1
2	[1x1 State]	vdp/x2

- Use braces `{ }` to access, modify, or add elements using index.

Examine the first element of the state dataset.

```
xFinal.get(1)
```

```
ans =
```

```
Simulink.SimulationData.State
Package: Simulink.SimulationData
```

```
Properties:
```

```
Name: ''  
BlockPath: [1x1 Simulink.SimulationData.BlockPath]  
Label: CSTATE  
Values: [1x1 timeseries]
```

Simulink.SimulationData.Unit class

Package: Simulink.SimulationData

Store units for simulation data

Description

Simulink creates `Simulink.SimulationData.Unit` objects to store unit information for signals when:

- Performing signal logging, which uses the `Dataset` format
- Logging root Output blocks, if in **Configurations Parameters** you select the **Output** parameter and set **Format** to `Dataset`
- Logging to a To Workspace block or To File block, if you set the **Save format** block parameter to the default of `Timeseries`

Construction

`unitsObj = Simulink.SimulationData.Unit(unitName)` creates a `Simulink.SimulationData.Unit` object with the unit that you specify.

Input Arguments

unitName — Name of logging data units

character vector

Name of logging data units, specified as a character vector.

Output Arguments

unitObj — Logging data units

`Simulink.SimulationData.Unit` object

Logging data units, returned as a `Simulink.SimulationData.Unit` object.

Properties

Name — Name of the units

character vector

Name of the units, specified as a character vector.

Methods

Method	Purpose
<code>setName</code>	Specify name of logging data unit

Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects (MATLAB).

Examples

Create and Use Inches Logging Units

Create a `Simulink.SimulationData.Unit` object representing inches.

```
inchesUnit = Simulink.SimulationData.Unit('inches');
```

Create a MATLAB timeseries object and set its `Units` field to the `Simulink.SimulationData.Unit` object.

```
ts = timeseries(1:10);  
ts.DataInfo.Units = inchesUnit;  
ts.DataInfo.Units
```

```
ans =
```

```
Units with properties:
```

```
Name: 'inches'
```

Simulink.SimulationInput class

Package: Simulink

Creates SimulationInput objects to make changes to a model for multiple or individual simulations

Description

The Simulink.SimulationInput object allows you to make changes to a model and run simulations with those changes. These changes are temporarily applied to the model. Through Simulink.SimulationInput object, you can change:

- Initial state
- Model parameters
- Block parameters
- External inputs
- Variables

Through the Simulink.SimulationInput object, you can also specify MATLAB functions to run at the start and the end of each simulation by using `in.setPreSimFcn` and `in.setPostSimFcn`, respectively. Simulink.SimulationInput does not support the ability to allow model references to have their own data dictionary.

Construction

`in = Simulink.SimulationInput('modelName')` creates a SimulationInput object for a model.

Input Arguments

modelName — Name of the model

character vector

Create a Simulink.SimulationInput object by passing the name of the model as an argument.

Example: `in = Simulink.SimulationInput('cstr')`

Properties

modelName — Name of the model

character vector

Name of the model for which the SimulationInput object is created.

InitialState — Initial state

Simulink.op.ModelOperatingPoint object

Initial state of the model for a simulation specified as a Simulink.op.ModelOperatingPoint object.

ExternalInput – External Input

numerical array, dataset object, timeseries, character array

External inputs added to the model for a simulation.

BlockParameters – Block parameters

array of `Simulink.Simulation.BlockParameter`

Block parameters of the model that are modified.

Variables – Variables

array of `Simulink.Simulation.Variable`

Variables of the model that are modified.

ModelParameters – Model parameters

array of `Simulink.Simulation.ModelParameter`

Model parameters of the model that are modified.

PreSimFcn – Function

MATLAB function

MATLAB function to run before the start of the simulation.

PostSimFcn – Function

MATLAB function

MATLAB function to run after the simulations.

UserString – User string

character array

Brief description of the simulation specified as a character array.

Methods

Method	Purpose
<code>setModelParameter</code>	Set model parameters to be used for a specific simulation through <code>SimulationInput</code> object.
<code>setBlockParameter</code>	Set block parameters to be used for a specific simulation through <code>SimulationInput</code> object.
<code>setInitialState</code>	Set initial state to be used for a specific simulation through <code>SimulationInput</code> object.
<code>setExternalInput</code>	Set external inputs for a simulation through <code>SimulationInput</code> object.
<code>setVariable</code>	Set variables for a simulation through <code>SimulationInput</code> object.
<code>setPreSimFcn</code>	Specify a MATLAB function to run before start of each simulation through <code>SimulationInput</code> object.

Method	Purpose
setPostSimFcn	Specify a MATLAB function to run after each simulation is complete through SimulationInput object.
applyToModel	Apply changes to the model specified through a SimulationInput object.
validate	Validate the contents of the SimulationInput object.
loadVariablesFromMATFile	Load variables from MAT-file into a Simulink.SimulationInput object.

Examples

Create a Simulink.SimulationInput Object

This example shows you how to create a SimulationInput object.

Open the model.

```
openExample('simulink/OpenTheModelExample');
open_system('ex_sldemo_househeat');
load_system('ex_sldemo_househeat')
```

Create a single SimulationInput object for a model.

```
model = 'ex_sldemo_househeat';
in = Simulink.SimulationInput(model);
```

Create an Array of Simulink.SimulationInput Objects

This example shows you how to create an array of SimulationInput objects.

Create an array of SimulationInput objects by using the for loop.

```
model = 'vdp';
for i = 10:-1:1
    in(i) = Simulink.SimulationInput(model);
end
```

Set Block Parameters using an Array of Simulink.SimulationInput Objects

This example modifies the block parameters of a model through the SimulationInput object.

Open the model.

```
openExample('simulink/OpenTheModelExample');
open_system('ex_sldemo_househeat');
load_system('ex_sldemo_househeat')
```

Create a SimulationInput object for this model.

```
mdl = 'sldemo_househeat';
in = Simulink.SimulationInput(mdl);
```

Modify block parameter.

```
in = in.setBlockParameter('sldemo_househeat/Set Point','Value','300');
```

Simulate the model.

```
out = sim(in)
```

Use Dataset as External Inputs with a Simulink.SimulationInput Objects

This example shows how use Dataset objects to set external inputs with Simulink.SimulationInput objects.

Open the model

```
mdl = 'sldemo_mdhref_counter';
open_system(mdl);
```

Create a Dataset object for this model.

```
t = (0:0.01:10)';
ds = Simulink.SimulationData.Dataset;
ds = ds.setElement(1, timeseries(5*ones(size(t)),t)); % First element
ds = ds.setElement(2, timeseries(10*sin(t),t)); % Second element
ds = ds.setElement(3, timeseries(-5*ones(size(t)),t)); % Third element
```

Create a Simulink.SimulationInput object and set the external inputs

```
in = Simulink.SimulationInput('sldemo_mdhref_counter');
in = in.setExternalInput('ds.getElement(1),ds.getElement(2),ds.getElement(3)');
```

Add other remaining variables in the expressions. Ensure that the dataset is also on the SimulationInput object.

Simulate the model.

```
in = in.setVariable('ds',ds);
```

Simulate the model

```
out = parsim(in)
```

applyToModel

Apply changes to the model specified through a `SimulationInput` object, `in`

Syntax

```
in.applyToModel
```

Description

`in.applyToModel` applies the changes specified through the `SimulationInput` object to the model. You can use it to debug a model or to interactively analyze a simulation.

Examples

Apply Changes Made Through the `Simulink.SimulationInput` Object to the Model

This example shows how to modify a model through a `SimulationInput` object and save those modifications.

Open the model and create a `SimulationInput` object.

```
open_system('sldemo_househeat');  
in = Simulink.SimulationInput('sldemo_househeat');
```

Modify block parameter, model parameters and a variable through `SimulationInput` object.

```
in = in.setBlockParameter('sldemo_househeat/Set Point', 'Value', '75');  
in = in.setVariable('cost', 50, 'Workspace', 'sldemo_househeat');  
in = in.setModelParameter('StartTime', '1', 'StopTime', '5');
```

Apply the modifications made in the above step to the model.

```
in.applyToModel
```

Simulink.Simulation.BlockParameter class

Package: Simulink.Simulation

Block parameters in Simulink.SimulationInput objects

Description

The `Simulink.Simulation.BlockParameter` object specifies the block parameter, path of the block, and the value of the block parameter used by the `Simulink.SimulationInput` object during simulation.

In most cases, there is no need to create an object of this class directly. It is recommended that you use the `setBlockParameter` method on the `Simulink.SimulationInput` object to add a block parameter to the `Simulink.SimulationInput` object.

Creation

`bp = Simulink.Simulation.BlockParameter('BlockPath', 'Name', 'Value')` creates a `Simulink.Simulation.BlockParameter` object, `bp`, that specifies the block parameter, `Name`, with a `Value` on its path, `BlockPath`.

Properties

BlockPath — Path of the block

character vector

Path of the block, specified as a character vector.

Name — Name of the block parameter

character vector

Name of the block parameter, specified as a character vector.

Value — Value of the block parameter

character vector

Value of the block parameter, specified as a character vector.

Simulink.Simulation.Variable

Variables in `Simulink.SimulationInput` objects

Description

The `Simulink.Simulation.Variables` object specifies the variable and its value used by the `Simulink.SimulationInput` object during simulation. By default, this object overrides variables that already exist in the base workspace or the data dictionary.

In most cases, there is no need to create an object of this class directly. To add a variable to the `Simulink.SimulationInput` object use the `setVariable` method on the `Simulink.SimulationInput` object.

Creation

`var = Simulink.Simulation.Variable('variableName'Value)` creates a `Simulink.Simulation.Variables` object, `var`, that specifies the variable and its value.

`var = Simulink.Simulation.Variable('variableName'Value, 'Workspace', 'WorkspaceName')` creates a `Simulink.Simulation.Variables` object, `var`, that specifies the variable defined in the specified workspace, `WorkspaceName` and its value. `Workspace` can either be a model's name to indicate that the variable is in a model workspace or `'global-workspace'` to indicate that it is either in the base workspace or in a data dictionary.

Properties

variableName — Name of the variable

character vector

Name of the variable, specified as a character vector.

Value — Value of the variable

character vector

Value of the variable, specified as a character vector.

WorkspaceName — Name of the variable

character vector

Name of the workspace that the variable is defined in, specified as a character vector.

```

ModelParameters:

Index	Name	Value
1	Start	'0'
2	Stop	'50'

Variables:

Index	Name	Value	Workspace
1	cost	50	global-workspace

Input Arguments

in — **Simulink.SimulationInput** object used to simulate the model
object

A `Simulink.SimulationInput` object that is used to specify changes to the model for a simulation.

“Run Parallel Simulations Using `parsim`”

Introduced in R2020a

removeVariable

Remove a variable from a `Simulink.SimulationInput` object or an array of `Simulink.SimulationInput` objects

Syntax

```
in = in.removeVariable('VariableName')
in = in.removeVariable('VariableName', 'Workspace', 'ModelName')
```

Description

`in = in.removeVariable('VariableName')` removes all the variables with the name `VariableName` from the `Simulink.SimulationInput` object.

`in = in.removeVariable('VariableName', 'Workspace', 'ModelName')` removes all the variables specified in base and model the workspace by `ModelName` from the `Simulink.SimulationInput` object.

Examples

Modify and Remove a Variable for a Simulation

This example modifies the model parameters through the `SimulationInput` object.

Open the model.

```
openExample('simulink/OpenTheModelExample');
open_system('ex_sldemo_househeat');
load_system('ex_sldemo_househeat')
```

Create a `SimulationInput` object for this model

```
in = Simulink.SimulationInput mdl;
```

Set the variable value to 50.

```
in = in.setVariable('cost',50);
```

By default, this variable is placed in the global workspace scope.

Assume that you added the variable accidentally and want to remove it

```
in = in.removeVariable('cost');
```

Input Arguments

'VariableName' — Name of variable

string

Name of the variable present in the `Simulink.SimulationInput` object

Example: 'Gain'

'Workspace' — Workspace for the variable

character vector

Set the scope of the variable by specifying the type of workspace.

Example: 'Workspace', 'sldemo_househeat'

setExternalInput

Set external inputs for a simulation through `SimulationInput` object, `in`

Syntax

```
in = in.setExternalInput([t, u1,..uN])
in = in.setExternalInput(ds)
in = in.setExternalInput(ts)
```

Description

`in = in.setExternalInput([t, u1,..uN])` allows you to directly specify numerical arrays as inputs to a model if a model has root inports.

`in = in.setExternalInput(ds)` allows you to directly specify dataset objects as external inputs to a model if a model has root inports.

`in = in.setExternalInput(ts)` allows you to directly specify timeseries object as external input if a model has a single root inport.

Examples

Set Numerical Arrays as External Inputs Through a Simulink.SimulationInput Object

This example shows how to set numerical arrays as external inputs.

Open the model

```
open_system('sldemo_mdlref_counter');
```

Create a `SimulationInput` object for this model.

```
in = Simulink.SimulationInput('sldemo_mdlref_counter');
```

Prepare external inputs.

```
t = (0:0.01:10)';
u1 = 5*ones(size(t));
u2 = 10*sin(t);
u3 = -5*ones(size(t));
```

Set external inputs to the model.

```
in = in.setExternalInput([t, u1, u2, u3]);
```

Simulate the model.

```
out = sim(in);
```

Input Arguments

[t, u1, ..uN] — Numerical array

numerical array

Numerical array to be used as an external input.

ds — Dataset object

`Simulink.SimulationData.Dataset` object

Dataset object to be used as an external input

ts — Time series

time object handle

Time series to be used as an external input

Introduced in R2017a

setPostSimFcn

Specify a MATLAB function to run after each simulation is complete through `SimulationInput` object, `in`

Syntax

```
in = in.setPostSimFcn(@(y) myfunction(arg1, arg2 ...))
```

Description

`in = in.setPostSimFcn(@(y) myfunction(arg1, arg2 ...))` runs after each simulation is complete. The `Simulink.SimulationOutput` object is passed as the argument `y` to this function. `myfunction` is any MATLAB function and can be used to do the post processing on the output. To return post processed data, you must return it as values in a struct. These values are then packed into the `Simulink.SimulationOutput` output to replace the usual logged data or add new data to the `Simulink.SimulationOutput` object.

Examples

Specify a MATLAB function for Postprocessing of the Output

This example specifies a MATLAB Function through `SimulationInput` object to run after each simulation is complete.

Create a `PostSimFcn` to get the mean of the output.

```
function newout = postsim(out);  
newout.mean = mean(out.yout);  
end
```

Create a `SimulationInput` object for a model.

```
in = Simulink.SimulationInput('vdp');  
in = in.setPostSimFcn(@(x) postsim(x));  
in = in.setModelParameter('SaveOutput', 'on');
```

Simulate the model.

```
out = sim(in)
```

View your result

```
out.mean
```

It is best practice to avoid using 'ErrorMessage' and 'SimulationMetadata' as field names in the function.

Input Arguments

y — Copy of Simulink.SimulationOutput object for postprocessing

Simulink.SimulationOutput object

This is a Simulink.SimulationOutput object which is an input to myfunction.

arg1, arg2 ... — Function arguments

character vectors object

Arguments specified to pass to the setPostSimFcn.

Introduced in R2017a

setPreSimFcn

Specify a MATLAB function to run before start of each simulation through `SimulationInput` object, `in`

Syntax

```
in = in.setPreSimFcn(@(x) myfunction(arg1, arg2 ...))
```

Description

`in = in.setPreSimFcn(@(x) myfunction(arg1, arg2 ...))` runs before each simulation starts. The `Simulink.SimulationInput` object is passed as an argument `x` to this function. `myfunction` is any MATLAB function and can be used to modify the `Simulink.SimulationInput` object. If you use `myfunction` to modify the `Simulink.SimulationInput` object, you must return `Simulink.SimulationInput` object as the only output argument.

Examples

Specify a MATLAB Function to Run Before Each Simulation

This example shows how to specify a MATLAB function through `SimulationInput` object to run at before start of each simulation.

Create a `PreSimFcn` function.

```
function presim(in)
    signalbuilder('sf_car/User Inputs', 'ActiveGroup', in.Variables.Value)
end
```

Open the model.

```
model = 'sf_car';
open_system(model);
```

Create an array of `SimulationInput` objects for this model. Use `in.setPreSimFcn` to run `presim` before simulation.

```
n = 4;
for idx = n:-1:1
    in(idx) = Simulink.SimulationInput(model);
    in(idx) = in(idx).setVariable('SigIndex', idx);
    in(idx) = in(idx).setPreSimFcn(@(x) presim(x));
end
```

Simulate the model.

```
out = sim(in)
```

Input Arguments

x — A `Simulink.SimulationInput` object as input to the `myfunction`

`Simulink.SimulationInput` object

This is an input to `myfunction` in which you can modify the `Simulink.SimulationInput` object.

arg1, arg2 ... — Function arguments

character vectors object

Arguments specified to pass to the `setPreSimFcn`.

setBlockParameter

Set block parameters to be used for a specific simulation through `SimulationInput` object, `in`

Syntax

```
in = in.setBlockParameter('BlockPath','ParameterName','Value',... 'BlockPathN'  
'ParameterNameN','ValueN')
```

Description

`in = in.setBlockParameter('BlockPath','ParameterName','Value',... 'BlockPathN'
'ParameterNameN','ValueN')` sets the parameter on the block specified at `BlockPath` with the properties `ParameterName` and `Value`. You can use the `setBlockParameter` method to specify block parameters in model reference hierarchy. You can set multiple block parameters in a model using the same `SimulationInput` object. For more information on block parameter, see “Block-Specific Parameters” on page 6-27.

You can use `getBlockParameter('BlockPath','ParameterName')` method to get the value of block parameter and the `removeBlockParameter('BlockPath','ParameterName')` method to remove block parameter from the `Simulink.SimulationInput` object.

Examples

Modify a Block Parameter for a Simulation

This example modifies the block parameters of a model through the `SimulationInput` object.

Open the model

```
mdl = 'sldemo_househeat';  
open_system(mdl);
```

Create a `SimulationInput` object for this model.

```
in = Simulink.SimulationInput(mdl);
```

Modify block parameter.

```
in = in.setBlockParameter('sldemo_househeat/Set Point','Value','300');
```

Simulate the model.

```
out = sim(in)
```

Modify Multiple Block Parameters for a Simulation

This example modifies the block parameters of a model through the `SimulationInput` object.

Open the model

```
mdl = 'vdp';  
open_system(mdl);
```

Create a `SimulationInput` object for this model.

```
in = Simulink.SimulationInput(mdl);
```

Modify block parameter.

```
in = in.setBlockParameter('vdp/Mu','Gain','40','vdp/Fcn','Position',[50 100 110 120]);
```

Simulate the model.

```
out = sim(in)
```

Input Arguments

'BlockPath' — Path of the block

character vector

`BlockPath` is the path of the block for which the parameter is changed

Example: `'sldemo_househeat/Set Point'`

'ParameterName' — Block parameter name

character vector

Specify optional comma-separated pairs of `ParameterName,Value` arguments. `ParameterName` is the parameter name and `Value` is the corresponding value. `ParameterName` must appear inside single quotes (`' '`). Block parameter values are typically specified as character vectors. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`. `ParameterNameN,ValueN` pairs follow the same syntax as `set_param`.

Example: `'Value','350'`

setInitialState

Set initial state to be used for a specific simulation through SimulationInput object, in

Syntax

```
in = in.setInitialState(xInitial)
```

Description

`in = in.setInitialState(xInitial)` sets the initial state of a model to `xInitial`, a `Simulink.op.ModelOperatingPoint` object.

Input Arguments

xInitial — `Simulink.op.ModelOperatingPoint` object

`Simulink.op.ModelOperatingPoint`

You can change the Initial State of a model by assigning it to a `Simulink.op.ModelOperatingPoint` object.

setModelParameter

Set model parameters to be used for a specific simulation through `SimulationInput` object, in

Syntax

```
in = in.setModelParameter('ParameterName', 'Value', ... 'ParameterNameN',  
'ValueN')
```

Description

`in = in.setModelParameter('ParameterName', 'Value', ... 'ParameterNameN', 'ValueN')` sets a model parameter `Name` with a `Value`. You can add multiple model parameters to the model using the same `SimulationInput` object.

You can use `getModelParameter('ParameterName')` method to get the value of model parameter and the `removeModelParameter('ParameterName')` method to remove model parameter from the `Simulink.SimulationInput` object

Examples

Modify a Model Parameter for a Simulation

This example modifies the model parameters of through the `SimulationInput` object

Open the model.

```
mdl = 'sldemo_househeat';  
open_system(mdl);
```

Create a `SimulationInput` object for this model.

```
in = Simulink.SimulationInput(mdl);
```

Specify a timeout of 5 seconds and modify model parameters, `StartTime` and `StopTime`

```
in = in.setModelParameter('Timeout',5);  
in = in.setModelParameter('StartTime','1','StopTime','4');
```

Simulate the model.

```
out = sim(in)
```

Input Arguments

'ParameterName', 'Value', ... 'ParameterNameN', 'ValueN' — Block parameter name
character vector

Specify optional comma-separated pairs of `ParameterName`, `Value` arguments. `ParameterName` is the parameter name and `Value` is the corresponding value. `ParameterName` must appear inside single quotes (' '). Model parameter values are typically specified as character vectors. You can

specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`. `ParameterNameN, ValueN` pairs follow the same syntax as `set_param`.

Example: `'StartTime', '1'`

“Run Parallel Simulations Using `parsim`”

Introduced in R2017a

setVariable

Set variables for a simulation through `SimulationInput` object, `in`

Syntax

```
in = in.setVariable('Name', 'Value')
in = in.setVariable('Name', 'Value', 'Workspace', 'ModelName')
```

Description

`in = in.setVariable('Name', 'Value')` assigns a `Value` to variable `Name`. You can add multiple variables to the model using the same `SimulationInput` object.

`in = in.setVariable('Name', 'Value', 'Workspace', 'ModelName')` assigns the `Value` to variable `Name`. Variables that are defined through the `SimulationInput` object are placed in the global workspace scope by default. The term global workspace is specific to the `Simulink.SimulationInput` object and its methods. Variables in the global workspace scope take precedence if a variable with the same name exists in the base workspace or the data dictionary. The variables in the model workspace take precedence over the global workspace scope. To change the value of a model workspace variable, set the scope by specifying the model name when you add the variable to the `SimulationInput` object.

While using the `setVariable` method, you can specify only one variable at a time.

You can use `getVariable('VariableName')` method to get the value of variable and the `removeVariable('VariableName')` method to remove variable from the `Simulink.SimulationInput` object

For information on using nonscalar variables, structure variables and parameter objects, see “Sweep Nonscalars, Structures, and Parameter Objects”.

Examples

Modify a Variable for a Simulation

This example modifies the model parameters of through the `SimulationInput` object.

Open the model.

```
mdl = 'sldemo_househeat';
open_system(mdl);
```

Create a `SimulationInput` object for this model

```
in = Simulink.SimulationInput(mdl);
```

Set the variable value to 50.

```
in = in.setVariable('cost',50);
```

By default, this variable is placed in the global workspace scope.

Simulate the model.

```
out = sim(in)
```

Modify a Variable for a Simulation in the Model Workspace

This example modifies the model parameters of `sldemo_househeat` through the `SimulationInput` object.

Set path and open the model.

```
mdl = 'sldemo_househeat';
open_system(mdl);
```

Create a `SimulationInput` object for this model

```
in = Simulink.SimulationInput(mdl);
```

Set the variable to 50 and set the scope to model workspace.

```
in = in.setVariable('cost',50,'Workspace','sldemo_househeat');
```

Simulate the model.

```
out = sim(in)
```

Input Arguments

'Name', 'Value' — Block parameter name

character vector

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the literal value of the variable. `Name` must appear inside single quotes (' ').

Example: `'StartTime','1'`

'Workspace' — Workspace for the variable

character vector

Set the scope of the defined variable by specifying the model name

Example: `'Workspace','sldemo_househeat'`

validate

Validate the contents of the `SimulationInput` object, `in`

Syntax

```
in.validate
```

Description

`in.validate` validates the changes made to the model through the `SimulationInput` object. This method validates all the changes made to the model through the `SimulationInput` object.

Examples

Validate Changes Made Through the SimulationInput Object

This example modifies and validates the variable of the model through the `SimulationInput` object.

Open the model.

```
mdl = 'sldemo_househeat';  
open_system(mdl);
```

Create a `SimulationInput` object for this model

```
in = Simulink.SimulationInput(mdl);
```

Modify a model parameter

```
in = in.setModelParameter('InvalidParamName', '5');
```

Validate this change

```
in.validate
```

loadVariablesFromMATFile

Load variables from MAT-file into a `Simulink.SimulationInput` object, `in`

Syntax

```
in = in.loadVariablesFromMATFile('filename')
```

Description

`in = in.loadVariablesFromMATFile('filename')` loads variables from the specified MAT-file into the `Variables` property of `Simulink.SimulationInput`.

Examples

Load Variables From MAT-File

This example shows how to load variables from MAT-File into `Simulink.SimulationInput` object using the `loadVariablesFromMATFile` method.

Create a `Simulink.SimulationInput` Object

Create a `Simulink.SimulationInput` object for the example model.

```
mdl = 'ex_loadVar_sldemo_househeat';
in = Simulink.SimulationInput(mdl);
in
```

```
in =
```

```
SimulationInput with properties:
```

```
    ModelName: 'ex_loadVar_sldemo_househeat'
   InitialState: [0x0 Simulink.op.ModelOperatingPoint]
  ExternalInput: []
 ModelParameters: [0x0 Simulink.Simulation.ModelParameter]
BlockParameters: [0x0 Simulink.Simulation.BlockParameter]
    Variables: [0x0 Simulink.Simulation.Variable]
    PreSimFcn: []
    PostSimFcn: []
    UserString: ''
```

Load Variables From MAT-File

Use the `loadVariablesFromMATFile` method of the `Simulink.SimulationInput` object.

```
in = in.loadVariablesFromMATFile('sldemo_househeat_data.mat');
in
```

```
in =
```

SimulationInput with properties:

```

    ModelName: 'ex_loadVar_sldemo_househeat'
    InitialState: [0x0 Simulink.op.ModelOperatingPoint]
    ExternalInput: []
    ModelParameters: [0x0 Simulink.Simulation.ModelParameter]
    BlockParameters: [0x0 Simulink.Simulation.BlockParameter]
    Variables: [1x25 Simulink.Simulation.Variable]
    PreSimFcn: []
    PostSimFcn: []
    UserString: ''

```

Simulate the Model

The model uses the loaded variables for simulation

```
out = sim(in)
```

```
out =
```

```

    Simulink.SimulationOutput:
      sldemo_househeat_output: [1x1 Simulink.SimulationData.Dataset]

    SimulationMetadata: [1x1 Simulink.SimulationMetadata]
      ErrorMessage: [0x0 char]

```

Input Arguments

filename — Name of the MAT file

character vector | string scalar

Name of MAT-file, specified as a character vector or string scalar.

Example: 'myFile'

Topics

“Run Multiple Simulations”

“Run Parallel Simulations Using parsim”

Introduced in R2017a

Simulink.Simulation.Futures class

Package: Simulink

Create Future object for simulation

Description

Create a `Simulink.Simulation.Future` object when you execute `parsim` with the `'RunInBackground'` argument set to `'on'`. The `parsim` command runs multiple simulations in parallel using the inputs specified with an array of `Simulink.SimulationInput` objects. You can use this object to monitor the status of ongoing simulations, fetch outputs of completed simulations, or cancel ongoing simulations.

The `parsim` command uses the Parallel Computing Toolbox license to run the simulations in parallel. `parsim` runs the simulations in serial if a parallel pool cannot be created or if Parallel Computing Toolbox is not used.

Construction

`future = parsim(in, 'RunInBackground', 'on')` creates a `Simulink.Simulation.Future` object, `future`, while running multiple simulations in parallel the using the inputs specified in the `Simulink.SimulationInput` object, `in`.

Input Arguments

in — `Simulink.SimulationInput` object array

object (default) | array

A `Simulink.SimulationInput` object or an array of `Simulink.SimulationInput` objects is used to run multiple simulations. Specify parameters and values of a model to run multiple simulations without making it dirty.

Example: `in = Simulink.SimulationInput('vdp'), in(1:10) = Simulink.SimulationInput('vdp')`

'RunInBackground' — `parsim` argument to enable `RunInBackground`

'off' (default) | 'on'

Set to `'on'`, to run simulations asynchronously, keeping the MATLAB command prompt available.

Properties

Diary — Log of outputs from the simulation

text file

Text log of outputs from the simulation.

This property is read-only.

ID — Numeric identifier of the future object

scalar integer

ID of the future object, specified as a scalar integer.

This property is read-only.

Read — Whether the outputs have been read

1 | 0

Whether a call to `fetchNext` or `fetchOutputs` has read the outputs in the `Simulink.Simulation.Future` object array, specified as 1 if true and 0 if false.

This property is read-only.

State — Current state of future object array

'pending' | 'queued' | 'running' | 'finished' | 'failed' | 'unavailable'

Current state of future object array, specified as 'pending', 'queued', 'running', 'finished', 'failed', or 'unavailable'.

This property is read-only.

Methods

Method	Purpose
<code>cancel</code>	Cancel a pending, queued, or running <code>Simulink.Simulation.Future</code> object
<code>fetchNext</code>	Fetch next available unread output from <code>Simulink.Simulation.Future</code> object array
<code>fetchOutputs</code>	Retrieve <code>Simulink.SimulationOutput</code> from <code>Simulink.Simulation.Future</code>
<code>wait</code>	Wait for <code>Simulink.Simulation.Future</code> objects to complete simulation

Examples

Create a Simulink.Simulation.Future Object

This example shows how to create a `Simulink.Simulation.Future` object array and use it to retrieve outputs and see the status of simulations.

This example runs several simulations of the `vdp` model, varying the value of the gain `Mu`.

Open the model and define a vector of `Mu` values.

```
open_system('vdp');
Mu_Values = [0.5:0.25:5];
MuVal_length = length(Mu_Values);
```

Using `Mu_Values`, initialize an array of `Simulink.SimulationInput` objects. To preallocate the array, a loop index is made to start from the largest value.

```
for i = MuVal_length:-1:1
    in(i) = Simulink.SimulationInput('vdp');
```

```
        in(i) = in(i).setBlockParameter('vdp/Mu',...  
            'Gain',num2str(Mu_Values(i)));  
end
```

Simulate the model using `parsim`. Set it to 'RunInBackground', to be able to use the command prompt, while simulations are running.

```
Future = parsim(in, 'RunInBackground', 'on');
```

Use the `fetchNext` method on `Future` simulations.

```
for i = 1:MuVal_length  
    [completedIdx, simOut] = fetchNext(Future)  
end
```

See Also

Functions

`batch` | `batchsim` | `cancel` | `fetchNext` | `fetchOutputs` | `parsim` | `wait`

Classes

`Simulink.SimulationInput`

Introduced in R2018a

cancel

Cancel a pending, queued, or running `Simulink.Simulation.Future` object

Syntax

```
cancel(Future)
```

Description

`cancel(Future)` stops the objects of the `Simulink.Simulation.Future` array, `Future`, that are currently in 'pending', 'queued', or 'running' state. For elements of the Futures in the 'finished' state, no action is taken.

Examples

Cancel Simulations of Future Objects

This example shows how to use the `cancel` method on an array of future objects to stop the simulations.

This example runs several simulations of the `vdp` model, varying the value of the gain `Mu`.

Open the model and define a vector of `Mu` values.

```
open_system('vdp');  
Mu_Values = [0.5:0.25:1000];  
MuVal_length = length(Mu_Values)
```

Using `Mu_Values`, initialize an array of `Simulink.SimulationInput` objects. To preallocate the array, a loop index is made to start from the largest value.

```
for i = MuVal_length:-1:1  
    in(i) = Simulink.SimulationInput('vdp');  
    in(i) = in(i).setBlockParameter('vdp/Mu', ...  
        'Gain', num2str(Mu_Values(i)));  
end
```

Simulate the model using `parsim`. Set to 'RunInBackground' to enable the use the command prompt, while simulations are running.

```
Future = parsim(in, 'RunInBackground', 'on');
```

Now, assume that you want to run simulations with different values of `Mu` and cancel the ongoing simulations.

cancel(Future)

Input Arguments

Future — Simulation.Simulink.Future object

array

Array of Simulation.Simulink.Future objects. To create Future, run parsim with 'RunInBackground' option set to 'on'.

Example: Future = parsim(in, 'RunInBackground', 'on')

Classes

Simulink.Simulation.Future | Simulink.SimulationInput

Introduced in R2018a

fetchNext

Fetch next available unread output from `Simulink.Simulation.Future` object array

Syntax

```
[idx,simOut] = fetchNext(Future)
[idx,simOut] = fetchNext(Future, Timeout)
```

Description

`[idx,simOut] = fetchNext(Future)` waits for the unread element of `Simulink.Simulation.Future` array, `Future`, to reach a 'finished' state. It returns the index of the simulation that finished, and the corresponding `Simulink.SimulationOutput` object.

`[idx,simOut] = fetchNext(Future, Timeout)` waits for a maximum of `Timeout` seconds for a result to become available. If the timeout expires before any result is available, `simOut` is returned as an empty array.

An error is reported if there are no elements in `Future` with property `Read` as false. You can check for any unread futures using `anyUnread = ~all([F.Read])`.

`fetchNext` displays an error if any element of `Future` with a 'finished' state encounters an error during execution. The `Read` property of that element becomes `true` allowing any subsequent call to `fetchNext` to proceed.

Examples

Create a Simulink.Simulation.Future Object

This example shows how to create a `Simulink.Simulation.Future` object array and use it to retrieve outputs and see the status of simulations.

This example runs several simulations of the `vdp` model, varying the value of the gain `Mu`.

Open the model and define a vector of `Mu` values.

```
open_system('vdp');
Mu_Values = [0.5:0.25:5];
MuVal_length = length(Mu_Values);
```

Using `Mu_Values`, initialize an array of `Simulink.SimulationInput` objects. To preallocate the array, a loop index is made to start from the largest value.

```
for i = MuVal_length:-1:1
    in(i) = Simulink.SimulationInput('vdp');
    in(i) = in(i).setBlockParameter('vdp/Mu',...
        'Gain',num2str(Mu_Values(i)));
end
```

Simulate the model using `parsim`. Set it to 'RunInBackground' to be able to use the command prompt, while simulations are running.

```
Future = parsim(in, 'RunInBackground', 'on');
```

Use the `fetchNext` method on `Future`.

```
for i = 1:MuVal_length
    [completedIdx, simOut] = fetchNext(Future)
end
```

Input Arguments

Future — `Simulation.Simulink.Future` object

array

Array of `Simulation.Simulink.Future` objects. To create `Future`, run `parsim` with 'RunInBackground' option set to 'on'.

Example: `Future = parsim(in, 'RunInBackground', 'on')`

Timeout — Number of seconds specified for `fetchNext` to time out

scalar

Specify a `Timeout` for `fetchNext` to retrieve the results from the `Simulation.Simulink.Future` array, `Future`.

Example: `[idx, simOut] = fetchNext(Future, 45)`

Output Arguments

idx — Index of the simulation

integer

When `fetchNext` method is used on an array of `Simulink.Simulation.Future` objects, it returns the index of the simulation whose output is being retrieved.

simOut — Simulation object containing logged simulation results

object | array

Array of `Simulink.SimulationOutput` objects that contain all of the logged simulation results. The size of the array is equal to the size of the array of `Simulink.SimulationInput` objects.

All simulation outputs (logged time, states, and signals) are returned in a single `Simulink.SimulationOutput` object. You define the model time, states, and output that are logged using the **Data Import/Export** pane of the Model Configuration Parameters dialog box. You can log signals using blocks such as the To Workspace and Scope blocks. The **Signal & Scope Manager** tool can directly log signals.

Introduced in R2017b

fetchOutputs

Retrieve `Simulink.SimulationOutput` from `Simulink.Simulation.Future` objects

Syntax

```
simOut = fetchOutputs(Future)
```

Description

`simOut = fetchOutputs(Future)` fetches the output from an array of `Simulink.Simulation.Future` objects, `Future`, after each element of `Future` is in a 'finished' state. `fetchOutputs` returns an array of `Simulink.SimulationOutput` objects.

Examples

Create a Future and Retrieve Outputs Using fetchOutputs

This example shows how to use the `fetchOutputs` method on an array of future objects to retrieve a `Simulink.SimulationOutput` array.

This example runs several simulations of the `vdp` model, varying the value of the gain `Mu`.

Open the model and define a vector of `Mu` values.

```
open_system('vdp');  
Mu_Values = [0.5,0.75,1,1.25];  
MuVal_length = length(Mu_Values);
```

Using `Mu_Values`, initialize an array of `Simulink.SimulationInput` objects. To preallocate the array, a loop index is made to start from the largest value.

```
for i = MuVal_length:-1:1  
    in(i) = Simulink.SimulationInput('vdp');  
    in(i) = in(i).setBlockParameter('vdp/Mu',...  
        'Gain',num2str(Mu_Values(i)));  
end
```

Simulate the model using `parsim`. Set to 'RunInBackground' to enable the use of command prompt, while simulations are running.

```
Future = parsim(in,'RunInBackground','on');
```

Use the `fetchOutputs` method on `Future`

```
simOut = fetchOutputs(Future)
```

```
simOut =  
1x4 Simulink.SimulationOutput array
```

Input Arguments

Future — `Simulation.Simulink.Future` object
array

Array of `Simulation.Simulink.Future` objects. To create, `Future`, run `parsim` with 'RunInBackground' option set to 'on'.

Example: `Future = parsim(in, 'RunInBackground', 'on')`

Output Arguments

simOut — `Simulation` object containing logged simulation results
object

Array of `Simulink.SimulationOutput` objects that contain all of the logged simulation results. The size of the array is equal to the size of the array of `Simulink.SimulationInput` objects.

All simulation outputs (logged time, states, and signals) are returned in a single `Simulink.SimulationOutput` object. You define the model time, states, and output that are logged using the **Data Import/Export** pane of the Model Configuration Parameters dialog box. You can log signals using blocks such as the To Workspace and Scope blocks. The **Signal & Scope Manager** tool can directly log signals.

Classes

`Simulink.Simulation.Future` | `Simulink.SimulationInput`

Introduced in R2018a

wait

Wait for `Simulink.Simulation.Future` objects to complete simulation

Syntax

```
Ok = wait(Future)
```

Description

`Ok = wait(Future)` blocks the command prompt until each element of the `Simulink.Simulation.Future` array, `Future` is in a 'finished' state.

Examples

Wait for the Future Array to Complete Simulations

This example shows how to use the `wait` method on an array of future objects.

This example runs several simulations of the `vdp` model, varying the value of the gain `Mu`.

Open the model and define a vector of `Mu` values.

```
open_system('vdp');
Mu_Values = [0.5:0.25:5];
MuVal_length = length(Mu_Values);
```

Using `Mu_Values`, initialize an array of `Simulink.SimulationInput` objects. To preallocate the array, a loop index is made to start from the largest value.

```
for i = MuVal_length:-1:1
    in(i) = Simulink.SimulationInput('vdp');
    in(i) = in(i).setBlockParameter('vdp/Mu', ...
        'Gain', num2str(Mu_Values(i)));
end
```

Simulate the model using `parsim`. Set to 'RunInBackground' to enable the use of command prompt while the simulations are running and to create an array of `Simulink.Simulation.Future` objects.

```
Future = parsim(in, 'RunInBackground', 'on');
```

Use the `wait` method on `Future` to block the execution.

```
Ok = wait(Future)
```

Input Arguments

Future — `Simulation.Simulink.Future` object

array

Array of `Simulation.Simulink.Future` objects. To create `Future`, run `parsim` with `'RunInBackground'` option set to `'on'`.

Example: `Future = parsim(in, 'RunInBackground', 'on')`

Output Arguments

Ok — Whether the wait is completed successfully

1 | 0

`Ok` is `true` if the wait completes successfully, `false` if any of the `Future` objects failed execution or were canceled. Specified as 1 if true, 0 if false.

Simulink.SimulationMetadata class

Package: Simulink

Access metadata of simulation runs

Description

The `SimulationMetadata` class contains information about a simulation run including:

- Model information
- Timing information
- Execution and diagnostic information
- Custom character vector to tag the simulation
- Custom data to describe the simulation

`SimulationMetadata` packages this information with the `SimulationOutput` object. To use `SimulationMetadata`, use one of these approaches:

- In **Configuration Parameters > Data Import/Export**, under **Save options**, select **Single simulation output**.
- Use `set_param` to set `ReturnWorkspaceOutputs` to on.

```
set_param(model_name, 'ReturnWorkspaceOutputs', 'on');
```

To retrieve the `SimulationMetadata` object, use the `getSimulationMetadata` method on a `SimulationOutput` object.

Properties

ModelInfo — Information about the model and simulation operating environment

structure

The `ModelInfo` structure has these fields.

Field Name	Type	Description
<code>ModelName</code>	char	Name of the model
<code>ModelVersion</code>	char	Version of the model
<code>ModelFilePath</code>	char	Absolute location of the <code>.mdl/.slx</code> file
<code>UserID</code>	char	System user ID of the machine used for the simulation
<code>MachineName</code>	char	Hostname of the machine used for the simulation
<code>Platform</code>	char	Operating system of the machine used for the simulation

Field Name	Type	Description
ModelStructuralChecksum	4-by-1 uint32	Structural checksum of the model calculated after an update diagram
SimulationMode	char	Simulation mode
StartTime	double	Simulation start time
StopTime	double	Time at which the simulation was terminated
SolverInfo	structure	Solver information: <ul style="list-style-type: none"> Fixed-step solvers - Solver type, name, and fixed step size Variable solvers - Solver type, name, and max step size (initial setting)
SimulinkVersion	structure	Version of Simulink
LoggingInfo	structure	Metadata about logging to persistent storage: <ul style="list-style-type: none"> LoggingToFile field — Indicates whether logging to persistent storage is enabled ('on' or 'off') LoggingFileName field — Specifies the resolved file name for the persistent storage MAT-file (if LoggingToFile is 'on').

ExecutionInfo — Structure to store information about a simulation run

structure

Structure to store information about a simulation run, including the reason a simulation stopped and any diagnostics reported during the simulation. The structure has these fields.

Field Name	Type	Description
StopEvent	Nontranslated character vector	<p>Reason the simulation stopped, represented by one of the following:</p> <ul style="list-style-type: none"> • ReachedStopTime - Simulation stopped upon reaching stop time and no errors were reported during execution. StopEvent has value ReachedStopTime, even if errors are reported in the stop callbacks, which are executed after the simulation ends. • ModelStop - Simulation stopped by a block or by solver before reaching stop time. • StopCommand - Simulation stopped manually by clicking the Stop button or using the set_param command. • DiagnosticError - Simulation stopped because an error was reported during simulation. • KeyboardControlC - Simulation stopped using keystroke Ctrl+C. • PauseCommand - Simulation paused manually by clicking the Pause button or using the set_param command. • ConditionalPause - Simulation paused using a conditional breakpoint. • PauseTime - Simulation paused at or after specified pause time. • StepForward - Simulation paused after clicking step forward. • StepBackward - Simulation paused after clicking step backward. • Timeout - Simulation stopped because execution time exceeded timeout specified by Timeout.
StopEventSource	Simulink.SimulationData.BlockPath	Source of stop event, if it is a valid Simulink object.
StopEventDescription	Translated character vector	Superset of information stored in StopEvent and StopEventSource.

Field Name	Type	Description
ErrorDiagnostic	struct	<p>Error reported during simulation, represented by the following fields:</p> <ul style="list-style-type: none"> • Diagnostic - MSLDiagnostic object that includes object paths, ID, message, cause, and stack. • SimulationPhase - Represented by one of these: Initialization, Execution, or Termination. • SimulationTime - Simulation time represented as a double, if reported during Execution; else, represented as []. <p>By passing the name-value pair 'CaptureErrors', 'on' to the sim command, errors generated during simulation are reported in ExecutionInfo.ErrorDiagnostic. The sim command does not capture generated errors.</p>
WarningDiagnostics	Array of struct	<p>Array of all warnings reported during the simulation. Each array item is represented by the following fields:</p> <ul style="list-style-type: none"> • Diagnostic - MSLDiagnostic object that includes object paths, ID, message, cause, and stack. • SimulationPhase - Represented as: Initialization, Execution, or Termination. • SimulationTime - Simulation time represented as a double, if reported during Execution; else, represented as [].

TimingInfo — Structure to store profiling information about the simulation

structure

Structure to store profiling information about the simulation, including the time stamps for the start and end of the simulation. The structure has these fields.

Field Name	Type	Description
WallClockTimestampStart	character vector	Wall clock time when the simulation started, in YYYY-MM-DD HH:MI:SS format with microsecond resolution
WallClockTimestampStop	character vector	Wall clock time when the simulation stopped, in YYYY-MM-DD HH:MI:SS format with microsecond resolution

Field Name	Type	Description
InitializationElapsedWallTime	double	Time spent before execution, in seconds
ExecutionElapsedWallTime	double	Time spent during execution, in seconds
TerminationElapsedWallTime	double	Time spent after execution, in seconds
TotalElapsedWallTime	double	Total time spent in initialization, execution, and termination, in seconds
ProfilerData	Simulink.profiler.Data	Profiling results of the model, returned as a Simulink.profiler.Data object Note The ProfilerData field is shown only when the Profile and ReturnWorkspaceOutputs model parameters are enabled

The ExecutionElapsedWallTime includes the time that Simulink spent to roll back or step back in a simulation. The ExecutionElapsedWallTime does not include the time spent between steps. For example, if you use Stepper to step through a simulation, the ExecutionElapsedWallTime time does not include the time when the simulation is in a paused state. For more information about using Stepper, see “How Simulation Stepper Helps With Model Analysis”.

UserString — Custom character vector to describe the simulation

character vector

Use Simulink.SimulationOutput.setUserString to directly store a character vector in the SimulationMetadata object that is contained in the SimulationOutput object.

UserData — Custom data to store in SimulationMetadata object that is contained in the SimulationOutput object

character vector

Use Simulink.SimulationOutput.setUserData to store custom data in the SimulationMetadata object that is contained in the SimulationOutput object.

Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects (MATLAB).

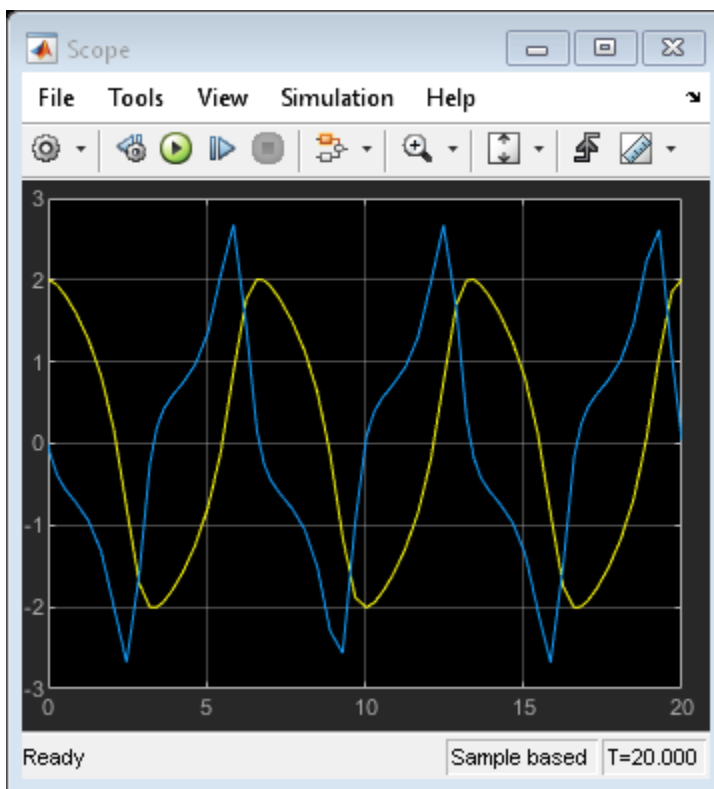

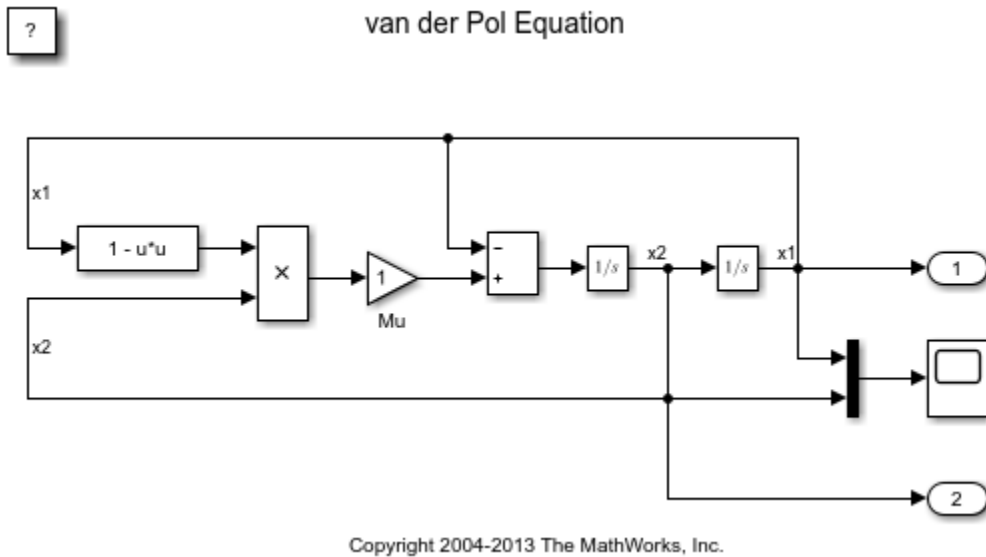

Examples

Get a SimulationMetadata Object for vdp Simulation

Simulate the vdp model. Retrieve metadata from a SimulationMetadata object of the simulation.

Simulate the vdp model. Save the results of the Simulink.SimulationOutput object in simout.

```
open_system('vdp');
simout = sim(bdroot, 'ReturnWorkspaceOutputs', 'on');
```

Retrieve metadata information about this simulation using `mData`. This is the `SimulationMetadata` object that `simout` contains.

```
mData=simout.getSimulationMetadata()
```

```
mData =
```

SimulationMetadata with properties:

```
    ModelInfo: [1x1 struct]
    TimingInfo: [1x1 struct]
    ExecutionInfo: [1x1 struct]
    UserString: ''
    UserData: []
```

Store custom data or string in simout.

```
simout=simout.setUserData(struct('param1','value1','param2','value2','param3','value3'));
simout=simout.setUserString('Store first simulation results');
```

Retrieve the custom data you stored from mData.

```
mData=simout.getSimulationMetadata()
disp(mData.UserData)
```

mData =

SimulationMetadata with properties:

```
    ModelInfo: [1x1 struct]
    TimingInfo: [1x1 struct]
    ExecutionInfo: [1x1 struct]
    UserString: 'Store first simulation results'
    UserData: [1x1 struct]

    param1: 'value1'
    param2: 'value2'
    param3: 'value3'
```

Retrieve the custom string you stored from mData.

```
mData=simout.getSimulationMetadata()
disp(mData.UserString)
```

mData =

SimulationMetadata with properties:

```
    ModelInfo: [1x1 struct]
    TimingInfo: [1x1 struct]
    ExecutionInfo: [1x1 struct]
    UserString: 'Store first simulation results'
    UserData: [1x1 struct]
```

Store first simulation results

Introduced in R2015a

Simulink.SimulationOutput class

Package: Simulink

Access object values of simulation results

Description

The `SimulationOutput` class contains all simulation outputs, including workspace variables.

You can use dot notation to access the data for simulation outputs. For example, to return data for the `xout` variable for a `simOut`, `SimulationOutput` object, use a `simOut.tout` command.

Alternatively, you can use `Simulink.SimulationOutput.who` and either `Simulink.SimulationOutput.get` or `Simulink.SimulationOutput.find` methods to access the output variable names and their respective values.

The `SimulationOutput` object is writeable. You can write to `logout` and `yout` in `SimulationOutput` object.

You can use the `plot` function to plot the `SimulationOutput` output.

```
plot(out)
```

Properties

SimulationMetadata — Metadata for simulation runs

`Simulink.SimulationMetadata` object

Metadata for simulation runs, returned as a `Simulink.SimulationMetadata` object. Fields other than the `UserData` and `UserString` fields are read only.

ErrorMessage — Simulation logging error messages

char vector

Simulation logging error message, returned as a char vector. (read only)

Methods

<code>find</code>	Access and display values of simulation results
<code>get</code>	Access and display values of simulation results
<code>getSimulationMetadata</code>	Return <code>SimulationMetadata</code> object for simulation
<code>setUserData</code>	Store custom data in <code>SimulationMetadata</code> object that <code>SimulationOutput</code> object contains
<code>setUserString</code>	Store custom character vector in <code>SimulationMetadata</code> object that <code>SimulationOutput</code> object contains
<code>who</code>	Access and display output variable names of simulation
<code>plot</code>	Plot simulation output data in the Simulation Data Inspector

Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects (MATLAB) in the MATLAB Programming Fundamentals documentation.

Examples

View Simulation Output and Metadata

Simulate a model and place the results of the `Simulink.SimulationOutput` object in `simOut` and view the simulation metadata.

Simulate the `vdp` model.

```
simOut = sim('vdp', 'SimulationMode', 'normal', 'AbsTol', '1e-5', ...
            'SaveState', 'on', 'StateSaveName', 'xoutNew', ...
            'SaveOutput', 'on', 'OutputSaveName', 'youtNew')
```

Simulink.SimulationOutput:

```
    xoutNew: [65x2 double]
    youtNew: [65x2 double]
```

```
SimulationMetadata: [1x1 Simulink.SimulationMetadata]
ErrorMessage: [0x0 char]
```

Get the values of the variable `youtNew`.

```
simOut.youtNew
```

Simulink returns and displays the values.

Get the timing information for the simulation.

```
myMetadata = simOut.SimulationMetadata
```

```
myMetadata =
```

SimulationMetadata with properties:

```
    ModelInfo: [1x1 struct]
    TimingInfo: [1x1 struct]
    ExecutionInfo: [1x1 struct]
    UserString: ''
    UserData: []
```

```
myMetadata.TimingInfo
```

```
ans =
```

struct with fields:

```
    WallClockTimestampStart: '2016-12-30 08:47:51.739935'
    WallClockTimestampStop: '2016-12-30 08:47:58.185579'
    InitializationElapsedWallTime: 5.9166
    ExecutionElapsedWallTime: 0.1910
```

```
TerminationElapsedWallTime: 0.3380  
TotalElapsedWallTime: 6.4456
```

Simulink.SubsysDataLogs

Container for subsystem signal data logs

Description

Note Before R2016a, the `Simulink.SubsysDataLogs` class was used in conjunction with the `ModelDataLogs` logging data format. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format.

However, you can use data that was logged in a previous release using `ModelDataLogs` format.

In releases before R2016a, Simulink created instances of this class to contain logs for signals in a subsystem models were logged in `ModelDataLogs` format. Objects of this class have a variable number of properties. The first property, named `Name`, is the name of the subsystem whose log data this object contains. The remaining properties are signal log or signal log container objects containing the data logged for the subsystem specified by this object's `Name` property.

For example, suppose you have this logged data from a model run in a release earlier than R2016a:

```
Simulink.SubsysDataLogs (Gain):
  Name          elements  Simulink Class
  a              1         Timeseries
  m              2         TsArray
```

You can use either fully qualified log names or the `unpack` command to access the signal logs contained by a `SubsysDataLogs` object. For example, to access the amplitudes logged for signal `a` in the preceding example, you could enter the following at the MATLAB command line:

```
data = logout.Gain.a.Data;
```

or

```
>> logout.unpack('all');
data = a.Data;
```

Introduced before R2006a

Simulink.SuppressedDiagnostic class

Package: Simulink

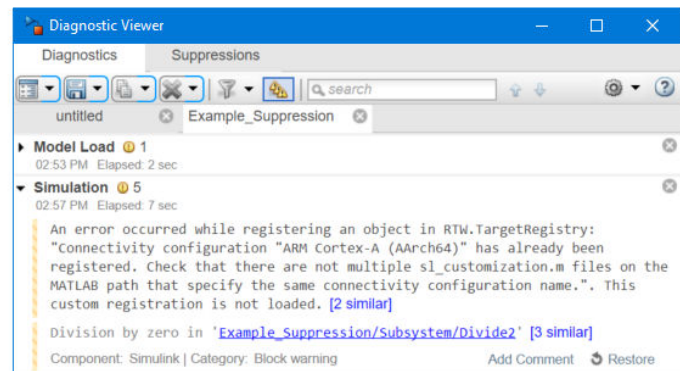

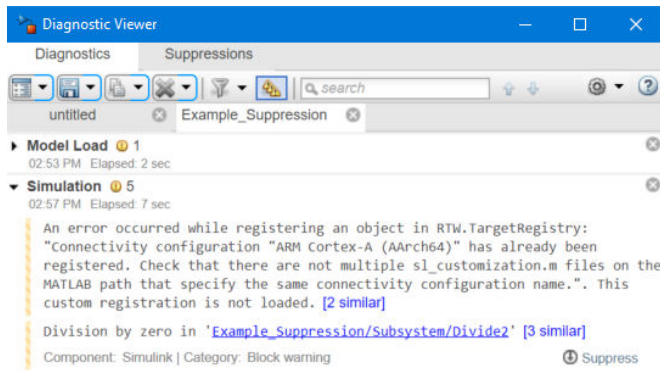

Suppress diagnostic messages from a specified block

Description

A `Simulink.SuppressedDiagnostic` object contains information related to diagnostic warnings or errors that are suppressed from being thrown during simulation.

Construction

The Diagnostic Viewer in Simulink includes an option to suppress certain diagnostics. This feature enables you to suppress warnings or errors for specific objects in your model. Click the **Suppress** button next to the warning in the Diagnostic Viewer to suppress the warning from the specified source. This action creates a `Simulink.SuppressedDiagnostic` object. You can access this object at the MATLAB command line using the `Simulink.getSuppressedDiagnostics` function. You can add a comment for the suppressed diagnostic. You can restore the diagnostic by clicking **Restore**.

`DiagnosticObject = Simulink.SuppressedDiagnostic(source, message_id)` creates a suppressed diagnostic object. The object suppresses all instances of diagnostics represented by `message_id` thrown by the blocks specified by `source`.

Input Arguments

source — System, block, or model object throwing diagnostic

model | subsystem | block path | block handle

The source of the diagnostic, specified as a model, subsystem, block path, block handle, cell array of block paths, or cell array of block handles.

To get the block path, use the `gcb` function.

To get the block handle, use the `getSimulinkBlockHandle` function.

Data Types: char | cell | string

message_id — message identifier of diagnostic

message identifier

The message identifier of the diagnostic, specified as a character vector or string. You can find the message identifier of diagnostics thrown during simulation by accessing the `ExecutionInfo` property of the `Simulink.SimulationMetadata` object associated with a simulation. You can also use the `lastwarn` function.

Data Types: char | string

Properties**Comments — Comments associated with the suppression object**

character vector

Comments associated with the suppression object, specified as a character vector. This property is optional.

Data Types: char

ID — Message identifier of the diagnostic that was suppressed

character vector

The message identifier of the diagnostic that was suppressed, specified as a character vector.

Data Types: char

LastModified — Date and time the suppression object was last modified

character vector

Date and time the suppression object was last modified, specified as a character vector. This property is read-only.

Data Types: char

LastModifiedBy — Name of the user who was last to add or edit the suppression object

character vector

Name of the user who last added or edited the suppression object, specified as a character vector. This property is optional.

Data Types: char

Source — block path of the source of the diagnostic

character vector

The block path of the model object that has a suppressed diagnostic, specified as a character vector.

Data Types: char

Methods

`restore` Remove specified diagnostic suppressions

`suppress` Suppress diagnostic specified by `Simulink.SuppressedDiagnostic` object

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Create a Simulink.SuppresseDiagnostic Object

Using the model from “Suppress Diagnostic Messages Programmatically”, create and then restore a diagnostic suppression.

Create a `Simulink.SuppresseDiagnostic` object, `suppression` to suppress the parameter precision loss warning thrown by the Constant block, `one`.

```
suppression = Simulink.SuppresseDiagnostic('Suppressor_CLI_Demo/one',...
'SimulinkFixedPoint:util:fxpParameterPrecisionLoss');
```

The parameter precision loss warning is no longer thrown in future simulations of this model.

Add accountability information to the object by editing the `LastModifiedBy` and `Comments` properties of the object.

```
suppression.LastModifiedBy = 'John Doe';
suppression.Comments = 'Reviewed: Joe Schmoie'
```

```
suppression =
```

```
SuppresseDiagnostic with properties:
```

```
    Source: 'Suppressor_CLI_Demo/one'
      Id: 'SimulinkFixedPoint:util:fxpParameterPrecisionLoss'
LastModifiedBy: 'John Doe'
    Comments: 'Reviewed: Joe Schmoie'
    LastModified: '2016-Jun-01 17:25:21'
```

You can restore the diagnostic using the `restore` method.

```
restore(suppression);
```

Property Attributes (MATLAB)

Introduced in R2016b

restore

Class: Simulink.SuppressedDiagnostic

Package: Simulink

Remove specified diagnostic suppressions

Syntax

```
restore(SuppressedDiagnostic)
```

Description

`restore(SuppressedDiagnostic)` removes the specified suppressed diagnostic object.

Input Arguments

SuppressedDiagnostic — Suppressed diagnostic object to restore

Simulink.SuppressedDiagnostic object

Simulink.SuppressedDiagnostic object

Examples

Restore a Suppressed Diagnostic

Using the model from “Suppress Diagnostic Messages Programmatically”, create and then restore a diagnostic suppression.

Create a `Simulink.SuppressedDiagnostic` object, `suppression` to suppress the parameter precision loss warning from the Constant block, `one`.

```
suppression = Simulink.SuppressedDiagnostic('Suppressor_CLI_Demo/one', ...  
'SimulinkFixedPoint:util:fxpParameterPrecisionLoss');
```

You can restore the diagnostic using the `restore` method.

```
restore(suppression);
```

Restore All Suppressed Diagnostics

Using the model from “Suppress Diagnostic Messages Programmatically”, restore all diagnostic suppressions associated with a model.

Use the `Simulink.suppressDiagnostic` function to suppress the parameter precision loss and parameter underflow warnings from the Constant block, `one`.

```
diags = {'SimulinkFixedPoint:util:fxpParameterPrecisionLoss', 'SimulinkFixedPoint:util:fxpParameterUnderflowWarning'};  
Simulink.suppressDiagnostic('Suppressor_CLI_Demo/one', diags);
```

Use the `Simulink.getSuppressedDiagnostics` function to get all suppressions associated with the model, returned as an array of `Simulink.SuppressedDiagnostic` objects.

```
suppressed_diagnostics = Simulink.getSuppressedDiagnostics('Suppressor_CLI_Demo')
```

```
suppressed_diagnostics =
```

```
1×2 SuppressedDiagnostic array with properties:
```

```
Source  
Id  
LastModifiedBy  
Comments  
LastModified
```

Restore all diagnostics using the `restore` method and iterating through the `suppressed_diagnostics` array.

```
for iter = 1:numel(suppressed_diagnostics)  
    restore(suppressed_diagnostics(iter));  
end
```

Simulink.TimeInfo

Provide information about time data in `Simulink.Timeseries` object

Description

Simulink software creates instances of these objects to describe the time data that it includes in `Simulink.Timeseries` objects.

Note The `Simulink.Timeseries` class is supported for backwards compatibility. The `ModelDataLogs` format created `Simulink.Timeseries` objects for signal logging data. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format. In R2016a or later, when you open a model from an earlier release that had used `ModelDataLogs` format, the model simulated in use `Dataset` format.

You can convert signal logging data from `ModelDataLogs` to `Dataset` format. Converting to `Dataset` format makes it easier to post-process with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see “Convert Logged Data to `Dataset` Format”.

If you have legacy code that uses the `ModelDataLogs` API, you can encounter situations that require updates to your code or model. See “Migrate Scripts That Use Legacy `ModelDataLogs` API”.

Properties

Name	Access	Description
Units	RW	The units, e.g., 'seconds', in which the time series data are expressed in the associated <code>Simulink.Timeseries</code> object.
Start	RW	If the associated signal is not in a conditionally executed subsystem, this field contains the simulation time of the first signal value recorded in the associated <code>Simulink.Timeseries</code> object. If the signal is in a conditionally executed subsystem, this field contains an array of times when the system became active.
end	RW	If the associated signal is not in a conditionally executed subsystem, this field contains the simulation time of the last signal value recorded in the associated <code>Simulink.Timeseries</code> object. If the signal is in a conditionally executed subsystem, this field contains an array of times when the system became inactive.
Increment	RW	The interval between simulation times at which signal data is logged in the associated <code>Simulink.Timeseries</code> object. If the signal is aperiodic (continuous signal with variable-step solver), this property has a value of NaN. A signal is periodic if it has a discrete sample time (not continuous or constant) or is continuous with a fixed-step solver.

Name	Access	Description
Length	W	The number of signal samples recorded in the associated <code>Simulink.Timeseries</code> object, i.e., the length of the arrays referenced by the object's <code>Time</code> and <code>Data</code> properties.

Simulink.Timeseries

Store data for any signal except mux or bus signal

Description

Note The `Simulink.Timeseries` class is supported for backwards compatibility. The `ModelDataLogs` format created `Simulink.Timeseries` objects for signal logging data. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format. In R2016a or later, when you open a model from an earlier release that had used `ModelDataLogs` format, the model simulated in use `Dataset` format.

You can convert signal logging data from `ModelDataLogs` to `Dataset` format. Converting to `Dataset` format makes it easier to post-process with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see “Convert Logged Data to Dataset Format”.

If you have legacy code that uses the `ModelDataLogs` API, you can encounter situations that require updates to your code or model. See “Migrate Scripts That Use Legacy `ModelDataLogs` API”.

Simulink software creates instances of this class to store signal data that it logs for any signal except a mux or bus signal, which are stored in a `Simulink.TsArray`. See “Export Signal Data Using Signal Logging” for more information.

Properties

Name	Access	Description
Name	RW	Name of this signal log.
BlockPath	RW	Path of the block that output the signal logged in this signal log.
PortIndex	RW	Index of the output port that emitted the signal logged in this signal log.
SignalName	RW	Name of the signal logged in this signal log.
ParentName	RW	Name of the parent of the signal recorded in this log, if the signal is an element of a mux or a virtual bus; otherwise, the same as <code>SignalName</code> .
TimeInfo	RW	An object of <code>Simulink.TimeInfo</code> class that describes the time data in this log.
Time	RW	An array containing the simulation times at which signal data was logged.
Data	RW	An array containing the signal data.

Introduced before R2006a

Simulink.TsArray

Store data for mux or bus signal

Description

Note Before R2016a, the `Simulink.TsArray` class was used in conjunction with the `ModelDataLogs` logging data format. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format.

However, you can use data that was logged in a previous release using `ModelDataLogs` format.

In releases earlier than R2016a, Simulink software created instances of this class to contain the data that it logs for a mux or bus signal. Other types of signals were stored in a `Simulink.Timeseries`.

Objects of the `Simulink.TsArray` class have a variable number of properties. The first property, called `Name`, specifies the log name of the logged signal. The remaining properties reference logs for the elements of the logged signal: `Simulink.Timeseries` objects for elementary signals and `Simulink.TsArray` objects for mux or bus signals. The name of each property is the log name of the corresponding signal.

For example, suppose you have this logged data from a model run in a release earlier than R2016a that was configured to log in `ModelDataLogs` format.

```
logout.b2
```

```
Simulink.TsArray (untitled/Bus Creator1):
  Name          elements  Simulink Class
  x1             1         Timeseries
  b1             2         TsArray
```

The `Simulink.ModelDataLogs` object, named `logout`, contains a `Simulink.TsArray` object, named `b2`, that contains the logs for the elements of `b2` (that is, the elementary signal `x1` and the bus signal `b1`). Entering the fully qualified name of the `Simulink.TsArray` object, (`logout.b2`) at the MATLAB command line reveals the structure of the signal log for this model.

You can use either fully qualified log names or the `unpack` command to access the signal logs contained by a `Simulink.TsArray` object. For example, to access the amplitudes logged for signal `x1` in the preceding example, you can enter the following at the MATLAB command line:

```
data = logout.b2.x1.Data;
```

or

```
logout.unpack('all');
data = x1.Data;
```

Simulink.Variant class

Package: Simulink

Specify conditions that control variant selection

Description

An object of the `Simulink.Variant` class represents a conditional expression called a variant control. The object allows you to specify a Boolean expression that activates a specific variant choice when it evaluates to `true`.

A variant control comprises one or more variant control variables, specified using MATLAB variables or `Simulink.Parameter` objects.

You specify variant controls for each variant choice represented in a Variant Subsystem or Model Variant block. For a given Variant Subsystem or Model Variant block, only one variant control can evaluate to `true` at a time. When a variant control evaluates to `true`, Simulink activates the variant choice that corresponds to that variant control.

Construction

`variantControl = Simulink.Variant(conditionExpression)` creates a variant control.

Properties

conditionExpression — Variant condition expression

'(default)' | character vector

Variant condition expression, specified as a character vector containing one or more of these operands and operators.

Operands

- Variable names that resolve to MATLAB variables or `Simulink.Parameter` objects with integer or enumerated data type and scalar literal values
- Variable names that resolve to `Simulink.Variant` objects
- Scalar literal values that represent integer or enumerated values

Operators

- Parentheses for grouping
- Arithmetic, relational, logical, or bit-wise operators

The variant condition expression evaluates to a Boolean value. This property has read and write access.

Example: `'(Fuel==2 || Emission==1) && Ratio==2'`

Examples

Create Variant Controls Using MATLAB Variables

Use MATLAB variables when you want to simulate the model but are not considering code generation.

Create MATLAB variables with scalar literal values.

```
Fuel = 3;
Emission = 1;
Ratio = 3;
```

Develop conditional expressions using the variables.

```
Variant1 = Simulink.Variant('Fuel==1 && Emission==2');
Variant2 = Simulink.Variant('(Fuel==2 || Emission==1) && Ratio==2');
Variant3 = Simulink.Variant('Fuel==3 || Ratio==4');
```

Create Variant Controls Using Simulink.Parameter Objects

If you want to generate preprocessor conditionals for code generation, use `Simulink.Parameter` objects.

Create variant `Simulink.Parameter` objects with scalar literal values.

```
Fuel = Simulink.Parameter(3);
Emission = Simulink.Parameter(1);
Ratio = Simulink.Parameter(3);
```

Specify the custom storage class for these objects as `ImportedDefine` so that the values are specified by an external header file.

Other valid values for the custom storage class are `Define` and `CompilerFlag`.

```
Fuel.CoderInfo.StorageClass = 'Custom';
Fuel.CoderInfo.CustomStorageClass = 'ImportedDefine';

Emission.CoderInfo.StorageClass = 'Custom';
Emission.CoderInfo.CustomStorageClass = 'ImportedDefine';

Ratio.CoderInfo.StorageClass = 'Custom';
Ratio.CoderInfo.CustomStorageClass = 'ImportedDefine';
```

Develop conditional expressions using the variables and create variant controls.

```
Variant1 = Simulink.Variant('Fuel==1 && Emission==2');
Variant2 = Simulink.Variant('(Fuel==2 || Emission==1) && Ratio==2');
Variant3 = Simulink.Variant('Fuel==3 || Ratio==4');
```

Simulink.VariantConfigurationData class

Package: Simulink

Class representing a variant configurations data object

Description

The variant configuration data object, stores a collection of variant configurations, constraints, and the name of the default active configuration. The `Simulink.VariantConfigurationData` class has properties that enable you to add, modify, or remove variant configurations, constraints, and control variables. Use an instance of `Simulink.VariantConfigurationData` class to do the following:

- Define and edit variant configurations.
- Add control variables to variant configurations.
- Add copy of variant configuration.
- Delete existing variant configurations, constraints, and sub model configurations.
- Set a specific configuration as default active.
- Validate model using default or a specific variant configuration.
- Query or create variant configurations data object for a given model.

Properties

VariantConfigurations

Set of variant configurations. The names of the configurations must be unique and valid MATLAB variable names.

Constraints

Set of constraints that must always be satisfied by the model for all variant configurations. The name of the constraints must be unique and valid MATLAB variable names.

DefaultConfigurationName

Name of the variant configuration to be used by default for validation.

Methods

addConfiguration	Add a new variant configuration to the variant configuration data object
addConstraint	Add a constraint to the variant configuration data object
addControlVariables	Add control variables to an existing variant configuration
addCopyOfConfiguration	Add a copy of an existing variant configuration to the variant configuration data object
addSubModelConfigurations	Add to a variant configuration the names of the configurations to be used for submodels
existsFor	Check if variant configuration data object exists for a model
getConfiguration	Returns the variant configuration with a given name from a variant configuration data object
getDefaultConfiguration	Returns default variant configuration, if any, for a variant configuration data object
getFor	Get existing variant configuration data object for a model
getOrCreateFor	Get existing or create a new variant configuration data object for a model
removeConfiguration	Remove a variant configuration with a given name from the variant configuration data object
removeConstraint	Remove a constraint from the variant configuration data object
removeControlVariable	Remove a control variable from a variant configuration
removeSubModelConfiguration	Remove from a variant configuration, the configuration to be used for a sub model.
setDefaultConfigurationName	Set name of the default variant configuration for a variant configuration data object
validateModel	Activate and validate all variant blocks in a model hierarchy
VariantConfigurationData	Object constructor with optional arguments for variant configurations, constraints, and default configuration name

Examples

```
load_system(model);
% Create variant config and associate it with model
variantConfig = Simulink.VariantConfigurationData;
set_param(model, 'VariantConfigurationObject', 'variantConfig');
```

“Variant Manager Overview”

addConfiguration

Class: Simulink.VariantConfigurationData

Package: Simulink

Add a new variant configuration to the variant configuration data object

Syntax

```
vcdataObj.addConfiguration(name)
vcdataObj.addConfiguration(name,description)
vcdataObj.addConfiguration(name,description,controlVars)
vcdataObj.addConfiguration(name,description,controlVars,
subModelConfigurations)
```

Description

`vcdataObj.addConfiguration(name)` adds a new variant configuration with a given name to the variant configuration data object.

`vcdataObj.addConfiguration(name,description)` adds a new variant configuration with a given name and optional description to the variant configuration data object.

`vcdataObj.addConfiguration(name,description,controlVars)` adds a new variant configuration with a given name, optional description, and control variables to the variant configuration data object.

`vcdataObj.addConfiguration(name,description,controlVars,subModelConfigurations)` adds a new variant configuration with a given name, optional description, control variables, and submodel configurations to the variant configuration data object.

Input Arguments

name

Name of variant configuration being added.

description

Description text for the variant configuration being added.

controlVars

Control variables for the variant configuration being added. This argument must be a vector of structures with required fields: **Name** and **Value**. The values assigned to the **Name** field must be unique and valid MATLAB variable names. The **Value** field can contain either character vectors or `Simulink.Parameter` objects. The values of control variables are checked during validation of the variant configuration.

subModelConfigurations

Vector of structures containing fields: `ModelName`, `ConfigurationName`. The names of submodels must be unique and valid MATLAB variable names and configuration names must be valid MATLAB variables.

Examples

```
% Define the variant configuration data object  
vcdataObj = Simulink.VariantConfigurationData;
```

```
% Add a variant configuration LinInterExp  
vcdataObj.addConfiguration('LinInterExp')
```

See Also

`Simulink.VariantConfigurationData` | `addControlVariables` | `addSubModelConfigurations`

addConstraint

Class: Simulink.VariantConfigurationData

Package: Simulink

Add a constraint to the variant configuration data object

Syntax

```
vcdataObj.addConstraint(nameOfConstraint)
vcdataObj.addConstraint(nameOfConstraint,condition)
vcdataObj.addConstraint(nameOfConstraint,condition,description)
```

Description

`vcdataObj.addConstraint(nameOfConstraint)` adds a new constraint with a given name to `vcdataObj`.

`vcdataObj.addConstraint(nameOfConstraint,condition)` adds a new constraint with a given name and condition expression to `vcdataObj`.

`vcdataObj.addConstraint(nameOfConstraint,condition,description)` adds a new constraint with a given name, condition expression, and description to `vcdataObj`.

Input Arguments

nameOfConstraint

Name of constraint being added. Must be unique and valid MATLAB variable name.

condition

Boolean expression that must evaluate to true. When the expression evaluates to true, it means the constraint is satisfied.

description

Text that describes the constraint.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add a constraint named LinNotExtern
vcdataObj.addConstraint('LinNotExtern','((Ctrl~=1)...
    || (PlantLocation ~=1))','Description of the constraint')
```

See Also

Simulink.VariantConfigurationData | addConfiguration | removeConfiguration |
removeConstraint

addControlVariables

Class: Simulink.VariantConfigurationData

Package: Simulink

Add control variables to an existing variant configuration

Syntax

```
vcdataObj.addControlVariables(nameOfConfiguration,controlVars)
```

Description

`vcdataObj.addControlVariables(nameOfConfiguration,controlVars)`, adds control variables to a variant configuration.

Input Arguments

nameOfConfiguration

Specifies the name of an existing configuration.

controlVars

Control variables being added. This argument must be a vector of structures with required fields: `Name` and `Value`. The values assigned to the `Name` field must be unique and valid MATLAB variable names. The `Value` field can contain either character vectors or `Simulink.Parameter` objects. The values of control variables are checked during validation of the variant configuration.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add a variant configuration named LinInterExp
vcdataObj.addConfiguration('LinInterExp',...
'Linear Internal Experimental Plant Controller');

% Add control variables SmartSensor1Mod and PlanLocation
vcdataObj.addControlVariables('LinInterExp',...
    cell2struct({'SmartSensor1Mod', '2';...
                'PlanLocation', '1'},...
                {'Name', 'Value'}, 2))
```

addCopyOfConfiguration

Class: Simulink.VariantConfigurationData

Package: Simulink

Add a copy of an existing variant configuration to the variant configuration data object

Syntax

```
vcdataObj.addCopyOfConfiguration(nameOfExistingConfiguration)
vcdataObj.addCopyOfConfiguration(nameOfExistingConfiguration,
nameOfTobeAddedConfiguration)
```

Description

`vcdataObj.addCopyOfConfiguration(nameOfExistingConfiguration)`, adds a new configuration with a default name (default name is based on existing configuration name being copied) as a copy of the existing configuration to the variant configuration data object.

`vcdataObj.addCopyOfConfiguration(nameOfExistingConfiguration, nameOfTobeAddedConfiguration)`, adds a new configuration with a specified name, as a copy of the existing configuration, to the variant configuration data object.

Input Arguments

nameOfExistingConfiguration

Name of existing configuration.

Default:

nameOfTobeAddedConfiguration

Name of new configuration to be added as a copy of the configuration.

Default:

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add the variant configuration LinInterExp
vcdataObj.addConfiguration('LinInterExp',...
    'Linear Internal Experimental Plant Controller');

% Add a copy of variant configuration LinInterExp
% and name the copy as LinExtExp
vcdataObj.addCopyOfConfiguration('LinInterExp', 'LinExtExp')
```

See Also

Simulink.VariantConfigurationData | addConfiguration | removeConfiguration |
setDefaultConfigurationName

addSubModelConfigurations

Class: Simulink.VariantConfigurationData

Package: Simulink

Add to a variant configuration the names of the configurations to be used for submodels

Syntax

```
vcdataObj.addSubModelConfigurations(nameOfConfiguration,
subModelConfigurations)
```

Description

`vcdataObj.addSubModelConfigurations(nameOfConfiguration, subModelConfigurations)`, specifies names of the configurations to be used for submodels.

Input Arguments

nameOfConfiguration

Name for the configuration of submodels that are model references.

subModelConfigurations

Vector of structures containing fields: `ModelName`, `ConfigurationName`. The names of submodels must be unique and valid MATLAB variable names and configuration names must be valid MATLAB variables.

Examples

- 1 Add the path to the model file.

```
addpath(fullfile(docroot,'toolbox','simulink','examples'));
```

- 2 Load the model.

```
load_system('slexVariantManagement');
```

- 3 Add a new submodel configuration to `LinInterExpNoNoise`.

```
vcdataObj.addSubModelConfigurations('LinInterExpNoNoise',...
[struct('ModelName', 'slexVariantManagementExternalPlantMdlRef',...
'ConfigurationName', 'LowFid')])
```

See Also

`Simulink.VariantConfigurationData` | `addControlVariables` | `removeControlVariable` | `removeSubModelConfiguration`

existsFor

Class: Simulink.VariantConfigurationData

Package: Simulink

Check if variant configuration data object exists for a model

Syntax

```
Simulink.VariantConfigurationData.existsFor(modelNameOrHandle)
```

Description

`Simulink.VariantConfigurationData.existsFor(modelNameOrHandle)` returns true if the variant configuration data object exists for the model.

Input Arguments

modelNameOrHandle

Name or handle to the model.

Examples

```
% Add the path to the model file
addpath(fullfile(docroot,'toolbox','simulink','examples'));

% Load the model
load_system('slexVariantManagement');

% Checks whether a variant configuration
% data object exists for model
[exists] = Simulink.VariantConfigurationData.existsFor...
('slexVariantManagement')
```

See Also

[Simulink.VariantConfigurationData | getFor](#)

getConfiguration

Class: Simulink.VariantConfigurationData

Package: Simulink

Returns the variant configuration with a given name from a variant configuration data object

Syntax

```
vcdataObj.getConfiguration(nameOfConfiguration)
```

Description

`vcdataObj.getConfiguration(nameOfConfiguration)` returns a specific variant configuration that is associated with the variant configuration data object.

Input Arguments

nameOfConfiguration

Name of the variant configuration to be returned.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add the variant configuration LinInterExp
vcdataObj.addConfiguration('LinInterExp',...
    'Linear Internal Experimental Plant Controller');

% Add a control variable SmartSensor1Mod
vcdataObj.addControlVariables('LinInterExp',...
    [struct('Name','SmartSensor1Mod','Value','2')]);

% Obtain information on the variant configuration..
% LinInterExp from the variant configuration data object
vc = vcdataObj.getConfiguration('LinInterExp')
```

getDefaultConfiguration

Class: Simulink.VariantConfigurationData

Package: Simulink

Returns default variant configuration, if any, for a variant configuration data object

Syntax

```
vcdataObj.getDefaultConfiguration
```

Description

`vcdataObj.getDefaultConfiguration` returns the default variant configuration. If no default variant configuration is defined, then `[]` is returned.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add the variant configuration named LinInterExp
vcdataObj.addConfiguration('LinInterExp',...
    'Linear Internal Experimental Plant Controller');

% Add the variant configuration LinInterStd
vcdataObj.addConfiguration('LinInterStd',...
    'Linear Internal Standard Plant Controller');

% Set LinExtExp as the default variant configuration
vcdataObj.setDefaultConfigurationName('LinExtExp');

% Obtain the default variant configuration
defvc = vcdataObj.getDefaultConfiguration
```

See Also

getFor

Class: Simulink.VariantConfigurationData

Package: Simulink

Get existing variant configuration data object for a model

Syntax

```
Simulink.VariantConfigurationData.getFor(modelNameOrHandle)
```

Description

`Simulink.VariantConfigurationData.getFor(modelNameOrHandle)`, returns the variant configuration object for the model. If no default variant configuration is defined, then `[]` is returned.

Input Arguments

modelNameOrHandle

Model name or handle.

Examples

```
% Add the path to the model file
addpath(fullfile(docroot,'toolbox','simulink','examples'));

% Load the model
load_system('slexVariantManagement');

% Obtain variant configuration data object for the model
% slexVariantManagement
vcdataObj = Simulink.VariantConfigurationData.getFor...
('slexVariantManagement')
```

See Also

getOrCreateFor

Class: Simulink.VariantConfigurationData

Package: Simulink

Get existing or create a new variant configuration data object for a model

Syntax

```
Simulink.VariantConfigurationData.getOrCreateFor(modelNameOrHandle)
```

Description

`Simulink.VariantConfigurationData.getOrCreateFor(modelNameOrHandle)`, returns the object if the variant configuration data objects exists otherwise, creates an empty object.

Input Arguments

modelNameOrHandle

Model name or handle to the model.

Examples

```
% Add the path to the model file
addpath(fullfile(docroot,'toolbox','simulink','examples'));

% Load the model
load_system('slexVariantManagement');

% Obtain existing or create an empty variant configuration
% data object for the slexVariantManagement model
vcdataObj = Simulink.VariantConfigurationData.getOrCreateFor...
('slexVariantManagement')
```

removeConfiguration

Class: Simulink.VariantConfigurationData

Package: Simulink

Remove a variant configuration with a given name from the variant configuration data object

Syntax

```
vcdataObj.removeConfiguration(nameOfConfiguration)
```

Description

`vcdataObj.removeConfiguration(nameOfConfiguration)` removes the configuration from the variant configuration data object.

Input Arguments

nameOfConfiguration

Name of the configuration to be removed.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add the LinInterExp variant configuration
% to the variant configuration data object
vcdataObj.addConfiguration('LinInterExp',...
    'Linear Internal Experimental Plant Controller');

% Remove the LinInterExp configuration
% from the variant configuration data object
vcdataObj.removeConfiguration('LinInterExp')
```

removeConstraint

Class: Simulink.VariantConfigurationData

Package: Simulink

Remove a constraint from the variant configuration data object

Syntax

```
vcdataObj.removeConstraint(nameOfConstraint)
```

Description

`vcdataObj.removeConstraint(nameOfConstraint)`, removes the constraint from the variant configuration data object.

Input Arguments

nameOfConstraint

Name of the constraint to be removed.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add a constraint named LinNotExtern
vcdataObj.addConstraint('LinNotExtern','((Ctrl~=1)...
    || (PlantLocation ~=1))',...
    'Description of the constraint');

% Remove the constraint LinNotExtern
% from the variant configuration
vcdataObj.removeConstraint('LinNotExtern')
```

removeControlVariable

Class: Simulink.VariantConfigurationData

Package: Simulink

Remove a control variable from a variant configuration

Syntax

```
vcdataObj.removeControlVariable(nameOfConfiguration,nameOfControlVariable)
```

Description

`vcdataObj.removeControlVariable(nameOfConfiguration,nameOfControlVariable)` removes a control variable from a variant configuration.

Input Arguments

nameOfConfiguration

Name of the variant configuration.

nameOfControlVariable

Name of the control variable to be deleted.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add a variant configuration named LinInterExp
vcdataObj.addConfiguration('LinInterExp',...
    'Linear Internal Experimental Plant Controller');

% Add control variables SmartSensor1Mod and PlanLocation
vcdataObj.addControlVariables('LinInterExp',...
    [struct('Name','SmartSensor1Mod','Value','2')]);

% Remove the control variable SmartSensor1Mod
% from the configuration LinInterExp
vcdataObj.removeControlVariable('LinInterExp',...
    'SmartSensor1Mod')
```

See Also

Simulink.VariantConfigurationData | addControlVariables

removeSubModelConfiguration

Class: Simulink.VariantConfigurationData

Package: Simulink

Remove from a variant configuration, the configuration to be used for a sub model.

Syntax

```
vcdataObj.removeSubModelConfiguration(nameOfConfiguration,nameOfSubModel)
```

Description

`vcdataObj.removeSubModelConfiguration(nameOfConfiguration,nameOfSubModel)`, removes the configuration specified for a submodel.

Input Arguments

nameOfConfiguration

Name of the submodel configuration to be removed.

nameOfSubModel

Name of the submodel from which the configuration must be removed.

Examples

- 1 Add the path to the model file.

```
addpath(fullfile(docroot,'toolbox','simulink','examples'));
```

- 2 Load the model.

```
load_system('slexVariantManagement');
```

- 3 Add a new submodel configuration to `LinInterExpNoNoise`.

```
vcdataObj.addSubModelConfigurations('LinInterExpNoNoise',...  
    [struct('ModelName','slexVariantManagementExternalPlantMdlRef',...  
    'ConfigurationName','LowFid')]);
```

- 4 Remove the submodel configuration `LinInterExpNoNoise` from the submodel `slexVariantManagementExternalPlantMdlRef`.

```
vcdataObj.removeSubModelConfiguration('LinInterExpNoNoise',...  
    'slexVariantManagementExternalPlantMdlRef')
```

See Also

`Simulink.VariantConfigurationData` | `addSubModelConfigurations`

setDefaultConfigurationName

Class: Simulink.VariantConfigurationData

Package: Simulink

Set name of the default variant configuration for a variant configuration data object

Syntax

```
vcdataObj.setDefaultConfigurationName(nameOfConfiguration)
```

Description

`vcdataObj.setDefaultConfigurationName(nameOfConfiguration)` sets the default configuration name. A variant configuration must exist with the same name. If an empty value is passed, then the default configuration name is cleared.

Input Arguments

nameOfConfiguration

Name of the configuration to be set as the default.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add the LinInterExp variant configuration
vcdataObj.addConfiguration('LinInterExp',...
    'Linear Internal Experimental Plant Controller');

% Set the configuration LinInterExp as default
vcdataObj.setDefaultConfigurationName('LinInterExp');

% Obtain the default variant configuration
dconfig = vcdataObj.getDefaultConfiguration
```

See Also

[Simulink.VariantConfigurationData | getDefaultConfiguration](#)

validateModel

Class: Simulink.VariantConfigurationData

Package: Simulink

Activate and validate all variant blocks in a model hierarchy

Syntax

```
Simulink.VariantConfigurationData.validateModel(modelName)
```

```
Simulink.VariantConfigurationData.validateModel(modelName, configName)
```

Description

`Simulink.VariantConfigurationData.validateModel(modelName)`, activates and validates the model and referenced models during simulation.

`Simulink.VariantConfigurationData.validateModel(modelName, configName)`, activates and validates the model and referenced models during simulation optionally using a variant configuration.

Input Arguments

modelName

Name of the model

configName

Name of the configuration to be activated and validated

Examples

- 1 Add the path to the model file.

```
addpath(fullfile(docroot, 'toolbox', 'simulink', 'examples'));
```

- 2 Load the model.

```
load_system('slexVariantManagement');
```

- 3 Activate and validate the model `slexVariantManagement` using the configuration `LinInterExpNoNoise`.

```
[valid, errors] = Simulink.VariantConfigurationData.validateModel...  
('slexVariantManagement', 'LinInterExpNoNoise')
```

VariantConfigurationData

Class: Simulink.VariantConfigurationData

Package: Simulink

Object constructor with optional arguments for variant configurations, constraints, and default configuration name

Syntax

```
vardataObj = Simulink.VariantConfigurationData(variantConfigurations)
```

Description

`vardataObj = Simulink.VariantConfigurationData(variantConfigurations)`, constructor that creates an empty variant configuration data object. Optionally, can also accept constraints and a default configuration name as inputs.

Input Arguments

variantConfigurations

Configurations that are part of the variant configuration data object.

constraints

Constraints to be satisfied by the model.

defaultConfigurationName

Name of the default configuration

Examples

```
% Create an empty variant configuration data object  
vcdataObj = Simulink.VariantConfigurationData
```

See Also

`Simulink.VariantConfigurationData` | `addConfiguration` | `addConstraint` | `addControlVariables` | `addSubModelConfigurations`

Simulink.VariantManager class

Package: Simulink

Class representing a set of Variant Manager functionality

Description

The variant manager class provides a set of methods to access Variant Manager functionality from the MATLAB command-line. Use an instance of `Simulink.VariantManager` class to:

- Convert the Subsystems or Model block to a Variant Subsystem.
- Find variables used in Variant control expressions.
- Generate a reduced model for specified variant configurations.
- Display or control behavior of a variant condition legend.

Method

<code>variantLegend</code>	Display or control behavior of variant condition legend
<code>reduceModel</code>	Generate reduced model for specified variant configurations
<code>convertToVariant</code>	Convert Subsystem, or Model block, or Variant Model block to a Variant Subsystem block

See Also

Topics

“Variant Manager Overview”

`variantLegend`

`convertToVariant`

variantLegend

Class: Simulink.VariantManager

Package: Simulink

Display or control behavior of variant condition legend

Syntax

```
Simulink.VariantManager.variantLegend(modelName, action)
```

Description

`Simulink.VariantManager.variantLegend(modelName, action)` displays or performs a specified action on the variant condition legend.

Input Arguments

modelName — Model for which the variant legend is displayed

character vector

Model for which the variant legend is displayed, specified as a character vector.

action — Task to be performed on the variant legend

'open' | 'print' | 'showCodeConditions' | 'close'

Task to be performed on the variant condition legend for the model. You can specify the task as:

- 'open' — Displays the variant condition legend for a model. The model must be open. If the legend is opened for the first time, the model is updated.
- 'print' — Prints the data in the variant condition legend. The legend must be open. There is no preview before printing the legend.
- 'showCodeConditions' — Displays code generation conditions column in the variant condition legend. The legend must be open. `showCodeConditions` is used as a name-value pair and accepts 'on' or 'off' as its values.
- 'close' — Closes the variant condition legend belonging to the specified model.

Examples

```
model = 'sldemo_variant_subsystems';
open_system(model);
% Open the variant condition legend
Simulink.VariantManager.variantLegend(model,'open');
% Display the code generation conditions
Simulink.VariantManager.variantLegend(model,'showCodeConditions','on');
```

Topics

“Create a Simple Variant Model”

“What Are Variants and When to Use Them”

Introduced in R2017b

reduceModel

Class: Simulink.VariantManager

Package: Simulink

Generate reduced model for specified variant configurations

Syntax

```
Simulink.VariantManager.reduceModel(Model)
```

```
Simulink.VariantManager.reduceModel(Model, Name, Value)
```

Description

`Simulink.VariantManager.reduceModel(Model)` creates a reduced model for the specified configuration. The referenced models and library blocks are also reduced. By default, the name of the reduced model and any reduced child referenced model name is the original model name suffixed with `_r`.

`Simulink.VariantManager.reduceModel(Model, Name, Value)` specifies the reduction parameters in the `Name` and `Value` arguments form.

Input Arguments

Model — Model to be reduced

character vector

Required field. Model to be reduced, specified as a character vector.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (`' '`) and is caseinsensitive whereas, the value string is casesensitive. You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

NamedConfigurations — Variant configuration name

{' '} | character vector | 'cell array'

Specifies the names of variant configurations. By default, current values of variant control variables are used for reduction.

VariableGroups — Variant control variable value

{' '} | 'cell array'

Specifies the variant control variable values to be used for reduction. By default, the current values of variant control variables are used.

The specified values must be a cell array with variant control variable names and their corresponding values.

Note 'VariableGroups' and 'NamedConfigurations' are mutually exclusive.

Consider this example:

```
Simulink.VariantManager.reduceModel('iv_model', ...
                                   'VariableGroups',...
                                   {{'V',1,'W',1},{'V',2,'W',2}})
```

FullRangeVariables — Variant control variable value

{'} | 'cell array'

Specifies the full-range variant control variable values to be used for reduction. This allows you to reduce a model for all valid values of the specified variant control variable. Provide a reference value for variant control variable that results in a successful model compilation.

Consider this example:

```
Simulink.VariantManager.reduceModel('slexVariantReducer',...
                                   'VariableGroups',{'V',1},...
                                   'FullRangeVariables',{'W',1});
```

You can specify a variant control variable, 'W', as a full-range variant control variable. This allows you to reduce the model for all valid values of variable 'W'. In the example, full-range variant control variable W uses a reference value of 1.

OutputFolder — Folder to store the reduced model

character vector

Specifies the folder to place the reduced models and related artifacts. By default, the reduced models are generated in ./reducedModel subfolder in the original model folder.

PreserveSignalAttributes — Preserve the signal attributes in the reduced model

{true} | false

When the value is `true`, the Variant Reducer preserves the compiled signal attributes between the original and reduced models by adding signal specification blocks at appropriate block ports in the reduced model. Compiled signal attributes include signal data types, signal dimensions, compiled sample times, etc.

Verbose — Displays step details

true | {false}

When the value is `true`, the Variant Reducer displays details of the steps performed during model reduction.

ModelSuffix — Reduced model name suffix

{_r}

Specifies the suffix to append to the reduced models and the related artifacts.

GenerateSummary — Generates a summary html file

true | {false}

When the value is `true`, the Variant Reducer generates a html file with details about the reduced model and any modifications that may be required for masks and callbacks.

Note To generate summary, you must have **Simulink Report Generator** license.

Examples

```
% Reduce model based on its variant control variable values in the base workspace.
Simulink.VariantManager.reduceModel('sldemo_variant_subsystems');
```

```
% Reduce the model associated with a variant configuration data object and configurations to be retained in the reduced model.
Simulink.VariantManager.reduceModel('slexVariantManagement', ...
    'NamedConfigurations', {'LinInterStd',
    'NonLinExterHighFid'})
```

```
% Reduce the model by specifying variant control variable values. Here, two groups are specified corresponding to
% {V==1, W==1}, and {V==2, W==2} respectively.
Simulink.VariantManager.reduceModel('iv_model', ...
    'VariableGroups',...
    {'V',1,'W',1},{V',2,'W',2}));
```

```
% Reduce the model by specifying variant control variable values where 'W' is a full-range variant control variable and
% automatically maps the specification to correspond to the following four explicit groups: {V==1, W==1}, {V==1, W==2},
% {V==2, W==1}, and {V==2, W==2}.
Simulink.VariantManager.reduceModel('slexVariantReducer',...
    'VariableGroups',...
    {'V',1},...
    'FullRangeVariables',{'W',1});
```

Variant Subsystem

Topics

“Create a Simple Variant Model”

“What Are Variants and When to Use Them”

Simulink.VariantManager

variantLegend

Introduced in R2016a

convertToVariant

Class: Simulink.VariantManager

Package: Simulink

Convert Subsystem, or Model block, or Variant Model block to a Variant Subsystem block

Syntax

```
variant_subsystem = Simulink.VariantManager.convertToVariant(block)
variant_subsystem = Simulink.VariantManager.convertToVariant(blockHandle)
```

Description

`variant_subsystem = Simulink.VariantManager.convertToVariant(block)` or `variant_subsystem = Simulink.VariantManager.convertToVariant(blockHandle)` converts a Subsystem, or Model block, or Variant Model block to a Variant Subsystem block. A Variant Subsystem can contain Subsystems, Model blocks, or both as choices.

Consider this model with Subsystem block.

You can convert this Subsystem block to a Variant Subsystem block using the `convertToVariant` method.

Similarly you can convert a Variant Model block to a Variant Subsystem block.

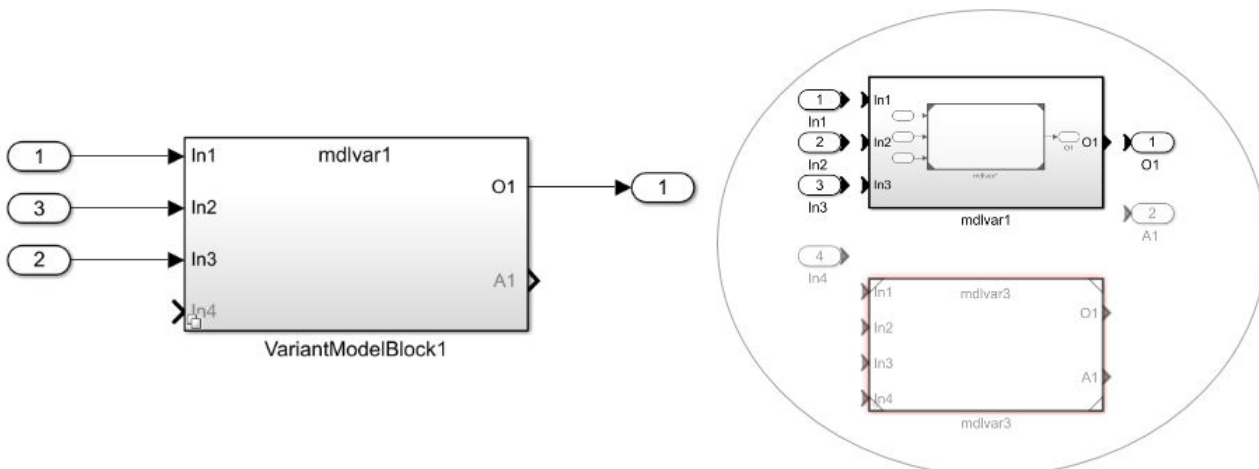

To convert a Variant Model block to a Variant Subsystem block, you can also use the Upgrade Advisor check, **Identify Variant Model blocks and convert those to Variant Subsystem containing Model block choices**. This check provides a **Fix** button to convert Variant Model blocks to Variant Subsystem blocks. For more information on using Upgrade Advisor check to convert a Variant Model block to a Variant Subsystem block, see “Upgrade Advisor Checks”

If there are inconsistencies in the port name or port number in models referenced by Variant Model block, Simulink corrects these inconsistencies while converting the Variant Model block to Variant Subsystem block.

Consider this model with Variant Model block having different port names.

When you convert this Variant Model block to a Variant Subsystem block, the inconsistencies are corrected automatically.

Note Future releases will no longer support using a Model block to contain model variants. You can use the `convertToVariant` method to convert model variants so that Model blocks are contained in a Variant Subsystem. Use of a Variant Subsystem block provides these advantages:

- Allows you to mix Model and Subsystem blocks as variant choices
- Supports flexible I/O, so that all variants do not need to have the same number of input and output ports

For an example of a model that uses a Variant Subsystem block as a container for variant models, see “Model Reference Variants” on page 14-469.

Limitations

You cannot convert a Subsystem block that meets the following condition:

- The Subsystem block is in a Simscape model that has Editing Mode set to **Restricted**.
- The Variant Model block has a mix of control ports or there is a name mismatch in control port types.
- The Variant Model block has control ports with different port numbers and name mapping.

Input Arguments

block — Subsystem or Model block to convert

block path | block handle

The path or block handle of the Subsystem or Model block to convert to a Variant Subsystem block. Specify a block path as a character vector and a block handle as a scalar.

Output Arguments

variant_subsystem — Handle of Variant Subsystem block

scalar returned by Simulink

If you specify an output argument, the method returns the block handle of the Variant Subsystem block created by the conversion.

Examples

```
open_system('sldemo_mdref_conversion');  
Simulink.VariantManager.convertToVariant('sldemo_mdref_conversion/Bus Counter');
```

Alternative Functionality

Simulink Editor

In the Simulink Editor, right-click the Model block and select **Subsystems & Model Reference > Convert to > Variant Subsystem**.

“Create a Simple Variant Model”

“What Are Variants and When to Use Them”

Introduced in R2017b

Simulink.WorkspaceVar

Store information about workspace variables and blocks that use them

Note `Simulink.WorkspaceVar` is not recommended. Use `Simulink.VariableUsage` instead.

Description

A `Simulink.WorkspaceVar` object describes attributes of a workspace variable and lists the blocks that use the variable.

Creation

The `Simulink.findVars` function returns one or more `Simulink.WorkspaceVar` objects that embody the results of searching for variables.

Only the `Simulink.WorkspaceVar` function can set any field value in a `Simulink.WorkspaceVar` object. The fields are otherwise read-only.

Syntax

```
varObj = Simulink.WorkspaceVar(varNames, wkspName)
```

Description

`varObj = Simulink.WorkspaceVar(varNames, wkspName)` creates an array of `Simulink.WorkspaceVar` objects to describe the variables `varNames`. The constructor sets the `Name` property of each object to one of the variable names specified by `varNames`, and sets the `Workspace` property of all the objects to the workspace specified by `wkspName`. You can specify `varNames` with variables that are not used in any loaded models.

Input Arguments

varNames — Names of target variables

character vector | cell array of character vectors

Names of target variables, specified as a character vector or a cell array of character vectors. The constructor creates a `Simulink.WorkspaceVar` object for each variable name. You can specify `varNames` with variables that are not used in any loaded models.

Example: 'k'

Example: {'k', 'asdf', 'fuelFlow'}

Data Types: char | cell

wkspName — Name of containing workspace

character vector

Name of the workspace that defines the target variables, specified as a character vector. For example, you can specify the MATLAB base workspace. The constructor also determines and sets the `WorkspaceType` property of each of the returned `Simulink.WorkspaceVar` objects.

Example: `'base workspace'`

Example: `'myModel'`

Example: `'myDictionary.slidd'`

Data Types: `char`

Properties

Name — Name of variable

`''` (empty character vector) (default) | character vector

This property is read-only.

Name of the variable described by the object, returned as a character vector.

Workspace — Name of workspace that contains variable

`''` (empty character vector) (default) | character vector

This property is read-only.

Name of the workspace that contains the variable, returned as a character vector. For example:

Workspace value	Meaning
<code>'base workspace'</code>	The MATLAB base workspace
<code>'MyModel'</code>	The model workspace for the model <code>MyModel</code> .
<code>'MyModel/Mask1'</code>	The mask workspace for the masked block <code>Mask1</code> in the model <code>MyModel</code> .

WorkspaceType — Type of workspace containing variable

`'unknown'` (default) | `'base'` | `'model'` | `'mask'`

This property is read-only.

Type of workspace that contains the variable, returned as a character vector. The possible values are:

- `'base'` — The base workspace
- `'model'` — A model workspace
- `'mask'` — A mask workspace

UsedByBlocks — Users of variable

`{}` (empty cell array) (default) | cell array of character vectors

This property is read-only.

Users of the variable, returned as a cell array of character vectors. Each character vector identifies a block that uses the variable. The `Simulink.findVars` function populates this property.

Object Functions

`intersect` Return intersection of two arrays of `Simulink.VariableUsage` objects
`setdiff` Return difference between two arrays of `Simulink.VariableUsage` objects

Examples

Create Object That Represents Variable in Base Workspace

Return a `Simulink.WorkspaceVar` object for a variable `k` in the base workspace.

```
var = Simulink.WorkspaceVar('k', 'base workspace');
```

Represent All Variables in the Base Workspace

Return an array of `Simulink.WorkspaceVar` objects containing one object for each variable returned by the `whos` command in the base workspace.

```
vars = Simulink.WorkspaceVar(who,WkspName)
```

Represent All Variables in a Model Workspace

Return an array of `Simulink.WorkspaceVar` objects that describes all the variables in a model workspace.

```
hws = get_param('mymodel', 'ModelWorkspace');  
vars=Simulink.WorkspaceVar(hws.whos, 'MyModel')
```

Represent All Variables in a Mask Workspace

Return an array of `Simulink.WorkspaceVar` objects that describes all the variables in a mask workspace.

```
maskVars = get_param('mymodel/maskblock', 'MaskWSVariables');  
vars = Simulink.WorkspaceVar(maskVars, 'mymodel/maskblock');
```

See Also

`Simulink.findVars` | `intersect` | `setdiff`

Introduced in R2010a

Simulink.VariableUsage

Store information about the relationship between variables and blocks in models

Description

A `Simulink.VariableUsage` object describes where a variable is used in models.

Use this information to:

- Prepare to permanently store the variables in files and workspaces. For more information about storing variables for a model, see “Determine Where to Store Variables and Objects for Simulink Models”.
- Reduce the number of variables that you need to store by eliminating unused variables.
- Prepare to partition variables and establish variable ownership when you work in a team.

To analyze variable usage in models, use `Simulink.VariableUsage` objects together with the `Simulink.findVars` function. The function returns and accepts `Simulink.VariableUsage` objects as arguments. For more information, see `Simulink.findVars`.

A `Simulink.VariableUsage` object can also describe the usage of an enumerated data type.

Only a `Simulink.VariableUsage` constructor or the `Simulink.findVars` function can set property values in a `Simulink.VariableUsage` object. The properties are otherwise read only.

Creation

The `Simulink.findVars` function returns `Simulink.VariableUsage` objects.

To create variable usage objects for use as a filter when using `Simulink.findVars`, use the `Simulink.VariableUsage` function described below.

Syntax

```
variableUsageObj = Simulink.VariableUsage(varNames,sourceName)
```

Description

`variableUsageObj = Simulink.VariableUsage(varNames,sourceName)` creates an array of `Simulink.VariableUsage` objects to describe the variables `varNames`. The constructor sets the `Name` property of each object to one of the variable names specified by `varNames`, and sets the `Source` property of all the objects to the source specified by `sourceName`. You can specify `varNames` with variables that are not used in any loaded models.

Input Arguments

varNames — Names of target variables

character vector | cell array of character vectors

Names of target variables, specified as a character vector or a cell array of character vectors. The constructor creates a `Simulink.VariableUsage` object for each variable name.

Example: `'k'`

Example: `{'k','asdf','fuelFlow'}`

Data Types: `char` | `cell`

sourceName — Name of variable source

character vector

Name of the source that defines the target variables, specified as a character vector. For example, you can specify the MATLAB base workspace or a data dictionary as a source. The constructor also determines and sets the `SourceType` property of each of the returned `Simulink.VariableUsage` objects.

Example: `'base workspace'`

Example: `'myModel'`

Example: `'myDictionary.sldd'`

Data Types: `char`

Properties

Name — Name of variable or enumerated type

`''` (empty character vector) (default) | character vector

This property is read-only.

The name of the variable or enumerated data type the object describes, returned as a character vector.

Source — Name of defining workspace

`''` (empty character vector) (default) | character vector

This property is read-only.

The name of the workspace or data dictionary that defines the described variable, returned as a character vector. The table shows some examples.

Source Value	Meaning
<code>'base workspace'</code>	MATLAB base workspace
<code>'MyModel'</code>	Model workspace for the model <code>MyModel</code>
<code>'MyModel/Mask1'</code>	Mask workspace for the masked block <code>Mask1</code> in the model <code>MyModel</code>
<code>'sldemo_fuelsys_dd_controller.sldd'</code>	The data dictionary named <code>'sldemo_fuelsys_dd_controller.sldd'</code>

The table shows some examples if you created the `Simulink.VariableUsage` object by using the `Simulink.findVars` function to find enumerated data types.

Source Value	Meaning
'BasicColors.m'	The enumerated type is defined in the MATLAB file 'BasicColors.m'.
' '	The enumerated type is defined dynamically and has no source.
'sldemo_fuelsys_dd_controller.sldd'	The enumerated type is defined in the data dictionary named 'sldemo_fuelsys_dd_controller.sldd'.

SourceType — Type of defining workspace

'unknown source' (default) | 'base workspace' | 'model workspace' | 'mask workspace' | 'data dictionary'

This property is read-only.

The type of the workspace that defines the variable, returned as a character vector. The possible values are:

- 'base workspace'
- 'model workspace'
- 'mask workspace'
- 'data dictionary'

If you created the `Simulink.VariableUsage` object by using the `Simulink.findVars` function to find enumerated data types, the possible values are:

- 'MATLAB file'
- 'dynamic class'
- 'data dictionary'

Users — Blocks that use the variable or models that use the enumerated type

{ } (empty cell array) (default) | cell array of character vectors

This property is read-only.

Blocks that use the variable or models that use the enumerated type, returned as a cell array of character vectors. Each character vector names a block or model that uses the variable or enumerated type. The `Simulink.findVars` function populates this property.

Object Functions

`intersect` Return intersection of two arrays of `Simulink.VariableUsage` objects
`setdiff` Return difference between two arrays of `Simulink.VariableUsage` objects
`union` Return union of two arrays of `Simulink.VariableUsage` objects

Examples

Create Object That Represents Variable in Base Workspace

Return a `Simulink.VariableUsage` object for a variable `k` in the base workspace.

```
var = Simulink.VariableUsage('k', 'base workspace');
```

You can use `var` as a filter for the `Simulink.findVars` function.

Represent All Variables in the Base Workspace

Return an array of `Simulink.VariableUsage` objects containing one object for each variable returned by the `whos` command in the base workspace.

```
vars = Simulink.VariableUsage(whos,'base workspace')
```

Represent All Variables in a Model Workspace

Return an array of `Simulink.VariableUsage` objects that describes all the variables in a model workspace.

```
hws = get_param('mymodel','ModelWorkspace');  
vars = Simulink.VariableUsage(hws.whos,'MyModel')
```

Represent All Variables in a Mask Workspace

Return an array of `Simulink.VariableUsage` objects that describes all the variables in a mask workspace.

```
maskVars = get_param('mymodel/maskblock','MaskWSVariables');  
vars = Simulink.VariableUsage(maskVars,'mymodel/maskblock');
```

“Manage Design Data”

Introduced in R2012b

Simulink.VariantConfigurationAnalysis class

Package: Simulink

Class representing a set of Variant Configuration Analysis functionality

Description

The `Simulink.VariantConfigurationAnalysis` class has methods that enable you to analyze or compare model references and libraries for each variant configuration in a model containing variant blocks. Use an instance of `Simulink.VariantConfigurationAnalysis` class to do the following:

- Get a list of active blocks for variant configuration
- Find blocks which are active across all variant configurations
- Find blocks which are inactive in all variant configurations
- Get a list of blocks which differ in active choice between variant configurations
- Get a list of active models for variant configuration
- Get a list of libraries which are used in variant configuration
- View variant configuration analysis in user interface screen
- Hide variant configuration analysis report
- View variant condition for blocks in given variant configuration

Properties

NamedConfigurations

Specifies the names of variant configuration(s) you want to analyze. The names are defined by the Variant Manager and saved in a variant configuration object associated with the model. If the model is associated with a variant configuration object, then the `VariantConfigurationObject` parameter is set to a `Simulink.VariantConfigurationData` object. For example, consider a variant configuration object "vcd", then `NamedConfigurations` must be one or multiple configuration names that is defined in "vcd". `NamedConfigurations` can be a string or a cell array of strings.

Method

<code>getActiveBlocks</code>	Returns a list of active blocks for variant configuration
<code>getAlwaysActiveBlocks</code>	Displays a list of blocks that are always active across all variant configurations
<code>getNeverActiveBlocks</code>	Returns a list of blocks that are inactive in all variant configurations
<code>getBlockDifferences</code>	Returns a list of blocks that differ in active choice between variant configurations
<code>getDependentModels</code>	Returns a list of active models for variant configurations
<code>getDependentLibraries</code>	Returns a list of libraries that are used in variant configurations
<code>showUI</code>	Displays variant configuration analysis in user interface view
<code>hideUI</code>	Hides variant configuration analysis report
<code>getVariantCondition</code>	Returns variant conditions for blocks in given variant configuration

"Variant Manager Overview"

getActiveBlocks

Class: Simulink.VariantConfigurationAnalysis

Package: Simulink

Returns a list of active blocks for variant configuration

Syntax

```
activeBlocks = VarConfigObj.getActiveBlocks(ConfigName)
```

Description

`activeBlocks = VarConfigObj.getActiveBlocks(ConfigName)` returns a list of active blocks for variant configuration.

Input Arguments

VarConfigObj — Variant configuration object

character vector

Variant configuration object for a specified configuration. You can use the `Simulink.VariantConfigurationAnalysis` method to obtain this value.

ConfigName — Variant configuration name

character vector | string

Specifies the name of variant configuration.

Output Arguments

activeBlocks — List of active blocks

cell array

Returns a list of active blocks as a cell array.

Examples

```
% Open model
open_system('slexVariantManagement');

% Get variant configuration object
VarConfigObj = Simulink.VariantConfigurationAnalysis('slexVariantManagement', 'NamedConfigurations', {'LinInterStd', ...
'NonLinExterLowFid', 'NonLinExterHighFid'})

% Get active blocks
ActiveBlocks = VarConfigObj.getActiveBlocks('LinInterStd')
```

getAlwaysActiveBlocks

Class: Simulink.VariantConfigurationAnalysis

Package: Simulink

Displays a list of blocks that are always active across all variant configurations

Syntax

```
alwaysActiveBlocks = VarConfigObj.getAlwaysActiveBlocks()
```

Description

`alwaysActiveBlocks = VarConfigObj.getAlwaysActiveBlocks()` displays a list of blocks that are always active across all variant configurations.

Input Arguments

VarConfigObj — Variant configuration object

character vector

Variant configuration object for a specified configuration. You can use the `Simulink.VariantConfigurationAnalysis` method to obtain this value.

Output Arguments

alwaysActiveBlocks — List of always active blocks

cell array

Displays a list of blocks that are always active, as a cell array.

Examples

```
% Open model
open_system('slexVariantManagement');

% Get variant configuration object
VarConfigObj = Simulink.VariantConfigurationAnalysis('slexVariantManagement', 'NamedConfigurations', {'LinInterStd', ...
'NonLinExterLowFid', 'NonLinExterHighFid'})

% Get always active blocks
alwaysActiveBlocks = VarConfigObj.getAlwaysActiveBlocks()
```

getNeverActiveBlocks

Class: Simulink.VariantConfigurationAnalysis

Package: Simulink

Returns a list of blocks that are inactive in all variant configurations

Syntax

```
getNeverActiveBlocks = VarConfigObj.getNeverActiveBlocks()
```

Description

`getNeverActiveBlocks = VarConfigObj.getNeverActiveBlocks()` returns a list of blocks that are inactive in all variant configurations.

Input Arguments

VarConfigObj — Variant configuration object

character vector

Variant configuration object for a specified configuration. You can use the `Simulink.VariantConfigurationAnalysis` method to obtain this value.

Output Arguments

neverActiveBlocks — List of never active blocks

cell array

Returns a list of blocks that are never active, as a cell array.

Examples

```
% Open model
open_system('slexVariantManagement');

% Get variant configuration object
VarConfigObj = Simulink.VariantConfigurationAnalysis('slexVariantManagement', 'NamedConfigurations', {'LinInterStd', ...
'NonLinExterLowFid', 'NonLinExterHighFid'})

% Get never active blocks
neverActiveBlocks = VarConfigObj.getNeverActiveBlocks()
```

getBlockDifferences

Class: Simulink.VariantConfigurationAnalysis

Package: Simulink

Returns a list of blocks that differ in active choice between variant configurations

Syntax

```
getBlockDifferences = VarConfigObj.getBlockDifferences()
```

Description

`getBlockDifferences = VarConfigObj.getBlockDifferences()` returns a list of blocks that are active in some of the analyzed configurations and inactive in other configurations.

Input Arguments

VarConfigObj — Variant configuration object

character vector

Variant configuration object for a specified configuration. You can use the `Simulink.VariantConfigurationAnalysis` method to obtain this value.

Output Arguments

getBlockDifferences — List of blocks that differ in active choice

cell array

Returns a list of blocks that differ in active choice between variant configurations, as a cell array.

Examples

```
% Open model
open_system('slexVariantManagement');

% Get variant configuration object
VarConfigObj = Simulink.VariantConfigurationAnalysis('slexVariantManagement', 'NamedConfigurations', {'LinInterStd', ...
'NonLinExterLowFid', 'NonLinExterHighFid'})

% Get block differences
getBlockDifferences = VarConfigObj.getBlockDifferences()
```

getDependentModels

Class: Simulink.VariantConfigurationAnalysis

Package: Simulink

Returns a list of active models for variant configurations

Syntax

```
dependentModels = VarConfigObj.getDependentModels(ConfigName)
```

Description

`dependentModels = VarConfigObj.getDependentModels(ConfigName)` returns a list of active models for variant configuration.

Input Arguments

VarConfigObj — Variant configuration object

character vector

Variant configuration object for a specified configuration. You can use the `Simulink.VariantConfigurationAnalysis` method to obtain this value.

ConfigName — Variant configuration name

character vector | string

Specifies the name of variant configuration.

Output Arguments

dependentModels — List of models

cell array

Returns a list of active models, as a cell array.

Examples

```
% Open model
open_system('slexVariantManagement');

% Get variant configuration object
VarConfigObj = Simulink.VariantConfigurationAnalysis('slexVariantManagement', 'NamedConfigurations', {'LinInterStd', ...
'NonLinExterLowFid', 'NonLinExterHighFid'})

% Get dependent models
dependentModels = VarConfigObj.getDependentModels('NonLinExterLowFid')
```

getDependentLibraries

Class: Simulink.VariantConfigurationAnalysis

Package: Simulink

Returns a list of libraries that are used in variant configurations

Syntax

```
dependentLibraries = VarConfigObj.getDependentLibraries(ConfigName)
```

Description

`dependentLibraries = VarConfigObj.getDependentLibraries(ConfigName)` returns a list of libraries that are used in variant configuration.

Input Arguments

VarConfigObj — Variant configuration object

character vector

Variant configuration object for a specified configuration. You can use the `Simulink.VariantConfigurationAnalysis` method to obtain this value.

ConfigName — Variant configuration name

character vector | string

Specifies the name of variant configuration.

Output Arguments

dependentLibraries — List of libraries

cell array

Returns a list of libraries, as a cell array.

Examples

```
% Open model
open_system('slexVariantManagement');

% Get variant configuration object
VarConfigObj = Simulink.VariantConfigurationAnalysis('slexVariantManagement', 'NamedConfigurations', {'LinInterStd', ...
'NonLinExterLowFid', 'NonLinExterHighFid'})

% Get dependent libraries
dependentLibraries = VarConfigObj.getDependentLibraries('LinInterStd')
```

showUI

Class: Simulink.VariantConfigurationAnalysis

Package: Simulink

Displays variant configuration analysis in user interface view

Syntax

```
VarConfigObj.showUI()
```

Description

`VarConfigObj.showUI()`, displays variant configuration analysis in user interface view.

Examples

```
% Open model
open_system('slexVariantManagement');

% Get variant configuration object
VarConfigObj = Simulink.VariantConfigurationAnalysis('slexVariantManagement', 'NamedConfigurations', {'LinInterStd', ...
'NonLinExterLowFid', 'NonLinExterHighFid'})

% Show UI
VarConfigObj.showUI()
```

See Also

“Create a Simple Variant Model”

Introduced in R2019a

hideUI

Class: Simulink.VariantConfigurationAnalysis

Package: Simulink

Hides variant configuration analysis report

Syntax

```
VarConfigObj.hideUI()
```

Description

`VarConfigObj.hideUI()`, hides the variant configuration analysis report.

Examples

```
% Open model
open_system('slexVariantManagement');

% Get variant configuration object
VarConfigObj = Simulink.VariantConfigurationAnalysis('slexVariantManagement', 'NamedConfigurations', {'LinInterStd', ...
'NonLinExterLowFid', 'NonLinExterHighFid'})

% Hide UI
VarConfigObj.hideUI()
```

getVariantCondition

Class: Simulink.VariantConfigurationAnalysis

Package: Simulink

Returns variant conditions for blocks in given variant configuration

Syntax

```
variantCondition = VarConfigObj.getVariantCondition(ConfigName)
```

Description

`variantCondition = VarConfigObj.getVariantCondition(ConfigName)`, returns the variant condition for block in given variant configuration.

Input Arguments

VarConfigObj — Variant configuration object

character vector

Variant configuration object for a specified configuration. You can use the `Simulink.VariantConfigurationAnalysis` method to obtain this value.

ConfigName — Variant configuration name

character vector | string

Specifies the name of variant configuration.

Output Arguments

variantCondition — Variant conditions for a block

cell array

Returns variant conditions for blocks in given variant configuration.

Examples

```
% Open model
open_system('slexVariantManagement');

% Get variant configuration object
VarConfigObj = Simulink.VariantConfigurationAnalysis('slexVariantManagement',...
'NamedConfigurations', {'LinInterStd', 'NonLinExterLowFid', 'NonLinExterHighFid'})

% Get variant condition
VariantCondition = VarConfigObj.getVariantCondition('NonLinExterLowFid',...
'slexVariantManagement/Controller/Linear Controller')
```

“Analyze Variant Configurations in Models Containing Variant Blocks” | “Variant Manager Overview”

Topics

“Create a Simple Variant Model”

Introduced in R2019b

intersect

Package: Simulink

Return intersection of two arrays of `Simulink.VariableUsage` objects

Syntax

```
VarsOut = intersect(VarsIn1,VarsIn2)
```

Description

`VarsOut = intersect(VarsIn1,VarsIn2)` returns an array that identifies the variables described in `VarsIn1` and in `VarsIn2`, which are arrays of `Simulink.VariableUsage` objects. If a variable is described by a `Simulink.VariableUsage` object in `VarsIn1` and in `VarsIn2`, the function returns a `Simulink.VariableUsage` object that stores the variable usage information from both objects in the `Users` property.

`intersect` compares the `Name`, `Source`, and `SourceType` properties of the `Simulink.VariableUsage` objects in `VarsIn1` with the same properties of the objects in `VarsIn2`. If `VarsIn1` and `VarsIn2` each contain `Simulink.VariableUsage` objects that have the same values for these three properties, they both describe the same variable.

To create `Simulink.VariableUsage` objects that describe the usage of variables in a model, use the `Simulink.findVars` function.

Examples

Compare Variables Used by Models

Given two models, discover the variables needed by both models.

```
model1Vars = Simulink.findVars('model1');  
model2Vars = Simulink.findVars('model2');  
commonVars = intersect(model1Vars,model2Vars);
```

Input Arguments

VarsIn1 — First array of variables for comparison

array of `Simulink.VariableUsage` objects

First array of variables for comparison, specified as an array of `Simulink.VariableUsage` objects.

VarsIn2 — Second array of variables for comparison

array of `Simulink.VariableUsage` objects

Second array of variables for comparison, specified as an array of `Simulink.VariableUsage` objects.

Output Arguments

VarsOut — Variables described in both input arrays

array of `Simulink.VariableUsage` objects

Variables that are described in both input arrays, returned as an array of `Simulink.VariableUsage` objects. The function returns an object for each variable that is described in `VarsIn1` and in `VarsIn2`.

See Also

`Simulink.VariableUsage` | `Simulink.findVars` | `setdiff` | `union`

Topics

“Manage Design Data”

Introduced in R2012b

setdiff

Package: Simulink

Return difference between two arrays of `Simulink.VariableUsage` objects

Syntax

```
VarsOut = setdiff(VarsIn1,VarsIn2)
```

Description

`VarsOut = setdiff(VarsIn1,VarsIn2)` returns an array that identifies the variables described in `VarsIn1` but not in `VarsIn2`, which are arrays of `Simulink.VariableUsage` objects. If a variable is described by a `Simulink.VariableUsage` object in `VarsIn1` but not in `VarsIn2`, the function returns a copy of the object.

`setdiff` compares the `Name`, `Source`, and `SourceType` properties of the `Simulink.VariableUsage` objects in `VarsIn1` with the same properties of the objects in `VarsIn2`. If `VarsIn1` and `VarsIn2` each contain a `Simulink.VariableUsage` object with the same values for these three properties, the objects describe the same variable, and `setdiff` does not return an object to describe it.

To create `Simulink.VariableUsage` objects that describe the usage of variables in a model, use the `Simulink.findVars` function.

Examples

Determine Variable Usage Difference Between Models

Given two models, discover the variables that are needed by the first model but not the second model.

```
model1Vars = Simulink.findVars('model1');  
model2Vars = Simulink.findVars('model2');  
differentVars = setdiff(model1Vars,model2Vars);
```

Find Variables Not Used by Model

Locate all variables in the base workspace that are not used by a loaded model that has been recently compiled.

```
models = find_system('type','block_diagram','LibraryType','None');  
base_vars = Simulink.VariableUsage(who,'base workspace');
```

```
used_vars = Simulink.findVars(models, 'WorkspaceType', 'base');  
unusedVars = setdiff(base_vars, used_vars);
```

Input Arguments

VarsIn1 — First array of variables for comparison

array of `Simulink.VariableUsage` objects

First array of variables for comparison, specified as an array of `Simulink.VariableUsage` objects.

VarsIn2 — Second array of variables for comparison

array of `Simulink.VariableUsage` objects

Second array of variables for comparison, specified as an array of `Simulink.VariableUsage` objects.

Output Arguments

VarsOut — Variables described in first array but not second array

array of `Simulink.VariableUsage` objects

Variables that are described in the first input array but not in the second input array, returned as an array of `Simulink.VariableUsage` objects. The function returns an object for each variable that is described in `VarsIn1` but not in `VarsIn2`.

See Also

`Simulink.VariableUsage` | `Simulink.findVars` | `intersect` | `union`

Topics

“Manage Design Data”

Introduced in R2012b

union

Package: Simulink

Return union of two arrays of `Simulink.VariableUsage` objects

Syntax

```
VarsOut = union(VarsIn1,VarsIn2)
```

Description

`VarsOut = union(VarsIn1,VarsIn2)` returns an array that is a combined set of the variables from `VarsIn1` and `VarsIn2`, which are arrays of `Simulink.VariableUsage` objects. The output array does not contain duplicates. If a variable is described by a `Simulink.VariableUsage` object in `VarsIn1` and in `VarsIn2`, the function returns a `Simulink.VariableUsage` object that stores the variable usage information from both objects in the `Users` property.

To create `Simulink.VariableUsage` objects that describe the usage of variables in a model, use the `Simulink.findVars` function.

Examples

Find the Union of Variables Used by Models

Given two models, discover the combined set of variables from both models.

```
model1Vars = Simulink.findVars('model1');  
model2Vars = Simulink.findVars('model2');  
unionVars = union(model1Vars,model2Vars);
```

Input Arguments

VarsIn1 — First array of variables for union

array of `Simulink.VariableUsage` objects

First array of variables for union, specified as an array of `Simulink.VariableUsage` objects.

VarsIn2 — Second array of variables for union

array of `Simulink.VariableUsage` objects

Second array of variables for union, specified as an array of `Simulink.VariableUsage` objects.

Output Arguments

VarsOut — Combined set of variables described in input arrays

array of `Simulink.VariableUsage` objects

Combined set of variables that are described in input arrays, returned as an array of `Simulink.VariableUsage` objects. The function returns an object for each variable that is described in `VarsIn1` or in `VarsIn2`.

Topics

“Manage Design Data”

Introduced in R2019b

Simulink.data.Dictionary class

Package: Simulink.data

Configure data dictionary

Description

An object of the `Simulink.data.Dictionary` class represents a data dictionary. The object allows you to perform operations on the data dictionary such as save or discard changes, import data from the base workspace, and add other data dictionaries as references.

Construction

The functions `Simulink.data.dictionary.create` and `Simulink.data.dictionary.open` create a `Simulink.data.Dictionary` object.

Properties

DataSources — Referenced data dictionaries

cell array of character vectors

This property is read-only.

Referenced data dictionaries by file name, returned as a cell array of character vectors. This property only lists directly referenced dictionaries whose parent is the `Simulink.data.Dictionary` object.

EnableAccessToBaseWorkspace — Specify whether models can use design data in the base workspace

false (default) | true

Whether linked models can use design data in the base workspace, specified as `true` or `false`.

To determine whether a dictionary provides access to the base workspace (including through referenced dictionaries), query the `HasAccessToBaseWorkspace` property.

For more information about this property, including restrictions that limit your ability to interact with base workspace data through the dictionary, see “Continue to Use Shared Data in the Base Workspace”.

Data Types: `logical`

HasAccessToBaseWorkspace — Query whether models can use design data in the base workspace

0 (default) | 1

This property is read-only.

Query whether models can use design data in the base workspace, returned as 1 (true) or 0 (false). If the dictionary or a referenced dictionary has the `EnableAccessToBaseWorkspace` property set to `true`, this property returns 1.

Use this property to determine whether models that link to the dictionary can use design data in the base workspace. You do not need to query each referenced dictionary to determine whether it has the `EnableAccessToBaseWorkspace` property set to `true`.

Data Types: `logical`

HasUnsavedChanges — Indicator of unsaved changes

0 | 1

This property is read-only.

Indicator of unsaved changes to the data dictionary, returned as 0 or 1. The value is 1 if changes have been made since last data dictionary save and 0 if not.

NumberOfEntries — Total number of entries in data dictionary

integer

This property is read-only.

Total number of entries in data dictionary, including those in referenced dictionaries, returned as an integer.

Methods

<code>addDataSource</code>	Add reference data dictionary to parent data dictionary
<code>close</code>	Close connection between data dictionary and <code>Simulink.data.Dictionary</code> object
<code>discardChanges</code>	Discard changes to data dictionary
<code>filepath</code>	Full path and file name of data dictionary
<code>getSection</code>	Return <code>Simulink.data.dictionary.Section</code> object to represent data dictionary section
<code>hide</code>	Remove data dictionary from Model Explorer
<code>importEnumTypes</code>	Import enumerated type definitions to data dictionary
<code>importFromBaseWorkspace</code>	Import base workspace variables to data dictionary
<code>listEntry</code>	List data dictionary entries
<code>removeDataSource</code>	Remove reference data dictionary from parent data dictionary
<code>saveChanges</code>	Save changes to data dictionary
<code>show</code>	Show data dictionary in Model Explorer

Copy Semantics

Handle. To learn how handle classes affect copy operations, see [Copying Objects \(MATLAB\)](#).

Examples

Create New Data Dictionary and Data Dictionary Object

Create a data dictionary file `myNewDictionary.sldd` and a `Simulink.data.Dictionary` object representing the new data dictionary. Assign the object to variable `dd1`.

```
dd1 = Simulink.data.dictionary.create('myNewDictionary.sldd')
```

```
dd1 =
```

```
data dictionary with properties:
```

```
    DataSources: {0x1 cell}  
    HasUnsavedChanges: 0  
    NumberOfEntries: 0
```

Open Existing Data Dictionary

Create a `Simulink.data.Dictionary` object representing the existing data dictionary `myDictionary_ex_API.sldd`. Assign the object to variable `dd2`.

```
dd2 = Simulink.data.dictionary.open('myDictionary_ex_API.sldd')
```

```
dd2 =
```

```
Dictionary with properties:
```

```
    DataSources: {'myRefDictionary_ex_API.sldd'}  
    HasUnsavedChanges: 0  
    NumberOfEntries: 4
```

Topics

“Store Data in Dictionary Programmatically”
“What Is a Data Dictionary?”

Introduced in R2015a

addDataSource

Class: Simulink.data.Dictionary

Package: Simulink.data

Add reference data dictionary to parent data dictionary

Syntax

```
addDataSource(dictionaryObj, refDictionaryFile)
```

Description

`addDataSource(dictionaryObj, refDictionaryFile)` adds a data dictionary, `refDictionaryFile`, as a reference dictionary to a parent dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object.

The parent dictionary contains all the entries that are defined in the referenced dictionary until the referenced dictionary is removed from the parent dictionary. The `DataSource` property of an entry indicates the dictionary that defines the entry.

Input Arguments

dictionaryObj — Parent data dictionary

`Simulink.data.Dictionary` object

Parent data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

refDictionaryFile — File name of data dictionary to reference

character vector

File name of data dictionary to reference, specified as a character vector that includes the `.sldd` extension. The data dictionary file must be on your MATLAB path.

Example: `'mySubDictionary_ex_API.sldd'`

Data Types: `char`

Examples

Add a Reference Data Dictionary to a Parent Data Dictionary

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Add the data dictionary `mySubDictionary_ex_API.sldd` as a reference dictionary to `myDictionary_ex_API.sldd`.

```
addDataSource(myDictionaryObj, 'mySubDictionary_ex_API.sldd');
```

Confirm the addition by viewing the `DataSources` property of variable `myDictionaryObj`. The property returns the name of the newly referenced dictionary.

```
myDictionaryObj.DataSources
```

```
ans =
```

```
    'myRefDictionary_ex_API.sldd'  
    'mySubDictionary_ex_API.sldd'
```

Alternatives

You can use the Model Explorer window to manage reference dictionaries. See “Partition Dictionary Data Using Referenced Dictionaries” for more information.

See Also

`Simulink.data.Dictionary` | `removeDataSource`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

close

Class: Simulink.data.Dictionary

Package: Simulink.data

Close connection between data dictionary and Simulink.data.Dictionary object

Syntax

```
close(dictionaryObj)
```

Description

`close(dictionaryObj)` closes the connection between the Simulink.data.Dictionary object `dictionaryObj` and the data dictionary it represents. `dictionaryObj` remains as a Simulink.data.Dictionary object but no longer represents any data dictionary.

Input Arguments

dictionaryObj — Target Simulink.data.Dictionary object

handle to Simulink.data.Dictionary object

Target Simulink.data.Dictionary object, specified as a handle to the object.

Tips

- Use the `close` function in a custom MATLAB function to disassociate a Simulink.data.Dictionary object from a data dictionary. Custom MATLAB functions can create and store variables and objects in function workspaces but cannot delete those variables and objects.
- The `close` function does not affect the content or the state of the represented data dictionary. The function does not discard unsaved changes to the represented dictionary or entries. You can save or discard them later.

See Also

Simulink.data.Dictionary

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

discardChanges

Class: Simulink.data.Dictionary

Package: Simulink.data

Discard changes to data dictionary

Syntax

```
discardChanges(dictionaryObj)
```

Description

`discardChanges(dictionaryObj)` discards all changes made to the specified data dictionary since the last time changes to the dictionary were saved using the `saveChanges` function. `discardChanges` also discards changes made to referenced data dictionaries. The changes to the target dictionary and its referenced dictionaries are permanently lost.

Input Arguments

dictionaryObj — Target data dictionary

Simulink.data.Dictionary object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

Examples

Discard Changes to Data Dictionary

Create a `Simulink.data.Dictionary` object representing the data dictionary `myDictionary_ex_API.sldd` and assign the object to variable `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd')
```

```
myDictionaryObj =
```

```
Dictionary with properties:
```

```
    DataSourcees: {'myRefDictionary_ex_API.sldd'}  
    HasUnsavedChanges: 0  
    NumberOfEntries: 4
```

Make a change to `myDictionary_ex_API.sldd` by adding an entry named `myNewEntry` with value 237. View the `HasUnsavedChanges` property of `myDictionaryObj` to confirm a change was made.

```
addEntry(dDataSectObj, 'myNewEntry', 237);  
myDictionaryObj
```

```
myDictionaryObj =
```

```
Dictionary with properties:
```

```
    DataSources: {'myRefDictionary_ex_API.sldd'}  
    HasUnsavedChanges: 1  
    NumberOfEntries: 5
```

Discard all changes to `myDictionary_ex_API.sldd`. The `HasUnsavedChanges` property of `myDictionaryObj` indicates changes were discarded.

```
discardChanges(myDictionaryObj)  
myDictionaryObj
```

```
myDictionaryObj =
```

```
Dictionary with properties:
```

```
    DataSources: {'myRefDictionary_ex_API.sldd'}  
    HasUnsavedChanges: 0  
    NumberOfEntries: 4
```

Alternatives

You can use the Model Explorer window to discard changes to data dictionaries. See “View and Revert Changes to Dictionary Entries” for more information.

Topics

“Store Data in Dictionary Programmatically”
“What Is a Data Dictionary?”

Introduced in R2015a

filepath

Class: Simulink.data.Dictionary

Package: Simulink.data

Full path and file name of data dictionary

Syntax

```
dictionaryFilePath = filepath(dictionaryObj)
```

Description

`dictionaryFilePath = filepath(dictionaryObj)` returns the full path and file name of the data dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object.

Input Arguments

dictionaryObj — Target data dictionary

`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

Examples

Return Path of Data Dictionary File

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Return the full path of `myDictionary_ex_API.sldd` and assign it to variable `myDictionaryFilePath`.

```
myDictionaryFilePath = filepath(myDictionaryObj)
```

```
myDictionaryFilePath =
```

```
C:\Users\jsmith\myDictionary_ex_API.sldd
```

See Also

`Simulink.data.Dictionary`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

getSection

Class: Simulink.data.Dictionary

Package: Simulink.data

Return Simulink.data.dictionary.Section object to represent data dictionary section

Syntax

```
sectionObj = getSection(dictionaryObj,sectionName)
```

Description

sectionObj = getSection(dictionaryObj,sectionName) returns a Simulink.data.dictionary.Section object representing one section, sectionName, of a data dictionary dictionaryObj, a Simulink.data.Dictionary object.

When you access the **Embedded Coder** section of a data dictionary, getSection returns a coder.Dictionary object representing the Embedded Coder Dictionary in the data dictionary.

Input Arguments

dictionaryObj — Data dictionary containing target section

Simulink.data.Dictionary object

Data dictionary containing target section, specified as a Simulink.data.Dictionary object. Before you use this function, represent the dictionary with a Simulink.data.Dictionary object by using, for example, the Simulink.data.dictionary.create or Simulink.data.dictionary.open function.

sectionName — Name of target data dictionary section

character vector

Name of target data dictionary section, specified as a character vector.

Example: 'Design Data'

Example: 'Configurations'

Example: 'EmbeddedCoder'

Data Types: char

Examples

Create New Data Dictionary Section Object

Open the data dictionary myDictionary_ex_API.sldd and represent it with a Simulink.data.Dictionary object named myDictionaryObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
dDataSectObj = getSection(myDictionaryObj, 'Design Data')
```

```
dDataSectObj =
```

```
Section with properties:
```

```
    Name: 'Design Data'
```

See Also

`Simulink.data.Dictionary` | `Simulink.data.dictionary.Section`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

hide

Class: Simulink.data.Dictionary

Package: Simulink.data

Remove data dictionary from Model Explorer

Syntax

```
hide(dictionaryObj)
```

Description

`hide(dictionaryObj)` removes the data dictionary `dictionaryObj` from the **Model Hierarchy** pane of Model Explorer. The target dictionary no longer appears as a node in the model hierarchy tree. Use this function when you are finished working with a data dictionary and want to reduce clutter in the Model Explorer.

Input Arguments

dictionaryObj — Target data dictionary

Simulink.data.Dictionary object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

Examples

Hide Data Dictionary from Model Explorer

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Open Model Explorer and display the new data dictionary as the selected tree node in the **Model Hierarchy** pane.

```
show(myDictionaryObj)
```

With Model Explorer open, at the MATLAB command prompt, call the `hide` function to observe the removal of `myDictionary_ex_API.sldd` from the model hierarchy tree.

```
hide(myDictionaryObj)
```

Tips

- To add a data dictionary as a node in the model hierarchy tree in Model Explorer, use the `show` function or use the interface to open and view the dictionary in Model Explorer.
- The `hide` function does not affect the content of the target dictionary.

Alternatives

You can remove a data dictionary from the **Model Hierarchy** pane of Model Explorer by right-clicking the dictionary tree node and selecting **Close**.

`Simulink.data.Dictionary | show`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

importEnumTypes

Class: Simulink.data.Dictionary

Package: Simulink.data

Import enumerated type definitions to data dictionary

Syntax

```
importedTypes = importEnumTypes(dictionaryObj,targetTypes)
[importedTypes,importFailures] = importEnumTypes(dictionaryObj,targetTypes)
```

Description

`importedTypes = importEnumTypes(dictionaryObj,targetTypes)` imports to the data dictionary `dictionaryObj` the definitions of one or more enumerated types `targetTypes`. `importEnumTypes` does not import MATLAB variables created using enumerated types but instead, in support of those variables, imports the definitions of the types. The target data dictionary stores the definition of a successfully imported type as an entry. This syntax returns a list of the names of successfully imported types. `importEnumTypes` saves changes made to the target dictionary, so before you use `importEnumTypes`, confirm that unsaved changes are acceptable.

`[importedTypes,importFailures] = importEnumTypes(dictionaryObj,targetTypes)` additionally returns a list of any target types that were not successfully imported. You can inspect the list to determine the reason for each failure.

Input Arguments

dictionaryObj — Target data dictionary

Simulink.data.Dictionary object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

targetTypes — Enumerated type definitions to import

cell array of character vectors | string array

Enumerated type definitions to import, specified as a cell array of character vectors or a string array. If any target types are defined using `classdef` blocks in MATLAB files or P-files, the files must be available on your MATLAB path so that `importEnumTypes` can disable them.

Example: {'myEnumType'}

Example: {'myFirstEnumType','mySecondEnumType','myThirdEnumType'}

Data Types: cell

Output Arguments

importedTypes — Target types successfully imported

array of structures

Target enumerated type definitions successfully imported, returned as an array of structures. Each structure in the array represents one imported type. The `className` field of each structure identifies a type by name and the `renamedFiles` field identifies any renamed MATLAB files or P-files.

importFailures — Target types not imported

array of structures

Enumerated type definitions targeted but not imported, returned as an array of structures. Each structure in the array represents one type not imported. The `className` field of each structure identifies a type by name and the `reason` field explains the failure.

Examples

Import Enumerated Data to Data Dictionary

Create a data dictionary `myNewDictionary.sldd` in your current working folder and a `Simulink.data.Dictionary` object representing the new data dictionary. Assign the object to the variable `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.create('myNewDictionary.sldd');
```

Run the script in the MATLAB file `myDataEnum_ex_API.m`. The file defines an enumerated type named `InstrumentTypes` using the `Simulink.defineIntEnumType` function and creates three variables based on the new type. Then, import the new variables from the base workspace to `myDictionary_ex_API.sldd`.

```
myDataEnum_ex_API
importFromBaseWorkspace(myDictionaryObj, 'varList', ...
{'firstEnumVariable', 'secondEnumVariable', 'thirdEnumVariable'});
```

Clear the imported variables from the base workspace. Before you can import an enumerated data type definition to the target data dictionary, you must clear the base workspace of any variables created using the target type.

```
clear firstEnumVariable
clear secondEnumVariable
clear thirdEnumVariable
```

Import the data type definition to `myDictionary_ex_API.sldd`.

```
importEnumTypes(myDictionaryObj, {'InstrumentTypes'})
ans =
```

```
    className: 'InstrumentTypes'  
    renamedFiles: {}
```

Tips

- Before you can import an enumerated data type definition to a data dictionary, you must clear the base workspace of any variables created using the target type.
- You can define an enumerated type using a `classdef` block in a MATLAB file or a P-file. `importEnumTypes` imports type definitions directly from these files if you specify the names of the types to import using the input argument `targetTypes` and if the files defining the types are on your MATLAB path.
- To avoid conflicting definitions for imported types, `importEnumTypes` renders MATLAB files or P-files ineffective by appending `.save` to their names. The `.save` extensions cause variables to rely on the definitions in the target data dictionary and not on the definitions in the files. You can remove the `.save` extensions to restore the files to their original state.
- You can use `importEnumTypes` to import enumerated types defined using the `Simulink.defineIntEnumType` function. Because such types are not defined using MATLAB files or P-files, `importEnumTypes` does not rename any files.
- Use the function `Simulink.findVars` to generate a list of the enumerated types that are used by a model. Then, use the list with `importEnumTypes` to import the definitions of the types to a data dictionary. See “Enumerations in Data Dictionary” for more information.

`Simulink.data.Dictionary` | `importFromBaseWorkspace`

Topics

“Enumerations in Data Dictionary”

“Store Data in Dictionary Programmatically”

Introduced in R2015a

importFromBaseWorkspace

Class: Simulink.data.Dictionary

Package: Simulink.data

Import base workspace variables to data dictionary

Syntax

```
importedVars = importFromBaseWorkspace(dictionaryObj)
importedVars = importFromBaseWorkspace(dictionaryObj,Name,Value)
[importedVars,existingVars] = importFromBaseWorkspace(____)
```

Description

`importedVars = importFromBaseWorkspace(dictionaryObj)` imports all variables from the MATLAB base workspace to the data dictionary `dictionaryObj` without overwriting existing entries in the dictionary. If any base workspace variables are already in the dictionary, the function present a warning and a list.

This syntax returns a list of names of the successfully imported variables. A variable is considered successfully imported only if `importFromBaseWorkspace` assigns the value of the variable to the corresponding entry in the target data dictionary.

`importedVars = importFromBaseWorkspace(dictionaryObj,Name,Value)` imports base workspace variables to a data dictionary, with additional options specified by one or more `Name,Value` pair arguments.

`[importedVars,existingVars] = importFromBaseWorkspace(____)` additionally returns a list of variables that were not overwritten. Use this syntax if `existingVarsAction` is set to 'none', the default value, which prevents existing dictionary entries from being overwritten.

Input Arguments

dictionaryObj — Target data dictionary

Simulink.data.Dictionary object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

clearWorkspaceVars — Flag to clear base workspace of imported variables

false (default) | true

Flag to clear the base workspace of any successfully imported variables, specified as the comma-separated pair consisting of 'clearWorkspaceVars' and true or false.

Example: 'clearWorkspaceVars',true

Data Types: logical

existingVarsAction — Action to take for existing dictionary variables

'none' (default) | 'error' | 'overwrite'

Action to take for existing dictionary variables, specified as the comma-separated pair consisting of 'existingVarsAction' and 'none', 'error', or 'overwrite'.

If you specify 'none', importFromBaseWorkspace attempts to import target variables but does not import or make any changes to variables that are already in the data dictionary.

If you specify 'error', importFromBaseWorkspace returns an error, without importing any variables, if any target variables are already in the data dictionary.

If you specify 'overwrite', importFromBaseWorkspace imports all target variables and overwrites any variables that are already in the data dictionary.

Example: 'existingVarsAction','error'

Data Types: char

varList — Variables to import

cell array of character vectors | string array

Names of specific base workspace variables to import, specified as the comma-separated pair consisting of 'varList' and a cell array of character vectors or a string array. If you want to import only one variable, specify the name inside a cell array. If you do not specify 'varList', importFromBaseWorkspace imports all variables from the MATLAB base workspace.

Example: 'varList',{'a','myVariable','fuelFlow'}

Example: 'varList',{'fuelFlow'}

Data Types: cell

Output Arguments

importedVars — Successfully imported variables

cell array of character vectors

Names of successfully imported variables, returned as a cell array of character vectors. A variable is considered successfully imported only if importFromBaseWorkspace assigns the value of the variable to the corresponding entry in the target data dictionary.

existingVars — Variables that were not imported

cell array of character vectors

Names of target variables that were not imported due to their existence in the target data dictionary, returned as a cell array of character vectors. existingVars has content only if 'existingVarsAction' is set to 'none' which is also the default. In that case importFromBaseWorkspace imports only variables that are not already in the target data dictionary.

Examples

Import All Base Workspace Variables to Data Dictionary

In the MATLAB base workspace, create variables to import.

```
a = 'Char Variable';  
myVariable = true;  
fuelFlow = 324;
```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import all base workspace variables to the data dictionary and return a list of successfully imported variables. If any base workspace variables are already in `myDictionary_ex_API.sldd`, `importFromBaseWorkspace` presents a warning and a list of the affected variables.

```
importFromBaseWorkspace(myDictionaryObj);
```

```
Warning: The following variables were not imported because  
they already exist in the dictionary:  
    fuelFlow
```

Specify Variables to Import to Data Dictionary from Base Workspace

In the MATLAB base workspace, create variables to import.

```
b = 'Char Variable';  
mySecondVariable = true;  
airFlow = 324;
```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import only the new base workspace variables to the data dictionary.

```
importFromBaseWorkspace(myDictionaryObj, 'varList', ...  
{'b', 'mySecondVariable', 'airFlow'});
```

Import Variables from Base Workspace and Overwrite Conflicts

In the MATLAB base workspace, create a variable to import.

```
fuelFlow = 324;
```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`. `myDictionary_ex_API.sldd` already contains an entry called `fuelFlow`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import the variable `fuelFlow` and overwrite the corresponding entry in `myDictionary_ex_API.sldd`.

```
importFromBaseWorkspace(myDictionaryObj, 'varList', {'fuelFlow'}, ...
    'existingVarsAction', 'overwrite');
```

`importFromBaseWorkspace` assigns the value of the base workspace variable `fuelFlow` to the value of the corresponding entry in `myDictionary_ex_API.sldd`.

Return Variables Not Imported to Data Dictionary from Base Workspace

Return a list of variables that are not imported from the MATLAB base workspace because they are already in the target data dictionary.

In the MATLAB base workspace, create variables to import.

```
fuelFlow = 324;
myNewVariable = 'This is a character vector.'
```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`. `myDictionary_ex_API.sldd` already contains an entry called `fuelFlow`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import the variables `fuelFlow` and `myNewVariable` to the data dictionary. Specify names for the output arguments of `importFromBaseWorkspace` to return the names of successfully and unsuccessfully imported variables.

```
[importedVars, existingVars] = importFromBaseWorkspace(myDictionaryObj, ...
    'varList', {'fuelFlow', 'myNewVariable'})
```

```
importedVars =
    'myNewVariable'
```

```
existingVars =
    'fuelFlow'
```

`importFromBaseWorkspace` does not import the variable `fuelFlow` because it is already in the target data dictionary.

Tips

- `importFromBaseWorkspace` can import MATLAB variables created from enumerated data types but cannot import the definitions of the enumerated types. Use the `importEnumTypes` function to import enumerated data type definitions to a data dictionary. If you import variables of enumerated data types to a data dictionary but do not import the enumerated type definitions, the dictionary is less portable and might not function properly if used by someone else.

Alternatives

- When you use the Simulink Editor to link a model to a data dictionary, you can choose to import model variables from the base workspace. See “Migrate Single Model to Use Dictionary” for more information.
- You can also use the Model Explorer window to drag-and-drop variables from the base workspace into a data dictionary.

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

listEntry

Class: Simulink.data.Dictionary

Package: Simulink.data

List data dictionary entries

Syntax

```
listEntry(dictionaryObj)
listEntry(dictionaryObj,Name,Value)
```

Description

`listEntry(dictionaryObj)` displays in the MATLAB Command Window a table of information about all the entries in the data dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object. The displayed information includes the name of each entry, the name of the section containing each entry, the status of each entry, the date and time each entry was last modified, the last user name to modify each entry, and the class of the value each entry contains. By default, the function sorts the list of entries alphabetically by entry name.

`listEntry(dictionaryObj,Name,Value)` displays the entries in a data dictionary with additional options specified by one or more `Name,Value` pair arguments.

To return the value of a data dictionary entry at the command prompt, use the `getValue` method of a `Simulink.data.dictionary.Entry` object. See “Store Data in Dictionary Programmatically”.

Input Arguments

dictionaryObj — Target data dictionary

`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Ascending — Sort order of list

`true` (default) | `false`

Sort order of the list of data dictionary entries, specified as the comma-separated pair consisting of 'Ascending' and `true` or `false`. If you specify `false`, `listEntry` sorts the list in descending order.

Example: 'Ascending',false

Data Types: logical

Class — Criteria to filter list by class

character vector

Criteria to filter the list of data dictionary entries by class, specified as the comma-separated pair consisting of 'Class' and a character vector identifying a valid class. The function lists only entries whose values are of the specified class.

Example: 'Class', 'Simulink.Parameter'

Data Types: char

LastModifiedBy — Criteria to filter list by user name of last modifier

character vector

Criteria to filter the list of data dictionary entries by the user name of the last user to modify each entry, specified as the comma-separated pair consisting of 'LastModifiedBy' and a character vector identifying the specified user name. The function lists only entries that were last modified by the specified user name.

Example: 'LastModifiedBy', 'jsmith'

Data Types: char

Limit — Maximum number of entries to list

integer

Maximum number of entries to list, specified as the comma-separated pair consisting of 'Limit' and an integer. The function lists up to the specified number of entries starting from the top of the sorted and filtered list.

Example: 'Limit', 9

Data Types: double

Name — Criteria to filter list by entry name

character vector

Criteria to filter the list of data dictionary entries by entry name, specified as the comma-separated pair consisting of 'Name' and a character vector defining the filter criteria. You can use an asterisk character, *, as a wildcard to represent any number of characters. The function lists only entries whose names match the filter criteria.

Example: 'Name', 'fuelFlow'

Example: 'Name', 'fuel*'

Data Types: char

Section — Criteria to filter list by data dictionary section

character vector

Criteria to filter the list of data dictionary entries by section, specified as the comma-separated pair consisting of 'Section' and a character vector identifying the target section. The function lists only entries that are contained in the target section.

Example: 'Section', 'Design Data'

SortBy — Flag to sort list by specific property

'Name' (default) | 'Section' | 'LastModified' | 'LastModifiedBy'

Flag to sort the list of data dictionary entries by a specific property, specified as the comma-separated pair consisting of 'SortBy' and a character vector identifying a property in the list of entries. Valid properties include 'Name', 'Section', 'LastModified', and 'LastModifiedBy'.

Example: 'SortBy', 'LastModifiedBy'

Examples**List All Entries in Data Dictionary**

Represent the data dictionary `sldemo_fuelsys_dd_controller.sldd` with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd_controller.sldd');
```

List all the entries in the data dictionary.

```
listEntry(myDictionaryObj)
```

Sort List of Data Dictionary Entries in Descending Order

Represent the data dictionary `sldemo_fuelsys_dd_controller.sldd` with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd_controller.sldd');
```

List all the entries in the data dictionary and sort the list in descending order by entry name.

```
listEntry(myDictionaryObj, 'Ascending', false)
```

Filter List of Data Dictionary Entries by Name

Represent the data dictionary `sldemo_fuelsys_dd_controller.sldd` with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd_controller.sldd');
```

List only the entries in the data dictionary whose names begin with `max`.

```
listEntry(myDictionaryObj, 'Name', 'max*')
```

Sort List of Data Dictionary Entries by Time of Modification

Represent the data dictionary `sldemo_fuelsys_dd_controller.sldd` with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd_controller.sldd');
```

List all the entries in the dictionary and sort the list by the date and time each entry was last modified.

```
listEntry(myDictionaryObj, 'SortBy', 'LastModified')
```

Topics

“Store Data in Dictionary Programmatically”

“What Is a Data Dictionary?”

Introduced in R2015a

removeDataSource

Class: Simulink.data.Dictionary

Package: Simulink.data

Remove reference data dictionary from parent data dictionary

Syntax

```
removeDataSource(dictionaryObj, refDictionaryFile)
```

Description

`removeDataSource(dictionaryObj, refDictionaryFile)` removes a referenced data dictionary, `refDictionaryFile`, from a parent dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object.

The parent dictionary no longer contains the entries that are defined in the referenced dictionary.

Input Arguments

dictionaryObj — Parent data dictionary

`Simulink.data.Dictionary` object

Parent data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

refDictionaryFile — File name of referenced data dictionary

character vector

File name of referenced data dictionary, specified as a character vector that includes the `.sldd` extension. The data dictionary file must be on your MATLAB path.

Example: `'myRefDictionary_ex_API.sldd'`

Data Types: `char`

Examples

Remove Referenced Data Dictionary from Parent Data Dictionary

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`. The `DataSources` property of `myDictionaryObj` indicates `myDictionary_ex_API.sldd` references `myRefDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd')
```

```
myDictionaryObj =  
    Dictionary with properties:  
        DataSources: {'myRefDictionary_ex_API.sldd'}  
        HasUnsavedChanges: 0  
        NumberOfEntries: 4
```

Remove myRefDictionary_ex_API.sldd from myDictionary_ex_API.sldd.

```
removeDataSource(myDictionaryObj, 'myRefDictionary_ex_API.sldd');
```

View the properties of the Simulink.data.Dictionary object myDictionaryObj, which represents the parent data dictionary. The DataSources property confirms the removal of myRefDictionary_ex_API.sldd.

```
myDictionaryObj  
myDictionaryObj =  
    Dictionary with properties:  
        DataSources: {0x1 cell}  
        HasUnsavedChanges: 1  
        NumberOfEntries: 3
```

Alternatives

You can use Model Explorer to manage reference dictionaries. See “Partition Dictionary Data Using Referenced Dictionaries” for more information.

[Simulink.data.Dictionary | addDataSource](#)

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

saveChanges

Class: Simulink.data.Dictionary

Package: Simulink.data

Save changes to data dictionary

Syntax

```
saveChanges(dictionaryObj)
```

Description

`saveChanges(dictionaryObj)` saves all changes made to a data dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object. `saveChanges` also saves changes made to referenced data dictionaries. The previous states of the target dictionary and its referenced dictionaries are permanently lost.

Input Arguments

dictionaryObj — Target data dictionary

`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

Examples

Save Changes to Data Dictionary

Create a new data dictionary `myNewDictionary.sldd` and represent the Design Data section with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.create('myNewDictionary.sldd')  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

```
myDictionaryObj =
```

```
data dictionary with properties:
```

```
    DataSources: {0x1 cell}  
    HasUnsavedChanges: 0  
    NumberOfEntries: 0
```

Change `myNewDictionary.sldd` by adding an entry named `myNewEntry` with value 237. View the `HasUnsavedChanges` property of `myDictionaryObj` to confirm a change was made.

```
addEntry(dDataSectObj, 'myNewEntry', 237);  
myDictionaryObj
```

```
myDictionaryObj =  
    Dictionary with properties:  
        DataSources: {0x1 cell}  
        HasUnsavedChanges: 1  
        NumberOfEntries: 1
```

Save all changes to `myNewDictionary.sldd`. The `HasUnsavedChanges` property of `myDictionaryObj` indicates changes were saved.

```
saveChanges(myDictionaryObj)  
myDictionaryObj  
myDictionaryObj =  
    Dictionary with properties:  
        DataSources: {0x1 cell}  
        HasUnsavedChanges: 0  
        NumberOfEntries: 1
```

Alternatives

You can use Model Explorer to save changes to a data dictionary by right-clicking on the dictionary tree node in the **Model Hierarchy** pane and selecting **Save Changes**.

See Also

`Simulink.data.Dictionary | discardChanges`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

show

Class: Simulink.data.Dictionary

Package: Simulink.data

Show data dictionary in Model Explorer

Syntax

```
show(dictionaryObj)
show(dictionaryObj, openModelExplorer)
```

Description

`show(dictionaryObj)` opens Model Explorer and displays the data dictionary `dictionaryObj` as the selected tree node in the **Model Hierarchy** pane.

`show(dictionaryObj, openModelExplorer)` enables you to add the target dictionary to the **Model Hierarchy** pane without opening Model Explorer.

Input Arguments

dictionaryObj — Target data dictionary

Simulink.data.Dictionary object

Target data dictionary, specified as a Simulink.data.Dictionary object. Before you use this function, represent the target dictionary with a Simulink.data.Dictionary object by using, for example, the Simulink.data.dictionary.create or Simulink.data.dictionary.open function.

openModelExplorer — Flag to open Model Explorer

true (default) | false

Flag to open Model Explorer, specified as true or false.

Data Types: logical

Examples

Show Data Dictionary in Model Explorer

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a Simulink.data.Dictionary object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Open Model Explorer and display `myDictionary_ex_API` as the selected node of the model hierarchy tree in the **Model Hierarchy** pane.

```
show(myDictionaryObj)
```

Add Data Dictionary to Model Hierarchy Tree

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Add `myDictionary_ex_API.sldd` to the model hierarchy tree without opening Model Explorer.

```
show(myDictionaryObj, false)
```

You can confirm the addition of `myDictionary_ex_API` to the model hierarchy tree by manually opening Model Explorer.

Tips

- Use the `hide` function to remove a data dictionary from the tree in the **Model Hierarchy** pane of Model Explorer. The dictionary does not appear in the hierarchy again until you use the `show` function or you open and view the dictionary in the Model Explorer using the interface.

See Also

`Simulink.data.Dictionary | hide`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

Simulink.data.dictionary.Entry class

Package: Simulink.data.dictionary

Configure data dictionary entry

Description

An object of the `Simulink.data.dictionary.Entry` class represents one entry of a data dictionary. The object allows you to perform operations such as assign the entry a value or change the name of the entry.

Before you can create a new `Simulink.data.dictionary.Entry` object, you must create a `Simulink.data.dictionary.Section` object representing the data dictionary section that contains the target entry. However, once created, the `Simulink.data.dictionary.Entry` object exists independently of the `Simulink.data.dictionary.Section` object. Use the function `getSection` to create a `Simulink.data.dictionary.Section` object.

Construction

The functions `addEntry`, `getEntry`, and `find` create `Simulink.data.dictionary.Entry` objects.

Properties

DataSource — File name of containing data dictionary

character vector

File name of containing data dictionary, specified as a character vector. Changes you make to this property affect the represented data dictionary entry.

Example: `'myDictionary.sldd'`

Data Types: `char`

LastModified — Date and time of last modification

character vector

Date and time of last modification to entry, returned in Coordinated Universal Time (UTC) as a character vector. This property is read only.

LastModifiedBy — Name of last user to modify entry

character vector

Name of last user to modify entry, returned as a character vector. This property is read only.

Name — Name of entry

character vector

Name of entry, specified as a character vector. Changes you make to this property affect the represented data dictionary entry.

Data Types: `char`

Status — State of entry

'New' | 'Modified' | 'Unchanged' | 'Deleted'

State of entry, returned as 'New', 'Modified', 'Unchanged', or 'Deleted'. The state is valid since the last data dictionary save. If the state is 'Deleted', the represented entry was deleted from its data dictionary. This property is read only.

Methods

deleteEntry	Delete data dictionary entry
discardChanges	Discard changes to data dictionary entry
find	Search in array of data dictionary entries
getValue	Return value of data dictionary entry
setValue	Set value of data dictionary entry
showChanges	Display changes made to data dictionary entry

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples**Add Entry to Data Dictionary and Modify its Value**

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Add an entry `myEntry` with value 27 to the Design Data section of `myDictionary_ex_API.sldd`. Assign the returned `Simulink.data.dictionary.Entry` object to variable `e`.

```
e = addEntry(dDataSectObj, 'myEntry', 27)
```

```
e =
```

Entry with properties:

```
    Name: 'myEntry'
    Value: 27
    DataSource: 'myDictionary_ex_API.sldd'
    LastModified: '2014-Aug-26 18:42:08.439709'
    LastModifiedBy: 'jsmith'
    Status: 'New'
```

Change the value of `myEntry` from 27 to the character vector 'My New Value'.

```
setValue(e, 'My New Value')
e
```

```
e =
```

```
Entry with properties:
```

```

        Name: 'myEntry'
        Value: 'My New Value'
    DataSource: 'myDictionary_ex_API.sldd'
    LastModified: '2014-Aug-26 18:45:58.336598'
    LastModifiedBy: 'jsmith'
        Status: 'New'
```

Return Value of Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
fuelFlowObj = getEntry(dDataSectObj, 'fuelFlow');
```

Return the value of the entry `fuelFlow` and assign the value to the variable `fuelFlowValue`.

```
fuelFlowValue = getValue(fuelFlowObj)
```

```
fuelFlowValue =
```

```
237
```

Move Entry Within Data Dictionary Hierarchy

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`. `myDictionary_ex_API.sldd` references the data dictionary `myRefDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Create a `Simulink.data.dictionary.Entry` object representing the entry `fuelFlow`, which resides in `myDictionary_ex_API.sldd`. Assign the object to variable `e`.

```
e = getEntry(dDataSectObj, 'fuelFlow')
```

```
e =
```

```
Entry with properties:
```

```

        Name: 'fuelFlow'
        Value: 237
    DataSource: 'myDictionary_ex_API.sldd'
    LastModified: '2014-Sep-05 13:12:06.099278'
    LastModifiedBy: 'jsmith'
        Status: 'Unchanged'
```

Migrate the entry `fuelFlow` to the reference data dictionary `myRefDictionary_ex_API.sldd` by modifying the `DataSource` property of `e`.

```
e.DataSource = 'myRefDictionary_ex_API.sldd'
```

```
e =
```

```
Entry with properties:
```

```
    Name: 'fuelFlow'  
    Value: 237  
    DataSource: 'myRefDictionary_ex_API.sldd'  
    LastModified: '2014-Sep-05 13:12:06.099278'  
    LastModifiedBy: 'jsmith'  
    Status: 'Modified'
```

Because `myDictionary_ex_API.sldd` references `myRefDictionary_ex_API.sldd`, both dictionaries belong to the same dictionary hierarchy, allowing you to migrate the entry `fuelFlow` between them.

Introduced in R2015a

deleteEntry

Class: Simulink.data.dictionary.Entry

Package: Simulink.data.dictionary

Delete data dictionary entry

Syntax

```
deleteEntry(entryObj)
```

Description

`deleteEntry(entryObj)` deletes the data dictionary entry represented by `entryObj`, a `Simulink.data.dictionary.Entry` object. The represented entry no longer exists in the data dictionary that defined it.

The function sets the `Status` properties of any `Simulink.data.dictionary.Entry` objects representing the deleted entry to `'Deleted'`. You can access only the `Status` properties of the objects.

Input Arguments

entryObj — Target data dictionary entry

`Simulink.data.dictionary.Entry` object

Target data dictionary entry, specified as a `Simulink.data.dictionary.Entry` object. Before you use this function, represent the target entry with a `Simulink.data.dictionary.Entry` object by using, for example, the `getEntry` function.

Examples

Delete Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');  
fuelFlowObj = getEntry(dDataSectObj, 'fuelFlow');
```

Delete the entry `fuelFlow` from the data dictionary `myDictionary_ex_API.sldd`. `myDictionary_ex_API.sldd` no longer contains the `fuelFlow` entry.

```
deleteEntry(fuelFlowObj)
```

Alternatives

You can use the Model Explorer window to view the contents of a data dictionary and delete entries.

`Simulink.data.dictionary.Entry | addEntry`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

discardChanges

Class: Simulink.data.dictionary.Entry

Package: Simulink.data.dictionary

Discard changes to data dictionary entry

Syntax

```
discardChanges(entryObj)
```

Description

`discardChanges(entryObj)` discards all changes made to the data dictionary entry `entryObj`, a `Simulink.data.dictionary.Entry` object, since the last time the containing data dictionary was saved using the `saveChanges` function. The changes to the entry are permanently lost.

Input Arguments

entryObj — Target data dictionary entry

`Simulink.data.dictionary.Entry` object

Target data dictionary entry, specified as a `Simulink.data.dictionary.Entry` object. Before you use this function, represent the target entry with a `Simulink.data.dictionary.Entry` object by using, for example, the `getEntry` function.

Examples

Discard Changes to Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
fuelFlowObj = getEntry(dDataSectObj,'fuelFlow');
```

Change the entry `fuelFlow` by assigning it the new value 493. Confirm a change was made by viewing the `Status` property of `fuelFlowObj`.

```
setValue(fuelFlowObj,493);
fuelFlowObj
```

```
fuelFlowObj =
```

```
Entry with properties:
```

```
    Name: 'fuelFlow'
    Value: 493
 DataSource: 'myDictionary_ex_API.sldd'
LastModified: '2014-Sep-05 13:14:30.661978'
```

```
LastModifiedBy: 'jsmith'  
Status: 'Modified'
```

Discard all changes to the entry `fuelFlow`. The `Status` property of `fuelFlowObj` shows that changes were discarded.

```
discardChanges(fuelFlowObj)  
fuelFlowObj
```

```
fuelFlowObj =
```

```
Entry with properties:
```

```
Name: 'fuelFlow'  
Value: 237  
DataSource: 'myDictionary_ex_API.slidd'  
LastModified: '2014-Sep-05 13:12:06.099278'  
LastModifiedBy: 'jsmith'  
Status: 'Unchanged'
```

Tips

- You can use the `discardChanges` function or the `saveChanges` function with an entire data dictionary, discarding or saving changes to all entries in the dictionary at once. However, only the `discardChanges` function can additionally operate on individual entries. You cannot use the `saveChanges` function to save changes to individual entries.

Alternatives

You can use Model Explorer and the Comparison Tool to discard changes to data dictionary entries. See “View and Revert Changes to Dictionary Entries” for more information.

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

find

Class: Simulink.data.dictionary.Entry

Package: Simulink.data.dictionary

Search in array of data dictionary entries

Syntax

```
foundEntries = find(targetEntries,PName1,PValue1,...,PNameN,PValueN)
foundEntries = find(targetEntries,PName1,PValue1,...,PNameN,PValueN,options)
```

Description

`foundEntries = find(targetEntries,PName1,PValue1,...,PNameN,PValueN)` searches the array of data dictionary entries `targetEntries` using search criteria `PName1,PValue1,...,PNameN,PValueN`, and returns an array of entries matching the criteria. This syntax matches the search criteria with the properties of the target entries, which are `Simulink.data.dictionary.Entry` objects, but not with the properties of their values. See `Simulink.data.dictionary.Entry` for a list of data dictionary entry properties.

`foundEntries = find(targetEntries,PName1,PValue1,...,PNameN,PValueN,options)` searches for data dictionary entries using additional search options. For example, you can match the search criteria with the values of the target entries.

Input Arguments

targetEntries — Data dictionary entries to search

array of `Simulink.data.dictionary.Entry` objects

Data dictionary entries to search, specified as an array `Simulink.data.dictionary.Entry` objects. Before you use this function, represent the target entries with `Simulink.data.dictionary.Entry` objects by using, for example, the `getEntry` function.

Example: `[myEntryObj1,myEntryObj2,myEntryObj3]`

PName1,PValue1,...,PNameN,PValueN — Search criteria

name-value pairs representing properties

Search criteria, specified as one or more name-value pairs representing names and values of properties of the target data dictionary entries. For a list of the properties of a data dictionary entry, see `Simulink.data.dictionary.Entry`. If you specify more than one name-value pair, the returned entries meet all of the criteria.

If you include the `'-value'` option to search in the values of the target entries, the search criteria apply to the values of the entries rather than to the entries themselves.

Example: `'LastModifiedBy','jsmith'`

Example: `'DataSource','myRefDictionary_ex_API.sldd'`

options — Additional search options

supported option codes

Additional search options, specified as one or more of the following supported option codes.

'-value'	This option causes <code>find</code> to search only in the values of the target data dictionary entries. Specify this option before any other search criteria or <code>options</code> arguments.
'-and', '-or', '-xor', or '-not' logical operators	These options modify or combine multiple search criteria or other option codes.
'-property', <code>propertyName</code>	This name-value pair causes <code>find</code> to search for entries or values that have the property <code>propertyName</code> regardless of the value of the property. Specify <code>propertyName</code> as a character vector.
'-class', <code>className</code>	This name-value pair causes <code>find</code> to search for entries or values that are objects of the class <code>className</code> . Specify <code>className</code> as a character vector.
'-isa', <code>className</code>	This name-value pair causes <code>find</code> to search for entries or values that are objects of the class or of any subclass derived from the class <code>className</code> . Specify <code>className</code> as a character vector.
'-regexp'	This option allows you to use regular expressions in your search criteria. This option affects only search criteria that follow '-regexp'.

Example: '-value'

Example: '-value', '-property', 'CoderInfo'

Example: '-value', '-class', 'Simulink.Parameter'

Output Arguments**foundEntries — Data dictionary entries matching search criteria**array of `Simulink.data.dictionary.Entry` objects

Data dictionary entries matching the specified search criteria, returned as an array of `Simulink.data.dictionary.Entry` objects.

Examples**Search Data Dictionary Entry Values for Specific Class**

Search in an array of data dictionary entries `myEntryObjs` for entries whose values are objects of the class `Simulink.Parameter`.

```
foundEntries = find(myEntryObjs, '-value', '-class', 'Simulink.Parameter')
```

Search Data Dictionary Entries for Modifying User

Search in an array of data dictionary entries `myEntryObjs` for entries that were last modified by the user `jsmith`.

```
foundEntries = find(myEntryObjs, 'LastModifiedBy', 'jsmith')
```

Search Data Dictionary Entries Using Multiple Criteria

Search in an array of data dictionary entries `myEntryObjs` for entries that were last modified by the user `jsmith` or whose names begin with `fuel`.

```
foundEntries = find(myEntryObjs, 'LastModifiedBy', 'jsmith', '-or', ...
'-regexp', 'Name', 'fuel*')
```

Search Data Dictionary Entries Using Regular Expressions

Search in an array of data dictionary entries `myEntryObjs` for entries whose names begin with `Press`.

```
foundEntries = find(myEntryObjs, '-regexp', 'Name', 'Press*')
```

Search Data Dictionary Entries for Specific Value

Search in an array of data dictionary entries `myEntryObjs` for entries whose values are 273. If you find more than one entry, store the entries in an array called `foundEntries`.

```
foundEntries = [];
for i = 1:length(myEntryObjs)
    if getValue(myEntryObjs(i)) == 273
        foundEntries = [foundEntries myEntryObjs(i)];
    end
end
```

Search Data Dictionary Entry Values for Specific Property

Search in an array of data dictionary entries `myEntryObjs` for entries whose values have a property `DataType`.

```
foundEntries = find(myEntryObjs, '-value', '-property', 'DataType')
```

“Store Data in Dictionary Programmatically”

Introduced in R2015a

getValue

Class: Simulink.data.dictionary.Entry

Package: Simulink.data.dictionary

Return value of data dictionary entry

Syntax

```
entryValue = getValue(entryObj)
```

Description

`entryValue = getValue(entryObj)` returns the value of the data dictionary entry `entryObj`, a `Simulink.data.dictionary.Entry` object.

To programmatically access variables for the purpose of sweeping block parameter values, consider using `Simulink.SimulationInput` objects instead of modifying the variables through the programmatic interface of the data dictionary. See “Optimize, Estimate, and Sweep Block Parameter Values”.

Input Arguments

entryObj — Target data dictionary entry

`Simulink.data.dictionary.Entry` object

Target data dictionary entry, specified as a `Simulink.data.dictionary.Entry` object. Before you use this function, represent the target entry with a `Simulink.data.dictionary.Entry` object by using, for example, the `getEntry` function.

Examples

Return Value of Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');  
fuelFlowObj = getEntry(dDataSectObj, 'fuelFlow');
```

Return the value of the entry `fuelFlow` and assign the value to variable `fuelFlowValue`.

```
fuelFlowValue = getValue(fuelFlowObj)
```

fuelFlowValue =

237

Simulink.data.dictionary.Entry | setValue

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

setValue

Class: Simulink.data.dictionary.Entry

Package: Simulink.data.dictionary

Set value of data dictionary entry

Syntax

```
setValue(entryObj, newValue)
```

Description

`setValue(entryObj, newValue)` assigns the value `newValue` to the data dictionary entry `entryObj`, a `Simulink.data.dictionary.Entry` object.

To programmatically access variables for the purpose of sweeping block parameter values, consider using `Simulink.SimulationInput` objects instead of modifying the variables through the programmatic interface of the data dictionary. See “Optimize, Estimate, and Sweep Block Parameter Values”.

Input Arguments

entryObj — Target data dictionary entry

`Simulink.data.dictionary.Entry` object

Target data dictionary entry, specified as a `Simulink.data.dictionary.Entry` object. Before you use this function, represent the target entry with a `Simulink.data.dictionary.Entry` object by using, for example, the `getEntry` function.

newValue — Value to assign to data dictionary entry

MATLAB expression

Value to assign to data dictionary entry, specified as a MATLAB expression. The expression must return a value that is supported by the data dictionary section that contains the entry.

Example: 27.5

Example: `myBaseWorkspaceVariable`

Example: `Simulink.Parameter`

Examples

Set Value of Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.slidd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');  
fuelFlowObj = getEntry(dDataSectObj, 'fuelFlow');
```

Set the value of the entry fuelFlow to 493. Then, view the Value property of fuelFlowObj to observe the change.

```
setValue(fuelFlowObj, 493)  
fuelFlowObj
```

```
fuelFlowObj =
```

```
Entry with properties:
```

```
    Name: 'fuelFlow'  
    Value: 493  
    DataSource: 'myDictionary_ex_API.slidd'  
    LastModified: '2014-Sep-05 13:37:22.161124'  
    LastModifiedBy: 'jsmith'  
    Status: 'Modified'
```

Alternatives

You can use the Model Explorer window to view and change the values of data dictionary entries.

“Store Data in Dictionary Programmatically”

Introduced in R2015a

showChanges

Class: Simulink.data.dictionary.Entry

Package: Simulink.data.dictionary

Display changes made to data dictionary entry

Syntax

```
showChanges(entryObj)
```

Description

`showChanges(entryObj)` opens the Comparison Tool to show changes made to the data dictionary entry `entryObj`, a `Simulink.data.dictionary.Entry` object. The Comparison Tool displays the properties of `entryObj` as they were when the data dictionary was last saved and as they were when the `showChanges` function was called.

Input Arguments

entryObj — Target data dictionary entry

`Simulink.data.dictionary.Entry` object

Target data dictionary entry, specified as a `Simulink.data.dictionary.Entry` object. Before you use this function, represent the target entry with a `Simulink.data.dictionary.Entry` object by using, for example, the `getEntry` function.

Examples

View Unsaved Changes to Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');  
fuelFlowObj = getEntry(dDataSectObj, 'fuelFlow');
```

Make a change to the entry `fuelFlow` by assigning it the new value 494.

```
setValue(fuelFlowObj, 494);
```

Observe the unsaved change to the entry `fuelFlow`. The Comparison Tool opens and compares side by side the current state of the entry with its most recently saved state.

```
showChanges(fuelFlowObj)
```

Alternatives

You can use Model Explorer and the Comparison Tool to view changes to data dictionary entries. See “View and Revert Changes to Dictionary Entries” for more information.

“Store Data in Dictionary Programmatically”

Introduced in R2015a

Simulink.data.dictionary.EnumTypeDefinition class

Package: Simulink.data.dictionary

Store enumerated type definition in data dictionary

Description

An object of the `Simulink.data.dictionary.EnumTypeDefinition` class defines an enumerated data type in a data dictionary. You store the object in a data dictionary entry so models linked to the dictionary can use the enumerated type definition.

In the MATLAB base workspace, objects of this class retain information about an enumerated type but do not define the type for use by other variables or by models.

Construction

When you use the function `importEnumTypes` to import the definitions of enumerated types to a data dictionary, Simulink creates a `Simulink.data.dictionary.EnumTypeDefinition` object in the dictionary for each imported definition. The dictionary stores each object in an individual entry.

The constructor `Simulink.data.dictionary.EnumTypeDefinition` creates an instance of this class with default property values and a single enumeration member that has underlying integer value 0.

Properties

AddClassNameToEnumNames — Flag to control enumeration identifiers in generated code

false (default) | true

Flag to prefix enumerations with the class name in generated code, specified as true or false.

If you specify true, when you generate code the identifier of each enumeration member begins with the name of the enumeration class. For example, an enumeration class `LEDcolor` with enumeration members `GREEN` and `RED` defines the enumeration members in generated code as `LEDcolor_GREEN` and `LEDcolor_RED`.

Data Types: logical

DataScope — Flag to control data type definition in generated code

'Auto' (default) | 'Imported' | 'Exported'

Flag to control data type definition in generated code, specified as 'Auto', 'Imported', or 'Exported'. The table describes the behavior of generated code for each value.

Value	Action
Auto (default)	<p>If you do not specify the property <code>Headerfile</code>, export the data type definition to <code>model_types.h</code>, where <i>model</i> is the model name.</p> <p>If you specify <code>Headerfile</code>, import the data type definition from the specified header file.</p>
Exported	<p>Export the data type definition to a separate header file.</p> <p>If you do not specify the property <code>Headerfile</code>, the header file name defaults to <code>type.h</code>, where <i>type</i> is the data type name.</p>
Imported	<p>Import the data type definition from a separate header file.</p> <p>If you do not specify the property <code>Headerfile</code>, the header file name defaults to <code>type.h</code>, where <i>type</i> is the data type name.</p>

DefaultValue — Default enumeration member

' ' (default) | character vector

Default enumeration member, specified as a character vector. Specify `DefaultValue` as the name of an enumeration member you have already defined.

When you create a `Simulink.data.dictionary.EnumTypeDefinition` object, `DefaultValue` is an empty character vector, ' ', and Simulink uses the first enumeration member as the default member.

Example: 'enumMember1'

Description — Description of enumerated data type in generated code

' ' (default) | character vector

Description of the enumerated data type, specified as a character vector. Use this property to explain the purpose of the type in generated code.

Example: 'Two possible colors of LED indicator: GREEN and RED.'

Data Types: char

HeaderFile — Name of header file defining enumerated data type in generated code

' ' (default) | character vector

Name of the header file that defines the enumerated data type in generated code, specified as a character vector. Use a `.h` extension to specify the file name.

If you do not specify `HeaderFile`, generated code uses a default header file name that depends on the value of the `DataScope` property.

Example: 'myTypeIncludeFile.h'

Data Types: char

StorageType — Data type of underlying integer values

' ' (default) | character vector

Data type of the integer values underlying the enumeration members, specified as a character vector. Generated code stores the underlying integer values using the data type you specify.

You can specify one of these supported integer types:

- 'int8'
- 'int16'
- 'int32'
- 'uint8'
- 'uint16'

To store the underlying integer values in generated code using the native integer type of the target hardware, specify `StorageType` as an empty character vector, ' ', which is the default value.

Example: 'int16'

' '

Methods

`appendEnumeral` Add enumeration member to enumerated data type definition in data dictionary

`removeEnumeral` Remove enumeration member from enumerated data type definition in data dictionary

Copy Semantics

Handle. To learn how handle classes affect copy operations, see [Copying Objects \(MATLAB\)](#).

Examples**Programmatically Create Enumerated Type Definition in Data Dictionary**

Create an object that can store the definition of an enumerated type. By default, the new type defines a single enumeration member `enum1` with underlying integer value 0.

```
myColors = Simulink.data.dictionary.EnumTypeDefinition
```

```
myColors =
```

```
    Simulink.data.dictionary.EnumTypeDefinition
        enum1
```

Add some enumeration members to the definition of the type.

```
appendEnumeral(myColors, 'Orange', 1, ' ')
appendEnumeral(myColors, 'Black', 2, ' ')
appendEnumeral(myColors, 'Cyan', 3, ' ')
myColors
```

```
myColors =
    Simulink.data.dictionary.EnumTypeDefinition
        enum1
        Orange
        Black
        Cyan
```

Remove the default enumeration member `enum1`. Since `enum1` is the first enumeration member in the list, identify it with index 1.

```
removeEnumeral(myColors,1)
myColors
```

```
myColors =
    Simulink.data.dictionary.EnumTypeDefinition
        Orange
        Black
        Cyan
```

Customize the enumerated type by configuring the properties of the object representing it.

```
myColors.Description = 'These are my favorite colors.';
myColors.DefaultValue = 'Cyan';
myColors.HeaderFile = 'colorsType.h';
```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import the object that defines the enumerated type `myColors` to the dictionary.

```
importFromBaseWorkspace(myDictionaryObj, 'varList', {'myColors'});
```

Alternatives

You can use Model Explorer to add and modify enumerated data types stored in a data dictionary.

See Also

`Simulink.data.Dictionary`

Topics

“Store Data in Dictionary Programmatically”

“Use Enumerated Data in Simulink Models”

Introduced in R2015a

appendEnumeral

Class: Simulink.data.dictionary.EnumTypeDefinition

Package: Simulink.data.dictionary

Add enumeration member to enumerated data type definition in data dictionary

Syntax

```
appendEnumeral(typeObj,memberName,memberValue,memberDesc)
```

Description

`appendEnumeral(typeObj,memberName,memberValue,memberDesc)` adds an enumeration member to the enumerated type definition stored by `typeObj`, a `Simulink.data.dictionary.EnumTypeDefinition` object.

Input Arguments

typeObj — Target enumerated type definition

`Simulink.data.dictionary.EnumTypeDefinition` object

Target enumerated type definition, specified as a `Simulink.data.dictionary.EnumTypeDefinition` object.

memberName — Name of new enumeration member

character vector

Name of the new enumeration member, specified as a character vector.

Example: 'myNewEnumMember'

Data Types: char

memberValue — Integer value underlying new enumeration member

integer

Integer value underlying the new enumeration member, specified as an integer.

The definition of the enumeration class determines the integer data type used in generated code to store the underlying values of enumeration members.

Example: 3

Data Types: single | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | double

memberDesc — Description of new enumeration member

character vector

Description of the new enumeration member, specified as a character vector.

If you do not want to supply a description for the enumeration member, use an empty character vector.

Example: 'Enumeration member number 1.'

Example: ''

Data Types: char

Examples

Programmatically Create Enumerated Type Definition in Data Dictionary

Create an object that can store the definition of an enumerated type. By default, the new type defines a single enumeration member `enum1` with underlying integer value 0.

```
myColors = Simulink.data.dictionary.EnumTypeDefinition
```

```
myColors =
```

```
    Simulink.data.dictionary.EnumTypeDefinition
        enum1
```

Add some enumeration members to the definition of the type.

```
appendEnumeral(myColors, 'Orange', 1, '')
```

```
appendEnumeral(myColors, 'Black', 2, '')
```

```
appendEnumeral(myColors, 'Cyan', 3, '')
```

```
myColors
```

```
myColors =
```

```
    Simulink.data.dictionary.EnumTypeDefinition
        enum1
        Orange
        Black
        Cyan
```

Remove the default enumeration member `enum1`. Since `enum1` is the first enumeration member in the list, identify it with index 1.

```
removeEnumeral(myColors, 1)
```

```
myColors
```

```
myColors =
```

```
    Simulink.data.dictionary.EnumTypeDefinition
        Orange
        Black
        Cyan
```

Customize the enumerated type by configuring the properties of the object representing it.

```
myColors.Description = 'These are my favorite colors.';
```

```
myColors.DefaultValue = 'Cyan';
```

```
myColors.HeaderFile = 'colorsType.h';
```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import the object that defines the enumerated type `myColors` to the dictionary.

```
importFromBaseWorkspace(myDictionaryObj, 'varList', {'myColors'});
```

Alternatives

You can use Model Explorer to add enumeration members to the enumerated data type represented by a `Simulink.data.dictionary.EnumTypeDefinition` object.

See Also

`Simulink.data.dictionary.EnumTypeDefinition` | `removeEnumeral`

Topics

“Store Data in Dictionary Programmatically”

“Use Enumerated Data in Simulink Models”

Introduced in R2015a

removeEnumeral

Class: Simulink.data.dictionary.EnumTypeDefinition

Package: Simulink.data.dictionary

Remove enumeration member from enumerated data type definition in data dictionary

Syntax

```
removeEnumeral(typeObj,memberNum)
```

Description

`removeEnumeral(typeObj,memberNum)` removes an enumeration member from the enumerated type definition stored by `typeObj`, a `Simulink.data.dictionary.EnumTypeDefinition` object.

Input Arguments

typeObj — Target enumerated type definition

`Simulink.data.dictionary.EnumTypeDefinition` object

Target enumerated type definition, specified as a `Simulink.data.dictionary.EnumTypeDefinition` object.

memberNum — Index of target enumeration member

integer

Index of target enumeration member, specified as an integer.

The first enumeration member in an enumerated type definition has index 1. For example, suppose an enumerated type `BasicColors` has this definition:

```
myColors =  
    Simulink.data.dictionary.EnumTypeDefinition  
        Orange  
        Black  
        Cyan
```

To remove the enumeration member `Black`, specify `memberNum` as 2. To remove the enumeration member `Cyan`, specify 3.

Do not specify `memberNum` using the integer value underlying an enumeration member. The integer value underlying the member is not equivalent to the index of the member.

Example: 3

Data Types: `single` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `double`

Examples

Programmatically Create Enumerated Type Definition in Data Dictionary

Create an object that can store the definition of an enumerated type. By default, the new type defines a single enumeration member `enum1` with underlying integer value 0.

```
myColors = Simulink.data.dictionary.EnumTypeDefinition
myColors =
    Simulink.data.dictionary.EnumTypeDefinition
        enum1
```

Add some enumeration members to the definition of the type.

```
appendEnumeral(myColors, 'Orange', 1, '')
appendEnumeral(myColors, 'Black', 2, '')
appendEnumeral(myColors, 'Cyan', 3, '')
myColors
myColors =
    Simulink.data.dictionary.EnumTypeDefinition
        enum1
        Orange
        Black
        Cyan
```

Remove the default enumeration member `enum1`. Since `enum1` is the first enumeration member in the list, identify it with index 1.

```
removeEnumeral(myColors, 1)
myColors
myColors =
    Simulink.data.dictionary.EnumTypeDefinition
        Orange
        Black
        Cyan
```

Customize the enumerated type by configuring the properties of the object representing it.

```
myColors.Description = 'These are my favorite colors.';
myColors.DefaultValue = 'Cyan';
myColors.HeaderFile = 'colorsType.h';
```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import the object that defines the enumerated type `myColors` to the dictionary.

```
importFromBaseWorkspace(myDictionaryObj, 'varList', {'myColors'});
```

Alternatives

You can use Model Explorer to remove enumeration members from the enumerated data type represented by a `Simulink.data.dictionary.EnumTypeDefinition` object.

`Simulink.data.dictionary.EnumTypeDefinition | appendEnumeral`

Topics

“Store Data in Dictionary Programmatically”

“Use Enumerated Data in Simulink Models”

Introduced in R2015a

Simulink.data.dictionary.Section class

Package: Simulink.data.dictionary

Configure data dictionary section

Description

An object of the `Simulink.data.dictionary.Section` class represents one section of a data dictionary, such as Design Data or Configurations. The object allows you to perform operations on the section such as add or delete entries and import data from files.

Before you can create a `Simulink.data.dictionary.Section` object, you must create a `Simulink.data.Dictionary` object representing the target data dictionary. Once created, the `Simulink.data.dictionary.Section` object exists independently of the `Simulink.data.Dictionary` object.

You cannot use the data dictionary programmatic interface (see “Store Data in Dictionary Programmatically”) to access the **Embedded Coder** section of a data dictionary. Instead, see Embedded Coder Dictionary.

Construction

The function `getSection` creates a `Simulink.data.dictionary.Section` object.

Properties

Name — Name of data dictionary section

character vector

Name of data dictionary section, returned as a character vector. This property is read only.

Methods

<code>addEntry</code>	Add new entry to data dictionary section
<code>assignin</code>	Assign value to data dictionary entry
<code>deleteEntry</code>	Delete data dictionary entry
<code>evalin</code>	Evaluate MATLAB expression in data dictionary section
<code>exist</code>	Check existence of data dictionary entry
<code>exportToFile</code>	Export data dictionary entries from section to MAT-file or MATLAB file
<code>find</code>	Search in data dictionary section
<code>getEntry</code>	Create <code>Simulink.data.dictionary.Entry</code> object to represent data dictionary entry
<code>importFromFile</code>	Import variables from MAT-file or MATLAB file to data dictionary section

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Create New Data Dictionary Section Object

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
dDataSectObj = getSection(myDictionaryObj, 'Design Data')
```

```
dDataSectObj =
```

```
    Section with properties:
```

```
        Name: 'Design Data'
```

Topics

“Store Data in Dictionary Programmatically”

“What Is a Data Dictionary?”

Introduced in R2015a

addEntry

Class: Simulink.data.dictionary.Section

Package: Simulink.data.dictionary

Add new entry to data dictionary section

Syntax

```
addEntry(sectionObj,entryName,entryValue)
entryObj = addEntry(sectionObj,entryName,entryValue)
```

Description

`addEntry(sectionObj,entryName,entryValue)` adds an entry, with name `entryName` and value `entryValue`, to the data dictionary section `sectionObj`, a `Simulink.data.dictionary.Section` object.

`entryObj = addEntry(sectionObj,entryName,entryValue)` returns a `Simulink.data.dictionary.Entry` object representing the newly added data dictionary entry.

Input Arguments

sectionObj — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

entryName — Name of new data dictionary entry

character vector

Name of new data dictionary entry, specified as a character vector.

Example: 'myNewEntry'

Data Types: char

entryValue — Value of new data dictionary entry

MATLAB expression

Value of new data dictionary entry, specified as a MATLAB expression that returns any valid data dictionary content.

Example: 27.5

Example: myBaseWorkspaceVariable

Example: Simulink.Parameter

Examples

Add Entry to Design Data Section of Data Dictionary

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Add an entry to the Design Data section of `myDictionary_ex_API.sldd` an entry `myNewEntry` with value 237.

```
addEntry(dDataSectObj, 'myNewEntry', 237)
```

Add New Simulink.Parameter Object to Data Dictionary

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Add an entry to the Design Data section of `myDictionary_ex_API.sldd`. Name the new entry `myNewParam` and assign a `Simulink.Parameter` object to the value.

```
addEntry(dDataSectObj, 'myNewParam', Simulink.Parameter)
```

The expression `Simulink.Parameter` constructs a new `Simulink.Parameter` object, and the `addEntry` function assigns the object to the value of the new data dictionary entry `myNewParam`.

Tips

- `addEntry` returns an error if the entry name you specify with `entryName` is already the name of an entry in the target data dictionary section or in the same section of any referenced dictionaries.

Alternatives

You can use Model Explorer to add entries to a data dictionary in the same way you can use it to add variables to a model workspace or the base workspace.

`Simulink.data.dictionary.Entry` | `Simulink.data.dictionary.Section` | `assignin`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

assignin

Class: Simulink.data.dictionary.Section

Package: Simulink.data.dictionary

Assign value to data dictionary entry

Syntax

```
assignin(sectionObj,entryName,entryValue)
```

Description

`assignin(sectionObj,entryName,entryValue)` assigns the value `entryValue` to the data dictionary entry `entryName` in the data dictionary section `sectionObj`, a `Simulink.data.dictionary.Section` object. If an entry with the specified name is not in the target section, `assignin` creates the entry with the specified name and value.

If an entry with the name specified by input argument `entryName` is not defined in the target data dictionary section but is defined in a referenced dictionary, `assignin` does not create a new entry in the target section but operates on the entry in the referenced dictionary.

To programmatically access variables for the purpose of sweeping block parameter values, consider using `Simulink.SimulationInput` objects instead of modifying the variables through the programmatic interface of the data dictionary. See “Optimize, Estimate, and Sweep Block Parameter Values”.

Input Arguments

sectionObj — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

entryName — Name of target data dictionary entry

character vector

Name of target data dictionary entry, specified as a character vector. If a matching entry does not already exist, the functions creates a new entry using the specified name.

Example: 'myEntry'

Data Types: char

entryValue — Value to assign to data dictionary entry

MATLAB expression

Value to assign to data dictionary entry, specified as a MATLAB expression that returns any valid data dictionary content.

Example: 27.5

Example: myBaseWorkspaceVariable

Example: Simulink.Parameter

Examples

Assign Value to Data Dictionary Entry

Assign a value to a data dictionary entry by operating on a `Simulink.data.dictionary.Section` object.

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Assign the value 237 to an entry `myAssignedEntry` in the data dictionary `myDictionary_ex_API.sldd`. If an entry named `myAssignedEntry` is not in `myDictionary_ex_API.sldd`, create it.

```
assignin(dDataSectObj, 'myAssignedEntry', 237)
```

Alternatives

You can use the Model Explorer window to view and change the values of data dictionary entries.

See Also

`Simulink.data.dictionary.Section | setValue`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

deleteEntry

Class: Simulink.data.dictionary.Section

Package: Simulink.data.dictionary

Delete data dictionary entry

Syntax

```
deleteEntry(sectionObj,entryName)
deleteEntry(sectionObj,entryName,'DataSource',dictionaryName)
```

Description

`deleteEntry(sectionObj,entryName)` deletes a data dictionary entry `entryName` from the data dictionary section `sectionObj`, a `Simulink.data.dictionary.Section` object. If there are multiple entries with the specified name in a hierarchy of reference dictionaries, the function deletes all the entries. If you represent a data dictionary entry with one or more `Simulink.data.dictionary.Entry` objects and later delete the entry using the `deleteEntry` function, the objects remain with their `Status` property set to 'Deleted'.

`deleteEntry(sectionObj,entryName,'DataSource',dictionaryName)` deletes an entry that is defined in the data dictionary `DictionaryName`. Use this syntax to uniquely identify an entry that is defined more than once in a hierarchy of referenced data dictionaries.

Input Arguments

sectionObj — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

entryName — Name of target data dictionary entry

character vector

Name of target data dictionary entry, specified as a character vector.

Example: 'myEntry'

Data Types: char

dictionaryName — Name of data dictionary that defines target entry

character vector

File name of data dictionary that defines the target entry, specified as a character vector including the `.sldd` extension.

Example: 'mySubDictionary_ex_API.sldd'

Data Types: char

Examples

Delete Entry from Data Dictionary Section

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`. The Design Data section of `myDictionary_ex_API.sldd` already contains an entry named `fuelFlow`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Delete the entry `fuelFlow` from the data dictionary `myDictionary_ex_API.sldd`. `myDictionary_ex_API.sldd` no longer contains the `fuelFlow` entry.

```
deleteEntry(dDataSectObj, 'fuelFlow')
```

Delete Entry from Reference Data Dictionary

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Delete the entry `myRefEntry` from the data dictionary `myRefDictionary_ex_API.sldd`. `myDictionary_ex_API.sldd` references `myRefDictionary_ex_API.sldd`, and `myRefDictionary_ex_API.sldd` defines an entry `myRefEntry`.

```
deleteEntry(dDataSectObj, 'myRefEntry', 'DataSource', ...  
            'myRefDictionary_ex_API.sldd')
```

Alternatives

You can use the Model Explorer window to delete entries from a data dictionary in the same way you can delete variables from a model workspace or the base workspace.

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

evalin

Class: Simulink.data.dictionary.Section

Package: Simulink.data.dictionary

Evaluate MATLAB expression in data dictionary section

Syntax

```
returnValue = evalin(sectionObj,expression)
```

Description

`returnValue = evalin(sectionObj,expression)` evaluates a MATLAB expression in the data dictionary section `sectionObj` and returns the values returned by `expression`.

To programmatically access variables for the purpose of sweeping block parameter values, consider using `Simulink.SimulationInput` objects instead of modifying the variables through the programmatic interface of the data dictionary. See “Optimize, Estimate, and Sweep Block Parameter Values”.

Input Arguments

sectionObj — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

expression — MATLAB expression to evaluate

character vector

MATLAB expression to evaluate, specified as a character vector.

Example: 'a = 5.3'

Example: 'whos'

Example: 'CurrentSpeed.Value = 290.73'

Data Types: char

Examples

List All Entries in Data Dictionary Section

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Execute the `whos` command in the Design Data section of `myDictionary_ex_API.sldd`.

```
evalin(dDataSectObj, 'whos')
```

Name	Size	Bytes	Class	Attributes
fuelFlow	1x1	8	double	
myRefEntry	1x1	1	logical	
parameterGain37	1x1	112	Simulink.Parameter	

Tips

- `evalin` allows you to treat a data dictionary section as a MATLAB workspace. You can think of entries contained in the section as workspace variables you can manipulate with MATLAB expressions.

`Simulink.data.dictionary.Section` | `Simulink.data.evalinGlobal`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

exist

Class: Simulink.data.dictionary.Section

Package: Simulink.data.dictionary

Check existence of data dictionary entry

Syntax

```
doesExist = exist(sectionObj,entryName)
```

Description

`doesExist = exist(sectionObj,entryName)` determines if the data dictionary section `sectionObj` contains an entry by the name of `entryName` and returns an indication.

Input Arguments

sectionObj — Target data dictionary section

Simulink.data.dictionary.Section object

Target data dictionary section, specified as a Simulink.data.dictionary.Section object. Before you use this function, represent the target section with a Simulink.data.dictionary.Section object by using, for example, the `getSection` function.

entryName — Name of target entry

character vector

Name of target entry, specified as a character vector.

Example: 'myEntry'

Data Types: char

Output Arguments

doesExist — Indication of entry existence

0 | 1

Indication of entry existence, returned as 0 if false and 1 if true.

Examples

Determine if Data Dictionary Entry Exists

Determine if an entry exists in a data dictionary by searching for the name of the entry

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a Simulink.data.dictionary.Section object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Determine if an entry `fuelFlow` exists in the Design Data section of `myDictionary_ex_API.sldd`.

```
exist(dDataSectObj, 'fuelFlow')
```

```
ans =
```

```
1
```

Determine if an entry `myEntry` exists in the Design Data section of `myDictionary_ex_API.sldd`.

```
exist(dDataSectObj, 'myEntry')
```

```
ans =
```

```
0
```

Tips

- `exist` also determines if a matching entry exists in the same section of any referenced data dictionaries. For example, if `sectionObj` represents the Design Data section of a data dictionary `myDictionary_ex_API.sldd`, `exist` searches the Design Data section of `myDictionary_ex_API.sldd` and the Design Data sections of any dictionaries referenced by `myDictionary_ex_API.sldd`.

Alternatives

You can use Model Explorer to search a data dictionary for an entry.

See Also

`Simulink.data.dictionary.Section` | `Simulink.data.existsInGlobal` | `find`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

exportToFile

Class: Simulink.data.dictionary.Section

Package: Simulink.data.dictionary

Export data dictionary entries from section to MAT-file or MATLAB file

Syntax

```
exportToFile(sectionObj, fileName)
```

Description

`exportToFile(sectionObj, fileName)` exports to a MAT or MATLAB file all the values of the entries contained in the data dictionary section `sectionObj`, a `Simulink.data.dictionary.Section` object. `exportToFile` exports the values of all entries, including those defined in referenced dictionaries.

Input Arguments

sectionObj — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

fileName — Name of MAT or MATLAB file

character vector

Name of target MAT or MATLAB file, specified as a character vector. `exportToFile` supplies a file extension `.mat` if you do not specify an extension.

Example: `'myNewFile.mat'`

Example: `'myNewFile.m'`

Data Types: `char`

Examples

Export Data Dictionary Entries to MAT or MATLAB Files

Represent the Design Data section of the data dictionary `myDictionary_ex_API.slidd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`. Represent the Configurations section of `myDictionary_ex_API.slidd` with an object named `configSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.slidd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');  
configSectObj = getSection(myDictionaryObj, 'Configurations');
```

Export the entries from the Design Data section of `myDictionary_ex_API.sldd` to a MATLAB file in your current working folder.

```
exportToFile(dDataSectObj, 'myDictionaryDesignData.m')
```

Export the entries from the Configurations section of `myDictionary_ex_API.sldd` to a MAT-file in your current working folder.

```
exportToFile(configSectObj, 'myDictionaryConfigurations.mat')
```

```
Exported 1 entries from scope 'Configurations'  
to MAT-file myDictionaryConfigurations.mat.
```

Limitation

The `exportToFile` method does not export enumerated data types (which are stored as `Simulink.data.dictionary.EnumTypeDefinition` objects). To transfer or copy an enumerated type from one dictionary to another, use the `getEntry` and `addEntry` methods of `Simulink.data.dictionary.Section` objects.

Alternatives

You can use Model Explorer to export data dictionary entries to a file. See “Export Design Data from Dictionary” for more information.

`Simulink.data.dictionary.Section | importFromFile`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

find

Class: Simulink.data.dictionary.Section

Package: Simulink.data.dictionary

Search in data dictionary section

Syntax

```
foundEntries = find(sectionObj,PName1,PValue1,...,PNameN,PValueN)
foundEntries = find(sectionObj,PName1,PValue1,...,PNameN,PValueN,options)
```

Description

`foundEntries = find(sectionObj,PName1,PValue1,...,PNameN,PValueN)` searches the data dictionary section `sectionObj` using search criteria `PName1,PValue1,...,PNameN,PValueN`, and returns an array of matching entries that were found in the target section. This syntax matches the search criteria with the properties of the entries in the target section but not with the properties of their values. See `Simulink.data.dictionary.Entry` for a list of data dictionary entry properties.

`foundEntries = find(sectionObj,PName1,PValue1,...,PNameN,PValueN,options)` searches for data dictionary entries using additional search options. For example, you can match the search criteria with the values of the entries in the target section.

Input Arguments

sectionObj — Data dictionary section to search

`Simulink.data.dictionary.Section` object

Data dictionary section to search, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

PName1,PValue1,...,PNameN,PValueN — Search criteria

name-value pairs representing properties

Search criteria, specified as one or more name-value pairs representing names and values of properties of the entries in the target data dictionary section. For a list of the properties of a data dictionary entry, see `Simulink.data.dictionary.Entry`. If you specify more than one name-value pair, the returned entries meet all of the criteria.

If you include the `'-value'` option to search in the values of the entries, the search criteria apply to the values of the entries rather than to the entries themselves.

Example: `'LastModifiedBy','jsmith'`

Example: `'DataSource','myRefDictionary_ex_API.sldd'`

options — Additional search options

supported option codes

Additional search options, specified as one or more of the following supported option codes.

'-value'	This option causes <code>find</code> to search only in the values of the entries in the target data dictionary section. Specify this option before any other search criteria or options arguments.
'-and', '-or', '-xor', '-not' logical operators	These options modify or combine multiple search criteria or other option codes.
'-property', propertyName	This name-value pair causes <code>find</code> to search for entries or values that have the property <code>propertyName</code> regardless of the value of the property. Specify <code>propertyName</code> as a character vector.
'-class', className	This name-value pair causes <code>find</code> to search for entries or values that are objects of the class <code>className</code> . Specify <code>className</code> as a character vector.
'-isa', className	This name-value pair causes <code>find</code> to search for entries or values that are objects of the class or of any subclass derived from the class <code>className</code> . Specify <code>className</code> as a character vector.
'-regexp'	This option allows you to use regular expressions in your search criteria. This option affects only search criteria that follow '-regexp'.

Example: '-value'

Example: '-value', '-property', 'CoderInfo'

Example: '-value', '-class', 'Simulink.Parameter'

Output Arguments

foundEntries — Data dictionary entries matching search criteria

array of `Simulink.data.dictionary.Entry` objects

Data dictionary entries matching the specified search criteria, returned as an array of `Simulink.data.dictionary.Entry` objects.

Examples

Return Array of All Entries in Data Dictionary Section

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Return all of the entries stored in the Design Data section of the data dictionary `myDictionary_ex_API.sldd`.

```
allEntries = find(dDataSectObj)
```

Search Data Dictionary Section for Specific Class

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Search in the Design Data section of `myDictionary_ex_API.sldd` for entries whose values are objects of the `Simulink.Parameter` class.

```
foundEntries = find(dDataSectObj, '-value', '-class', 'Simulink.Parameter')
```

Search Data Dictionary Section for Modifying User

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Search in the Design Data section of `myDictionary_ex_API.sldd` for entries that were last modified by the user `jsmith`.

```
foundEntries = find(dDataSectObj, 'LastModifiedBy', 'jsmith')
```

Search Data Dictionary Section Using Multiple Criteria

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Search in the Design Data section of `myDictionary_ex_API.sldd` for entries that were last modified by the user `jsmith` or whose names begin with `fuel`.

```
foundEntries = find(dDataSectObj, 'LastModifiedBy', 'jsmith', '-or', ...  
    '-regexp', 'Name', 'fuel*')
```

Search Data Dictionary Section Using Regular Expressions

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Search in the Design Data section of `myDictionary_ex_API.sldd` for entries whose names begin with `fuel`.

```
foundEntries = find(dDataSectObj, '-regexp', 'Name', 'fuel*')
```

Search Data Dictionary Section for Specific Value

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Return all of the entries stored in the Design Data section of the data dictionary `myDictionary_ex_API.sldd`.

```
allEntries = find(dDataSectObj);
```

Find the entries with value 237. If you find more than one entry, store the entries in an array called `foundEntries`.

```
foundEntries = [];
for i = 1:length(allEntries)
    if getValue(allEntries(i)) == 237
        foundEntries = [foundEntries allEntries(i)];
    end
end
```

Search Data Dictionary Section for Specific Property

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Search in the Design Data section of `myDictionary_ex_API.sldd` for entries whose values have a property `DataType`.

```
foundEntries = find(dDataSectObj, '-value', '-property', 'DataType')
```

Alternatives

You can use Model Explorer to search a data dictionary for entries using arbitrary criteria.

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

getEntry

Class: Simulink.data.dictionary.Section

Package: Simulink.data.dictionary

Create Simulink.data.dictionary.Entry object to represent data dictionary entry

Syntax

```
entryObj = getEntry(sectionObj,entryName)
entryObj = getEntry(sectionObj,entryName,'DataSource',dictionaryName)
```

Description

`entryObj = getEntry(sectionObj,entryName)` returns an array of Simulink.data.dictionary.Entry objects representing data dictionary entries `entryName` found in the data dictionary section `sectionObj`, a Simulinkdata.dictionary.Section object. `getEntry` returns multiple objects if multiple entries have the specified name in a reference hierarchy of data dictionaries.

`entryObj = getEntry(sectionObj,entryName,'DataSource',dictionaryName)` returns an object representing a data dictionary entry that is defined in the data dictionary `dictionaryName`. Use this syntax to uniquely identify an entry that is defined more than once in a hierarchy of referenced data dictionaries.

Input Arguments

sectionObj — Target data dictionary section

Simulink.data.dictionary.Section object

Target data dictionary section, specified as a Simulink.data.dictionary.Section object. Before you use this function, represent the target section with a Simulink.data.dictionary.Section object by using, for example, the `getSection` function.

entryName — Name of target data dictionary entry

character vector

Name of target data dictionary entry, specified as a character vector.

Example: 'myEntry'

Data Types: char

dictionaryName — Name of data dictionary containing target entry

character vector

File name of data dictionary containing the target entry, specified as a character vector including the `.sldd` extension.

Example: 'mySubDictionary_ex_API.sldd'

Data Types: char

Output Arguments

entryObj — Target data dictionary entry

Simulink.data.dictionary.Entry object

Target data dictionary entry, returned as one or more Simulink.data.dictionary.Entry objects.

Examples

Set Value of Data Dictionary Entry

Represent the Design Data section of the data dictionary myDictionary_ex_API.slidd with a Simulink.data.dictionary.Section object named dDataSectObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.slidd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Represent the data dictionary entry fuelFlow with a Simulink.data.dictionary.Entry object named fuelFlowObj. fuelFlow is defined in the data dictionary myDictionary_ex_API.slidd.

```
fuelFlowObj = getEntry(dDataSectObj, 'fuelFlow');
```

Set the value of the entry fuelFlow to 493.

```
setValue(fuelFlowObj, 493)
```

Set Value of Entry in Reference Dictionary

Represent the Design Data section of the data dictionary myDictionary_ex_API.slidd with a Simulink.data.dictionary.Section object named dDataSectObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.slidd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Represent the data dictionary entry myRefEntry with a Simulink.data.dictionary.Entry object named refEntryObj. myDictionary_ex_API.slidd references myRefDictionary_ex_API.slidd, and myRefDictionary_ex_API.slidd defines an entry myRefEntry.

```
refEntryObj = getEntry(dDataSectObj, 'myRefEntry', 'DataSource', ...
    'myRefDictionary_ex_API.slidd');
```

Set the value of the entry myRefEntry to 493.

```
setValue(refEntryObj, 493)
```

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

importFromFile

Class: Simulink.data.dictionary.Section

Package: Simulink.data.dictionary

Import variables from MAT-file or MATLAB file to data dictionary section

Syntax

```
importedVars = importFromFile(sectionObj,fileName)
importedVars = importFromFile(sectionObj,fileName,'existingVarsAction',
existAction)
[importedVars,existingVars] = importFromFile( __ )
```

Description

`importedVars = importFromFile(sectionObj,fileName)` imports variables defined in the MAT-file or MATLAB file `fileName` to the data dictionary section `sectionObj` without overwriting any variables that are already in the target section. If any variables are already in the target section, the function displays a warning and a list in the MATLAB Command Window. This syntax returns a list of variables that were successfully imported. A variable is considered successfully imported only if `importFromFile` assigns the value of the variable to the corresponding entry in the target data dictionary.

`importedVars = importFromFile(sectionObj,fileName,'existingVarsAction',existAction)` imports variables that are already in the target section by taking a specified action `existAction`. For example, you can choose to use the variable values in the target file to overwrite the corresponding values in the target section.

`[importedVars,existingVars] = importFromFile(__)` returns a list of variables in the target section that were not overwritten. Use this syntax if `existingVarsAction` is set to 'none', the default value, which prevents existing dictionary entries from being overwritten.

Input Arguments

sectionObj — Target data dictionary section

Simulink.data.dictionary.Section object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

fileName — Name of MAT or MATLAB file

character vector

Name of target MAT or MATLAB file, specified as a character vector. `importFromFile` automatically supplies a file extension `.mat` if you do not specify an extension.

Example: 'myFile.mat'

Example: 'myFile.m'

Data Types: char

existAction — Action to take for existing dictionary variables

'none' (default) | 'overwrite' | 'error'

Action to take for existing dictionary variables, specified as 'none', 'overwrite', or 'error'.

If you specify 'none', `importFromFile` attempts to import target variables but does not import or make any changes to variables that are already in the data dictionary section.

If you specify 'overwrite', `importFromFile` imports all target variables and overwrites any variables that are already in the data dictionary section.

If you specify 'error', `importFromFile` returns an error, without importing any variables, if any target variables are already in the data dictionary section.

Example: 'overwrite'

Data Types: char

Output Arguments

importedVars — Successfully imported variables

cell array of character vectors

Names of successfully imported variables, returned as a cell array of character vectors. A variable is considered successfully imported only if `importFromFile` assigns its value to the corresponding entry in the target data dictionary.

existingVars — Variables that were not imported

cell array of character vectors

Names of target variables that were not imported due to their existence in the target data dictionary, returned as a cell array of character vectors. `existingVars` has content only if `existAction` is set to 'none', which is also the default. In that case `importFromFile` imports only variables that are not already in the target data dictionary.

Examples

Import to Data Dictionary from File

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Import all variables contained in the file `myData_ex_API.m` to the data dictionary and return a list of successfully imported variables. If any variables are already in `myDictionary_ex_API.sldd`, `importFromFile` returns a warning and a list of the affected variables.

```
importFromFile(dDataSectObj, 'myData_ex_API.m')
```

Warning: The following variables were not imported because they already exist in the dictionary:

```

    fuelFlow

ans =

    'myFirstEntry'
    'mySecondEntry'
    'myThirdEntry'

```

Import Variables from File and Overwrite Conflicts

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```

myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');

```

Import all variables contained in the file `myData_ex_API.m` to the data dictionary, overwrite any variables that are already in the dictionary, and return a list of successfully imported variables.

```

importFromFile(dDataSectObj, 'myData_ex_API.m', 'existingVarsAction', 'overwrite')

ans =

    'fuelFlow'
    'myFirstEntry'
    'mySecondEntry'
    'myThirdEntry'

```

Return Variables Not Imported to Data Dictionary from File

Return a list of variables that are not imported from a file because they are already in the target data dictionary

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```

myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');

```

Import all variables contained in the file `myData_ex_API.m` to the data dictionary. Specify names for the output arguments of `importFromFile` to return the names of successfully and unsuccessfully imported variables.

```

[importedVars,existingVars] = importFromFile(dDataSectObj, 'myData_ex_API.m')

importedVars =

    'myFirstEntry'
    'mySecondEntry'
    'myThirdEntry'

existingVars =

    'fuelFlow'

```

`importFromFile` does not import the variable `fuelFlow` because it is already in the target data dictionary.

Tips

- `importFromFile` can import MATLAB variables created from enumerated data types but cannot import the definitions of the enumerated types. Use the `importEnumTypes` function to import enumerated data type definitions to a data dictionary. If you import variables of enumerated data types to a data dictionary but do not import the enumerated type definitions, the dictionary is less portable and might not function properly if used by someone else.

Alternatives

You can use the Model Explorer to import variables to a data dictionary from a file. See “Import Data to Dictionary from File” for more information.

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

Simulink.DualScaledParameter

Specify name, value, units, and other properties of Simulink dual-scaled parameter

Description

Use `Simulink.DualScaledParameter` so that you can define an object that stores two scaled values of the same physical value.

For example, for temperature measurement, you can store a Fahrenheit scale and a Celsius scale with conversion defined by a computation method that you provide. Given one scaled value, the `Simulink.DualScaledParameter` computes the other scaled value using the computation method.

A dual-scaled parameter inherits some properties from the `Simulink.Parameter` class. A dual-scaled parameter has:

- A calibration value. The value that you prefer to use.
- A main value. The real-world value that Simulink uses.
- An internal stored integer value. The value that is used in the embedded code.

You can use `Simulink.DualScaledParameter` objects in your model for both simulation and code generation. The parameter computes the internal value before code generation via the computation method. This offline computation results in leaner generated code.

If you provide the calibration value, the parameter computes the main value using the computation method. This method can be a first-order rational function.

$$y = \frac{ax + b}{cx + d}$$

- x is the calibration value.
- y is the main value.
- a and b are the coefficients of the CalToMain compute numerator.
- c and d are the coefficients of the CalToMain compute denominator.

If you provide the calibration minimum and maximum values, the parameter computes minimum and maximum values of the main value. Simulink performs range checking of parameter values. The software alerts you when the parameter object value lies outside a range that corresponds to its specified minimum and maximum values and data type.

Creation

Create a `Simulink.DualScaledParameter` object:

- By using the Model Data Editor. Instead of creating a `Simulink.Parameter` object, create a `Simulink.DualScaledParameter` object. See “Interact with a Model That Uses Workspace Variables”.

- By using the Model Explorer:
 - 1 In the **Model Hierarchy** pane, select a workspace or data dictionary.
 - 2 On the toolbar, select **Add > Add Custom**.
 - 3 In the Model Explorer — Select Object dialog box, set **Object class** to `Simulink.DualScaledParameter`.
- By using the `Simulink.DualScaledParameter` function, described below.

Syntax

```
DSParam = Simulink.DualScaledParameter
```

Description

`DSParam = Simulink.DualScaledParameter` returns a `Simulink.DualScaledParameter` object with default property values.

Properties

For information about properties in the property dialog box of a `Simulink.DualScaledParameter` object, see “Simulink.DualScaledParameter Property Dialog Box”.

CalibrationValue — Calibration value of this parameter

[] (default) | finite, real, double number

Calibration value of this parameter, specified as a finite, real, double number. This value represents the value that you prefer to use.

Before specifying `CalibrationValue`, you must specify `CalToMainCompuNumerator` and `CalToMainCompuDenominator` to define the computation method. The parameter uses the computation method and the calibration value to calculate the main value that Simulink uses.

Corresponds to **Calibration value** in the property dialog box.

Example: 5.34

Data Types: `double`

CalibrationMin — Calibration minimum value of this parameter

[] (default) | finite, real, double, scalar number

Calibration minimum value of this parameter, specified as a finite, real, double, scalar number. The default value, [], means the minimum is unspecified.

Before specifying `CalibrationMin`, you must specify `CalToMainCompuNumerator` and `CalToMainCompuDenominator` to define the computation method. The parameter uses the computation method and the calibration minimum value to calculate the minimum or maximum value that Simulink uses. A first order rational function is strictly monotonic, either increasing or decreasing. If it is increasing, setting the calibration minimum sets the main minimum value. If it is decreasing, setting the calibration minimum sets the main maximum.

If the parameter value is less than the minimum value or if the minimum value is outside the range of the parameter data type, Simulink generates a warning. In these cases, when updating the diagram or starting a simulation, Simulink generates an error.

Corresponds to **Calibration minimum** in the property dialog box.

Example: 10.51

Data Types: double

CalibrationMax — Calibration maximum value of this parameter

[] (default) | finite, real, double, scalar number

Calibration maximum value of this parameter, specified as a finite, real, double, scalar number. The default value, [], means the maximum is unspecified.

Before specifying **CalibrationMax**, you must specify **CalToMainCompuNumerator** and **CalToMainCompuDenominator** to define the computation method. The parameter uses the computation method and the calibration maximum value to calculate the corresponding maximum or minimum value that Simulink uses. A first order rational function is strictly monotonic, either increasing or decreasing. If it is increasing, setting the calibration maximum sets the main maximum value. If it is decreasing, setting the calibration maximum sets the main minimum.

If the parameter value is less than the minimum value or if the minimum value is outside the range of the parameter data type, Simulink generates a warning. In these cases, when updating the diagram or starting a simulation, Simulink generates an error.

Corresponds to **Calibration maximum** in the property dialog box.

Example: -10.51

Data Types: double

CalToMainCompuNumerator — Numerator coefficients of the computation method

[] (default) | finite, real, double scalar | finite, real, double vector

Numerator coefficients of the computation method, specified as a scalar number or vector of values for the numerator coefficients **a** and **b** of the first-order linear equation:

$$y = \frac{ax + b}{cx + d}$$

The default value is [] (unspecified). Specify finite, real, double scalar values for **a** and **b**. For example, [1 1] or, for reciprocal scaling, 1.

Once you have applied **CalToMainCompuNumerator**, you cannot change it.

Corresponds to **CalToMain compute numerator** in the property dialog box.

Example: [1 1]

Example: 1

Data Types: double

CalToMainCompuDenominator — Denominator coefficients of the computation method

[] (default) | finite, real, double scalar | finite, real, double vector

Denominator coefficients of the computation method, specified as a scalar number or vector of values for the denominator coefficients **c** and **d** of the first-order linear equation:

$$y = \frac{ax + b}{cx + d}$$

The default value is `[]` (unspecified). Specify finite, real, double scalar values for `c` and `d`. For example, `[1 1]`.

Once you have applied `CalToMainCompuDenominator`, you cannot change it.

Corresponds to **CalToMain compute denominator** in the property dialog box.

Example: `[1 1]`

Data Types: `double`

CalibrationName — Name of the calibration parameter

`''` (empty character vector) (default) | character vector

Name of the calibration parameter, specified as a character vector.

Corresponds to **Calibration name** in the property dialog box.

Example: `'This is a calibration parameter.'`

Data Types: `char`

CalibrationDocUnits — Measurement units for this calibration parameter's value

`''` (empty character vector) (default) | character vector

Measurement units for this calibration parameter's value, specified as a character vector.

Corresponds to **Calibration units** in the property dialog box.

Example: `'Fahrenheit'`

Data Types: `char`

IsConfigurationValid — Information about validity of configuration

`true` (default) | `false`

This property is read-only.

Information about the validity of the object configuration, returned as `true` (valid) or `false` (invalid). If Simulink detects an issue with the configuration, it sets this field to `false` and provides information in the `DiagnosticMessage` property.

Corresponds to **Is configuration valid** in the property dialog box.

Data Types: `logical`

DiagnosticMessage — Diagnostic information about invalid configuration

`''` (empty character vector) (default) | character vector

This property is read-only.

Diagnostic information about an invalid object configuration, returned as a character vector. If you specify invalid property settings, Simulink displays a message in this field. Use the diagnostic information to help you fix an invalid configuration issue.

Corresponds to **Diagnostic message** in the property dialog box.

Data Types: `char`

Examples

Create and Update a Dual-Scaled Parameter

Create a `Simulink.DualScaledParameter` object that stores a temperature as both Fahrenheit and Celsius.

Create a `Simulink.DualScaledParameter` object.

```
Temp = Simulink.DualScaledParameter;
```

Set the computation method that converts between Fahrenheit and Celsius.

```
Temp.CalToMainCompuNumerator = [1 -32];
Temp.CalToMainCompuDenominator = [1.8];
```

Set the value of the temperature that you want to see in Fahrenheit.

```
Temp.CalibrationValue = 212
```

```
Temp =
```

```
DualScaledParameter with properties:
```

```

    CalibrationValue: 212
    CalibrationMin: []
    CalibrationMax: []
    CalToMainCompuNumerator: [1 -32]
    CalToMainCompuDenominator: 1.8000
    CalibrationName: ''
    CalibrationDocUnits: ''
    IsConfigurationValid: 1
    DiagnosticMessage: ''
    Value: 100
    CoderInfo: [1x1 Simulink.CoderInfo]
    Description: ''
    DataType: 'auto'
    Min: []
    Max: []
    Unit: ''
    Complexity: 'real'
    Dimensions: [1 1]
```

The `Simulink.DualScaledParameter` calculates `Temp.Value` which is the value that Simulink uses. `Temp.CalibrationValue` is 212 (degrees Fahrenheit), so `Temp.Value` is 100 (degrees Celsius).

Name the value and specify the units.

```
Temp.CalibrationName = 'TempF';
Temp.CalibrationDocUnits = 'Fahrenheit';
```

Set calibration minimum and maximum values.

```
Temp.CalibrationMin = 0;
Temp.CalibrationMax = 300;
```

If you specify a calibration value outside this allowable range, Simulink generates a warning.

Specify the units that Simulink uses.

```
Temp.Unit = 'degC';
```

Open the Simulink.DualScaledParameter dialog box.

open `Temp`

The screenshot shows the 'Simulink.DualScaledParameter: Temp' dialog box. It has two tabs: 'Calibration Attributes' and 'Main Attributes'. The 'Calibration Attributes' tab is active. The dialog contains the following fields:

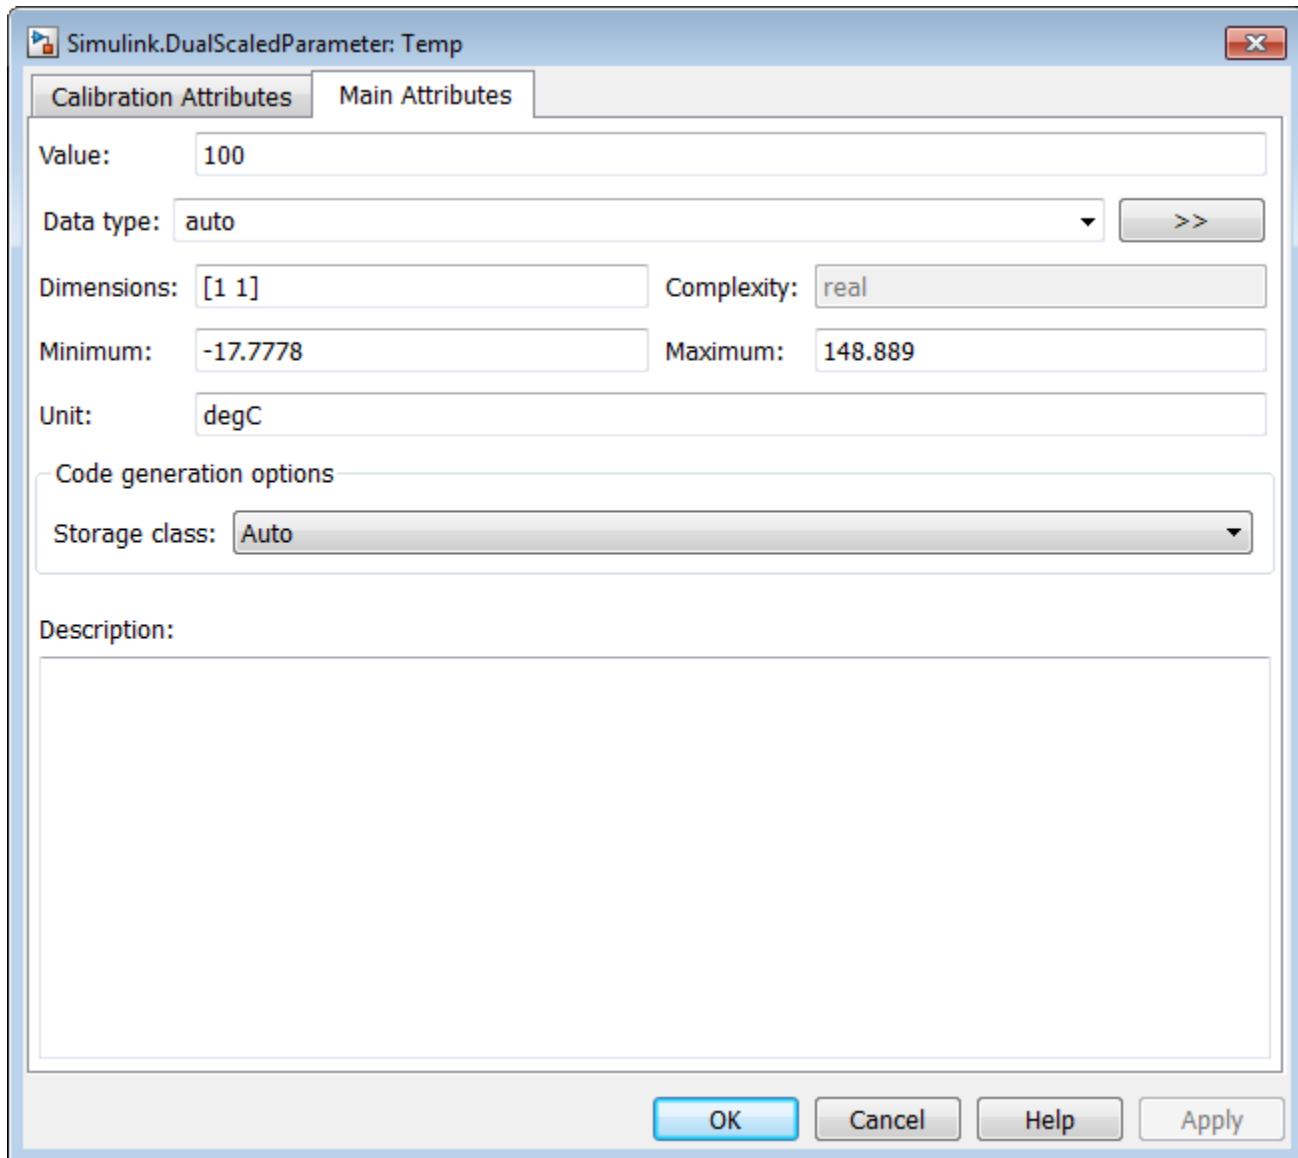

- Calibration value: 212
- Calibration minimum: 0
- Calibration maximum: 300
- CalToMain compute numerator: [1 -32]
- CalToMain compute denominator: 1.8
- Calibration name: 'TempF'
- Calibration units: 'Fahrenheit'

Below these fields is a 'Parameter validation' section with a checkbox 'Is configuration valid:' which is checked and set to 'true'. Below this is a 'Diagnostic message:' label and a large empty text area.

At the bottom of the dialog are four buttons: 'OK', 'Cancel', 'Help', and 'Apply'.

The **Calibration Attributes** tab displays the calibration value and the computation method that you specified.

In the dialog box, click the **Main Attributes** tab.

This tab displays information about the value used by Simulink.

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using MATLAB® Coder™.

To control the appearance of a `Simulink.DualScaledParameter` object in the generated code, use the **Storage class** property, which the object inherits from `Simulink.Parameter`.

Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

Simulink.Mask class

Package: Simulink

Control masks programmatically

Description

Use an instance of `Simulink.Mask` class to perform the following operations:

- Create, copy, and delete masks.
- Create, edit, and delete mask parameters.
- Determine the block that owns the mask.
- Obtain workspace variables defined for a mask.

Properties

Type

Specifies the mask type of the associated block.

Type: character vector | string scalar

Default: Empty character vector

Description

Specifies the block description of the associated block.

Type: character vector | string scalar

Default: Empty character vector

Help

Specifies the help text that is displayed for the mask.

Type: character vector | string scalar

Default: Empty character vector

Initialization

Specifies the initialization commands for the associated block.

Type: character vector | string scalar

Default: Empty character vector

SelfModifiable

Indicates that the block can modify itself and its content.

Type: boolean

Values: 'on' | 'off'

Default: 'off'

Display

Specifies MATLAB code for drawing the block icon.

Type: character vector | string scalar

Default: Empty character vector

IconFrame

Sets the visibility of the block frame. (Visible is on, Invisible is off).

Type: boolean

Values: 'on' | 'off'

Default: 'on'

IconOpaque

Sets the transparency of the icon (Opaque is on, Transparent is off).

Type: boolean

Values: 'on' | 'off'

Default: 'on'

RunInitForIconRedraw

Specifies whether Simulink must run mask initialization before executing the mask icon commands.

Type: enum

Values: 'auto' | 'on' | 'off'

Default: 'auto'

IconRotate

Sets icon to rotate with the block.

Type: enum

Values: 'none' | 'port'

Default: 'none'

PortRotate

Specifies the port rotation policy for the masked block.

Type: enum

Values: 'default' | 'physical'

Default: 'default'

IconUnits

Specifies the units for the drawing commands.

Type: enum

Values: 'pixel' | 'autoscale' | 'normalized'

Default: 'autoscale'

Methods

addParameter	Add a parameter to a mask
copy	Copy a mask from one block to another
create	Create a mask on a Simulink block
delete	Unmask a block and delete the mask from memory
get	Get a block mask as a mask object
addDialogControl	Add dialog control elements to mask dialog box
getDialogControl	Search for a specific dialog control on the mask
getOwner	Determine the block that owns a mask
getParameter	Get a mask parameter using its name
getWorkspaceVariables	Get all the variables defined in the mask workspace for a masked block
numParameters	Determine the number of parameters in a mask
removeDialogControl	Remove dialog control element from mask dialog box
removeParameter	Remove parameter from mask dialog box
removeAllParameters	Remove all existing parameters from a mask
set	Set the properties of an existing mask
addParameterConstraint	Add parameter constraint to a mask
removeParameterConstraint	Delete a mask parameter constraint
removeCrossParameterConstraint	Delete a cross-parameter constraint
removeAllParameterConstraints	Delete all mask parameter constraints
removeAllCrossParameterConstraints	Delete all cross-parameter constraints from a mask
getParameterConstraint	Get mask parameter constraint properties
getCrossParameterConstraint	Get cross-parameter constraint
getAssociatedParametersOfConstraint	Get mask parameters associated with a constraint
addCrossParameterConstraint	Add cross-parameter constraint

addParameter

Class: Simulink.Mask

Package: Simulink

Add a parameter to a mask

Syntax

```
p = Simulink.Mask.get(blockName)
p.addParameter(Name, Value)
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`p.addParameter(Name, Value)` appends a parameter to the mask. If you do not specify name-value pairs as arguments with this command, Simulink generates name for the mask parameter with control type set to `edit`.

Input Arguments

blockName

The handle to the block or the path to the block inside the model.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name, Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1, Value1, . . . , NameN, ValueN`.

Type

Type of control that is used to specify the value of this parameter. The permitted values are: `edit`, `checkbox`, `popup`, `combobox`, `listbox`, `radiobutton`, `slider`, `dial`, `spinbox`, `unit`, `textarea`, `breakpoint`, `customtable`, `tree`, `unit`, `min`, `max`.

Default: `edit`

TypeOptions

The options that are displayed within a popup control or in a promoted parameter. This field is a cell array.

Default: empty

Name

The name of the mask parameter. This name is assigned to the mask workspace variable created for this parameter.

Default: generated name

Prompt

Text that identifies the parameter on the Mask Parameters dialog box.

Default: empty

Value

The default value of the mask parameter in the Mask Parameters dialog box.

Default: Type specific; depends on the Type of the parameter

Evaluate

Option to specify whether parameter must be evaluated.

Default: 'on'

Tunable

Option to specify whether parameter is tunable.

Default: 'on'

Enabled

Option to specify whether user can set parameter value.

Default: 'on'

Visible

Option to set whether mask parameter is hidden or visible to the user.

Default: 'on'

Callback

Container for MATLAB code that executes when user makes a change in the Mask Parameters dialog box.

Default: empty

Container

Option to specify a container for the child parameters. The permitted values are the names of 'panel', 'group', and 'tab'.

Examples

- 1 Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```

- 2 Add a parameter to the mask without specifying name-value pairs for parameter attributes.

```
p.addParameter;
```

- 3 Add a mask parameter of type popup that cannot be evaluated.

```
p.addParameter('Type','popup','TypeOptions',...  
{'Red' 'Blue' 'Green'},'Evaluate','off');
```

See Also

“Create Block Masks” | `Simulink.Mask`

Simulink.Mask.copy

Class: Simulink.Mask

Package: Simulink

Copy a mask from one block to another

Syntax

```
pSource = Simulink.Mask.get(srcBlockName)
pDest = Simulink.Mask.create(destBlockName)
pDest.copy(pSource)
```

Description

`pSource = Simulink.Mask.get(srcBlockName)` gets the mask on the source block specified by `blockName` as a mask object.

`pDest = Simulink.Mask.create(destBlockName)` creates an empty mask on the destination block specified by `destBlockName`.

`pDest.copy(pSource)` overwrites the destination mask with the source mask.

Input Arguments

`srcBlockName`

The handle to the source block or the path to the source block inside the model.

Note The source block should be masked.

`destBlockName`

The handle to the destination block or the path to the destination block inside the model.

Note The destination block should have an empty mask. Otherwise, the copied mask will overwrite the non-empty mask.

Examples

- 1 Create an empty mask on the destination block using the block's path.

```
pDest = Simulink.Mask.create('myModel/Subsystem');
```
- 2 Get source mask as an object using the source block's path.

```
pSource = Simulink.Mask.get('myModel/Abs');
```
- 3 Make the destination mask a copy of the source mask.

```
pDest.copy(pSource);
```

See Also

“Create Block Masks” | `Simulink.Mask`

Simulink.Mask.create

Class: Simulink.Mask

Package: Simulink

Create a mask on a Simulink block

Syntax

```
p = Simulink.Mask.create(blockName)
```

Description

`p = Simulink.Mask.create(blockName)` creates an empty mask on the block specified by `blockName`. If the specified block is already masked, an error message appears.

Input Arguments

blockName

The handle to the block or the path to the block inside the model.

Examples

- 1 Create a mask using a block's handle.

Note In the model, select the block to be masked.

```
p = Simulink.Mask.create(gcbh);
```

- 2 Create a mask using the block's path.

```
p = Simulink.Mask.create('myModel/Subsystem');
```

See Also

"Create Block Masks" | Simulink.Mask

delete

Class: Simulink.Mask

Package: Simulink

Unmask a block and delete the mask from memory

Syntax

```
p = Simulink.Mask.get(blockName)
p.delete
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`p.delete` un.masks the block and deletes the mask from memory.

Input Arguments

blockName

The handle to the block or the path to the block inside the model.

Examples

- 1 Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```
- 2 Unmask the block using the mask object and delete the mask from memory.

```
p.delete;
```

See Also

"Create Block Masks" | `Simulink.Mask`

Simulink.Mask.get

Class: Simulink.Mask

Package: Simulink

Get a block mask as a mask object

Syntax

```
p = Simulink.Mask.get(blockName)
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object. If the specified block is not masked, a null value returns.

Input Arguments

blockName

The handle to the block or the path to the block inside the model.

Examples

- 1 Get mask as an object using a masked block's handle.

Note In the model, select the masked block.

```
p = Simulink.Mask.get(gcbh);
```

- 2 Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```

See Also

"Create Block Masks" | Simulink.Mask

addDialogControl

Class: Simulink.Mask

Package: Simulink

Add dialog control elements to mask dialog box

Syntax

```
successIndicator = maskObj.addDialogControl(controlType,controlIdentifier)  
successIndicator = maskObj.addDialogControl(Name,Value)
```

Description

`successIndicator = maskObj.addDialogControl(controlType,controlIdentifier)` adds dialog control elements like text, hyperlinks, or tabs to mask dialog box. First get the mask object and assign it to the variable `maskObj`

`successIndicator = maskObj.addDialogControl(Name,Value)` specifies the `Name` and `Value` arguments for an element on the mask dialog box. You can specify multiple Name-Value pairs.

Input Arguments

controlType — Value type of dialog control element

character vector | string scalar

Type of dialog control element, specified

- 'panel'
- 'group'
- 'tabcontainer'
- 'tab'
- 'collapsiblepanel'
- 'text'
- 'image'
- 'hyperlink'
- 'pushbutton'

controlIdentifier — Unique identifier for the element

character vector | string scalar

Specifies the programmatic identifier for the element of mask dialog box. Use a name that is unique and does not have space between words. For more information, see “Variable Names” (MATLAB).

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' ') and is case-sensitive.

You can specify several name and value pair arguments in any order as Name1,Value1, . . . ,NameN,ValueN.

Type

Type of control that is used to specify the value of this dialog control element. Type is a required argument. The permitted values are 'panel', 'group', 'tabcontainer', 'tab', 'collapsiblepanel', 'text', 'image', 'hyperlink', and 'pushbutton'.

Default: empty

Name

The identifier of the dialog control element. Name is a required argument. This field is available for all dialog control types.

Default: empty

Prompt

Text that is displayed in the dialog control element on the Mask dialog box. This field is available for all except for panel and image dialog control types.

Default: empty

Tooltip

Tooltip for the dialog control element.

Default: empty

Enabled

Option to specify whether you can set value for the dialog control element. This field is available for all dialog control types.

Default: 'on'

Visible

Option to set whether the dialog control element is hidden or visible to the user. This field is available for all dialog control types.

Default: 'on'

Callback

Container for MATLAB code that executes when you edit the dialog control element and click **Apply**. This field is available only for the hyperlink and pushbutton dialog control types.

Default: empty

Row

Option to set whether the dialog control is placed in the new row or the same row. This field is available for all dialog control types.

Default: empty

Filepath

Contains the path to an image file. This field is available for image, and pushbutton dialog control types.

Default: empty

Container

Option to specify a container for the child dialog control. The permitted values are the names of 'panel', 'group', and 'tab' dialog controls.

Examples

Add Dialog Control Elements to Mask Dialog Box

Get mask object and add dialog control element to it.

```
% Get mask object on model Engine
maskObj = Simulink.Mask.get('Engine/Gain');

% Add hyperlink to mask dialog box

maskLink = maskObj.addDialogControl('hyperlink','link');
maskLink.Prompt = 'Mathworks Home Page';
maskLink.Callback = 'web(''www.mathworks.com'')'

% Alternative method to add hyperlink

maskLink = maskObj.addDialogControl('hyperlink','link');
maskLink.Prompt = 'www.mathworks.com';

% Add text to mask dialog box

maskText = maskObj.addDialogControl('text','text_tag');
maskText.Prompt = 'Enable range checking';

% Add button to mask dialog box

maskButton = maskObj.addDialogControl('pushbutton','button_tag');
maskButton.Prompt = 'Compute';
```

Add Dialog Control Elements to Mask Dialog Box Tabs

Create tabs on the mask dialog box and add elements to these tabs.

```
% Get mask object on a block named 'GainBlock'
maskObj = Simulink.Mask.get('GainBlock/Gain');

% Create a tab container
```

```
maskObj.addDialogControl('tabcontainer','allTabs');
tabs = maskObj.getDialogControl('allTabs');

% Create tabs and name them

maskTab1 = tabs.addDialogControl('tab','First');
maskTab1.Prompt = 'First tab';

maskTab2 = tabs.addDialogControl('tab','Second');
maskTab2.Prompt = 'Second tab';

% Add elements to one of the tabs

firstTab = tabs.getDialogControl('First');
firstTab.addDialogControl('text','textOnFirst');
firstTab.getDialogControl('textOnFirst').Prompt = 'Tab one';
```

Add Dialog Control Element Using Name-Value Pair

Add dialog control element and specify values for it

```
% Get mask object on model Engine
maskObj = Simulink.Mask.get('Engine/Gain');

% Add a dialog box and specify values for it
maskDialog = maskObj.addDialogControl('Type','text',...
'Prompt','hello','Visible','off');
```

“Create Block Masks” | Control Masks Programmatically | Simulink.Mask

Introduced in R2014a

getDialogControl

Class: Simulink.Mask

Package: Simulink

Search for a specific dialog control on the mask

Syntax

```
[control, phandle] = handle.getDialogControl(cname)
```

Description

`[control, phandle] = handle.getDialogControl(cname)` , search for a specific child dialog control recursively on the mask dialog.

Input Arguments

cname

Name of the dialog control being searched on the mask dialog.

Default:

Output Arguments

control

Target dialog control being searched on the mask dialog.

phandle

Parent of the dialog control being searched mask dialog.

Examples

Find a dialog control

Find a text dialog control on the mask dialog box. `maskObj` is the handle to the mask object. The `getDialogControl` method returns the handle to the dialog control (`hdlgctrl`) and handle to the parent dialog control (`phandle`).

```
[hdlgctrl, phandle] = maskObj.getDialogControl('txt_var')
```

“Create Block Masks” | Simulink.Mask

getOwner

Class: Simulink.Mask

Package: Simulink

Determine the block that owns a mask

Syntax

```
p = Simulink.Mask.get(blockName)
p.getOwner
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`p.getOwner` returns the interface to the block that owns the mask.

Input Arguments

`blockName`

The handle to the block or the path to the block inside the model.

Examples

- 1 Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```

- 2 Get the interface to the block that owns the mask.

```
p.getOwner;
```

See Also

"Create Block Masks" | `Simulink.Mask`

getParameter

Class: Simulink.Mask

Package: Simulink

Get a mask parameter using its name

Syntax

```
p = Simulink.Mask.get(blockName)
param = p.getParameter(paramName)
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`param = p.getParameter(paramName)` returns an array of mask parameters.

Input Arguments

blockName

The handle to the block or the path to the block inside the model.

paramName

The name of the parameter you want to get.

Examples

- 1 Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```

- 2 Get a mask parameter by using its name.

```
param = p.getParameter('intercept');
```

"Create Block Masks" | `Simulink.Mask`

getWorkspaceVariables

Class: Simulink.Mask

Package: Simulink

Get all the variables defined in the mask workspace for a masked block

Syntax

```
p = Simulink.Mask.get(blockName)
vars = p.getWorkspaceVariables
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`vars = p.getWorkspaceVariables` returns as a structure all the variables defined in the mask workspace for the masked block.

Input Arguments

`blockName`

The handle to the block or the path to the block inside the model.

Examples

- 1 Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```
- 2 Get all the variables defined in the mask workspace for the masked block.

```
vars = p.getWorkspaceVariables;
```

See Also

"Create Block Masks" | Simulink.Mask

numParameters

Class: Simulink.Mask

Package: Simulink

Determine the number of parameters in a mask

Syntax

```
p = Simulink.Mask.get(blockName)
p.numParameters
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`p.numParameters` returns the number of parameters in the mask.

Input Arguments

blockName

The handle to the block or the path to the block inside the model.

Examples

- 1 Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```

- 2 Get the number of parameters in the mask.

```
p.numParameters;
```

"Create Block Masks" | `Simulink.Mask`

removeDialogControl

Class: Simulink.Mask

Package: Simulink

Remove dialog control element from mask dialog box

Syntax

```
successIndicator = maskVariable.removeDialogControl(controlIdentifier)
```

Description

`successIndicator = maskVariable.removeDialogControl(controlIdentifier)` removes dialog control element, specified by `controlIdentifier`, like text, hyperlinks, or tabs from a mask dialog box. First get the mask object and assign it to the variable `maskVariable`.

Successful removal of a dialog control element returns a Boolean value of 1.

Input Arguments

controlIdentifier — Unique identifier for the element

character vector | string scalar

Programmatic identifier for the dialog control element of mask dialog box.

Examples

Remove Dialog Control Element from Mask Dialog Box

```
% Get mask object on the Gain block in the model Engine.
```

```
maskObj = Simulink.Mask.get('Engine/Gain');
```

```
% Remove element named AllTab from mask dialog box.
```

```
p = maskObj.removeDialogControl('AllTab');
```

See Also

"Create Block Masks" | Simulink.Mask

Introduced in R2013b

removeParameter

Class: Simulink.Mask

Package: Simulink

Remove parameter from mask dialog box

Syntax

```
successIndicator = maskVariable.removeParameter(controlIdentifier)
```

Description

`successIndicator = maskVariable.removeParameter(controlIdentifier)` removes parameter, specified by `controlIdentifier`, like edit, check box, popup from an existing mask dialog box. First get the mask object and assign it to the variable `maskVariable`.

Successful removal of a parameter returns a Boolean value of 1.

Input Arguments

controlIdentifier — Unique identifier for the parameter

character vector | string scalar

Programmatic identifier for the parameter of mask dialog box, specified as a character vector.

Examples

Remove Parameter from Mask Dialog Box

```
% Get mask object on the Gain block in the model Engine.  
maskObj = Simulink.Mask.get('Engine/Gain');  
  
% Remove parameter named checkbox1 from mask dialog box.  
p = maskObj.removeParameter('checkbox1');
```

Note You can also use the index number as the `controlIdentifier`.

removeAllParameters

Class: Simulink.Mask

Package: Simulink

Remove all existing parameters from a mask

Syntax

```
p = Simulink.Mask.get(blockName)
p.removeAllParameters
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`p.removeAllParameters` deletes all existing parameters from the mask.

Input Arguments

`blockName`

The handle to the block or the path to the block inside the model.

Examples

- 1 Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```

- 2 Delete all existing parameters from the mask.

```
p.removeAllParameters;
```

See Also

"Create Block Masks" | Simulink.Mask

set

Class: Simulink.Mask

Package: Simulink

Set the properties of an existing mask

Syntax

```
p = Simulink.Mask.get(blockName)
p.set(Name,Value)
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`p.set(Name,Value)` sets mask properties that you specify using name-value pairs as arguments.

Input Arguments

blockName

The handle to the block or the path to the block inside the model.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Type

Text used as title for mask documentation that user sees on clicking **Help** in the Mask Parameters dialog box.

Default: empty

Description

Text used as summary for mask documentation that user sees on clicking **Help** in the Mask Parameters dialog box.

Default: empty

Help

Text used as body text for mask documentation that user sees on clicking **Help** in the Mask Parameters dialog box.

Default: empty

Initialization

MATLAB code that initializes the mask.

Default: empty

SelfModifiable

Option to set whether the mask can modify itself during simulation.

Default: 'off'

Display

MATLAB code that draws the mask icon.

Default: empty

IconFrame

Option to specify whether the mask icon appears inside a visible block frame.

Default: 'on'

MaskIconOpaque

Option to set the mask icon as opaque or transparent.

Default: 'opaque'

RunInitForIconRedraw

Option to specify whether Simulink should run mask initialization before executing the mask icon commands.

Default: 'off'

IconRotate

Option to specify icon rotation.

Default: 'none'

PortRotate

Option to specify port rotation.

Default: 'default'

IconUnits

Option to specify whether mask icon is autoscaled, normalized, or scaled in pixels.

Default: 'autoscale'

Examples

- 1 Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```

- 2 Modify the mask so that its mask icon is transparent and its documentation summarizes what it does.

```
p.set('IconOpaque','off','Type','Random number generator','Description',...  
'This block generates random numbers.');
```

“Create Block Masks” | `Simulink.Mask`

addParameterConstraint

Class: Simulink.Mask

Package: Simulink

Add parameter constraint to a mask

Syntax

```
paramConstraint = maskObj.addParameterConstraint(Name,Value)
```

Description

`paramConstraint = maskObj.addParameterConstraint(Name,Value)` adds a constraint to the specified mask. Constraints can only be associated to the **Edit** type mask parameters.

Input Arguments

maskObj — Block mask handle

mask object

Block mask handle, specified as a mask object. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information, see `Simulink.Mask.get`

Data Types: `char` | `cell`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name, Value` arguments. `Name` is the argument name and `Value` is the corresponding value. You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Name — Mask constraint name

character vector | string

Required field. Must be a valid MATLAB name. Specifies a name for the mask parameter constraint.

Parameters — Mask parameter name

cell array of character vector | string

Optional field. Specifies the **Edit** mask parameter name to which you want to associate the constraint.

Rules — Rule for mask parameter constraint

`Data Type` | `Dimension` | `Complexity` | `Sign` | `Finiteness` | `Minimum` | `Maximum` | `CustomConstraint`

Required field. Rules are defined within curly braces. A constraint can have single or multiple rules.

Name-Value Pairs for Rules

Name	Value
DataType	double, single, numeric, integer, int8, uint8, int16, uint16, int32, uint32, boolean, enum, fixdt
Dimension	scalar, rowvector, columnvector, 2dmatrix, ndmatrix
Complexity	real, complex
Sign	positive, negative, zero
Finiteness	finite, inf, -inf, NaN
Minimum	character vector
Maximum	character vector
CustomConstraint	Valid MATLAB expression returning logical true or false.
CustomErrorMessage	character vector or a message catalog ID. If you use the message catalog ID to specify an error, the error message must not have any holes in it. This error message is specifically for custom constraint validation failure.

Output Arguments**paramConstraint — Mask parameter constraint**

character vector | string

Handle to the mask parameter constraint, returned as a character vector. You can associate a constraint to the mask parameter either during or after creating the constraint.

Examples**Create Mask Constraint with Single Rule**

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Create mask constraint with single rule.
paramConstraint = maskObj.addParameterConstraint('Name','const2',...
'Parameters',{'Parameter2'}, 'Rules', {'DataType', 'uint8'})
```

ans =

Constraints with properties:

```
      Name: 'const2'
ConstraintRules: [1x1 Simulink.Mask.ParameterConstraintRules]
```

Create Mask Constraint with Multiple Rules

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);
```

```
% Create mask constraint with multiple rules.  
paramConstraint = maskObj.addParameterConstraint('Name','const3',...  
'Parameters',{'Parameter3'}, 'Rules', {{'DataType', 'uint8'},{'DataType', {'fixdt(1,8,4)'}}})
```

```
ans =
```

```
Constraints with properties:
```

```
      Name: 'const3'  
ConstraintRules: [1x2 Simulink.Mask.ParameterConstraintRules]
```

See Also

“Create Block Masks” | `Simulink.Mask`

Introduced in R2018a

removeParameterConstraint

Class: Simulink.Mask

Package: Simulink

Delete a mask parameter constraint

Syntax

```
maskObj.removeParameterConstraint(paramConstraint)
```

Description

`maskObj.removeParameterConstraint(paramConstraint)` deletes the specified mask parameter constraint.

Input Arguments

maskObj — Block mask handle

mask object

Handle to the block mask, specified as mask object. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information, see `Simulink.Mask.get`.

Data Types: `char` | `cell`

paramConstraint — Mask constraint name

character vector | string

Name of the mask parameter constraint to be deleted, specified as character vector.

Examples

```
% Get block mask handle.  
maskObj = Simulink.Mask.get(gcb);  
  
% Remove mask constraint with name 'const1'.  
maskObj.removeParameterConstraint('const1')
```

See Also

“Create Block Masks” | `Simulink.Mask`

Introduced in R2018a

removeCrossParameterConstraint

Class: Simulink.Mask

Package: Simulink

Delete a cross-parameter constraint

Syntax

```
maskObj.removeCrossParameterConstraint(CrossConstraint)
```

Description

`maskObj.removeCrossParameterConstraint(CrossConstraint)` deletes the specified cross-constraint.

Input Arguments

maskObj — Block mask handle

mask object

Handle to the block mask, specified as mask object. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information, see `Simulink.Mask.get`.

Data Types: `char` | `cell`

CrossConstraint — Cross constraint name

character vector | string

Name of the cross-constraint to be removed, specified as character vector.

Examples

```
% Get block mask handle.  
maskObj = Simulink.Mask.get(gcb);  
  
% Remove cross-constraint of name 'const1'.  
maskObj.removeCrossParameterConstraint('const1')
```

See Also

“Create Block Masks” | `Simulink.Mask`

Introduced in R2018a

removeAllParameterConstraints

Class: Simulink.Mask

Package: Simulink

Delete all mask parameter constraints

Syntax

```
maskObj.removeAllParameterConstraints()
```

Description

`maskObj.removeAllParameterConstraints()` deletes all the parameter constraints from a mask.

Input Arguments

maskObj — Block mask handle

mask object

Handle to the block mask. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information see, `Simulink.Mask.get`

Examples

```
% Get block mask handle.  
maskObj = Simulink.Mask.get(gcb);  
  
% Remove all constraints from the mask.  
maskObj.removeAllParameterConstraints()
```

See Also

“Create Block Masks” | `Simulink.Mask`

removeAllCrossParameterConstraints

Class: Simulink.Mask

Package: Simulink

Delete all cross-parameter constraints from a mask

Syntax

```
maskObj.removeAllCrossParameterConstraints()
```

Description

`maskObj.removeAllCrossParameterConstraints()` deletes all cross-constraints from a mask.

Examples

```
% Get block mask handle.  
maskObj = Simulink.Mask.get(gcb);  
  
% Remove all cross constraints from the mask.  
maskObj.removeAllCrossParameterConstraints()
```

See Also

“Create Block Masks” | Simulink.Mask

Introduced in R2018a

getParameterConstraint

Class: Simulink.Mask

Package: Simulink

Get mask parameter constraint properties

Syntax

```
paramConstraint = maskObj.getParameterConstraint(paramConstraintName)
```

Description

`paramConstraint = maskObj.getParameterConstraint(paramConstraintName)` gets the properties of a mask parameter constraint.

Input Arguments

maskObj — Block mask handle

mask object

Handle to the block mask, specified as mask object. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information, see `Simulink.Mask.get`.

Data Types: char | cell

paramConstraintName — Mask constraint name

character vector | string

Name of the constraint of which you want get the properties, specified as character vector.

Output Arguments

paramConstraint — Mask constraint property

cell array of character vector

Constraint properties, returned as a cell array.

Examples

```
% Get block mask handle.
```

```
maskObj = Simulink.Mask.get(gcb);
```

```
% Find parameters associated with the constraint.
```

```
paramConstraint = maskObj.getParameterConstraint('const3')
```

```
ans =
```

```
Constraints with properties:
```

```
Name: 'const3'  
ConstraintRules: [1x2 Simulink.Mask.ParameterConstraintRules]
```

See Also

“Create Block Masks” | `Simulink.Mask`

Introduced in R2018a

getCrossParameterConstraint

Class: Simulink.Mask

Package: Simulink

Get cross-parameter constraint

Syntax

```
CrossConstraint = maskObj.getCrossParameterConstraint(CrossConstraintName)
```

Description

`CrossConstraint = maskObj.getCrossParameterConstraint(CrossConstraintName)` gets the properties of a cross parameter constraint on a mask. Apply a cross-parameter constraint to specify rules between mask parameter values.

Input Arguments

maskObj — Block mask handle

mask object

Handle to the block mask, specified as mask object. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information, see `Simulink.Mask.get`.

Data Types: char | cell

CrossConstraintName — Cross-constraint name

character vector | string

Name of the cross-parameter constraint for which you get the constraint properties, specified as the mask object.

Output Arguments

CrossConstraint — Cross-constraint property

cell array

Cross-parameter constraint properties, returned as a cell array.

Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get cross constraint.
CrossConstraint = maskObj.getCrossParameterConstraint('crossparam1')

ans =
```

```
CrossParameterConstraints with properties:  
    Name: 'crossparam1'  
    Rule: 'Parameter2 > Parameter3'  
    ErrorMessage: ''
```

See Also

“Create Block Masks” | `Simulink.Mask`

Introduced in R2018a

getAssociatedParametersOfConstraint

Class: Simulink.Mask

Package: Simulink

Get mask parameters associated with a constraint

Syntax

```
maskParam = maskObj.getAssociatedParametersOfConstraint(paramConstraintName)
```

Description

`maskParam = maskObj.getAssociatedParametersOfConstraint(paramConstraintName)` gets the parameters that are associated with a mask constraint.

Input Arguments

maskObj — Block mask handle

mask object

Handle to the block mask, specified as mask object. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information, see `Simulink.Mask.get`.

Data Types: char | cell

paramConstraintName — Mask constraint name

character vector | string

Name of the constraint for which you want to find the associated mask parameters, specified as character vector.

Output Arguments

maskParam — Mask parameter name

cell array of character vector

Mask parameter, specified as a cell array.

Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Find parameters associated with the constraint.
maskParam = maskObj.getAssociatedParametersOfConstraint('const3')

ans =

    1×1 cell array
```

```
{'Parameter1'}
```

See Also

“Create Block Masks” | [Simulink.Mask](#)

Introduced in R2018a

addCrossParameterConstraint

Class: Simulink.Mask

Package: Simulink

Add cross-parameter constraint

Syntax

```
CrossConstraint = maskObj.addCrossParameterConstraint(Name,Value)
```

Description

`CrossConstraint = maskObj.addCrossParameterConstraint(Name,Value)` adds a constraint among parameters of a mask.

Input Arguments

maskObj — Block mask handle

mask object

Block mask handle, specified as a mask object. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information, see `Simulink.Mask.get`.

Data Types: `char` | `cell`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Name — Cross-parameter constraint name

character vector | string

Cross-parameter constraint name, specified as a character vector. Must be a valid MATLAB value.

Rule — Cross-parameter constraint rule

MATLAB expression | string

Cross-parameter constraint rule, specified as a valid MATLAB expression that returns logical true or false. You can specify multiple rules by separating them with a logical operators like `&&`. For example, `parameter1 > parameter2 && parameter2 > parameter3`. Here, `parameter1`, `parameter2` and `parameter3` are parameters of a mask.

ErrorMessage — Error message

character vector | string

Optional field. Specifies the error message to be displayed when the cross parameter constraint rule is not satisfied. You can specify the error message as character vector or as a message catalog ID. If you use the message catalog ID to specify an error, the error message must not have any holes in it. Simulink displays a default error message if no user-defined error message is found.

Output Arguments

CrossConstraint — Cross parameter constraint

cell array

Handle to the cross-parameter constraint, returned as a cell array.

Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Add cross parameter constraint.
CrossConstraint = maskObj.addCrossParameterConstraint('Name','crossconstraint1',...
'Rule','upperbound > lowerbound','ErrorMessage','Incorrect value specified.')
```

```
ans =
```

```
  CrossParameterConstraints with properties:
```

```
      Name: 'crossconstraint1'
      Rule: 'upperbound > lowerbound'
  ErrorMessage: 'Incorrect value specified.'
```

“Create Block Masks” | Simulink.Mask

Introduced in R2018a

Simulink.Mask.Constraints class

Package: Simulink.Mask

Create Mask Constraint

Description

Use an instance of the `Simulink.Mask.Constraint` to add or remove a parameter constraint rule.

Properties

DataType

Specifies the data type associated with the constraint rule.

Type: double, single, numeric, integer, int8, uint8, int16, uint16, int32, uint32, boolean, enum, fixdt, string

Default: Empty

Dimension

Specifies the dimension associated with the constraint rule.

Type: scalar, rowvector, columnvector, 2dmatrix, ndmatrix

Default: Empty

Complexity

Specifies the complexity associated with the constraint rule.

Type: real, complex

Default: Empty

Sign

Specifies the sign associated with the constraint rule.

Type: positive, negative, zero

Default: Empty

Finiteness

Specifies the finiteness associated with the constraint rule.

Type: finite, inf, -inf, NaN

Default: Empty

Range

Specifies the range associated with the constraint rule.

Type: Minimum, Maximum

Default: Empty

CustomConstraint

Specifies the custom constraint associated with the constraint rule.

Type: Valid MATLAB expression

Default: Empty

CustomErrorMessage

Specifies the custom error message associated with the custom constraint rule.

Type: Character vector

Default: Empty

Methods

addParameterConstraintRule

Add rules to a parameter constraint

removeParameterConstraintRule

Delete a mask parameter constraint rule

See Also

Introduced in R2018a

addParameterConstraintRule

Class: Simulink.Mask.Constraints

Package: Simulink.Mask

Add rules to a parameter constraint

Syntax

```
paramConstRule = paramConstraint.addParameterConstraintRule(Name,Value)
```

Description

`paramConstRule = paramConstraint.addParameterConstraintRule(Name,Value)` adds rule to a parameter constraint.

Input Arguments

paramConstraint — Handle to mask constraint

constraint object

Handle to the mask parameter constraint for which you want to add constraint rules, specified as constraint object.

Data Types: char | cell

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Name-Value Pair for Rules

Name	Value
DataType	double, single, numeric, integer, int8, uint8, int16, uint16, int32, uint32, boolean, enum, fixdt
Dimension	scalar, rowvector, columnvector, 2dmatrix, ndmatrix
Complexity	real, complex
Sign	positive, negative, zero
Finiteness	finite, inf, -inf, NaN
Minimum	string
Maximum	string
CustomConstraint	Valid MATLAB expression

Output Arguments

paramConstRule — Mask constraint rule

cell array

Mask constraint rule, specified as a cell array.

Examples

```
% Get mask constraint handle
paramConstraint = maskObj.getParameterConstraint('const3');

% Add rules to the constraint.
paramConstRule = paramConstraint.addParameterConstraintRule('DataType','int8')
```

ans =

ParameterConstraintRules with properties:

```
    DataType: 'int8'
    Dimension: {0x1 cell}
    Complexity: {0x1 cell}
           Sign: {0x1 cell}

removeParameterConstraintRule

Class: Simulink.Mask.Constraints

Package: Simulink.Mask

Delete a mask parameter constraint rule

Syntax

```
paramConstraint.removeParameterConstraintRule(RuleIndex)
```

Description

`paramConstraint.removeParameterConstraintRule(RuleIndex)` deletes the specified constraint rule from a mask parameter constraint.

Input Arguments

paramConstraint — Handle to constraint

constraint object

Handle to mask parameter constraint of which you want to remove constraint rule, specified as an object.

Data Types: char | cell

RuleIndex — Constraint rule index

integer

Index number of the mask constraint rule, specified as an integer.

Examples

```
% Get block mask handle.  
maskObj = Simulink.Mask.get(gcb);  
  
% Get mask constraint handle.  
paramConstraint = maskObj.getParameterConstraint('const3');  
  
% Remove mask constraint rule.  
paramConstraint.removeParameterConstraintRule(1)
```

See Also

“Create Block Masks” | Simulink.Mask

Introduced in R2018a

addColumn

Class: Simulink.dialog.parameter.CustomTable

Package: Simulink.dialog.parameter

Add new column in the custom table

Syntax

```
tableControl.addColumn(Name, Value)
```

Description

`tableControl.addColumn(Name, Value)` adds a column with the specified properties in the custom table.

Input Arguments

tableControl — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: char vector | cell array

Specify optional comma-separated pairs of `Name, Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Add column.
tableControl.addColumn( 'Name', 'HDL Name', 'Type', 'edit' );
```

setTableCell

Class: Simulink.dialog.parameter.CustomTable

Package: Simulink.dialog.parameter

Set the properties of a custom table cell

Syntax

```
tableCell = tableControl.setTableCell([rowIdx colIdx], Type customtable,  
Evaluate, off)
```

Description

`tableCell = tableControl.setTableCell([rowIdx colIdx], Type customtable, Evaluate, off)` sets the specified properties of a cell in a custom table.

Input Arguments

tableControl — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: Numeric Array Name Value Pair

rowIdx — Row index

Row index number of the custom table cell for which the value is being fetched.

For example, '3'.

colIdx — Column index

Column index number of the custom table cell for which the value is being fetched.

For example, '5'.

Examples

```
% Get block mask handle.  
maskObj = Simulink.Mask.get(gcb);  
  
% Get custom table handle.  
tableControl = maskObj.getDialogControl('myTable');  
  
% Get cell properties.
```

```
tableCell = tableControl.setTableCell([2 2]);
```

getNumberOfColumns

Class: Simulink.dialog.parameter.CustomTable

Package: Simulink.dialog.parameter

Get value of a table cell

Syntax

```
numberOfColumns = tableControl()
```

Description

`numberOfColumns = tableControl()` gets the number of columns in a custom table.

Output Arguments

numberOfColumns — Table cell value

integer

Number of columns in the custom table returned as an integer.

Examples

```
% Get block mask handle.  
maskObj = Simulink.Mask.get(gcb);  
  
% Get custom table handle.  
tableControl = maskObj.getDialogControl('myTable');  
  
% Get cell value.  
numberOfColumns = tableControl.getNumberOfColumns();
```

See Also

“Create Block Masks” | Simulink.Mask

Introduced in R2019a

getNumberOfRows

Class: Simulink.dialog.parameter.CustomTable

Package: Simulink.dialog.parameter

Get the number of rows available in a custom table

Syntax

```
numberOfRows = tableControl()
```

Description

`numberOfRows = tableControl()` gets the number of rows in a custom table.

Output Arguments

numberOfRows — Number of Rows

integer

Number of rows in the custom table returned as an integer.

Examples

```
% Get block mask handle.  
maskObj = Simulink.Mask.get(gcf);  
  
% Get custom table handle.  
tableControl = maskObj.getDialogControl('myTable');  
  
% Get number of rows.  
numberOfRows = tableControl.getNumberOfRows();
```

See Also

“Create Block Masks” | Simulink.Mask

Introduced in R2019a

addRow

Class: Simulink.dialog.parameter.CustomTable

Package: Simulink.dialog.parameter

Add a new row in the custom table

Syntax

```
NewRow = tableControl.addRow(RowValue)
```

Description

`NewRow = tableControl.addRow(RowValue)` adds a row with the specified properties in the custom table.

Input Arguments

tableControl — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: char vector

RowValue — Row Values for each column

table object

Row values specified for the number of columns available. If five values are provided for `RowValue` in a custom table with five columns, one row is added to the table. If 10 row values are added for such a table, then two rows are added.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: char vector | cell array

Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Add a row with six column values.
tableControl.addRow( 'sig5', 'Input', 'Inherit', 'Inherit', 'on', 'Inherit' );
```

getChangedCells

Class: Simulink.dialog.parameter.CustomTable

Package: Simulink.dialog.parameter

Get all the changed cells of a custom table

Syntax

```
changedCells = tableControl.getChangedCells()
```

Description

`changedCells = tableControl.getChangedCells()` gets the properties of a cell in the custom table.

Output Arguments

changedCells — Cells in a custom table whose values have been changed

cell array

Shows the changed cells in a custom table.

Examples

```
% Get block mask handle.  
maskObj = Simulink.Mask.get(gcb);  
  
% Get custom table handle.  
tableControl = maskObj.getDialogControl('myTable');  
  
% Get changed cells.  
changedCell = tableControl.getchangedCells( );
```

```
ans =
```

```
    1x4 cell array  
  
    {1x2 double}    {1x2 double}    {1x2 double}    {1x2 double}  
Output: Cell Array  
Input: None
```

getColumn

Class: Simulink.dialog.parameter.CustomTable

Package: Simulink.dialog.parameter

Get the column properties

Syntax

```
FetchColumn = tableControl.getColumn(column)
```

Description

`FetchColumn = tableControl.getColumn(column)` fetches the information from the specified column of the custom table.

Input Arguments

tableControl — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: integer

columnIndex — Column Index

string | character array

Index of the column in the custom table.

For example, '4'.

Output Arguments

fetchcolumn — Column properties

column object

Column object

Examples

```
% Get block mask handle.
```

```
maskObj = Simulink.Mask.get(gcb);
```

```
% Get custom table handle.
```

```
tableControl = maskObj.getDialogControl('myTable');
```

```
% Get properties of column 3.  
tableControl.getColumn(3);
```

```
ans =
```

```
TableParamColumnInfo with properties:
```

```
    Name: 'Data Type'  
    Type: 'popup'  
  Enabled: 'on'  
TypeOptions: {4x1 cell}
```

getSelectedRows

Class: Simulink.dialog.parameter.CustomTable

Package: Simulink.dialog.parameter

Get all the selected rows of a custom table

Syntax

```
selectedRows = tableControl.getSelectedRows()
```

Description

`selectedRows = tableControl.getSelectedRows()` fetches the information from the specified column of a custom table.

Output Arguments

selectedRows — Row information

numeric array

Value of the specified rows, returned as a numeric array.

Examples

```
% Get block mask handle.  
maskObj = Simulink.Mask.get(gcb);  
  
% Get custom table handle.  
tableControl = maskObj.getDialogControl('myTable');  
  
% Get selected rows.  
selectedRows = tableControl.getSelectedRows();
```

```
ans =
```

```
     3     4
```

getTableCell

Class: Simulink.dialog.parameter.CustomTable

Package: Simulink.dialog.parameter

Get the properties of a custom table cell

Syntax

```
tableCell = tableControl.getTableCell([rowIdx colIdx])
```

Description

`tableCell = tableControl.getTableCell([rowIdx colIdx])` gets the properties of a cell in a custom table.

Input Arguments

tableControl — Custom table handle

table object

Handle to a custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: numeric array

rowIdx — Row index

Row index number of the custom table cell for which the value is being fetched.

For example, '3'.

colIdx — Column index

Column index number of the custom table cell for which the value is being fetched.

For example, '5'.

Output Arguments

tableCell — Table cell object

cell object

Properties of the table cell, returned as a cell array.

Examples

```
% Get block mask handle.  
maskObj = Simulink.Mask.get(gcb);
```

```
% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Get cell properties.
tableCell = tableControl.getTableCell( [2 2] );

tableCell =

    CustomTableParamCellObject with properties:

        Value: 'Inherit'
        Type: 'popup'
        Enabled: 'off'
        TypeOptions: {4x1 cell}

tableCell.Value = 'Value'
```

getValue

Class: Simulink.dialog.parameter.CustomTable

Package: Simulink.dialog.parameter

Get value of a table cell

Syntax

```
tableCellValue = tableControl.getValue([rowIdx colIdx])
```

Description

`tableCellValue = tableControl.getValue([rowIdx colIdx])` gets the value of a cell in a custom table.

Input Arguments

tableControl — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: numeric array

rowIdx — Row index

|

Row index number of the custom table cell for which the value is being fetched.

For example, [2 2].

colIdx — Column index

|

Column index number of the custom table cell for which the value is being fetched.

For example,[2 2].

Output Arguments

tableCellValue — Table cell value

character vector

Value of the table cell, returned as a character vector.

Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Get cell value.
tableCellValue = tableControl.getValue([2 2]);
```

```
ans =
    'Input'
```

insertColumn

Class: Simulink.dialog.parameter.CustomTable

Package: Simulink.dialog.parameter

Insert a column at a specific position in the custom table

Syntax

```
tableControl.insertColumn(columnIndex[Name,Value])
```

Description

`tableControl.insertColumn(columnIndex[Name,Value])` inserts a column with the specified properties at a specified index in a custom table.

Input Arguments

tableControl — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: char vector | cell array

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name, Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Type —

edit | checkbox | popup

Type of control that is used to specify the value of this parameter. The permitted values are: edit (default), checkbox, popup.

TypeOptions —

''

The options that are displayed within a popup control or in a promoted parameter. This field is a cell array.

Enabled —

'on' | 'off'

Option to specify whether the user can set parameter value.

Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Insert a column at the fifth position.
tableControl.insertColumn(5, 'Name', 'HDL Name', 'Type', 'edit');
```

See Also

“Create Block Masks” | Simulink.Mask

insertRow

Class: Simulink.dialog.parameter.CustomTable

Package: Simulink.dialog.parameter

Insert a row at a specific position in a custom table

Syntax

```
InsertedRow = tableControl.insertRow(rowIndex,string1,string2)
```

Description

`InsertedRow = tableControl.insertRow(rowIndex,string1,string2)` inserts a row with specified properties at the specified index in a custom table.

Input Arguments

tableControl — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: `char` | `vector` | `cell` | `array`

rowIndex — Row Index

Index in table at which the new row is to be inserted.

For example, '4'.

Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Insert Row.
tableControl.insertRow( rowIndex,'insertSig4', 'Input', 'Inherit', 'Inherit', 'on', 'Inherit' );
```

removeColumn

Class: Simulink.dialog.parameter.CustomTable

Package: Simulink.dialog.parameter

Remove an existing column from a specific position in a custom table

Syntax

```
tableControl.removeColumn(columnIndex)
```

Description

`tableControl.removeColumn(columnIndex)` removes a column from the specified index in a custom table.

Input Arguments

tableControl — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: `string`

columnIndex — Column Index

integer

Column index number of the custom table from which the column is to be removed.

For example, '4'.

Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Remove the third column.
tableControl.removeColumn(3);
```

removeRow

Class: Simulink.dialog.parameter.CustomTable

Package: Simulink.dialog.parameter

Remove an existing row from a specific position in a custom table

Syntax

```
tableControl.removeRow(rowIndex)
```

Description

`tableControl.removeRow(rowIndex)` removes the row from a specified position in a custom table.

Input Arguments

tableControl — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: integer

rowIndex — Row Index

Row index number of the custom table from which the row is to be removed.

For example, '4'.

Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Remove row with index number 6.
tableControl.removeRow(6);
```

swapRows

Class: Simulink.dialog.parameter.CustomTable

Package: Simulink.dialog.parameter

Swap two existing rows in a custom table

Syntax

```
tableControl.swapRows(rowIndex1, rowIndex2)
```

Description

`tableControl.swapRows(rowIndex1, rowIndex2)` swaps specified rows in a custom table.

Input Arguments

tableControl — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: `integer`

rowIndex1 — Row Index value

`integer`

Row index number of the first row to be swapped with another row.

For example, '4'.

rowIndex2 — Row Index value

`integer`

Row index number of the second row to be swapped with another row.

For example, '5'.

Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Swap rows 3 and 6.
```

```
tableControl.swapRows(3,6);
```

Simulink.dialog.parameter.CustomTable class

Package: Simulink.dialog.parameter

Create custom tables programmatically

Description

Use an instance of `Simulink.dialog.parameter.CustomTable` class to perform the following operations:

- Create and remove custom tables
- Insert, remove, and get values of columns.
- Insert, remove, swap, and add rows.

Methods

<code>addColumn</code>	Add new column in the custom table
<code>setTableCell</code>	Set the properties of a custom table cell
<code>getNumberOfColumns</code>	Get value of a table cell
<code>getNumberOfRows</code>	Get the number of rows available in a custom table
<code>addRow</code>	Add a new row in the custom table
<code>getChangedCells</code>	Get all the changed cells of a custom table
<code>getColumn</code>	Get the column properties
<code>getSelectedRows</code>	Get all the selected rows of a custom table
<code>getTableCell</code>	Get the properties of a custom table cell
<code>getValue</code>	Get value of a table cell
<code>insertColumn</code>	Insert a column at a specific position in the custom table
<code>insertRow</code>	Insert a row at a specific position in a custom table
<code>removeColumn</code>	Remove an existing column from a specific position in a custom table
<code>removeRow</code>	Remove an existing row from a specific position in a custom table
<code>swapRows</code>	Swap two existing rows in a custom table

Simulink.dialog.ListBoxControl class

Package: Simulink.dialog

Control listbox programmatically

Description

Use an instance of `Simulink.dialog.ListBoxControl` class to perform the following operations:

- Get selected items from the listbox
- Set selected items in the listbox

Properties

Name

Uniquely identifies the dialog control and is a required field.

Type: character vector

Prompt

Specifies the text displayed on the button dialog control.

Type: character vector

Default: empty

Type Options

Specifies the options shown in the listbox.

Type: cell array

Default: empty

Callback

Specifies the MATLAB command (s) to be executed when the dialog control is invoked.

Type: character vector

Default: empty

Row

Specifies whether dialog control is placed on the current row or on a new row.

Type: character vector

Value: 'current' | 'new'

Default: 'current'

Enabled

Indicates whether container is active on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

Visible

Indicates whether container is displayed on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

Multiselect

Indicates whether container is enabled for multiple selection.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

Methods

setSelectedItems	Set values for a listbox
getSelectedItems	Get the values of selected items from a listbox

See Also

Topics

setSelectedItems

Class: Simulink.dialog.ListBoxControl

Package: Simulink.dialog

Set values for a listbox

Syntax

```
setItems = listBoxControl.setSelectedItems({string1,'string2',...})
```

Description

`setItems = listBoxControl.setSelectedItems({string1,'string2',...})` set the values for the selected items in the listbox.

Input Arguments

listControl — Lisbox handle

table object

Handle to the listbox, specified as an object. You can use the `getDialogControl` command to get the listbox handle. For more information, see `getDialogControl`.

For example, `listboxControl = maskObj.getDialogControl('listboxname')`. Here, `maskObj` is the mask object and `listboxname` is the name of the listbox.

Data Types: cell array

string1 — value to be set

string

Value to be set for selected items in the listbox

For example, 'Hello'.

Examples

```
% Get block mask handle
maskObj = Simulink.Mask.get(gcb);

% Get listbox handle
listboxControl = maskObj.getDialogControl('Control2');

% Set selected items
listboxControl.setSelectedItems({'Hello','World'});
```

See Also

"Create Block Masks" | Simulink.Mask

Introduced in R2019a

getSelectedItems

Class: Simulink.dialog.ListBoxControl

Package: Simulink.dialog

Get the values of selected items from a listbox

Syntax

```
getItems = listBoxControl.getSelectedItems()
```

Description

`getItems = listBoxControl.getSelectedItems()` fetches the information of the selected items from the listbox.

Output Arguments

getItems — value of selected items

cell array

Value of the selected items, returned as a cell array.

Examples

```
% Get block mask handle
maskObj = Simulink.Mask.get(gcb);

% Get listbox handle
listBoxControl = maskObj.getDialogControl('Control2');

% Get selected items
getItems = listBoxControl.getSelectedItems();

getItems =
    1x2 cell array
    {'Hello', 'World'}
```

“Create Block Masks” | Simulink.Mask

Introduced in R2019a

Simulink.MaskParameter class

Package: Simulink

Control mask parameters programmatically

Description

Use an instance of `Simulink.MaskParameter` to set the properties of mask parameters.

Properties

Type

Specifies the mask parameter type.

Type: character vector

Values:

'edit' | 'checkbox' | 'popup' | 'min' | 'max' | 'promote' | 'combobox' | 'radiobutton' | 'unit' | 'slider' | 'dial' | 'spinbox'

Default: 'edit'

TypeOptions

Specifies the option for the parameter if it exists, otherwise, it is empty. Applicable for parameters of type popup, radio, `DatatypeStr`, and promote .

Type: cell array of character vectors

Default: {}

Name

Specifies the name of the mask parameter. This name is assigned to the mask workspace variable created for the mask parameter. The mask parameter name must not match the built-in parameter name.

Type: character vector

Default: Auto generated

Prompt

Specifies a character vector that appears as the label associated with the parameter on the mask dialog.

Type: character vector

Default: Empty character vector

Value

Specifies the value of the mask parameter.

Default: Depends on the type of the parameter.

Evaluate

Indicates if the parameter value is to be evaluated in MATLAB or treated as a character vector when the block is evaluated.

Type: boolean

Values: 'on' | 'off'

Default: 'on'

Tunable

Indicates if the parameter value can be changed during simulation.

Type: boolean

Values: 'on' | 'off'

Default: 'on'

NeverSave

Indicates if the parameter value gets saved in the model file.

Type: boolean

Values: 'on' | 'off'

Default: 'off'

Hidden

Indicates if the parameter should never show on the mask dialog box.

Type: boolean

Values: 'on' | 'off'

Default: 'off'

ReadOnly

Indicates if the parameter on the mask dialog box is editable or is read-only.

Type: boolean

Values: 'on' | 'off'

Default: 'off'

Enabled

Indicates if the parameter is enabled in the mask dialog box.

Type: boolean

Values: 'on' | 'off'

Default: 'on'

Visible

Indicates if the parameter is visible in the mask dialog box.

Type: boolean

Values: 'on' | 'off'

Default: 'on'

ShowTooltip

Indicates if tool tip is enabled for the mask parameter.

Type: boolean

Values: 'on' | 'off'

Default: 'on'

Callback

Specifies the MATLAB code that executes when a user changes the parameter value from the mask dialog box.

Type: character vector

Default: Empty character vector

TabName

Specifies the tab name of the mask dialog box where the parameter is displayed.

Type: character vector

Default: Empty character vector

Alias

Specifies the alternate name for mask parameter.

Type: character vector

Default: Empty character vector

DialogControl

Specifies the layout options of mask dialog.

Type: Class of type Simulink.dialog.parameter.<Typeofparameter>

Values:

'edit' | 'checkbox' | 'popup' | 'min' | 'max' | 'promote' | 'combobox' | 'radiobutton' | 'unit' | 'slider' | 'dial' | 'spinbox'

Default: Edit

ConstraintName

Indicates the constraint associated with a parameter. To associate a constraint programmatically the constraint must be already available. To associate a constraint from a mat file use the format <matfilename>:<constraintname>.

Type: character vector

Default: Empty character vector

Methods

set Set properties of mask parameters

```

Description

`Simulink.MaskParameter.set(Name, Value)` sets the properties of a mask parameter.

Input Arguments

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1, Value1, . . . , NameN, ValueN`.

Type

Type of control that is used to specify the value of this parameter.

Default: edit

TypeOptions

The options that are displayed within a popup control or in a promoted parameter. This field is a cell array.

Default: empty

Name

The name of the mask parameter. This name is assigned to the mask workspace variable created for this parameter.

Default: empty

Prompt

Text that identifies the parameter on the Mask Parameters dialog.

Default: empty

Value

The default value of the mask parameter in the Mask Parameters dialog.

Default: Type specific; depends on the Type of the parameter

Evaluate

Option to specify whether parameter must be evaluated.

Default: 'on'

Tunable

Option to specify whether parameter is tunable.

Default: 'on'

Enabled

Option to specify whether user can set parameter value.

Default: 'on'

Visible

Option to set whether mask parameter is hidden or visible to the user.

Default: 'on'

Callback

Container for MATLAB code that executes when user makes a change in the Mask Parameters dialog and clicks **Apply**.

Default: empty

Examples

- 1 Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```

- 2 Get a mask parameter.

```
a = p.Parameters(1);
```

- 3 Edit mask parameter so it is of type popup, cannot be evaluated.

```
a.set('Type','popup','TypeOptions',{'Red' 'Blue' 'Green'},...
'Evaluate','off');
```

Simulink.dialog.Control class

Package: Simulink.dialog

Create instances of dialog control

Description

Use an instance of `Simulink.dialog.Control` class to create, delete, or search dialog controls.

Properties

Name

Uniquely identifies the dialog control element and is a required field.

Type: character vector

See Also

`Simulink.dialog.Button` | `Simulink.dialog.Hyperlink` | `Simulink.dialog.Image` | `Simulink.dialog.Text` | `Simulink.dialog.parameter.Control` | `Simulink.dialog.Container` | "Create Block Masks"

Simulink.dialog.Container class

Package: Simulink.dialog

Create instances of a container dialog control

Description

Use an instance of Simulink.dialog.Container class to add container type dialog control.

Properties

Name

Uniquely identifies the container dialog control and is a required field.

Type: character vector

Enabled

Indicates whether container is active on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

Visible

Indicates whether container is displayed on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

AlignPrompts

Allows you to align the parameters vertically on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'off'

DialogControls

Specifies the child dialog controls contained in the container.

Type: Simulink.dialog.Control

Default: Empty array

Methods

<code>addDialogControl</code>	Add dialog control elements to mask dialog box
<code>removeDialogControl</code>	Remove dialog control element from mask dialog box
<code>getDialogControl</code>	Search for a specific dialog control on the mask

See Also

`Simulink.dialog.Group` | `Simulink.dialog.Panel` | `Simulink.dialog.Tab` | `Simulink.dialog.TabContainer` | `Simulink.dialog.Control` | "Create Block Masks"

addDialogControl

Class: Simulink.dialog.Container

Package: Simulink.dialog

Add dialog control elements to mask dialog box

Syntax

```
successIndicator = maskObj.addDialogControl(controlType,controlIdentifier)  
successIndicator = maskObj.addDialogControl(Name,Value)
```

Description

`successIndicator = maskObj.addDialogControl(controlType,controlIdentifier)` adds dialog control elements like text, hyperlinks, or tabs to mask dialog box. First get the mask object and assign it to the variable `maskObj`

`successIndicator = maskObj.addDialogControl(Name,Value)` specifies the `Name` and `Value` arguments for an element on the mask dialog box. You can specify multiple `Name-Value` pairs.

Input Arguments

controlType — Value type of dialog control element

character vector

Type of dialog control element, specified

- 'panel'
- 'group'
- 'tabcontainer'
- 'tab'
- 'collapsiblepanel'
- 'text'
- 'image'
- 'hyperlink'
- 'pushbutton'

controlIdentifier — Unique identifier for the element

character vector

Specifies the programmatic identifier for the element of mask dialog box. Use a name that is unique and does not have space between words. For more information, see “Variable Names” (MATLAB).

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' ') and is case-sensitive.

You can specify several name and value pair arguments in any order as Name1, Value1, . . . , NameN, ValueN.

Type

Type of control that is used to specify the value of this dialog control element. Type is a required argument. The permitted values are 'panel', 'group', 'tabcontainer', 'tab', 'collapsiblepanel', 'text', 'image', 'hyperlink', and 'pushbutton'. If the parent dialog control type is 'tabcontainer', the child dialog control must be 'tab'.

Name

The identifier of the dialog control element. Name is a required argument. This field is available for all dialog control types.

Prompt

Text that is displayed in the dialog control element on the Mask dialog box. This field is available for all except for panel and image dialog control types.

Default: empty

Enabled

Option to specify whether you can set value for the dialog control element. This field is available for all dialog control types.

Default: 'on'

Visible

Option to set whether the dialog control element is hidden or visible to the user. This field is available for all dialog control types.

Default: 'on'

Callback

Container for MATLAB code that executes when you edit the dialog control element and click **Apply**. This field is available only for the hyperlink and pushbutton dialog control types.

Default: empty

Row

Option to set whether the dialog control is placed in the new row or the same row. This field is available for all dialog control types.

Default: empty

FilePath

Contains the path to an image file. This field is available for image, and pushbutton dialog control types.

Default: empty

Container

Option to specifies a container for the child dialog control. The permitted values are the names of 'panel', 'group', and 'tab' dialog controls.

Examples

Add Dialog Control Elements to Mask Dialog Box

Get mask object and add dialog control element to it.

```
% Get mask object on model Engine
maskObj = Simulink.Mask.get('Engine/Gain');

% Add hyperlink to mask dialog box

maskLink = maskObj.addDialogControl('hyperlink','link');
maskLink.Prompt = 'Mathworks Home Page';
maskLink.Callback = 'web(''www.mathworks.com'')'

% Alternative method to add hyperlink

maskLink = maskObj.addDialogControl('hyperlink','link');
maskLink.Prompt = 'www.mathworks.com';

% Add text to mask dialog box

maskText = maskObj.addDialogControl('text','text_tag');
maskText.Prompt = 'Enable range checking';

% Add button to mask dialog box

maskButton = maskObj.addDialogControl('pushbutton','button_tag');
maskButton.Prompt = 'Compute';
```

Add Dialog Control Elements to Mask Dialog Box Tabs

Create tabs on the mask dialog box and add elements to these tabs.

```
% Get mask object on a block named 'GainBlock'
maskObj = Simulink.Mask.get('GainBlock/Gain');

% Create a tab container

maskObj.addDialogControl('tabcontainer','allTabs');
tabs = maskObj.getDialogControl('allTabs');

% Create tabs and name them

maskTab1 = tabs.addDialogControl('tab','First');
maskTab1.Prompt = 'First tab';
```

```
maskTab2 = tabs.addDialogControl('tab','Second');
maskTab2.Prompt = 'Second tab';

% Add elements to one of the tabs

firstTab = tabs.getDialogControl('First');
firstTab.addDialogControl('text','textOnFirst');
firstTab.getDialogControl('textOnFirst').Prompt = 'Tab one';
```

Add Dialog Control Element Using Name-Value Pair

Add dialog control element and specify values for it

```
% Get mask object on model Engine

maskObj = Simulink.Mask.get('Engine/Gain');

% Add a dialog box and specify values for it

maskDialog = maskObj.addDialogControl('Type','text',...
'Prompt','hello','Visible','off');
```

removeDialogControl

Class: Simulink.dialog.Container

Package: Simulink.dialog

Remove dialog control element from mask dialog box

Syntax

```
successIndicator = maskVariable.removeDialogControl(controlIdentifier)
```

Description

`successIndicator = maskVariable.removeDialogControl(controlIdentifier)` removes dialog control element, specified by `controlIdentifier`, like text, hyperlinks, or tabs from a mask dialog box. First get the mask object and assign it to the variable `maskVariable`.

Successful removal of a dialog control element returns a Boolean value of 1.

Input Arguments

controlIdentifier — Unique identifier for the element

character vector

Programmatic identifier for the dialog control element of mask dialog box, specified as a character vector.

Examples

Remove Dialog Control Element from Mask Dialog Box

```
% Get mask object on the Gain block in the model Engine.
```

```
maskObj = Simulink.Mask.get('Engine/Gain');
```

```
% Remove element named AllTab from mask dialog box.
```

```
maskTab = maskObj.removeDialogControl('AllTab');
```

Simulink.dialog.Container | “Create Block Masks”

Introduced in R2013b

getDialogControl

Class: Simulink.dialog.Container

Package: Simulink.dialog

Search for a specific dialog control on the mask

Syntax

```
[control, phandle] = handle.getDialogControl(controlIdentifier)
```

Description

[control, phandle] = handle.getDialogControl(controlIdentifier), search for a specific child dialog control recursively on the mask dialog box.

Input Arguments

controlIdentifier

Name of the dialog control being searched on the mask dialog box.

Default:

Output Arguments

control

Target dialog control being searched on the mask dialog box.

phandle

Parent of the dialog control being searched mask dialog box.

Examples

Find a dialog control

Find a text dialog control on the mask dialog box. `maskObj` is the handle to the mask object. The `getDialogControl` method returns the handle to the dialog control (`hdlgctrl`) and handle to the parent dialog control (`phandle`).

```
[hdlgctrl, phandle] = maskObj.getDialogControl('txt_var')
```

Simulink.dialog.Panel class

Package: Simulink.dialog

Create an instance of a panel dialog control

Description

Use an instance of Simulink.dialog.Panel class to create an instance of panel dialog control.

Properties

Name

Uniquely identifies the panel dialog control and is a required field.

Type: character vector

Row

Specifies whether panel is placed on the current row or on a new row.

Type: character vector

Values: 'current' | 'new'

Default: 'new'

Enabled

Specifies whether panel is active on the mask dialog box.

Type: boolean

Values: 'on' | 'off'

Default: 'on'

Visible

Specifies whether panel is displayed on the mask dialog box.

Type: boolean

Values: 'on' | 'off'

Default: 'on'

DialogControls

Specifies the child dialog controls contained in the panel.

Type: Simulink.dialog.Control

Default: Empty array

Methods

<code>addDialogControl</code>	Add dialog control elements to mask dialog box
<code>removeDialogControl</code>	Remove dialog control element from mask dialog box
<code>getDialogControl</code>	Search for a specific dialog control on the mask

Simulink.dialog.Group class

Package: Simulink.dialog

Create an instance of a group dialog control

Description

Use an instance of Simulink.dialog.Group class to create an instance of group dialog control.

Properties

Name

Uniquely identifies the group dialog control and is a required field.

Type: character vector

Prompt

Specifies the text displayed on the group.

Type: character vector

Default: Empty character vector

Row

Specifies whether group is placed on the current row or on a new row.

Type: character vector

Values: 'current' | 'new'

Default: 'new'

Enabled

Specifies whether group is active on the mask dialog box.

Type: boolean

Values: 'on' | 'off'

Default: 'on'

Visible

Specifies whether group is displayed on the mask dialog box.

Type: boolean

Values: 'on' | 'off'

Default: 'on'

DialogControls

Specifies the child dialog controls contained in the group.

Type: Simulink.dialog.Control

Default: Empty array

Methods

addDialogControl	Add dialog control elements to mask dialog box
removeDialogControl	Remove dialog control element from mask dialog box
getDialogControl	Search for a specific dialog control on the mask

Simulink.dialog.Tab class

Package: Simulink.dialog

Create an instance of a tab dialog control

Description

Use an instance of `Simulink.dialog.Tab` class to create an instance of tab dialog control.

Properties

Name

Uniquely identifies the tab dialog control and is a required field.

Type: character vector

Prompt

Specifies the text displayed on the tab.

Type: character vector

Default: Empty character vector

Enabled

Specifies whether tab is active on the mask dialog box.

Type: boolean

Values: 'on' | 'off'

Default: 'on'

Visible

Specifies whether tab is displayed on the mask dialog box.

Type: boolean

Values: 'on' | 'off'

Default: 'on'

DialogControls

Specifies the child dialog controls contained in the tab dialog control.

Type: Simulink.dialog.Control

Default: Empty array

Methods

<code>addDialogControl</code>	Add dialog control elements to mask dialog box

Simulink.dialog.TabContainer class

Package: Simulink.dialog

Create an instance of a tab container dialog control

Description

Use an instance of `Simulink.dialog.TabContainer` class to create an instance of tab container dialog control. Tab container dialog box be used to group the tab dialog controls.

Properties

Name

Uniquely identifies the tab container dialog control and is a required field.

Type: character vector

Row

Specifies whether tab container is placed on the current row or on a new row.

Type: enumerated string

Values: 'current' | 'new'

Default: 'new'

Enabled

Specifies whether tab container is active on the mask dialog box.

Type: boolean

Values: 'on' | 'off'

Default: 'on'

Visible

Specifies whether tab container is displayed on the mask dialog box.

Type: boolean

Values: 'on' | 'off'

Default: 'on'

DialogControls

Specifies the child dialog controls contained in the group. `Simulink.dialog.TabContainer` class can only contain `Simulink.dialog.Tab` dialog control.

Type: Simulink.dialog.Tab

Default: Empty array

Methods

addDialogControl	Add dialog control elements to mask dialog box
removeDialogControl	Remove dialog control element from mask dialog box
getDialogControl	Search for a specific dialog control on the mask

Simulink.dialog.Button class

Package: Simulink.dialog

Create a button dialog control

Description

Use an instance of Simulink.dialog.Button class to add a button dialog control.

Properties

Name

Uniquely identifies the dialog control and is a required field.

Type: character vector

Prompt

Specifies the text displayed on the button dialog control.

Type: character vector

Default: empty

FilePath

Specifies the path to the image file to be shown on the button dialog control.

Type: character vector

Default: empty

Callback

Specifies the MATLAB command (s) to be executed when the dialog control is invoked.

Type: character vector

Default: empty

Row

Specifies whether dialog control is placed on the current row or on a new row.

Type: character vector

Value: 'current' | 'new'

Default: 'current'

Enabled

Indicates whether container is active on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

Visible

Indicates whether container is displayed on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

Simulink.dialog.Hyperlink class

Package: Simulink.dialog

Create a hyperlink dialog control

Description

Use an instance of `Simulink.dialog.Hyperlink` class to add a hyperlink dialog control.

Properties

Name

Uniquely identifies the dialog control and is a required field.

Type: character vector

Prompt

Specifies the text displayed on the hyperlink.

Type: character vector

Default: empty

Callback

Specifies the MATLAB command (s) to be executed when the dialog control is invoked.

Type: character vector

Default: empty

Row

Specifies whether hyperlink is placed on the current row or on a new row.

Type: character vector

Value: 'current' | 'new'

Default: 'new'

Enabled

Indicates whether hyperlink is active on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

Visible

Indicates whether hyperlink is displayed on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

Package: Simulink.dialog

Create an image dialog control

Description

Use an instance of `Simulink.dialog.Image` class to add an image dialog control.

Properties

Name

Uniquely identifies the dialog control and is a required field.

Type: character vector

FilePath

Specifies the path to the image file to be displayed on the dialog box.

Type: character vector

Default: empty

Row

Specifies whether dialog control is placed on the current row or on a new row.

Type: character vector

Value: 'current' | 'new'

Default: 'new'

Enabled

Indicates whether image is active on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

Visible

Indicates whether image is displayed on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

`Simulink.dialog.Control` | "Create Block Masks"

Simulink.dialog.Text class

Package: Simulink.dialog

Create a text dialog control

Description

Use an instance of `Simulink.dialog.Text` class to add a text dialog control.

Properties

Name

Uniquely identifies the dialog control element and is a required field.

Type: character vector

Prompt

Specifies the text displayed on the mask dialog box.

Type: character vector

Default: empty

WordWrap

Specifies whether to wrap long text to the next line on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

Row

Specifies whether dialog control is placed on the current row or on a new row.

Type: character vector

Value: 'current' | 'new'

Default: 'new'

Enabled

Indicates whether dialog control is active on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

Visible

Indicates whether dialog control is displayed on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

`Simulink.dialog.Control` | "Create Block Masks"

Simulink.op.ModelOperatingPoint class

Package: Simulink.op

Access simulation operating point data

Description

The `Simulink.op.ModelOperatingPoint` class contains all of the information associated with an operating point of a simulation, including the logged states, the time of the snapshot, and the start time of the simulation. To access this data for a specific block in the model, use the `get` method or the `loggedStates` property.

Properties

description — Description of the saved operating point

character vector

Description of the saved operating point object, specified as a character vector. By default, Simulink generates a character vector based on your model name.

loggedStates — Continuous and discrete states of the blocks

dataset | structure

Continuous and discrete states of the block that depend on the `SaveFormatSettings` of the model.

If specified as a `Dataset` format, you cannot assign a structure or a `Simulink.SimulationData.Dataset` object with a different number of elements than that of the `Dataset` object used for `loggedStates`.

If specified as a `Structure` format, you cannot assign a `Dataset` object.

snapshotTime — Simulation time of saving operating point

double

Time at which Simulink takes a snapshot of the complete simulation operating point.

This data is read-only.

startTime — Time at which simulation starts

double

Time at which simulation of the model starts.

This data is read-only.

Methods

Public Methods

Method	Purpose
set	Set operating point of individual Stateflow chart, MATLAB function, or S-function block
get	Access operating point of individual Stateflow chart, MATLAB function, or S-Function block

Examples

Save and Restore an Operating Point

Use the `sim` command with `set_param`. Set the `SaveOperatingPoint` parameter to 'on'.

```
fuelsys
set_param('fuelsys','SaveFinalState','on','FinalStateName',...
'myOperPoint','SaveOperatingPoint','on');
simOut = sim('fuelsys','StopTime','10')
myOperPoint = simOut.myOperPoint
```

Note Before you save the operating point, it is recommended that you disable the **Block Reduction** parameter in **Configuration Settings > Simulation Target > Advanced Parameters**.

See Also

get | set

Introduced in R2019a

get

Class: Simulink.op.ModelOperatingPoint

Package: Simulink.op

Access operating point of an individual Stateflow chart, MATLAB function, or S-function block

Syntax

```
blockOperatingPoint = get(modelOperatingPoint, 'blockpath')
```

Description

`blockOperatingPoint = get(modelOperatingPoint, 'blockpath')` returns the operating point of the block specified by `blockpath`. The `blockpath` must refer to a Stateflow chart, MATLAB functions, or S-function block. To access states of other types of blocks, see the `loggedStates` property of the `ModelOperatingPoint` class.

Input Arguments

modelOperatingPoint — A `Simulink.op.ModelOperatingPoint` object
object

Operating point object for the model.

blockpath — Path of the block
character vector

Path of the block to set the operating point values, specified as a character vector

Output Arguments

blockOperatingPoint — Operating point of the block specified
string

Name of the operating point to be set to the specified block.

Examples

Get the Operating Point of a Block

To get the operating point of a block that is in a referenced model, specify the full path of the block relative to the root model.

```
model = 'sldemo_fuelsys_dd';  
opt = struct('SaveFinalState','on','SaveOperatingPoint','on','StopTime','1');  
simOut = sim(model,opt);  
modelOp = simOut.modelOpFinal;  
blockPath = 'sldemo_fuelsys_dd/Fuel Rate Controller|sldemo_fuelsys_dd_controller/control_logic';  
chartOp = get(modelOp, blockPath)
```

This data is read only.

Topics

“Save and Restore Simulation Operating Point”

“Operating Point Behavior”

Introduced in R2019a

set

Class: Simulink.op.ModelOperatingPoint

Package: Simulink.op

Set operating point of an individual Stateflow chart, MATLAB function, or S-function block

Syntax

```
set(modelOperatingPoint, 'blockpath', blockOperatingPoint)
```

Description

`set(modelOperatingPoint, 'blockpath', blockOperatingPoint)` sets the operating point to the block specified by a `blockpath`. The `blockpath` must refer to a Stateflow chart, a MATLAB function, or a S-function block. To modify states of other types of blocks, use the `loggedStates` of the `Simulink.op.ModelOperatingPoint` class.

Input Arguments

modelOperatingPoint — A `Simulink.op.ModelOperatingPoint` object

object

Operating point object for the model.

blockpath — Path of the block

character vector

Path of the block for which to set the operating point values, specified as a character vector

blockOperatingPoint — Operating point of the block specified

object

Operating point to be set to the specified block, specified as an object.

Examples

Set the Operating Point of a Block

This example shows how to set the operating point for a block.

```
newOperPoint = set(myOperPoint, 'myModel/chart', newChartOperPoint)
```

Simulink.sfunction.Analyzer class

Package: Simulink.sfunction

Create a Simulink S-function analyzer object

Description

This class enables you to perform checks on S-functions within a model or a library. These checks include MEX compiler setup check, source code check, MEX-file check, parameter robustness check for S-functions. The check result can be accessed either from a MATLAB structure or an HTML report.

The S-function analyzer checks the source code of the S-functions based on the S-function names. The S-function source code can be automatically included in the analysis if the source file is a single .c or .cpp file in the MATLAB path that has the same name as the S-function. Otherwise, the build information can be specified through the S-function Analyzer APIs. If no source code is available on the specified path, the analysis is skipped.

Construction

`sfunAnalyzer = Simulink.sfunction.Analyzer(model)` creates a `Simulink.sfunction.Analyzer` object with the model you specify. In this case, the source code for the S-function can be automatically included in the analysis if the source code file is a single .c or .cpp file in the MATLAB path that has the same name as the S-function. For example, if the specified model contains an S-function called `mysfun`, and the source file for `mysfun` is a single file `mysfun.c` in the MATLAB path, a `Simulink.sfunction.analyzer.BuildInfo` object is automatically created and included in the analysis.

`sfunAnalyzer = Simulink.sfunction.Analyzer(model, 'BuildInfo', {bdInfo})` creates a `Simulink.sfunction.Analyzer` object with the model and a `Simulink.sfunction.analyzer.BuildInfo` object named `bdInfo`.

`sfunAnalyzer = Simulink.sfunction.Analyzer(model, 'Options', {opts})` creates an `Simulink.sfunction.Analyzer` object with the model and a `Simulink.sfunction.analyzer.Options` object named `opts`.

Input Arguments

model — Specify a model in the path

character vector | string

Names of the model in the path, specified as a string or character vector.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Example: `'BuildInfo', {buildInfo}`

BuildInfo — Specify the buildinfo object

cell array

A cell array of buildinfo objects. See `Simulink.sfunction.analyzer.BuildInfo` for more information.

Options — Specify the S-function analyzer running options

object

An object to specify S-function analyzer running options. These checks include Polyspace® Code Prover™ and parameter robustness checks. See `Simulink.sfunction.analyzer.Options` for more information.

Methods

<code>run</code>	Perform checks on S-functions
<code>generateReport</code>	Generate an HTML report of S-function checks

See Also

`Simulink.sfunction.analyzer.BuildInfo` | `Simulink.sfunction.analyzer.Options` | `findSfunctions` | `generateReport` | `run`

Introduced in R2017b

run

Class: Simulink.sfunction.Analyzer

Package: Simulink.sfunction

Perform checks on S-functions

Syntax

```
result = run()
```

Description

`result = run()` returns a struct containing the result from the analyzer checks. An example result struct has the following fields:

```
TimeGenerated: '19-Jul-2017 19:25:32'  
Platform: 'win64'  
Release: '(R2017b)'  
SimulinkVersion: '9.0'  
ExemptedBlocks: {}  
MexConfiguration: [1x1 mex.CompilerConfiguration]  
Data: [4x4 struct]
```

Output Arguments

result — Sfunction.Analyzer structure

MATLAB structure

MATLAB structure containing the result of S-function analyzer.

[Simulink.sfunction.Analyzer](#) | [Simulink.sfunction.analyzer.BuildInfo](#) | [Simulink.sfunction.analyzer.Options](#) | [findSfunctions](#) | [run](#)

Introduced in R2017b

Simulink.sfunction.analyzer.BuildInfo class

Package: Simulink.sfunction.analyzer

Create an object to represent build information

Description

Simulink.sfunction.analyzer.BuildInfo object captures the build information for S-functions, such as source files, header files, and linking libraries, for use with the Simulink.sfunction.Analyzer class.

Construction

`bdInfo = Simulink.sfunction.analyzer.BuildInfo(SfcnFile)` creates a Simulink.sfunction.analyzer.BuildInfo object.

`bdInfo = Simulink.sfunction.analyzer.BuildInfo(SfcnFile, 'SrcPath', {srcpaths}, 'ExtraSrcFileList', {srcfilelist})` creates a Simulink.sfunction.analyzer.BuildInfo object for a C-MEX S-function source file, a list of extra source files located in the specified path.

`bdInfo = Simulink.sfunction.analyzer.BuildInfo(SfcnFile, 'ObjFileList', {objfilelist})` creates a Simulink.sfunction.analyzer.BuildInfo object for C-MEX S-function source file and list of extra objective code files.

`bdInfo = Simulink.sfunction.analyzer.BuildInfo(SfcnFile, 'IncPaths', {incpathslist})` creates a Simulink.sfunction.analyzer.BuildInfo object for C-MEX S-function source file and paths to the folders including header files.

`bdInfo = Simulink.sfunction.analyzer.BuildInfo(SfcnFile, 'LibFileList', {libfilelist}, 'LibPaths', {libpaths})` creates a Simulink.sfunction.analyzer.BuildInfo object for C-MEX S-function source file and library files and library file paths used for building.

`bdInfo = Simulink.sfunction.analyzer.BuildInfo(SfcnFile, 'PreProcDefList', {preprocdir})` creates a Simulink.sfunction.analyzer.BuildInfo object for C-MEX S-function source file and pre-processor directives list.

Input Arguments

SfcnFile — S-function source file

character vector | string

S-function source file having the same name as the S-function.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Example: 'SrcPath', {srcpath}

SrcPath — Source file path

cell array of character vectors | string

Search paths to extra S-function source files that are referenced by `SfcnFile`, specified as a cell array or a string.

ExtraSrcFileList — Extra source file list

cell array of character vectors | string

List of extra S-function source files, specified as a cell array or string.

ObjFileList — Extra objective code

cell array

List of objective files used for building, specified as a cell array.

IncPaths — Search paths for header files

cell array of character vectors | string

Specify paths to include folders for header files, specified as a cell array or a string.

LibFileList — External libraries list

cell array of character vectors | string

List of external library files used for building, specified as a cell array or string.

LibPaths — Search paths for external libraries

cell array of character vectors | string

Search paths for external library files used for building, specified as a cell array or a string.

PreProcDefList — Preprocessor directives

cell array of character vectors | string

List of the preprocessor directives, specified as a cell array or a string.

Output Arguments

bdInfo — BuildInfo object

object

Build information for the S-functions supplied to the S-function analyzer. Returns a `simulink.sfunction.analyzer.BuildInfo` object.

Examples

Create a `bdInfo` object for an S-function `mysfun` that includes a source file `mysfun.c`:

Basic Use

```
bdInfo = Simulink.sfunction.analyzer.BuildInfo('mysfun.c');
```

The output `bdInfo` has the following fields:

```
bdInfo =
    BuildInfo with properties:
        SfcnFile: 'mysfun.c'
        SfcnName: 'mysfun'
        SrcType: 'C'
        SrcPaths: {}
    ExtraSrcFileList: {}
    ObjFileList: {}
        IncPaths: {}
    LibFileList: {}
        LibPaths: {}
    PreProcDefList: {}
```

Advanced Use

Create a `bdInfo` object for an S-function `mysfun` that includes a source file `mysfun.c` and also includes:

- List of extra source files, `extra1.c` and `extra2.c`
- Paths to source file folders, `/path1` and `/path2`.
- List of objective files, `o1.obj` and `o2.obj`.
- List of library files, `l1.lib` and `l2.lib`.
- Library paths, `/libpath1`.
- Pre-processor running directives, `-DDEBUG`.

```
Simulink.sfunction.analyzer.BuildInfo('mysfun.c',...
    'ExtraSrcFileList',{extra1.c,extra2.c},... %specify extra s
    'SrcPaths',{/path1,/path2},... %specify paths t
    'ObjFileList',{o1.obj,o2.obj},... %specify object
    'LibFileList',{l1.lib,l2.lib},... %specify library
    'LibPaths',{/libpath1},... %specify library
    'PreProcDefList',{DEBUG}); %specify preproc
```

Introduced in R2017b

Simulink.sfunction.analyzer.Options class

Package: Simulink.sfunction.analyzer

Create an object to specify options for running S-function checks

Description

Simulink.sfunction.analyzer.Options object is created through the constructor Simulink.sfunction.analyzer.Options(). Simulink.sfunction.analyzer.Options object captures the options for running S-function checks. These checks include whether to enable Polyspace and Parameter Robustness checks, maximum model simulation time and output path for result report.

Construction

opts= Simulink.sfunction.analyzer.Options() returns a options object with these property values:

```
EnablePolyspace: 0
EnableRobustness: 0
ReportPath: ''
ModelSimTimeOut: 10
```

Properties

EnablePolyspace — Polyspace Code Prover check

False (default) | True

Boolean type check to determine whether to include Polyspace Code Prover check.

Note These checks usually take some time to run.

EnableRobustness — Parameter robustness check

False (default) | True

Boolean type check to indicate whether to include Robustness checks.

Note These checks usually take some time to run.

ReportPath — Generated report directory

current working directory (default) | character array

Path to the generated report directory.

ModelSimTimeOut — Maximum model simulation time

10 (default) | scalar

Maximum model simulation time in seconds.

EnableUsePublishedOnly — Check for use of only documented APIs

False (default) | True

Check to indicate if any undocumented S-function APIs are used in the code.

Introduced in R2017b

findSfunctions

Find and return all eligible S-functions in a model

Syntax

```
sfuns = Simulink.sfunction.analyzer.findSfunctions(model)
```

Description

`sfuns = Simulink.sfunction.analyzer.findSfunctions(model)` returns all eligible S-functions in a model for the S-function checks. Rules are applied to filter out all ineligible S-functions.

Input Arguments

model — A Simulink model or library in path

character vector | string vector

A Simulink model or library in path specified as a string or a character vector.

Output Arguments

sfuns — A list of all eligible S-functions

cell array of character vectors

Eligible S-functions in the model, specified as a cell array of character vectors.

Introduced in R2017b

plot

Package: Simulink.SimulationData

Plot simulation output data in the Simulation Data Inspector

Syntax

```
plot(simOutObj)
runObj = plot(simOutObj)
```

Description

`plot(simOutObj)` plots the simulation output data in the simulation output object, `simOutObj`, in the Simulation Data Inspector and opens the Simulation Data Inspector so you can view the plotted simulation output data. You can use the `plot` function to plot simulation results stored in these simulation output objects:

- `Simulink.SimulationOutput`
- `Simulink.SimulationData.DataStoreMemory`
- `Simulink.SimulationData.Parameter`
- `Simulink.SimulationData.Signal`
- `Simulink.SimulationData.State`
- `sltest.Assessment`

These simulation output objects also have plot functions that plot the data in and then open the Simulation Data Inspector:

- `Simulink.SimulationData.Dataset`
- `Simulink.SimulationData.DatasetRef`

When a simulation output object contains fewer than eight signals to plot, the Simulation Data Inspector layout changes to 1-by- n , where n is the number of signals to plot, and plots one signal on each subplot. When the simulation output object contains more than eight signals to plot, the Simulation Data Inspector layout changes to 1-by-1 and plots the first signal in the simulation output object.

When some or all of the data in a `Simulink.SimulationOutput` object is in a Simulation Data Inspector run, the `plot` function opens the Simulation Data Inspector and plots all the signals in the run. When you do not select the **Record logged workspace data in Simulation Data Inspector** option, logged states data does not appear in the Simulation Data Inspector and is not plotted. When the data does not correspond to a run in the Simulation Data Inspector, the `plot` function imports the data to a new run. When you use the `plot` function to plot a single signal, the `plot` function always imports the data for the signal to a new run.

`runObj = plot(simOutObj)` returns the `Simulink.sdi.Run` object corresponding to the plotted data.

Examples

Access and Plot Simulation Output Data

When you create a new model in R2019a or later, the default model configuration saves simulation outputs in a single output. The single simulation output is a `Simulink.SimulationOutput` object that contains one or more types of other simulation output objects, depending on the kinds of data you log. This example uses a model configured to save a single simulation output and shows how to access each type of logged data and use the `plot` function to plot the data in the Simulation Data Inspector and then open the Simulation Data Inspector so you can view the data.

The `ex_vdp_simout_plot` model used in this example is configured to log signals, outputs, and states and return all logged data in a single simulation output. This example shows how to access each type of logged data and use the `plot` function to plot the data in the Simulation Data Inspector. To generate the `SimulationOutput` object containing all the logged data, simulate the model.

```
open_system('ex_vdp_simout_plot.slx')
out = sim('ex_vdp_simout_plot.slx');
```

Plot Data in a SimulationOutput Object

You can pass the single simulation output, stored in a `Simulink.SimulationOutput` object, to the `plot` function to plot and view the data in the Simulation Data Inspector. When you plot data in a `SimulationOutput` object that corresponds to a run in the Simulation Data Inspector, data in the object that also logs to the Simulation Data Inspector is plotted. The model logs four signals, data for the two Output blocks, and states. Signal and output data always log to the Simulation Data Inspector, and states data only appears in the Simulation Data Inspector when you select the **Record logged workspace data in Simulation Data Inspector** option, which is not selected for this model. When you use the `plot` function to plot the data, the Simulation Data Inspector layout updates to a 1-by-6 layout and plots one signal on each subplot.

```
plot(out)
```

Plot Logged States Data

When you do not log states data to the Simulation Data Inspector, you can use the `plot` function to import and plot the states data. The model logs data for two states, `x1` and `x2`. The states data is saved in a `Simulink.SimulationData.Dataset` object, `xout`, with one element corresponding to each `Simulink.SimulationData.State` object. You can use the `plot` function to plot the data for both signals by plotting `xout`, or you can plot data for a single state.

Access the `Dataset` object, `xout`, using the `get` function for the `SimulationOutput` object. You can also access the logged output and signal data using the `get` function.

```
xout = get(out, 'xout');
```

When you plot the data for both states in the `Dataset` object, the Simulation Data Inspector layout changes to 1-by-2 and plots the data for each state on one subplot.

```
plot(xout)
```

Plot Data for a Single Signal

When you plot the data for a single signal, the Simulation Data Inspector always imports the data for the signal to a new run. Use the `get` function for the `SimulationOutput` object to access the signal logging `Dataset` object, `logout`.

```
logout = get(out, 'logout');
```

Then, use the `get` function for the `Dataset` object to access the data for the first element.

```
sig1 = get(logout, 1);
```

When you plot the data for the signal, the Simulation Data Inspector imports the signal to a new run, updates the layout to 1-by-1, and plots the signal.

```
plot(sig1)
```

Input Arguments

simOutObj — Simulation output object containing simulation data to plot

`Simulink.SimulationOutput` | `Simulink.SimulationData.DataStoreMemory` |
`Simulink.SimulationData.Parameter` | `Simulink.SimulationData.Signal` |
`Simulink.SimulationData.State` | `sltest.Assessment`

Simulation output object containing data you want to plot and view in the Simulation Data Inspector. This plot function supports these simulation output objects:

- `Simulink.SimulationOutput`
- `Simulink.SimulationData.DataStoreMemory`
- `Simulink.SimulationData.Parameter`
- `Simulink.SimulationData.Signal`
- `Simulink.SimulationData.State`
- `sltest.Assessment`

Example: `plot(out)`

Output Arguments

runObj — `Simulink.sdi.Run` object corresponding to plotted data

`Simulink.sdi.Run` object

`Simulink.sdi.Run` object corresponding to the plotted data.

`plot`

Topics

“View Data with the Simulation Data Inspector”

Introduced in R2019b

addElement

Class: Simulink.SimulationData.Dataset

Package: Simulink.SimulationData

Add element to end of a Dataset object

Syntax

```
dataset = addElement(dataset,element)
dataset = addElement(dataset,element,name)
```

Description

`dataset = addElement(dataset,element)` adds an element to the `Simulink.SimulationData.Dataset` dataset.

`dataset = addElement(dataset,element,name)` adds an element to the `Simulink.SimulationData.Dataset` data set and gives the element the name that you specify with the name argument. If the object already has a name, the element instead uses the name you specify by using the name argument.

Input Arguments

dataset — Data set

`SimulationData.Dataset` object

The data set to which to add the element.

element — Element to add

`Simulink.SimulationData.Signal` object | `Simulink.SimulationData.State` object | `Simulink.SimulationData.DataStoreMemory` object | timeseries object | `matlab.io.datastore.SimulationDatastore` object

Element to add to the data set, specified as a `Simulink.SimulationData.Signal`, `Simulink.SimulationData.DataStoreMemory`, or `matlab.io.datastore.SimulationDatastore` object.

name — Name for element

character vector

Name for element, specified as a character vector.

Output Arguments

dataset — Data set

character vector

The data set to which you add the element, returned as a character vector. The new element is added to the end of the data set.

Examples

Create a Data Set

Create a data set and add three elements to it.

```
time = 0.1*(0:100)';
ds = Simulink.SimulationData.Dataset;
element1 = Simulink.SimulationData.Signal;
element1.Name = 'A';
element1.Values = timeseries(sin(time),time);
ds = addElement(ds,element1);
element2 = Simulink.SimulationData.Signal;
element2.Name = 'B';
element2.Values = timeseries(2*sin(time),time);
ds = addElement(ds,element2);
element3 = Simulink.SimulationData.Signal;
element3.Name = 'C';
element3.Values = timeseries(3*sin(time),time);
ds = addElement(ds,element3);
ds
```

```
ds =
```

```
Simulink.SimulationData.Dataset '' with 3 elements
```

		Name	BlockPath
1	[1x1 Signal]	A	''
2	[1x1 Signal]	B	''
3	[1x1 Signal]	C	''

- Use braces { } to access, modify, or add elements using index.

Create a Run in the Simulation Data Inspector

You can programmatically import data into the Simulation Data Inspector by creating a run from data in the base workspace or a file. This example creates data in the workspace and then illustrates several methods of creating a Simulation Data Inspector run containing the data.

Create Data

Create data in the workspace. The Simulation Data Inspector supports time series data in many formats. This example creates data using the `timeseries` and `Simulink.SimulationData.Dataset` formats and saves the data in a MAT-file.

Create a sine signal and a cosine signal, and store the data for each signal in a `timeseries` object with a descriptive name.

```
time = 0:0.2:20;

sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals,time);
sine_ts.Name = 'Sine, T=5';
```

```
cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals,time);
cos_ts.Name = 'Cosine, T=8';
```

You can use the `Dataset` format to group related signal data together in a single object. The `Dataset` format is the default format for logged data and is supported for loading simulation input data. Create a `Dataset` object that contains the sinusoid timeseries data.

```
sinusoids_ds = Simulink.SimulationData.Dataset;
sinusoids_ds = addElement(sinusoids_ds,cos_ts);
sinusoids_ds = addElement(sinusoids_ds,sine_ts);
```

Scale each signal by a factor of 2 and create a `Dataset` object to contain the signal data for the results.

```
doubSine = 2*sine_ts;
doubCos = 2*cos_ts;

doubSinusoids_ds = Simulink.SimulationData.Dataset;
doubSinusoids_ds = addElement(doubSinusoids_ds,doubSine);
doubSinusoids_ds = addElement(doubSinusoids_ds,doubCos);
```

Finally, save the timeseries data to a MAT-file.

```
save sinusoids.mat sine_ts cos_ts
```

Open the Simulation Data Inspector

Open the Simulation Data Inspector so you can see the runs you create in each section.

```
Simulink.sdi.view
```

Create a Run Using a Simulink.sdi.Run Object

You can import your data into a run in the Simulation Data Inspector by creating an empty run and then adding data to the run from the workspace or a file. Depending on your task, you can use the `Simulink.sdi.Run.create` function or the `Simulink.sdi.createRun` function to create the empty run. The `Simulink.sdi.Run.create` function returns the `Simulink.sdi.Run` object for the new run, and the `Simulink.sdi.createRun` function returns the run ID for the new run.

This example creates an empty run using the `Simulink.sdi.Run.create` function, gives the run a meaningful name and description, and then adds the sine and cosine timeseries data using the `add` function.

```
sinusoidsRun = Simulink.sdi.Run.create;
sinusoidsRun.Name = 'Sinusoids';
sinusoidsRun.Description = 'Sine and cosine signals of different frequencies';

add(sinusoidsRun,'vars',sine_ts,cos_ts)
```

This example uses the `Simulink.sdi.createRun` function to create a new run in the Simulation Data Inspector called `My Waves` and then uses the `Simulink.sdi.addToRun` function to add the sine and cosine timeseries data to the run.

```
runID = Simulink.sdi.createRun('My Waves');
signalID = Simulink.sdi.addToRun(runID,'vars',sine_ts,cos_ts);
```

Create a Run from a Workspace Variable

You can create a run from a single variable in the workspace. After creating the run, you can add additional data, or you can create another run to contain your other data. The variable you use to create the run can be a `timeseries` object with data that corresponds to only one signal, or it can be a `Dataset` object that contains several signals.

When you use this syntax to create a run from a single workspace variable, the run takes the same name as the object used to create it.

```
runID = Simulink.sdi.createRun(sine_ts);
```

The `Simulink.sdi.createRun` function returns the run ID for the run it creates. You can use the `Simulink.sdi.getRun` function to access the Run object for the run.

```
sineRun = Simulink.sdi.getRun(runID);
sineRun.Name
```

```
ans =
'Sine, T=5'
```

Create a Run from Multiple Workspace Variables

When your data exists in multiple variables in your workspace, you can use the `Simulink.sdi.createRun` function with the `vars` option to import the data from multiple variables into a single run in the Simulation Data Inspector. You can also use this syntax to create a run for a single variable that uses a name you specify.

This example creates a run called `My Sinusoids` that contains data for the sine and cosine `timeseries` objects.

```
runID = Simulink.sdi.createRun('My Sinusoids','vars',sine_ts,cos_ts);
```

Create a Run and Specify Source Names

You can use the `namevalue` option of the `Simulink.sdi.createRun` function to create a run and specify names for the signals in the run. This syntax can be particularly helpful when you import individual leaf signals from hierarchical data.

This example creates a run containing the data for both the `Dataset` objects. Each `Dataset` object contains data for more than one signal, so the imported run data has hierarchy. The name-value syntax in this example specifies a name for the hierarchical node that corresponds to each `Dataset` object.

```
runID = Simulink.sdi.createRun('Waves','namevalue',{'Sinusoids',...
    'BigSinusoids'},{sinusoids_ds,doubSinusoids_ds});
```

Create a Run from Data in a File

You can also use the `Simulink.sdi.createRun` function to import data into the Simulation Data Inspector from a file. Use the `file` option to import the data in the `simusoids.mat` file.

```
runID = Simulink.sdi.createRun('Wave Data','file','sinusoids.mat');
```

Alternative

To streamline indexing syntax, you can use curly braces ({}) to add an element to a dataset, instead of using `addElement`. For the index, use a scalar that is greater than the number of elements by one. The new element becomes the last element of the dataset.

```
time = 0.1*(0:100)';  
ds = Simulink.SimulationData.Dataset;  
element1 = Simulink.SimulationData.Signal;  
element1.Name = 'A';  
element1.Values = timeseries(sin(time),time);  
ds{1} = element1;  
element2 = Simulink.SimulationData.Signal;  
element2.Name = 'B';  
element2.Values = timeseries(2*sin(time),time);  
ds{2} = element2;  
element3 = Simulink.SimulationData.Signal;  
element3.Name = 'C';  
element3.Values = timeseries(3*sin(time),time);  
ds{3} = element3;
```

concat

Class: Simulink.SimulationData.Dataset

Package: Simulink.SimulationData

Concatenate dataset to another dataset

Syntax

```
dataset1 = concat(dataset1,dataset2)
```

Description

`dataset1 = concat(dataset1,dataset2)` concatenates the elements of `dataset2` to `dataset1`.

Input Arguments

dataset1 — Dataset to concatenate to

data set

Dataset to concatenate to with `dataset2`, returned as a cell array.

dataset2 — Dataset to concatenate

data set

Data set to concatenate to `dataset1`, specified as a cell array.

Output Arguments

dataset1 — Concatenated dataset

data set

Concatenated dataset from `dataset1` and `dataset2`.

Examples

Concatenate ds1 to ds

Convert output from two To Workspace blocks to Dataset format and concatenate them.

```
mdl = 'myvdp';  
open_system(mdl);  
sim(mdl)  
ds = Simulink.SimulationData.Dataset(simout);
```

```
ds1 = Simulink.SimulationData.Dataset(simout1);  
dsfinal = concat(ds,ds1);
```

exportToPreviousRelease

Package: Simulink.SimulationData

Save a Dataset object to a MAT-file you can open in any release

Syntax

```
exportToPreviousRelease(ds, filename, dsname)
exportToPreviousRelease( ___, version)
exportToPreviousRelease( ___, '-append' )
exportToPreviousRelease( ___, '-nocompression' )
```

Description

`exportToPreviousRelease(ds, filename, dsname)` saves the `Simulink.SimulationData.Dataset` object, `ds`, to the MAT-file specified by the `filename` input, using the name specified by the `dsname` input. You can load the Dataset saved in the file in any release that supports the Dataset format. When you do not use this function to save a Dataset object to a file, you may not be able to load the data in releases prior to R2017a. When you do not need to open and use the Dataset data in a release prior to R2017a, you can use the `save` function.

`exportToPreviousRelease(___, version)` saves data stored in a Dataset object to a MAT-file you can load in a previous release, using the MAT-file version specified by `version`.

`exportToPreviousRelease(___, '-append')` adds data stored in a Dataset object to a MAT-file you can load in a previous release without overwriting the contents of the MAT-file.

`exportToPreviousRelease(___, '-nocompression')` saves the Dataset object to a MAT-file without compression. The `'-nocompression'` option only supports Version 7 and Version 7.3 MAT-files.

Examples

Save a Dataset to a MAT-File to Load in a Prior Release

You can use the `exportToPreviousRelease` function to save data stored in a `Simulink.SimulationData.Dataset` object in a MAT-file that you can load in a previous release. This example saves data logged from a simulation in a MAT-file using the `exportToPreviousRelease` function, and then appends another Dataset object containing data logged from another simulation to the same MAT-file.

Save Dataset Data to a MAT-File

To create a Dataset object containing logged data, run a simulation of the `ex_vdp` model that logs data for signals `x1` and `x2`. The model is configured to generate a single simulation output containing all simulation data, including the signal logging data stored in the Dataset object, `logout`.

```
open_system('ex_vdp.slx')
out = sim('ex_vdp');
logouts = out.logouts;
```

Use the `exportToPreviousRelease` function to save the signal logging data to a MAT-file you can share with colleagues and collaborators who may use different Simulink™ versions.

```
exportToPreviousRelease(logouts, 'vdpLoggedData.mat', 'ex_vdpSim1')
```

Append Additional Data to the MAT-File

You can use the `exportToPreviousRelease` function to add data to a MAT-file. For example, if you run another simulation that logs data and get new results you want to share. You can load the `Dataset` object saved using the `exportToPreviousRelease` function in any release that supports the `Dataset` format.

```
set_param('ex_vdp/Mu', 'Gain', '0.5')
out = sim('ex_vdp');
logouts = out.logouts;
```

```
exportToPreviousRelease(logouts, 'vdpLoggedData.mat', 'ex_vdpSim2', '-append')
```

Input Arguments

ds — Dataset object containing data you want to load in an earlier release

`Simulink.SimulationData.Dataset` object

`Simulink.SimulationData.Dataset` object you want to save in a MAT-file and load in a previous release.

Example: `logouts`

filename — Name of file to export data to

string | character array

Name of the file to export data to. If the file does not exist, the `exportToPreviousRelease` function creates the file. When the file exists, you can overwrite the data in the file, or you can use the `'-append'` input to append the `Dataset` data to the file.

Example: `'myfile.mat'`

Data Types: char | string

dsname — Name to use for the saved Dataset object in the MAT-file

string | character array

Name to use for the `Dataset` object saved in the MAT-file. The name does not have to match the name of the `Dataset` object containing the data you want to save in the MAT-file.

Example: `'myLoggedData'`

Data Types: char | string

version — MAT-file version

'-v7' (default) | '-v7.3' | '-v6'

MAT-file version. By default, the `exportToPreviousRelease` function creates Version 7 MAT-files, unless you have changed the preference for the default MAT-file version created by save operations.

For more information, see “MAT-File Versions” (MATLAB). You cannot save `Dataset` data to Version 4 MAT-files.

Data Types: `char` | `string`

get

Class: Simulink.SimulationData.Dataset

Package: Simulink.SimulationData

Get element or collection of elements from dataset

Syntax

```
element = get(dataset,index)
element = get(dataset,name)
element = get(dataset,{name})
```

Description

`element = get(dataset,index)` returns the element corresponding to the `index`. The `getElement` method uses the same syntax and behavior as the `get` method.

`element = get(dataset,name)` returns the element whose name matches `name`. When `name` is in a cell array, return the index of the element whose name matches `name`.

`element = get(dataset,{name})` returns a single element if only one element name matches, a `SimulationData.Dataset` if multiple elements with this name exist.

If you use **Log Dataset data to file** to create the MAT-file, use `getAsDatastore` for fast access to the data.

Input Arguments

dataset — Dataset

`SimulationData.Dataset` object

The data set from which to get the element.

index — Index value of element to get

scalar numeric

Index value of element to get. The index reflects the index value of a data set element.

name — Name for data set element

character array | cell array

Name for a data set element, specified as:

- A character array reflecting the name of the data set element
- A cell array containing one character vector. To return a `SimulationData.Dataset` object that can contain one element, use this format. Consider this form when writing scripts.

Output Arguments

element — Element

element | SimulationData.Dataset object | empty object

The element that the `get` method finds.

- If `index` is the first argument after the data set, the method returns the element at the `index`.
- If `name` is the first argument after the data set:
 - If the method finds one element, it returns the element.
 - If the method finds more than one element, return a Dataset that contains the elements.
 - If the method does not find an element, it returns an empty object.

Examples

Access Dataset Elements

Access Simulink.SimulationData.Dataset elements in the top model of the `ex_bus_logging` model. The signal logging dataset is `topOut`.

```
open_system(docpath(fullfile(docroot, 'toolbox', 'simulink', ...
'examples', 'ex_bus_logging')));
open_system(docpath(fullfile(docroot, 'toolbox', 'simulink', ...
'examples', 'ex mdlref_counter_bus')));
sim('ex_bus_logging')
topOut
```

```
topOut =
```

```
Simulink.SimulationData.Dataset
Package: Simulink.SimulationData
```

```
Characteristics:
      Name: 'topOut'
  Total Elements: 4
```

```
Elements:
  1: 'COUNTERBUS'
  2: 'OUTPUTBUS'
  3: 'INCREMENTBUS'
  4: 'inner_bus'
```

```
-Use get or getElement to access elements by index, name or
  block path.
```

```
-Use addElement or setElement to add or modify elements.
```

```
Methods, Superclasses
```

Access Dataset Elements with Index

Access the element at `index` if the first argument is a numeric value.

```
el = logout.get(1);
```

Access Dataset Elements with Characters

Access the element whose name matches name.

```
el = logout.get('name');
```

Access Dataset Elements with Cell Array

Return a dataset if the first argument is a cell array with a character vector as the first element.

```
ds = logout.get({'my_name'});
```

Alternatives

You can use curly braces to streamline indexing syntax to get an element in a dataset, instead of using `get` or `getElement`. The index must be a scalar that is not greater than the number of elements in the variable. For example, get the second element of the `logout` dataset.

```
logout{2}
```

Also, you can use the `find` method to get an element or collection of elements from a dataset.

getElementNames

Class: Simulink.SimulationData.Dataset

Package: Simulink.SimulationData

Return names of all elements in dataset

Syntax

```
element_list = getElementNames(dataset)
```

Description

`element_list = getElementNames(dataset)` returns the names of all of the elements in the `Simulink.SimulationData.Dataset` object.

Input Arguments

dataset — Data set

`SimulationData.Dataset` object

The data set from which to the element name.

Output Arguments

element_list — Data set

cell array

Data set, returned as a cell array of the character vectors containing names of all of the elements of the dataset.

Examples

Return Names of Elements

Return the names of the elements for the `topOut` data set (the signal logging data).

```
open_system(docpath(fullfile(docroot, 'toolbox', 'simulink', ...
'examples', 'ex_bus_logging')));
open_system(docpath(fullfile(docroot, 'toolbox', 'simulink', ...
'examples', 'ex_mdref_counter_bus')));
sim('ex_bus_logging')
el_names = topOut.getElementNames

el_names =

    'COUNTERBUS'
    'OUTPUTBUS'
```

```
'INCREMENTBUS'  
'inner_bus'
```

Introduced in R2011a

find

Class: Simulink.SimulationData.Dataset

Package: Simulink.SimulationData

Get element or collection of elements from dataset

Syntax

```
[datasetOut,retIndex]=find(datasetIn,Name,Value,...)
```

```
[datasetOut,retIndex]=find(datasetIn,Name,Value,'-logicaloperator',...Name,Value,...)
```

```
[datasetOut,retIndex]=find(datasetIn,'-regexp',Name,Value,...)
```

Description

`[datasetOut,retIndex]=find(datasetIn,Name,Value,...)` returns a `Simulink.SimulationData.Dataset` object and indices of the elements whose property values match the specified property names and values. Specify optional comma-separated pairs of `Name,Value` properties. `Name` is the property name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name-value pair properties in any order as `Name1,Value1,...,NameN,ValueN`.

`[datasetOut,retIndex]=find(datasetIn,Name,Value,'-logicaloperator',...Name,Value,...)` applies the logical operator to the matching property value. You can combine multiple logical operators. Logical operator can be one of:

- `-or`
- `-and`

If you do not specify an operation, the method assumes `-and`.

`[datasetOut,retIndex]=find(datasetIn,'-regexp',Name,Value,...)` matches elements using regular expressions as if the value of the property is passed to the `regexp` function as:

```
regexp(element.Name,Value)
```

The method applies regular expression matching to the name-value pairs that appear after `-regexp`. If there is no `-regexp`, the method matches elements as if the value of the property is passed as:

```
isequal(element.Name,Value)
```

For more information on `-regexp`, see “`-regexp With Multiple Block Paths`” on page 5-856.

- regexp With Multiple Block Paths

`-regexp` works with properties of type `char`. To specify multiple block paths, you can use `Simulink.SimulationData.BlockPath` and `Simulink.BlockPath`. For example, when a signal is logged in a referenced model, you can use `Simulink.SimulationData.BlockPath` to specify multiple block paths.

The method returns elements that contain a **BlockPath** property where one or more of the individual block paths match the specified `Value` path when you use:

- - regex with the **BlockPath** Name property.
- `Value` as a character vector or scalar object of type `Simulink.SimulationData.BlockPath` with one block path

Input Arguments

datasetIn — `SimulationData.Dataset`

`SimulationData.Dataset` object

`SimulationData.Dataset` object in which to search for matching elements.

Name — Name of property

character vector

Name of property to find in the element.

Value — Value of property

character vector | double | `Simulink.SimulationData.BlockPath`

Value of property to find in the element.

Output Arguments

datasetOut — `SimulationData.Dataset` data set

`SimulationData.Dataset`

`SimulationData.Dataset` object that contains the elements that match the specified criteria. If there is no matching `SimulationData.Dataset` object, the returned `SimulationData.Dataset` object contains no elements.

retIndex — Indices

vector

Indices of the elements `datasetIn` that match the specified criteria.

Examples

Find Block Path

Find a specific block path (specified by character vector) and port index.

```
dsOut = find(dsIn, 'BlockPath', 'vdp/x1', 'PortIndex', 1)
```

Find Elements

Find elements that have either name or propagated name as `InValve`.

```
dsOut = find(dsIn, 'Name', 'InValve', '-or', 'PropagatedName', 'InValve')
dsOut = find(dsIn, '-regex', 'Name', 'In*', '-or', ...
             '-regex', 'PropagatedName', 'In*')
```

Find and Change Element

Find and replace all elements containing `specified_name` with a `new_name`.

```
[dsOut,idxInDs] = find(ds, 'specified_name');
for idx=1: length(idxInDs)
    % process each element
    elm = get(dsOut, idx);
    elm.Name= 'New_Name'
    dsIn = setElement(dsIn, idxInDs(idx), elm);
end
```

Find Signals in subSys Using -regexp

Find all signals logged in a `subSys` using `-regexp`.

```
dsOut = find(dsIn, '-regexp', 'BlockPath', 'mdl/subSys/.*')
```

Find Signals in Referenced Model

Find all signals logged in the Model block.

```
dsOut = find(dsIn, '-regexp', 'BlockPath', 'refmdl/ModelBlk')
```

Alternative

You can use curly braces to streamline indexing syntax to get an element in a dataset, instead of using `find`. The index must be a scalar that is not greater than the number of elements in the variable. For example, get the second element of the `logout` dataset.

```
logout{2}
```

Also, you can use the `get` method to get an element or collection of elements from a dataset.

numElements

Class: Simulink.SimulationData.Dataset

Package: Simulink.SimulationData

Get number of elements in data set

Syntax

```
length = numElements(dataset)
```

Description

`length = numElements(dataset)` gets the number of elements in the top-level dataset. To get the number of elements of a nested data set, use `numElements` with the nested data set.

Input Arguments

dataset — Data set

`SimulationData.Dataset` object

The data set from which to get the number of elements.

Output Arguments

length — Number of elements

double

Number of elements, returned as a double.

Examples

Get Number of Elements

Get the number of elements in the signal logging data set for the `ex_bus_logging`.

```
length = topOut.numElements()
```

plot

Class: Simulink.SimulationData.Dataset

Package: Simulink.SimulationData

Plot data in the Simulation Data Inspector

Syntax

```
plot(ds)
plot(ds,viewer)
runObj = plot(ds)
```

Description

`plot(ds)` plots the data in the `Simulink.SimulationData.Dataset` or `Simulink.SimulationData.DatasetRef` in the **Simulation Data Inspector**. When there are eight signals or fewer in the `Dataset` or `DatasetRef` object, the Simulation Data Inspector plot layout changes to 1-by-n, where n is equal to the number of signals, and plots one signal on each subplot. When the `Dataset` or `DatasetRef` object contains more than eight signals, the Simulation Data Inspector plot layout changes to 1-by-1 and plots the first signal.

`plot(ds,viewer)` displays the plot in the Simulation Data Inspector or Signal Preview window, according to the value specified for `viewer`.

`runObj = plot(ds)` plots the data in the `Dataset` object and returns the corresponding `Simulink.sdi.Run` object.

Input Arguments

ds — Dataset or DatasetRef object with data to plot

`Simulink.SimulationData.Dataset` object | `Simulink.SimulationData.DatasetRef` object

`Dataset` or `DatasetRef` object that contains the data to plot.

viewer — Specify viewer to use to plot data

'datainspector' (default) | 'preview'

Specify the viewer used to plot the data. By default, the `plot` function plots data in the Simulation Data Inspector. When you specify 'preview', the data displays in a read-only plot in the Signal Preview window.

Output Arguments

runObj — Simulink.sdi.Run object corresponding to the plotted data

`Simulink.sdi.Run` object

`Simulink.sdi.Run` object corresponding to the plotted data. When you view data in a Signal Preview window, the `plot` function returns empty (`[]`).

Examples

Plot a Data Set

Create a `timeseries` object `ts` and add elements to plot in the Simulation Data Inspector.

```
% Create a timeseries object
ts = timeseries([0;20],[0;10]);
% Create a SimulationData.Dataset
ds = Simulink.SimulationData.Dataset();
% Place timeseries object in dataset
ds = ds.addElement(ts,'ts');
% Plot the element
plot(ds);
```

Compatibility Considerations

'sdi' input is not recommended

Not recommended starting in R2019b

Starting in R2019b, specify the `viewer` argument for the `plot` function as `'datainspector'` to view plotted data in the Simulation Data Inspector.

setElement

Class: Simulink.SimulationData.Dataset

Package: Simulink.SimulationData

Change element stored at specified index

Syntax

```
dataset = setElement(dataset,index,... element)
```

```
dataset = setElement(index,element, name)
```

Description

`dataset = setElement(dataset,index,... element)` changes the element stored at the specified index, for an existing index. If `index` is one greater than the number of elements in the data set, the function adds the element at the end of the data set.

`dataset = setElement(index,element, name)` changes the element stored at the specified index and gives it the name that you specify. You can use `name` to identify an element that does not have a name. If the signal already has a name, the element instead uses the name you specify by using the `name` argument.

Input Arguments

dataset — Data set

SimulationData.Dataset object

The data set for which to set the element.

index — Index

scalar

Index for the added element, specified as a scalar numeric value. The value must be between 1 and the number of elements plus 1.

element — Element to replace existing element

Simulink.SimulationData.Signal object | Simulink.SimulationData.DataStoreMemory object

Element to replace existing element or to add to the data set, specified as a Simulink.SimulationData.Signal object or Simulink.SimulationData.DataStoreMemory object.

name — Element name

character vector

Element name, returned as a character vector.

Output Arguments

dataset — Data set

character vector

Data set in which you change or add an element, specified as a character vector.

Examples

Set Element Name

Set element name.

```
ds = Simulink.SimulationData.Dataset
element1 = Simulink.SimulationData.Signal
element1.Name = 'A'
ds = ds.addElement(element1)
element2 = Simulink.SimulationData.Signal
element2.Name = 'B'
elementNew = Simulink.SimulationData.Signal
ds = ds.setElement(2,elementNew,'B1')
ds
```

ds =

```
Simulink.SimulationData.Dataset
Package: Simulink.SimulationData
```

```
Characteristics:
      Name: 'topOut'
  Total Elements: 2
```

```
Elements:
  1: 'A'
  2: 'B1'
```

Use `getElement` to access elements by index, name or block path.

Methods, Superclasses

Alternative

You can use curly braces to streamline indexing syntax to change an element in a dataset, instead of using `setElement`. The index must be a scalar that is not greater than the number of elements in the variable. For example, change the name of second element of the `logout` dataset.

```
logout{2}.Name = 'secondSignal'
```

coder.BuildConfig class

Package: coder

Build context during code generation

Description

The code generator creates an object of this class to facilitate access to the build context. The build context encapsulates the settings used by the code generator including:

- Target language
- Code generation target
- Target hardware
- Build toolchain

Use `coder.BuildConfig` methods in the methods that you write for the `coder.ExternalDependency` class.

Construction

The code generator creates objects of this class.

Methods

<code>getHardwareImplementation</code>	Get handle of copy of hardware implementation object
<code>getStdLibInfo</code>	Get standard library information
<code>getTargetLang</code>	Get target code generation language
<code>getToolchainInfo</code>	Returns handle of copy of toolchain information object
<code>isCodeGenTarget</code>	Determine if build configuration represents specified target
<code>isMatlabHostTarget</code>	Determine if hardware implementation object target is MATLAB host computer

Copy Semantics

Value. To learn how value classes affect copy operations, see [Copying Objects \(MATLAB\)](#).

Examples

Use `coder.BuildConfig` methods to access the build context in `coder.ExternalDependency` methods

This example shows how to use `coder.BuildConfig` methods to access the build context in `coder.ExternalDependency` methods. In this example, you use:

- `coder.BuildConfig.isMatlabHostTarget` to verify that the code generation target is the MATLAB host. If the host is not MATLAB report an error.
- `coder.BuildConfig.getStdLibInfo` to get the link-time and run-time library file extensions. Use this information to update the build information.

Write a class definition file for an external library that contains the function `adder`.

```

=====
% This class abstracts the API to an external Adder library.
% It implements static methods for updating the build information
% at compile time and build time.
=====

classdef AdderAPI < coder.ExternalDependency
    %#codegen

    methods (Static)

        function bName = getDescriptiveName(~)
            bName = 'AdderAPI';
        end

        function tf = isSupportedContext(buildContext)
            if buildContext.isMatlabHostTarget()
                tf = true;
            else
                error('adder library not available for this target');
            end
        end

        function updateBuildInfo(buildInfo, buildContext)
            % Get file extensions for the current platform
            [~, linkLibExt, execLibExt, ~] = buildContext.getStdLibInfo();

            % Add file paths
            hdrFilePath = fullfile(pwd, 'codegen', 'dll', 'adder');
            buildInfo.addIncludePaths(hdrFilePath);

            % Link files
            linkFiles = strcat('adder', linkLibExt);
            linkPath = hdrFilePath;
            linkPriority = '';
            linkPrecompiled = true;
            linkLinkOnly = true;
            group = '';
            buildInfo.addLinkObjects(linkFiles, linkPath, ...
                linkPriority, linkPrecompiled, linkLinkOnly, group);

            % Non-build files for packaging
            nbFiles = 'adder';
            nbFiles = strcat(nbFiles, execLibExt);
            buildInfo.addNonBuildFiles(nbFiles, '', '');
        end

        %API for library function 'adder'
        function c = adder(a, b)
            if coder.target('MATLAB')

```

```
        % running in MATLAB, use built-in addition
        c = a + b;
    else
        % Add the required include statements to the generated function code
        coder.cinclude('adder.h');
        coder.cinclude('adder_initialize.h');
        coder.cinclude('adder_terminate.h');
        c = 0;

        % Because MATLAB Coder generated adder, use the
        % housekeeping functions before and after calling
        % adder with coder.ceval.

        coder.ceval('adder_initialize');
        c = coder.ceval('adder', a, b);
        coder.ceval('adder_terminate');
    end
end
end
end
```

“Develop Interface for External C/C++ Code” (MATLAB Coder)

“Build Process Customization” (MATLAB Coder)

Introduced in R2013b

coder.ExternalDependency class

Package: coder

Interface to external code

Description

`coder.ExternalDependency` is an abstract class for developing an interface between external code and MATLAB code intended for code generation. You can define classes that derive from `coder.ExternalDependency` to encapsulate the interface to external libraries, object files, and C/C++ source code. This encapsulation allows you to separate the details of the interface from your MATLAB code.

To define a class derived from `coder.ExternalDependency`, create a subclass. For example:

```
classdef myClass < coder.ExternalDependency
```

You must define all of the methods listed in “Methods” on page 5-870. These methods are static and are not compiled. The code generator invokes these methods in MATLAB after code generation is complete to configure the build for the generated code. The `RTW.BuildInfo` and `coder.BuildConfig` objects that describe the build information and build context are automatically created during the build process. The `updateBuildInfo` method provides access to these objects. For more information on build information customization, see “Build Process Customization” (MATLAB Coder).

You also define methods that call the external code. These methods are compiled. For each external function that you want to call, write a method to define the programming interface to the function. In the method, use `coder.ceval` to call the external function.

Methods

<code>getDescriptiveName</code>	Return descriptive name for external dependency
<code>isSupportedContext</code>	Determine if build context supports external dependency
<code>updateBuildInfo</code>	Update build information

Examples

Encapsulate the Interface to an External C Dynamic Library

This example shows how to encapsulate the interface to an external C dynamic linked library using `coder.ExternalDependency`.

Write a function `adder` that returns the sum of its inputs.

```
function c = adder(a,b)
%#codegen
c = a + b;
end
```

Generate a library that contains adder.

```
codegen('adder', '-args', {-2,5}, '-config:dll', '-report')
```

Write the class definition file AdderAPI.m to encapsulate the library interface.

```
%=====
% This class abstracts the API to an external Adder library.
% It implements static methods for updating the build information
% at compile time and build time.
%=====

classdef AdderAPI < coder.ExternalDependency
    %#codegen

    methods (Static)

        function bName = getDescriptiveName(~)
            bName = 'AdderAPI';
        end

        function tf = isSupportedContext(buildContext)
            if buildContext.isMatlabHostTarget()
                tf = true;
            else
                error('adder library not available for this target');
            end
        end

        function updateBuildInfo(buildInfo, buildContext)
            % Get file extensions for the current platform
            [~, linkLibExt, execLibExt, ~] = buildContext.getStdLibInfo();

            % Add file paths
            hdrFilePath = fullfile(pwd, 'codegen', 'dll', 'adder');
            buildInfo.addIncludePaths(hdrFilePath);

            % Link files
            linkFiles = strcat('adder', linkLibExt);
            linkPath = hdrFilePath;
            linkPriority = '';
            linkPrecompiled = true;
            linkLinkOnly = true;
            group = '';
            buildInfo.addLinkObjects(linkFiles, linkPath, ...
                linkPriority, linkPrecompiled, linkLinkOnly, group);

            % Non-build files for packaging
            nbFiles = 'adder';
            nbFiles = strcat(nbFiles, execLibExt);
            buildInfo.addNonBuildFiles(nbFiles, '', '');
        end

        %API for library function 'adder'
        function c = adder(a, b)
            if coder.target('MATLAB')
                % running in MATLAB, use built-in addition
                c = a + b;
            end
        end
    end
end
```

```

else
    % Add the required include statements to the generated function code
    coder.cinclude('adder.h');
    coder.cinclude('adder_initialize.h');
    coder.cinclude('adder_terminate.h');
    c = 0;

    % Because MATLAB Coder generated adder, use the
    % housekeeping functions before and after calling
    % adder with coder.ceval.

    coder.ceval('adder_initialize');
    c = coder.ceval('adder', a, b);
    coder.ceval('adder_terminate');
end
end
end
end
end

```

Write a function `adder_main` that calls the external library function `adder`.

```

function y = adder_main(x1, x2)
    %#codegen
    y = AdderAPI.adder(x1, x2);
end

```

Generate a MEX function for `adder_main`. The MEX Function exercises the `coder.ExternalDependency` methods.

```
codegen('adder_main', '-args', {7,9}, '-report')
```

Copy the library to the current folder using the file extension for your platform. For Windows, use:

```
copyfile(fullfile(pwd, 'codegen', 'dll', 'adder', 'adder.dll'));
```

For Linux, use:

```
copyfile(fullfile(pwd, 'codegen', 'dll', 'adder', 'adder.so'));
```

Run the MEX function and verify the result.

```
adder_main_mex(2,3)
```

TimeScopeConfiguration

Control Scope block appearance and behavior

Description

Scope configuration properties control the appearance and behavior of a scope block. Create a scope configuration object with `get_param`, and then change property values using the object with dot notation.

Creation

`myScopeConfiguration = get_param(gcbh, 'ScopeConfiguration')` creates a scope configuration object for the selected scope block.

Properties

Name — Title on a scope window

block name (default) | character vector | string scalar

Title on a scope window, specified as a character vector or string scalar.

NumInputPorts — Number of input ports

'1' (default) | character vector

Number of input ports on a scope block, specified as a character vector or string scalar. The maximum number of input ports is 96.

UI Use

Select **File > Number of Input Ports**.

ActiveDisplay — Display for setting display-specific properties

'1' (default) | character vector

Display for setting display-specific properties, specified as a character vector or string. The number of a display corresponds to its column-wise placement index. For multi-column layouts, the displays are numbered down and then across.

Dependency

Setting this property selects the display for setting the properties `ShowGrid`, `ShowLegend`, `Title`, `PlotAsMagnitudePhase`, `YLabel`, and `YLimits`.

UI Use

Open the **Configuration Properties**. On the **Display** tab, set **Active display**.

AxesScaling — How to scale y-axes

'Manual' (default) | 'Auto' | 'Updates'

How to scale y-axes, specified as one of these values:

- 'Manual' — Manually scale y-axes with the **Scale Y-axis Limits** button.
- 'Auto' — Scale y-axes during and after simulation.
- 'Updates' — Scale y-axes after specified number of block updates (time intervals).

Dependency

If this property is set to 'Updates', also specify the property `AxesScalingNumUpdates`

UI Use

Open the **Configuration Properties**. On the **Main** tab, set **Axes scaling**.

AxesScalingNumUpdates — Number of updates before scaling y-axes

'10' (default) | character vector | string scalar

Number of updates before scaling y-axes, specified as a character vector or string scalar.

Dependency

Activate this property by setting `AxesScaling` to 'Updates'.

UI Use

Open the **Configuration Properties**. On the **Main** tab, set **Number of updates**.

DataLogging — Save scope data

false (default) | true

Set this property to `true` to save scope data to a variable in the MATLAB workspace.

This property does not apply to floating scopes and scope viewers.

Dependency

If this property is set to `true`, you must also specify the properties `DataLoggingVariableName` and `DataLoggingSaveFormat`.

UI Use

Open the **Configuration Properties**. On the **Logging** tab, set **Log data to workspace**.

DataLoggingVariableName — Variable name for saving scope data

'ScopeData' (default) | character vector | string scalar

Variable name for saving scope data in the MATLAB workspace, specified as a character vector or string scalar. This property does not apply to floating scopes and scope viewers.

Dependency

Activate this property by setting `DataLogging` to `true`.

UI Use

Open the **Configuration Properties**. On the **Logging** tab, set **Variable name**.

DataLoggingSaveFormat — Variable format for saving scope data

'Dataset' (default) | 'Structure With Time' | 'Structure' | 'Array'

Variable format for saving scope data to the MATLAB workspace, specified as one of these values:

- 'Dataset' — Save data as a dataset object. This format does not support variable-size data, MAT-file logging, or external mode archiving. See `Simulink.SimulationData.Dataset`.
- 'StructureWithTime' — Save data as a structure with associated time information. This format does not support single- or multiport frame-based data, or multirate data.
- 'Structure' — Save data as a structure. This format does not support multirate data.
- 'Array' — Save data as an array with associated time information. This format does not support multiport sample-based data, single- or multiport frame-based data, variable-size data, or multirate data.

This property does not apply to floating scopes and scope viewers.

Dependency

Activate this property by setting `DataLogging` to `true`.

UI Use

Open the **Configuration Properties**. On the **Logging** tab, set **Save format**.

DataLoggingLimitDataPoints — Limit buffered data

`false` (default) | `true`

Set to `true` to limit buffered data before plotting and saving data.

For simulations with **Stop time** set to `inf`, always set this parameter to `true`.

Dependency

If this property is set to `true`, also specify the number of data values to plot and save with the property `DataLoggingMaxPoints`.

UI Use

Open the **Configuration Properties**. On the **Logging** tab, set **Limit data points to last**.

DataLoggingMaxPoints — Maximum number of data values

'5000' (default) | character vector | string scalar

Maximum number of data values to plot and save, specified as a character vector or string scalar. The data values that are plotted and saved are from the end of a simulation. For example, setting this property to 100 saves the last 100 data points.

Dependency

Activate this property by setting `DataLoggingLimitDataPoints` to `true`. Specifying this property limits the data values a scope plots and the data values saved in the MATLAB variable specified in `DataLoggingVariableName`.

UI Use

Open the **Configuration Properties**. On the **Logging** tab, set the text box to the right of **Limit data points to last**.

DataLoggingDecimateData — Reduce scope data

`false` (default) | `true`

Set this property to `true` to reduce scope data before plotting and saving.

Dependency

If this property is set to `true`, you must also specify the `DataLoggingDecimation` property.

UI Use

Open the **Configuration Properties**. On the **Logging** tab, set **Decimation**.

DataLoggingDecimation — Decimation factor

'1' (default) | character vector | string scalar

Decimation factor applied to the signal data before plotting and saving, specified as a character vector or string scalar. The scope buffers every N^{th} data point, where N is the decimation factor you specify. A value of 1 buffers all data values.

Dependency

Activate this property by setting `DataLoggingDecimateData` to `true`.

UI Use

Open the **Configuration Properties**. On the **Logging** tab, set the text box to the right of **Decimation**.

FrameBasedProcessing — Frame-based processing of signals

`false` (default for Time Scope block) | `true` (default for Scope block)

Set this property to `true` to process signals as frame-based.

- `false` — Process signal values in a channel at each time interval (sample based).
- `true` — Process signal values in a channel as a group of values from multiple time intervals (frame based). Frame-based processing is available only with discrete input signals.

UI Use

Open the **Configuration Properties**. On the **Main** tab, set **Input processing**.

LayoutDimensions — Number of display rows and columns

[1 1] (default) | [numberOfRows numberOfColumns]

Number of display rows and columns, specified with as a two-element vector. The maximum layout dimension is 16-by-16.

- If the number of displays is equal to the number of ports, signals from each port appear on separate displays.
- If the number of displays is less than the number of ports, signals from additional ports appear on the last y -axis.

UI Use

Open the **Configuration Properties**. On the **Main** tab, select the **Layout** button.

MaximizeAxes — Maximize size of signal plots

'Auto' (default) | 'On' | 'Off'

Specify whether or not to maximize the size of signal plots:

- 'Auto' — If `Title` and `YLabel` are not specified, maximize all plots.
- 'On' — Maximize all plots. Values in `Title` and `YLabel` are hidden.
- 'Off' — Do not maximize plots.

Each of the plots expands to fit the full display. Maximizing the size of signal plots removes the background area around the plots.

UI Use

Open the **Configuration Properties**. On the **Main** tab, set **Maximize axes**.

MinimizeControls — Hide menu and toolbar

`false` (default) | `true`

Set this property to `true` to hide the menu and toolbar.

If you dock the scope, this property is inactive.

OpenAtSimulationStart — Open scope when starting simulation

`true` (default for Time Scope) | `false` (default for Scope)

Set this property to `true` to open the scope when the simulation starts.

UI Use

Select **File > Open at Start of Simulation**

PlotAsMagnitudePhase — Magnitude and phase plots

`false` (default) | `true`

Specify whether or not to display the magnitude and phase plots:

- `false` — Display signal plot.
If the signal is complex, plot the real and imaginary parts on the same y-axis (display).
- `true` — Display magnitude and phase plots.
If the signal is real, plot the absolute value of the signal for the magnitude. The phase is 0 degrees for positive values and 180 degrees for negative values.

Dependency

Set the `ActiveDisplay` property before setting this property.

UI Use

Open the **Configuration Properties**. On the **Display** tab, set **Plot signals as magnitude and phase**.

Position — Size and location of the scope

[`left bottom width height`]

Size and location of scope window, specified as a four-element vector consisting of the left, bottom, width, and height positions, in pixels.

By default, a scope window appears in the center of your screen with a width of 560 pixels and height of 420 pixels.

ShowGrid — Vertical and horizontal grid lines`true` (default) | `false`

Set this property to `true` to display vertical and horizontal grid lines.

Dependency

Set the `ActiveDisplay` property before setting this property.

UI Use

Open the **Configuration Properties**. On the **Display** tab, set **Show grid**.

SampleTime — Time interval`'-1'` (default) | character vector | string scalar

Time interval between Scope block updates during a simulation, specified as a character vector or string scalar. This property does not apply to floating scopes and scope viewers.

UI Use

Open the **Configuration Properties**. On the **Main** tab, set **Sample Time**.

ShowLegend — Signal legend`false` (default) | `true`

Set this property to `true` to display the legend.

Names listed in the legend are the signal names from the model. For signals with multiple channels, a channel index is appended after the signal name. See the Scope block reference for an example.

Dependency

Set the `ActiveDisplay` property before setting this property.

UI Use

Open the **Configuration Properties**. On the **Display** tab, set **Show legend**.

ShowTimeAxisLabel — Display or hide x-axis labels`true` (default for Time Scope block) | `false` (default for Scope block)

Set this property to `true` to display the x-axis labels.

Dependency

Set the `ActiveDisplay` property before setting this property.

If this property is set to `true`, also set `TimeAxisLabels`. If `TimeAxisLabels` is set to `'None'`, this property is inactive.

UI Use

Open the **Configuration Properties**. On the **Time** tab, set **Show time-axis label**.

TimeAxisLabels — How x-axis labels display`'All'` (default for Time Scope block) | `'Bottom'` (default for Scope block) | `'None'`

How x-axis labels display, specified as one of these values:

- 'All' — Display x-axis labels on all displays.
- 'Bottom' — Display x-axis labels only on the bottom display.
- 'None' — Do not display labels and deactivate ShowTimeAxisLabel property.

Dependency

Set the ActiveDisplay property before specifying this property.

Set ShowTimeAxisLabel to true and set Maximize axes to 'Off'.

UI Use

Open the **Configuration Properties**. On the **Time** tab, set **Time-axis labels**.

TimeDisplayOffset — x-axis range offset

'0' (default) | character vector | string scalar

x-axis range offset number, specified as a character vector or string scalar. For input signals with multiple channels, enter a scalar or vector of offsets.

- Scalar — Offset all channels of an input signal by the same value.
- Vector — Independently offset the channels.

UI Use

Open the **Configuration Properties**. On the **Time** tab, set **Time display offset**.

TimeSpan — Length of x-axis range to display

'0' (default) | character vector | string scalar | 'Auto'

Length of x-axis range to display, specified as one of these values:

- Positive real number — Any value less than the total simulation time specified as a character vector or string scalar.
- 'Auto' — Difference between the simulation start and stop times.

The block calculates the beginning and end times of the x-axis range using the TimeDisplayOffset and TimeSpan properties. For example, if you set TimeDisplay to 10 and the TimeSpan to 20, the scope sets the x-axis range from 10 to 30.

UI Use

Open the **Configuration Properties**. On the **Time** tab, set **Time span**.

TimeSpanOverrunAction — How to display data

'Wrap' (default) | 'Scroll'

How to display data beyond the visible x-axis range, specified as one of these values:

- 'Wrap' — Draw a full screen of data from left to right, clear the screen, and then restart drawing of data.
- 'Scroll' — Move data to the left as new data is drawn on the right. This mode is graphically intensive and can affect run-time performance.

You can see the effects of this option only when plotting is slow with large models or small step sizes.

UI Use

Open the **Configuration Properties**. On the **Time** tab, set **Time span overrun action**.

TimeUnits — Units to display on the x-axis

'Metric' (default for Time Scope block) | 'None' (default for Scope block) | 'Seconds'

Units to display on the x-axis, specified as one of these values:

- 'Metric' — Display time units based on the length of the TimeSpan property.
- 'None' — Display Time on the x-axis.
- 'Seconds' — Display Time (seconds) on the x-axis.

UI Use

Open the **Configuration Properties**. On the **Time** tab, set **Time units**.

Title — Title for display

'%<SignalLabel>' (default) | character vector | string scalar

Title for a display, specified as a character vector or string scalar. The default value %<SignalLabel> uses the input signal name for the title.

Dependency

Set the ActiveDisplay property before setting this property.

UI Use

Open the **Configuration Properties**. On the **Display** tab, set **Title**.

Visible — Visibility of scope window

true (default) | false

Set this property to true to make the scope window visible.

YLabel — Y-axis label

' ' (default) | character vector | string scalar

y-axis label for active display, specified as a character vector or string scalar.

Dependency

Set the ActiveDisplay property before setting this property.

If PlotAsMagnitudePhase is true, the value of YLabel is hidden and plots are labeled Magnitude and Phase.

UI Use

Open the **Configuration Properties**. On the **Display** tab, set **Y-label**.

YLimits — Minimum and maximum values of y-axis

[-10 10] (default) | [ymin ymax]

Minimum and maximum values of y-axis, specified as a two-element numeric vector.

Dependency

Set the `ActiveDisplay` property before setting this property.

When `PlotAsMagnitudePhase` is `true`, this property specifies the y-axis limits for the magnitude plot. The y-axis limits of the phase plot are always `[-180 180]`.

UI Use

Open the **Configuration Properties**. On the **Display** tab, set **Y-limits (Minimum)** and **Y-limits (Maximum)**.

Examples

Create Scope Configuration Object

This example creates a scope configuration object using the 'vdp' model which models the van der Pol equation.

```
open_system('vdp')
myScopeConfiguration = get_param('vdp/Scope','ScopeConfiguration');
myScopeConfiguration.NumInputPorts = '2';
```

Simulink.Simulation.Job class

Package: Simulink

Execute `batchsim` to create a `Simulink.Simulation.Job` object, `simJob`

Description

Execute `batchsim` command with a parallel pool to create a `Simulink.Simulation.Job` object. The `batchsim` command offloads multiple simulations to run in batch using the inputs specified with an array of `Simulink.SimulationInput` objects. You can use this object to monitor the status of a batch job, fetch outputs of a completed batch job, or cancel one or more jobs.

The `batchsim` command uses the Parallel Computing Toolbox™ license to run the simulations on compute cluster. If a parallel pool cannot be created `batchsim` runs the simulations in serial. In the absence of Parallel Computing Toolbox license, `batchsim` errors out.

Construction

`simJob = batchsim(in)` creates a `Simulink.Simulation.Job` object, `simJob`, while running multiple simulations in batches on a compute cluster using the inputs specified in the `Simulink.SimulationInput` object, `in`.

`createSimulationJob(batchJob)` creates a `Simulink.Simulation.Job` object from a `parallel.job` object, `batchJob`. Use the `createSimulationJob` command to retrieve the job object returned by the `batchsim` command.

Input Arguments

in — `Simulink.SimulationInput` object array

object (default) | array

A `Simulink.SimulationInput` object or an array of `Simulink.SimulationInput` objects used to run multiple simulations. Specify parameters and values of a model to run multiple simulations without making it dirty.

Example: `in = Simulink.SimulationInput('vdp'), in(1:10) = Simulink.SimulationInput('vdp')`

Properties

AdditionalPaths — Folders to add to MATLAB search path of workers

character vector | string | string array | array of character vectors

Specified folders to add to MATLAB search path of parallel workers.

This property is read-only.

AttachedFiles — Files and folders sent to the workers

character vector | string | string array | array of character vectors

Files and folders to send to the parallel workers.

This property is read-only.

AutoAddClientPath — Whether user-added entries on client path are added to each worker path

true (default) | false

Whether user-added entries on the client path are added to each parallel worker path at the start of the batch job, specified as true or false.

CreateDateTime — Date and time of simJob creation

datetime object

Date and time at which the batch job was created, specified as a datetime object.

This property is read-only.

EnvironmentVariables — Environment variables sent to the workers

character vector | string | string array | array of character vectors

Defines the names of environment variables that are copied from a client session to the parallel workers.

This property is read-only after job submission.

FinishDateTime — Date and time of simJob completion

datetime object

Date and time at when the batch job completes execution, specified as a datetime object.

This property is read-only.

ID — Numeric identifier of the simJob object

scalar integer

ID of the future object, specified as a scalar integer.

This property is read-only.

Name — simJob name

string | character vector

Name of the job object, specified as a string.

Parent — Cluster object containing simJob

parallel.cluster object

Cluster object that contains the Simulink.Simulation.Job object, simJob.

StartDateTime — Date and time when simJob starts running

datetime object

Date and time when the Simulink.Simulation.Job starts running, specified as a datetime object.

This property is read-only.

State — Current state of future object array

'pending' | 'queued' | 'running' | 'finished' | 'failed'

Current state of future object array, specified as 'pending', 'queued', 'running', 'finished', or 'failed'.

This property is read-only.

SubmitDateTime — Date and time of simJob submission

datetime object

Date and time when the Simulink.Simulation.Job is submitted, specified as a datetime object.

This property is read-only.

Tag — Label associated with simJob

string

Label associated with Simulink.Simulation.Job object.

Type — Job Type

independent | pool

Type of the Simulink.Simulation.Job object, specified as independent or pool.

UserData — Data associated with simJob

string

Stores any data associated with a job object. The data is stored in a client MATLAB session, and is not available on the workers.

UserName — Name of the user who creates the simJob object

string | character vector

Name of the user who creates the Simulink.Simulation.Job object.

Methods

Method	Purpose
cancel	Cancel a pending, queued, or running Simulink.Simulation.Job object
diary	Display or save Command Window text of batch job
fetchOutputs	Retrieve an array of Simulink.SimulationOutput objects from all simulations in Simulink.Simulation.Job
listAutoAttachedFiles	List of files automatically attached to job, task, or parallel pool
wait	Wait for Simulink.Simulation.Job object to change state

Examples

Run Parallel Simulations With `batchsim` to Create `Simulink.Simulation.Job`

This example shows how to run parallel simulations in batch using the `sldemo_househeat` model. `batchsim` offloads simulations to the compute cluster, enabling you to carry out other tasks while the batch job is processing, or close the client MATLAB and access the batch job later.

Observe the model behavior for different temperature set points.

1. Open the model.

```
open_system('sldemo_househeat');
```

2. Define a set of values for different temperatures.

```
setPointValues = 65:2:85;
spv_Length = length(setPointValues);
```

3. Using the `setPointValues`, initialize an array of `Simulink.SimulationInput` objects.

```
in(1:spv_Length) = Simulink.SimulationInput('sldemo_househeat');
for i = 1:1:spv_Length
    in(i) = in(i).setBlockParameter('sldemo_househeat/Set Point',...
        'Value',num2str(setPointValues(i)));
end
```

4. Specify the pool size of the number of workers to use. In addition to the number of workers used to run simulations in parallel, a head worker is required. In this case, assume that three workers are available to run a batch job for the parallel simulations. The job object returns useful metadata as shown. You can use the job ID to access the job object later from any machine. `NumWorkers` displays how many workers are running the simulations - the number of workers specified in the `'Pool'` argument plus an additional head worker.

```
simJob = batchsim(in,'Pool',3)

        ID: 1
        Type: pool
    NumWorkers: 4
        Username: #####
        State: running
    SubmitDateTime: ##-###-#### ##:##:##
    StartDateTime:
    Running Duration: 0 days 0h 0m 0s
```

cancel

Package: Simulink

Cancel a pending, queued, or running `Simulink.Simulation.Job` object

Syntax

```
cancel(simJob)
cancel(simJob, 'Message')
```

Description

`cancel(simJob)` stops the `Simulink.Simulation.Job` object, `simJob`, that is currently in 'pending', 'queued', or 'running' state.

`cancel(simJob, 'Message')` stops the `Simulink.Simulation.Job` object, `simJob`, that is in 'pending', 'queued', or 'running' state and displays a user-specified message.

The `State` property of `Simulink.Simulation.Job` object is set to finished, and other pending simulations are canceled. Canceling a job object disables you to fetch results from it. A canceled job object cannot be started again.

Note On canceling the job, the results of the completed simulations in the job are also lost.

Examples

Cancel a Batch Job

This example shows how to use the `cancel` method on a `simJob` object to stop simulations. The example runs several simulations of the `vdp` model, varying the value of the gain `Mu`.

1. Open the model and define a vector of `Mu` values.

```
open_system('vdp');
mu_Values = [0.5:0.25:1000];
muVal_Length = length(mu_Values);
```

2. Using `mu_Values`, initialize an array of `Simulink.SimulationInput` objects.

```
in(1:muVal_Length) = Simulink.SimulationInput('vdp');
for i = 1:1:muVal_Length
    in(i) = in(i).setBlockParameter('vdp/Mu', ...
        'Gain', num2str(mu_Values(i)));
end
```

3. Specify the pool size of the number of workers to use. In addition to the number of workers used to run simulations in parallel, a head worker is required. In this case, assume that three workers are available to run a batch job for the parallel simulations. The simulations are offloaded onto the default cluster profile.

```
simJob = batchsim(in, 'Pool',3);
```

4. Now, assume that you want to run simulations with different values of Mu and cancel the ongoing simulations.

```
cancel(simJob)
```

Input Arguments

simJob — **Simulink.Simulation.Job** object
object

A `Simulink.Simulation.Job` object. To create a `simJob`, run `batchsim`.

Example: `simJob = batchsim(in, 'Pool',6)`

diary

Package: Simulink

Display or save Command Window text of `Simulink.Simulation.Job` object

Syntax

```
diary(simJob)
diary(simJob, 'filename')
```

Description

`diary(simJob)` displays the Command Window output from the `Simulink.Simulation.Job` object, `simJob`, in the MATLAB Command Window. The Command Window output is captured only if the `batchsim` command includes the `'CaptureDiary'` argument with a value of `true`.

`diary(simJob, 'filename')` causes the Command Window output from the batch job to be appended to the specified file. Open the file, `filename`, with any text editor.

Examples

Display the Diary of `simJob`

This example uses `sldemo_househeat` model to show how to display the diary of the `Simulink.Simulation.Job` object, `simJob`. To create a `simJob`, you run parallel simulations using the `batchsim` command.

1. Open the model.

```
open_system('sldemo_househeat');
```

2. Define a set of values for different temperatures.

```
setPointValues = 65:2:85;
spv_Length = length(setPointValues);
```

3. Using `setPointValues`, initialize an array of `Simulink.SimulationInput` objects.

```
in(1:spv_Length) = Simulink.SimulationInput('sldemo_househeat');
for i = 1:1:spv_Length
    in(i) = in(i).setBlockParameter('sldemo_househeat/Set Point',...
        'Value', num2str(setPointValues(i)));
end
```

4. Specify the pool size of the number of workers to use. In addition to the number of workers used to run simulations in parallel, a head worker is required. In this case, assume that three workers are available to run a batch job for the parallel simulations. The job object returns useful metadata as shown. You can use the job ID to access the job object later from any machine. `NumWorkers` displays how many workers are running the simulations - the number of workers specified in the `'Pool'` argument plus an additional head worker.

```
simJob = batchsim(in, 'Pool', 3)

        ID: 1
        Type: pool
    NumWorkers: 4
        Username: #####
        State: running
    SubmitDateTime: ##-###-#### #:##:##
    StartDateTime:
    Running Duration: 0 days 0h 0m 0s
```

5. Use the `diary` method of the `Simulink.Simulation.Job` object to display the output of the batch job in the MATLAB command window.

Note that the diary is not displayed here because this is an example model.

```
diary(simJob)
```

Input Arguments

simJob — `Simulink.Simulation.Job` object
object

A `Simulink.Simulation.Job` object. To create a `simJob`, run `batchsim`.

Example: `simJob = batchsim(in, 'Pool', 4)`

'filename' — File to append with Command Window output text
string

Specify a file to append with Command Window output text from the `Simulink.Simulation.Job` object.

Example: `diary(simJob, 'abc.txt')`

fetchOutputs

Package: Simulink

Retrieve an array of `Simulink.SimulationOutput` objects from all simulations in `Simulink.Simulation.Job`

Syntax

```
out = fetchOutputs(simJob)
```

Description

`out = fetchOutputs(simJob)` returns an array of `Simulink.SimulationOutput` objects containing the results of the simulations in a batch job, `simJob`.

`fetchOutputs` reports an error if the job is not in the 'finished' state, or if one of its simulations encounters an error during execution. Use the `wait` method to wait for the job to complete before fetching outputs.

Examples

Fetch Outputs of the Batch Simulations

This example shows how to run parallel simulations in batch and fetch the resulting `Simulink.SimulationOutput` objects from the `Simulink.Simulation.Job` object. `batchsim` command offloads simulations to the compute cluster, enabling you to carry out other tasks while the batch job is processing, or close the client MATLAB and access the batch job later.

1. Open the model.

```
open_system('sldemo_househeat');
```

2. Define a set of values for different temperatures.

```
setPointValues = 65:2:85;
spv_Length = length(setPointValues);
```

3. Using `setPointValues`, initialize an array of `Simulink.SimulationInput` objects.

```
in(1:spv_Length) = Simulink.SimulationInput('sldemo_househeat');
for i = 1:1:spv_Length
    in(i) = in(i).setBlockParameter('sldemo_househeat/Set Point',...
        'Value',num2str(setPointValues(i)));
end
```

4. Specify the pool size of the number of workers to use. In addition to the number of workers used to run simulations in parallel, a head worker is required. In this case, assume that three workers are available to run a batch job for the parallel simulations. The job object returns useful metadata as shown. You can use the job ID to access the job object later from any machine. `NumWorkers` displays

how many workers are running the simulations - the number of workers specified in the 'Pool' argument plus an additional head worker.

```
simJob = batchsim(in, 'Pool', 3)

        ID: 1
        Type: pool
    NumWorkers: 4
        Username: #####
        State: running
    SubmitDateTime: ##-###-#### #:##:##
    StartDateTime:
    Running Duration: 0 days 0h 0m 0s
```

5. Access the results of the batch job using the `fetchOutputs` method. `fetchOutputs` returns an array of `Simulink.SimulationOutput` objects. You can fetch outputs only once `simJob` is in finished state.

```
out = fetchOutputs(simJob)
```

```
1x11 Simulink.SimulationOutput array
```

Input Arguments

simJob — `Simulink.Simulation.Job` object

object

A `Simulink.Simulation.Job` object. To create `simJob`, run `batchsim`.

Example: `simJob = batchsim(in, 'Pool', 4)`

Output Arguments

out — Simulation object containing logged simulation results

object

Array of `Simulink.SimulationOutput` objects that contain all of the logged simulation results. The size of the array is equal to the size of the array of `Simulink.SimulationInput` objects passed to `batchsim`.

All simulation outputs (logged time, states, and signals) are returned in a single `Simulink.SimulationOutput` object. You define the model time, states, and output that are logged using the **Data Import/Export** pane of the Model Configuration Parameters dialog box. You can log signals using blocks such as the To Workspace and Scope blocks. The **Signal & Scope Manager** tool can directly log signals.

listAutoAttachedFiles

Package: Simulink

List of files automatically attached to the `Simulink.Simulation.Job` object or parallel pool

Syntax

```
listAutoAttachedFiles(simJob)
```

Description

`listAutoAttachedFiles(simJob)` performs a dependency analysis on the `Simulink.Simulation.Job` job object, `simJob`. Then it displays a list of the code files that are already attached or are going to be automatically attached to the job object, `simJob`.

Examples

Run Parallel Simulations with `batchsim` and List Attached Files

This example shows how to run parallel simulations in batch and list any attached files. `batchsim` offloads simulations to the compute cluster, enabling you to carry out other tasks while the batch job is processing, or close the client MATLAB and access the batch job later.

1. Open the model.

```
open_system('sldemo_househeat');
```

2. Define a set of values for different temperatures.

```
setPointValues = 65:2:85;
spv_Length = length(setPointValues);
```

3. Using the `setPointValues`, initialize an array of `Simulink.SimulationInput` objects.

```
in(1:spv_Length) = Simulink.SimulationInput('sldemo_househeat');
for i = 1:1:spv_Length
    in(i) = in(i).setBlockParameter('sldemo_househeat/Set Point',...
    'Value',num2str(setPointValues(i)));
end
```

4. Specify the pool size of the number of workers to use. In addition to the number of workers used to run simulations in parallel, a head worker is required. In this case, assume that three workers are available to run a batch job for the parallel simulations. The job object returns useful metadata as shown. You can use the job ID to access the job object later from any machine. `NumWorkers` displays how many workers are running the simulations - the number of workers specified in the `'Pool'` argument plus an additional head worker.

```
simJob = batchsim(in,'Pool',3)
```

```
    ID: 1
  Type: pool
```

```
    NumWorkers: 4
      Username: #####
        State: running
  SubmitDateTime: ##-##-#### #:##:##
  StartDateTime:
Running Duration: 0 days 0h 0m 0s
```

If `AutoAttachFiles` property of `Simulink.Simulation.Job` is set to true in the cluster profile, then the job running on the cluster has the necessary code files automatically attached to it. Use the `listAutoAttachedFiles` method to view the attached files.

Note that the list of attached files is not displayed here because this is an example model.

```
listAutoAttachedFiles(simJob)
```

Input Arguments

simJob — `Simulink.Simulation.Job` object
object

A `Simulink.Simulation.Job` object. To create a `simJob`, run `batchsim`.

Example: `simJob = batchsim(in,'Pool',4)`

wait

Package: Simulink

Wait for Simulink.Simulation.Job object to change state

Syntax

```
wait(simJob)
wait(simJob, 'stateOfJob')
wait(simJob, 'stateOfJob', timeout)
```

Description

`wait(simJob)` blocks execution in a client session until the job identified by the object `simJob` reaches the 'finished' state or fails. This occurs when all the simulations finish execution on the workers.

`wait(simJob, 'stateOfJob')` blocks execution in the client session until the specified job object changes state to the value of 'state'. The valid states to wait for are 'queued', 'running', and 'finished'. If the object is currently or has already been in the specified state, `wait` is not performed and execution returns immediately. For example, if you execute `wait(simJob, 'queued')` for a job already in the 'finished' state, the call returns immediately.

`wait(simJob, 'stateOfJob', timeout)` blocks execution until either the job reaches the specified 'state', or timeout seconds elapse, whichever happens first.

Examples

Wait for Simulations in simJob to Finish

This example shows uses the `sldemo_househeat` model to show how to wait for the batch simulations to finish.

1. Open the model.

```
open_system('sldemo_househeat');
```

2. Define a set of values for different temperatures.

```
setPointValues = 65:2:85;
spv_Length = length(setPointValues);
```

3. Using the `setPointValues`, initialize an array of Simulink.SimulationInput objects.

```
in(1:spv_Length) = Simulink.SimulationInput('sldemo_househeat');
for i = 1:1:spv_Length
    in(i) = in(i).setBlockParameter('sldemo_househeat/Set Point', ...
        'Value', num2str(setPointValues(i)));
end
```

4. Specify the pool size of the number of workers to use. In addition to the number of workers used to run simulations in parallel, a head worker is required. In this case, assume that three workers are available to run a batch job for the parallel simulations. The job object returns useful metadata as shown. You can use the job ID to access the job object later from any machine. NumWorkers displays how many workers are running the simulations - the number of workers specified in the 'Pool' argument plus an additional head worker.

```
simJob = batchsim(in, 'Pool', 3)

        ID: 1
        Type: pool
    NumWorkers: 4
        Username: #####
        State: running
    SubmitDateTime: ##-##-#### #:##:##
    StartDateTime:
    Running Duration: 0 days 0h 0m 0s
```

5. Now, wait for the job to finish before retrieving the outputs.

```
wait(simJob)
```

Input Arguments

simJob — **Simulink.Simulation.Job** object
object

A Simulink.Simulation.Job object. To create a simJob, run batchsim.

Example: `simJob = batchsim(in, 'Pool', '5')`

'stateOfJob' — **Value of the simulation job object State property to wait for**
'pending' | 'queued' | 'running' | 'finished' | 'failed' | 'unavailable'

Value of the State property of Simulink.Simulation.Job object to wait for.

Example: `wait(simJob, 'queued')`

timeout — **Maximum time to wait, in seconds**
object

Specify a timeout for wait to block execution in seconds.

Example: `wait(simJob, 5)`

simulink.schedule.OrderedSchedule

Creates an `OrderedSchedule` object containing priority order of the partitions of a model

Description

The `simulink.schedule.OrderedSchedule` object is a representation of the execution order of the partitions of the specified model. Access this object as a model parameter with `get_param`. You can use the `OrderedSchedule` object to modify the schedule of the partitions of the model through the command line.

You can use `set_param` to apply the schedule to the model.

Creation

`get_param mdl, 'Schedule'` creates an `OrderedSchedule` object for the specified model, `mdl`.

Properties

Order — Priority order of the partitions

table

Priority order of the partitions, specified as a table where:

RateSections — Sections of the order table

array

`RateSections` is an array of objects containing a portion of the order table with a single rate. Use the `RateSections` to easily modify the order of the execution of partitions within valid groups.

Description — Description of the `OrderedSchedule` object

string

Purpose of an individual schedule object, specified as a string.

Examples

Create and Analyze Random Schedules for a Model Using the Schedule Editor API

This example uses the Schedule Editor API to perform operations on the schedule. Then it uses a function to generate random schedules and analyze them in Simulation Data Inspector

Open the Model and get the Schedule Object

Open a model of a Throttle Position Control system and use `get_param` to obtain the `simulink.schedule.OrderedSchedule` object. This object contains the current schedule.

```

model = 'ScheduleEditorAPIWithSubsystemPartitions';
open_system(model);
schedule = get_param(model, 'Schedule')

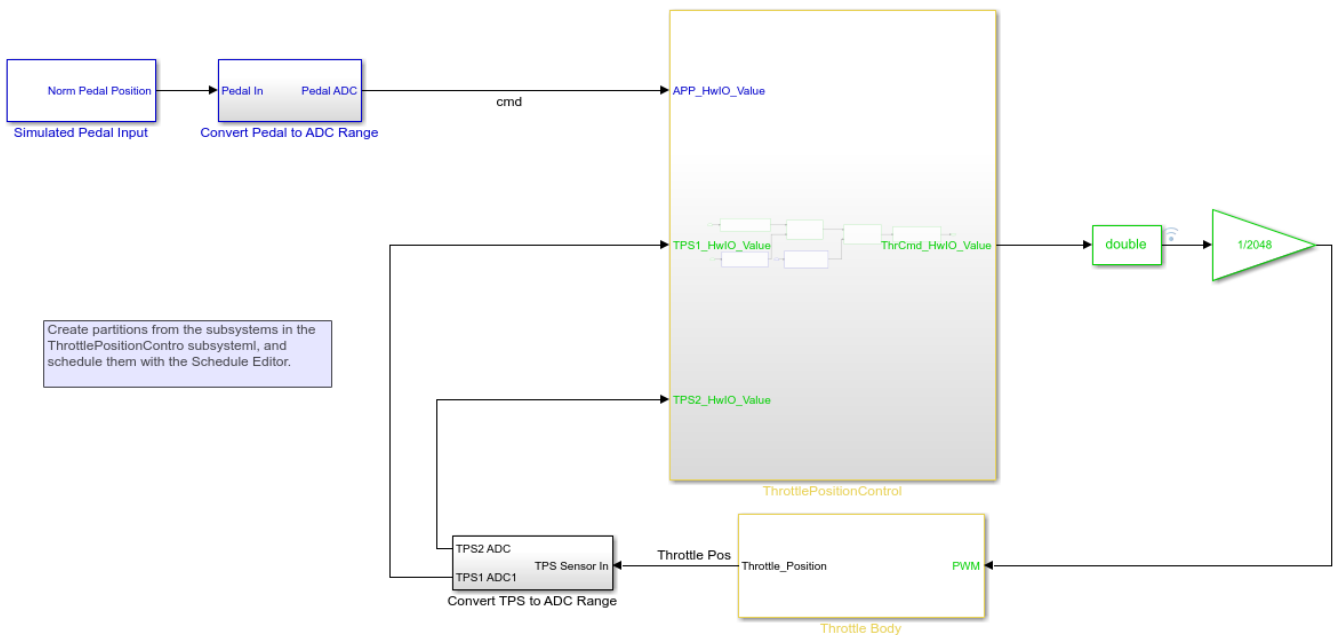

schedule =

    OrderedSchedule with properties:

        Order: [9x3 table]
        RateSections: [3x1 simulink.schedule.RateSection]
        Description: ''
    
```

Schedule Subsystem Partitions with the Schedule Editor

Copyright 2018 The MathWorks, Inc.

Examine the Schedule Object

The schedule object has an Order property that contains the execution order of the partitions in the model. The Order property displays a table that contains partition names, their index, type, and their trigger.

```
schedule.Order
```

```
ans =
```

9x3 table

Index	Type	Trigger
-------	------	---------

Cont	1	Periodic	"0"
TPSSecondaryRun5ms	2	Periodic	"0.005"
MonitorRun5ms	3	Periodic	"0.005"
ControllerRun5ms	4	Periodic	"0.005"
ActuatorRun5ms	5	Periodic	"0.005"
D2	6	Periodic	"0.005"
D3	7	Periodic	"0.01"
APPSnsrRun	8	Periodic	"0.01"
TPSPPrimaryRun10ms	9	Periodic	"0.01"

Use the index variable in the `Order` table to change the execution order of the model

```
schedule.Order.Index('ActuatorRun5ms') = 2;
schedule.Order
```

```
ans =
```

```
9x3 table
```

	Index	Type	Trigger
Cont	1	Periodic	"0"
ActuatorRun5ms	2	Periodic	"0.005"
TPSSecondaryRun5ms	3	Periodic	"0.005"
MonitorRun5ms	4	Periodic	"0.005"
ControllerRun5ms	5	Periodic	"0.005"
D2	6	Periodic	"0.005"
D3	7	Periodic	"0.01"
APPSnsrRun	8	Periodic	"0.01"
TPSPPrimaryRun10ms	9	Periodic	"0.01"

Any moves within the `Order` property that are made to modify the schedule should result in valid schedule. To perform the schedule modifications and valid moves easier, each partition is grouped with partitions of the same rate in the `RateSections` property. Each element of the `RateSection` property contains an order table with partitions of the same rate.

```
schedule.RateSections(2)
schedule.RateSections(2).Order
```

```
ans =
```

```
RateSection with properties:
```

```
Rate: "0.005"
Order: [5x3 table]
```

```
ans =
```

```
5x3 table
```

	Index	Type	Trigger

ActuatorRun5ms	2	Periodic	"0.005"
TPSSecondaryRun5ms	3	Periodic	"0.005"
MonitorRun5ms	4	Periodic	"0.005"
ControllerRun5ms	5	Periodic	"0.005"
D2	6	Periodic	"0.005"

Use the index variable to move the partitions within RateSections.

```
schedule.RateSections(2).Order.Index('ActuatorRun5ms') = 5;
schedule.Order
```

```
ans =
```

```
9x3 table
```

	Index	Type	Trigger

MonitorRun5ms	3	Periodic	"0.005"
ControllerRun5ms	4	Periodic	"0.005"
ActuatorRun5ms	5	Periodic	"0.005"
D2	6	Periodic	"0.005"
D3	7	Periodic	"0.01"
APPSnsrRun	8	Periodic	"0.01"
TPSPPrimaryRun10ms	9	Periodic	"0.01"

Create a Function to Generate Random Schedules

In this section, we create three different functions: `randomSchedule`, `generateSimulationInputs` and `simulateRandomSchedules`

`randomSchedule` function is used to create random schedules by using random permutations of index modifications in the `schedule` object. Using the `Order` and the `RateSections` properties of the `schedule` object, partitions in the schedules are moved around in different, random combinations. With these randomly created schedules, models are simulated and compared to study the effect of different schedules on simulation. In the function `randomSchedule`, the input is the model name. Then use `get_param` to obtain the `simulink.schedule.OrderedSchedule` object of the model. The schedule object and its properties are used to modify and randomize the schedules. Create a variable `firstExecutionOrder` for the first rate section of the model. The `rateSections(1).ExecutionOrder = [firstExecutionOrder(1,:); reSchedule(firstExecutionOrder(2:end,:))]` line of code calls the function `reSchedule` which creates random permutations of the indexes.

```
type randomSchedule
```

```
function schedule = randomSchedule(model)
    % schedule = randomSchedule(model) Produces a
    % simulink.schedule.OrderedSchedule that has a randomized permutation
    % of the model's original execution order schedule
```

```

arguments
    model char = bdroot
end

schedule = get_param(model, 'Schedule');

rateSections = schedule.RateSections;
firstOrder = rateSections(1).Order;

% This assumes that the slowest discrete rate is at index 1. This may
% not be the case for all models (ex. JMAAB-B).
rateSections(1).Order = [firstOrder(1,:); reSchedule(firstOrder(2:end,:))];

for i=2:length(rateSections)
    rateSections(i).Order = reSchedule(rateSections(i).Order);
end

schedule.RateSections = rateSections;
end

function out = reSchedule(in)
    numPartitions = height(in);
    in.Index = in.Index(randperm(numPartitions));
    out = in;
end

```

To analyze the effects of different schedules on the model, simulate the model with the different schedules. In this function, create an array of `Simulink.SimulationInput` objects. Through this array of `Simulink.SimulationInput` objects, you can apply the schedules to the model with the `setModelParameters` method of the `Simulink.SimulationInput` object.

type [generateSimulationInputs](#)

```

function in = generateSimulationInputs(model, numSimulations)
    % in = generateSimulationInputs(model, numSimulations) Generates
    % numSimulations Simulink.SimulationInput objects each containing a
    % different, randomized execution order schedule
    arguments
        model char = bdroot
        numSimulations double = 10
    end

    in(numSimulations) = Simulink.SimulationInput();
    in = in.setModelName(model);
    for idx = 1:numSimulations
        in(idx) = in(idx).setModelParameter('Schedule', randomSchedule(model));
    end
end

```

In the last function, use the array of `Simulink.SimulationInput` objects to run multiple simulations. Once the simulations are complete, you can plot the output of all the simulations in Simulation Data Inspector.

type [simulateRandomSchedules](#)

```

function out = simulateRandomSchedules(model, numSimulations)

```

```
% out = simulateRandomSchedules(model, numSimulations) Simulates a
% model numSimulations number of times. Each simulation has a
% randomized execution order schedule.
arguments
    model char = bdroot
    numSimulations double = 10
end

in = generateSimulationInputs(model, numSimulations);
out = sim(in);
plot(out);
end
```

Execute the Functions

Now run the above functions for the `ScheduleEditorAPIWithSubsystemPartitions` model. First, use the `randomSchedule` function to create randomly generated schedules, then, use the `generateSimulationInputs` function to generate an array of `Simulink.SimulationInput` objects, and use the `simulateRandomSchedule` function to simulate the model with different schedules and plot their results for comparison. Let's run simulations with 15 randomly generated schedules.

```
simulateRandomSchedules(model, 15)
```

```
[29-Feb-2020 11:00:23] Running simulations...
[29-Feb-2020 11:01:00] Completed 1 of 15 simulation runs

Schedule Editor

Topics

“Schedule the Partitions”

“Create Partitions”

Introduced in R2020a

simulink.schedule.createSchedule

Create a new schedule using provided schedule and ordering

Syntax

```
outputSchedule = createSchedule(inputSchedule, partitionOrder)
outputSchedule = createSchedule(inputSchedule, partitionOrder,
'IgnoreExtra', true)
```

Description

`outputSchedule = createSchedule(inputSchedule, partitionOrder)` creates a new `simulink.schedule.OrderedSchedule` object, `sch` with all the partitions present in the `simulink.schedule.OrderedSchedule` object, `inputSchedule`, according to order specified by the vector, `partitionOrder`.

`outputSchedule = createSchedule(inputSchedule, partitionOrder, 'IgnoreExtra', true)` creates a new `simulink.schedule.OrderedSchedule` object, `sch` with all the partitions present in the `simulink.schedule.OrderedSchedule`, `Schedule`, according to order specified by the parameter, `partitionOrder` while ignoring any partitions that are not already present in `sch`. `PartitionOrder` must contain all partitions of `inputSchedule`.

Input Arguments

inputSchedule — A `simulink.schedule.Orderedschedule` object

object

An existing `simulink.schedule.Orderedschedule` object copied to create new schedule.

partitionOrder — A vector of partition names

vector

Partition names in the desired order, specified as a vector of strings.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Example: `'IgnoreExtra', true`

IgnoreExtra — Ignore additional partitions

false (default) | true

When specified as true, `createSchedule` function ignores any additional partitions in `partitionOrder` that are not present in the object, `inputSchedule`.

Output Arguments

outputSchedule — New `simulink.schedule.Orderedschedule` object
object

Simulink.dialog.TreeControl class

Package: Simulink.dialog

Control Tree control programmatically

Description

Use an instance of Simulink.dialog.TreeControl class to perform the following operations:

- Get selected items from the tree
- Set selected items in the tree

Properties

Name

Uniquely identifies the dialog control and is a required field.

Type: character vector or string

Prompt

Specifies the text displayed on the tree dialog control.

Type: character vector or string

Default: empty

TreeItems

Specifies the items shown in the tree.

Type: cell array

Default: empty

Callback

Specifies the MATLAB command (s) to be executed when the dialog control is invoked.

Type: character vector or string

Default: empty

Row

Specifies whether dialog control is placed on the current row or on a new row.

Type: character vector

Value: 'current' | 'new'

Default: 'current'

Enabled

Indicates whether tree control is active on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

Visible

Indicates whether tree control is displayed on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

Multiselect

Indicates whether tree control is enabled for multiple selection.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

Tooltip

Indicates whether tree control has a tooltip configured.

Type: character vector or string

Default: empty

Methods

setSelectedItems(TreeControl)	Set values for a tree
getSelectedItems(TreeControl)	Get the values of selected items from a tree hierarchy

See Also

setSelectedItems(TreeControl)

Class: Simulink.dialog.TreeControl

Package: Simulink.dialog

Set values for a tree

Syntax

```
treeControl.setSelectedItems({'Node1/ChildNode1', 'Node1/ChildNode2'})
```

Description

`treeControl.setSelectedItems({'Node1/ChildNode1', 'Node1/ChildNode2'})` set the values for the selected items in the tree.

Input Arguments

TreeControl — tree handle

table object

Handle to the tree, specified as an object. You can use the `getDialogControl` command to get the tree handle. For more information, see `getDialogControl`.

For example, `treeControl = maskObj.getDialogControl('TreeControl')`. Here, `maskObj` is the mask object and `TreeControl` is the name of the tree.

Data Types: cell array

value — value to be set

cell-array of string

Value to be set for selected items in the tree.

Examples

```
maskObj = Simulink.Mask.get( gcb );
treeControl = maskObj.getDialogControl('Control2')
```

```
% Set selected items
treeControl.setSelectedItems({'Node1/ChildNode1', 'Node1/ChildNode2'})
```

See Also

“Create Block Masks” | Simulink.Mask

Introduced in R2019b

getSelectedItems(TreeControl)

Class: Simulink.dialog.TreeControl

Package: Simulink.dialog

Get the values of selected items from a tree hierarchy

Syntax

```
selectedItems = treeControl.getSelectedItems()
```

Description

`selectedItems = treeControl.getSelectedItems()` fetches the information of the selected items in the tree.

Output Arguments

selectedItems — value of selected items

cell array

Value of the selected items, returned as a cell array.

Examples

```
% Get block mask handle
maskObj = Simulink.Mask.get(gcb);

% Get tree handle
treeControl = maskObj.getDialogControl('TreeControl');
treeControl.getSelectedItems();
```

```
ans =
```

```
4×1 cell array
```

```
 {'Node1/ChildNode1'}
 {'Node1/ChildNode2'}
 {'Node2/ChildNode1'}
 {'Node2/ChildNode2'}
```

“Create Block Masks” | Simulink.Mask

Introduced in R2019b

getSimulationJobs

Get all `Simulink.Simulation.Job` objects from cluster

Syntax

```
jobs = getSimulationJobs(myCluster)
```

Description

`jobs = getSimulationJobs(myCluster)` returns an array of `Simulink.Simulation.Job` objects that correspond to the jobs created by executing of `batchsim` on cluster, `myCluster`.

Examples

Get a Simulink.Simulation.Job Object from the Cluster

This example shows how to access a `batchsim` job that was submitted to a cluster. Assume that `myCluster` is a `parallel.Cluster` object on which the `Simulink.Simulation.Job` object is running.

```
jobs = getSimulationJobs(myCluster)
```

1×2 Job array:

	ID	Type	State	FinishDateTime	Username
1	3	pool	queued		#####
2	4	pool	queued		#####

The output displays all the `Simulink.Simulation.Job` objects on cluster, `myCluster`.

Input Arguments

myCluster — `parallel.Cluster` object

object

Cluster object representing parallel cluster compute resources.

Output Arguments

jobs — Array of `Simulink.Simulation.Job` objects

array

Array of `Simulink.Simulation.Job` objects submitted by executing `batchsim` command.

Programmatic Model Editor Appearance Parameters

Use the following parameters to control how your model appears in the Simulink editor. To query and/or modify the value of a parameter, use `get_param` or `set_param`.

Model Appearance Parameters

Parameter	Description	Values
BlockNameDataTip	Specifies whether to display the block name as a data tip. In the Simulink Editor, in the Debug tab, select Information Overlays > Name in Tooltip .	'on' {'off'}
BlockParametersDataTip	Specifies whether to display a block parameter in a data tip. In the Simulink Editor, in the Debug tab, select Information Overlays > Parameters in Tooltip .	'on' {'off'}
BlockDescription-StringDataTip	Specifies whether to display the user description for a block as a data tip. In the Simulink Editor, in the Debug tab, select Information Overlays > Description in Tooltip .	'on' {'off'}
BrowserLookUnderMasks	Show masked subsystems in the Model Browser. On the Modeling tab, select Environment > Model Browser . In the Model Browser pane, click  and select Systems with Mask Parameters .	'on' {'off'}
BrowserShowLibraryLinks	Show library links in the Model Browser. On the Modeling tab, select Environment > Model Browser . In the Model Browser pane, click  and select Library Links .	'on' {'off'}
CompiledModelBlockNormalModeVisibility	For a top model that is being simulated or that is in a compiled state, return information about which Model blocks have normal mode visibility enabled.	Return values indicate which Model blocks have normal mode visibility enabled.

Parameter	Description	Values
DefaultAnnotationFontName DefaultBlockFontName DefaultLineFontName	Name of font to use for new annotation text, block text, or signal line labels and on existing annotations, block names, or signal lines whose FontName property is set to 'auto'. To set, in the Format tab, click Fonts for Model .	character vector
DefaultAnnotationFontSize DefaultBlockFontSize DefaultLineFontSize	Size of font to use for new annotation text, block text, or signal line labels and on existing annotations, blocks, or signal lines whose FontSize property is set to -1. To set, in the Format tab, click Fonts for Model .	positive integer
DefaultAnnotationFontAngle DefaultBlockFontAngle DefaultLineFontAngle	Angle of font for new annotation text, block text, or signal line labels and on existing annotations, blocks, or signal lines whose FontAngle property is set to 'auto'. To set, in the Format tab, click Fonts for Model .	{'normal'} {'italic'}
DefaultAnnotationFontWeight DefaultBlockFontWeight DefaultLineFontWeight	Weight of font for new annotation text, block text, or signal line labels and on existing annotations, blocks, or signal lines whose FontWeight property is set to 'auto'. To set, in the Format tab, click Fonts for Model .	{'normal'} {'bold'}
ExecutionContextIcon	Show execution context bars on conditional subsystems that do not propagate execution context across the subsystem boundaries. In the Simulink Editor, in the Debug tab, select Information Overlays > Execution Context .	'on' {'off'}
HideAutomaticNames	Hides block names given automatically by the Simulink Editor. See "Hide or Display Block Names".	{'on'} 'off'

Parameter	Description	Values
LineUpdate	<p>Specifies when to update line routing to avoid overlapping lines and obstacles in the model.</p> <p>When set to the default 'deferred', scripts postpone line routing until they pause or complete. To perform deferred line routing within a script, you can use function <code>Simulink.BlockDiagram.routeLine</code>.</p>	{'deferred'} 'none' 'immediate'
MaxMDLFileLineLength	<p>Controls the line lengths in the model file. Use this to avoid line-wrapping, which can be important for source control tools.</p> <p>Specifies the maximum length in bytes, which may differ from the number of characters in Japanese, and is different from the number of columns when tabs are present.</p>	integer — -1 (unlimited) or ≥ 80 . Default is 120.
ModelBrowserVisibility	<p>Show the Model Browser.</p> <p>In the Simulink Editor, in the Modeling tab, select Environment > Model Browser.</p>	'on' {'off'}
ModelBrowserWidth	<p>Width of the Model Browser pane in the model window. To display the Model Browser pane, see the <code>ModelBrowserVisibility</code> parameter.</p>	integer — {200}
ModelBlockNormalModeVisibility	<p>Use with <code>set_param</code> to set normal mode visibility on for the specified Model blocks.</p> <p>You can set this parameter with the Model Block Normal Mode Visibility dialog box. For details, see “Specify the Instance Having Normal Mode Visibility”.</p>	<p>With <code>set_param</code>, use an array of <code>Simulink.BlockPath</code> objects or cell array of cell arrays of character vectors of paths to blocks or models.</p> <p>With <code>set_param</code>, an empty array specifies to use the Simulink default selection for the instance to have normal mode visibility enabled.</p>
ModelBlockNormalModeVisibilityBlockPath	<p>Return information about which Model blocks have normal mode visibility enabled. Use with a model that you are editing.</p>	<p>Return values indicate which Model blocks have normal mode visibility enabled. See “Simulate Multiple Referenced Model Instances in Normal Mode”.</p>

Parameter	Description	Values
PortDataTypeDisplayFormat	<p>When you display port data types in a model, choose whether to display data type aliases, base data types, or both.</p> <p>In the Simulink Editor, in the Debug tab, set by Information Overlays > Base Data Types and Information Overlays > Alias Data Types.</p>	'AliasTypeOnly' 'BaseTypeOnly' 'BaseAndAliasTypes'
ReqHilite	<p>Highlights all the blocks in the Simulink diagram that have requirements associated with them.</p> <p>In the Simulink Editor, in the Apps tab, under Verification, Validation, and Test, click Requirements Viewer. The Requirements Viewer tab appears. Click Highlight Links.</p>	'on' {'off'}
SampleTimeAnnotations	In the Simulink Editor, in the Debug tab, select Information Overlays > Text .	'on' {'off'}
SampleTimeColors	In the Simulink Editor, in the Debug tab, select Information Overlays > Colors .	'on' {'off'}
ScreenColor	<p>Background color of the model window.</p> <p>In the Simulink Editor, on the Format tab, set Background.</p>	'black' {'white'} 'red' 'green' 'blue' 'cyan' 'magenta' 'yellow' 'gray' 'lightBlue' 'orange' 'darkGreen' [r,g,b,a] where r, g, b, and a are the red, green, blue, and alpha values of the color normalized to the range 0.0 to 1.0. The alpha value is ignored.
ShowLinearization-Annotations	Toggles linearization icons in the model.	{'on'} 'off'
ShowLineDimensions	<p>Show signal dimensions on this model's block diagram.</p> <p>In the Simulink Editor, on the Debug tab, select Information Overlays > Signal Dimensions.</p>	'on' {'off'}
ShowLoopsOnError	Highlight invalid loops graphically.	{'on'} 'off'

Parameter	Description	Values
ShowModelReferenceBlockIO	<p>Toggles display of I/O mismatch on block.</p> <p>In the Simulink Editor, in the Debug tab, select Information Overlays > Ref. Model I/O Mismatch.</p>	'on' {'off'}
ShowModelReference-BlockVersion	<p>Toggles display of version on block.</p> <p>In the Simulink Editor, in the Debug tab, select Information Overlays > Ref. Model Version.</p>	'on' {'off'}
ShowPageBoundaries	<p>Toggles display of page boundaries on the Simulink Editor canvas.</p> <p>In the Simulink Editor, in the Simulation tab, select Print > Show Page Boundaries.</p>	'on' {'off'}
ShowPortDataTypes	<p>Show data types of ports on this model's block diagram.</p> <p>In the Simulink Editor, in the Debug tab, select Information Overlays > Base Data Types.</p>	'on' {'off'}
ShowPortUnits	<p>Show units of ports, subsystem, and model block icons on the model block diagram.</p> <p>In the Simulink Editor, in the Debug tab, select Information Overlays > Port Units.</p>	'on' {'off'}
ShowStorageClass	<p>Show storage classes of signals on this model's block diagram.</p> <p>In the Simulink Editor, in the Debug tab, select Information Overlays > Storage Class.</p>	'on' {'off'}
ShowTestPointIcons	<p>Show test point icons on this model's block diagram.</p> <p>In the Simulink Editor, in the Debug tab, select Information Overlays > Log & Testpoint.</p>	{'on'} 'off'
ShowViewerIcons	<p>Show viewer icons on this model's block diagram.</p> <p>In the Simulink Editor, in the Debug tab, select Information Overlays > Viewers.</p>	{'on'} 'off'

Parameter	Description	Values
SortedOrder	<p>Show the sorted order of this model's blocks on the block diagram.</p> <p>In the Simulink Editor, in the Debug tab, select Information Overlays > Execution Order.</p>	'on' {'off'}
ZoomFactor	<p>Zoom factor of the Simulink Editor window expressed as a percentage of normal (100%) or by the keywords <code>FitSystem</code> or <code>FitSelection</code>.</p> <p>In the Simulink Editor, set by the zoom commands on the View menu.</p>	{'100'} 'FitSystem' 'FitSelection'
WideLines	<p>Draws lines that carry vector or matrix signals wider than lines that carry scalar signals.</p> <p>In the Simulink Editor, on the Debug tab, select Information Overlays > Nonscalar Signals.</p>	'on' {'off'}

"About Common Block Properties" on page 6-12
"Examples of Setting Block Properties" on page 6-26

About Common Block Properties

This table lists the properties common to all Simulink blocks, including block callback properties (see "Callbacks for Customized Model Behavior"). Examples of commands that change these properties follow this table (see "Examples of Setting Block Properties" on page 6-26).

Common Block Properties

Property	Description	Values
AncestorBlock	Name of the library block that the block is linked to (for blocks with a disabled link).	character vector
AttributesFormatString	Block annotation text (corresponds to block properties).	character vector
BackgroundColor	Block background color.	color value <code>'[r,g,b]'</code> <code>'[r,g,b,a]'</code> r, g, and b, are the red, green, blue values of the color in the range 0.0 to 1.0. If specified, the alpha value (a) is ignored. Possible color values are 'black', 'white', 'red', 'green', 'blue', 'cyan', 'magenta', 'yellow', 'gray', 'lightBlue', 'orange', 'darkGreen'.
BlockDescription	Block description shown at the top of the block parameters dialog box or property inspector.	character array
BlockDiagramType	Returns <code>model</code> if it is in an open Simulink block diagram. Returns <code>library</code> if it is a Simulink library.	<code>'model'</code> <code>'library'</code>
BlockType	Block type (read-only).	character array
BlockKeywords	Associates one or more keywords with a custom library block.	character vector string scalar string array
ClipboardFcn	Function called when block is copied to the clipboard (Ctrl+C) or when the menu item Copy is selected.	function character vector
CloseFcn	Function called when <code>close_system</code> is run on block.	function character vector
Commented	Exclude block from simulation.	<code>{'off'}</code> <code>'on'</code> <code>'through'</code>

Property	Description	Values
CompiledBusType	<p>Returns whether the signal connected to a port is not a bus, is a virtual, or is a nonvirtual bus (read-only).</p> <p>Specify a port or line handle when using <code>get_param</code>. For example:</p> <pre>ports = get_param(gcb, 'PortHandles'); feval(gcs, [], [], [], 'compile'); bt = get_param(ports.Outputport, 'CompiledBusType')</pre> <p>See “Display Information About Buses”.</p>	'NOT_BUS' 'VIRTUAL_BUS' 'NON_VIRTUAL_BUS'
CompiledIsActive	<p>Specifies whether the block status is active or not at compile time.</p> <p><code>CompiledIsActive</code> returns off if any one of these conditions is true at compile time:</p> <ul style="list-style-type: none"> • Block is inactive path of Inline Variant. • Block is inactive choice of Variant Subsystem. • Block is commented out is within a Subsystem block that is commented out. • Block is inactive due to condition propagated from Variant Subsystem block. <p><code>CompiledIsActive</code> returns off for inactive choices and returns on for active choices of Variant Subsystem.</p>	'off' 'on'
CompiledPortComplexSignals	<p>Complexity of port signals after updating diagram. You must compile the model before querying this property. For example:</p> <pre>vdp([], [], [], 'compile'); d = get_param(gcb, 'CompiledPortComplexSignals'); vdp([], [], [], 'term');</pre>	structure array
CompiledPortDataTypes	<p>Data types of port signals after updating diagram. You must compile the model before querying this property. See <code>CompiledPortComplexSignals</code>.</p>	structure array

Property	Description	Values
CompiledPortDesignMin	Design minimum of port signals after updating diagram. You must compile the model before querying this property. For example: <pre>feval(gcs, [], [], [], 'compile'); ports = get_param(gcb, 'PortHandles'); min = get_param(ports.Output, 'CompiledPortDesignMin'); feval(model, [], [], [], 'term');</pre>	structure array
CompiledPortDesignMax	Design maximum of port signals at compile time. You must compile the model before querying this property. For example: <pre>feval(gcs, [], [], [], 'compile'); ports = get_param(gcb, 'PortHandles'); max = get_param(ports.Output, 'CompiledPortDesignMax'); feval(model, [], [], [], 'term');</pre>	structure array
CompiledPortDimensions	Dimensions of port signals after updating diagram. You must compile the model before querying this property. For details, see "Get Compiled Port Dimensions".	numeric array
CompiledPortDimensionsMode	Indication whether the port signal has a variable size (after updating diagram). You must compile the model before querying this property. See "Determine Whether Signal Line Has Variable Size".	double number. 0 indicates the signal does not have a variable size. 1 indicates the signal has a variable size.
CompiledPortFrameData	Frame mode of port signals after updating diagram. You must compile the model before querying this property.	structure array
CompiledPortWidths	Structure of port widths after updating diagram. You must compile the model before querying this property.	structure array
CompiledSampleTime	Block sample time after updating diagram. You must compile the model before querying this property.	vector [sample time, offset time] or cell {[sample time 1, offset time 1]; [sample time 2, offset time 2]; ... [sample time n, offset time n]}
ContinueFcn	Function called at the restart of a simulation (after a pause).	function character vector

Property	Description	Values
CopyFcn	Function called when block is copied. See “Block Callback Parameters” for details.	function character vector
DataTypeOverrideCompiled	For internal use.	
DeleteFcn	Function called when block is deleted. See “Block Callback Parameters” for details.	MATLAB expression
DestroyFcn	Function called when block is destroyed. See “Block Callback Parameters” for details.	MATLAB expression
Description	Description of block. Set by the Description field in the General pane of the Block Properties dialog box.	text and tokens
Diagnostics	For internal use.	
DialogParameters	List of names/attributes of block-specific parameters for an unmasked block, or mask parameters for a masked block.	structure
DropShadow	Display drop shadow.	{'off'} 'on'
ExtModeLoggingSupported	Enable a block to support uploading of signal data in external mode (for example, with a scope block).	{'off'} 'on'
ExtModeLoggingTrig	Enable a block to act as the trigger block for external mode signal uploading.	{'off'} 'on'
ExtModeUploadOption	Enable a block to upload signal data in external mode when the Select all check box on the External Signal & Triggering dialog box is not selected. A value of <code>log</code> indicates the block uploads signals. A value of <code>none</code> indicates the block does not upload signals. The value <code>monitor</code> is currently not in use. If the Select all check box on the External Signal & Triggering dialog box is selected, it overrides this parameter setting.	{'none'} 'log' 'monitor'
FontAngle	Font angle.	'normal' 'italic' 'oblique' {'auto'}
FontName	Font name.	character array

Property	Description	Values
FontSize	Font size. A value of -1 specifies that this block inherits the font size specified by the <code>DefaultBlockFontSize</code> model parameter.	real {' -1' }
FontWeight	Font weight.	'light' 'normal' 'demi' 'bold' {'auto'}
ForegroundColor	Foreground color of block icon.	color value '[r,g,b]' '[r,g,b,a]' r, g, and b, are the red, green, blue values of the color in the range 0.0 to 1.0. The value changes if it is too similar to the canvas color (<code>ScreenColor</code> parameter). Use <code>get_param</code> to return the actual value. If specified, the alpha value (a) is ignored. Possible color values are 'black', 'white', 'red', 'green', 'blue', 'cyan', 'magenta', 'yellow', 'gray', 'lightBlue', 'orange', 'darkGreen'.
Handle	Block handle.	real
HideAutomaticName	Specify whether the block name given automatically by the Simulink Editor displays in the model. To hide automatic names, use the default setting of 'on'. (The <code>HideAutomaticNames</code> parameter for the model must also be set to 'on'.) Set to 'off' to display the name, and also set the block <code>ShowName</code> parameter to 'on'. Blocks whose <code>ShowName</code> parameter is 'off' are hidden regardless of this setting. For more information on how the parameters interact, see "Hide or Display Block Names".	{'on'} 'off'
HiliteAncestors	For internal use.	

Property	Description	Values
InitFcn	<p>Initialization function for a block. Created on the Callbacks pane of the Model Properties dialog box. For more information, see “Create Model Callbacks”.</p> <p>On non-masked blocks, updating the diagram or running the simulation call this function.</p>	MATLAB expression
InputSignalNames	Names of input signals.	cell array
IntrinsicDialogParameters	List of names/attributes of block-specific parameters (regardless of whether the block is masked or unmasked). Use instead of DialogParameters if you want block-specific parameters for masked or unmasked blocks.	structure
IOSignalStrings	Block paths to objects that are connected to the Signal & Scope Manager. Simulink software saves these paths when the model is saved.	list
IOType	Signal & Scope Manager type. For internal use.	
LibraryVersion	For a linked block, the initial value of this property is the ModelVersion of the library at the time the link was created. The value updates with increments in the model version of the library.	character vector — {'1.1'}
LineHandles	Handles of lines connected to block.	structure
LinkData	<p>Array of details about changes to the blocks inside the link that differ between a parameterized link and its library, listing the block names and parameter values. Use [] to reset to deparameterized, e.g., <code>set_param(gcf, 'linkData', [])</code>.</p> <p>See “Restore Disabled or Parameterized Links”.</p>	cell array

Property	Description	Values
LinkStatus	Link status of block. Updates out-of-date linked blocks when queried using <code>get_param</code> . See “Control Linked Block Programmatically”.	'none' 'resolved' 'unresolved' 'implicit' 'inactive' 'restore' 'propagate' 'propagateHierarchy' 'restoreHierarchy'
LoadFcn	Function called when block is loaded.	MATLAB expression
MinMaxOverflow-Logging_Compiled	For internal use.	
ModelCloseFcn	Function called when model is closed. The <code>ModelCloseFcn</code> is called prior to the block's <code>DeleteFcn</code> and <code>DestroyFcn</code> callbacks, if either are set.	MATLAB expression
ModelParamTableInfo	For internal use.	
MoveFcn	Function called when block is moved.	MATLAB expression
Name	Block or signal name. To specify a signal name, use the corresponding port or line handle. <code>ports = get_param(gcf, 'PortHandles');</code> <code>set_param(ports.Output(1), 'Name', 'NewName');</code> Alternatively, to name an output signal of a block, you can use <code>SignalNameFromLabel</code> .	character vector
NameChangeFcn	Function called when block name is changed.	MATLAB expression
NamePlacement	Position of block name.	{'normal'} 'alternate'
ObjectParameters	Names/attributes of block's parameters.	structure
OpenFcn	Function called when this Block Parameters dialog box opens.	MATLAB expression
Orientation	Where block faces.	{'right'} 'left' 'up' 'down'
OutputSignalNames	Names of output signals.	cell array
Parent	Name of the system that owns the block.	character vector {'untitled'}

Property	Description	Values
ParentCloseFcn	Function called when parent subsystem is closed. The ParentCloseFcn of blocks at the root model level is not called when the model is closed.	MATLAB expression
PauseFcn	Function called at the pause of a simulation.	function character vector

Property	Description	Values
PortConnectivity	<p>The value of this property is an array of structures, each of which describes one of the block's input or output ports. Each port structure has the following fields:</p> <ul style="list-style-type: none"> • Type Specifies the port's type and/or number. The value of this field can be: <ul style="list-style-type: none"> • n, where n is the number of the port for data ports • 'enable' if the port is an enable port • 'trigger' if the port is a trigger port • 'state' for state ports • 'ifaction' for action ports • 'LConn#' for a left connection port where # is the port's number • 'RConn#' for a right connection port where # is the port's number • Position The value of this field is a two-element vector, $[x\ y]$, that specifies the port's position. • SrcBlock Handle of the block connected to this port. This field is null for output ports and -1 for unconnected input ports. SrcBlock property is a valid source handle for Variant Subsystem blocks. • SrcPort Number of the port connected to this port, starting at zero. This field is null for both output ports and unconnected input ports. • DstBlock Handle of the block to which this port is connected. This field is 	structure array

Property	Description	Values
	<p>null for input ports and contains a 1-by-0 empty matrix for unconnected output ports.</p> <ul style="list-style-type: none"> • DstPort <p>Number of the port to which this port is connected, starting at zero. This field is null for input ports and contains a 1-by-0 empty matrix for unconnected output ports. For Simscape blocks, the field contains port handles.</p>	

Property	Description	Values
PortHandles	<p>The value of this property is a structure that specifies the handles of the block's ports. The structure has the following fields:</p> <ul style="list-style-type: none"> • Inport Handles of the block's input ports. • Outputport Handles of the block's output ports. • Enable Handle of the block's enable port. • Trigger Handle of the block's trigger port. • State Handle of the block's state port. • LConn Handles of the block's left connection ports (for blocks that support Physical Modeling tools). • RConn Handles of the block's right connection ports (for blocks that support Physical Modeling tools). • Ifaction Handle of the block's action port. • Reset Handle of the block's reset port. 	structure array
PortRotationType	Type of port rotation used by this block (read-only).	'default' 'physical'

Property	Description	Values
Ports	<p>A vector that specifies the number of each kind of port this block has. The order of the vector's elements corresponds to the following port types:</p> <ul style="list-style-type: none"> • Inport • Outport • Enable • Trigger • State • LConn • RConn • Ifaction • Reset 	vector
Position	<p>Position of block in model window.</p> <p>To help with block alignment, the position you set can differ from the actual block position by a few pixels. Use <code>get_param</code> to return the actual position.</p>	<p>vector of coordinates, in pixels: [left top right bottom]</p> <p>The origin is the upper-left corner of the Simulink Editor canvas before any canvas resizing. Supported coordinates are between -1073740824 and 1073740823, inclusive. Positive values are to the right of and down from the origin. Negative values are to the left of and up from the origin.</p>
PostSaveFcn	Function called after the block is saved.	MATLAB expression
PreCopyFcn	Function called before the block is copied. See "Block Callback Parameters" for details.	MATLAB expression
PreDeleteFcn	Function called before the block is deleted. See "Block Callback Parameters" for details.	MATLAB expression
PreSaveFcn	Function called before the block is saved. See "Block Callback Parameters" for details.	MATLAB expression
Priority	Specifies the block's order of execution relative to other blocks in the same model. Set by the Priority field on the General pane of the Block Properties dialog box.	character vector { ' ' }
ReferenceBlock	Name of the library block to which this block links.	character vector { ' ' }

Property	Description	Values
RequirementInfo	For internal use.	
RTWData	User specified data, used by Simulink Coder software. Intended only for use with user written S-functions. See the section “S-Function RTWdata” (Simulink Coder) for details.	
SampleTime	Value of the sample time parameter. See “Specify Sample Time” for more details.	character vector
Selected	Status of whether or not block is selected.	{'on'} 'off'
ShowName	Display or hide block name. To display a block name given by the Simulink Editor (automatic names), set the block 'HideAutomaticName' parameter to 'off' and ShowName to 'on'. To hide an automatic block name given by the Editor, set ShowName to 'on', HideAutomaticName to 'on', and HideAutomaticNames on the model to 'on'. For more information on how the parameters interact, see “Hide or Display Block Names”.	{'on'} 'off'
SignalHierarchy	If the signal is a bus, returns the name and hierarchy of the signals in the bus (read-only). Specify a port or line handle when using <code>get_param</code> . For example: <pre>ports = get_param(gcf,'PortHandles'); feval(gcs,[],[],[],'compile'); sh = get_param(ports.Outport,'SignalHierarchy')</pre> See “Display Information About Buses”.	values reflect the structure of the signal that you specify
StartFcn	Function called at the start of a simulation.	MATLAB expression
StatePerturbation-ForJacobian	State perturbation size to use during linearization. See “Change Perturbation Level of Blocks Perturbed During Linearization” (Simulink Control Design) for details.	character vector

Property	Description	Values
StaticLinkStatus	Link status of block. Does not update out-of-date linked blocks when queried using <code>get_param</code> . See also <code>LinkStatus</code> .	'none' 'resolved' 'unresolved' 'implicit' 'inactive' 'restore' 'propagate' 'propagateHierarchy' 'restoreHierarchy'
StopFcn	Function called at the termination of a simulation.	MATLAB expression
Tag	Text that appears in the block label that Simulink software generates. Set by the Tag field on the General pane of the Block Properties dialog box.	character vector {' '}
Type	Simulink object type (read-only).	'block'
UndoDeleteFcn	Function called when block deletion is undone.	MATLAB expression
UserData	User-specified data that can have any MATLAB data type.	{'[]'}
UserDataPersistent	Status of whether or not <code>UserData</code> will be saved in the model file.	'on' {'off'}

Examples of Setting Block Properties

These examples illustrate how to change common block properties.

This command changes the orientation of the Gain block in the `mymodel` system so it faces the opposite direction (right to left).

```
set_param('mymodel/Gain','Orientation','left')
```

This command associates an `OpenFcn` callback with the Gain block in the `mymodel` system.

```
set_param('mymodel/Gain','OpenFcn','my_open_cb')
```

This command sets the `Position` property of the Gain block in the `mymodel` system. The block is 75 pixels wide by 25 pixels high.

```
set_param('mymodel/Gain','Position',[50 250 125 275])
```

Block-Specific Parameters

To write scripts that create and modify models, you can use the `get_param` and `set_param` functions to query and modify the properties and parameters of a block or diagram. Use the tables to determine the programmatic name of a parameter or property in a block dialog box.

Programmatic Parameters of Blocks and Models

Programmatic parameters that describe a model are model parameters. Parameters that describe a block are block parameters. Parameters that are common to all Simulink blocks are common block parameters (see “Common Block Properties” on page 6-12). Many blocks also have unique block-specific parameters. A masked block can have mask parameters (see “Mask Parameters” on page 6-131).

The model and block properties also include callbacks, which are commands that execute when a certain model or block event occurs. These events include opening a model, simulating a model, copying a block, opening a block, etc. See “Model, Block, and Port Callbacks”.

Tip For block parameters that accept array values, the number of elements in the array cannot exceed what `int_T` can represent. This limitation applies to both simulation and Simulink Coder code generation.

The maximum number of characters that a parameter edit field can contain is 49,000.

Block-Specific Parameters and Programmatic Equivalents

The tables list block-specific parameters for Simulink blocks. The type of the block appears in parentheses after the block name. Some Simulink blocks work as masked subsystems. The tables indicate masked blocks by adding the designation "masked subsystem" after the block type.

The type listed for nonmasked blocks is the value of the `BlockType` parameter (see "Common Block Properties" on page 6-12). The type listed for masked blocks is the value of the `MaskType` parameter (see "Mask Parameters" on page 6-131).

The **Dialog Box Prompt** column indicates the text of the prompt for the parameter in the block dialog box. The **Values** column shows the type of value required (scalar, vector, variable), the possible values (separated with a vertical line), and the default value (enclosed in braces).

Continuous Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Derivative (Derivative)		
CoefficientInTFApproximation	Coefficient c in the transfer function approximation $s/(c*s+1)$ used for linearization	{'inf'}
Integrator (Integrator)		
ExternalReset	External reset	{'none'} 'rising' 'falling' 'either' 'level' 'level hold'
InitialConditionSource	Initial condition source	{'internal'} 'external'
InitialCondition	Initial condition	scalar or vector — {'0'}
LimitOutput	Limit output	{'off'} 'on'
UpperSaturationLimit	Upper saturation limit	scalar or vector — {'inf'}
LowerSaturationLimit	Lower saturation limit	scalar or vector — {'-inf'}
ShowSaturationPort	Show saturation port	{'off'} 'on'
ShowStatePort	Show state port	{'off'} 'on'
AbsoluteTolerance	Absolute tolerance	character vector, scalar, or vector — {'auto'} {'-1'} any real scalar or vector
IgnoreLimit	Ignore limit and reset when linearizing	{'off'} 'on'
ZeroCross	Enable zero-crossing detection	'off' {'on'}
ContinuousStateAttributes	State Name	{' '} user-defined
WrapState	Wrap state	{'off'} 'on'
WrappedStateUpperValue	Upper value of wrapped state	scalar or vector — {'pi'}
WrappedStateLowerValue	Lower value of wrapped state	scalar or vector — {'-pi'}
Second-Order Integrator (SecondOrderIntegrator)		
ICSourceX	Initial condition source x	{'internal'} 'external'
ICX	Initial condition x	scalar or vector — {'0'}
LimitX	Limit x	{'off'} 'on'
UpperLimitX	Upper limit x	scalar or vector — {'inf'}
LowerLimitX	Lower limit x	scalar or vector — {'-inf'}
WrapStateX	Enable wrapping of x	{'off'} 'on'
WrappedUpperValueX	Upper value for wrapping x	scalar or vector — {'pi'}
WrappedLowerValueX	Lower value for wrapping x	scalar or vector — {'-pi'}
AbsoluteToleranceX	Absolute tolerance x	character vector, scalar, or vector — {'auto'} {'-1'} any real scalar or vector
StateNameX	State name x	{ } user-defined

Block (Type)/Parameter	Dialog Box Prompt	Values
ICSourceDXDT	Initial condition source dx/dt	{'internal'} 'external'
ICDXDT	Initial condition dx/dt	scalar or vector — {'0'}
LimitDXDT	Limit dx/dt	{'off'} 'on'
UpperLimitDXDT	Upper limit dx/dt	scalar or vector — {'inf'}
LowerLimitDXDT	Lower limit dx/dt	scalar or vector — {'-inf'}
AbsoluteToleranceDXDT	Absolute tolerance dx/dt	character vector, scalar, or vector — {'auto'} {'-1'} any real scalar or vector
StateNameDXDT	State name dx/dt	{ } user-defined
ExternalReset	External reset	{'none'} 'rising' 'falling' 'either'
ZeroCross	Enable zero-crossing detection	{'on'} 'off'
ReinitDXDTwhenXreachesSaturation	Reinitialize dx/dt when x reaches saturation	{'off'} 'on'
IgnoreStateLimitsAndResetForLinearization	Ignore state limits and the reset for linearization	{'off'} 'on'
ShowOutput	Show output	{'both'} 'x' 'dxdt'
State-Space (StateSpace)		
A	A	matrix — {'1'}
B	B	matrix — {'1'}
C	C	matrix — {'1'}
D	D	matrix — {'1'}
InitialCondition	Initial conditions	vector — {'0'}
AbsoluteTolerance	Absolute tolerance	character vector, scalar, or vector — {'auto'} {'-1'} any real scalar or vector
ContinuousStateAttributes	State Name	{' '} user-defined
Transfer Fcn (TransferFcn)		
Numerator	Numerator coefficients	vector or matrix — {'[1]'}
Denominator	Denominator coefficients	vector — {'[1 1]'}
AbsoluteTolerance	Absolute tolerance	character vector, scalar, or vector — {'auto'} {'-1'} any real scalar or vector
ContinuousStateAttributes	State Name	{' '} user-defined
Transport Delay (TransportDelay)		
DelayTime	Time delay	scalar or vector — {'1'}
InitialOutput	Initial output	scalar or vector — {'0'}
BufferSize	Initial buffer size	scalar — {'1024'}
FixedBuffer	Use fixed buffer size	{'off'} 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
TransDelayFeedthrough	Direct feedthrough of input during linearization	{'off'} 'on'
PadeOrder	Pade order (for linearization)	{'0'}
Variable Time Delay (VariableTimeDelay)		
VariableDelayType	Select delay type	'Variable transport delay' {'Variable time delay'}
MaximumDelay	Maximum delay	scalar or vector — {'10'}
InitialOutput	Initial output	scalar or vector — {'0'}
MaximumPoints	Initial buffer size	scalar — {'1024'}
FixedBuffer	Use fixed buffer size	{'off'} 'on'
ZeroDelay	Handle zero delay	{'off'} 'on'
TransDelayFeedthrough	Direct feedthrough of input during linearization	{'off'} 'on'
PadeOrder	Pade order (for linearization)	{'0'}
ContinuousStateAttributes	State Name	{' '} user-defined
Variable Transport Delay (VariableTransportDelay)		
VariableDelayType	Select delay type	{'Variable transport delay'} 'Variable time delay'
MaximumDelay	Maximum delay	scalar or vector — {'10'}
InitialOutput	Initial output	scalar or vector — {'0'}
MaximumPoints	Initial buffer size	scalar — {'1024'}
FixedBuffer	Use fixed buffer size	{'off'} 'on'
TransDelayFeedthrough	Direct feedthrough of input during linearization	{'off'} 'on'
PadeOrder	Pade order (for linearization)	{'0'}
AbsoluteTolerance	Absolute tolerance	character vector, scalar, or vector — {'auto'} {'-1'} any positive real scalar or vector
ContinuousStateAttributes	State Name	{' '} user-defined
Zero-Pole (ZeroPole)		
Zeros	Zeros	vector — {'[1]'}
Poles	Poles	vector — {'[0 -1]'}
Gain	Gain	vector — {'[1]'}
AbsoluteTolerance	Absolute tolerance	character vector, scalar, or vector — {'auto'} {'-1'} any positive real scalar or vector
ContinuousStateAttributes	State Name	{' '} user-defined

Discontinuities Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Backlash (Backlash)		
BacklashWidth	Deadband width	scalar or vector — {'1'}
InitialOutput	Initial output	scalar or vector — {'0'}
ZeroCross	Enable zero-crossing detection	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Coulomb & Viscous Friction (Coulombic and Viscous Friction) (masked subsystem)		
offset	Coulomb friction value (Offset)	{'[1 3 2 0]}'
gain	Coefficient of viscous friction (Gain)	{'1'}
Dead Zone (DeadZone)		
LowerValue	Start of dead zone	scalar or vector — {'-0.5'}
UpperValue	End of dead zone	scalar or vector — {'0.5'}
SaturateOnIntegerOverflow	Saturate on integer overflow	'off' {'on'}
LinearizeAsGain	Treat as gain when linearizing	'off' {'on'}
ZeroCross	Enable zero-crossing detection	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Dead Zone Dynamic (Dead Zone Dynamic) (masked subsystem)		
Hit Crossing (HitCross)		
HitCrossingOffset	Hit crossing offset	scalar or vector — {'0'}
HitCrossingDirection	Hit crossing direction	'rising' 'falling' {'either'}
ShowOutputPort	Show output port	'off' {'on'}
ZeroCross	Enable zero-crossing detection	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Quantizer (Quantizer)		
QuantizationInterval	Quantization interval	scalar or vector — {'0.5'}
LinearizeAsGain	Treat as gain when linearizing	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Rate Limiter (RateLimiter)		
RisingSlewLimit	Rising slew rate	{'1'}
FallingSlewLimit	Falling slew rate	{'-1'}
SampleTimeMode	Sample time mode	'continuous' {'inherited'}
InitialCondition	Initial condition	{'0'}
LinearizeAsGain	Treat as gain when linearizing	'off' {'on'}
Rate Limiter Dynamic (Rate Limiter Dynamic) (masked subsystem)		
Relay (Relay)		

Block (Type)/Parameter	Dialog Box Prompt	Values
OnSwitchValue	Switch on point	{'eps'}
OffSwitchValue	Switch off point	{'eps'}
OnOutputValue	Output when on	{'1'}
OffOutputValue	Output when off	{'0'}
ZeroCross	Enable zero-crossing detection	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	'Inherit: Inherit via back propagation' {'Inherit: All ports same datatype'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16)' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)' 'Enum: <class name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
Saturation (Saturate)		
UpperLimit	Upper limit	scalar or vector — {'0.5'}
LowerLimit	Lower limit	scalar or vector — {'-0.5'}
LinearizeAsGain	Treat as gain when linearizing	'off' {'on'}
ZeroCross	Enable zero-crossing detection	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	'Inherit: Inherit via back propagation' {'Inherit: Same as input'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
Saturation Dynamic (Saturation Dynamic) (masked subsystem)		
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Same as second input'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
OutputDataTypeScalingMode	Deprecated in R2007b	
OutDataType	Deprecated in R2007b	
OutScaling	Deprecated in R2007b	
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
DoSatur	Saturate on integer overflow	{'off'} 'on'
Wrap To Zero (Wrap To Zero) (masked subsystem)		
Threshold	Threshold	{'255'}

Discrete Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Delay (Delay)		
DelayLengthSource	Delay length > Source	{'Dialog'} 'Input port'
DelayLength	Delay length > Value	{'2'}
DelayLengthUpperLimit	Delay length > Upper limit	{'100'}
InitialConditionSource	Initial condition > Source	{'Dialog'} 'Input port'
InitialCondition	Initial condition > Value	{'0.0'}
ExternalReset	External reset	{'None'} 'Rising' 'Falling' 'Either' 'Level' 'Level hold'
InputProcessing	Input processing	'Columns as channels (frame based)' {'Elements as channels (sample based)'} 'Inherited'
UseCircularBuffer	Use circular buffer for state	{'off'} 'on'
PreventDirectFeedthrough	Prevent direct feedthrough	{'off'} 'on'
RemoveDelayLengthCheckInGeneratedCode	Remove delay length check in generated code	{'off'} 'on'
DiagnosticForDelayLength	Diagnostic for delay length	{'None'} 'Warning' 'Error'
SampleTime	Sample time (-1 for inherited)	{'-1'}
StateName	State name	{''}
StateMustResolveToSignalObject	State name must resolve to Simulink signal object	{'off'} 'on'
StateSignalObject	Signal object class Code generation storage class	Simulink.Signal object Object of a class that is derived from Simulink.Signal
StateStorageClass	Code generation storage class	{'Auto'} 'Model default' 'ExportedGlobal' 'ImportedExtern' 'ImportedExternPointer' 'Custom'
CodeGenStateStorageTypeQualifier	Code generation storage type qualifier	{''}
Difference (Difference) (masked subsystem)		
ICPrevInput	Initial condition for previous input	{'0.0'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} 'Inherit: Inherit via back propagation' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
OutputDataTypeScalingMode	Deprecated in R2007b	
OutDataType	Deprecated in R2007b	
OutScaling	Deprecated in R2007b	
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'} 'on'
Discrete Derivative (Discrete Derivative) (masked subsystem)		
gainval	Gain value	{'1.0'}
ICPrevScaledInput	Initial condition for previous weighted input $K \cdot u / T_s$	{'0.0'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} 'Inherit: Inherit via back propagation' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
OutputDataTypeScalingMode	Deprecated in R2007b	
OutDataType	Deprecated in R2007b	
OutScaling	Deprecated in R2007b	

Block (Type)/Parameter	Dialog Box Prompt	Values
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'} 'on'
Discrete FIR Filter (Discrete FIR Filter)		
CoefSource	Coefficient source	{'Dialog parameters'} 'Input port'
FilterStructure	Filter structure	{'Direct form'} 'Direct form symmetric' 'Direct form antisymmetric' 'Direct form transposed' 'Lattice MA' Note You must have a DSP System Toolbox license to use a filter structure other than Direct form.
Coefficients	Coefficients	vector — {'[0.5 0.5]'} Note You must have a DSP System Toolbox license to use a filter structure other than Direct form.
InputProcessing	Input processing	'Columns as channels (frame based)' {'Elements as channels (sample based)'} Note You must have a DSP System Toolbox license to use a filter structure other than Direct form.
InitialStates	Initial states	scalar or vector — {'0'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
CoefMin	Coefficients minimum	{'[]'}
CoefMax	Coefficients maximum	{'[]'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
TapSumDataTypeStr	Tap sum data type	{'Inherit: Same as input'} 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)'
CoefDataTypeStr	Coefficients data type	{'Inherit: Same word length as input'} 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16)' 'fixdt(1,16,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
ProductDataTypeStr	Product output data type	{'Inherit: Inherit via internal rule'} 'Inherit: Same as input' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)'
AccumDataTypeStr	Accumulator data type	{'Inherit: Inherit via internal rule'} 'Inherit: Same as input' 'Inherit: Same as product output' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)'
StateDataTypeStr	State data type	'Inherit: Same as input' {'Inherit: Same as accumulator'} 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)'
OutDataTypeStr	Output data type	'Inherit: Same as input' {'Inherit: Same as accumulator'} 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'fixdt(1,16)' 'fixdt(1,16,0)'
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnIntegerOverflow	Saturate on integer overflow	{'off'} 'on'
Discrete Filter (DiscreteFilter)		
Numerator	Numerator coefficients	vector — {'[1]'}'
Denominator	Denominator coefficients	vector — {'[1 0.5]'}'
IC	Initial states	{'0'}
SampleTime	Sample time (-1 for inherited)	{'1'}
a0EqualsOne	Optimize by skipping divide by leading denominator coefficient (a0)	{'off'} 'on'
NumCoefMin	Numerator coefficient minimum	{'[]'}
NumCoefMax	Numerator coefficient maximum	{'[]'}
DenCoefMin	Denominator coefficient minimum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
DenCoefMax	Denominator coefficient maximum	{'[]'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
StateDataTypeStr	State data type	{'Inherit: Same as input' 'int8' 'int16' 'int32' 'fixdt(1,16,0)'}
NumCoefDataTypeStr	Numerator coefficient data type	{'Inherit: Inherit via internal rule' 'int8' 'int16' 'int32' 'fixdt(1,16)' 'fixdt(1,16,0)'}
DenCoefDataTypeStr	Denominator coefficient data type	{'Inherit: Inherit via internal rule' 'int8' 'int16' 'int32' 'fixdt(1,16)' 'fixdt(1,16,0)'}
NumProductDataTypeStr	Numerator product output data type	{'Inherit: Inherit via internal rule' 'Inherit: Same as input' 'int8' 'int16' 'int32' 'fixdt(1,16,0)'}
DenProductDataTypeStr	Denominator product output data type	{'Inherit: Inherit via internal rule' 'Inherit: Same as input' 'int8' 'int16' 'int32' 'fixdt(1,16,0)'}
NumAccumDataTypeStr	Numerator accumulator data type	{'Inherit: Inherit via internal rule' 'Inherit: Same as input' 'Inherit: Same as product output' 'int8' 'int16' 'int32' 'fixdt(1,16,0)'}
DenAccumDataTypeStr	Denominator accumulator data type	{'Inherit: Inherit via internal rule' 'Inherit: Same as input' 'Inherit: Same as product output' 'int8' 'int16' 'int32' 'fixdt(1,16,0)'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule' 'Inherit: Same as input' 'int8' 'int16' 'int32' 'fixdt(1,16,0)'}
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'} 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' { 'Floor' } 'Nearest' 'Round' 'Simplest' 'Zero'

StateMustResolveToSignalObject	State name must resolve to Simulink signal object	{'off'} 'on'
StateSignalObject	Signal object class Code generation storage class	Simulink.Signal object Object of a class that is derived from Simulink.Signal
StateStorageClass	Code generation storage class	{'Auto'} 'Model default' 'ExportedGlobal' 'ImportedExtern' 'ImportedExternPointer' 'Custom'
CodeGenStateStorageTypeQualifier	Code generation storage type qualifier	{''}
Zero-Order Hold (ZeroOrderHold)		
SampleTime	Sample time (-1 for inherited)	{'1'}

Logic and Bit Operations Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Bit Clear (Bit Clear) (masked subsystem)		
iBit	Index of bit (0 is least significant)	{'0'}
Bit Set (Bit Set) (masked subsystem)		
iBit	Index of bit (0 is least significant)	{'0'}
Bitwise Operator (S-Function) (Bitwise Operator) (masked subsystem)		
logicop	Operator	{'AND' 'OR' 'NAND' 'NOR' 'XOR' 'NOT'}
UseBitMask	Use bit mask ...	'off' {'on'}
NumInputPorts	Number of input ports	{'1'}
BitMask	Bit Mask	{'bin2dec('11011001')'}
BitMaskRealWorld	Treat mask as	'Real World Value' {'Stored Integer'}
Combinatorial Logic (CombinatorialLogic)		
TruthTable	Truth table	{'[0 0;0 1;0 1;1 0;0 1;1 0;1 0;1 1]'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Compare To Constant (Compare To Constant) (masked subsystem)		
relop	Operator	'==' '~=' '<' {'<='} '>=' '>'
const	Constant value	{'3.0'}
OutDataTypeStr	Output data type	{'boolean'} 'uint8'
ZeroCross	Enable zero-crossing detection	'off' {'on'}
Compare To Zero (Compare To Zero) (masked subsystem)		
relop	Operator	'==' '~=' '<' {'<='} '>=' '>'
OutDataTypeStr	Output data type	{'boolean'} 'uint8'
ZeroCross	Enable zero-crossing detection	'off' {'on'}
Detect Change (Detect Change) (masked subsystem)		
vinit	Initial condition	{'0'}
OutDataTypeStr	Output data type	{'boolean'} 'uint8'
Detect Decrease (Detect Decrease) (masked subsystem)		
vinit	Initial condition	{'0.0'}
OutDataTypeStr	Output data type	{'boolean'} 'uint8'
Detect Fall Negative (Detect Fall Negative) (masked subsystem)		
vinit	Initial condition	{'0'}
OutDataTypeStr	Output data type	{'boolean'} 'uint8'
Detect Fall Nonpositive (Detect Fall Nonpositive) (masked subsystem)		

Block (Type)/Parameter	Dialog Box Prompt	Values
vinit	Initial condition	{'0'}
OutDataTypeStr	Output data type	{'boolean'} 'uint8'
Detect Increase (Detect Increase) (masked subsystem)		
vinit	Initial condition	{'0.0'}
OutDataTypeStr	Output data type	{'boolean'} 'uint8'
Detect Rise Nonnegative (Detect Rise Nonnegative) (masked subsystem)		
vinit	Initial condition	{'0'}
OutDataTypeStr	Output data type	{'boolean'} 'uint8'
Detect Rise Positive (Detect Rise Positive) (masked subsystem)		
vinit	Initial condition	{'0'}
OutDataTypeStr	Output data type	{'boolean'} 'uint8'
Extract Bits (Extract Bits) (masked subsystem)		
bitsToExtract	Bits to extract	{'Upper half'} 'Lower half' 'Range starting with most significant bit' 'Range ending with least significant bit' 'Range of bits'
numBits	Number of bits	{'8'}
bitIdxRange	Bit indices ([start end], 0-based relative to LSB)	{'[0 7]'}
outScalingMode	Output scaling mode	{'Preserve fixed-point scaling'} 'Treat bit field as an integer'
Interval Test (Interval Test) (masked subsystem)		
IntervalClosedRight	Interval closed on right	'off' {'on'}
uplimit	Upper limit	{'0.5'}
IntervalClosedLeft	Interval closed on left	'off' {'on'}
lowlimit	Lower limit	{'-0.5'}
OutDataTypeStr	Output data type	{'boolean'} 'uint8'
Interval Test Dynamic (Interval Test Dynamic) (masked subsystem)		
IntervalClosedRight	Interval closed on right	'off' {'on'}
IntervalClosedLeft	Interval closed on left	'off' {'on'}
OutDataTypeStr	Output data type	{'boolean'} 'uint8'
Logical Operator (Logic)		
Operator	Operator	{'AND'} 'OR' 'NAND' 'NOR' 'XOR' 'NXOR' 'NOT'
Inputs	Number of input ports	{'2'}

Block (Type)/Parameter	Dialog Box Prompt	Values
IconShape	Icon shape	{'rectangular'} 'distinctive'
SampleTime	Sample time (-1 for inherited)	{'-1'}
AllPortsSameDT	Require all inputs and output to have the same data type	{'off'} 'on'
OutDataTypeStr	Output data type	'Inherit: Logical (see Configuration Parameters: Optimization)' {'boolean'} 'fixdt(1,16)'
Relational Operator (RelationalOperator)		
Operator	Relational operator	'==' '~=' '<' {'<='} '>=' '>' 'isInf' 'isNaN' 'isFinite'
ZeroCross	Enable zero-crossing detection	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all inputs to have the same data type	{'off'} 'on'
OutDataTypeStr	Output data type	'Inherit: Logical (see Configuration Parameters: Optimization)' {'boolean'} 'fixdt(1,16)'
Shift Arithmetic (ArithShift)		
BitShiftNumberSource	Bits to shift > Source	{'Dialog'} 'Input port'
BitShiftDirection	Bits to shift > Direction	'Left' 'Right' {'Bidirectional'}
BitShiftNumber	Bits to shift > Number	{'8'}
BinPtShiftNumber	Binary points to shift > Number	{'0'}
DiagnosticFor00RShift	Diagnostic for out-of-range shift value	{'None'} 'Warning' 'Error'
Check00RBitShift	Check for out-of-range 'Bits to shift' in generated code	{'off'} 'on'
nBitShiftRight	Deprecated in R2011a	
nBinPtShiftRight	Deprecated in R2011a	

Lookup Table Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Cosine (Cosine) (masked subsystem)		
Formula	Output formula	'sin(2*pi*u)' {'cos(2*pi*u)'} 'exp(j*2*pi*u)' 'sin(2*pi*u) and cos(2*pi*u)'
NumDataPoints	Number of data points for lookup table	{'(2^5)+1'}
OutputWordLength	Output word length	{'16'}
InternalRulePriority	Internal rule priority for lookup table	{'Speed'} 'Precision'
Direct Lookup Table (n-D) (LookupNDDirect)		
NumberOfTableDimensions	Number of table dimensions	'1' {'2'} '3' '4'
InputsSelectThisObjectFromTable	Inputs select this object from table	{'Element'} 'Vector' '2-D Matrix'
TableIsInput	Make table an input	{'off'} 'on'
Table	Table data	{'[4 5 6;16 19 20;10 18 23]}'}
DiagnosticForOutOfRangeInput	Diagnostic for out-of-range input	'None' {'Warning'} 'Error'
SampleTime	Sample time (-1 for inherited)	{'-1'}
TableMin	Table minimum	{'[]}'}
TableMax	Table maximum	{'[]}'}
TableDataTypeStr	Table data type	{'Inherit: Inherit from 'Table data''} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'boolean' 'fixdt(1,16)' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'} 'on'
maskTabDims	Deprecated in R2009b	
explicitNumDims	Deprecated in R2009b	
outDims	Deprecated in R2009b	
tabIsInput	Deprecated in R2009b	
mxTable	Deprecated in R2009b	
clipFlag	Deprecated in R2009b	
samptime	Deprecated in R2009b	
Interpolation Using Prelookup (Interpolation_n-D)		
NumberOfTableDimensions	Number of table dimensions	'1' {'2'} '3' '4'

Block (Type)/Parameter	Dialog Box Prompt	Values
Table	Table data > Value	{'sqrt([1:11]' * [1:11])'}
TableSource	Table data > Source	{'Dialog'} 'Input port'
TableSpecification	Specification	{'Explicit values'} 'Lookup table object' To set this parameter from 'Explicit values' to 'Lookup table object', use the same call to set_param to set the parameter LookupTableObject. For example: <pre>set_param('myModel/myInterpBlock',... 'TableSpecification',... 'Lookup table object',... 'LookupTableObject','myLUTObject')</pre>
LookupTableObject	Name of lookup table object	{''}
InterpMethod	Interpolation method	'Flat' {'Linear point-slope'} 'Nearest' 'Linear Lagrange'
ExtrapMethod	Extrapolation method	'Clip' {'Linear'}
ValidIndexMayReachLast	Valid index input may reach last index	{'off'} 'on'
DiagnosticForOutOfRangeInput	Diagnostic for out-of-range input	{'None'} 'Warning' 'Error'
RemoveProtectionIndex	Remove protection against out-of-range index in generated code	{'off'} 'on'
NumSelectionDims	Number of sub-table selection dimensions	{'0'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
TableDataTypeStr	Table data > Data Type	'Inherit: Inherit from 'Table data'' {'Inherit: Same as output'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16)' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
TableMin	Table data > Minimum	{'[]'}
TableMax	Table data > Maximum	{'[]'}
IntermediateResultsDataTy peStr	Intermediate results > Data Type	{'Inherit: Inherit via internal rule'} 'Inherit: Same as output' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output > Data Type	'Inherit: Inherit via back propagation' {'Inherit: Inherit from table data'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
OutMin	Output > Minimum	{'[]'}
OutMax	Output > Maximum	{'[]'}
InternalRulePriority	Internal rule priority	{'Speed'} 'Precision'
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnIntegerOverflow	Saturate on integer overflow	{'off'} 'on'
CheckIndexInCode	Deprecated in R2011a	
n-D Lookup Table, 1-D Lookup Table, 2-D Lookup Table (Lookup_n-D)		
NumberOfTableDimensions	Number of table dimensions	'1' '2' '3' '4'. Default is '1' for 1-D Lookup Table, '2' for 2-D Lookup Table, '3' for n-D Lookup Table.
DataSpecification	(n-D Lookup Table) Data specification	{'Table and breakpoints'} 'Lookup table object' To set this parameter from 'Table and breakpoints' to 'Lookup table object', use the same call to set_param to set the parameter LookupTableObject. For example: set_param('myModel/myLookupBlock',... 'DataSpecification','Lookup table... object',... 'LookupTableObject','myLUTObject')
LookupTableObject	Name of lookup table object.	{''}
Table	Table data	{'reshape(repmat([4 5 6;16 19 20;10 18 23],1,2),[3,3,2])'}
BreakpointsSpecification	Breakpoints specification	{'Explicit values'} 'Even spacing'
BreakpointsFor-Dimension1FirstPoint	First point	{'1'}
BreakpointsFor-Dimension2FirstPoint	First point	{'1'}

Block (Type)/Parameter	Dialog Box Prompt	Values
BreakpointsForDimension3FirstPoint	First point	{'1'}
...
BreakpointsForDimension30FirstPoint	First point	{'1'}
BreakpointsForDimension1Spacing	Spacing	{'1'}
BreakpointsForDimension2Spacing	Spacing	{'1'}
BreakpointsForDimension3Spacing	Spacing	{'1'}
...
BreakpointsForDimension30Spacing	Spacing	{'1'}
BreakpointsForDimension1	Breakpoints 1	{'[10,22,31]}'}
BreakpointsForDimension2	Breakpoints 2	{'[10,22,31]}'}
BreakpointsForDimension3	Breakpoints 3	{'[5, 7]}'}
...
BreakpointsForDimension30	Breakpoints 30	{'[1:3]}'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InterpMethod	Interpolation method	'Flat' 'Nearest' {'Linear point-slope'} 'Linear Lagrange' 'Cubic spline'
ExtrapMethod	Extrapolation method	'Clip' {'Linear'} 'Cubic spline'
UseLastTableValue	Use last table value for inputs at or above last breakpoint	{'off'} 'on'
DiagnosticForOutOfRangeInput	Diagnostic for out-of-range input	{'None'} 'Warning' 'Error'
RemoveProtectionInput	Remove protection against out-of-range input in generated code	{'off'} 'on'
IndexSearchMethod	Index search method	'Evenly spaced points' 'Linear search' {'Binary search'}
BeginIndexSearchUsingPreviousIndexResult	Begin index search using previous index result	{'off'} 'on'
UseOneInputPortForAllInputData	Use one input port for all input data	{'off'} 'on'
SupportTunableTableSize	Support tunable table size in code generation	{'off'} 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
MaximumIndicesForEachDimension	Maximum indices for each dimension	{'[]'}
TableDataTypeStr	Table data > Data Type	'Inherit: Inherit from 'Table data'' {'Inherit: Same as output'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16)' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
TableMin	Table data > Minimum	{'[]'}
TableMax	Table data > Maximum	{'[]'}
BreakpointsForDimension1DataTypeStr	Breakpoints 1 > Data Type	{'Inherit: Same as corresponding input'} 'Inherit: Inherit from 'Breakpoint data'' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16)' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
BreakpointsForDimension1Min	Breakpoints 1 > Minimum	{'[]'}
BreakpointsForDimension1Max	Breakpoints 1 > Maximum	{'[]'}
BreakpointsForDimension2DataTypeStr	Breakpoints 2 > Data Type	{'Inherit: Same as corresponding input'} 'Inherit: Inherit from 'Breakpoint data'' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16)' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
BreakpointsForDimension2Min	Breakpoints 2 > Minimum	{'[]'}
BreakpointsForDimension2Max	Breakpoints 2 > Maximum	{'[]'}
...
BreakpointsForDimension30DataTypeStr	Breakpoints 30 > Data Type	{'Inherit: Same as corresponding input'} 'Inherit: Inherit from 'Breakpoint data'' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16)' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
BreakpointsForDimension30 Min	Breakpoints 30 > Minimum	{'[]'}
BreakpointsForDimension30 Max	Breakpoints 30 > Maximum	{'[]'}
FractionDataTypeStr	Fraction > Data Type	{'Inherit: Inherit via internal rule'} 'double' 'single' 'fixdt(1,16,0)'
IntermediateResults DataTypeStr	Intermediate results > Data Type	'Inherit: Inherit via internal rule' {'Inherit: Same as output'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
OutDataTypeStr	Output > Data Type	'Inherit: Inherit via back propagation' 'Inherit: Inherit from table data' {'Inherit: Same as first input'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
OutMin	Output > Minimum	{'[]'}
OutMax	Output > Maximum	{'[]'}
InternalRulePriority	Internal rule priority	{'Speed'} 'Precision'
InputSameDT	Require all inputs to have the same data type	'off' {'on'}
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' 'Floor' 'Nearest' 'Round' {'Simplest'} 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} 'on'
ProcessOutOfRangeInput	Deprecated in R2009b	
Lookup Table Dynamic (Lookup Table Dynamic) (masked subsystem)		
LookUpMeth	Lookup Method	'Interpolation-Extrapolation' {'Interpolation-Use End Values'} 'Use Input Nearest' 'Use Input Below' 'Use Input Above'

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output data type	{'fixdt('double')} 'Inherit: Inherit via back propagation' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'boolean' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
OutputDataTypeScaling Mode	Deprecated in R2007b	
OutDataType	Deprecated in R2007b	
OutScaling	Deprecated in R2007b	
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'} 'on'
Prelookup (PreLookup)		
BreakpointsSpecification	Specification	{'Explicit values'} 'Even spacing' 'Breakpoint object' To set this parameter from 'Explicit values' or 'Even spacing' to 'Breakpoint object', use the same call to <code>set_param</code> to set the parameter <code>BreakpointObject</code> . For example: <code>set_param('myModel/myPrelookupBlock', ... 'BreakpointsSpecification', ... 'Breakpoint object', ... 'BreakpointObject', 'myBPObject')</code>
BreakpointObject	Name of breakpoint object	{''}
BreakpointsFirstPoint	First point	{'10'}
BreakpointsSpacing	Spacing	{'10'}
BreakpointsNumPoints	Number of points	{'11'}
BreakpointsData	Value	{'[10:10:110]'}
BreakpointsDataSource	Source	{'Dialog'} 'Input port'
IndexSearchMethod	Index search method	'Evenly spaced points' 'Linear search' {'Binary search'}
BeginIndexSearchUsing PreviousIndexResult	Begin index search using previous index result	{'off'} 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
OutputOnlyTheIndex	Output only the index	{'off'} 'on'
ExtrapMethod	Extrapolation method	'Clip' {'Linear'}
UseLastBreakpoint	Use last breakpoint for input at or above upper limit	{'off'} 'on'
DiagnosticForOutOfRange Input	Diagnostic for out-of-range input	{'None'} 'Warning' 'Error'
RemoveProtectionInput	Remove protection against out-of-range input in generated code	{'off'} 'on'
SampleTime	Sample time (-1 for inherited)	{'-1'}
BreakpointDataTypeStr	Breakpoint > Data Type	{'Inherit: Same as input'} 'Inherit: Inherit from Breakpoint data' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16)' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
BreakpointMin	Breakpoint > Minimum	{'[]'}
BreakpointMax	Breakpoint > Maximum	{'[]'}
IndexDataTypeStr	Index > Data Type	'int8' 'uint8' 'int16' 'uint16' 'int32' {'uint32'} 'fixdt(1,16)'
FractionDataTypeStr	Fraction > Data Type	{'Inherit: Inherit via internal rule'} 'double' 'single' 'fixdt(1,16,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
ProcessOutOfRangeInput	Deprecated in R2011a	
Sine (Sine) (masked subsystem)		
Formula	Output formula	{'sin(2*pi*u)'} 'cos(2*pi*u)' 'exp(j*2*pi*u)' 'sin(2*pi*u) and cos(2*pi*u)'
NumDataPoints	Number of data points for lookup table	{'(2^5)+1'}
OutputWordLength	Output word length	{'16'}
InternalRulePriority	Internal rule priority for lookup table	{'Speed'} 'Precision'

Math Operations Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Abs (Abs)		
ZeroCross	Enable zero-crossing detection	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	'Inherit: Inherit via internal rule' 'Inherit: Inherit via back propagation' {'Inherit: Same as input'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} 'on'
Add (Sum)		
IconShape	Icon shape	{'rectangular'} 'round'
Inputs	List of signs	{'++'}
CollapseMode	Sum over	{'All dimensions'} 'Specified dimension'
CollapseDim	Dimension	{'1'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all inputs to have the same data type	{'off'} 'on'
AccumDataTypeStr	Accumulator data type	{'Inherit: Inherit via internal rule'} 'Inherit: Same as first input' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} {'Inherit: Inherit via back propagation'} {'Inherit: Same as first input'} {'Inherit: Same as accumulator'} {'double'} {'single'} {'int8'} {'uint8'} {'int16'} {'uint16'} {'int32'} {'uint32'} {'int64'} {'uint64'} {'fixdt(1,16,0)'} {'fixdt(1,16,2^0,0)'}
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'} {'on'}
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} {'on'}
Algebraic Constraint (Algebraic Constraint)		
Constraint	Constraint on input signal	{'f(z) = 0'} 'f(z) = z'
Solver	Algebraic Loop Solver	{'auto'} 'Trust Region' 'Line Search'
Tolerance	Solver Tolerance	{'auto'}
InitialGuess	Initial guess	{'0'}
Assignment (Assignment)		
NumberOfDimensions	Number of output dimensions	{'1'}
IndexMode	Index mode	'Zero-based' {'One-based'}
OutputInitialize	Initialize output (Y)	{'Initialize using input port <Y0>'} 'Specify size for each dimension in table'
IndexOptionArray	Index Option	'Assign all' {'Index vector (dialog)'} 'Index vector (port)' 'Starting index (dialog)' 'Starting index (port)'
IndexParamArray	Index	cell array
OutputSizeArray	Output Size	cell array

Block (Type)/Parameter	Dialog Box Prompt	Values
DiagnosticForDimensions	Action if any output element is not assigned	'Error' 'Warning' {'None'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
IndexOptions	See the IndexOptionArray parameter for more information.	
Indices	See the IndexParamArray parameter for more information.	
OutputSizes	See the OutputSizeArray parameter for more information.	
Bias (Bias)		
Bias	Bias	{'0.0'}
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} 'on'
Complex to Magnitude-Angle (ComplexToMagnitudeAngle)		
Output	Output	'Magnitude' 'Angle' {'Magnitude and angle'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Complex to Real-Imag (ComplexToRealImag)		
Output	Output	'Real' 'Imag' {'Real and imag'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Divide (Product)		
Inputs	Number of inputs	{'*/'}
Multiplication	Multiplication	{'Element-wise(.*)' } 'Matrix(*)'
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all inputs to have same data type	{'off'} 'on'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} 'Inherit: Inherit via back propagation' 'Inherit: Same as first input' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} 'on'
Dot Product (DotProduct)		
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all inputs to have same data type	'off' {'on'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} 'Inherit: Inherit via back propagation' 'Inherit: Same as first input' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
OutputDataTypeScaling Mode	Deprecated in R2007b	
OutDataType	Deprecated in R2007b	
OutScaling	Deprecated in R2007b	
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} 'on'
Find (Find)		
IndexOutputFormat	Index output format	{'Linear indices'} 'Subscripts'
NumberOfInputDimensions	Number of input dimensions	integer — {'1'}

Block (Type)/Parameter	Dialog Box Prompt	Values
IndexMode	Index mode	{'Zero-based'} 'One-based'
ShowOutputForNonzero InputValues	Show output port for nonzero input values	{'off'} 'on'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'fixdt(1,16)'
Gain (Gain)		
Gain	Gain	{'1'}
Multiplication	Multiplication	{'Element-wise(K.*u)'} 'Matrix(K*u)' 'Matrix(u*K)' 'Matrix(K*u) (u vector)'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} 'Inherit: Inherit via back propagation' 'Inherit: Same as input' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} 'on'
ParamMin	Parameter minimum	{'[]'}
ParamMax	Parameter maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
ParamDataTypeStr	Parameter data type	{'Inherit: Inherit via internal rule'} {'Inherit: Same as input'} {'Inherit: Inherit from 'Gain''} {'double'} {'single'} {'int8'} {'uint8'} {'int16'} {'uint16'} {'int32'} {'uint32'} {'fixdt(1,16)'} {'fixdt(1,16,0)'} {'fixdt(1,16,2^0,0)'}
Magnitude-Angle to Complex (MagnitudeAngleToComplex)		
Input	Input	'Magnitude' 'Angle' {'Magnitude and angle'}
ConstantPart	Magnitude or Angle	{'0'}
ApproximationMethod	Approximation method	{'None'} 'CORDIC'
NumberOfIterations	Number of iterations	{'11'}
ScaleReciprocalGainFactor	Scale output by reciprocal of gain factor	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Math Function (Math)		
Operator	Function	{'exp'} 'log' '10^u' 'log10' 'magnitude^2' 'square' 'pow' 'conj' 'reciprocal' 'hypot' 'rem' 'mod' 'transpose' 'hermitian'
OutputSignalType	Output signal type	{'auto'} 'real' 'complex'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	'Inherit: Inherit via internal rule' {'Inherit: Inherit via back propagation'} {'Inherit: Same as first input'} {'double'} {'single'} {'int8'} {'uint8'} {'int16'} {'uint16'} {'int32'} {'uint32'} {'int64'} {'uint64'} {'fixdt(1,16,0)'} {'fixdt(1,16,2^0,0)'}

Block (Type)/Parameter	Dialog Box Prompt	Values
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	'off' {'on'}
Matrix Concatenate (Concatenate)		
NumInputs	Number of inputs	{'2'}
Mode	Mode	'Vector' {'Multidimensional array'}
ConcatenateDimension	Concatenate dimension	{'2'}
MinMax (MinMax)		
Function	Function	{'min'} 'max'
Inputs	Number of input ports	{'1'}
ZeroCross	Enable zero-crossing detection	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all inputs to have the same data type	{'off'} 'on'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} 'Inherit: Inherit via back propagation' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} 'on'
MinMax Running Resetable (MinMax Running Resetable) (masked subsystem)		

Block (Type)/Parameter	Dialog Box Prompt	Values
Function	Function	{'min'} 'max'
vinit	Initial condition	{'0.0'}
Permute Dimensions (PermuteDimensions)		
Order	Order	{'[2,1]'}
Polynomial (Polyval)		
coefs	Polynomial Coefficients	{'[+2.081618890e-019, -1.441693666e-014, +4.719686976e-010, -8.536869453e-006, +1.621573104e-001, -8.087801117e+001]'}
Product (Product)		
Inputs	Number of inputs	{'2'}
Multiplication	Multiplication	{'Element-wise(*)'} 'Matrix(*)'
CollapseMode	Multiply over	{'All dimensions'} 'Specified dimension'
CollapseDim	Dimension	{'1'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all inputs to have same data type	{'off'} 'on'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} 'Inherit: Inherit via back propagation' 'Inherit: Same as first input' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' 'Floor' 'Nearest' 'Round' 'Simplest' {'Zero'}
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
Product of Elements (Product)		
Inputs	Number of inputs	{ '*' }
Multiplication	Multiplication	{ 'Element-wise(*)' } 'Matrix(*)'
CollapseMode	Multiply over	{ 'All dimensions' } 'Specified dimension'
CollapseDim	Dimension	{ '1' }
SampleTime	Sample time (-1 for inherited)	{ '-1' }
InputSameDT	Require all inputs to have same data type	{ 'off' } 'on'
OutMin	Output minimum	{ '[]' }
OutMax	Output maximum	{ '[]' }
OutDataTypeStr	Output data type	{ 'Inherit: Inherit via internal rule' } 'Inherit: Inherit via back propagation' 'Inherit: Same as first input' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{ 'off' } 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' { 'Floor' } 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{ 'off' } 'on'
Real-Imag to Complex (RealImagToComplex)		
Input	Input	'Real' 'Imag' { 'Real and imag' }
ConstantPart	Real part or Imag part	{ '0' }
SampleTime	Sample time (-1 for inherited)	{ '-1' }
Reciprocal Sqrt (Sqrt)		
Operator	Function	'sqrt' 'signedSqrt' { 'rSqrt' }
OutputSignalType	Output signal type	{ 'auto' } 'real' 'complex'

Block (Type)/Parameter	Dialog Box Prompt	Values
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	'Inherit: Inherit via internal rule' 'Inherit: Inherit via back propagation' {'Inherit: Same as first input'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	'off' {'on'}
IntermediateResults DataTypeStr	Intermediate results data type	{'Inherit: Inherit via internal rule'} 'Inherit: Inherit from input' 'Inherit: Inherit from output' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
AlgorithmType	Method	'Exact' {'Newton-Raphson'}
Iterations	Number of iterations	{'3'}
Reshape (Reshape)		
OutputDimensionality	Output dimensionality	{'1-D array'} 'Column vector (2-D)' 'Row vector (2-D)' 'Customize' 'Derive from reference input port'
OutputDimensions	Output dimensions	{'[1,1]}'}
Rounding Function (Rounding)		

Block (Type)/Parameter	Dialog Box Prompt	Values
Operator	Function	{'floor'} 'ceil' 'round' 'fix'
SampleTime	Sample time (-1 for inherited)	{'-1'}
Sign (Signum)		
ZeroCross	Enable zero-crossing detection	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Signed Sqrt (Sqrt)		
Operator	Function	'sqrt' {'signedSqrt'} 'rSqrt'
OutputSignalType	Output signal type	{'auto'} 'real' 'complex'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	'Inherit: Inherit via internal rule' 'Inherit: Inherit via back propagation' {'Inherit: Same as first input'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	'off' {'on'}
IntermediateResults DataTypeStr	Intermediate results data type	{'Inherit: Inherit via internal rule'} 'Inherit: Inherit from input' 'Inherit: Inherit from output' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
AlgorithmType	Method	{'Exact'} 'Newton-Raphson'
Iterations	Number of iterations	{'3'}
Sine Wave Function (Sin)		
SineType	Sine type	{'Time based'} 'Sample based'
TimeSource	Time	'Use simulation time' {'Use external signal'}
Amplitude	Amplitude	{'1'}
Bias	Bias	{'0'}
Frequency	Frequency	{'1'}
Phase	Phase	{'0'}
Samples	Samples per period	{'10'}
Offset	Number of offset samples	{'0'}
SampleTime	Sample time	{'0'}
VectorParams1D	Interpret vector parameters as 1-D	'off' {'on'}
Slider Gain (Slider Gain) (masked subsystem)		
low	Low	{'0'}
gain	Gain	{'1'}
high	High	{'2'}
Sqrt (Sqrt)		
Operator	Function	{'sqrt'} 'signedSqrt' 'rSqrt'
OutputSignalType	Output signal type	{'auto'} 'real' 'complex'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	'Inherit: Inherit via internal rule' 'Inherit: Inherit via back propagation' {'Inherit: Same as first input'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	'off' {'on'}
IntermediateResults DataTypeStr	Intermediate results data type	{'Inherit: Inherit via internal rule'} 'Inherit: Inherit from input' 'Inherit: Inherit from output' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
AlgorithmType	Method	{'Exact'} 'Newton-Raphson'
Iterations	Number of iterations	{'3'}
Squeeze (Squeeze) (masked subsystem)		
None	None	None
Subtract (Sum)		
IconShape	Icon shape	{'rectangular'} 'round'
Inputs	List of signs	{'+- '}
CollapseMode	Sum over	{'All dimensions'} 'Specified dimension'
CollapseDim	Dimension	{'1'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all inputs to have the same data type	{'off'} 'on'
AccumDataTypeStr	Accumulator data type	{'Inherit: Inherit via internal rule'} 'Inherit: Same as first input' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'

RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} {'on'}
Trigonometric Function (Trigonometry)		
Operator	Function	{'sin'} 'cos' 'tan' 'asin' 'acos' 'atan' 'atan2' 'sinh' 'cosh' 'tanh' 'asinh' 'acosh' 'atanh' 'sincos' 'cos + jsin'
ApproximationMethod	Approximation method	{'None'} 'CORDIC'
NumberOfIterations	Number of iterations	{'11'}
OutputSignalType	Output signal type	{'auto'} 'real' 'complex'
SampleTime	Sample time (-1 for inherited)	{'-1'}
Unary Minus (UnaryMinus)		
SampleTime	Sample time (-1 for inherited)	{'-1'}
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} {'on'}
Vector Concatenate (Concatenate)		
NumInputs	Number of inputs	{'2'}
Mode	Mode	{'Vector'} 'Multidimensional array'
Weighted Sample Time Math (SampleTimeMath)		
TsampMathOp	Operation	{'+'} '-' '*' '/' 'Ts Only' '1/Ts Only'

Block (Type)/Parameter	Dialog Box Prompt	Values
weightValue	Weight value	{'1.0'}
TsampMathImp	Implement using	{'Online Calculations'} 'Offline Scaling Adjustment'
OutDataTypeStr	Output data type	{'Inherit via internal rule'} 'Inherit via back propagation'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} 'on'
OutputDataTypeScaling Mode	Deprecated in R2009b	
DoSatur	Deprecated in R2009b	

Model Verification Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Assertion (Assertion)		
Enabled	Enable assertion	'off' {'on'}
AssertionFailFcn	Simulation callback when assertion fails	{''}
StopWhenAssertionFail	Stop simulation when assertion fails	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Check Dynamic Gap (Checks_DGap) (masked subsystem)		
enabled	Enable assertion	'off' {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off' {'on'}
export	Output assertion signal	{'off'} 'on'
icon	Select icon type	{'graphic'} 'text'
Check Dynamic Range (Checks_DRange) (masked subsystem)		
enabled	Enable assertion	'off' {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off' {'on'}
export	Output assertion signal	{'off'} 'on'
icon	Select icon type	{'graphic'} 'text'
Check Static Gap (Checks_SGap) (masked subsystem)		
max	Upper bound	{'100'}
max_included	Inclusive upper bound	'off' {'on'}
min	Lower bound	{'0'}
min_included	Inclusive lower bound	'off' {'on'}
enabled	Enable assertion	'off' {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off' {'on'}
export	Output assertion signal	{'off'} 'on'

Timed-Based Linearization (Timed Linearization) (masked subsystem)		
LinearizationTime	Linearization time	{'1'}
SampleTime	Sample time (of linearized model)	{'0'}
Trigger-Based Linearization (Triggered Linearization) (masked subsystem)		
TriggerType	Trigger type	{'rising'} {'falling'} {'either'} {'function-call'}
SampleTime	Sample time (of linearized model)	{'0'}

Ports & Subsystems Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Action Port (ActionPort)		
InitializeStates	States when execution is resumed	{'held'} 'reset'
PropagateVarSize	Propagate sizes of variable-size signals	{'Only when execution is resumed'} 'During execution'
Atomic Subsystem (SubSystem)		
ShowPortLabels	Show port labels Note The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none' {'FromPortIcon'} 'FromPortBlockName' 'SignalName' 'off' 'on'
BlockChoice	Block choice	{''}
TemplateBlock	Template block	{''}
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'} 'ReadOnly' 'NoReadOrWrite'
ErrorFcn	Name of error callback function	{''}
PermitHierarchicalResolution	Permit hierarchical resolution	{'All'} 'ExplicitOnly' 'None'
TreatAsAtomicUnit	Treat as atomic unit	'off' {'on'}
TreatAsGroupedWhenPropagatingVariantConditions	Treat as grouped when propagating variant conditions	'off' {'on'}
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'} 'on'
CheckFcnCallInpInsideContextMsg	Warn if function-call inputs are context-specific	{'off'} 'on'
SystemSampleTime	Sample time (-1 for inherited)	{'-1'}
RTWSystemCode	Function packaging	{'Auto'} 'Inline' 'Nonreusable function' 'Reusable function'
RTWFcnNameOpts	Function name options	{'Auto'} 'Use subsystem name' 'User specified'
RTWFcnName	Function name	{''}
RTWFileNameOpts	File name options	{'Auto'} 'Use subsystem name' 'Use function name' 'User specified'
RTWFileName	File name (no extension)	{''}

Block (Type)/Parameter	Dialog Box Prompt	Values
FunctionInterfaceSpec	Function interface This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'void_void'} 'Allow arguments (Optimized)' 'Allow arguments (Match graphical interface)'
FunctionWithSeparateData	"Function with separate data" on page 1-0 This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'off'} 'on'
RTWMemSecFuncInitTerm	"Memory section for initialize/terminate functions" on page 1-0 This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'Inherit from model'} 'Default' list of memory sections from model's package
RTWMemSecFuncExecute	"Memory section for execution functions" on page 1-0 This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'Inherit from model'} 'Default' list of memory sections from model's package
RTWMemSecDataConstants	"Memory section for constants" on page 1-0 This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'Inherit from model'} 'Default' list of memory sections from model's package
RTWMemSecDataInternal	"Memory section for internal data" on page 1-0 This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'Inherit from model'} 'Default' list of memory sections from model's package
RTWMemSecDataParameters	"Memory section for parameters" on page 1-0 This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'Inherit from model'} 'Default' list of memory sections from model's package
DataTypeOverride	No dialog box prompt Specifies data type used to override fixed-point data types. Set by Data type override on the Fixed-Point Tool.	{'UseLocalSettings'} 'ScaledDouble' 'Double' 'Single' 'Off'

Block (Type)/Parameter	Dialog Box Prompt	Values
MinMaxOverflowLogging	No dialog box prompt Setting for fixed-point instrumentation. Set by Fixed-point instrumentation mode on the Fixed-Point Tool.	{'UseLocalSettings'} 'MinMaxAndOverflow' 'OverflowOnly' 'ForceOff'
SimViewingDevice	No dialog box prompt If set to 'on', designates the block as a Signal Viewing Subsystem — an atomic subsystem that encapsulates processing and viewing of signals received from the target system in External mode. For more information, see “Signal Viewing Subsystems” (Simulink Coder).	{'off'} 'on'
IsSubsystemVirtual		boolean — {'off'} 'on' Read-only
Code Reuse Subsystem (SubSystem)		
ShowPortLabels	Show port labels Note The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none' {'FromPortIcon'} 'FromPortBlockName' 'SignalName' 'off' 'on'
BlockChoice	Block choice	{''}
TemplateBlock	Template block	{''}
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'} 'ReadOnly' 'NoReadOrWrite'
ErrorFcn	Name of error callback function	{''}
PermitHierarchicalResolution	Permit hierarchical resolution	{'All'} 'ExplicitOnly' 'None'
TreatAsAtomicUnit	Treat as atomic unit	'off' {'on'}
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'} 'on'
CheckFcnCallInpInsideContextMsg	Warn if function-call inputs are context-specific	{'off'} 'on'
SystemSampleTime	Sample time (-1 for inherited)	{'-1'}

Block (Type)/Parameter	Dialog Box Prompt	Values

RTWFileName	File name (no extension)	{''}
DataTypeOverride	No dialog box prompt Specifies data type used to override fixed-point data types. Set by Data type override on the Fixed-Point Tool.	{'UseLocalSettings'} 'ScaledDouble' 'Double' 'Single' 'Off'
MinMaxOverflowLogging	No dialog box prompt Setting for fixed-point instrumentation. Set by Fixed-point instrumentation mode on the Fixed-Point Tool.	{'UseLocalSettings'} 'MinMaxAndOverflow' 'OverflowOnly' 'Off'
IsSubsystemVirtual		boolean — {'off'} 'on' Read-only
In1 (Inport)		
Port	Port number	{'1'}
IconDisplay	Icon display	'Signal name' {'Port number'} 'Port number and signal name'
LatchByDelayingOutsideSignal	Latch input by delaying outside signal	{'off'} 'on'
LatchInputForFeedbackSignals	Latch input for feedback signals of function-call subsystem outputs	{'off'} 'on'
Interpolate	Interpolate data	'off' {'on'}
UseBusObject	Specify properties via bus object	{'off'} 'on'
BusObject	Bus object for specifying bus properties	{'BusObject'}
BusOutputAsStruct	Output as nonvirtual bus	{'off'} 'on'
PortDimensions	Port dimensions (-1 for inherited)	{'-1'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Data type	{'Inherit: auto'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'boolean' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)' 'Enum: <class name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
Unit	Specify physical unit of the input signal to the block.	{'inherit'} '<Enter unit>'
UnitNoProp	Specify physical unit of the input signal to the block without propagation. For a list of acceptable units, see Allowed Units.	'<Enter unit>'
SignalType	Signal type	{'auto'} 'real' 'complex'
Model (ModelReference)		
ModelNameDialog	The name of the referenced model exactly as you typed it in, with any surrounding whitespace removed. When you set <code>ModelNameDialog</code> programmatically or with the GUI, Simulink automatically sets the values of <code>ModelName</code> and <code>ModelFile</code> based on the value of <code>ModelNameDialog</code> .	{'<Enter Model Name>'}
ModelName	The value of <code>ModelNameDialog</code> stripped of any filename extension that you provided. For backward compatibility, setting <code>ModelName</code> programmatically actually sets <code>ModelNameDialog</code> , which then sets <code>ModelName</code> as described. You cannot use <code>get_param</code> to obtain the <code>ModelName</code> of a protected model, because the name without a suffix would be ambiguous. Use <code>get_param</code> on <code>ModelFile</code> instead. You can test <code>ProtectedModel</code> to determine programmatically whether a referenced model is protected.	character vector — Set automatically when <code>ModelNameDialog</code> is set.

Block (Type)/Parameter	Dialog Box Prompt	Values
ModelFile	The value of ModelNameDialog with a filename extension. The suffix of the first match Simulink finds becomes the suffix of ModelFile. Setting ModelFile programmatically actually sets ModelNameDialog, which then sets ModelFile as described.	character vector — Set automatically when ModelNameDialog is set.
ProtectedModel	Read-only boolean indicating whether the model referenced by the block is protected (on) or unprotected (off).	boolean — 'off' 'on' — Set automatically when ModelNameDialog is set.
InstanceParameters	Structure array of instance-specific parameters on the Model block.	structure with fields: Name, Value, Path, and Argument.
ParameterArgumentNames	Names of instance-specific parameters that the referenced model defines. Corresponds to the Name column in the table on the Instance parameters tab.	{ '' }
ParameterArgumentValues	Values for model arguments. Corresponds to the Value column in the table on the Instance parameters tab.	structure with no fields
SimulationMode	Specifies whether to simulate the model by generating and executing code or by interpreting the model in Simulink software.	{ 'Normal' } 'Accelerator' 'Software-in-the-loop (SIL)' 'Processor-in-the-loop (PIL)'
Variant	Specifies whether the Model block references variant models or Variant Subsystems.	{ 'off' } 'on'
VariantConfigurationObject	Specifies the variant configuration object that is associated with the model.	{ '' } The value is an empty character vector if no configuration object is associated; otherwise, it is the name of a Simulink.VariantConfigurationData object.
LabelModeActiveChoice	Specifies the selected choice when VariantcontrolMode is set to Label, and if so, the name of that label mode active choice.	{ '' } The value is the empty character vector if no label mode active choice is specified; or the name of the label mode active choice.
ActiveVariant	The variant that is currently active, either because its variant condition is true or LabelModeActiveChoice has specified this variant.	{ '' } The value is the empty character vector if no variant is active; or the name of the active variant.

Block (Type)/Parameter	Dialog Box Prompt	Values
GeneratePreprocessor Conditionals	Locally controls whether generated code contains preprocessor conditionals. This parameter applies only to Simulink Coder code generation and has no effect on the behavior of a model in Simulink. The parameter is available only for ERT targets. For more information, see “Variant Systems” (Embedded Coder).	{'off'} 'on'
DefaultDataLogging		{'off'} 'on'
Out1 (Output)		
Port	Port number	{'1'}
IconDisplay	Icon display	'Signal name' {'Port number'} 'Port number and signal name'
UseBusObject	Specify properties via bus object	{'off'} 'on'
BusObject	Bus object for validating input bus	{'BusObject'}
BusOutputAsStruct	Output as nonvirtual bus in parent model	{'off'} 'on'
PortDimensions	Port dimensions (-1 for inherited)	{'-1'}
VarSizeSig	Variable-size signal	{'Inherit'} 'No' 'Yes'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}
OutDataTypeStr	Data type	{'Inherit: auto'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'boolean' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)' 'Enum: <class name>' 'Bus: <object name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
Unit	Specify physical unit of the input signal to the block. For a list of acceptable units, see Allowed Units.	{'inherit'} '<Enter unit>'

Block (Type)/Parameter	Dialog Box Prompt	Values
UnitNoProp	Specify physical unit of the input signal to the block without propagation. For a list of acceptable units, see Allowed Units.	'<Enter unit>'
SignalObject	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See “Design Data Interface by Configuring Inport and Outport Blocks” (Simulink Coder).	Simulink.Signal object Object of a class that is derived from Simulink.Signal
StorageClass	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See “Design Data Interface by Configuring Inport and Outport Blocks” (Simulink Coder).	{'Auto'} 'Model default' 'ExportedGlobal' 'ImportedExtern' 'ImportedExternPointer' 'Custom'
SignalName	Signal name	character vector
SignalType	Signal type	{'auto'} 'real' 'complex'
OutputWhenDisabled	Output when disabled	{'held'} 'reset'
InitialOutput	Initial output	{'[]'}
MustResolveToSignalObject	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See “For Signals”.	{'off'} 'on'
Subsystem (SubSystem)		
ShowPortLabels	Show port labels Note The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none' {'FromPortIcon'} 'FromPortBlockName' 'SignalName' 'off' 'on'
BlockChoice	Block choice	{''}
TemplateBlock	Template block	{''}
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'} 'ReadOnly' 'NoReadOrWrite'
ErrorFcn	Name of error callback function	{''}
PermitHierarchicalResolution	Permit hierarchical resolution	{'All'} 'ExplicitOnly' 'None'
TreatAsAtomicUnit	Treat as atomic unit	{'off'} 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
TreatAsGroupedWhenPropagatingVariantConditions	Treat as grouped when propagating variant conditions	'off' {'on'}
VariantControl	Variant control	{'Variant'} '(default)'
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'} 'on'
CheckFcnCallInp InsideContextMsg	Warn if function-call inputs are context-specific	{'off'} 'on'
SystemSampleTime	Sample time (-1 for inherited)	{'-1'}

RTWFileName	Code generation file name (no extension)	{''}
DataTypeOverride	No dialog box prompt Specifies data type used to override fixed-point data types. Set by Data type override on the Fixed-Point Tool.	{'UseLocalSettings'} 'ScaledDouble' 'Double' 'Single' 'Off'

Block (Type)/Parameter	Dialog Box Prompt	Values
MinMaxOverflowLogging	No dialog box prompt Setting for fixed-point instrumentation. Set by Fixed-point instrumentation mode on the Fixed-Point Tool.	{'UseLocalSettings'} 'MinMaxAndOverflow' 'OverflowOnly' 'ForceOff'
IsSubsystemVirtual		boolean — {'off'} 'on' Read-only
Unit Conversion		
OutDataTypeStr	Output data type	{'Inherit via internal rule'} 'Inherit via back propagation'
Unit System Configuration		
AllowAllUnitSystems	Allow or restrict unit systems.	boolean — {'on'} 'off'
UnitSystems	Displays allowed unit system.	cell array of character vectors — {'SI', 'English', SI (extended)', 'CGS'}
While Iterator (WhileIterator)		
MaxIters	Maximum number of iterations (-1 for unlimited)	{'5'}
WhileBlockType	While loop type	{'while'} 'do-while'
ResetStates	States when starting	{'held'} 'reset'
ShowIterationPort	Show iteration number port	{'off'} 'on'
OutputDataType	Output data type	{'int32'} 'int16' 'int8' 'double'
While Iterator Subsystem (SubSystem)		
ShowPortLabels	Show port labels Note The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none' {'FromPortIcon'} 'FromPortBlockName' 'SignalName' 'off' 'on'
BlockChoice	Block choice	{''}
TemplateBlock	Template block	{''}
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'} 'ReadOnly' 'NoReadOrWrite'
ErrorFcn	Name of error callback function	{''}
PermitHierarchicalResolution	Permit hierarchical resolution	{'All'} 'ExplicitOnly' 'None'

Block (Type)/Parameter	Dialog Box Prompt	Values
TreatAsAtomicUnit	Treat as atomic unit	'off' {'on'}
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'} 'on'
CheckFcnCallInp InsideContextMsg	Warn if function-call inputs are context-specific	{'off'} 'on'
SystemSampleTime	Sample time (-1 for inherited)	{'-1'}
RTWSystemCode	Code generation function packaging	{'Auto'} 'Inline' 'Nonreusable function' 'Reusable function'
RTWFcnNameOpts	Code generation function name options	{'Auto'} 'Use subsystem name' 'User specified'
RTWFcnName	Code generation function name	{''}
RTWFileNameOpts	Code generation file name options	{'Auto'} 'Use subsystem name' 'Use function name' 'User specified'
RTWFileName	Code generation file name (no extension)	{''}
DataTypeOverride	No dialog box prompt Specifies data type used to override fixed-point data types. Set by Data type override on the Fixed-Point Tool.	{'UseLocalSettings'} 'ScaledDouble' 'Double' 'Single' 'Off'
MinMaxOverflowLogging	No dialog box prompt Setting for fixed-point instrumentation. Set by Fixed-point instrumentation mode on the Fixed-Point Tool.	{'UseLocalSettings'} 'MinMaxAndOverflow' 'OverflowOnly' 'ForceOff'
IsSubsystemVirtual		boolean — {'off'} 'on' Read-only

Signal Attributes Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Bus to Vector (BusToVector)		
Data Type Conversion (DataTypeConversion)		
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via back propagation'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'boolean' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)' 'Enum: <class name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
ConvertRealWorld	Input and output to have equal	{'Real World Value (RWV)' 'Stored Integer (SI)'} 'Stored Integer (SI)'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} 'on'
SampleTime	Sample time (-1 for inherited)	{'-1'}
Data Type Conversion Inherited (Conversion Inherited) (masked subsystem)		
ConvertRealWorld	Input and Output to have equal	{'Real World Value'} 'Stored Integer'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'} 'on'
Data Type Duplicate (DataTypeDuplicate)		
NumInputPorts	Number of input ports	{'2'}
Data Type Propagation (Data Type Propagation) (masked subsystem)		
PropDataTypeMode	1. Propagated data type	'Specify via dialog' {'Inherit via propagation rule'}
PropDataType	1.1. Propagated data type (e.g., fixdt(1,16), fixdt('single'))	{'fixdt(1,16)'} 'fixdt('single')'

Block (Type)/Parameter	Dialog Box Prompt	Values
IfRefDouble	1.1. If any reference input is double, output is	{'double'} 'single'
IfRefSingle	1.2. If any reference input is single, output is	'double' {'single'}
IsSigned	1.3. Is-Signed	'IsSigned1' 'IsSigned2' {'IsSigned1 or IsSigned2'} 'TRUE' 'FALSE'
NumBitsBase	1.4.1. Number-of-Bits: Base	'NumBits1' 'NumBits2' {'max([NumBits1 NumBits2])'} 'min([NumBits1 NumBits2])' 'NumBits1+NumBits2'
NumBitsMult	1.4.2. Number-of-Bits: Multiplicative adjustment	{'1'}
NumBitsAdd	1.4.3. Number-of-Bits: Additive adjustment	{'0'}
NumBitsAllowFinal	1.4.4. Number-of-Bits: Allowable final values	{'1:128'}
PropScalingMode	2. Propagated scaling	'Specify via dialog' {'Inherit via propagation rule'} 'Obtain via best precision'
PropScaling	2.1. Propagated scaling: Slope or [Slope Bias] ex. 2 ⁻⁹	{'2 ⁻¹⁰ '}
ValuesUsedBestPrec	2.1. Values used to determine best precision scaling	{' [5 -7]'}
SlopeBase	2.1.1. Slope: Base	'Slope1' 'Slope2' 'max([Slope1 Slope2])' {'min([Slope1 Slope2])'} 'Slope1*Slope2' 'Slope1/Slope2' 'PosRange1' 'PosRange2' 'max([PosRange1 PosRange2])' 'min([PosRange1 PosRange2])' 'PosRange1*PosRange2' 'PosRange1/PosRange2'
SlopeMult	2.1.2. Slope: Multiplicative adjustment	{'1'}
SlopeAdd	2.1.3. Slope: Additive adjustment	{'0'}

Block (Type)/Parameter	Dialog Box Prompt	Values
BiasBase	2.2.1. Bias: Base	{'Bias1'} 'Bias2' 'max([Bias1 Bias2])' 'min([Bias1 Bias2])' 'Bias1*Bias2' 'Bias1/Bias2' 'Bias1+Bias2' 'Bias1-Bias2'
BiasMult	2.2.2. Bias: Multiplicative adjustment	{'1'}
BiasAdd	2.2.3. Bias: Additive adjustment	{'0'}
Data Type Scaling Strip (Scaling Strip) (masked subsystem)		
IC (InitialCondition)		
Value	Initial value	{'1'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Probe (Probe)		
ProbeWidth	Probe width	'off' {'on'}
ProbeSampleTime	Probe sample time	'off' {'on'}
ProbeComplexSignal	Detect complex signal	'off' {'on'}
ProbeSignalDimensions	Probe signal dimensions	'off' {'on'}
ProbeFramedSignal	Detect framed signal	'off' {'on'}
ProbeWidthDataType	Data type for width	{'double'} 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'Same as input'
ProbeSampleTimeDataType	Data type for sample time	{'double'} 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'Same as input'
ProbeComplexityDataType	Data type for signal complexity	{'double'} 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'boolean' 'Same as input'
ProbeDimensionsDataType	Data type for signal dimensions	{'double'} 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'Same as input'
ProbeFrameDataType	Data type for signal frames	{'double'} 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'boolean' 'Same as input'
Rate Transition (RateTransition)		

Block (Type)/Parameter	Dialog Box Prompt	Values
Integrity	Ensure data integrity during data transfer	'off' {'on'}
Deterministic	Ensure deterministic data transfer (maximum delay)	'off' {'on'}
InitialCondition	Initial conditions	{'0'}
OutPortSampleTimeOpt	Output port sample time options	{'Specify'} 'Inherit' 'Multiple of input port sample time'
OutPortSampleTimeMultiple	Sample time multiple (>0)	{'1'}
OutPortSampleTime	Output port sample time	{'-1'}
Signal Conversion (SignalConversion)		
ConversionOutput	Output	{'Signal copy'} 'Virtual bus' 'Nonvirtual bus'
OutDataTypeStr	Data type	{'Inherit: auto'} 'Bus: <object name>'
OverrideOpt	Exclude this block from 'Block reduction' optimization	{'off'} 'on'
Signal Specification (SignalSpecification)		
Dimensions	Dimensions (-1 for inherited)	{'-1'}
VarSizeSig	Variable-size signal	{'Inherit'} 'No' 'Yes'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}
OutDataTypeStr	Data type	{'Inherit: auto'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'boolean' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)' 'Enum: <class name>' 'Bus: <object name>'
BusOutputAsStruct	Require nonvirtual bus	{'off'} 'on'
Unit	Specify physical unit of the input signal to the block. For a list of acceptable units, see Allowed Units.	{'inherit'} '<Enter unit>'
UnitNoProp	Specify physical unit of the input signal to the block without propagation. For a list of acceptable units, see Allowed Units.	'<Enter unit>'

Block (Type)/Parameter	Dialog Box Prompt	Values
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
SignalType	Signal type	{'auto'} 'real' 'complex'
Weighted Sample Time (SampleTimeMath)		
TsampMathOp	Operation	'+' '-' '*' '/' {'Ts Only'} '1/Ts Only'
weightValue	Weight value	{'1.0'}
TsampMathImp	Implement using	{'Online Calculations'} 'Offline Scaling Adjustment'
OutDataTypeStr	Output data type	{'Inherit via internal rule'} 'Inherit via back propagation'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} 'on'
OutputDataTypeScaling Mode	Deprecated in R2009b	
DoSatur	Deprecated in R2009b	
Width (Width)		
OutputDataTypeScaling Mode	Output data type mode	{'Choose intrinsic data type'} 'Inherit via back propagation' 'All ports same datatype'
DataType	Output data type	{'double'} 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32'

Signal Routing Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Bus Assignment (BusAssignment)		
AssignedSignals	Signals that are being assigned	{ '' }
InputSignals	Signals in the bus	matrix — { '{' }'
Bus Creator (BusCreator)		
InheritFromInputs	Override bus signal names from inputs	{ 'on' } 'off' If set to 'on', overrides bus signal names from inputs. Otherwise, inherits bus signal names from a bus object.
Inputs	Number of inputs	{ '2' }
DisplayOption		'none' 'signals' { 'bar' }
NonVirtualBus	Output as nonvirtual bus	{ 'off' } 'on'
OutDataTypeStr	Data type	{ 'Inherit: auto' } 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'boolean' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)' 'Enum: <class name>' 'Bus: <object name>'
Bus Selector (BusSelector)		
OutputSignals	Selected signals	character vector — in the form 'signal1,signal2'
OutputAsBus	Output as bus	{ 'off' } 'on'
InputSignals	Signals in bus	matrix — { '{' }'
Data Store Memory (DataStoreMemory)		
DataStoreName	Data store name	{ 'A' }
ReadBeforeWriteMsg	Detect read before write	'none' { 'warning' } 'error'
WriteAfterWriteMsg	Detect write after write	'none' { 'warning' } 'error'
WriteAfterReadMsg	Detect write after read	'none' { 'warning' } 'error'
InitialValue	Initial value	{ '0' }
StateMustResolveToSignalObject	Data store name must resolve to Simulink signal object	{ 'off' } 'on'
DataLogging	Log Signal Data	'off' { 'on' }
DataLoggingNameMode	Logging Name	{ 'SignalName' } 'Custom'
DataLoggingName	Logging Name	{ '' }
DataLoggingLimitDataPoints	Limit data points to last	'off' { 'on' }
DataLoggingMaxPoints	Limit data points to last	non-zero integer {5000}

Block (Type)/Parameter	Dialog Box Prompt	Values
DataLoggingDecimateData	Decimation	'off' {'on'}
DataLoggingLimitDataPoints	Decimation	non-zero integer {2}
StateStorageClass	Storage class	{'Auto'} 'Model default' 'ExportedGlobal' 'ImportedExtern' 'ImportedExternPointer' 'Custom'
StateSignalObject	Signal object class Storage class	Simulink.Signal object Object of a class that is derived from Simulink.Signal
RTWStateStorageTypeQualifier	Code generation type qualifier	{''}
VectorParams1D	Interpret vector parameters as 1-D	'off' {'on'}
ShowAdditionalParam	Show additional parameters	{'off'} 'on'
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}
OutDataTypeStr	Data type	{'Inherit: auto'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'boolean' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)' 'Enum: <class name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
SignalType	Signal type	{'auto'} 'real' 'complex'
Data Store Read (DataStoreRead)		
DataStoreElements	Corresponds to the parameters on the Element Selection tab of the block dialog box. See "Specification using the command line".	
DataStoreName	Data store name	{'A'}
SampleTime	Sample time	{'0'}
Data Store Write (DataStoreWrite)		
DataStoreElements	Corresponds to the parameters on the Element Assignment tab of the block dialog box. See "Specification using the command line".	

Block (Type)/Parameter	Dialog Box Prompt	Values
DataStoreName	Data store name	{'A'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Demux (Demux)		
Outputs	Number of outputs	{'2'}
DisplayOption	Display option	'none' {'bar'}
Environment Controller (Environment Controller) (masked subsystem)		
From (From)		
GotoTag	Goto tag	{'A'}
IconDisplay	Icon display	'Signal name' {'Tag'} 'Tag and signal name'
Goto (Goto)		
GotoTag	Goto tag	{'A'}
IconDisplay	Icon display	'Signal name' {'Tag'} 'Tag and signal name'
TagVisibility	Tag visibility	{'local'} 'scoped' 'global'
Goto Tag Visibility (GotoTagVisibility)		
GotoTag	Goto tag	{'A'}
Index Vector (MultiPortSwitch)		
DataPortOrder	Data port order	{'Zero-based contiguous'} 'One-based contiguous' 'Specify indices'
Inputs	Number of data ports	{'1'}
zeroidx	Deprecated in R2010a	
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all data port inputs to have the same data type	{'off'} 'on'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} 'Inherit: Inherit via back propagation' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnIntegerOverflow	Saturate on integer overflow	{'off'} 'on'
AllowDiffInputSizes	Allow different data input sizes (Results in variable-size output signal)	{'off'} 'on'
Manual Switch (Manual Switch) (masked subsystem)		
varsize	Allow different input sizes (Results in variable-size output signal)	{'off'} 'on'
SampleTime	Sample time (-1 for inherited)	{'-1'}
Merge (Merge)		
Inputs	Number of inputs	{'2'}
InitialOutput	Initial output	{'[]'}
AllowUnequalInputPortWidths	Allow unequal port widths	{'off'} 'on'
InputPortOffsets	Input port offsets	{'[]'}
Multiport Switch (MultiPortSwitch)		
DataPortOrder	Data port order	'Zero-based contiguous' {'One-based contiguous'} 'Specify indices'
Inputs	Number of data ports	{'3'}
zeroidx	Deprecated in R2010a	
DataPortIndices	Data port indices	{'1,2,3'}
DataPortForDefault	Data port for default case	{'Last data port'} 'Additional data port'
DiagnosticForDefault	Diagnostic for default case	'None' 'Warning' {'Error'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all data port inputs to have the same data type	{'off'} 'on'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} 'Inherit: Inherit via back propagation' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} 'on'
AllowDiffInputSizes	Allow different data input sizes (Results in variable-size output signal)	{'off'} 'on'
Mux (Mux)		
Inputs	Number of inputs	{'2'}
DisplayOption	Display option	'none' 'signals' {'bar'}
UseBusObject	For internal use	
BusObject	For internal use	
NonVirtualBus	For internal use	
Selector (Selector)		
NumberOfDimensions	Number of input dimensions	{'1'}
IndexMode	Index mode	'Zero-based' {'One-based'}
IndexOptionArray	Index Option	'Select all' {'Index vector (dialog)'} 'Index vector (port)' 'Starting index (dialog)' 'Starting index (port)'
IndexParamArray	Index	cell array
OutputSizeArray	Output Size	cell array
InputPortWidth	Input port size	{'1'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
IndexOptions	See the IndexOptionArray parameter for more information.	
Indices	See the IndexParamArray parameter for more information.	
OutputSizes	See the IndexParamArray parameter for more information.	
Switch (Switch)		
Criteria	Criteria for passing first input	{'u2 >= Threshold'} 'u2 > Threshold' 'u2 ~= 0'
Threshold	Threshold	{'0'}
ZeroCross	Enable zero-crossing detection	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}

Block (Type)/Parameter	Dialog Box Prompt	Values
InputSameDT	Require all data port inputs to have the same data type	{'off'} 'on'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} 'Inherit: Inherit via back propagation' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)' 'Enum: <class name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} 'on'
AllowDiffInputSizes	Allow different input sizes (Results in variable-size output signal)	{'off'} 'on'
Variant Source (VariantSource)		
VariantControls	Variant control	{'Variant'} '(default)'
LabelModeActiveChoice	Label mode active choice	{''}
AllowZeroVariantControls	Allow zero active variant controls	{'off'} 'on'
ShowConditionOnBlock	Show variant condition on block	{'off'} 'on'
GeneratePreprocessorConditionals	Analyze all choices during update diagram and generate preprocessor conditionals	{'off'} 'on'
CompiledActiveVariantControl		string – {''} The value is a empty string if no variant is active; or the name of the active variant. Compile the model before querying this property.
CompiledActiveVariantPort		string – {'-1'} The value is -1 if no variant is active; or the index of the active variant. Compile the model before querying this property.
Variant Sink (VariantSink)		

Block (Type)/Parameter	Dialog Box Prompt	Values
VariantControls	Variant control	{'Variant'} '(default)'
LabelModeActiveChoice	Label mode active choice	{''}
AllowZeroVariantControls	Allow zero active variant controls	{'off'} 'on'
ShowConditionOnBlock	Show variant condition on block	{'off'} 'on'
GeneratePreprocessorConditionals	Analyze all choices during update diagram and generate preprocessor conditionals	{'off'} 'on'
CompiledActiveVariantControl		string – {''} The value is a empty string if no variant is active; or the name of the active variant. Compile the model before querying this property.
CompiledActiveVariantPort		string – {'-1'} The value is -1 if no variant is active; or the index of the active variant. Compile the model before querying this property.
Vector Concatenate (Concatenate)		
NumInputs	Number of inputs	{'2'}
Mode	Mode	{'Vector'} 'Multidimensional array'

Sinks Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Display (Display)		
Numeric display format	Format	{'short'} 'long' 'short_e' 'long_e' 'bank' 'hex (Stored Integer)' 'binary (Stored Integer)' 'decimal (Stored Integer)' 'octal (Stored Integer)'
Decimation	Decimation	{'1'}
Floating	Floating display	{'off'} 'on'
SampleTime	Sample time (-1 for inherited)	{'-1'}
Floating Scope (Scope)		
Floating		'off' {'on'}
Location		vector — {'[376 294 700 533]'}
Open		{'off'} 'on'
NumInputPorts		Do not change this parameter with the command-line. To add inputs, use the signal selector button  .
TickLabels		'on' 'off' {'OneTimeTick'}
ZoomMode		{'on'} 'xonly' 'yonly'
AxesTitles		character vector
Grid		'off' {'on'} 'xonly' 'yonly'
TimeRange		{'auto'}
YMin		{'-5'}
YMax		{'5'}
SaveToWorkspace		{'off'} 'on'
SaveName		{'ScopeData'}
DataFormat		{'StructureWithTime'} 'Structure' 'Array'
LimitDataPoints		'off' {'on'}
MaxDataPoints		{'5000'}
Decimation		{'1'}
SampleInput		{'off'} 'on'
SampleTime		{'0'}
Out1 (Output)		

Block (Type)/Parameter	Dialog Box Prompt	Values
Port	Port number	{'1'}
IconDisplay	Icon display	'Signal name' {'Port number'} 'Port number and signal name'
BusOutputAsStruct	Output as nonvirtual bus in parent model	{'off'} 'on'
PortDimensions	Port dimensions (-1 for inherited)	{'-1'}
VarSizeSig	Variable-size signal	{'Inherit'} 'No' 'Yes'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}
OutDataTypeStr	Data type	{'Inherit: auto'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'boolean' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)' 'Enum: <class name>' 'Bus: <object name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
SignalObject	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See “Design Data Interface by Configuring Inport and Outport Blocks” (Simulink Coder).	Simulink.Signal object Object of a class that is derived from Simulink.Signal
StorageClass	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See “Design Data Interface by Configuring Inport and Outport Blocks” (Simulink Coder).	{'Auto'} 'Model default' 'ExportedGlobal' 'ImportedExtern' 'ImportedExternPointer' 'Custom'
SignalName	Signal name	character vector
SignalType	Signal type	{'auto'} 'real' 'complex'
OutputWhenDisabled	Output when disabled	{'held'} 'reset'
InitialOutput	Initial output	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
MustResolveToSignalObject	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See “For Signals”.	{'off'} 'on'
Scope (Scope)		
Floating		{'off'} 'on'
Location		vector — {'[188 390 512 629]'}
Open		{'off'} 'on'
NumInputPorts		Do not change this parameter with the set_param command. Instead, use the TimeScopeConfiguration object or Number of Input Ports parameter in the Scope block.
TickLabels		'on' 'off' {'OneTimeTick'}
ZoomMode		{'on'} 'xonly' 'yonly'
AxesTitles		character vector
Grid		'off' {'on'} 'xonly' 'yonly'
TimeRange		{'auto'}

NumBits	Number of Bits	{'16'}

Block (Type)/Parameter	Dialog Box Prompt	Values
tsamp	Sample time	{'-1'}
Counter Limited (Counter Limited) (masked subsystem)		
uplimit	Upper limit	{'7'}
tsamp	Sample time	{'-1'}
Digital Clock (DigitalClock)		
SampleTime	Sample time	{'1'}
Enumerated Constant (EnumeratedConstant)		
OutDataTypeStr	Output data type	{'Enum: SLDemoSign'}
Value	Value	{'SLDemoSign.Positive'} 'SLDemoSign.Zero' 'SLDemoSign.Negative'
SampleTime	Sample time	{'inf'}
From File (FromFile)		
FileName	File name	{'untitled.mat'}
ExtrapolationBeforeFirstDataPoint	Data extrapolation before first data point	{'Linear extrapolation'} 'Hold first value' 'Ground value'
InterpolationWithinTimeRange	Data interpolation within time range	{'Linear interpolation'} 'Zero order hold'
ExtrapolationAfterLastDataPoint	Data extrapolation after last data point	{'Linear extrapolation'} 'Hold last value' 'Ground value'
SampleTime	Sample time	{'0'}
From Workspace (FromWorkspace)		
VariableName	Data	{'simin'}
OutDataTypeStr	Output Data type	{'Inherit: auto'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'boolean' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)' 'Enum: <class name>' 'Bus: <object name>'
SampleTime	Sample time	{'0'}
Interpolate	Interpolate data	'off' {'on'}
ZeroCross	Enable zero-crossing detection	'off' {'on'}
OutputAfterFinalValue	Form output after final data value by	{'Extrapolation'} 'Setting to zero' 'Holding final value' 'Cyclic repetition'

Block (Type)/Parameter	Dialog Box Prompt	Values
Ground		
In1 (Inport)		
Port	Port number	{'1'}
IconDisplay	Icon display	'Signal name' {'Port number'} 'Port number and signal name'
BusOutputAsStruct	Output as nonvirtual bus	{'off'} 'on'
PortDimensions	Port dimensions (-1 for inherited)	{'-1'}
VarSizeSig	Variable-size signal	{'Inherit'} 'No' 'Yes'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}
OutDataTypeStr	Data type	{'Inherit: auto'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'boolean' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)' 'Enum: <class name>' 'Bus: <object name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
Unit	Specify physical unit of the input signal to the block. For a list of acceptable units, see Allowed Units.	{'inherit'} '<Enter unit>'
UnitNoProp	Specify physical unit of the input signal to the block without propagation. For a list of acceptable units, see Allowed Units.	'<Enter unit>'
SignalType	Signal type	{'auto'} 'real' 'complex'
LatchByDelayingOutsideSignal	Latch input by delaying outside signal	{'off'} 'on'
LatchInputForFeedbackSignals	Latch input for feedback signals of function-call subsystem outputs	{'off'} 'on'
OutputFunctionCall	Output a function-call trigger signal	{'off'} 'on'
Interpolate	Interpolate data	'off' {'on'}
Pulse Generator (DiscretePulseGenerator)		

Block (Type)/Parameter	Dialog Box Prompt	Values
PulseType	Pulse type	{'Time based'} 'Sample based'
TimeSource	Time (t)	{'Use simulation time'} 'Use external signal'
Amplitude	Amplitude	{'1'}
Period	Period	{'10'}
PulseWidth	Pulse width	{'5'}
PhaseDelay	Phase delay	{'0'}
SampleTime	Sample time	{'1'}
VectorParams1D	Interpret vector parameters as 1-D	'off' {'on'}
Ramp (Ramp) (masked subsystem)		
slope	Slope	{'1'}
start	Start time	{'0'}
InitialOutput	Initial output	{'0'}
VectorParams1D	Interpret vector parameters as 1-D	'off' {'on'}
Random Number (RandomNumber)		
Mean	Mean	{'0'}
Variance	Variance	{'1'}
Seed	Seed	{'0'}
SampleTime	Sample time	{'0.1'}
VectorParams1D	Interpret vector parameters as 1-D	'off' {'on'}
Repeating Sequence (Repeating table) (masked subsystem)		
rep_seq_t	Time values	{'[0 2]'}
rep_seq_y	Output values	{'[0 2]'}
Repeating Sequence Interpolated (Repeating Sequence Interpolated) (masked subsystem)		
OutValues	Vector of output values	{'[3 1 4 2 1].''}
TimeValues	Vector of time values	{'[0 0.1 0.5 0.6 1].''}
LookUpMeth	Lookup Method	{'Interpolation-Use End Values'} 'Use Input Nearest' 'Use Input Below' 'Use Input Above'
tsamp	Sample time	{'0.01'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output data type	'Inherit: Inherit via back propagation' {'double'} 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
OutputDataTypeScaling Mode	Deprecated in R2007b	
OutDataType	Deprecated in R2007b	
OutScaling	Deprecated in R2007b	
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
Repeating Sequence Stair (Repeating Sequence Stair) (masked subsystem)		
OutValues	Vector of output values	{'[3 1 4 2 1].''}
tsamp	Sample time	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	'Inherit: Inherit via back propagation' {'double'} 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'boolean' 'fixdt(1,16)' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)' 'Enum: <class name>'
OutputDataTypeScaling Mode	Deprecated in R2007b	
OutDataType	Deprecated in R2007b	
ConRadixGroup	Deprecated in R2007b	
OutScaling	Deprecated in R2007b	
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
Signal Builder (Sigbuilder block) (masked subsystem)		
Signal Editor (SignalEditor)		
Filename	File name	{'untitled.mat'}
ActiveScenario	Active scenario	{'Scenario'}

Block (Type)/Parameter	Dialog Box Prompt	Values
ActiveSignal	Signals	{'Signal 1'}
IsBus	Output a bus signal	'on' {'off'}
OutputBusObjectStr	Select bus object	{'Bus: BusObject'}
SampleTime	Sample time	{'0'}
Interpolate	Interpolate data	{'off'} 'on'
ZeroCross	Enable zero-crossing detection	{'off'} 'on'
OutputAfterFinalValue	Form output after final data value by	{'Setting to zero'} 'Extrapolation' 'Holding final value'
Unit	Unit	{'inherit'}
PreserveSignalName	—	boolean — {'off'} 'on'
NumberOfScenarios	—	Read-only. Use get_param to get this value.
NumberOfSignals	—	Read-only. Use get_param to get this value.
Signal Generator (SignalGenerator)		
WaveForm	Wave form	{'sine'} 'square' 'sawtooth' 'random'
TimeSource	Time (t)	{'Use simulation time'} 'Use external signal'
Amplitude	Amplitude	{'1'}
Frequency	Frequency	{'1'}
Units	Units	'rad/sec' {'Hertz'}
VectorParams1D	Interpret vector parameters as 1-D	'off' {'on'}
Sine Wave (Sin)		
SineType	Sine type	{'Time based'} 'Sample based'
TimeSource	Time	{'Use simulation time'} 'Use external signal'
Amplitude	Amplitude	{'1'}
Bias	Bias	{'0'}
Frequency	Frequency	{'1'}
Phase	Phase	{'0'}
Samples	Samples per period	{'10'}
Offset	Number of offset samples	{'0'}
SampleTime	Sample time	{'0'}
VectorParams1D	Interpret vector parameters as 1-D	'off' {'on'}
Step (Step)		
Time	Step time	{'1'}

Block (Type)/Parameter	Dialog Box Prompt	Values
Before	Initial value	{'0'}
After	Final value	{'1'}
SampleTime	Sample time	{'0'}
VectorParams1D	Interpret vector parameters as 1-D	'off' {'on'}
ZeroCross	Enable zero-crossing detection	'off' {'on'}
Uniform Random Number (UniformRandomNumber)		
Minimum	Minimum	{'-1'}
Maximum	Maximum	{'1'}
Seed	Seed	{'0'}
SampleTime	Sample time	{'0.1'}
VectorParams1D	Interpret vector parameters as 1-D	'off' {'on'}
Waveform Generator (WaveformGenerator)		
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	'Inherit: Inherit via back propagation' {'Inherit: Inherit from table data'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'boolean' 'fixdt(1,16)' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' 'Floor' {'Nearest'} 'Round' 'Simplest' 'Zero'
SaturateOnIntegerOverflow	Saturate on integer overflow	{'off'} 'on'
SelectedSignal	Output signal	{'1'}
SampleTime	Sample time	{'0'}

String Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Compose String (Compose String)		
Format	Format	scalar {"%d %f"} "%d" "%i" "%o" "%x" "%X" "%f" "%e" "%E" "%g" "%G" "%s" optional operators and text
OutDataTypeStr	Output data type	{"stringtype(255)} "stringtype(N)" "string"
Scan String (Scan String)		
Format	Format	scalar {"%d %f"} "%d" "%i" "%o" "%x" "%X" "%f" "%e" "%E" "%g" "%G" "%s" optional operators and text
String Compare (String Compare)		
CaseSensitive	Case sensitivity for string compare	'off' {'on'}
CompareOption	Amount of characters to compare	{"Entire string"} "First N characters"
NumberOfCharacters	Number of characters to compare	{'1'} scalar
String Concatenate (String Concatenate)		
Inputs	Number of inputs	{"2"}
OutDataTypeStr	Output data type	{"stringtype(128)} "stringtype(N)" "string"
String Constant (String Constant)		
String	String	{"Hello!"} scalar
OutDataTypeStr	Output data type	{"stringtype(128)} "stringtype(N)" "string"
String to ASCII (String to ASCII)		
OutputVectorSize	Output vector size	{"31"} scalar
String to Double (String to Double)		
Format	Format	scalar {"%d %f"} "%d" "%i" "%o" "%x" "%X" "%f" "%e" "%E" "%g" "%G" "%s" optional operators and text
String to Enum (String to Enum)		

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output data type	{"Enum: S1DemoSign"} <data type expression>
String to Single (String to Single)		
Format	Format	scalar {"%f"} "%d" "%i" "%o" "%x" "%X" "%f" "%e" "%E" "%g" "%G" "%s" optional operators and text
Substring (Substring)		
InheritMaximumLength	Inherit maximum length from input	'off' {'on'}
OutDataTypeStr	Output data type	{"stringtype(31)} "stringtype(N)" "string"
StringFromIdxToEnd	Output string from 'idx' to end	{'off'} 'on'

User-Defined Functions Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
MATLAB Function (Stateflow) (masked subsystem)		
MATLAB System (MATLABSystem)		
System	System object class name	{''}
Level-2 MATLAB S-Function (M-S-Function)		
FunctionName	S-function name	{'mlfile'}
Parameters	Arguments	{''}
Interpreted MATLAB Function (MATLABFcn)		
MATLABFcn	MATLAB function	{'sin'}
OutputDimensions	Output dimensions	{'-1'}
OutputSignalType	Output signal type	{'auto'} 'real' 'complex'
Output1D	Collapse 2-D results to 1-D	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
S-Function (S-Function)		
FunctionName	S-function name	{'system'}
Parameters	S-function parameters	{''}
SFunctionModules	S-function modules	{''}
S-Function Builder (S-Function Builder) (masked subsystem)		
FunctionName	S-function name	{'system'}
Parameters	S-function parameters	{''}
SFunctionModules	S-function modules	{''}

Additional Discrete Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Fixed-Point State-Space (Fixed-Point State-Space) (masked subsystem)		
A	State Matrix A	{'[2.6020 -2.2793 0.6708; 1 0 0; 0 1 0]'} }
B	Input Matrix B	{'[1; 0; 0]'} }
C	Output Matrix C	{'[0.0184 0.0024 0.0055]'} }
D	Direct Feedthrough Matrix D	{'[0.0033]'} }
InitialCondition	Initial condition for state	{'0.0'}
InternalDataType	Data type for internal calculations	{'fixdt('double')'}
StateEqScaling	Scaling for State Equation AX+BU	{'2^0'}
OutputEqScaling	Scaling for Output Equation CX+DU	{'2^0'}
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'} 'on'
Transfer Fcn Direct Form II (Transfer Fcn Direct Form II) (masked subsystem)		
NumCoefVec	Numerator coefficients	{'[0.2 0.3 0.2]'} }
DenCoefVec	Denominator coefficients excluding lead (which must be 1.0)	{'[-0.9 0.6]'} }
vinit	Initial condition	{'0.0'}
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'} 'on'
Transfer Fcn Direct Form II Time Varying (Transfer Fcn Direct Form II Time Varying) (masked subsystem)		
vinit	Initial condition	{'0.0'}
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'} 'on'
Unit Delay Enabled (Unit Delay Enabled) (masked subsystem)		

Block (Type)/Parameter	Dialog Box Prompt	Values
vinit	Initial condition	{'0.0'}
tsamp	Sample time	{'-1'}
Unit Delay Enabled External IC (Unit Delay Enabled External Initial Condition) (masked subsystem)		
tsamp	Sample time	{'-1'}
Unit Delay Enabled Resettable (Unit Delay Enabled Resettable) (masked subsystem)		
vinit	Initial condition	{'0.0'}
tsamp	Sample time	{'-1'}
Unit Delay Enabled Resettable External IC (Unit Delay Enabled Resettable External Initial Condition) (masked subsystem)		
tsamp	Sample time	{'-1'}
Unit Delay External IC (Unit Delay External Initial Condition) (masked subsystem)		
tsamp	Sample time	{'-1'}
Unit Delay Resettable (Unit Delay Resettable) (masked subsystem)		
vinit	Initial condition	{'0.0'}
tsamp	Sample time	{'-1'}
Unit Delay Resettable External IC (Unit Delay Resettable External Initial Condition) (masked subsystem)		
tsamp	Sample time	{'-1'}
Unit Delay With Preview Enabled (Unit Delay With Preview Enabled) (masked subsystem)		
vinit	Initial condition	{'0.0'}
tsamp	Sample time	{'-1'}
Unit Delay With Preview Enabled Resettable (Unit Delay With Preview Enabled Resettable) (masked subsystem)		
vinit	Initial condition	{'0.0'}
tsamp	Sample time	{'-1'}
Unit Delay With Preview Enabled Resettable External RV (Unit Delay With Preview Enabled Resettable External RV) (masked subsystem)		
vinit	Initial condition	{'0.0'}
tsamp	Sample time	{'-1'}
Unit Delay With Preview Resettable (Unit Delay With Preview Resettable) (masked subsystem)		
vinit	Initial condition	{'0.0'}
tsamp	Sample time	{'-1'}
Unit Delay With Preview Resettable External RV (Unit Delay With Preview Resettable External RV) (masked subsystem)		
vinit	Initial condition	{'0.0'}
tsamp	Sample time	{'-1'}

Additional Math: Increment - Decrement Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Decrement Real World (Real World Value Decrement) (masked subsystem)		
Decrement Stored Integer (Stored Integer Value Decrement) (masked subsystem)		
Decrement Time To Zero (Decrement Time To Zero) (masked subsystem)		
Decrement To Zero (Decrement To Zero) (masked subsystem)		
Increment Real World (Real World Value Increment) (masked subsystem)		
Increment Stored Integer (Stored Integer Value Increment) (masked subsystem)		

Mask Parameters

About Mask Parameters

This section lists parameters that describe masked blocks. You can use these descriptive parameters with `get_param` and `set_param` to obtain and specify the properties of a block mask.

The descriptive mask parameters listed in this section apply to all masks, and provide access to all mask properties. Be careful not to confuse these descriptive mask parameters with the mask-specific parameters defined for an individual mask in the Mask Editor **Parameters** pane.

See “Masking Fundamentals” and “Mask Editor Overview” for information about block masks and the Mask Editor.

Mask Parameters

Parameter	Description/Prompt	Values
Mask	Turns mask on or off.	{'on'} 'off'
MaskCallbackString	Mask parameter callbacks that are executed when the respective parameter is changed on the dialog. Set by the Dialog callback field on the Parameters pane of the Mask Editor dialog box. For more information, see “Mask Callback Code”.	pipe-delimited character vector {' '}
MaskCallbacks	Cell array version of MaskCallbackString.	cell array {' []'}
MaskDescription	Block description. Set by the Mask description field on the Documentation pane of the Mask Editor dialog box.	character vector {' '}
MaskDisplay	Drawing commands for the block icon. Set by the Icon Drawing commands field on the Icon & Ports pane of the Mask Editor dialog box.	character vector {' '}
MaskEditorHandle	For internal use only.	
MaskEnableString	Option that determines whether a parameter is greyed out in the dialog. Set by the Enable parameter check box on the Parameters pane of the Mask Editor dialog box.	pipe-delimited character vector {' '}
MaskEnables	Cell array version of MaskEnableString.	cell array of character vectors, each either 'on' or 'off' {' []'}
MaskHelp	Block help. Set by the Mask help field on the Documentation pane of the Mask Editor dialog box.	character vector {' '}
MaskIconFrame	Set the visibility of the icon frame (Visible is on, Invisible is off). Set by the Block Frame option on the Icon & Ports pane of the Mask Editor dialog box.	{'on'} 'off'
MaskIconOpaque	Set the transparency of the icon. Set by the Icon Transparency option on the Icon & Ports pane of the Mask Editor dialog box.	{'opaque'} 'transparent' 'opaque-with-ports'

Parameter	Description/Prompt	Values
MaskIconRotate	Set the rotation of the icon (Rotates is on, Fixed is off). Set by the Icon Rotation option on the Icon & Ports pane of the Mask Editor dialog box.	'on' {'off'}
MaskIconUnits	Set the units for the drawing commands. Set by the Icon Units option on the Icon & Ports pane of the Mask Editor dialog box.	'pixel' {'autoscale'} 'normalized'
MaskInitialization	Initialization commands. Set by the Initialization commands field on the Initialization pane of the Mask Editor dialog box.	MATLAB command {' '}
MaskNames	Cell array of mask dialog parameter names. Set inside the Variable column in the Parameters pane of the Mask Editor dialog box.	matrix {' []'}
MaskPortRotate	Specify the port rotation policy for the masked block. Set in the Port Rotation area on the Icon & Ports pane of the Mask Editor dialog box. For more information, see “Format a Model”.	{'default'} 'physical'
MaskPrompts	List of dialog parameter prompts (see below). Set inside the Dialog parameters area on the Parameters pane of the Mask Editor dialog box.	cell array of character vectors {' []'}
MaskPromptString	List of dialog parameter prompts (see below). Set inside the Dialog parameters area on the Parameters pane of the Mask Editor dialog box.	character vector {' '}
MaskPropertyName	Pipe-delimited version of MaskNames.	character vector {' '}
MaskRunInitForIconRedraw	Specifies whether Simulink must run mask initialization before executing the mask icon commands.	{'auto'} 'on' 'off'
MaskSelfModifiable	Indicates that the block can modify itself. Set by the Allow library block to modify its contents check box on the Initialization pane of the Mask Editor dialog box.	'on' {'off'}

Parameter	Description/Prompt	Values
MaskStyles	Determines whether the dialog parameter is a check box, edit field, or pop-up list. Set by the Type column in the Parameters pane of the Mask Editor dialog box.	cell array {' [] '} edit, checkbox, popup, combobox, radiobutton, slider, dial, spinbox, unit, textarea, customtable, unidt, min, max.
MaskStyleString	Comma-separated version of MaskStyles.	character vector { ' ' }
MaskTabNameString	For internal use only.	
MaskTabNames	For internal use only.	
MaskToolTipsDisplay	Determines which mask dialog parameters to display in the tooltip for this masked block. Specify as a cell array of 'on' or 'off' values, each of which indicates whether to display the parameter named at the corresponding position in the cell array returned by MaskNames.	cell array of 'on' and 'off' {''}
MaskToolTipString	Comma-delimited version of MaskToolTipsDisplay.	character vector { ' ' }
MaskTunableValues	Allows the changing of mask dialog values during simulation. Set by the Tunable column in the Parameters pane of the Mask Editor dialog box.	cell array of character vectors { ' [] ' }
MaskTunableValueString	Comma-delimited character vector version of MaskTunableValues.	delimited character vector { ' ' }
MaskType	Mask type. Set by the Mask type field on the Documentation pane of the Mask Editor dialog box.	character vector { 'Stateflow' }
MaskValues	Dialog parameter values.	cell array { ' [] ' }
MaskValueString	Delimited character vector version of MaskValues.	delimited character vector { ' ' }
MaskVarAliases	Specify aliases for a block's mask parameters. The aliases must appear in the same order as the parameters appear in the block's MaskValues parameter.	cell array { ' [] ' }
MaskVarAliasString	For internal use only.	
MaskVariables	List of the dialog parameters' variables (see below). Set inside the Dialog parameters area on the Parameters pane of the Mask Editor dialog box.	character vector { ' ' }

Parameter	Description/Prompt	Values
MaskVisibilities	Specifies visibility of parameters. Set with the Show parameter check box in the Options for selected parameter area on the Parameters pane of the Mask Editor dialog box.	matrix {' []'}
MaskVisibilityString	Delimited character vector version of MaskVisibilities.	character vector {' '}
MaskWSVariables	List of the variables defined in the mask workspace (read only).	matrix {' []'}

See Control Masks Programmatically, for more information on setting the mask parameters from the MATLAB command line.

Tools and Apps

Bus Editor

Create, modify, and manage Simulink.Bus objects

Description

To interactively create a `Simulink.Bus` object, and the `Simulink.BusElement` objects that it contains, use the Simulink Bus Editor.

The `Bus` objects that you create using the Bus Editor are stored in the MATLAB base workspace. To simulate a block that uses a `Bus` object, the `Bus` object must be in the base workspace or in a data dictionary.

To save `Bus` object definitions using the Bus Editor, export the `Bus` objects from the base workspace into a MATLAB code file or MAT-file. If you save a `Bus` object in a MATLAB code file, you can edit it programmatically. For details, see “Create Bus Objects Programmatically”.

You can use the Bus Editor to change and delete existing `Bus` objects and bus elements. The Bus Editor displays all `Bus` objects in the base workspace. Changes that create, reorder, or delete entities take effect immediately in the base workspace.

Note The Bus Editor does not provide an undo capability. Changes to properties take effect when you apply them.

For more information on `Bus` objects, see “Specify Bus Properties with Simulink.Bus Objects”.

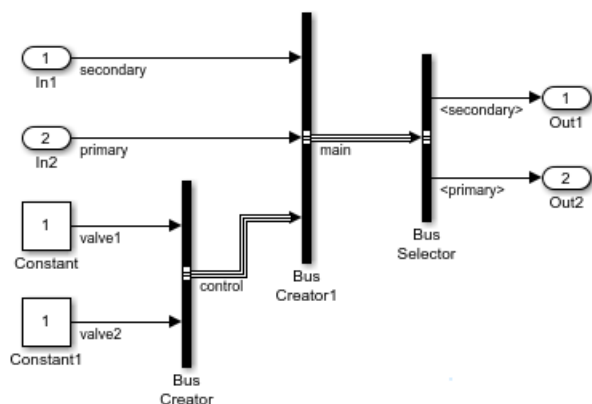

Open the Bus Editor

- On the **Modeling** tab, in the **Design** gallery, click **Bus Editor**.
- At the MATLAB command prompt, enter `buseditor`.
- In the Model Explorer, in a `Bus` object dialog box, click the **Launch Bus Editor** button.

Examples

Create Bus Objects Using the Bus Editor

This example shows how to create a `Bus` object that corresponds to the `control` bus in `model`. This bus contains two signals as elements.

- 1 In the Bus Editor, click the **Add Bus** button .

A Bus object with a default name appears in the left pane and its default properties appear in the **Simulink.Bus** dialog pane.

- 2 Specify the name for the Bus object using the **Name** property. For easy identification, use a name that reflects the bus associated with the bus object. The bus that combines the valve inputs is named `control`, therefore, name the Bus object `CONTROL`.

Tip Click **Apply** after editing properties or choose to automatically apply changes when you click a different object.

- 3 Click the **Add/Insert BusElement** button .

A bus element with a default name and default properties is created in the `CONTROL` Bus object. The bus element appears in the left pane nested under the `CONTROL` Bus object.

- 4 In the **Simulink.BusElement** dialog pane, set **Name** to `VALVE1`, which reflects the name of the corresponding signal in the bus.
- 5 To determine the signal properties for BusElement object `VALVE1`, open the Block Parameters dialog box for the Constant block.

The properties on the **Signal Attributes** tab match the default BusElement object properties, so no change is required.

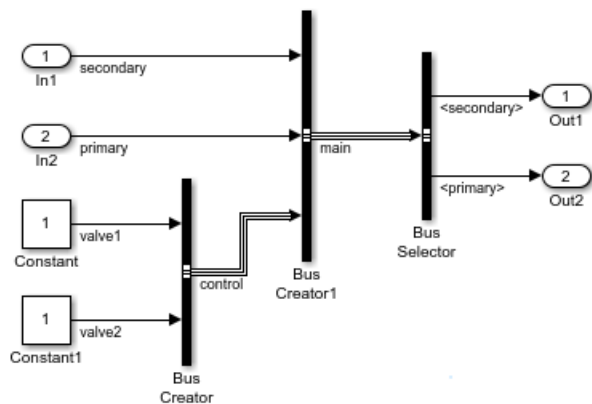

- 6 Similarly, create a BusElement object named `VALVE2` that corresponds to the `valve2` element.
- 7 To determine the signal properties for BusElement object `VALVE2`, open the Block Parameters dialog box for the Constant1 block.

The **Output data type** specified by the Constant1 block is `int8`, which does not match the default BusElement object properties. Set the **Data Type** property of BusElement object `VALVE2` to `int8`.

Nest Bus Objects Using the Bus Editor

Any signal in a bus can be another bus, which can in turn contain subordinate buses, to any depth. Describing nested buses using Bus objects requires nesting the Bus object definitions.

Model has two buses, with one bus nested inside the other bus.

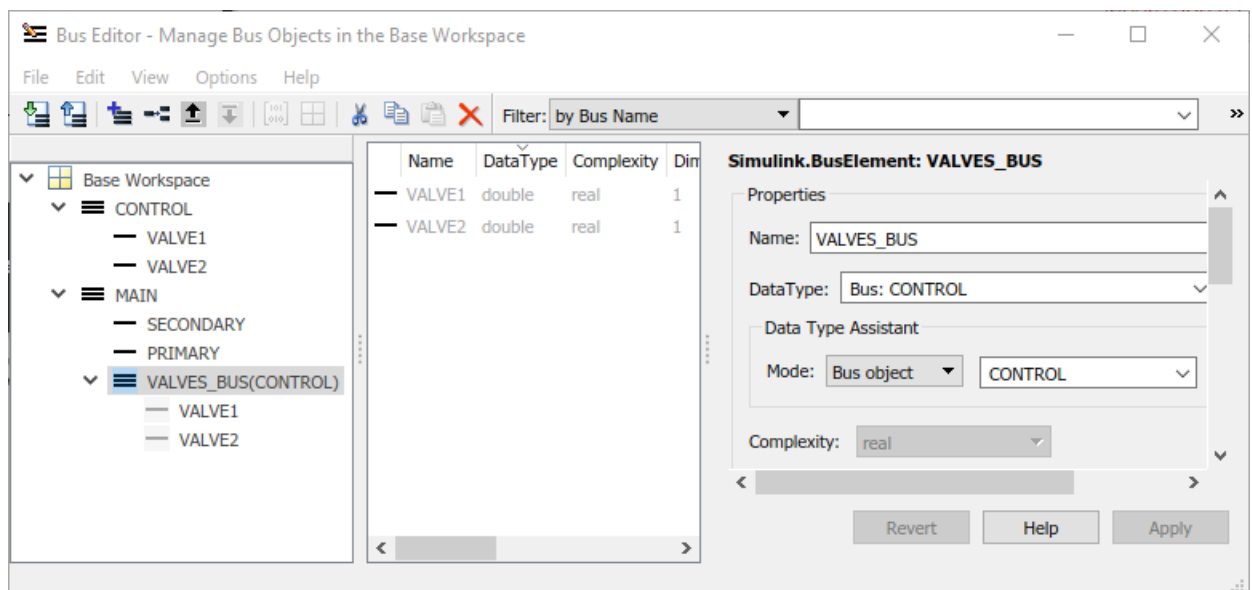

This example shows how to nest a Bus object that corresponds to the control bus in a Bus object that corresponds to the main bus.

- 1 Create a Bus object named CONTROL that fully specifies the control bus.
- 2 Create a Bus object named MAIN that fully specifies the main bus, temporarily using default values for the BusElement object that specifies the nested control bus.

To identify that this BusElement object corresponds to a nested bus, you can name it VALVES_BUS.

- 3 In the **Simulink.BusElement** dialog pane for VALVES_BUS, set the **Data type** parameter to Bus: <object name>, where <object name> is the name of the Bus object for the control bus.

Tip A Bus object cannot directly or indirectly reference itself. If you define a circular structure, the Bus Editor warns you and sets the data type of the element that would have completed the circle to double.

Edit Bus Objects Using the Bus Editor

To edit a Bus object or BusElement object:

- 1 In the left pane, select the object to edit.
- 2 In the **Simulink.Bus** or **Simulink.BusElement** dialog pane, edit the object properties.
- 3 Click **Apply**.

When you have a Bus object selected, you can edit its BusElement objects in the middle pane.

To make the same edit to a property in multiple BusElement objects, use the middle pane. Hold the **Ctrl** key while you select multiple bus element objects and enter the new value in the property for one of the selected bus element objects. The change applies to all the selected BusElement objects.

You can use the Bus Editor to copy and paste Bus objects or BusElement objects. Right-click an object and use the context menu to copy and paste the Bus object. Copying a Bus object also copies its BusElement objects. The copied objects have the same property values as the original objects.

To change the order of bus elements in a Bus object, in the left pane, select a bus element and use the **Move Element Up**  or **Move Element Down** button .

To delete a Bus object, in the left pane, select the Bus object and click the **Delete**  button or **Delete** key. Deleting a Bus object deletes its BusElement objects.

If you delete a Bus object, in the Simulink Editor, update any blocks that use that Bus object. To find where a bus object is used in a model, see “Finding Blocks That Use a Specific Variable”.

Save Bus Objects Using the Bus Editor

When you create Bus objects in the base workspace, before you close MATLAB, save the Bus objects for future use.

You can save Bus objects to one of these locations:

- Data dictionary
- MATLAB code file
- MAT-file
- Database or other external files

The Bus Editor can save Bus objects in a MAT-file or MATLAB code file. To save Bus objects in other locations, see “Save Simulink.Bus Objects”.

Tip To display a reminder to save Bus objects before closing the Bus Editor, select **Options > Always Warn Before Closing**.

- 1 Select which Bus objects you want to export.
 - To export all visible Bus objects in the Bus Editor, select **File > Export to File**. Bus objects hidden by a filter do not export.

- To export only selected Bus objects, right-click a Bus object, then select **Export to File**.
 - To include nested Bus objects used by the selected Bus object, select **Export with Dependent Bus Objects to File**.
- 2 In the Export dialog box, specify the name for the export file.
 - 3 Set **Save as type** to MATLAB files (*.m) or MAT-files (*.mat).
 - 4 Click **Save**.
 - 5 For a MATLAB code file, in the additional dialog box that appears, select the export format.
 - Cell — Stores Bus objects in a compressed format.
 - Object — Store Bus objects in the Simulink.Bus object format, which is easier to read and edit.

Filter Displayed Bus Objects in the Bus Editor

By default, the Bus Editor displays all Bus objects that exist in the base workspace, in alphabetical order. When you want to reduce the number of Bus objects displayed, you can apply a filter.

The Bus Editor can display only those Bus objects that have:

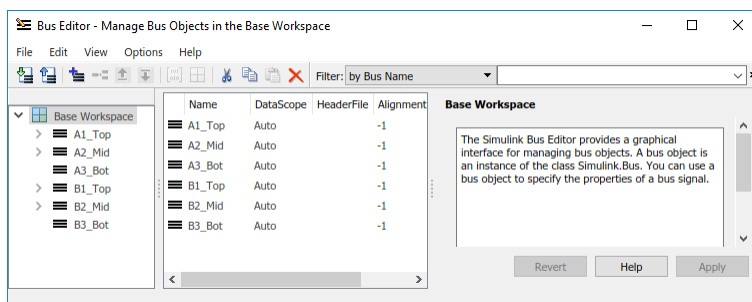

- Names that match a given search term or regular expression
- A specified relationship to a specified Bus object

You can work with any Bus object that is visible in a filtered display exactly as in an unfiltered display. If you change the name or dependency of an object so that it no longer passes the current filter, the object disappears from the display. Conversely, if some activity outside the Bus Editor changes a filtered object so that it passes the current filter, the object immediately becomes visible.

Tip Bus objects created or imported from outside the Bus Editor are not visible until you reopen the Bus Editor.

Operations performed in the left pane for the base workspace affect only visible objects. An object that a filter hides is unaffected by the operation. To act on all existing Bus objects, clear the filter.

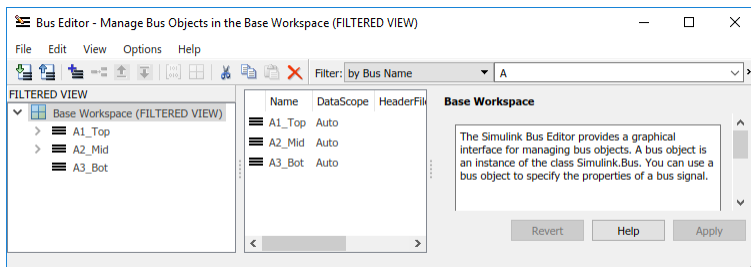

In this example, the Bus Editor displays the Bus objects that are in the base workspace.

These Bus objects form two hierarchies. A1_Top is the parent of A2_Mid, which is the parent of A3_Bot. Similarly, B1_Top is the parent of B2_Mid, which is the parent of B3_Bot.

To filter by name, select by **Bus Name** from the list and type the filter term. See “Regular Expressions” (MATLAB) for complete information about MATLAB regular expression syntax.

As you type, the Bus Editor updates dynamically to show only the Bus objects whose names match the filter expression. The comparison is case-sensitive. For example, typing A displays only the Bus objects whose names contain an uppercase A.

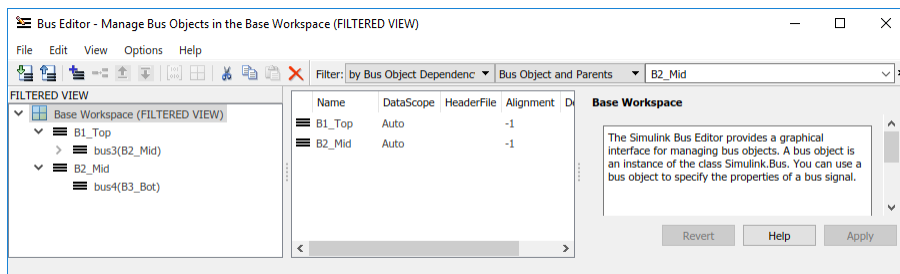

To filter by relationship, select by **Bus Object Dependency** from the list. In the second list that appears, select the type of relationship to display.

- **Bus Object and Parents** — Show a specified bus object and all superior Bus objects in the hierarchy (default).
- **Bus Object and Dependents** — Show a specified Bus object and all subordinate Bus objects in the hierarchy.
- **Bus Object and Related Objects** — Show a specified Bus object and all superior and subordinate Bus objects.

Type a Bus object by name or select an existing Bus object name from the list.

For example, if you select **Bus Object and Dependents** and type B2, the Bus Editor displays only the Bus object hierarchies that contain the B2 Bus object.

Load Bus Objects Into the Base Workspace

You can use the Bus Editor to import the definitions from a MAT-file or MATLAB code file to the base workspace. The import loads the complete contents of the file, not just the Bus objects.

- 1 Choose **File > Import into Base Workspace**.
- 2 Use the Open File dialog box to navigate to and import the desired file.

Library Browser

Find and add blocks to your model

Description

The Library Browser opens and displays a tree view of the Simulink block libraries on your system.

As you click libraries in the tree, the contents of the library appear in the right pane. Use the Library Browser to locate blocks and visuals (annotations) to add to your model. Navigate the libraries using the tree structure in the left pane or by double-clicking sublibraries in the right pane. Sublibraries, blocks, and text and image annotations can appear in the right pane. Pause on any item to see a description.

The Recently Used Blocks structure at the bottom of the tree contains the blocks and libraries from the supplied libraries that you used most recently.

When you find the item you are looking for, you can drag it into your model, or you can select it and use the context menu to add it.

Open the Library Browser

- On the **Home** tab, click **Simulink**, and choose a model template. In the new model, click the **Library Browser** button .

Examples

Search and Sort Blocks

You can search for blocks and annotations using the search controls. To use regular expressions, whole word search, or case-sensitive search, use the **Search for subsystems, blocks, and annotations** button . For annotations, you can search for any of the text in the annotation or any part of its description.

- 1 By default, library contents appear in alphabetical order. Subsystems appear first, then blocks, and then annotations. If you prefer to view the contents of the libraries in the order set by the developer of the library, right-click the right pane and select **Sort in library model order**. This setting stays in effect from session to session.
- 2 To return to the alphabetical order, right-click and select **Sort in alphabetical order**. Depending on how the library designer set up the library, some items might not appear in alphabetical order. For example, in the **Simulink** library, the Additional Math & Discrete library appears as the last item regardless of the sorting option you choose.

You can create your own libraries and, optionally, have them appear in the Library Browser. See “Create a Custom Library”.

Set Properties and Parameters

As you build a model, you can set parameters and properties on model elements. For example, you can set parameters and properties for blocks that affect how the block functions. You can also set properties on Stateflow charts, signal lines, visual elements such as annotations, and on the model.

Based on your workflow and goals, set parameters and properties using:

- 1** The Property Inspector, which stays open in the editor as you work and updates based on the current selection
 - 2** A dialog box that is associated with an element, such as a specific block
 - 3** The Model Data Editor, which stays open and displays information about signals, states, and algorithmic block parameters (for instances, gains and filter coefficients) in a table
 - 4** For blocks whose parameter value appears on the block icon, you can select the block, pause on the value, and edit the value directly. For more information, see “Set Block Parameters”
- “Build and Edit a Model Interactively”
 - “Keyboard and Mouse Actions for Simulink Modeling”

Programmatic Use

`slLibraryBrowser` opens the Library Browser.

Introduced before R2006a

Model Explorer

View, modify, and add elements of Simulink models, Stateflow charts, and workspace variables

Description

Use the Model Explorer to view, modify, and add elements of Simulink models, Stateflow charts, and workspace variables

The Model Explorer lets you focus on specific elements (for example, blocks, signals, and properties) without navigating through the model or chart.

Use the Model Explorer to search for:

- Variables in workspaces and data dictionaries
- Variable usage in a model
- Instances of a type of block
- Block parameters and parameter values

Using your search results, you can apply changes to multiple elements at once.

To manipulate model data (block parameters, signals, and states) in a searchable, sortable table, consider using the Model Data Editor. You can specify data attributes such as parameter values, signal names, and initial values for states. See “Configure Data Properties by Using the Model Data Editor”.

To create, modify, and view the entries in a data dictionary, use the Model Explorer. See “Edit and Manage Workspace Variables by Using Model Explorer” and “View and Revert Changes to Dictionary Data”.

Customizing Views

If a standard view does not meet your needs, you can either modify the view or create a new view.

You can customize the object property table represented by the current view. As you modify the object property table, you change the current view definition.

The Model Explorer saves the following changes to the object property table as part of the column view definition:

- Grouping by property
- Sorting in a column
- Changing the order of property columns
- Adding a property column
- Hiding and removing property columns

When you change from one view to another view, the Model Explorer saves any customizations that you have made to the previous view.

For example, suppose you use the **Block Data Types** view and you remove the **LockScale** property column. If you then switch to use the **Data Objects** view, and later use the **Block Data**

Types view again, the Block Data Types view no longer includes the LockScale column that you deleted.

At the end of a Simulink session, the Model Explorer saves the view customizations that you made during that session. When you reopen the Model Explorer, Simulink uses the customized view, reflecting any changes that you made to the view in the previous session.

Control the Font Size

You can change the font size in the Model Explorer panes:

- To increase the font size, press the **Ctrl + Plus Sign (+)**.

Alternatively, from the Model Explorer **View** menu, select **Increase Font Size**.

- To decrease the font size, press the **Ctrl + Minus Sign (-)**.

Alternatively, from the Model Explorer **View** menu, select **Decrease Font Size**.

Note The changes remain in effect for the Model Explorer and in the Simulink dialog boxes across Simulink sessions.

Create a New View

To create a new view that has a new name, you can use one of these approaches:

- Copy an existing view, rename it, and customize the view.
- Create a completely new view.

After you create a new view, you can customize it.

Create a New View

Action	Instructions
Copying and renaming an existing view	<p>You can build a new view by copying an existing view, renaming it, and optionally customizing the renamed view. In the View Manager dialog box:</p> <ol style="list-style-type: none"> 1 Select the view that you want to use as the starting point for your new view. 2 Click the Copy button. <p>A new row appears at the bottom of the View Manager table of views. The new row contains the name of the view you copied, followed by a number in parentheses. For example, if you copy the Stateflow view, the initial name of the copied view is Stateflow (1).</p>
Creating a completely new view	<p>To create a completely view, in the View Manager dialog box, click the New button. A new view row appears at the bottom of the View Manager dialog box list of views.</p>
Naming and describing a new view	<p>Once you create a view, you can name the view and provide a description of the view:</p> <ol style="list-style-type: none"> 1 Double-click New View in the left column of the table of views and replace the text with a name for the view. 2 Double-click Description in the table and replace the text with a description of the view. 3 Click OK.

Reset Views to Factory Settings

You can reset (restore) the original definition of a specific standard view (that is, a view shipped with the Model Explorer) if that view is the current view. To do so, click the **Options** button in the column view details section and select **Reset This View to Factory Settings**.

To reset the factory settings for *all* standard views in one step, in the View Manager dialog box, click the **Options** button and select **Reset All Views to Factory Settings**.

Note When you reset all views, the Model Explorer removes all the custom views you have created. Before you reset views to factory settings, export any views that you will want to use in the future.

Displaying Partial or Whole Model Hierarchy Contents

By default, the Model Explorer displays objects for the system that you select in the **Model Hierarchy** pane. It does not display data for child systems. You can override that default, so that the Model Explorer displays objects for the whole hierarchy of the currently selected system. To toggle

between displaying only the current system and displaying the whole system hierarchy of the current system, use one of these techniques:

- Select **View > Show Current System and Below**.
- Click the **Show Current System and Below** button  at the top of the **Contents** pane.

When you select the **Show Current System and Below** option:

- The **Model Hierarchy** pane highlights in pale blue the current system and its child systems.
- After the path in the **Contents of** field, the text (and below) appears.
- The appearance of the **Show Current System and Below** button at the top of the **Contents** pane and in the **View** menu changes.
- The status bar indicates the scope of the displayed objects when you hover over the **Show Current System and Below** button.

Loading very large models for the current system and below can be slow. To stop the loading process at any time, either click the **Show Current System and Below** button or click another node in the tree hierarchy.

If you show the current system and below, you might want to change the view to better reflect the displayed system contents.

The setting for the **Show Current System and Below** option is persistent across Simulink sessions.

Displaying Linked Library Subsystems and Masked Subsystems

By default, the Model Explorer does not display the contents of linked library subsystems or masked subsystems in the **Model Hierarchy** pane. To display the contents of linked library subsystems, use one of these approaches:

- At the top of the **Model Hierarchy** pane, click the **Show/Hide Library Links** button  or the **Show/Hide Masked Subsystems** button .
- From the **View** menu, select **Show Library Links** or **Show Masked Subsystems**.

Library-linked subsystems and masked subsystems are visible in the **Contents** pane, regardless of how you configure the **Model Hierarchy** pane.

Note Search does not find elements in linked library or masked subsystems that are not displayed in the **Model Hierarchy** pane.

For subsystems that are both library-linked and masked, how you set the linked library subsystems and masked subsystems options affects which subsystems appear in the **Model Hierarchy** pane, as described in the following table.

Settings	Subsystems Displayed in the Model Hierarchy Pane
Show Library Links	Only library-linked, unmasked subsystems
Hide Masked Subsystems	
Hide Library Links	Only masked subsystems that are not library-linked subsystems
Show Masked Subsystems	
Show Library Links	All library-linked or masked subsystems
Show Masked Subsystems	

Navigating to the Block Diagram

To open a graphical object (for example, a model, subsystem, or chart) in an editor window, right-click the object in the **Model Hierarchy** pane, then select **Open**.

Adding Objects to a Model, Chart, or Workspace

You can use the Model Explorer to add many kinds of objects to a model, chart, or workspace. The types of objects that you can add depend on the node that you select in the **Model Hierarchy** pane. Use toolbar buttons or the **Add** menu to add objects. The **Add** menu lists the types of objects you can add.

Focusing on Specific Elements of a Model or Chart

As you explore a model or chart, you might want to narrow the contents that you see in the Model Explorer to particular elements of a model or chart. You can use several different techniques. The table summarizes techniques for controlling the content the Model Explorer displays and how the contents appear.

Technique	When to Use
Show partial or whole model hierarchy contents	To control how much of a hierarchical model to display
Use the Row Filter option	To focus on, or hide, a specific kind of a model object, such as signals
Search	To find objects that might not be currently displayed
Filter contents	To focus on specific objects in the Contents pane, based on a search string

Once you have the general set of data that you are interested in, you can use the following techniques to organize the display of contents.

Technique	When to Use
Sort	To quickly organize data for a property in ascending or descending order
Group by property column	To logically group data based on values for a property

Technique	When to Use
Use column views	To display a named subset of property columns to apply to different kinds of nodes in the Model Hierarchy pane
Add, delete, or rearrange property table columns	To customize property columns

Searching Using Model Explorer

Model Explorer helps you to explore and modify your model using advanced techniques. Use the Model Explorer for to search for:

- Variables in workspaces and data dictionaries
- Variable usage in a model
- Instances of a type of block
- Block parameters and parameter values

You can combine search criteria and iteratively refine the results. Search in Model Explorer for model elements, starting with the node you select in the model hierarchy. You can search the entire model, in a particular system, or in a system and all the systems below it in the hierarchy.

Using your search results, you can apply changes to multiple elements at once.

To modify algorithmic block parameters such as the **Gain** parameter of a Gain block, consider using the Model Data Editor. See “Configure Data Properties by Using the Model Data Editor”.

Open the Model Explorer

- From the Simulink Editor **Modeling** tab, click **Model Explorer**.
- In an open model in the Simulink Editor, right-click a block and from the context menu, select **Explore**.
- In an open Stateflow chart, right-click in the drawing area and from the context menu, select **Explore**.

Examples

Edit Object Properties

Use this workflow to view and edit object properties.

- 1 To specify whether to display only the current system or the whole system hierarchy, select the model in the **Model Hierarchy** pane.
- 2 Control the model information the **Contents** pane displays:
 - Control which property columns to display using the **View > Column View** option.
 - Control which types of objects to display using the **View > Row Filter** option.
 - Directly manipulate column headings
- 3 Identify model elements with specific values using the search bar.

- 4 Edit the values for model elements, in either the **Contents** pane or the **Dialog** pane. To edit workspace variables, you can use the Variable Editor.
- 5 To open a properties dialog box for an object in the **Model Hierarchy** pane, right-click the object, and select **Properties**. Alternatively, click an object and from the **Edit** menu, select **Properties**.

You can change modifiable properties in the **Contents** pane (for example, a block name) by editing the displayed value. To edit a value, first select the row that contains the value, and then click the value. An edit control replaces the value (for example, an edit field for text values or a list for a range of values). For workspace variables that are arrays or structures, you can use the Variable Editor. Use the edit control to change the value of the selected property.

To assign the same property value to multiple objects in the **Contents** pane, select the objects and then change one of the selected objects to have the new property value. An edit control replaces the value with `<edit>`, indicating that you are doing batch editing. The Model Explorer assigns the new property value to the other selected objects, as well.

You can also change property values using the **Dialog** pane.

Delete Views

Use these steps delete a view from the **Column View** list of views.

- 1 In the View Manager dialog box, select one or more views that you want to remove from the list.
- 2 Click the **Delete** button or the **Delete** key.
- 3 Click **OK**.

Deleting a view using the View Manager dialog box permanently deletes that view from the Model Explorer interface. If you think you or someone else might want to use a view again, consider exporting the view before you delete it.

Reorder Views

Use these steps change the position of a view in the **Column View** list, in the View Manager dialog box.

- 1 Select one or more views that you wish to move up or down one row in the table of views.
- 2 Click the up or down arrow buttons to the right of the table of views. Repeat this step until the view appears where you want it to be in the table.
- 3 Click **OK**.

Export Views

Use these steps export views that you or others can then import, in the View Manager dialog box.

- 1 In the View Manager dialog box, select one or more views that you want to export.
- 2 Click the **Export** button. An Export Views dialog box opens, with check marks next to the views that you selected.
- 3 Click **OK**. An Export to File Name dialog box opens.

- 4** Navigate to the folder to which you want to export the view. By default, the Model Explorer exports views to the MATLAB current folder.
- 5** Specify the file name for the exported view. The file format is `.mat`.
- 6** Click **OK**.

Export Views

Use these steps to import view files from another location for use by the Model Explorer.

- 1** In the View Manager dialog box, click the **Import** button. The Select `.mat` File to Import dialog box opens.
- 2** Navigate to the folder from which you want to import the view.
- 3** Select the MAT-file containing the view that you want to import and then click **Open**. A confirmation dialog box opens. Click **OK** to import the view.

The imported view appears at the bottom of the **Column View** list of views. The Model Explorer automatically renames the view if a name conflict occurs.

Expand and Edit Model References

To browse a model that includes Model blocks, you can expand the **Model Hierarchy** pane nodes of the Model blocks.

For example, the `sldemo_mdref_depgraph` model includes Model blocks that reference other models. If you open the `sldemo_mdref_depgraph` model and expand that model node in the **Model Hierarchy** pane, you see that the model contains several Model blocks, including `heat2cost`.

To browse a model referenced by a Model block:

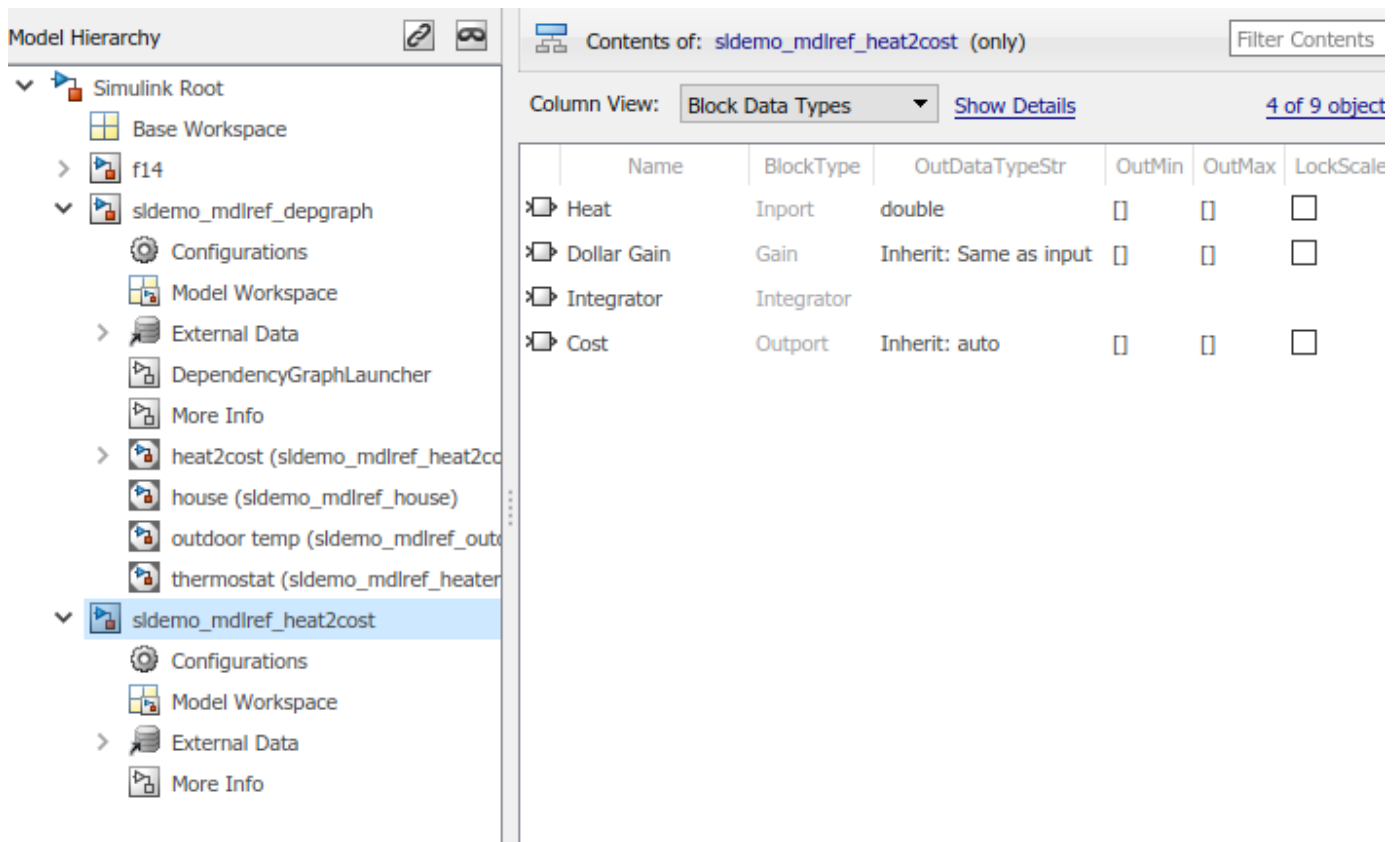

- 1** Right-click the referenced model node in the **Model Hierarchy** pane.
- 2** Select **Open Model**.
 - The referenced model opens.
 - The **Model Hierarchy** pane indicates that you can expand the Model block node (read-only).
 - The **Contents** pane displays objects corresponding to the Model block node (read-only).
 - The **Model Hierarchy** pane displays a separate expandable node for the referenced model.
- 3** For example, if you right-click the `heat2cost` Model block node and select **Open Model**, the **Contents** pane displays the objects corresponding to the `heat2cost` Model block. You can expand the `heat2cost` node.

The screenshot shows the Model Explorer interface. On the left is the **Model Hierarchy** pane, which is expanded to show the `heat2cost` node under `sldemo_md1ref_heat2cost`. On the right is the **Contents of: sldemo_md1ref_depgraph/heat2cost (only)** pane, which displays a table of block data types.

Name	BlockType	OutDataTypeStr	OutMin	OutMax	Loc
Model Workspace					
Heat	Inport	double			<input type="checkbox"/>
Dollar Gain	Gain	Inherit: Same as input			<input type="checkbox"/>
Integrator	Integrator				
Cost	Output	Inherit: auto			<input type="checkbox"/>

You can browse the contents of the referenced model, but you cannot edit the model objects that are inside the Model block.

To edit the referenced model, expand the referenced model node in the **Model Hierarchy** pane, and then you access the properties of objects in the referenced model. For example, expand the `sldemo_md1ref_heat2cost` node.

For information about referenced models, see “Model References”.

Cut, Copy, and Paste Objects Between Workspaces

This example shows how to cut, copy, and paste workspace objects from one workspace into another workspace.

- 1 In the **Contents** pane, right-click on the workspace object you want to cut or copy.
- 2 Select **Cut** or **Copy**.
 - You can also cut a workspace object by selecting in the **Contents** pane **Edit > Cut** or by clicking the **Cut** button.
 - You can also copy a workspace object by selecting **Edit > Copy** or by clicking the **Copy** button.
- 3 If you want to paste the workspace object that you cut or copied, in the **Model Hierarchy** pane, right-click the workspace into which you want to paste the object, and select **Paste**.
 - You can also paste the object by selecting **Edit > Paste** or by clicking the **Paste** button.
 - When you copy and paste (or drag and drop), you can manage the resolution of name conflicts. In the dialog box, choose an action for each item whose name conflicts with an existing item.
 - **Skip** — Default action when the conflicting items have the same value.

- **Replace** — Default action when the conflicting items have different values.
- **Keep both** — Preserve both copies. The name given to the copied item follows the naming rules that are used in the MATLAB workspace.

If the source and destination are the same, the software resolves the name conflict by following the naming rules that are used in the MATLAB workspace.

You can also cut, copy, and paste by selecting an object and performing drag and drop operations.

Search for a Parameter and Refine Results

In this example, you search for model elements that have an **Integer rounding mode** parameter. You then refine the results to include only n-D Lookup table blocks. You can use the search results to find out more about how these values are set or make batch changes to the model elements found by the search.

- 1 Open the model `sldemo_fuelsys`.
- 2 Open Model Explorer. On the **Modeling** tab, click **Model Explorer**.

By default, the Model Explorer searches the current system and below. You can use the model

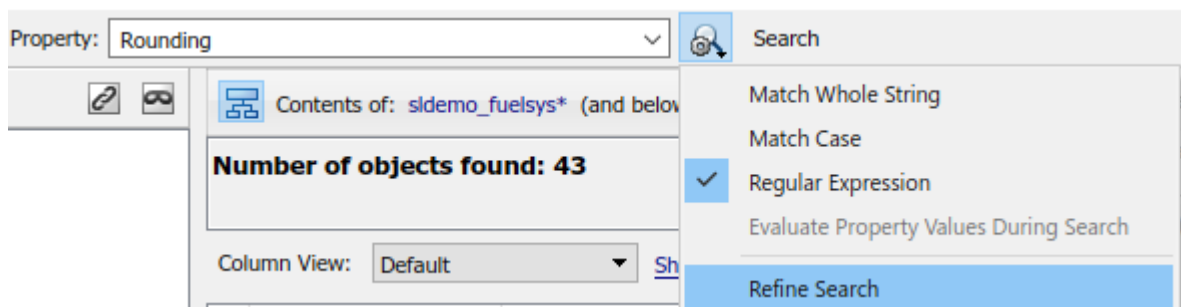

hierarchy tree in combination with the **Show contents** button  to specify the scope of the search. For example, you can select a node and set the search to **current system only** to keep the search only at that level. Set the search to **current system and below** to search the current system and all the subsystems within it.

- 3 For this example, leave the search scope set to search the current system and below, starting with the top level of the model. Specify your search criteria. In the search bar, set:

- **Search** to by Property Name
- **Property** to Rounding

Rounding is the programmatic name for the **Integer rounding mode** parameter. For a list of these names, see “Block-Specific Parameters” on page 6-27.

- 4 Click **Search**. In the **Search Results** box, 43 results appear. You can go to an item by clicking the link to the path.
- 5 Refine the search. In the search bar, click **Search Options** and select **Refine Search**.

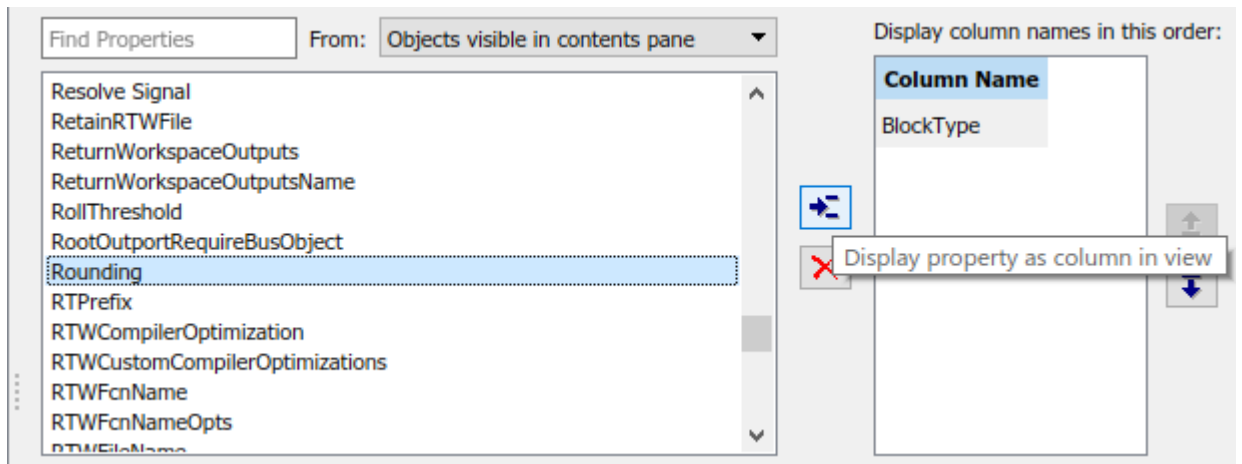

The search button label changes to **Refine**. With this label in effect, additional search criteria act on the previous set of results.

- 6 Set **Search** to by **Block Type** and set **Type** to **Lookup_n-D**. Click **Refine**.

The search returns 5 items.

- 7 To work further with the values, click **Show Details**.
- 8 The property you are interested in learning more about or acting on is **Rounding**. First add a column for it in the search results. Select **Rounding** from the list (you can enter it in the **Find Properties** box to locate it quickly), and click the **Display property as column in view** button.

A column for **Rounding** appears in the search results. For any parameter or property that appears in a column, you can view, sort, and change values for multiple items. For example, to change the **Rounding** values on all n-D Lookup Table blocks you find by searching, select all the items in the list. In the **Rounding** column, click one cell and select a new value from the list (for example, **Floor**).

Tip To view a summary of the search options that you used, expand the **Number of objects found** box by clicking the **Show Search Details** button .

You can use the Model Explorer to create, modify, and view the entries in a data dictionary. See “Edit and Manage Workspace Variables by Using Model Explorer” and “View and Revert Changes to Dictionary Data”.

- “Build and Edit a Model Interactively”

Parameters

Search Bar Controls

Search Bar — Search for model elements, starting with the node you select in the model hierarchy

toolbar field

Open the search bar using the **View > Toolbars > Search Bar** option. The search bar includes these controls: Search Type and Search Options.

Search Type — Specify the type of objects or properties to include in the search

search object

Use the **Search Type** control to specify the type of objects or properties to include in the search.

Search Type Option	Description
by Name	Searches a model or chart for all objects that have the specified string in the name of the object.
by Property Name	Searches for objects that have a specified property. Specify the target property name from a list of properties that objects in the search domain can have.
by Property Value	Searches for objects with a property value that matches the value you specify. Specify the name of the property, the value to be matched, and the type of match (for example, equals, less than, or greater than).
by Block Type	Searches for blocks of a specified block type. Select the target block type from the list of types contained in the currently selected model.
by Stateflow Type	Searches for Stateflow objects of a specified type.
for Variable Usage	Searches for blocks that use variables defined in a workspace. Select the base workspace or a model workspace (model name) and, optionally, the name of a variable.
for Referenced Variables	Searches for variables that a model or block uses. Specify the name of the model or block in the by System field. The model or block must be in the Model Hierarchy pane.
for Unused Variables	Searches for variables that are defined in a workspace but not used by any model or block. Select the name of the workspace from the drop-down list for the in Workspace field.
for Library Links	Searches for library links in the current model.
by Class	Searches for Simulink objects of a specified class.
for Fixed Point Capable	Searches a model for all blocks that support fixed-point computations.
for Model References	Searches a model for references to other models.
by Dialog Prompt	Searches a model for all objects whose dialogs contain the prompt you specify.
by String	Searches a model for all objects in which the string you specify occurs.

Search Options — Specify search strings

search string

Use the **Search Options** control to specify the scope and how to apply search strings.

Search Option	Description
Match Whole String	Do not allow partial string matches (for example, do not allow sub to match substring).

Search Option	Description
Match Case	Considers case when matching strings (for example, Gain does not match gain).
Regular Expression	Considers a string to be matched as a regular expression.
Evaluate Property Values During Search	Applies only for searches by property value. If enabled, Model Explorer evaluates the value of each property as a MATLAB expression and compares the result to the search value. If this option is disabled (the default), the Model Explorer compares the unevaluated property value to the search value.
Refine Search	Initiates a secondary search that provides additional search criteria to refine the initial search results. The second search operation searches for objects that meet both the original and the new search criteria.

By default, search strings are case-insensitive and are treated as regular expressions and the search allows partial string matches. You cannot use wildcard characters in search strings. For example, if you enter *1 as a name search string, you get no search results unless there is an item whose name starts with the two characters *1. If there is an out1 item, the search results do not include that item.

Model Hierarchy Pane

Simulink Root — Display display nodes representing the MATLAB workspace, Simulink models, and Stateflow charts

node structure

Expand **Simulink Root** to display nodes representing the MATLAB workspace, Simulink models, and Stateflow charts that are in the current session.

Base Workspace — MATLAB workspace

node structure

Base Workspace represents the MATLAB workspace. The MATLAB workspace is the base workspace for Simulink models and Stateflow charts. Variables defined in this workspace are visible to all open models and charts.

Expanding a model or chart node in the **Model Hierarchy** pane displays nodes representing the following elements, as applicable for the models and charts you have open.

Node	Description
Configurations	Select the Configurations node to show the model's configuration sets and configuration references in the Contents pane. For information about adding, deleting, saving, and moving configuration sets, see “Manage Configuration Sets for a Model”.

Node	Description
Model Workspace	For information about how to use the Model Explorer to work with model workspace variables, see these topics: <ul style="list-style-type: none"> • “Edit and Manage Workspace Variables by Using Model Explorer” • “Model Workspaces”
External data	Expand the External Data node to display external data sources for the model, including the base workspace (if access is enabled), and data dictionaries.
Top-level subsystems	Expand a node representing a subsystem to display underlying subsystems, if any.
Model blocks	Expand model blocks to show contents of referenced models.
Stateflow charts	<ul style="list-style-type: none"> • Expand a node representing a Stateflow chart to display the top-level states of the chart. • Expand a node representing a state to display its substates.

Contents Pane

Contents Pane — Describe the Model Explorer Contents pane

table

The **Contents** pane displays one of two tables containing information about models and charts, depending on the tab that you select:

- The **Contents** tab displays an object property table for the node that you select in the **Model Hierarchy** pane.
- The **Search Results** tab displays the search results table.

Optionally, you can also open a column view details section in the **Contents** pane. This graphic shows the **Contents** pane with the column view details section opened.

To open the column view details section, click **Show Details**, at the top of the **Contents** pane.

The **Column view details** section provides an interface for customizing the column view (hidden by default).

The **Object property table** section displays a table of model and chart object data (open by default).

In the object property table section of the **Contents** tab and in the **Search Results** tab:

- Table columns correspond to object properties (for example, **Name** and **BlockType**).

The object property table displays the first two columns (the object icon and the **Name** property) persistently, so that these columns remain visible regardless of how far you scroll to the right.

- Table rows correspond to objects (for example, blocks, and states).

The objects and properties displayed in the **Contents** pane depend on:

- The column view that you select in the **Contents** pane
- The node that you select in the **Model Hierarchy** pane

- The kind of object (for example, subsystem or chart) that you select in the **Model Hierarchy** pane
- The **View > Row Filter** options that you select

The **Contents of** link at the top left side of the **Contents** pane links to the currently selected node in the **Model Hierarchy** pane. The model data displayed in the **Contents** pane reflects the setting of the **Current System and Below** option. In this example, **Contents of** links to the vdp model, which is the currently selected node.

Views — Named set of properties

The Model Explorer uses views to specify sets of property columns to display in the **Contents** pane.

For each kind of node in the **Model Hierarchy** pane, certain properties are most relevant for the objects displayed in the **Contents** pane. For example, for a Simulink model node, such as a model or subsystem, some properties that are useful to display include:

- BlockType (block type)
- OutDataTypeStr (output data type)
- OutMin (minimum value for the block output)

Generally, a column view does not contain the total set of properties for all the objects in a node. Specifying a subset of properties to display can streamline the task of exploring and editing model and chart object properties and increase the density of the data displayed in the **Contents** pane.

You can use a view to capture the following characteristics of the model information to show in the Model Explorer:

- Properties that you want to display in the **Contents** pane
- Layout of the **Contents** pane (for example, grouping by property, the order of property columns, and sorting)

You can use views in the following ways:

- Use the standard views shipped with the Model Explorer
- Customize the standard views
- Create your own views

The first time you open the Model Explorer, the software automatically applies one of the standard views to the node you select in the **Model Hierarchy** pane. The Model Explorer applies a view based on the kind of node you select.

The Model Explorer assigns one of four categories of nodes in the **Model Hierarchy** pane. The Model Explorer initially associates a default view with each node category. The four node categories are:

Node Category	Kinds of Hierarchy Nodes Included	Initial Associated View
Simulink	Models, subsystems, and root level models	Block Data Types

Node Category	Kinds of Hierarchy Nodes Included	Initial Associated View
Workspace	Base and model workspace objects	Data Objects
Stateflow	Stateflow charts and states	Stateflow
Configurations	Configurations section node	Configurations
Other	Objects that do not fit into one of the first three categories; for example, configuration sets	Default

The **Column View** field at the top of the **Contents** pane displays the view that the Model Explorer is currently using.

In the **Contents** pane, from the **Column View** list, you can select a different view. If you select a different view, then the Model Explorer associates that view with the category of the current node. For example, suppose the selected node in the **Model Hierarchy** pane is a Simulink model, and the current view is **Data Objects**. If you change the view to **Signals**, then when you select another Simulink model node, the Model Explorer uses the **Signals** view.

By default, the Model Explorer automatically applies a view, based on the category of node that you select and the last view used for that node. You can manually select a view from the **Column View** list that better meets your current task.

You can shift from the default mode of having the Model Explorer automatically apply views to a mode in which you must manually select a view to change views.

To enable the manual view selection mode:

- 1 Select **View > Column View > Manage Views**.

The View Manager dialog box opens.

- 2 In the View Manager dialog box, click the **Options** button and clear **Change View Automatically**.

In the manual view selection mode, if you switch to a different kind of node in the **Model Hierarchy** pane that has a different view associated with it, the **Contents** pane displays a yellow informational bar suggesting a view to use.

You can manage views (for example, create a new view or export a view) using the View Manager dialog box. To open the View Manager dialog box, select the **Manage Views** option from either:

- The **View > Column View** menu
- The options listed when you click the **Options** button in the column view details section

The View Manager dialog box displays a list of defined views and provides tools for you to manage views.

You can manage views in several ways, including creating, deleting, reordering, exporting, importing, and resetting views.

Tip Interface – Display/hide tips

tip field

The tip interface appears immediately above the object property table. It does not appear if you use automatic view selection. The tip interface displays a link for changing the current view to a suggested view. To choose the suggested view displayed in the tip bar, click the link. To hide the currently displayed tip, from the menu button on the right-hand side of the tip bar, select **Hide This Tip**.

Initially, the suggested view is the default view associated with a node. If you associate a different view with a node category, then the tip suggests the most recently selected view when you select similar nodes.

To change from manual specification of views to automatic specification, from the tip interface, select the down arrow and then the **Change View Automatically** menu item.

To enable the tip interface, under **Options** on the right side, select **Manage Views**, and then **Options > Change View Automatically**.

Property Dialog Pane — Describes the Model Explorer Dialog pane dialog box

Use the **Dialog** pane to view and change properties of objects that you select in the **Model Hierarchy** pane or in the **Contents** pane.

By default, the **Dialog** pane appears in the Model Explorer, to the right of the **Contents** pane. To show or hide the **Dialog** pane, use one of these approaches:

- From the **View** menu, select **Show Dialog Pane**.
- From the main toolbar, click the **Dialog View** button.

To edit property values using the **Dialog** pane:

- 1 In the **Contents** pane, select an object (such as a block or signal). The **Dialog** pane displays the properties of the object you selected.
- 2 Change a property (for example, the port number of an Outport block) in the **Dialog** pane.
- 3 Click **Apply** to accept the change, or click **Revert** to return to the original value.

By default, clicking outside a dialog box with unapplied changes causes the Apply Changes dialog box to appear. Click **Apply** to accept the changes or **Ignore** to revert to the original settings.

To prevent the **Apply Changes** dialog box from displaying:

- 1 In the dialog box, click the **In the future Apply or Ignore (whichever I select) without asking** check box.
- 2 If you want Simulink to apply changes without warning you, press **Apply**. If you want Simulink to ignore changes without warning you, press **Ignore**.

To restore the **Apply Changes** dialog box, from the **Tools** menu, select **Prompt if dialog has unapplied changes**.

When you select a numeric MATLAB variable or a `Simulink.Parameter` object in a model workspace, the **Argument** check box appears in the Dialog pane. This check box configures the variable or object as a model argument. See “Parameterize Instances of a Reusable Referenced Model”.

Programmatic Use

`daexplr` opens the Model Explorer.

“Build and Edit a Model Interactively”

Introduced before R2006a

Simulation Data Inspector

Inspect and compare data and simulation results to validate and iterate model designs

Description

The Simulation Data Inspector visualizes and compares multiple kinds of data.

Using the Simulation Data Inspector, you can inspect and compare time series data at multiple stages of your workflow. This example workflow shows how the Simulation Data Inspector supports all stages of the design cycle:

1 “View Data with the Simulation Data Inspector”.

Run a simulation in a model configured to log data to the Simulation Data Inspector, or import data from the workspace or a MAT-file. You can view and verify model input data or inspect logged simulation data while iteratively modifying your model diagram, parameter values, or model configuration.

2 “Inspect Simulation Data”.

Plot signals on multiple subplots, zoom in and out on specified plot axes, and use data cursors to understand and evaluate the data. “Create Plots Using the Simulation Data Inspector” to tell your story.

3 “Compare Simulation Data”

Compare individual signals or simulation runs and analyze your comparison results with relative, absolute, and time tolerances. The compare tools in the Simulation Data Inspector facilitate iterative design and allow you to highlight signals that do not meet your tolerance requirements. For more information about the comparison operation, see “How the Simulation Data Inspector Compares Data”.

4 “Save and Share Simulation Data Inspector Data and Views”.

Share your findings with others by saving Simulation Data Inspector data and views.

You can also harness the capabilities of the Simulation Data Inspector from the command line. For more information, see “Inspect and Compare Data Programmatically”.

Open the Simulation Data Inspector

- Simulink Toolstrip: On the **Simulation** tab, under **Review Results**, click **Data Inspector**.
- Click the streaming badge on a signal to open the Simulation Data Inspector and plot the signal.
- MATLAB command prompt: Enter `Simulink.sdi.view`.

Examples

Add Signals to a Run

This example shows how to use `Simulink.sdi.createRunOrAddToStreamedRun` to add data to an existing run for a model. In this example, you add logged states data to the run created through simulation.

Simulate the Model

Simulate the model to generate data. The model `slexAircraftExample` is configured to log outputs, so the Simulation Data Inspector automatically creates a run with the logged output data. Using this simulation syntax, `out` contains the output data (`yout`) and the states data (`xout`).

```
load_system('slexAircraftExample')
out = sim('slexAircraftExample','ReturnWorkspaceOutputs','on',...
         'SaveFormat','Dataset');
```

Add Logged States Data to Run

The Simulation Data Inspector automatically created a run for the logged output data. Add the logged state data to the existing run using `Simulink.sdi.createRunOrAddToStreamedRun`.

```
Simulink.sdi.createRunOrAddToStreamedRun('slexAircraftExample','Run 1',...
                                         {'out'},{out});
```

Open the Simulation Data Inspector to View Results

Using `Simulink.sdi.createRunOrAddToStreamedRun` avoids redundancy in the data shown in the Simulation Data Inspector. Using `Simulink.sdi.createRun` to bring the states data into the Simulation Data Inspector creates a second run. `Simulink.sdi.addToRun` creates a duplicate signal from the output data. Using `Simulink.sdi.createRunOrAddToStreamedRun`, you can include all simulation data in a single run without duplicating any signals.

```
Simulink.sdi.view
```

Modify Parameter for Several Runs

This example shows how to modify a parameter for all the runs in the Simulation Data Inspector programmatically.

Generate Runs

Load the `vdp` model and mark the `x1` and `x2` signals for logging. Then, run several simulations.

```
% Clear all data from the Simulation Data Inspector repository
Simulink.sdi.clear

% Load the model and mark signals of interest for streaming
load_system('vdp')
Simulink.sdi.markSignalForStreaming('vdp/x1',1,'on')
Simulink.sdi.markSignalForStreaming('vdp/x2',1,'on')

% Simulate the model with several Mu values
for gain = 1:5
    gainVal = num2str(gain);
    set_param('vdp/Mu','Gain',gainVal)
```

```
    sim('vdp');  
end
```

Use Simulink.sdi.getRunCount to Assign Tolerance to x1 Signals

```
count = Simulink.sdi.getRunCount;  
  
for a = 1:count  
    runID = Simulink.sdi.getRunIDByIndex(a);  
    vdpRun = Simulink.sdi.getRun(runID);  
    sig = vdpRun.getSignalByIndex(1);  
    sig.AbsTol = 0.1;  
end  
  
% Open the Simulation Data Inspector to view your data  
Simulink.sdi.view
```

- “View Data with the Simulation Data Inspector”
- “Inspect Simulation Data”
- “Compare Simulation Data”
- “Iterate Model Design Using the Simulation Data Inspector”

Programmatic Use

`Simulink.sdi.view` opens the Simulation Data Inspector from the MATLAB command line.

Simulink Editor

Create models and set model properties

Description

The Simulink Editor allows you to create and configure system models.

The Simulink Editor is an intuitive tool for building models. In addition to providing standard methods for working with diagrams in a vector graphics editor, the editor provides shortcuts that help you to add and connect blocks. The Simulink Editor also gives you access to the tools you need for technical operations such as importing data, simulating your model, and analyzing model performance.

Interactive Model Building

When you build a model in the Simulink Editor, you use common techniques for working with graphics objects. Some of these actions include:

- Selection using click, shift-click, and dragging
- Resizing objects using handles and moving objects by dragging
- Clipboard operations, that is, cut, copy, and paste
- Undo/redo (up to 101 operations)

Note After you undo or redo block parameter changes, a visual cue appears that shows the current values of the affected parameters. Some parameter changes are not affected by the Undo or Redo commands. After you undo or redo changes to block parameters, use the cue to see the parameters affected.

A small subset of parameters do not support Undo. Changing these parameters clears the Undo history, whether you make the change in the Property Inspector or in the block dialog box.

You zoom and scroll the editing area. On the **Modeling** tab, select **Environment > Zoom**. If you are using a supported touch display platform, you can pinch to zoom and swipe to scroll. The supported touch display devices include Microsoft Windows platforms with a Windows 7 certified or Windows 8 certified touch display and Macintosh platforms with an Apple Magic Trackpad.

The editor supports additional shortcuts for scrolling that are unique to Simulink. Shortcuts and the other interactive model building techniques are summarized in “Keyboard and Mouse Actions for Simulink Modeling”. For a tutorial, see “Build and Edit a Model Interactively”.

Model Design Error Detection

The Simulink Editor can provide you with visual cues for some model design issues. In the model editor, highlighted blocks alert you to issues while you edit. To see a description of the issue, hover over a highlighted block and click the error or warning symbol.

Similar to the Diagnostic Viewer, if an error or warning has a predefined fix, the notification dialog box can provide you with suggested actions along with corresponding **Fix** buttons.

Simulink can detect block errors and warnings, such as:

- Goto and From block mismatches.
- Duplicate data store blocks. The value of the Duplicate data store names parameter determines if there is a visual cue, and if the cue is an error or warning.

The **Errors and Warnings** option is enabled by default. To turn off this option, in the **Debug** tab, select **Diagnostics > Edit-Time Errors & Warnings**.

Exploring the Model Hierarchy

Use the Model Browser to navigate a model hierarchy using a tree structure. The browser helps you to understand the organization of your model and explore systems within systems.

To display the Model Browser, in the Simulink Editor, in the **Modeling** tab, select **Environment > Model Browser**. You can toggle the Model Browser display by clicking the **Hide/Show Model Browser** control .

In the Model Browser, specify whether to include blocks that are linked to a library or masked subsystems. Click  and select **Library Links** or **Systems with Mask Parameters**. For information on these types of blocks, see “Linked Blocks” and “Masking Fundamentals”.

Search for Model Elements Using Find

You can search in Simulink models by clicking **Find** on the **Modeling** tab. Use Find to locate, navigate to, and select any element that matches the search string that you enter. Searching can match the string anywhere in the element, such as in the name and in parameter values. You can customize the search to look only in certain types of elements or when specific parameters are set a certain way.

Default Search	Search Options
In the current system	Specify to search the current system and all systems below it in the model hierarchy.

Default Search	Search Options
In all model elements, including all types of Simulink and Stateflow objects	Narrow your search to include only the elements you are interested in, such as blocks, annotations, or signals.
In parameters	Specify to omit parameter values from the search.
Case-insensitive, partial matches	Search for an exact match and use regular expressions.
In referenced models but not in linked blocks or masked systems	You can turn each of these options off and on.

Open the Simulink Editor

- Create a model. On the MATLAB **Home** tab, click **Simulink** and choose a model template.
Alternatively, if you already have the Library Browser open, click the **New Model** button .
- Open an existing model. To open recent models, on the MATLAB **Home** tab, click **Simulink**.
Alternatively, if you know the name of the model you want, at the MATLAB command prompt, enter the name, such as `vdp`.

Tip The first model that you open in a MATLAB session takes longer to open than subsequent models. By default, MATLAB does not start Simulink until you open the first model to reduce MATLAB startup time and avoid unnecessary system memory use.

To speed up opening the first model, you can configure MATLAB startup to also start Simulink. For more information on how to do that and also start Simulink without opening models or the Library Browser, see the `start_simulink` reference page.

Examples

Perform Basic Search Using Model Browser

Search in the current level of the model `sldemo_fuelsys` for any model element that contains the number 2.

Open the Property Inspector to see the properties and parameters of the current selection. In the **Modeling** tab, under **Design**, click **Property Inspector**.

- 1 Open the model `sldemo_fuelsys`.
- 2 On the **Modeling** tab, click **Find**.
- 3 In the search box, enter 2 and press **Enter**.

Nine model elements appear highlighted. The first element found, the copyright annotation, has a stronger highlight to show that it is the current match.

- 4 To move to the next element, click the search box down arrow. In this example, the current selection highlight moves to a Constant block. The block name does not appear in the model. Look in the Property Inspector to see the block name, `Constant2`.

- 5 Use the up and down arrows to move through the rest of the elements found.

Perform an Advanced Search Using Model Browser

You can narrow your search by specifying search criteria.

- 1 On the **Modeling** tab, click **Find**.
- 2 Enter the search string. Alternatively, you can add the search string later.
- 3 Click **View Details**.

- 4 Click the **Configure advanced search settings** button .
- 5 In the Advanced Search Settings dialog box, for each criterion you want to set, click the **Add property and value** button . Select the property and enter the value for each criterion.
- 6 Set any other advanced search settings, and then click **OK**.
- 7 If you entered a search string, the search executes. Alternatively, you can enter the search string after you specify the criteria, or enter an asterisk (*) to search for any model element that matches the advanced criteria.

Tip You can cancel a search and view partial search results. In the Finder interface, click the **Stop Search** button.

Search for a Property Value

Using the search box, you can specify a property and value to search for. Enter the search string in the form **Property:Value**. For example, to search for all **Constant value** parameters whose value is `throttle_sw`, type `Value:throttle_sw` and press **Enter**. To search for all Constant blocks, enter `BlockType:Constant`. To search for text that appears in the description of the block, use the form `Description:textstring`.

- 1 Search using the programmatic name of the property. To find the programmatic name, in the Property Inspector, pause on the property.
- 2 Enter the full property name, case insensitive. You cannot use regular expressions or partial matches for the property name.
- 3 By default, the value search is case insensitive and finds partial matches. Use the advanced search settings to make the search case sensitive, specify `verbatim`, or search using regular expressions.

Search for a String That Has a Colon

To search for a string that has a colon and prevent the text before the colon from being treated as a property, use one of these approaches.

Escape the colon using a backslash, for example, Earth\`:` a planet.

Use single or double quotes around the expression, for example, 'Earth: a planet' or "Earth: a planet".

Specify Search Criteria and Sort Results

You can specify criteria for your search and sort the results using the Finder interface. In this example, you search for all elements that contain the string `fuel`. You then use the Finder interface to narrow your results. You can interact with search results while the search runs. However, you can sort the results only after the search is complete.

Tip Use the model browser with the Finder interface to select the starting point for your search.

- 1 Open the model `sldemo_fuelsys`.
- 2 On the **Modeling** tab, click **Find**. Next to the search box, click **View Details**.

- 3 To expand the scope of the search, in the Finder interface, click the **Click to search in current system and below** button .
- 4 Search for any elements that include the string `fuel`. In the search box, enter `fuel` and press **Enter**.

The model has many elements with `fuel` in the name or in a parameter or property value, including blocks, annotations, signals (data), and Stateflow charts.

Use the Finder interface to make your results more meaningful. For example, you can sort by any of the headings and double-click an item in the list to go to and select the element in the model. Click an item in the list to make it the current match in the model if it is displayed.

- 5 When a search returns too many results, use the advanced search settings. Next to the search box, click the **Configure advanced search settings** button .
- 6 Search only for blocks. In the Advanced Search Settings dialog box, under **Object Type**, clear the **Stateflow** check box. Expand the **Simulink** list and clear the **Annotations** and **Signals** check boxes.
- 7 Narrow the search further to look only in blocks whose description contains the word `input`. Under **Property : Value**, from the property list, select `BlockDescription`. In the value box, enter `input`, and then click the **Add property and value** button . Click **OK**.
- 8 Searching returns fewer blocks. You can add more property values to narrow the search further. For example, you can specify the type of blocks to search in. Open the Advanced Search Settings dialog box. Under **Property : Value**, add another property-value pair. Set the property to `BlockType` and the value to `MultiPortSwitch`. Click the **Add property and value** button and click **OK**.

- One block appears in the list.
- 9 Clear the advanced search criteria. Click the arrow on the **Configure advanced search settings** button and select **Clear advanced settings**.
- “Build and Edit a Model Interactively”

Parameters

Toolstrip — Access and discover Simulink capabilities when you need them Simulation | Debug | Modeling | Format | Apps

To support common user workflow tasks, tabs called **Simulation**, **Debug**, **Modeling**, **Format**, and **Apps** provide functionality corresponding to each task.

The **Apps** tab provides a gallery of applications from the Simulink family of products. Apps may open a new contextual tab, a separate window, or they may be a shortcut to the configuration parameters.

When you select a model component, a contextual tab activates, displaying the tools to assist you in a step in your workflow. For example, when you select a subsystem block, the **Subsystem** tab appears. If you select a Stateflow® chart, the **State Chart** tab appears. When the block or chart is no longer selected, the contextual tabs disappear.

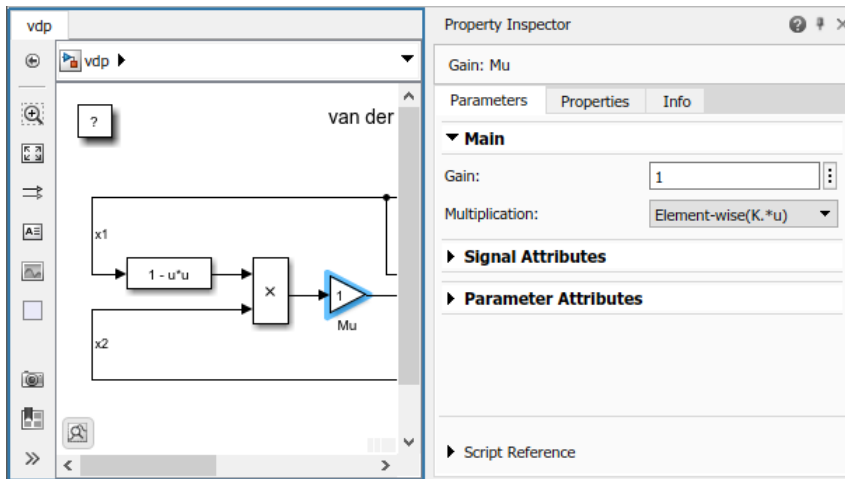

The quick access toolbar contains frequently used options such as save, undo, and redo.

After opening a gallery, you can mark buttons as favorites. Buttons that are favorites appear at the top of the gallery for quicker access.

Commands also appear on context menus. Context menus appear when you right-click a model element or a blank area of the editor. For example, right-click a block, and the menu displays the commands relevant for working on blocks, such as clipboard and alignment operations. Some commands appear only on a context menu.

Property Inspector — Edit parameters dialog box

When you click **Property Inspector** (on the **Modeling** tab, under **Design**), the interface appears in the Simulink Editor on the right. You can drag the Property Inspector from the default location and dock it in another location in the editor. You can collapse the Property Inspector interface by clicking the pushpin. The figure shows a block selected with the Property Inspector displayed.

The Property Inspector is useful when you set parameters and properties as you work. It can stay open and available for setting values for the current selection. Values take effect when you set them. This workflow simplifies your interaction with the interface.

You can alternatively open a dialog box for a selected model element by right-clicking and selecting an item such as **Properties**, or for blocks, **Block Parameters**. Double-clicking a block generally opens a block dialog box. (Use one of the menu commands on Subsystem and Model blocks.)

The Property Inspector and dialog boxes operate on a single selection. The main difference is that the Property Inspector updates with each selection and the dialog box shows settings for only the element you opened it from. For this reason, the dialog box is useful if:

- You are moving through the model hierarchy and want to see or set element parameters or properties as you navigate the model.
- You want to compare the parameters or properties of similar elements.
- The settings are advanced and appear only in the dialog box.

Model Data Editor – Edit model data dialog box

With the Model Data Editor (on the **Modeling** tab, click **Model Data Editor**), you can configure multiple signals, states, and algorithmic parameters at once. You can set only certain parameters and properties such as data types, initial values, and physical units. To work with one model element at a time, open the Property Inspector. To perform batch operations, open the Model Data Editor.

For more information about setting block properties and parameters, see “Signal Properties”. To learn to use the Model Data Editor, see “Configure Data Properties by Using the Model Data Editor”.

Palette – Access additional shortcuts along the left side of the editor icons

The palette along the left side of the editor provides more shortcuts. The palette shortcuts have to do with the model appearance and how you navigate the model rather than how you build and operate it. For example, the palette includes a shortcut for adding annotations and other visuals, like boxed-in areas for labeling the model. It also provides a zoom button for zooming on a particular part of the model.

Hide/Show Explorer Bar — Hide or display a bar that shows where you are in the model hierarchy

off (default) | on

The **Hide/Show Explorer Bar** button in the upper left corner of the editor window displays a bar that shows where you are in the model hierarchy.

Hide/Show Model Browser — Hide or display a hierarchical view of the model

off (default) | on

The **Hide/Show Model Browser** button displays a hierarchical view of the model that you can use to navigate.

Show Perspectives Views — Enable code, requirements, and interface perspectives

off (default) | on

The control in the lower-right corner opens additional views of the model. One such view is the interface view, which helps you to trace model interfaces. Click the control to see these views.

Model Data Access — Retrieve model data

off (default) | on

A badge in the lower-left corner indicates that a model has external data sources, such as a data dictionary, or that there is data in the model workspace. Click the badge, then use the menu to navigate to these data sources.

- To open the Model Explorer with the **Model Workspace** node selected, click the **Model Workspace** link.
- To open the Model Explorer with the **External Data** node for the model selected, click the **External Data** link.
- To add or change a linked data dictionary, click the gear icon to open the **External Data** tab of the Model Properties dialog box.

Programmatic Use

`simulink` opens the Simulink Start Page. Select a model or template to open the Simulink Editor on top of MATLAB.

Simulink Onramp

Three-hour interactive training course included with Simulink license

Description

To help you get started quickly with Simulink basics, Simulink Onramp provides a self-paced, interactive tutorial.

After completing Simulink Onramp, you will be able to create, modify, and troubleshoot Simulink models that simulate dynamic systems and perform basic signal analysis.

To teach concepts incrementally, Simulink Onramp uses hands-on exercises. You receive automated assessments and feedback after submitting tasks. Your progress is saved if you exit the application, so you can complete the training in multiple sessions.

Simulink Onramp covers these topics:

- Simulink blocks and signals
- Visualizing signal values during simulation
- Math and logic operators for algorithms
- Obtaining help from documentation
- MATLAB variables and functions in Simulink
- Dynamic systems in Simulink
- Discrete-time systems
- Continuous-time systems
- Simulation duration

Simulink Onramp helps you practice what you learn with these projects:

- Automotive Performance Modes
- Modeling a Thermostat
- Peregrine Falcon Dive

Open the Simulink Onramp

- On the Simulink Start Page, click the Simulink Onramp button  Simulink Onramp.
- On the Simulink Toolstrip quick access toolbar, click **Help > Learn Simulink**.
- At the MATLAB command prompt, enter `learning.simulink.launchOnramp('simulink')`.

Simulink Profiler

Identify sources of simulation slowdowns

Description

Use the **Simulink Profiler** to examine model and block execution and identify issues that can contribute to poor simulation performance.

Open the Simulink Profiler

- 1 Open a model.
- 2 On the **Debug** tab, select **Performance Advisor > Simulink Profiler**.
- 3 On the **Profile** tab, click **Profile**.

When simulation is complete, the **Profiler Report** pane opens and displays the simulation profile for the model.

The screenshot displays the Simulink Profiler interface for a model named 'sldemo_antiwindup'. The main workspace shows a block diagram titled 'Anti-Windup PID Control Demonstration'. The diagram includes a summing junction, a PID controller block, a saturation block (SAT(u)), a first-order process block (1/(10s+1)), and a dead time block. The output is labeled 'yout'.

The Profiler Report window at the bottom shows the following data:

Path	Time Plot (Dark Band = Self Time)	Total Time (s)	Self Time (s)	Number of Calls
sldemo_antiwindup	[Bar chart]	1.524	0.565	18013
Scope	[Bar chart]	0.637	0.637	6004
Scope1	[Bar chart]	0.313	0.313	6004
PID Controller	[Bar chart]	0.004	0.000	0
Dead Time	[Bar chart]	0.001	0.001	8005

The Property Inspector on the right shows details for the 'Dead Time' block, including a 'Total Time Breakdown for Dead Time' and a 'Self Time Breakdown for Dead Time' table.

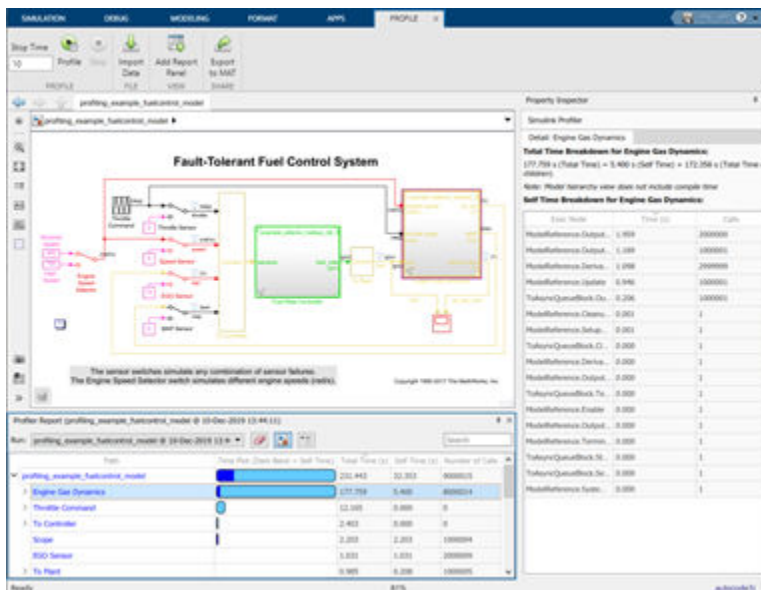

Exec Node	Time (s)	Calls
TransportDelay.Ou...	0.001	4000
TransportDelay.Cle...	0.000	1
TransportDelay.Up...	0.000	2001
TransportDelay.Ou...	0.000	2001
TransportDelay.Start	0.000	1
TransportDelay.Set...	0.000	1

Examples

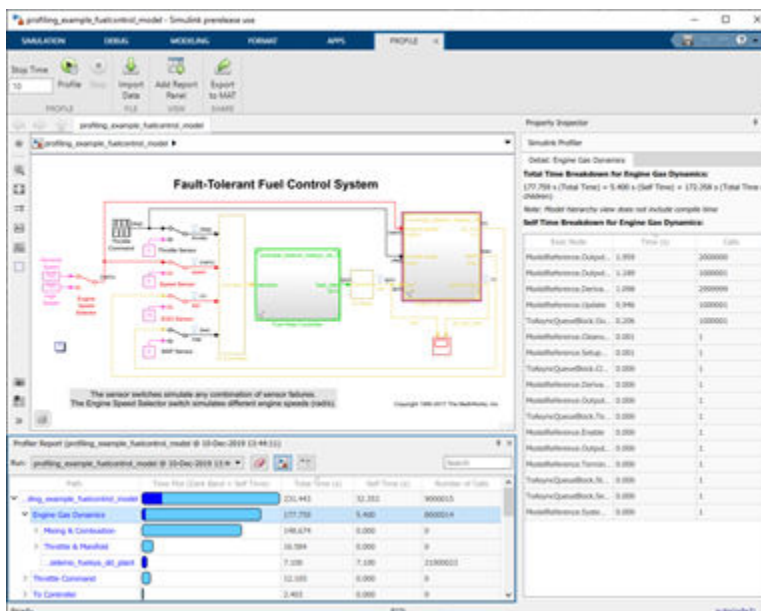

Identify Performance Slowdowns using the Simulink Profiler

This example shows how to use the Simulink Profiler to track down the source of a simulation slowdown in your model.

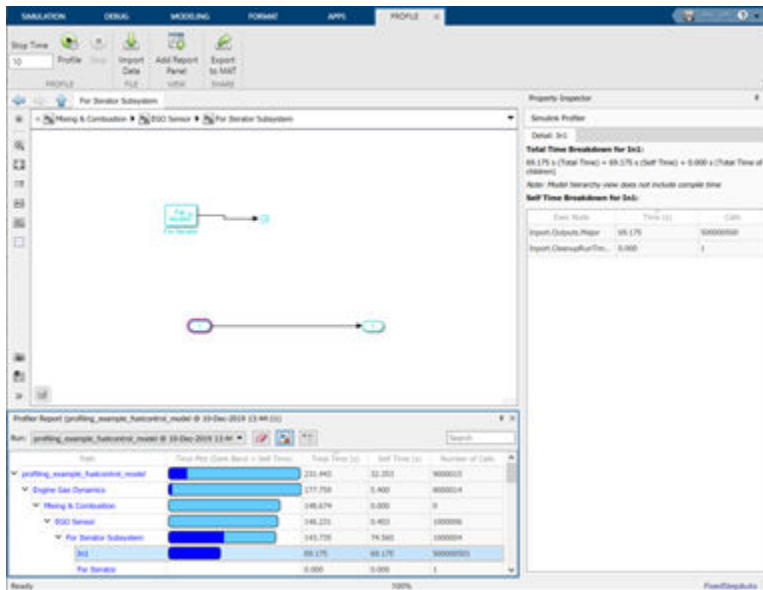

This example uses a modified version of the `sldemo_fuel_sys_dd` model, or the Modeling a Fault-Tolerant Fuel Control System example model with a slowdown artificially inserted.

Recursively expand the block hierarchy view. By default, the profiler sorts the blocks at the same level of the model in descending order of **Total Time(s)**.

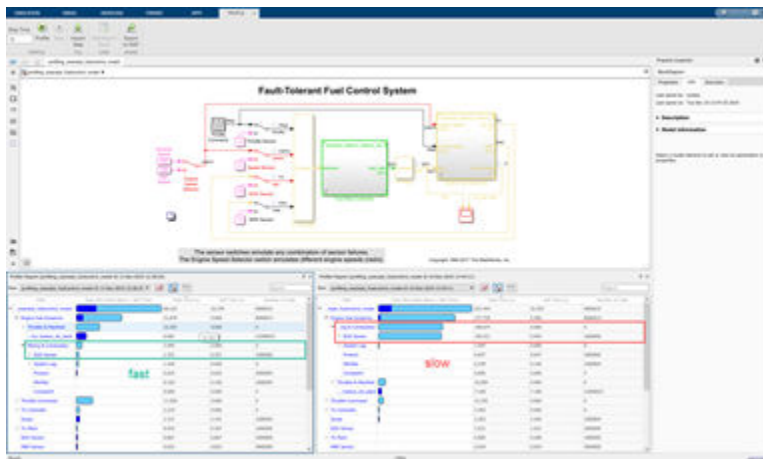

Observe that the For Iterator subsystem accounts for approximately 98% of the execution time of the EGO Sensor subsystem. It is highly probable that this is the source of the slow performance of the model.

Delete the block, reconnect the broken signal and profile the model again. You should see significantly faster simulation times.

To compare the results between the two runs, click **Add Report Panel** and select the previous run from the **Run** dropdown.

“Understanding Total Time and Self Time in Profiler Reports”

“How Profiler Captures Performance Data”

Introduced in R2007b

Solver Profiler

Identify solver performance bottlenecks

Description

Use the **Solver Profiler** to examine solver and model behavior to identify issues that can contribute to poor simulation performance.

Use the **Solver Profiler** to analyze a model for patterns that affect its simulation. The **Solver Profiler** presents graphical and statistical information about the simulation, solver settings, events, and errors. You can use this data to identify locations in the model that caused simulation bottlenecks.

In addition, there are multiple factors that can limit the simulation speed. The Solver Profiler logs and reports all the major events that occur when simulating a model:

- Zero-crossing events
- Solver exception events
- Solver reset events
- Jacobian computation events

These events are common and necessary for an accurate simulation. However, they do incur computational cost and frequent occurrences can slow down or even stall the simulation.

Available actions

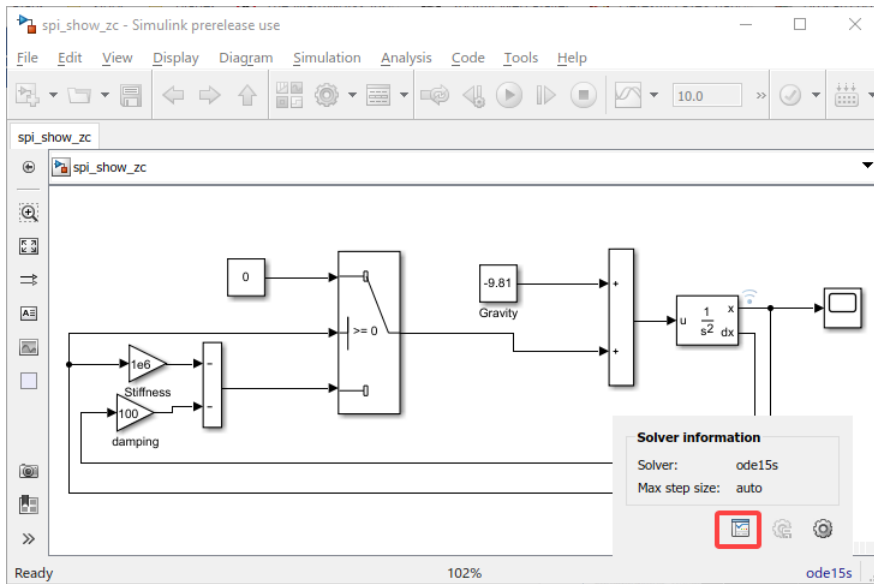

- **Trace**
- **Filter**
- **Explore**

Information Panes

- **Statistics**
- **Step Size**
- **Suggestions**

Open the Solver Profiler

Open the Solver Profiler by clicking the hyperlink in the lower-right corner of the Simulink Editor.

Examples

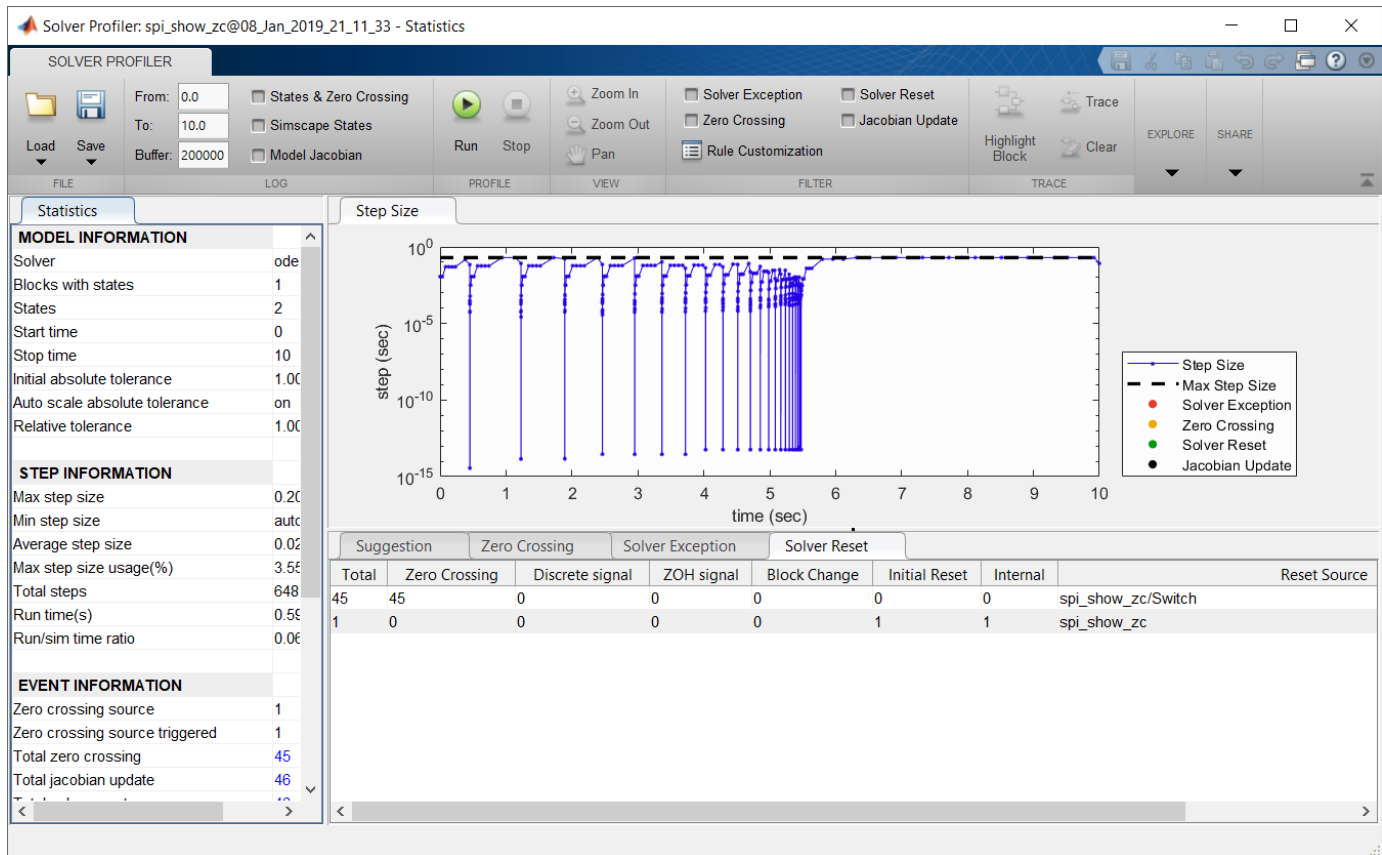

Locate source blocks for solver events

This example shows how to find the source of a particular solver event using a model that simulates a ball bouncing off the ground. As the ball comes to rest, the density of zero-crossings increase, leading to a solver slowdown.

To begin, open the `ex_spi_show_zc` model and launch the Solver Profiler.

Click **Run** to profile the model.

Notice that the model has 45 zero-crossing events, Select the **Zero Crossing** tab in the Results pane.

Select the `ex_spi_show_zc/Switch` field in the Results pane. All zero crossing events caused by the Switch block are highlighted in the **Step Size** plot.

In the **Trace** section of the toolbar, select **Highlight Block**.

You should see the Switch block causing the zero crossing events.

- “Examine Model Dynamics Using Solver Profiler”
- “Solver Resets”
- “Zero-Crossing Events”
- “Solver Exception Events”

- “Jacobian Logging and Analysis”

Parameters

Log

States & Zero Crossing — Save model states to file

off (default) | on

By default, the profiler does not save the states of the model. Enabling this parameter configures the profiler to save the states to a MAT-file.

Simscape States — Save Simscape states to file

off (default) | on

Enable this parameter to save Simscape states to a file.

Model Jacobian — Save model Jacobian

off (default) | on

Option to log the solver Jacobian matrices to memory. This option is useful for simulations that use implicit solvers. For a comparison of solvers, see “Compare Solvers”.

For a more detailed explanation of the solver Jacobian, see “Choose a Jacobian Method for an Implicit Solver”.

From — Profiler start time

model start time (default) | scalar

Time, in seconds, of the simulation that the profiler starts analyzing the model. This is not the same as the start time of the simulation.

To — Profiler stop time

model stop time (default) | scalar

Time, in seconds, of the simulation to which the profiler should profile the model. By default, the analysis continues until the end of the simulation. Changing this parameter does not change the stop time of the model which you specify in the Model Configuration Parameters.

A value less than the configured stop time of the model stops the profiling and simulation at `StopTime`.

Buffer — Memory impact of logging

50000 (default) | positive scalar

Maximum number of events that are logged. If the number of logged events reaches this value and memory is available, increase `BufferSize`. If memory is limited, consider lowering the value.

Filter

Solver Exception — Show solver exception events

off (default) | on

Enable this parameter to highlight solver exception events in the Step Size plot of the Solver Profiler.

Solver Reset — Show solver reset events

off (default) | on

Enable this parameter to highlight solver reset events in the Step Size plot of the Solver Profiler.

Zero Crossing — Show zero crossing events

off (default) | on

Enable this parameter to highlight zero crossing events in the Step Size plot of the Solver Profiler.

Jacobian Update — Show Jacobian update events

off (default) | on

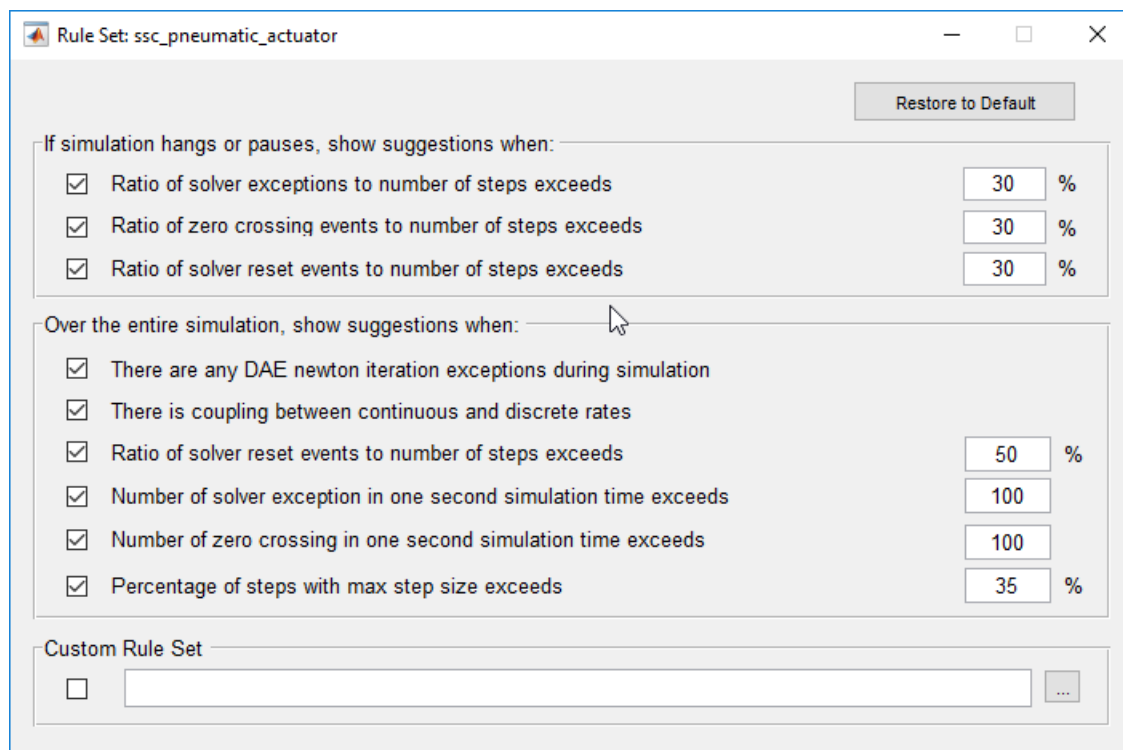

Enable this parameter to highlight Jacobian update events in the Step Size plot of the Solver Profiler.

Rule Customization — Change thresholds for profiler rules

off (default) | on

Click **Rule Customization** in the Solver Profiler to access the rule set. You can change the thresholds for most of these rules and also select which rules you want to apply selectively during a simulation run.

To modify a rule, enable its customization and then enter a desired threshold value.

**Custom Rule Set**

You can override the settings on the **Rule Set** dialog box by specifying a custom rule set.

Create a rule set as a MATLAB script and specify the path to the script in the **Custom Rule Set** section of the **Rule Set** dialog box.

A simple rule set example looks as follows:

```
function diagnosticsString = customRule(profilerData)
    if isempty(profilerData.zcEvents)
        diagnosticsString{1} = 'No zero crossing event detected.';
    else
        diagnosticsString{1} = 'Zero-crossing events detected.';
    end
end
```

The input to the function is an array of structures called `profilerData`. This array of structures organizes all the information that the Solver Profiler collects during a profiling run. It contains the following substructures.

Substructure	Fields
<code>stateInfo</code> : Stores information on block states	<ul style="list-style-type: none"> <code>name</code>: Block name <code>value</code>: State values <code>blockIdx</code>: Block ID
<code>blockInfo</code> : Cross-reference of blocks and state IDs	<ul style="list-style-type: none"> <code>name</code>: Block name <code>stateIdx</code>: State ID
<code>zcSrcInfo</code> : Stores information on blocks causing zero crossing events	<ul style="list-style-type: none"> <code>name</code>: Block name <code>blockIdx</code>: Block ID
<code>zcEvents</code> : Cross-reference of the time stamps of zero crossing events and the corresponding state IDs	<ul style="list-style-type: none"> <code>t</code>: Event timestamp <code>srcIdx</code>: Block ID
<code>exceptionEvents</code> : Cross-reference of exception event timestamps, the ID of the corresponding state that caused the event, and the cause.	<ul style="list-style-type: none"> <code>t</code>: Event timestamp <code>stateIdx</code>: State ID <code>cause</code>: Cause of exception
<code>resetTime</code> : Stores timestamps of solver resets.	None
<code>tout</code> : Stores simulation times.	None

Data Types: `double`

More About

Statistics Pane

The statistics pane displays information on model parameters, including:

- **Average step size** — A measure of how fast the solver advances. It is calculated as the total simulation time divided by the number of steps the solver used. It is bounded by the model configuration parameters **Max step size** and **Min step size**.
- **Max step size usage** — The percentage of maximum step sizes used by the solver among all step sizes.
- **Zero crossing** — A solver-specific event that affects model dynamics. During simulation, the solver detects zero crossing. Zero crossing detection incurs computation cost. For more information, see “Zero-Crossing Detection”.

- **Solver reset** — An event that causes the solver to reset its parameters. Solver reset detection incurs computation cost. The solver reset statistics are broken down into **Zero Crossing**, **Discrete Signal**, **ZOH Signal**, **Block Change**, **Initial Reset**, and **Internal** solver reset events. For more information, see “Solver Resets”
- **Solver exception** — An event that renders the solver unable to solve model states to meet accuracy specifications. To solve model states accurately, the solver has to run a few adjusted trials, which incur computation cost.
- **Error control exception** — An event where a solution obtained by the solver has an error that is greater than the tolerance specification.
- **Newton iteration exception** — An event specific to implicit solvers. Newton iterations do not converge after a few trials.
- **Infinite state exception** — An event where one or more states solved by the solver are infinite.
- **DAE newton iteration exception** — An event specific to implicit solvers for Simscape models. The Newton iteration does not converge even though the solver violates the minimum step size constraint.

Suggestions and Exceptions Pane

The suggestions and exceptions pane displays information on exceptions, including:

- **Zero crossing** — A solver-specific event that affects model dynamics. During simulation, the solver detects zero crossing. Zero crossing detection incurs computation cost. For more information, see “Zero-Crossing Detection”.
- **Solver reset** — An event that causes the solver to reset its parameters. Solver reset detection incurs computation cost. The solver reset statistics are broken down into **Zero Crossing**, **Discrete Signal**, **ZOH Signal**, **Block Change**, **Initial Reset**, and **Internal** solver reset events. For more information, see “Solver Resets”
- **Solver exception** — An event that renders the solver unable to solve model states to meet accuracy specifications. To solve model states accurately, the solver has to run a few adjusted trials, which incur computation cost.
- **Error control exception** — An event where a solution obtained by the solver has an error that is greater than the tolerance specification.
- **Newton iteration exception** — An event specific to implicit solvers. Newton iterations do not converge after a few trials.
- **Infinite state exception** — An event where one or more states solved by the solver are infinite.
- **DAE newton iteration exception** — An event specific to implicit solvers for Simscape models. The Newton iteration does not converge even though the solver violates the minimum step size constraint.

Solver Reset Pane

The **Solver Reset** pane shows a tabulated list of solver resets that have occurred when simulating the model. Each row of the table corresponds to a block in the model. The following causes of solver resets are recorded:

- **Zero Crossing**
- **Discrete Signal**
- **ZOH Signal**

- **Block Change**
- **Initial Reset**
- **Internal**

Topics

“Examine Model Dynamics Using Solver Profiler”

“Solver Resets”

“Zero-Crossing Events”

“Solver Exception Events”

“Jacobian Logging and Analysis”

Introduced in R2016a

States Explorer

Visualize states in model

Description

Use the **States Explorer** to view individual state dynamics of your model

Open the States Explorer

- Profile the model using the **Solver Profiler**. Ensure that the **States & Zero Crossing** parameter is enabled.
- Select **States** in the **Explore** section of the **Solver Profiler** toolbar.

See Also

`solverprofiler.profileModel` | Solver Profiler | Zero Crossing Explorer

Introduced in R2016a

Zero Crossing Explorer

Visualize and interactively explore zero-crossing events

Description

Use the **Zero Crossing Explorer** to visualize and analyze zero crossing events that occur for each state in your model.

Open the Zero Crossing Explorer

- Profile the model using the **Solver Profiler**. Ensure that the **States & Zero Crossing** parameter is enabled.
- Select **Zero Crossing** in the **Explore** section of the **Solver Profiler** toolstrip.

Examples

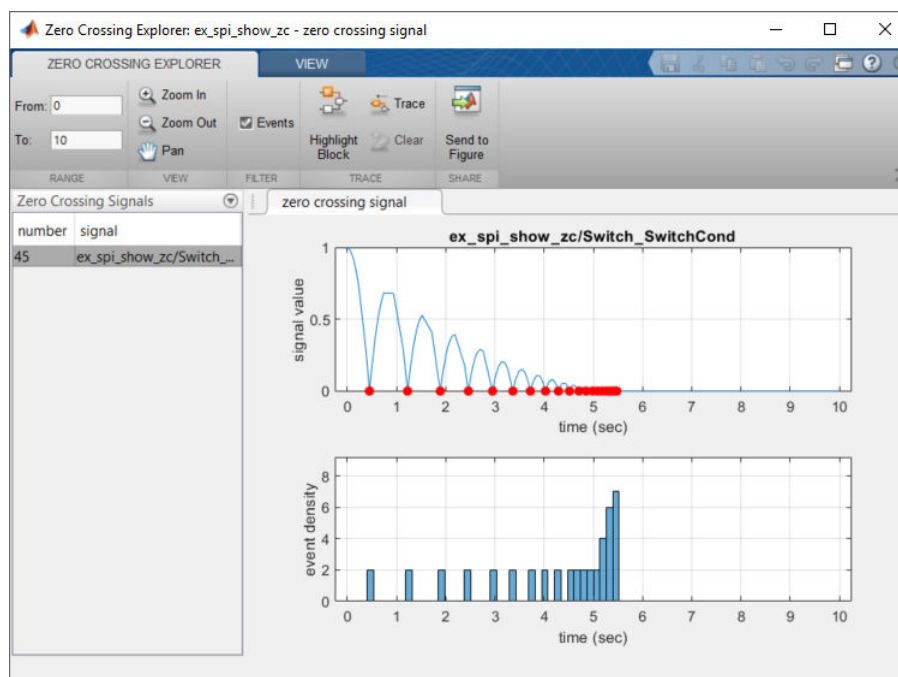

Interactively Explore Zero Crossings

Use the **Zero Crossing Explorer** to examine clusters of zero crossing events

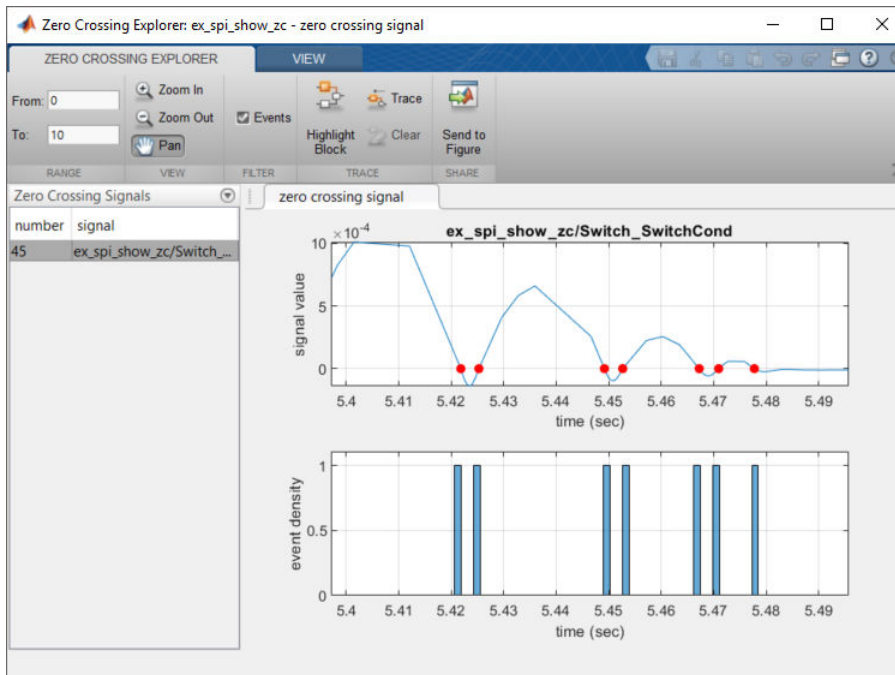

Open the `ex_spi_show_zc` model and launch the **Solver Profiler**.

Enable the **States & Zero Crossing** parameter in the **Log** section of the toolstrip and run the **Solver Profiler**.

When profiling has completed, launch the **Zero Crossing Explorer**

There is an increase in the density of zero crossing events halfway through the simulation. Zoom in on the **event density** plot between the 5 and 6 second mark

A closer examination reveals that each bounce corresponds to two zero crossings — from positive to negative and vice-versa. This is an artefact of numerically solving state dynamics that approach 0 value. Around 5.48 seconds, the ball being simulated in the model comes to 'rest', hence the isolated single zero crossing event.

Objects

Simulink.BlockPath

Fully specified Simulink block path

Description

A `Simulink.BlockPath` object represents a fully specified block path that uniquely identifies a block within a model hierarchy, even when the model hierarchy references the same model multiple times.

Creation

Use either the `Simulink.BlockPath` (described here) or the `gcbp` function to create a `Simulink.BlockPath` object. To get a `Simulink.BlockPath` object for the most recently clicked or loaded block, use the `gcbp` function.

Syntax

```
bp = Simulink.BlockPath
bp = Simulink.BlockPath(blockpath)
bp = Simulink.BlockPath(paths)
bp = Simulink.BlockPath(paths, subpath)
```

Description

`bp = Simulink.BlockPath` creates an empty `BlockPath` object.

`bp = Simulink.BlockPath(blockpath)` creates a copy of the specified `BlockPath` object.

`bp = Simulink.BlockPath(paths)` creates a `BlockPath` object from the specified cell array of character vectors. Each character vector represents a path at a level of model hierarchy. Simulink builds the full block path based on the character vectors.

`bp = Simulink.BlockPath(paths, subpath)` creates a `BlockPath` object from the character vector or cell array of character vectors that you specify with the `paths` argument. The object contains a path for an individual component of the block, such as a signal, that you specify with the `subpath` argument.

Input Arguments

blockpath — Existing `BlockPath` object

`BlockPath` object

`BlockPath` object that you want to copy.

paths — Paths used to build block path

character vector | cell array of character vectors

Paths used to build the block path, specified as a character vector or cell array of character vectors.

Specify each character vector in order, from the top model to the specific block for which you are creating a `BlockPath` object.

Each character vector must be a path to a block within the Simulink model. The block must be:

- A block in a single model
- A Model block (except for the last character vector, which may be a block other than a Model block)
- A block in the model referenced by the Model block that the previous character vector specifies

subpath — Individual component of a block

character vector

Individual component of a block, such as a signal, specified as a character vector.

Output Arguments

bp — Simulink.BlockPath object

`Simulink.BlockPath` object

The `Simulink.BlockPath` object that represents the specified block path.

Properties

Block Path — Fully specified block path

' ' (default) | character vector

A fully specified block path that uniquely identifies a block within a model hierarchy, even when the model hierarchy references the same model multiple times, specified as a character vector.

Example: `'sf_car/shift_logic'`

Data Types: char

SubPath — Component of the block

' ' (default) | character vector

A component of the block, specified as a character vector that provides the block path. For example, if the block path refers to a Stateflow chart, you can use `SubPath` to indicate the chart signals.

Example: `'gear_state.first'`

Data Types: char

Object Functions

<code>convertToCell</code>	Convert a block path to a cell array of character vectors
<code>getBlock</code>	Get a single block path in a model reference hierarchy
<code>getLength</code>	Get the number of hierarchy levels in a block path
<code>open</code>	Open the specified model, library, subsystem, or block
<code>validate</code>	Determine whether the block path represents a valid block hierarchy

Examples

Create a Simulink.BlockPath Object Using a Cell Array

Create a block path object called `bp2`, using a cell array of character vectors representing elements of the block path.

```
sldemo_mdref_depgraph  
bp2 = Simulink.BlockPath({'sldemo_mdref_depgraph/thermostat', ...  
    'sldemo_mdref_heater/Fahrenheit to Celsius', ...  
    'sldemo_mdref_F2C/Gain1'})
```

```
bp2 =
```

```
Simulink.BlockPath  
Package: Simulink
```

```
Block Path:  
    sldemo_mdref_depgraph/thermostat  
    sldemo_mdref_heater/Fahrenheit to Celsius  
    sldemo_mdref_F2C/Gain1
```

The resulting block path reflects the model reference hierarchy for the block path

Simulink.Bus

Specify properties of buses

Description

`Simulink.Bus` objects, used with `Simulink.BusElement` objects, specify and validate the properties of a bus. When you simulate a model or update diagram, Simulink checks whether buses connected to blocks match specified `Simulink.Bus` objects.

A `Bus` object specifies only the architectural properties of a bus. For example, a bus object can specify element names, hierarchy, order, and data types. A `Bus` object cannot specify the values of the signals in a bus.

A `Bus` object is analogous to a structure definition in C: it defines the members of the bus, but does not create the bus. A `Bus` object is also similar to a cable connector. The connector defines all the pins and their configuration and controls what types of wires can be connected to it. Similarly, a `Bus` object defines the configuration and properties of the signals that the associated bus must have.

`Bus` objects contain `Simulink.BusElement` objects. Each `BusElement` object specifies the properties of a signal in a bus, such as its name, data type, and dimension. The order of the `BusElement` objects in the `Bus` object defines the order of the signals in the bus.

A `Bus` object can specify properties that were not defined by constituent signals, but were left to be inherited.

To create and modify `Bus` objects in the base workspace or a data dictionary, you can use the **Bus Editor** or MATLAB commands. You cannot store `Bus` objects in model workspaces.

To use `Bus` objects in a model, see “Specify Bus Properties with `Simulink.Bus` Objects”.

Creation

Syntax

```
busObject = Simulink.Bus
```

Description

`busObject = Simulink.Bus` returns a `Bus` object with these property values:

```
Description: ''
DataScope: 'Auto'
HeaderFile: ''
Alignment: -1
Elements: [0x0 Simulink.BusElement]
```

The name of the `Bus` object is the name of the MATLAB variable to which you assign the `Bus` object.

Properties

Description — Bus description

character vector

Bus description, specified as a character vector. Use the description to document information about the Bus object, such as the kind of signal it applies to or where the Bus object is used. This information does not affect Simulink processing.

Elements — Properties of signals within the bus

array of `Simulink.BusElement` objects

Elements of the bus, specified as an array of `Simulink.BusElement` objects. Each `BusElement` object defines the name, data type, dimensions, and other properties of a signal within the bus.

DataScope — Data type definition mode in generated code

'Auto' (default) | 'Exported' | 'Imported'

Data type definition mode in generated code, specified as 'Auto', 'Exported', or 'Imported'. This property specifies whether during code generation the data type definition is imported from, or exported to, the header file specified with the `HeaderFile` property.

Value	Action
'Auto' (default)	Import the data type definition from the specified header file. If you do not specify the header file, export the data type definition to the default header file.
'Exported'	Export the data type definition to the specified header file or default header file.
'Imported'	Import the data type definition from the specified header file or default header file.

HeaderFile — C header file used with data type definition

character vector

C header file used with data type definition, specified as a character vector. Based on the value of the `DataScope` property, import the data type definition from or export the data type definition to the header file. The Simulink Coder software uses this property for code generation. Simulink software ignores this property.

By default, the generated `#include` directive uses the preprocessor delimiter `"` instead of `<` and `>`. To generate the directive `#include <myTypes.h>`, specify `HeaderFile` as `<myTypes.h>`.

Alignment — Data alignment boundary

-1 (default) | integer

Data alignment boundary, specified as an integer, in number of bytes. The Simulink Coder software uses this property for code generation. Simulink software ignores this property.

The starting memory address for the data allocated for the bus is a multiple of the `Alignment` setting. If the object occurs in a context that requires alignment, you must specify an `Alignment` value with a positive integer that is a power of 2, not exceeding 128.

Examples

Create Bus Objects and BusElement Objects

This example shows how to create a Bus object and its associated BusElement objects in the base workspace.

Create a Bus object named CONTROL.

```
CONTROL = Simulink.Bus;
```

Create and specify properties for two BusElement objects, named VALVE1 and VALVE2.

```
valve1 = Simulink.BusElement;  
valve1.Name = 'VALVE1';  
valve1.Dimensions = 1;  
valve1.DimensionsMode = 'Fixed';  
valve1.DataType = 'double';  
valve1.SampleTime = -1;  
valve1.Complexity = 'real';
```

```
valve2 = Simulink.BusElement;  
valve2.Name = 'VALVE2';  
valve2.Dimensions = 1;  
valve2.DimensionsMode = 'Fixed';  
valve2.DataType = 'double';  
valve2.SampleTime = -1;  
valve2.Complexity = 'real';
```

Assign the elements to the CONTROL Bus object.

```
CONTROL.Elements = [valve1 valve2];
```

Alternatives

To interactively create a Bus object, use the **Bus Editor**.

To create Bus objects from blocks in a model, MATLAB data, and external C code, see “Create Bus Objects Programmatically”.

Simulink.BusElement

Specify properties of elements of buses

Description

A `Simulink.BusElement` object is an element of a `Simulink.Bus` object that specifies the properties of a signal in a bus.

`BusElement` objects validate the properties of signals in a bus. A `Simulink.Bus` object contains `BusElement` objects. A `BusElement` object exists only within a `Bus` object. You can specify a `Bus` object, but not a `BusElement` object, as a block parameter value. When you simulate a model or update diagram, Simulink checks whether the signals in a bus connected to blocks have the properties specified by the `BusElement` objects. If not, Simulink halts and displays an error message.

You can use the Simulink Bus Editor (see “Create and Specify Simulink.Bus Objects”), or MATLAB commands (see “Create Bus Objects Programmatically”) to create and modify `Bus` objects and `BusElement` objects in the base MATLAB workspace.

Creation

Syntax

```
busElementObject = Simulink.BusElement
```

Description

`busElementObject = Simulink.BusElement` returns a `BusElement` object with these property values:

```
Name: 'a'
Complexity: 'real'
Dimensions: 1
DataType: 'double'
Min: []
Max: []
DimensionsMode: 'Fixed'
SampleTime: -1
Unit: ''
Description: ''
```

Properties

Name — Name of element

character vector

Name of element, specified as a character vector.

Complexity — Numeric type of element

'real' (default) | 'complex'

Numeric type of the element, specified as 'real' or 'complex'.

Dimensions — Dimensions of element

array

Dimensions of element, specified as an array.

DataType — Data type of element

built-in Simulink data type | a `Simulink.NumericType` object | a `Simulink.Bus` object

Data type of element, specified as a built-in Simulink data type or `Simulink.NumericType` object. Examples of built-in data types include `double` and `uint8`. You can specify a `Simulink.NumericType` object whose `DataTypeMode` property is set to a value other than 'Fixed-point: unspecified scaling'. Specifying a `Bus` object allows you to create `Bus` objects that specify hierarchical buses (that is, buses that contain other buses).

Min — Minimum value of element

double | []

Minimum value of the element, specified as a double. This value must be a finite real double scalar or, if the element is a bus, the value must be empty, [].

Max — Maximum value of element

double | []

Maximum value of the element, specified as a double. This value must be a finite real double scalar or, if the element is a bus, the value must be empty, [].

DimensionsMode — Specify how to handle size of element

'Fixed' (default) | 'Variable'

Specify how to handle size of element, specified as 'Fixed' or 'Variable'.

SampleTime — Sample time of element

-1 (default) | double

Sample time of element, specified as a double. The sample time is the size of the interval between times when this signal value must be recomputed. If these conditions apply, use the default value of -1:

- The element is a bus.
- The bus that includes this element passes through a block that changes the bus sample time, such as a Rate Transition block.

Unit — Physical unit for expressing element

character vector

Physical unit for expressing element, specified as a character vector (for example, 'inches').

Examples

Create Bus Objects and BusElement Objects

This example shows how to create a Bus object and its associated BusElement objects in the base workspace.

Create a Bus object named CONTROL.

```
CONTROL = Simulink.Bus;
```

Create and specify properties for two BusElement objects, named VALVE1 and VALVE2.

```
valve1 = Simulink.BusElement;
valve1.Name = 'VALVE1';
valve1.Dimensions = 1;
valve1.DimensionsMode = 'Fixed';
valve1.DataType = 'double';
valve1.SampleTime = -1;
valve1.Complexity = 'real';

valve2 = Simulink.BusElement;
valve2.Name = 'VALVE2';
valve2.Dimensions = 1;
valve2.DimensionsMode = 'Fixed';
valve2.DataType = 'double';
valve2.SampleTime = -1;
valve2.Complexity = 'real';
```

Assign the elements to the CONTROL Bus object.

```
CONTROL.Elements = [valve1 valve2];
```

Alternatives

To interactively create a BusElement object, use the **Bus Editor**.

To create BusElement objects from blocks in a model, MATLAB data, and external C code, see “Create Bus Objects Programmatically”.

Compatibility Considerations

Simulink.BusElement objects will no longer support the SampleTime property

Not recommended starting in R2019b

In a future release, the SampleTime property of Simulink.BusElement objects will be removed.

To prepare:

- When defining BusElement objects, use the default SampleTime value (-1).
- To specify the sample time for an element of a bus, use the SampleTime block parameter of corresponding blocks. For example, you can use In Bus Element, Out Bus Element, and Signal Specification blocks to specify sample time.

Simulink.BusElement objects will no longer support the SamplingMode property

Not recommended starting in R2016b

In R2016b, the `SamplingMode` property of `Simulink.BusElement` objects was removed. Scripts that use the `SamplingMode` property of `Simulink.BusElement` objects continue to work. `Simulink.Bus.cellToObject` continues to require the `SamplingMode` field and `Simulink.Bus.objectToCell` continues to include the sampling mode in the output cell arrays.

In a future release, support for the `SamplingMode` property will be removed.

To specify whether a signal is sample-based or frame-based, define the sampling mode of input signals at the block level instead of at the signal level.

Simulink.ConfigSet

Model configuration set

Description

Use the `Simulink.ConfigSet` object to access a model configuration set. Get information about your configuration set and manage configuration parameters.

Creation

Use the `getActiveConfigSet` function to get the active configuration set for a model. Use the `getConfigSet` function to get a model configuration set by name.

Properties

Description — Description of the configuration set

character vector

Description of the configuration set, specified as a character vector. Use the description to provide additional information about a configuration set, such as its purpose.

Name — Name of the configuration set

character vector

Name of the configuration set, specified by a character vector. This name represents the configuration set in the Model Explorer.

Object Functions

<code>copy</code>	Copy configuration set or reference
<code>getFullName</code>	
<code>getModel</code>	
<code>get_param</code>	Get parameter names and values
<code>isActive</code>	
<code>isValidParam</code>	
<code>saveAs</code>	
<code>setPropEnabled</code>	
<code>set_param</code>	Set system and block parameter values

Examples

Get the Active Configuration Set for a Model

Open the model `vdp` and get the active configuration set.

```
vdp  
configSetObj = getActiveConfigSet(vdp);
```

Topics

“Manage Configuration Sets for a Model”

“Share a Configuration with Multiple Models”

Introduced in R2006a

Simulink.ConfigSetRef

Link model to freestanding configuration set

Description

Use the ConfigSetRef object to allow a model to reference configuration sets that are not saved in a model.

Creation

Create a ConfigSetRef object by using the getConfigSet function to call a model configuration reference by name.

Properties

Description — Description of configuration reference

character vector

Description of the configuration reference, specified as a character vector. Use this property to provide additional information about a configuration reference, such as its purpose. This field can remain blank.

Name — Name of configuration reference

character vector

Name of the configuration reference, specified as a character vector. This name represents the configuration reference in the Model Explorer.

SourceName — Variable that contains referenced configuration set

character vector

Name of the variable in the workspace or the data dictionary that contains the referenced configuration set, specified as a character vector.

Object Functions

copy	Copy configuration set or reference
getFullName	
getModel	
get_param	Get parameter names and values
getRefConfigSet	
isActive	
refresh	

Examples

Create and Reference a Freestanding Configuration Set

Use a `ConfigSetRef` object to allow a model to use a freestanding configuration set, which is not associated with a model.

Open the model `vdp`. Create a freestanding configuration set by copying the configuration set of the model.

```
model = 'vdp';  
open_system(model)  
  
freeConfigSet = copy(getActiveConfigSet(model));
```

Create a configuration reference. To point the reference to your freestanding configuration, set the `SourceName` property to `freeConfigSet`, the base workspace variable that represents your configuration. Name the reference `vdpConfigRef`.

```
configRef = Simulink.ConfigSetRef;  
set_param(configRef, 'SourceName', 'freeConfigSet');  
set_param(configRef, 'Name', 'vdpConfigRef');
```

Attach the configuration reference to the `vdp` model and activate it.

```
attachConfigSet('vdp', configRef);  
setActiveConfigSet('vdp', 'vdpConfigRef');
```

Symbol

C Function block data symbol

Description

Define C Function block symbols and their properties.

Creation

Access a `Symbol` object through one of the following methods.

- `addSymbol` function
- `getSymbol` function
- Access the `Symbols` property of a `SymbolSpec` object.

Properties

Name — Symbol name in source code

character vector

Symbol name in source code, specified as a character vector.

Data Types: character

PortNumber — Port number

scalar integer

Port number, specified as a scalar integer. For input and output symbols, `PortNumber` indicates the port index on the block. For parameter symbols, `PortNumber` indicates the order that the symbol appears in the block parameter mask.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64

Size — Size dimensions of the symbol

'1' (default) | character vector

Size of the symbol data specified as a character vector containing a scalar integer. The C Function block supports only scalars and vectors. Matrices and higher-dimension arrays are not supported. You can use a size expression to define the size of an output. Use -1 to inherit size.

Data Types: character

Type — Data type of symbol

'double' (default) | character vector

Data type of the symbol, specified as a character vector that evaluates to a numeric data type, or as a `Simulink.AliasType` object.

Example: `mySymbol.DataType = 'int32'`

Data Types: char

Scope — Scope of the symbol

'Input' (default) | 'Output' | 'Persistent' | 'Parameter' | 'Constant'

Scope of the symbol, specified as one of the following values.

- **Input** — Input symbol to the C Function block.
- **Output** — Output symbol to the C Function block.
- **Parameter** — Define a symbol as parameter. The parameter name is defined by the `Label` property of the symbol.
- **Persistent** — Define a symbol as persistent data.
- You can define a void pointer using the `Persistent` scope in the C Function block. A *void pointer* is a pointer that can store any type of data that you create or allocate.
- **Constant** — Define a symbol as constant using value-size or numeric expressions.

Data Types: character

Label — Symbol label

character vector

Symbol label, specified as a character vector. For symbols with their scope set to `Input` or `Output`, this label appears as the port name on the block. For symbols with their scope set to `Parameter`, this label is the label that appears on the block parameter mask. If the scope is `Constant`, the label is the constant expression. You cannot define a label for `Persistent` symbols.

Data Types: character

SymbolSpec

Query and configure C Function block data symbols

Description

Use the SymbolSpec object to query and configure C Function block symbol definitions and their properties.

Creation

Syntax

```
myCFunctionObj = get_param(CFcnBlk, 'SymbolSpec')
```

Description

`myCFunctionObj = get_param(CFcnBlk, 'SymbolSpec')` creates a C Function block symbol configuration object for the specified C Function block.

Input Arguments

CFcnBlk — C Function block

character vector

C Function block path specified as a character vector, or a handle to the C Function block.

Properties

Symbols — Symbols defined in the C Function block

Symbol object | array of Symbol objects

The symbols defined in the C Function block, specified as a Symbol object, or an array of Symbol objects.

Symbol objects define the properties of each symbol in the C Function block.

Object Functions

<code>addSymbol</code>	Add a symbol object definition to a C Function block
<code>getSymbol</code>	Get a symbol object definition of a C Function block
<code>deleteSymbol</code>	Delete a symbol object definition from a C Function block

Simulink.HMI.InstrumentedSignals

Save and restore signal logging specification

Description

A `Simulink.HMI.InstrumentedSignals` object acts as a specification for logged signals in a model, including signals in subsystems, library instances, and Stateflow charts. You can get a `Simulink.HMI.InstrumentedSignals` object for the logging configuration in your model using the `get_param` function with the `InstrumentedSignals` model parameter. You can save several logging configurations as `Simulink.HMI.InstrumentedSignals` objects and easily swap the logging configuration for your model using `set_param`.

Note An `InstrumentedSignals` object for a model does not include signals logged inside referenced models. To get a list of logged signals in a referenced model, create an `InstrumentedSignals` object for the referenced model.

Creation

The `get_param` function returns a `Simulink.HMI.InstrumentedSignals` object for the `InstrumentedSignals` model parameter.

Properties

Model — Model name

character vector

Name of the model that corresponds to the list of logged signals.

Example: 'sldemo_fuelsys'

Count — Number of logged signals

integer

Number of logged signals in the model.

Example: 10

Data Types: `uint32`

Examples

Save and Restore a Set of Logged Signals

This example shows how to use the `Simulink.HMI.InstrumentedSignals` object to save a set of logged signals to restore after running a simulation with a different signal logging configuration.

Save the Initial Signal Logging Configuration

This example uses the `sldemo_fuelsys` model, which is configured to log 10 signals. Open the model and use the `get_param` function to get a `Simulink.HMI.InstrumentedSignals` object representing the signal logging configuration.

```
load_system sldemo_fuelsys

initSigs = get_param('sldemo_fuelsys','InstrumentedSignals');
```

You can save the initial signal logging configuration in a MAT-file for later use.

```
save initial_instSigs.mat initSigs
```

Remove All Logging Badges

To return to a baseline of no logged signals, you can use the `set_param` function to remove all logging badges from signals in your model. Then, you can easily select a different configuration of signals to log in the Simulink™ Editor or using the `Simulink.sdi.markSignalForStreaming` function.

```
set_param('sldemo_fuelsys','InstrumentedSignals',[])
```

Restore Saved Logging Configuration

After working with a different set of logged signals, you can restore a saved configuration using the `Simulink.HMI.InstrumentedSignals` object. For example, if you saved the logging configuration to a MAT-file, you can load the MAT-file contents into the workspace and use the `set_param` function to restore the previously saved logging configuration.

```
load initial_instSigs.mat

set_param('sldemo_fuelsys','InstrumentedSignals',initSigs)
```

Simulink.HMI.ParamSourceInfo

Information about Dashboard block variable and parameter connections

Description

Use a `Simulink.HMI.ParamSourceInfo` object to connect a Dashboard block to a variable or parameter programmatically using the `set_param` function. The `get_param` function returns a `Simulink.HMI.ParamSourceInfo` object when you use the function to query the connection information for a Dashboard block connected to a variable or parameter.

The `Simulink.HMI.ParamSourceInfo` object contains four properties. Some of the properties apply to connecting Dashboard blocks to parameters, and some apply for connecting Dashboard blocks to variables. Not all fields have a value for a connection because a given Dashboard block connects to either a parameter or a variable.

Creation

Syntax

```
paramSourceInfo = Simulink.HMI.ParamSourceInfo
```

Description

`paramSourceInfo = Simulink.HMI.ParamSourceInfo` creates the empty `Simulink.HMI.ParamSourceInfo` object, `paramSourceInfo`.

Properties

BlockPath — Path to the block associated with the parameter or variable

`Simulink.BlockPath`

`Simulink.BlockPath` object for the block associated with the parameter or variable. You can create a `Simulink.BlockPath` object for a block by passing a character array describing the path to `Simulink.BlockPath`. You can get a character array describing the block path for a selected block using the `gcb` function.

Example: `Simulink.BlockPath('vdp/Mu')`

ParamName — Name of the connected tunable block parameter

character array

Name of the connected tunable block parameter, specified as a character array. A `Simulink.HMI.ParamSourceInfo` object connected to a variable does not have a value for the `ParamName` property.

Example: `Gain`

VarName — Name of the connected variable

character array

Name of the connected variable, specified as a character array. A `Simulink.HMI.ParamSourceInfo` object connected to a tunable parameter does not have a value for the `VarName` property.

Example: `Mu`

WksType — Source workspace for the connected variable

'base' | 'model' | data dictionary file path

Source workspace for the connected variable, specified as a character array. The source workspace can be the base workspace, model workspace, or a data dictionary. When the source workspace is a data dictionary, the `WksType` property value is the file path for the data dictionary, specified as a character array. A `Simulink.HMI.ParamSourceInfo` object connected to a tunable parameter does not have a value for the `WksType` property.

Example: `'modelData.sldd'`

Examples

Programmatically Add and Connect a Dashboard Block

This example shows how to programmatically add Dashboard blocks to a model and connect them to elements in the model. The example adds a Dashboard Scope block and a Slider block to the `vdp` model and connects and configures the blocks.

Add Blocks

Use the `add_block` function to add a Dashboard Scope block and a Slider block to the `vdp` model. This example also specifies the position of the blocks.

```
open_system('vdp')

scopePos = [550 140 800 305];
sliderPos = [550 30 800 120];

add_block('simulink_hmi_blocks/Dashboard Scope','vdp/Dashboard Scope',...
    'Position',scopePos)
add_block('simulink_hmi_blocks/Slider','vdp/Slider','Position',sliderPos)
```

Connect the Dashboard Scope Block

Use a cell array of `Simulink.HMI.SignalSpecification` objects to connect the Dashboard block to the `x1` and `x2` signals. The `Simulink.HMI.SignalSpecification` object specifies a connected signal using the block path and port index for the source of the signal. The default value for the `OutputPortIndex` is 1, so this example does not specify the output port for the `x1` and `x2` signals.

```
x1_sigSpec = Simulink.HMI.SignalSpecification;
x1_sigSpec.BlockPath = Simulink.BlockPath('vdp/x1');

x2_sigSpec = Simulink.HMI.SignalSpecification;
x2_sigSpec.BlockPath = Simulink.BlockPath('vdp/x2');

connection_dashboardScope = {x1_sigSpec x2_sigSpec};
```

Use the `set_param` function to configure the connected signals for the Dashboard Scope block.

```
set_param('vdp/Dashboard Scope', "Binding", connection_dashboardScope)
```

Connect and Configure the Slider Block

Use a `Simulink.HMI.ParamSourceInfo` object and the `set_param` function to connect the Slider block to the Gain parameter of the Mu block. To connect a parameter, the `Simulink.HMI.ParamSourceInfo` needs to specify the block path for the block that corresponds to the parameter and the name of the parameter.

```
slider_param = Simulink.HMI.ParamSourceInfo;  
slider_param.BlockPath = Simulink.BlockPath('vdp/Mu');  
slider_param.ParamName = 'Gain';
```

```
set_param('vdp/Slider', "Binding", slider_param)
```

Configure the scale for the slider for a range of 1 to 10 with a tick mark spacing of 1.

```
slider_limits = [1 1 10];
```

```
set_param('vdp/Slider', "Limits", slider_limits)
```

Introduced in R2019a

Simulink.HMI.SignalSpecification

Programmatically connect a Dashboard block to a signal

Description

Use a `Simulink.HMI.SignalSpecification` object to programmatically connect a Dashboard block to a signal.

The `SignalSpecification` object contains the block path, port index, and frame processing mode for a signal. To connect a Dashboard block to a signal, specify the corresponding `SignalSpecification` object as the value for the `Binding` parameter for the block using the `set_param` function.

Creation

Syntax

```
sigSpec = Simulink.HMI.SignalSpecification
```

Description

`sigSpec = Simulink.HMI.SignalSpecification` creates an empty `Simulink.HMI.SignalSpecification` object. Specify the block path and port index that correspond to the origin of the signal you want to connect.

Properties

BlockPath — Path of the block with the signal as an output

`Simulink.BlockPath` (default) | character vector

Block path for the block that has the signal you want to connect as an output, specified as a character vector or a `Simulink.BlockPath` object.

```
Example: sigSpec.BlockPath = 'vdp/Mu';
```

```
Example: sigSpec.BlockPath = myBlockPath;
```

OutputPortIndex — Block output port corresponding to the signal

1 (default) | scalar

Output port index corresponding to the signal, specified as a scalar, real integer.

```
Example: sigSpec.OutputPortIndex = 2;
```

FrameProcessingMode — Processing mode for the signal data

"sample" (default) | "frame"

Processing mode for the signal data, specified as `sample` or `frame`.

- `sample` — Each element in a sample of the signal is processed as a channel.
- `frame` — Each column in a sample of the signal is processed as a channel.

Example: `sigSpec.FrameProcessingMode = "frame";`

Note Only the Dashboard Scope block supports frame-based data.

Examples

Programmatically Add and Connect a Dashboard Block

This example shows how to programmatically add Dashboard blocks to a model and connect them to elements in the model. The example adds a Dashboard Scope block and a Slider block to the `vdp` model and connects and configures the blocks.

Add Blocks

Use the `add_block` function to add a Dashboard Scope block and a Slider block to the `vdp` model. This example also specifies the position of the blocks.

```
open_system('vdp')

scopePos = [550 140 800 305];
sliderPos = [550 30 800 120];

add_block('simulink_hmi_blocks/Dashboard Scope','vdp/Dashboard Scope',...
    'Position',scopePos)
add_block('simulink_hmi_blocks/Slider','vdp/Slider','Position',sliderPos)
```

Connect the Dashboard Scope Block

Use a cell array of `Simulink.HMI.SignalSpecification` objects to connect the Dashboard block to the `x1` and `x2` signals. The `Simulink.HMI.SignalSpecification` object specifies a connected signal using the block path and port index for the source of the signal. The default value for the `OutputPortIndex` is 1, so this example does not specify the output port for the `x1` and `x2` signals.

```
x1_sigSpec = Simulink.HMI.SignalSpecification;
x1_sigSpec.BlockPath = Simulink.BlockPath('vdp/x1');

x2_sigSpec = Simulink.HMI.SignalSpecification;
x2_sigSpec.BlockPath = Simulink.BlockPath('vdp/x2');

connection_dashboardScope = {x1_sigSpec x2_sigSpec};
```

Use the `set_param` function to configure the connected signals for the Dashboard Scope block.

```
set_param('vdp/Dashboard Scope',"Binding",connection_dashboardScope)
```

Connect and Configure the Slider Block

Use a `Simulink.HMI.ParamSourceInfo` object and the `set_param` function to connect the Slider block to the `Gain` parameter of the `Mu` block. To connect a parameter, the `Simulink.HMI.ParamSourceInfo` needs to specify the block path for the block that corresponds to the parameter and the name of the parameter.

```
slider_param = Simulink.HMI.ParamSourceInfo;  
slider_param.BlockPath = Simulink.BlockPath('vdp/Mu');  
slider_param.ParamName = 'Gain';
```

```
set_param('vdp/Slider','Binding',slider_param)
```

Configure the scale for the slider for a range of 1 to 10 with a tick mark spacing of 1.

```
slider_limits = [1 1 10];
```

```
set_param('vdp/Slider','Limits',slider_limits)
```

MATLABFunctionConfiguration

Configure MATLAB Function block properties programmatically

Description

The MATLABFunctionConfiguration object controls the MATLAB Function block properties such as description, sample time, and the function script. You can create a configuration object using `get_param` and change the property values of the object using dot notation.

Creation

`myMFBConfigobj = get_param(gcb, 'MATLABFunctionConfiguration')` creates a MATLAB Function block configuration object for the selected MATLAB Function block.

Properties

Path — Path of the block relative to the model

character vector (default)

Display the path of the MATLAB Function block relative to the model.

Data Types: char

FunctionScript — Block function script

character vector (default)

Display the script for the MATLAB Function block.

Data Types: char

UpdateMethod — Block update method

Inherited (default) | Discrete | Continuous

Update method of the block, specified as an enumerated string.

Specify an UpdateMethod using one of these values:

- **Inherited** — Input to the MATLAB Function block determines when the block is updated during a simulation. The input is explicitly triggered by a signal on its trigger port originated from a connected Simulink block. If the UpdateMethod is changed to the 'Inherited', the sample time automatically sets to -1.
- **Discrete** — Simulink model generates an implicit event at regular time intervals to awaken the block at the rate you specify in the SampleTime property. Other blocks in the model can have different sample times.
- **Continuous** — The MATLAB Function block updates at major time steps only, although it computes outputs and local continuous variables during minor and major time steps. If the UpdateMethod is changed to 'Continuous', the sample time automatically sets to 0.

When you set the `UpdateMethod` to `Inherited` or `Continuous` and attempt to change `SampleTime`, Simulink displays a warning and ignores the input sample time.

UI Use

Open the **Ports and Data Manager** and change the **Update Method** to the method you choose.

Data Types: enumerated

SampleTime — Block sample time

character vector (default) | '0' | '-1'

Change the sample time of the MATLAB Function block. Sample time is only valid when the `UpdateMethod` is set to `Discrete`. If the `UpdateMethod` is set to `'Continuous'` or `'Inherited'`, any changes made to the sample time are ignored.

UI Use

Open the **Ports and Data Manager** and change the **Sample Time**.

Data Types: char

Description — Block Description

character vector (default)

Description of the block, specified as a character vector.

UI Use

Open the **Ports and Data Manager** and change the **Description** to the text you choose.

Data Types: char

DocumentLink — Documentation link for the block

character vector (default)

Documentation link for the block, specified as a character vector.

UI Use

Open the **Ports and Data Manager** and change the **Document Link** to your block documentation link.

Data Types: char

SupportVariableSizing — Support variable input and output data

1 (default) | 0 | true | false

Specify whether the simulation supports variable input and output data dimensions.

UI Use

Open the **Ports and Data Manager** and check the **Support variable-size arrays** to turn this setting on.

Data Types: logical

AllowDirectFeedthrough — Direct feedthrough status of the block

1 (default) | 0 | true | false

Display or change whether the block has direct feedthrough. The block is considered to have direct feedthrough if the output of the block directly depends on the input of the block. The block does not have direct feedthrough if the outputs of the block depend on the internal states and properties rather than the input of the block.

UI Use

Open the **Ports and Data Manager** and check the **Allow direct feedthrough** to turn this setting on.

Data Types: `logical`

Saturate on Integer Overflow — Specify whether overflows saturate

`1` (default) | `0` | `true` | `false`

Specify whether the integer overflow saturates. If this setting is set to `true`, the overflows saturate to either the minimum or maximum value that the data type can represent. If the setting is `false`, the overflow wraps to the appropriate value that the data type can represent. If your model has a possible overflow, and you want to apply saturation protection in your generated code, it is recommended to have this setting on. If you have performance restrictions, and not concerned with the integer overflow, you can set this property to `false`.

UI Use

Open the **Ports and Data Manager** and check the **Saturate on integer overflow** box to turn this setting on.

Data Types: `logical`

Treat As Fi — Specify data types as fi objects

'FixedPoint' (default) | 'FixedPointAndInteger'

Specify which data types to treat as `fi` data types. To learn more about `fi` objects, see “fi Object Properties” (Fixed-Point Designer).

UI Use

Open the **Ports and Data Manager** and select an option from the **Treat these inherit Simulink signal types as fi objects** menu.

Data Types: `string`

FimathMode — Specify fixed-point settings

'SameAsMATLAB' (default) | 'UserSpecified'

Specify which fixed-point math settings to use. You can use the current MATLAB fixed-point math settings, or you can enable the edit box to specify the desired fixed-point math settings. To learn more about fixed-point math, see `fimath`.

UI Use

Open the **Ports and Data Manager** and choose from the **MATLAB Function fimath** settings.

Data Types: `string`

Fimath — Specify the fixed-point math settings

'fimath('SumMode','FullPrecision')' (default) |
 fimath(...'PropertyName',PropertyValue...)

Specify the `fimath` construction function you want to use.

`fimath(... 'PropertyName', PropertyValue...)` allows you to set the attributes of a `fimath` object using property name/property value pairs. To learn more `fimath` object properties, see “`fimath` Object Properties” (Fixed-Point Designer).

UI Use

Open the **Ports and Data Manager** and edit the **MATLAB Function `fimath`** box with the appropriate `fimath` expression.

Data Types: `string`

Examples

Create a MATLAB Function Block Configuration Object

This example creates a MATLAB Function block configuration object using the 'sldemo_radar_eml' model.

```
open_system('sldemo_radar_eml')
myMFBConfig = get_param('sldemo_radar_eml/MATLAB Function', 'MATLABFunctionConfiguration');
myMFBConfig.Description = 'Radar data processing tracker using Extended Kalman';
```

Introduced in R2019b

FunctionPortSpecification

Query and configure C Caller block properties

Description

Query and configure the C Caller block function definition and return argument. Configure the C Caller block input arguments programmatically.

Creation

`myCCallerConfigObj = get_param(gcb, 'FunctionPortSpecification')` creates a C Caller block configuration object for the selected C Caller block.

Properties

CPrototype — C function mapping to the C Caller block

character vector

Displays the mapping of the C function input to the C Caller block in the model. You cannot edit this property using the command line. To edit the C function mapping, edit the source code of the C Caller block.

Example: `real_T add(real_T u1, real_T u2);`

Data Types: char

InputArguments — List of function input arguments

FunctionArgument object

Returns the list of function input arguments in a “FunctionArgument Object” on page 8-33.

ReturnArgument — List of function output arguments

FunctionArgument scalar

Returns a scalar or an empty “FunctionArgument Object” on page 8-33.

Data Types: char

FunctionArgument Object

The `FunctionArgument` is a class that carries port specification information of a C Caller block programmatically. The `FunctionArgument` object has these properties:

- 1 **Name** — Name of the variable in the source code, specified as a character vector. This property is read-only.
- 2 **PortNumber** — Port number of the `InputArgument` that has been edited, specified as `uint32`. This property is read-only.
- 3 **Size** — Size of the Simulink port dimensions specified as a character vector. You can edit this property if it is allowed in the function definition.

- 4 **Type** — Simulink data type for the specified port specified as a character vector. You can edit this property if it is allowed in the function definition.
- 5 **Label** — Port label on the Simulink block specified as a character vector. You can change the port label programmatically, for example:

```
myCCallerObj.my_CCaller.InputArguments(1).Label = 'inputport1'

my_CCallerObj =
```

FunctionPortSpecification with properties:

```
    CPrototype: 'real_T add(real_T u1, real_T u2);'
    InputArguments: [1x2 Simulink.CustomCode.FunctionArgument]
    ReturnArgument: [1x1 Simulink.CustomCode.FunctionArgument]
```

- 6 **Scope** — Mapping of the Simulink scope to the input argument specified as a character vector. If the variable is defined as a constant qualifier, the argument can be an input or a parameter. If no constant qualifier exists, you can change an output argument to an input, inputoutput, or to a parameter. If your scope fits any of the scenarios above, you can change it programmatically:

```
my_CCallerObj.InputArguments(1).Scope = 'parameter'

my_CCallerObj =
```

FunctionPortSpecification with properties:

```
    CPrototype: 'extern real_T add(real_T u1, real_T u2);'
    InputArguments: [1x2 Simulink.CustomCode.FunctionArgument]
    ReturnArgument: [1x1 Simulink.CustomCode.FunctionArgument]
```

Examples

Create a C Caller Configuration Object

This example creates a C Caller configuration object using the 'slexCCallerExample' demo model.

```
my_CCallerObj = get_param('slexCCallerExample/C Caller', 'FunctionPortSpecification')

my_CCallerObj =
```

FunctionPortSpecification with properties:

```
    CPrototype: 'real_T add(real_T u1, real_T u2);'
    InputArguments: [1x2 Simulink.CustomCode.FunctionArgument]
    ReturnArgument: [1x1 Simulink.CustomCode.FunctionArgument]
```

Create a FunctionArgument object for the 1st input port:

```
inargone = my_CCallerObj.InputArguments(1)

inargone =
```

FunctionArgument with properties:

```
    Name: 'u1'
    PortNumber: 1
    Size: '1'
```

```
Type: 'double'  
Label: 'u1'  
Scope: 'Parameter'
```

Change the label for the first input port:

```
inargone.Label = 'inputport1'
```

```
inargone =
```

```
FunctionArgument with properties:
```

```
Name: 'u1'  
PortNumber: 1  
Size: '1'  
Type: 'double'  
Label: 'inputport1'  
Scope: 'Parameter'
```

Simulink.Parameter

Store, share, and configure parameter values

Description

Create a `Simulink.Parameter` object to set the value of one or more block parameters in a model, such as the **Gain** parameter of a Gain block. You create the object in a workspace or in a data dictionary. Set the parameter value in the object, then reference the object from the block.

Use a `Simulink.Parameter` object to:

- Share a value among multiple block parameters.
- Represent an engineering constant or a tunable calibration parameter.
- Separate a parameter value from its data type and other properties.
- Configure parameter data for code generation.

The `Value` property of the object stores the parameter value. To use the object in a model, set the value of a block parameter to an expression that includes the name of the object. Omit the `Value` property from the expression. For more information, see “Use Parameter Objects”.

For more information about block parameters, see “Set Block Parameter Values” and “How Generated Code Stores Internal Signal, State, and Parameter Data” (Simulink Coder).

Creation

Create a `Simulink.Parameter` object:

- Directly from a block dialog box or the Property Inspector. See “Create, Edit, and Manage Workspace Variables”.
- By using the Model Data Editor. Inspect the **Parameters** tab. Right-click the row that contains a variable and from the context menu, select **Convert to parameter object**.
- By using the Model Explorer. See “Create Data Objects from Built-In Data Class Package Simulink”.
- By using the `Simulink.Parameter` function described below.

Syntax

```
paramObj = Simulink.Parameter  
paramObj = Simulink.Parameter(paramValue)
```

Description

`paramObj = Simulink.Parameter` returns a `Simulink.Parameter` object with default property values.

`paramObj = Simulink.Parameter(paramValue)` returns a `Simulink.Parameter` object and initializes the `Value` property to `paramValue`.

Properties

For information about the properties in the property dialog box of a `Simulink.Parameter` object, see “`Simulink.Parameter` Property Dialog Box”.

CoderInfo — Specifications for generating code for parameter object

`Simulink.CoderInfo` object

Specifications for generating code for the parameter object, returned as a `Simulink.CoderInfo` object.

This property is read only. Instead, modify the properties of the `Simulink.CoderInfo` object that this property contains.

For example, the `StorageClass` property of the `Simulink.CoderInfo` object determines how Simulink code generation toolboxes allocate memory for the parameter object in the generated code. For more information, see “Apply Storage Classes to Individual Signal, State, and Parameter Data Elements” (Simulink Coder) and “Choose Storage Class for Controlling Data Representation in Generated Code” (Embedded Coder).

Complexity — Numeric complexity of parameter value

'real' (default) | 'complex'

Numeric complexity of the parameter value, returned as 'real' (if the value is real) or 'complex' (if the value is complex). Simulink determines the complexity from the parameter value that you specify in the `Value` property. This property is read only.

Data Types: char

DataType — Data type of parameter value

'auto' (default) | character vector

Data type of the parameter value in the `Value` property, specified as 'auto' or a character vector. When you simulate the model or generate code, Simulink casts the value to the specified data type.

If you specify 'auto', the default setting, the parameter object uses the same data type as the block parameters that use the object. See “Reduce Maintenance Effort with Data Type Inheritance”.

When you set the `Value` property to something other than a double number, the object typically sets the `DataType` property based on the value of the `Value` property. For example, when you set the `Value` property to `int8(5)`, the object sets the value of the `DataType` property to 'int8'.

To explicitly specify a built-in data type (see “Data Types Supported by Simulink”), specify one of these options:

- 'double'
- 'single'
- 'int8'
- 'uint8'

- 'int16'
- 'uint16'
- 'int32'
- 'uint32'
- 'int64'
- 'uint64'
- 'boolean'

To specify a fixed-point data type, use the `fixdt` function. For example, specify `'fixdt(1,16,5)'`.

If you use a `Simulink.AliasType` or `Simulink.NumericType` object to create and share custom data types in your model, specify the name of the object.

To specify an enumerated data type, use the name of the type preceded by `Enum:`. For example, specify `'Enum: myEnumType'`.

When you store a structure or array of structures in the `Value` property of the object, the object sets the `DataType` property to `'struct'`. To specify a `Simulink.Bus` object as the data type, use the name of the bus object preceded by `Bus:`. For example, specify `'Bus: myBusObject'`.

Example: `'auto'`

Example: `'int8'`

Example: `'fixdt(1,16,5)'`

Example: `'myAliasTypeObject'`

Example: `'Enum: myEnumType'`

Example: `'Bus: myBusObject'`

Data Types: char

Description — Custom description of parameter object

`''` (default) | character vector

Custom description of the parameter object, specified as a character vector. Use this property to document the significance that the parameter object has in your algorithm.

If you have an Embedded Coder license, you can configure this description to appear in the generated code as a comment. See “Simulink data object descriptions” (Embedded Coder).

Example: `'This parameter represents the maximum rotation speed of the engine.'`

Data Types: char

Dimensions — Dimensions of parameter value

`[0 0]` (default) | row vector | character vector

Dimensions of the value stored in the `Value` property, returned as a row vector or specified as a character vector.

When you set the `Value` property of the object, the object sets the value of the `Dimensions` property to a double row vector. The vector is the same vector that the `size` function returns.

To use symbolic dimensions, specify a character vector. See “Implement Dimension Variants for Array Sizes in Generated Code” (Embedded Coder).

Example: `[1 3]`

Example: `'[1 myDimParam]'`

Data Types: `double` | `char`

Max — Maximum value of parameter

`[]` (default) | real `double` scalar

Maximum value that the `Value` property of the object can store, specified as a real `double` scalar.

The default value is empty, which means the parameter value does not have a maximum.

If you store a complex number in the `Value` property, the `Max` property applies separately to the real and imaginary parts.

If you store a structure in the `Value` property, the object ignores the `Max` property. Instead, use a `Simulink.Bus` object as the data type of the parameter object and specify a maximum value for each field by using the elements of the bus object. See “Control Field Data Types and Characteristics by Creating Parameter Object”.

If `Value` is greater than the maximum value or if the maximum value is outside the range of the object data type, Simulink generates a warning. When updating the diagram or starting a simulation, Simulink generates an error.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

Example: `5.32`

Data Types: `double`

Min — Minimum value of parameter

`[]` (default) | real `double` scalar

Minimum value that the `Value` property of the object can store, specified as a real `double` scalar.

The default value is empty, which means the parameter value does not have a minimum.

If you store a complex number in the `Value` property, the `Min` property applies separately to the real and imaginary parts.

If you store a structure in the `Value` property, the object ignores the `Min` property. Instead, use a `Simulink.Bus` object as the data type of the parameter object and specify a minimum value for each field by using the elements of the bus object. See “Control Field Data Types and Characteristics by Creating Parameter Object”.

If `Value` is less than the minimum value or if the minimum value is outside the range of the object data type, Simulink generates a warning. When updating the diagram or starting a simulation, Simulink generates an error.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

Example: `-0.92`

Data Types: double

Unit — Physical unit of parameter value

' ' (default) | character vector

Physical unit of parameter value, specified as a character vector that describes a valid unit. For more information, see “Unit Specification in Simulink Models”.

Example: 'degC'

Data Types: char

Value — Value to use in block parameters

[] (default) | numeric | boolean | enum | structure | scalar | array | <mathematical expression>

Value to use in block parameters, specified as any of these valid values:

- Numeric value
- Boolean value
- Instance of enumerated type
- Structure
- Scalar or array
- Mathematical expression (see “Set Variable Value by Using a Mathematical Expression”)

You can also use MATLAB syntax to specify the value.

Example Expression	Description
15.23	Specifies a scalar value
[3 4; 9 8]	Specifies a matrix
3+2i	Specifies a complex value
struct('A',20,'B',5)	Specifies a structure with two fields, A and B, with double-precision values 20 and 5. Organize block parameters into structures (see “Organize Related Block Parameter Definitions in Structures”) or initialize the signal elements in a bus (see “Specify Initial Conditions for Bus Signals”).
slexpr('myVar + myOtherVar')	Specifies the expression myVar + myOtherVar where myVar and myOtherVar are other MATLAB variables or parameter objects. Simulink preserves this mathematical relationship between the object and the variables.

To use a `Simulink.Parameter` object to store a value of a particular numeric data type, specify the ideal value with the `Value` property and control the type with the `DataType` property.

If you set the `Value` property by using a typed expression such as `single(32.5)`, the `DataType` property changes to reflect the new type. A best practice is to use an expression that is not typed to avoid accumulating numerical error through repeated quantizations or data type saturation, especially for fixed-point data types.

Example: 3.15

Example: 1.2 + 3.2i

Example: true

Example: myEnumType.myEnumValue

Example: struct('field1',15,'field2',7.32)

Example: slexpr('myVar + myOtherVar')

Data Types: double | single | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | logical | struct | fi | enum

Complex Number Support: Yes

Examples

Use Parameter Object to Set Value of Gain Parameter

- 1 At the command prompt, create a `Simulink.Parameter` object.

```
myParam = Simulink.Parameter;
```

- 2 Assign a numeric value to the `Value` property.

```
myParam.Value = 15.23;
```

- 3 Specify the minimum and maximum values the parameter can take with the `Min` and `Max` properties.

```
myParam.Min = 10.11;
```

```
myParam.Max = 25.27;
```

- 4 Open a new Simulink model. Add a Gain block and set its **Gain** parameter to `myParam`. During simulation, the **Gain** parameter uses the value 15.23.

Change Value Stored by Parameter Object

- 1 At the command prompt, create a `Simulink.Parameter` object that stores the value 2.52.

```
myParam = Simulink.Parameter(2.52);
```

- 2 Change the value by accessing the `Value` property of the object. This technique preserves the values of the other properties of the object.

```
myParam.Value = 1.13;
```

Create Parameter Object with Specific Numeric Data Type

To reduce model maintenance, you can leave the `DataType` property at its default value, `auto`. The parameter object acquires a data type from the block parameter that uses the object.

To reduce the risk of the data type changing when you make changes to signal data types and other data types in your model, you can explicitly specify a data type for the parameter object. For example, when you generate code that exports parameter data to your custom code, explicitly specify a data type for the object.

- 1 At the MATLAB command prompt, create a `Simulink.Parameter` object that stores the value 18.25.

```
myParam = Simulink.Parameter(18.25);
```

The expression `18.25` returns the number 18.25 with the double-precision, floating-point data type `double`. The `Value` property stores the number 18.25 with double precision.

- 2 Use the `DataType` property to specify the single-precision data type `single`.

```
myParam.DataType = 'single';
```

When you simulate or generate code, the object casts the value of the `Value` property, 18.25, to the data type specified by the `DataType` property, `single`.

Set Parameter Value to a Mathematical Expression

This example shows how to set the value of a parameter object, `myParam`, to the sum of two other variables, `myVar` and `myOtherVar`. With this technique, when you change the values of the independent variables, Simulink immediately calculates the new value of the parameter object.

- 1 Create the two independent variables.

```
myVar = 5.2;  
myOtherVar = 9.8;
```

- 2 Create the parameter object.

```
myParam = Simulink.Parameter;
```

- 3 Set the value of the parameter object to the expression `myVar + myOtherVar`.

```
myParam.Value = slexpr('myVar + myOtherVar')
```

When you simulate or generate code, the expression evaluates to 15.

Simulink.sdi.DiffRunResult

Access run comparison results

Description

The `Simulink.sdi.DiffRunResult` object provides access to run comparison metadata and comparison results. Use the `getSignalByIndex` function to access the metadata and comparison results for each signal in the run comparison.

Creation

A `Simulink.sdi.DiffRunResult` object is created when you perform a comparison using the Simulation Data Inspector.

When you compare data using the UI, use the `Simulink.sdi.getCurrentComparison` function to access the results in a `Simulink.sdi.DiffRunResult` object.

Programmatic comparisons using the `Simulink.sdi.compareRuns` function or the `compare` function return a `DiffRunResult` object.

Properties

MatlabVersion — Software version used to create object

character vector

This property is read-only.

Version of MATLAB used to create the `DiffRunResult` object, returned as a character vector.

RunID1 — Baseline run ID

integer

This property is read-only.

Run identifier for the comparison baseline run, returned as an integer.

RunID2 — ID for run to compare

integer

This property is read-only.

Run identifier of the run to compare, returned as an integer.

Count — Number of signals compared

integer

This property is read-only.

Number of signals that aligned between the two runs in the comparison, returned as an integer. For more information on how signals are aligned for comparisons, see “Signal Alignment”.

DateCreated — Object creation date

`datetime`

This property is read-only.

Date and time the `Simulink.sdi.DiffRunResult` object was created, returned as a `datetime` object.

Data Types: `datetime`

GlobalTolerance — Global tolerance values used for comparison

`structure`

This property is read-only.

Global tolerance values used for the run comparison, returned as a structure with fields:

- `AbsTol` — Global absolute tolerance used for the run comparison.
- `RelTol` — Global relative tolerance used for the run comparison.
- `TimeTol` — Global time tolerance used for the run comparison.

For more information about how tolerances are used and calculated for comparisons, see “Tolerance Specification”.

Summary — Comparison results summary

`structure`

This property is read-only.

Comparison results summary, returned as a structure with a field for each `Status` a signal comparison result could have. The value of each field indicates the number of signals in the run comparison with the corresponding `Status`.

- `WithinTolerance` — Signal comparison completed, and all data points compared fell within the specified tolerance.
- `OutOfTolerance` — Signal comparison completed, and some data points compared fell outside of the specified tolerance.
- `Unaligned` — Signal from the baseline run did not align with a signal in the run to compare.
- `Empty` — Aligned signal in the baseline run or run to compare contains no data.
- `EmptySynced` — Synchronized signal in the baseline run or run to compare contains no data. An empty synchronized signal can mean that the signals do not overlap or, if you specified the intersection synchronization method, that they included none of the same time points.
- `Canceled` — Signal result not computed because the user canceled the comparison.
- `Pending` — Comparison is in progress and the signal result computation has not started.
- `Processing` — Signal result computation in progress.
- `UnitsMismatch` — The signal units in the baseline run and run to compare do not match.
- `DataTypeMismatch` — The signal data types in the baseline run and run to compare do not match. Only results of comparisons configured to check signal data types can have this status.

- **TimeMismatch** — The signal time vectors in the baseline run and run to compare do not match. Only results of comparisons configured to check signal time vectors can have this status.
- **StartStopMismatch** — The signal start and stop times in the baseline run and run to compare do not match. Only results of comparisons configured to check signal start and stop times can have this status.
- **Unsupported** — The Simulation Data Inspector comparison algorithm does not support this type of signal. For example, signals with data types that lose precision when converted to `double` are not supported.

For more information about alignment, tolerances, and synchronization, see “How the Simulation Data Inspector Compares Data”. For more information about how to configure a comparison to check additional metadata, see `Simulink.sdi.compareRuns`.

Options — Comparison configuration

`n-by-2` cell array

This property is read-only.

Configuration options used for the comparison, returned as an `n-by-2` cell array. Each row in the cell array corresponds to an option used by the comparison. Every comparison requires that aligned signal units match, so the `Options` property always includes a row to indicate that units must match. Other possible configuration options correspond to these name-value pairs for the `Simulink.sdi.compareRuns` function:

- `DataType`
- `Time`
- `StartStop`
- `StopOnFirstMismatch`

Status — Status of run comparison

`Completed` | `Canceled` | `Stopped`

This property is read-only.

Status of the run comparison, indicating how the comparison ended, returned as one of the following:

- `Completed` — Comparison finished computing all results
- `Canceled` — Comparison ended because the user canceled the comparison operation in the UI
- `Stopped` — Comparison ended because the comparison detected a mismatch and was configured to stop on the first mismatch

StopReason — Signal result that stopped the run comparison

`Simulink.sdi.DiffSignalResult`

This property is read-only.

Signal result for signal comparison that caused the run comparison to stop without comparing remaining signals, returned as a `Simulink.sdi.DiffSignalResult` object. The `StopReason` property is empty when the comparison completes without detecting a mismatch and when the comparison is not configured to stop on the first mismatch. You can configure a simulation to stop on the first mismatch using the `Simulink.sdi.compareRuns` function and the `'StopOnFirstMismatch'` name-value pair.

Object Functions

getResultByIndex Return signal comparison result
 saveResult Save comparison results to an MLDATX file

Examples

Analyze Simulation Data Using Signal Tolerances

Using the Simulation Data Inspector programmatic interface, you can specify signal tolerance values to use in comparisons. This example uses the `slexAircraftExample` model and the Simulation Data Inspector to evaluate the effect of changing the time constant for the low-pass filter following the control input.

Configure the Model

Load the model and mark signals of interest for logging. This example logs data for the `q` and `alpha` signals.

```
load_system('slexAircraftExample')

Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',3,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on')
```

Run Simulations

Run simulations with different low-pass filter time constants to generate results to compare. The `slexAircraftExample` model stores variables associated with the model in the model workspace. To modify the time constant value, access the model workspace and use the `assignin` function.

```
out1 = sim('slexAircraftExample');

modelWorkspace = get_param('slexAircraftExample','modelworkspace');
assignin(modelWorkspace,'Ts',1)

out2 = sim('slexAircraftExample');
```

Access and Compare Simulation Results

Access the simulation results using the Simulation Data Inspector programmatic interface. Each simulation creates a run in the Simulation Data Inspector with a unique run ID. You use the run IDs to compare the simulation results.

```
runIDs = Simulink.sdi.getAllRunIDs;
runIDTs1 = runIDs(end-1);
runIDTs2 = runIDs(end);
```

Use the `Simulink.sdi.compareRuns` function to compare the data from the simulations. Then inspect the `Status` property of the signal result to see whether the signals fell within the default tolerance of 0.

```
diffRun1 = Simulink.sdi.compareRuns(runIDTs1,runIDTs2);

sig1Result1 = getResultByIndex(diffRun1,1);
sig2Result1 = getResultByIndex(diffRun1,2);

sig1Result1.Status
```

```
ans =
OutOfTolerance
```

```
sig2Result1.Status
```

```
ans =
OutOfTolerance
```

Compare Runs with Signal Tolerances

By default, signals use 0 for all tolerance values, so the comparison returns out-of-tolerance results when the signals are not identical. To further analyze the effect of the time constant change, specify tolerance values for the signals. You can specify tolerances for a programmatic comparison using the properties of the `Simulink.sdi.Signal` objects in the runs you compare. The comparison uses the tolerances specified for the baseline `Signal` object. This example specifies a combination of time and absolute tolerances.

To specify tolerances, first access the `Simulink.sdi.Signal` objects that correspond to each signal in the runs you want to compare.

```
run1 = Simulink.sdi.getRun(runIDTs1);
sigID1 = getSignalIDByIndex(run1,1);
sigID2 = getSignalIDByIndex(run1,2);

sig1 = Simulink.sdi.getSignal(sigID1);
sig2 = Simulink.sdi.getSignal(sigID2);
```

Check the `Name` property to identify each `Signal` object.

```
sig1.Name

ans =
'q, rad/sec'
```

```
sig2.Name

ans =
'alpha, rad'
```

Specify an absolute tolerance of 0.1 and a time tolerance of 0.6 for the `q` signal using the `AbsTol` and `TimeTol` properties of the `q` signal object in the baseline run.

```
sig1.AbsTol = 0.1;
sig1.TimeTol = 0.6;
```

Specify an absolute tolerance of 0.2 and a time tolerance of 0.8 for the `alpha` signal using the `AbsTol` and `TimeTol` properties of the `alpha` signal object in the baseline run.

```
sig2.AbsTol = 0.2;
sig2.TimeTol = 0.8;
```

Compare the runs again and access the results.

```
diffRun2 = Simulink.sdi.compareRuns(runIDTs1,runIDTs2);
sig1Result2 = getResultByIndex(diffRun2,1);
sig2Result2 = getResultByIndex(diffRun2,2);
```

Check the `Status` property of each signal to determine whether the comparison results fell within the specified tolerances.

```
sig1Result2.Status
```

```
ans =  
WithinTolerance
```

```
sig2Result2.Status
```

```
ans =  
WithinTolerance
```

Configure Comparisons to Check Metadata

You can use the `Simulink.sdi.compareRuns` function to compare signal data and metadata, including data type and start and stop times. A single comparison may check for mismatches in one or more pieces of metadata. When you check for mismatches in signal metadata, the `Summary` property of the `Simulink.sdi.DiffRunResult` object may differ from a basic comparison because the `Status` property for a `Simulink.sdi.DiffSignalResult` object can indicate the metadata mismatch. You can configure comparisons using the `Simulink.sdi.compareRuns` function for imported data and for data logged from a simulation.

This example configures a comparison of runs created from workspace data three ways to show how the `Summary` of the `DiffSignalResult` object can provide specific information about signal mismatches.

Create Workspace Data

The `Simulink.sdi.compareRuns` function compares time series data. Create data for a sine wave to use as the baseline signal, using the `timeseries` format. Give the `timeseries` the name `Wave Data`.

```
time = 0:0.1:20;  
sig1vals = sin(2*pi/5*time);  
sig1_ts = timeseries(sig1vals,time);  
sig1_ts.Name = 'Wave Data';
```

Create a second sine wave to compare against the baseline signal. Use a slightly different time vector and attenuate the signal so the two signals are not identical. Cast the signal data to the `single` data type. Also name this `timeseries` object `Wave Data`. The Simulation Data Inspector comparison algorithm will align these signals for comparison using the name.

```
time2 = 0:0.1:22;  
sig2vals = single(0.98*sin(2*pi/5*time2));  
sig2_ts = timeseries(sig2vals,time2);  
sig2_ts.Name = 'Wave Data';
```

Create and Compare Runs in the Simulation Data Inspector

The `Simulink.sdi.compareRuns` function compares data contained in `Simulink.sdi.Run` objects. Use the `Simulink.sdi.createRun` function to create runs in the Simulation Data Inspector for the data. The `Simulink.sdi.createRun` function returns the run ID for each created run.

```
runID1 = Simulink.sdi.createRun('Baseline Run','vars',sig1_ts);
runID2 = Simulink.sdi.createRun('Compare to Run','vars',sig2_ts);
```

You can use the `Simulink.sdi.compareRuns` function to compare the runs. The comparison algorithm converts the signal data to the `double` data type and synchronizes the signal data before computing the difference signal.

```
basic_DRR = Simulink.sdi.compareRuns(runID1,runID2);
```

Check the `Summary` property of the returned `Simulink.sdi.DiffRunResult` object to see the result of the comparison.

```
basic_DRR.Summary
```

```
ans = struct with fields:
    OutOfTolerance: 1
    WithinTolerance: 0
    Unaligned: 0
    UnitsMismatch: 0
    Empty: 0
    Canceled: 0
    EmptySynced: 0
    DataTypeMismatch: 0
    TimeMismatch: 0
    StartStopMismatch: 0
    Unsupported: 0
```

The difference between the signals is out of tolerance.

Compare Runs and Check for Data Type Match

Depending on your system requirements, you may want the data types for signals you compare to match. You can use the `Simulink.sdi.compareRuns` function to configure the comparison algorithm to check for and report data type mismatches.

```
dataType_DRR = Simulink.sdi.compareRuns(runID1,runID2,'DataType','MustMatch');
dataType_DRR.Summary
```

```
ans = struct with fields:
    OutOfTolerance: 0
    WithinTolerance: 0
    Unaligned: 0
    UnitsMismatch: 0
    Empty: 0
    Canceled: 0
    EmptySynced: 0
    DataTypeMismatch: 1
    TimeMismatch: 0
    StartStopMismatch: 0
    Unsupported: 0
```

The result of the signal comparison is now `DataTypeMismatch` because the data for the baseline signal is `double` data type, while the data for the signal compared to the baseline is `single` data type.

Compare Runs and Check for Start and Stop Time Match

You can use the `Simulink.sdi.compareRuns` function to configure the comparison algorithm to check whether the aligned signals have the same start and stop times.

```
startStop_DRR = Simulink.sdi.compareRuns(runID1,runID2, 'StartStop', 'MustMatch');
startStop_DRR.Summary
```

```
ans = struct with fields:
    OutOfTolerance: 0
    WithinTolerance: 0
    Unaligned: 0
    UnitsMismatch: 0
    Empty: 0
    Canceled: 0
    EmptySynced: 0
    DataTypeMismatch: 0
    TimeMismatch: 0
    StartStopMismatch: 1
    Unsupported: 0
```

The signal comparison result is now `StartStopMismatch` because the signals created in the workspace have different stop times.

Alternatives

You can view and inspect comparison results using the Simulation Data Inspector UI. For more information, see “Compare Simulation Data”.

For software tests, see the `Simulink.sdi.constraints.MatchesSignal` constraint.

Introduced in R2012b

Simulink.sdi.DiffSignalResult

Access signal comparison results

Description

The `Simulink.sdi.DiffSignalResult` object contains the data and metadata for signal comparison results. A `Simulink.sdi.DiffSignalResult` object includes the difference signal, tolerance data, and the synchronized signal data.

Creation

When you use the Simulation Data Inspector to compare runs or signals, you can access signal comparison results in a `Simulink.sdi.DiffSignalResult` object two ways:

- By using the `Simulink.sdi.compareSignals` function to compare signals.
- By using the `getResultByIndex` function to access `DiffSignalResult` objects in `Simulink.sdi.DiffRunResult` objects.

Properties

Status — Comparison result signal status

`WithinTolerance` | `OutOfTolerance` | `Unaligned` | `Pending` | `Processing` | ...

This property is read-only.

Status of the signal comparison corresponding to the `DiffSignalResult` object, returned as one of the following options. The status can indicate where a given signal comparison is in the comparison process during a long comparison, or it can indicate information about the result of the signal comparison.

- `WithinTolerance` — Signal comparison completed, and all data points compared fell within the specified tolerance.
- `OutOfTolerance` — Signal comparison completed, and some data points compared fell outside of the specified tolerance.
- `Unaligned` — Signal from the baseline run did not align with a signal in the run to compare.
- `Empty` — Aligned signal in the baseline run or run to compare contains no data.
- `EmptySynced` — Synchronized signal in the baseline run or run to compare contains no data. An empty synchronized signal can mean that the signals do not overlap or, if you specified the intersection synchronization method, that they included none of the same time points.
- `Canceled` — Signal result not computed because the user canceled the comparison or the algorithm ended the comparison before computing this signal result.
- `Pending` — Comparison is in progress and the signal result computation has not started.
- `Processing` — Signal result computation in progress.
- `UnitsMismatch` — The signal units in the baseline run and run to compare do not match.

- **DataTypeMismatch** — The signal data types in the baseline run and run to compare do not match. Only results of comparisons configured to check signal data types can have this status.
- **TimeMismatch** — The signal time vectors in the baseline run and run to compare do not match. Only results of comparisons configured to check signal time vectors can have this status.
- **StartStopMismatch** — The signal start and stop times in the baseline run and run to compare do not match. Only results of comparisons configured to check signal start and stop times can have this status.
- **Unsupported** — The Simulation Data Inspector comparison algorithm does not support this type of signal. For example, signals with data types that lose precision when converted to `double` are not supported.

For more information about alignment, tolerances, and synchronization, see “How the Simulation Data Inspector Compares Data”. For more information about configuring comparisons to check for additional metadata, see `Simulink.sdi.compareRuns`.

AlignBy — Property by which signals aligned for comparison

character vector

This property is read-only.

Property by which signals aligned in a run comparison, returned as a character vector. When the `DiffSignalResult` object was created from a signal comparison, the `AlignBy` property is empty. For more information about how run comparisons align signals, see “How the Simulation Data Inspector Compares Data”.

SignalID1 — Baseline signal ID

integer

This property is read-only.

Unique signal identifier for the baseline signal in the comparison, returned as an integer.

SignalID2 — Signal ID of the signal to compare

integer

This property is read-only.

Unique signal identifier for the signal to compare against the baseline signal, returned as an integer.

MaxDifference — Maximum difference

double

This property is read-only.

Maximum difference between the two comparison signals, returned as a double.

Sync1 — Synchronized Baseline signal

timeseries

This property is read-only.

Synchronized baseline signal, returned as a `timeseries` object. For more information about synchronization, see “How the Simulation Data Inspector Compares Data”.

Sync2 — Synchronized Compare to signal`timeseries`

This property is read-only.

Synchronized signal to compare, returned as a `timeseries` object. For more information about synchronization, see “How the Simulation Data Inspector Compares Data”.

Diff — Difference signal`timeseries`

This property is read-only.

Difference signal resulting from the comparison, returned as a `timeseries` object.

Examples**Compare Signals Within a Simulation Run**

This example uses the `slexAircraftExample` model to demonstrate how to compare the input and output signals of the control system.

Configure and Simulate the Model

The `slexAircraftExample` model does not log data. Load the model and mark the input and output signals for logging.

```
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot',1,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on')
```

Simulate the model. The data for the logged signals logs to the Simulation Data Inspector and to the workspace.

```
out = sim('slexAircraftExample');
```

Access Simulation Data

Use the Simulation Data Inspector programmatic interface to access the data. The `Simulink.sdi.Run.getLatest` function returns the most recently created run in the Simulation Data Inspector repository. Use the `getSignalIDByIndex` function to access the signal IDs for the logged signals.

```
aircraftRun = Simulink.sdi.Run.getLatest;

signalID1 = getSignalIDByIndex(aircraftRun,1);
signalID2 = getSignalIDByIndex(aircraftRun,2);
```

Specify Tolerance Values

You can specify tolerance values to use in the comparison as a property in the logged `Simulink.sdi.Signal` object. Use the `Simulink.sdi.getSignal` function to access the `Signal` object using the signal ID.

```
signal1 = Simulink.sdi.getSignal(signalID1);
signal1.AbsTol = 0.1;
```

Compare Signals

Use the `Simulink.sdi.compareSignals` function to compare the input and output signals. This example uses the `isValidSignalID` function to verify that both signal IDs are still valid before calling the `Simulink.sdi.compareSignals` function. A signal ID becomes invalid when the signal is deleted from the Simulation Data Inspector. After the comparison, check the status in the `Simulink.sdi.DiffSignalResult` object.

```
if (isValidSignalID(aircraftRun,signalID1) && isValidSignalID(aircraftRun,signalID2))
    sigDiff = Simulink.sdi.compareSignals(signalID1,signalID2);

    match = sigDiff.Status
end

match =
OutOfTolerance
```

The comparison result is out of tolerance. You can use the `Simulink.sdi.view` function to inspect and analyze the comparison results.

Alternatives

You can view and inspect comparison results using the Simulation Data Inspector UI. For more information, see “Compare Simulation Data”.

Introduced in R2012b

Simulink.profiler.Data

Programmatically access Simulink Profiler information

Description

The `Simulink.profiler.Data` object provides access to simulation profiling metadata.

Creation

Access the `Simulink.profiler.Data` object from the `SimulationMetadata.TimingInfo` field of the `Simulink.SimulationOutput` object.

Properties

run — Profiling session identifier

character vector | string scalar

This is a read only property.

Identifier of the profiling session, returned as a character vector or string scalar.

Example: `'vdp @ 21-Nov-2019 13:48:00'`

Data Types: `char` | `string`

UserString — User documentation of profiling session

"" (default) | character vector | string scalar

Use the `UserString` field to document relevant information about the current profiling session

Example: `profilingData.UserString = "Updated gain to reduce chatter.";`

Data Types: `char` | `string`

rootUINode — Block hierarchy of the model

`Simulink.profiler.UINode` object

Block hierarchy of the model, returned as a `Simulink.profiler.UINode` object with the following fields:

Field	Value	Description
<code>totalTime</code>	double	Execution time of the block, as well as its children.
<code>selfTime</code>	double	Execution time of the block, excluding its children
<code>numberOfCalls</code>	double	Number of times the block was executed during the simulation.

Field	Value	Description
children	Simulink.profiler.UINode array	Contents of the current block
path	string scalar	Path of the block relative to the top level of the model. Note The path of the rootUINode field is the name of the model

A `Simulink.profiler.UINode` object corresponds to a row in the block hierarchy view of the Simulink Profiler.

rootExecNode — Execution stack of the model

`Simulink.profiler.ExecNode`

Execution phases of the model, returned as a `Simulink.profiler.ExecNode` object with the following fields:

Field	Value	Description
totalTime	double	Execution time of the stack element, as well as its children.
selfTime	double	Execution time of the stack element, excluding its children
numberOfCalls	double	Number of times the stack element was executed during the simulation.
location		Specific phase of the model's execution
children	Simulink.profiler.ExecNode array	Similar tasks corresponding to the execution phase of the parent.
objectPath	string scalar	Path of the model element corresponding to the current element of the execution stack. Note The objectPath field of the rootExecNode is the name of the model

A `Simulink.profiler.ExecNode` object corresponds to a row in the execution stack view of the Simulink Profiler.

Simulink.sdi.Run

Access run signals and metadata

Description

The `Simulink.sdi.Run` object contains run metadata and allows you to access the `Simulink.sdi.Signal` objects that contain data and metadata for the signals in the run. You can also use a `Simulink.sdi.Run` object to import data into the Simulation Data Inspector from the workspace or a file.

Creation

The Simulation Data Inspector creates `Simulink.sdi.Run` objects when you import data or simulate a model that logs data. You can access a Run object in the Simulation Data Inspector three ways:

- When you want to access a run that corresponds to a specific run ID, use the `Simulink.sdi.getRun` function.

Tip Use the `Simulink.sdi.getAllRunIDs` function to get the run IDs for all the runs in the Simulation Data Inspector.

- When you want to access the most recently created run in the Simulation Data Inspector, use the `Simulink.sdi.Run.getLatest` function.
- When you want to access the run that corresponds to the in-progress or most recently completed simulation of a model, use the `Simulink.sdi.getCurrentSimulationRun` function.

You can also programmatically create a `Simulink.sdi.Run` object to import data into the Simulation Data Inspector.

- Create an empty run in the Simulation Data Inspector using the `Simulink.sdi.Run.create` function.
- Create an empty run in the Simulation Data Inspector or import data into the Simulation Data Inspector using the `Simulink.sdi.createRun`.

Tip Use the `add` function or the `Simulink.sdi.addToRun` function to import data into an empty Run object.

Properties

ID — Run ID

integer

This property is read-only.

Unique numerical identification for the run, returned as an integer.

Name — Run name

character vector | string

Run name, specified as a character vector or string.

By default, the `Name` property is empty when you use the `Simulink.sdi.Run.create` function to create a run.

You can specify the run name when you use the `Simulink.sdi.createRun` function to create a run.

When you create a run by simulating a model that logs data, the run name is generated according to the run-naming rule in the Simulation Data Inspector. You can modify the run-naming rule in the Simulation Data Inspector in the UI or by using the `Simulink.sdi.setRunNamingRule` function.

Example: 'Run 1: vdp'

Description — Run description

[] (default) | character vector | string

Description of the run, specified as a character vector or string. By default, `Description` is empty. Use the `Description` property to add notes about the significance of the data within the run, like the test or simulation conditions used to create the data.

Example: 'Initial simulation'

Tag — Information tag

[] (default) | character vector | string

Tag for additional run information, specified as a character vector or string. By default, `Tag` is empty. You can use the `Tag` property to attach additional information to the Run object. For example, you could use the `Tag` property to include parameter values used for the simulation that created the run in the Run object metadata.

Example: 'Gain = 2'

DateCreated — Run creation timestamp

datetime object

Date and time the run was created, returned as a `datetime` object.

Example: 07-Dec-2019 13:55:25

Data Types: `datetime`

RunIndex — Index of run in Simulation Data Inspector

integer

This property is read-only.

Index of the run in the Simulation Data Inspector when the run was created, returned as an integer. The `RunIndex` matches the run number in the run name when you use the run index as part of the run-naming rule.

If you delete runs from the Simulation Data Inspector, the value of the `RunIndex` property may not match the index of the run ID in the vector returned by the `Simulink.sdi.getAllRunIDs` function.

SignalCount — Number of signals in run

integer

This property is read-only.

Number of signals in the run, returned as an integer.

Model — Model simulated to create run

character vector

Name of the model simulated to create the run, returned as a character vector. The `Model` property is empty for runs created by importing data into the Simulation Data Inspector.

SimMode — Simulation mode

character vector

Simulation mode used in the simulation that created the run, returned as a character vector. The `SimMode` property is empty for runs created by importing data into the Simulation Data Inspector.

StartTime — Run start time

scalar

First time point shared by all signals in the run, returned as a scalar.

StopTime — Run stop time

scalar

Last time point shared by all signals in the run, returned as a scalar.

SLVersion — Software version used for model simulation that created run

character vector

Version of Simulink used for the simulation that created the run, returned as a character vector. The `SLVersion` property is empty for runs created by importing data into the Simulation Data Inspector.

ModelVersion — Version of model simulated to create run

character vector

Version of the model that was simulated to create the run, returned as a character vector. The version of a model is stored in its model properties. The `ModelVersion` property is empty for runs created by importing data into the Simulation Data Inspector.

UserID — System account

character vector

System account used to perform the simulation that created the run, returned as a character vector. The `UserID` property is empty for runs created by importing data into the Simulation Data Inspector.

MachineName — Name of machine used for simulation

character vector

Name of the machine used to perform the simulation that created the run, returned as a character vector. The `MachineName` property is empty for runs created by importing data into the Simulation Data Inspector.

Platform — Operating system on machine used for simulation

character vector

Operating system on the machine used to perform the simulation, returned as a character vector. The `Platform` property is empty for runs that do not correspond to a simulation.

Example: 'PCWIN64'

TaskName — Task name

[] (default) | character vector

Name of the simulation task that corresponds to the run, returned as a character vector. The `TaskName` property is empty unless the run was created using Parallel Computing Toolbox workers.

SolverType — Type of solver used in simulation that created run

'Variable-Step' | 'Fixed-Step'

Type of solver used in the simulation that created the run, returned as 'Variable-Step' or 'Fixed-Step'. The `SolverType` property is empty for runs created by importing data into the Simulation Data Inspector.

SolverName — Name of solver used in simulation that created run

character vector

Name of the solver used in the simulation that created the run, returned as a character vector. The `SolverName` property is empty for runs created by importing data into the Simulation Data Inspector.

Example: ode45

SolverStepSize — Solver step size used in simulation

character vector

Step size used by the solver during the simulation, returned as a character vector. If the simulation used a fixed-step solver, the `SolverStepSize` property indicates the fixed step size used in the simulation. If the simulation used a variable-step solver, the `SolverStepSize` property indicates the maximum step size used in the simulation.

Example: '0.4'

Status — Simulation status

character vector

Simulation status, returned as a character vector. When the simulation is running, the `Status` property is 'Running'. When a simulation is paused or completes, the `Status` property takes the value from the `StopEvent` field of the `Simulink.SimulationMetadata` object `StopEvent` property. The `StopEvent` property has one of these values:

- `ReachedStopTime` — The simulation completed with no reported errors, not including errors reported in the `StopFcn` callback, which executes after the simulation stops.
- `ModelStop` — A block or solver stopped the simulation before the simulation stop time.
- `StopCommand` — A **Stop** button press or `set_param` function call ended the simulation.
- `DiagnosticError` — A reported error ended the simulation.
- `KeyboardControlC` — A Ctrl+C keyboard entry ended the simulation.
- `PauseCommand` — A **Pause** button press or `set_param` function call paused the simulation.
- `ConditionalPause` — A conditional breakpoint paused the simulation.

- **PauseTime** — A specified pause time paused the simulation.
- **StepForward** — The simulation paused after stepping forward while stepping through a simulation.
- **StepBackward** — The simulation paused after stepping backward while stepping through a simulation.
- **TimeOut** — The simulation stopped after the simulation execution time exceeded the timeout time specified using the 'TimeOut' name-value pair for the `sim` function.

StopEventSource — Block that issued stop event`Simulink.SimulationData.BlockPath`

Block that issued the stop event that stopped the simulation, returned as a `Simulink.SimulationData.BlockPath` object.

StopEventDescription — Translated description of simulation stop`character vector`

Translated description of the simulation stop, returned as a character vector. The `StopEventDescription` includes a description of the stop event and the associated simulation time, if applicable. The `StopEventDescription` property takes its value from the `StopEventDescription` field of the `Simulink.SimulationMetadata` object `ExecutionInfo` property.

Example: `'Pause command issued at time 100'`

ExecutionErrors — Errors that occurred during simulation`character vector`

Errors that occurred during simulation, returned as a character vector.

ExecutionWarnings — Warnings that occurred during simulation`character vector`

Warnings that occurred during simulation, returned as a character vector.

ModelInitializationTime — Time to initialize model for simulation that created run`double`

Time required to initialize the model for the simulation that created the run, returned as a double. The `ModelInitializationTime` property is empty for runs created by importing data into the Simulation Data Inspector.

ModelExecutionTime — Execution time for simulation that created run`double`

Execution time for the simulation that created the run, returned as a double. The `ModelExecutionTime` property is empty for runs created by importing data into the Simulation Data Inspector.

ModelTerminationTime — Time to terminate simulation that created run`double`

Time to terminate the simulation that created the run, returned as a double. The `ModelTerminationTime` property is empty for runs created by importing data into the Simulation Data Inspector.

ModelTotalElapsedTime — Total simulation time for simulation that created run

double

Total simulation time for the simulation that created the run, returned as a double. The `ModelTotalElapsedTime` property is empty for runs created by importing data into the Simulation Data Inspector.

UserString — User-specified string

character vector

User-specified string that corresponds to the simulation, returned as a character vector. Often, the `UserString` provides a brief description of the simulation. You specify the `UserString` for a simulation in the `Simulink.SimulationInput` object for the simulation.

Object Functions

<code>add</code>	Add signals to <code>Simulink.sdi.Run</code> object
<code>export</code>	Export run to base workspace or file
<code>getAllSignalIDs</code>	Get all signal IDs for signals in <code>Simulink.sdi.Run</code> object
<code>getAllSignals</code>	Get all signals in <code>Simulink.sdi.Run</code> object
<code>getDatasetRef</code>	Create a <code>Simulink.sdi.DatasetRef</code> object for a run
<code>getSignalByIndex</code>	Get signal in <code>Simulink.sdi.Run</code> object by index
<code>getSignalIDByIndex</code>	Get signal ID for signal at specified index in <code>Simulink.sdi.Run</code> object
<code>getSignalIDsByName</code>	Get signal IDs for signals inside <code>Simulink.sdi.Run</code> object using signal name
<code>getSignalsByName</code>	Access signals in a <code>Simulink.sdi.Run</code> object using signal name
<code>isValidSignalID</code>	Check whether signal ID corresponds to signal in <code>Simulink.sdi.Run</code> object

Examples**Plot Signals from Simulation Run**

This example demonstrates how to access the `Simulink.sdi.Run` object for a Simulation Data Inspector run created by logging signals. From the `Simulink.sdi.Run` object you can get `Simulink.sdi.Signal` objects that contain the logged signal data and metadata. You can use the `Signal` objects and the `plotOnSubPlot` function to plot the data in the Simulation Data Inspector.

Create a Simulation Run and Access the Run Object

The `ex_vdp` model logs two signals. To create a simulation run containing the logged data, simulate the model.

```
sim('ex_vdp');
```

The Simulation Data Inspector keeps track of runs by assigning a unique numeric run ID to each run created by simulation, importing data, or opening a session. To access the run object for the simulation you just performed, use the `Simulink.sdi.getAllRunIDs` function and take the last run ID in the returned vector.

```
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

Once you have the run ID for the run, you can use the `Simulink.sdi.getRun` function to get the `Simulink.sdi.Run` object that corresponds to the run. You can use the `Run` object to check the metadata associated with the run, including the number of signals in the run.

```
vdpRun = Simulink.sdi.getRun(runID);  
vdpRun.SignalCount  
ans = int32  
     2
```

Plot Data Using Signal Objects

Use the `getSignalByIndex` function to access signals from the Run object, `fuelRun`.

```
signal1 = getSignalByIndex(vdpRun,1);  
signal2 = getSignalByIndex(vdpRun,2);
```

Use the `Simulink.sdi.setSubPlotLayout` function to specify a 3-by-1 layout.

```
Simulink.sdi.setSubPlotLayout(2,1)
```

Before plotting the data, use the `Simulink.sdi.clearAllSubPlots` function to clear any data that is already plotted.

```
Simulink.sdi.clearAllSubPlots
```

Plot one signal on each subplot. To plot signals on the first subplot, you can set the checked property for the signal. To plot signals on subplots other than the first subplot, use the `plotOnSubPlot` function.

```
signal1.Checked = true;  
plotOnSubPlot(signal2,2,1,true);
```

View the Plotted Data

To view the plots you just created, open the Simulation Data Inspector using the `Simulink.sdi.view` function.

Create a Run and View the Data

This example shows how to create a run, add data to it, and then view the data in the Simulation Data Inspector.

Create Data for the Run

Create timeseries objects to contain data for a sine signal and a cosine signal. Give each timeseries object a descriptive name.

```
time = linspace(0,20,100);

sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals,time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals,time);
cos_ts.Name = 'Cosine, T=8';
```

Create a Run and Add Data

Use the `Simulink.sdi.view` function to open the Simulation Data Inspector.

```
Simulink.sdi.view
```

To import data into the Simulation Data Inspector from the workspace, create a `Simulink.sdi.Run` object using the `Simulink.sdi.Run.create` function. Add information about the run to its metadata using the `Name` and `Description` properties of the `Run` object.

```
sinusoidsRun = Simulink.sdi.Run.create;
sinusoidsRun.Name = 'Sinusoids';
sinusoidsRun.Description = 'Sine and cosine signals with different frequencies';
```

Use the `add` function to add the data you created in the workspace to the empty run.

```
add(sinusoidsRun, 'vars', sine_ts, cos_ts);
```

Plot the Data in the Simulation Data Inspector

Use the `getSignalByIndex` function to access `Simulink.sdi.Signal` objects that contain the signal data. You can use the `Simulink.sdi.Signal` object properties to specify the line style and color for the signal and plot it in the Simulation Data Inspector. Specify the `LineColor` and `LineDashed` properties for each signal.

```
sine_sig = getSignalByIndex(sinusoidsRun,1);
sine_sig.LineColor = [0 0 1];
sine_sig.LineDashed = '-.';

cos_sig = sinusoidsRun.getSignalByIndex(2);
cos_sig.LineColor = [0 1 0];
cos_sig.LineDashed = '--';
```

Use the `Simulink.sdi.setSubPlotLayout` function to configure a 2-by-1 subplot layout in the Simulation Data Inspector plotting area. Then use the `plotOnSubPlot` function to plot the sine signal on the top subplot and the cosine signal on the lower subplot.

```
Simulink.sdi.setSubPlotLayout(2,1);

plotOnSubPlot(sine_sig,1,1,true);
plotOnSubPlot(cos_sig,2,1,true);
```

Close the Simulation Data Inspector and Save Your Data

When you have finished inspecting the plotted signal data, you can close the Simulation Data Inspector and save the session to an `MLDATX` file.

```
Simulink.sdi.close('sinusoids.mldatx')
```

Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
```

```

Simulink.sdi.clear
Simulink.sdi.enablePCTSupport('local')

% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];

```

Initialize Parallel Workers

Use `gcp` to create a pool of local workers to run parallel simulations if you don't already have one. In an `spmd` code block, load the `slexAircraftExample` model and select signals to log. To avoid data concurrency issues using `sim` in `parfor`, create a temporary directory for each worker to use during simulations.

```
p = gcp;
```

```
Starting parallel pool (parpool) using the 'local' profile ...
connected to 4 workers.
```

```
spmd
```

```

% Load system and select signals to log
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model', 4, 'on')

% Create temporary directory on each worker
workDir = pwd;
addpath(workDir)
tempDir = tempname;
mkdir(tempDir)
cd(tempDir)

```

```
end
```

Run Parallel Simulations

Use `parfor` to run the seven simulations in parallel. Select the value for `Ts` for each simulation, and modify the value of `Ts` in the model workspace. Then, run the simulation and build an array of `Simulink.sdi.WorkerRun` objects to access the data with the Simulation Data Inspector. After the `parfor` loop, use another `spmd` segment to remove the temporary directories from the workers.

```
parfor index = 1:7
```

```

% Select value for Ts
Ts_val = Ts_vals(index);

% Change the filter time constant and simulate
modelWorkspace = get_param('slexAircraftExample','modelworkspace');
modelWorkspace.assignin('Ts',Ts_val)
sim('slexAircraftExample')

% Create a worker run for each simulation
workerRun(index) = Simulink.sdi.WorkerRun.getLatest

```

```
end
```

```
spmd
```

```

% Remove temporary directories
cd(workDir)
rmdir(tempDir, 's')
rmpath(workDir)

```

```
end
```

Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

```
ds(7) = Simulink.SimulationData.Dataset;
```

```

for a = 1:7
    ds(a) = workerRun(a).getDataset;
end
ds(1)

```

```
ans =
Simulink.SimulationData.Dataset '' with 2 elements
```

		Name	BlockPath
1	[1x1 Signal]	alpha, rad	...rcraftExample/Aircraft Dynamics Model
2	[1x1 Signal]	Stick	slexAircraftExample/Pilot

- Use braces { } to access, modify, or add elements using index.

Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```

for b = 1:7
    datasetRef(b) = workerRun(b).getDatasetRef;
end

```

```
datasetRef(1)
```

```
ans =
DatasetRef with properties:
    Name: 'Run 3: slexAircraftExample'
    Run: [1x1 Simulink.sdi.Run]
numElements: 2
```

Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local `Run` objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```

for c = 1:7
    Runs(c) = workerRun(c).getLocalRun;
    Ts_val_str = num2str(Ts_vals(c));
    desc = strcat('Ts = ', Ts_val_str);

```

```
Runs(c).Description = desc;  
Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);
```

```
end
```

Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

```
Simulink.sdi.cleanupWorkerResources
```

Alternatives

You can view run metadata and import data using the Simulation Data Inspector UI. For more information, see “View Data with the Simulation Data Inspector”.

Introduced in R2012b

Simulink.sdi.Signal

Access signal data and metadata

Description

A `Simulink.sdi.Signal` object contains data and metadata for a signal in the Simulation Data Inspector. You can use the `Signal` object properties to inspect signal metadata, visualize signals on time plots, and compare signals using the `Simulink.sdi.compareSignals` function.

Creation

A `Simulink.sdi.Signal` object is created for each signal you log in a model simulation or import into the Simulation Data Inspector. You can access `Signal` objects in the Simulation Data Inspector several ways. Generally, to access a `Signal` object, you first need to get the `Simulink.sdi.Run` object that contains the signal.

- The `Simulink.sdi.getSignal` function returns a `Signal` object that corresponds to the signal ID you provide.
- The `getSignal` function returns the `Signal` object with the specified signal ID inside the specified `Run` object.
- The `getSignalByIndex` function returns the `Signal` object at the specified index within the specified `Run` object.

Properties

Signal Properties

ID — Signal identifier

integer

This property is read-only.

Unique number identifying the signal, returned as an integer. The Simulation Data Inspector assigns a unique numeric ID to each run and signal.

RunID — Run identifier

integer

This property is read-only.

Run identifier for the run that contains the signal, returned as an integer. The Simulation Data Inspector assigns a unique numeric ID to each run and signal.

Name — Signal name

character vector | string

Name of the signal, specified as a character vector or string. When the `Signal` object contains data logged from a simulation, the name matches the name specified for the signal in the model. If the

model does not specify the name, the signal name is the block path to the block that produces the signal.

Example: 'fuel'

Description — Signal description

' ' (default) | character vector | string

Description of the signal, specified as a character vector or a string. You can use the `Description` property to annotate the signal or identify the signal content beyond the `Name`. When you log Simscape data to the Simulation Data Inspector, the `Description` property is populated automatically for each node.

Units — Signal measurement units

character vector | string

Signal units of measure, specified as a string or character vector.

Example: 'g/s'

Data Type — Data type for signal data

character vector | string

This property is read-only.

Data type of signal data, returned as a character vector or string.

Example: 'double'

Complexity — Complexity of signal data

"real" | "complex"

This property is read-only.

Complexity of signal data, returned as "real" or "complex".

Example: "real"

SampleTime — Signal sample time

character vector

This property is read-only.

Signal sample time, returned as a character vector or scalar. A value of 'Continuous' indicates a variable-step simulation.

Example: 'Continuous'

Example: '0.1'

Model — Name of model that produced signal

character vector

This property is read-only.

Name of the model that produced the signal, returned as a character vector. The `Model` property is empty for `Signal` objects that contain data that was not produced by simulating a model.

Example: 'sldemo_fuelsys'

BlockPath — Block path for block that produced signal

character vector

This property is read-only.

Block path for the block that produced the signal, returned as a character array. The `BlockPath` property is a relative path that does not include model hierarchy. The `BlockPath` property is empty for `Signal` objects that contain data that was not produced by simulating a model.

Example: 'sldemo_fuelsys/Engine Gas Dynamics'

FullBlockPath — Complete block path for block that produced the signal

character vector | cell array

This property is read-only.

Complete block path for the block that produced the signal, including the full model hierarchy, returned as a character vector. For signals within referenced models, `FullBlockPath` is a cell array that contains the full path. For other signals, `FullBlockPath` is identical to `BlockPath`. The `FullBlockPath` property is empty for `Signal` objects that contain data that was not produced by simulating a model.

BlockName — Name of block that produced signal

character vector

This property is read-only.

Name of the block that produced the signal, returned as a character vector. The `BlockName` property is empty for `Signal` objects that contain data that was not produced by simulating a model.

Example: 'Engine Gas Dynamics'

PortIndex — Block port index

integer

This property is read-only.

Index of the output port connected to the signal on the block that produces the signal. The `PortIndex` property is empty for `Signal` objects that contain data that was not produced by simulating a model.

Example: 1

Dimensions — Signal dimensions

integer | integer array

This property is read-only.

Signal dimensions, returned as an integer or integer array.

Example: [1 2]

Channel — Index of signal within matrix

integer array

This property is read-only.

Index of the signal within a matrix, returned as an integer array.

NumPoints — Number of samples in signal

integer

This property is read-only.

Number of samples in the signal, returned as an integer.

Values — Signal values

timeseries | structure

Time and data values for the signal, returned as a `timeseries` object for non-bus signals or structure matching the bus hierarchy for bus signals.

RootSource — High-level structure that contains the imported signal

character vector

This property is read-only.

Name of the high-level structure containing the signal, returned as a character vector. The `RootSource` property only has value for imported signals.

Example: When you import the `Simulink.SimulationOutput` object `simOut` containing structure `xout`, the `RootSource` is `'simOut.get('xout')`

TimeSource — Source of imported signal time data

character vector

This property is read-only.

Path to the signal time data, returned as a character vector. The `TimeSource` property only has value for imported signals.

Example: When you import the `Simulink.SimulationOutput` object `simOut` containing structure `xout`, the `TimeSource` is `'simOut.get('xout').time'`

DataSource — Source of imported signal data

character vector

This property is read-only.

Path to the signal sample values, returned as a character array. The `DataSource` property only has value for imported signals.

Example: When you import the `Simulink.SimulationOutput` object `simOut` containing structure `xout`, the `DataSource` is `'simOut.get('xout').signals(1).values'`

Children — Signals contained by composite signal

`Simulink.sdi.Signal` vector

This property is read-only.

Signals contained by the composite signal, returned as `Simulink.sdi.Signal` objects. The `Children` property is empty for scalar signals.

Visualization Properties

ComplexFormat — Display format for complex signals

"real-imaginary" | "magnitude" | "magnitude-phase" | "phase"

Complex format used to display complex signal data in the Simulation Data Inspector, specified as one of the following values. You can modify the `ComplexFormat` property for a `Signal` object to change how the Simulation Data Inspector displays the signal data when the object contains data for a complex signal.

- "real-imaginary" — The real and imaginary components of the signal display together when you plot the signal. The imaginary component of the signal is plotted with a different shade of the **Line Color**.
- "magnitude" — The magnitude of the signal displays when you plot the signal.
- "magnitude-phase" — The magnitude and phase of the signal display together when you plot the signal.
- "phase" — The phase of the signal displays when you plot the signal. The phase is plotted with a different shade of the **Line Color**.

Data Types: `char` | `string`

Checked — Whether signal is plotted

0 or false (default) | 1 or true

Whether the signal is plotted, specified as a logical value. Setting `Checked` to `false` clears the signal from all subplots. Setting `Checked` to `true` plots the signal on the active subplot.

Data Types: `logical`

LineColor — Signal line color

1-by-3 vector

Color of signal in plots, specified as a 1-by-3 RGB vector with values between 0 and 1.

Example: `[0 0.5 0.5]`

Data Types: `double`

LineDashed — Signal line style

'-' | '--' | ':' | '-.'

Signal line style used when displaying the signal in the Simulation Data Inspector, specified as one of the following values:

- '-' — Solid
- '--' — Dashed
- ':' — Dotted
- '-.' — Dash-dotted

InterpMethod — Interpolation method

'linear' (default) | 'zoh' | 'none'

Interpolation method used in data visualization and the synchronization step of comparisons, specified as one of the following values:

- 'zoh' — Zero-order hold interpolation
- 'linear' — Linear interpolation
- 'none' — No interpolation

For more information about the interpolation options, see “How the Simulation Data Inspector Compares Data”.

Comparison Properties

AbsTol — Absolute tolerance

0 (default) | scalar

Absolute tolerance to use in signal comparisons, specified as a positive-valued scalar.

The Simulation Data Inspector uses tolerances specified in the signal properties of the baseline signal when the `OverrideGlobalTol` property is set to `1` or `true`. For more information about tolerances in the Simulation Data Inspector, see “How the Simulation Data Inspector Compares Data”.

Example: `0.1`

Data Types: `double`

RelTol — Relative tolerance

0 (default) | scalar

Relative tolerance to use in signal comparisons, specified as a positive-valued scalar. The relative tolerance is expressed as a fractional multiplier. For example, `0.1` specifies a 10 percent tolerance.

The Simulation Data Inspector uses tolerances specified in the signal properties of the baseline signal when the `OverrideGlobalTol` property is set to `1` or `true`. For more information about tolerances in the Simulation Data Inspector, see “How the Simulation Data Inspector Compares Data”.

Example: `0.05`

Data Types: `double`

TimeTol — Time tolerance

0 (default) | scalar

Time tolerance for the signal used in signal comparisons, specified as a positive-valued scalar. Specify the time tolerance in seconds.

The Simulation Data Inspector uses tolerances specified in the signal properties of the baseline signal when the `OverrideGlobalTol` property is set to `1` or `true`. For more information about tolerances in the Simulation Data Inspector, see “How the Simulation Data Inspector Compares Data”.

Example: `0.1`

Data Types: `double`

OverrideGlobalTol — Whether comparisons use signal tolerance

0 or false (default) | 1 or true

Whether comparisons use signal tolerance values instead of global tolerance values, specified as a logical value. Set the `OverrideGlobalTol` property to `1` or `true` to use the tolerance values defined in the `Signal` object properties. Set the property to `0` or `false` to use global tolerance values.

For more information about tolerances in the Simulation Data Inspector, see “How the Simulation Data Inspector Compares Data”.

Data Types: `logical`

SyncMethod — Synchronization method

'union' (default) | 'intersection'

Method used to synchronize signals in comparisons, specified as 'union' or 'intersection'. For more information about the synchronization options, see “How the Simulation Data Inspector Compares Data”.

Object Functions

<code>convertUnits</code>	Convert units of <code>Simulink.sdi.Signal</code> object
<code>export</code>	Export <code>Simulink.sdi.Signal</code> object to workspace or file
<code>getAsTall</code>	Create tall timetable from <code>Simulink.sdi.Signal</code> object
<code>plotOnSubPlot</code>	Plot <code>Simulink.sdi.Signal</code> object on Simulation Data Inspector subplot

Examples

Analyze Simulation Data Using Signal Tolerances

Using the Simulation Data Inspector programmatic interface, you can specify signal tolerance values to use in comparisons. This example uses the `slexAircraftExample` model and the Simulation Data Inspector to evaluate the effect of changing the time constant for the low-pass filter following the control input.

Configure the Model

Load the model and mark signals of interest for logging. This example logs data for the `q` and `alpha` signals.

```
load_system('slexAircraftExample')

Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',3,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on')
```

Run Simulations

Run simulations with different low-pass filter time constants to generate results to compare. The `slexAircraftExample` model stores variables associated with the model in the model workspace. To modify the time constant value, access the model workspace and use the `assignin` function.

```
out1 = sim('slexAircraftExample');

modelWorkspace = get_param('slexAircraftExample','modelworkspace');
assignin(modelWorkspace,'Ts',1)

out2 = sim('slexAircraftExample');
```

Access and Compare Simulation Results

Access the simulation results using the Simulation Data Inspector programmatic interface. Each simulation creates a run in the Simulation Data Inspector with a unique run ID. You use the run IDs to compare the simulation results.

```
runIDs = Simulink.sdi.getAllRunIDs;
runIDTs1 = runIDs(end-1);
runIDTs2 = runIDs(end);
```

Use the `Simulink.sdi.compareRuns` function to compare the data from the simulations. Then inspect the `Status` property of the signal result to see whether the signals fell within the default tolerance of 0.

```
diffRun1 = Simulink.sdi.compareRuns(runIDTs1,runIDTs2);
```

```
sig1Result1 = getResultByIndex(diffRun1,1);
sig2Result1 = getResultByIndex(diffRun1,2);
```

```
sig1Result1.Status
```

```
ans =
OutOfTolerance
```

```
sig2Result1.Status
```

```
ans =
OutOfTolerance
```

Compare Runs with Signal Tolerances

By default, signals use 0 for all tolerance values, so the comparison returns out-of-tolerance results when the signals are not identical. To further analyze the effect of the time constant change, specify tolerance values for the signals. You can specify tolerances for a programmatic comparison using the properties of the `Simulink.sdi.Signal` objects in the runs you compare. The comparison uses the tolerances specified for the baseline `Signal` object. This example specifies a combination of time and absolute tolerances.

To specify tolerances, first access the `Simulink.sdi.Signal` objects that correspond to each signal in the runs you want to compare.

```
run1 = Simulink.sdi.getRun(runIDTs1);
sigID1 = getSignalIDByIndex(run1,1);
sigID2 = getSignalIDByIndex(run1,2);
```

```
sig1 = Simulink.sdi.getSignal(sigID1);
sig2 = Simulink.sdi.getSignal(sigID2);
```

Check the `Name` property to identify each `Signal` object.

```
sig1.Name
```

```
ans =
'q, rad/sec'
```

```
sig2.Name
```

```
ans =
'alpha, rad'
```

Specify an absolute tolerance of 0.1 and a time tolerance of 0.6 for the `q` signal using the `AbsTol` and `TimeTol` properties of the `q` signal object in the baseline run.

```
sig1.AbsTol = 0.1;  
sig1.TimeTol = 0.6;
```

Specify an absolute tolerance of 0.2 and a time tolerance of 0.8 for the alpha signal using the `AbsTol` and `TimeTol` properties of the alpha signal object in the baseline run.

```
sig2.AbsTol = 0.2;  
sig2.TimeTol = 0.8;
```

Compare the runs again and access the results.

```
diffRun2 = Simulink.sdi.compareRuns(runIDTs1,runIDTs2);  
sig1Result2 = getResultByIndex(diffRun2,1);  
sig2Result2 = getResultByIndex(diffRun2,2);
```

Check the `Status` property of each signal to determine whether the comparison results fell within the specified tolerances.

```
sig1Result2.Status
```

```
ans =  
WithinTolerance
```

```
sig2Result2.Status
```

```
ans =  
WithinTolerance
```

Define Comparison and Visualization Properties for a Signal

This example shows how to obtain a `Simulink.sdi.Signal` object and modify its properties using the Simulation Data Inspector programmatic interface.

Create Data in the Simulation Data Inspector

When you simulate a model that logs data, a run is created in the Simulation Data Inspector to contain the logged data. You can also create a run in the Simulation Data Inspector by importing data. This example simulates the `slexAircraftExample` model and logs the data in `Dataset` format.

```
simOut = sim('slexAircraftExample','SaveFormat','Dataset');
```

Get a Simulink.sdi.Signal Object

The programmatic simulation returns the logged data in the workspace variable `simOut`. You can access the logged data in that variable. However, to use the Simulation Data Inspector programmatic interface, you need to access the logged data in `Simulink.sdi.Run` and `Simulink.sdi.Signal` objects.

First, use the `Simulink.sdi.getCurrentSimulationRun` to get the `Run` object that was created when you simulated the `slexAircraftExample` model.

```
aircraftRun = Simulink.sdi.getCurrentSimulationRun('slexAircraftExample');
```

You can use the `getAllSignals` function to access the `Signal` objects for all the signals in the run. From the returned array of `Signal` objects, select the first signal.

```
signals = getAllSignals(aircraftRun);  
sig = signals(1);
```

Modify the Signal Properties

The `Simulink.sdi.Signal` object has properties that specify options for comparing and visualizing the signal. Specify a line style and color for the signal. Then, use the `Simulink.sdi.setSubPlotLayout` to configure the Simulation Data Inspector to show a single subplot, and use the `plotOnSubPlot` function to plot the signal.

```
sig.LineColor = [1 0.4 0.6];
sig.LineDashed = '-';

Simulink.sdi.setSubPlotLayout(1,1)
plotOnSubPlot(sig,1,1,true)
```

Use the `Simulink.sdi.view` function to open the Simulation Data Inspector and view the plotted signal.

Compare Signals Within a Simulation Run

This example uses the `slexAircraftExample` model to demonstrate how to compare the input and output signals of the control system.

Configure and Simulate the Model

The `slexAircraftExample` model does not log data. Load the model and mark the input and output signals for logging.

```
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot',1,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on')
```

Simulate the model. The data for the logged signals logs to the Simulation Data Inspector and to the workspace.

```
out = sim('slexAircraftExample');
```

Access Simulation Data

Use the Simulation Data Inspector programmatic interface to access the data. The `Simulink.sdi.Run.getLatest` function returns the most recently created run in the Simulation Data Inspector repository. Use the `getSignalIDByIndex` function to access the signal IDs for the logged signals.

```
aircraftRun = Simulink.sdi.Run.getLatest;

signalID1 = getSignalIDByIndex(aircraftRun,1);
signalID2 = getSignalIDByIndex(aircraftRun,2);
```

Specify Tolerance Values

You can specify tolerance values to use in the comparison as a property in the logged `Simulink.sdi.Signal` object. Use the `Simulink.sdi.getSignal` function to access the `Signal` object using the signal ID.

```
signal1 = Simulink.sdi.getSignal(signalID1);
signal1.AbsTol = 0.1;
```

Compare Signals

Use the `Simulink.sdi.compareSignals` function to compare the input and output signals. This example uses the `isValidSignalID` function to verify that both signal IDs are still valid before calling the `Simulink.sdi.compareSignals` function. A signal ID becomes invalid when the signal is deleted from the Simulation Data Inspector. After the comparison, check the status in the `Simulink.sdi.DiffSignalResult` object.

```
if (isValidSignalID(aircraftRun,signalID1) && isValidSignalID(aircraftRun,signalID2))
    sigDiff = Simulink.sdi.compareSignals(signalID1,signalID2);

    match = sigDiff.Status
end

match =
OutOfTolerance
```

The comparison result is out of tolerance. You can use the `Simulink.sdi.view` function to inspect and analyze the comparison results.

Plot Signals from Simulation Run

This example demonstrates how to access the `Simulink.sdi.Run` object for a Simulation Data Inspector run created by logging signals. From the `Simulink.sdi.Run` object you can get `Simulink.sdi.Signal` objects that contain the logged signal data and metadata. You can use the `Signal` objects and the `plotOnSubPlot` function to plot the data in the Simulation Data Inspector.

Create a Simulation Run and Access the Run Object

The `ex_vdp` model logs two signals. To create a simulation run containing the logged data, simulate the model.

```
sim('ex_vdp');
```

The Simulation Data Inspector keeps track of runs by assigning a unique numeric run ID to each run created by simulation, importing data, or opening a session. To access the run object for the simulation you just performed, use the `Simulink.sdi.getAllRunIDs` function and take the last run ID in the returned vector.

```
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

Once you have the run ID for the run, you can use the `Simulink.sdi.getRun` function to get the `Simulink.sdi.Run` object that corresponds to the run. You can use the `Run` object to check the metadata associated with the run, including the number of signals in the run.

```
vdpRun = Simulink.sdi.getRun(runID);

vdpRun.SignalCount

ans = int32
     2
```

Plot Data Using Signal Objects

Use the `getSignalByIndex` function to access signals from the `Run` object, `fuelRun`.

```
signal1 = getSignalByIndex(vdpRun,1);  
signal2 = getSignalByIndex(vdpRun,2);
```

Use the `Simulink.sdi.setSubPlotLayout` function to specify a 3-by-1 layout.

```
Simulink.sdi.setSubPlotLayout(2,1)
```

Before plotting the data, use the `Simulink.sdi.clearAllSubPlots` function to clear any data that is already plotted.

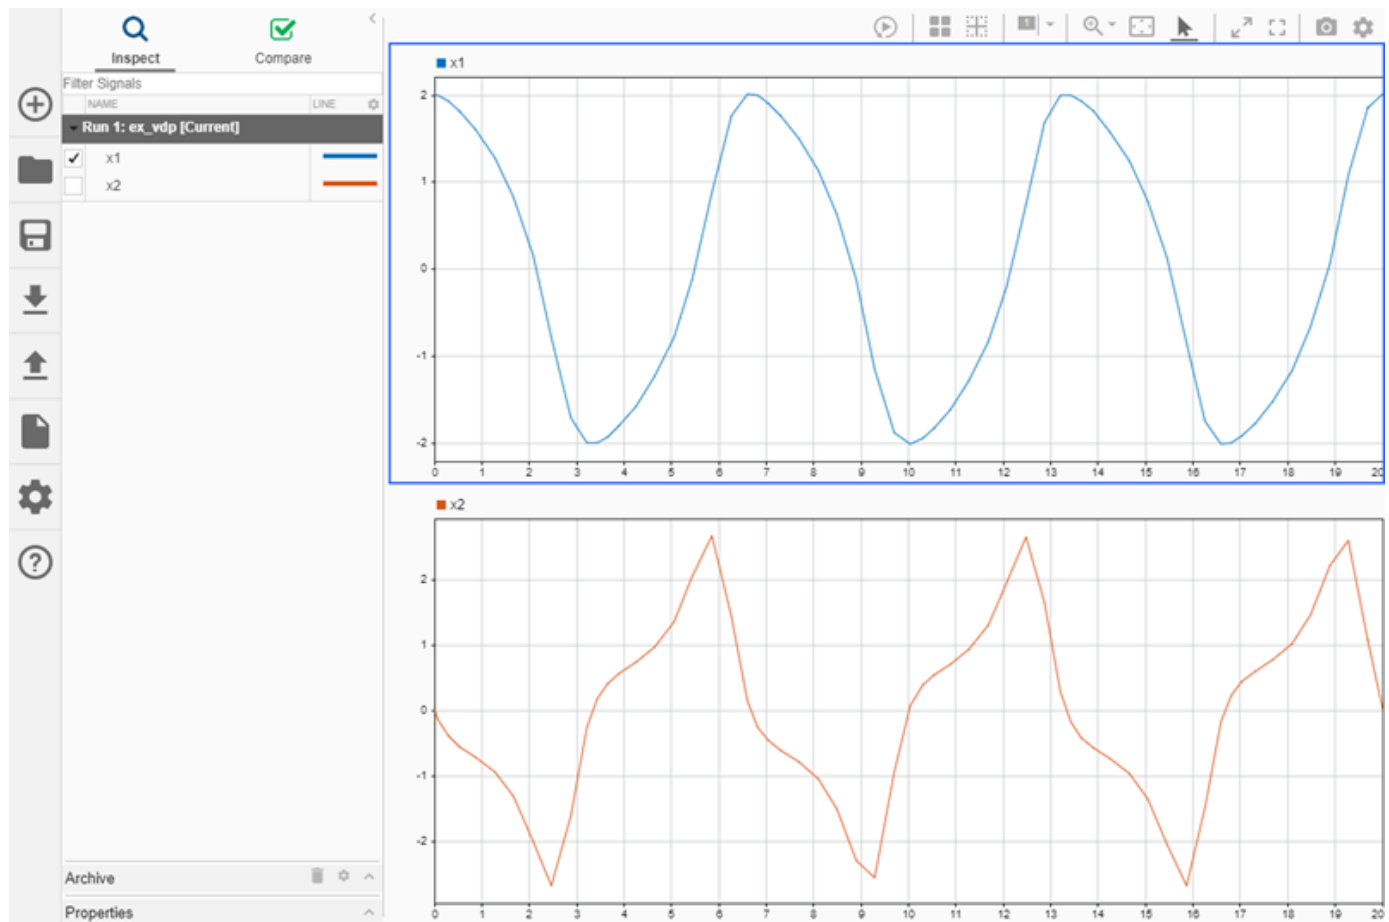

```
Simulink.sdi.clearAllSubPlots
```

Plot one signal on each subplot. To plot signals on the first subplot, you can set the `checked` property for the signal. To plot signals on subplots other than the first subplot, use the `plotOnSubPlot` function.

```
signal1.Checked = true;  
plotOnSubPlot(signal2,2,1,true);
```

View the Plotted Data

To view the plots you just created, open the Simulation Data Inspector using the `Simulink.sdi.view` function.

Simulink.Signal

Specify attributes of signal

Description

This object enables you to create workspace objects that you can use to assign or validate the attributes of a signal or discrete state, such as its data type, numeric type, dimensions, and so on.

You can use a signal object to:

- Assign values to signal attributes that are left unassigned (have a value of `-1` or `auto`) by the signal source.
- Validate signal attributes whose values are explicitly assigned by the signal source. Such attributes have values other than `-1` or `auto`. Successful validation guarantees that the signal has the attributes that you intended it to have.

You can create a `Simulink.Signal` object in the MATLAB workspace or in a model workspace.

Use signal objects to assign or validate signal or discrete state attributes by giving the signal or discrete state the same name as the workspace variable that references the `Simulink.Signal` object.

For more information about using signal objects, see “Use Simulink.Signal Objects to Specify and Control Signal Attributes” and “Data Objects”.

Creation

Create a `Simulink.Signal` object:

- By using the Model Data Editor. See “For Signals”.
- By using the Model Explorer. See “Create Data Objects from Built-In Data Class Package Simulink”.
- Directly from a signal properties dialog box or the Property Inspector in a model. See “Create Signal Object from Signal Properties Dialog Box”.
- By using the `Simulink.Signal` function, described below.

Syntax

```
signalObj = Simulink.Signal
```

Description

`signalObj = Simulink.Signal` returns a `Simulink.Signal` object with default property values.

Properties

For information about properties in the property dialog box of a `Simulink.Signal` object, see “Property Dialog Box”.

CoderInfo — Specifications for generating code for signal

`Simulink.CoderInfo` object

Information used by Simulink Coder for generating code for this signal. The value of this property is an object of `Simulink.CoderInfo` class.

For more information, see “Apply Storage Classes to Individual Signal, State, and Parameter Data Elements” (Simulink Coder) and “Choose Storage Class for Controlling Data Representation in Generated Code” (Embedded Coder).

Complexity — Numeric complexity of signal

'auto' (default) | 'real' | 'complex'

Character vector specifying the numeric type of this signal. Valid values are 'auto' (determined by Simulink), 'real', or 'complex'.

Data Types: char

DataType — Data type of signal

'auto' (default) | character vector

Character vector specifying the data type of this signal.

The default value, 'auto', specifies that Simulink should determine the data type. You can specify a built-in data type (for example, 'uint8' or 'single') or a custom data type. To specify a custom data type, use a MATLAB expression that specifies the type, (for example, the name of a `Simulink.NumericType` object that you create in the base workspace).

To specify a bus object as the data type for the signal object, use the 'Bus: <object_name>' syntax. See “Bus Support” for details about what you need to do if you specify a bus object as the data type.

Example: 'auto'

Example: 'int8'

Example: 'fixdt(1,16,5)'

Example: 'myAliasTypeObject'

Example: 'Enum: myEnumType'

Example: 'Bus: myBusObject'

Data Types: char

Description — Custom description of signal

' ' (empty character vector) (default) | character vector

Description of this signal. This field is intended for use in documenting this signal.

This property is used by the Simulink Report Generator and for code generation.

If you have an Embedded Coder license, you can add the signal description as a comment for the variable declaration in generated code:

- Specify a storage class for the signal object other than `Auto`.
- On the **Code Generation > Comments** pane of the model Configuration Parameters dialog box, select the model configuration parameter **Simulink data object descriptions**. For more information, see “Simulink data object descriptions” (Embedded Coder).

Example: `'This signal represents the rotation speed of the engine.'`

Data Types: `char`

Dimensions — Dimensions of signal

`-1` (default) | row vector | character vector

Scalar or vector specifying the dimensions of this signal.

Valid values are `-1` (the default) specifying any dimensions, `N` specifying a vector signal of size `N`, or `[M N]` specifying an `MxN` matrix signal.

To use symbolic dimensions, specify a character vector.

Example: `[1 3]`

Example: `'[1 myDimParam]'`

Data Types: `double` | `char`

DimensionsMode — Dimension mode of signal

`'auto'` (default) | `'Fixed'` | `'Variable'`

Dimensions mode of the signal. Valid values are:

- `'auto'` — Allows variable-size and fixed-size signals.
- `'Fixed'` — Allows only fixed-size signals. Does not allow variable-size signals.
- `'Variable'` — Allows only variable-size signals.

For information about variable-size signals, see “Variable-Size Signal Basics”.

Max — Maximum value of signal

`[]` (empty) (default) | real double scalar

Maximum value that this signal can have.

The default value is `[]` (unspecified). Specify a finite, real, double, scalar value.

Note If you specify a bus object as the data type for a signal, do not set the maximum value for bus data on the signal property dialog box. Simulink ignores this setting. Instead, set the maximum values for bus elements of the bus object specified as the data type. For information on the Maximum property of a bus element, see `Simulink.BusElement`.

Simulink uses this value in the following ways:

- When updating the diagram or starting a simulation, Simulink generates an error if the initial value of the signal is greater than the maximum value or if the maximum value is outside the range of the data type of the signal.
- When you enable the **Simulation range checking** diagnostic, Simulink alerts you during simulation if the signal value is greater than the maximum value (see “Simulation range checking”).

Example: 5.32

Data Types: double

Min — Minimum value of signal

[] (empty) (default) | real double scalar

Minimum value that this signal can have.

The default value is [] (unspecified). Specify a finite, real, double, scalar value.

Note If you specify a bus object as the data type for a signal, do not set the minimum value for bus data on the signal property dialog box. Simulink ignores this setting. Instead, set the minimum values for bus elements of the bus object specified as the data type. For information on the Minimum property of a bus element, see `Simulink.BusElement`.

Simulink uses this value in the following ways:

- When updating the diagram or starting a simulation, Simulink generates an error if the signal's initial value is less than the minimum value or if the minimum value is outside the range for the data type of the signal.
- When you enable the **Simulation range checking** diagnostic, Simulink alerts you during simulation if the signal value is less than the minimum value (see “Simulation range checking”).

Example: -0.92

Data Types: double

InitialValue — Initial value of signal or state

' ' (empty character vector) (default) | character vector

Signal or state value before a simulation takes its first time step.

You can specify any MATLAB expression, including the name of a workspace variable, that evaluates to a numeric scalar value or array.

At the command prompt or in a script, even if you use a number, specify the initial value as a character vector.

```
mySigObject.InitialValue='5.3';
```

```
mySigObject.InitialValue = 'myNumericVariable';
```

To specify an initial value for a signal that uses a numeric data type other than `double`, cast the initial value to the signal data type. For example, you can specify `'single(73.3)'` to use 73.3 as the initial value for a signal of data type `single`.

If you use a bus object as the data type for the signal object, set `InitialValue` to a character vector containing either `0` or a MATLAB structure that matches the bus object. See “Bus Support” for details.

If the initial value evaluates to a MATLAB structure, then in the **Configuration Parameters** dialog box, set “Underspecified initialization detection” to **Simplified**.

If necessary, Simulink converts the initial value to ensure type, complexity, and dimension consistency with the corresponding block parameter value. If you specify an invalid value or expression, an error message appears when you update the model. Also, Simulink performs range checking of the initial value. The software alerts you when the initial value of the signal lies outside a range that corresponds to its specified minimum and maximum values and data type.

Classic initialization mode: In this mode, initial value settings for signal objects that represent the following signals and states override the corresponding block parameter initial values if undefined (specified as `[]`):

- Output signals of conditionally executed subsystems and Merge blocks
- Block states

Simplified initialization mode: In this mode, if a signal object is attached to the signal line connected to the Outport block of a conditionally executed subsystem, Simulink uses the `InitialValue` from the `Simulink.signal` object.

Example: `'15.23'`

Example: `'myInitParam'`

Data Types: `char`

SampleTime — Sample time of signal

-1 (default) | `double` scalar or array

Rate at which this signal should be updated.

See “Specify Sample Time” for details.

Example: `0.001`

Example: `2`

Data Types: `double`

Unit — Physical unit of signal value

`''` (default) | valid unit

Physical unit used for expressing this signal value (for example, inches).

For more information, see “Unit Specification in Simulink Models”.

Example: `'degC'`

Data Types: `char`

Examples

Simulink.Signal Examples

For examples that show how to use `Simulink.Signal` objects, see “Use Simulink.Signal Objects to Specify and Control Signal Attributes” and “Data Objects”.

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using MATLAB® Coder™.

To control the appearance of a `Simulink.Signal` object in the generated code, use the **Storage class** property.

Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

- “Simulink Check Checks” (Simulink Check)

Migrating to Simplified Initialization Mode Overview

Simplified initialization mode was introduced in R2008b to improve the consistency of simulation results. This mode is especially important for models that do not specify initial conditions for conditionally executed subsystem output ports. For more information, see “Simplified Initialization Mode” and “Classic Initialization Mode”.

Use the Model Advisor checks in **Migrating to Simplified Initialization Mode** to help migrate your model to simplified initialization mode.

See Also

- “Simplified Initialization Mode”

- “Check model settings for migration to simplified initialization mode” on page 9-35

Identify unconnected lines, input ports, and output ports

Check ID: `mathworks.design.UnconnectedLinesPorts`

Check for unconnected lines or ports.

Description

This check lists unconnected lines or ports. These can have difficulty propagating signal attributes such as data type, sample time, and dimensions.

Note Ports connected to ground/terminator blocks will pass this test.

Results and Recommended Actions

Condition	Recommended Action
Lines, input ports, or output ports are unconnected.	Connect the signals. Double-click the list of unconnected items to locate failure.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

Tips

Use the `PortConnectivity` command to obtain an array of structures describing block input or output ports.

See Also

“Common Block Properties” on page 6-12 for information on the `PortConnectivity` command.

“Model Advisor Exclusion Overview” (Simulink Check)

Check root model Inport block specifications

Check ID: `mathworks.design.RootInportSpec`

Check that root model Inport blocks fully define dimensions, sample time, and data type.

Description

Using root model Inport blocks that do not fully define dimensions, sample time, or data type can lead to undesired simulation results. Simulink software back-propagates dimensions, sample times and data types from downstream blocks unless you explicitly assign them values.

Results and Recommended Actions

Condition	Recommended Action
Root-level Inport blocks have undefined attributes.	Fully define the attributes of the root-level Inport blocks.

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

Tips

The following configurations pass this check:

- **Configuration Parameters > Solver > Periodic sample time constraint** is set to Ensure sample time independent
- For export-function models, *inherited sample time* is not flagged.

See Also

- “About Data Types in Simulink”.
- “Determine Signal Dimensions”.
- “Specify Sample Time”.
- “Model Advisor Exclusion Overview” (Simulink Check)

Check optimization settings

Check ID: `mathworks.design.OptimizationSettings`

Check for optimizations that can lead to non-optimal code generation and simulation.

Description

This check reviews the status of optimizations that can improve code efficiency and simulation time.

Results and Recommended Actions

Condition	Recommended Action
<p>The specified optimizations are off.</p>	<p>Select the following optimization check boxes on the Optimization pane in the Configuration Parameters dialog box:</p> <ul style="list-style-type: none"> • “Remove root level I/O zero initialization” (Embedded Coder) • “Remove internal data zero initialization” (Embedded Coder) <p>Select the following optimization check boxes on the Optimization pane in the Configuration Parameters dialog box:</p> <ul style="list-style-type: none"> • “Inline invariant signals” (Simulink Coder) (only if you have a Simulink Coder license) <p>Select the following optimization check boxes in the Configuration Parameters dialog box:</p> <ul style="list-style-type: none"> • “Block reduction” • “Conditional input branch execution” • “Implement logic signals as Boolean data (vs. double)” • “Use memset to initialize floats and doubles to 0.0” (Simulink Coder) • “Remove code from floating-point to integer conversions that wraps out-of-range values” (Simulink Coder) (only if you have a Simulink Coder license) • “Signal storage reuse” (Simulink Coder) (only if you have a Simulink Coder license) • “Enable local block outputs” (Simulink Coder) • “Reuse local block outputs” (Simulink Coder) • “Eliminate superfluous local variables (Expression folding)” (Simulink Coder) <p>Select the following optimization check boxes on the Optimization pane in the Configuration Parameters dialog box:</p> <hr/> <p>Note Model Advisor checks these parameters only if there is a Stateflow chart in the model.</p> <hr/> <ul style="list-style-type: none"> • “Use bitsets for storing state configuration” (Simulink Coder) • “Use bitsets for storing Boolean data” (Simulink Coder)
<p>“Application lifespan (days)” is set as infinite. This could lead to expensive 64-bit counter usage.</p>	<p>Choose a stop time if this is not intended.</p>

Condition	Recommended Action
The specified diagnostics, which can increase the time it takes to simulate your model, are set to warning or error.	Select none for: <ul style="list-style-type: none"> • Solver data inconsistency • Array bounds exceeded • Diagnostics > Data Validity > Simulation range checking
The specified Embedded Coder parameters are off.	If you have an Embedded Coder license and you are using an ERT-based system target file: <ul style="list-style-type: none"> • Select Single output/update function. For details, see “Single output/update function” (Simulink Coder). • Select Ignore test point signals. For details, see “Ignore test point signals” (Embedded Coder). • Set Pass reusable subsystem outputs as to <code>Individual</code> arguments. For details, see “Pass reusable subsystem outputs as” (Embedded Coder).

Tips

If the system contains Model blocks and the referenced model is in Accelerator mode, simulating the model requires generating and compiling code.

check

See Also

- “Model Configuration Parameters: Code Generation Optimization” (Simulink Coder)

Check diagnostic settings ignored during accelerated model reference simulation

Check ID: `mathworks.design.ModelRefSIMConfigCompliance`

Checks for referenced models for which Simulink changes configuration parameter settings during accelerated simulation.

Description

For models referenced in accelerator mode, Simulink ignores the settings of the following configuration parameters that you set to a value other than None.

- **Array bounds exceeded**
- **Diagnostics > Data Validity > Inf or NaN block output**
- **Diagnostics > Data Validity > Division by singular matrix**
- **Diagnostics > Data Validity > Wrap on overflow**

Also, for models referenced in accelerator mode, Simulink ignores the following **Configuration Parameters > Diagnostics > Data Validity > Data Store Memory block** parameters if you set them to a value other than `Disable all`. For details, see “Data Store Diagnostics”.

- **Detect read before write**

- **Detect write after read**
- **Detect write after write**

Results and Recommended Actions

Condition	Recommended Action
You want to see the results of running the identified diagnostics with settings to produce warnings or errors.	Simulate the model in Normal mode and resolve diagnostic warnings or errors.

Check for parameter tunability information ignored for referenced models

Check ID: `mathworks.design.ParamTunabilityIgnored`

Checks if parameter tunability information is included in the Model Parameter Configuration dialog box.

Description

Simulink software ignores tunability information specified in the Model Parameter Configuration dialog box. This check identifies those models containing parameter tunability information that Simulink software will ignore if the model is referenced by other models.

Results and Recommended Actions

Condition	Recommended Action
Model contains ignored parameter tunability information.	Click the links to convert to equivalent Simulink parameter objects in the MATLAB workspace.

See Also

“Create Tunable Calibration Parameter in the Generated Code” (Simulink Coder).

Check for implicit signal resolution

Check ID: `mathworks.design.ImplicitSignalResolution`

Identify models that attempt to resolve named signals and states to `Simulink.Signal` objects.

Description

Requiring Simulink software to resolve all named signals and states is inefficient and slows incremental code generation and model reference. This check identifies those signals and states for which you may turn off implicit signal resolution and enforce resolution.

Results and Recommended Actions

Condition	Recommended Action
Not all signals and states are resolved.	Turn off implicit signal resolution and enforce resolution for each signal and state that does resolve.

See Also

“Resolve Signal Objects for Output Data”.

Check for optimal bus virtuality

Check ID: `mathworks.design.OptBusVirtuality`

Identify virtual buses that could be made nonvirtual. Making these buses nonvirtual improves generated code efficiency.

Description

This check identifies blocks incorporating virtual buses that cross a subsystem boundary. Changing these to nonvirtual improves generated code efficiency.

Results and Recommended Actions

Condition	Recommended Action
Blocks that specify a virtual bus crossing a subsystem boundary.	Change the highlighted bus to nonvirtual.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

- “Signal Basics”
- “Types of Composite Signals”
- “Model Advisor Exclusion Overview” (Simulink Check)

Check for Discrete-Time Integrator blocks with initial condition uncertainty

Check ID: `mathworks.design.DiscreteTimeIntegratorInitCondition`

Identify Discrete-Time Integrator blocks with state ports and initial condition ports that are fed by neither an Initial Condition nor a Constant block.

Description

Discrete-Time Integrator blocks with state port and initial condition ports might not be suitably initialized unless they are fed from an Initial Condition or Constant block. This is more likely to happen when Discrete-Time Integrator blocks are used to model second-order or higher-order dynamic systems.

Results and Recommended Actions

Condition	Recommended Action
Discrete-Time Integrator blocks are not initialized during the model initialization phase.	Add a Constant or Initial Condition block to feed the external Initial Condition port.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

- IC block
- Discrete-Time Integrator block
- Constant block
- “Model Advisor Exclusion Overview” (Simulink Check)

Identify disabled library links

Check ID: `mathworks.design.DisabledLibLinks`

Search model for disabled library links.

Description

Disabled library links can cause unexpected simulation results. Resolve disabled links before saving a model.

Note This check may overlap with “Check model for block upgrade issues” on page 9-42.

Results and Recommended Actions

Condition	Recommended Action
Library links are disabled.	Click the Library Link > Resolve link option in the context menu.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

Tips

- Use the Model Browser to find library links.
- To enable a broken link, right-click a block in your model to display the context menu. Select **Library Link > Resolve link**.

See Also

“Restore Disabled or Parameterized Links”

“Model Advisor Exclusion Overview” (Simulink Check)

Check for large number of function arguments from virtual bus across model reference boundary

Check ID: `mathworks.design.CheckVirtualBusAcrossModelReferenceArgs`

Checks virtual bus signals that cross model reference boundaries and flags cases where using virtual buses across a model reference boundary increases the number of function arguments significantly.

Description

To improve the speed of the code generation process, you can use this check to reduce the number of generated function arguments. If the check finds a model that where many arguments will be generated for a function, you can click **Update Model** to modify the model so that it generates fewer arguments.

Results and Recommended Action

Methods that generate many function arguments as the result of a virtual bus signal crossing model reference boundary slow down the code generation process.

Condition	Recommended Action
Methods are listed that generate a large number of arguments for the current the model configuration that this check can reduce by modifying the model.	Click Update Model .

Clicking **Update Model** resets Inport and Outport block parameters and inserts Signal Conversion blocks, as necessary, to reduce the number of generated function arguments for the model.

See Also

“Nonvirtual Buses at Model Interfaces”

Identify parameterized library links

Check ID: `mathworks.design.ParameterizedLibLinks`

Search model for parameterized library links.

Description

Parameterized library links that are unintentional can result in unexpected parameter settings in your model. This can result in improper model operation.

Results and Recommended Actions

Condition	Recommended Action
Parameterized links are listed.	Verify that the links are intended to be parameterized.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

Tips

- Right-click a block in your model to display the context menu. Choose **Link Options** and click **Go To Library Block** to see the original block from the library.
- To parameterize a library link, choose **Look Under Mask**, from the context menu and select the parameter.

See Also

“Restore Disabled or Parameterized Links”

“Model Advisor Exclusion Overview” (Simulink Check)

Identify unresolved library links

Check ID: mathworks.design.UnresolvedLibLinks

Search the model for unresolved library links, where the specified library block cannot be found.

Description

Check for unresolved library links. Models do not simulate while there are unresolved library links.

Results and Recommended Actions

Condition	Recommended Action
Library links are unresolved.	Locate missing library block or an alternative.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

“Fix Unresolved Library Links”

“Model Advisor Exclusion Overview” (Simulink Check)

Identify configurable subsystem blocks for converting to variant subsystem blocks

Check ID: `mathworks.design.CSStoVSSConvert`

Search the model to identify configurable subsystem blocks at the model or subsystem level.

Results and Recommended Actions

Condition	Recommended Action
Configurable subsystem blocks are identified.	Convert these blocks to variant subsystem blocks to avoid compatibility issues. See Configurable Subsystem.

Capabilities and Limitations

You can run this check on your library models.

See Also

“Convert to Variant Subsystem” on page 1-165

Identify Variant Model blocks and convert those to Variant Subsystem containing Model block choices

Check ID: `mathworks.design.ConvertMdlrefVarToVSS`

Search the model to identify Variant Model blocks.

Results and Recommended Actions

Condition	Recommended Action
Variant Model blocks available in the model are listed.	Convert these blocks to Variant Subsystem blocks.

See Also

“Convert to Variants”

Identify Variant blocks using Variant objects with empty conditions

Check ID: `mathworks.design.emptyVariant0bjects`

Search the model to identify the Variant blocks or library having empty Variant objects.

Results and Recommended Actions

Condition	Recommended Action
The Variant blocks in the model or library having empty Variant objects are listed.	Use valid conditions in the variant objects.

See Also

“Introduction to Variant Controls”

Check usage of function-call connections

Check ID: `mathworks.design.CheckForProperFcnCallUsage`

Check model diagnostic settings that apply to function-call connectivity and that might impact model execution.

Description

Check for connectivity diagnostic settings that might lead to non-deterministic model execution.

Results and Recommended Actions

Condition	Recommended Action
Diagnostic > Connectivity > Context-dependent inputs is set to <code>Disable All</code> or <code>Use local settings</code> . This might lead to non-deterministic model execution.	Set Diagnostics > Connectivity > Context-dependent inputs to <code>Enable all</code> as errors.

See Also

Function-Call Subsystem

Check Data Store Memory blocks for multitasking, strong typing, and shadowing issues

Check ID: `mathworks.design.DataStoreMemoryBlkIssue`

Look for modeling issues related to Data Store Memory blocks.

Description

Checks for multitasking data integrity, strong typing, and shadowing of data stores of higher scope.

Results and Recommended Actions

Condition	Recommended Action
The Duplicate data store names check is set to <code>none</code> or <code>warning</code> .	Consider setting the “Duplicate data store names” check to <code>error</code> in the Configuration Parameters dialog box, on the Diagnostics > Data Validity pane.

Condition	Recommended Action
<p>The data store variable names are not strongly typed in one of the following:</p> <ul style="list-style-type: none"> • Signal Attributes pane of the Block Parameters dialog for the Date Store Memory block • Global data store name 	<p>Specify a data type other than auto by taking one of the following actions:</p> <ul style="list-style-type: none"> • Choose a data type other than <code>Inherit: auto</code> on the Signal Attributes pane of the Block Parameters dialog for the Date Store Memory block. • If you are using a global data store name, then specify its data type in the <code>Simulink.Signal</code> object.
<p>The Multitask data store check is set to none or warning.</p>	<p>Consider setting the “Multitask data store” check to error in the Configuration Parameters dialog box, on the Diagnostics > Data Validity pane.</p>

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

See Also

- “Local and Global Data Stores”
- “Storage Classes for Data Store Memory Blocks” (Simulink Coder)
- Data Store Memory
- Data Store Read

- “Duplicate data store names”
- “Multitask data store”
- “Model Advisor Exclusion Overview” (Simulink Check)

Check if read/write diagnostics are enabled for data store blocks

Check ID: `mathworks.design.DiagnosticDataStoreBlk`

For data store blocks in the model, enable the read-and-write diagnostics order checking to detect run-time issues.

Description

Check for the read-and-write diagnostics order checking. By enabling the read-and-write diagnostics, you detect potential run-time issues.

Results and Recommended Actions

Condition	Recommended Action
<p>The Detect read before write check is disabled.</p>	<p>Consider enabling “Detect read before write” in the Configuration Parameter dialog box Diagnostics > Data Validity pane.</p>

Condition	Recommended Action
The Detect write after read check is disabled.	Consider enabling “Detect write after read” in the Configuration Parameter dialog box Diagnostics> Data Validity pane.
The Detect write after write check is disabled.	Consider enabling “Detect write after write” in the Configuration Parameter dialog box Diagnostics> Data Validity pane.

Capabilities and Limitations

Exclude blocks and charts from this check if you have a Simulink Check license.

Tips

.

- The run-time diagnostics can slow simulations down considerably. Once you have verified that Simulink does not generate warnings or errors during simulation, set them to **Disable all**.

See Also

- “Local and Global Data Stores”
- Data Store Memory
- Data Store Read
- Data Store Write
- “Detect read before write”
- “Detect write after read”

- “Check for potential ordering issues involving data store access” on page 9-18
- “Model Advisor Exclusion Overview” (Simulink Check)

Check data store block sample times for modeling errors

Check ID: `mathworks.design.DataStoreBlkSampleTime`

Identify modeling errors due to the sample times of data store blocks.

Description

Check data store blocks for continuous or fixed-in-minor-step sample times.

Results and Recommended Actions

Condition	Recommended Action
Data store blocks in your model have continuous or fixed-in-minor-step sample times.	Consider making the listed blocks discrete or replacing them with either Memory or Goto and From blocks.

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

See Also

- “Local and Global Data Stores”
- Data Store Memory
- Data Store Read
- Data Store Write
- “Fixed-in-Minor-Step”
- “Model Advisor Exclusion Overview” (Simulink Check)

Check for potential ordering issues involving data store access

Check ID: `mathworks.design.OrderingDataStoreAccess`

Look for read/write issues which may cause inaccuracies in the results.

Description

During an **Update Diagram**, identify potential issues relating to read-before-write, write-after-read, and write-after-write conditions for data store blocks.

Results and Recommended Actions

Condition	Recommended Action
Reading and writing (read-before-write or write-after-read condition) occur out of order.	Consider restructuring your model so that the Data Store Read block executes before the Data Store Write block.
Multiple writes occur within a single time step.	Change the model to write data only once per time step or refer to the following Tips section.

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

Tips

This check performs a static analysis which might not identify every instance of improper usage. Specifically, Function-Call Subsystems, Stateflow Charts, MATLAB for code generation, For Iterator Subsystems, and For Each Subsystems can cause both missed detections and false positives. For a more comprehensive check, consider enabling the following diagnostics on the **Diagnostics > Data Validity** pane in the Configuration Parameters dialog box: “Detect read before write”, “Detect write after read”, and “Detect write after write”.

See Also

- “Local and Global Data Stores”
- Data Store Memory

- Data Store Read
- Data Store Write
- “Detect read before write”
- “Detect write after read”
- “Detect write after write”

Check structure parameter usage with bus signals

Check ID: `mathworks.design.MismatchedBusParams`

Identify blocks and `Simulink.Signal` objects that initialize bus signals by using mismatched structures.

Description

In a model, you can use a MATLAB structure to initialize a bus signal. For example, if you pass a bus signal through a Unit Delay block, you can set the **Initial condition** parameter to a structure. For basic information about initializing buses by using structures, see “Specify Initial Conditions for Bus Signals”.

Run this check to generate efficient and readable code by matching the shape and numeric data types of initial condition structures with those of bus signals. Matching these characteristics avoids unnecessary explicit typecasts and replaces field-by-field structure assignments with, for example, calls to `memcpy`.

Partial Structures

This check lists blocks and `Simulink.Signal` objects that initialize bus signals by using partial structures. During the iterative process of creating a model, you can use partial structures to focus on a subset of signal elements in a bus. For a mature model, use full structures to:

- Generate readable and efficient code.
- Support a modeling style that explicitly initializes unspecified signals. When you use partial structures, Simulink implicitly initializes unspecified signals.

For more information about full and partial structures, see “Create Full Structures for Initialization” and “Create Partial Structures for Initialization”.

Data Type Mismatches

This check lists blocks and `Simulink.Signal` objects whose initial condition structures introduce data type mismatches. The fields of these structures have numeric data types that do not match the data types of the corresponding bus signal elements.

When you configure an initial condition structure to appear as a tunable global structure in the generated code, avoid unnecessary explicit typecasts by matching the data types. See “Generate Tunable Initial Condition Structure for Bus Signal” (Simulink Coder).

Results and Recommended Actions

Condition	Recommended Action
Block or signal object uses partial structure	Consider using the function <code>Simulink.Bus.createMATLABStructure</code> to create a full initial condition structure.
Data types of structure fields do not match data types of corresponding signal elements	Consider defining the structure as a <code>Simulink.Parameter</code> object, and creating a <code>Simulink.Bus</code> object to use as the data type of the bus signal and of the parameter object. To control numeric data types, use the <code>Simulink.BusElement</code> objects in the bus object.

Check Delay, Unit Delay and Zero-Order Hold blocks for rate transition

Check ID: `mathworks.design.ReplaceZOHDelayByRTB`

Identify Delay, Unit Delay, or Zero-Order Hold blocks that are used for rate transition. Replace these blocks with actual Rate Transition blocks.

Description

If a model uses Delay, Unit Delay, or Zero-Order Hold blocks to provide rate transition between input and output signals, Simulink makes a hidden replacement of these blocks with built-in Rate Transition blocks. In the compiled block diagram, a yellow symbol and the letters “RT” appear in the upper-left corner of a replacement block. This replacement can affect the behavior of the model, as follows:

- These blocks lose their algorithmic design properties to delay a signal or implement zero-order hold. Instead, they acquire rate transition behavior.
- This modeling technique works only in specific transition configurations (slow-to-fast for Delay and Unit Delay blocks, and fast-to-slow for Zero-Order Hold block). Set the block sample time to be equal to the slower rate (source for the Delay and Unit Delay blocks and destination for the Zero-Order Hold block).
- When the block sample time of a downstream or upstream block changes, these Delay, Unit Delay and Zero-Order Hold blocks might not perform rate transition. For example, setting the source and destination sample times equal stops rate transition. The blocks then assume their original algorithmic design properties.
- The block sample time shows incomplete information about sample time rates. The block code runs at two different rates to handle data transfer. However, the block sample time and sample time color show it as a single-rate block. Tools and MATLAB scripts that use sample time information base their behavior on this information.

An alternative is to replace Delay, Unit Delay, or Zero-Order Hold blocks with actual Rate Transition blocks.

- The technique ensures unambiguous results in block behavior. Delay, Unit Delay, or Zero-Order Hold blocks act according to their algorithmic design to delay and hold signals respectively. Only Rate Transition blocks perform actual rate transition.
- Using an actual Rate Transition block for rate transition offers a configurable solution to handle data transfer if you want to specify deterministic behavior or the type of memory buffers to implement.

Use this check to identify instances in your model where Delay, Unit Delay or Zero-Order Hold blocks undergo hidden replacement to provide rate transition between signals. Click **Upgrade Model** to replace these blocks with actual Rate Transition blocks.

Results and Recommended Actions

Condition	Recommended Action
Model has no instances of Delay, Unit Delay, or Zero-Order Hold blocks used for rate transition.	No action required.
Model has instances of Delay, Unit Delay, or Zero-Order Hold blocks used for rate transition.	<p>The check identifies these instances and allows you to upgrade the model.</p> <ol style="list-style-type: none"> 1 Click Upgrade Model to replace with actual Rate Transition blocks. 2 Save changes to your model.

If you do not choose to replace the Delay, Unit Delay, and/or Zero-Order Hold blocks with actual Rate Transition blocks, Simulink continues to perform a hidden replacement of these blocks with built-in rate transition blocks.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

- “Run Model Advisor Checks”
- “Model Upgrades”
- Rate Transition
- “Model Advisor Exclusion Overview” (Simulink Check)

Check for calls to `slDataTypeAndScale`

Check ID: `mathworks.design.CallsSlDataTypeAndScale`

Identify calls to the internal function `slDataTypeAndScale`.

Description

In some previous versions of Simulink, opening a model that had been saved in an earlier version triggers an automatic upgrade to code for data type handling. The automatic upgrade inserts calls to the internal function `slDataTypeAndScale`. Although Simulink continues to support some uses of the function, if you eliminate calls to it, you get cleaner and faster code.

Simulink does not support calls to `slDataTypeAndScale` when:

- The first argument is a `Simulink.AliasType` object.
- The first argument is a `Simulink.NumericType` object with property `IsAlias` set to true.

Running **Check for calls to `slDataTypeAndScale`** identifies calls to `slDataTypeAndScale` that are required or recommended for replacement. In most cases, running the check and following the recommended action removes the calls. You can ignore calls that remain. Run the check unless you are sure there are not calls to `slDataTypeAndScale`.

Results and Recommended Actions

Condition	Recommended Action
Required Replacement Cases	Manually or automatically replace calls to <code>slDataTypeAndScale</code> . Cases listed require you to replace calls to <code>slDataTypeAndScale</code> .
Recommended Replacement Cases	For the listed cases, it is recommended that you manually or automatically replace calls to <code>slDataTypeAndScale</code> .
Manual Inspection Cases	Inspect each listed case to determine whether it should be manually upgraded.

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

Tips

- Do not manually insert a call to `slDataTypeAndScale` into a model. The function was for internal use only.
- Running **Check for calls to `slDataTypeAndScale`** calls the Simulink function `slRemoveDataTypeAndScale`. Calling this function directly provides a wider range of conversion options. However, you very rarely need more conversion options.

See Also

- For more information about upgrading data types and scales, in the MATLAB Command Window, execute the following:
 - `help slDataTypeAndScale`
 - `help slRemoveDataTypeAndScale`
- “Model Advisor Exclusion Overview” (Simulink Check)

Check bus signals treated as vectors

Check ID: `mathworks.design.BusTreatedAsVector`

Identify bus signals that Simulink treats as vectors.

Description

You cannot use bus signals that the Simulink software implicitly converts to vectors. Instead, either insert a Bus to Vector conversion block between the bus signal and the block input port that it feeds, or use the `Simulink.BlockDiagram.addBusToVector` command.

Results and Recommended Actions

Condition	Recommended Action
Bus signals are implicitly converted to vectors.	Use <code>Simulink.BlockDiagram.addBusToVector</code> or insert a Bus to Vector block.
Model is not configured to identify bus signals that Simulink treats as vectors.	In the Configuration Parameters dialog box, on the Diagnostics > Connectivity pane, set Bus signal treated as vector to error.

Action Results

Clicking **Modify** inserts a Bus to Vector block at the input ports of blocks that implicitly convert bus signals to vectors.

Tips

- Run this check before running **Check consistency of initialization parameters for Output and Merge blocks**.
- For more information, see “Identify Automatic Bus Conversions”.

See Also

- “Identify Automatic Bus Conversions”
- Bus to Vector block
- “Bus signal treated as vector”

- `Simulink.BlockDiagram.addBusToVector`

Check for potentially delayed function-call subsystem return values

Check ID: `mathworks.design.DelayedFcnCallSubsys`

Identify function-call return values that might be delayed because Simulink software inserted an implicit Signal Conversion block.

Description

So that signals reside in contiguous memory, Simulink software can automatically insert an implicit Signal Conversion block in front of function-call initiator block input ports. This can result in a one-step delay in returning signal values from calling function-call subsystems. The delay can be avoided by ensuring the signal originates from a signal block within the function-call system. Or, if the delay is acceptable, insert a Unit Delay block in front of the affected input ports.

Results and Recommended Actions

Condition	Recommended Action
The listed block input ports could have an implicit Signal Conversion block.	Decide if a one-step delay in returning signal values is acceptable for the listed signals. <ul style="list-style-type: none"> • If the delay is not acceptable, rework your model so that the input signal originates from within the calling subsystem. • If the delay is acceptable, insert a Unit Delay block in front of each listed input port.

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

See Also

Signal Conversion block

Unit Delay block

“Model Advisor Exclusion Overview” (Simulink Check)

Identify block output signals with continuous sample time and non-floating point data type

Check ID: `mathworks.design.OutputSignalSampleTime`

Find continuous sample time, non-floating-point output signals.

Description

Non-floating-point signals might not represent continuous variables without loss of information.

Results and Recommended Actions

Condition	Recommended Action
Signals with continuous sample times have a non-floating-point data type.	On the identified signals, either change the sample time to be discrete or fixed-in-minor-step ([0 1]).

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

See Also

“What Is Sample Time?”.

“Model Advisor Exclusion Overview” (Simulink Check)

Check usage of Merge blocks

Check ID: `mathworks.design.MergeBlkUsage`

Identify Merge blocks with parameter settings that can lead to unexpected behavior, and help migrate your model to simplified initialization mode.

Note Run this check along with the other checks in the “Migrating to Simplified Initialization Mode Overview” on page 9-4.

Description

Simplified initialization mode was introduced in R2008b to improve the consistency of simulation results. For more information, see “Simplified Initialization Mode” and “Classic Initialization Mode”.

This Model Advisor check identifies settings in the Merge blocks in your model that can cause problems if you use classic initialization mode. It also recommends settings for consistent behavior of Merge blocks. The results of the subchecks contain two types of statements: Failed and Warning. Failed statements identify issues that you must address manually before you can migrate the model to the simplified initialization mode. Warning statements identify issues or changes in behavior that can occur after migration.

Results and Recommended Actions

Condition	Recommended Action
Check the run-time diagnostic setting of the Merge block.	<ol style="list-style-type: none"> 1 In the Configuration Parameters dialog box, set “Detect multiple driving blocks executing at the same time step” to <code>error</code>. 2 Verify that the model simulates without errors before running this check again.
Check for Model blocks that are using the PIL simulation mode.	The simplified initialization mode does not support the Processor-in-the-loop (PIL) simulation for model references.
Check for library blocks with instances that cannot be migrated.	Examine the failed subcheck results for each block to determine the corrective actions.
Check for single-input Merge blocks.	<p>Replace both the Mux block used to produce the input signal and the Merge block with one multi-input Merge block.</p> <p>Single-input Merge blocks are not supported in the simplified initialization mode.</p>

Condition	Recommended Action
Check for root Merge blocks that have an unspecified Initial output value.	<p>If you do not specify an explicit value for the Initial output parameter of root Merge blocks, then Simulink uses the default initial value of the output data type.</p> <p>A root Merge block is a Merge block with an output port that does not connect to another Merge block. For information on the default initial value, see “Initialize Signal Values”.</p>
Check for Merge blocks with nonzero input port offsets.	<p>Clear the Allow unequal port widths parameter of the Merge block.</p> <hr/> <p>Note Consider using Merge blocks only for signal elements that require true merging. You can combine other elements with merged elements using the Concatenate block.</p>
Check for Merge blocks that have unconnected inputs or that have inputs from non-conditionally executed subsystems.	<p>Set the Number of inputs parameter of the Merge block to the number of Merge block inputs. You must connect each input to a signal.</p> <p>Verify that each Merge block input is driven by a conditionally executed subsystem. Merge blocks cannot be driven directly by an Iterator Subsystem or a block that is not a conditionally executed subsystem.</p>
Check for Merge blocks with inputs that are combined or reordered outside of conditionally executed subsystems.	<p>Verify that combinations or reordering of Merge block input signals takes place within a conditionally executed subsystem. Such designs may use Mux, Bus Creator, or Selector blocks.</p>
Check for Merge blocks with inconsistent input sample times.	<p>Verify that input signals to each Merge block have the same Sample time.</p> <p>Failure to do so could result in unpredictable behavior. Consequently, the simplified initialization mode does not allow inconsistent sample times.</p>
Check for Merge blocks with multiple input ports that are driven by a single source.	<p>Verify that the Merge block does not have multiple input signals that are driven by the same conditionally executed subsystem or conditionally executed Model block.</p>

Condition	Recommended Action
Check for Merge blocks that use signal objects to specify the Initial output value.	<p>Verify that the following behavior is acceptable.</p> <p>In the simplified initialization mode, signal objects cannot specify the Initial output parameter of the Merge block. While you can still initialize the output signal for a Merge block using a signal object, the initialization result may be overwritten by that of the Merge block.</p> <hr/> <p>Note Simulink generates a warning that the initial value of the signal object has been ignored.</p>

Check usage of Outport blocks

Check ID: `mathworks.design.InitParamOutportMergeBlk`

Identify Outport blocks and conditional subsystems with parameter settings that can lead to unexpected behavior, and help migrate your model to simplified initialization mode.

Note Run this check along with the other checks in the “Migrating to Simplified Initialization Mode Overview” on page 9-4.

Description

Simplified initialization mode was introduced in R2008b to improve the consistency of simulation results. This mode is especially important for models that do not specify initial conditions for conditionally executed subsystem output ports. For more information, see “Simplified Initialization Mode” and “Classic Initialization Mode”.

This Model Advisor check identifies Outport blocks and conditional subsystems in your model that can cause problems if you use the simplified initialization mode. It also recommends settings for consistent behavior of Outport blocks. The results of the subchecks contain two types of statements: Failed and Warning. Failed statements identify issues that you must address manually before you can migrate the model to the simplified initialization mode. Warning statements identify issues or changes in behavior that can occur after migration.

Results and Recommended Actions

Condition	Recommended Action
Check for blocks inside of the Iterator Subsystem that require elapsed time.	<p>Within an Iterator Subsystem hierarchy, do not use blocks that require a service that maintains the time that has elapsed between two consecutive executions.</p> <p>Since an Iterator Subsystem can execute multiple times at a given time step, the concept of elapsed time is not well-defined between two such executions. Using these blocks inside of an Iterator Subsystem can cause unexpected behavior.</p>
Check for Outport blocks that have conflicting signal buffer requirements.	<p>The Outport block has a function-call trigger or function-call data dependency signal passing through it, along with standard data signals. Some of the standard data signals require an explicit signal buffer for the initialization of the output signal of the corresponding subsystem. However, buffering function-call related signals lead to a function-call data dependency violation.</p> <p>Consider modifying the model to pass function-call related signals through a separate Outport block. For examples of function-call data dependency violations, see the example model <code>sl_subsys_semantics</code>.</p> <p>A standard data signal may require an additional signal copy for one of the following reasons:</p> <ul style="list-style-type: none"> • The Outport block is driven by a block with output that cannot be overwritten. The Ground block and the Constant block are examples of such blocks. • The Outport block shares the same signal source with another Outport block in the same subsystem or in one nested within the current subsystem but having a different initial output value. • The Outport block connects to the input of a Merge block • One of the input signals of the Outport block is specifying a <code>Simulink.Signal</code> object with an explicit initial value.

Condition	Recommended Action
Check for Outport blocks that are driven by a bus signal and whose Initial output value is not scalar.	For Outport blocks driven by bus signals, classic initialization mode does not support Initial Condition (IC) structures, while simplified initialization mode does. Hence, when migrating a model from classic to simplified mode, specify a scalar for the Initial Output parameter. After migration completes, to specify different initial values for different elements of the bus signal, use IC structures. For more information, see "Create Initial Condition Structures".
Check for Outport blocks that require an explicit signal copy.	<p>An explicit copy of the bus signal driving the Outport block is required for the initialization of the output signal of the corresponding subsystem. Insert a Signal Conversion block before the Outport block, then set the Output parameter of the Signal Conversion block to Bus copy.</p> <p>A standard data signal may require an additional signal copy for one or more of the following reasons:</p> <ul style="list-style-type: none"> • A block with output that cannot be overwritten is driving the Outport block. The Ground block and the Constant block are examples of such blocks. • The Outport block shares the same signal source with another Outport block in the same subsystem or in one nested within the current subsystem but having a different initial output value. • The Outport block connects to the input of a Merge block • One of the input signals of the Outport block is specifying a <code>Simulink.Signal</code> object with an explicit initial value.
Check for merged Outport blocks that inherit the Initial Output value from Outport blocks that have been configured to reset when the blocks become disabled.	When Outport blocks are driving a Merge block, do not set their Output when disabled parameters to reset .
Check for merged Outport blocks that are driven by nested conditionally executed subsystems.	Determine if the new behavior of the Outport blocks is acceptable. If it is not acceptable, modify the model to account for the new behavior before migrating to the simplified initialization mode.

Condition	Recommended Action
Check for merged Outport blocks that reset when the blocks are disabled.	<p>Set the Output when disabled parameter of the Outport block to <code>held</code>. This setting is required because the Outport block connects to a Merge block.</p> <p>For more information, see Outport.</p>
Check for Outport blocks that have an undefined Initial output value with invalid initial condition sources.	<p>Verify that the following behavior is acceptable.</p> <p>When the Initial output parameter is unspecified (<code>[]</code>), it inherits the initial output from the source blocks. If at least one of the sources of the Outport block is not a valid source to inherit the initial value, the block uses the default initial value for that data type.</p> <p>For simplified initialization mode, valid sources an Outport blocks can inherit the Initial output value from are: Constant, Initial Condition, Merge (with initial output), Stateflow chart, function-call model reference, or conditionally executed subsystem blocks.</p>
Check Outport blocks that have automatic rate transitions.	<p>Simulink has inserted a Rate Transition block at the input of the Outport block. Specify the Initial output parameter for each Outport block.</p> <p>Otherwise, perform the following procedure:</p> <ol style="list-style-type: none"> 1 In the Configuration Parameters dialog box, on the Solver pane, clear the option “Automatically handle rate transition for data transfer”. 2 Run this Model Advisor check again.
Check Outport blocks that have a special signal storage requirement and have an undefined Initial output value.	<p>Verify that the following behavior is acceptable.</p> <p>Specify the Initial output parameter for the Outport block. Set this value to <code>[]</code> (empty matrix) to use the default initial value of the output data type.</p>
Check the Initial output setting of Outport blocks that reset when they are disabled.	<p>Specify the Initial output parameter of the Outport block.</p> <p>You must specify the Initial output value for blocks that are configured to reset when they become disabled.</p>

Condition	Recommended Action
Check the Initial output setting for Outport blocks that pass through a function-call data dependency signal.	<p>You cannot specify an Initial output value for the Outport block because function-call data dependency signals are passing through it. To set the Initial output value:</p> <ol style="list-style-type: none"> 1 Set the Initial output parameter of the Outport block to []. 2 Provide the initial value at the source of the data dependency signal rather than at the Outport block.
Check for Outport blocks that use signal objects to specify the Initial output value.	<p>Verify that the following behavior is acceptable.</p> <p>In the simplified initialization mode, signal objects cannot specify the Initial output parameter of an Outport block. You can still initialize the input or output signals for an Outport block using signal objects, but the initialization results may be overwritten by those of the Outport block.</p> <p>Note If you are working with a conditionally executed subsystem Outport block, Simulink generates a warning that the initial value of the signal object has been ignored.</p>
Check for library blocks with instances that have warnings.	Examine the warning subcheck results for each block before migrating to the simplified initialization mode.
Check for merged Outport blocks that are either unconnected or connected to a Ground block.	<p>Verify that the following behavior is acceptable.</p> <p>The Outport block is driving a Merge block, but its inputs are either unconnected or connected to Ground blocks. In the classic initialization mode, unconnected or grounded outputs do not update the merge signal even when their parent conditionally executed subsystems are executing. In the simplified initialization mode, however, these outputs will update the merge signal with a value of zero when their parent conditionally executed subsystems are executing.</p>

Condition	Recommended Action
<p>Check for Outport blocks that obtain the Initial output value from an input signal when they are migrated.</p>	<p>Verify that the following behavior is acceptable.</p> <p>The Initial output parameter of the Outport block is not specified. As a result, the simplified initialization mode will assume that the Initial output value for the Outport block is derived from the input signal. This assumption may result in different initialization behavior.</p> <p>If this behavior is not acceptable, modify your model before you migrate to the simplified initialization mode.</p>
<p>Check for outer Outport blocks that have an explicit Initial output.</p>	<p>Verify that the following behavior is acceptable.</p> <p>In classic initialization mode, the Initial output and Output when disabled parameters of the Outport block must match those of their source Outport blocks.</p> <p>In simplified initialization mode, Simulink sets the Initial output parameter of outer Outport blocks to [] (empty matrix) and Output when disabled parameter to held.</p>
<p>Check for blocks that read input from conditionally executed subsystems during initialization.</p>	<p>Verify that the following behavior is acceptable.</p> <p>Some blocks, such as the Discrete-Time Integrator block, read their inputs from conditionally executed subsystems during initialization in the classic initialization mode. Simulink performs this step as an optimization technique.</p> <p>This optimization is not allowed in the simplified initialization mode because the output of a conditionally executed subsystem at the first time step after initialization may be different than the initial value declared in the corresponding Outport block. In particular, this discrepancy occurs if the subsystem is active at the first time step.</p>

Condition	Recommended Action
<p>Check for a migration conflict for Outport blocks that use a Dialog as the Source of initial output value.</p>	<p>Other instances of Outport blocks with the same library link either cannot be migrated or are being migrated in a different manner. Review the results from the Check for library blocks with instances that cannot be migrated to learn about the different migration paths for other instances of each Outport block.</p> <p>The Outport block will maintain its current settings and use its specified Initial output value.</p>
<p>Check for a migration conflict for Outport blocks that use Input signal as the Source of initial output value.</p>	<p>Other instances of Outport blocks with the same library link either cannot be migrated or are being migrated in a different manner. Review the results from the Check for library blocks with instances that cannot be migrated to learn about the different migration paths for other instances of each Outport block.</p> <p>The Outport block currently specifies an Initial output of [] (empty matrix), and the Output when disabled as held. This means that each output does not perform initialization, but implicitly relies on source blocks to initialize its input signal.</p> <p>After migration, the parameter Source of initial output value will be set to Input signal to reflect this behavior.</p>
<p>Check for a migration conflict for Outport blocks that have SimEvents semantics.</p>	<p>Other instances of Outport blocks with the same library link either cannot be migrated or are being migrated in a different manner. Review the results from the Check for library blocks with instances that cannot be migrated to learn about the different migration paths for other instances of each Outport block.</p> <p>The Outport blocks will continue to use an Initial output value of [] (empty matrix) and an Output when disabled setting of held. Simulink will maintain these settings because their parent conditionally executed subsystems are connected to SimEvents blocks.</p>

Condition	Recommended Action
Check for a migration conflict for innermost Outport blocks with variable-size input and unspecified Initial output .	<p>For these Outport blocks, the signal size varies only when the parent subsystem of the block is re-enabled. Therefore, Simulink implicitly assumes that the Initial output parameter is equal to 0, even though the parameter is unspecified, []. Consequently, unless you specify the parameter, the Model Advisor will explicitly set the parameter to 0 when the model is migrated to the simplified initialization mode.</p> <p>Other instances of Outport blocks with the same library link either cannot be migrated or are being migrated in a different manner. Review the results from the Check for library blocks with instances that cannot be migrated to learn about the different migration paths for other instances of each Outport block.</p>
Check for a migration conflict for Outport blocks that use a default ground value as the Initial output.	The parameter Initial output is set to [] (empty matrix) and the source of the Outport is an invalid initial condition source. Thus, the block uses the default initial value as the initial output in the simplified initialization mode. Other instances of Outport blocks with the same library link either have errors or are being migrated differently.
Check for a migration conflict for merged Outport blocks without explicit specification of Initial output .	Review the results from the subcheck Check for library blocks with instances that cannot be migrated to learn about different migration paths for other instances of each Outport block. For the remaining Outport blocks, Initial output is set to [] (empty matrix) and Output when disabled is set to held respectively, in simplified initialization mode.

Check usage of Discrete-Time Integrator blocks

Check ID: mathworks.design.DiscreteBlock

Identify Discrete-Time Integrator blocks with parameter settings that can lead to unexpected behavior, and help migrate your model to simplified initialization mode.

Note Run this check along with the other checks in the “Migrating to Simplified Initialization Mode Overview” on page 9-4.

Description

Simplified initialization mode was introduced in R2008b to improve the consistency of simulation results. For more information, see “Simplified Initialization Mode” and “Classic Initialization Mode”.

This Model Advisor check identifies settings in Discrete-Time Integrator blocks in your model that can cause problems if you use the simplified initialization mode. It also recommends settings for consistent behavior of Discrete-Time Integrator blocks. The results of the subchecks contain two types of statements: Failed and Warning. Failed statements identify issues that you must address manually before you can migrate the model to the simplified initialization mode. Warning statements identify issues or changes in behavior that can occur after migration.

Results and Recommended Actions

Condition	Recommended Action
Check for Discrete-Time Integrator blocks whose parameter Initial condition setting is set to Output.	Determine if the new behavior of the Discrete-Time Integrator blocks is acceptable. If it is not acceptable, modify the model to account for the new behavior before migrating to the simplified initialization mode.
Check for Discrete-Time Integrator blocks whose Initial condition setting parameter is set to State (most efficient) and are in a subsystem that uses triggered sample time.	Use periodic sample time for the block, or set Initial Condition setting to Output.
Check for blocks inside of the Iterator Subsystem that require elapsed time.	<p>Within an Iterator Subsystem hierarchy, do not use blocks that require a service that maintains the time that has elapsed between two consecutive executions.</p> <p>Since an Iterator Subsystem can execute multiple times at a given time step, the concept of elapsed time is not well-defined between two such executions. Using these blocks inside of an Iterator Subsystem can cause unexpected behavior.</p>

Check model settings for migration to simplified initialization mode

Note Do not run this check in isolation. Run this check along with the other checks in the “Migrating to Simplified Initialization Mode Overview” on page 9-4.

Check ID: `mathworks.design.ModelLevelMessages`

Identify settings in Model blocks and model configuration parameters that can lead to unexpected behavior, and help migrate your model to simplified initialization mode.

Description

Simplified initialization mode was introduced in R2008b to improve consistency of simulation results. For more information, see “Simplified Initialization Mode” and “Classic Initialization Mode”.

This Model Advisor check identifies issues in the model configuration parameters and Model blocks in your model that can cause problems when you migrate to simplified initialization mode. The results of the subchecks contain two types of statements: Failed and Warning. Failed statements identify issues that you must address manually before you can migrate the model to simplified initialization mode. Warning statements identify issues or changes in behavior that can occur after migration.

After running this Model Advisor consistency check, if you click **Explore Result** button, the messages pertain only to blocks that are not library-links.

Note Because it is difficult to undo these changes, select **File > Save Restore Point As** to back up your model before migrating to the simplified initialization mode.

For more information, see “Model Configuration Parameters: Connectivity Diagnostics”.

Results and Recommended Actions

Condition	Recommended Action
Verify that all Model blocks are using the simplified initialization mode.	Migrate the model referenced by the Model block to the simplified initialization mode, then migrate the top model.
Verify simplified initialization mode setting	Set Configuration Parameters > Underspecified initialization detection to Simplified .

Action Results

Clicking **Modify Settings** causes the following:

- The Model parameter is set to **simplified**
- If an Output block has the **Initial output** parameter set to the empty character vector, [], then the **SourceOfInitialOutputValue** parameter is set to **Input signal**.
- If an Outputport has an empty **Initial output** and a variable-size signal, then the **Initial output** is set to zero.

Check S-functions in the model

Check ID: mathworks.design.SFuncAnalyzer

Perform quality checks on S-functions in Simulink models or subsystems.

Description

The S-function analyzer performs quality checks on S-functions to identify improvements and potential problems in the specified model.

Results and Recommended Actions

Condition	Recommended Action
Continuous states are modified in <code>mdlOutputs</code> method.	Modify Continuous States at a major time step and use <code>ssSetSolverNeedsReset</code> function in S-function code.
Continuous states are modified in the <code>mdlUpdate</code> method.	Modify Continuous States only at a major time step and use <code>ssSetSolverNeedsReset</code> function in S-function code.
S-function discrete states are modified in the <code>mdlOutputs</code> at a minor step.	Modify the discrete states only at a major step guarded by <code>ssIsMajorTimeStep</code> function.
S-function mode vector is modified in the <code>mdlOutputs</code> method at a minor step.	Modify the mode vector only at a major step guarded by <code>ssIsMajorTimeStep</code> function.
S-function is using static or global variables to declare internal states.	Declare the states explicitly using <code>ssSetNumDiscStates</code> function or "Model Global Data by Creating Data Stores".
S-function has continuous states but sample time is not declared continuous.	Specify continuous sample time using <code>ssSetSampleTime</code> function.
S-function has discrete states but the <code>mdlOutputs</code> and <code>mdlUpdate</code> methods are combined.	Define the <code>mdlOutputs</code> and <code>mdlUpdate</code> methods separately and modify discrete states only in <code>mdlUpdate</code> method.
S-function sets the <code>SS_OPTION_CAN_BE_CALLED_CONDITIONALLY</code> option when having state-like data or multiple sample times.	Remove the options when the S-function has state-like data or multiple sample times.
MEX compilers do not exist on the machine.	Check for the presence or install MEX compilers on the machine.
S-function encounters errors while compiling the model.	Check the Diagnostic Viewer output and recompile the model.

Check for non-continuous signals driving derivative ports

Check ID: `mathworks.design.NonContSigDerivPort`

Identify noncontinuous signals that drive derivative ports.

Description

Noncontinuous signals that drive derivative ports cause the solver to reset every time the signal changes value, which slows down simulation.

Results and Recommended Actions

Condition	Recommended Action
There are noncontinuous signals in the model driving derivative ports.	<ul style="list-style-type: none"> • Make the specified signals continuous. • Replace the continuous blocks receiving these signals with discrete state versions of the blocks.

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

See Also

- “Simulink Models” on page 12-6
- “Simulation Phases in Dynamic Systems”
- “Model Advisor Exclusion Overview” (Simulink Check)

Runtime diagnostics for S-functions

Check ID: `mathworks.design.DiagnosticSFcn`

Check array bounds and solver consistency if S-Function blocks are in the model.

Description

Validates whether S-Function blocks adhere to the ODE solver consistency rules that Simulink applies to its built-in blocks.

Results and Recommended Actions

Condition	Recommended Action
Solver data inconsistency is set to none.	In the Configuration Parameters dialog box, set Solver data inconsistency to warning or error.
Array bounds exceeded is set to none.	In the Configuration Parameters dialog box, set Array bounds exceeded to warning or error

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

Check model for foreign characters

Check ID: `mathworks.design.characterEncoding`

Check for characters that are incompatible with the current encoding

Description

Check for characters in the model file that cannot be represented in the current encoding. These can cause errors during simulation, and may be corrupted when saving the model.

Results and Recommended Actions

Condition	Recommended Action
Incompatible characters found	Change the current encoding to the encoding specified in the model file, using <code>slCharacterEncoding</code> . To change the current encoding you need to close the models, and this closes the Model Advisor.

Tips

The Upgrade Advisor report shows the encoding you need, or you can retrieve the encoding from the model using the command:

```
get_param(modelname, 'SavedCharacterEncoding')
```

Use `slCharacterEncoding` to change the encoding. This setting applies to the current MATLAB session, so if you restart MATLAB and want to open the same model, you will need to make the same change to the current encoding again.

For more information see:

- `slCharacterEncoding`
- “Save Models with Different Character Encodings”

See Also

- “Consult the Upgrade Advisor”.
- “Model Upgrades”

Identify unit mismatches in the model

Check ID: `mathworks.design.UnitMismatches`

Identify instances of unit mismatches between ports in the model.

Description

Check for instances of unit mismatches between ports in the model.

Results and Recommended Actions

Condition	Recommended Action
Unit mismatches found	Change one of the mismatched unit settings to match the unit settings for the other port.

See Also

- “Unit Specification in Simulink Models”.

Identify automatic unit conversions in the model

Check ID: `mathworks.design.AutoUnitConversions`

Identify instances of automatic unit conversions in the model.

Description

Identify instances of automatic unit conversions in the model.

Results and Recommended Actions

Condition	Recommended Action
Automatic unit conversions found	Check that the converted units are expected for the model.

See Also

- “Unit Specification in Simulink Models”.

Identify disallowed unit systems in the model

Check ID: `mathworks.design.DisallowedUnitSystems`

Identify instances of disallowed unit systems in the model.

Description

Identify instances of disallowed unit systems in the model.

Results and Recommended Actions

Condition	Recommended Action
Disallowed unit systems found	Either choose a unit that conforms to the configured unit system, or select another unit system. For more information, see “Restricting Unit Systems”.

See Also

- “Unit Specification in Simulink Models”.

Identify undefined units in the model

Check ID: `mathworks.design.UndefinedUnits`

Identify instances of unit specifications, not defined in the unit database, in the model.

Description

Identify instances of unit specifications, not defined in the unit database, in the model.

Results and Recommended Actions

Condition	Recommended Action
Undefined units found	Change the unit to one that Simulink supports.

See Also

- “Unit Specification in Simulink Models”.
- Allowed Units

Identify ambiguous units in the model

Check ID: `mathworks.design.AmbiguousUnits`

Identify instances of ambiguous unit specifications, such as duplicate unit names in the unit database, in the model.

Description

Identify instances of ambiguous unit specifications, such as duplicate unit names in the unit database, in the model.

Results and Recommended Actions

Condition	Recommended Action
Ambiguous units found	You can ignore the warning or specify the unit with corresponding unit system using the format <code>unit_system::unit_name</code> .

See Also

- “Unit Specification in Simulink Models”.
- Allowed Units

Check model for block upgrade issues

Check ID: mathworks.design.Update

Check for common block upgrade issues.

Description

Check blocks in the model for compatibility issues resulting from using a new version of Simulink software.

Results and Recommended Actions

Condition	Recommended Action
Blocks with compatibility issues found.	Click Modify to fix the detected block issues.
Check update status for the Level 2 API S-functions.	Consider replacing Level 1 S-functions with Level 2.

Action Results

Clicking **Modify** replaces blocks from a previous release of Simulink software with the latest versions.

See Also

- “Write Level-2 MATLAB S-Functions”.
- “Consult the Upgrade Advisor”.
- “Model Upgrades”

Check model for block upgrade issues requiring compile time information

Check ID: mathworks.design.UpdateRequireCompile

Check for common block upgrade issues.

Description

Check blocks for compatibility issues resulting from upgrading to a new version of Simulink software. Some block upgrades require the collection of information or data when the model is in the compile mode. For this check, the model is set to compiled mode and then checked for upgrades.

Results and Recommended Actions

Condition	Recommended Action
Model contains Lookup Table or Lookup Table (2-D) blocks and some of the blocks specify Use Input Nearest or Use Input Above for a lookup method.	Replace Lookup Table blocks and Lookup Table (2-D) blocks with n-D Lookup Table blocks. Do not apply Use Input Nearest or Use Input Above for lookup methods; select another option.

Condition	Recommended Action
Model contains Lookup Table or Lookup Table (2-D) blocks and some blocks perform multiplication first during interpolation.	Replace Lookup Table blocks and Lookup Table (2-D) blocks with n-D Lookup Table blocks. However, because the n-D Lookup Table block performs division first, this replacement might cause a numerical difference in the result.
Model contains Lookup Table or Lookup Table (2-D) blocks. Some of these blocks specify Interpolation-Extrapolation as the Lookup method but their input and output are not the same floating-point type.	Replace Lookup Table blocks and Lookup Table (2-D) blocks with n-D Lookup Table blocks. Then change the extrapolation method or the port data types for block replacement.
Model contains Unit Delay blocks with Sample time set to -1 that inherit a continuous sample time.	Replace Unit Delay blocks with Memory blocks.

Check Data Store Memory blocks for multitasking

Action Results

Clicking **Modify** replaces blocks from a previous release of Simulink software with the latest versions.

Check that the model is saved in SLX format

Check ID: mathworks.design.UseSLXFile

Check that the model is saved in SLX format.

Description

Check whether the model is saved in SLX format.

Results and Recommended Actions

Condition	Recommended Action
Model not saved in SLX format	Consider upgrading to the SLX file format to use the latest features in Simulink.

Capabilities and Limitations

You can run this check on your library models.

Tips

Simulink Projects can help you upgrade models to SLX format and preserve file revision history in source control. See “Convert from MDL to SLX in a Project and Preserve Revision History” on page 14-530.

See Also

Check model for SB2SL blocks

Check ID: `mathworks.simulink.SB2SL.Check`

Check that the model does not have outdated SB2SL blocks.

Description

Check if the model contains outdated SB2SL blocks.

Results and Recommended Actions

Condition	Recommended Action
Model contains outdated SB2SL blocks	Consider upgrading the model to current SB2SL blocks.

Action Results

Clicking **Update SB2SL Blocks** replaces blocks with the latest versions.

See Also

- “Consult the Upgrade Advisor”.

Check Model History properties

Check ID: `mathworks.design.SLXModelProperties`

Check for edited model history properties

Description

Check models for edited Model History property values that could be used with source control tool keyword substitution. This keyword substitution is incompatible with SLX file format.

In the MDL file format you can configure some model properties to make use of source control tool keyword substitution. If you save your model in SLX format, source control tools cannot perform keyword substitution. Information in the model file from such keyword substitution is cached when you first save the MDL file as SLX, and is not updated again. The Model Properties History pane and Model Info blocks in your model show stale information from then on.

Results and Recommended Actions

Condition	Recommended Action
Edited model history properties	Manually or automatically reset the properties to the default values. Click the button to reset, or to inspect and change these properties manually, open the Model Properties dialog and look in the History pane.

Capabilities and Limitations

You can run this check on your library models.

See Also

- “Consult the Upgrade Advisor”.
- “Model Upgrades”

Identify Model Info blocks that can interact with external source control tools

Check ID: `mathworks.design.ModelInfoKeywordSubstitution`

Use this check to find Model Info blocks that can be altered by external source control tools through keyword substitution.

Description

This check searches for character vectors in the Model Info block enclosed within dollar signs that can be overwritten by an external source control tool. Using third-party source control tool keyword expansion might corrupt your model files when you submit them. Keyword substitution is not available in SLX model file format.

For a more flexible interface to source control tools, use a Simulink project instead of the Model Info block. See “About Source Control with Projects”.

Results and Recommended Actions

Condition	Recommended Action
The Model Info block contains fields like this: <code>\$keyword\$</code>	Review the list of fields in the report, then remove the keyword character vectors from the Model Info block.

Identify Model Info blocks that use the Configuration Manager

Check ID: `mathworks.design.ModelInfoConfigurationManager`

Use this check to find Model Info blocks that use the Configuration Manager.

Description

Model Info blocks using the Configuration Manager allow risky keyword substitution using external source control tools. Using third-party source control tool keyword expansion might corrupt your model files when you submit them. Keyword substitution is not available in SLX model file format. The Configuration Manager for the Model Info block will be removed in a future release.

For a more flexible interface to source control tools, use a Simulink project instead of the Model Info block. See “About Source Control with Projects”.

Results and Recommended Actions

Condition	Recommended Action
A Model Info block is using the Configuration Manager.	Click Remove the Configuration Manager .

Check model for upgradable SerDes Toolbox blocks

Check ID: mathworks.design.serdesUpgrades

Lists blocks saved in a previous version of SerDes Toolbox™ that are outdated.

Description

This check searches for and lists SerDes Toolbox blocks that can be upgraded for compatibility with the current release.

Results and Recommended Actions

Condition	Recommended Action
Blocks saved in older versions of SerDes Toolbox are found.	Click Upgrade SerDes Toolbox Blocks to upgrade the SerDes Toolbox blocks to be compatible with the current release.

Action Results

Clicking **Upgrade SerDes Toolbox Blocks** upgrades the outdated SerDes Toolbox blocks to be compatible with the current release.

See Also

- “Design and Simulate SerDes Systems” (SerDes Toolbox)

Check model for legacy 3DoF or 6DoF blocks

Check ID: mathworks.design.Aeroblks.CheckDOF

Lists 3DoF and 6DoF blocks are outdated.

Description

This check searches for 3DoF and 6DoF blocks from library versions prior to 3.13 (R2014a).

Results and Recommended Actions

Condition	Recommended Action
Blocks configured with old versions of 3DoF or 6DoF blocks found.	Click Replace 3DoF and 6DoF Blocks to replace the blocks with latest versions.

Action Results

Clicking **Replace 3DoF and 6DoF Blocks** replaces blocks with the latest versions.

See Also

- “Equations of Motion” (Aerospace Blockset)

Check model and local libraries for legacy Aerospace Blockset blocks

Check ID: mathworks.design.Aeroblks.CheckFG

Lists blocks configured to use FlightGear versions that are outdated or not supported.

Description

This check searches and lists blocks configured to use FlightGear versions that are outdated or not supported.

Results and Recommended Actions

Condition	Recommended Action
Blocks configured with old versions of FlightGear are found.	Click Update FlightGear blocks to change block settings to latest supported version of FlightGear. Then, download latest version of FlightGear that MATLAB supports.

Action Results

Clicking **Update FlightGear blocks** changes block settings to the latest supported version of FlightGear.

See Also

- “Flight Simulator Interfaces” (Aerospace Blockset)

Check model for Aerospace Blockset navigation blocks

Check ID: mathworks.design.Aeroblks.CheckNAV

Searches for Three-Axis Inertial Measurement Unit, Three-Axis Gyroscope, and Three-Axis Accelerometer blocks prior to 3.21 (R2018a).

Description

This check searches for Three-Axis Inertial Measurement Unit, Three-Axis Gyroscope, and Three-Axis Accelerometer blocks that have been updated in R2018a.

Results and Recommended Actions

Condition	Recommended Action
Three-Axis Inertial Measurement Unit, Three-Axis Gyroscope, and Three-Axis Accelerometer blocks prior to R2018a.	In R2018a or later, if you did not previously solve for steady state conditions, save the model now. If you previously solved for steady state conditions for the model, solve for these steady state conditions again, and then save the model.

See Also

- Three-axis Accelerometer
- Three-axis Gyroscope
- Three-axis Inertial Measurement Unit

Check and update masked blocks in library to use promoted parameters

Check ID: `mathworks.design.CheckAndUpdateOldMaskedBuiltinBlocks`

Check for libraries that should be updated to use promoted parameters.

Description

This check searches libraries created before R2011b for masked blocks that should be updated to use promoted parameters. Since R2011b, if a block parameter is not promoted, its value in the linked block is locked to its value in the library block. This check excludes blocks of type Subsystem, Model reference, S-Function and M-S-Function.

Results and Recommended Actions

Condition	Recommended Action
Libraries that need to be updated are found	Click Update . Once the libraries have been updated, run the check again

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

- “Consult the Upgrade Advisor”.
- “Model Upgrades”

- “Model Advisor Exclusion Overview” (Simulink Check)

Check and update mask image display commands with unnecessary `imread()` function calls

Check ID: `mathworks.design.CheckMaskDisplayImageFormat`

Check identifies masks using image display commands with unnecessary calls to the `imread()` function.

Description

This check searches for the mask display commands that make unnecessary calls to the `imread()` function, and updates them with mask display commands that do not call the `imread()` function. Since 2013a, a performance and memory optimization is available for mask images specified using the image path instead of the RGB triple matrix.

Results and Recommended Actions

Condition	Recommended Action
Mask display commands that make unnecessary calls to the <code>imread()</code> function are found.	Click Update . Once the blocks have been updated, run the check again.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

- “Consult the Upgrade Advisor”.
- “Model Upgrades”
- “Model Advisor Exclusion Overview” (Simulink Check)

Check and update mask to affirm icon drawing commands dependency on mask workspace

Check ID: `mathworks.design.CheckMaskRunInitFlag`

Check identifies if the mask icon drawing commands have dependency on the mask workspace.

Description

This check identifies if the mask icon drawing commands have dependency on the mask workspace and updates the `RunInitForIconRedraw` property accordingly. If there is no mask workspace dependency, the value of `RunInitForIconRedraw` is set to `off`, whereas, if there is mask workspace dependency the values is set to `on`.

Setting the values of `RunInitForIconRedraw` to `off` when there is no mask workspace dependency optimizes the performance by not executing the mask initialization code before drawing the block icon.

Results and Recommended Actions

Condition	Recommended Action
Mask drawing commands that are dependent or independent of the mask workspace are found.	Click Update . Once the blocks have been updated, run the check again.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

- “Consult the Upgrade Advisor”.
- “Model Upgrades”
- “Model Advisor Exclusion Overview” (Simulink Check)

Identify masked blocks that specify tabs in mask dialog using `MaskTabNames` parameter

Check ID: `mathworks.design.CheckAndUpdateOldMaskTabnames`

This check identifies masked blocks that specify tabs in mask dialog using the `MaskTabNames` parameter.

Description

This check identifies masked blocks that use the `MaskTabNames` parameter to programmatically create tabs in the mask dialog. Since R2013b, dialog controls are used to group parameters in a tab on the mask dialog.

Results and Recommended Actions

Condition	Recommended Action
Masked blocks that use the <code>MaskTabNames</code> parameter to create tabs programmatically in the mask dialog are found.	Click Upgrade available in the Action section. Once the blocks have been updated, run the check again.

Capabilities and Limitations

You can run this check on your library models.

See Also

- “Consult the Upgrade Advisor”.

Identify questionable operations for strict single-precision design

Check ID: `mathworks.design.StowawayDoubles`

For a strict single-precision design, this check identifies the blocks that introduce double-precision operations, and non-optimal model settings.

Description

For a strict single-precision design, this check identifies the blocks that introduce double-precision operations, and non-optimal model settings.

Results and Recommended Actions

Condition	Recommended Action
Double-precision floating-point operations found in model.	Verify that: <ul style="list-style-type: none"> • Block input and output data types are set correctly. • In the Configuration Parameters dialog box, Default for underspecified data type is set to single.
Model uses a library standard that is not optimal for strict-single designs.	Verify that: <ul style="list-style-type: none"> • All target-specific math libraries used by the model support single-precision implementations. <p>Set Configuration Parameters > Standard math library to C99 (ISO).</p>
Logic signals are not implemented as Boolean data.	Verify that: <ul style="list-style-type: none"> • In the Configuration Parameters dialog box, Implement logic signals as Boolean data is selected.

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

Check `get_param` calls for block `CompiledSampleTime`

Check ID: `mathworks.design.CallsGetParamCompiledSampleTime`

Use this check to identify MATLAB files in your working environment that contain `get_param` function calls to return the block `CompiledSampleTime` parameter.

Description

For multi-rate blocks (including subsystems), Simulink returns the block compiled sample time as a cell array of the sample rates in the block. The return value is a cell array of pairs of doubles. MATLAB code that accepts this return value only as pairs of doubles can return an error when called with a multi-rate block. Use this check to identify such code in your environment. Modify these instances of code to accept a cell array of pairs of doubles instead.

For example, consider a variable `blkTs`, which has been assigned the compiled sample time of a multi-rate block.

```
blkTs = get_param(block, 'CompiledSampleTime');
```

Here are some examples in which the original code works only if `blkTs` is a pair of doubles and the block is a single-rate block:

- Example 1

```
if isinf(blkTs(1))
    disp('found constant sample time')
end
```

Since `blkTs` is now a cell array, Simulink gives this error message:

```
Undefined function 'isinf' for input arguments of type 'cell'
```

Instead, use this code, for which `blkTs` can be a cell array or a pair of doubles.

```
if isequal(blkTs, [inf,0])
    disp('found constant sample time')
end
```

- Example 2

```
if all(blkTs == [-1,-1])
    disp('found triggered sample time')
end
```

For the above example, since `blkTs` is now a cell array, Simulink gives this error:

```
Undefined function 'eq' for input arguments of type 'cell'
```

Instead, use this code, for which `blkTs` can be a cell array or a pair of doubles.

```
if isequal(blkTs, [-1,-1])
    disp('found triggered sample time')
end
```

- Example 3

```

if (blkTs(1) == -1)
    disp('found a triggered context')
end

```

Again, since blkTs is now a cell array, Simulink gives this error:

```

Undefined function 'eq' for input arguments of type 'cell'

```

Instead, use this code.

```

if ~iscell(blkTs)
    blkTs = {blkTs};
end
for idx = 1:length(blkTs)
    thisTs = blkTs{idx};
    if (thisTs(1) == -1)
        disp('found a triggered context')
    end
end
end

```

The above code checks for a triggered type sample time (triggered or async). In cases in which a block has constant sample time ([inf,0]) in addition to triggered or async or when a block has multiple async rates, this alternative property detects the triggered type sample time.

This check scans MATLAB files in your environment. If the check finds instances of MATLAB code that contain `get_param` calls to output the block compiled sample time, Upgrade Advisor displays these results. It suggests that you modify code that accepts the block compiled sample time from multi-rate blocks.

Results and Recommended Actions

Condition	Recommended Action
No MATLAB files call <code>get_param(block,CompiledSampleTime)</code>	None
Some MATLAB files call <code>get_param(block,CompiledSampleTime)</code>	If files use the block <code>CompiledSampleTime</code> parameter from multi-rate blocks, modify these files to accept the parameter as a cell array of pairs of doubles

- “Sample Times in Subsystems”
- “Block Compiled Sample Time”

Check if all simulation outputs are returned as a single `Simulink.SimulationOutput` object

Check ID: `mathworks.design.CheckSingleSimulationOutput`

Use this check to identify if the simulation result is returned as a single `Simulink.SimulationOutput` object.

Description

This check scans your model to verify if the parameter `ReturnWorkspaceOutputs` is enabled. Enabling this parameter, returns simulation outputs in a `Simulink.SimulationOutput` when simulating interactively. Simulation outputs include signal, state, output, DSM logging, and scope and To Workspace block logging.

When `ReturnWorkspaceOutputs` is enabled, it provides:

- Easier management of simulation data.
- Automatic access to `SimulationMetadata`.
- Compatibility with multiple parallel simulations and batch simulations.

Results and Recommended Actions

Condition	Recommended Action
Simulation outputs are not returned as a single <code>Simulink.SimulationOutput</code> object	Return all simulation outputs as a single <code>Simulink.SimulationOutput</code> object

See Also

- “Single simulation output”
- `Simulink.SimulationOutput`

Check model for parameter initialization and tuning issues

Check ID: `mathworks.design.ParameterTuning`

Use this check to identify issues in the model that occur when you initialize parameters or tune them.

Description

This check scans your model for parameter initialization and tuning issues like:

- Rate mismatch between blocks
- Divide by zero issue in conditionally executed subsystems
- Invalid control port value in Index Vector blocks

Results and Recommended Actions

Condition	Recommended Action
The model has rate transition issues.	Select Automatically handle rate transition for data transfer in the Solver pane of the model configuration parameters.
The model has a divide by zero issue in a conditionally executed subsystem with a control port.	At the command prompt, run <code>set_param(control_port,'DisallowConstTsAndPrmTs', 'on')</code>
The model has an invalid control port value in a conditionally executed subsystem.	At the command prompt, run <code>set_param(control_port,'DisallowConstTsAndPrmTs', 'on')</code>

Action Results

Select **Upgrade model** to resolve issues in the model related to parameter initialization and tuning.

See Also

- “Automatic Rate Transition”

Check for virtual bus across model reference boundaries

Check ID: `mathworks.design.CheckVirtualBusAcrossModelReference`

Check virtual bus signals that cross model reference boundaries.

Description

This check identifies root-level Inport and Outport blocks in referenced models and Model blocks with virtual bus outputs that require updates to change to nonvirtual bus signals.

If the check identifies issues, click **Update Model** to convert root-level Inport and Outport blocks configured for virtual buses to use nonvirtual buses in these situations:

- For root-level Inport blocks — Enable the **Output as nonvirtual bus** parameter and insert a Signal Conversion block after the Inport block. The Signal Conversion block is configured to output a virtual bus.
- For root-level Outport blocks — Enable the **Output as nonvirtual bus in parent model** parameter.
- For Model blocks — For ports whose Outport blocks were updated to address issues, insert a Signal Conversion block after the corresponding ports of the Model block. The Signal Conversion block is configured to output a virtual bus.

Recommended Action and Results

To resolve issues, click **Upgrade Model**.

Note Run the **Analyze model hierarchy and continue upgrade sequence** check on the top-level model and then down through the model reference hierarchy.

Clicking **Upgrade Model** converts affected root-level Inport and Outport blocks configured for virtual buses to use nonvirtual buses in models where you:

- Use function prototype control
- Perform C++ code generation with the `I/O arguments step method` option.

Alternatively, you can change the C++ code generation function specification setting to `Default step method`:

- 1 In the **Configuration Parameters > Code Generation > Interface** pane, click **Configure C++ Class Interface**.
 - 2 In the dialog box, set the **Function specification** parameter to `Default step method`.
- Use buses that have variable-dimension signals

- Use an associated non-auto storage class for Outport block signals
 - The conversion for non-auto storage class occurs only if you have the target generation license that the model requires. For example, an ERT target requires an Embedded Coder license.
- Use Export-function models where an Outport block is driven by a nonvirtual bus
- Have Model blocks that reference models containing Outport blocks that have been fixed — Clicking **Upgrade Model** updates Model blocks referencing the models that had Outport blocks fixed by the **Analyze model hierarchy and continue upgrade sequence** check.

- “Nonvirtual Buses at Model Interfaces”

Check model for custom library blocks that rely on frame status of the signal

Check ID: `mathworks.design.DSPFrameUpgrade`

This check identifies custom library blocks in the model that depend on the frame status of the signal.

Description

This check searches for the custom library blocks in a model that depend on the frame status of the signal. The check analyzes the blocks, recommends fixes, and gives reasons for the fixes. You must make the fixes manually.

Results and Recommended Actions

Condition	Recommended Action
The check finds custom library blocks that depend on the frame status of the signal.	Follow the recommendation given by the Upgrade Advisor.

Capabilities and Limitations

You can run this check only on custom library blocks in your model.

You must make the fixes manually.

This check appears only if you have the DSP System Toolbox installed.

See Also

“Frame-based processing” (DSP System Toolbox)

Check model for S-function upgrade issues

Check ID: `'mathworks.design.CheckForSFcnUpgradeIssues'`

Use this check on your model to identify your S-function's upgrade compatibility issues. These issues may include the use of 32-bit APIs, compilation with incompatible options, or use of deprecated separate complex APIs. Some common issues and information related to the fixes are described in results and recommendations section below.

Description

When upgrading your S-functions to use the features in the latest release, this check scans your model to warn against S-function upgrade incompatibility issues. If the result of this check gives a warning or error, fix your C MEX S-functions according to the description.

Results and Recommended Actions

Condition	Recommended Action
Custom-built S-functions are not supported.	Recompile your S-function with available compatible options. See “Custom-built MEX File Not Supported In Current Release” (MATLAB) for more information.
S-function is not compiled with the latest API (mex -R2018a).	Recompile using the latest flag (mex -R2018a). See “MEX File Is Compiled With Outdated Option” (MATLAB) for more information.
S-function uses 32-bit functions.	Modify your code according to the instructions in “MEX File Calls A 32-bit Function” (MATLAB).
S-function is using deprecated separate complex APIs (mxGetPi, mxSetPi, mxGetImagData, mxSetImagData).	Use interleaved complex APIs and recompile your code with the latest flag (mex -R2018a). See “Upgrade MEX Files to Use Interleaved Complex API” (MATLAB) for more information.
S-function is using deprecated type-unsafe data API (mxGetData, mxSetData).	Use type-safe data APIs and recompile your code. See “MEX File Calls An Untyped Data Access Function” (MATLAB) for more information.
S-function is compiled with a future release and not supported in current release.	See “MEX File Built In MATLAB Release Not Supported In Current Release” (MATLAB) to recompile your files.

Check Rapid accelerator signal logging

Check ID: mathworks.design.CheckRapidAcceleratorSignalLogging

When simulating your model in rapid accelerator mode, use this check to find signals logged in your model that are globally disabled. Rapid accelerator mode supports signal logging. Use this check to enable signal logging globally.

Description

This check scans your model to see if a simulation is in rapid accelerator mode and whether the model contains signals with signal logging. If the check finds an instance and signal logging is globally disabled, an option to turn on signal logging globally appears.

Results and Recommended Actions

Condition	Recommended Action
Simulation mode is not rapid accelerator.	None. You can enable signal logging in rapid accelerator mode.
Simulation mode is rapid accelerator. Upgrade Advisor did not find signals with signal logging enabled.	None. The model does not use signal logging. Enable signal logging for signals and globally if you want to log signals.
Simulation mode is rapid accelerator. Upgrade Advisor found signals with signal logging enabled. However, global setting for signal logging was disabled.	Enable signal logging globally if you want to log signals with signal logging enabled.
Signal logging was already globally enabled.	None.

Action Results

Selecting **Modify** enables signal logging globally in your model.

See Also

- “Signal Logging in Rapid Accelerator Mode”
- “Consult the Upgrade Advisor”.

Check virtual bus inputs to blocks

Check ID: `mathworks.design.VirtualBusUsage`

Check bus input signals for a set of blocks.

Description

Check bus input signals for a set of blocks.

Starting in R2015b, virtual bus signal inputs to blocks that require nonbus or nonvirtual bus input can cause an error. Examples of blocks that can specify a bus object as their output data type include a Bus Creator block and a root Inport block. The blocks that cause an error when they have a virtual bus input in this situation are:

- Assignment
- Delay

The Delay block causes an error only if you use the Block Parameters dialog box to:

- Set an initial condition that is a MATLAB structure or zero.
- Specify a value for **State name**.
- Permute Dimension
- Reshape
- Selector
- Unit Delay

The Unit Delay block causes an error only if you use the Block Parameters dialog box to:

- Set an initial condition that is a MATLAB structure or zero.
- Specify a value for **State name**.
- Vector Concatenate

Results and Recommended Actions

Condition	Recommended Action
Virtual bus signal input to these blocks: <ul style="list-style-type: none"> • Assignment • Delay (if you specify an initial condition from the dialog box that is a MATLAB structure or zero and the value for State name is not empty) • Permute Dimension • Reshape • Selector • Unit Delay (if you specify an initial condition that is a MATLAB structure or zero and the value for State name is not empty) • Vector Concatenate 	In the Upgrade Advisor, click Modify . The check inserts a Bus to Vector block to attempt to convert virtual bus input signals to vector signals. For issues that the Upgrade Advisor identifies but cannot fix, modify the model manually. For details, see “Identify Automatic Bus Conversions”.

Action Results

Clicking **Modify** inserts a Bus to Vector block at the input ports of blocks.

For many models, running the Upgrade Advisor modifies your model so that bus signals are not treated as vectors. However, for some models you can encounter compatibility issues even after running the check. Modify your model manually to address those issues.

After you compile the model using Upgrade Advisor, the Simulink Editor sometimes indicates that you need to save the model (the model is dirty), even though you did not make changes. To prevent this issue from reoccurring for this model, save the model.

Modeling Pattern	Issue	Solution
Data Store Memory block with Data Type set to Inherit: auto	A Data Store Memory block whose associated Data Store Read or Data Store Write blocks read or write bus signal data must use a bus object.	In the Data Store Memory block, set the Data Type signal attribute to Bus: <BusObject> .
Signal Conversion block Output parameter matches input bus type	A Signal Conversion block whose Output parameter is set to Nonvirtual bus requires a virtual bus input. A Signal Conversion block whose Output parameter is set to Virtual bus requires a nonvirtual bus input.	To create a copy of the input signal, set Output to Signal copy .

Modeling Pattern	Issue	Solution
Merge, Switch, or Multiport Switch block with multiple bus inputs	Merge, Switch, or Multiport Switch blocks with multiple bus inputs require those inputs to have the same names and hierarchy.	Reconfigure the model so that the bus inputs have the same names and hierarchy.
Root Inport block outputting a virtual bus and specifying a value for Port dimensions	A root Inport block that outputs to a virtual bus must inherit the dimensions.	Set the Inport block Port dimensions signal attribute to 1 or -1 (inherit).
Mux block with nonvirtual bus inputs	A Mux block cannot accept nonvirtual bus signals.	To treat the output as an array, replace the Mux block with a Vector Concatenate block. If you want a virtual bus output, use a Bus Creator block to combine the signals.
Bus to Vector block without a virtual bus signal input	A nonbus signal does not need a Bus to Vector block.	Remove the Bus to Vector block.
Assignment block with virtual bus inputs	The Upgrade Advisor converts the Assignment block Y0 port bus input to a vector.	Add a Bus to Vector block before the Assignment block.
S-function using a nonvirtual bus	An S-function that is not a Level-2 C S-function does not support nonvirtual bus signals.	Change the S-function to be a Level-2 C S-function. Consider using an S-Function Builder block to create a Level-2 C S-function.
Stateflow chart with parameterized data type	In a Stateflow chart, you cannot parameterize the data type of an input or output in terms of another input or output if the data type is a bus object.	For the parameterized port, set Data Type to Bus: <object name>.
Subsystem with bus operations in a Stateflow chart	An Inport block inside a subsystem in a Stateflow chart requires a bus object data type if its signal is a bus.	In the Inport block, set Data type to Bus: <object name>.
Ground block used as a bus source	The output signal of a Ground block cannot be a source for a bus.	Use a Constant block with Constant value set to 0 and the Output data type signal attribute set to Bus: <object name>.
Root Outport block with a single-element bus object data type	The input to the Outport block must be a bus if it specifies a bus object as its data type.	In the Outport block, set Data type to Inherit: auto .

Check for root outports with constant sample time

Check ID: `mathworks.design.CheckConstRootOutportWithInterfaceUpgrade`

Use this check to identify root outports with a constant sample time used with an AUTOSAR target, Function Prototype Control, or the model C++ class interface.

Description

Root outports with constant sample time are not supported when using an AUTOSAR target, Function Prototype Control, or the model C++ class interface. Use this check to identify root Outport blocks with this condition and modify the blocks as recommended.

Results and Recommended Actions

Condition	Recommended Action
Root outport with constant sample time used with an AUTOSAR target, Function Prototype Control or the model C++ class interface.	Consider one of the following: <ul style="list-style-type: none"> • Set the sample time of the block to the fundamental sample time. • Identify the source of the constant sample time and set its sample time to the fundamental sample time. • Place a Rate Transition block with inherited sample time (-1) before the block.

See Also

- “Consult the Upgrade Advisor”.

Analyze model hierarchy and continue upgrade sequence

Check ID: `com.mathworks.Simulink.UpgradeAdvisor.UpgradeModelHierarchy`

Check for child models and guide you through upgrade checks.

Description

This check identifies child models of this model, and guides you through upgrade checks to run both non-compile and compile checks. The Advisor provides tools to help with these tasks:

- If the check finds child models, it offers to run the Upgrade Advisor upon each child model in turn and continue the upgrade sequence. If you have a model hierarchy you need to check and update each child model in turn.
- If there are no child models, you still need to continue the check sequence until you have run both non-compile and compile checks.

You must run upgrade checks in this order: first the checks that do not require compile time information and do not trigger an Update Diagram, then the compile checks.

Click **Continue Upgrade Sequence** to run the next checks. If there are child models, this will open the next model. Keep clicking **Continue Upgrade Sequence** until the check passes.

Results and Recommended Actions

Condition	Recommended Action
Child models found	Click Continue Upgrade Sequence to run the next checks. If there are child models, this will close the current Upgrade Advisor session, and open Upgrade Advisor for the next model in the hierarchy.
No child models, but more checks to run	If there are no child models, click Continue Upgrade Sequence to refresh the Upgrade Advisor with compilation checks selected. The compile checks trigger an Update Diagram (marked with ^). Run the next checks and take advised actions. When you return to this check, click Continue Upgrade Sequence until this check passes.

Tips

Best practice for upgrading a model hierarchy is to check and upgrade each model starting at the leaf end and working up to the root model.

When you click **Continue Upgrade Sequence**, the Upgrade Advisor opens the leaf model as far inside the hierarchy as it can find. Subsequent steps guide you through upgrading your hierarchy from leaf to root model.

When you open the Upgrade Advisor, the checks that are selected do not require compile time information and do not trigger an Update Diagram. Checks that trigger an Update Diagram are not selected to run by default, and are marked with ^. When you use the Upgrade Advisor on a hierarchy, keep clicking **Continue Upgrade Sequence** to move through this sequence of analysis:

- 1 The Upgrade Advisor opens each model and library in turn, from leaf to root, and selects the non-compile checks. Run the checks, take any advised actions, then click **Continue Upgrade Sequence** to open the next model and continue.
- 2 When you reach the root end of the hierarchy, the Upgrade Advisor then opens each model again in the same order (but not libraries) and selects only the checks that require a model compile. Run the checks, take any advised actions, then click **Continue Upgrade Sequence** to open the next model. Continue until you reach the end of the hierarchy and this check passes.

Check Access to Data Stores

Check ID: `mathworks.design.ConflictsForDataStoreReadWriters`

Identify potential execution order sensitivity when reading and writing to data stores.

Description

The execution order of blocks that read and write to the same data store can change the simulation result. When blocks in the same hierarchy access the same data store, the execution order is not deterministic.

Results and Recommended Actions

Condition	Recommended Action
Data Store Memory block accessed by multiple blocks in the same hierarchy.	To enforce execution order for the blocks, consider the following: <ul style="list-style-type: none"> • Add a data dependency between the blocks. • Set block priority. • Move blocks into separate Function-Call Subsystem blocks and schedule them.

See Also

- “Local and Global Data Stores”
- Data Store Memory

- Data Store Write

Check relative execution orders for Data Store Read and Data Store Write blocks

Check ID: `mathworks.design.TaskBasedSorting`

Check relative execution order changes between legacy and task-based sorting for Data Store Read and Data Store Write blocks.

Description

Legacy models used block sorting to determine block execution order. With task-based sorting, the relative execution order involving Data Store Memory blocks can change. This check detects the changes and provides an option to update your model with the original execution order.

Results and Recommended Actions

Condition	Recommended Action
Execution order with a Data Store Memory block changes. You want the original execution order.	Click the Modify button.

See Also

- “Control and Display Execution Order”

Check for case mismatches in references to models and libraries**Check ID:** `mathworks.design.CaseSensitiveBlockDiagramNames`

Identify and fix case-insensitive references to models and libraries.

Description

Starting R2020a, Simulink model and library names are case-sensitive. This check detects and provides an option to fix case-insensitive references to models and libraries.

Results and Recommended Actions

Condition	Recommended Action
The check finds case mismatches in references to models and libraries.	Follow the recommendation given by the Upgrade Advisor.

- “Consult the Upgrade Advisor”

Model Reference Conversion Advisor

Model Reference Conversion Advisor

Check Conversion Input Parameters

Use input parameters to configure the actions the advisor performs and the output it produces.

You can use the default parameters to run the advisor without changing any parameters.

Input Parameter	Description
New model name	<p>The advisor provides a model name that is based on the Subsystem block name and is unique in the MATLAB path.</p> <p>The model name cannot exceed 59 characters.</p> <p>Tip If the advisor generates an error indicating that the target referenced model already exists, then use the New model name parameter to specify a new file name.</p>
Conversion data file name	<p>The advisor creates a file for storing data created during the conversion. By default, the advisor uses the model name at the beginning of the file name and appending <code>_conversion_data.mat</code>. For example, if the subsystem is in a model named <code>myModel</code>, the conversion file name is <code>myModel_conversion_data.mat</code>.</p> <p>You can save the conversion data in a MAT-file (default) or a MATLAB file. If you use a <code>.m</code> file extension, the advisor serializes all variables to a MATLAB file.</p> <p>Note If the top model uses a data dictionary, you cannot select this option.</p>
Fix errors automatically	<p>By default, if an advisor check finds any errors and the advisor can fix the error, the advisor provides a Fix button that you can click to have the advisor fix the issue.</p> <p>If you enable this parameter, the advisor fixes all conversion errors that it can, without displaying the Fix button.</p>

Input Parameter	Description
<p>Replace content of a subsystem with a Model block</p>	<p>By default, the advisor updates the original model by inserting a Model block in the model. The advisor action depends on whether you use the automatic fix options.</p> <ul style="list-style-type: none"> • If you use the automatic fixes, then the advisor replaces the Subsystem block with a Model block unless the automatic fixes change the input or output ports. If the ports change, then the advisor includes the contents of the subsystem in a Model block that is inserted in the Subsystem block. • If you do not use the automatic fixes, then the advisor replaces the Subsystem block with a Model block. <p>Clear this parameter to have the advisor open a new Simulink Editor window that contains only a Model block that references the newly created referenced model. The advisor does not update the original model in the other Simulink Editor window.</p>
<p>Check simulation results after conversion</p>	<p>Compare the results of simulating the top model for the referenced model to the results of simulating the baseline model that has the subsystem.</p> <p>To use this option, before performing the conversion, enable signal logging for the subsystem output signals of interest in the model. Set these advisor options:</p> <ul style="list-style-type: none"> • Model block simulation mode — Use the same simulation mode as in the original model. • Replace content of a subsystem with a Model block — Enable this option. • Stop time — Specify when you want the simulations to end. The default is the stop time of the top model. If the top model stop time is set to <code>inf</code>, the advisor stops after 10 seconds. • Absolute tolerance — Specify a value if you do not want to use the default of '1e-06'. • Relative tolerance — Specify a value if you do not want to use the default of '1e-03'. <p>To see the results after the conversion is complete, click View comparison results. The advisor displays the results of the comparison in the Simulation Data Inspector. For more information, see “Compare Simulation Results Before and After Conversion”.</p>
<p>Stop time</p>	<p>By default, the advisor uses the stop time of the top model, unless the stop time of the top model is <code>inf</code>. If the stop time of the top model is <code>inf</code>, the advisor uses a default stop time of 10. You can specify a different stop time.</p> <p>To use this option, select Check simulation results after conversion.</p>

Input Parameter	Description
Absolute tolerance	The absolute signal tolerance for the simulation run comparison. The default is 1e-06. To use this option, select Check simulation results after conversion .
Relative tolerance	The relative signal tolerance for the simulation run comparison. The default is 1e-03. To use this option, select Check simulation results after conversion .
Model block simulation mode	Simulation mode for the new Model block that references the referenced model. <ul style="list-style-type: none">• Normal (default)• Accelerator

After you configure the advisor, to start the conversion checks, click **Run this task**.

Simulink Performance Advisor Check Overview

Use Performance Advisor checks to improve model simulation time.

See Also

“Improve Simulation Performance Using Performance Advisor”

Baseline

Establish a measurement to compare the performance of a simulation after Performance Advisor implements improvements.

See Also

“Create a Performance Advisor Baseline Measurement”

Checks that Require Update Diagram

These checks require that **Update Diagram** occurs in order to run.

See Also

“Improve Simulation Performance Using Performance Advisor”

Checks that Require Simulation to Run

These checks require simulation to run in order to collect sufficient performance data. Performance Advisor reports the results after simulation completes.

See Also

“Improve Simulation Performance Using Performance Advisor”

Check Simulation Modes Settings

These checks evaluate simulation modes (Normal, Accelerator, Rapid Accelerator, Rapid Accelerator with up-to-date check off) and identify the optimal mode to achieve fastest simulation.

See Also

“What Is Acceleration?”

Check Compiler Optimization Settings

Use these checks to select compiler optimization settings for improved performance.

See Also

“Compiler optimization level”

Create baseline

Select this check to create a baseline when Performance Advisor runs. You can also create a baseline manually. A baseline is the measurement of simulation performance before you run checks in Performance Advisor. The baseline includes the time to run the simulation and the simulation results (signals logged). Before you create a baseline for a model, in the **Data Import/Export** pane of the Configuration Parameters dialog box:

- Select the **States** check box.
- Set the **Format** parameter to `Structure with time`.

See Also

“Create a Performance Advisor Baseline Measurement”

Identify resource-intensive diagnostic settings

To improve simulation speed, disable diagnostics where possible. For example, some diagnostics, such as **Solver data inconsistency** or **Array bounds exceeded**, incur run-time overheads during simulations.

See Also

- “Diagnostics”
- “Improve Simulation Performance Using Performance Advisor”

Check optimization settings

To improve simulation speed, enable optimizations where possible. For example, if some optimizations, such as Block Reduction, are disabled, enable these optimizations to improve simulation speed.

You can also trade off compile-time speed for simulation speed by setting the compiler optimization level. Compiler optimizations for accelerations are disabled by default. Enabling them accelerates simulation runs but results in longer build times. The speed and efficiency of the C compiler used for Accelerator and Rapid Accelerator modes also affects the time required in the compile step.

- “Improve Simulation Performance Using Performance Advisor”

Check MATLAB System block simulation mode

In general, to improve simulation speed, choose `Code generation` for the **Simulate using** parameter of the MATLAB System block. Because data exchange between MATLAB and Simulink passes through several software layers, `Interpreted execution` usually slows simulations, particularly if the model needs many data exchanges.

This check identifies which MATLAB System blocks can generate code and changes the **Simulate using** parameter value to Code generation where possible.

While Code generation does not support all MATLAB functions, the subset of the MATLAB language that it does support is extensive. By using this Code generation, you can improve performance.

See Also

- MATLAB System
- “Simulation Modes”
- “Improve Simulation Performance Using Performance Advisor”

Identify Interpreted MATLAB Function blocks

To improve simulation speed, replace Interpreted MATLAB Function blocks with MATLAB Function blocks where possible. Because data exchange between MATLAB and Simulink passes through several software layers, Interpreted MATLAB Function blocks usually slow simulations, particularly if the model needs many data exchanges.

Additionally, because you cannot compile an Interpreted MATLAB Function, an Interpreted MATLAB Function block impedes attempts to use an acceleration mode to speed up simulations.

While MATLAB Function blocks do not support all MATLAB functions, the subset of the MATLAB language that it does support is extensive. By replacing your interpreted MATLAB code with code that uses only this embeddable MATLAB subset, you can improve performance.

See Also

- MATLAB Function
- “Improve Simulation Performance Using Performance Advisor”

Identify simulation target settings

To improve simulation speed, disable simulation target settings where possible. For example, in the Configuration Parameters dialog box, clear the **Simulation Target > Echo expression without semicolons** check box to improve simulation speed.

See Also

- “Model Configuration Parameters: Simulation Target”
- “Improve Simulation Performance Using Performance Advisor”

Check model reference rebuild setting

To improve simulation speed, in the Configuration Parameters dialog box, verify that the **Model Referencing > Rebuild** parameter is set to If any changes in known dependencies detected.

See Also

- “Rebuild”
- “Improve Simulation Performance Using Performance Advisor”

Identify Scope blocks

Opened and uncommented Scope blocks can impact simulation performance. To improve simulation performance, close and comment out Scope blocks. Right-click a scope block, and then select **Comment Out**.

For opened Scopes, you can improve simulation speed by reducing updates. From the Scope **Simulation** menu, select **Reduce Updates to Improve Performance**.

See Also

- “Improve Simulation Performance Using Performance Advisor”

Identify active instrumentation settings on the model

Identify active instrumentation settings on the model. The fixed-point instrumentation mode controls which objects log minimum, maximum, and overflow data during simulation. Instrumentation is required to collect simulation ranges using the Fixed-Point Tool. These ranges are used to propose data types for the model (requires Fixed-Point Designer). When you are not actively converting your model to fixed point, disable the fixed-point instrumentation to restore the maximum simulation speed to your model.

From the model **Analysis** menu, select **Data Type Design > Fixed-Point Tool**. Under **System under design**, click **Continue**.

In the Model Hierarchy pane, the Fixed-Point Tool denotes systems that currently have instrumentation turned on with (mmo), or (o). Right-click the system in the model hierarchy and, under Fixed-point instrumentation mode, select **Use local settings** or **Force off**.

See Also

- Fixed-Point Instrumentation and Data Type Override (Fixed-Point Designer)

Check model reference parallel build

To improve simulation, verify the number of referenced models in the model. If there are two or more referenced models, build the model in parallel if possible.

Performance Advisor analyzes the model and estimates the build time on the current computer as if it were using several cores. It also estimates the parallel build time for the model in the same way an estimation would be performed if Parallel Computing Toolbox or MATLAB Parallel Server software were installed on the computer. Performance Advisor performs this estimate as follows:

- 1 Search the model for referenced models that do not refer to other referenced models.
- 2 Calculate the average number of blocks in each of the referenced models that do not refer to other referenced models.

- 3 Of the list of referenced models that do not refer to others, select a referenced model whose number of blocks is closest to the calculated average.
- 4 Build this model to obtain the build time.
- 5 Based on the number of blocks and the build time for this referenced model, estimate the build time for all other referenced models.
- 6 Based on these build times, estimate the parallel build time for the top model.

To calculate the overhead time introduced by the parallel build mechanism, set the Parallel Build Overhead Time Estimation Factor. Performance Advisor calculates the estimated build time with overhead as:

$$(1 + \text{Parallel Build Overhead Time Estimation Factor}) * (\text{Build time on a single machine})$$

See Also

- "Enable parallel model reference builds"

Check Delay block circular buffer setting

To improve simulation, check that each Delay block in the model uses the appropriate buffer type. By default, the block uses an array buffer (the **Use circular buffer for state** option is not selected). However, when the delay length is large, a circular buffer can improve execution speed by keeping the number of copy operations constant.

If the Delay block is currently using an array buffer, and all of the following conditions are true, Performance Advisor selects a circular buffer:

- The Delay block is in sample-based mode, i.e., either the **Input processing** parameter is set to `Elements as channels (sample based)`, or the input signal type is set to `Sample based`.
- The value or upper limit of the delay length is 10 or greater.
- The size of the state—equal to the delay length multiplied by the total of all output signal widths—is 1000 or greater.

See Also

- Delay
- “Improve Simulation Performance Using Performance Advisor”

Check continuous and discrete rate coupling

If your model contains both discrete and continuous rates, the coupling between these rates can slow down simulation. Performance Advisor checks for these conditions in your model.

- The model is using a variable step solver.
- The model contains both continuous and discrete rates.
- The fastest discrete rate is relatively smaller than **Max step size** determined by the solver.

Setting the `DecoupledContinuousIntegration` parameter to `on` might speed up simulation.

See Also

- “Solver Selection Criteria”
- “Speed Up Simulation”
- “Improve Simulation Performance Using Performance Advisor”

Check zero-crossing impact on continuous integration

If your model contains zero-crossings which do not impact the continuous integration, the simulation might slow down when all the following conditions are satisfied:

- The model uses a variable-step solver.
- The model contains blocks that have continuous states and zero-crossings.
- Some of the zero-crossings do not affect the integration of the continuous states.

Setting the `MinimalZcImpactIntegration` parameter to `On` might speed up simulation.

See Also

- “Speed Up Simulation”
- “Solver Selection Criteria”
- “Improve Simulation Performance Using Performance Advisor”

Check discrete signals driving derivative port

Run this check if your simulation has many unnecessary resets. A discrete signal driving a block with continuous states triggers a reset at every sample time hit of the block. These resets are computationally expensive. Performance Advisor checks for these signals and blocks and provides a list of the same.

You can edit the model around the discovered discrete signals that drive these blocks to remove such cases. For example, inserting a Zero Order Hold block between the discrete signal and the corresponding block with continuous states might help resolve the issue.

See Also

- “Speed Up Simulation”
- “Modeling Techniques That Improve Performance”

Check solver type selection

To improve simulation, check that the model uses the appropriate solver type.

Explicit vs. Implicit Solvers

Selecting a solver depends on the approximation of the model stiffness at the beginning of the simulation. A stiff system has both slowly and quickly varying continuous dynamics. Implicit solvers are specifically designed for stiff problems, whereas explicit solvers are designed for non-stiff problems. Using non-stiff solvers to solve stiff systems is inefficient and can lead to incorrect results. If a non-stiff solver uses a very small step size to solve your model, check to see if you have a stiff system.

Model	Recommended Solver
Represents a stiff system	ode15s
Does not represent a stiff system	ode45

Performance Advisor uses the heuristic shown in the table to choose between explicit and implicit solvers.

Original Solver	Performance Advisor Action
Variable step solver	Calculates the system stiffness at 0 first. Then: <ul style="list-style-type: none"> • If the stiffness is greater than 1000, Performance Advisor chooses ode15s. • If the stiffness is less than 1000, Performance Advisor chooses ode45.
Fixed-step continuous solver	<ul style="list-style-type: none"> • If the stiffness is greater than 1000, Performance Advisor chooses ode14x. • If the stiffness is less than 1000, Performance Advisor chooses ode3.

This heuristic works best if the system stiffness does not vary during simulation. If the system stiffness varies with time, choose the most appropriate solver for that system rather than the one Performance Advisor suggests.

Select multi-thread co-simulation setting on or off

Adjust co-simulation settings for better performance and accuracy.

- Validate and revert changes if simulation time increases — Performance Advisor reverts previous co-simulation settings when the simulation time increases.
- Validate and revert changes if degree of accuracy is greater than tolerance — Performance Advisor reverts previous co-simulation settings if the degree of accuracy is greater than tolerance.

Tip You can use the `tic` and `toc` functions to measure the simulation time.

See Also

- `tic`
- `toc`
- `sim`

Identify co-simulation signals for numerical compensation

Identify co-simulation signals that may need explicit numerical compensation.

- Validate and revert changes if time of simulation increases — Performance Advisor reverts previous co-simulation settings the simulation time increases.
- Validate and revert changes if degree of accuracy is greater than tolerance — Performance Advisor reverts co-simulations if the degree of accuracy is greater than tolerance.

Tip You can use the `tic` and `toc` functions to measure the simulation time.

See Also

- `tic`
- `toc`
- `sim`

Select simulation mode

To achieve fastest simulation time, use this check to evaluate the following modes and identify the optimal selection:

- Normal

- Accelerator
- Rapid Accelerator
- Rapid Accelerator with up-to-date check off

In Normal mode, Simulink interprets your model during each simulation run. If you change the model frequently, this is generally the preferred mode to use because it requires no separate compilation step. It also offers the most flexibility to make changes to your model.

In Accelerator mode, Simulink compiles a model into a binary shared library or DLL where possible, eliminating the block-to-block overhead of an interpreted simulation in Normal mode. Accelerator mode supports the debugger and profiler, but not runtime diagnostics.

In Rapid Accelerator mode, simulation speeds are fastest but this mode only works with models where C-code is available for all blocks in the model. Also, this mode does not support the debugger or profiler.

When choosing Rapid Accelerator with up-to-date check off, Performance Advisor does not perform an up-to-date check during simulation. You can run the Rapid Accelerator executable repeatedly while tuning parameters without incurring the overhead of up-to-date checks. For instance, if you have a large model or a model that makes extensive use of model reference, this method of execution can increase efficiency.

For models with 3-D signals, Normal or Accelerator modes work best.

See Also

- “Choosing a Simulation Mode”
- “Comparing Performance”
- “Run Simulations Programmatically”

Select compiler optimizations on or off

Use this check to determine whether performing compiler optimization can help improve simulation speed. The optimization can only be performed in Accelerator or Rapid Accelerator modes.

Note This check will be skipped if MATLAB is not configured to use an optimizing compiler.

See Also

- “How Acceleration Modes Work”
- “Choosing a Simulation Mode”
- “Comparing Performance”

Final Validation

This check validates the overall performance improvement of simulation time and accuracy in a model. If the performance is worse than the original model, Performance Advisor discards all changes to the model and loads the original model.

Global settings for validation do not apply to this check. If you have not validated the performance improvement from changes resulting from other checks, use this check to perform a final validation of all changes to a model.

Maximum Size Limits of Simulink Models

The following table documents some limits on the size and complexity of Simulink models.

Model Feature	Limit
Maximum number of levels in a block diagram	1024
Maximum number of branches in a line	1024
Maximum length of a parameter name	63
Maximum length of a parameter character vector value	32768
Maximum size of a model window, as determined by supported coordinates	-1073740824 to 1073740823, inclusive
Maximum number of bytes for a single logged data point	90 MB
Maximum number of bytes of logged simulation data	Limited by available hard drive space
Maximum number of bytes for an individual block I/O buffer length	$2^{31}-1$ bytes
Maximum number of bytes for an individual DWork buffer length	$2^{31}-1$ bytes
Maximum length of integer and fixed-point data types	128 bits
Maximum length of string data type	32,766 characters

Systems and Models

The concepts in this topic provide a consistent and common language for using Simulink software tools.

System

A system is a group of interdependent physical and functional parts with measurable characteristics that change over time.

For example, a vehicle is a *system* with multiple parts. Measurable characteristics include the linear speed of the vehicle and the rotational speed of the wheels.

System Component

A system component is part of a *system* that interacts with the other parts of the system. The interactions between components define the structure and behavior of the *system*.

For example, a cruise control module is a *system component* in a vehicle *system*. A microcontroller and the hardware associated with it define the structure while a software algorithm to control speed defines the behavior.

Model

A model is a mathematical description of a *system* derived either from physical laws or experimental data. The description typically uses a set of variables with a set of differential and difference equations that define the relationships between the variables.

In the following example for a vehicle, $u(t)$ is the force (N) moving a vehicle forward, $v(t)$ is the velocity (m/s), b is a drag coefficient (N·s/m), and m is the mass of the vehicle (kg).

The vehicle is a continuous system. For continuous systems, differential equations describe the rate of change for variables with the equations defined for all values of time. The velocity of the vehicle $v(t)$ and its acceleration $v'(t)$ are defined with the following first order differential equation.

$$mv'(t) + bv(t) = u(t)$$

You can create a Simulink model for this equation by adding blocks, specifying block behavior, and using signal lines to connect the blocks to each other. The following Simulink block diagram implements the differential equation.

Model Component

A model component is part of a *model* that interacts with the other parts through an interface of inputs and outputs. Simulink implements *model components* using Subsystem and Model blocks. A Model block references another Simulink model saved in a separate file.

In the following example, the control model was saved in the Simulink model file `control_model.slx`, and then referenced from a Model block in a second Simulink model. A Subsystem block was added for modeling the vehicle mechanics.

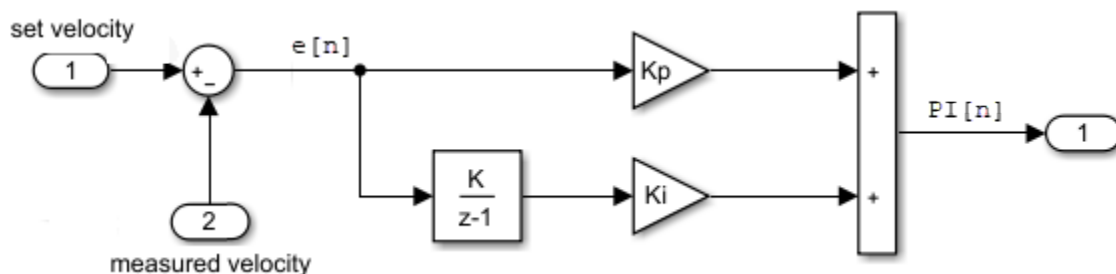

Typically, controllers are built with discrete systems using a computer to implement the control algorithm. For discrete systems, difference equations describe the rate of change for variables defined only at specific times. For example, the control signal for a simple discrete PI (proportional-integral) controller can be defined with the following difference equation.

$$PI[n] = e[n]K_p + (e[n] + \text{integral}[n-1])K_i$$

Where $e[n]$ is the error between a signal whose value is controlled (velocity) and the specified value (set velocity), K_p is the proportion constant, K_i is the integration constant, and n is the time step.

The following Simulink block diagram implements the difference equation.

See also: “Model a Continuous System”, “Component-Based Modeling Guidelines”, “Create a Custom Library”, “Model Reference Basics”.

Differential Algebraic Equations

Some systems of equations contain additional constraints that involve the independent variable and the state vector in addition to differential equations. Such systems are called differential algebraic equations (DAEs),

The term algebraic refers to equations that do not involve any derivatives.

In Simulink models, algebraic loops are algebraic constraints. Models with algebraic loops define a system of differential algebraic equations.

For example,

$$\begin{aligned}x' &= x \\ 0 &= -x + u - 2x\end{aligned}$$

is a system of differential algebraic equations implemented in the following Simulink model

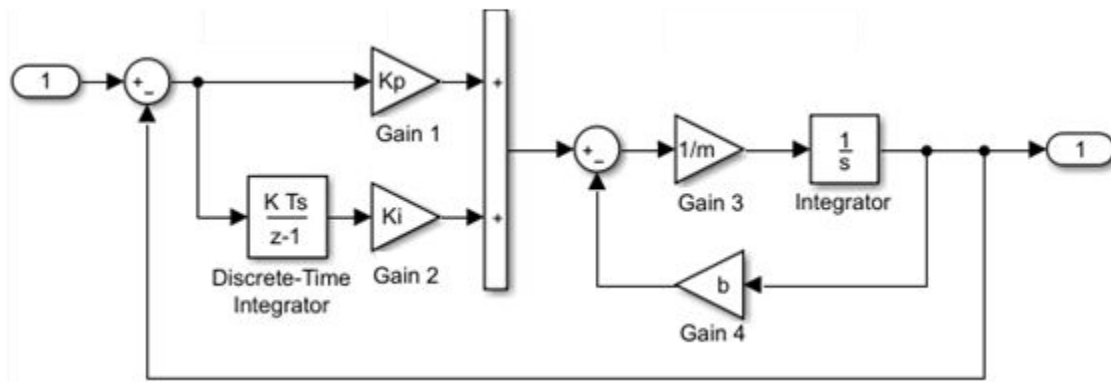

Simulink Models

A model is an abstract and simplified description of a system using mathematical equations and diagrams. The modeling concepts in this topic provide context for understanding the process of mathematically describing a system with Simulink software tools.

Block Diagram

A block diagram is a visual representation of a model in the Simulink Editor. The editor allows you to add blocks selected from block libraries representing elementary model components. Elementary components include integrator, gain, and sum blocks. Blocks are connected to each other with signal and event lines to visually construct the model equations.

Block Diagram Semantics

A classic block diagram of a system is drawn graphically with blocks and lines. The history of these block diagrams is derived from engineering areas such as Feedback Control Theory and Signal Processing. A block within a block diagram defines a model in itself. The relationships between elementary models are represented by signal lines connecting the blocks. Collectively the blocks and lines in a block diagram describe the overall model of a system.

Simulink extends classic block diagrams by:

- Adding a set of equations (block methods) to each block that define the time-based relationships between the input signals, output signals, and the block state variables.
- Adding parameters to each block that specify the coefficients from the model equations.
- Providing a Simulink engine for numerical solution of the block diagram by evaluating the relationships over time, where time starts at a user specified “start time” and ends at a user specified “stop time.”

See also: “Simulink Block Diagrams”, “Build and Edit a Model Interactively”, Use block diagrams to graphically represent dynamic systems, “Simulation”

Blocks

A block is a basic modeling construct of the Simulink Editor. You add instances of the blocks from the built-in Simulink libraries to perform specific operations. You can also create your own custom blocks. Some blocks have input signals, output signals, and state. Most blocks have parameters that you use to specify block behavior. Whether a block has parameters and the nature of those parameters is specific to each block.

Each block represents a set of equations for the Simulink engine. The equations are represented as block methods. The blocks shown above have the following block methods.

$$\begin{cases} x[n+1] = u[n] \\ y[n] = x[n] \end{cases} \quad \begin{cases} \frac{dx}{dt} = u(t) \\ y(t) = x(t) \end{cases} \quad y(t) = 2 * x(t) \quad y(t) = 5$$

Block methods are evaluated during the simulation of a block diagram. The evaluation of the block methods is performed within a simulation loop, where each cycle through the simulation loop represents the evaluation of the block diagram at a given point in time.

Virtual Blocks

Virtual blocks organize and provide graphical hierarchy in a model, but they do not affect the simulation result. During model simulation, the Simulink engine flattens all virtual blocks. That is, Simulink expands the blocks in place before execution. This expansion is similar to the way macros work in a programming language such as C or C++.

Simulink defines the following virtual blocks:

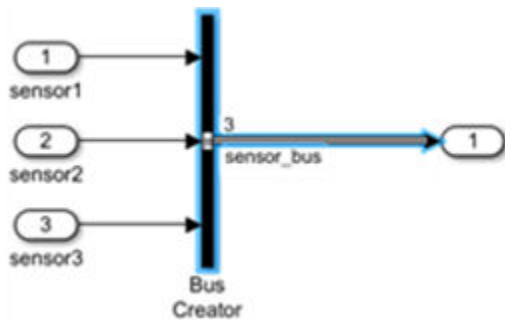

- Virtual Subsystem - Use a virtual subsystem to encapsulate related and functional parts within a larger model. A Virtual Subsystem block has the check box for the parameter **Treat as atomic unit** cleared.

- Inport and Outport - Use port blocks to move data (signals) and events (function-calls) from outside a System block or referenced Model block to within the block.

- Bus Creator, Bus Assignment, Bus Selector - Bus blocks combine signals into a virtual bus and manage the routing of signals around a complex block diagram. Virtual buses are simply a graphical convenience and do not change the behavior of the model.

See “Nonvirtual and Virtual Blocks”, “Signal Types”, “Types of Composite Signals”.

Non-Virtual Blocks

Non-virtual blocks provide execution control and graphical hierarchy in a model. Simulink defines the following non-virtual Subsystem and Model blocks:

- Atomic Subsystem and Model - Blocks within an Atomic Subsystem block or a Model block that references a model execute as a single unit (atomic execution) at each time step. For an Atomic Subsystem block, the check box for the parameter **Treat as atomic unit** is selected.

You can place any Simulink block in an Atomic Subsystem or referenced model, including blocks with different execution rates. This flexibility provides the advantage of grouping functional aspects of a model at the execution level.

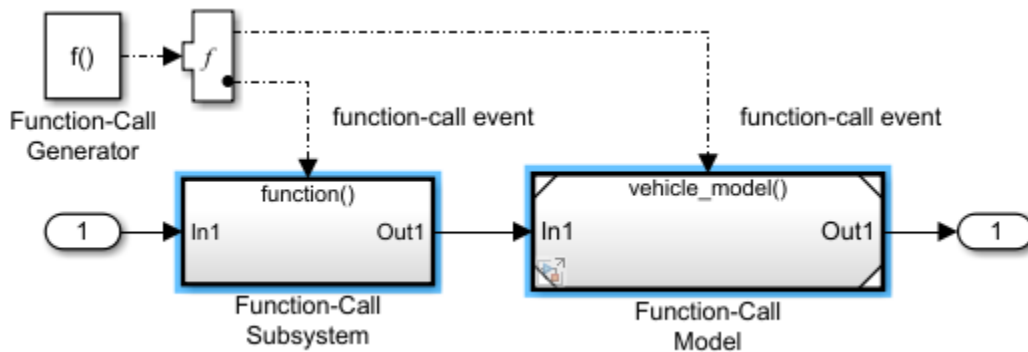

In the following example, the vehicle model is an Atomic Subsystem block containing blocks that model the mechanics of a car. The control model is referenced from a Model block.

- Enabled and Triggered - Atomic Subsystem or Model block whose execution is controlled external data from a signal. Contains an Enable or Trigger port block. For the Trigger port block, the parameter **Trigger type** is set to rising, falling, or either.

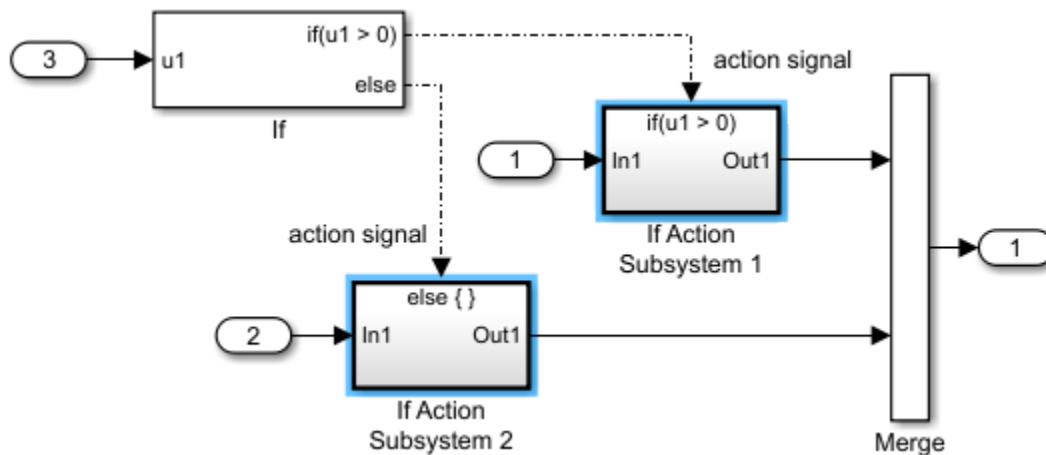

- Function-Call - Atomic Subsystem or Model block whose execution is controlled by an event from a function-call initiator (e.g., Stateflow chart, Function-Call Generator, and S-Function blocks), Contains a Trigger port block with **Trigger type** set to function-call.

Simulink defines the following non-virtual components for only Subsystem blocks.

- Action Subsystem - Atomic Subsystem block whose execution is controlled by an event from an action initiator (e.g., If or Switch Case block). Contains an Action Port block within the Subsystem block.

- While Iterator Subsystem- Atomic Subsystem block that runs multiple iterations during each model time step. Contains a While Iterator block that controls the number of iterations by evaluating a logical condition.

A while iterator subsystem is similar to a function-call subsystem in that it can run for any number of iterations at a given time step. The while iterator subsystem differs from a function-call subsystem in that there is no separate initiator.

- For Iterator Subsystem - Atomic Subsystem block that runs a fixed number of iterations during each model time step. Contains a For Iterator block that controls the number of iterations.

See “Nonvirtual and Virtual Blocks”.

Block Mask

A block mask is a custom block parameter interface that displays only selected block parameters. A mask for a Subsystem block allows you to provide an interface for setting parameters on blocks inside the Subsystem block without having to navigate the model hierarchy.

See “Masking Fundamentals”.

Custom Blocks

Custom blocks are new blocks that extend the built-in functionality of Simulink. You can create libraries of custom blocks to use in your model.

The following blocks define the algorithm of a custom block either graphically with a block diagram or programmatically.

- MATLAB Function - Code a MATLAB function using the MATLAB language that runs in a Simulink model . See “Implementing MATLAB Functions Using Blocks”.
- MATLAB System - Bring existing System objects based on matlab.System into Simulink. See “MATLAB System Block”.
- Subsystem - Draw a block diagram representing an algorithm, wrap this diagram in an instance of the Simulink Subsystem block, and then provide the block with a parameter dialog using a Simulink block mask. See Subsystem, Atomic Subsystem, CodeReuse Subsystem.
- C Caller - Integrates your external C code into a Simulink model. See “Integrate C Code Using C Caller Blocks”.

- S- function - Create a custom block programmatically by creating a MATLAB file or a MEX-file that contains the block's system functions. The resulting file is called an S-function. You then associate the S-function with instances of the Simulink S-Function block in your model. See S-Function.

See “Types of Custom Blocks”, “Block Authoring and Simulation Integration”.

Lines

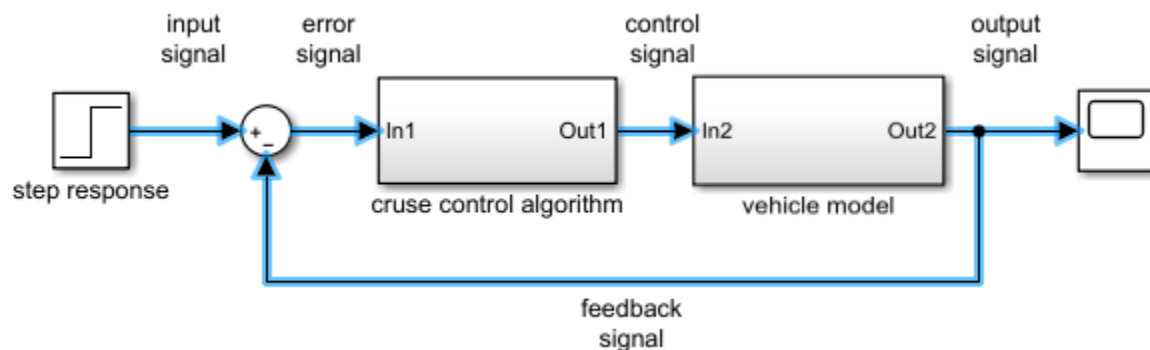

A line is a basic modeling construct of the Simulink Editor. Lines connect the output ports of blocks with the input ports of other blocks.

Signal Lines

Signal lines transfer data during a simulation from one block to another block. Signals are time varying quantities that have values at all points in time (continuous) or at specified time points (discrete). The source of a signal corresponds to the block that writes to the signal during evaluation of its block output method. The destination of a signal is the block that reads the signal during the evaluation of its block input method.

You can specify signal attributes, including signal name, data type (e.g., double, 32-bit integer), numeric type (e.g., real, complex) and dimension (e.g., one-dimensional, two-dimensional, multi-dimension array). Many blocks can accept or output a signal of any data type or dimensionality. Other blocks impose restriction on the attributes of the signal they can handle.

During a simulation, save data from a signal by logging the signals.

Event Lines

In response to a function-call or action initiator, event lines send an event to a Subsystem or Model block. The block that receives the event, executes the blocks within it one or more times during a time step. Function-call initiators include Function-Call Generator blocks, Stateflow charts, and S-function blocks. Action initiators include If and Switch Case blocks.

See “Signals” and “Signal Basics”.

Data

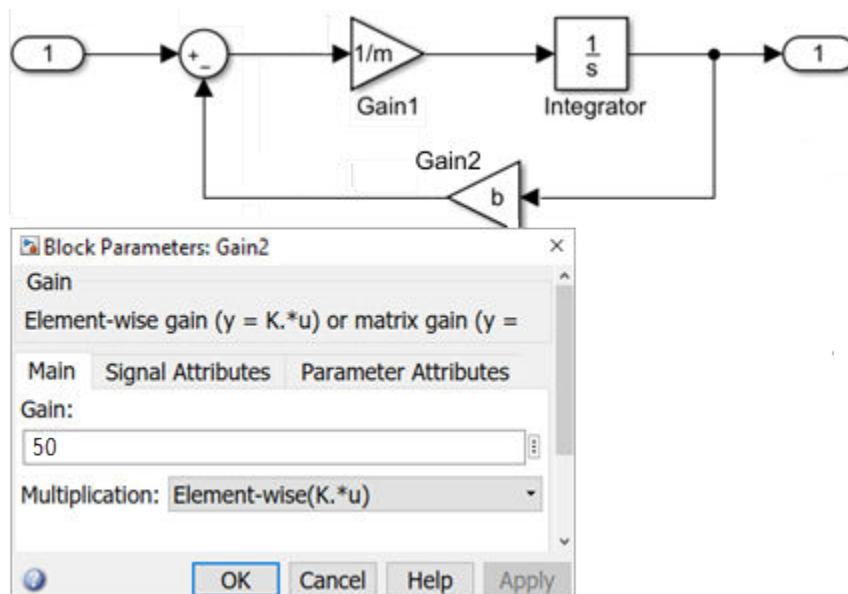

Data is the parameter and input signal values that Simulink uses to produce the output values resulting from simulating the behavior of a model.

Types of data:

- Model parameters - Variables to specify block and signal parameters in a model. Includes MATLAB variables, parameter and signal data objects, data type objects, and bus objects.
- Model configuration parameters - Control a simulation.
- Simulation data - Input data that you use to drive a simulation and the output data that a simulation generates.
- Data Objects - Use the `Simulink.Signal` and `Simulink.Parameter` classes to create data objects. See “Data Objects”.

Location of data:

- **Block parameters** - Use block parameters to directly specify numerical values. You can also enter a variable name and define its value in the Simulink model workspace, a Simulink data dictionary, or the MATLAB base workspace.

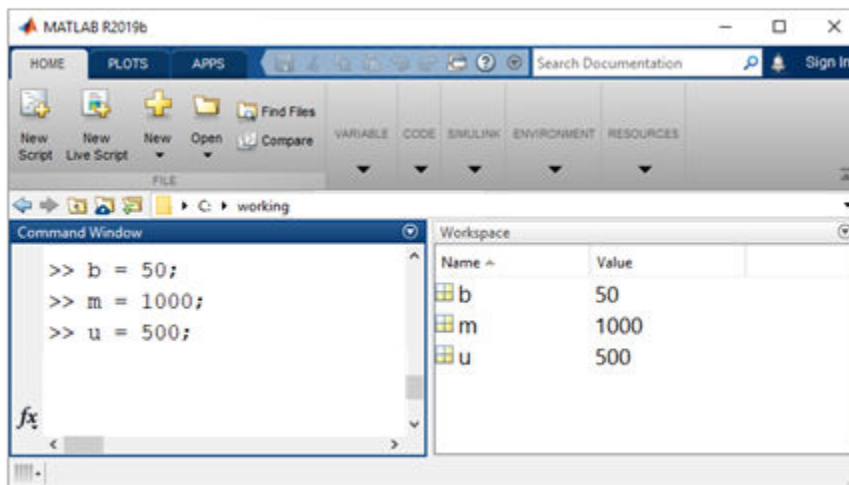

- **MATLAB base workspace** - Use the MATLAB base workspace to save variables that are separate from the model in a MAT-file or MATLAB script.

Simulink treats the base workspace and the data dictionary as a single global name space. If the base workspace and a referenced data dictionary have identical variable name, Simulink uses the variable value in the data dictionary.

The MATLAB base workspace contains variables that are global and visible to all Simulink models.

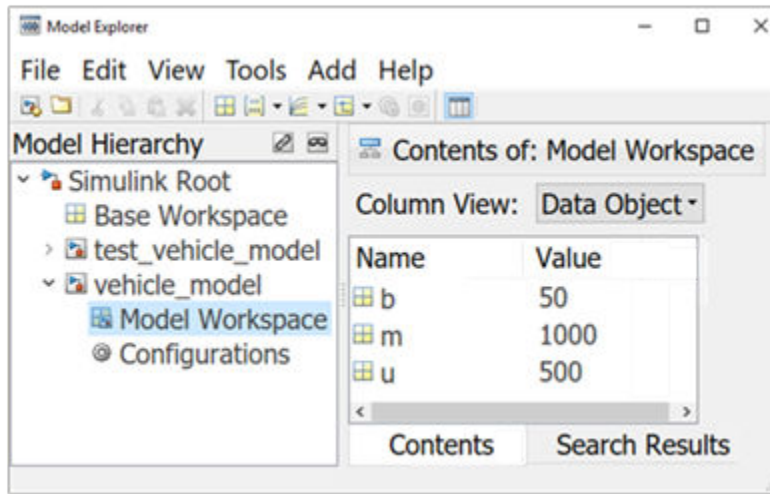

See “Comparison of Signal Loading Techniques”, “Export Simulation Data”.

- **Simulink model workspace** - Use the model workspace to define and store local data variables. Variables defined in a model workspace are visible only within the scope of the model with a unique name space. Therefore, you can use the same variable name in multiple model workspaces and you can assign a unique variable value to the name in each model.

Define variables in the data dictionary using Model Explorer. In the **Modeling** tab, click **Model Explorer** . In the left pane, select Model Workspace.

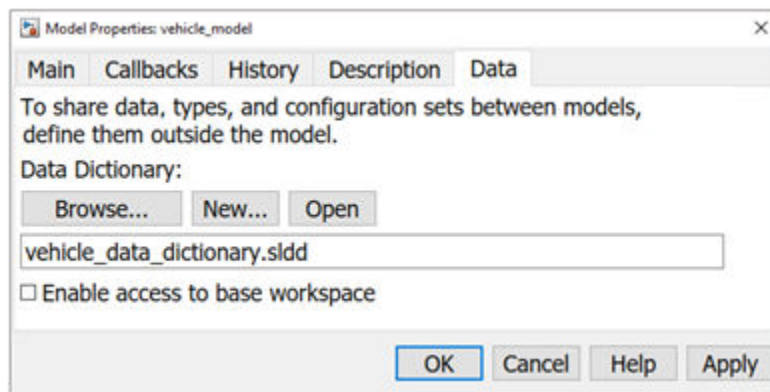

Values for the model workspace variables are initialized from values saved with the model, from a separate MAT-file or MATLAB file, or initialized using MATLAB code saved with the model.

See “Model Workspaces”, “Specify Source for Data in Model Workspace”.

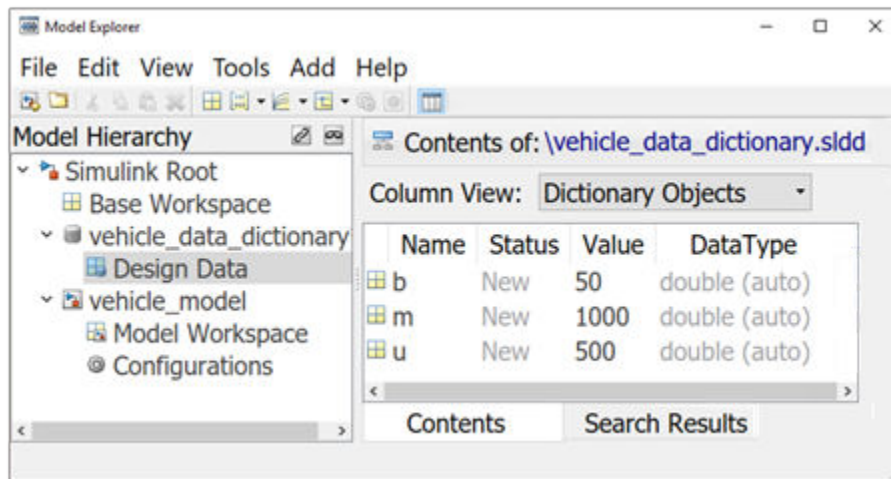

- **Simulink data dictionary** - Use a Data Dictionary to define and store global data, share data between models, and track changes made to the data. Data is saved in a file separate from the model.

Create a data dictionary file. In the **Modeling** tab, under **Design**, click **Data Dictionary** . Click **New** and enter a file name with an extension .sldd.

Define variables in the data dictionary using Model Explorer. In the **Modeling** tab, click **Model Explorer** . In the left pane, select **Design Data**.

See “What Is a Data Dictionary?”.

- Imported and exported data - Import signals for a simulation from the MATLAB base workspace, a MAT-file, or a spreadsheet. Create input signals using a source block or the Signal Editor block. Use signal logging to export simulation results. Signals are saved as vectors [t, X, Y] for time, state and output at each major time step.

See also: “Determine Where to Store Variables and Objects for Simulink Models”, “Symbol Resolution”.

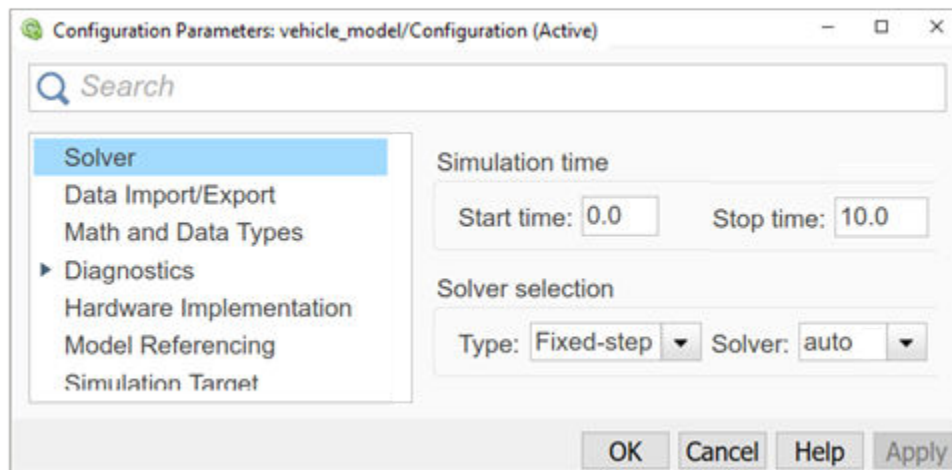

Parameters

Parameters are Simulink model characteristics that affect the simulation and code generation result.

Model Parameters

Model parameters specify model behavior during compilation, simulation, and code generation such as the solver to use and the types of errors and warnings to display.

To specify model parameters, in the **Modeling** tab, click **Model Settings** . The Configuration Parameters dialog box opens.

See “Set Model Configuration Parameters for a Model”.

Block Parameters

Block parameters define model dynamics and mathematics. Whether a block has parameters that you can set and the nature of those parameters is specific to each block. To specify block parameters, open the block parameter dialog box, or in the **Modeling** tab, under **Design**, click one of the following:

- **Property Inspector** - Specify block parameters directly or enter a variable name for a parameter value.
- **Model Data Editor** - Specify block parameters with variables.
- **Model Explorer** - Specify block parameters with variables.

See “Set Block Parameter Values”.

Block Parameter Variables

If you have a single parameter used in many locations across a large model, updating every instance of that parameter can be a difficult task. Instead, enter a variable name as the value of a parameter and then define the variable once using one of the following methods.

- **Simulink Model Workspace** - Create model workspace variables and assign values to the variables. The parameters you define are specific to the model and saved with the model. Use a MATLAB variable for ease of maintenance. Use a `Simulink.Parameter` object to control additional properties including, data type, dimensions, and units. See “Edit and Manage Workspace Variables by Using Model Explorer” .
- **Simulink Data Dictionary** - Create design data variables in a data dictionary and link the dictionary to a model. During model simulation, Simulink retrieves data from the data dictionary.
- **MATLAB Base Workspace** - In the MATLAB base workspace, define parameters using any MATLAB mechanism for defining a variable. For example, you can use a MAT-file and load the variables when you open the model. Use MATLAB expressions to specify parameter variable values. Simulink evaluates the expressions before running a simulation. See “Save and Load Workspace Variables” (MATLAB), “Save Workspace Variables” (MATLAB), “Load Workspace Variables” (MATLAB).

Using the MATLAB base workspace or a Simulink data dictionary to define variables is useful when you are using the same set of parameters for more than one model. This mechanism also allows you to use different sets of parameter values for the same model.

See also “Share and Reuse Block Parameter Values by Creating Variables”, “Create, Edit, and Manage Workspace Variables”.

Model Argument and Instance Parameters

When you reference the same model from multiple Model blocks you create instances of the model. You can set block parameters to use the same value or a different value for each instance of the model.

To use different values,

- 1 In the model workspace for the referenced model, create a MATLAB variable or `Simulink.Parameter` object.
- 2 Enter a parameter name and a default parameter **Value**. Select the **Argument** check box to create a model argument.
- 3 For a block in the referenced model, enter the name of the model argument for the value of a block parameter.
- 4 For each Model block, open the block parameters dialog box, select the **Instance parameters** tab, enter a value for the instance parameter with the model argument name.

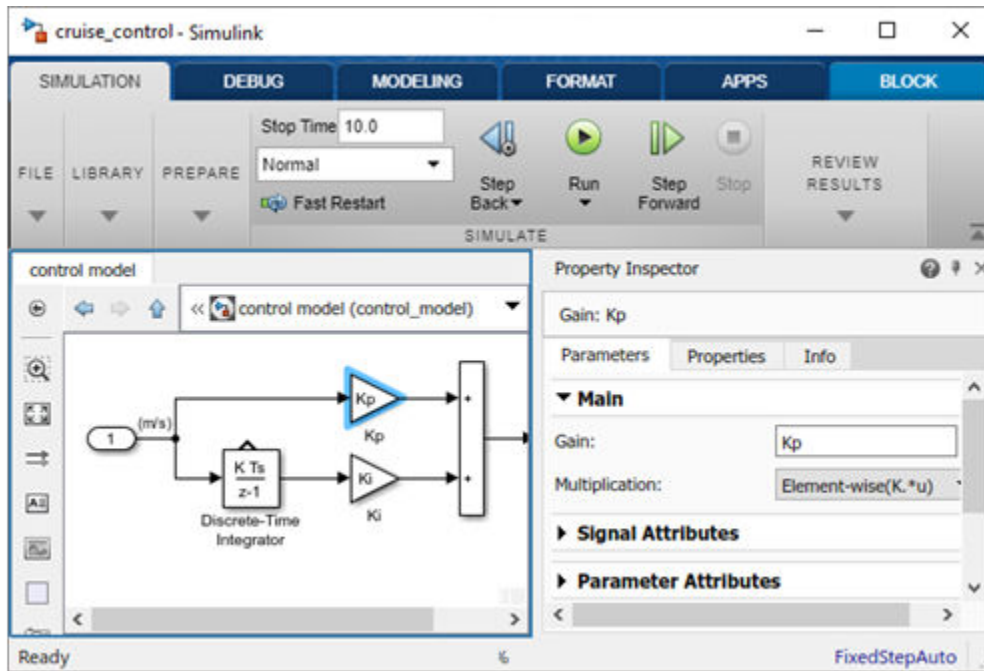

See also “Parameterize Instances of a Reusable Referenced Model”. “Tunable Block Parameters” on page 12-17

Tunable Block Parameters

You can change the value of a tunable block parameter during a simulation. This allows you to determine interactively the most suitable value for a parameter. When you change the value of a tunable parameter, the change takes effect at the start of the next time step. For example, the gain parameter of the Gain block is tunable. You can change the block gain while a simulation is running. See “Tune and Experiment with Block Parameter Values”.

Setting Block Parameters with the Property Inspector

To specify parameters, in the **Modeling** tab, under **Design**, click **Property Inspector**. Click a block to display the block parameters and properties.

See also “Specify Block Properties”.

Property

Properties are Simulink model characteristics that generally do not affect the simulation result. To specify properties, in the **Modeling** tab, under **Design**, click **Property Inspector**.

Model Properties

With the Property Inspector opened, click a blank space within a block diagram, or in the **Modeling** tab, select **Model Settings > Model Properties**. Model properties include:

- General - Name and location of model file.
- Design Data - Variables defined outside the model that parameterize the model and its blocks and signals.
- Callbacks - Commands that execute when a specific model event occurs.

See “Manage Model Properties”.

Block Properties

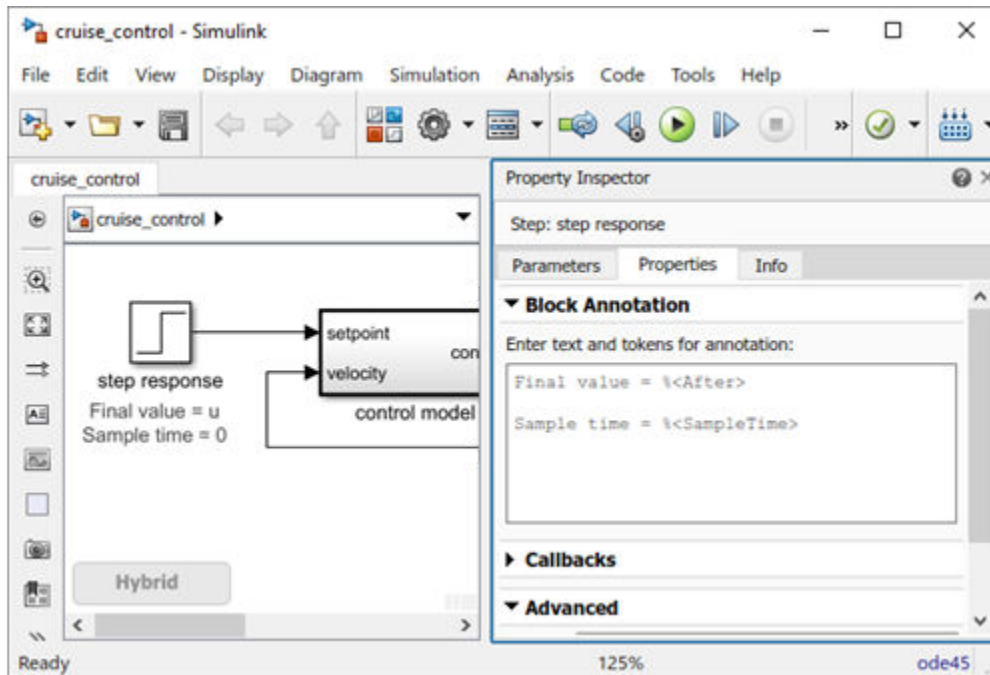

With the Property Inspector opened, select a block, and then select the **Properties** tab. Block properties include:

- Block Annotation - Values of selected block parameters displayed below the block.
- Callbacks - Commands that execute when a specific block event occurs. For example, you can set up a MATLAB script to load and define block parameter variables using expressions.
- Priority - Set the relative execution order of blocks. A lower value executes the block first before a larger priority value.

- Tags - Block identifiers that are programmatically searchable.

Setting Model and Block Properties with Property Inspector

To set properties, in the **Simulation** tab, under **Prepare**, click **Property Inspector**. Click an empty space to display the model properties. Click a block to display the block properties.

See also: “Specify Block Properties”, “Callbacks for Customized Model Behavior”.

State variable

The state of a model is defined by the values of its state variables. State variables are the set of variables whose values at time zero with the values of model inputs and the model equations can determine the behavior of a model during a simulation. Examples of state variables include, motor position and velocity, inductor current, capacitor voltage, solution temperature, and gas pressure.

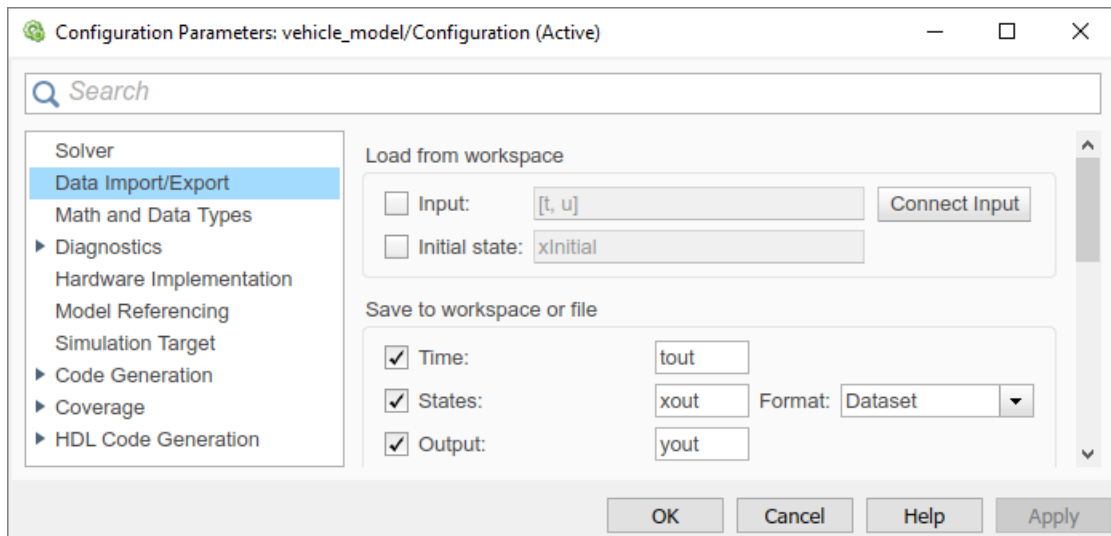

If the current output value of a block is a function of the previous output value, the block defines a state variable that needs to be saved between time steps. Computing a block output hence entails saving the value of the state variable at the current time step for use in computing the output at a subsequent time step.

Working with States

The following facilities are provided for determining, initializing, and logging model states during simulation:

- The **Data Import/Export** pane of a model's Configuration Parameters dialog box (see “State Information”) allows you to specify initial values for model states, and to record the values of the states at each time step during simulation as an array or structure variable in the MATLAB workspace.

Open the Configuration Parameters dialog box. Select the **States** check block for logging to the MATLAB variable `xout`.

In the MATLAB Command Window, list the logged values for state of the Integrator block at each time step.

```
>> xout{1}.Values.Data
ans =
    0.0000
    1.8127
    3.2968
    4.5119 . . .
```

- The `model` command displays information about the states defined by a model, including the total number of states, the block that defines each state with its initial value. List blocks in the model `vehicle_model` with states.

In the MATLAB Command Window, enter the model function, and then list blocks with state.

```
[sys,x0,str,ts] = vehicle_model([],[],[], 'sizes')
str =
    {'vehicle_model/Integrator'}
```

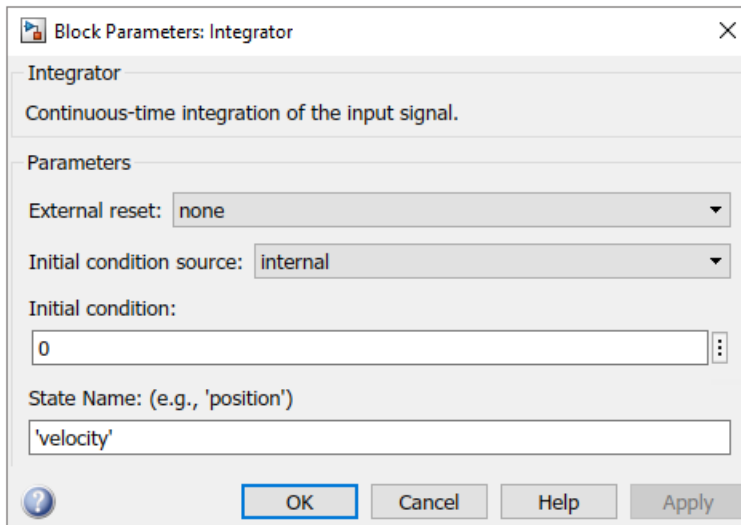

- The Simulink debugger displays the value of a state at each time step during a simulation, and the Simulink debugger's `states` command displays information about the model's current states (see "Simulink Debugger").

In the MATLAB Command Window, start the Simulink debugger, and then enter the command `states`.

```
sldebug 'vehicle_model'
(sldebug @0): >> states

Continuous States for 'vehicle_model':
Idx Value (system:block:element Name 'BlockName')
    0. 0 (0:0:0 CSTATE 'vehicle_model/Integrator')
```

- The Block Parameters dialog box (and the `ContinuousStateAttributes` parameter) allows you to give names to states for those blocks (such as the Integrator) that employ continuous states. This can simplify analyzing data logged for states, especially when a block has multiple states.

Continuous States

A continuous state is defined for all values of time. An example of a continuous state would be the velocity of a car shown on an analog speedometer with a needle position that changes continuously with the rotation of a tire.

Blocks with continuous states and the block parameter **Initial condition** include:

- Integrator
- State-Space
- Transfer Fcn

In general, excluding simple models, analytical methods do not exist for integrating states represented by ordinary differential equations. Integrating the states requires the use of numerical methods.

Discrete States

A discrete state is defined only at specific times. It is an approximation of a continuous state where the state is updated at periodic or aperiodic time intervals. An example of a discrete state would be the velocity of a car shown on a digital speedometer that is updated every second as opposed to continuously.

Blocks with discrete states include:

- Discrete Time Integrator
- Discrete State-Space
- Discrete Transfer Fcn
- Delay

Computing the discrete state for a block requires knowing its value at the previous time step and also the current input value to the block. Simulink provides two types of discrete solvers:

- Fixed-step discrete solver - determines a fixed step size that hits all the sample times for all the model's discrete states, regardless of whether the states actually change value at the sample time hits.
- Variable-step discrete solver - varies the step size to ensure that sample time hits occur only at times when the states change value.

Modeling Hybrid Systems

A hybrid model has both continuous and discrete states. Solving such a model entails choosing a step size that satisfies both the precision constraint on the continuous state integration and the sample time interval constraint on the discrete states. Simulink meets this requirement by passing the next sample time interval for the discrete solver as an additional constraint on the continuous solver. The continuous solver chooses a step size that advances the simulation up to but not beyond the time of the next discrete sample time. The continuous solver can take a time step short of the next sample time hit to meet its accuracy constraint but it cannot take a step beyond the next sample time hit even if its accuracy constraint allows it to.

You can simulate hybrid systems using any of the integration methods, but certain methods are more effective than others. For most hybrid systems, `ode23` and `ode45` are superior to the other solvers in terms of efficiency. Because of discontinuities associated with the sample and hold of the discrete blocks, do not use the `ode15s` and `ode113` solvers for hybrid systems.

Sample Time

Sample time is the time interval that specifies the rate ($1 / \text{sample time}$) for executing block methods to produce outputs and update internal state of blocks. Time is an inherent component of a block diagram in that the simulation results of a block diagram change with time.

Sample time is specified as:

- Continuous - Blocks run at variable times based on solver settings.
- Discrete - Blocks run at specific times that are explicitly specified.

In the following example, the controller runs at a discrete rate specified with a sample time of `0.01` seconds while Simulink determined the vehicle model to have a continuous sample time.

Determining a system's behavior over time thus entails repeatedly solving the model at intervals, called time steps or time intervals, from the start of the time span to the end of the time span. The process of solving a model at successive time steps is referred to as *simulating* the system that the model represents.

See also “What Is Sample Time?”, “Types of Sample Time”, “Specify Sample Time”, and “View Sample Time Information”.

Block Sample Times

Every Simulink block has a sample time which defines when the block will execute. Most blocks allow you to specify the sample time via a `SampleTime` parameter. Common choices include discrete, continuous, and inherited sample times.

Common Sample Time Types	Sample Time	Examples
Discrete	$[T_s, T_o]$	Unit Delay, Digital Filter
Continuous	$[0, 0]$	Integrator, Derivative
Inherited	$[-1, 0]$	Gain, Sum

For discrete blocks, the sample time is a vector $[T_s, T_o]$ where T_s is the time interval or period between consecutive sample times and T_o is an initial offset to the sample time. In contrast, the sample times for nondiscrete blocks are represented by ordered pairs that use zero, a negative integer, or infinity to represent a specific type of sample time. For example, continuous blocks have a nominal sample time of $[0, 0]$ and are used to model systems in which the states change continuously (e.g., a car accelerating). Whereas you indicate the sample time type of an inherited block symbolically as $[-1, 0]$ and Simulink then determines the actual value based upon the context of the inherited block within the model.

Note that not all blocks accept all types of sample times. For example, a discrete block cannot accept a continuous sample time.

For a visual aid, Simulink allows the optional color-coding and annotation of any block diagram to indicate the type and speed of the block sample times. You can capture all of the colors and the annotations within a legend (see “View Sample Time Information”).

For a more detailed discussion of sample times, see “Sample Time”

Units

Units are used to measure the total amount of a quantity.

Simulink *units* are specified as a Inport block or Outport block parameter at the boundaries of a Simulink *model component*. Simulink *model components* include Subsystem blocks, Model blocks, Stateflow charts, and Simulink to Simscape converter blocks. To display units on a model, in the **Debug** tab, select **Information Overlays > Units**.

See also: “Unit Specification in Simulink Models”, “Converting Units”.

Direct Feedthrough

Simulink block characteristic where the output port signal of a block is computed from the values of its input port signals. The output signal value is a function of the input signal values.

Blocks with direct feedthrough include the Gain, Product, Sum, Transfer Fcn, State-Space, and Math Function blocks.

See also: “Algebraic Loop Concepts”.

Algebraic Loop

Signal loop between blocks with *direct feedthrough*. An algebraic loop generally occurs when an input port of a block with *direct feedthrough* is driven directly by the output port of the same block or indirectly through other blocks with *direct feedthrough*.

In the following model, the two Gain blocks with *direct feedthrough* create an *algebraic loop*.

See also: “Algebraic Loop Concepts”.

Artificial Algebraic Loops

An *artificial algebraic loop* occurs when an atomic subsystem or Model block causes Simulink to detect an algebraic loop, even though the contents of the subsystem do not contain a direct feedthrough from the input to the output. When you create an atomic subsystem, all Inport blocks are direct feedthrough, resulting in an algebraic loop.

Start with the included model, which represents a simple proportional control of the plant described by

$$G(s) = \frac{1}{s^2 + 2s + 1}$$

which can be rewritten in state-space form as

$$\dot{x} = \begin{bmatrix} -2 & -1 \\ 1 & 0 \end{bmatrix} x + \begin{pmatrix} 0 \\ 1 \end{pmatrix} u$$

$$y = [0 \quad 1] x$$

The system has neither algebraic variables nor direct feedthrough and does not contain an algebraic loop.

Modify the model as described in the following steps:

- 1 Enclose the Controller and Plant blocks in a subsystem.
- 2 In the subsystem dialog box, select **Treat as atomic unit** to make the subsystem atomic.
- 3 In the **Diagnostics** pane of the Model Configuration Parameters, set the **Algebraic Loop** parameter to error.

When simulating this model, an algebraic loop occurs because the subsystem is direct feedthrough, even though the path within the atomic subsystem is not direct feedthrough. Simulation stops with an algebraic loop error.

Zero-Crossing Detection

The simulation uses a technique known as *zero-crossing detection* to accurately locate a discontinuity without resorting to excessively small time steps during a simulink. Usually this technique improves simulation run times.

Simulink Simulation

Simulating the model of a dynamic system allows you to gain insight about the behavior of a proposed system design without the time consuming process of actually building the system. The concepts in this topic provide a context for understanding how to control a model simulation with Simulink software tools.

Compilation

Compilation is the Simulink process where the block diagram is translated to an internal representation that interacts with the Simulink engine.

There are no model-level sets of differential equations that are solved numerically as a whole. Instead, the model-level equations correspond to the individual block equations that are solved numerically in a specific order.

Block Methods

The functionality of a single block is defined by multiple equations. These equations are represented as block methods. These block methods are evaluated (executed) during the execution of a block diagram. The evaluation of these block methods is performed within a simulation loop, where each cycle through the simulation loop represent the evaluation of the block diagram at a given point in time. Common block methods include:

- Derivative - Computes the derivatives of the block's continuous states at the current time step, given the block inputs and the values of the states at the previous time step.
- Update - Computes the value of the block's discrete states at the current time step, given its inputs at the current time step and its discrete states at the previous time step.
- Output - Computes the outputs of a block given its inputs at the current time step and its states at the previous time step.

$$\left\{ \begin{array}{ll} X = [x_c, x_d] & \text{Model states} \\ \dot{x}_c = f_c(X, U, t) & \text{Derivative method} \\ x_d[n + 1] = f_d(X, U, t) & \text{Update method} \\ Y = [y_1, y_2] & \\ Y = g(X, U, t) & \text{Output method} \end{array} \right.$$

$$X(t_0) = X_0 \quad \text{Initial model states}$$

Model Method

In addition to block methods, a set of methods is provided that compute the model properties and its outputs. The Simulink software similarly invokes these methods during simulation to determine a model's properties and its outputs. The model methods generally perform their tasks by invoking block methods of the same type. For example, the model Outputs method invokes the Outputs methods of the blocks that it contains in the order specified by the model to compute its outputs. The model Derivatives method similarly invokes the Derivatives methods of the blocks that it contains to determine the derivatives of its states.

See also: "Simulation Phases in Dynamic Systems".

Callback

Callbacks are MATLAB expressions that execute in response to a specific modeling action. Simulink provides model, block, and port callback parameters that identify specific kinds of modeling actions. You provide the code for callback parameters. Simulink executes the callback code when the associated modeling action occurs.

Model Callback

Model callback parameters include:

- `PreloadFcn` - Executes before a model loads. For example, you can provide code that loads the variable values a model uses into the MATLAB workspace.

See “Model Callbacks”.

Block Callback

Block callback parameters include:

- `OpenFcn` - Execute when you open a Subsystem block.
- `LoadFcn` - Execute after a diagram is loaded. For a Subsystem blocks, also execute block callback parameters for the blocks within Subsystem block.

Port Callback

Port callback parameter:

- `ConnectionCallback` - Execute code every time the connectivity of a port changes.

See “Port Callbacks”.

Execution Order

The Execution order is the sequence in which block output methods are called after evaluating direct feedthrough of each input port. To display execution order, in the **Debug** tab, select **Information Overlays > Execution Order**.

In the following model, the Integrator block output runs first, and then the loop of blocks connected to the Integrator block input. Missing execution numbers in a sequence are usually due to hidden buffer blocks.

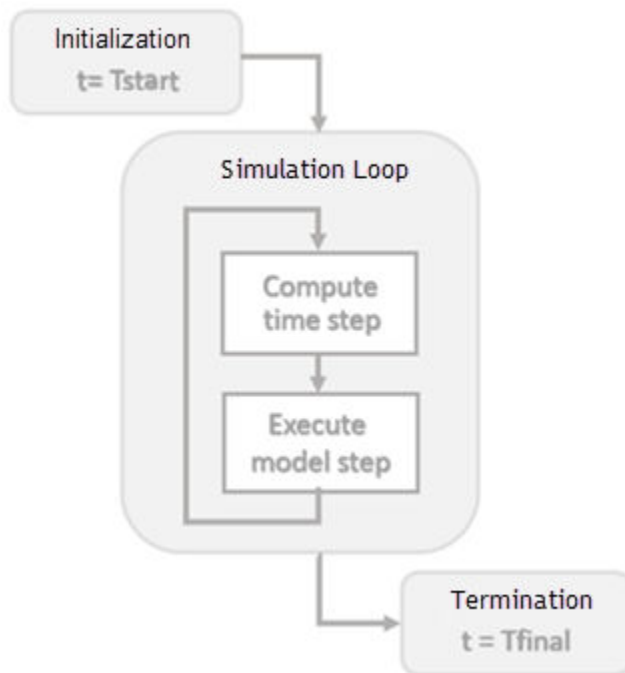

See also: “Control and Display Execution Order”, “Simulation Phases in Dynamic Systems”.

Simulation

Simulation is the process after model *compilation* where block method outputs and states are computed at successive time steps over a specified time range using a numerical solver.

During each simulation loop, Simulink calculates a Δt to determine the time step $t(k+1) = t(k) + \Delta t$. The size of Δt is based on an estimated error between the simulated solution and the actual solution. At the end of a simulation, data results are given as vectors $[t, X, Y]$ for time, state and output at each time step.

See also: “Simulation Phases in Dynamic Systems”, “Simulate a Model Interactively”, “Speed Up Simulation”.

Solver

A Solver finds an approximate solution for a set of model equations. Simulink uses established numerical solvers for this task.

Solver step size can be fixed or variable:

- Fixed step - Time step $T(k+1) = T(k) + \Delta t$ where Δt is constant. If step size is too large, simulation results can have a large error. In the following example, a step size of 2 distorts the shape of a sine wave signal. You can specify the size of the time step in the case of fixed-step solvers, or the solver can automatically determine the step size in the case of variable-step solvers.

- Variable step - Variable step solvers iterate to reach a solution based on an error tolerance. Time step $T(k+1) = T(k) + \Delta t_k$ where Δt_k changes from one simulation step to the next depending on the estimated error. Smaller time steps increase the accuracy of the simulation results. To minimize the computation workload, a variable-step solver chooses the largest step size consistent with achieving an overall level of precision specified by the error tolerance and observing zero-crossings. This ensures that all model states are computed to the accuracy specified by the user.

Choosing a solver method depends on the nature of the model equations. Euler's method is a simple numerical solver that calculates the next value of y by using the slope (y') of a tangent line to y . If y is a function that integrates a ramp function x with a slope of 1, $y' = x$, and a numerical solver would use the following equations.

$$x[n+1] = x[n] + \Delta t * 1$$

$$y[n+1] = y[n] + \Delta t * x[n+1]$$

Decreasing the step size increases the accuracy of the results. but it increases the time to complete a simulation. In the following example, a step size of 2 shows an error of about 20 percent after 10 seconds while a step size of 0.5 produces a result that is closer to the actual solution.

See also: "Simulation Phases in Dynamic Systems", "Compare Solvers", "Check and Improve Simulation Accuracy", "Choose a Solver".

.

Simulink Tools

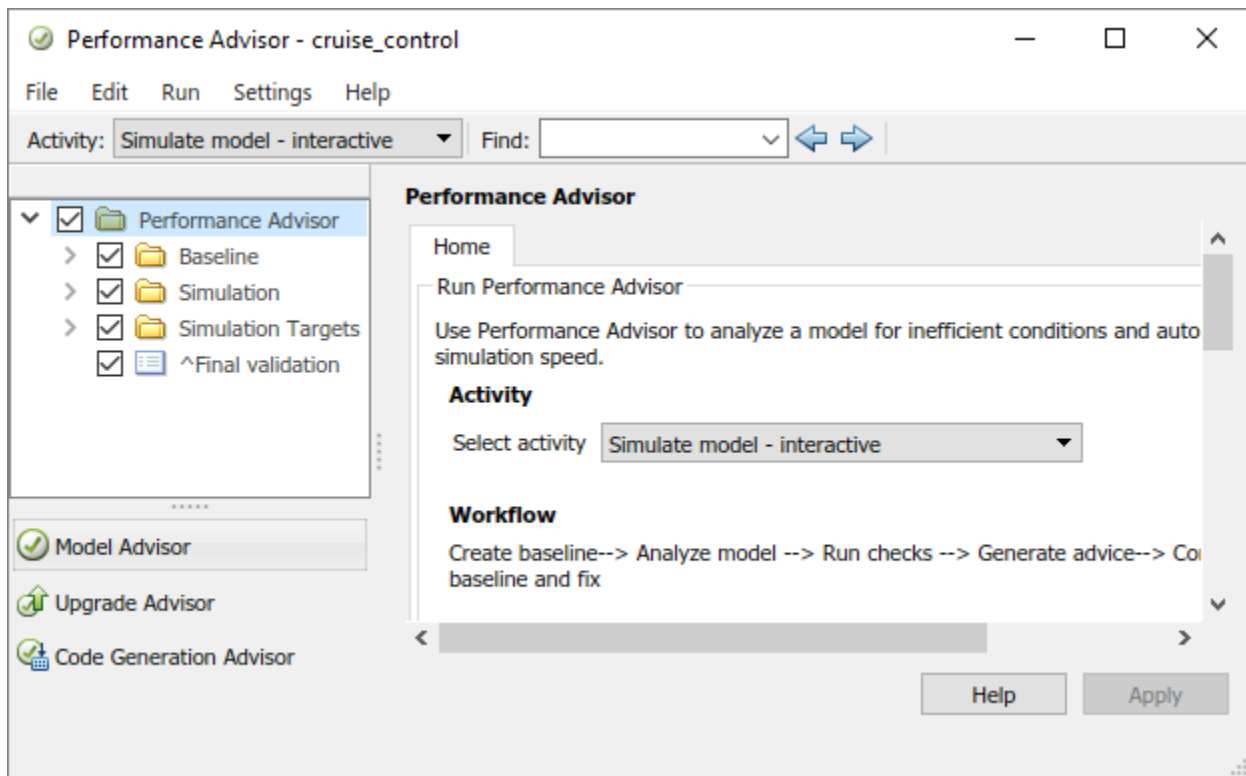

Code Generation Advisor - Simulink tool that checks a model for how objectives such as efficiency, traceability, and safety, map to code generation options in a model configuration set. To open and run the advisor, in the **Modeling** tab, click **Model Advisor**, and then click **Code Generation Advisor**.

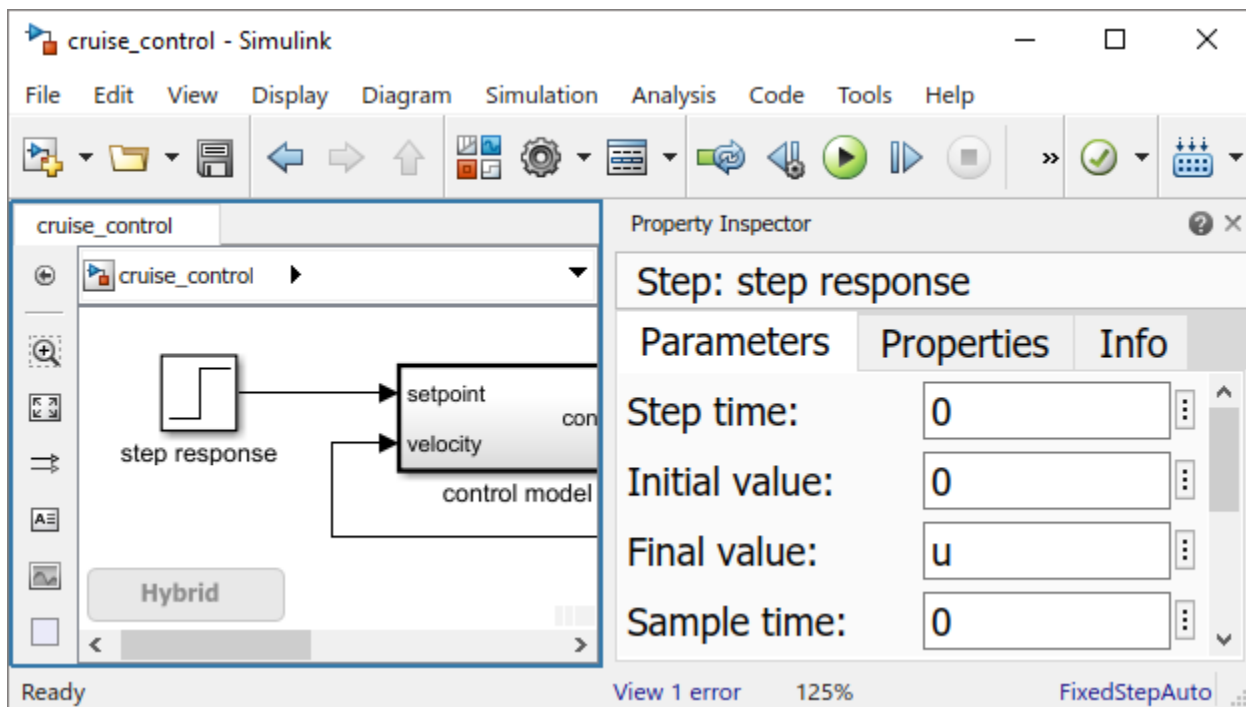

Configuration Parameter dialog - Simulink tool to select and specify *model parameters*. To open the dialog box, in the **Simulation** tab, under **Configuration & Simulation**, click **Model Settings**.

Performance Advisor - Simulink tool that checks for conditions that might slow down a simulation. The advisor can automatically make changes to a model to address these conditions or you can review and apply suggested changes manually. To open the advisor, in the **Debug** tab, click **Performance Advisor**.

Property Inspector - Simulink tool to define and edit parameters and properties for models and blocks. To open the inspector in a Simulink Editor pane, in the **Modeling** tab, under **Design**, click **Property Inspector**.

Simulation Data Inspector - Simulink tool to visualize simulation results and compare results from multiple simulations. Select signals to log by right-clicking a signal and then selecting **Log Selected Signals**. After running a simulation, open the inspector by clicking the toolbar icon .

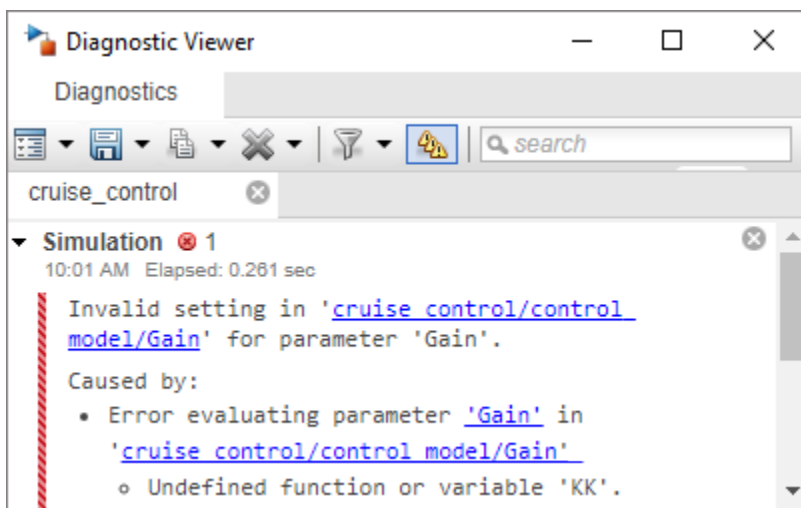

Upgrade Advisor - Simulink tool to identify new feature benefits and needed changes to your model when upgrading to a new release. To open the advisor, in the **Modeling** tab, select **Model Advisor** > **Upgrade Advisor**.

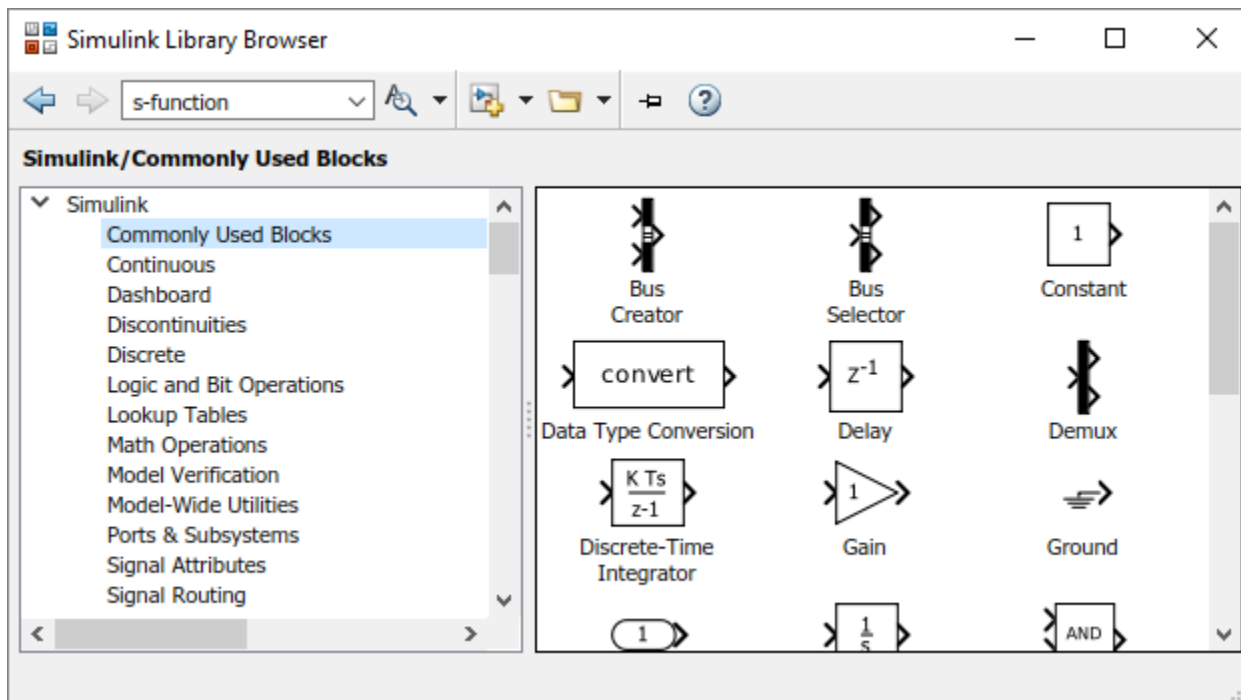

debugger, Simulink debugger - Simulink tool to troubleshoot model simulations by stepping through calls to the block-level methods. To open the debugger, in the **Debug** tab, select **Breakpoints List > Debug Model**.

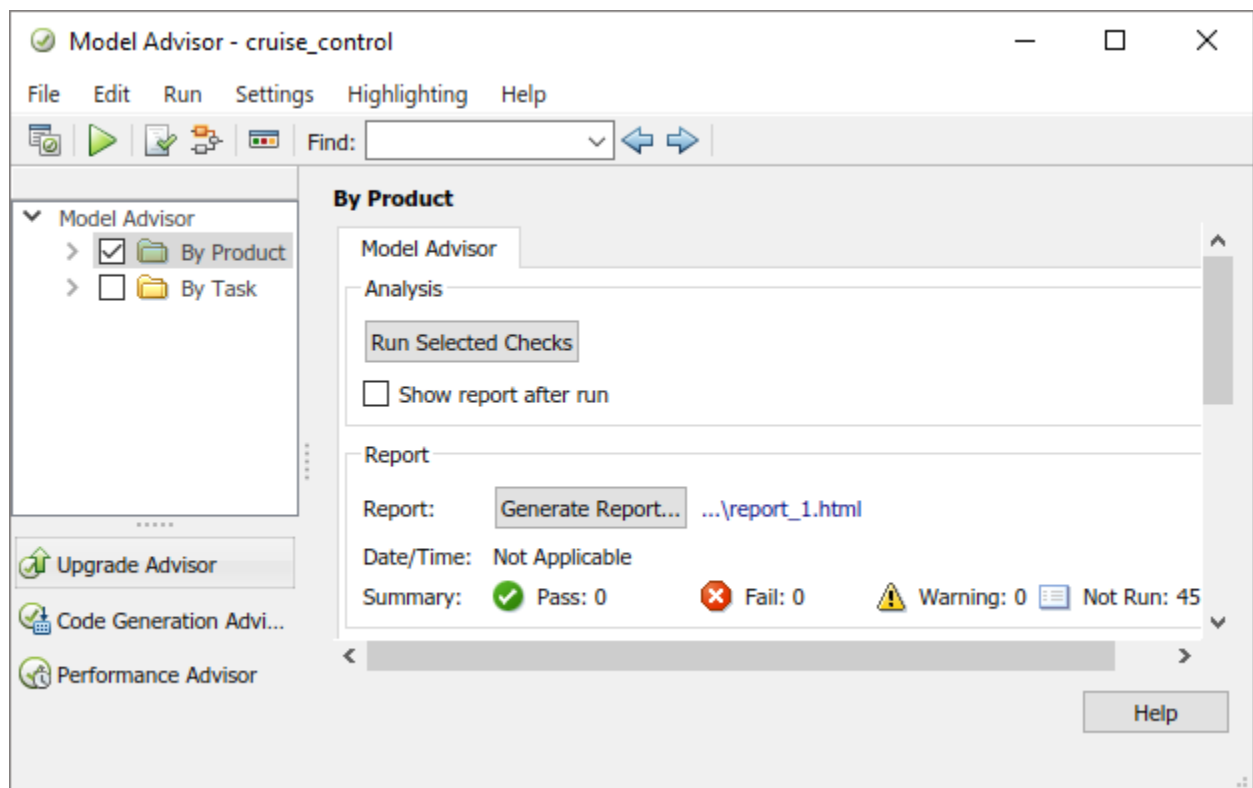

Diagnostic Viewer - Simulink tool that displays error, warning, and information messages for conditions detected during a Simulink operation. To open the viewer, in the **Debug** tab, click **Diagnostics**.

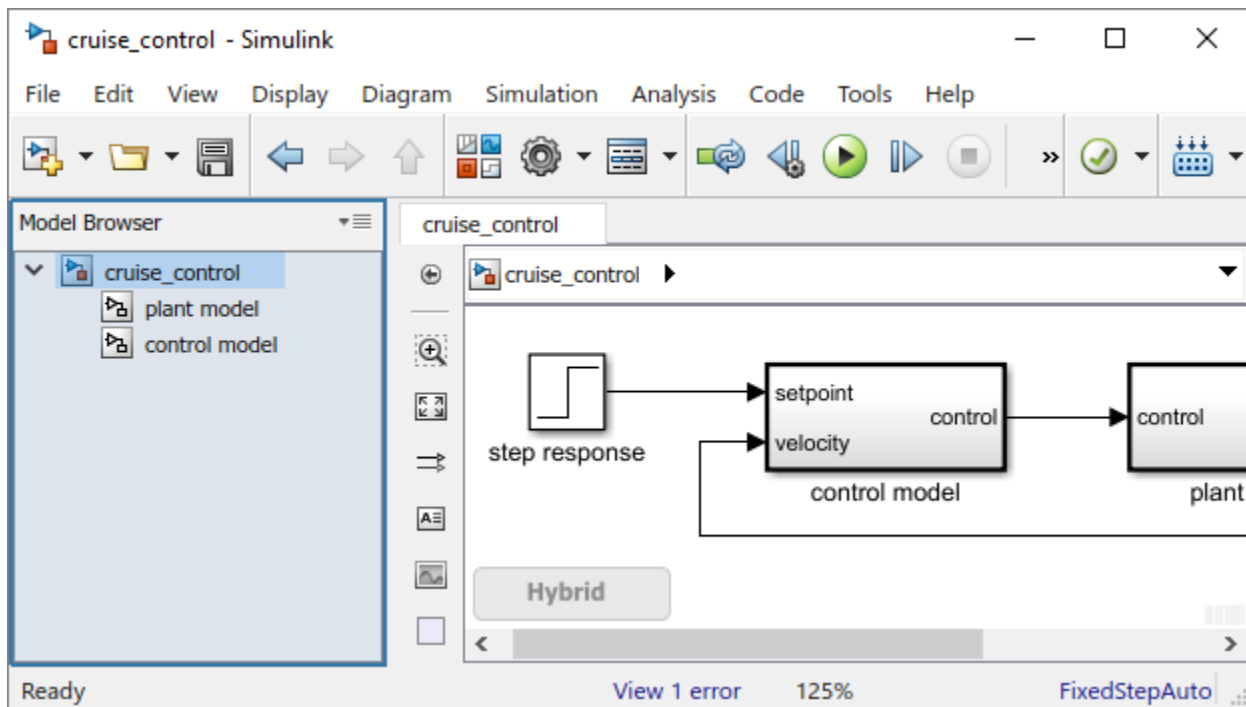

Library Browser, Simulink Library Browser - Simulink tool for searching and selecting model blocks. To open the browser, click the Simulink Editor toolbar icon .

Model Advisor - Simulink tool that checks a Simulink model for conditions and configuration settings that cause inaccurate or inefficient simulation of a *model*. To open and run the advisor, in the **Modeling** tab, click **Model Advisor**.

Model Browser - Simulink tool to view and navigate the structure of a model. To open the Model Browser in a Simulink Editor pane, in the **Modeling** tab, select **Environment** > **Model Browser**.

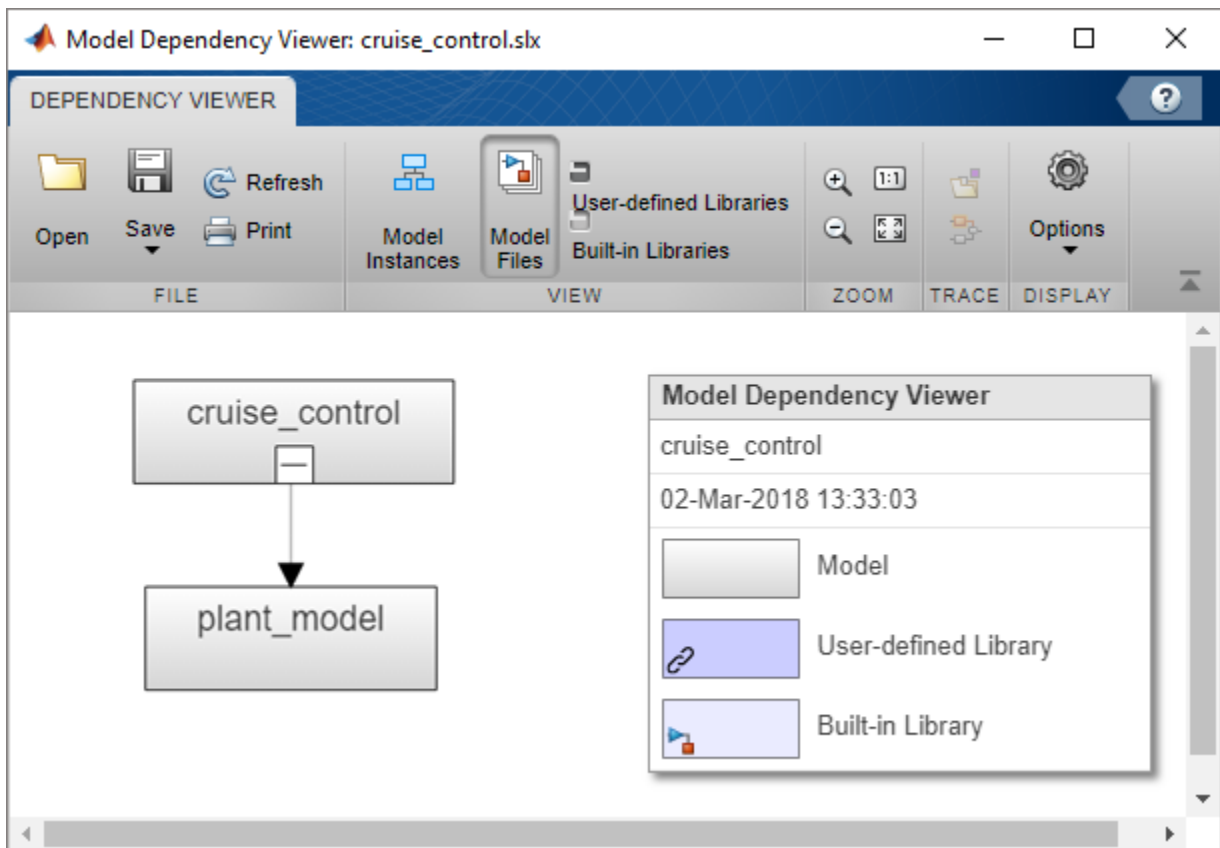

Model Data Editor - Simulink tool to define and edit data items in a list that you can sort, group, and filter. For example, enter property and parameter values, such as data types and dimensions without having to locate the items in the block diagram. To open the Model Data Editor, in the Simulink Editor, in the **Modeling** tab, under **Design**, click **Model Data Editor**.

The screenshot shows the Simulink Model Data Editor for the 'cruise_control' model. The diagram displays a 'step response' block connected to a 'control model' block, which is connected to a 'plant model' block. The 'control model' block has two inputs: 'setpoint' and 'velocity'. The 'plant model' block has two outputs: 'control' and 'velocity'. The 'control model' block is highlighted with a blue border. The Model Data Editor window shows the 'Signals' tab with a table of dependencies.

	Source	Name	Data Type	Min	Max	Dimensions	Complexity	Sample Time	Unit	Resolve	
	control m...		double	-Inf	Inf	1	real	[0 0]	m/s	<input type="checkbox"/>	
	plant mo...		double	-Inf	Inf	1	real	[0 0]	inherit	<input type="checkbox"/>	
	step resp...		double	-Inf	Inf	1	real	0	[0 0]	m/s	<input type="checkbox"/>

Model Dependency Viewer - Simulink tool to graph the models and libraries referenced directly or indirectly by the parent model. To open the viewer, in the **Modeling** tab, select **Compare > Dependencies > Models & Libraries**. In the following example, the `plant_model` is referenced from the parent `cruise_control` model.

Model Explorer - Simulink tool to view and modify elements of a Simulink model, Stateflow chart, or model workspace variables. To open the explorer window, in the **Modeling** tab, click **Model Explorer**.

The screenshot shows the Simulink Model Explorer window. The title bar reads "Model Explorer". The menu bar includes "File", "Edit", "View", "Tools", "Add", and "Help". The toolbar contains various icons for file operations and search. Below the toolbar is a search bar with a dropdown menu set to "by Name" and a "Name:" input field. The main area is divided into three panes:

- Model Hierarchy:** Shows a tree view starting with "Simulink Root". Under "Simulink Root", there are two main branches: "cruise_control" and "cruise_control_expanded". Each branch contains sub-items like "Base Workspace", "Model Workspace", "Configuration (Active)", "Embedded Coder Dictionary", and "Simulink Design Verifier results".
- Contents of: Root (only):** A pane showing search results in a table view. The column headers are "Name" and "BlockType". The results are:

Name	BlockType
Base Workspace	
cruise_control01*	
cruise_control_expanded*	
- Simulink Root Information:** A text pane providing context. It states: "The Simulink Root is the top most Simulink hierarchy. All loaded model libraries live under the Simulink Root. Global instances of Simulink data classes, such as [Parameter](#), [Signal](#), or other [data classes](#) can be found in the Simulink Base Workspace or data dictionary along with any valid MATLAB workspace variables." Below the text are navigation arrows and buttons for "Revert" and "Help".

At the bottom of the main area, there are tabs for "Contents" and "Search Results", with "Search Results" currently selected.

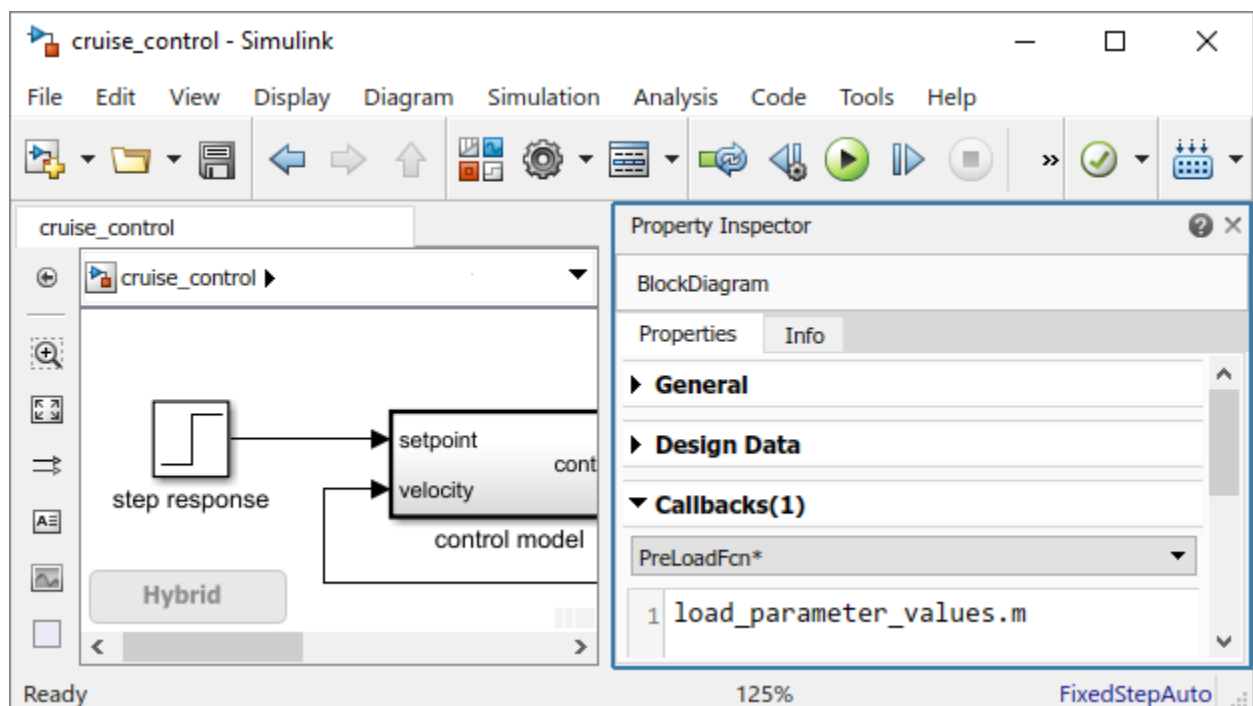

Programming Constructs in Simulink

Simulink command - MATLAB command that is specific to Simulink modeling or simulation. Enter Simulink commands in the MATLAB Command Window or use in MATLAB scripts for testing a model programmatically. The following commands set simulation parameters, run a simulation, and saves the simulation results. In the first statement, `sim` is a *Simulink command* for running a simulation.

```
simOut = sim('cruise_control','SimulationMode','normal',...
            'AbsTol','1e-5','SaveState','on',...
            'StateSaveName','xout','SaveOutput','on',...
            'OutputSaveName','yout','SaveFormat','Dataset');
outputs = simOut.get('yout')
```

callback, model callback - MATLAB code that executes in response to a specific model or block action. To add a model callback, in the **Modeling** tab, under **Design**, click **Property Inspector**, then in the **Properties** tab, select a function from the **Callbacks** list, and then enter MATLAB code or the name of a MATLAB script.

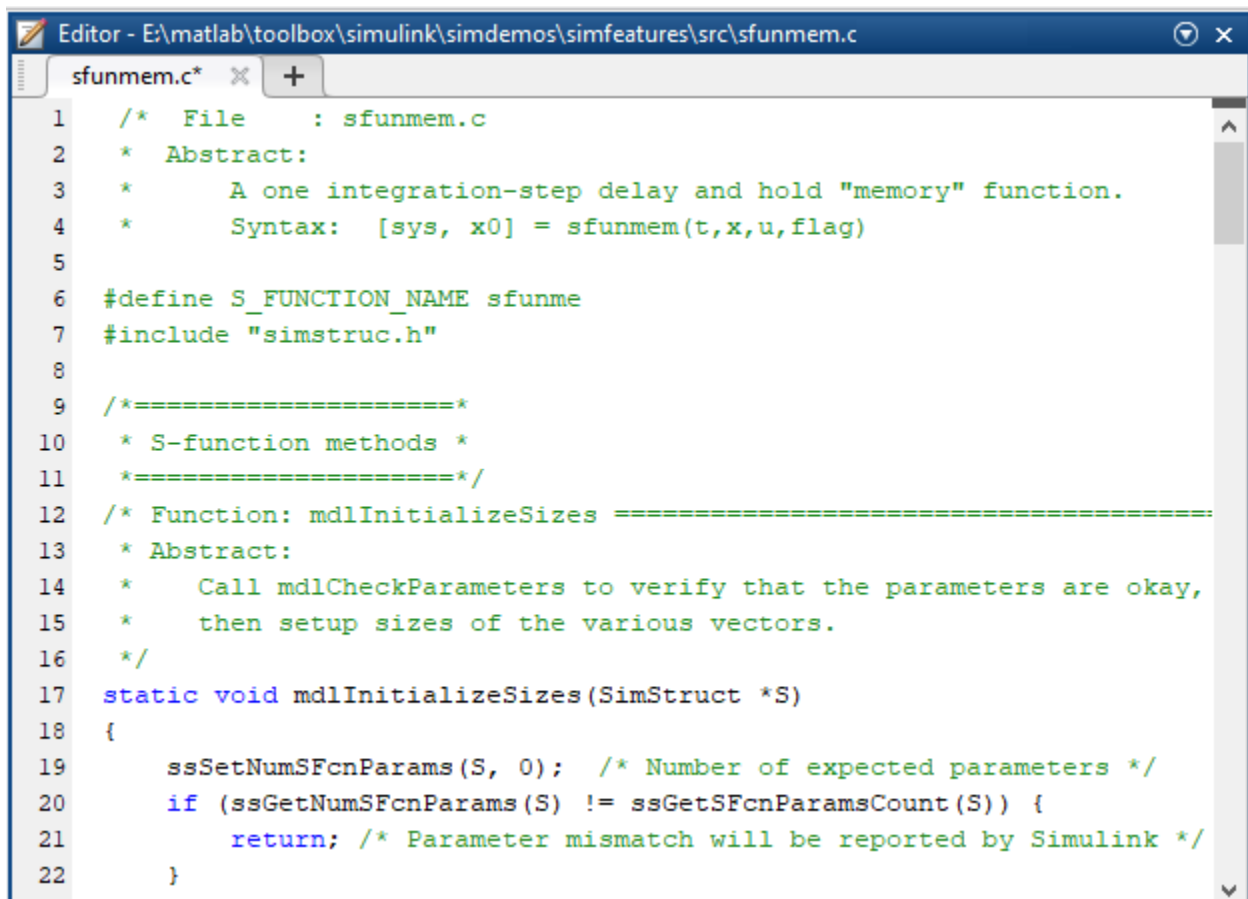

In the following example, when Simulink loads a model it also loads a file into the MATLAB workspace with parameters values for the model.

Simulink function - Computational unit that calculates a set of outputs when provided with a set of inputs. A common text interface between function caller and function definition allows various definition formats using a Simulink Function block, exported Stateflow graphical function, or exported Stateflow MATLAB function.

MATLAB Function -

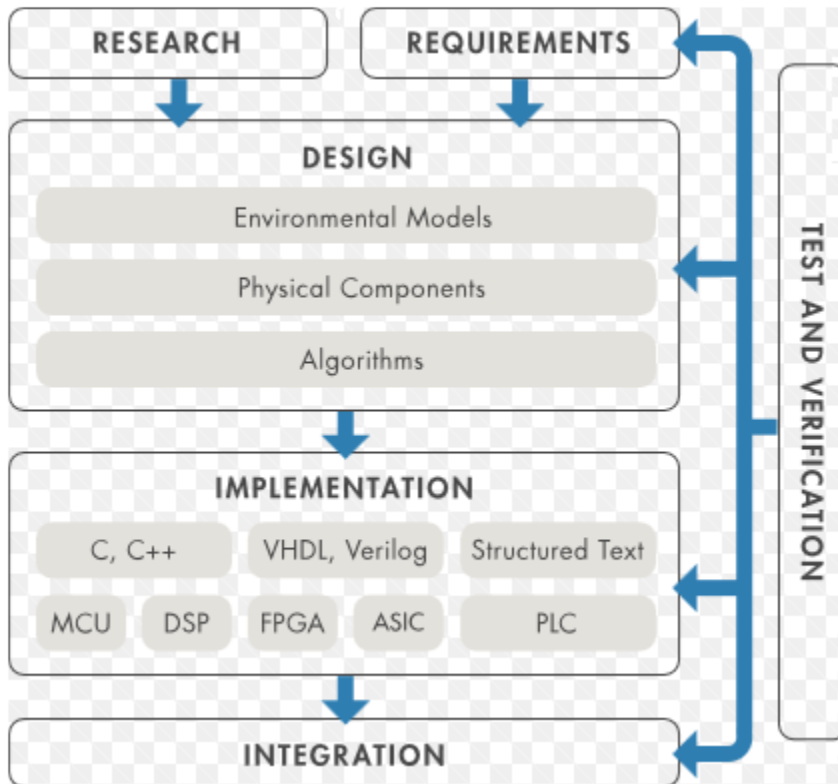

S-function, system-function - Computer language description of a Simulink S-Function block written in MATLAB code, C, C++, or Fortran. C, C++, and Fortran S-functions are compiled as MEX files using the MATLAB mex utility.

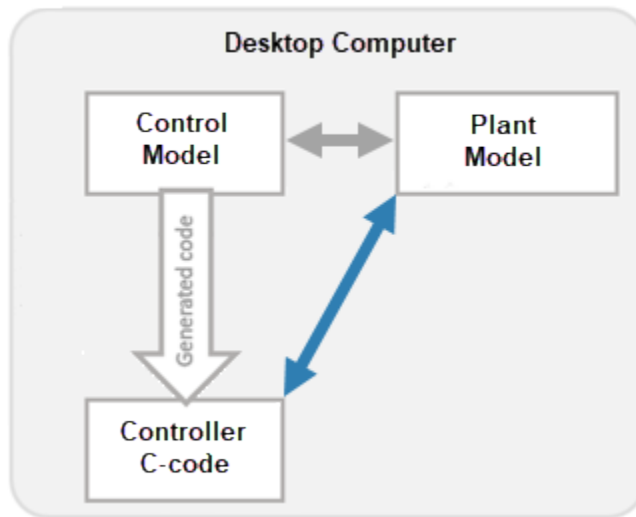

```
Editor - E:\matlab\toolbox\simulink\simdemos\simfeatures\src\sfunmem.c
sfunmem.c* x +
1  /* File      : sfunmem.c
2  * Abstract:
3  *      A one integration-step delay and hold "memory" function.
4  *      Syntax: [sys, x0] = sfunmem(t,x,u,flag)
5
6  #define S_FUNCTION_NAME sfunme

Model Development Processes

model-based design - Development process that uses a system model as an executable specification throughout development. The process supports model and model component design, model simulation of dynamic behavior, code generation from the model, and continuous test and verification.

software-in-the-loop (SIL) simulation - Development process where compiled source code on a development computer executes as a separate process from the rest of the Simulink model. Typical goals include initial source code testing and verification by comparing software-in-the-loop results with model simulation results and system requirements.

In the following example, to run a software-in-the-loop simulation for the controller, right-click the Model block labeled `control_model` and then select **Block parameters**. From the **Simulation mode** list, select Software-in-the-loop (SIL).

processor-in-the-loop (PIL) simulation - Development process that cross-compiler source code and runs the resulting object code on a target processor using hardware-specific data attributes and sample time attributes. Typical goals include object code verification by comparing processor-in-the-loop results with model simulation and *software-in-the-loop (SIL)* results.

hardware-in-the-loop (HIL) simulation - Development process that pairs physical components, such as the hardware and software for a controller, with a virtual real-time implementation of a physical component, such as a plant.

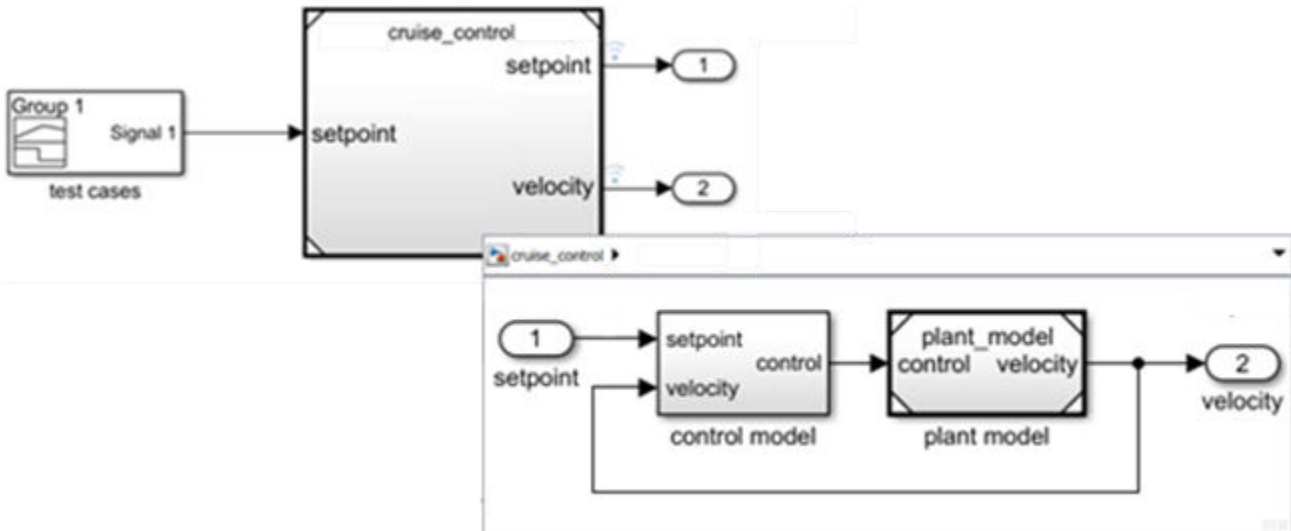

In the following example, code for the controller model is generated and downloaded to the production controller hardware. Code is generated for the plant model and downloaded to a real-time hardware computer (e.g. Simulink Realtime).

Test Harness

Simulink model that provides a framework for testing the simulation behavior and outputs of another model or model component. Objectives of the test harness are to automate the testing process, execute a test suite with multiple test cases, and analyze results.

In the following model, a Signal Builder block provides test signals while outputs are logged for analysis in the Simulation Data Inspector or MATLAB.

Create Mux Signal and Extract Elements

This example shows how to create a mux signal and extract elements from the mux signal.

Open and simulate the example model, which creates a mux signal that contains three signals and extracts those signals using Demux and Selector blocks.

Copyright 2019 The MathWorks, Inc.

The **Signal Dimensions** information overlay displays the number of signals that the mux signal contains.

The **Nonscalar Signals** information overlay displays mux signals with thicker lines than scalar signals.

The Demux block extracts the elements of the mux signal in the order that the Mux block receives them.

The Selector block extracts the elements of the mux signal based on the specified **Index** in the dialog box. Because mux signals are vectors that provide index-based access to their elements, the Selector block uses `Index vector (dialog)` for the **Index Option**.

More About

- “Types of Composite Signals”

Manage Bus-to-Vector Conversions

This example shows how to find and manage implicit bus-to-vector conversions.

Blocks that do not accept buses may implicitly convert buses to vectors. When a bus is treated as a vector, bus elements become inaccessible.

Some buses cannot convert to vectors. For more information, see [Bus to Vector](#).

Identify Implicit Bus-to-Vector Conversions

Open and simulate model `ex_bus_to_vector`.

To accept the bus, the Gain blocks implicitly convert the bus to a vector.

To identify buses treated as vectors before simulation, use function `Simulink.BlockDiagram.addBusToVector`.

```
[blocks] = Simulink.BlockDiagram.addBusToVector('ex_bus_to_vector')

### Processing block diagram 'ex_bus_to_vector'
### Number of blocks left that are connected to a bus being used as a vector: 2
### Done processing block diagram 'ex_bus_to_vector'

blocks =

    1x2 struct array with fields:

        BlockPath
        InputPort
        LibPath
```

To identify buses treated as vectors during simulation, set the **Bus signal treated as vector** configuration parameter to `warning` or `error`. The default setting for **Bus signal treated as vector** is `none`, which generates no warning or error message when a block implicitly converts a bus to a vector.

Explicitly Define Bus-to-Vector Conversions

To insert Bus to Vector blocks where blocks implicitly convert buses to vectors, use function `Simulink.BlockDiagram.addBusToVector` with `reportOnly` set to `false`. When you use function `Simulink.BlockDiagram.addBusToVector` with `reportOnly` set to `false`, the function saves the model. To create a writable copy of model `ex_bus_to_vector`, this example uses the `save_system` function.

```
save_system('ex_bus_to_vector','ex_bus_to_vector_blocks');
[blocks,busToVectors] =
Simulink.BlockDiagram.addBusToVector('ex_bus_to_vector_blocks',true,false);
```

The Gain blocks no longer implicitly convert the bus to a vector. The inserted Bus to Vector blocks perform the conversion explicitly.

Bus to Vector blocks are virtual and do not affect simulation results, code generation, or performance.

Function `Simulink.BlockDiagram.addBusToVector` returns no remaining implicit bus-to-vector conversions.

```
[blocks] = Simulink.BlockDiagram.addBusToVector('ex_bus_to_vector_blocks')
```

```
###No buses used as vectors left to process
```

```
blocks =
```

```
1x0 empty struct array with fields:
```

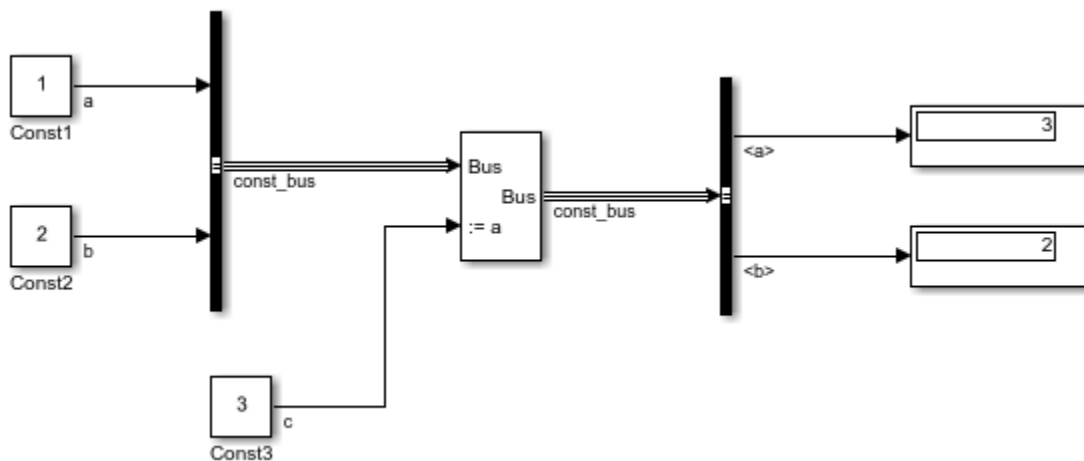

```
BlockPath
InputPort
MixedAttributes
```

By specifying acceptable bus-to-vector conversions with Bus to Vector blocks, you can more easily identify unexpected conversions. Having configuration parameter **Bus signal treated as vector** set to **warning** or **error** alerts you when an unexpected bus-to-vector conversion occurs.

Assign Signal Values to a Bus

This example shows how to use a Bus Assignment block to change a bus element value without adding Bus Selector and Bus Creator blocks to select bus elements and reassemble them into a bus.

Open the model and simulate it.

Initially, the value of signal a is 1. However, the Bus Assignment block replaces that initial value of signal a with the value of signal c, which is 3. The const_bus output signal has a value of 3 for signal a, as the Display block shows.

Initialize Your Model Using the Callback Button Block

This example shows how to use the Callback Button block to perform initialization routines on your model.

Explore the Model

The example model builds on the `sldemo_fuelsys` featured model. When you open the model, to bind the workspace variables to their Dashboard blocks, you have to update the model diagram. Here, the Callback Button block at the bottom of the Dashboard subsystem in the model has been configured to update the diagram on the release of the mouse button when you click the block.

Fault-Tolerant Fuel Control System Dashboard

You do not need to start a simulation for the Callback Button to react to your input. Just select and then click the Callback Button to run the initialization code. Double-click the Callback Button block to view and edit its parameters, including the press and click scripts.

Control a Parameter Value with Callback Button Blocks

This example models control of a system that consists of two masses attached on either side of a spring. A control loop damps the oscillation of the spring that results when an external force acts on the system. The model uses Callback Button blocks to provide an interface for you to adjust the frequency of the external force before and during simulation.

Explore the Model

The model for this example adds two Callback Button blocks, labeled Frequency + and Frequency - to the Double Mass-Spring System model. When you simulate the model, an animation visualizes the system.

Click the button labeled Frequency + to increase the oscillation frequency. When you adjust the frequency of the external force, the Callback Button block displays a message in the command window indicating the new frequency value. You can adjust the parameter during a simulation and while the model is idle.

Both Callback Button blocks in this model are configured with a ClickFcn that responds to your clicks and a PressFcn that executes when you press the Callback Button block. Double-click the Frequency + Callback Button block to view its parameters.

When you click the Frequency + Callback Button block, the ClickFcn increases the frequency of the external force by 0.1. If you press the Callback Button block for more than the 500 ms Press Delay, the PressFcn increases the frequency of the external force by 0.1 every second.

Control the Duty Cycle of a PWM Signal Using Dashboard Blocks

This example shows how a simulation dashboard built using Dashboard blocks controls the duty cycle of a PWM signal generated by the model. The example is a modified version of the `sfncdemo_pwm` example. The PWM Generator block takes a duty cycle and period as inputs to generate a PWM output. You can control the source for the duty cycle using a switch.

Build the Dashboard Subsystem

To create the Dashboard subsystem in this example:

1. Add a Subsystem block to the model.
2. Delete the pre-populated contents of the subsystem.
3. Add the contents of the dashboard. The dashboard in this example includes a Rocker Switch block and a Knob block, which allow you to modify variables during simulation. The Dashboard Scope block displays the generated PWM signal.

Use areas in the Dashboard subsystem to group and label Dashboard blocks. For more information about creating areas, see "Box and Label Areas of a Model".

Connect Blocks in the Model

In this model, the Rocker Switch block in the Dashboard subsystem provides the interface for selecting the duty cycle source. A Switch block with a Constant block as its control input replaces the Manual Switch in the `sfncdemo_pwm` model. Replacing the Manual Switch block requires three

blocks but allows you to gather model controls and visualizations in a single view. The Rocker Switch block connects to the value of the Constant block. In this model, the Constant block value is set by the variable `duty_cycle_source`.

This model also uses the variable `duty_cycle` to set the magnitude of the duty cycle for both the duty cycle (constant) and duty cycle (varying) sources. The Knob block in the Dashboard subsystem connects to the `duty_cycle` variable, allowing you to modify its value during simulation.

The Dashboard Scope block displays the output of the PWM Generator block, allowing you to observe the generated PWM signal during simulation.

Interactively Simulate

This model uses simulation pacing to slow model execution so you can interact with the model during simulation. For more information, see “Simulation Pacing”.

Run the simulation. Use the Rocker Switch block to select the varying duty cycle input and observe the resulting PWM waveform on the Dashboard Scope block. Change the magnitude of the duty cycle using the Knob block and observe the effect on the generated PWM signal.

Control Merging Signals with the Push Button Block

This example model is a modified version of the “Merging Signals” on page 14-320 example. The mergedemo model illustrates how to use Simulink® to merge two different signals using source blocks and triggered subsystems. In the mergedemo model, a square wave enables and disables the triggered subsystems that provide input to the Merge block. In this model, you can control the enable signal for the triggered subsystems using the Signal Select Push Button block.

Model Modifications

To create this model from the mergedemo example:

1. Delete the Discrete Pulse Generator block controlling the triggered subsystem and the Scope block.
2. Add a Push Button block, an Outport block, a Constant block, and a Dashboard Scope block.
3. Connect the Outport block to the output of the Merge block.
4. Display the output signal of the Merge block on the Dashboard Scope.
5. Connect the Constant block to the input of the Data Type Conversion block and specify a variable name as its value. This model uses the variable name `signal_select`. Click the `Unrecognized functions or variables` error, and create the variable in the Model Workspace.

Now, the variable `signal_select` controls the triggered subsystems.

6. Press Ctrl+D to update the diagram so the variable you just created is available for connection.

7. Connect the Push Button block to the `signal_select` variable.

In this example, the On Value for the Push Button block is set to 0. When you press the Push Button block, the value of `signal_select` changes to 0, enabling the triggered subsystem connected to the sawtooth wave. If you want pressing the Push Button block to enable the triggered subsystem connected to the sine wave, set the On Value for the Push Button block to 1.

Interactive Simulation

This model uses simulation pacing to slow model execution so you can interact with the model during simulation. For more information about simulation pacing, see "Simulation Pacing".

Run the simulation. As the model simulates, press and hold the Signal Selection Push Button block. You can observe the effect of pressing the Push Button block on the Dashboard Scope block.

Tune the Relative Slip for an Anti-Lock Braking System

This example shows how to use a subsystem made of Dashboard blocks to tune the value of the Desired relative slip for the “Modeling an Anti-Lock Braking System” on page 14-163 example. You can use the Slider block or the Edit block to change the value of the Desired relative slip and observe the results during simulation on the Dashboard Scope block.

Build the Dashboard Subsystem

This model uses a Subsystem block to gather the controls and displays for the model in a single interface. To create the subsystem for this model:

1. Add a Subsystem block to the `sldemo_absbrake` model.
2. Delete the pre-populated contents of the subsystem. A subsystem of Dashboard blocks does not need Inport or Outport blocks because Dashboard blocks do not use ports to make connections.
3. Add the components of the dashboard.

The dashboard for this model includes an Edit block and a Slider block that both control the value of the Desired relative slip input. The Dashboard Scope block displays the resulting slip value, `slp` throughout the simulation.

You can use areas in the subsystem to group and label related controls and displays. For more information about creating areas, see “Box and Label Areas of a Model”.

Interactively Simulate

You can use the Dashboard subsystem as a convenient interface to configure separate simulations that use different values for the Desired relative slip.

The Slider block and the Edit block both change the value of the `Desired relative slip` input. Use the Slider block to fine tune the value of the relative slip input, and use the Edit block to enter an exact value.

Interactively Simulate a Vehicle Climate Control System

In this example, you use a Dashboard of controls and displays to interactively simulate a climate control system of a car. You can adjust the fan and air recycling controls as well as set the internal temperature and modify the external temperature. A Linear Gauge block, a Dashboard Scope block, and a Display block show the internal temperature of the car. The model in this example adds the Dashboard to the `sldemo_auto_climatecontrol` model. For more information about the underlying model, see “Simulating Automatic Climate Control Systems” on page 14-188.

Build the Dashboard Subsystem

This model uses a Subsystem block to gather the controls and displays in a single interface for the model. To create the subsystem in this example:

1. Add a Subsystem block to the `sldemo_auto_climatecontrol` model.
2. Delete the prepopulated contents of the subsystem. The subsystem does not need inports or outports because the Dashboard blocks do not use ports to make connections.
3. Add the contents of the dashboard.

In the dashboard for this model:

- Two Check Box blocks turn the fans and air recycling on and off.
- A Knob block sets the internal temperature.

- An Edit block allows you to specify the external temperature.
- A Dashboard Scope block displays the value of the internal temperature over time.
- A Linear Gauge block displays the instantaneous internal temperature value.
- A Display block shows the instantaneous internal temperature value.

You can use areas in the subsystem to group and label related controls and displays. For more information about creating areas, see “Box and Label Areas of a Model”.

Connect Blocks in the Model

To explore connections between each block in the Dashboard subsystem and the model, you can select a block in the dashboard, pause on the ellipsis that appears above it, and click Jump to Connected Element. The Simulink® editor navigates to and highlights the block or signal connected to that block in the dashboard.

The Check Box blocks connect to the `dist_req` and `recycle_air` constant blocks. In the `sldemo_auto_climatecontrol` model, the fan and air recycling signals are controlled by Manual Switch blocks with two Constant blocks as inputs.

To replace a Manual Switch block in the `sldemo_auto_climatecontrol` model with a Check Box block:

1. Delete the Manual Switch block and one of the Constant blocks.
2. Connect the other Constant block directly to the Mux block.
3. Specify a variable as the Constant block value.

This model uses the variable `dist_req` to control the fans and the variable `recycle_air` to control air recycling.

4. Click the Unrecognized functions or variables error, and create the variable in the Model Workspace.

Now, the variable `dist_req` holds the state of the fans.

5. Press Ctrl+D to update the diagram so the variable you just created is available for connection.
6. Connect the Check Box block to the `dist_req` variable.

Follow a similar process to replace the air recycling manual switch.

The Knob block connects to the `USet` parameter of the User Setpoint in Celsius masked subsystem. Similarly, the Edit block connects to the `x` parameter of the External Temperature in Celsius masked

subsystem. The Dashboard Scope, Linear Gauge, and Display blocks all connect to the output signal of the Kelvin to Celsius subsystem.

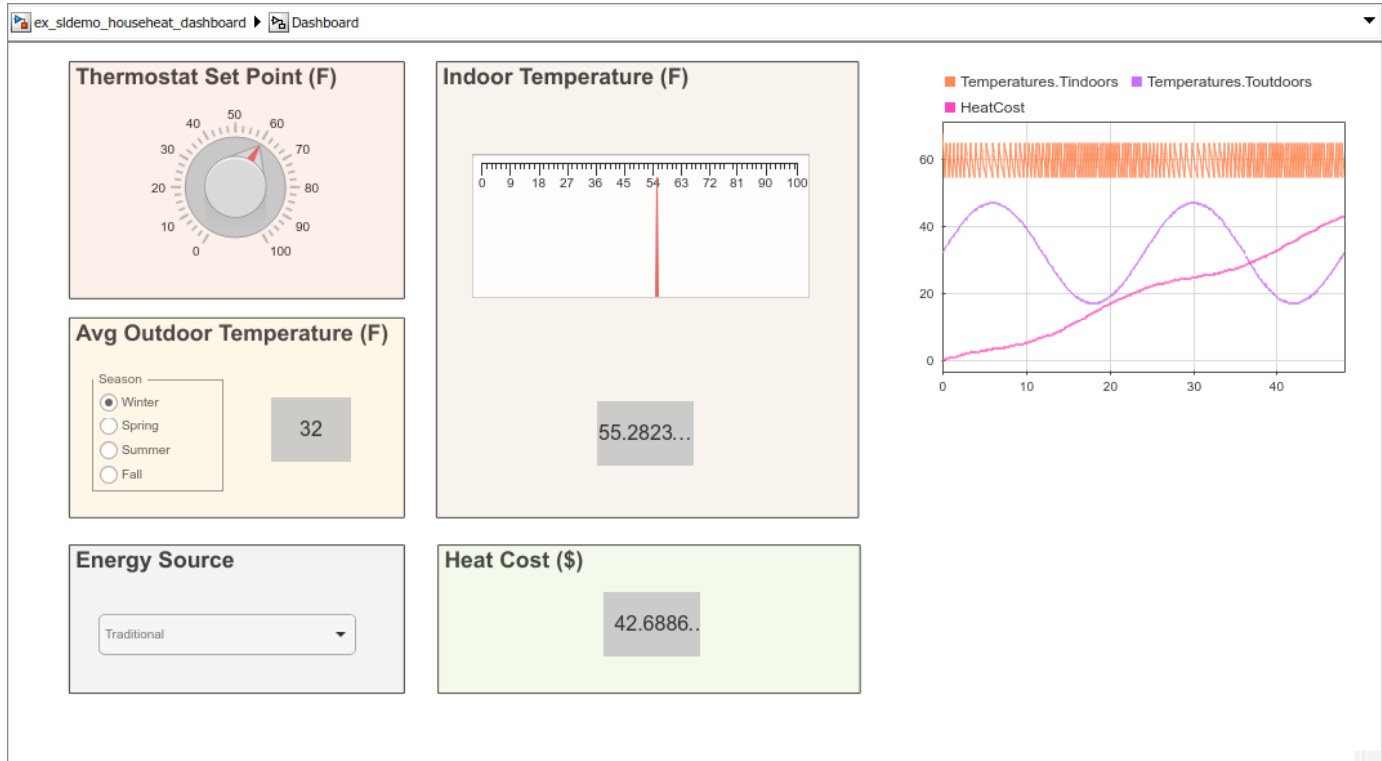

Interactive Simulation

This model uses simulation pacing to slow model execution so you can interact with the model during simulation. For more information, see “Simulation Pacing”.

Run the simulation. Use the Check Box blocks to control the fans and air recycling. Use the Knob block to adjust the internal temperature set point, and specify the external temperature with the Edit block. You can observe the resulting internal temperature on the Dashboard Scope block, the Linear Gauge block, and the Display block.

Interactively Simulate a Thermal Model of a House

This example uses a dashboard of controls and indicators to configure and then interactively simulate a thermal model of a house. You can configure the simulation to use either traditional or renewable energy sources and to use an outdoor temperature setpoint based on the season. During the simulation, you can adjust the thermostat and monitor the indoor temperature and heat cost. The model in this example adds a subsystem named Dashboard to the `sldemo_househeat` model. For more information about the underlying model, see “Thermal Model of a House” on page 14-22.

Build the Dashboard Subsystem

This model uses a Subsystem block to organize the controls and displays for the model in a single interface. To create the subsystem in this example:

1. Add a Subsystem block to the model.
2. Delete the prepopulated contents of the subsystem. A subsystem of Dashboard blocks does not require Inport or Outport blocks because Dashboard blocks do not use ports to make connections.
3. Add the components of the dashboard.

The dashboard for this model includes a Knob block, a Radio Button block, and a Combo Box block to modify simulation parameters. A Linear Gauge block, three Display blocks, and a Dashboard Scope block display key signals during simulation.

You can use areas in the subsystem to group and label related controls and displays. For more information about creating areas, see “Box and Label Areas of a Model”.

Connect Dashboard Blocks to the Model

To explore connections between each block in the Dashboard subsystem and the model, you can select a block in the dashboard, pause on the ellipsis that appears above it, and click Jump to Connected Element. The Simulink® editor navigates to and highlights the block or signal connected to that block in the dashboard.

- The Knob block connects to the Set Point block and allows you to adjust the thermostat set point in the model during simulation.
- The Radio Button Block connects to the Avg Outdoor Temp block and maps seasonal average temperatures for Boston, MA, to season labels. Right-click the Radio Button block and select Block Parameters from the context menu to modify the average temperature value used for each season.
- The Display block in the Avg Outdoor Temperature area shows the outdoor temperature value used in the simulation based on the selected season.
- The Combo Box block connects to the Gain block used to calculate the cost during simulation. Right-click the Combo Box block and select Block Parameters from the context menu to view or modify the cost, specified in units of cents per Joule.
- The Linear Scale and Display blocks in the Indoor Temperature area provide analog and digital indications of the instantaneous value of the house temperature during simulation.
- The Display block in the Heat Cost area shows the cumulative cost of heating the house over the course of the simulation is shown on a Display block.
- The Dashboard Scope block displays the heat cost, indoor temperature, and outdoor temperature in the same plot.

Interactively Simulate

This model uses simulation pacing to slow model execution so you can interact with the model during simulation. For more information, see “Simulation Pacing”.

The simulation is set up to run for 48 hours. Within that time period, it makes sense to use the Radio Button block and Combo Box block to configure a simulation for a particular season and energy source. If you want to run another type of simulation where you interactively modify the season or energy source, consider lengthening the simulation time to something more realistic for those types of changes.

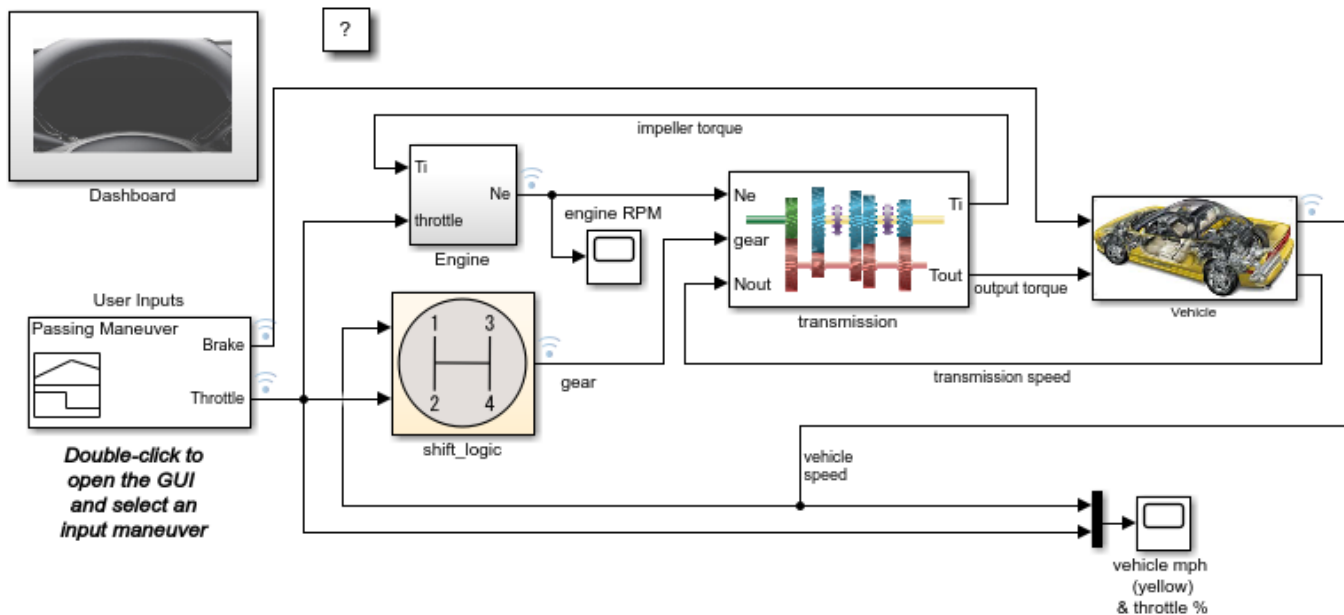

Choose the season and energy source for a 48-hour simulation, and then run the simulation. During the simulation, use the Knob block to adjust the set point for the house thermostat, and observe the effect of the change on the indoor temperature and heat cost.

Create a Realistic Dashboard Using the Custom Gauge Block

You can use the Custom Gauge block to create a dashboard of controls and indicators for your model that looks how it would in a real system.

Model Overview

This example model uses four Custom Gauge blocks and a MultiStateImage block to create a dashboard for the `sf_car` model like one you might see in a real car.

Explore the Model

To understand the connections between the Dashboard and model, you can select each block and jump to the signal it displays in the model. To jump to the connected signal, hover on the ellipsis that appears over the block when you select it. Then, click the arrow button.

The Custom Gauge block on the left represents the `vehicle speed` signal, acting as a speedometer on the dashboard and using the default Custom Gauge appearance and a value arc you can see when you simulate the model.

The Custom Gauge blocks at the top of the model display the throttle and brake signals. You can create this type of gauge by deleting the background image and needle image from the default Custom Gauge. Then, draw an arc and select colors for the tick marks, arc, and value arc.

The Custom Gauge block on the right displays the engine RPM signal on a custom gauge face. You can create a gauge like this by deleting the background image in the default Custom Gauge and uploading your own.

The MultiStateImage block on the bottom displays the gear signal using seven segment display style number images that correspond to the value of the gear signal.

Observe System During Simulation

You can use the dashboard to monitor the system response during simulation. The User Inputs subsystem includes several simulation inputs to model different vehicle maneuvers. To change the simulation input, navigate to the top level of the model and double-click the User Inputs subsystem. You can use the drop-down menu at the top of the gui to choose the vehicle action for the model to simulate. Choose between a passing maneuver, gradual acceleration, hard braking, and coasting. To monitor the system response during simulation, navigate back to the Dashboard subsystem and then press the play button to simulate the model.

Solve a Linear System of Algebraic Equations

Use the Algebraic Constraint block to solve the system

$$\begin{aligned} z_1 + z_2 &= 1 \\ z_2 - z_1 &= 1 \end{aligned}$$

The model represents the problem in a vectorized form as

$$\begin{bmatrix} 1 & 1 \\ -1 & 1 \end{bmatrix} \begin{bmatrix} z_1 \\ z_2 \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$

The signal fed to the Algebraic Constraint block $f(z)$ is a 2×1 vector of the form

$$\begin{bmatrix} z_1 + z_2 - 1 \\ -z_1 - 1 + z_2 - 1 \end{bmatrix}$$

The block is configured to constrain $f(z)$ to 0. Thus solving for $f(z) = 0$ yields the solution $z_1 = 0, z_2 = 1$

Model a Planar Pendulum

Consider a point mass m suspended by a massless rod of length l under the influence of gravity. The position of the mass can be expressed in Cartesian coordinates by (x,y) .

Modeling the System

A force balance of the mass gives the equations of motion in the x and y directions.

$$m\ddot{x} = F \sin \theta \quad (1)$$

$$m\ddot{y} + F \cos \theta = -mg \quad (2)$$

Let (u, v) be the velocities in (x, y) respectively. The system can be rewritten as a system of first order ODEs

$$\dot{x} = u \quad (3)$$

$$\dot{u} = -F \frac{x}{ml} \quad (4)$$

$$\dot{y} = v \quad (5)$$

$$\dot{v} = -F \frac{y}{ml} - g \quad (6)$$

where F is the tension in the rod. The system also possesses the geometric constraint

$$x^2 + y^2 = l^2 \quad (7)$$

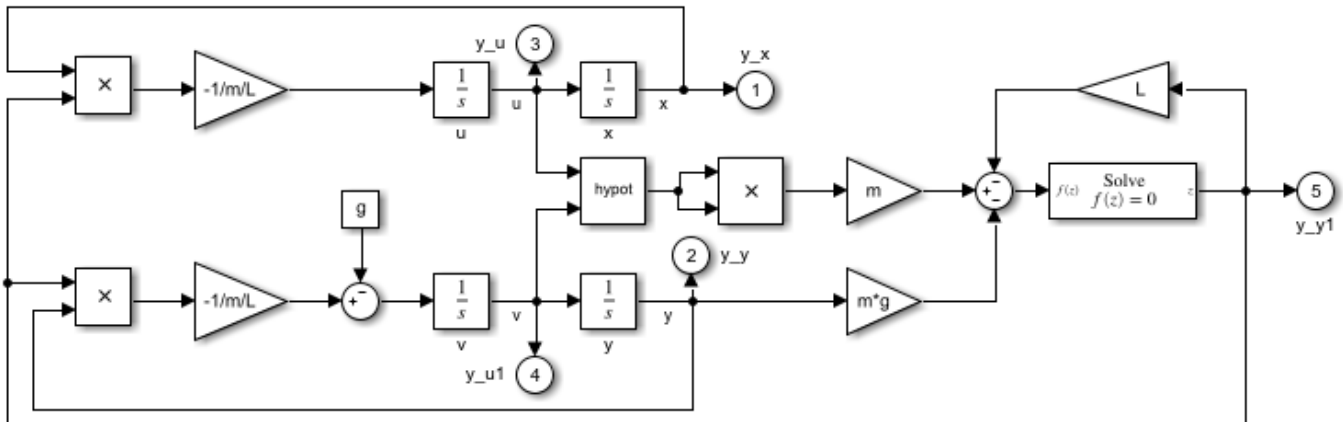

Differentiate (7) twice with respect to time t to arrive at

$$m(u^2 + v^2) - Fl - mgy = 0 \quad (8)$$

This relationship is useful since it allows F to be determined at every step for use in modeling the kinematics of the system.

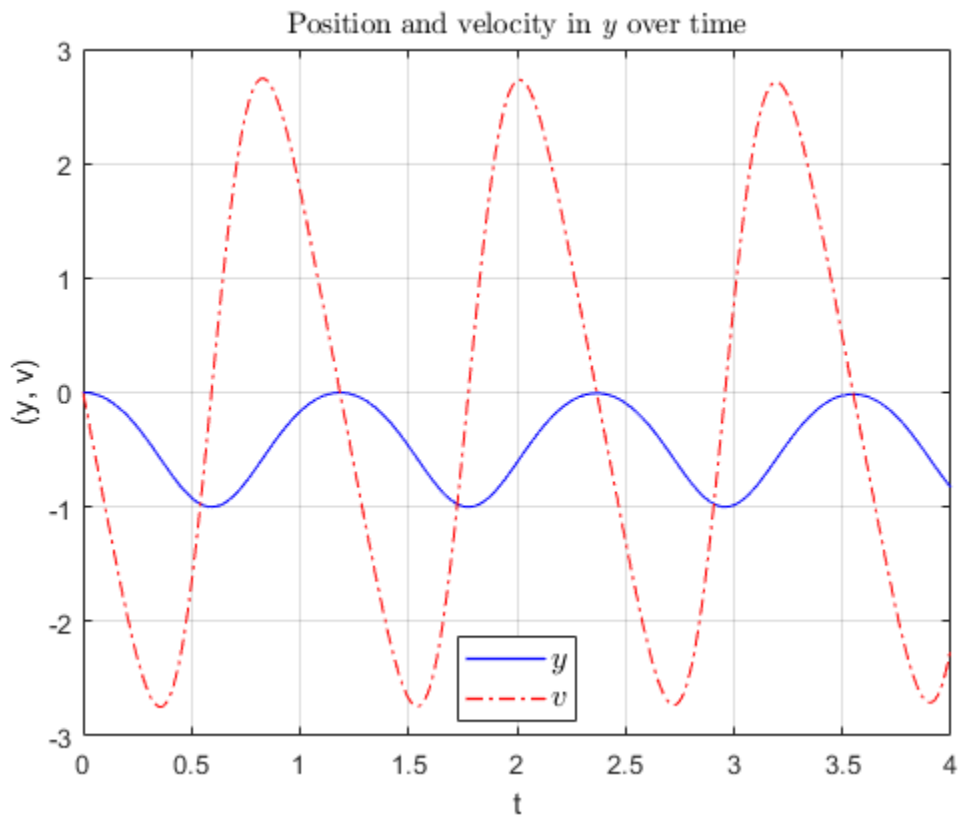

Simulating the System

The system is simulated as shown in the figure below

Equation (8) contains one unknown F and is of the form $f(z) = 0$ where $f(z) = m(u^2 + v^2) - Fl - mgy$. The Algebraic Constraint block constrains $f(z)$ to 0 and solves for F in accordance with (8).

Improved Linearization with Transfer Fcn Blocks

The Laplace domain transfer function for the operation of differentiation is:

$$\frac{Y(s)}{X(s)} = s$$

This equation is not a proper transfer function, nor does it have a state-space representation. As such, the Simulink software linearizes this block as an effective gain of 0 unless you explicitly specify that a proper first-order transfer function should be used to approximate the linear behavior of this block.

To improve linearization, you can also try to incorporate the derivative term in other blocks. For example, if you have a Derivative block in series with a Transfer Fcn block, try using a single Transfer Fcn block of the form

$$\frac{s}{s+a}$$

For example, you can replace the first set of blocks in this figure with the blocks below them:

View Dead Zone Output on Sine Wave

This example shows the effect of the Dead Zone block on a sine wave. The model uses a dead zone lower limit of -0.5 and an upper limit as 0.5 . Set these values through the parameters **Start of Dead Zone** and **End of Dead Zone**.

View Backlash Output on Sine Wave

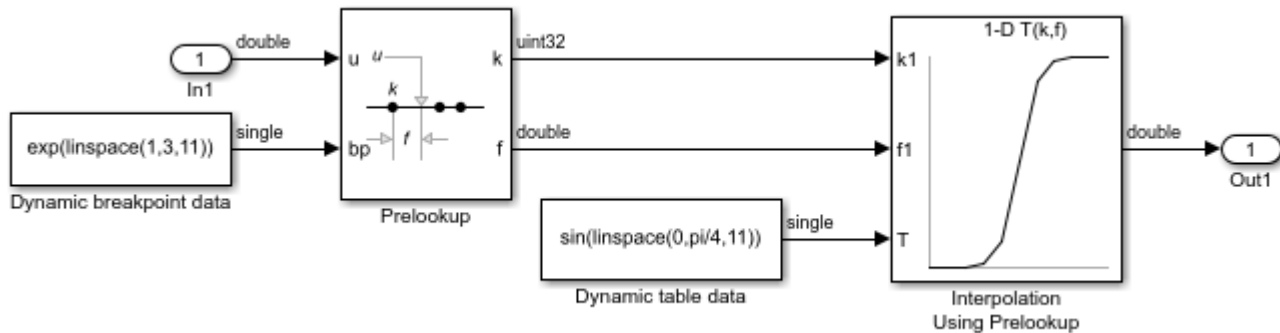

This example shows the effect of the Backlash block on a sine wave using default parameters. The initial **Deadband width** is 1 and the **Initial output** is 0.

The initial deadband is centered around 0 and has a width of 1, which extends .5 in each direction. The output from the Backlash block begins at 0 and does not change until the input reaches the edge of the deadzone at .5. Then the output engages in a positive direction and changes an equal amount as the input. After the input reaches a value of 1, it starts moving in a negative direction. At this point the output disengages and stays flat until the input passes through the deadband width of 1. Once the input reaches the end of the deadband zone at 0, then the output engages and starts moving in a negative direction with the input.

Prelookup With External Breakpoint Specification

This example shows how to feed a breakpoint dataset from a Constant block to the bp input port of the Prelookup block.

The Prelookup block inherits the following breakpoint attributes from the bp input port:

- **Minimum:** Inf
- **Maximum:** Inf
- **Data type:** single

Similarly, a Constant block feeds the table data values to the T input port of the Interpolation Using Prelookup block, which inherits the following attributes:

- **Minimum:** Inf
- **Maximum:** Inf
- **Data type:** single

Simulink® uses double-precision, floating-point data to perform the computations in this model. However, the model stores the breakpoint and table data as single-precision, floating-point data. Using a lower-precision data type to store breakpoint and table data reduces the memory requirement.

Prelookup with Evenly Spaced Breakpoints

This example shows how to specify evenly spaced breakpoint data in the Prelookup block.

In the **Breakpoints data** section, the **Specification** parameter is set to `Even spacing`. The parameters **First point**, **Spacing**, and **Number of points** are set to 25, 12, and 4 respectively. Specifying these parameters creates four evenly spaced breakpoints: [25, 37, 49, 61].

An alternative way to specify evenly spaced breakpoints is to set **Specification** to `Explicit values` and set **Value** to [25:12:61].

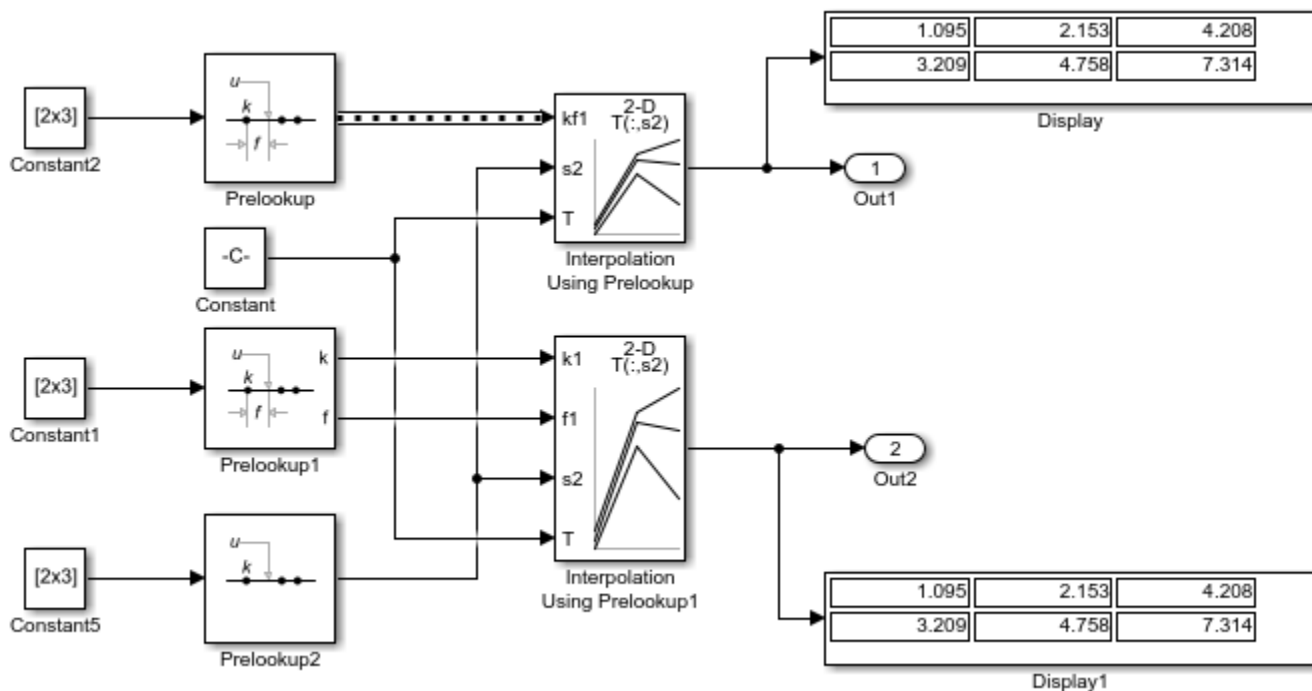

Simulink® uses double-precision, floating-point data to perform the computations in this model. However, the model stores the breakpoints and table data as double.

Configure the Prelookup Block to Output Index and Fraction as a Bus

This example shows how to output a bus containing the index (k) and fraction (f) from the Prelookup block. The bus object can then be used as an input to the Interpolation Using Prelookup block. The example also shows how to get the same results without using a bus object.

Open and simulate the model.

At the top of the model, open the dialog box for the Prelookup block. In the **Main** tab, note that **Output selection** is set to Index and fraction as bus. In the **Data Types** tab, note that **Output** is set to Bus: myBus. In the Simulink® Editor, select **Modeling>Model Settings>Model Properties** and open the **Callbacks** tab. In the model's PreLoadFcn, the code defines the bus object myBus, which specifies the index as the first bus element and the fraction as the second element.

Open the dialog box for the Interpolation Using Prelookup block. In the **Main** tab, note that **Require index and fraction as bus** check box is selected. That option configures the block to use the bus output from the Prelookup block.

Approximating the sinh Function Using the Lookup Table Dynamic Block

This example shows how to use the Lookup Table Dynamic block to approximate the \sinh function. The breakpoint data is given by the vector $[-5:5]$ and the table data is given by the vector $\sinh([-5:5])$. The input x is provided by the Constant block as a 1-by-3 vector containing values that are below, within, and above the breakpoint data values.

To see how each lookup method handles input values that are below, within, and above the breakpoint data values, change the value of the **Lookup Method** parameter on the Lookup Table Dynamic block.

The Lookup Table Dynamic block outputs the following values when using the specified lookup methods and inputs.

Lookup Method	Input	Output	Comment
Interpolation-Extrapolation	1.4	2.156	N/A
	5.2	83.59	N/A
Interpolation-Use End Values	1.4	2.156	N/A
	5.2	74.2	The block uses the value for $\sinh(5.0)$.
Use Input Above	1.4	3.627	The block uses the value for $\sinh(2.0)$.
	5.2	74.2	The block uses the value for $\sinh(5.0)$.
Use Input Below	1.4	1.175	The block uses the value for $\sinh(1.0)$.
	-5.2	-74.2	The block uses the value for $\sinh(-5.0)$.
Use Input Nearest	1.4	1.175	The block uses the value for $\sinh(1.0)$.

Create a Logarithm Lookup Table

This example shows how to use the n-D Lookup Table block to create a logarithm lookup table. The lookup table allows you to approximate the common logarithm (base 10) over the input range [1,10] without performing an expensive computation.

Providing Table Data as an Input to the Direct Lookup Table Block

This example shows how to provide table data as an input to the Direct Lookup Table block. In the following model, `a` is a 4-D array of linearly increasing values that you define with the following model preload function:

```
a = reshape(1:2800, [4 5 20 7]);
```

When you run the model, you get the following results:

The block labeled TableData feeds a 4-D array to the Direct Lookup Table (n-D) block, with a data type of double. Because the Direct Lookup Table (n-D) block uses zero-based indexing, the output is:

```
a(:,2,4,3)
```

The output has the same data type as the table data input signal: double.

Specifying Table Data in the Direct Lookup Table Block Dialog Box

This example shows how to specify table data on the dialog box of the Direct Lookup Table (n-D) block. In the following model, the table data is a 4-D array of linearly increasing values that you define with the following model preload function:

```
a = reshape(1:2800, [4 5 20 7]);
```

When you run the model, you get the following results:

Because the Direct Lookup Table (n-D) block uses zero-based indexing, the output is:

```
a(:,2,4,3)
```

The output data type matches the Direct Lookup Table block's **Table data type**, which is set to `int16`.

Using the Quantizer and Saturation blocks in sldemo_boiler

This example shows how the Quantizer and Saturation blocks are used in the model ex_sldemo_boiler. The ADC subsystem digitizes the input analog voltage by:

- Multiplying the analog voltage by 256/5 with the Gain block
- Rounding the value to integer floor with the Quantizer block
- Limiting the output to a maximum of 255 (the largest unsigned 8-bit integer value) with the Saturation block

This subsystem models a typical 8-bit analog-to-digital converter having an input range of 0-5 volts

Scalar Expansion with the Coulomb and Viscous Friction Block

This example shows a model with a scalar input to a Coulomb & Viscous Friction block that uses scalar expansion to output a vector.

Double click the friction block to see the parameters. **Coefficient of viscous friction (Gain)** is a scalar value 2, but **Coulomb friction value (Offset)** is a vector value [1 3 2 0]. Therefore, the block uses element-wise scalar expansion to compute the output.

Each output is calculated using this formula.

$$y = \text{sign}(x) .* (\text{Gain} .* \text{abs}(x) + \text{Offset})$$

For example, the first offset 1 is calculated as follows.

$$y = - * ((2 * 5) + 1)$$

$$y = -11$$

If the dimensions for the input and Offset are the same, then no expansion is necessary.

Sum Block Reorders Inputs

This example shows how the Sum block reorders inputs. If you use a - sign as the first operation, the block reorders the inputs, if possible, to use a + operation. For example, in the expression $\text{output} = -a - b + c$, the Sum block reorders the input so that $\text{output} = c - a - b$. To initialize the accumulator, the Sum block uses the first + input port.

The block avoids performing a unary minus operation on the first operand a because doing so can change the value of a for fixed-point data types. In that case, the output value differs from the result of accumulating the values for a , b , and c .

Both the constant inputs use `int8` data types. The Sum block also uses `int8` for the accumulator and output data types and has **Saturate on integer overflow** turned on. The Sum block reorders the inputs to give the ideal result of 127.

- 1 Reorders inputs from $(-Input1 + Input2)$ to $(Input2 - Input1)$.
- 2 Initializes the accumulator by using the first + input port. $Accumulator = \text{int8}(-1) = -1$
- 3 Continues to accumulate values. $Accumulator = Accumulator - \text{int8}(-128) = 127$
- 4 Calculates the block output. $Output = \text{int8}(127) = 127$

If the Sum block does not reorder the inputs, then you get the nonideal result of 126.

- 1 Initializes the accumulator by using the first input port. $Accumulator = \text{int8}(-(-128)) = 127$
- 2 Because saturation is on, the initial value of the accumulator saturates at 127 and does not wrap.
- 3 Continues to accumulate values. $Accumulator = Accumulator + \text{int8}(-1) = 126$
- 4 Calculates the block output. $Output = \text{int8}(126) = 126$

To explicitly specify a unary minus operation for $\text{output} = -a - b + c$, you can use the Unary Minus block in the Math Operations library.

Iterated Assignment with the Assignment Block

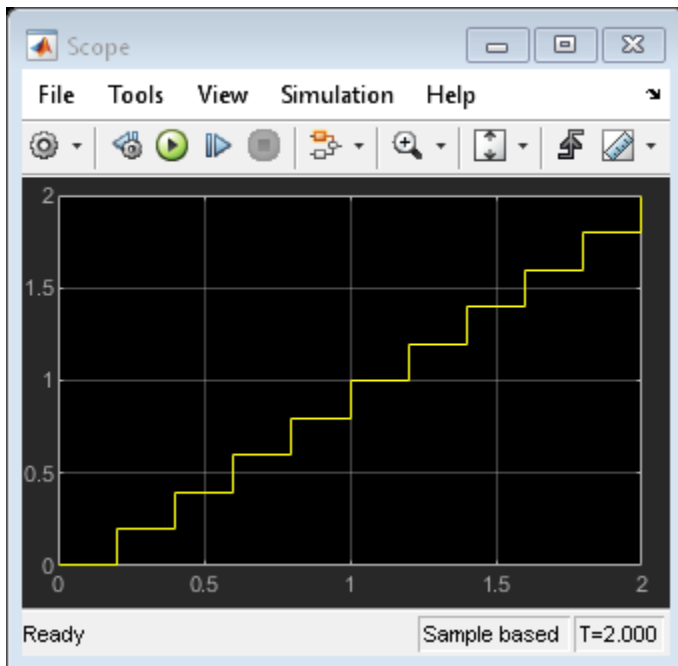

This example shows using the Assignment block to assign values computed in a For or While Iterator loop to successive elements. You can use vector, matrix or multidimensional signals and do the assignment in a single time step. In this model, the For Iterator block creates a vector signal each of whose elements equals $3 * i$ where i is the index of the element.

The iterator generates indices for the Assignment block. On the first iteration, the Assignment block copies the first input (Y0) to the output (Y) and assigns the second input (U) to the output Y(E1). On successive iterations, the Assignment block assigns the current value of U to Y(Ei), that is, without first copying Y0 to Y. These actions occur in a single time step.

View Sample Time Using the Digital Clock Block

This example shows how to view the simulation sample time at a specified sampling interval using the Digital Clock block. In this model, the Scope shows the output of a Digital Clock block with the **Sample time** set to 0.2.

In this configuration, the Digital Clock block outputs the simulation time every 0.2 seconds. Otherwise, the block holds the output at the previous value.

Bit Specification Using a Positive Integer

This example shows how to specify the **Number of bits** in the Counter Free-Running block as a positive integer.

At $t = 255$, the counter reaches the maximum value of $(2^8) - 1$. If you increase the stop time of the simulation to 256, the counter wraps to zero.

Bit Specification Using an Unsigned Integer Expression

This example shows how to specify the **Number of bits** in the Counter Free-Running block as an unsigned integer expression.

At $t = 254$, the counter reaches the maximum value of $\text{uint8}(2^{(\text{uint8}(8))} - 1)$. If you increase the stop time of the simulation to 255, the counter wraps to zero.

Track Running Minimum Value of Chirp Signal

This example shows how to track the running minimum value of a signal generated by the Chirp Signal block.

The Chirp Signal block generates a sine wave whose frequency increases at a linear rate with time. The MinMax Running Resettable block tracks the minimum value of that chirp signal over time. The running minimum value is reset every 5 seconds by the Pulse Generator block.

Horizontal Matrix Concatenation

This example shows how to perform a horizontal matrix concatenation with the Matrix Concatenate block. When you set the **Concatenate dimension** parameter to 2 and the inputs are 2-D matrices, the block performs horizontal matrix concatenation and places the input matrices side-by-side to create the output matrix.

Vertical Matrix Concatenation

This example shows how to perform a vertical matrix concatenation with the Matrix Concatenate block. When you set the **Concatenate dimension** parameter to 1 and the inputs are 2-D matrices, the block performs vertical matrix concatenation and places the input matrices on top of each other to create the output matrix.

Multidimensional Matrix Concatenation

This example shows how to perform multidimensional matrix concatenation with the Matrix Concatenate block. When you set the **Concatenate dimension** parameter to 3 and the inputs are 2-D matrices, the block performs multidimensional matrix concatenation.

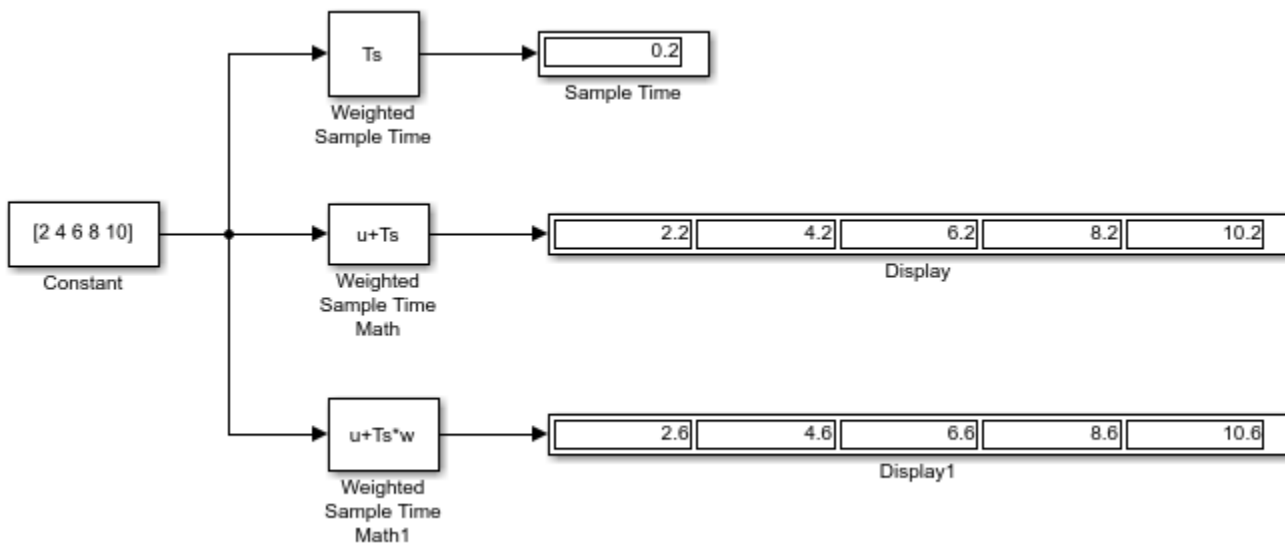

Unary Minus of Matrix Input

This example shows how to compute the unary minus of a matrix input.

Sample Time Math Operations Using the Weighted Sample Time Math Block

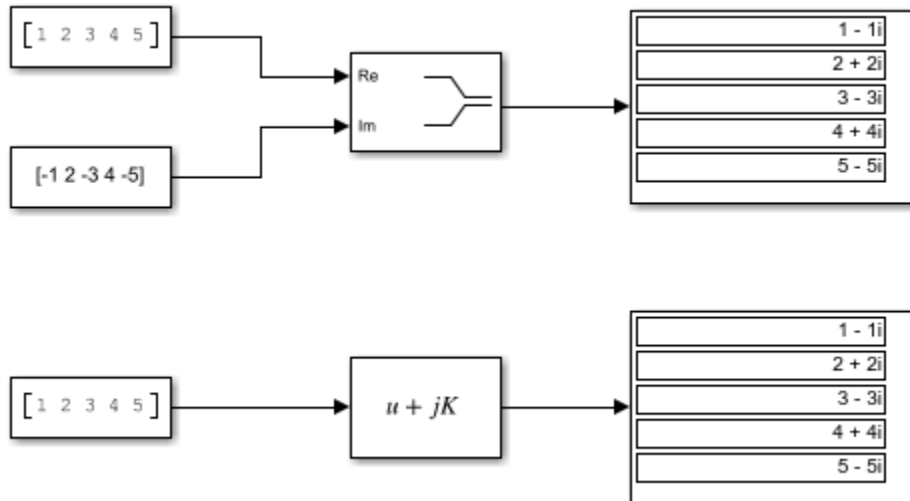

This example shows how to add the sample time value to a signal using the Weighted Sample Time Math block.

Using the Weighted Sample Time block, you can see the sample time of this model is 0.2 . When you set the **Operation** parameter to $+$ and the **Weight value** to 1 on the Weighted Sample Time Math block, the block adds the sample time value of 0.2 to the input signal. When you set the **Weight value** to 3 in the Weighted Sample Time Math1 block, the block adds $T_s \times 3$ to the input signal, thus increasing each value by 0.6 .

Construct Complex Signal from Real and Imaginary Parts

This example shows how to use the Real-Imag to Complex block to construct a complex-valued signal from real and imaginary parts. You can provide both the real and imaginary parts as block inputs, or provide one value as an input, and the other on the block dialog box.

Construct Complex Signal from Magnitude and Phase Angle

This example shows how to use the Magnitude-Angle to Complex block to construct a complex-valued signal. You can provide both the magnitude and phase angle as block inputs, or provide one value as an input, and the other on the block dialog box.

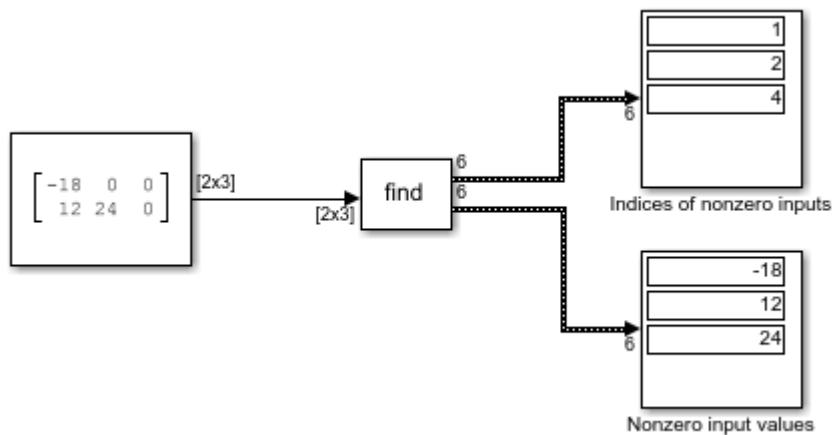

Find Nonzero Elements in an Array

This example shows how to use the Find block to find nonzero elements in an array. In the following model, the block is configured to output both the one-based linear index and the value of each nonzero element.

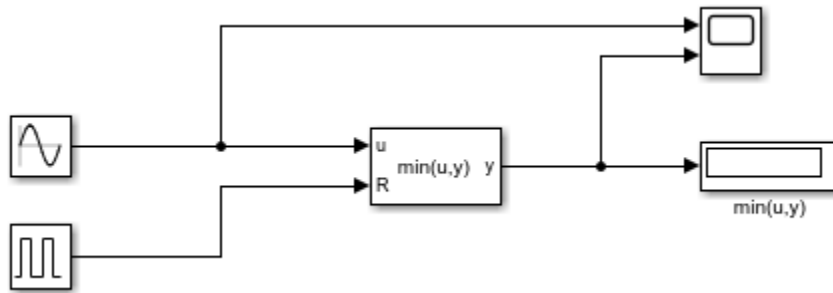

ans =

```
Simulink.SimulationOutput:  
    tout: [51x1 double]  
  
SimulationMetadata: [1x1 Simulink.SimulationMetadata]  
ErrorMessage: [0x0 char]
```

Calculate the Running Minimum Value with the MinMax Running Resettable Block

This example shows how to use the MinMax Running Resettable block to calculate the running minimum value. To watch how the running minimum value changes at each time step, you can use the Step Forward button to advance the simulation one step at a time.

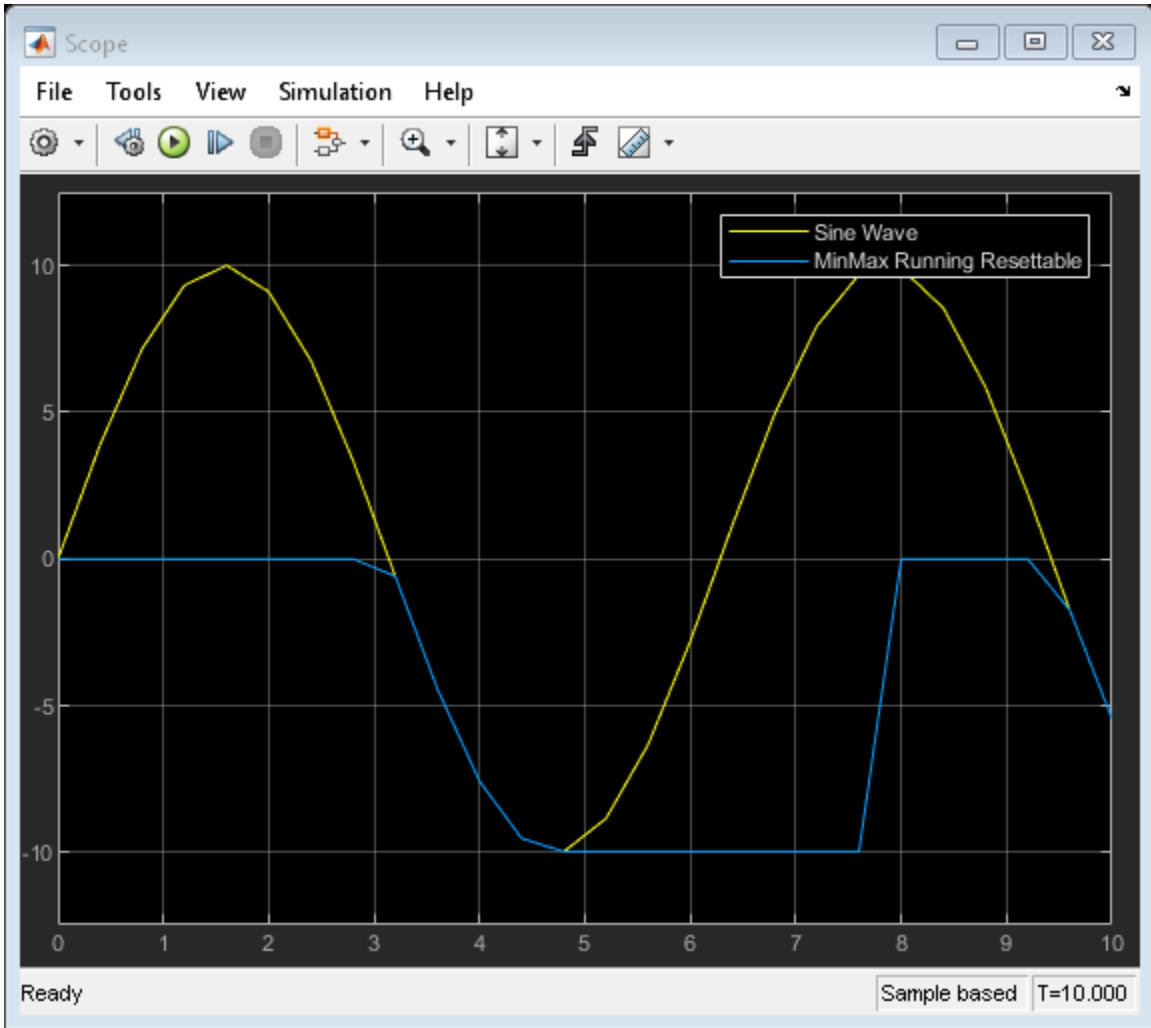

After running the full simulation, you can view the results in the Scope. The initial value of the running minimum is 0. It begins tracking the Sine Wave signal when the sine wave values turn negative. When the MinMax Running Resettable block receives a reset signal at $T=8$, the block resets the running minimum value to 0. The running minimum value tracks at 0 for a few time steps, until the sine wave values turn negative again.

ans =

```
Simulink.SimulationOutput:
      tout: [26x1 double]

SimulationMetadata: [1x1 Simulink.SimulationMetadata]
      ErrorMessage: [0x0 char]
```

Find Maximum Value of Input

This example shows how to use the MinMax block to output the maximum value of two sine waves.

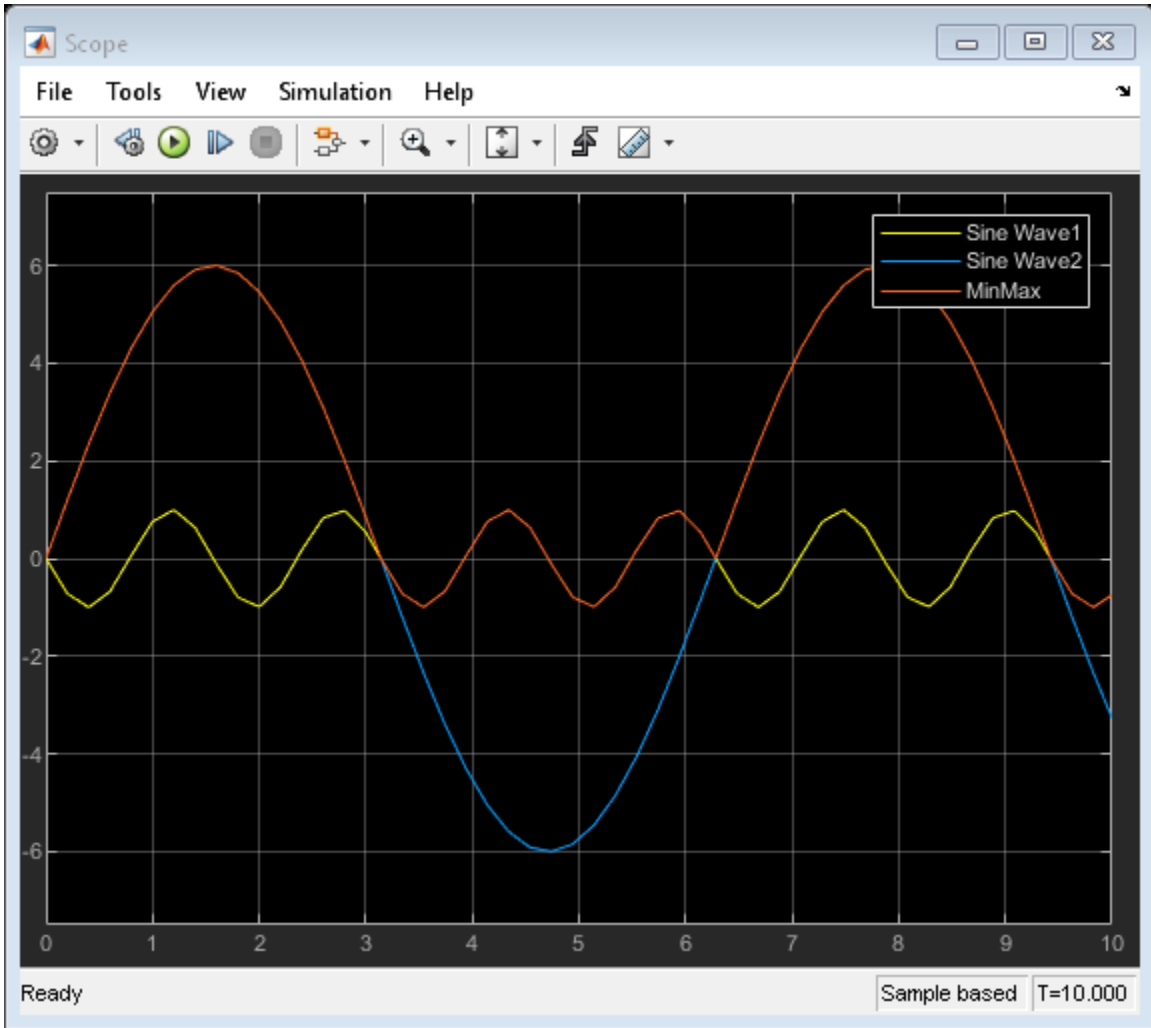

After running the full simulation, you can view the results in the Scope. Initially, the maximum value (orange line) tracks SineWave2. When the SineWave2 values turn negative, the maximum value begins tracking SineWave1. When the SineWave2 values become positive again, the maximum value resumes tracking SineWave2.

ans =

```
Simulink.SimulationOutput:
      tout: [57x1 double]

SimulationMetadata: [1x1 Simulink.SimulationMetadata]
  ErrorMessage: [0x0 char]
```

Permute Array Dimensions

This example shows how to use the Permute Dimensions block to permute the first and third dimensions of a 3-by-4-by-5 input array.

When you set the **Order** parameter to `[3, 2, 1]`, the block permutes the first and third dimensions, and outputs a 5-by-4-by-3 array.

Multiply Inputs of Different Dimensions with the Product Block

This example shows how to perform element-wise (`.*`) multiplication of inputs using the Product block. In this example, the Product block multiplies two scalars, a scalar and a vector, and two 2x2 matrices.

Multiply and Divide Inputs Using the Product Block

This example shows how to multiply and divide several input signals using the Product block.

Divide Inputs of Different Dimensions Using the Divide Block

This example shows how to perform element-wise (\cdot *) division of two inputs using the Divide block. In this example, the Divide block divides two scalars, a vector by a scalar, a scalar by a vector, and two matrices.

Complex Division Using the Product of Elements Block

This example shows how to perform element-wise complex division using the Product of Elements block.

The top Product of Elements block collapses the matrix input to a scalar by taking successive inverses of the four elements:

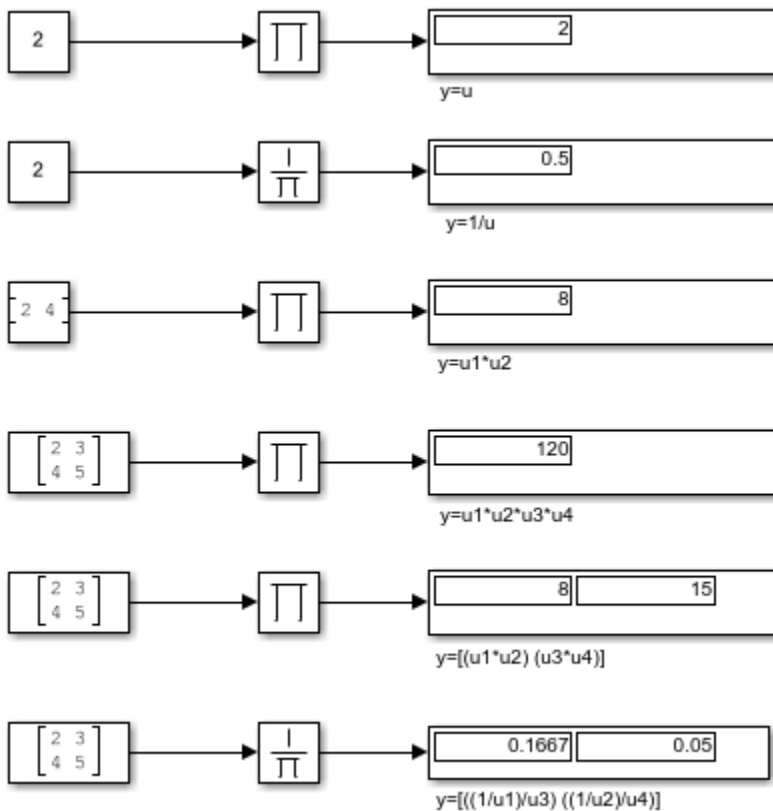

- $y = (((1/2+i)/3)/4-i)/5$

The bottom Product of Elements block collapses the matrix input to a vector by taking successive inverses along the second dimension:

- $y(1) = ((1/2+i)/3)$
- $y(2) = ((1/4-i)/5)$

Element-Wise Multiplication and Division Using the Product of Elements Block

This example shows how to use the Product of Elements block to perform element-wise multiplication and division of inputs.

sin Function with Floating-Point Input

This example shows how to use the Trigonometric Function block to compute the sine of a floating-point input. The output of the Trigonometric Function block has the same data type as the input because the input data type is floating-point and the **Approximation method** is none.

sincos Function with Fixed-Point Input

This example shows how to use the Trigonometric Function block to compute the CORDIC approximation of `sincos` for a fixed-point input signal.

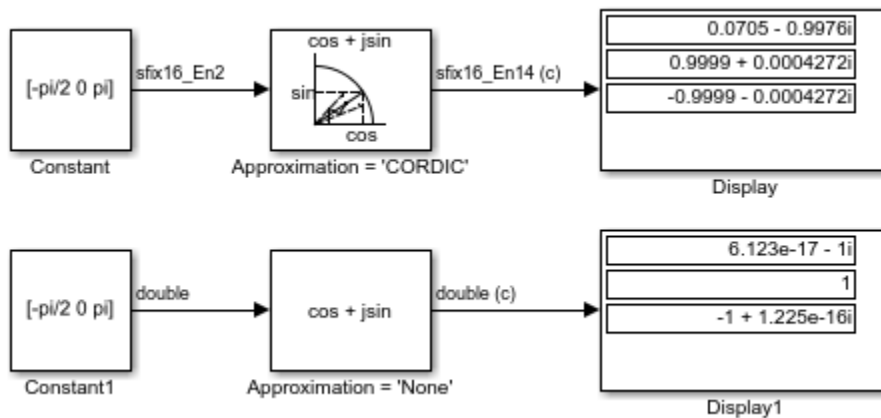

The Trigonometric Function block parameters are:

- **Function:** `sincos`
- **Approximation method:** CORDIC
- **Number of iterations:** 11

When using the CORDIC approximation method, the input to the Trigonometric Function block must be in the range $[-2\pi, 2\pi)$. The output type of the Trigonometric Function block is `fixdt(1, 13, 11)` because the input is a fixed-point signal and the **Approximation method** is set to CORDIC. The output fraction length equals the input word length minus two.

Trigonometric Function Block Behavior for Complex Exponential Output

This example compares the complex exponential output for two different configurations of the Trigonometric Function block.

When the **Approximation method** is CORDIC, the input data type can be fixed point, in this case: `fixdt(1,16,2)`. The output data type is `fixdt(1,16,14)` because the output fraction length equals the input word length minus two.

When the **Approximation method** is None, the input data type must be floating point. The output data type is the same as the input data type.

Create Bus Object from Constant Block

This example shows how a single Constant block can replace the six Constant blocks that model `ex_bus_initial_conditions` uses to create a bus object.

```
load_system('ex_constantbus');
out = sim('ex_constantbus');
open_system('ex_constantbus');
```

Verify that the output from the Constant block reflects the values from the `constant_value_struct`.

```
constant_value_struct
```

```
constant_value_struct =
```

```
struct with fields:
```

```
  A: [1x1 struct]
```

```
  B: 5
```

```
  C: [1x1 struct]
```

Examine the logged data in the `logout` variable, focusing on the A1 bus signal. The `constant_value_struct` structure sets the B element to 5.

```
out.logout.get('A1').Values.B.Data(1)
```

```
ans =
```

```
    5
```

Control Algorithm Execution Using Enumerated Signal

This example shows how to use a signal of an enumerated data type to control the execution of a block algorithm. For basic information about using enumerated data types in models, see “Use Enumerated Data in Simulink Models”.

Define Enumerated Type

Copy the enumerated type definition `ex_SwitchCase_MyColors` into a script file in your current folder.

```
classdef ex_SwitchCase_MyColors < Simulink.IntEnumType
    enumeration
        Red(0)
        Yellow(1)
        Blue(2)
        Mauve(3)
    end
end
```

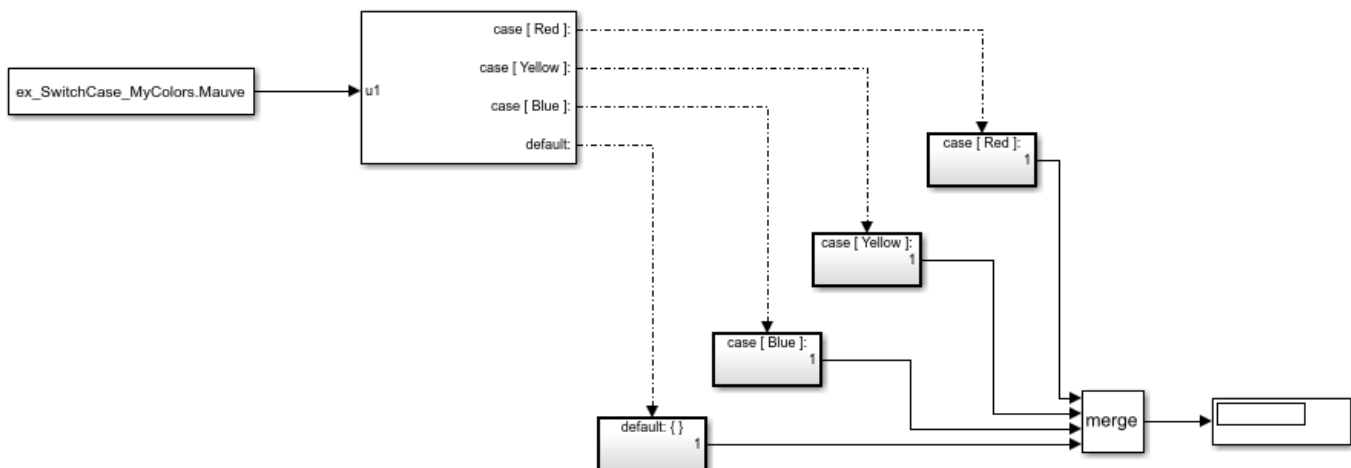

Alternatively, you can use the function `Simulink.defineIntEnumType` to define the type.

```
Simulink.defineIntEnumType('ex_SwitchCase_MyColors',...
    {'Red','Yellow','Blue','Mauve'},[0;1;2;3])
```

Explore Example Model

Open the example model `ex_enum_switch_case`.

```
open_system('ex_enum_switch_case')
```

Open the Enumerated Constant block dialog box. The constant output value is `ex_SwitchCase_MyColors.Blue`.

Open the Switch Case block dialog box. The **Case conditions** box is specified as a cell array containing three of the four possible enumeration members. The block has four outputs corresponding to the three specified enumeration members and a default case.

Open the Switch Case Action Subsystem blocks. The subsystems each contain a Constant block that uses a different constant value.

Control Execution During Simulation

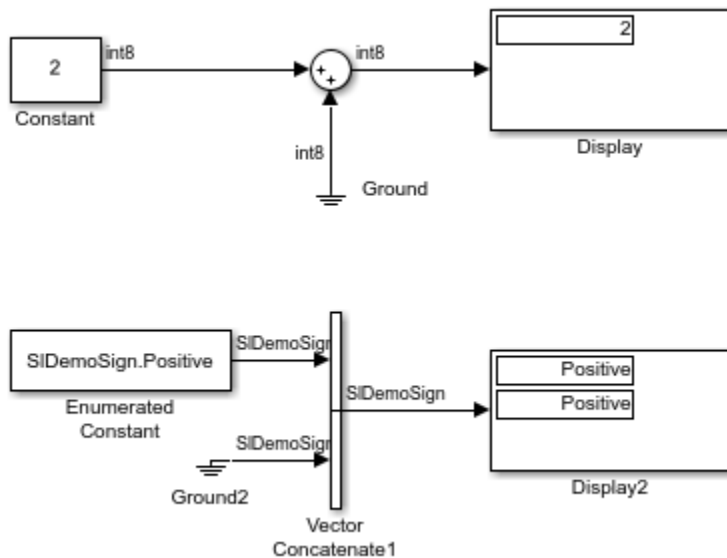

Simulate the model. The Display block shows the value 5, which corresponds to the case `ex_SwitchCase_MyColors.Blue`.

In the Enumerated Constant block dialog box, specify **Value** as `ex_SwitchCase_MyColors.Red` and click **Apply**. The Display block shows 19.

Specify **Value** as `ex_SwitchCase_MyColors.Mauve` and click **Apply**. The Display block shows 3, which corresponds to the default case.

Integer and Enumerated Data Type Support in the Ground Block

This example shows how to use the Ground block to ground block input ports that have integer and enumerated data types. In top row of this example, the output of the Constant block determines the data type (`int8`) of the port to which the Ground block is connected. That port determines the output data type of the Ground block, and the Ground block outputs a signal with zero value, and data type `int8`.

In the bottom row of this example, the Ground block is connected to a port with an enumerated data type. For enumerated data types, the Ground block outputs the default value of the enumeration. This behavior applies whether or not:

- The enumeration can represent zero
- The default value of the enumeration is zero

If the enumerated type does not have a default value, the Ground block outputs the first enumeration value in the type definition.

Fixed-Point Data Type Support in the Ground Block

This example shows how to use the Ground block to ground block input ports that have fixed-point data types. The top row of this example illustrates the Ground block behavior when the fixed-point data type can represent zero. In that case, the Ground block outputs a signal with zero value, and the same fixed-point data type as the port it is connected to.

In the bottom row of this example, the output of the Constant block determines the data type of the port to which the Ground block is connected (`fixdt(0,8,1,1)`). Because zero cannot be represented exactly by the data type `fixdt(0,8,1,1)`, the Ground block outputs a nonzero value that is the closest possible value to zero (in this case, 1).

Read 1-D Array and Structure From Workspace

This example shows how to read 1-D signals from the MATLAB workspace. When you open the model, the following code is executed by a PreLoadFcn callback:

```
t = 0.2 * [0:49]';  
x = sin(t);  
y = 10*sin(t);  
wave.time = t;  
wave.signals.values = [x,y];  
wave.signals.dimensions = 2;
```

In the top row of the model, the From Workspace block reads the array [t, x, y] from the MATLAB workspace.

In the bottom row of the model, the From Workspace block reads the same values from the workspace, but this time they are read from a structure named `wave`.

Read Structure From Workspace Using Model Sample Time

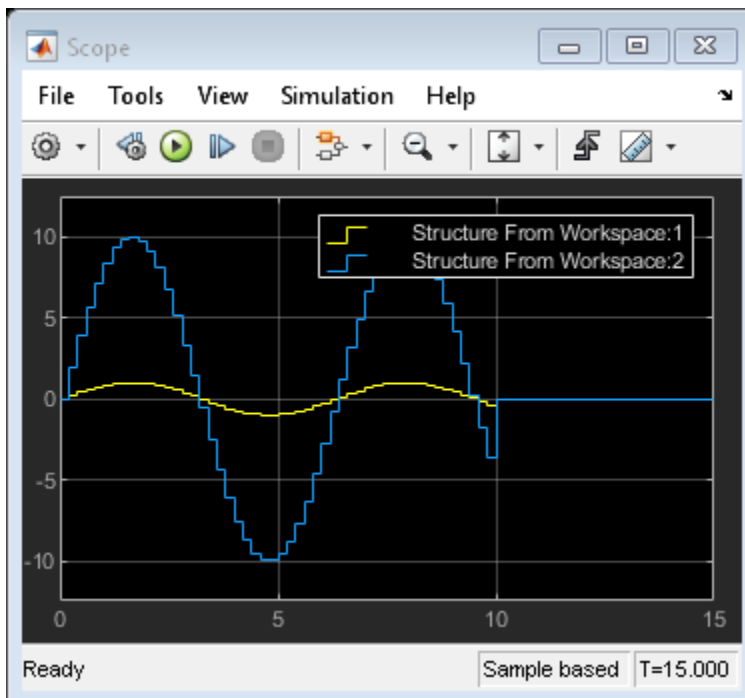

This example shows how to read a structure from the MATLAB workspace using a sample time specified in the From Workspace block. When you open the model, the following code is executed by a PreLoadFcn callback:

```
t = 0.2 * [0:49]';
x = sin(t);
y = 10*sin(t);
wave.time = [];
wave.signals.values = [x,y];
wave.signals.dimensions = 2;
```

The From Workspace block is configured as follows:

- **Sample time:** 0.2
- **Interpolate data:** off
- **Form output after final data value by:** Setting to zero

When you run the model, the From Workspace block reads the structure wave from the workspace. After the last time hit for which workspace data is available, the block outputs 0.

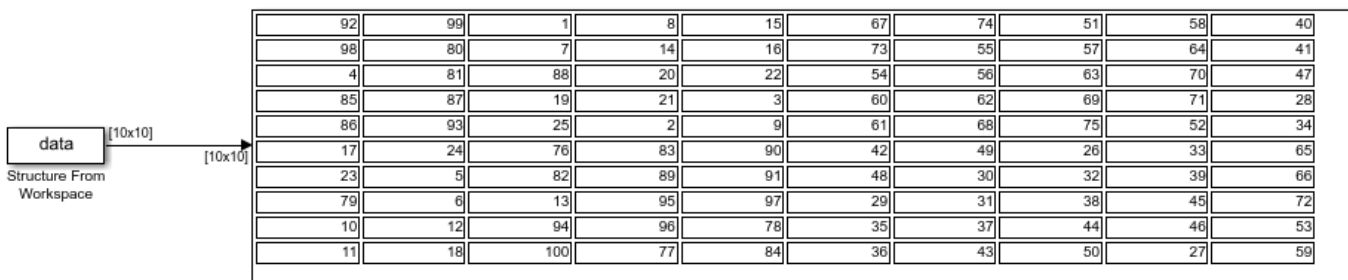

Read 2-D Signals in Structure Format From Workspace

This example shows how to read a 2-D structure from the MATLAB workspace. When you open the model, the following code is executed by a PreLoadFcn callback:

```
t1 = 0.2 * [0:49]';
m = magic(10);
M = repmat(m,[1 1 length(t1)]);
data.time=t1;
data.signals.values = M;
data.signals.dimensions=[10 10];
```

This code creates 10-by-10 matrix (2-D signal) by using the `magic` function, and then creates a 3-D matrix by adding a time vector. The time vector must be a column vector. The `signals.values` field is a 3-D matrix where the third dimension corresponds to time. The `signals.dimensions` field is a two-element vector. The first element is the number of rows and the second element is the number of columns in the `signals.values` field.

When you run the model, the From Workspace block reads the structure `data` from the workspace.

From File Block Loading Timeseries Data

Create a MATLAB® `timeseries` object with time and signal values. Save the `timeseries` object to a MAT-file and load into a model using a From File block.

Create an array with the time and signal data, specifying signal data for 10 time steps.

```
t = .1*(1:10);  
d = .2*(1:10);  
x = [t;d];
```

Create a MATLAB `timeseries` object.

```
ts = timeseries(x(2:end,:),x(1,:))
```

```
timeseries
```

```
Common Properties:
```

```
    Name: 'unnamed'  
    Time: [10x1 double]  
    TimeInfo: tsdata.timemetadata  
    Data: [1x1x10 double]  
    DataInfo: tsdata.datametadata
```

Save the `timeseries` object in a Version 7.3 MAT-file.

```
save('mySignals','ts','-v7.3')
```

Add a From File block and set the **File name** parameter of that block to `mySignals.mat`.

Simulate the model. The Scope block reflects the data loaded from the `mySignals.mat` file.

Eliminate Singleton Dimension with the Squeeze Block

This example shows a model using the Squeeze block to eliminate a dimension of size 1.

The Squeeze block converts a multidimensional array from the Constant block of size 3-by-1-by-2 into a 3-by-2 signal.

Difference Between Time- and Sample-Based Pulse Generation

This example shows the difference in behavior of the Pulse Generator block in time-based and sample-based modes.

Consider this model, with two Pulse Generator blocks. One block has the **Pulse type** parameter set to Time based, and the other to Sample based. Both blocks are configured to output a pulse with an amplitude of one that is on for five seconds, followed by off for five seconds. The simulation time runs from three seconds to a stop time of 18 seconds. Notice the time offset notice in the lower right corner.

```
ans =
```

```
Simulink.SimulationOutput:  
    tout: [61x1 double]  
  
SimulationMetadata: [1x1 Simulink.SimulationMetadata]  
    ErrorMessage: [0x0 char]
```

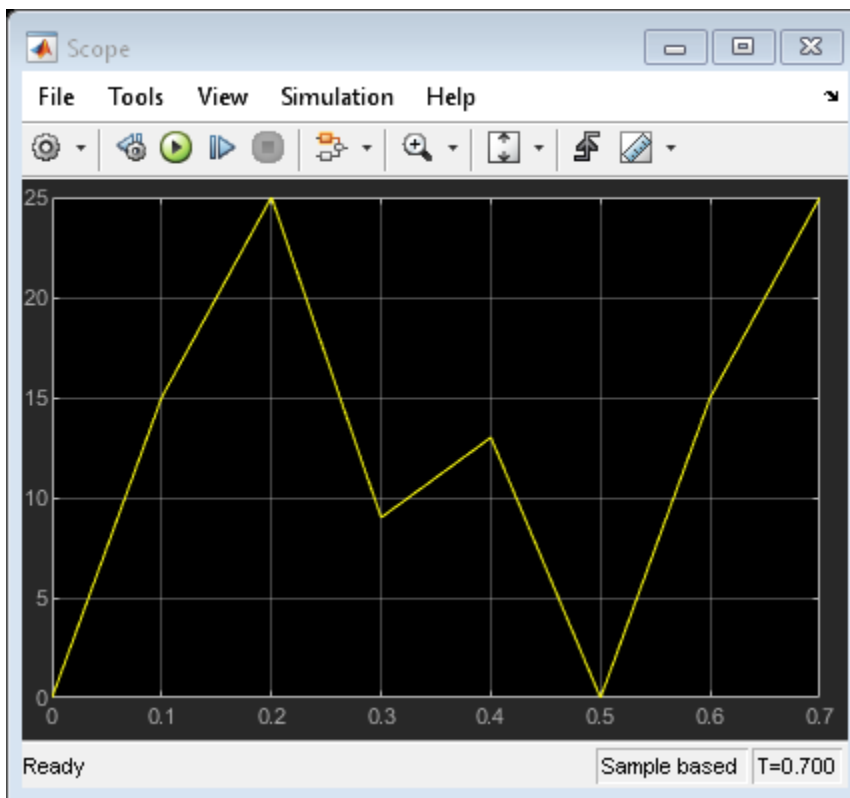

Notice that the time-based Pulse Generator produces an on signal for only two seconds and then switches to off. This is due to the block starting to compute the output from $t=0$ even though it does not output the simulation until $t=3$. The sample-based block outputs a pulse of five seconds on followed by five seconds off. In this case, the block output does not depend on simulation time and starts only when the simulation starts.

Specify a Waveform with the Repeating Sequence Block

This example shows how you specify a waveform with the Repeating Sequence block. In this model, the block defines the **Time values** parameter as $[0:0.1:0.5]$ and the **Output values** parameter as $[0\ 15\ 25\ 09\ 13\ 17]$. The stop time of the simulation is 0.7 second.

- Input period is 0.5.
- Output at any time t is the output at time $t = t - 0.5n$, where $n = 0,1,2$, and so on.
- Sequence repeats at $t = 0.5n$.

At $t = 0.5$, the expected output is equal to the output at $t = 0$, which is 0. Therefore, the last value in the **Output values** parameter vector $[0\ 15\ 25\ 09\ 13\ 17]$ does not appear.

Tune Phase Delay on Pulse Generator During Simulation

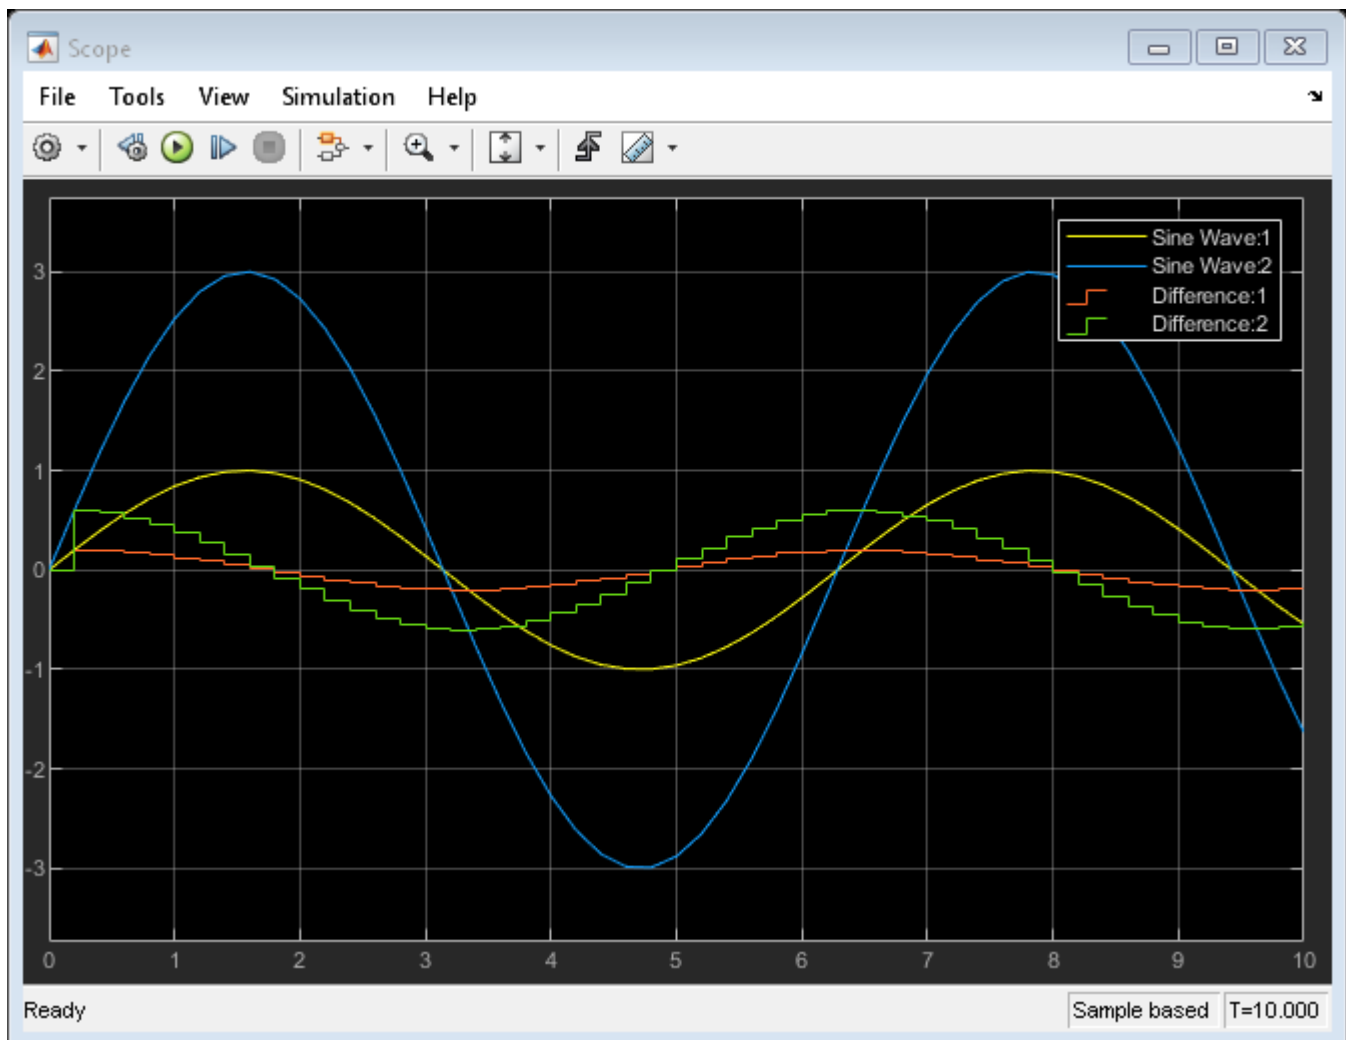

This example shows how to modify a model so that you can change a phase delay for a Pulse Generation block during simulation. You cannot tune the value of the **Phase delay** parameter during simulation. As a workaround, add a Constant block and a Variable Time Delay block.

In the Pulse Generator block, set the value of the **Phase delay** parameter to zero. Use the Constant block to specify the delay time in seconds. To tune the delay time during simulation, change the value stored in the Constant block.

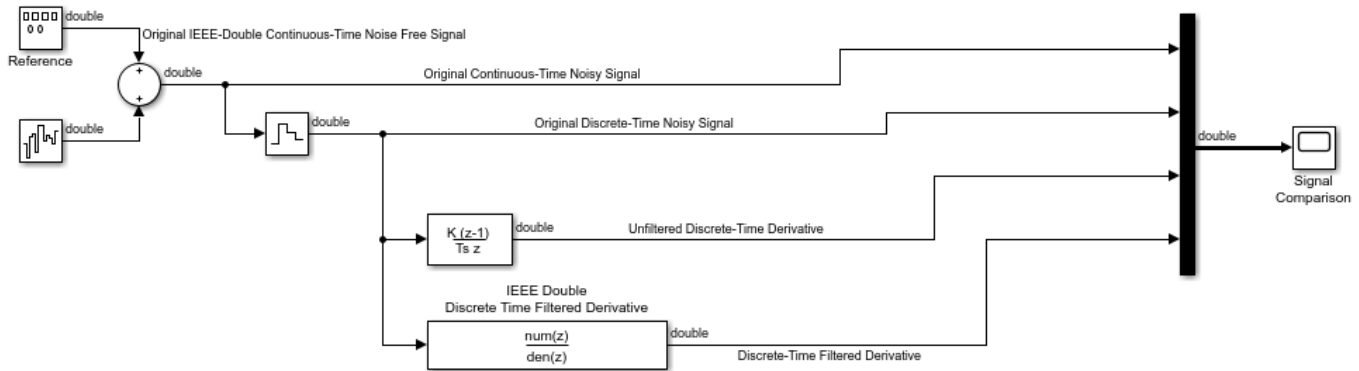

Difference Sine Wave Signal

This example shows how to calculate the difference in a sine wave signal at each time step. The input is a 1-by-2 vector of sine waves, with amplitude 1 and 3. The difference block calculates the difference in each sine wave signal at every time step. The Scope block displays both the original sine waves and the output of the difference block.

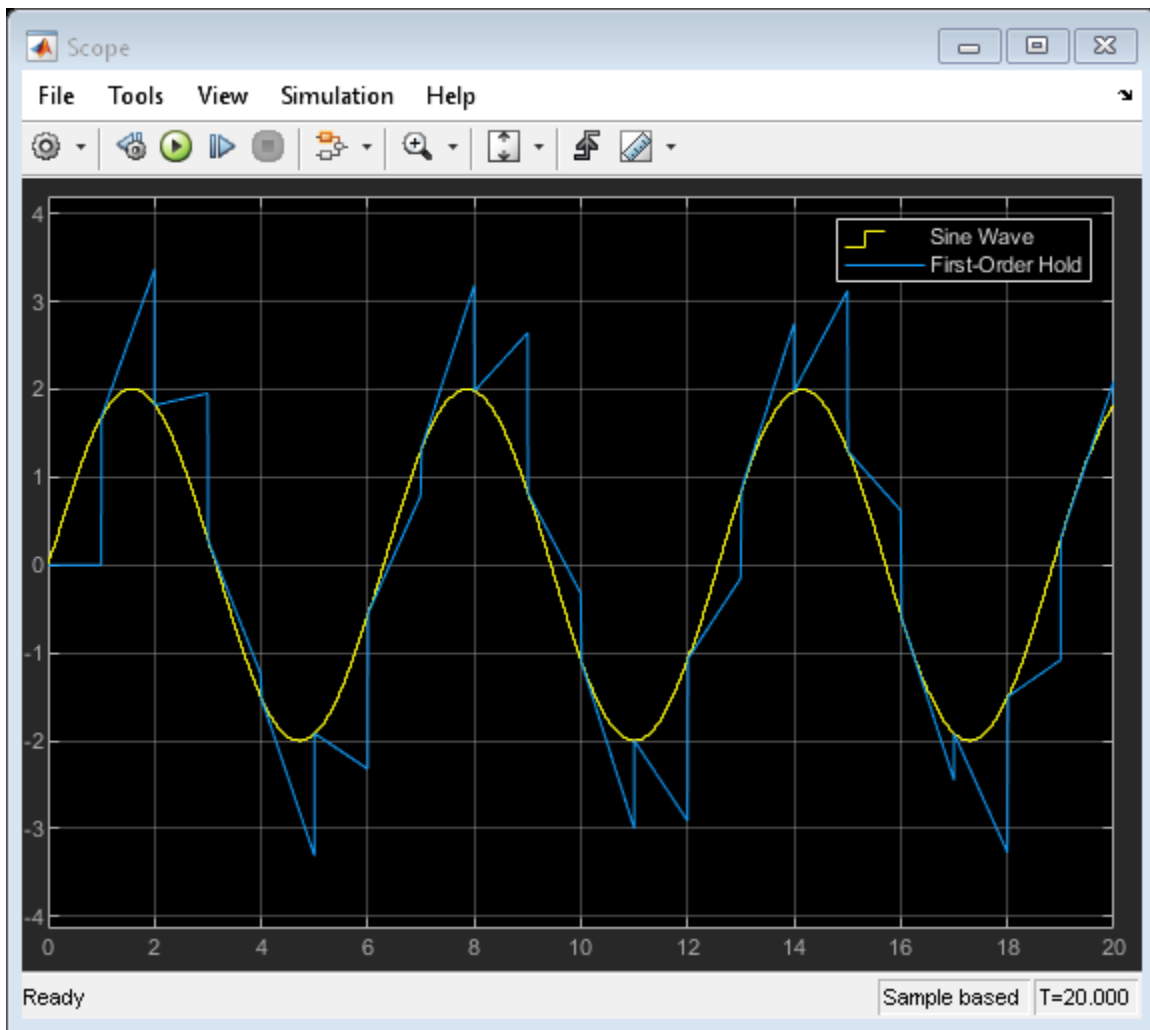

Discrete-Time Derivative of Floating-Point Input

This example shows how to use the Discrete Derivative block to compute the discrete-time derivative of a floating-point input signal. The unfiltered discrete-time derivative is compared to a filtered discrete-time derivative that is computed by the Discrete Filter block.

First-Order Sample-and-Hold of a Sine Wave

This example shows how to perform a first-order sample-and-hold of a sine wave signal using the First-Order Hold block.

Calculate and Display Simulation Step Size using Memory and Clock Blocks

This example shows how to use the Memory and Clock blocks to calculate and display the step size in a simulation. The Sum block subtracts the time at the previous time step, which the Memory block generates, from the current time, which the Clock block generates.

Because **Inherit sample time** is not selected for the Memory block, the block sample time depends on the type of solver for simulating the model. In this case, the model uses a fixed-step solver. Therefore, the sample time of the Memory block is the solver step size, or 1.

If you replace the Memory block with a Unit Delay block, you get the same results. The Unit Delay block inherits a discrete sample time of 1.

Capture the Velocity of a Bouncing Ball with the Memory Block

The `sldemo_bounce` example shows how to use the Second-Order Integrator and Memory blocks to capture the velocity of a bouncing ball just before it hits the ground.

```
open_system('sldemo_bounce');
```

Copyright 2004-2013 The MathWorks, Inc.

Because **Inherit sample time** is not selected for the Memory block, the block sample time depends on the type of solver for simulating the model. In this case, the model uses a variable-step (ode23) solver. Therefore, the sample time of the Memory block is continuous but fixed in minor time step: [0, 1]. When you run the model, you get these results.

```
sim('sldemo_bounce');
```

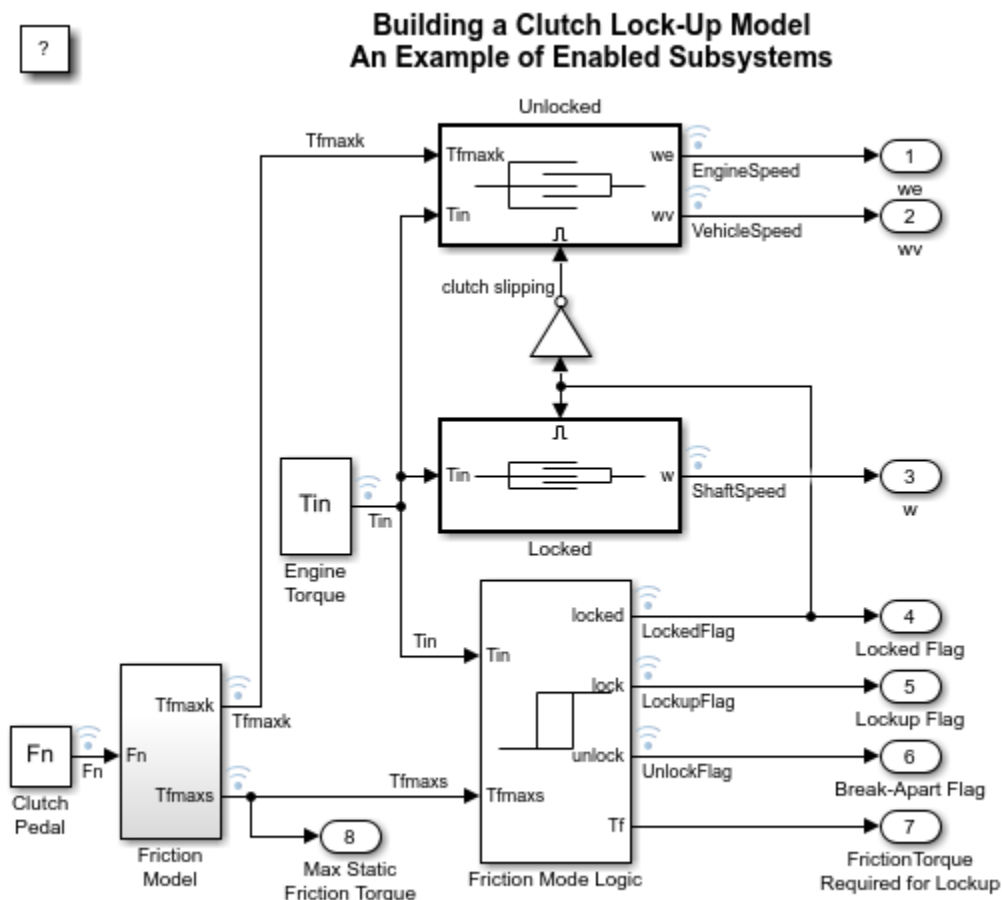

If you replace the Memory block with a Unit Delay block, you get the same results. However, a warning also appears due to the discrete Unit Delay block inheriting a continuous sample time.

For more information, see the model description.

Implement a Finite-State Machine with the Combinatorial Logic and Memory Blocks

The `ex_sldemo_clutch` example shows how you can use the Memory block with the Combinatorial Logic block to implement a finite-state machine. This construct appears in the Friction Mode Logic/Lockup FSM subsystem:

Copyright 1990-2017 The MathWorks, Inc.

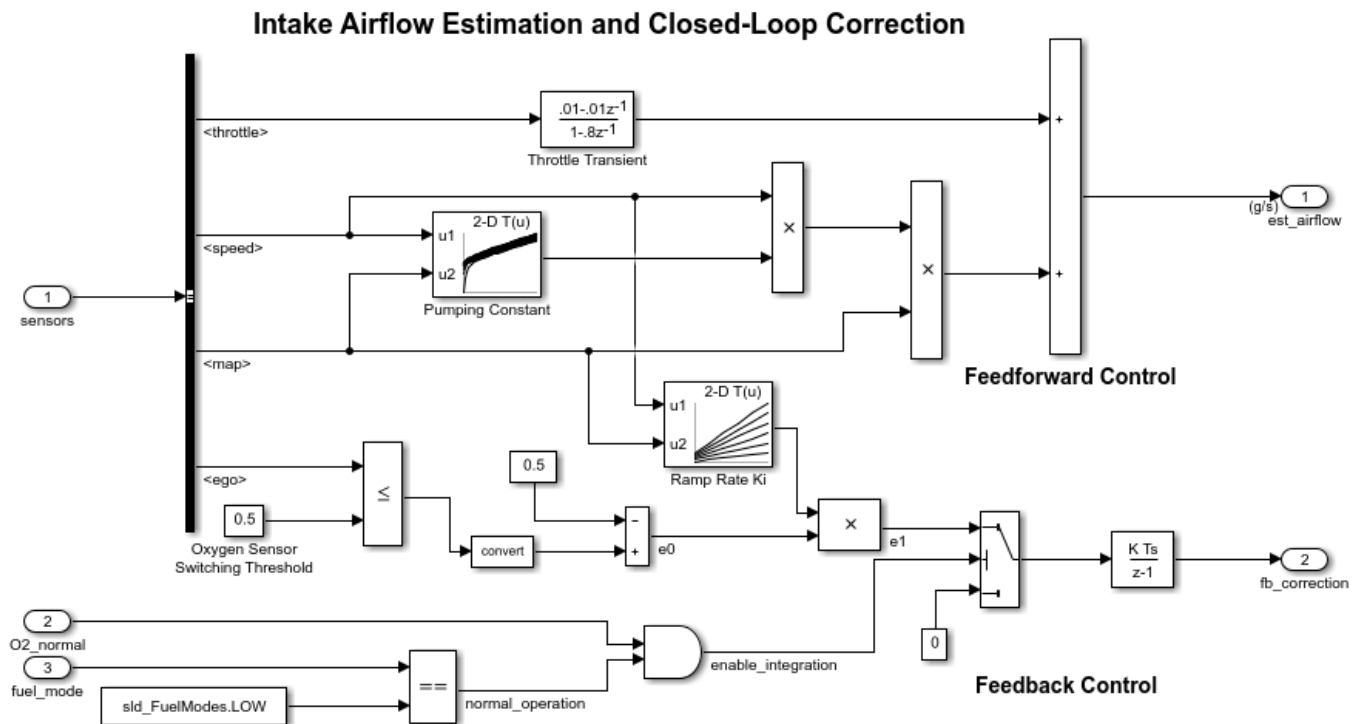

Because **Inherit sample time** is not selected for the Memory block, the block sample time depends on the type of solver for simulating the model. In this case, the model uses a variable-step (ode23) solver. Therefore, the sample time of the Memory block is continuous but fixed in minor time step: [0, 1].

For more information, see the model description.

Discrete-Time Integration Using the Forward Euler Integration Method

The `sldemo_fuelsys` model uses a Discrete-Time Integrator block in the `fuel_rate_control/airflow_calc` subsystem. This block uses the Forward Euler integration method.

When the Switch block feeds a nonzero value into the Discrete-Time Integrator block, integration occurs. Otherwise, integration does not occur.

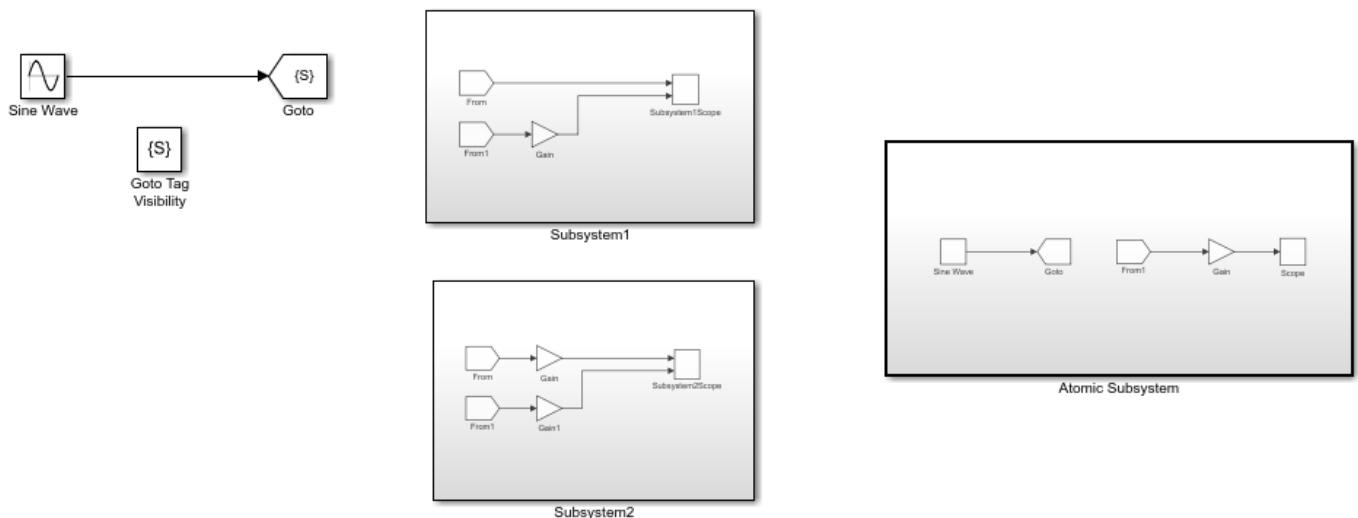

For more information, see the model description.

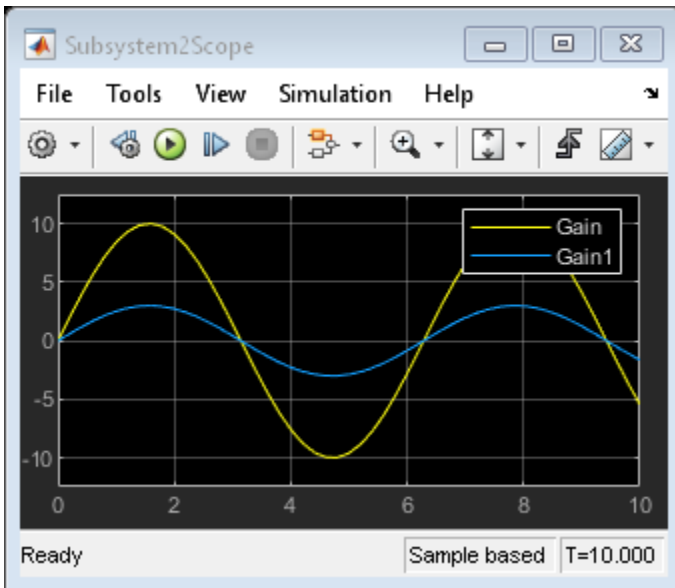

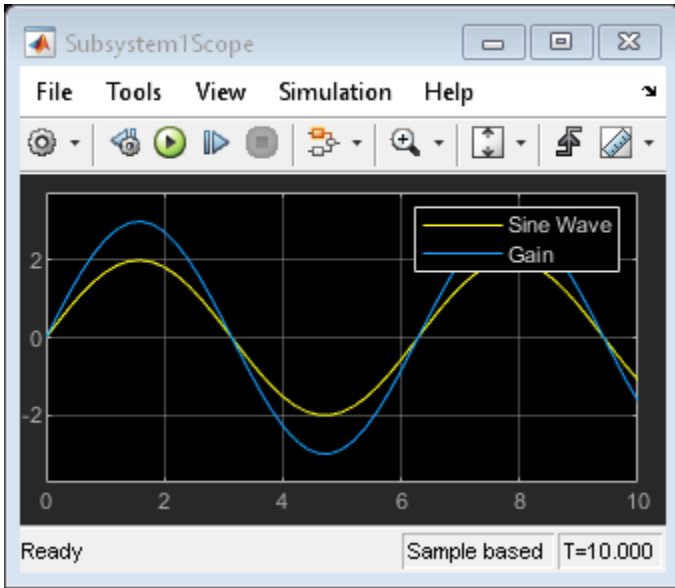

Signal Routing with the From, Goto, and Goto Tag Visibility Blocks

This example shows how to use the From, Goto, and Goto Tag Visibility blocks to route signals in your model. The GotoGlobal block at the top-level of the model has the **Goto tag** parameter set to G and the **Tag visibility** set to global. Thus, the G tag can be seen by From and Goto blocks at any level of the model hierarchy, except locations that span nonvirtual subsystem boundaries (like the Atomic Subsystem in this model). The From block at the top level of the model can see and connect to the global G tag, but cannot see or connect to the scoped S tag or L local tag that are specified on Goto blocks further down in the model hierarchy.

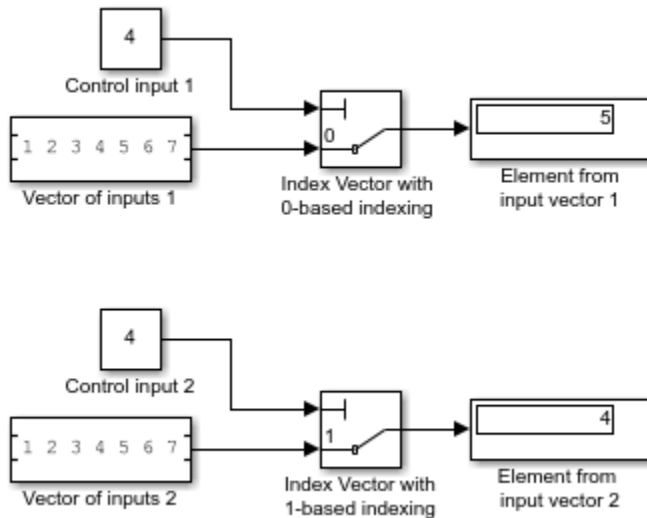

Inside of the Main Subsystem, the Goto block with **Goto tag** set to S has a **Tag visibility** of scoped. The Goto Tag Visibility block placed at the same level as that Goto block indicates the S tag can be seen by all From and Goto blocks at that level and below, except for locations that cross a nonvirtual subsystem boundary (i.e. the boundary with the Atomic Subsystem). Inside of Subsystem1 and Subsystem2, the From blocks can see and connect to the global Goto tag G, and the scoped Goto tag S.

Zero-Based and One-Based Indexing with the Index Vector Block

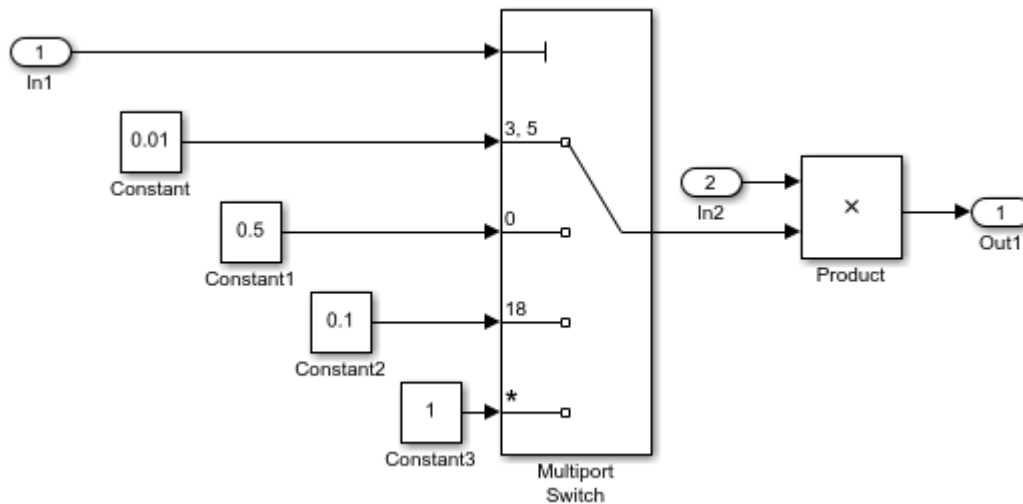

This example shows how the Index Vector block works with zero-based and one-based indexing.

The Index Vector block is from the Simulink Signal Routing library. It is a special configuration of the Multiport Switch block. To configure the Multiport Switch block as an Index Vector block, set the **Number of data ports** to 1 and **Data port order** to Zero-based contiguous.

Noncontiguous Values for Data Port Indices of Multiport Switch Block

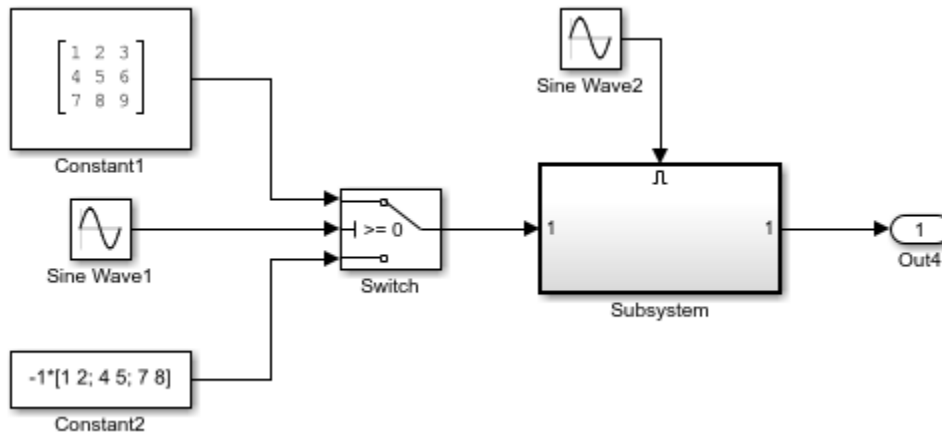

This example shows how to use a Multiport Switch block that specifies noncontiguous integer values for data ports. The values of the indices are visible on the data port labels. You do not have to open the block dialog box to determine which value maps to each data port.

When you set **Data port for default case** to `Additional data port`, an extra port with a * label appears. This port corresponds to the default case, which applies when the control input does not match the data port indices 3, 5, 0, or 18. When that happens in this example, the Multiport Switch block outputs a value of 1.

Using Variable-Size Signals on the Delay Block

This example shows how the Delay block supports variable-size signals for sample-based processing. The Switch block controls whether the input signal to the enabled subsystem is a 3-by-3 or 3-by-2 matrix.

The Delay block appears inside the enabled subsystem.

The model follows these rules for variable-size signals while using sample-based processing.

- Signal dimensions change only during state reset when the block is enabled.
- Initial condition must be scalar.

The rules are implemented by these blocks.

- Enable block sets **Propagate sizes of variable-size signals** to Only when enabling.
- Delay block sets the **Initial condition** to the scalar value 0.0.

Bus Signals with the Delay Block for Frame-Based Processing

This example shows how the Delay block supports bus signals for frame-based processing.

Each Constant block supplies an input signal to the Bus Creator block, which outputs a two-dimensional bus signal. After the Delay block delays the bus signal by three sample periods, the Bus Selector block separates the bus back into the two original signals.

The model follows these rules for bus signals.

- For the initial condition, set the value on the dialog box.
- For frame-based processing, signal dimensions of the data input port *u* cannot be larger than two.

The model implements the rules by:

- Setting the **Initial condition** to a scalar value of 0.
- Setting bus input to the Delay block as two dimensions.

Control Execution of Delay Block with Enable Port

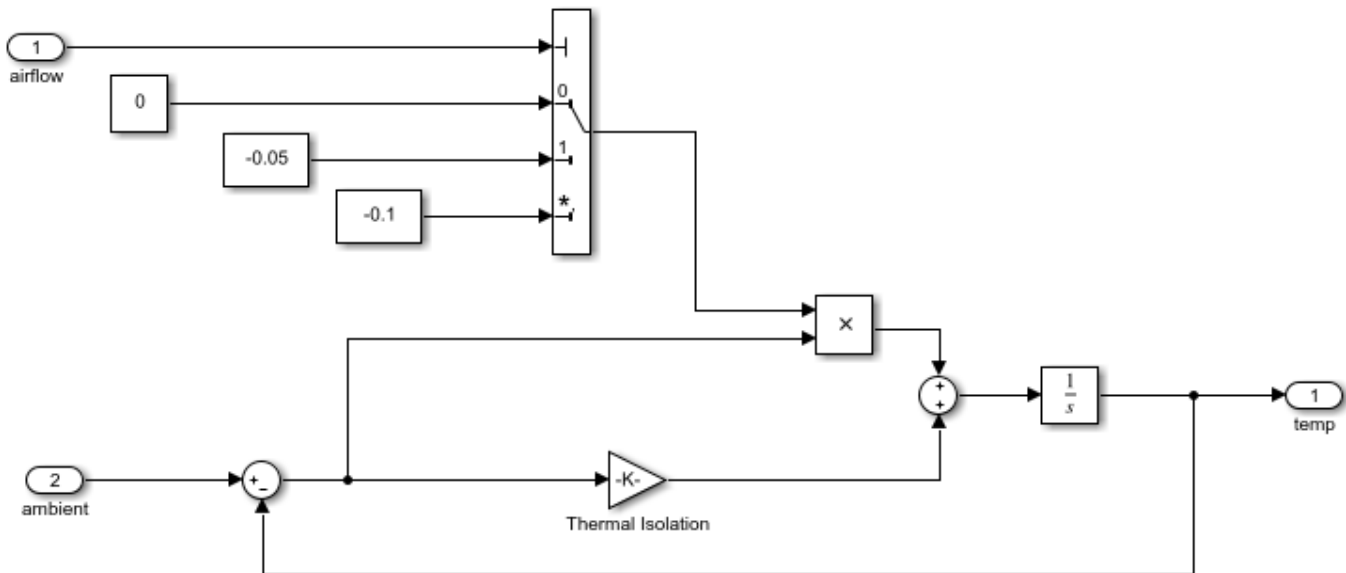

This example shows how you can enable or disable the execution of the Delay block using an enable port. In this model, a ramp input signal feeds into a Delay block. The execution of the block is controlled by an enabling signal from the Pulse Generator block.

The blue line shows that the Delay block outputs the input signal value delayed by one time step while the enabling signal has a value of one. At $t=5$ the enabling signal transitions to zero and the Delay block stops executing. The output is held at the last value until the block is enabled again.

Zero-Based Indexing for Multiport Switch Data Ports

The `sf_aircontrol` model uses a Multiport Switch block in the Physical Plant subsystem. This block uses zero-based indexing for contiguous ordering of three data ports.

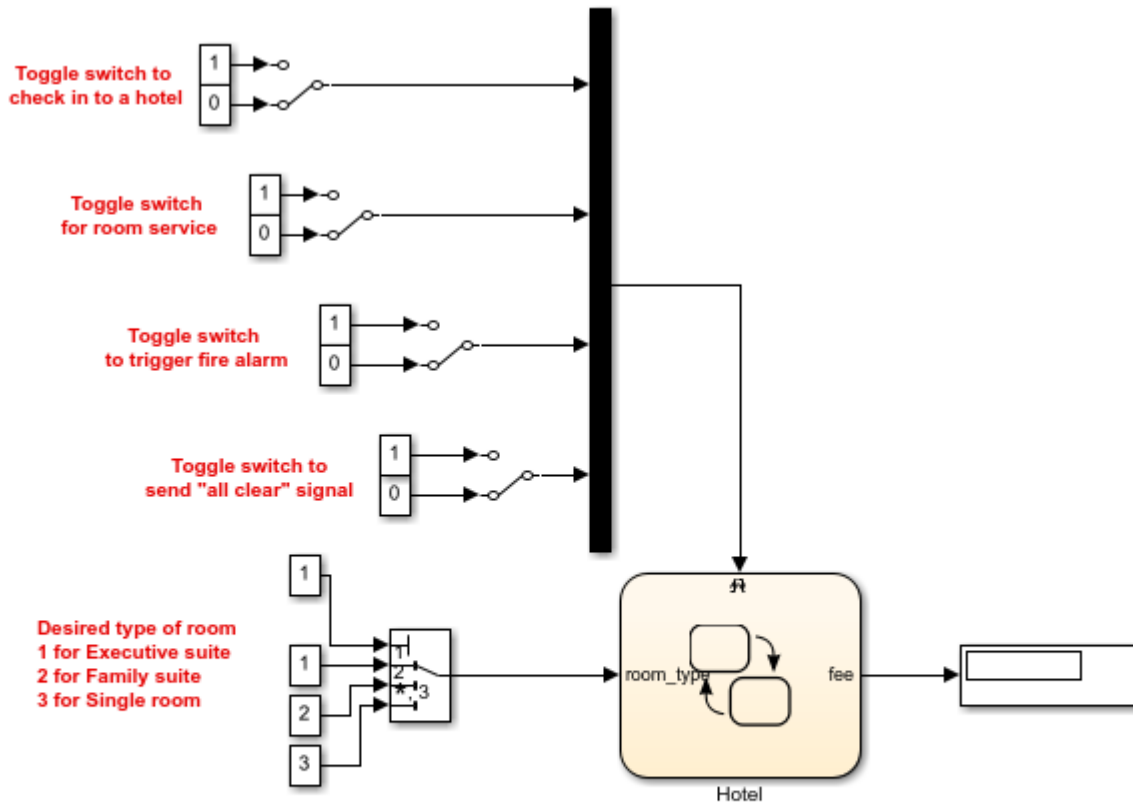

The indices are visible on the data port labels. You do not have to open the block dialog box to determine if the data ports use zero-based or one-based indexing.

When you set **Data port for default case** to **Last data port**, the last data port includes a * on the label (in this case, the label is *, 2). The comma after the * indicates that the data port index has a value. This port corresponds to the default case, which applies when the control input does not match the data port indices. In this example, the Multiport Switch block outputs a value of -0.1 when the control input does not match the data port indices of 0, 1, or 2.

One-Based Indexing for Multiport Switch Data Ports

The `sf_semantics_hotel_checkin` model uses a Multiport Switch block. This block uses one-based indexing for contiguous ordering of three data ports.

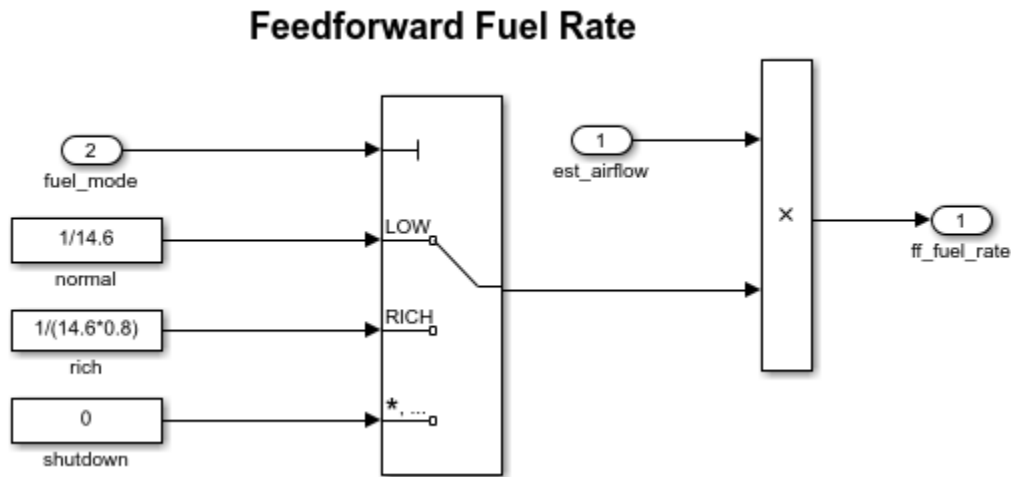

Copyright 2008-2013 The MathWorks, Inc.

When you increase the size of the block icon, the indices are visible on the data port labels. You do not have to open the block dialog box to determine whether the data ports use zero-based or one-based indexing.

Enumerated Names for Data Port Indices of the Multiport Switch Block

The `sldemo_fuelsys` model uses a Multiport Switch block in the `fuel_rate_control/fuel_calc/feedforward_fuel_rate` subsystem. This block uses the enumerated type `sl_d_FuelModes` to specify three data port indices: LOW, RICH, and DISABLED.

When you set **Data port for default case** to Last data port, the last data port includes a * on the label. The comma and ellipsis after the * indicate that the data port index has a value. This port corresponds to the default case, which applies when the control input does not match the data port indices LOW, RICH, or DISABLED. In this case, the Multiport Switch block outputs a value of 0.

Prevent Block Windup in Multiloop Control

This example shows how to use signal tracking to prevent block windup in a two-loop control system.

The Inner Loop subsystem contains a saturation limit:

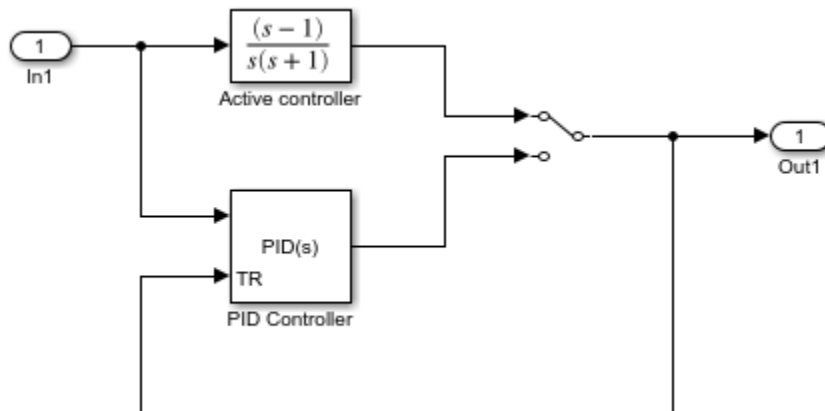

In this example, the inner loop has an effective gain of 1 when it does not saturate. When the inner loop does saturate, however, the integrator in the PID Controller can begin to wind up.

If the PID controller tracks the output of the inner loop, then its output never exceeds the saturated inner-loop output. To achieve this tracking, connect the Saturation block output to the tracking input of the PID Controller.

Bumpless Control Transfer

This example shows how to use signal tracking to achieve bumpless control transfer in a system that switches between a PID Controller block and another controller. You can make the PID controller track the output of the other controller by connecting the signal you want to track to the TR port of the PID Controller block. For example:

The input **In1** takes a reference signal that feeds both controllers. The output **Out1** drives a controlled system (not shown). A switch transfers control between the Active controller block (a Zero-Pole block) and the PID Controller block. When the Active controller is in the loop, the PID Controller block tracks its output. Thus, the two controllers have the same output when you switch to PID control, ensuring smooth operation.

Bumpless Control Transfer with a Two-Degree-of-Freedom PID Controller

This example shows how to use signal tracking to achieve bumpless control transfer in a system that switches between a PID Controller (2DOF) block and another controller. You can make the PID controller track the output of the other controller by connecting the signal you want to track to the TR port of the PID Controller block. For example:

The input Ref takes a reference signal, and the input y takes the measured feedback from the plant. These signals feed the 2DOF controller, and the difference between them feeds the Active controller block (a Zero-Pole block). The output u drives the plant. A switch transfers control between the active controller and the PID Controller (2DOF) block. When the Active controller is in the loop, the PID Controller (2DOF) block tracks its output. Thus, the two controllers have the same output when you switch to PID control, ensuring smooth operation.

Using a Bit Set block

If the Bit Set block is turned on for bit 2 bit 2 is set to 1.

A vector of constants $2.^{[0\ 1\ 2\ 3\ 4]}$ is represented in binary as [00001 00010 00100 01000 10000].

With bit 2 set to 1, the result is [00101 00110 00100 01100 10100], which is represented in decimal as [5 6 4 12 20].

Using a Bit Clear block

If the Bit Clear block is turned on for bit 2, bit 2 is set to 0.

A vector of constants $2.^{[0\ 1\ 2\ 3\ 4]}$ is represented in binary as [00001 00010 00100 01000 10000].

With bit 2 set to 1, the result is [00101 00110 00100 01100 10100], which is represented in decimal as [5 6 4 12 20].

With bit 2 set to 0, the result is [00001 00010 00000 01000 10000], which is represented in decimal as [1 2 0 8 16].

Two-Input AND Logic

This example builds a two-input AND function, which returns 1 when both input elements are 1, and 0 otherwise. To implement this function, specify the **Truth table** parameter value as [0; 0; 0; 1]. The portion of the model that provides the inputs to and the output from the Combinatorial Logic block might look like this:

The following table indicates the combination of inputs that generate each output. The input signal labeled **Input** corresponds to the column in the table labeled **Input 1**. Similarly, the input signal **Input 2** corresponds to the column with the same name. The combination of these values determines the row of the **Output** column of the table that is passed as block output. For example, if the input vector is [1 0], the input references the third row:

($2^{1*1} + 1$) The output value is 0.

Row	Input 1	Input 2	Output
1	0	0	0
2	0	1	0
3	1	0	0
4	1	1	1

Circuit Logic

This sample circuit has three inputs: the two bits (**a** and **b**) to be summed and a carry-in bit (**c**). It has two outputs: the carry-out bit (**c'**) and the sum bit (**s**).

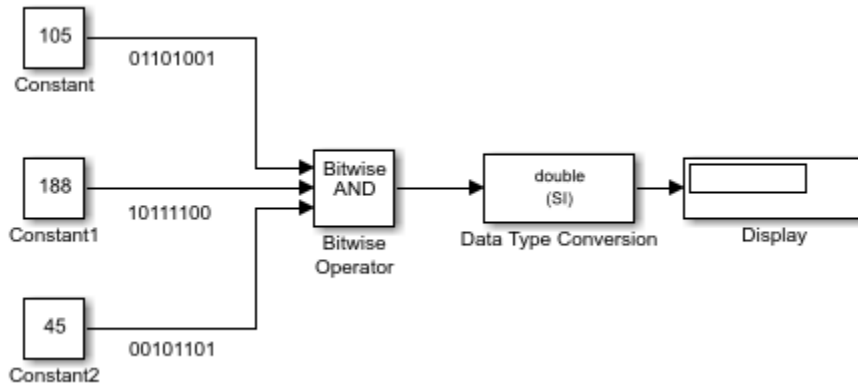

The truth table and corresponding outputs for each combination of input values for this circuit appear in the following table.

Inputs			Outputs	
a	b	c	c'	s
0	0	0	0	0
0	0	1	0	1
0	1	0	0	1
0	1	1	1	0
1	0	0	0	1
1	0	1	1	0
1	1	0	1	0
1	1	1	1	1

To implement this adder with the Combinatorial Logic block, you enter the 8-by-2 matrix formed by columns **c'** and **s** as the **Truth table** parameter. You can also implement sequential circuits (that is, circuits with states) with the Combinatorial Logic block by including an additional input for the state of the block and feeding the output of the block back into this state input.

Unsigned Inputs for the Bitwise Operator Block

The following model shows how the Bitwise Operator block works for unsigned inputs.

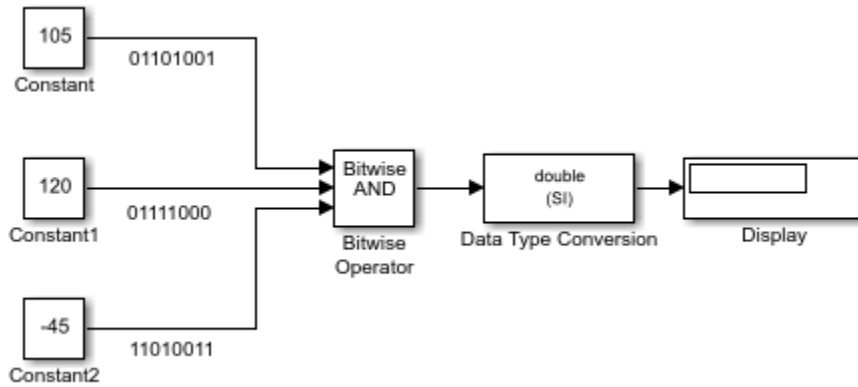

Each Constant block outputs an 8-bit unsigned integer (uint8). To determine the binary value of each Constant block output, use the dec2bin function. The results for all logic operations appear in the next table.

Operation	Binary Value	Decimal Value
AND	00101000	40
OR	11111101	253
NAND	11010111	215
NOR	00000010	2
XOR	11111000	248
NOT	N/A	N/A

Signed Inputs for the Bitwise Operator Block

The following model shows how the Bitwise Operator block works for signed inputs.

Each Constant block outputs an 8-bit signed integer (`int8`). To determine the binary value of each Constant block output, use the `dec2bin` function. The results for all logic operations appear in the next table.

Operation	Binary Value	Decimal Value
AND	01000000	64
OR	11111011	-5
NAND	10111111	-65
NOR	00000100	4
XOR	11000010	-62
NOT	N/A	N/A

Merge Block with Input from Atomic Subsystems

This example shows a Merge block with inputs from two atomic subsystems.

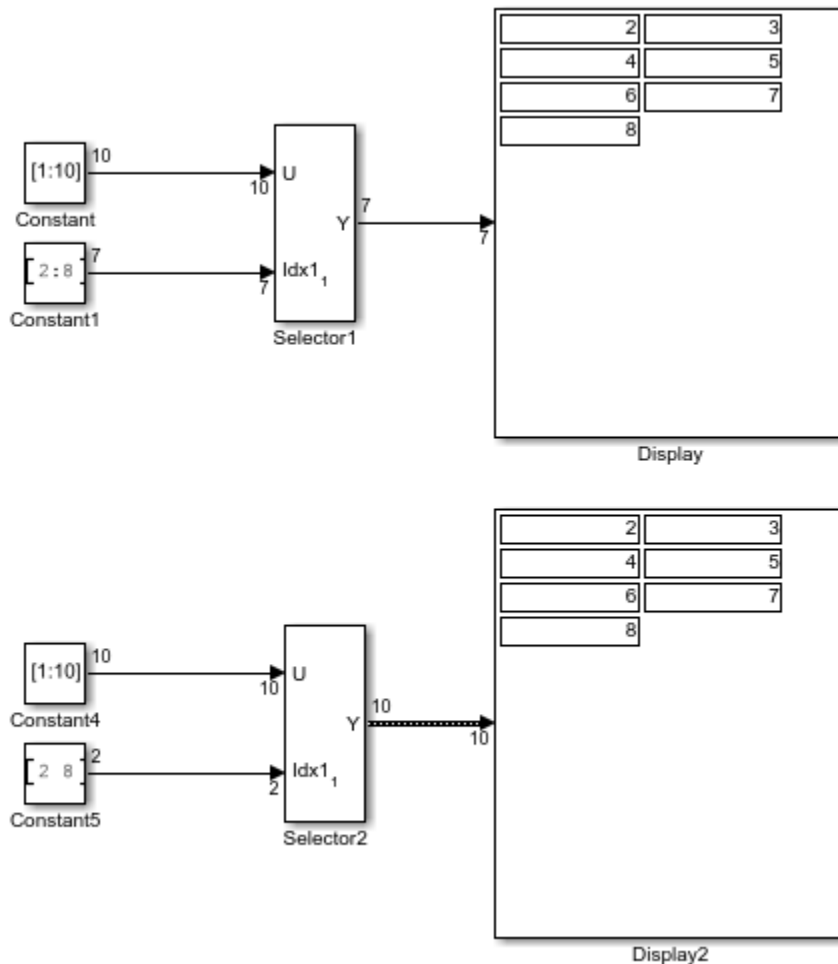

Each Atomic Subsystem block contains an enabled subsystem. This satisfies the requirement that inputs to a Merge block are from a conditionally executed subsystem.

Index Options with the Selector Block

This example shows two Selector blocks with the same kind of input signals, but two different **Index Option** settings.

Both Selector blocks select 7 values from the input signal that feeds the input port. The Selector1 block outputs a fixed-size signal, whereas the Selector2 block outputs a variable-size signal whose compiled signal dimension is 10 instead of 7.

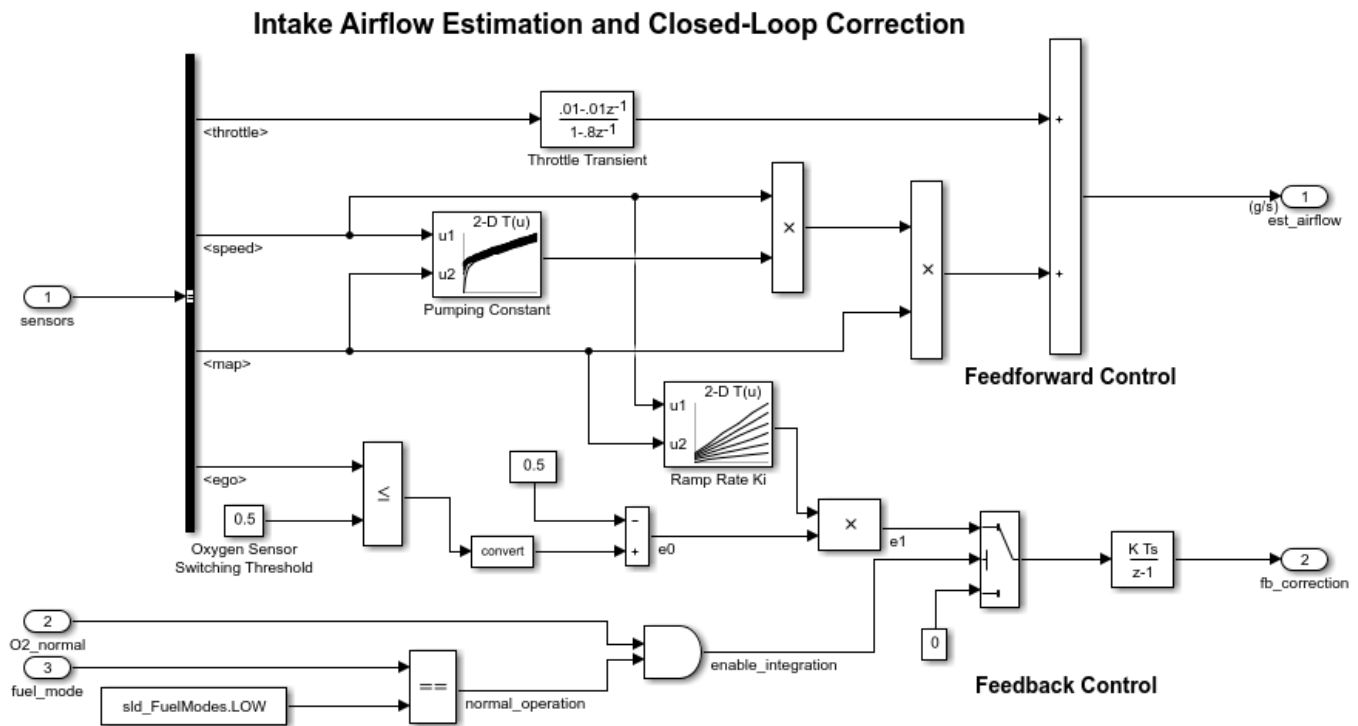

The Selector1 block sets **Index Option** to Index vector (port), which uses the input signal from Constant1 as the index vector. The dimension of the input signal is 7, so the Display block shows the 7 values of the Constant1 block. The Selector2 block sets the **Input port size** parameter to 10, which is the size of the largest input signal to the Selector2 block.

The Selector2 block also sets the **Index Option** to Starting and ending indices (port). The output is then set to the size of **Input port size** parameter (10), even though the size of the input signal is 7.

Switch Block with a Boolean Control Port Example

This example shows a Switch block with a Boolean input for the control port.

```
open_system('sldemo_fuelsys');
open_system('sldemo_fuelsys/fuel_rate_control/airflow_calc');
```

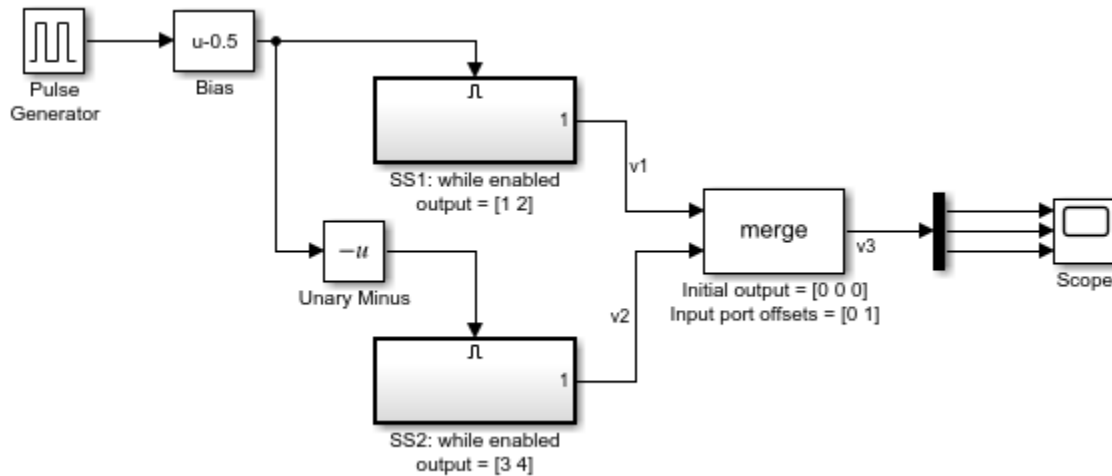

The value of the control port on the Switch block determines whether or not the feedback correction occurs. The control port value depends on the output of the Logical Operator block. When the Logical Operator block output is `true`, then the Switch block control port is 1 and the feedback control occurs. If the Logical Operator block output is `false` then the feedback control does not occur.

Merge Block with Unequal Input Widths Example

This example shows how to use the Merge block with inputs ports that have different widths. If you select **Allow unequal port widths**, the block accepts scalar and vector inputs having differing numbers of elements. You can specify an offset for each input signal relative to the beginning of the output signal. The width of the output signal is:

$$\max(w_1 + o_1, w_2 + o_2, \dots, w_n + o_n)$$

where w_n are the widths of the input signals, and o_n are the offsets.

The Merge block has the following output width.

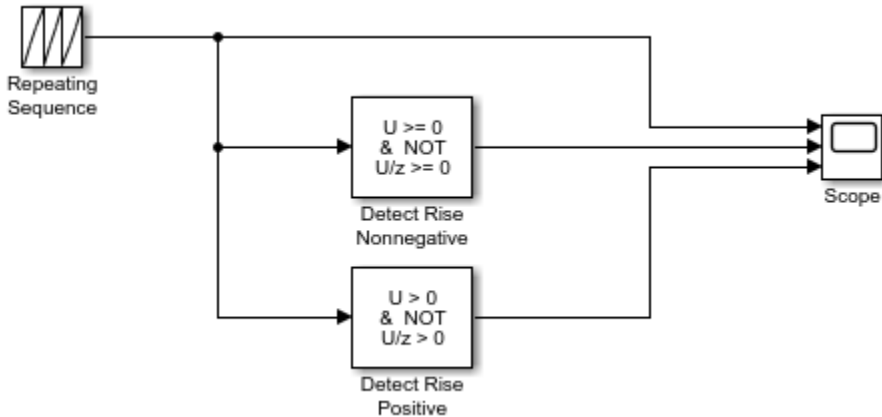

$$\max(2 + 0, 2 + 1) = 3$$

In this example, the offset of $v1$ is 0 and the offset of $v2$ is 1. The Merge block maps the elements of $v1$ to the first two elements of $v3$ and the elements of $v2$ to the last two elements of $v3$. Only the second element of $v3$ is effectively merged, as show in the scope output.

If you use Simplified Initialization Mode, you must clear the `Allow unequal port widths` check box. The input port offsets for all signals must be zero.

Detect Rising Edge of Signals

This example shows how to detect the rising edge of a signal using the Detect Rise Nonnegative and Detect Rise Positive blocks.

With a fixed-step size of 0.25, this example illustrates the difference between the Detect Rise Nonnegative and Detect Rise Positive blocks. The Detect Rise Nonnegative block outputs true (1) at $t=1$ because the input signal increased from a negative value to a nonnegative value (0). The Detect Rise Positive block outputs true (1) at $t=1.25$ because the input signal increased from a nonpositive value (0) to a strictly positive value.

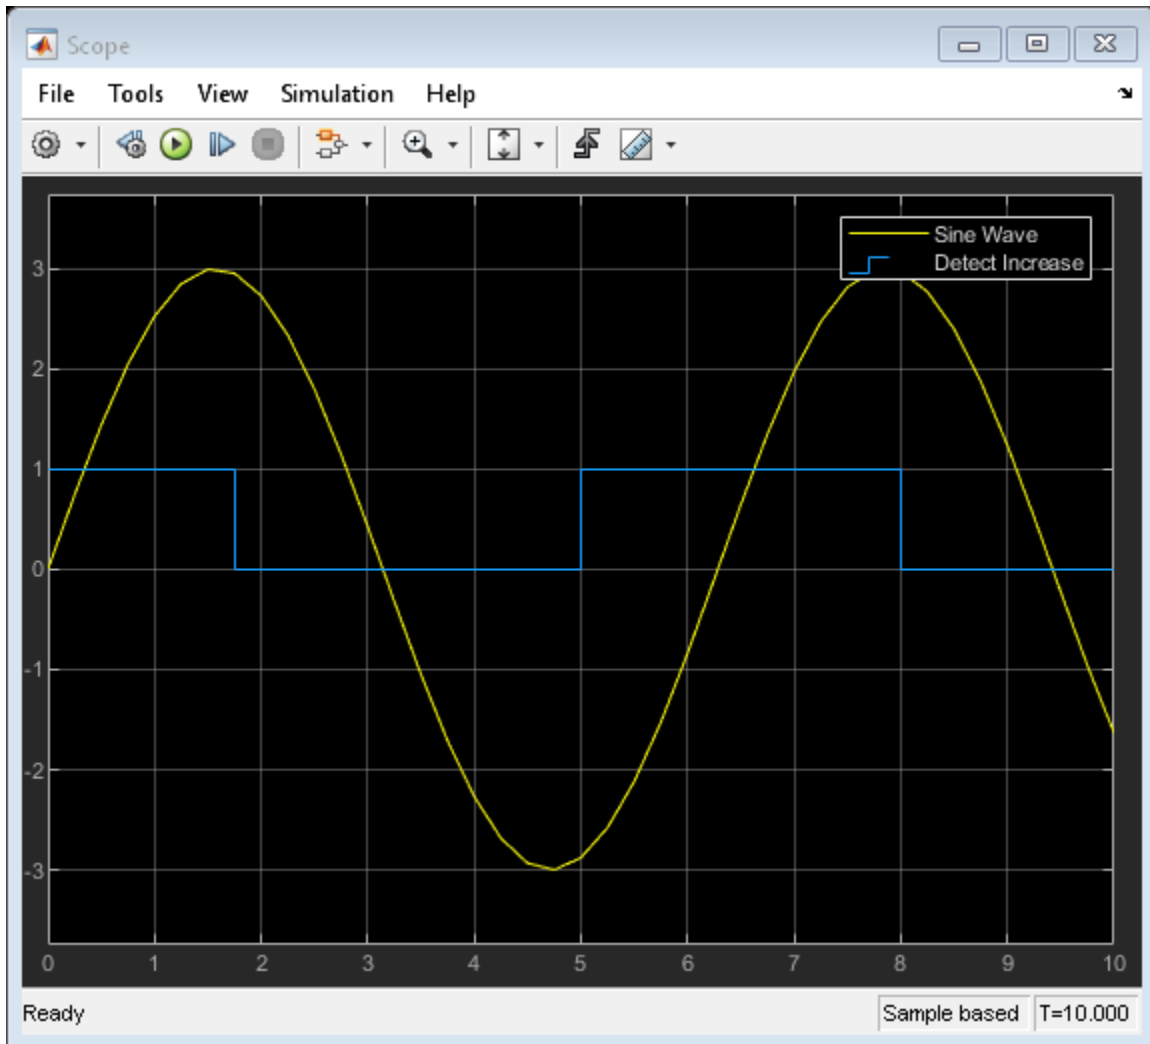

Detect Falling Edge Using the Detect Fall Nonpositive Block

This example shows how to use the Detect Fall Nonpositive block to detect a falling edge in the input signal. The block detects a falling edge when the signal value decreases from a strictly positive value to a nonpositive value. In this example, the **Initial condition** of the Detect Fall Nonpositive block is set to 1. This means that the Boolean expression $U/z \leq 0$ evaluates to true and the block assumes the initial value of the input signal is nonpositive.

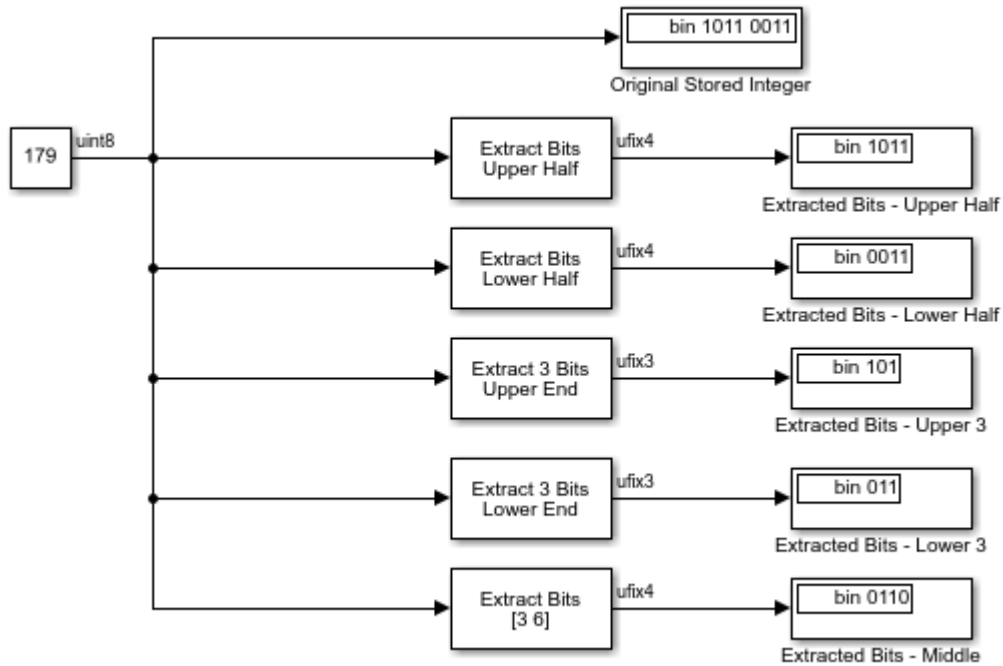

Detect Increasing Signal Values with the Detect Increase Block

This example shows how to use the Detect Increase Block to detect increasing signal values. Because the **Initial condition** is set to -1, the block detects an increasing signal value starting at time $t=0$. If you change the **Initial condition** parameter to a nonnegative value, the block detects the first increasing signal value at $t=0.25$.

Extract Bits from Stored Integer Value

This example shows how to extract specific bits from the stored integer value of an input signal.

Detect Signal Values Within a Dynamically Specified Interval

This example shows how to detect when an input signal falls within a dynamically specified interval. The interval is defined by two Sine Wave blocks. When the input to the Interval Test Dynamic block falls between those sine waves, the Interval Test Dynamic block outputs true (1).

Model a Digital Thermometer Using the Polynomial Block

This example shows how the `ex_sl-demo_boiler` model uses the Polynomial block.

In the Boiler Plant model/digital thermometer subsystem, the Polynomial Block models a first-order polynomial using the coefficients [0.05 0.75]

This subsystem models a digital thermometer composed of a simple temperature sensor and an ADC. The transfer function of the sensor is:

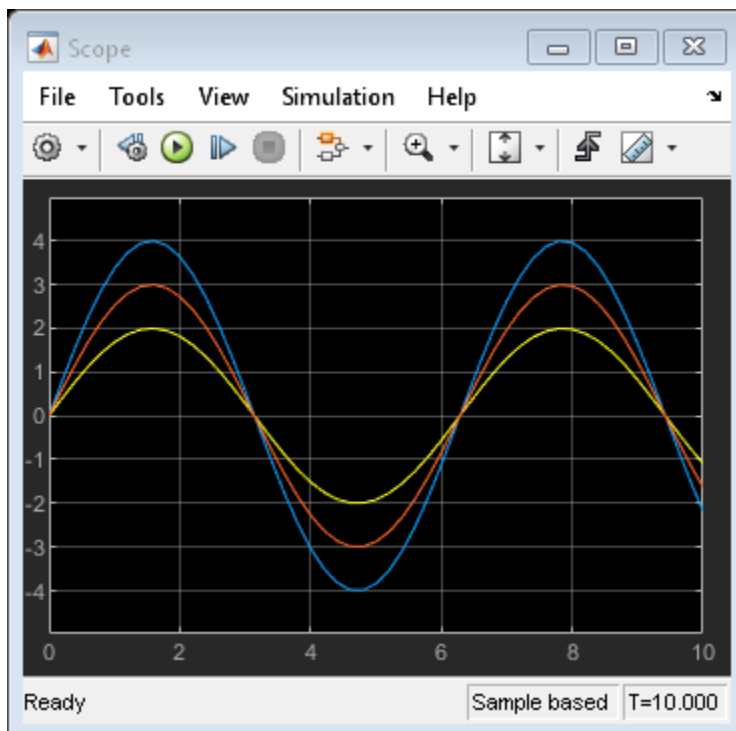

$$V = .05 * T + 0.75$$

for T in degrees C.

The conversion block inverts the combined transfer function of the sensor and ADC so that the output is an `sfix(8)` code representing T in degrees C.

Convert Data Types in Simulink Models

This example shows three different methods of converting data types in your model using the Data Type Conversion and Data Type Conversion Inherited blocks. In this model, a Sine Wave block generates the input signal. The Sine Wave block only outputs double-precision data types, so to generate a sine wave with a data type of single, you must perform a data type conversion.

In the first row, the Data Type Conversion Inherited block uses the data type coming from the Constant block (single) as the reference data type, and converts the sine wave to single.

In the second row, the Data Type Conversion block has the **Output data type** set to single, and the sine wave is converted accordingly.

In the third row, the Data Type Conversion1 block has the **Output data type** set to `Inherit`: `Inherit via back propagation`. Because the downstream Gain2 block has a data type of `single`, the Data Type Conversion1 block converts the sine wave to a data type of `single`.

Control Data Types with the Data Type Duplicate Block

This example shows how to control data types in your model using the Data Type Duplicate block. In this model, the data type of the Constant block (currently `single`) drives the data types throughout the model.

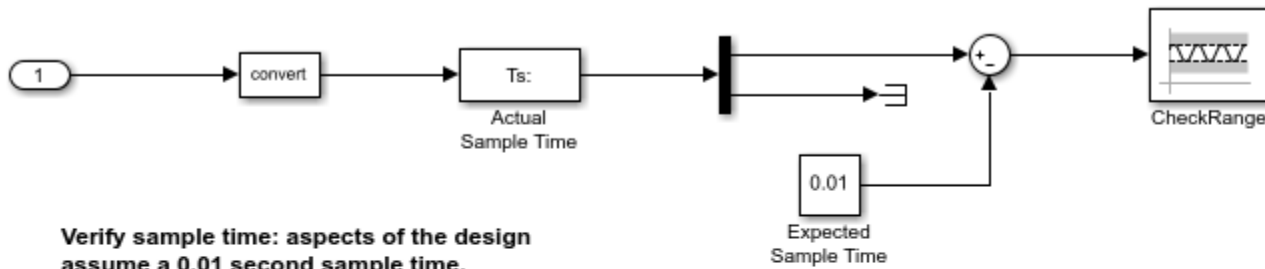

The Constant1 block has its **Output data type** parameter set to `Inherit: Inherit via back propagation`. Because the Constant1 and Constant blocks are both connected to the Data Type Duplicate block, the Constant1 block can inherit its data type from the Constant block. The Sum block has its **Output data type** set to `Inherit: Same as first input`, so it is also able to inherit its data type from the Constant block.

If you change the data type of the Constant block from `single` to `int32`, the `int32` data type propagates throughout the model.

Probe Sample Time of a Signal

The `sldemo_fuelsys` model shows how to check the sample time of a signal using the Probe block. This enables you to verify that the sample time matches the assumed value of the design.

The contents of this subsystem are excluded from the code Simulink Coder generates.

- To work correctly this system must continue to
- * Contain no output ports
 - * Enable its 'Treat as Atomic Unit' parameter
 - * Specify its 'Mask type' parameter as "VerificationSubsystem"

For more information, see the model description.

Convert Signals Between Continuous Time and Discrete Time

The `sldemo_fuelsys` model shows how to use the Rate Transition block to convert signals between continuous time and discrete time.

Fault-Tolerant Fuel Control System

[Open the Dashboard](#) subsystem to simulate any combination of sensor failures.

Copyright 1990-2017 The MathWorks, Inc.

In the `To Controller` subsystem, the Rate Transition block converts the signal from continuous time to discrete time. This discrete-time signal can then be processed by the `fuel_rate_control` subsystem.

The To Plant subsystem uses the Rate Transition block to convert the discrete-time output of the fuel_rate_control subsystem back to continuous time.

This system:

- Permits upstream signal data type to change
- Converts signals from discrete to continuous time

For more information, see the model description.

Convert Muxed Signal to a Vector

This example shows how to use the Signal Conversion block to convert a muxed input signal to a vector.

To convert the muxed signal to a vector, the **Output** parameter of the Signal Conversion block is set to **Signal copy**.

Create Contiguous Copy of a Bus Signal

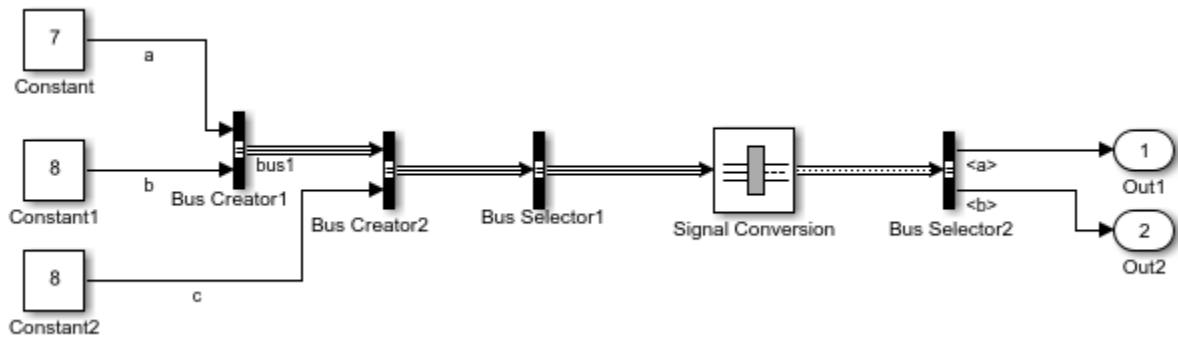

This example shows how to use the Signal Conversion block to create a contiguous copy of a bus signal.

The Bus Creator block creates a nonvirtual bus signal that is input to the Signal Conversion block. With the **Output** parameter set to **Signal copy**, the Signal Conversion block creates another contiguous copy of that input bus signal.

Convert Virtual Bus to a Nonvirtual Bus

In the following example, the Signal Conversion block converts a virtual bus signal from the first Bus Selector block to a nonvirtual bus signal that inputs to the second Bus Selector block. The Signal Conversion block has its **Output** parameter set to `Nonvirtual bus`, and specifies a bus object that matches the bus signal hierarchy of the bus that the first Bus Creator block outputs.

Convert Nonvirtual Bus to Virtual Bus

In the following example, the Signal Conversion block converts the nonvirtual bus signal from the Bus Creator block to a virtual bus signal that inputs to the Bus Selector block. The Signal Conversion block has its **Output** set to Virtual bus.

Remove Scaling from a Fixed-Point Signal

This example shows how to strip the scaling from a fixed-point input signal. To do so, the Data Type Scaling Strip block maps the input to the smallest built-in data type that has enough data bits to hold the input. The stored integer value of the input is the value of the output.

Stop Simulation Block with Relational Operator Block

This example shows how to control when a simulation stops by using a Stop Simulation block with a Relational Operator block. When you simulate the model, the model stops simulation when the simulation time reaches 10.

Output Simulation Data with Blocks

This example shows how To Workspace and To File blocks write data to the workspace and to a file respectively.

Open Example Model

```
open_system('ex_ToWorkspace_ToFile');
```

Output Simulation Data with Blocks

Copyright 1990-2018 The MathWorks, Inc.

Simulate with Default Parameter Values

1. To name the output variables and file, modify the **Variable name** and **File name** block parameter values by using the Block Parameters dialog boxes or the command line.

```
set_param('ex_ToWorkspace_ToFile/To Workspace',...
    'VariableName','simoutToWorkspace')
```

```
set_param('ex_ToWorkspace_ToFile/To File',...
    'FileName','simoutToFile.mat',...
    'MatrixName','simoutToFileVariable')
```

2. Simulate the model.

```
out = sim('ex_ToWorkspace_ToFile');
```

3. To view the input signal for the To Workspace and To File blocks, open the scope viewer.

4. To access the data stored by the To File block, load the output file.

```
load('simoutToFile.mat')
```

5. Plot the data stored by the To Workspace and To File blocks.

```
subplot(2,1,1)
plot(out.simoutToWorkspace,'-o')
legend('simoutToWorkspace')
```

```
subplot(2,1,2)
plot(simoutToFileVariable,'-o')
legend('simoutToFileVariable')
```

As shown by the plots, the data stored by each block is the same given the default block parameter values.

Simulate with Custom Parameter Values

1. To keep the data from the previous simulation, specify new names for the output variables and file.

```
set_param('ex_ToWorkspace_ToFile/To Workspace',...
    'VariableName', 'simoutToWorkspace2')
```

```
set_param('ex_ToWorkspace_ToFile/To File',...
    'FileName', 'simoutToFile2.mat',...
    'MatrixName', 'simoutToFileVariable2')
```

2. To change the amount of data collected, modify the **Limit data points to last**, **Decimation**, and **Sample time** block parameter values.

```
set_param('ex_ToWorkspace_ToFile/To Workspace',...
    'MaxDataPoints', '3',...
    'Decimation', '20',...
    'SampleTime', '0.5')
```

```
set_param('ex_ToWorkspace_ToFile/To File',...
    'Decimation', '20',...
    'SampleTime', '1')
```

The To File block does not provide the option to limit data points to the last data points collected.

3. Select **Single simulation output**, then modify the **Logging intervals** configuration parameter value.

```
set_param('ex_ToWorkspace_ToFile',...
    'ReturnWorkspaceOutputs','on',...
    'LoggingIntervals','[20,90]')
```

4. Simulate the model.

```
out = sim('ex_ToWorkspace_ToFile');
```

5. To access the data stored by the To File block, load the output file.

```
load('simoutToFile2.mat')
```

6. Plot the data stored by the To Workspace and To File blocks.

```
subplot(2,1,1)
hold on
plot(out.simoutToWorkspace2,'-*','DisplayName','simoutToWorkspace2')
hold off

subplot(2,1,2)
hold on
plot(simoutToFileVariable2,'-*','DisplayName','simoutToFileVariable2')
hold off
```

In this example, the To Workspace block collects data at 20, 30, 40, ..., 90 seconds. The data represents every 20th sample time within the logging intervals. When the simulation is completed or

paused, the To Workspace block writes only the last three collected sample points to the workspace: 70, 80, and 90 seconds.

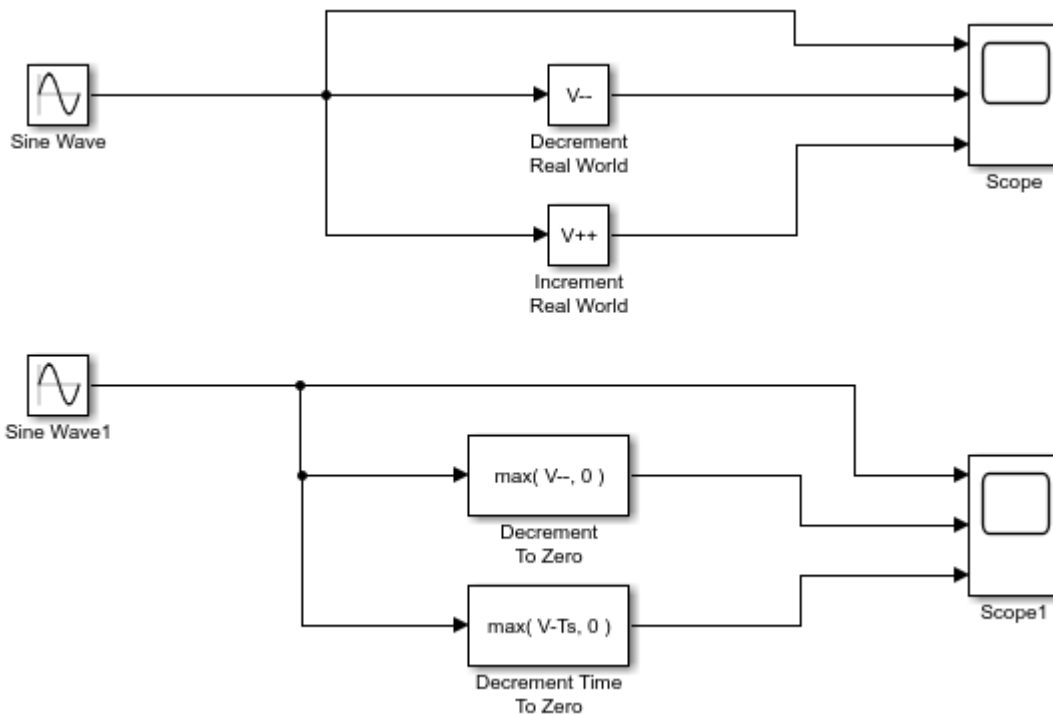

The To File block collects data at 20, 40, 60, and 80 seconds. The data similarly represents every 20th sample time within the logging intervals. However, the sample time for the To File block is double the sample time for the To Workspace block.

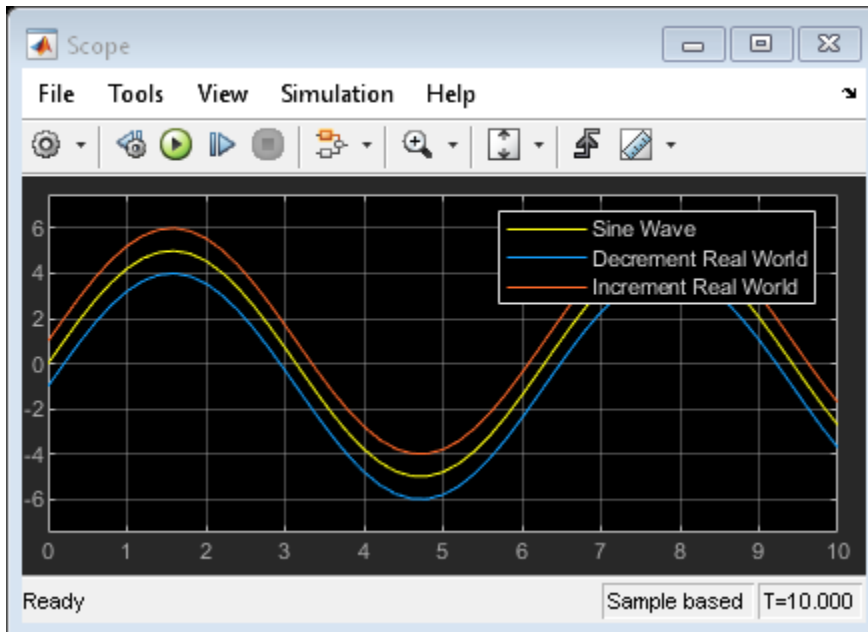

Increment and Decrement Real-World Values

This example shows how to increase and decrease the real-world value of a signal using the following blocks:

- Increment Real World
- Decrement Real World
- Decrement Time To Zero
- Decrement To Zero

The Scope block shows the output of a Sine Wave block with amplitude 5, as well as the real-world value of that signal incremented and decremented by one.

The Scope1 block shows the output of a Sine Wave block with amplitude 3, as well as the output of the Decrement To Zero and Decrement Time To Zero blocks:

- The Decrement To Zero block decreases the input sine wave signal by one, and ensures the value never goes below zero.
- The Decrement Time To Zero block decreases the input sine wave signal by the sample time, T_s , and ensures that the value never goes below zero.

Increment and Decrement Stored Integer Values

This example shows how to increase and decrease the stored integer value of a signal by one.

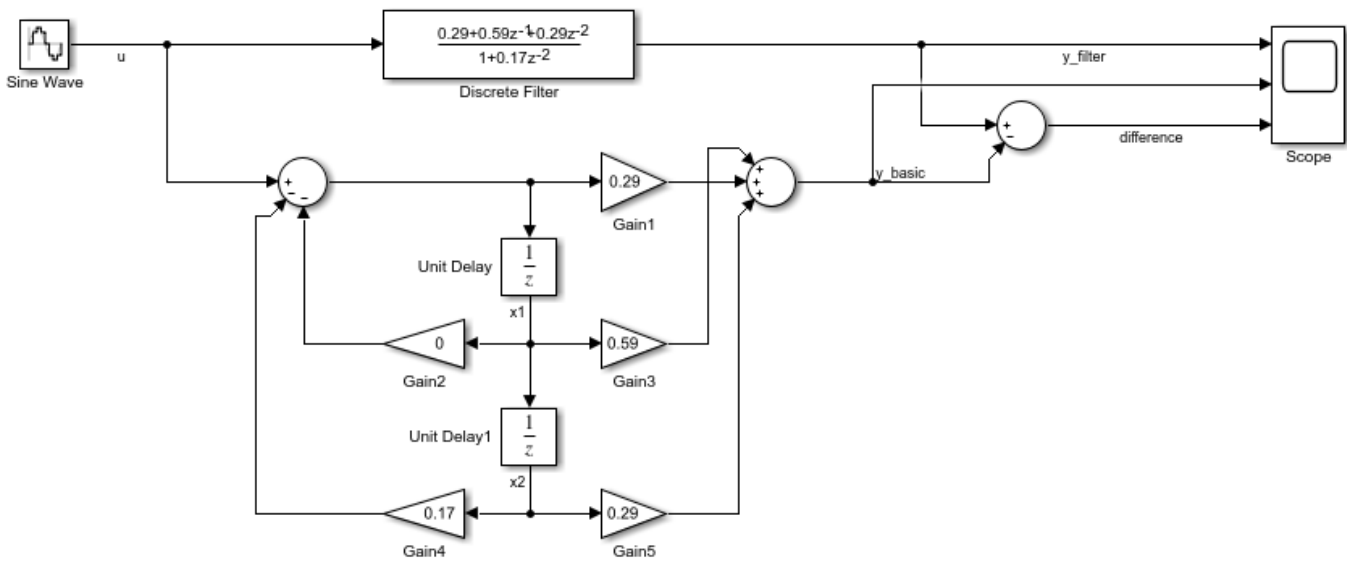

- The Increment Stored Integer block increases the stored integer value of the input signal by one.
- The Decrement Stored Integer block decreases the stored integer value of the input signal by one.

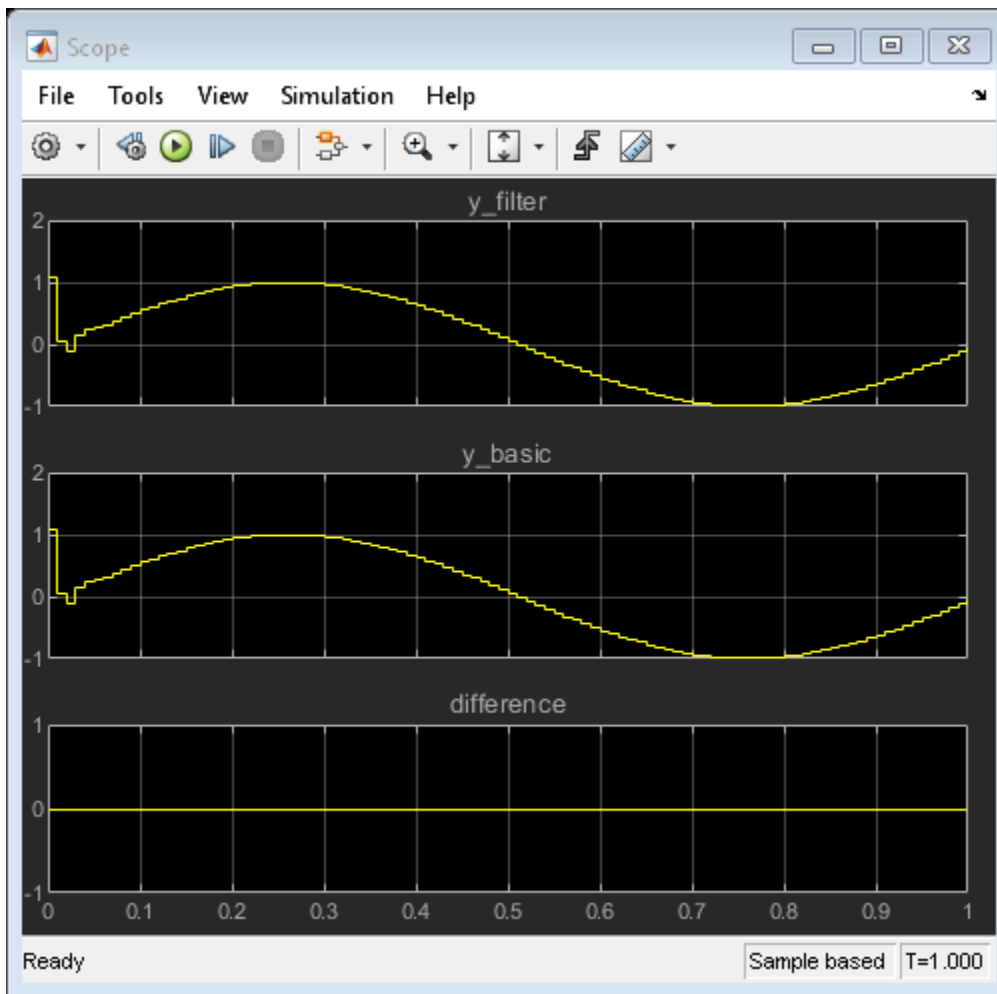

If you change the value of the input signal to 127 (the maximum value representable by an `int8` data type), incrementing the stored integer value by one causes an overflow. Because overflows in the Increment and Decrement Stored Integer blocks always wrap, the Increment Stored Integer block will output a value of -128.

Specify a Vector of Initial Conditions for a Discrete Filter Block

This example shows how to specify a vector of non-zero initial conditions for the Discrete Filter block.

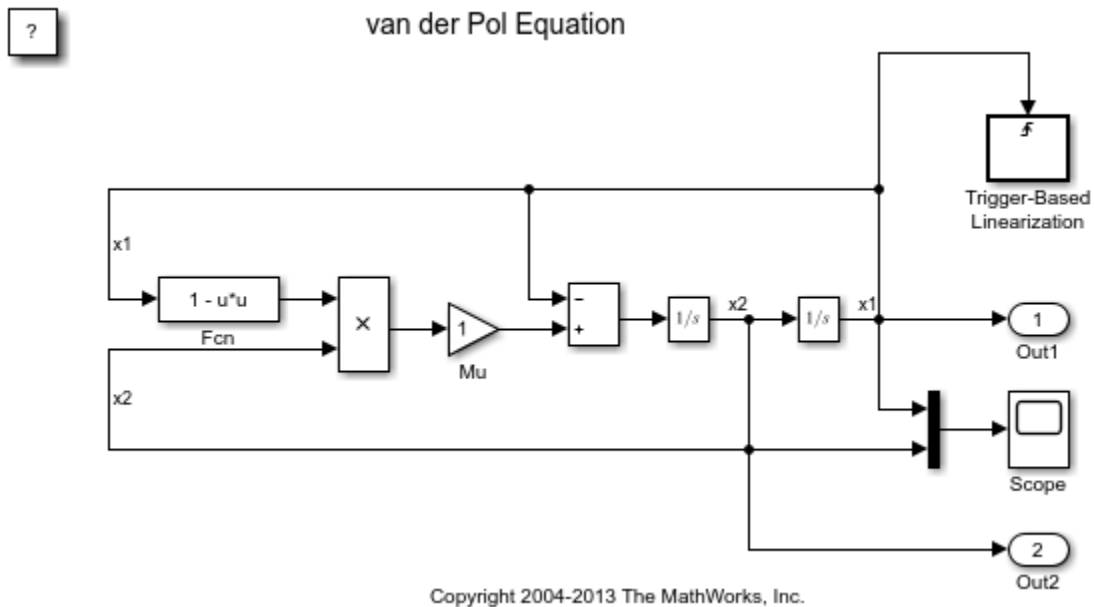

The Scope shows that with the **Initial states** of the Discrete Filter block set to $[1 \ 2]$, the difference between the signal filtered by the Discrete Filter block and the signal from the filter's building blocks is zero. This demonstrates that you can enter the initial conditions of the Discrete Filter block as a vector of $[1 \ 2]$. As an alternative, you can set the initial condition of the Unit Delay Block to 2. The resulting output is the same.

Generate Linear Models for a Rising Edge Trigger Signal

You can use state and simulation time logging to extract the model states at operating points. In this example, the model is configured to get the states when the x1 signal triggers the Trigger-Based Linearization block on a rising edge.

In this model, the **Trigger type** of the Trigger-Based Linearization block is set to **rising**. On the Data Import/Export pane of the Model Configuration Parameters dialog box, the States and Time check boxes are selected.

After simulating the model, the following variables appear in the MATLAB workspace:

- `ex_vdp_triggered_linearization_Trigger_Based_Linearization`
- `tout`
- `xout`

To get the index to the first operating point time, execute the following command:

```
ind1 = find(ex_vdp_triggered_linearization_Trigger_Based_Linearization(1).OperPoint.t==tout);
```

To get the state vector at this operating point, execute the following command:

```
x1 = xout(ind1,:);
```

Generate Linear Models at Predetermined Times

This example shows how to use the Timed-Based Linearization block to generate linear models at predetermined times.

In this model, the **Linearization time** of the Timed-Based Linearization block is set to [2 5]. On the Data Import/Export pane of the Model Configuration Parameters dialog box, the States and Time check boxes are selected. These settings enable you to get the states of the model at the simulation times of 2 and 5 seconds.

F-14 Flight Control

Copyright 1990-2014 The MathWorks, Inc.

After simulating the model, the following variables appear in the MATLAB workspace:

- `ex_f14_linearization_Timed_Based_Linearization`
- `tout`
- `xout`

To get the indices to the operating point times, execute the following command:

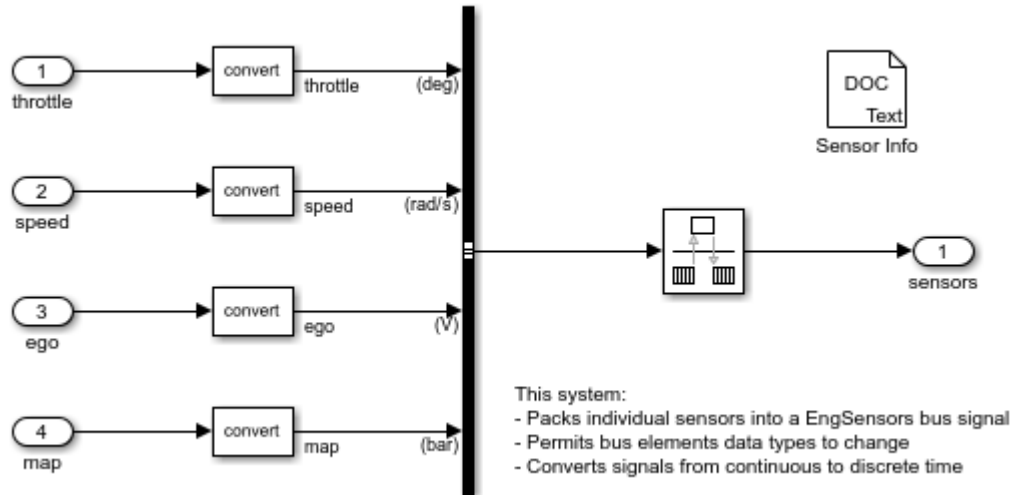

```
ind1 = find(ex_f14_linearization_Timed_Based_Linearization(1).OperPoint.t==tout);
```

To get the state vectors at the operating points, execute the following command:

```
ind2 = find(ex_f14_linearization_Timed_Based_Linearization(1).OperPoint.t==tout);
```

Capture Measurement Descriptions in a DocBlock

This example shows how to use a DocBlock to capture information about a model. In the `sldemo_fuelsys` model, a DocBlock labeled `Sensor Info` is used to document measurement descriptions inside of the `To_Controller` subsystem.

For more information, see the model description.

Square Root of Negative Values

This example shows how to compute the square root of a negative-valued input signal as complex-valued output.

ans =

```
Simulink.SimulationOutput:  
    tout: [51x1 double]  
  
SimulationMetadata: [1x1 Simulink.SimulationMetadata]  
ErrorMessage: [0x0 char]
```

By setting the **Function** to `sqrt` and **Output signal type** to `complex`, the block produces the correct result of $0 + 10i$ for an input of -100 . If you change the **Output signal type** to `auto` or `real`, the block outputs NaN.

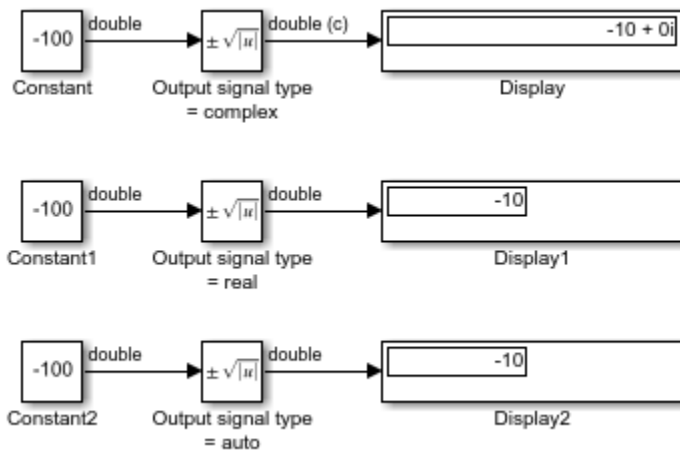

Signed Square Root of Negative Values

This example shows how to compute the signed square root of a negative-valued input signal.

ans =

```
Simulink.SimulationOutput:
      tout: [51x1 double]

SimulationMetadata: [1x1 Simulink.SimulationMetadata]
ErrorMessage: [0x0 char]
```

When the block input is negative and you set the **Function** to `signedSqrt`, the Sqrt block output is the same for any setting of the **Output signal type** parameter. By setting the **Format** of the first Display block to `decimal (Stored Integer)`, you can see the value of the imaginary part for the complex output.

rSqrt of Floating-Point Inputs

This example shows how to compute the rSqrt of a floating-point input signal. The Sqrt block has the following settings:

- **Method** = Newton-Raphson
- **Number of iterations** = 1
- **Intermediate results data type** = Inherit: Inherit from input

After one iteration of the Newton-Raphson algorithm, the block output is within 0.0004 of the final value (0.4834).

ans =

```
Simulink.SimulationOutput:  
    tout: [51x1 double]  
  
SimulationMetadata: [1x1 Simulink.SimulationMetadata]  
ErrorMessage: [0x0 char]
```

rSqrt of Fixed-Point Inputs

This example shows how to compute the rSqrt of a fixed-point input signal. The Sqrt block has the following settings:

- **Method** = Newton-Raphson
- **Number of iterations** = 1
- **Intermediate results data type** = Inherit: Inherit from input

After one iteration of the Newton-Raphson algorithm, the block output is within 0.0459 of the final value (0.4834).

ans =

```
Simulink.SimulationOutput:  
    tout: [51x1 double]  
  
SimulationMetadata: [1x1 Simulink.SimulationMetadata]  
ErrorMessage: [0x0 char]
```

Model a Series RLC Circuit

Physical systems can be described as a series of differential equations in an implicit form,

$$F(t, x, \{\dot{x}\}) = 0, \text{ or in the implicit state-space form } E\dot{x} = Ax + Bu$$

If E is nonsingular, then the system can be easily converted to a system of ordinary differential equations (ODEs) and solved as such:

$$\dot{x} = (E^{-1}A)x + (E^{-1}B)u$$

Many times, states of a system appear without a direct relation to their derivatives, usually representing physical conservation laws. For example:

$$\begin{aligned} \dot{x}_1 &= x_2 \\ 0 &= x_1 + x_2 \end{aligned}$$

In this case, E is singular and cannot be inverted. This class of systems are commonly called *descriptor* systems and the equations are called differential-algebraic equations (DAEs).

Series RLC Circuit

Consider the simple series RLC circuit.

From Kirchoff's Voltage Law, the voltage drop across the circuit is equal to the sum of the voltage drop across each of its elements:

$$V_{AC} = V_R + V_L + V_C$$

From Kirchoff's Current Law:

$$I_{AC} = I_R = I_L = I_C$$

where the subscripts R , L , and C denote the resistance, inductance, and capacitance respectively.

$$V_R = I(t)R$$

$$V_L = LI_L \text{ or } \dot{I}_L = \frac{1}{L}V_L$$

$$V_C = V_{AC}(0) + \int_0^t I_C(\tau) d\tau \text{ or } \dot{V}_c = \frac{1}{C}I_c$$

In Implicit State-Space Form

Model the system in Simulink with $R = 10 \Omega$, $L = 1 \times 10^{-6} H$, $C = 1 \times 10^{-4} F$ to find the voltage across the resistor V_R . To use the Descriptor State-Space block, the system can be written in the implicit, or *descriptor*, state-space form $E\dot{x} = Ax + Bu$ as shown below.

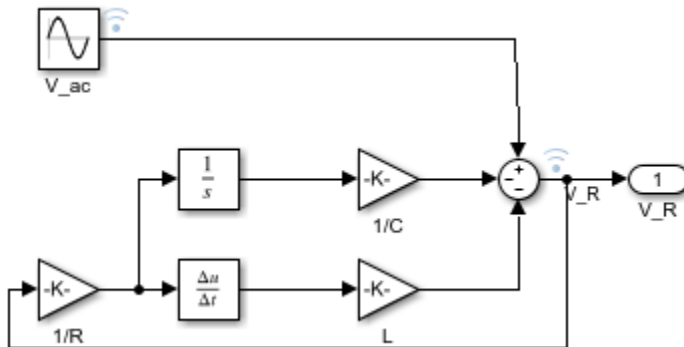

$$\begin{bmatrix} 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} \dot{V}_C \\ \dot{V}_L \\ \dot{V}_R \\ \dot{I}_L \\ \dot{I}_{AC} \end{bmatrix} = \begin{bmatrix} 0 & 0 & 0 & \frac{1}{C} & 0 \\ 1 & 1 & 1 & 0 & 0 \\ 0 & 0 & -1 & R & 0 \\ 0 & \frac{1}{L} & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & -1 \end{bmatrix} \begin{bmatrix} V_C \\ V_L \\ V_R \\ I_L \\ I_{AC} \end{bmatrix} + \begin{bmatrix} 0 \\ -1 \\ 0 \\ 0 \\ 0 \end{bmatrix} V_{AC}$$

where $x = [V_C \ V_L \ V_R \ I_L \ I_{AC}]^T$ is the state vector.

Set $C = [0 \ 0 \ 1 \ 0 \ 0]$ since the voltage across the resistor is being measured.

Compare this to modeling the system with an algebraic loop in order to find V_R .

The simulation of both models produces identical results. However, the Descriptor State-Space block allows you to make a simpler block diagram and avoid algebraic loops.

Extract Vector Elements and Distribute Evenly Across Outputs

This example shows how you can use the Demux block to distribute an input signal evenly over the desired number of outputs. For an input vector of length 6, when you set the **Number of outputs** parameter to 3, the Demux block creates three output signals, each of size 2.

ans =

```
Simulink.SimulationOutput:  
    tout: [1x1 double]  
  
SimulationMetadata: [1x1 Simulink.SimulationMetadata]  
ErrorMessage: [0x0 char]
```

See Also

Demux

Extract Vector Elements Using the Demux Block

When using the Demux block to extract and output elements from a vector input, you can use -1 in a vector expression to indicate that the block dynamically sizes the corresponding port. When a vector expression comprises both positive values and -1 values, the block assigns as many elements as needed to the ports with positive values. The block distributes the remaining elements as evenly as possible over the ports with -1 values.

In this example, the **Number of outputs** parameter of the Demux block is set to [-1, 3, -1]. Thus, the block outputs three signals where the second signal always has three elements. The sizes of the first and third signals depend on the size of the input signal. For an input vector with seven elements, the Demux block outputs two elements on the first port, three elements on the second port, and two elements on the third port.

ans =

```
Simulink.SimulationOutput:  
    tout: [11x1 double]  
  
SimulationMetadata: [1x1 Simulink.SimulationMetadata]  
ErrorMessage: [0x0 char]
```

Detect Change in Signal Values

This example shows how to detect a change in signal values using the Detect Change block. When the input from the Pulse Generator block remains the same, the Detect Change block outputs zero (false), indicating that there was no change in signal values. When the value of the Pulse Generator block changes, the Detect Change block outputs one (true) indicating that the current signal value does not equal its previous value.

Detect Change | Pulse Generator | Scope

Detect Fall to Negative Signal Values

This example shows how to detect when a signal value decreases to a strictly negative value from a value that was greater than or equal to zero.

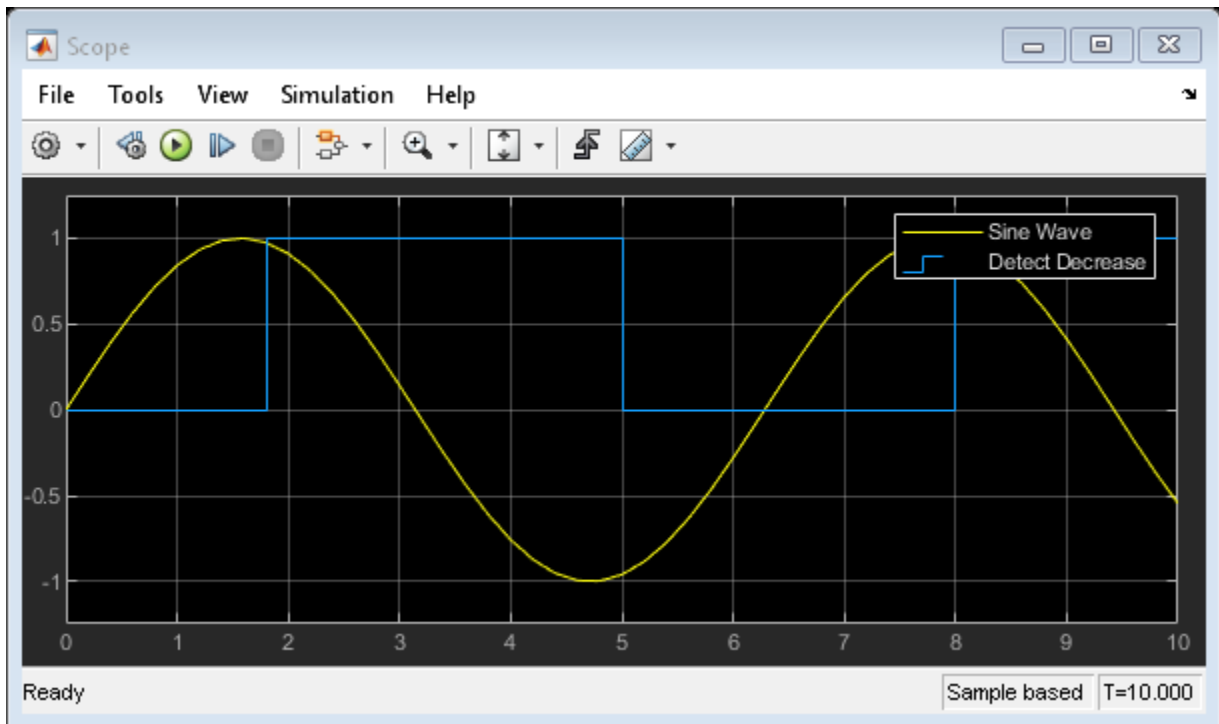

See Also

Detect Fall Negative | Scope | Sine Wave

Detect Decreasing Signal Values

This example shows how to determine if an input signal is strictly less than its previous value using the Detect Decrease block. When the current input to the Detect Decrease block is less than its previous value, the block outputs one (true). When the current input is greater than or equal to the previous signal value, the Detect Decrease block outputs zero (false).

See Also

Detect Decrease | Scope | Sine Wave

Function-Call Blocks Connected to Branches of the Same Function-Call Signal

In this model, a Function-Call Feedback Latch block is on the feedback signal between the branched blocks. As a result, the latch block delays the signal at the input of the destination function-call block, and the destination function-call block executes prior to the source function-call block of the latch block.

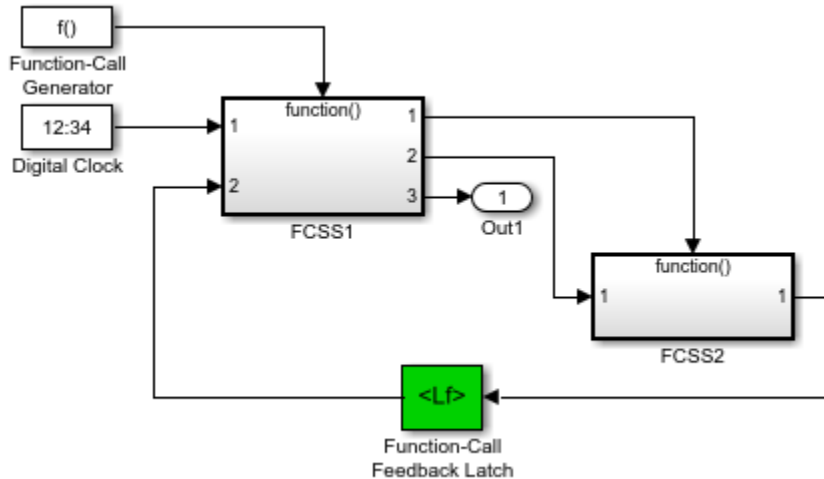

See Also

Function-Call Feedback Latch | Function-Call Generator | Function-Call Split | Function-Call Subsystem

Function-Call Feedback Latch on Feedback Signal Between Child and Parent

In this model, the Function-Call Feedback Latch block is on the feedback signal between the child and the parent. This arrangement prevents the signal value, read by the parent (FCSS1), from changing during execution of the child. In other words, the parent reads the value from the previous execution of the child (FCSS2).

Digital Clock | Function-Call Feedback Latch | Function-Call Generator | Function-Call Subsystem

Function-Call Subsystem with Merged Signal As Input

In this model a merged signal serves as the input to a function-call subsystem. Latching is necessary if one of the signals entering the Merge block forms a feedback loop with the function-call subsystem. In this example, one of the output signals from FCSS2 combines with the output of an Enabled Subsystem block and then feeds back into an inport of FCSS2.

Partitioning an Input Signal with the For Each Block

The following model demonstrates the partitioning of an input signal by a For Each block. Each row of this 2-by-3 input array contains three integers that represent the (x, y, z)-coordinates of a point. The goal is to translate each of these points based on a new origin at (-20, -10, -5) and to display the results.

By placing the process of summing an input signal and the new origin inside of a For Each Subsystem block, you can operate on each set of coordinates by partitioning the input signal into two row vectors. To accomplish such partitioning, use the default settings of 1 for both the partition dimension and the partition width. If you also use the default concatenation dimension of 1, each new set of coordinates stacks in the d1 direction, making your display a 2-by-3 array.

See Also

For Each | For Each Subsystem

Specifying the Concatenation Dimension in the For Each Block

This example shows how to specify a concatenation dimension in the For Each block. When you specify a **Concatenation Dimension** of 2 on the **Output Concatenation** tab, each set of results stacks in the d2 direction, and the result is a single row vector.

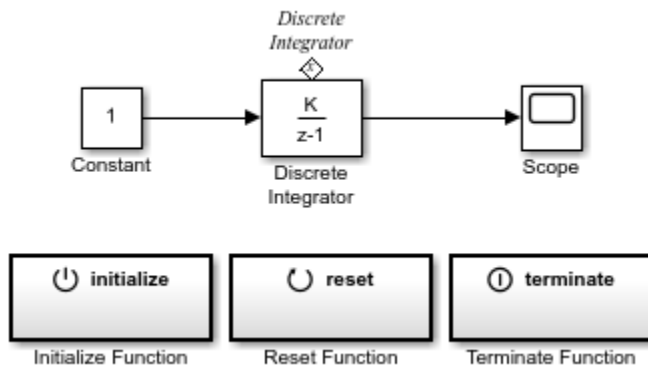

To learn how the For Each block and subsystem handle a model with states, see the For Each Subsystem block reference page.

Related Examples

- “Using Initialize, Reset, and Terminate Functions”

Reading and Writing States with the Initialize Function and Terminate Function Blocks

In this example, the Initialize Function block uses the State Writer block to set the initial condition of a Discrete Integrator block to 10. The Terminate Function block includes a State Reader block, which reads the state of the Discrete Integrator block. The **Event type** parameter of the Event Listener block for the initialize and terminate functions is set to `Initialize` and `Terminate`, respectively.

Simulation of a Bouncing Ball

This example shows how to use two different approaches to modeling a bouncing ball using Simulink®.

Overview

Figure 1: A ball is thrown up with a velocity of 15 m/s from a height of 10 m.

A bouncing ball model is a classic example of a **hybrid dynamic system**. A hybrid dynamic system is a system that involves both continuous dynamics, as well as, discrete transitions where the system dynamics can change and the state values can jump. The continuous dynamics of a bouncing ball is simply given by:

$$\frac{dv}{dt} = -g,$$

$$\frac{dx}{dt} = v,$$

where g is the acceleration due to gravity, $x(t)$ is the position of the ball and $v(t)$ is the velocity. Therefore, the system has two continuous states: position x and velocity v .

The hybrid system aspect of the model originates from the modeling of a collision of the ball with the ground. If one assumes a partially elastic collision with the ground, then the velocity before the collision, v^- , and velocity after the collision, v^+ , can be related by the coefficient of restitution of the ball, κ , as follows:

$$v^+ = -\kappa v^-, \quad x = 0$$

The bouncing ball therefore displays a jump in a continuous state (velocity) at the transition condition, $x = 0$.

A bouncing ball is one of the simplest models that shows the **Zeno phenomenon**. Zeno behavior is informally characterized by an infinite number of events occurring in a finite time interval for certain hybrid systems. As the ball loses energy in the bouncing ball model, a large number of collisions with the ground start occurring in successively smaller intervals of time. Hence the model experiences Zeno behavior. Models with **Zeno behavior** are inherently difficult to simulate on a computer, but are encountered in many common and important engineering applications.

Using Two Integrator Blocks to Model a Bouncing Ball

Open this model

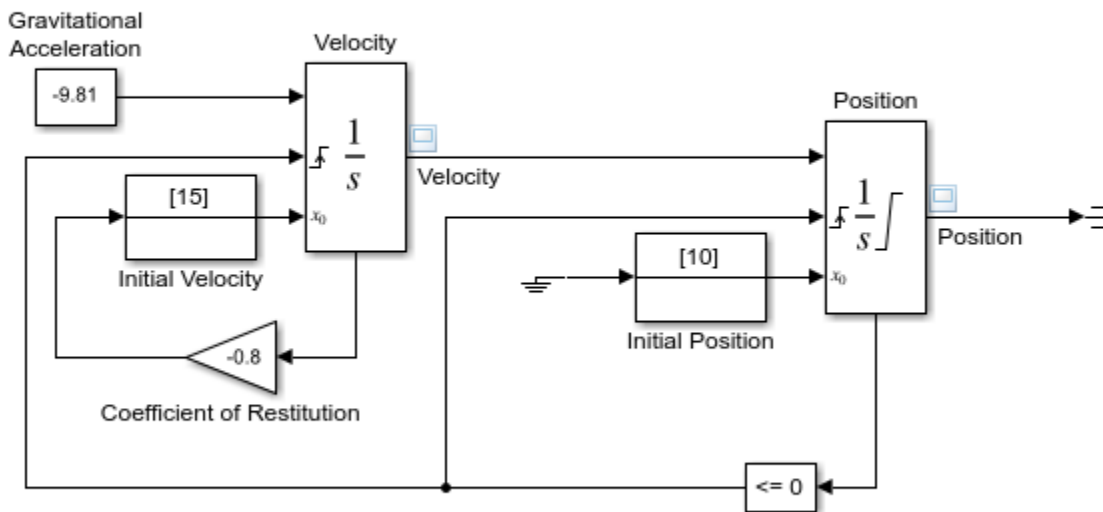

You can use two Integrator blocks to model a bouncing ball. The Integrator on the left is the velocity integrator modeling the first equation and the Integrator on the right is the position integrator. Navigate to the position integrator block dialog and observe that it has a lower limit of zero. This condition represents the constraint that the ball cannot go below the ground.

The state port of the position integrator and the corresponding comparison result is used to detect when the ball hits the ground and to reset both integrators. The state port of the velocity integrator is used for the calculation of v^+ .

Bouncing Ball Model

Two separate Integrators are less efficient than a single Second-Order Integrator for simulating a bouncing ball. [Click here to see slidemo_bounce for the recommended modeling approach.](#)

Copyright 1990-2013 The MathWorks, Inc.

To observe the Zeno behavior of the system, navigate to the Solver pane of the Configuration Parameters dialog box. In the 'Zero-crossing options' section, confirm that 'Algorithm' is set to 'Nonadaptive' and that the simulation 'Stop time' is set to 25 seconds. Run the simulation.

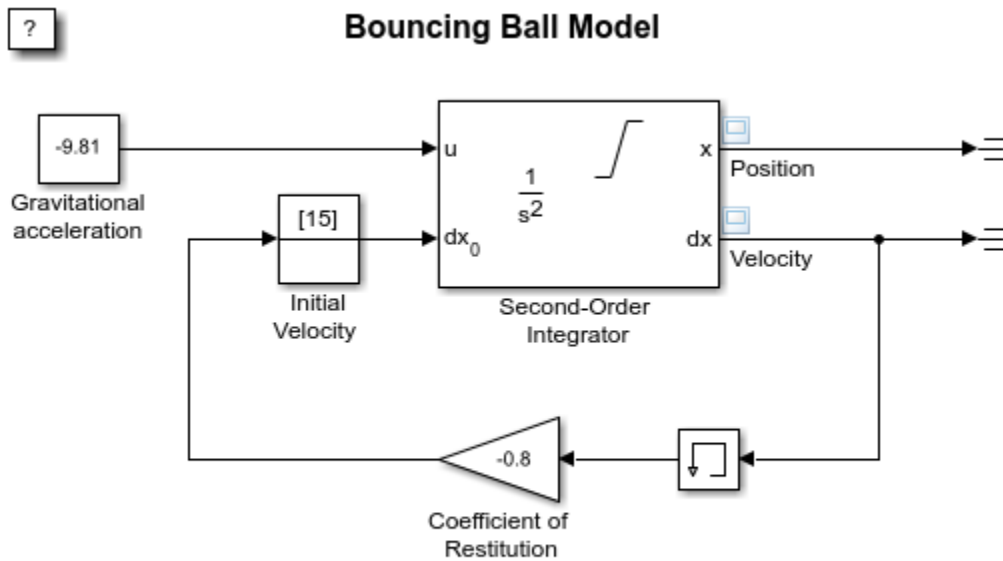

Observe that the simulation errors out as the ball hits the ground more and more frequently and loses energy. Consequently, the simulation exceeds the default limit of 1000 for the 'Number of consecutive zero crossings' allowed. Now navigate to the Configuration Parameters dialog box. In the 'Zero-crossing options' section, set the 'Algorithm' to 'Adaptive'. This algorithm introduces a sophisticated treatment of such chattering behavior. Therefore, you can now simulate the system beyond 20 seconds. Note, however, the chatter of the states between 21 seconds and 25 seconds and warning from Simulink about the strong chattering in the model around 20 seconds.

Using a Second-Order Integrator Block to Model a Bouncing Ball

Open this model

You can use a single Second-Order Integrator block to model this system. The second equation $dx/dt = v$ is internal to the Second-Order Integrator block in this case. Navigate to the Second-Order

Integrator block dialog and notice that, as earlier, x has a lower limit of zero. Navigate to the Attributes tab on the block dialog and note that the option 'Reinitialize dx/dt when x reaches saturation' is checked. This parameter allows us to reinitialize dx/dt (v in the bouncing ball model) to a new value at the instant x reaches its saturation limit. For the bouncing ball model, this option therefore implies that when the ball hits the ground, its velocity can be set to a different value, i.e., to the velocity after the impact. Notice the loop for calculating the velocity after a collision with the ground. To capture the velocity v^- of the ball just before the collision, the dx/dt output port of the Second-Order Integrator block and a Memory block are used. v^- is then used to calculate the rebound velocity v^+ .

Copyright 2004-2013 The MathWorks, Inc.

Navigate to the Solver pane of the Configuration Parameters dialog box. Confirm that 'Algorithm' is set to 'Nonadaptive' in the 'Zero-crossing options' section and the simulation 'Stop Time' is set to 25 seconds. Simulate the model. Note that the simulation encountered no problems. You were able to simulate the model without experiencing excessive chatter after $t = 20$ seconds and without setting the 'Algorithm' to 'Adaptive'.

Second-Order Integrator Model Is the Preferable Approach to Modeling Bouncing Ball

One can analytically calculate the exact time t^* when the ball settles down to the ground with zero velocity by summing the time required for each bounce. This time is the sum of an infinite geometric series given by:

$$t^* = \frac{1}{g} \left(v_0 + v_1 \left(\frac{1 + \kappa}{1 - \kappa} \right) \right), \quad v_1 = \sqrt{v_0^2 + 2gx_0}.$$

Here x_0 and v_0 are initial conditions for position and velocity respectively. The velocity and the position of the ball must be identically zero for $t > t^*$. In the figure below, results from both simulations are plotted near t^* . The vertical red line in the plot is t^* for the given model parameters. For $t < t^*$ and far away from t^* , both models produce accurate and identical results. Hence, only a

magenta line from the second model is visible in the plot. However, the simulation results from the first model are inexact after t^* ; it continues to display excessive chattering behavior for $t > t^*$. In contrast, the second model using the Second-Order Integrator block settles to exactly zero for $t > t^*$.

Figure 2: Comparison of simulation results from the two approaches.

Figure 2 conclusively shows that the second model has superior numerical characteristics as compared to the first model. The reason for the higher accuracy associated with the Second-Order Integrator model is as follows. The second differential equation $dx/dt = v$ is internal to the Second-Order Integrator block. Therefore, the block algorithms can leverage this known relationship between the two states and deploy heuristics to clamp down the undesirable chattering behavior for certain conditions. These heuristics become active when the two states are no longer mutually consistent with each other due to integration errors and chattering behavior. You can thus use physical knowledge of the system to alleviate the problem of simulation getting stuck in a Zeno state for certain classes of Zeno models.

Single Hydraulic Cylinder Simulation

This example shows how to use Simulink® to model a hydraulic cylinder. You can apply these concepts to applications where you need to model hydraulic behavior. See two related examples that use the same basic components: four cylinder model and two cylinder model with load constraints.

- Note: This is a basic hydraulics example. You can more easily build hydraulic and automotive models using Simscape™ Driveline™ and Simscape Fluids™.
- **Simscape Fluids** provides component libraries for modeling and simulating fluid systems. It includes models of pumps, valves, actuators, pipelines, and heat exchangers. You can use these components to develop fluid power systems such as front-loader, power steering, and landing gear actuation systems. Engine cooling and fuel supply systems can also be developed with Simscape Fluids. You can integrate mechanical, electrical, thermal, and other systems using components available within the Simscape product family.
- **Simscape Driveline** provides component libraries for modeling and simulating one-dimensional mechanical systems. It includes models of rotational and translational components, such as worm gears, planetary gears, lead screws, and clutches. You can use these components to model the transmission of mechanical power in helicopter drivetrains, industrial machinery, vehicle powertrains, and other applications. Automotive components, such as engines, tires, transmissions, and torque converters, are also included.

Analysis and Physics of the Model

Figure 1 shows a schematic diagram of the basic model. The model directs the pump flow, Q , to supply pressure, p_1 , from which laminar flow, q_{1ex} , leaks to exhaust. The control valve for the piston/cylinder assembly is modeled as turbulent flow through a variable-area orifice. Its flow, q_{12} , leads to intermediate pressure, p_2 , which undergoes a subsequent pressure drop in the line connecting it to the actuator cylinder. The cylinder pressure, p_3 , moves the piston against a spring load, resulting in position x .

Figure 1: Schematic diagram of the basic hydraulic system

At the pump output, the flow is split between leakage and flow to the control valve. We model the leakage, q_{1ex} , as laminar flow (see Equation Block 1).

Equation Block 1

$$Q = q_{12} + q_{1ex}$$

$$q_{1ex} = C_2 \cdot p_1$$

$$p_1 = \frac{(Q - q_{12})}{C_2}$$

$$Q = \text{pump flow}$$

$$q_{12} = \text{control valve flow}$$

$$q_{1ex} = \text{leakage}$$

$$C_2 = \text{flow coefficient}$$

$$p_1 = \text{pump pressure}$$

We modeled turbulent flow through the control valve with the orifice equation. The sign and absolute value functions accommodate flow in either direction (see Equation Block 2).

Equation Block 2

$$q_{12} = C_d \cdot A \cdot \text{sgn}(p_1 - p_2) \cdot \sqrt{\frac{2}{\rho} |p_1 - p_2|}$$

$$C_d = \text{orifice discharge coefficient}$$

$$A = \text{orifice area}$$

$$p_2 = \text{pressure downstream of control valve}$$

$$\rho = \text{fluid density}$$

The fluid within the cylinder pressurizes due to this flow, $q_{12} = q_{23}$, minus the compliance of the piston motion. We also modeled fluid compressibility in this case (see Equation Block 3).

Equation Block 3

$$\frac{dp_3}{dt} = \frac{\beta}{V_3} \left(q_{12} - A_c \frac{dx}{dt} \right)$$

$$V_3 = V_{30} + A_c \cdot x$$

$$p_3 = \text{piston pressure}$$

$$\beta = \text{fluid bulk modulus}$$

$$V_3 = \text{fluid volume at } p_3$$

$$V_{30} = \text{fluid volume in the piston for } x = 0$$

$$A_c = \text{cylinder cross-sectional area}$$

We neglected the piston and spring masses because of the large hydraulic forces. We completed the system of equations by differentiating this relationship and incorporating the pressure drop between p_2 and p_3 . Equation Block 3 models laminar flow in the line from the valve to the actuator. Equation block 4 gives the force balance at the piston.

Equation Block 4

$$x = p_3 \frac{A_c}{K}$$

$$\frac{dx}{dt} = \frac{dp_3}{dt} \frac{A_c}{K}$$

$$q_{23} = q_{12} = C_1 (p_2 - p_3)$$

$$p_2 = p_3 + \frac{q_{12}}{C_1}$$

K = spring constant

C_1 = laminar flow coefficient

Modeling

Figure 2 shows the top level diagram of the model. The pump flow and the control valve orifice area are simulation inputs. The model is organized as two subsystems: the 'Pump' and the 'Valve/Cylinder/Piston/Spring Assembly'.

Opening the Model and Running the Simulation

To open this model, type `sldemo_hydcyl` at MATLAB® terminal (click on the hyperlink if you are using MATLAB Help). Press the "Play" button on the model toolbar to run the simulation.

- Note: The model logs relevant data to MATLAB workspace, into the `Simulink.SimulationOutput` object out. The signal logging data is stored within out, in a structure called `sldemo_hydcyl_output`. Logged signals have a blue indicator (see the model). Read more about Signal Logging in Simulink Help.

Single Hydraulic Cylinder Simulation

Copyright 1990-2012 The MathWorks, Inc.

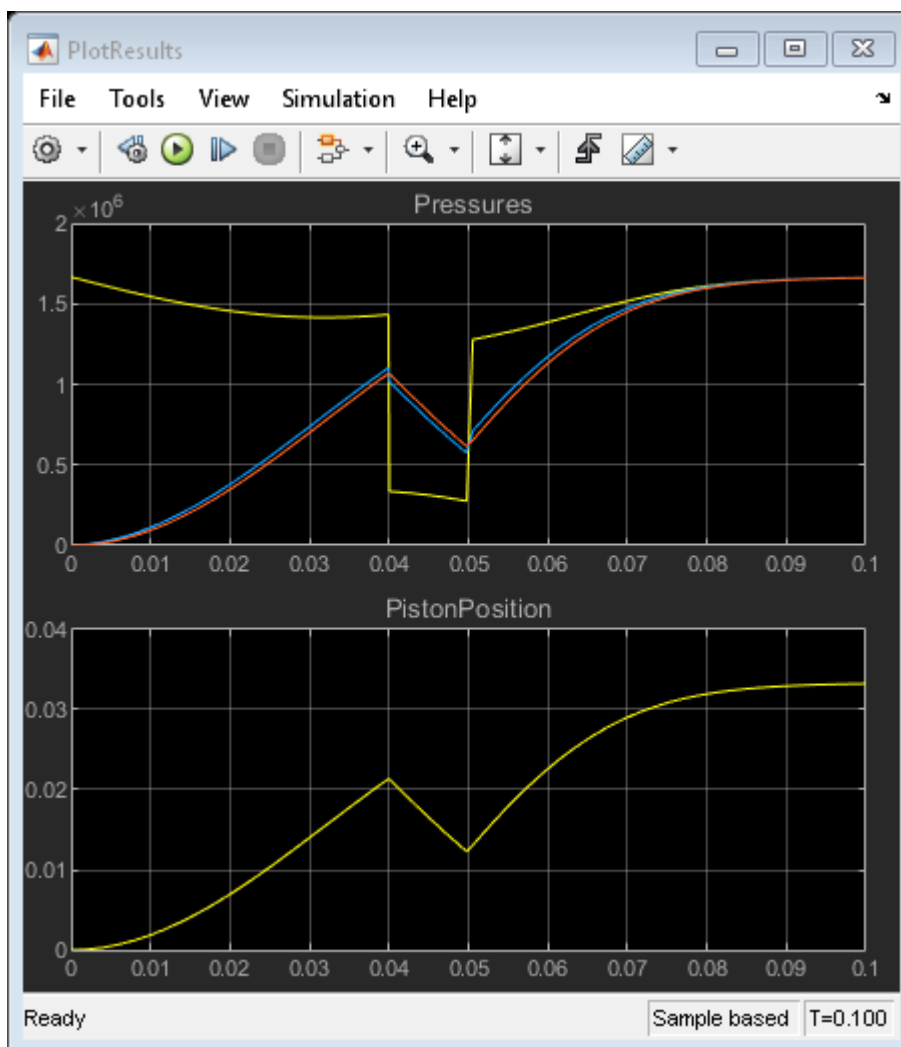

Figure 2: Single cylinder model and simulation results**'Pump' Subsystem**

Right click on the 'Pump' masked subsystem and select "Look Under Mask" to see its components. The pump model computes the supply pressure as a function of the pump flow and the load (output) flow (Figure 3). Q_{pump} is the pump flow data (saved in the model workspace). A matrix with column vectors of time points and the corresponding flow rates $[T, Q]$ specifies the flow data. The model calculates pressure p_1 as indicated in Equation Block 1. Because $Q_{\text{out}} = q_{12}$ is a direct function of p_1 (via the control valve), an algebraic loop is formed. An estimate of the initial value, p_{10} , enables a more efficient solution.

**Figure 3:** The pump subsystem

We masked the 'Pump' subsystem in Simulink to allow the user to easily access the parameters (see Figure 4). The parameters to be specified are T , Q , p_{10} , and C_2 . We then assigned the masked block the icon shown in Figure 2, and saved it in a Simulink library.

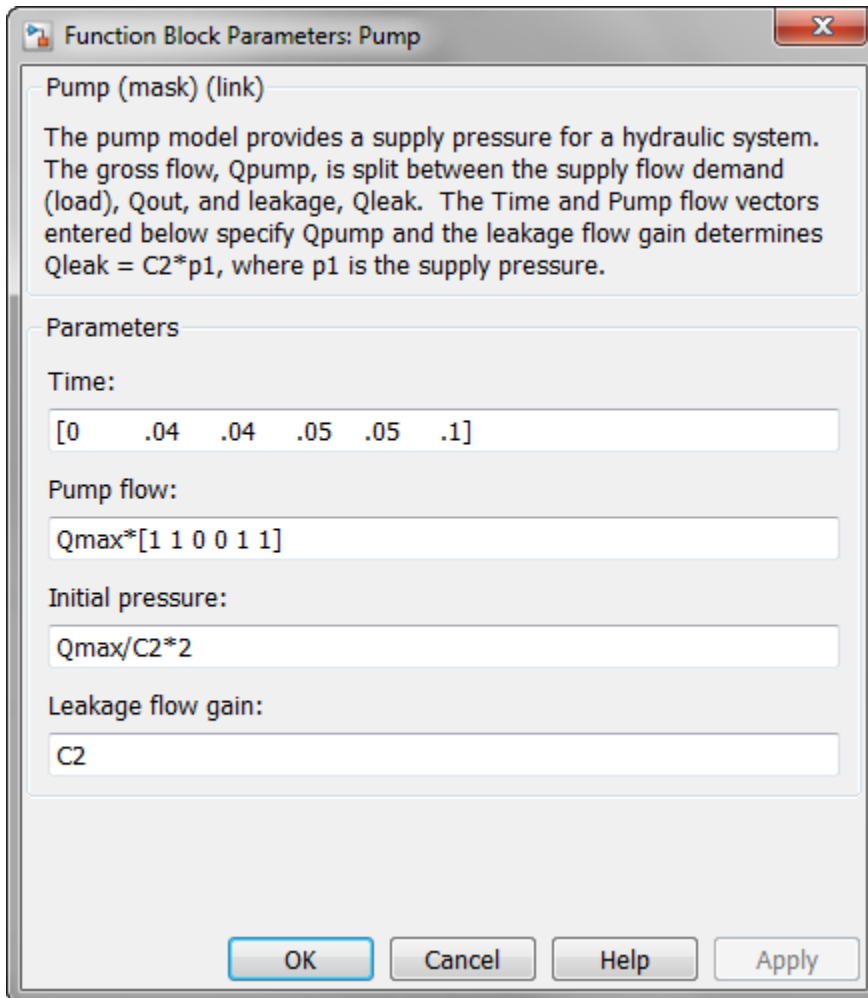

Figure 4: Entering pump parameters

'Valve/Cylinder/Piston/Spring Assembly' Subsystem

Right click on the 'Valve/Cylinder/Piston/Spring Assembly' in the model and select "Look Under Mask" to see the Actuator subsystem (see Figure 5). A system of differential-algebraic equations models the cylinder pressurization with the pressure p_3 , which appears as a derivative in Equation Block 3 and is used as the state (integrator). If we neglect piston mass, the spring force and piston position are direct multiples of p_3 and the velocity is a direct multiple of p_3 's time derivative. This latter relationship forms an algebraic loop around the 'Beta' Gain block. The intermediate pressure p_2 is the sum of p_3 and the pressure drop due to the flow from the valve to the cylinder (Equation Block 4). This relationship also imposes an algebraic constraint through the control valve and the $1/C_1$ gain.

The control valve subsystem computes the orifice (Equation Block2). It uses as inputs the upstream and downstream pressures and the variable orifice area. The 'Control Valve Flow' Subsystem computes the signed square root:

$$y = \text{sgn}(u)\sqrt{|u|}$$

Three nonlinear functions are used, two of which are discontinuous. In combination, however, y is a continuous function of u .

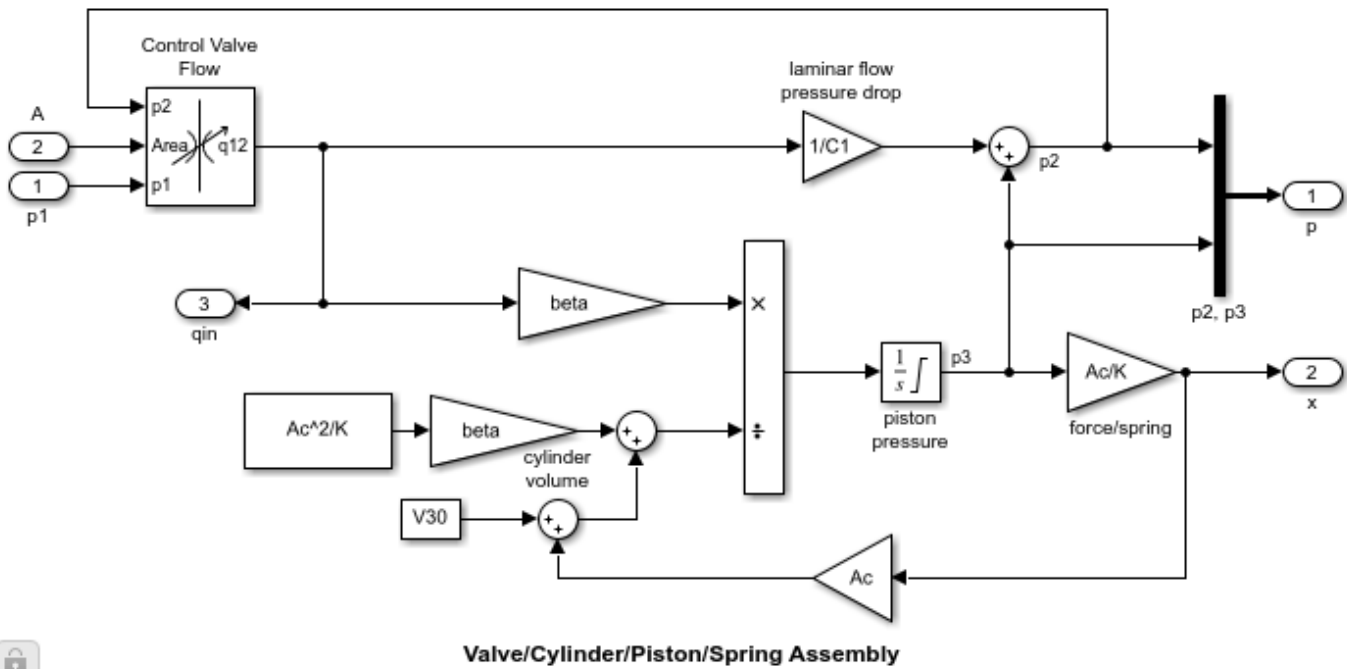

Figure 5: The valve/cylinder/piston/spring subsystem

Results

Simulation Parameters

We simulated the model using the following data. The information is loaded from a MAT-file - `sldemo_hydcyl_data.mat`, which is also used for the other two hydraulic cylinder models. The users can enter data via the Pump and Cylinder Masks shown in Figures 4 and 6.

$$C_d = 0.61$$

$$\rho = 800 \text{ kg/m}^3$$

$$C_1 = 2e - 8 \text{ m}^3/\text{sec}/\text{Pa}$$

$$C_2 = 3e - 9 \text{ m}^3/\text{sec}/\text{Pa}$$

$$\beta = 7e8 \text{ Pa}$$

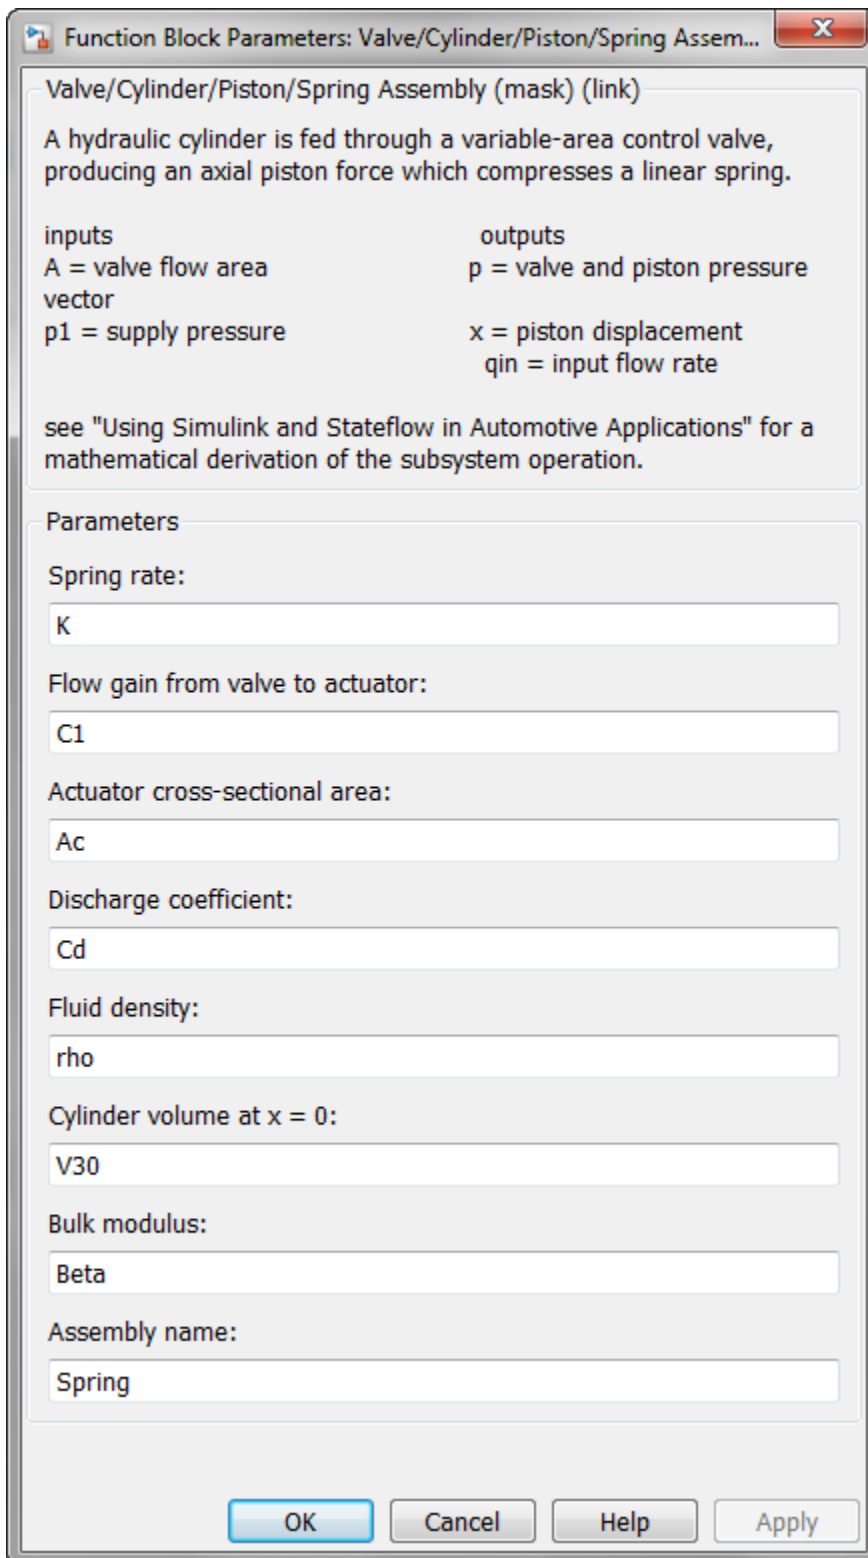

$$A_c = 1e - 3 \text{ m}^2$$

$$K = 5e4 \text{ N/m}$$

$$V_{30} = 2.5e - 5 \text{ m}^3$$

$$T = [0 \ 0.04 \ 0.04 \ 0.05 \ 0.05 \ 0.1] \text{ sec}$$

$$Q = [0.005 \ 0.005 \ 0 \ 0 \ 0.005 \ 0.005] \text{ m}^3/\text{sec}$$

Plotting Simulation Results

The system initially steps to a pump flow of $0.005 \text{ m}^3/\text{sec}=300 \text{ l}/\text{min}$, abruptly steps to zero at $t=0.04 \text{ sec}$, then resumes its initial flow rate at $t=0.05 \text{ sec}$.

The control valve starts with zero orifice area and ramps to $1\text{e-}4 \text{ sq.m.}$ during the 0.1 sec simulation time. With the valve closed, all of the pump flow goes to leakage so the initial pump pressure increases to $p_{10} = Q/C2 = 1667 \text{ kPa}$.

As the valve opens, pressures p_2 and p_3 build up while p_1 decreases in response to the load increase as shown in Figure 7. When the pump flow cuts off, the spring and piston act like an accumulator and p_3 decreases continuously. Then the flow reverses direction, so p_2 , though relatively close to p_3 , falls abruptly. At the pump itself, all of the back-flow leaks and p_1 drops radically. The behavior reverses as the flow is restored.

The piston position is directly proportional to p_3 , where the hydraulic and spring forces balance. Discontinuities in the velocity at 0.04 sec and 0.05 sec indicate negligible mass. The model reaches a steady state when all of the pump flow again goes to leakage, now due to zero pressure drop across the control valve (which means $p_3 = p_2 = p_1 = p_{10}$).

Closing the Model

Close the model and clear generated data.

Thermal Model of a House

This example shows how to use Simulink® to create the thermal model of a house. This system models the outdoor environment, the thermal characteristics of the house, and the house heating system.

The `sldemo_househeat_data.m` file initializes data in the model workspace. To make changes, you can edit the model workspace directly or edit the file and re-load the model workspace. To view the model workspace, from the Simulink Editor **Modeling** tab, click **Model Explorer**.

Opening the Model

Open the `sldemo_househeat` model

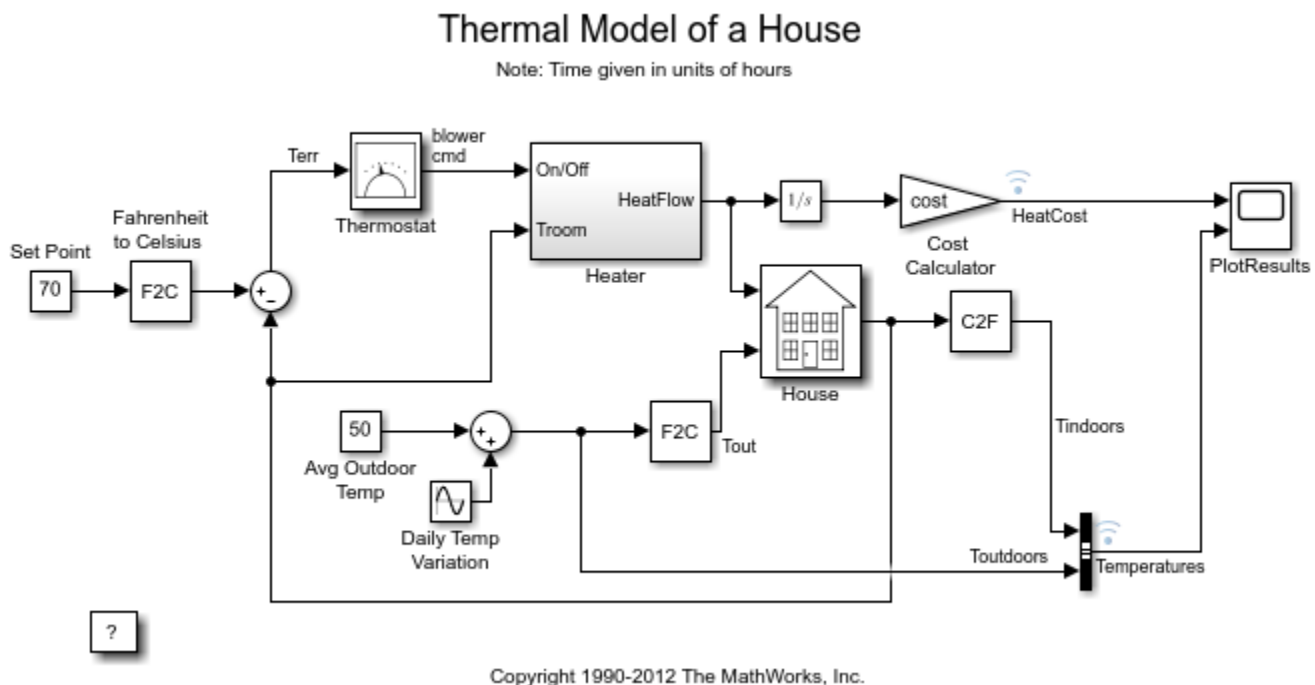

Figure 1: The House Heating Model

Model Initialization

This model calculates heating costs for a generic house. When the model is opened, it loads the information about the house from the `sldemo_househeat_data.m` file. The file does the following:

- Defines the house geometry (size, number of windows)
- Specifies the thermal properties of house materials
- Calculates the thermal resistance of the house
- Provides the heater characteristics (temperature of the hot air, flow-rate)
- Defines the cost of electricity (0.09\$/kWhr)
- Specifies the initial room temperature (20 deg. Celsius = 68 deg. Fahrenheit)

- **Note:** Time is given in units of hours. Certain quantities, like air flow-rate, are expressed per hour (not per second).

Model Components

Set Point

"Set Point" is a constant block. It specifies the temperature that must be maintained indoors. It is 70 degrees Fahrenheit by default. Temperatures are given in Fahrenheit, but then are converted to Celsius to perform the calculations.

Thermostat

"Thermostat" is a subsystem that contains a Relay block. The thermostat allows fluctuations of 5 degrees Fahrenheit above or below the desired room temperature. If air temperature drops below 65 degrees Fahrenheit, the thermostat turns on the heater. See the thermostat subsystem below.

Open the Thermostat subsystem

Figure 2: The "Thermostat" Subsystem

Heater

"Heater" is a subsystem that has a constant air flow rate, "Mdot", which is specified in the sldemo_househeat_data.m file. The thermostat signal turns the heater on or off. When the heater is on, it blows hot air at temperature THeater (50 degrees Celsius = 122 degrees Fahrenheit by default) at a constant flow rate of Mdot (1kg/sec = 3600kg/hr by default). The heat flow into the room is expressed by the Equation 1.

Equation 1

$$\frac{dQ}{dt} = (T_{heater} - T_{room}) \cdot Mdot \cdot c$$

$$\frac{dQ}{dt} = \text{heat flow from the heater into the room}$$

c = heat capacity of air at constant pressure

$Mdot$ = air mass flow rate through heater (kg/hr)

T_{heater} = temperature of hot air from heater

T_{room} = current room air temperature

Open the Heater subsystem

Figure 3: The Heater Subsystem

Cost Calculator

"Cost Calculator" is a Gain block. "Cost Calculator" integrates the heat flow over time and multiplies it by the energy cost. The cost of heating is plotted in the "PlotResults" scope.

House

"House" is a subsystem that calculates room temperature variations. It takes into consideration the heat flow from the heater and heat losses to the environment. Heat losses and the temperature time derivative are expressed by Equation 2.

Equation 2

$$\left(\frac{dQ}{dt}\right)_{losses} = \frac{T_{room} - T_{out}}{R_{eq}}$$

$$\frac{dT_{room}}{dt} = \frac{1}{M_{air} \cdot c} \cdot \left(\frac{dQ_{heater}}{dt} - \frac{dQ_{losses}}{dt}\right)$$

M_{air} = mass of air inside the house

R_{eq} = equivalent thermal resistance of the house

Open the House subsystem

Figure 4: The House Subsystem

Modeling the Environment

We model the environment as a heat sink with infinite heat capacity and time varying temperature T_{out} . The constant block "Avg Outdoor Temp" specifies the average air temperature outdoors. The "Daily Temp Variation" Sine Wave block generates daily temperature fluctuations of outdoor temperature. Vary these parameters and see how they affect the heating costs.

Running the Simulation and Visualizing the Results

Run the simulation and visualize the results. Open the "PlotResults" scope to visualize the results. The heat cost and indoor versus outdoor temperatures are plotted on the scope. The temperature outdoor varies sinusoidally, whereas the indoors temperature is maintained within 5 degrees Fahrenheit of "Set Point". Time axis is labeled in hours.

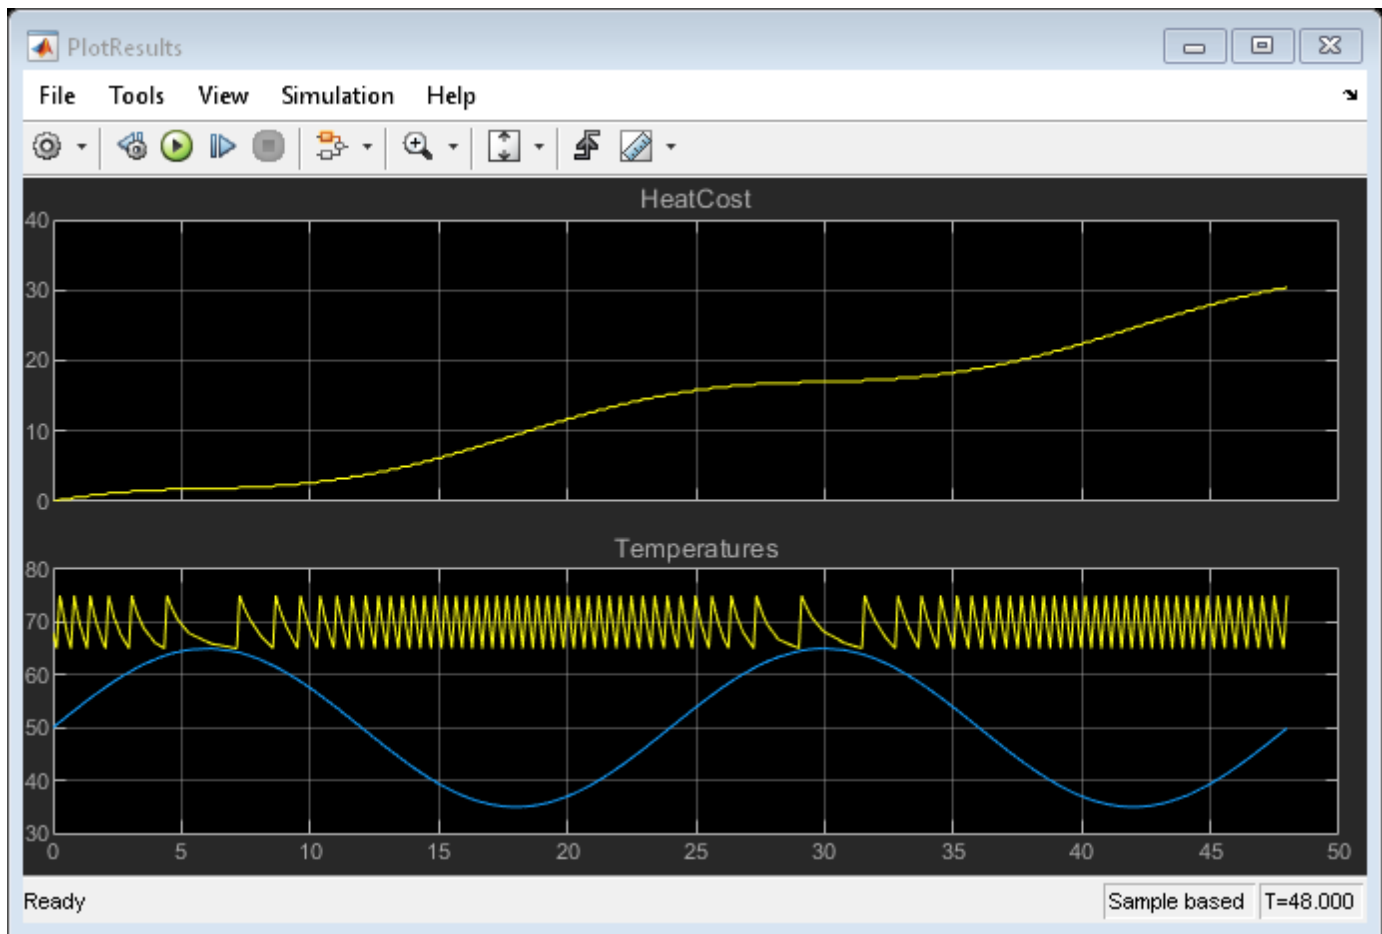

Figure 5: Simulation results (time axis labeled in hours)

According to this model, it would cost around \$30 to heat the house for two days. Try varying the parameters and observe the system response.

Remarks

This particular model is designed to calculate the heating costs only. If the temperature of the outside air is higher than the room temperature, the room temperature will exceed the desired "Set Point".

You can modify this model to include an air conditioner. You can implement the air conditioner as a modified heater. To do this, add parameters like the following to `sldemo_househeat_data.m`.

- Cold air output
- Temperature of the stream from the air conditioner
- Air conditioner efficiency

You would also need to modify the thermostat to control both the air conditioner and the heater.

Approximating Nonlinear Relationships: Type S Thermocouple

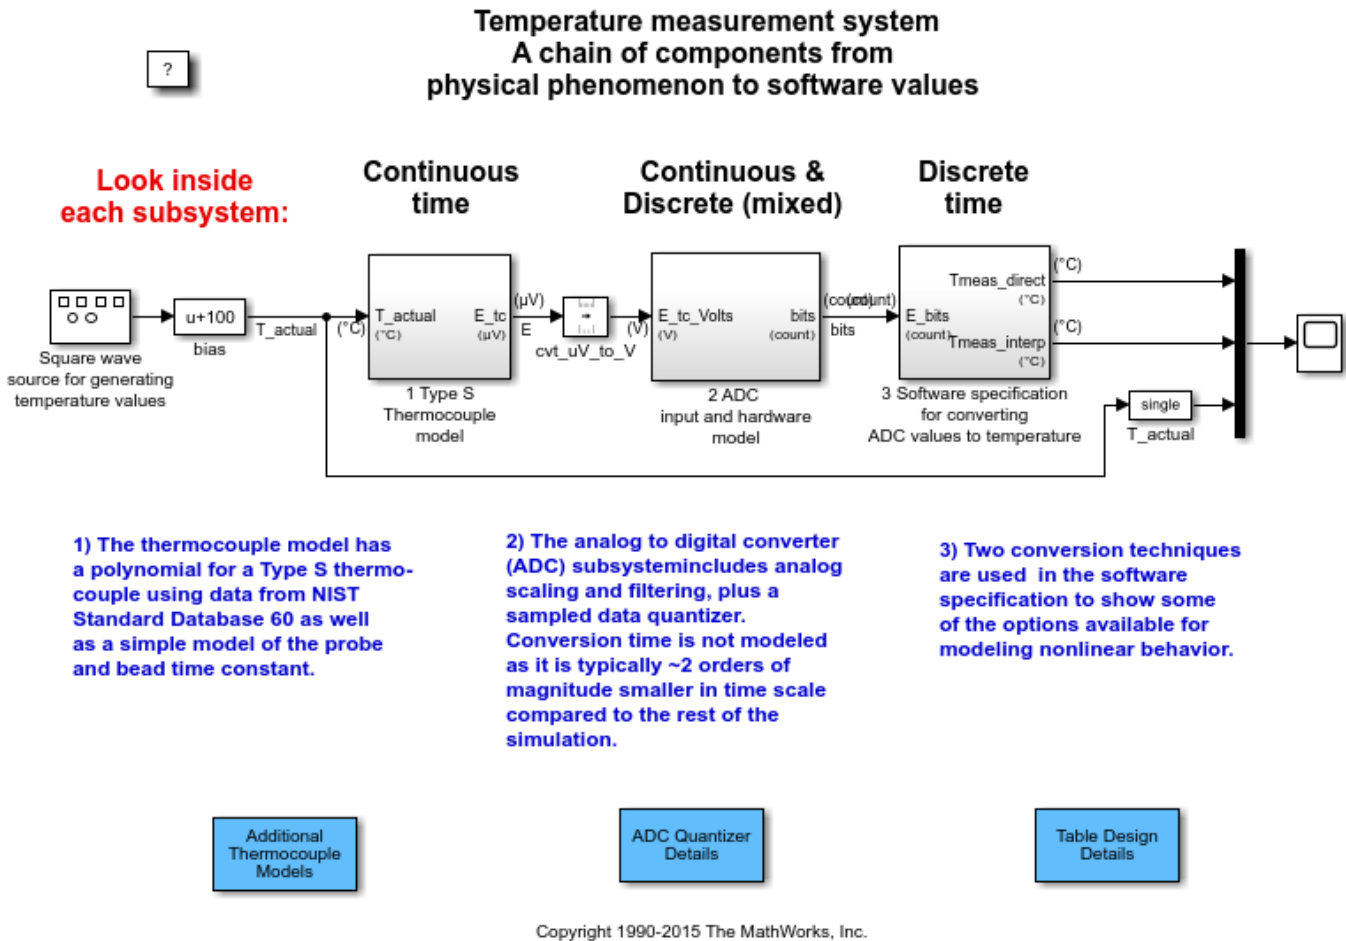

This example shows how to approximate nonlinear relationships of a type S thermocouple.

Thermocouple Modeling and Signal Conversion

The thermocouple is one of the popular analog transducers today, along with other devices such as position sensors, strain gages, pressure transducers, and resistance temperature devices (RTDs). Operating under the principle of the Seebeck effect (a.k.a. thermoelectric effect), thermocouples have an empirically determined nonlinear behavior that is well known over each junction type's useful operating range. If you run the model, you will be able to see the cumulative effect of each component on dynamic measurement accuracy. This example will focus on models for each of these components in a dynamic temperature measurement system for a Type S (Platinum-10% Rhodium(+)) versus Platinum(-) : a thermocouple device and probe assembly, a signal conditioning method, an analog to digital converter (ADC), and a software specification for converting the ADC output into a temperature value. An additional section shows how to obtain and use standard NIST ITS-90 thermocouple data with Simulink® models. Look-up tables and a polynomial block are used in this design to capture the nonlinear behavior of the thermocouple. Note that the polynomial block is a viable alternative to look-up tables for some applications, minimizing ROM usage at the cost of some additional computation for the full polynomial representation.

Open the model

```
open_system('sldemo_tc')
```

1) The thermocouple model has a polynomial for a Type S thermocouple using data from NIST Standard Database 60 as well as a simple model of the probe and bead time constant.

2) The analog to digital converter (ADC) subsystem includes analog scaling and filtering, plus a sampled data quantizer. Conversion time is not modeled as it is typically ~2 orders of magnitude smaller in time scale compared to the rest of the simulation.

3) Two conversion techniques are used in the software specification to show some of the options available for modeling nonlinear behavior.

Figure 1: Temperature measurement system: a chain of components from physical phenomenon to software values

Simulating the Thermocouple Signal

The two main features of the thermocouple model are the probe and bead dynamics and the thermocouple's conversion of temperature into a millivolt signal. The probe+bead dynamics are modeled as a 30 msec first order system, and the nonlinear thermocouple behavior is modeled using the segment 1 polynomial data from NIST Standard Database 60 for a Type S thermocouple from -50 to 1063 degC. For numerical stability, the coefficients were scaled to return microvolts from the polynomial block. The output of the 1 Type S Thermocouple model subsystem is then converted to volts with a Unit Conversion block. Note that units are specified on the subsystem input and output ports and displayed on the subsystem icons. To learn more about units in Simulink see Simulink Units.

An alternative implementation to using the polynomial is an interpolated look-up table. Table data could be used in a look-up table block in place of the polynomial block. Sample data was constructed from NIST Standard Database 60 for a Type S thermocouple in file `sldemo_create_tc_tabledata.m`. Access to this database is described below in the section titled "Thermocouple Reference Data Download and Import Procedure".

Anti-Aliasing Filter and Analog to Digital Converter (ADC) Models

The ADC in this model expects a 0 to 5 volt signal, so the raw thermocouple sense voltage is biased and amplified corresponding to a range of -0.235 mV to 18.661 mV (-50 degC to 1765 degC). A third order Butterworth anti-aliasing filter was designed for $W_n = 15$ Hz using the Signal Processing Toolbox™:

```
[num,den] = butter(3, 15*2*pi, 'low', 's')
```

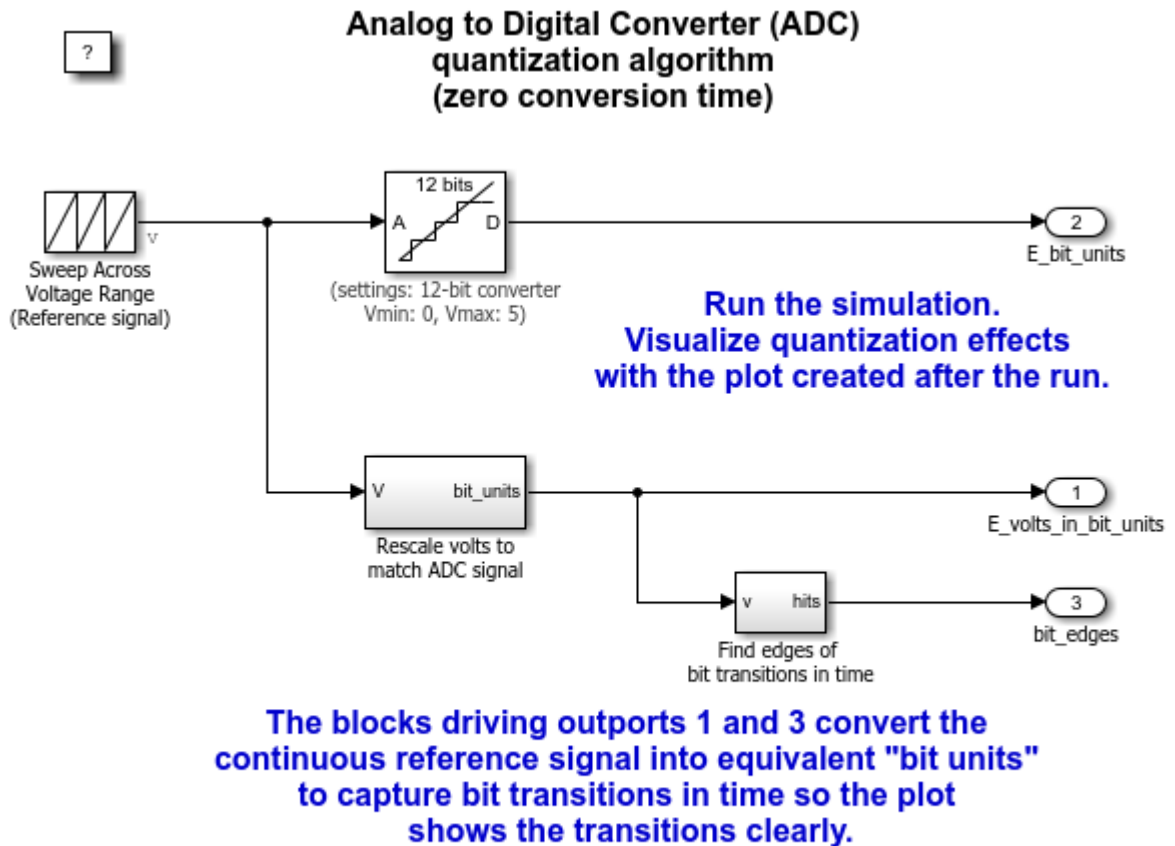

The output of the anti-aliasing filter feeds a sample-and-hold device that drives the quantization model. Since the sample period is 20 msec in this example, the conversion time is ignored as it is typically 2 orders of magnitude smaller for devices currently available. (Note: if the conversion time were an appreciable fraction of the sample period, it could not be ignored as it would significantly affect the system's dynamics.)

The quantization algorithm in the model takes in a 0 to 5 volt signal and outputs a 12-bit digital word in a 16-bit signed integer. A value of 0 corresponds to 0 Volts and a value of 4096 would correspond to 5 Volts. A change in the least significant bit (LSB) is about 1.2 mV. As 12 bits can only reach the value of 4095, the highest voltage that can be read by this device is approximately 4.9988 Volts. In order to have no more than 1/2 LSB error within the operating range, the quantizer changes values midway between each voltage point, resulting in a 1/2-width interval at 0 Volts and a 3/2-width interval just below 5 Volts. The last interval has 1 full LSB due to its 3/2-width size.

Understanding Data Converters

The `sldemo_adc_quantize` model allows you to explore the A/D converter component in more detail:

```
open_system('sldemo_adc_quantize')
```

Figure 2: Details of ADC quantization modeling (zero conversion time)

```
sim('sldemo_adc_quantize')
set(gcf, 'Color', [1, 1, 1]);
```

Figure 3: Quantization characteristic of ADC.

```
ax = get(gcf, 'Children');  
set(ax(1), 'xlim', [4085, 4100]);
```

Figure 4: Quantization characteristic of ADC: zoomed in to top of range to reveal 1 LSB error behavior at high end (rest of range only has 1/2 LSB max error).

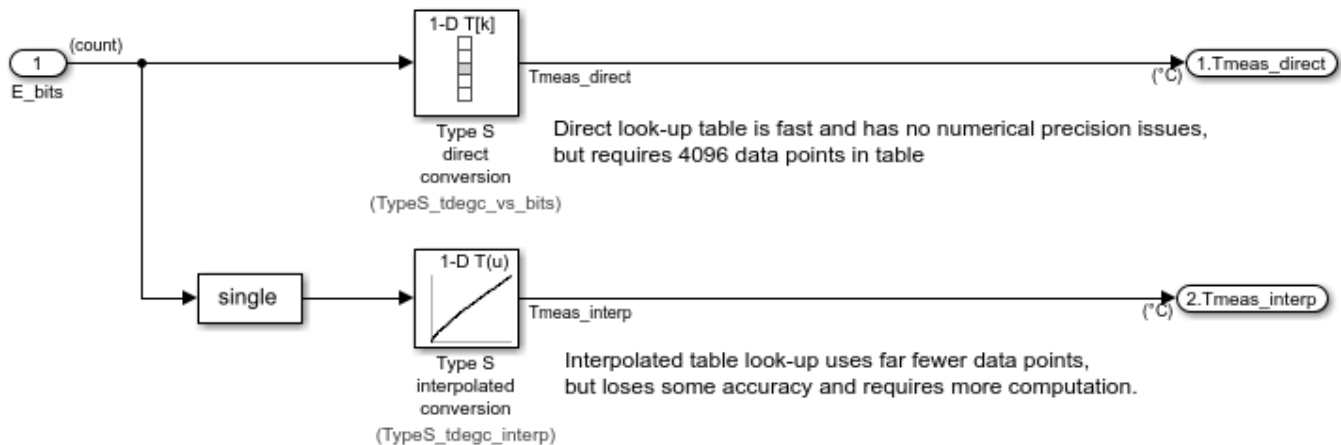

Software Specification for Converting ADC Output to Temperature Values

The input conversion subsystem requires a 16 bit unsigned integer input from the ADC whose full scale range is 0 to 4095 counts, corresponding to -0.235 mV and 18.6564 mV thermocouple loop voltage. The best accuracy and fastest algorithm for input conversion is a direct look-up table. Since the input is an integer from 0 to 4095, a table can be constructed that gives the thermocouple temperature corresponding to each possible input value, so the conversion process can be reduced to indexing into a table. This however, requires one number per ADC output value and for a 12-bit ADC, this can be a burden in memory constrained environments. For double precision data, this is a 16 kB ROM requirement. See file `sldemo_create_tc_tabledata.m` for the method used to construct the direct look-up table from the Type S thermocouple reference data. The error associated with this approach is entirely isolated to the table construction process as there is an output value associated with every possible input value - the run-time look-up process introduces no additional error.

An interpolated table was also put into the model, using only 664 bytes. This is a big reduction in ROM required compared to the direct table look-up, but it takes a bit longer to compute than an indirect memory access and introduces error into the measurement, which goes down as the number of points in the table increases.

```
open_system(sprintf('sldemo_tc/3 Software specification\nfor converting\nADC values to temperatur
```

Input: 0 to 4095 integer "counts" , where
0 counts corresponds to 0 input volts and -0.236 thermocouple millivolts
4096 counts corresponds to 5 input volts and 18.661 thermocouple millivolts

Tables derived from ITS-90 thermocouple reference data from NIST Standard Database 60 related to NIST Monograph 175 (ITS-90).

Thermocouple Reference Data Download and Import Procedure

Using the NIST ITS-90 Thermocouple Database (Standard Reference Database 60 from NIST Monograph 175), you can access the standard reference data describing the behavior for the eight standard thermocouple types. This database relates thermocouple output to the International Temperature Scale of 1990. Follow these steps to acquire and read in the data needed to fully exercise the support files included with this example:

1. Visit the NIST Standard database 60 site on the Internet and download the file all.tab to a local directory. This file is the one under the All Thermocouple Types hyperlink. After the download is complete, return to this page.
2. cd to the directory where you downloaded the all.tab thermocouple database
3. Parse the database and convert it to a MATLAB structure array using the conversion tool readstdtcddata.m:

```
tcddata = readstdtcddata('all.tab');
save thermocouple_its90.mat tcddata;
```

(tip: highlight the above MATLAB code and use right mouse menuitem "Evaluate Selection" to execute it)

You now have a complete set of temperature (T, degC) vs. voltage (E, mV) data, approximating polynomial coefficients, and inverse polynomial coefficients for the standard thermocouple types B, E, J, K, N, R, S, and T in the tcddata variable of file thermocouple_its90.mat. The MATLAB script in sldemo_create_tc_tabledata.m uses this data to prepare lookup table block parameters used in the example model.

Conditioning Reference Data for Use in a Look-Up Table

If you review the thermocouple data tables in the `tdata` structure or in `all.tab`, you will probably notice a few things:

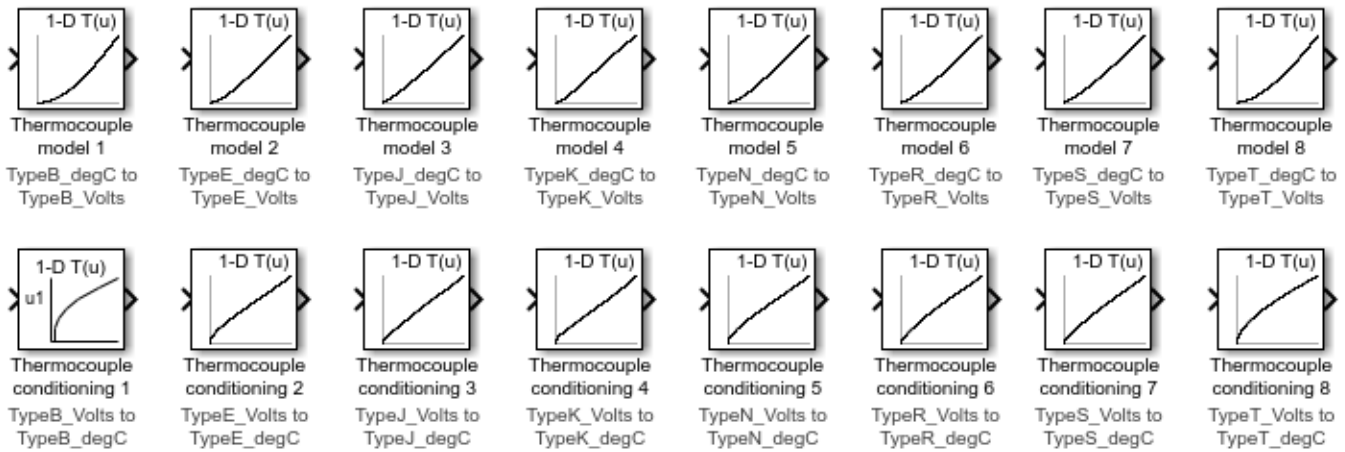

- Repeated 0 degC temperature points in the data
- Repeated voltage points in the data due to the 3-digit output format
- Non-monotonic behavior with two temperatures having the same output, e.g., for the Type B thermocouple, $T(E)$ won't work but $E(T)$ does work

The `readstdtdata()` routine will remove the repeated 0 degC temperature points from the data, but the repeated voltages due to the data format and non-monotonic behavior of some of the curve ends must be dealt with on an individual basis. A reference model named `sldemo_tc_blocks` was constructed using `sldemo_tc_blocks_data.mat`. It contains look-up tables with data populated from the interpolating polynomials for the eight standard thermocouples in `all.tab`:

```
open_system('sldemo_tc_blocks')
```

Full-Range 2 degrees Celsius Interpolated Thermocouple Tables created from ITS-90 Interpolating Polynomials

Note: this model has data in its Model Workspace. Browse/Edit the model workspace from the View / Model Explorer menu item.

**To use these blocks, load data into the model workspace or base workspace:
>> load sldemo_tc_blocks_data.mat**

Digital Waveform Generation: Approximating a Sine Wave

This example shows some of the main steps needed to design and evaluate a sine wave data table for use in digital waveform synthesis applications in embedded systems and arbitrary waveform generation instruments.

Real-Time direct digital synthesis of analog waveforms using embedded processors and digital signal processors (DSPs) connected to digital-to-analog converters (DACs) is becoming pervasive even in the smallest systems. Developing waveforms for use in embedded systems or laboratory instruments can be streamlined using the tight integration of MATLAB® and Simulink®. You can develop and analyze the waveform generation algorithm and its associated data at your desktop before implementing it with Simulink® Coder™ on target hardware.

When feasible, the most accurate way to digitally synthesize a sine wave is to compute the full precision $\sin()$ function directly for each time step, folding ωt into the interval 0 to 2π . In real-time systems, the computational burden is typically too large to permit this approach. One popular way around this obstacle is to use a table of values to approximate the behavior of the $\sin()$ function, either from 0 to 2π , or even half wave or quarter wave data to leverage symmetry.

Tradeoffs to consider include algorithm efficiency, data ROM size required, and accuracy/spectral purity of the implementation. Similar analysis is needed when performing your own waveform designs. The table data and look-up algorithm alone do not determine performance in the field. Additional considerations such as the accuracy and stability of the real-time clock, and digital to analog converter are also needed in order to assess overall performance. The Signal Processing Toolbox™ and the DSP System Toolbox™ complement the capabilities of MATLAB and Simulink for work in this area.

Another popular way to approximate the behavior of sine wave is to use the CORDIC approximation method. CORDIC is an acronym for COordinate Rotation DIGital Computer. The Givens rotation-based CORDIC algorithm is among one of the most hardware-efficient algorithms because it requires only shift-add iterative operations.

If you have Fixed-Point Designer license, then you can see “Compute Sine and Cosine Using CORDIC Rotation Kernel” (Fixed-Point Designer) for an example on CORDIC approximation.

The distortion analysis in this example is based on principles presented in "Digital Sine-Wave Synthesis Using the DSP56001/DSP56002", by Andreas Chrysafis, Motorola® Inc. 1988

Create a Table in Double Precision Floating Point

The following commands make a 256 point sine wave and measure its total harmonic distortion when sampled first on the points and then by jumping with a delta of 2.5 points per step using linear interpolation. Similar computations are done by replacing the sine values with CORDIC sine approximation. For frequency-based applications, spectral purity can be more important than absolute error in the table.

The file `ssinthd.m` is the core function in this example. It is used for calculating total harmonic distortion (THD) for digital sine wave generation with or without interpolation. This THD algorithm proceeds over an integral number of waves to achieve accurate results. The number of wave cycles used is A . Since the step size 'delta' is A/B and traversing A waves will hit all points in the table at least one time, which is needed to accurately find the average THD across a full cycle.

The relationship used to calculate THD is:

$$\text{THD} = (\text{ET} - \text{EF}) / \text{ET}$$

where ET = total energy, and EF = fundamental energy

The energy difference between ET and EF is spurious energy.

```
N      = 256;
angle  = 2*pi * (0:(N-1))/N;

s      = sin( angle )';
thd_ref_1  = ssinthd( s, 1, N, 1, 'direct' )
thd_ref_2p5 = ssinthd( s, 5/2, 2*N, 5, 'linear' )

cs     = cordicsin( angle, 50 )';
thd_ref_1c  = ssinthd(cs, 1, N, 1, 'direct' )
thd_ref_2p5c = ssinthd(cs, 5/2, 2*N, 5, 'linear' )
```

```
thd_ref_1 =
    4.8049e-32
```

```
thd_ref_2p5 =
    1.4176e-09
```

```
thd_ref_1c =
    1.2577e-30
```

```
thd_ref_2p5c =
    1.4176e-09
```

Put the Sine Wave Approximations in a Model

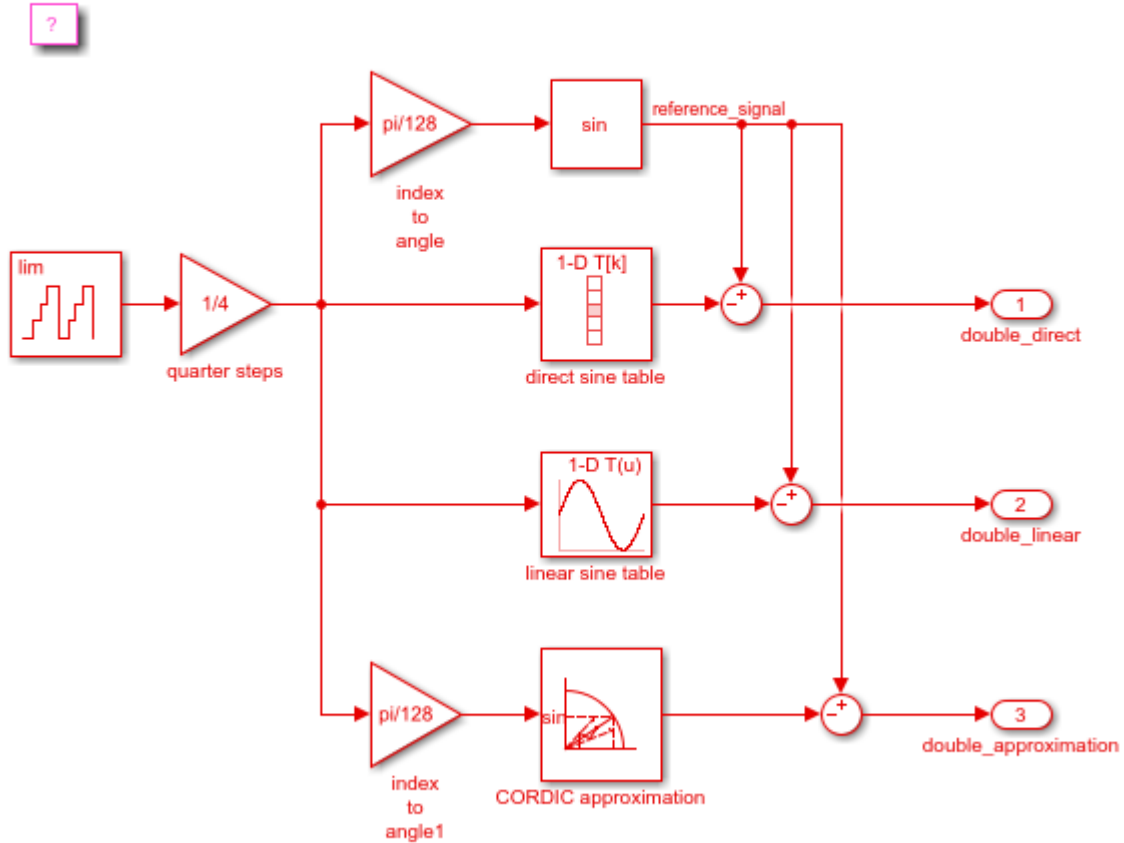

You can put the sine wave designed above into a Simulink model and see how it works as a direct lookup, with linear interpolation, and with CORDIC approximation. This model compares the output of the floating point tables to the `sin()` function. As expected from the THD calculations, the linear interpolation has a lower error than the direct table lookup in comparison to the `sin()` function. The CORDIC approximation shows a lower error margin when compared to the linear interpolation method. This margin depends on the number of iterations when computing the CORDIC sin approximation. You can typically achieve greater accuracy by increasing the number of iterations (corresponding to a longer computation time). The CORDIC approximation eliminates the need for explicit multipliers. It is used when multipliers are less efficient or non-existent in hardware.

Open the `sldemo_tonegen` model

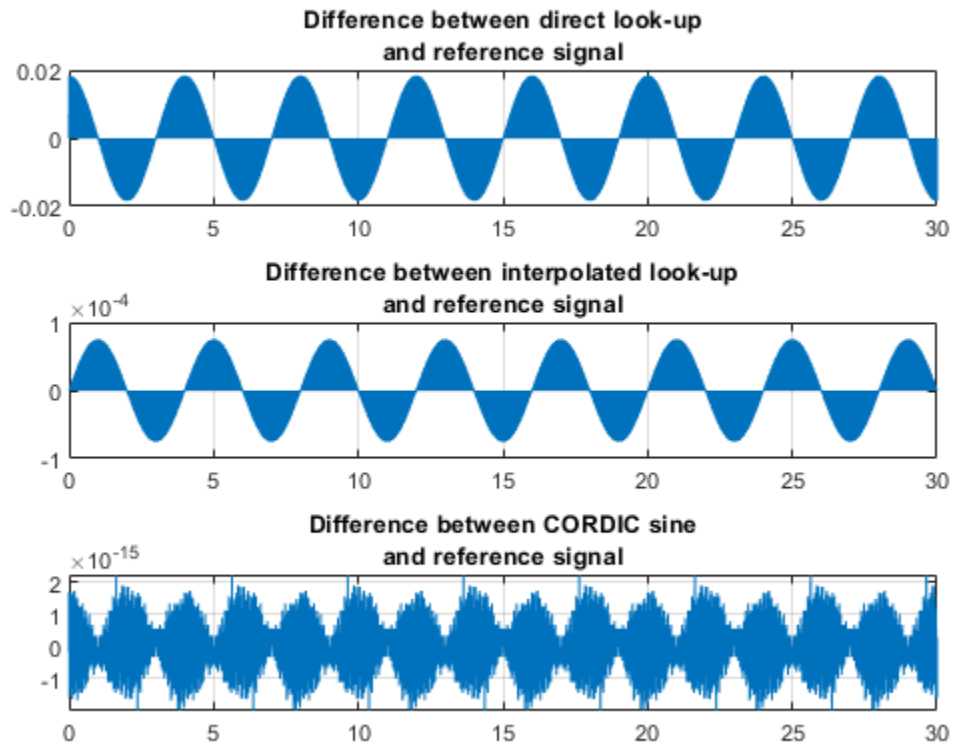

```
open_system('sldemo_tonegen');
set_param('sldemo_tonegen', 'StopFcn', '');
out = sim('sldemo_tonegen');
currentFig = figure('Color',[1,1,1]);
subplot(3,1,1), plot(out.tonegenOut.time, out.tonegenOut.signals(1).values); grid
title({'Difference between direct look-up', 'and reference signal'});
```

```
subplot(3,1,2), plot(out.tonegenOut.time, out.tonegenOut.signals(2).values); grid
title({'Difference between interpolated look-up', 'and reference signal'});
subplot(3,1,3), plot(out.tonegenOut.time, out.tonegenOut.signals(3).values); grid
title({'Difference between CORDIC sine', 'and reference signal'});
```

Comparison in approximate sine wave accuracy between direct look-up, linear interpolation and CORDIC approximation vs. reference signal

Copyright 1990-2013 The MathWorks, Inc.

Taking a Closer Look at Waveform Accuracy

Zooming in on the signals between 4.8 and 5.2 seconds of simulation time (for example), you can see a different characteristic due to the different algorithms used:

```
ax = get(currentFig, 'Children');  
set(ax(3), 'xlim', [4.8, 5.2])  
set(ax(2), 'xlim', [4.8, 5.2])  
set(ax(1), 'xlim', [4.8, 5.2])
```

The Same Table, Implemented in Fixed Point

Now convert the floating point table into a 24 bit fractional number using 'nearest' rounding. The new table is tested for total harmonic distortion in direct lookup mode at 1, 2, and 3 points per step, then with fixed point linear interpolation.

```
bits = 24;
is = num2fixpt( s, sfrac(bits), [], 'Nearest', 'on');

thd_direct1 = ssinthd(is, 1, N, 1, 'direct')
thd_direct2 = ssinthd(is, 2, N, 2, 'direct')
thd_direct3 = ssinthd(is, 3, N, 3, 'direct')

thd_linterp_2p5 = ssinthd(is, 5/2, 2*N, 5, 'fixptlinear')

thd_direct1 =
    2.6423e-15

thd_direct2 =
    2.8660e-15

thd_direct3 =
```

```
2.6423e-15

thd_linterp_2p5 =
1.4175e-09
```

Compare Results for Different Tables and Methods

Choosing a table step rate of 8.25 points per step (33/4), jump through the double precision and fixed point tables in both direct and linear modes and compare distortion results:

```
thd_double_direct = ssinthd( s, 33/4, 4*N, 33, 'direct')
thd_sfrac24_direct = ssinthd(is, 33/4, 4*N, 33, 'direct')

thd_double_linear = ssinthd( s, 33/4, 4*N, 33, 'linear')
thd_sfrac24_linear = ssinthd(is, 33/4, 4*N, 33, 'fixptlinear')
```

```
thd_double_direct =
4.7061e-05
```

```
thd_sfrac24_direct =
4.7061e-05
```

```
thd_double_linear =
7.9741e-10
```

```
thd_sfrac24_linear =
8.1751e-10
```

Using Preconfigured Sine Wave Blocks

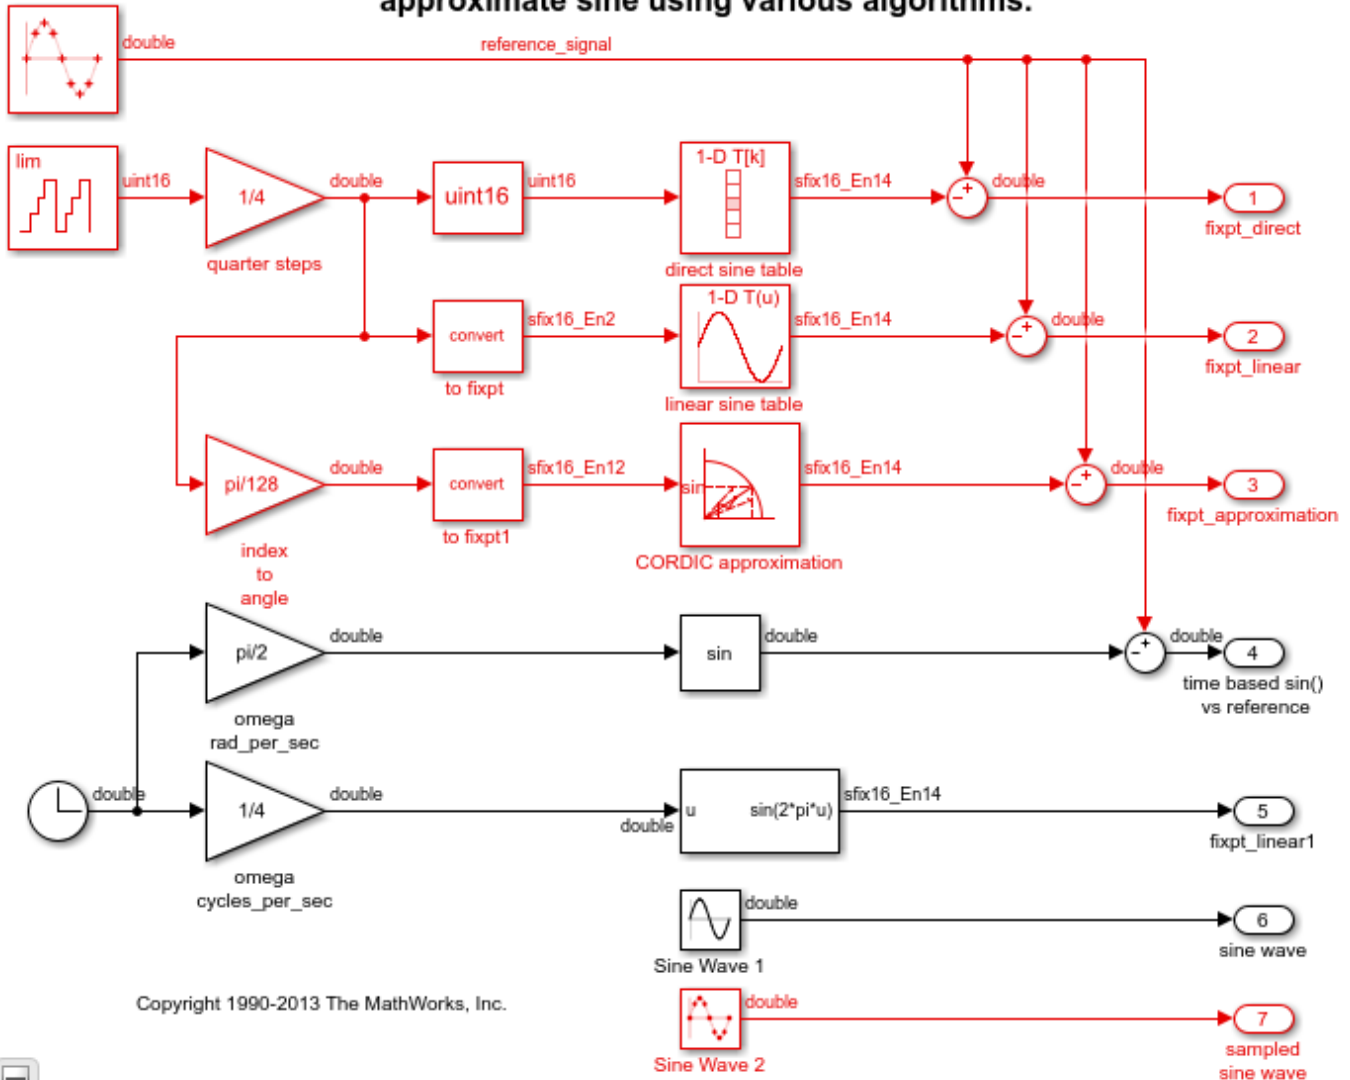

Simulink also includes a Sine Wave source block with continuous and discrete modes, plus fixed point Sin and Cosine function blocks that implement the function approximation with a linearly interpolated lookup table that exploits the quarter wave symmetry of sine and cosine. Example `sldemo_tonegen_fixpt` uses a sampled sine wave source as the reference signal and compares it with a lookup table with or without interpolation, and with CORDIC sine approximation in fixed point data types.

Open the `sldemo_tonegen_fixpt` model

```
open_system('sldemo_tonegen_fixpt');
set_param('sldemo_tonegen_fixpt', 'StopFcn', '');
out = sim('sldemo_tonegen_fixpt');
figure('Color',[1,1,1]);
subplot(3,1,1), plot(out.tonegenOut.time, out.tonegenOut.signals(1).values); grid
title({'Difference between direct look-up', 'and reference signal'});
subplot(3,1,2), plot(out.tonegenOut.time, out.tonegenOut.signals(2).values); grid
```

```
title({'Difference between interpolated look-up', 'and reference signal'});
subplot(3,1,3), plot(out.tonegenOut.time, out.tonegenOut.signals(3).values); grid
title({'Difference between CORDIC sine', 'and reference signal'});
```

Additional blocks to calculate sine and approximate sine using various algorithms.

Use of Sine Function with a Clock Input

The model also compares the sine wave source reference with the `sin()` function whose input angle in radians is time based (computed using a clock). This section tests the assumption that the clock input would return repeatable results from the `sin()` function for period 2π . The following plot shows that the `sin()` function accumulates error when its input is time based. This also shows that a sampled sine wave source is more accurate to use as a waveform generator.

```
subplot(1,1,1), plot(out.tonegenOut.time, out.tonegenOut.signals(4).values); grid
title({'Difference between time based sin()', 'and reference signal'});
```

Survey of Behavior for Direct Lookup and Linear Interpolation

The file `sldemo_sweeptable_thd.m` performs a full frequency sweep of the fixed point tables and will let us more thoroughly understand the behavior of this design. Total harmonic distortion of the 24-bit fractional fixed point table is measured at each step size, moving through it D points at a time, where D is a number from 1 to $N/2$, incrementing by 0.25 points. N is 256 points in this example; the 1, 2, 2.5, and 3 cases were done above. Frequency is discrete and therefore a function of the sample rate.

Notice the modes of the distortion behavior in the plot. They match with common sense: when retrieving from the table precisely at a point, the error is smallest; linear interpolation has a smaller error than direct lookup in between points. What is not intuitive is that the error is relatively constant for each of the modes up to the Nyquist frequency.

```
figure('Color',[1,1,1])
tic, sldemo_sweeptable_thd(24, 256), toc
```

Elapsed time is 1.344793 seconds.

Next Steps

To take this example further, try different table precision and element counts to see the effect of each. Using CORDIC approximation, try different numbers of iterations to see the effects on accuracy and computation time. You can investigate different implementation options for waveform synthesis algorithms using automatic code generation available from the Simulink Coder and production code generation using Embedded Coder™. Embedded Target products offer direct connections to a variety of real-time processors and DSPs, including connection back to the Simulink diagram while the target is running in real-time. The Signal Processing Toolbox and DSP System Toolbox offer prepackaged capabilities for designing and implementing a wide variety of sample-based and frame-based signal processing systems with MATLAB and Simulink.

```
bdclose('sldemo_tonegen');
bdclose('sldemo_tonegen_fixpt');
```

Accurate Zero-Crossing Detection

This example shows how zero crossings work in Simulink®. In this model, three shifted sine waves are fed into an absolute value block and saturation block. At exactly $t = 5$, the output of the switch block changes from the absolute value to the saturation block. Zero crossings in Simulink will automatically detect exactly when the switch block changes its output, and the solver will step to the exact time that the event happens. This can be seen by examining the output in the scope.

Spiral Galaxy Formation Simulation Using MATLAB Function Blocks

This model was inspired by the classic paper "Galactic Bridges and Tails" (Toomre & Toomre 1972). The original paper explained how disc shaped galaxies could develop spiral arms. Two disc shape galaxies originally are far apart. They then fly by each other and almost collide. Once the galaxies are close enough, mutual gravitational forces cause spiral arms to form.

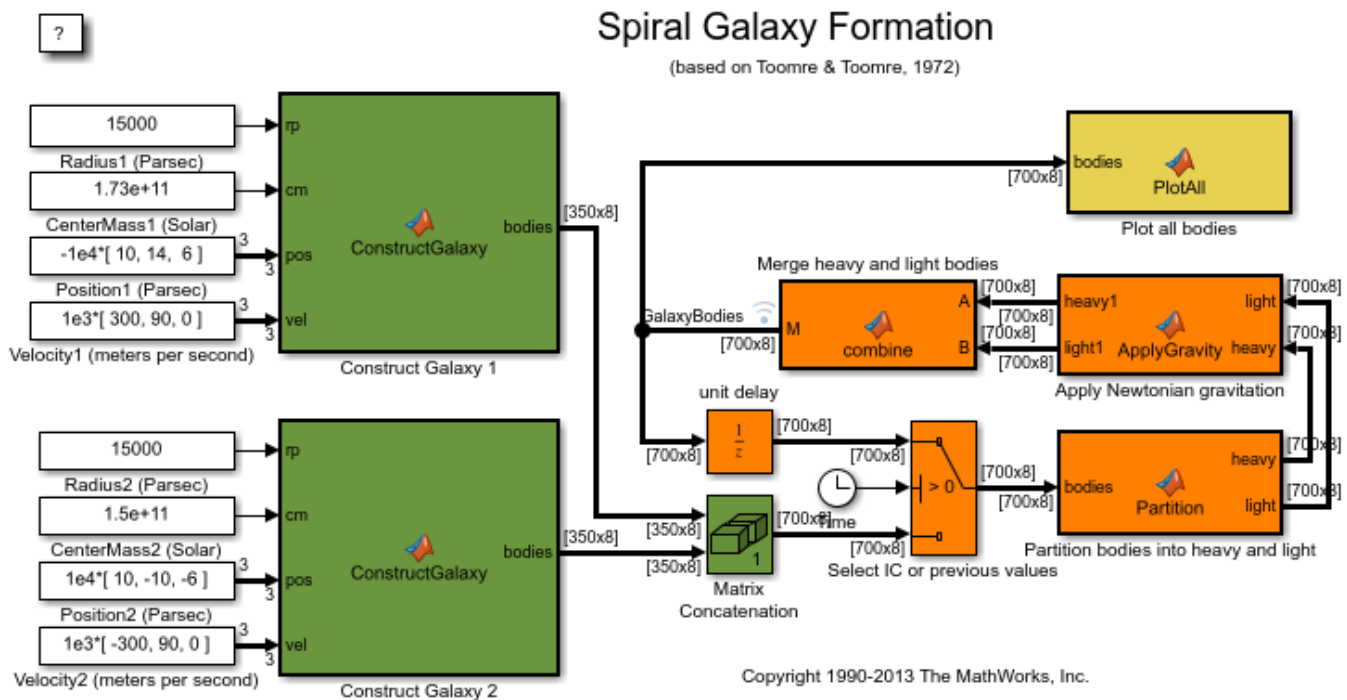

Except for the "PlotAll" visualization block's use of plotting routines, all MATLAB® function blocks in this model support code generation with Simulink® Coder™ and Embedded Coder™.

- Requirements:** For this example, Simulink® generates code for the simulation in a Simulink project directory created in the current working directory (pwd). If you do not want to affect the current directory (or if you cannot generate files in this directory), you should change your working directory.

Opening the Model and Running the Simulation

Open the model and run the simulation by executing the code below. If you are using MATLAB® Help, select the code you want to execute and press F9 (or select code, right click on selection and select "Evaluate Selection"). The Simulink model will load, compile, and run.

```
model = 'sldemo_eml_galaxy';
open_system(model);
sim(model);
```

Model Description

This section describes the model in detail and explains the role of each block in the model. The green blocks initialize the simulation, the orange blocks are the core of the simulation, and the yellow block makes the galaxy animation view.

Initial Conditions

The model requires initial conditions for each galaxy. The initial conditions are: galaxy radius in parsecs (rp), galaxy mass in solar mass units (cm), galaxy position in parsecs (pos), and galaxy velocity in m/s (vel).

In the model, constant blocks specify the initial conditions. The initial conditions have been chosen such that the galaxies will nearly collide at some point in time.

"ConstructGalaxy" Blocks

The initial conditions are passed to the MATLAB function blocks Construct Galaxy 1 and Construct Galaxy 2. These MATLAB function blocks contain MATLAB code that builds the galaxy models.

In a typical galaxy, most of the mass is concentrated in its center as a super-massive black hole and/or star agglomeration. We model the galaxy as a disc with radius r with most of its mass concentrated in the inner circle of radius $r/3$. In addition to this super-massive nucleus, the "ConstructGalaxy" MATLAB function block creates 349 random stars with masses ranging from 4 to 24 solar masses. These stars are randomly positioned within distance $r/3$ and r from the center of the galaxy. The stars initially move in circular orbits around the galaxy core. Every object (star or galaxy core) has mass, position (x, y, z) , and velocity (V_x, V_y, V_z) .

"Matrix Concatenation" Block

This block joins information about both galaxies. At this point the model has 700 objects: 1 core for each galaxy and 349 stars around each core. These 700 objects interact according to Newtonian mechanics.

"Partition" Block

This MATLAB function block separates all 700 objects into two groups: heavy bodies and light bodies. The heavy bodies are the galaxy cores. The light bodies are the stars. Because the galaxy cores are much heavier than individual stars, the model will consider only the heavy-heavy and heavy-light interactions. We can ignore the light-light body interactions. This will save a lot of time since 698 out of 700 bodies in the model are light.

"ApplyGravity" Block

This MATLAB function block uses Newtonian mechanics to compute the velocities and positions of the bodies at each step. The "combine" block is also a MATLAB function block. It merges the data about heavy and light objects together.

"PlotAll" Block

This MATLAB function block plots the bodies in a figure and updates the position of each star at every step in the simulation.

Closing the Model

Close the model without saving any changes. Clear data generated by simulation/example.

```
close_system(model,0);  
clear model sldemo_eml_galaxy_output;
```

Note:

- In this model, signal logging is turned on (observe that the 'GalaxyBodies' signal has a little blue signal logging antenna on it). The model saves output data in a `Dataset` object. Any other data is saved/modified in the model workspace to avoid cluttering the MATLAB workspace.
- To modify signal logging settings, right-click on the signal line and select "Signal Properties". In this example, the signal name is 'GalaxyBodies' and the "Log signal data" checkbox is checked.
- The logged data is saved to the MATLAB workspace as a `Dataset` object with the name 'sldemo_eml_galaxy_output'. Information on the 'GalaxyBodies' signal can be retrieved from this object by typing `sldemo_eml_galaxy_output.get('GalaxyBodies')` which returns a `Simulink.SimulationData.Signal` object. See more about working with these objects in the "Simulink.SimulationData.Signal" documentation.

Comments About the Model

Despite its simplicity, this model provides insight into how our own galaxy evolved. This example allows the user to maximally simplify the model and run a fast simulation. The user can easily modify this example by adding more galaxies.

Modulo-4 Counter Using Flip-Flops

This example shows how to use Flip-Flop blocks (found in the Simulink® Extras Library) to implement a Modulo-4 counter. The model takes the output of a Modulo-4 counter and generates a half clock cycle width pulse on every fourth clock pulses. Effectively, it produces a pulse whenever both outputs of the Modulo-4 counter are equal to 1.

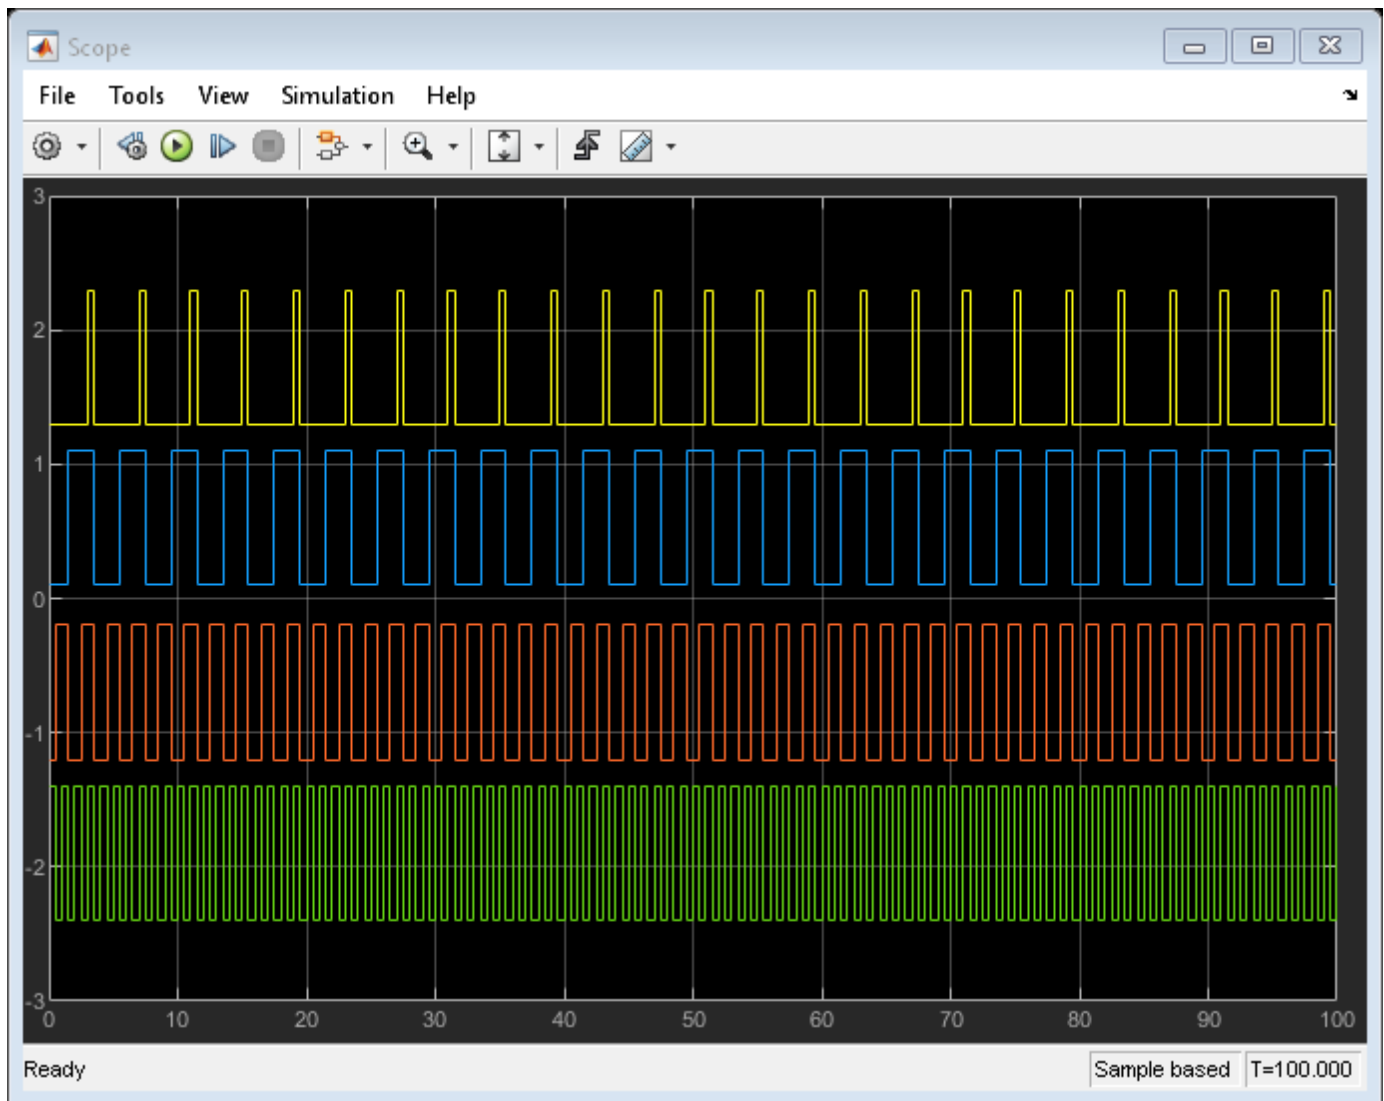

?

Clocked Flip-Flop Logic Model

This system takes the output of the Modulo-4 counter and generates a 1/2 clock cycle width pulse on every fourth clock pulse. Effectively, it produces a pulse whenever both outputs of the Modulo-4 counter are equal to 1.

Copyright 1990-2013 The MathWorks, Inc.

Counters Using Conditionally Executed Subsystems

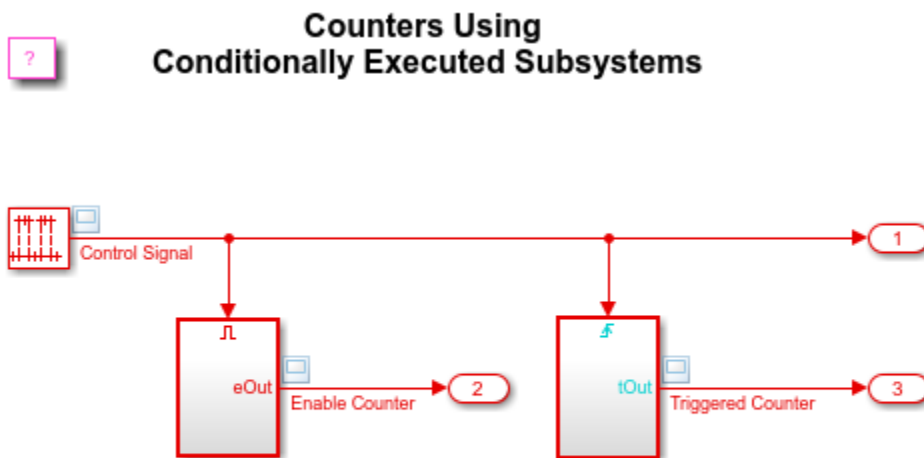

This model shows the contrast between enabled subsystems and triggered subsystems for the same control signal, through the use of counter circuits. After running the simulation, the scope shows three plots.

The first of these plots shows the control signal which is the output of the discrete pulse generator.

The second plot shows the output of the counter circuit in the enabled subsystem. The counter increments while the subsystem is enabled and then holds its output when the subsystem is disabled. The counter resets to zero when the subsystem is re-enabled because the enable port was configured to reset states when enabling.

The third plot shows the output of the counter circuit in the triggered subsystem. The counter increments every rising edge of the control signal.

The signals are shown in a Signal Viewer scope that does not require a scope block to be put into the block diagram. Instead, the "scope" icon notation on the ports show that a Signal Viewer is attached. Double click on the scope icon to make the Signal Viewer appear if it is hidden.

Friction Model with Hard Stops

This example shows how to model friction one way in Simulink®. The two integrators in the model calculate the velocity and position of the system, which is then used in the Friction Model to calculate the friction force.

Running the simulation shows the initial condition response on the Scope.

State Events

This example shows how to handle state events. Run the simulation and see the phase plane plot, where the state x_1 is along the X-axis and the state x_2 is along the Y-axis.

State-Event Handling

Bang-Bang Control Using Temporal Logic

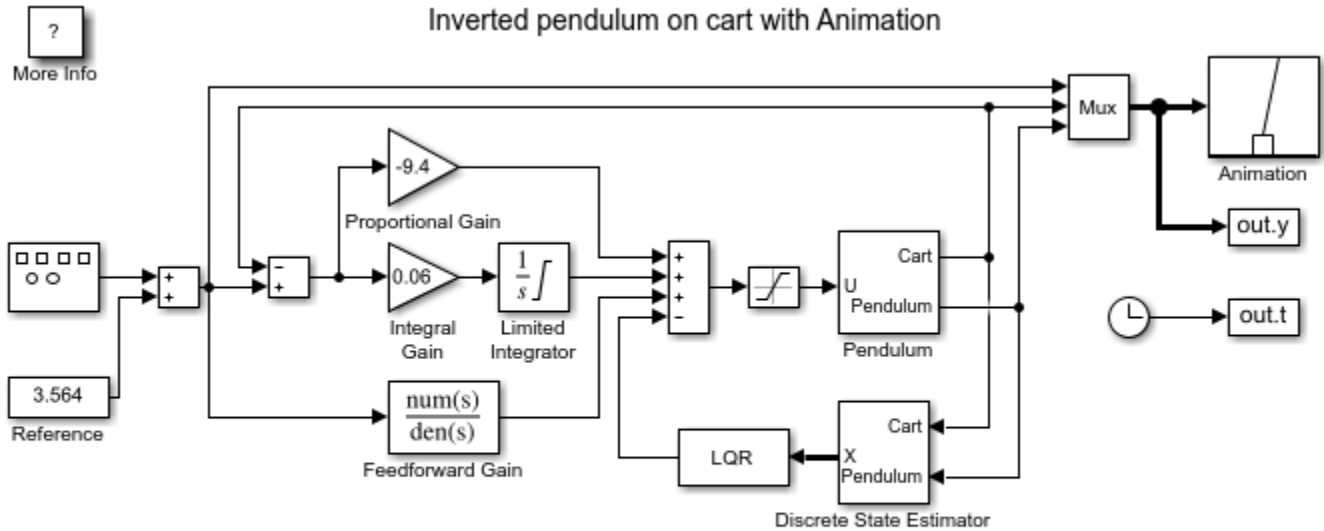

This example shows how to use Stateflow® to model a bang-bang temperature control system for a boiler. The boiler dynamics are modeled in Simulink®.

The Bang-Bang Controller Stateflow chart shows how to use functions and Subcharts within Stateflow.

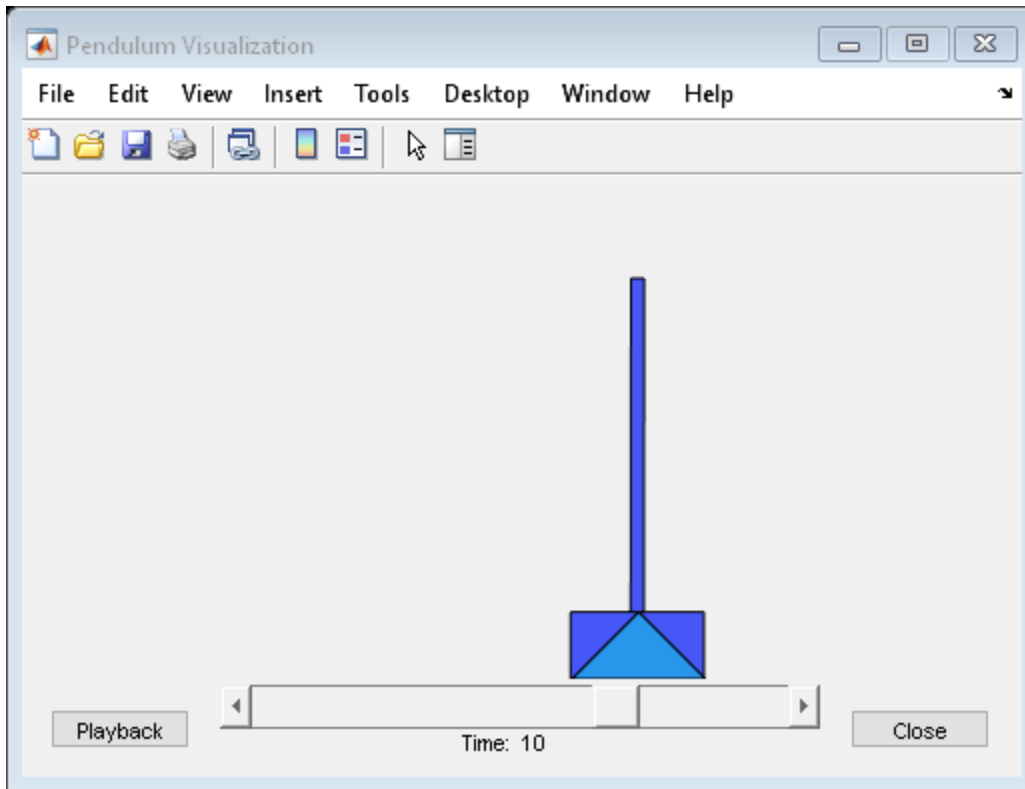

Inverted Pendulum with Animation

This example shows how to model an inverted pendulum. The animation is created using MATLAB® Handle Graphics®. The animation block is a masked S-function. For more information, use the context menu to look under the Animation block's mask and open the S-function for editing.

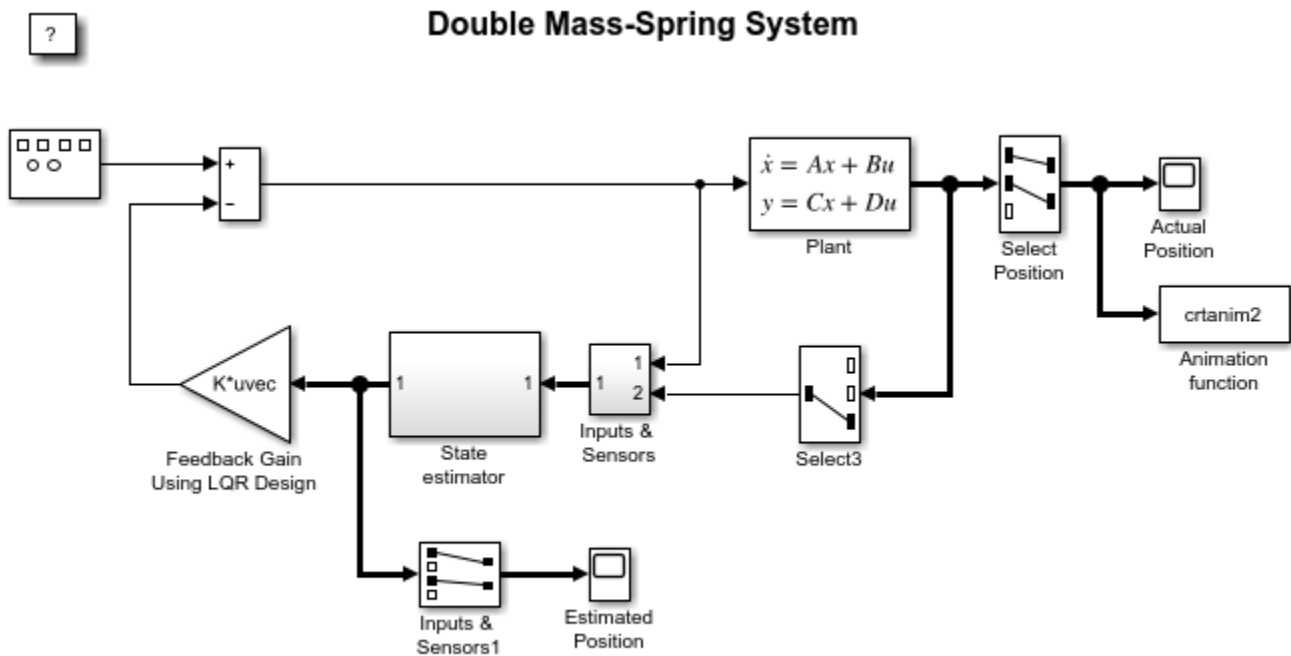

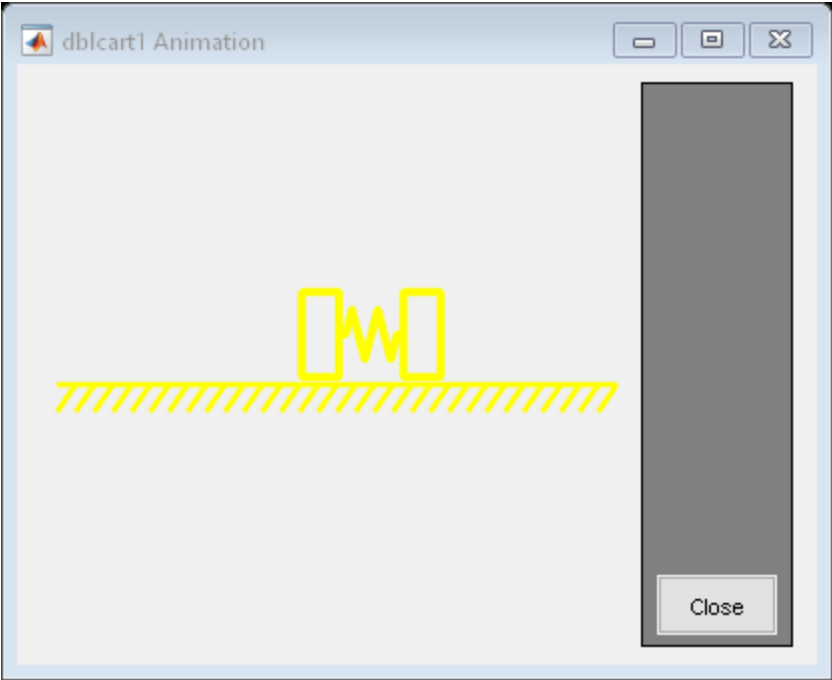

Copyright 1990-2015 The MathWorks, Inc.

Double Spring Mass System

This example shows how to model a double spring-mass-damper system with a periodically varying forcing function. Associated with the example is an animation function that will automatically open a figure window and display to it. In this system, the only sensor is attached to the mass on the left, and the actuator is attached to the mass on the left. State estimation and LQR control are used.

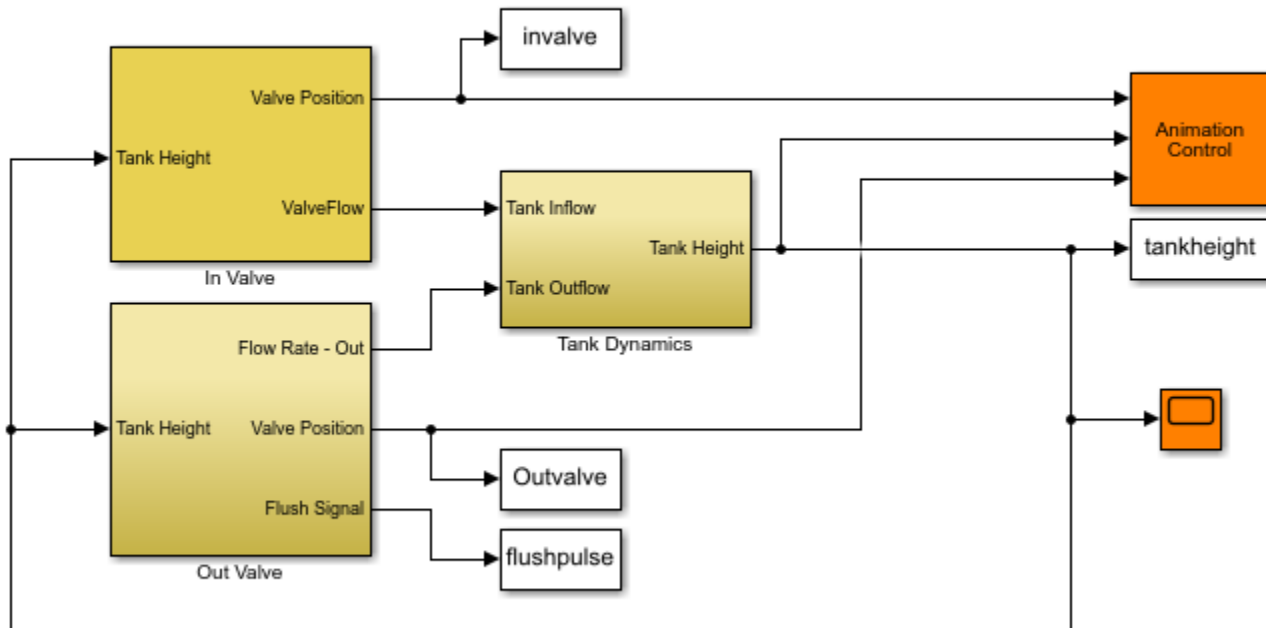

Tank Fill and Empty with Animation

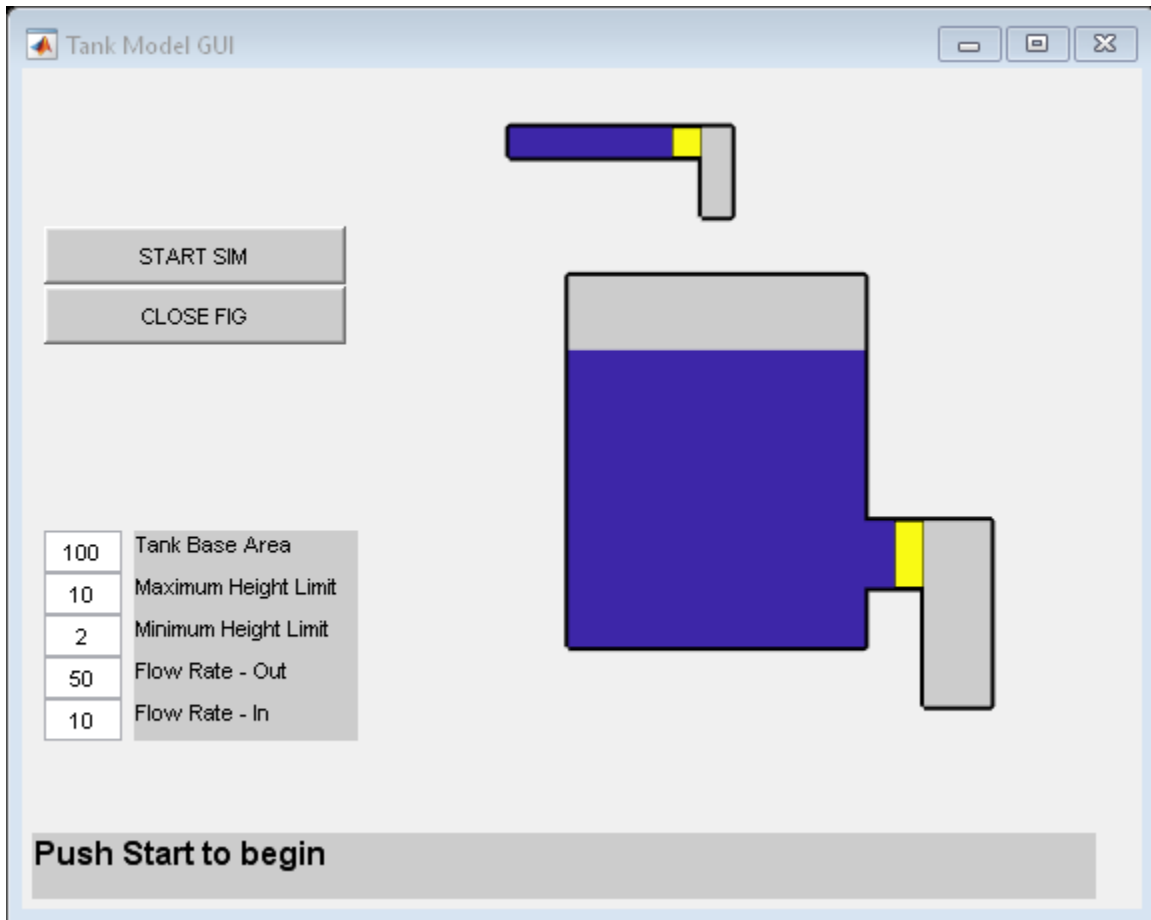

This example shows how to model the dynamics of liquid in a tank. The associated animation provides a graphical display of the tank as it empties and refills, based on user-defined tank parameters. The tank empties at the start of the simulation and again part way through the simulation. When the simulation is stopped, a plot is generated showing the liquid height and the states of the two valves.

Simulating Systems with Variable Transport Delay Phenomena

This example shows two cases where you can use Simulink® to model variable transport delay phenomena.

Vertical Wheel Displacement on a One-Dimensional Car

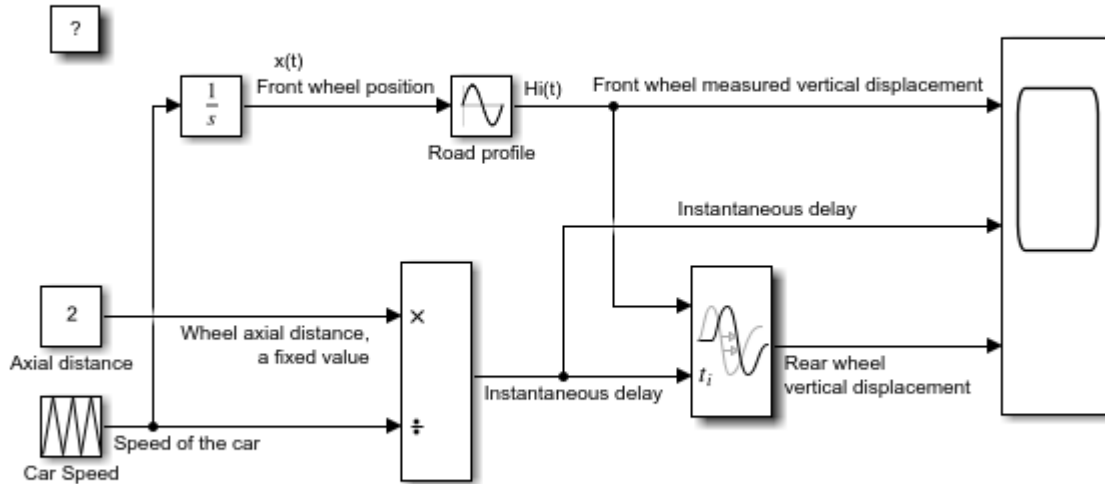

Figure 1: Illustration of a car with speed $v(t)$.

A car is running along a road with speed $v(t)$. A sensor is installed at the front wheel to measure the vertical displacement $H_i(t)$ of the front wheel caused by the road profile. If the wheels and road never lose contact, then the vertical displacement of the rear wheel, $H_o(t)$, can be seen as a variable transport delay of $H_i(t)$, which is determined by the length L between the two wheels and the speed $v(t)$.

Vertical displacement of the wheels of a one dimensional car

Copyright 1990-2013 The MathWorks, Inc.

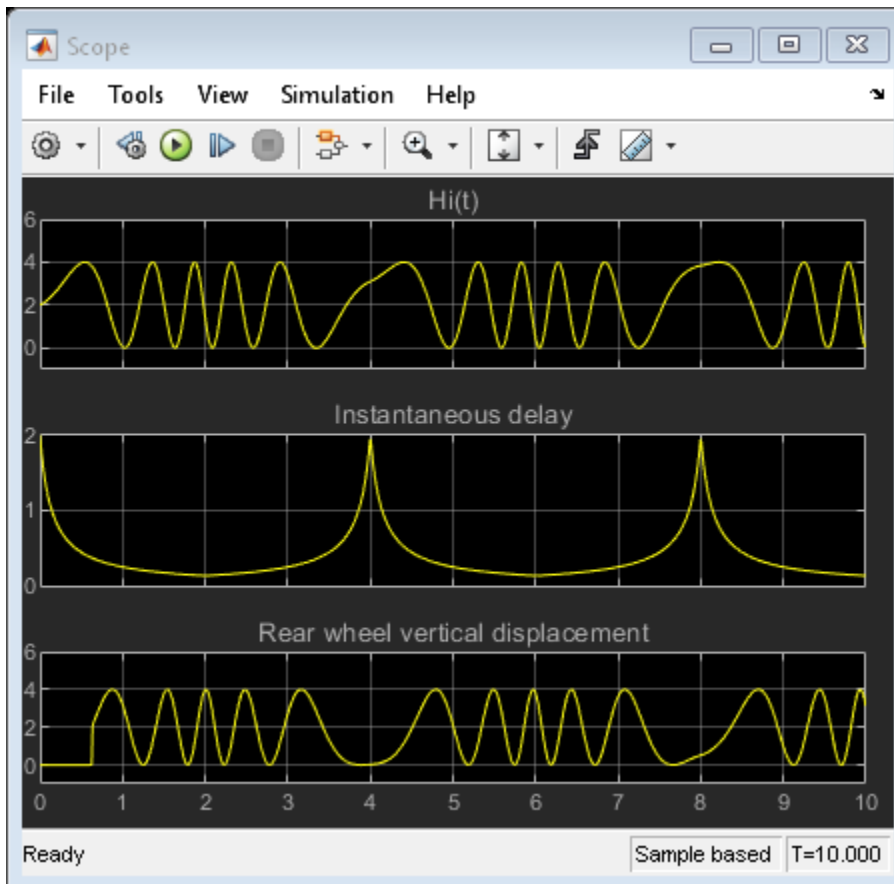

Figure 2: Vertical displacement of the wheels.

Incompressible Flow Through a Fixed Length Pipe

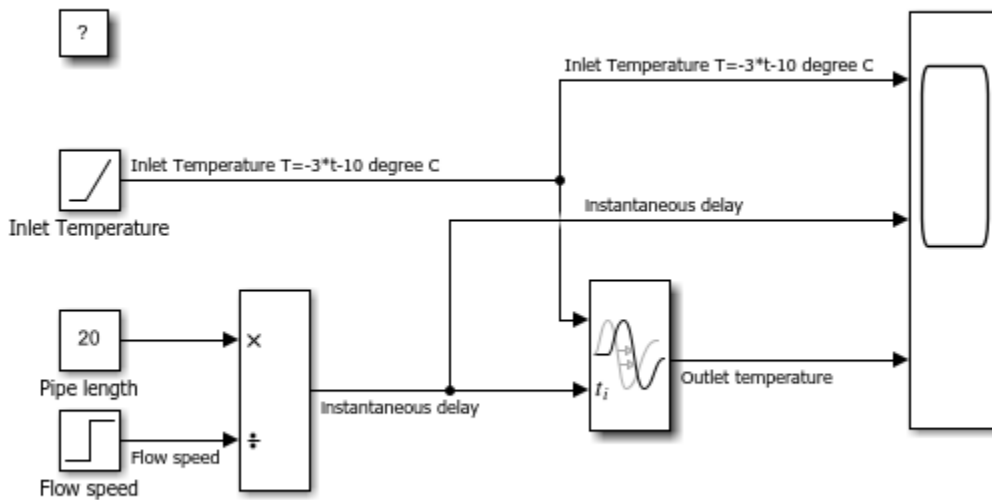

Figure 3: Illustration of a fixed-length pipe.

An incompressible flow goes through a pipe of length L with speed $v(t)$. At the inlet, the flow temperature is T_i . We can model the temperature at the outlet T_o as a variable transport delay of T_i . At time $t=0$, the pipe is empty and until $t=2$, there is no flow at the outlet. Thus, the output temperature before $t=2$ is the initial output temperature.

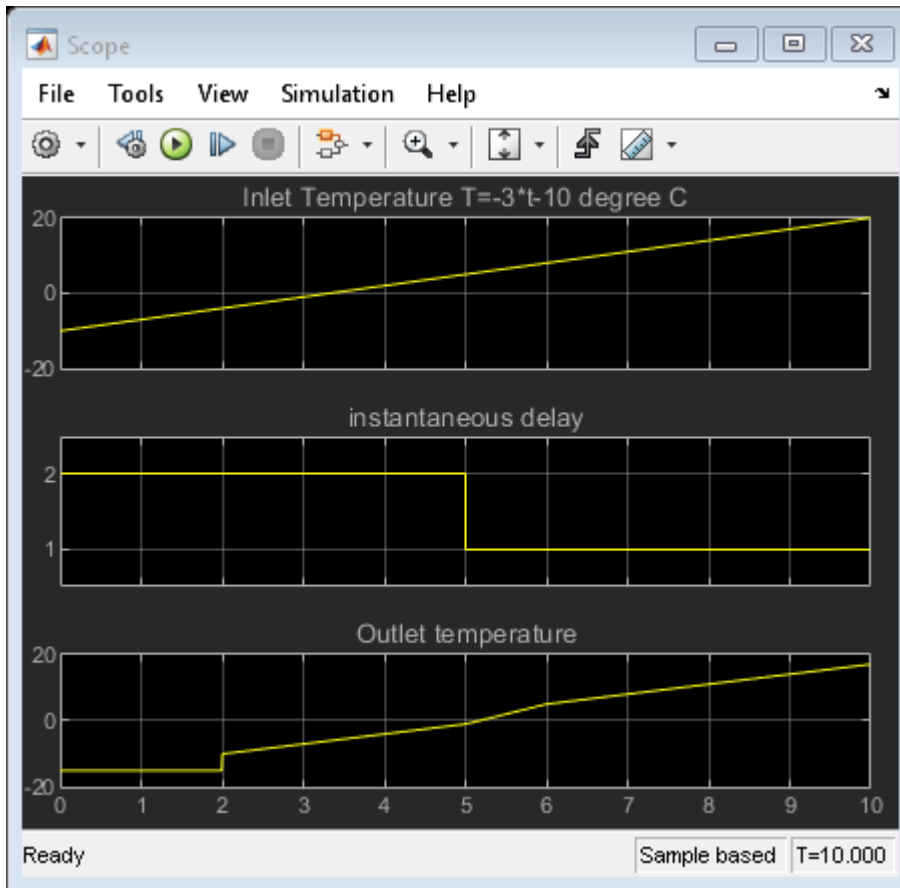

Figure 4: Incompressible flow through a fixed-length pipe.

Modeling a Foucault Pendulum

This example shows how to model a Foucault pendulum. The Foucault pendulum was the brainchild of the French physicist Leon Foucault. It was intended to prove that Earth rotates around its axis. The oscillation plane of a Foucault pendulum rotates throughout the day as a result of axial rotation of the Earth. The plane of oscillation completes a whole circle in a time interval T , which depends on the geographical latitude.

Foucault's most famous pendulum was installed inside the Paris Pantheon. This was a 28kg metallic sphere attached to a 67 meter long wire. This example simulates a 67 meter long pendulum at the geographic latitude of Paris.

Simulink® Model

The simplest way to solve the Foucault pendulum problem in Simulink® is to build a model that solves the coupled differential equations for the system. This model is shown in Figure 1. The equations that describe the Foucault pendulum are given below. For details on the physics of the model and the derivation of these equations, see Analysis and Physics.

$$\ddot{x} = 2\Omega \sin \lambda \dot{y} - \frac{g}{L}x$$

$$\ddot{y} = -2\Omega \sin \lambda \dot{x} - \frac{g}{L}y$$

x, y = pendulum bob coordinates as seen by an observer on Earth

Ω = Earth's angular speed of revolution about its axis (*rad/sec*)

g = acceleration of gravity (*m/sec²*)

L = length of the pendulum string (*m*)

λ = geographic latitude (*rad*)

Opening the Model

Type `sldemo_foucault` in MATLAB® Command Window to open this model. This model logs simulation data to the variable `sldemo_foucault_output`. Logged signals have a blue indicator. Read more about signal logging in Simulink Help.

This model solves the differential equations for the Foucault Pendulum problem and plots the position of the pendulum bob in the XY plane. You can access or modify the parameters (g , Ω , λ , L and initial conditions) in MATLAB workspace.

Copyright 1990-2015 The MathWorks, Inc.

Figure 1: The Foucault pendulum model

Initial Conditions

This model loads the constants and initial conditions from the `sldemo_foucault_data.m` file. The contents of this file are shown in Table 1 below. You can modify simulation parameters directly in MATLAB workspace. The initial amplitude of the pendulum must be small compared to pendulum length, because the differential equations are valid only for small oscillations.

Table 1: Initial conditions

```
g = 9.83;           % acceleration of gravity (m/sec^2)
L = 67;            % pendulum length (m)
initial_x = L/100; % initial x coordinate (m)
initial_y = 0;     % initial y coordinate (m)
initial_xdot = 0;  % initial x velocity (m/sec)
initial_ydot = 0;  % initial y velocity (m/sec)
Omega=2*pi/86400; % Earth's angular velocity of rotation about its axis (rad/sec)
lambda=49/180*pi; % latitude in (rad)
```

Running the Simulation

Press the "Play" button on the toolbar in the model window to run the simulation. The simulation will use a variable step stiff solver, ode23t. It will simulate a Foucault pendulum for 3600 seconds (you can change the simulation time). The model uses a default relative tolerance $RelTol = 1e-6$.

Figure 2: Foucault pendulum simulation results (simulation time of 3600 sec)

Results

The simulation results are shown in Figure 2 above. The simulation calculates the pendulum x and y coordinates, and the x and y velocity components of the pendulum.

The pendulum oscillation plane completes a 360 degree sweep in more than 24 hours. The sweep period is a function of geographic latitude λ (see derivation in Analysis and Physics).

Figure 3: The Animation block shows how much the pendulum oscillation plane rotates in an hour

After you run the simulation, double click the animation block to animate the results.

- Note: The "Animate Results" portion of the example requires Signal Processing Toolbox™. Double-clicking on the animation block will cause an error if it is not installed. All other parts of the example will function correctly without the Signal Processing Toolbox.

The `sldemo_foucault_animate.m` file plots the position of the pendulum bob at different points in time. You can clearly see how the pendulum oscillation plane rotates.

- Note: If you are running the simulation at a large relative tolerance, the result will be numerically unstable over a long period of time. Make sure that you are using a stiff variable-step solver. Read more about numerical instability of stiff problems and solver performance in the "Exploring Variable-Step Solvers Using a Stiff Model" example.

Closing the Model

Close the model. Clear generated data.

Analysis and Physics

This section analyzes the Foucault pendulum and describes the physics behind it. The pendulum can be modeled as a point mass suspended on a wire of length L . The pendulum is located at the geographical latitude λ . It is convenient to use the reference frames shown in Figure 4: the inertial frame I (relative to the center of the Earth), and the non-inertial frame N (relative to an observer on Earth's surface). The non-inertial frame accelerates as a result of rotation.

Figure 4: The Inertial and Non-Inertial Frames for the Problem

Point O is the origin of the non-inertial frame N. It is the point on the surface of the earth beneath the point of suspension of the pendulum. The non inertial frame is chosen such that the z-axis points away from the center of the Earth and is perpendicular to Earth's surface. The x-axis points south and the y-axis points west.

As mentioned in the introduction, the oscillation plane of a Foucault pendulum rotates. The oscillation plane completes a full rotation in time T_{rot} given by the following formula, where T_{day} is the duration of one day (i.e. the time it takes the Earth to revolve around its axis once).

$$T_{rot} = T_{day} \cdot \sin \lambda$$

The sine factor requires further discussion. It is often incorrectly assumed that the oscillation plane of the pendulum is fixed in the inertial frame relative to the center of the Earth. This is only true at the north and south poles. To eliminate this confusion, think about the point S (see Figure 4), where the pendulum is suspended. In the inertial frame I, point S moves on a circle. The pendulum bob is suspended on a wire of constant length. For simplicity ignore the air friction. In the inertial frame I, there are only two forces that act on the bob - the wire tension T and the gravitational force F_g .

The vector r gives the position of the pendulum bob, B (see Figure 4). Newton's second law states that the sum of all forces acting on a body equals the mass times the acceleration of the body.

$$m \vec{r} = \vec{T} + \vec{F}_g$$

Throughout this proof, the dots denote time derivatives, arrows denote vectors, caps denote unitary vectors (i, j, and k along x, y, and z axes). A dot above the vector arrow indicated the time derivative of the vector. An arrow above the dot indicated the vector of the time derivative. See the difference between total acceleration and radial acceleration below.

Total Acceleration:

$$\ddot{\vec{r}} = \frac{d^2 \vec{r}}{dt^2} = \frac{d^2}{dt^2} (x\hat{i} + y\hat{j} + z\hat{k})$$

Radial Acceleration:

$$\vec{r} = \left(\frac{d^2 r}{dt^2} \right) = \ddot{x}\hat{i} + \ddot{y}\hat{j} + \ddot{z}\hat{k}$$

The acceleration of gravity points towards the center of the earth (negative z-direction).

$$g = 9.83 \text{ m/sec}^2$$

$$\vec{g} = -g\hat{k}$$

$$m\ddot{\vec{r}} = \vec{T} - mg\hat{k}$$

Decompose the acceleration term:

$$\vec{r} = r_x\hat{i} + r_y\hat{j} + r_z\hat{k}$$

$$\dot{\vec{r}} = (\dot{r}_x\hat{i} + \dot{r}_y\hat{j} + \dot{r}_z\hat{k}) + r_x\dot{\hat{i}} + r_y\dot{\hat{j}} + r_z\dot{\hat{k}}$$

The time derivatives of unit vectors appear because the non-inertial reference frame N is rotating in space. This means that the unitary vectors i, j, and k rotate in space. Their time derivatives are given below. Omega is Earth's angular velocity of revolution around its axis. The scalar Omega is the value of the angular velocity. The vectorial Omega is the vector angular velocity. Its direction is determined by the right hand rule.

$$\dot{\hat{i}} = \vec{\Omega} \times \hat{i}$$

$$\dot{\hat{j}} = \vec{\Omega} \times \hat{j}$$

$$\dot{\hat{k}} = \vec{\Omega} \times \hat{k}$$

Rewrite the time derivative of the vector r relative to Omega.

$$\dot{\vec{r}} = (\dot{r}_x\hat{i} + \dot{r}_y\hat{j} + \dot{r}_z\hat{k}) + \vec{\Omega} \times \vec{r} = \vec{\dot{r}} + \vec{\Omega} \times \vec{r}$$

Similarly, express the second time derivative of the vector r.

$$\ddot{\vec{r}} = \vec{\ddot{r}} + 2\vec{\Omega} \times \vec{\dot{r}} + \vec{\Omega} \times (\vec{\Omega} \times \vec{r})$$

\vec{r} = acceleration in the non-inertial frame N (x, y, z components)

$2\vec{\Omega} \times \vec{r}$ = Coriolis acceleration

$\vec{\Omega} \times (\vec{\Omega} \times \vec{r})$ = additional term due to rotation of non-inertial frame N

To simplify this equation, assume that Omega for Earth is very small. This allows us to ignore the third term in the equation above. In fact, the second term (which is already much smaller than the first term) is four orders of magnitude greater than the third term. This reduces the equation to the following form:

$$\ddot{\vec{r}} \simeq \vec{r} + 2\vec{\Omega} \times \dot{\vec{r}}$$

Newton's Second Law can be written and decomposed into x,y, and z components as follows:

$$m\ddot{\vec{r}} = \vec{T} - mg\hat{k} - 2m\vec{\Omega} \times \dot{\vec{r}}$$

$$m\ddot{x} = T_x + 2m\Omega\dot{y}\sin\lambda$$

$$m\ddot{y} = T_y - 2m\Omega(\dot{x}\sin\lambda + \dot{z}\cos\lambda)$$

$$m\ddot{z} = T_z - mg + 2m\Omega\dot{y}\cos\lambda$$

The angular amplitude of oscillations is small. Therefore, we can ignore the vertical velocity and vertical acceleration (z-dot and z-double-dot). The string tension components can be expressed using small angle approximations, which also considerably simplify the problem, making it two-dimensional (see below).

$$T_z = mg - 2m\Omega\dot{y}\cos\lambda \simeq mg$$

$$T_x = -T\frac{x}{L}$$

$$T_y = -T\frac{y}{L}$$

$$T_z = T\frac{L-z}{L} \simeq T$$

Characteristic Differential Equations

Finally the physics of the problem can be described by the system of coupled equations given below. The x and y coordinates specify the position of the pendulum bob as seen by an observer on Earth.

$$\ddot{x} - 2\Omega\sin\lambda\dot{y} + \frac{g}{L}x = 0$$

$$\ddot{y} + 2\Omega\sin\lambda\dot{x} + \frac{g}{L}y = 0$$

Analytic Solution (Approximate)

The following is an analytic solution to the Foucault pendulum problem. Unfortunately, it is not exact. If you try to substitute the analytic solution into the differential equations, uncanceled terms of the

order Omega squared will remain. However, because Omega is very small, we can ignore the uncanceled terms for practical purposes.

$$\eta = x + i \cdot y \text{ (complex number)}$$

$$\ddot{\eta} + (2i\Omega \sin \lambda)\dot{\eta} + \frac{g}{L}\eta = 0$$

$$\eta = \left(C_1 e^{i\sqrt{g/L}t} + C_2 e^{-i\sqrt{g/L}t} \right) e^{-i\Omega t \sin \lambda}$$

C_1, C_2 are complex integration constants

Actual Differential Equation System Is Asymmetric

During the derivation, terms involving Omega squared were ignored. This resulted in xy symmetry in the differential equations. If the Omega squared terms are taken into consideration, the differential equation system becomes asymmetric (see below).

$$\ddot{x} - 2\Omega \sin \lambda \dot{y} + \left(\frac{g}{L} - \Omega^2 \sin^2 \lambda \right) x = 0$$

$$\ddot{y} + 2\Omega \sin \lambda \dot{x} + \left(\frac{g}{L} - \Omega^2 \right) y = 0$$

You can easily modify the current Foucault pendulum model to account for asymmetric differential equations. Simply edit the corresponding Gain blocks that contain g/L and add the necessary expression. This change will introduce a very small overall correction to the numerical result.

Foucault Pendulum Model with VRML Visualization

This example shows how to solve the differential equations for the Foucault Pendulum problem and displays the pendulum bob movement in the VRML scene. You can modify the Pendulum location by changing the Latitude / Longitude constant values in the model and other parameters (g , Ω , L and initial conditions) in MATLAB® workspace.

There are two VRML scenes associated with this model. The first scene shows the Foucault pendulum itself, the second shows geographical position of the pendulum on the Earth. During the simulation, two arrow markers indicate the current and the initial position of the pendulum in the Earth coordinate system.

This model solves the differential equations for the Foucault Pendulum problem and displays the pendulum bob movement in the VRML scene. You can modify the Pendulum location by changing the Latitude / Longitude constant values in the model and other parameters (g , Ω , L and initial conditions) in MATLAB(R) workspace.

Exploring Variable-Step Solvers Using a Stiff Model

This example shows the behaviour of variable-step solvers in a Foucault pendulum model. Simulink® solvers ode45, ode15s, ode23, and ode23t are used as test cases. Stiff differential equations are used to solve this problem. There is no exact definition of stiffness for equations. Some numerical methods are unstable when used to solve stiff equations and very small step-sizes are required to obtain a numerically stable solution to a stiff problem. A stiff problem may have a fast changing component and a slow changing component.

Foucault pendulum is an example of a stiff problem. The pendulum completes an oscillation in a few seconds (fast changing component) whereas the Earth completes a rotation about its axis in a day (slow changing component). The oscillation plane of the pendulum slowly rotates because of Earth's axial rotation. Read more about the physics of a Foucault pendulum in *Modelling a Foucault Pendulum*.

The simulation calculates the position of the pendulum bob in the x-y plane as viewed by an observer on the surface of Earth. The total energy of the pendulum is then calculated and used to assess the performance of various Simulink solvers.

Foucault Pendulum Model

The Foucault pendulum is described by the system of coupled differential equations given below. Friction and air drag are not taken into consideration (this greatly simplifies the equations). A full derivation of these equations is given in the *Foucault Pendulum* example.

$$\ddot{x} = 2\Omega \sin \lambda \dot{y} - \frac{g}{L}x$$

$$\ddot{y} = -2\Omega \sin \lambda \dot{x} - \frac{g}{L}y$$

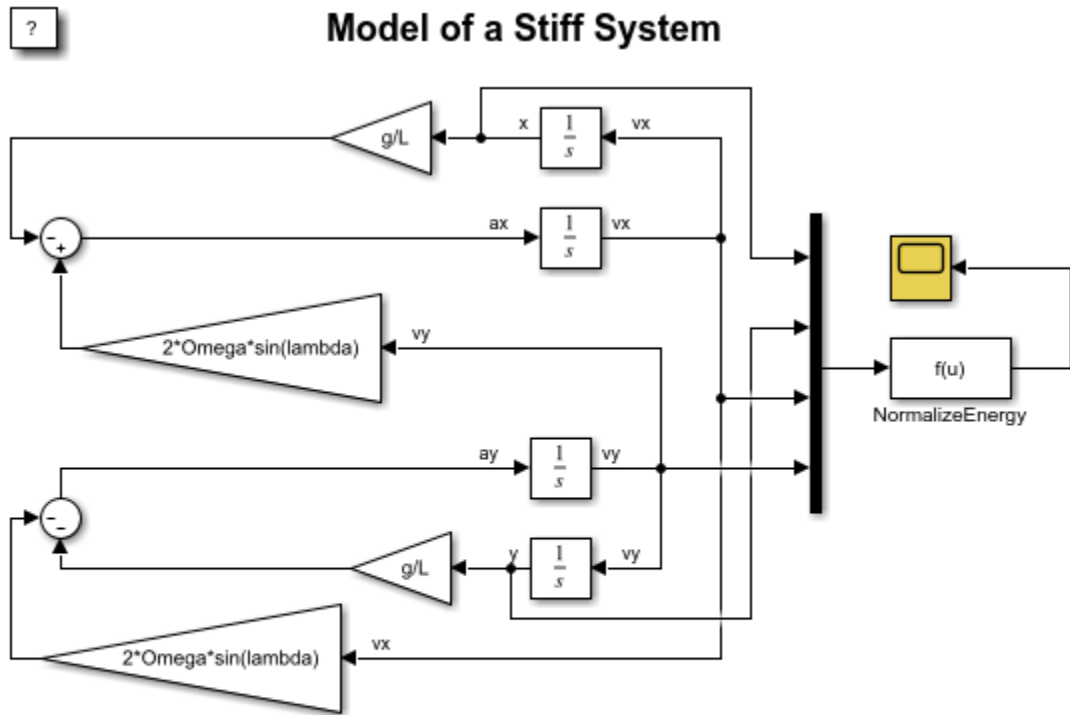

Ω = Earth's angular velocity of rotation around its axis

λ = geographic latitude

g = acceleration of gravity

x and y = coordinates of the pendulum bob

The model shown in Figure 1 is used to solve the differential equations describing a Foucault pendulum. Type `sldemo_solvers` in MATLAB® Command Window to open the model. The example simulates a Foucault pendulum for 86400 seconds. The constants and initial conditions are saved the model workspace.

This model simulates a Foucault pendulum (a stiff system). The model calculates the normalized pendulum energy, E.

Copyright 1990-2013 The MathWorks, Inc.

Figure 1: Foucault pendulum model used top assess solver performance

Variable Step Solvers

This example investigates the performance of ode45, ode15s, ode23, and ode23t variable-step solvers. To read more about a particular solver, for example ode45, type help ode45 in MATLAB Command Window.

Solver	Problem Type	Order of Accuracy	When to Use
ode45	Nonstiff	Medium	Most of the time. This should be the first solver you try.
ode23	Nonstiff	Low	For problems with crude error tolerances or for solving moderately stiff problems.
ode113	Nonstiff	Low to high	For problems with stringent error tolerances or for solving computationally intensive problems.
ode15s	Stiff	Low to medium	If ode45 is slow because the problem is stiff.
ode23s	Stiff	Low	If using crude error tolerances to solve stiff systems and the mass matrix is constant.
ode23t	Moderately Stiff	Low	For moderately stiff problems if you need a solution without numerical damping.
ode23tb	Stiff	Low	If using crude error tolerances to solve stiff systems.

Figure 2: List of variable-step solvers available in Simulink

Assessing Solver Performance

There are different ways to assess the performance of a solver. If a problem has a closed form solution, you could compare the solver results with the expected theoretical result. You could also monitor the time it takes to simulate a model using a particular solver.

Unfortunately there is no exact theoretical solution for the Foucault Pendulum problem. There is an approximate closed form solution, however it cannot be used to assess solver performance (see the Foucault pendulum example).

Total Energy Conservation

This example assesses solver performance by verifying the energy conservation law. In a frictionless environment, the total energy of the pendulum must remain constant. The calculated energy of the pendulum, however, will not remain constant as a result of limited numeric accuracy.

This example calculates the normalized total energy of the pendulum at every time-step. The relative error in energy equals the change in total energy over the course of the simulation. Ideally, the relative error in energy must be zero because energy is conserved. Total energy is the sum of potential and kinetic energy. "NormalizeEnergy" block calculates normalized pendulum energy using the expressions given below.

$$E = \frac{v_x^2 + v_y^2}{2} + g(L - \sqrt{L^2 - x^2 - y^2})$$

$$E_{normalized}(t) = \frac{E(t)}{E(0)}$$

$$E(0) = \text{initial total energy}$$

Figure 3: Normalized energy versus time

Figure 3 shows a plot of normalized energy versus time as calculated using ode23 and ode23t. It is clear that in this particular problem ode23t is much more accurate than ode23. In the simulation

that used `ode23`, the normalized pendulum energy decreased by more than 60%. A pendulum with lower energy has a lower oscillation amplitude. You can see this effect in Figure 4, where the amplitude of the pendulum calculated by `ode23` decreases as the oscillation plane rotates.

Figure 4: Pendulum position as calculated using `ode23` and `ode23t`

Figure 4 illustrates the difference between a stiff and a non-stiff solver. Each plot shows the position of the pendulum bob throughout a day (every 15th data point is plotted as a blue point). The black dot marks the initial position of the pendulum bob and the black line marks the initial pendulum oscillation plane. The red line indicates the oscillation plane after a day. The yellow line shows the oscillation plane at some intermediate point in time. Note that the oscillation plane of the pendulum does not complete a full rotation within a day. How fast the oscillation plane rotates depends on the geographical latitude (see details in the Foucault pendulum example). Observe that the pendulum amplitude in the left plot decreases whereas the amplitude in the right plot remains constant. For the same relative tolerance, `RelTol=1e-5`, the stiff solver gives a more accurate result, but requires more execution time.

Figure 5 shows a more detailed performance study of Simulink solvers. Four solvers were chosen to illustrate how relative error and simulation execution time vary as a function of relative tolerance. You can use the `sldemo_solvers_mcode.m` script for more extensive solver tests. This script generates C code from the model to speed up the simulations. Note that the script can take several minutes to execute.

```
Building RSim executable for model..
Time taken: 39.733348 seconds.
```

```
Running generated RSim executable..
Time taken: 124.230064 seconds.
```

Figure 5: Relative error and execution time for various solver settings. `AbsTol = '1e-7'` for all simulations.

Observe that in this example relative error does not decrease very significantly for relative tolerances below $1e-6$. This is a numeric solver limitation that depends on the particular model. Reducing the solver relative tolerance does not necessarily improve accuracy. You need to estimate the minimal accuracy that is required for your problem and choose the solver accordingly to minimize simulation costs. For example you may want to know the position of the Foucault pendulum bob within a few centimeters. It is unnecessary to calculate the position of a pendulum within a few microns because you cannot measure the position that accurately.

Conclusions

The numeric results of a simulation can behave differently depending on solver settings. This is crucial in the case of stiff problems. When working with stiff models, choose a solver that will give an

accurate result at a minimal price. The relative tolerance (variable-step solvers) or step size (fixed-step solvers) have to be small enough that the result is numerically stable. Although some solvers are more efficient than others, stiff solvers are better suited for solving stiff problems. Variable step solvers are more robust than fixed-step solvers.

Exploring the Solver Jacobian Structure of a Model

The example shows how to use Simulink® to explore the solver Jacobian sparsity pattern, and the connection between the solver Jacobian sparsity pattern and the dependency between components of a physical system. A Simulink model that models the synchronization of three metronomes placed on a free moving base are used.

The Solver Jacobian Pattern

In general, the continuous part of a Simulink model can be written as:

$$\begin{cases} \dot{x} = f(x, u) \\ y = g(x, u) \end{cases}$$

where x are the continuous states and u are the inputs. y are the outputs.

The matrix:

$$J_x = \frac{\partial f}{\partial x}$$

is called the system solver Jacobian matrix. When an implicit ODE solver is used to solve the system equations, J_x needs to be computed when needed. For example, the Jacobian matrix of a set of first order ODEs

$$\begin{cases} \dot{x}_1 = x_1 x_2 \\ \dot{x}_2 = x_2 \end{cases}$$

is

$$J_x = \begin{bmatrix} \frac{\partial f_1}{\partial x_1} & \frac{\partial f_1}{\partial x_2} \\ \frac{\partial f_2}{\partial x_1} & \frac{\partial f_2}{\partial x_2} \end{bmatrix} = \begin{bmatrix} x_2 & x_1 \\ 0 & 1 \end{bmatrix}$$

You can convert the solver Jacobian matrix to a Boolean sparse matrix by representing each non-zero element as 1, and each element that is always zero (hard zero) as 0. For example, the Boolean matrix corresponding to above Jacobian J_x is:

$$J_{xp} = \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix},$$

where J_{xp} is called the solver Jacobian pattern matrix.

The solver Jacobian pattern matrix can be generated directly from the original system equations by using the following rule:

$$J_{xp}(i, j) = \begin{cases} 1 & \text{if } x_j \text{ is explicitly used to compute } \dot{x}_i \\ 0 & \text{otherwise} \end{cases}$$

As you can see, the solver Jacobian pattern matrix actually represents the dependency between the state variables and their derivatives. If computing of \dot{x}_i needs the value of x_j , then there exists a

dependency $\dot{x}_i \leftarrow x_j$ and $J_{xp}(i, j) = 1$. These dependencies are determined by the physical nature of the system, and thus by studying the solver Jacobian matrix, you can explore the physical structure of the physical system represented by the model. Simulink provides APIs for the user to get the solver Jacobian pattern matrix. The following shows how to access the solver Jacobian pattern and to use it to study the model.

The Pattern and Dependency: Synchronization of Metronomes

Synchronization is defined as an adjustment of rhythms of oscillating objects due to their weak interaction [1]. One of the first scientifically documented observations of synchronization was reported by the Dutch scientist Christiaan Huygens, the inventor of pendulum clock [2]. Huygens discovered that two pendulums attached to the same beam supported by chairs would swing in exact opposite direction after some time. A similar set up used in this example is shown in Figure 1.

Moving base with mass M
Pendulum with mass m , rotational inertia J , length r

Figure 1: Set up used in this example: three metronomes on a moving base

Modeling the System

The model of this physical system can be divided into two parts:

- The metronomes mechanism
- The moving base

The metronomes mechanism

Referring to Figure 1, the dynamic equations of a single metronome on a moving base can be derived as[3]:

$$\underbrace{\ddot{\theta}}_{\text{Angular acceleration}} + \underbrace{\frac{mrg}{J} \sin \theta}_{\text{Gravitational term}} + \underbrace{\frac{b}{J} \left[\left(\frac{\theta}{\theta_r} \right)^2 - 1 \right] \dot{\theta}}_{\text{Escapement and damping term}} + \underbrace{\left(\frac{rm \cos \theta}{J} \right) \ddot{x}}_{\text{Coupled inertial force term}} = 0 \quad (\text{eq.1})$$

The first two terms describe a simple pendulum without friction. The third term is used to approximate the escapement* and any damping of the metronome. This term increases the angular velocity for $\theta < \theta_0$ and decreases it for $\theta > \theta_0$ [3]. The last term is the coupled effect from the moving base, in terms of an inertial force.

The moving base

Assuming the motion of the base is frictionless, then the center of mass of the system will not change and you can derive the following:

$$x = -\frac{m}{M + 3m} r(\sin \theta_1 + \sin \theta_2 + \sin \theta_3),$$

where M is the mass of the base and m is the mass of the pendulum.

Then eq.1 can be changed to:

$$\ddot{x} = -\frac{m}{M + 3m} r \left[\ddot{\theta}_1 \cos \theta_1 - \sin \theta_1 (\dot{\theta}_1)^2 + \ddot{\theta}_2 \cos \theta_2 - \sin \theta_2 (\dot{\theta}_2)^2 + \ddot{\theta}_3 \cos \theta_3 - \sin \theta_3 (\dot{\theta}_3)^2 \right] \quad (eq.2)$$

The following shows the above system implemented using Simulink. The model contains three metronome subsystems and the moving base.

Exploring the Solver Jacobian Structure of a Model

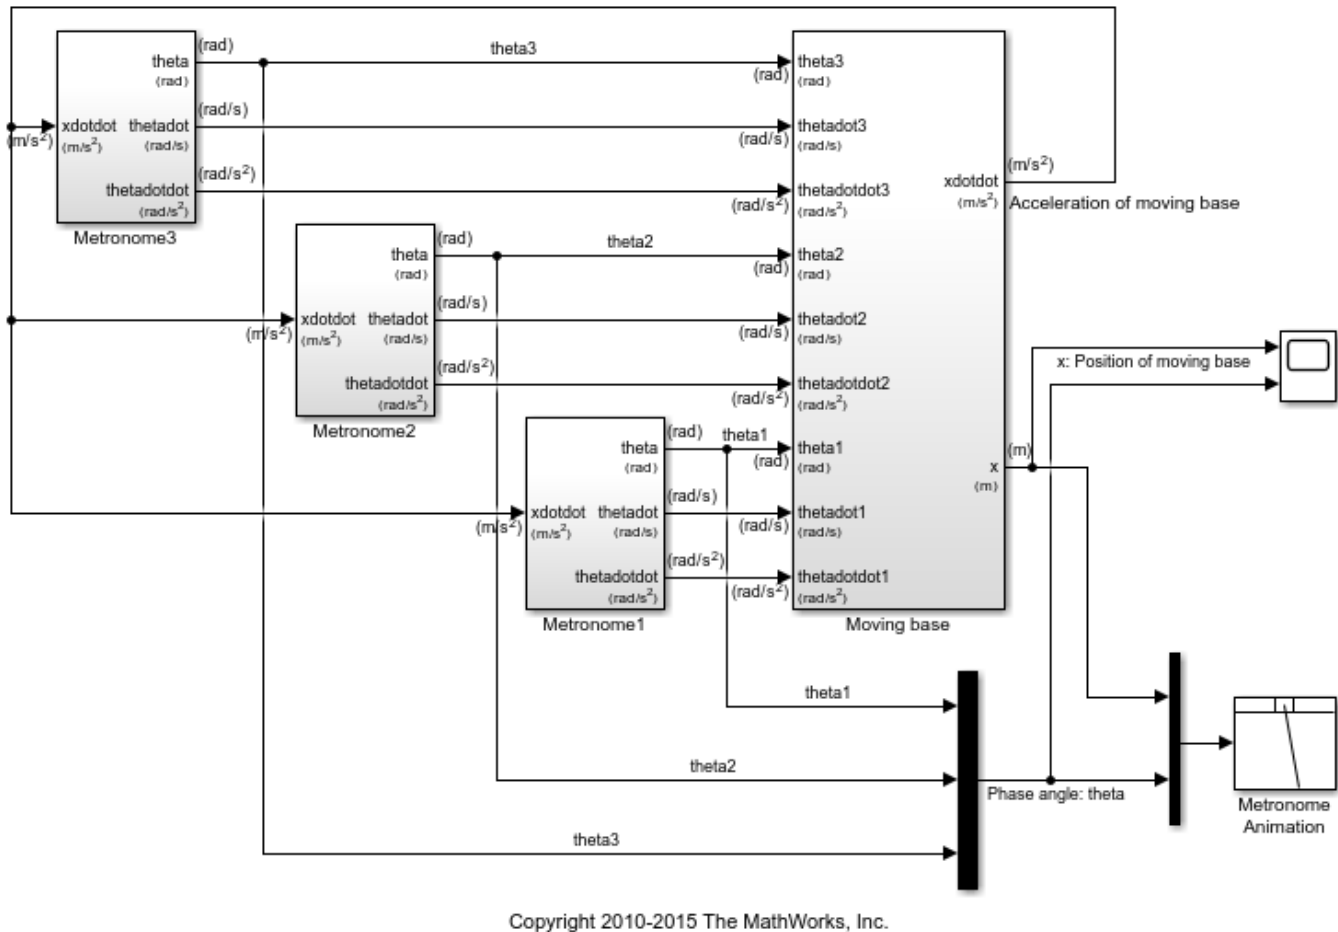

Figure 2: The Simulink model of the metronomes system

Simulation of this system shows an interesting phenomenon: Synchronization. It shows that all three metronomes with different initial phase angle eventually become synchronized with each other. Figure 3 shows the simulation results. The main cause for synchronization is the moving base that links all these metronomes together. This physical connection can be observed from the dynamic equation of each metronome.

Also, this physical connection can also be observed from the solver Jacobian pattern of this model. The following MATLAB® code shows how to get the solver Jacobian pattern.

Time: 40

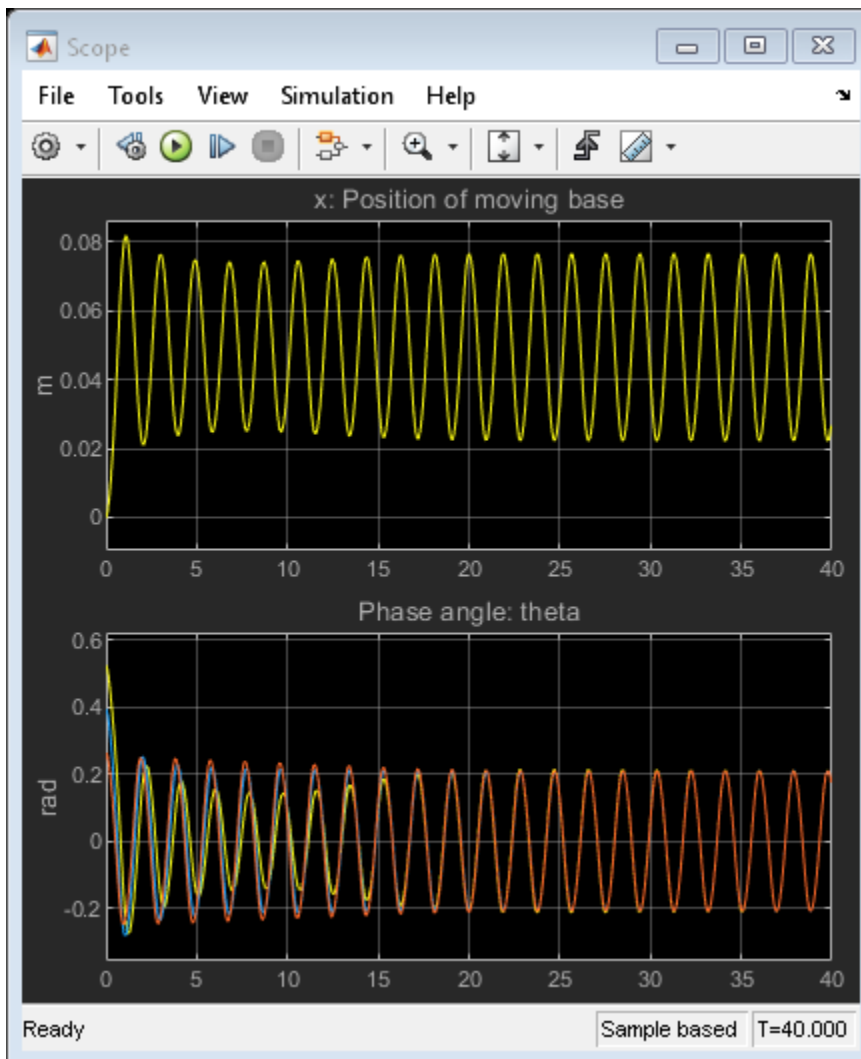

Figure 3: The synchronized metronomes

Steps to Get the Solver Jacobian Pattern

% 1. Set the solver to be any implicit solver

```
set_param mdl, 'Solver', 'ode15s');
```

% 2. Set the solver Jacobian method to be Sparse perturbation *

```
set_param mdl, 'SolverJacobianMethodControl', 'SparsePerturbation');
```

% 3. Get the solver Jacobian object.

```
J = Simulink.Solver.getSlvrJacobianPattern(mdl);
disp('J = ');
disp(J);
```

% 4. Show the pattern in a figure. use the method J.show

```
J.show;
```

% 5. Explore the pattern with the given state name and other information

```
stateNames = J.stateNames;
disp('stateNames = ');
disp(stateNames);
```

The results you will see are:

```
J =
SlvrJacobianPattern with properties:

    Jpattern: [8x8 double]
  numColGroup: 6
    colGroup: [8x1 double]
  stateNames: {8x1 cell}
  blockHandles: [8x1 double]

stateNames =
{'sldemo_metro/Moving base/Integrator1'           }
{'(sldemo_metro/Metronome1/Integrator2).(Theta1)' }
{'(sldemo_metro/Metronome2/Integrator2).(Theta2)' }
{'(sldemo_metro/Metronome3/Integrator2).(Theta3)' }
{'(sldemo_metro/Metronome3/Integrator1).(Thetadot_3)'}
{'(sldemo_metro/Metronome2/Integrator1).(Thetadot_2)'}
{'(sldemo_metro/Metronome1/Integrator1).(Thetadot_1)'}
{'sldemo_metro/Moving base/Integrator'           }
```

Figure 4: The solver Jacobian pattern

Properties of the Solver Jacobian Pattern Object

The solver Jacobian pattern J is an object. It contains the following properties:

`Jpattern`: A sparse mxArray which is the Jacobian pattern.

`numColGroup`: Number of column groups.

`colgroup`: A column partition of the sparse pattern matrix.

`stateNames`: A cell array containing the state name of each state.

`blockHandles`: Block handles of the owner of each state.

Study of the Solver Jacobian Pattern

Referring to Figure 4. First, the solver Jacobian of this model is sparse and the number of non-zero element is 28. Secondly, the number of column groups is 6; is less than the number of states 8.

The row 1-4 indicates the following dependencies:

$$\begin{aligned}\dot{x}_1 &\leftarrow x_8(\text{baseposition} \leftarrow \text{baseseed}) \\ \dot{x}_2 &\leftarrow x_7(\dot{\text{Theta}}1 \leftarrow \text{Thetadot1}) \\ \dot{x}_3 &\leftarrow x_6(\dot{\text{Theta}}2 \leftarrow \text{Thetadot2}) \\ \dot{x}_4 &\leftarrow x_5(\dot{\text{Theta}}3 \leftarrow \text{Thetadot3})\end{aligned}$$

These relations are clear since speed is the derivative of position. Row 5-8 shows the following relations:

$$\begin{aligned}\dot{x}_5 &\leftarrow x_{2-7} \\ \dot{x}_6 &\leftarrow x_{2-7} \\ \dot{x}_7 &\leftarrow x_{2-7} \\ \dot{x}_8 &\leftarrow x_{2-7}\end{aligned}$$

These relations show that to compute the angular acceleration of the metronomes or acceleration of the moving base, the angular position and angular speed of the metronomes are needed, but not the position and speed of the base. These relations can be found by studying eq.(1) and eq.(2) directly.

Conclusion

The Solver Jacobian pattern is a tool to study the data dependency relations between the derivatives of the state variables and the state variables. These relations usually reflect certain physical couplings in the physical system. By using the tools provided, you can discover these relations associated with a Simulink model, even without the original dynamic equations of the physical model.

Double Bouncing Ball: Use of Adaptive Zero-Crossing Location

This example shows how to choose the correct zero-crossing location algorithm, based on the system dynamics. For Zeno dynamic systems, or systems with strong chattering, you can select the adaptive zero-crossing detection algorithm through the Configure pane:

```
--> Solver
--> Zero-crossing options
--> Algorithm: [Non-adaptive, Adaptive]
```

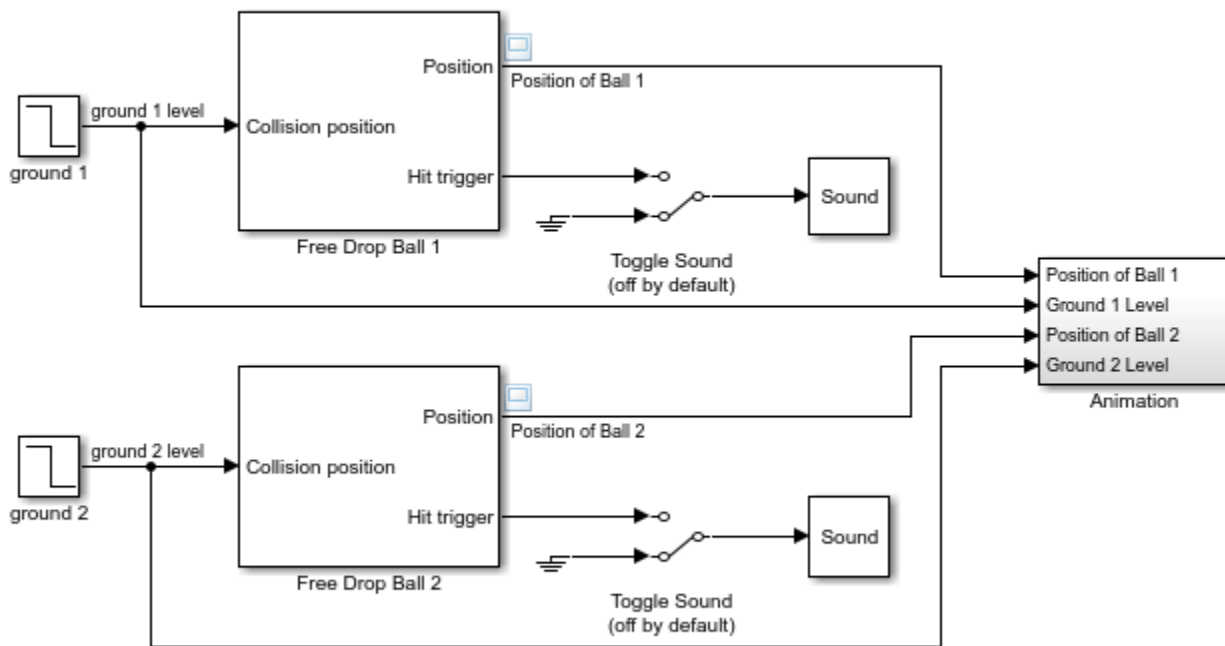

You can run this model by typing 'sldemo_doublebounce' at the MATLAB® command-line

The Double Bouncing Ball System

The Simulink® model in this example is used to simulate two bouncing balls. They start from the ground with different initial speeds, and their ground levels will change at different times.

Open the model

Passing Zeno : Double Bouncing Ball

Copyright 1990-2013 The MathWorks, Inc.

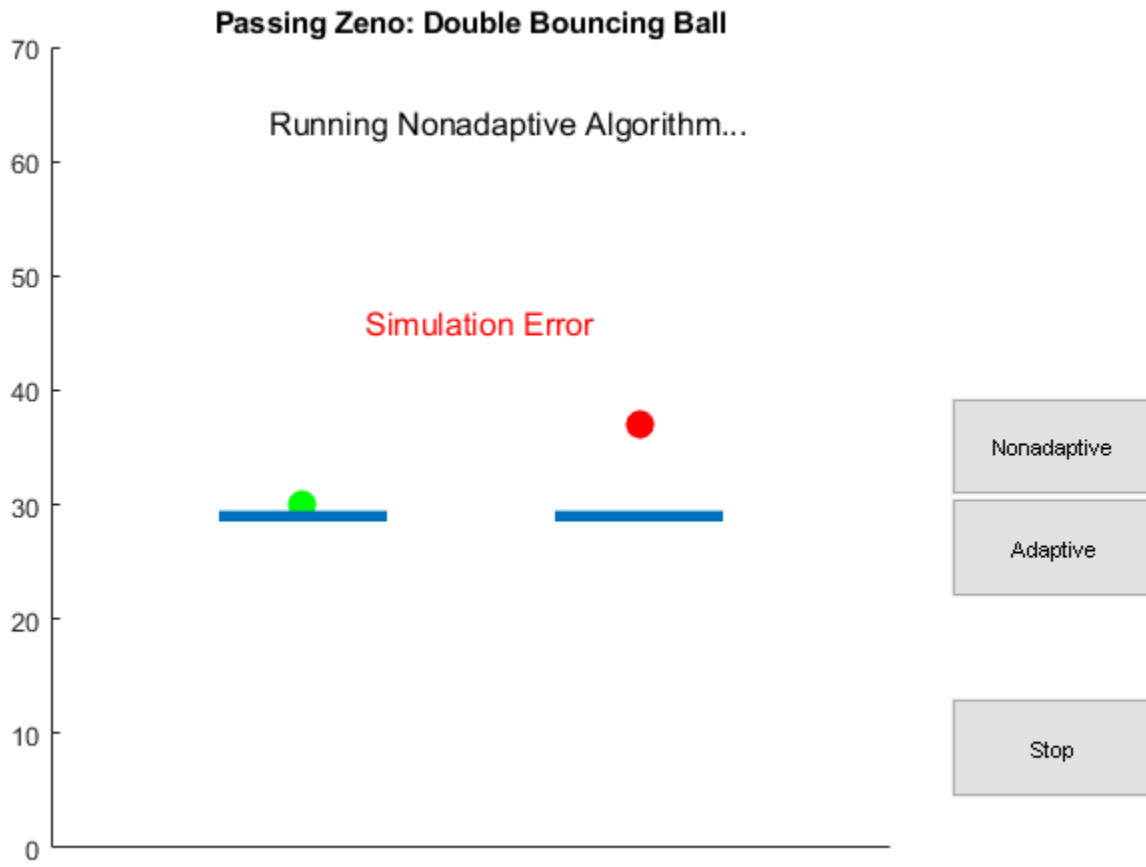

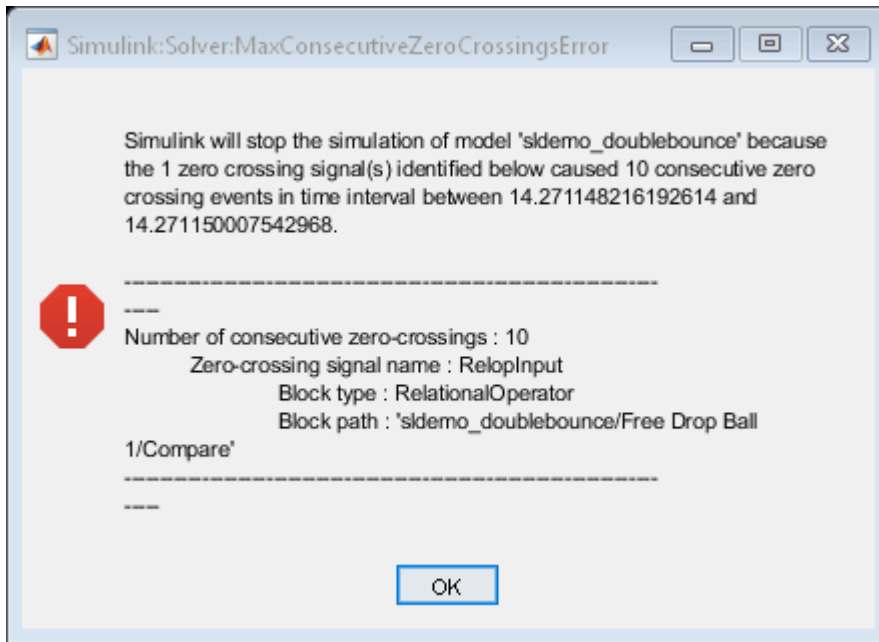

Figure 1: The double bouncing ball model and animation

Double Bouncing Balls With Non-adaptive Zero-Crossing Location Algorithm

If the Non-adaptive zero-crossing location algorithm is used, the consecutive zero-crossing error causes the simulation to stop. This system is actually a so-called 'Zeno dynamic system'. When either ball is very close to the ground, Simulink will hang because too many zero crossings are detected in a very short period.

Figure 2: Vertical displacement of both balls with Non-adaptive zero-crossing location algorithm.

The simulation does not complete and an error message is shown. The ground level changing events cannot be observed.

Double Bouncing Balls With Adaptive Zero-Crossing Location Algorithm

If the adaptive algorithm is selected, Simulink will adaptively turn on/off the process to precisely locate the zero-crossing time. The conditions to turn on/off the location are:

1) Zero-crossing signal value is below a threshold value. You can control the threshold value through the Configure pane:

```
--> Solver
    --> Zero-crossing options
        --> Algorithm: [Adaptive]
        --> Signal threshold
```

2) Consecutive zero-crossing diagnostic is hit. You can define consecutive zero crossing through the Configure pane:

```
--> Solver
--> Solver diagnostic controls
--> Time tolerance and
--> Number of consecutive zero crossings.
```

Figure 3: Vertical displacement of both balls with adaptive zero crossing location algorithm.

The simulation has completed. The ground level changing events can be observed. A warning is shown to inform you when searching for events is turned off.

Four Hydraulic Cylinder Simulation

This example shows how to use Simulink® to create a model with four hydraulic cylinders. See two related examples that use the same basic components: single cylinder model and model with two cylinders and load constraints.

- Note: This is a basic hydraulics example. You can more easily build hydraulic and automotive models using Simscape™ Driveline™ and Simscape Fluids™.
- **Simscape Fluids** provides component libraries for modeling and simulating fluid systems. It includes models of pumps, valves, actuators, pipelines, and heat exchangers. You can use these components to develop fluid power systems such as front-loader, power steering, and landing gear actuation systems. Engine cooling and fuel supply systems can also be developed with Simscape Fluids. You can integrate mechanical, electrical, thermal, and other systems using components available within the Simscape product family.
- **Simscape Driveline** provides component libraries for modeling and simulating one-dimensional mechanical systems. It includes models of rotational and translational components, such as worm gears, planetary gears, lead screws, and clutches. You can use these components to model the transmission of mechanical power in helicopter drivetrains, industrial machinery, vehicle powertrains, and other applications. Automotive components, such as engines, tires, transmissions, and torque converters, are also included.

Modeling

Figure 1 shows the top level diagram of the model. This model has a single pump and four actuators. The same pump pressure (p_1) drives each cylinder assembly and the sum of their flows loads the pump. Although each of the four control valves could be controlled independently, as in an active suspension system, in this case all four receive the same commands, a linear ramp in orifice area from zero to 0.002 sq.m. .

Opening the Model and Running the Simulation

To open this model, type `sldemo_hydcyl4` at MATLAB® terminal (click on the hyperlink if you are using MATLAB Help). Press the "Play" button on the model toolbar to run the simulation.

- Note: The model logs relevant data to MATLAB workspace, into the Simulink.SimulationOutput object `out`. The signal logging data is stored within `out`, in a structure called `sldemo_hydcyl4_output`. Logged signals have a blue indicator (see the model). Read more about Signal Logging in Simulink Help.

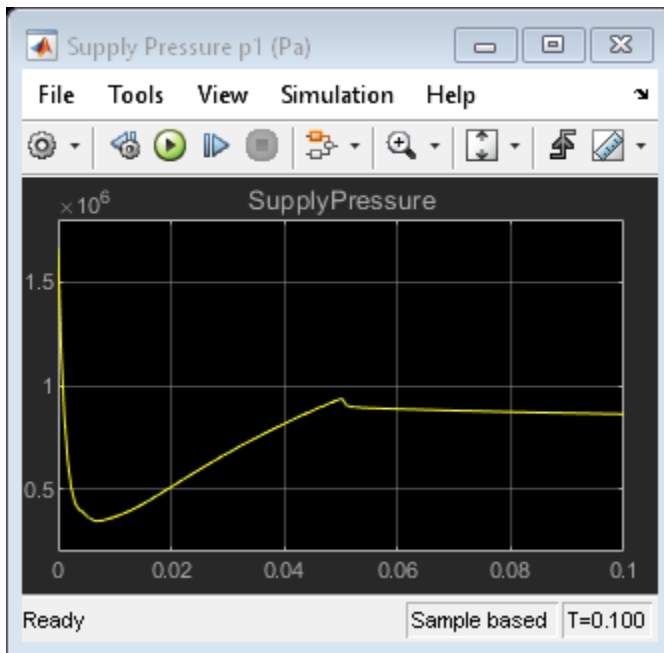

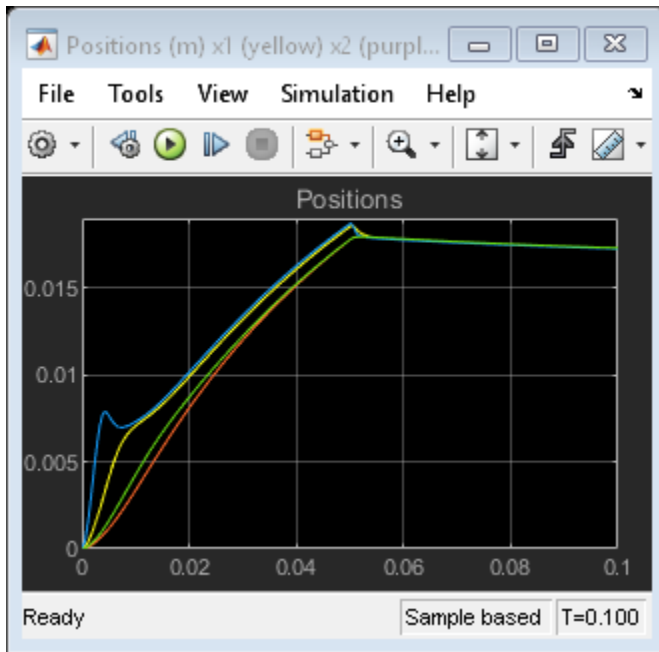

Figure 1: Four cylinder model and simulation results

Model Description

The pump flow begins at $0.005 \text{ m}^3/\text{sec}$ (just like in the single cylinder model), then it drops to $0.0025 \text{ m}^3/\text{sec}$ at $t=0.05 \text{ sec}$. The parameters $C1$, $C2$, Cd , ρ , and $V30$ are identical to those in the single cylinder model. However, by assuming individual values for K , A , and β , each one of the four cylinders exhibit distinctive transient responses. The table below gives the characteristics of the four actuators.

Parameter	Actuator1	Actuator2	Actuator3	Actuator4
Spring Constant	K	K/4	4K	K
Piston Area	Ac	Ac/4	4Ac	Ac
Bulk Modulus	Beta	Beta	Beta	Beta/1000

Beta = 7e8 Pa [fluid bulk modulus]
 K = 5e4 N/m [spring constant]
 Ac = 1e-3 m² [cylinder cross-sectional area]

The ratio of area and spring constant is the same for all pistons, so they should have the same steady state output. The dominant time constant for each actuator subsystem is proportional to

$$\frac{A_c^2}{K}$$

(result obtained from dimensional analysis), so we can expect the piston assembly 2 to be somewhat faster than assembly 1. The piston assembly 3 is expected to be slower than 1 or 2. The piston assembly 4 has a significantly lower bulk modulus beta (as would be the case with air), thus we expect piston 4 to respond more sluggishly than piston 1.

Results

Figure 2: Piston positions in four cylinder example

Figure 3: Pump Supply Pressure, p_1

The initial jolt of flow at $t=0$ is seen by the four actuators as a pressure impulse. The pump pressure (p_1), which is initially high, drops rapidly because there is a high flow demand from the four loads. During the initial transient (about 4 msec), distinct responses identify the individual dynamic characteristics of each assembly unit.

As predicted by the parameter values, actuator 2 responds much faster than actuator 1. The third and fourth pistons are much slower because they require more working fluid to move the same distance. In case 3, the piston displaces more volume due to its larger cross-sectional area. In case 4, although the displaced volume is the same as in case 1, the device requires more fluid because it is subsequently compressed.

As the pump pressure falls to the level within the cylinders, the distinctions in behavior are blurred. The individual responses blend into an overall system response which maintains the flow balance between the components. At $t=0.05$ sec, the pump flow drops to a level that is close to the equilibrium and the actuator flows are nearly zero. The individual steady state piston positions are equal, as predicted by the design.

Close the model. Clear generated data.

Two Cylinder Model with Load Constraints

This example shows how to model a rigid rod supporting a large mass interconnecting two hydraulic actuators. The model eliminates the springs as it applies the piston forces directly to the load. These forces balance the gravitational force and result in both linear and rotational displacement.

See two related examples that use the same basic components: four cylinder model and single cylinder model.

- Note: This is a basic hydraulics example. You can more easily build hydraulic and automotive models using Simscape™ Driveline™ and Simscape Fluids™.
- **Simscape Fluids** provides component libraries for modeling and simulating fluid systems. It includes models of pumps, valves, actuators, pipelines, and heat exchangers. You can use these components to develop fluid power systems such as front-loader, power steering, and landing gear actuation systems. Engine cooling and fuel supply systems can also be developed with Simscape Fluids. You can integrate mechanical, electrical, thermal, and other systems using components available within the Simscape product family.
- **Simscape Driveline** provides component libraries for modeling and simulating one-dimensional mechanical systems. It includes models of rotational and translational components, such as worm gears, planetary gears, lead screws, and clutches. You can use these components to model the transmission of mechanical power in helicopter drivetrains, industrial machinery, vehicle powertrains, and other applications. Automotive components, such as engines, tires, transmissions, and torque converters, are also included.

Analysis and Physics of the Model

We assume the rotation angle of the rod is small. The equations of motion for the rod are given below in Equation Block 1. The equations describing the cylinder and pump behavior are the same as in the single cylinder example.

Equation Block 1:

$$M \frac{d^2 z}{dt^2} = F_b + F_a + F_{ext}$$

$$I \frac{d^2 \theta}{dt^2} = \frac{L}{2} F_b - \frac{L}{2} F_a$$

z – displacement at the center

M – total mass

F_a – piston A force

F_b – piston B force

F_{ext} – external force at center

θ – clockwise angular displacement

I – moment of inertia of the rod

L – rod length

The positions and velocities of the individual pistons follow directly from the geometry. See the corresponding equations below in Equation Block 2.

Equation Block 2:

$$z_a = z - \theta \frac{L}{2}$$

$$z_b = z + \theta \frac{L}{2}$$

$$\frac{dz_a}{dt} = \frac{dz}{dt} - \frac{d\theta}{dt} \frac{L}{2}$$

$$\frac{dz_b}{dt} = \frac{dz}{dt} + \frac{d\theta}{dt} \frac{L}{2}$$

z_a – piston A displacement

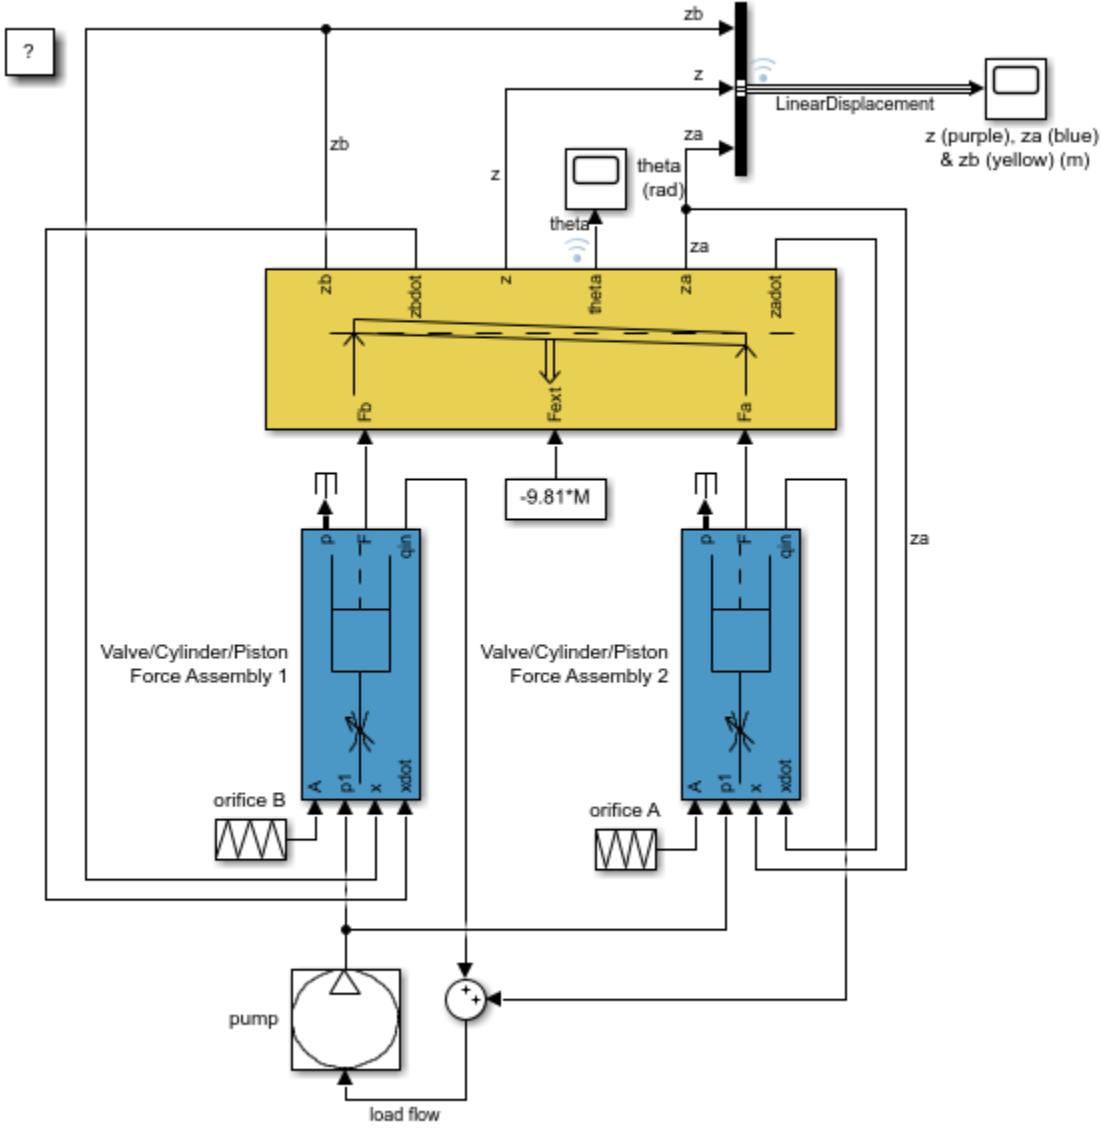

z_b – piston B displacement

Opening the Model and Running the Simulation

To open this model, type `sldemo_hydrod` at MATLAB® terminal (click on the hyperlink if you are using MATLAB Help). Press the "Play" button on the model toolbar to run the simulation.

- Note: The model logs relevant data to MATLAB workspace into the Simulink.SimulationOutput object `out`. The signal logging data is stored within `out`, in a structure called `sldemo_hydrod_output`. Logged signals have a blue indicator (see the model). Read more about Signal Logging in Simulink Help.
- Note: The model logs all the continuous states of the system to MATLAB workspace in a structure called `xout`. Each state is assigned a name to facilitate data logging. The names of the states are available in the 'stateName' field of `xout.signals`. Read more about state names in Simulink Help.

Two Cylinder with Connecting Rod Simulation

Copyright 1990-2012 The MathWorks, Inc.

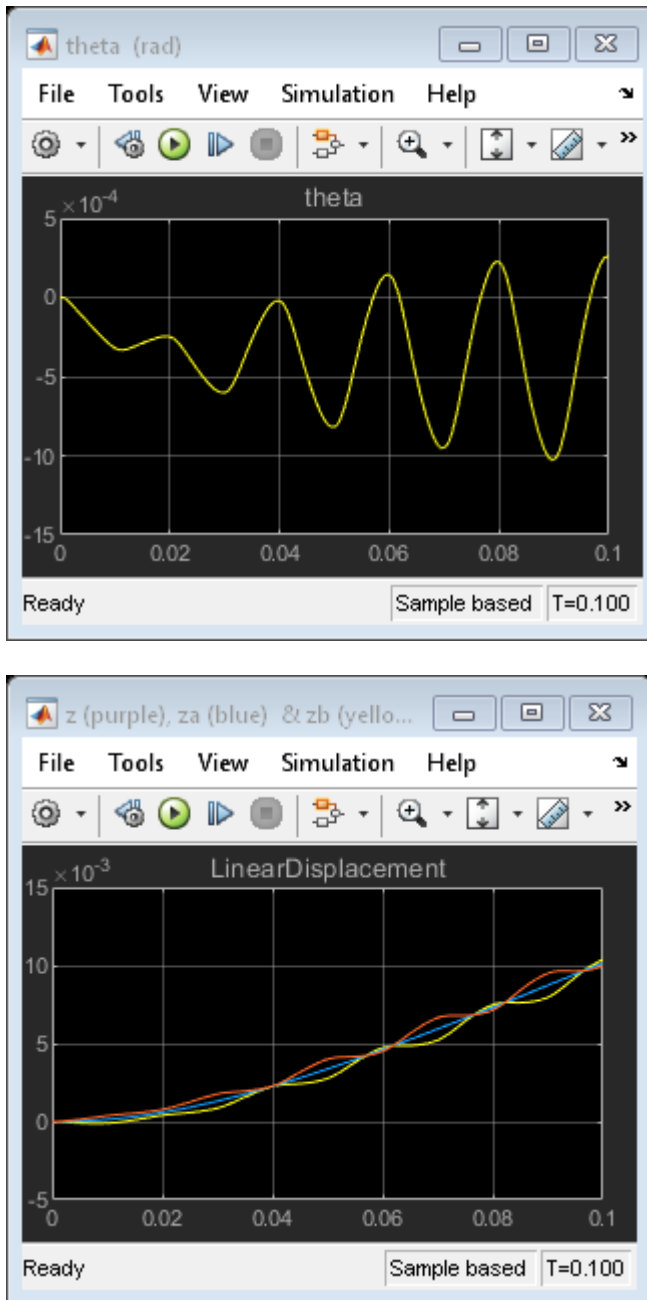

Figure 1: Two cylinder model and simulation results

'Mechanical Load' Subsystem

This subsystem is shown in Figure 2. It solves the equations of motion, which we compute directly using standard Simulink blocks. It is assumed that the rotation angle is small. Look under the mask of the 'Mechanical Load' subsystem to see its structure (right click on the subsystem > select "Look Under Mask").

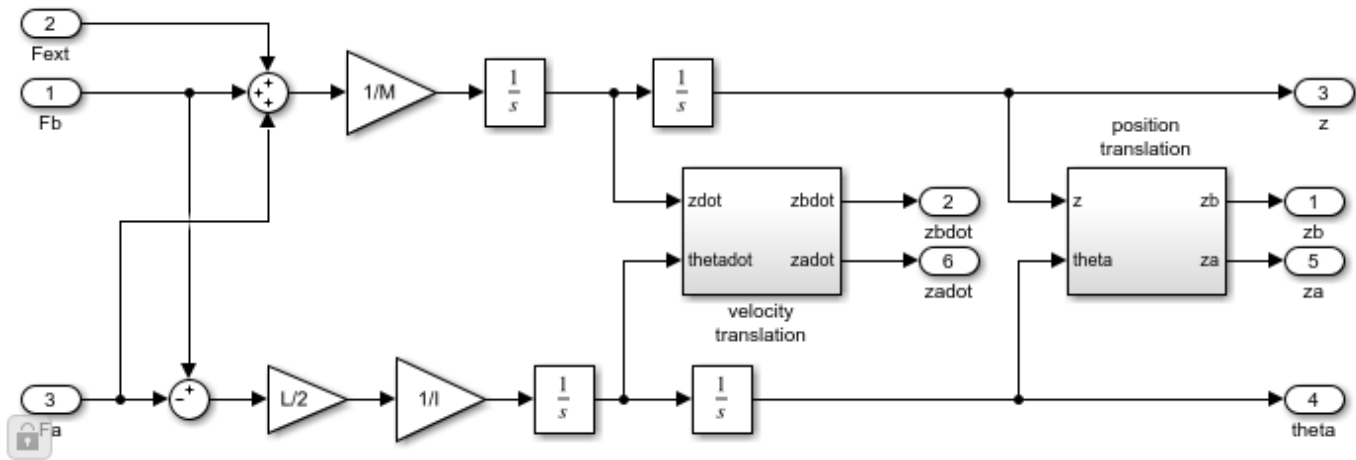

Figure 2: 'Mechanical Load' subsystem

Simulation Parameters

The parameters used in this simulation are identical to the parameters used in the single cylinder model, except for the following:

$L = 1.5 \text{ m}$
 $M = 2500 \text{ kg}$
 $I = 100 \text{ kg/m}^2$
 $Q_{\max} = 0.005 \text{ m}^3/\text{sec}$ (constant)
 $C_2 = 3e-9 \text{ m}^3/\text{sec/Pa}$
 $F_{\text{ext}} = -9.81 * M \text{ Newtons}$

Although the pump flow is constant, the model controls the valves independently. Initially, at $t = 0$, the cross-section of valve B is zero. It grows linearly to $1.2e-5 \text{ m}^2$ at $t = 0.01 \text{ sec}$, and then linearly decreases to zero at $t = 0.02 \text{ sec}$. The cross-section of valve A is $1.2e-5 \text{ sq.m.}$ at $t = 0$ and it linearly decreases to zero at $t = 0.01 \text{ sec}$, then it linearly increases to $1.2e-5 \text{ sq.m.}$ at $t = 0.02 \text{ sec}$. Then the behavior of the valves A and B repeats periodically with the same pattern. In other words the valves A and B are 180 degrees out of phase.

Results

Figures 3 and 4 show the linear and angular displacements of the rod. The linear displacement response is typical of a type-one integrating system. The relative positions and the angular movement of the rod illustrate the response of the two pistons to the out-of-phase control signals (the cross-section of the valves A and B).

Conclusions

Simulink provides a productive environment for simulating hydraulic systems, offering enhancements that provide enormous productivity in modeling and flexibility in numerical methods. The use of masked subsystems and model libraries facilitates structured modeling with automatic component updates. As users modify library elements, the models that use the elements automatically incorporate the new versions. Simulink can use differential-algebraic equations (DAEs) to model some fluid elements as incompressible and others as compliant, allowing efficient solutions for complex systems of interdependent circuits.

Models such as this one can ultimately be used as part of overall plant or vehicle systems. The hierarchical nature of Simulink allows independently developed hydraulic actuators to be placed, as appropriate, in larger system models (for example adding controls in the form of sensors or valves). In cases such as these, tools from the MATLAB Control System Toolbox™ can analyze and tune the overall closed-loop system. The MATLAB/Simulink environment can thus support the entire design, analysis, and modeling cycle.

Modeling a Fault-Tolerant Fuel Control System

This example shows how to combine Stateflow® with Simulink® to efficiently model hybrid systems. This type of modeling is particularly useful for systems that have numerous possible operational modes based on discrete events. Traditional signal flow is handled in Simulink while changes in control configuration are implemented in Stateflow. The model described below represents a fuel control system for a gasoline engine. The system is highly robust in that individual sensor failures are detected and the control system is dynamically reconfigured for uninterrupted operation.

Analysis and Physics

Physical and empirical relationships form the basis for the throttle and intake manifold dynamics of this model. The air-fuel ratio is computed by dividing the air mass flow rate (pumped from the intake manifold) by the fuel mass flow rate (injected at the valves). The ideal (i.e. stoichiometric) mixture ratio provides a good compromise between power, fuel economy, and emissions. The target air-fuel ratio for this system is 14.6. Typically, a sensor determines the amount of residual oxygen present in the exhaust gas (EGO). This gives a good indication of the mixture ratio and provides a feedback measurement for closed-loop control. If the sensor indicates a high oxygen level, the control law increases the fuel rate. When the sensor detects a fuel-rich mixture, corresponding to a very low level of residual oxygen, the controller decreases the fuel rate.

Modeling

Figure 1 shows the top level of the Simulink model. To open the model, type `sldemo_fuelsys` in MATLAB® Command Window. Press the Play button in the model window toolbar to run the simulation. The model loads necessary data into the model workspace from `sldemo_fuelsys_data.m`. The model logs relevant data to MATLAB workspace in a data structure called `sldemo_fuelsys_output` and streams the data to the Simulation Data Inspector. Logged signals are marked with a blue indicator while streaming signals are marked with the light blue badge (see Figure 1).

Note that loading initial conditions into the model workspace keeps simulation data isolated from data in other open models that you may have open. This also helps avoid MATLAB workspace cluttering. To view the contents of the model workspace select Modeling > Model Explorer, and click on Model Workspace from the Model Hierarchy list.

Notice that units are visible on the model and subsystem icons and signal lines. Units are specified on the ports and on the bus object. To learn more about units in Simulink see Simulink Units.

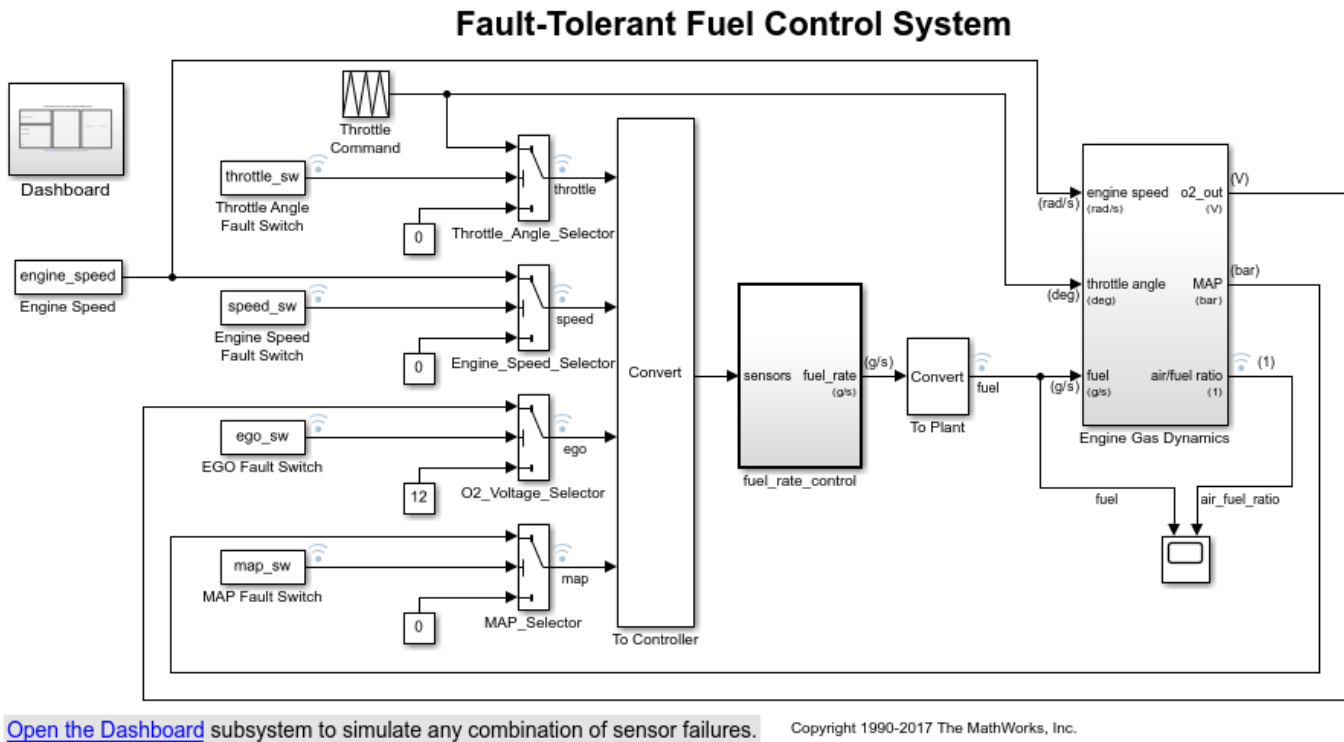

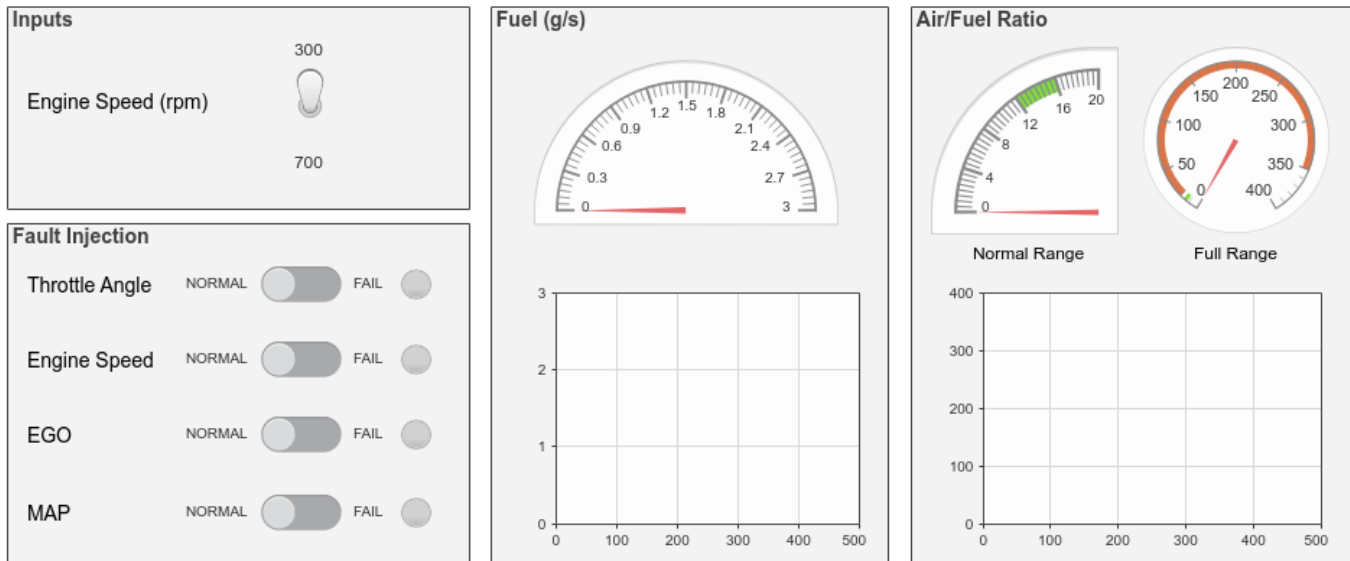

Figure 1: Top-level diagram for the fuel control system model

The Dashboard subsystem (shown in Figure 2) allows the user to interact with the model during simulation. The Fault Injection switches can be moved from the Normal to Fail position to simulate sensor failures, while the Engine Speed selector switch can be toggled to change the engine speed. The fuel and air/fuel ratio signals are visualized using the dashboard gauges and scopes to provide visual feedback during a simulation run.

Fault-Tolerant Fuel Control System Dashboard

[Update Diagram](#) (Ctrl+D) to bind switches to model workspace variables.

Figure 2: Dashboard subsystem for the fuel control system model

The `fuel_rate_control` uses signals from the system's sensors to determine the fuel rate which gives a stoichiometric mixture. The fuel rate combines with the actual air flow in the engine gas dynamics model to determine the resulting mixture ratio as sensed at the exhaust.

The user can selectively disable each of the four sensors (throttle angle, speed, EGO and manifold absolute pressure [MAP]) by using the slider switches in the dashboard subsystem, to simulate failures. Simulink accomplishes this by binding slider switches to the value parameter of the constant block. Double-click on the dashboard subsystem to open the control dashboard to change the position of the switch. Similarly, the user can induce the failure condition of a high engine speed by toggling the engine speed switch on the dashboard subsystem. A Repeating Table block provides the throttle angle input and periodically repeats the sequence of data specified in the mask.

The `fuel_rate_control` block, shown in Figure 3, uses the sensor input and feedback signals to adjust the fuel rate to give a stoichiometric ratio. The model uses three subsystems to implement this strategy: control logic, airflow calculation, and fuel calculation. Under normal operation, the model estimates the airflow rate and multiplies the estimate by the reciprocal of the desired ratio to give the fuel rate. Feedback from the oxygen sensor provides a closed-loop adjustment of the rate estimation in order to maintain the ideal mixture ratio.

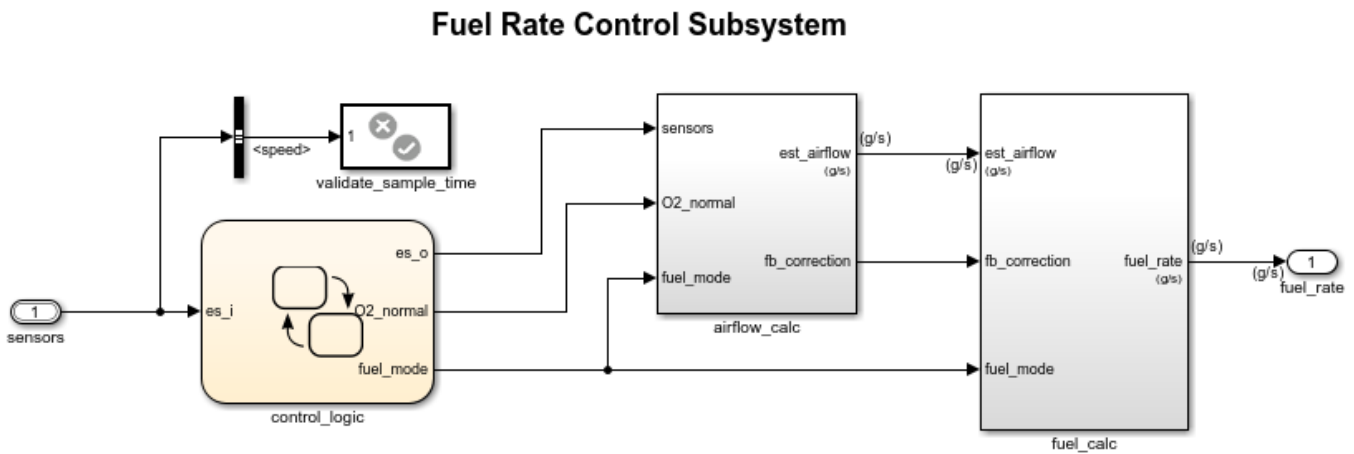

Figure 3: Fuel rate controller subsystem

Control Logic

A single Stateflow chart, consisting of a set of six parallel states, implements the control logic in its entirety. The four parallel states shown at the top of Figure 4 correspond to the four individual sensors. The remaining two parallel states at the bottom consider the status of the four sensors simultaneously and determine the overall system operating mode. The model synchronously calls the entire Stateflow diagram at a regular sample time interval of 0.01 sec. This permits the conditions for transitions to the correct mode to be tested on a timely basis.

To open the control_logic Stateflow chart, double click on it in the fuel_rate_control subsystem.

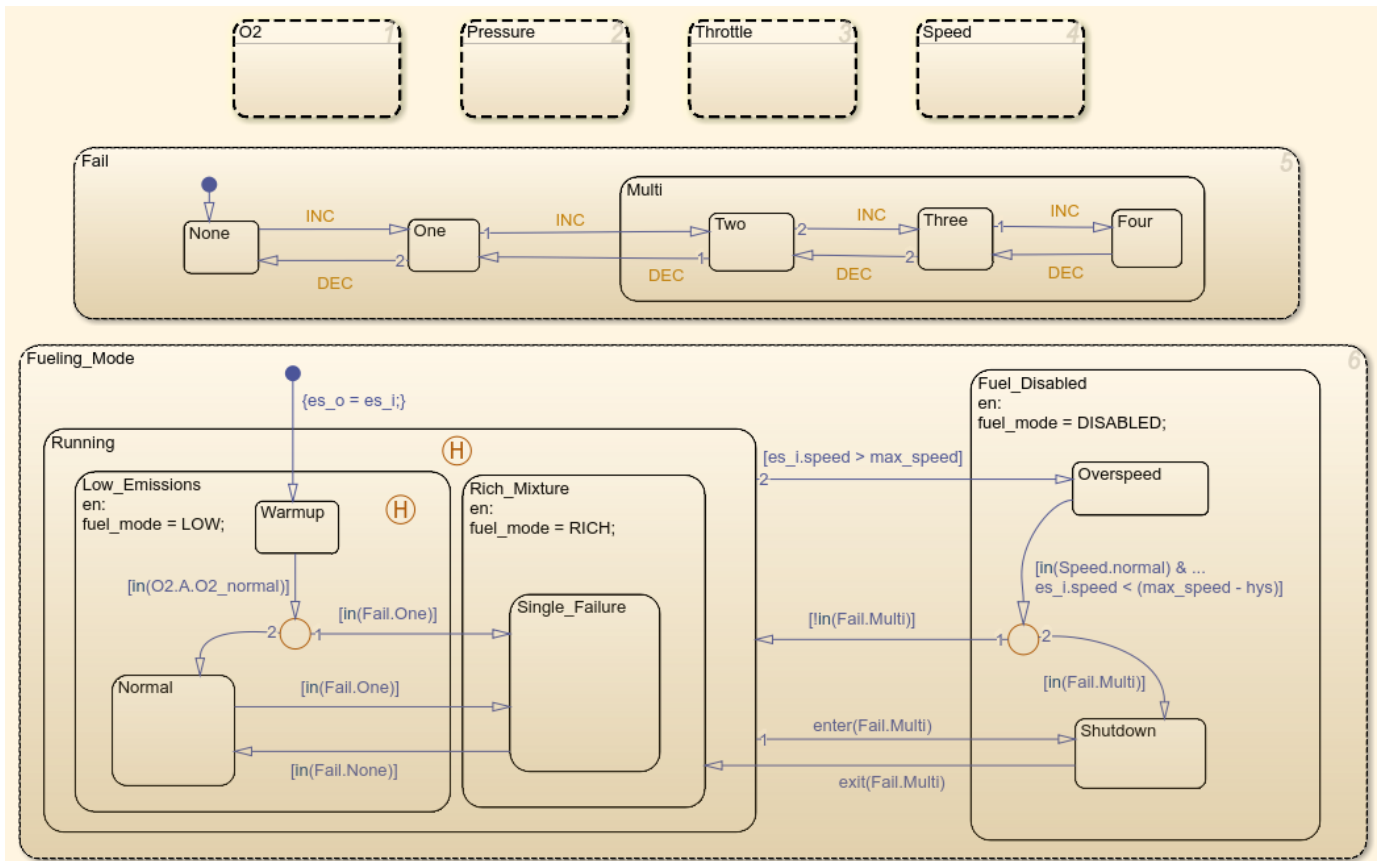

Figure 4: The control logic chart

When execution begins, all of the states start in their `normal` mode with the exception of the oxygen sensor (EGO). The `O2_warmup` state is entered initially until the warmup period is complete. The system detects throttle and pressure sensor failures when their measured values fall outside their nominal ranges. A manifold vacuum in the absence of a speed signal indicates a speed sensor failure. The oxygen sensor also has a nominal range for failure conditions but, because zero is both the minimum signal level and the bottom of the range, failure can be detected only when it exceeds the upper limit.

Regardless of which sensor fails, the model always generates the directed event broadcast `Fail.INC`. In this way the triggering of the universal sensor failure logic is independent of the sensor. The model also uses a corresponding sensor recovery event, `Fail.DEC`. The `Fail` state keeps track of the number of failed sensors. The counter increments on each `Fail.INC` event and decrements on each `Fail.DEC` event. The model uses a superstate, `Multi`, to group all cases where more than one sensor has failed.

The bottom parallel state represents the fueling mode of the engine. If a single sensor fails, operation continues but the air/fuel mixture is richer to allow smoother running at the cost of higher emissions. If more than one sensor has failed, the engine shuts down as a safety measure, since the air/fuel ratio cannot be controlled reliably.

During the oxygen sensor warm-up, the model maintains the mixture at normal levels. If this is unsatisfactory, the user can change the design by moving the warm-up state to within the `Rich_Mixture` superstate. If a sensor failure occurs during the warm-up period, the

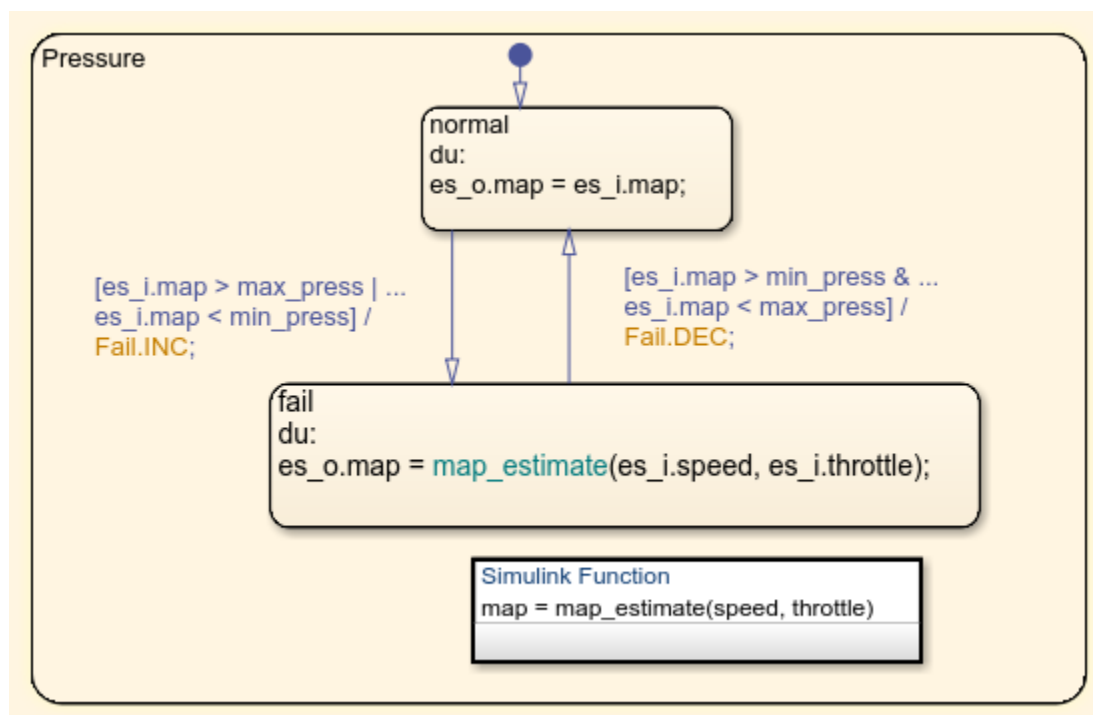

`Single_Failure` state is entered after the warm-up time elapses. Otherwise, the `Normal` state is activated at this time.

A protective overspeed feature has been added to the model by creating a new state in the `Fuel_Disabled` superstate. Through the use of history junctions, we assured that the chart returns to the appropriate state when the model exits the overspeed state. As the safety requirements for the engine become better specified, we can add additional shutdown states to the `Fuel_Disabled` superstate.

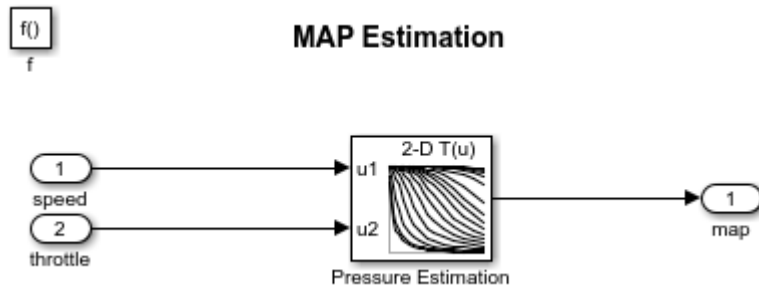

Sensor Correction

When a sensor fails, an estimate of the sensor is computed. For example, open the pressure sensor calculation. Under normal sensor operation the value of the pressure sensor is used. Otherwise, the value is estimated.

```
ans =
    logical
     0
```

The estimate of manifold pressure is computed as a function of engine speed and throttle position. The value is computed conveniently using a Simulink function inside Stateflow.

Airflow Calculation

The Airflow Calculation block (shown in Figure 6) is the location for the central control laws. This block is found inside the fuel_rate_control subsystem (open this block). The block estimates the intake air flow to determine the fuel rate which gives the appropriate air/fuel ratio. Closed-loop control adjusts the estimation according to the residual oxygen feedback in order to maintain the mixture ratio precisely. Even when a sensor failure mandates open-loop operation, the most recent closed-loop adjustment is retained to best meet the control objectives.

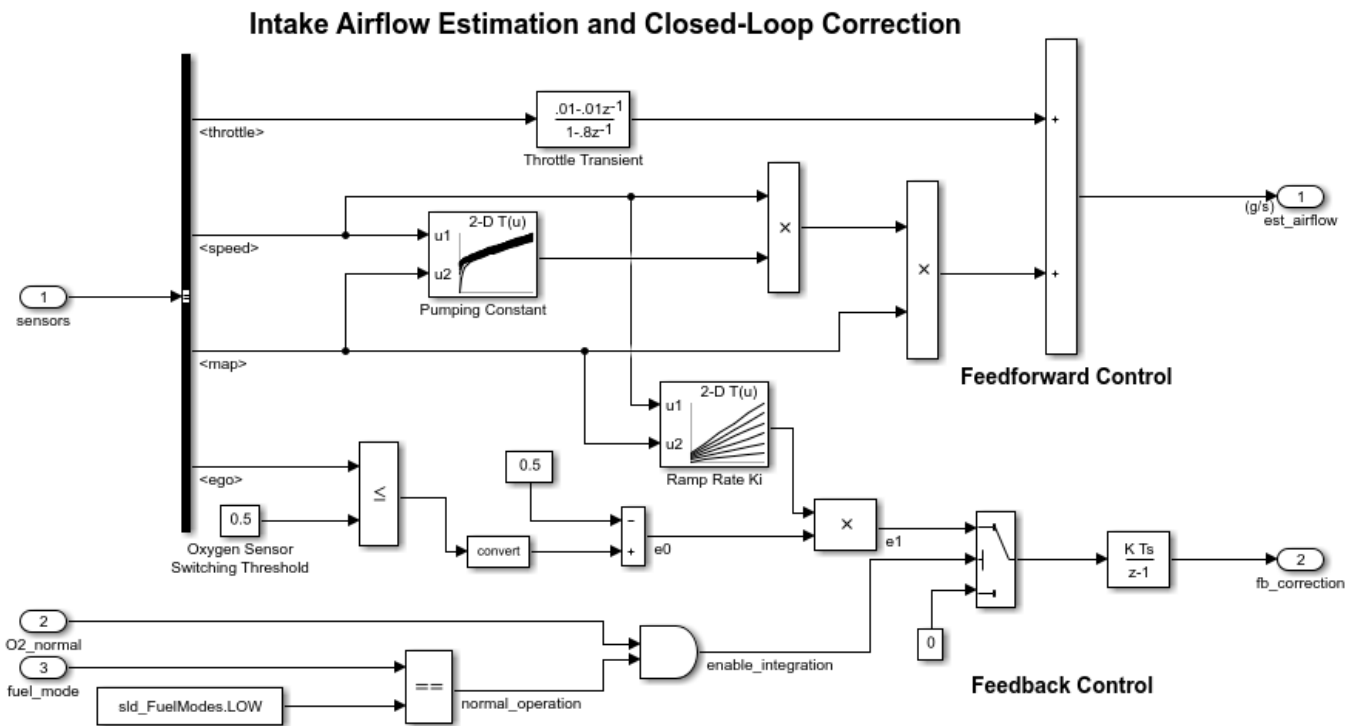

Figure 6: Airflow estimation and correction

Equation 1

The engine's intake air flow can be formulated as the product of the engine speed, the manifold pressure and a time-varying scale factor.

$$q = \frac{N}{4\pi} V_{cd} \nu \frac{P_m}{RT} = C_{pump}(N, P_m) N P_m = \text{intake mass flow}$$

N = engine angular speed (Rad/sec)

V_{cd} = engine cylinder displacement volume

ν = volumetric efficiency

P_m = manifold pressure

R, T = specific gas constant, gas temperature

C_{pump} is computed by a lookup table and multiplied by the speed and pressure to form the initial flow estimate. During transients, the throttle rate, with the derivative approximated by a high-pass filter, corrects the air flow for filling dynamics. The control algorithm provides additional correction according to Equation 2.

Equation 2

$$e_0 = 0.5 \text{ for } EGO \leq 0.5$$

$$e_0 = -0.5 \text{ for } EGO > 0.5$$

$$e_1 = K_i(N, P_m)e_0 \text{ for } EGO \leq 0.5$$

$$\dot{e}_2 = e_1 \text{ for LOW mode with valid EGO signal}$$

$$\dot{e}_2 = 0 \text{ for RICH, DISABLE or EGO warmup}$$

e_0, e_1, e_2 = intermediate error signals

Figure 7: Engine Gas Dynamics subsystem

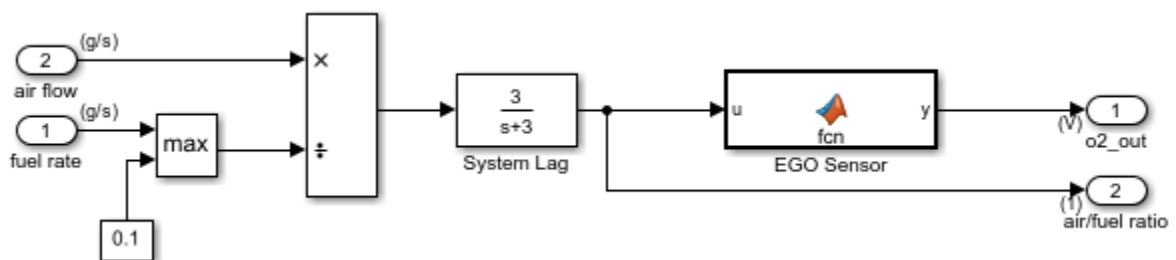

Figure 8: Mixing & Combustion block within the Engine Gas Dynamics subsystem

The nonlinear oxygen sensor (EGO Sensor block) is found inside the Mixing & Combustion block (see Figure 8) within the Engine Gas Dynamics subsystem (see Figure 7). EGO Sensor is modeled as a hyperbolic tangent function, and it provides a meaningful signal when in the vicinity of 0.5 volt. The raw error in the feedback loop is thus detected with a switching threshold, as indicated in Equation 2. If the air-fuel ratio is low (the mixture is lean), the original air estimate is too small and needs to be increased. Conversely, when the oxygen sensor output is high, the air estimate is too large and needs to be decreased. Integral control is utilized so that the correction term achieves a level that brings about zero steady-state error in the mixture ratio.

The normal closed-loop operation mode, LOW, adjusts the integrator dynamically to minimize the error. The integration is performed in discrete time, with updates every 10 milliseconds. When operating open-loop however, in the RICH or O2 failure modes, the feedback error is ignored and the integrator is held. This gives the best correction based on the most recent valid feedback.

Fuel Calculation

The fuel_calc subsystem (within the fuel_rate_control subsystem, see Figure 9) sets the injector signal to match the given airflow calculation and fault status. The first input is the computed airflow estimation. This is multiplied with the target fuel/air ratio to get the commanded fuel rate. Normally the target is stoichiometric, i.e. equals the optimal air to fuel ratio of 14.6. When a sensor fault occurs, the Stateflow control logic sets the mode input to a value of 2 or 3 (RICH or DISABLED) so that the mixture is either slightly rich of stoichiometric or is shut down completely.

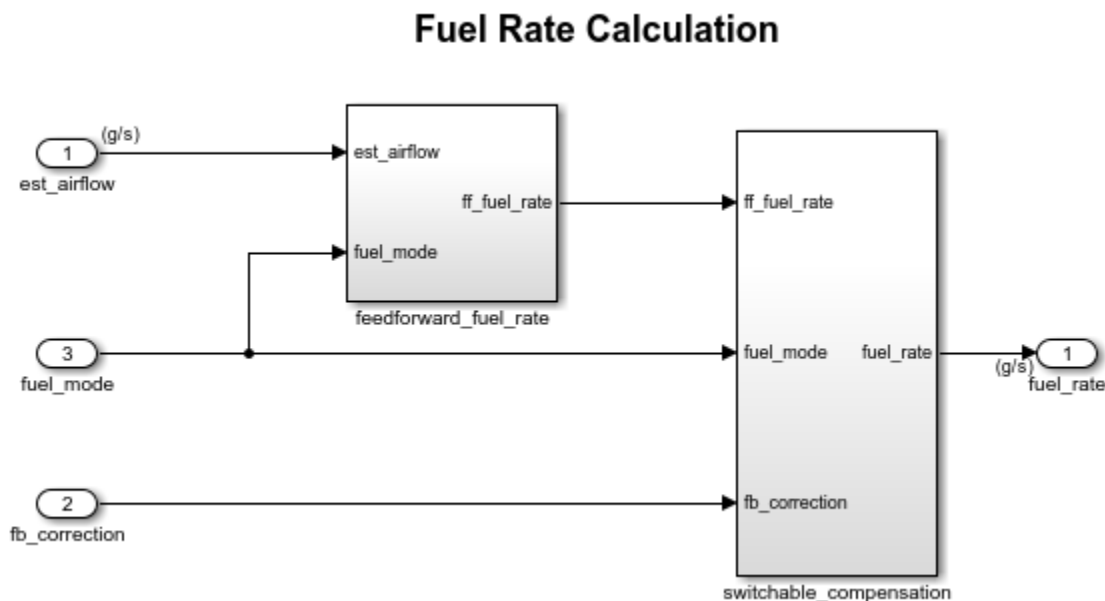

Figure 9: fuel_calc subsystem

The fuel_calc subsystem (Figure 9) employs adjustable compensation (Figure 10) in order to achieve different purposes in different modes. In normal operation, phase lead compensation of the feedback correction signal adds to the closed-loop stability margin. In RICH mode and during EGO sensor failure (open loop), however, the composite fuel signal is low-pass filtered to attenuate noise introduced in the estimation process. The end result is a signal representing the fuel flow rate which, in an actual system, would be translated to injector pulse times.

Loop Compensation and Filtering

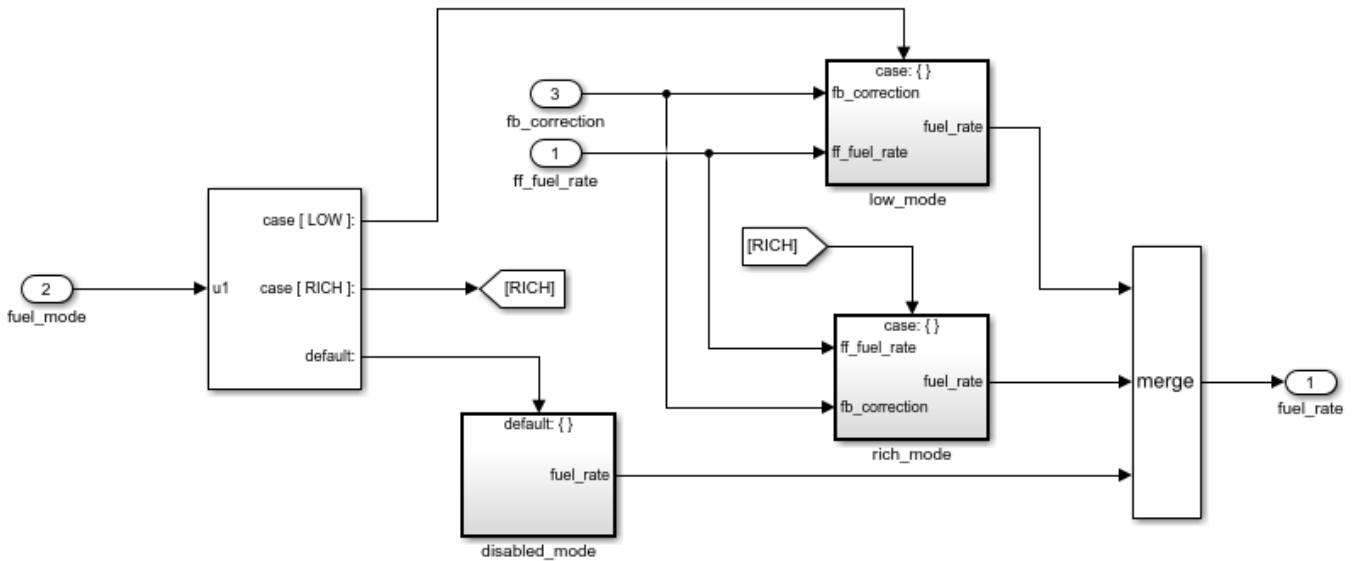

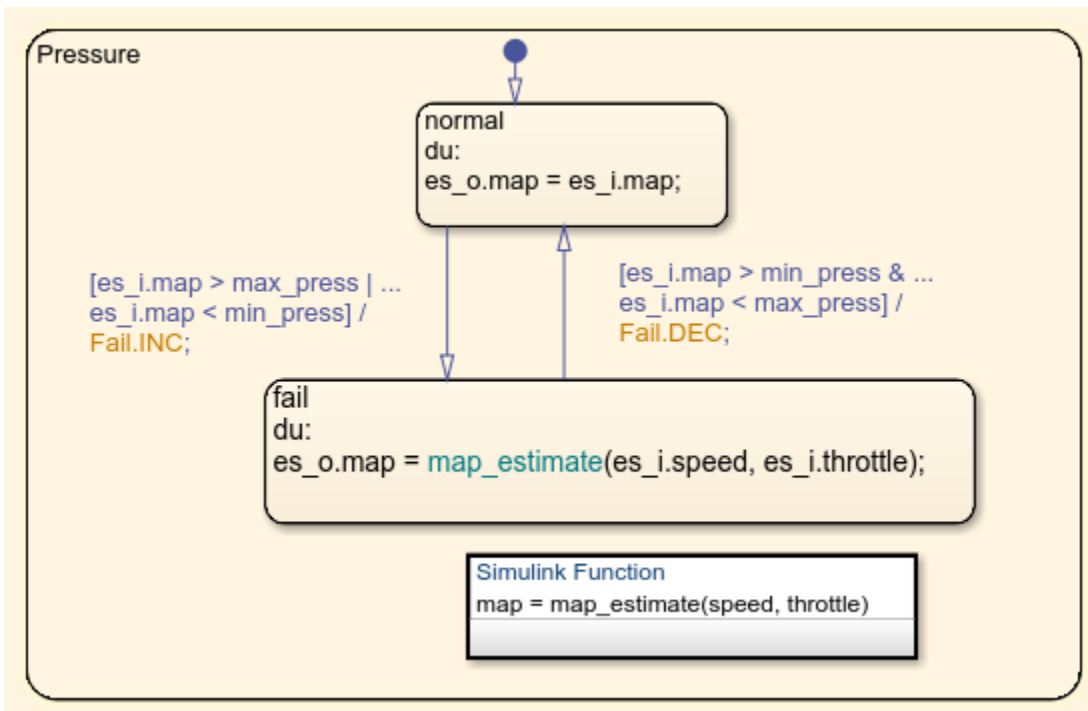

Figure 10: Switchable compensation subsystem

Results and Conclusions

Simulation results are shown in Figure 11 and Figure 12. The simulation is run with a throttle input that ramps from 10 to 20 degrees over a period of two seconds, then goes back to 10 degrees over the next two seconds. This cycle repeats continuously while the engine is held at a constant speed so

that the user can experiment with different fault conditions and failure modes. Click on a sensor fault switch in the dashboard subsystem to simulate the failure of the associated sensor. Repeat this operation to slide the switch back for normal operation.

Figure 11: Comparing the fuel flow rate for different sensor failures

Figure 11 compares the fuel flow rate under fault-free conditions (baseline) with the rate applied in the presence of a single failure in each sensor individually. In each case note the nonlinear relationship between fuel flow and the triangular throttle command (shown in Figure 13). In the baseline case, the fuel rate is regulated tightly, exhibiting a small ripple due to the switching nature of the EGO sensor's input circuitry. In the other four cases the system operates open loop. The control strategy is proven effective in maintaining the correct fuel profile in the single-failure mode. In each of the fault conditions, the fuel rate is essentially 125% of the baseline flow, fulfilling the design objective of 80% rich.

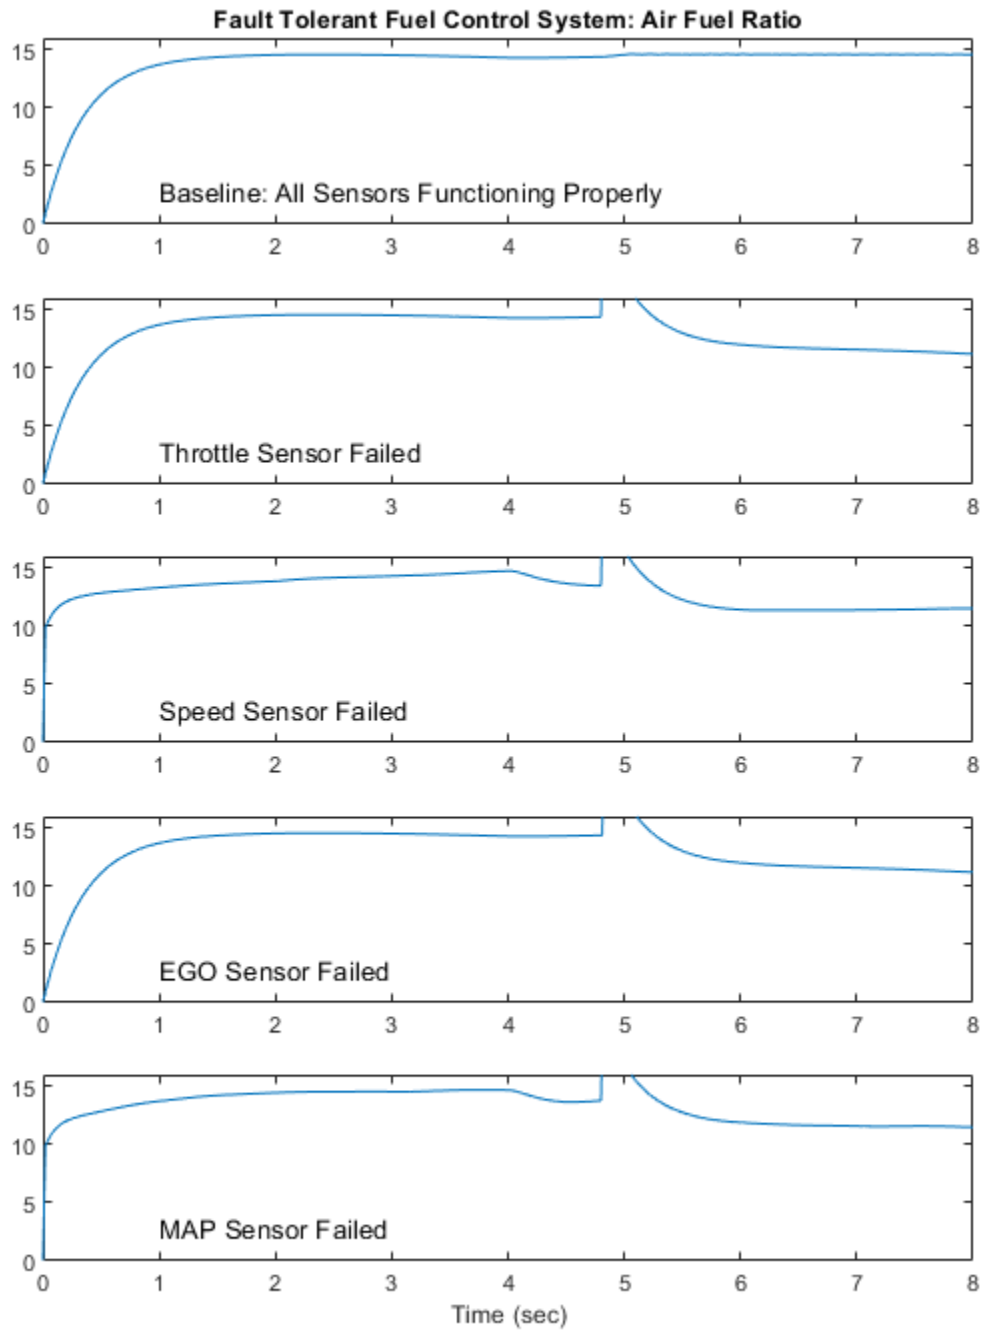

Figure 12: Comparing the air-fuel ratio for different sensor failures

Figure 12 plots the corresponding air/fuel ratio for each case. The baseline plot shows the effects of closed-loop operation. The mixture ratio is regulated very tightly to the stoichiometric objective of

14.6. The rich mixture ratio is shown in the bottom four plots of Figure 12. Although they are not tightly regulated, as in the closed-loop case, they approximate the objective of air/fuel ($0.8 \times 14.6 = 11.7$).

Figure 13: Throttle command

The transient behavior of the system is shown in Figure 14. With a constant 12 degree throttle angle and the system in steady-state, a throttle failure is introduced at $t = 2$ and corrected at $t = 5$. At the onset of the failure, the fuel rate increases immediately. The effects are seen at the exhaust as the rich ratio propagates through the system. The steady-state condition is then quickly recovered when closed-loop operation is restored.

Figure 14: Transient response to fault detection

Remarks

With animation enabled in the Stateflow debugger, the state transitions are highlighted in the Stateflow diagram (see Figure 4) as the various states are activated. The sequence of activation is indicated by changing colors. This closely coupled synergy between Stateflow and Simulink fosters the modeling and development of complete control systems. An engineer's concepts can develop in a natural and structured fashion with immediate visual feedback reinforcing each step.

Using a Data Dictionary to Manage the Data for a Fuel Control System

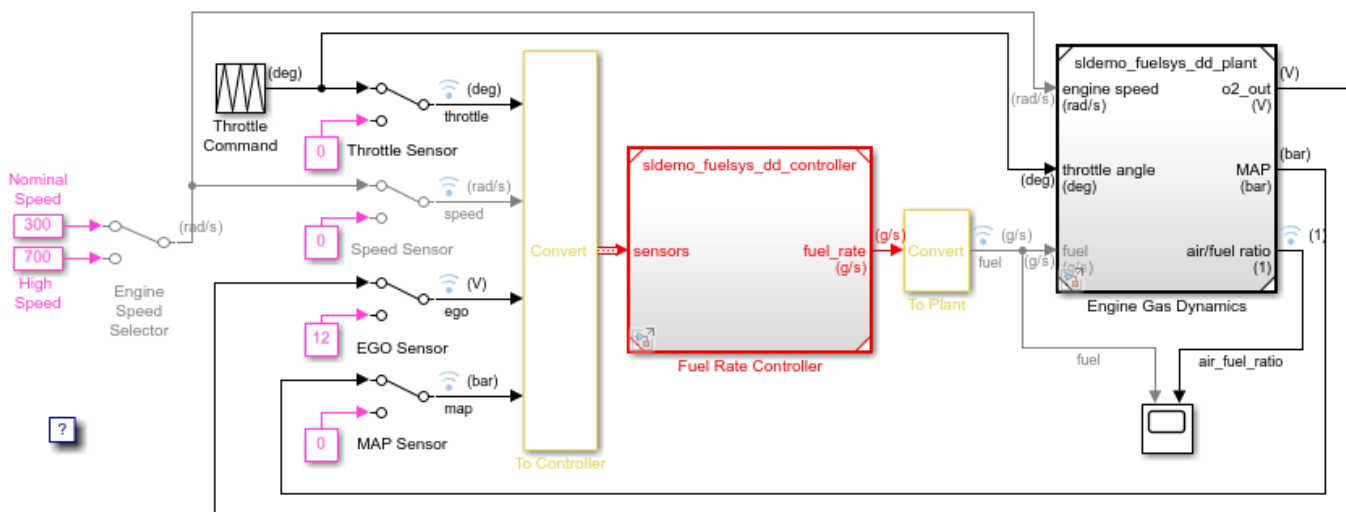

This example shows how to use data dictionaries to manage the data for a fuel rate control system designed using Simulink® and Stateflow®. To familiarize yourself with the fuel rate control model see `sldemo_fuelsys`.

Familiarize Yourself with the Model

The `sldemo_fuelsys_dd` model is a closed-loop system containing a "plant" and "controller". The plant is used to validate the design of the controller. In this example, the plant and controller are represented by separate models that are referenced from the test harness model. Let's take a look at these models.

Open and Compile the Test Harness Model

Investigate the Data Used by the Controller

The global design data for the controller model is defined in a data dictionary. Using data dictionaries has many advantages over defining data in the base workspace. To learn about data dictionaries see the documentation for Simulink Data Dictionary.

The controller model is explicitly linked to a data dictionary. This link is set up on the Data tab of the Model Properties dialog.

The icon in the lower-left corner of the model window shows that this model is linked to a data dictionary. You can open the data dictionary in the Model Explorer by clicking on this icon.

This data dictionary contains parameter and signal objects that are used to configure the controller algorithm for simulation and code generation. It also contains a reference to another data dictionary that defines the data type objects used by this model.

Initially, this data dictionary is configured for a float-point controller, as is seen by the data type display on the signal lines in the controller model. You can easily switch between floating-point and fixed-point controllers by changing the types dictionary (`sldemo_fuelsys_dd_types.sldd`) to reference the appropriate dictionary:

- Floating-point types: `sldemo_fuelsys_dd_float.sldd`
- Fixed-point types: `sldemo_fuelsys_dd_fixpt.sldd`

Investigate the Units Used by the Components

Notice that units are visible on the model and subsystem icons and signal lines. Units are specified on the ports and on the bus, signal and parameter objects in the data dictionary. To learn more about units in Simulink see [Simulink Units](#).

Simulate the Test Harness Model

The test harness model is also linked to a data dictionary (`sldemo_fuelsys_dd.sldd`). This data dictionary contains references to the data dictionaries for the plant and controller models but it does not contain any additional data.

Simulate the test harness model to validate the behavior of the controller in either the floating-point or fixed-point configuration.

Modeling Engine Timing Using Triggered Subsystems

This example shows how to model a four-cylinder spark ignition internal combustion engine from the throttle to the crankshaft output. We used well-defined physical principles supplemented, where appropriate, with empirical relationships that describe the system's dynamic behavior without introducing unnecessary complexity.

*Note: See the closed-loop engine model (an enhanced version of this model).

Analysis and Physics

This example describes the concepts and details surrounding the creation of engine models with emphasis on important Simulink® modeling techniques. The basic model uses the enhanced capabilities of Simulink to capture time-based events with high fidelity. Within this simulation, a triggered subsystem models the transfer of the air-fuel mixture from the intake manifold to the cylinders via discrete valve events. This takes place concurrently with the continuous-time processes of intake flow, torque generation and acceleration. A second model adds an additional triggered subsystem that provides closed-loop engine speed control via a throttle actuator. These models can be used as standalone engine simulations. Or, they can be used within a larger system model, such as an integrated vehicle and powertrain simulation, in the development of a traction control system.

This model is based on published results by Crossley and Cook (1991). It describes the simulation of a four-cylinder spark ignition internal combustion engine. The Crossley and Cook work also shows how a simulation based on this model was validated against dynamometer test data. The ensuing sections (listed below) analyze the key elements of the engine model that were identified by Crossley and Cook:

- 1 Throttle
 - 2 Intake manifold
 - 3 Mass flow rate
 - 4 Compression stroke
 - 5 Torque generation and acceleration
- Note: Additional components can be added to the model to provide greater accuracy in simulation and to more closely replicate the behavior of the system.

Throttle

The first element of the model is the throttle body. The control input is the angle of the throttle plate. The rate at which the model introduces air into the intake manifold can be expressed as the product of two functions:

- 1 an empirical function of the throttle plate angle only
- 2 a function of the atmospheric and manifold pressures

In cases of lower manifold pressure (greater vacuum), the flow rate through the throttle body is sonic and is only a function of the throttle angle. This model accounts for this low pressure behavior with a switching condition in the compressibility equations shown in Equation 1.

Equation 1

$$\dot{m}_{ai} = f(\theta) \cdot g(P_m) = \text{mass flow rate into manifold (g/s)}$$

$$f(\theta) = 2.821 - 0.05231 \cdot \theta + 0.10299 \cdot \theta^2 - 0.00063 \cdot \theta^3$$

$$g(P_m) = 1; \text{ if } P_m \leq P_{amb}/2$$

$$g(P_m) = \frac{2}{P_{amb}} \sqrt{P_m P_{amb} - P_m^2}; \text{ if } P_{amb}/2 \leq P_m \leq P_{amb}$$

$$g(P_m) = -\frac{2}{P_m} \sqrt{P_m P_{amb} - P_{amb}^2}; \text{ if } P_{amb} \leq P_m \leq 2P_{amb}$$

$$g(P_m) = -1; \text{ if } P_m \geq 2P_{amb}$$

\dot{m}_{ai} → mass flow rate into manifold (g/s);

θ → throttle angle (deg);

P_m → manifold pressure (bar);

P_{amb} → ambient (atmospheric) pressure (bar);

Intake Manifold

The simulation models the intake manifold as a differential equation for the manifold pressure. The difference in the incoming and outgoing mass flow rates represents the net rate of change of air mass with respect to time. This quantity, according to the ideal gas law, is proportional to the time derivative of the manifold pressure (see Equation 2). Note that, unlike the model of Crossley and Cook (see also references 3 through 5), this model doesn't incorporate exhaust gas recirculation (EGR), although this can easily be added.

Equation 2

$$\dot{P}_m = \frac{RT}{V_m} (\dot{m}_{ai} - \dot{m}_{ao})$$

R → specific gas constant;

T → temperature (K);

V_m → manifold volume (m^3);

\dot{m}_{ao} → mass flow rate of air out of the manifold (g/s);

\dot{P}_m → rate of change of manifold pressure (bar/s);

Intake Mass Flow Rate

The mass flow rate of air that the model pumps into the cylinders from the manifold is described in Equation 3 by an empirically derived equation. This mass rate is a function of the manifold pressure and the engine speed.

Equation 3

$$\dot{m}_{ao} = -0.366 + 0.08979 \cdot N \cdot P_m - 0.0337 \cdot N \cdot P_m^2 + 0.0001 \cdot N^2 \cdot P_m$$

$N \rightarrow$ engine angular speed (rad/s);

$P_m \rightarrow$ manifold pressure (bar);

To determine the total air charge pumped into the cylinders, the simulation integrates the mass flow rate from the intake manifold and samples it at the end of each intake stroke event. This determines the total air mass that is present in each cylinder after the intake stroke and before compression.

Compression Stroke

In an inline four-cylinder four-stroke engine, 180 degrees of crankshaft revolution separate the ignition of each successive cylinder. This results in each cylinder firing on every other crank revolution. In this model, the intake, compression, combustion, and exhaust strokes occur simultaneously (at any given time, one cylinder is in each phase). To account for compression, the combustion of each intake charge is delayed by 180 degrees of crank rotation from the end of the intake stroke.

Torque Generation and Acceleration

The final element of the simulation describes the torque developed by the engine. An empirical relationship dependent upon the mass of the air charge, the air/fuel mixture ratio, the spark advance, and the engine speed is used for the torque computation (see Equation 4).

Equation 4

$$Torque_{eng} = -181.3 + 379.36 \cdot m_a + 21.91 \cdot \left(\frac{A}{F}\right) - 0.85 \cdot \left(\frac{A}{F}\right)^2 + 0.26 \cdot \sigma - 0.0028 \cdot \sigma^2 +$$

$$+ 0.027 \cdot N - 0.000107 \cdot N^2 + 0.00048 \cdot N \cdot \sigma + 2.55 \cdot \sigma \cdot m_a - 0.05 \cdot \sigma^2 \cdot m_a$$

$m_a \rightarrow$ mass of air in cylinder for combustion (g);

$\left(\frac{A}{F}\right) \rightarrow$ air to fuel ratio;

$\sigma \rightarrow$ spark advance (degrees before top - dead - center);

$Torque_{eng} \rightarrow$ torque produced by the engine (Nm);

Calculate the engine angular acceleration using Equation 5

Equation 5

$$J\dot{N} = Torque_{eng} - Torque_{load}$$

$J \rightarrow$ engine rotational moment of inertia ($kg \cdot m^2$);

$\dot{N} \rightarrow$ engine angular acceleration (rad/s^2);

Open-Loop Model

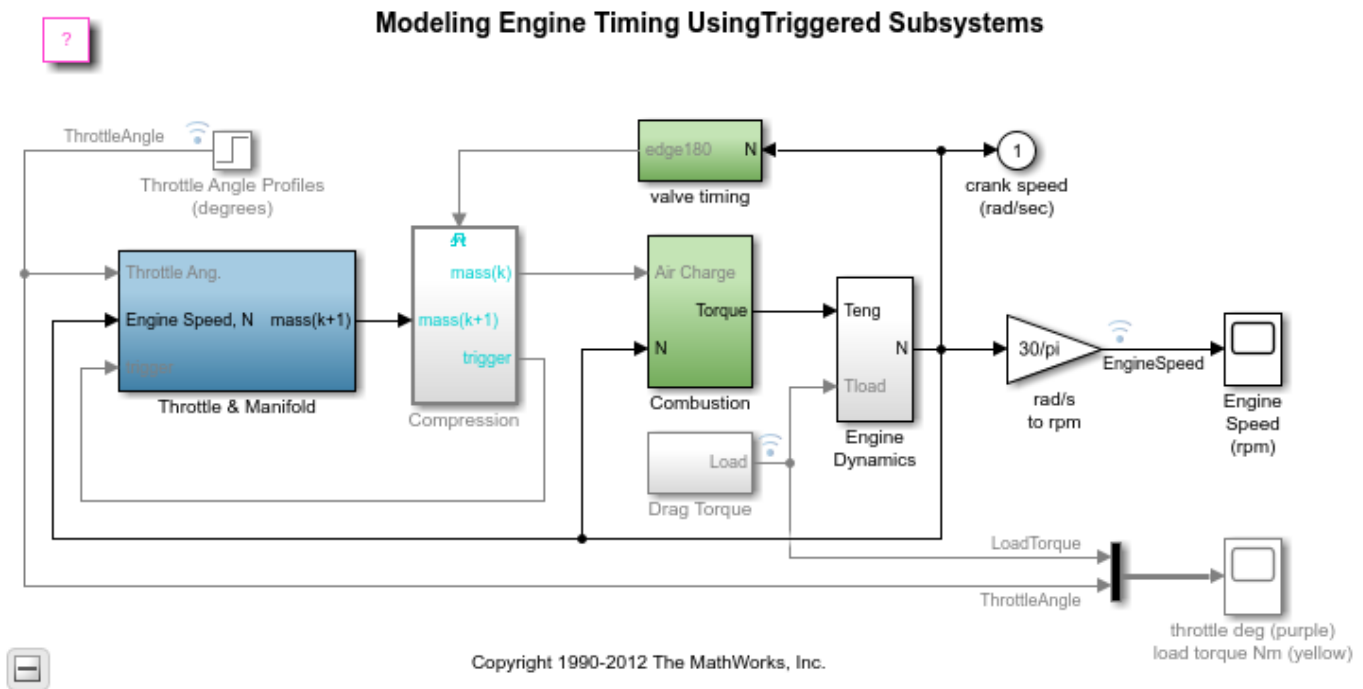

We incorporated the model elements described above into an engine model using Simulink. The following sections describe the decisions we made for this implementation and the key Simulink elements used. This section shows how to implement a complex nonlinear engine model easily and quickly in Simulink environment. We developed this model in conjunction with Ken Butts, Ford Motor Company® (2).

Figure 1 shows the top level of the model. Note that, in general, the major blocks correspond to the high-level list of functions given in the model description in the preceding summary. Taking advantage of Simulink's hierarchical modeling capabilities, most of the blocks in Figure 1 are made up of smaller blocks. The following paragraphs describe these smaller blocks.

Opening and Running the Simulation

To open the model type `sldemo_engine` in MATLAB® terminal (click on the hyperlink if you are using MATLAB Help).

Press the "Play" button on the model toolbar to run the simulation.

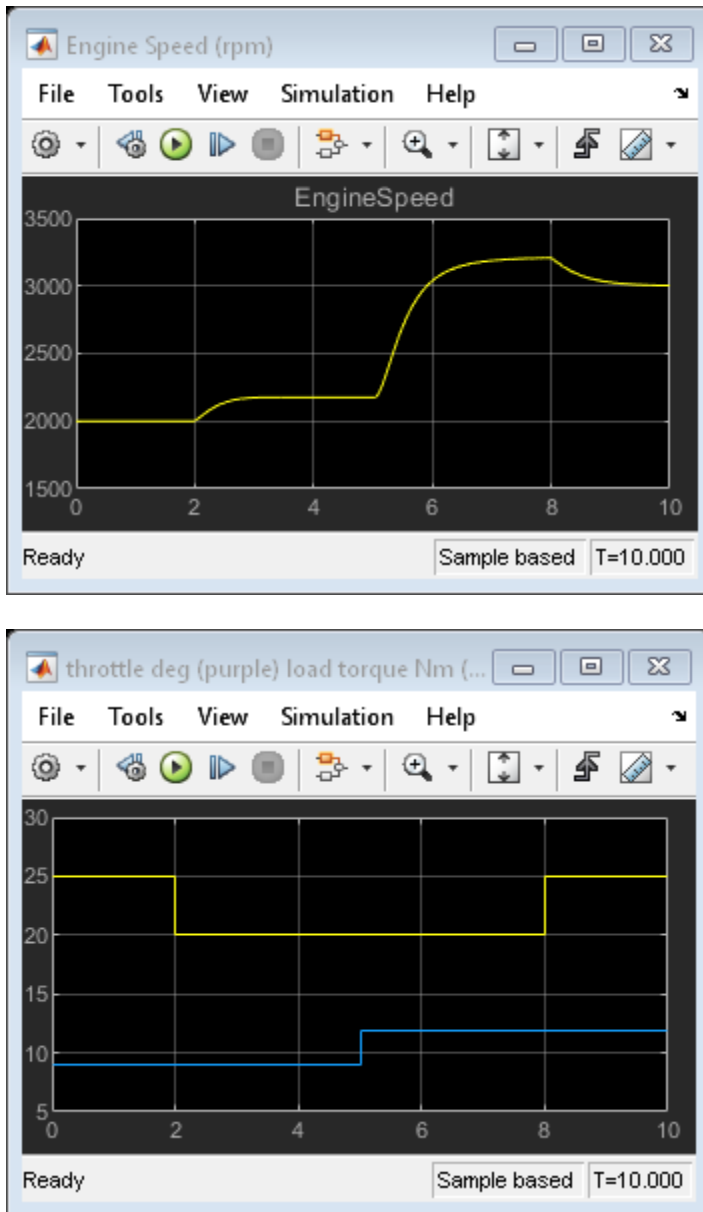

Figure 1: The top level of the engine model and simulation results

- Note: The model logs relevant data to MATLAB workspace in a structure called `sldemo_engine_output`. Logged signals have a blue indicator (see the model). Read more about Signal Logging in Simulink Help.

Throttle/Manifold

In the model, double click on the 'Throttle & Intake Manifold' subsystem to open it. It contains two other subsystems - the 'Throttle' and the 'Intake Manifold' subsystems. Open the 'Throttle' and 'Intake Manifold' to see their components.

Intake Manifold Vacuum

Figure 2: The 'Throttle' and 'Intake Manifold' subsystems

Simulink models for the throttle and intake manifold subsystems are shown in Figure 2. The throttle valve behaves in a nonlinear manner and is modeled as a subsystem with three inputs. Simulink implements the individual equations, given in Equation 1, as function blocks. These provide a convenient way to describe a nonlinear equation of several variables. A 'Switch' block determines whether the flow is sonic by comparing the pressure ratio to its switch threshold, which is set at one half (Equation 1). In the sonic regime, the flow rate is a function of the throttle position only. The direction of flow is from the higher to lower pressure, as determined by the Sign block. With this in mind, the 'Min' block ensures that the pressure ratio is always unity or less.

The differential equation from Equation 2 models the intake manifold pressure. A Simulink function block computes the mass flow rate into the cylinder, a function of manifold pressure and engine speed (see Equation 3).

Intake and Compression

An integrator accumulates the cylinder mass air flow in the 'Intake' block (located inside the 'Throttle & Manifold' subsystem). The 'Valve Timing' block issues pulses that correspond to specific rotational positions in order to manage the intake and compression timing. Valve events occur each cam rotation, or every 180 degrees of crankshaft rotation. Each event triggers a single execution of the 'Compression' subsystem. The output of the trigger block within the 'Compression' subsystem then feeds back to reset the Intake integrator. In this way, although both triggers conceptually occur at the same instant in time, the integrator output is processed by the 'Compression' block immediately prior to being reset. Functionally, the 'Compression' subsystem uses a 'Unit Delay' block to insert 180 degrees (one event period) of delay between the intake and combustion of each air charge.

Consider a complete four-stroke cycle for one cylinder. During the intake stroke, the 'Intake' block integrates the mass flow rate from the manifold. After 180 degrees of crank rotation, the intake valve closes and the 'Unit Delay' block in the 'Compression' subsystem samples the integrator state. This value, the accumulated mass charge, is available at the output of the 'Compression' subsystem 180 degrees later for use in combustion. During the combustion stroke, the crank accelerates due to the generated torque. The final 180 degrees, the exhaust stroke, ends with a reset of the Intake integrator, prepared for the next complete 720 degrees cycle of this particular cylinder.

For four cylinders, we could use four 'Intake' blocks, four 'Compression' subsystems, etc., but each would be idle 75% of the time. We've made the implementation more efficient by performing the tasks of all four cylinders with one set of blocks. This is possible because, at the level of detail we've modeled, each function applies to only one cylinder at a time.

Combustion

Engine torque is a function of four variables. The model uses a 'Mux' block to combine these variables into a vector that provides input to the 'Torque Gen' block. A function block computes the engine torque (described empirically in Equation 4). The torque which loads the engine, computed by step functions in the Drag Torque block, is subtracted in the Engine Dynamics subsystem. The difference divided by the inertia yields the acceleration, which is integrated to arrive at the engine crankshaft speed.

Plotting Simulation Results

We used the following default inputs for the simulation:

$$\textit{Throttle} = 8.97 \text{ (deg) if } t < 5$$

$$\textit{Throttle} = 11.93 \text{ (deg) if } t \geq 5$$

$$\textit{Load} = 25 \text{ (Nm) if } t \leq 2 \text{ or } t \geq 8$$

$$\textit{Load} = 20 \text{ (Nm) if } 2 < t \leq 8$$

Try adjusting the throttle to compensate for the load torque. Figure 3 shows the simulated engine speed, the throttle commands which drive the simulation, and the load torque which disturbs it.

Closing Model

Close the model. Clear generated data.

Conclusions

The ability to model nonlinear, complex systems, such as the engine model described here, is one of Simulink's key features. The power of the simulation is evident in the presentation of the models above. Simulink retains model fidelity, including precisely timed cylinder intake events, which is critical in creating a model of this type. The basic engine model shows the flexibility of Simulink.

*Note: See the closed-loop engine model (an enhanced version of this model).

Engine Timing Model with Closed Loop Control

This example shows how to enhance a version of the open-loop engine model (`sldemo_engine` - described in "Modeling Engine Timing Using Triggered Subsystems" example). This model, `sldemo_enginewc`, contains a closed-loop and shows the flexibility and extensibility of Simulink® models. In this enhanced model, the objective of the controller is to regulate engine speed with a fast throttle actuator, such that changes in load torque have minimal effect. This is easily accomplished in Simulink by adding a discrete-time PI controller to the engine model.

Closed-Loop Model

We chose a control law which uses proportional plus integral (PI) control. The integrator is needed to adjust the steady-state throttle as the operating point changes, and the proportional term compensates for phase lag introduced by the integrator.

- Note: See the open-loop engine model (this model is an enhanced version of the open-loop model).

Equation 1

$$\theta = K_p(N_{set} - N) + K_I \int (N_{set} - N)dt$$

N_{set} = speed set point (rpm)

K_p = proportional gain

K_I = integral gain

Opening and Running the Simulation

To open this model type `sldemo_enginewc` at MATLAB® terminal (click on the hyperlink if you are using MATLAB Help). Press the "Play" button on the model toolbar to run the simulation.

- Note: The model logs relevant data to MATLAB workspace in a structure called `sldemo_enginewc_output`. Logged signals have a blue indicator (see the model). Read more about Signal Logging in Simulink Help.

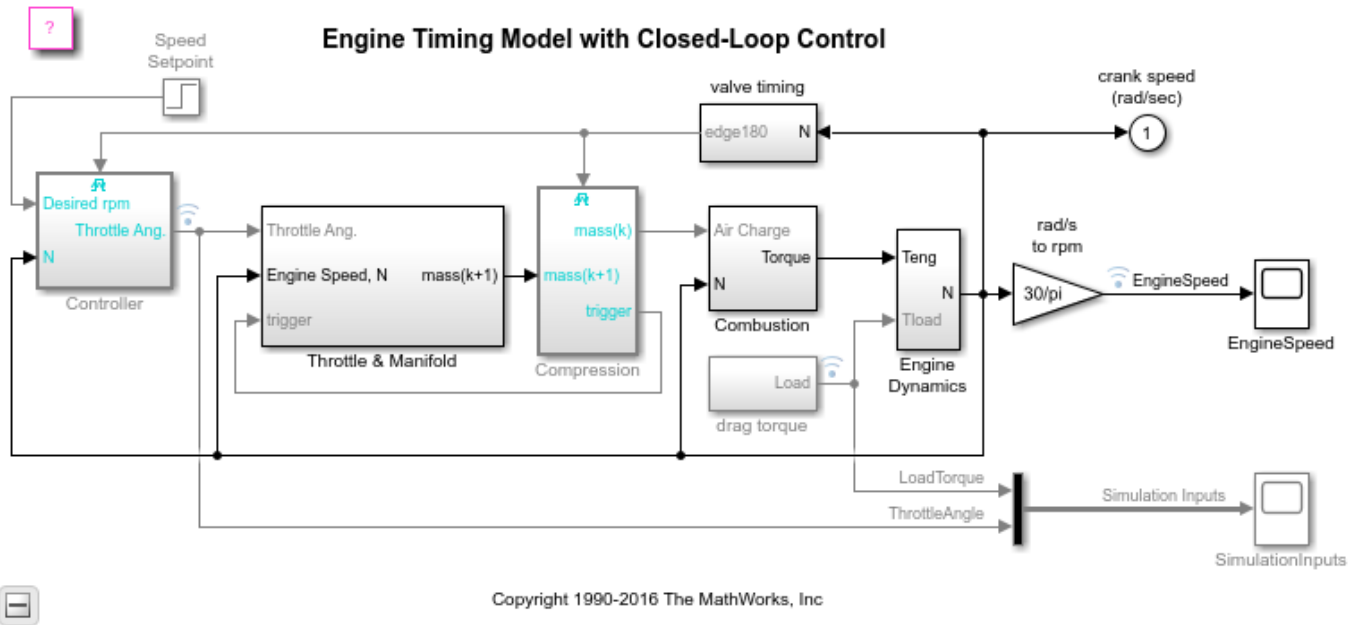

Figure 1: Closed-loop engine model and simulation results

In this model we employ a discrete-time controller, which is suitable for microprocessor implementation. The integral term in Equation 1 must thus be realized with a discrete-time approximation. As is typical in the industry, the controller execution is synchronized with the engine's crankshaft rotation. The controller is embedded in a triggered subsystem that is triggered by the valve timing signal described above.

The detailed construction of the 'Controller' subsystem is illustrated in Figure 2. Of note is the use of the 'PID Controller' block. This block implements a proportional-integral control system in discrete time. Note the setting for sample time set (internally) at -1. This indicates that the block inherits its sample time, in this case executing each time the subsystem is triggered. The key component that makes this a triggered subsystem is the 'Trigger' block shown at the bottom of Figure 2. Any subsystem can be converted to a triggered subsystem by dragging a copy of this block into the subsystem diagram from the Simulink Connections library.

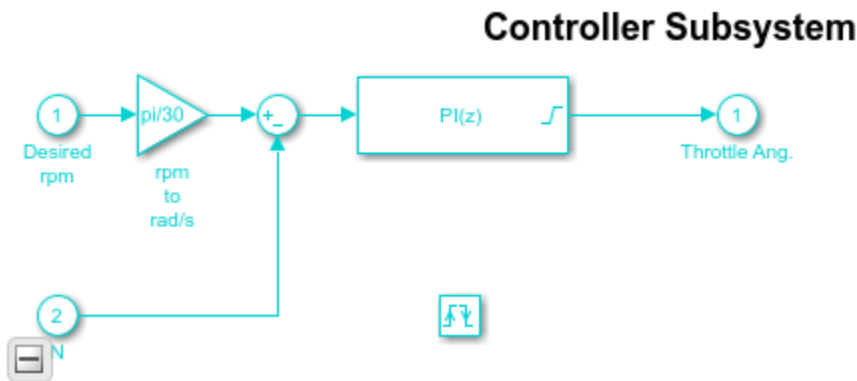

Figure 2: Speed controller subsystem

Results

Typical simulation results are shown in Figure 3. The speed set point steps from 2000 rpm to 3000 rpm at $t = 5$ sec. The torque disturbances are identical to those used in `sldemo_engine`, the open-loop model (open the other engine model). Note the quick transient response, with zero steady-state error. Several alternative controller tunings (K_i and K_p) are shown. These can be adjusted by the user at MATLAB command line. This allows the engineer to understand the relative effects of parameter variations.

Figure 3: Typical simulation results

Closing Model

Close the model. Clear logged data.

Conclusions

The ability to model nonlinear, complex systems, such as the engine model described here, is one of Simulink's key features. The power of the simulation is evident in the presentation of the models above. Simulink retains model fidelity, including precisely timed cylinder intake events, which is critical in creating a model of this type. The complete speed control system shows the flexibility of Simulink. In particular, the Simulink modeling approaches allow rapid prototyping of an interrupt-driven engine speed controller.

Building a Clutch Lock-Up Model

This example shows how to use Simulink® to model and simulate a rotating clutch system. Although modeling a clutch system is difficult because of topological changes in the system dynamics during lockup, this example shows how Simulink's enabled subsystems easily handle such problems. We illustrate how to employ important Simulink modeling concepts in the creation of the clutch simulation. Designers can apply these concepts to many models with strong discontinuities and constraints that may change dynamically.

In the example, we use enabled subsystems to build the clutch model. Two enabled subsystems model the clutch dynamics in either the locked or unlocked position. After running the simulation, a GUI opens. Checking any of the boxes on the GUI produces a plot of any of the selected variables (versus time).

There is an alternative clutch model (`sldemo_clutch_if`) that uses 'If/Else' blocks instead of enabled subsystems (open the other clutch model).

Analysis and Physics

The clutch system in this example consists of two plates that transmit torque between the engine and transmission (see Figure 1). There are two distinct modes of operation:

- 1) slipping - the two plates have differing angular velocities
- 2) lockup - the two plates rotate together.

Handling the transition between these two modes presents a modeling challenge. As the system loses a degree of freedom upon lockup, the transmitted torque goes through a step discontinuity. The magnitude of the torque drops from the maximum value supported by the friction capacity to a value that is necessary to keep the two halves of the system spinning at the same rate. The reverse transition, break-apart, is likewise challenging, as the torque transmitted by the clutch plates exceeds the friction capacity.

Figure 1: The clutch system, analyzed using a lumped-parameter model

Variables Used

The following variables are used in the analysis and modeling.

T_{in} = input (engine) torque;

F_n = normal force between friction plates;

I_e, I_v = moments of inertia for the engine and for the transmission/vehicle;

b_e, b_v = damping rates at the engine and transmission/vehicle sides of the clutch;

μ_k, μ_s = kinetic and static coefficients of friction;

ω_e, ω_v = angular speeds of the engine and transmission input shafts;

r_1, r_2 = inner and outer radii of the clutch plate friction surfaces;

R = equivalent net radius;

T_{cl} = torque transmitted through the clutch;

T_l = friction torque required of the clutch to maintain lockup;

Equation 1

The state equations for the coupled system are derived as follows:

$$I_e \dot{\omega}_e = T_{in} - b_e \omega_e - T_{cl}$$

$$I_v \dot{\omega}_v = T_{cl} - b_v \omega_v$$

Equation 2

The torque capacity of the clutch is a function of its size, friction characteristics, and the normal force that is applied.

$$(T_f)_{\max} = \int \int_A \frac{r \times F_f}{A} da = \frac{F_n \mu}{\pi(r_2^2 - r_1^2)} \int_{r_1}^{r_2} \int_0^{2\pi} r^2 dr d\theta = \frac{2}{3} R F_n \mu$$

$$R = \frac{r_2^3 - r_1^3}{r_2^2 - r_1^2}$$

Equation 3

When the clutch is slipping, the model uses the kinetic coefficient of friction and the full capacity is available, in the direction that opposes slip.

$$T_{fmaxk} = \frac{2}{3} R F_n \mu_k$$

$$T_{cl} = \text{sgn}(\omega_e - \omega_v) T_{fmaxk}$$

where sgn denotes the sign function.

Equation 4

When the clutch is locked, the angular velocities of the engine and transmission input shafts are the same, and the system torque acts on the combined inertia as a single unit. So, we combine the differential equations (Equation 1) into a single equation for the locked state.

$$\omega_e = \omega_v = \omega$$

$$(I_e + I_v)\dot{\omega} = T_{in} - (b_e + b_v)\omega$$

Equation 5

Solving Equation 1 and Equation 4, the torque transmitted by the clutch while locked is:

$$T_{cl} = T_f = \frac{I_v T_{in} - (I_v b_e - I_e b_v)\omega}{I_v + I_e}$$

Equation 6

The clutch thus remains locked unless the magnitude of T_f exceeds the static friction capacity, T_{fmaxs} .

$$T_{fmaxs} = \frac{2}{3}RF_n\mu_s$$

The state diagram in Figure 2 describes the overall behavior of the clutch.

Figure 2: A state diagram describing the friction mode transitions

Modeling

There are two methods for solving this type of problem:

- 1) Compute the clutch torque transmitted at all times, and employ this value directly in the model
- 2) Use two different dynamic models and switch between them at the appropriate times

Because of its overall capabilities, Simulink can model either method. In this example, we describe a simulation for the second method. In the second method, switching between two dynamic models must be performed with care to ensure that the initialized states of the new model match the state values immediately prior to the switch. But, in either approach, Simulink facilitates accurate

simulation due to its ability to recognize the precise moments at which transitions between lockup and slipping occur.

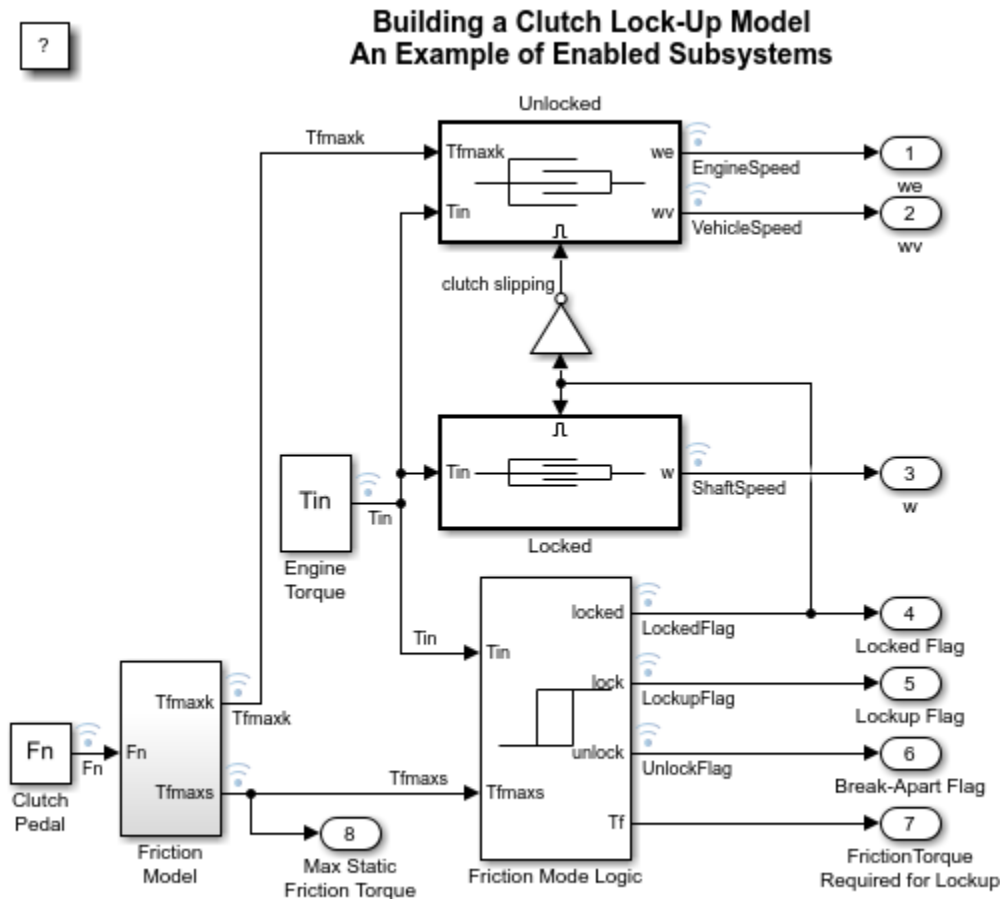

The simulation model for the clutch system uses enabled subsystems, a particularly useful feature in Simulink. The simulation can use one subsystem while the clutch is slipping and the other when it is locked. A diagram of the Simulink model appears in Figure 3.

- Opening the Model and Running the Simulation

To open this model type `sldemo_clutch` in MATLAB® terminal (click on the hyperlink if you are using MATLAB Help).

When the model is open, press the "Play" button on the model toolbar to run the simulation.

- Note: If you are using MATLAB Help, you can execute code from the example page by selecting the code and pressing F9. You can also Select Code > Right Click > Select "Evaluate Selection".

Copyright 1990-2017 The MathWorks, Inc.

Figure 3: Top level diagram for the clutch model

- Note: The model logs relevant data to MATLAB workspace in a structure called `sldemo_clutch_output`. Logged signals have a blue indicator (see the model). Read more about Signal Logging in Simulink Help.

- The 'Unlocked' Subsystem

Double click on the 'Unlocked' subsystem in the model window to open it. This subsystem models both sides of the clutch, coupled by the friction torque. It is constructed around the integrator blocks which calculate engine and vehicle speeds (see Figure 4). The model uses gain, multiplication, and summation blocks to compute the speed derivatives (acceleration) from the states and the subsystem inputs of engine torque, T_{in} , and clutch capacity, T_{fmaxk} .

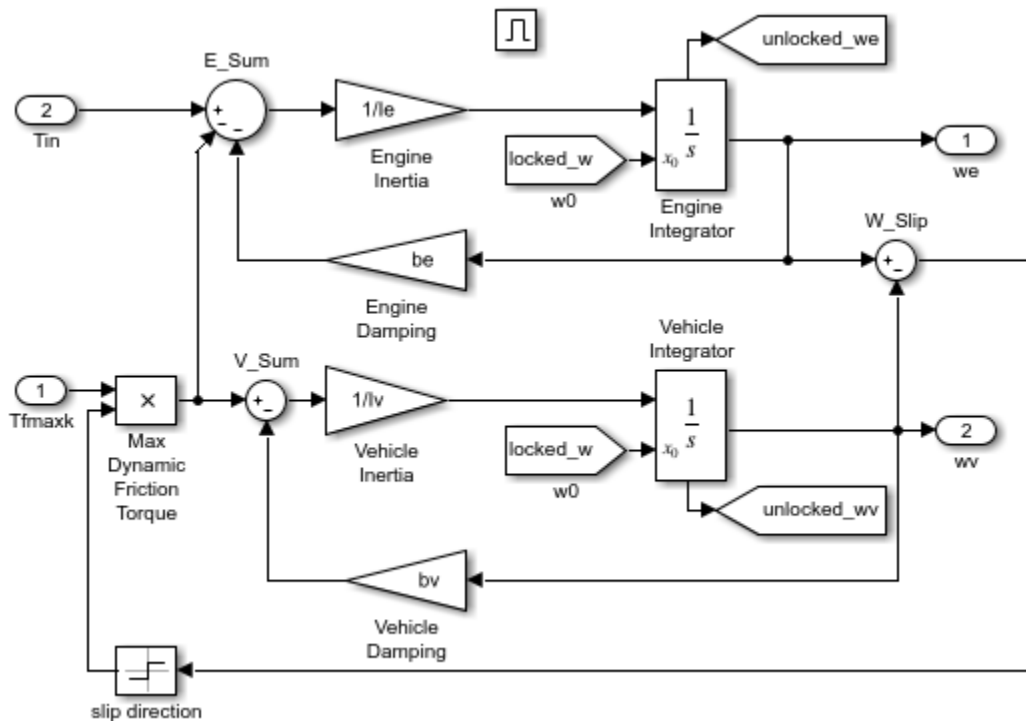

Figure 4: The 'Unlocked' subsystem

Enabled subsystems, such as 'Unlocked', feature several other noteworthy characteristics. The 'Enable' block at the top of the diagram in Figure 4, defines the model as an enabled subsystem. To create an enabled subsystem, we group the blocks together like any other subsystem. We then insert an 'Enable' block from the Simulink Connections library. This means that:

- An enable input appears on the subsystem block, identified by the pulse-shaped symbol used on the 'Enable' block itself.
- The subsystem executes only when the signal at the enable input is greater than zero.

In this example, the 'Unlocked' subsystem executes only when the supervising system logic determines that it should be enabled.

There is another important consideration when using systems that can be enabled or disabled. When the system is enabled, the simulation must reinitialize the integrators to begin simulating from the correct point. In this case, both sides of the clutch are moving at the same velocity the moment it unlocks. The 'Unlocked' subsystem, which had been dormant, needs to initialize both integrators at that speed in order to keep the system speeds continuous.

The simulation uses 'From' blocks to communicate the state of the locked speed to the initial condition inputs of the two integrators. Each 'From' block represents an invisible connection between itself and a 'Goto' block somewhere else in the system. The 'Goto' blocks connect to the state ports of the integrators so that the model can use these states elsewhere in the system without explicitly drawing in the connecting lines.

- The 'Locked' Subsystem

Open the 'Locked' subsystem by double clicking on it in the model window. This is another enabled subsystem in the clutch model (see Figure 5). It uses a single state to represent the engine and vehicle speeds. It computes acceleration as a function of the speed and input torque. As in the 'Unlocked' case, a 'From' block provides the integrator initial conditions and a 'Goto' block broadcasts the state for use elsewhere in the model. While simulating, either the 'Locked' or the 'Unlocked' subsystem is active at all times. Whenever the control changes, the states are neatly handed off between the two.

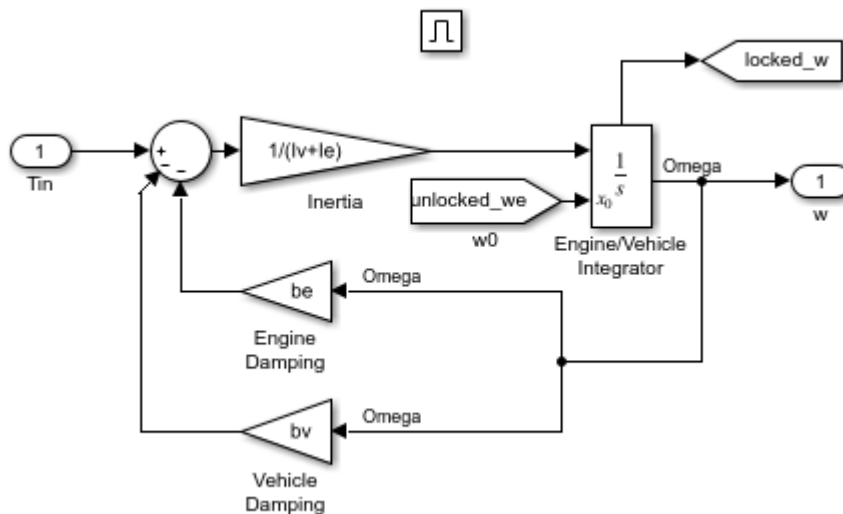

Figure 5: The 'Locked' Subsystem

- The 'Friction Mode Logic' Subsystem

The 'Friction Mode Logic' subsystem (shown in Figure 6) computes the static and kinetic friction (with the appropriate friction coefficient) according to the following formula:

$$T_{fmax} = \frac{2}{3}RF_n\mu$$

Open the 'Friction Mode Logic' subsystem by double clicking on it in the model window.

Figure 6: The 'Friction Mode Logic' Subsystem

- Other Components

The remaining blocks calculate the torque required for lockup (Equation 5), and implement the logic described in Figure 2. One key element is located in the 'Lockup Detection' subsystem within the 'Friction Mode Logic' subsystem. This is the 'Simulink Hit Crossing' block which precisely locates the instant at which the clutch slip reaches zero. This places the mode transition at exactly the right moment.

- System Inputs

The system inputs are normal force, F_n , and engine torque, T_{in} . Each of these is represented by a matrix table in the model workspace. The inputs are plotted in Figure 7. You can visualize various signals by checking the corresponding boxes on the 'Clutch Demo Signals' GUI.

Figure 7: System inputs: normal force and engine torque

- Results

The following parameter values are used to show the simulation. These are not meant to represent the physical quantities corresponding to an actual system, but rather to facilitate a meaningful baseline example.

$$I_e = 1 \text{ kg} \cdot \text{m}^2$$

$$I_v = 5 \text{ kg} \cdot \text{m}^2$$

$$b_e = 2 \text{ Nm/rad/sec}$$

$$b_v = 1 \text{ Nm/rad/sec}$$

$$\mu_k = 1$$

$$\mu_s = 1.5$$

$$R = 1 \text{ m}$$

For the inputs shown above, the system velocities behave as shown in Figure 8 below. The simulation begins in the Unlocked mode, with an initial engine speed flare as the vehicle side accelerates its larger inertia. At about $t = 4$ sec, the velocities come together and remain locked, indicating that

the clutch capacity is sufficient to transmit the torque. At $t = 5$ sec, the engine torque begins to decrease, as does the normal force on the friction plates. Consequently, the onset of slip occurs at about $t = 6.25$ sec as indicated by the separation of the engine and vehicle speeds.

Figure 8: Angular velocities of the engine, vehicle and shaft for default inputs

Notice that the various states remain constant while they are disabled. At the time instants at which transitions take place, the state hand-off is both continuous and smooth. This is a result of supplying each integrator with the appropriate initial conditions to use when the state is enabled.

Closing Model

Close the model. Clear generated data.

Conclusions

This example shows how to use Simulink and its standard block library to model, simulate, and analyze a system with topological discontinuities. This is a powerful example of the 'Hit Crossing' block and how it can be used to capture specific events during a simulation. The Simulink model of this clutch system can serve as a guide when creating models with similar characteristics. You can apply the principles used in this example to any system with topological discontinuities.

Modeling Clutch Lock-Up Using If Blocks

This example shows how to use If/Else subsystems to build a clutch model. An 'If' subsystem models the clutch dynamics in the locked position while an 'Else' subsystem models the unlocked position. One or the other is enabled using the 'If' block. The dot-dashed lines from the 'If' block denote control signals, which are used to enable If/Else (or other conditional) subsystems.

This is an alternative to the clutch model with enabled subsystems - `sldemo_clutch` (open the other clutch model).

Analysis and Physics

The clutch system in this example consists of two plates that transmit torque between the engine and transmission. There are two distinct modes of operation:

- 1) slipping - the two plates have differing angular velocities
- 2) lockup - the two plates rotate together.

Handling the transition between these two modes presents a modeling challenge. As the system loses a degree of freedom upon lockup, the transmitted torque goes through a step discontinuity. The magnitude of the torque drops from the maximum value supported by the friction capacity to a value that is necessary to keep the two halves of the system spinning at the same rate. The reverse transition, break-apart, is likewise challenging, as the torque transmitted by the clutch plates exceeds the friction capacity.

- Note: You can find a detailed analysis of this system, including equations and diagrams, in the example for the clutch model with enabled subsystems.

Modeling

You can use the following two methods for solving this problem:

- 1) Compute the clutch torque transmitted at all times, and employ this value directly in the model
- 2) Use two different dynamic models and switch between them at the appropriate times

Simulink® can model either method. In this example, we describe a simulation for the second method. Switching between two dynamic models must be performed with care to ensure that the initialized states of the new model match the state values immediately prior to the switch. In either approach, Simulink facilitates accurate simulation due to its ability to recognize the precise moments at which transitions between lockup and slipping occur.

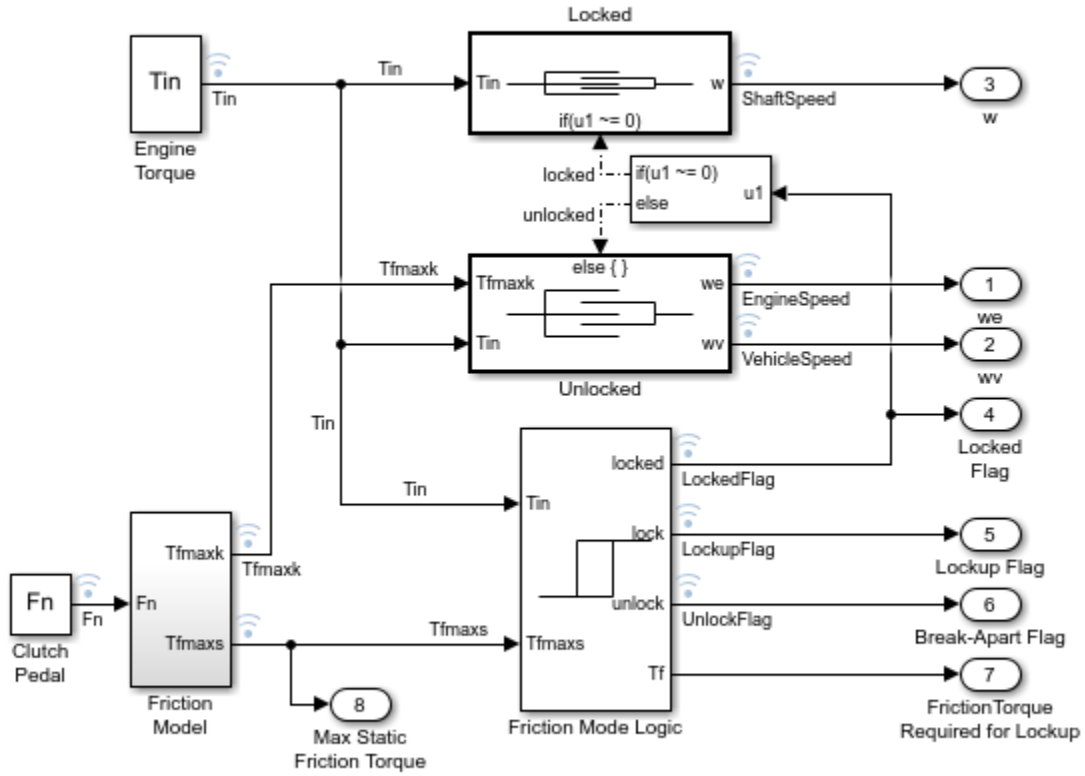

Opening the Model and Running the Simulation

To open this model type `sldemo_clutch_if` in MATLAB® terminal (click on the hyperlink if you are using MATLAB Help).

When the model is open, press the "Play" button on the model toolbar to run the simulation.

Clutch Simulation An Example of the If Block

Copyright 1990-2012 The MathWorks, Inc.

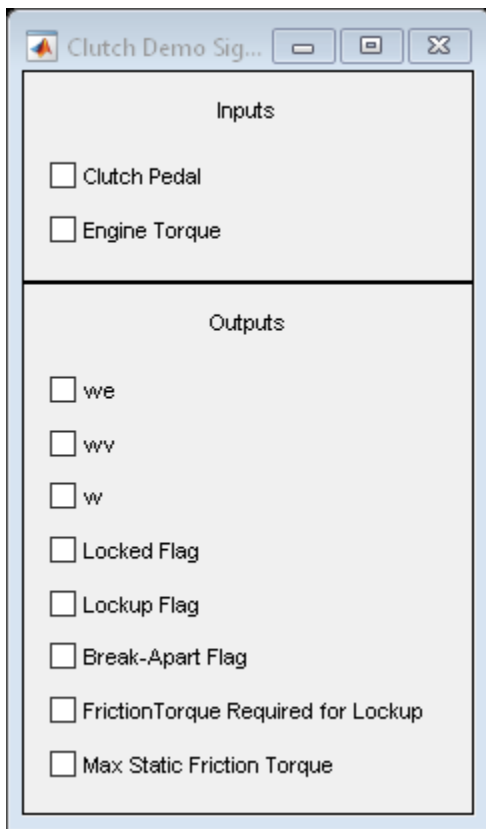

Figure 1: Top level diagram for the clutch model

- Note: The model logs relevant data to MATLAB workspace in a structure called `sldemo_clutch_if_output`. Logged signals have a blue indicator (see the model). Read more about Signal Logging in Simulink Help.

The 'If' Block

The 'If' block uses the `LockedFlag` signal to switch between the 'Locked' and 'Unlocked' subsystems. Double click on the 'If' block in the model to set its parameters (see Figure 2). `LockedFlag` represents the status of the clutch. `LockedFlag = 1` if the clutch is locked and `LockedFlag = 0` if the clutch is unlocked.

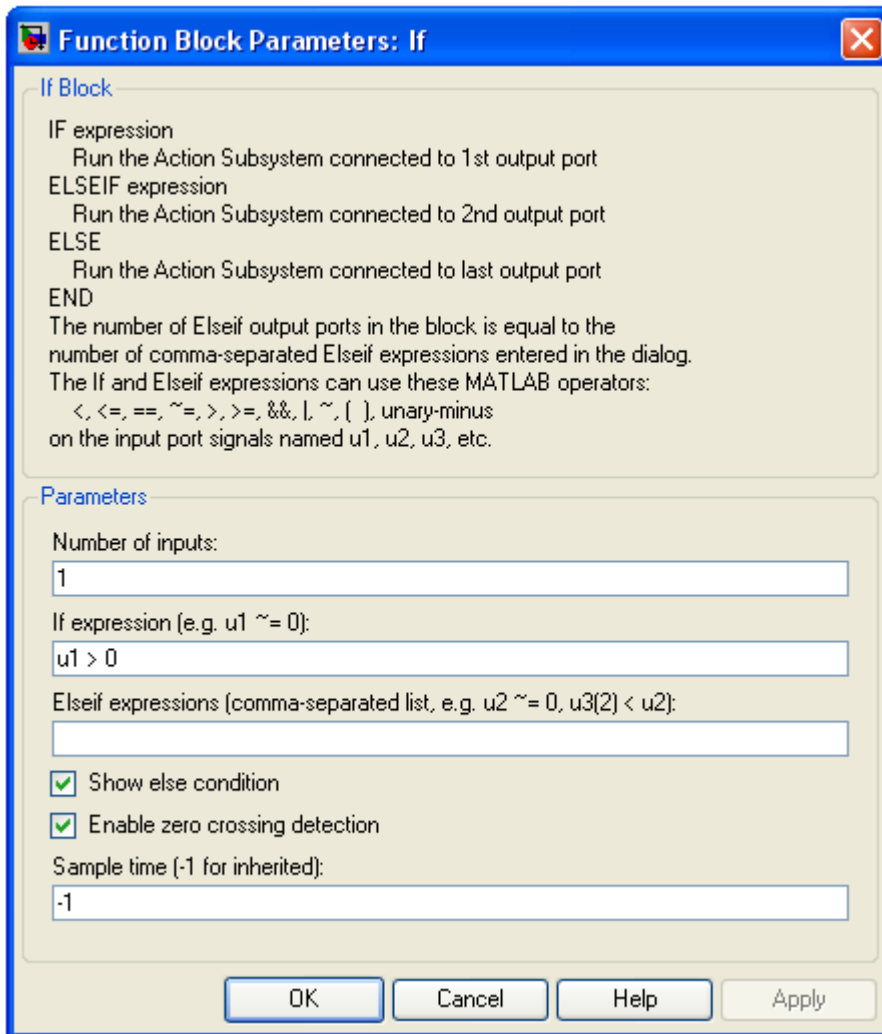

Figure 2: Setting 'If' block parameters

Other Blocks and Subsystems

The other components of this model are similar to those used in the clutch model with enabled subsystems (open the other clutch model). See a detailed description in Building a Clutch Lock-Up Model example.

Results

The inputs for this model are the same as for the model that uses enabled subsystems (sldemo_clutch). System velocities behave as shown in Figure 3 below. As expected, the results obtained from sldemo_clutch and sldemo_clutch_if are identical.

Figure 3: Angular velocities of the engine, vehicle and shaft for default inputs

Closing Model

Close the model. Clear generated data.

Conclusions

This example shows how to use 'If' blocks in Simulink to model a system with topological discontinuities. This is an alternative to using enabled subsystems.

Modeling an Anti-Lock Braking System

This example shows how to model a simple model for an Anti-Lock Braking System (ABS). It simulates the dynamic behavior of a vehicle under hard braking conditions. The model represents a single wheel, which may be replicated a number of times to create a model for a multi-wheel vehicle.

This model uses the signal logging feature in Simulink®. The model logs signals to the MATLAB® workspace where you can analyze and view them. You can view the code in `sldemo_absbrakeplots.m` to see how this is done.

In this model, the wheel speed is calculated in a separate model named `sldemo_wheel_speed_absbrake`. This component is then referenced using a 'Model' block. Note that both the top model and the referenced model use a variable step solver, so Simulink will track zero-crossings in the referenced model.

Analysis and Physics

The wheel rotates with an initial angular speed that corresponds to the vehicle speed before the brakes are applied. We used separate integrators to compute wheel angular speed and vehicle speed. We use two speeds to calculate slip, which is determined by Equation 1. Note that we introduce vehicle speed expressed as an angular velocity (see below).

$$\omega_v = \frac{V}{R} \text{ (equals the wheel angular speed if there is no slip)}$$

Equation 1

$$\omega_v = \frac{V_v}{R_r}$$

$$slip = 1 - \frac{\omega_w}{\omega_v}$$

ω_v = vehicle speed divided by wheel radius

V_v = vehicle linear velocity

R_r = wheel radius

ω_w = wheel angular velocity

From these expressions, we see that slip is zero when wheel speed and vehicle speed are equal, and slip equals one when the wheel is locked. A desirable slip value is 0.2, which means that the number of wheel revolutions equals 0.8 times the number of revolutions under non-braking conditions with the same vehicle velocity. This maximizes the adhesion between the tire and road and minimizes the stopping distance with the available friction.

Modeling

The friction coefficient between the tire and the road surface, μ , is an empirical function of slip, known as the mu-slip curve. We created mu-slip curves by passing MATLAB variables into the block diagram using a Simulink lookup table. The model multiplies the friction coefficient, μ , by the weight on the wheel, W , to yield the frictional force, F_f , acting on the circumference of the tire. F_f is

divided by the vehicle mass to produce the vehicle deceleration, which the model integrates to obtain vehicle velocity.

In this model, we used an ideal anti-lock braking controller, that uses 'bang-bang' control based upon the error between actual slip and desired slip. We set the desired slip to the value of slip at which the mu-slip curve reaches a peak value, this being the optimum value for minimum braking distance (see note below.).

- Note: In an actual vehicle, the slip cannot be measured directly, so this control algorithm is not practical. It is used in this example to illustrate the conceptual construction of such a simulation model. The real engineering value of a simulation like this is to show the potential of the control concept prior to addressing the specific issues of implementation.

Creating a Temporary Directory for the Example

During this example, Simulink generates files in the current working directory. If you do not want to generate files in this directory, change the working directory to a suitable directory:

```
origdir = cd(tempdir);
```

Opening the Model

To open this model type `sldemo_absbrake` in MATLAB terminal (or click on the hyperlink if you are using MATLAB Help).

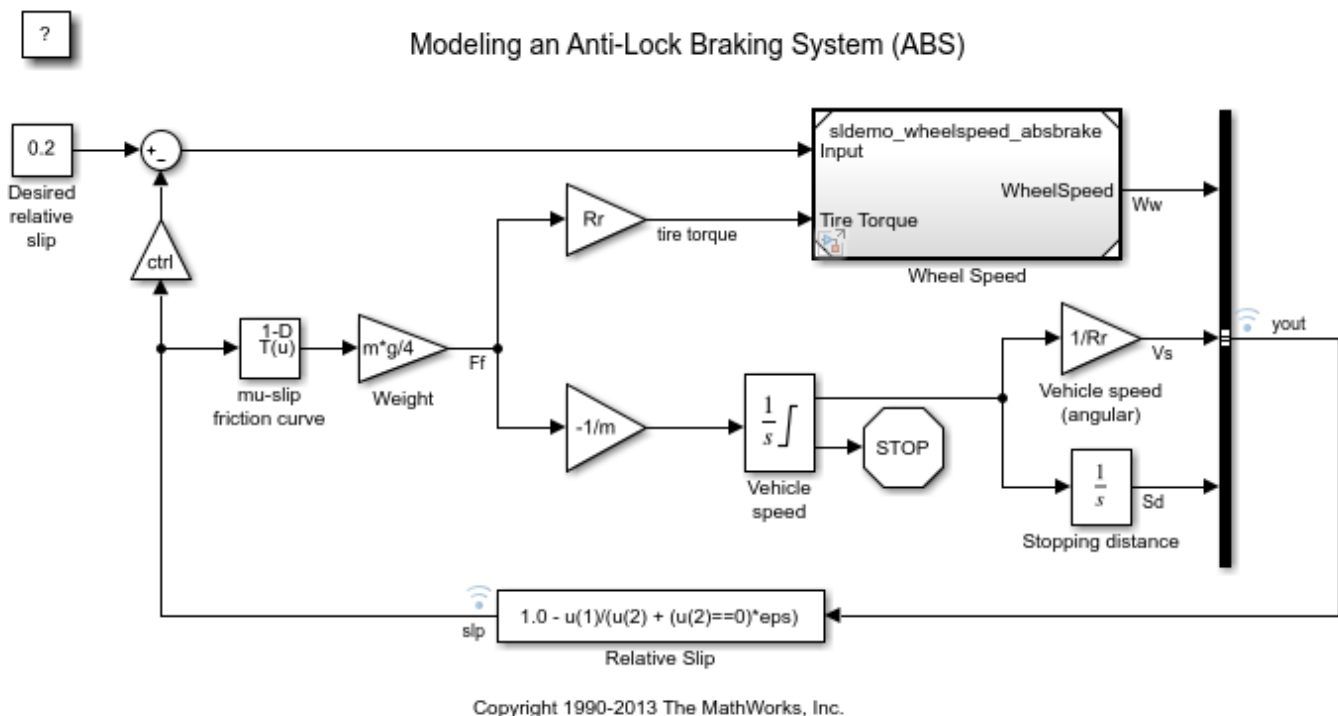

Figure 1: Anti-Lock Braking (ABS) Model

Double click on the 'Wheel Speed' subsystem in the model window to open it. Given the wheel slip, the desired wheel slip, and the tire torque, this subsystem calculates the wheel angular speed.

?

Calculate the Wheel Speed for the Anti-Lock Braking System (ABS) Simulation

Figure 2: Wheel Speed subsystem

To control the rate of change of brake pressure, the model subtracts actual slip from the desired slip and feeds this signal into a bang-bang control (+1 or -1, depending on the sign of the error, see Figure 2). This on/off rate passes through a first-order lag that represents the delay associated with the hydraulic lines of the brake system. The model then integrates the filtered rate to yield the actual brake pressure. The resulting signal, multiplied by the piston area and radius with respect to the wheel (K_f), is the brake torque applied to the wheel.

The model multiplies the frictional force on the wheel by the wheel radius (R_r) to give the accelerating torque of the road surface on the wheel. The brake torque is subtracted to give the net torque on the wheel. Dividing the net torque by the wheel rotational inertia, I , yields the wheel acceleration, which is then integrated to provide wheel velocity. In order to keep the wheel speed and vehicle speed positive, limited integrators are used in this model.

Running the Simulation in ABS Mode

Press the "Play" button on the model toolbar to run the simulation. You can also run the simulation by executing the `sim('sldemo_absbrake')` command in MATLAB. ABS is turned on during this simulation.

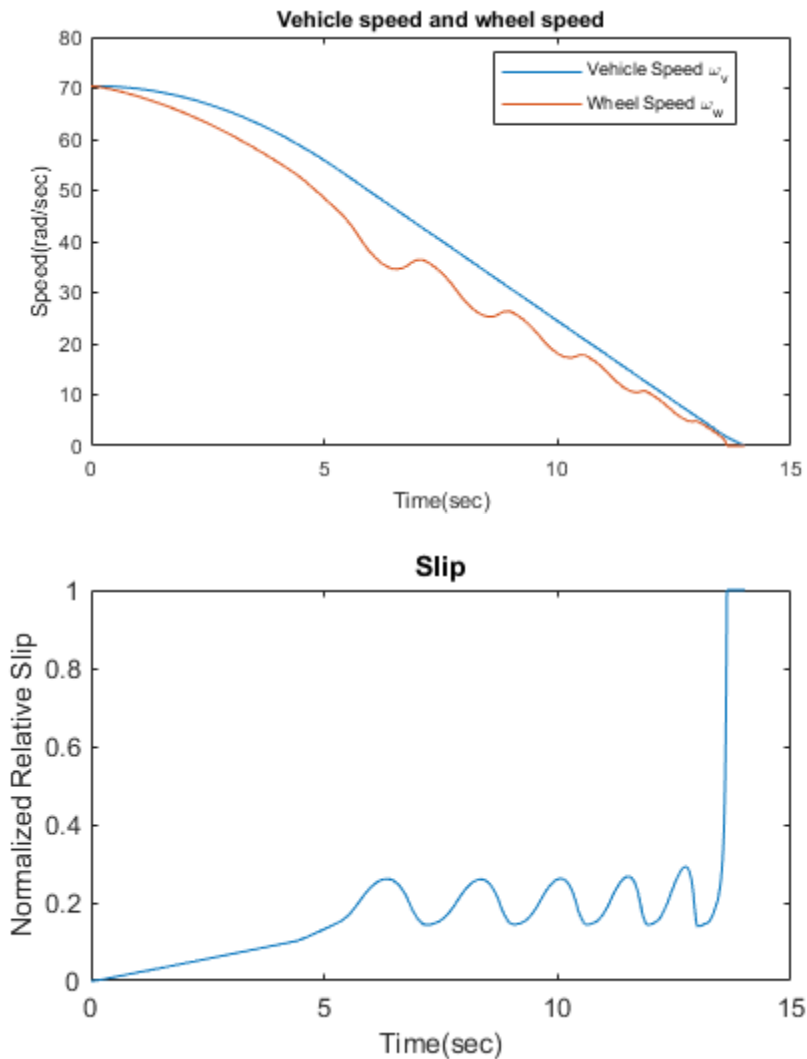

Figure 3: Baseline Simulation Results

- Note: The model logs relevant data to MATLAB workspace in a structure called `sldemo_absbrake_output`. Logged signals have a blue indicator. In this case `yout` and `slp` are logged (see the model). Read more about Signal Logging in Simulink Help.

Figure 3 visualizes the ABS simulation results (for default parameters). The first plot in Figure 3 shows the wheel angular velocity and corresponding vehicle angular velocity. This plot shows that the wheel speed stays below vehicle speed without locking up, with vehicle speed going to zero in less than 15 seconds.

Running the Simulation Without ABS

For more meaningful results, consider the vehicle behavior without ABS. At the MATLAB command line, set the model variable `ctrl = 0`. This disconnects the slip feedback from the controller (see Figure 1), resulting in maximum braking. The results are shown in Figure 4.

```
ctrl = 0;
```

Now run the simulation again. This will model braking without ABS.

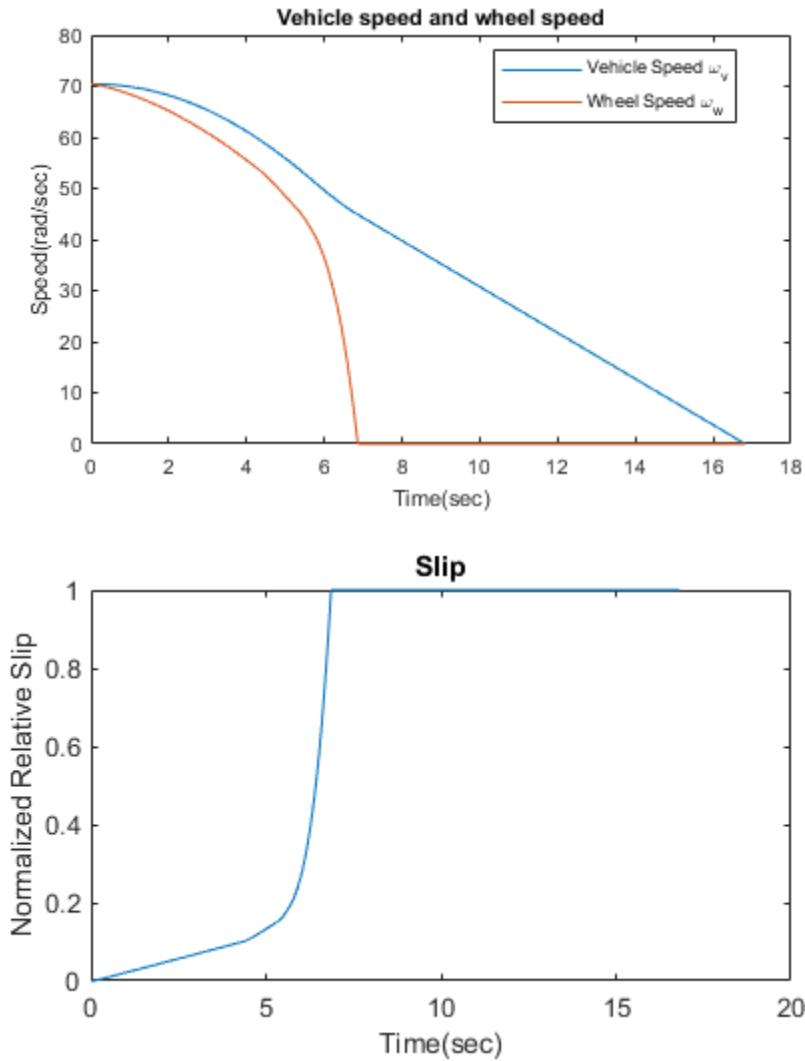

Figure 4: Maximum braking simulation results (braking without ABS)

Braking With ABS Versus Braking Without ABS

In the upper plot of Figure 4, observe that the wheel locks up in about seven seconds. The braking, from that point on, is applied in a less-than-optimal part of the slip curve. That is, when $\text{slip} = 1$, as seen in the lower plot of Figure 4, the tire is skidding so much on the pavement that the friction force has dropped off.

This is, perhaps, more meaningful in terms of the comparison shown in Figure 5. The distance traveled by the vehicle is plotted for the two cases. Without ABS, the vehicle skids about an extra 100 feet, taking about three seconds longer to come to a stop.

Figure 5: Stopping distance for hard braking with and without ABS

Closing the Model

Close the model. Close the 'Wheel Speed' subsystem. Clear logged data. Change back to the original directory.

```
cd(origdir);
```

Conclusions

This model shows how you can use Simulink to simulate a braking system under the action of an ABS controller. The controller in this example is idealized, but you can use any proposed control algorithm in its place to evaluate the system's performance. You can also use the Simulink® Coder™ with Simulink as a valuable tool for rapid prototyping of the proposed algorithm. C code is generated and compiled for the controller hardware to test the concept in a vehicle. This significantly reduces the time needed to prove new ideas by enabling actual testing early in the development cycle.

For a hardware-in-the-loop braking system simulation, you can remove the 'bang-bang' controller and run the equations of motion on real-time hardware to emulate the wheel and vehicle dynamics. You can do this by generating real-time C code for this model using the Simulink Coder. You can then test an actual ABS controller by interfacing it to the real-time hardware, which runs the generated code. In this scenario, the real-time model would send the wheel speed to the controller, and the controller would send brake action to the model.

Automotive Suspension

This example shows how to model a simplified half-car model that includes an independent front and rear vertical suspension. The model also includes body pitch and bounce degrees of freedom. The example provides a description of the model to show how simulation can be used to investigate ride characteristics. You can use this model in conjunction with a powertrain simulation to investigate longitudinal shuffle resulting from changes in throttle setting.

Analysis and Physics

Figure 1: A free-body diagram of the half-car model

Figure 1 illustrates the modeled characteristics of the half-car. The front and rear suspension are modeled as spring/damper systems. A more detailed model would include a tire model, and damper nonlinearities such as velocity-dependent damping (with greater damping during rebound than compression). The vehicle body has pitch and bounce degrees of freedom. They are represented in the model by four states: vertical displacement, vertical velocity, pitch angular displacement, and pitch angular velocity. A full model with six degrees of freedom can be implemented using vector algebra blocks to perform axis transformations and force/displacement/velocity calculations. The front suspension influences the bounce (i.e. vertical degree of freedom) according to Equation 1.

Equation 1

$$F_{front} = 2K_f(L_f\theta - z) + 2C_f(L_f\dot{\theta} - \dot{z})$$

F_{front}, F_{rear} = upward force on body from front/rear suspension

K_f, K_r = front and rear suspension spring constant

C_f, C_r = front and rear suspension damping rate

L_f, L_r = horizontal distance from gravity center to front/rear suspension

$\theta, \dot{\theta}$ = pitch (rotational) angle and its rate of change

z, \dot{z} = bounce (vertical) distance and its rate of change

The pitch contribution to the front suspension is given by Equation 2.

Equation 2

$$M_{front} = -L_{front}F_{front} \text{ (pitch moment due to front suspension)}$$

Equation 3 contains expressions for the rear suspension.

Equation 3

$$F_{rear} = -2K_r(L_r\theta + z) - 2C_r(L_r\dot{\theta} + \dot{z})$$

$$M_{rear} = L_rF_{rear} \text{ pitch moment due to rear suspension}$$

The forces and moments result in body motion according to Newton's Second Law (see Equation 4).

Equation 4

$$m_b\ddot{z} = F_{front} + F_{rear} - m_bg$$

$$I_{yy}\ddot{\theta} = M_{front} + M_{rear} + M_y$$

$$m_b = \text{body mass}$$

$$M_y = \text{pitch moment induced by vehicle acceleration}$$

$$I_{yy} = \text{body moment of inertia about gravity center}$$

The Model

To open this model, type `sldemo_suspn` in MATLAB® Command Window. Figure 2 shows the top-level diagram of the suspension model.

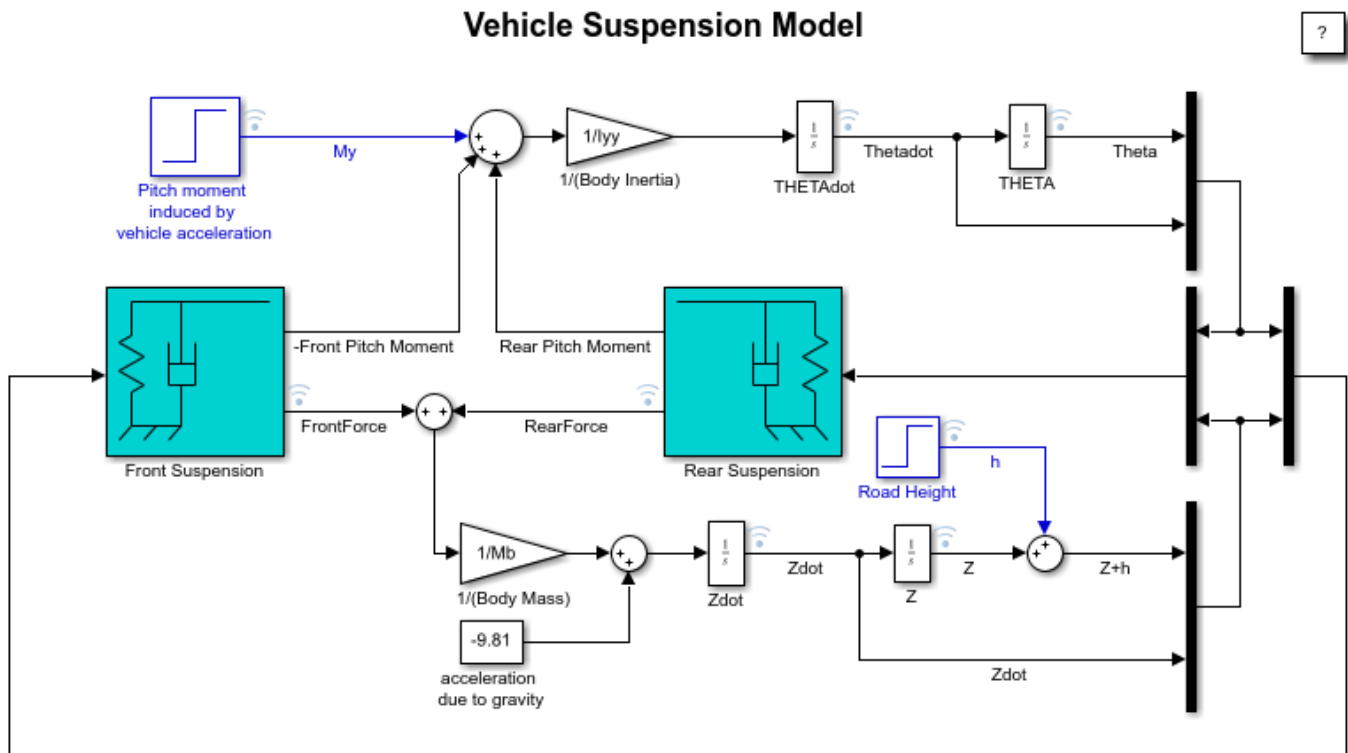

Figure 2: Top-level diagram of the suspension model

The suspension model shown in Figure 2 has two inputs, and both input blocks are blue on the model diagram. The first input is the road height. A step input here corresponds to the vehicle driving over a road surface with a step change in height. The second input is a horizontal force acting through the center of the wheels that results from braking or acceleration maneuvers. This input appears only as a moment about the pitch axis because the longitudinal body motion is not modeled.

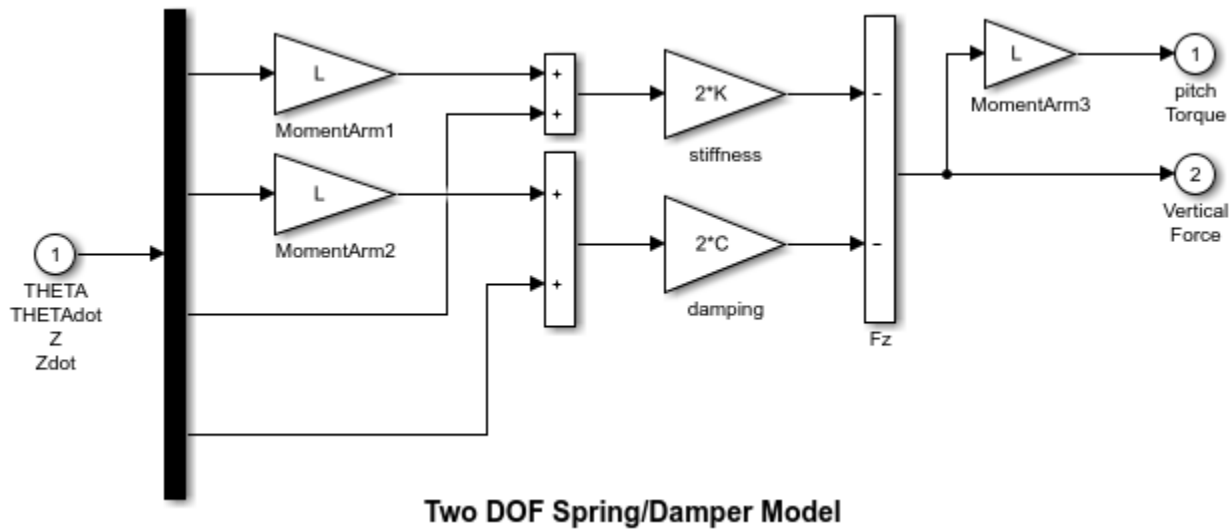

Figure 3: The Spring/Damper model used in FrontSuspension and RearSuspension subsystems

The spring/damper subsystem that models the front and rear suspensions is shown in Figure 3. Right click on the Front/Rear Suspension block and select Mask > Look Under Mask to see the front/rear suspension subsystem. The suspension subsystems are used to model Equations 1-3. The equations are implemented directly in the Simulink® diagram through the straightforward use of Gain and Summation blocks.

The differences between front and rear are accounted for as follows. Because the subsystem is a masked block, a different data set (L, K and C) can be entered for each instance. Furthermore, L is thought of as the Cartesian coordinate x , being negative or positive with respect to the origin, or center of gravity. Thus, K_f , C_f , and $-L_f$ are used for the front suspension block whereas K_r , C_r , and L_r are used for the rear suspension block.

Running the Simulation

To run this model, press the Play button on the toolbar in the model window. Initial conditions are loaded into the model workspace from the `sldemo_suspd.m` file (open this file to view its contents). To see the contents of the model workspace, in the Simulink Editor, on the **Modeling** tab, under **Design**, select **Model Explorer**. In the Model Explorer, look under the contents of the `sldemo_suspn` model and select "Model Workspace". Loading initial conditions in the model workspace prevents any accidental modifications of parameters and keeps MATLAB workspace clean.

Note that the model logs relevant data to MATLAB workspace in a data structure called `sldemo_suspn_output`. Type the name of the structure to see what data it contains. Read more about signal logging in Simulink Help.

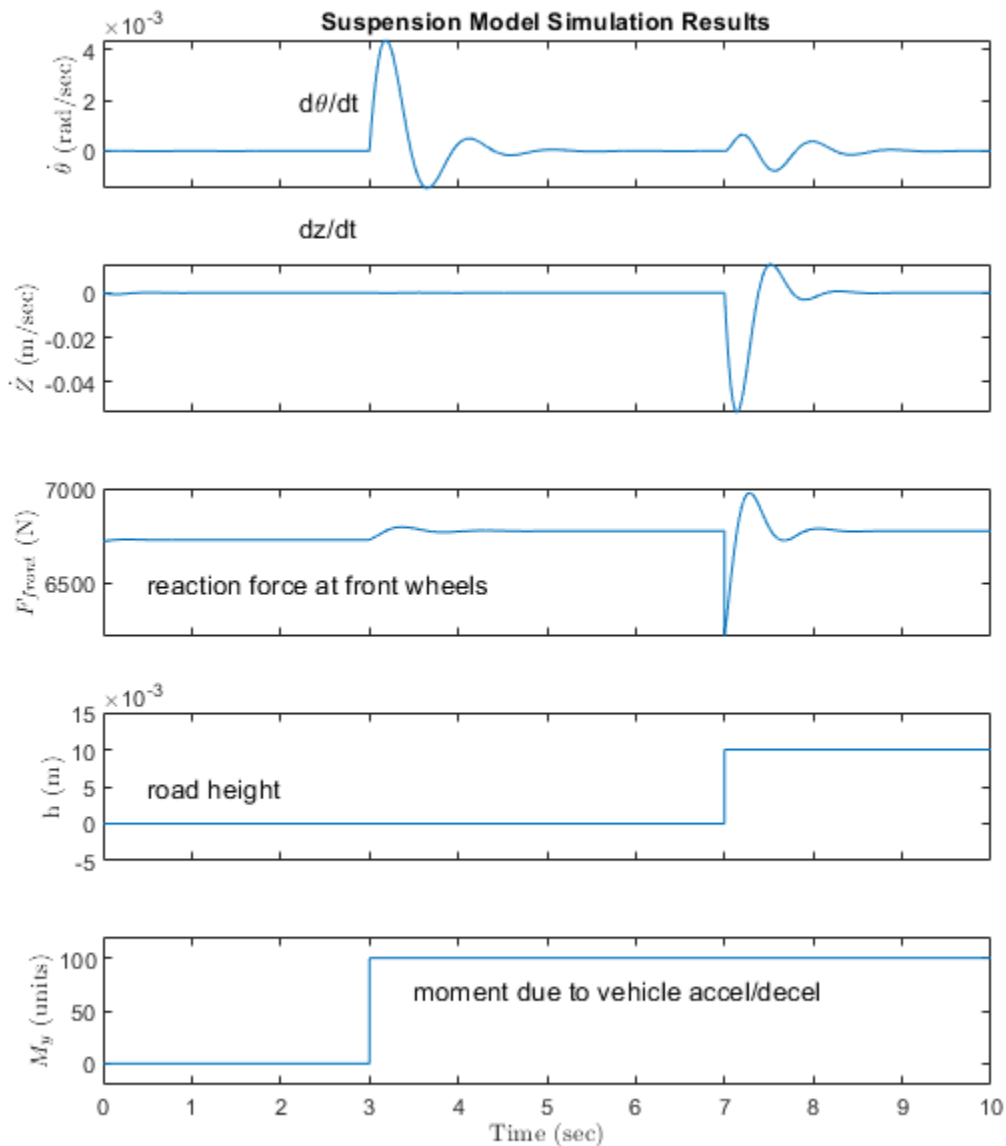

Figure 4: Simulation results

Simulation results are displayed in Figure 4. The results are plotted by the `sldemo_suspgraph.m` (you can open this file to see how it is done). The default initial conditions are given in Table 1 below.

Table 1: Default initial conditions

```
Lf = 0.9;    % front hub displacement from body gravity center (m)
Lr = 1.2;    % rear hub displacement from body gravity center (m)
Mb = 1200;   % body mass (kg)
Iyy = 2100;  % body moment of inertia about y-axis in (kg m^2)
```

```
kf = 28000; % front suspension stiffness in (N/m)
kr = 21000; % rear suspension stiffness in (N/m)
cf = 2500; % front suspension damping in (N sec/m)
cr = 2000; % rear suspension damping in (N sec/m)
```

Closing the Model

Close the model and delete generated data from MATLAB workspace.

Conclusions

This model allows you to simulate the effects of changing the suspension damping and stiffness, thereby investigating the tradeoff between comfort and performance. In general, racing cars have very stiff springs with a high damping factor, whereas passenger vehicles have softer springs and a more oscillatory response.

Modeling an Automatic Transmission Controller

This example shows how to model an automotive drivetrain with Simulink®. Stateflow® enhances the Simulink model with its representation of the transmission control logic. Simulink provides a powerful environment for the modeling and simulation of dynamic systems and processes. In many systems, though, supervisory functions like changing modes or invoking new gain schedules must respond to events that may occur and conditions that develop over time. As a result, the environment requires a language capable of managing these multiple modes and developing conditions. In the following example, Stateflow shows its strength in this capacity by performing the function of gear selection in an automatic transmission. This function is combined with the drivetrain dynamics in a natural and intuitive manner by incorporating a Stateflow block in the Simulink block diagram.

Analysis and Physics

Figure 1 shows the power flow in a typical automotive drivetrain. Nonlinear ordinary differential equations model the engine, four-speed automatic transmission, and vehicle. The model discussed in this example directly implements the blocks from Figure 1 as modular Simulink subsystems. On the other hand, the logic and decisions made in the Transmission Control Unit (TCU) do not lend themselves to well-formulated equations. TCU is better suited for a Stateflow representation. Stateflow monitors the events which correspond to important relationships within the system and takes the appropriate action as they occur.

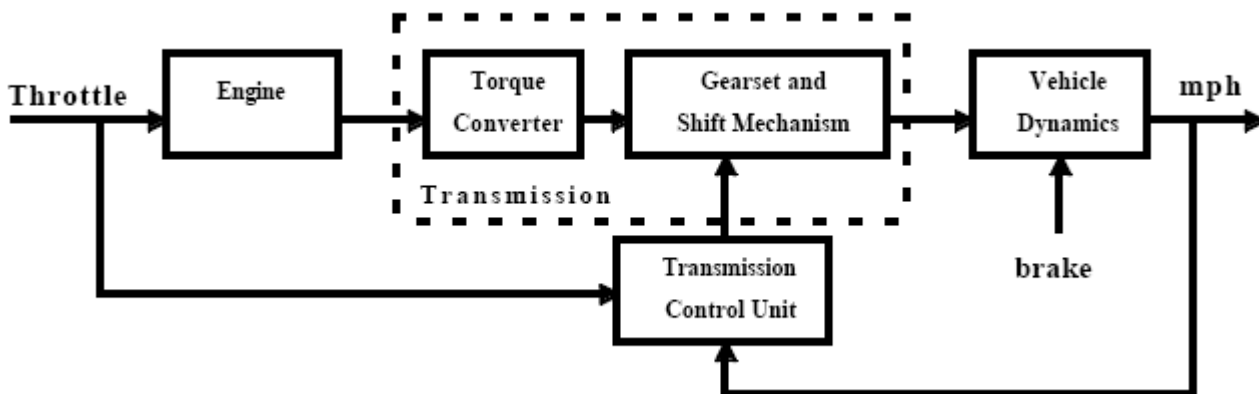

Figure 1: Generic block diagram for a drivetrain system

The throttle opening is one of the inputs to the engine. The engine is connected to the impeller of the torque converter which couples it to the transmission (see Equation 1).

Equation 1

$$I_{ei}\dot{N}_e = T_e - T_i$$

N_e = engine speed (RPM)

I_{ei} = moment of inertia of the engine and the impeller

T_e, T_i = engine and impeller torque

The input-output characteristics of the torque converter can be expressed as functions of the engine speed and the turbine speed. In this example, the direction of power flow is always assumed to be from the impeller to the turbine (see Equation 2).

Equation 2

$$T_i = \frac{N_e^2}{K^2}$$

$$K = f_2 \frac{N_{in}}{N_e} = \text{K-factor (capacity)}$$

N_{in} = speed of turbine (torque converter output) = transmission input speed (RPM)

$$R_{TQ} = f_3 \frac{N_{in}}{N_e} = \text{torque ratio}$$

The transmission model is implemented via static gear ratios, assuming small shift times (see Equation 3).

Equation 3

$$R_{TR} = f_4(\text{gear}) = \text{transmission ratio}$$

$$T_{out} = R_{TR} T_{in}$$

$$N_{in} = R_{TR} N_{out}$$

T_{in}, T_{out} = transmission input and output torques

N_{in}, N_{out} = transmission input and output speed (RPM)

The final drive, inertia, and a dynamically varying load constitute the vehicle dynamics (see Equation 4).

Equation 4

$$I_v \dot{N}_w = R_{fd}(T_{out} - T_{load})$$

I_v = vehicle inertia

N_w = wheel speed (RPM)

R_{fd} = final drive ratio

$T_{load} = f_5(N_w) = \text{load torque}$

The load torque includes both the road load and brake torque. The road load is the sum of frictional and aerodynamic losses (see Equation 5).

Equation 5

$$T_{load} = \text{sgn}(mph)(R_{load0} + R_{load2}mph^2 + T_{brake})$$

R_{load0}, R_{load2} = friction and aerodynamic drag coefficients

T_{load}, T_{brake} = load and brake torques

mph = vehicle linear velocity

The model programs the shift points for the transmission according to the schedule shown in Figure 2. For a given throttle in a given gear, there is a unique vehicle speed at which an upshift takes place. The simulation operates similarly for a downshift.

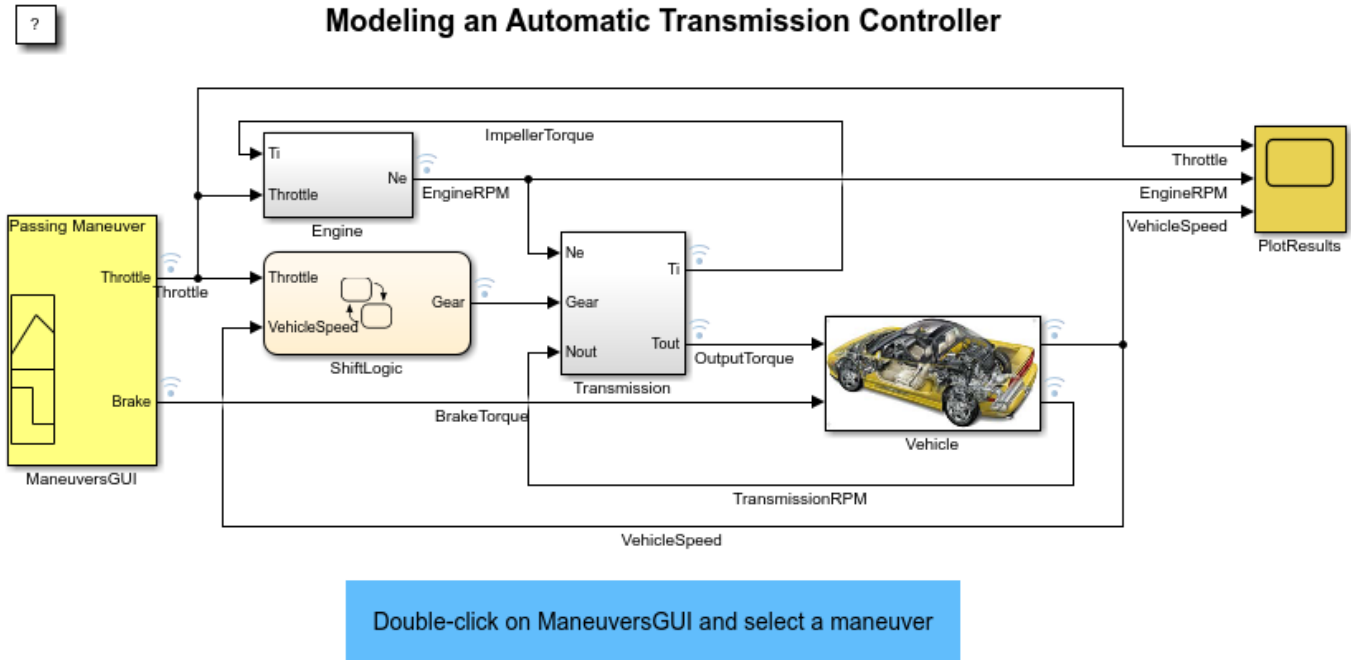

Figure 2: Shift schedule

Modeling

To open this model type `sldemo_autotrans` in MATLAB® terminal. Initial conditions are set in the Model Workspace.

The top-level diagram of the model is shown in Figure 3. To run the simulation, press the Play button on the toolbar in the model window. Note that the model logs relevant data to MATLAB Workspace in a data structure called `sldemo_autotrans_output`. Logged signals have a blue indicator (see Figure 3). After you run the simulation, you can view the components of the data structure by typing

sldemo_autotrans_output in MATLAB Command Window. Also note that the units appear on the subsystem icons and signal lines. To learn more about units in Simulink see Simulink Units.

Copyright 1990-2019 The MathWorks, Inc.

Figure 3: Model diagram and sample simulation results (passing maneuver)

Modeling

The Simulink model shown in Figure 3 is composed of modules which represent the engine, transmission, and the vehicle, with an additional shift logic block to control the transmission ratio. User inputs to the model are in the form of throttle (given in percent) and brake torque (given in ft-lb). The user inputs throttle and brake torques using the ManeuversGUI interface.

The Engine subsystem consists of a two-dimensional table that interpolates engine torque versus throttle and engine speed. Figure 4 shows the composite Engine subsystem. Double click on this subsystem in the model to view its structure.

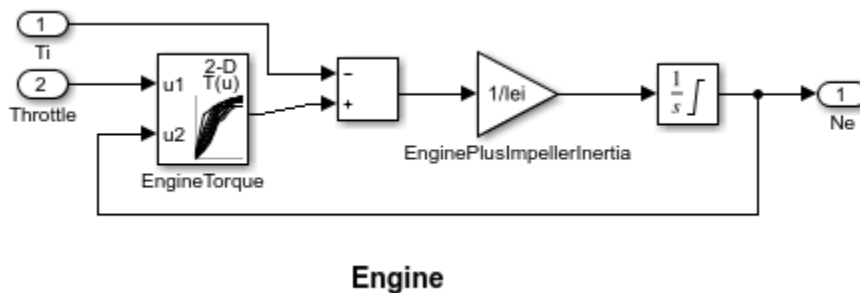

Figure 4: Engine subsystem

The TorqueConverter and the TransmissionRatio blocks make up the Transmission subsystem, as shown in Figure 5. Double click on the Transmission subsystem in the model window to view its components.

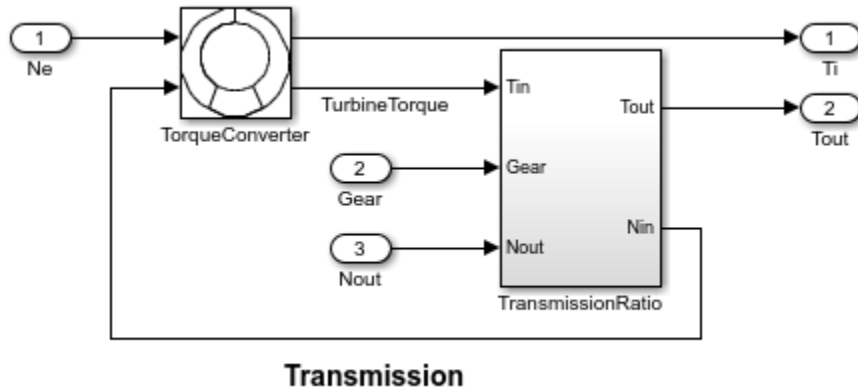

Figure 5: Transmission subsystem

The TorqueConverter is a masked subsystem, which implements Equation 2. To open this subsystem, right click on it and select Mask > Look Under Mask from the drop-down menu. The mask requires a vector of speed ratios (N_{in}/N_e) and vectors of K-factor (f2) and torque ratio (f3). Figure 6 shows the implementation of the TorqueConverter subsystem.

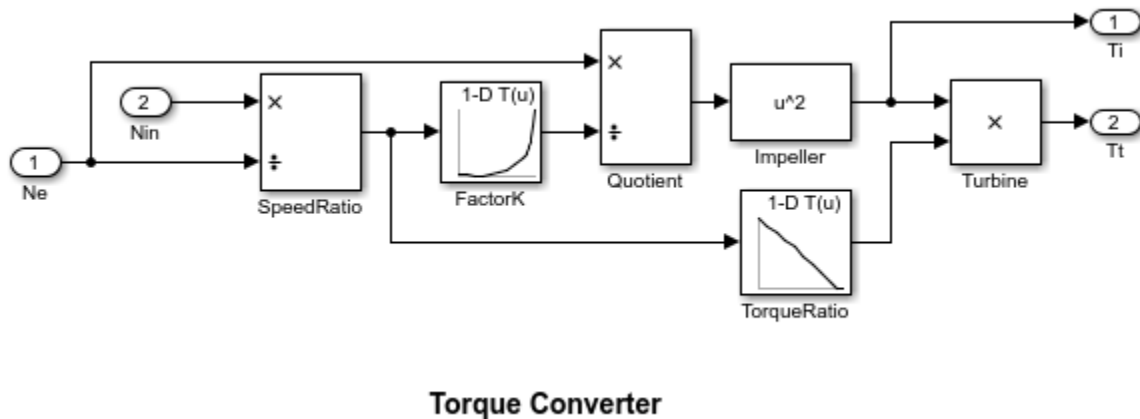

Figure 6: Torque converter subsystem

The transmission ratio block determines the ratio shown in Table 1 and computes the transmission output torque and input speed, as indicated in Equation 3. Figure 7 shows the block diagram for the subsystem that realizes this ratio in torque and speed.

Table 1: Transmission gear ratios

gear	Rtr = N_{in}/N_e
1	2.393
2	1.450
3	1.000
4	0.677

Figure 7: Transmission gear ratio subsystem

The Stateflow block labeled ShiftLogic implements gear selection for the transmission. Double click on ShiftLogic in the model window to open the Stateflow diagram. The Model Explorer is utilized to define the inputs as throttle and vehicle speed and the output as the desired gear number. Two dashed AND states keep track of the gear state and the state of the gear selection process. The overall chart is executed as a discrete-time system, sampled every 40 milliseconds. The Stateflow diagram shown in Figure 8 illustrates the functionality of the block.

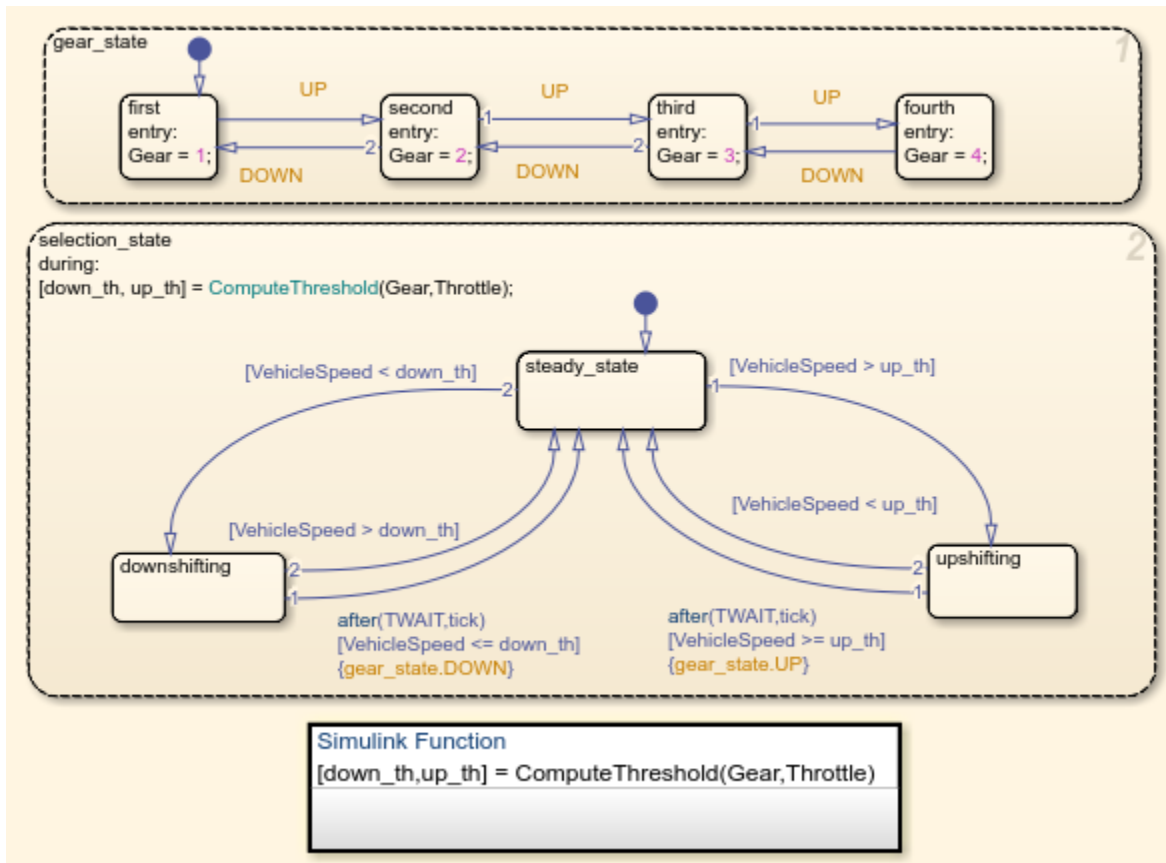

Figure 8: Stateflow diagram of the transmission shift logic

The shift logic behavior can be observed during simulation by enabling animation in the Stateflow debugger. The `selection_state` (always active) begins by performing the computations indicated in its `during` function. The model computes the upshift and downshift speed thresholds as a function of the instantaneous values of gear and throttle. While in `steady_state`, the model compares these values to the present vehicle speed to determine if a shift is required. If so, it enters one of the confirm states (`upshifting` or `downshifting`), which records the time of entry.

If the vehicle speed no longer satisfies the shift condition, while in the confirm state, the model ignores the shift and it transitions back to `steady_state`. This prevents extraneous shifts due to noise conditions. If the shift condition remains valid for a duration of `TWAIT` ticks, the model transitions through the lower junction and, depending on the current gear, it broadcasts one of the shift events. Subsequently, the model again activates `steady_state` after a transition through one of the central junctions. The shift event, which is broadcast to the `gear_selection` state, activates a transition to the appropriate new gear.

For example, if the vehicle is moving along in second gear with 25% throttle, the state `second` is active within `gear_state`, and `steady_state` is active in the `selection_state`. The `during` function of the latter, finds that an upshift should take place when the vehicle exceeds 30 mph. At the moment this becomes true, the model enters the `upshifting` state. While in this state, if the vehicle speed remains above 30 mph for `TWAIT` ticks, the model satisfies the transition condition leading down to the lower right junction. This also satisfies the condition `[[gear == 2]]` on the transition leading from here to `steady_state`, so the model now takes the overall transition from

upshifting to `steady_state` and broadcasts the event `UP` as a transition action. Consequently, the transition from second to third is taken in `gear_state` which completes the shift logic.

The Vehicle subsystem (Figure 9) uses the net torque to compute the acceleration and integrate it to compute the vehicle speed, per Equation 4 and Equation 5. The Vehicle subsystem is masked. To see the structure of the Vehicle block, right click on it and select `Mask > Look Under Mask` from the drop-down menu. The parameters entered in the mask menu are the final drive ratio, the polynomial coefficients for drag friction and aerodynamic drag, the wheel radius, vehicle inertia, and initial transmission output speed.

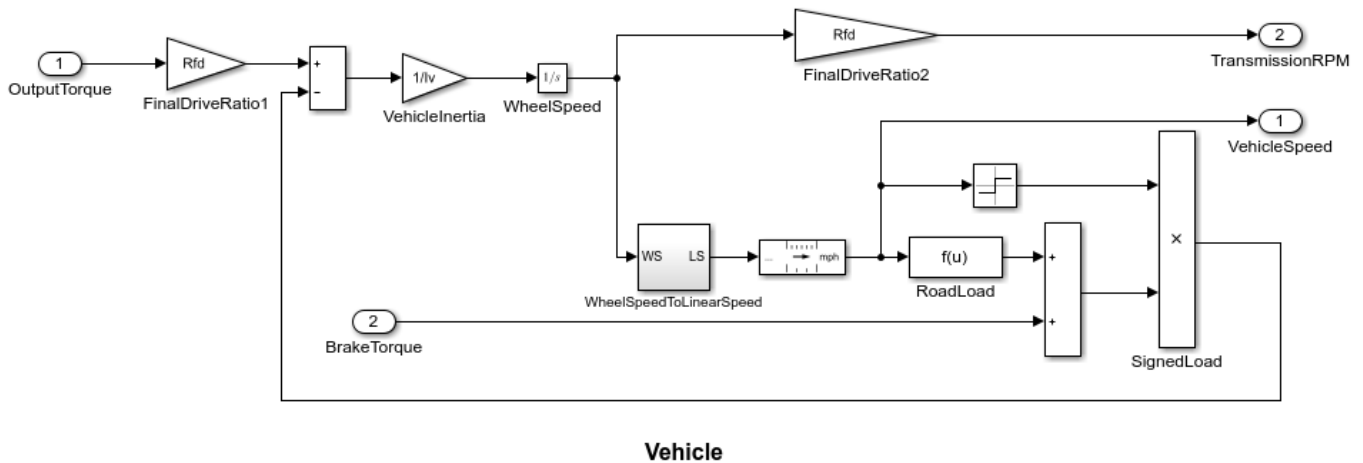

Figure 9: Vehicle subsystem (masked)

Results

The engine torque map, and torque converter characteristics used in the simulations are shown in Figure 10 and Figure 11.

Figure 10: Engine torque map

Figure 11: Torque converter characteristics (see Figure 5 and Equation 2)

The first simulation (passing maneuver) uses the throttle schedule given in Table 2 (this data is interpolated linearly).

Table 2: Throttle schedule for first simulation (passing maneuver)

Time (sec)	Throttle (%)
0	60
14.9	40
15	100
100	0
200	0

The first column corresponds to time; the second column corresponds to throttle opening in percent. In this case no brake is applied (brake torque is zero). The vehicle speed starts at zero and the engine at 1000 RPM. Figure 12 shows the plot for the baseline results, using the default parameters. As the driver steps to 60% throttle at $t=0$, the engine immediately responds by more than doubling its speed. This brings about a low speed ratio across the torque converter and, hence, a large torque ratio (see Figure 6 and Figure 11). The vehicle accelerates quickly (no tire slip is modeled) and both the engine and the vehicle gain speed until about $t = 2$ sec, at which time a 1-2 upshift occurs. The engine speed characteristically drops abruptly, then resumes its acceleration. The 2-3 and 3-4 upshifts take place at about four and eight seconds, respectively. Notice that the vehicle speed remains much smoother due to its large inertia.

Figure 12: Passing maneuver simulation time history

At $t=15\text{sec}$, the driver steps the throttle to 100% as might be typical of a passing maneuver. The transmission downshifts to third gear and the engine jumps from about 2600 RPM to about 3700 RPM. The engine torque thus increases somewhat, as well as the mechanical advantage of the transmission. With continued heavy throttle, the vehicle accelerates to about 100 mph and then shifts into overdrive at about $t = 21 \text{ sec}$. The vehicle cruises along in fourth gear for the remainder of the simulation. Double click on the ManeuversGUI block and use the graphical interface to vary the throttle and brake history.

Closing the Model

Close the model, clear generated data.

Conclusions

One can easily enhance this basic system in a modular manner, for example, by replacing the engine or transmission with a more complex model. We can thus build up large systems within this structure via step-wise refinement. The seamless integration of Stateflow control logic with Simulink signal processing enables the construction of a model which is both efficient and visually intuitive.

Vehicle Electrical System

This example shows how to simulate the electrical system of a vehicle using Simulink® and Simscape™ Power Systems™.

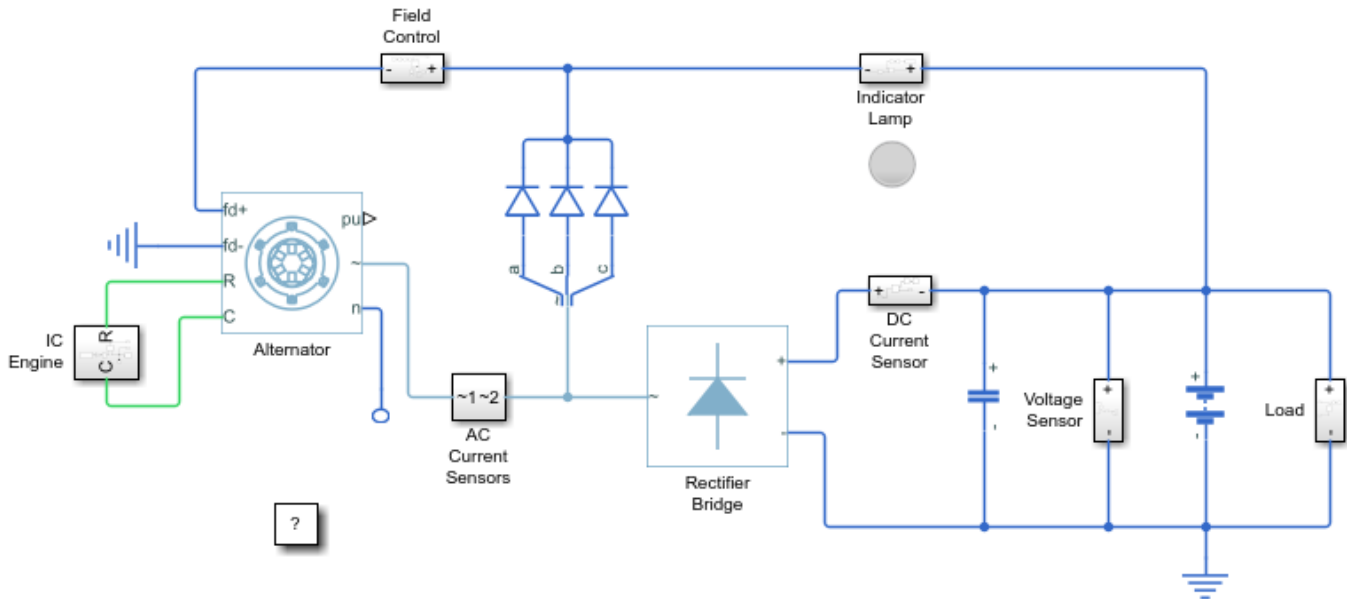

Figure 1: The vehicle electrical system.

System Components

The system simulated consists of a few components. The main power source is the internal combustion (IC) engine which drives the shaft of the alternator. The alternator produces the AC power. The diode trio rectifies the AC current generated from the alternator to DC current which is applied to the alternator field. The indicator lamp lights when the system is turned on and the alternator is not producing power. The rectifier bridge converts the AC power into DC power. The smoothing capacitor, voltage sensor, battery, and vehicle loads are connected to the DC bus.

The alternator is a 3-phase synchronous machine with its field current regulated to give control over the DC bus voltage. This is simulated by using the Synchronous Machine Round Rotor model.

The 3-phase AC output of the alternator is fed into the 6-pulse rectifier bridge to give the DC voltage required to charge the car battery and to supply the balance of the electrical system of the car.

Operation of the System

When the IC engine is off, the battery supplies the current to the alternator field winding. The indicator lamp is turned on.

When the IC engine runs, the alternator will start to produce voltage and the diode trio will conduct and let the current flow to the alternator field winding. The indicator lamp is then turned off.

When the DC bus voltage reaches the upper voltage limit (i.e., 14.5 V in the model), the current flowing to the alternator field is bypassed. As a result, the DC bus voltage decreases. If it reaches the lower voltage limit (i.e., 13.5 V in the model), the diode trio is reconnected to the field winding.

Simulating Automatic Climate Control Systems

This example shows how to simulate the working of an automatic climate control system in a car using Simulink® and Stateflow®. You can enter a temperature value you would like the air in the car to reach by double clicking the User Setpoint in Celsius Block and entering the temperature value. You can also set the External Temperature in Celsius in a similar way. The numerical display on the right-hand side of the model shows the reading of a temperature sensor placed behind the driver's head. This is the temperature that the driver should be feeling. When the model is run and the climate control is active, it is this display box whose value changes to show the change of temperature in the car.

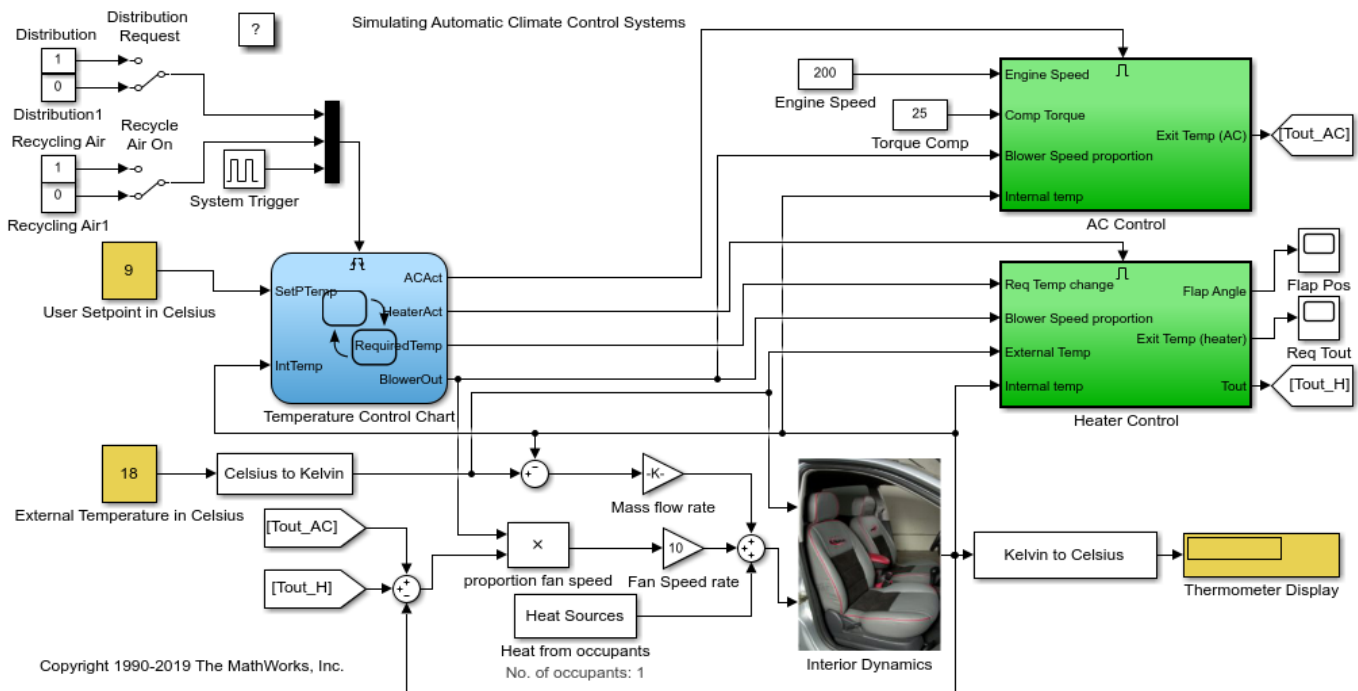

Figure 1: The automatic climate control system.

The Stateflow® Controller

The supervisory controller is implemented in Stateflow. Double clicking the Stateflow chart shows how this supervisory control logic has been formulated.

The **Heater_AC** state shows that when you enter a setpoint temperature that is greater than the current temperature in the car by at least 0.5 deg C, the heater system will be switched on. The heater will remain active until the current temperature in the car is within 0.5 deg of the setpoint temperature. Similarly, when the user enters a setpoint that is 0.5 deg C (or more) lower than the current car temperature, the air conditioner is turned on and stays active until the air temperature in the car is within 0.5 deg C of the setpoint temperature, after which, the system will switch off. A dead band of 0.5 deg has been implemented to avoid the problem of continuous switching.

In the **Blower** State, the larger the difference between the setpoint temperature and the current temperature, the harder the fan blows. This ensures that the temperature will reach the required value in a reasonable amount of time, despite the temperature difference. Once again, when the air temperature in the car is within 0.5 deg C of the setpoint temperature, the system will switch off.

The Air Distribution(**AirDist**) and Recycling Air States(**Recyc_Air**) are controlled by the two switches that trigger the Stateflow chart. An internal transition has been implemented within these two states to facilitate effective defrosting of the windows when required. When the defrost state is activated, the recycling air is turned off.

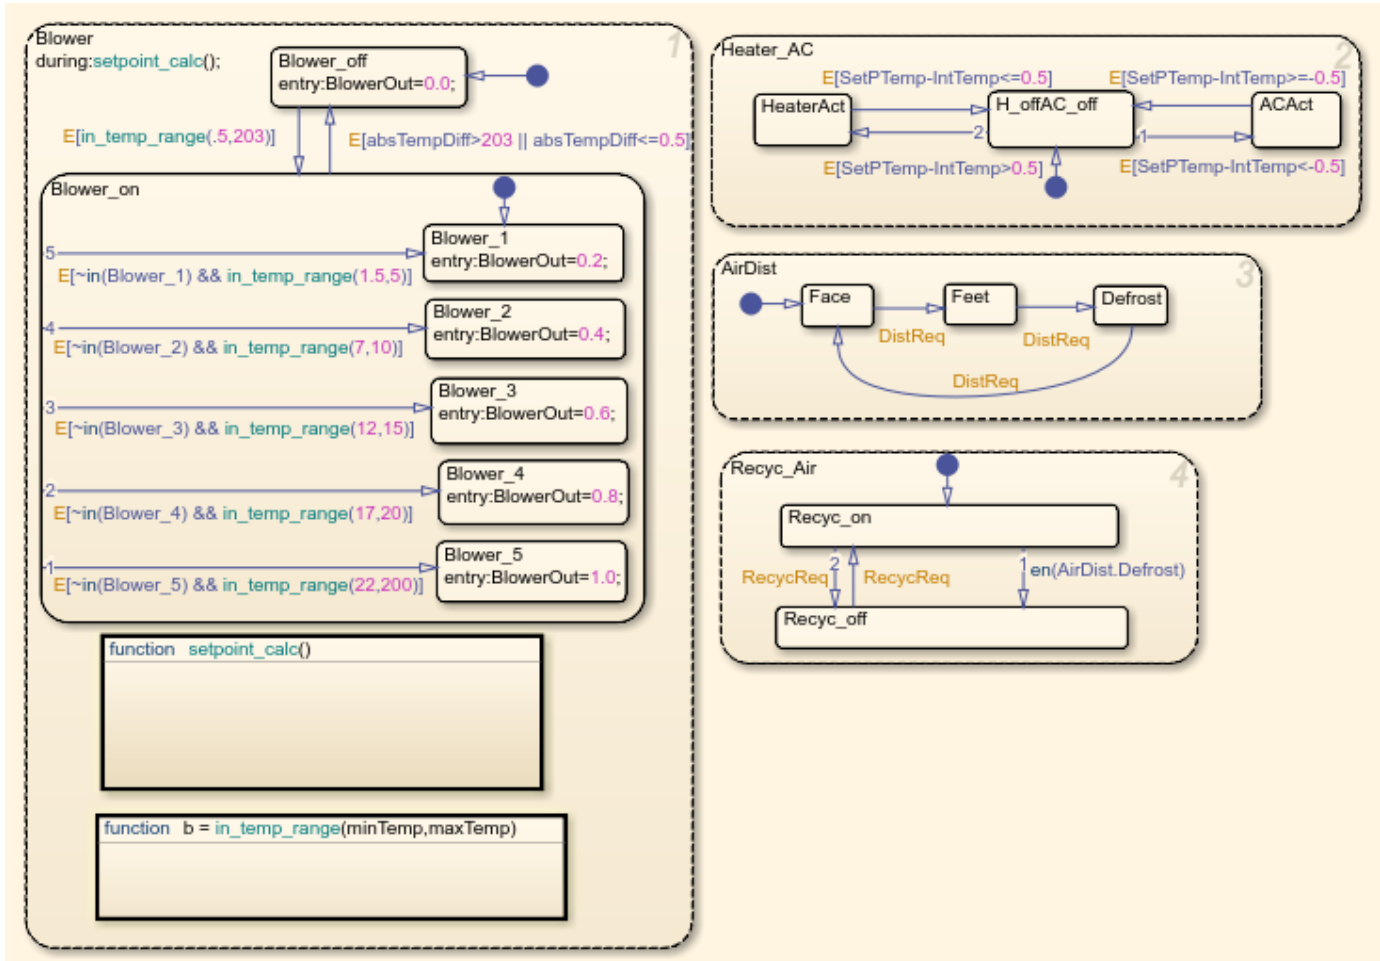

Figure 2: The supervisory control logic in Stateflow.

Heater and Air Conditioner Models

The heater model was built from the equation for a heater exchanger shown below:

$$T_{out} = T_s - (T_s - T_{in})e^{[-\pi \cdot D \cdot L \cdot hc / (m_{dot} \cdot C_p)]}$$

Where:

- T_s = constant (radiator wall temperature)
- D = 0.004m (channel diameter)
- L = 0.05m (radiator thickness)
- N = 30000 (Number of channels)
- k = 0.026 W/mK = constant (thermal conductivity of air)

- $C_p = 1007 \text{ J/kgK} = \text{constant}$ (specific heat of air)
- Laminar flow ($hc = 3.66(k/D) = 23.8 \text{ W/m}^2\text{K}$)

In addition, the effect of the heater flap is taken into account. Similar to the operation of the blower, the greater the temperature difference between the required setpoint temperature and the current temperature in the car, the more the heater flap is opened and the greater the heating effect.

The air conditioner model was built from the equation below:

$$y \cdot (w \cdot T_{\text{comp}}) = \dot{m} \cdot (h_4 - h_1)$$

Where:

- $y = \text{efficiency}$
- $\dot{m} = \text{mass flow rate}$
- $w = \text{speed of the engine}$
- $T_{\text{comp}} = \text{compressor torque}$
- $h_4, h_1 = \text{enthalpy}$

Here we have bang-bang control of the A/C system where the temperature of the air that exits the A/C is determined by the engine speed and compressor torque.

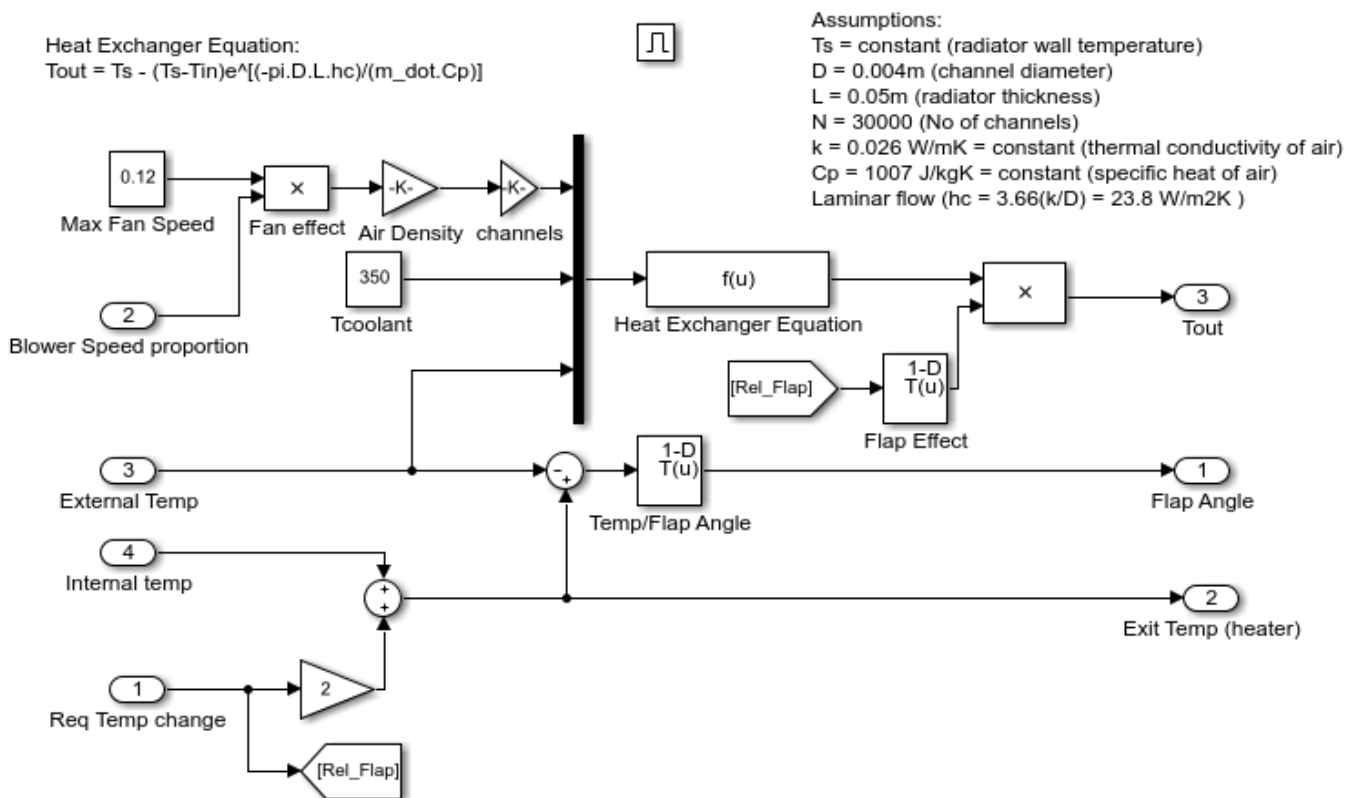

Figure 3: Heater control subsystem.

Figure 4: A/C control subsystem.

Heat Transfer in the Cabin

The temperature of the air felt by the driver is affected by all of these factors:

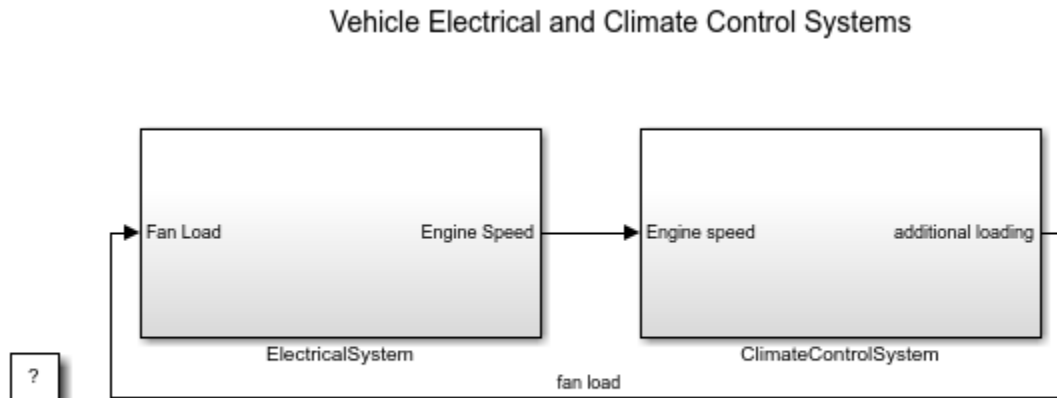

- The temperature of the air exiting the vents
- The temperature of the outside air
- The number of people in the car

These factors are inputs into the thermodynamic model of the interior of the cabin. We take into account the temperature of the air exiting the vents by calculating the difference between the vent air temperature and the current temperature inside the car and multiplying it by the fan speed proportion (mass flow rate). Then 100W of energy is added per person in the car. Lastly, the difference between the temperature of the outside air and the interior air temperature is multiplied by a lesser mass flow rate to account for the air radiating into the car from the outside.

The output of the interior dynamics model is fed to the display block as a measure of the temperature read by a sensor placed behind the driver's head.

Vehicle Electrical and Climate Control Systems

This example shows how to interface the vehicle climate control system with a model of the electrical system to examine the loading effects of the climate control system on the entire electrical system of the car.

Copyright 2017-2019 The MathWorks, Inc.

Figure 1: Vehicle Electrical and Climate Control System

The Climate Control System

Double clicking on the ClimateControlSystem subsystem will open the model of the climate control system. Here the user can enter the temperature value they would like the air in the car to reach by double clicking on the USER SETPOINT IN CELSIUS Block and entering the value into the dialog box. The EXTERNAL TEMPERATURE IN CELSIUS can also be set by the user in a similar way. The numerical display on the right hand side of the model shows the reading of a temperature sensor placed behind the driver's head. This is the temperature that the driver should be feeling. When the model is run and the climate control is active, it is this display box whose value changes showing the change of temperature in the car.

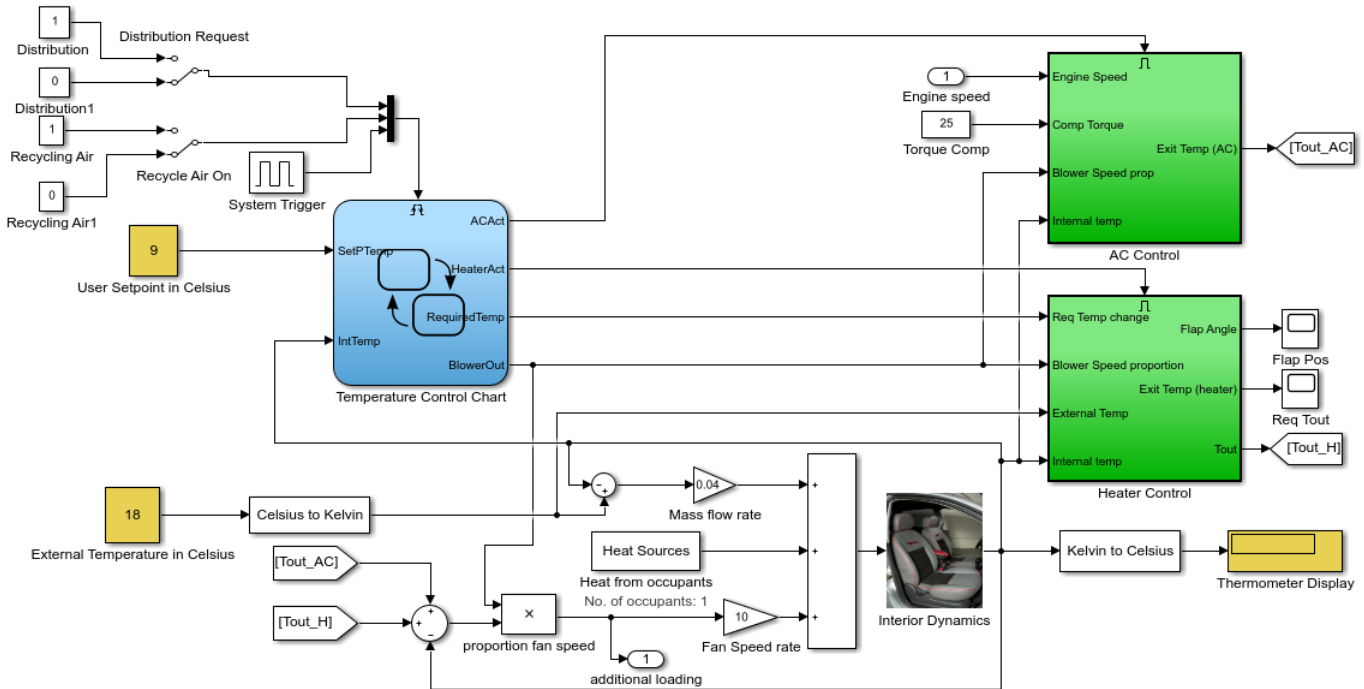

Figure 2: The automatic climate control system.

The Stateflow® Controller

The control of the system is implemented in Stateflow®. Double clicking on the Stateflow chart will show how this supervisory control logic has been formulated.

The **Heater_AC** state shows that when the user enters a setpoint temperature which is greater than the current temperature in the car by at least 0.5 deg C, the heater system will be switched on. The heater will remain active until the current temperature in the car reaches to within 0.5 deg of the setpoint temperature. Similarly, when the user enters a setpoint which is 0.5 deg C (or more) lower than the current car temperature, the Air Conditioner is turned on and stays active until the temperature of the air in the car reaches to within 0.5 deg C of the setpoint temperature. After which, the system will switch off. The dead band of 0.5 deg has been implemented to avoid the problem of continuous switching.

In the **Blower** State, the larger the difference between the setpoint temperature and the current temperature, the harder the fan blows. This ensures that the temperature will reach the required value in a reasonable amount of time, despite the temperature difference. Once again, when the temperature of the air in the car reaches to within 0.5 deg C of the setpoint temperature, the system will switch off.

The Air Distribution (**AirDist**) and Recycling Air States (**Recyc_Air**) are controlled by the two switches that trigger the Stateflow chart. An internal transition has been implemented within these two states to facilitate effective defrosting of the windows when required. When the defrost state is activated, the recycling air is turned off.

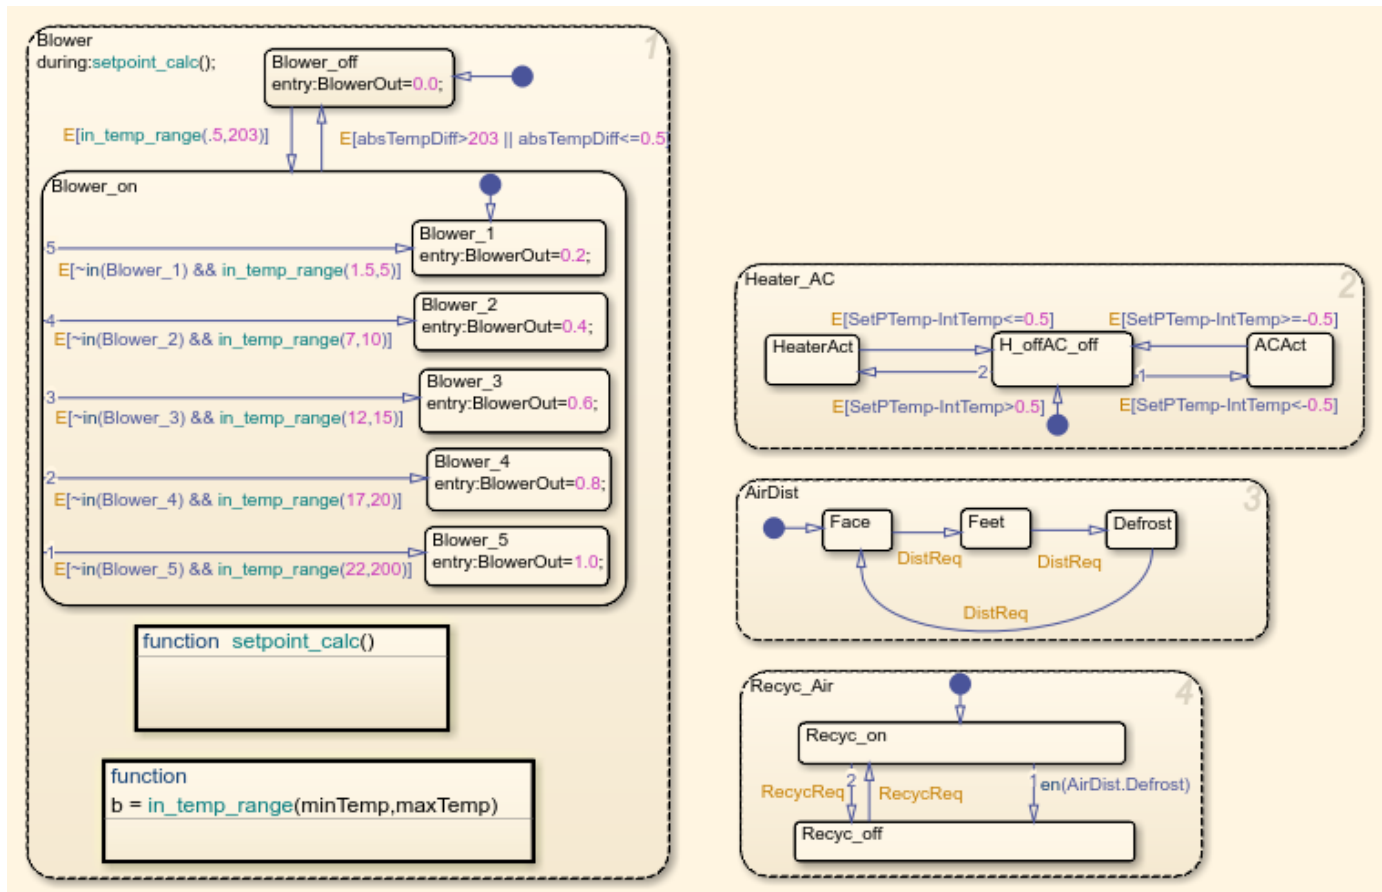

Figure 3: The supervisory control logic in Stateflow.

Heater and Air Conditioner Models

The heater model was built from the equation for a heat exchanger shown below:

$$T_{out} = T_s - (T_s - T_{in})e^{[-\pi \cdot D \cdot L \cdot hc] / (m_{dot} \cdot C_p)}$$

Where:

- T_s = constant (radiator wall temperature)
- D = 0.004m (channel diameter)
- L = 0.05m (radiator thickness)
- N = 30000 (Number of channels)
- k = 0.026 W/mK = constant (thermal conductivity of air)
- C_p = 1007 J/kgK = constant (specific heat of air)
- Laminar flow ($hc = 3.66(k/D) = 23.8 \text{ W/m}^2\text{K}$)

In addition, the effect of the heater flap is taken into account. Similar to the operation of the blower, the greater the temperature difference between the required setpoint temperature and the current temperature in the car, the more the heater flap is opened and the greater the heating effect.

The Air Conditioner system is one of the two places where the climate control model interfaces with the car's electrical system model. The compressor loads the engine of the car when the A/C system is active. The final temperature to exit from the A/C is calculated as follows:

$$y \cdot (w \cdot T_{comp}) = \dot{m} \cdot (h_4 - h_1)$$

Where:

- y = efficiency
- \dot{m} = mass flow rate
- w = speed of the engine
- T_{comp} = compressor torque
- h_4, h_1 = enthalpy

Here we have bang-bang control of the A/C system where the temperature of the air that exits the A/C is determined by the engine speed and compressor torque.

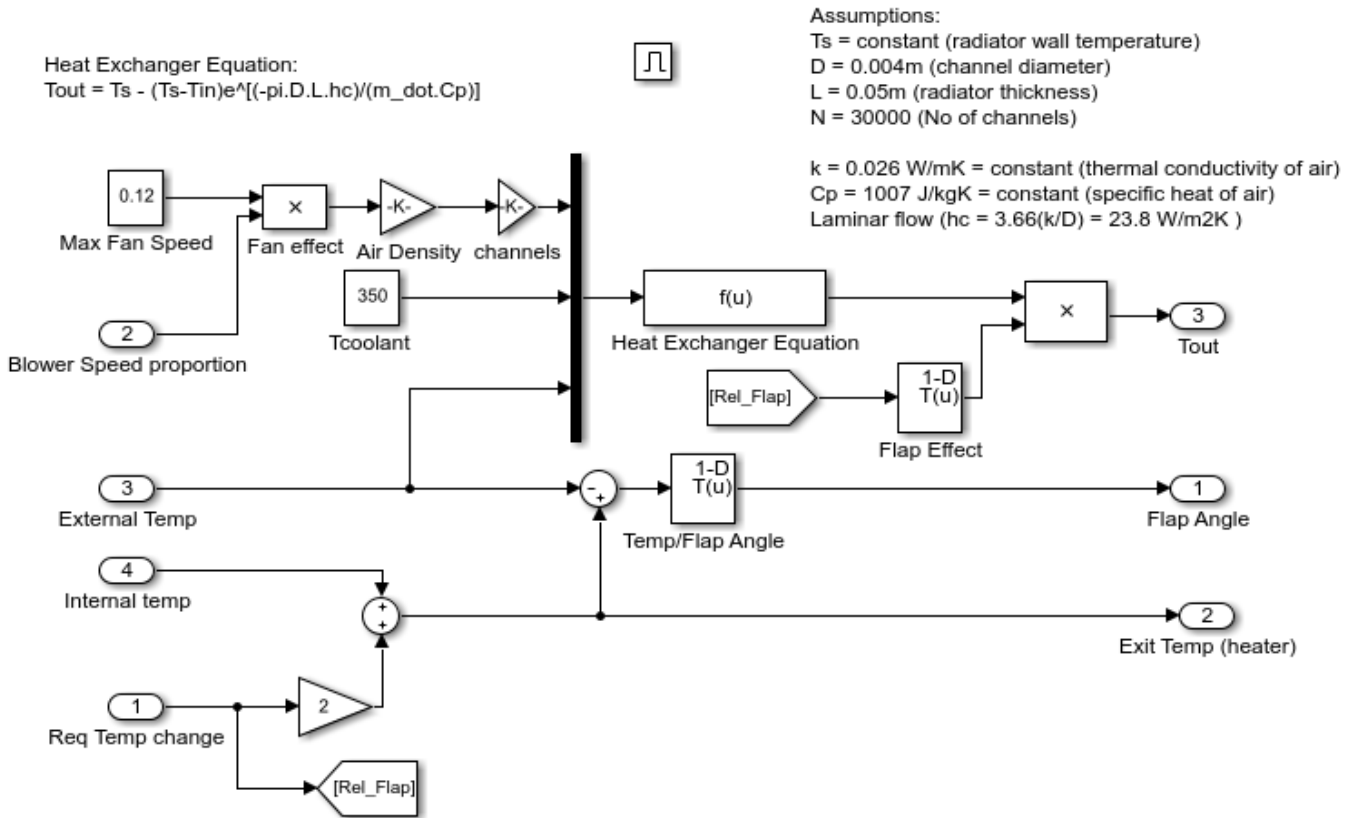

Figure 4: Heater control subsystem.

Figure 5: A/C control subsystem.

Heat Transfer in the Cabin

The temperature of the air felt by the driver is affected by all of these factors:

- The temperature of the air exiting the vents
- The temperature of the outside air
- The number of people in the car

These factors are inputs into the thermodynamic model of the interior of the cabin. We take into account the temperature of the air exiting the vents by calculating the difference between the vent air temperature and the current temperature inside the car and multiplying it by the fan speed proportion (mass flow rate). Then 100W of energy is added per person in the car. Lastly, the difference between the temperature of the outside air and the interior air temperature is multiplied by a lesser mass flow rate to account for the air radiating into the car from the outside.

The output of the interior dynamics model is fed to the display block as a measure of the temperature read by a sensor placed behind the driver's head.

The Electrical System

This electrical system models the car at idle speed. The PID controllers ensure that the car's alternator (modeled by a synchronous machine which has its field current regulated to control the output voltage) is also operating at the required speed. The alternator output is then fed through a 3-phase 6-pulse rectifier bridge to supply the voltage needed to charge the battery which supplies the voltage for the car's DC bus.

The fan used in the climate control system is fed off this DC bus as are the windscreen wipers, radio etc. As the difference between the setpoint temperature and the current temperature in the car drops, so does the fan speed and therefore so does the loading on the DC bus. The inclusion of feedback in the electrical system regulates the DC bus voltage.

The additional model of the car's electrical system allows for the changing of the engine speed. Changing the engine speed shows the effect on the DC bus voltage.

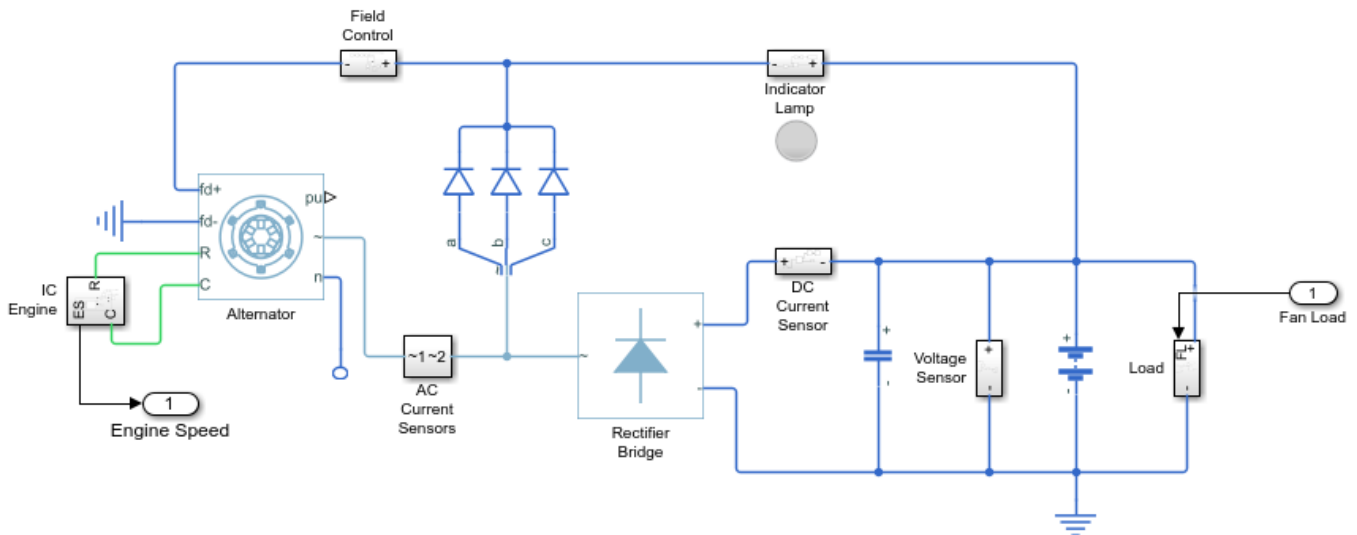

Figure 6: The electrical system

Power Window Control Project

This example shows how you can use MathWorks® software and the Model-Based Development process to go from concept to implementation for a power window system for an automobile.

Overview of Design Requirements

In this example, consider the passenger-side power window system of an automobile. Note a critical aspect of this system is that it can never exert a force of more than 100 N on an object when closing the window, for example:

When the model detects such an object, it must lower the window by about 10 centimeters.

For more information on design requirements see power window controller documentation

Using Model-Based Development and Large Scale Modeling

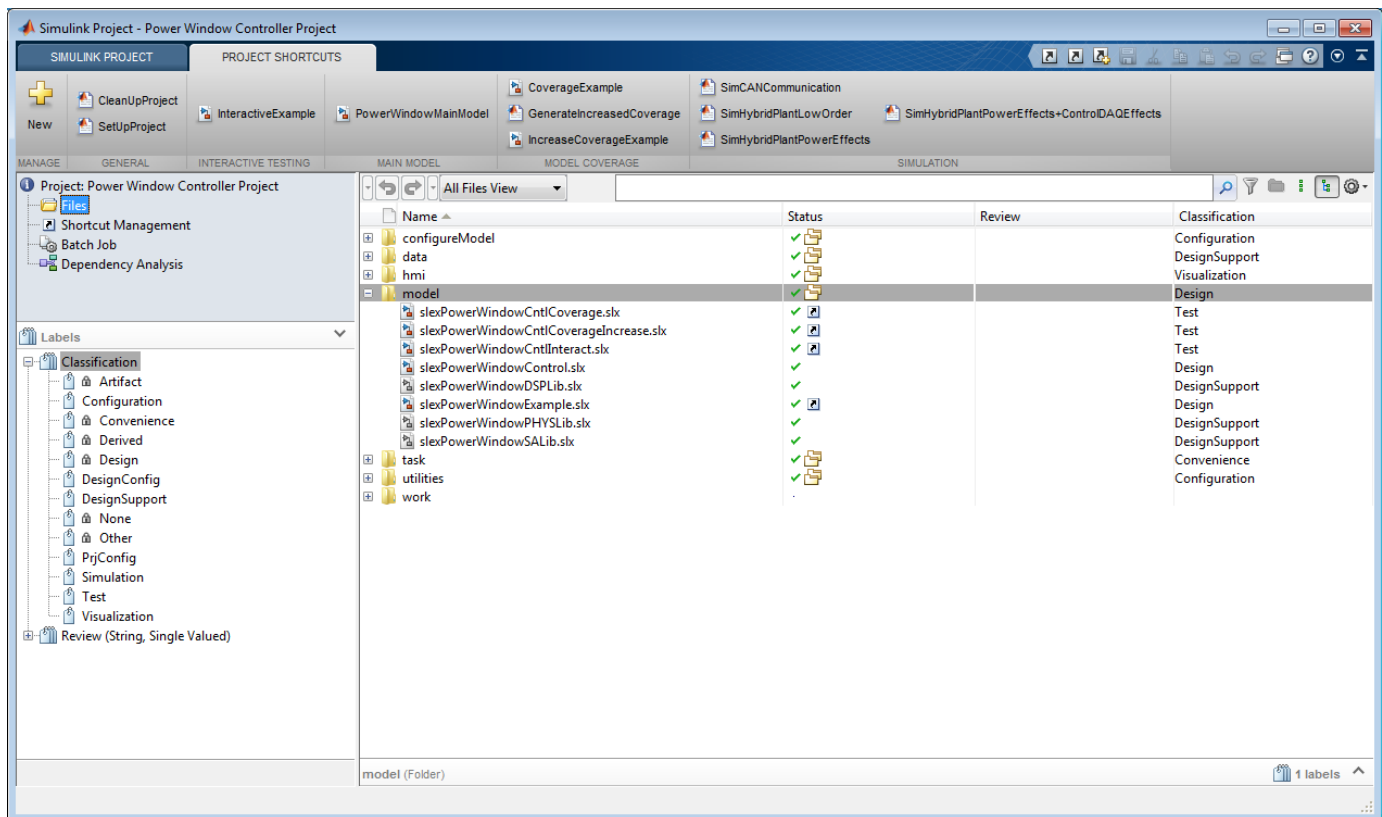

This example uses Model-Based Design and large scale modeling techniques such as,

- **Model Blocks** to separate the hierarchy into separate models.
- **Variant Subsystems Blocks** to model and switch between different design choices.
- **Libraries** to capture algorithms for reuse in variant subsystems.
- **Simulink® Project** to manage the files required for the system development.

Opening Power Window Control Project

Run the following command to create and open a working copy of the project files for this example.

```
slxPowerWindowStart
```

Exploring the Project

Upon visual inspection of the project, you can see features from Simulink Project used to organize the example. These features are

- Folders
- File Classification
- Shortcuts

Folders

The project is organized into the following folders:

- **configureModel** - contains the MATLAB® files controlling the main system model variant configuration.
- **data** - contains the images required by the project.
- **hmi** - contains the files to animate the response of the power window.
- **model** - contains the main system model, controller model, models for testing the controller, and libraries which support these models.
- **task** - contains the MATLAB files that simulate the model for the different model configurations and generate coverage reports for the controller.
- **utilities** - contains the MATLAB files to initialize the model, to generate spreadsheet input, to add data to the generated spreadsheet and to manage the project's environment at startup and shutdown.

File Classification

Files in Simulink Projects have different classifications visible in Labels Pane. Each label describes the specific role a file contributes to the body of the project. In this project, new classifications were added, including:

- **Configuration** - the files that configure the project or model.
- **PrjConfig** - the files that configure the project by adding its files to the path at startup and removing them at shutdown.
- **DesignConfig** - the files that determine which model configuration is active at a given time.
- **Design** - the main system model and its referenced control model.
- **DesignSupport** - files such as libraries, data, and model simulation.
- **Simulation** - the files that simulate the model for a specific configuration.
- **Test** - the control coverage, the control interaction, and the test harness models.
- **Visualization** - the files that animate the motion of the power window.

Shortcuts

Project shortcuts are used to obtain quick access to project files that are used most often. Some shortcuts contain general tasks such as adding the project to the path at startup and removing it at shutdown. In addition, project shortcut groups help organize the shortcuts. The new shortcut groups are

- **Interactive Testing** - contains files used for interactive testing of the controller.
- **Main Model** - contains file for top level Simulink model.
- **Model Coverage** - contains files used for model coverage of the controller.
- **Simulation** - contains files used for simulation of model variant configurations.

Exploring Simulink Models in Project

The Simulink Models for this project are located in the model folder. The models of interest are

- Main System Model
- Models for Testing

Main System Model

In this example under the model folder, the main system model is `slexPowerWindowExample`. This model consists of the driver and passenger switch blocks, which generate the inputs to the system. The inputs then go through the control system model, which validates the states of the passenger and driver inputs. The control system block also determines if there is an obstacle blocking the window's path. The referenced controller produces the window motion command signals sent to the active variant of the window system. The window system output is the feedback to the control system block.

To visualize the results of simulation, Simulation Data Inspector (SDI) logs the output data and Simulink 3D Animation™ animates the window's motion.

Model Variants

The main system model in this project uses the `Variant Subsystem` block to allow for multiple implementations of within a subsystem. The active implementation can be programmatically changed

prior to simulation. In the main model, there are four Variant Subsystem blocks each with variant choices that can be programmatically modified. Those four variant subsystems are:

- `slexPowerWindowExample/driver_switch`
- `slexPowerWindowExample/passenger_switch`
- `slexPowerWindowExample/window_system`
- `slexPowerWindowExample/power_window_control_system/detect_obstacle_endstop`

Each variant choice is associated with a variant control. The variant choice is active when its variant control evaluates to `true`.

Since there are four programmatically modifiable Variant Subsystem blocks in the main model, there are MATLAB files to control the combinations of variant choices to create model variant configurations which are found under the `DesignConfig` classification. Available model variant configurations are

- Power Window Controller Hybrid System Model
- Power Window Controller and Detailed Plant Model
- Power Window Controller With Data Acquisition Effects
- Power Window Controller With Controller Area Network (CAN) Communication

Power Window Controller Hybrid System Model

This model variant uses Stateflow® and Simulink to model both discrete event reactive behavior and continuous time behavior. It uses a low order plant model to validate the roll-up and roll-down behavior. You can simulate this variant configuration using the `SimHybridPlantLowOrder` shortcut. This shortcut activates only the variant subsystem corresponding to this model configuration. Since this model does not take into account power effects, the only output logged is position. Simulation Data Inspector (SDI) displays the logged position data.

Power Window Controller and Detailed Plant Model

This model variant shows a more detailed plant model that includes power effects in the electrical and mechanical domains is used to validate that the force exerted by the window on a trapped object never exceeds 100 N. This model variant requires Simscape™ Multibody™ and Simscape Power Systems™ products to be installed. You can simulate this variant configuration using the `SimHybridPlantPowerEffects` shortcut. Unlike the previous variant model, this variant configuration takes into account the power effects. SDI displays the logged data from armature current, position, and force exerted by the power window.

Power Window Controller With Data Acquisition Effects

This model variant shows additional effects due to implementation that affect the control. The phenomena included are signal conditioning to measure the armature current and quantization of the measurement. This model variant requires Simscape Multibody, Simscape Power Systems, DSP System Toolbox™, and Fixed-Point Designer™ products to be installed. You can simulate this variant configuration using the `SimHybridPlantPowerEffects+ControlDAQEffects` shortcut. Like the previous model, SDI displays the logged data from armature current, position, and force exerted by the power window.

Power Window Controller With CAN Communication

This model variant shows the use of a CAN to communicate the commands to control window movement. The switches that may be located in the center console of the vehicle and that produce the commands are included in this model variant. This model variant requires Simscape Multibody, Simscape Power Systems, DSP System Toolbox, and Fixed-Point Designer products to be installed. You can simulate this variant configuration on a machine running windows OS using the| SimCANCommunication| shortcut.

Models for Testing

To test the state machine that controls the power window, you can run the project shortcuts for testing. Available model shortcuts for testing the controller are

- InteractiveExample
- CoverageExample
- IncreaseCoverageExample

InteractiveExample

This model shortcut opens the model, slxPowerWindowCntlInteract. This model contains the power window controller which is a state machine. This model also contains inputs to the controller which are selected with manual switch blocks.

The power window controller has four external inputs:

- Passenger Input
- Driver Input
- Window Frame Endstops
- Obstacle Present

Passenger Input

This input consists of a vector with three elements:

- `neutral`: the passenger control switch is not depressed
- `up`: the passenger control switch generates the up signal
- `down`: the passenger control switch generates the down signal

Driver Input

This input consists of a vector with three elements:

- `neutral`: the driver control switch is not depressed
- `up`: the driver control switch generates the up signal
- `down`: the driver control switch generates the down signal

Window Frame Endstops

This input consists of a vector with two elements:

- `0`: window moves freely between top or bottom
- `1`: window is stuck at the top or bottom because of physical limitations

Obstacle Present

This input consists of a vector with two elements:

- 0: window moves freely between top or bottom
- 1: window has obstacle within its frame

You can interactively test the controller by simulating the model and selecting the desired combination of inputs via the manual switch blocks. After making the selection of inputs, you can verify the internal controller state and controller output against the desired result for this specific set of inputs.

CoverageExample

This model shortcut opens the model, `slexPowerWindowCntlCoverage`. This model contains the power window controller which is a state machine. This model also contains inputs to the controller which are repeating sequence blocks.

You can use the Simulink Coverage (TM) Model Coverage tool to validate the discrete event control of the window. The Model Coverage tool helps determine the extent to which a model test case exercises the conditional branches of the controller. It also helps evaluate whether all transitions in the discrete event control are taken given the test case we run. It also evaluates whether all clauses in a condition that enables a particular transition have become true. One transition may be enabled by multiple clauses, e.g., the transition from emergency back to neutral occurs when either 100 ticks have occurred or when the endstop is reached.

IncreaseCoverageExample

This model shortcut opens the model, `slexPowerWindowCntlCoverageIncrease`. This model contains the power window controller that is a state machine. This model also contains a From Spreadsheet block that provides multiple sets of inputs to the controller. These input sets combine with the one from the `CoverageExample` model to exercise more of the logic in the power window controller.

These input sets are:

- `Logged`: Logged from the `CoverageExample`.
- `LoggedObstacleOffEndStopOn`: Logged from the `CoverageExample` with ability to hit endstop.
- `LoggedObstacleOnEndStopOff`: Logged from the `CoverageExample` with obstacle in window.
- `LoggedObstacleOnEndStopOn`: Logged from the `CoverageExample` with obstacle in window and ability to hit endstop.
- `DriverLoggedPassengerNeutral`: Logged from the `CoverageExample` for only the driver. Passenger takes no action.
- `DriverDownPassengerNeutral`: Driver lowering window. Passenger takes no action.
- `DriverUpPassengerNeutral`: Driver raising window. Passenger takes no action.
- `DriverAutoDownPassengerNeutral`: Driver lowering window for 1 second (auto-down). Passenger takes no action.
- `DriverAutoUpPassengerNeutral`: Driver raising window for 1 second (auto-up). Passenger takes no action.
- `PassengerAutoDownDriverNeutral`: Passenger lowering window for 1 second (auto-down). Driver takes no action.
- `PassengerAutoUpDriverNeutral`: Passenger raising window for 1 second (auto-up). Driver takes no action.

The model coverage shortcut, `GenerateIncreasedCoverage`, uses the multiple input sets with the Simulink Coverage Model Coverage tool to validate the discrete event control of the window and generate a coverage report for the multiple input sets. The Model Coverage tool helps determine the extent to which a model test case exercises the conditional branches of the controller. It also helps evaluate if all transitions in the discrete event control have been taken into account given the input sets we run.

Developing the Apollo Lunar Module Digital Autopilot

"Working on the design of the Lunar Module digital autopilot was the highlight of my career as an engineer. When Neil Armstrong stepped off the LM (Lunar Module) onto the moon's surface, every engineer who contributed to the Apollo program felt a sense of pride and accomplishment. We had succeeded in our goal. We had developed technology that never existed before, and through hard work and meticulous attention to detail, we had created a system that worked flawlessly." -Richard J. Gran, *The Apollo 11 Moon Landing: Spacecraft Design Then and Now*

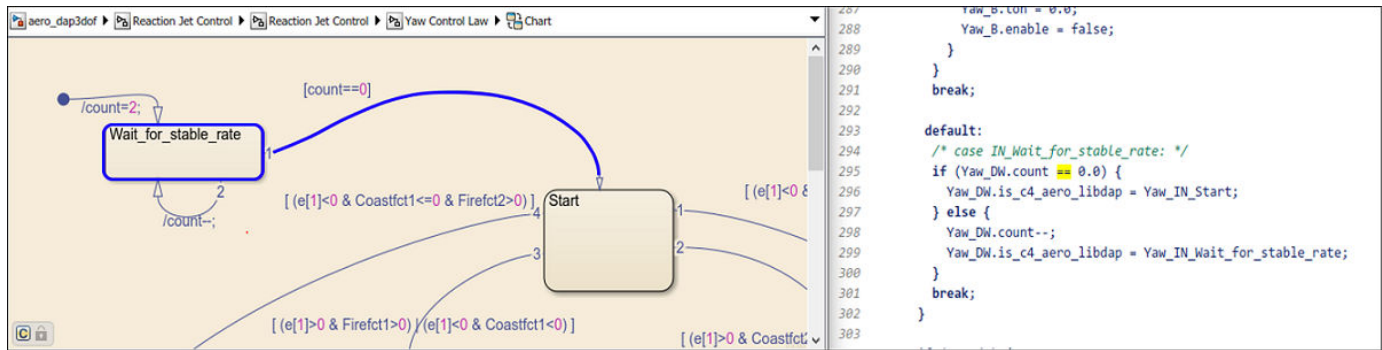

This example shows how Richard and the other engineers who worked on the Apollo Lunar Module digital autopilot design team could have done it using Simulink® and Aerospace Blockset™ if they had been available in 1961.

Model Description

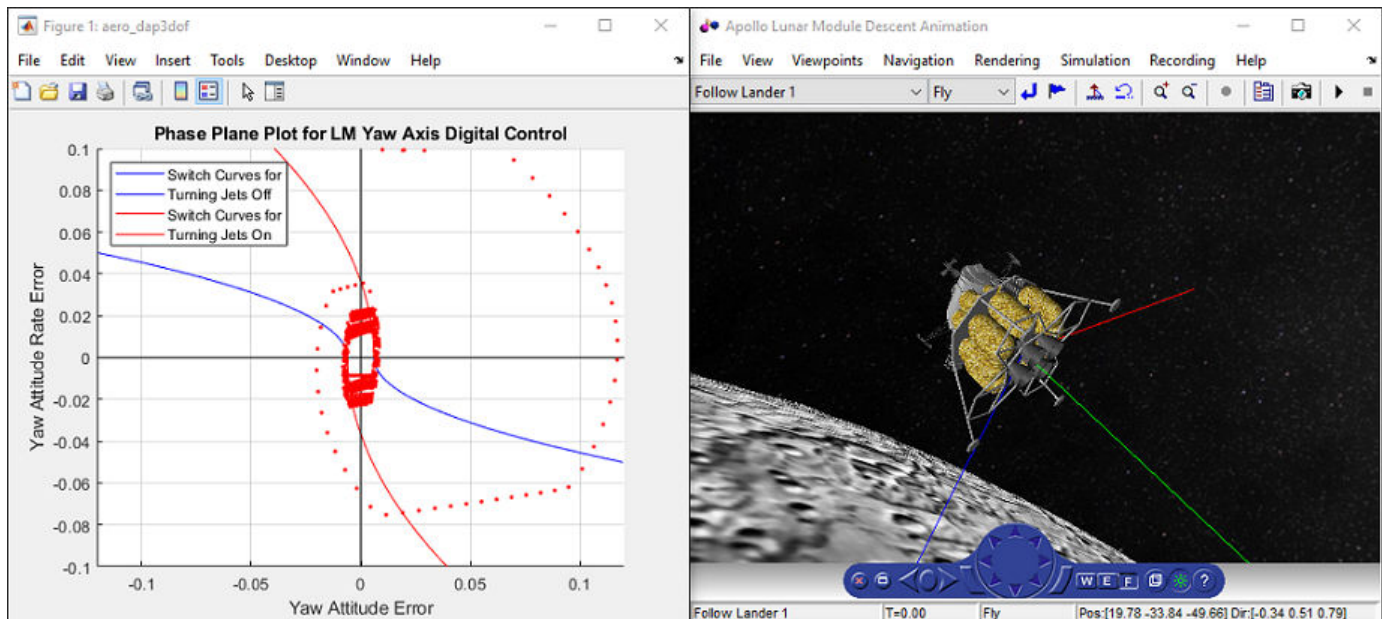

Developing the autopilot in Simulink takes a fraction of the time it took for the original design of the Apollo Lunar Module autopilot.

The Reaction Jet Control subsystem models the digital autopilot design proposed (and implemented) by MIT Instrumentation Laboratories (MIT IL), now called Draper Labs. A Stateflow® diagram in the model specifies the logic that implements the phase-plane control algorithm described in the technical article *The Apollo 11 Moon Landing: Spacecraft Design Then and Now*. Depending on which region of the diagram the Lunar Module is executing, the Stateflow diagram is in either a `Fire_region` or a `Coast_region`. Note, the transitions between these different regions depend on certain parameters. The Stateflow diagram determines whether to transition to another state and then computes which reaction jets to fire.

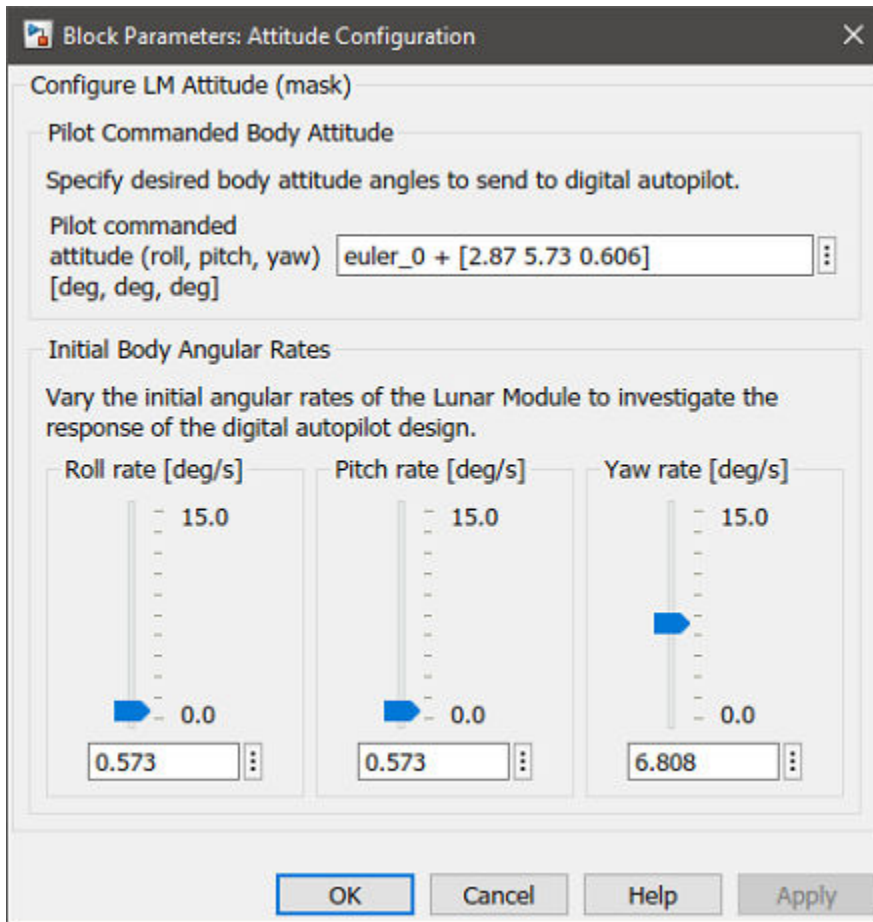

Translational and rotational dynamics of the Lunar Module are approximated in the Lunar Module Dynamics subsystem. Access various visualization methods of the Lunar Module states and autopilot performance in the Visualization area of the model, including Simulink scopes, animation with Simulink 3D Animation, and a phase plane plot.

Interactive Controls

To interact with the Lunar Module model, vary autopilot settings and Lunar Module initial states in the Commands area. For example, to observe how the digital autopilot design handles increased initial body rates, use the slider components in the Configure LM Attitude subsystem.

Mission Description

The LM digital autopilot has 3 degrees of freedom. This means that by design, the reaction jet thrusters are configured and commanded to rotate the vehicle without impacting the vehicle's orbital trajectory. Therefore, the translational dynamics in his model are approximated solely via orbit propagation using the Moon Zonal Harmonic Gravity Model from Aerospace Blockset. To demonstrate the digital autopilot design behavior, the "Descent Orbit Insertion" mission segment, just prior to the initiation of the powered descent, was selected from the Apollo 11 Mission Report.

NASA-S-69-3709

Figure 5-1 . - Lunar descent orbital events .

5-19

The Descent Orbit Insertion burn began 101 hours, 36 minutes, and 14 seconds after lift-off and lasted 30 seconds. The burn set the Lunar module on a trajectory to lower its orbit from approximately 60 nautical miles to 50,000 ft over about an hour. At 50,000 ft, the Module initiated its powered descent.

Initialize the model `aero_dap3dof` with the approximate trajectory of the Lunar Module immediately after the descent orbit insertion burn.

MissionTime_GMT	MissionPhase
16-Jul-1969 13:32:00	{'Range Zero (lift-off)'} }
20-Jul-1969 19:08:14	{'Descent Orbit Insertion (Engine ignition)'} }
20-Jul-1969 19:08:44	{'Descent Orbit Insertion (Engine cutoff)'} }
20-Jul-1969 20:05:05	{'Powered Descent (Engine ignition)'} }

The trajectory of the module at Descent orbit insertion (Engine cutoff) and Powered descent initiation (Engine ignition) is provided in the *Apollo 11 Mission Report* (Table 7-II.- Trajectory Parameters).

Var1	Latitude_deg	Longitude_deg	Altitude_mi
{'Descent Orbit Insertion (Engine cutoff)'} {'Powered Descent (Engine ignition)' }	-1.16 1.02	-141.88 39.39	57.8 6.4

The Simulink model `aero_dap3dof` is initialized to align with the beginning of the mission phase "Descent Orbit Insertion trajectory (Engine cutoff)". Open the `aero_dap3dof` model and run the simulation.

Closing Remarks

Building a digital autopilot was a daunting task in 1961 because there was very little industrial infrastructure for it - everything about it was in the process of being invented. Here is an excerpt from the technical article *The Apollo 11 Moon Landing: Spacecraft Design Then and Now*:

"One reason why the [autopilot's machine code] was so complex is that the number of jets that could be used to control the rotations about the pilot axes was large. A decision was made to change the axes that the autopilot was controlling to the "jet axes" shown in `aero_dap3dof`. This change dramatically reduced the number of lines of code and made it much easier to program the autopilot in the existing computer. Without this improvement, it would have been impossible to have the autopilot use only 2000 words of storage. The lesson of this change is that when engineers are given the opportunity to code the computer with the system they are designing, they can often modify the design to greatly improve the code."

Designing a High Angle of Attack Pitch Mode Control

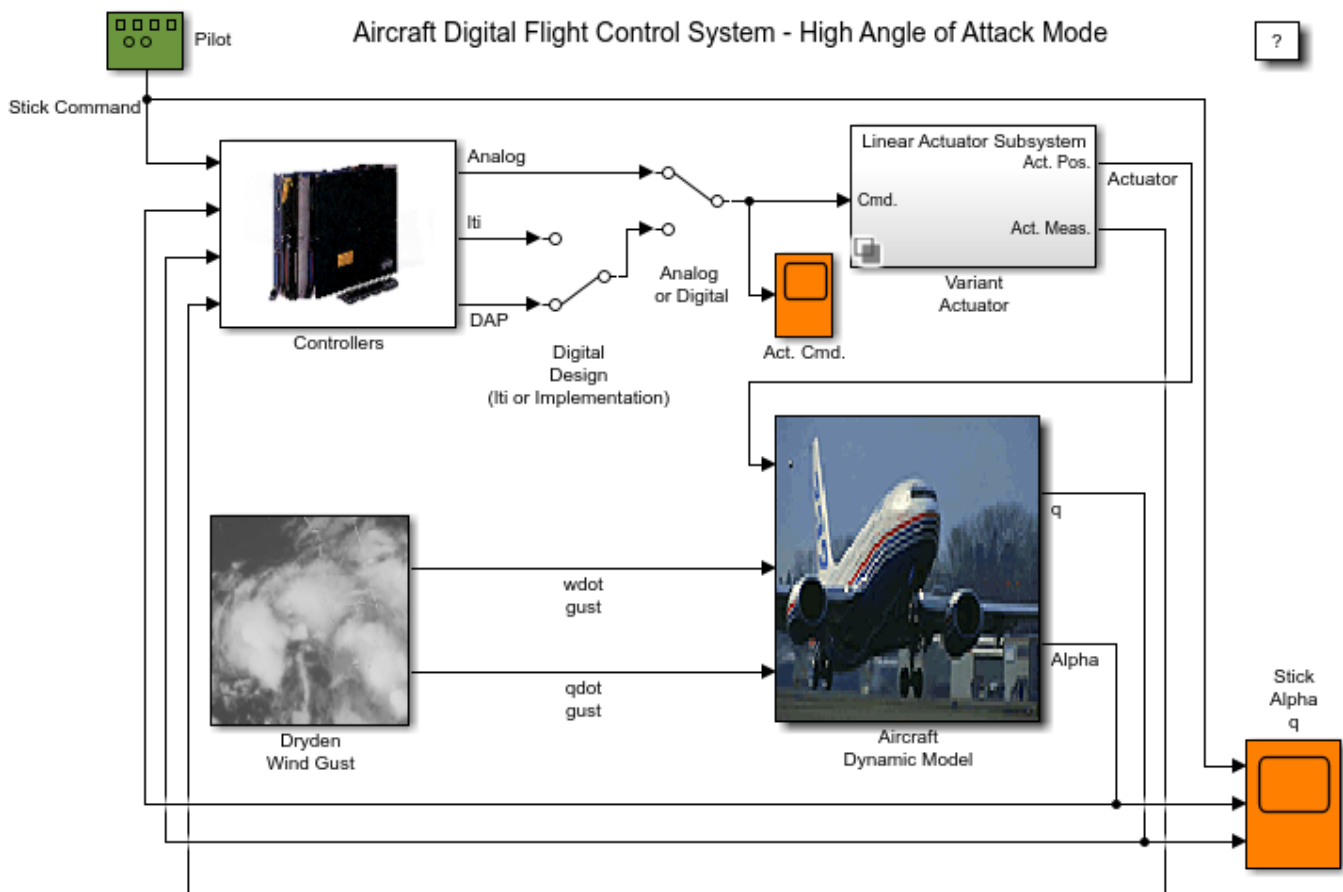

Control Design Using Simulink®

This example shows how to use the Control System Toolbox™ and Simulink® Control Design™ to interact with Simulink to design a digital pitch control for the aircraft. In this example, we will design the controller to permit the aircraft to operate at a high angle of attack with minimal pilot workload.

Our example takes you through the first pass at designing a digital autopilot for a high angle of attack controller. To run everything in this example you must have the Control System Toolbox, Simulink Control Design, Simulink, and Simulink® Coder™. If you don't have all of these products, you can still run portions of the example using cell execution mode of the MATLAB® editor.

Below is a Simulink model of the aircraft. The control systems in the Controllers block can be switched in the model to allow you to see the analog response and then to switch to a design created using the Control System Toolbox's Linear Time Invariant (LTI) objects. A controller is also included that is a discrete implementation of the analog design that is similar to the algorithm that would go into an on-board flight computer. Take a few moments to explore the model.

Open the aircraft model

Copyright 2013 -2014 The MathWorks, Inc.

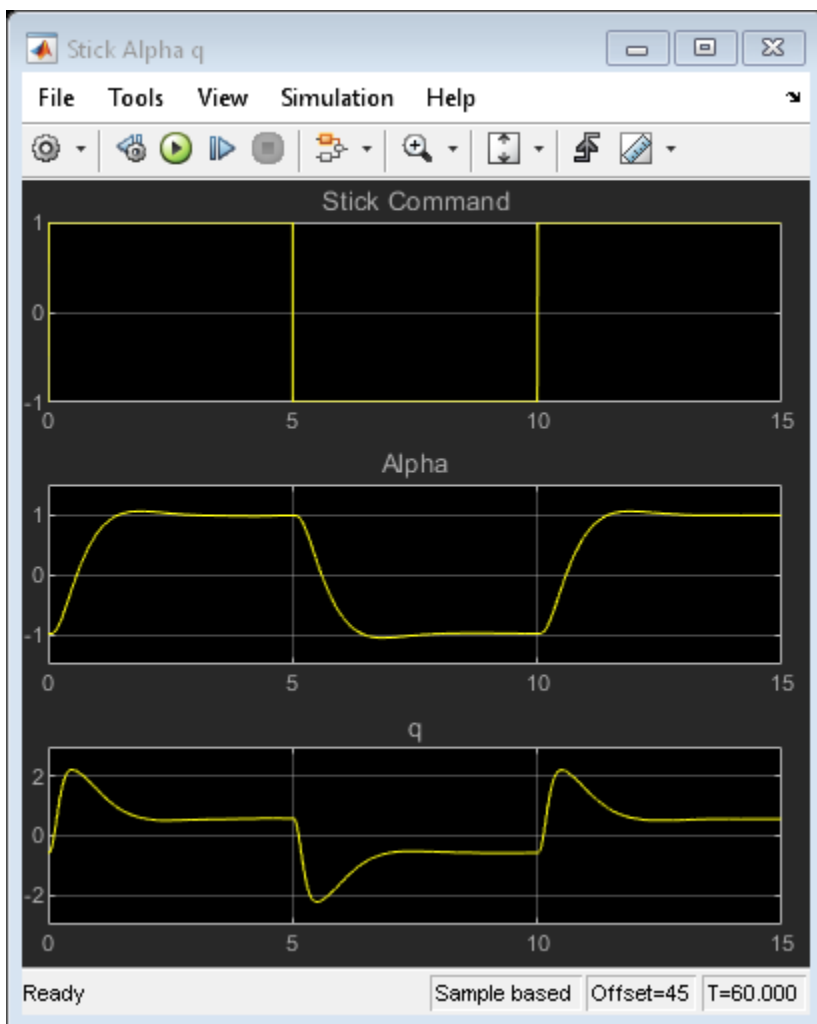

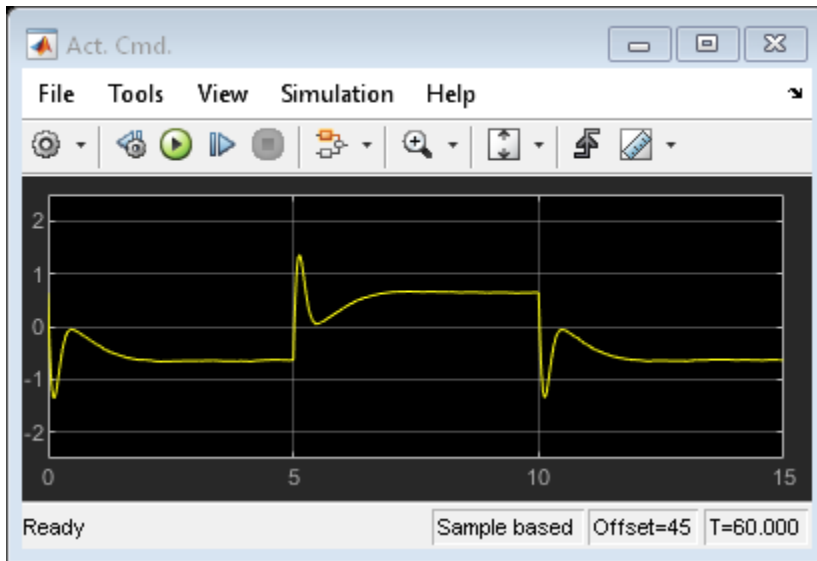

Figure 1: Simulink model of the aircraft flight control system.

Trim and Linearization

The model can be linearized using the Linear Analysis Tool, launched from `slexAircraftPitchControlAutopilot` Simulink model. In the Simulink Editor, on the **Apps** tab, under **Control Systems**, click **Model Linearizer**.

For help type `help slcontrol` or `help ltview` or look at the Control System Toolbox and Simulink Control Design product documentation.

Open the `slexAircraftPitchControlAutopilot` model

To view the linearized model parameters:

```
apmdl = 'slexAircraftPitchControlAutopilot';
open_system(apmdl)
op = operpoint(apmdl);
io = getlinio(apmdl);
contap = linearize(apmdl,op,io)
```

contap =

A =	Alpha-sensor	Pitch Rate L	Proportional	Stick Prefil
Alpha-sensor	-2.526	0	0	0
Pitch Rate L	0	-4.144	0	0
Proportional	-1.71	0.9567	0	10
Stick Prefil	0	0	0	-10

B =	Alpha Sensed	Stick	q Sensed
Alpha-sensor	1	0	0
Pitch Rate L	0	0	1
Proportional	0	0	-0.8156
Stick Prefil	0	1	0

C =	Alpha-sensor	Pitch Rate L	Proportional	Stick Prefil
Sum	2.986	-1.67	-3.864	-17.46

D =	Alpha Sensed	Stick	q Sensed
Sum	0	0	1.424

Continuous-time state-space model.

The Original Analog Autopilot for the High Angle of Attack Mode

?

This autopilot configuration uses a traditional design.
The parameters T_s , T_{al} , W_1 , W_2 , K_a , K_q , K_f , and K_i need to be optimized.

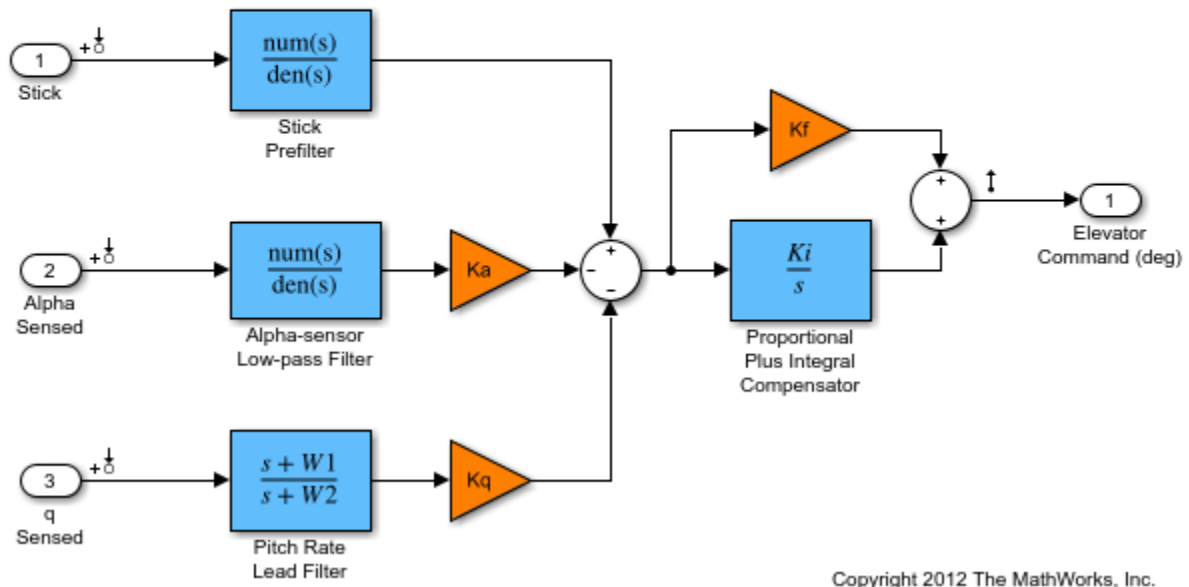

Figure 2: Original analog autopilot.

Linear Time-Invariant (LTI) Systems

There are three types of LTI objects you can use to develop a linear model:

State Space (SS), Transfer Function (TF), and Zero-Pole-Gain (ZPG) objects.

The variable `contap` is a State Space object. You can then get one of the other types with the other commands. When you create the object in MATLAB, you can manipulate it using operations such as `*`, `+`, `-`, etc. This is called "overloading" the MATLAB operators. Try creating an object of your own and see what happens when adding, multiplying, etc. with the `contap` object.

To see exactly what is stored in the LTI object, type `get(contap)` or `contap.InputName` for example.

To view Zero/Pole/Gain transfer functions:

```
contap = tf(contap);
contap = zpk(contap)
```

```
contap =
```

```
From input "Alpha Sensed" to output "Sum":
2.9857 (s+2.213)
-----
s (s+2.526)
```

```

From input "Stick" to output "Sum":
-17.46 (s+2.213)
-----
      s (s+10)

From input "q Sensed" to output "Sum":
1.424 (s+2.971) (s+2.213)
-----
      s (s+4.144)

```

Continuous-time zero/pole/gain model.

Discretized Controller Using Zero-Order Hold

Now the LTI object will be used to design the digital autopilot that will replace the analog autopilot. The analog system is coded into the LTI object called `contap` (CONTinuous AutoPilot).

The first attempt at creating a digital autopilot will use a zero-order hold with a sample time of 0.1 seconds. Note that the discrete object maintains the type (ss, tf, or zpk).

It is clear from Bode plot below that the systems do not match in phase from 3 rad/sec to the half sample frequency (the vertical black line) for the pilot stick input and the angle of attack sensor. This design has poorer response than the analog system. Go to the Simulink model and start the simulation (make sure you can see the scope windows). While the simulation is running, double-click the manual switch labeled Analog or Digital.

Does the simulation verify the conclusion reached by interpreting the Bode diagram?

```

discap = c2d(contap, 0.1, 'zoh');
get(discap)
bode(contap,discap)

      Z: {[0.8016] [0.8039] [2x1 double]}
      P: {[2x1 double] [2x1 double] [2x1 double]}
      K: [0.2943 -1.2458 1.4240]
DisplayFormat: 'roots'
Variable: 'z'
IODElay: [0 0 0]
InputDelay: [3x1 double]
OutputDelay: 0
Ts: 0.1000
TimeUnit: 'seconds'
InputName: {3x1 cell}
InputUnit: {3x1 cell}
InputGroup: [1x1 struct]
OutputName: {'Sum'}
OutputUnit: {''}
OutputGroup: [1x1 struct]
Notes: [0x1 string]
UserData: []
Name: ''
SamplingGrid: [1x1 struct]

```

Figure 3: Bode diagram comparing analog and ZOH controllers.

Tustin (Bilinear) Discretization

Now try different conversion techniques. You can use the Tustin transformation. In the command window type the commands above.

It should be clear that the systems still do not match in phase from 3 rad/sec to the half sample frequency, the Tustin transformation does better. The simulation uses the LTI object as it is designed. To see how the object is used look in the Controllers subsystem by using the browser or by double clicking the icon. The LTI block picks up an LTI object from the workspace. You can change the object name used in the block to any LTI object in the workspace.

Try using "discap1", the Tustin discretization of the analog design:

```
discap1 = c2d(contap,0.1,'tustin');
bode(contap,discap,discap1)
```

Figure 4: Bode diagram comparing analog and 0.1 sec Tustin controllers.

Selecting a Sample Time

The Tustin transform performs better than the zero-order hold from the analysis so far. The sample time of 0.1 second appears to be too slow for the discrete system to track the performance of the analog system at half the sample frequency.

Now transform the analog design using the Tustin transform with a 0.05 second sample period:

```
discap = c2d(contap,0.05,'tustin')
bode(contap,discap)
```

```
discap =
```

```
From input "Alpha Sensed" to output "Sum":
0.074094 (z-0.8951) (z+1)
-----
(z-1) (z-0.8812)
```

```
From input "Stick" to output "Sum":
-0.36852 (z-0.8951) (z+1)
-----
(z-1) (z-0.6)
```

```
From input "q Sensed" to output "Sum":
```

$$\frac{1.4629 (z-0.8617) (z-0.8951)}{(z-1) (z-0.8123)}$$

Sample time: 0.05 seconds
Discrete-time zero/pole/gain model.

Figure 5: Bode diagram comparing analog and 0.05 sec Tustin controllers.

Real-World Considerations

Now that we have what appears to be a workable design, we need to implement it in a form that will include some of the necessary elements that were ignored in the linear analysis. For example, if you look at the analog autopilot that is in the Controllers subsystem, you will see some logic that stops the integrator from winding up when the actuator saturates:

Open the AnalogControl subsystem

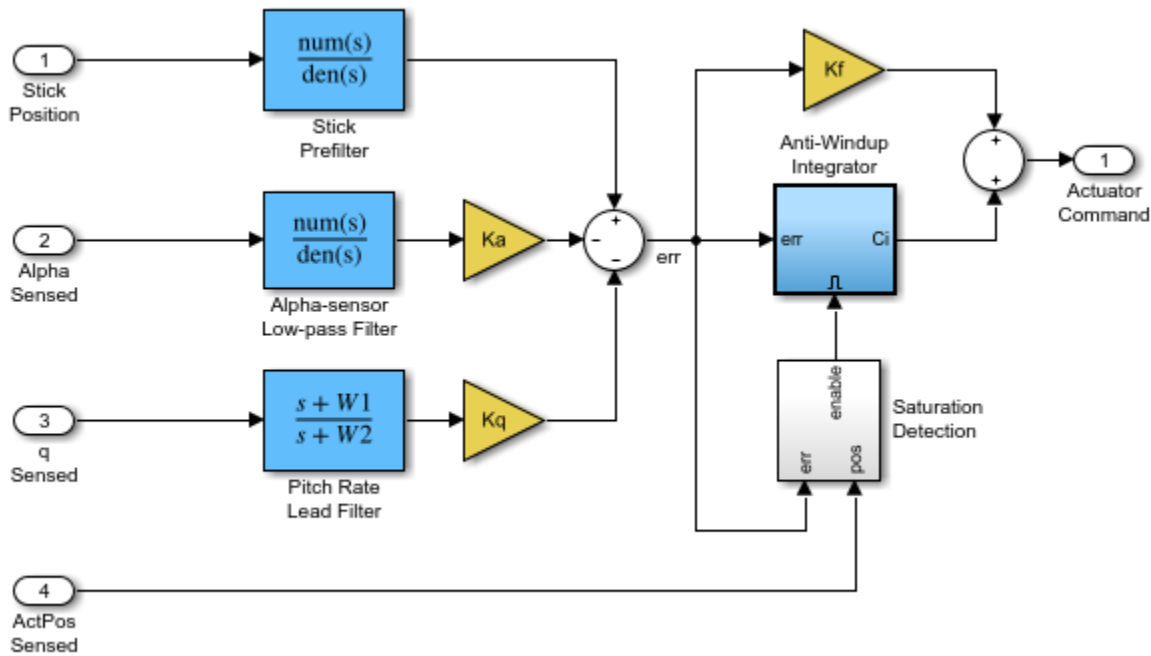

Figure 6: AnalogControl subsystem.

Implementation of the Full Design

The integrator wind-up is only one of the practical issues that needs to be addressed. Another is the need to eliminate aliased high frequency signals that could enter at measurement points. These aliased signals can be prevented by specifying analog filters in front of the sample and hold (ZOH) blocks that model the analog-to-digital converter (ADC) devices typically used for measuring signals in an embedded application. Additionally, the filters in the digital section of the autopilot operate at a higher sampling rate than the compensator to provide a conditioned signal to the compensator. The analog filters are necessary because once a signal is aliased, there is no way to separate the valid in-band frequency content from aliased content.

This new controller is called Digital Control. The filters have a sample time of deltat1 (set to be $1/10$ of deltat). The zero-order hold blocks specify these sample times for various downstream blocks through sample time inheritance.

The switches in the `slexAircraftPitchControlExample` model are set up so you can switch between the analog autopilot, the digital LTI object, and the digital autopilot that could be implemented using software.

Try simulating the system again and switch among the three autopilot designs. You should see that the designs are not significantly affected by which autopilot is active. You can also increase the amplitude of the wind gust and verify that the anti-aliasing filters are working satisfactorily. To increase the gust amplitude, open the Dryden Wind Gust subsystem and change (by double clicking the icon) the noise variance of the White Noise that drives the gust simulation.

Open the DigitalControl subsystem:

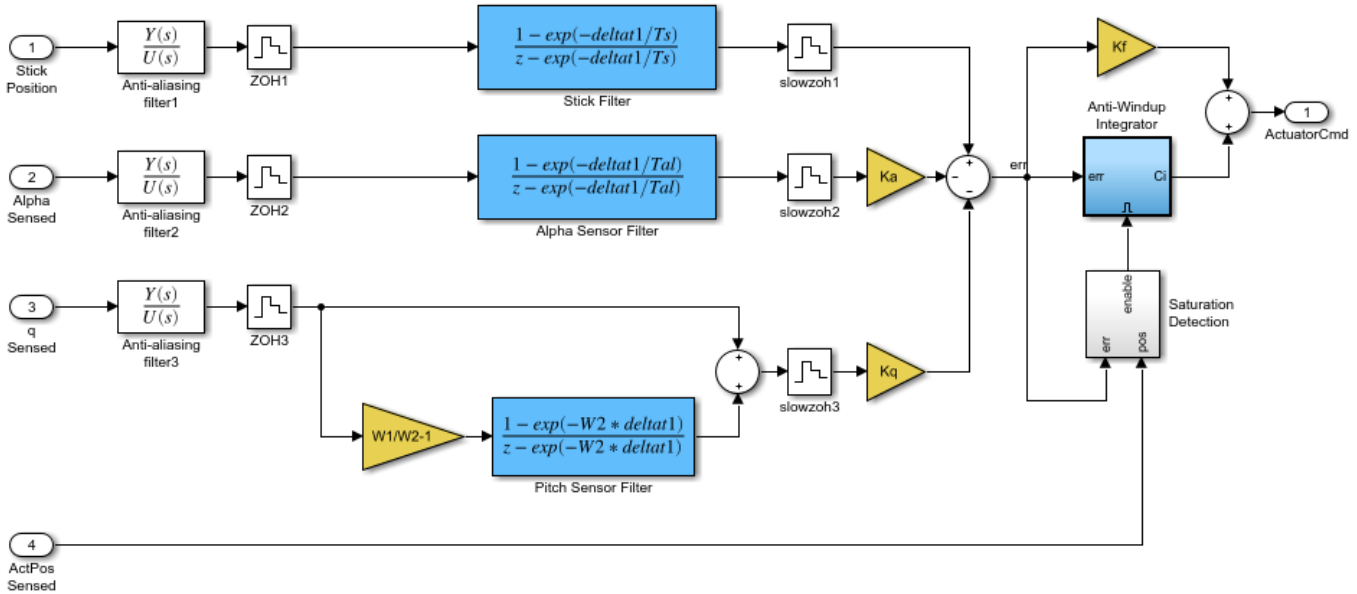

Figure 7: DigitalControl subsystem.

Variant Systems for Design Variants

The actuators in the Simulink model use the Variant Subsystems block to represent multiple actuator implementations, where only one implementation is active during simulation. You can double-click the Variant Actuator Subsystem block to view the different actuator implementations.

To make the simulation change, use the nonlinear actuator instead of the linear one. You can do this by using the Variant Subsystem block's "Variant > Override using" context menu.

Note that Simulink must be stopped in order to reconfigure the actuator selection. You should also note that the nonlinear actuator has saturations on position and rate.

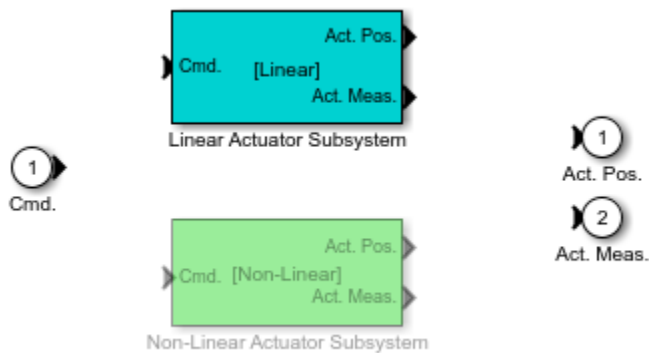

Figure 8: Variant Subsystem for Actuators

Code Generation

The autopilot design can be transformed into embeddable code using Simulink Coder. A separate model of the digital autopilot, `slexAircraftPitchControlDAP`, is open below; it was coded into a host-

based standalone program using Simulink Coder and the compiler specified using the `mex -setup` configuration. The simulation results can be used as a validation baseline for the functional correctness of the generated code.

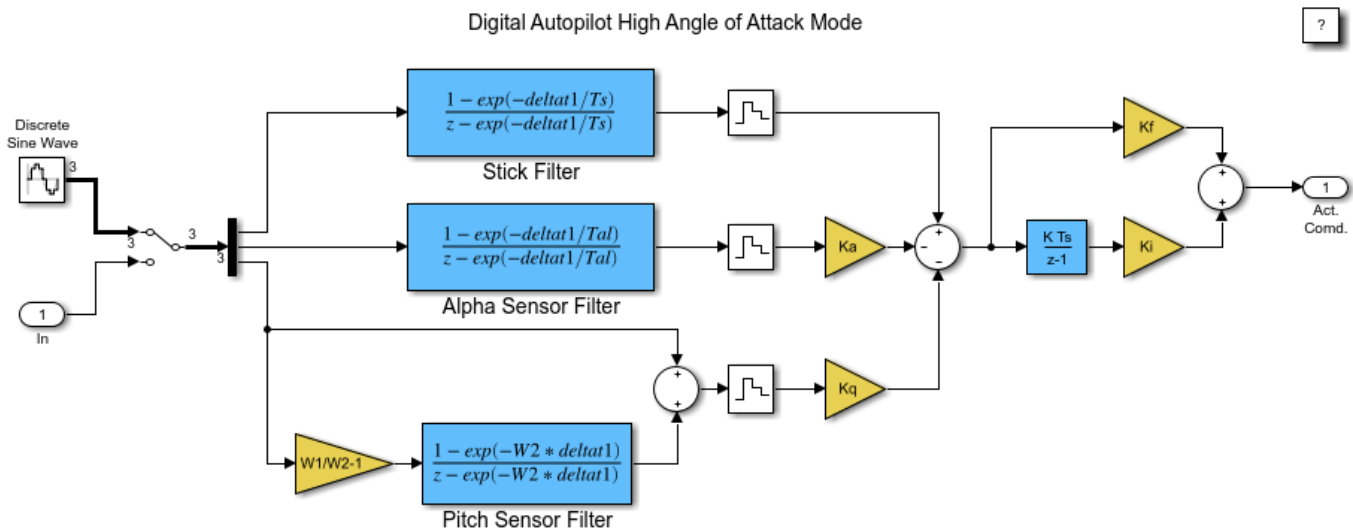

The executable file resulting from code generation and compilation is `slexAircraftPitchControlDAP.exe`. If you create it, it can be run from the OS shell (DOS) command line directly or from MATLAB by typing:

```
>> !slexAircraftPitchControlDAP.exe
```

The executable program creates a file called `slexAircraftPitchControlDAP.mat` that you can load by typing `load slexAircraftPitchControlDAP`.

Two variables called `rt_tout` and `rt_yout` will be in the workspace and their variance against the simulation baseline can be plotted. Note that the variance is effectively zero for this model on this host. Some small numeric variance is to be expected in more complex calculations due to differing compiler optimizations and use of intermediate register variables having higher precision than the 64-bit storage format of a double. Significant variances should be examined as they could indicate a numerical stability problem in your model's algorithms, a compiler or run-time library bug, or other problems.

Open the `slexAircraftPitchControlDAP` model:

Copyright 2012 The MathWorks, Inc.

Figure 9: Comparison of simulation and code generation results.

Behavior of the First Pass Design

Here is the time response of the high angle of attack mode digital pitch controller design:

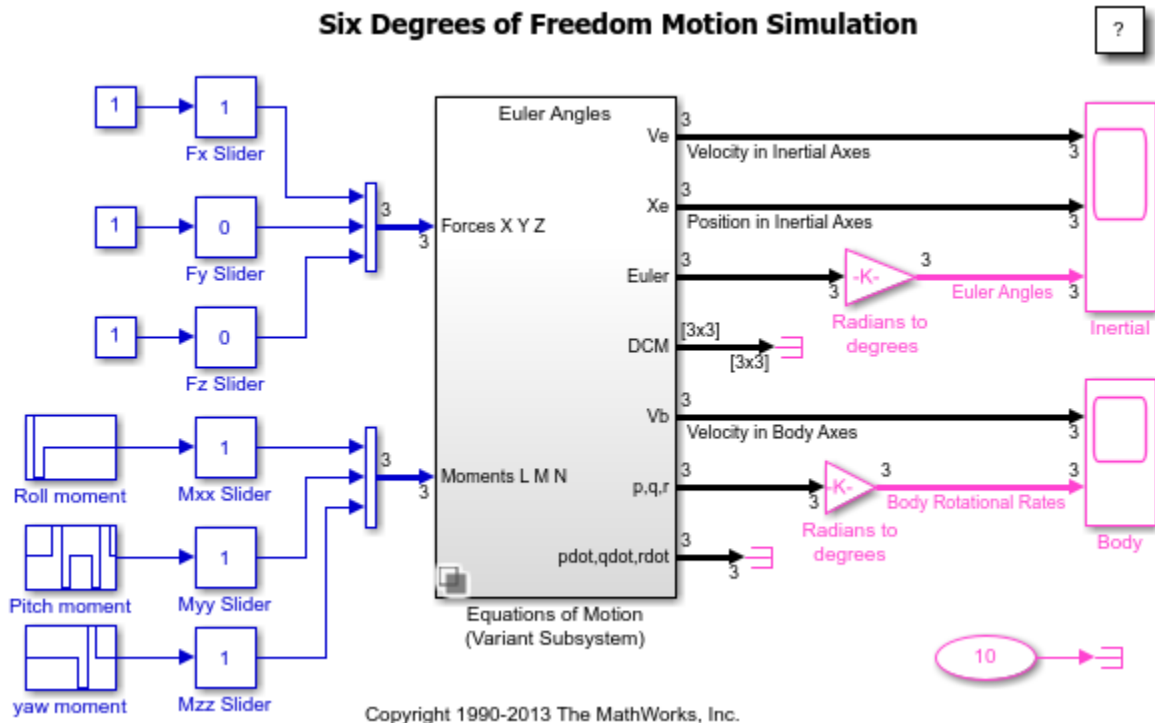

Figure 10: Response of the aircraft Digital Pitch Control Design.

Summary

Further work on this design might include incorporating and analyzing more of the real-world effects on the compensator such as the effect of the anti-aliasing filter dynamics and computational delay of the embedded digital computer on the overall "plant" seen by the digital computations. The combination of the real plant, the computational delay, the anti-aliasing filters, and the sample-and-hold delay are just a few of the additional items that might affect the design of the digital compensator parameters.

Six Degrees of Freedom (6-DoF) Motion Platform

This example shows how to model six degrees of freedom motion in Simulink®. You can switch between using Euler Angles and Quaternions to model the equations of motion, using the Variant Subsystem block's "Variant > Override using" context menu.

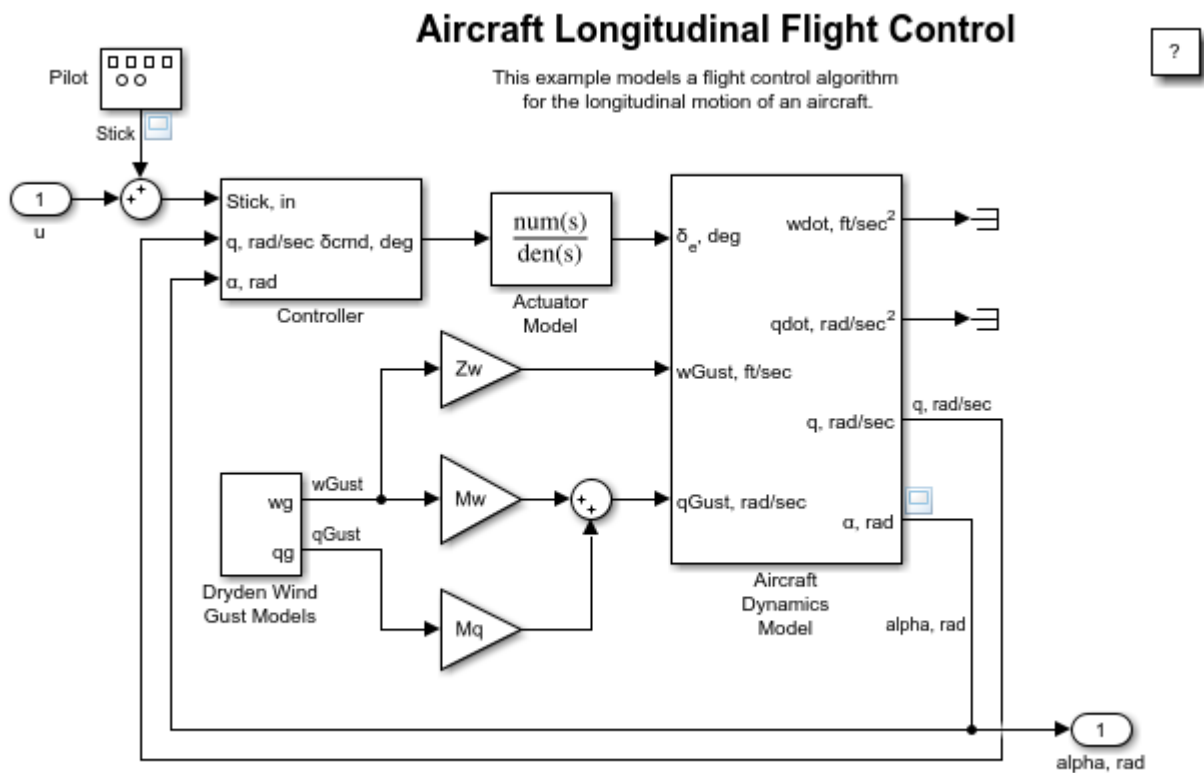

Aircraft Longitudinal Flight Control

This example shows how to model flight control for the longitudinal motion of an aircraft. First order linear approximations of the aircraft and actuator behavior are connected to an analog flight control design that uses the pilot's stick pitch command as the set point for the aircraft's pitch attitude and uses aircraft pitch angle and pitch rate to determine commands. A simplified Dryden wind gust model is incorporated to perturb the system.

The Viewers and Generators Manager was used in this model to create the model scope for viewing signals, Scope1. Found on Simulation -> Prepare -> Viewers Manager, the Viewers and Generators Manager allows you to instrument your model without having to add blocks to the model. If you close a model scope, such as for batch simulations, you can later reopen it by double-clicking the "scope" icon on the signal of interest.

Parameters for the model are stored in a file named slxAircraftData.m. This file is loaded by the model into the model workspace. You can view and edit data in the model workspace directly by using the Model Explorer, which is launched using the Modeling -> Design -> Model Explorer menu item.

Radar Tracking Using MATLAB Function Block

This example shows how to use an extended Kalman filter with the MATLAB® Function block in Simulink® to estimate an aircraft's position from radar measurements. The filter implementation is found in the MATLAB Function block, the contents of which are stored in the Simulink model itself.

At the end of the simulation, three figures display the following information: the actual trajectory compared to the estimated trajectory; the estimation residual for range; and the actual, measured, and estimated positions.

Radar Tracking Using MATLAB Function Block

Optical Sensor Image Generation

Generating an Optical Sensor Image From Simulated Movement Data

This example shows how to generate a movie with 64 frames and a frame size of 64 by 64 pixels (at 10 frames per second). The movie contains a simulation of a moving target that is moving through a structured background that is itself moving. A jitter motion caused by random vibration is also generated (in a Simulink® model called "aero_vibrati") and the jitter motion is added into the overall sensor motion. Finally, the image is blurred through a Gaussian optical point spread function.

Note: Changing `delt` here also requires a change in the parameters set-up dialog box in the Simulink model "vibration".

```
delt = 0.1;           % Sample time of the generated sequence
num_frames= 64;     % Number of frames to generate
framesize = 64;     % Square frame size in pixels

out = zeros(framesize,framesize,num_frames); % Initialize movie storage as a 3D Array
```

Generate a Target and Define Its Motion

The first stage is to define the shape and motion of the target object. The shape chosen is a large plus sign, and the image is defined by a matrix representing the image intensity at each pixel position. The Target is defined to be traveling from center to bottom right of the image.

```
target = [zeros(3,11)
          zeros(1,5) 6 zeros(1,5)
          zeros(1,5) 6 zeros(1,5)
          zeros(1,3) 6 6 6 6 6 zeros(1,3) % Target is a plus sign 5 by 5 pixels across
          zeros(1,5) 6 zeros(1,5)         % with an intensity of 6 (S/N ratio is ~4).
          zeros(1,5) 6 zeros(1,5)         % The total target image is made on an 11x11 grid to
          zeros(3,11)];                   % allow the image to be interpolated without error.

target_velx = 1; % target velocity in x direction in pixels per second
target_vely = 1; % target velocity in y direction in pixels per second
target_x_initially = framesize/2; % the target is initially in the center of the frame in x
target_y_initially = framesize/2; % and in y

figure(1);
colormap('gray');
image(target*32);
title('Target Image')
```

Build Background and Target Composite Image

Generate a sinusoidally correlated background and give it a drift motion. Then, overlay the target onto the background image.

```

backsize = framesize+36; % Make the background bigger than the frame so when it
                          % drifts there are new pixels available to drift into.
xygrid = (1:backsize)/backsize;
B=2*sin(2*pi*xygrid).^2*cos(2*pi*xygrid).^2;

psd = fft2(B);
psd = real(psd.*conj(psd));

background = B + 0.5*randn(backsize); % Add a specular Gaussian white
                                     % sequence to the structure with
                                     % variance of 0.25 (sigma of 0.5).

xoff = 10;
yoff = 10; % Sensor location is offset from the 0,0 of the background
driftx = 1;
drifty = 1; % drift rate of the background in a and y directions pix/sec.

minout = min(min(min(background)));
maxout = max(max(max(background)));
colormap('gray');
image((background-minout)*64/(maxout-minout))
title('Background image with additive white specular noise')

```

Simulate the Tracker's Rotational Vibration

Rotational vibration of the tracker is simulated using model `aero_vibrati`. The data required to simulate the vibration of the tracker is generated by running the Simulink model "aero_vibrati".

Run Simulink vibration model using `sim` command (Note -- if the `delt` is changed from 0.1 seconds, the Simulink model must be changed also to ensure that the sample time for the vibration match the sample time in this tracker image model).

The resulting random rotations are shown in Figure 1.

```
omega = 2*pi*5;           % The structural frequencies are 5, 10 and 15 Hz in the model.
zeta   = 0.01;           % Damping ratio for all modes

open_system('aero_vibrati')
simout = sim('aero_vibrati', 'SrcWorkspace', 'current');

vibdat = simout.get('vibdat');           % The Simulink model "aero_vibrati"
                                         % generates the vibration data at
                                         % a sample time of 0.01 sec.
vibx = vibdat(1:10:1000);               % The output of simulation is
                                         % returned as the variable simout
viby = vibdat(1001:10:2000);            % The variable simout contains
                                         % the in array vibdat that contains
                                         % the vibration data

levarmx = 10;   % Rotational lever arm for vibration noise in x
```

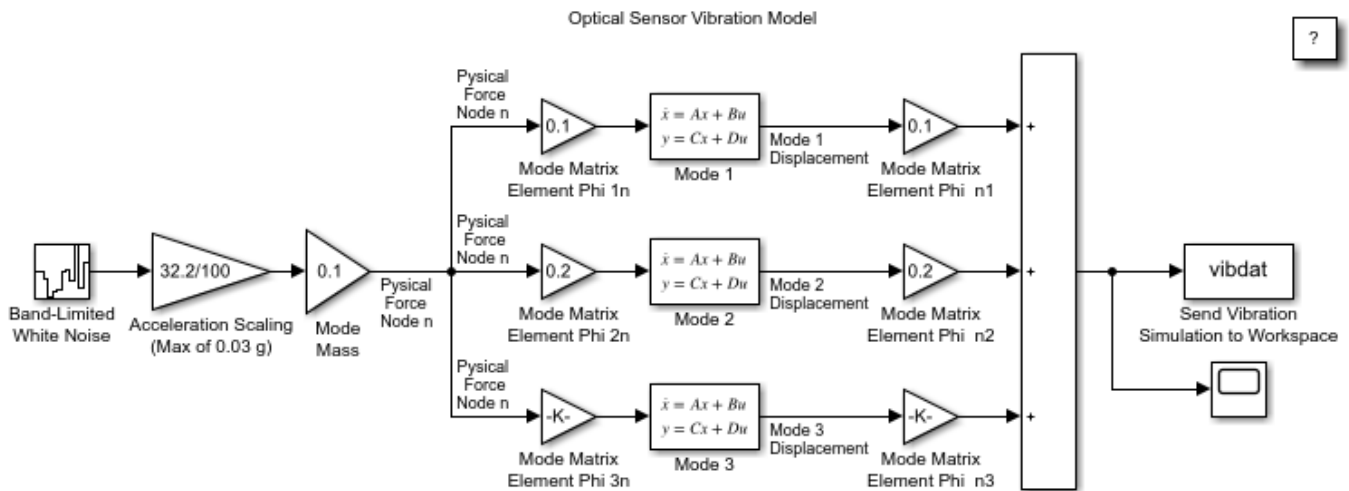

```

levarmy = 10; % and in y.

subplot(211);
plot(0.01*(1:10:1000),vibx);grid;
title('Time history of the random Tracker rotations')
xlabel('Time');ylabel('x direction')

subplot(212);
plot(0.01*(1:10:1000),viby);grid;
xlabel('Time');ylabel('y direction')

```

Copyright 1990-2013 The MathWorks, Inc.

Simulate the Motion Effects From the Background, Target, and Jitter

The frames that will make up the movie are now created and stored in a multidimensional array (out). Each frame has the background and target at differing positions due to the target motion, background drift, and tracker vibration. The first frame of the movie will be shown in Figure 1.

```
clf; drawnow;
```

```
for t = 1:num_frames
```

```
    % Drift the Background at the rate driftx and drifty
    % (in pixels/second) and add in the vibration:
    xshift = driftx*delt*t+levarmx*vibx(t,1);
    yshift = drifty*delt*t+levarmy*viby(t,1);
```

```
    % Interpolate the 2D image using the MATLAB(R) function interp2:
    [xgrid, ygrid] = meshgrid(1:backsize);
    [xindex, yindex] = meshgrid(xshift:1:xshift+backsize,yshift:1:yshift+backsize);
    outtemp = interp2(xgrid,ygrid,background,xindex,yindex);
```

```
    % Truncate the drifted image down from backsize to framesize:
    out(:, :, t) = outtemp(xoff:xoff+framesize-1,xoff:xoff+framesize-1);
```

```
    % Now let the target move also:
    tpixinx = floor(target_velx*delt*t);
    tpixiny = floor(target_vely*delt*t); % Before interpolating extract the number of pixels moved
    txi = target_velx*delt*t - tpixinx;
```

```

tyi = target_vely*delt*t - tpixiny; % Interpolate on sub-pixels around the origin only
[txgrid tygrid] = meshgrid(1:11); % meshgrid here generates a matrix of grid elements
[txi tyi] = meshgrid(txi+1:txi+11,tyi+1:tyi+11); % meshgrid generates 2 matrices with the x and y coordinates

% Interpolate the intensity values first using interp2 -- a built in MATLAB command
temp = interp2(txgrid,tygrid,target,txi,tyi);

% Insert the target at the location determined by the initial offset, and the number of whole pixels
tx = tpixinx + target_x_initially-1;
ty = tpixiny + target_y_initially-1;
out(tx:tx+6,ty:ty+6,t) = temp(9:-1:3,9:-1:3) + out(tx:tx+6,ty:ty+6,t);

end

minout = min(min(min(out)));
maxout = max(max(max(out)));
colormap('gray');
image((out(:,:,1)-minout) * 64/(maxout-minout));
title('First frame of combined target and background image.')

```

Pass the Images Through Optics -- Use a Gaussian "Aperture Function"

This code segment can use a measured aperture function just as easily - simply replace the next five lines by "load measured_aperture" where measured_aperture is the measured function stored in ASCII and the data stored in the file measured_aperture.mat is a MATLAB® .mat file that contains the matrix apfunction. (in MATLAB type "help load" for how to use load and look at the c and fortran code that shows how to read and write MATLAB .mat files).

(Note: When the Point Spread Function is Gaussian, then so is the Aperture function)

To simulate the effect of the tracker optics, each of the movie frames is now blurred using a 2-D FFT (Fast Fourier Transform). The first frame of the resulting image is shown in Figure 1.

```
x = 1:framesize;
y = 1:framesize;
sigma = 120;
apfunction = exp(-(x-framesize/2).^2/(2*sigma))' * exp(-(y-framesize/2).^2/(2*sigma));
apfunction = fftshift(apfunction); % Rotate so it conforms with FFT convention

for j = 1:num_frames
    out(:,:,j) = real(ifft2(apfunction.*fft2(out(:,:,j))));
end

minout = min(min(min(out)));
maxout = max(max(max(out)));
colormap('gray');
image((out(:,:,1)-minout)*64/(maxout-minout));
title('First frame of blurred image.')
```

Generate the MATLAB® Movie and Play It Back

Scale the movie frame so that it has 64 intensity values from the min to the max and then show the result as an image. See MATLAB help for how the `moviein` and `getframe` work.

```
minout = min(min(min(out)));
maxout = max(max(max(out)));
```

```
M = moviein(num_frames);  
for j = 1:num_frames  
    image((out(:,:,j)-minout)*64/(maxout-minout))  
    drawnow  
    M(:,j) = getframe;  
end  
  
colormap('gray')  
movie(M);
```

OPTIONAL: Save the Movie in a .mat File

You can optionally save the generated tracker movie in a mat file and also save the psd of the background for later use with the movie.

```
save trackerimage out  
save psdback psd  
save moviedat M  
  
bdclose('aero_vibrati');
```

Air Traffic Control Radar Design

This example shows how to model a conceptual air traffic control (ATC) radar simulation based on the radar range equation.

Model Description

To make parameters for radar system design easier to change and easier to determine their values, a GUI is supplied with this model. Radar and weather parameters may be changed from this GUI. While simulating, the effects of these parameters can be seen on the scope display which shows the actual aircraft range in yellow and the estimated aircraft range from the radar in magenta. Another output that can be viewed is the calculated signal to noise ratio (SNR) is compared to the ideal SNR. Ideal SNR is also specified from the GUI. The result is shown in the display block and will be either 1 (SNR \geq ideal SNR) or 0 (SNR $<$ ideal SNR).

Simulink® and Stateflow® are used in the model, which is divided into three main subsystems, radar, aircraft, and weather.

Using subsystems is helpful in two ways: the model is organized and easier to understand and the work can be split between multiple engineers by subsystems. The Stateflow machine labeled "check SNR" performs the logic comparing calculated SNR to the ideal SNR and output data based on this comparison.

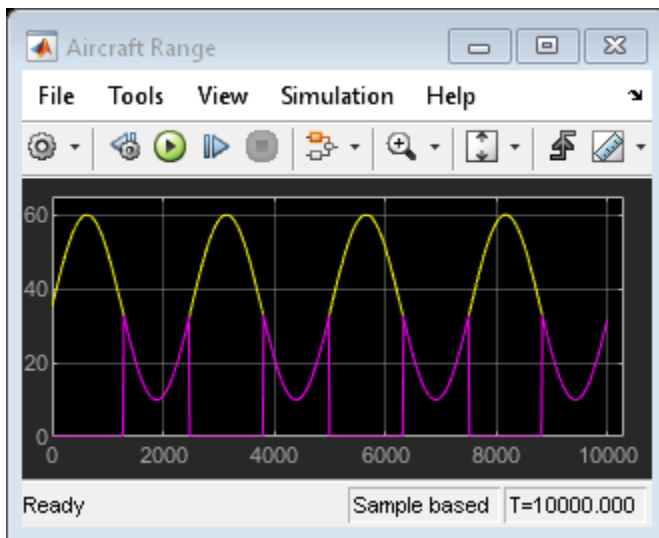

You can run the simulation to determine if the radar can pick up the aircraft by the output on the scope. Using the GUI, the radar and the weather parameters can be altered and will change the range where the aircraft can be "seen".

Design Issues

Radar systems are designed for a specific purpose and can very seldom be used for other applications effectively. Each new radar specification requires the computation of new parameter values. When designing a radar for an application, there are a number of parameters which shape the design. Some of these parameters are contained or derived logically from the customer specification. Others are selected arbitrarily using the design engineer's best judgment. This is the first approximate solution for the system design. From here, continual refinement of the design parameters takes place until an optimum design is reached. If any changes occur in the customer specification, it could cause a need to rework the design process over from the beginning. The parametric nature of this design strategy lends itself to automation.

Design Specification

We're interested in performing conceptual design for a ground-based air traffic control (ATC) radar. Let's take a look at a potential customer specification.

- **Customer Requirements**
 - Maximum Range = 50 Nautical Miles
 - Lateral Resolution = 2 Nautical Miles
 - Range Resolution = 150 meters
- **Logically Derived Parameters**
 - Scan Time, Hits per Scan, Receiver Bandwidth, SNR, Antenna Gain, $\text{Power}_{\text{ave}} * \text{Antenna Aperture}$
- **Best-Judgement Parameters**
 - Target Cross-Section, Detection Performance, Coverage, Pulse Repetition Frequency, Integration Efficiency, Transmitted Waveform, Receiver Noise Figure, Attenuation, System Losses
- **Additional Concerns**
 - Weather

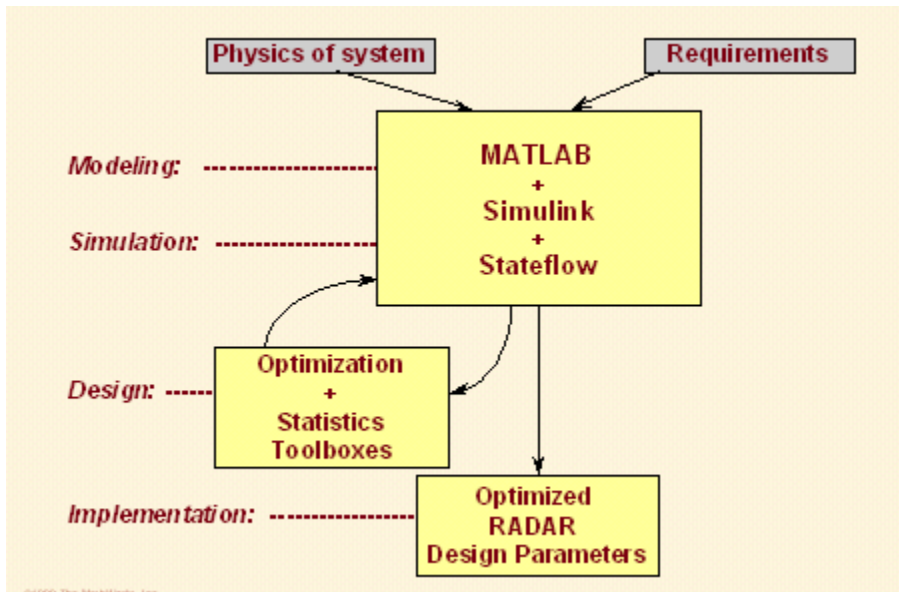

© 1999 The MathWorks, Inc.

This is an example of a customer specification upon which a design process would be based. The customer, possibly the FAA, provides some basic requirements for the radar design leaving a number of parameter selections up to the design engineer.

It should be noted that some of the logically derived parameters are dependent on assumptions made by the engineer and would need to be re-calculated each time the best-judgment parameters are optimized. This problem lends itself well to simulation. By using Simulink and Stateflow, the design engineer has the analysis capability to have time-varying design cases for Monte Carlo test runs, i.e.: aircraft cross-sections and locations, weather cross-sections, and locations.

MathWorks® Products in the Design Process

Here's how MathWorks® products fit the job of conceptual radar design:

Using the customer specification and the radar range equations along with equations describing the physics of the system, a model is built in MATLAB®, Simulink, and Stateflow. Using the model with the `sim` command for batch runs, those best-judgment parameters can be optimized for various conditions, weather, aircraft, using a Monte Carlo simulation run to prove robustness. The result is a set of optimized radar parameters that can be used to build a detailed block diagram model of the full radar system for further system analysis in Simulink with the DSP System Toolbox™.

Designing a Guidance System in MATLAB and Simulink

This example shows how to use the model of the missile airframe presented in a number of published papers (References [1], [2] and [3]) on the use of advanced control methods applied to missile autopilot design. The model represents a tail controlled missile travelling between Mach 2 and Mach 4, at altitudes ranging between 10,000ft (3,050m) and 60,000ft (18,290m), and with typical angles of attack ranging between +/-20 degrees.

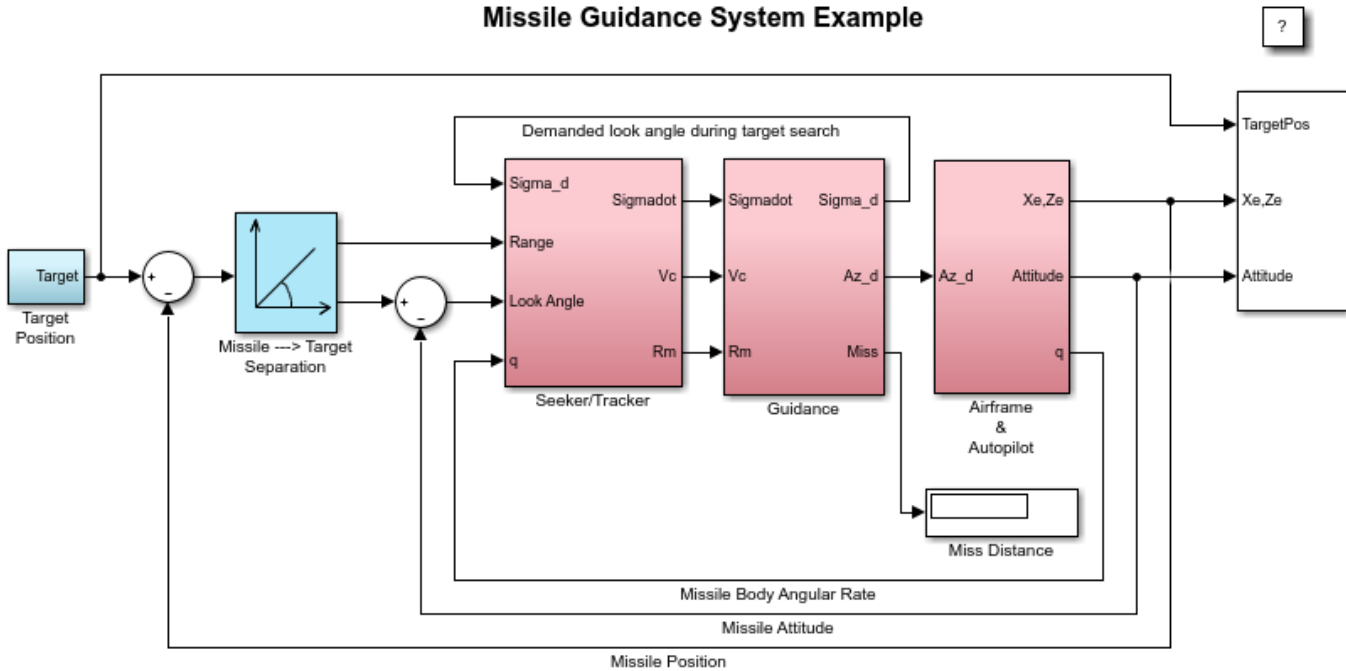

Model of the Airframe Dynamics

The core element of the model is a nonlinear representation of the rigid body dynamics of the airframe. The aerodynamic forces and moments acting on the missile body are generated from coefficients that are non-linear functions of both incidence and Mach number. The model can be created with Simulink® and the Aerospace Blockset™. The aim of this blockset is to provide reference components, such as atmosphere models, which will be common to all models irrespective of the airframe configuration. Simplified versions of the components available in the Aerospace Blockset are included with these examples to give you a sense of the potential for reuse available from standard block libraries.

Open the model

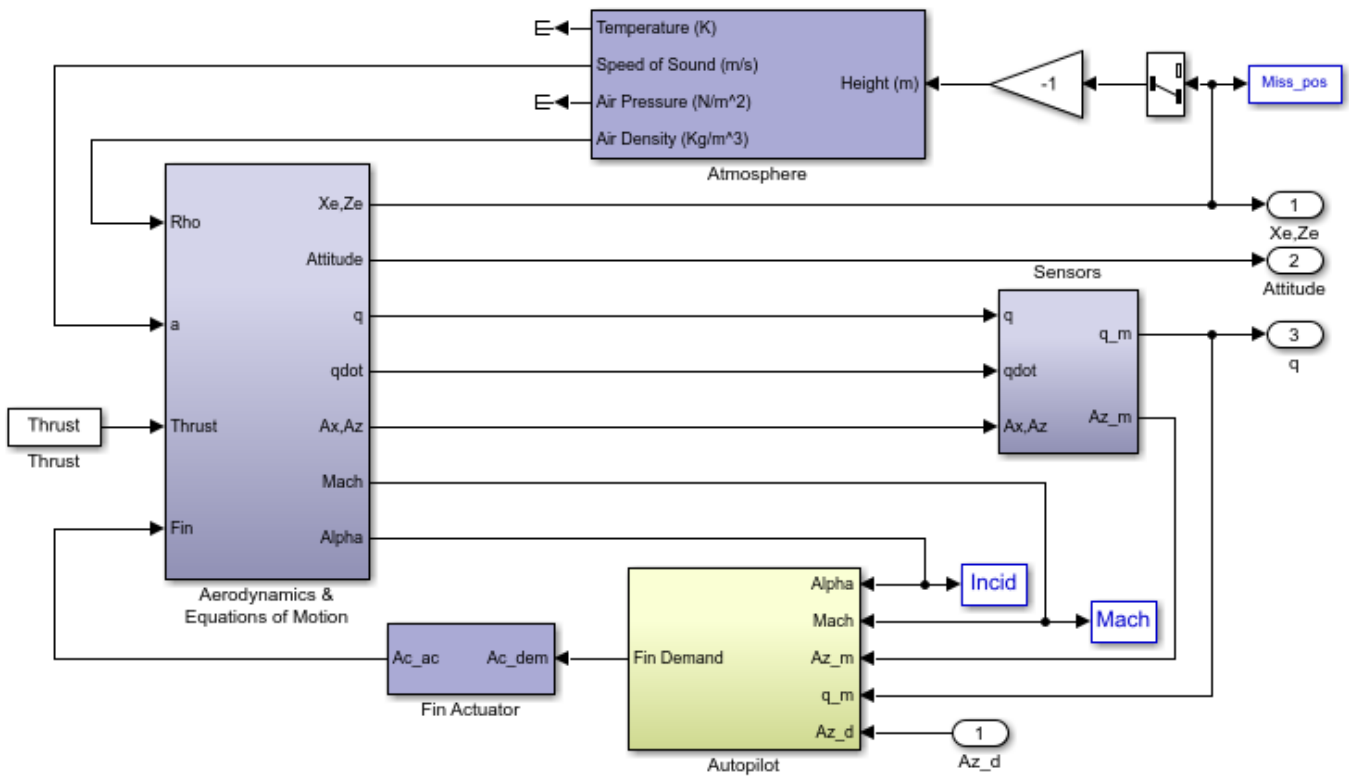

Missile Guidance System Example

Copyright 1990-2014 The MathWorks, Inc.

Representing the Airframe in Simulink

The airframe model consists of four principal subsystems, controlled through the acceleration-demand autopilot. The Atmosphere model calculates the change in atmospheric conditions with changing altitude, the Fin Actuator and Sensors models couple the autopilot to the airframe, and the Aerodynamics and Equations of Motion model calculates the magnitude of the forces and moments acting on the missile body, and integrates the equations of motion.

International Standard Atmosphere Model

$$\text{Troposphere Model} = \begin{cases} T = T_0 - Lh \\ \rho = \rho_0 \left(\frac{T}{T_0} \right)^{(g/LR)-1} \\ P = P_0 \left(\frac{T}{T_0} \right)^{(g/LR)} \\ a = \sqrt{\gamma RT} \end{cases}$$

T_0 = Absolute temperature at mean sea level [K]

ρ_0 = Air density at mean sea level [Kg/m³]

P_0 = Static pressure at mean sea level [N/m²]

h = Altitude [m]

T = Temperature at altitude h

ρ = Air density at altitude h

P = Static pressure at altitude h

a = Speed of sound at altitude h

L = Lapse rate [K/m]

R = Characteristic gas constant [J/Kg/K]

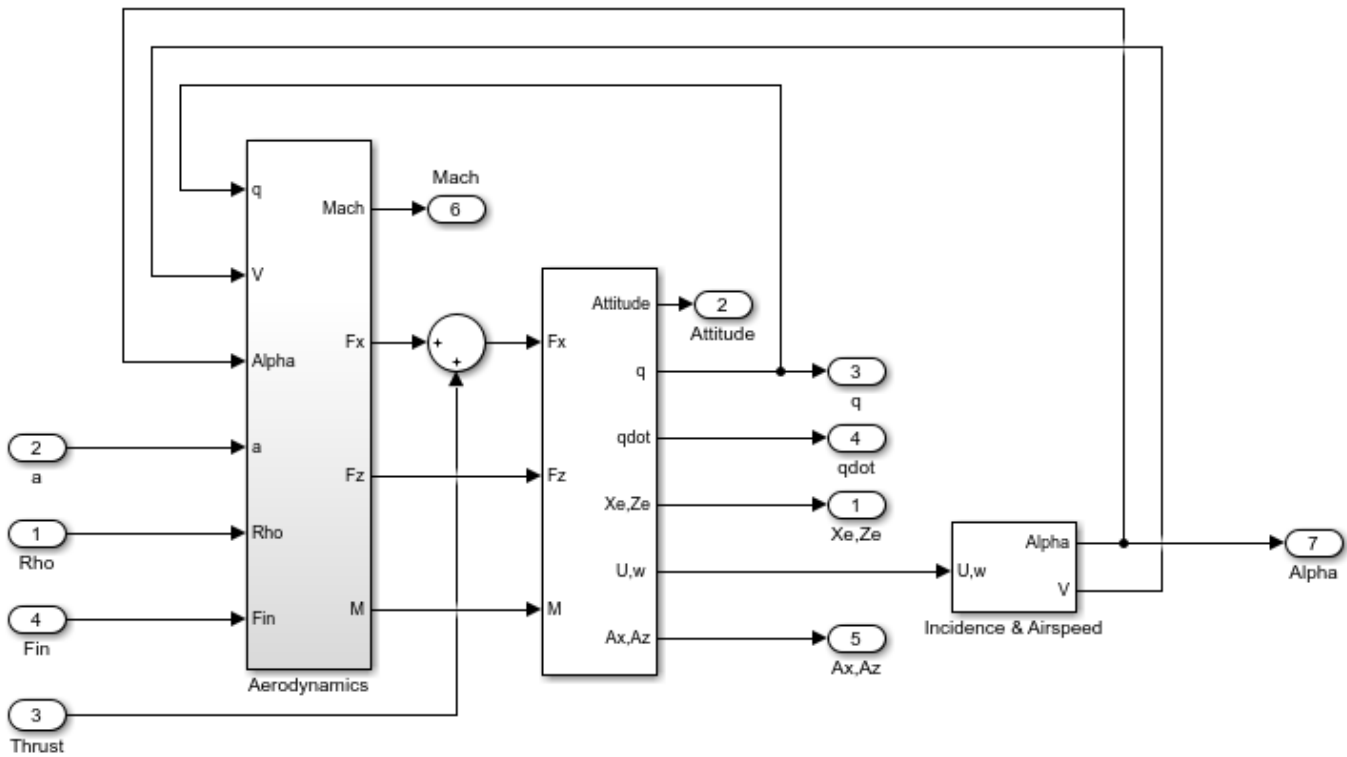

g = Acceleration due to gravity [m/s²]

The Atmosphere Subsystem that is used is an approximation to the International Standard Atmosphere, and is split into two separate regions. The troposphere region lies between sea level and 11Km, and in this region there is assumed to be a linear temperature drop with changing altitude. Above the troposphere lies the lower stratosphere region ranging between 11Km and 20Km. In this region the temperature is assumed to remain constant.

Aerodynamic Coefficients for Constructing Forces and Moments

The Aerodynamics & Equations of Motion Subsystem generates the forces and moments applied to the missile in body axes, and integrates the equations of motion which define the linear and angular motion of the airframe.

The aerodynamic coefficients are stored in datasets, and during the simulation the value at the current operating condition is determined by interpolation using 2-D lookup table blocks.

Classical Three Loop Autopilot Design

The aim of the missile autopilot is to control acceleration normal to the missile body. In this example the autopilot structure is a three loop design using measurements from an accelerometer placed

ahead of the center of gravity, and a rate gyro to provide additional damping. The controller gains are scheduled on incidence and Mach number, and are tuned for robust performance at an altitude of 10,000 ft.

To design the autopilot using classical design techniques requires that linear models of the airframe pitch dynamics be derived about a number of trimmed flight conditions. MATLAB® can determine the trim conditions, and derive linear state space models directly from the non-linear Simulink model, saving both time, and aiding in the validation of the model that has been created. The functions provided by the MATLAB Control System Toolbox™ and Simulink® Control Design™ allow the designer to visualize the behavior of the airframe open loop frequency (or time) responses. To see how to trim and linearize the airframe model you can run the companion example, "Airframe Trim and Linearize".

Airframe Frequency Response

Autopilot designs are carried out on a number of linear airframe models derived at varying flight conditions across the expected flight envelope. To implement the autopilot in the non-linear model involves storing the autopilot gains in 2 dimensional lookup tables, and incorporating an anti-windup gain to prevent integrator windup when the fin demands exceed the maximum limits. Testing the autopilot in the nonlinear Simulink model is then the best way to show satisfactory performance in the presence of non-linearities such as actuator fin and rate limits, and with the gains now dynamically varying with changing flight condition.

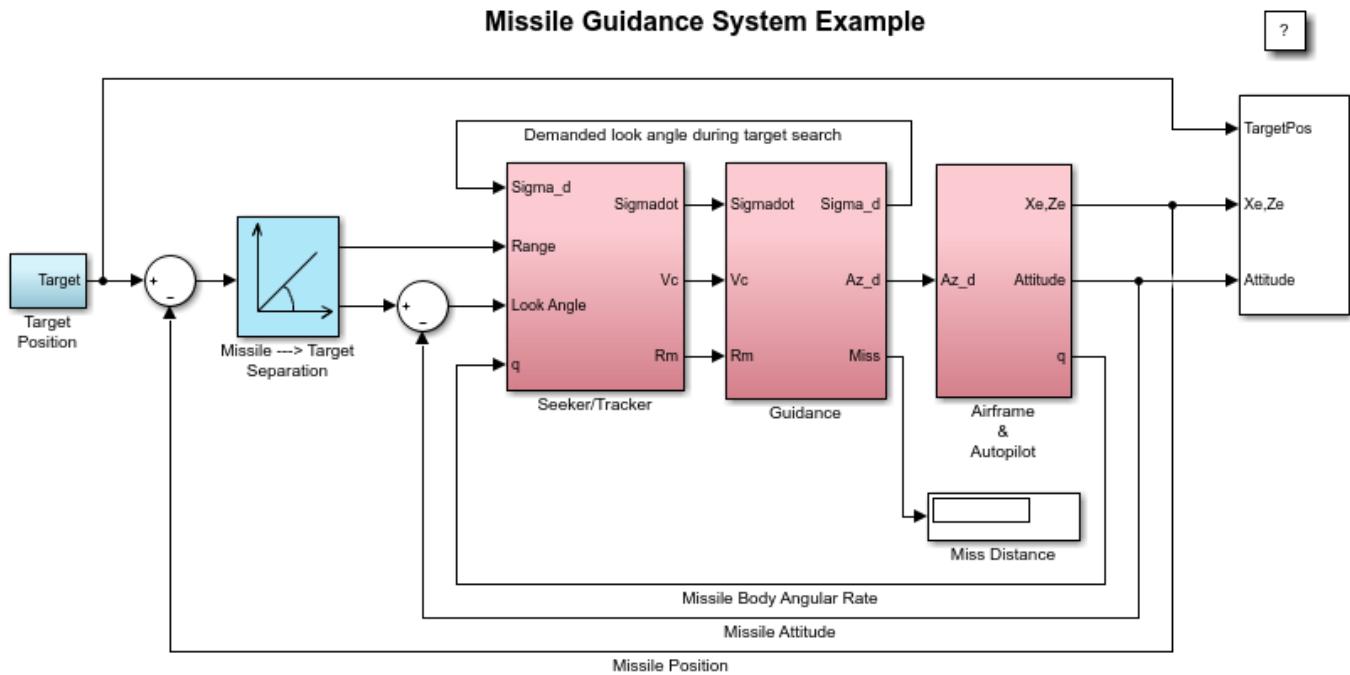

Figure: Simulink implementation of gain scheduled autopilot

Homing Guidance Loop

The complete Homing Guidance Loop consists of a Seeker/Tracker Subsystem which returns measurements of the relative motion between the missile and target, and the Guidance Subsystem which generates normal acceleration demands which are passed to the autopilot. The autopilot is now part of an inner loop within the overall homing guidance system. Reference [4] provides information on the differing forms of guidance that are currently in use, and provides background information on the analysis techniques that are used to quantify guidance loop performance.

Guidance Subsystem

The function of the Guidance subsystem is to not only generate demands during closed loop tracking, but also perform an initial search to locate the target position. A Stateflow® model is used to control the transfer between these differing modes of operation. Switching between modes is triggered by events generated either in Simulink, or internal to the Stateflow model. Controlling the way the Simulink model then behaves is achieved by changing the value of the variable **Mode** that is passed out to Simulink. This variable is used to switch between the differing control demands that can be generated. During target search the Stateflow model controls the tracker directly by sending demands to the seeker gimbals (**Sigma**). Target acquisition is flagged by the tracker once the target lies within the beamwidth of the seeker (**Acquire**), and after a short delay closed loop guidance starts. Stateflow is an ideal tool for rapidly defining all the operational modes, whether they are for normal operation, or unusual situations. For example, the actions to be taken should there be loss of lock on the target, or should a target not be acquired during target search are catered for in this Stateflow diagram.

Proportional Navigation Guidance

Once the seeker has acquired the target a Proportional Navigation Guidance (PNG) law is used to guide the missile until impact. This form of guidance law has been used in guided missiles since the 1950s, and can be applied to radar, infrared or television guided missiles. The navigation law requires measurements of the closing velocity between the missile and target, which for a radar guided missile could be obtained using a Doppler tracking device, and an estimate for the rate of change of the inertial sightline angle.

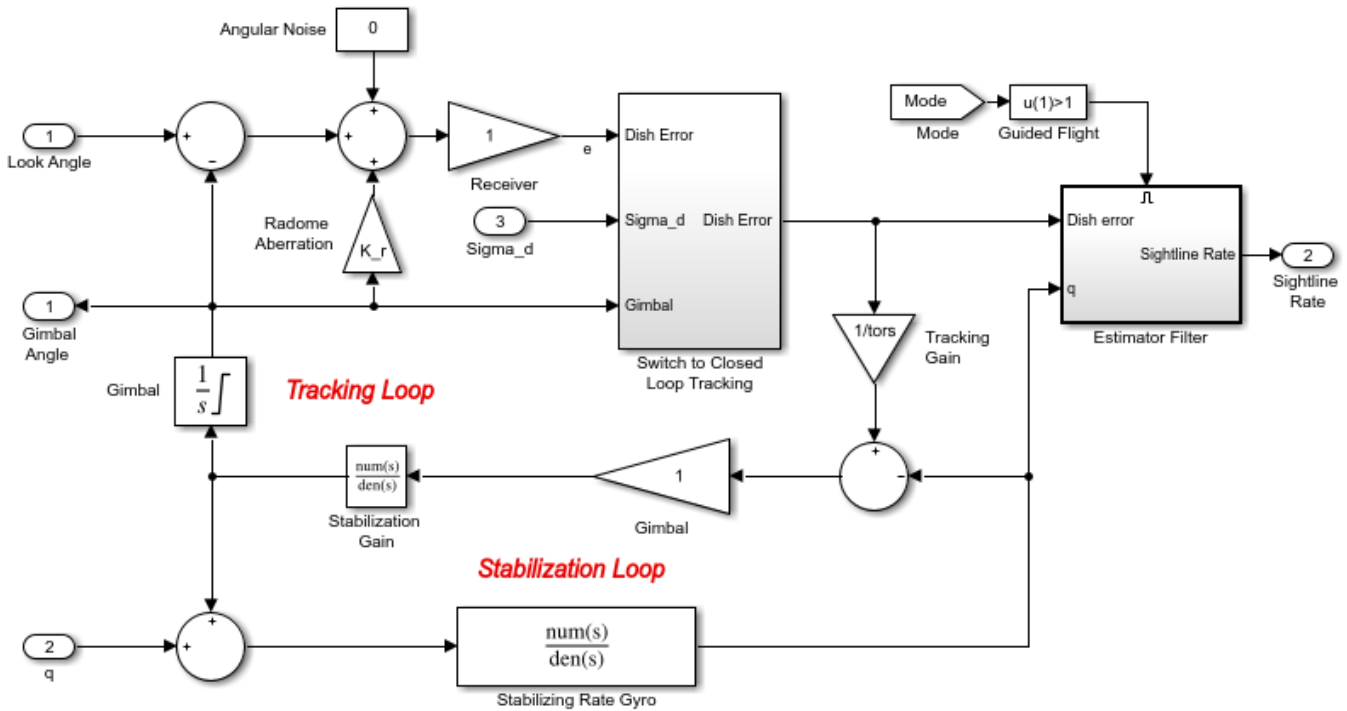

Figure: Proportional Navigation Guidance Law

Seeker/Tracker Subsystem

The aim of the Seeker/Tracker Subsystem is both to drive the seeker gimbals to keep the seeker dish aligned with the target, and to provide the guidance law with an estimate of the sightline rate. The tracker loop time constant **tors** is set to 0.05 seconds, and is chosen as a compromise between maximizing speed of response, and keeping the noise transmission to within acceptable levels. The stabilization loop aims to compensate for body rotation rates, and the gain **Ks**, which is the loop cross-over frequency, is set as high as possible subject to the limitations of the bandwidth of the stabilizing rate gyro. The sightline rate estimate is a filtered value of the sum of the rate of change of the dish angle measured by the stabilizing rate gyro, and an estimated value for the rate of change of the angular tracking error (**e**) measured by the receiver. In this example the bandwidth of the estimator filter is set to half that of the bandwidth of the autopilot.

Radome Aberration

For radar guided missiles a parasitic feedback effect that is commonly modelled is that of radome aberration. It occurs because the shape of the protective covering over the seeker distorts the returning signal, and then gives a false reading of the look angle to the target. Generally the amount of distortion is a nonlinear function of the current gimbal angle, but a commonly used approximation is to assume a linear relationship between the gimbal angle and the magnitude of the distortion. In the above system, the radome aberration is accounted for in the gain block labeled "Radome Aberration". Other parasitic effects, such as sensitivity in the rate gyros to normal acceleration, are also often modelled to test the robustness of the target tracker and estimator filters.

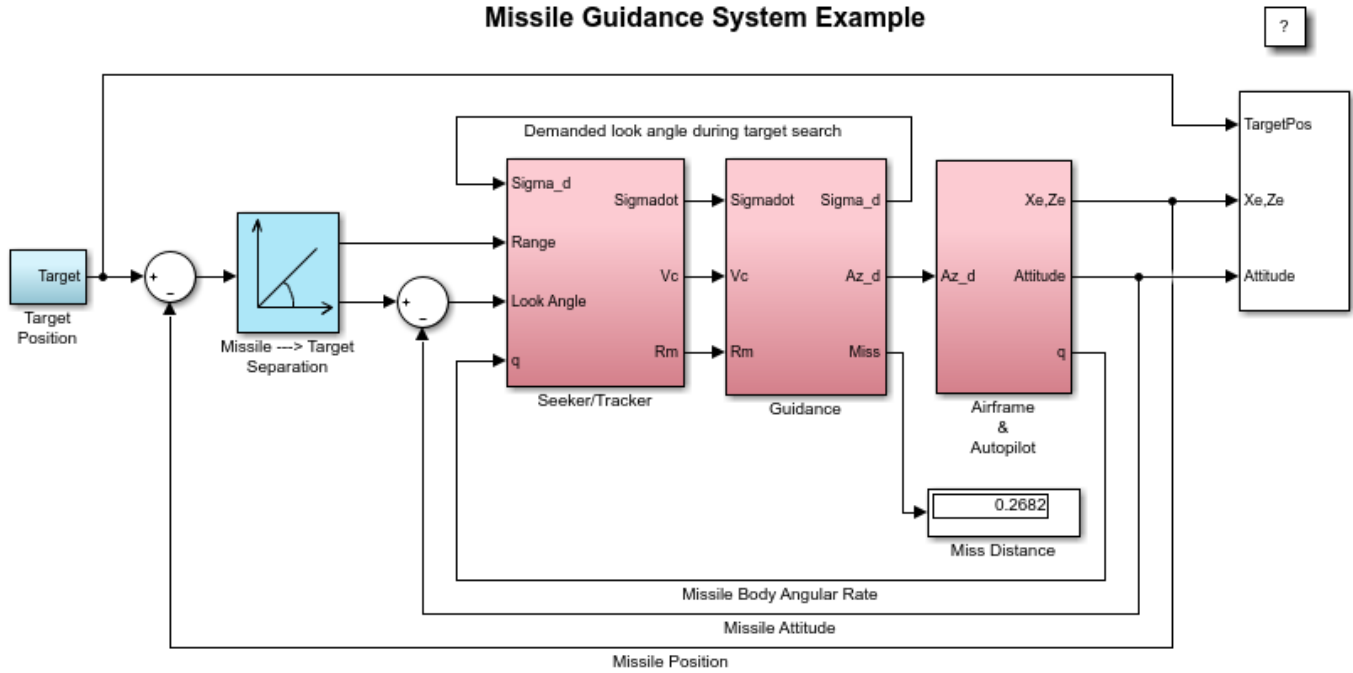

Figure: Radome aberration geometry

Running the Guidance Simulation

Now to show the performance of the overall system. In this case the target is defined to be travelling at a constant speed of 328m/s, on a reciprocal course to the initial missile heading, and 500m above the initial missile position. From the simulation results it can be determined that acquisition occurred 0.69 seconds into the engagement, with closed loop guidance starting after 0.89 seconds. Impact with the target occurred at 3.46 seconds, and the range to go at the point of closest approach was calculated to be 0.265m.

The `aero_guid_plot.m` script creates a performance analysis

Airframe Trim and Linearize

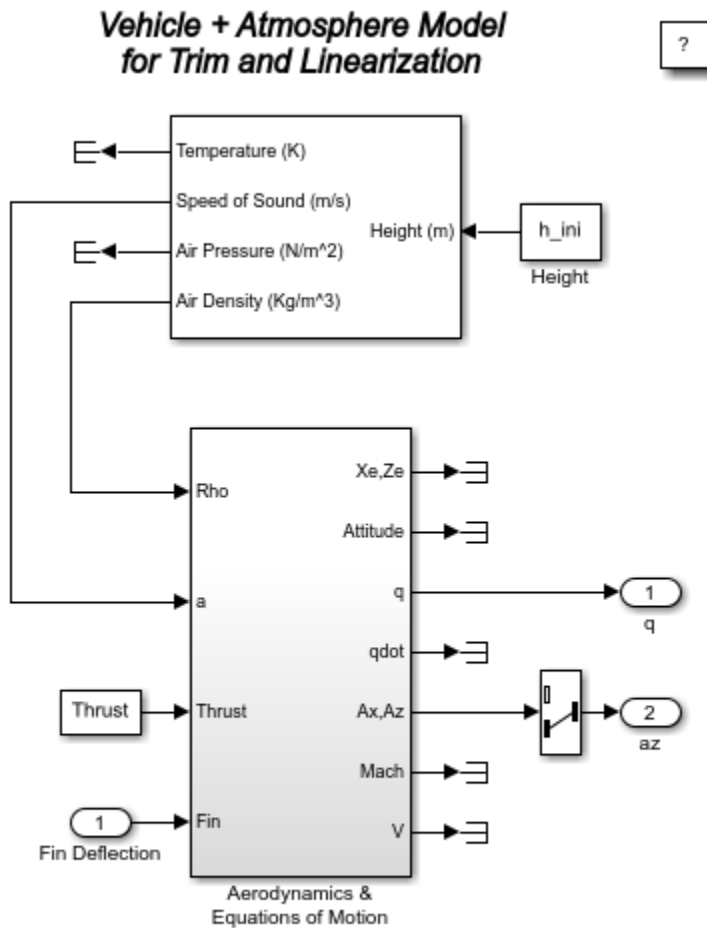

This example shows how to trim and linearize an airframe using Simulink® Control Design™

Designing an autopilot using classical design techniques requires linear models of the airframe pitch dynamics for a number of trimmed flight conditions. MATLAB® can determine the trim conditions and derive linear state-space models directly from the nonlinear Simulink® and Aerospace Blockset™ model. This saves time and helps to validate the model. The functions provided by Simulink Control Design allow you to visualize the behavior of the airframe in terms of open-loop frequency (or time) responses.

Initialize Guidance Model

The first problem is to find the elevator deflection, and the resulting trimmed body rate (q), which will generate a given incidence value when the missile is travelling at a set speed. Once the trim condition is found, a linear model can be derived for the dynamics of the perturbations in the states around the trim condition.

```
open_system('aero_guidance_airframe');
```

Define State Values

```

h_ini    = 10000/m2ft;      % Trim Height [m]
M_ini    = 3;               % Trim Mach Number
alpha_ini = -10*d2r;       % Trim Incidence [rad]
theta_ini = 0*d2r;         % Trim Flightpath Angle [rad]
v_ini    = M_ini*(340+(295-340)*h_ini/11000); % Total Velocity [m/s]

q_ini    = 0;               % Initial pitch Body Rate [rad/sec]

```

Set Operating Point and State Specifications

The first state specifications are Position states, the second state specification is Theta. Both are known, but not at steady state. The third state specifications are body axis angular rates of which the variable w is at steady state.

```

Anti-Windup Control Using a PID Controller

Model Description

This example shows how to use anti-windup schemes to prevent integration wind-up in PID controllers when the actuators are saturated. We use the PID Controller block in Simulink® which features two built-in anti-windup methods, back-calculation and clamping, as well as a tracking mode to handle more complex scenarios.

The plant to be controlled is a saturated first-order process with dead-time.

We start by opening the model.

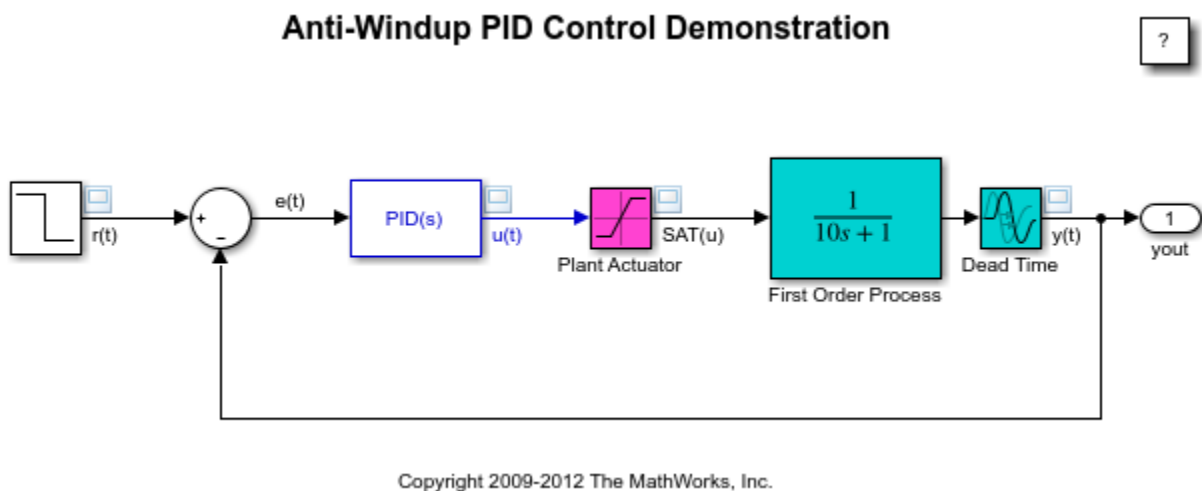

Figure 1: Simulink model of PID control of a plant with input saturation.

To open this model, type `sldemo_antiwindup` in a MATLAB® terminal.

The PID Controller has been tuned with saturation ignored using the PID tuner of Simulink® Control Design™.

The controlled plant is a first-order process with dead-time described by

$$P(s) = \frac{1}{10s + 1} e^{-2s}$$

The plant has known input saturation limits of $[-10, 10]$, which are accounted for in the Saturation block labeled Plant Actuator. The PID Controller block in Simulink features two built-in anti-windup methods that allow the PID Controller block to account for the available information about the plant input saturation.

Performance Without Using Anti-Windup

First, we examine the effect of saturation on the closed-loop when the saturation model is not considered by the PID Controller block. Simulating the model in Figure 1 generates the results shown below.

Figure 2: Setpoint vs. measured output with no anti-windup.

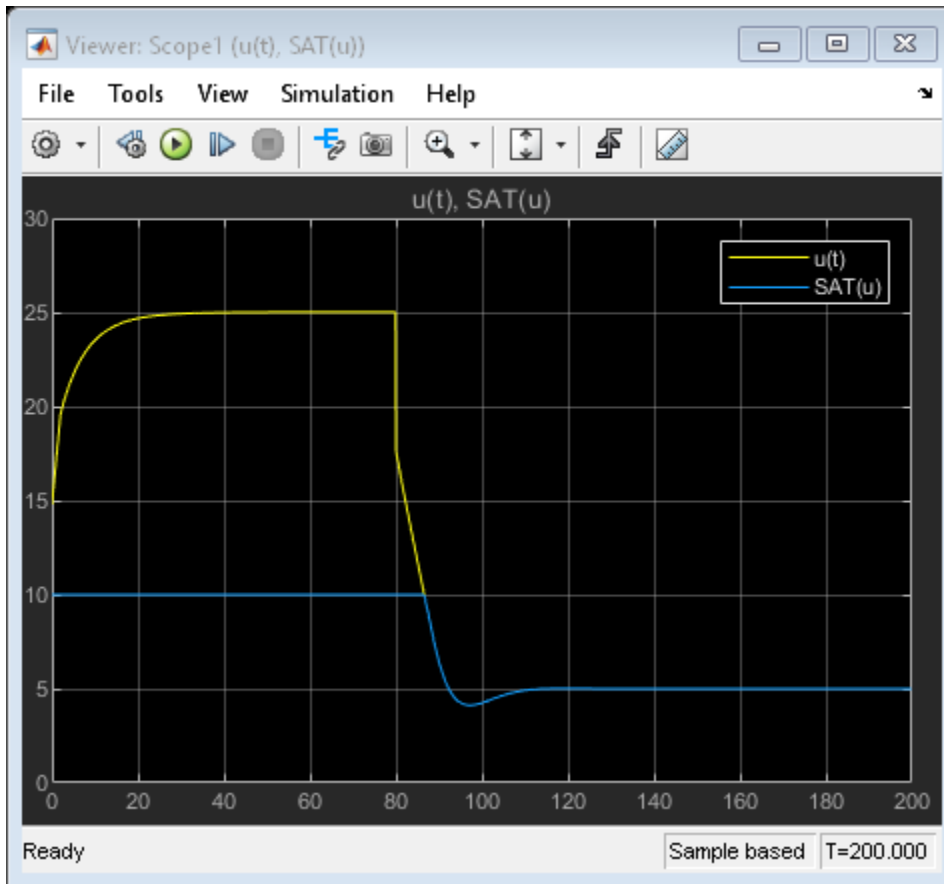

Figure 3: Controller output and saturated input with no anti-windup.

Figures 2 and 3 highlight two of the problems that arise when controlling a system with input saturation:

- 1 When the setpoint value is 10, the PID control signal reaches a steady-state at about 24, outside the range of the actuator. The controller is therefore operating in a nonlinear region where increasing the control signal has no effect on the system output, a condition known as *winding up*. Note that the dc-gain of the plant is unity, and therefore there is no reason for the controller output to have a steady-state value outside the actuator's range.
- 2 When the setpoint value becomes 5, there is a considerable delay before the PID controller output returns to within the actuator range.

Designing the PID controller to account for the effect of saturation will improve its performance by allowing it to operate in the linear region most of the time and recover quickly from nonlinearity. Anti-windup circuitry is one way to achieve this.

Configuring the Block for Anti-Windup Based on Back-Calculation

The back-calculation anti-windup method uses a feedback loop to discharge the PID Controller internal integrator when the controller hits specified saturation limits and enters nonlinear operation. To enable anti-windup, go to the **Output Saturation** tab in the block dialog; select **Limit output**; and enter the plant's saturation limits. Then, select **back-calculation** from the **Anti-windup method** menu and specify the **Back-calculation coefficient (Kb)**. The inverse of this gain is the

time constant of the anti-windup loop. In this example, the back-calculation gain is chosen to be 1. For more information on how to choose this value, see Reference [1].

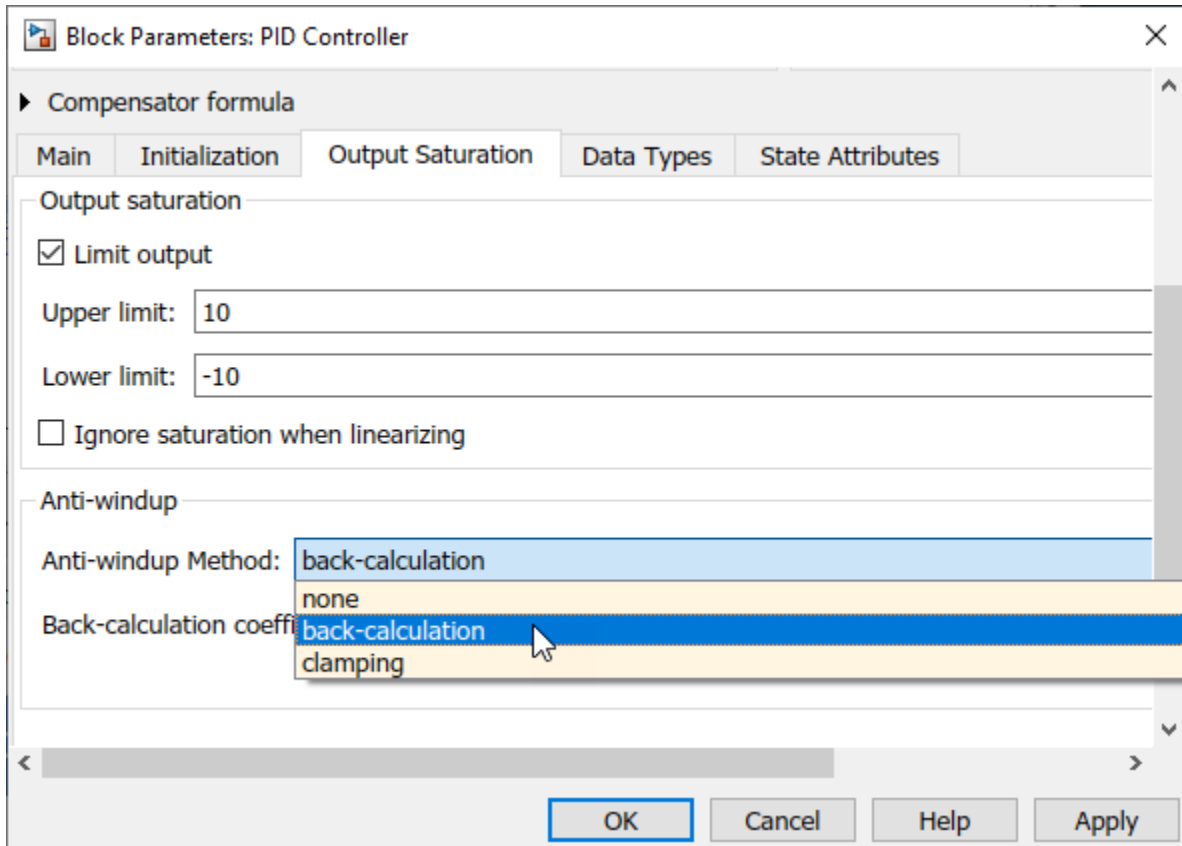

Figure 4: Enabling the back-calculation anti-windup method.

Once back-calculation is enabled, the block has an internal tracking loop that discharges the Integrator output.

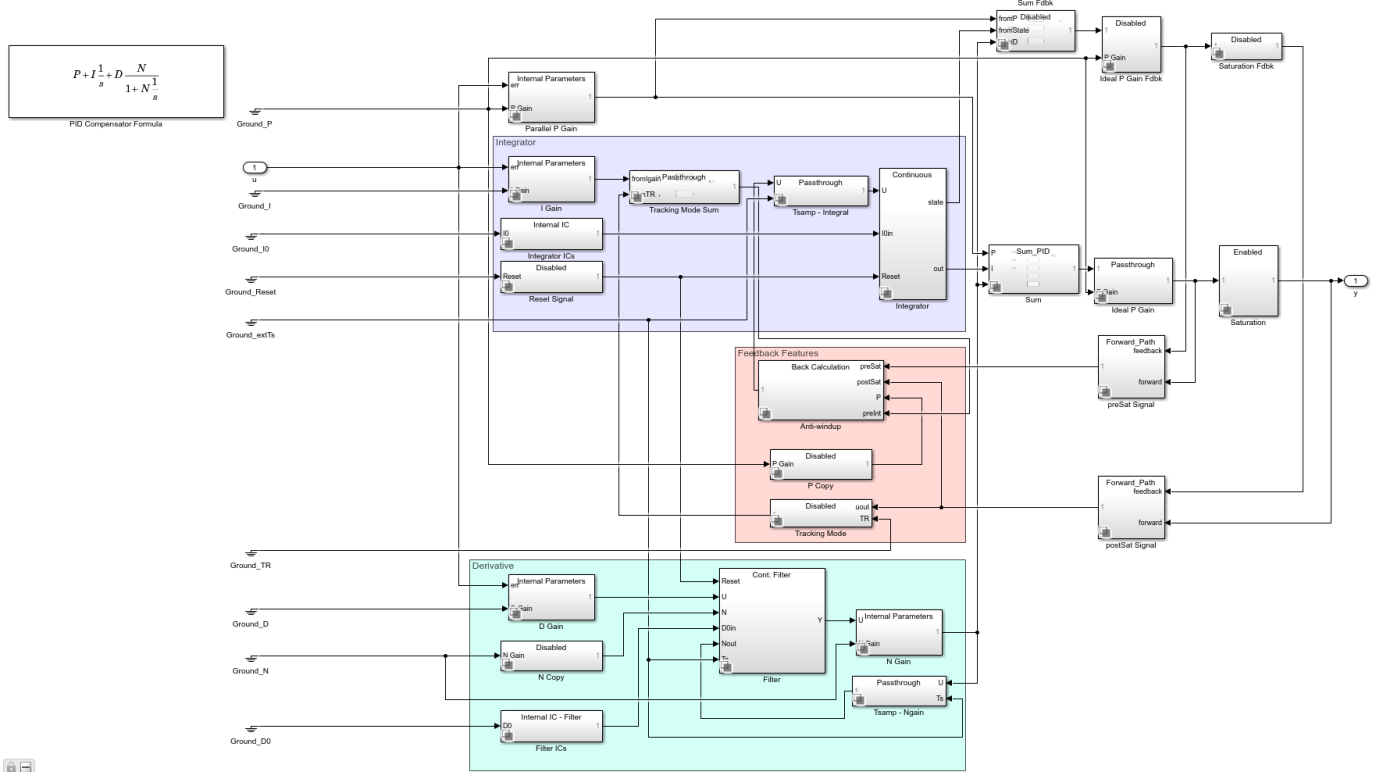

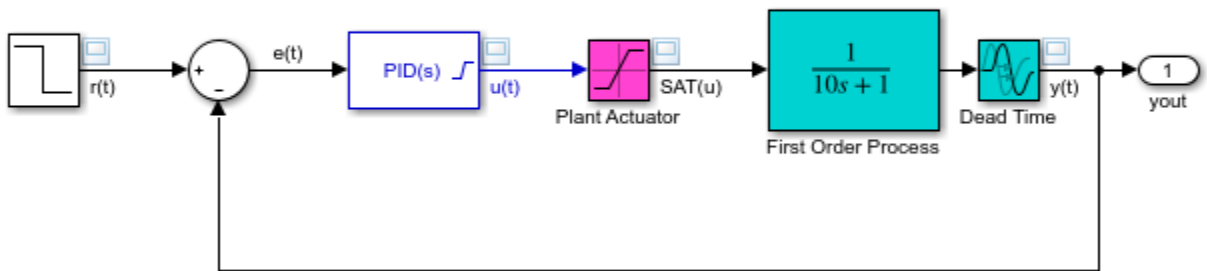

Figure 5: Under-mask view of the PID Controller block with back-calculation.

Figures 6 and 7 illustrate the result of simulating the model with anti-windup activated. Note how quickly the PID control signal returns to the linear region and how fast the loop recovers from saturation.

Anti-Windup PID Control Demonstration

Copyright 2009-2012 The MathWorks, Inc.

Figure 6: Setpoint vs. measured output with back-calculation.

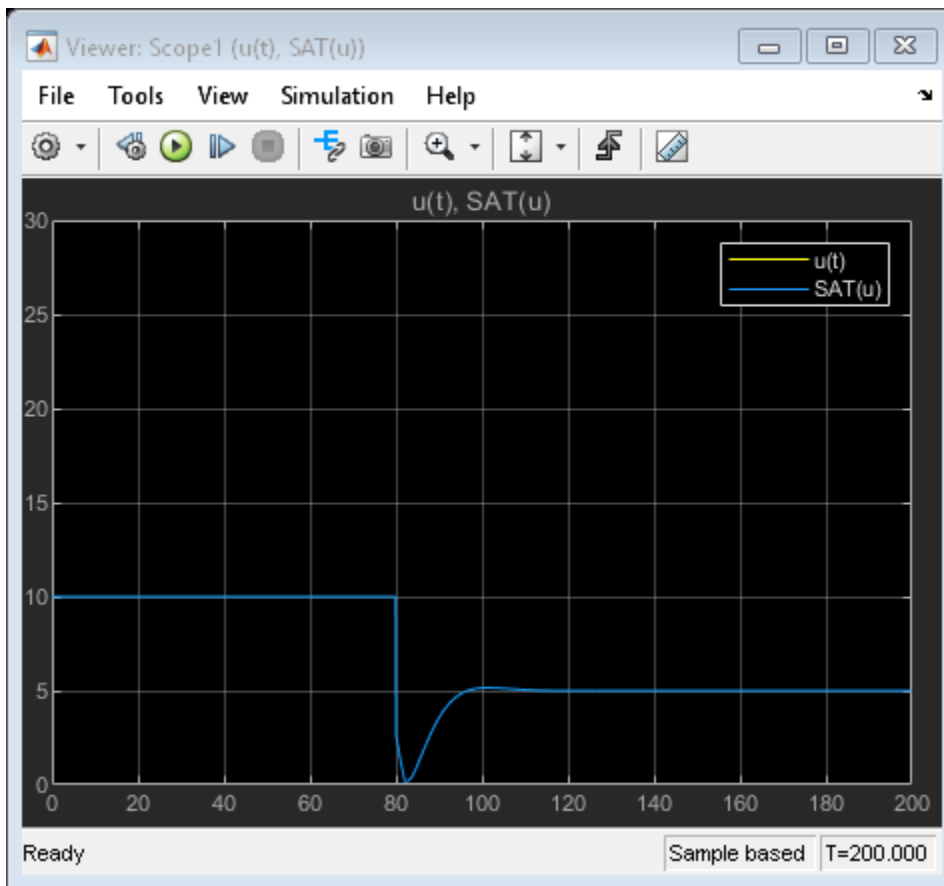

Figure 7: Controller output and saturated input with back-calculation.

Figure 7 shows that the controller output $u(t)$ and the saturated input $SAT(u)$ coincide with each other because **Limit output** is enabled.

To better visualize the effect of anti-windup, Figure 8 illustrates the plant measured output $y(t)$ with and without anti-windup.

Figure 8: Measured output with and without anti-windup.

Configuring the Block for Anti-Windup Based on Integrator Clamping

Another commonly used anti-windup strategy is based on conditional integration. To enable anti-windup, go to the **PID Advanced** tab in the block's dialog; select **Limit output**; and enter the plant's saturation limits. Then, select **clamping** from the **Anti-windup method** menu.

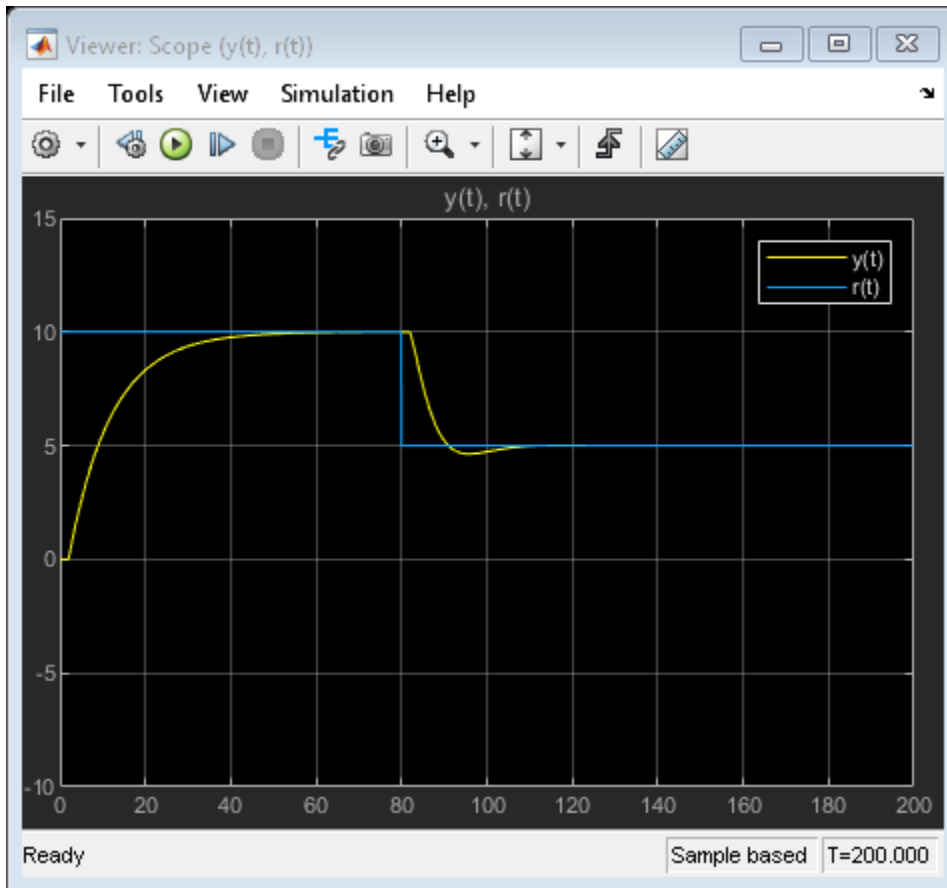

Figure 9: Setpoint vs. measured output with clamping.

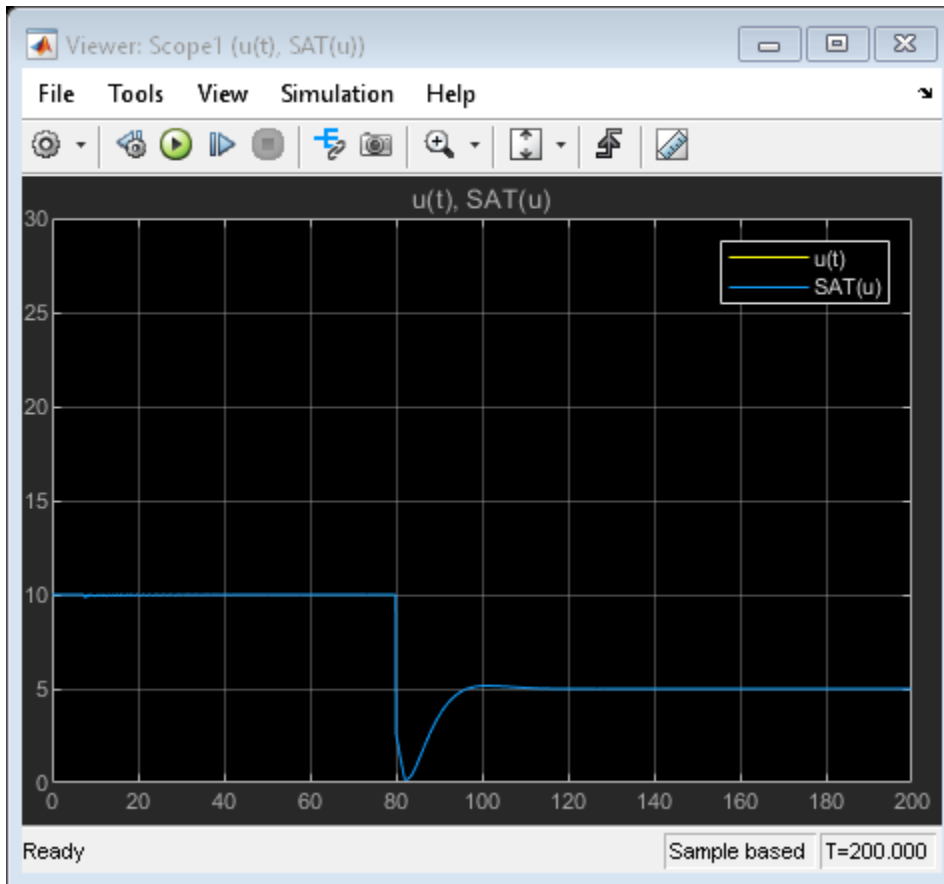

Figure 10: Controller output and saturated input with clamping.

Figure 10 shows that the controller output $u(t)$ and the saturated input $SAT(u)$ coincide with each other because **Limit output** is enabled.

For more information on when to use *clamping*, see Reference [1].

Using Tracking Mode to Handle Complex Anti-Windup Scenarios

The previously discussed anti-windup strategies relied on built-in methods to process the saturation information provided to the block via its dialog. For those built-in techniques to work as intended, two conditions must be met:

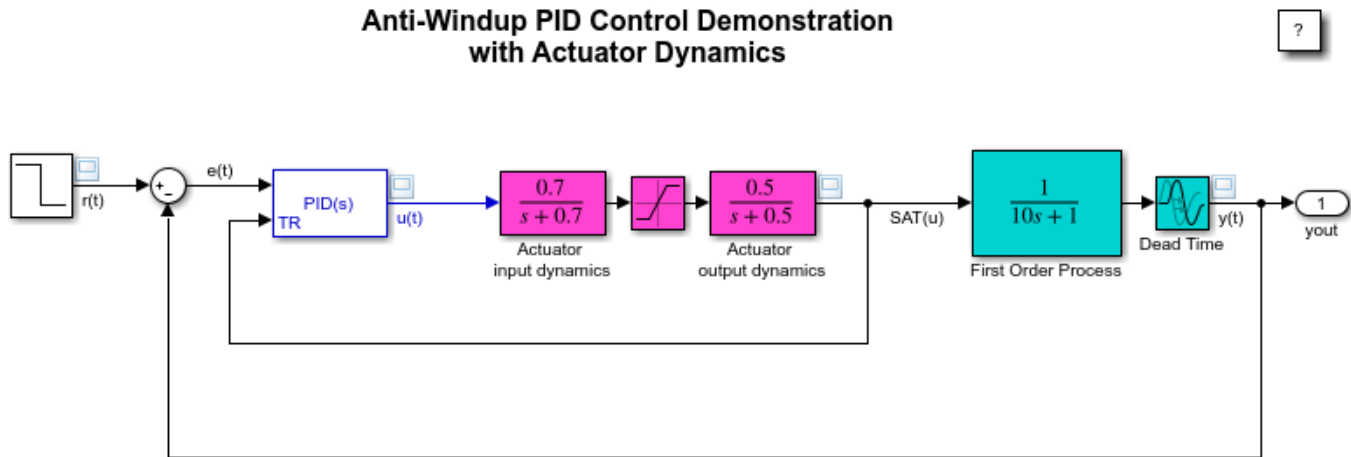

- 1 The plant's saturation limits are known and can be entered into the dialog of the block.
- 2 The PID Controller output signal is the only signal feeding the actuator.

These conditions may be restrictive when handling general anti-windup scenarios. The PID Controller block features a tracking mode that allows the user to set up a back-calculation anti-windup loop externally. The following two examples are considered to illustrate the use of tracking mode for anti-windup purposes:

- 1 Anti-windup for saturated actuators with cascaded dynamics
- 2 Anti-windup for PID control with Feedforward

Constructing Anti-Windup Circuitry for Saturated Actuators with Cascaded Dynamics

In the following model, the actuator has complex dynamics. This is common when an actuator has its own closed-loop dynamics. The PID controller is in an outer loop and sees the actuator dynamics as an inner loop, or simply a cascaded saturated dynamics as shown in Figure 1.

Copyright 2009-2012 The MathWorks, Inc.

Figure 11: Simulink model of PID controller with cascaded actuator dynamics.

To open this model, type `sldemo_antiwindupactuator` in a MATLAB terminal.

In this case, a successful anti-windup strategy requires feeding back the actuator output to the tracking port of the PID Controller block as shown in Figure 11. To configure the tracking mode of the PID Controller block, go to the **PID Advanced** tab in the block's dialog; select **Enable tracking mode**; and specify the gain K_t . The inverse of this gain is the time constant of the tracking loop. For more information on how to choose this gain, see Reference [1].

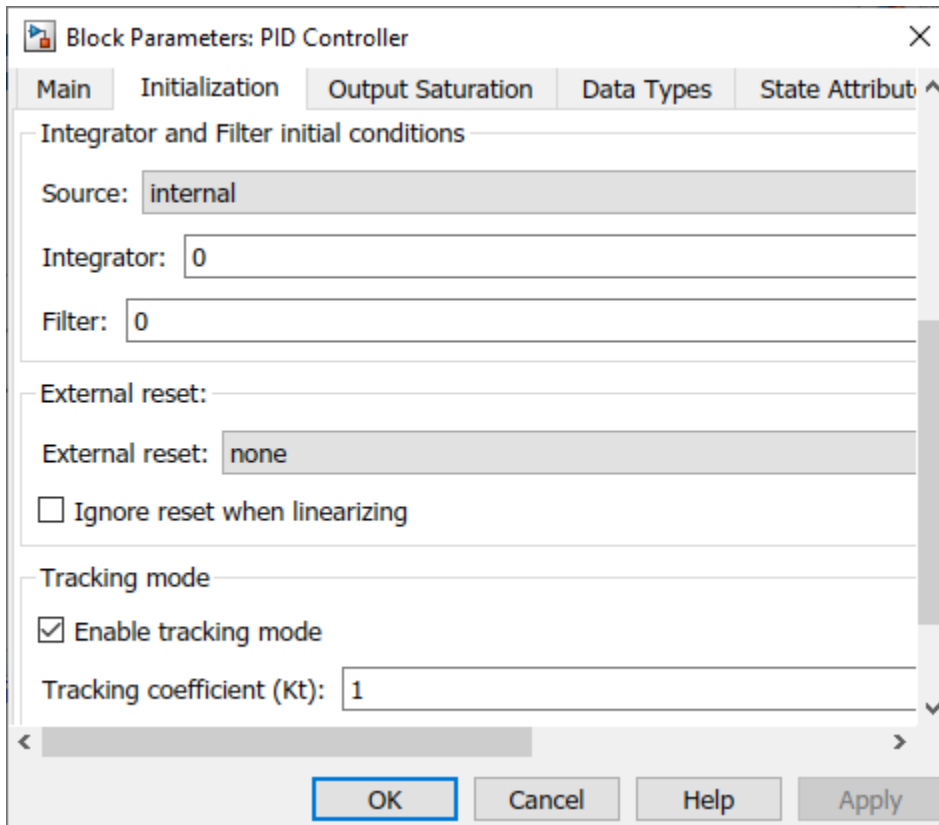

Figure 12: Enabling the tracking mode of the PID Controller block.

Figures 13 and 14 show that the plant's measured output $y(t)$ and the controller output $u(t)$ are responding almost immediately to changes in the setpoint. Without the anti-windup circuit, these responses would be sluggish with long delays.

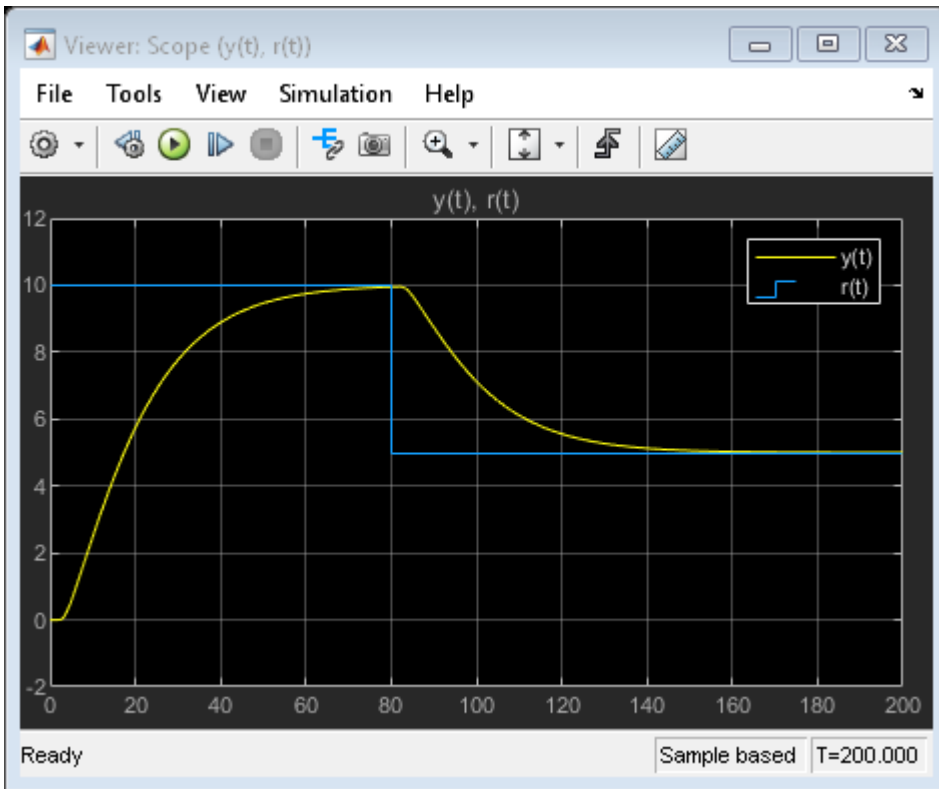

Figure 13: Setpoint vs. measured output.

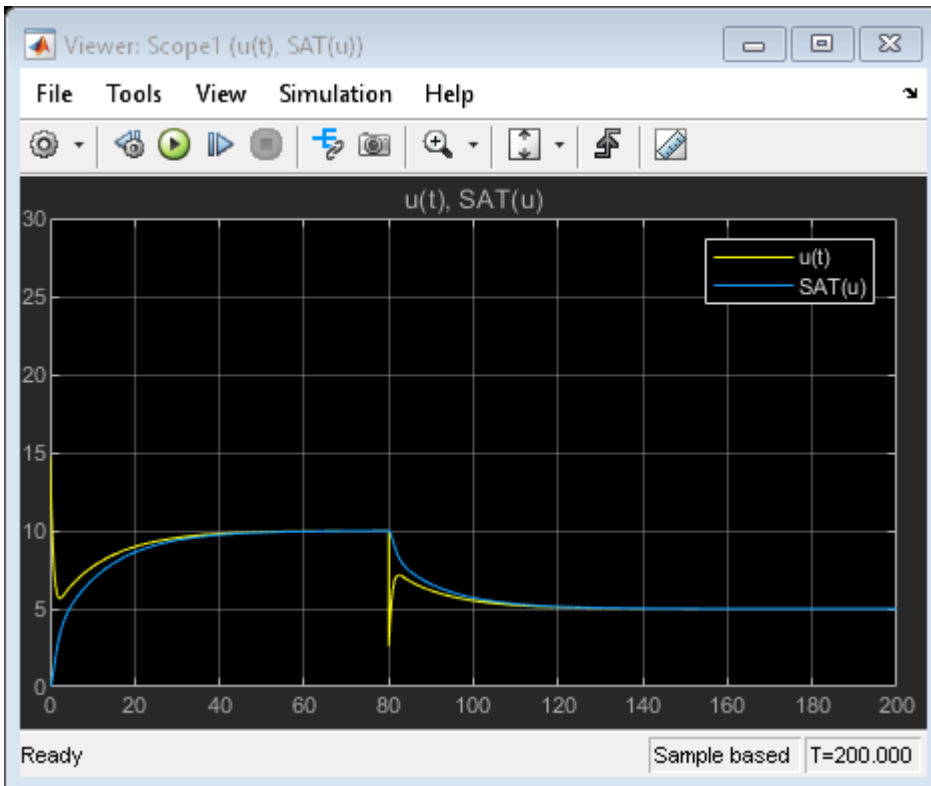

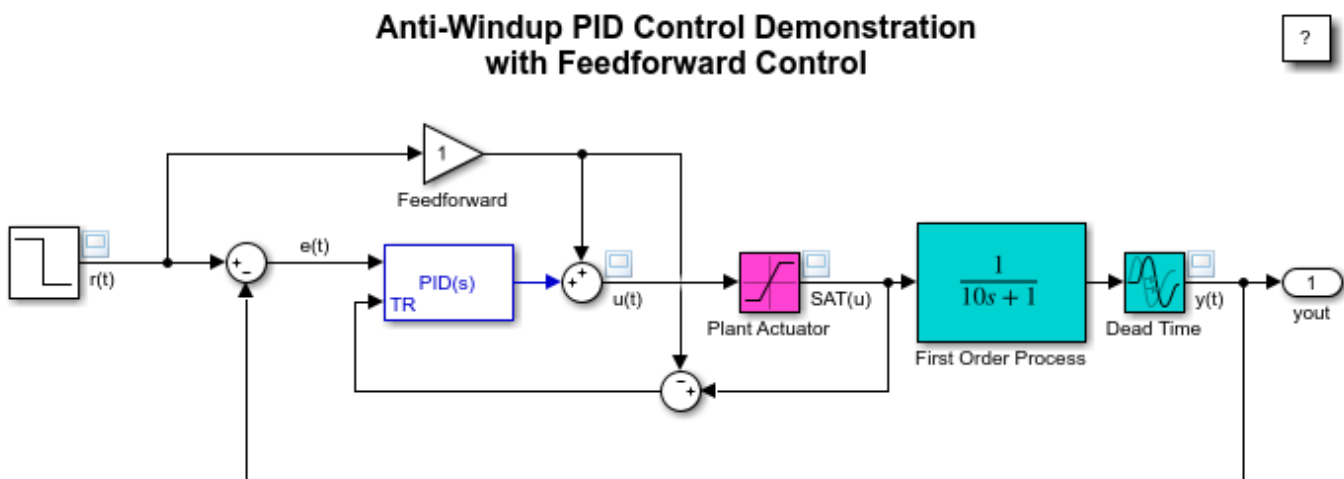

Figure 14: Controller output and effective saturated input.

Constructing Anti-Windup Circuitry for PID Control with Feedforward

In another common control configuration, the actuator receives a control signal that is a combination of a PID control signal and a feedforward control signal.

To accurately build a back-calculation anti-windup loop, the tracking signal should subtract the contribution of the feedforward signal. This allows the PID Controller block to know its share of the effective control signal applied to the actuator.

The following model includes a feedforward control.

Copyright 2009-2012 The MathWorks, Inc.

Figure 15: Simulink model of PID controller with feedforward, and plant input saturation.

The feedforward gain is selected to be unity here because the plant has a dc-gain of 1.

To open this model, type `sldemo_antiwindupfeedforward` in a MATLAB terminal.

Figures 16 and 17 show that the plant's measured output $y(t)$ and the controller output $u(t)$ are responding almost immediately to changes in the setpoint. When the setpoint value is 10, note how in Figure 17 the controller output $u(t)$ reduces to be within the range of the actuator.

Figure 16: Setpoint vs. measured output without anti-windup.

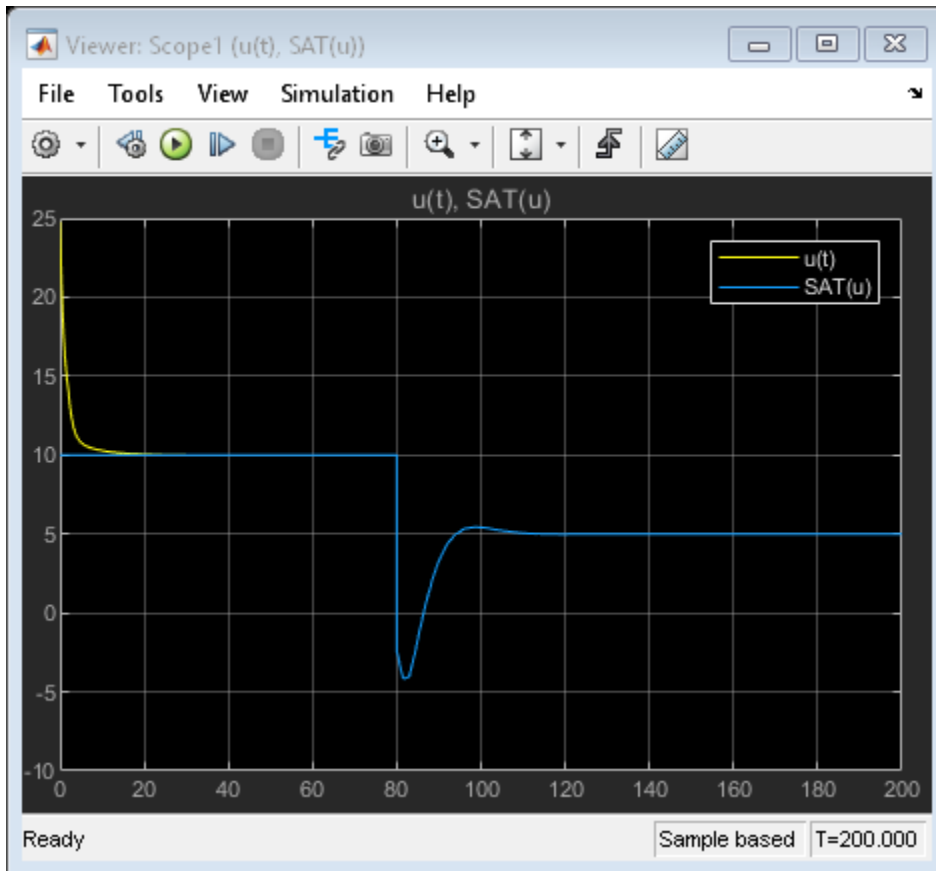

Figure 17: Controller output and saturated input with anti-windup.

Summary

The PID Controller block supports several features that allow it to handle controller windup issues under commonly encountered industrial scenarios.

Bumpless Control Transfer Between Manual and PID Control

Model Description

This example shows how to achieve bumpless control transfer when switching from manual control to PID control. We use the PID Controller block in Simulink® to control a first-order process with dead-time.

We start by opening the model.

Copyright 2009-2018 The MathWorks, Inc.

Figure 1: Simulink model of PID control with bumpless transfer.

To open this model, type `sldemo_bumpless` in a MATLAB® terminal.

The PID Controller has been tuned with saturation ignored using the PID tuner of Simulink® Control Design™.

The controlled plant is a first-order process with dead-time described by

$$P(s) = \frac{4}{2.5s + 1} e^{-s}$$

For several operational reasons, the engineers decided to start the control process in an open-loop manner by feeding the plant input with a saturating ramp signal to drive the output of the plant slowly to a desired steady-state value of 40. A control transfer is scheduled to happen at $t = 150$. This transition between open-loop control and closed-loop control therefore involves two control phases of operation:

- 1 Manual: A saturated ramp signal feeds the plant input during start-up until $t = 150$.

- Automatic: A PID controller will engage the plant at $t = 150$, and must take over the process without introducing bumps at the plant input.

To support smooth control transition, the PID Controller block supports two modes of operation: a **tracking mode** and a **control mode**. In control mode, the PID Controller block operates as an ordinary PID controller. In tracking mode, however, the block has an extra input that allows the PID block to adjust its internal state by changing its integrator output so that the block output tracks a prescribed signal feeding this extra input port.

To achieve bumpless control transfer, the PID Controller block must be in tracking mode when the plant is in the manual control phase (open-loop control), and in control mode when the plant is in the automatic control phase (closed-loop control).

Configuring the Block for Tracking Mode

To activate signal tracking, go to the **Initialization** tab in the block dialog; select **Enable tracking mode**, and specify the gain K_t . The inverse of this gain is the time constant of the tracking loop. For more information on how to choose this gain, see Reference [1].

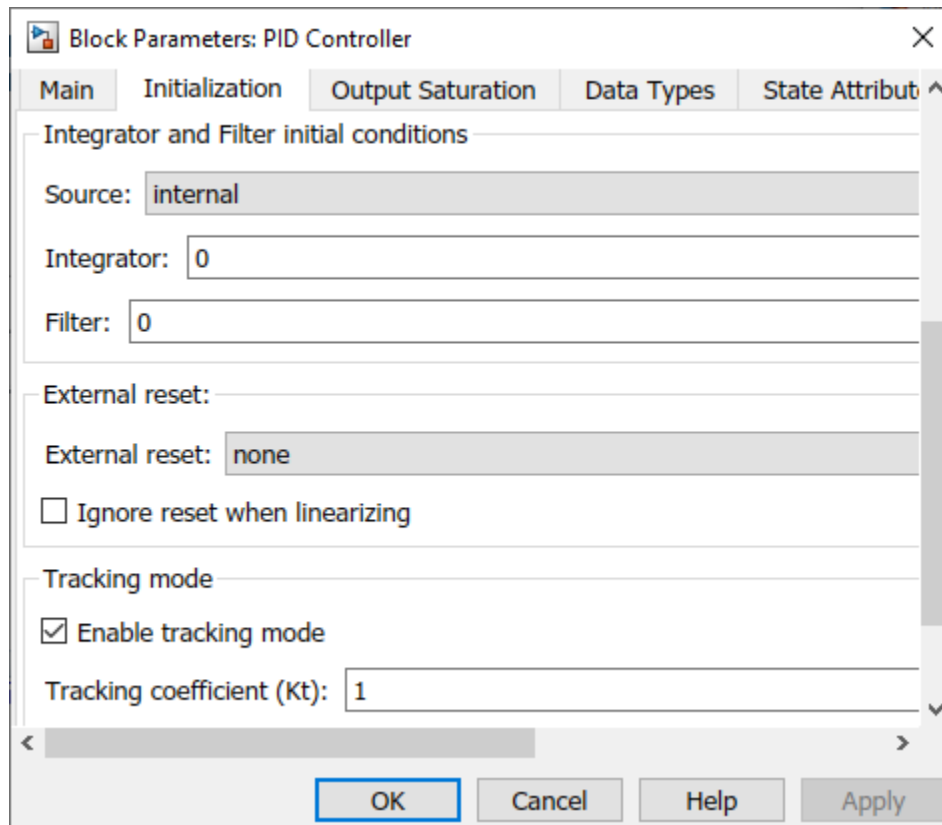

Figure 2: Enabling the tracking mode of the PID Controller block.

As shown in Figure 1, once tracking mode is enabled, the block has a second input port denoted by TR. Internally this new port is wired as shown under mask:

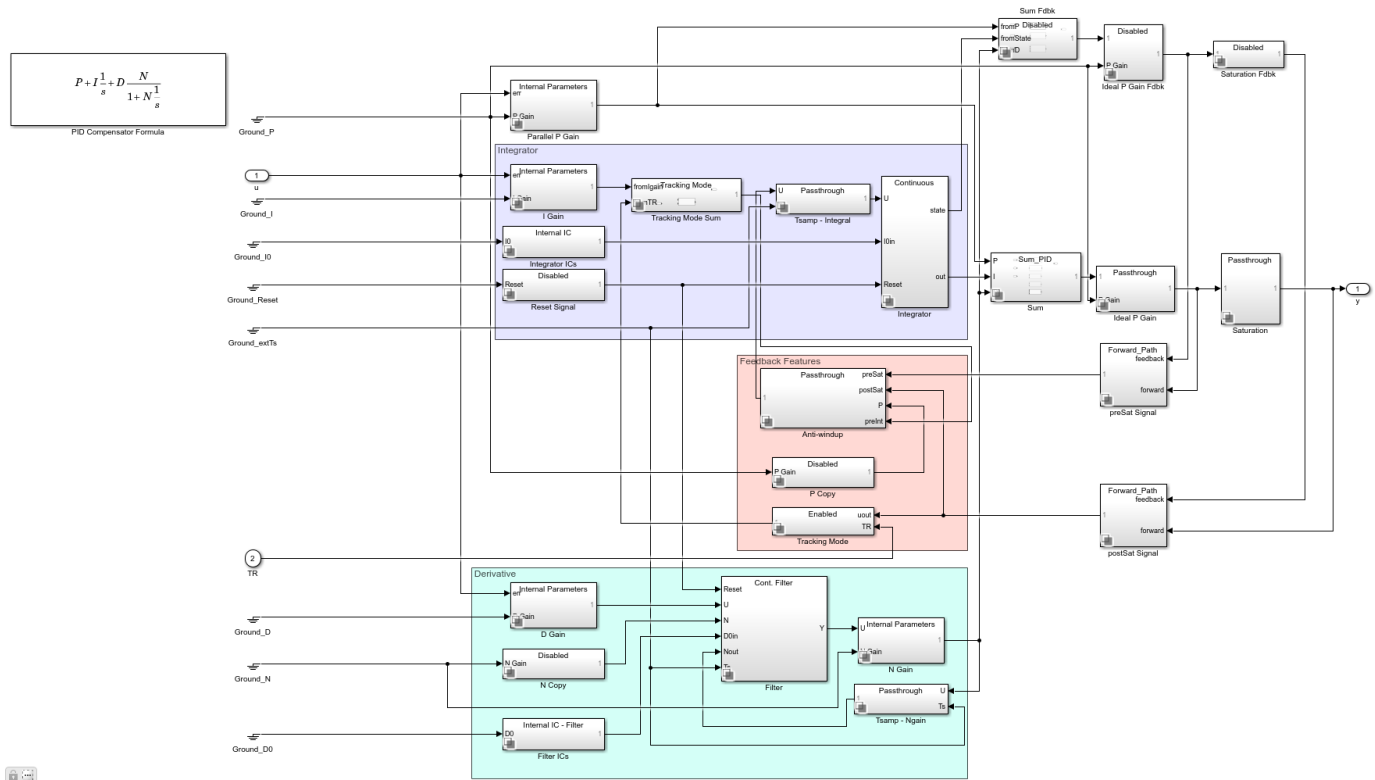

Figure 3: Under-mask view of the PID Controller block with tracking mode.

Setting Up the Switching Mechanism

In addition to enabling tracking mode for the PID Controller block, a switching mechanism is needed to achieve the control transfer. Switch 1 determines which signal feeds the plant input and feeds the tracking port of the PID Controller block.

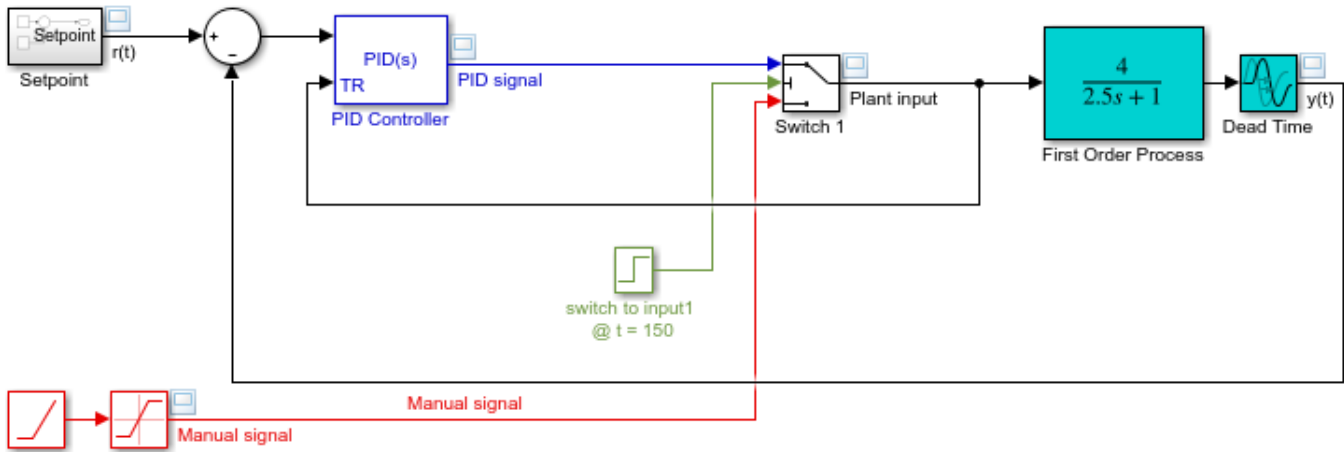

At time $t = 0$, Switch 1 directs the manual control signal to the plant input and the tracking port of the PID Controller block. This allows the output of the PID Controller block to track the manual control signal during the manual phase by adjusting the PID Controller's internal integrator. When control transfer occurs, therefore, the PID Controller output will be approximately the same as the manual control signal.

At time $t = 150$, Switch 1 switches, directing the output of the PID Controller block to the plant input and the PID Controller block's tracking input. The PID Controller block now tracks its own output, which is equivalent to control mode.

Simulating the Bumpless Control Transfer

The setpoint signal and the closed-loop response of the model are shown in Figure 4.

Bumpless Control Transfer Demonstration

Copyright 2009-2018 The MathWorks, Inc.

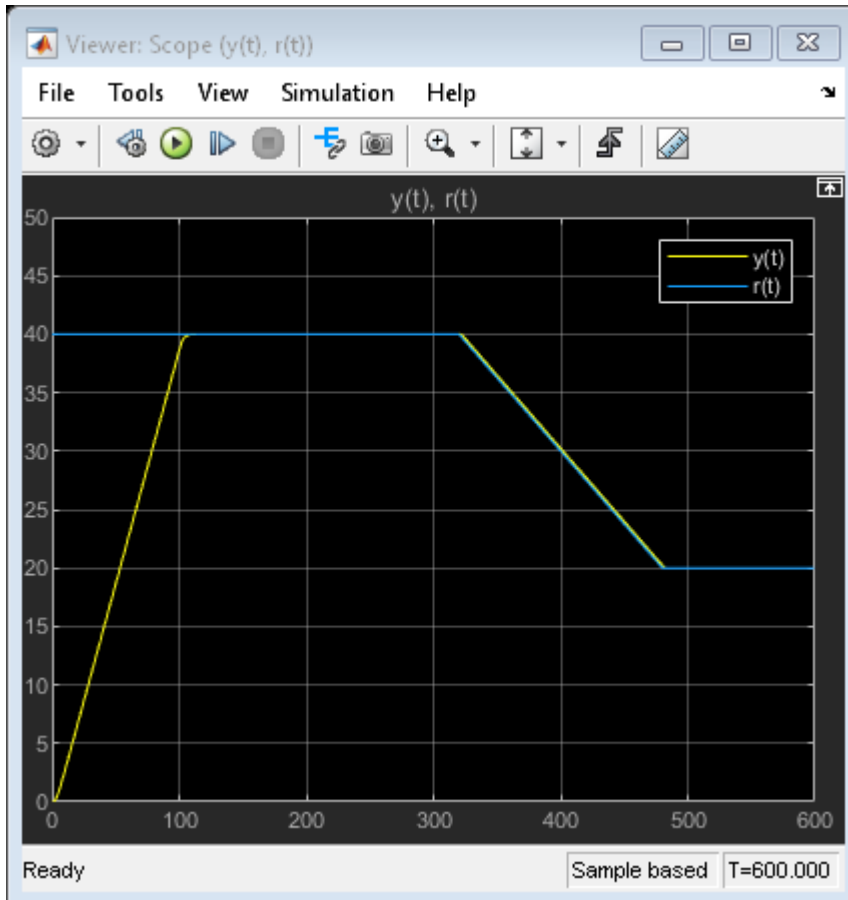

Figure 4: Setpoint vs. measured output.

Figure 4 clearly shows that the measured output tracks the Setpoint profile without any output bumps at the time of switching ($t = 150$). To investigate this further, the plant input, control signals are shown in Figure 5.

**Figure 5:** Control signal switching.

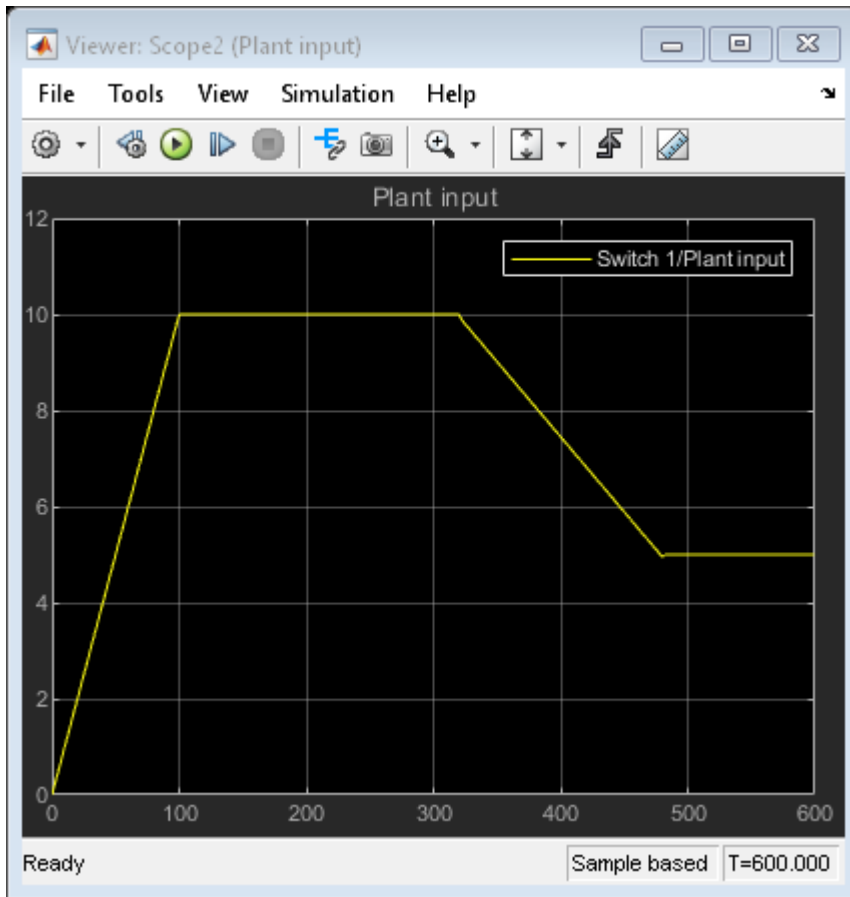

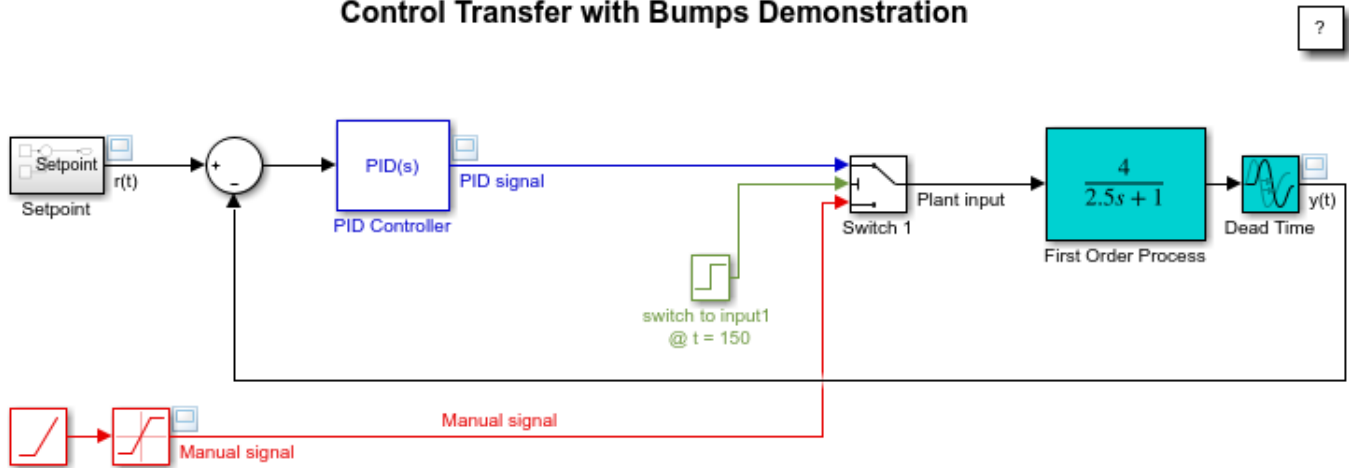

Figure 6: Plant input.

Figures 5 and 6 show that at the switching instance, the plant input has experienced no step changes (bumps), and therefore the control transfer happens in smooth bumpless fashion as intended.

To see the significance of the bumpless transfer setup, consider the case where tracking mode is not used. In this case, the following setup is obtained:

Control Transfer with Bumps Demonstration

Copyright 2009-2018 The MathWorks, Inc.

Figure 7: Simulink model of PID control with no bumpless transfer.

To open this model, type `sldemo_bumplessno` in a MATLAB terminal.

Figures 8 and 9 show the performance in the absence of an appropriate bumpless control transfer strategy.

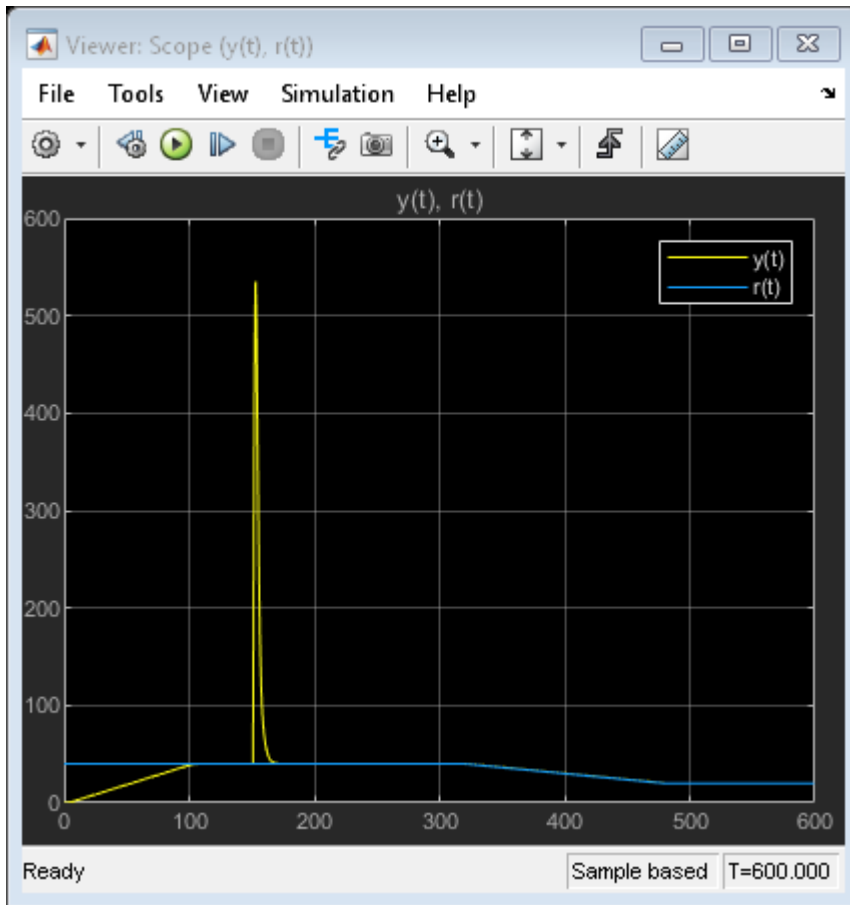

Figure 8: Setpoint vs. measured output.

Figure 9: Control signal switching.

It is evident from Figures 8 and 9 that allowing the PID controller to float while the plant is under manual control can result in undesirable large transients upon switching.

Summary

As this example shows, the PID Controller block supports bumpless control transfer through the use of tracking mode.

Two Degree-of-Freedom PID Control for Setpoint Tracking

Model Description

This example shows how to regulate the speed of an electric motor using two degrees-of-freedom PID control with set-point weighting. We use the PID Controller (2DOF) block in Simulink® as shown below.

Two degree-of-freedom PID Control Demonstration

Copyright 2009-2018 The MathWorks, Inc.

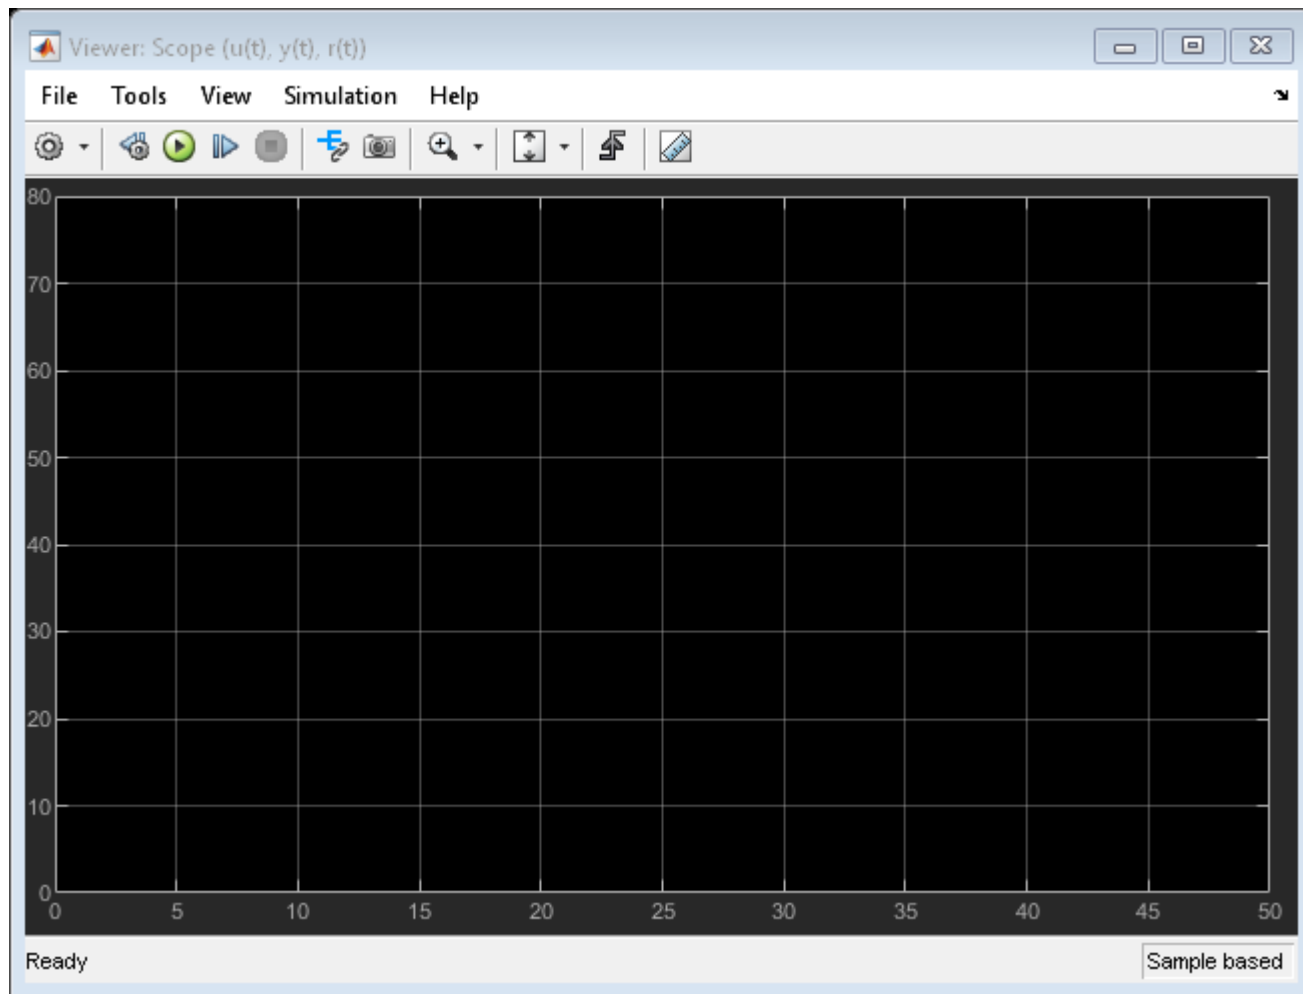

Figure 1: Simulink model with two degree-of-freedom PID control of a DC motor.

To open this model, type `sldemo_pid2dof` in a MATLAB® terminal.

The electric motor is an armature-controlled DC motor. Voltage input controls the shaft speed of the motor. The block diagram of the motor is shown in **Figure 2**. The motor experiences a load torque T_d (0-5 Nm).

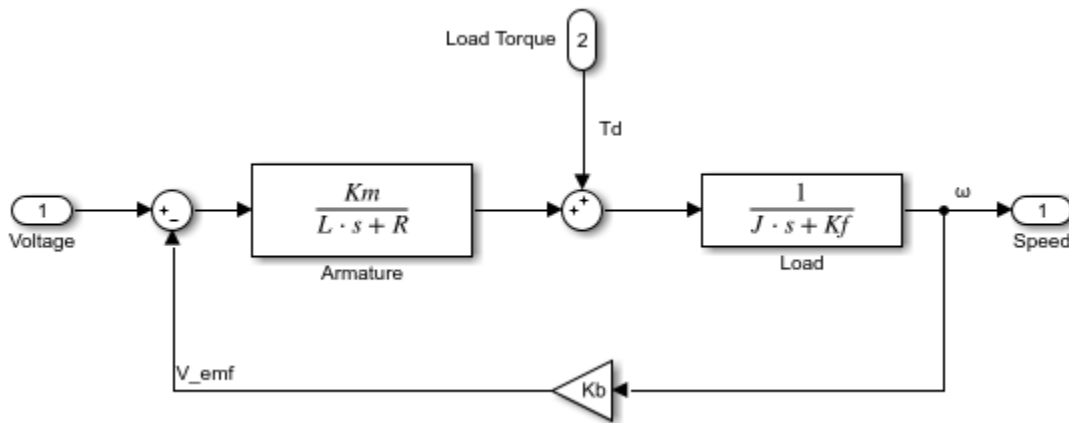

Figure 2: Block diagram of the motor.

Two Degree-of-Freedom PID Control

In contrast to the PID Controller block, the PID Controller (2DOF) block provides an extra degree of freedom to allow users to weight the setpoint as it passes through the proportional action channel and the derivative action channel. See the PID Controller (2DOF) help page or type `doc('PID Controller 2DOF')` in a MATLAB terminal for more details. The schematic of the PID Controller (2DOF) appearing in the model is shown below.

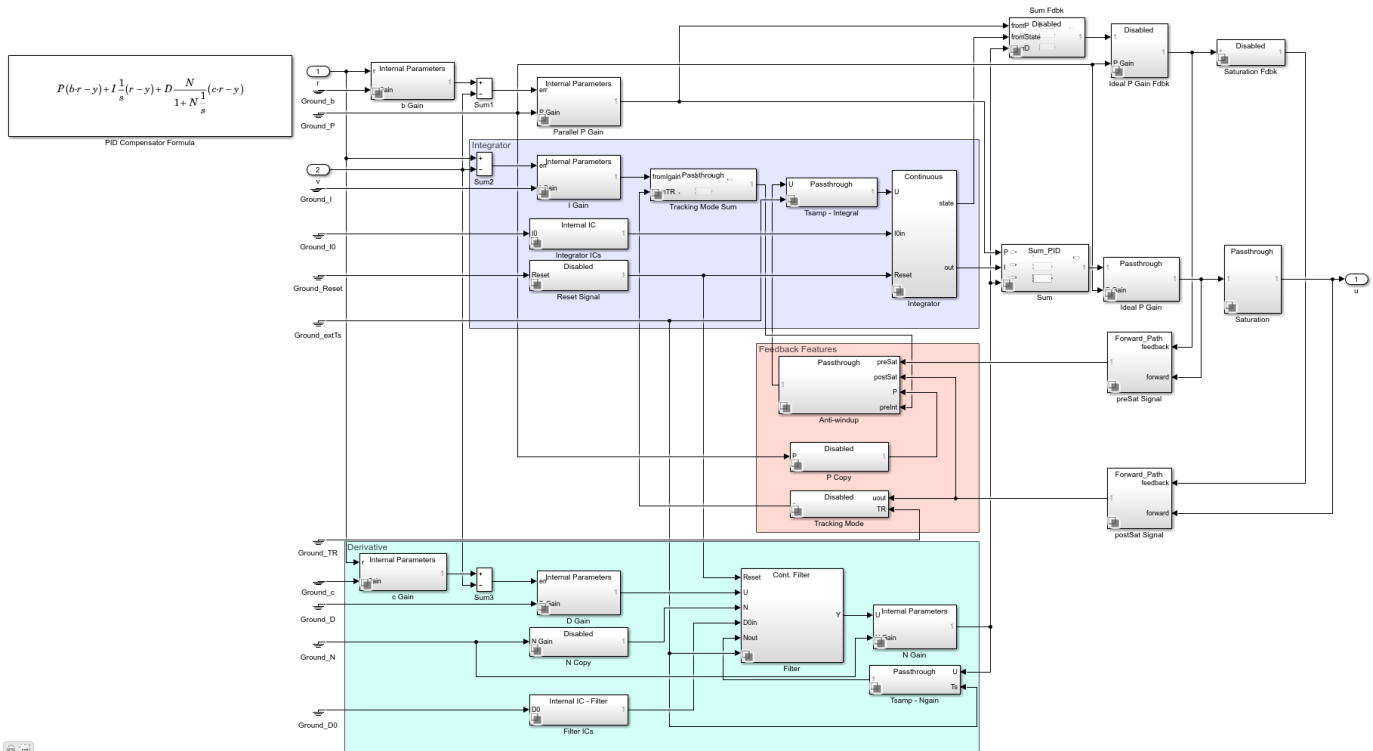

Figure 3: Under-mask view of the PID Controller (2DOF).

As shown in Figure 3, the error signal seen by the proportional action is given by

$$b * r - y$$

The signal seen by the derivative action is

$$c * r - y$$

and the signal seen by the integral action is

$$r - y$$

In general, the setpoint weight c is chosen to be 0 to prevent undesirable transients upon a change in the setpoint, which is an effect known as *derivative kick*. The setpoint b affects the overshoot performance of the controller. Generally, a small b value reduces overshoot. However, smaller b values can also result in slower response to setpoint changes. For more details on picking the right setpoint values, see Reference [1].

When $b = 1$ and $c = 1$, the behavior of the two degree-of-freedom PID controller is identical to a classical PID controller.

Simulating with $b = 1$ and $c = 1$

When $b = 1$ and $c = 1$, the behavior of the two degree-of-freedom PID controller is identical to a classical PID controller. The control signal, setpoint signal, and closed-loop response of the model are shown in Figure 4.

Two degree-of-freedom PID Control Demonstration

Copyright 2009-2018 The MathWorks, Inc.

Figure 4: Control signal, setpoint vs. measured output.

Figure 4 clearly shows the spikes in the control signal, which are caused by aggressive proportional and derivative response to the setpoint change. Modifying the b and c weights can make this response less aggressive, as shown next.

Simulating with the $b = 0$ and $c = 0$

In this case, the two degree-of-freedom PID controller is known as I-PD where only the I action acts on the classical error signal, and the PD action acts only on the measured output.

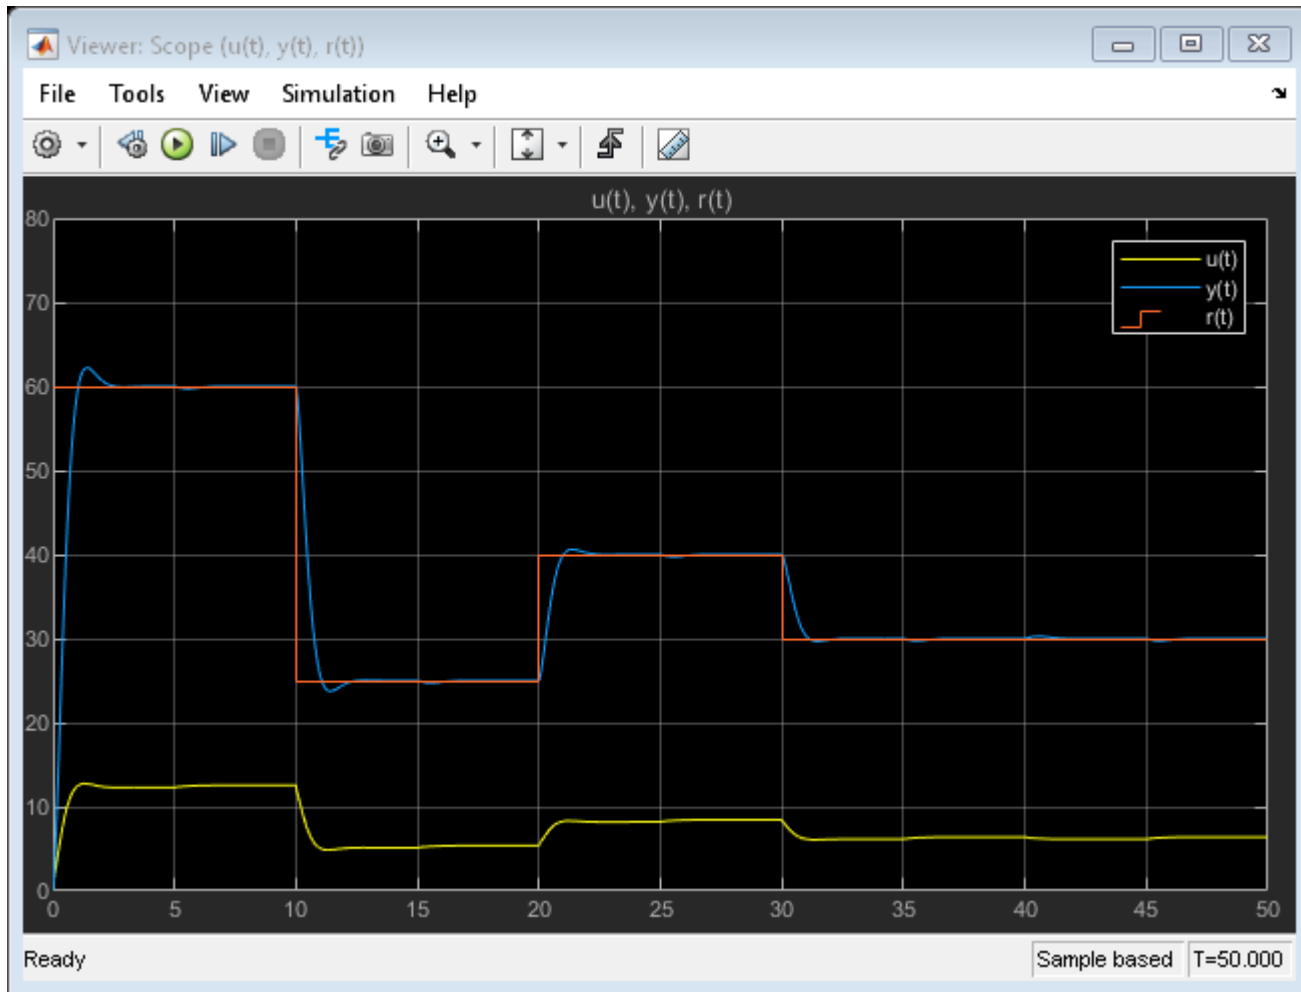

Figure 5: Control signal, setpoint vs. measured output.

The simulation results clearly show the absence of large transients in the control signal due to the sudden changes in the setpoint.

See Reference [1] for more information on how b and c are chosen.

Summary

The PID Controller (2DOF) block in Simulink supports two degree-of-freedom PID control. This block can be used for tracking complex setpoint profiles and moderating the impact of sudden setpoint changes on control signal transients. The PID tuner of Simulink® Control Design™ can be used to automatically tune all the gains (P, I, D, N, b , c) of the PID Controller (2DOF) block.

Data Typing in Simulink

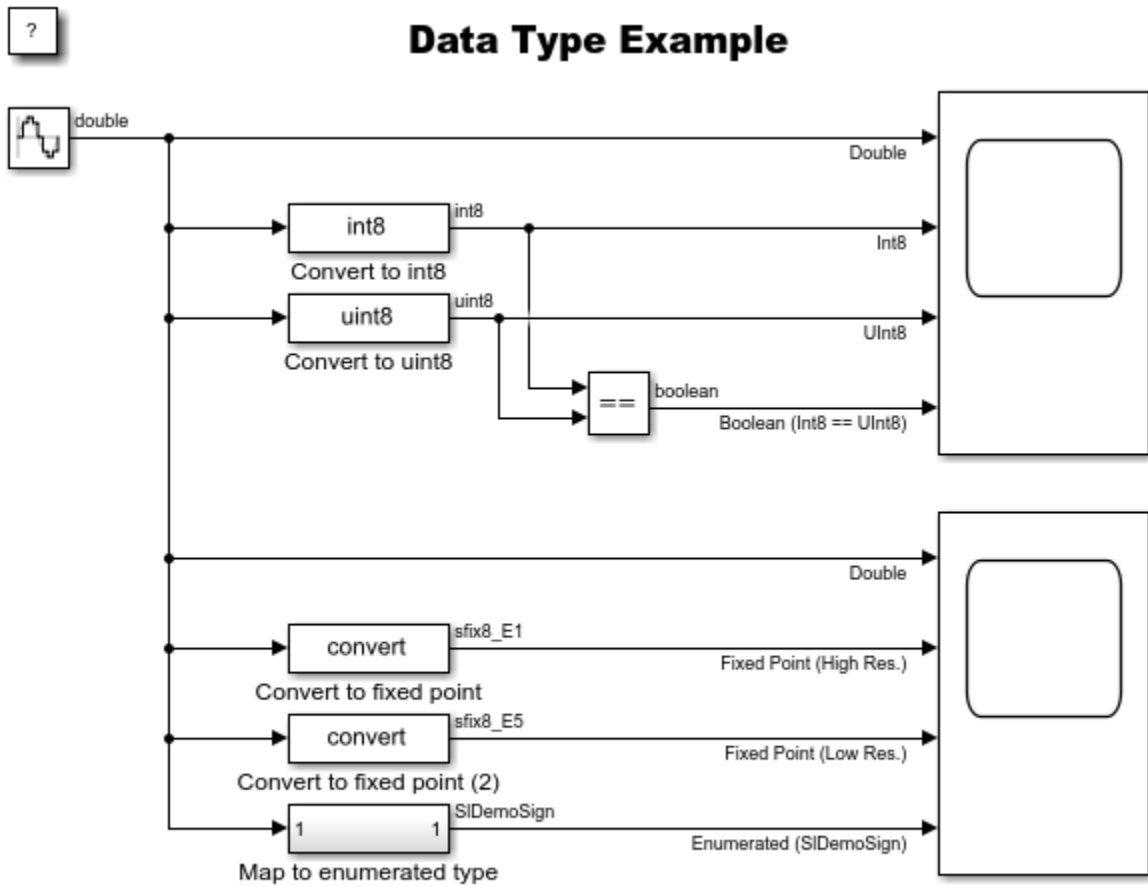

This example shows how to use data types in Simulink. The model used in this example converts a double-precision sine wave having an amplitude of 150 to various data types and displays the converted signals on two scopes.

The first scope shows the original sine wave and the result of converting this signal to signed and unsigned 8-bit integer data types with saturation enabled. The bottom axes show the boolean results of comparing the signed and unsigned integer values.

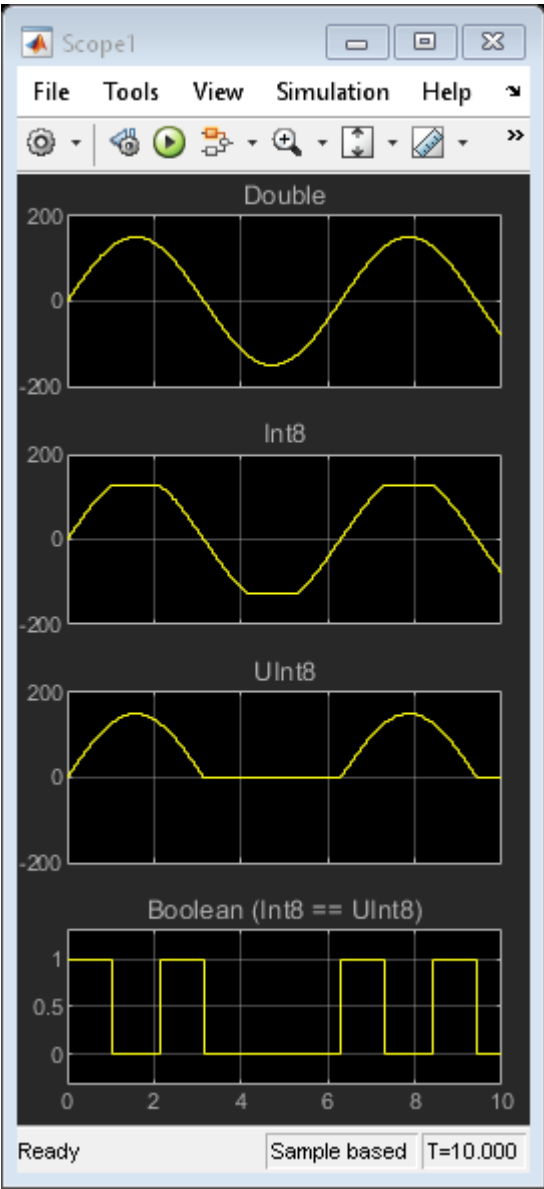

The second scope shows the original sine wave and the result of converting this signal to two fixed-point data types: one high-resolution, the other lower resolution. The bottom axes show the result of mapping the sine wave to an enumerated data type that indicates whether the signal is positive, negative or zero.

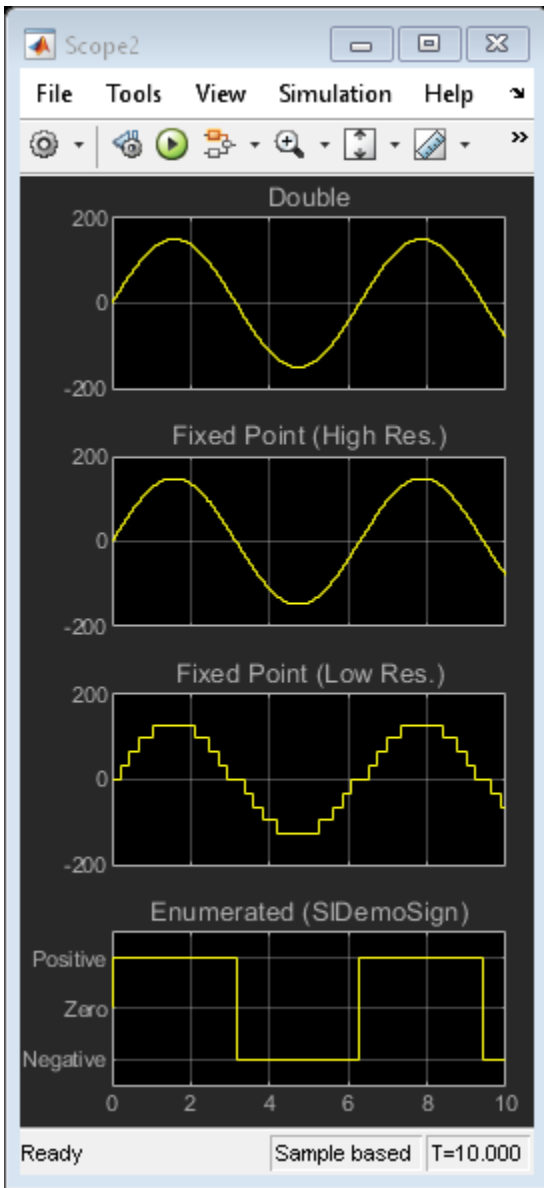

Similar data type support exists for parameters and states. Simulink also supports other integer and floating-point data types, such as, single, int16, and uint32, and fixed-point types with slope/bias and wordlengths from 1 to 128 bits. You can also define types for bus signals and aliases for existing types.

NOTE: If you do not have a license for Fixed-Point Designer™ then the fixed-point signals will be replaced by single-precision signals.

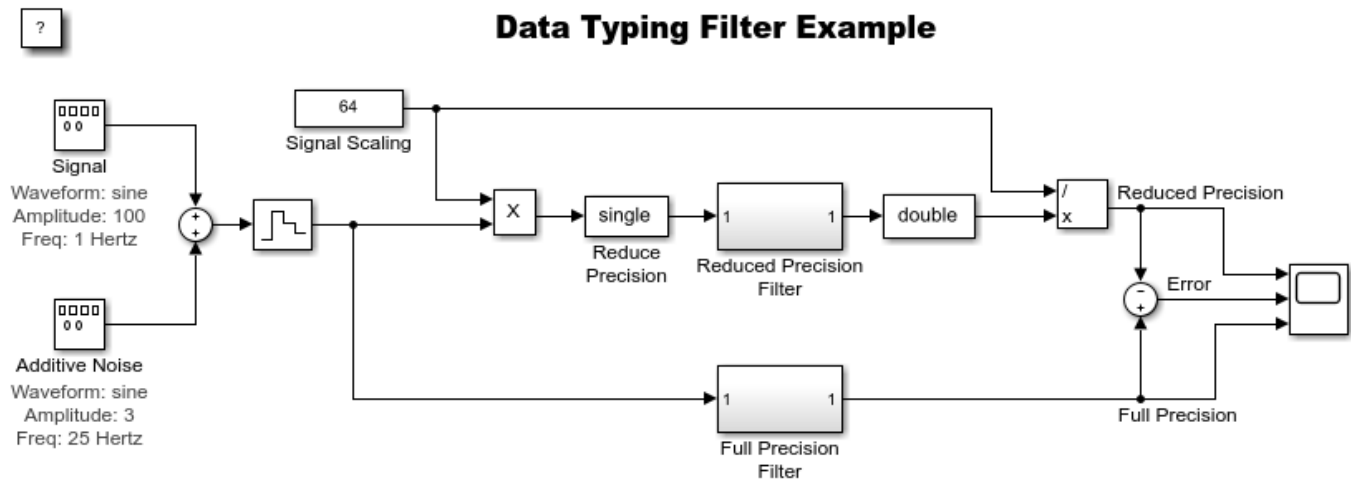

Copyright 2004-2015 The MathWorks, Inc.

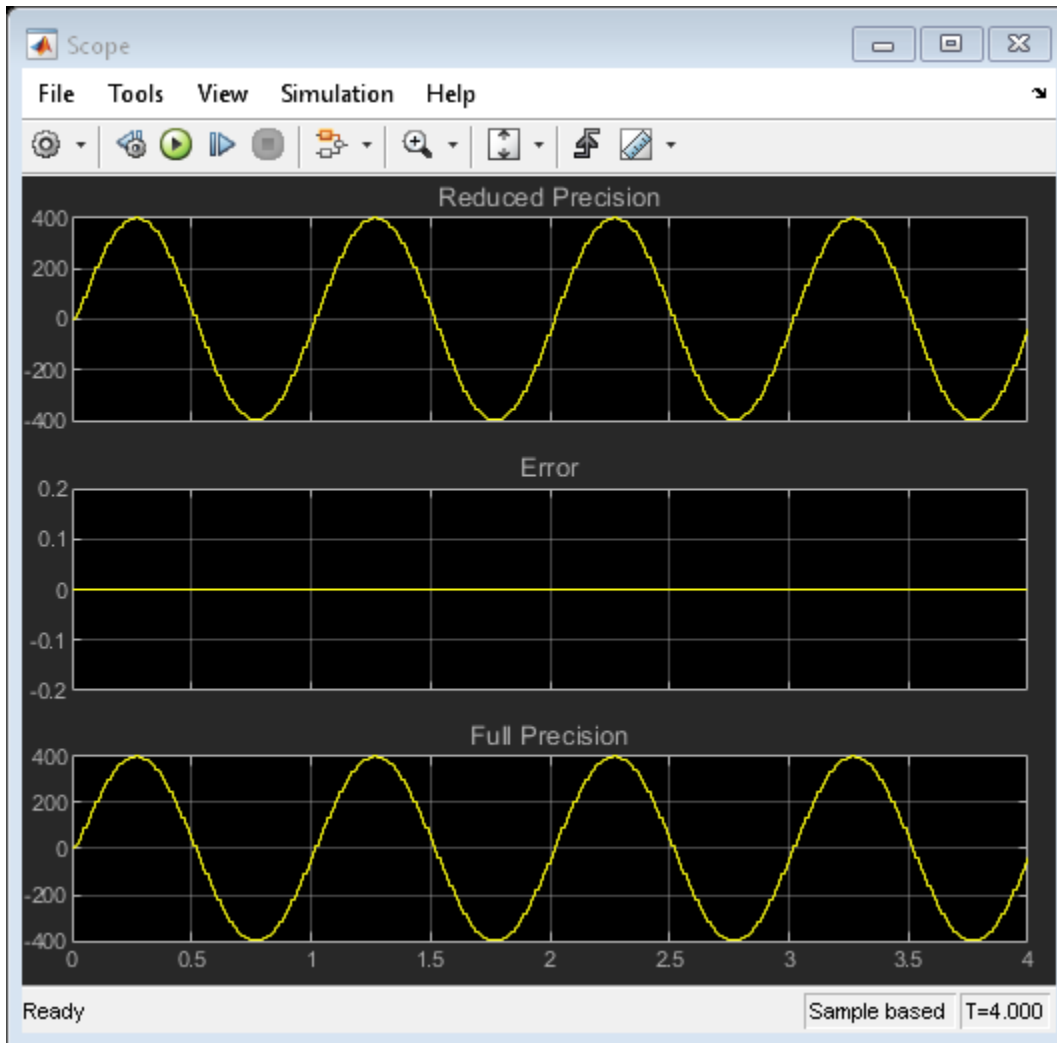

Data Typing Filter

This example shows how a filter can be applied to signals of different data types using standard Simulink® blocks. In this example, a signal with some noise on it is produced. This signal is then fed into a filter as a single precision data type and a standard double data type. The output from the filter for each signal is then compared and the error is displayed on the scope.

Copyright 2004-2015 The MathWorks, Inc.

Simulink Bus Signals

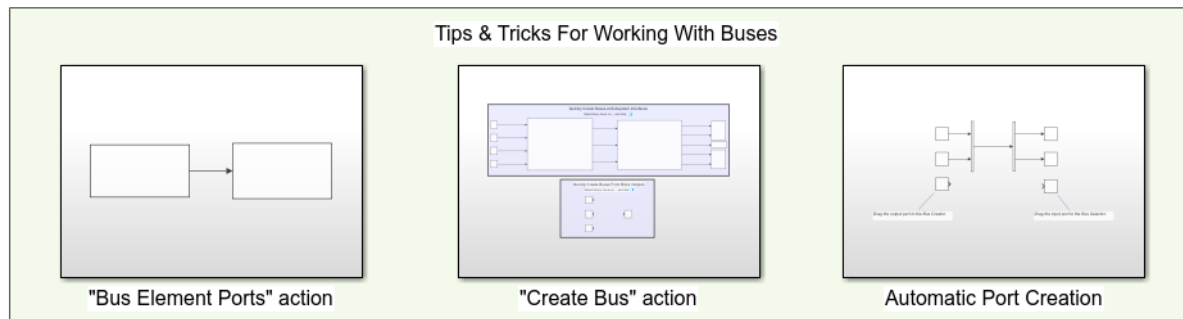

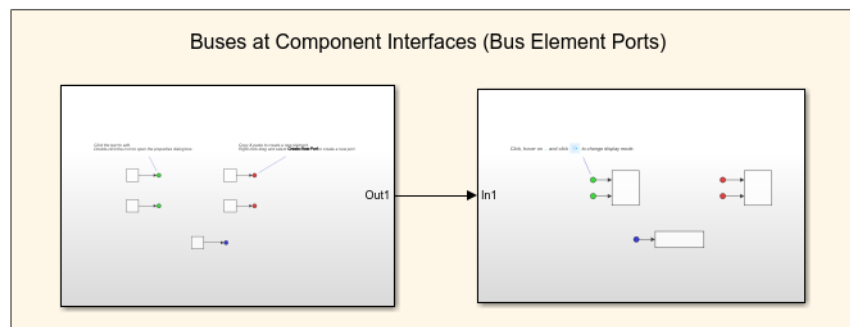

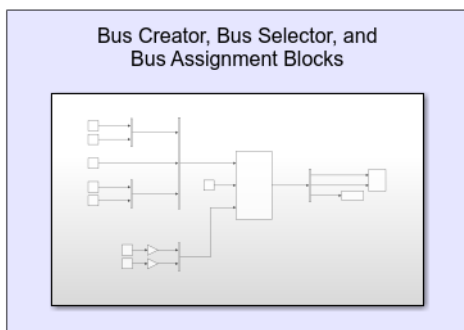

This example introduces you to the following Simulink® bus signal capabilities:

- Bus Creator, Bus Selector, and Bus Assignment blocks
- Bus Element Ports at component interfaces
- Smart editing to perform common bus workflows faster

The three areas in the `slexBusExample` model used in this example correspond to these three capabilities.

Buses in Simulink

[Click here for help](#)

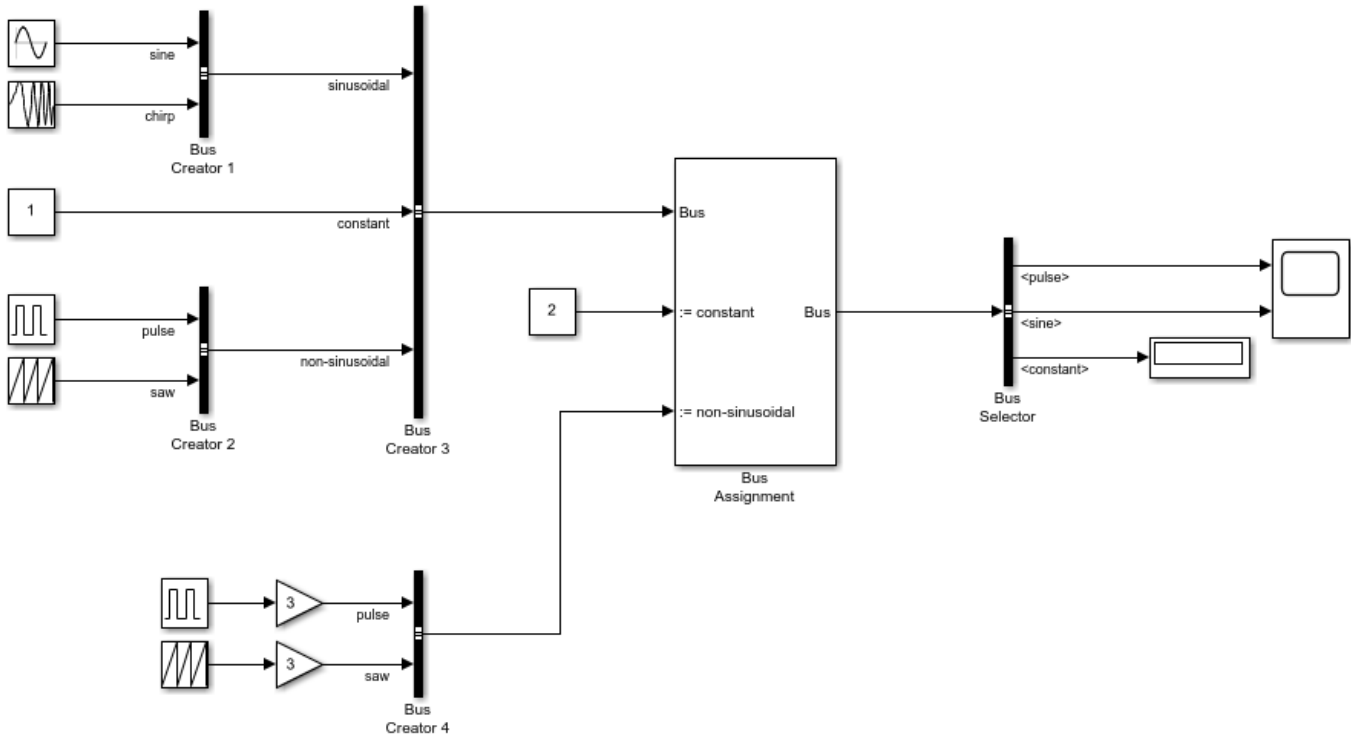

Copyright 2004-2017 The MathWorks, Inc.

Bus Creator, Bus Selector, and Bus Assignment Blocks

The subsystem in the "Bus Creator, Bus Selector, and Bus Assignment Blocks" area shows how to

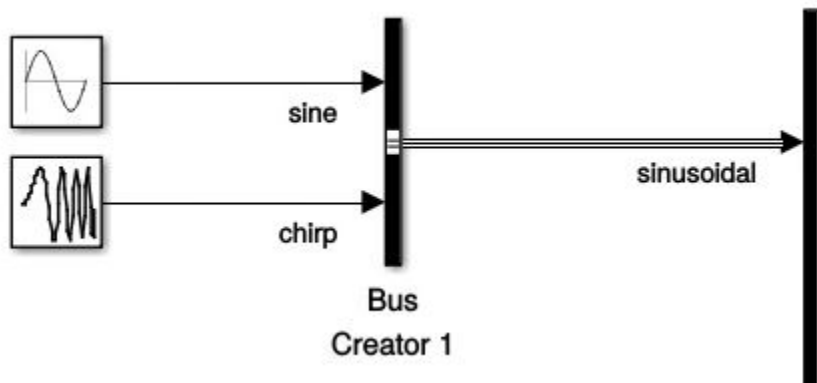

- Create bus signals using the Bus Creator block
- Replace signals in a bus using the Bus Assignment block
- Select signals from a bus using the Bus Selector block

Use a Bus Creator block to bundle the signals connected to its inputs into a bus. A bus signal represents a set of signals, analogous to a bundle of wires tied together. For example, the bus signal created by **Bus Creator 1** contains the two signals connected to its inputs: `sine` and `chirp`. You can view the hierarchy of a signal by right-clicking on it and selecting **Signal Hierarchy** from the menu. You can also create *nested* buses. For example, `sinusoidal` and `non-sinusoidal` are sub-bus signals in the bus created by **Bus Creator 3**.

Use a Bus Assignment block to replace one or more signals in the signal that is connected to its **Bus** input. For example, **Bus Assignment** replaces the signals `constant` and `non-sinusoidal` in the bus created by **Bus Creator 3** with new signals. You can use the Bus Assignment block to replace both leaf and sub-bus signals.

Use a Bus Selector block to extract one or more signals from the bus connected to its input. For example, **Bus Selector** selects the `non-sinusoidal.pulse`, `sinusoidal.sine`, and `constant` signals. You can run the simulation to visualize `non-sinusoidal.pulse` and `sinusoidal.sine` in the scope and `constant` in the display.

After running the simulation, look at the lines in `slexBusExample`. Notice that several signals are drawn with three lines. This line format indicates that the signal is a **bus signal**.

For more information on buses, see [Getting Started with Buses](#).

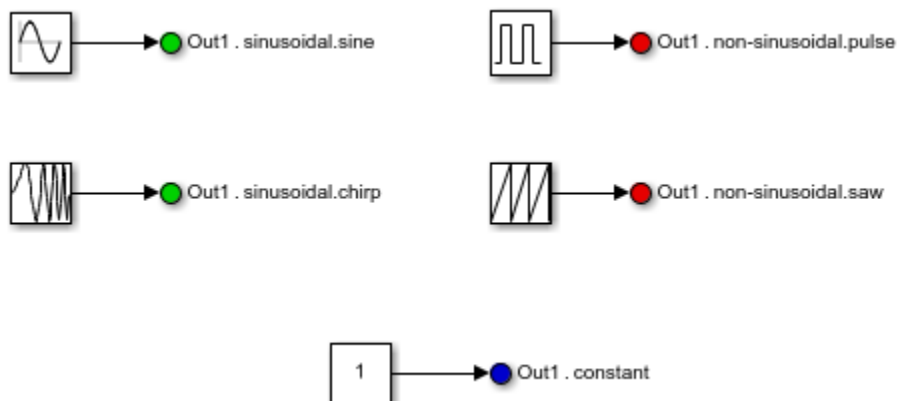

Bus Element Ports at Component Interfaces

The subsystems in the "Buses at Component Interfaces (Bus Element Ports)" area show how to

- Create bus signals using the Out Bus Element block
- Select signals from a bus using the In Bus Element block

Out Bus Element Blocks

The first subsystem consists of five source blocks and five Out Bus Element blocks.

An Out Bus Element block is similar to a Bus Creator block connected to an Outport block. Each Out Bus Element block has a label. You can display this label in two modes. In **Expanded Notation** mode, the label is made up of the name of the corresponding subsystem port and a dot-separated string that determines the element in the bus. For example, the Out Bus Element block with the label `Out1.sinusoidal.sine` creates a leaf-signal named `sine` in a sub-bus named `sinusoidal` at the output port named `Out1`. In **Compact Notation** mode the leaf-signal name becomes the label. You can switch between **Expanded Notation** and **Compact Notation**.

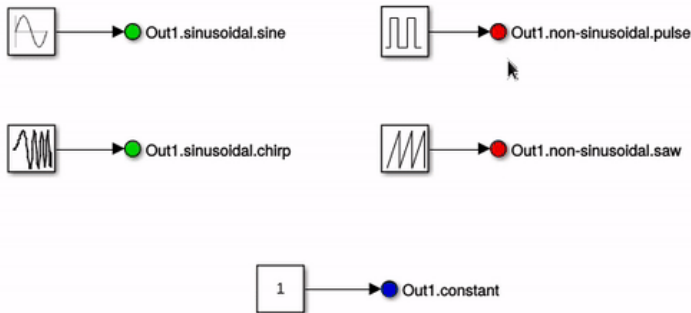

In either mode, you can directly edit the label text to change the element created in the output bus.

To create a new element in the bus, copy and paste an Out Bus Element block. To create a new output port at the subsystem interface, right-click and drag an Out Bus Element block and select **Create New Port**.

To see the bus created by a group of Out Bus Element blocks, double click on the icon of one of the blocks to open the port properties dialog box. You can highlight the signals connected to the blocks, change the name and number of the port, change the colors of the blocks, and reorder the signals in the bus.

In Bus Element Blocks

The second subsystem consists of two Scope blocks, one Display block, and five In Bus Element blocks.

An In Bus Element block is similar to an Inport block connected to a Bus Selector block. The labels of In Bus Element blocks work the same way as Out Bus Element block labels do. For example, the In Bus Element block with the label `In1.sinusoidal.sine` selects a leaf signal named `sine` in a sub-bus named `sinusoidal`.

To change the element selected from the input bus, edit the label text directly. If a bus is already connected to the corresponding input port, you can select from a list of available signals.

To select a new element from the bus, copy and paste an In Bus Element block. To create a new input port at the subsystem interface, right-click and drag an In Bus Element block and select **Create New Port**. To see the bus accessed by a group of In Bus Element blocks, double-click the icon of one of the blocks to open the port properties dialog box. You can change the name and number of the port, change the color of the blocks, and observe any missing or unused signals in the incoming bus.

For more information about using In Bus Element and Out Bus Element blocks, see Simplify Subsystem Bus Interfaces.

Smart Editing to Perform Common Bus Workflows Faster

The subsystems in the "Tips & Tricks For Working With Buses" area show how to speed up common bus tasks by using:

- The "Bus Element Ports" smart editing cue to convert Bus Selector and Bus Creator blocks to In Bus Element and Out Bus Element blocks
- The "Create Bus" smart editing cue to create buses at subsystem interfaces and to bundle outputs of individual blocks into a bus
- Automatic port creation to add a new signal to a Bus Creator block and to select a new signal from a Bus Selector block

Convert Bus Creator and Bus Selector blocks to In Bus Element and Out Bus Element Blocks

You can use the "Bus Element Ports" smart editing cue to convert existing subsystems that use Bus Selector and Bus Creator blocks at their interfaces to use instead In Bus Element and Out Bus Element blocks.

- 1 Click on a Bus Selector block that is connected to an Inport block or a Bus Creator block that is connected to an Output block.
- 2 Select **Bus Element Ports** from the action bar.

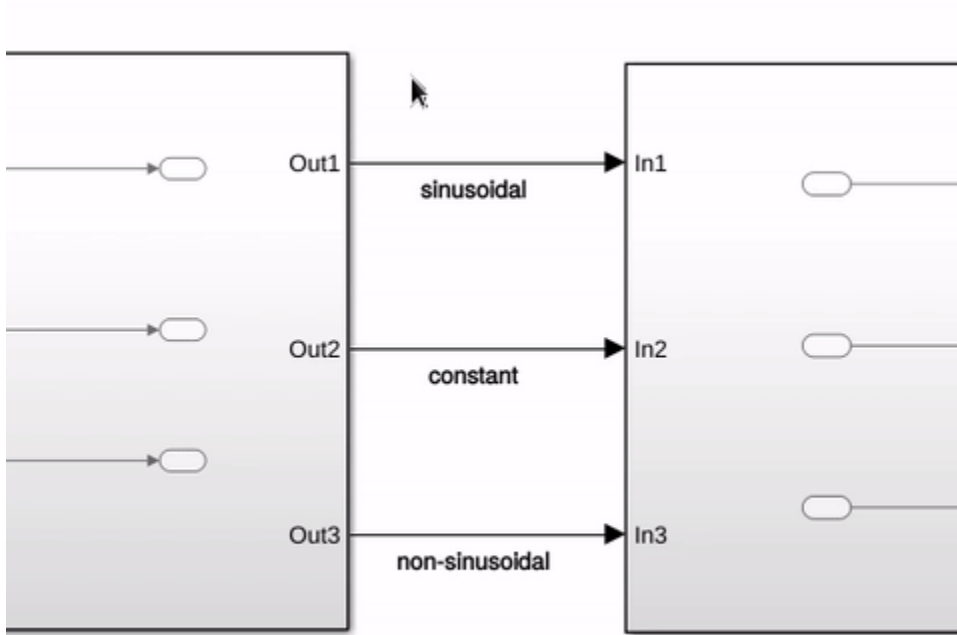

Bundle Individual Signals into a Bus

You can use the "Create Bus" smart editing cue to bundle multiple signals into a bus.

- 1 Drag a selection box around the signals of interest.
- 2 Select **Create Bus** from the action bar.

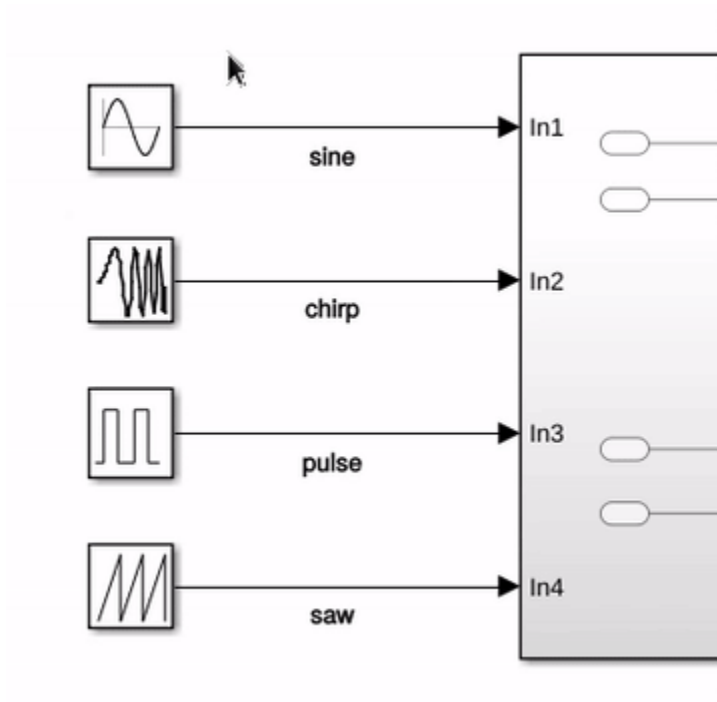

Between Subsystems

When performed between two subsystems, this action replaces the Inport and Outport blocks in the source and destination subsystems with In Bus Element and Out Bus Element blocks.

Subsystem Inputs

When performed at the input of a subsystem that is connected to some other non-subsystem block, this action bundles the selected signals into a bus using a Bus Creator block and replaces the Inport blocks in the subsystem with In Bus Element blocks.

Subsystem Outputs

When performed at the output of a subsystem that is connected to some other non-subsystem block, this action replaces the Output blocks in the subsystem with Out Bus Element blocks and inserts a Bus Selector block to maintain connectivity.

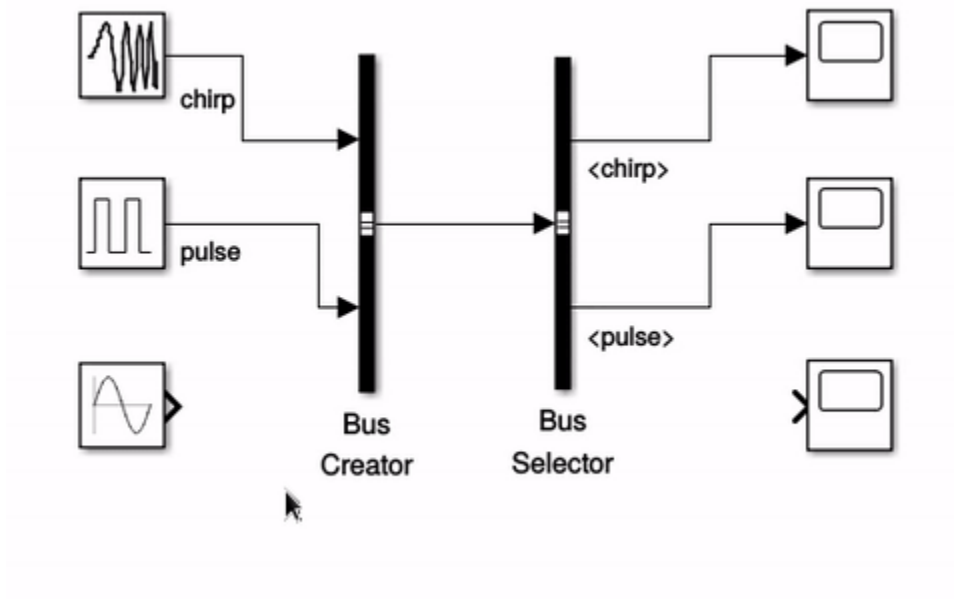

Block Outputs

When performed at the outputs of individual blocks, this action inserts a Bus Creator block, resizes it, and makes the connections.

Automatic Port Creation

You can add a new signal to a bus by dragging a signal line to a Bus Creator block. To select a new signal from a bus, drag a signal line to a Bus Selector block and choose the signal you want from the list of available signals.

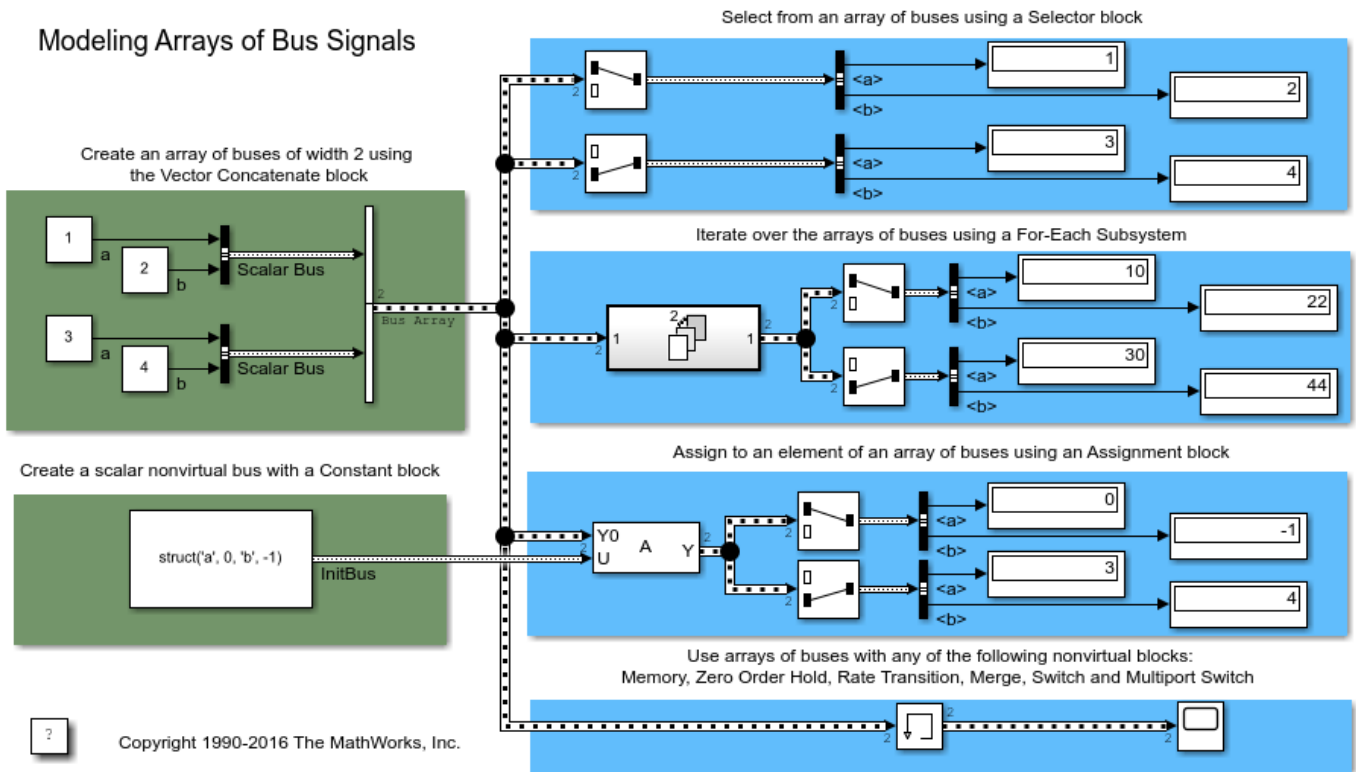

Modeling Arrays of Buses

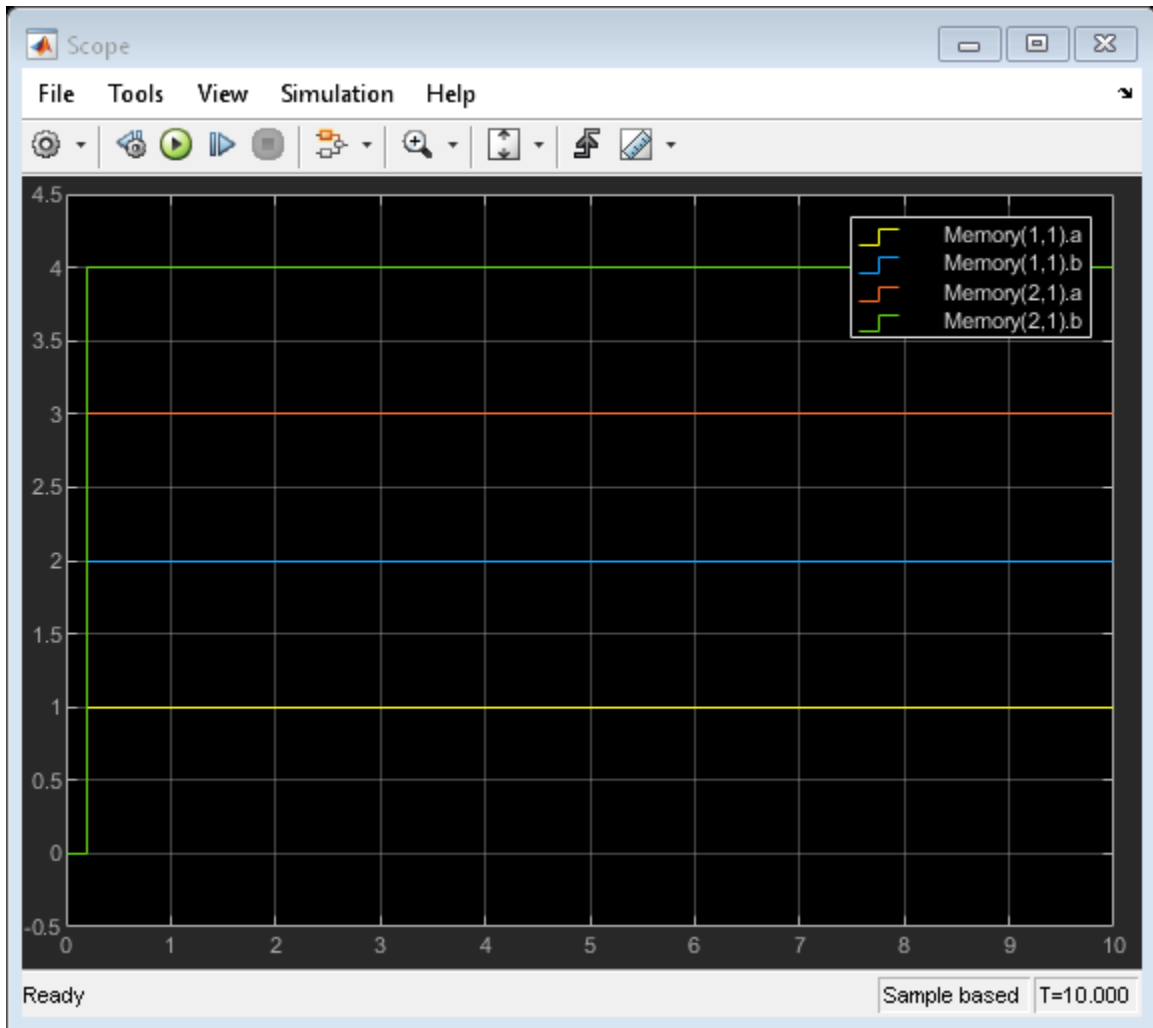

This example illustrates the use of arrays of buses in Simulink® to represent structured data compactly, eliminating the need to include multiple copies of the same buses. You can also use For Each subsystems to iteratively process each element of the bus array.

In this example, the array of buses is created using a Vector Concatenate block. The input bus signals to the Concatenate block must be nonvirtual and of the same type (that is, have the same names, hierarchies and attributes for the leaf elements).

The example also illustrates the use of the Selector and Assignment blocks to select from and assign into the array of buses.

Modeling Arrays of Bus Signals

Matrix Signals

This example shows how to use matrix and frame signals in Simulink® diagrams. Through this example, you can access models that relate to the following practical applications.

- Feedback Systems
- Lunar Module Digital Autopilot
- Matrix Support S-Function
- Frame Signals

Matrix and Frame Support Models

Variable-Size Signal Basic Operations

This model shows how variable-size signals can be generated and also illustrates some of the operations that can be applied to them. The purpose of this example is to introduce you to the basic operations associated with variable-size signals.

About This Example

Open the example model `sldemo_varsize_basic`. This model contains several blocks that support variable-size signals.

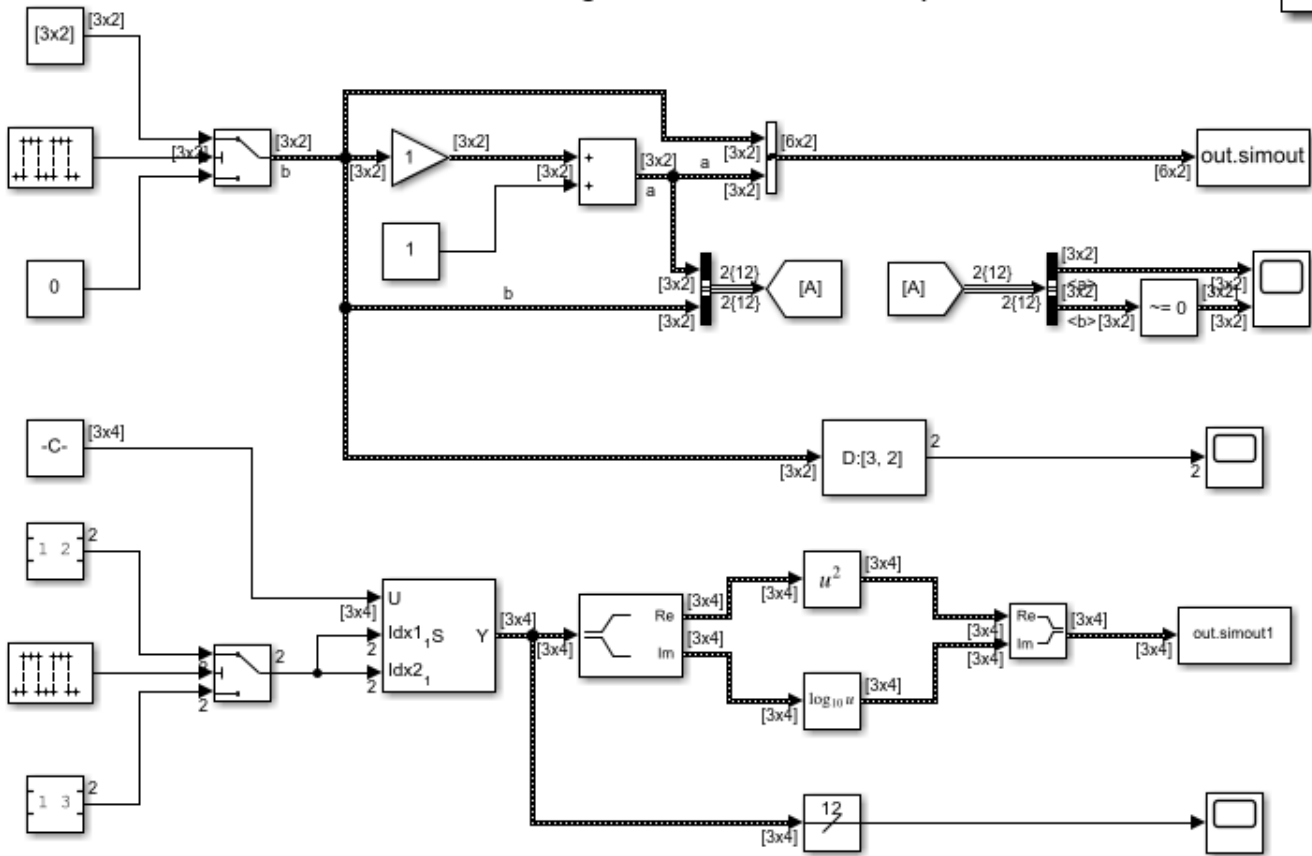

Common ways of generating variable-size signals are:

- Use a Switch block with a different size signal at each input port.
- Use a Selector block and allow the size selection index to change over time.

Eighty blocks can operate with variable-size signals including the Gain block, the Sum block, the Math Function block, the Matrix Concatenate block, and the Bus Creator block. In addition, you can probe variable-size signals using the Width or the Probe block, display variable-size signals on Scope blocks and save variable-size signals to the workspace using the To Workspace block.

For a complete list of blocks that support variable-size signals, see "Simulink® Block Support for Variable-Size Signals" in the Simulink documentation.

Variable-Size Signal Generation and Operations

Copyright 2009-2013 The MathWorks, Inc.

Variable-Size Signal Length Adaptation

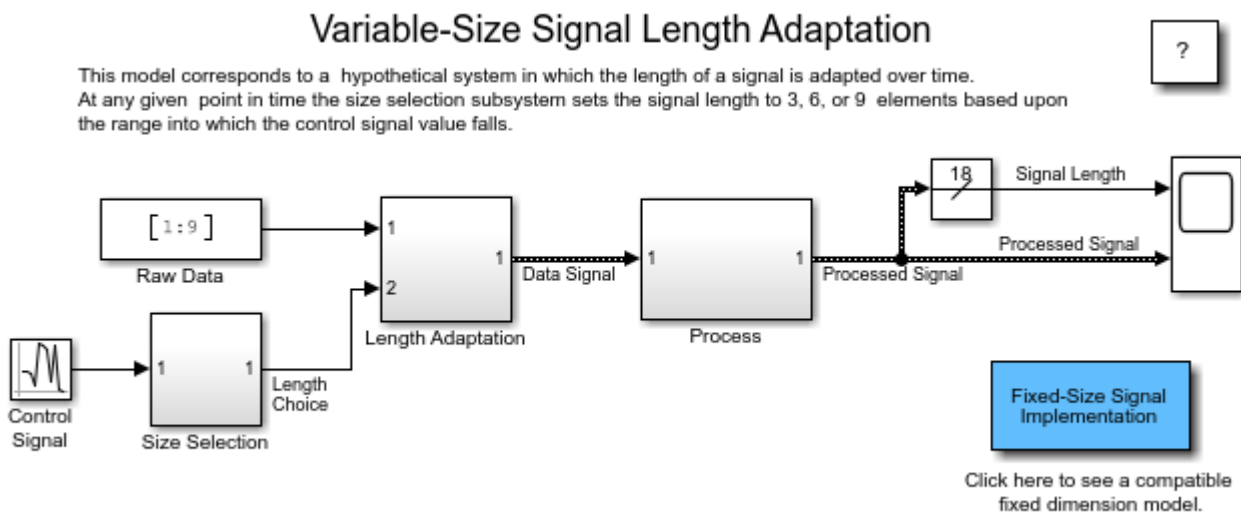

This model shows a hypothetical system where the length of a signal changes over time by adapting to the changes of a control signal.

About This Example

Open the example model `sldemo_varsize_dataLengthAdapt`.

This model consists of two sections: the left section generates a signal and converts the signal to variable size; the right section processes the variable-size signal and outputs it to a scope. Length adaptation is based on the value of the control signal. When the control signal falls within one of the three predefined ranges, the size of the data signal changes accordingly.

This variable-size signal is then fed into a processing block, where blocks supportive of variable-size signals, operate on it. Note the application of a MATLAB Function block with both the input and the output signals of variable-size. The resulting signal, as well as the signal width, are fed to a scope for visualization.

Multimode Variable-Size Signal

This model shows how to use different operation modes to correspond to different signal sizes

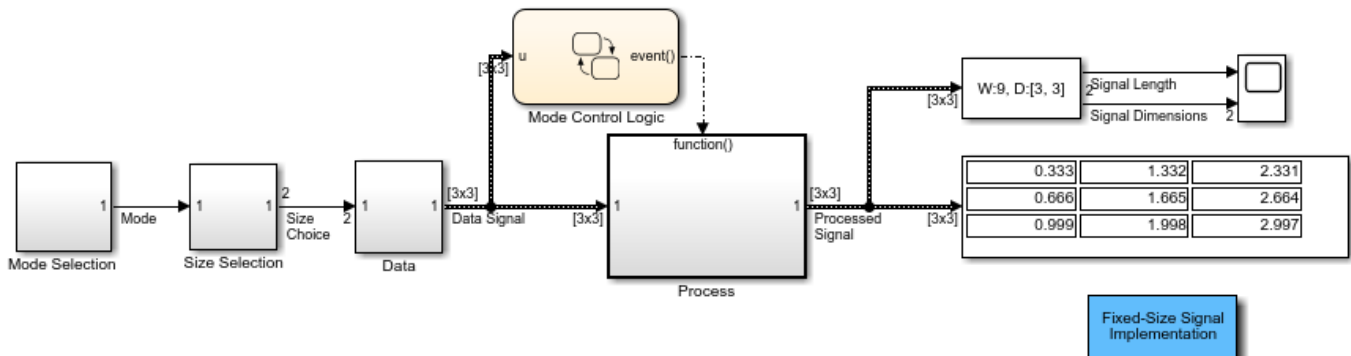

About This Example

Open the example model `sldemo_varsize_multimode`. The processing subsystem in this model receives a variable-size signal where the size of the signal depends on the operation mode of the system. For each mode change, the Mode Control Logic Stateflow® Chart generates a function-call to reset the blocks contained in the Process subsystem.

Mode-Dependent Variable-Size Signals

This model represents a system that has three operation modes. For each mode, the signal has a different size. One Function-Call subsystem with variable-size signals handles the processing of the different signal sizes for each mode. The Mode Control Logic block detects the data signal length changes, and responds by issuing mode switching events. This event triggers the reset of the state and the repropagation of signal sizes within the subsystem.

Click here to see a compatible fixed-size model.

Parallel Channel Power Allocation

This model shows a potential use of the Find block. This block outputs a variable-size signal containing the indices of the nonzero values of the input.

About This Example

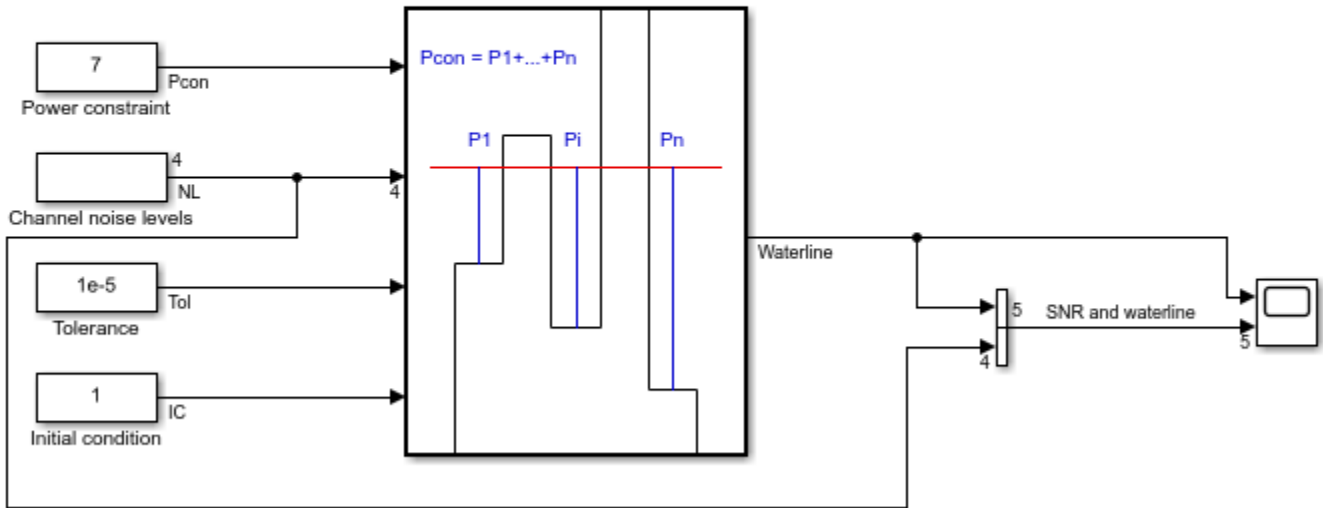

Open the example model `sldemo_varsize_channel_pow_alloc`. This model implements the waterfilling algorithm for obtaining the optimal power allocation for communication channels when a power budget exists. The communication channels involved are independent (i.e., parallel channels) and have different noise levels.

The algorithm iteratively increases the value of the waterline, so that the channels which have a noise level less than the waterline are broadcast. The power used by these transmitting channels is equal to the difference between the waterline and the noise level of the channel. The sum of the power used by all the channels transmitting should satisfy the power budget within the specified tolerance.

The Find block is used in the calculation of the total power used for a certain waterline value. The channels which are set to transmit at that waterline level are selected using logical indexing. The logical indices are obtained after thresholding the difference of the waterline and the channel noise levels. As a result, the channels with noise levels larger than the waterline are assigned a zero, and those with noise levels below the waterline are assigned ones. The Find block is used for converting the logical indices into linear indices. Note that this signal is properly modeled by a variable-size signal since the number of channels below the threshold is unknown at compile time. The linear indices are fed into a Selector block that picks the channel transmission powers. Subsequently, these powers are summed to get the current value of used power. If this value is smaller than the power budget, the waterline is increased and the process is repeated until the used power equals the power constraint.

Optimal Power Allocation for Parallel Channels (Waterfilling)

The NL signal contains the channel noise levels.
 The Pcon signal is the total available power budget.
 Tol is the tolerance to use in the search for the waterline level.

Merging Signals

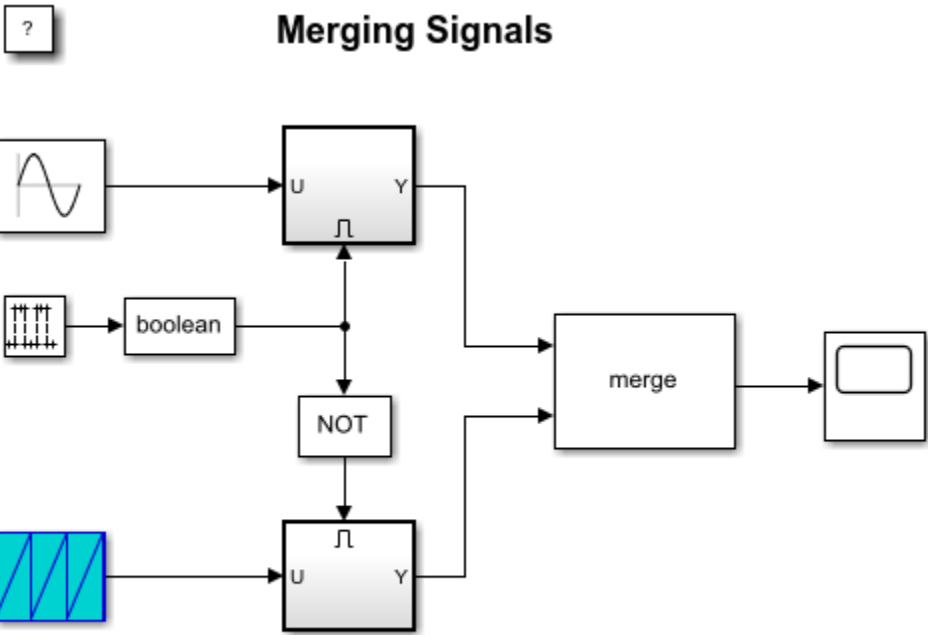

This model shows the following Simulink® concepts:

Model Description

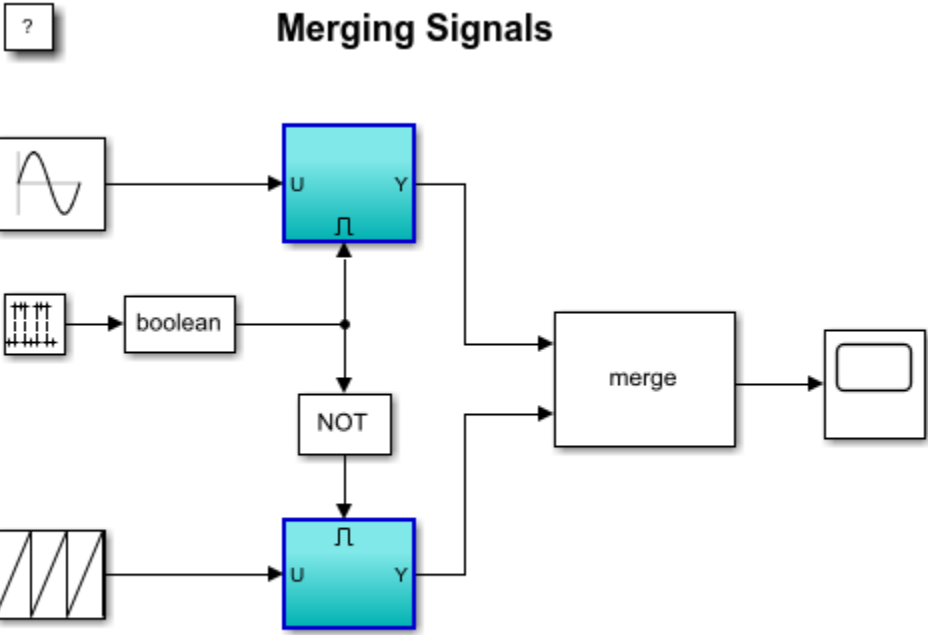

Copyright 2004-2015 The MathWorks, Inc.

The left side of this model contains two blocks, for example the Repeating Sequence block, from the Simulink Sources library. Each block generates a scalar output signal of the form displayed on the block's icon.

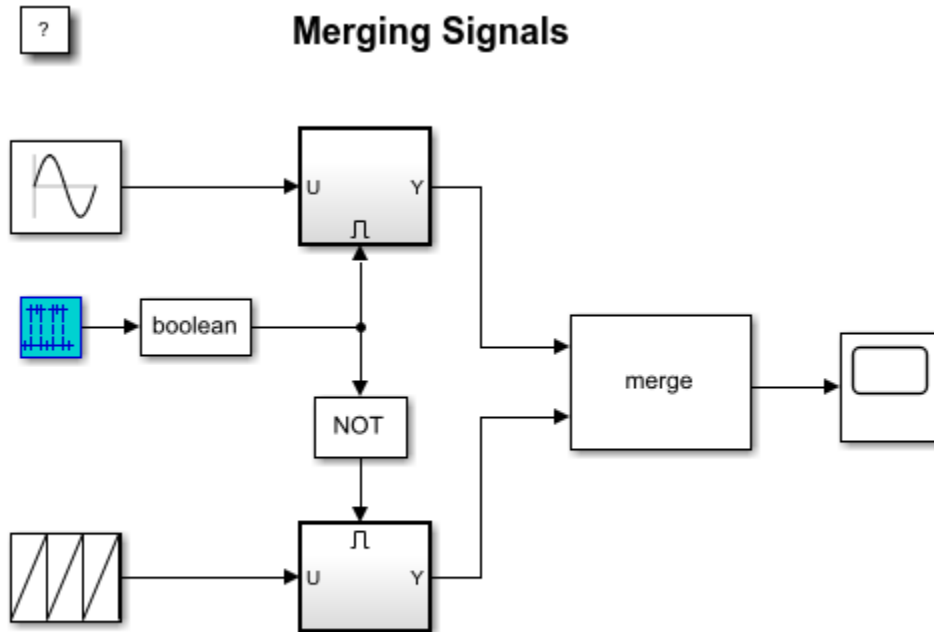

Copyright 2004-2015 The MathWorks, Inc.

These two signals are fed into different Enabled Subsystems, which are outlined with thick lines.

Copyright 2004-2015 The MathWorks, Inc.

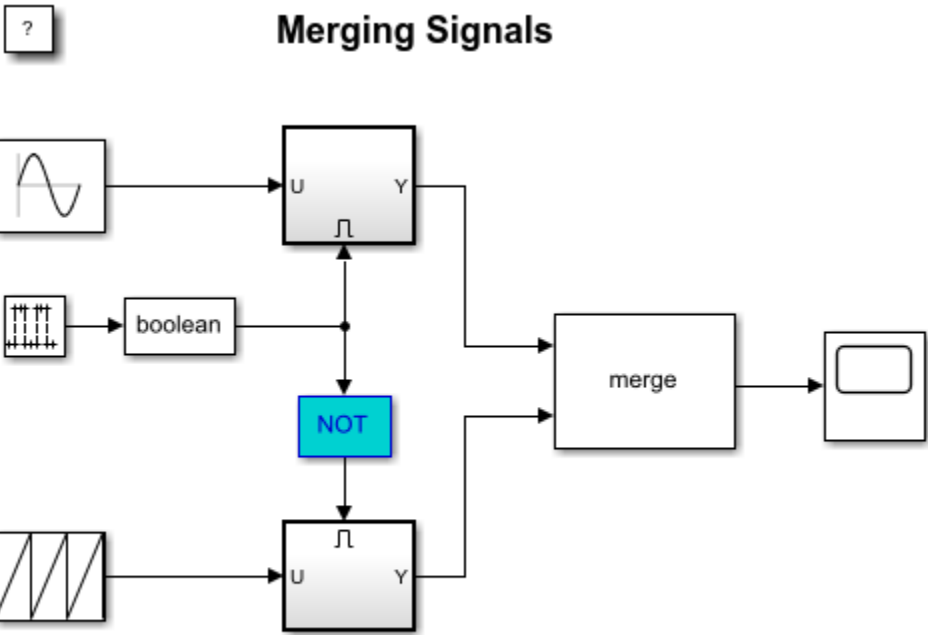

The enabled (or conditionally executed) subsystems are controlled by the signal generated by a Discrete Pulse Generator block.

Copyright 2004-2015 The MathWorks, Inc.

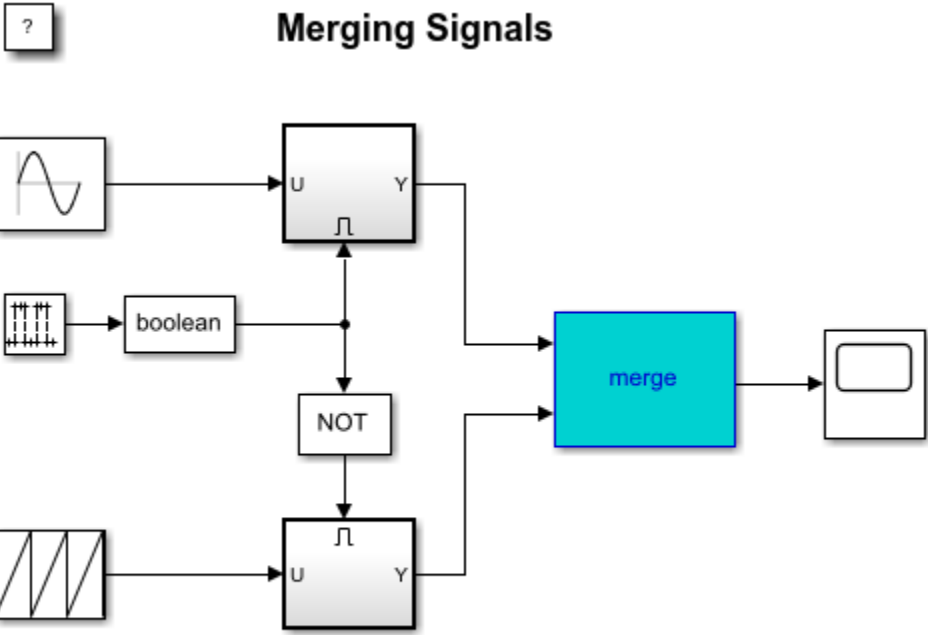

This block's output toggles between the values of zero and one every five seconds. When the output of the Discrete Pulse Generator block is positive, the top enabled subsystem is simulating. When the output of the Discrete Pulse Generator block is zero, the bottom enabled subsystem is simulating.

To force the bottom enabled subsystem to simulate when the Discrete Pulse Generator block's output is zero, the output is passed through a Logical Operator block set to the NOT operator. The NOT block outputs a value of one when its input is zero.

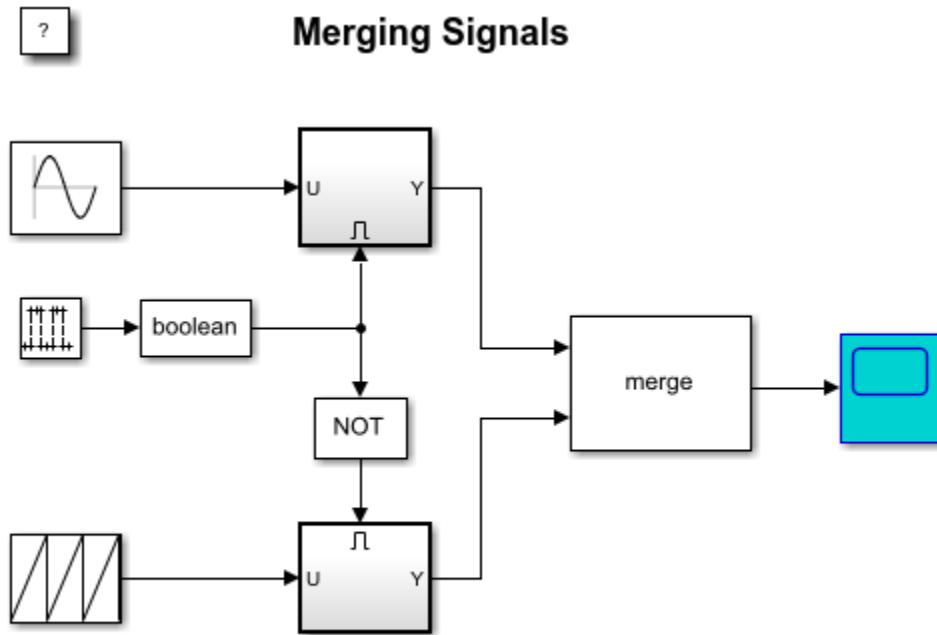

Copyright 2004-2015 The MathWorks, Inc.

The outputs of the two enabled subsystems are fed into a Merge block.

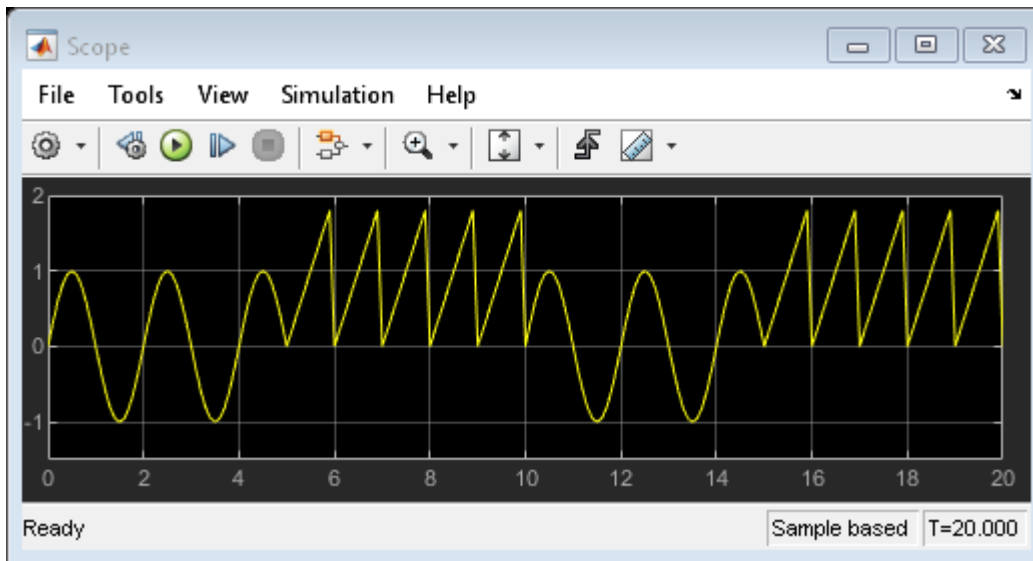

Copyright 2004-2015 The MathWorks, Inc.

The output of the Merge block is, finally, displayed on a Simulink Scope.

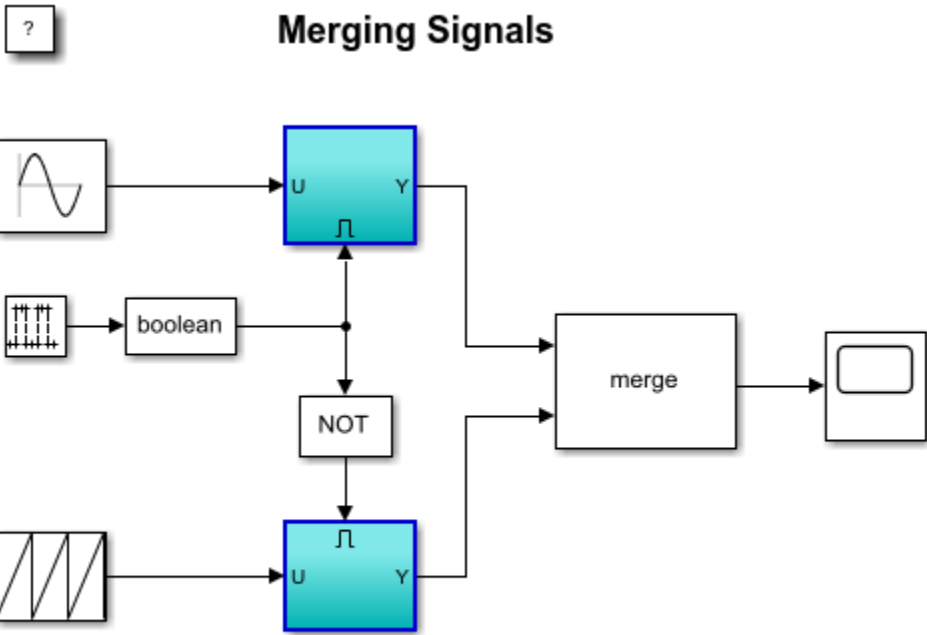

Copyright 2004-2015 The MathWorks, Inc.

You can run the simulation to see the output of the Merge block on the Scope. Notice that the type of waveform shown on the Scope changes every five seconds. This is due to the behavior of the Merge block.

Conditionally Executed Subsystems

The Merge block example contains two conditionally executed subsystems.

Copyright 2004-2015 The MathWorks, Inc.

A conditionally executed subsystem is a subsystem that is only executed at particular times during the simulation, i.e., when certain conditions are met. In this case, the subsystems are enabled subsystems, distinguished by their icons and the additional input port on the top or bottom of the block, as shown below.

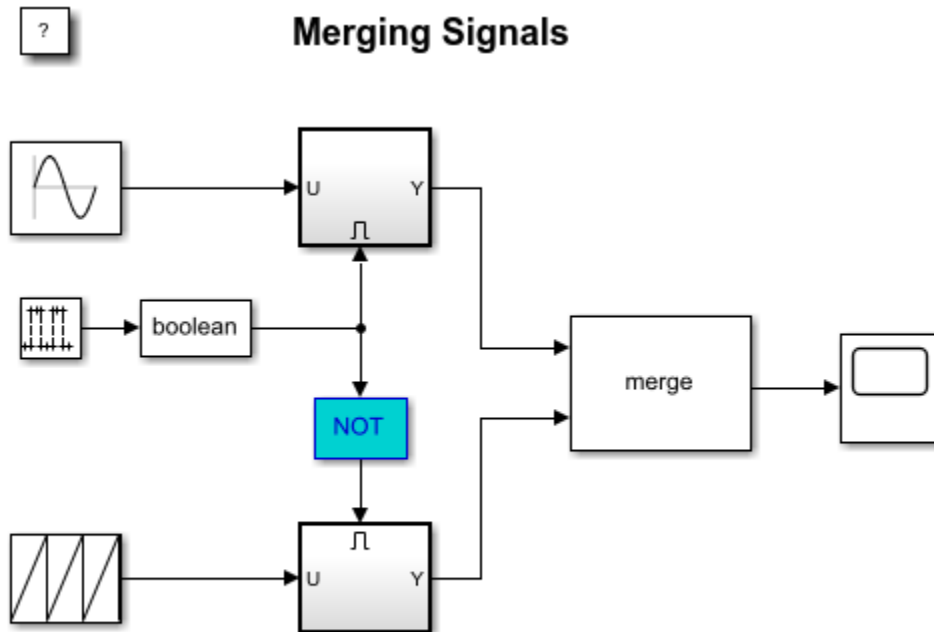

The signal feeding into the additional port is called the control signal. The value of this signal provides the condition that determines whether the subsystem is executed, or not, at any given time step. Enabled subsystems are executed when the control signal is strictly positive.

In this example, you want to execute one of the enabled subsystems when the control signal is positive, and the other when the control signal is zero. You can do this by using the Logical Operator block in Simulink.

Logical Operator Block

The Logical Operator block in Simulink gives you a method for incorporating logical operators and boolean signals into your Simulink diagram.

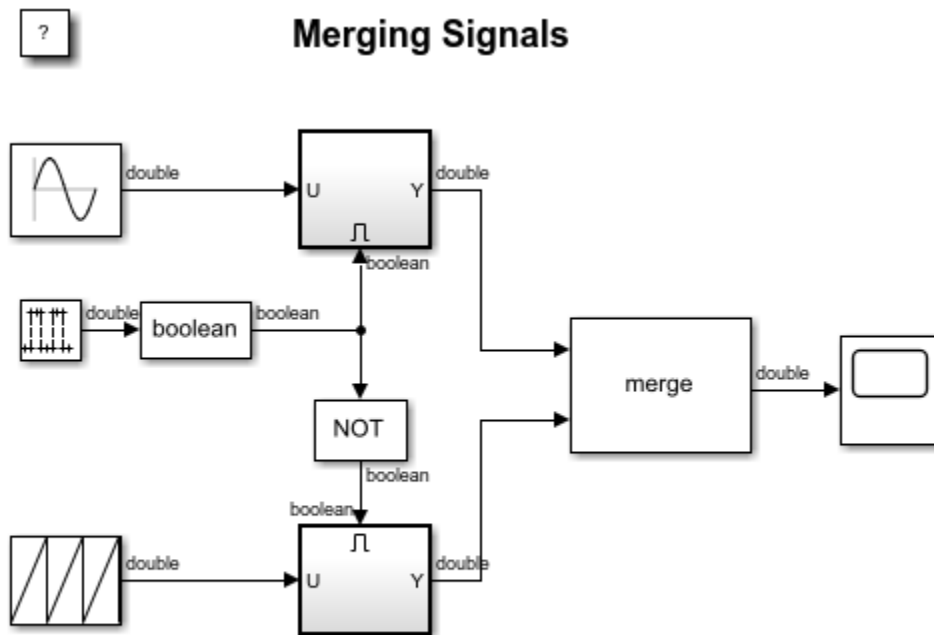

Copyright 2004-2015 The MathWorks, Inc.

You can open the Logical Operator block to see the different operators that are listed in the drop down menu. The current setting of NOT returns 1 (or TRUE) when the input signal is non-zero, or 0 (FALSE) when the input signal is strictly zero.

In this example, you can use this feature to generate a positive value when the control signal goes to zero by maintaining the current operator setting of NOT and closing the dialog.

Note: In the Simulink Editor, on the **Debug** tab, the **Information Overlays** menu offers options for displaying signal and port properties on the block diagram.

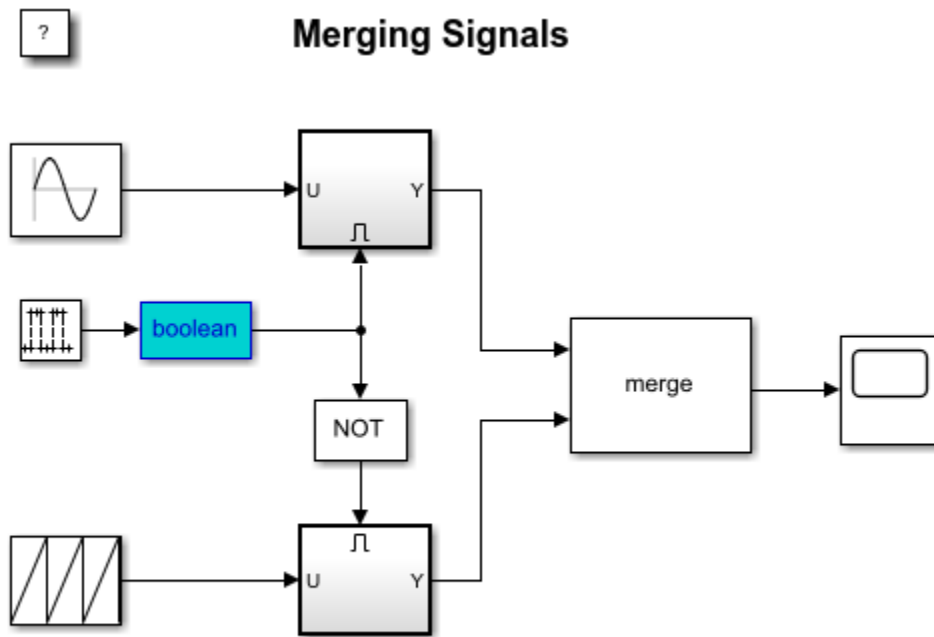

Copyright 2004-2015 The MathWorks, Inc.

Boolean Signals in Simulink®

You have the option to have Simulink to use boolean or double values for the inputs and outputs of the Logical Operator block, using the following steps.

1. To open the Configuration Parameters dialog box, in the Simulink Editor, on the **Modeling** tab, select **Model Settings**.
2. Go to the Optimization page in the Configuration Parameters dialog.
3. See that the **Implement logic signals as boolean data (vs. double)** parameter has been enabled. This optimization tells Simulink whether or not it should allow a signal whose data type is double to be passed into and out of blocks that support the boolean data type.
4. Click the **OK** button on the **Configuration Parameters dialog**.

By having the Data Type Conversion block after the Discrete Pulse Generator block, you avoid an error indicating that the Logical Operator block expects a boolean input signal.

Copyright 2004-2015 The MathWorks, Inc.

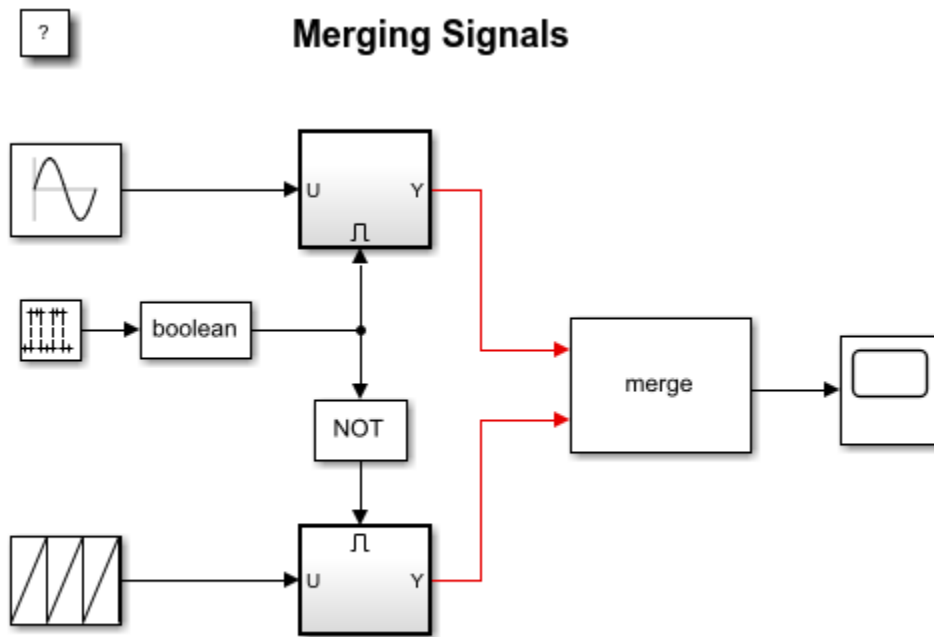

The Merge Block and Alternately Enabling Subsystems

You can use the Merge block to create a single signal whose value is equal to the output of whichever enabled subsystem is currently executing. The following steps.

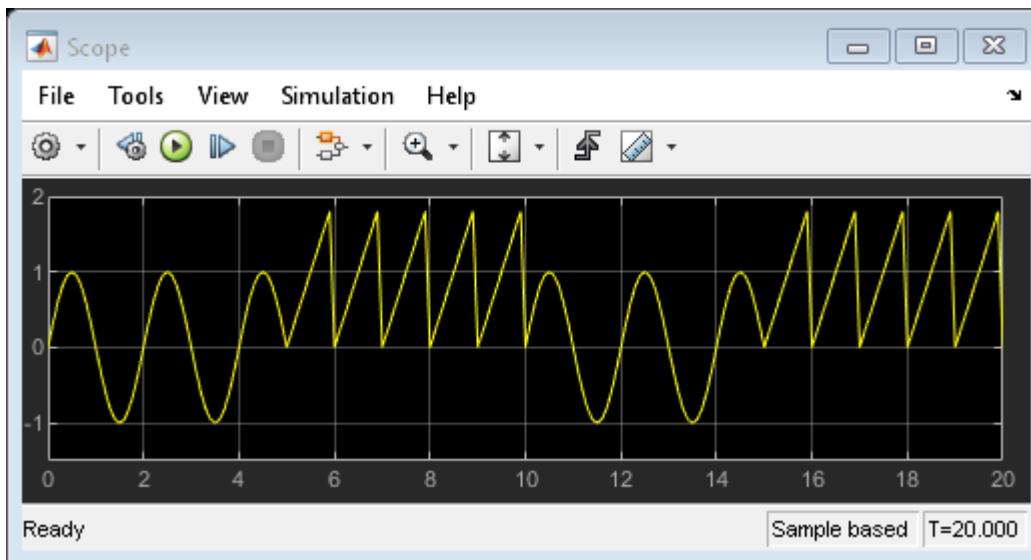

Copyright 2004-2015 The MathWorks, Inc.

1. Open the Merge block's Block Parameter dialog by double clicking on the block.
2. Specify the **Number of inputs** as the number of enabled subsystems whose outputs you want to merge. In this case you want to set the *Number of inputs *to be 2.
3. Leave the **Initial output field** empty to specify that the Merge block sets its initial output to the initial value of one of its input signals. In this case, the output will be the initial value of the subsystem that is enabled when the simulation starts.
4. Close the Merge block's Block Parameter dialog.
5. Connect the output of the two conditionally executed subsystems to the inputs of the Merge block.

Copyright 2004-2015 The MathWorks, Inc.

As before, when you run the simulation, the output of the Merge block is the value of whatever conditionally executed subsystem is executing at any point in time.

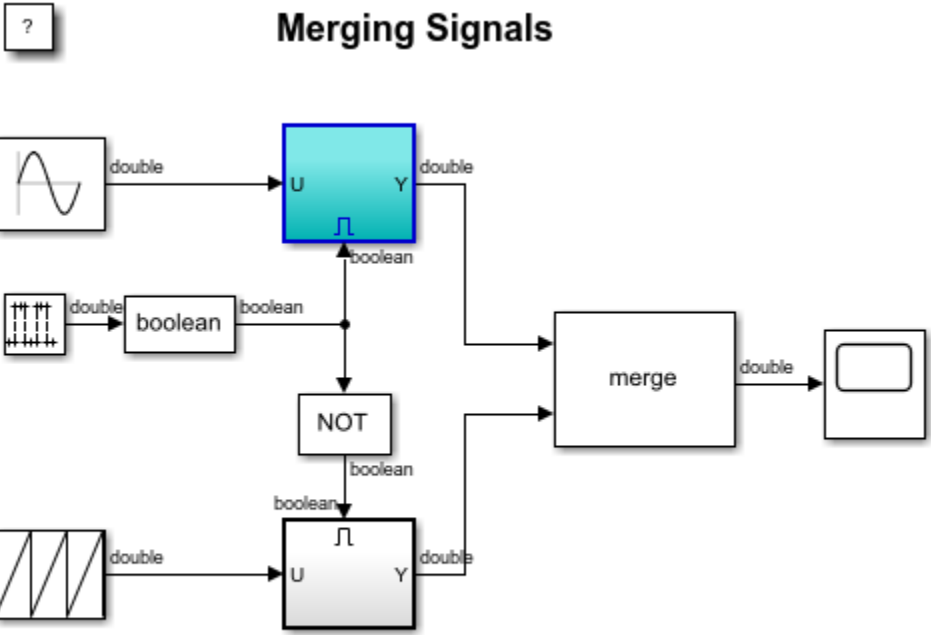

Interesting Feature: Programmatically Changing a Block's Background Color

When you ran the simulation, you should have noticed that the color of the currently executing conditionally executing subsystems changed. This does **not** happen automatically for all conditionally executing subsystems. It was achieved using an S-function and MATLAB® code!

If you open one of the enabled subsystems by double clicking on the block in the Simulink diagram, you'll see it contains the following.

- 1. An Enable block, which is what makes this a conditionally executed subsystem and adds the input port for the control signal

- 2. A Level-2 MATLAB-file S-function block, which runs the MATLAB file S-function mergefcn.m

At each time step, the S-function's mdlUpdate subfunction executes. It sets the BackgroundColor property of the Subsystems based on whether it is currently executing, or not, with the following command.

```
set_param('mergedemo/Subsystem','BackgroundColor','green')
```

For more information on how to write MATLAB file S-functions, see the documentation.

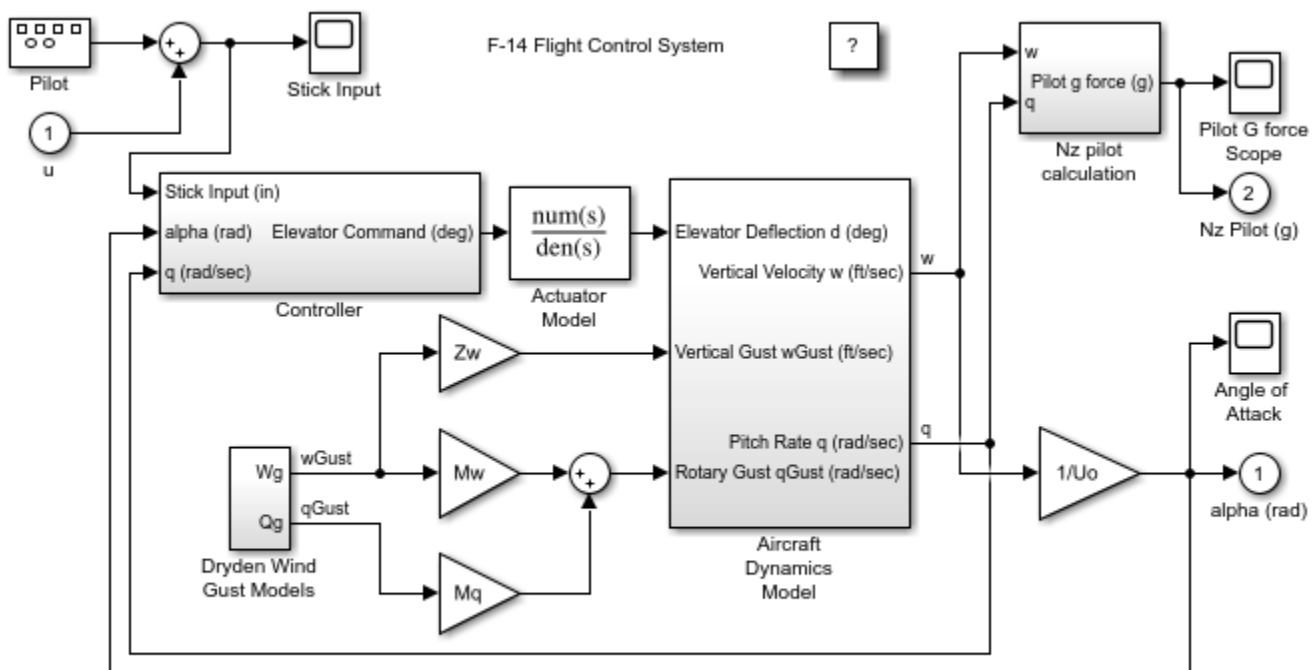

Migration to Structure Parameters

This example shows how to convert a Simulink® model that is parameterized by unstructured workspace variables to a model that is parameterized by a MATLAB® structure. The example uses a number of Simulink utilities to organize model variables from the base workspace into a hierarchical structure and then apply the structure to the model.

Model Description

Open the model `sldemo_applyVarStruct`.

This model uses a number of numeric parameters from the base workspace.

Copyright 1994-2015 The MathWorks, Inc.

Example Requirements

This example changes the original model and creates files in the current working directory. If you plan to save the example models, save a copy in the current directory.

Typical Workflow

Migrating a model to use structure parameters follows these steps:

1. Collect all numeric variables used by the model into a MATLAB structure.
2. Modify the MATLAB structure (if necessary).
3. Apply the MATLAB structure to the model.
4. Configure the appearance of the parameter structure in the generated code (optional).

Collecting Numeric Variables into a MATLAB Structure

You can use **Simulink.findVars** to find out what variables are used by the Simulink model.

```
model = 'sldemo_applyVarStruct';  
varList = Simulink.findVars(model, 'WorkspaceType', 'base')
```

```
varList =
```

```
    20x1 VariableUsage array with properties:
```

```
    Name  
    Source  
    SourceType  
    Users
```

```
var = varList(1)
```

```
var =
```

```
    VariableUsage with properties:
```

```
        Name: 'Ka'  
        Source: 'base workspace'  
    SourceType: 'base workspace'  
        Users: {'sldemo_applyVarStruct/Controller/Gain3'}
```

You can use **Simulink.BlockDiagram.createVarStruct** to generate a MATLAB structure containing all numeric variables from the base workspace or data dictionary used by the model.

```
Simulink.BlockDiagram.createVarStruct(model, 'ModelParam')
```

```
Created variable 'ModelParam' in base workspace.
```

Variable **ModelParam** is a MATLAB structure that contains the numeric variables as fields (sorted by name).

NOTE:

- The model and all data that the model uses must be loaded before calling **Simulink.BlockDiagram.createVarStruct**.
- You cannot give the MATLAB structure the same name as an existing variable.

Modifying the MATLAB Structure

The original structure contains all the variables in one level of hierarchy. You can change the structure before applying it to the model. For example, reorder parameter fields, add extra levels to group model parameters, or add extra fields.

NOTE:

- Do not change the names of the leaf fields in the structure.
- Do not clear the original variables until you have finished the migration process.

1. One way to do this is to use **Simulink.saveVars** to write the structure to a MATLAB script and make changes in the file.

```
Simulink.saveVars('sldemo_applyVarStruct_data.m','ModelParam')
edit sldemo_applyVarStruct_data.m
```

2. Edit the MATLAB script as needed. For example, split the structure into two structures.

- **'ControlParam'** contains all parameters for the Controller subsystem.
- **'ModelParam'** contains all other numeric parameters.

```
ControlParam = struct;
ControlParam.Ka = 0.677;
ControlParam.Kf = -1.746;
ControlParam.Ki = -3.864;
ControlParam.Kq = 0.8156;
ControlParam.Tal = [0.3959 1];
ControlParam.Ts = [0.1 1];
ControlParam.W1 = [1 2.971];
ControlParam.W2 = [1 4.144];
```

```
ModelParam = struct;
ModelParam.Md = -6.8847;
ModelParam.Mq = -0.6571;
ModelParam.Mw = -0.00592;
ModelParam.Swg = 3;
ModelParam.Ta = 0.05;
ModelParam.Uo = 689.4;
ModelParam.Vto = 690.4;
ModelParam.Zd = -63.9979;
ModelParam.Zw = -0.6385;
ModelParam.a = 2.5348;
ModelParam.b = 64.13;
ModelParam.g = 32.2;
```

Save the modified data file. You can use it as a preload function.

3. Run the modified MATLAB script to create the MATLAB structures.

```
sldemo_applyVarStruct_data;
```

Applying the MATLAB Structure to the Model

You can use **Simulink.BlockDiagram.applyVarStruct** to automatically replace the variable references in the block diagram by the equivalent structure references.

1. Apply the MATLAB structure to the model. The model will be changed. You can then save it to a writable directory.

```
[applied,unapplied]=Simulink.BlockDiagram.applyVarStruct(model,'ControlParam')
[applied,unapplied]=Simulink.BlockDiagram.applyVarStruct(model,'ModelParam')
```

NOTE:

- You can use **'preview'** ApplyMode to get information about what will be changed without actually changing the model:

```
Simulink.BlockDiagram.applyVarStruct(model,'ModelParam', 'ApplyMode', 'preview')
```

- If the model has been compiled, you can use '**cached**' SearchMethod to avoid model recompiling:

```
Simulink.BlockDiagram.applyVarStruct(model, 'ModelParam', 'SearchMethod', 'cached')
```

- If **unapplied** output is not empty, you can investigate the reason using **Simulink.findVars(model, 'WorkspaceType', 'base', 'Name', variableName)**. The probable causes are: you changed structure field names or added extra fields; the variable is used by a block that needs special consideration, e.g., Stateflow® chart, S-Function or Model block.

2. Test the MATLAB structure in the modified model.

Clear unnecessary variables and run the simulation to check results.

```
clear;
model = 'sldemo_applyVarStruct';
sldemo_applyVarStruct_data;

sim('sldemo_applyVarStruct');
```

- Check for any warnings or errors.
- Check simulation results.

Configuring the Structure Parameter to Appear in Generated Code

By default, the MATLAB structure does not appear in generated code because numeric values are inlined. Code generation requires Simulink® Coder™.

1. To make the structure variable tunable, create **Simulink.Parameter** with the structure value and 'ExportedGlobal' storage class.

```
p=Simulink.Parameter;
p.Value=ControlParam;
p.CoderInfo.StorageClass='ExportedGlobal';
ControlParam=p;
clear p;

rtwbuild('sldemo_applyVarStruct');
```

The generated code now contains a structure type definition for the tunable structure in the **model_types.h** header file. By default, Simulink Coder generates an automatic name for the type of parameter structures. This name is unique, but not easy to recognize.

```
typedef struct {
    real_T Ka;
    real_T Kf;
    real_T Ki;
    real_T Kq;
    real_T Tal[2];
    real_T Ts[2];
    real_T W1[2];
    real_T W2[2];
} struct_mn4cJ7zsH8aqc8bBlbIkqC;
```

2. You can control this type name by using **Simulink.Bus** to specify the data type of the Simulink.Parameter object.

You can use **Simulink.Bus.createObject** to create a bus object with the same shape as the MATLAB structure.

```
busInfo=Simulink.Bus.createObject(ControlParam.Value)
```

Assign the bus object name to the Simulink.Parameter DataType attribute.

```
ParamType=eval(busInfo.busName);
ControlParam.DataType='Bus: ParamType';
clear(busInfo.busName);
clear busInfo;
```

NOTE: Only **Simulink.Parameter** can accept the bus object name as a data type. For MATLAB structures, Simulink Coder generates an automatic name for the type.

3. Resave the data file to include the modified workspace variables.

```
Simulink.saveVars('sldemo_applyVarStruct_data.m', '-append')
```

4. Regenerate code for the modified model (requires Simulink Coder).

```
rtwbuild(model);
```

The generated type definition now appears as:

```
typedef struct {
    real_T Ka;
    real_T Kf;
    real_T Ki;
    real_T Kq;
    real_T Tal[2];
    real_T Ts[2];
    real_T W1[2];
    real_T W2[2];
} ParamType;
```

The parameter definition is:

```
ParamType ControlParam = {
    0.677,
    -1.746,
    -3.864,
    0.8156,
    {0.3959, 1.0},
    {0.1, 1.0},
    {1.0, 2.971},
    {1.0, 4.144}
}
```

Share Data Store Between Instances of a Reusable Algorithm

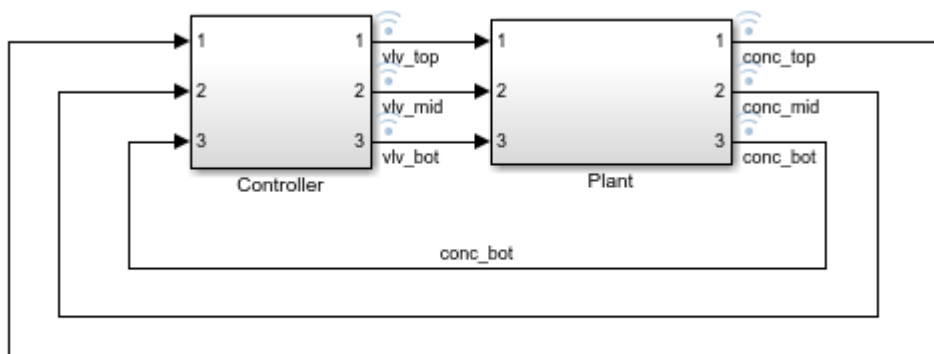

To reuse an algorithm, instead of copying and pasting the blocks, you can encapsulate them in a separate model file. Then, you can refer to the model repeatedly with Model blocks. Each Model block is a standalone instance of the algorithm.

By default, each instance calculates and stores its own copy of the signals that the model contains. Therefore, the instances do not interact. However, you can use a data store to share a piece of data between the instances.

This example shows how to share a fault indication between all instances of a reusable control algorithm. Any instance can set the fault, causing all instances to take action to clear it.

Explore Example Models

Open the example model `sldemo_shared_data`.

Copyright 2017 The MathWorks, Inc.

The Controller subsystem refers to the controller algorithm model, `sldemo_shared_data_alg`, multiple times through three Model blocks.

Open the algorithm model.

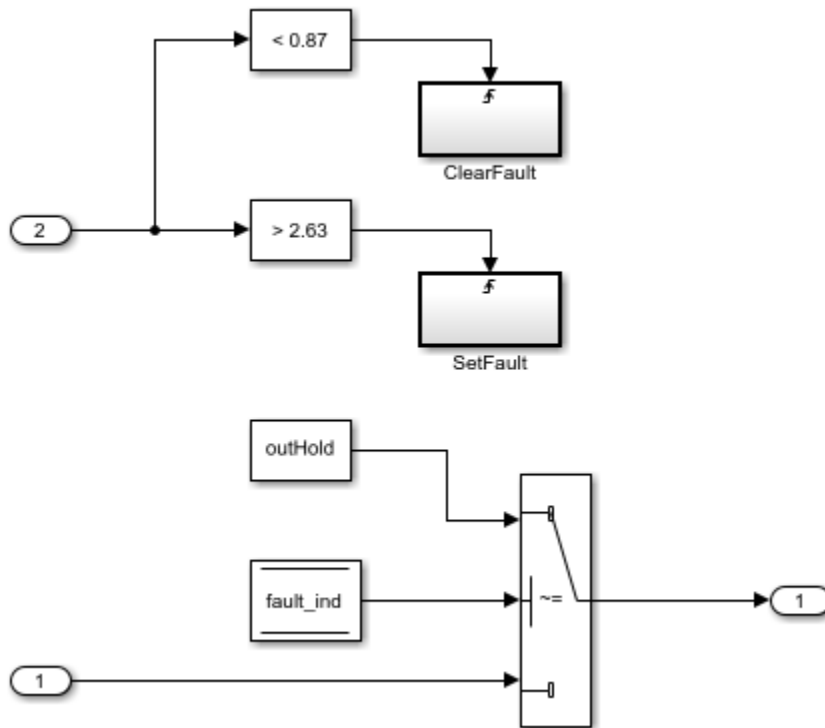

Copyright 2017 The MathWorks, Inc.

The Data Store Memory block `fault_ind` represents a fault indication. The block parameter **Signal Attributes** > **Share across model instances** is selected, so all instances of

`sldemo_shared_data_alg` share the indication. Because the block exists in `sldemo_shared_data_alg`, the indication is local to the model. Other models that refer to `sldemo_shared_data_alg` cannot read or write to the indication.

The Algorithm subsystem uses a PID controller to generate a position command for an actuator (represented by a block in `sldemo_shared_data`).

The Fault Handling subsystem sets and clears the fault indication. Each time an instance of the algorithm experiences a fault condition (the controlled input exceeds 2.63), the subsystem increments the value of the data store by 1. Each time an instance clears its fault condition, the subsystem decrements the value by 1.

Simulate Example Models

Simulate the parent model, `sldemo_shared_data`.

Use the Simulation Data Inspector to observe the position commands and the controlled signals. In the Simulink Editor toolbar, click the highlighted button.

Partway through the simulation, the controlled signal `conc_mid` experiences a disturbance.

Current plot held

The disturbance triggers a fault in the corresponding instance of the control algorithm. Due to the fault, all three position commands (the `vlv` signals) lock at zero.

Later, when the fault condition clears, all of the position commands and controlled signals return to nominal values.

Attaching Input Data to External Inputs via Custom Input Mappings

This example shows how to create a custom mapping function for the Root Inport Mapper tool. The Root Inport Mapper tool associates MAT-file data with a specific input port, based on one of these criteria.

- **Port Order** - Maps in the order it appears in the file to the corresponding port number.
- **Block Name** - Maps by variable name to the corresponding root inport with the matching block name.
- **Signal Name** - Maps by variable name to the corresponding root inport with the matching signal name.
- **Block Path** - Maps by the BlockPath parameter to the corresponding root inport with the matching block path.
- **Custom** - Maps using a MATLAB function.

Use a custom mapping criteria when the data you are trying to map does not match any of the other mapping criteria.

Custom Mapping Scenario

If the combination of input data and the model input ports does not match Port Order, Block Name, Signal Name, or Block Path mapping criteria, you can do one of the following:

- Rename the input data in the MAT-file
- Rename the input ports on the model
- Use the custom mapping mode

This example shows how to write a custom mapping function.

The workflow described below includes

- Create a MATLAB File to contain the custom mapping function
- Declare the custom mapping function name, inputs, and outputs
- Initialize the output for assignment of the return value
- Define and implement your mapping algorithm
- Validate your mapping algorithm

Create a New MATLAB Function File

Create a MATLAB function file. This file will contain your custom mapping function.

Declare Custom Mapping Function

Declare a custom mapping function name, and specify the inputs and outputs. `slexCustomMappingMyCustomMap` is the custom mapping function in this example. It declares the function inputs and outputs as defined below.

Inputs

- *modelName* - String that contains the model name.
- *signalNames* - Cell array of strings that contain variable names of signals to map
- *signals* - Cell array of signal data aligned with *signalNames* such that *signalNames*{1} is the variable name of the signal stored in *signals*{1}.

Outputs

- *inputMap* - Array or scalar of objects that result from the `getRootInportMap` function.

Initialize the Output

Initialize the value of the output variable `inputMap`. To do this use the `getRootInportMap` command with the empty property as shown in the example function `slexCustomMappingMyCustomMap` or in the code snippet below. This initializes the output variable to empty so that a value can be assigned to the output.

```
inputMap = getRootInportMap('empty');
```

Define Your Custom Mapping Algorithm

Things to think about when defining your custom mapping algorithm.

- What is the criteria for mapping signals to a root-level inport, for example `BlockName` mapping matches the name of the input signal to the name of the root-level inport block name.
- What information is needed to create a mapping.
- What happens if the mapping criteria determines that there is no match between signal and root-level inport.

The example addresses these items by

- Using the root-level port number and signal name for mapping criteria.
- Using a utility function `slexCustomMappingGetPortNames` to get root-level inport block names to provide as input along with the variable `|signalName|` to the `getRootInportMap` function which creates the mapping.
- Including a logical condition to handle the case where there is no match between port number and signal name.

Implement Your Mapping Algorithm

Next, implement your mapping algorithm.

In the `slexCustomMappingMyCustomMap` implementation, the root-level inport port number is the mapping criteria. The algorithm gets this port number from the root-level inport block. It then gets the numerical values appended to the names of the signals that are passed into the function, and compares the port number with the numerical values.

NOTE: In addition to implementing your mapping algorithm, you should also include a logical statement to handle situations where a mapping is not possible. The example function does this by using an `if` statement with the `isempty` function to determine if a mapping can be made.

Create the Mapping

The final step is to use the `getRootInportMap` function to create a custom map. The `getRootInportMap` function uses Property-Value pairs to create a custom map. The properties are:

- *model* - String that represents the model name.
- *signalName* - String or cell of strings that contains the value of the variable name of the signal to map.
- *blockName* - String or cell of strings that contains the value of the block name of the port to be mapped.

The following code is an example of this function. This same code appears in the example function `slexCustomMappingMyCustomMap`.

```
inputMap = getRootInportMap(...
    'model',modelName,...
    'signalName',signalNames,...
    'blockName',portNames);
```

Validate the Custom Mapping Function

To validate the custom mapping function at the command line:

- 1 Open the model against which you want to test your function.
- 2 Create some input signals to support the model.
- 3 Call your custom mapping function with the correct input parameters.
- 4 Validate the expected input string to send to the `sim` command, or to place in the model configuration parameters External Input String edit box.

Execute the lines of code in the following example. This code uses the custom mapping function provided with this example. If the custom map function succeeds, you should see a comma-separated list of variable names displayed in the order of the port number to which they are assigned ('port1,port2').

```
load_system('slexAutotransRootInportsExample');
port1      = timeseries(ones(10,1)*10);
port2      = timeseries(zeros(10,1));
inputMap    = slexCustomMappingMyCustomMap('slexAutotransRootInportsExample',{'port1' ,
externalInputString = getInputString(inputMap,'base');
close_system('slexAutotransRootInportsExample',0);
```

If your signals are in a `Simulink.SimulationData.Dataset`, you can execute the lines of code in the following example. This code uses the custom mapping function provided with this example. If the custom mapping function succeeds, you should see a comma-separated list of variable names displayed in the order of the port number to which they are assigned ('ds.getElement(1),port1,ds.getElement(2)').

```
load_system('slexAutotransRootInportsExample');
ds = Simulink.SimulationData.Dataset;
ds = ds.addElement( timeseries(ones(10,1)*10),'port1');
ds = ds.addElement( timeseries(zeros(10,1)),'port1');
inputMap    = slexCustomMappingMyCustomMap('slexAutotransRootInportsExample',{'ds'},{ ds
```

```
externalInputString = getInputString(inputMap,'base');  
close_system('slexAutotransRootInportsExample',0);
```

Using Mapping Modes with Custom-Mapped External Inputs

This example shows how to implement a custom mapping algorithm similar to a Simulink mapping mode. It uses the `getSlRootInportMap` and `getRootInportMap` functions to implement the custom mapping.

This example assumes that you are familiar with the `getRootInportMap` command and the Root Inport Mapper Tool custom mapping capability. If you are not familiar with those concepts, read the documentation and review the examples that pertain to `getRootInportMap` and custom mappings.

The Workflow

This example shows how you can use a built-in Simulink mapping mode to perform as many mappings as possible. It then flags the root inports that were not able to be assigned a signal. The algorithm then overrides the flagged mappings with custom mappings to map the remaining signals. To implement such a solution, create a custom mapping function using the `getSlRootInportMap`.

This example uses a list of inputs with two kinds of signals:

- Signals that can be mapped using the Simulink block name mapping mode.
- Signals that cannot be mapped using the Simulink block name mapping mode. You must map these signals with a custom mapping mode.

Assume the following scenario:

- You want to use a group of signals as inputs to your Simulink model.
- The signals are named such that the variable names match the block name of the root-level inport.
- Each signal that uses this naming convention is within tolerance.
- Each signal that has the 'x' character appended to its name is considered outside tolerance.

This example uses a mapping mode similar to the Simulink block name mapping method.

The root-level inport block names are:

- Throttle
- Brake

The signal variable names are:

- Throttlex
- Brake

To map inputs to root-level inport blocks in this scenario, you need a custom mapping function for the Root Inport Mapper tool. This example uses the `AlmostBlockName` custom mapping function.

For this example, you will use the `slexAutotransRootInportsExample` model to validate your custom mapping function.

Declare the Custom Mapping Function

Declare the function name, inputs, and outputs. To do this, copy and paste the following code snippet into a MATLAB file and save the file as `AlmostBlockName.m`.

```
function inputMap = AlmostBlockName( modelName, signalNames, signals )
```

Get the Simulink BlockName Mapping

Next, map all the signals. To do this, first map all the signals within tolerance using the Simulink block name mapping mode, then map the signals outside tolerance.

To map signals within tolerance to a model using one of the Simulink mapping modes, use the function `getSlRootInportMap`. This function returns the `inputMap` and a vector of logical values. Each logical value indicates a successful or unsuccessful mapping of `inputMap` to a signal. To map by block name, insert the following lines of code just after the function declaration.

```
inputMap = getRootInportMap('empty');
if ~bdIsLoaded(modelName)
    load_system(modelName);
end

[inputMap, hasASignal] = getSlRootInportMap('Model', modelName, ...
    'MappingMode','BlockName',...
    'signalName',signalNames, 'signalValue', signals);
```

Find the Missing Input Signals

In the previous step, you created a mapping using a block name mapping mode. You must now account for an empty `inputMap` and for `inputMap(s)` that were not associated with a signal within tolerance. The function `getSlRootInportMap` has flagged these signals with the output variable `hasASignal`. To do this:

- 1 Check the `inputMap` variable.
- 2 If the `inputMap` variable is not empty, determine which elements of the `inputMap` vector were not assigned a signal. To do this, use the logical `~` on the `hasASignal` vector as shown below. The `emptyIndex` vector now contains a logical vector where true means the `inputMap` does not have a signal mapped to it.
- 3 Copy and paste the following code snippet under the call to the `getSlRootInportMap` and before the `end` to the `if bdIsLoaded(modelName)`.

```
if ~isempty(inputMap)
    emptyIndex = ~hasASignal;
end
```

The code snippet performs steps one and two for you.

Complete the Mapping

In the previous step, you created a logical vector `emptyIndex` to see if any of the `inputMap` objects were not associated to a signal. If all the elements of the `emptyIndex` vector are false, you have a complete mapping and the code added in this section will not be executed.

If the `emptyIndex` vector contains at least one value that is true, you have `inputMap` objects that are not associated to a signal. Manually assign the variable `signal(s)` to that `inputMap`. Then, override the `inputMap` with the signal name that matches the expected signal name:

- 1 In the `emptyIndex` vector, find all the items that are true. These items point to the `inputMap(s)` that still need to be associated with a signal.
- 2 For each `inputMap`, use the 'BlockName' property to get the name of the inport block that the `inputMap` is assigned to.

- 3 Append an 'x' to the block name to get the name of the signal to be assigned to the `inputMap`.
- 4 Compare the result to each item in the `signalNames` variable cell array.
- 5 If a match is found, override the `inputMap` with the signal name that matches the expected signal name. To override the `inputMap` object, use the `getRootInportMap` function with the 'InputMap' and the 'SignalName' properties.

```

if isa( signals{1}, 'Simulink.SimulationData.Dataset')
    signalNames = signals{1}.getElementNames';
end

idxEmpty = find(emptyIndex==true);
for kEmpty =1:length(idxEmpty)
    idxOfEmpty = idxEmpty(kEmpty);
    destBlockName = get(inputMap(idxOfEmpty),'BlockName');
    outSideToleranceSig = [destBlockName 'x'];
    isAMatch = strcmp(signalNames, outSideToleranceSig);
    if any(isAMatch)
        inputMap(idxOfEmpty) = getRootInportMap('InputMap', ...
            inputMap(idxOfEmpty),'SignalName',outSideToleranceSig);
    end
end
end

```

The Custom Map File

When you are done, the file `AlmostBlockName.m` should resemble the following code.

```

function inputMap = AlmostBlockName(modelName, signalNames, signals)
inputMap = getRootInportMap('empty');
if bdIsLoaded(modelName)

    [inputMap, hasASignal] = getSlRootInportMap('Model', modelName, ...
        'MappingMode','BlockName',...
        'signalName',signalNames, 'signalValue', signals);

    if ~isempty(inputMap)
        emptyIndex = ~hasASignal;
        idxEmpty = find(emptyIndex==1);

        if isa( signals{1}, 'Simulink.SimulationData.Dataset')
            signalNames = signals{1}.getElementNames';
        end

        for kEmpty =1:length(idxEmpty)
            idxOfEmpty = idxEmpty(kEmpty);
            destBlockName = get(inputMap(idxOfEmpty),'BlockName');
            nonNominalSig = [destBlockName 'x'];
            isAMatch = strcmp(signalNames, nonNominalSig);
            if any(isAMatch)
                inputMap(idxOfEmpty) = getRootInportMap('InputMap', ...
                    inputMap(idxOfEmpty),'SignalName',nonNominalSig);
            end
        end
    end

end
end
end

```

Validate the Custom Mapping

To validate your custom mapping:

- 1 Save the `AlmostBlockName` function in a file on the MATLAB path.
- 2 To see the results of your mapping function, copy and paste the following code snippet to the MATLAB Command Window.

```
modelName = 'slexAutotransRootInportsExample';
Throttlex = timeseries(zeros(10,1));
Brake     = timeseries(ones(10,1));
signalNames= {'Throttlex' , 'Brake'};
signals   = { Throttlex , Brake };
open_system(modelName);
inputMap  = AlmostBlockName(modelName, signalNames, signals);
inputStr  = getInputString(inputMap, 'base');
close_system(modelName);
```

After running the code snippet, the variable `inputStr` contains the string `'Throttlex,Brake'`.

If your signals are in a `Simulink.SimulationData.Dataset`, to see the results of your mapping function, use the following code snippet at the MATLAB Command Window.

```
modelName = 'slexAutotransRootInportsExample';
Throttlex = timeseries(zeros(10,1));
Brake     = timeseries(ones(10,1));
ds        = Simulink.SimulationData.Dataset;
ds        = ds.addElement( Throttlex, 'Throttlex' );
ds        = ds.addElement( Brake, 'Brake' );
signalNames= {'ds'};
signals   = { ds };
open_system(modelName);
inputMap  = AlmostBlockName(modelName, signalNames, signals);
inputStr  = getInputString(inputMap, 'base');
close_system(modelName);
```

After running the code snippet for signals in a `Simulink.SimulationData.Dataset`, the variable `inputStr` contains the string `'ds.getElement('Throttlex'),ds.getElement('Brake)'`.

Converting Harness-Driven Models to Use Harness-Free External Inputs

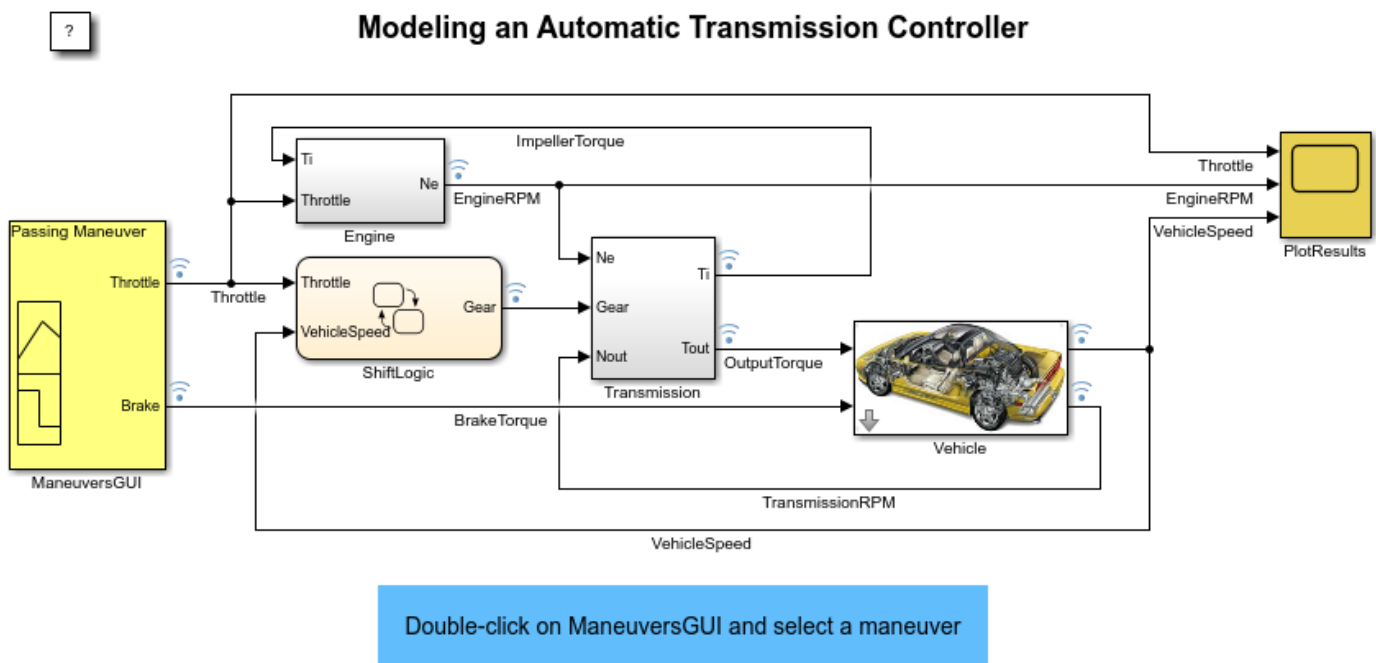

This example shows how to convert a harness model that uses a Signal Builder block as an input to a harness-free model with root inports. The example collects data from the harness model and stores it in MAT-files for the harness-free model. After storing the data, the example removes the Signal Builder block from the harness model and adds root inports to create a harness-free model. Then, the data in the MAT-files is mapped to the root inports of the model.

Save Harness Data to MAT-Files

Before converting the model to be harness-free, collect the test cases in the harness.

For this example, you will modify the model `sldemo_autotrans` from the **Modeling an Automatic Transmission Controller** example.

Open the example model. In the MATLAB Command Window, type `sldemo_autotrans`.

Exporting Signal Builder Block Groups

Export data that defines Signal Builder block signal groups to a MAT-file from the Signal Builder window. To export Signal Builder signal data, formatted as `Simulink.SimulationData.Dataset`, to a MAT-file, open the Signal Builder window and select **File > Export Data > To MAT-File**. In the dialog, enter a name for the MAT-file to contain the data and the number of the group you want to export. For this example, the file name is `slxAutotransRootInportPassingManeuver.mat` and the group number is 1 for the Passing Maneuver group.

Remove the Signal Builder Block

Remove the Signal Builder block named `ManeuversGUI` and replace it with two inports.

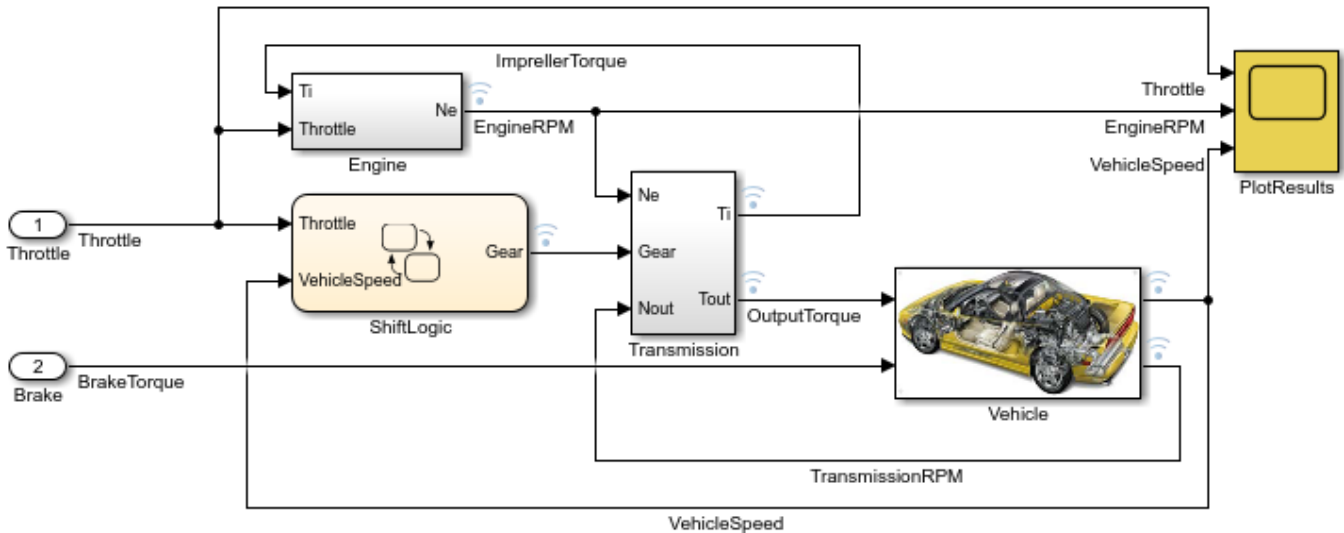

- 1 Delete the Signal Builder block named ManeuversGUI.
- 2 From the **Simulink/Commonly Used Blocks** library, drag two inport blocks into the model.
- 3 Connect the input ports to the lines previously connected to the Signal Builder block.
- 4 Rename the inport ports. Name the input port connected to the Throttle line **Throttle**. Name the input port connected to the BrakeTorque line **Brake**.

Save the model as `slexAutotransRootImportsExample1.slx` or use the example `slexAutotransRootImportsExample.slx`.

The remaining steps of this example use the model `slexAutotransRootImportsExample.slx`. If you saved the model with a different name use your model name in the steps going forward.

?

Modeling an Automatic Transmission Controller with Root Imports

Copyright 2012 - 2014 The MathWorks, Inc.

Set Up Harness-Free Inputs

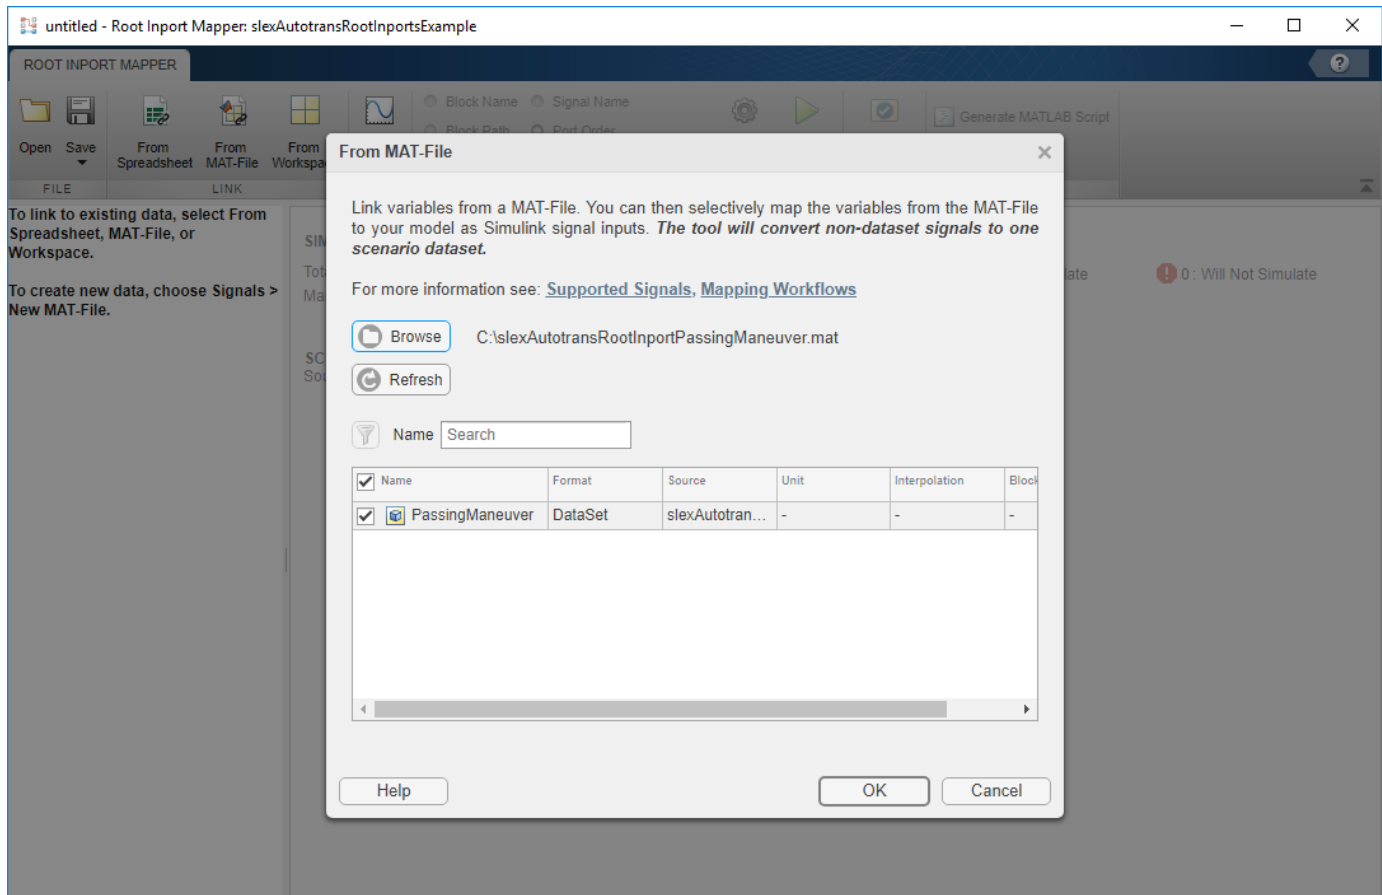

Now that the model is harness-free, set up the inputs that you already saved (See "Save Harness Data to MAT-Files").

In the Modeling tab, select Model Settings. In the Data Import/Export pane, click the **Connect Input** button.

Map Signals to Root Inport

The Root Inport Mapper tool opens.

The example uses this tool to set up the model inputs from the MAT-file and map those inputs to an input port, based on a mapping algorithm. To select the MAT-file that contains the input data, click the **From MAT-File** button on the Root Inport Mapper toolbar. When the link dialog appears, click the Browse button. In the browser, select the MAT-file that you saved earlier.

Select a Mapping Mode

When you select the MAT-file `slexAutotransRootInportPassingManeuver.mat` that contains the input data, determine the root input port to which to send input data. Simulink matches input data with input ports based on one of five criteria:

- **Port Order** - Maps in the order it appears in the file to the corresponding port number.
- **Block Name** - Maps by variable name to the corresponding root inport with the matching block name.
- **Signal Name** - Maps by variable name to the corresponding root inport with the matching signal name.
- **Block Path** - Maps by the BlockPath parameter to the corresponding root inport with the matching block path.
- **Custom** - Maps using a MATLAB function.

Earlier in this example, you saved input data to variables of the same name as the harness signals Throttle and Brake, and added input ports with names matching the variables. Given the set of conditions for the input data and the model input ports, the best choice for a mapping criteria is

Block Name. Using this criteria, Simulink tries to match input data variable names to the names of the input ports. To select this option:

- 1 Click the **Block Name** radio button.
- 2 Click the **Options** button and select **Update Model**. This verifies the mapping.
- 3 Click the **Map** button.

When compiling the data, Simulink evaluates inports against the following criteria to determine compatibility issues. The status of this compatibility is reflected by the table colors green, orange, or red. Warnings and errors are flagged with diagnostic messages. If the **Options > Update Model** option is not selected, Root Inport Mapper determines the compatibility status by evaluating these block parameters and assigned signals:

- **Data Type** - Double, single, enum,
- **Complexity** - Real or complex
- **Dimensions** - Signal dimensions vs port dimensions

The screenshot shows the 'ROOT INPORT MAPPER' window. The 'MAPPING SUMMARY' section displays the following information:

- Total Scenario Datasets: 1
- 0 Not Mapped
- 1 Mapped
- 0 Warnings
- 0 Errors

The 'SCENARIO DETAILS' section shows the source as 'PassingManeuver - slxAutotransRootInportPassingManeuver.mat' and the mode as 'Block Name'. Below this is a table with the following data:

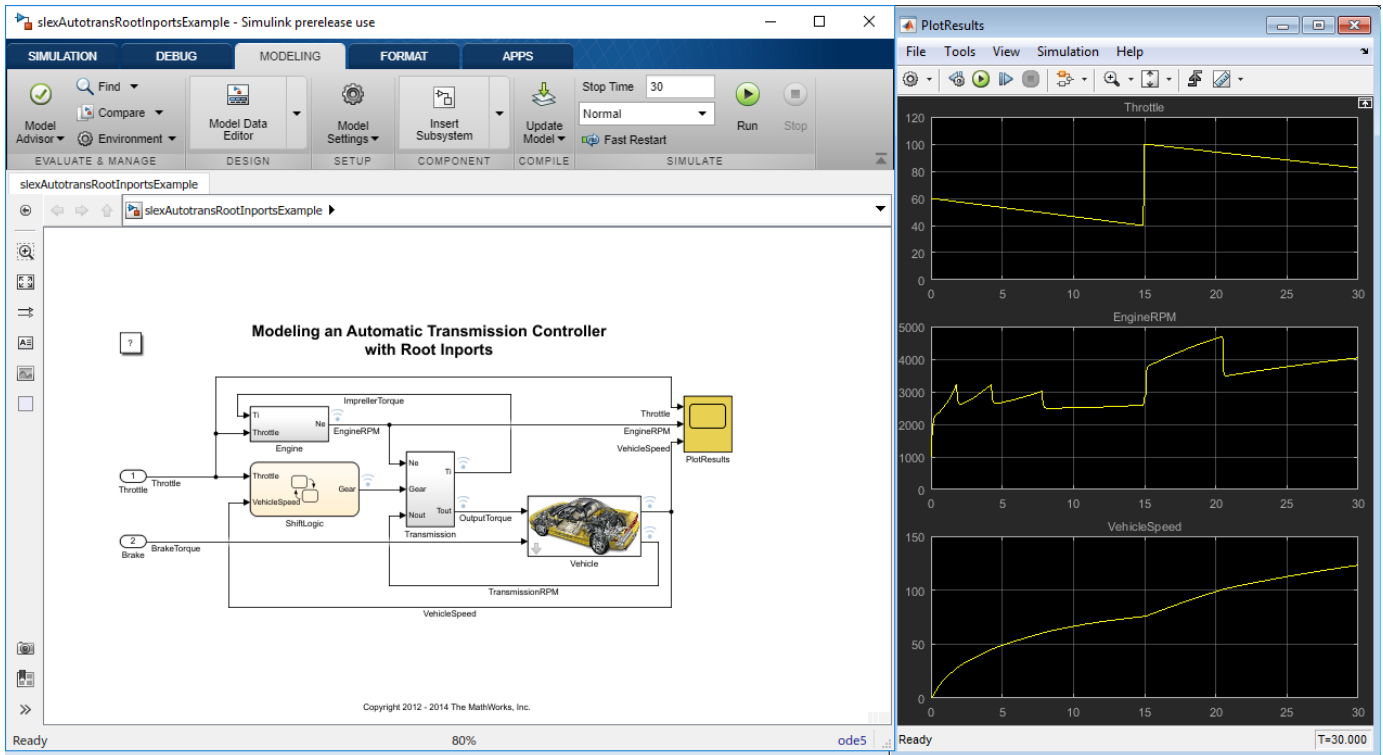

STATUS	SCENARIO SIGNAL	PORT	BLOCK NAME	MAPPED SIGNAL
✓	Throttle	1	Throttle	PassingManeuver.getElement('Throttle')
✓	Brake	2	Brake	PassingManeuver.getElement('Brake')

Finalize the Inputs to the Model

Review the results of the mapping compatibility. Click the Scenario Dataset 'PassingManeuver' in the scenario dataset list. To prepare for simulation, click **Mark for Simulation**. This action applies the mapping variables to the Configuration Parameter **Data Import/Export > External Input** text box. If this text box has content, it is overwritten.

Simulating the Model

With the changes applied you can now simulate the model and view the results. Run the model. To view the results of the simulation, double-click the Scope Block **PlotResults**.

Logging States in Structure Format

This example shows how logging state trajectories of a Simulink® model in a structure format can be better than the traditional method of logging states in an array format. The ordering of the states along the columns in the logged matrix depends on the block sorted order, which the Simulink software determines during model compilation. Various factors can affect the block sorted order, which can alter the ordering of the states.

This example illustrates how logging the states in the Structure format, which stores the block names with the state trajectories, can help prevent the state ordering problem.

Problem with Logging in Array Format

By default, the Simulink software logs the state trajectories in array format, which is a matrix with N columns, where N is the number of states. The matrix has M rows, with each row corresponding to a single simulation time step. This M-by-N matrix form is easy to manipulate in MATLAB®. However, the ordering of the state variables along the columns of the logged matrix depends on the block sorted order. Therefore, any MATLAB code which expects a fixed mapping between the states of blocks in the model and the columns of the states matrix is prone to breaking when the block sorted order changes due to changes in the model.

For example, consider the following two block diagrams:

```
mdl1 = 'sldemo_state_logging1';
mdl2 = 'sldemo_state_logging2';
open_system(mdl1);
open_system(mdl2);
```

sldemo_state_logging1

Copyright 2006-2013 The MathWorks, Inc.

Copyright 2006-2013 The MathWorks, Inc.

The two diagrams have the same blocks, the only difference is the ordering of output ports. Simulate the models and log the states in array format:

```
simOut1 = sim mdl1, 'SaveFormat', 'Array';
simOut2 = sim mdl2, 'SaveFormat', 'Array';
```

Extract the states vectors from the Simulink.SimulationOutput object, which contains the output logs of the simulation:

```
x1 = simOut1.get('xout');
x2 = simOut2.get('xout');
```

Note that the relative ordering of the integrator blocks is different in the two block diagrams. This causes the logged states `x1` and `x2` to differ because the mapping between the columns and the states is different:

```
isequal(x1, x2)
```

```
ans =
    logical
     0
```

Using Structure Format Logging

Simulate the models again, but this time log the states in structure format:

```
simOut1=sim mdl1, 'SaveFormat', 'Structure';
simOut2=sim mdl2, 'SaveFormat', 'Structure';
```

Extract the structures, which contain the state logs, from the simulation output object:

```
x1s = simOut1.get('xout');
x2s = simOut2.get('xout');
```

Display these structures. Note that these structures have two fields: time and signals. The field 'time' is empty because we chose 'Structure' for the model parameter 'SaveFormat'. We could have chosen 'StructureWithTime' to store the time vector in the states structure:

```
disp(x1s);
disp(x2s);

    time: []
 signals: [1x2 struct]

    time: []
 signals: [1x2 struct]
```

The software logs the state trajectories into `xs.signals(k).values` along with the names of blocks `xs.signals(k).blockName` that correspond to these states. Extract the states into a matrix (like in array format) like this:

```
x1a = [x1s.signals.values];
x2a = [x2s.signals.values];
```

Note that the state ordering problem still exists (`x1a` and `x2a` are the same as `x1` and `x2`, obtained via array format):

```
isequal(x1a, x2a)
```

```
ans =

    logical

     0
```

Obtaining States Matrix with Fixed State Order

To fix the state ordering problem, use the block names stored along with the values to map the states to a fixed order, for example, the alphabetical order of the block names:

```
[~, idx1] = sort({x1s.signals.blockName});
x1 = [x1s.signals(idx1).values];

[~, idx2] = sort({x2s.signals.blockName});
x2 = [x2s.signals(idx2).values];

isequal(x1, x2)
```

```
ans =

    logical

     1
```

By re-ordering the signals arrays in `x1` and `x2` into the alphabetical order of the block names, and extracting the values fields, in that order, into the matrices `x1` and `x2`, we have a mechanism for logging the states into a matrix with a fixed mapping of the block states to columns of the logged matrix.

Close the models and clear the variables which were used in this example:

```
close_system mdl1;  
close_system mdl2;  
clear ans idx1 idx2 mdl1 mdl2 simOut1 simOut2 x1 x1a x1s x2 x2a x2s
```

Saving and Restoring Simulation Operating Point

This example shows the workflow and the benefits of saving and restoring a simulation operating point using a `ModelOperatingPoint` object.

The `ModelOperatingPoint` object contains the complete snapshot of all variables that are related to the simulation of a model. After saving the `ModelOperatingPoint` object at the end of a simulation, Simulink® can reload the operating point and continue the simulation from the time at which the `ModelOperatingPoint` object was saved. This action produces the same simulation results as if the simulation were never interrupted.

This example illustrates:

- How saving the Final states (logged states) is not always sufficient for complete and accurate restoration of a simulation state.
- How you can save and restore the complete operating point of a simulation, yielding faster simulation workflows

Difficulties with Models with Variable Transport Delay

The states that are logged during a simulation are a subset of all the information needed to fully describe the state of a simulation. Certain blocks rely on internal information that is not logged as part of state logging and final state export. One such block is the Transport Delay block. Models with Transport Delay blocks are usually difficult to fully restore to a particular state because the state of the transport delay is not saved in the structure format or the array format as part of "Final states" data logging.

To illustrate this issue, compare the simulation results for two cases:

1. Simulate a model, which contains a Transport Delay block, from 0 to 5 seconds and save the "Final states" values in the workspace. Then load this first set of final states and simulate from 5 to 10 seconds.
2. Simulate the same model from 0 to 10 seconds and force the model to produce an output at 5 seconds. We call the result of this simulation the baseline result because it is a nonstop simulation.

The results of the first simulation match the first half of the baseline result. If the simulation state of the first simulation had been restored completely, the second simulation results would match the second half of the baseline.

To begin, load this model:

```
mdl = 'slexVariableTransportDelay';
load_system(mdl);
```

Simulate until time of 5 and save the final state in structure format:

```
out = sim(mdl, 'StopTime', '5', 'SaveFinalState', 'on', ...
          'FinalStateName', 'xFinal', 'SaveFormat', 'Structure');
y1 = out.ScopeData;
```

Load the final state from the last simulation and run to 10:

```
assignin('base', 'xFinal', out.get('xFinal'));
out1 = sim(mdl, 'StartTime', '5', 'StopTime', '10', ...
```

```

        'SaveFinalState', 'off', ...
        'LoadInitialState', 'on', 'InitialState', 'xFinal');
y2 = out1.ScopeData;

```

Run a nonstop simulation which will serve as the baseline result:

```

out2 = sim mdl, 'OutputOption', 'AdditionalOutputTimes', ...
        'OutputTimes', '[0 5 10]', 'LoadInitialState', 'off');
y = out2.ScopeData;

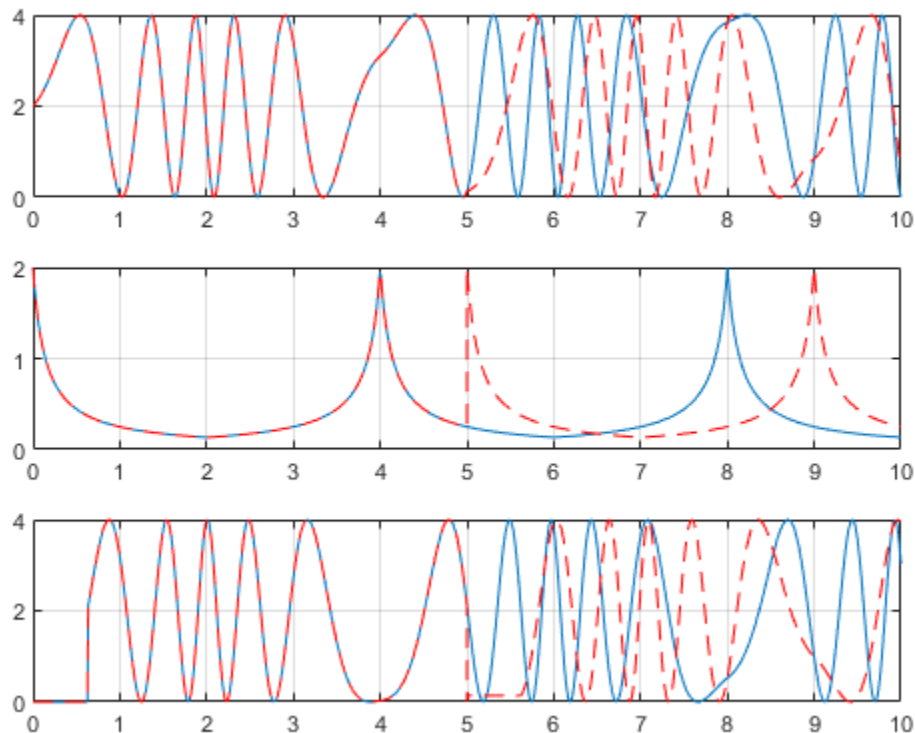

```

Plot the results. Note that the second half of the baseline result does not match the simulation from 5 to 10 seconds, whose initial state was restored from the final state saved at 5 seconds:

```

figure;
for idx=1:3
    subplot(3, 1, idx);
    plot(y.time,y.signals(idx).values);
    hold on;
    plot([y1.time; y2.time],...
        [y1.signals(idx).values;y2.signals(idx).values], 'r--');
    hold off;
    grid on;
end

```

Saving and Restoring the Complete Operating Point of a Simulation

You can save the complete final operating point in a Simulink.op.ModelOperatingPoint object. The ModelOperatingPoint object contains all the variables which are needed to restore the simulation

results. By using the complete `ModelOperatingPoint`, Simulink is able to restore the simulation state completely and to reproduce the baseline simulation results.

Set the parameter for Simulink to save the complete operating point at the end of the simulation.

```
out3 = sim mdl, 'StopTime', '5', 'SaveFinalState', 'on', ...
            'LoadInitialState', 'off', 'SaveOperatingPoint', 'on', ...
            'FinalStateName', 'xFinal');
y1 = out3.ScopeData;
```

Load the `ModelOperatingPoint` from the last simulation and run for an additional 5 seconds. The start time value must remain 0.0 (that value was the start time of the original simulation). The software stores the original simulation start time in `xFinal`. This value must match the start time of the current simulation to enable restoration of the simulation state.

```
assignin('base', 'xFinal', out3.get('xFinal'));
out4 = sim mdl, 'StopTime', '10', 'SaveFinalState', 'off', ...
            'LoadInitialState', 'on', 'InitialState', 'xFinal');
y2 = out4.ScopeData;
```

Plot the results and compare them with the baseline simulation. Note that this time, the simulation state has been completely restored and the simulation results after the operating point restore match the baseline.

```
figure;
for idx=1:3
    subplot(3, 1, idx);
    plot(y.time, y.signals(idx).values);
    hold on
    plot([y1.time; y2.time], ...
        [y1.signals(idx).values; y2.signals(idx).values], 'r--');
    hold off;
    grid on;
end
```

Close the model and clear the variables which were used in this example

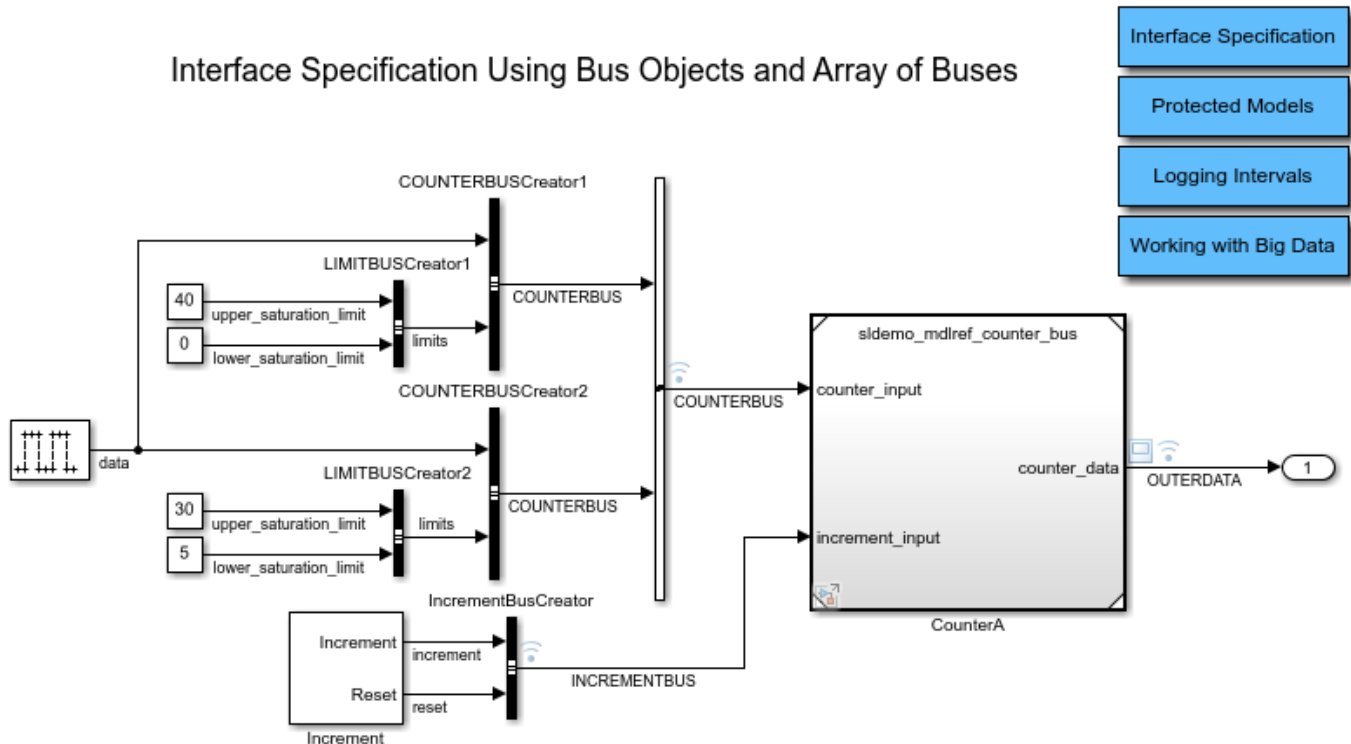

```
close_system mdl, 0);  
clear mdl idx xFinal y y1 y2 y3 out out1 out2 out3 out4
```

Logging Intervals

This example shows how to specify logging intervals. Simulink limits the data logging to the specified intervals.

Open the Example Model

Open the example model.

Copyright 1990-2019 The MathWorks, Inc.

Description of the Example

In this example, you can reduce the amount of logged data by limiting data logging to specific simulation-time intervals. The Increment block in this example has two signals: Increment and Reset. Double-click the Increment block to see the signals. In this example, you will specify two intervals to log the data of two system events triggered by the Increment and Reset signals. The first interval captures the first reset event. The second interval captures the behavior of the system after the increment event takes place and the signals reach the lower saturation limits. The intervals are based on the Increment and Reset signal values.

Set up the Logging Intervals and Simulate the Model

You can specify the Logging Intervals parameter value in "**Configuration Parameters > Data Import/Export > Logging intervals**" settings. To enable the Logging Intervals parameter, turn on "Single simulation output". Click here to open the Configuration Parameters Dialog.

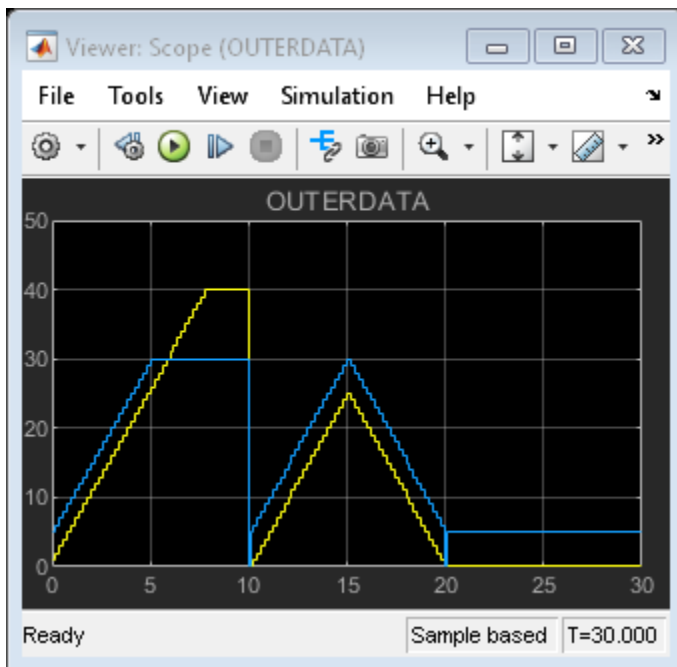

The Logging Intervals parameter value must be a real double matrix with two columns. The matrix elements cannot be NaN. Each row defines the start and end times for an interval. Intervals must be disjoint and ordered.

Set Logging Intervals to [9,10.5;14.5,30] and simulate the model.

OUTERDATA is a wide signal with two elements. The scope shows the values of the OUTERDATA signal during simulation. The scope does not honor the Logging Intervals specification. The Logging Intervals specification is honored when logging time, root outputs, signals, Datastore memory, states, and other kinds of data. The Figure shows the logged values of the OUTERDATA captured as part of signal logging:

```
>> out.get('topOut').get('OUTERDATA')
```

The MATLAB stem function is being used to display the logged data - ignoring the interpolation settings of the data.

Exit

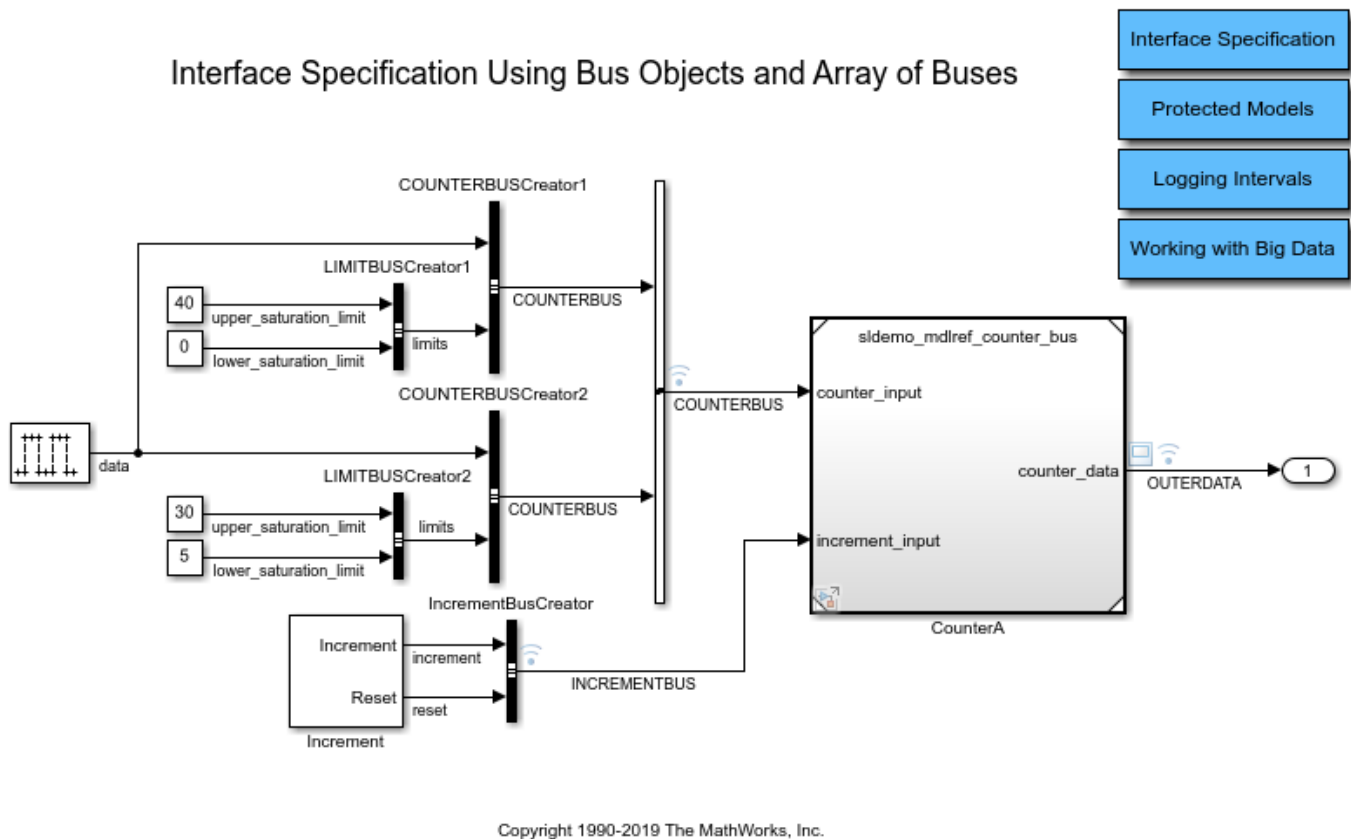

Close the model.

Working with Big Data

This example shows how Simulink models handle big data as input to and output from a simulation.

Open the Example Model

Open the example model.

Description of the Example

Big data refers to data that is too large to load into system memory all at once.

Simulink can produce big data as simulation output and consume big data as simulation input. To handle big data for both input and output, the entire data is stored in a MAT-file on the hard disk. Only small chunks of this data are loaded into system memory at any time during simulation. This approach is known as streaming. Simulink can stream data to and from a MAT-file. Streaming solves the memory issues because the capacity of the hard disk is typically much greater than the capacity of the random access memory.

This example shows how to handle big data in Simulink simulations. The logging to file capability is used to stream big data as the output of a simulation. Streaming from file then supplies big data as input to a simulation.

Set up Logging to File

To stream output data to a MAT-file, enable logging to file.

Enable logging to file by selecting the "**Configuration Parameters > Data Import/Export > Log Dataset data to file**" settings checkbox. Click here to open the Configuration Parameters Dialog. You can also specify the name of the file that will contain the result.

The programmatic way to enable Logging to file is by setting the model parameter `LoggingToFile` to on.

When logging to file is enabled on a model, simulation of that model streams logged signals directly into the MAT-file. Additionally, if logging of States or Output is enabled and `SaveFormat` is specified as Dataset, those values are streamed into same the MAT-file.

Simulate the Model

This example changes the directory to a temporary directory, which has write permissions. Then the example calls the `sim` command to simulate the model, logging to file.

Set the parameter `SignalLoggingName`, which specifies the name of the Dataset object to hold the result of signal logging, to `topOut`. Set the parameter `LoggingFileName`, which specifies the name of the resulting MAT-file, to `top.mat`. The `StopTime` parameter is set to 5000 seconds. For a more realistic big data example, the stop time would be a much larger value, which would result in many more data samples to log.

Create a DatasetRef Object to Reference the Logged Dataset Within the MAT-file

Use a `DatasetRef` object to reference the resulting Dataset in the logged MAT-file. The benefit of using `DatasetRef` is that the referenced MAT-file is not loaded into memory. `DatasetRef` is a very light wrapper object for referencing a Dataset that is stored in a file. The alternative of calling the `load` function on this file loads the entire file into memory, which might not be possible if this Dataset contains big data.

Obtain a Reference to a Logged Signal

You can use `{ }` indexing of `DatasetRef` object to reference individual signals within a Dataset, without loading these signals into memory. For example, to reference the seconds signal:

The `Values` field of `sig2` is a `SimulationDatastore` object, which is a light-weight reference to the data of signal 2, stored on disk:

```
ans =

SimulationDatastore with properties:

    ReadSize: 100
  NumSamples: 50001
    FileName: 'C:\TEMP\Bdoc20a_1326390_8984\ib9D0363\0\top.mat'

Data Preview:

    Time      Data
    _____
```

```

0 sec      1    5
0.1 sec   1    5
0.2 sec   2    6
0.3 sec   2    6
0.4 sec   3    7
:         :

```

Obtain More References to Other Logged Signals

This example uses some of these logged signals as inputs to the simulation of the referenced model. Create light-weight references for each of these. These are bus signals in the model and the resulting Values fields are structures of SimulationDatastore objects. Each structure reflects the hierarchy of the original bus signal.

Create a New Dataset Object to Use as Simulation Input

Specify the input signals to a simulation through a Dataset object. Each element in this Dataset provides input data to the inport block corresponding to the same index. Create an empty Dataset `ds` and then place the references to the logged signals into it as elements number one and two.

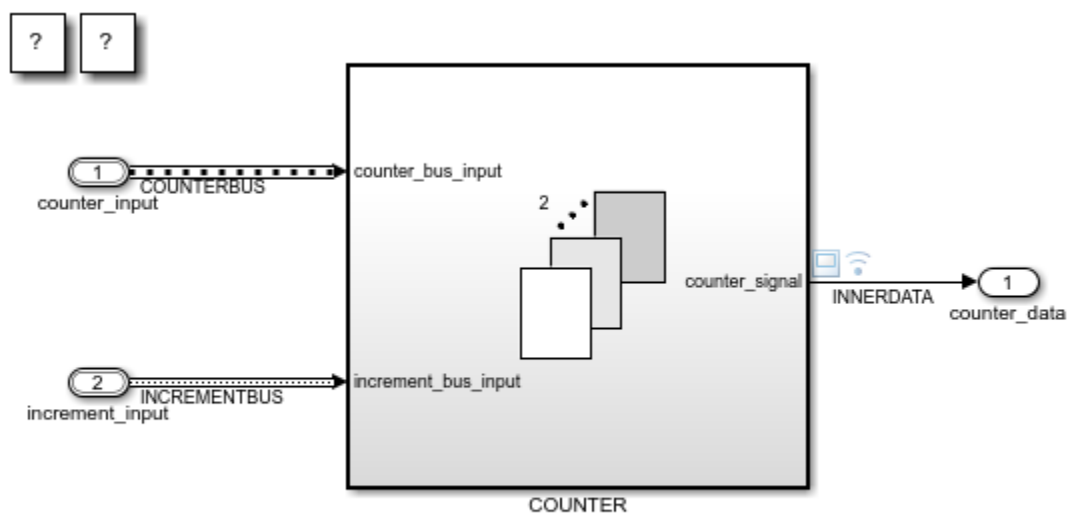

Use `{ }` indexing on the Dataset object to assign elements into appropriate positions.

Within each element of the Dataset, you can mix references to signal data (e.g., SimulationDatastore object) with in-memory data (e.g., timeseries objects). To change one of the upper saturation limits from 30 to 37:

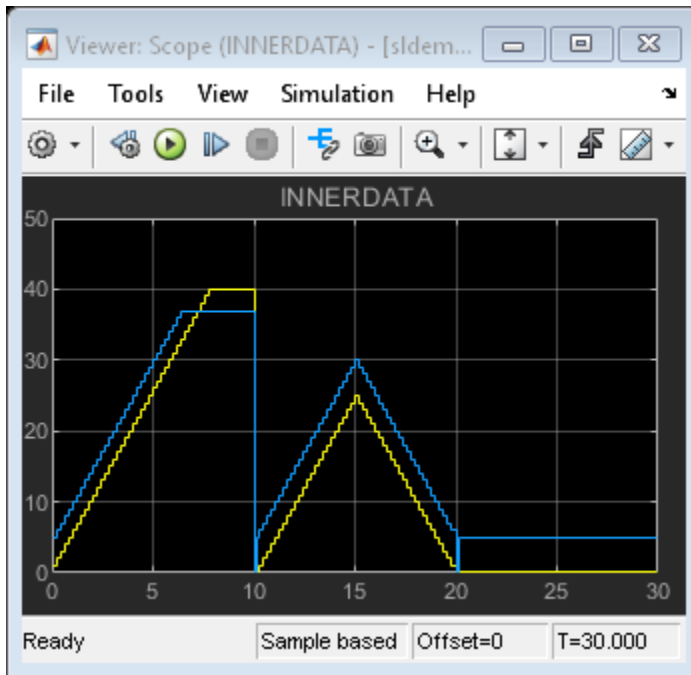

Stream Input Data into Simulation

Now simulate the referenced model `sldemo_mdref_counter_bus`, and use the Dataset `ds` as input. The data that is referenced by SimulationDatastore objects is streamed into the simulation without overwhelming the system.

The data for upper saturation limit is not streamed because that signal is specified as an in-memory timeseries. The change in saturation limit is reflected at around time 6 in the scope (the signal now saturates to a value of 37 instead of 30).

Copyright 1990-2019 The MathWorks, Inc.

Summary

This example has demonstrated a round trip workflow of big data from and to simulation. Logging to persistent storage was used to stream data from the first simulation into a MAT-file. A second simulation was then set up to stream the data from that file as input. A more realistic example would have a larger value for the model StopTime parameter, resulting in a larger logged MAT-file. The second simulation could also be configured for a longer StopTime. However, even with the larger data files for output and input, the memory requirements for the longer simulations remain the same!

MATLAB Workflow

SimulationDatastore allows you to analyze the logged data incrementally in MATLAB. Going back to the reference to the second logged signal, assign the datastore to a new variable to simplify access to it.

Access the Data in Chunks

SimulationDatastore allows incremental reading of the referenced data. The reading is done in chunks and is controlled by the ReadSize property. The default value for ReadSize is 100 samples (each sample for a signal is the data logged for a single time step of simulation). Change it to 1000 for this example. Each read of the datastore returns a timetable representation of the data.

Reset the SimulationDatastore Read Counter

Each read on the datastore advances the read counter. You can reset this counter and start reading from the beginning:

Iterate Through All Data in the Datastore

Use SimulationDatastore for incremental access to the logged simulation data for big data analysis in MATLAB. You can iterate over the entire data record and chunks:

Exit

Close the model.

If-Then-Else Blocks

This example shows what happens when a sine wave is fed into an If block. After running the simulation, the scope shows three plots. This example is designed to compare the If block with enabled subsystems.

The first of these plots shows the original sine wave and the absolute value of the original sine wave offset by two. The absolute value of the sine wave is only shown when the subsystem is executed. This occurs between 0 and 2.5 seconds and 5 and 7.5 seconds. When the subsystem is not executed then the output of the subsystem is reset to 0. The value of 0 is determined by the initial condition of the output. You can see when the subsystem is executed by looking at the second plot. A value of 1 indicates that it is executed.

The second plot shows the original value of the input signal. If the signal is towards the top of the plot then the if subsystem related to the first plot is executed. If the signal is towards the bottom of the plot then the else subsystem related to the third plot is executed.

The third plot shows the original sine wave and the saturation limited sine wave offset by two. The saturated value of the sine wave is only shown when the subsystem is executed. This occurs between 2.5 and 5 seconds and 7.5 and 10 seconds.

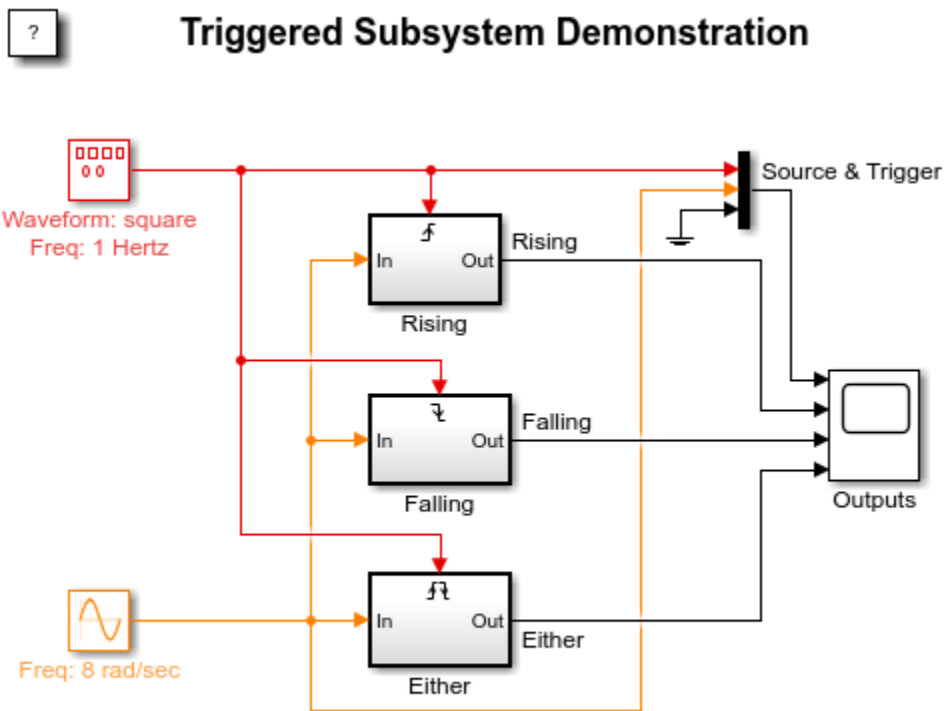

Copyright 1990-2013 The MathWorks, Inc.

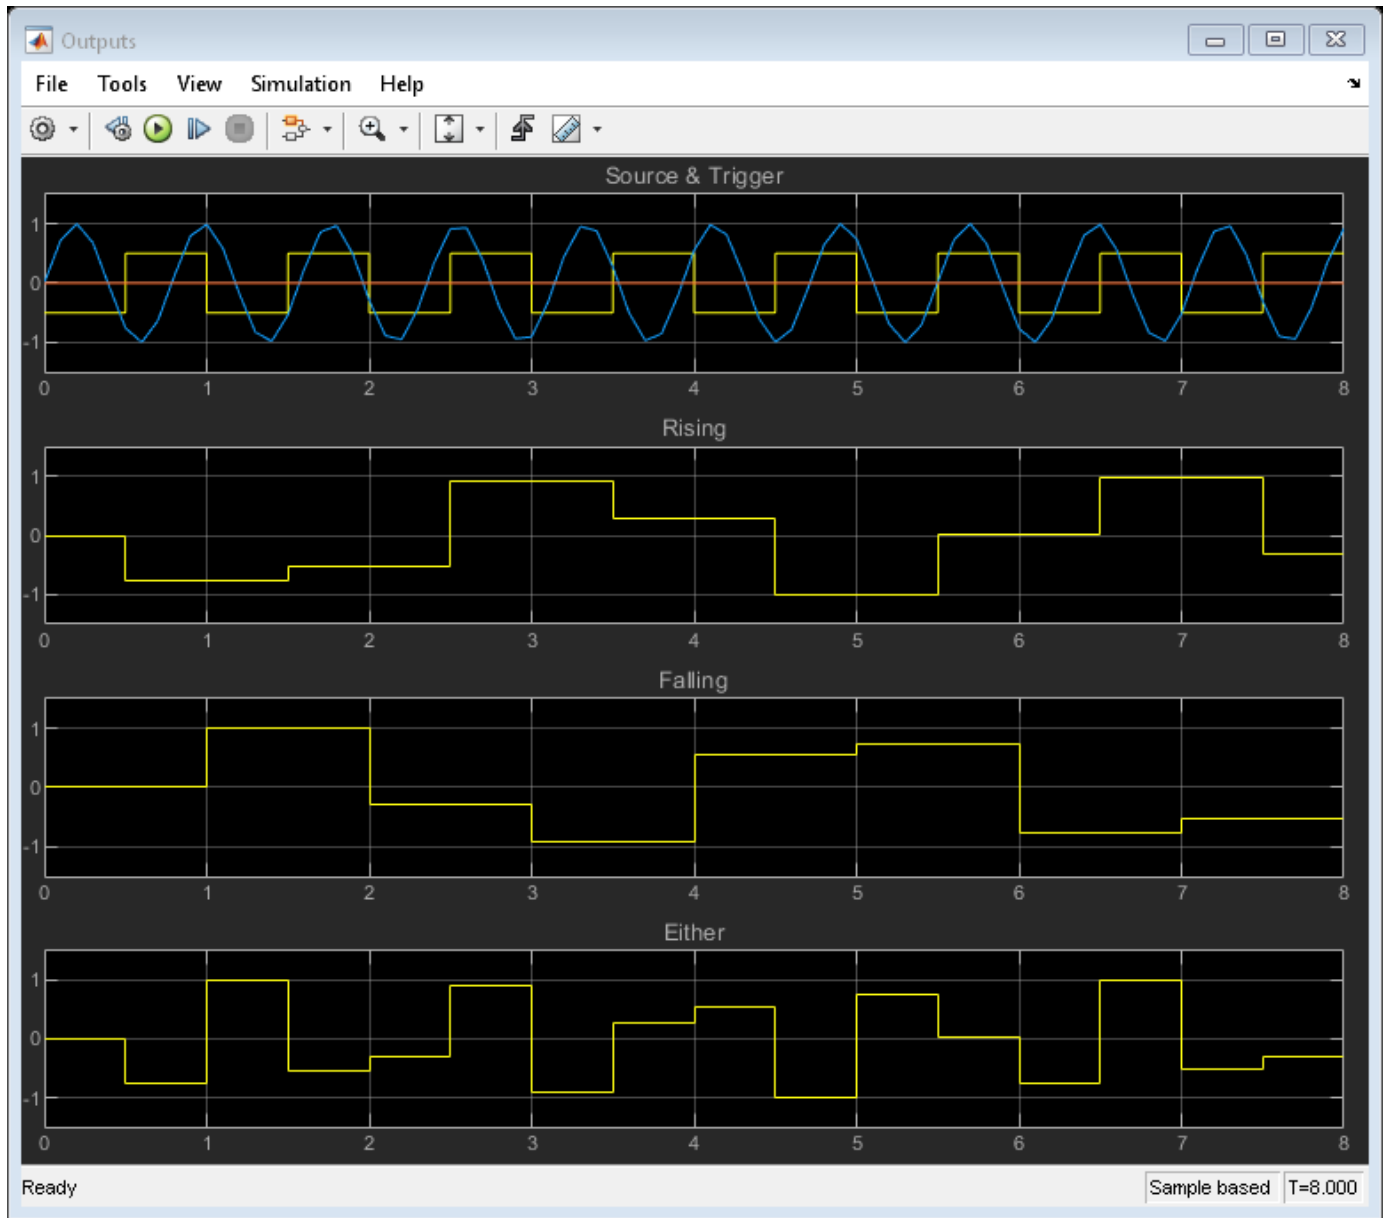

Triggered Subsystems

This model shows triggered subsystems and describes the different trigger types. A triggered subsystem is executed for a single time step whenever the trigger port transitions from false to true in a specified direction. The transition of the trigger port may occur when the direction of the transition is rising, falling, or both rising and falling. A rising transition occurs when the trigger signal transitions from zero or below to a positive value. A falling transition occurs when the trigger signal transitions from zero or above to a negative value.

After running the simulation, look closely at the top plot in the scope. This shows a sine wave, a waveform, and the grounded value of zero. As the waveform transitions through zero, each of the subsystems is triggered appropriately. The output of each subsystem is equal to the current value of the sine wave at that time.

Copyright 1990-2015 The MathWorks, Inc.

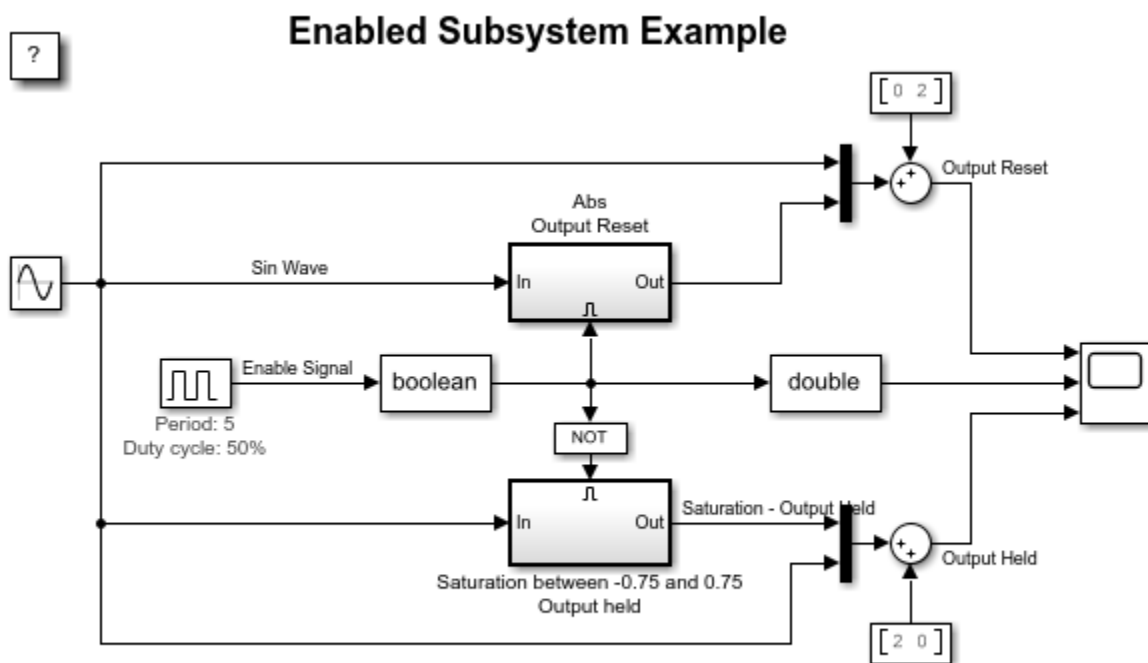

Enabled Subsystems

This example shows what happens when a sine wave is fed into an enabled subsystem. After running the simulation, the scope shows three plots.

The first of these plots shows the original sine wave and the absolute value of the original sine wave offset by two. The absolute value of the sine wave is only shown when the subsystem is enabled. This occurs between 0 and 2.5 seconds and 5 and 7.5 seconds. When the subsystem is not enabled then the output of the subsystem is reset to 0. The value of 0 is determined by the initial condition of the output. You can see when the subsystem is enabled by looking at the second plot. A value of 1 indicates that it is enabled.

The second plot shows the original value of the enable signal. If the signal is towards the top of the plot then the subsystem related to the first plot is enabled. If the signal is towards the bottom of the plot then the subsystem related to the third plot is enabled. The difference on when the subsystems are enabled is caused by the logical NOT block.

The third plot shows the original sine wave and the saturation limited sine wave offset by two. The saturated value of the sine wave is only shown when the subsystem is enabled. This occurs between 2.5 and 5 seconds and 7.5 and 10 seconds.

Copyright 2004-2015 The MathWorks, Inc.

Advanced Enabled Subsystems

This model shows what happens when a sine wave is fed into an enabled subsystem. The four subsystems in the model contain integrators, either discrete or continuous as described by the Subsystem name. After running the simulation, the two scopes show the results for the discrete enabled subsystems (top scope) and continuous enabled subsystems (bottom scope.)

Each Scope shows the output for all combinations of where the states or outputs of the enabled subsystem are either held or reset when the subsystem is disabled. The colors on the scope correspond to the following state and output configuration.

Yellow: Reset states; Held outputs

Purple: Reset states; Reset outputs

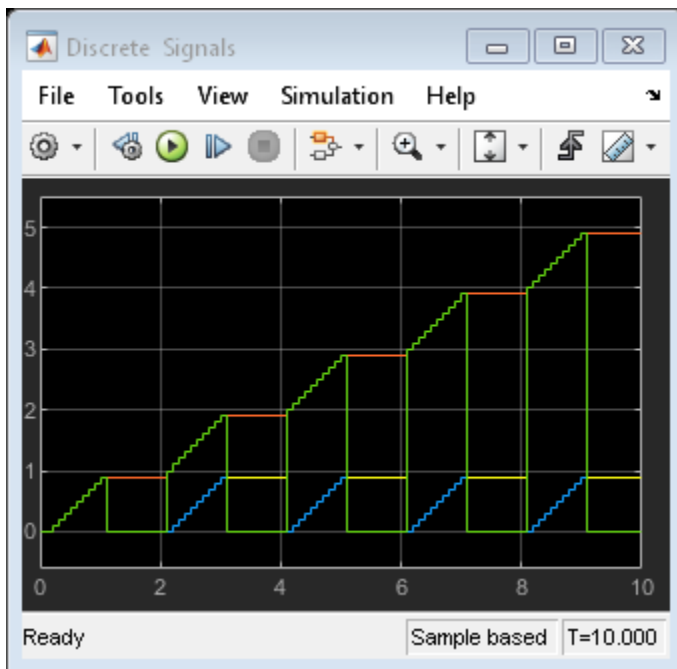

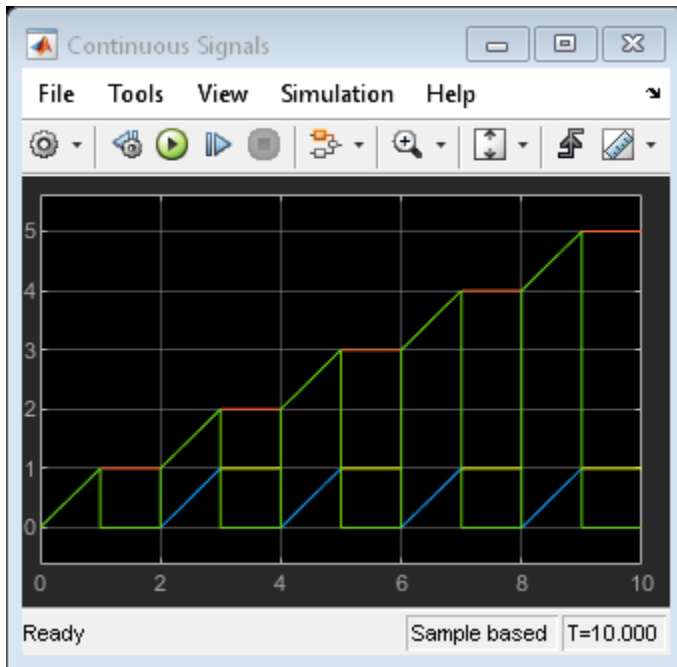

Cyan: Held states; Held outputs

Red: Held states; Reset outputs

Enabled Subsystems in Simulink

Copyright 2004-2015 The MathWorks, Inc.

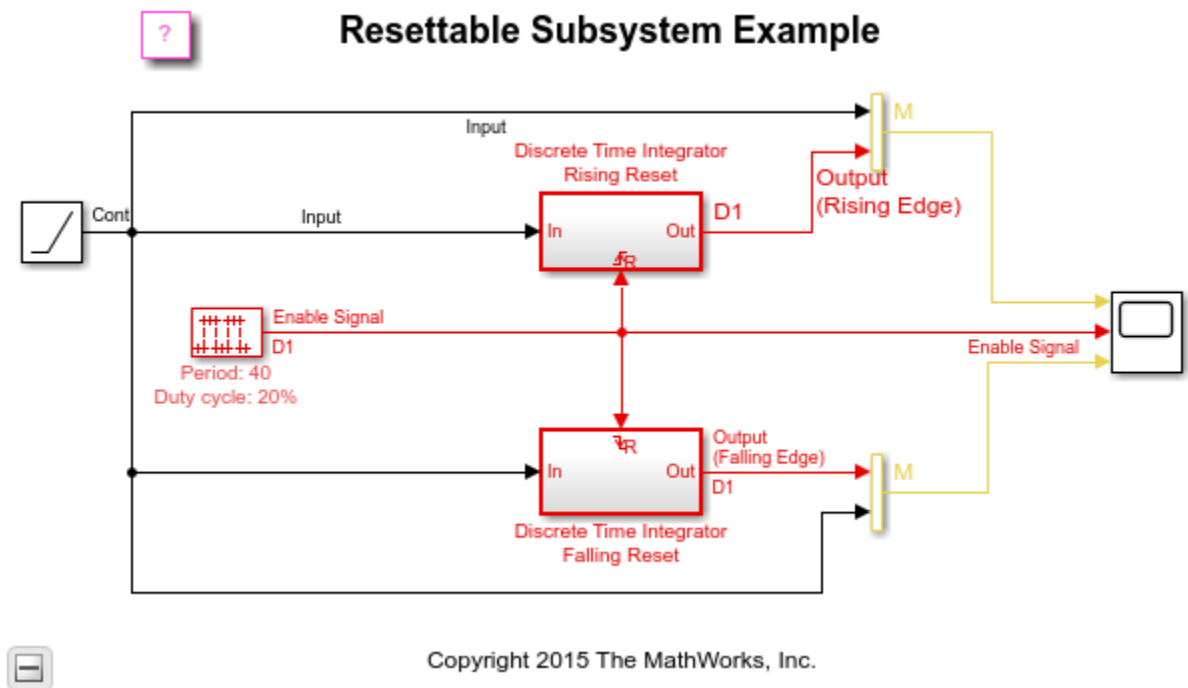

Resettable Subsystems

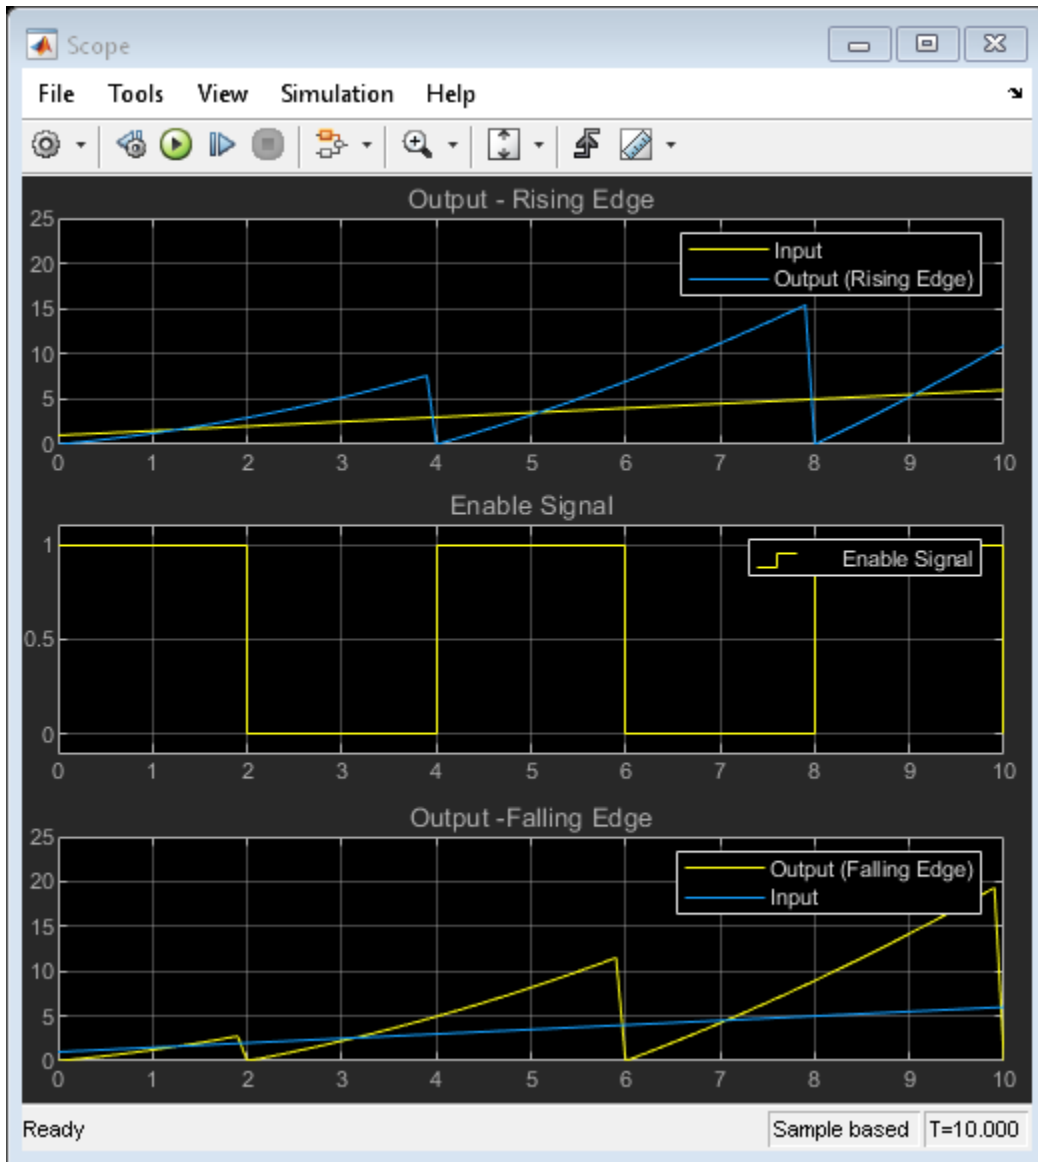

This example shows what happens when a ramp signal is integrated using two resettable subsystems. After running the simulation, the scope shows three plots.

The middle plot shows the original value of the reset signal. In this example, we are using a discrete sample time pulse signal. The rising and falling edges are what cause the two subsystems to reset.

The top and bottom plots show the original ramp as a reference and its integration. The subsystems corresponding to the top and bottom plots reset on every rising and falling edge of the pulse, respectively. When each subsystem resets, the state of the integrator block is set to its initial condition value, which is 0. You can refer to the middle plot to determine when each subsystem resets.

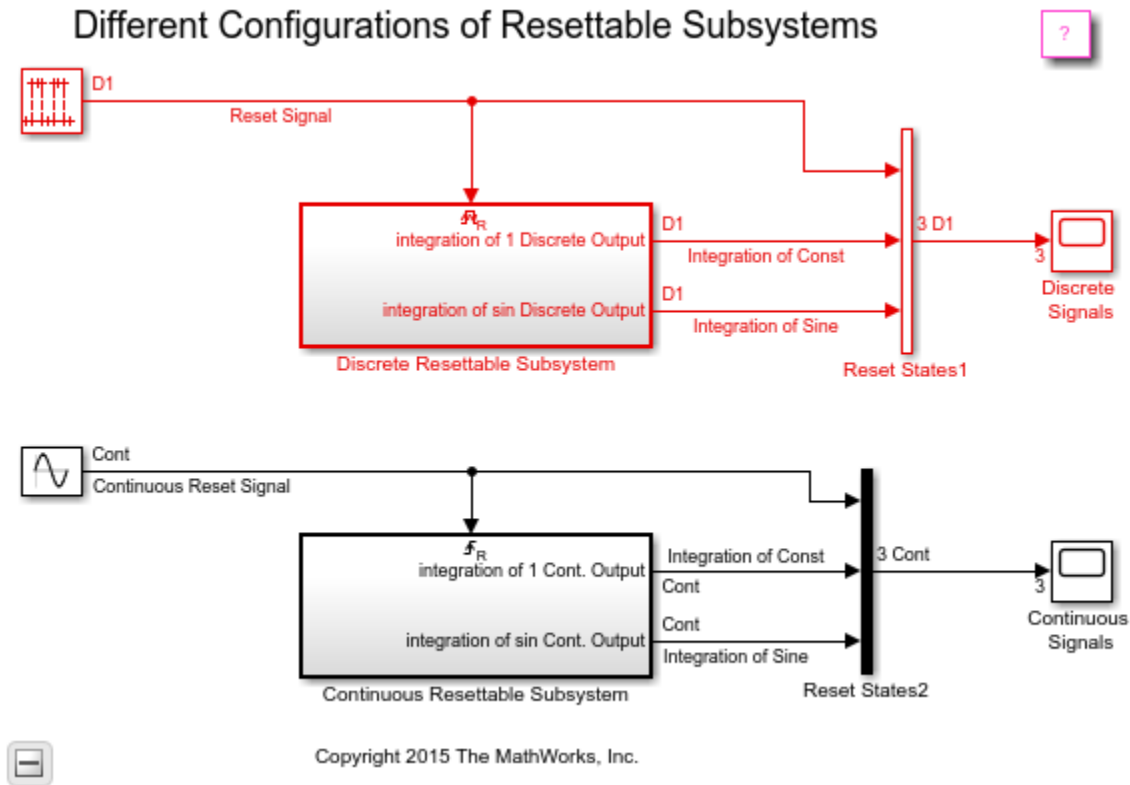

Notice how the reset happens for blocks within the subsystem, without the need for each block to have its own reset port. This provides a more convenient way of handling reset at a subsystem level.

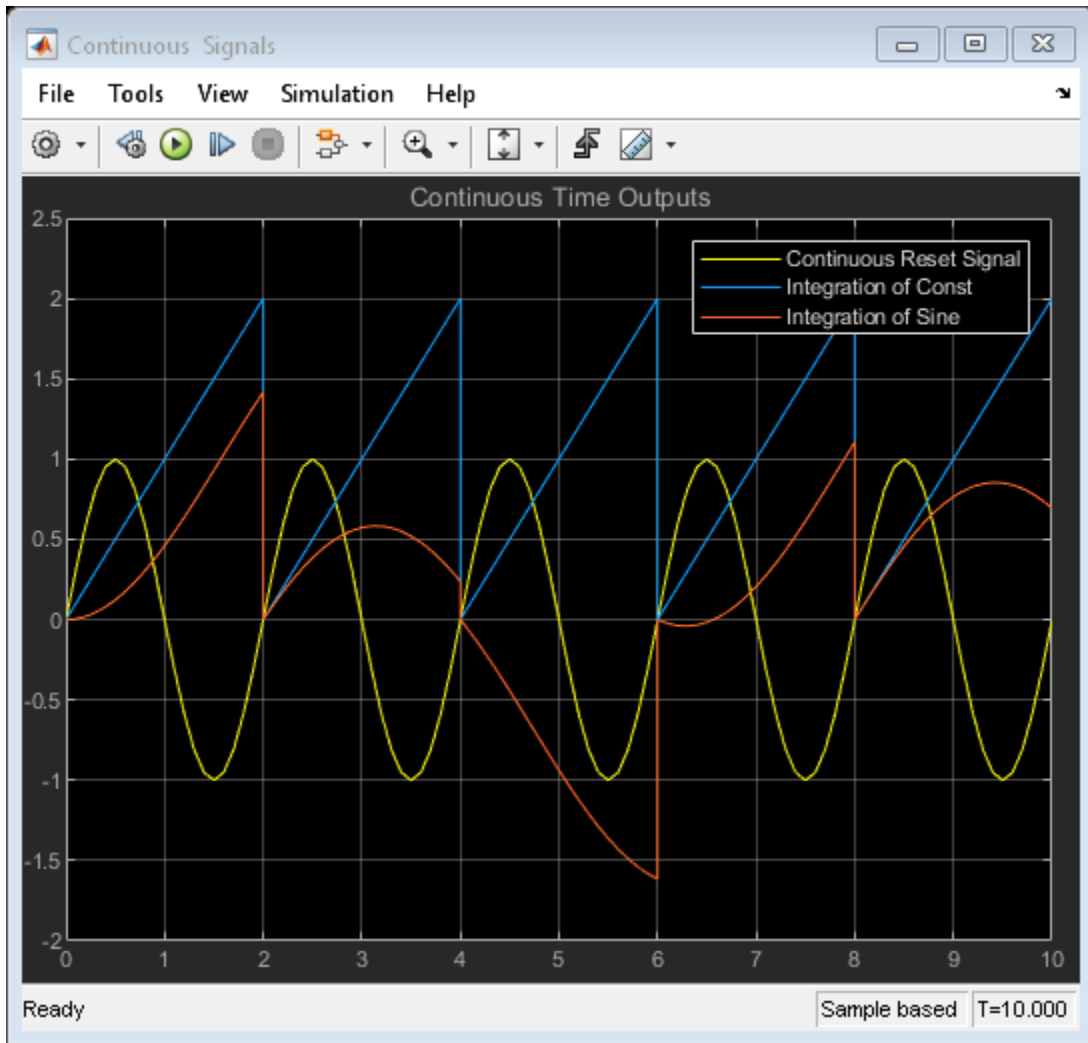

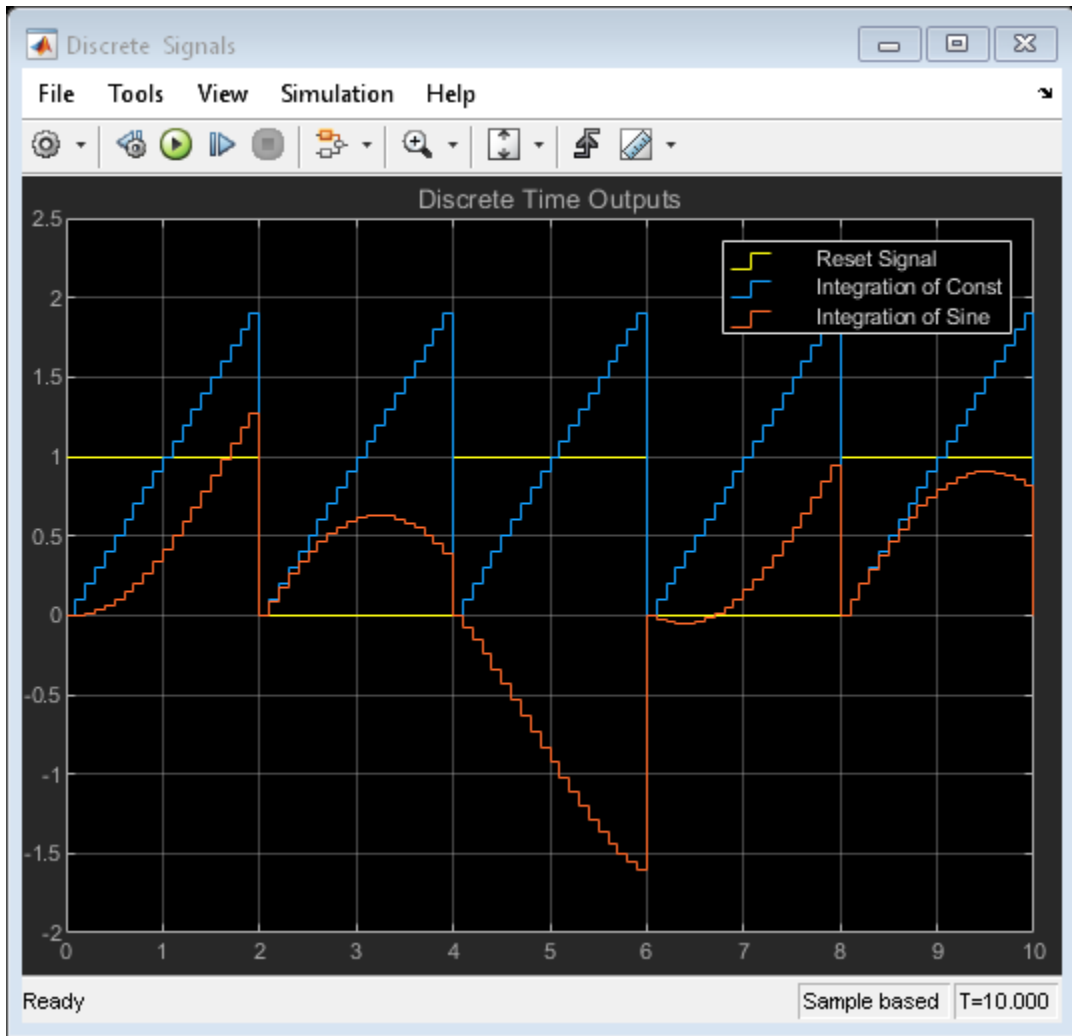

Discrete and Continuous Resettable Subsystems

This example shows the comparison between behaviors of discrete and continuous resettable subsystems. After running the simulation, the two scopes show the results for the discrete resettable subsystem (top scope), and continuous enabled subsystems (bottom scope).

Variant Subsystems

This model illustrates Simulink® variant subsystems. Variant subsystems let you provide multiple implementations for a subsystem where only one implementation is active during simulation. You can programmatically swap out the active implementation and replace it with one of the other implementations without modifying the model.

Overview of Variant Subsystems

A Variant Subsystem block contains two or more child subsystems where one child is active during model execution. The active child subsystem is referred to as the *active variant*. You can programmatically switch the active variant of the Variant Subsystem block by changing values of variables in the base workspace, or by manually overriding variant selection using the Variant Subsystem block dialog. The *active variant* is programmatically wired to the Inport and Outport blocks of the Variant Subsystem by Simulink during model compilation.

To programmatically control variant selection, a `Simulink.Variant` object is associated with each child subsystem in the Variant Subsystem block dialog. `Simulink.Variant` objects are created in the MATLAB® base workspace. These objects have a property named `Condition`, which is an expression, that evaluates to a boolean value and is used to determine the active variant child subsystem. For example, defining

```
VSS_LINEAR_CONTROLLER=Simulink.Variant('VSS_MODE==1');
```

in the base workspace creates a `Simulink.Variant` object where the constructor argument (`'VSS_MODE==1'`) defines when the variant is active. Using the Variant Subsystem dialog, you then associate `VSS_LINEAR_CONTROLLER` with one of the child subsystems within the Variant Subsystem. Defining

```
VSS_MODE=1
```

in the base workspace, activates the `VSS_LINEAR_CONTROLLER` variant. The condition argument can be a *simple expression* consisting of scalar variables, enumerations, equality, inequality, `&&`, `,` and `~`. Parenthesis `()` can be used for precedence grouping.

Using Variant Subsystems

The model in this example uses the following variant objects and variant control variable, which are defined in the MATLAB base workspace:

```
VSS_LINEAR_CONTROLLER=Simulink.Variant('VSS_MODE==1');
```

```
VSS_NONLINEAR_CONTROLLER=Simulink.Variant('VSS_MODE==2');
```

```
VSS_MODE=2;
```

Opening the example model `sldemo_variant_subsystems` runs the **PreLoadFcn** defined in File -> ModelProperties -> Callbacks. This populates the base workspace with the variables for the Variant Subsystem block named Controller:

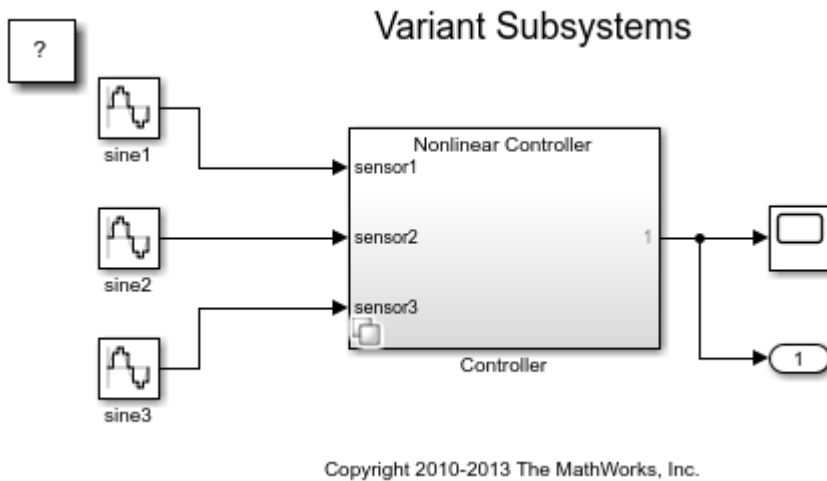

Figure 1: The example model, `sldemo_variant_subsystems`

To specify the `Simulink.Variant` objects association for the Controller subsystem, right-click on the Controller subsystem and select `Subsystem Parameters`, which will open the Controller subsystem block dialog.

The Controller subsystem block dialog specifies two potential variants. The two variants are in turn associated with the two `Simulink.Variant` objects `VSS_LINEAR_CONTROLLER` and `VSS_NONLINEAR_CONTROLLER`, which exist in the base workspace. These objects have a property named **Condition**, an expression that evaluates to a boolean and that determines which variant is active. The condition is also shown in the Variant Subsystem block dialog. In this example, the Condition properties of `VSS_LINEAR_CONTROLLER` and `VSS_NONLINEAR_CONTROLLER` are `VSS_MODE == 1` and `VSS_MODE == 2`, respectively. The variable `VSS_MODE` resides in the base workspace, and can be a standard MATLAB variable or a `Simulink.Parameter`.

If there is no associated variant object or a '%' (comment) character prefixes the variant object in the Variant Subsystem parameters dialog box, then the child subsystem is considered commented out and is not used during model execution.

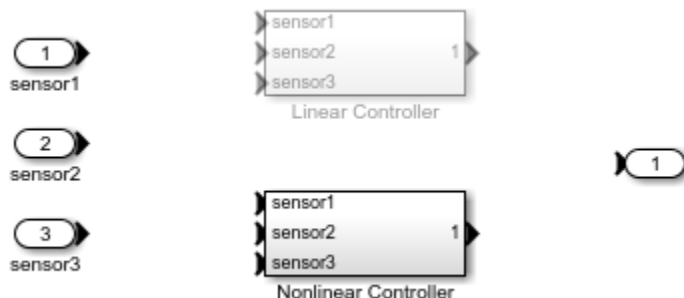

Figure 2: Contents of the Controller subsystem block

Within a Variant Subsystem block, you can place Inport, Outport, and Subsystem blocks. In this example, the Linear Controller Subsystem block is associated with the variant object,

VSS_LINEAR_CONTROLLER, and the Nonlinear Controller Subsystem block is associated with the variant object, VSS_NONLINEAR_CONTROLLER.

Signal connections are not allowed in the Variant Subsystem. Simulink programmatically wires up the Inport and Outport blocks to the active variant when simulating the model.

Switching Active Variants

To simulate using the Linear Controller variant, define:

```
VSS_MODE=1
```

in the base workspace and then simulate the model.

Figure 3: Simulation using the Linear Controller variant

To simulate using the Nonlinear Controller, define

```
VSS_MODE=2
```

in the base workspace and then simulate the model.

Figure 4: Simulation using the Nonlinear Controller variant

Enumerations and Reuse

The `sldemo_variant_subsystems_enum` model illustrates the following `Simulink.Variant` capabilities:

1. **Enumerations:** MATLAB enumeration classes can be used to improve readability in the conditions of the variant object.
2. **Reuse:** `Simulink.Variant` objects can be reused in different Variant Subsystem blocks.

This example uses the following variables which are defined in the MATLAB base workspace:

```
VSSE_LINEAR_CONTROLLER=Simulink.Variant( ...
'VSSE_MODE==sldemo_vss_CONTROLLER_TYPE.LINEAR')

VSSE_NONLINEAR_CONTROLLER=Simulink.Variant( ...
'VSSE_MODE==sldemo_vss_CONTROLLER_TYPE.NONLINEAR')

VSSE_MODE=sldemo_vss_CONTROLLER_TYPE.LINEAR

VSSE_PROTOTYPE=Simulink.Variant( ...
'VSSE_MODE_BUILD==sldemo_vss_BUILD_TYPE.PROTOTYPE')

VSSE_PRODUCTION=Simulink.Variant( ...
'VSSE_MODE_BUILD==sldemo_vss_BUILD_TYPE.PRODUCTION')

VSSE_MODE_BUILD=sldemo_vss_BUILD_TYPE.PRODUCTION
```

In these `Simulink.Variant` objects, we use the enumeration classes, `sldemo_vss_BUILD_TYPE.m`, and `sldemo_vss_CONTROLLER_TYPE.m` to define the `Simulink.Variant` **Condition** parameters which improves readability.

The three filter Variant Subsystems blocks, Filter1, Filter2, and Filter3 all use the VSSE_PROTOTYPE and VSSE_PRODUCTION Simulink.Variant objects.

Opening the example model `sldemo_variant_subsystems_enum` runs the **PreLoadFcn** defined in File -> ModelProperties -> Callbacks. This populates the base workspace with variables for the Variant Subsystem blocks:

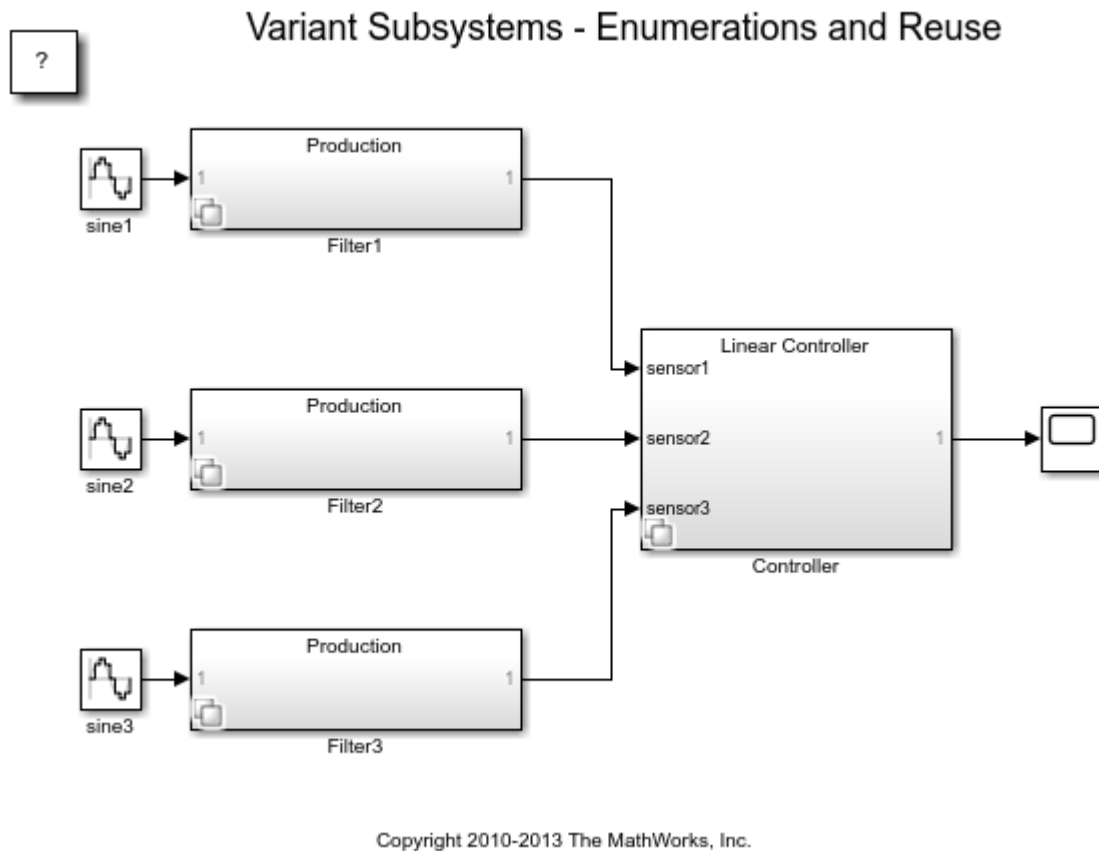

Figure 5: The example model, `sldemo_variant_subsystems_enum`

Code Generation

You can use the Simulink® Coder™ to generate code from a model containing Variant Subsystem blocks. By default the generated code contains only the active variant. Alternatively, you can generate code for all variants guarded by C preprocessor conditionals (`#if`, `#elif`, `#endif`) when using the Embedded Coder™.

To generate preprocessor conditionals, the types of blocks that you can place within the child subsystems of a Variant Subsystem block are limited. During the code generation process, one Merge block is placed at the input of each Outport block within the variant subsystem and connected to the child subsystems within the variant subsystem. Thus, the restrictions placed on Merge blocks apply to the contents of Variant Subsystem blocks. The restriction checks are only performed when generating code. In addition, the child subsystems of the Variant Subsystem block must be Atomic subsystems, which are created by selecting the **Treat as atomic unit** parameter of the Subsystem parameters dialog box.

Code generation of preprocessor conditionals is active when

- 1 Embedded Coder target is selected on the Code Generation pane of the Configuration Parameters dialog box.
- 2 The **Override variant conditions and use following variant** is *not* selected on the Variant Subsystem block parameter dialog box.

When code generation of preprocessor conditionals is active, the generated code contains all child subsystems of the Variant Subsystem blocks protected by C preprocessor conditionals. In this case, the selection of the active variants is deferred until compile-time of the generated code. Only one variant object which is encoded in C macros, must evaluate to true (be active).

In addition, the variant control variables (such as VSS_MODE and VSSE_MODE above) must be Simulink.Parameter objects that specify how the #define's for the variant control variables are managed in the generated code. For the sldemo_variant_subsystems, you can clear the VSS_MODE double from the base workspace. Use Model Explorer -> Simulink Root -> Base Workspace to add a new Simulink.Parameter named VSS_MODE. Specify the parameter **Value** as 1 or 2, the **Data Type** as int32, and **Storage class** as ImportedDefine with **Custom attributes Header file** as sldemo_variant_subsystems_vdef.h. You should then create this header in the current working directory:

```
/* File: sldemo_variant_subsystems_vdef.h */
#ifndef SLDEMO_VARIANT_SUBSYSTEM_VDEF_H
#define SLDEMO_VARIANT_SUBSYSTEM_VDEF_H
#define VSS_MODE 1
#endif
```

See the Embedded Coder documentation for more information on code generation for variant subsystems.

Block Priority

This model shows what happens when blocks are assigned different priorities. The block priority affects the order in which the blocks are executed. You can set the block priority through the Block Properties dialog.

The block sorting order is calculated only at the beginning of a simulation. For this reason, changes to a block's Priority property are only updated when the simulation is started. Double click on the green block to change the priority levels for the blocks and see what happens.

Inside of each triggered subsystem is an S-Function which controls the coloring of the blocks and also slows down the simulation. The priority level of the block is displayed using the format attribute string that can be set in the Block Properties dialog.

Monitoring Ink Status on a Shared Printer Using Simulink Functions

This example shows how clients, in this case three computers, can send jobs to a server, a printer, and receive status from that server. This example highlights how Simulink Functions can be called from different subsystems and interact both in Simulink® and Stateflow®.

Example Requirements

Note that when you simulate the example, Stateflow might generate code in the current working folder.

Overview

In this example, the computers each generate randomly sized print jobs at regular intervals. The printer interacts with the computers through two Simulink Functions on the Simulink canvas and one Exported Graphical Function in Stateflow.

1. The clients use Function Caller blocks to invoke the addPrintJob interface of the printer.
2. The client-server interaction, modeled by this call, may have a negative return value if the printer has run out of ink.

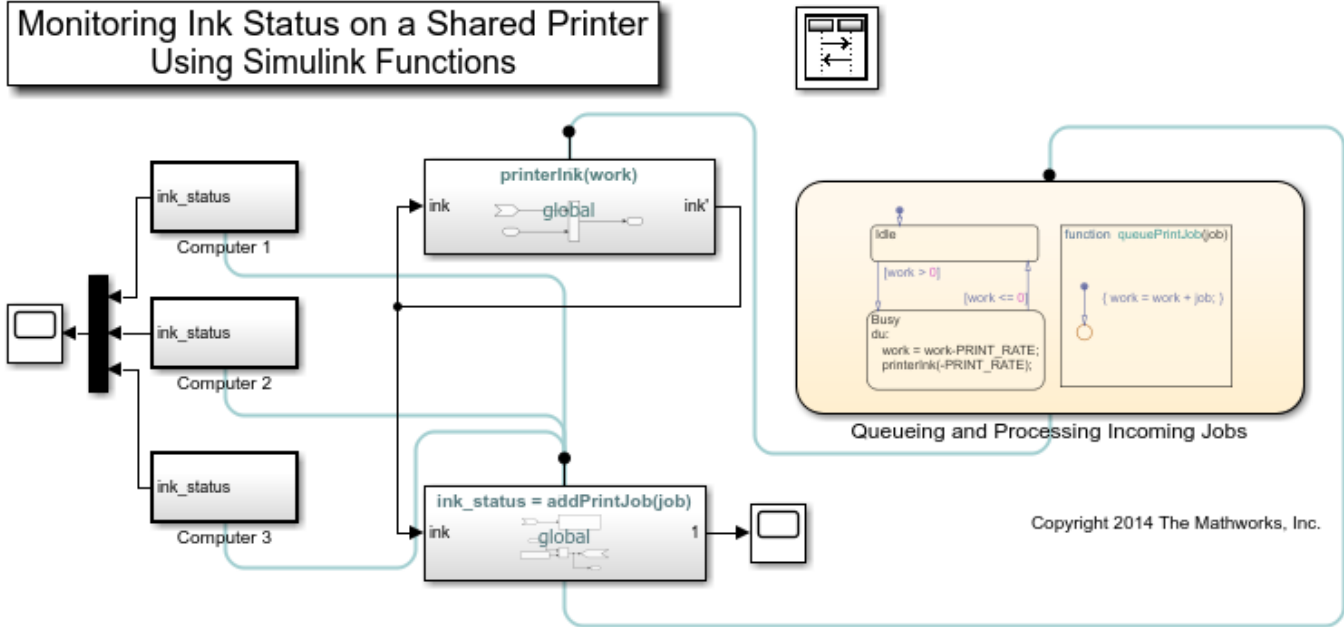

The example shows how to interface Simulink and Stateflow using functions.

1. The implementation of addPrintJob uses a Function Caller block to invoke queuePrintJob, which is a Stateflow Exported Graphical Function.
2. The queuePrintJob function interacts with other content in the chart using a local chart variable 'work'.
3. The implementation of the chart makes a call to printerInk, which is a Simulink Function.
4. The printerInk function job uses the graphical input and outputs to interact with the addPrintJob function.

The example also shows how to visualize and debug Simulink Functions.

1. You can enable the visualization lines connecting functions and their respective callers. In the Simulink Editor, on the **Debug** tab, under **Information Overlays**, click **Function Connectors**.
2. The Message Viewer block shows where calls to functions are generated, and which functions are called at different times. This helps to understand the flow of calls with respect to time, and also analyze the arguments sent during these calls to functions.

Monitoring Ink Status on a Shared Printer Using Simulink Functions

Modeling Services and Access from Application Software

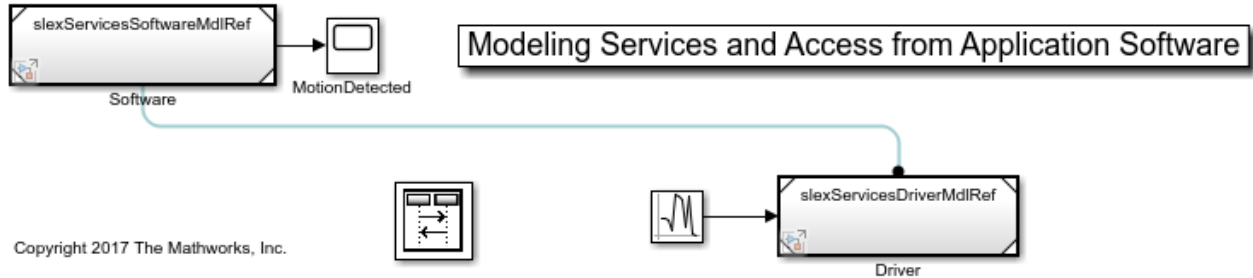

This examples shows a typical software modeling pattern involving services and access to those services in an application.

Overview

Driver model represents services provided, read() and write(), related to motion detection.

The chart in the Software model makes calls to the services using the notation `slexServicesDriverMdlRef.write()`. The notation compactly identifies the function to be called, and the Driver model from where the function's argument attributes are inherited, making this Software model independently compilable.

Simulating the model, and inspecting Sequence Viewer block shows how the chart makes motion detection decisions based on the services.

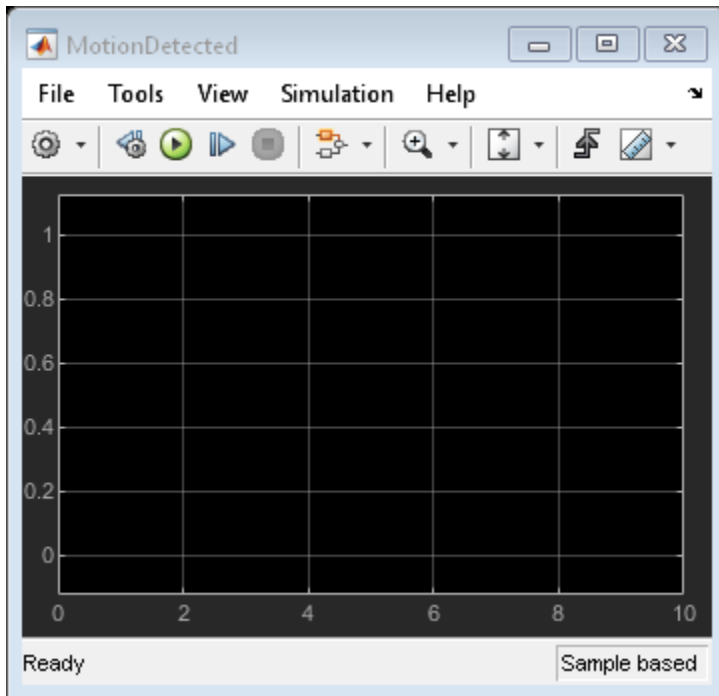

Copyright 2017 The Mathworks, Inc.

Modeling Reusable Components Using Multiply Instanced Simulink Functions

In this example, the model `slexCounterFunctionMdlRef` contains a Simulink Function `update()` which maintains a counter. Multiple instancing provides the ability to reuse this logic as `CounterA` and `CounterB` in this application model.

Overview

The qualified calling notation `CounterA.update` and `CounterB.update` is used to distinguish the two different instances of the counter logic. Note that each instance may be called from multiple caller blocks as illustrated in this example.

Closing the Models

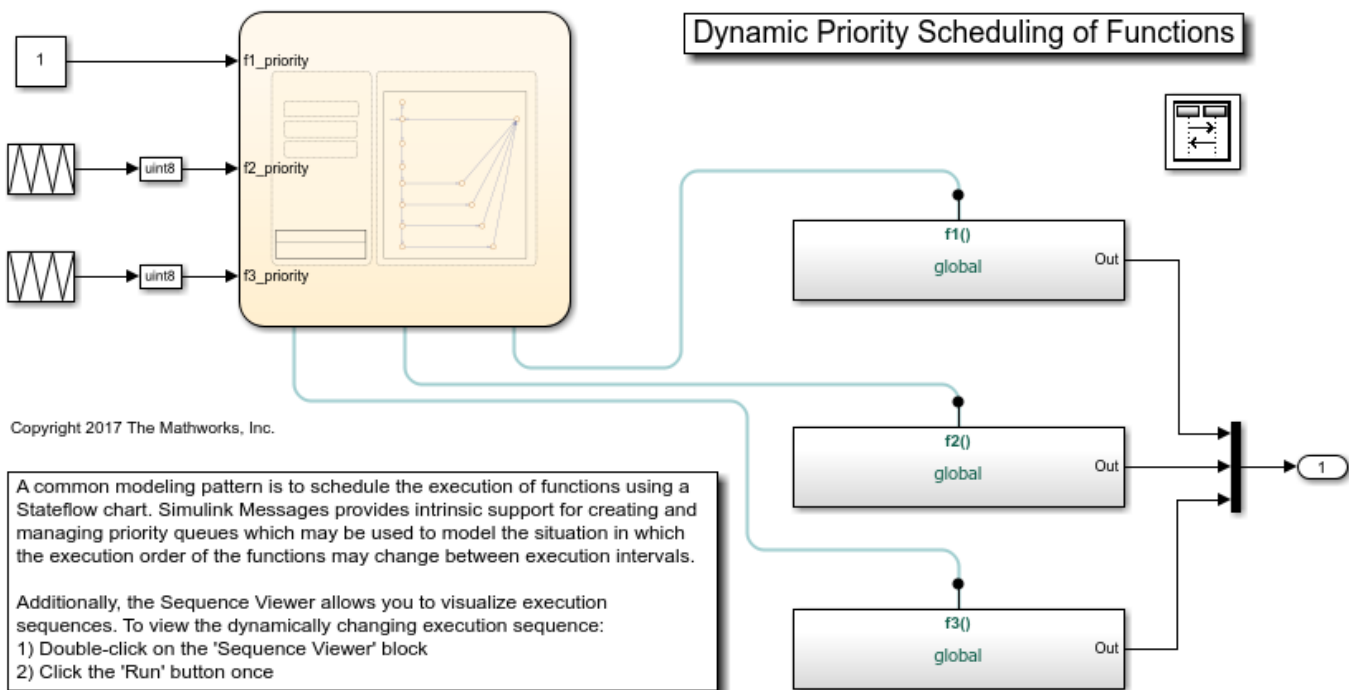

Dynamic Priority Scheduling of Functions

This example shows a common modeling pattern to dynamically schedule the execution of functions using a Stateflow chart.

Overview

Simulink Messages provides intrinsic support for creating and managing priority queues which may be used to model the situation in which the execution order of the functions may change between execution intervals.

Additionally, the Sequence Viewer allows you to visualize execution sequences. To view the dynamically changing execution sequence: 1. Double-click on the 'Sequence Viewer' block 2. Click the 'Run' button once

Closing the Models

Component-Based Modeling with Model Reference

This example shows how to use Model Reference. It walks you through simulation and code generation of a model that references another model multiple times.

Example Requirements

During this example, Simulink® and Simulink® Coder™ generate code in the code generation folder created in the current working directory. If you do not want to (or cannot) generate files in this directory, you should change your working directory.

Simulink Coder is required to generate code to be deployed in standalone applications.

If you plan to alter the example models:

1. Preserve the example in its original state by copying the following files from your MATLAB® installation directory, without changing their names, to a different directory:

```
toolbox/simulink/simdemos/simfeatures/modelreference/sldemo_mdref_basic.slx
toolbox/simulink/simdemos/simfeatures/modelreference/sldemo_mdref_counter.slx
```

2. Change your current working directory to the directory to which you copied the files

3. Continue with the example

About Model Reference

Open the example model `sldemo_mdref_basic`. This model contains three Model blocks: CounterA, CounterB and CounterC. These blocks reference the same model, `sldemo_mdref_counter`, which is a separate model and not a subsystem of `sldemo_mdref_basic`.

Simulation Mode

The Model block has a parameter named **SimulationMode** that controls how the referenced model is simulated. If the parameter is set to **Accelerator**, the referenced model is simulated through code generation. If the parameter is set to **Normal**, the referenced model is simulated in interpreted mode. In this model, the Model blocks CounterA and CounterB reference `sldemo_mdref_counter` in Normal mode, which is indicated by the hollow corners on the Model block icon. The other instances, CounterC, references `sldemo_mdref_counter` in Accelerator mode, which is indicated by the filled corners on the Model block icon. To learn more about interacting with models that are referenced more than once in Normal mode, see the example `sldemo_mdref_depgraph`.

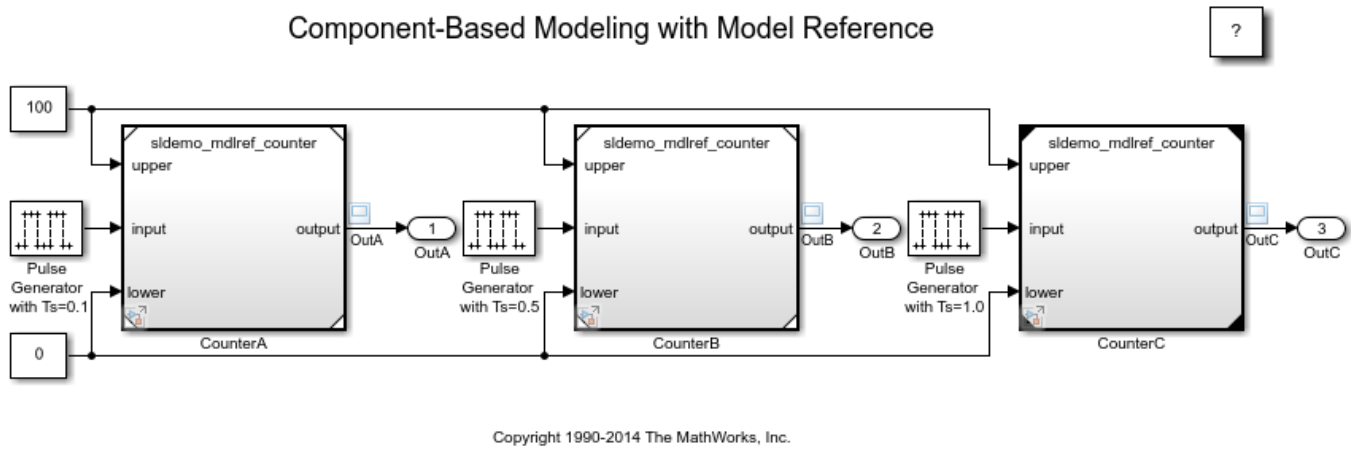

Figure 1: The top model, `sldemo_mdref_basic`

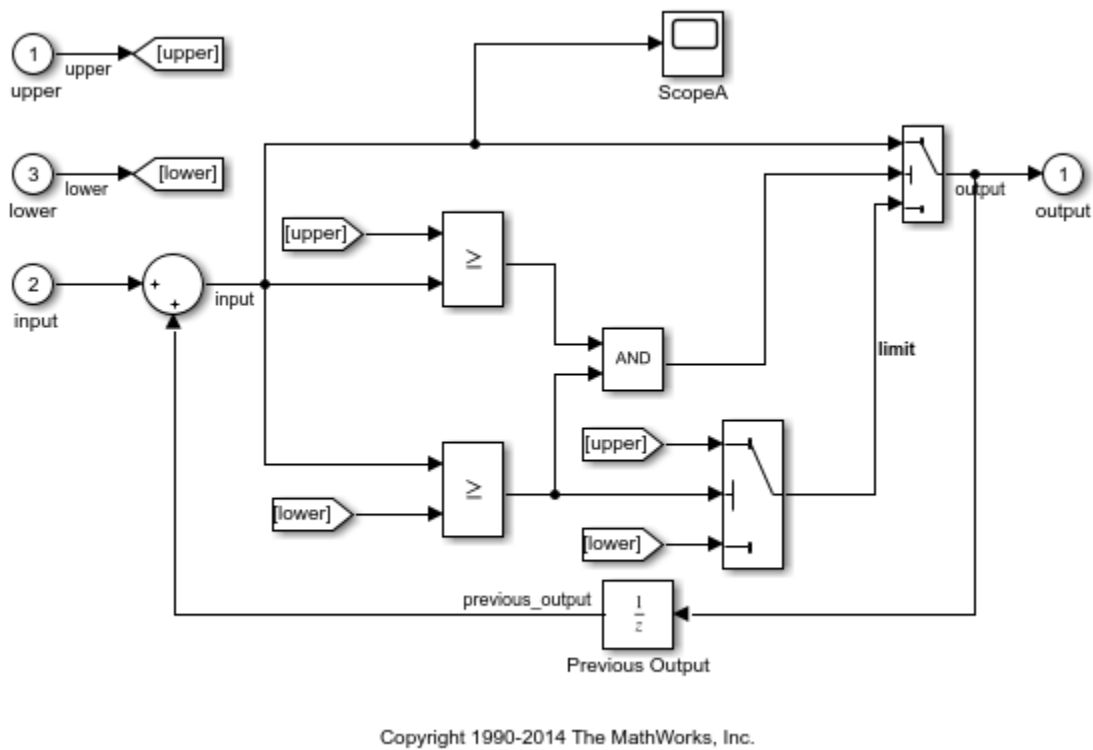

Figure 2: The referenced model, `sldemo_mdref_counter`

Model Reference has several advantages over subsystems:

- You can develop the referenced model independently from the models in which it is used.
- You can reference a model multiple times in another model without having to make redundant copies.
- Multiple models can reference a single model.

- The referenced model is not loaded until it is needed, a feature called *Incremental Loading*. Incremental loading speeds up model load times.
- If a model is referenced in Accelerator mode, Simulink creates special binaries to be used in simulations. If the binaries are up-to-date, because the referenced model has not changed since the binaries were created, no code generation occurs when models that use these binaries are simulated or compiled. This is called *Incremental Code Generation*. The use of binaries increases simulation speed and modularity in code generation.
- Generating code for a model with Model blocks also takes advantage of incremental code generation.

Simulation Through Code Generation (Does not require Simulink Coder)

Simulation of a model that references other models in Accelerator mode requires the generation of code and a binary file called the Simulation Target for each unique referenced model. This process does not require Simulink Coder. For this example, a simulation target is built for the `sldemo_mdhref_counter` model. You can create the Simulation Target by any of the following actions:

- Updating `sldemo_mdhref_basic`
- Simulating `sldemo_mdhref_basic`
- Issuing the command:

```
slbuild('sldemo_mdhref_counter','ModelReferenceSimTarget')
```

Remarks:

- If a model is referenced in Normal mode, the simulation target is not built for that referenced model.
- Once the simulation target is built, subsequently simulating or updating the model does not trigger a rebuild of the referenced model's simulation target unless the referenced model has changed.
- Turn on the sample time colors for `sldemo_mdhref_basic`. Note that the Model blocks have inherited different sample times. The Model Blocks inherit their sample times if the referenced model does not explicitly specify a sample time.

Code Generation for Standalone Applications (Requires Simulink Coder)

When creating a standalone executable for `sldemo_mdhref_basic`, the code and binaries for the targets of `sldemo_mdhref_counter` are first generated. The necessary targets are built if they are not up-to-date. You can build the target for `sldemo_mdhref_counter` and the standalone executable for `sldemo_mdhref_basic` by any of the following actions:

- Building the standalone executable for `sldemo_mdhref_basic`.
- Building the Model Reference target of `sldemo_mdhref_counter`, followed by building the standalone executable for `sldemo_mdhref_basic`.

Remarks:

- Once the model reference coder target of `sldemo_mdhref_counter` is built, subsequent builds of `sldemo_mdhref_basic` do not trigger a rebuild of `sldemo_mdhref_counter` unless `sldemo_mdhref_counter` changes (Incremental Code Generation).

- Note that the code generated for the referenced model `sldemo_mdhref_counter` is reused.
- The HTML report of the generated code for `sldemo_mdhref_basic` has a link to the HTML report of the generated code for `sldemo_mdhref_counter` in the Referenced Model section.

Build the Standalone Target and view the HTML report of the generated code

Export Simulation Data

You can log time, outputs, states, and final states data of the simulation. The logging is configured to use Dataset format.

Incremental Loading

Close `sldemo_mdhref_counter` and `sldemo_mdhref_basic` and then re-open `sldemo_mdhref_basic`. At the MATLAB prompt issue the command:

```
find_system('type','block_diagram')
```

The referenced model is not listed because it is not loaded. Double click on any Model block. At the MATLAB prompt, issue the command:

```
find_system('type','block_diagram')
```

The referenced model is now listed, illustrating how incremental loading works.

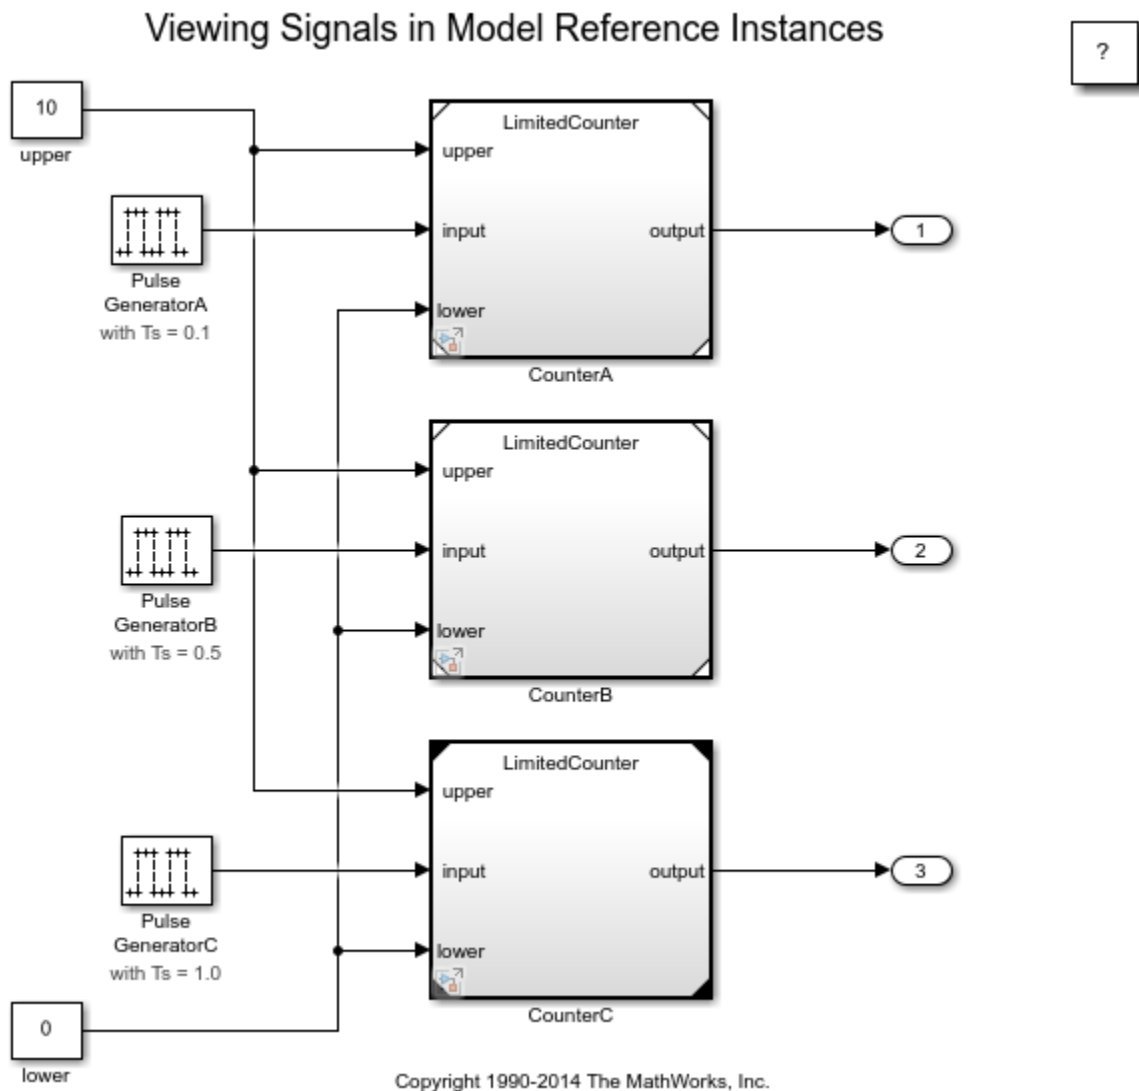

Viewing Signals in Model Reference Instances

This example shows how to use the Simulation Data Inspector to view and analyze signals in referenced models. The Simulation Data Inspector relies on signal logging so this example shows how to configure your model to log signals in referenced models.

Open the Example Models

Run the following command to create and open a working copy of the project files.

```
slexMultiInstanceModelStart
```

The project example copies files to your temporary folder so that you can edit them and use them under local version control.

The Simulink® Project Tool opens and loads the project already under version control.

The project is configured to run some startup tasks.

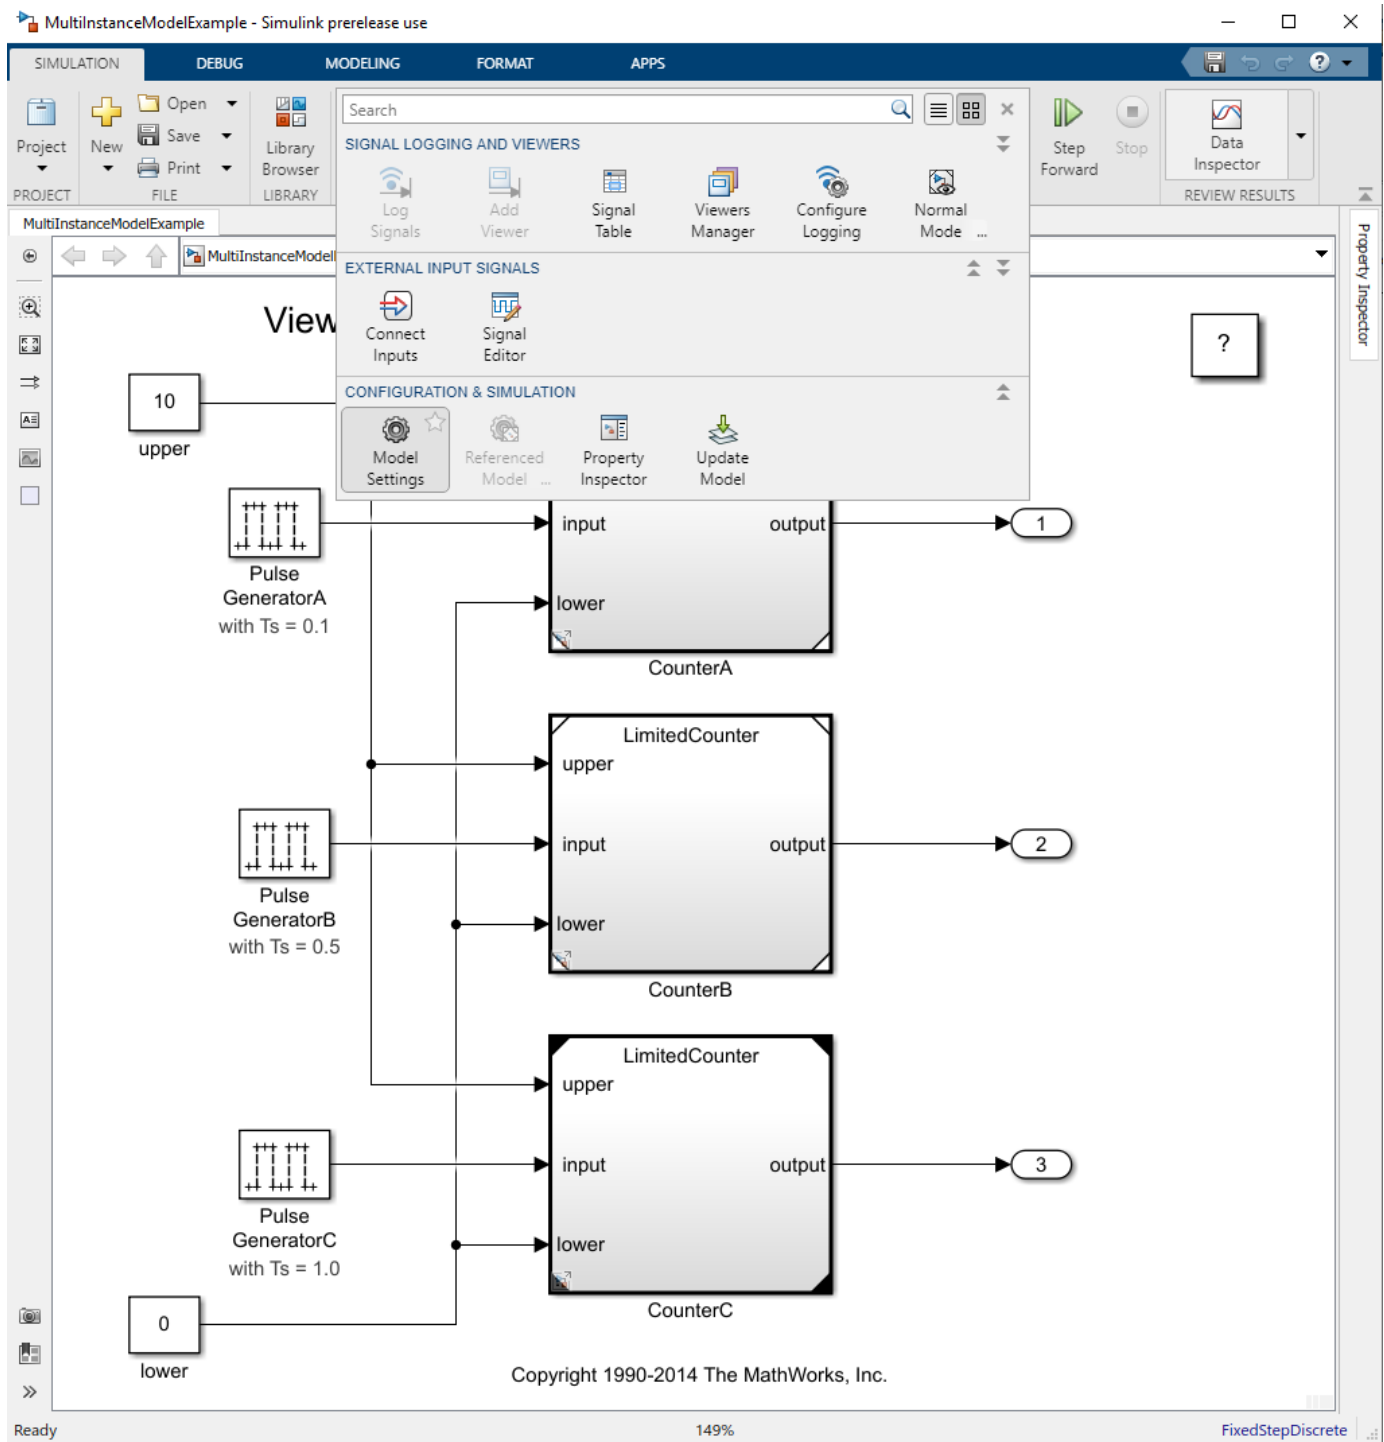

Setting up Signals to Log in Referenced Models

The first task in setting up a referenced model to view signals using the Simulation Data Inspector is to set up that model for logging. To do that, edit the referenced model and mark the signals for logging. Note that four signals are already set up for logging (marked with the blue wi-fi badge). To log an additional signal:

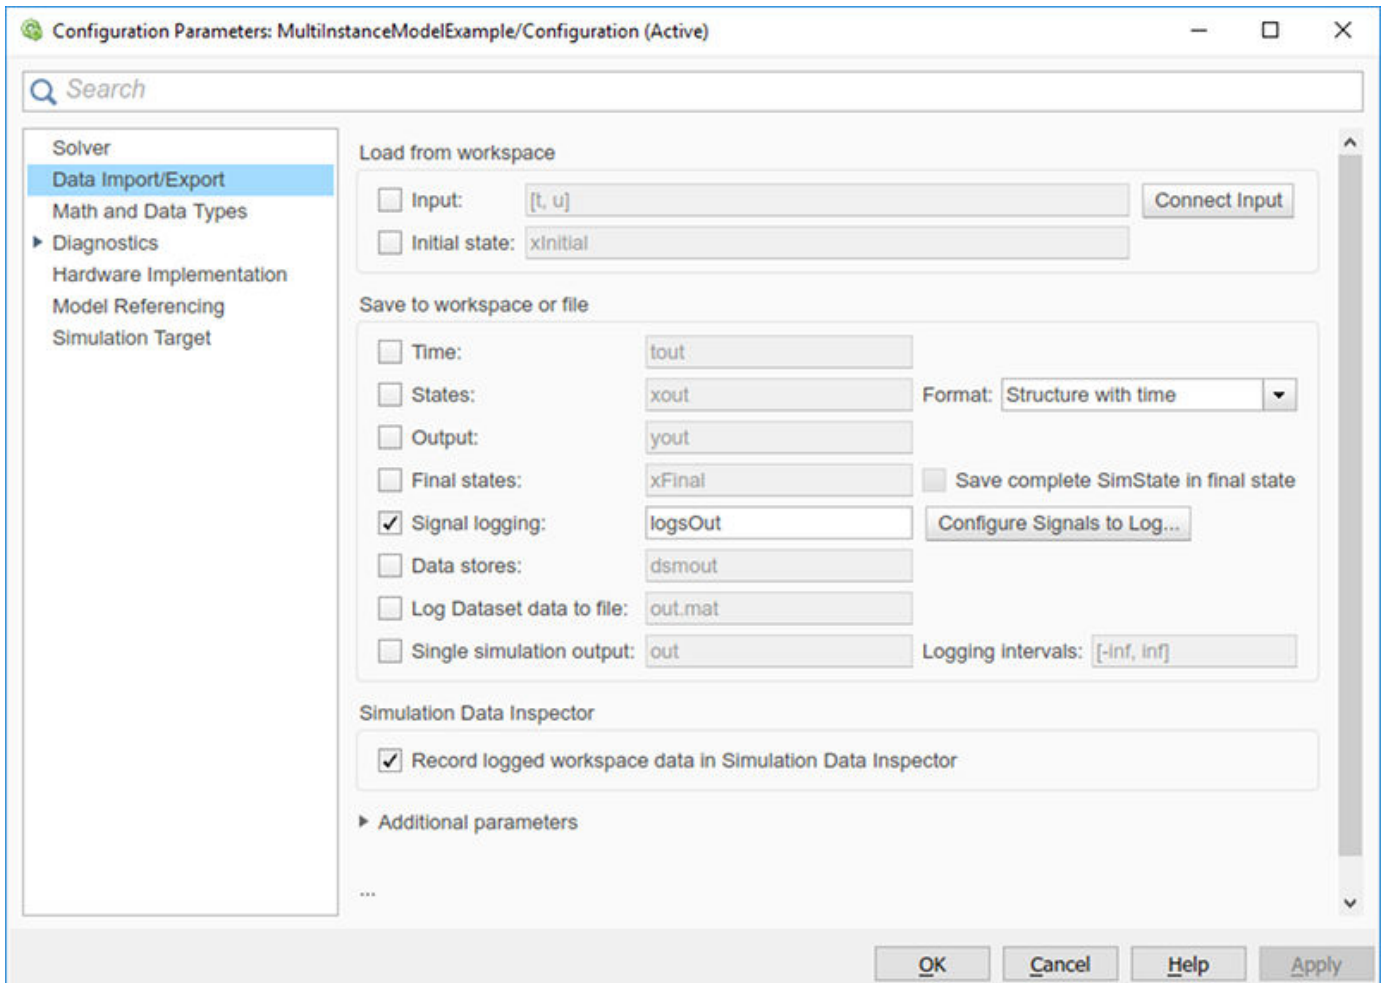

- 1 Select the raw output signal.
- 2 In the **Simulation** tab, from the **Prepare** gallery, click **Log Signals** as shown below.

Copyright 1990-2014 The MathWorks, Inc.

Once the signals to log have been selected in the referenced model, the next step is to select which signals to actually log from the topmost model in the hierarchy. In the top model, on the **Modeling** tab, click **Model Settings**.

On the **Data Import/Export** pane, click the **Configure Signals to Log...** button to activate the Simulink Signal Logging Selector dialog.

There are two Logging modes that can be used when logging signals in referenced models. The first is **Log all signals as specified in model**, which will honor any logging settings that were made in referenced models. If you need to override any of those settings, such as selecting only a subset of logged signals, then you should use the **Override signals** mode. In this mode, you are given the ability to select a subset of loggable signals and configure their properties, such as decimation and name.

Viewing and Analyzing Logged Signals Using the Simulation Data Inspector

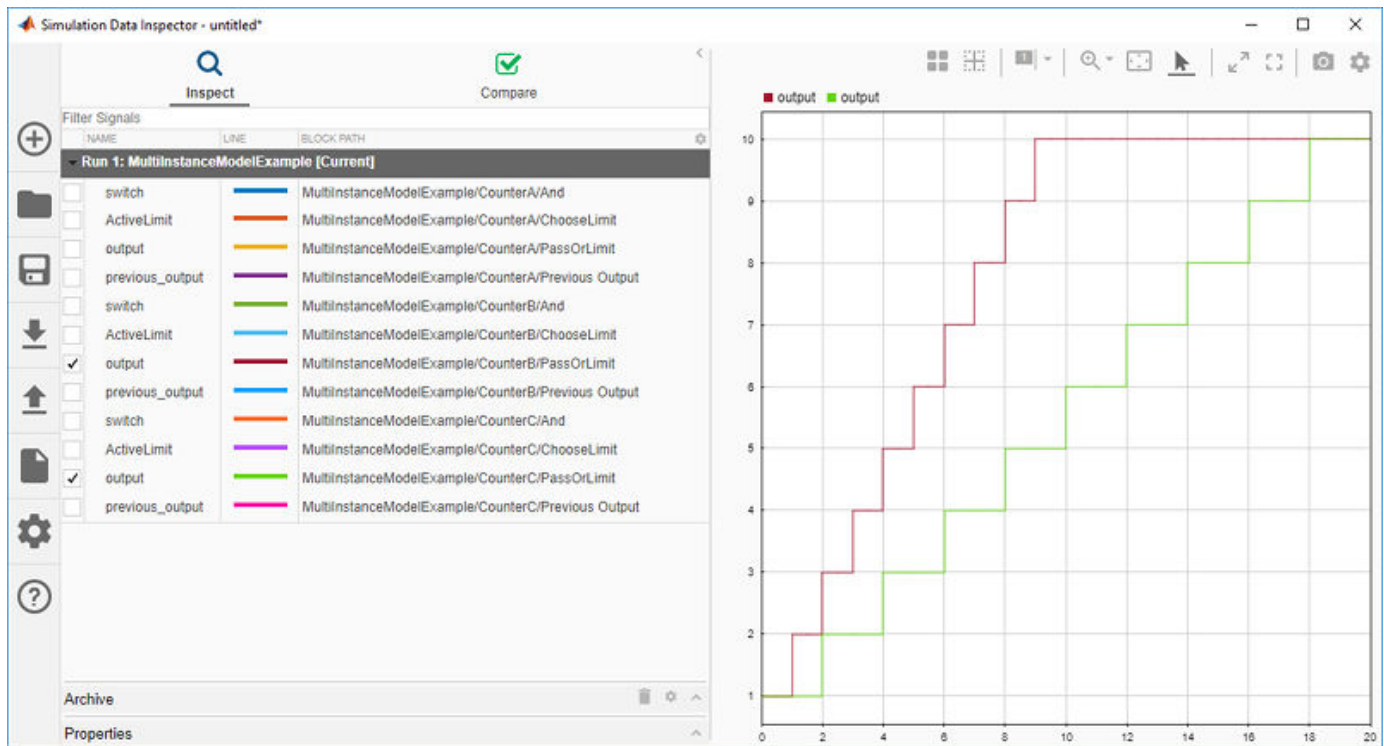

Once logging has been configured for a model hierarchy and all changes to the models have been saved, the model can be simulated. The simulation creates a Dataset object in the base workspace. You can analyze and view the logged data in this object using standard MATLAB tools. In addition, Simulink provides the Simulation Data Inspector, for viewing and analyzing data created from simulations. See the documentation for more details on using the Simulation Data Inspector.

With the Simulation Data Inspector, you can:

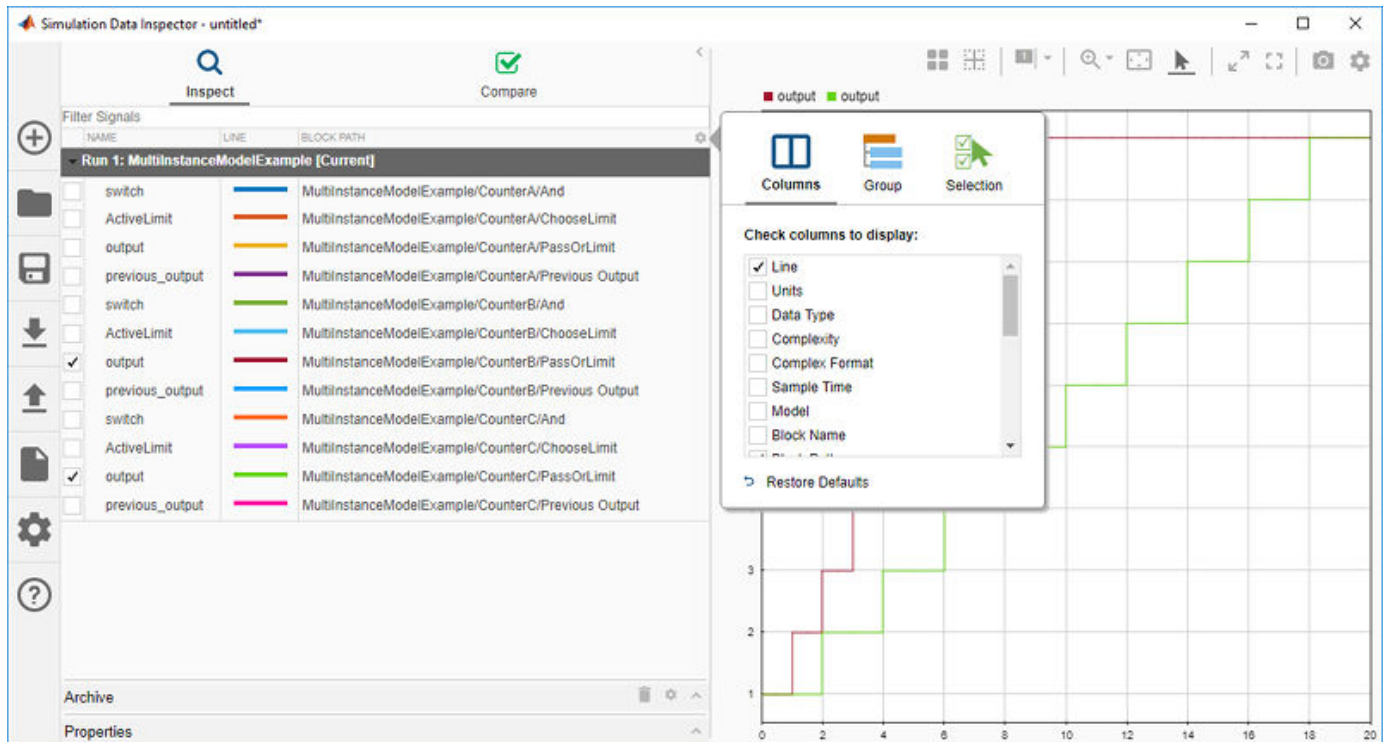

- View signal traces for any logged signals
- Visually compare signal values for any logged signals
- Compare signal values collected over multiple simulations

After a simulation is done or while using the Simulation Stepper, you will see a highlight around the **Data Inspector** icon in the **Simulation** tab, which indicates that clicking it will open the Simulation Data Inspector.

For example, you can use the Simulation Data Inspector to view the **output** signal of two of the instances of the model **LimitedCounter**. In the Simulation Data Inspector, you can see that **CounterA** increases more rapidly than **CounterB**. This behavior is expected because the Pulse Generator driving this model is running at a faster rate.

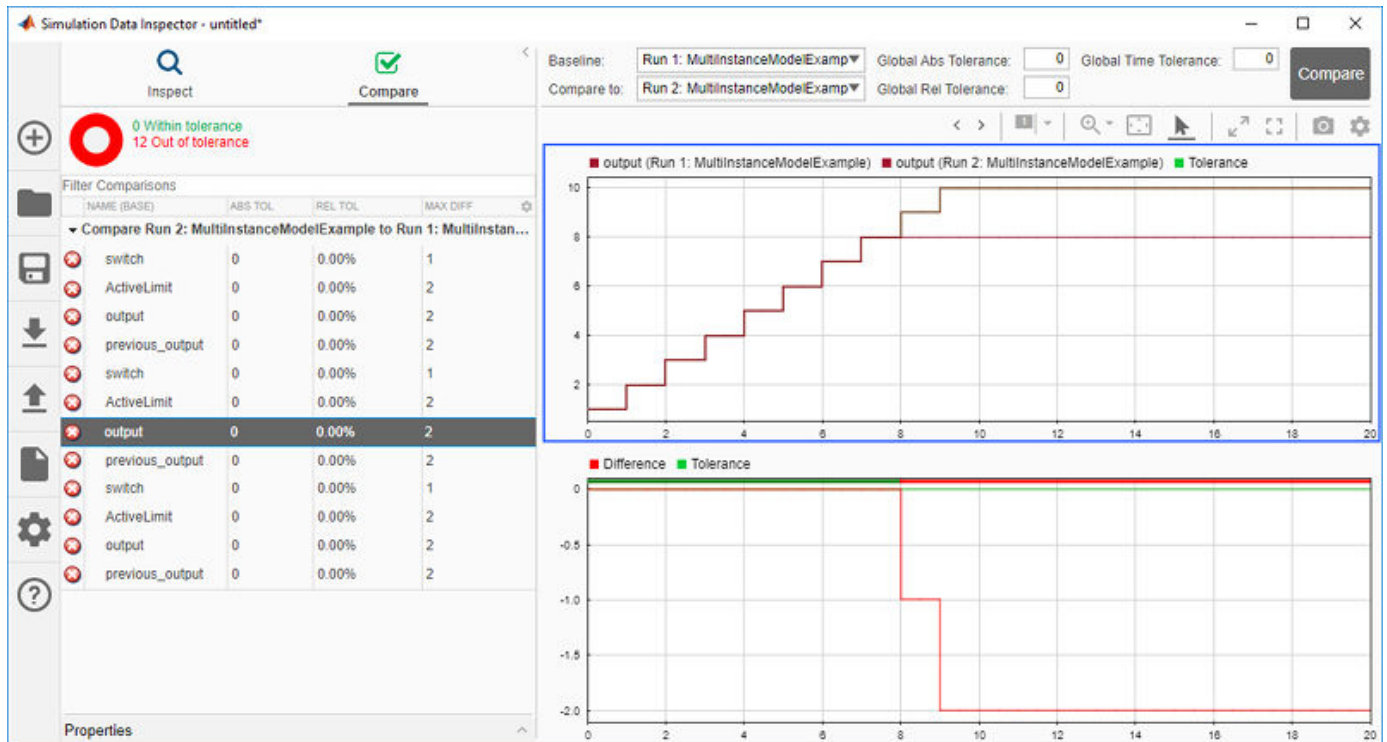

You can configure what to display in the inspect table by clicking the gear icon at the right top of the table.

Another useful tool that the Simulation Data Inspector provides is the ability to compare multiple simulation runs. This functionality can help you understand how changes to your model will affect results. For example, you can change the value of the upper limit of the counter models to 8 and simulate the model again to see how that affects output values. To change the value, double click on the block `MultiInstanceModelExample/upper` and modify the Value parameter to 8.

Now if you compare the results from the first simulation for the output of the `CounterA` instance of `LimitedCounter`, you see that the upper limit of this signal has changed from 10 to 8, as expected. Because the tolerances are set to zero, the red octagon next to each signal indicates that the values have changed between runs.

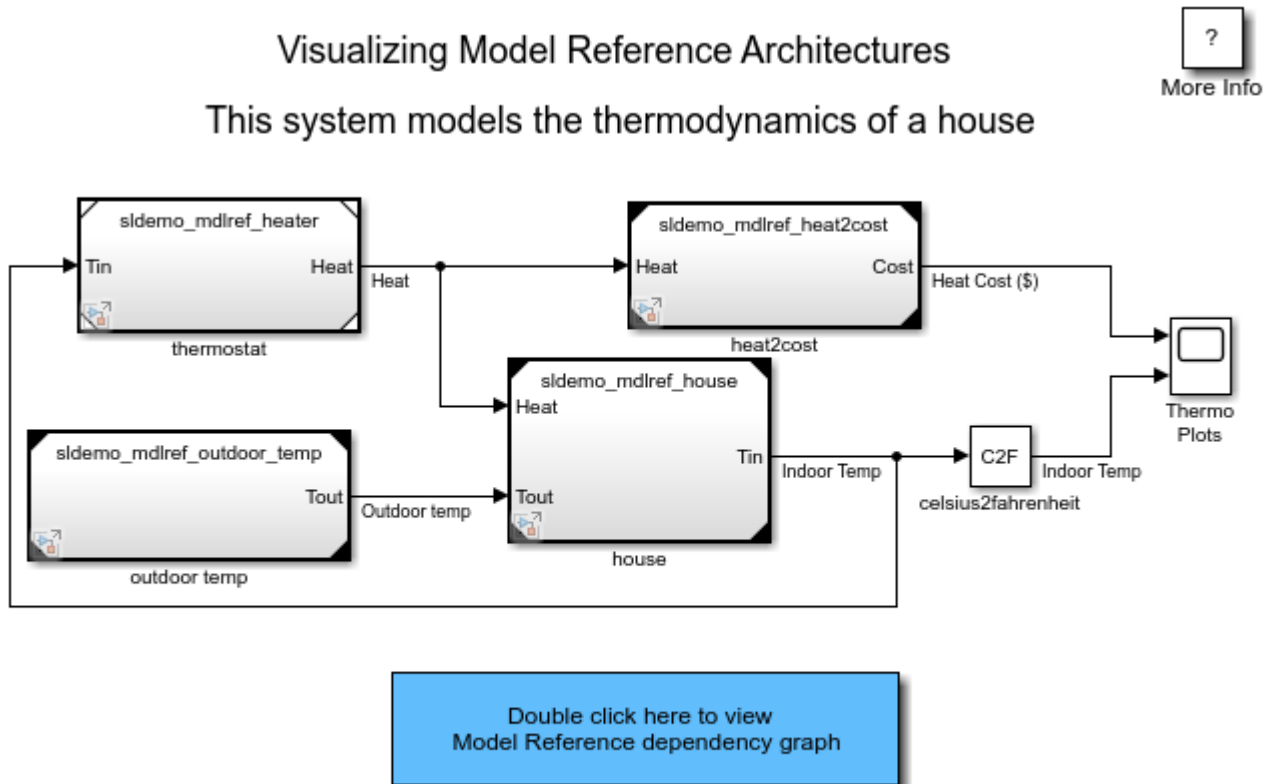

Visualizing Model Reference Architectures

This example shows how to view, explore and analyze model dependencies using the Dependency Analyzer. It shows how to find referenced models and interact with the dependency graph.

Open Model

```
open_system("sldemo_mdref_depgraph");
```

Copyright 1990-2014 The MathWorks, Inc.

Find Referenced Models

Use the `find_mdrefs` function to find all `sldemo_mdref_depgraph` references.

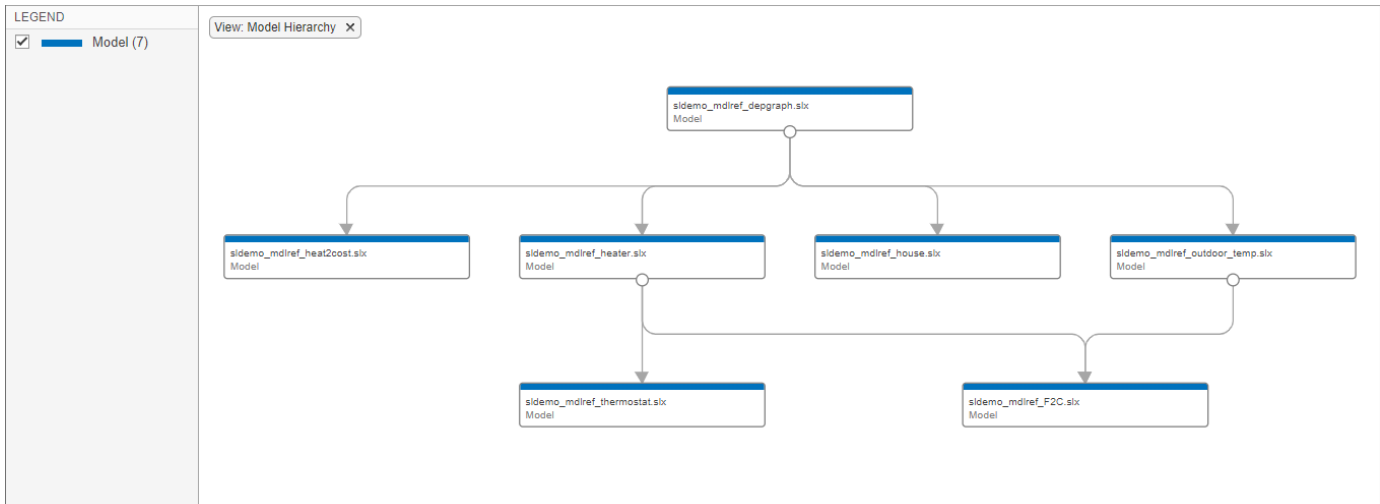

```
[refMdlS, modelBlks] = find_mdrefs('sldemo_mdref_depgraph');
```

`find_mdrefs` returns two cell arrays, `refMdlS` and `modelBlks`. `refMdlS` contains the names of all models that are directly or indirectly referenced by `sldemo_mdref_depgraph`. By default, the last element in `refMdlS` is the name of the input model. `modelBlks` contains block paths for all model blocks in the top model and all referenced models.

View Model Reference Dependency Graph

To view the dependency graph for the `sldemo_mdref_depgraph` model, perform one of these actions to open the Dependency Analyzer for a model:

- Use the `depview` function.
- In the **Modeling** tab, in the **Design** section, click **Dependency Analyzer**.

In the dependency graph, the boxes represent Simulink models. The arrows indicate dependencies. For example, the link from `sldemo_mdref_depgraph` to `sldemo_mdref_house` indicates that `sldemo_mdref_depgraph` references `sldemo_mdref_house`. If the model references libraries, subsystems or protected models, the dependency graph shows them in the hierarchy.

In this view, only one box exists for each model in the graph and at most one arrow exists from one box to another box. The dependency graph does not show if multiple references exist from one model to another model. This view does not show which models are referenced in normal mode and which models are referenced in accelerator mode.

Interact with the Dependency Graph

- To select a box, click on it.
- To open the model or library associated with a box, double-click on it.
- To pan the dependency graph, click and hold the mouse wheel button then drag the mouse.
- To zoom into and out of the region under the mouse pointer, use the mouse wheel.
- To center the dependency graph and adjust the zoom so that the dependency graph fills the available space, press the space bar.

View Model Instances Dependency Graph

To view the referenced model instances in the dependency graph, perform one of these actions:

- Use `depview('sldemo_mdref_depgraph', 'ModelReferenceInstance', true)`.
- From the Dependency Analyzer, in the **Views** section, select **Model Instances**.

In the instance view, the boxes represent Simulink models. The arrows indicate dependencies. The dependency graph shows when multiple references exist from one model to another model. In the instance view, libraries are never shown.

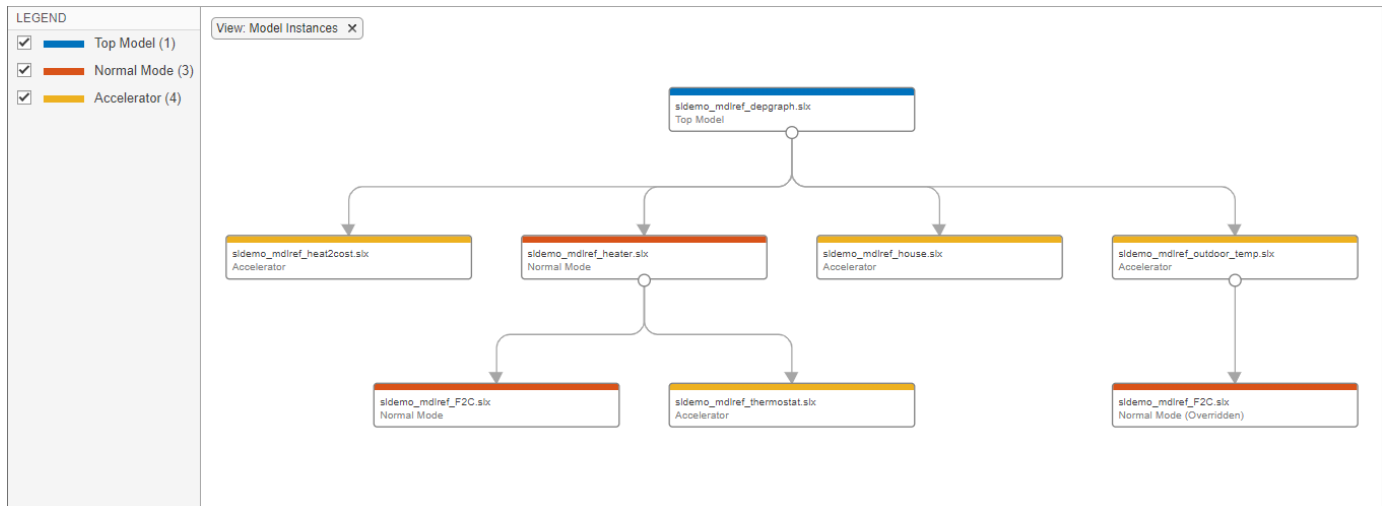

In this view two boxes are labeled `sldemo_mdref_F2C` because this model is referenced twice, once by `sldemo_mdref_outdoor_temp` and once by `sldemo_mdref_heater`. The top model is colored in blue. The red color denotes a normal mode reference and the yellow color denotes an accelerator mode reference.

`sldemo_mdref_heater` makes a normal mode reference to `sldemo_mdref_F2C` and an accelerator mode reference to `sldemo_mdref_thermostat`.

Explore the Model Instance Views

Currently, the reference `sldemo_mdref_outdoor_temp` makes to `sldemo_mdref_F2C` is an accelerator mode reference. Suppose you want to change this reference to be a normal mode reference:

- 1 Select the arrow linking `sldemo_mdref_outdoor_temp` to `sldemo_mdref_F2C`.
- 2 In the **Properties** pane on the right, in the dependency table, click `sldemo_mdref_outdoor_temp/Fahrenheit` to `Celsius`. Simulink opens the model `sldemo_mdref_outdoor_temp` and highlights the `sldemo_mdref_F2C` block.
- 3 Select the `sldemo_mdref_F2C` block.
- 4 In the **Model Block** tab, change the **Simulation Mode** to `Normal`.
- 5 To see this change, go to the dependency graph and click **Analyze**.

The dependency graph now shows the reference `sldemo_mdref_outdoor_temp` makes to `sldemo_mdref_F2C` as a Normal Mode (Overridden) reference. Note that `sldemo_mdref_F2C` is configured to run in normal mode but its parent, `sldemo_mdref_outdoor_temp`, is configured to run in accelerator mode. Normal mode references from models running in accelerator mode are not supported, so `sldemo_mdref_F2C` will run in accelerator mode during simulation.

To make this model run in normal mode, you must configure all of its ancestors to run in normal mode. To do this:

- 1 Select the arrow linking `sldemo_mdref_depgraph` to `sldemo_mdref_outdoor_temp`.
- 2 In the **Properties** pane on the right, in the dependency table, click `sldemo_mdref/outdoor_temp`. Simulink opens the model `sldemo_mdref_depgraph` and highlights the `sldemo_mdref_outdoor_temp` block.
- 3 Select the `sldemo_mdref_outdoor_temp` block.
- 4 In the **Model Block** tab, change the **Simulation Mode** to Normal. (If there were more accelerator mode ancestors of `sldemo_mdref_F2C`, these would also need to be changed to normal mode references.)
- 5 To see this change, go to the dependency graph and click **Analyze**.

Close Model

```
close_system("sldemo_md1ref_depgraph");
```

Introduction to Managing Data with Model Reference

This example shows the basic concepts related to managing data with model reference.

For a more detailed discussion of this topic, see: “Detailed Workflow for Managing Data with Model Reference” on page 14-429.

NOTE: This example uses the same model as the more detailed example. As a result, the model uses certain features that this introductory example does not describe.

Example Requirements

During this example, Simulink® generates code in the code generation folder created in the current directory. If you do not want to (or if you cannot) generate files in this directory, you should change your working directory.

If you plan to alter the example models:

1. Preserve the example in its original state by copying the following files from your MATLAB® installation directory, without changing their names, to a different directory:

```
toolbox/simulink/simdemos/simfeatures/modelreference/sldemo_mdref_datamngt.slx
toolbox/simulink/simdemos/simfeatures/modelreference/sldemo_mdref_datamngt_wsdata.m
toolbox/simulink/simdemos/simfeatures/modelreference/sldemo_mdref_counter_datamngt.slx
toolbox/simulink/simdemos/simfeatures/modelreference/sldemo_mdref_counter_datamngt_types.m
toolbox/simulink/simdemos/simfeatures/modelreference/sldemo_mdref_counter_datamngt_wsdata.m
```

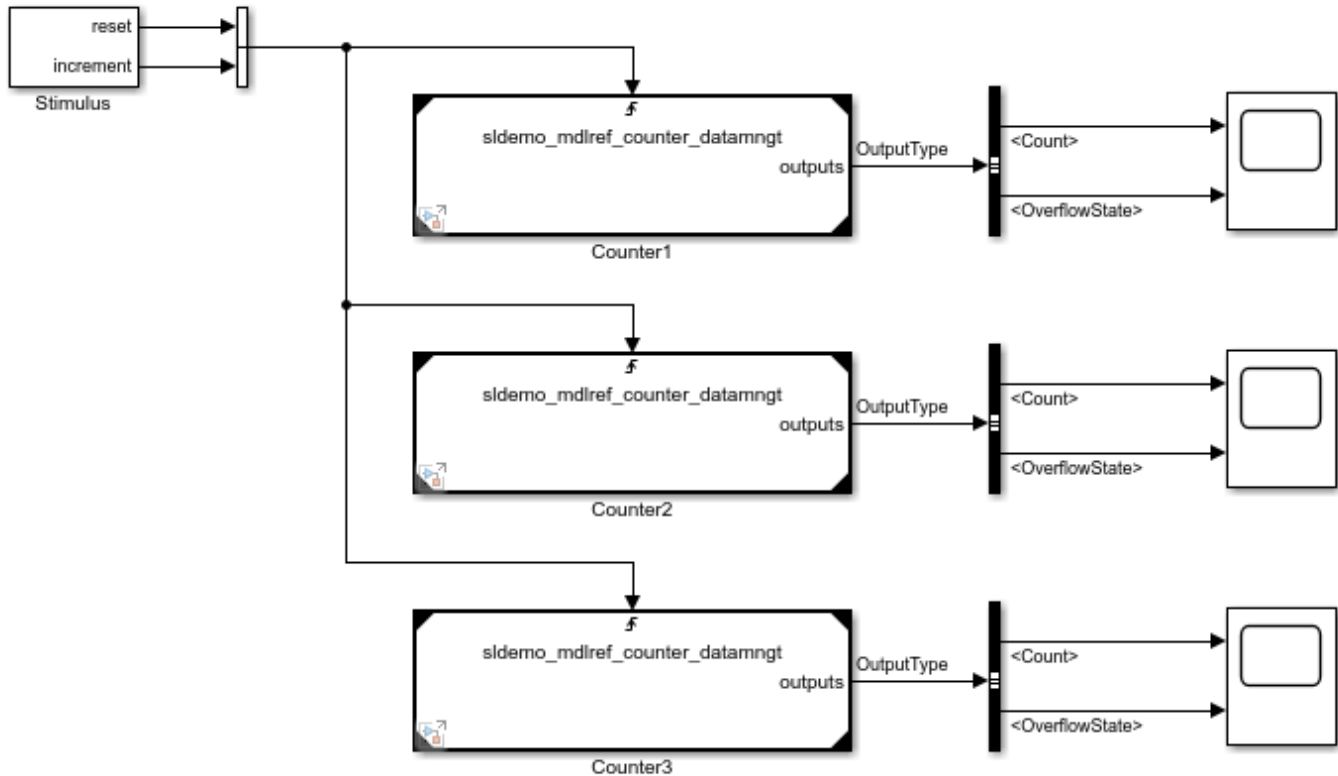

2. Change your current directory to the directory to which you copied the files.

3. Continue with the example.

Open the Example Model

```
open_system('sldemo_mdref_datamngt')
```

? Managing Data with Model Reference

Copyright 1990-2014 The MathWorks, Inc.

Example Content

This example uses a top model (`sldemo_mdhref_datamngt`) that contains three Model blocks: Counter1, Counter2, and Counter3. These blocks reference the same model (`sldemo_mdhref_counter_datamngt`).

The referenced model implements a limited counter algorithm that:

- Resets the counter if the first trigger input changes
- Increments the counter by a specified amount if the second input changes
- Saturates the counter between the specified upper and lower limits

The referenced model outputs a bus signal that contains:

- **Count:** the value of the counter as an 8-bit integer
- **OverflowState:** an enumerated value that indicates whether the counter is at the upper limit, lower limit, or in range

Example Outline

The sequence of steps in the example is as follows:

1. Prepare the referenced model (sldemo_mdhref_counter_datamngt) to use structures for the signals and parameters in its external interface.
2. Prepare the top model (sldemo_mdhref_datamngt) to call the referenced model.
3. Simulate the top model and examine the results.

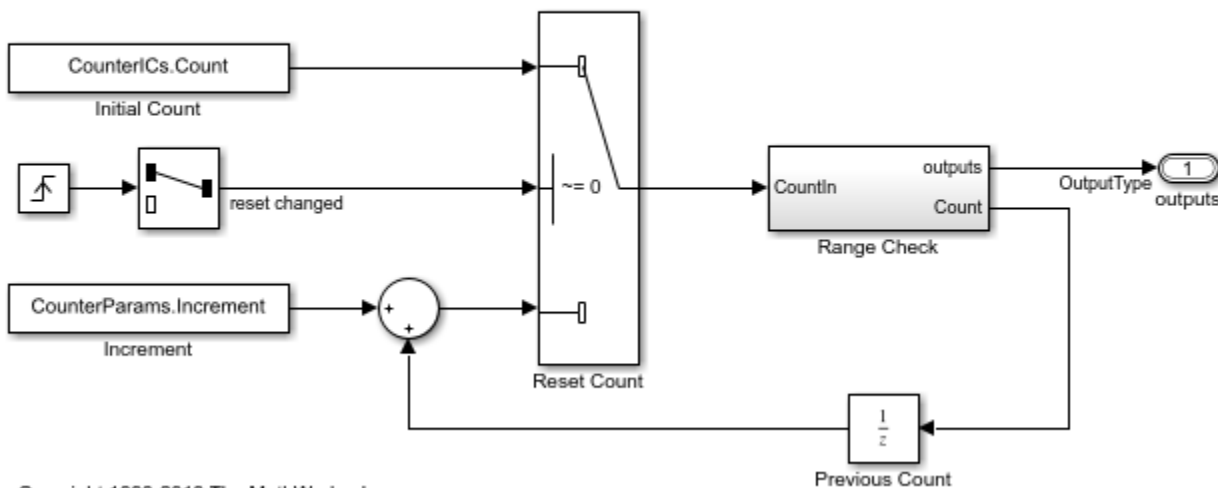

Referenced Model: Setting Up Parameters

The referenced model has two model arguments (CounterParams, CounterICs) that parameterize the blocks in the model. Model arguments provide different parameter values to each instance of a referenced model. In this model, the arguments are defined as parameter structures to reduce the number of arguments being passed to the referenced model.

The process for defining the model arguments is as follows:

1. Open the referenced model (sldemo_mdhref_counter_datamngt).

- * If reset input changes, set count to initial condition.
- * Otherwise (increment input changed), increment count.
- * In either case, limit the count to the upper/lower limits specified.

2. Define MATLAB structures to parameterize the referenced model.

```
CounterParams.Increment = int8(1);
CounterParams.LowerLimit = int8(-10);
CounterParams.UpperLimit = int8(10);
```

```
CounterICs.Count = int8(0);
CounterICs.OverflowState = SLDemoRangeCheck.InRange;
```

NOTE: This example uses an 8-bit integer for the counter, so the numeric fields also use 8-bit integers.

3. Use the MATLAB structures as model arguments.

Model arguments are defined as variables in the model workspace of a referenced model. You can initialize the model workspace from a number of different data sources. This example uses a MATLAB

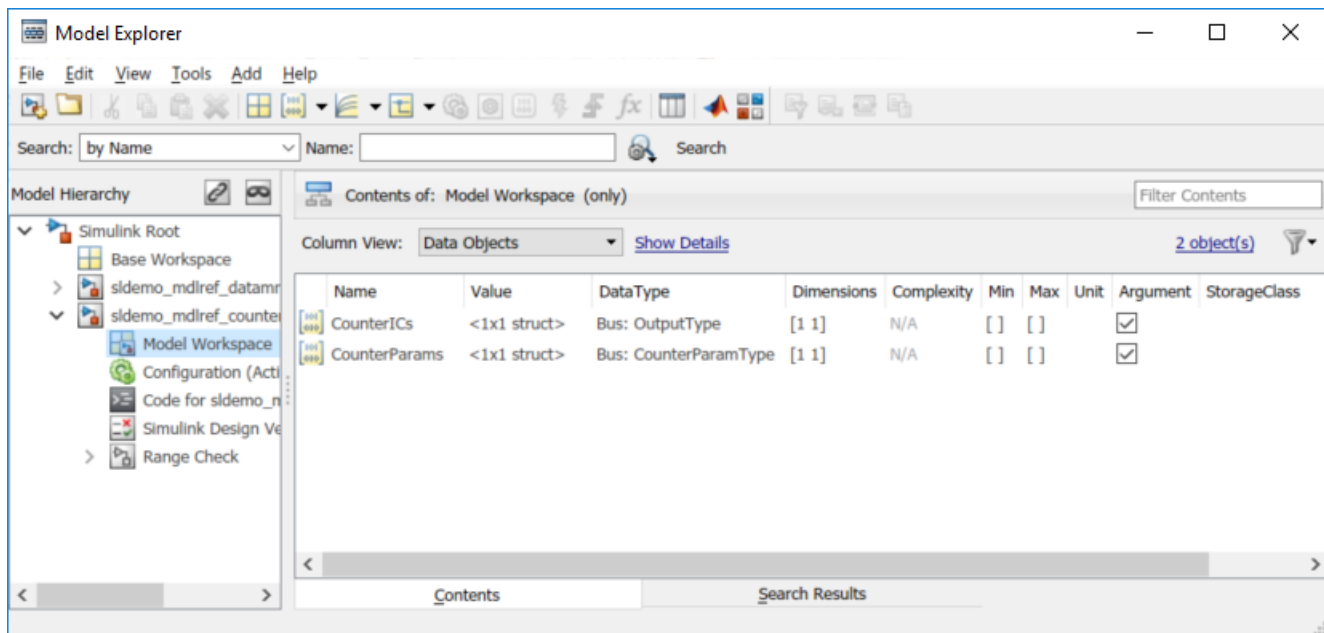

script (sldemo_md1ref_counter_datamngt_wsdata) to create the parameter structures for the model arguments. Using a MATLAB script makes it easy to create and modify the parameter structure outside the model. It also facilitates incremental changes, version control, and data differencing.

Set the data source in the dialog of the model workspace.

You can use the Model Explorer to view and edit the contents of the model workspace.

Select the Argument checkbox to configure variables as model arguments.

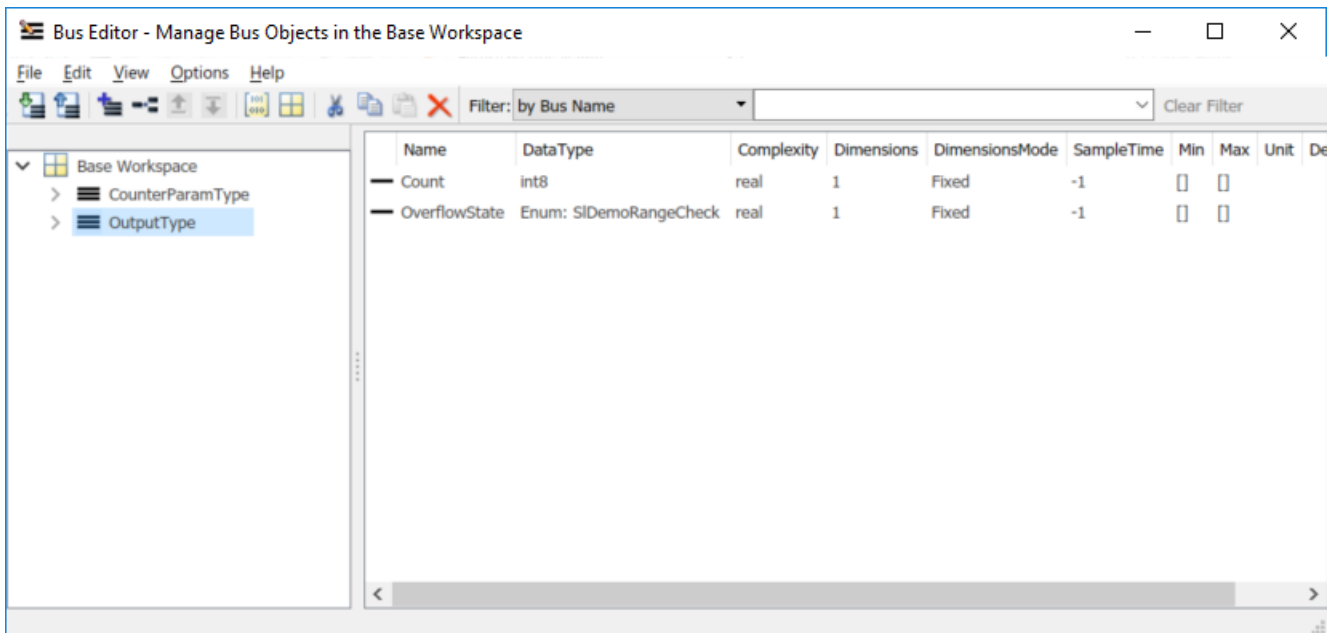

Referenced Model: Defining the Shape of the Output Bus Signal

The referenced model produces two results and packages them into a bus signal:

- **Count:** the value of the counter as an 8-bit integer
- **OverflowState:** an enumerated value that indicates whether the counter is at the upper limit, lower limit, or in range

To define the bus type for the root output of the referenced model:

1. Use the Bus Editor to define the bus object (OutputType).

Alternatively, you can create the bus object at the MATLAB command line:

```
OutputType = Simulink.Bus;
OutputType.Elements = Simulink.BusElement;
OutputType.Elements(1).Name = 'Count';
OutputType.Elements(1).DataType = 'int8';
OutputType.Elements(2) = Simulink.BusElement;
OutputType.Elements(2).Name = 'OverflowState';
OutputType.Elements(2).DataType = 'Enum: SLDemoRangeCheck';
```

2. Configure the root output of the referenced model to output a nonvirtual bus signal based on this bus object (OutputType).

Referenced Model: Setting Initial Value for Bus Output

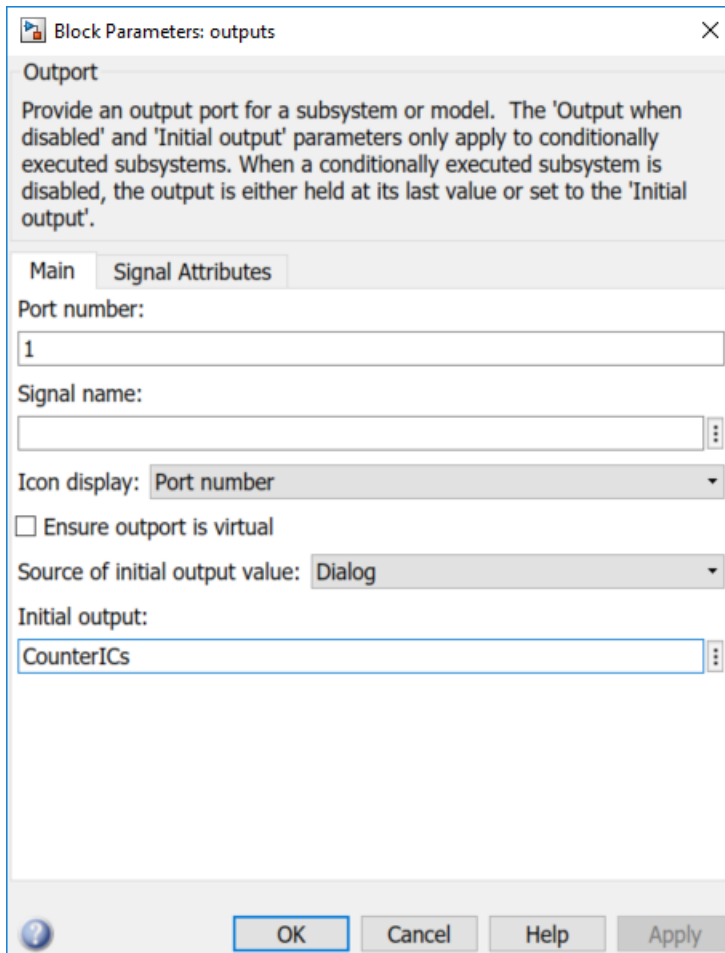

In general, the initial values for bus signals and states can be specified as '0', in which case all of the elements of the bus will be initialized to zero (or the relevant ground value). However, in certain cases, it is desirable to specify nonzero initial values for bus signals and states. In this example, the initial condition of the counter is tunable, so the initial value of output signal must be set consistently.

To specify the initial value of the output of the referenced model:

1. Create a parameter structure that is compatible with the bus signal that you want to initialize. One of the model arguments (CounterICs) is a parameter structure that matches the shape of the output signal. This structure was defined as follows:

```
CounterICs.Count          = int8(0);
CounterICs.OverflowState = SLDemoRangeCheck.InRange;
```

2. Open the dialog box for the root output and enter the name of the structure (CounterICs) into the **Initial output** field.

NOTE: In general, when initializing a bus signal or state, the parameter structure does not need to match the bus type exactly, but its fields must be a subset of the elements in the bus object and the attributes of these fields must match the elements in the bus object.

Referenced Model: Masking Referenced Model

It is often useful to mask the referenced model to customize the user interface. You can create a mask on a model and then reference it from a Model block. To mask a model, click **Create Model Mask** in the model workspace section of Model Explorer for the model.

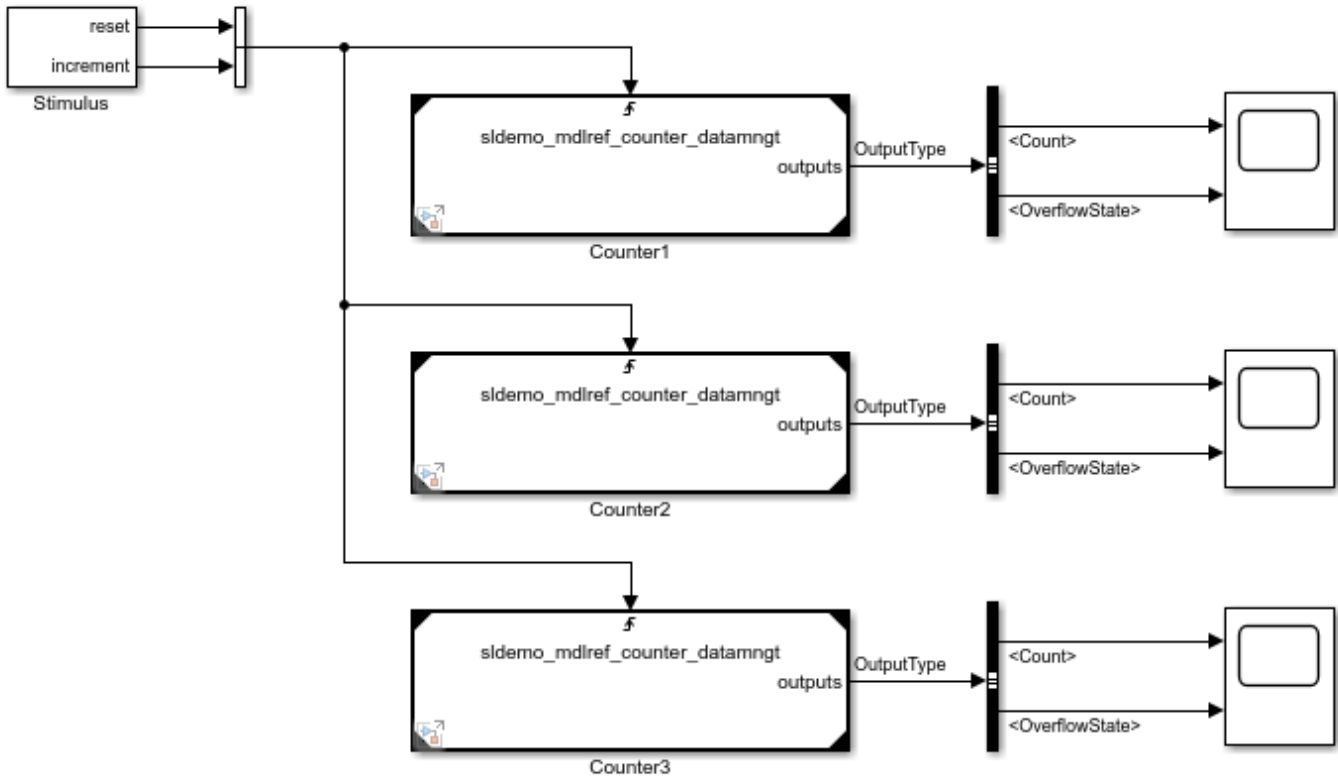

When you reference a masked model from a Model block, a mask is generated automatically on the Model block. For more information, see the topic **Create and Reference a Masked Model**.

Top Model: Parameterizing Model Blocks

The referenced model is configured to accept a structure for its model argument. This example calls each instance of the referenced model with different parameter values.

1. Open the top model (sldemo_mdref_datamngt).

? Managing Data with Model Reference

Copyright 1990-2014 The MathWorks, Inc.

2. Create parameter structures with the same "shape" as the model arguments defined in the referenced model.

```
Param1.Increment = int8(1);
Param1.LowerLimit = int8(-20);
Param1.UpperLimit = int8(20);
```

```
Param2 = Param1;
Param2.Increment = int8(2);
```

```
IC1.Count = int8(0);
IC1.OverflowState = SLDemoRangeCheck.InRange;
```

```
IC2 = IC1;
IC2.Count = int8(-10);
```

3. Set the mask parameters on the masked Model blocks to use these parameters.

For example, the parameters of the first Model block ('sldemo_mdref_datamngt/Counter1') are set as:

- **Param1** for the **Counter** parameters

- **IC1** for the **Initial conditions**

Top Model: Scheduling Calls to the Referenced Model

As mentioned earlier, the referenced model implements a limited counter algorithm with two trigger inputs. The algorithm detects "rising edges" in the trigger inputs and reacts as follows:

- Resets the counter if the first trigger input changes.
- Increments the counter by a specified amount if the second input changes.

In this example, you drive all three instances of the counter algorithm with the same trigger inputs, generated by the Stimulus subsystem. The period and sample time of the trigger inputs are defined by the values entered for the mask parameters of the Stimulus subsystem:

- Reset counter every 4 seconds.
- Increment counter 5 times per second (period = 0.2 second).
- Sample time is 0.1 second.

NOTE: Reset and increment periods must be at least 2 times the sample time.

Simulating the Top Model

1. Save or close the referenced model.

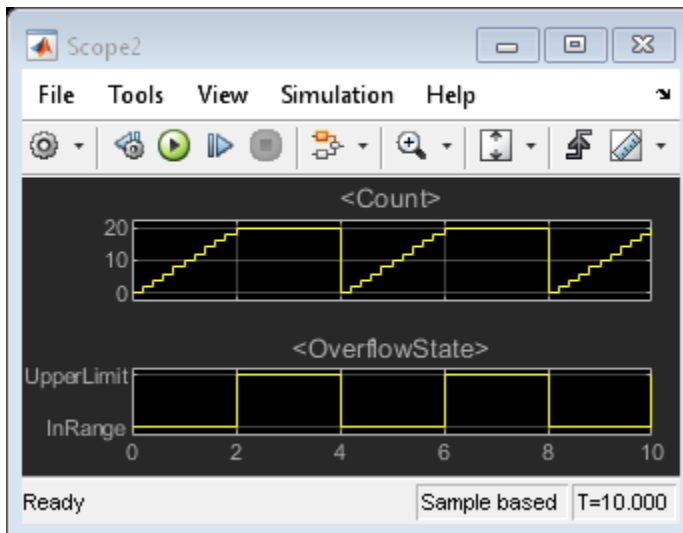

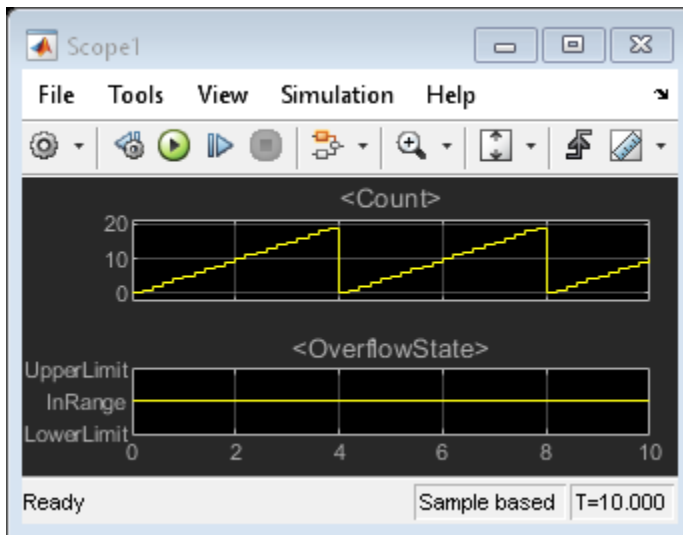

You need to save the referenced model before it can be used by the top model. Alternatively, you can close the referenced model and use the original version of the model provided with this example.

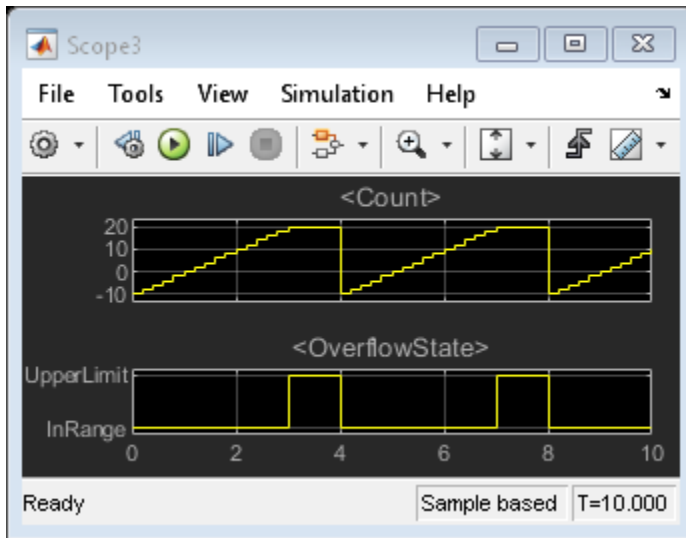

2. Simulate the top model by selecting **Simulation > Run**.

```
sim('sldemo_mdref_datamngt')
```

NOTE: Simulating the top model automatically generates a simulation target for the referenced model.

3. Review the simulation results as displayed by the Scope blocks.

Detailed Workflow for Managing Data with Model Reference

This example shows a number of tools and techniques that make up a workflow for managing data with model reference.

For a basic introduction to this topic, see: “Introduction to Managing Data with Model Reference” on page 14-417.

Example Requirements

During this example, Simulink® and Simulink® Coder™ generate code in the code generation folder created in the current directory. If you do not want to (or if you cannot) generate files in this directory, you should change your working directory. Simulink Coder is required to generate model reference binaries to be deployed in standalone applications.

If you plan to alter the example models:

1. Preserve the example in its original state by copying the following files from your MATLAB® installation directory, without changing their names, to a different directory:

```
toolbox/simulink/simdemos/simfeatures/modelreference/sldemo_mdref_datamngt.slx
toolbox/simulink/simdemos/simfeatures/modelreference/sldemo_mdref_datamngt_wsdata.m
toolbox/simulink/simdemos/simfeatures/modelreference/sldemo_mdref_counter_datamngt.slx
toolbox/simulink/simdemos/simfeatures/modelreference/sldemo_mdref_counter_datamngt_types.m
toolbox/simulink/simdemos/simfeatures/modelreference/sldemo_mdref_counter_datamngt_wsdata.m
```

2. Change your current directory to the directory to which you copied the files.

3. Continue with the example.

Open the Example Model

```
open_system('sldemo_mdref_datamngt')
```

? Managing Data with Model Reference

Copyright 1990-2014 The MathWorks, Inc.

Example Content

This example uses a top model (`sldemo_mdhref_datamngt`) that contains three Model blocks: Counter1, Counter2, and Counter3. These blocks reference the same model (`sldemo_mdhref_counter_datamngt`).

The referenced model implements a limited counter algorithm that:

- Resets the counter if the first trigger input changes
- Increments the counter by a specified amount if the second input changes
- Saturates the counter between the specified upper and lower limits

The referenced model outputs a bus signal that contains:

- **Count:** the value of the counter as an 8-bit integer
- **OverflowState:** an enumerated value that indicates whether the counter is at the upper limit, lower limit, or in range

This model is configured to show a number of Simulink features working together:

- **Tunable parameter structures:** Collect variables into a MATLAB structure that parameterizes the model. In this example, the model arguments of the referenced model are defined as parameter structures.
- **Model arguments:** Pass different parameter values to each model reference instance.
- **Bus objects:** Define the "shape" of structures for signals and parameters used in the model reference interface. Define type name for structure parameters and signals in generated code.
- **Simulink.Bus.createMATLABStruct:** Static method for creating a MATLAB structure that matches the shape of the bus object.
- **Bus initialization:** Uses a parameter structure to initialize bus signals and states.
- **Masked Model block:** Creates a customized interface for a model reference block.
- **Triggered model reference:** Explicit control over scheduling of components.

This example also uses other features that are useful for managing data in Simulink:

- **Simulink.saveVars:** Serialize workspace variables to a MATLAB script. Supports incremental modification, data differencing, and version control.
- **Simulink.findVars:** Discover how workspace variables are used by a model.

Example Outline

The sequence of steps in the example is as follows:

1. Prepare the referenced model (sldemo_mdref_counter_datamngt) to use structures for the signals and parameters in its external interface.
2. Prepare the top model (sldemo_mdref_datamngt) to call the referenced model.
3. Simulate the top model and examine the results.
4. Generate code to create a standalone executable for the top model.

Referenced Model: Setting Up Parameters

The referenced model has two model arguments (CounterParams, CounterICs) that parameterize the blocks in the model. Model arguments provide different parameter values to each instance of a referenced model. In this model, the arguments are defined as parameter structures to reduce the number of arguments being passed to the referenced model.

The process for defining the model arguments is as follows:

1. Open the referenced model (sldemo_mdref_counter_datamngt).

- * If reset input changes, set count to initial condition.
- * Otherwise (increment input changed), increment count.
- * In either case, limit the count to the upper/lower limits specified.

Copyright 1990-2013 The MathWorks, Inc.

2. Define MATLAB structures to parameterize the referenced model.

```
CounterParams.Increment = int8(1);
CounterParams.LowerLimit = int8(-10);
CounterParams.UpperLimit = int8(10);

CounterICs.Count = int8(0);
CounterICs.OverflowState = SLDemoRangeCheck.InRange;
```

NOTE: This example uses an 8-bit integer for the counter, so the numeric fields also use 8-bit integers.

3. Use the MATLAB structures as model arguments.

Model arguments are defined as variables in the model workspace of a referenced model. You can initialize the model workspace from a number of different data sources. This example uses a MATLAB script (`sldemo_mdref_counter_datamngt_wsdata`) to create the parameter structures for the model arguments. Using a MATLAB script makes it easy to create and modify the parameter structure outside the model. It also facilitates incremental changes, version control, and data differencing.

Set the data source in the dialog of the model workspace.

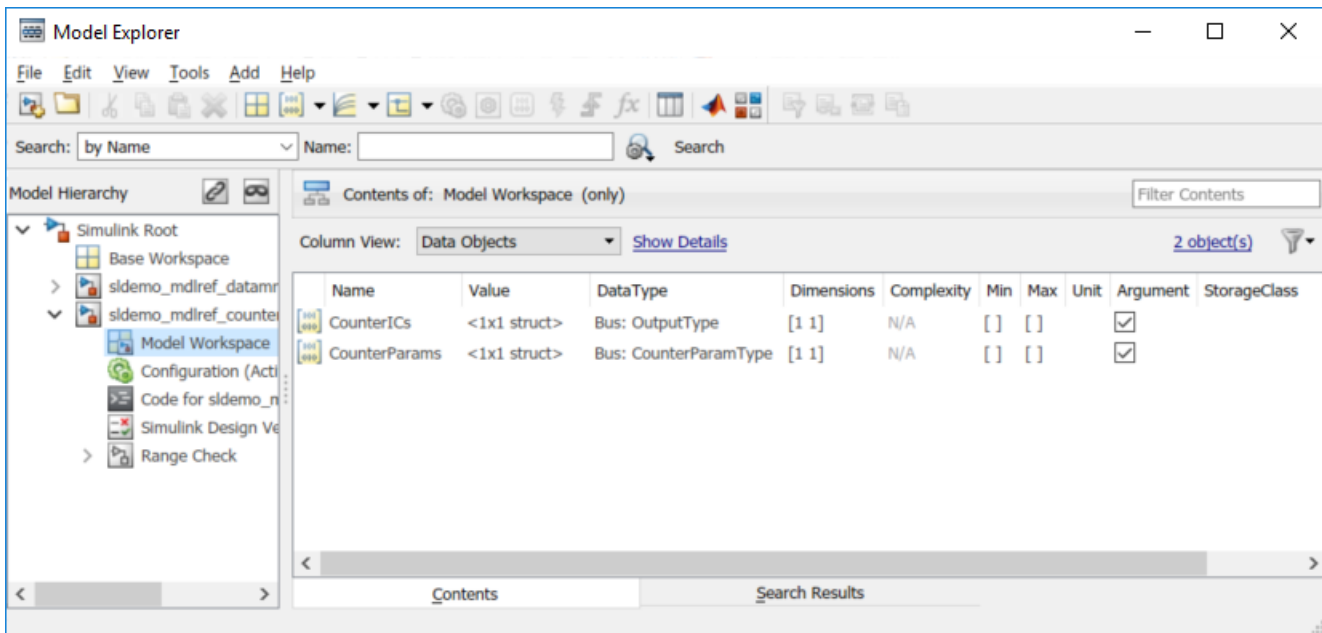

Alternatively, you can set the data source from the MATLAB command line:

```
hWS = get_param('sldemo_mdref_counter_datamngt', 'ModelWorkspace');
hWS.DataSource = 'MATLAB File';
hWS.FileName = 'sldemo_mdref_counter_datamngt_wsdata.m';
hWS.reload;
```

You can use the Model Explorer to view and edit the contents of the model workspace.

Select the Argument checkbox to configure variables as model arguments.

Alternatively, you can set the list of model arguments from the MATLAB command line:

```
set_param('sldemo_mdref_counter_datamngt', ...
    'ParameterArgumentNames', 'CounterParams,CounterICs');
```

4. Explore how the referenced model uses the model arguments.

A number of blocks in the referenced model use the model arguments:

- A Constant block specifies the increment amount (CounterParams.Increment).
- Various blocks inside the "Range Check" subsystem use the values of the lower and upper limits (CounterParams.LowerLimit and CounterParams.UpperLimit).
- Various blocks use the initial condition of the counter (CounterICs.Count).
- The root Output block uses the initial condition structure (CounterICs) to initialize the system output prior to execution.

You can use **Simulink.findVars** to discover the blocks that use the model argument.

```
paramInfo = Simulink.findVars('sldemo_mdhref_counter_datamngt', ...
                             'Name', 'CounterParams');
icInfo     = Simulink.findVars('sldemo_mdhref_counter_datamngt', ...
                             'SearchMethod', 'cached', ...
                             'Name',       'CounterICs');
```

```
paramBlks = paramInfo.UsedByBlocks
icBlks     = icInfo.UsedByBlocks
```

```
paramBlks =
```

```
3x1 cell array
```

```
 {'sldemo_mdhref_counter_datamngt/Increment'          }
 {'sldemo_mdhref_counter_datamngt/Range Check/Detect Overflow'}
 {'sldemo_mdhref_counter_datamngt/Range Check/Saturate Count' }
```

```
icBlks =
```

```
3x1 cell array
```

```
 {'sldemo_mdhref_counter_datamngt/Initial Count' }
 {'sldemo_mdhref_counter_datamngt/Previous Count'}
 {'sldemo_mdhref_counter_datamngt/outputs'      }
```

NOTE: Once you have compiled the model, you can use `Simulink.findVars` to retrieve the **'cached'** variable usage information.

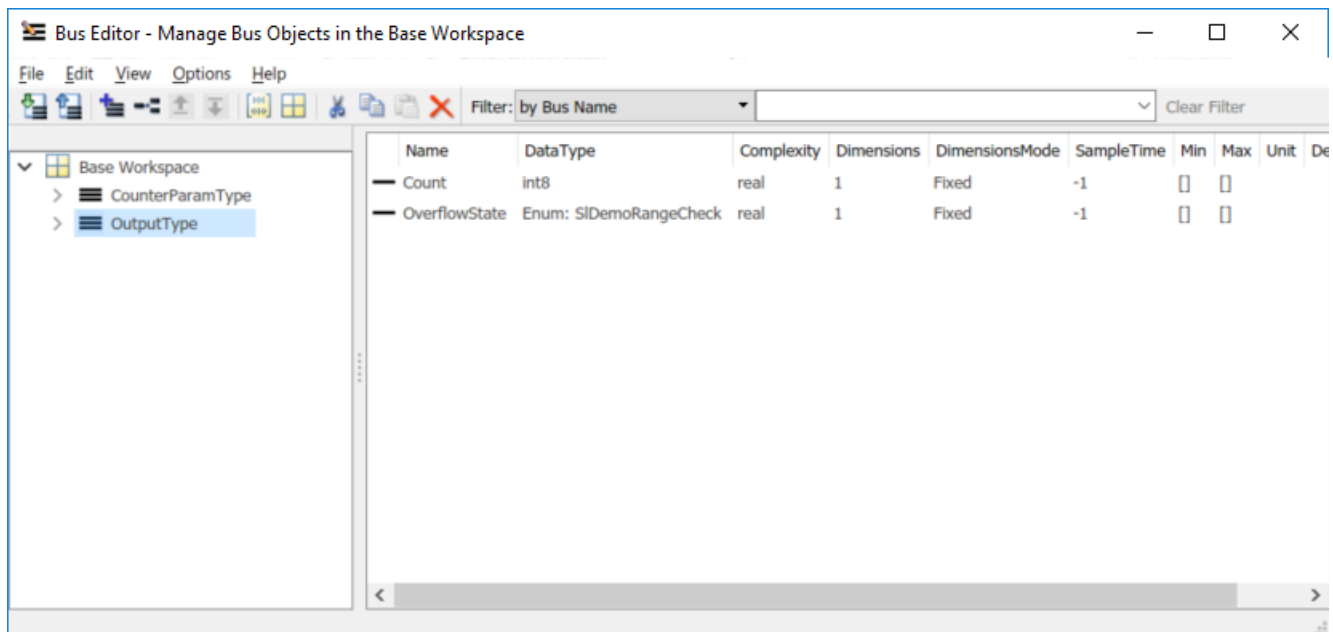

Referenced Model: Defining the Shape of the Output Bus Signal

The referenced model produces two results and packages them into a bus signal:

- **Count:** the value of the counter as an 8-bit integer
- **OverflowState:** an enumerated value that indicates whether the counter is at the upper limit, lower limit, or in range

To define the bus type for the root output of the referenced model:

1. Use the Bus Editor to define the bus object (OutputType).

Alternatively, you can create the bus object at the MATLAB command line:

```
OutputType = Simulink.Bus;
OutputType.Elements = Simulink.BusElement;
OutputType.Elements(1).Name = 'Count';
OutputType.Elements(1).DataType = 'int8';
OutputType.Elements(2) = Simulink.BusElement;
OutputType.Elements(2).Name = 'OverflowState';
OutputType.Elements(2).DataType = 'Enum: SLDemoRangeCheck';
```

2. Configure the root output of the referenced model to output a nonvirtual bus signal based on this bus object (OutputType).

Alternatively, you can set the block parameters from the MATLAB command line:

```
set_param('sldemo_mdref_counter_datamngt/outputs', ...
          'UseBusObject', 'on', ...
          'BusObject', 'OutputType', ...
          'BusOutputAsStruct', 'on');
```

3. Create a MATLAB script to recreate this bus object.

This example uses a MATLAB script (`sldemo_mdref_counter_datamngt_types`) to recreate the bus objects used by the referenced model.

You can create this MATLAB script manually, or use **Simulink.saveVars**:

```
Simulink.saveVars('sldemo_mdref_counter_datamngt_types.m', 'OutputType');
```

4. Configure the referenced model to create the global data that it uses.

It is common practice for a model to recreate all of the global data and types that it uses. In this example, the referenced model's **PreLoadFcn** is used to execute the MATLAB script that creates the bus objects for the referenced model. The referenced model does not use any other global variables.

To set the **PreLoadFcn** model callback, open the Model Properties dialog box from the **Modeling** tab by clicking the **Model Settings** button arrow, and then under **Top Model**, selecting **Model**

Properties. On the **Callbacks** tab of the Model Properties dialog box, in the **Model pre-load function** box, call the `sldemo_mdref_counter_datamngt_types` script, and then click **Apply**.

Alternatively, set the callback from the MATLAB command line.

```
set_param('sldemo_mdref_counter_datamngt', ...
          'PreLoadFcn', 'sldemo_mdref_counter_datamngt_types');
```

5. Explore how the bus type is used in the model hierarchy.

This bus type forms part of the interface for the referenced model and is referred to by blocks in both the top and referenced models. Use **find_mdrefs** and **Simulink.findVars** to find out about all the places where this bus object is used in the model reference hierarchy.

```
models = find_mdrefs('sldemo_mdref_datamngt');
open_system(models);
varInfo = Simulink.findVars(models, 'Name', 'OutputType');
blks = vars.UsedByBlocks
```

```
models =
```

```
2x1 cell array
```

```
 {'sldemo_mdref_counter_datamngt'}
 {'sldemo_mdref_datamngt' }
```

```
blks =
```

```
7x1 cell array
```

```
 {'sldemo_mdref_counter_datamngt/Initial Count' }
 {'sldemo_mdref_counter_datamngt/Previous Count' }
 {'sldemo_mdref_counter_datamngt/Range Check/Bus Creator'}
 {'sldemo_mdref_counter_datamngt/outputs' }
 {'sldemo_mdref_datamngt/Counter1' }
 {'sldemo_mdref_datamngt/Counter2' }
 {'sldemo_mdref_datamngt/Counter3' }
```

Referenced Model: Setting Initial Value for Bus Output

In general, the initial values for bus signals and states can be specified as '0', in which case all of the elements of the bus will be initialized to zero (or the relevant ground value). However, in certain cases, it is desirable to specify nonzero initial values for bus signals and states. In this example, the initial condition of the counter is tunable, so the initial value of output signal must be set consistently.

To specify the initial value of the output of the referenced model:

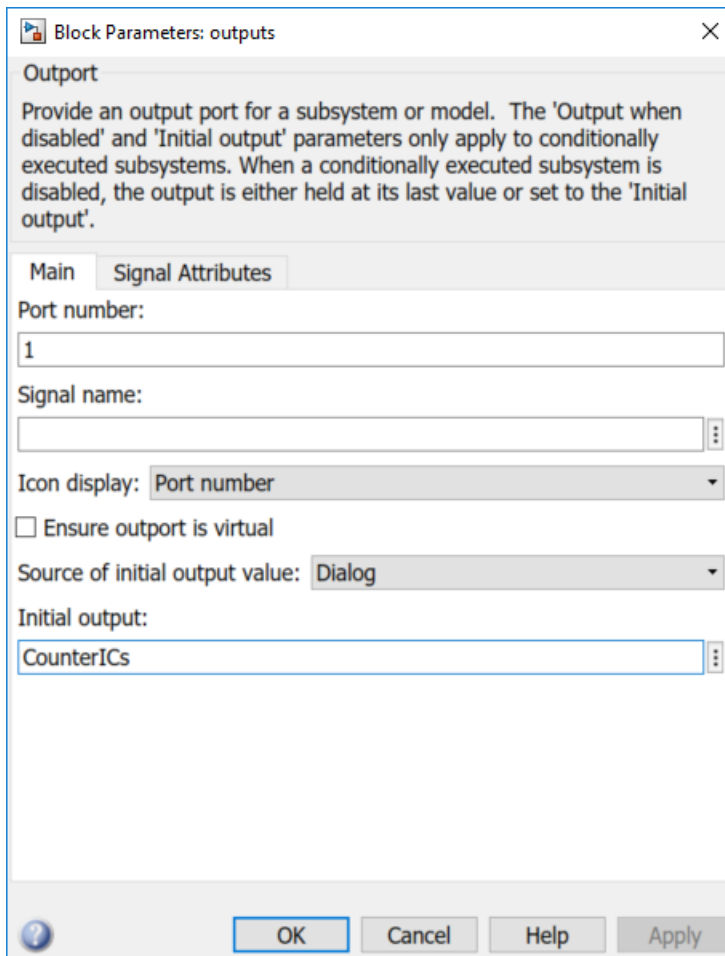

1. Create a parameter structure that is compatible with the bus signal that you want to initialize. One of the model arguments (CounterICs) is a parameter structure that matches the shape of the output signal. This structure was defined as follows:

```
CounterICs.Count = int8(0);
CounterICs.OverflowState = SLDemoRangeCheck.InRange;
```

Alternatively, you could have used the static method, `Simulink.Bus.createMATLABStruct` to create the structure using the ground value of the OutputType.

```
CounterICs = Simulink.Bus.createMATLABStruct('OutputType');
```

2. Open the dialog box for the root outport and enter the name of the structure (CounterICs) into the **Initial output** field.

Alternatively, you can set the block parameters from the MATLAB command line:

```
set_param('sldemo_mdref_counter_datamngt/outputs', ...
    'InitialOutput', 'CounterICs');
```

NOTE: In general, when initializing a bus signal or state, the parameter structure does not need to match the bus type exactly, but its fields must be a subset of the elements in the bus object and the attributes of these fields must match the elements in the bus object.

Referenced Model: Masking Referenced Model

It is often useful to mask the referenced model to customize the user interface. You can create a mask on a model and then reference it from a Model block. To mask a model, click **Create Model Mask** in the model workspace section of Model Explorer for the model.

When you reference a masked model from a Model block, a mask is generated automatically on the Model block. For more information, see the topic **Create and Reference a Masked Model**.

Top Model: Parameterizing Model Blocks

The referenced model is configured to accept a structure for its model argument. This example calls each instance of the referenced model with different parameter values.

1. Open the top model (sldemo_mdref_datamngt).

? Managing Data with Model Reference

Copyright 1990-2014 The MathWorks, Inc.

2. Create parameter structures with the same "shape" as the model arguments defined in the referenced model.

```
Param1.Increment = int8(1);
Param1.LowerLimit = int8(-20);
Param1.UpperLimit = int8(20);
```

```
Param2 = Param1;
Param2.Increment = int8(2);
```

```
IC1.Count = int8(0);
IC1.OverflowState = SLDemoRangeCheck.InRange;
```

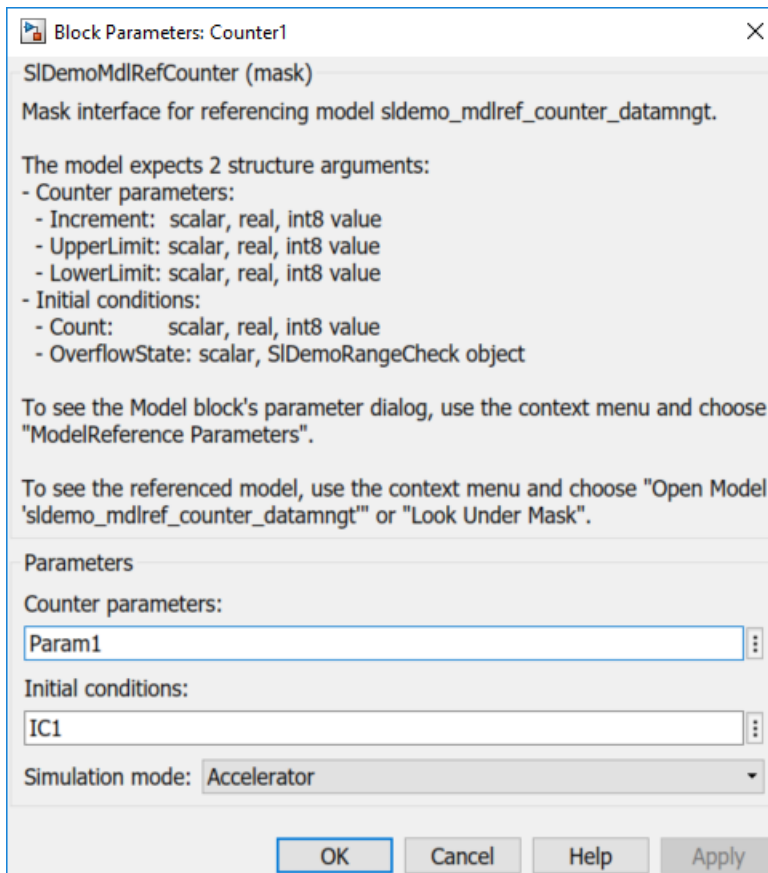

```
IC2 = IC1;
IC2.Count = int8(-10);
```

3. Set the mask parameters on the masked Model blocks to use these parameters.

For example, the parameters of the first Model block ('sldemo_mdref_datamngt/Counter1') are set as:

- **Param1** for the **Counter** parameters

- **IC1** for the **Initial conditions**

Alternatively, you can set the block parameters from the MATLAB command line:

```
set_param('sldemo_mdref_datamngt/Counter1', ...
          'CounterParams', 'Param1', ...
          'CounterICs', 'IC1');
```

3. Create a MATLAB script to recreate these workspace variables.

This example uses a MATLAB script (sldemo_mdref_datamngt_wsdata) to recreate these workspace variables.

You can create this MATLAB script manually, or use **Simulink.saveVars**:

```
Simulink.saveVars('sldemo_mdref_datamngt_wsdata.m', 'Param*');
```

4. Configure the top model to create all global variables.

It is good practice for the top model to recreate all of the global data and types used throughout the model reference hierarchy. This configuration avoids loading referenced models when simulating the top model.

In this example, the top model's **PreLoadFcn** is used to execute the MATLAB scripts that create the workspace data for the top model and the types for the referenced model. The referenced model does not use any global data.

```
set_param('sldemo_mdref_datamngt', ...
         'PreLoadFcn', ['sldemo_mdref_datamngt_wsdata; ', ...
                        'sldemo_mdref_counter_datamngt_types']);
```

Top Model: Scheduling Calls to the Referenced Model

As mentioned earlier, the referenced model implements a limited counter algorithm with two trigger inputs. The algorithm detects "rising edges" in the trigger inputs and reacts as follows:

- Resets the counter if the first trigger input changes.
- Increments the counter by a specified amount if the second input changes.

In this example, you drive all three instances of the counter algorithm with the same trigger inputs, generated by the Stimulus subsystem. The period and sample time of the trigger inputs are defined by the values entered for the mask parameters of the Stimulus subsystem:

- Reset counter every 4 seconds.
- Increment counter 5 times per second (period = 0.2 second).
- Sample time is 0.1 second.

NOTE: Reset and increment periods must be at least 2 times the sample time.

Simulating the Top Model

1. Save or close the referenced model.

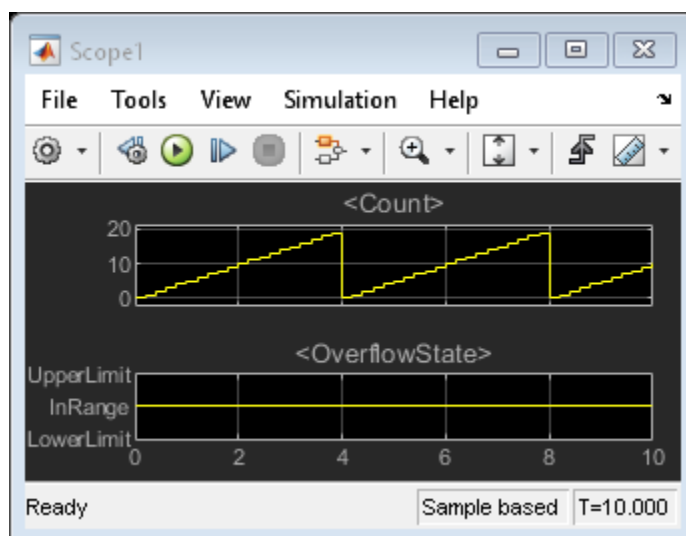

You need to save the referenced model before it can be used by the top model. Alternatively, you can close the referenced model and use the original version of the model provided with this example.

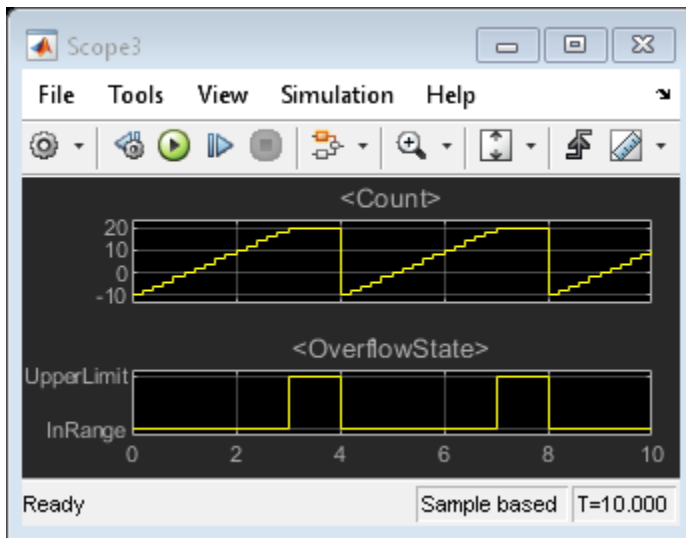

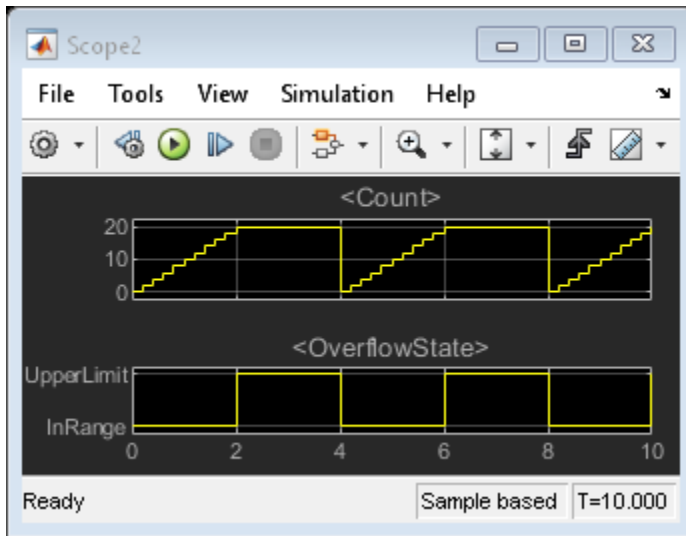

2. Simulate the top model by selecting **Simulation > Run**.

```
sim('sldemo_mdref_datamngt')
```

NOTE: Simulating the top model automatically generates a simulation target for the referenced model.

3. Review the simulation results as displayed by the Scope blocks.

Generating Code for the Top Model (Requires Simulink Coder)

To generate code and build a standalone executable for the top model, open the top model, and then press **Ctrl+B**.

Alternatively, use `rtwbuild` at the MATLAB command line.

```
rtwbuild('sldemo_mdhref_datamngt')
```

NOTE: When you generate code for the top model, Simulink Coder automatically generates code for the referenced model. Use Embedded Coder™ to generate embedded code for production deployment.

Controlling the Type Name for the Model Argument

By default, Simulink Coder generates an automatic name for the type of the parameter structures. This name is unique and deterministic, but not easy to recognize. You can control this type name by

using `Simulink.Parameter` objects to define the parameter structures and `Simulink.Bus` objects to define the type.

1. Define the bus type for the model argument by using the Bus Editor or by typing the following commands at the MATLAB command line:

```
CounterParamType = Simulink.Bus;
CounterParamType.Elements = Simulink.BusElement;
CounterParamType.Elements(1).Name = 'Increment';
CounterParamType.Elements(1).DataType = 'int8';
CounterParamType.Elements(2) = Simulink.BusElement;
CounterParamType.Elements(2).Name = 'LowerLimit';
CounterParamType.Elements(2).DataType = 'int8';
CounterParamType.Elements(3) = Simulink.BusElement;
CounterParamType.Elements(3).Name = 'UpperLimit';
CounterParamType.Elements(3).DataType = 'int8';
```

2. Modify the existing MATLAB script to recreate this bus object.

This bus type must be defined in the base workspace, along with the bus type for the referenced model's output. You can manually modify the MATLAB script that defines the types for the referenced model or use **Simulink.saveVars** to append this variable to the existing MATLAB script.

```
Simulink.saveVars('sldemo_mdref_counter_datamngt_types.m', 'CounterParamType', '-append');
```

3. Create `Simulink.Parameters` to define the model arguments.

To associate the bus types with the model arguments, you must use `Simulink.Parameter` objects in place of the MATLAB structures in the model workspace of the referenced model.

```
CounterParams = Simulink.Parameter;
CounterParams.Value.Increment = 1;
CounterParams.Value.LowerLimit = -10;
CounterParams.Value.UpperLimit = 10;
CounterParams.DataType = 'Bus: CounterParamType';

CounterICs = Simulink.Parameter;
CounterICs.Value.Count = 0;
CounterICs.Value.OverflowState = SLDemoRangeCheck.InRange;
CounterICs.DataType = 'Bus: OutputType';
```

NOTE: When you set the data type of a parameter object to be a bus, you can use double-precision values for the numeric fields of the parameter structure. Simulink converts these double-precision values to the appropriate numeric data type during model compilation.

You can manually modify the MATLAB script that defines the model argument or use **Simulink.saveVars** to update the existing MATLAB script.

```
Simulink.saveVars('sldemo_mdref_counter_datamngt_wsdata.m', '-update');
```

NOTE: When you use the **-update** option, you do not need to specify the variables to be written out because **Simulink.saveVars** writes out only the values of variables already defined in the MATLAB script.

5. Reload the contents of the model workspace.

You have modified the data source that is used by the referenced model's workspace. If this model is open, you must reload the contents of the model workspace.

You can reload by using the model workspace's dialog box or at the MATLAB command line.

```
hWS = get_param('sldemo_mdref_counter_datamngt', 'ModelWorkspace');
hWS.reload;
```

Controlling Representation of Parameters in the Top Model

You can use a similar approach to convert the parameter structures in the top model to use Simulink.Parameter objects. This configuration gives you control over the type name and enables you to control how these parameters appear in the generated code.

1. Create Simulink.Parameter objects with the ExportedGlobal storage class to define the parameter structures for the top model as a exported, tunable variables in the generated code.

```
Param1 = Simulink.Parameter;
Param1.Value.Increment = 1;
Param1.Value.LowerLimit = -10;
Param1.Value.UpperLimit = 10;
Param1.DataType = 'Bus: CounterParamType';
Param1.CoderInfo.StorageClass = 'ExportedGlobal';

Param2 = Param1.copy;
Param2.Value.Increment = 2;

IC1 = Simulink.Parameter;
IC1.Value.Count = 0;
IC1.Value.OverflowState = SLDemoRangeCheck.InRange;
IC1.DataType = 'Bus: OutputType';
IC1.CoderInfo.StorageClass = 'ExportedGlobal';

IC2 = IC1.copy;
IC2.Value.Count = -10;
```

2. Modify the existing MATLAB script to recreate these workspace variables.

You can manually modify the MATLAB script that defines the parameters for the top model or use **Simulink.saveVars** to update the existing MATLAB script.

```
Simulink.saveVars('sldemo_mdref_datamngt_wsdata.m', '-update');
```

NOTE: When you use the **-update** option, you do not need to specify the variables to be written out because **Simulink.saveVars** writes out only the values of variables already defined in the MATLAB script.

Regenerate Code for the Top Model (Requires Simulink Coder)

To generate code and build a standalone executable for the top model, open the top model, and then press **Ctrl+B**.

Alternatively, use `rtwbuild` at the MATLAB command line.

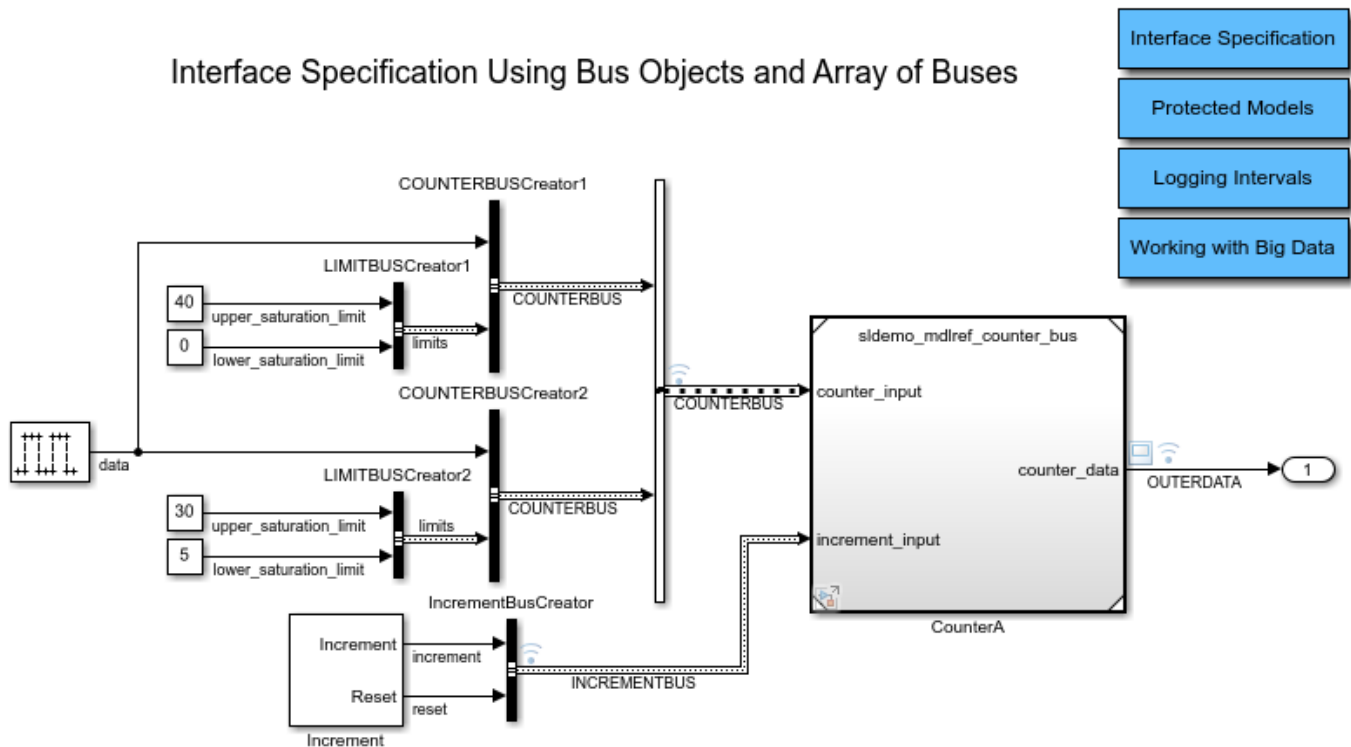

```
rtwbuild('sldemo_mdref_datamngt')
```

Interface Specification Using Bus Objects

This example shows how to propagate bus signals into referenced models. It also shows how you can simulate the referenced models independently using logged signal data from the parent model. (For a quick introduction to Model Reference, see “Component-Based Modeling with Model Reference” on page 14-400. See Simulink® documentation for more information about configuring signals for data logging.)

Open The Example Model

Open the example model

Copyright 1990-2019 The MathWorks, Inc.

Example Requirements

During this example, Simulink and Simulink® Coder™ may generate code in the code generation folder created in the current working directory. If you do not want to (or cannot) generate files in this directory, you should change the working directory to a suitable directory. Simulink Coder is required to generate code to be deployed in standalone applications.

Description of Bus Signal Setup for the Example

This model, `sldemo_mdref_bus` contains a Model block, `CounterA`, that references `sldemo_mdref_counter_bus`, a model of a simple counter. A bus signal called `COUNTERBUS` feeds the data and the saturation limits of the counter into the model. `COUNTERBUS` contains two

signals: the data and LIMITBUS. The data signal is used in counting, and LIMITBUS contains the upper and lower limit values of the counter. The following shows the structure of COUNTERBUS:

```
* COUNTERBUS (bus signal)
  * data
  * LIMITBUS (bus signal)
    * upper_saturation_limit
    * lower_saturation_limit
```

The Model block CounterA contains a second input port that feeds a bus signal of type INCREMENTBUS. This signal is used to change the increment and reset the counter. The following shows the structure of INCREMENTBUS:

```
* INCREMENTBUS (bus signal)
  * increment
  * reset
```

The example also includes a data dictionary file named `sldemo_mdhref_bus.sldd` that contains bus objects that define the elements of COUNTERBUS, LIMITBUS and INCREMENTBUS.

Note: You can view these bus objects in the Model Explorer by opening the data dictionary from the **Data** tab in the dialog pane and selecting its **Design Data** in the **Model Hierarchy** pane. To view these bus objects in the Bus Editor, select one of them in the Model Explorer and click **Launch Bus Editor** in the dialog pane. The model uses these bus objects to specify the outputs of the following Bus Creator blocks:

- COUNTERBUSCreator1
- COUNTERBUSCreator2
- LIMITBUSCreator1
- LIMITBUSCreator2
- IncrementBusCreator

The Inport `counter_input` of the referenced model `sldemo_mdhref_counter_bus` specifies the COUNTERBUS bus object in its **Data type** field on the **Signal Attributes** tab. The Inport `increment_input` is similarly configured to use the bus object INCREMENTBUS.

Logging Signal Data

Now you can simulate `sldemo_mdhref_bus` to see the output in the scope window.

Note that the following signals have been marked for signal logging:

- COUNTERBUS
- INCREMENTBUS
- OUTERDATA
- INNERDATA

After the model simulates, the logged signal is available in the **Base Workspace** in the `topOut` variable.

```
topOut =
```

```
Simulink.SimulationData.Dataset 'topOut' with 4 elements
```

	Name	BlockPath
1 [1x1 Signal]	COUNTERBUS	sldemo_mdref_bus/Concatenate
2 [1x1 Signal]	OUTERDATA	sldemo_mdref_bus/CounterA
3 [1x1 Signal]	INCREMENTBUS	sldemo_mdref_bus/IncrementBusCreator
4 [1x1 Signal]	INNERDATA	...erA sldemo_mdref_counter_bus/COUNTER

- Use braces { } to access, modify, or add elements using index.

This model uses **Dataset** format for signal logging. To access Dataset format logged data for a given signal, use the `getElement` method:

```
>> topOut.getElement('COUNTERBUS')

Simulink.SimulationData.Signal
Package: Simulink.SimulationData

Properties:
    Name: 'COUNTERBUS'
    PropagatedName: ''
    BlockPath: [1x1 Simulink.SimulationData.BlockPath]
    PortType: 'outport'
    PortIndex: 1
    Values: [2x1 struct]
```

Bus data is logged as a MATLAB structure in the `Values` field:

```
>> topOut.getElement('COUNTERBUS').Values

2x1 struct array with fields:

    data
    limits
```

This structure contains MATLAB **timeseries** objects for each bus signal:

```
>> topOut.getElement('COUNTERBUS').Values(1).data
and
>> topOut.getElement('COUNTERBUS').Values(2).data

timeseries

Common Properties:
    Name: 'data'
    Time: [301x1 double]
    TimeInfo: tsdata.timemetadata
    Data: [301x1 int32]
    DataInfo: tsdata.datametadata

timeseries

Common Properties:
    Name: 'data'
    Time: [301x1 double]
    TimeInfo: tsdata.timemetadata
```

```
Data: [301x1 int32]
DataInfo: tsdata.datametadate
```

You can also plot a logged data using the `plot` command:

```
>> topOut.getElement('OUTERDATA').Values.plot()
```

Logging Model Reference Signals

To log signals in the referenced model, select the Model block and click **Log Signals** on the **Model Block** tab.

Note that for this model, the logging mode **Log all signals as specified in model** is selected. This means that all the signals that are logged when simulating `sldemo_md1ref_counter_bus` standalone are logged when simulating the top model. To change logging for any of these signals or to log a subset of signals:

- Set the logging mode to "Override signals".
- Uncheck the top-level Model block on the left hierarchy view to indicate that this model should not use "Log all signals as specified in model".
- Use the list on the right side to specify which signals to log when simulating the top model.
- To save these changes, save the top model.

Loading Data

Open the referenced model `sldemo_mdhref_counter_bus`.

The referenced model `sldemo_mdhref_counter_bus` has been configured to read the logged signal data through the root Inport blocks. You can see how this is done by opening the Configuration Parameters dialog of the referenced model and selecting the **Data Import/Export** tab. The **Input** field is configured to read the logged data from `topOut` for both input ports. A **comma-separated list** specifies values for the 2 input ports. The `increment_input` port uses a **structure of timeseries** to load data for INCREMENTBUS and the `counter_input` port uses an **array of structure of timeseries** to load data for COUNTERBUS.

- `topOut.getElement('COUNTERBUS')`
- `topOut.getElement('INCREMENTBUS')`

An easy way you can configure the **Input** field is by clicking the **Connect Input** button. This action opens the Root Inport Mapper tool. In this example, this tool uses a mapping algorithm to set up the **Input** field from logged data in the base workspace.

To select the data to import:

- 1 Click the **From Workspace** button in the Root Inport Mapper toolstrip.
- 2 Select the logged data `topOut` and click the **OK** button.

Now that the data is loaded into the Root Inport Mapper tool, you can determine the root input port for which to assign input data. Simulink matches input data with input ports based on one of five criteria (block name, block path, signal name, or a custom algorithm). Since `topOut` was logged using signal names from the model, the best choice for a mapping criteria is **Signal Name**. Using this criteria, Simulink tries to match input data variable names to the names of the input signals.

To select this option:

- 1 In the Root Inport Mapper hierarchy pane, select scenario dataset `topOut`.
- 2 Click the **Signal Name** radio button.
- 3 From the **Map to Model** button dropdown, click **Map All**.

When mapping data, Simulink evaluates inports against the input data to determine compatibility. The Root Inport Mapper table reflects the status of this compatibility with a green check mark, orange warning triangle, or red error exclamation mark. In this example, the table shows a green status indicating there is no compatibility issue. You can simulate the model with this mapping of input data to inports. The map action also sets the **Input** field in the **Data Import/Export** tab of the Configuration Parameters dialog with the proper comma separated list of inputs. To apply the changes to the model, in the Configuration Parameters dialog, click **Apply**.

You can simulate `sldemo_mdhref_counter_bus` to see the output in the scope window. After simulation, the scopes from `sldemo_mdhref_bus` and `sldemo_mdhref_counter_bus` show the same trace. The signal feeding the scope in the referenced model is also logged. The logged data is available in the MATLAB workspace under the variable `subOut`. You can verify that the data in `topOut.getElement('OUTERDATA')` and `subOut.getElement('INNERDATA')` is the same.

Code Generation For Standalone Applications (Requires Simulink Coder)

Create the executable and inspect the code for `sldemo_mdhref_bus`.

Exit

Close `sldemo_mdref_counter_bus` and `sldemo_mdref_bus`.

Converting Subsystems to Model Reference

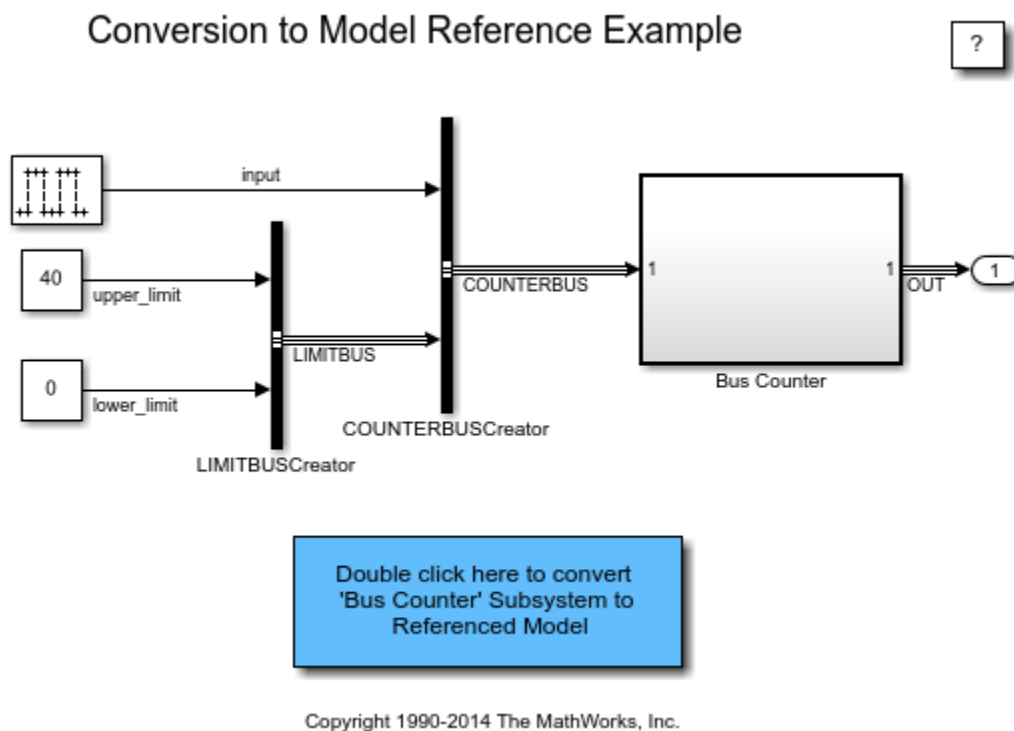

This example shows how to automate conversion of a model containing buses to use model reference.

Example Requirements

During this example, Simulink® generates files in the current working directory. If you do not want to generate files in this directory, you should change the working directory to a suitable directory.

Open the Example Model

Open the example model. This model contains an atomic subsystem, Bus Counter, modeling a simple counter.

Convert a Subsystem to Model Reference

You can use `Simulink.SubSystem.convertToModelReference` to convert an atomic subsystem to model reference. Then, based on its input arguments, it either replaces the subsystem block with a Model block that references the new model, or it creates another, temporary model containing a Model block that references the model derived from the subsystem block. For more information see Simulink documentation or type:

help [Simulink.SubSystem.convertToModelReference](#)

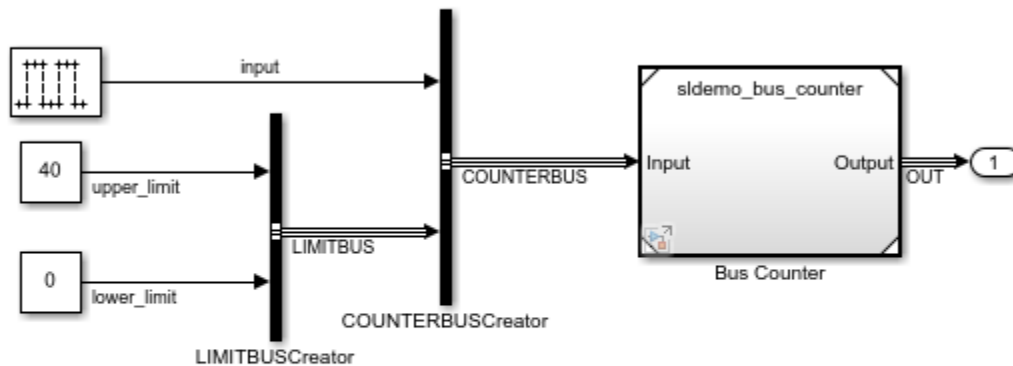

at the MATLAB® prompt.

Perform the Conversion

You can run the following command to convert the Bus Counter subsystem to a Model block.

```
Simulink.SubSystem.convertToModelReference(...
    'sldemo_mdhref_conversion/Bus Counter', ...
    'sldemo_bus_counter', ...
    'ReplaceSubsystem', true);
```

Conversion to Model Reference Example

Double click here to convert 'Bus Counter' Subsystem to Referenced Model

Copyright 1990-2014 The MathWorks, Inc.

Simulate and Generate Code from the Model

You can update, simulate, and generate code for the model containing the Model block.

Export Simulation Data

You can log time, outputs, states, and final states data of the simulation. The logging is configured to use Dataset format.

Close Models and Clear Workspace

Close the models added to the workspace during this example.

Model Reference Conversion Advisor

You can use the Model Reference Conversion Advisor to interactively perform the conversion. To do so, set the 'UseConversionAdvisor' parameter to 'true' when calling Simulink.SubSystem.convertToModelReference.

You can also access the advisor by selecting a Subsystem block. In the **Subsystem Block** tab, select **Convert > Model Block**.

Using Data Stores Across Multiple Models

This example shows how to use and log local data stores. It also shows how to define, use and log global data stores to share global data among referenced models.

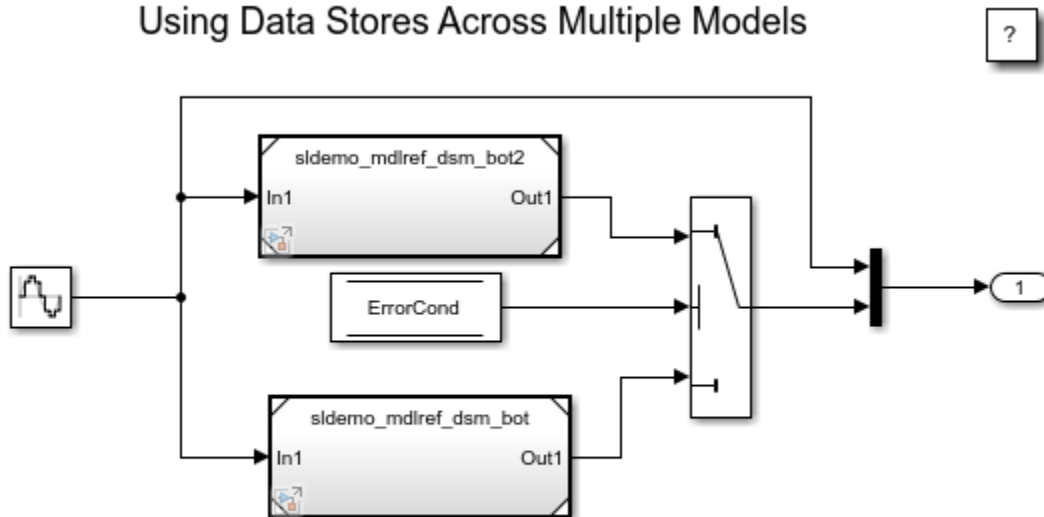

Open the Example Models

Open the example models. The top model `sldemo_mdref_dsm` references models `sldemo_mdref_dsm_bot` and `sldemo_mdref_dsm_bot2`. Logging of data stores is turned on for `sldemo_mdref_dsm` on the Data Import/Export pane of the Configuration Parameters dialog.

Reference model `sldemo_mdref_dsm_bot` amplifies the incoming signal by 5 if the signal is positive or by 2 if the signal is negative and writes the value of this signal to local data store `RefSignalVal`. This local data store is configured to log all written values to the workspace after simulation. The logging parameters for this local data store are controlled by the Logging tab of the block parameters dialog.

Reference model `sldemo_mdref_dsm_bot2` sets the value of a global boolean data store named `ErrorCond` to true if the value of its incoming signal is outside of the range $(-0.8, 0.8)$. The top model also monitors the data store `ErrorCond` and switches between the outputs of the two referenced models, depending on the value of that data store.

Using Data Stores Across Multiple Models

Define a Global Data Store Using a Simulink® Signal Object

To specify to Simulink that the top model and both of the referenced models use the same memory for the Data Store named `ErrorCond` in each model, create an instance of a `Simulink.Signal` object named `ErrorCond` in the base workspace. Since this object is visible to each model, its scope encompasses the individual models and implies that there is one global data store of that name that is shared among the models. Note that none of the three models contains a Data Store Memory block with a data store name of `ErrorCond`. If any model contained such a block, that block would define a data store local to the model, which would shadow the global data store.

Since the object `ErrorCond` defines a global data store, it must explicitly define the `DataType`, `Complexity`, `Dimensions`, and `SamplingMode` properties to non-inherited settings. `SampleTime` and `StorageClass` may be left as their inherited values, or explicitly set.

The example includes a MAT-file named `sldemo_mdref_dsm_data.mat` that contains the `Simulink.Signal` object `ErrorCond`. The `preload` function of the model `sldemo_mdref_dsm` loads this MAT-file causing the object to be loaded in the base workspace. You can view this object by selecting the base workspace in the Model Explorer. You can also create this object from the MATLAB® command prompt. The following commands define the object used in this example:

```
ErrorCond = Simulink.Signal;
ErrorCond.Description = 'Use to signal that subsystem output is invalid';
ErrorCond.DataType = 'boolean';
ErrorCond.Complexity = 'real';
ErrorCond.Dimensions = 1;
ErrorCond.SamplingMode='Sample based';
ErrorCond.SampleTime = 0.1;
ErrorCond.LoggingInfo.DataLogging = true;
```

Logging a Global Data Store

To log all the values written to the global data store, set the `DataLogging` property of the `LoggingInfo` property of the `Simulink.Signal` object. The `LoggingInfo` property also allows specification of other logging parameters such as decimation and maximum points.

```
Simulink.LoggingInfo (handle)
  DataLogging: 1
    NameMode: 0
  LoggingName: ''
  DecimateData: 0
    Decimation: 2
  LimitDataPoints: 0
    MaxPoints: 5000
```

Simulate the Model

Now you can simulate `sldemo_mdref_dsm` to see the output. The reference model `sldemo_mdref_dsm_bot` writes to the data store `ErrorCond` while the top model `sldemo_mdref_dsm` reads from the data store. The blue line represents the input to `sldemo_mdref_dsm_bot`; the green line represents the output of the Switch block. Note that the output switches when the magnitude of the input signal falls outside of the range.

View Logged Results

Both the global data store `ErrorCond` and the local data store `RefSignalVal` are configured to log all written values after simulation. These logged results are stored in the base workspace in the `dsmout` variable.

```
dsmout =
```

```
Simulink.SimulationData.Dataset 'dsmout' with 2 elements
```

	Name	BlockPath
1	<code>ErrorCond</code>	<code>''</code>
2	<code>RefSignalVal</code>	<code>...dlref_dsm/A sldemo_mdref_dsm_bot/DSM</code>

- Use braces `{ }` to access, modify, or add elements using index.

To access the data stored for the local data store, use the `getElement` function to get the correct data store element based on the name `RefSignalVal`.

```
>> dsmout.getElement('RefSignalVal')
```

```
Simulink.SimulationData.DataStoreMemory
Package: Simulink.SimulationData
```

```
Properties:
```

```

        Name: 'RefSignalVal'
        BlockPath: [1x1 Simulink.SimulationData.BlockPath]
        Scope: 'local'
        DSMWriterBlockPaths: [1x2 Simulink.SimulationData.BlockPath]
        DSMWriters: [101x1 uint32]
        Values: [1x1 timeseries]

```

Data is stored in a timeseries within the Values field.

```
>> plot(dsmout.getElement('RefSignalVal').Values);
```

To determine which block wrote to the data store at a given time, use the `DSMWriters` property. This array contains a list of indices into the `DSMWriterBlockPaths` array. For example, the block path of the Data Store Write block that wrote the 5th value to the data store can be obtained as follows:

```
>> dsm = dsmout.getElement('RefSignalVal');
>> dsm.DSMWriterBlockPaths(dsm.DSMWriters(5))
```

```
Simulink.SimulationData.BlockPath
Package: Simulink.SimulationData
```

```
Block Path:
'sldemo_mdref_dsm/A'
'sldemo_mdref_dsm_bot/PositiveSS/DSW'
```

Use the `getBlock` method to access block path character vectors from this object.

Model Reference Function-Call

This example shows how to use a model reference block which is explicitly triggered by means of its function-call trigger port.

Example Requirements

During this example, Simulink® generates files in the current working directory. If you do not want to generate files in this directory, you should change the working directory to a suitable directory.

Open Example Model

If you haven't already opened it, open the example model.

Model Referenced Function-Call

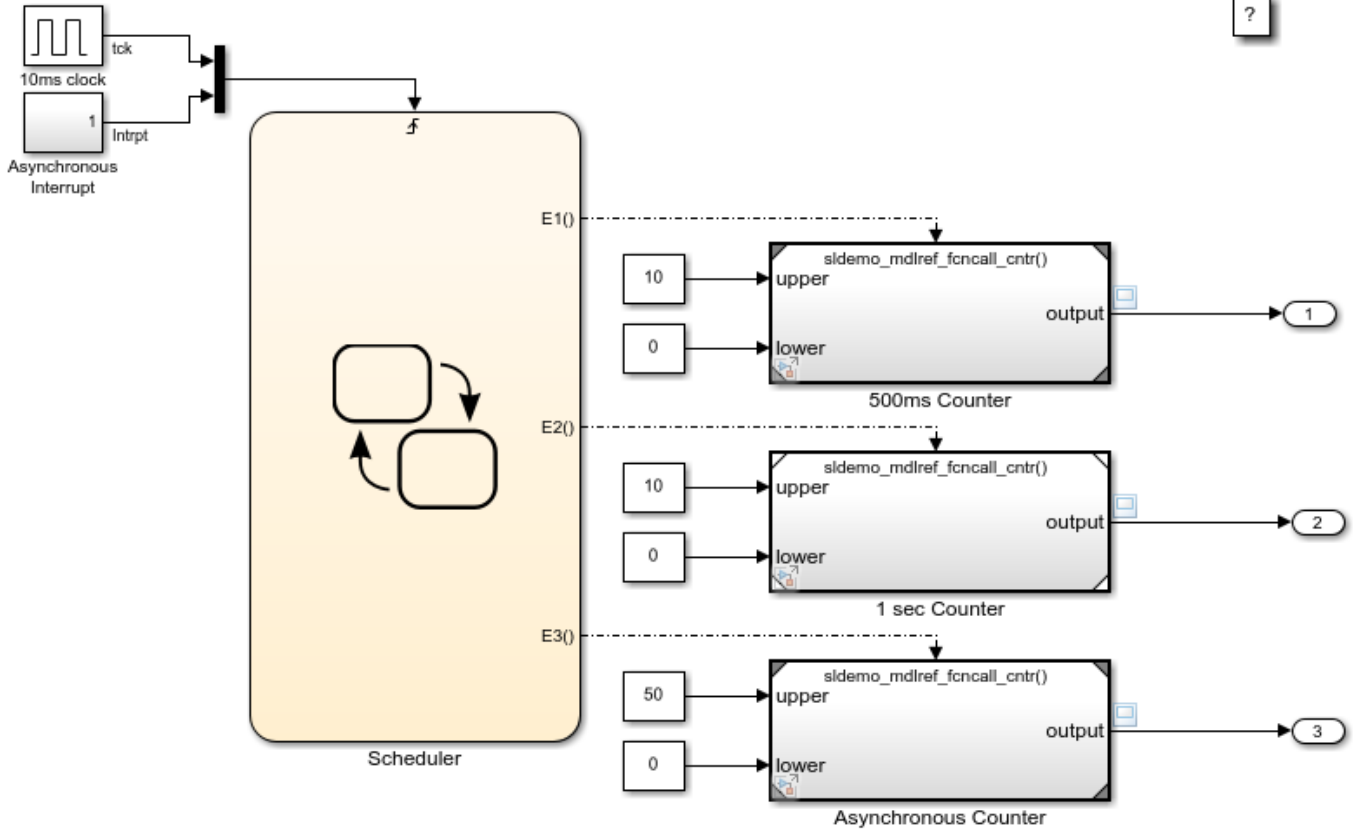

This model contains three Model blocks: 500ms Counter, 1 sec Counter and Asynchronous Counter. These blocks reference the same model `sldemo_mdref_fcncall_cntr`. The model blocks represent saturating counters which increment their output values by one each time they are explicitly triggered through their function-call trigger ports. The Stateflow® Chart Scheduler calls each Model block at its specified rate.

Simulate the Model

Now you can simulate the model `sldemo_mdref_fcncall` and verify the behavior of the counters by examining the results displayed on the scope blocks.

Model Reference Function-Call

?

Close the Model

Close the example model.

Protected Models for Model Reference

This example shows how to create and use a protected model in Normal and Accelerator mode simulations, as well as for code generation.

Example Requirements

Before you can generate protected models, you must have Simulink® Coder™ installed. To generate the read-only view of protected models, you must have Simulink® Report Generator™ installed.

Open the Example Model

Open the example model, `sldemo_mdref_bus`.

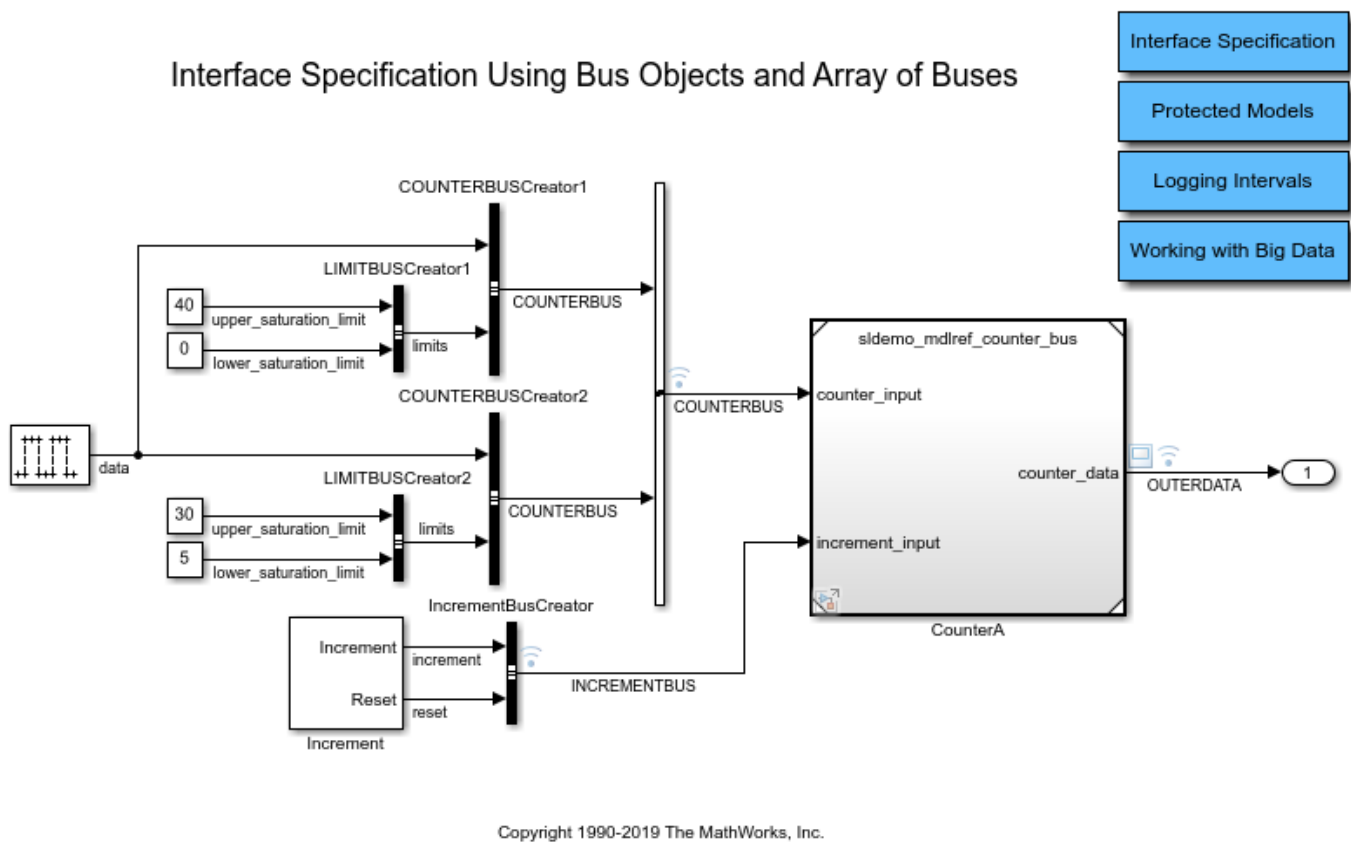

Figure 1: The example model, `sldemo_mdref_bus`

Protect the Referenced Model

This model contains one Model block, CounterA. To protect the model referenced by this block, select this block and click **Protect** on the **Model Block** tab. A dialog box opens where you can select options for creating a protected model.

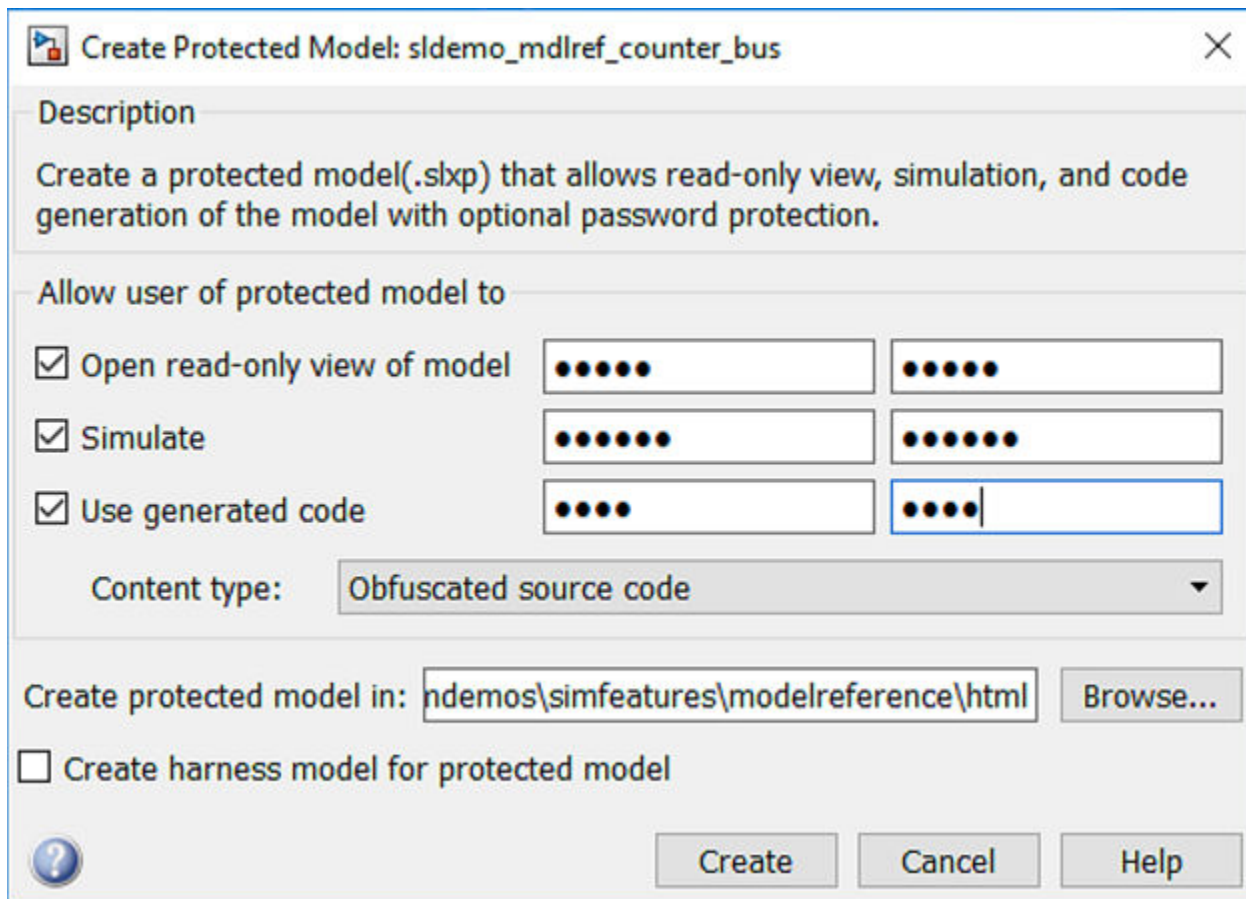

Figure 2: Protected model dialog box

Under **Allow user of protected model to** select **Open read-only view of model**, **Simulate**, and **Generate code**. You have the option of entering passwords for the three aforementioned functionalities. The three passwords are used to protect the respective functionalities. Enter separate passwords for the three options and click **Create**. A protected model file, `sldemo_mdref_counter_bus.slxp`, is generated in the current working folder. You can use this protected model in Normal and Accelerator mode simulations, as well as for code generation. You can also open a read-only view of the model. The original model file is not required.

Determine the Variables for a Protected Model

To simulate a model that references a protected model, you might need to define variables in the base workspace or data dictionaries. For example, the protected model, `sldemo_mdref_counter_bus`, needs the variables that specify the buses at the root input and output ports of the model. When you ship a protected model, you must include definitions of the required variables or the model is unusable. The `protect` command generates a protected model and determines the required variables. For example:

```
[~, neededVars] =
Simulink.ModelReference.protect('sldemo_mdref_counter_bus', 'Mode',
'CodeGeneration', 'OutputFormat', 'MinimalCode', 'ObfuscateCode', true,
'Harness', true, 'Report', true, 'Webview', true)
```

The second output of the `protect` function, `neededVars`, includes variables you must send to the recipient. The value of `neededVars` is a cell array that contains the names of the variables required for the protected model. However, the cell array might also contain the names of variables that the model does not need.

Before you share a protected model, edit `neededVars` to delete the names of any variables that the model does not need. Save the required variables into a data dictionary.

Use the Protected Model

When the Model block references a protected model, a shield badge is displayed on the block.

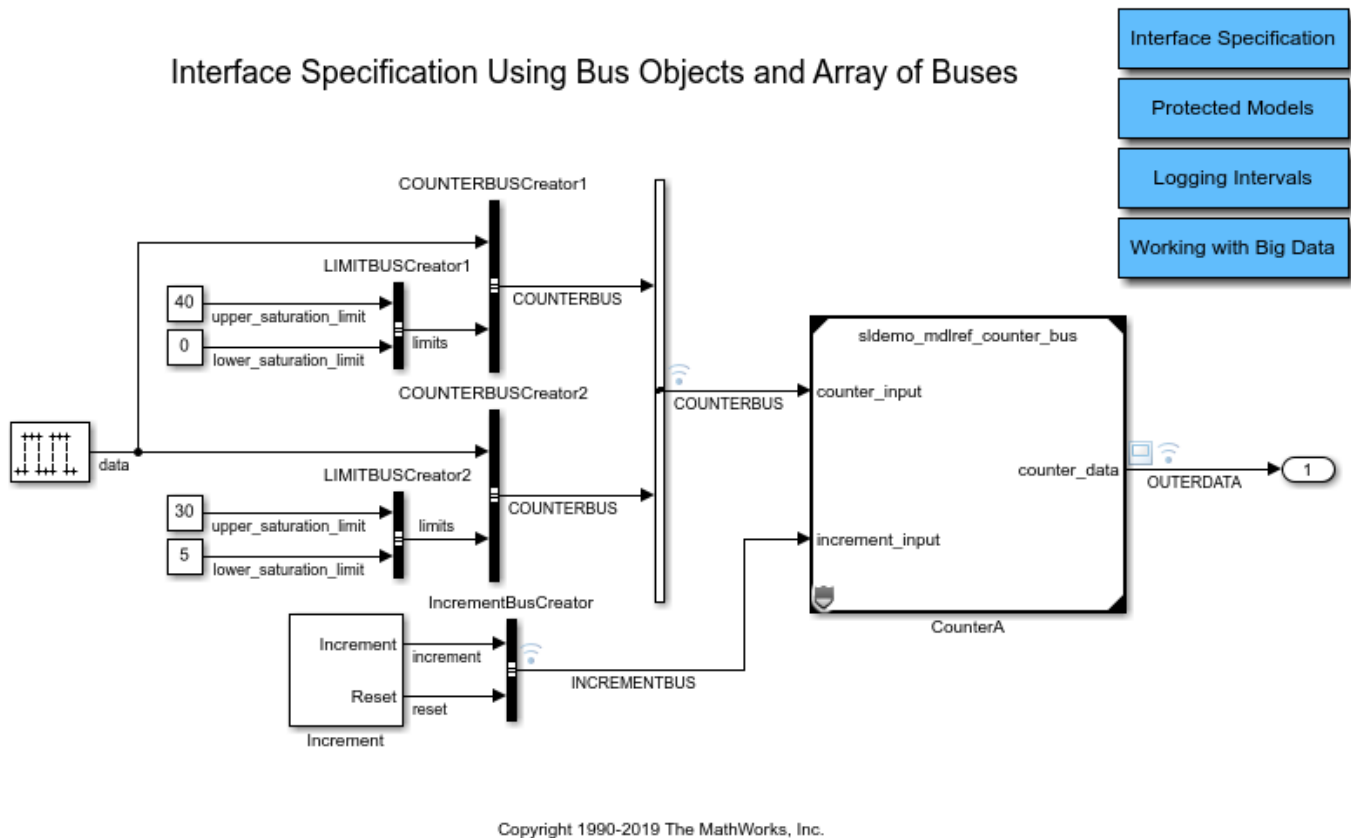

Figure 3: Referencing a protected model

Right-click on the shield badge and select **Authorize....** Enter the passwords you used while creating the protected model.

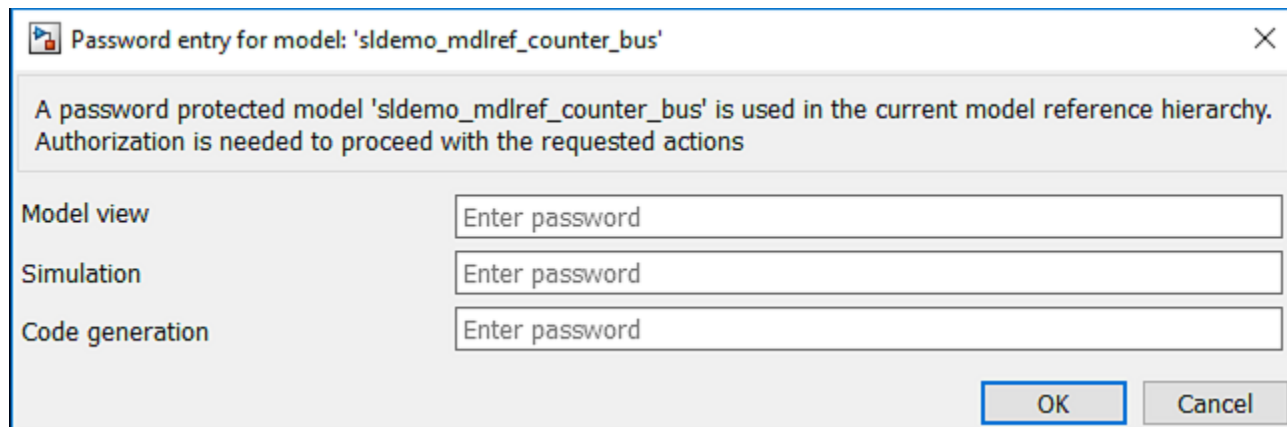

Figure 4: Password entry dialog

Now you can simulate the model in either Normal or Accelerator mode. You can also build the top model by selecting **Code > C/C++ Code > Build Model**.

Double-click the Model block to open the read-only view of the model. Alternatively, right-click on the shield badge and select **Show Webview** to open the read-only view of the model.

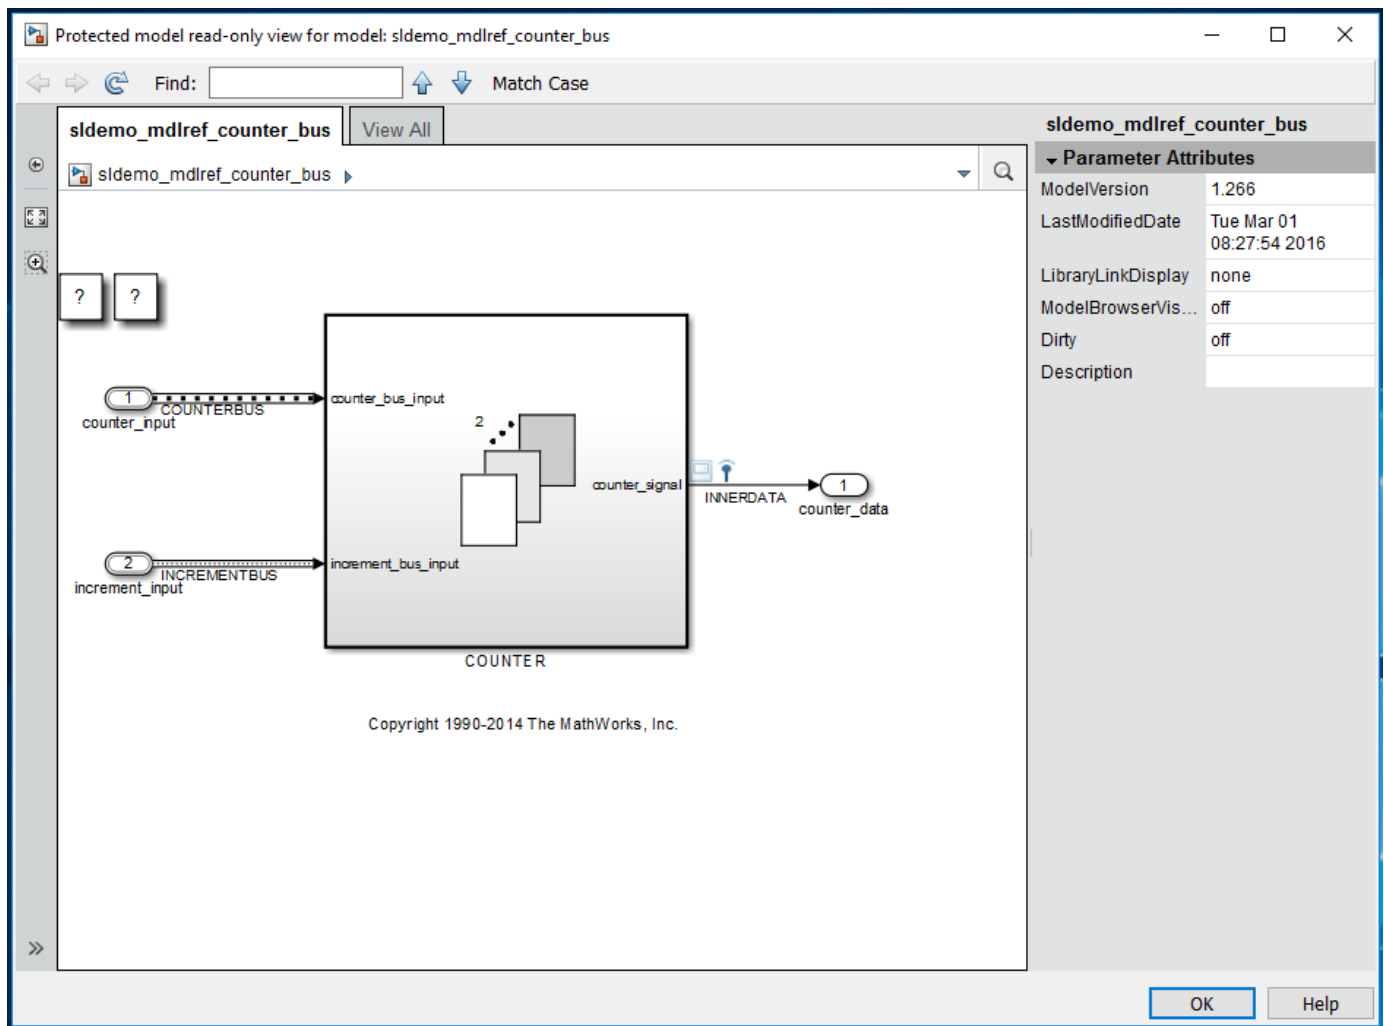

Figure 5: The protected model web view

Right-click on the shield badge and select **Display Report** to open the report

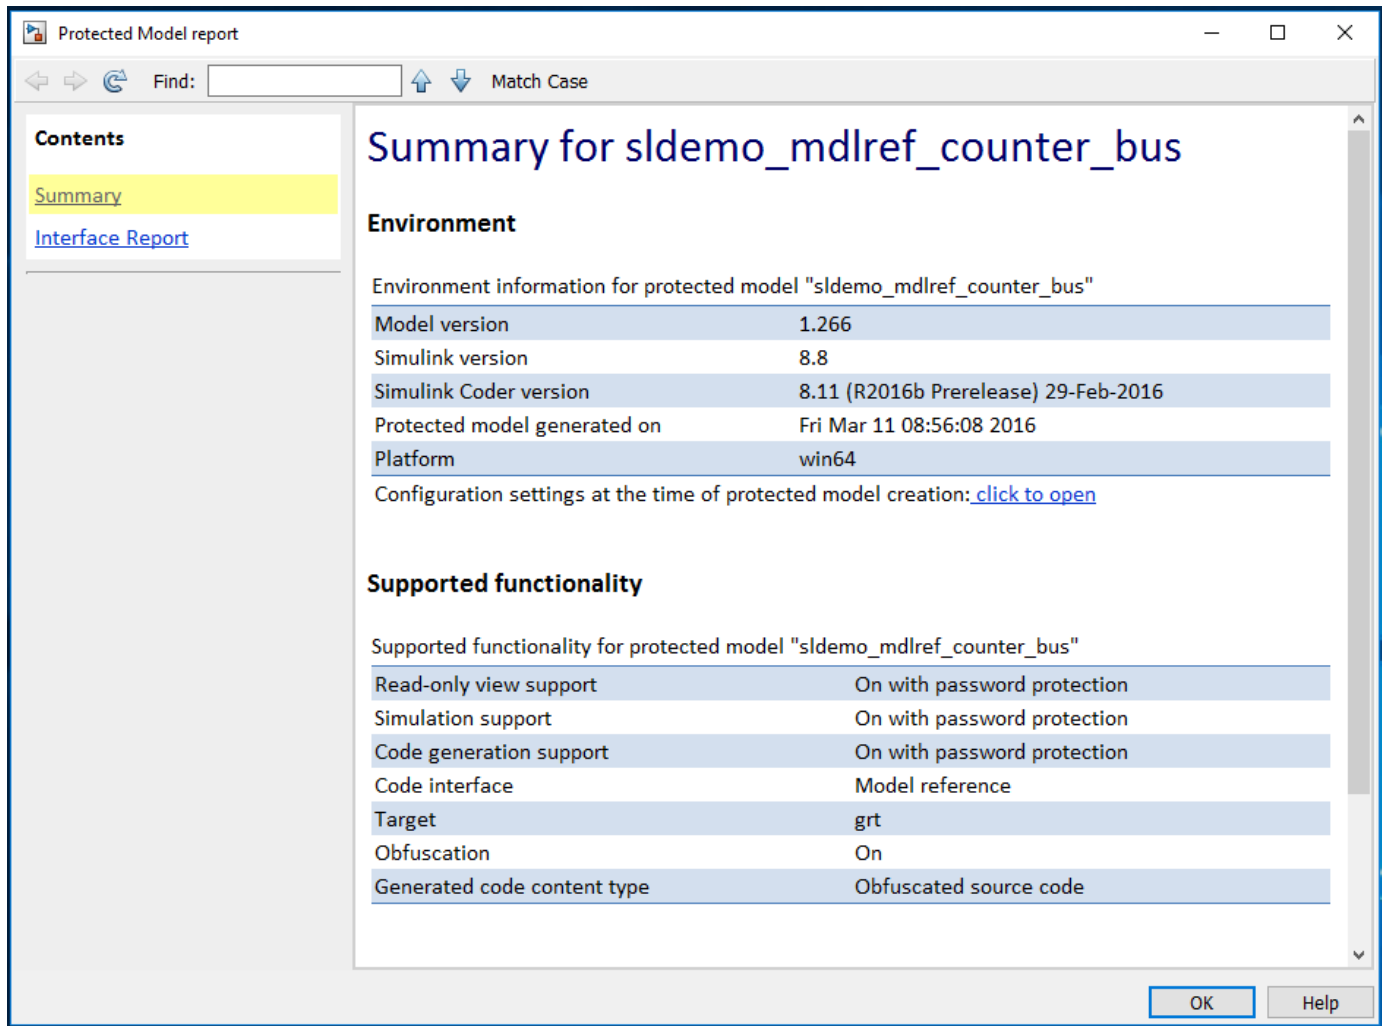

Figure 6: The protected model report

Model Reference Variants

This example shows how to use model reference variants. A Model block is used to reference one Simulink® model from another Simulink model. A Variant Subsystem block can contain Model blocks as variants. A *variant* describes one of N possible modes a Variant Subsystem block can operate in. Each variant references a specific model with its associated model-specific arguments. Only one variant is active for simulation. You can switch the active variant by changing the values of variables in the base workspace, or by manually overriding variant selection using the Variant Subsystem block dialog.

For new models, use a Variant Subsystem block instead of a Model block to contain model variants, unless you need to use variants that are conditionally executed models (models with control ports). Support for using a Model block to contain model variants will be removed in a future release.

Example Requirements

During this example, Simulink and Simulink® Coder™ may generate code in the code generation folder in the current working folder. If you do not want to (or cannot) generate files in this folder, you should change the working folder.

Overview of Model Variants

A Model block is used to reference one Simulink model (the *child model*) from another Simulink model (the *parent model*). A Variant Subsystem block can have Model blocks as variants. The variants comprise a set of models that have the potential to be referenced by the Variant Subsystem block. In this example, there are two models that are potentially referenced by the Variant Subsystem block named Controller.

Each *variant* is associated with a `Simulink.Variant` object. `Simulink.Variant` objects are created in the MATLAB® base workspace. For example:

```
V_LINEAR_CONTROLLER=Simulink.Variant('CTRL==1');
```

where the constructor argument ('CTRL==1') defines the condition when the variant is active. In this case, defining:

```
CTRL=1
```

in the base workspace would activate the `V_LINEAR_CONTROLLER` variant. The condition argument can be a *simple expression* consisting of scalar variables, enumerations, equality, inequality, &&, , and ~. Parenthesis () can be used for precedence grouping.

For a given Variant Subsystem block, one variant is active during simulation. The *active variant* is determined by evaluating the variant object conditions in the MATLAB base workspace. Alternatively, you can instruct the Variant Subsystem block to use a specific variant by selecting the **Override variant conditions and use following variant** checkbox.

Specifying Variants

The model used in this example requires the following variables be defined in the MATLAB base workspace:

```
V_LINEAR_CONTROLLER=Simulink.Variant('CTRL==1');
```

```
V_NONLINEAR_CONTROLLER=Simulink.Variant('CTRL==2');
```

```
CTRL=2;
```

Opening the model `sldemo_mdref_variants` runs the **PreLoadFcn** defined in File -> ModelProperties -> Callbacks. This callback populates the base workspace with the variables for the Variant Subsystem block named Controller:

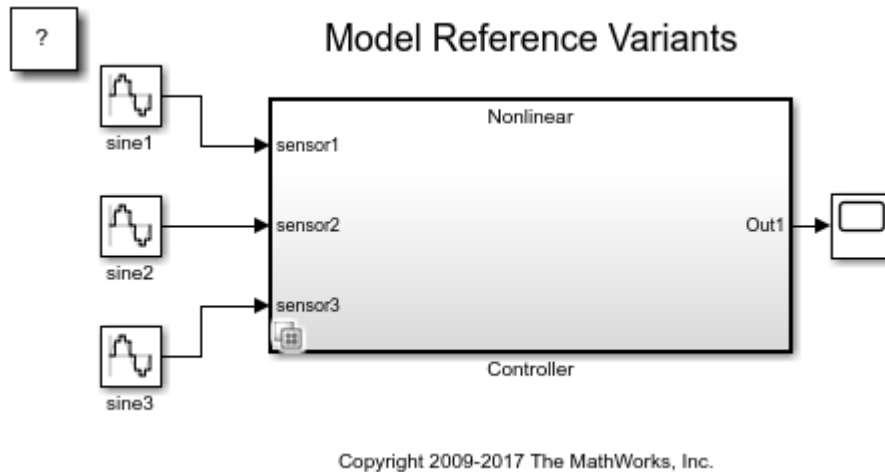

Figure 1: The top model, `sldemo_mdref_variants`

Right-click the Variant Subsystem block Controller and select the menu item **Block Parameters (Subsystem)** to open the block dialog box.

The dialog box specifies two potential variants. The two variants are in turn associated with the two Simulink.Variant objects `V_LINEAR_CONTROLLER` and `V_NONLINEAR_CONTROLLER`, which exist in the base workspace. These objects have a property named **Condition**, an expression that evaluates to a boolean and that determines which variant is active. The **Condition** is also shown in the Variant Subsystem block dialog. In this example, the condition of `V_LINEAR_CONTROLLER` and `V_NONLINEAR_CONTROLLER` are `CTRL == 1` and `CTRL == 2`, respectively. The variable `CTRL` resides in the base workspace, and may be a standard MATLAB variable or a `Simulink.Parameter`.

Switching Active Variants

To simulate using the `sldemo_mrv_linear_controller`, define:

```
CTRL=1
```

in the base workspace and then simulate the model.

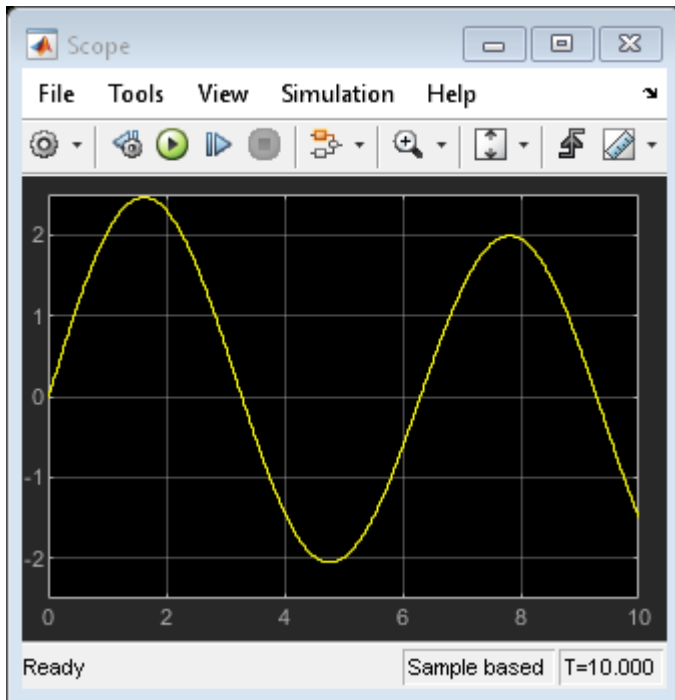

Figure 2: Simulation using the `sldemo_mrv_linear_controller` variant

To simulate using the `sldemo_nonlinear_controller`, define

`CTRL=2`

in the base workspace and then simulate the model.

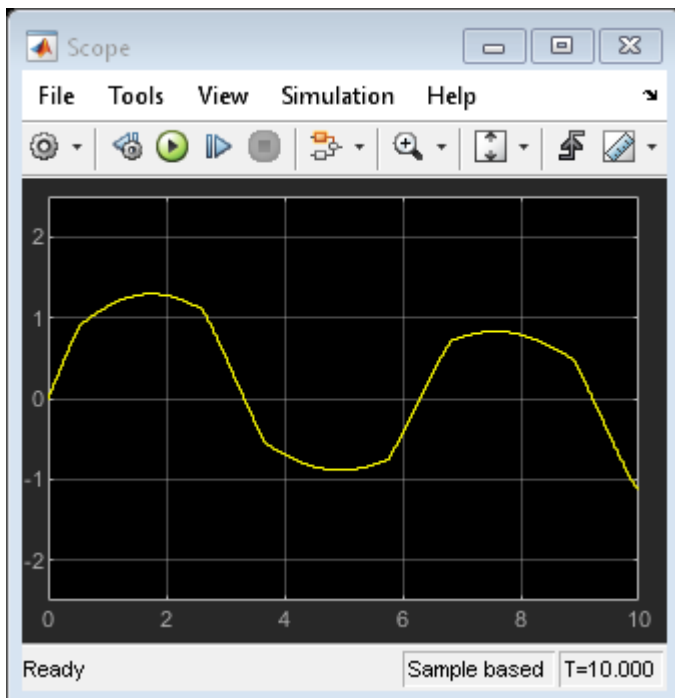

Figure 3: Simulation using the `sldemo_mrv_nonlinear_controller` variant

Enumerations and Reuse

The `sldemo_mdref_variants_enum` model illustrates `Simulink.Variant` capabilities:

1. **Enumerations:** MATLAB enumeration classes can be used to improve readability in the conditions of the variant object.
2. **Reuse:** `Simulink.Variant` objects can be reused in different Variant Subsystem blocks.

This example requires the following variables be defined in the MATLAB base workspace:

```
VE_LINEAR_CONTROLLER=Simulink.Variant('E_CTRL==sldemo_mrv_CONTROLLER_TYPE.LINEAR')
```

```
VE_NONLINEAR_CONTROLLER=Simulink.Variant('E_CTRL==sldemo_mrv_CONTROLLER_TYPE.NONLINEAR')
```

```
E_CTRL=sldemo_mrv_CONTROLLER_TYPE.LINEAR
```

```
VE_PROTOTYPE=Simulink.Variant('E_CURRENT_BUILD==sldemo_mrv_BUILD_TYPE.PROTOTYPE')
```

```
VE_PRODUCTION=Simulink.Variant('E_CURRENT_BUILD==sldemo_mrv_BUILD_TYPE.PRODUCTION')
```

```
E_CURRENT_BUILD=sldemo_mrv_BUILD_TYPE.PRODUCTION
```

In these `Simulink.Variant` objects we use the enumeration classes `sldemo_mrv_BUILD_TYPE.m` and `sldemo_mrv_CONTROLLER_TYPE.m` within the `Simulink.Variant` **Condition** properties to improve readability.

The `VE_PROTOTYPE` and `VE_PRODUCTION` `Simulink.Variant` objects are reused across the three filter Variant Subsystem blocks, `Filter1`, `Filter2`, and `Filter3`.

Opening the model `sldemo_mdref_variants_enum` runs the **PreLoadFcn** defined in `File -> ModelProperties -> Callbacks`. This callback populates the base workspace with variables for the Variant Subsystem blocks, which are displayed in the MATLAB Command Window:

Assigning Tasks to Cores for Multicore Programming

This example shows how to take advantage of executing code on a multicore processor by graphical partitioning. This example requires Simulink Coder™ to generate multithreaded code.

Introduction

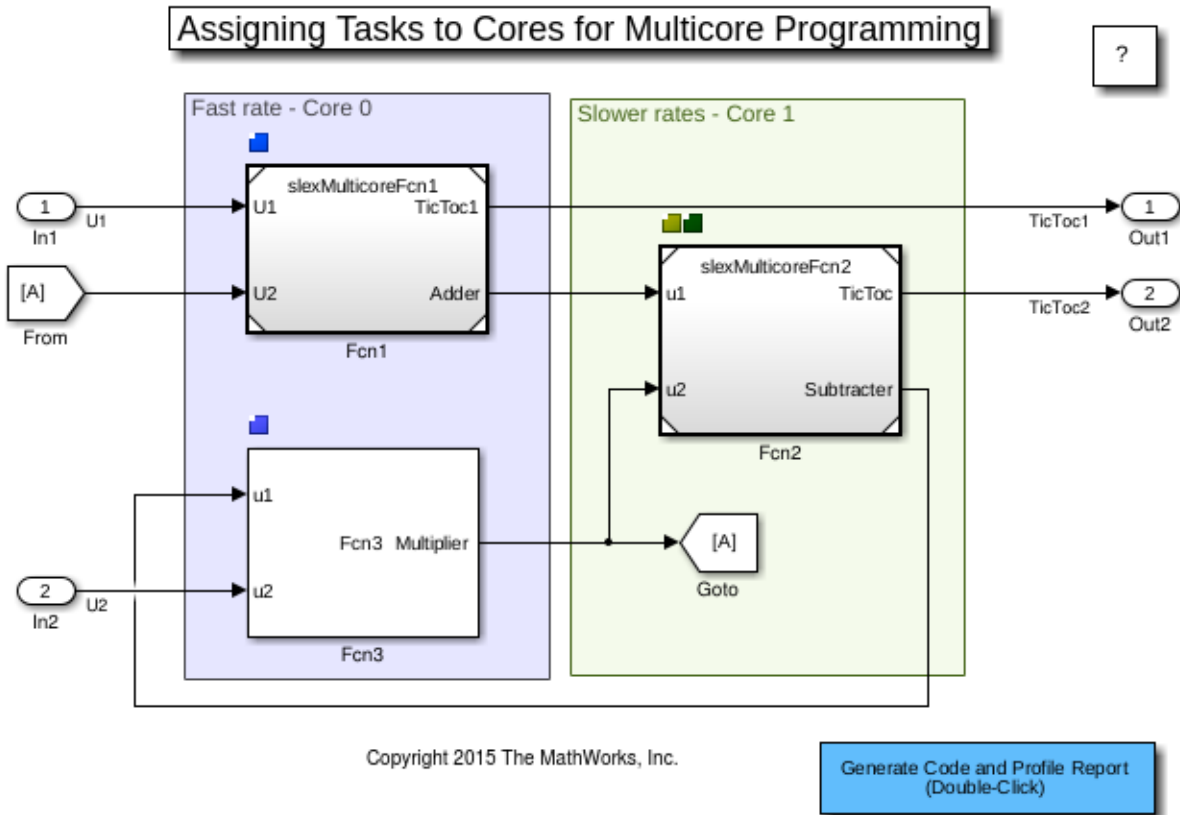

Multicore programming allows you to make use of the processing power of modern multicore processors to create high-performance applications. Simulink™ allows you to take advantage of multicore programming by allowing you to graphically partition your algorithms and to assign the code generated from those partitions to parallel threads on your multicore processor.

The parallel threads are typically scheduled by an operating system, assigning threads to cores dynamically. This allows the scheduler to make good use of the cores while providing a notion of fairness. However, in many applications, you may need additional control on how the cores are used or you may want to dedicate a set of cores to specific logic, for example to improve determinism. This level of control is achievable through graphical partitioning and is illustrated in this example.

Try the Example

A typical situation for multicore consists of a multi-rate model for which you want to assign code for the fast rates to one core and the code for the slower rates to other cores. This may allow you to add more logic to these faster rates or to achieve more determinism. More generally, you may want to dedicate cores to application logic with the greatest demand on resources. To begin, open the multicore project:

slexMulticoreExample

Generate Multithreaded Code

This application model is already partitioned into four concurrent tasks through the Concurrent Execution dialog which you may access from the Solvers pane of the model's Configuration Parameters. Use this dialog to specify logic, task and core assignments. In this example, we have partitioned the application logic as:

Name	TriggerType	Period
Block: Fc1		
Core1:Task1	Periodic	.1
Block: Fc2		
Core2:Task4	Periodic	.4
Core2:Task3	Periodic	.2
Block: Fc3		
Core1:Task2	Periodic	.1

Double-click on the 'Generate Code and Profile Report' button to generate multi-threaded code, and profile its execution. This action runs and instruments the generated executable and produces both profiling results and a core occupancy map, the latter illustrated below. The illustration shows how the cores were utilized at each time step of execution. In this example, the first core was used for the fast rates (Task1 and Task2) and the second core was used for the slower rates (Task3 and Task4).

You may go back to the Concurrent Execution dialog to try out different core assignments. In particular, you may try to specify no core affinity by leaving the 'Affinity' property as '[]'. This is the default setting which allows Simulink™ to generate multi-threaded code suitable for dynamic scheduling on your multicore processor.

Clock Tick / Task	0	10																		19		
Task1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
Task2	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Task3	1	NR	1	NR	1	NR	1	NR	1	NR	1	NR	1	NR	1	NR	1	NR	1	NR	1	NR
Task4	1	NR	NR	NR	1	NR	NR	NR	1	NR	NR	NR	1	NR	NR	NR	1	NR	NR	NR	1	NR

Implement an FFT on a Multicore Processor and an FPGA

This example shows you how to take advantage of a multicore processor target with FPGA acceleration by graphically partitioning a model. This example requires Simulink Coder™ to generate multi-threaded code and HDL Coder™ to generate HDL code. You cannot generate HDL code on Macintosh systems.

Introduction

Several modern processors include multicore processors integrated with FPGA components to create high-performance applications. These require multicore and FPGA programming, including programming of parallel threads, HDL, and communication interfaces between the cores of the system. Simulink™ allows you to take advantage of these approaches by graphically partitioning your algorithms and by assigning the software generated from those partitions to threads on your processor and to modules on your FPGA. The example uses one application level model to generate one executable, consisting of multiple threads and HDL code, to take advantage of the hardware parallelism of the FPGA. This is illustrated in the figure below.

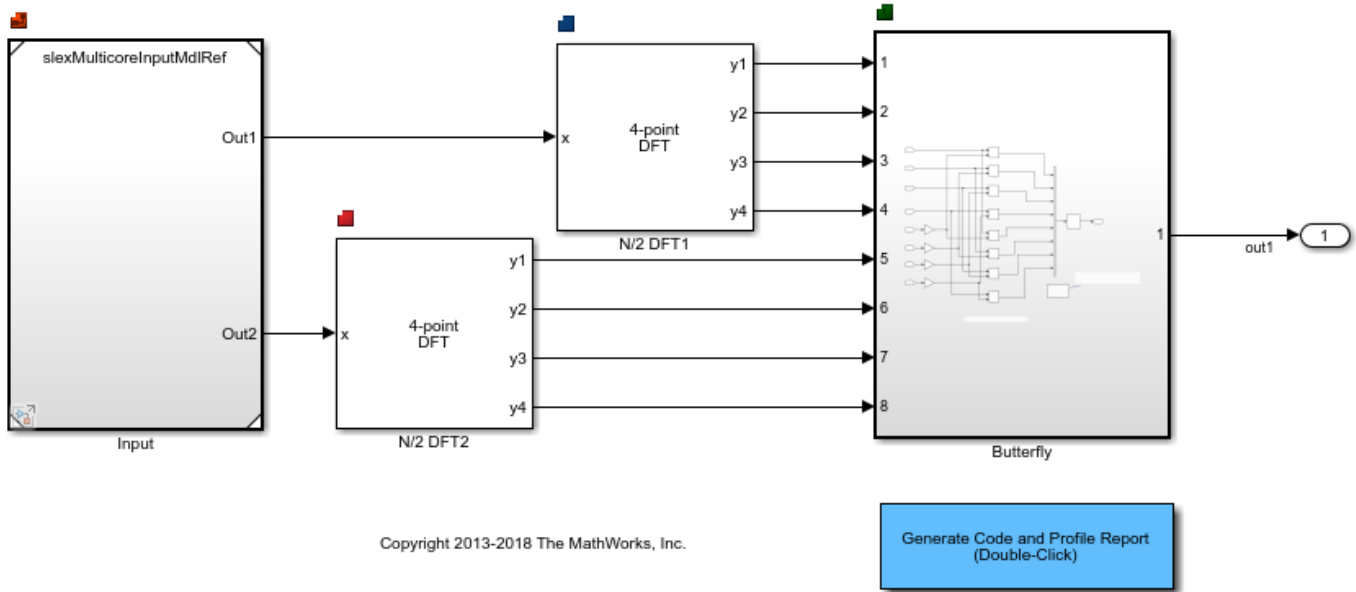

Example Model

Load the example model:

```
slexMulticoreFPGAExample
```

Implement an FFT on a Multicore Processor and an FPGA

Architecture Definition

All concurrent execution settings for this model can be accessed in the Concurrent Execution dialog box (Configuration Parameters>Solvers>Configure Tasks).

The first step to implement our algorithm is to define structural elements of our target architecture. This includes structural elements of the hardware, such as the number and type of processing nodes (CPU, FPGA) and the communication channels (AXI, PCI).

This also includes software settings in the model's Configuration Parameters (e.g. System Target File, hardware Implementation, data transfer settings). In this example we have selected the pre-configured target architecture 'Sample architecture'. This architecture uses your desktop as a stand-in for the deployment process.

Partitioning and Mapping the Model

Partition the model to decide which functions run sequentially and which run concurrently.

The example model is partitioned explicitly, consisting of MATLAB System blocks, a Model block, an Atomic Subsystem and an Outport block. Explicit partitioning creates partitions based on these blocks at the root-level of the model. Implicit partitioning, on the other hand, creates partitions based on the block sample times and other scheduling constraints.

After partitioning the model, you can map partitions to CPU tasks and FPGA nodes. You can change the mapping for design space exploration, through the GUI or the API. During mapping, signals will be auto-mapped to channels.

You can change how the blocks are mapped to the threads and to the FPGA in the Concurrent Execution dialog box. You can also find more information in the documentation

Map blocks to tasks

Generate Multithreaded and HDL Code

Double-click on the 'Generate Code and Profile Report' button to generate multithreaded code. In this example, the host computer replaces the target environment. C code is generated for blocks mapped to processor tasks. This code is organized using threads native to the desktop machine. The code snippet shows how threads are created. In addition, HDL code is generated for blocks mapped to hardware nodes. The code snippet below illustrates how the module/entity is created in VHDL.

Multicore Programming of a Field-Oriented Control on Zynq

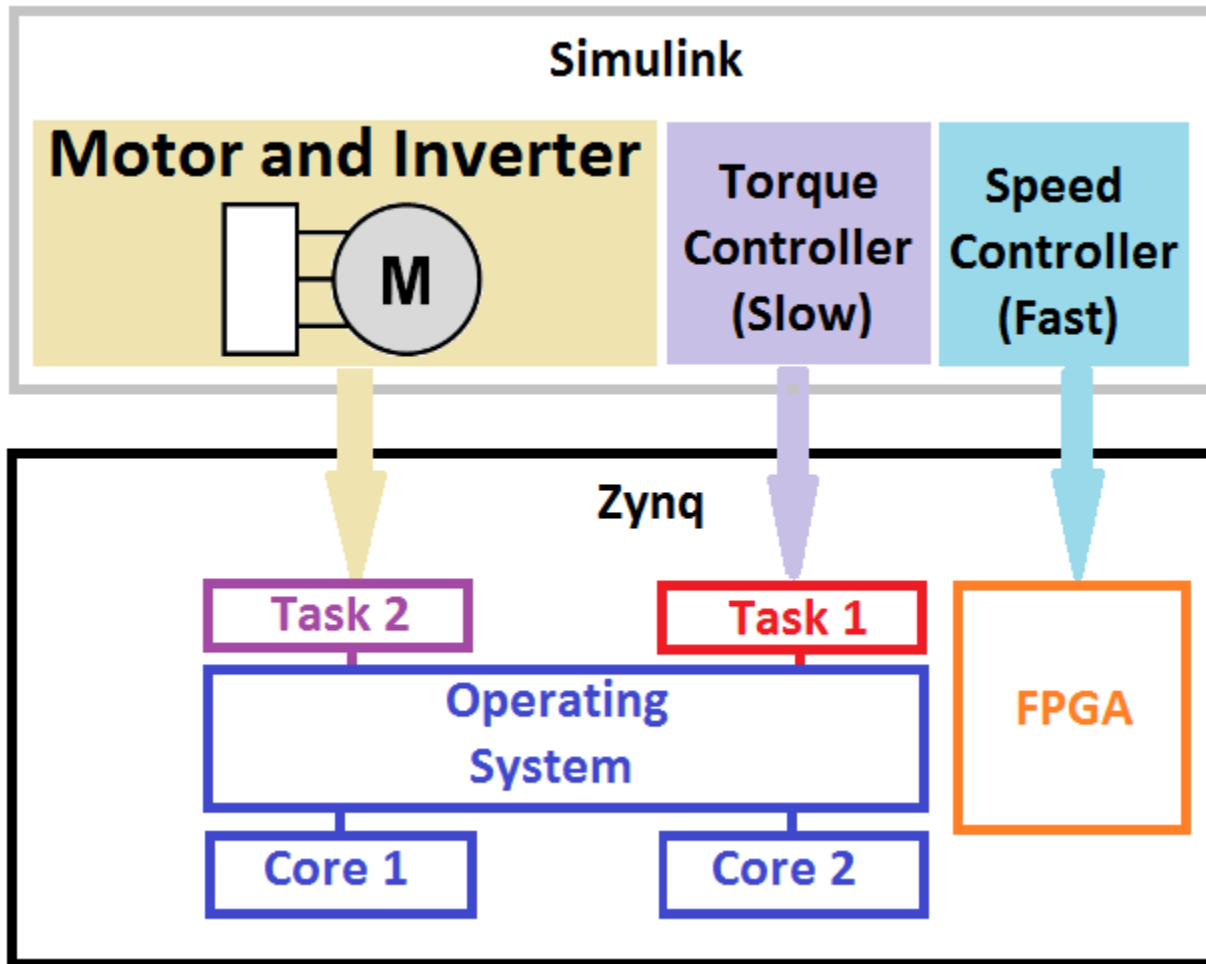

This example demonstrates how to implement a control algorithm containing multiple rates on Zynq. To take advantage of both the cores and the FPGA hardware, the example uses graphical partitioning approach such that code from different partitions are distributed across the cores and the hardware.

Introduction

In this example, we show a workflow for generating code for a motor control algorithm, and testing the generated code on a Xilinx® Zynq™-7000 SoC ZC702 evaluation board. Motor control algorithm in the example is a Field-Oriented Control algorithm composed of a speed controller (fast component) and a torque controller (slow component). One typical workflow is to generate code for these two components of the controller, upload the generated code to an evaluation board and connect the evaluation board to a real-world motor. The purpose of this example is to show how to follow this workflow. This is illustrated in the block diagram below

In order for this example to be self-contained and since there is redundant computer power on the target processor, we model the motor using one of the tasks of the CPU of the evaluation board.

The example assumes that a Xilinx® Zynq™-7000 SoC ZC702 evaluation board is connected to your computer. You can find the connection and installation steps in the documentation .

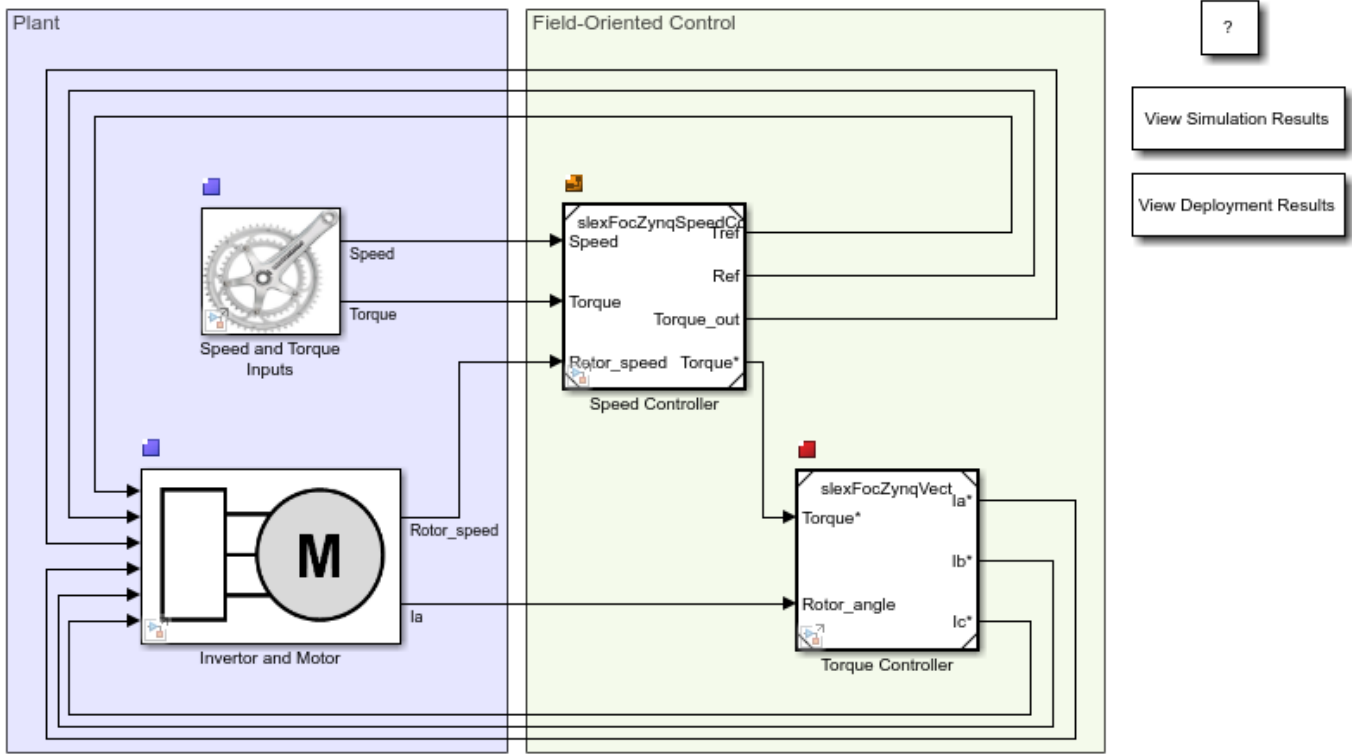

This example requires Embedded Coder™ to generate multi-threaded code, HDL Coder (TM) to generate HDL code and Simscape Power Systems (TM) to model the permanent magnet synchronous machine in the example. You cannot generate HDL code on Macintosh systems.

Example Model

The example model consists of two Simulink areas. In the Permanent Magnet Synchronous Machine area, there are two blocks: "Speed and Torque Inputs" block which provides the reference inputs to the feedback system, and "Invertor and Motor" block which is the plant we aim to control in this example. The "Invertor and Motor" block also contains peripherals: a scope that can be used for investigating the simulation results and a UDP sender. The generated code for the UDP sender is responsible for sending the simulation data from the Zynq ZC702 evaluation board to the host machine. The Field-Oriented Control contains the controller blocks "Speed controller" and "Torque controller". Load the model by typing

```
slxFocZynqExample
```

Multicore Programming of a Field-Oriented Control on Zynq

Copyright 2015 - 2019 The MathWorks, Inc.

Architecture Definition

The target architecture in the example is Xilinx Zynq ZC702 evaluation kit. This can be verified by accessing the "Concurrent Execution" dialog box following the steps:

- Go to Simulation>Model Configuration Parameters,
- Click "Configure Tasks" at the Solver pane, under the Additional Options section.

Concurrent Execution

The configuration for concurrent execution enables definition of tasks and assignment of blocks to these tasks.

Associated model: [slexFocZynqExample](#)
Associated configuration: [Configuration](#)

Concurrency modeling options

Enable explicit model partitioning for concurrent behavior

Target architecture: Xilinx Zynq ZC702 evaluation kit Select...

The evaluation board has an ARM Cortex-A9 CPU and a field-programmable gate array (FPGA). There are two tasks running on the ARM CPU. "Torque controller" is mapped to the first task and the blocks that constitute the plant ("Speed and Torque Inputs" block and "Invertor and Motor") are mapped to the second task. "Speed controller" operating at high frequency in the control loop is mapped to the FPGA. These settings can be changed in the "Tasks and Mapping" section of the "Concurrent Execution" dialog box.

Map blocks to tasks

Refresh mapping table (*invokes update diagram) 

Name	TriggerType	Period	Autogenerated
Block: Invertor and Motor			
Periodic:Task2	Periodic	Ts	No
Block: Speed Controller			
Programmable_Logic	FPGA		No
Block: Speed and Torque Inputs			
Periodic:Task2	Periodic	Ts	No
Block: Torque Controller			
Periodic:Task1	Periodic	Ts	No

Generate Multi-threaded and HDL Code

Press Ctrl-B or click on "Deploy to Hardware" to generate the multi-threaded and HDL code. The generated executable and the FPGA bitstream will be uploaded to Zynq board automatically. In order to perform this step, Zynq board should be connected to the computer and the environment should be set properly. You can consult to the documentation for additional information.

Receive Data from the Zynq

First, open the scope by double-clicking "View Simulation Results", and run the simulation (Simulation>Run) to obtain the following output:

Compare this simulation output with the output of the executable that runs on the Zynq ZC702 board. In order to make this comparison, access the UDP receiver model by double-clicking on the "View Deployment Results". When the UDP receiver model is selected, run the simulation (Simulation>Run). The run command will send a signal to the Zynq ZC702 board to start running the executable on the board. The simulation data will be sent via UDP from the Zynq ZC702 board to the host machine. The captured UDP signal is displayed on the scope of the UDP Receiver model.

Close the Model

```
close_system('slexFocZynqExample', 0);
```

Multicore Deployment of a Plant Model

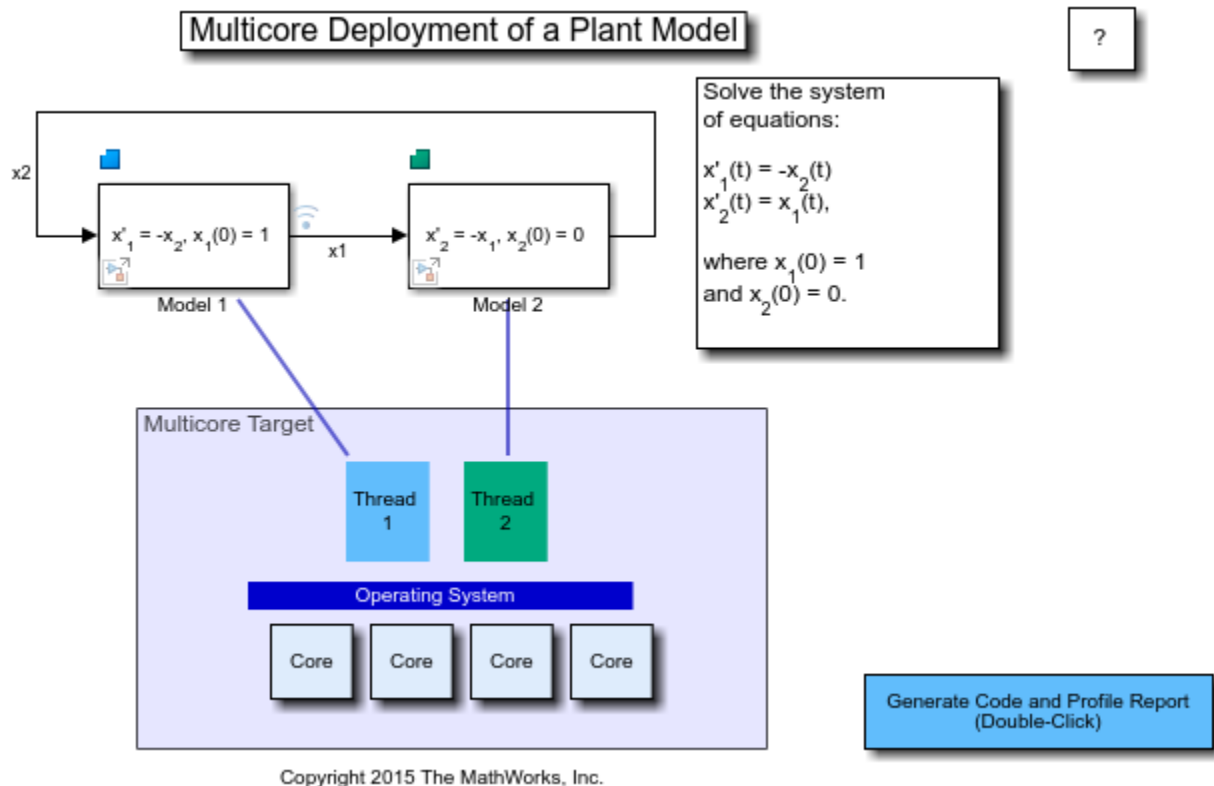

This example illustrates how to take advantage of executing multithreaded code on a multicore processor using graphical partitioning. This example requires Simulink® Coder™ to generate multithreaded code.

Overview

One objective of model-based design is to create realistic models of physical systems and to simulate these models in real-time, for example, to verify controllers using hardware-in-the-loop (HIL). However, as more features are added to the plant model, the computational requirements may exceed the resources available by single-core processing systems.

Partitioning the plant and controller into separate pieces is one way to address the computational needs of complex models. With Simulink® you can partition a plant using Model blocks and then assign the code generated by each sub-model to threads for real-time execution on an HIL system such as Simulink Real-Time™. To see how this works, let us use our host computer as a stand-in for the real-time execution environment and generate real-time multi-threaded code for the following model.

slexMulticoreSolverExample

Symmetric Multicore Processing

The illustration above shows that the code generated for the model is separated into two threads. In this example, the target is assumed to be a Symmetric Multicore Processor, so that the threads are

not associated with any particular core. The operating system is responsible for making the best use of the cores when scheduling thread execution. Ideally, to provide maximum flexibility, the number of threads (Nt) should be greater than the number of cores (Nc). Double-click on the 'Generate Code and Profile Report' button to generate multi-threaded code, profile its execution and visualize the results. The visualization shows a core occupancy map of how the cores were utilized at each time step of execution. It can be seen that the threads float across cores as deemed best by the operating system scheduler. This kind of scheduling is good when the operating system also needs to run other processes.

Clock Tick / Task	0	10	19
Thread1	14 6 6 12 12 14 12 12 12 4 4 0 0 4 6 8 14 10 10 12		
Thread2	10 2 0 0 0 0 14 14 14 2 2 14 14 2 2 0 0 0 14 4		

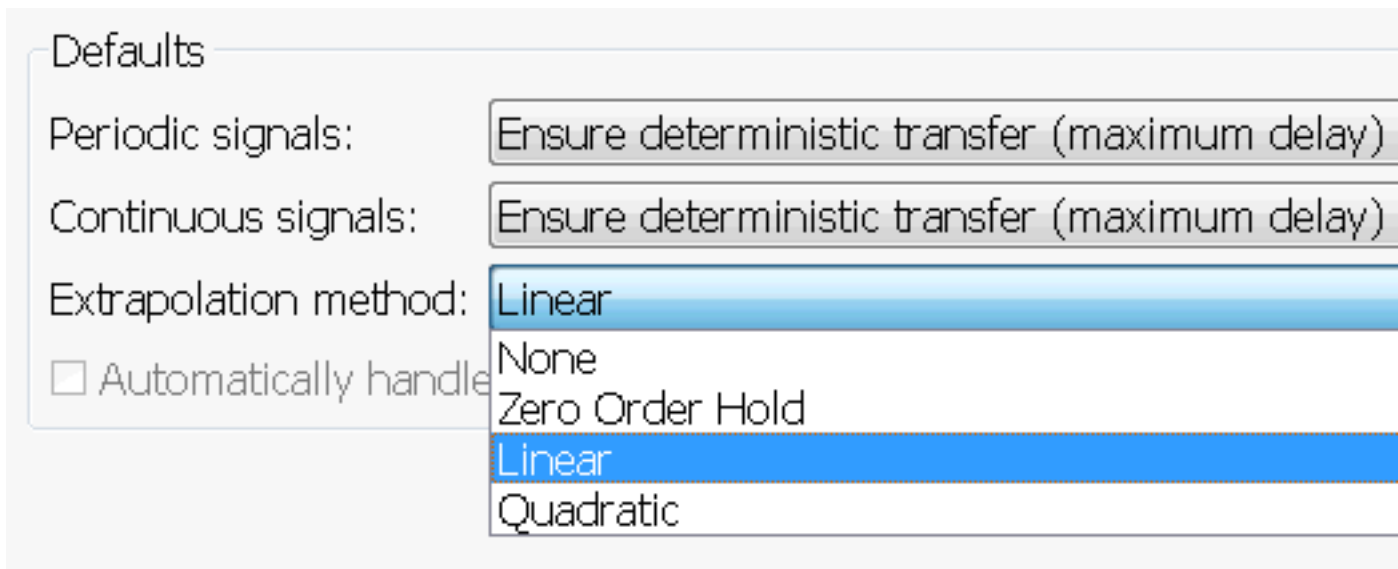

Thread Synchronization

Simulink® Coder™ generates code such that the two threads may execute simultaneously and possibly on two different cores. This means that the signal values for x_1 and x_2 must be synchronized between the two threads. Simulink® provides several options to handle this requirement as illustrated here:

Data Transfer Options

Defaults

- Periodic signals: Ensure deterministic transfer (maximum delay)
- Continuous signals: Ensure deterministic transfer (maximum delay)
- Extrapolation method: Ensure data integrity only
Ensure deterministic transfer (maximum delay)
- Automatically handle: Ensure deterministic transfer (minimum delay)

Using the script below, we will simulate and demonstrate the effect of the deterministic modes to understand how Simulink® handles synchronization.

- Reference solution (ode3) - Simulink® is configured to provide the reference solution by synchronizing data at each major and minor time step.
- Zero Order Hold - Each thread is solving a sub-system of equations using its own solver, while synchronizing data only on major time steps.
- Linear extrapolation - In addition to the Zero Order Hold mode, each solver extrapolates data using linear predictions to compensate for data latency errors.

For most systems where the synchronization points are smooth, the linear extrapolation mode provides a good tradeoff between communication bottlenecks and numerical accuracy.

```
h = figure;
hVal = ishold;
hold on;
mdl = 'slexMulticoreSolverExample';
dt = get_param(mdl, 'DataTransfer');

modes = { ...
    'Ensure deterministic transfer (minimum delay)', ...
    'None', 'k:', ...
    'Ensure deterministic transfer (maximum delay)', ...
    'Zero Order Hold', 'm', ...
    'Ensure deterministic transfer (maximum delay)', ...
    'Linear', 'b' ...
};

for i=1:3:length(modes)
dt.DefaultTransitionBetweenContTasks = modes{i};
dt.DefaultExtrapolationMethodBetweenContTasks = modes{i+1};
out = sim(mdl);
plot(out.logout.get('x1').Values.Time, ...
    out.logout.get('x1').Values.Data, ...
    modes{i+2});
end
```

```
legend('Reference solution (ode3)', ...  
       'Zero Order Hold Extrapolation', ...  
       'Linear Extrapolation');
```

Closing the Models

```
close_system('slexMulticoreSolverExample',0);  
close_system('slexMulticoreSolverMdlref',0);  
if ~hVal, hold off; end  
delete(h);
```

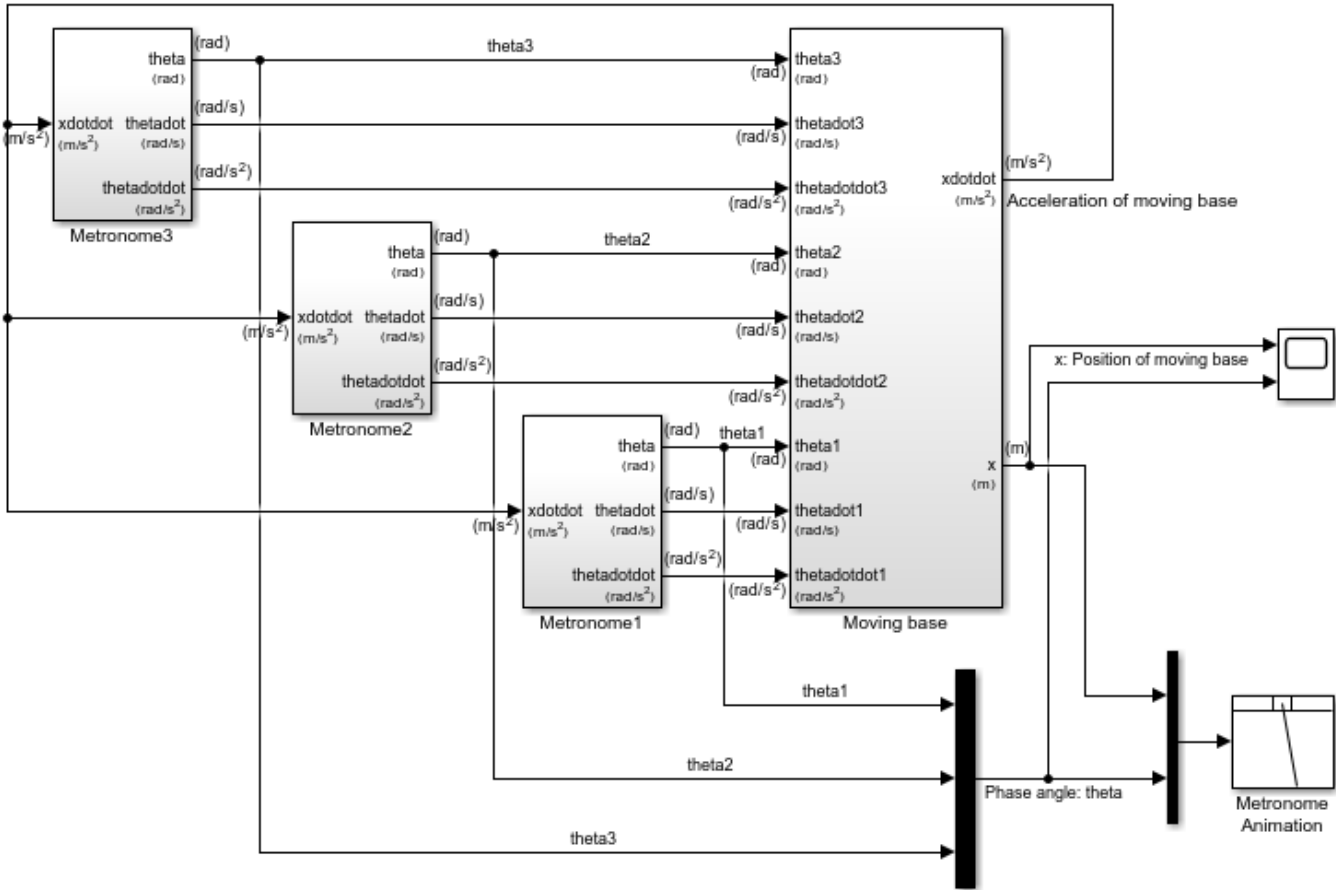

Modeling Objects with Identical Dynamics Using For Each Subsystem

This example shows how to model multiple objects with identical dynamics using the For Each Subsystem. The number of objects is parameterized by the length of the input signal.

This example illustrates how you can implement the model `sldemo_metro_basic`, using one For Each Subsystem to model three identical metronomes and another to model the identical effect that the motion of each metronome has on the moving base.

The continuous dynamics of the three identical metronomes in `sldemo_metro_basic` are modeled in identical subsystems: `sldemo_metro_basic/Metronome1`, `sldemo_metro_basic/Metronome2`, and `sldemo_metro_basic/Metronome3`. You can represent these three subsystems as one For Each subsystem. The initial position of the metronomes is passed in as a mask parameter to the For Each subsystem, which is used as an initial condition for one of the integrators. The For Each subsystem is configured to partition this parameter along the first dimension. As a result, an input vector with three elements defines initial positions for three metronomes.

Exploring the Solver Jacobian Structure of a Model Base model for `sldemo_metro_foreach`

Copyright 2018 The MathWorks, Inc.

Figure 1: Metronomes modeled using three subsystems with identical dynamics

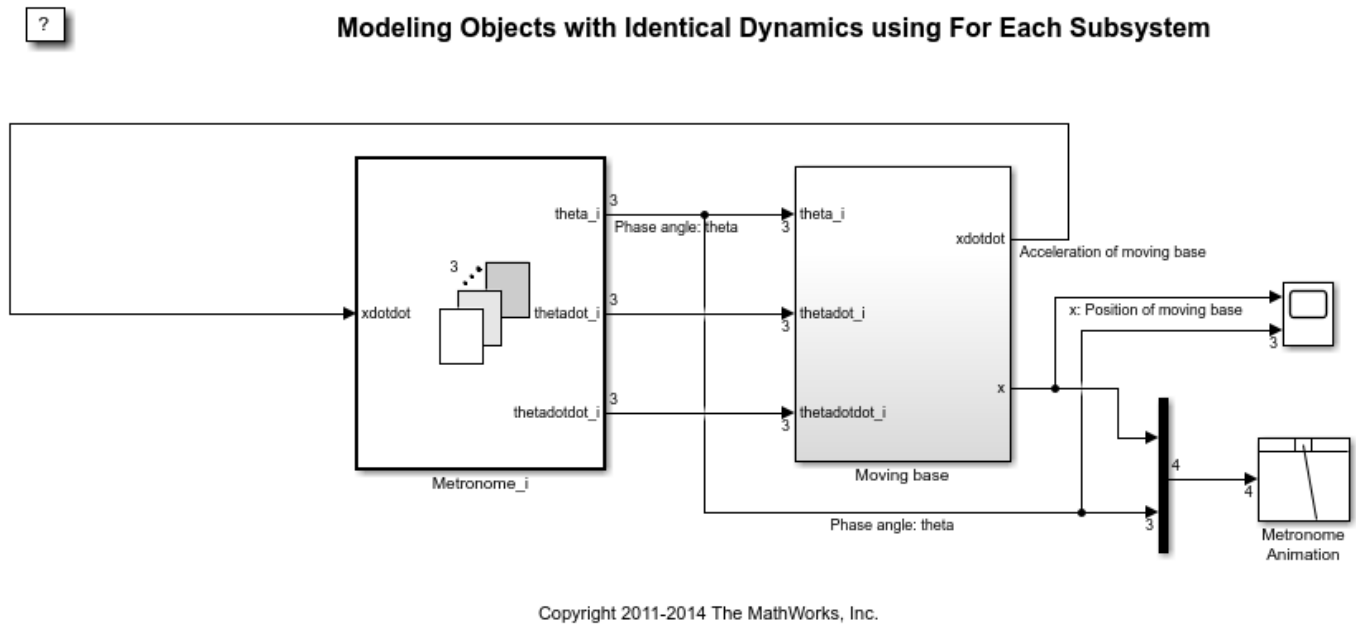

Figure 2: Metronomes modeled using one For Each subsystem

On examining the dynamics of the Moving base, note that it involves three identical second-order differential terms corresponding to each metronome. You can replace the three copies with one For Each Subsystem. Instead of nine input signals, the For Each subsystem requires only three input signals: the angular displacements, the angular velocities, and the angular accelerations for all metronomes. The For Each subsystem is configured to partition the input signal along the first dimension and operates on one element from each signal for one iteration (i.e. one metronome).

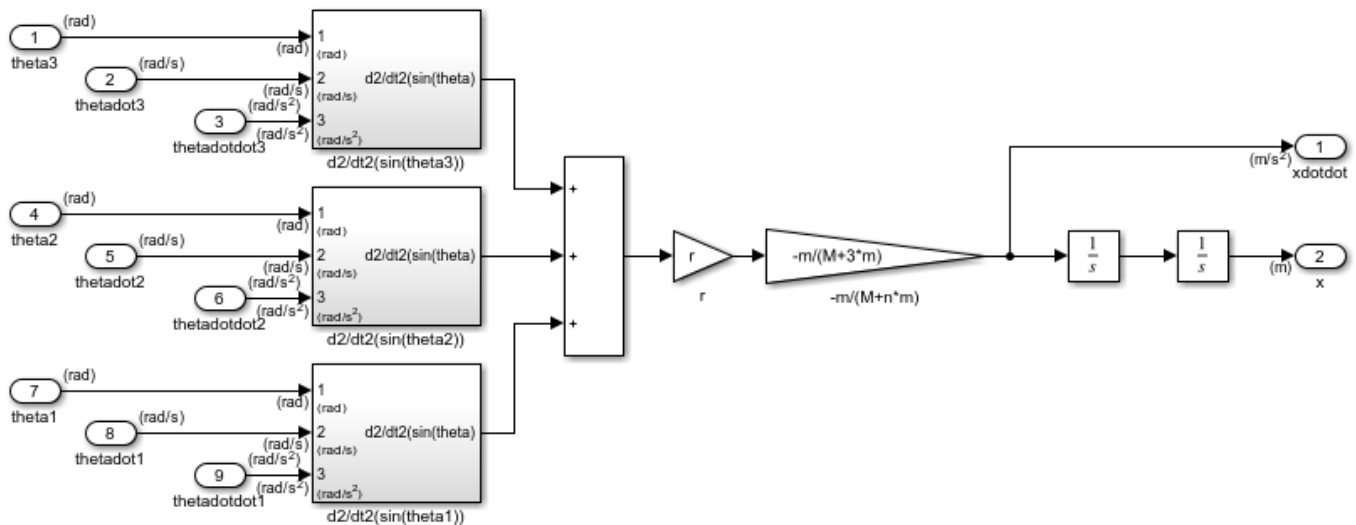

Figure 3: Second-order differential terms modeled using copies of the same subsystem

Figure 4: Second-order differential terms modeled using one For Each subsystem

After implementing the original model with two For Each subsystems, the model is now parameterized for the number of metronomes. To increase the number of metronomes, introduce a new value to the mask parameter.

For example:

Theta4 = 0.7568;

Double-click on the Metronome i block to open the mask dialog and change Input Positions (Partitioned) to: [Theta1 Theta2 Theta3 Theta4]

Execute the model to see the displacement angles of the four metronomes and the position of the moving base.

```
sim('sldemo_metro_foreach');
```

Figure 5: Simulation animation with For Each subsystem parameterized for four metronomes

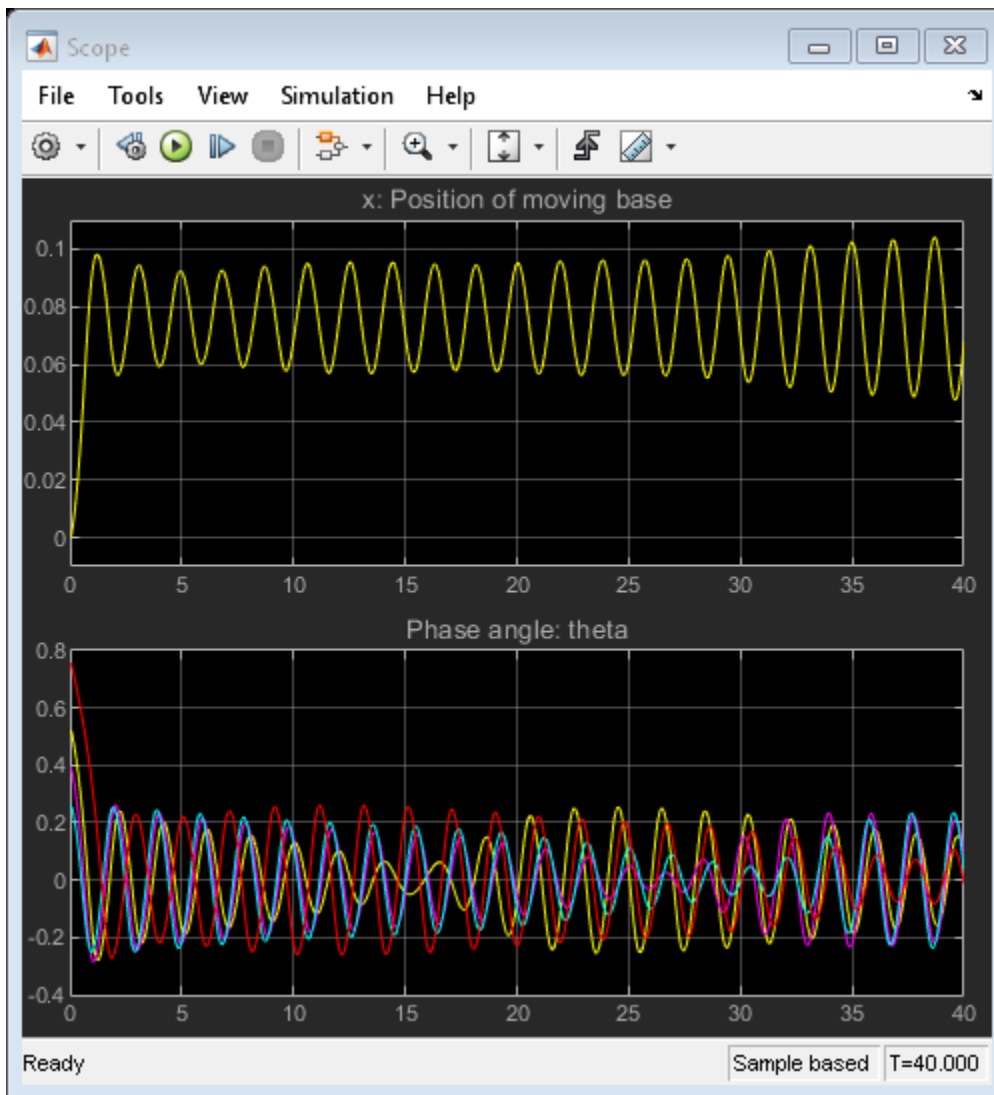

Figure 6: Simulation result with For Each subsystem parameterized for four metronomes

Vectorizing a Scalar Algorithm with For Each Subsystem

This example shows how to use the For Each Subsystem. In this example the operations are performed on a vector for simplicity.

Open the example model `sldemo_foreach_vectorized`. This model contains a For Each Subsystem that processes the input signals one by one.

The inputs to the For Each Subsystem are: the signals to process, the coefficients of the FIR filter to use with each of these signals, and the common gain.

Each signal is scalar and needs to be processed individually. Consequently, the For Each Block that controls the partition dimension is set to partition the input signal along dimension 1, by slicing through a partition width of 1. For each input signal, a corresponding set of coefficients must also be partitioned using the same criterion. The gain is common to all the signals, thus this input is not partitioned.

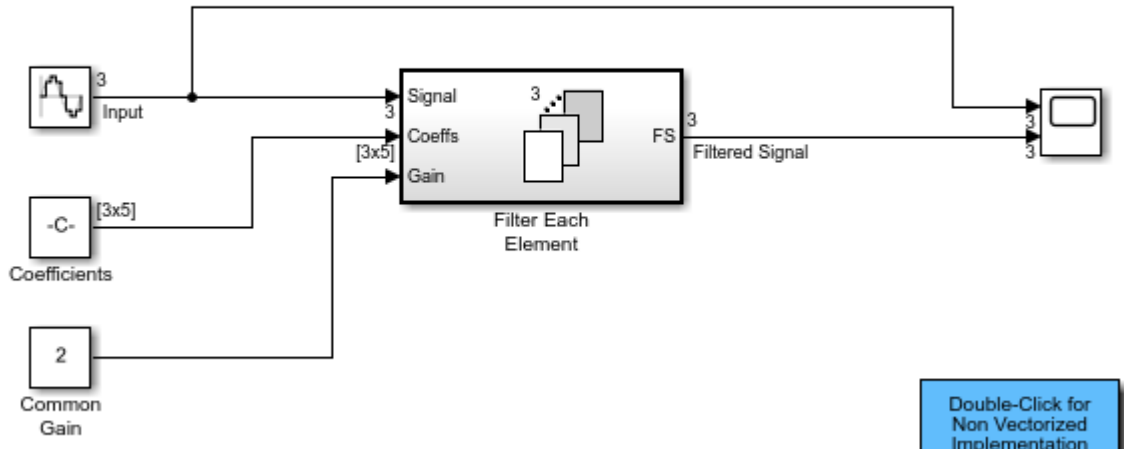

Since the output signal dimension is expected to match the input signal dimension, the concatenation dimension is set equal to the partition dimension. If you prefer to change the signal dimension (a transpose in this case), you can choose 2 as the concatenation dimension.

For the For Each Subsystem, you must set the partition dimension and width, but not the input signal size. A check then ensures that this size is a multiple of the partition width. If no error is detected, the subsystem then calculates the number of independent executions that the enclosed subsystem will perform. These executions are independent, in that, the state associated with a given contained block has a unique value in each of the respective executions.

To see a non-vectorized implementation for this model, double-click on the subsystem in the left corner of the model. This implementation does not use the For Each Subsystem. It mimics its functionality by replicating the subsystem as many times as necessary and also by selecting and concatenating the signals appropriately. This replication process is prone to error and is not scalable—changing the input signal size would require changing the model accordingly.

For Each Subsystem: Vectorizing a Scalar Algorithm

?

Copyright 2009-2015 The MathWorks, Inc.

Tiled Processing of 2D Signals with For Each Subsystem

This example shows how to use the For Each Subsystem. In this example the operations are performed on matrices.

Open the example model `sldemo_foreach_tiled`. This model contains a For Each Subsystem that processes submatrices of a matrix input signal.

To process submatrices of a matrix signal, you will need to use nested For Each Subsystems. The outer subsystem can be used to partition the signal along the first dimension, while the inner one can be used to partition along the second dimension. This order is arbitrary, and can be changed without affecting the result.

In this example a $[4 \times 4]$ matrix is to be partitioned into $[2 \times 2]$ submatrices. The outer subsystem partitions the signal along the first dimension. The resulting subarrays are then partitioned by the inner subsystem along the second dimension. Concatenation of the outputs respects the partitioning order to preserve the shape of the input signal. Note, however, that the output dimensions change since the processing of the submatrices results in scalar outputs.

To see a tile repetition implementation for this model, double-click on the subsystem in the left corner of the model window. This implementation does not use the For Each Subsystem. Instead, it mimics the functionality of the For Each Subsystem by replicating the subsystem as many times as necessary and by selecting and concatenating the signals appropriately. This replication process is prone to error and is not scalable- changing the input signal size would require changing the model accordingly.

Neighborhood Processing Using For Each Subsystems

This example shows how to use the For Each Subsystem block to process submatrices data when neighboring submatrices overlap each other. To demonstrate this data processing approach, the example implements the image edge detection with linear filters using the For Each Subsystem block. Each For Each Subsystem block has a For Each block that needs to be configured for partitioning and concatenation.

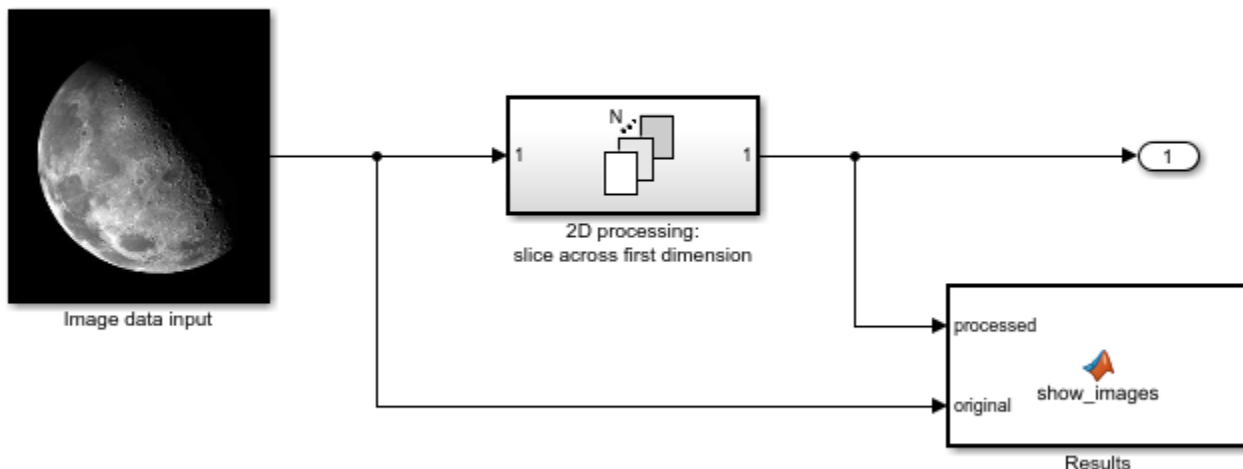

Open the example model `slxForEachOverlapExample`. This model uses a 3-by-3 kernel to implement the edge detection application for a given two-dimensional image. Because of the two-dimensional input signal, this example uses nested for each subsystems.

- The outer for each subsystem partitions the signal along the first dimension. The outer For Each block is configured to partition the input signal along dimension 1. The block specifies a partition width of 3 and a partition offset of -2. (A partition offset of -2 indicates that each slice overlaps its neighboring slices by 2 elements.)
- The inner for each subsystem partitions the signal along the second dimension. The inner For Each block has the same settings as the outer For Each block except that the inner block is set to partition and concatenate signals along dimension 2.

The partitioning order is arbitrary. To ensure correctness of the result, the concatenation order of the outputs follows the partitioning order.

For simplicity, this example does not handle data padding. As a result, the size of the output image is slightly smaller than the size of the input image.

Neighborhood Processing Using For Each Subsystems: Image Edge Detection

The result of the comparison between the original image and the processed image is shown below.

Figure 1: Original image vs. processed image

Using a Project with SVN

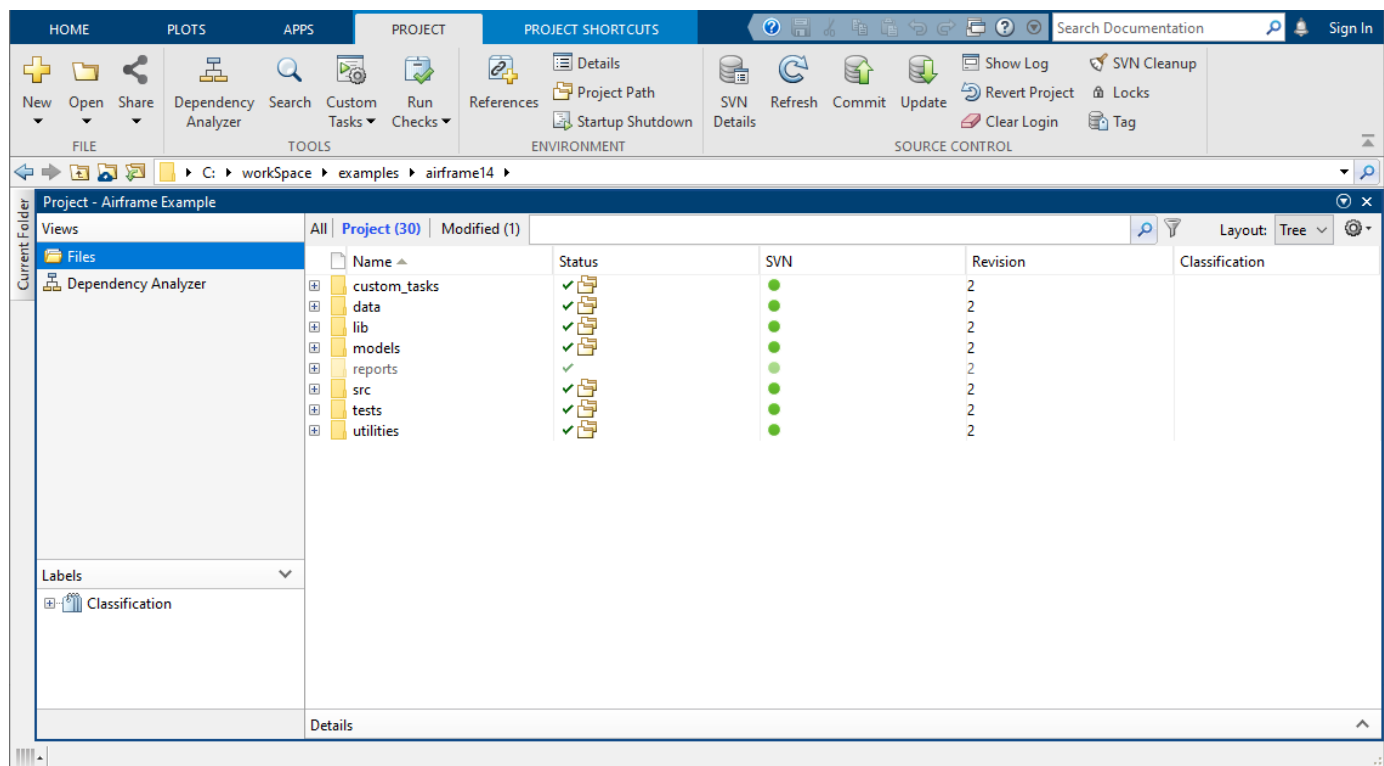

This example shows how to use a project to manage the files within your design. Starting with an existing project that is already uses source control, this example shows how to view modified files, compare file revisions, and analyze project dependencies.

Set Up the Example Files and Open the Project

Create and open a working copy of the project example files. MATLAB® copies the files to an example folder so that you can edit them. The example project is under Subversion (SVN) version control.

```
sldemo_slproject_airframe_svn
```

```
Building with 'MinGW64 Compiler (C)'.  
MEX completed successfully.
```

Manage the Project Path

When you open your project, MATLAB adds the project path to the MATLAB search path before applying startup shortcuts.

When you close your project, MATLAB removes the project path from the MATLAB search path after applying shutdown shortcuts.

- To add or remove folders to the the project path, on the **Project** tab, in the **Environment** section, click **Project Path**:

- To add a folder (without subfolders) to the project path, click **Add Folder**. If you want to add a folder and its subfolders, click **Add with Subfolders** instead. Then use the Open dialog box to add the new folder.
- To remove a folder from the project path, from the display list, select the folder. Then click **Remove**.

It is important to add project files to the project path to ensure the Dependency Analyzer detects all project files.

Specify Project Details, Startup Folder, and Derived Files Folders

2. On the **Project** tab, in the **Environment** section, click **Details**. Use the Project Details dialog box to:

- Edit the project name or add a description.
- View the **Project root** folder. You can change your project root by moving your entire project on your file system, and reopening your project in its new location. All project file paths are stored as relative paths.
- View or edit the **Start Up** folder. By default, this is set to the project root. When you open the project, the current working folder changes to the project root folder. You can specify a different startup folder or click **Clear**.
- View or edit the **Simulation cache folder** and **Code generation folder**.

To change the default project root for new projects, on the MATLAB **Home** tab, in the **Environment** section, click **Preferences**. Select **MATLAB > Project** and specify the **Default folder**.

Automate Startup and Shutdown Tasks

You can set project files, such as MATLAB scripts and Simulink® models, to run, open, or close when the project opens or closes.

3. To configure an existing file to run on project startup and shutdown, or to specify environment options, click the **Startup Shutdown** button in the **Project** tab. In the Manage Project Startup and Shutdown dialog box

- Add or remove startup and shutdown files. If execution order is important, change the order using the arrow buttons.
- Use the check boxes to specify environment options. Select **Start Simulink before this project starts** to start Simulink when you open the project. Select **Refresh Simulink customizations** to run `sl_customization` files on project startup and shutdown.

Project Shortcuts for Common Tasks

Create project shortcuts for common tasks to make it easy to find and access important files and operations. For example, find and open top models, run code, and simulate models.

4. On the **Project Shortcuts** tab, this example project has shortcuts for the top-level model, a utility function to rebuild s-functions, and a design description document.

- Click the shortcut *F14 Model* to open the root model for this project.
- Click the shortcut *Rebuild Project's S-functions* to generate the S-Function.
- Click the **New Shortcut** button to create new shortcuts for a project file.

- Right click a shortcut and select **Edit Shortcut** to edit a shortcut.

View Source Control Information

On the **Project** tab, in the **Source Control** section, click **SVN Details**.

5. Use the Source Control Information dialog box to:

- View the **Repository location** folder. You can change your project root by moving your entire project on your file system, and reopening your project in its new location. All project file paths are stored as relative paths.
- View or change the used source control integration.

Explore Files Views

6. In the **Files** view, select the **Project (number of files)** view to manage the files within your project. This view only shows files that are part of your project.

7. Use the **All** view to see all the files in your working copy. This shows all the files that are under the project root, not just the files that are in the project. This view is useful for adding files to your project from your working copy.

8. Use the **Modified (number of files)** view to review the modified files before committing your changes to source control. The modified files view is visible only if you are using source control with your project.

9. In any **Files** view, at the top right, change the layout from **Tree** to **List** to view the files as a list. Click the Organize View button  to customize the views and to sort files.

The **SVN** column provides source control information on individual files such as Unmodified, Added, Modified, or Deleted.

View Modified Files and Compare Revisions

10. Open and make a change to one of the models in the `models` folder or to one of the MATLAB files in the utility folder. For example, add a comment in `find_top_models.m` in the utility folder.

11. To review, analyze, and commit modified or added project files, use the **Modified (number of files)** view. You see:

- The file you made changes to, for example, `find_top_models.m`.
- The files stored in the `resources/project` folder. These are internal project definition files generated by your changes. The project definition files allow you to add metadata to files, for example, by creating shortcuts, adding labels, and adding a project description. Project definition files also define the files that are added to your project. You can review changes in revisions of project definition files like any other project files.

12. To review changes in a modified file, right-click selected file, for example, `find_top_models.m`

- Select **Compare > Compare to Ancestor** to run a comparison against the local Git repository.
- Select **Compare > Compare to Revision** to compare the file to other revisions.

13. The Comparison Tool summarizes results in a report. Purple indicates modified items, blue indicates inserted items, and yellow indicates deleted items. To save a printable version of the report, select **Publish > HTML**, **Word**, or **PDF**.

14. If you are happy with your changes, on the **Project** tab, click the **Commit** button to commit your changes to source control.

Analyze Project Dependencies

15. Use the Dependency Analyzer to investigate dependencies visually and explore the structure of your project. On the **Project** tab, in the **Tools** section, click **Dependency Analyzer**.

The Dependency Analyzer summarizes the results in the pane on the right. It lists the names of the used **Products** and **External Toolboxes**. It detects problems, such as missing files, files not in the project, unsaved changes, and out-of-date derived files. In this example, the analyzer identifies a "Not in project" file and tags it with a warning sign .

16. To highlight problem files, in the **Problems** section, point to the problem message and click the magnifying glass. In this example, the `timesthree.mexw64` file is required by the project but is not currently part of it. Right-click `timesthree.mexw64` and select **Add to Project** or **Hide Warnings**. The next time you run the dependency analysis, the analyzer will not mark this file as a problem.

17. Perform an impact analysis on a selected file.

An impact analysis shows you how a change affects other files before you make the change. For example, to find required files for `timesthree.mexw64` to run properly, right `timesthree.mexw64` and select **Find Required**. To find how changes to `timesthree.mexw64` impact files, right `timesthree.mexw64` and select **Find Impacted**.

Related Examples

Using a Project with Git

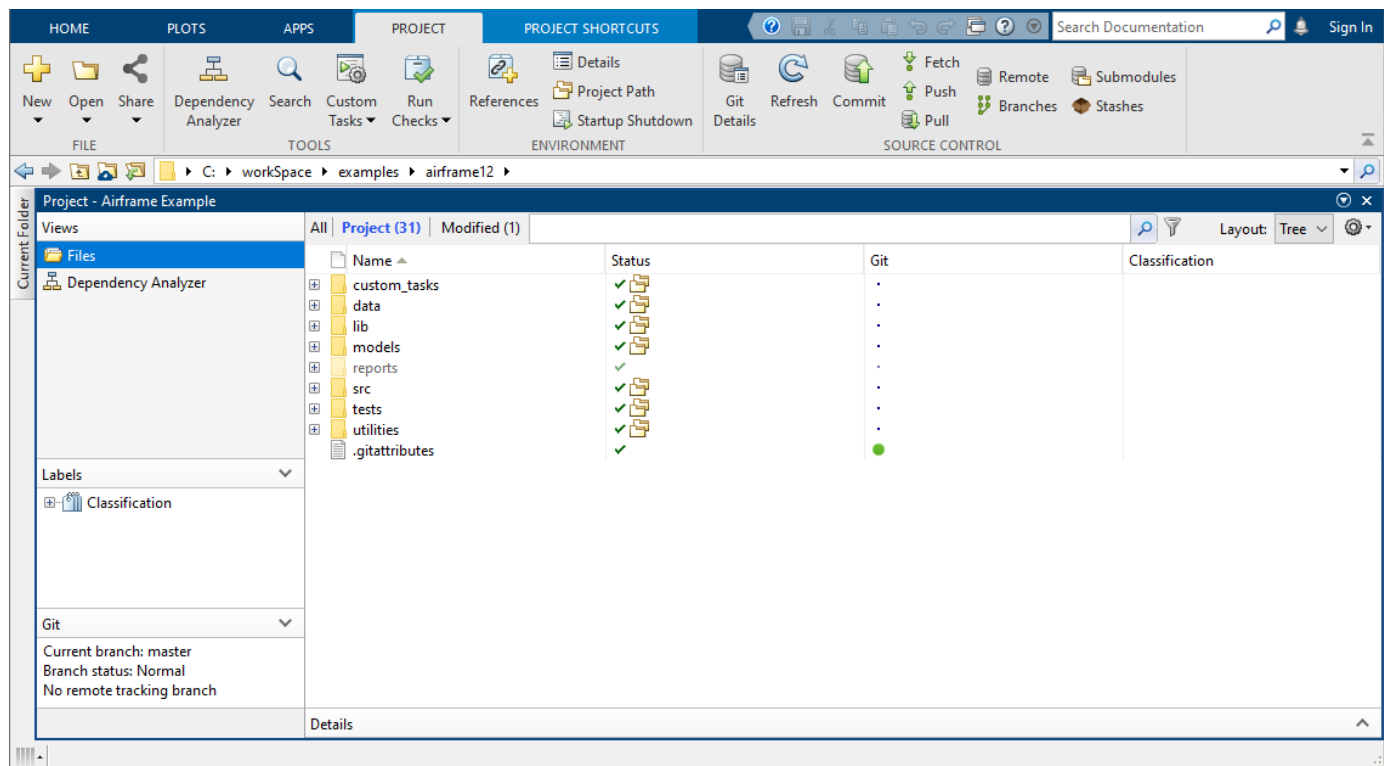

This example shows how to use a project to manage the files within your design. Starting with an existing project that is already checked into source control, this example shows how to view modified files, compare file revisions, and analyze project dependencies.

Set up the Example Files and Open the Project

Create and open a working copy of the project example files. MATLAB® copies the files to an example folder so that you can edit them. The example project is under Git™ source control.

```
sldemo_slproject_airframe
```

```
Starting: Simulink
Building with 'MinGW64 Compiler (C)'.
MEX completed successfully.
```

Manage the Project Path

When you open your project, MATLAB adds the project path to the MATLAB search path before applying startup shortcuts.

When you close your project, MATLAB removes the project path from the MATLAB search path after applying shutdown shortcuts.

1. To add or remove folders to the the project path, on the **Project** tab, in the **Environment** section, click **Project Path**:

- To add a folder (without subfolders) to the project path, click **Add Folder**. If you want to add a folder and its subfolders, click **Add with Subfolders** instead. Then use the Open dialog box to add the new folder.
- To remove a folder from the project path, from the display list, select the folder. Then click **Remove**.

It is important to add project files to the project path to ensure the Dependency Analyzer detects all project files.

Specify Project Details, Startup Folder, and Derived Files Folders

2. On the **Project** tab, in the **Environment** section, click **Details**. Use the Project Details dialog box to:

- Edit the project name or add a description.
- View the **Project root** folder. You can change your project root by moving your entire project on your file system, and reopening your project in its new location. All project file paths are stored as relative paths.
- View or edit the **Start Up** folder. By default, this is set to the project root. When you open the project, the current working folder changes to the project root folder. You can specify a different startup folder or click **Clear**.
- View or edit the **Simulation cache folder** and **Code generation folder**.

To change the default project root for new projects, on the MATLAB **Home** tab, in the **Environment** section, click **Preferences**. Select **MATLAB > Project** and specify the **Default folder**.

Automate Startup and Shutdown Tasks

You can set project files, such as MATLAB scripts and Simulink® models, to run, open, or close when the project opens or closes.

3. To configure an existing file to run on project startup and shutdown, or to specify environment options, click the **Startup Shutdown** button in the **Project** tab. In the Manage Project Startup and Shutdown dialog box

- Add or remove startup and shutdown files. If execution order is important, change the order using the arrow buttons.
- Use the check boxes to specify environment options. Select **Start Simulink before this project starts** to start Simulink when you open the project. Select **Refresh Simulink customizations** to run `sl_customization` files on project startup and shutdown.

Project Shortcuts for Common Tasks

Create project shortcuts for common tasks to make it easy to find and access important files and operations. For example, find and open top models, run code, and simulate models.

4. On the **Project Shortcuts** tab, this example project has shortcuts for the top-level model, a utility function to rebuild s-functions, and a design description document.

- Click the shortcut *F14 Model* to open the root model for this project.
- Click the shortcut *Rebuild Project's S-functions* to generate the S-Function.
- Click the **New Shortcut** button to create new shortcuts for a project file.

- Right click a shortcut and select **Edit Shortcut** to edit a shortcut.

View Source Control Information

On the **Project** tab, in the **Source Control** section, click **Git Details**.

5. Use the Source Control Information dialog box to:

- View the **Repository location** folder. You can change your project root by moving your entire project on your file system, and reopening your project in its new location. All project file paths are stored as relative paths.
- View or change the used source control integration.

Explore Files Views

6. In the **Files** view, select the **Project (number of files)** view to manage the files within your project. This view only shows files that are part of your project.

7. Use the **All** view to see all the files in your working copy. This shows all the files that are under the project root, not just the files that are in the project. This view is useful for adding files to your project from your working copy.

8. Use the **Modified (number of files)** view to review the modified files before committing your changes to source control. The modified files view is visible only if you are using source control with your project.

9. In any **Files** view, at the top right, change the layout from **Tree** to **List** to view the files as a list. Click the Organize View button  to customize the views and to sort files.

The **Git** column provides source control information on individual files such as Unmodified, Added, Modified, or Deleted.

View Modified Files and Compare Revisions

10. Open and make a change to one of the models in the `models` folder or to one of the MATLAB files in the utility folder. For example, add a comment in `find_top_models.m` in the utility folder.

11. To review, analyze, and commit modified or added project files, use the **Modified (number of files)** view. You see:

- The file you made changes to, for example, `find_top_models.m`.
- The files stored in the `resources/project` folder. These are internal project definition files generated by your changes. The project definition files allow you to add metadata to files, for example, by creating shortcuts, adding labels, and adding a project description. Project definition files also define the files that are added to your project. You can review changes in revisions of project definition files like any other project files.

12. To review changes in a modified file, right-click selected file, for example, `find_top_models.m`

- Select **Compare > Compare to Ancestor** to run a comparison against the local Git repository.
- Select **Compare > Compare to Revision** to compare the file to other revisions.

13. The Comparison Tool summarizes results in a report. Purple indicates modified items, blue indicates inserted items, and yellow indicates deleted items. To save a printable version of the report, select **Publish > HTML, Word, or PDF**.

14. If you are happy with your changes, on the **Project** tab, click the **Commit** button to commit your changes to source control.

Analyze Project Dependencies

15. Use the Dependency Analyzer to investigate dependencies visually and explore the structure of your project. On the **Project** tab, in the **Tools** section, click **Dependency Analyzer**.

The Dependency Analyzer summarizes the results in the pane on the right. It lists the names of the used **Products** and **External Toolboxes**. It detects problems, such as missing files, files not in the project, unsaved changes, and out-of-date derived files. In this example, the analyzer identifies a "Not in project" file and tags it with a warning sign .

16. To highlight problem files, in the **Problems** section, point to the problem message and click the magnifying glass. In this example, the `timesthree.mexw64` file is required by the project but is not currently part of it. Right-click `timesthree.mexw64` and select **Add to Project** or **Hide Warnings**. The next time you run the dependency analysis, the analyzer will not mark this file as a problem.

17. Perform an impact analysis on a selected file.

An impact analysis shows you how a change affects other files before you make the change. For example, to find required files for `timesthree.mexw64` to run properly, right `timesthree.mexw64` and select **Find Required**. To find how changes to `timesthree.mexw64` impact files, right `timesthree.mexw64` and select **Find Impacted**.

Further Information

"Project Management"

Using a Project

This example shows how to use an existing project to manage the files within your design. It shows how to automate startup and shutdown tasks, add shortcuts for common tasks, run checks, upgrade project files, analyze project dependencies, and share your project.

As a design grows, managing referenced files and dependencies becomes more complicated. Projects help you organize large hierarchies by finding required files, managing and sharing files and settings, and interacting with source control.

This project example is not under source control. As a result, essential tools needed in a collaborative environment are not available for use, for example, comparing files to their ancestors, comparing revisions and resolving conflicts.

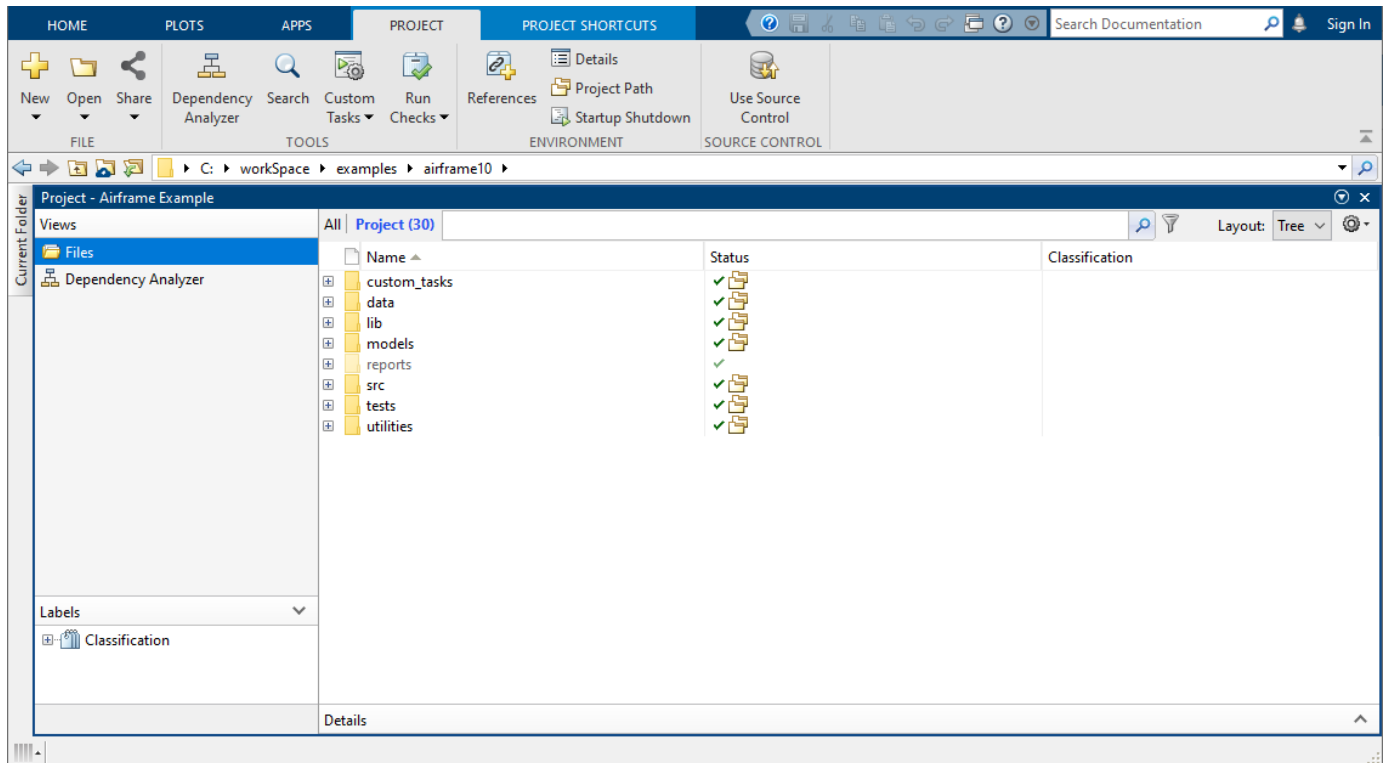

- To use available source control integration in MATLAB® such as Git™ and SVN, see “Using a Project with Git” on page 14-505 or “Using a Project with SVN” on page 14-501 example instead.
- To use an external source control with project, put the project folder under the source control of choice and customize it to use the MATLAB® Comparison Tool for diff and merge. For more information, see “Customize External Source Control to Use MATLAB for Diff and Merge” (MATLAB).

Set up the Example Files and Open the Project

Create and open a working copy of the project example files. MATLAB® copies the files to an example folder so that you can edit them.

```
Simulink.ModelManagement.Project.projectDemo('airframe');  
rebuild_s_functions('no_progress_dialog');
```

```
Building with 'MinGW64 Compiler (C)'.  
MEX completed successfully.
```

Manage the Project Path

When you open your project, MATLAB adds the project path to the MATLAB search path before applying startup shortcuts.

When you close your project, MATLAB removes the project path from the MATLAB search path after applying shutdown shortcuts.

1. To add or remove folders to the the project path, on the **Project** tab, in the **Environment** section, click **Project Path**:

- To add a folder (without subfolders) to the project path, click **Add Folder**. If you want to add a folder and its subfolders, click **Add with Subfolders** instead. Then use the Open dialog box to add the new folder.
- To remove a folder from the project path, from the display list, select the folder. Then click **Remove**.

It is important to add project files to the project path to ensure the Dependency Analyzer detects all project files.

Specify Project Details, Startup Folder, and Derived Files Folders

2. On the **Project** tab, in the **Environment** section, click **Details**. Use the Project Details dialog box to:

- Edit the project name or add a description.
- View the **Project root** folder. You can change your project root by moving your entire project on your file system, and reopening your project in its new location. All project file paths are stored as relative paths.

- View or edit the **Start Up** folder. By default, this is set to the project root. When you open the project, the current working folder changes to the project root folder. You can specify a different startup folder or click **Clear**.
- View or edit the **Simulation cache folder** and **Code generation folder**.

To change the default project root for new projects, on the MATLAB **Home** tab, in the **Environment** section, click **Preferences**. Select **MATLAB > Project** and specify the **Default folder**.

Automate Startup and Shutdown Tasks

You can set project files, such as MATLAB scripts and Simulink® models, to run, open, or close when the project opens or closes.

3. To configure an existing file to run on project startup and shutdown, or to specify environment options, click the **Startup Shutdown** button in the **Project** tab. In the Manage Project Startup and Shutdown dialog box

- Add or remove startup and shutdown files. If execution order is important, change the order using the arrow buttons.
- Use the check boxes to specify environment options. Select **Start Simulink before this project starts** to start Simulink when you open the project. Select **Refresh Simulink customizations** to run `sl_customization` files on project startup and shutdown.

Project Shortcuts for Common Tasks

Create project shortcuts for common tasks to make it easy to find and access important files and operations. For example, find and open top models, run code, and simulate models.

4. On the **Project Shortcuts** tab, this example project has shortcuts for the top-level model, a utility function to rebuild s-functions, and a design description document.

- Click the shortcut *F14 Model* to open the root model for this project.
- Click the shortcut *Rebuild Project's S-functions* to generate the S-Function.
- Click the **New Shortcut** button to create new shortcuts for a project file.
- Right click a shortcut and select **Edit Shortcut** to edit a shortcut.

Explore Files Views

6. In the **Files** view, select the **Project (number of files)** view to manage the files within your project. This view only shows files that are part of your project.

7. Use the **All** view to see all the files in your working copy. This shows all the files that are under the project root, not just the files that are in the project. This view is useful for adding files to your project from your working copy.

8. In any **Files** view, at the top right, change the layout from **Tree** to **List** to view the files as a list. Click the Organize View button  to customize the views and to sort files.

Analyze Project Dependencies

9. Use the Dependency Analyzer to investigate dependencies visually and explore the structure of your project. On the **Project** tab, in the **Tools** section, click **Dependency Analyzer**.

The Dependency Analyzer summarizes the results in the pane on the right. It lists the names of the used **Products** and **External Toolboxes**. It detects problems, such as missing files, files not in the project, unsaved changes, and out-of-date derived files. In this example, the analyzer identifies a "Not in project" file and tags it with a warning sign .

10. To highlight problem files, in the **Problems** section, point to the problem message and click the magnifying glass. In this example, the `timesthree.mexw64` file is required by the project but is not part of it. Right-click `timesthree.mexw64` and select **Add to Project** or **Hide Warnings**. The next time you run the dependency analysis, the analyzer will not mark this file as a problem.

11. Perform an impact analysis on a selected file.

An impact analysis shows you how a change affects other files before you make the change. For example, to find required files for `timesthree.mexw64` to run properly, right `timesthree.mexw64` and select **Find Required**. To find how changes to `timesthree.mexw64` impact files, right `timesthree.mexw64` and select **Find Impacted**.

Run Checks and Upgrade Project Files

12. Upgrade all models, libraries, and MATLAB code files in your project to the latest release using a simple workflow. On the **Project** tab, select **Run Checks > Upgrade**.

To upgrade all files, run all checks, and apply fixes automatically where possible, click **Upgrade**. If you want to change the settings, use these options before clicking **Upgrade**:

- If you want to run upgrade checks but not apply fixes automatically where possible, clear the check box **Apply upgrades automatically**.
- If you want to change which files to upgrade and which checks to run, click **Change Options**. In the Upgrade Options dialog box, clear check boxes for models and checks you want to exclude from the upgrade.

The Upgrade Project tool apply all fixes automatically when possible, upgrade all model hierarchies in the project at once, and produce a report.

Share Project

Before sharing projects with other users, it is helpful to find required files or toolboxes using the Dependency Analyzer.

13. On the **Project** tab, select **Share** and explore the different sharing options.

You can share your project as an archive and send it by email. On the **Project** tab, select **Share > Archive**. You can export the whole project or just a part of it using **Export profile**. If you decide to exclude files from your project, use the Dependency Analyzer to examine the impact of excluding a file on the project. If you have referenced projects and want to export the referenced project files, then select the **Include referenced projects** check box.

You can also share your project and make it publicly available on GitHub®. This adds Git source control to the open project.

Further Information

“Project Management”

Perform Impact Analysis with a Project

This example shows how to perform file-level impact analysis using the Dependency Analyzer. It shows how to visualize project structure, analyze project dependencies, find required toolboxes and products, identify and fix problems, and assess how a change will affect other project files.

You can run a dependency analysis at any point in your workflow. In a collaborative environment, you typically check dependencies

- when you first set up or explore a project
- when you run tests to validate changes to your design
- before you submit a version of your project to source control
- before you share or package your project

Set Up the Example Files and Open the Project

Create and open a working copy of the project example files. MATLAB® copies the files to an example folder so that you can edit them. The example project is under Git™ source control.

```
sldemo_slproject_airframe;
```

```
Building with 'MinGW64 Compiler (C)'.  
MEX completed successfully.
```

Visualize Project Structure and Dependencies

Run a dependency analysis on all the files in your project.

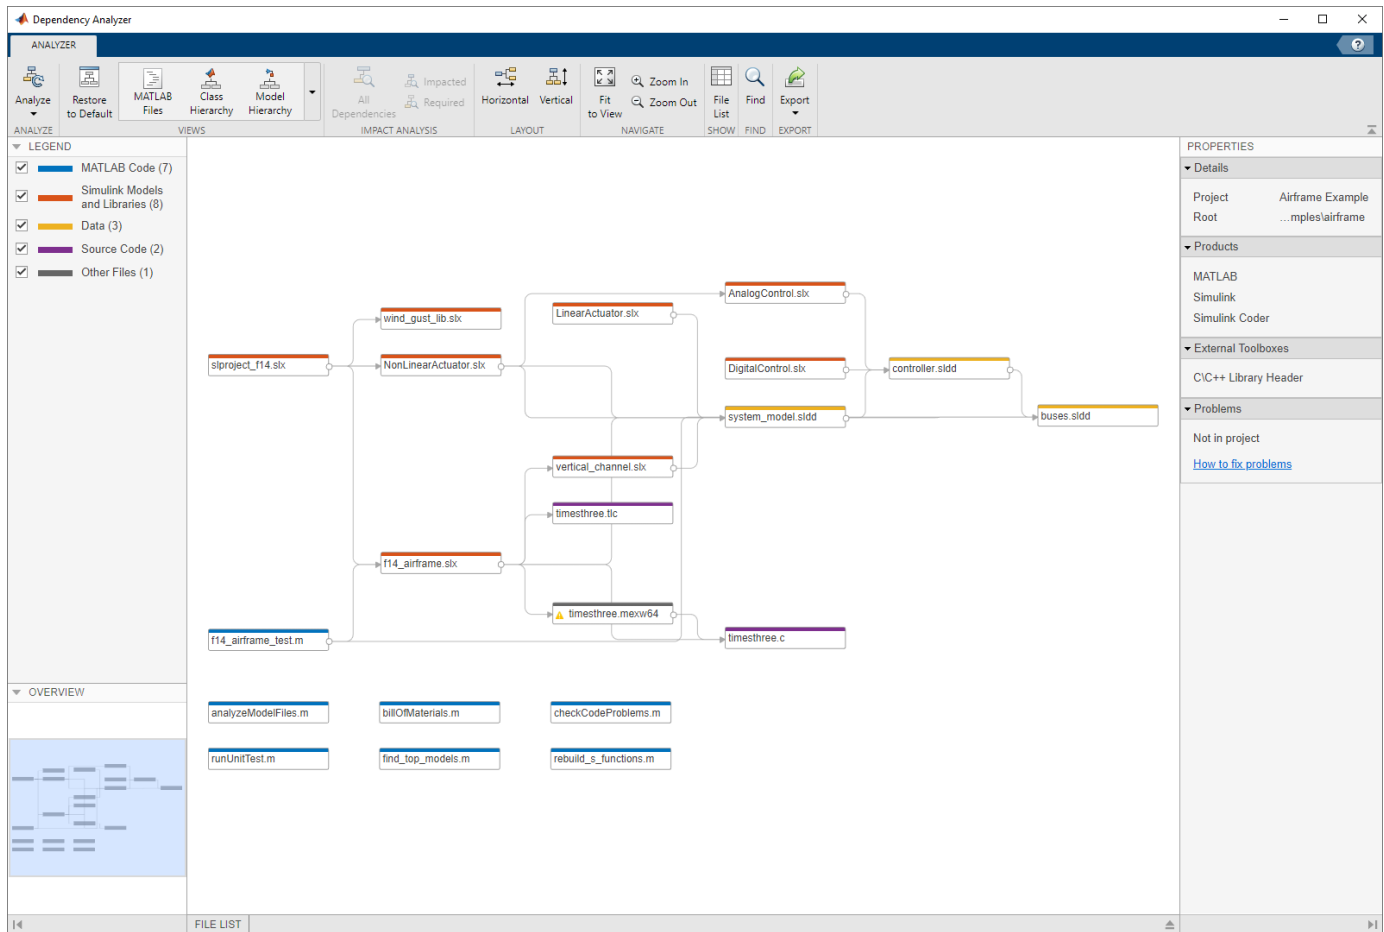

1. On the **Project** tab, click **Dependency Analyzer**.

The dependency graph shows:

- Your project structure and its file dependencies, including how files such as models, libraries, functions, data files, source files, and derived files relate to each other. Each item in the graph represents a file and each arrow represents a dependency
- Relationships between source and derived files (such as .m and .p files, .slx and .slxp, and .c and .mex files), and between C/C++ source and header files

When no file is selected, the **Properties** pane shows:

- The project details
- The required products and toolboxes for the entire project
- The list of problems for the entire project, such as missing files, files not in the project, files with unsaved changes, and out-of-date derived files

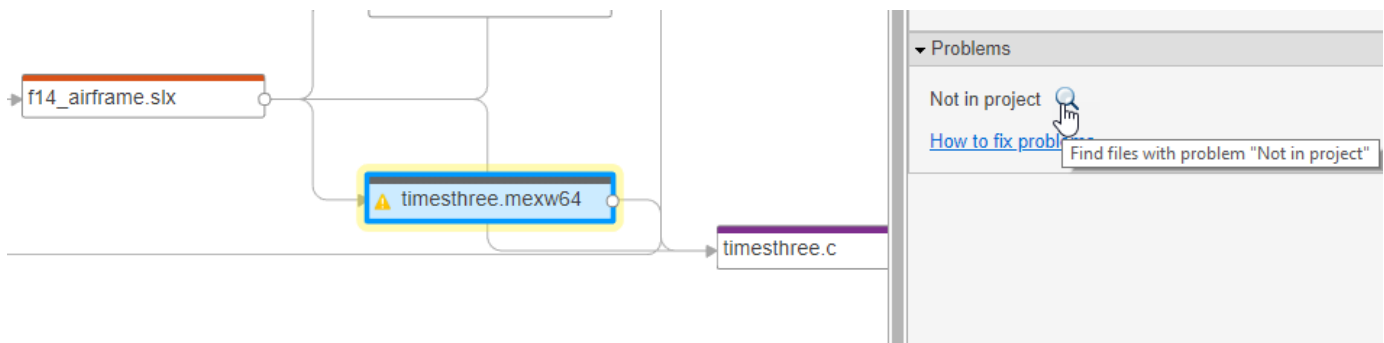

Investigate and Resolve Problems

The Dependency Analyzer identifies problems, such as missing files, files not in the project, unsaved changes, and out-of-date derived files. You can examine problem files using the dependency graph or the file list.

Use the graph to investigate problem files.

2. In the **Properties** pane, in the **Problems** section, point to **Not in project** and click the magnifying glass icon .

The graph highlights the files with this specific problem, in this example, `timesthree.mexw64`.

Take actions to resolve the problem file.

3. Right-click `timesthree.mexw64` and select **Add to Project**. To remove `timesthree.mexw64` from the problem list without adding it to the project, right-click and select **Hide Warnings**.

4. Click **Analyze** to update the graph and the **Problems** list.

Tip: For large projects, use the **File List** to investigate your project problem files. For more details, see “Investigate Problem Files in File List”.

View Modified Files

5. Open and make a change to one of the models, for example, `vertical_channel.slx`.

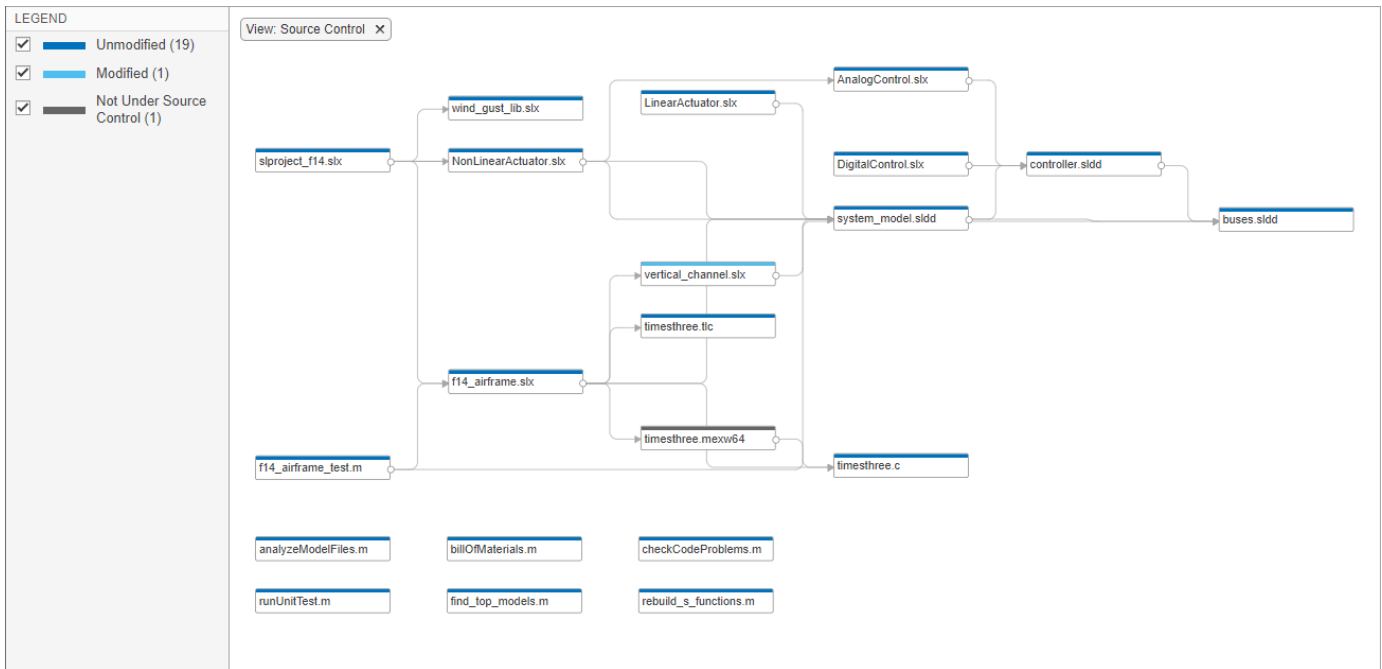

a. In the dependency graph, double-click `vertical_channel.slx` to open it.

b. Move a block in `vertical_channel.slx` and save the model.

Use the **Views** gallery to display the source control status of each file in the dependency graph.

6. In the Dependency Analyzer toolstrip, expand the **Views** gallery and click **Source Control**.

The color of each item in the graph now represents its source control status. Since you made a change to `vertical_channel.slx`, its source control status is **Modified**.

Find the Impact of the Change

You can use the **Impact Analysis** tools to find:

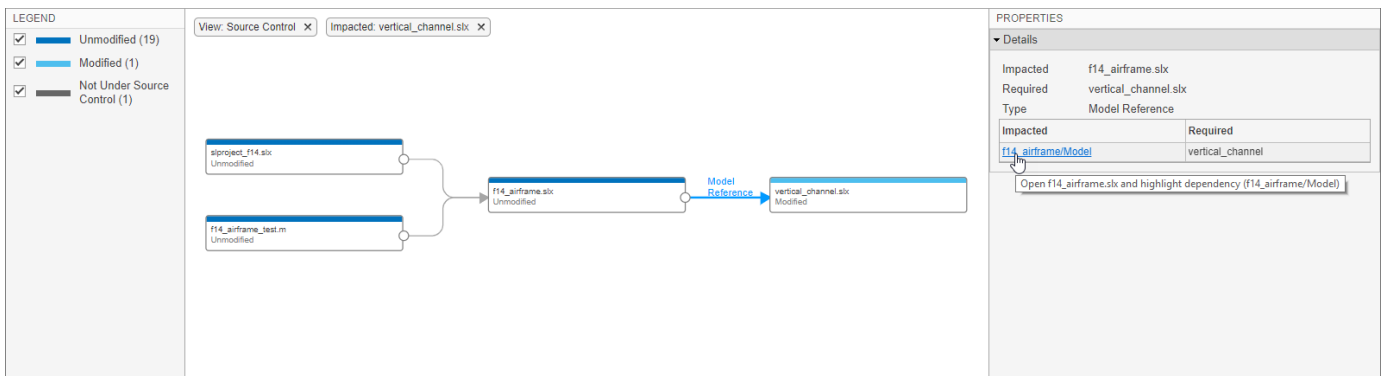

- the files impacted by a change to a file
- the files required by a file to run successfully

7. Use the **Impact Analysis** tools to assess the impact your change has on other files.

a. In the dependency graph, select the file you modified, for example, `vertical_channel.slx`.

b. In the **Impact Analysis** section, click **Impacted**.

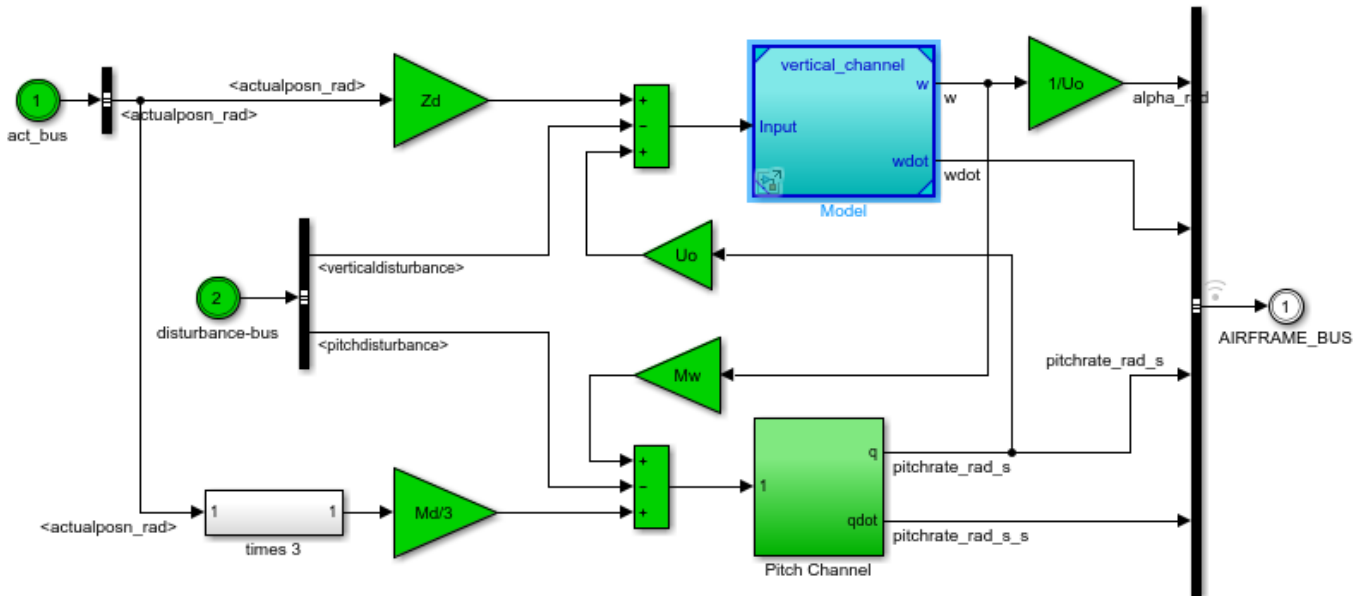

The dependency graph filters files and shows only those impacted by the changes you made to `vertical_channel.slx`.

8. Find where the dependency to `vertical_channel.slx` is introduced in `f14_airframe.slx`.

a. Select the dependency arrow linking `f14_airframe.slx` to `vertical_channel.slx`.

b. In the **Properties** pane, click the link under **Impacted**. Simulink® opens the model `f14_airframe.slx` and highlights the model block `vertical_channel`.

Copyright 1990-2018 The MathWorks, Inc.

Identify Tests to Run

Project automatically associates Classification labels to each project files. This includes **Design**, **Artifact**, **Convenience**, **Derived**, and **Test** labels. The **Test** label identifies which files are tests. You can create additional classification to label your files. See “Add Labels to Files”.

9. Determine which tests you need to run to validate the changes you made to `vertical_channel.slx`.

a. To display the Classification labels associated to each file in the dependency graph, expand the **Views** gallery and click **Classification**.

The dependency graph showing only files impacted by the changes you made to `vertical_channel.slx` is now colored by label Classifications.

b. Identify the tests affected by your change.

In the graph, there are two **Design** files and one **Test** file impacted by the changes you made to `vertical_channel.slx`. `f14_airframe_test.m` is the test you need to run to validate the design changes.

Tip: To clear all filters and restore the graph to show all analyzed dependencies in the project, click **Restore to Default**. Alternatively, manually remove all filters showing at the top of the graph.

Export Results and Run Tests

You can send files to other tools using the **Export** menu. MATLAB exports only the selected files in the current filtered view. If no files are selected, MATLAB exports all files in the current filtered view.

10. Run the selected test to validate the design changes.

a. Select the test you want to run, in this example, `f14_airframe_test.m`.

b. In the Dependency Analyzer toolstrip, in the **Export** section, select **Export > Send to Custom Task**.

In the Custom Task dialog box, the test file `f14_airframe_test.m` exported from the impact analysis is already selected.

c. In the Custom Task dialog box, in the **Custom task** field, select **Run Unit Tests** and Click **Run Task**.

The **Run Unit Tests** custom task runs the MATLAB unit test you selected and creates a summary report. Examine the **Results** section after selecting the test you run, in this example `f14_airframe_test.m`.

- To save the selected file paths to a variable, select **Export > Export to Workspace**.
- To switch to the project **Files** view with the files selected, select the **Export > Show in project Files View**.

Referencing Projects from Another Project

This example shows how to use referenced projects as independent components within your project.

Setting Up the Example Files and Opening the Project

Create and open a working copy of the project example files. MATLAB® copies the files to an example folder so that you can edit them. The example project is under Subversion (SVN) version control.

```
sldemo_slproject_airframe_references;
```

How Referenced Projects Work

When the parent project is loaded, the referenced projects are loaded first, to add project paths from the referenced project to the MATLAB search path, and to run startup shortcuts from the referenced projects.

- You can run the shortcuts in referenced projects from the parent project, using the Project Shortcuts tab.
- You can examine and open referenced projects by clicking the References node in the Views pane.

Example Referenced Projects

This project provides an airframe simulation which brings in functionality from these other projects by referencing them:

- Signal Multiplier: This referenced project shows how to develop an S-function as an independent project. The referenced project provides source code, build support and path management. The build directory is on the project path, so it is also on the path for the parent project. You can run the "rebuild s-function" shortcut from the parent project on the Project Shortcuts tab.
- Wind Gust library: This referenced project provides a library and a data dictionary that contains the required bus objects for the library. This project's path ensures that the library is set up for use in the parent project.

Further Information

"Componentization of Large Projects"

Automate Label Management in a Project

This example shows how to use the project functions to manage labels.

Open the Airframe Example Project

Create and open a working copy of the project example files. MATLAB® copies the files to an example folder so that you can edit them.

```
sldemo_slproject_airframe;
```

```
Starting: Simulink  
Building with 'MinGW64 Compiler (C)'.  
MEX completed successfully.
```

Get a Project Object.

Create a project object to manipulate the currently open project at the command line.

```
project = currentProject;
```

View the Labels of a File

Examine the files in the project.

```
files = project.Files;  
disp(files);
```

```
1×31 ProjectFile array with properties:
```

```
Path  
Labels  
Revision  
SourceControlStatus
```

Use indexing to access files in this list. For example, get file number 10. Each file has two properties describing its path and attached labels.

```
aFile = files(10);  
disp(aFile);
```

```
ProjectFile with properties:
```

```
Path: "C:\workSpace\examples\airframe2\data\system_model.sldd"  
Labels: [1×1 matlab.project.Label]  
Revision: "57973f5e87ca65215ab688e3544287e07db794c4"  
SourceControlStatus: Unmodified
```

Find information about a file attached labels by indexing into the file object Labels property. The following command gets the first label attached to this particular file.

```
label = aFile.Labels(1);  
disp(label);
```

```
Label with properties:
```

```
File: "C:\workSpace\examples\airframe2\data\system_model.sldd"  
DataType: 'none'
```

```
Data: []
Name: "Design"
CategoryName: "Classification"
```

Attach a Label to a Subset of Files.

The following code attaches the label **Design** in the **Classification** category to all files in the project with the .m file extension.

First get the list of files:

```
files = project.Files;
```

Then loop through each file and attach the label **Design** from the **Classification** category if the file has the extension .m.

```
for fileIdx = 1:numel(files)
    file = files(fileIdx);
    [~, ~, fileExtension] = fileparts(file.Path);
    if strcmp(fileExtension, '.m')
        addLabel(file, 'Classification', 'Design');
    end
end
```

Find a Named Label

You can set and query data on a label that is attached to a file. To do this, you first need to find the file object. You can do this by looping through all files in the project, as shown in the previous step. Alternatively, you can use the `findFile` function on the project.

The following code finds the file object for the file 'utilities/rebuild_s_functions.m'.

```
pathToLocate = fullfile('utilities', 'rebuild_s_functions.m');
file = findFile(project, pathToLocate);
```

Examine the `Labels` property to get an array of Label objects, one for each label attached to the file.

```
labels = file.Labels;
disp(labels);
```

Label with properties:

```
File: "C:\workSpace\examples\airframe2\utilities\rebuild_s_functions.m"
DataType: 'none'
Data: []
Name: "Design"
CategoryName: "Classification"
```

To find a label by name, use `findLabel` on the file object.

```
label = findLabel(file, 'Classification', 'Design');
disp(label);
```

Label with properties:

```
File: "C:\workSpace\examples\airframe2\utilities\rebuild_s_functions.m"
DataType: 'none'
Data: []
```

```
Name: "Design"  
CategoryName: "Classification"
```

Create a New Category

You must create new labels before you can attach them to a file. You define labels in categories, giving each category a name and supported data type.

The following code creates a category of labels called Engineers which can be used to denote file ownership in a project. These labels have the char datatype for attaching String data.

```
createCategory(project, 'Engineers', 'char');  
engineersCategory = findCategory(project, 'Engineers');  
createLabel(engineersCategory, 'Sam');  
createLabel(engineersCategory, 'Pat');  
createLabel(engineersCategory, 'Alex');
```

You can now attach an Sam label from the 'Engineers' category to a file in the project.

```
addLabel(file, 'Engineers', 'Sam');  
label = findLabel(file, 'Engineers', 'Sam');
```

Set Label Data

The following command sets the data for the attached label.

```
label.Data = 'Maintenance responsibility';  
disp(label)
```

Label with properties:

```
File: "C:\workSpace\examples\airframe2\utilities\rebuild_s_functions.m"  
DataType: 'char'  
Data: 'Maintenance responsibility'  
Name: "Sam"  
CategoryName: "Engineers"
```

Further Information

“Project Management”

Running Custom Tasks with a Project

This example shows how to apply a custom task to a set of files managed by project. The example custom task analyzes the Simulink models which are in the project, reporting the number of blocks in each model.

Setting Up the Example Files and Opening Project

1. Run the following commands to create and open a working copy of the "sldemo_slproject_airframe" example.

```
sldemo_slproject_airframe;  
  
Building with 'MinGW64 Compiler (C)'.  
MEX completed successfully.
```

The project example copies files to a new folder so that you can edit them and put them under local version control.

Select a Custom Task

2. Click the Custom Task button in the Tools section of the project toolbar tab.

You define a custom task with a MATLAB® function. The example Airframe project contains example custom tasks in the custom_tasks folder.

3. The "Custom Task" menu lists available custom tasks.

To view, edit, and create custom tasks, click Custom Tasks > Manage Custom Tasks in the Tools section of the Project toolbar tab.

4. Select the 'Analyze Model Files' custom task.

The function name of your selected custom task appears in the "Custom task" edit box. The example analyzeModelFiles adds a label from the category "Metrics" to each model file in the project. Labels in this category have numerical data. The custom task will count the number of blocks in each model and attach this number to the label.

Select Files to Include in the Custom Task

5. In the Custom Task dialog box, verify that all model files have selected check boxes in the Include column.

Running a Custom Task

6. Click the Run Task button on the bottom right of the Custom Task dialog box.

The results for a selected file are also shown in the Results pane at the bottom of the dialog box. This can be useful when the results returned are long, or contain HTML markup.

The following example shows the dialog box after running the custom task on some models. You can customize the columns to show with the "cog" icon Actions button at the top right.

The screenshot shows the 'Custom Task Report - analyzeModelFiles' window. The task is 'analyzeModelFiles', it has run on 23 files, and was completed on 13/08/2019 at 08:23. The report table lists the following files and their results:

Name	Path	Results
controller.sldd	\$\data	
DigitalControl.slx	\$\models	Block Count: 47
f14_airframe.slx	\$\models	Block Count: 28
f14_airframe_test.m	\$\tests	
find_top_models.m	\$\utilities	
LinearActuator.slx	\$\models	Block Count: 8
NonLinearActuator.slx	\$\models	Block Count: 9
readme.txt	\$\lib	
rebuild_s_functions.m	\$\utilities	
runUnitTest.m	\$\custom_tasks	
slproject_f14.pdf	\$\reports	
slproject_f14.slx	\$\models	Block Count: 39

Below the table, the results for 'DigitalControl.slx' are shown: Block Count: 47. The window includes 'Publish Report' and 'Close' buttons. At the bottom of the main window, the custom task is set to 'analyzeModelFiles' with a 'Browse...' button. A status bar at the bottom indicates '15 files are included but not shown in the current view' and has a 'Run Task' button.

Editing an Existing Custom Task

Custom Tasks are MATLAB functions. Edit your custom task with the MATLAB editor. In the following steps, you modify the custom task to use the project API to add a label with data, as well as saving any dirty model files.

7. Run the following MATLAB code to create a Metrics category and a Block Count label in the project.

```
project = currentProject;
category = createCategory(project, 'Metrics', 'double');
```

8. Double-click analyzeModelFiles.m (or right-click and select Open) to edit it in the MATLAB editor.

9. Add the following lines just after the sprintf command:

```
[~, compileStats] = sldiagnostics(name, 'CompileStats');
addLabel(projectFile, 'Metrics', 'CPU Compile Time', sum([compileStats.Statistics.CPUTime]));
```

You can use the MATLAB editor to set breakpoints and debug a custom task function, just as with any other MATLAB function.

If you rerun the custom task, it adds the CPU Compile Time label to each model file that can be compiled, and attaches data to the label showing the total time for all compilation phases for the model. Models that cannot be compiled show "Failed to analyze file" in the Custom Task Report, and details display as a warning in the command window. Examine the custom task `analyzeModelFiles.m` to see how to handle errors.

To view the new metrics data, either show the Metrics column in the Custom Task Report, or look in the project files view.

Creating a New Custom Task

Create a new custom task by creating a new MATLAB function. Your custom tasks must:

- Be saved on the MATLAB path.
- Accept a single input argument: a full path to a file.
- Return a single output argument.

To create custom tasks, click Custom Tasks > Manage Custom Tasks in the Tools section of the project toolstrip tab. In the Manage Custom Tasks dialog box, click Add to open a new file with instructions that guide you to create a custom task with the correct function signature.

10. Click "Add" and select the "Add Using New Script" menu item.

A file dialog opens asking you to choose where to create the new custom task. The custom task must be saved on the MATLAB path to run.

11. Provide a file name and save the file in the 'custom_tasks' folder within the project.

The MATLAB editor opens the file pre-populated with a simple example custom task.

12. To create your new custom task, edit the contents of the example custom task function and save.

"Project Management"

Upgrade Simulink Models Using a Project

Easily upgrade all the models in your project using the Upgrade Project tool in a project.

Setting Up the Example Files and Opening the Project

Run the following commands to create and open a working copy of the project files.

```
sldemo_slproject_airframe;
```

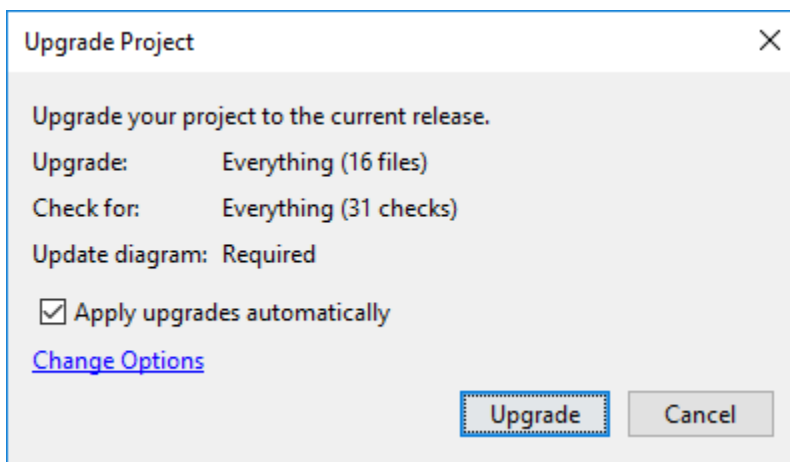

```
Building with 'MinGW64 Compiler (C)'.  
MEX completed successfully.
```

The project example copies files to a new folder so that you can edit them and use them under Git version control. Placing your files under version control lets you compare the upgraded model files with the original versions.

Automatically Upgrade All Project Models and MATLAB Code at Once

Upgrade all models and MATLAB code in your project to the latest release using a simple workflow. The Upgrade Project tool can apply fixes automatically when possible, upgrade all model hierarchies in the project at once, and produce a report.

In the Project tab click Run Checks > Upgrade.

This loads the upgrade advisor checks and runs a dependency analysis on your project to ensure the project hierarchy is handled correctly.

Click Upgrade to run all upgrade checks on all models, libraries and MATLAB code in your project. If any check fails and there is a fix available, the project automatically applies the fix and runs the relevant checks again to ensure they now pass.

Inspect the results of the upgrade in the report.

Upgrade Project Report

“Upgrade All Project Models, Libraries, and MATLAB Code Files”

Convert from MDL to SLX in a Project and Preserve Revision History

Project Tools for Migrating Model Files to SLX

A project helps you upgrade model files from MDL format to SLX format. The default file format for Simulink® models in R2012b and subsequent releases is SLX. You can use the project integrity checks to automatically add the new SLX file to your project, remove the MDL file from the project, and preserve the revision history of your MDL file with the new SLX file. You can then commit your changes to source control and maintain the continuity of your model file history.

Open the Airframe Example Project

Create and open a working copy of the airframe project using Git™ source control.

```
Simulink.ModelManagement.Project.projectDemo('airframeConvertToSlx', 'git');
```

```
Starting: Simulink
```

```
rebuild_s_functions('no_progress_dialog');
```

```
Building with 'MinGW64 Compiler (C)'.  
MEX completed successfully.
```

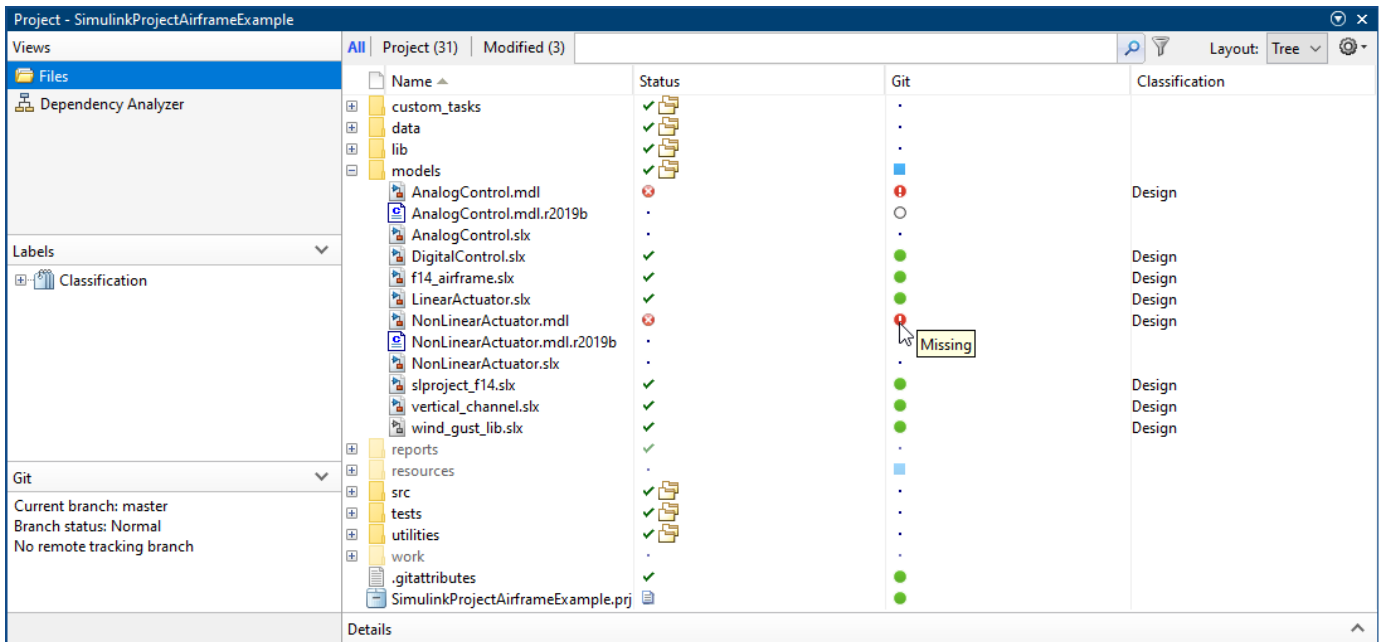

Find All MDL Files in the Project and Convert to SLX

In the models folder, check if this project contains models saved in MDL format.

To find all the MDL files in this project and resave them as SLX files, use the project API:

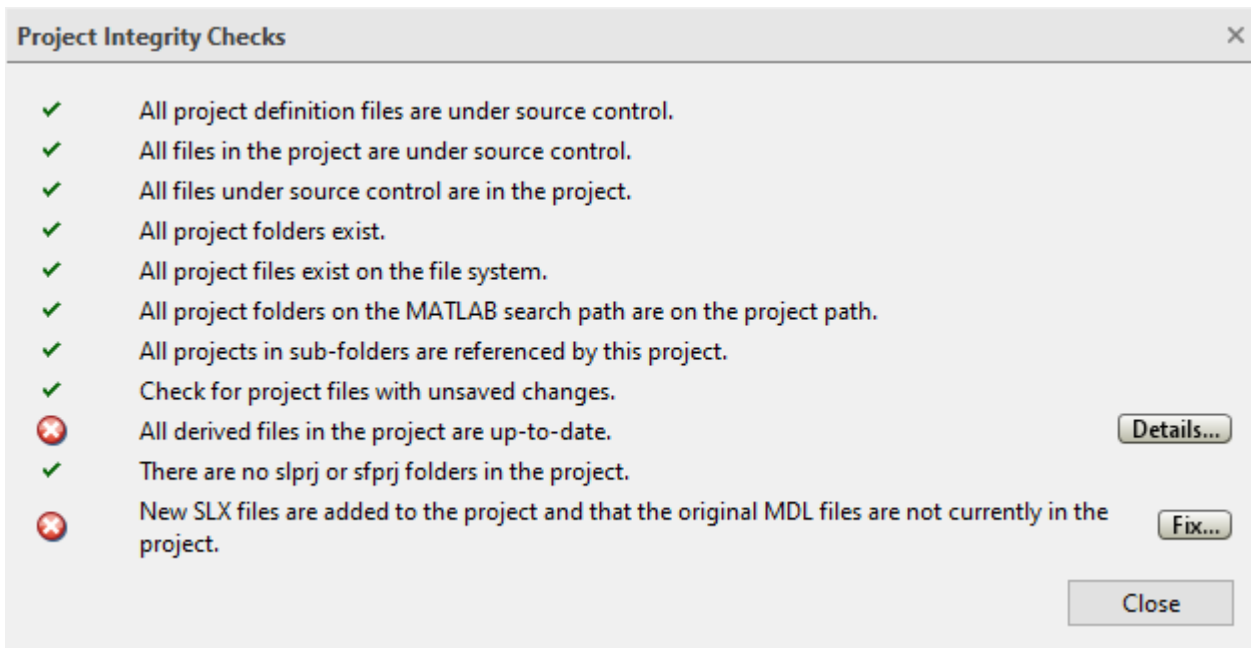

```
project = currentProject;
allProjectFiles = project.Files;
for fileIndex = 1:numel(allProjectFiles)
    projectFile = allProjectFiles(fileIndex);
    [folder, name, ext] = fileparts(projectFile.Path);
    if strcmp(ext, '.mdl')
        % This is a MDL file. Load it and then save as an SLX file.
        mdlModel = fullfile(folder, [name + ext]);
        slxModel = fullfile(folder, [name + '.slx']);
        load_system(mdlModel);
        % Save a new copy of this file in SLX format:
        save_system(name, slxModel);
        close_system(name,0);
    end
end
```

To see the results, in the **Files** view, change the view from **Project (number of files)** to **All**. Expand the models folder. Simulink® saves the model in SLX format and creates a backup file by renaming the MDL file to filename.mdl.releasename, for example, AnalogControl.mdl.r2019b. The project also reports the original name of the MDL file as missing.

Run the Project Checks

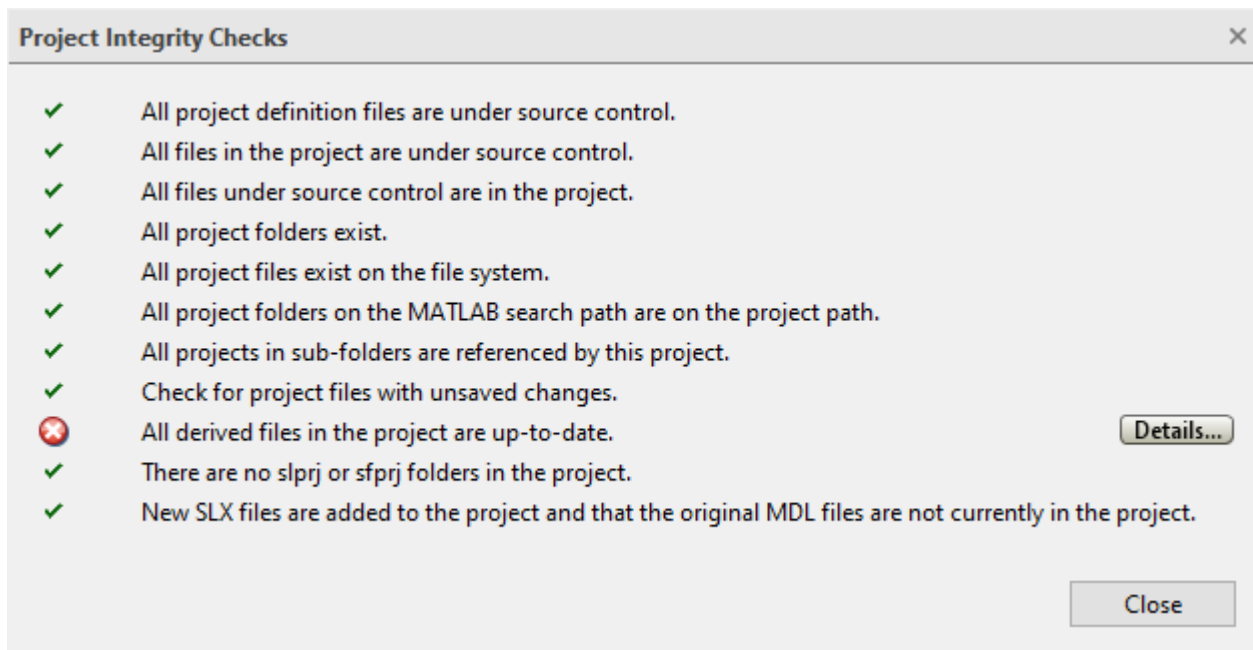

To resolve these issues, on the Project tab, click **Run Checks** > **Check Project** to run the project integrity checks. The checks look for MDL files converted to SLX and offer automatic fixes if that check fails. Click the **Fix** button to view recommended actions and decide whether to make the changes.

The Missing Files dialog box offers to remove the missing MDL file from the project and add the new SLX file to the project.

Project checks rerun after you click **Yes** to perform the fix. Close the Project Integrity Checks dialog box.

Verify Changes After Upgrade to SLX

Click the **Modified** files view of the project. Project checks added the newly created SLX files to the project and scheduled the original MDL files for removal.

Commit Changes and Verify Revision History

On the Project tab, in the Source Control section, click **Commit**. Enter a comment for your submission in the dialog box, for example, Convert to SLX, and click **Submit**. Right-click the new SLX model. Select **Source Control > Show Revisions**. In the File Revisions dialog box, verify that the previous revision is filename.mdl, for example, AnalogControl.mdl. The revision history of the previous model file is preserved with the new SLX file.

Further Information

“Project Management”

Export a Subset of a Project Using an Export Profile

This example shows how to export a release version of a project using an export profile. The example export profile streamlines the exported project by removing files from the project which are only useful for the development of the project, but are not necessary for running the project's top-level models.

Set Up the Example Files and Open the Project

1. Run the following commands to create and open a working copy of the airframe project.

```
sldemo_slproject_airframe;
```

```
Building with 'MinGW64 Compiler (C)'.  
MEX completed successfully.
```

The classification label set is used to define the purpose of each file in the project. This example project adds several new labels to the 'classification' label set: 'analysis', 'upgrade', and 'utility'. These labels are used to identify files which are used for custom analysis tasks, upgrading to the latest version and general purpose utility functions.

Some files in the project are useful for the development of the project, but do not need including in a release version of the project when it is exported. For this example, files labelled in the project with the labels 'analysis', 'test', 'upgrade' and 'artifact' do not need including in the release version of the project.

This example demonstrates how the export profile management feature can be used to exclude files from a project export based on the attached labels.

Open the Export Profile Manager Tool

To view the available export profiles for a project:

2. Click the "Share" button in the Project toolbar tab.
3. Select the menu item "Manage Export Profiles..."

The Manage Export Profiles dialog box will appear.

The left hand panel shows all of the defined export profiles. The airframe project defines one export profile called 'Release', which should be already be selected in the dialog box.

The export profile shows two panels. The first panels shows the labels which will cause a file to not be exported if attached to a file. The release profile has been defined such that any file which has the 'analysis', 'test', 'artifact', or 'upgrade' label attached will not be exported.

The second panel defines labels which will not be included in the exported project. Here the labels 'analysis' and 'upgrade' are removed because no files in the exported project will use them.

The export profile interface allows new profiles to be defined and existing profiles to be removed.

Using an Export Profile When Exporting a Project

To use an export profile:

4. Click the "Share" button in the Project toolbar tab.

5. Select the "Zip Archive".

6. In the project archive dialog, select the export profile to be applied. Select the 'Release' profile to use the profile that is defined by the airframe project.

7. Click the Archive button to export the project using the selected export profile.

Further Information

Create and Reference a Project Programmatically

This example shows how to programmatically create a new project and add it as a reference project in your main project. It covers how to create a project from the command line, add files and folders, set up the project path, define project shortcuts and create a reference to the new project in another project.

Set up the Example Files

1. Create a working copy of the Airframe Example project and open the project. MATLAB® copies the files to an examples folder so that you can edit them. Use `currentProject` to create a project object from the currently loaded project.

```
sldemo_slproject_airframe;
```

```
Starting: Simulink
Building with 'MinGW64 Compiler (C)'.
MEX completed successfully.
```

```
mainProject = currentProject
```

```
mainProject =
```

```
Project with properties:
```

```

                Name: "Airframe Example"
SourceControlIntegration: "Git"
    RepositoryLocation: "C:\workSpace\examples\repositories\airframe"
SourceControlMessages: ["Branch status: Normal" "No remote tracking branch" "Current
    ReadOnly: 0
    TopLevel: 1
    Dependencies: [1x1 digraph]
    Categories: [1x1 matlab.project.Category]
    Files: [1x31 matlab.project.ProjectFile]
    Shortcuts: [1x7 matlab.project.Shortcut]
    ProjectPath: [1x7 matlab.project.PathFolder]
    ProjectReferences: [1x0 matlab.project.ProjectReference]
    StartupFiles: [1x0 string]
    ShutdownFiles: [1x0 string]
    Description: "This is an example project. Use the "Project Shortcuts" toolstrip
    RootFolder: "C:\workSpace\examples\airframe"
    SimulinkCacheFolder: "C:\workSpace\examples\airframe\work\cache"
    ProjectStartupFolder: "C:\workSpace\examples\airframe"
    SimulinkCodeGenFolder: "C:\workSpace\examples\airframe\work\codegen"
```

The Airframe Example project is a top level project (`TopLevel: 1`) with no referenced projects (`ProjectReferences: [1x0]`).

Create New Project

2. Create a new project called Wind Gust Library. Airframe project will use Wind Gust Library through a project reference.

a. Create a blank project and set the project name.

```
windGustFolder = fullfile(mainProject.RootFolder, "refs", "Wind Gust Library");
windGust = matlab.project.createProject(windGustFolder);
windGust.Name = "Wind Gust Library";
```

b. Move the `wind_gust_lib.slx` from the main project to the new folder, and add it to the Wind Gust Library project. Then, remove the file from the Airframe Example project.

```
movefile("../..\models\wind_gust_lib.slx");
addFile(windGust, "wind_gust_lib.slx");

reload(mainProject);
removeFile(mainProject, "models\wind_gust_lib.slx");
```

c. Add the Wind Gust Library project root folder to the Wind Gust Library project path. This makes the files available when the Airframe Example project or any project that references the Wind Gust Library project is loaded.

```
reload(windGust);
addPath(windGust, windGust.RootFolder);
```

d. Create a Wind Gust Library project shortcut.

```
shortcut = addShortcut(windGust, "wind_gust_lib.slx");
shortcut.Group = "Top Level Model";
```

Add a Project Reference

3. Add the new Wind Gust Library project to the Airframe Example project as a project reference. This allows the Airframe Example project to view, edit, and run files in the Wind Gust Library project.

```
reload(mainProject);
addReference(mainProject, windGust)

ans =
    ProjectReference with properties:

        Project: [1x1 matlab.project.Project]
        File: "C:\workSpace\examples\airframe\refs\Wind Gust Library"
        StoredLocation: "refs/Wind Gust Library"
        Type: "Relative"
```

The main project Airframe Example references the Wind Gust Library stored in `../refs/Wind Gust Library`.

4. Use `ProjectReferences` method to query the Wind Gust Library project.

```
mainProject.ProjectReferences(1).Project

ans =
    Project with properties:

        Name: "Wind Gust Library"
        SourceControlIntegration: ""
        RepositoryLocation: ""
        SourceControlMessages: [1x0 string]
        ReadOnly: 1
        TopLevel: 0
        Dependencies: [1x1 digraph]
        Categories: [1x1 matlab.project.Category]
        Files: [1x1 matlab.project.ProjectFile]
```

```
Shortcuts: [1x1 matlab.project.Shortcut]
ProjectPath: [1x1 matlab.project.PathFolder]
ProjectReferences: [1x0 matlab.project.ProjectReference]
StartupFiles: [1x0 string]
ShutdownFiles: [1x0 string]
Description: ""
RootFolder: "C:\workSpace\examples\airframe\refs\Wind Gust Library"
```

The Wind Gust Library project is not a top level project (TopLevel: 0). It is referenced by the the top level project Airframe Example (TopLevel: 1).

“Componentization of Large Projects”

Compare and Merge Simulink Models

This example shows how to use the comparison report in MATLAB® to understand what has changed between two different designs. It shows how to view and merge the changes between two Simulink® models from the comparison report.

Compare The Models

Create a working copy of the example files. MATLAB® copies the files to an example folder so that you can edit them.

```
slcomparisons.examples.simulinkMerge;
```

A user made some changes to the model `sl_aircraft1` and saved the resulting model as `sl_aircraft2`.

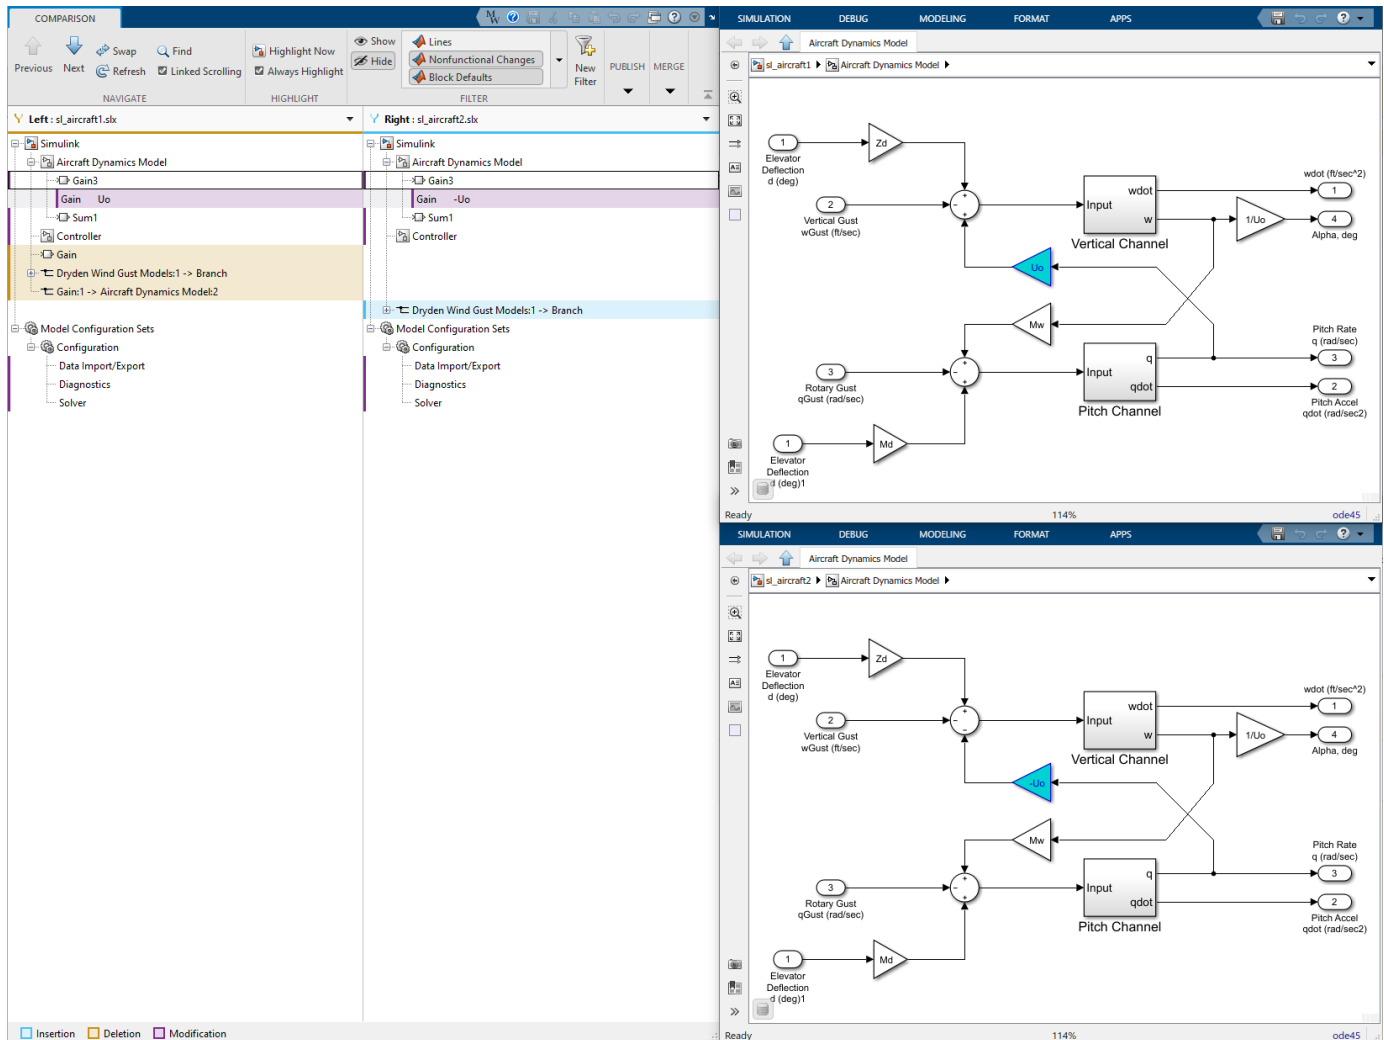

Use `visdiff` to compare the `sl_aircraft1` and `sl_aircraft2` models.

```
visdiff('sl_aircraft1', 'sl_aircraft2');
```

Understand The Results

The Comparison Tool shows a report that only includes the differences between the two models, not the complete model hierarchies.

Colors indicate if items have been modified (purple), inserted (blue), or deleted (yellow).

Stepping Through Differences

Use the **Next** and **Previous** navigation buttons on the **Comparison** tab to step through groups of changes in the report:

- The report goes through the changes one by one. If the selected item in the **Left** tree has a match, it will also be selected in the **Right** tree.
- Matlab displays both models next to the report. The report highlights the selected items in both Simulink models if it is possible.

To control highlighting in models, on the **Comparison** tab, in the **Highlight** section, select or clear the check box **Always Highlight**. You can click the **Highlight Now** button to highlight the currently selected report node at any time.

Filtering Results

You can control the type of changes displayed in the comparison report by applying filters. To see the available filters and whether or not they are applied to the current report, on the **Comparison** tab, in the **Filter** section, click the down arrow to expand the filter gallery. Click filter names to toggle

whether they are applied. In the **Filter** section, click **Show** or **Hide** to control how the filters are applied.

For example, some information in the Simulink model file is defined as being nonfunctional. These are changes that are unlikely to change the behavior of the design. Nonfunctional items are hidden by default. You can show them by deselecting the **Nonfunctional Changes** button when the **Hide** filter button is selected.

Publish Results

To save a printable version of a model comparison report, select **Publish > HTML, Word, or PDF**.

Merge Changes in Simulink Models

You can merge the changes between the two Simulink models by clicking the **Merge Mode** button in the toolstrip. This creates a third file, `targetFile`, which can contain the changes from either the left model (`sl_aircraft1`) or right model (`sl_aircraft2`). Use the buttons in the **Target** tree to select the differences to keep in the `targetFile`.

Click the **Save File** button to save the changes you selected over the right model (`sl_aircraft2`).

Merging tips

You must merge blocks before lines in the Simulink part of the report. You must merge states and junctions before merging transitions, or the report cannot make the connections.

For information on merging between models with identical names, see “Comparing Models with Identical Names”.

Compare and Merge Simulink Models Containing Stateflow

This example shows how to use the comparison report in MATLAB® to understand what has changed between two different designs. It shows how to view and merge the changes between two Simulink® models containing Stateflow® using the comparison report. A Stateflow license is required to run this example.

Compare The Models

Create a working copy of the example files. MATLAB® copies the files to an example folder so that you can edit them.

```
slcomparisons.examples.stateflowMerge;
```

A user added a new kickdown mode to the shift_logic. You can use the Simulink Model Comparison to compare the two models and produce a report to explore and merge the differences.

Use `visdiff` to compare the `sl_sfcar_1` and `sl_sfcar_2` models.

```
visdiff('sl_sfcar_1', 'sl_sfcar_2');
```

Understand The Results

The Comparison Tool shows a report that only includes the differences between the two models, not the complete model hierarchies.

Colors indicate if items have been modified (purple), inserted (blue), or deleted (yellow).

The screenshot displays the Simulink Model Comparison interface. The left pane shows a comparison report between two models: `sl_sfcar_1_slx` (Left) and `sl_sfcar_2_slx` (Right). The report is color-coded to show changes: yellow for deletions, blue for insertions, and purple for modifications. Key changes include the addition of a `KICKDOWN_EVENT` and a `kickdown` block in the `shift_logic` Stateflow chart in the right model. The right pane shows the Simulink model diagrams for both versions, with annotations indicating where to click to open the GUI and select an input maneuver.

Stepping Through Differences

Use the **Next** and **Previous** navigation buttons on the **Comparison** tab to step through groups of changes in the report:

- The report goes through the changes one by one. If the selected item in the **Left** tree has a match, it will also be selected in the **Right** tree.
- Matlab displays both models next to the report. The report highlights the selected items in both Simulink models if it is possible.

Highlight Differences in the Simulink Models

Select the tree node `Out1` in the **Right** tree. Observe the report highlights `Out1` in the report, and the corresponding block in the model `sl_sfcar_2`.

To control highlighting in models, on the **Comparison** tab, in the **Highlight** section, select or clear the check box **Always Highlight**. You can click the **Highlight Now** button to highlight the currently selected report node at any time.

Highlight Differences in a Stateflow Chart

Browse down the tree to locate the Stateflow charts in the report. Observe the Stateflow chart icon next to the `shift_logic` node. Click **kickdown** in the **Right** tree. The report displays both `shift_logic` Stateflow charts. Observe where the new **kickdown** functionality has been added to one of the charts.

Filtering Results

You can control the type of changes displayed in the comparison report by applying filters. To see the available filters and whether or not they are applied to the current report, on the **Comparison** tab, in the **Filter** section, click the down arrow to expand the filter gallery. Click filter names to toggle whether they are applied. In the **Filter** section, click **Show** or **Hide** to control how the filters are applied.

For example, some information in the Simulink model file is defined as being nonfunctional. These are changes that are unlikely to change the behavior of the design. Nonfunctional items are hidden by default. You can show them by deselecting the **Nonfunctional Changes** button when the **Hide** filter button is selected.

Merge Changes in Models Containing Stateflow

You can merge the changes between the two Simulink and Stateflow models by clicking the **Merge Mode** button in the toolbar. This creates a third file, `targetFile`, which can contain the changes from either the left model or right model. Use the buttons in the **Target** tree to select the differences to keep in the `targetFile`.

Click the **Save File** button to save the changes you selected over the right model (`sl_sfcar_2`).

Merging tips

You must merge blocks before lines in the Simulink part of the report. You must merge states and junctions before merging transitions, or the report cannot make the connections.

For information on merging between models with identical names, see “Comparing Models with Identical Names”.

Resolve Conflicts with Simulink Three-Way Merge

This example shows you how to use Simulink® Three-Way Merge to resolve conflicts in Simulink models. You can view and merge the Simulink model differences in the resulting report.

Set up the Example Project

Create and open a working copy of the example project. MATLAB® copies the files to an example folder so that you can edit them.

```
slcomparisons.examples.simulinkThreeWayMerge;
```

Simulink Model Changes and Conflicts

The example project is under Git™ source control. You attempt to merge the changes of another user on the master Git branch into your TaskBranch. This operation results in conflicts.

To resolve the conflicts using the Three-Way Model Merge tool, this example shows how to examine your local file (**Mine**), the conflicting revision (**Theirs**) and the common ancestor of these two files (**Base**).

Theirs: Another user updated the pilot model subsystem to use an explicit gain block for the amplitude of the pilot's input commands. He also updated the Simulation stop time.

Mine: You changed some configuration settings for the pilot model subsystem.

The Merge tool automatically merges nonconflicted differences. Follow the steps below to review the automerge choices, edit if desired, and decide how to resolve any remaining differences. After resolving the conflicts, commit the resolved model to source control.

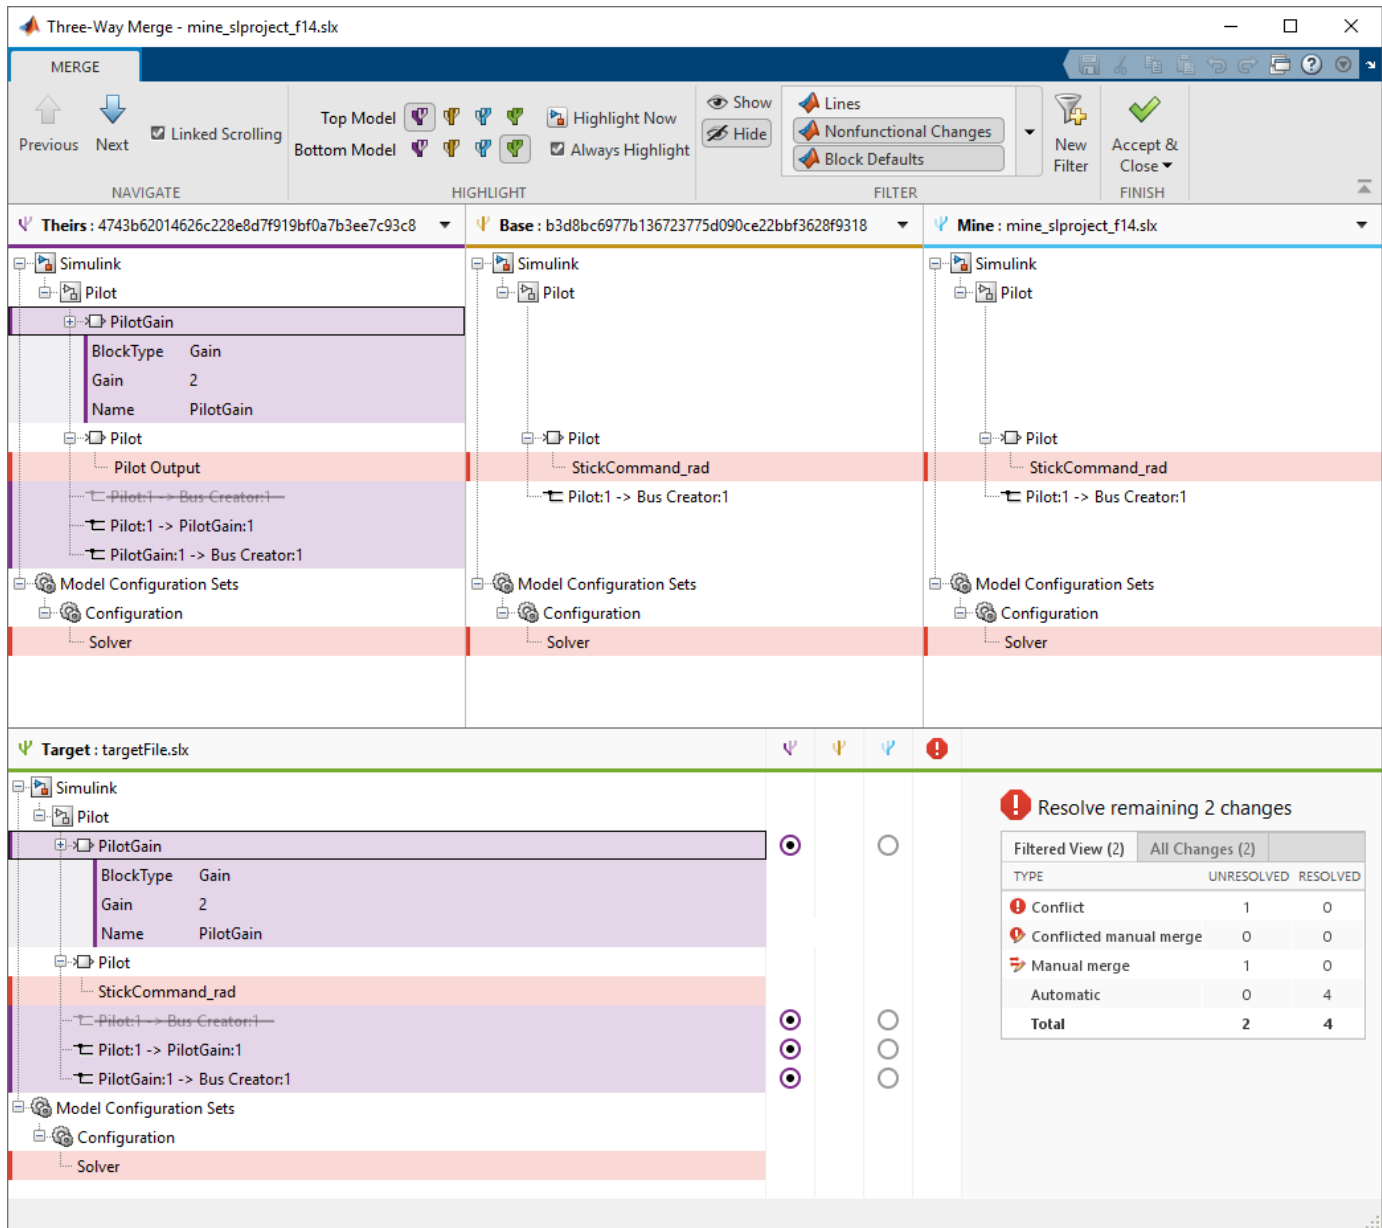

Open Simulink Three-Way Merge

Look for conflicted files in the project files view. The `slproject_f14` file shows a red warning symbol in the Git column, which indicates a conflict.

1. To see a detailed report of the conflicts, right-click the `slproject_f14` file and select **View Conflicts**.

View Changes

The Three-Way Merge tool shows the changes to the two Simulink designs that have caused this file conflict.

- The **Theirs**, **Base** and **Mine** trees show the differences between the conflicting revision, your revision, and the base ancestor of these files.
- The **Target** tree shows the file that you will merge changes into. This is a temporary file and will be copied into the project when you choose to accept the merge result.

2. Examine a difference by clicking a row in one of the trees. The merge tool displays the change for each model in an editor, for example the Simulink Editor or Configuration Parameters dialog box, to the right of the Three-Way Merge window.

3. On the **Merge** tab, in the **Highlight** section, choose the models to display with the **Top Model** or **Bottom Model** buttons.

Review Automatic Merges

The merge tool automatically merges most nonconflicted differences.

4. Examine the first change at the top of the **Theirs** tree by clicking the row called `PilotGain`. This node has been merged automatically and you can adjust the automatic choices using the buttons in the **Target** tree. If you want, review the other automatic merge choices.

Resolve Conflicts

There are two types of difference that require user action.

Conflict: The merge tool cannot automatically resolve these differences and you need to choose which design you want in the target file. In the **Target** pane, look for warnings in the conflict column

Manual merge: Some differences must be merged manually in Simulink or ignored. In the **Target**

pane, these items are indicated by a pencil icon in the conflict column .

5. Select the `StickCommand_rad` row. This difference requires a manual merge, indicated by a pencil icon in the conflict column .

Resolve the line change difference in the `targetFile` by renaming the line connected to the output of the block named `Pilot` in the Simulink Editor from `StickCommand_rad` to `Pilot Output`.

After resolving the difference save the changes in the Editor, and mark the change resolved using the manual merge control in the Conflicts column.

The merge report does not update to show any changes you make in the Editor.

6. Use the **Next** toolbar button to review and resolve the changes until you reach a conflict. This `StopTime` parameter has been changed by both users and is conflicted. Resolve the conflict using the **Mine** change. Select the button next to `StopTime` in the mine column in the **Target** pane.

Change Filters

By default the report hides all nonfunctional changes, such as the repositioning of items.

7. On the **Merge** tab, in the **Filter** section, turn on and off filters to explore the different changes between these designs.

Accept Changes

8. After you resolve all filtered and unfiltered changes, click **Accept & Close**. The merge tool closes the report and the models, accepts the merge result in the `targetFile`, and marks the conflict as resolved in the source control tool. You can now commit changes to source control and continue your work.

Call C Functions Using C Caller Block

This example shows how to use the C Caller block to call your handwritten C functions.

In this example, four custom C functions are defined in `my_func.h`, and implemented in `my_func.c`.

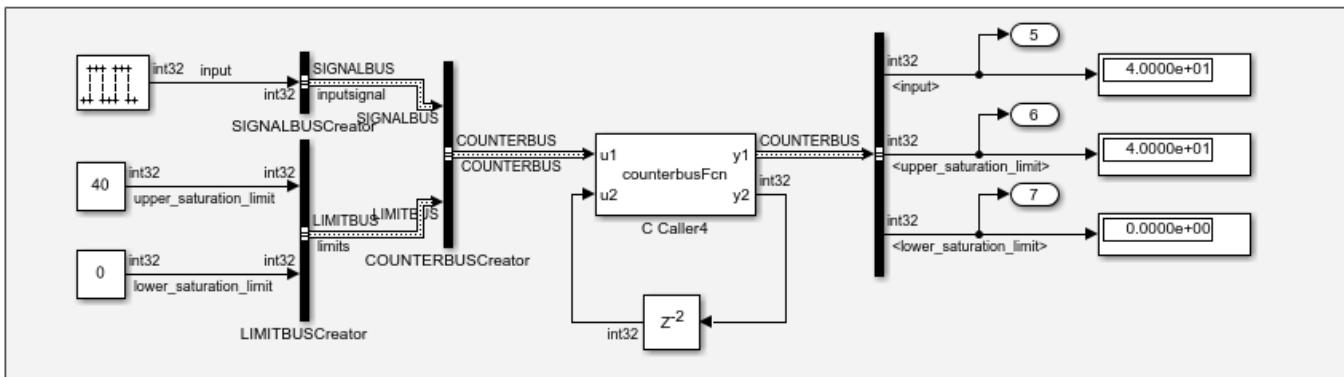

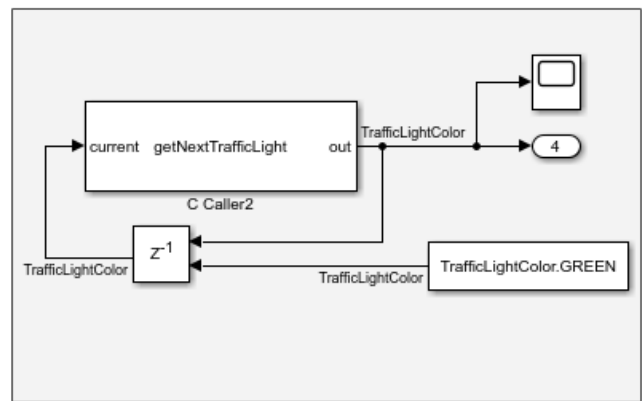

The header file and the source file are specified in "**Model Configuration Parameters > Simulation Target**". Then C functions can be called via C Caller blocks. For example, the block 'add' adds a signal and a constant together, and the block 'timesK' multiplies the signal by a parameter K. C Caller block supports C structure and enumeration types. Use command "**Simulink.importExternalCTypes**" to import these types into Simulink as matching Simulink.Bus object or Simulink.IntEnumType.

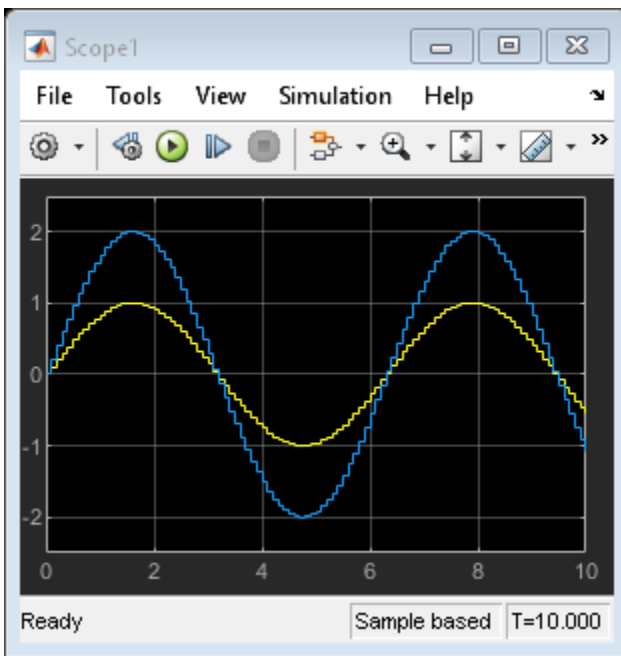

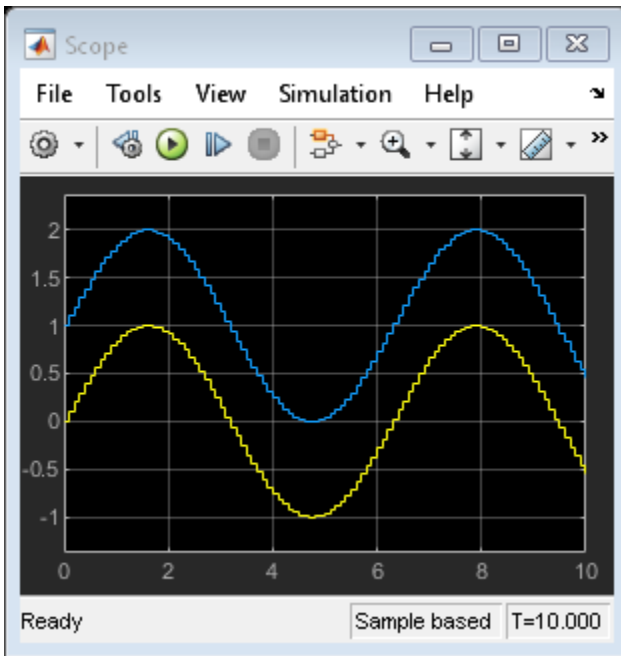

Call C Functions Using C Caller Block

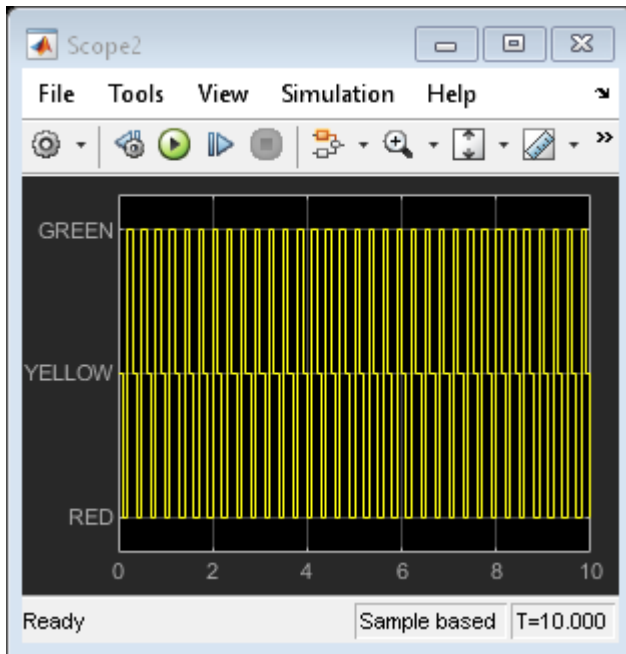

```
matlabroot\toolbox\simulink\simdemos\simfeatures\include\my_func.h
```

```
matlabroot\toolbox\simulink\simdemos\simfeatures\src\my_func.c
```

Copyright 2019 The MathWorks, Inc.

Set up custom C code in model configuration

Add '#include "my_func.h"' to "**Configuration Parameters > Simulation Target > Header File**" field.

Add 'include' to "**Configuration Parameters > Simulation Target > Include directories**" field.

Add 'src/my_func.c' to "**Configuration Parameters > Simulation Target > Source Files**" field.

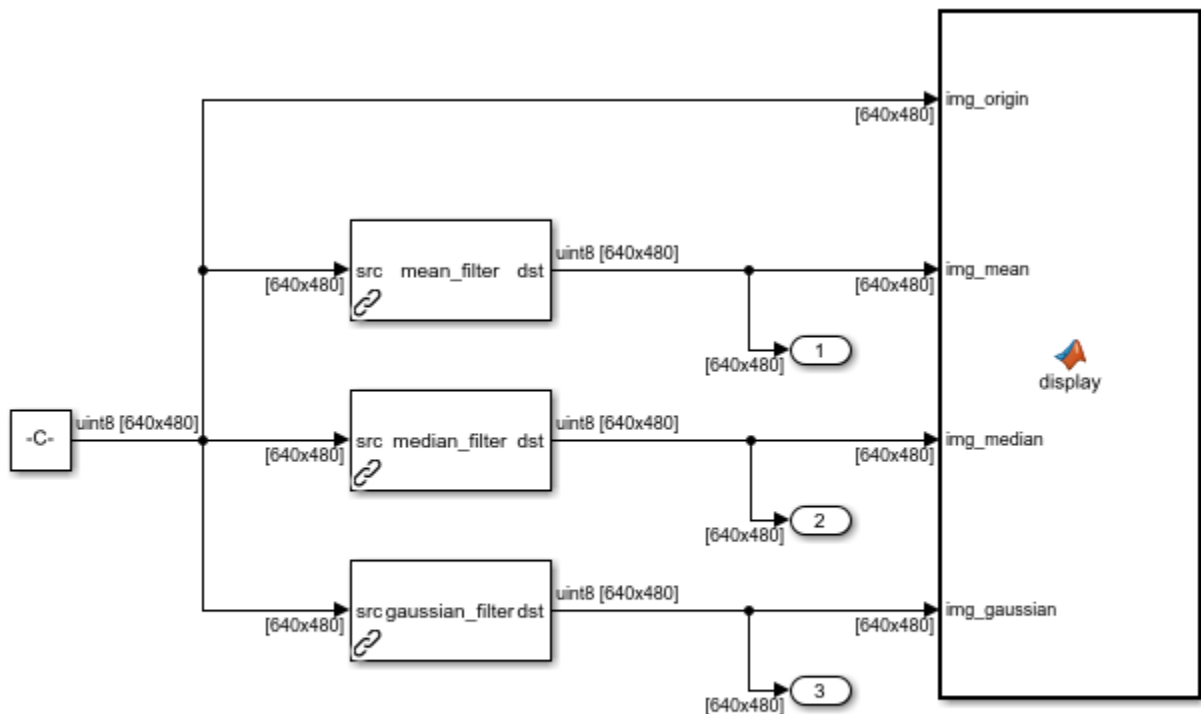

Bring Custom Image Filter Algorithms as Reusable Blocks in Simulink

This example shows how to bring in C code image filter algorithms using C Caller blocks in a reusable Simulink library.

In this example, three image filter blocks are C Caller blocks in a library model. Their dependent C code is specified in the library model custom code settings.

The image filter C functions are implemented using "Row-major" array layout. Library custom code settings have "Default function array layout" set accordingly to "Row-major".

These library image filter blocks can be reused by adding them to models.

Custom Code and Hand Coded Blocks using the S-function API

This library launches examples of different types of Simulink® S-functions. Simulink S-functions allow you to extend Simulink with new hand coded blocks, interface to custom external code, and create live interfaces to other programs. Models containing S-functions in the following programming languages can be accessed through this demonstration: C, C++, M and Fortran.

Each example contains a model that exercises an S-function block and a link for editing the S-function code. You can also access the main S-function file by using the Edit... button on the S-function block dialog (which is under a mask in some of the models; use the "Look Under Mask" context menu item to access the S-function dialog in this situation).

Additionally, the S-function Builder block is a masked version of the S-function block that includes an easy to use editor that automatically builds an S-function out of a core algorithm that you enter into it along with input, output, and parameter attributes. By default, the S-function Builder also creates a TLC file for use with Simulink® Coder™ and Embedded Coder™.

Inputs Passed by Value or Address to Legacy Functions

This example shows you how to use the Legacy Code Tool to integrate legacy C functions that pass their input arguments by value versus address.

The Legacy Code Tool allows you to:

- Provide the legacy function specification,
- Generate a C-MEX S-function that is used during simulation to call the legacy code, and
- Compile and build the generated S-function for simulation.

Providing the Legacy Function Specification

Functions provided with the Legacy Code Tool take a specific data structure or array of structures as the argument. The data structure is initialized by calling the function `legacy_code()` using 'initialize' as the first input. After initializing the structure, you have to assign its properties to values corresponding to the legacy code being integrated. For detailed help on the properties, call `legacy_code('help')`. The prototypes of the legacy functions being called in this example are:

- FLT filterV1(const FLT signal, const FLT prevSignal, const FLT gain)
- FLT filterV2(const FLT* signal, const FLT prevSignal, const FLT gain)

where FLT is a typedef to float. The legacy source code is found in the files `your_types.h`, `myfilter.h`, `filterV1.c`, and `filterV2.c`.

Note the difference in the `OutputFcnSpec` defined in the two structures; the first case specifies that the first input argument is passed by value, while the second case specifies pass by pointer.

```
defs = [];
```

```
% sldemo_sfun_filterV1
def = legacy_code('initialize');
def.SFunctionName = 'sldemo_sfun_filterV1';
def.OutputFcnSpec = 'single y1 = filterV1(single u1, single u2, single p1)';
def.HeaderFiles   = {'myfilter.h'};
def.SourceFiles   = {'filterV1.c'};
def.IncPaths      = {'sldemo_lct_src'};
def.SrcPaths      = {'sldemo_lct_src'};
defs = [defs; def];

% sldemo_sfun_filterV2
def = legacy_code('initialize');
def.SFunctionName = 'sldemo_sfun_filterV2';
def.OutputFcnSpec = 'single y1 = filterV2(single u1[1], single u2, single p1)';
def.HeaderFiles   = {'myfilter.h'};
def.SourceFiles   = {'filterV2.c'};
def.IncPaths      = {'sldemo_lct_src'};
def.SrcPaths      = {'sldemo_lct_src'};
defs = [defs; def];
```

Generating and Compiling an S-Function for Use During Simulation

The function `legacy_code()` is called again with the first input set to 'generate_for_sim' in order to automatically generate and compile the C-MEX S-function according to the description provided by

the input argument 'defs'. This S-function is used to call the legacy functions in simulation. The source code for the S-function is found in the file `sldemo_sfun_filterV1.c` and `sldemo_sfun_filterV2.c`.

```
legacy_code('generate_for_sim', defs);
```

```
### Start Compiling sldemo_sfun_filterV1

Generating an `rtwmakecfg.m` File for Code Generation

After the TLC block file is created, the function `legacy_code()` can be called again with the first input set to `'rtwmakecfg_generate'` in order to generate an `rtwmakecfg.m` file to support code generation through Simulink® Coder™. Generate the `rtwmakecfg.m` file if the required source and header files for the S-functions are not in the same directory as the S-functions, and you want to add these dependencies in the makefile produced during code generation.

Note: Complete this step only if you are going to simulate the model in accelerated mode.

```
legacy_code('rtwmakecfg_generate', def);
```

Generating Masked S-Function Blocks for Calling the Generated S-Functions

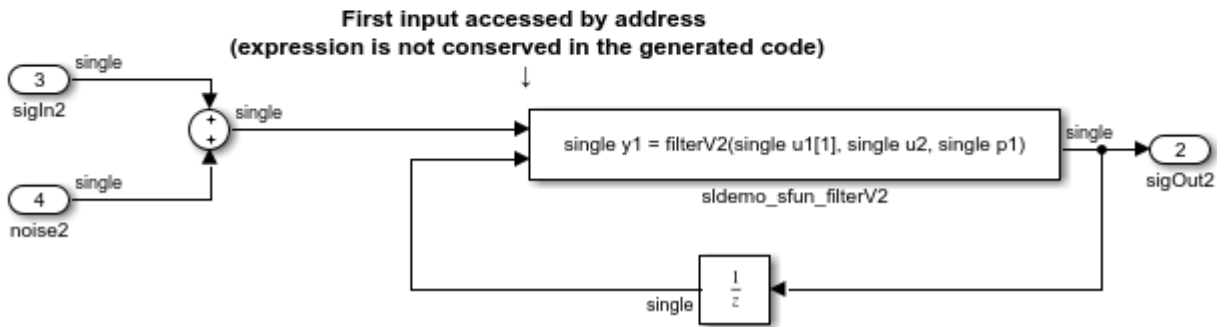

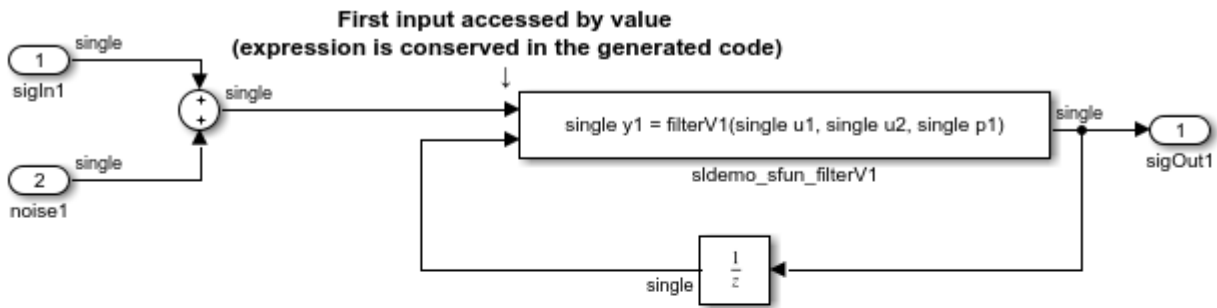

After the C-MEX S-function source is compiled, the function `legacy_code()` can be called again with the first input set to `'slblock_generate'` in order to generate masked S-function blocks which are configured to call those S-functions. The blocks are placed in a new model and can be copied to an existing model.

```
% legacy_code('slblock_generate', defs);
```

Demoing the Generated Integration with Legacy Code

The model `sldemo_lct_filter` shows integration with the legacy code. The subsystem `TestFilter` serves as a harness for the calls to the legacy C functions via the generate S-functions, with unit delays serving to store the previous output values.

```
open_system('sldemo_lct_filter')
open_system('sldemo_lct_filter/TestFilter')
sim('sldemo_lct_filter');
```

Output Passed by Return Argument from Legacy Functions

This example shows you how to use the Legacy Code Tool to integrate legacy C functions that pass their output as a return argument.

The Legacy Code Tool allows you to:

- Provide the legacy function specification,
- Generate a C-MEX S-function that is used during simulation to call the legacy code, and
- Compile and build the generated S-function for simulation.

Providing the Legacy Function Specification

Functions provided with the Legacy Code Tool take a specific data structure or array of structures as the argument. The data structure is initialized by calling the function `legacy_code()` using 'initialize' as the first input. After initializing the structure, you have to assign its properties to values corresponding to the legacy code being integrated. For detailed help on the properties, call `legacy_code('help')`. The prototype of the legacy functions being called in this example is:

```
FLT gainScalar(const FLT in, const FLT gain)
```

where FLT is a typedef to float. The legacy source code is found in the files `your_types.h`, `gain.h`, and `gainScalar.c`.

```
% sldemo_sfun_gain_scalar
def = legacy_code('initialize');
def.SFunctionName = 'sldemo_sfun_gain_scalar';
def.OutputFcnSpec = 'single y1 = gainScalar(single u1, single p1)';
def.HeaderFiles    = {'gain.h'};
def.SourceFiles    = {'gainScalar.c'};
def.IncPaths       = {'sldemo_lct_src'};
def.SrcPaths       = {'sldemo_lct_src'};
```

Generating and Compiling an S-Function for Use During Simulation

The function `legacy_code()` is called again with the first input set to 'generate_for_sim' in order to automatically generate and compile the C-MEX S-function according to the description provided by the input argument 'def'. This S-function is used to call the legacy functions in simulation. The source code for the S-function is found in the file `sldemo_sfun_gain_scalar.c`.

```
legacy_code('generate_for_sim', def);
```

```

Building with 'Microsoft Visual C++ 2017 (C)'.
MEX completed successfully.
    mex('sldemo_sfun_gain_scalar.c', '-IB:\matlab\toolbox\simulink\simdemos\simfeatures\sldemo_l
Building with 'Microsoft Visual C++ 2017 (C)'.
MEX completed successfully.
### Finish Compiling sldemo_sfun_gain_scalar
### Exit
```

Generating an `rtwmakecfg.m` File for Code Generation

After the TLC block file is created, the function `legacy_code()` can be called again with the first input set to 'rtwmakecfg_generate' in order to generate an `rtwmakecfg.m` file to support code generation

through Simulink® Coder™. Generate the `rtwmakecfg.m` file if the required source and header files for the S-functions are not in the same directory as the S-functions, and you want to add these dependencies in the makefile produced during code generation.

Note: Complete this step only if you are going to simulate the model in accelerated mode.

```
legacy_code('rtwmakecfg_generate', def);
```

Generating a Masked S-Function Block for Calling the Generated S-Function

After the C-MEX S-function source is compiled, the function `legacy_code()` can be called again with the first input set to `'slblock_generate'` in order to generate a masked S-function block that is configured to call that S-function. The block is placed in a new model and can be copied to an existing model.

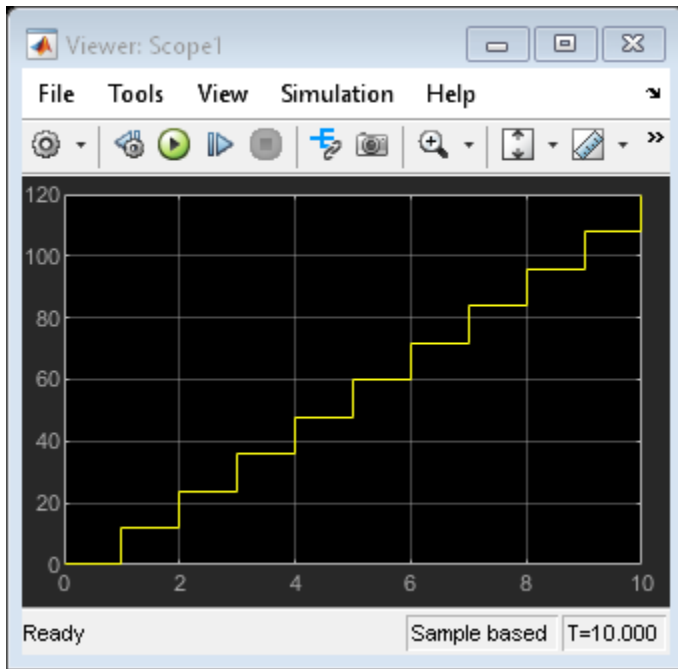

```
% legacy_code('slblock_generate', def);
```

Demoing the Generated Integration with Legacy Code

The model `sldemo_lct_gain` shows integration with the legacy code. The subsystem `TestGain` serves as a harness for the call to the legacy C function via the generate S-function.

```
if isempty(find_system('SearchDepth',0,'Name','sldemo_lct_gain'))
    open_system('sldemo_lct_gain')
    open_system('sldemo_lct_gain/TestGain')
    sim('sldemo_lct_gain');
end
```

Fixed Point Signals in Legacy Functions

This example shows you how to use the Legacy Code Tool to integrate legacy C functions that pass their inputs and outputs using signals of fixed point data type.

The Legacy Code Tool allows you to:

- Provide the legacy function specification,
- Generate a C-MEX S-function that is used during simulation to call the legacy code, and
- Compile and build the generated S-function for simulation.

Providing the Legacy Function Specification

Functions provided with the Legacy Code Tool take a specific data structure or array of structures as the argument. The data structure is initialized by calling the function `legacy_code()` using 'initialize' as the first input. After initializing the structure, you have to assign its properties to values corresponding to the legacy code being integrated. For detailed help on the properties, call `legacy_code('help')`. The prototype of the legacy functions being called in this example is:

```
myFixpt timesS16(const myFixpt in1, const myFixpt in2, const uint8_T fracLength)
```

where `myFixpt` is logically a fixed point data type which is physically a typedef to a 16-bit integer:

```
myFixpt = Simulink.NumericType;
myFixpt.DataTypeMode = 'Fixed-point: binary point scaling';
myFixpt.Signed = true;
myFixpt.WordLength = 16;
myFixpt.FractionLength = 10;
myFixpt.IsAlias = true;
myFixpt.HeaderFile = 'timesFixpt.h';
```

The legacy source code is found in the files `timesFixpt.h`, and `timesS16.c`.

```
% sldemo_sfun_times_s16
def = legacy_code('initialize');
def.SFunctionName = 'sldemo_sfun_times_s16';
def.OutputFcnSpec = 'myFixpt y1 = timesS16(myFixpt u1, myFixpt u2, uint8 p1)';
def.HeaderFiles = {'timesFixpt.h'};
def.SourceFiles = {'timesS16.c'};
def.IncPaths = {'sldemo_lct_src'};
def.SrcPaths = {'sldemo_lct_src'};
```

Generating and Compiling an S-Function for Use During Simulation

The function `legacy_code()` is called again with the first input set to 'generate for sim' in order to automatically generate and compile the C-MEX S-function according to the description provided by the input argument 'def'. This S-function is used to call the legacy functions in simulation. The source code for the S-function is found in the file `sldemo_sfun_times_s16.c`.

```
legacy_code('generate_for_sim', def);
```

```
### Start Compiling sldemo_sfun_times_s16
mex('-IB:\matlab\toolbox\simulink\simdemos\simfeatures\sldemo_lct_src', '-IC:\TEMP\Bdoc20a_1
Building with 'Microsoft Visual C++ 2017 (C)'.
MEX completed successfully.
```

```

Building with 'Microsoft Visual C++ 2017 (C)'.
MEX completed successfully.
### Finish Compiling sldemo_sfun_times_s16
### Exit

```

Generating an `rtwmakecfg.m` File for Code Generation

After the TLC block file is created, the function `legacy_code()` can be called again with the first input set to `'rtwmakecfg_generate'` in order to generate an `rtwmakecfg.m` file to support code generation through Simulink® Coder™. Generate the `rtwmakecfg.m` file if the required source and header files for the S-functions are not in the same directory as the S-functions, and you want to add these dependencies in the makefile produced during code generation.

Note: Complete this step only if you are going to simulate the model in accelerated mode.

```
legacy_code('rtwmakecfg_generate', def);
```

Generating a Masked S-Function Block for Calling the Generated S-Function

After the C-MEX S-function source is compiled, the function `legacy_code()` can be called again with the first input set to `'slblock_generate'` in order to generate a masked S-function block that is configured to call that S-function. The block is placed in a new model and can be copied to an existing model.

```
% legacy_code('slblock_generate', def);
```

Demoing the Generated Integration with Legacy Code

The model `sldemo_lct_fixpt_signals` shows integration with the legacy code. The subsystem `TestFixpt` serves as a harness for the call to the legacy C function via the generated S-function, and the scope compares the output of the function with the output of the built-in Simulink® product block; the results are identical.

```

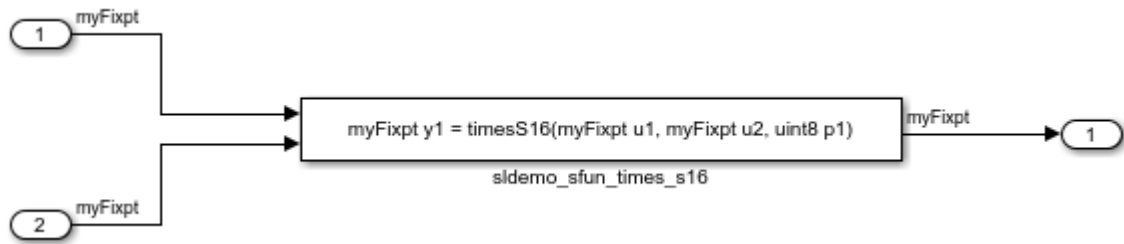

open_system('sldemo_lct_fixpt_signals')
open_system('sldemo_lct_fixpt_signals/TestFixpt')
sim('sldemo_lct_fixpt_signals')

ans =

    Simulink.SimulationOutput:
        yout: [101x2 double]

    SimulationMetadata: [1x1 Simulink.SimulationMetadata]
        ErrorMessage: [0x0 char]

```

Fixed Point Parameters in Legacy Functions

This example shows you how to use the Legacy Code Tool to integrate legacy C functions that pass their inputs and outputs using parameters of fixed point data type.

The Legacy Code Tool allows you to:

- Provide the legacy function specification,
- Generate a C-MEX S-function that is used during simulation to call the legacy code, and
- Compile and build the generated S-function for simulation.

Providing the Legacy Function Specification

Functions provided with the Legacy Code Tool take a specific data structure or array of structures as the argument. The data structure is initialized by calling the function `legacy_code()` using 'initialize' as the first input. After initializing the structure, you have to assign its properties to values corresponding to the legacy code being integrated. For detailed help on the properties, call `legacy_code('help')`. The prototype of the legacy functions being called in this example is:

```
myFixpt timesS16(const myFixpt in1, const myFixpt in2, const uint8_T fracLength)
```

where `myFixpt` is logically a fixed point data type which is physically a typedef to a 16-bit integer:

```
myFixpt = Simulink.NumericType;
myFixpt.DataTypeMode = 'Fixed-point: binary point scaling';
myFixpt.Signed = true;
myFixpt.WordLength = 16;
myFixpt.FractionLength = 10;
myFixpt.IsAlias = true;
myFixpt.HeaderFile = 'timesFixpt.h';
```

The legacy source code is found in the files `timesFixpt.h`, and `timesS16.c`.

```
% sldemo_sfun_gain_fixpt
def = legacy_code('initialize');
def.SFunctionName = 'sldemo_sfun_gain_fixpt';
def.OutputFcnSpec = 'myFixpt y1 = timesS16(myFixpt u1, myFixpt p1, uint8 p2)';
def.HeaderFiles = {'timesFixpt.h'};
def.SourceFiles = {'timesS16.c'};
def.IncPaths = {'sldemo_lct_src'};
def.SrcPaths = {'sldemo_lct_src'};
```

Generating and Compiling an S-Function for Use During Simulation

Lookup Tables Implemented in Legacy Functions

This example shows you how to use the Legacy Code Tool to integrate legacy C functions that implement N-dimensional table lookups.

The Legacy Code Tool allows you to:

- Provide the legacy function specification,
- Generate a C-MEX S-function that is used during simulation to call the legacy code, and
- Compile and build the generated S-function for simulation.

Providing the Legacy Function Specification

Functions provided with the Legacy Code Tool take a specific data structure or array of structures as the argument. The data structure is initialized by calling the function `legacy_code()` using 'initialize' as the first input. After initializing the structure, you have to assign its properties to values corresponding to the legacy code being integrated. For detailed help on the properties, call `legacy_code('help')`. The prototype of the legacy function being called in this example is:

```
FLT directLookupTableND(const FLT *tableND, const UINT32 nbDims, const UINT32 *tableDims,
const UINT32 *tableIdx)
```

where FLT is a typedef to float, and UINT32 is a typedef to unsigned int32. The legacy source code is found in the files `your_types.h`, `lookupTable.h`, and `directLookupTableND.c`.

```
defs = [];
evalin('base','load sldemo_lct_data.mat')

% sldemo_sfundlut3D
def = legacy_code('initialize');
def.SFunctionName = 'sldemo_sfundlut3D';
def.OutputFcnSpec = 'single y1 = DirectLookupTable3D(single p1[][][], uint32 p2[3], uint32 u1[3])';
def.HeaderFiles = {'lookupTable.h'};
def.SourceFiles = {'directLookupTableND.c'};
def.IncPaths = {'sldemo_lct_src'};
def.SrcPaths = {'sldemo_lct_src'};
defs = [defs; def];

% sldemo_sfundlut4D
def = legacy_code('initialize');
def.SFunctionName = 'sldemo_sfundlut4D';
def.OutputFcnSpec = 'single y1 = DirectLookupTable4D(single p1[][][][][], uint32 p2[4], uint32 u1[4])';
def.HeaderFiles = {'lookupTable.h'};
def.SourceFiles = {'directLookupTableND.c'};
def.IncPaths = {'sldemo_lct_src'};
def.SrcPaths = {'sldemo_lct_src'};
defs = [defs; def];
```

Generating and Compiling an S-Function for Use During Simulation

The function `legacy_code()` is called again with the first input set to 'generate_for_sim' in order to automatically generate and compile the C-MEX S-function according to the description provided by the input argument 'defs'. Demoing the Generated Integration with Legacy Code

The model `sldemo_lct_lut` shows integration with the legacy code. The subsystem `TestFixpt` serves as a harness for the call to the legacy C function, and the Display blocks compare the output of the function with the output of the built-in Simulink® lookup blocks; the results are identical.

```
open_system('sldemo_lct_lut')
open_system('sldemo_lct_lut/TestLut1')
sim('sldemo_lct_lut');
```

LookUp Table are defined as:
 >> LUT3D = single(reshape([1:4*5*6], [4 5 6]));
 >> LUT4D = single(reshape([1:4*5*6*2], [4 5 6 2]))

Start and Terminate Actions Within Legacy Functions

This example shows you how to use the Legacy Code Tool to integrate legacy C functions that have start and terminate actions.

The Legacy Code Tool allows you to:

- Provide the legacy function specification,
- Generate a C-MEX S-function that is used during simulation to call the legacy code, and
- Compile and build the generated S-function for simulation.

Providing the Legacy Function Specification

Functions provided with the Legacy Code Tool take a specific data structure or array of structures as the argument. The data structure is initialized by calling the function `legacy_code()` using the 'initialize' first input. After initializing the structure, you have to assign its properties to values corresponding to the legacy code being integrated. For detailed help on the properties, call `legacy_code('help')`. The prototypes of the legacy functions being called in this example are:

- `void initFaultCounter(unsigned int *counter)`
- `void openLogFile(void **fid)`
- `void incAndLogFaultCounter(void *fid, unsigned int *counter, double time)`
- `void closeLogFile(void **fid)`

The legacy source code is found in the files `your_types.h`, `fault.h`, and `fault.c`.

```
% sldemo_sfun_fault
def = legacy_code('initialize');
def.SFunctionName = 'sldemo_sfun_fault';
def.InitializeConditionsFcnSpec = 'initFaultCounter(uint32 work2[1])';
def.StartFcnSpec = 'openLogFile(void **work1)';
def.OutputFcnSpec = 'incAndLogFaultCounter(void *work1, uint32 work2[1], double u)';
def.TerminateFcnSpec = 'closeLogFile(void **work1)';
def.HeaderFiles = {'fault.h'};
def.SourceFiles = {'fault.c'};
def.IncPaths = {'sldemo_lct_src'};
def.SrcPaths = {'sldemo_lct_src'};
def.Options.useTlcWithAccel = false;
```

Generating and Compiling an S-Function for Use During Simulation

The function `legacy_code()` is called again with the first input set to 'generate_for_sim' in order to automatically generate and compile the C-MEX S-function according to the description provided by the input argument 'def'. This S-function is used to call the legacy functions in simulation. The source code for the S-function is found in the file `sldemo_sfun_fault.c`.

```
legacy_code('generate_for_sim', def);

### Start Compiling sldemo_sfun_fault

Generating an `rtwmakecfg.m` File for Code Generation

After the TLC block file is created, the function `legacy_code()` can be called again with the first input set to `'rtwmakecfg_generate'` in order to generate an `rtwmakecfg.m` file to support code generation through Simulink® Coder™. Generate the `rtwmakecfg.m` file if the required source and header files for the S-functions are not in the same directory as the S-functions, and you want to add these dependencies in the makefile produced during code generation.

Note: Complete this step only if you are going to simulate the model in accelerated mode.

```
legacy_code('rtwmakecfg_generate', def);
```

Generating a Masked S-Function Block for Calling the Generated S-Function

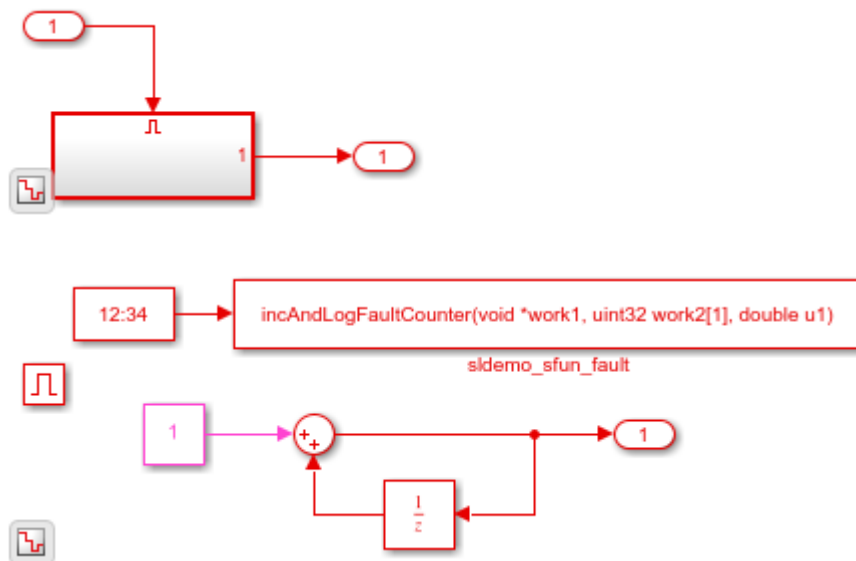

After the C-MEX S-function source is compiled, the function `legacy_code()` can be called again with the first input set to `'slblock_generate'` in order to generate a masked S-function block that is configured to call that S-function. The block is placed in a new model and can be copied to an existing model.

```
% legacy_code('slblock_generate', def);
```

Demoing the Generated Integration with Legacy Code

The model `sldemo_lct_start_term` shows integration with the legacy code. The subsystem `TestFixpt` serves as a harness for the call to the legacy C function, and the scope compares the output of the function with the output of the built-in Simulink® product block; the results should be identical.

```
open_system('sldemo_lct_start_term')
open_system('sldemo_lct_start_term/TestFault')
sim('sldemo_lct_start_term');
```

This demonstration illustrates how the Legacy Code Tool is used to call legacy functions that have start and terminate actions

mdlInitializeConditions → call `initFaultCounter()` → reset the fault counter
 mdlStart → call `openLogFile()` → open the file 'slidemo_lct_fault.log' for logging faults
 mdlOutput → call `incAndLogFaultCounter()` → increment the fault counter and append one line in the log file
 mdlTerminate → call `closeLogFile()` → close the logging file

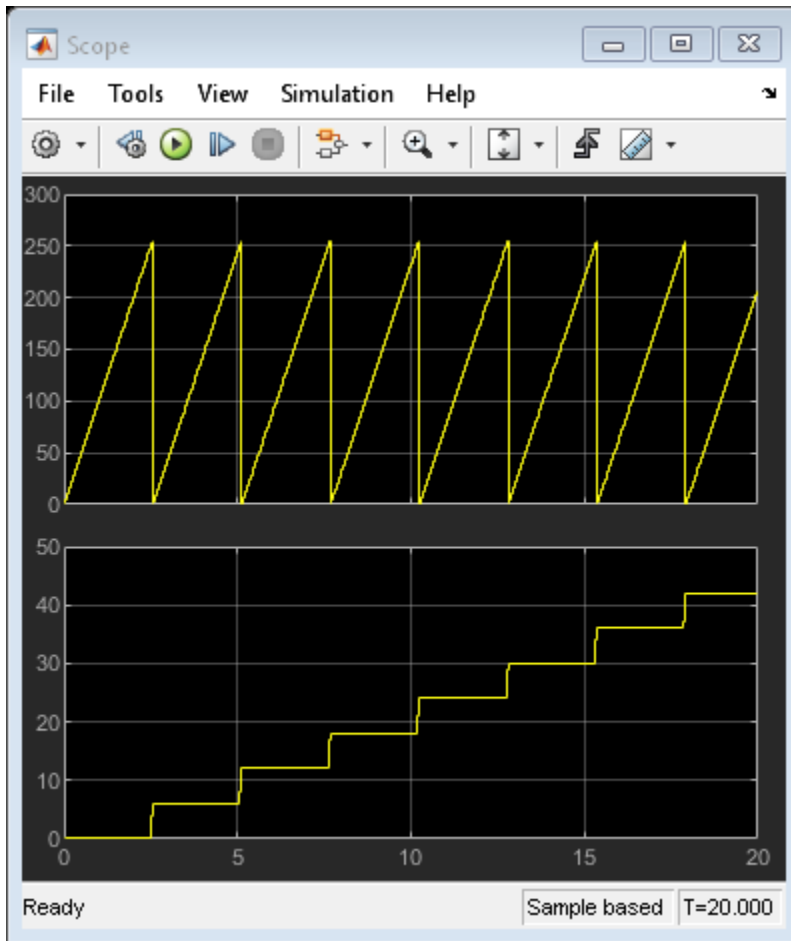

- run the model and edit the generated logging file 'slidemo_lct_fault.log'

To view the sources for this demonstration
 click the links below.

- open legacy files `fault.h` and `fault.c`
- open registration script `slidemo_lct_start_term_script.m`
- open generated S-Function `slidemo_sfunk_fault.c`

Using Buses with Legacy Functions Having Structure Arguments

This example shows you how to use the Legacy Code Tool to integrate legacy C functions with structure arguments using Simulink® buses.

The Legacy Code Tool allows you to:

- Provide the legacy function specification,
- Generate a C-MEX S-function that is used during simulation to call the legacy code, and
- Compile and build the generated S-function for simulation.

Providing the Legacy Function Specification

Functions provided with the Legacy Code Tool take a specific data structure or array of structures as the argument. The data structure is initialized by calling the function `legacy_code()` using 'initialize' as the first input. After initializing the structure, you have to assign its properties to values corresponding to the legacy code being integrated. For detailed help on the properties, call `legacy_code('help')`. The prototype of the legacy functions being called in this example is:

```
counterbusFcn(COUNTERBUS *u1, int32_T u2, COUNTERBUS *y1, int32_T *y2)
```

where COUNTERBUS is a struct typedef defined in `counterbus.h` and implemented with a Simulink.Bus object in the base workspace. The legacy source code is found in the files `counterbus.h`, and `counterbus.c`.

```
evalin('base','load sldemo_lct_data.mat')
```

```
% sldemo_sfun_counterbus
def = legacy_code('initialize');
def.SFunctionName = 'sldemo_sfun_counterbus';
def.OutputFcnSpec = 'void counterbusFcn(COUNTERBUS u1[1], int32 u2, COUNTERBUS y1[1], int32 y2[1])';
def.HeaderFiles = {'counterbus.h'};
def.SourceFiles = {'counterbus.c'};
def.IncPaths = {'sldemo_lct_src'};
def.SrcPaths = {'sldemo_lct_src'};
```

Generating and Compiling an S-Function for Use During Simulation

The function `legacy_code()` is called again with the first input set to 'generate_for_sim' in order to automatically generate and compile the C-MEX S-function according to the description provided by the input argument 'def'. This S-function is used to call the legacy functions in simulation. The source code for the S-function is found in the file `sldemo_sfun_counterbus.c`.

```
legacy_code('generate_for_sim', def);
```

```
### Start Compiling sldemo_sfun_counterbus

ErrorMessage: [0x0 char]
```

Inherited Signal Dimensions for Legacy Function Arguments

This example shows you how to use the Legacy Code Tool to integrate legacy C functions whose arguments have inherited dimensions.

The Legacy Code Tool allows you to:

- Provide the legacy function specification,
- Generate a C-MEX S-function that is used during simulation to call the legacy code, and
- Compile and build the generated S-function for simulation.

Providing the Legacy Function Specification

Functions provided with the Legacy Code Tool take a specific data structure or array of structures as the argument. The data structure is initialized by calling the function `legacy_code()` using 'initialize' as the first input. After initializing the structure, you have to assign its properties to values corresponding to the legacy code being integrated. For detailed help on the properties, call `legacy_code('help')`. The prototypes of the legacy functions being called in this example are:

- `void mat_add(real_T *u1, real_T *u2, int32_T nbRows, int32_T nbCols, real_T *y1)`
- `void mat_mult(real_T *u1, real_T *u2, int32_T nbRows1, int32_T nbCols1, int32_T nbCols2, real_T *y1)`

where `real_T` is a typedef to `double`, and `int32_T` is a typedef to a 32-bit integer. The legacy source code is found in the files `mat_ops.h`, and `mat_ops.c`.

```
defs = [];
```

```
% sldemo_sfun_mat_add
def = legacy_code('initialize');
def.SFunctionName = 'sldemo_sfun_mat_add';
def.OutputFcnSpec = ['void mat_add(double u1[][], double u2[][], ' ...
                    'int32 u3, int32 u4, double y1[size(u1,1)][size(u1,2)]]'];
def.HeaderFiles    = {'mat_ops.h'};
def.SourceFiles    = {'mat_ops.c'};
def.IncPaths       = {'sldemo_lct_src'};
def.SrcPaths       = {'sldemo_lct_src'};
defs = [defs; def];
```

```
% sldemo_sfun_mat_mult
def = legacy_code('initialize');
def.SFunctionName = 'sldemo_sfun_mat_mult';
def.OutputFcnSpec = ['void mat_mult(double u1[p1][p2], double u2[p2][p3], ' ...
                    'int32 p1, int32 p2, int32 p3, double y1[p1][p3]']];
def.HeaderFiles    = {'mat_ops.h'};
def.SourceFiles    = {'mat_ops.c'};
def.IncPaths       = {'sldemo_lct_src'};
def.SrcPaths       = {'sldemo_lct_src'};
defs = [defs; def];
```

Generating and Compiling an S-Function for Use During Simulation

The function `legacy_code()` is called again with the first input set to 'generate_for_sim' in order to automatically generate and compile the C-MEX S-function according to the description provided by the input argument 'defs'. This S-function is used to call the legacy functions in simulation. The

source code for the S-function is found in the file `sldemo_sfund_mat_add.c` and `sldemo_sfund_mat_mult.c`.

```
legacy_code('generate_for_sim', defs);
```

```

Generating an `rtwmakecfg.m` File for Code Generation

After the TLC block file is created, the function `legacy_code()` can be called again with the first input set to `'rtwmakecfg_generate'` in order to generate an `rtwmakecfg.m` file to support code generation through Simulink® Coder™. Generate the `rtwmakecfg.m` file if the required source and header files for the S-functions are not in the same directory as the S-functions, and you want to add these dependencies in the makefile produced during code generation.

Note: Complete this step only if you need to simulate the model in accelerated mode.

```
legacy_code('rtwmakecfg_generate', def);
```

Generating Masked S-Function Blocks for Calling the Generated S-Functions

After the C-MEX S-function source is compiled, the function `legacy_code()` can be called again with the first input set to `'slblock_generate'` in order to generate masked S-function blocks which are configured to call those S-functions. The blocks are placed in a new model and can be copied to an existing model.

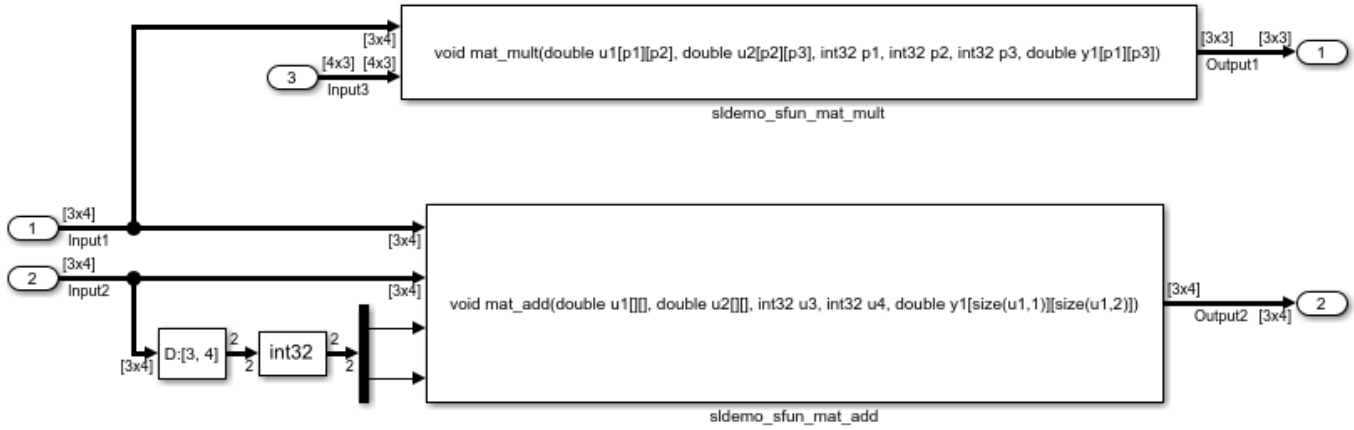

```
% legacy_code('slblock_generate', defs);
```

Demoing the Generated Integration with Legacy Code

The model `sldemo_lct_inherit_dims` shows integration with the legacy code. The subsystem `TestMatOps` serves as a harness for the calls to the legacy C functions, with unit delays serving to store the previous output values.

```
open_system('sldemo_lct_inherit_dims')
open_system('sldemo_lct_inherit_dims/TestMatOps')
sim('sldemo_lct_inherit_dims');
```

Input/Output matrix dimensions are related to the parameter's values

↑
Input matrices are dynamically sized
the Output matrix dimensions are related to the Input matrices dimensions

C++ Object Methods as Legacy Functions

This example shows you how to use the Legacy Code Tool to integrate legacy C++ object methods.

The Legacy Code Tool allows you to:

- Provide the legacy function specification,
- generate a C++ MEX S-function that is used during simulation to call the legacy code, and
- Compile and build the generated S-function for simulation.

Providing the Legacy Function Specification

Functions provided with the Legacy Code Tool take a specific data structure or array of structures as the argument. The data structure is initialized by calling the function `legacy_code()` using 'initialize' as the first input. After initializing the structure, you have to assign its properties to values corresponding to the legacy code being integrated. For detailed help on the properties, call `legacy_code('help')`. The definition of the legacy C++ class being used in this example is:

```
class adder {
private:
    int int_state;
public:
    adder();
    int add_one(int increment);
    int get_val();
};
```

The legacy source code is found in the files `adder_cpp.h` and `adder_cpp.cpp`.

```
% sldemo_sfun_adder_cpp
def = legacy_code('initialize');
def.SFunctionName = 'sldemo_sfun_adder_cpp';
def.StartFcnSpec = 'createAdder()';
def.OutputFcnSpec = 'int32 y1 = adderOutput(int32 u1)';
def.TerminateFcnSpec = 'deleteAdder()';
def.HeaderFiles = {'adder_cpp.h'};
def.SourceFiles = {'adder_cpp.cpp'};
def.IncPaths = {'sldemo_lct_src'};
def.SrcPaths = {'sldemo_lct_src'};
def.Options.language = 'C++';
def.Options.useTlcWithAccel = false;
```

Generating and Compiling an S-Function for Use During Simulation

The function `legacy_code()` is called again with the first input set to 'generate_for_sim' in order to automatically generate and compile the C-MEX S-function according to the description provided by the input argument 'def'. This S-function is used to call the legacy functions in simulation. The source code for the S-function is found in the file `sldemo_sfun_adder_cpp.cpp`.

```
legacy_code('generate_for_sim', def);
```

```

Persistent Memory Within Legacy Functions

This example shows you how to use the Legacy Code Tool to integrate legacy C functions with instance specific persistent memory.

The Legacy Code Tool allows you to:

- Provide the legacy function specification,
- Generate a C-MEX S-function that is used during simulation to call the legacy code, and
- Compile and build the generated S-function for simulation.

Providing the Legacy Function Specification

Functions provided with the Legacy Code Tool take a specific data structure or array of structures as the argument. The data structure is initialized by calling the function `legacy_code()` using 'initialize' as the first input. After initializing the structure, you have to assign its properties to values corresponding to the legacy code being integrated. For detailed help on the properties, call `legacy_code('help')`. The prototype of the legacy functions being called in this example are:

```
void memory_bus_init(COUNTERBUS *mem, int32_T upper_sat, int32_T lower_sat);

void memory_bus_step(COUNTERBUS *input, COUNTERBUS *mem, COUNTERBUS *output);
```

where `mem` is an instance specific persistent memory for applying a one integration step delay. `COUNTERBUS` is a struct typedef defined in `counterbus.h` and implemented with a Simulink.Bus object in the base workspace. The legacy source code is found in the files `memory_bus.h`, and `memory_bus.c`.

```
evalin('base','load sldemo_lct_data.mat')
```

```
% sldemo_sfun_work
def = legacy_code('initialize');
def.SFunctionName = 'sldemo_sfun_work';
def.InitializeConditionsFcnSpec = 'void memory_bus_init(COUNTERBUS work1[1], int32 p1, int32 p2)';
def.OutputFcnSpec = 'void memory_bus_step(COUNTERBUS u1[1], COUNTERBUS work1[1], COUNTERBUS y1[1])';
def.HeaderFiles = {'memory_bus.h'};
def.SourceFiles = {'memory_bus.c'};
def.IncPaths = {'sldemo_lct_src'};
def.SrcPaths = {'sldemo_lct_src'};
```

Generating and Compiling an S-Function for Use During Simulation

The function `legacy_code()` is called again with the first input set to 'generate_for_sim' in order to automatically generate and compile the C-MEX S-function according to the description provided by the input argument 'def'. This S-function is used to call the legacy functions in simulation. The source code for the S-function is found in the file `sldemo_sfun_work.c`.

```
legacy_code('generate_for_sim', def);
```

```
### Start Compiling sldemo_sfun_work
mex('-IB:\matlab\toolbox\simulink\simdemos\simfeatures\sldemo_lct_src', '-IC:\TEMP\Bdoc20a1...
Building with 'Microsoft Visual C++ 2017 (C)'.
MEX completed successfully.

```

```
Building with 'Microsoft Visual C++ 2017 (C)'.
MEX completed successfully.
### Finish Compiling sldemo_sfund_work
### Exit
```

Generating an `rtwmakecfg.m` File for Code Generation

After the TLC block file is created, the function `legacy_code()` can be called again with the first input set to `'rtwmakecfg_generate'` in order to generate an `rtwmakecfg.m` file to support code generation through Simulink® Coder™. Generate the `rtwmakecfg.m` file if the required source and header files for the S-functions are not in the same directory as the S-functions, and you want to add these dependencies in the makefile produced during code generation.

Note: Complete this step only if you are going to simulate the model in accelerated mode.

```
legacy_code('rtwmakecfg_generate', def);
```

Generating a Masked S-Function Block for Calling the Generated S-Function

After the C-MEX S-function source is compiled, the function `legacy_code()` can be called again with the first input set to `'slblock_generate'` in order to generate a masked S-function block that is configured to call that S-function. The block is placed in a new model and can be copied to an existing model.

```
% legacy_code('slblock_generate', def);
```

Demomg the Generated Integration with Legacy Code

The model `sldemo_lct_work` shows integration with the legacy code. The subsystem `memory_bus` serves as a harness for the call to the legacy C function.

```
open_system('sldemo_lct_work')
open_system('sldemo_lct_work/memory_bus')
sim('sldemo_lct_work')
```

```
ans =
```

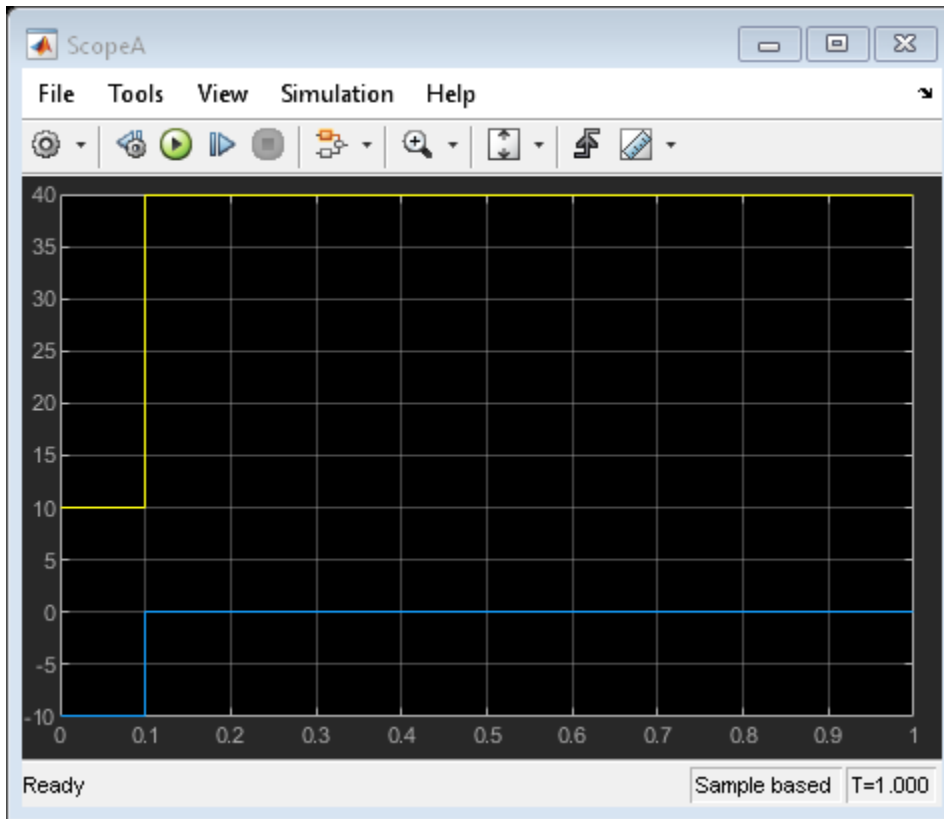

```
Simulink.SimulationOutput:
  ScopeDataA: [11x3 double]
  tout: [11x1 double]

SimulationMetadata: [1x1 Simulink.SimulationMetadata]
ErrorMessage: [0x0 char]
```

This legacy function apply a one integration step delay. The output is the previous input value. The parameters P1 and P2 set the initial values of the sub structure fields "upper_saturation_limit" and "lower_saturation_limit"

Multi-Dimensional Signals in Legacy Functions

This example shows you how to use the Legacy Code Tool to integrate legacy C functions with Multi-Dimensional Signals.

The Legacy Code Tool allows you to:

- Provide the legacy function specification,
- Generate a C-MEX S-function that is used during simulation to call the legacy code, and
- Compile and build the generated S-function for simulation.

Providing the Legacy Function Specification

Functions provided with the Legacy Code Tool take a specific data structure or array of structures as the argument. The data structure is initialized by calling the function `legacy_code()` using 'initialize' as the first input. After initializing the structure, you have to assign its properties to values corresponding to the legacy code being integrated. For detailed help on the properties, call `legacy_code('help')`. The prototype of the legacy functions being called in this example are:

```
void array3d_add(real_T *y1, real_T *u1, real_T *u2, int32_T nbRows, int32_T nbCols, int32_T nbPages);
```

where `real_T` is a typedef to `double`, and `int32_T` is a typedef to a 32-bit integer. The legacy source code is found in the files `ndarray_ops.h`, and `ndarray_ops.c`.

```
% sldemo_sfun_ndarray_add
def = legacy_code('initialize');
def.SFunctionName = 'sldemo_sfun_ndarray_add';
def.OutputFcnSpec = ['void array3d_add(double y1[size(u1,1)][size(u1,2)][size(u1,3)], ', ...
                    'double u1[][][], double u2[][][], ' ...
                    'int32 size(u1,1), int32 size(u1,2), int32 size(u1,3))'];
def.HeaderFiles   = {'ndarray_ops.h'};
def.SourceFiles   = {'ndarray_ops.c'};
def.IncPaths      = {'sldemo_lct_src'};
def.SrcPaths      = {'sldemo_lct_src'};
```

where `y1` is a 3-D output signal of same dimensions as the 3-D input signal `u1`. Note that the last 3 arguments passed to the legacy function correspond to the number of element in each dimension of the 3-D input signal `u1`.

Generating and Compiling an S-Function for Use During Simulation

The function `legacy_code()` is called again with the first input set to 'generate_for_sim' in order to automatically generate and compile the C-MEX S-function according to the description provided by the input argument 'def'. This S-function is used to call the legacy functions in simulation. The source code for the S-function is found in the file `sldemo_sfun_ndarray_add.c`.

```
legacy_code('generate_for_sim', def);
```

```
### Start Compiling sldemo_sfun_ndarray_add
mex('-IB:\matlab\toolbox\simulink\simdemos\simfeatures\sldemo_lct_src', '-IC:\TEMP\Bdoc20a_1
Building with 'Microsoft Visual C++ 2017 (C)'.
MEX completed successfully.
mex('sldemo_sfun_ndarray_add.c', '-IB:\matlab\toolbox\simulink\simdemos\simfeatures\sldemo_l
```

```
Building with 'Microsoft Visual C++ 2017 (C)'.
MEX completed successfully.
### Finish Compiling sldemo_sfundarray_add
### Exit
```

Generating an rtwmakecfg.m File for Code Generation

After the TLC block file is created, the function `legacy_code()` can be called again with the first input set to `rtwmakecfg_generate` in order to generate an `rtwmakecfg.m` file to support code generation through Simulink® Coder™. Generate the `rtwmakecfg.m` file if the required source and header files for the S-functions are not in the same directory as the S-functions, and you want to add these dependencies in the makefile produced during code generation.

Note: Complete this step only if you are going to simulate the model in accelerated mode.

```
legacy_code('rtwmakecfg_generate', def);
```

Generating a Masked S-Function Block for Calling the Generated S-Function

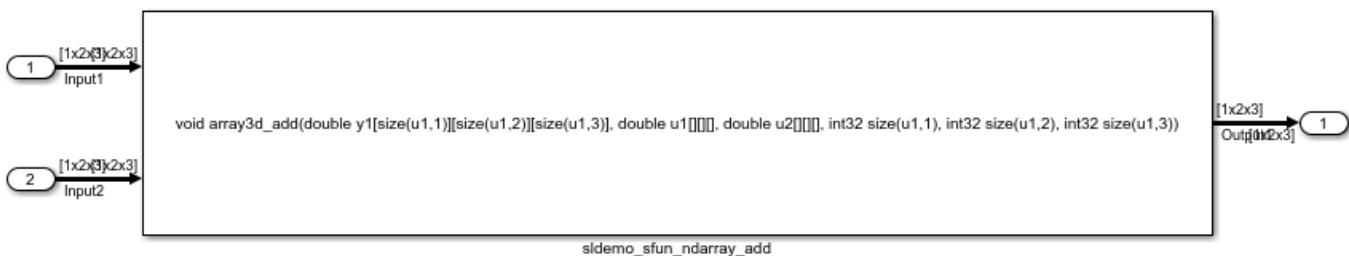

After the C-MEX S-function source is compiled, the function `legacy_code()` can be called again with the first input set to `slblock_generate` in order to generate a masked S-function block that is configured to call that S-function. The block is placed in a new model and can be copied to an existing model.

```
% legacy_code('slblock_generate', def);
```

Demoing the Generated Integration with Legacy Code

The model `sldemo_lct_ndarray` shows integration with the legacy code. The subsystem `ndarray_add` serves as a harness for the call to the legacy C function.

```
open_system('sldemo_lct_ndarray')
open_system('sldemo_lct_ndarray/ndarray_add')
sim('sldemo_lct_ndarray');
```

This legacy function computes the addition of the 2 input signals:

- Input1 and Input2 are dynamically sized 3D arrays
- Output1 is a dynamically sized 3D array of same size as Input1
- the last 3 function's arguments allow to pass the Input1's dimensions to the legacy function

Complex Signals in Legacy Function

This example shows you how to use the Legacy Code Tool to integrate legacy C functions using complex signals.

The Legacy Code Tool allows you to:

- Provide the legacy function specification,
- Generate a C-MEX S-function that is used during simulation to call the legacy code, and
- Compile and build the generated S-function for simulation.

Providing the Legacy Function Specification

Functions provided with the Legacy Code Tool take a specific data structure or array of structures as the argument. The data structure is initialized by calling the function `legacy_code()` using 'initialize' as the first input. After initializing the structure, you have to assign its properties to values corresponding to the legacy code being integrated. For detailed help on the properties, call `legacy_code('help')`. The prototype of the legacy functions being called in this example is:

```
void cplx_gain(creal_T *input, creal_T *gain, creal_T *output);
```

where `creal_T` is the complex representation of a double. The legacy source code is found in the files `cplxgain.h`, and `cplxgain.c`.

```
% sldemo_sfun_gain_scalar
def = legacy_code('initialize');
def.SFunctionName = 'sldemo_sfun_cplx_gain';
def.OutputFcnSpec = 'void cplx_gain(complex<double> u1[1], complex<double> p1[1], complex<double>';
def.HeaderFiles = {'cplxgain.h'};
def.SourceFiles = {'cplxgain.c'};
def.IncPaths = {'sldemo_lct_src'};
def.SrcPaths = {'sldemo_lct_src'};
```

Generating and Compiling an S-Function for Use During Simulation

The function `legacy_code()` is called again with the first input set to 'generate_for_sim' in order to automatically generate and compile the C-MEX S-function according to the description provided by the input argument 'def'. This S-function is used to call the legacy functions in simulation. The source code for the S-function is found in the file `sldemo_sfun_cplx_gain.c`.

```
legacy_code('generate_for_sim', def);

### Start Compiling sldemo_sfun_cplx_gain
mex('-IB:\matlab\toolbox\simulink\simdemos\simfeatures\sldemo_lct_src', '-IC:\TEMP\Bdoc20a_1
Building with 'Microsoft Visual C++ 2017 (C)'.
MEX completed successfully.
mex('sldemo_sfun_cplx_gain.c', '-IB:\matlab\toolbox\simulink\simdemos\simfeatures\sldemo_lct
Building with 'Microsoft Visual C++ 2017 (C)'.
MEX completed successfully.
### Finish Compiling sldemo_sfun_cplx_gain
### Exit
```

Generating an `rtwmakecfg.m` File for Code Generation

After the TLC block file is created, the function `legacy_code()` can be called again with the first input set to 'rtwmakecfg_generate' in order to generate an `rtwmakecfg.m` file to support code generation

through Simulink® Coder™. Generate the `rtwmakecfg.m` file if the required source and header files for the S-functions are not in the same directory as the S-functions, and you want to add these dependencies in the makefile produced during code generation.

Note: Complete this step only if you are going to simulate the model in accelerated mode.

```
legacy_code('rtwmakecfg_generate', def);
```

Generating a Masked S-Function Block for Calling the Generated S-Function

After the C-MEX S-function source is compiled, the function `legacy_code()` can be called again with the first input set to `'slblock_generate'` in order to generate a masked S-function block that is configured to call that S-function. The block is placed in a new model and can be copied to an existing model.

```
% legacy_code('slblock_generate', def);
```

Demoing the Generated Integration with Legacy Code

The model `sldemo_lct_cplxgain` shows integration with the legacy code. The subsystem `complex_gain` serves as a harness for the call to the legacy C function via the generate S-function.

```
if isempty(find_system('SearchDepth',0,'Name','sldemo_lct_cplxgain'))
    open_system('sldemo_lct_cplxgain')
    open_system('sldemo_lct_cplxgain/complex_gain')
    sim('sldemo_lct_cplxgain');
end
```

Specified or Inherited Sample Time with Legacy Functions

This example shows you how to use the Legacy Code Tool to integrate legacy C functions with the sample time specified, inherited and parameterized.

The Legacy Code Tool allows you to:

- Provide the legacy function specification,
- Generate a C-MEX S-function that is used during simulation to call the legacy code, and
- Compile and build the generated S-function for simulation.

Providing the Legacy Function Specification

Functions provided with the Legacy Code Tool take a specific data structure or array of structures as the argument. The data structure is initialized by calling the function `legacy_code()` using 'initialize' as the first input. After initializing the structure, you have to assign its properties to values corresponding to the legacy code being integrated. For detailed help on the properties, call `legacy_code('help')`. The prototypes of the legacy functions being called in this example are:

```
FLT gainScalar(const FLT in, const FLT gain)
```

where FLT is a typedef to float. The legacy source code is found in the files `your_types.h`, `gain.h`, and `gainScalar.c`.

```
defs = [];
```

```
% sldemo_sfun_st_inherited
def = legacy_code('initialize');
def.SFunctionName = 'sldemo_sfun_st_inherited';
def.OutputFcnSpec = 'single y1 = gainScalar(single u1, single p1)';
def.HeaderFiles = {'gain.h'};
def.SourceFiles = {'gainScalar.c'};
def.IncPaths = {'sldemo_lct_src'};
def.SrcPaths = {'sldemo_lct_src'};
defs = [defs; def];
```

```
% sldemo_sfun_st_fixed
def = legacy_code('initialize');
def.SFunctionName = 'sldemo_sfun_st_fixed';
def.OutputFcnSpec = 'single y1 = gainScalar(single u1, single p1)';
def.HeaderFiles = {'gain.h'};
def.SourceFiles = {'gainScalar.c'};
def.IncPaths = {'sldemo_lct_src'};
def.SrcPaths = {'sldemo_lct_src'};
def.SampleTime = [2 1];
defs = [defs; def];
```

```
% sldemo_sfun_st_parameterized
def = legacy_code('initialize');
def.SFunctionName = 'sldemo_sfun_st_parameterized';
def.OutputFcnSpec = 'single y1 = gainScalar(single u1, single p1)';
def.HeaderFiles = {'gain.h'};
def.SourceFiles = {'gainScalar.c'};
def.IncPaths = {'sldemo_lct_src'};
def.SrcPaths = {'sldemo_lct_src'};
```

```
def.SampleTime = 'parameterized';
defs = [defs; def];
```

Generating and Compiling an S-Function for Use During Simulation

The function `legacy_code()` is called again with the first input set to `'generate_for_sim'` in order to automatically generate and compile the C-MEX S-function according to the description provided by the input argument `'defs'`. This S-function is used to call the legacy functions in simulation. The source code for the S-function is found in the file `sldemo_sfun_st_inherited.c` and `sldemo_sfun_st_fixed.c`, `sldemo_sfun_st_parameterized.c`.

```
legacy_code('generate_for_sim', defs);
```

```
### Start Compiling sldemo_sfun_st_inherited

Generating an `rtwmakecfg.m` File for Code Generation

After the TLC block file is created, the function `legacy_code()` can be called again with the first input set to `'rtwmakecfg_generate'` in order to generate an `rtwmakecfg.m` file to support code generation through Simulink® Coder™. Generate the `rtwmakecfg.m` file if the required source and header files for the S-functions are not in the same directory as the S-functions, and you want to add these dependencies in the makefile produced during code generation.

Note: Complete this step only if you are going to simulate the model in accelerated mode.

```
legacy_code('rtwmakecfg_generate', def);
```

Generating Masked S-Function Blocks for Calling the Generated S-Functions

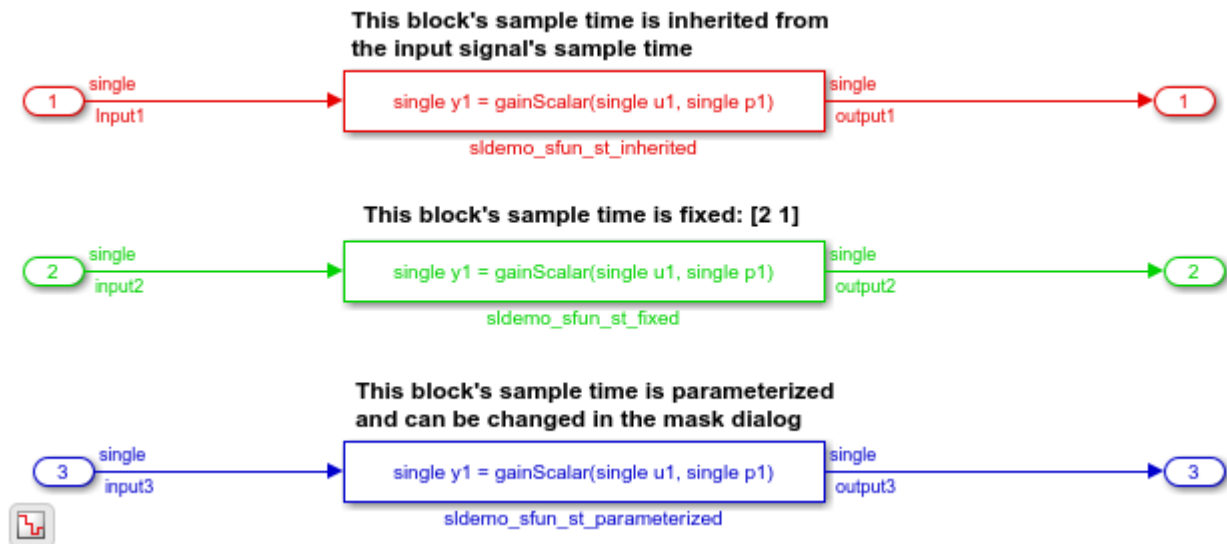

After the C-MEX S-function source is compiled, the function `legacy_code()` can be called again with the first input set to `'slblock_generate'` in order to generate masked S-function blocks which are configured to call those S-functions. The blocks are placed in a new model and can be copied to an existing model.

```
% legacy_code('slblock_generate', defs);
```

Demoing the Generated Integration with Legacy Code

The model `sldemo_lct_sampletime` shows integration with the legacy code. The subsystem `sample_time` serves as a harness for the calls to the legacy C functions, with unit delays serving to store the previous output values.

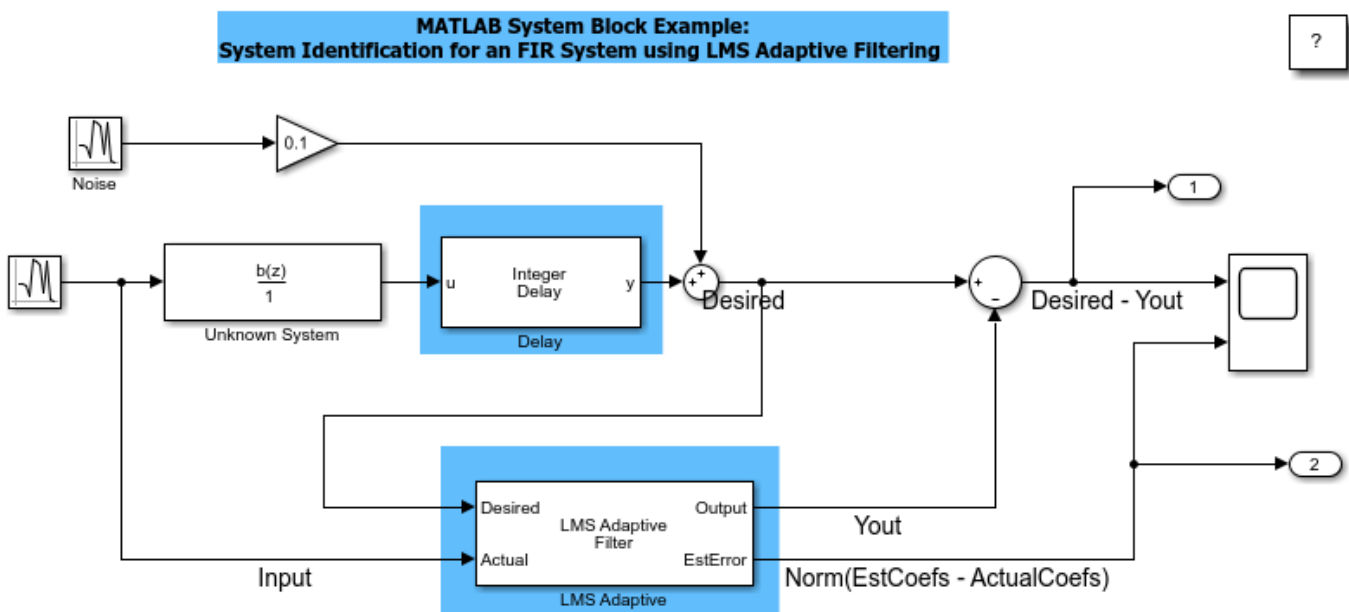

```
open_system('sldemo_lct_sampletime')
open_system('sldemo_lct_sampletime/sample_time')
sim('sldemo_lct_sampletime');
```

System Identification for an FIR System Using MATLAB System Blocks

This example shows how to use the MATLAB System block to implement Simulink® blocks using a System object™. It highlights two MATLAB System blocks. Access the MATLAB source code for each System object by clicking the "Source Code" hyperlink from the block dialog.

- The Delay block uses a System object that has direct feedthrough set to false. This implies that the System object does not directly use the input to compute the output. Therefore, the Delay block could be safely used in a feedback system without introducing an algebraic loop.
- The LMS Adaptive Filter block estimates the coefficients of an unknown system (formed by the Unknown System and Delay blocks). Its inputs are the desired signal and the actual signal. Its outputs are the estimated signal and the vector norm of the error in the estimated coefficients.
- The Scope displays the error in the estimated signal and the vector norm of the error in the estimated coefficients.

MATLAB System Block with Variable-Size Input and Output Signals

This example shows how to use the MATLAB System block to create Simulink® blocks with variable-size input and output signals.

It highlights two MATLAB System blocks. Both blocks use the same System object™ whose MATLAB source code you can access by clicking the "Source Code" hyperlink from the block dialog.

This System object inherits from the interface classes `matlab.System` and `matlab.system.mixin.Propagates`. The interface class `matlab.System` is required for all System objects. To use variable-size signals with a MATLAB System block, also inherit your System object from `matlab.system.mixin.Propagates`.

The System object specifies whether each output is fixed-size or variable-size. It also specifies the size, type, and complexity of each output. The output signals of the block represent the linear indices and elements of the input that conform to the condition specified in the block dialog.

Copyright 2013 The MathWorks, Inc.

Illustration of Law of Large Numbers

This example shows how to use MATLAB System blocks to illustrate the law of large numbers.

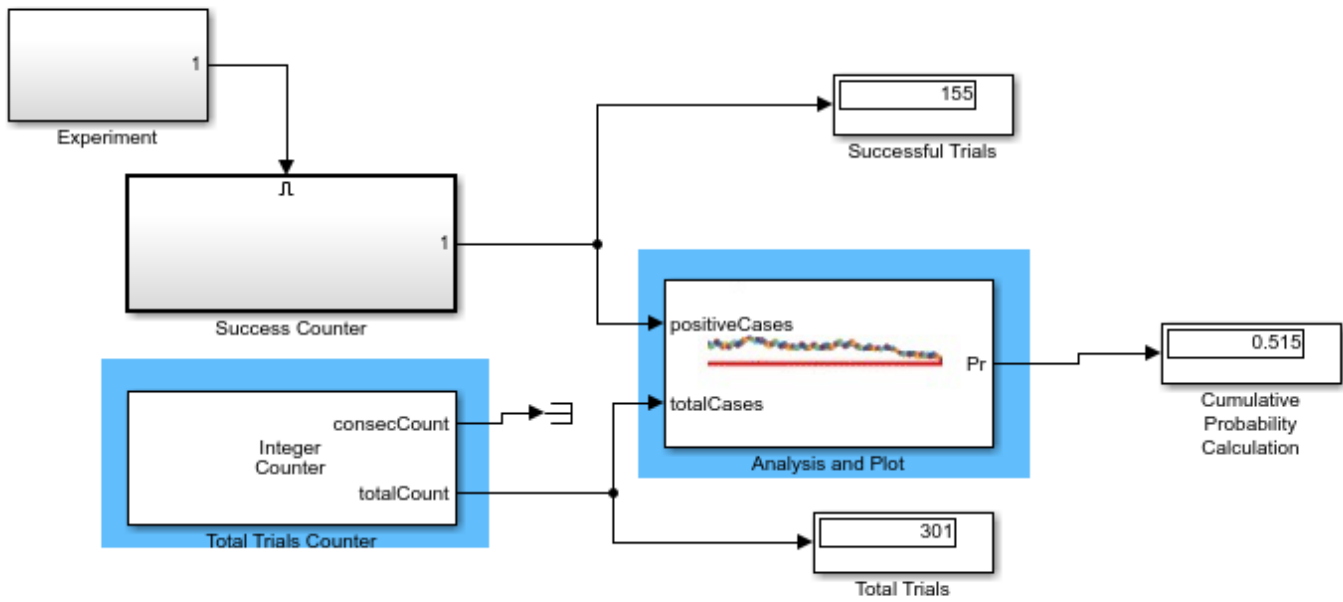

The law of large numbers states that the cumulative average probability of an event approaches the expected value as the number of trials approaches infinity. You can see this in the generated plot.

A Uniform Random Number block connected to Compare To Constant block acts as a Bernoulli trial. The example uses the high value as successful outcome of the experiment.

This example highlights the use of MATLAB System block as follows:

- The Success Counter counts the number of successful trials. The Total Trials Counter counts the total number of trials. Both blocks use the same System object™. This System object is a source block that uses the "resetImpl" method to count the number of times the block has run at consecutive time steps.
- The Analysis and Plot block calculates the average probability and plots it. It uses a System object that inherits from the interface classes `matlab.System` and `matlab.system.mixin.Propagates`. The interface class `matlab.System` is required for all System objects. To use features not supported for code generation, such as unsupported functions, inherit your System object from `matlab.system.mixin.Propagates`. As a result, this block cannot simulate in "Code generation" mode. It must simulate in "Interpreted execution" mode.
- The two MATLAB System blocks use custom icons. The Analysis and Plot block uses an image file icon. The Total Trials Counter block uses a multiline text icon. The "getIconImpl" methods of the corresponding System objects define these custom icons.

MATLAB System Block Example: Illustration of Law of Large Numbers

Using Buses with MATLAB System Blocks

This example shows how to use buses as inputs and outputs to the MATLAB System block.

- The Gain block uses a System object™ that applies the gain specified in the block to the bus elements 'a' and 'b' of the incoming bus. The output of the block is the same bus type as the input.
- The Math Operations block uses a System object that computes the sum, product, and difference between the two bus elements 'a' and 'b' of the input bus. The output of the block is a bus with three elements: 'sum', 'prod', and 'diff'.
- Note, if a System block output bus is the same type as the input bus, you must still specify the output bus name in the 'getOutputDataTypeImpl' method. This is because the 'propagatedInputDataType' method does not return the input bus object during bus propagation.
- Before model initialization, all bus types used as either inputs or outputs to the MATLAB System block must be available in the MATLAB base workspace.

Run Quality Checks on S-Functions

This example demonstrates how to use S-Function analyzer APIs to check S-functions, in order to identify potential problems and improvements.

The S-Function analyzer MATLAB command line APIs consist of:

- **Simulink.sfunction.Analyzer** - The class used to launch S-function analyzer and get analysis results.
- **Simulink.sfunction.analyzer.BuildInfo** - The class used to create an object to specify the build information for an S-function.
- **Simulink.sfunction.analyzer.Options** - The class used to specify the running options for S-function Analyzer.
- **Simulink.sfunction.analyzer.findSfunctions** - The static method to return all feasible S-functions in a model or library for S-function analyzer.

See the help for more detailed information about the above APIs.

Specify the Input Model or Library (required)

The S-Function analyzer requires a model or a library in MATLAB path as input, which contains the S-function blocks to be analyzed.

```
model = 'slexSfunctionCheckExample';
```

Specify the Build Information for S-functions (optional)

S-Function analyzer checks the source code of S-functions when they are available. Heuristics are applied to automatically locate the source code based on S-function names. For example, if S-function source code and the input model are in the same folder, the source code will be included in the analysis automatically. Otherwise, the build information has to be specified through `Simulink.sfunction.analyzer.BuildInfo`. If no source code is available, this section can be skipped.

To specify the build information, first determine the eligible S-functions in the input model, then create a `Simulink.sfunction.analyzer.BuildInfo` object for each S-function. For S-function `slexBadSFcn`, there are two associated source files: `slexBadSFcn.c` and `slexBadSFcn_wrapper.c`

```
sfunctions= Simulink.sfunction.analyzer.findSfunctions(model);
bdInfo= Simulink.sfunction.analyzer.BuildInfo(fullfile(matlabroot, 'toolbox', 'simulink', 'simdemos',
    'ExtraSrcFileList', {'slexBadSFcn_wrapper.c'}, ...
    'SrcPaths', {fullfile(matlabroot, 'toolbox', 'simulink', 'simdemos', 'ExtraSrcFileList', 'slexBadSFcn_wrapper.c')});
```

Specify the Running Options for S-function Analyzer (optional)

The execution options for S-function analyzer can be configured through `Simulink.sfunction.analyzer.Options` object, such as whether to enable Polyspace checks and Parameter Robustness checks, model simulation timeout, and output path for result report. If no specific options are needed, this section can be skipped. All default options will be applied.

```
opts = Simulink.sfunction.analyzer.Options();
opts.EnableRobustness = 1;
```

Run the S-function Analyzer and See the Result (required)

```
sfunAnalyzer = Simulink.sfunction.Analyzer(model, 'BuildInfo', {bdInfo}, 'Options', opts);  
analysisResult=sfunAnalyzer.run();  
sfunAnalyzer.generateReport();
```

Interpolation Algorithm Selection and Trajectory Animation

This example shows how to use a dynamic comet plot to visualize the result of changing the interpolation and extrapolation options for a 2-D data set running in an-D Lookup Table block. Algorithm options can be employed in different situations to tradeoff accuracy, smoothness, data size, and performance.

Try opening the model and using the lookup table block's dialog to change the interpolation and extrapolation algorithms. A copy of the dialog is embedded in the right hand pane in the Model Explorer and will show up after the first simulation. You can enter and tweak values for the entire model and its blocks from the Model Explorer, including settings for model configuration parameters, Simulink blocks, Stateflow® charts, and Simulink® Coder™ settings for code generation and data management.

To make the plot, data from the simulation is logged using the non-intrusive logging features. Non-intrusive logging is annotated on the block diagram by the small blue "transmitter antennas" on certain block output ports. These logging points can be set in three ways: from the MATLAB® command line using `set_param()`, from the Diagram > Signals & Ports > Signal & Scope Manager, and from the signal properties dialog.

Lookup Table algorithm selection demo

- Run the model
- Use the "Rotate 3-D" button on the figure toolbar to grab, rotate, and view the surface
- Change interpolation/extrapolation in the Model Explorer
- Re-run the model to see the effects

Copyright 1990-2012 The MathWorks, Inc.

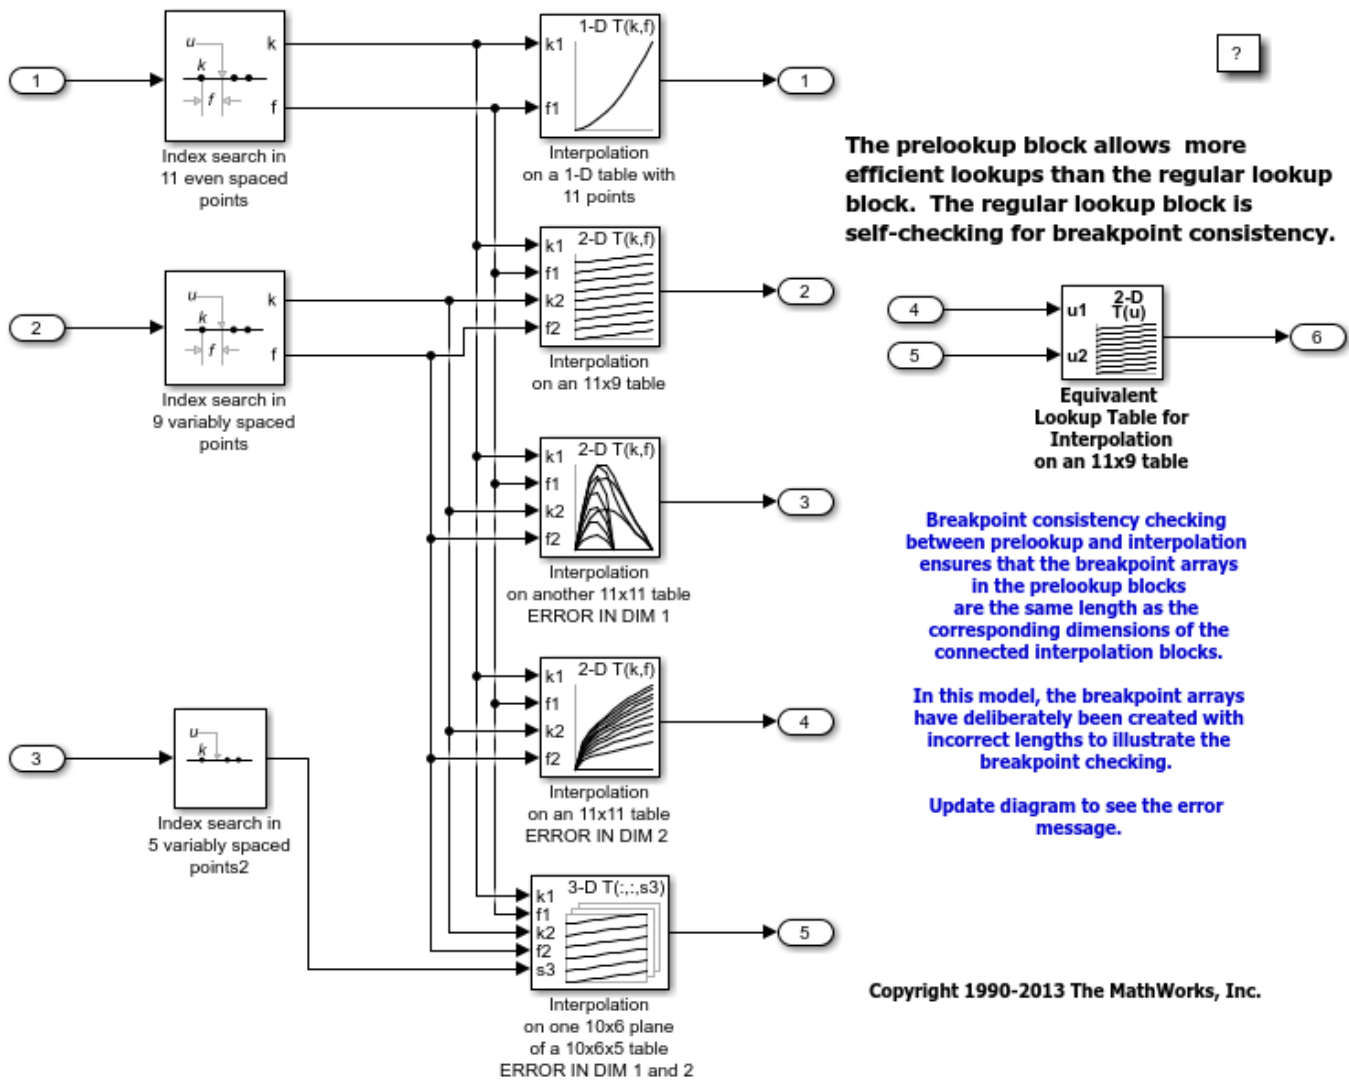

Using the Prelookup and Interpolation Blocks

The Prelookup block allows you to minimize the number of index searches performed across a set of look-up tables and also to mix clipping, extrapolation, and index search algorithms within one table calculation.

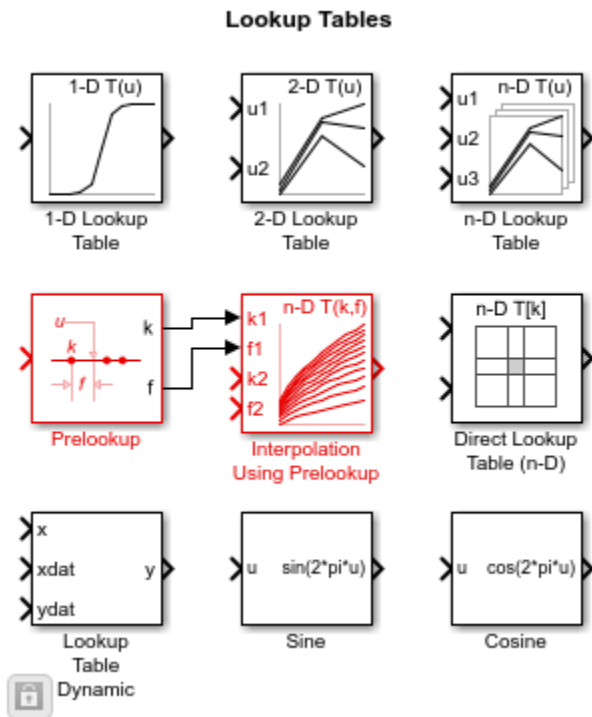

Introduction

This model uses Prelookup and Interpolation Using Prelookup blocks. Note how the Prelookup blocks perform the index search portion of the computation and the Interpolation Using Prelookup blocks perform the rest:

Open the model

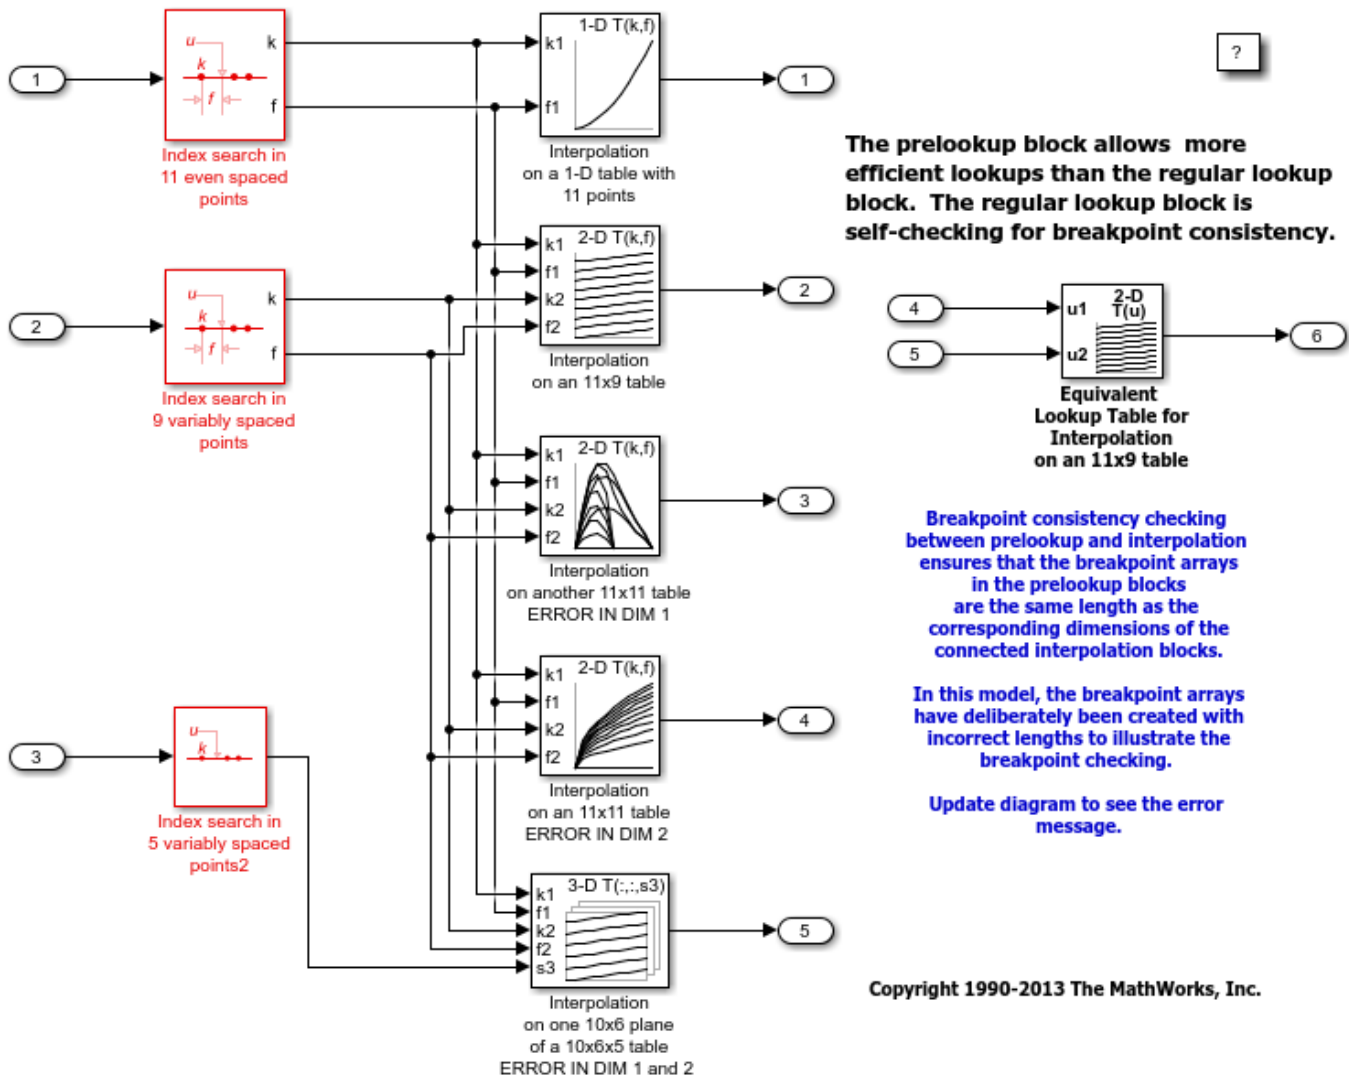

These blocks can be found in the Simulink® block library in the Lookup Tables sub-library:

Optimization: PreLookup + Interpolation Using Prelookup Blocks

Use of the PreLookup block should be considered for tables with intensive index searches in breakpoint sets. The Prelookup blocks allow you to perform an index search once and reuse the result in many table lookups. In this model, 3 index search results are used in 5 blocks in a total of 10 uses. Equivalent regular lookup tables such as the example to the right would have required 10 index searches instead of 3.

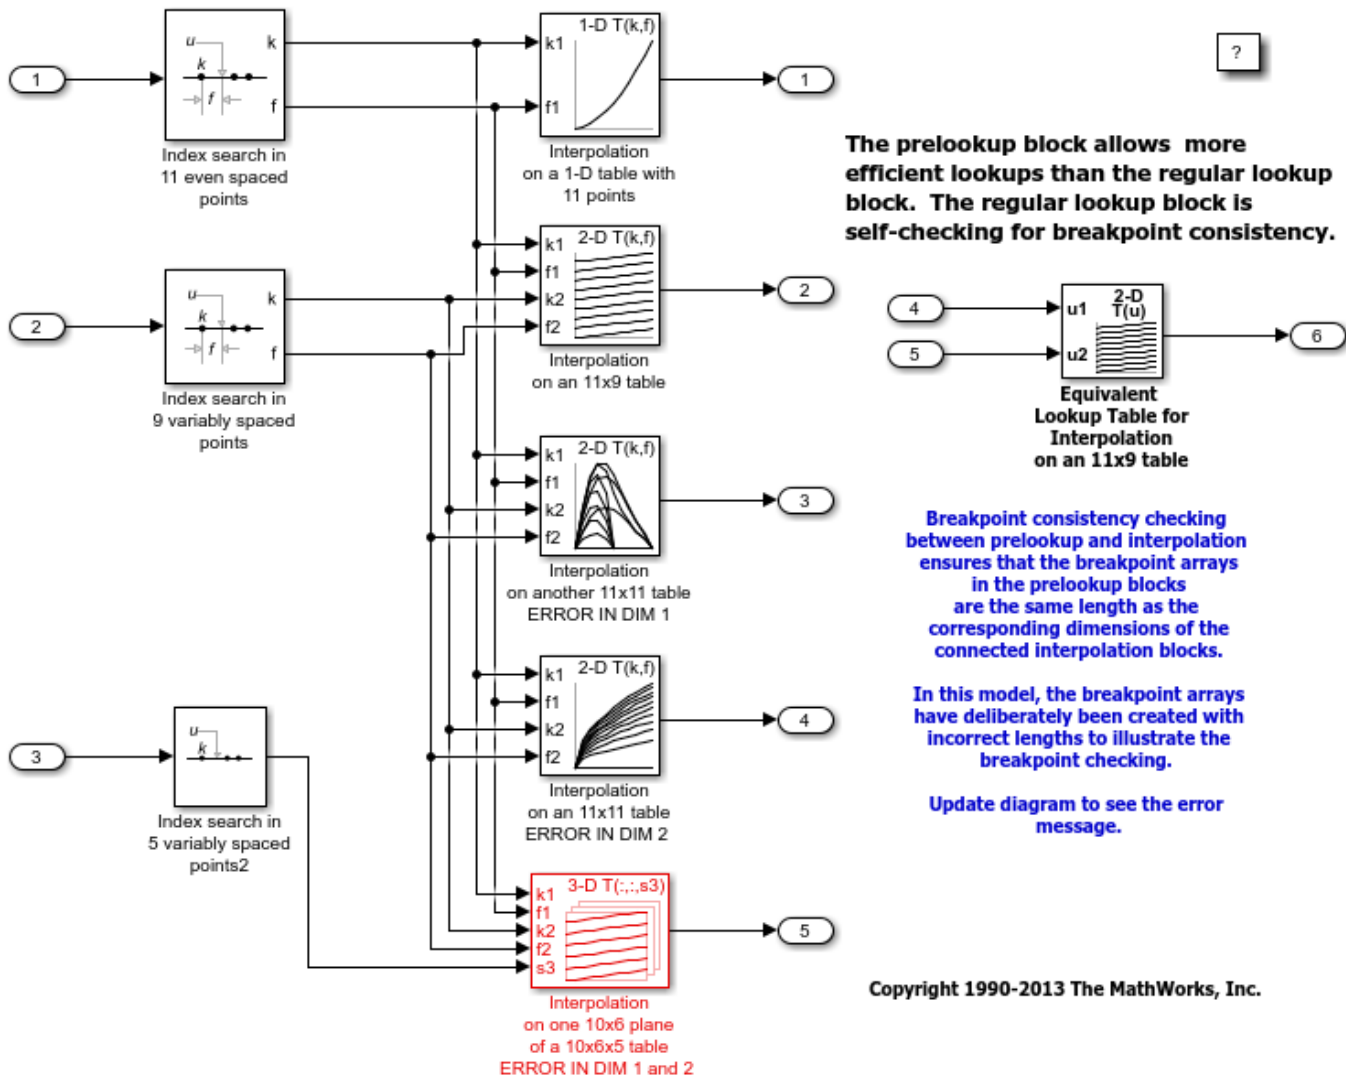

Optimization: Sub-table Selection Option in the Interpolation Using Prelookup Blocks

One of the Interpolation blocks in this model is configured using a capability: trailing dimensions of an n-D table can be marked as "selection dimensions", meaning that the input for that dimension is an integer used only to make a sub-table selection, such as picking a 2-D plane from a 3-D table. The sub-table is then interpolated normally.

Interpolation of sub-tables can save tremendous amounts of computation. For every dimension eliminated from interpolation, the computation almost halves. Since an N-dimensional interpolation takes $(2^N) - 1$ individual interpolation operations ($y = y_{low} + f \cdot (y_{high} - y_{low})$), even just one dimension of selection can almost double the speed of the interpolation. Extreme example: a 5-D table with 3 dimensions of sub-table selection and 2-D interpolation: 5-D interpolation would take $2^5 - 1 = 31$ interpolations, but a 2-D interpolation takes only $2^2 - 1 = 3$.

The selection ports support vectorization to allow multiple sub-table selection / interpolations in a single block.

The sub-table or multi-table mode of operation is activated by setting a positive integer for the Number of sub-table selections dimensions parameter in the block's parameter dialog. The number you set is interpreted as the number of dimensions to select from the highest dimensions. For example, if you have a 3-D table and choose 2, that means the first dimension will be interpolated and dimensions 2 and 3 will be selected:

NOTE: you can remove highlighting from a model using the View / Remove highlighting menu item or this command:

```
set_param mdl, 'HiliteAncestors', 'none'
```

Breakpoint and Table Data Consistency Checking

Using Prelookup and Interpolation Using Prelookup blocks introduces a need to ensure that the length of the 'Breakpoint data' parameter in the Prelookup blocks matches the corresponding dimension of the 'Table data' parameter in the connected Interpolation Using Prelookup blocks.

Simulink always checks the consistency between the two blocks when updating the block diagram. Simulink reports errors if it encounters inconsistent breakpoint and table data. For example:

```
try
    evalc(['sim(', mdl, ')']);
catch E
    disp(['Error:', E.message]);
end
```

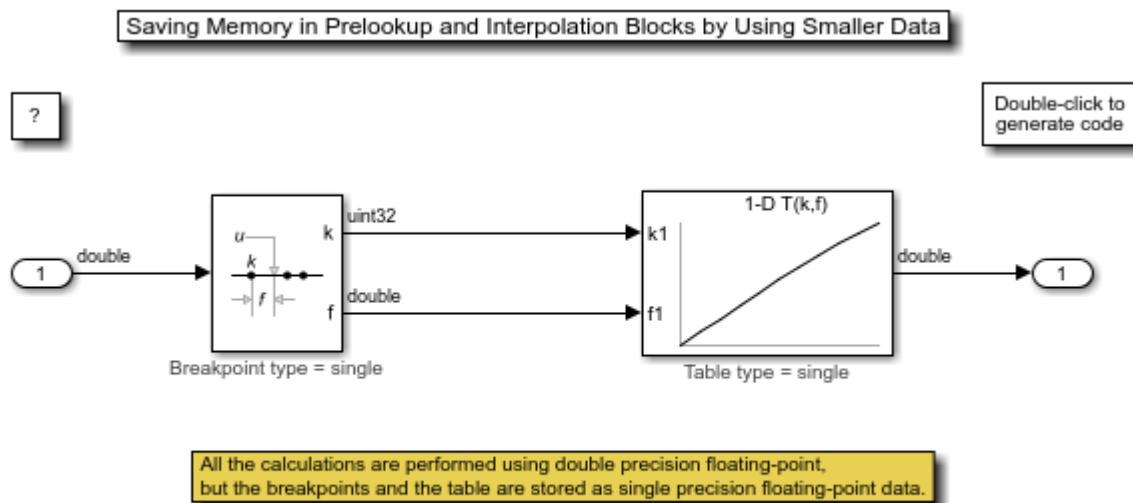

Error:The range of values for input port k2 of block '[k2](matlab:open_and_hilite_hyperlink)' is not consistent with the table data.

Saving Memory in Prelookup and Interpolation Blocks by Using Smaller Data

This example shows how to save memory in Prelookup and Interpolation blocks. The Prelookup and Interpolation Using Prelookup blocks allow the data type storing breakpoints and table data to be set explicitly. Note that the Prelookup block allows the breakpoint data to differ from the input data type, and the Interpolation Using Prelookup block allows the table data to differ from the output data type.

In this model, the breakpoints and table are stored using single precision floating-point data type, and the calculations are performed using double precision floating-point data type. This reduces the amount of breakpoint and table data memory by half.

To see this in the generated code, open the model and build it.

Model Advisor

This example shows the capabilities of the Model Advisor to check a model or subsystem for conditions and configuration settings that can result in inaccurate or inefficient simulation of the system represented by the model or generation of inefficient code from the model. The Model Advisor produces a report that lists all the suboptimal conditions or settings that it finds, suggesting better model configuration settings where appropriate.

The Model Advisor can be started through menus or the command line and can also be configured and used through a comprehensive API.

Simulink Model Discretizer

This interactive example discretizes the Actuator Model in an aircraft Simulink® model.

If you haven't already, open the Simulink aircraft model, `slexAircraftExample.slx`.

To open the Model Discretizer, in the Simulink Editor, on the **Apps** tab, under **Apps**, under **Control Systems**, click **Model Discretizer**. This opens the Model Discretizer.

The Simulink model window and the Model Discretizer GUI are laid out in the screen for easy navigation.

- The model tree is shown in the left panel of the Model Discretizer GUI.
- Discretization parameters are set through the right panel of the Model Discretizer GUI.
- Discretization status is shown in the lower part of the right panel.
- By default, only continuous blocks are shown in the Model Discretizer GUI.
- In the Simulink model window, blocks in red color are continuous blocks.

You can browse through the continuous blocks one by one using the model tree view. Select the View->Next continuous block menu in the Model Discretizer GUI. This causes the Actuator Model to be highlighted.

Before discretizing the Actuator Model block, set the discretization parameters: transform method, sample time, critical frequency. Critical frequency has to be specified if the transform method 'tustin with prewarping' is selected.

After setting the discretization parameters, select the Discretize->Discretize current block menu in the Model Discretizer GUI. Or you can just click the s->z button icon in the tool bar. The discretized Actuator Model is highlighted in blue color in the model.

By default, the Actuator Model was replaced by a discrete block beneath a continuous block dialog, allowing you to continue entering the Actuator Model parameters in the s-domain. Double click the Actuator Model in the model window. Two new fields 'Sample time' and 'Method' were added to the block dialog window. These parameters are used to automatically convert the continuous parameters to equivalent discrete parameters.

Introduction to Profiling Models

The following example, with the `slAccelDemoF14` model, illustrates the use of Simulink® Accelerator™ profiler feature.

Activating the Profiler

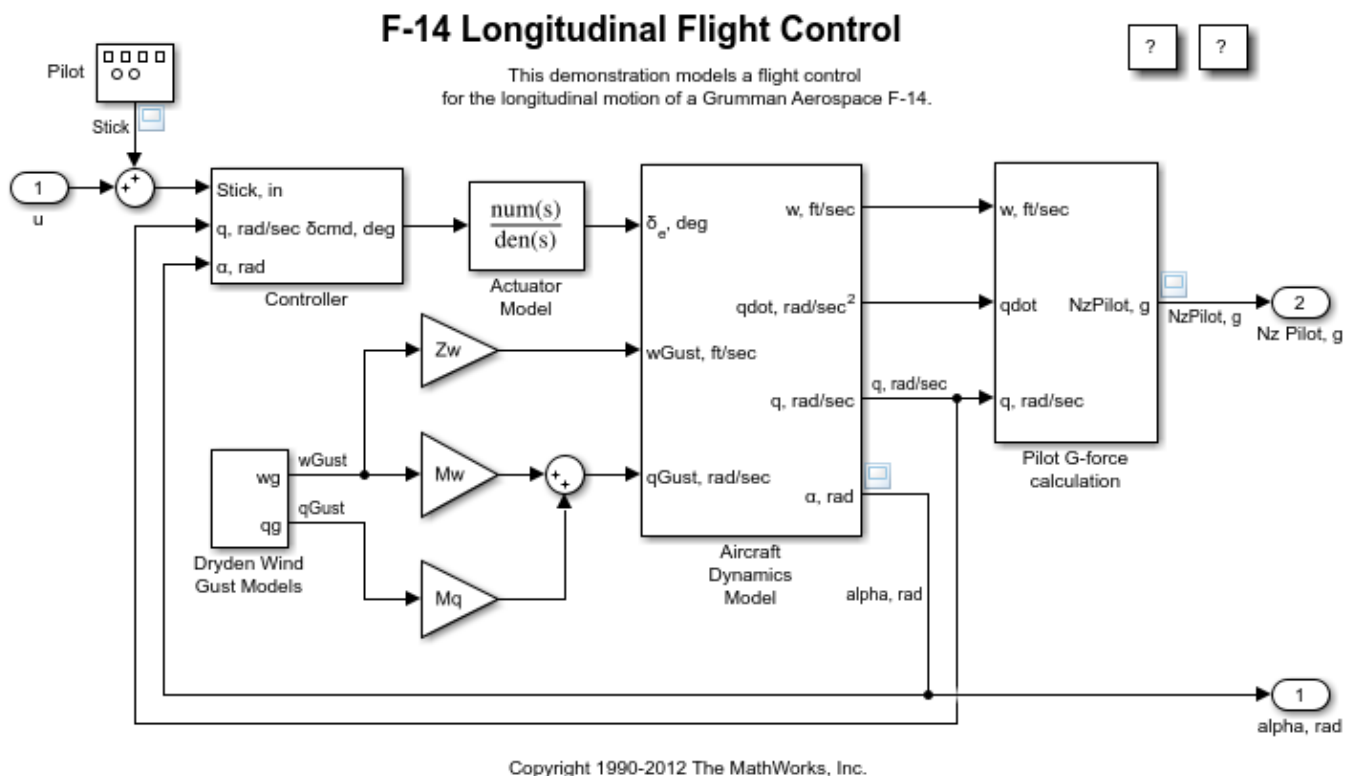

To activate the Simulink® Profiler, in the Simulink Editor, on the **Debug** tab, under **Performance Advisor**, click **Activate Profiler**. You can also issue a `set_param` command at the MATLAB® command prompt.

```
modelName = 'slAccelDemoF14';
load_system(modelName)
set_param(modelName, 'Profile', 'on')
```

Running the Simulation

While the simulation runs, the profiler is collecting data for the report. Once the simulation is complete it creates an HTML report.

```
open_system(modelName)
sim(modelName);
```

Viewing the Report

The generated report consists of a summary HTML-files. Hyperlinks in the summary enable you to review the detailed timing information for each function.

reset	0.000	1

Cleaning Up

Close the model.

```
bdclose(modelName)
```

Introduction to Accelerating Models

Simulink® Accelerator™ speeds up the execution of your model, by creating and compiling C code that takes the place of the interpretive code that Simulink uses when in Normal mode (that is, when Simulink® is not in Accelerator mode). Simulink Accelerator generates the C code from your Simulink model and invokes the MATLAB® mex function to compile and dynamically link the generated code to Simulink. This code generation and compilation process happens the first time you accelerate the model and any time the model changes are significant enough to require re-generation (for example, the addition of a block).

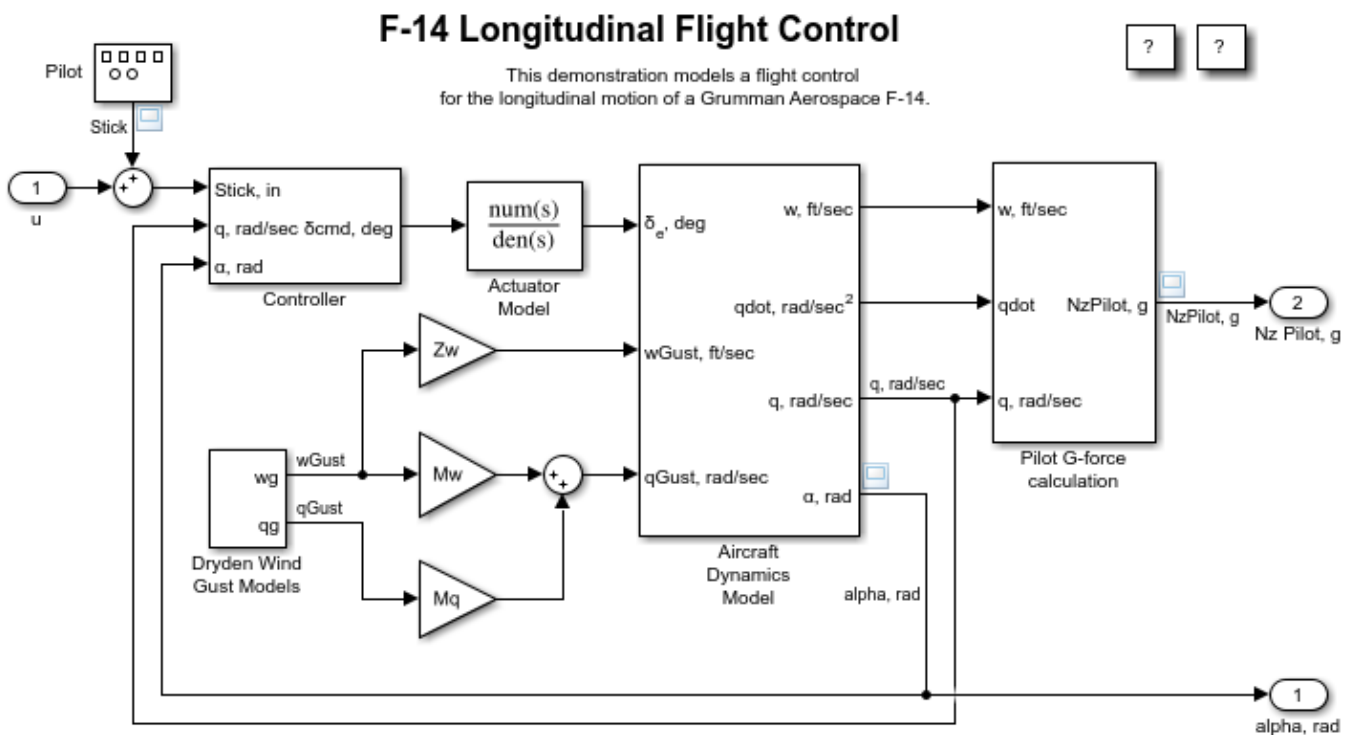

The following example, with the slAccelDemoF14 model, illustrates the use of Simulink Accelerator.

Measuring the Non-accelerated Time

Open the slAccelDemoF14 model and set the stop time to 3000 seconds. Simulate the model and time how long it takes using TIC/TOC.

```
modelName = 'slAccelDemoF14';
open_system(modelName)
set_param(modelName, 'stoptime', '3000')
tic
sim(modelName);
toc
```

Elapsed time is 6.569618 seconds.

Copyright 1990-2012 The MathWorks, Inc.

Turning on the Accelerator

To activate the Simulink® Accelerator, in the Simulink Editor, on the **Simulation** tab, under **Simulate**, select **Accelerator**. You can also issue a `set_param` command at the MATLAB® command prompt.

```
set_param(modelName, 'SimulationMode', 'Accelerator')
```

Creating a Temporary Working Directory

Since running in accelerated mode creates some files, first move to a temporary area.

```
originalDir = pwd;  
tempDir = tempname;  
mkdir(tempDir)  
cd(tempDir)
```

Building the Accelerated Model

Build the accelerated model and simulate it. When running in Accelerator mode, you can start the model by selecting **Run** on the **Simulation** tab or by running the command:

```
sim(modelName)
```

at the MATLAB prompt. In either case, the progress of the code generation process will be displayed in the MATLAB command window. To suppress this display wrap the `sim` command inside an `evalc`.

```
evalc('sim(modelName);');
```

Simulating the Accelerated Model

Simulate the model again. Notice the model simulation runs much faster on subsequent runs.

```
tic  
sim(modelName);  
toc
```

```
Elapsed time is 2.856876 seconds.
```

Changing a Tunable Parameter and Simulating the Accelerated Model

Change the value of one of the tunable parameters in the model and simulate the model again. Notice the accelerated version of the model does not have to be re-generated and so the simulation still runs more quickly in Accelerated mode than in Normal mode.

```
modelWorkspace = get_param(modelName, 'ModelWorkspace');  
evalin(modelWorkspace, 'Mw=Mw*2;');  
tic  
sim(modelName);  
toc
```

```
Elapsed time is 3.195202 seconds.
```

Cleaning Up

Close the model and remove the generated files.

```
bdclose(modelName)  
clear([modelName, '_acc'])
```

```
cd(originalDir)  
rmdir(tempDir, 's')
```

Determining Why Simulink Accelerator Is Regenerating Code

Sometimes Simulink® regenerates the simulation target for a model at the beginning of a simulation in Accelerator Mode (TM) but it is not always clear why regeneration happens. This example shows how to use Simulink® MATLAB® commands to determine why Simulink regenerates code for Accelerator Mode simulations.

Simulink's Accelerator Mode speeds up simulation of your model by creating an executable version of the model, called a simulation target, and running this target instead of interpreting the model, as is done during Normal Mode simulation. Accelerator Mode creates the simulation target by generating C code from your model and invoking the MATLAB® mex function to compile and dynamically link the generated code to Simulink.

The process of code generation and compilation happens during the first time that you simulate your model in Accelerator Mode. Additionally, code generation may happen on subsequent simulations, especially if the model changes between simulations (for example, after addition of a block). Code generation takes time and it is often desirable to avoid it, in order to maximize the number of simulations within a given time span.

Simulink uses the model's checksum to determine if the code needs to be regenerated. This checksum is an array of four integers computed by using an md5 checksum algorithm based on attributes of the model and the blocks that it contains. Any change in the model that changes the checksum causes Simulink to regenerate the simulation target for Accelerator Mode.

Sometimes, it is not clear which model change triggered a checksum change and hence code regeneration. This example shows how to investigate why Simulink needs to regenerate code for Accelerator Mode simulation for a given model and its configuration.

Create a Temporary Working Directory

Since simulating in Accelerator Mode creates some files, first move to a temporary area.

```
originalDir = pwd;  
tempDir = tempname;  
mkdir(tempDir)  
cd(tempDir)
```

Open an Example Model

We will use a simple model, `slAccelDemoWhyRebuild`, throughout this example.

```
model = 'slAccelDemoWhyRebuild';  
open_system(model)  
set_param(model, 'AccelVerboseBuild', 'on');
```

Determining Why the Simulink Accelerator Re-builds

Copyright 2006-2015 The MathWorks, Inc.

The first time the model runs in Accelerator mode, it generates and compiles code as expected.

```

simOutput = evalc(['sim('',model,'')']);
if ~isempty(strfind(simOutput,'Building the Accelerator target for model'))
    disp('Built Simulink Accelerator mex file')
else
    disp('Did not build Simulink Accelerator mex file')
end
  
```

Built Simulink Accelerator mex file

If the simulation is run again, without any changes to the model, we expect that Simulink can reuse the existing code and does not need to regenerate the code. Execute the same commands to verify.

```

simOutput = evalc(['sim('',model,'')']);
if ~isempty(strfind(simOutput,'Building the Accelerator target for model'))
    disp('Built Simulink Accelerator mex file')
else
    disp('Did not build Simulink Accelerator mex file')
end
  
```

Did not build Simulink Accelerator mex file

Now we change some parameters in the model. We will set the following settings for the block 'Integrator': - set 'Ignore limit and reset when linearizing' to 'on' - set 'Initial Condition' to '5'

```

set_param([model,'/Integrator'],'IgnoreLimit','on');
set_param([model,'/Integrator'],'InitialCondition','5');
  
```

When we run the simulation again, we see that Simulink regenerates the code.

```

simOutput = evalc(['sim('',model,'')']);
if ~isempty(strfind(simOutput,'Building the Accelerator target for model'))
    disp('Built Simulink Accelerator mex file')
else
    disp('Did not build Simulink Accelerator mex file')
end
  
```

Built Simulink Accelerator mex file

We would like to know why.

To determine if the previously generated code is still valid for the current model configuration, Simulink compares the checksum of the model as used to generate the code to the current checksum. If they are equal, the previously generated code is still valid and Simulink Accelerator Mode reuses it for the current simulation. If the values differ, Simulink Accelerator Mode regenerates and rebuilds the code. Thus, examining the details of the checksum computation can reveal why Simulink regenerated the code.

Get the Checksum Details

The following command gets the model checksum computation details:

```
[cs1,csdet1]=Simulink.BlockDiagram.getChecksum(model);
```

The first output is the model checksum value itself. The second output gives details of what went into the checksum computation.

Let us set the modified block parameters to their original values and get the checksum and details for that configuration

```
set_param([model,'/Integrator'],'IgnoreLimit','off');  
set_param([model,'/Integrator'],'InitialCondition','0');  
[cs2,csdet2]=Simulink.BlockDiagram.getChecksum(model);
```

Comparing these two checksum values is equivalent to determining if the Simulink Accelerator will regenerate code. Note that the checksum values are different, as we expect based on the fact that Simulink Accelerator regenerates code every time it runs.

```
if (cs1 ~= cs2)  
    disp('Checksums are different')  
else  
    disp('Checksums are the same')  
end
```

```
Checksums are different
```

Now that we know that the checksums differ, the next question is why. Many things go into the checksum computation, including signal data types, some block parameter values, and block connectivity information. To understand why the checksums differ, we need to see what has changed about the items used in computing the checksum. The checksum details returned as the second argument give that information.

```
csdet1
```

```
csdet1 =
```

```
    struct with fields:
```

```
        ContentsChecksum: [1x1 struct]  
        InterfaceChecksum: [1x1 struct]  
        ContentsChecksumItems: [186x1 struct]  
        InterfaceChecksumItems: [47x1 struct]
```

The checksum details is a structure array with four fields. Two of the fields are the component checksums of the model checksum (these are called ContentsChecksum and InterfaceChecksum) and

the other two are the corresponding checksum details. These details correspond to various information which went into to the computation of the two component checksums. The model [structural] checksum is a function of ContentsChecksum and InterfaceChecksum.

First, let's determine if the difference lies in the model's contents or the model's interface

```
if (csdet1.ContentsChecksum.Value ~= csdet2.ContentsChecksum.Value)
    disp('Contents checksums are different')
else
    disp('Contents checksums are the same')
end
if (csdet1.InterfaceChecksum.Value ~= csdet2.InterfaceChecksum.Value)
    disp('Interface checksums are different')
else
    disp('Interface checksums are the same')
end
```

```
Contents checksums are different
Interface checksums are the same
```

Use the Details to Determine Why Checksum Changed

Now that we know the change is in the ContentsChecksum, we can look at the ContentsChecksumItems to see what has changed.

```
idxForDifferences=[];
for idx = 1:length(csdet1.ContentsChecksumItems)
    if (~strcmp(csdet1.ContentsChecksumItems(idx).Handle, ...
               csdet2.ContentsChecksumItems(idx).Handle))
        idxForDifferences=[idxForDifferences,idx];
        disp(['Handles different for item ',num2str(idx)]);
    end
    if (~strcmp(csdet1.ContentsChecksumItems(idx).Identifier, ...
               csdet2.ContentsChecksumItems(idx).Identifier))
        disp(['Identifiers different for item ',num2str(idx)]);
        idxForDifferences=[idxForDifferences,idx];
    end
    if(ischar(csdet1.ContentsChecksumItems(idx).Value))
        if (~strcmp(csdet1.ContentsChecksumItems(idx).Value, ...
                   csdet2.ContentsChecksumItems(idx).Value))
            disp(['String Values different for item ',num2str(idx)]);
            idxForDifferences=[idxForDifferences,idx];
        end
    end
    if(isnumeric(csdet1.ContentsChecksumItems(idx).Value))
        if (csdet1.ContentsChecksumItems(idx).Value ~= ...
            csdet2.ContentsChecksumItems(idx).Value)
            disp(['Numeric values are different for item ',num2str(idx)]);
            idxForDifferences=[idxForDifferences,idx];
        end
    end
end
```

```
String Values different for item 42
```

Now that we know the differences are in the items at the indices listed in idxForDifferences, we can look at those items in the two ContentsChecksumItems arrays

```
blk1 = csdet1.ContentsChecksumItems(idxForDifferences(1)).Handle
blk2 = csdet2.ContentsChecksumItems(idxForDifferences(1)).Handle
id1 = csdet1.ContentsChecksumItems(idxForDifferences(1)).Identifier
id2 = csdet2.ContentsChecksumItems(idxForDifferences(1)).Identifier

blk1 =
    'slAccelDemoWhyRebuild/Integrator'

blk2 =
    'slAccelDemoWhyRebuild/Integrator'

id1 =
    'IgnoreLimit'

id2 =
    'IgnoreLimit'
```

The Handle for both items is 'slAccelDemoWhyRebuild/Integrator', which indicates the block with the changing data. The identifier for both is 'IgnoreLimit' which tells us that this was the block setting which changed, resulting in a different checksum for the model. The setting for the Initial Condition of the block does not appear in the checksum detail. Therefore, we expect that if only the setting for the Initial Condition is modified, that no rebuild will occur.

Avoid a Rebuild on Successive Simulations

Now that we found the parameter which causes the checksums to differ for this workflow, we can validate the findings by keeping that parameter constant and seeing whether rebuild occurs on successive simulations.

Let's simulate the model in Accelerator mode again. We expect it to rebuild for this simulation because we changed the parameter ('IgnoreLimit') for the checksum computation above.

```
simOutput = evalc(['sim('',model,'')']);
if ~isempty(strfind(simOutput,'Building the Accelerator target for model'))
    disp('Built Simulink Accelerator mex file')
else
    disp('Did not build Simulink Accelerator mex file')
end
```

```
Built Simulink Accelerator mex file
```

Now let's only change the Initial Condition setting and simulate again. We expect that no rebuild should happen this time.

```
set_param([model,'/Integrator'],'InitialCondition','-3');
simOutput = evalc(['sim('',model,'')']);
if ~isempty(strfind(simOutput,'Building the Accelerator target for model'))
    disp('Built Simulink Accelerator mex file')
else
```

```
    disp('Did not build Simulink Accelerator mex file')  
end
```

Did not build Simulink Accelerator mex file

As expected from the checksum analysis, changing the parameter for 'Initial Condition' does not cause a regeneration of code for simulation in Accelerator mode.

Cleaning Up

Close the model and remove the generated files.

```
bdclose(model)  
clear([model, '_acc'])  
cd(originalDir)  
rmdir(tempDir, 's')
```

Parallel Simulations Using Parsim: Test-Case Sweep

This example shows how you can run multiple Simulink® simulations corresponding to different test cases in the Signal Editor block using SimulationInput objects and the `parsim` command. The `parsim` command uses Parallel Computing Toolbox™, if it is available, to run simulations in parallel, otherwise the simulations are run in serial.

Model Overview

The model `sldemo_suspn_3dof` shown below simulates the vehicle dynamics based on the road - suspension interaction for different road profiles. The vehicle dynamics are captured in three degrees of freedom: vertical displacement, roll, and pitch. The road profile data for the left and right tires is imported into the Signal Editor block as different test cases. The Road-Suspension Interaction subsystem calculates the suspension forces on the vehicle at the four tire locations based on the road data and the current vehicle state. In the Body Dynamics subsystem these forces and the resulting pitch and roll moments are used to determine the vehicle motion in three degrees of freedom: vertical displacement, roll, and pitch.

The suspension model is simulated using different road profiles to determine if the design meets desired performance goals. Parallel Computing Toolbox is used to speed up these multiple simulations, as illustrated below.

```
mdl = 'sldemo_suspn_3dof';
isModelOpen = bdIsLoaded(mdl);
open_system(mdl);
```

Copyright 2011-2018 The MathWorks, Inc.

Set up Data Required for Multiple Simulations

Determine the number of cases in the Signal Editor block using the `NumberOfScenarios` parameter of the Signal Editor block. The number of cases is used to determine the number of iterations to run in step 3.

```
sigEditBlk = [mdl '/Road Profiles'];
numCases = str2double(get_param(sigEditBlk, 'NumberOfScenarios'));
```

Create an array of `Simulink.SimulationInput` objects to define the set of simulations to run. Each `SimulationInput` object corresponds to one simulation and will be stored as an array in a variable, `in`. The mask parameter, `ActiveScenario`, specifies the sweep value for the Signal Editor block scenario. The active scenario is set for each simulation.

```
for idx = numCases:-1:1
    in(idx) = Simulink.SimulationInput mdl;
    in(idx) = setBlockParameter(in(idx), sigEditBlk, 'ActiveScenario', idx);
end
```

Note that specifying the model parameter on the `SimulationInput` object does not apply it to the model immediately. The specified value will be applied during the simulation and reverted back to its original value, if possible, after the simulation finishes.

Run Simulations in Parallel Using Parsim

Use the `parsim` function to execute the simulations in parallel. The array of `SimulationInput` objects, `in`, created in the last step is passed into the `parsim` function as the first argument. The output from the `parsim` command is an array of `Simulink.SimulationOutput` objects which is stored in the variable `out`. Set the `'ShowProgress'` option to `'on'` to print a progress of the simulations on the MATLAB command window.

```
out = parsim(in, 'ShowProgress', 'on');
```

```

Each `SimulationOutput` object contains the logged signal along with the `SimulationMetadata`. When running multiple simulations using `parsim`, errors are captured so that subsequent simulations can continue to run. Any errors would show up in the `ErrorMessage` property of the `SimulationOutput` object.

Plot Results

Plot the vertical vehicle displacement from the different simulations to see how the vehicle performed to the different road profiles. The signal is logged in the SimulationOutput object in the Dataset format. Use the `get` method to obtain the timeseries object containing the time and signal data from each element of `out`.

```

legend_labels = cell(1,numCases);
for i = 1:numCases
    simOut = out(i);
    ts = simOut.logsout.get('vertical_disp').Values;
    ts.plot;
    legend_labels{i} = ['Run ' num2str(i)];
    hold all
end
title('Response of a 3-DoF Suspension Model')
xlabel('Time (s)');
ylabel('Vehicle vertical displacement (m)');
legend(legend_labels,'Location','NorthEastOutside');

```

Close MATLAB Workers

Last, close the parallel pool and the model if they were not previously opened.

```

if(~isModelOpen)
    close_system mdl, 0);
end
delete(gcp('nocreate'));

```

Parallel pool using the 'local' profile is shutting down.

Parallel Simulations Using Parsim: Parameter Sweep in Normal Mode

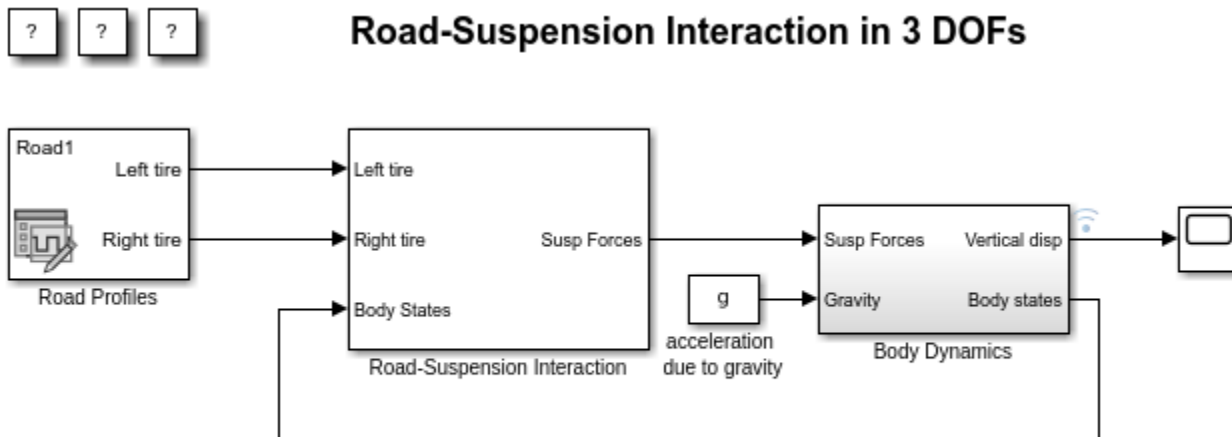

This example shows how to run multiple simulations of a Monte Carlo study in parallel by using Parallel Computing Toolbox™. Parallel execution leverages the multiple cores of your host machine to run many simulations more quickly. These simulations could also be run in parallel on computer clusters using the MATLAB Parallel Server™. This example will work even if the Parallel Computing Toolbox™ or the MATLAB Parallel Server™ is not available, but the simulations will run in serial.

Explore Example Model

The model `sldemo_suspn_3dof` simulates vehicle dynamics based on the interaction between road and suspension for different road profiles. The model captures vehicle dynamics in three degrees of freedom: vertical displacement, roll, and pitch. The Signal Editor block stores measured road profile data for the left and right tires as different test groups. The Road-Suspension Interaction subsystem calculates the suspension forces on the vehicle at the four tire locations based on the road data and the current vehicle state. The Body Dynamics subsystem uses these forces and the resulting pitch and roll moments to calculate the vehicle motion in each of the three degrees of freedom.

In this Monte Carlo study, you inspect the impact of the front suspension coefficients on the vehicle dynamics. You run multiple simulations, each with a different coefficient value.

```
mdl = 'sldemo_suspn_3dof';
isModelOpen = bdIsLoaded(mdl);
open_system(mdl);
```

Copyright 2011-2018 The MathWorks, Inc.

In the model, double-click the Road-Suspension Interaction block. The mask dialog box opens. The mask parameter **Front susp. damping** sets the value of the damping coefficient, 150.

For the Body Dynamics block, find the signal that exits the `Vertical disp` output port. This signal represents the vertical vehicle displacement over time, which the suspension damping coefficient influences.

Right-click the signal and select **Properties**.

In the Signal Properties dialog box, the **Logging and accessibility** tab has **Log signal data** checked on, indicating that the signal is configured for logging. After the simulation finishes, you can use the specified logging name, `vertical_disp`, to identify the signal and acquire the simulation output data from the `SimulationOutput` object.

Prepare Parameter Inputs

Calculate the sweep values for the coefficient as percentages of the design value ranging from 5% to 95% in increments of 10%. Store the values in a variable, `Cf_sweep`, in the base workspace.

```
Cf_sweep = Cf*(0.05:0.1:0.95);
```

Determine the number of simulations to run, which is equal to the number of sweep values. Store the number in a variable, `numSims`.

```
numSims = length(Cf_sweep);
```

Use a `for` loop to:

- 1 Create `Simulink.SimulationInput` objects for the model. Create one object per simulation. Store the objects as an array in a variable, `in`.
- 2 Specify the sweep value for each simulation. Identify the target mask parameter by its underlying name, `Cf`.

```
for i = numSims:-1:1
    in(i) = Simulink.SimulationInput mdl;
    in(i) = setBlockParameter(in(i), [mdl '/Road-Suspension Interaction'], 'Cf', num2str(Cf_sweep(i)));
end
```

Note that specifying the block parameter on the `SimulationInput` object does not apply it to the model immediately. The specified value will be applied during the simulation and reverted back to its original value, if possible, after the simulation finishes.

Run Simulations in Parallel Using Parsim

Use the `parsim` function to execute the simulations in parallel. The array of `SimulationInput` objects, `in`, created in the last step is passed into the `parsim` function as the first argument. The output from the `parsim` command is an array of `SimulationOutput` objects which is stored in the variable `out`. Set the `'ShowProgress'` option to `'on'` to print a progress of the simulations on the MATLAB command window.

```
out = parsim(in, 'ShowProgress', 'on');
```

```

    simOut = out(i);
    ts = simOut.logout.get('vertical_disp').Values;
    % 'ts' is a MATLAB 'timeseries' object that stores the time and
    % data values for the logged 'vertical_disp' signal.
    % Use the 'plot' method of the object to plot the data against the
    % time.
    plot(ts);
    legend_labels{i} = ['Run ' num2str(i)];
    hold all
end

title('Response of a 3-DoF Suspension Model')
xlabel('Time (s)');
ylabel('Vehicle vertical displacement (m)');
legend(legend_labels,'Location','NorthEastOutside');
```

Close MATLAB Workers

Last, close the parallel pool and the model if they were not previously opened.

```
if(~isModelOpen)
    close_system mdl, 0);
end
delete(gcp('nocreate'));
```

Parallel pool using the 'local' profile is shutting down.

Parallel Simulations Using Parsim: Parameter Sweep in Rapid Accelerator Mode

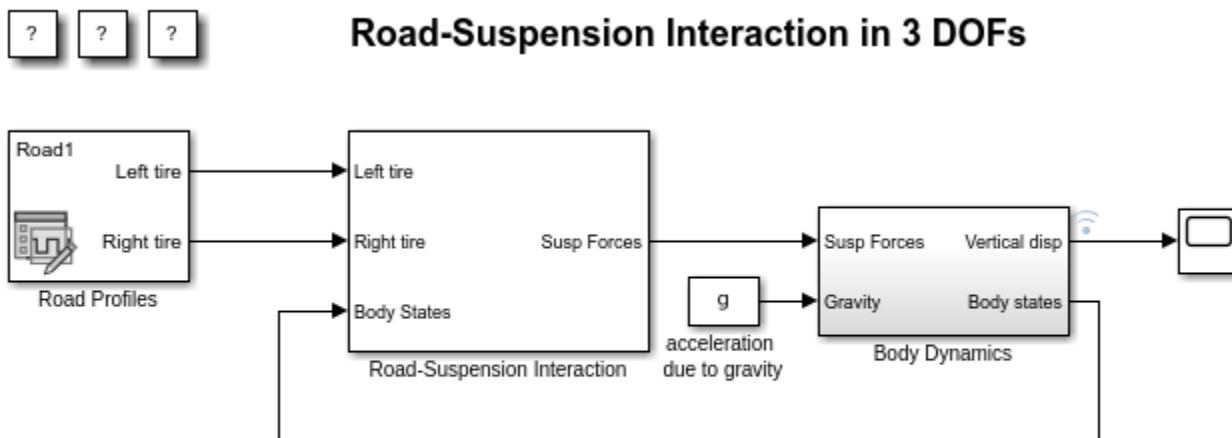

This example shows how to run multiple simulations of a Monte Carlo study in parallel by using Parallel Computing Toolbox™. Parallel execution leverages the multiple cores of your host machine to run many simulations more quickly. These simulations could also be run in parallel on computer clusters using the MATLAB Parallel Server™. This example will work even if the Parallel Computing Toolbox™ or the MATLAB Parallel Server™ is not available, but the simulations will run in serial.

Explore Example Model

The model `sldemo_suspn_3dof` simulates vehicle dynamics based on the interaction between road and suspension for different road profiles. The model captures vehicle dynamics in three degrees of freedom: vertical displacement, roll, and pitch. The Signal Editor block stores measured road profile data for the left and right tires as different test groups. The Road-Suspension Interaction subsystem calculates the suspension forces on the vehicle at the four tire locations based on the road data and the current vehicle state. The Body Dynamics subsystem uses these forces and the resulting pitch and roll moments to calculate the vehicle motion in each of the three degrees of freedom.

In this Monte Carlo study, the vehicle mass is varied to study its effect on the vehicle dynamics. Parallel Computing Toolbox is used to speed up these multiple simulations, as illustrated below.

```
mdl = 'sldemo_suspn_3dof';
isModelOpen = bdIsLoaded(mdl);
open_system(mdl);
```

Copyright 2011-2018 The MathWorks, Inc.

Setup to Build the Rapid Accelerator Target

The Rapid Accelerator executable for the model is built in the `SetupFcn` call using the `buildRapidAcceleratorTarget` function from the `Simulink.BlockDiagram` package. The `buildRapidAcceleratorTarget` function returns the default run-time parameter set which is assigned to a global variable, `RTP`, in the `SetupFcn` and is used in the next step to modify the parameter values. Open `sldemo_parsim_paramsweep_suspn_raccel_setup` in the editor to inspect the

code. Note that the build process is optimized so that if the build files are already present and compatible with the model and machine architecture then it returns early.

Set up Multiple Simulations Using SimulationInput Objects

Store the sweep values in a variable, `Mb_sweep`, in the base workspace.

```
Mb_sweep = Mb*(0.5:5:45.5);
```

Determine the number of simulations to run, which is equal to the number of sweep values. Store the number in a variable, `numSims`.

```
numSims = length(Mb_sweep);
```

Use a for loop to:

- 1 Create Simulink.SimulationInput objects for the model. Create one object per simulation. Store the objects as an array in a variable, `in`.
- 2 Specify the model parameters on the SimulationInput object.

```
for i = numSims:-1:1
    in(i) = Simulink.SimulationInput mdl;
    in(i) = in(i).setModelParameter('SimulationMode', 'rapid', ...
        'RapidAcceleratorUpToDateCheck', 'off');
    in(i).PreSimFcn = @(x) sldemo_parsim_paramsweep_suspn_raccel_presim(x, Mb_sweep(i));
end
```

The SimulationInput object is used to modify the model parameters. 'SimulationMode' is set to use rapid accelerator and 'RapidAcceleratorUpToDateCheck' model parameter is set to 'off' to skip up-to-date checks since there are no structural changes made to the model between simulations and the same build files can be used. Note that specifying the model parameter on the SimulationInput object does not apply it to the model immediately. The specified value will be applied during the simulation and reverted back to its original value, if possible, after the simulation finishes. Inspect the code in the PreSimFcn, `sldemo_parsim_paramsweep_suspn_raccel_presim`. It uses `modifyTunableParameters` from the Simulink.BlockDiagram package to change the parameter corresponding to vehicle mass. The first argument to the PreSimFcn is always the SimulationInput object, and is passed into the function by Simulink®. The PreSimFunction adds another model parameter to the SimulationInput object and returns it to be used for simulation.

Run Simulations in Parallel Using Parsim

Use the `parsim` function to execute the simulations in parallel. The array of SimulationInput objects, `in`, created in the last step is passed into the `parsim` function as the first argument. The output from the `parsim` command is an array of Simulink.SimulationOutput objects which is stored in the variable `out`. Set the 'ShowProgress' option to 'on' to print a progress of the simulations on the MATLAB command window. As mentioned earlier, the SetupFcn is passed as a parameter to the `parsim` command to build the rapid accelerator target on the workers if required.

```
out = parsim(in, 'ShowProgress', 'on', ...
    'SetupFcn', @() sldemo_parsim_paramsweep_suspn_raccel_setup mdl);
```

```

```

Each `SimulationOutput` object contains the logged signal along with the `SimulationMetadata`. When running multiple simulations using `parsim`, errors are captured so that subsequent simulations can continue to run. Any errors would show up in the `ErrorMessage` property of the `SimulationOutput` object.

Plot Results

Plot the vertical vehicle displacement from the different simulations to see how varying the vehicle mass affected the vehicle dynamics. Use the `get` method of the `SimulationOutput` object to obtain the time and signal data contained in each element of `simout`.

```
legend_labels = cell(1,numSims);
for i = 1:numSims
    simOut = out(i);
    ts = simOut.logout.get('vertical_disp').Values;
    ts.plot;
    legend_labels{i} = ['Run ' num2str(i)];
    hold all
end
title('Response of a 3-DoF Suspension Model')
xlabel('Time (s)');
ylabel('Vehicle vertical displacement (m)');
legend(legend_labels,'Location','NorthEastOutside');
```

Close MATLAB Workers

Last, close the parallel pool and the model if they were not previously opened.

```
if(~isModelOpen)
    close_system mdl, 0;
end
delete(gcp('nocreate'));
```

Parallel pool using the 'local' profile is shutting down.

Rapid Accelerator Simulations Using Parsim

This example shows the use of Rapid Accelerator in applications that require running parallel simulations for a range of input and parameter values.

We use the engine idle speed model which simulates the idle speed of an engine. The input of this model is the voltage of the bypass air valve and the output is the idle speed.

We run parallel simulations using `parsim` with two sets of valve voltages and by independently varying two of the three gain parameters of the transfer functions over a range of two values. The following table lists the eight simulations that will be run along with the parameter values. The external inputs, `inpSets`, are created in Step 2 below, and `gain2` and `gain3` are the variables corresponding to the two gain parameters.

Run	ExternalInput	gain2	gain3
1	inpSets(1)	25	20
2	inpSets(1)	25	30
3	inpSets(1)	35	20
4	inpSets(1)	35	30
5	inpSets(2)	25	20
6	inpSets(2)	25	30
7	inpSets(2)	35	20
8	inpSets(2)	35	30

It is easy to customize this example for your own application by modifying the script file used to build this example. Click the link in the top left corner of this page to edit the script file. Click the link in the top right corner to run this example from MATLAB®.

Step 1: Preparation

First we open the model where the simulation mode has been set to Rapid Accelerator. The default input data, and the required parameters are preloaded in the base workspace.

Open model:

```
mdl = 'sldemo_raccel_engine_idle_speed';
open_system(mdl);
```

Step 2: Create Input Sets

Here we perturb the default input values vector to obtain a new input values vector.

```
inpSets(1) = timeseries(inpData, time);
rndPertb = 0.5 + rand(length(time), 1);
inpSets(2) = timeseries(inpData.*rndPertb, time);
numInpSets = length(inpSets);
```

Step 3: Create Parameter Sets

We want to see how the idle speed changes for different values of parameters `gain2` and `gain3`. Create an array of `Simulink.SimulationInput` objects to specify the different parameter values and external input for each simulation. The array of `SimulationInput` objects is preallocated for better

performance. Also note that the external input can be directly specified on the SimulationInput object instead of using a model parameter.

```
gain2_vals = 25:10:35;
gain3_vals = 20:10:30;

num_gain2_vals = length(gain2_vals);
num_gain3_vals = length(gain3_vals);

numSims = num_gain2_vals*num_gain3_vals*numInpSets;
in(1:numSims) = Simulink.SimulationInput mdl);

idx = 1;
for iG2 = 1:num_gain2_vals
    for iG3 = 1:num_gain3_vals
        for inpSetsIdx = 1:numInpSets
            in(idx) = in(idx).setModelParameter('SimulationMode', 'rapid', ...
                'RapidAcceleratorUpToDateCheck', 'off', ...
                'SaveTime', 'on', ...
                'SaveOutput', 'on');
            % Use setVariable to specify a new value for a variable during
            % simulations
            in(idx) = in(idx).setVariable('gain2', gain2_vals(iG2));
            in(idx) = in(idx).setVariable('gain3', gain3_vals(iG3));
            in(idx).ExternalInput = inpSets(inpSetsIdx);
            idx = idx + 1;
        end
    end
end
end
```

Note that we also use the `setModelParameter` method of the `SimulationInput` object to set model parameters to run the simulations in Rapid Accelerator mode and enable logging. The Rapid Accelerator target is built using the `SetupFcn`. The Rapid Accelerator target is built once and used by all subsequent simulations saving the time required for model compilation. Here is the code for the `SetupFcn`

```
function sldemo_parallel_rapid_accel_sims_script_setup mdl)
    % Temporarily change the current folder on the workers to an empty
    % folder so that any existing slprj folder on the client does not
    % interfere in the build process.
    currentFolder = pwd;
    tempDir = tempname;
    mkdir(tempDir);
    cd(tempDir);
    oc = onCleanup(@() cd(currentFolder));
    Simulink.BlockDiagram.buildRapidAcceleratorTarget mdl);
end
```

Step 4: Execute Simulations

Use the `parsim` function to execute the simulations in parallel. The array of `SimulationInput` objects, `in`, created in the last step is passed into the `parsim` function as the first argument. Store the simulation output data in a variable, `out`, whose value is an array of `Simulink.SimulationOutput` objects. Each `SimulationOutput` object contains the logged signal along with the `SimulationMetadata`. When running multiple simulations using `parsim`, errors are captured so that subsequent simulations can continue to run. Any errors would show up in the `ErrorMessage` property of the `SimulationOutput` object.

```
out = parsim(in, 'ShowProgress', 'on', ...
    'SetupFcn', @( ) sldemo_parallel_rapid_accel_sims_script_setup mdl));

[16-Oct-2018 15:54:39] Checking for availability of parallel pool...

[16-Oct-2018 15:56:38] Completed 8 of 8 simulation runs
[16-Oct-2018 15:56:38] Cleaning up parallel workers...
```

Step 5: Plot Results

Plot the engine idle speed with respect to time for different parameter values and inputs. The output is logged in the array format and can be accessed from the SimulationOutput object.

```
for i = 1:numSims
    simOut = out(i);
    t = simOut.tout;
    y = simOut.yout;
    plot(t, y)
    hold all
end
```

**Step 6: Close MATLAB Workers**

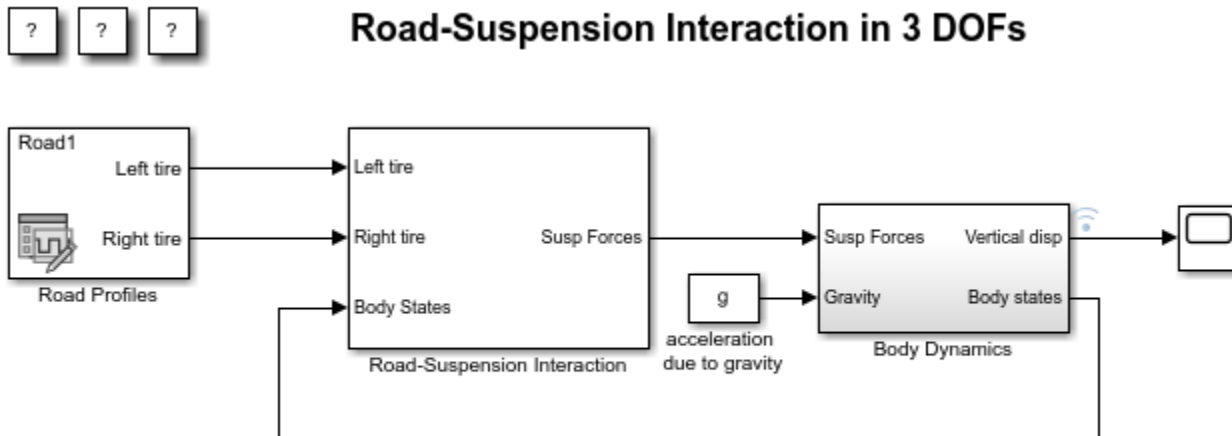

```
delete(gcf('nocreate'))
```

Parallel pool using the 'local' profile is shutting down.

Multiple Simulations Workflow Tips

The goal of this demo is to provide helpful tips for running multiple simulations using parallel simulation tools. This example will work even if the Parallel Computing Toolbox™ is not available, but the simulations will run in serial. We will be using the model `sldemo_suspn_3dof` for this example.

```
mdl = 'sldemo_suspn_3dof';
isModelOpen = bdIsLoaded(mdl);
open_system(mdl);
```

Copyright 2011-2018 The MathWorks, Inc.

Initializing an Array of Simulink.SimulationInput Objects

Typically you will construct an array of `Simulink.SimulationInput` objects in order to run multiple simulations. There are several ways to initialize the array before populating it with data.

```
numSims = 5;
Cf_sweep = Cf*linspace(.05,.95, numSims);
```

Method 1: Initialize the array before the loop

```
in(numSims) = Simulink.SimulationInput;
for idx = 1:numSims
    % Need to populate the model name since we get any empty array by default
    in(idx).ModelName = 'sldemo_suspn_3dof';
    in(idx) = in(idx).setVariable('Cf', Cf_sweep(idx));
end
```

Method 2: Initialize the array in the loop

Note that the loop variable `idx` starts from the largest value so that the entire array is pre-allocated.

```
for idx = numSims:-1:1
    % Since we are indexing from 5 to 1, the first iteration will
    % initialize the array.
    in(idx) = Simulink.SimulationInput('sldemo_suspn_3dof');
```

```

    in(idx) = in(idx).setVariable('Cf', Cf_sweep(idx));
end

```

Setting Model and Block Parameters

The `setModelParameter` and `setBlockParameter` methods use the same parameter-value pair syntax that the `set_param` API uses. This means that most values you pass in to these methods should be character arrays, not their literal value.

```

for idx = numSims:-1:1
    in(idx) = Simulink.SimulationInput('sldemo_suspn_3dof');

    % Incorrect
    in(idx) = in(idx).setModelParameter('StartTime', 5);

    % Correct
    in(idx) = in(idx).setModelParameter('StartTime', '3');
end

```

Setting Variables

The `setVariable` method expects that you will pass the literal value you want to assign to a variable. The idea is that this closely reflects the `assignin` syntax.

```

for idx = numSims:-1:1
    in(idx) = Simulink.SimulationInput('sldemo_suspn_3dof');

    % Incorrect, Cf is expected to be a double, not a character array
    in(idx) = in(idx).setVariable('Cf', '2500');

    % Correct, Cf is a scalar double
    in(idx) = in(idx).setVariable('Cf', 2500);
end

```

Diagnosing Runtime Errors

Assume that you've accidentally set up an array of `Simulink.SimulationInput` objects with an incorrect value.

```

Mb_sweep = linspace(0, 1500, numSims);
for idx = numSims:-1:1
    in(idx) = Simulink.SimulationInput('sldemo_suspn_3dof');

    % Accidentally set the Mass to 0 on the first iteration
    in(idx) = in(idx).setVariable('Mb', Mb_sweep(idx));

    % Shorten the stop time
    in(idx) = in(idx).setModelParameter('StopTime', '1');
end

```

Simulating these will cause a runtime error

```

out = sim(in);

[29-Feb-2020 05:00:23] Running simulations...
[29-Feb-2020 05:00:26] Completed 1 of 5 simulation runs. Run 1 has errors.
[29-Feb-2020 05:00:27] Completed 2 of 5 simulation runs
[29-Feb-2020 05:00:28] Completed 3 of 5 simulation runs

```

```
[29-Feb-2020 05:00:29] Completed 4 of 5 simulation runs
[29-Feb-2020 05:00:31] Completed 5 of 5 simulation runs
Warning: Simulation(s) with indices listed below completed with errors. Please
inspect the corresponding SimulationOutput to get more details about the error:
[1]
```

Fortunately, you can inspect the `Simulink.SimulationOutput` object to see any error messages that come from a simulation.

```
out(1).ErrorMessage
```

```
ans =
```

```
'Derivative of state '1' in block 'sldemo_suspn_3dof/Body Dynamics/Vertical (Z) dynamics/Zdo
```

This works to debug issues on parallel workers too.

```
for idx = numSims:-1:1
    in(idx) = Simulink.SimulationInput('sldemo_suspn_3dof');

    % Accidentally set the Mass to 0 on the first iteration
    in(idx) = in(idx).setVariable('Mb', Mb_sweep(idx));

    % Shorten the stop time
    in(idx) = in(idx).setModelParameter('StopTime', '1');
end
```

```
out = parsim(in);
```

```
[29-Feb-2020 05:00:31] Checking for availability of parallel pool...
Starting parallel pool (parpool) using the 'local' profile ...
Connected to the parallel pool (number of workers: 12).
[29-Feb-2020 05:02:52] Starting Simulink on parallel workers...

[29-Feb-2020 05:03:57] Completed 5 of 5 simulation runs
Warning: Simulation(s) with indices listed below completed with errors. Please
inspect the corresponding SimulationOutput to get more details about the error:
[1]
[29-Feb-2020 05:03:57] Cleaning up parallel workers...
```

Inspecting the `Simulink.SimulationOutput` reveals a non-finite derivative error.

```
out(1).ErrorMessage
```

```
ans =
```

```
'Derivative of state '1' in block 'sldemo_suspn_3dof/Body Dynamics/Vertical (Z) dynamics/Zdo
```

The `applyToModel` method will configure your model with the settings on the `SimulationInput` so you can debug the problem locally.

```
in(1).applyToModel;
```

Notice that the value of the variable `Mb` in the base workspace changes to 0 to reflect the value that was used in the simulation corresponding to the first `SimulationInput` object in `in`.

Close MATLAB Workers

Last, close the parallel pool and the model if they were not previously opened.

```
if(~isModelOpen)
    close_system mdl, 0);
end
delete(gcf('nocreate'));
```

Parallel pool using the 'local' profile is shutting down.

Streamline Simulink Blockset Authoring Process with Blockset Designer

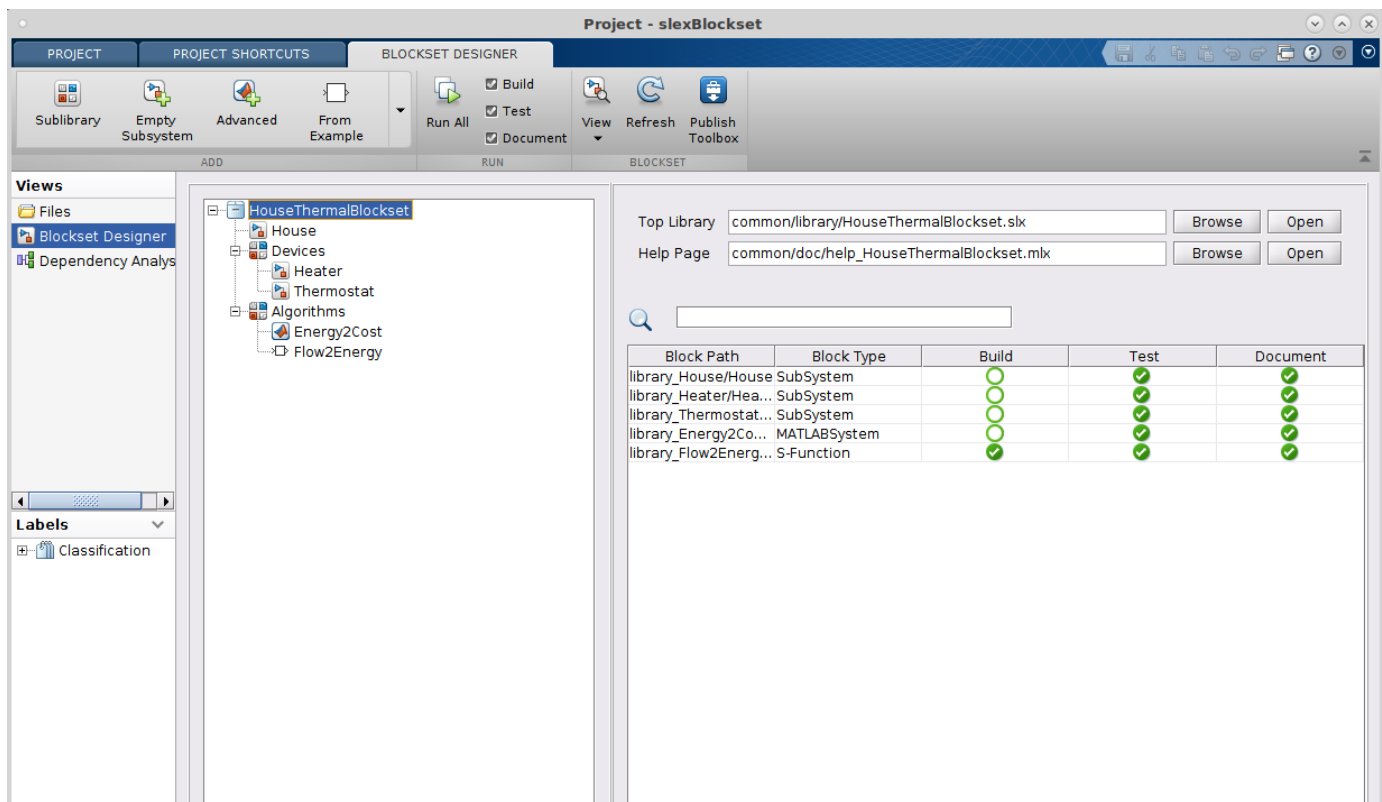

This example shows how to manage artifacts associated with a Simulink blockset with a single Blockset Designer Project.

Introduction

Simulink Blockset Designer is a Project™ based environment to author a Simulink blockset. It provides a one-stop shop for the development and maintenance of Simulink blockset artifacts such as source code, TLC-files, build scripts, test suites, libraries, models, and documentations. This example demonstrates how to streamline such a Simulink blockset project.

Try the Example

Run `slexBlocksetDesignerExample` to open the Simulink Blockset Designer project. Then click the 'Run All' button in toolstrip to start.

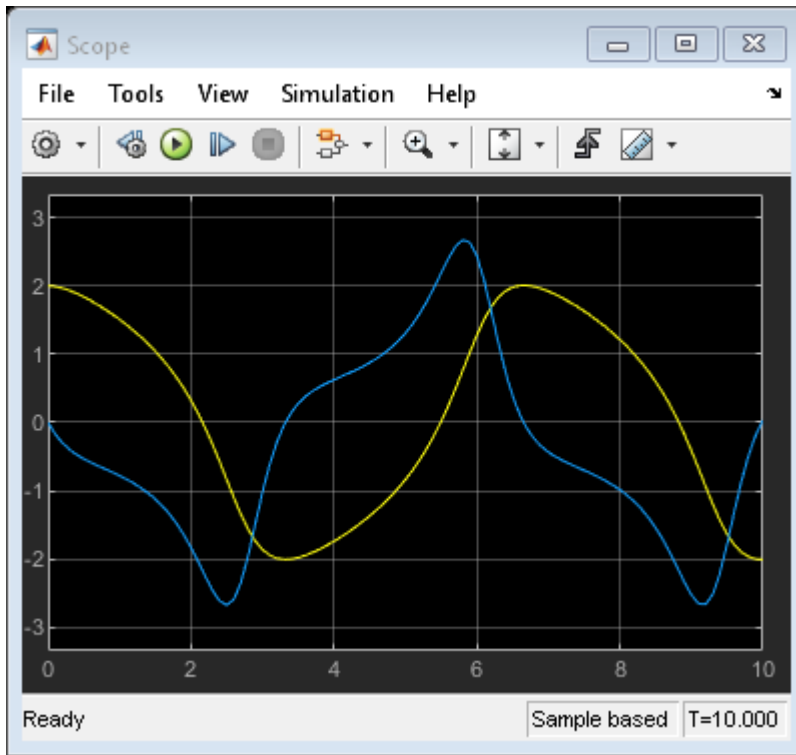

Importing a Co-Simulation FMU into Simulink

This model shows how to use the FMU Import block to load an FMU file. The FMU file supports execution in co-simulation mode. Simulink supports stepping back and forth, tuning parameters in between, and saving states for the FMU Import block as long as the FMU itself supports these features.

Importing a Co-Simulation FMU into Simulink

Copyright 2017 The MathWorks, Inc.

Importing a Model Exchange FMU into Simulink

This model shows how to use the FMU Import block to load an FMU file. The FMU file supports execution in Model Exchange mode.

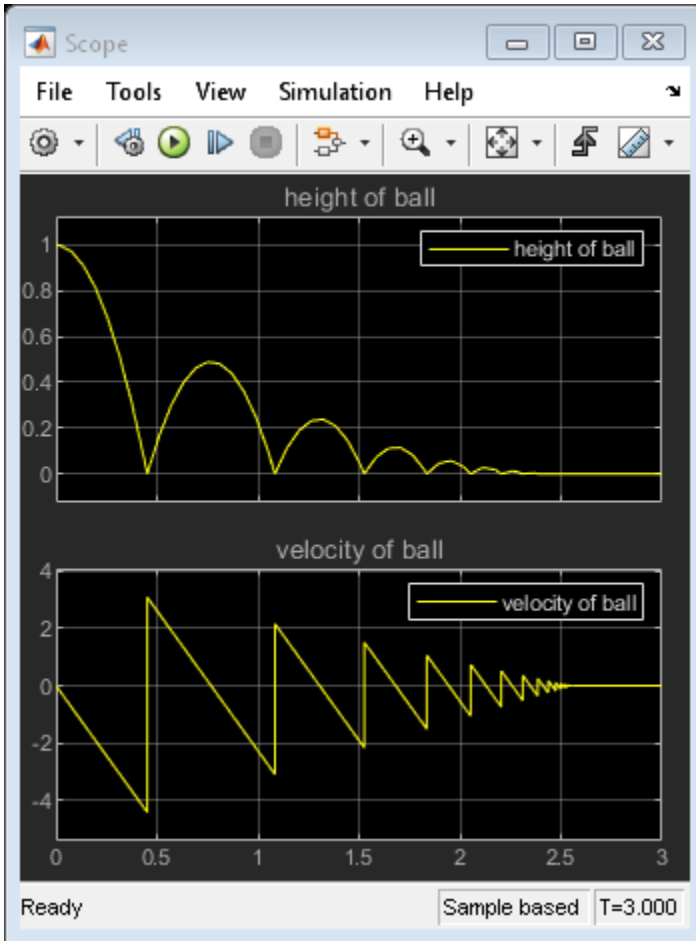

Bouncing Ball System

This FMU file models a bouncing ball system, which is an example of a hybrid dynamic system. The FMU file supports FMI 2.0 Model Exchange mode. You can change acceleration due to gravity and coefficient of restitution in the FMU block dialog. You can also tune parameters during simulation.

Importing a Model Exchange FMU into Simulink

Copyright 2017 The MathWorks, Inc.

Using Bus Signals and Structure Parameters in the FMU Import Block

This model shows how to use bus signals and structure parameters in an FMU Import block. The FMU supports execution in Model Exchange mode.

Bus Signals and Structure Parameters Model

This FMU file models a simple system that computes the weighted average of two input bus signals, `vehicle`, packed into an array of buses. Each of the input bus signals contains four bus elements, `wheel`. Each bus element contains two scalar signals, `position` and `speed`. The FMU accepts two structure parameters, `Weight` and `Bias`, and uses them to compute the weighted average `ev` of input signals:

$$ev.wheel(i).position = vehicle(1).wheel(i).position * Weight.v1 + Bias.v1 + vehicle(2).wheel(i).position * Weight.v2 + Bias.v2$$

$$ev.wheel(i).speed = vehicle(1).wheel(i).speed * Weight.v1 + Bias.v1 + vehicle(2).wheel(i).speed * Weight.v2 + Bias.v2$$

where

$$i = 1 \dots 4.$$

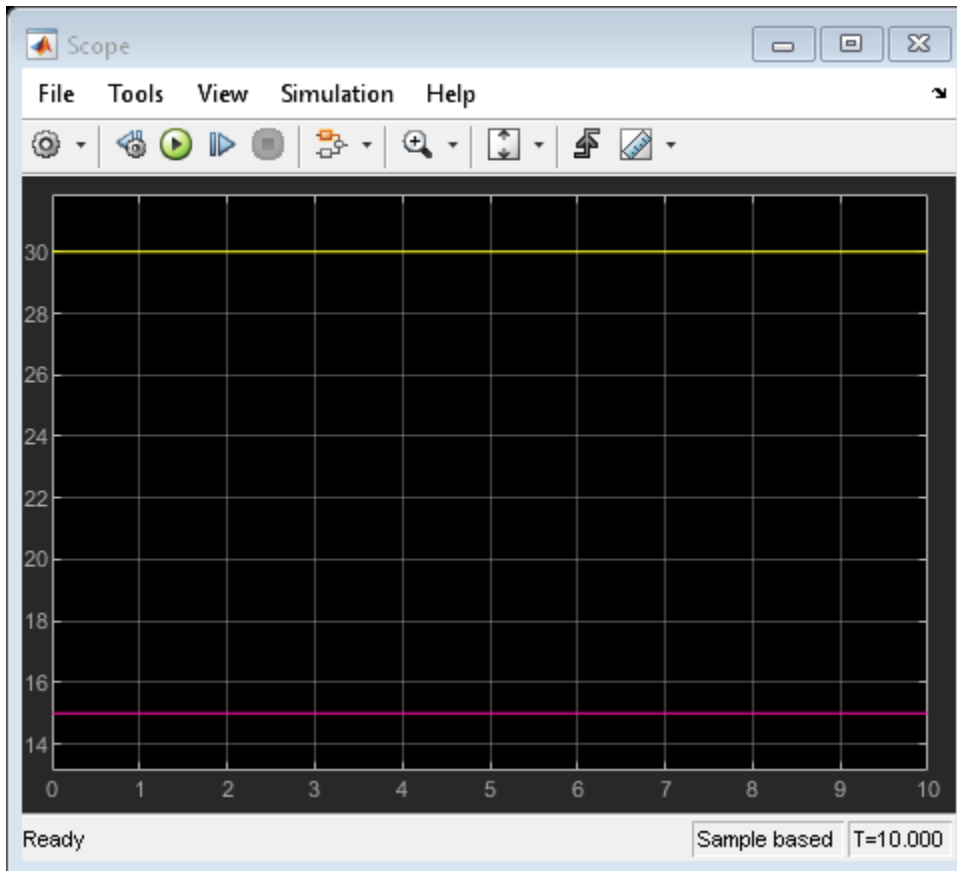

The FMU file supports FMI 1.0 Model Exchange mode.

The FMU Import block supports non-virtual bus types. You must create a bus object whose structure matches the associated structure in the FMU file. When naming the bus object structures, use the variable names defined in the `modelDescription.xml` of the FMU file. For more information, see FMU documentation.

Using Bus Signals and Structure Parameters in the FMU Import Block

Co-Simulation Signal Compensation

This example shows how to use co-simulation and signal compensation for interfacing signals.

In co-simulation, components (slaves) have their own local solver. During simulation, local solvers maintain their own time by integrating from the previous step to the current step using the data exchanged between components at the previous step.

Simulink (master) serves as an integration platform and performs data exchange between slaves. Slaves do not expose their internal states to the master. The master treats slaves as discrete blocks that exchange data at discrete time intervals.

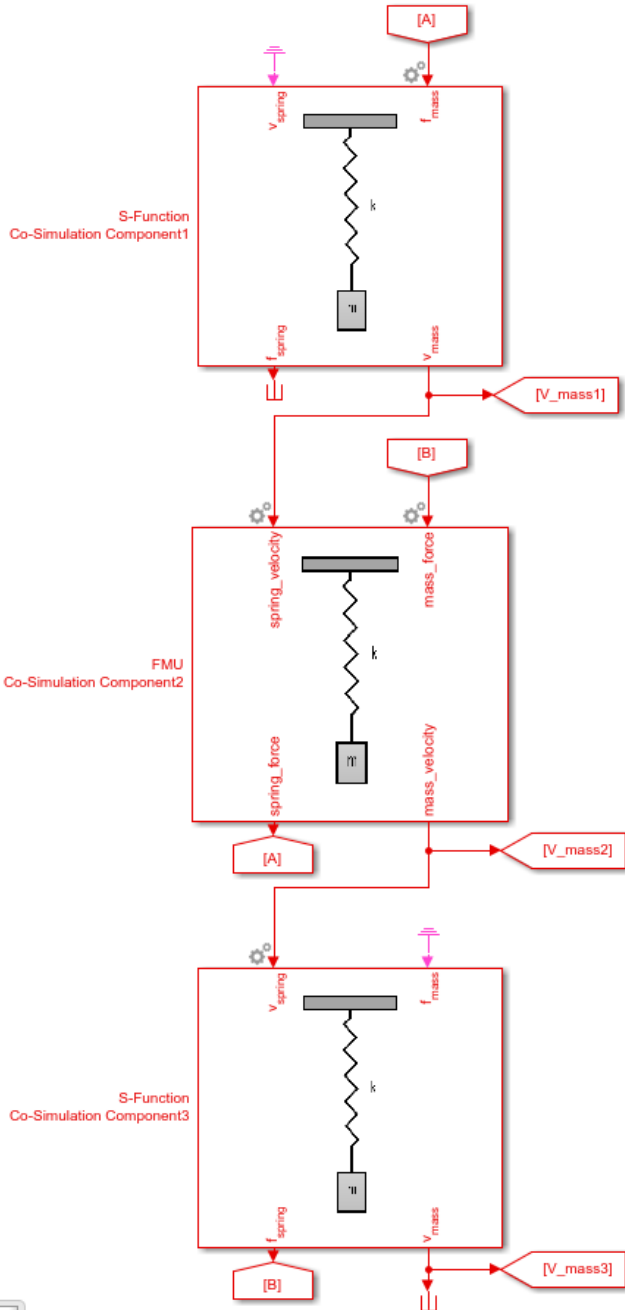

Connecting these co-simulation components does not form an algebraic loop. Instead, it introduces one-step delay during data exchange. This one-step delay can cause simulation to be less accurate or unstable.

To mitigate this issue, Simulink automatically identifies interfacing signals between these components. These signals are ideally continuous quantities that must be sampled due to co-simulation. To achieve better co-simulation stability and accuracy, Simulink performs numerical compensation on these signals. A 'gear' icon displays on the affected component to indicate this.

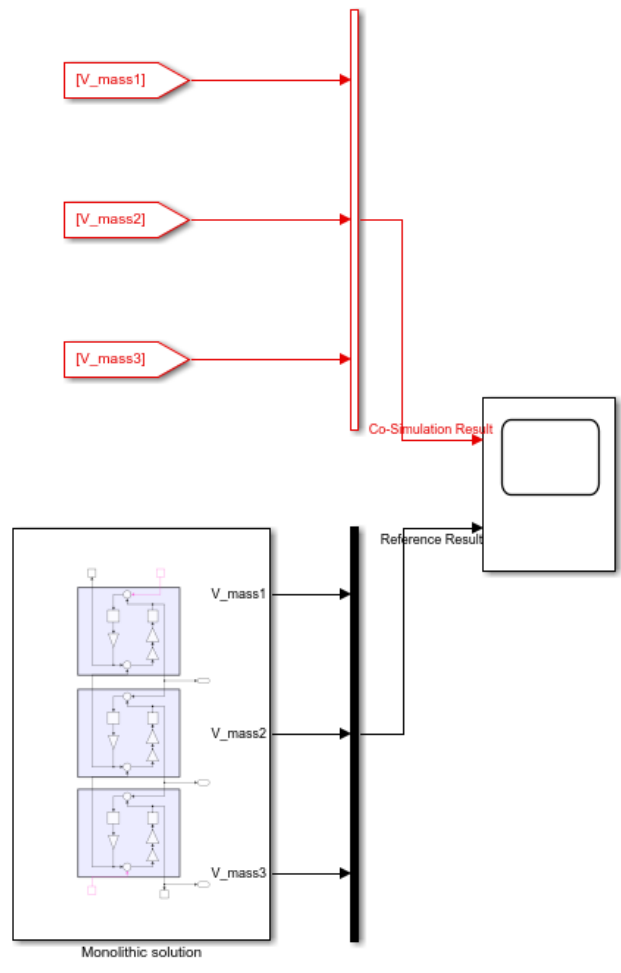

Triple Mass-Spring System

This example shows how to perform numerical compensation for three standalone mass-spring components (two implemented in C-MEX S-Function, one implemented using FMU Co-Simulation v2.0). These components are connected to form a triple mass-spring system. When you update the block diagram, the numerical compensation icons appear at the input ports.

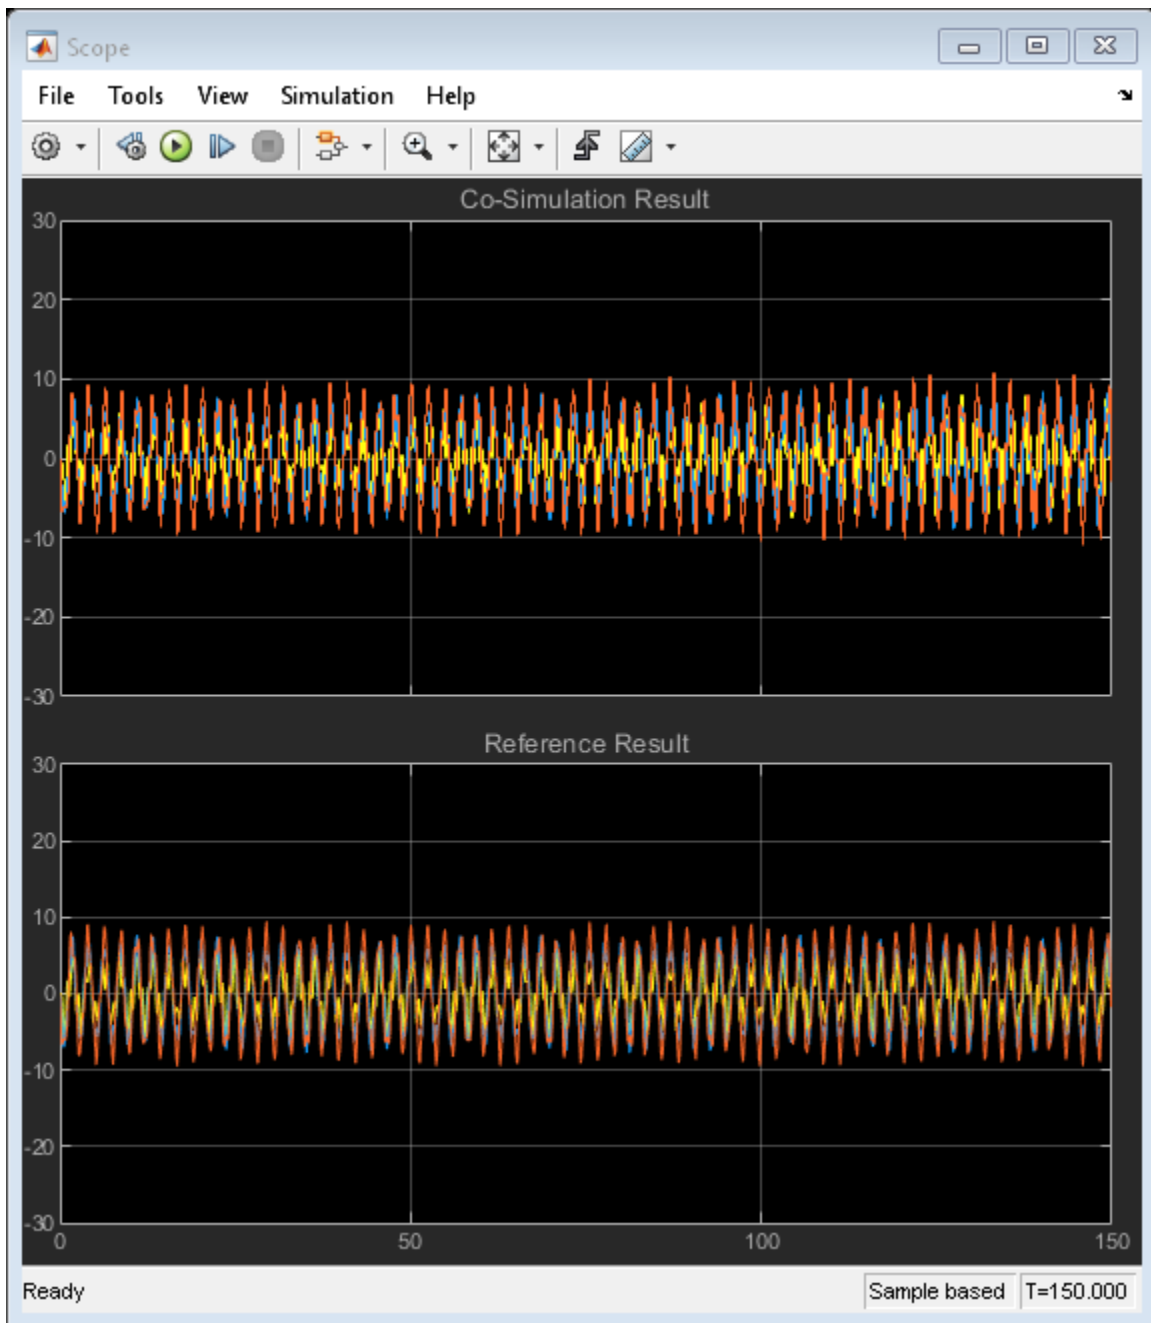

The monolithic subsystem uses Simulink continuous blocks and is solved using a Simulink solver. It represents a pure form of the triple mass-spring system. Simulating the monolithic subsystem results in the most accurate output. Experiment toggling the numerical compensation behavior of the co-simulation components and compare the output of the co-simulation components with the monolithic subsystem output.

Co-Simulation Signal Compensation

Copyright 2017 The MathWorks, Inc.

Multithread Co-Simulation

This example shows how to run co-simulation on multiple threads.

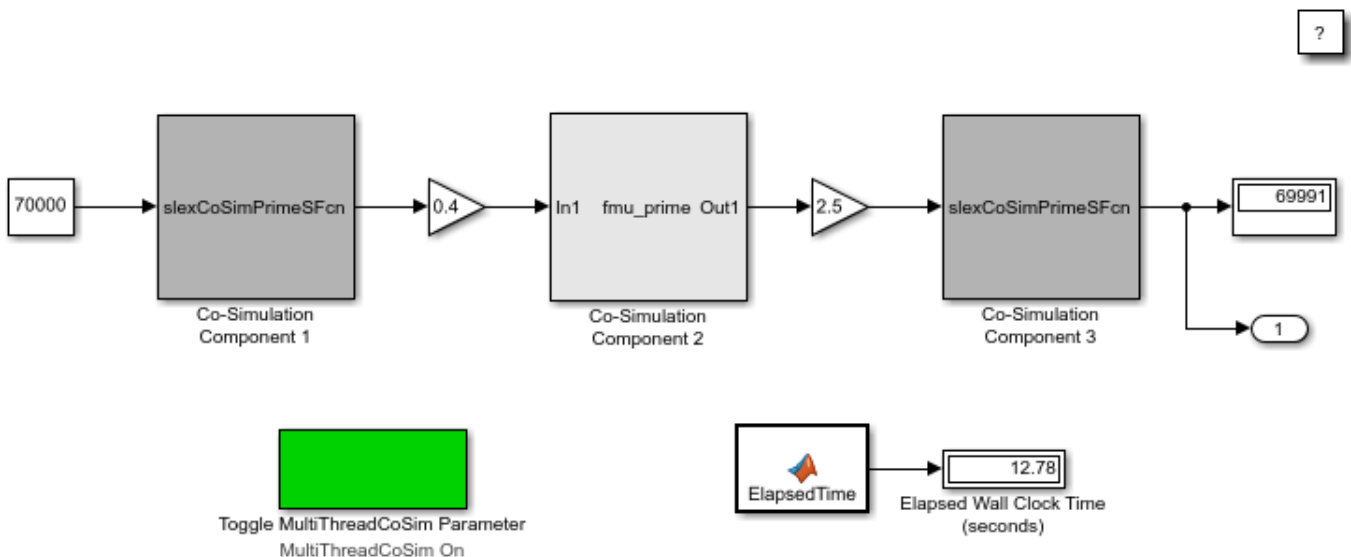

Simulink is an integration platform that supports co-simulation between components with local solvers or that involves simulation tools. For example, co-simulation can involve an S-function as a co-simulation gateway between Simulink and third-party tools or custom code. It can also involve an FMU in co-simulation mode imported to Simulink.

By default, Simulink configures all models to run on multiple threads with the MultiThreadCoSim parameter.

This example shows how to run multithreaded co-simulation of three components (two implemented in C-MEX S-Function, one implemented using FMU Co-Simulation v2.0). These components compute prime numbers to find the maximum prime number that is smaller than or equal to the given input.

Multithreaded co-simulation best suits models with computationally intensive and loosely coupled components. In this example, each component computes prime numbers using a brute-force search. The intensity of the computation is directly proportional to the given range, which is a block input that you can experiment with. Also, components exchange a scalar signal, which is the maximum prime number within the given range, at communication times.

Experiment toggling the MultiThreadCoSim parameter and measuring the wall clock time.

Pulse Width Modulation Using MATLAB System Block

This example shows how to use MATLAB System block to generate Pulse Width Modulation (PWM) signals based on the input period and duty cycle signals by using controllable sample time and `setNumTicksUntilNextHit`.

In this example, MATLAB System block registers a controllable sample time so that it can schedule the next hit while changing the output value. In this example, the MATLAB System block has two input ports and one output port. The first input port is the duty cycle signal and the second input port is the period signal. The MATLAB System block has two block parameters: the amplitude of the generated PWM signal and the resolution of the controllable sample time.

In this example, the MATLAB System block demonstrates the use of the function: `* createSampleTime(obj, 'Type', 'Controllable', 'TickTime', obj.Resolution)` to register a controllable sample time in `getSampleTimeImpl` method. The resolution must be a positive finite integer that defines the fundamental step size that the MATLAB System block can schedule the next hit for this sample time.

MATLAB System Block demonstrates the use of the method: `* setNumTicksUntilNextHit(obj, numTicks)` to schedule the next hit of the controllable sample time. The next hit happens after $t = t_{\text{current}} + \text{numTicks} * \text{resolution}$. `numTicks` must be a positive integer. The MATLAB System block can use this method to schedule the execution of the controllable sample time in `setupImpl` and `stepImpl`.

Modeling Cyber-Physical Systems

Cyber-physical systems combine computer and physical systems to achieve design goals. Simulation of cyber-physical systems requires a combination of modeling techniques such as continuous-time, discrete-time, discrete-event, and finite state modeling. Simulink® and its companion products provide functionality to apply a wide range of modeling techniques and seamlessly integrate them in one simulation environment, which is ideal for modeling cyber-physical systems.

This example shows how continuous-time, discrete-event, and finite-state modeling techniques combine to simulate the behavior of a variable speed conveyor belt system. In SimEvents®, entities are discrete items of interest in a discrete-event simulation. Because passengers are discrete individuals, they are modeled by SimEvents® entities, created by the Entity Generator block. A Stateflow® chart models the operational modes and motor dynamics of the variable speed conveyor belt. Finally, the Entity Transport Delay block models passenger throughput as a function of conveyor belt dynamics, providing a bridge between the discrete-event and continuous-time domains.

Note: The example uses blocks from SimEvents® and Stateflow®. If you do not have a SimEvents or Stateflow license, you can open and simulate the model but only make basic changes such as modifying block parameters.

Model Structure

The model includes these key components:

- **Passengers** — Models the arrival of passengers as a Poisson process. The output is a sequence of SimEvents® entities corresponding to the passengers who step on the conveyor belt. The

distribution of inter-arrival time (Δt) of a Poisson process is $P(\Delta t) = \lambda e^{-\lambda \Delta t}$, where λ is the arrival rate. λ is modeled by a MATLAB action in the Entity Generator block for *rush hour*, *normal hour*, and *free hour*. The passenger arrival rate changes with time as:

$$\lambda(t) = \begin{cases} 2, & \text{mod}(t, 300) \in [0, 180), \quad \text{rush hour} \\ 0.5, & \text{mod}(t, 300) \in [180, 240), \quad \text{normal hour} \\ 0.1, & \text{mod}(t, 300) \in [240, 300), \quad \text{free hour} \end{cases}$$

- **Entity Transport Delay** — Holds the passengers on the conveyor belt until they arrive at the other terminal, based on the time delay calculated by the Stateflow chart.
- **Dynamics of conveyor belt** — Models the operation of a variable speed conveyor belt. See the Conveyor Belt Dynamics section for more details.
- **Dashboard** — Shows the runtime status of the conveyor belt. The color of the Mode Lamp indicates the mode of the conveyor belt.

Conveyor Belt Dynamics

A Stateflow® chart models the dynamics of the variable speed conveyor belt. Note in the chart that the velocity and power of the belt are plotted against a logarithmic scale of the load weight. The conveyor belt has these modes:

- **Idle** — The weight of the load is small. The belt maintains a low velocity to save energy. The Mode Lamp is gray in this mode.

- **OnDemand** — This is the normal operating mode, which maintains the optimal velocity for passenger comfort and throughput. The power will proportionally increase with the weight of the load. The Mode Lamp is green in this mode.
- **Max** — Maximum power mode. The weight of the load is too large for the conveyor belt to maintain the optimal velocity. The conveyor belt operates at the maximum possible velocity that does not exceed the maximum power. The Mode Lamp is red in this mode.

Results

The Scope and blocks in the DashBoard show the simulation results.

Simulation results: 1. Number of passengers versus simulation time. 2. Velocity (blue) and power (red) versus simulation time.

Three operation cycles are observed within a time span of 900. Each cycle has a period of 300, which aligns with the period of the arrival rate. The top plot shows the number of passengers on the conveyor belt over time, and the bottom plot shows the velocity and power of the conveyor belt. The velocity and power are normalized for better visualization.

The first two thirds of each period correspond to *rush hour*, and the number of passengers on the conveyor belt increases dramatically. Consequently, the conveyor belt enters into the **Max** mode quickly, which is characterized by the maximum output power with a velocity that is inversely proportional to the number of passengers. In the last third of each period, the airport is in the *normal hour* followed by the *free hour*. Therefore, the number of passengers on the conveyor belt drops and even becomes zero for some time.

The conveyor belt then operates in **OnDemand** and **Idle** modes accordingly. In **OnDemand** mode, the velocity is locked to a default value, and the power is proportional to the number of passengers. In **Idle** mode, both the velocity and power are maintained at low values to reduce energy consumption. Overall, the conveyor belt operates according to the load of the airport.

Schedule an Export-Function Model Using the Schedule Editor

This example shows how to view and edit the order of function-calls in an export-function model using the Schedule Editor. As in all export-function models, the desired functionality is modeled as function-call subsystems. These function-call subsystems define the partitions that are scheduled by the Schedule Editor.

With the Schedule Editor, you can easily view and edit the schedule of the function-calls. The behavior of the system depends on the order of these partitions. In this example, we change the order and observe its effects on the behavior of the system by simulating the model. To see the impact of editing the schedule on the simulation, we compare the model simulations before and after scheduling.

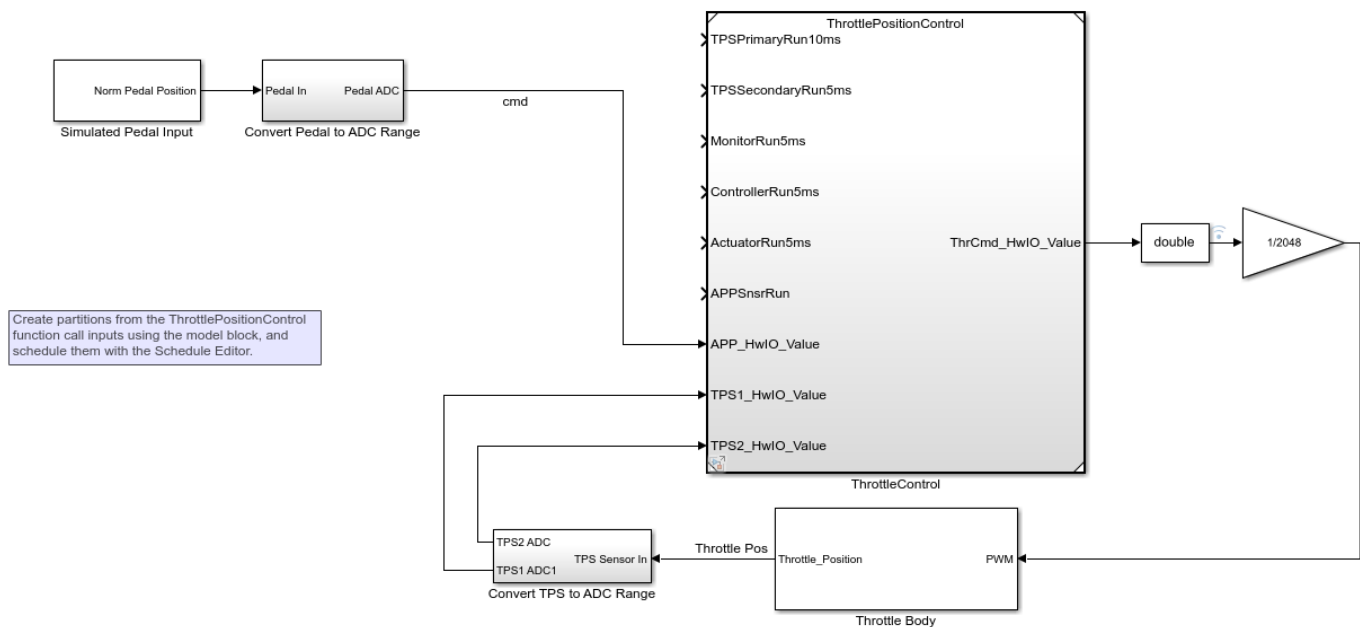

Create Partitions from Referenced Export-Function Model

To view and edit the schedule of the export-function model, reference the model.

```
open_system('ThrottlePositionControlTop.slx');
```

Schedule an Export-Function Model with the Schedule Editor

Copyright 2018 The MathWorks, Inc.

ThrottlePositionControl is the referenced export-function model. By default, each function has an input port that can be used to trigger these functions. The Schedule Editor automatically handles these ports. To use the Schedule Editor, set the Schedule Rates With parameter to Schedule Editor.

```
set_param('ThrottlePositionControlTop/ThrottleControl', 'ScheduleRatesWith', 'Schedule Editor');
```

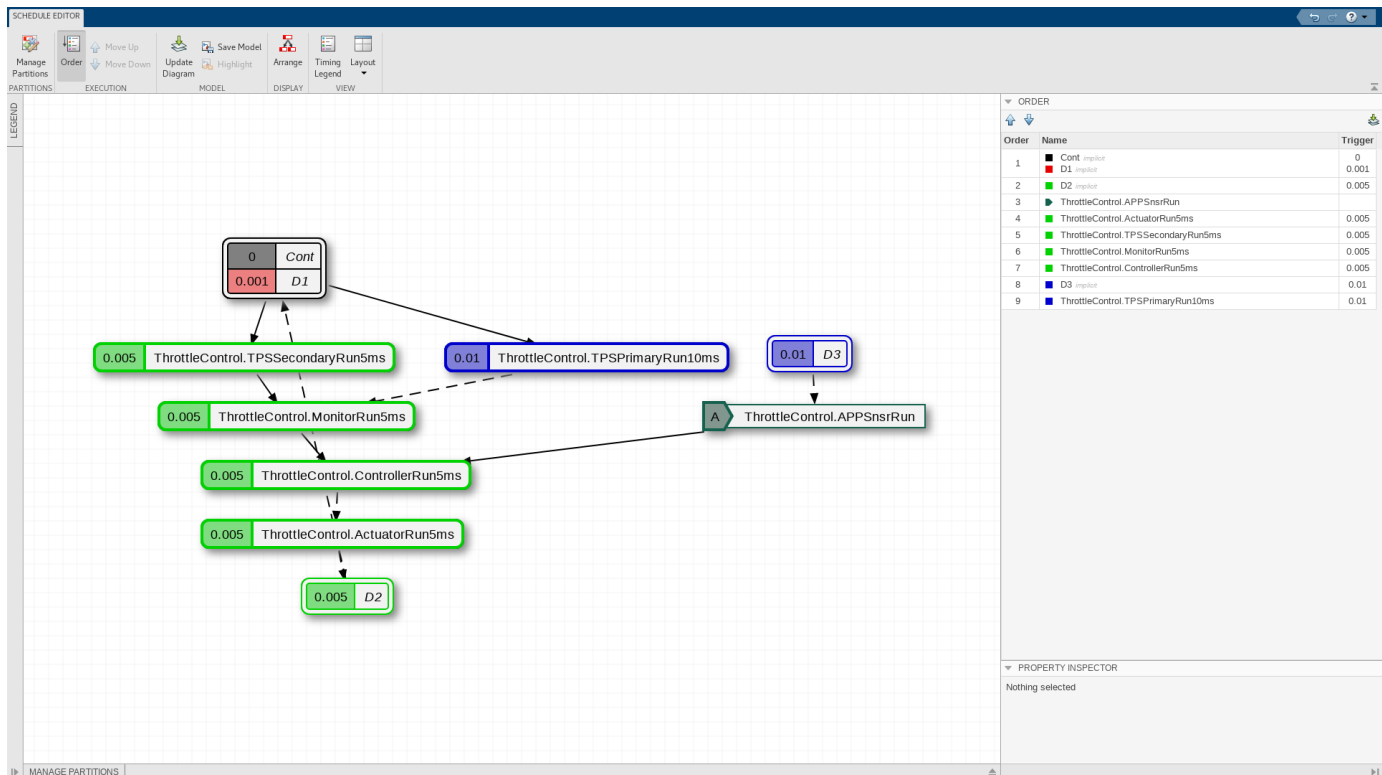

Establish a Simulation Baseline

To observe the impact of scheduling on the model behavior, establish a baseline by simulating the model before editing the schedule. Simulate the model.

```
sim('ThrottlePositionControlTop');
```

Open the Schedule Editor

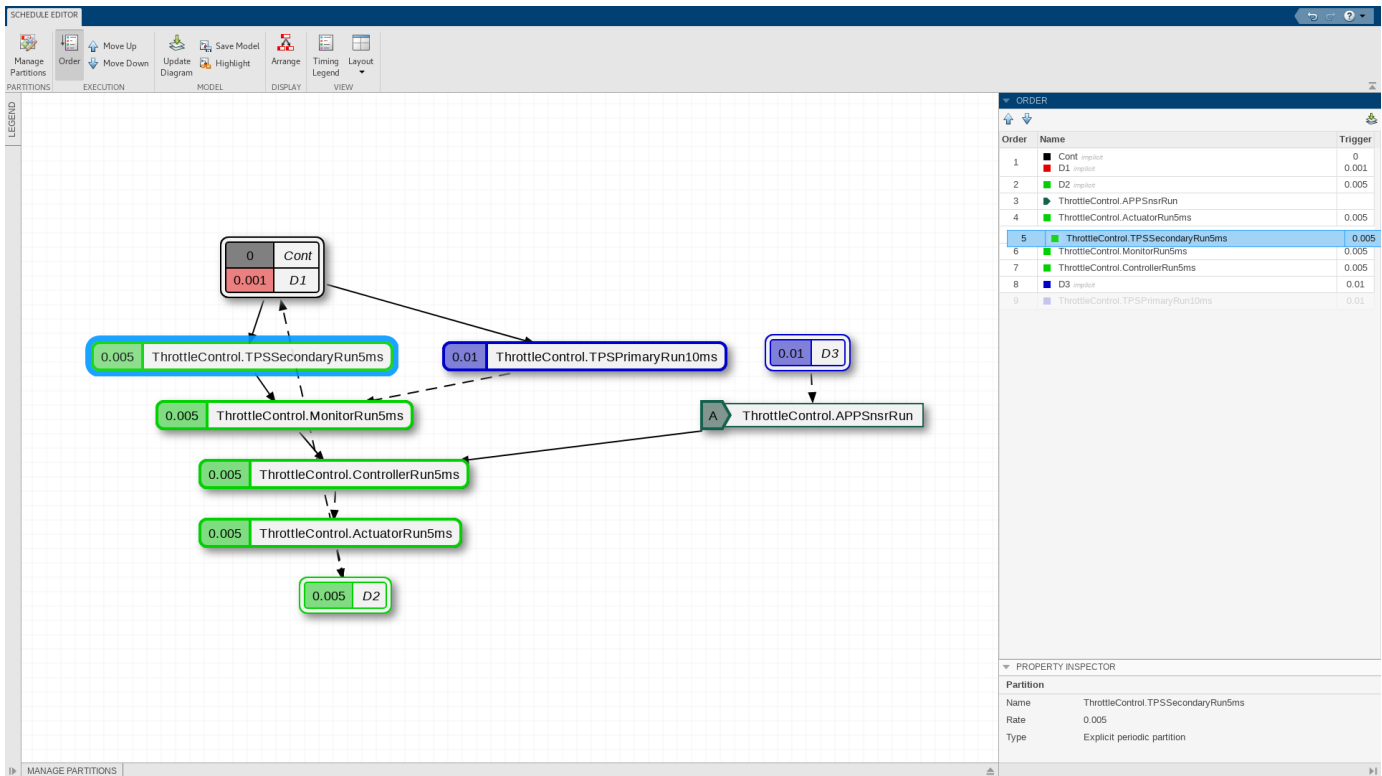

To open the Schedule Editor, click **Schedule Editor** in the **Design** section of the **Modeling** tab. In the Schedule Editor, different components of the model are represented as partitions. Update the diagram to see the partitions. Partitions are the entry-points in the model. The Schedule Editor shows the order and data communications of these partitions. The arrows are data connections between the partitions that show the data flow. The dashed lines indicate that there is a delay because the source runs after the destination. The solid lines indicate that there is no delay as the source runs before the destination.

Edit Partition Schedule

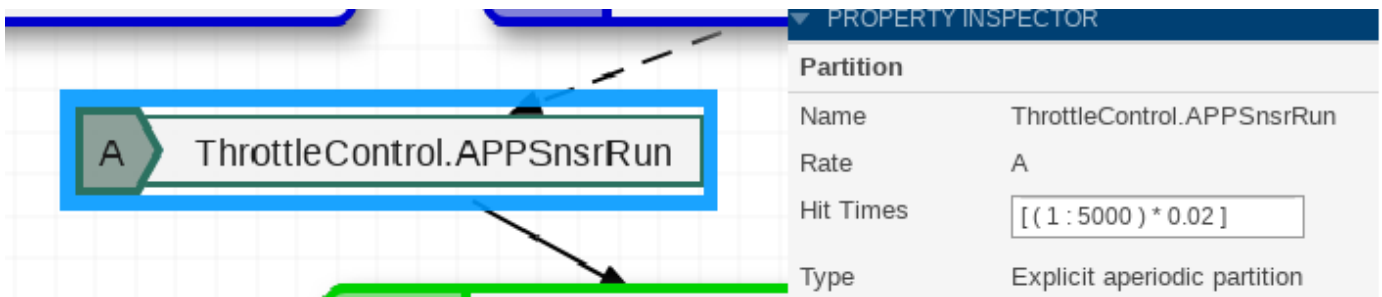

The Order pane shows the order the partitions run in at a given time step. Assume that the order of the partitions is in an imperfect state. In this case, to remove the delay, you want to run the `ThrottleControl.ActuatorRun5ms` partition after the `ThrottleControl.ControllerRun5ms` partition.

Drag `ThrottleControl.ActuatorRun5ms` after the `ThrottleControl.ControllerRun5ms` in the Order pane. Observe that the delay between the `ThrottleControl.ControllerRun5ms` and the `ThrottleControl.ActuatorRun5ms` partitions changes to a dependency. Observe that now there is no delay between the executions of `ThrottleControl.ControllerRun5ms` and `ThrottleControl.ActuatorRun5ms`.

Schedule the Execution of Aperiodic Partitions

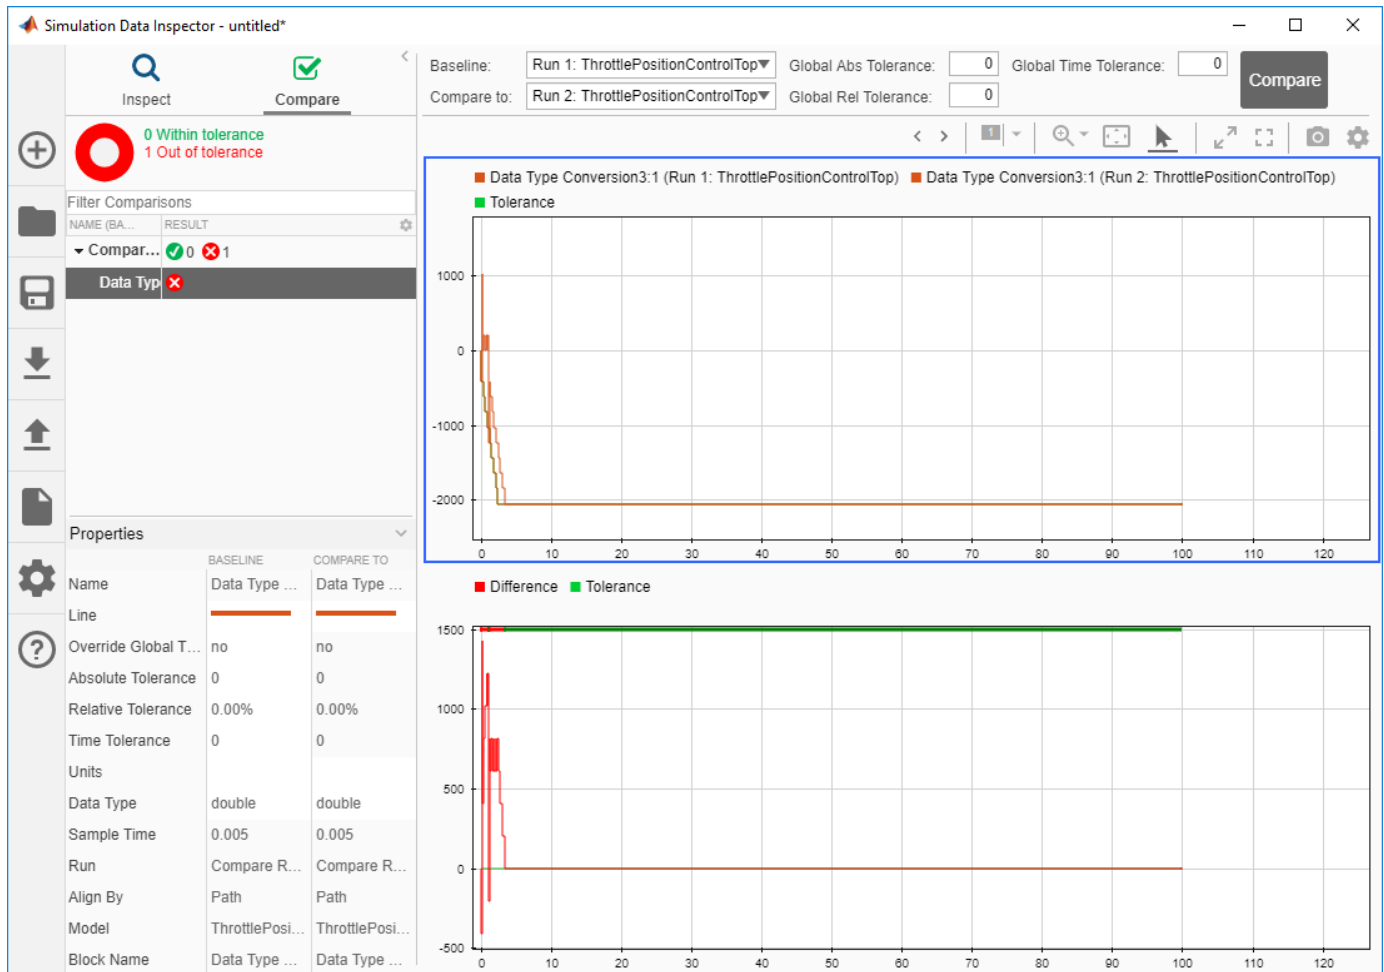

The export-function model contains an unconstrained partition, AccelerationPedalPositionSensor. Suppose you want to schedule an unconstrained partition to simulate as if it were discrete. Schedule `ThrottleControl.APPSnrRun` partition to run at $[0:0.02:100]$ to observe its behavior at different instances of time. Click the unconstrained partition and enter $[(1:5000)*0.02]$ for Hit Times in the Property Inspector.

Compare the Runs in Simulation Data Inspector

Now, simulate the model with the changed schedule.

Open the Simulation Data Inspector. Select the two runs and compare. You can see how changing the schedule impacts the model behavior. For more information, see [View Data with the Simulation Data Inspector](#).

Promote Block Parameters on a Mask

You can use Parameter Promotion to promote any underlying parameter of a block either to a block mask or to a subsystem mask. This model contains a subsystem that has 3 Gain blocks (**Gain1**, **Gain2**, and ***Gain3**). The variable K represents the Gain parameter for these Gain blocks. You can promote only the Gain parameter of each of these Gain blocks to the block mask as a single parameter. When you do so, the parameter K is available on the mask for editing and its value will be applied to **Gain1** , **Gain2** , and **Gain3** blocks.

- 1 Select the Subsystem block.
- 2 On the **Subsystem Block** tab, in the **Mask** group, click **Create Mask/Edit Mask**.
- 3 In the Mask Editor dialog box, click the **Parameters & Dialog** tab.
- 4 In the **Controls** pane, click **Promote** .
- 5 In the **Property editor** pane, **Type options** field, click
- 6 In the **Promoted Parameter Selector** dialog box, select **Gain1** .
- 7 Select **Gain** from the **Promotable parameters** table and click the Add to promoted parameter list button. Similarly, add Gain parameter for **Gain2**.
- 8 Click **OK** .
- 9 In the Mask Editor dialog box, edit the prompt names for the **Gain** parameter. Here the Prompt used is **Common gain** .
- 10 Click **OK** to finish creating subsystem mask with many-to-one promotion.
- 11 Simulate the model. Notice that the value 4 is passed from the mask to the underlying block **Gain1**, **Gain2** , and **Gain3** . In this case, the output shows 64.

```
open_system('promote_block_param_to_mask');
```
